

# ETSI TS 100 392-2 V3.9.1 (2019-01)

TECHNICAL SPECIFICATION

## **Terrestrial Trunked Radio (TETRA); Voice plus Data (V+D); Part 2: Air Interface (AI)**

---

**Reference**

RTS/TCCE-03249

---

**Keywords**

air interface, radio, TETRA, V+D

**ETSI**

---

650 Route des Lucioles

# Contents

|   |    |
|---|----|
| Intellectual Property Rights .....  | 45 |
| Foreword.....   | 45 |
| Modal verbs terminology.....  | 46 |
| 1 Scope .....   | 47 |
| 2 References .....  | 48 |
| 2.1 Normative references .....  | 48 |
| 2.2 Informative references.....   | 50 |
| 3 Definition of terms, symbols and abbreviations.....                               | 51 |
| 3.1 Terms.....  | 51 |
| 3.2 Symbols.....  | 59 |
| 3.3 Abbreviations .....   | 59 |
| 4 Radio aspects.....  | 66 |
| 4.1 Introduction .....  | 66 |
| 4.2 Set of logical channels.....  | 66 |
| 4.3 Reference configuration .....   | 66 |
| 4.4 Error control schemes.....  | 67 |
| 4.5 Multiple access and timeslot structure.....                                     | 67 |
| 4.5.1 General.....  | 67 |
| 4.5.2 Hyperframes, multiframes and frames.....                                      | 68 |
| 4.5.3 Timeslots and bursts .....  | 68 |
| 4.5.4 Mapping of logical channels onto physical channels.....                       | 69 |
| 4.6 Coding, interleaving and scrambling.....  | 69 |
| 4.7 Modulation .....  | 69 |
| 4.8 Transmission and reception .....  | 69 |
| 4.9 Other radio-related functions.....  | 69 |
| 4.10 Performance .....  | 70 |
| 4.11 TETRA modes of operation .....   | 70 |
| 4.11.0 General.....   | 70 |
| 4.11.1 Main control channel modes of operation.....                                 | 71 |
| 4.11.1.1 Conventional Access (CA) mode.....   | 71 |
| 4.11.1.2 Direct Access (DA) mode .....  | 71 |
| 4.11.2 Transmission modes .....   | 71 |
| 4.11.2.1 Downlink-Continuous Transmission (D-CT) mode.....                          | 71 |
| 4.11.2.2 Downlink-Carrier Timesharing Transmission (D-CTT) mode.....                | 71 |
| 4.11.2.3 Downlink-Main Control Channel Timesharing Transmission (D-MCCTT) mode..... | 71 |
| 4.11.2.4 Multiple Slot Transmission (MST) mode .....                                | 71 |
| 4.11.3 Control modes.....   | 71 |
| 4.11.3.1 Normal Control Mode (NCM) .....  | 71 |
| 4.11.3.2 Minimum Control Mode (MCM).....  | 72 |
| 5 Modulation .....  | 73 |
| 5.1 Introduction .....  | 73 |
| 5.2 Modulation type .....   | 73 |
| 5.3 Modulation rate .....   | 73 |
| 5.4 Modulation symbol definition .....  | 73 |
| 5.5 Modulated signal definition.....  | 75 |
| 5.6 Modulation filter definition .....  | 75 |
| 5.7 Modulation block diagram .....  | 76 |
| 5.8 Introduction to QAM channels.....   | 76 |
| 5.9 Modulation type .....   | 76 |
| 5.10 Use of sub-carriers in QAM carriers .....                                      | 76 |
| 5.11 Modulation rate .....  | 76 |
| 5.12 Modulation symbol definition .....   | 77 |
| 5.13 Bit to symbol mapping .....  | 77 |
| 5.14 Data, synchronization and pilot symbol multiplexing .....                      | 80 |

|           |   |    |
|-----------|---|----|
| 5.15      | Sub-carrier frequency domain multiplexing.....                    | 81 |
| 5.16      | Modulated signal definition.....                                  | 81 |
| 5.17      | Modulation filter definition.....                                 | 82 |
| 5.18      | Modulation block diagram.....                                     | 83 |
| 6         | Radio transmission and reception.....                             | 84 |
| 6.1       | Introduction.....   | 84 |
| 6.2       | Frequency bands and channel arrangement.....                      | 84 |
| 6.3       | Reference test planes.....  | 84 |
| 6.4       | Transmitter characteristics.....                                  | 85 |
| 6.4.1     | Output power for phase modulation.....                            | 85 |
| 6.4.1.0   | General.....  | 85 |
| 6.4.1.1   | Base Station (BS).....  | 85 |
| 6.4.1.2   | Mobile Station (MS).....  | 86 |
| 6.4.2     | Unwanted conducted emissions for phase modulation.....            | 86 |
| 6.4.2.1   | Definitions.....  | 86 |
| 6.4.2.2   | Unwanted emissions close to the carrier.....                      | 87 |
| 6.4.2.2.0 | General.....  | 87 |
| 6.4.2.2.1 | Emission during the useful part of the burst.....                 | 87 |
| 6.4.2.2.2 | Emission during the switching transients.....                     | 87 |
| 6.4.2.3   | Unwanted emissions far from the carrier.....                      | 88 |
| 6.4.2.4   | Unwanted emissions during the CLCH and BLCH.....                  | 88 |
| 6.4.2.5   | Unwanted emissions in the non-transmit state.....                 | 89 |
| 6.4.3     | Unwanted radiated emissions for phase modulation.....             | 89 |
| 6.4.4     | RF tolerance for phase modulation.....                            | 89 |
| 6.4.5     | RF Output power time mask for phase modulation.....               | 89 |
| 6.4.5.0   | General.....  | 89 |
| 6.4.5.1   | BS.....   | 90 |
| 6.4.5.2   | MS.....   | 90 |
| 6.4.6     | Transmitter intermodulation attenuation for phase modulation..... | 90 |
| 6.4.6.1   | Definition.....   | 90 |
| 6.4.6.2   | BS.....   | 91 |
| 6.4.6.3   | MS.....   | 91 |
| 6.4.7     | Intra-BS intermodulation requirements.....                        | 91 |
| 6.4.8     | Output power for QAM.....   | 91 |
| 6.4.8.0   | General.....  | 91 |
| 6.4.8.1   | BS.....   | 92 |
| 6.4.8.2   | MS.....   | 92 |
| 6.4.9     | Unwanted conducted emissions for QAM.....                         | 93 |
| 6.4.9.1   | Definitions.....  | 93 |
| 6.4.9.2   | Unwanted emissions close to the carrier.....                      | 93 |
| 6.4.9.2.0 | General.....  | 93 |
| 6.4.9.2.1 | Emission during the useful part of the burst.....                 | 93 |
| 6.4.9.2.2 | Emission during the switching transients.....                     | 94 |
| 6.4.9.3   | Unwanted emissions far from the carrier.....                      | 94 |
| 6.4.9.4   | Unwanted emissions during the CLCH-Q and BLCH-Q.....              | 95 |
| 6.4.9.5   | Unwanted emissions in the non-transmit state.....                 | 96 |
| 6.4.10    | RF Output power time mask for QAM.....                            | 96 |
| 6.4.10.0  | General.....  | 96 |
| 6.4.10.1  | BS.....   | 97 |
| 6.4.10.2  | MS.....   | 97 |
| 6.4.11    | Transmitter intermodulation attenuation.....                      | 97 |
| 6.4.12    | Intra-BS intermodulation requirements.....                        | 97 |
| 6.5       | Receiver characteristics.....                                     | 97 |
| 6.5.0     | General.....  | 97 |
| 6.5.1     | Blocking characteristics.....                                     | 97 |
| 6.5.1.1   | Definition.....   | 97 |
| 6.5.1.2   | Specification for Phase Modulation.....                           | 98 |
| 6.5.1.3   | Specification for QAM.....  | 98 |
| 6.5.2     | Spurious response rejection.....                                  | 99 |
| 6.5.2.1   | Definition.....   | 99 |
| 6.5.2.2   | Specification for phase modulation.....                           | 99 |

|           |  |     |
|-----------|--|-----|
| 6.5.2.3   | Specification for QAM.....   | 99  |
| 6.5.3     | Intermodulation response rejection.....  | 100 |
| 6.5.3.1   | Definition .....   | 100 |
| 6.5.3.2   | Specification for Phase Modulation .....   | 100 |
| 6.5.3.3   | Specification for QAM.....   | 100 |
| 6.5.4     | Unwanted conducted emissions.....  | 101 |
| 6.5.4.1   | Definition .....   | 101 |
| 6.5.4.2   | Specification.....   | 101 |
| 6.5.5     | Unwanted radiated emissions .....  | 101 |
| 6.6       | Transmitter/receiver performance for phase modulation.....                           | 101 |
| 6.6.0     | General.....   | 101 |
| 6.6.1     | Transmitter performance for phase modulation.....                                    | 101 |
| 6.6.1.1   | Modulation accuracy for phase modulation .....                                       | 101 |
| 6.6.1.2   | Vector error magnitude requirement at symbol time for phase modulation.....          | 102 |
| 6.6.2     | Receiver performance for phase modulation .....                                      | 103 |
| 6.6.2.0   | General .....  | 103 |
| 6.6.2.1   | Nominal error rates for phase modulation.....  | 103 |
| 6.6.2.1.1 | Nominal error rates for $\pi/4$ -DQPSK modulation .....                              | 103 |
| 6.6.2.1.2 | Nominal error rates for $\pi/8$ -D8PSK modulation .....                              | 103 |
| 6.6.2.2   | Dynamic reference sensitivity performance for phase modulation .....                 | 104 |
| 6.6.2.2.0 | General .....  | 104 |
| 6.6.2.2.1 | BS receiver performance .....  | 104 |
| 6.6.2.2.2 | MS receiver performance .....  | 106 |
| 6.6.2.3   | Receiver performance at reference interference ratios for Phase Modulation.....      | 107 |
| 6.6.2.3.0 | General .....  | 107 |
| 6.6.2.3.1 | BS receiver performance .....  | 108 |
| 6.6.2.3.2 | MS receiver performance .....  | 109 |
| 6.6.2.4   | Static reference sensitivity performance for phase modulation.....                   | 110 |
| 6.6.2.4.0 | General .....  | 110 |
| 6.6.2.4.1 | BS receiver performance .....  | 110 |
| 6.6.2.4.2 | MS receiver performance .....  | 111 |
| 6.6.2.5   | MS receiver performance for synchronization burst acquisition.....                   | 112 |
| 6.7       | Transmitter/receiver performance for QAM .....                                       | 112 |
| 6.7.0     | General.....   | 112 |
| 6.7.1     | Transmitter performance for QAM.....   | 112 |
| 6.7.1.1   | Modulation accuracy for QAM.....   | 112 |
| 6.7.1.2   | Vector error magnitude requirement at symbol time for QAM.....                       | 113 |
| 6.7.2     | Receiver performance for QAM .....   | 114 |
| 6.7.2.0   | General.....   | 114 |
| 6.7.2.1   | Nominal error rates for QAM.....   | 114 |
| 6.7.2.2   | Dynamic reference sensitivity performance for QAM.....                               | 114 |
| 6.7.2.3   | Receiver performance at reference interference ratios for QAM.....                   | 117 |
| 6.7.2.3.1 | Adjacent channel interference .....  | 117 |
| 6.7.2.3.2 | Co-channel interference.....   | 117 |
| 6.7.2.4   | Static reference sensitivity performance for QAM .....                               | 118 |
| 6.7.2.5   | MS receiver performance for frequency correction burst acquisition on a DA cell..... | 118 |
| 6.8       | Propagation conditions .....   | 118 |
| 6.8.0     | General.....   | 118 |
| 6.8.1     | Propagation conditions - introduction.....   | 118 |
| 6.8.2     | Tap-gain process types.....  | 119 |
| 6.8.3     | Propagation models.....  | 119 |
| 7         | Radio sub-system synchronization .....   | 121 |
| 7.1       | Introduction .....   | 121 |
| 7.2       | General description of synchronization system.....                                   | 121 |
| 7.3       | Timebase counters for phase modulation .....   | 121 |
| 7.3.1     | Timing counters for phase modulation .....   | 121 |
| 7.3.2     | Values of the counters for phase modulation.....                                     | 121 |
| 7.4       | Timing of phase modulation signals.....  | 122 |
| 7.5       | Timebase counters for QAM .....  | 122 |
| 7.5.1     | Timing counters for QAM.....   | 122 |
| 7.5.2     | Values of the counters for QAM.....  | 122 |

|           |  |     |
|-----------|--|-----|
| 7.6       | Timing of QAM signals .....  | 123 |
| 7.7       | BS requirements for synchronization .....  | 123 |
| 7.8       | MS requirements for synchronization .....  | 124 |
| 8         | Channel coding and scrambling .....  | 125 |
| 8.1       | Introduction .....   | 125 |
| 8.2       | General .....  | 125 |
| 8.2.1     | Interfaces in the error control structure .....  | 125 |
| 8.2.1.1   | Interfaces for phase modulation .....  | 125 |
| 8.2.1.2   | Interfaces for QAM .....   | 127 |
| 8.2.2     | Notation .....   | 128 |
| 8.2.3     | Definition of error control codes .....  | 128 |
| 8.2.3.1   | 16-state Rate-Compatible Punctured Convolutional (RCPC) codes .....  | 128 |
| 8.2.3.1.0 | General .....  | 128 |
| 8.2.3.1.1 | Encoding by the 16-state mother code of rate 1/4 .....   | 128 |
| 8.2.3.1.2 | Puncturing of the mother code .....  | 129 |
| 8.2.3.1.3 | Puncturing scheme of the RCPC code of rate 2/3 .....   | 129 |
| 8.2.3.1.4 | Puncturing scheme of the RCPC code of rate 1/3 .....   | 129 |
| 8.2.3.1.5 | Puncturing scheme of the RCPC code of rate 292/432 .....   | 129 |
| 8.2.3.1.6 | Puncturing scheme of the RCPC code of rate 148/432 .....   | 129 |
| 8.2.3.2   | Shortened (30,14) Reed-Muller (RM) code .....  | 130 |
| 8.2.3.3   | $(K_I + 16, K_I)$ block code .....   | 130 |
| 8.2.3.4   | 8-state Parallel Concatenated Convolutional Code (PCCC) for QAM .....  | 131 |
| 8.2.3.4.0 | General .....  | 131 |
| 8.2.3.4.1 | Encoding by the upper 8-state RSC encoder of rate 1/2 .....  | 131 |
| 8.2.3.4.2 | Interleaving by the quadratic-congruence interleaver .....   | 132 |
| 8.2.3.4.3 | Encoding the interleaved bits by the lower 8-state RSC encoder of rate 1/2 .....   | 133 |
| 8.2.3.4.4 | Merging the systematic and parity bits for the PCCC encoder .....  | 133 |
| 8.2.3.4.5 | Puncturing scheme for the PCCC encoder .....   | 134 |
| 8.2.3.4.6 | Puncturing scheme for the PCCC encoder with coding rate 2/3 .....  | 134 |
| 8.2.3.4.7 | Puncturing scheme for the PCCC encoder with coding rate 1/2 .....  | 134 |
| 8.2.3.5   | (16,5) Reed-Muller (RM) code for QAM .....   | 134 |
| 8.2.4     | Definition of interleaving schemes .....   | 134 |
| 8.2.4.1   | Block interleaving for phase modulation .....  | 134 |
| 8.2.4.2   | Interleaving over $N$ blocks .....   | 135 |
| 8.2.4.3   | Block interleaving for QAM .....   | 135 |
| 8.2.5     | Definition of scrambling .....   | 136 |
| 8.2.5.1   | Scrambling method .....  | 136 |
| 8.2.5.2   | Scrambling sequence .....  | 136 |
| 8.3       | Error control schemes .....  | 137 |
| 8.3.1     | Error control schemes for phase modulation .....   | 137 |
| 8.3.1.0   | General .....  | 137 |
| 8.3.1.1   | Access Assignment Channel (AACH) .....   | 139 |
| 8.3.1.2   | Broadcast Synchronization Channel (BSCH) .....   | 139 |
| 8.3.1.3   | Traffic channels in circuit switched mode .....  | 140 |
| 8.3.1.3.1 | Frame stealing and multi-slot transmission .....   | 140 |
| 8.3.1.3.2 | Traffic CHannel, net rate = 4,8 kbit/s (TCH/4,8) .....   | 140 |
| 8.3.1.3.3 | Traffic CHannel, net rate = 2,4 kbit/s (TCH/2,4) .....   | 141 |
| 8.3.1.3.4 | Traffic CHannel, net rate = 7,2 kbit/s (TCH/7,2) .....   | 141 |
| 8.3.1.3.5 | Traffic Channel-P8, net rate = 10,8 kbit/s (TCH-P8/10,8) .....   | 142 |
| 8.3.1.3.6 | Speech Traffic Channel, full slot (TCH/S) .....  | 142 |
| 8.3.1.3.7 | Speech Traffic Channel, half slot (TCH/S) .....  | 142 |

# Intellectual Property Rights

## Essential patents

IPRs essential or potentially essential to normative deliverables may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: *"Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards"*, which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (<https://ipr.etsi.org/>).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

## Trademarks

The present document may include trademarks and/or tradenames which are asserted and/or registered by their owners. ETSI claims no ownership of these except for any which are indicated as being the property of ETSI, and conveys no right to use or reproduce any trademark and/or tradename. Mention of those trademarks in the present document does not constitute an endorsement by ETSI of products, services or organizations associated with those trademarks.

---

# Foreword

This Technical Specification (TS) has been produced by ETSI Technical Committee TETRA and Critical Communications Evolution (TCCE).

The present document is part 2 of a multi-part deliverable covering the Terrestrial Trunked Radio (TETRA); Voice plus Data (V+D), Release 2, as identified below:

- Part 1: "General network design";
- Part 2: "Air Interface (AI)";**
- Part 3: "Interworking at the Inter-System Interface (ISI)";
- Part 4: "Gateways basic operation";
- Part 5: "Peripheral Equipment Interface (PEI)";
- Part 7: "Security";
- Part 9: "General requirements for supplementary services";
- Part 10: "Supplementary services stage 1";
- Part 11: "Supplementary services stage 2";
- Part 12: "Supplementary services stage 3";
- Part 13: "SDL model of the Air Interface (AI)";
- Part 14: "Protocol Implementation Conformance Statement (PICS) proforma specification";
- Part 15: "TETRA frequency bands, duplex spacings and channel numbering";
- Part 16: "Network Performance Metrics";
- Part 17: "TETRA V+D and DMO specifications";
- Part 18: "Air interface optimized applications".

NOTE 1: Part 3, sub-parts 6 and 7 (Speech format implementation), part 4, sub-part 3 (Data networks gateway), part 10, sub-part 15 (Transfer of control), part 13 (SDL) and part 14 (PICS) of this multi-part deliverable are in status "historical" and are not maintained.

NOTE 2: Some parts are also published as Technical Specifications such as ETSI TS 100 392-2 and those may be the latest version of the document.

---

## Modal verbs terminology

In the present document "**shall**", "**shall not**", "**should**", "**should not**", "**may**", "**need not**", "**will**", "**will not**", "**can**" and "**cannot**" are to be interpreted as described in clause 3.2 of the [ETSI Drafting Rules](#) (Verbal forms for the expression of provisions).

"**must**" and "**must not**" are **NOT** allowed in ETSI deliverables except when used in direct citation.

---

# 1 Scope

The present document defines the Air Interface (AI) for the Terrestrial Trunked Radio (TETRA) system supporting Voice plus Data (V+D) conventional access (CA) and direct access (DA) and contains the specifications of the physical layer, the data link layer and the network layer according to the ISO model.

First, it establishes the TETRA radio aspects (layer 1):

- it defines and specifies the modulation;
- it defines and specifies the radio transmission and reception;
- it defines and specifies the synchronization;
- it defines and specifies the channel coding;
- it defines and specifies the channel multiplexing;
- it defines and specifies the control over the radio link.

Secondly, it establishes the services, messages and protocols used for voice and circuit mode data transfer, starting with the upper layers:

- it defines and specifies the services provided by the CC sub-entity;
- it defines and specifies the services provided by the SS sub-entity;
- it defines and specifies the services provided by the SDS sub-entity;
- it defines and specifies the protocol used by the Circuit Mode Control Entity (CMCE) to communicate across the air interface in order to offer the services of the Call Control (CC), Supplementary Service (SS) and Short Data Service (SDS) sub-entities;
- it defines and specifies the services and protocol used for the management of the users' mobility inside and across TETRA networks, namely the ones of the Mobility Management (MM) entity and the MLE;
- it defines and specifies the services and protocol used in the data link layer subdivided in two sub-entities, the Logical Link Control (LLC) and the Medium Access Control (MAC) entities.

Thirdly, it establishes the services, messages and protocols used for packet data transfer:

- it defines and specifies the services provided by the Sub-Network Specific Data Control Protocol (SND) sub-entity;
- it defines and specifies the protocol used by Sub-Network Specific Data Control Protocol (SND).

---

## 2 References

### 2.1 Normative references

References are either specific (identified by date of publication and/or edition number or version number) or non-specific. For specific references, only the cited version applies. For non-specific references, the latest version of the referenced document (including any amendments) applies.

Referenced documents which are not found to be publicly available in the expected location might be found at <http://docbox.etsi.org/Reference>.

NOTE: While any hyperlinks included in this clause were valid at the time of publication, ETSI cannot guarantee their long term validity.

The following referenced documents are necessary for the application of the present document.

## 3 Definition of terms, symbols and abbreviations

### 3.1 Terms

For the purposes of the present document, the following terms apply:

**$\pi/4$ -DQPSK channel:** channel on which signalling and data messages are sent using  $\pi/4$ -DQPSK bursts

**access code:** subdivision of mobiles for random access opportunities

**acknowledged data transfer:** service provided by the layer below which gives an acknowledgement back over the air interface from the lower layer peer entity

NOTE: This service is used by the layer 3 entities to get a secure transmission including retransmissions.

**advanced link:** bidirectional connection-oriented path between an MS and a BS using the acknowledged service - or unidirectional connection-oriented path between a BS and one or several MSs using the unacknowledged service - with provision of windowing, segmentation, extended error protection and choice among several throughputs

NOTE: The advanced link requires a set-up phase.

**announced cell reselection:** cell reselection where the MS-MLE informs the SwMI both in the old cell (leaving cell) and in the new cell (arriving cell) that cell change is performed

NOTE: There can be three types of announced cell reselection:

- type 1: the MS-MLE knows the new cell and the channel allocations (e.g. the traffic channel) on the new cell before leaving the old cell;
- type 2: the MS-MLE knows the new cell before changing to it, but does not know the channel allocation on the new cell in advance;
- type 3: the MS-MLE does not need to know the new cell before leaving the old cell. The old cell is only informed by the MS-MLE that it wants to change cell.

TETRA V+D may support all three types of announced cell reselection.

**assessment:** estimation of the path loss parameter of the serving cell main carrier or of a channel class (on the serving cell or an adjacent cell), based on measurements made on another channel or carrier radiated from the same site and applying conversion factors to those measurements

**assigned channel:** channel allocated by the infrastructure to certain MSs using channel allocation command(s) addressed to those MSs

NOTE: An assigned channel may be allocated for secondary control purposes or for a circuit mode call.

**Associated Control Channel (ACCH):** dedicated signalling channel associated with a channel that has been assigned for circuit mode traffic

NOTE: It comprises the Fast Associated Control Channel (FACCH) which uses frames 1 to 18 when there is no traffic in a given direction or the Slow Associated Control Channel (SACCH) which is always available in frame 18 when there is traffic.

**attached to a cell:** MS is said to be attached to a cell when the MS is camped on a cell and, if registration is required, has registered on the cell

NOTE: The MS may be in idle mode (i.e. not actively processing a transaction) or in active mode (i.e. actively processing a transaction in reception and/or in transmission). It is the MM which decides when an MS is said to be attached.

**background class data:** data that requires high delivery reliability but can tolerate delay

**background measurement:** measurements performed by the lower layers while maintaining current service toward the service users, i.e. MS-MLE

**basic link:** bidirectional connectionless path between one or several MSs and a BS, with a provision of both unacknowledged and acknowledged services on a single message basis

**Bit Error Ratio (BER):** limit ratio of the bits wrongly received to all bits received in a given logical channel

**broadcast:** unidirectional point to multi-point mode of transmission

**C-plane:** plane for control and packet data signalling

**call-related service:** service requested from call set-up initiation until call disconnection and related to that call

NOTE: The call-related service can also be valid a certain short time after disconnection but before next call set-up is initiated.

**call unrelated service:** service either requested outside a call or inside a call but not referring to that call

**called user application:** user application which receives an incoming call

**calling user application:** user application which initiates an outgoing call

**camped:** MS is said to be camped on a cell when the MS is synchronized on the cell BS, and has decoded the Broadcast Network Channel (BNCH) of a conventional access cell or the QAM Broadcast Network Channel (BNCH-Q) of a direct access cell, and has selected the cell as its serving cell

NOTE: The synchronization procedure is performed by the MAC and the interpretation of the network information from the BNCH or BNCH-Q is performed by a procedure in the MLE. It is the MLE which decides when an MS is said to be camped on a cell.

**carrier specific signalling:** additional  $\pi/4$ -DQPSK common signalling channel allocated in conjunction with a traffic channel specific to the carrier

**cell reselection:** act of changing the serving cell from an old cell to a new cell

NOTE: The cell reselection is performed by procedures located in the MLE and in the MAC. When the reselection is made and possible registration is performed, the MS is said to be attached to the cell.

**channel class:** set of values indicating the general RF characteristics of a concentric channel or fully super-sectored channel

**common control channels:** control channels transmitted by the infrastructure to control the MS population

NOTE: The common control channels comprise the  $\pi/4$ -DQPSK Main Control Channel (MCCH) or QAM Main Control Channel (MCCH-Q), and common Secondary Control Channels (SCCH).

**concatenated text message:** part of a chain of single SDS text messages belonging to a longer text message

NOTE: Each single SDS text message can be concatenated to other SDS text messages using either the UDH protocol or concatenation of SDS-TL messages.

**concatenation-part:** single SDS message that is sent as part of a concatenated SDS-TL message

**concentric channel:** channel that has essentially the same azimuthal radiation pattern as the main carrier and is radiated from the same site as the main carrier

NOTE: A concentric channel may have a larger or smaller range and coverage area than the main carrier (i.e. it may be a non-conforming channel); and it may use a different modulation mode, RF bandwidth and RF power from the main carrier.

**confirmed service:** service provided by the layer below which ensures that a message is responded to by the peer entity before new messages are allowed

NOTE: The service may be used for synchronization of peer entities or for provision of sequential behaviour.

**conforming channel:** channel that has essentially the same azimuthal radiation pattern as the main carrier, is radiated from the same site as the main carrier and has essentially the same range and coverage area as the main carrier

NOTE: A conforming channel is a special case of a concentric channel: it is a concentric channel that has essentially the same range and coverage area as the main carrier.

**Conventional Access (CA):** method of operation in which the main carrier uses phase modulation

**Conventional Access (CA) cell:** cell on which the main carrier uses phase modulation

**Conventional Access (CA) MS:** MS that is currently camped on a conventional access cell

**current serving BS:** BS on one of whose channels the MS is currently operating

**D8PSK channel:** channel on which signalling and data messages are sent using either  $\pi/4$ -DQPSK bursts or  $\pi/8$ -D8PSK bursts

**data/speech item:** all of the functions associated with a complete unidirectional transmission of information during a circuit mode call

NOTE: A call can be made up of one or more call transactions. In a half-duplex call these data/speech items are sequential and unidirectional on one user's point of view.

**differentiated services code point:** value of the Differentiated Services (DS) field in IPv4 headers

NOTE: The differentiated services code point may be used to select the per hop behaviour that an IP packet experiences at each node.

**diffserv:** Differentiated Services (DS) field in IPv4 headers

**Direct Access (DA):** method of operation in which the main carrier uses QAM

**Direct Access (DA) cell:** cell on which the main carrier uses QAM

**Direct Access (DA) MS:** MS that is currently camped on a direct access cell

**direct set-up signalling:** signalling procedure where immediate communication can take place between the calling and the called users without the alerting process and without an explicit response from the called user that he has answered

**dummy call identity:** call identity used by MS or LS before the SwMI has allocated a valid call identity

NOTE: In TETRA the value of the dummy call identity is zero.

**duplex frequency spacing:** fixed frequency spacing between up and downlink frequencies directions

NOTE: The duplex spacing is defined in clause 6 and in ETSI TS 100 392-15 [18].

**eccentric channel:** channel that is not radiated from the same site as the main carrier

NOTE 1: The present document supports up to a maximum separation of 4 km between the eccentric channel's transmitter site and the main carrier's transmitter site.

NOTE 2: An eccentric channel is a non-conforming channel and is not a concentric, sectored or super-sectored channel.

**foreground measurement:** measurements performed by the lower layers while employing the whole capacity, e.g. no concurrent service is maintained

**fully super-sectored channel:** super-sectored channel that is radiated from the same site as the main carrier, and has an azimuthal extent that is greater than, and entirely contains, the azimuthal extent of the main carrier

**group home SwMI:** SwMI which owns the MCC and the MNC of the group identity

NOTE: This definition is for the purposes of the air interface. In the inter system interface standard ETSI EN 300 392-3-5 [i.3] the group home SwMI is referring to the data base locations and not directly to the MCC or MNC of the group identity.

**Group TETRA Subscriber Identity (GTSI):** identity used to set up and receive group calls and messages

NOTE: A TETRA user may have multiple GTSIs associated to its ITSI. Multiple users may have the same GTSI as a valid reception address.

**half duplex operation:** each MS asks for permission to transmit for each transaction

NOTE: In TETRA trunked mode operation half duplex means two-frequency simplex operation.

**home network:** network where an MS has a subscription

NOTE: This means that a subscriber identity has been allocated in advance of any network access.

**Individual TETRA Subscriber Identity (ITSI):** identity used to specify an individual TETRA user

NOTE: An ITSI cannot be shared by multiple users.

**initial cell selection:** act of searching for and choosing a serving cell when the MS has no knowledge of any usable cells e.g. at power on or after a previous deactivation has taken place

NOTE: The initial cell selection is performed by procedures located in the MLE and in the MAC. When the cell has been selected and camped on and, if required, registration has been performed, the MS is said to be attached to the cell.

**interrupted measurement:** measurements performed by the lower layers interrupting current services

**irregular channel:** non-conforming channel that needs to be monitored by the MS in order for the MS to discover whether the channel would be usable as an assigned channel

NOTE 1: Sectorized channels and semi-super-sectorized channels are irregular channels. An eccentric channel is an irregular channel, if it does not fully cover the area of the cell. The SwMI may broadcast information about a fully super-sectorized channel as either a channel class or an irregular channel, if broadcast is needed (for example, if the channel does not fully cover the area of the cell).

NOTE 2: The SwMI does not need to broadcast information about channels that fully cover the area of the cell, since the MS does not normally need to monitor or assess these channels or inform the SwMI that these channels would be usable as an assigned channel. Nevertheless, the SwMI may choose to broadcast information about channels that fully cover the area of the cell; for example, in some cases, this may aid MSs that are sending or receiving real-time class data.

**irregular channel monitoring:** monitoring of irregular channels on the serving cell or on adjacent cells

**link adaptation:** process of adaptively changing the modulation level on a D8PSK channel, or the modulation level and/or coding rate on a QAM channel

**LLC frame:** generic name given to one LLC data message, regardless the type of link (basic or advanced) used

NOTE: An LLC frame comprises of a TL-SDU and LLC headers and a frame check sequence if applied. An LLC frame may be segmented for transmission.

**Location Area (LA):** cell or group of cells within which the SwMI transmits the same value of the "location area" information element

**logical channel:** generic term for any distinct data path

NOTE: Logical channels are considered to operate between logical endpoints.

**MAC block:** unit of information transferred between the upper MAC and lower MAC for a particular logical channel

NOTE: Logical channels are e.g. SCH/F, SCH/HD or SCH/HU. The lower MAC performs channel coding for insertion into the appropriate physical slot, half slot or subslot.

**main carrier:** carrier containing the common control channel(s) transmitted by the infrastructure to control the MS population

NOTE: The frequency of the main carrier is broadcast by the infrastructure.

**Main Control Channel (MCCH):** principal common control channel transmitted by the infrastructure to control the MSs in a conventional access cell

NOTE: The frequency of the main carrier for the conventional access cell is broadcast by the infrastructure, and the MCCH is located on timeslot 1 of the main carrier. The MCCH is a  $\pi/4$ -DQPSK channel.

**Main Control Channel - QAM (MCCH-Q):** principal common control channel transmitted by the infrastructure to control the MSs in a direct access cell

NOTE: The frequency of the main carrier for the direct access cell is broadcast by the infrastructure, and the MCCH-Q is located on timeslot 1 of the main carrier or timeslots 1 and 2 of the main carrier or timeslots 1, 2 and 3 of the main carrier or all four timeslots of the main carrier. The MCCH-Q is a QAM channel.

**Message Erasure Rate (MER):** limit ratio of the messages detected as wrong by the receiver to all messages received in a given logical channel

**message trunking:** traffic channel is permanently allocated for the complete duration of the call

NOTE: The call may include several separate call transactions (several pressel activations by separate terminals). The channel is only de-allocated if the call is (explicitly) released or if a time-out expires.

**migration:** changing between two networks that have different MNCs and/or MCCs, where the user does not have a subscription (ITSI) for at least one of the two networks

NOTE: Migration occurs when an MS moves to, or powers up in, a network other than the home network. The term is also used for returning to the home network.

**minimum mode:** mode of operation in which the infrastructure allocates all four timeslots of a conventional access main carrier for traffic or assigned control purposes

NOTE 1: In this mode, only frame 18 can be used for common control without disturbing the established services.

NOTE 2: Minimum mode is not supported for direct access.

**monitoring:** act of measuring the power of the main carrier on neighbour cells and calculating the path loss parameter C2 based upon information on neighbour cells broadcasted by the serving cell, or of measuring the power of an irregular carrier on the serving cell or a neighbour cell and calculating the path loss parameter C2, or of measuring the power of the main carrier on the serving cell and calculating the path loss parameter C2

**MS timing offset:** delay of the received signal relative to the expected signal from an MS at zero distance under static channel conditions

**network:** collection of interconnected cells broadcasting the same MNC and MCC

NOTE: A TETRA network may be connected to another TETRA network with a different MNC and/or MCC. In addition, entities outside the scope of the present document may be connected to a TETRA network.

**non-conforming channel:** channel that is not a conforming channel

NOTE: A non-conforming channel:

- has a different azimuthal radiation pattern from the main carrier; and/or
- has a different range and coverage area from the main carrier; and/or
- is not radiated from the same site as the main carrier.

**non-conforming concentric channel:** channel that has essentially the same azimuthal radiation pattern as the main carrier and is radiated from the same site as the main carrier, but has a different range and coverage area from the main carrier

**normal mode:** mode of operation in which the MCCH is present in timeslot 1 of all frames 1 to 18 or in which the MCCH-Q is present in at least timeslot 1 of all frames 1 to 18

**on/off hook signalling:** signalling procedure which includes an alerting process to the called user

NOTE: An explicit response from the called user that he has answered is waited before the call can be set up.

**phase modulation carrier:** carrier that is currently carrying  $\pi/4$ -DQPSK and/or D8PSK channel(s)

**piggy-backing:** method of sending a layer 3 message concatenated with a layer 2 acknowledgement in the same air interface transmission

**Probability of Undetected Erroneous Message (PUEM):** limit ratio of the erroneous messages detected as right by the receiver to all messages received in a given logical channel

**protocol entity instance:** instance of a protocol entity refers to one independent process related to the protocol defined by that entity

NOTE: There may be multiple protocol entity instances e.g. circuit mode calls running simultaneously but independently from each other.

**QAM carrier:** carrier that is currently carrying QAM channel(s)

**QAM channel:** channel on which signalling and data messages are sent using QAM bursts

**quasi transmission trunking:** traffic channel is allocated for each call transaction (while the pressel is activated) and in addition the channel de-allocation is delayed for a short period at the end of the transaction (after the pressel release)

NOTE: During this "channel hang-time" the channel allocation may be re-used for a new call transaction that is part of the same call. A delayed channel de-allocation procedure applies at the end of each transaction.

**random access attempt:** period from the initiation of the random access procedure until the MS receives a response from the BS or abandons the procedure

NOTE: The random access is abandoned e.g. after sending the maximum permitted number of retries.

**ranking:** procedural method of listing cells in descending order from the most suitable for communication to the least suitable for communication

NOTE: As inputs to the ranking procedure are:

- outputs from the monitor process (e.g. C2 parameters);
- outputs from the scanning process (e.g. C1 parameters);
- network parameters received in the MLE broadcast.

**real-time class data:** data that cannot tolerate delay but can tolerate some packet loss

**received SDU number:** received SDU number N(R) is the number of the received data TL-SDU

**received segment sequence number:** number of the currently received segment

**registered area:** area of the MS's present LA or the areas of a group of LAs notified to the MS by the SwMI

NOTE: The SwMI may send the MS a list of LAs comprising the MS's registered area (always including the MS's present LA) in a D-LOCATION UPDATE ACCEPT PDU. If the SwMI does not include this information in the PDU, the MS assumes that the registered area is limited to its present LA.

**roaming:** changing LA within a network of the same MNC/MCC

**scanning:** act of measuring the power of the main carrier on neighbour cells and calculating the path loss parameter C1 based upon the information on the neighbour cells broadcast by the neighbour cells themselves

**SDU number:** number on the advanced link to keep TL-SDUs in order

**Secondary Control Channel (SCCH):** control channel other than the MCCH or MCCH-Q

NOTE: There are two types of SCCH:

- a common SCCH, which has the same functionality as the MCCH (for Conventional Access) or MCCH-Q (for Direct Access) but is used only by a subset of the MS population; and
- an assigned SCCH, which may be allocated to certain MSs after an initial random access or paging message.

**sectored channel:** channel that has an azimuthal extent that is smaller than, and contained entirely within, the azimuthal extent of the main carrier, and is radiated from the same site as the main carrier

NOTE: A sectored channel is a non-conforming channel and is not a concentric, super-sectored or eccentric channel.

**segment:** LLC segment is the advanced link unit of transmission and re-transmission

NOTE: A segment is the numbered piece of a TL-SDU, normally fitting into one MAC layer PDU.

**semi-super-sectored channel:** super-sectored channel that is radiated from the same site as the main carrier, and has an azimuthal extent that exceeds the azimuthal extent of the main carrier in one azimuthal direction and is less than the azimuthal extent of the main carrier in the other azimuthal direction

**sent SDU number (N(S)):** number of the current TL-SDU

**sent segment sequence number (S(S)):** number of the currently sent segment

**serving cell:** cell that is currently providing service to the MS

**simplex:** half-duplex operation

NOTE: Mainly used in TETRA standardization to differentiate half-duplex from (full) duplex communication.

**subscriber class:** subdivision of the subscriber population

NOTE: The operator may define the values and meaning of each class.

**subscription:** permit for an MS to use a network, characterized by the MS possessing a subscriber identity (ITSI) provided by the network and, optionally, an authentication key provided by the network

NOTE: The network for which the MS has a subscription is the MS's home network.

**super-sectored channel:** channel that has an azimuthal extent that exceeds the azimuthal extent of the main carrier in at least one azimuthal direction, and is radiated from the same site as the main carrier

NOTE 1: A super-sectored channel may be either a fully super-sectored channel or a semi-super-sectored channel.

NOTE 2: A super-sectored channel is a non-conforming channel and is not a concentric, sectored or eccentric channel.

**surveillance:** process of monitoring the quality of the radio link to the serving cell

**telemetry class data:** data that can tolerate moderate delays and limited packet loss, and is intermittent or periodic in nature

**Time Division Multiple Access (TDMA) frame number:** timing of TDMA frames within a multiframe

**timebase:** device which determines the timing state of signals transmitted by a BS or MS

**timeslot number:** timing of timeslots within a TDMA frame

**TLA:** layer 2 SAP (TLA-SAP)

**TLB:** layer 2 SAP (TLB-SAP)

**TLC:** layer 2 SAP (TLC-SAP)

**TLC-SAP:** management Service Access Point (SAP)

NOTE: The TLC-SAP is a way of modelling layer-to-layer communication for management and control purpose.

**TL-SDU:** SDU from the service user (i.e. MLE)

**TM-SDU:** SDU from the layer above MAC (i.e. LLC)

**transmission trunking:** traffic channel is individually allocated for each call transaction (for each activation of the channel)

NOTE: The channel is immediately de-allocated at the end of the call transaction (subject to unavoidable protocol delays).

**U-plane:** plane for user traffic signalling

**umbrella channel:** assignable channel that fully covers the areas of multiple cells

**unacknowledged data transfer:** service provided by the layer below which does not give any acknowledgement back over the air interface from the lower layer peer entity

**unannounced cell reselection:** cell reselection where the MS-MLE does not inform the old cell (leaving cell) that it intends to change to a new cell

NOTE: Only the new cell (arriving cell) is informed about the cell reselection.

**unconfirmed service:** service provided by the layer below which does not ensure response from peer entities before allowing new messages

NOTE: This implies that messages to be transported may arrive in a different order at the peer entity since the sequence cannot be ensured.

**undeclared cell reselection:** cell reselection where the MS-MLE does not inform the old cell (leaving cell) or the new cell (arriving cell) that cell change is performed

**useful part of a burst:** modulation symbol times  $SN0$  to  $SNmax$  of a burst for phase modulation, or modulation symbol times  $SN-Q1$  to  $SN-Qmax$  of a burst for QAM

**visited SwMI:** SwMI which is broadcasting an MCC and/or MNC which is different than the MCC and MNC of the related TETRA identity

NOTE: This definition is for the purposes of the air interface. In the inter system interface standard ETSI EN 300 392-3-5 [i.3] the visited SwMI is referring to the data base locations and not directly to the MCC or MNC of the MS and SwMI.

## 3.2 Symbols

Void.

## 3.3 Abbreviations

For the purposes of the present document, the following abbreviations apply:

|                |   |
|----------------|---|
| $\pi/4$ -DQPSK | $\pi/4$ -shifted Differential Quaternary Phase Shift Keying |
| $\pi/8$ -D8PSK | $\pi/8$ -shifted Differential 8 Phase Shift Keying          |
| (V)ASSI        | Visited Alias Short Subscriber Identity                     |
| (V)GSSI        | Visited Group Short Subscriber Identity                     |
| AAA            | Authentication, Authorization, Accounting                   |
| AACH           | Access Assignment CHannel                                   |
| AACH-Q         | Access Assignment CHannel, QAM                              |
| ACCH           | Associated Control CHannel                                  |
| ACELP          | Algebraic Code-Excited Linear Prediction                    |
| ACK            | ACKnowledgement   |
| AGA            | Air - Ground - Air service                                  |
| AGC            | Automatic Gain Control                                      |
| AGNSS          | Assisted Global Navigation Satellite System                 |
| AI             | Air Interface   |
| AL             | Advanced Link   |
| ALLOC          | Allocate  |
| APP            | Approved  |
| AR             | Acknowledgement Request                                     |
| ASCII          | American Standard Code for Information Interchange          |
| ASSI           | Alias Short Subscriber Identity                             |
| AT             | ATtention   |
| ATID           | Address Type Identifier in Demand                           |
| ATSI           | Alias TETRA Subscriber Identity                             |
| BBK            | Broadcast BloCk   |
| BCCH           | Broadcast Control CHannel                                   |
| BCCH-Q         | Broadcast Control CHannel, QAM                              |
| BE             | Big Endian  |
| BER            | Bit Error Rate  |
| BKN1           | Broadcast bloCk 1   |
| BKN2           | Broadcast bloCk 2   |
| BL             | Basic Link  |
| BLCH           | Base station Linearization CHannel                          |
| BLCH-Q         | Base station Linearization Channel, QAM                     |
| BN             | Bit Number  |
| BNCH           | Broadcast Network CHannel                                   |

|         |  |
|---------|--|
| BNCH-Q  | Broadcast Network CHannel, QAM   |

## 4 Radio aspects

### 4.1 Introduction

This clause is an introduction to the radio aspects of the TETRA V+D standard. It consists of a general description of the organization of the radio-related functions with reference to the clauses where each part is specified in detail. Furthermore, it introduces the reference configuration that will be used throughout the present document.

### 4.2 Set of logical channels

The radio subsystem provides a certain number of logical channels as defined in clause 9. The logical channels represent the interface between the protocol and the radio.

### 4.3 Reference configuration

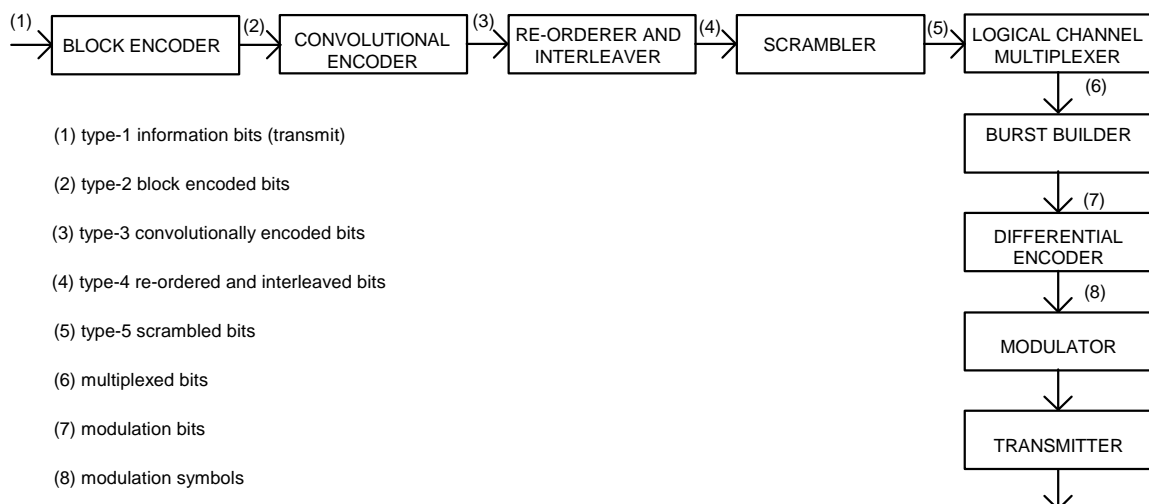

For the purpose of elaborating the specification of the radio-related functions, a reference configuration of the transmission chain is used as shown in figures 4.1 and 4.2.

NOTE: Only the transmission part is specified, the receiver being specified via overall performance requirements.

With reference to this configuration, the radio clauses address the following functional units:

- clause 5: bit-to-symbol mapping encoding and modulation;
- clause 6: characteristics of transmitter and receiver;
- clause 8: channel coding, interleaving and scrambling;
- clause 9: burst building and logical channel multiplexing.

This reference configuration also defines a number of points of vocabulary in relation to the names of bits at different levels in the configuration.

**Figure 4.1: Reference configuration for phase modulation**

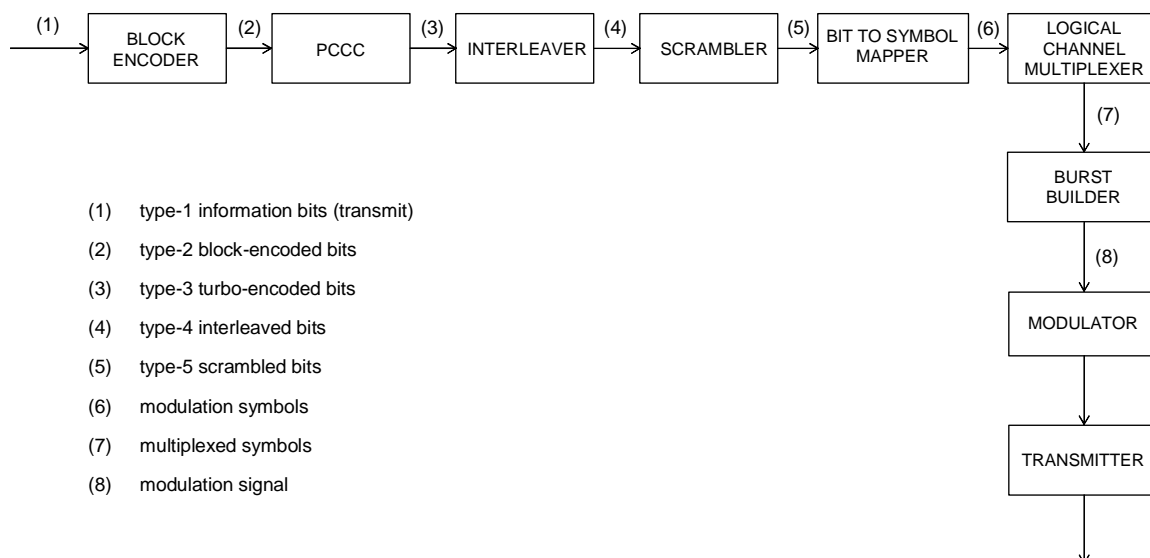

Figure 4.2: Reference configuration for QAM modulation

## 4.4 Error control schemes

The different error control schemes are described in detail in clause 8.

## 4.5 Multiple access and timeslot structure

### 4.5.1 General

The access scheme is TDMA with 4 physical channels per carrier. For phase modulation the carrier bandwidth is 25 kHz. For QAM the carrier bandwidth is 25 kHz, 50 kHz, 100 kHz or 150 kHz.

The following clauses briefly introduce the structures of hyperframe, multiframe, frame, timeslot, and burst, as well as the mapping of the logical channels onto the physical channels. The appropriate specifications are found in clause 9.

## 4.5.2 Hyperframes, multiframes and frames

A diagrammatic representation of the TDMA structure is shown in figure 4.3.

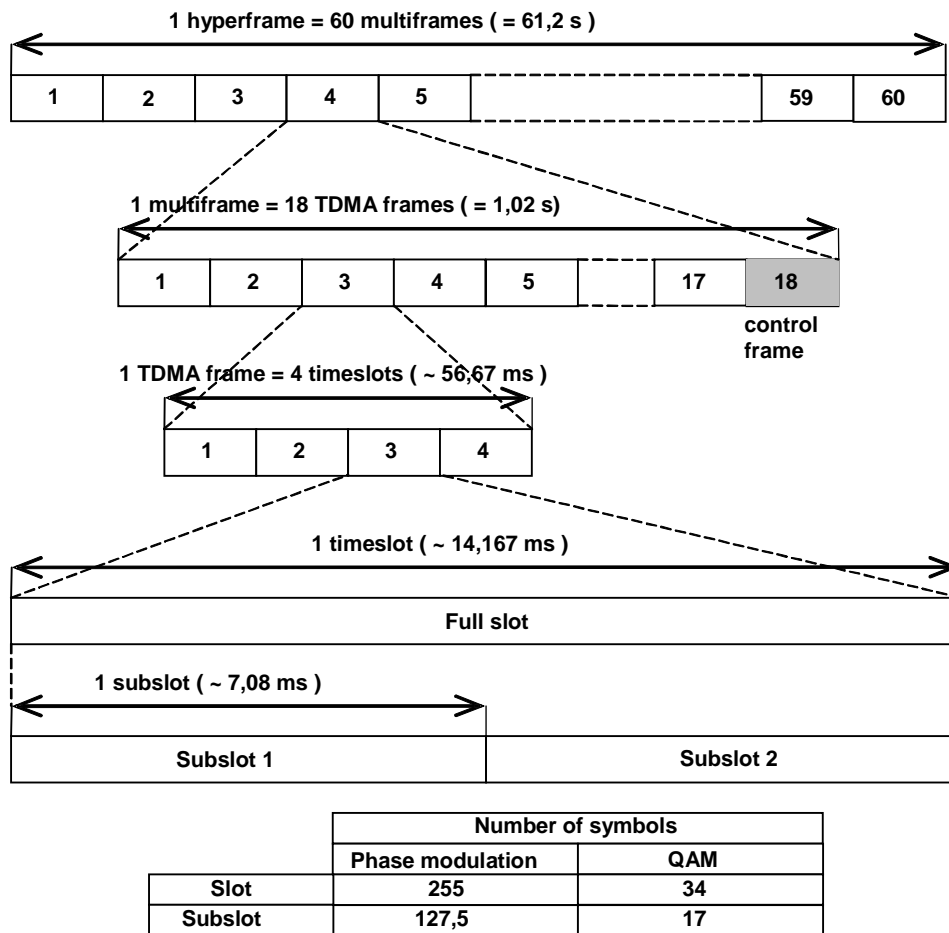

Figure 4.3: V+D TDMA structure

The hyperframe level defines the top-level frame hierarchy. One hyperframe is subdivided into 60 multiframes and lasts 61,2 s.

One multiframe is subdivided in 18 frames, and has a duration of 1,02 s. The eighteenth frame in a multiframe is a control frame.

One frame is subdivided into 4 timeslots and has duration of  $170/3$  ms  $\approx 56,67$  ms.

## 4.5.3 Timeslots and bursts

The timeslot is a time interval of  $85/6$  ms  $\approx 14,167$  ms. For phase modulation the timeslot corresponds to 255 symbol durations, each one with a duration of  $500/9$   $\mu$ s  $\approx 55,56$   $\mu$ s. For QAM the timeslot is divided into 34 modulation symbol durations, each one with a duration of  $5/12$  ms  $\approx 416,7$   $\mu$ s. The uplink timeslots may be subdivided into 2 subslots.

The physical content of a timeslot or subslot is carried by a burst. The different types of bursts are defined in clause 9.

## 4.5.4 Mapping of logical channels onto physical channels

Three types of physical channels are defined:

- the Traffic Physical (TP) channel carrying mainly circuit mode traffic;
- the Control Physical (CP) channel carrying exclusively the control channel. One CP channel is defined as the MCCH (for Conventional Access) or MCCH-Q (for Direct Access); the others, if any, are called Extended Control Channel (ECCH). The Radio Frequency (RF) carrier containing the MCCH or MCCH-Q is called the main carrier; and
- the Unallocated Physical (UP) channel is a physical channel not allocated to one or more Mobile Stations (MSs).

The mapping of the logical channels onto the physical channels, according to the mode of operation, is defined in clause 9.

NOTE: Conventional Access (CA) is a method of operation in which the main carrier is a phase modulation carrier. Direct Access (DA) is a method of operation in which the main carrier is a QAM carrier.

## 4.6 Coding, interleaving and scrambling

The coding, interleaving and scrambling schemes associated with each logical channel shall be as specified in clause 8.

## 4.7 Modulation

For phase modulation the modulation scheme is  $\pi/4$ -shifted Differential Quaternary Phase Shift Keying ( $\pi/4$ -DQPSK) or  $\pi/8$ -shifted Differential 8 PSK ( $\pi/8$ -D8PSK). The modulation rate is 36 kbit/s for  $\pi/4$ -DQPSK and 54 kbit/s for  $\pi/8$ -D8PSK.

For QAM the modulation scheme is 4-QAM, 16-QAM or 64-QAM. A multi sub-carrier approach with 8 sub-carriers per 25 kHz is used, i.e. 8, 16, 32 and 48 sub-carriers in 25 kHz, 50 kHz, 100 kHz and 150 kHz carriers respectively. The modulation symbol rate on each sub-carrier is 2 400 symbols/s.

These schemes are specified in detail in clause 5.

## 4.8 Transmission and reception

The modulated stream is transmitted on a RF carrier.

The specific RF channels, together with the requirements on the transmitter and the receiver characteristics, are specified in clause 6.

For Base Stations (BSs) and MSs, power classes are defined in clause 6.

## 4.9 Other radio-related functions

Transmission involves other functions. These functions, which may necessitate the handling of specific protocols between BS and MS, are the radio subsystem synchronization, the radio subsystem adaptive power control and, for D8PSK and QAM channels, the radio subsystem adaptive link control.

The synchronization:

- incorporates frequency and time acquisition by the receiver;
- incorporates adjustment of the timebase of the MSs.

The requirements on synchronization are specified in clause 7.

The adaptive power control:

- adjusts the RF transmit power, in order to ensure that the required quality of transmission is achieved with the least possible radiated power;
- is managed by the MS during the initial access, and by the MS or BS during operational use;
- is provided for battery saving and reduction of interference levels.

The requirements on adaptive power control are specified in clause 10.

The adaptive link control:

- adjusts the modulation and coding to achieve the required Quality of Service.

The measurements required for adaptive link control are specified in clause 10.

## 4.10 Performance

Under typical urban fading conditions (i.e. multipath delays no greater than 5  $\mu$ s), the quality thresholds for speech using the full-rate ACELP Codec (EN 300 395-2 [21]) with  $\pi/4$ -DQPSK modulation are reached at a  $C/I_c$  (co-channel interference) value of 19 dB, and a dynamic reference sensitivity level of -106 dBm for BSs and -103 dBm for mobile equipment.

Details of performance requirements of phase modulation and QAM modulation in various channel conditions are given in clause 6.

## 4.11 TETRA modes of operation

### 4.11.0 General

The TETRA modes of operation which are supported by the present document and which impact on the radio descriptions are:

- Main control channel modes of operation:
  - Conventional Access (CA) mode.
  - Direct Access (DA) mode.
- Transmission modes:
  - Downlink-Continuous Transmission (D-CT) mode:
    - the D-CT mode is mandatory for MSs, i.e. such equipment shall be able to interwork with a TETRA BS that would be in the D-CT mode.
  - Downlink-Carrier Timesharing Transmission (D-CTT) mode.
  - Downlink-Main Control Channel Timesharing Transmission (D-MCCTT) mode.
  - Multiple Slot Transmission (MST) mode.
- Control modes:
  - Normal Control Mode (NCM):
    - the NCM is mandatory for all TETRA equipment.
  - Minimum Control Mode (MCM):
    - the MCM is mandatory only for MSs using CA mode.

In the following clauses, each of the above modes of operations is defined.

## 4.11.1 Main control channel modes of operation

### 4.11.1.1 Conventional Access (CA) mode

A CA cell is a cell on which the main carrier uses phase modulation. The bandwidth of the CA main carrier is 25 kHz. The MCCH is a single-slot  $\pi/4$ -DQPSK channel that occupies slot 1 of the main carrier in normal control mode; it is used for common control signalling. The BS may also operate up to three single-slot  $\pi/4$ -DQPSK common secondary control channels on the CA main carrier if it requires more capacity for common control signalling.

A CA MS is an MS that is currently camped on a CA cell, so it receives a  $\pi/4$ -DQPSK common control channel unless it is directed by the BS to an assigned channel - assigned for a circuit mode call or for secondary control. (An assigned channel may be a  $\pi/4$ -DQPSK, D8PSK or QAM channel, and may be either a single-slot or a multi-slot channel.)

### 4.11.1.2 Direct Access (DA) mode

A DA cell is a cell on which the main carrier uses QAM. The bandwidth of the DA main carrier is 25 kHz, 50 kHz, 100 kHz or 150 kHz. The MCCH-Q occupies one, two, three or four timeslots of the main carrier per TDMA frame, whereas a QAM common secondary control channel is a single-slot channel. If the BS needs more than one slot for common control, it may use either a multi-slot MCCH-Q or multiple single-slot QAM common control channels.

A DA MS is an MS that is currently camped on a DA cell, so it receives a QAM common control channel unless it is directed by the BS to an assigned channel - assigned for secondary control or for a circuit mode call. (An assigned channel may be a QAM,  $\pi/4$ -DQPSK or D8PSK channel, and may be either a single-slot or a multi-slot channel.)

## 4.11.2 Transmission modes

### 4.11.2.1 Downlink-Continuous Transmission (D-CT) mode

In the D-CT mode, the BS always uses the continuous downlink bursts. The transmission is continuous on the main carrier. On the other carriers discontinuous downlink transmission is allowed for phase modulation carriers but is transparent for the MSs. Discontinuous downlink transmission is not supported on QAM carriers.

### 4.11.2.2 Downlink-Carrier Timesharing Transmission (D-CTT) mode

In the D-CTT mode, a phase modulation carrier frequency may be shared by several cells, each of its four physical channels being allocated independently to these cells. The BS uses the discontinuous downlink bursts.

### 4.11.2.3 Downlink-Main Control Channel Timesharing Transmission (D-MCCTT) mode

In the D-MCCTT mode, the MCCH is shared by several CA cells, each of its frames being allocated independently to these cells. The BS uses the discontinuous downlink bursts.

### 4.11.2.4 Multiple Slot Transmission (MST) mode

In the MST mode, two to four physical channels are used for the same communication. This is used, for example, to increase the data transmission rate or to mix voice and data.

## 4.11.3 Control modes

### 4.11.3.1 Normal Control Mode (NCM)

The Normal Control Mode (NCM) provides the TETRA services with full performance. It requires the assignment of one MCCH (for CA) or MCCH-Q (for DA).

#### 4.11.3.2 Minimum Control Mode (MCM)

The Minimum Control Mode (MCM) on a CA cell provides the TETRA services with reduced performance. In the MCM, all physical channels of each RF carrier should be devoted to traffic. Minimum mode is not supported for DA.

## 5 Modulation

### 5.1 Introduction

The clauses 5.2 to 5.7 apply to the baseband part of the transmitter in the case of phase modulation channels, and clauses 5.8 to 5.18 apply to the baseband part of the transmitter in the case of QAM channels.

### 5.2 Modulation type

The modulation used shall be  $\pi/4$ -shifted Differential Quaternary Phase Shift Keying ( $\pi/4$ -DQPSK) or  $\pi/8$ -shifted Differential 8 PSK ( $\pi/8$ -D8PSK).

### 5.3 Modulation rate

The modulation rate shall be 36 kbit/s for  $\pi/4$ -DQPSK and 54 kbit/s for  $\pi/8$ -D8PSK.

### 5.4 Modulation symbol definition

$B(m)$  denotes the modulation bit of a sequence to be transmitted, where  $m$  is the bit number. The sequence of modulation bits shall be mapped onto a sequence of modulation symbols  $S(k)$ , where  $k$  is the corresponding symbol number.

The modulation symbol  $S(k)$  shall result from a differential encoding. This means that  $S(k)$  shall be obtained by applying a phase transition  $D\phi(k)$  to the previous modulation symbol  $S(k-1)$ , hence, in complex notation:

$$S(k) = S(k-1) \exp(jD\phi(k))$$

$$S(0) = 1 \tag{5.1}$$

The above expression for  $S(k)$  corresponds to the continuous transmission of modulation symbols carried by an arbitrary number of bursts. The symbol  $S(0)$  is the symbol before the first symbol of the first burst and shall be transmitted as a phase reference.

In the case of  $\pi/4$ -DQPSK modulation, the phase transition  $D\phi(k)$  shall be related to the modulation bits as shown in table 5.1 and figure 5.1.

**Table 5.1: Phase transitions for  $\pi/4$ -DQPSK modulation**

| $B(2k-1)$ | $B(2k)$ | $D\phi(k)$ |
|-----------|---------|------------|
| 1         | 1       | $-3\pi/4$  |
| 0         | 1       | $+3\pi/4$  |
| 0         | 0       | $+\pi/4$   |
| 1         | 0       | $-\pi/4$   |

**Figure 5.1:  $\pi/4$ -DQPSK modulation symbol constellation and possible transitions**

The complex modulation symbol  $S(k)$  shall take one of the eight values  $\exp(j n\pi/4)$ , where  $n = 2, 4, 6, 8$  for even  $k$  and  $n = 1, 3, 5, 7$  for odd  $k$ . The constellation of the modulation symbols and the possible transitions between them are as shown in figure 5.1.

In the case of  $\pi/8$ -D8PSK modulation, the phase transition  $D\phi(k)$  shall be related to the modulation bits as shown in table 5.2 and figure 5.2.

**Table 5.2: Phase transitions for  $\pi/8$ -D8PSK modulation**

| B(3k-2) | B(3k-1) | B(3k) | D $\phi(k)$ |
|---------|---------|-------|-------------|
| 0       | 0       | 0     | $+\pi/8$    |
| 0       | 0       | 1     | $+3\pi/8$   |
| 1       | 0       | 1     | $+5\pi/8$   |
| 1       | 0       | 0     | $+7\pi/8$   |
| 0       | 1       | 0     | $-\pi/8$    |
| 0       | 1       | 1     | $-3\pi/8$   |
| 1       | 1       | 1     | $-5\pi/8$   |
| 1       | 1       | 0     | $-7\pi/8$   |

**Figure 5.2:  $\pi/8$ -D8PSK modulation symbol constellation and possible transitions**

The complex modulation symbol  $S(k)$  shall take one of the sixteen values  $\exp(j n \pi/8)$ , where  $n = 2, 4, 6$  to  $16$  for even  $k$  and  $1, 3, 5$  to  $15$  for odd  $k$ . The constellation of the modulation symbols and the possible transitions between them are as shown in figure 5.2.

## 5.5 Modulated signal definition

The modulated signal, at carrier frequency  $f_c$ , shall be given by:

$$M(t) = \text{Re}\{s(t) \exp(j(2\pi f_c t + \phi_0))\} \quad (5.2)$$

Where:

- $\phi_0$  is an arbitrary phase;
- $s(t)$  is the complex envelope of the modulated signal defined as:

$$s(t) = \sum_{k=0}^K S(k)g(t - t_k) \quad (5.3)$$

Where:

- $K$  is the maximum number of symbols;
- $T$  is the symbol duration;
- $t_k = kT$  is the symbol time corresponding to modulation symbol  $S(k)$ ;
- $g(t)$  is the ideal symbol waveform, obtained by the inverse Fourier transform of a square root raised cosine spectrum  $G(f)$ , defined as follows:

$$\begin{aligned} G(f) &= 1 && \text{for} && |f| \leq (1 - \alpha)/2T \\ G(f) &= \sqrt{0.5(1 - \sin(\pi(2|f|T - 1)/2\alpha))} && \text{for} && (1 - \alpha)/2T \leq |f| \leq (1 + \alpha)/2T \\ G(f) &= 0 && \text{for} && |f| \geq (1 + \alpha)/2T \end{aligned} \quad (5.4)$$

Where  $\alpha$  is the roll-off factor, which determines the width of the transmission band at a given symbol rate. The value of  $\alpha$  shall be 0,35. For practical implementation, a time limited windowed version of  $g(t)$ , designed under the constraints given by the specified modulation accuracy and adjacent channel attenuation may be applied.

## 5.6 Modulation filter definition

The ideal modulation filter shall be a linear phase filter which is defined by the magnitude of its frequency response  $|H(f)| = G(f)$ .

## 5.7 Modulation block diagram

A block diagram of the modulation process is shown on figure 5.3. This diagram is for explanatory purposes and does not prescribe a specific implementation. The modulation filter excited by the complex Dirac impulse function  $S(k)\delta(t-t_k)$  ideally has an impulse response  $g(t)$ .

Figure 5.3: Block diagram of the modulation process

## 5.8 Introduction to QAM channels

Given the discrete channelization ranging from single 25 kHz carriers up to 150 kHz, there is insufficient bandwidth to permit resolution of individual multi-path echoes in the transmission path. It is thus necessary to ensure that the channel time delay is a small fraction of the symbol period for negligible channel induced Inter Symbol Interference. For this reason, each QAM carrier is divided into a number of frequency-division multiplexed sub-carriers, each carrying a complex signal using the QAM modulation. The sub-carrier approach is used because the low symbol rate in each sub-carrier gives the modulation inherent resistance to time dispersion hence avoiding the need for an adaptive equalizer.

Clauses 5.9 to 5.18 apply to the baseband part of the transmitter.

## 5.9 Modulation type

The modulation types used on each sub-carrier shall be 4-QAM, 16-QAM or 64-QAM.

## 5.10 Use of sub-carriers in QAM carriers

A multi sub-carrier approach with 8 sub-carriers per 25 kHz is used, i.e. 8, 16, 32 and 48 sub-carriers in 25 kHz, 50 kHz, 100 kHz and 150 kHz carriers respectively.

## 5.11 Modulation rate

The modulation symbol rate on each sub-carrier shall be 2 400 symbols/s. The overall carrier symbol rate shall be 19 200 symbol/s for 25 kHz carriers, 38 400 symbol/s for 50 kHz carriers, 76 800 symbol/s for 100 kHz carriers and 115 200 symbol/s for 150 kHz carriers. The modulation gross bit rates are given in table 5.3.

Table 5.3: Gross bit rates for QAM Carriers (kbit/s)

| Modulation type | Carrier bandwidth |        |         |         |
|-----------------|-------------------|--------|---------|---------|
|                 | 25 kHz            | 50 kHz | 100 kHz | 150 kHz |
| 4-QAM           | 38,4              | 76,8   | 153,6   | 230,4   |
| 16-QAM          | 76,8              | 153,6  | 307,2   | 460,8   |
| 64-QAM          | 115,2             | 230,4  | 460,8   | 691,2   |

## 5.12 Modulation symbol definition

In this clause the term **symbol** refers to the composite signal, which is emitted from the modulator at a 2 400 symbol/s rate. Each sub-carrier symbol may carry data, time domain pilots, or time domain synchronization information. The term **sub-carrier symbol** refers to a generic symbol in a particular sub-carrier. Each **data sub-carrier symbol** conveys a predetermined number of bits of information dependent on the symbol constellation complexity. The **synchronization sub-carrier symbols** and **pilot sub-carrier symbols** convey no data information.

## 5.13 Bit to symbol mapping

Figures 5.4, 5.5 and 5.6 show the three different mappings of QAM symbols onto a complex plane. It can be seen from the three constellation diagrams that the pilot sub-carrier symbols and synchronization sub-carrier symbols are not constrained to lie on the constellation points, instead, they can take on any phase angle as long as the magnitude of these symbols corresponds to the synchronization/pilot locus. A circle of unity amplitude is selected as this locus independent of the modulation. Note that this circle is not the outer circle of 16-QAM and 64-QAM constellations. The header sub-carrier symbols also lie on this circle but use 4-QAM in all three cases.

Tables 5.4, 5.5 and 5.6 show the vector and bit definition for 4-QAM, 16-QAM and 64-QAM respectively.

The modulation symbol  $S_m(k)$  shall be related to the modulation bits defined in tables 5.4, 5.5 and 5.6, subject to the appropriate scaling factors:

- For 4-QAM the values in table 5.4 shall be multiplied by  $1/\sqrt{2}$ .
- For 16-QAM the values in table 5.5 shall be multiplied by  $1/\sqrt{10}$ .
- For 64-QAM the values in table 5.6 shall be multiplied by  $1/\sqrt{42}$ .

Figure 5.4: 4-QAM Symbol Constellation

Table 5.4: Vector and bit definition (4-QAM)

| $B(2k-1)$ | $B(2k)$ | $X+Yj$  |
|-----------|---------|---------|
| 0         | 0       | $+1+1j$ |
| 0         | 1       | $+1-1j$ |
| 1         | 0       | $-1+1j$ |
| 1         | 1       | $-1-1j$ |

| 1       | 1       | 0       | 0       | 0       | 0     | -1+7j |
| 1       | 1       | 0       | 0       | 0       | 1     | -1+5j |
| 1       | 1       | 0       | 0       | 1       | 0     | -1+1j |
| 1       | 1       | 0       | 0       | 1       | 1     | -1+3j |
| 1       | 1       | 0       | 1       | 0       | 0     | -1-7j |
| 1       | 1       | 0       | 1       | 0       | 1     | -1-5j |
| 1       | 1       | 0       | 1       | 1       | 0     | -1-1j |
| 1       | 1       | 0       | 1       | 1       | 1     | -1-3j |
| 1       | 1       | 1       | 0       | 0       | 0     | -3+7j |
| 1       | 1       | 1       | 0       | 0       | 1     | -3+5j |
| 1       | 1       | 1       | 0       | 1       | 0     | -3+1j |
| 1       | 1       | 1       | 0       | 1       | 1     | -3+3j |
| 1       | 1       | 1       | 1       | 0       | 0     | -3-7j |
| 1       | 1       | 1       | 1       | 0       | 1     | -3-5j |
| 1       | 1       | 1       | 1       | 1       | 0     | -3-1j |
| 1       | 1       | 1       | 1       | 1       | 1     | -3-3j |

## 5.14 Data, synchronization and pilot symbol multiplexing

Figure 5.7 shows the multiplexing of data, synchronization and pilot symbols.

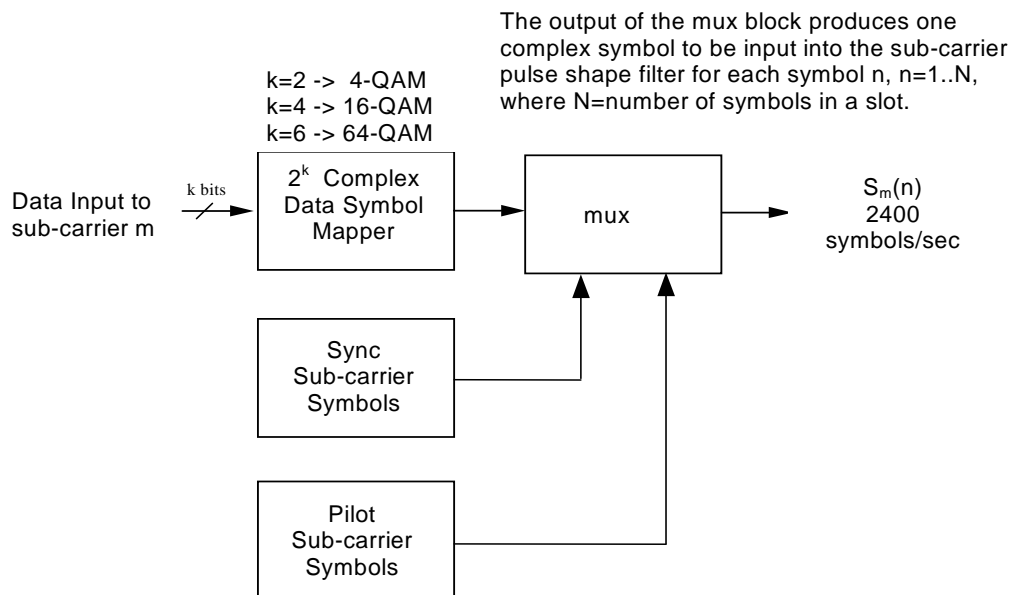

Figure 5.7: Symbol multiplexing

## 5.15 Sub-carrier frequency domain multiplexing

The number of sub-carriers  $M$  shall be 8, 16, 32 and 48 respectively for 25 kHz, 50 kHz, 100 kHz and 150 kHz carrier bandwidths. The sub-carrier centre frequency  $f_m$  in Hz shall be defined by the following formula:

$$f_m = (0,5625 - (M/2-m) \times 1,125)/T \quad (5.5)$$

for  $m = 0, 1, \dots, M-1$

where  $T$  is the symbol duration in s as defined in clause 5.11. This leads to a sub-carrier spacing of 2,7 kHz.

## 5.16 Modulated signal definition

The modulated signal, at carrier frequency  $f_c$ , shall be given by:

$$M(t) = \text{Re}\{s(t) \exp(j(2\pi f_c t + \phi_0))\} \quad (5.6)$$

Where:

- $\phi_0$  is an arbitrary phase;
- $s(t)$  is the complex envelope of the modulated signal defined as:

$$s_m(t) = \sum_{n=1}^N S_m(n) g(t - t_n) e^{j(\omega_m t + \varphi_m)} \quad (5.7)$$

$$s(t) = \sum_{m=0}^{M-1} s_m(t) = \sum_{m=0}^{M-1} \sum_{n=1}^N S_m(n) g(t - t_n) e^{j(\omega_m t + \varphi_m)}$$

Where:

- $M$  is the number of sub-carriers;
- $N$  is the number of modulated symbols on each sub-carrier in one slot;
- $T$  is the symbol duration on each sub-carrier;
- $t_n = nT$  is the symbol time corresponding to modulation symbol  $S_m(n)$ ;
- $S_m(n)$  is the modulation symbol at time  $t_n$  on sub-carrier  $m$ ;
- $\omega_m = 2\pi f_m$  is sub-carrier angular frequency;
- $\varphi_m$  is the phase control for sub-carrier  $m$  during the slot;
- $g(t)$  is the ideal symbol waveform, obtained by the inverse Fourier transform of a square root raised cosine spectrum  $G(f)$ , defined as follows:

$$\begin{aligned} G(f) &= 1 && \text{for} && |f| \leq (1 - \alpha)/2T \\ G(f) &= \sqrt{0,5 \left( 1 - \sin\left(\pi \left( 2|f|T - 1 \right) / 2\alpha \right) \right)} && \text{for} && (1 - \alpha)/2T \leq |f| \leq (1 + \alpha)/2T \\ G(f) &= 0 && \text{for} && |f| \geq (1 + \alpha)/2T \end{aligned} \quad (5.8)$$

Where  $\alpha$  is the roll-off factor, which determines the width of the transmission band at a given symbol rate. The value of  $\alpha$  shall be 0,20. For practical implementation, a time limited windowed version of  $g(t)$ , designed under the constraints given by the specified modulation accuracy and adjacent channel attenuation may be applied.

## 5.17 Modulation filter definition

The ideal modulation filter shall be a linear phase filter which is defined by the magnitude of its frequency response  $|H(f)| = G(f)$ .

The frequency domain specification  $G(f)$  of the transmit pulse-shape filter results in a unique specification for the time domain impulse response  $g(t)$ . Figure 5.8 shows a sample implementation of the impulse response. Time  $t_0$  in figure 5.8, the peak of the impulse response for the first modulated symbol in a slot is an important parameter in the multi sub-carrier modulation specification.

**Figure 5.8: Sample impulse response**

The phase relationship of the sub-carriers to the synchronization sub-carrier symbols and the pilot sub-carrier symbols is important in multi sub-carrier modulation. For the synchronization sub-carrier symbols to produce a correct time synchronization pattern, the phase relationship of the synchronization sub-carrier symbols to the instantaneous sub-carrier frequency domain multiplexers in equation 5.7 has to be controlled. Also, by exercising control over the phase relationship of the sub-carrier frequency domain multiplexers to the pilot sub-carrier symbols, the pilots may be designed to achieve lowest peak-to-average power ratio for the composite multi sub-carrier modulation. Time  $t_0$  in figure 5.8 defines the time reference at the start of modulation when all sub-carrier frequency domain multiplexers shall have a value of 0 radians, i.e.  $\omega_m t_0 + \varphi_m = 0$ , which is equivalent to say that the sub-carrier frequency domain multiplexers all have a phase of 0 radians at  $t = t_0$ .

The condition  $\omega_m t_0 + \varphi_m = 0$  needs to be fulfilled for every transmitted slot. This mathematical expression is correct if the notation in equation 5.7, i.e.  $\sum_{n=1}^N$ , refers to a single slot.

**NOTE:** This condition can be fulfilled by pre-rotating all sub-carrier symbols of each transmitted slot  $n$  by  $-\omega_m(t_0 + n \times N \times T)$  radians, where  $N \times T$  is the slot duration and  $n$  is an integer equal or greater than 0.

In downlink timeslots, the time reference  $t_0$  coincides with the start of the timeslot. In uplink timeslots or for the first uplink subslot, the time reference  $t_0$  occurs two QAM symbol periods after the start of the timeslot; for the second uplink subslot, the time reference  $t_0$  occurs 19 QAM symbol periods after the start of the timeslot.

## 5.18 Modulation block diagram

A block diagram of the modulation process is shown on figure 5.9. Figure 5.9 is for explanatory purposes and does not prescribe a specific implementation.

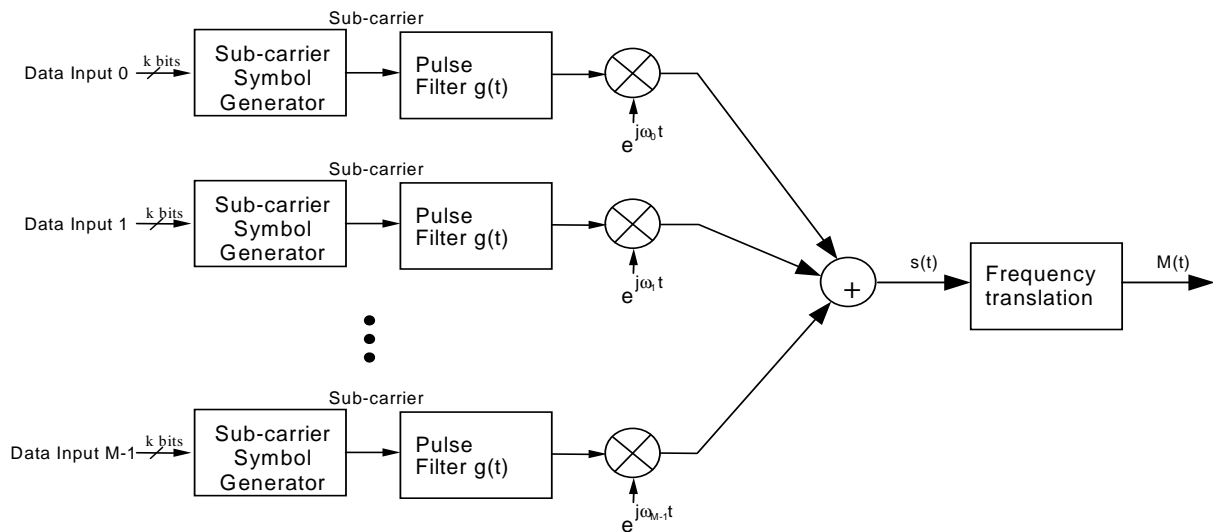

Figure 5.9: Block diagram of the modulation process

## 6 Radio transmission and reception

### 6.1 Introduction

Clause 6 defines the requirements for the MS and the BS transceiver of the TETRA  $\pi/4$ -DQPSK, D8PSK and QAM systems. Clause 6 is applicable to TETRA systems operating at radio frequencies of 138 MHz to 1 GHz.

NOTE: Simulations for setting the receiver requirements were performed using  $\pi/4$ -DQPSK modulation at 138 MHz. Statements about the other modulation methods are presented in relevant places for frequencies below 300 MHz.

### 6.2 Frequency bands and channel arrangement

When used in dedicated TETRA frequency bands, TETRA MSs shall transmit in the TETRA uplink frequency band, and TETRA BSs shall transmit in the TETRA downlink frequency band. The uplink and downlink frequency bands are of equal width. Their edges shall be as follows:

- $F_{up, min}$  to  $F_{up, max}$  (MHz): mobile transmit, base receive.
- $F_{dw, min}$  to  $F_{dw, max}$  (MHz): base transmit, mobile receive.

The TETRA RF channel raster shall be 25 kHz, or multiples thereof for higher bandwidth carriers. Multiples of 6,25 kHz and 12,5 kHz shall also be supported for cases where either there is an offset for some frequencies within a band, or where adjacent carriers have different bandwidths. In order to ensure compliance with the radio regulations outside the band, a guard band may be needed at each side of both uplink and downlink bands.

The centre frequencies of downlink RF carriers,  $F_{down,c}$  shall be given by the value of downlink carrier frequency defined in clause 21, the corresponding centre frequency of uplink RF carriers,  $F_{up,c}$ , shall be given by:

$$F_{up,c} = F_{down,c} - D \quad (6.1)$$

The uplink and downlink transmit and receive centre frequencies and the duplex spacing ( $D$ ) are allocated by national regulatory authorities, refer to clause 21 and ETSI TS 100 392-15 [18].

### 6.3 Reference test planes

For the purposes of testing, all TETRA stations shall have at least one antenna connector as specified by the manufacturer.

The base station equipment may include, at the discretion of the manufacturer, some or all of the optional items shown in figure 6.1 if they are necessary to meet the requirements of the present document, with the antenna connection(s) at Points 1T, 1R or 2. The equipment has to comply with the present document at the antenna connector(s) specified.

In the case of equipment comprising several transmitters, only one transmitter shall be transmitting during all measurements, except for measuring intermodulation attenuation.

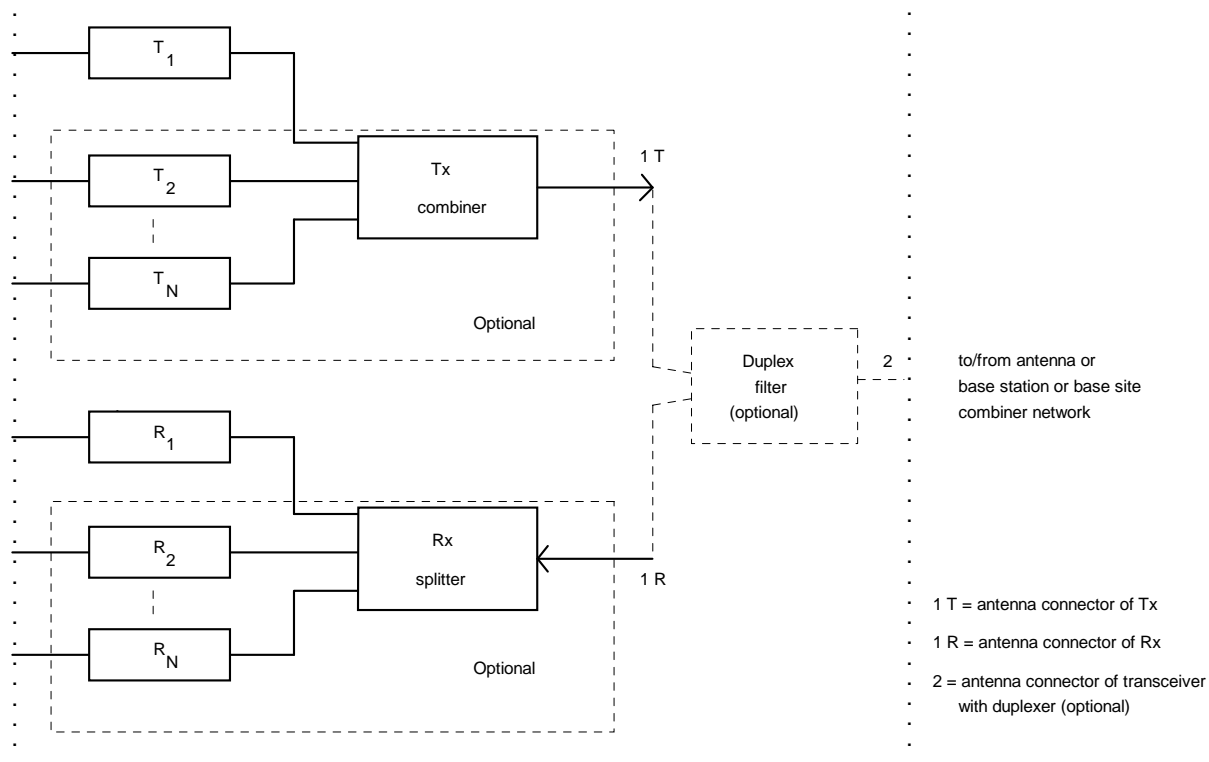

Figure 6.1: Reference interconnection of transmitters and receivers at BS

## 6.4 Transmitter characteristics

### 6.4.1 Output power for phase modulation

#### 6.4.1.0 General

In clauses 6.4.1.1 and 6.4.1.2, power is defined as the average power, measured through the square root raised cosine filter defined in clause 5 over the useful part of the burst as defined in clause 9.

The powers at which MSs or BSs may operate are specified in clauses 6.4.1.1 and 6.4.1.2.

#### 6.4.1.1 Base Station (BS)

The BS transmitter nominal power shall be as defined in table 6.1 according to its power class.

Table 6.1: Nominal power of BS transmitters

| Power class | Nominal power per carrier |
|-------------|---------------------------|
| 1 (40 W)    | 46 dBm                    |
| 2 (25 W)    | 44 dBm                    |
| 3 (15 W)    | 42 dBm                    |
| 4 (10 W)    | 40 dBm                    |
| 5 (6,3 W)   | 38 dBm                    |
| 6 (4 W)     | 36 dBm                    |
| 7 (2,5 W)   | 34 dBm                    |
| 8 (1,6 W)   | 32 dBm                    |
| 9 (1 W)     | 30 dBm                    |
| 10 (0,6 W)  | 28 dBm                    |

NOTE: The tolerances of the nominal power per carrier are given in ETSI EN 300 394-1 [i.13].

### 6.4.1.2 Mobile Station (MS)

The MS nominal power shall be as defined in table 6.2 according to its power class.

**Table 6.2: Nominal power of MS transmitters**

| Power class | Nominal power |
|-------------|---------------|
| 1 (30 W)    | 45 dBm        |
| 1L (17,5 W) | 42,5 dBm      |
| 2 (10 W)    | 40 dBm        |
| 2L (5,6 W)  | 37,5 dBm      |
| 3 (3 W)     | 35 dBm        |
| 3L (1,8 W)  | 32,5 dBm      |
| 4 (1 W)     | 30 dBm        |
| 4L (0,56 W) | 27,5 dBm      |

NOTE 1: The tolerances of the nominal power per carrier are given in ETSI EN 300 394-1 [i.13].

The different power levels needed for adaptive power control (see clause 10) shall have the values as defined in table 6.3, starting from the minimum power control level of 15 dBm (step level 7) up to the nominal power level corresponding to the class of the particular MS as stated in table 6.2.

**Table 6.3: Nominal MS power control levels**

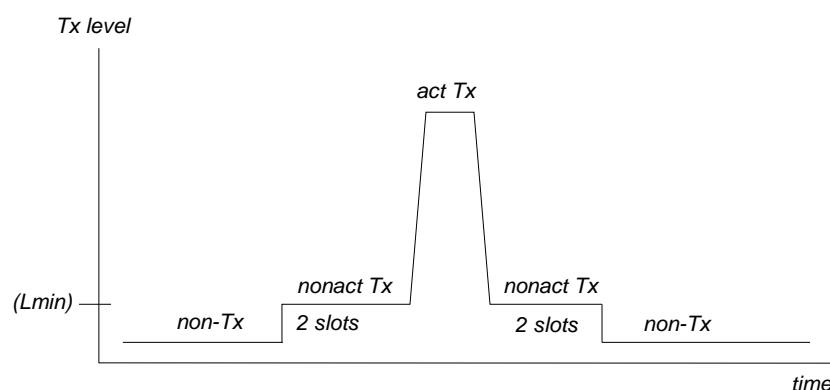

| Step level | Power  |
|------------|--------|
| 1          | 45 dBm |
| 2          | 40 dBm |
| 3          | 35 dBm |
| 4          | 30 dBm |
| 5          | 25 dBm |
| 6          | 20 dBm |
| 7          | 15 dBm |

NOTE 2: The tolerances of the nominal power per carrier are given in ETSI EN 300 394-1 [i.13].

## 6.4.2 Unwanted conducted emissions for phase modulation

### 6.4.2.1 Definitions

Unwanted emissions are defined as conducted emissions at frequencies or time intervals outside the allocated channel. The specified limits shall be met under realistic conditions, for instance under varying antenna mismatch. Unless otherwise stated, unwanted emissions are specified for an equipment in the active transmit (act Tx) state, i.e. whenever this equipment transmits bursts, or whenever it ramps-up/linearizes or ramps-down. The non-active transmit (nonact Tx) state is a state occurring during two timeslot durations (approximately 28 ms) before and after any active transmit state.

**Figure 6.2: Schematic presentation of transmitter states**

An equipment is said to be in the non-transmit (non-Tx) state whenever it is not in the active or non-active transmit state (refer to figure 6.2).

## 6.4.2.2 Unwanted emissions close to the carrier

### 6.4.2.2.0 General

The emissions in clauses 6.4.2.2.1 and 6.4.2.2.2 shall be measured through the square root raised cosine filter with a roll-off factor of 0,35 and a symbol duration of 500/9  $\mu$ s, as defined in clauses 5.5 and 5.6.

Measurements shall be done at the nominal centre frequency and at the frequency offsets specified in tables 6.4 and 6.5. When applicable, relative measurements (dBc) shall refer to the level measured at the nominal centre frequency.

### 6.4.2.2.1 Emission during the useful part of the burst

The levels given in tables 6.4 and 6.5 shall not be exceeded at the listed frequency offsets from the nominal carrier frequency.

**Table 6.4: Maximum adjacent power levels for frequencies below 700 MHz**

| Frequency offset | Maximum level for MS power classes 4 and 4L | Maximum level for other power classes |
|------------------|---|---------------------------------------|
| 25 kHz           | -55 dBc                                     | -60 dBc                               |
| 50 kHz           | -70 dBc                                     | -70 dBc                               |
| 75 kHz           | -70 dBc                                     | -70 dBc                               |

In any case, no requirement less than -36 dBm shall apply i.e. the maximum power level need not be less than -36 dBm.

**Table 6.5: Maximum adjacent power levels for frequencies above 700 MHz**

| Frequency offset   | Maximum level      |
|--|--------------------|
| 25 kHz   | -55 dBc            |
| 50 kHz   | -65 dBc            |
| 75 kHz   | -65 dBc (see note) |
| NOTE: A level of -70 dBc shall apply for:<br>BS Power Classes 1, 2 and 3 and for<br>MS Power Classes 1 and 1L. |                    |

In any case, no requirement less than -36 dBm shall apply i.e. the maximum power level need not be less than -36 dBm.

The specifications assume that the centre frequency is at the above listed frequency offsets from the nominal carrier frequency. The measured values shall be averaged over the useful part of the burst (see clause 9). The scrambled bits shall have a pseudo-random distribution from burst to burst.

### 6.4.2.2.2 Emission during the switching transients

At the frequency offset from the nominal carrier frequency given below, peak power measurements shall be done, covering at least the ramp-up period and the ramp-down period (figure 6.3, periods  $t_1$  and  $t_3$ ) (see clause 6.4.5 for definition of  $t_1$  and  $t_3$ ).

The maximum hold level of -45 dBc for MS Power Classes 4 and 4L and -50 dBc for other Power Classes at a frequency offset of 25 kHz shall not be exceeded. This requirement does not apply to linearization channels.

In any case no requirement less than -36 dBm shall apply i.e. the maximum peak power level need not be less than -36 dBm.

### 6.4.2.3 Unwanted emissions far from the carrier

These unwanted emissions are emissions (discrete, wideband noise, modulated or un-modulated) occurring at offsets of equal to, or greater than, 100 kHz from the carrier frequency, measured in the frequency range 9 kHz to 4 GHz.

a) Discrete spurious:

- the maximum allowed power for each spurious emission shall be less than -36 dBm measured in 100 kHz bandwidth in the frequency range 9 kHz to 1 GHz and -30 dBm measured in 1 MHz bandwidth in the frequency range 1 GHz to 4 GHz (1 GHz to 12,75 GHz for equipment capable of operating at frequencies above 470 MHz). Specific measurement methods are required both when measuring within  $\pm f_{rb}$  of carrier frequency, due to the presence of wideband noise, and in the lower part of the spectrum.

b) Wideband noise:

- the wideband noise levels, measured through the modulation filter defined in clause 5.6 should not exceed the limits shown in tables 6.6 and 6.7, for the nominal power levels as stated, and at the listed offsets from the nominal carrier frequency. The requirements apply symmetrically to both sides of the transmitter band.

**Table 6.6: Wideband noise limits for frequencies below 700 MHz**

| Frequency offset    | Maximum wideband noise level                |   |   |
|---------------------|---|---|---|
|                     | MS nominal power level $\leq 1$ W (class 4) | MS nominal power level = 1,8 W or 3 W (class 3L or 3) | MS nominal power level $\geq 5,6$ W (class 2L) BS all classes |
| 100 kHz to 250 kHz  | -75 dBc                                     | -78 dBc   | -80 dBc   |
| 250 kHz to 500 kHz  | -80 dBc                                     | -83 dBc   | -85 dBc   |
| 500 kHz to $f_{rb}$ | -80 dBc                                     | -85 dBc   | -90 dBc   |
| $> f_{rb}$          | -100 dBc                                    | -100 dBc  | -100 dBc  |

NOTE:  $f_{rb}$  denotes the frequency offset corresponding to the near edge of the receive band or 5 MHz (10 MHz for frequencies above 520 MHz) whichever is greater.

**Table 6.7: Wideband noise limits for frequencies above 700 MHz**

| Frequency offset    | Maximum wideband noise level                |  |  |
|---------------------|---|--|--|
|                     | MS nominal power level $\leq 1$ W (class 4) | MS nominal power levels from 1,8 W to 10 W and BS Nominal power levels $\leq 10$ W | MS and BS nominal power levels from 15 W to 40 W |
| 100 kHz to 250 kHz  | -74 dBc                                     | -74 dBc  | -80 dBc  |
| 250 kHz to 500 kHz  | -80 dBc                                     | -80 dBc  | -85 dBc  |
| 500 kHz to $f_{rb}$ | -80 dBc                                     | -85 dBc  | -90 dBc  |
| $> f_{rb}$          | -100 dBc                                    | -100 dBc   | -100 dBc   |

NOTE:  $f_{rb}$  denotes the frequency offset corresponding to the near edge of the received band or 10 MHz whichever is greater.

All levels in tables 6.6 and 6.7 are expressed in dBc relative to the actual transmitted power level, and in any case no limit tighter than -55 dBm for offsets  $< f_{rb}$  or -70 dBm for offsets  $> f_{rb}$  shall apply.

### 6.4.2.4 Unwanted emissions during the CLCH and BLCH

The following emissions shall be measured through a square root raised cosine filter with a roll-off factor of 0,35 and a symbol duration of 500/9  $\mu$ s as defined in clauses 5.5 and 5.6.

The sum of the time periods during which the peak power, at a frequency offset of  $\pm 25$  kHz during the BLCH/CLCH, is above -45 dBc shall not exceed 1 ms. This peak power shall never exceed -30 dBc.

NOTE: 0 dBc refers to the transmit power during normal operation after the CLCH or BLCH.

### 6.4.2.5 Unwanted emissions in the non-transmit state

The specifications of clause 6.5.4.2 apply.

### 6.4.3 Unwanted radiated emissions for phase modulation

Unwanted radiated emissions are emissions (whether modulated or un-modulated) radiated by the cabinet and structure of the equipment (MS or BS). This is also known as cabinet radiation.

The limits given in clause 6.4.2.3 shall apply for frequencies between 30 MHz and 4 GHz only.

### 6.4.4 RF tolerance for phase modulation

The RF tolerance for BSs and MSs is defined in clause 7.

### 6.4.5 RF Output power time mask for phase modulation

#### 6.4.5.0 General

The transmit level versus time mask for TETRA station transmission is shown in figure 6.3. For the time mask the power level of 0 dBc refers to the output power level of the TETRA station under consideration.

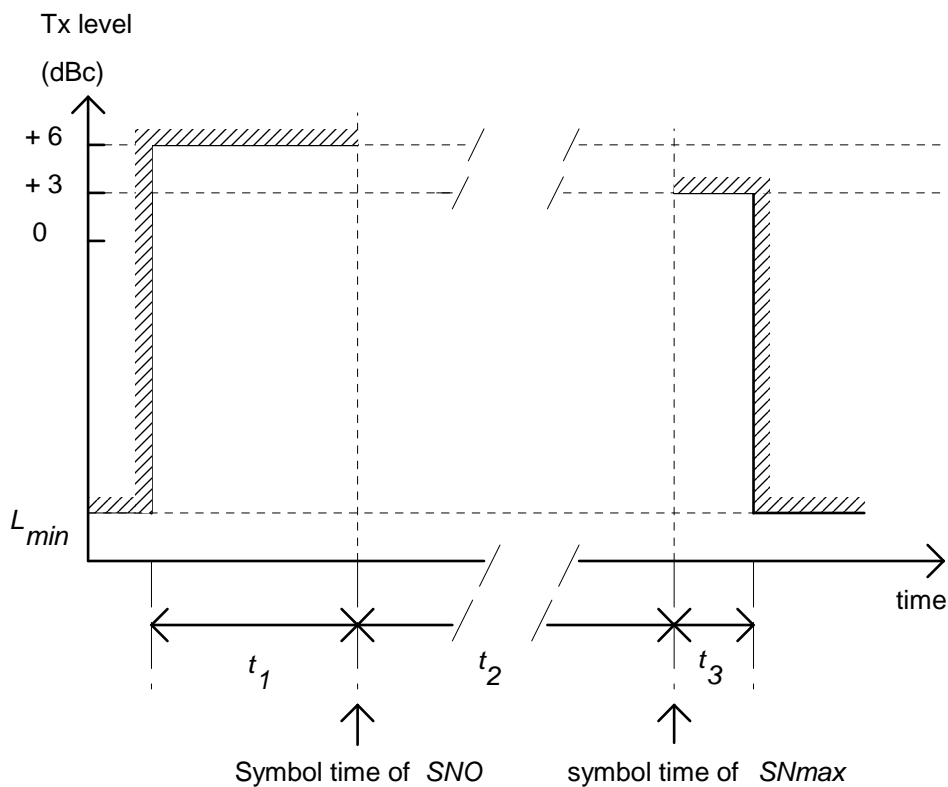

Figure 6.3: Transmit level versus time mask

**Table 6.8: Transmit level versus time mask symbol durations (refer figure 6.3)**

| Burst Type                                     | $t_1$       | $t_2$          | $t_3$       |
|--|-------------|----------------|-------------|
| Control uplink                                 | 16          | 103            | 15          |
| Linearization uplink                           | 119         | 0              | 15          |
| Linearization downlink                         | 107         | 0              | 0           |
| Normal uplink                                  | 16          | 231 (see note) | 15          |
| Discontinuous downlink                         | 7           | 246 (see note) | 7           |
| Continuous downlink                            | Unspecified | Unspecified    | Unspecified |
| NOTE: In the case of single slot transmission. |             |                |             |

Whenever bursts are consecutively transmitted by the same TETRA station on the same frequency, the transmit level versus time mask applies at the beginning of the transmission of the first burst and at the end of the transmission of the last burst.

The symbol numbers referred to as  $SNO$  and  $SNmax$  are defined in clause 9. The timing of the transmitted bursts is specified in clause 7. The time periods  $t_1$ ,  $t_2$  and  $t_3$ , whose durations are stated in table 6.8, are defined in the following way:

- the time  $t_1$  starts at the beginning of the ramp-up of the first burst, and expires just before the symbol time of  $SNO$ ;
- the time  $t_2$  starts at the symbol time of  $SNO$  of the first burst and finishes at the symbol time of  $SNmax$  of the last burst;
- the time  $t_3$  starts just after the symbol time of  $SNmax$  of the last burst and finishes at the end of the ramp-down.

In this clause, the specifications of clauses 6.4.1 and 6.6.1 shall apply during the time  $t_2$ . The output power shall be measured through the square root raised cosine filter with a roll off factor of 0,35 and a symbol duration of 500/9  $\mu$ s as defined in clauses 5.5 and 5.6.

#### 6.4.5.1 BS

The BS output power shall be at the nominal level, as specified in clause 6.4.1.1. Power control shall not be applied to the downlink transmissions.

In the non-active transmit state the specification  $L_{min} = -40$  dBc shall apply.

The peak transmit power during BLCH shall not exceed +6 dBc.

#### 6.4.5.2 MS

The MS output power shall be able to be reduced to levels defined in table 6.3, down to a minimum level of 15 dBm. The power levels that can be achieved, according to the class of the MS, are detailed in clause 6.4.1.2.

During the non-active transmit state the specification  $L_{min} = -70$  dBc or  $L_{min} = -36$  dBm, whichever is greater, shall apply.

### 6.4.6 Transmitter intermodulation attenuation for phase modulation

#### 6.4.6.1 Definition

The intermodulation attenuation is the ratio of the power level of the wanted signal to the power level of an intermodulation component. It is a measure of the capability of the transmitter to inhibit the generation of signals in its non-linear elements caused by the presence of the useful carrier and an interfering signal reaching the transmitter via its antenna.

### 6.4.6.2 BS

The intermodulation attenuation of the BS equipment shall be at least 70 dB for any intermodulation component when measured in a 30 kHz bandwidth. The interfering signal shall be un-modulated and have a frequency offset of at least 500 kHz from the carrier frequency. The power level of the interfering signal shall be 30 dB below the power level of the modulated output signal from the transmitter under test. If the intermodulation attenuation is achieved by additional, internal or external, isolating devices they shall be included in the measurements.

However, in the case of BS equipment with only one transmitter and which is not intended to be co-located with other radio equipment operating in the same frequency band, an intermodulation attenuation of at least 40 dB shall be sufficient.

In any case no requirement less than -36 dBm shall apply to intermodulation components i.e. the power of any intermodulation component need not be less than -36 dBm.

All power levels stated in the cases above refer to the antenna connector of the BS described in clause 6.3.

### 6.4.6.3 MS

In an MS, intermodulation may be caused when operating transmitters in the close vicinity of each other.

For an MS transmitter operating at the nominal power defined by its class, the intermodulation attenuation shall be at least 60 dB for any intermodulation component when measured in 30 kHz bandwidth. The interfering signal shall be un-modulated and have a frequency offset of at least 500 kHz from the carrier frequency. The power level of the interfering signal shall be 50 dB below the power level of the modulated output signal from the transmitter under test.

## 6.4.7 Intra-BS intermodulation requirements

In a BS, intermodulation may be caused by combining several transmitters and carriers to feed a single antenna.

For all transmitters of a single TETRA BS, the power of any intermodulation components, when measured in a 30 kHz bandwidth, shall not exceed -60 dBc in the relevant downlink frequency band. In any case no requirement less than -36 dBm shall apply i.e. the power of any intermodulation component need not be less than -36 dBm.

NOTE: The value of -60 dBc refers to the carrier power of the transmitter with the highest output power measured at the antenna connector of the BS described in clause 6.3.

In the case where the performance is achieved by additional internal or external isolating devices (such as circulators) they shall be supplied at the time of conformance testing and shall be used for measurements.

## 6.4.8 Output power for QAM

### 6.4.8.0 General

In clauses 6.4.8.1 and 6.4.8.2, power for QAM is defined as the sum of the powers of each of the sub-carriers within the RF channel bandwidth. For each sub-carrier, reference power is defined as the average power, measured at symbol time through the square root raised cosine filter defined in clause 5.16, over the pilot and sync symbols within the QAM burst as defined in clause 9.

The powers at which MSs or BSs may operate are specified in clauses 6.4.8.1 and 6.4.8.2.

### 6.4.8.1 BS

The BS transmitter nominal power shall be as defined in table 6.9 according to its power class.

The power tolerances are defined in clause 7.1.1.2 of ETSI EN 300 394-1 [i.13].

**Table 6.9: Nominal power of BS QAM transmitters**

| Power class | Nominal power per modulated RF carrier<br>(see note) |
|-------------|--|
| 1 (40 W)    | 46 dBm   |
| 2 (25 W)    | 44 dBm   |
| 3 (15 W)    | 42 dBm   |
| 4 (10 W)    | 40 dBm   |
| 5 (6,3 W)   | 38 dBm   |
| 6 (4 W)     | 36 dBm   |
| 7 (2,5 W)   | 34 dBm   |
| 8 (1,6 W)   | 32 dBm   |
| 9 (1 W)     | 30 dBm   |
| 10 (0,6 W)  | 28 dBm   |

NOTE: "Modulated RF carrier" has an RF channel bandwidth of 25 kHz, 50 kHz, 100 kHz or 150 kHz, comprising 8, 16, 32 or 48 modulated sub-carriers respectively.

### 6.4.8.2 MS

The MS nominal power shall be as defined in table 6.10 according to its power class.

The power tolerances are defined in clause 6 of ETSI EN 300 394-1 [i.13].

**Table 6.10: Nominal power of MS QAM transmitters**

| Power class  | Nominal power |
|--------------|---------------|
| 1 (30 W)     | 45 dBm        |
| 1L ( 17,5 W) | 42,5 dBm      |
| 2 (10 W)     | 40 dBm        |
| 2L (5,6 W)   | 37,5 dBm      |
| 3 (3 W)      | 35 dBm        |
| 3L (1,8 W)   | 32,5 dBm      |
| 4 (1 W)      | 30 dBm        |
| 4L (0,56 W)  | 27,5 dBm      |
| 5 (0,32 W)   | 25 dBm        |
| 5L (0,18 W)  | 22,5 dBm      |

The different power levels needed for adaptive power control (see clause 10.2) shall have the values as defined in table 6.11, starting from the minimum power control level of 15 dBm (step level 7) up to the nominal power level corresponding to the class of the particular MS as stated in table 6.10.

The power tolerances are defined in clause 6 of ETSI EN 300 394-1 [i.13].

**Table 6.11: Nominal MS QAM power control levels**

| Step level | Power  |
|------------|--------|
| 1          | 45 dBm |
| 2          | 40 dBm |
| 3          | 35 dBm |
| 4          | 30 dBm |
| 5          | 25 dBm |
| 6          | 20 dBm |
| 7          | 15 dBm |

## 6.4.9 Unwanted conducted emissions for QAM

### 6.4.9.1 Definitions

The definitions in clause 6.4.2.1 apply.

### 6.4.9.2 Unwanted emissions close to the carrier

#### 6.4.9.2.0 General

The unwanted emissions in clauses 6.4.9.2.1 and 6.4.9.2.2 shall be measured through the square root raised cosine filter with a roll-off factor of 0,35 and a symbol duration of 500/9  $\mu$ s, as defined in clauses 5.5 and 5.6.

Measurements shall be done at the nominal centre frequency and at the frequency offsets specified in tables 6.12, 6.13, 6.14 and 6.15. When applicable, relative measurements (dBc) shall refer to the power level measured at the nominal centre frequency as defined in clause 6.4.8.

#### 6.4.9.2.1 Emission during the useful part of the burst

The levels given in tables 6.12, 6.13, 6.14 and 6.15 shall not be exceeded at the listed frequency offsets from the nominal carrier frequency.

**Table 6.12: Maximum adjacent power levels for 25 kHz QAM**

| Frequency offset | Maximum level for MS and BS |
|------------------|-----------------------------|
| 25 kHz           | -55 dBc                     |
| 50 kHz           | -65 dBc                     |
| 75 kHz           | -67 dBc                     |

NOTE: The maximum adjacent channel power levels for 25 kHz QAM channel are applicable also for the RAB channels on 50 kHz, 100 kHz and 150 kHz QAM channels.

**Table 6.13: Maximum adjacent power levels for 50 kHz QAM**

| Frequency offset | Maximum level for MS and BS |
|------------------|-----------------------------|
| 37,5 kHz         | -55 dBc                     |
| 62,5 kHz         | -63 dBc                     |
| 87,5 kHz         | -65 dBc                     |

**Table 6.14: Maximum adjacent power levels for 100 kHz QAM**

| Frequency offset | Maximum level for MS and BS |
|------------------|-----------------------------|
| 62,5 kHz         | -55 dBc                     |
| 87,5 kHz         | -60 dBc                     |
| 112,5 kHz        | -60 dBc                     |

**Table 6.15: Maximum adjacent power levels for 150 kHz QAM**

| Frequency offset | Maximum level for MS and BS |
|------------------|-----------------------------|
| 87,5 kHz         | -55 dBc                     |
| 112,5 kHz        | -60 dBc                     |
| 137,5 kHz        | -60 dBc                     |

In any case, no requirement less than -36 dBm shall apply i.e. the maximum power level need not be less than -36 dBm.

The specifications assume that the centre frequency is at the above listed frequency offsets from the nominal carrier frequency. The measured values shall be averaged over the useful part of the burst (see clause 9). The scrambled bits shall have a pseudo-random distribution from burst to burst.

#### 6.4.9.2.2 Emission during the switching transients

At the frequency offset from the nominal carrier frequency given below, peak power measurements shall be done, covering at least the ramp-up period and the ramp-down period (figure 6.4, periods  $t_1$  and  $t_3$ ) (see clause 6.4.10 for definition of  $t_1$  and  $t_3$ ).

For 25 kHz QAM the maximum hold level of -45 dBc at a frequency offset of 25 kHz shall not be exceeded.

For 50 kHz QAM the maximum hold level of -45 dBc at a frequency offset of 37,5 kHz shall not be exceeded.

For 100 kHz QAM the maximum hold level of -45 dBc at a frequency offset of 62,5 kHz shall not be exceeded.

For 150 kHz QAM the maximum hold level of -45 dBc at a frequency offset of 87,5 kHz shall not be exceeded.

This requirement does not apply to linearization channels.

In any case no requirement less than -36 dBm shall apply i.e. the maximum peak power level need not be less than -36 dBm.

#### 6.4.9.3 Unwanted emissions far from the carrier

These unwanted emissions are emissions (discrete, wideband noise, modulated or un-modulated) occurring at offsets of equal to, or greater than, 100 kHz from the carrier frequency, measured in the frequency range 9 kHz to 4 GHz.

##### a) Discrete spurious:

- the maximum allowed power for each spurious emission shall be less than -36 dBm measured in 100 kHz bandwidth in the frequency range 9 kHz to 1 GHz and -30 dBm measured in 1 MHz bandwidth in the frequency range 1 GHz to 4 GHz (1 GHz to 12,75 GHz for equipment capable of operating at frequencies above 470 MHz). Specific measurement method are required both when measuring within  $\pm f_{rb}$  of carrier frequency, due to the presence of wideband noise, and in the lower part of the spectrum.

##### b) Wideband noise:

- the wideband noise levels, measured through the modulation filter defined in clause 5.6 should not exceed the limits shown in tables 6.16, 6.17, 6.18 and 6.19, for the nominal power levels as stated, and at the listed offsets from the nominal carrier frequency. When applicable, relative measurements (dBc) shall refer to the power level measured at the nominal centre frequency as defined in clause 6.4.8. The requirements apply symmetrically to both sides of the transmitter band.

**Table 6.16: Wideband noise limits 25 kHz QAM**

| Frequency offset      | Maximum wideband noise level for MS and BS  |   |   |
|-----------------------|---|---|---|
|                       | MS nominal power level $\leq 1$ W (class 4) | MS nominal power level = 1,8 W or 3 W (class 3L or 3) | MS nominal power level $\geq 5,6$ W (class 2L) BS all classes |
| 100 kHz to 250 kHz    | -70 dBc                                     | -70 dBc   | -70 dBc   |
| 250 kHz to 500 kHz    | -74 dBc                                     | -74 dBc   | -80 dBc   |
| 500 kHz to 2 500 kHz  | -80 dBc                                     | -80 dBc   | -80 dBc   |
| 2 500 kHz to $f_{rb}$ | -80 dBc                                     | -80 dBc   | -90 dBc   |
| $> f_{rb}$            | -95 dBc                                     | -95 dBc   | -95 dBc   |

NOTE:  $f_{rb}$  denotes the frequency offset corresponding to the near edge of the receive band or 5 MHz (10 MHz for frequencies above 520 MHz) whichever is greater.

Table 6.17: Wideband noise limits 50 kHz QAM

| Frequency offset       | Maximum wideband noise level for MS and BS  |   |  |
|------------------------|---|---|--|
|                        | MS nominal power level $\leq 1$ W (class 4) | MS nominal power level = 1,8 W or 3 W (class 3L or 3) | MS nominal power level $\geq 5,6$ W (class 2L)<br>BS all classes |
| 112,5 kHz to 262,5 kHz | -68 dBc                                     | -68 dBc   | -70 dBc  |
| 262,5 kHz to 500 kHz   | -72 dBc                                     | -72 dBc   | -75 dBc  |
| 500 kHz to $f_{rb}$    | -78 dBc                                     | -78 dBc   | -80 dBc  |
| $> f_{rb}$             | -95 dBc                                     | -95 dBc   | -95 dBc  |

NOTE:  $f_{rb}$  denotes the frequency offset corresponding to the near edge of the receive band or 5 MHz (10 MHz for frequencies above 520 MHz) whichever is greater.

Table 6.18: Wideband noise limits 100 kHz QAM

| Frequency offset       | Maximum wideband noise level for MS and BS  |  |
|------------------------|---|--|
|                        | MS nominal power level $\leq 3$ W (class 3) | MS nominal power level $\geq 5,6$ W (class 2L)<br>BS all classes |
| 137,5 kHz to 287,5 kHz | -60 dBc                                     | -70 dBc  |
| 287,5 kHz to 537,5 kHz | -65 dBc                                     | -70 dBc  |
| 537,5 kHz to 1 000 kHz | -73 dBc                                     | -75 dBc  |
| 1 000 kHz to $f_{rb}$  | -73 dBc                                     | -80 dBc  |
| $> f_{rb}$             | -95 dBc                                     | -95 dBc  |

NOTE:  $f_{rb}$  denotes the frequency offset corresponding to the near edge of the receive band or 5 MHz (10 MHz for frequencies above 520 MHz) whichever is greater.

Table 6.19: Wideband noise limits 150 kHz QAM

| Frequency offset       | Maximum wideband noise level for MS and BS  |  |
|------------------------|---|--|
|                        | MS nominal power level $\leq 3$ W (class 3) | MS nominal power level $\geq 5,6$ W (class 2L)<br>BS all classes |
| 162,5 kHz to 312,5 kHz | -60 dBc                                     | -60 dBc  |
| 312,5 kHz to 562,5 kHz | -63 dBc                                     | -70 dBc  |
| 562,5 kHz to 1 500 kHz | -70 dBc                                     | -75 dBc  |
| 1 500 kHz – $f_{rb}$   | -70 dBc                                     | -80 dBc  |
| $> f_{rb}$             | -95 dBc                                     | -95 dBc  |

NOTE:  $f_{rb}$  denotes the frequency offset corresponding to the near edge of the receive band or 5 MHz (10 MHz for frequencies above 520 MHz) whichever is greater.

All levels in tables 6.16 to 6.19 are expressed in dBc relative to the actual transmitted power level, and in any case no limit tighter than -55 dBm for offsets  $< f_{rb}$  or -70 dBm for offsets  $> f_{rb}$  shall apply.

#### 6.4.9.4 Unwanted emissions during the CLCH-Q and BLCH-Q

The following emissions shall be measured through a square root raised cosine filter with a roll-off factor of 0,35 and symbol duration of 500/9  $\mu$ s as defined in clauses 5.5 and 5.6.

For 25 kHz QAM the sum of the time periods during which the peak power, at a frequency offset of  $\pm 25$  kHz during the BLCH-Q/CLCH-Q, is above -45 dBc shall not exceed 1 ms. This peak power shall never exceed -30 dBc.

For 50 kHz QAM the sum of the time periods during which the peak power, at a frequency offset of  $\pm 37,5$  kHz during the BLCH-Q/CLCH-Q, is above -45 dBc shall not exceed 1 ms. This peak power shall never exceed -30 dBc.

For 100 kHz QAM the sum of the time periods during which the peak power, at a frequency offset of  $\pm 62,5$  kHz during the BLCH-Q/CLCH-Q, is above -45 dBc shall not exceed 1 ms. This peak power shall never exceed -30 dBc.

For 150 kHz QAM the sum of the time periods during which the peak power, at a frequency offset of  $\pm 87,5$  kHz during the BLCH-Q/CLCH-Q, is above -43 dBc shall not exceed 1 ms. This peak power shall never exceed -30 dBc.

NOTE: 0 dBc refers to the transmit power during normal operation after the CLCH-Q or BLCH-Q.

### 6.4.9.5 Unwanted emissions in the non-transmit state

The specifications of clause 6.5.4.2 apply.

## 6.4.10 RF Output power time mask for QAM

### 6.4.10.0 General

The QAM transmit level versus time mask for TETRA mobile station transmission is shown in figure 6.4 and table 6.20. For the time mask the power level of 0 dBc refers to the output power level of the TETRA mobile station under consideration. Unwanted emissions due to switching transients are specified in clause 6.4.9.2.2.

Figure 6.4: Transmit level versus time mask for QAM

Table 6.20: Transmit level versus time mask symbol durations (refer figure 6.4)

| Burst Type                                     | $t_1$ | $t_2$       | $t_3$ |
|--|-------|-------------|-------|
| Control/random access uplink                   | 2,0   | 13,0        | 2,5   |
| Linearization uplink                           | 15,0  | 0,0         | 2,5   |
| Normal uplink                                  | 2,0   | 30,0 (note) | 2,5   |
| NOTE: In the case of single slot transmission. |       |             |       |

Whenever bursts are consecutively transmitted by the same TETRA mobile station on the same frequency, the transmit level versus time mask applies at the beginning of the transmission of the first burst and at the end of the transmission of the last burst.

The symbol numbers referred to as  $SN-Q1$  and  $SN-Qmax$  are defined in clause 9 for QAM. The timing of the transmitted bursts is specified in clause 7 for QAM. The time periods  $t_1$ ,  $t_2$  and  $t_3$ , whose durations are stated in table 6.20, are defined in the following way:

- the time  $t_1$  starts at the beginning of the ramp-up of the first burst, and expires just before the symbol time of  $SN-Q1$ ;
- the time  $t_2$  starts at the symbol time of  $SN-Q1$  of the first burst and finishes at the symbol time of  $SN-Qmax$  of the last burst;
- the time  $t_3$  starts just after the symbol time of  $SN-Qmax$  of the last burst and finishes at the end of the ramp-down.

In this clause, the specifications of clauses 6.4.8 and 6.7.1.2 shall apply during the time  $t_2$ .

#### 6.4.10.1 BS

The BS QAM output power shall be at the nominal level, as specified in clause 6.4.8.1, excluding linearization bursts.

#### 6.4.10.2 MS

The MS QAM output power shall be able to be reduced to levels defined in table 6.11, down to a minimum level of 15 dBm. The power levels that can be achieved, according to the class of the MS, are detailed in clause 6.4.8.2.

During the non-active transmit state the specification  $L_{min} = -70$  dBc or  $L_{min} = -36$  dBm, whichever is greater, shall apply.

### 6.4.11 Transmitter intermodulation attenuation

Requirements in clause 6.4.6 apply.

### 6.4.12 Intra-BS intermodulation requirements

Requirements in clause 6.4.7 apply.

## 6.5 Receiver characteristics

### 6.5.0 General

In this clause, the levels of the test signals are given in terms of power levels (dBm) at the antenna connector of the receiver. For the definition of power level refer to clauses 6.4.1 and 6.4.8.

Sources of test signals shall be connected in such a way that the impedance presented to the receiver input is a 50  $\Omega$  non-reactive impedance.

This requirement shall be met irrespective of whether one or more signals using a combining network are applied to the receiver simultaneously.

Static propagation conditions are assumed in all cases, for both wanted and unwanted signals.

### 6.5.1 Blocking characteristics

#### 6.5.1.1 Definition

Blocking is a measure of the capability of the receiver to receive a modulated wanted input signal in the presence of an unwanted un-modulated input signal on frequencies other than those of the spurious responses or the adjacent channels, without this unwanted input signal causing a degradation of the performance of the receiver beyond a specified limit.

### 6.5.1.2 Specification for Phase Modulation

The blocking performance specification given in table 6.21 shall apply at all frequencies except those at which spurious responses occur (see clause 6.5.2).

**Table 6.21: Blocking levels of the receiver**

| Offset from nominal Rx freq. | Level of interfering signal |
|------------------------------|-----------------------------|
| 50 kHz to 100 kHz            | -40 dBm                     |
| 100 kHz to 200 kHz           | -35 dBm                     |
| 200 kHz to 500 kHz           | -30 dBm                     |
| > 500 kHz                    | -25 dBm                     |

The static reference sensitivity performance as specified in clause 6.6.2.4 shall be met when the following signals are simultaneously input to the receiver:

- a wanted signal at the nominal receive frequency  $f_o$ , 3 dB above the static reference sensitivity level as specified in clause 6.6.2.4;
- a continuous sine wave signal at a frequency offset from  $f_o$  and level as defined in table 6.21.

### 6.5.1.3 Specification for QAM

The blocking performance specification given in tables 6.22, 6.23, 6.24 and 6.25 shall apply at all frequencies except those at which spurious responses occur (see clause 6.5.2).

**Table 6.22: Blocking levels of the 25 kHz (8 subchannels) QAM receiver**

| Offset from nominal Rx freq. | Level of interfering signal |
|------------------------------|-----------------------------|
| 50 kHz to 100 kHz            | -40 dBm                     |
| 100 kHz to 200 kHz           | -35 dBm                     |
| 200 kHz to 500 kHz           | -30 dBm                     |
| > 500 kHz                    | -25 dBm                     |

**Table 6.23: Blocking levels of the 50 kHz (16 subchannels) QAM receiver**

| Offset from nominal Rx freq. | Level of interfering signal |
|------------------------------|-----------------------------|
| 100 kHz to 200 kHz           | -40 dBm                     |
| 200 kHz to 400 kHz           | -35 dBm                     |
| 400 kHz to 1 000 kHz         | -30 dBm                     |
| > 1 000 kHz                  | -25 dBm                     |

**Table 6.24: Blocking levels of the 100 kHz (32 subchannels) QAM receiver**

| Offset from nominal Rx freq. | Level of interfering signal |
|------------------------------|-----------------------------|
| 200 kHz to 400 kHz           | -40 dBm                     |
| 400 kHz to 600 kHz           | -35 dBm                     |
| 600 kHz to 1 000 kHz         | -30 dBm                     |
| > 1 000 kHz                  | -25 dBm                     |

**Table 6.25: Blocking levels of the 150 kHz (48 subchannels) QAM receiver**

| Offset from nominal Rx freq. | Level of interfering signal |
|------------------------------|-----------------------------|
| 300 kHz to 500 kHz           | -40 dBm                     |
| 500 kHz to 800 kHz           | -35 dBm                     |
| 800 kHz to 1 000 kHz         | -30 dBm                     |
| > 1 000 kHz                  | -25 dBm                     |

The static reference sensitivity performance as specified in clause 6.7.2.4 shall be met when the following signals are simultaneously input to the receiver:

- a wanted signal at the nominal receive frequency  $f_o$ , 3 dB above the static reference sensitivity level as specified in clause 6.7.2.4;
- a continuous sine wave signal at a frequency offset from  $f_o$  and level as defined in tables 6.22, 6.23, 6.24 and 6.25.

## 6.5.2 Spurious response rejection

### 6.5.2.1 Definition

Spurious response rejection is a measure of the capability of a receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of an unwanted un-modulated signal at any other frequency at which a response is obtained, i.e. for which the blocking limit is not met.

### 6.5.2.2 Specification for phase modulation

- a) The static reference sensitivity performance as specified in clause 6.6.2.4 shall be met when the following signals are simultaneously applied to the receiver:
  - a wanted signal at nominal receive frequency  $f_o$ , 3 dB above the static reference sensitivity level as specified in clause 6.6.2.4;
  - a continuous sine wave signal with any offset from nominal Rx frequency  $\geq 50$  kHz at a level of -45 dBm.
- b) The number of frequencies within a limited frequency range, defined below, at which the blocking specification of clause 6.5.1.2 is not met shall not exceed  $0,05 \times$  (number of frequency channels in the limited frequency range).

The limited frequency range is defined as the frequency of the local oscillator signal  $f_{lo}$  applied to the first mixer of the receiver plus or minus the sum of the intermediate frequencies ( $f_{i1}, \dots, f_{in}$ ) and a half of the switching range ( $sr$ ) of the receiver.

Hence the frequency  $f_l$  of the limited frequency range is:

$$f_{lo} - \sum_{j=1}^n f_{ij} - \frac{sr}{2} \leq f_l \leq f_{lo} + \sum_{j=1}^n f_{ij} + \frac{sr}{2} \quad (6.2)$$

Where receiver switching range ( $sr$ ) is the maximum frequency range over which the receiver can be operated without reprogramming or realignment as declared by the manufacturer.

### 6.5.2.3 Specification for QAM

- a) The static reference sensitivity performance as specified in clause 6.7.2.4 shall be met when the following signals are simultaneously applied to the receiver:
  - a wanted signal at nominal receive frequency  $f_o$ , 3 dB above the static reference sensitivity level as specified in clause 6.7.2.4;
  - a continuous sine wave signal with any offset from nominal Rx frequency  $\geq f_{spur}$  at a level of -45 dBm. The value of  $f_{spur}$  is defined in table 6.26.

**Table 6.26: Continuous sine wave offset frequency  $f_{spur}$** 

| QAM Channel bandwidth | Offset from nominal Rx freq. |
|-----------------------|------------------------------|
| 25 kHz                | 50 kHz                       |
| 50 kHz                | 100 kHz                      |
| 100 kHz               | 200 kHz                      |
| 150 kHz               | 300 kHz                      |

- b) The number of frequencies within a limited frequency range, defined below, at which the blocking specification of clause 6.5.1.3 is not met shall not exceed  $0,05 \times$  (number of frequency channels in the limited frequency range).

The limited frequency range is defined as the frequency of the local oscillator signal  $f_{lo}$  applied to the first mixer of the receiver plus or minus the sum of the intermediate frequencies ( $f_{i1}, \dots, f_{in}$ ) and a half of the switching range ( $sr$ ) of the receiver.

Hence the frequency  $f_l$  of the limited frequency range is:

$$f_{lo} - \sum_{j=1}^n f_{ij} - \frac{sr}{2} \leq f_l \leq f_{lo} + \sum_{j=1}^n f_{ij} + \frac{sr}{2} \quad (6.3)$$

Where receiver switching range ( $sr$ ) is the maximum frequency range over which the receiver can be operated without reprogramming or realignment as declared by the manufacturer.

## 6.5.3 Intermodulation response rejection

### 6.5.3.1 Definition

Intermodulation response rejection is a measure of the capability of the receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of two or more unwanted signals with a specific frequency relationship to the wanted signal frequency as defined in ETSI EN 300 113-1 [4].

### 6.5.3.2 Specification for Phase Modulation

The static reference sensitivity performance as specified in clause 6.6.2.4 shall be met when the following signals are simultaneously input to the receiver:

- a wanted signal at the nominal receive frequency  $f_o$ , 3 dB above the static reference sensitivity level;
- a continuous sine wave signal at frequency  $f_1$  and with a level of -47 dBm;
- a pseudo-random sequence TETRA  $\pi/4$ -DQPSK modulating a signal at frequency  $f_2$ , with a level of -47 dBm, such that  $f_o = 2f_1 - f_2$  and  $|f_2 - f_1| = 200$  kHz.

### 6.5.3.3 Specification for QAM

The static reference sensitivity performance as specified in clause 6.7.2.4 shall be met when the following signals are simultaneously input to the receiver:

- a wanted signal at the nominal receive frequency  $f_o$ , 3 dB above the static reference sensitivity level;
- a continuous sine wave signal at frequency  $f_1$  and with a level of -47 dBm;
- a pseudo-random sequence TETRA  $\pi/4$ -DQPSK modulating a signal at frequency  $f_2$ , with a level of -47 dBm, such that  $f_o = 2f_1 - f_2$  and  $|f_2 - f_1| = f_x$ . Where  $f_x$  is defined in table 6.27.

Table 6.27:  $f_x$  definition

| QAM Channel bandwidth | Offset from nominal Rx freq. |
|-----------------------|------------------------------|
| 25 kHz                | 200 kHz                      |
| 50 kHz                | 400 kHz                      |
| 100 kHz               | 800 kHz                      |
| 150 kHz               | 1 200 kHz                    |

## 6.5.4 Unwanted conducted emissions

### 6.5.4.1 Definition

Unwanted emissions from the equipment when in reception are defined as conducted emissions at any frequency, when the equipment is in the non-transmit state.

### 6.5.4.2 Specification

The peak power emitted by the equipment shall not exceed -57 dBm at frequencies between 9 kHz and 1 GHz, as measured in a bandwidth of 100 kHz.

For equipment only capable of operating below 470 MHz the power emitted by the equipment shall not exceed -47 dBm from 1 GHz to 4 GHz, as measured in a bandwidth of 1 MHz.

For equipment capable of operating above 470 MHz the power emitted by the equipment shall not exceed -47 dBm from 1 GHz to 12,75 GHz, as measured in a bandwidth of 1 MHz.

## 6.5.5 Unwanted radiated emissions

Unwanted radiated emissions are emissions radiated by the cabinet and structure of the equipment (MS or BS) in the non-transmit state. This is also known as cabinet radiation.

The limits given in clause 6.5.4.2 shall apply for frequencies between 30 MHz and 4 GHz only.

## 6.6 Transmitter/receiver performance for phase modulation

### 6.6.0 General

Clause 6.6.1 specifies the modulation accuracy requirement, by setting limits on the Root Mean Square (RMS) error between the actual transmitted signal waveform and the ideal signal waveform. Clause 6.6.2 specifies the receiver performance, assuming that transmit errors do not occur. Clause 6.8 specifies all the propagation models that are defined in the present document.

### 6.6.1 Transmitter performance for phase modulation

#### 6.6.1.1 Modulation accuracy for phase modulation

The specified requirement is vector error magnitude; this does not only take into account modulation filtering linear distortion (amplitude and phase) or modulator impairments (quadrature offset, phase and linear amplitude errors in the modulation symbol constellation) but is a measure of the whole transmitter quality. It also takes into account local oscillator phase noise, filter distortion, and non-linearity of amplifiers. Vector error magnitude shall be specified at symbol time (see clause 6.6.1.2) and the vector error magnitude requirement shall be fulfilled by the TETRA equipment with maximum and with minimum power levels (as defined in clause 6.4.1).

The modulation symbol  $s(t)$  transmitted by an ideal transmitter having a filter impulse response  $g(t)$  is defined in clause 5.

Let  $Z(k)$  denote the output of an ideal receive filter with impulse response:

$$g^*(-t)|_{t=t_k} \quad (6.4)$$

The ideal transmit and receive filters in cascade form a raised cosine Nyquist filter, having a symbol waveform going through zero at symbol duration intervals, so there is no inter-symbol interference at any instant  $t = t_k$ , where  $t_k$  is the symbol time corresponding to the  $k$ -th symbol (as defined in clause 5).

In this case, the output of an ideal receive filter at any instant  $t_k$ , stimulated by an ideal transmitter, will be equal to the  $k$ -th modulation symbol  $S(k)$ :

$$Z(k) = s(t) * g^*(-t)|_{t=t_k} = S(k) \quad (6.5)$$

In this clause, the numbering of the modulation symbols used is the one defined in clause 9.

### 6.6.1.2 Vector error magnitude requirement at symbol time for phase modulation

Let  $Z(k)$  be the output produced by observing the real transmitter through the ideal receive filter at symbol time  $t_k \times Z(k)$  is modelled as:

$$Z(k) = \{C_0 + [S(k) + E(k)]\} C_1 W(k) \quad (6.6)$$

Where:

- $E(k)$  is the vector error of modulation symbol  $S(k)$ ;
- $W(k) = \exp(jk\Theta)$  accounts for a frequency offset giving  $\Theta$  radians per symbol phase rotation due to transmitter frequency inaccuracy (see clause 7). The possible amplitude variations shall be integrated in the vector error;
- $C_0$  is a complex constant characterizing the residual carrier;
- $C_1$  is a complex constant representing the output amplitude and initial phase of the transmitter.

The magnitude of  $C_0$  shall be less than 5 % of the magnitude of  $S(k)$ . The task of the test receiver is then to:

- estimate the symbol time for processing the receive part;
- estimate the values of  $C_0$ ,  $C_1$  and  $\Theta$ . The resulting estimates shall be denoted by  $C_0'$ ,  $C_1'$  and  $\Theta'$  respectively;
- perform a normalization of the modulation symbol  $Z(k)$  accordingly. The modulation symbol that results from this normalization shall be denoted by  $Z'(k)$ :

$$Z'(k) = \left[ Z(k) \exp(-jk\Theta') / C_1' \right] - C_0' \quad (6.7)$$

With the above notations, the Sum Square Vector Error (SSVE) is defined as:

$$SSVE = \sum_{k=1}^{SNmax} |Z'(k) - S(k)|^2 \quad (6.8)$$

Where  $SNmax$  is the number of symbols in the burst.

The RMS vector error is then computed as the square root of the sum-square vector error divided by the number of symbols in the burst:

$$RMSVE = \sqrt{SSVE / SNmax} \quad (6.9)$$

The RMS vector error in any burst shall be less than 0,1 and the peak vector error magnitude  $|Z'(k) - S(k)|$  shall be less than 0,3 for any symbol.

## 6.6.2 Receiver performance for phase modulation

### 6.6.2.0 General

This clause specifies the minimum required receiver performance in terms of Bit Error Ratio (BER), Message Erasure Rate (MER) or Probability of Undetected Erroneous Message (PUEM) (whichever is appropriate), taking into account that transmitter errors do not occur, and that the transmitter shall be tested separately (see clause 6.6.1).

In this clause, the levels of the test signals are given in terms of power levels (dBm) at the antenna connector of the receiver. For the definition of power level refer to clause 6.4.1.

Three equipment classes are specified, distinguishing their intended operating environments and testing conditions. The classes have preferred operating conditions, as follows:

- **Class B:** equipment is optimized for use in built-up and urban areas. The present document guarantees good performance at the reference sensitivity and interference level in static and TU50 conditions, but not in extreme propagation conditions (hilly terrain);
- **Class A:** equipment is optimized for use in urban areas and in areas with hilly or mountainous terrain. It is resilient to extreme propagation conditions (hilly terrain) and is specified in static, TU50 and HT200 conditions;
- **Class D:** equipment has the same performance requirements as class A for  $\pi/4$ -DQPSK modulation, and is further optimized to enhance the performance of  $\pi/8$ -D8PSK modulation in hilly or mountainous terrain using equalization or other techniques. It is resilient to extreme propagation conditions (hilly terrain) and is specified in static, TU50 and HT200 conditions;
- **Class E:** equipment comprises an equalizer and is specified for  $\pi/4$ -DQPSK modulation in static, TU50, HT200 (PACQ only) and EQ200 conditions. It is not applicable to BS equipment. Class E performance is specified only for  $\pi/4$ -DQPSK modulation.

### 6.6.2.1 Nominal error rates for phase modulation

#### 6.6.2.1.1 Nominal error rates for $\pi/4$ -DQPSK modulation

This clause describes the transmission requirements in terms of error ratios in nominal conditions i.e. without interference and with an input level of -85 dBm. The relevant propagation conditions are given in clause 6.8.

Under the following propagation conditions, the BER of the non-protected bits, equivalent to the TCH/7,2 shall have the limits given in table 6.28.

**Table 6.28: Nominal error rates**

| Propagation model | BER    | Equipment class |
|-------------------|--------|-----------------|
| STATIC            | 0,01 % | A, B, E         |
| TU50              | 0,4 %  | A, B, E         |
| HT200             | 3 %    | A               |
| EQ200             | 2 %    | E               |

This performance shall be maintained up to -40 dBm input level for the static conditions, and multipath conditions. Furthermore, for static conditions, a BER of < 0,1 % shall be maintained up to -20 dBm.

#### 6.6.2.1.2 Nominal error rates for $\pi/8$ -D8PSK modulation

This clause describes the transmission requirements in terms of error ratios in nominal conditions i.e. without interference and with an input level of -85 dBm. The relevant propagation conditions are given in clause 6.8.

Under the following propagation conditions, the BER of the non-protected bits, equivalent to the TCH-P8/10,8 shall have the limits given in table 6.29.

**Table 6.29: Nominal error rates**

| Propagation model | BER    | Equipment class |
|-------------------|--------|-----------------|
| STATIC            | 0,01 % | A, B, D         |
| TU50              | 0,4 %  | A, B, D         |
| HT200             | 5 %    | A, D            |

This performance shall be maintained up to -40 dBm input level for the static conditions, and multipath conditions. Furthermore, for static conditions, a BER of < 0,1 % shall be maintained up to -20 dBm.

## 6.6.2.2 Dynamic reference sensitivity performance for phase modulation

### 6.6.2.2.0 General

The minimum required dynamic reference sensitivity performance is specified according to the logical channel, the propagation condition and the receiver class at the dynamic reference sensitivity level. The dynamic reference sensitivity level shall be:

- for MS  $\pi/4$ -DQPSK modulation: -103 dBm;
- for MS  $\pi/8$ -D8PSK modulation: -97 dBm;
- for BS  $\pi/4$ -DQPSK modulation: -106 dBm;
- for BS  $\pi/8$ -D8PSK modulation: -100 dBm.

Tables 6.31 and 6.33a give the maximum permissible receiver MER or BER at dynamic reference sensitivity performance for TU50, HT200 or EQ200 propagation conditions with  $\pi/4$ -DQPSK modulation. For BSCH, SCH/HD, SCH/HU, SCH/F and BNCH, a PUEM <  $10^{-5}$  shall be achieved at the  $\pi/4$ -DQPSK dynamic reference sensitivity level. For AACH, a PUEM <  $10^{-4}$  shall be achieved at the  $\pi/4$ -DQPSK dynamic reference sensitivity level.

Tables 6.32 and 6.34 give the maximum permissible receiver MER or BER at dynamic reference sensitivity performance for TU50 or HT200 propagation conditions with  $\pi/8$ -D8PSK modulation. For SCH-P8/HD, SCH-P8/HU and SCH-P8/F, a PUEM <  $10^{-5}$  shall be achieved at the  $\pi/8$ -D8PSK dynamic reference sensitivity level.

### 6.6.2.2.1 BS receiver performance

Table 6.30 gives the maximum permissible receiver MER or BER at dynamic reference sensitivity performance with  $\pi/4$ -DQPSK modulation for frequencies below 300 MHz.

**Table 6.30: Maximum permissible BS receiver MER or BER at dynamic reference sensitivity level with  $\pi/4$ -DQPSK modulation for frequencies below 300 MHz**

| Logical channel | Error count type | Class A               |        | Class B               |
|-----------------|------------------|-----------------------|--------|-----------------------|
|                 |                  | Propagation condition |        | Propagation condition |
|                 |                  | TU50                  | HT200  | TU50                  |
| SCH/HU          | MER              | 10,5 %                | 11 %   | 10,5 %                |
| SCH/F           | MER              | 11 %                  | 11 %   | 9,2 %                 |
| TCH/7,2         | BER              | 2,5 %                 | 4 %    | 2,2 %                 |
| TCH/4,8 N = 1   | BER              | 4 %                   | 4 %    | 2,2%                  |
| TCH/4,8 N = 4   | BER              | 1,2 %                 | 4 %    | 1,2 %                 |
| TCH/4,8 N = 8   | BER              | 0,4 %                 | 4 %    | 0,06 %                |
| TCH/2,4 N = 1   | BER              | 1,2 %                 | 1,3 %  | 0,55 %                |
| TCH/2,4 N = 4   | BER              | 0,08 %                | 0,3 %  | 0,08 %                |
| TCH/2,4 N = 8   | BER              | 0,015 %               | 0,15 % | 0,015 %               |
| STCH            | MER              | 10,5 %                | 11 %   | 10,5 %                |

NOTE: N gives the interleaving depth in number of blocks (see clause 8).

Table 6.31 gives the maximum permissible receiver MER or BER at dynamic reference sensitivity performance with  $\pi/4$ -DQPSK modulation for frequencies above 300 MHz.

**Table 6.31: Maximum permissible BS receiver MER or BER at dynamic reference sensitivity level with  $\pi/4$ -DQPSK modulation for frequencies above 300 MHz**

| Logical channel | Error count type | Class A               |        | Class B               |
|-----------------|------------------|-----------------------|--------|-----------------------|
|                 |                  | Propagation condition |        | Propagation condition |
|                 |                  | TU50                  | HT200  | TU50                  |
| SCH/HU          | MER              | 8 %                   | 9,5 %  | 8 %                   |
| SCH/F           | MER              | 11 %                  | 11 %   | 8 %                   |
| TCH/7,2         | BER              | 2,5 %                 | 4 %    | 2,2 %                 |
| TCH/4,8 N = 1   | BER              | 4 %                   | 4 %    | 2 %                   |
| TCH/4,8 N = 4   | BER              | 1,2 %                 | 4 %    | 0,4 %                 |
| TCH/4,8 N = 8   | BER              | 0,4 %                 | 4 %    | 0,06 %                |
| TCH/2,4 N = 1   | BER              | 1,2 %                 | 1,3 %  | 0,35 %                |
| TCH/2,4 N = 4   | BER              | 0,02 %                | 0,3 %  | 0,01 %                |
| TCH/2,4 N = 8   | BER              | 0,01 %                | 0,15 % | 0,01 %                |
| STCH            | MER              | 9 %                   | 11 %   | 8 %                   |

NOTE: N gives the interleaving depth in number of blocks (see clause 8).

Table 6.32 gives the maximum permissible receiver MER or BER at dynamic reference sensitivity performance with  $\pi/8$ -D8PSK modulation. The performance with  $\pi/8$ -D8PSK modulation below 300 MHz is outside the scope of the present document.

**Table 6.32: Maximum permissible BS receiver MER or BER at dynamic reference sensitivity level with  $\pi/8$ -D8PSK modulation**

| Logical channel | Error count type | Class A, class D      |               |               | Class B               |

### 6.6.2.3 Receiver performance at reference interference ratios for Phase Modulation

#### 6.6.2.3.0 General

The minimum required reference interference performance (for co-channel,  $C/I_c$ , or adjacent channel,  $C/I_a$ ) is specified according to the logical channel, the propagation condition and the receiver class at the reference interference ratio. The reference interference ratio shall be, for BS and all types of MS for  $\pi/4$ -DQPSK modulation:

- for co-channel interference  $C/I_c = 19$  dB for MS and BS;
- for adjacent channel interference below 700 MHz  $C/I_a = -40$  dB for MS; and  
 $C/I_a = -45$  dB for BS;
- for adjacent channel interference above 700 MHz  $C/I_a = -40$  dB for MS and BS.

The reference interference ratio shall be, for BS and all types of MS for  $\pi/8$ -D8PSK modulation:

- for co-channel interference  $C/I_c = 25$  dB for MS and BS;
- for adjacent channel interference below 700 MHz  $C/I_a = -34$  dB for MS; and  
 $C/I_a = -39$  dB for BS;
- for adjacent channel interference above 700 MHz  $C/I_a = -34$  dB for MS and BS.

In case of co-channel interference these specifications apply for a wanted input signal level of -85 dBm, and in case of adjacent channel interference for a wanted input signal level 3 dB above the dynamic reference sensitivity level. In case of co-channel interference the interference shall be a continuous TETRA random signal of the same modulation type subjected to an independent realization of the same propagation condition as the wanted signal. In the case of adjacent channel interference the interference shall be a continuous TETRA random modulated signal of the same modulation type subjected to static propagation conditions.

In tables 6.36 and 6.39 the performance for TU50, HT200 or EQ200 propagation conditions is given for the reference interference level. For BSCH, SCH/HD, SCH/HU, SCH/F, BNCH, a PUEM  $< 10^{-5}$  shall be achieved at the  $\pi/4$ -DQPSK reference interference level. For AACH a PUEM  $< 10^{-4}$  shall be achieved at the  $\pi/4$ -DQPSK reference interference level.

In tables 6.37 and 6.40 the performance for TU50 or HT200 propagation conditions is given for the reference interference level. For SCH-P8/HD, SCH-P8/HU and SCH-P8/F, a PUEM  $< 10^{-5}$  shall be achieved at the  $\pi/8$ -D8PSK reference interference level.

## 6.6.2.3.1 BS receiver performance

Table 6.35 gives the maximum permissible receiver MER or BER at reference interference with  $\pi/4$ -DQPSK modulation for frequencies below 300 MHz.

**Table 6.35: Maximum permissible BS receiver MER or BER at reference interference level with  $\pi/4$ -DQPSK modulation for frequencies below 300 MHz**

| Logical channel | Error count type | Class A               |        | Class B               |

| TCH-P8/10,8     | BER              | 1,6 %                    | 4,5 %   | 3,5 %   | 3,5 %                       | 4,5 %   | 3,6 %   | 1,4 %                 |

NOTE 1: N gives the interleaving depth in number of blocks (see clause 8).  
NOTE 2: Class B receiver performance are for both Continuous and Discontinuous downlink mode.

#### 6.6.2.4 Static reference sensitivity performance for phase modulation

##### 6.6.2.4.0 General

The minimum required static reference sensitivity performance is specified according to the logical channel and the receiver class at the static reference sensitivity level. The static reference sensitivity level shall be:

- for MS  $\pi/4$ -DQPSK modulation: -112 dBm;
- for MS  $\pi/8$ -D8PSK modulation: -107 dBm;
- for BS  $\pi/4$ -DQPSK modulation: -115 dBm;
- for BS  $\pi/8$ -D8PSK modulation: -110 dBm.

Tables 6.41 and 6.43 give the minimum required reference sensitivity performance for  $\pi/4$ -DQPSK. For BSCH, SCH/HD, SCH/HU, SCH/F, BNCH, a PUEM  $< 10^{-5}$  shall be achieved at the static reference sensitivity level. For AACH a PUEM  $< 10^{-4}$  shall be achieved at the static reference sensitivity level.

Tables 6.42 and 6.44 give the minimum required reference sensitivity performance for  $\pi/8$ -D8PSK. For SCH-P8/HD, SCH-P8/HU, SCH-P8/F, a PUEM  $< 10^{-5}$  shall be achieved at the static reference sensitivity level.

##### 6.6.2.4.1 BS receiver performance

Table 6.41 gives the minimum required reference sensitivity performance for  $\pi/4$ -DQPSK.

**Table 6.41: Maximum permissible BS receiver MER or BER at static reference sensitivity level with  $\pi/4$ -DQPSK modulation**

| Logical channel | Error count type | Class A | Class B |
|-----------------|------------------|---------|---------|
| SCH/HU          | MER              | 3 %     | 3 %     |
| SCH/F           | MER              | 10 %    | 10 %    |
| TCH/7,2         | BER              | 3 %     | 4 %     |
| TCH/4,8 N = 1   | BER              | 3,3 %   | 0,3 %   |
| TCH/4,8 N = 4   | BER              | 1 %     | 0,2 %   |
| TCH/4,8 N = 8   | BER              | 0,4 %   | 0,2 %   |
| TCH/2,4 N = 1   | BER              | 0,2 %   | 0,01 %  |
| TCH/2,4 N = 4   | BER              | 0,01 %  | 0,01 %  |
| TCH/2,4 N = 8   | BER              | 0,01 %  | 0,01 %  |
| STCH            | MER              | 8 %     | 5 %     |

NOTE: N gives the interleaving depth in number of blocks (see clause 8).

Table 6.42 gives the minimum required reference sensitivity performance for  $\pi/8$ -D8PSK.

**Table 6.42: Maximum permissible BS receiver MER or BER at static reference sensitivity level with  $\pi/8$ -D8PSK modulation**

| Logical channel | Error count type | Class A, D | Class B |
|-----------------|------------------|------------|---------|
| SCH-P8/HU       | MER              | 4,5 %      | 4,3 %   |
| SCH-P8/F        | MER              | 9,3 %      | 9,3 %   |
| TCH-P8/10,8     | BER              | 3,8 %      | 3,1 %   |

#### 6.6.2.4.2 MS receiver performance

Table 6.43 gives the minimum required reference sensitivity performance for  $\pi/4$ -DQPSK.

**Table 6.43: Maximum permissible MS receiver MER or BER at static reference sensitivity level**

| Logical channel | Error count type | Continuous downlink mode | Discontinuous downlink mode | Class B |
|-----------------|------------------|--------------------------|-----------------------------|---------|
|                 |                  | Class A, E               | Class A                     |         |
| AACH            | MER              | 28 %                     | 28 %                        | 38 %    |
| BSCH            | MER              | 3 %                      | 3 %                         | 3 %     |
| SCH/HD          | MER              | 2,5 %                    | 8 %                         | 5 %     |
| BNCH            | MER              | 2,5 %                    | 8 %                         | 5 %     |
| SCH/F           | MER              | 4,5 %                    | 9 %                         | 9 %     |
| TCH/7,2         | BER              | 3,5 %                    | 3,5 %                       | 4 %     |
| TCH/4,8 N = 1   | BER              | 0,3 %                    | 2 %                         | 0,3 %   |
| TCH/4,8 N = 4   | BER              | 0,2 %                    | 0,8 %                       | 0,2 %   |
| TCH/4,8 N = 8   | BER              | 0,15 %                   | 0,4 %                       | 0,15 %  |
| TCH/2,4 N = 1   | BER              | 0,01 %                   | 0,01 %                      | 0,01 %  |
| TCH/2,4 N = 4   | BER              | 0,01 %                   | 0,01 %                      | 0,01 %  |
| TCH/2,4 N = 8   | BER              | 0,01 %                   | 0,01 %                      | 0,01 %  |
| STCH            | MER              | 2,5 %                    | 8 %                         | 5 %     |

NOTE 1: N gives the interleaving depth in number of blocks (see clause 8).  
NOTE 2: Class B receiver performance are for both Continuous and Discontinuous downlink mode.

Table 6.44 gives the minimum required reference sensitivity performance for  $\pi/8$ -D8PSK.

**Table 6.44: Maximum permissible MS receiver MER or BER at static reference sensitivity level with  $\pi/8$ -D8PSK modulation**

| Logical channel | Error count type | Continuous downlink mode | Discontinuous downlink mode | Class B |
|-----------------|------------------|--------------------------|-----------------------------|---------|
|                 |                  | Class A, D               | Class A, D                  |         |
| SCH-P8/HD       | MER              | 5,6 %                    | 5,6 %                       | 1,6 %   |
| SCH-P8/F        | MER              | 10 %                     | 10 %                        | 9,3 %   |
| TCH-P8/10,8     | BER              | 3,9 %                    | 3,9 %                       | 3,2 %   |

NOTE: Class B receiver performance are for both Continuous and Discontinuous downlink modes.

### 6.6.2.5 MS receiver performance for synchronization burst acquisition

This clause specifies reference sensitivity performance of a MS receiver for the acquisition of the phase modulation Synchronization (sub) Burst (SB), refer to table 6.45. The performance is defined in terms of the probability PACQ of detecting a single transmitted SB and correctly decoding its BSCH information for the condition where the MS is listening on the frequency while the SB is transmitted and where the MS is already frequency synchronized but not synchronized in terms of time slots.

**Table 6.45: MS receiver performance for synchronization burst acquisition**

| Propagation condition/eq. class  | TU50/class B | HT200/class A, E |
|--|--------------|------------------|
| PACQ   | 0,8          | 0,8              |
| NOTE: This specification applies for continuous and discontinuous downlink mode. |              |                  |

## 6.7 Transmitter/receiver performance for QAM

### 6.7.0 General

Clause 6.7.1 specifies the modulation accuracy requirement, by setting limits on the Root Mean Square (RMS) error between the actual transmitted signal waveform and the ideal signal waveform. Clause 6.7.2 specifies the receiver performance, assuming that transmit errors do not occur. Clause 6.8 specifies all the propagation models that are defined in the present document.

### 6.7.1 Transmitter performance for QAM

#### 6.7.1.1 Modulation accuracy for QAM

The specified requirement is vector error magnitude; this does not only take into account modulation filtering linear distortion (amplitude and phase) or modulator impairments (quadrature offset, phase and linear amplitude errors in the modulation symbol constellation) but is a measure of the whole transmitter quality. It also takes into account local oscillator phase noise, filter distortion, non-linearity of amplifiers and overlap of sub-carriers. Vector error magnitude is specified at symbol time (see clause 6.7.1.2) and the vector error magnitude requirement shall be fulfilled by the TETRA QAM equipment over all sub-carriers within the channel bandwidth with maximum and with minimum power levels (as defined in clause 6.4.8).

The modulation symbol  $s_m(t)$  transmitted on an individual sub-carrier  $m$  by an ideal transmitter having a filter impulse response  $g(t)$  is defined in clause 5.16.

Let  $Z_m(k)$  denote the output of an ideal sub-carrier receive filter with impulse response:

$$g^*(-t)\Big|_{t=t_k} \quad (6.10)$$

The ideal sub-carrier transmit and receive filters in cascade form a raised cosine Nyquist filter, having a sub-carrier symbol waveform going through zero at symbol duration intervals, so there is no inter-symbol interference at any instant  $t = t_k$ , where  $t_k$  is the symbol time corresponding to the  $k$ -th symbol (as defined in clause 5.16). In the frequency domain, the ideal sub-carrier transmit and receive filters have a bandwidth slightly greater than the sub-carrier spacing, so there is some sub-carrier overlap and limited inter-sub-carrier-symbol interference.

In this case, the output of an ideal sub-carrier receive filter at any instant  $t_k$ , stimulated by an ideal transmitter, will be equal to the  $k$ -th modulation symbol  $S_m(k)$  for the associated sub-carrier  $SC_m$ :

$$Z_m(k) = s_m(t) * g^*(-t)\Big|_{t=t_k} = S_m(k) + I_m(k) \quad (6.11)$$

where  $I_m(k)$  is the inter-sub-carrier-symbol interference.

In this clause, the numbering of the modulation symbols used is the one defined in clause 9 for QAM.

### 6.7.1.2 Vector error magnitude requirement at symbol time for QAM

Let  $Z_m(k)$  for an individual sub-carrier  $m$  be the output produced by observing the real transmitter through the ideal sub-carrier receive filter at symbol time  $t_k$ .  $Z_m(k)$  is modelled as:

$$Z_m(k) = \{S_m(k) + E_m(k)\}C_m W(k) \quad (6.12)$$

Where:

- $E_m(k)$  is the vector error of modulation symbol  $S_m(k)$  on sub-carrier  $m$ ;
- $W(k)$  accounts for phase and amplitude variations common to all sub-carriers as a function of symbol number  $k$ ;
- $C_m$  is a complex constant representing the output amplitude and initial phase of the transmitter, characterized for the initial sync symbols on the  $m$ -th sub-carrier.

The task of the test receiver is then to:

- estimate the symbol time for processing the receive part;
- estimate the values of  $C_m$  from all sync and pilot symbols on each sub-carrier  $m$ ;
- estimate the values of  $W(k)$  as a best fit for all pilot symbols in the burst;
- estimate the values of  $W(k)$  across the burst in time by interpolation. The resulting estimates shall be denoted by  $W'(k)$  respectively;
- perform a normalization of the modulation symbol  $Z_m(k)$  accordingly. The modulation symbol that results from this normalization shall be denoted by  $Z'_m(k)$ :

$$Z'_m(k) = \left[ Z_m(k) / (C_m W'(k)) \right] \quad (6.13)$$

With the above notations, the Sum Square Vector Error (SSVE) is defined as:

$$SSVE = \sum_{m=0}^{M-1} \sum_{k=1}^{SN_{max}} \left| Z'_m(k) - S_m(k) \right|^2 \quad (6.14)$$

where  $SN_{max}$  is the number of symbols per sub-carrier in the burst and  $M$  is the number of sub-carriers.  $S_m(k)$  includes pilot and sync sub-carrier symbols.

The RMS vector error across all sub-carriers is then computed as the square root of the sum-square vector error divided by the total number of sub-carrier symbols in the burst including pilot and sync sub-carrier symbols:

$$RMSVE = \sqrt{SSVE / (M \times SN_{max})} \quad (6.15)$$

The RMS vector error in any burst shall be less than 0,1.

NOTE 1: It is recommended that the transmitter's RMS vector error in 64-QAM  $r = 1$  bursts should be significantly less than 0,1 (e.g. 0,04 to 0,06).

Additional tasks of the test receiver are to:

- Calculate  $\theta(k)$ , the difference in phase of  $W'(k)$  between successive symbols:

$$\theta(k) = \arg(W'(k)) - \arg(W'(k+1)) \text{ for } k = 1 \text{ to } (SN_{max} - 1) \quad (6.16)$$

- Calculate the mean frequency error  $df_{mean}$  over the burst:

$$df_{mean} = 1 / (2\pi T \cdot (SN_{max} - 1)) \sum_{k=1}^{SN_{max}-1} \theta(k) \quad (6.17)$$

where:

$df_{mean}$  is expressed in Hz and  $T$  is the symbol duration in s;

- Calculate the peak frequency error  $df_{peak}$  over the burst:

$$df_{peak} = 1/(2\pi T)\theta(k) \text{ for the greatest absolute value of } \theta(k) \quad (6.18)$$

NOTE 2: In the present clause identifier " $SN_{max}$ " is used instead of "SNmax" used elsewhere.

## 6.7.2 Receiver performance for QAM

### 6.7.2.0 General

This clause specifies the minimum required receiver performance in terms of Bit Error Ratio (BER), Message Erasure Rate (MER) or Probability of Undetected Erroneous Message (PUEM) (whichever is appropriate), taking into account that transmitter errors do not occur, and that the transmitter shall be tested separately (see clause 6.7.1).

In this clause, the levels of the test signals are given in terms of power levels (dBm) at the antenna connector of the receiver. For the definition of power level refer to clause 6.4.8.

The performance below 300 MHz is outside the scope of the present document.

NOTE: The multicarrier QAM is tolerant to the most of the propagation effects down to 138 MHz, but deep slow fading may increase MER above the values defined for frequencies above 300 MHz.

### 6.7.2.1 Nominal error rates for QAM

For SCH-Q/RA, SCH-Q/HU, SCH-Q/U, SCH-Q/D, SCH-Q/B, BNCH-Q and BSCH-Q a PUEM  $< 10^{-5}$  shall be achieved at the dynamic reference sensitivity level. For AACH-Q, a PUEM  $< 5 \times 10^{-4}$  shall be achieved at the dynamic reference sensitivity levels.

For QAM the nominal error rates for non-protected bits are outside the scope of the present document.

For static conditions, an MER less than 10 % shall be maintained up to -20 dBm on 4-QAM  $r=1/2$  and 16-QAM  $r=1/2$  channels.

### 6.7.2.2 Dynamic reference sensitivity performance for QAM

The minimum required dynamic reference sensitivity performance is specified according to the logical channel, the propagation condition, coding rate, modulation and channel bandwidth.

Tables 6.46, 6.47 and 6.48 specify dynamic reference sensitivity for frequencies below 700 MHz for 4-QAM, 16-QAM and 64-QAM respectively.

Table 6.49 specifies the maximum permissible receiver MER for frequencies below 700 MHz at dynamic reference sensitivities specified in tables 6.46, 6.47 and 6.48.

Tables 6.50, 6.51 and 6.52 specify dynamic reference sensitivity for frequencies above 700 MHz for 4-QAM, 16-QAM and 64-QAM respectively.

Table 6.53 specifies the maximum permissible receiver MER for frequencies above 700 MHz at dynamic reference sensitivities specified in tables 6.50, 6.51 and 6.52.

**Table 6.46: 4-QAM BS and MS dynamic reference sensitivity for frequencies below 700 MHz**

| Channel BW | BS, $r = 1/2$ | MS, $r = 1/2$ |
|------------|---------------|---------------|
| 25 kHz     | -111 dBm      | -108 dBm      |
| 50 kHz     | -108 dBm      | -105 dBm      |
| 100 kHz    | -105 dBm      | -102 dBm      |
| 150 kHz    | -104 dBm      | -101 dBm      |

Table 6.47: 16-QAM BS and MS dynamic reference sensitivity for frequencies below 700 MHz

| Channel BW | BS, $r = 1/2$ | MS, $r = 1/2$ |
|------------|---------------|---------------|
| 25 kHz     | -106 dBm      | -103 dBm      |
| 50 kHz     | -102 dBm      | -100 dBm      |
| 100 kHz    | -100 dBm      | -97 dBm       |
| 150 kHz    | -99 dBm       | -96 dBm       |

Table 6.48: 64-QAM BS and MS dynamic reference sensitivity for frequencies below 700 MHz

| Channel BW | BS, $r = 1/2$ | BS, $r = 2/3$ | MS, $r = 1/2$ | MS, $r = 2/3$ |
|------------|---------------|---------------|---------------|---------------|
| 25 kHz     | -101 dBm      | -98 dBm       | -98 dBm       | -95 dBm       |
| 50 kHz     | -98 dBm       | -94 dBm       | -95 dBm       | -91 dBm       |
| 100 kHz    | -95 dBm       | -92 dBm       | -92 dBm       | -88 dBm       |
| 150 kHz    | -94 dBm       | -91 dBm       | -91 dBm       | -87 dBm       |

Table 6.49: Maximum permissible MS and BS receiver MER at dynamic reference sensitivity level for frequencies below 700 MHz

| Type of channel | Payload modulation | BS/MS | Code rate | 25 kHz |        | 50 kHz |       | 100 kHz |       | 150 kHz |        |
|-----------------|--------------------|-------|-----------|--------|--------|--------|-------|---------|-------|---------|--------|
|                 |                    |       |           | TU50   | HT200  | TU50   | HT200 | TU50    | HT200 | TU50    | HT200  |
| SCH-Q/RA        | 4-QAM              | BS    | 1/2       | 11,1 % | 7,4 %  | -      | -     | -       | -     | -       | -      |
| SICH-Q/U in CB  | 4-QAM              | BS    | 1/2       | 5,5 %  | 1,8 %  | 3,6 %  | 1,6 % | 3,8 %   | 1,2 % | 5,3 %   | 2,0 %  |

### 6.7.2.3 Receiver performance at reference interference ratios for QAM

#### 6.7.2.3.1 Adjacent channel interference

The minimum required reference adjacent channel interference performance is specified in table 6.54 according to the wanted signal channel bandwidth.

**Table 6.54: Adjacent channel interferer frequency offsets and mean power levels for QAM**

| QAM Channel bandwidth | TETRA $\pi/4$ -DQPSK Interferer offset from $f_o$ | TETRA $\pi/4$ -DQPSK Interferer level for MS | TETRA $\pi/4$ -DQPSK Interferer level for BS |
|-----------------------|---|--|--|
| 25 kHz                | 25 kHz  | -63 dBm                                      | -62 dBm                                      |
| 50 kHz                | 37,5 kHz  | -65 dBm                                      | -65 dBm                                      |
| 100 kHz               | 62,5 kHz  | -65 dBm                                      | -65 dBm                                      |
| 150 kHz               | 87,5 kHz  | -65 dBm                                      | -65 dBm                                      |

The static reference sensitivity performance as specified in clause 6.7.2.4 shall be met when the following signals are simultaneously input to the receiver:

- a wanted signal at the nominal receive frequency  $f_o$ , 3 dB above the static reference sensitivity level as specified in clause 6.7.2.4; and
- a TETRA  $\pi/4$ -DQPSK random modulated continuous signal at a frequency offset from  $f_o$  and level as defined in table 6.54.

#### 6.7.2.3.2 Co-channel interference

The minimum required reference co-channel interference performance is specified according to channel bandwidth, modulation, coding rate and propagation conditions. For BS co-channel interference ratio is defined for SCH-Q/U logical channel. For MS co-channel interference ratio is defined for SCH-Q/D logical channel. Co-channel interference specifications apply for a wanted input signal level of 25 dB above dynamic reference sensitivity (as specified in tables 6.50, 6.51, 6.52, 6.46, 6.47 and 6.48).

Table 6.55 defines co-channel interference ratios  $C/I_c$ , for frequencies below 700 MHz. Table 6.56 defines co-channel interference ratios  $C/I_c$ , for frequencies above 700 MHz. The maximum permissible MER for reference co-channel interference ratios is 10 %.

**Table 6.55: BS and MS minimum dynamic reference interference ratio ( $C/I_c$  for 10 % MER) for frequencies below 700 MHz**

| Modulation | $r = 1/2$<br>TU50 | $r = 1/2$<br>HT200 | $r = 2/3$<br>TU50 | $r = 2/3$<br>HT200 |
|------------|-------------------|--------------------|-------------------|--------------------|
| 4-QAM      | 14 dB             | 12 dB              | -                 | -                  |
| 16-QAM     | 19 dB             | 17 dB              | -                 | -                  |
| 64-QAM     | 23 dB             | 22 dB              | 27 dB             | 26 dB              |

**Table 6.56: BS and MS minimum dynamic reference interference ratio ( $C/I_c$  for 10 % MER) for frequencies above 700 MHz**

| Modulation | $r = 1/2$<br>TU50 | $r = 1/2$<br>HT200 | $r = 2/3$<br>TU50 | $r = 2/3$<br>HT200 |
|------------|-------------------|--------------------|-------------------|--------------------|
| 4-QAM      | 14 dB             | 12 dB              | -                 | -                  |
| 16-QAM     | 19 dB             | 17 dB              | -                 | -                  |
| 64-QAM     | 24 dB             | 23 dB              | 27 dB             | 29 dB              |

### 6.7.2.4 Static reference sensitivity performance for QAM

The minimum required static reference sensitivity performance for MS is specified in table 6.57.

**Table 6.57: QAM Sensitivity levels for MS**

| Channel BW | 4-QAM 3 %<br>BER Sensitivity | 16-QAM 3 %<br>BER Sensitivity | 64-QAM 3 %<br>BER Sensitivity |
|------------|------------------------------|-------------------------------|-------------------------------|
| 25 kHz     | -113 dBm                     | -106 dBm                      | -101 dBm                      |
| 50 kHz     | -110 dBm                     | -103 dBm                      | -97 dBm                       |
| 100 kHz    | -107 dBm                     | -100 dBm                      | -95 dBm                       |
| 150 kHz    | -105 dBm                     | -99 dBm                       | -93 dBm                       |

The minimum required static reference sensitivity performance for BS is specified in table 6.58.

**Table 6.58: QAM Sensitivity levels for BS**

| Channel BW | 4-QAM 3 %<br>BER Sensitivity | 16-QAM 3 %<br>BER Sensitivity | 64-QAM 3 %<br>BER Sensitivity |
|------------|------------------------------|-------------------------------|-------------------------------|
| 25 kHz     | -116 dBm                     | -109 dBm                      | -104 dBm                      |
| 50 kHz     | -113 dBm                     | -106 dBm                      | -100 dBm                      |
| 100 kHz    | -110 dBm                     | -103 dBm                      | -98 dBm                       |
| 150 kHz    | -108 dBm                     | -102 dBm                      | -96 dBm                       |

### 6.7.2.5 MS receiver performance for frequency correction burst acquisition on a DA cell

This clause specifies reference sensitivity performance of a MS receiver for the acquisition of the QAM Frequency Correction Burst (FCB), refer to table 6.59. The performance is defined in terms of the probability PACQ of detecting a single transmitted FCB and correctly decoding its BSCH-Q information for the condition where the MS is listening on the frequency while the FCB is transmitted and where the MS is already frequency synchronized but not synchronized in terms of time slots.

**Table 6.59: MS receiver performance for frequency correction burst acquisition on a DA cell**

| Propagation condition | TU50 | HT200 |
|-----------------------|------|-------|
| PACQ                  | 0,8  | 0,8   |

## 6.8 Propagation conditions

### 6.8.0 General

The following clauses contain all necessary information on the propagation models that are referred to in the present document.

#### 6.8.1 Propagation conditions - introduction

Radio wave propagation in the mobile radio environment is described by dispersive multipath caused by reflection, diffraction and scattering. Different paths may exist between a BS and a MS due to large distant reflectors and/or scatterers and due to scattering in the vicinity of the mobile, giving rise to a number of partial waves arriving with different amplitudes and delays. Since the mobile will be moving, a Doppler shift is associated with each partial wave, depending on the mobile's velocity and the angle of incidence. The delayed and Doppler shifted partial waves interfere at the receiver causing frequency and time selective fading on the transmitted signal.

When system bandwidth and propagation path lengths are sufficiently small (which is the case for TETRA), the resulting frequency and time selective fading process may be simulated by a simplified propagation model. Such a model exhibits only a few discrete paths which are independently fading. For practical channel simulation, stationary Gaussian processes with a power density spectrum equal to the classical Doppler spectrum are commonly assumed.

Based on extensive investigations (Digital Land Mobile Radiocommunications, M. Failli (Ed.), Final Report 14.3.1984-13.9.1988, published by European Commission, Directorate of General Telecommunication, Information Industries and Innovation. Luxembourg. ISBN 92-825-9946-9. (1989) [i.17]) some tapped delay line models which are typical for urban, rural, or hilly area propagation conditions or for quasi-synchronous operation were derived. These models are defined in the following terms (see also table 6.60):

- number of discrete taps;
- relative delay of each tap;
- average relative power of the complex tap-gain process of each tap;
- type of the complex tap-gain process of each tap.

All stochastic tap-gain processes are mutually statistically independent.

## 6.8.2 Tap-gain process types

This clause defines the statistical properties of the stationary complex tap-gain processes, to be applied for the propagation models, in terms of a Probability Density Function (PDF) and a Power Density Spectrum (PDS) which models the Doppler spectrum. The complex tap-gain processes, denoted by  $a(t)$  and defined hereunder, are normalized to unity power.

CLASS is the tap-gain process having a PDS equal to the classical Doppler spectrum. The real and imaginary parts of  $a(t)$  exhibit an identical Gaussian PDF, an identical PDS and are mutually statistically independent. Hence  $|a(t)|$  is Rayleigh distributed. The PDS of  $a(t)$  is defined by:

$$S(f) = S_{CLASS}(f, f_d) = \frac{1}{\pi f_d \sqrt{1 - (f/f_d)^2}} \quad \text{for } -f_d < f < f_d, \text{ and}$$

$$S(f) = 0 \quad \text{elsewhere} \quad (6.19)$$

Where the parameter  $f_d$  represents the maximum Doppler shift (in Hz), defined as  $f_d = v/\lambda$  with the vehicle speed  $v$  (in m/s) and the wavelength  $\lambda$  (in m).

$STATIC(f_s)$  is a tap-gain process with a constant magnitude  $|a(t)| = 1$ . The PDS of  $a(t)$  is defined by:

$$S(f) = S_{STATIC}(f, f_s) = \delta(f - f_s) \quad (6.20)$$

Where  $\delta(\cdot)$  represents the Dirac delta function and  $f_s$  the Doppler shift (in Hz).

$RICE$  is a tap-gain process which is the sum process of the two processes  $CLASS$  and  $STATIC(f_s)$ , with  $f_s = 0,7 f_d$ , each contributing half of the total power. Hence  $|a(t)|$  is Rician distributed and the PDS is:

$$S(f) = S_{RICE}(f, f_d) = 0,5 S_{CLASS}(f, f_d) + 0,5 S_{STATIC}(f, 0,7 f_d) \quad (6.21)$$

## 6.8.3 Propagation models

In this clause, the propagation models that are referred to in the present document are defined. For Phase modulation three models are used TU50, HT200 and EQ200, refer to table 6.60. For QAM two models are used: TU50 and HT200 refer to table 6.61. For Phase modulation the vehicle speed  $x$  (in km/h), which affects  $f_d$  (see clause 6.8.2), is attributed to the model designation in the frequency range 380 MHz to 520 MHz (e.g. HT200 means Hilly Terrain for 200 km/h in the 380 MHz to 520 MHz frequency range).

For Phase Modulation to keep the Doppler shift constant relative to 430 MHz, for frequencies outside the 380 MHz to 520 MHz range, for testing purposes only, the vehicle speed in the model is adjusted according the formula:

- $v = 20 \text{ [Hz]} \times \lambda \text{ [m]}$ , when TU50 is specified;
- $v = 80 \text{ [Hz]} \times \lambda \text{ [m]}$ , when HT200 and EQ200 are specified.

NOTE:  $x = v \times 3,6$ .

**Table 6.60: Propagation models for Phase Modulation**

| Propagation model    | Tap number | Relative delay ( $\mu\text{s}$ ) | Average relative power (dB) | Tap-gain process |
|----------------------|------------|----------------------------------|-----------------------------|------------------|
| Static               | 1          | 0                                | 0                           | STATIC(0)        |
| Rural Area (RAx)     | 1          | 0                                | 0                           | RICE             |
| Typical Urban (TUx)  | 1          | 0                                | 0                           | CLASS            |
|                      | 2          | 5                                | -22,3                       | CLASS            |
| Bad Urban (BUx)      | 1          | 0                                | 0                           | CLASS            |
|                      | 2          | 5                                | -3,0                        | CLASS            |
| Hilly Terrain (HTx)  | 1          | 0                                | 0                           | CLASS            |
|                      | 2          | 15                               | -8,6                        | CLASS            |
| Equalizer Test (EQx) | 1          | 0                                | 0                           | CLASS            |
|                      | 2          | 11,6                             | 0                           | CLASS            |
|                      | 3          | 73,2                             | -10,2                       | CLASS            |
|                      | 4          | 99,3                             | -16                         | CLASS            |

**Table 6.61: Propagation models for QAM**

| Propagation model   | Tap number | Relative delay ( $\mu\text{s}$ ) | Average relative power (dB) | Tap-gain process |
|---------------------|------------|----------------------------------|-----------------------------|------------------|
| Typical Urban (TUx) | 1          | 0,0                              | -3,0                        | CLASS            |
|                     | 2          | 0,2                              | 0,0                         | CLASS            |
|                     | 3          | 0,6                              | -2,0                        | CLASS            |
|                     | 4          | 1,6                              | -6,0                        | CLASS            |
|                     | 5          | 2,4                              | -8,0                        | CLASS            |
|                     | 6          | 5,0                              | -10,0                       | CLASS            |
| Hilly Terrain (HTx) | 1          | 0,0                              | 0,0                         | CLASS            |
|                     | 2          | 0,2                              | -2,0                        | CLASS            |
|                     | 3          | 0,4                              | -4,0                        | CLASS            |
|                     | 4          | 0,6                              | -7,0                        | CLASS            |
|                     | 5          | 15,0                             | -6,0                        | CLASS            |
|                     | 6          | 17,2                             | -12,0                       | CLASS            |

## 7 Radio sub-system synchronization

### 7.1 Introduction

Clauses 7.2 to 7.8 define the requirements for synchronization on the TETRA V+D radio sub-system, for carrier frequencies of between 300 MHz and 1 GHz. It does not define the synchronization algorithms to be used in the BS and MS. These are up to the manufacturer to specify.

### 7.2 General description of synchronization system

This clause gives a general description of the synchronization system. Detailed requirements are given in the subsequent clauses.

The BS sends signals on the BSCH to enable an MS to synchronize itself to a phase modulation channel and if necessary correct its frequency standard to be in line with that of the BS. The BS sends signals on the BSCH-Q to enable an MS to synchronize itself to a QAM channel on a DA cell and if necessary correct its frequency standard to be in line with that of the BS. The signals sent by the BS for these purposes are frequency correction signals and synchronization signals.

The timings of timeslots, TDMA frames and multiframe are all related to a common set of counters which run continuously whether the MS and BS are transmitting or not (see clauses 7.3 and 7.5). Thus, once the MS has determined the correct setting of these counters, all its processes are synchronized to the current serving BS.

The MS has to time its transmissions to the BS in line with those received from the BS. This process is called "mobile timebase adjustment".

### 7.3 Timebase counters for phase modulation

#### 7.3.1 Timing counters for phase modulation

The timing state of the signals transmitted by a BS or MS shall be defined by the following counters:

- Symbol Number ( $SN$ )(1 - 255);
- Timeslot Number ( $TN$ )(1 - 4);
- TDMA Frame Number ( $FN$ )(1 - 18);
- TDMA Multiframe Number ( $MN$ )(1 - 60).

NOTE:  $SN0$  indicates the last symbol of the previous timeslot, i.e.  $SN0$  equals  $SN255$  of the previous timeslot.

#### 7.3.2 Values of the counters for phase modulation

The relationship between these counters shall be as follows:

- $SN$  increments every  $500/9 \mu\text{s}$  (for an MS, this holds unless otherwise required by the mobile timebase adjustment);
- $TN$  increments at the beginning of each timeslot (at symbol time of  $SN0$  of the downlink for a continuous downlink transmission);
- $FN$  increments whenever  $TN$  changes from count 4 to 1;
- $MN$  increments whenever  $FN$  changes from 18 to 1.

The simultaneous change of state of all counters to 1 defines the timebase reference. This timebase reference takes into account the offset required in the case of MCCH sharing ( $\pm 18$  frames).

## 7.4 Timing of phase modulation signals

The timing of modulation symbols transmitted by the MS and BS is defined in clause 9.

The MS may use the timing of receipt of the synchronization burst to set-up its timebase counters. If it does, it shall do so as follows:

- the value of  $TN$  shall be read from the BSCH, when received. In any other case, augmentation of  $TN$  shall be given by:

$$TN: = TN \bmod (4) + 1 \quad (7.1)$$

- the value of  $FN$  shall be read from the BSCH, when received. In any other case, augmentation of  $FN$  shall be given by:

$$FN: = FN \bmod (18) + 1 \quad (7.2)$$

- the value of  $MN$  is read from the BSCH, when received. In any other case, augmentation of  $MN$  shall be given by:

$$MN: = MN \bmod (60) + 1 \quad (7.3)$$

When BSs that differ from the current serving BS are being monitored for call re-establishment or handover purposes, the MS may choose to store the values of  $TN$ ,  $FN$  and  $MN$  for all the BSs whose synchronization bursts have been detected relative to  $TN$ ,  $FN$  and  $MN$  for its current serving BS.

## 7.5 Timebase counters for QAM

### 7.5.1 Timing counters for QAM

The timing state of the signals transmitted by a BS or MS on a QAM channel shall be defined by the following counters:

- QAM Symbol Number ( $SN-Q$ )( $I - 34$ );
- Timeslot Number ( $TN$ )( $I - 4$ );
- TDMA Frame Number ( $FN$ )( $I - 18$ );
- TDMA Multiframe Number ( $MN$ )( $I - 60$ ).

### 7.5.2 Values of the counters for QAM

The relationship between these counters shall be as follows:

- $SN-Q$  increments every 5/12 msec (for an MS, this holds unless otherwise required by the mobile timebase adjustment);
- $TN$  increments at the beginning of each timeslot (at symbol time of  $SN-QI$  on the downlink);
- $FN$  increments whenever  $TN$  changes from count 4 to 1;
- $MN$  increments whenever  $FN$  changes from 18 to 1.

The simultaneous change of state of all counters to 1 defines the timebase reference.

## 7.6 Timing of QAM signals

The timing of modulation symbols transmitted by the MS and BS on a QAM channel is defined in clause 9.

The initial values of the *TN*, *FN* and *MN* counters are transmitted by the BS only in a synchronization burst on phase modulated channels and in a FCB on QAM channels as defined in clause 9. In the case of a CA MS these counters can be initialized by the MS only when the MS is on a phase modulated channel.

On a QAM channel, a CA MS shall set-up its timebase counters as follows:

- *SN-Q* shall be set by the timing of the synchronization symbols.
- The value of *TN*, *FN* and *MN* shall be retained from the values read from the BSCH on one of the phase modulated channels of the BS. While being on a QAM channel, the MS shall update *TN*, *FN* and *MN* as defined in clause 7.4 and clause 7.5.2.

On a QAM channel a DA MS may set *SN-Q* by the timing of the synchronization symbols. A DA MS may use the timing of receipt of the FCB to set-up its timebase counters. If it does, it shall do so as follows:

- the value of *TN* shall be read from the BSCH-Q, when received. In any other case, augmentation of *TN* shall be given by:

$$TN: = TN \bmod (4) + 1 \quad (7.4)$$

- the value of *FN* shall be read from the BSCH-Q, when received. In any other case, augmentation of *FN* shall be given by:

$$FN: = FN \bmod (18) + 1 \quad (7.5)$$

- the value of *MN* is read from the BSCH-Q, when received. In any other case, augmentation of *MN* shall be given by:

$$MN: = MN \bmod (60) + 1 \quad (7.6)$$

NOTE: FCB is not necessarily sent on QAM carriers other than the DA main carrier.

When BSs that differ from the current serving BS are being monitored for call re-establishment or handover purposes, the MS may choose to store the values of *TN*, *FN* and *MN* for all the BSs whose FCBs have been detected relative to *TN*, *FN* and *MN* for its current serving BS.

## 7.7 BS requirements for synchronization

The BS shall use a single frequency source with accuracy better than  $\pm 0,2$  ppm ( $\pm 0,1$  ppm for frequencies above 520 MHz) for both RF frequency generation and clocking the timebase. The same source shall be used for all carriers of the BS.

It is optional whether the timebase counters of different BSs are synchronized together.

The channels of different carriers transmitted by a BS shall be synchronized together, i.e. controlled by the same set of counters. The timing difference between the start of timeslots transmitted on different carriers shall be less than  $125/9$   $\mu$ s. This includes carriers that are carrying eccentric channels.

NOTE 1: When the MS moves to an eccentric channel within the cell, the timing difference seen by the MS depends additionally on the difference between its distance from the eccentric channel's transmitter site and its distance from the main carrier's transmitter site.

The present document supports up to a maximum separation of 4 km between an eccentric channel's transmitter site and the main carrier's transmitter site.

Additionally, the BS shall not send a channel allocation to an MS that is using an eccentric channel allocating the MS to another eccentric channel on the same cell where the separation between the transmitter sites of the two eccentric channels is more than 4 km.

In case of timesharing of the same carrier by different BSs, the timing difference between the timebase references of two any such BS shall be less than  $250/9 \mu\text{s}$ .

When the neighbour cell information broadcast indicates that the cells are synchronized, then the timing difference between the start of timeslots transmitted by those BSs should be less than  $250/9 \mu\text{s}$ . TDMA frame synchronization and offset is defined in clause 18.5.23.

NOTE 2: The timing difference seen by MSs depends additionally on the distances to the basestations.

The timing of any QAM channels used by a CA cell shall be synchronized to the timing of the phase modulated channels. This shall be done so that:

- The start of timeslots on QAM channels shall be synchronized with the start of timeslots on phase modulated channels of the BS. This means that for continuous downlink transmission, the symbol time of *SN-QI* on QAM channels shall be coincident with the symbol time of *SNO* (*SN255* of the previous timeslot) on phase modulated channels of that BS;
- *TN*, *FN* and *MN* shall be synchronized for QAM channels and phase modulated channels of the BS.

The timing of any phase modulated channels used by a DA cell shall be synchronized to the timing of QAM channels. This shall be done so that:

- The start of timeslots on phase modulated channels shall be synchronized with the start of timeslots on QAM channels of the BS. This means that for continuous downlink transmission, the symbol time of *SNO* (*SN255* of the previous timeslot) on phase modulated channels shall be coincident with the symbol time of *SN-QI* on QAM channels of that BS;
- *TN*, *FN* and *MN* shall be synchronized for QAM channels and phase modulated channels of the BS.

## 7.8 MS requirements for synchronization

The MS shall only transmit to the BS if the requirements of items a) to c) below are met:

- a) The MS carrier frequency shall be accurate to within  $\pm 100$  Hz compared to signals received from the BS (these signals may have an apparent frequency error due to BS frequency error and Doppler shift). The signals from the BS shall be averaged by the MS over sufficient time that errors due to noise or interference are allowed for within the above  $\pm 100$  Hz figure.
- b) The MS shall adjust its internal timebase in line with that of signals received from the BS. If the MS determines that the timing difference exceeds  $125/9 \mu\text{s}$ , it shall adjust its timebase in steps of not greater than  $125/9 \mu\text{s}$ . This adjustment shall be performed at intervals of not less than 1 second and not greater than 3 seconds until the timing difference is less than  $125/9 \mu\text{s}$ .
- c) In determining the timing of signals from the BS, the timings shall be assessed in such a way that the timing assessment error is less than  $125/18 \mu\text{s}$ . The assessment algorithm shall be such that the requirements of (b) can be met.

The conditions under which the requirements of items a) to c) shall be met shall be 3 dB below the reference sensitivity level defined in clause 6 and 3 dB less carrier to interference ratio than the reference interference ratios defined in clause 6. Static or dynamic reference sensitivity levels shall be used depending on the applied propagation conditions.

When the MS obeys a channel allocation for an eccentric channel on the current cell, and when it moves from an eccentric channel, the timing difference perceived by the MS on the new channel relative to the old channel may be up to  $\pm 250/9 \mu\text{s}$  (caused by BS timing imperfections and geographical delay) in addition to any further propagation delay effects. See also clause 7.7.

## 8 Channel coding and scrambling

### 8.1 Introduction

A reference configuration of the TETRA transmission chain is given in clause 4. According to the reference configuration, clause 8 defines the error control process which applies to the information bits packed in MAC blocks (see definition in clause 19), and which provides multiplexed bits packed in multiplexed blocks.

Clause 8 applies to all logical channels, however channel coding for speech service is defined in ETSI EN 300 395-2 [21], clause 5. The definition of logical channels is given in clause 9.

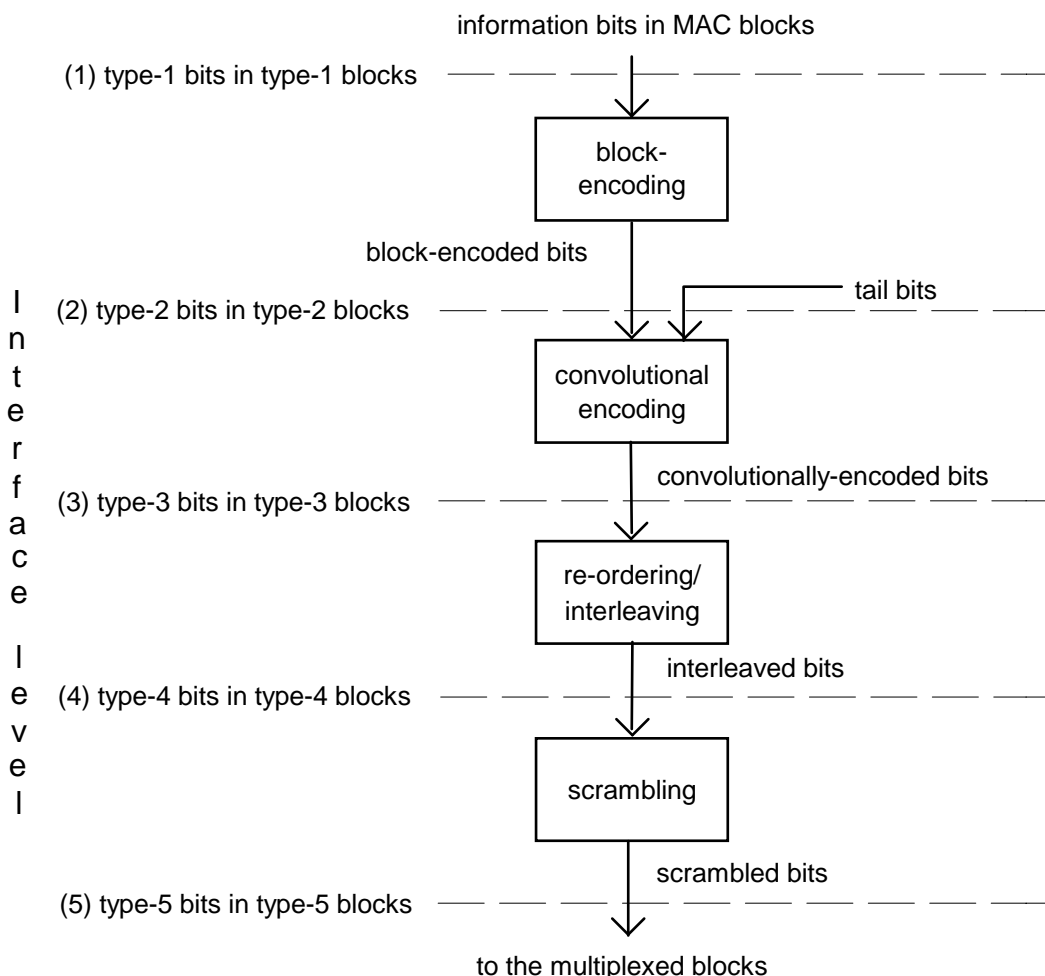

Clause 8 includes the specification of encoding, re-ordering and interleaving, and scrambling, but does not specify any data processing on the receive part.

A definition of the error control process is provided for each kind of logical channel.

### 8.2 General

#### 8.2.1 Interfaces in the error control structure

##### 8.2.1.1 Interfaces for phase modulation

**Figure 8.1: Interfaces in the error control structure for phase modulation**

The definition of interfaces within the error control structure is given by figure 8.1.

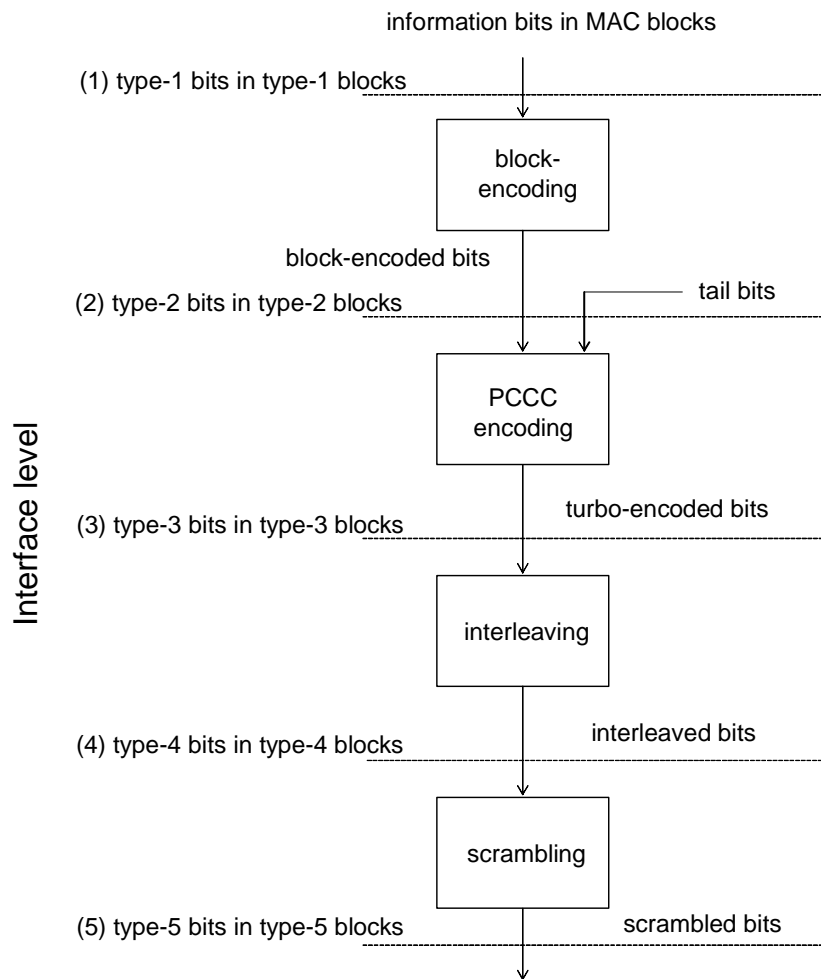

Each logical channel shall have its own error control scheme. For each one, the information bits (possibly including one or more MAC headers (see clause 23.4.2.3)) are referred to as type-1 bits. The type-1 bits are packed in MAC blocks (see clause 19), which are referred to as type-1 blocks, this defines interface (1) in figure 8.1.

The processing in the transmit part shall be as follows:

- the type-1 bits shall be encoded by a block code, providing block-encoded bits. In some cases tail bits shall be appended to these block-encoded bits. The block-encoded bits and the tail bits (if added) are referred to as type-2 bits and shall be packed in a type-2 block, this defines interface (2);
- the type-2 bits shall be encoded by a convolutional code, which provides the convolutionally encoded bits. The convolutionally-encoded bits are referred to as type-3 bits and shall be packed in a type-3 block, this defines interface (3);
- the type-3 bits shall be reordered and interleaved, into interleaved bits: the interleaved bits are referred to as type-4 bits and shall be packed in encoded blocks (see clause 19). Encoded blocks are referred to as type-4 blocks, this defines interface (4);
- the type-4 bits shall be scrambled, into type-5 bits, which compose type-5 blocks: this defines the interface (5). These bits shall then be mapped into multiplexed blocks. A multiplexed block shall be one of 5 different kinds:
  - control block;
  - broadcast block;
  - synchronization block;
  - block-1 block; or
  - block-2 block.

All these operations are made on a per type-1 block basis. The sizes of type-1 blocks and of type-5 blocks and multiplexed blocks depend on the logical channel with which they are associated.

### 8.2.1.2 Interfaces for QAM

NOTE: The tail bits are used only if PCCC is used.

**Figure 8.2: Interfaces in the error control structure for QAM**

The definition of interfaces within the error control structure is given by figure 8.2. Each logical channel shall have its own error control scheme. For each one, the information bits (including one or more MAC headers, see clause 23.4.2.3) are referred to as type-1 bits. The type-1 bits are packed in MAC blocks, which are referred to as type-1 blocks. This defines interface (1) in figure 8.2.

The processing in the transmit part shall be as follows:

- the type-1 bits shall be encoded by a block code, providing block-encoded bits. When the block-encoded bits are to be further encoded by a PCCC (see next point), three tail bits shall be appended to them. The block-encoded bits and the tail bits (if added) are referred to as type-2 bits and shall be packed in a type-2 block, this defining interface (2);
- the type-2 bits shall be in some cases encoded by a parallel-concatenated convolutional code (hereinafter referred to as a PCCC), which provides the PCCC encoded bits. Alternatively, no further encoding shall be carried out on the type-2 bits (uncoded case). The PCCC encoded bits or alternatively the uncoded bits are referred to as type-3 bits and shall be packed in a type-3 block, this defining interface (3);
- the type-3 bits shall be reordered into interleaved bits: the interleaved bits are referred to as type-4 bits and shall be packed in encoded blocks. Encoded blocks are referred to as type-4 blocks, this defining interface (4);
- the type-4 bits shall be scrambled into type-5 bits, which compose type-5 blocks: this defines the interface (5).

All these operations are made on a per type-1 block basis. The sizes of type-1 blocks and of type-5 blocks depend on the logical channel with which they are associated and on the modulation format and PCCC coding rate employed.

## 8.2.2 Notation

For ease of understanding, a notation for bits and blocks is given for use throughout clause 8:

- $x$  is the interface number, as defined in figures 8.1 and 8.2;
- $n$  is a block number;
- $Bx(n)$  is the type- $x$  block number  $n$ ;
- $Kx$  is the number of bits that are carried by one type- $x$  block;
- $k$  is a bit number;
- $bx(n,k)$  is the bit number  $k$  in the type- $x$  block number  $n$ ;
- alternatively  $bx(k)$  is the type- $x$  bit number  $k$  in a type- $x$  block (for ease of notation), with  $k = 1, 2, \dots, Kx$  and  $n = 1, 2, \dots$

The bits of the multiplexed blocks shall be denoted as:

- $cb(k)$ : bit number  $k$  in an control block;
- $bb(k)$ : bit number  $k$  in a broadcast block;
- $sb(k)$ : bit number  $k$  in a synchronization block;
- $bkn1(k)$ : bit number  $k$  in a block-1 block;
- $bkn2(k)$ : bit number  $k$  in a block-2 block.

## 8.2.3 Definition of error control codes

### 8.2.3.1 16-state Rate-Compatible Punctured Convolutional (RCPC) codes

#### 8.2.3.1.0 General

The RCPC codes shall encode  $K_2$  type-2 bits  $b_2(1), b_2(2), \dots, b_2(K_2)$  into  $K_3$  type-3 bits  $b_3(1), b_3(2), \dots, b_3(K_3)$ . This encoding shall be performed in two steps:

- encoding by a 16-state mother code of rate 1/4;
- puncturing of the mother code so to obtain a 16-state RCPC code of rate  $K_2/K_3$ .

A general description of these two steps is given in clauses 8.2.3.1.1 and 8.2.3.1.2 respectively. The puncturing co-efficients of the 16-state RCPC codes of rates 2/3, 1/3, 292/432 and 148/432 are given in clauses 8.2.3.1.3, 8.2.3.1.4, 8.2.3.1.5 and 8.2.3.1.6 respectively.

#### 8.2.3.1.1 Encoding by the 16-state mother code of rate 1/4

The input to the mother code of any type-2 bit  $b_2(k)$ ,  $k = 1, 2, \dots, K_2$ , implies the output, by the mother code, of 4 bits, denoted by  $V(4(k-1)+i)$ ,  $i = 1, 2, 3, 4$ , which shall be calculated as follows.

Any of the 4 generator polynomials of the mother code,  $G_i(D)$ ,  $i = 1, 2, 3, 4$ , can be written as:

$$G_i(D) = \sum_{j=0}^4 g_{i,j} D^j \quad \text{for } i = 1, 2, 3, 4 \quad (8.1)$$

Where  $g_{i,j} = 0$  or 1,  $j = 0, 1, 2, 3, 4$ .

This means that the encoded bits are defined by:

$$V(4(k-1) + i) = \sum_{j=0}^4 b_2(k-j)g_{i,j} \quad \text{for } i = 1, 2, 3, 4, \text{ and } k = 1, 2, \dots, K_2 \quad (8.2)$$

Where the sum is meant modulo 2, and where  $b_2(k-j) = 0$  for  $k \leq j$ .

The generator polynomials of the mother code shall be:

$$G_1(D) = 1 + D + D^4 \quad (8.3)$$

$$G_2(D) = 1 + D^2 + D^3 + D^4 \quad (8.4)$$

$$G_3(D) = 1 + D + D^2 + D^4 \quad (8.5)$$

$$G_4(D) = 1 + D + D^3 + D^4 \quad (8.6)$$

### 8.2.3.1.2 Puncturing of the mother code

The puncturing of the mother code into a 16-state RCPC code of rate  $(K_2/K_3)$  is achieved by selecting  $K_3$  type-3 bits out of the  $(4 K_2)$  bits encoded by the mother code. This selection shall be as follows.

Denoting by  $P(1), P(2), \dots, P(t)$  the  $t$  puncturing coefficients (each one being equal to 1, 2, 3, 4, 5, 6, 7 or 8), the type-3 bits are given by:

$$b_3(j) = V(k) \quad \text{for } j = 1, 2, \dots, K_3 \quad (8.7)$$

with  $k = 8((i-1) \text{ div } t) + P(i - t((i-1) \text{ div } t))$

Where  $i$  and  $t$  are defined in the following puncturing schemes.

### 8.2.3.1.3 Puncturing scheme of the RCPC code of rate 2/3

The  $t = 3$  puncturing co-efficients shall be:

$$P(1) = 1, P(2) = 2, P(3) = 5, \text{ and } i = j \quad (8.8)$$

### 8.2.3.1.4 Puncturing scheme of the RCPC code of rate 1/3

The  $t = 6$  puncturing co-efficients shall be:

$$P(1) = 1, P(2) = 2, P(3) = 3, P(4) = 5, P(5) = 6, P(6) = 7, \text{ and } i = j \quad (8.9)$$

### 8.2.3.1.5 Puncturing scheme of the RCPC code of rate 292/432

The  $t = 3$  puncturing co-efficients shall be:

$$P(1) = 1, P(2) = 2, P(3) = 5, \text{ and } i = j + (j-1) \text{ div } 65, \text{ with } j = 1, 2, \dots, 432 \quad (8.10)$$

### 8.2.3.1.6 Puncturing scheme of the RCPC code of rate 148/432

The  $t = 6$  puncturing co-efficients shall be:

$$P(1) = 1, P(2) = 2, P(3) = 3, P(4) = 5, P(5) = 6, P(6) = 7, \text{ and } i = j + (j-1) \text{ div } 35, \text{ with } j = 1, 2, \dots, 432 \quad (8.11)$$

### 8.2.3.2 Shortened (30,14) Reed-Muller (RM) code

The shortened (30,14) RM code shall encode 14 type-1 bits  $b_1(1), b_1(2), \dots, b_1(14)$  into 30 type-2 bits  $b_2(1), b_2(2), \dots, b_2(30)$ .

The vector of the 30 type-2 bits shall be derived from:

$$[b_2(1), b_2(2), \dots, b_2(30)] = [b_1(1), b_1(2), \dots, b_1(14)] \times \mathbf{G} \quad (8.12)$$

Where  $\mathbf{G}$  is the generator matrix:

$$\mathbf{G} = \mathbf{I}_{14} \begin{bmatrix} 1 & 0 & 0 & 1 & 1 & 0 & 1 & 1 & 0 & 1 & 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 1 & 1 & 0 & 1 & 1 & 1 & 1 & 0 & 0 & 0 & 0 & 0 \\ 1 & 1 & 1 & 1 & 1 & 1 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 \\ 1 & 1 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 1 & 1 & 0 & 0 \\ 1 & 0 & 0 & 1 & 1 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 1 & 0 & 1 & 0 \\ 0 & 1 & 0 & 1 & 0 & 1 & 0 & 0 & 0 & 0 & 1 & 1 & 0 & 1 & 1 & 0 \\ 0 & 0 & 1 & 0 & 1 & 1 & 0 & 0 & 0 & 0 & 1 & 0 & 1 & 1 & 1 & 0 \\ 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 0 & 1 & 1 & 1 & 1 & 1 \\ 1 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 0 & 0 & 1 & 1 & 1 & 0 & 0 & 1 \\ 0 & 1 & 0 & 0 & 0 & 0 & 1 & 0 & 1 & 0 & 1 & 1 & 0 & 1 & 0 & 1 \\ 0 & 0 & 1 & 0 & 0 & 0 & 0 & 1 & 1 & 0 & 1 & 0 & 1 & 1 & 0 & 1 \\ 0 & 0 & 0 & 1 & 0 & 0 & 1 & 0 & 0 & 1 & 1 & 1 & 0 & 0 & 1 & 1 \\ 0 & 0 & 0 & 0 & 1 & 0 & 0 & 1 & 0 & 1 & 1 & 0 & 1 & 0 & 1 & 1 \\ 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 1 & 1 & 1 & 0 & 0 & 1 & 1 & 1 \end{bmatrix} \quad (8.13)$$

Where  $\mathbf{I}_{14}$  denotes the (14 x 14) identity matrix.

### 8.2.3.3 $(K_1 + 16, K_1)$ block code

The  $(K_1 + 16, K_1)$  code shall encode  $K_1$  type-1 bits  $b_1(1), b_1(2), \dots, b_1(K_1)$  into  $(K_1 + 16)$  type-2 bits  $b_2(1), b_2(2), \dots, b_2(K_1 + 16)$ . The encoding rule shall be as follows (see Recommendation ITU-T X.25 [28]).

The type-1 bits are treated as the co-efficients of the polynomial:

$$M(X) = \sum_{k=1}^{K_1} b_1(k) X^{K_1-k} \quad (8.14)$$

Let  $F(X)$  be:

$$F(X) = \left[ \left( X^{16} M(X) + X^{K_1} \sum_{i=0}^{15} X^i \right) \bmod G(X) \right] + \sum_{i=0}^{15} X^i \quad (8.15)$$

Where all operations are meant modulo 2, and  $G(X)$  is the generator polynomial of the code:

$$G(X) = X^{16} + X^{12} + X^5 + 1 \quad (8.16)$$

$F(X)$  is of degree 15, with co-efficients denoted by  $f(0), f(1), \dots, f(15)$ :

$$F(X) = \sum_{i=0}^{15} f(i) X^i \quad (8.17)$$

The  $K_2$  type-2 bits, with  $K_2 = K + 16$ , are then given by:

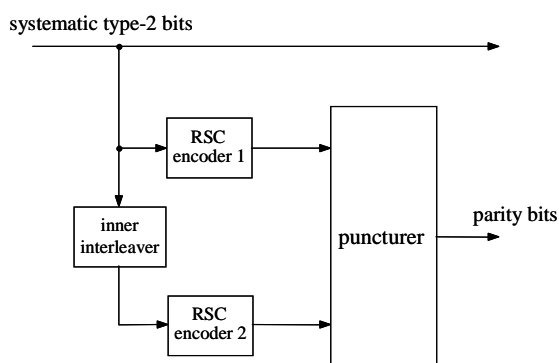

$$\begin{aligned} b_2(k) &= b_1(k) && \text{for } k = 1, 2, \dots, K_1; \text{ and} \\ b_2(k) &= f(K_1 + 16 - k) && \text{for } k = K_1 + 1, K_1 + 2, \dots, K_1 + 16. \end{aligned} \quad (8.18)$$

### 8.2.3.4 8-state Parallel Concatenated Convolutional Code (PCCC) for QAM

#### 8.2.3.4.0 General

With reference to figure 8.3, the PCCC shall encode  $K_2$  type-2 input bits  $b_2(1), b_2(2), \dots, b_2(K_2)$  into  $K_3$  type-3 bits  $b_3(1), b_3(2), \dots, b_3(K_3)$ . The  $K_2$  type-2 input bits include three tail bits  $b_2(K_2 - 2), b_2(K_2 - 1), b_2(K_2)$ , that force the final state of the upper constituent recursive systematic convolutional (RSC) encoder to zero. A second set of three tail bits  $b'_2(K_2 - 2), b'_2(K_2 - 1), b'_2(K_2)$  is appended to the interleaved  $K_2 - 3$  type-2 bits  $b'_2(1), b'_2(2), \dots, b'_2(K_2 - 3)$  to force the final state of the lower RSC encoder to zero. The initial state of both constituent encoders shall be zero. As sketched in figure 8.3, this encoding shall be performed in four steps:

- encoding by a 8-state RSC encoder of rate 1/2 (the upper RSC encoder in figure 8.3);
- interleaving the  $K_2 - 3$  type-2 bits  $b_2(1), b_2(2), \dots, b_2(K_2 - 3)$  by means of a quadratic-congruence inner interleaver;
- appending three tail bits  $b'_2(K_2 - 2), b'_2(K_2 - 1), b'_2(K_2)$  to the  $K_2 - 3$  interleaved bits and encoding the resulting  $K_2$  bits by a second 8-state RSC encoder of rate 1/2 identical to the encoder in a), and retaining only the parity bits;
- puncturing the parity bits at the output of the two RSC encoders so to obtain an 8-state PCCC of overall rate  $K_2 / K_3$ .

**Figure 8.3: PCCC encoder**

A general description of these four steps is given in clauses 8.2.3.4.1, 8.2.3.4.2, 8.2.3.4.3 and 8.2.3.4.5, respectively. The puncturing scheme of the 8-state PCCC encoders of rates 2/3 and 1/2 are given in clauses 8.2.3.4.6 and 8.2.3.4.7, respectively.

#### 8.2.3.4.1 Encoding by the upper 8-state RSC encoder of rate 1/2

The RSC upper encoder structure is shown in figure 8.4. The input to the RSC encoder of any type-2 bit  $b_2(k)$ ,  $k = 1, 2, \dots, K_2$ , implies the output of 2 bits, denoted by  $V_1[2(k-1) + i]$ ,  $i = 1, 2$ , which shall be calculated as follows.

**Figure 8.4: RSC encoder**

The first bit is systematic, i.e.:

$$V_1[2(k-1) + i] = b_2(k) \quad \text{for } k = 1, 2, \dots, K_2 \text{ and } i = 1. \quad (8.19)$$

The second (parity) bit is generated through the generator  $G_1(D)/G_0(D)$  where  $G_0(D)$  and  $G_1(D)$  are polynomials identifying the recursive and non-recursive sections of the encoder, and can be written as:

$$G_0(D) = \sum_{i=0}^3 g_{0,i} D^i \quad (8.20)$$

$$G_1(D) = \sum_{i=0}^3 g_{1,i} D^i \quad (8.21)$$

where  $g_{0,0} = 1$  and  $g_{0,i}$ ,  $i = 1, 2, 3$ , and  $g_{1,i}$ ,  $i = 0, 1, 2, 3$ , are equal to 0 or 1.

This means that the parity bits are calculated as:

$$V_1[2(k-1) + 2] = \sum_{i=1}^3 V_1[2(k-i-1) + 2] g_{0,i} + \sum_{i=0}^3 b_2(k-i) g_{1,i} \quad \text{for } k = 1, 2, \dots, K_2, \quad (8.22)$$

where the sum is meant modulo 2, and where  $V_1[2(k-i-1) + 2] = 0$  and  $b_2(k-i) = 0$  for  $k \leq i$ .

The generator polynomials of the parity bit shall be:

$$G_0(D) = 1 + D^2 + D^3 \quad (8.23)$$

$$G_1(D) = 1 + D + D^3 \quad (8.24)$$

The three type-2 tail bits  $b_2(K_2 - 2)$ ,  $b_2(K_2 - 1)$ ,  $b_2(K_2)$  depend on the state of the convolutional encoder after application of the bit  $b_2(K_2 - 3)$  to its input, and force the final encoder state to zero. The tail bits are chosen as shown in table 8.1.

**Table 8.1: Tail bits for the RSC encoder**

| Encoder state<br>[s <sub>2</sub> s <sub>1</sub> s <sub>0</sub> ]<br>[s' <sub>2</sub> s' <sub>1</sub> s' <sub>0</sub> ] | Tail bits<br>b <sub>2</sub> (K <sub>2</sub> - 2) b <sub>2</sub> (K <sub>2</sub> - 1) b <sub>2</sub> (K <sub>2</sub> )<br>b' <sub>2</sub> (K <sub>2</sub> - 2) b' <sub>2</sub> (K <sub>2</sub> - 1) b' <sub>2</sub> (K <sub>2</sub> ) |
|--|--|
| 000  | 000  |
| 001  | 100  |
| 010  | 110  |
| 011  | 010  |
| 100  | 011  |
| 101  | 111  |
| 110  | 101  |
| 111  | 001  |

#### 8.2.3.4.2 Interleaving by the quadratic-congruence interleaver

A quadratic-congruence block interleaver shall re-order  $K_2 - 3$  type-2 bits  $b_2(1)$ ,  $b_2(2)$ , ...,  $b_2(K_2 - 3)$  into  $K_2 - 3$  type-2 permuted bits  $b'_2(1)$ ,  $b'_2(2)$ , ...,  $b'_2(K_2 - 3)$ , by means of the following two-step algorithm:

- first, the sequence of indices  $c_m$ ,  $m = 0, 1, \dots, S - 1$  is calculated, where  $S$  is the smallest power of 2 larger than or equal to  $K_2 - 3$ , as follows:

$$c_0 = 0, \text{ and}$$

$$c_m = [c_{m-1} + m] \bmod S, \quad m = 1, 2, \dots, S - 1 \quad (8.25)$$

b) Second, the  $K_2 - 3$  type-2 bits  $b_2(1), b_2(2), \dots, b_2(K_2 - 3)$  undergo the following procedure:

```

flag ← false
i ← 0
while i ≤ (S - 2)/2
    x ← ci+1
    y ← [ci + S/2] mod S
    if (x < K2 - 3 and y < K2 - 3)
        swap bits b2(x + 1) and b2(y + 1)
    else if (x < K2 - 3 and y ≥ K2 - 3)
        if (flag = true)
            swap bits b2(x + 1) and b2(t + 1)
            flag ← false
        else
            t ← x
            flag ← true
    else if (x ≥ K2 - 3 and y < K2 - 3)
        if (flag = true)
            swap positions b2(y + 1) and b2(t + 1)
            flag ← false
        else
            t ← y
            flag ← true
    i ← i + 1

```

(8.26)

Upon completion of the above procedure, the input sequence of  $K_2 - 3$  type-2 bits  $b_2(1), b_2(2), \dots, b_2(K_2 - 3)$  is turned into the sequence of  $K_2 - 3$  type-2 interleaved bits  $b'_2(1), b'_2(2), \dots, b'_2(K_2 - 3)$ .

NOTE: Any bits that are not swapped remain in their original positions.

#### 8.2.3.4.3 Encoding the interleaved bits by the lower 8-state RSC encoder of rate 1/2

This convolutional encoder shall be identical to the one described in clause 8.2.3.4.1 and shall operate on the sequence of  $K_2$  type-2 interleaved bits  $b'_2(1), b'_2(2), \dots, b'_2(K_2 - 3)$  and tail bits  $b'_2(K_2 - 2), b'_2(K_2 - 1), b'_2(K_2)$ , yielding at its output the sequence denoted by  $V_2[2(k - 1) + i], i = 1, 2, k = 1, 2, \dots, K_2$ . Only the sequence of parity bits is taken into account, that is generated as follows:

$$V_2[2(k - 1) + 2] = \sum_{i=1}^3 V_2[2(k - i - 1) + 2]g_{0,i} + \sum_{i=0}^3 b'_2(k - i)g_{1,i} \text{ for } k = 1, 2, \dots, K_2, \quad (8.27)$$

where the sum is meant modulo 2, and where  $V_2[2(k - i - 1) + 2] = 0$  and  $b'_2(k - i) = 0$  for  $k \leq i$ .

The three type-2 tail bits  $b'_2(K_2 - 2), b'_2(K_2 - 1), b'_2(K_2)$  depend on the state of the lower convolutional encoder after application of the bit  $b'_2(K_2 - 3)$  to its input, and force the final encoder state to zero. The tail bits are chosen as shown in table 8.1.

#### 8.2.3.4.4 Merging the systematic and parity bits for the PCCC encoder

The systematic and parity bits at the output of the two RSC encoders are merged together so as to generate a single sequence of  $3K_2$  bits, as follows:

$$V(k) = \begin{cases} V_1[k \bmod 3 + 2(k \operatorname{div} 3)], & (k - 1) \bmod 3 = 0, 1 \\ V_2[2(k \operatorname{div} 3)], & (k - 1) \bmod 3 = 2 \end{cases}, \quad k = 1, 2, \dots, 3K_2 \quad (8.28)$$

### 8.2.3.4.5 Puncturing scheme for the PCCC encoder

Puncturing the sequence  $V(k)$ ,  $k = 1, 2, \dots, 3K_2$  permits to achieve a code of rate  $K_2/K_3$ . This is done by selecting  $K_3$  type-3 bits out of the  $3K_2$  encoded bits  $V(k)$ ,  $k = 1, 2, \dots, 3K_2$ . This selection shall be as follows:

Denoting by  $P(1); P(2); \dots; P(t)$  the  $t$  puncturing coefficients (each one being equal to 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 or 12), the type-3 bits are given by:

$$b_3(j) = V(k), j = 1, 2, \dots, K_3, \text{ with } k = 12[(i-1)\text{div } t] + P\{i - t[(i-1)\text{div } t]\} \quad (8.29)$$

Where  $i$  and  $t$  are defined in the puncturing schemes defined in clauses 8.2.3.4.6 and 8.2.3.4.7.

### 8.2.3.4.6 Puncturing scheme for the PCCC encoder with coding rate 2/3

The  $t = 6$  puncturing co-efficients shall be:

$$P(1) = 1, P(2) = 2, P(3) = 4, P(4) = 7, P(5) = 9, P(6) = 10, \text{ and } i = j \quad (8.30)$$

### 8.2.3.4.7 Puncturing scheme for the PCCC encoder with coding rate 1/2

The  $t = 8$  puncturing co-efficients shall be:

$$P(1) = 1, P(2) = 2, P(3) = 4, P(4) = 6, P(5) = 7, P(6) = 8, P(7) = 10, P(8) = 12, \text{ and } i = j \quad (8.31)$$

### 8.2.3.5 (16,5) Reed-Muller (RM) code for QAM

The (16,5) RM code shall encode 5 type-1 bits  $b_1(1), b_1(2), \dots, b_1(5)$  into 16 type-2 bits  $b_2(1), b_2(2), \dots, b_2(16)$ .

The vector of the 16 type-2 bits shall be derived from:

$$[b_2(1), b_2(2), \dots, b_2(16)] = [b_1(1), b_1(2), \dots, b_1(5)] \times \mathbf{G} \quad (8.32)$$

where  $\mathbf{G}$  is the generator matrix:

$$\mathbf{G} = \begin{bmatrix} 0 & 1 & 1 & 1 & 0 & 1 & 1 & 1 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 1 & 1 & 1 & 1 & 1 & 1 \\ \mathbf{I}_5 & 1 & 1 & 1 & 0 & 0 & 0 & 0 & 1 & 1 & 1 & 1 \\ 1 & 0 & 1 & 1 & 1 & 0 & 1 & 0 & 1 & 0 & 1 \\ 1 & 1 & 0 & 1 & 1 & 1 & 0 & 0 & 1 & 1 & 0 \end{bmatrix} \quad (8.33)$$

$\mathbf{I}_5$  denoting the  $(5 \times 5)$  identity matrix.

## 8.2.4 Definition of interleaving schemes

### 8.2.4.1 Block interleaving for phase modulation

A  $(K, a)$  block interleaver shall re-order  $K_3$  type-3 bits  $b_3(1), b_3(2), \dots, b_3(K_3)$  into  $K_4$  type-4 bits  $b_4(1), b_4(2), \dots, b_4(K_4)$ , with  $K = K_3 = K_4$ , in the following way:

$$b_4(k) = b_3(i), \quad i = 1, 2, \dots, K \quad (8.34)$$

$$\text{with } k = 1 + ((a \times i) \bmod K)$$

### 8.2.4.2 Interleaving over $N$ blocks

Interleaving over  $N$  blocks use two steps to interleave a sequence of  $M$  type-3 blocks  $B_3(1), B_3(2), \dots, B_3(M)$  of 432 bits each into a sequence of  $(M + N - 1)$  type-4 blocks  $B_4(1), B_4(2), \dots, B_4(M + N - 1)$  of 432 bits each, where  $M$  is an integer and  $N$  has values 1, 4, or 8. This interleaving shall be as follows.

Firstly, a diagonal interleaver interleaves the  $M$  blocks  $B_3(1), B_3(2), \dots, B_3(M)$  into  $(M+N-1)$  blocks  $B'_3(1), B'_3(2), \dots, B'_3(M + N - 1)$ . Denoting by  $b'_3(m,k)$  the  $k$ -th bit of block  $B'_3(m)$ , with  $k = 1, 2, \dots, 432$  and  $m = 1, 2, \dots, M + N - 1$ ,

$$b'_3(m,k) = b_3(m - j, j+1+(i \times N)) \text{ for } 1 \leq m - j \leq M;$$

$$b'_3(m,k) = 0, \text{ otherwise;} \quad (8.35)$$

with:

$$j = (k - 1) \text{ div } (432/N) \text{ and } i = (k - 1) \text{ mod } (432/N).$$

A block interleaver then interleaves each block  $B'_3(m)$  into type-4 block  $B_4(m)$ ,  $m = 1, 2, \dots, M + N - 1$ :

$$b_4(m,i) = b'_3(m,k) \quad (8.36)$$

with:

$$k = 1, 2, \dots, 432, \text{ and } i = 1 + [(103 \times k) \text{ mod } 432]$$

### 8.2.4.3 Block interleaving for QAM

A  $(K, a)$  block interleaver shall re-order  $K_3$  type-3 bits  $b_3(1), b_3(2), \dots, b_3(K_3)$  into  $K_4$  type-4 bits  $b_4(1), b_4(2), \dots, b_4(K_4)$ , with  $K = K_3 = K_4$ , in the following way:

$$b_4(k) = b_3(i), \quad i = 1, 2, \dots, K \quad (8.37)$$

$$\text{with } k = 1 + (a \times i) \text{ mod } K$$

The values of  $K$  and  $a$  for the various logical channels, bandwidths and modulation formats are specified below in table 8.2 (relevant to logical channels mapping on burst headers) and tables 8.3 to 8.6 (relevant to logical channels mapping on burst payloads). Detailed error control schemes for logical channels for QAM can be found in clause 8.3.2. The last row of table 8.2 means that the block-encoded bits relevant to logical channels SICH-Q/D and AACH-Q are concatenated and then interleaved.

**Table 8.2: Values of  $K$  and  $a$  for logical channels mapping on burst headers, for any bandwidth**

| Logical channel   | 4/16/64-QAM     |
|-------------------|-----------------|
| SICH-Q/U          | $K = 16, a = 5$ |
| SICH-Q/D + AACH-Q | $K = 64, a = 9$ |

**Table 8.3: Values of  $K$  and  $a$  for logical channels mapping on burst payloads, 8 subcarriers**

| Logical channel | 4-QAM             | 16-QAM            | 64-QAM             |
|-----------------|-------------------|-------------------|--------------------|
| SCH-Q/HU        | $K = 152, a = 13$ | $K = 304, a = 17$ | $K = 456, a = 23$  |
| SCH-Q/U         | $K = 400, a = 21$ | $K = 800, a = 29$ | $K = 1200, a = 37$ |
| SCH-Q/D, BNCH-Q | $K = 408, a = 23$ | $K = 816, a = 29$ | $K = 1224, a = 35$ |
| SCH-Q/RA        | $K = 168, a = 13$ | -                 | -                  |
| BSCH-Q          | $K = 272, a = 19$ | -                 | -                  |

**Table 8.4: Values of  $K$  and  $a$  for logical channels mapping on burst payloads, 16 subcarriers**

| Logical channel | 4-QAM             | 16-QAM               | 64-QAM               |
|-----------------|-------------------|----------------------|----------------------|
| SCH-Q/HU        | $K = 320, a = 17$ | $K = 640, a = 27$    | $K = 960, a = 31$    |
| SCH-Q/U         | $K = 816, a = 29$ | $K = 1\ 632, a = 41$ | $K = 2\ 448, a = 49$ |
| SCH-Q/D, BNCH-Q | $K = 880, a = 29$ | $K = 1\ 760, a = 41$ | $K = 2\ 640, a = 53$ |
| BSCH-Q          | $K = 272, a = 19$ | -                    | -                    |
| SCH-Q/B         | $K = 472, a = 21$ | -                    | -                    |

**Table 8.5: Values of  $K$  and  $a$  for logical channels mapping on burst payloads, 32 subcarriers**

| Logical channel | 4-QAM                | 16-QAM               | 64-QAM               |

## 8.2.5 Definition of scrambling

### 8.2.5.1 Scrambling method

Scrambling shall transform  $K_4$  type-4 bits  $b_4(1), b_4(2), \dots, b_4(K_4)$  into  $K_5$  type-5 bits  $b_5(1), b_5(2), \dots, b_5(K_5)$ , with  $K_5 = K_4$ , as follows:

$$b_5(k) = b_4(k) + p(k) \quad \text{for } k = 1, 2, \dots, K_5 \quad (8.38)$$

Where the addition is meant modulo 2, and  $p(k)$  is the  $k$ -th bit of the scrambling sequence.

### 8.2.5.2 Scrambling sequence

The scrambling sequence  $\{p(k), k = 1, 2, \dots, K_5\}$  shall be generated from the 30 bits of the extended colour code  $e(1), e(2), \dots, e(30)$  (see clauses 19 and 23), except for the BSCH and BSCH-Q, by means of linear feedback registers. For the scrambling of BSCH and BSCH-Q, all bits  $e(1), e(2), \dots, e(30)$  shall be set equal to zero.

NOTE: Normal colour code is applied to SCH-Q/B although it is sent in the same burst as BSCH-Q. Normal colour code is also applied to SICH-Q, even when it is sent in the same burst as BSCH-Q.

The scrambling sequence generator shall be based upon the following connection polynomial:

$$c(x) = \sum_{i=0}^{32} c_i X^i \quad (8.39)$$

With  $c_i = 1$  for  $i = 0, 1, 2, 4, 5, 7, 8, 10, 11, 12, 16, 22, 23, 26$  and  $32$ , and  $c_i = 0$  elsewhere and where all operations are meant modulo 2. The resultant polynomial is therefore:

$$c(x) = 1 + X + X^2 + X^4 + X^5 + X^7 + X^8 + X^{10} + X^{11} + X^{12} + X^{16} + X^{22} + X^{23} + X^{26} + X^{32} \quad (8.40)$$

The  $k$ -th bit of the scrambling sequence is given by:

$$p(k) = \sum_{i=1}^{32} c_i p(k-i) \tag{8.41}$$

With the following initialization:

$$p(k) = e^{(1-k)} \quad \text{for } k = -29, -28, \dots, 0; \text{ and}$$

$$p(k) = 1 \quad \text{for } k = -31, -30 \tag{8.42}$$

### 8.3 Error control schemes

#### 8.3.1 Error control schemes for phase modulation

##### 8.3.1.0 General

The error control scheme associated with each logical channel is defined in clauses 8.3.1.1 to 8.3.1.4 for phase modulation. Figures 8.5, 8.6 and 8.7 give the error control structure.

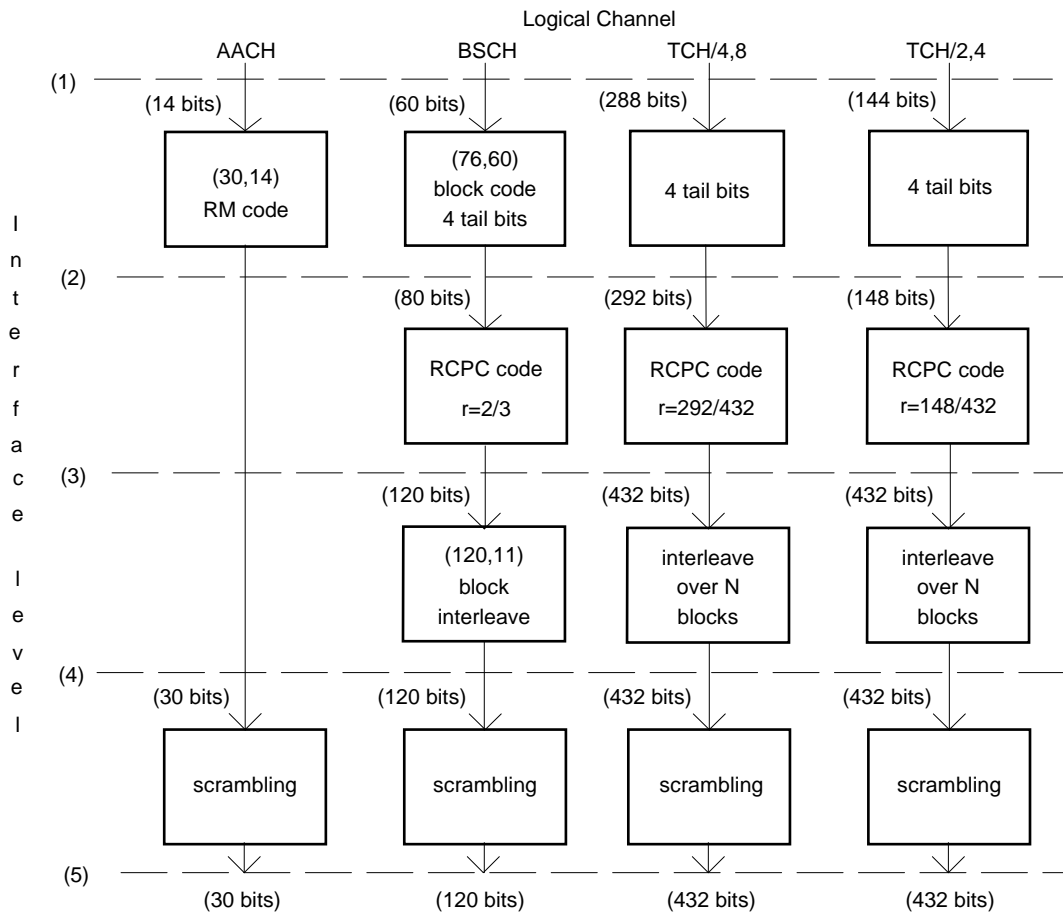

Figure 8.5: Error control structure for  $\pi/4$  DQPSK logical channels (part 1)

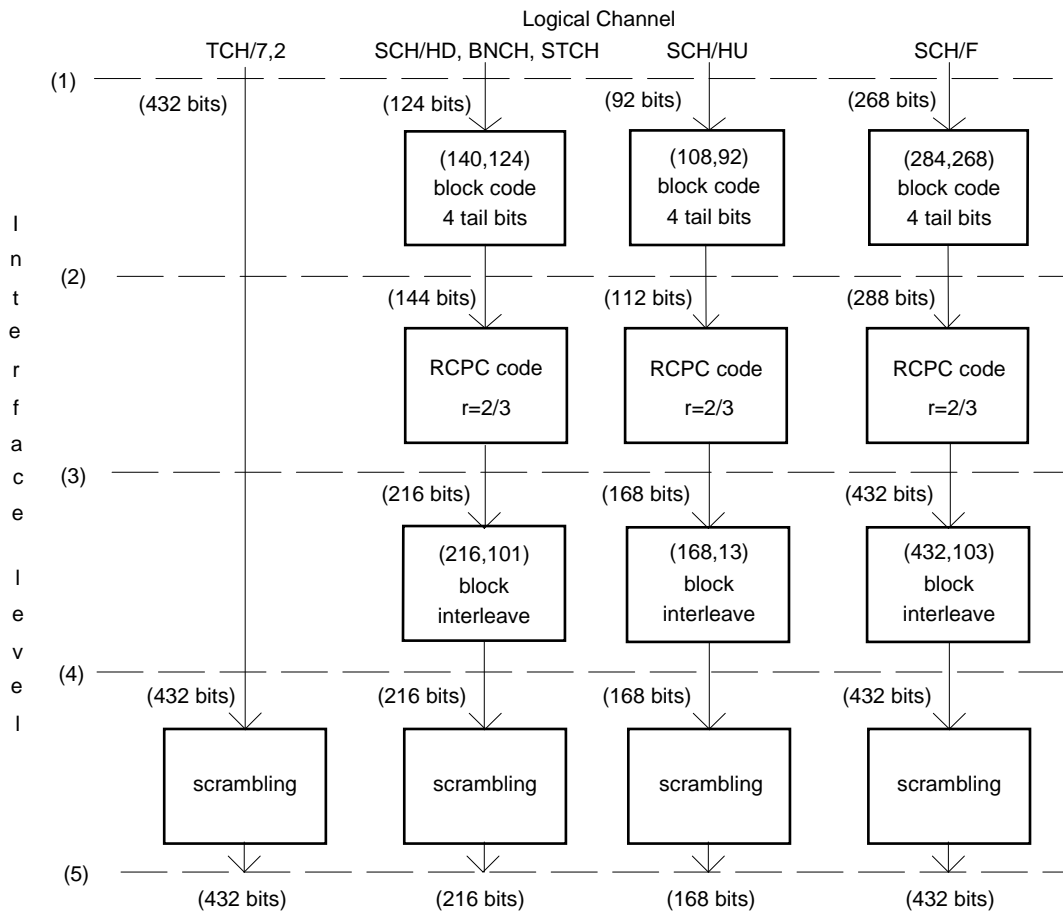

Figure 8.6: Error control structure for  $\pi/4$  DQPSK logical channels (part 2)

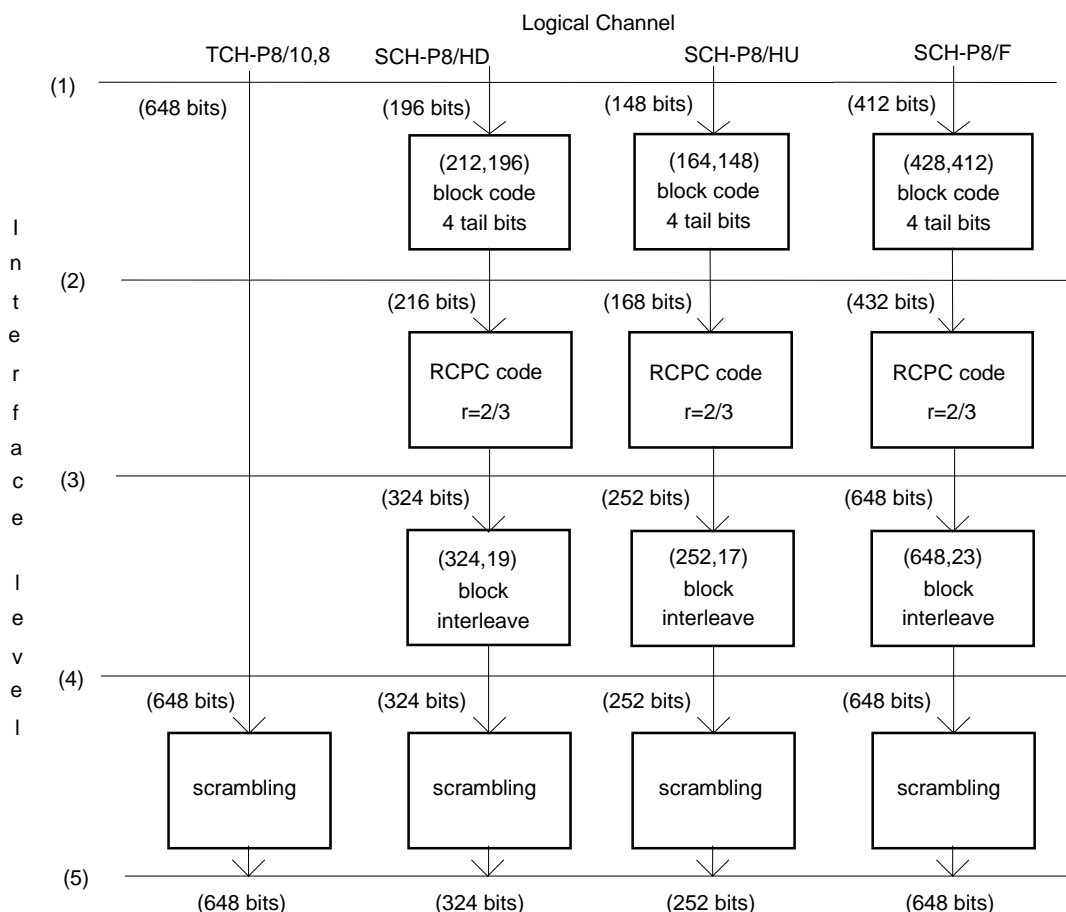

Figure 8.7: Error control structure for  $\pi/8$  D8PSK logical channels

### 8.3.1.1 Access Assignment Channel (AACH)

One type-1 block shall contain 14 type-1 bits  $b_1(1), b_1(2), \dots, b_1(14)$ .

A shortened (30,14) RM code (see clause 8.2.3.2) shall encode the 14 type-1 bits into 30 type-2 bits,  $b_2(1), b_2(2), \dots, b_2(30)$ .

The type-4 bits shall be the same as the type-2 bits:

$$b_4(k) = b_2(k) \quad \text{for } k = 1, 2, \dots, 30 \quad (8.43)$$

The 30 type-4 bits  $b_4(1), b_4(2), \dots, b_4(30)$ , compose the type-4 block for AACH. They shall be scrambled into bits  $b_5(1), b_5(2), \dots, b_5(30)$ , according to clause 8.2.5.1, with the scrambling sequence as defined in clause 8.2.5.2. The multiplexed bits of the BBK shall be defined as:

$$bb(k) = b_5(k), \quad \text{for } k = 1, 2, \dots, 30 \quad (8.44)$$

### 8.3.1.2 Broadcast Synchronization Channel (BSCH)

One type-1 block shall contain 60 type-1 bits  $b_1(1), b_1(2), \dots, b_1(60)$ .

A (76,60) block code shall encode the 60 type-1 bits into 76 block-encoded bits,  $b_2(1), b_2(2), \dots, b_2(76)$ . This code is the  $(K_I+16, K_I)$  block code as defined in clause 8.2.3.3, with  $K_I = 60$ .

Four tail bits,  $b_2(77), b_2(78), b_2(79), b_2(80)$ , all set equal to zero, shall be appended to the 76 block-encoded bits.

The resultant bits  $b_2(1), b_2(2), \dots, b_2(80)$  shall be the type-2 bits.

A 16-state RCPC code with rate  $2/3$  (see clause 8.2.3.1), shall encode the 80 type-2 bits into 120 type-3 bits,  $b_3(1), b_3(2), \dots, b_3(120)$ .

A (120, 11) block interleaving (see clause 8.2.4.1) shall re-order the 120 type-3 bits into 120 type-4 bits,  $b_4(1), b_4(2), \dots, b_4(120)$ .

The 120 type-4 bits,  $b_4(1), b_4(2), \dots, b_4(120)$  compose the type-4 block for BSCH. They shall be scrambled into bits  $b_5(1), b_5(2), \dots, b_5(120)$ , according to clause 8.2.5.1, with the scrambling sequence as defined in clause 8.2.5.2.

The multiplexed bits of the synchronization block shall be defined as:

$$sb(k) = b_5(k), \quad \text{for } k = 1, 2, \dots, 120 \quad (8.45)$$

### 8.3.1.3 Traffic channels in circuit switched mode

#### 8.3.1.3.1 Frame stealing and multi-slot transmission

In case frame stealing is activated for one of the data traffic channels defined in clauses 8.3.1.3.2 to 8.3.1.3.7 the multiplexed bits either of block-1 or of block-1 and block-2 are replaced by STCH bits. This means that the bits are replaced after coding, interleaving and scrambling. The construction of STCH bits is defined in clause 8.3.1.4.1.

NOTE: Frame stealing on speech traffic channels modifies the type of logical channel which the speech channel encoder is using, refer to ETSI EN 300 395-2 [21] clause 5 and see notes in clauses 8.3.1.3.6 and 8.3.1.3.7.

In the case of multi-slot transmission, up to four low bit rate traffic channels shall be multiplexed. This is further described in clause 23.

#### 8.3.1.3.2 Traffic CHannel, net rate = 4,8 kbit/s (TCH/4,8)

A sequence of  $M$  type-1 blocks,  $B_1(m)$ ,  $m = 1, 2, \dots, M$ , shall be transmitted, whereby  $M$  is not limited.

One type-1 block shall contain 288 type-1 bits,  $b_1(1), b_1(2), \dots, b_1(288)$ .

The  $K_2 = 292$  type-2 bits shall comprise the 288 type-1 bits mapped as follows:

$$b_2(j) = b_1(j), \quad \text{for } j = 1, 2, \dots, 288 \quad (8.46)$$

with the addition of four tail bits,  $b_2(289), b_2(290), b_2(291), b_2(292)$ , all set equal to zero.

A 16-state RCPC code with rate  $292/432$  (see clause 8.2.3.1) shall encode the 292 type-2 bits into 432 type-3 bits,  $b_3(1), b_3(2), \dots, b_3(432)$ .

An interleaving over  $N$  blocks (see clause 8.2.4.2) shall interleave bits from  $M$  type-3 blocks (of 432 bits each) into  $(M+N-1)$  type-4 blocks (of 432 bits each): the bits in one type-4 block shall be denoted by  $b_4(1), b_4(2), \dots, b_4(432)$ . The parameter  $N$  shall be pre-set at the call set-up, and may take the values 1, 4 or 8.

The 432 type-4 bits  $b_4(1), b_4(2), \dots, b_4(432)$  shall compose the type-4 block for TCH/4,8. They shall be scrambled into bits  $b_5(1), b_5(2), \dots, b_5(432)$ , according to clause 8.2.5.1, with the scrambling sequence as defined in clause 8.2.5.2.

The multiplexed bits of block-1 are defined as:

$$bkn1(k) = b_5(k), \quad \text{for } k = 1, 2, \dots, 216 \quad (8.47)$$

In case of frame stealing of block-1  $bkn1(1), bkn1(2), \dots, bkn1(216)$  shall be discarded, and replaced with the STCH bits as defined in clause 8.3.1.4.1 for block-1.

The multiplexed bits of block-2 are defined as:

$$bkn2(k) = b_5(k+216), \quad \text{for } k = 1, 2, \dots, 216 \quad (8.48)$$

In case of frame stealing of block-2,  $bkn2(1), bkn2(2), \dots, bkn2(216)$  shall be discarded, and replaced with the STCH bits as defined in clause 8.3.1.4.1 for block-2.

### 8.3.1.3.3 Traffic CHannel, net rate = 2,4 kbit/s (TCH/2,4)

A sequence of  $M$  type-1 blocks,  $B_1(m)$ ,  $m = 1, 2, \dots, M$ , shall be transmitted, whereby  $M$  is not limited.

One type-1 block shall contain 144 type-1 bits,  $b_1(1), b_1(2), \dots, b_1(144)$ .

The  $K_2 = 148$  type-2 bits shall comprise the 144 type-1 bits mapped as follows:

$$b_2(j) = b_1(j), \quad \text{for } j = 1, 2, \dots, 144 \quad (8.49)$$

with the addition of four tail bits,  $b_2(145), b_2(146), b_2(147), b_2(148)$ , all set equal to zero.

A 16-state RCPC code with rate 148/432 (see clause 8.2.3.1) encodes the 148 type-2 bits into 432 type-3 bits,  $b_3(1), b_3(2), \dots, b_3(432)$ .

An interleaving over  $N$  blocks (see clause 8.2.4.2) shall interleave bits from  $M$  type-3 blocks (of 432 bits each) into  $(M + N - 1)$  type-4 blocks (of 432 bits each): the bits in one type-4 block shall be denoted by  $b_4(1), b_4(2), \dots, b_4(432)$ . The parameter  $N$  shall be pre-set at the call set-up, and may take the values 1, 4 or 8.

The 432 type-4 bits  $b_4(1), b_4(2), \dots, b_4(432)$  shall compose the type-4 block for TCH/2,4. They shall be scrambled into bits  $b_5(1), b_5(2), \dots, b_5(432)$ , according to clause 8.2.5.1, with the scrambling sequence as defined in clause 8.2.5.2.

The multiplexed bits of block-1 are defined as:

$$bkn1(k) = b_5(k), \quad \text{for } k = 1, 2, \dots, 216 \quad (8.50)$$

In case of frame stealing of block-1  $bkn1(1), bkn1(2), \dots, bkn1(216)$  shall be discarded, and replaced with the STCH bits as defined in clause 8.3.1.4.1 for block-1.

The multiplexed bits of block-2 are defined as:

$$bkn2(k) = b_5(k+216), \quad \text{for } k = 1, 2, \dots, 216 \quad (8.51)$$

In case of frame stealing of block-2,  $bkn2(1), bkn2(2), \dots, bkn2(216)$  shall be discarded, and replaced with the STCH bits as defined in clause 8.3.1.4.1 for block-2.

### 8.3.1.3.4 Traffic CHannel, net rate = 7,2 kbit/s (TCH/7,2)

A sequence of  $M$  type-1 blocks,  $B_1(m)$ ,  $m = 1, 2, \dots, M$ , shall be transmitted, whereby  $M$  is not limited.

One type-1 block shall contain 432 type-1 bits,  $b_1(1), b_1(2), \dots, b_1(432)$ .

There shall be 432 type-4 bits, which are the same as the type-1 bits:

$$b_4(k) = b_1(k), \quad \text{for } k = 1, 2, \dots, 432 \quad (8.52)$$

The 432 type-4 bit  $b_4(1), b_4(2), \dots, b_4(432)$  shall compose the type-4 block for TCH/7,2. They shall be scrambled into bits  $b_5(1), b_5(2), \dots, b_5(432)$ , according to clause 8.2.5.1, with the scrambling sequence as defined in clause 8.2.5.2.

The multiplexed bits of block-1 shall be defined as:

$$bkn1(k) = b_5(k), \quad \text{for } k = 1, 2, \dots, 216 \quad (8.53)$$

In case of frame stealing of block-1  $bkn1(1), bkn1(2), \dots, bkn1(216)$  shall be discarded, and replaced with the STCH bits as defined in clause 8.3.1.4.1 for block-1.

The multiplexed bits of block-2 shall be defined as:

$$bkn2(k) = b_5(k+216), \quad \text{for } k = 1, 2, \dots, 216 \quad (8.54)$$

In case of frame stealing of block-2,  $bkn2(1), bkn2(2), \dots, bkn2(216)$  shall be discarded, and replaced with the STCH bits as defined in clause 8.3.1.4.1 for block-2.

### 8.3.1.3.5 Traffic Channel-P8, net rate = 10,8 kbit/s (TCH-P8/10,8)

A sequence of  $M$  type-1 blocks,  $B_1(m)$ ,  $m = 1, 2, \dots, M$ , shall be transmitted, whereby  $M$  is not limited.

One type-1 block shall contain 648 type-1 bits,  $b_1(1), b_1(2), \dots, b_1(648)$ .

There shall be 648 type-4 bits, which are the same as the type-1 bits:

$$b_4(k) = b_1(k), \quad \text{for } k = 1, 2, \dots, 648 \quad (8.55)$$

The 648 type-4 bit  $b_4(1), b_4(2), \dots, b_4(648)$  shall compose the type-4 block for TCH-P8/10,8. They shall be scrambled into bits  $b_5(1), b_5(2), \dots, b_5(648)$ , according to clause 8.2.5.1, with the scrambling sequence as defined in clause 8.2.5.2.

The multiplexed bits of block-1 shall be defined as:

$$bkn1(k) = b_5(k), \quad \text{for } k = 1, 2, \dots, 324 \quad (8.56)$$

The multiplexed bits of block-2 shall be defined as:

$$bkn2(k) = b_5(k+324), \quad \text{for } k = 1, 2, \dots, 324 \quad (8.57)$$

### 8.3.1.3.6 Speech Traffic Channel, full slot (TCH/S)

ETSI EN 300 395-2 [21] defines in clause 5.5.3 432 type-4 bits  $C_4(1), C_4(2), \dots, C_4(432)$ . For the purpose of scrambling those bits are mapped into  $b_4(k) = C_4(k)$  for  $k = 1, 2, \dots, 432$ . The  $b_4(1), b_4(2), \dots, b_4(432)$  bits shall be scrambled into bits  $b_5(1), b_5(2), \dots, b_5(432)$ , according to clause 8.2.5.1, with the scrambling sequence as defined in clause 8.2.5.2.

The multiplexed bits of block-1 shall be defined as:

$$bkn1(k) = b_5(k), \quad \text{for } k = 1, 2, \dots, 216 \quad (8.58)$$

and the multiplexed bits of block-2 shall be defined as:

$$bkn2(k) = b_5(k + 216), \quad \text{for } k = 1, 2, \dots, 216 \quad (8.59)$$

NOTE: It is considered that the MS is not stealing from a full slot speech channel but the MAC first informs the speech channel encoder which discards the type-1 bits of speech frame A and then uses half slot speech channel encoding for the type-1 bits of speech frame B.

### 8.3.1.3.7 Speech Traffic Channel, half slot (TCH/S)

ETSI EN 300 395-2 [21] defines in clauses 5.4.3.2, 5.6.2 and 5.6.2.1 216 type-3 bits  $C_3(1), C_3(2), \dots, C_3(216)$ . For the purpose of further processing those bits are mapped into  $b_3(k) = C_3(k)$  for  $k = 1, 2, \dots, 216$ .

As specified in ETSI EN 300 395-2 [21] clause 5.6.3, a (216, 101) block interleaver (see clause 8.2.4.1) shall re-order the 216 type-3 bits  $b_3(1), b_3(2), \dots, b_3(216)$ , into 216 type-4 bits,  $b_4(1), b_4(2), \dots, b_4(216)$ .

The 216 type-4 bits  $b_4(1), b_4(2), \dots, b_4(216)$  shall compose the type-4 block for the half slot speech channel. They shall be scrambled into bits  $b_5(1), b_5(2), \dots, b_5(216)$ , according to clause 8.2.5.1, with the scrambling sequence as defined in clause 8.2.5.2.

The multiplexed bits of block-2 shall be defined as:

$$bkn2(k) = b_5(k), \quad \text{for } k = 1, 2, \dots, 216 \quad (8.60)$$

NOTE: The MAC does not use block-1 for half slot speech transmission.

### 8.3.1.4 Signalling channels for signalling and packet mode data

#### 8.3.1.4.1 Signalling CHannel for mapping onto Half-bursts on the Downlink (SCH/HD), Broadcast Network CHannel (BNCH), and STealing CHannel (STCH)

One type-1 block shall contain 124 type-1 bits,  $b_1(1), b_1(2), \dots, b_1(124)$ .

A (140,124) block code shall encode the 124 type-1 bits into 140 block-encoded bits  $b_2(1), b_2(2), \dots, b_2(140)$ . This code shall be the  $(K_I+16, K_I)$  block code as defined in clause 8.2.3.3, with  $K_I = 124$ .

Four tail bits,  $b_2(141), b_2(142), b_2(143), b_2(144)$ , all set equal to zero, shall be appended to the 140 block-encoded bits.

The resultant bits  $b_2(1), b_2(2), \dots, b_2(144)$  shall be the type-2 bits.

A 16-state RCPC code with rate 2/3 (see clause 8.2.3.1) shall encode the 144 type-2 bits into 216 type-3 bits,  $b_3(1), b_3(2), \dots, b_3(216)$ .

A (216,101) block interleaver (see clause 8.2.4.1) shall re-order the 216 type-3 bits into 216 type-4 bits,  $b_4(1), b_4(2), \dots, b_4(216)$ .

The 216 type-4 bits  $b_4(1), b_4(2), \dots, b_4(216)$  shall compose the type-4 block for SCH/HD, BNCH, and STCH. They shall be scrambled into bits  $b_5(1), b_5(2), \dots, b_5(216)$ , according to clause 8.2.5.1, with the scrambling sequence as defined in clause 8.2.5.2.

The type-5 bits may be multiplexed onto block-1, in which case the multiplexed bits are defined as:

$$b_{kn1}(k) = b_5(k), \quad \text{for } k = 1, 2, \dots, 216 \quad (8.61)$$

or they may be multiplexed into block-2, in which case the multiplexed bits shall be defined as:

$$b_{kn2}(k) = b_5(k), \quad \text{for } k = 1, 2, \dots, 216 \quad (8.62)$$

#### 8.3.1.4.2 Signalling CHannel for mapping onto Half-bursts on the Downlink (SCH-P8/HD)

One type-1 block shall contain 196 type-1 bits,  $b_1(1), b_1(2), \dots, b_1(196)$ .

A (212,196) block code shall encode the 196 type-1 bits into 212 block-encoded bits  $b_2(1), b_2(2), \dots, b_2(212)$ . This code shall be the  $(K_I+16, K_I)$  block code as defined in clause 8.2.3.3, with  $K_I = 196$ .

Four tail bits,  $b_2(213), b_2(214), b_2(215), b_2(216)$ , all set equal to zero, shall be appended to the 212 block-encoded bits.

The resultant bits  $b_2(1), b_2(2), \dots, b_2(216)$  shall be the type-2 bits.

A 16-state RCPC code with rate 2/3 (see clause 8.2.3.1) shall encode the 216 type-2 bits into 324 type-3 bits,  $b_3(1), b_3(2), \dots, b_3(324)$ .

A (324,19) block interleaver (see clause 8.2.4.1) shall re-order the 324 type-3 bits into 324 type-4 bits,  $b_4(1), b_4(2), \dots, b_4(324)$ .

The 324 type-4 bits  $b_4(1), b_4(2), \dots, b_4(324)$  shall compose the type-4 block for SCH-P8/HD. They shall be scrambled into bits  $b_5(1), b_5(2), \dots, b_5(324)$ , according to clause 8.2.5.1, with the scrambling sequence as defined in clause 8.2.5.2.

The type-5 bits may be multiplexed onto block-1, in which case the multiplexed bits are defined as:

$$b_{kn1}(k) = b_5(k), \quad \text{for } k = 1, 2, \dots, 324 \quad (8.63)$$

or they may be multiplexed into block-2, in which case the multiplexed bits shall be defined as:

$$b_{kn2}(k) = b_5(k), \quad \text{for } k = 1, 2, \dots, 324 \quad (8.64)$$

### 8.3.1.4.3 Signalling CHannel for mapping onto Half-bursts on the Uplink (SCH/HU)

One type-1 block shall contain 92 type-1 bits  $b_1(1), b_1(2), \dots, b_1(92)$ .

A (108,92) block code shall encode the 92 type-1 bits into 108 block-encoded bits,  $b_2(1), b_2(2), \dots, b_2(108)$ . This code is the  $(K_I+16, K_I)$  block code as defined in clause 8.2.3.3, with  $K_I=92$ .

Four tail bits,  $b_2(109), b_2(110), b_2(111), b_2(112)$ , all set equal to zero, shall be appended to the 108 block-encoded bits.

The resultant bits  $b_2(1), b_2(2), \dots, b_2(112)$  shall be the type-2 bits.

A 16-state RCPC code with rate 2/3 (see clause 8.2.3.1) shall encode the 112 type-2 bits into 168 type-3 bits,  $b_3(1), b_3(2), \dots, b_3(168)$ .

A (168, 13) block interleaver (see clause 8.2.4.1) shall re-order the 168 type-3 bits into 168 type-4 bits,  $b_4(1), b_4(2), \dots, b_4(168)$ .

The 168 type-4 bits  $b_4(1), b_4(2), \dots, b_4(168)$  shall compose the type-4 block for SCH/HU. They shall be scrambled into bits  $b_5(1), b_5(2), \dots, b_5(168)$ , according to clause 8.2.5.1, with the scrambling sequence as defined in clause 8.2.5.2.

The multiplexed bits of the control block (which is the type-5 block for SCH/HU) are defined as:

$$cb(k) = b_5(k), \quad \text{for } k = 1, 2, \dots, 168 \quad (8.65)$$

### 8.3.1.4.4 Signalling CHannel for mapping onto Half-bursts on the Uplink (SCH-P8/HU)

One type-1 block shall contain 148 type-1 bits  $b_1(1), b_1(2), \dots, b_1(148)$ .

A (164,148) block code shall encode the 148 type-1 bits into 164 block-encoded bits,  $b_2(1), b_2(2), \dots, b_2(164)$ . This code is the  $(K_I+16, K_I)$  block code as defined in clause 8.2.3.3, with  $K_I=148$ .

Four tail bits,  $b_2(165), b_2(166), b_2(167), b_2(168)$ , all set equal to zero, shall be appended to the 164 block-encoded bits.

The resultant bits  $b_2(1), b_2(2), \dots, b_2(168)$  shall be the type-2 bits.

A 16-state RCPC code with rate 2/3 (see clause 8.2.3.1) shall encode the 168 type-2 bits into 252 type-3 bits,  $b_3(1), b_3(2), \dots, b_3(252)$ .

A (252, 17) block interleaver (see clause 8.2.4.1) shall re-order the 252 type-3 bits into 252 type-4 bits,  $b_4(1), b_4(2), \dots, b_4(252)$ .

The 252 type-4 bits  $b_4(1), b_4(2), \dots, b_4(252)$  shall compose the type-4 block for SCH-P8/HU. They shall be scrambled into bits  $b_5(1), b_5(2), \dots, b_5(252)$ , according to clause 8.2.5.1, with the scrambling sequence as defined in clause 8.2.5.2.

The multiplexed bits of the control block (which is the type-5 block for SCH-P8/HU) are defined as:

$$cb(k) = b_5(k), \quad \text{for } k = 1, 2, \dots, 252 \quad (8.66)$$

### 8.3.1.4.5 Signalling CHannel for mapping onto Full bursts (SCH/F)

One type-1 block shall contain 268 type-1 bits,  $b_1(1), b_1(2), \dots, b_1(268)$ .

A (284,268) block code shall encode the 268 type-1 bits into 284 block-encoded bits  $b_2(1), b_2(2), \dots, b_2(284)$ . This code shall be the  $(K_I+16, K_I)$  block code as defined in clause 8.2.3.3, with  $K_I=268$ .

Four tail bits,  $b_2(285), b_2(286), b_2(287), b_2(288)$ , all set equal to zero, shall be appended to the 284 block-encoded bits.

The resultant bits  $b_2(1), b_2(2), \dots, b_2(288)$  shall be the type-2 bits.

A 16-state RCPC code with rate 2/3 (see clause 8.2.3.1) encodes the 288 type-2 bits into 432 type-3 bits,  $b_3(1), b_3(2), \dots, b_3(432)$ .

A (432,103) block interleaver (see clause 8.2.4.1) shall re-order the 432 type-3 bits into 432 type-4 bits,  $b_4(1), b_4(2), \dots, b_4(432)$ .

The 432 type-4 bits  $b_4(1), b_4(2), \dots, b_4(432)$  shall compose the type-4 block for SCH/F. They shall be scrambled into bits  $b_5(1), b_5(2), \dots, b_5(432)$ , according to clause 8.2.5.1, with the scrambling sequence as defined in clause 8.2.5.2.

The multiplexed bits of block-1 are defined as:

$$b_{kn1}(k) = b_5(k), \quad \text{for } k = 1, 2, \dots, 216 \quad (8.67)$$

and the multiplexed bits of block 2 are defined as:

$$b_{kn2}(k) = b_5(k+216), \quad \text{for } k = 1, 2, \dots, 216 \quad (8.68)$$

#### 8.3.1.4.6 Signalling CHannel for mapping onto Full bursts (SCH-P8/F)

One type-1 block shall contain 412 type-1 bits,  $b_1(1), b_1(2), \dots, b_1(412)$ .

A (428,412) block code shall encode the 412 type-1 bits into 428 block-encoded bits  $b_2(1), b_2(2), \dots, b_2(428)$ . This code shall be the  $(K_I+16, K_I)$  block code as defined in clause 8.2.3.3, with  $K_I = 412$ .

Four tail bits,  $b_2(429), b_2(430), b_2(431), b_2(432)$ , all set equal to zero, shall be appended to the 428 block-encoded bits.

The resultant bits  $b_2(1), b_2(2), \dots, b_2(432)$  shall be the type-2 bits.

A 16-state RCPC code with rate 2/3 (see clause 8.2.3.1) encodes the 432 type-2 bits into 648 type-3 bits,  $b_3(1), b_3(2), \dots, b_3(648)$ .

A (648,23) block interleaver (see clause 8.2.4.1) shall re-order the 648 type-3 bits into 648 type-4 bits,  $b_4(1), b_4(2), \dots, b_4(648)$ .

The 648 type-4 bits  $b_4(1), b_4(2), \dots, b_4(648)$  shall compose the type-4 block for SCH-P8/F. They shall be scrambled into bits  $b_5(1), b_5(2), \dots, b_5(648)$ , according to clause 8.2.5.1, with the scrambling sequence as defined in clause 8.2.5.2.

The multiplexed bits of block-1 are defined as:

$$b_{kn1}(k) = b_5(k), \quad \text{for } k = 1, 2, \dots, 324 \quad (8.69)$$

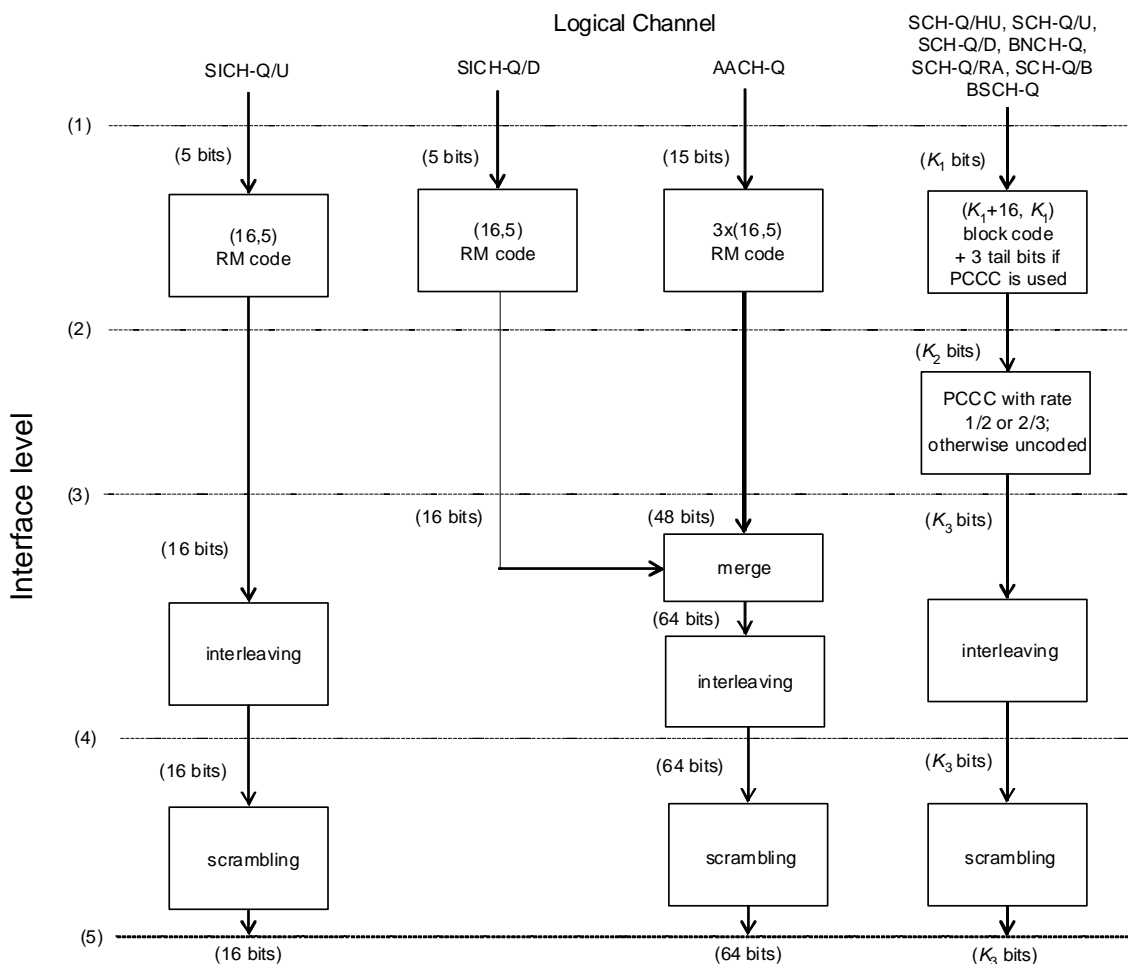

and the multiplexed bits of block 2 are defined as:

$$b_{kn2}(k) = b_5(k+324), \quad \text{for } k = 1, 2, \dots, 324 \quad (8.70)$$

## 8.3.2 Error control schemes for QAM

### 8.3.2.0 General

The error control scheme associated with each logical channel employing QAM is defined in clauses 8.3.2.1 to 8.3.2.9. Figure 8.8 gives the error control structure.

**Figure 8.8: Error control structure for QAM logical channels**

### 8.3.2.1 Slot Information Channel - QAM/Uplink (SICH-Q/U)

A type-1 block shall contain 5 type-1 bits  $b_1(1), b_1(2), \dots, b_1(5)$ .

A (16,5) RM code (see clause 8.2.3.5) shall encode the 5 type-1 bits into 16 type-2 bits,  $b_2(1), b_2(2), \dots, b_2(16)$ .

The type-3 bits shall be the same as the type-2 bits:

$$b_3(k) = b_2(k), \quad k = 1, 2, \dots, 16 \quad (8.71)$$

The 16 type-3 bits  $b_3(1), b_3(2), \dots, b_3(16)$  compose the type-3 block for SICH-Q/U. They shall be interleaved into 16 type-4 bits  $b_4(1), b_4(2), \dots, b_4(16)$  according to clause 8.2.4.3, with interleaving parameters given by the second row of table 8.2.

The 16 type-4 bits  $b_4(1), b_4(2), \dots, b_4(16)$  shall be scrambled into 16 type-5 bits  $b_5(1), b_5(2), \dots, b_5(16)$  according to clause 8.2.5.1, with scrambling sequence as defined in clause 8.2.5.2.

### 8.3.2.2 Slot Information Channel - QAM/Downlink (SICH-Q/D)

A type-1 block shall contain 5 type-1 bits  $b_1(1), b_1(2), \dots, b_1(5)$ .

A (16,5) RM code (see clause 8.2.3.5) shall encode the 5 type-1 bits into 16 type-2 bits,  $b_2(1), b_2(2), \dots, b_2(16)$ .

The type-3 bits shall be the same as the type-2 bits:

$$b_3(k) = b_2(k), \quad k = 1, 2, \dots, 16 \quad (8.72)$$

The 16 type-3 bits  $b_3(1), b_3(2), \dots, b_3(16)$  compose the type-3 block for SICH-Q/D. As described in clause 8.3.2.3, they shall be merged with the type-3 bits relevant to the AACH-Q and shall then undergo block interleaving and scrambling.

### 8.3.2.3 Access Assignment Channel - QAM (AACH-Q)

A type-1 block shall contain 15 type-1 bits  $b_1(1), b_1(2), \dots, b_1(15)$ . This sequence is split into three 5-bit sub-sequences, as follows:

- 1<sup>st</sup> sub-sequence:  $b_1(1), b_1(2), \dots, b_1(5)$ ;
- 2<sup>nd</sup> sub-sequence:  $b_1(6), b_1(7), \dots, b_1(10)$ ;
- 3<sup>rd</sup> sub-sequence:  $b_1(11), b_1(12), \dots, b_1(15)$ .

A (16,5) RM code (see clause 8.2.3.5) shall encode each of the above three sub-sequences into 16 type-2 bits, as follows:

- the sequence  $b_1(1), b_1(2), \dots, b_1(5)$  shall produce the sequence  $b_2(1), b_2(2), \dots, b_2(16)$ ;
- the sequence  $b_1(6), b_1(7), \dots, b_1(10)$  shall produce the sequence  $b_2(17), b_2(18), \dots, b_2(32)$ ;
- the sequence  $b_1(11), b_1(12), \dots, b_1(15)$  shall produce the sequence  $b_2(33), b_2(34), \dots, b_2(48)$ .

The three encoded sequences are then merged into a single 48 type-2 bits sequence  $b_2(1), b_2(2), \dots, b_2(48)$ .

The type-3 bits shall be the same as the type-2 bits:

$$b_3(k) = b_2(k), \quad k = 1, 2, \dots, 48 \quad (8.73)$$

The 48 type-3 bits  $b_3(1), b_3(2), \dots, b_3(48)$  compose the type-3 block for AACH-Q. They shall be merged with the type-3 bits relevant to the SICH-Q/D so as to generate the 64 type-3 bits  $b'_3(1), b'_3(2), \dots, b'_3(64)$ , as follows:

- the first 16 bits  $b'_3(1), b'_3(2), \dots, b'_3(16)$  shall coincide with the type-3 block for SICH-Q/D (see clause 8.3.2.2);
- the remaining 48 bits  $b'_3(17), b'_3(18), \dots, b'_3(64)$  shall coincide with the type-3 block for AACH-Q.

The 64 type-3 bits  $b'_3(1), b'_3(2), \dots, b'_3(64)$  shall be interleaved into 64 type-4 bits  $b_4(1), b_4(2), \dots, b_4(64)$  according to clause 8.2.4.3, with interleaving parameters given by the last row of table 8.2.

The 64 type-4 bits  $b_4(1), b_4(2), \dots, b_4(64)$  shall be scrambled into 64 type-5 bits  $b_5(1), b_5(2), \dots, b_5(64)$  according to clause 8.2.5.1, with scrambling sequence as defined in clause 8.2.5.2.

### 8.3.2.4 Signalling Channel - QAM/Half slot Uplink (SCH-Q/HU)

One type-1 block shall contain  $K_1$  type-1 bits  $b_1(1), b_1(2), \dots, b_1(K_1)$  where  $K_1$  depends on the bandwidth, the modulation and the PCCC coding rate. Table 8.7 shows the values of  $K_1$  for all allowed bandwidths, modulations and coding rates.

**Table 8.7: Values of  $K_1$  for logical channel SCH-Q/HU**

| Number of sub-carriers | 4-QAM     | 16-QAM    |         | 64-QAM    |           |         |
|------------------------|-----------|-----------|---------|-----------|-----------|---------|
|                        | $r = 1/2$ | $r = 1/2$ | uncoded | $r = 1/2$ | $r = 2/3$ | uncoded |
| 8                      | 57        | 133       | 288     | 209       | 285       | 440     |
| 16                     | 141       | 301       | 624     | 461       | 621       | 944     |
| 32                     | 309       | 637       | 1 296   | 965       | 1 293     | 1 952   |
| 48                     | 477       | 973       | 1 968   | 1 469     | 1 965     | 2 960   |

A  $(K_1 + 16, K_1)$  block code shall encode the  $K_1$  type-1 bits into  $K_1 + 16$  block-encoded type-2 bits  $b_2(1), b_2(2), \dots, b_2(K_1 + 16)$ . This code is the  $(K_1 + 16, K_1)$  block code defined in clause 8.2.3.3, with  $K_1$  one of the values of table 8.7.

In case a PCCC encoder is used with coding rate  $r$  equal to  $1/2$  or  $2/3$  (see clause 8.2.3.4), three tail bits,  $b_2(K_1 + 17), b_2(K_1 + 18), b_2(K_1 + 19)$ , whose values are as specified in table 8.1, shall be appended to the  $K_1 + 16$  block-encoded bits. If PCCC is not used (uncoded case), no tail bits shall be appended to the  $K_1 + 16$  block-encoded bits.

The resultant bits  $b_2(1), b_2(2), \dots, b_2(K_2)$  shall be the type-2 bits, with  $K_2 = K_1 + 19$  or  $K_2 = K_1 + 16$  depending on whether PCCC is used or not, respectively.

As already mentioned, a PCCC scheme with coding rate  $r$  equal to  $1/2$  or  $2/3$  may be used to encode the  $K_2$  type-2 bits into  $K_3$  type-3 bits,  $b_3(1), b_3(2), \dots, b_3(K_3)$ . Alternatively, no PCCC encoder may be used (uncoded case) and in this case  $K_3 = K_2 = K_1 + 16$ . The possible values of  $K_3$  depending on bandwidth and modulation are shown in table 8.8.

**Table 8.8: Values of  $K_3$  for logical channel SCH-Q/HU**

| Number of subcarriers | 4-QAM $K_3$ | 16-QAM $K_3$ | 64-QAM $K_3$ |
|-----------------------|-------------|--------------|--------------|
| 8                     | 152         | 304          | 456          |
| 16                    | 320         | 640          | 960          |
| 32                    | 656         | 1 312        | 1 968        |
| 48                    | 992         | 1 984        | 2 976        |

A  $(K_3, a)$  block interleaver (see clause 8.2.4.3, tables 8.3 to 8.6) shall re-order the  $K_3$  type-3 bits into  $K_4 = K_3$  type-4 bits,  $b_4(1), b_4(2), \dots, b_4(K_4)$ . The  $K_4$  type-4 bits  $b_4(1), b_4(2), \dots, b_4(K_4)$  shall compose the type-4 block for SCH-Q/HU. They shall be scrambled into  $K_5 = K_4$  bits  $b_5(1), b_5(2), \dots, b_5(K_5)$ , according to clause 8.2.5.1, with the scrambling sequence as defined in clause 8.2.5.2.

### 8.3.2.5 Signalling Channel - QAM/Uplink (SCH-Q/U)

One type-1 block shall contain  $K_1$  type-1 bits  $b_1(1), b_1(2), \dots, b_1(K_1)$ , where  $K_1$  depends on the bandwidth, the modulation and the PCCC coding rate. Table 8.9 shows the values of  $K_1$  for all allowed bandwidths, modulations and coding rates.

**Table 8.9: Values of  $K_1$  for logical channel SCH-Q/U**

| Number of sub-carriers | 4-QAM     | 16-QAM    |         | 64-QAM    |           |         |
|------------------------|-----------|-----------|---------|-----------|-----------|---------|
|                        | $r = 1/2$ | $r = 1/2$ | uncoded | $r = 1/2$ | $r = 2/3$ | uncoded |
| 8                      | 181       | 381       | 784     | 581       | 781       | 1 184   |
| 16                     | 389       | 797       | 1 616   | 1 205     | 1 613     | 2 432   |
| 32                     | 805       | 1 629     | 3 280   | 2 453     | 3 277     | 4 928   |
| 48                     | 1 221     | 2 461     | 4 944   | 3 701     | 4 941     | 7 424   |

A  $(K_I + 16, K_I)$  block code shall encode the  $K_I$  type-1 bits into  $K_I + 16$  block-encoded type-2 bits  $b_2(1), b_2(2), \dots, b_2(K_I + 16)$ . This code is the  $(K_I + 16, K_I)$  block code defined in clause 8.2.3.3, with  $K_I$  one of the values of table 8.9.

In case a PCCC encoder is used with coding rate  $r$  equal to 1/2 or 2/3 (see clause 8.2.3.4), three tail bits,  $b_2(K_I + 17)$ ,  $b_2(K_I + 18)$ ,  $b_2(K_I + 19)$ , whose values are as specified in table 8.1, shall be appended to the  $K_I + 16$  block-encoded bits. If PCCC is not used (uncoded case), no tail bits shall be appended to the  $K_I + 16$  block-encoded bits.

The resultant bits  $b_2(1), b_2(2), \dots, b_2(K_2)$  shall be the type-2 bits, with  $K_2 = K_I + 19$  or  $K_2 = K_I + 16$  depending on whether PCCC is used or not, respectively.

As already mentioned, a PCCC scheme with coding rate  $r$  equal to 1/2 or 2/3 may be used to encode the  $K_2$  type-2 bits into  $K_3$  type-3 bits,  $b_3(1), b_3(2), \dots, b_3(K_3)$ . Alternatively, no PCCC encoder may be used (uncoded case) and in this case  $K_3 = K_2 = K_I + 16$ . The possible values of  $K_3$  depending on bandwidth and modulation are shown in table 8.10.

**Table 8.10: Values of  $K_3$  for logical channel SCH-Q/U**

| Number of subcarriers | 4-QAM $K_3$ | 16-QAM $K_3$ | 64-QAM $K_3$ |
|-----------------------|-------------|--------------|--------------|
| 8                     | 400         | 800          | 1 200        |
| 16                    | 816         | 1 632        | 2 448        |
| 32                    | 1 648       | 3 296        | 4 944        |
| 48                    | 2 480       | 4 960        | 7 440        |

A  $(K_3, a)$  block interleaver (see clause 8.2.4.3, tables 8.3 to 8.6) shall re-order the  $K_3$  type-3 bits into  $K_4 = K_3$  type-4 bits,  $b_4(1), b_4(2), \dots, b_4(K_4)$ . The  $K_4$  type-4 bits  $b_4(1), b_4(2), \dots, b_4(K_4)$  shall compose the type-4 block for SCH-Q/U. They shall be scrambled into  $K_5 = K_4$  bits  $b_5(1), b_5(2), \dots, b_5(K_5)$ , according to clause 8.2.5.1, with the scrambling sequence as defined in clause 8.2.5.2.

### 8.3.2.6 Signalling Channel - QAM/Downlink (SCH-Q/D) and Broadcast Network Channel - QAM (BNCH-Q)

One type-1 block shall contain  $K_I$  type-1 bits  $b_1(1), b_1(2), \dots, b_1(K_I)$ , where  $K_I$  depends on the bandwidth, the modulation and the PCCC coding rate. Table 8.11 shows the values of  $K_I$  for all allowed bandwidths, modulations and coding rates.

**Table 8.11: Values of  $K_I$  for logical channels SCH-Q/D and BNCH-Q**

| Number of sub-carriers | 4-QAM     |           | 16-QAM  |           | 64-QAM    |         |
|------------------------|-----------|-----------|---------|-----------|-----------|---------|
|                        | $r = 1/2$ | $r = 1/2$ | uncoded | $r = 1/2$ | $r = 2/3$ | uncoded |
| 8                      | 185       | 389       | 800     | 593       | 797       | 1 208   |
| 16                     | 421       | 861       | 1 744   | 1 301     | 1 741     | 2 624   |
| 32                     | 893       | 1 805     | 3 632   | 2 717     | 3 629     | 5 456   |
| 48                     | 1 365     | 2 749     | 5 520   | 4 133     | 5 517     | 8 288   |

A  $(K_I + 16, K_I)$  block code shall encode the  $K_I$  type-1 bits into  $K_I + 16$  block-encoded type-2 bits  $b_2(1), b_2(2), \dots, b_2(K_I + 16)$ . This code is the  $(K_I + 16, K_I)$  block code defined in clause 8.2.3.3, with  $K_I$  one of the values of table 8.11.

In case a PCCC encoder is used with coding rate  $r$  equal to 1/2 or 2/3 (see clause 8.2.3.4), three tail bits,  $b_2(K_I + 17)$ ,  $b_2(K_I + 18)$ ,  $b_2(K_I + 19)$ , whose values are as specified in table 8.1, shall be appended to the  $K_I + 16$  block-encoded bits. If PCCC is not used (uncoded case), no tail bits shall be appended to the  $K_I + 16$  block-encoded bits.

The resultant bits  $b_2(1), b_2(2), \dots, b_2(K_2)$  shall be the type-2 bits, with  $K_2 = K_I + 19$  or  $K_2 = K_I + 16$  depending on whether PCCC is used or not, respectively.

As already mentioned, a PCCC scheme with coding rate  $r$  equal to 1/2 or 2/3 may be used to encode the  $K_2$  type-2 bits into  $K_3$  type-3 bits,  $b_3(1), b_3(2), \dots, b_3(K_3)$ . Alternatively, no PCCC encoder may be used (uncoded case) and in this case  $K_3 = K_2 = K_I + 16$ . The possible values of  $K_3$  depending on bandwidth and modulation are shown in table 8.12.

**Table 8.12: Values of  $K_3$  for logical channels SCH-Q/D and BNCH-Q**

| Number of subcarriers | 4-QAM $K_3$ | 16-QAM $K_3$ | 64-QAM $K_3$ |
|-----------------------|-------------|--------------|--------------|
| 8                     | 408         | 816          | 1 224        |
| 16                    | 880         | 1 760        | 2 640        |
| 32                    | 1 824       | 3 648        | 5 472        |
| 48                    | 2 768       | 5 536        | 8 304        |

A ( $K_3, a$ ) block interleaver (see clause 8.2.4.3, tables 8.3 to 8.6) shall re-order the  $K_3$  type-3 bits into  $K_4 = K_3$  type-4 bits,  $b_4(1), b_4(2), \dots, b_4(K_4)$ . The  $K_4$  type-4 bits  $b_4(1), b_4(2), \dots, b_4(K_4)$  shall compose the type-4 block for SCH-Q/D or BNCH-Q. They shall be scrambled into  $K_5 = K_4$  bits  $b_5(1), b_5(2), \dots, b_5(K_5)$  according to clause 8.2.5.1, with the scrambling sequence as defined in clause 8.2.5.2.

### 8.3.2.7 Signalling Channel - QAM/Random Access (SCH-Q/RA)

One type-1 block shall contain  $K_1 = 65$  type-1 bits  $b_1(1), b_1(2), \dots, b_1(65)$ .

A (81,65) block code shall encode the 65 type 1 bits into 81 block-encoded bits  $b_2(1), b_2(2), \dots, b_2(81)$ . This code shall be the ( $K_1 + 16, K_1$ ) block code defined in clause 8.2.3.3, with  $K_1 = 65$ .

Three tail bits,  $b_2(82), b_2(83), b_2(84)$ , whose values are as specified in table 8.1, shall be appended to the 81 block-encoded bits. The resultant bits  $b_2(1), b_2(2), \dots, b_2(K_2)$ , with  $K_2 = 84$ , shall be the type-2 bits.

A PCCC scheme with coding rate  $r$  equal to 1/2 shall be used to encode the 84 type-2 bits into  $K_3 = 168$  type-3 bits,  $b_3(1), b_3(2), \dots, b_3(168)$ .

A (168,13) block interleaver (see clause 8.2.4.3, table 8.3) shall re-order the 168 type-3 bits into  $K_4 = K_3 = 168$  type-4 bits,  $b_4(1), b_4(2), \dots, b_4(168)$ . The type-4 bits  $b_4(1), b_4(2), \dots, b_4(168)$  shall compose the type-4 block for SCH-Q/RA. They shall be scrambled into  $K_5 = K_4 = 168$  bits  $b_5(1), b_5(2), \dots, b_5(168)$ , according to clause 8.2.5.1, with the scrambling sequence as defined in clause 8.2.5.2.

### 8.3.2.8 Broadcast Synchronization Channel - QAM (BSCH-Q)

One type-1 block shall contain 117 type-1 bits  $b_1(1), b_1(2), \dots, b_1(117)$ . Only the 4-QAM modulation is applicable. Only coding rate  $r$  equal to 1/2 is applicable.

A (133,117) block code shall encode the 117 type-1 bits into 133 block-encoded bits,  $b_2(1), b_2(2), \dots, b_2(133)$ . This code is the ( $K_1 + 16, K_1$ ) block code as defined in clause 8.2.3.3, with  $K_1 = 117$ .

Three tail bits,  $b_2(134), b_2(135), b_2(136)$ , whose values are as specified in table 8.1, shall be appended to the 133 block-encoded bits.

The resultant bits  $b_2(1), b_2(2), \dots, b_2(136)$  shall be the type-2 bits.

A PCCC scheme with coding rate 1/2 (see clause 8.2.3.4) shall encode the 136 type-2 bits into 272 type-3 bits,  $b_3(1), b_3(2), \dots, b_3(272)$ .

A (272,19) block interleaving (see clause 8.2.4.3) shall re-order the 272 type-3 bits into 272 type-4 bits,  $b_4(1), b_4(2), \dots, b_4(272)$ .

The 272 type-4 bits,  $b_4(1), b_4(2), \dots, b_4(272)$  compose the type-4 block for BSCH-Q. They shall be scrambled into bits  $b_5(1), b_5(2), \dots, b_5(272)$ , according to clause 8.2.5.1, with the scrambling sequence as defined in clause 8.2.5.2.

The multiplexed bits of the synchronization block shall be defined as:

$$sb(k) = b_5(k), \quad \text{for } k = 1, 2, \dots, 272 \quad (8.74)$$

### 8.3.2.9 Signalling Channel Data set B - QAM (SCH-Q/B)

One type-1 block shall contain  $K_1$  type-1 bits  $b_1(1), b_1(2), \dots, b_1(K_1)$ , where  $K_1$  depends on the bandwidth. Only the 4-QAM modulation is applicable. Only coding rate  $r$  equal to 1/2 is applicable. Table 8.13 shows the values of  $K_1$  for all allowed bandwidths.

**Table 8.13: Values of  $K_1$  for logical channel SCH-Q/B**

| Number of sub-carriers | 4-QAM     |
|------------------------|-----------|
|                        | $r = 1/2$ |
| 8                      | -         |
| 16                     | 217       |
| 32                     | 689       |
| 48                     | 1 161     |

A  $(K_1 + 16, K_1)$  block code shall encode the  $K_1$  type-1 bits into  $K_1 + 16$  block-encoded type-2 bits  $b_2(1), b_2(2), \dots, b_2(K_1 + 16)$ . This code is the  $(K_1 + 16, K_1)$  block code defined in clause 8.2.3.3, with  $K_1$  one of the values of table 8.13.

Three tail bits,  $b_2(K_1 + 17), b_2(K_1 + 18), b_2(K_1 + 19)$ , whose values are as specified in table 8.1, shall be appended to the  $K_1 + 16$  block-encoded bits.

The resultant bits  $b_2(1), b_2(2), \dots, b_2(K_2)$  shall be the type-2 bits, with  $K_2 = K_1 + 19$ .

A PCCC scheme with coding rate 1/2 shall encode the  $K_2$  type-2 bits into  $K_3$  type-3 bits,  $b_3(1), b_3(2), \dots, b_3(K_3)$ . The possible values of  $K_3$  depending on bandwidth are shown in table 8.14.

**Table 8.14: Values of  $K_3$  for logical channel SCH-Q/B**

| Number of subcarriers | 4-QAM $K_3$ |
|-----------------------|-------------|
| 8                     | -           |
| 16                    | 472         |
| 32                    | 1 416       |
| 48                    | 2 360       |

A  $(K_3, a)$  block interleaver (see clause 8.2.4.3, tables 8.4 to 8.6) shall re-order the  $K_3$  type-3 bits into  $K_4 = K_3$  type-4 bits,  $b_4(1), b_4(2), \dots, b_4(K_4)$ . The  $K_4$  type-4 bits  $b_4(1), b_4(2), \dots, b_4(K_4)$  shall compose the type-4 block for SCH-Q/B. They shall be scrambled into  $K_5 = K_4$  bits  $b_5(1), b_5(2), \dots, b_5(K_5)$  according to clause 8.2.5.1, with the scrambling sequence as defined in clause 8.2.5.2.

---

## 9 Channel multiplexing

### 9.1 Introduction

Clauses 9 defines the physical channels of the V+D radio sub-system required to support the logical channels. They include a description of the logical channels and the definitions of TDMA frames, timeslots and bursts.

### 9.2 Logical channels

#### 9.2.0 General

A logical channel is defined as a logical communication pathway between two or more parties. The logical channels represent the interface between the protocol and the radio subsystem.

The definition of the logical channels that are supported by the radio subsystem is given below.

#### 9.2.1 Logical channels hierarchy

The logical channels may be separated into two categories: the traffic channels carrying speech or data information in circuit switched mode and the control channels carrying signalling messages and packet data. The logical channels supported by the MAC are described here, with their hierarchical relationship.

#### 9.2.2 Traffic channels for $\pi/4$ -DQPSK

The traffic channels shall carry user information. Different traffic channels are defined for speech or data applications and for different data message speeds:

- Speech Traffic Channel (TCH/S);
- Circuit mode traffic channels as follows:
  - 7,2 kbit/s net rate (TCH/7.2);
  - 4,8 kbit/s net rate (TCH/4.8);
  - 2,4 kbit/s net rate (TCH/2.4).

Higher net rate up to 28,8 kbit/s, 19,2 kbit/s or 9,6 kbit/s may be used. They are obtained by allocating up to 4 Traffic Physical (TP) channels to the same communication.

NOTE: Three different depths of interleaving (with  $N = 1, 4, \text{ or } 8$ ) may be applied to the traffic channels TCH/4,8 and TCH/2,4 as detailed in clause 8.2.4.2.

#### 9.2.2a Traffic channels for $\pi/8$ -D8PSK

A single uncoded traffic channel is defined for  $\pi/8$ -D8PSK which enables nominal error rate references to be determined.

- Uncoded traffic channel as follows:
  - 10,8 kbit/s net rate (TCH-P8/10,8).

## 9.2.3 Control CHannels (CCH) for phase modulation

### 9.2.3.1 General

The CCH shall carry signalling messages and packet data. Five categories of control channel are defined:

- Broadcast Control CHannel (BCCH);
- Linearization CHannel (LCH);
- Signalling CHannel (SCH);
- Access Assignment CHannel (AACH); and
- STealing CHannel (STCH).

### 9.2.3.2 BCCH

The BCCH shall be a uni-directional channel for common reception by all MSs. It shall broadcast general information to all MSs.

Two categories of BCCHs are defined, network and synchronization:

- Broadcast Network Channel (BNCH):
  - down-link only, broadcasts network information to MSs.
- Broadcast Synchronization Channel (BSCH):
  - down-link only, broadcast information used for frequency, time and scrambling synchronization of the MSs.

### 9.2.3.3 LCH

The LCH shall be used by the BSs and MSs to linearize their transmitter.

Two categories of LCHs are defined, common and BS:

- Common Linearization Channel (CLCH):
  - up-link, shared by all the MSs.
- BS Linearization CHannel (BLCH):
  - downlink, used by the BS.

### 9.2.3.4 SCH for $\pi/4$ -DQPSK

The SCH is shared by all MSs, and carries messages. A message may be specific to an MS, a group of MSs or all MSs. SCH has 3 categories:

- Full size Signalling Channel (SCH/F):
  - uplink and downlink, where messages are coded across an entire timeslot.
- Half size Downlink Signalling Channel (SCH/HD):
  - downlink only, where messages are separately coded in each half of a timeslot.
- Half size Uplink Signalling Channel (SCH/HU):
  - uplink only, where messages are coded across one subslot.

### 9.2.3.4a SCH for $\pi/8$ -D8PSK

As in the case of  $\pi/4$ -DQPSK, the SCH has 3 categories:

- Full size Signalling Channel (SCH-P8/F):
  - uplink and downlink, where messages are coded across an entire timeslot.
- Half size Downlink Signalling Channel (SCH-P8/HD):
  - downlink only, where messages are separately coded in each half of a timeslot.
- Half size Uplink Signalling Channel (SCH-P8/HU):
  - uplink only, where messages are coded across one subslot.

### 9.2.3.5 AACH

The AACH shall be present on all transmitted downlink slots. It shall be used to indicate on each physical channel the assignment of the uplink and downlink slots. The AACH shall be internal to the MAC.

### 9.2.3.6 STCH

The STCH is a channel associated to a TCH that temporarily "steals" a part of the associated TCH capacity to transmit control messages. It may be used when fast signalling is required. In half duplex mode the STCH is unidirectional and has the same direction as the associated TCH.

## 9.2.4 QAM Control Channels (CCH-Q)

### 9.2.4.1 General

The CCH-Q shall carry signalling messages and packet data. Five categories of control channel are defined:

- QAM Broadcast Control Channel (BCCH-Q);
- QAM Linearization Channel (LCH-Q);
- QAM Signalling Channel (SCH-Q);
- QAM Access Assignment Channel (AACH-Q); and
- QAM Slot Information Channel (SICH-Q).

### 9.2.4.2 BCCH-Q

The BCCH-Q shall be a uni-directional channel for common reception by all MSs. It shall broadcast general information to all MSs.

Two categories of BCCH-Q are defined:

- QAM Broadcast Network Channel (BNCH-Q):
  - downlink only, broadcasts network information to MSs.
- QAM Broadcast Synchronization Channel (BSCH-Q):
  - downlink only, broadcasts information used for frequency, time and scrambling synchronization of the direct access MSs and network information.

### 9.2.4.3 LCH-Q

The LCH-Q shall be used by the base and MSs to linearize their transmitter.

Two categories of LCH-Qs are defined, common and BS:

- QAM Common Linearization Channel (CLCH-Q):
  - uplink, shared by all the MSs.
- QAM BS Linearization Channel (BLCH-Q):
  - downlink, used by the BS.

Each of these two categories may be further subdivided according to channel bandwidth (25 kHz, 50 kHz, 100 kHz and 150 kHz). For all channel bandwidths, the sole use of the LCH-Q is to linearize the transmitter using part of or all of the channel bandwidth.

### 9.2.4.4 SCH-Q

The SCH-Q is shared by all MSs, and carries messages. A message may be specific to an MS, a group of MSs or all MSs. SCH-Q has 4 categories:

- QAM Full size Downlink Signalling Channel (SCH-Q/D):
  - downlink only, where messages are coded across an entire timeslot.
- QAM Full size Uplink Signalling Channel (SCH-Q/U):
  - uplink only, where messages are coded across an entire timeslot.
- QAM Half size Uplink Signalling Channel (SCH-Q/HU):
  - uplink only, where messages are coded across one subslot.
- QAM Random Access Uplink Signalling Channel (SCH-Q/RA):
  - uplink only, used for random access messages.

Each of the first 3 categories may be further subdivided according to channel bandwidth (25 kHz, 50 kHz, 100 kHz and 150 kHz), and modulation / coding combination. The fourth category (SCH-Q/RA) is 25 kHz only and fixed modulation/coding.

For the first 3 categories, the channel subdivision is indicated as channel bandwidth followed by modulation followed by coding:

$$\text{SCH-Q/}\{D|U|HU\}\{25|50|100|150\}\text{-}\{4|16|64\}\{H|M|U\}$$

Where {D|U|HU} denotes one of D, U or HU indicating that the channel is for the downlink (D), uplink (U) or half slot uplink (HU) respectively, {4|16|64} denotes one of 4, 16 or 64 indicating that the channel is using 4-QAM, 16-QAM or 64-QAM modulation, and {H|M|U} denotes one of H, M or U indicating that the channel is using high protection (rate 1/2) (H), medium protection (rate 2/3) (M) or unprotected (rate 1/1) (U). The SCH-Q/D channel for 25 kHz using 4-QAM modulation and high protection (rate 1/2) is according to the naming convention named as SCH-Q/D25-4H.

The total list of valid SCH-Q for 25 kHz operations is then:

- SCH-Q/D25-4H, SCH-Q/D25-16H, SCH-Q/D25-64H, SCH-Q/D25-64M, SCH-Q/D25-16U, SCH-Q/D25-64U;
- SCH-Q/U25-4H, SCH-Q/U25-16H, SCH-Q/U25-64H, SCH-Q/U25-64M, SCH-Q/U25-16U, SCH-Q/U25-64U;
- SCH-Q/HU25-4H, SCH-Q/HU25-16H, SCH-Q/HU25-64H, SCH-Q/HU25-64M, SCH-Q/HU25-16U, SCH-Q/HU25-64U;
- SCH-Q/RA.

This gives a total of 19 SCH-Q for 25 kHz operations, and a total of 73 SCH-Q for all channel bandwidths.

#### 9.2.4.4a SCH-Q/B

The SCH-Q/B is shared by all MSs, and carries messages. A message may be specific to an MS, a group of MSs or all MSs. SCH-Q/B is used only in the downlink direction and only on 50 kHz, 100 kHz and 150 kHz QAM channels.

SCH-Q/B is subdivided according to channel bandwidth (50 kHz, 100 kHz and 150 kHz).

The channel subdivision is indicated as channel bandwidth:

SCH-Q/B {50|100|150}

The SCH-Q/B logical channel uses 4-QAM modulation and high protection (rate 1/2).

NOTE: A value of the element contained in the SICH-Q/D in the downlink header block indicates that a burst is an FCB. All MSs that understand the FCB value in the SICH-Q/D will decode the SCH-Q/B. However BS designers should note that some conventional access MSs may not understand the FCB value in the SICH-Q/D.

#### 9.2.4.5 AACH-Q

The AACH-Q shall be present on all transmitted downlink slots (except slots containing BLCH-Q). It shall be used to indicate on each QAM physical channel the assignment of the uplink and downlink slots. The AACH-Q shall be internal to the MAC.

#### 9.2.4.6 SICH-Q

The SICH-Q shall be present on all transmitted slots, except slots carrying SCH-Q/RA or containing BLCH-Q. On the downlink, it shall be used to indicate the modulation and coding used in the remainder of the slot or whether the burst is an FCB. On the uplink, it shall be used to indicate the modulation and coding used in the remainder of the slot or subslot. The SICH-Q shall be internal to the MAC.

Two categories of SICH-Qs are defined, downlink and uplink:

- QAM Downlink Slot Information Channel (SICH-Q/D):
  - downlink only, included in all downlink slots (except slots containing BLCH-Q);
- QAM Uplink Slot Information Channel (SICH-Q/U):
  - uplink only, included in all uplink slots or subslots, except subslots carrying SCH-Q/RA or containing CLCH-Q.

Each of the 2 categories may be further subdivided according to channel bandwidth (25 kHz, 50 kHz, 100 kHz and 150 kHz). The notation for SICH-Q is:

SICH-Q/{D|U}{25|50|100|150}

NOTE 1: The content of the SICH-Q/D and SICH-Q/U channels is the same in all channel bandwidths.

NOTE 2: The multiple channels are defined here for testing purpose. The target performance of the various channels will not vary significantly in terms of required  $E_b/N_0$  as the channel bandwidth changes, but since the fraction of power devoted to headers goes down as the channel bandwidth goes up, the reference sensitivity will vary.

## 9.3 The physical resource

### 9.3.1 General

The physical resource available to the radio sub-system is an allocation of part of the radio spectrum. This resource shall be partitioned both in frequency and time. Frequency shall be partitioned by RF channels divided into bands as defined in clause 6. Time shall be partitioned by timeslots and TDMA frames as defined in clauses 9.3.2 to 9.3.9.

The access scheme shall be TDMA.

The TDMA structure shall be composed of hyperframes, multiframes, frames, slots and subslots. Figure 9.1 repeats the representation of the TDMA structure given in figure 4.3.

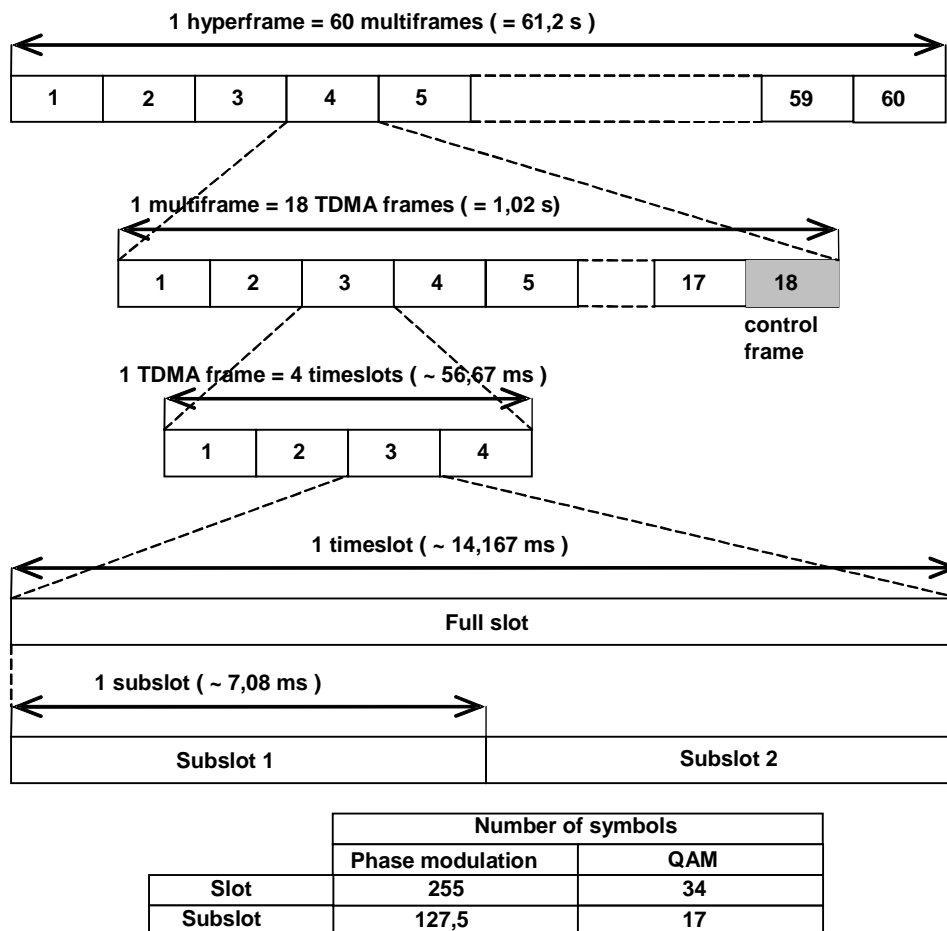

Figure 9.1: TDMA structure

### 9.3.2 RF channels for phase modulation

A RF channel is defined as a specified portion of the RF spectrum. Clause 6 defines the carrier separation which applies to TETRA channels.

The DownLink (DL) comprises RF channels used in the BS to MS direction.

The UpLink (UL) comprises RF channels used in the MS to BS direction.

In case of conventional access one pair of phase modulated radio frequencies (uplink and downlink) of the cell allocation shall be used to carry the MCCCH (see clauses 9.4.2.1 and 9.5.1) and shall be known as the CA main carrier.

### 9.3.2a RF channels for QAM

Clause 6 defines the carrier separation which applies to TETRA QAM channels. These channels can exist in addition to the phase modulation channels or independent of them.

The DownLink (DL) comprises RF channels used in the BS to MS direction.

The UpLink (UL) comprises RF channels used in the MS to BS direction.

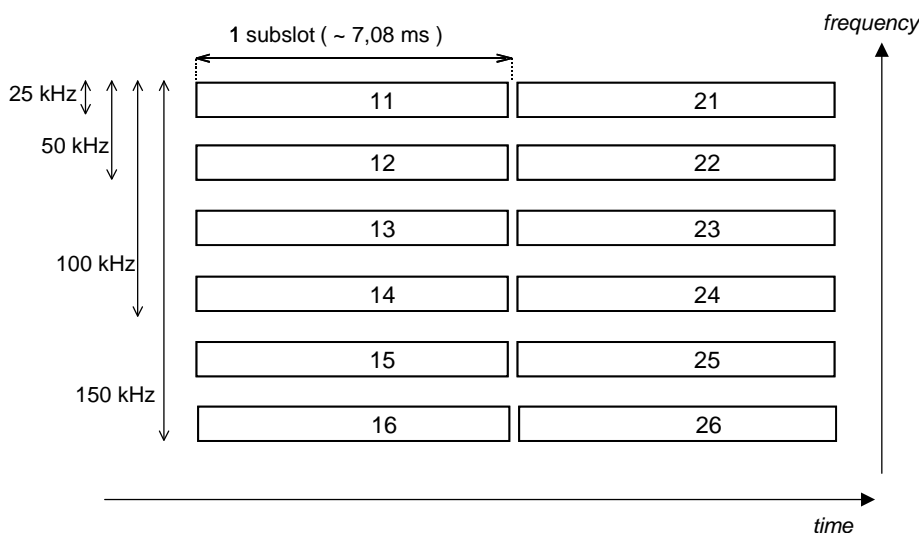

The QAM channel TDMA structure is identical to the phase modulation TDMA structure as shown in figure 9.1.

In case of conventional access one pair of phase modulated radio frequencies (uplink and downlink) of the cell allocation shall be used to carry the MCCH (see clauses 9.4.2.1 and 9.5.1) and shall be known as the CA main carrier.

In case of direct access one pair of QAM radio frequencies (uplink and downlink) of the cell allocation shall be used to carry the MCCH-Q (see clauses 9.4.6.1 and 9.5.6) and shall be known as the DA main carrier.

### 9.3.2b Random access RF channels for QAM

The Uplink Random Access comprises RF channels used in the MS to BS direction, see figure 9.2.

**Figure 9.2: Random access time / frequency structure**

RAB channels are independent 25 kHz channels and the separation of the center frequency from the center frequency of the neighbour RAB channel is 25 kHz as shown in table 9.1.

**Table 9.1: Centre frequency offset of RAB channels from QAM channel centre frequency**

| RAB # | Offset from allocated BW centre (kHz) |        |         |         |
|-------|---------------------------------------|--------|---------|---------|
|       | 25 kHz                                | 50 kHz | 100 kHz | 150 kHz |
| 11/21 | 0                                     | 12,5   | 37,5    | 62,5    |
| 12/22 | -                                     | -12,5  | 12,5    | 37,5    |
| 13/23 | -                                     | -      | -12,5   | 12,5    |
| 14/24 | -                                     | -      | -37,5   | -12,5   |
| 15/25 | -                                     | -      | -       | -37,5   |
| 16/26 | -                                     | -      | -       | -62,5   |

### 9.3.3 Timeslots

The basic unit of the TDMA structure is the timeslot. A timeslot shall have a duration of 85/6 ms (approximately 14,17 ms) which corresponds to 255 phase modulation symbols duration in the Phase Modulation case and to 34 symbols duration in the QAM case.

### 9.3.4 TDMA frame

Four timeslots shall form a TDMA frame. The TDMA frame has a duration of  $170/3$  ms (approximately 56,67 ms).

The TDMA frames shall be numbered by a Frame Number (*FN*). The *FN* shall be cyclically numbered from 1 to 18. The *FN* shall be incremented at the end of each TDMA frame.

The frame *FN18* (also termed the control frame) shall be exclusively devoted to control channels.

### 9.3.5 Timeslot numbering

The timeslots within a TDMA frame shall be numbered from 1 to 4 and a particular timeslot shall be referenced by its Timeslot Number (TN).

### 9.3.6 Subslot

The uplink timeslots may be divided into 2 subslots. The subslots within a timeslot shall be numbered from 1 to 2 and a particular subslot shall be referenced by its SubSlot Number (SSN).

A subslot shall have a duration of  $85/12$  ms (approximately 7,08 ms) which corresponds to 127,5 phase modulation symbols duration in the Phase Modulation case and to 17 symbols duration in the QAM case.

#### 9.3.6a Random access uplink RF channel subslots for QAM

For QAM, the random access uplink RF channel subslots shall be numbered from 11 and 21 in 25 kHz QAM channels, 11 to 12 and 21 to 22 in 50 kHz QAM channels, 11 to 14 and 21 to 24 in 100 kHz QAM channels and 11 to 16 and 21 to 26 in 150 kHz QAM channels. A particular random access uplink RF channel subslot shall be referenced by its QAM Subslot Number (SSN-Q).

A random access uplink RF channel subslot shall have a duration of  $85/12$  ms (approximately 7,08 ms), which corresponds to 17 symbols duration, and use 25 kHz of channel bandwidth, as depicted in figure 9.2.

### 9.3.7 Multiframe

Eighteen TDMA frames shall form a multiframe. The multiframe shall have a duration of 1,02 s.

The multiframes shall be numbered by a Multiframe Number (*MN*). The *MN* shall be cyclically numbered from 1 to 60. The *MN* shall be incremented whenever the TDMA *FN* returns to 1.

### 9.3.8 Hyperframe

The hyperframe is the longest recurrent time period of the TDMA structure. Sixty multiframes shall form a hyperframe. The hyperframe shall have a duration of 61,2 s.

### 9.3.9 Frame alignment

At the BS, the start of the hyperframe, multiframe and TDMA frame on the uplink shall be delayed by the fixed period of 2 timeslots from the start of the hyperframe, multiframe and TDMA frame on the downlink.

## 9.4 Physical channels

### 9.4.1 General

A physical channel is defined by a pair of radio carrier frequencies (downlink and uplink) and a *TN*. There shall be 4 physical channels per pair of radio frequencies.

Clauses 9.4.2 to 9.4.5 apply to Phase Modulation channels.

Clauses 9.4.6 to 9.4.9 apply to QAM channels.

## 9.4.2 Types of physical channels for phase modulation

### 9.4.2.0 General

Three types of physical channel are defined:

- the Control Physical channel;
- the Traffic Physical channel; and
- the Unallocated Physical channel.

The type of physical channel shall be indicated in the AACH.

### 9.4.2.1 CP channel for phase modulation

The CP channel is a physical channel carrying exclusively CCH. Two types of CP channels are defined:

- the Main Control CHannel (MCCH); and
- the Secondary Control CHannel (SCCH).

In each conventional access cell one phase modulated RF carrier shall be defined as the main carrier (CA main carrier).

Whenever a MCCH is used, the MCCH shall be located on timeslot 1 of the main carrier.

SCCH may be common SCCH or assigned SCCH:

- Phase modulation common SCCH(s) are used only in the case of conventional access. If provided, they are used to extend the signalling capacity of the MCCH.
- Phase modulation assigned SCCHs may be allocated both by conventional access cells and by direct access cells. MSs may be directed to a phase modulation assigned SCCH by the BS. For example, conventional access MSs may be directed from the MCCH or a  $\pi/4$ -DQPSK common SCCH to a phase modulation assigned SCCH and direct access MSs may be directed from the MCCH-Q or a QAM common SCCH to a phase modulation assigned SCCH.

### 9.4.2.2 TP channel

The TP channel is a physical channel carrying TCH.

### 9.4.2.3 UP channel

The UP channel is a physical channel not allocated to one or more MS.

## 9.4.3 Bursts for phase modulation

### 9.4.3.1 General

A burst is a period of RF carrier that is modulated by a data stream. A burst, therefore, represents the physical content of a timeslot or subslot.

The description of a physical channel will be made in terms of timeslots and TDMA frames and not in terms of bursts. This is because there is not a one-to-one mapping between a particular physical channel and the use of a particular burst.

A given physical channel shall use the same timeslot number in every TDMA frame.

### 9.4.3.2 Phase modulation symbol numbering

A timeslot shall be divided into 255 phase modulation symbol durations, each one with a duration of 1/18 ms (approximately 55,56  $\mu$ s). A particular modulation symbol within a burst shall be referenced by a Symbol Number ( $SN$ ), with the first modulation symbol numbered  $SN1$  and the last modulation symbol numbered  $SNmax$ .

Different types of bursts are defined, having different durations.

At the beginning of the transmission of a single burst or of consecutive bursts, a supplementary symbol  $SN0$  is defined. It does not carry information but shall be used as phase reference for the differential modulation.

### 9.4.3.3 Phase modulation bit numbering

In the following sections the content of the burst is defined in terms of phase modulation bits.

A particular modulation bit within a burst shall be referenced by a Bit Number ( $BN$ ), with the first modulation bit numbered  $BN1$  and the last modulation bit numbered  $BNmax$ . At the modulator the modulation bits shall be grouped together and converted into one modulation symbol as described in clause 5.  $\pi/4$ -DQPSK symbols contain two information bits and  $\pi/8$ -D8PSK symbols contain three information bits.

### 9.4.3.4 Burst timing

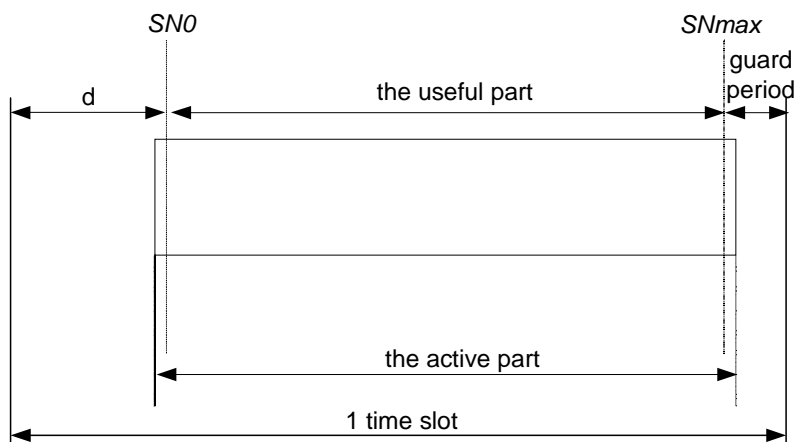

The symbol time is defined as the instant at which the transmitted symbol waveform is at a maximum for the symbol of interest. The timing of a modulation symbol is determined by its symbol time.

The bits  $BN(2n-1)$  and  $BN(2n)$  shall determine the symbol  $SN(n)$  for  $\pi/4$ -DQPSK and the bits  $BN(3n-2)$ ,  $BN(3n-1)$  and  $BN(3n)$  shall determine the symbol  $SN(n)$  for  $\pi/8$ -D8PSK. The symbol time of the modulation symbol  $SN(n)$  shall be delayed by  $(n+d)$  modulation symbol durations with respect to the start of the slot, with:

- $n$ : integer (1 to  $SNmax$ );
- $d$ : is defined as the burst delay. The burst delay represents the delay between the start of the timeslot and the symbol time of the symbol  $SN0$ . The burst delay is expressed in modulation symbol duration and varies with the type of burst and the SSN. The values of the burst delays are given in table 9.2.
- *useful part of the burst* is defined as shown in figure 9.3.

NOTE: Symbol time of the symbol  $SN0$  is same as symbol time of the symbol  $SN255$  of the previous slot.

The symbol time of the symbol  $SN0$  occurs one modulation symbol duration before the symbol time of the symbol  $SN1$  of the first burst of a transmission.

NOTE 1: For certain burst types  $d$  and the guard period may be of length zero.

NOTE 2: The active part of the burst is the period during which modulation symbols are present; it is longer than the useful part by an amount equal to the sum of the time necessary for symbol rise and decay.

Figure 9.3: Burst timing for phase modulation

## 9.4.4 Type of bursts for phase modulation

### 9.4.4.1 General

Eight types of  $\pi/4$ -DQPSK burst exist in the system. Figure 9.4 summarizes the description of the  $\pi/4$ -DQPSK bursts and their timing with respect to the timeslot. Five types of  $\pi/8$ -D8PSK burst exist in the system. Figure 9.4 summarizes the description of the  $\pi/8$ -D8PSK bursts and their timing with respect to the timeslot. Table 9.2 lists burst types.

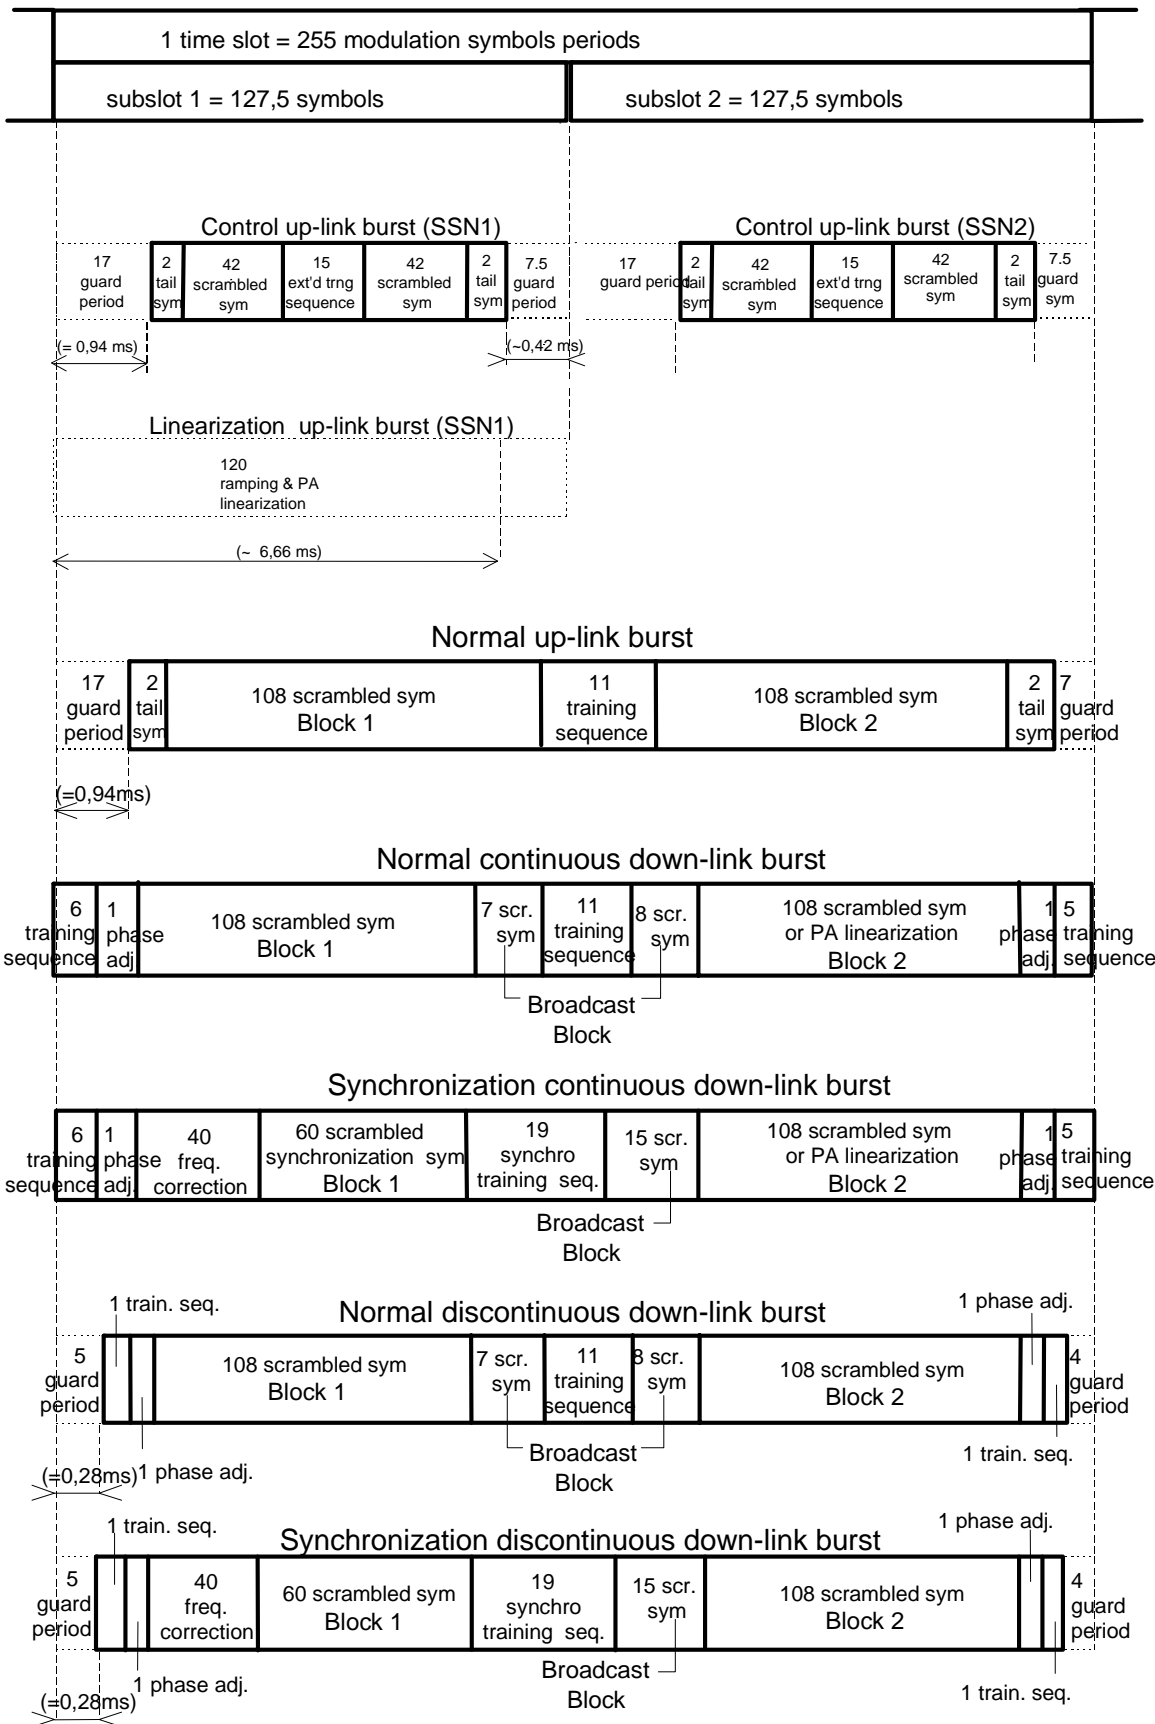

Figure 9.4: Types of bursts for phase modulation

NOTE 1:  $\pi/8$ -D8PSK modulation is not used in the synchronization continuous down-link burst or the synchronization discontinuous down-link burst but may be used in all other types of burst.  $\pi/4$ -DQPSK modulation may be used for all types of burst. The modulation of the linearization up-link burst is undefined.

NOTE 2: The power-time mask is defined in clause 6, figure 6.3 and table 6.8. The  $t_1$  period defined in clause 6, table 6.8 may be used for ramping and PA linearization.

**Table 9.2: Burst types for Phase Modulation**

| Burst type  | $S_{nmax}$     | $d$ burst delay (in symbol duration) |                | Bit allocation       |
|---|----------------|--------------------------------------|----------------|----------------------|
|   |                | SSN 1                                | SSN 2          |                      |
| control uplink burst (CB) (see note 1)                              | 103            | 17                                   | 144,5          | see clause 9.4.4.2.1 |
| linearization uplink burst (LB)                                     | not applicable | not applicable                       | not allowed    | see clause 6.4.5     |
| linearization downlink burst (LDB)                                  | not applicable | not allowed                          | not applicable | see clause 6.4.5     |
| normal uplink burst (NUB) (see note 1)                              | 231            | 17                                   |                | see clause 9.4.4.2.4 |
| normal continuous downlink burst (NDB) (see note 1)                 | 255            | 0                                    |                | see clause 9.4.4.2.5 |
| synchronization continuous downlink burst (SB) (see note 2)         | 255            | 0                                    |                | see clause 9.4.4.2.6 |
| normal discontinuous downlink burst (NDB) (see note 1)              | 246            | 5                                    |                | see clause 9.4.4.2.7 |
| synchronization discontinuous downlink burst (SB) (see note 2)      | 246            | 5                                    |                | see clause 9.4.4.2.8 |
| NOTE 1: May use either $\pi/4$ -DQPSK or $\pi/8$ -D8PSK modulation. |                |                                      |                |                      |
| NOTE 2: Shall use $\pi/4$ -DQPSK modulation only.                   |                |                                      |                |                      |

The generic name for normal continuous and discontinuous downlink burst is Normal Downlink Burst (NDB). The generic name for synchronization continuous and discontinuous downlink burst is Synchronization downlink Burst (SB).

## 9.4.4.2 Modulation bits allocation

### 9.4.4.2.0 General

The bursts are divided into burst fields containing contiguous modulation bits of the same type. The burst fields are described in clause 9.4.4.3.

The downlink bursts contain 3 independent blocks, called Broadcast Block (BBK), Block 1 ( $BKN1$ ) and Block 2 ( $BKN2$ ). The normal uplink bursts contains two independent blocks, called Block 1 ( $BKN1$ ) and Block 2 ( $BKN2$ ). A separate logical channel may be mapped on each block. The broadcast block shall be made of the two scrambled broadcast bits fields and shall contain 30 bits.

For  $\pi/4$ -DQPSK, block 1 and block 2 shall be made of one field and shall contain 216 scrambled bits. In the case of synchronization bursts, block 1 contains 120 bits.

For  $\pi/8$ -D8PSK, block 1 and block 2 shall be made of one field and shall contain 324 scrambled bits.

#### 9.4.4.2.1 Control uplink Burst (CB)

The allocation of the modulation bits in the  $\pi/4$ -DQPSK CB shall be in accordance with table 9.3. The CB shall be used by MS to transmit control messages to the BS.

**Table 9.3: Control uplink Burst (CB) for  $\pi/4$ -DQPSK**

| Bit Number (BN)   | Field length (bits) | Field content              | Field bits number     | Definition           |
|---|---------------------|----------------------------|-----------------------|----------------------|
| 1 to 4  | 4                   | tail bits                  | $t1$ to $t4$          | see clause 9.4.4.3.5 |
| 5 to 88   | 84                  | scrambled control bits     | $cb(1)$ to $cb(84)$   | see clause 8         |
| 89 to 118   | 30                  | extended training sequence | $x1$ to $x30$         | see clause 9.4.4.3.3 |
| 119 to 202  | 84                  | scrambled control bits     | $cb(85)$ to $cb(168)$ | see clause 8         |
| 203 to 206  | 4                   | tail bits                  | $t1$ to $t4$          | see clause 9.4.4.3.5 |
| NOTE: All fields shall be sent using $\pi/4$ -DQPSK modulation. |                     |                            |                       |                      |

The allocation of the modulation bits in the  $\pi/8$ -D8PSK CB shall be in accordance with table 9.4. The CB shall be used by MS to transmit control messages to the BS.

**Table 9.4: Control uplink Burst (CB) for  $\pi/8$ -D8PSK**

| Bit Number (BN)   | Field length (bits) | Field content                  | Field bits number      | Definition           |
|---|---------------------|--------------------------------|------------------------|----------------------|
| 1 to 6  | 6                   | tail bits -P8                  | $T1$ to $T6$           | see clause 9.4.4.3.5 |
| 7 to 132  | 126                 | scrambled control bits         | $cb(1)$ to $cb(126)$   | see clause 8         |
| 133 to 177  | 45                  | extended training sequence -P8 | $X1$ to $X45$          | see clause 9.4.4.3.3 |
| 178 to 303  | 126                 | scrambled control bits         | $cb(127)$ to $cb(252)$ | see clause 8         |
| 304 to 309  | 6                   | tail bits -P8                  | $T1$ to $T6$           | see clause 9.4.4.3.5 |
| NOTE: All fields shall be sent using $\pi/8$ -D8PSK modulation. |                     |                                |                        |                      |

#### 9.4.4.2.2 Linearization uplink Burst (LB)

The LB may be used by the MSs to linearize their transmitters. The LB contains no useful bits and its timing shall only be determined by the time mask (see clause 6).

#### 9.4.4.2.3 Linearization downlink burst

The linearization downlink burst replaces BKN2 of either a normal continuous downlink burst or a synchronization continuous downlink burst.

The linearization downlink burst may be used by the BS to linearize its transmitter. The linearization downlink burst contains no useful bits and its timing shall be determined only by the time mask (see clause 6).

#### 9.4.4.2.4 Normal Uplink Burst (NUB)

The allocation of the modulation bits in the NUB for  $\pi/4$ -DQPSK shall be in accordance with table 9.5. The NUB shall be used by MSs to transmit control or traffic messages to the BS.

**Table 9.5: Normal Uplink Burst (NUB) for  $\pi/4$ -DQPSK**

| Bit Number (BN)   | Field length (bits) | Field content            | Field bits number              | Definition           |
|---|---------------------|--------------------------|--------------------------------|----------------------|
| 1 to 4  | 4                   | tail bits                | $t1$ to $t4$                   | see clause 9.4.4.3.5 |
| 5 to 220  | 216                 | scrambled block 1 bits   | $bkn1(1)$ to $bkn1(216)$       | see clause 8         |
| 221 to 242  | 22                  | normal training sequence | $n1$ to $n22$ or $p1$ to $p22$ | see clause 9.4.4.3.2 |
| 243 to 458  | 216                 | scrambled block 2 bits   | $bkn2(1)$ to $bkn2(216)$       | see clause 8         |
| 459 to 462  | 4                   | tail bits                | $t1$ to $t4$                   | see clause 9.4.4.3.5 |
| NOTE: All fields shall be sent using $\pi/4$ -DQPSK modulation. |                     |                          |                                |                      |

The allocation of the modulation bits in the NUB for  $\pi/8$ -D8PSK shall be in accordance with table 9.6. The NUB shall be used by MSs to transmit control or traffic messages to the BS.

**Table 9.6: Normal Uplink Burst (NUB) for  $\pi/8$ -D8PSK**

| Bit Number (BN)   | Field length (bits) | Field content               | Field bits number              | Definition           |
|---|---------------------|-----------------------------|--------------------------------|----------------------|
| 1 to 6  | 6                   | tail bits -P8               | $T1$ to $T6$                   | see clause 9.4.4.3.5 |
| 7 to 330  | 324                 | scrambled block 1 bits      | $bkn1(1)$ to $bkn1(324)$       | see clause 8         |
| 331 to 363  | 33                  | normal training sequence-P8 | $N1$ to $N33$ or $P1$ to $P33$ | see clause 9.4.4.3.2 |
| 364 to 687  | 324                 | scrambled block 2 bits      | $bkn2(1)$ to $bkn2(324)$       | see clause 8         |
| 688 to 693  | 6                   | tail bits -P8               | $T1$ to $T6$                   | see clause 9.4.4.3.5 |
| NOTE: All fields shall be sent using $\pi/8$ -D8PSK modulation. |                     |                             |                                |                      |

#### 9.4.4.2.5 Normal continuous downlink burst

The allocation of the modulation bits in the normal continuous downlink  $\pi/4$ -DQPSK burst shall be in accordance with table 9.7. The normal continuous downlink burst shall be used by the BS in continuous transmission mode to transmit control or traffic messages to the MS.

**Table 9.7: Normal continuous downlink burst for  $\pi/4$ -DQPSK**

| Bit Number (BN)   | Field length (bits) | Field content              | Field bits number              | Definition           |
|---|---------------------|----------------------------|--------------------------------|----------------------|
| 1 to 12   | 12                  | normal training sequence 3 | $q11$ to $q22$                 | see clause 9.4.4.3.2 |
| 13 to 14  | 2                   | phase adjustment bits      | $ha1$ to $ha2$                 | see clause 9.4.4.3.6 |
| 15 to 230   | 216                 | scrambled block 1 bits     | $bkn1(1)$ to $bkn1(216)$       | see clause 8         |
| 231 to 244  | 14                  | scrambled broadcast bits   | $bb(1)$ to $bb(14)$            | see clause 8         |
| 245 to 266  | 22                  | normal training sequence   | $n1$ to $n22$ or $p1$ to $p22$ | see clause 9.4.4.3.2 |
| 267 to 282  | 16                  | scrambled broadcast bits   | $bb(15)$ to $bb(30)$           | see clause 8         |
| 283 to 498  | 216                 | scrambled block 2 bits     | $bkn2(1)$ to $bkn2(216)$       | see clause 8         |
| 499 to 500  | 2                   | phase adjustment bits      | $hb1$ to $hb2$                 | see clause 9.4.4.3.6 |
| 501 to 510  | 10                  | normal training sequence 3 | $q1$ to $q10$                  | see clause 9.4.4.3.2 |
| NOTE: All fields shall be sent using $\pi/4$ -DQPSK modulation. |                     |                            |                                |                      |

The allocation of the modulation bits in the normal continuous downlink  $\pi/8$ -D8PSK burst shall be in accordance with table 9.8.

**Table 9.8: Normal continuous downlink burst for  $\pi/8$ -D8PSK**

| Bit Number (BN)   | Field length (bits) | Field content                            | Field bits number              | Definition           |
|---|---------------------|--|--------------------------------|----------------------|
| 1 to 12   | 12                  | normal training sequence 3 (see note 1)  | $q11$ to $q22$                 | see clause 9.4.4.3.2 |
| 13 to 15  | 3                   | phase adjustment bits (see note 2)       | $ha1$ to $ha3$                 | see clause 9.4.4.3.6 |
| 16 to 339   | 324                 | scrambled block 1 bits (see note 2)      | $bkn1(1)$ to $bkn1(324)$       | see clause 8         |
| 340 to 353  | 14                  | scrambled broadcast bits (see note 1)    | $bb(1)$ to $bb(14)$            | see clause 8         |
| 354 to 386  | 33                  | normal training sequence-P8 (see note 2) | $N1$ to $N33$ or $P1$ to $P33$ | see clause 9.4.4.3.2 |
| 387 to 402  | 16                  | scrambled broadcast bits (see note 1)    | $bb(15)$ to $bb(30)$           | see clause 8         |
| 403 to 726  | 324                 | scrambled block 2 bits (see note 2)      | $bkn2(1)$ to $bkn2(324)$       | see clause 8         |
| 727 to 729  | 3                   | phase adjustment bits (see note 2)       | $hb1$ to $hb3$                 | see clause 9.4.4.3.6 |
| 730 to 739  | 10                  | normal training sequence 3 (see note 1)  | $q1$ to $q10$                  | see clause 9.4.4.3.2 |
| NOTE 1: This field shall be sent using $\pi/4$ -DQPSK modulation. |                     |  |                                |                      |
| NOTE 2: This field shall be sent using $\pi/8$ -D8PSK modulation. |                     |  |                                |                      |

#### 9.4.4.2.6 Synchronization continuous downlink burst

The allocation of the modulation bits in the synchronization continuous downlink burst shall be in accordance with table 9.9. The synchronization continuous downlink burst shall be used by BSs in continuous transmission mode to broadcast synchronization messages and to transmit control messages to the MSs.

**Table 9.9: Synchronization continuous downlink burst**

| Bit Number (BN) | Field length (bits) | Field content                          | Field bits number        | Definition           |
|-----------------|---------------------|--|--------------------------|----------------------|
| 1 to 12         | 12                  | normal training sequence 3             | $q11$ to $q22$           | see clause 9.4.4.3.2 |
| 13 to 14        | 2                   | phase adjustment bits                  | $hc1$ to $hc2$           | see clause 9.4.4.3.6 |
| 15 to 94        | 80                  | frequency correction                   | $f1$ to $f80$            | see clause 9.4.4.3.1 |
| 95 to 214       | 120                 | scrambled synchronization block 1 bits | $sb(1)$ to $sb(120)$     | see clause 8         |
| 215 to 252      | 38                  | synchronization training sequence      | $y1$ to $y38$            | see clause 9.4.4.3.4 |
| 253 to 282      | 30                  | scrambled broadcast bits               | $bb(1)$ to $bb(30)$      | see clause 8         |
| 283 to 498      | 216                 | scrambled block 2 bits                 | $bkn2(1)$ to $bkn2(216)$ | see clause 8         |
| 499 to 500      | 2                   | phase adjustment bits                  | $hd1$ to $hd2$           | see clause 9.4.4.3.6 |
| 501 to 510      | 10                  | normal training sequence 3             | $q1$ to $q10$            | see clause 9.4.4.3.2 |

NOTE: All fields shall be sent using  $\pi/4$ -DQPSK modulation

#### 9.4.4.2.7 Normal discontinuous downlink burst

The allocation of the modulation bits in the  $\pi/4$ -DQPSK normal discontinuous downlink burst shall be in accordance with table 9.10. The normal discontinuous downlink burst shall be used by BS in timesharing transmission mode to transmit control or traffic messages to the MS.

**Table 9.10: Normal discontinuous downlink burst for  $\pi/4$ -DQPSK**

| Bit Number (BN) | Field length (bits) | Field content              | Field bits number              | Definition           |
|-----------------|---------------------|----------------------------|--------------------------------|----------------------|
| 1 to 2          | 2                   | normal training sequence 3 | $q21$ to $q22$                 | see clause 9.4.4.3.2 |
| 3 to 4          | 2                   | phase adjustment bits      | $hg1$ to $hg2$                 | see clause 9.4.4.3.6 |
| 5 to 220        | 216                 | scrambled block 1 bits     | $bkn1(1)$ to $bkn1(216)$       | see clause 8         |
| 221 to 234      | 14                  | scrambled broadcast bits   | $bb(1)$ to $bb(14)$            | see clause 8         |
| 235 to 256      | 22                  | normal training sequence   | $n1$ to $n22$ or $p1$ to $p22$ | see clause 9.4.4.3.2 |
| 257 to 272      | 16                  | scrambled broadcast bits   | $bb(15)$ to $bb(30)$           | see clause 8         |
| 273 to 488      | 216                 | scrambled block 2 bits     | $bkn2(1)$ to $bkn2(216)$       | see clause 8         |
| 489 to 490      | 2                   | phase adjustment bits      | $hh1$ to $hh2$                 | see clause 9.4.4.3.6 |
| 491 to 492      | 2                   | normal training sequence 3 | $q1$ to $q2$                   | see clause 9.4.4.3.2 |

NOTE: All fields shall be sent using  $\pi/4$ -DQPSK modulation.

The allocation of the modulation bits in the  $\pi/8$ -D8PSK normal discontinuous downlink burst shall be in accordance with table 9.11.

**Table 9.11: Normal discontinuous downlink burst for  $\pi/8$ -D8PSK**

| Bit Number (BN) | Field length (bits) | Field content                            | Field bits number              | Definition           |
|-----------------|---------------------|--|--------------------------------|----------------------|
| 1 to 2          | 2                   | normal training sequence 3 (see note 1)  | $q21$ to $q22$                 | see clause 9.4.4.3.2 |
| 3 to 5          | 3                   | phase adjustment bits (see note 2)       | $hg1$ to $hg3$                 | see clause 9.4.4.3.6 |
| 6 to 329        | 324                 | scrambled block 1 bits (see note 2)      | $bkn1(1)$ to $bkn1(324)$       | see clause 8         |
| 330 to 343      | 14                  | scrambled broadcast bits (see note 1)    | $bb(1)$ to $bb(14)$            | see clause 8         |
| 344 to 376      | 33                  | normal training sequence-P8 (see note 2) | $N1$ to $N33$ or $P1$ to $P33$ | see clause 9.4.4.3.2 |
| 377 to 392      | 16                  | scrambled broadcast bits (see note 1)    | $bb(15)$ to $bb(30)$           | see clause 8         |
| 393 to 716      | 324                 | scrambled block 2 bits (see note 2)      | $bkn2(1)$ to $bkn2(324)$       | see clause 8         |
| 717 to 719      | 3                   | phase adjustment bits (see note 2)       | $hh1$ to $hh3$                 | see clause 9.4.4.3.6 |
| 720 to 721      | 2                   | normal training sequence 3 (see note 1)  | $q1$ to $q2$                   | see clause 9.4.4.3.2 |

NOTE 1: This field shall be sent using  $\pi/4$ -DQPSK modulation.  
NOTE 2: This field shall be sent using  $\pi/8$ -D8PSK modulation.

### 9.4.4.2.8 Synchronization discontinuous downlink burst

The allocation of the modulation bits in the synchronization discontinuous downlink burst shall be in accordance with table 9.12. The synchronization discontinuous downlink burst shall be used by the BS in timesharing transmission mode to broadcast synchronization messages and to transmit control messages to the MS.

**Table 9.12: Synchronization discontinuous downlink burst**

| Bit Number (BN)   | Field length (bits) | Field content                          | Field bits number        | Definition           |
|---|---------------------|--|--------------------------|----------------------|
| 1 to 2  | 2                   | normal training sequence 3             | $q21$ to $q22$           | see clause 9.4.4.3.2 |
| 3 to 4  | 2                   | phase adjustment bits                  | $hi1$ to $hi2$           | see clause 9.4.4.3.6 |
| 5 to 84   | 80                  | frequency correction                   | $f1$ to $f80$            | see clause 9.4.4.3.1 |
| 85 to 204   | 120                 | scrambled synchronization block 1 bits | $sb(1)$ to $sb(120)$     | see clause 8         |
| 205 to 242  | 38                  | synchronization training sequence      | $y1$ to $y38$            | see clause 9.4.4.3.4 |
| 243 to 272  | 30                  | scrambled broadcast bits               | $bb(1)$ to $bb(30)$      | see clause 8         |
| 273 to 488  | 216                 | scrambled block 2 bits                 | $bkn2(1)$ to $bkn2(216)$ | see clause 8         |
| 489 to 490  | 2                   | phase adjustment bits                  | $hj1$ to $hj2$           | see clause 9.4.4.3.6 |
| 491 to 492  | 2                   | normal training sequence 3             | $q1$ to $q2$             | see clause 9.4.4.3.2 |
| NOTE: All fields shall be sent using $\pi/4$ -DQPSK modulation. |                     |  |                          |                      |

### 9.4.4.3 Burst fields

#### 9.4.4.3.1 Frequency correction field

The frequency correction field shall contain 80 bits:

$$(f1, f2, \dots, f8) = (1, 1, \dots, 1) \quad (9.1)$$

$$(f9, f10, \dots, f72) = (0, 0, \dots, 0) \quad (9.2)$$

$$(f73, f74, \dots, f80) = (1, 1, \dots, 1) \quad (9.3)$$

The frequency correction field generates an un-modulated carrier at 2,25 kHz above the nominal carrier frequency, preceded and followed by a short period (4 symbol durations) of un-modulated carrier at 6,75 kHz below the nominal carrier frequency.

#### 9.4.4.3.2 Normal training sequence

Three 22 bit normal training sequences are defined for  $\pi/4$ -DQPSK modulation.

The first two  $\pi/4$ -DQPSK normal training sequences shall be used on the  $\pi/4$ -DQPSK normal uplink and downlink bursts. The type of training sequence shall be used as a flag indicating the presence of one or two logical channels on the blocks 1 and 2 of the burst, according to table 9.13.

**Table 9.13: Training sequence mapping to logical channels**

| Normal training sequence | Logical channel   |
|--------------------------|---|
| 1                        | TCH<br>SCH/F  |
| 2                        | STCH + TCH<br>STCH + STCH<br>SCH/HD + SCH/HD<br>SCH/HD + BNCH |

The third  $\pi/4$ -DQPSK training sequence shall be a supplementary training sequence spread over two consecutive downlink bursts.

The  $\pi/4$ -DQPSK normal training sequence 1 shall be:

$$(n1, n2, \dots, n22) = (1, 1, 0, 1, 0, 0, 0, 0, 1, 1, 1, 0, 1, 0, 0, 1, 1, 1, 0, 1, 0, 0) \quad (9.4)$$

The  $\pi/4$ -DQPSK normal training sequence 2 shall be:

$$(p1, p2, \dots, p22) = (0,1, 1,1, 1,0, 1,0, 0,1, 0,0, 0,0, 1,1, 0,1, 1,1, 1,0) \quad (9.5)$$

The  $\pi/4$ -DQPSK normal training sequence 3 shall be:

$$(q1, q2, \dots, q22) = (1,0, 1,1, 0,1, 1,1, 0,0, 0,0, 0,1, 1,0, 1,0, 1,1, 0,1) \quad (9.6)$$

Two 33 bit normal training sequences are defined for  $\pi/8$ -D8PSK.

The  $\pi/8$ -D8PSK normal training sequences shall be used on the  $\pi/8$ -D8PSK normal uplink and downlink bursts. The type of training sequence shall be used as a flag indicating the presence of one or two logical channels on the blocks 1 and 2 of the burst, according to table 9.14.

**Table 9.14: Training sequence mapping to logical channels for  $\pi/8$ -D8PSK**

| Normal training sequence | Logical channel       |
|--------------------------|-----------------------|
| 1                        | SCH-P8/F              |
| 2                        | SCH-P8/HD + SCH-P8/HD |

The normal training sequence 1-P8 shall be:

$$(N1, N2, \dots, N33) = (1,1,1, 0,0,1, 1,0,1, 1,1,1, 0,0,0, 1,1,1, 1,0,0, 0,1,1, 1,1,0, 0,0,0, 0,0,0) \quad (9.7)$$

The normal training sequence 2-P8 shall be:

$$(P1, P2, \dots, P33) = (1,0,1, 0,1,1, 1,1,1, 1,0,1, 0,1,0, 1,0,1, 1,1,0, 0,0,1, 1,0,0, 0,1,0, 0,1,0) \quad (9.8)$$

On a  $\pi/8$ -D8PSK channel, receivers determine whether a slot contains a  $\pi/4$ -DQPSK normal uplink or downlink burst or a  $\pi/8$ -D8PSK normal uplink or downlink burst by determining whether normal training sequence 1 or normal training sequence 2 uses the  $\pi/4$ -DQPSK form or the  $\pi/8$ -D8PSK form.

#### 9.4.4.3.3 Extended training sequence

The extended training sequence for  $\pi/4$ -DQPSK shall be a 30 bit synchronization word used for the uplink control burst.

The extended training sequence for  $\pi/4$ -DQPSK shall be:

$$(x1, x2, \dots, x30) = (1,0, 0,1, 1,1, 0,1, 0,0, 0,0, 1,1, 1,0, 1,0, 0,1, 1,1, 0,1, 0,0, 0,0, 1,1) \quad (9.9)$$

The extended training sequence for  $\pi/8$ -D8PSK shall be a 45 bit synchronization word used for the uplink control burst.

The extended training sequence for  $\pi/8$ -D8PSK shall be:

$$(X1, X2, \dots, X45) = (0,1,1,1,0,0,1,1,0,1,0,0,0,0,1,0,0,0,1,1,1,0,1,1,0,1,0,1,0,1,1,1,1,1,0,1,0,0,0,0,0,1,1,1,0) \quad (9.10)$$

On a D8PSK channel, receivers determine whether a subslot contains a  $\pi/4$ -DQPSK control uplink burst or a  $\pi/8$ -D8PSK control uplink burst by determining whether the extended training sequence uses the  $\pi/4$ -DQPSK form or the  $\pi/8$ -D8PSK form.

#### 9.4.4.3.4 Synchronization training sequence

The synchronization training sequence shall be a 38 bit synchronization word used for the synchronization downlink burst.

The synchronization training sequence shall be:

$$(y1, y2, \dots, y38) = (1,1, 0,0, 0,0, 0,1, 1,0, 0,1, 1,1, 0,0, 1,1, 1,0, 1,0, 0,1, 1,1, 0,0, 0,0, 0,1, 1,0, 0,1, 1,1) \quad (9.11)$$

#### 9.4.4.3.5 Tail bits

The tail bit field for  $\pi/4$ -DQPSK shall contain 4 bits used for reducing the effect of filter transient response at the beginning and end of the bursts and for equalization purposes.

The contents of the  $\pi/4$ -DQPSK tail bit field shall be:

$$(t1, t2, t3, t4) = (1, 1, 0, 0) \quad (9.12)$$

The tail bit field for  $\pi/8$ -D8PSK shall contain 6 bits used for reducing the effect of filter transient response at the beginning and end of the bursts.

The contents of the  $\pi/8$ -D8PSK tail bit field shall be:

$$(T1, T2, \dots, T6) = (1, 1, 1, 0, 0, 0) \quad (9.13)$$

#### 9.4.4.3.6 Phase adjustment bits

The  $\pi/4$ -DQPSK phase adjustment bits shall be used on the  $\pi/4$ -DQPSK bursts defined in clauses 9.4.4.2 and 9.4.5.3 to provide a known phase relationship between the different training sequences of the burst, whatever is the content of the blocks.

The value of the pair of phase adjustment bits shall be set so that the phase shift  $D\phi$  they generate (see clause 5) is equal to:

$$D\phi = - \sum_{n=n1}^{n2} D\phi(n) \quad (9.14)$$

Where  $D\phi(n)$  is the phase transition generated by the bits  $BN(2n-1)$ ,  $BN(2n)$ ,  $n1$  and  $n2$  are given by table 9.15 for  $\pi/4$ -DQPSK.

**Table 9.15:  $\pi/4$ -DQPSK Phase adjustment bits**

| phase adjustment bits   | $n1$ | $n2$           |
|---|------|----------------|
| $(ha1, ha2)$  | 8    | 122            |
| $(hb1, hb2)$  | 123  | 249            |
| $(hc1, hc2)$  | 8    | 108            |
| $(hd1, hd2)$  | 109  | 249            |
| $(he1, he2)$  | 112  | 230 (see note) |
| $(hf1, hf2)$  | 1    | 111            |
| $(hg1, hg2)$  | 3    | 117            |
| $(hh1, hh2)$  | 118  | 244            |
| $(hi1, hi2)$  | 3    | 103            |
| $(hj1, hj2)$  | 104  | 244            |
| NOTE: The $n2$ value 230 does not include the second symbol of the tail in the phase balance causing a non-zero phase change. |      |                |

The  $\pi/8$ -D8PSK phase adjustment bits shall be used on the  $\pi/8$ -D8PSK bursts defined in clauses 9.4.4.2 and 9.4.5.3 to provide a known phase relationship between the different training sequences of the burst, whatever the content of the blocks. The value of the three phase adjustment bits shall be set so that the phase shift  $D\phi$  they generate (see clause 5) is equal to a phase as defined by equation 9.14 or 9.15 (see table 9.16).

$$D\phi = - \sum_{n=n1}^{n2} D\phi(n) + \frac{\pi}{8} \quad (9.15)$$

Where  $D\phi(n)$  is the phase transition generated by the bits  $BN(3n-2)$ ,  $BN(3n-1)$ ,  $BN(3n)$ ,  $n1$  and  $n2$  are given by table 9.16 for  $\pi/8$ -D8PSK.

**Table 9.16: Phase adjustment bits for  $\pi/8$ -D8PSK**

| phase adjustment bits | $n1$ | $n2$             |
|-----------------------|------|------------------|
| $(ha1, ha2, ha3)$     | 8    | 122 (see note 1) |
| $(hb1, hb2, hb3)$     | 123  | 249 (see note 2) |
| $(he1, he2, he3)$     | 111  | 231 (see note 1) |
| $(hf1, hf2, hf3)$     | 1    | 110 (see note 1) |
| $(hg1, hg2, hg3)$     | 3    | 117 (see note 1) |
| $(hh1, hh2, hh3)$     | 118  | 244 (see note 2) |

NOTE 1: In this case,  $D\phi$  has a resultant phase shift of  $\pi/8$  (see expression 9.15).  
NOTE 2: In this case,  $D\phi$  has a resultant phase shift of 0 (see expression 9.14).

## 9.4.5 Transmission modes for phase modulation

### 9.4.5.1 BS continuous transmission

When the BS is in continuous transmission mode normal downlink bursts or synchronization bursts shall be transmitted on all unused downlink slots of the main carrier and may be transmitted on the unallocated physical channels of the other carriers.

On the main carrier the BS shall only be allowed to ramp down and up during a BLCH. On the other carriers the BS may ramp down and up during the slots of an UP channel.

The first burst after ramp up of a downlink continuous transmission (D-CT) shall be preceded by a start burst ( $SN_{max} = 5$ ), according to table 9.17.

**Table 9.17: Start burst**

| Bit Number (BN) | Field length (bits) | Field content              | Field bits number | Definition       |
|-----------------|---------------------|----------------------------|-------------------|------------------|
| 1 to 10         | 10                  | normal training sequence 3 | $q1$ to $q10$     | clause 9.4.4.3.2 |

The last burst before ramp down of a D-CT shall be followed by a stop burst ( $SN_{max} = 6$ ), according to table 9.18.

**Table 9.18: Stop burst**

| Bit Number (BN) | Field length (bits) | field content              | field bits number | definition       |
|-----------------|---------------------|----------------------------|-------------------|------------------|
| 1 to 12         | 12                  | normal training sequence 3 | $q11$ to $q22$    | clause 9.4.4.3.2 |

### 9.4.5.2 BS timesharing transmission

The BS in timesharing transmission mode need not to ramp down and up between adjacent discontinuous downlink bursts. In the case where the BS does not perform the ramping, the discontinuous burst shall be followed by 4 symbols (corresponding to the guard period) according to table 9.19, and the subsequent burst shall be preceded by 5 symbols (corresponding to the ramp up and linearization period) according to table 9.20.

**Table 9.19: Bits following the burst**

| Bit number | Field length (bits) | Field content              | Field bits number | Definition       |
|------------|---------------------|----------------------------|-------------------|------------------|
| 1 to 8     | 8                   | normal training sequence 3 | $q3$ to $q10$     | clause 9.4.4.3.2 |

**Table 9.20: Bits preceding the burst**

| Bit number | Field length (bits) | Field content              | Field bits number | Definition       |
|------------|---------------------|----------------------------|-------------------|------------------|
| 1 to 10    | 10                  | normal training sequence 3 | $q11$ to $q20$    | clause 9.4.4.3.2 |

### 9.4.5.3 MS multiple slot transmission

The MS transmitting on more than 1 physical channel need not to ramp down and up between adjacent normal uplink bursts. In the case where the MS does not perform the ramping, the burst shall be followed by 7 symbols (corresponding to the guard period) defined in table 9.21 for  $\pi/4$ -DQPSK and in table 9.23 for  $\pi/8$ -D8PSK, the subsequent burst shall be preceded by 17 symbols (corresponding to the ramp up and linearization period), according table 9.22 for  $\pi/4$ -DQPSK and table 9.24 for  $\pi/8$ -D8PSK.

**Table 9.21: Bits following a  $\pi/4$ -DQPSK burst**

| Bit number | Field length (bits) | Field content              | Field bits number | Definition       |
|------------|---------------------|----------------------------|-------------------|------------------|
| 1 to 2     | 2                   | phase adjustment bits      | $he1$ to $he2$    | clause 9.4.4.3.6 |
| 3 to 4     | 2                   | tail bits                  | $t1$ to $t2$      | clause 9.4.4.3.5 |
| 5 to 14    | 10                  | normal training sequence 3 | $q1$ to $q10$     | clause 9.4.4.3.2 |

**Table 9.22: Bits preceding a  $\pi/4$ -DQPSK burst**

| Bit number | Field length (bits) | Field content              | Field bits number | Definition       |
|------------|---------------------|----------------------------|-------------------|------------------|
| 1 to 30    | 30                  | extended training sequence | $x1$ to $x30$     | clause 9.4.4.3.3 |
| 31 to 32   | 2                   | tail bits                  | $t3$ to $t4$      | clause 9.4.4.3.5 |
| 33 to 34   | 2                   | phase adjustment bits      | $hf1$ to $hf2$    | clause 9.4.4.3.6 |

**Table 9.23: Bits following a  $\pi/8$ -D8PSK burst**

| Bit number  | Field length (bits) | Field content              | Field bits number | Definition       |
|---|---------------------|----------------------------|-------------------|------------------|
| 1 to 3  | 3 (see note 2)      | phase adjustment bits      | $he1$ to $he3$    | clause 9.4.4.3.6 |
| 4 to 5  | 2 (see note 1)      | tail bits                  | $t1$ to $t2$      | clause 9.4.4.3.5 |
| 6 to 15   | 10 (see note 1)     | normal training sequence 3 | $q1$ to $q10$     | clause 9.4.4.3.2 |
| NOTE 1: This field shall be sent using $\pi/4$ -DQPSK modulation. |                     |                            |                   |                  |
| NOTE 2: This field shall be sent using $\pi/8$ -D8PSK modulation. |                     |                            |                   |                  |

**Table 9.24: Bits preceding a  $\pi/8$ -D8PSK burst**

| Bit number  | Field length (bits) | Field content              | Field bits number | Definition       |
|---|---------------------|----------------------------|-------------------|------------------|
| 1 to 30   | 30 (see note 1)     | extended training sequence | $x1$ to $x30$     | clause 9.4.4.3.3 |
| 31 to 32  | 2 (see note 1)      | tail bits                  | $t3$ to $t4$      | clause 9.4.4.3.5 |
| 33 to 35  | 3 (see note 2)      | phase adjustment bits      | $hf1$ to $hf3$    | clause 9.4.4.3.6 |
| NOTE 1: This field shall be sent using $\pi/4$ -DQPSK modulation. |                     |                            |                   |                  |
| NOTE 2: This field shall be sent using $\pi/8$ -D8PSK modulation. |                     |                            |                   |                  |

## 9.4.6 Types of physical channels for QAM

### 9.4.6.0 General

In QAM channels, two types of physical channel are defined:

- the Control Physical (CP) Channel; and
- the Unallocated Physical channel.

### 9.4.6.1 CP channel for QAM

The CP channel is a physical channel carrying exclusively CCH. Two types of CP channels for QAM are defined:

- the Main Control CHannel (MCCH-Q); and
- the QAM Secondary Control CHannel (SCCH).

In each direct access cell one QAM RF carrier shall be defined as the main carrier (DA main carrier).

The DA main carrier shall have one MCCH-Q. The MCCH-Q shall be 1 to 4 slots wide. The MCCH-Q shall start on timeslot 1 of the DA main carrier.

QAM SCCH may be common SCCH or assigned SCCH:

- QAM common SCCH(s) are used only for direct access. If provided they are used to extend the signalling capacity of the MCCH-Q.
- QAM assigned SCCHs may be allocated both by conventional access cells and by direct access cells. MSs may be directed to a QAM assigned SCCH by the BS, for example, from the MCCH or a  $\pi/4$ -DQPSK common SCCH for conventional access or from the MCCH-Q or a QAM common SCCH for direct access.

### 9.4.6.2 UP channel

The UP channel is a physical channel not allocated to one or more MS.

## 9.4.7 Bursts for QAM

### 9.4.7.1 General

A burst is a period of RF carrier that is modulated by a data stream. A burst therefore represents the physical content of a timeslot or subslot.

### 9.4.7.2 Modulation symbol numbering

A timeslot shall be divided into 34 QAM modulation symbol durations, each one with a duration of  $5/12$  ms (approximately 416,6  $\mu$ s). A particular modulation symbol within a burst shall be referenced by a Symbol Number ( $SN$ ), with the first modulation symbol numbered  $SN1$  and the last modulation symbol numbered  $SNmax$ .

Different types of bursts are defined, having different durations. The content of the burst is defined in terms of modulation symbols. Each modulation symbol is composed of several sub-carrier symbols (see clause 5.10). Sub-carrier symbols ( $SS$ ) within a burst shall be referenced by two indices and shall be denoted as  $SS(i,j)$ , the first index  $i$  being a time index numbered from 1 to  $N$  and the second index  $j$  being the sub-carrier index from 0 to  $M-1$ , where  $M$  is the number of sub-carriers. The relation between sub-carrier index and its frequency is defined in clause 5.

Sub-carrier symbols can be either **data sub-carrier symbol** ( $Dx$ ), **synchronization sub-carrier symbols** ( $Sx$ ), **pilot sub-carrier symbols** ( $Px$ ), **header sub-carrier symbols** ( $Hx$ ), **frequency-correction sub-carrier symbols** ( $Fx$ ), **filler sub-carrier symbols** ( $Fix$ ) or **zeroed sub-carrier symbols** ( $Zx$ ).

### 9.4.7.3 Modulation bit numbering

Only data sub-carrier symbols convey information bits. The number of bits in each data sub-carrier symbol is a function of the QAM constellation used.

The number of information bits in a burst is also a function of the burst type. A particular modulation bit within a burst shall be referenced by a Bit Number ( $BN$ ), with the first modulation bit numbered  $BN1$  and the last modulation bit numbered  $BNmax$ .

At the modulator, the modulation bits shall be grouped according to the constellation used. For 4-QAM, they shall be grouped in pairs of consecutive numbered bits. For 16-QAM, they shall be grouped in sets of four consecutive numbered bits. For 64-QAM, they shall be grouped in sets of six consecutive numbered bits. Each group shall be converted into one modulation symbol as described in clause 5.4.

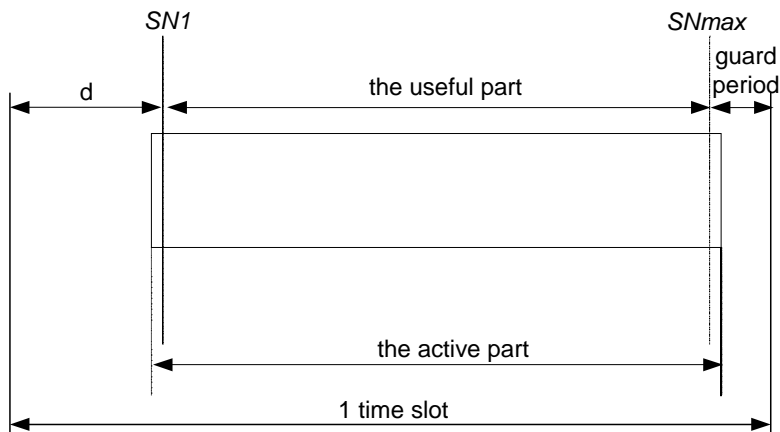

The mapping of information bits into data sub-carrier symbols for all burst types is presented in clause 5.5.

### 9.4.7.4 Burst timing

The symbol time is defined as the instant at which the transmitted symbol waveform is at a maximum for the symbol of interest. The timing of a modulation symbol is determined by its symbol time.

The symbol time of the modulation symbol  $SN(n)$  shall be delayed by  $(n+d-1)$  modulation symbol durations with respect to the start of the slot, with:

- $n$ : integer (1 ... ( $SNmax$ ));
- $d$ : is defined as the burst delay. The burst delay represents the delay between the start of the timeslot and the symbol time of the symbol  $SN1$ . The burst delay shall be expressed in modulation symbol duration and varies with the type of burst and the SSN. The values of the burst delays are given in table 9.25.
- *useful part of the burst* is defined as shown in figure 9.5.

NOTE 1: For certain burst types  $d$  and the guard period may be of length zero.

NOTE 2: The active part of the burst is the period during which modulation symbols are present; it is longer than the useful part by an amount equal to the sum of the time necessary for symbol rise and decay.

**Figure 9.5: Burst timing for QAM**

### 9.4.8 Type of bursts for QAM

#### 9.4.8.1 General

Seven types of QAM bursts shall exist in the system. Figure 9.6 summarizes the description of the bursts and their timing with respect to the timeslot.

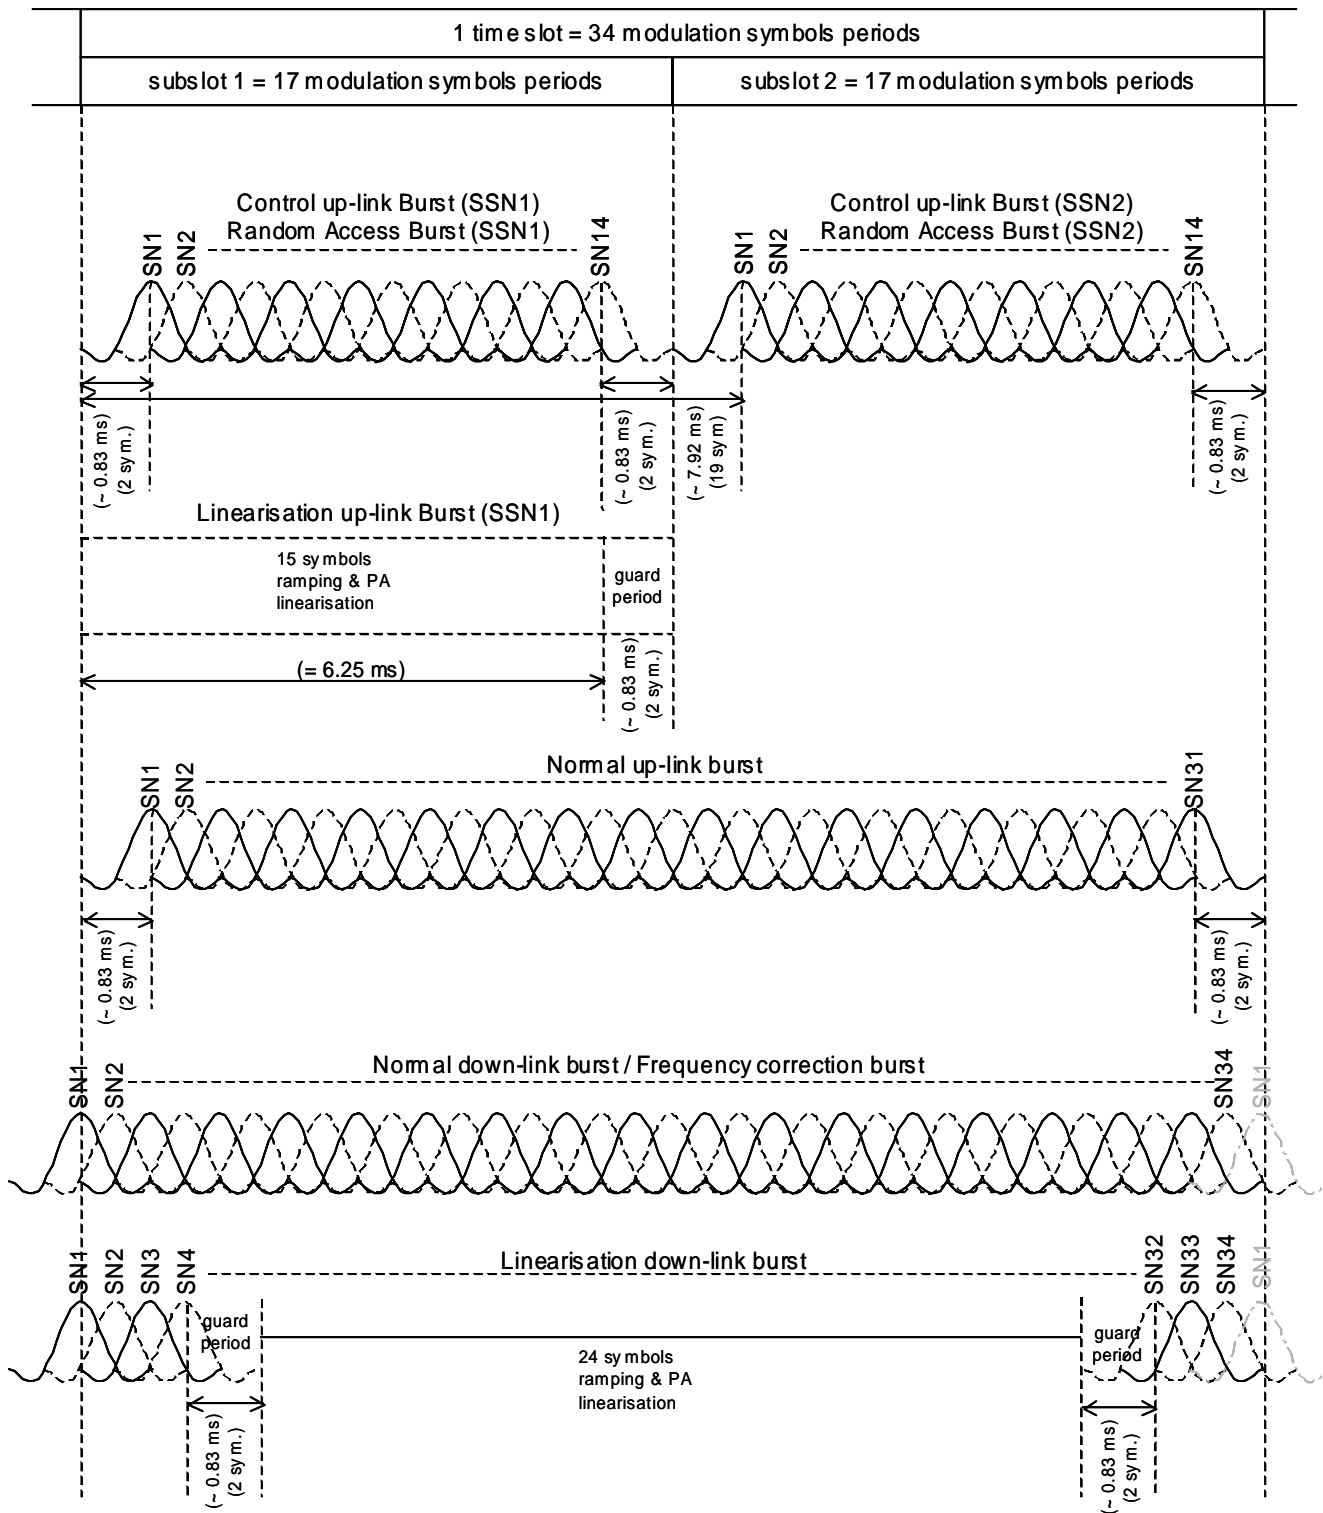

Figure 9.6: Types of bursts for QAM

NOTE: The power-time mask is defined in clause 6.4.10. The  $t_1$  period defined in clause 6.4.10 may be used for ramping and PA linearization.

**Table 9.25: Burst types for QAM**

| Burst type                         | SNmax          | d burst delay (in symbol duration) |             | Symbol allocation |
|------------------------------------|----------------|------------------------------------|-------------|-------------------|
|                                    |                | SSN 1                              | SSN 2       |                   |
| Control uplink burst (CB)          | 14             | 2                                  | 19          | See clause P.1.1  |
| Random access uplink burst (RAB)   | 14             | 2                                  | 19          | See clause P.1.2  |
| Linearization uplink burst (LB)    | not applicable | not applicable                     | not allowed | See clause P.1.3  |
| Normal uplink burst (NUB)          | 31             | 2                                  |             | See clause P.1.4  |
| Normal downlink burst (NDB)        | 34             | 0                                  |             | See clause P.1.5  |
| Linearization downlink burst (LDB) | 34             | 0                                  |             | See clause P.1.6  |
| Frequency correction burst (FCB)   | 34             | 0                                  |             | See clause P.1.7  |

### 9.4.8.2 Modulation symbols allocation

The bursts are composed of sub-carrier symbol sets containing symbols of the same modulation type. When considered together, the sets compose either a valuable information for a proper operation of the physical layer or carry logical channel information.

The sub-carrier symbol sets used with QAM modulation are sync sequence set, secondary sync sequence set, pilots set, header set, data set, frequency correction set, filler set and zeroed symbols set.

Sync sequence set, secondary sync sequence set, pilot set and filler set use symbols that lie in the unit circle of the constellation as described in clause 5.13. The frequency correction set uses symbols that lie in the unit circle of the constellation as described in clause 5.13 or zeroed (null) sub-carrier symbols. The header set uses only 4-QAM modulation sub-carrier symbols. The zeroed set use symbols whose magnitude is equal to zero. The data set may generally use any 4-QAM, 16-QAM or 64-QAM modulation sub-carrier symbols.

The sub-carrier symbol sets are described in clause 9.4.8.3.

The allocation of the sub-carrier symbols and their content for each of the seven types of QAM burst shall be as defined in clauses P.1.1 to P.1.7. However, note that the Linearization uplink Burst (LB) contains no useful symbols and its timing shall only be determined by the time mask (see clause 6.4.10).

### 9.4.8.3 Burst sub-carrier symbol sets

#### 9.4.8.3.1 General on burst sub-carrier symbol sets

All of the sub-carrier symbol sets in the clauses 9.4.8.3.2 to 9.4.8.3.8 have been defined such that the sub-carrier frequency domain multiplexers will all start at phase 0 radians, at  $t = t_0 = 0$ , at the beginning of each burst, where  $t_0$  is shown in figures 5.8. This includes bursts transmitted in SubSlot Number 2. This makes their definition independent of the waveform filter.

In a physical implementation, the defined sub-carrier symbols should be pre-rotated to compensate for the delay through the transmit symbol waveform  $g(t)$  in order to maintain proper phasing. For example, a filter with delay  $t_d$  should rotate each sub-carrier symbol by  $-2\pi f_m t_d$  radians, where  $f_m$  is the sub-carrier frequency and  $t_0$  is the time delay through the symbol waveform  $g(t)$  prior to modulation to insure that proper phasing of the sub-carrier frequency domain multiplexers is achieved.

#### 9.4.8.3.2 Uplink sync sequence set

The Uplink Sync sequence Sets contain  $2M$  sub-carrier symbols where  $M$  is the number of sub-carriers used.

They are denoted  $USSx$ , where  $x$  is the number of sub-carriers. For example,  $USS8$  denotes the Uplink Sync Sequence Set in the case of 8 sub-carriers.

The amplitude of the symbols is as described in clause 5.13. The symbol waveform filter independent phases are defined as a multiple of  $\pi$  radians.

The values of the phases shall be as expressed in clause P.2.1.

The  $USSx$  are used in all control uplink bursts and normal uplink bursts of the corresponding number of sub-carriers  $x$ .  $USS8$  is used in the Random Access burst.

#### 9.4.8.3.3 Downlink sync sequence set

The Downlink sync Sequence Sets contain  $1.5M$  sub-carrier symbols where  $M$  is the number of sub-carriers used.

They are denoted  $DSSx$ , where  $x$  is the number of sub-carriers. For example,  $DSS8$  denotes the Downlink Sync Sequence Set in the case of 8 sub-carriers.

The amplitude of the symbols is as described in clause 5.13. The symbol waveform filter independent phases are defined as a multiple of  $\pi$  radians.

The values of the phases shall be as expressed in clause P.2.2.

The  $DSSx$  are used in all normal downlink bursts and in the linearization downlink bursts of the corresponding number of sub-carriers  $x$ .

#### 9.4.8.3.3a Secondary sync sequence set

The secondary sync sequence set contains 8 sub-carrier symbols independent of the number of sub-carriers used.

They are denoted SSS.

The values of the phases shall be as expressed in clause P.2.9. The symbol waveform filter independent phases are defined as a multiple of  $\pi$  radians.

The SSS are used in all frequency correction bursts and help the MS, together with its surrounding pilots, time synchronize to the BS, following successful frequency correction.

#### 9.4.8.3.4 Half-slot uplink pilots set

The Half-slot Uplink Pilots Set contain  $1.5M$  sub-carrier symbols where  $M$  is the number of sub-carriers used.

They are denoted  $HUPSx$ , where  $x$  is the number of sub-carriers. For example,  $HUPS8$  denotes the Half-slot Uplink Pilots Set in the case of 8 sub-carriers.

The amplitude of the symbols is as described in clause 5.13. The symbol waveform filter independent phases are defined as a multiple of  $\pi$  radians.

The values of the phases shall be as expressed in clause P.2.3.

The  $HUPSx$  are used in all control uplink bursts of the corresponding number of sub-carriers  $x$ .  $HUPS8$  is used in the Random Access burst.

#### 9.4.8.3.5 Full-slot uplink pilots set

The Full-slot Uplink Pilots Set contains  $3M$  sub-carrier symbols where  $M$  is the number of sub-carriers used.

They are denoted  $FUPSx$ , where  $x$  is the number of sub-carriers. For example,  $FUPS8$  denotes the Full-slot Uplink Pilots Set in the case of 8 sub-carriers.

The amplitude of the symbols is as described in clause 5.13. The symbol waveform filter independent phases are defined as a multiple of  $\pi$  radians.

The values of the phases shall be as expressed in clause P.2.4.

The  $FUPSx$  are used in all normal uplink bursts of the corresponding number of sub-carriers  $x$ .

#### 9.4.8.3.6 Full-slot downlink pilots set

The Full-slot Downlink Pilots Set contain  $3M$  sub-carrier symbols where  $M$  is the number of sub-carriers used.

They are denoted  $FDPSx$ , where  $x$  is the number of sub-carriers. For example,  $FDPS8$  denotes the Full-slot Downlink Pilots Set in the case of 8 sub-carriers.

The amplitude of the symbols is as described in clause 5.13. The symbol waveform filter independent phases are defined as a multiple of  $\pi$  radians.

The values of the phases shall be as expressed in clause P.2.5.

The  $FUPSx$  are used in all normal downlink bursts of the corresponding number of sub-carriers  $x$ .

#### 9.4.8.3.7 Filler sets

Two different filler sets are defined. Filler Set A is used in the Linearization Downlink Burst as shown in clause P.1.6 and when a NUB is appended to a second NUB or to a CB. In the latter case, Filler Set A is appended to the end of the first NUB. Filler Set B is used when a CB is concatenated with a second CB or a NUB, and is appended to the end of the first CB.

The Filler Sets contains  $3M$  sub-carrier symbols where  $M$  is the number of sub-carriers used.

They are denoted  $FiSQx$ , where  $Q$  can be equal to A or B and  $x$  is the number of sub-carriers. For example,  $FiSA8$  denotes the Filler Set A used, for example, in the LDB in the case of 8 sub-carriers.

The amplitude of the symbols is as described in clause 5.13. The symbol waveform filter independent phases are defined as a multiple of  $\pi$  radians.

The values of the phases shall be as expressed in clause P.2.6.

The  $FiSAx$  are used in all linearization downlink bursts.

The MS transmitting on more than 1 slot need not to ramp down and up between adjacent normal uplink bursts. In the case where the MS does not perform the ramping, the burst shall be followed by 3 filler symbols (FiSA or FiSB, depending on the particular concatenation) corresponding to the guard period (total of  $3M$  sub-carrier symbols, where  $M$  is the number of sub-carriers) defined in clause P.2.6.

#### 9.4.8.3.8 Linearization downlink zeroed set

The linearization downlink zeroed set is a set of sub-carrier symbols whose magnitude is equal to zero. The number of sub-carrier symbols in the set is equal to  $2,5M$  where  $M$  is the number of sub-carriers.

They are denoted  $LZSx$ , where  $x$  is the number of sub-carriers. For example,  $LZS8$  denotes the Linearization downlink Zeroed Set in the case of 8 sub-carriers.

$LZS8$  is composed of sub-carrier symbols Z1 to Z20.  $LZS16$  is composed of sub-carrier symbols Z1 to Z40.  $LZS32$  is composed of sub-carrier symbols Z1 to Z80.  $LZS48$  is composed of sub-carrier symbols Z1 to Z120, see clause P.1.6.

#### 9.4.8.3.9 Frequency correction set

The Frequency Correction Set contains 60 sub-carrier symbols independent of the number of sub-carriers used.

They are denoted FrCS. The amplitude of the non-zero symbols is as described in clause 5.13 for pilots. The rest have zero amplitude.

The values of the phases shall be as expressed in clause P.2.8.

#### 9.4.8.3.10 Frequency correction data set A

The Frequency Correction data set A contains 136 sub-carrier symbols independent of the number of sub-carriers used.

### 9.4.8.3.11 Frequency correction data set B

The Frequency Correction data set B is used on 50 kHz, 100 kHz and 150 kHz QAM channels. The table 9.26 shows the number of sub-carrier symbols for different numbers of subcarriers.

**Table 9.26: Number of sub-carrier symbols for data set B**

| Number of sub-carriers | Number of subcarrier symbols |
|------------------------|------------------------------|
| 8                      | -                            |
| 16                     | 236                          |
| 32                     | 708                          |
| 48                     | 1 180                        |

## 9.4.9 Transmission modes for QAM

### 9.4.9.1 BS transmission

For QAM modulation, only BS continuous transmission is supported.

### 9.4.9.2 MS multiple slot transmission

The MS transmitting on more than 1 physical channel need not to ramp down and up between adjacent normal uplink bursts. In the case where the MS does not perform the ramping, the burst shall be followed by 3 filler symbols (FiSA or FiSB, depending on the particular concatenation) corresponding to the guard period (total of  $3M$  sub-carrier symbols, where  $M$  is the number of sub-carriers) defined in clause P.2.6.

## 9.5 Mapping of logical channels into physical channels

### 9.5.0 General

Clauses 9.5.1 to 9.5.5 apply to phase modulation and clauses 9.5.6 to 9.5.10 to QAM.

## 9.5.1 General mapping of logical channels into $\pi/4$ -DQPSK physical channels

$\pi/4$ -DQPSK physical channels use  $\pi/4$ -DQPSK bursts.  $\pi/4$ -DQPSK bursts use  $\pi/4$ -DQPSK modulation. Table 9.27 defines the mapping in time of logical channels into  $\pi/4$ -DQPSK physical channel types.

**Table 9.27: Mapping of logical channels into  $\pi/4$ -DQPSK physical channels**

| Logical channel | Direction | Burst type       | SSN/Block                                 | Physical channel  | FN                     | TN                                       |
|-----------------|-----------|------------------|---|-------------------|------------------------|--|
| BSCH            | DL        | SB               | <i>BKN1</i><br><i>BKN1</i>                | CP, TP<br>UP      | 18<br>1...18           | 4-( <i>MN</i> +1)mod4#<br>1...4          |

| TCH             | DL        | NDB              | <i>BKN1</i> , <i>BKN2</i>                 | TP                | 1...17                 | 1...4                                    |
|                 | UL        | NUB              | <i>BKN1</i> , <i>BKN2</i>                 | TP                | 1...17                 | 1...4                                    |
| STCH            | DL        | NDB              | <i>BKN1</i> , <i>BKN2</i>                 | TP                | 1...17                 | 1...4                                    |
|                 | UL        | NUB              | <i>BKN1</i> , <i>BKN2</i>                 | TP                | 1...17                 | 1...4                                    |

NOTE: # indicates a mandatory mapping.

The mapping for  $\pi/4$ -DQPSK TP and CP physical channels shall be as summarized in tables 9.28 and 9.29.

**Table 9.28: TDMA frame mapping on  $\pi/4$ -DQPSK TP channel**

| Frame<br>FN | DOWNLINK                         |                          | UPLINK                                      |   |
|-------------|----------------------------------|--------------------------|---|---|
|             | Block <i>BKN1</i>                | Block <i>BKN2</i>        | Subslot <i>SSN1</i><br>or Block <i>BKN1</i> | Subslot <i>SSN2</i><br>or Block <i>BKN2</i> |
| 1 to 17     | TCH<br>STCH + TCH<br>STCH + STCH |                          | TCH<br>STCH + TCH<br>STCH + STCH            |   |
| 18          | SCH/HD<br>BSCH<br>SCH/HD         | SCH/HD<br>SCH/HD<br>BNCH | SCH/HU<br>CLCH                              | SCH/HU<br>SCH/HU                            |

**Table 9.29: TDMA frame mapping on  $\pi/4$ -DQPSK CP channel**

| Frame<br>FN | DOWNLINK                  |                   | UPLINK                                      |   |
|-------------|---------------------------|-------------------|---|---|
|             | Block <i>BKN1</i>         | Block <i>BKN2</i> | Subslot <i>SSN1</i><br>or Block <i>BKN1</i> | Subslot <i>SSN2</i><br>or Block <i>BKN2</i> |
| 1 to 18     | SCH/F<br>SCH/HD<br>SCH/HD |                   | SCH/F<br>SCH/HU<br>CLCH                     |   |
| 18          | BSCH                      | SCH/HD            |   | SCH/HU                                      |

In all cases the AACH shall be mapped onto the broadcast block of each downlink slot. On the downlink the BLCH may replace the SCH/HD of the block *BKN2*.

### 9.5.1a General mapping of logical channels into D8PSK physical channels

D8PSK is the general name for a channel that allows both  $\pi/4$ -DQPSK and  $\pi/8$ -D8PSK bursts.  $\pi/4$ -DQPSK bursts use  $\pi/4$ -DQPSK modulation.  $\pi/8$ -D8PSK bursts use both  $\pi/4$ -DQPSK modulation and  $\pi/8$ -D8PSK modulation, as defined in clause 9.4.4.2. The transmitter may send a  $\pi/4$ -DQPSK burst or a  $\pi/8$ -D8PSK burst independently of the preceding type of burst. The uplink and downlink burst types are chosen independently.

Table 9.30 defines the mapping in time of logical channels within a D8PSK physical channel.

**Table 9.30: Mapping of logical channels into D8PSK physical channels**

| Logical channel | Direction | Burst type   | SSN/Block         | Physical channel | FN     | TN                      |
|-----------------|-----------|--|-------------------|------------------|--------|-------------------------|
| BSCH            | DL        | SB ( $\pi/4$ -DQPSK)                                       | <i>BKN1</i>       | CP               | 18     | $4-(MN+1)\text{mod}4\#$ |
| BNCH            | DL        | NDB ( $\pi/4$ -DQPSK)                                      | <i>BKN2</i>       | CP               | 18     | $4-(MN+3)\text{mod}4\#$ |
|                 |           | NDB ( $\pi/4$ -DQPSK)                                      | <i>BKN2</i>       | CP               | 1...18 | 1...4                   |
| AACH            | DL        | NDB ( $\pi/4$ -DQPSK)                                      | <i>BBK</i>        | CP               | 1...18 | 1...4#                  |
|                 |           | NDB ( $\pi/8$ -D8PSK) (see note 2)<br>SB ( $\pi/4$ -DQPSK) |                   |                  |        |                         |
| BLCH            | DL        | NDB, SB ( $\pi/4$ -DQPSK)<br>NDB ( $\pi/8$ -D8PSK)         | <i>BKN2</i>       | CP               | 1...18 | 1...4                   |
| CLCH            | UL        | LB   | <i>SSN1</i>       | CP               | 18     | $4-(MN+1)\text{mod}4\#$ |
|                 |           |  | <i>SSN1</i>       | CP               | 1...18 | 1...4                   |
| SCH/F           | DL        | NDB ( $\pi/4$ -DQPSK)                                      | <i>BKN1+BKN2</i>  | CP               | 1...18 | 1...4                   |
|                 | UL        | NUB ( $\pi/4$ -DQPSK)                                      | <i>BKN1+BKN2</i>  | CP               | 1...18 | 1...4                   |
| SCH-P8/F        | DL        | NDB ( $\pi/8$ -D8PSK)                                      | <i>BKN1+BKN2</i>  | CP               | 1...18 | 1...4                   |
|                 | UL        | NUB ( $\pi/8$ -D8PSK)                                      | <i>BKN1+BKN2</i>  | CP               | 1...18 | 1...4                   |
| SCH/HD          | DL        | NDB, SB ( $\pi/4$ -DQPSK)                                  | <i>BKN1, BKN2</i> | CP               | 1...18 | 1...4                   |
| SCH-P8/HD       | DL        | NDB ( $\pi/8$ -D8PSK)                                      | <i>BKN1, BKN2</i> | CP               | 1...18 | 1...4                   |
| SCH/HU          | UL        | CB ( $\pi/4$ -DQPSK)                                       | <i>SSN1, SSN2</i> | CP               | 1...18 | 1...4                   |
| SCH-P8/HU       | UL        | CB ( $\pi/8$ -D8PSK)                                       | <i>SSN1, SSN2</i> | CP               | 1...18 | 1...4                   |

NOTE 1: # indicates a mandatory mapping.  
NOTE 2: Transmitted using  $\pi/4$ -DQPSK modulation in a  $\pi/8$ -D8PSK burst.

The mapping of TDMA frames onto D8PSK physical channels shall be as summarized in table 9.31.

**Table 9.31: TDMA frame mapping on D8PSK channel**

| Frame FN | DOWNLINK                      |                             | UPLINK   |   |
|----------|-------------------------------|-----------------------------|--|---|
|          | Block <i>BKN1</i>             | Block <i>BKN2</i>           | Subslot <i>SSN1</i> or Block <i>BKN1</i>                   | Subslot <i>SSN2</i> or Block <i>BKN2</i>                          |
| 1 to 18  | SCH/F<br>SCH-P8/F             |                             | SCH/F<br>SCH-P8/F  |   |
|          | SCH/HD<br>SCH-P8/HD<br>SCH/HD | SCH/HD<br>SCH-P8/HD<br>BNCH | SCH/HU<br>SCH-P8/HU<br>SCH/HU<br>SCH-P8/HU<br>CLCH<br>CLCH | SCH/HU<br>SCH-P8/HU<br>SCH-P8/HU<br>SCH/HU<br>SCH/HU<br>SCH-P8/HU |
|          | 18                            | BSCH                        | SCH/HD   |   |

In all cases the AACH shall be mapped onto the broadcast block of each downlink slot. On the downlink the BLCH may replace the SCH/HD or SCH-P8/HD of the block *BKN2*.

### 9.5.1b General mapping of logical channels into unallocated physical channels for phase modulation

Unallocated physical channels shall use  $\pi/4$ -DQPSK bursts. The mapping shall be as summarized in table 9.32.

**Table 9.32: TDMA frame mapping on unallocated physical channel**

| Frame<br><i>FN</i> | DOWNLINK          |                   | UPLINK              |                     |
|--------------------|-------------------|-------------------|---------------------|---------------------|
|                    | Block <i>BKN1</i> | Block <i>BKN2</i> | Subslot <i>SSN1</i> | Subslot <i>SSN2</i> |
| 1 to 18            | SCH/HD<br>BSCH    | SCH/HD<br>BNCH    | CLCH                |                     |

The AACH shall be mapped onto the broadcast block of each downlink slot. On the downlink the BLCH may replace the SCH/HD of the block *BKN2*.

**NOTE:** When a phase modulation channel first becomes unallocated after being used as an assigned channel (assigned for a circuit mode call or for secondary control), it is recommended that the BS maps SCH/HD + SCH/HD onto some slots of the unallocated physical channel(s) for several multiframes i.e. the BS should not map BSCH + BNCH onto all slots.

This is because any MSs that did not receive the channel allocation sent before the channel became unallocated will not receive the AACH in slots containing BSCH + BNCH (except when  $FN = 18$  and  $(MN + TN) \bmod 4 = 3$ ). However, when the BS maps SCH/HD + SCH/HD onto slots of the unallocated physical channel(s) (except when  $FN = 18$  and  $(MN + TN) \bmod 4 = 3$ ), any MSs remaining on the channel may receive the AACH; the MSs may then recognize quickly that the channel has become unallocated (see clause 23.5.6.1.1) instead of having to wait for the inactivity time-out to expire (see clause 23.5.6.1.2) or for RDC failure (see clause 23.7.3.1.1).

### 9.5.2 Mapping of BCCH and CLCH for phase modulation

The BCCH and CLCH shall be mapped on the control frame of  $\pi/4$ -DQPSK and  $\pi/8$ -D8PSK CP and TP channels. BCCH shall be transmitted within a  $\pi/4$ -DQPSK burst.

**Table 9.33: Mapping of the BCCH onto the control frame**

| Multiframe         | Frame<br><i>FN18</i> | Timeslot   |            |            |            |
|--------------------|----------------------|------------|------------|------------|------------|
|                    |                      | <i>TN1</i> | <i>TN2</i> | <i>TN3</i> | <i>TN4</i> |
| $(MN) \bmod 4 = 1$ | downlink <i>BKN1</i> |            | BSCH       |            |            |
|                    | downlink <i>BKN2</i> |            |            |            | BNCH       |
|                    | uplink <i>SSN1</i>   |            | CLCH       |            |            |
| $(MN) \bmod 4 = 2$ | downlink <i>BKN1</i> | BSCH       |            |            |            |
|                    | downlink <i>BKN2</i> |            |            | BNCH       |            |
|                    | uplink <i>SSN1</i>   | CLCH       |            |            |            |
| $(MN) \bmod 4 = 3$ | downlink <i>BKN1</i> |            |            |            | BSCH       |
|                    | downlink <i>BKN2</i> |            | BNCH       |            |            |
|                    | uplink <i>SSN1</i>   |            |            |            | CLCH       |
| $(MN) \bmod 4 = 0$ | downlink <i>BKN1</i> |            |            | BSCH       |            |
|                    | downlink <i>BKN2</i> | BNCH       |            |            |            |
|                    | uplink <i>SSN1</i>   |            |            | CLCH       |            |

The mapping of the BCCH and CLCH on the control frame shall be a function of the time slot and multiframe numbers and shall be obtained from the following algorithms or from table 9.33.

- Down-link:
  - BNCH mapped if:

$$FN = 18 \text{ and } (MN + TN) \bmod 4 = 1 \quad (9.16)$$

- BSCH mapped if:

$$FN = 18 \text{ and } (MN + TN) \bmod 4 = 3 \quad (9.17)$$

- Up-link:

- CLCH mapped if:

$$FN = 18 \text{ and } (MN + TN) \bmod 4 = 3 \quad (9.18)$$

The BSCH shall always be transmitted on a synchronization burst.

NOTE: Downlink slots for which  $FN = 18$  and  $(MN + TN) \bmod 4 = 1$  or  $3$  are sent using  $\pi/4$ -DQPSK modulation.

In addition to this mapping the BS may map the CLCH onto the up-link subslot 1 and the BNCH on the downlink block 2 of a CP channel. The mapping shall be performed on a slot to slot basis. The mapping of the CLCH shall be indicated on the AACH.

A MS may linearize its transmitter at any CLCH occurrence, even from another physical channel, provided this does not violate other mapping rules. The number of MS transmitter linearizations on one carrier is limited to once per multiframe period.

The BLCH may be mapped onto block 2 of the downlink slots, when a SCH/HD, SCH-P8/HD or a BSCH is mapped onto block 1. The number of BLCH occurrences on one carrier shall not exceed one per 4 multiframe periods.

At initial power-on of an RF carrier, the BS may linearize its transmitter using the BLCH. In this case the BLCH is mapped on a burst similar to the downlink linearization burst, but with an unspecified duration preceding the start burst.

Slots of an unallocated physical channel may be filled up with the BCCH, the BSCH is mapped onto block 1 and BNCH onto block 2. Whenever a BCCH is mapped on the downlink, a CLCH may also be mapped into the up-link.

### 9.5.3 Mapping of SCH for $\pi/4$ -DQPSK physical channels

On the up-link one SCH/F or two SCH/HU (one on each subslot) may be mapped, except if a CLCH is mapped on subslot 1 (equation 9.18) then only one SCH/HU may be mapped, onto subslot 2. On the down-link one SCH/F or two SCH/HD may be mapped on block 1 and block 2 except on the control frame if a BNCH is mapped onto block 2, then only one SCH/HD shall be mapped onto block 1.

Whenever a normal downlink burst is transmitted on an UP channel and if no BCCH is transmitted then the SCH/HD shall be mapped onto block 1 and block 2. The SCH/HD shall contain dummy messages (null SDU as described in clause 21).

The BS shall indicate on the AACH the type of logical channel(s) to be used on the next up-link subslot (SCH/HU or CLCH) or slot (SCH/F). This indication shall only be valid within one frame and for one physical channel.

In the case where several downlink TP channels are allocated to one single communication, the uplink and downlink SCH shall be mapped onto frame  $FN18$  of the allocated physical channel showing the lowest timeslot number  $TN$ .

In the case where several uplink TP channels are allocated to one single communication, the uplink and downlink SCH shall be mapped onto frame  $FN18$  of the allocated physical channel showing the highest timeslot number  $TN$ .

In the case where several downlink and uplink TP channels have been allocated simultaneously to one single communication, the uplink and downlink SCH shall be mapped onto frame  $FN18$  of the allocated physical channel showing the lowest timeslot number  $TN$ .

#### 9.5.3a Mapping of SCH for $\pi/8$ -D8PSK physical channels

On the up-link one SCH/F or SCH-P8/F may be mapped. Any combination of SCH/HU and SCH-P8/HU (one on each subslot) may be mapped. If a CLCH is mapped on subslot 1 (equation 9.18) then SCH/HU or SCH-P8/HU may be mapped onto subslot 2.

On the downlink, one SCH/F or one SCH-P8/F or two SCH/HD or two SCH-P8/HD may be mapped on block 1 and block 2 except on the control frame if a BNCH is mapped onto block 2, and then only one SCH/HD shall be mapped onto block 1.

The BS shall indicate on the AACH the type of logical channel(s) to be used on the next up-link subslot or slot. This indication shall only be valid within one frame and for one physical channel.

### 9.5.4 Mapping of TCH and STCH for phase modulation

The TCH shall be mapped onto block 1 and block 2 of the frames 1 to 17 of a TP channel.

The STCH may be mapped onto any frame allowed for traffic. The STCH steals a part or all of the TCH bits within a burst.

The presence of stolen traffic in one burst shall be indicated by the type of training sequence.

In case of stealing, the STCH shall always steal first the first half slot of the burst.

### 9.5.5 Mapping of AACH for phase modulation

The AACH is mapped onto the broadcast block of each downlink slot for both  $\pi/4$ -DQPSK and  $\pi/8$ -D8PSK bursts.

### 9.5.6 General mapping of logical channels for QAM

Table 9.34 defines the mapping in time of logical channels into physical channel types.

**Table 9.34: Mapping of QAM logical channel into QAM physical channels**

| Logical channel | Direction | Burst type | SSN                    | Physical channel | FN           | TN                                      |
|-----------------|-----------|------------|------------------------|------------------|--------------|---|
| BSCH-Q          | DL        | FCB        | -                      | CP, UP           | 18<br>1...18 | $4-(MN+1)\text{mod}4\#$<br>1...4        |
| BNCH-Q          | DL        | NDB, FCB   | -                      | CP, UP           | 18<br>1...18 | $4-(MN+3)\text{mod}4\#$<br>1...4        |
| AACH-Q          | DL        | NDB, FCB   | -                      | CP, UP           | 1...18       | 1...4#                                  |
| SICH-Q/D        | DL        | NDB, FCB   | -                      | CP, UP           | 1...18       | 1...4#                                  |
| SICH-Q/U        | UL        | NUB, CB    | -                      | CP               | 1...18       | 1...4#                                  |
| BLCH-Q          | DL        | LDB        | -                      | CP, UP           | 1...18       | 1...4                                   |
| CLCH-Q          | UL        | LB         | SSN1                   | CP               | 18           | $4-(MN+1)\text{mod}4\#$<br>(see note 2) |
|                 |           |            | SSN1                   | CP, UP           | 1...18       | 1...4                                   |
| SCH-Q/D         | DL        | NDB        | -                      | CP, UP           | 1...18       | 1...4                                   |
| SCH-Q/U         | UL        | NUB        | -                      | CP               | 1...18       | 1...4                                   |
| SCH-Q/HU        | UL        | CB         | SSN1, SSN2             | CP               | 1...18       | 1...4                                   |
| SCH-Q/RA        | UL        | RAB        | SSN11 through<br>SSN26 | CP               | 1...18       | 1...4                                   |
| SCH-Q/B         | DL        | FCB        | -                      | CP, UP           | 18<br>1...18 | $4-(MN+1)\text{mod}4\#$<br>1...4        |

NOTE 1: # indicates a mandatory mapping. Mandatory mapping of BSCH-Q and BNCH-Q applies only to DA main carriers.

NOTE 2: The MS shall only use the CLCH-Q in the lowest numbered TN of its channel.

The mapping to the CP channel shall be as summarized in table 9.35.

**Table 9.35: TDMA frame mapping on QAM CP channel**

| Frame<br><i>FN</i> | DOWNLINK |  | UPLINK   |   |
|--------------------|----------|--|--|---|
|                    |          |  | Subslot <i>SSN1</i> or<br><i>SSN11</i> through<br><i>SSN16</i>   | Subslot <i>SSN2</i> or<br><i>SSN21</i> through<br><i>SSN26</i>                  |
| 1 to 18            |          | SCH-Q/D<br>BLCH-Q<br>BNCH-Q<br>BSCH-Q<br>SCH-Q/B | SCH-Q/HU<br>SCH-Q/RA<br>CLCH-Q<br>SCH-Q/HU<br>SCH-Q/RA<br>CLCH-Q | SCH-Q/U<br>SCH-Q/HU<br>SCH-Q/RA<br>SCH-Q/HU<br>SCH-Q/RA<br>SCH-Q/HU<br>SCH-Q/RA |

### 9.5.7 General mapping of logical channels into unallocated physical channels for QAM

The mapping to UP channel shall be as presented in table 9.36.

**Table 9.36: TDMA frame mapping on QAM unallocated physical channel**

| Frame<br><i>FN</i> | DOWNLINK |  | UPLINK   |  |
|--------------------|----------|--|--|--|
|                    |          |  | Subslot <i>SSN1</i> or<br><i>SSN11</i> through<br><i>SSN16</i> | Subslot <i>SSN2</i> or<br><i>SSN21</i> through<br><i>SSN26</i> |
| 1 to 18            |          | SCH-Q/D<br>BLCH-Q<br>BNCH-Q<br>BSCH-Q<br>SCH-Q/B | CLCH-Q   |  |

### 9.5.8 Mapping of BCCH-Q and CLCH-Q for QAM

The CLCH-Q shall be mapped on the control frame of CP channels as presented in table 9.37.

**Table 9.37: Mapping of the BCCH-Q onto the control frame**

| Multiframe         | Frame<br><i>FN18</i> | Timeslot           |                    |                    |                    |
|--------------------|----------------------|--------------------|--------------------|--------------------|--------------------|
|                    |                      | <i>TN1</i>         | <i>TN2</i>         | <i>TN3</i>         | <i>TN4</i>         |
| $(MN) \bmod 4 = 1$ | downlink             |                    | BSCH-Q<br>(note 2) |                    | BNCH-Q<br>(note 2) |
|                    | uplink <i>SSN1</i>   |                    | CLCH-Q<br>(note 1) |                    |                    |
| $(MN) \bmod 4 = 2$ | downlink             | BSCH-Q<br>(note 2) |                    | BNCH-Q<br>(note 2) |                    |
|                    | uplink <i>SSN1</i>   | CLCH-Q<br>(note 1) |                    |                    |                    |
| $(MN) \bmod 4 = 3$ | downlink             |                    | BNCH-Q<br>(note 2) |                    | BSCH-Q<br>(note 2) |
|                    | uplink <i>SSN1</i>   |                    |                    |                    | CLCH-Q<br>(note 1) |
| $(MN) \bmod 4 = 0$ | downlink             | BNCH-Q<br>(note 2) |                    | BSCH-Q<br>(note 2) |                    |
|                    | uplink <i>SSN1</i>   |                    |                    | CLCH-Q<br>(note 1) |                    |

NOTE 1: On a multi-slot channel CLCH-Q is only mapped and the MS shall only use the slot for linearization, when it is the lowest numbered timeslot of the channel.

NOTE 2: Mandatory mapping of BSCH-Q and BNCH-Q applies only for DA main carriers.

The mapping of the BCCH-Q and CLCH-Q on the control frame shall be a function of the time slot and multiframe numbers and shall be obtained from the following algorithms or from table 9.37.

- Down-link (mandatory mapping only on the DA main carrier):

- BNCH-Q mapped if:

$$FN = 18 \text{ and } (MN + TN) \bmod 4 = 1 \quad (9.19)$$

- BSCH-Q mapped if:

$$FN = 18 \text{ and } (MN + TN) \bmod 4 = 3 \quad (9.20)$$

NOTE 1: Whenever BSCH-Q is used on a 50 kHz, 100 kHz or 150 kHz channel, there will also be an SCH-Q/B.

- Up-link:

- CLCH-Q mapped if:

$$FN = 18 \text{ and } (MN + TN) \bmod 4 = 3 \text{ and } TN \text{ is the lowest numbered timeslot of the MS's channel} \quad (9.21)$$

NOTE 2: If the channel is a multislot channel, and  $FN = 18$  and  $(MN + TN) \bmod 4 = 3$  and  $TN$  is not the lowest numbered timeslot of the multislot channel, then CLCH-Q is not mapped.

In addition to this mapping the BS may map the CLCH-Q onto the up-link subslot 1 and the BSCH-Q and/or the BNCH-Q on the downlink of a CP channel. The mapping shall be performed on a slot to slot basis. The mapping of the CLCH-Q shall be indicated on the AACH-Q.

The number of BLCH-Q occurrences on one carrier shall not exceed one per 4 multiframe periods.

At initial power-on of an RF carrier, the BS may linearize its transmitter using the BLCH-Q. In this case the BLCH-Q is mapped on a burst similar to the downlink linearization burst, but with an unspecified duration preceding the start burst.

On a UP channel, the BS may map the BSCH-Q and/or the BNCH-Q on the downlink and may map CLCH-Q onto the uplink subslot 1.

### 9.5.9 Mapping of SCH-Q for QAM

On the up-link one SCH-Q/U or two SCH-Q/HU (one on each subslot) may be mapped, except if a CLCH-Q is mapped on subslot 1 (equation 9.21) then only one SCH/HU may be mapped, onto subslot 2. Alternatively SCH-Q/RA may be mapped on the up-link (see table 9.35). On the down-link one SCH-Q/D may be mapped.

The BS shall indicate on the AACH-Q the type of logical channel(s) to be used on the next up-link subslot (SCH-Q/HU, SCH-Q/RA or CLCH-Q) or slot (SCH-Q/U). This indication shall only be valid within one frame and for one physical channel.

NOTE: On 50 kHz, 100 kHz and 150 kHz QAM channels SCH-Q/B mapping is same as for BSCH-Q. SCH-Q/B is not mapped on a 25 kHz channel.

### 9.5.10 Mapping of SICH-Q and AACH-Q for QAM

The SICH-Q/D and AACH-Q shall be mapped onto the header block of each downlink slot except slots containing BLCH-Q, and the SICH-Q/U shall be mapped onto the header block of each uplink slot or subslot, except subslots containing CLCH-Q or SCH-Q/RA.

The details of the mapping of the SICH-Q/D and AACH-Q into the bits that define the header block in the downlink slot are defined in clause 8.

## 9.6 Monitoring pattern for transmitting MSs

A particular monitoring pattern shall be referenced by its Monitoring Pattern Number (*MPN*). The monitoring patterns shall be numbered from 1 to 3. The BS shall assign 0 to 3 patterns to each up-link TCH during the call or transaction set-up. The transmitting MS shall monitor at least all frames belonging to the assigned monitoring pattern(s). In some cases, the BS may allocate no monitoring pattern, but, as a result, the MS may not be so easily reachable.

For a given monitoring pattern, the frame sequence may be obtained with the following equation or by using table 9.38.

$$(MN + MPN - 1) \bmod 3 = (FN) \bmod 3 \quad (9.22)$$

**Table 9.38: Monitoring patterns for transmitting MSs**

| Multiframe         | Monitoring Patterns           |                               |                               |
|--------------------|-------------------------------|-------------------------------|-------------------------------|
|                    | MPN 1                         | MPN 2                         | MPN 3                         |
| $(MN) \bmod 3 = 1$ | <i>FN</i> 1, 4, 7, 10, 13, 16 | <i>FN</i> 2, 5, 8, 11, 14, 17 | <i>FN</i> 3, 6, 9, 12, 15, 18 |
| $(MN) \bmod 3 = 2$ | <i>FN</i> 2, 5, 8, 11, 14, 17 | <i>FN</i> 3, 6, 9, 12, 15, 18 | <i>FN</i> 1, 4, 7, 10, 13, 16 |
| $(MN) \bmod 3 = 0$ | <i>FN</i> 3, 6, 9, 12, 15, 18 | <i>FN</i> 1, 4, 7, 10, 13, 16 | <i>FN</i> 2, 5, 8, 11, 14, 17 |

## 9.7 BS timesharing transmission

### 9.7.1 Carrier sharing for Phase Modulation

In carrier sharing mode one carrier frequency shall be shared among up to four cells, each cell being allocated at least one physical channel. The mapping of logical channels into physical channels shall follow the general mapping rules, except that on the downlink discontinuous bursts shall be used. (see also clause 23.3.2.1).

### 9.7.2 MCCH sharing for Phase Modulation

In MCCH sharing mode, the MCCH shall be shared among several cells. The TDMA frames of the MCCH shall be divided into frames reserved to one BS (reserved frames) and frames shared by all cells (common frames). The BS shall transmit during the reserved frames and may transmit during the common frames. The transmission during the common frames should be managed by the network (see also clause 23.3.2.2).

The frames reserved for a BS shall be calculated from the *TS\_RESERVED\_FRAMES* parameter that indicates the number of reserved frames per two multiframes. This parameter may take one of the following values:

- 1, 2, 3, 4, 6, 9, 12, 18;

and shall be broadcast on the BSCH. Up to 36 cells may share the same MCCH. The *FN* of the reserved frames may be obtained from the following equation or from table 9.39.

- the frame *FN* in the multiframe *MN* is reserved to the BS if:

$$FN + 18 [(MN + 1) \bmod 2] \text{ is a multiple of } 36 / \text{TS\_RESERVED\_FRAMES} \quad (9.23)$$

For any value of *TS\_RESERVED\_FRAMES*, frame 18 of the even multiframes shall be reserved, in order to transmit the BCCH. The TDMA frame and multiframe numbering of all cells sharing one MCCH shall be offset in order to avoid collision of the transmitted bursts.

The allocation of the common frames shall be sent on the BNCH.

The mappings of logical channel into physical channel shall follow for the reserved and common frames the same rules as for continuous transmission, except that on the downlink the discontinuous bursts shall be used.

Table 9.39: Reserved frames in BS timing

| Multi-frame MN | Frame FN | RESERVED FRAMES |   |   |   |   |   |    |    |
|----------------|----------|-----------------|---|---|---|---|---|----|----|
|                |          | 1               | 2 | 3 | 4 | 6 | 9 | 12 | 18 |
| odd            | 1        |                 |   |   |   |   |   |    |    |
|                | 2        |                 |   |   |   |   |   |    |    |
|                | 3        |                 |   |   |   |   |   |    |    |
|                | 4        |                 |   |   |   |   |   |    |    |
|                | 5        |                 |   |   |   |   |   |    |    |
|                | 6        |                 |   |   |   |   |   |    |    |
|                | 7        |                 |   |   |   |   |   |    |    |
|                | 8        |                 |   |   |   |   |   |    |    |
|                | 9        |                 |   |   |   |   |   |    |    |
|                | 10       |                 |   |   |   |   |   |    |    |
|                | 11       |                 |   |   |   |   |   |    |    |
|                | 12       |                 |   |   |   |   |   |    |    |
|                | 13       |                 |   |   |   |   |   |    |    |
|                | 14       |                 |   |   |   |   |   |    |    |
|                | 15       |                 |   |   |   |   |   |    |    |
|                | 16       |                 |   |   |   |   |   |    |    |
|                | 17       |                 |   |   |   |   |   |    |    |
|                | 18       |                 |   |   |   |   |   |    |    |
| even           | 1        |                 |   |   |   |   |   |    |    |
|                | 2        |                 |   |   |   |   |   |    |    |
|                | 3        |                 |   |   |   |   |   |    |    |
|                | 4        |                 |   |   |   |   |   |    |    |
|                | 5        |                 |   |   |   |   |   |    |    |
|                | 6        |                 |   |   |   |   |   |    |    |
|                | 7        |                 |   |   |   |   |   |    |    |
|                | 8        |                 |   |   |   |   |   |    |    |
|                | 9        |                 |   |   |   |   |   |    |    |
|                | 10       |                 |   |   |   |   |   |    |    |
|                | 11       |                 |   |   |   |   |   |    |    |
|                | 12       |                 |   |   |   |   |   |    |    |
|                | 13       |                 |   |   |   |   |   |    |    |
|                | 14       |                 |   |   |   |   |   |    |    |
|                | 15       |                 |   |   |   |   |   |    |    |
|                | 16       |                 |   |   |   |   |   |    |    |
|                | 17       |                 |   |   |   |   |   |    |    |
|                | 18       |                 |   |   |   |   |   |    |    |

### 9.7.3 BS timesharing transmission for QAM

QAM channels shall not use BS timesharing transmission.

## 9.8 Modes of control

### 9.8.0 General

Two modes of control are defined:

- Normal Control Mode (NCM); and
- Minimum Control Mode (MCM).

### 9.8.1 Normal Control Mode

The NCM is a mode of operation providing the TETRA services with full performance. In NCM a MCCH or MCCH-Q shall be assigned.

## 9.8.2 Minimum Control Mode

The MCM is a mode of operation on a CA cell providing the TETRA services with reduced performance. In MCM all physical channels may be assigned channels.

---

## 10 Radio subsystem link control

### 10.1 Introduction

Clauses 10.2 to 10.4 specify the radio subsystem link control implementation in MSs and BSs for V+D. The following aspects of radio subsystem link control are addressed:

- RF power control;
- the basis for signal strength measurement;
- link adaptation (applicable to D8PSK and QAM channels only).

### 10.2 RF power control

Adaptive RF power control shall be used by the MS. By minimizing the transmit power levels, interference to co-channel and adjacent channel users is reduced and MS power consumption could be reduced. Adaptive RF power control shall not be used by the BS.

### 10.3 Radio link measurements

#### 10.3.0 General

The radio link measurements include signal strength, signal quality and round-trip MS-BS path delay as presented in clauses 10.3.1, 10.3.2 and 10.3.3.

#### 10.3.1 Received signal strength

##### 10.3.1.1 Signal strength measurement

The received signal strength shall be measured over the range from -115 dBm to -50 dBm with an absolute accuracy of  $\pm 4$  dB. The relative accuracy between two measurements on the same carrier or on different carriers shall be  $\pm 3$  dB.

##### 10.3.1.2 Sample duration for signal strength measurement

To enable correct measurement of the received signal strength, the minimum Sample Duration (SD) shall be one of the following defined values:

- SD1 = 1 ms sample duration (1 ms integration time);
- SD2 = 4 ms sample duration (4 ms integration time).

#### 10.3.2 Signal quality

The quality of the radio downlink shall be estimated from the success rate of decoding the AACH or AACH-Q (see clause 23).

#### 10.3.3 Round-trip MS-BS path delay

The round-trip MS-BS path delay may be used by the BS as a criterion to relinquish a radio uplink. The path delay of the MS is a representation of the distance of the MS to the serving BS. This distance may be used to prevent MS grossly exceeding the planned cell boundaries. This information may be sent by the BS to the MS when appropriate. The allowable distance may be restricted on a cell to cell basis by the network operator, as required.

## 10.4 Link adaptation

Link adaptation may be used by the BS and MS to improve usage of the channel. This is achieved by the BS and/or MS transmitters changing the modulation type and/or coding rate, refer to clause 23.2.3. Link adaptation methods may include measurements of the radio link quality and/or the use of BS-MS link adaptation signalling, refer to clauses 23.1.4 and 23.4.9.

---

## 11 Call Control (CC) service description

### 11.1 Introduction

This clause describes the services offered by the CC sub-entity in the Circuit Mode Control Entity (CMCE). The CC Service Access Point (SAP) is used in conformance testing as a normative boundary in TETRA MSs and TETRA LSs.

### 11.2 Services offered

The CC services shall be provided with a CC sub-entity at the service access point TNCC-SAP. In order to cater for concurrent services there may exist multiple instances of the TNCC-SAP running at the same time.

At the TNCC-SAP one instance of the call control shall consist a set of the following calling user application and called user application services:

- basic call set-up (with attributes);
- call maintenance;
- Dual Tone Multiple Frequency (DTMF) encoding and sending;
- PTT requests/grants/information;
- call clearance;
- change of tele/bearer service within a call.

## 11.3 CC service

### 11.3.1 CC primitives exchanged through the TNCC-SAP

The flow of CC primitives shall be as illustrated in figure 11.1.

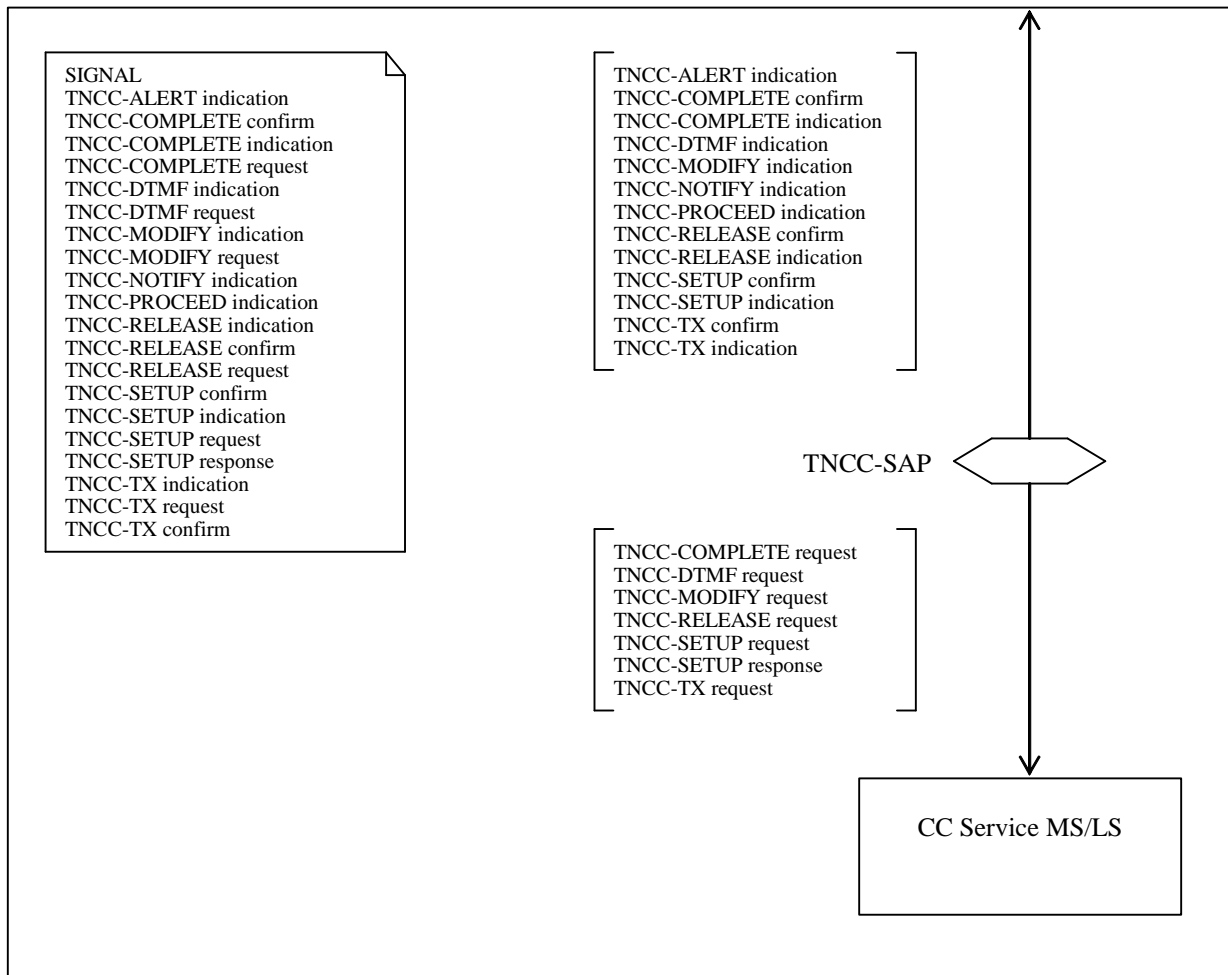

Figure 11.1: CC services provided at TNCC-SAP MS-side

### 11.3.2 Service primitives at the TNCC-SAP

Each TNCC-SAP shall be characterized by a SAP and the set of service primitives available for each SAP shall be as specified in this clause.

**TNCC-ALERT indication:** the primitive shall be used in the call set-up phase towards the calling user application when on/off hook signalling is employed.

**TNCC-COMplete request/indication/confirm:** the primitives shall be used as a termination of the call set-up phase at the called user application.

**TNCC-DTMF request/indication:** the primitives may be used during a circuit mode call to exchange DTMF information between user applications.

**TNCC-MODIFY request/indication:** the primitives may be used during call active phase as an indication that an existing tele or bearer service has been modified.

**TNCC-NOTIFY indication:** the primitives may be used during call set-up and call active phases to notify the user application about the status of the call.

**TNCC-PROCEED indication:** the primitive may be used during call set-up phase to indicate progress of the call set-up.

**TNCC-RELEASE request/indication/confirm:** the primitives shall be used to initiate the call release phase. Further it shall be used to indicate the termination of the call release phase. The primitives may also be used during the call set-up phase to request or indicate rejection of a call.

**TNCC-SETUP request/indication/response/confirm:** the primitives shall be used to initiate the call set-up phase and shall also be used to indicate the termination of the call set-up phase.

**TNCC-TX request/indication/confirm:** the primitives shall be used during call active phase to request and indicate change in the transmission permission.

### 11.3.3 Primitive description

#### 11.3.3.0 General

The information contained in the primitive description tables which follow corresponds to the following key:

- M: Mandatory;
- C: Conditional;
- O: Optional;
- : Not used.

#### 11.3.3.1 TNCC-ALERT primitive

**TNCC-ALERT indication:** the primitive shall be used to indicate to the calling user application, that the call has been received, and alerting at the called user application has been initiated. The called user application is using on/off hook signalling and the primitive indicates that the called user application is alerting.

The parameters are defined in table 11.1.

**Table 11.1: Parameters for the primitive TNCC-ALERT**

| Parameter   | Indication   |
|---|--------------|
| Basic service information (offered):                  |              |
| Circuit mode service                                  | O            |
| Communication type                                    | O            |
| Data call capacity                                    | C (see note) |
| Data service  | C (see note) |
| Encryption flag                                       | O            |
| Speech service  | C (see note) |
| Call queued   | O            |
| Call time-out, set-up phase                           | M            |
| Notification indicator                                | O            |
| Simplex/duplex  | M            |
| NOTE: Depending on the value of circuit mode service. |              |

### 11.3.3.2 TNCC-COMplete primitive

**TNCC-COMplete request:** the primitive shall be used by the called user application to complete individual call set-up.

**TNCC-COMplete indication:** the primitive shall be used as an indication to the called user application that the call set-up has been completed. The called user application shall also be informed whether the SwMI has granted transmission permission to the calling user application or whether the right to transmit has been handed over to the another user application.

**TNCC-COMplete confirm:** the primitive shall be used to confirm to the called user application that the call set-up has been completed.

The parameters are defined in table 11.2.

**Table 11.2: Parameters for the primitive TNCC-COMplete**

| Parameter                            | Request   | Indication | Confirm |
|--------------------------------------|---|------------|---------|
| Access priority                      | O   | -          | -       |
| Basic service information (offered): |   |            |         |
| Circuit mode service                 | O   | -          | -       |
| Communication type                   | O   | -          | -       |
| Data call capacity                   | C (see note)                                    | -          | -       |
| Data service                         | C (see note)                                    | -          | -       |
| Encryption flag                      | O   | -          | -       |
| Speech service                       | C (see note)                                    |            |         |
| Call time-out                        | -   | M          | M       |
| Hook method                          | M   | -          | -       |
| Notification indicator               | -   | O          | O       |
| Simplex/duplex                       | M   | -          | -       |
| Transmission grant                   | -   | M          | M       |
| Transmission request permission      | -   | M          | M       |
| Transmission status                  | -   | M          | M       |
| Traffic stealing                     | O   | -          | -       |
| NOTE:                                | Depending on the value of circuit mode service. |            |         |

### 11.3.3.3 TNCC-DTMF primitive

**TNCC-DTMF request:** the primitive shall be used as a request from the user application to send a number of DTMF digits to another user application.

**TNCC-DTMF indication:** the primitive shall be used as an indication to the user application that a number of DTMF digits has arrived from another user application.

The parameters are defined in table 11.3.

**Table 11.3: Parameters for the primitive TNCC-DTMF**

| Parameter             | Request  | Indication     |
|-----------------------|--|----------------|
| Access priority       | O  | -              |
| DTMF tone delimiter   | M  | O (see note 4) |
| DTMF result           | -  | C (see note 3) |
| Number of DTMF digits | C (see note 1)   | C (see note 2) |
| DTMF digits           | C (see note 1)   | C (see note 2) |
| Traffic stealing      | O  | -              |
| NOTE 1:               | Present when the value of DTMF tone delimiter is "DTMF tone start".  |                |
| NOTE 2:               | Present when DTMF tone delimiter is present and set to "DTMF tone start".  |                |
| NOTE 3:               | Present when DTMF tone delimiter is not present.   |                |
| NOTE 4:               | The time difference between "DTMF tone start" and "DTMF tone end" may not correspond to the tone duration at the originator. |                |

### 11.3.3.4 TNCC-MODIFY primitive

**TNCC-MODIFY request:** the primitive shall be used as a request from the user application to the SwMI to change the call attributes and/or the simplex/duplex selection.

NOTE: If a change in call attribute is requested, it cannot change from point-to-multipoint to point-to-point.

**TNCC-MODIFY indication:** the primitive shall be used as an indication to a user application that the call attribute has changed from one tele/bearer service to another tele/bearer service. The primitive shall also be used for indicating a change in the call timer or a change in the simplex/duplex operation.

The parameters are defined in table 11.4.

**Table 11.4: Parameters for the primitive TNCC-MODIFY**

| Parameter   | Request      | Indication   |
|---|--------------|--------------|
| Access priority                                       | O            | -            |
| Basic service information (new):                      |              |              |
| Circuit mode service                                  | O            | O            |
| Communication type                                    | O            | O            |
| Data call capacity                                    | C (see note) | C (see note) |
| Data service  | C (see note) | C (see note) |
| Encryption flag                                       | O            | O            |
| Speech service  | C (see note) | C (see note) |
| Call time-out   | -            | O            |
| Notification indicator                                | -            | O            |
| Simplex/duplex  | O            | O            |
| Traffic stealing                                      | O            | -            |
| NOTE: Depending on the value of circuit mode service. |              |              |

### 11.3.3.5 TNCC-NOTIFY primitive

**TNCC-NOTIFY indication:** the primitive shall provide information from the SwMI to the user application about a circuit mode call.

The parameters are defined in table 11.5.

NOTE: ETSI EN 300 392-9 [9] defines in clause 5.2 "NOTIFICATION indication primitive" that the NOTIFICATION indication is also providing information to the user application about the circuit mode call.

**Table 11.5: Parameters for the primitive TNCC-NOTIFY**

| Parameter  | Indication   |
|--|--------------|
| Call status  | O            |
| Call time-out in set-up phase  | O            |
| Call time-out  | O            |
| Call ownership   | O            |
| Notification indicator   | O            |
| Poll response percentage   | O (see note) |
| Poll response number   | O (see note) |
| Poll response addresses  | O (see note) |
| Poll request   | O            |
| NOTE: Only one of these values is applicable in a service primitive. |              |

### 11.3.3.6 TNCC-PROCEED primitive

**TNCC-PROCEED indication:** the primitive shall be used as an indication to the user application that call establishment has been initiated in the SwMI. The indication may also contain information about changes in call attributes, changes in the hook method or the simplex/duplex operation.

The parameters are defined in table 11.6.

**Table 11.6: Parameters for the primitive TNCC-PROCEED**

| Parameter   | Indication   |
|---|--------------|
| Basic service information (offered):                  |              |
| Circuit mode service                                  | O            |
| Communication type                                    | O            |
| Data call capacity                                    | C (see note) |
| Data service  | C (see note) |
| Encryption flag                                       | O            |
| Speech service  | C (see note) |
| Call status   | O            |
| Hook method   | O            |
| Notification indicator                                | O            |
| Simplex/duplex  | O            |
| NOTE: Depending on the value of circuit mode service. |              |

### 11.3.3.7 TNCC-RELEASE primitive

**TNCC-RELEASE request:** the primitive shall be used by the user application to either leave a continuing call or request disconnection of the call. If he wants to disconnect the call the SwMI is requested to release the connection. The SwMI is also requested to release the call identifier and all connections associated with it.

**TNCC-RELEASE indication:** the primitive shall be used as an indication to the user application, that the SwMI has released the call identifier and the corresponding connection. This primitive may also indicate a loss of resources at a lower layer.

**TNCC-RELEASE confirm:** the primitive shall be used to indicate to the initiator of the call release, that the SwMI has released the call identifier and the connection.

The parameters are defined in table 11.7.

**Table 11.7: Parameters for the primitive TNCC-RELEASE**

| Parameter              | Request | Indication | Confirm |
|------------------------|---------|------------|---------|
| Access priority        | O       | -          | -       |
| Disconnect cause       | M       | M          | M       |
| Disconnect status      | -       | -          | M       |
| Disconnect type        | M       | -          | -       |
| Notification indicator | -       | O          | O       |
| Traffic stealing       | O       | -          | -       |

### 11.3.3.8 TNCC-SETUP primitive

**TNCC-SETUP request:** the primitive shall be used to initiate the call establishment of a circuit switched call by a calling user application.

**TNCC-SETUP indication:** the primitive shall be used as an indication to a called user application that a call establishment has been initiated and a circuit switched call is in progress or has been established.

**TNCC-SETUP response:** the primitive shall be used by the called user application to indicate that the call has been accepted and call set-up can now proceed towards the call active phase. The user application may change the attributes of the call and the simplex/duplex operation may be changed.

**TNCC-SETUP confirm:** the primitive shall be used as a confirmation to the calling user application that the call set-up phase has now been terminated by the SwMI and an end-to-end connection has been set-up. The call shall now be considered as being in its active phase.

The parameters are defined in table 11.8.

**Table 11.8: Parameters for the primitive TNCC-SETUP**

| Parameter  | Request               | Indication     | Response       | Confirm        |
|--|-----------------------|----------------|----------------|----------------|
| Access priority  | O                     | -              | O              | -              |
| Area selection   | O (see note 6)        | -              | -              | -              |
| Basic service information:   |                       |                |                |                |
| Circuit mode service   | M                     | M              | O              | M              |
| Communication type   | M                     | M              | O              | M              |
| Data call capacity   | C (see note 1)        | C (see note 1) | C (see note 1) | C (see note 1) |
| Data service   | C (see note 1)        | C (see note 1) | C (see note 1) | C (see note 1) |
| Encryption flag  | M                     | M              | O              | M              |
| Speech service   | C (see note 1)        | C (see note 1) | C (see note 1) | C (see note 1) |
| Call priority  | M                     | M              | -              | O              |
| Call ownership   | -                     | -              | -              | M              |
| Call amalgamation  | -                     | -              | -              | M              |
| Call time-out  | -                     | M              | -              | M              |
| Called party type identifier   | M                     | -              | -              | -              |
| Called party SNA   | C (see note 2)        | -              | -              | -              |
| Called party SSI   | C (see notes 2 and 3) | M              | -              | -              |
| Called party extension   | C (see note 2)        | O (see note 8) | -              | -              |
| External subscriber number (called)  | O                     | -              | -              | -              |
| Calling party:   |                       |                |                |                |
| Calling party SSI  | -                     | O              | -              | -              |
| Calling party extension  | -                     | O (see note 4) | -              | -              |
| External subscriber number (calling)   | -                     | O              | -              | -              |
| CLIR control   | O (see note 7)        | O (see note 7) | O (see note 7) | -              |
| Hook method selection  | M                     | M              | M              | M              |
| Notification indicator   | -                     | O              | -              | O              |
| Request to transmit/send data  | M                     | -              | -              | -              |
| Simplex/duplex selection   | M                     | M              | M              | M              |
| Traffic stealing   | O                     | -              | O              | -              |
| Transmission grant   | -                     | M (see note 5) | -              | M (see note 5) |
| Transmission request permission  | -                     | M              | -              | M              |
| NOTE 1: Depending on the value of circuit mode service type.   |                       |                |                |                |
| NOTE 2: Depending on the value of called party type identifier.  |                       |                |                |                |
| NOTE 3: The application should ensure that individual calls (basic service) use called party ISSI, and group calls use GSSI.   |                       |                |                |                |
| NOTE 4: If not present, the user application shall assume that the address extension is the MNI of the current network.  |                       |                |                |                |
| NOTE 5: Transmission grant is applicable also in duplex calls.   |                       |                |                |                |
| NOTE 6: Usage of this parameter is defined in ETSI EN 300 392-12-8 [14].   |                       |                |                |                |
| NOTE 7: Usage of this parameter is defined in ETSI EN 300 392-12-1 [11].   |                       |                |                |                |
| NOTE 8: MSs that do not support migration i.e. registers only to the home network need not provide the Called party extension for incoming group calls except, if MS support foreign network group addresses for which the Called party extension is mandatory. The support of foreign group addresses and how the user of the MS knows that migration limitation are outside the scope of the present document. For individual calls the Called party extension is not needed in any network in the present document as the MS can have only a single ITSI. |                       |                |                |                |

### 11.3.3.9 TNCC-TX primitive

**TNCC-TX request:** the primitive shall be used as a request from the user application that it wants to transmit or that it has ceased its transmission. In the request for transmission the requested priority and the encryption mode shall be indicated. The user application should use a TNCC-TX request for a request to transmit only when a previous TNCC-TX indication has indicated that a request for transmission is allowed.

**TNCC-TX indication:** the primitive shall be used as an indication to the user application concerning the transmit status of the call. The primitive shall also be used to inform the user application about whether another user has been granted transmission or ceased its transmission. The encryption state of the actual transmission is indicated in the encryption control parameter.

**TNCC-TX confirm:** the primitive shall be used as a confirmation to the user application that the request to transmit has been granted. The encryption state of the actual transmission is indicated in the encryption control parameter.

The parameters are defined in table 11.9.

**Table 11.9: Parameters for the primitive TNCC-TX**

| Parameter                    | Request   | Indication   | Confirm |
|------------------------------|---|--------------|---------|
| Access priority              | O   | -            | -       |
| Encryption flag              | M   | M            | M       |
| Notification indicator       | -   | O            | -       |
| Transmitting party SSI       | -   | O            | -       |
| Transmitting party extension | -   | O (see note) | -       |
| External subscriber number   | -   | O            | -       |
| Traffic stealing             | O   | -            | -       |
| Transmission condition       | M   | -            | -       |
| Transmit request permission  | -   | M            | M       |
| Transmission status          | -   | M            | M       |
| Tx demand priority           | M   | -            | -       |
| NOTE:                        | If not present, the user application shall assume that the address extension is the MNI of the current network. |              |         |

### 11.3.4 Parameter description

Parameters shall be part of the primitives described in clause 11.3.3 and if applied the parameters shall contain the values specified in this clause. These values are selected to correspond to element values used in the air interface protocol:

- Access priority =
  - low priority;
  - high priority;
  - emergency priority.

The default value of the access priority parameter shall be "low priority", which will be applied when no access priority parameter is explicitly defined:

- Area selection =
  - area not defined;
  - area 1;
  - etc.;
  - area 14;
  - all areas in this system.

The default value of the area selection parameter shall be "area not defined", which will be applied when area selection is not used:

- Basic service information (a set of parameters) =
  - circuit mode service;
  - communication type;
  - data service;
  - data call capacity (data service only);
  - encryption flag;
  - speech service.
- Call amalgamation =
  - call not amalgamated;
  - call amalgamated.
- Call ownership =
  - a call owner;
  - not a call owner.
- Call priority =
  - priority not defined;
  - lowest priority;
  - etc.;
  - highest non-pre-emptive priority;
  - lowest pre-emptive priority;
  - etc.;
  - second highest pre-emptive priority;
  - emergency pre-emptive priority.
- Call queued =
  - call is not queued;
  - call is queued.
- Call status =
  - call status unknown;
  - call is progressing;
  - call is queued;
  - requested subscriber is paged;
  - call continue;
  - hang timer has expired.

- Call time-out =
  - call time-out infinite;
  - call time-out value-1;
  - call time-out value-2;
  - etc.;
  - call time-out value-15.

Refer to clause 14.7.1 for the time-out values:

- Call time-out in set-up phase =
  - call time-out pre-defined;
  - call time-out value-1;
  - call time-out value-2;
  - etc.;
  - call time-out value-7.

Refer to clause 14.7.2 for the time-out values:

- Called party extension =
  - country code and network code part of TSI.
- Called party SNA =
  - Short Number Address (SNA).
- Called party SSI =
  - Short Subscriber Identity (SSI).
- Called party type identifier =
  - SNA;
  - SSI;
  - TETRA subscriber identity (TSI).
- Calling party extension =
  - Mobile Country Code (MCC) + Mobile Network Code (MNC).
- Calling party SSI =
  - Individual Short Subscriber Identity (ISSI).
- Circuit mode service =
  - data service;
  - speech service.

- CLIR control =
  - not implemented or use default mode;
  - presentation not restricted;
  - presentation restricted.
- Communication type =
  - point-to-point;
  - point-to-multipoint;
  - point-to-multipoint acknowledged;
  - broadcast.
- Data service (service per one time slot) =
  - unprotected: 7,2 kbit/s, no interleaving;
  - low protection: 4,8 kbit/s, short interleaving depth = 1;
  - low protection: 4,8 kbit/s, medium interleaving depth = 4;
  - low protection: 4,8 kbit/s, long interleaving depth = 8;
  - high protection: 2,4 kbit/s, short interleaving depth = 1;
  - high protection: 2,4 kbit/s, medium interleaving depth = 4;
  - high protection: 2,4 kbit/s, long interleaving depth = 8.

NOTE 1: The increase in interleaving depth gives a better error protection, but also generates a longer transmission delay.

- Data call capacity =
  - one time slot;
  - two time slots;
  - three time slots;
  - four time slots.
- Disconnect cause =
  - cause not defined or unknown;
  - user requested disconnection;
  - non-call owner requested disconnection;
  - called party busy;
  - called party not reachable;
  - called party does not support encryption;
  - congestion in infrastructure;
  - not allowed traffic case;
  - incompatible traffic case;
  - requested service not available;

- pre-emptive use of resource;
  - invalid call identifier;
  - call rejected by the called party;
  - no idle CC entity;
  - expiry of timer;
  - SwMI requested disconnection;
  - acknowledged service not completed;
  - loss of resources;
  - usage marker failure;
  - called party requires encryption;
  - concurrent set-up not supported;
  - called party is under the same DM-GATE of the calling party.
- Disconnect status =
    - disconnection successful;
    - disconnection unsuccessful, the user is released from the call;
    - disconnection unsuccessful, not the call owner, the user is released from the call;
    - disconnection unsuccessful, user not authorized, the user is released from the call;
    - the user is released from the call.
- Disconnect type =
    - disconnect call;
    - leave call without disconnection;
    - leave call temporarily.
- DTMF digits =
    - Each digit shall be one of the following:
    - digit 0;
    - etc.;
    - digit 9;
    - digit \*;
    - digit #;
    - digit A;
    - digit B;
    - digit C;
    - digit D.

- DTMF result =
  - DTMF not supported;
  - DTMF not subscribed.
- DTMF tone delimiter =
  - DTMF;
  - tone end.

NOTE 2: The length of the received DTMF tone may be modified by the lower layer protocol depending on the signalling capacity availability.

- Encryption flag =
  - clear end-to-end transmission;
  - encrypted end-to-end transmission.
- External subscriber number digits =
  - Up to 24 digits. Each digit shall be one of the following:
  - digit 0;
  - etc.;
  - digit 9;
  - digit \*;
  - digit #;
  - digit +.
- Hook method selection =
  - no hook signalling (direct through-connect);
  - hook on/hook off signalling (individual call); and call acceptance signalling (group call).
- Notification indicator =
  - refer to ETSI EN 300 392-9 [9], clause 7.2.2.
- Number of DTMF digits =
  - 1 to 254.
- Poll request =
  - no poll answer requested;
  - poll answer requested.
- Poll response addresses =
  - TSI addresses 1-N.

- Poll result identifier =
  - poll result not known;
  - the percentage of responding group members;
  - the number of responding group members;
  - the addresses of the responding group members.
- Poll response number =
  - no poll response;
  - 1 poll response;
  - etc.;
  - 63 or more poll responses.
- Poll response percentage =
  - 0 %;
  - 1 %;
  - etc.;
  - 100 %.
- Request to transmit/send data =
  - request to transmit/send data;
  - request that other MS/LS may transmit/send data.
- Simplex/duplex selection =
  - simplex operation;
  - duplex operation.
- Speech service =
  - TETRA encoded one timeslot speech;
  - proprietary encoded one timeslot speech.
- Traffic stealing =
  - do not steal traffic;
  - steal traffic.

The default value of the traffic stealing parameter shall be "do not steal traffic", which will be applied when no traffic stealing parameter is explicitly defined, not used or otherwise defined in the protocol.

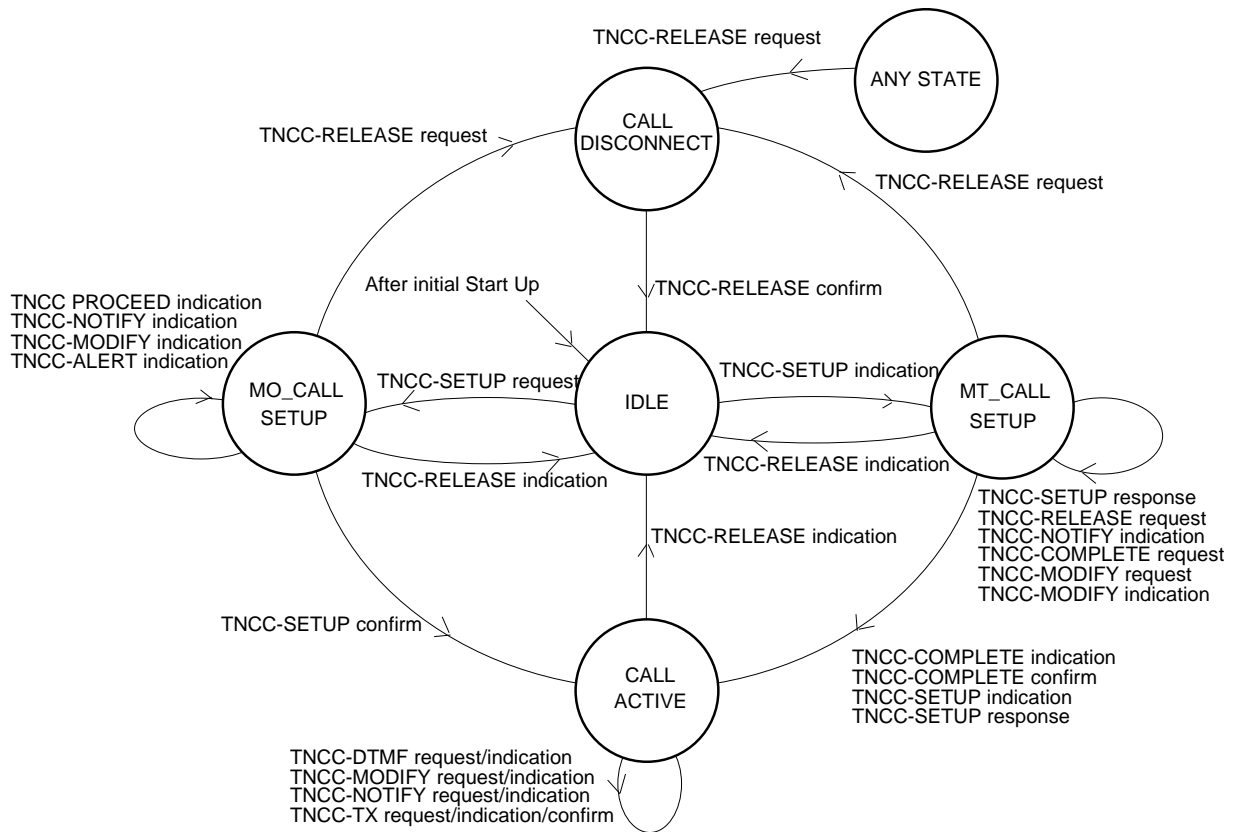

- Transmission condition =
  - request to transmit;
  - transmission ceased.

- Transmission grant =
  - transmission granted;
  - transmission not granted;
  - transmission request queued;
  - transmission granted to another user.
- Transmission request permission =
  - allowed to request for transmission;
  - not allowed to request for transmission.
- Transmission status =
  - transmission ceased;
  - transmission granted;
  - transmission not granted;
  - transmission request queued;
  - transmission granted to another user;
  - transmission interrupt;
  - transmission wait;
  - transmission request failed.
- Transmitting party extension =
  - Mobile Country Code (MCC) + Mobile Network Code (MNC).
- Transmitting party SSI =
  - Individual Short Subscriber Identity (ISSI); or
  - Group Short Subscriber Identity (GSSI).
- Tx demand priority =
  - low priority;
  - high priority;
  - pre-emptive priority;
  - emergency pre-emptive priority.

The default value of the TX demand priority parameter shall be "low priority", which will be applied when no TX demand priority parameter is explicitly defined.

## 11.4 States for CC SAP

The state transitions visible at the TNCC-SAP shall be as shown in figure 11.2.

**Figure 11.2: State transition diagram for one instance at the CC SAP**

## 12 Supplementary Service (SS) service description

### 12.1 Introduction

This clause describes general services offered by the CMCE at the SS SAP of the TETRA V+D layer 3 service boundary. This SAP with the CC SAP is used in supplementary service conformance testing as a normative boundary in TETRA MSs and in TETRA LSs.

### 12.2 Services offered

The SS services are provided at the TNSS-SAP and TNCC-SAP. Refer to clause 11.3 on those supplementary services which utilize also TNCC-SAP. For call related actions the TNSS-SAP and TNCC-SAP are linked together by the call instance and, therefore, there is no "call identifier" parameter in the primitives.

The SS may consist of the following services:

- invocation of an SS;
- activation/deactivation of an SS;
- definition of an SS;
- cancellation of an SS;
- interrogation of an SS;
- registration of a user to a supplementary service;
- reception of supplementary service messages.

### 12.3 SS service

#### 12.3.1 Primitives exchanged through TNSS-SAP

The SS primitives are defined in ETSI EN 300 392-9 [9] and in each supplementary service stage 3 description ETSI EN/ETS 300 392-12 [10], when available.

The supplementary service primitives shall contain in addition to supplementary services specific parameters also the access priority parameter as defined in table 12.1.

**Table 12.1: Parameters for the supplementary service primitives**

| Parameter                                  | Request | Indication | Response | Confirm |
|--|---------|------------|----------|---------|
| Access priority                            | O       | -          | O        | -       |
| Supplementary service dependent parameters |         |            |          |         |

## 12.3.2 Parameter description

Parameters shall be part of the primitives described in clause 12.3.1 and if applied the parameters shall contain the values specified in this clause. These values are selected to correspond to element values used in the air interface protocol.

- Access priority =
  - low priority;
  - high priority;
  - emergency priority.

The default value of the access priority parameter shall be "low priority", which will be applied when no access priority parameter is explicitly defined.

---

# 13 Short Data Service (SDS) service description

## 13.1 Introduction

This clause describes the services offered by the short data service sub-entity in the CMCE at the SDS SAP of the TETRA V+D layer 3 service boundary. The SDS SAP is used in conformance testing as a normative boundary in TETRA MSs.

## 13.2 Services offered

The SDS shall be provided by a single SDS functional entity at the TNSDS-SAP.

The short data functional entity shall consist of the following mobile originated and mobile terminated services:

- a) user defined short message reception and transmission:
  - individual message;
  - group message.
- b) pre-defined short message reception and transmission:
  - individual message;
  - group message.

## 13.3 SDS

### 13.3.1 SDS primitives exchanged through the TNSDS-SAP

**TNSDS-CANCEL request:** the primitive may be used by the user application to cancel sending of a message before it is sent at least once over the air interface.

**TNSDS-STATUS request/indication:** the primitives shall be used to send or receive a pre-coded message defined by either the present document or by the network operator.

**TNSDS-REPORT indication:** the primitive shall be used to indicate whether a TNSDS-UNITDATA request or a TNSDS-STATUS request has been either transmitted successfully or the transmission failure reason.

**TNSDS-UNITDATA request/indication:** the primitives shall be used to send or receive a user defined message.

The flow of short data service primitives shall be as illustrated in figure 13.1.

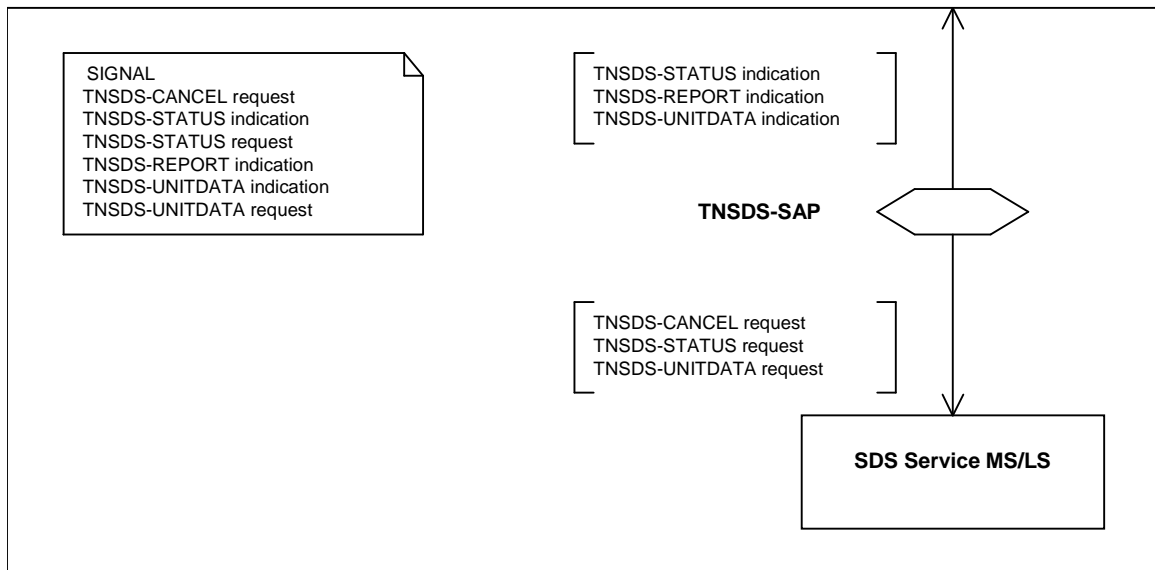

Figure 13.1: SDS provided at TNSDS-SAP (MS-side)

## 13.3.2 Service primitives at the TNSDS-SAP

### 13.3.2.0 General

The information contained in the primitive description tables which follow corresponds to the following key:

- M: Mandatory;
- C: Conditional;
- O: Optional;
- : Not used.

The SDS-TL protocol modifies the TNSDS primitives so that a certain range of Status number values of the TNSDS-STATUS primitives are used by the SDS-TL protocol and the User defined data-4 parameter is only available via the SDS-TL-SAP, refer to clause 29.1.1.

#### 13.3.2.1 TNSDS-STATUS primitive

**TNSDS-STATUS request:** the primitive shall be used by the user application to send a pre-defined message to another user or users given in the address parameter.

NOTE: The status message is selected from a set of pre-coded messages and only the status number is given as a parameter.

**TNSDS-STATUS indication:** the primitive shall indicate to the user application that a pre-coded status message from another user application has been received.

The parameters are defined in table 13.1.

**Table 13.1: Parameters for the TNSDS-STATUS primitive**

| Parameter   | Request        | Indication     |
|---|----------------|----------------|
| Access priority   | O              | -              |
| Traffic stealing  | O              | -              |
| Graceful service degradation mode   | O              | O              |
| Area selection  | O (see note 3) | -              |
| Called party type identifier  | M              | -              |
| Called party SNA  | C (see note 1) | -              |
| Called party SSI  | C (see note 1) | M              |
| Called party extension  | C (see note 1) | O (see note 2) |
| Called party address type   | -              | O              |
| External subscriber number (called)   | O              |                |
| Calling party SSI   | -              | M              |
| Calling party extension   | -              | O (see note 2) |
| External subscriber number (calling)  |                | O              |
| Status number   | M              | M              |
| Handle  | M              | -              |
| NOTE 1: Depending on the value of called party type identifier.   |                |                |
| NOTE 2: If not present, the user application shall assume that the address extension is the MNI of the current network. |                |                |
| NOTE 3: Usage of this parameter is defined in ETSI EN 300 392-12-8 [14].  |                |                |

### 13.3.2.2 TNSDS-REPORT primitive

**TNSDS-REPORT indication:** the primitive shall be used as an indication to the user application that the PDU belonging to a request, i.e. the TNSDS-UNITDATA request or the TNSDS-STATUS request, has been either transmitted successfully or lost.

The parameters are defined in table 13.2.

**Table 13.2: Parameters for the TNSDS-REPORT primitive**

| Parameter       | Indication |
|-----------------|------------|
| Transfer result | M          |
| Handle          | M          |

### 13.3.2.3 TNSDS-UNITDATA primitive

**TNSDS-UNITDATA request:** the primitive shall be used by the user application to send a user defined message to another user application or applications given in the address parameter.

**TNSDS-UNITDATA indication:** the primitive shall be used as an indication to the user that a user application defined message from another user application has been received. The message may either be a user defined individual message or a user defined group message.

The parameters are defined in table 13.3.

**Table 13.3: Parameters for the TNSDS-UNITDATA primitive**

| Parameter  | Request               | Indication            |
|--|-----------------------|-----------------------|
| Access priority  | O                     | -                     |
| Traffic stealing   | O                     | -                     |
| Graceful service degradation mode  | O                     | O                     |
| Area selection   | O (see note 5)        | -                     |
| Called party type identifier   | M                     | -                     |
| Called party SNA   | C (see note 1)        | -                     |
| Called party SSI   | C (see note 1)        | M                     |
| Called party extension   | C (see note 1)        | O (see note 2)        |
| Called party address type  | -                     | O                     |
| External subscriber number (called)  | O                     | -                     |
| Calling party:   |                       |                       |
| Calling party SSI  | -                     | M                     |
| Calling party extension  | -                     | O (see note 2)        |
| External subscriber number (calling)   | -                     | O                     |
| Short data type identifier   | M                     | M                     |
| User defined data-1  | C (see note 3)        | C (see note 3)        |
| User defined data-2  | C (see note 3)        | C (see note 3)        |
| User defined data-3  | C (see note 3)        | C (see note 3)        |
| User defined data-4  | C (see notes 3 and 4) | C (see notes 3 and 4) |
| NOTE 1: Depending on the value of called party type identifier.  |                       |                       |
| NOTE 2: If not present, the user application shall assume that the address extension is the MNI of the current network.  |                       |                       |
| NOTE 3: Depending on the value of short data type identifier.  |                       |                       |
| NOTE 4: This parameter is modified by the SDS-TL protocol and it contains always a protocol identifier, and is available via the SDS-TL-SAP, refer to clause 29.1.1. |                       |                       |
| NOTE 5: Usage of this parameter is defined in ETSI EN 300 392-12-8 [14].   |                       |                       |

### 13.3.2.4 TNSDS-CANCEL primitive

**TNSDS-CANCEL request:** the primitive may be used by the user application to cancel sending of a message before it is sent at least once over the air interface.

### 13.3.3 Parameter description

Parameters shall be part of the primitives at the TNSDS SAP. When applied the parameters shall contain the values specified in this clause:

- Access priority =
  - low priority;
  - high priority;
  - emergency priority.

The default value of the access priority parameter shall be low priority, which will be applied when no access priority parameter is used:

- Area Selection =
  - area not defined;
  - area 1;
  - etc.;
  - area 14;
  - all areas in this system.

The default value of the area selection parameter shall be "area not defined", which will be applied when area selection is not used:

- Called party address type =
  - broadcast;
  - individual;
  - group.
- Called party extension =
  - MCC + MNC.
- Called party short number address =
  - SNA.
- Called party SSI =
  - ISSI;
  - GSSI.
- Called party type identifier =
  - SNA;
  - SSI;
  - TSI.
- Calling party extension =
  - MCC + MNC.
- Calling party SSI =
  - ISSI.

- External Subscriber Number =
  - Up to 24 digits. Each digit shall be one of the following:
    - digit 0;
    - etc.;
    - digit 9;
    - digit \*;
    - digit #;
    - digit +.
- Graceful service degradation mode =
  - not eligible for sending in graceful service degradation mode;
  - eligible for sending in graceful service degradation mode;
  - message received in graceful service degradation mode.
- Handle =
  - a local SDU identifier.
- Status number =
  - 0 emergency call;
  - 1 to 19 999 reserved;
  - 20 000 to 20 999 status values for international co-operation;
  - 21 000 to 31 743 reserved;
  - 32 768 to 65 535 available for TETRA network specific definition.

NOTE 1: Further status number definitions may be added in the maintenance of the present document as an annex.

NOTE 2: Pre-defined status values from 31 744 to 32 767 are used by SDS-TL protocol and will not be available as pre-defined status values.

NOTE 3: The meaning of the status values for international co-operation is outside the scope of the present document.

- Short data type identifier =
  - user defined data-1;
  - user defined data-2;
  - user defined data-3;
  - user defined data-4.

- Traffic stealing =
  - do not steal traffic;
  - steal traffic.

The default value of the traffic stealing parameter shall be do not steal traffic, which will be applied when no traffic stealing parameter is used:

- Transfer result =
  - success;
  - failure, no more re-tries;
  - delayed transmission due to the graceful service degradation mode, still trying transmit.
- User defined data 1 =
  - 16 bit user defined data.
- User defined data 2 =
  - 32 bit user defined data.
- User defined data 3 =
  - 64 bit user defined data.
- User defined data-4 =
  - protocol identifier; and
  - user defined data bits, maximum length 2 039 bits.

### 13.3.4 State description

#### 13.3.4.1 NULL state

No short data message shall be in progress.

#### 13.3.4.2 SHORT DATA INITIATED state

Short data message sending in progress state. Waiting for the completion of a message transfer.

### 13.3.5 Service state diagram for the TNSDS-SAP

Supplementary services state diagram is presented in figure 13.2.

**Figure 13.2: Service state diagram for the mobile terminated short data message**

## 14 CMCE protocol

### 14.1 Introduction

This clause defines the layer 3.2 CMCE air interface protocol for the MS. There shall be a peer-to-peer relationship between the layers on the terminal side and the SwMI side. The protocol for the SwMI side is, however, outside the scope of the present document. The CMCE protocol is the network layer protocol that shall be used to provide services to an end user application in the area of CC services, of SDS and of supplementary services.

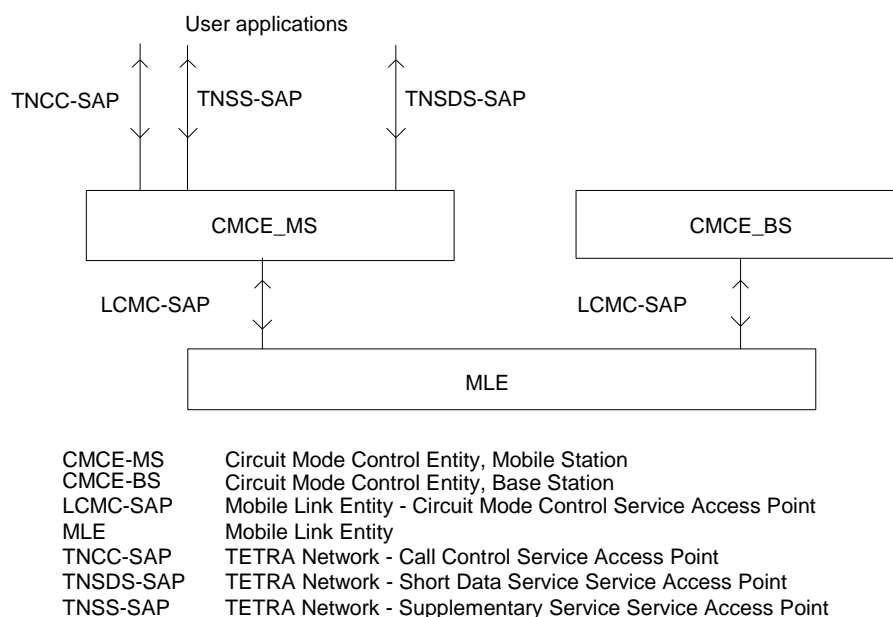

This clause specifies:

- the functional requirements for implementations claiming conformance to the present document;
- procedures for specific transmission of:
  - control information for circuit mode services;
  - call unrelated short data messages;
  - control information for call related/call unrelated supplementary service messages;
- the encoding of the Protocol Data Units (PDUs) used for the transmission of data and control information;
- procedures for the correct interpretation of protocol control information.

### 14.2 Overview of CMCE

#### 14.2.0 General

Figure 14.1 shows the position of the CMCE protocols in both the MS and in the BS protocol stack. The present document does not define a BS protocol architecture or user application SAPs for the CMCE within the SwMI.

**Figure 14.1: System view**

## 14.2.1 Communication routes of the CMCE model

The CMCE model defines routes used for information exchange between the sub-entities as shown in figure 14.2.

The external routes are routes between a sub-entity of the CMCE and an entity in another layer. Each external route shall be mapped onto a SAP.

There are four external routes:

- The ra route shall correspond to the TNCC-SAP. The primitives exchanged on that route are described in clause 11.
- The rb route shall correspond to the TNSS-SAP. The primitives exchanged on that route are described in clause 12.
- The rc route shall correspond to the TNSDS-SAP. The primitives exchanged on that route are described in clause 13.
- The ri route shall correspond to the LCMC-SAP. The primitives exchanged on that route are described in clause 17.

The internal routes are routes between sub-entities of the CMCE.

There are five internal routes:

- the rd route shall be a route between the CC sub-entity and the PC sub-entity;
- the re route shall be a route between the SS sub-entity and the PC sub-entity;
- the rg route shall be a route between the SS sub-entity and the CC sub-entity;
- the rf route shall be a route between the SDS sub-entity and the PC sub-entity;
- the rh route shall be a route between the SS sub-entity and the SDS sub-entity.

## 14.2.2 Protocol structure and protocol stack

The CMCE is the layer 3 sub-layer for circuit mode CC, SS and SDS as described in clauses 11, 12 and 13 respectively. CMCE shall provide services to the user applications through service primitives defined for the following three SAPs:

- TNCC-SAP for CC services;
- TNSS-SAP for SS services;
- TNSDS-SAP for SDS.

NOTE: Although there are separate SAPs defined for CC and SS, the protocol description is based on the CC service primitives, which contain a mixture of CC and SS parameters.

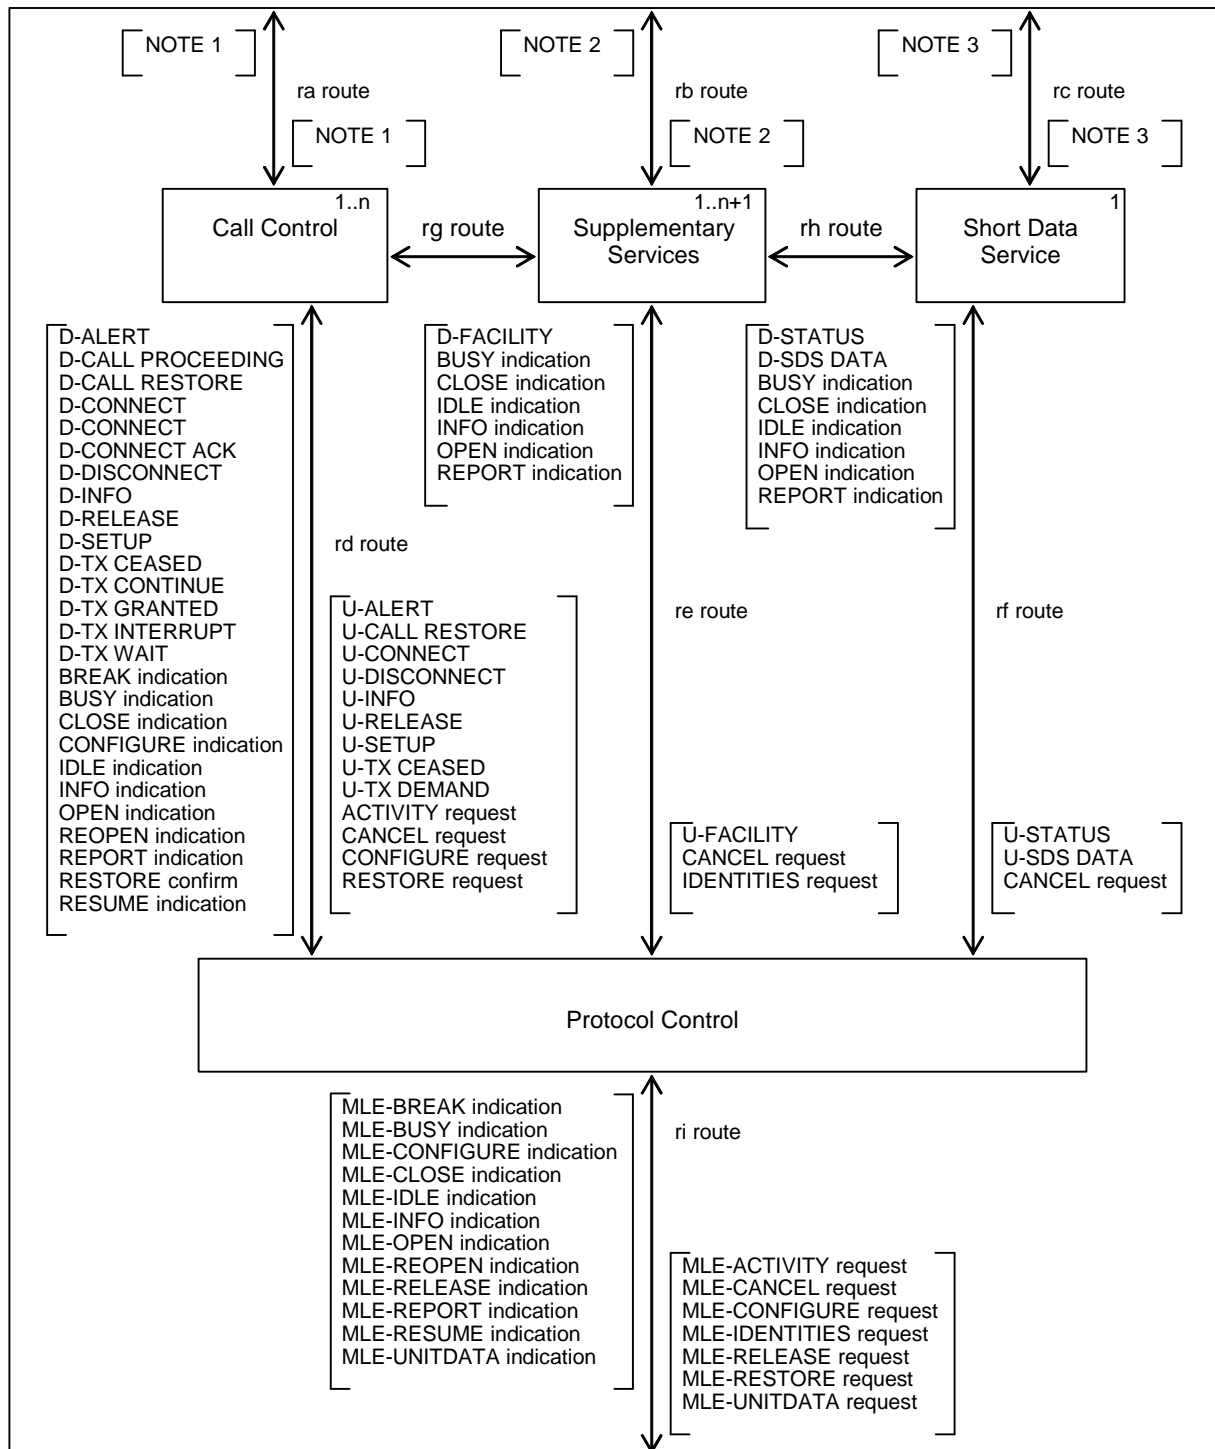

CMCE shall obtain services from the underlying voice and data MLE through the LCMC-SAP.

There shall be one instance of the CMCE entity per TSI family within the MS.

The CMCE is internally subdivided into four different sub-entities:

- CC;
- SS;
- SDS; and
- Protocol Control (PC).

The information exchange between the CC and the SS sub-entities is defined in the supplementary service definitions. The structure is as shown in figure 14.2.

NOTE 1: Service primitives for the TNCC-SAP are defined in clause 11.

NOTE 2: Service primitives for the TNSS-SAP are defined in clause 12.

NOTE 3: Service primitives for the TNSDS-SAP are defined in clause 13.

**Figure 14.2: Block view of CMCE-MS**

PC uses on route rf BREAK (GSDM) indication and RESUME indication also for SDS in the graceful service degradation mode, those primitives are not presented in the figure 14.2.

### 14.2.3 Addressing rules

In addition to the normal TSI which is used in different forms in the initial call set-up messages (ITSI, GTSI, SSI), the CMCE entity shall also use the call identifier for call handling.

The call identifier shall be used as a unique reference to a call between a call participant and the SwMI. A call identifier is allocated at call set-up time by the SwMI and the call identifier may be changed by the SwMI by allocating a new call identifier to the MS for the call. Once allocated, the call identifier shall be used in subsequent call related CMCE messages for that call. Where the call spans more than one LA, the call identifier may be different in different LAs. In the case of a group call, the call identifier shall be the same for all participating MSs in each LA (except as described in note 1). In the case of an individual call, the call identifier may be different for two MS in the same LA participating in the same individual call.

NOTE 1: When an MS requests a type 1/2 cell reselection, the SwMI may send the MS a call identifier for the requested LA while the MS is still using the original LA (see clause 18.3.4.7.5).

The layer 3 air interface messages may contain only the SSI part of an address. The following rules define how the receiving entity shall, if it needs to do so, derive the MNI (i.e. convert the SSI to full ITSI or GTSI) if the MNI is not supplied over the air interface.

- The SwMI shall interpret the "Called party SSI" or "Other party SSI" on received uplink messages as belonging to the SwMI (i.e. the "missing" MNI is the MNI of the current network).
- The MS shall interpret the "Calling party address SSI" or "Transmitting party address SSI" on received downlink messages as belonging to the current SwMI (i.e. the "missing" MNI is the MNI of the current network).

NOTE 2: The MNI of the SwMI (MCC and MNC) is sent in the broadcast D-MLE-SYNC PDU (refer to clause 18.4.2.1) or the D-MLE-SYNC-DA PDU (refer to clause 18.4.2.1a).

NOTE 3: The first rule forces the MS to send the MNI over the air interface also when the called user address belongs to the home network of the MS and MS has migrated to a foreign network - edition 1 of the Dialling and Addressing Designer's Guide, ETSI TR 102 300-5 [i.1], describes a different approach which is no longer valid.

NOTE 4: The second rule allows to use only SSI addressing so that all MSs in the same SwMI, independently of whether they are in their home or in a visited SwMI, will understand it in the same manner (for example group calls having participants belonging to different networks).

NOTE 5: The supplementary service related information in U/D-FACILITY PDU or in facility information element may use SSI differently, refer to supplementary service definitions.

NOTE 6: The visiting GSSI ((V)GSSI) is used only as a layer 2 address in reception and also by MM in layer 3 PDUs in the group attachment/detachment procedures.

- V-GSSI shall not be used as "Called party SSI" or "Other party SSI" in CMCE PDUs.

NOTE 7: If a SwMI allocates a temporary address the MS will consider that the MNI of it is the one of the current SwMI.

### 14.2.4 CC, SS and SDS sub-entities

#### 14.2.4.0 General

The CMCE model describes the protocol behaviour of CC, SS and SDS functional entities.

#### 14.2.4.1 CC sub-entity

The CC process is a functional sub-entity which provides a set of procedures for the establishment, maintenance and release of circuit switched services. It provides support for the TETRA basic call signalling. The CC shall manage invocation of the SS-Access Priority.

The CC process shall use the ra signalling route for communication with the user application (see clause 11) and the rd signalling route for communication with the protocol control process. The information exchange of SS related parameters needed for SS information exchange is not defined.

There can be multiple instances of CC per CMCE entity. Depending on its physical capabilities an MS may be able to support up to four active concurrent circuit mode calls at the same time.

#### 14.2.4.2 SS sub-entity

The SS process is a functional sub-entity which provides procedures for transfer of information related to SSs. The transfer of SS information is either call related or call unrelated.

The SS processes shall use the rb signalling route for communication with the user application over the TNSS-SAP (see clause 12) and the re signalling route for communication with the protocol control process. Internal communication between the CC process and the SS process is outside the scope of the present document.

SSs related to a call in progress shall have a fixed relationship with the corresponding CC entity instance and these SS instances shall cease to exist after the CC instance ceases to exist.

There shall be also a SS entity, which is not related to any calls in progress. That entity may use either a U/D-FACILITY PDU or any CC PDU, when appropriate, to exchange SS information between a MS and a SwMI. The facility field of the CC PDUs shall only be used to exchange SS information between a MS and the SwMI.

#### 14.2.4.3 SDS sub-entity

The SDS process shall be a functional sub-entity which provides procedures for transfer of short data and status messages. The SDS entity shall also manage invocation of the SS- Access Priority for the short data PDU exchange.

The SDS process shall use the rc signalling route for communication with the user application over the TNSDS-SAP (see clause 13) and the rf signalling route for communication with the protocol control process.

The SDS entity shall not be related to any call and it shall provide SDS services independently of whether the SDS message is directed to a user application involved in an active CC call, or not.

There shall only be one instance of SDS entity per CMCE entity.

#### 14.2.5 PC sub-entity

The PC sub-entity shall provide the following functionality:

- PC shall act as an upwards/downwards router by discriminating the upper sub-entities within CMCE. The analysis of the content of the various information elements in the PDUs shall be done by the sub-entity which is responsible for and owns the individual elements. Outgoing PDUs shall be routed to the MLE in primitives.
- PC shall ensure that there is only one mobile originated call set-up in progress at any one time by only allowing one CC sub-entity at a time to be actively setting up a call until SwMI allocates a call identifier to that call or the call set-up is discarded.
- MLE shall give indications of the progress of the PDU transmission to PC by MLE-REPORT indication primitives. PC shall be responsible for handling of general error procedures for the CMCE protocol.
- PC shall use the signalling routes rd, re, rf for communication with the CC, SS and SDS sub-entities and the ri signalling route for communication with the MLE over the LCMC-SAP.
- there shall only be one instance of PC per CMCE entity.

## 14.2.6 Internal routes

The PDUs and local primitives are grouped per each sub-entity and internal route.

From PC to CC on rd route:

- D-ALERT;
- D-CALL PROCEEDING;
- D-CALL RESTORE;
- D-CONNECT;
- D-CONNECT ACKNOWLEDGE;
- D-DISCONNECT;
- D-INFO;
- D-RELEASE;
- D-SETUP;
- D-TX CEASED;
- D-TX CONTINUE;
- D-TX GRANTED;
- D-TX INTERRUPT;
- D-TX WAIT;
- BREAK indication;
- BUSY indication;
- CLOSE indication;
- CONFIGURE indication;
- IDLE indication;
- INFO indication;
- OPEN indication;
- REOPEN indication;
- REPORT indication;
- RESTORE confirm;
- RESUME indication.

From CC to PC on rd route:

- U-ALERT;
- U-CALL RESTORE;
- U-CONNECT;
- U-DISCONNECT;
- U-INFO;

- U-RELEASE;
- U-SETUP;
- U-TX CEASED;
- U-TX DEMAND;
- ACTIVITY request;
- CANCEL request;
- CONFIGURE request;
- RESTORE request.

From PC to SS on re route:

- D-FACILITY;
- BUSY indication;
- CLOSE indication;
- IDLE indication;
- INFO indication;
- OPEN indication;
- REPORT indication.

From SS to PC on re route:

- U-FACILITY;
- IDENTITIES request;
- CANCEL request.

NOTE 1: U/D-FACILITY PDUs are used to transport SS information, which is not related to any ongoing call or related to a call during SS-CC retention time after the call.

NOTE 2: SS information, which relates to an ongoing call is transported either as a predefined element in a CC PDU or as a facility element in a CC or in a U/D-INFO PDU (see clause 14.7).

From PC to SDS on rf route:

- D-STATUS;
- D-SDS-DATA;
- BUSY indication;
- CLOSE indication;
- IDLE indication;
- INFO indication;
- OPEN indication;
- REPORT indication.

In addition in the graceful service degradation mode from PC to SDS on rf route, refer to annex Q:

- BREAK indication;
- BREAK (GSDM) indication;
- RESUME indication.

From SDS to PC on rf route:

- U-STATUS;
- U-SDS-DATA;
- CANCEL request.

## 14.2.7 Intra-CMCE primitive summary

### 14.2.7.0 General

The sub-entities inside CMCE shall be responsible for setting parameters in each PDU it is sending. These parameters are used in the lower layers in the transmission process. These parameters are not visible outside the MS protocol stack, but shall affect to the functions inside the protocol stack.

#### 14.2.7.1 Down link CC PDU parameters

The following parameters shall accompany each PDU in addition to the PDU contents (SDU). The contents of the SDUs are defined in clause 14.7. These parameters shall be valid for rd route (see clause 17.3.4 for ri route parameters):

- received TETRA address;
- received address type;
- channel change response required.

The D-CALL RESTORE PDU should be a SDU in the RESTORE confirm primitive and the parameters used in this primitive shall be:

- SDU;
- restoration result.

#### 14.2.7.2 Uplink CC PDU parameters

Each PDU shall convey following information as parameters in addition to the PDU contents. The contents of the PDUs are defined in clause 14.7. These parameters shall be valid for rd route (see clause 17.3.4 for ri route parameters):

- endpoint identifier;
- layer 2 service;
- PDU priority;
- stealing permission;
- stealing repeats flag.

The MS shall send the U-RESTORE REQUEST PDU as an SDU in the RESTORE request primitive.

The parameters used in this primitive shall be:

- SDU;
- layer 2 service;
- PDU priority;
- stealing permission;
- stealing repeats flag.

#### 14.2.7.3 Downlink SS PDU parameters

Each PDU shall convey following information as parameters in addition to the PDU contents. The contents of the PDUs are defined in clause 14.7. These parameters shall be valid for re route (see clause 17.3.4 for ri route parameters):

- channel change response required;
- received TETRA address;
- received address type.

#### 14.2.7.4 Uplink SS PDU parameters

Each PDU shall convey following information as parameters in addition to the PDU contents. The contents of the PDUs are defined in clause 14.7. These parameters shall be valid for re route (see clause 17.3.4 for ri route parameters):

- layer 2 service;
- PDU priority;
- stealing permission.

#### 14.2.7.5 Down link SDS PDU parameters

Each PDU shall convey following information as parameters in addition to the PDU contents. The contents of the PDUs are defined in clause 14.7. These parameters shall be valid for rf route (see clause 17.3.3 for ri route parameters):

- received TETRA address;
- received address type.

#### 14.2.7.6 Uplink SDS PDU parameters

Each PDU shall convey following information as parameters in addition to the PDU contents. The contents of the PDUs are defined in clause 14.7. These parameters shall be valid for rf route (see clause 17.3.4 for ri route parameters):

- layer 2 service;
- PDU priority;
- stealing permission;
- link identifier;
- eligible for graceful service degradation mode.

## 14.2.7.7 CMCE management primitives

### 14.2.7.7.0 ACTIVITY request

The parameter used in this primitive shall be:

- call state (see clause 17.3.9).

### 14.2.7.7.1 BREAK indication

The parameter used in this primitive shall be:

- none; or
- permitted services in MS graceful service degradation mode; indicated as "BREAK (GSDM) indication".

NOTE: The value "none" indicates that no service is temporarily available.

### 14.2.7.7.1a BUSY indication

There are no parameters associated with this primitive.

### 14.2.7.7.2 CANCEL request

The parameter used in this primitive shall be:

- handle.

### 14.2.7.7.3 CLOSE indication

There are no parameters associated with this primitive.

### 14.2.7.7.4 CONFIGURE indication

The parameters used in this primitive shall be:

- endpoint identifier;
- endpoint status.

#### 14.2.7.7.5 CONFIGURE request

The parameters used in this primitive shall be:

- add temporary GSSI;
- circuit mode type (see clause 14.8.2);
- channel change accepted (see clause 17.3.9);
- leave assigned channel;
- delete temporary GSSI;
- encryption flag;
- call identifier;
- endpoint identifier;
- simplex/duplex;
- slots per frame;
- switch U-plane on/off;
- Tx grant.

#### 14.2.7.7.6 IDENTITIES request

The parameter used with this primitive shall be:

- list of attached GSSIs;
- list of detached GSSIs.

#### 14.2.7.7.6a IDLE indication

There are no parameters associated with this primitive.

#### 14.2.7.7.6b INFO indication

The parameters used with this primitive shall be:

- broadcast parameters (see clause 17.3.9);
- subscriber class match (see clause 17.3.9).

#### 14.2.7.7.7 OPEN indication

There are no parameters associated with this primitive.

#### 14.2.7.7.8 REOPEN indication

There are no parameters associate with this primitive.

#### 14.2.7.7.9 REPORT indication

The parameter used in this primitive shall be:

- transfer result.

#### 14.2.7.7.10 RESUME indication

There are no parameters associated with this primitive.

### 14.3 Overview of services required by the CMCE

In order to transfer messages over the air interface, CMCE shall use the services of the MLE, which in turn shall rely on the service from underlying layers. The services required from MLE shall be as described in clause 17.

### 14.4 CMCE protocol states

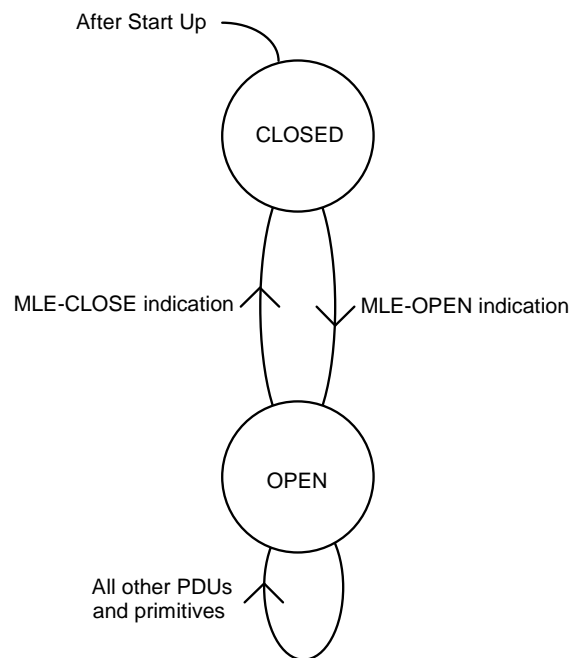

#### 14.4.0 General

CMCE shall comprise 4 sub-entities each of them having a separate state transition diagram as shown in figures 14.3, 14.4, 14.5 and 14.6.

Only the main states are shown.

#### 14.4.1 States for PC

##### 14.4.1.0 General

**Figure 14.3: State transition diagram for the PC sub-entity**

##### 14.4.1.1 CLOSED

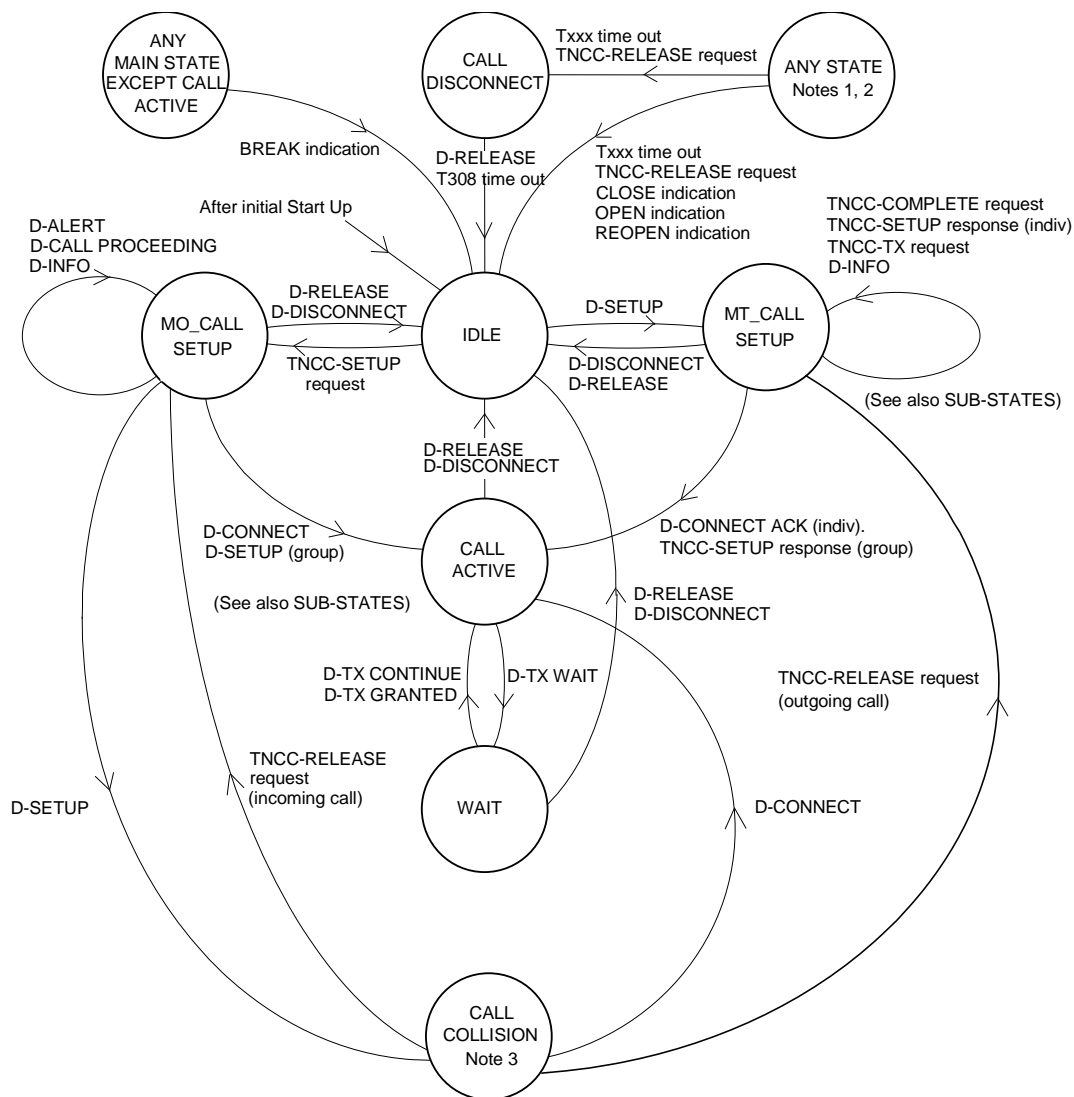

This state exists after an MLE-CLOSE indication primitive has been received from the MLE indicating that access to communication resources is no longer allowed and the PC sub-entity shall inform the CC, SS and SDS sub-entities with CLOSE indication primitives. The PC sub-entity shall also enter state CLOSED after initial start up.

##### 14.4.1.2 OPEN

This is the normal state and indicates that a communication path to a peer entity is open. It is set after an MLE-OPEN indication primitive has been received from the MLE. When PC receives a MLE-OPEN indication primitive and goes to state OPEN, the CC, SS and SDS sub-entities shall be informed with OPEN indication primitives.

## 14.4.2 States for CC

### 14.4.2.0 General

NOTE 1: The TNCC-RELEASE request primitive transitions from the state "ANY STATE" are not applicable for the "CALL COLLISION" state.

NOTE 2: The selection of the TNCC-RELEASE request primitive transition from the state "ANY STATE" is dependent on the need for sending disconnection message over the air interface, refer to clauses 14.5.1.1.3 and 14.5.2.1.3.

NOTE 3: The TNCC-RELEASE request primitive transitions from CALL COLLISION state present interactions between two call control instances and show a simplified view, refer to clauses 14.5.1.1.3 and 14.5.2.1.3.

**Figure 14.4: State transition diagram for the CC sub-entity**

A further subdivision of the main states MT-CALL-SETUP and CALL-ACTIVE belonging to the CC sub-entity may be considered as detailed in figures 14.5 and 14.6.

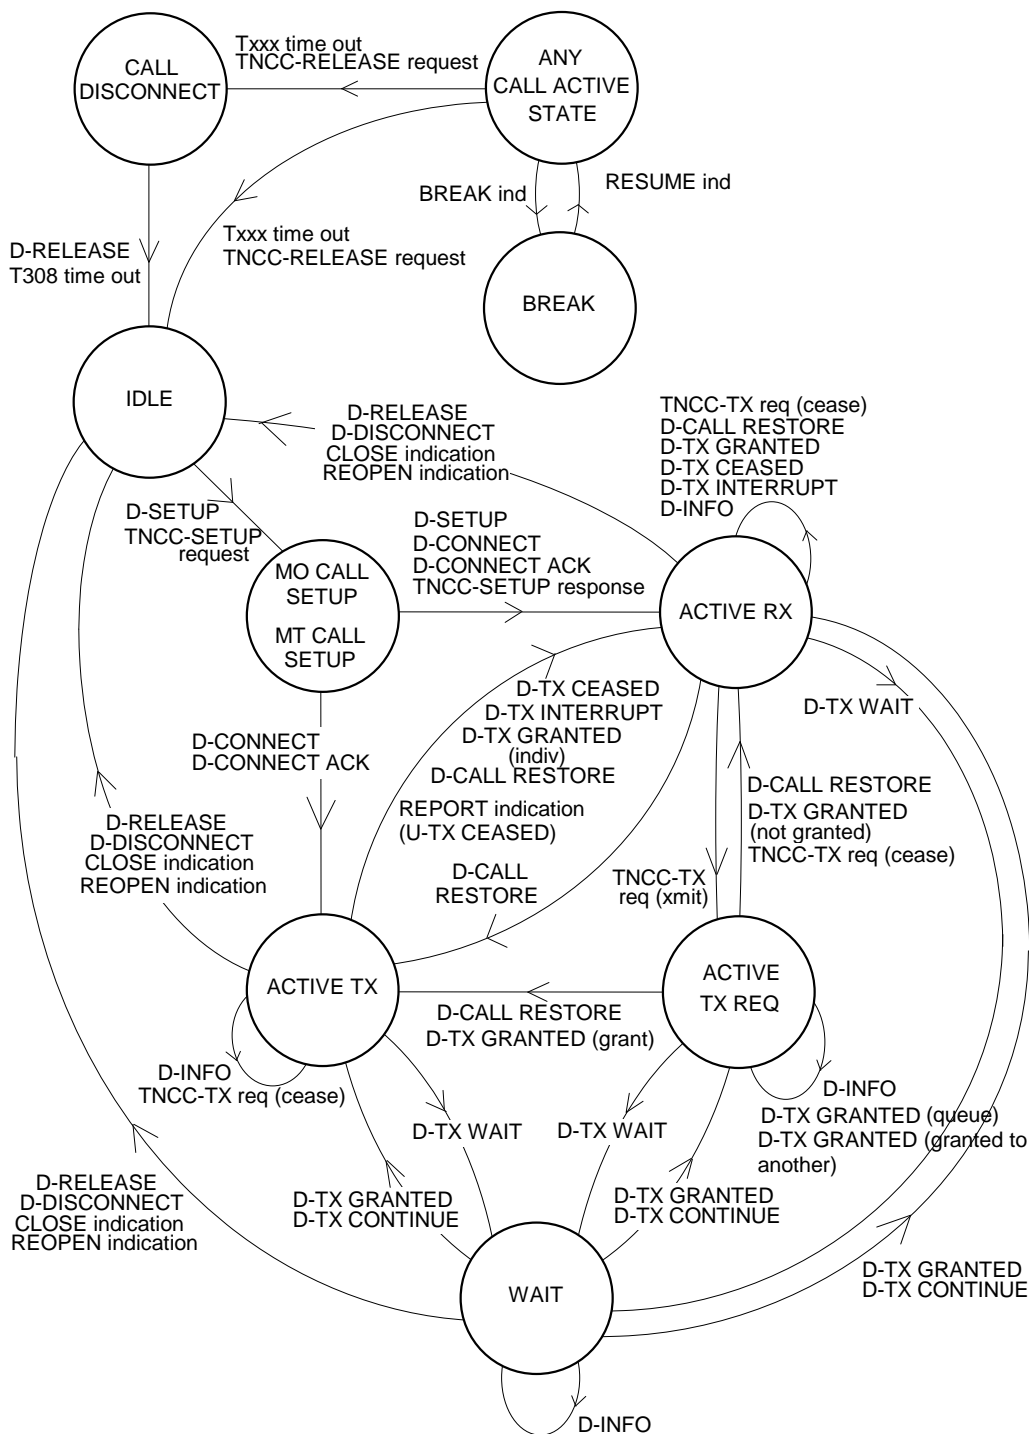

Figure 14.5: Sub state transition diagram for the CALL-ACTIVE state

**Figure 14.6: Sub state transition diagram for the MT-CALL-SETUP state**

#### 14.4.2.1 IDLE

This is the normal state when no calls exist and indicates that the CC sub-entity is available to handle a call set-up. This is the state that CC shall enter after initial start up.

**NOTE:** Any transition to or from the IDLE state should be accompanied with the generation of an **ACTIVITY** request primitive (see clause 14.2.7.7.0), containing the appropriate call state, to the PC entity.

#### 14.4.2.2 MO-CALL-SETUP

This state exists when a MS originated call set-up has been initiated but the call has not been established. It exists after a U-SETUP PDU has been sent as the result of the receipt of a TNCC-SETUP request primitive until a D-CONNECT PDU is received indicating that the call set-up is successful. If the call set-up is unsuccessful or the user application disconnects the call the CC sub-entity shall leave this state.

#### 14.4.2.3 MT-CALL-SETUP

This state exists during a call set-up where the CC sub-entity is the call terminating CC sub-entity. It exists after the receipt of a D-SETUP PDU, until the receipt of a D-CONNECT ACKNOWLEDGE PDU, for point-to-point calls only, or receipt of a TNCC-SETUP response primitive for point-to-multipoint calls only. The MT-CALL SETUP state is also left if the call set-up is unsuccessful, or if the user application rejects the call.

#### 14.4.2.4 CALL ACTIVE

This state exists when the call has been established.

NOTE: Transitions between the ACTIVE RX and ACTIVE TX sub-states should be accompanied with the generation of an ACTIVITY request primitive (see clause 14.2.7.7.0), containing the appropriate call state, to the PC entity.

#### 14.4.2.5 CALL DISCONNECT

This state exists when an established call is in the progress of disconnecting. It exists after the receipt of a TNCC-RELEASE request primitive from the user application, or if a timer initiated disconnection occurs, until either a D-RELEASE PDU is received, or the call disconnect timer expires.

#### 14.4.2.6 WAIT

The state exists if there is a temporary interruption to the call. The CC shall enter this state upon receipt of a D-TX WAIT PDU and remain in this state until a D-TX CONTINUE PDU or D-TX GRANTED PDU is received, or the call is disconnected.

### 14.4.3 States for SS

There shall only exist 2 general generic states for the SS sub-entity as shown in figure 14.7. Each individual service shall then have its own state transition diagrams associated with its protocol.

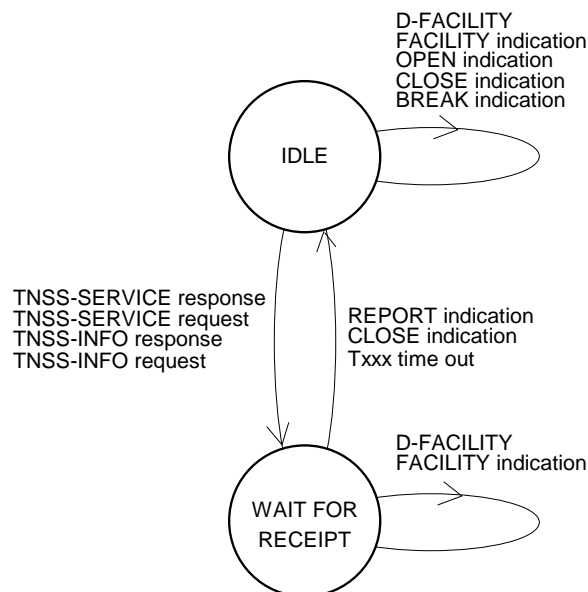

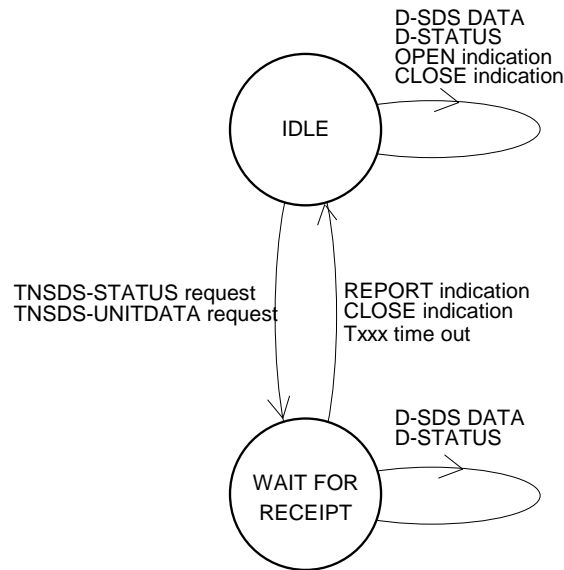

Figure 14.7: State transition diagram for the SS sub-entity

## 14.4.4 States for SDS

There shall only exist 2 generic states for the SDS sub-entity as shown in figure 14.8.

**Figure 14.8: State transition diagram for the SDS**

## 14.5 Procedures

### 14.5.0 General

In this protocol the routing of PDUs and primitives is implicit by the PDU and primitive name as defined in clause 14.2.

The timers in the following procedures are:

- started - meaning that the timer shall start to measure time as indicated in the parameter value T3xx independently of the current timer count; or
- stopped - meaning that the timer shall be stopped at the current timer count; or
- reset - meaning that the timer count shall be set to its initial value, be it zero or parameter value T3xx.

Depending on timer T3xx the starting value shall either be pre-defined or dynamically set by air interface protocol procedures.

NOTE 1: In IDLE state all timers T3xx are stopped and whenever a timer is started it will get a proper value as stored, or from a PDU as appropriate.

NOTE 2: There is no call identifier associated to a CC instance in IDLE state.

## 14.5.1 Individual CC procedures

### 14.5.1.0 General

The CC procedures handled by the CC sub-entity shall be applicable for both speech and data circuit mode calls. Individual speech and data circuit mode calls shall be set-up as point-to-point calls. The specification shall be applicable for the procedures and states that reside in the MS.

#### 14.5.1.1 Call set-up procedures

##### 14.5.1.1.0 General

Call set-up procedure examples are presented in figures 14.9 and 14.10.

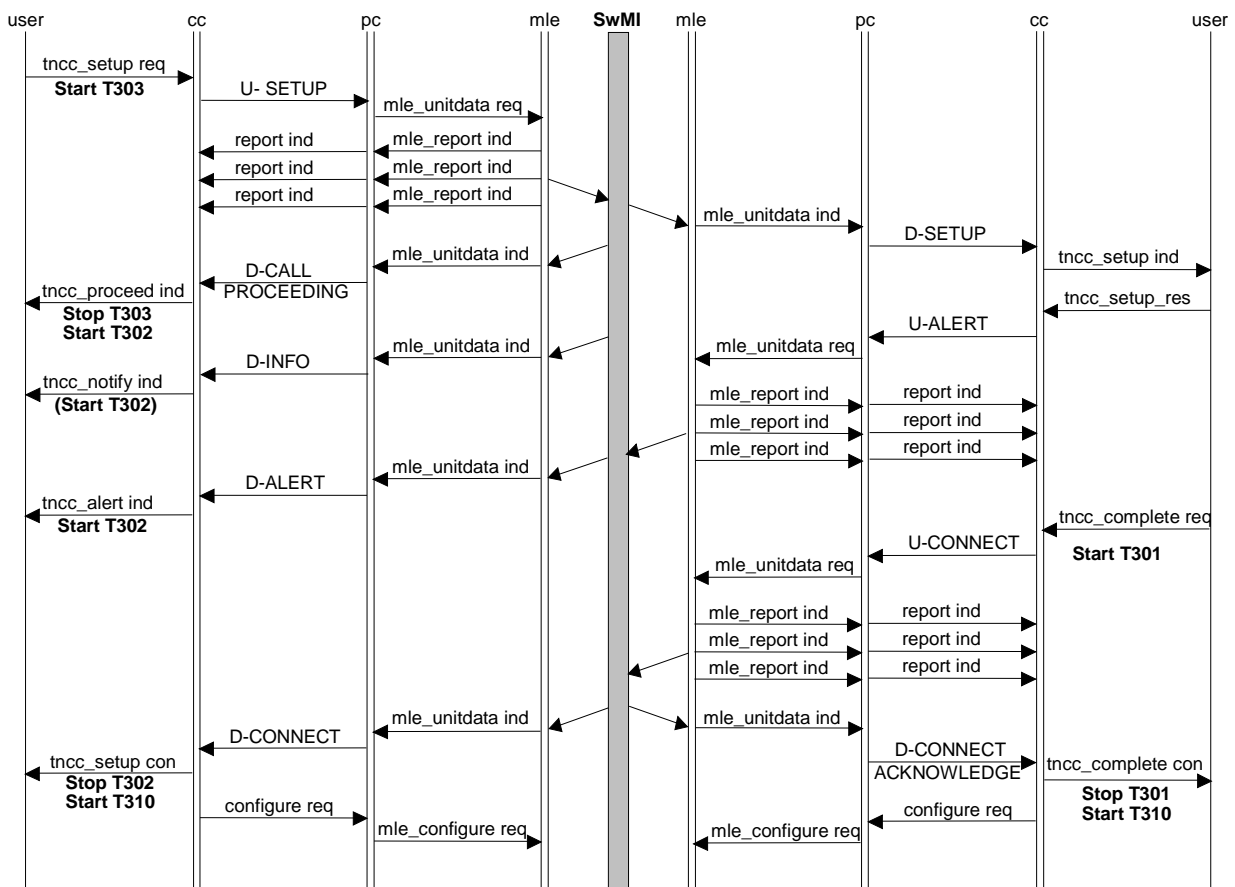

Figure 14.9: Individual call set-up scenario using on/off hook signalling

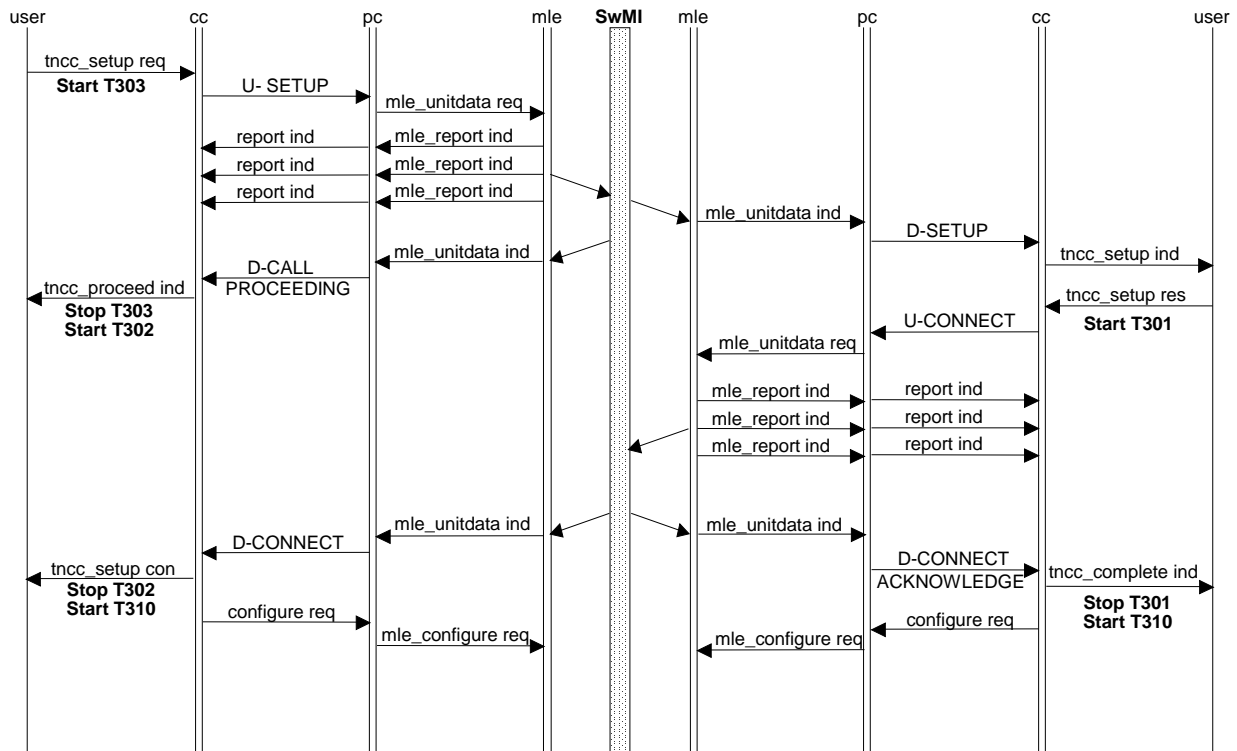

Figure 14.10: Individual call set-up scenario using direct set-up signalling

#### 14.5.1.1.1 Incoming call

Notification of the arrival of an incoming call to the CC sub-entity shall be made by the reception of a D-SETUP PDU which shall be delivered to the user application in a TNCC-SETUP indication primitive via the TNCC-SAP. If the user application can support the call it shall immediately return a TNCC-SETUP response primitive otherwise it shall return a TNCC-RELEASE request primitive (see clause 14.5.1.1.5).

On receipt of a D-SETUP PDU the CC sub-entity shall enter state MT-CALL-SETUP and take the following actions, which are dependent upon the information contained within the D-SETUP PDU:

- the call identifier shall be used as the reference to this call in subsequent PDUs during the call;
- it shall be indicated to the called MS in the D-SETUP PDU if on/off hook signalling or direct set-up signalling is used for this call set-up;
- if on/off hook signalling is requested and the CC receives a TNCC-SETUP response primitive indicating that the called user application has accepted on/off hook signalling, the CC shall send a U-ALERT PDU indicating that the called party is alerted, see figure 14.9 right hand side. The CC sub-entity shall remain in state MT-CALL-SETUP;
- when on/off hook signalling is used and the CC receives a TNCC-COMPLETE request primitive indicating that the called user application has answered, the CC shall send a U-CONNECT PDU and start timer T301. The CC sub-entity shall remain in state MT-CALL-SETUP. Upon receipt of a D-CONNECT ACKNOWLEDGE PDU, the CC shall inform the user application with a TNCC-COMPLETE confirm primitive, enter state CALL-ACTIVE, stop timer T301 and start timer T310, see figure 14.9 right hand side. The D-CONNECT ACKNOWLEDGE PDU shall contain an indication as to which party is permitted to transmit. The CC sub-entity shall send a CONFIGURE request primitive for lower layer configuration;
- in a duplex call the SwMI shall grant permission to talk in the D-CONNECT ACKNOWLEDGE PDU;

- if direct set-up signalling is used and the CC receives a TNCC-SETUP response primitive indicating that the called user application has accepted direct call set-up signalling, the CC shall send a U-CONNECT PDU indicating that the MS is ready for immediate communication, and shall start timer T301. Upon receipt of the U-CONNECT PDU the SwMI should send a D-CONNECT ACKNOWLEDGE PDU in return. The CC sub-entity shall then inform the user application with a TNCC-COMPLETE indication primitive and shall enter state CALL-ACTIVE, stop timer T301 and start timer T310, see figure 14.10 right hand side. The D-CONNECT ACKNOWLEDGE PDU shall contain an indication as to which party is permitted to transmit. The CC sub-entity shall send a CONFIGURE request primitive for lower layer configuration;
- if transmission is not granted but the D-CONNECT ACKNOWLEDGE PDU contains an indication that the MS is allowed to request transmission permission, the CC shall follow the transmission control procedures outlined in clause 14.5.1.2.1;
- where the called MS is unable to accept the request for a basic service, it may according to the rules stated below, offer a different basic service to the calling party. The offered value shall be indicated in the U-CONNECT or U-ALERT PDU. Where the called MS is unable to offer a different service according to the rules below then the call shall be rejected using a U-DISCONNECT PDU as defined in clause 14.5.1.1.5, e.g. if circuit mode data is requested but the terminal cannot support data;
- for circuit mode unprotected bearer services:
  - if 28,8 kbit/s requested, 21,6 kbit/s, 14,4 kbit/s or 7,2 kbit/s may be offered;
  - if 21,6 kbit/s requested, 14,4 kbit/s or 7,2 kbit/s may be offered;
  - if 14,4 kbit/s requested, 7,2 kbit/s may be offered;
- for circuit mode protected (low) bearer services:
  - if 19,2 kbit/s requested, 14,4 kbit/s, 9,6 kbit/s or 4,8 kbit/s may be offered;
  - if 14,4 kbit/s requested, 9,6 kbit/s or 4,8 kbit/s may be offered;
  - if 9,6 kbit/s requested, 4,8 kbit/s may be offered;
  - if interleaving depth  $N = 8$  requested,  $N = 4$  or  $N = 1$  may be offered;
  - if interleaving depth  $N = 4$  requested,  $N = 1$  may be offered;
- for circuit mode protected (high) bearer services:
  - if 9,6 kbit/s requested, 7,2 kbit/s, 4,8 kbit/s or 2,4 kbit/s (high) may be offered;
  - if 7,2 kbit/s requested, 4,8 kbit/s or 2,4 kbit/s (high) may be offered;
  - if 4,8 kbit/s requested, 2,4 kbit/s (high) may be offered;
  - if interleaving depth  $N = 8$  requested,  $N = 4$  or  $N = 1$  may be offered;
  - if interleaving depth  $N = 4$  requested,  $N = 1$  may be offered;
- if the called MS is requested to support a duplex call and is unable to do so, then it shall offer a simplex call by setting the simplex/duplex element accordingly in either the U-ALERT or U-CONNECT PDU;
- if the called MS is requested to use direct call set-up and it is unable to support this, but does support on/off hook signalling, then it shall offer this service by sending the U-ALERT PDU;
- if the called MS is requested to use on/off hook signalling and is unable to support this, but does support direct call set-up, then it shall offer this service by setting the hook method element accordingly in the U-CONNECT PDU;
- if the called user application during the call set-up cannot continue to support of the call for other reasons that those stated above the request for call set-up shall be rejected by issuing a TNCC-RELEASE request primitive. The request to release the call set-up shall be mapped to a U-DISCONNECT PDU and follow the procedure defined in clause 14.5.1.3.

During the call set-up phase, the SwMI may send the D-INFO PDU containing a new value for T301 to prolong the call set-up time. If the CC in the called MS receives an D-INFO PDU containing a Call time-out, set-up phase element the CC shall start timer T301 using the specified value.

#### 14.5.1.1.2 Outgoing call

To initiate the call establishment, the user application shall transfer a TNCC-SETUP request primitive across the TNCC SAP to the CC sub-entity. The TNCC-SETUP request primitive shall be handled by a CC sub-entity instance that is in state IDLE.

The CC shall select a PDU priority based on the requested access priority value as defined in clause 14.5.6.2. The CC shall convert the TNCC-SETUP request primitive into a corresponding U-SETUP PDU and send it. The CC sub-entity shall then enter the MO-CALL-SETUP state and start timer T303.

The following describes the normal call set-up procedures:

- The progress of the transmission of the U-SETUP PDU may be reported to the CC in one or more REPORT indication primitives. If the PDU transfer has failed, the CC shall stop timer T303, inform the user application with a TNCC-RELEASE indication primitive and return to state IDLE.
- The SwMI may respond to the receipt of the U-SETUP PDU with a D-CALL PROCEEDING PDU indicating that the SwMI has received all information concerning the call set-up necessary to effect the call establishment. On reception of the PDU, the CC shall inform the user application with a TNCC-PROCEED indication primitive. In the case where On/Off Hook Signalling is requested or the called user application selects that method and alerting information is ready at the time when the D-CALL PROCEEDING PDU should have been sent, the SwMI may respond with a D-ALERT PDU instead of the D-CALL PROCEEDING PDU. Also if the call through connection is ready at the time when the D-CALL PROCEEDING PDU should have been sent, the SwMI may send a D-CONNECT PDU instead. On receipt of any of the above PDUs, Timer T303 shall be stopped, see figure 14.9 left hand side.
- The D-CALL PROCEEDING, D-ALERT or D-CONNECT PDU shall contain a Call Identifier which shall be used as the reference to this call in subsequent PDUs for the duration of the call.
- The D-INFO PDU shall not be used to allocate a call identifier.
- On reception of the DU-CALL PROCEEDING PDU the CC shall start timer T302, see figure 14.9 left hand side. The CC sub-entity shall remain in state MO-CALL-SETUP.
- If on/off hook signalling is requested and the CC receives a D-ALERT PDU, the CC shall inform the user application by issuing a TNCC-ALERT indication primitive.
- On reception of a D-ALERT PDU, the timer T302 shall be started using the specified value, see figure 14.9 left hand side.
- During the call set-up phase, the SwMI may send the D-INFO PDU containing a new T302 to prolong the call set-up time. Upon reception of a D-INFO PDU containing Call time out, set-up phase element, the timer T302 shall be started using the specified value.
- In a duplex call the SwMI shall grant permission to talk in the D-CONNECT PDU.
- When a D-CONNECT PDU is received, the CC shall send a CONFIGURE request primitive for lower layer configuration and inform the user application with a TNCC-SETUP confirm primitive and enter state CALL-ACTIVE. The timer T302 shall be stopped, and timer T310 shall be started, see figure 14.9 left hand side. The D-CONNECT PDU shall contain an indication which party is permitted to transmit.
- If transmission is not granted but the D-CONNECT PDU contains an indication that the MS is allowed to request transmission permission it shall follow the transmission control procedures defined in clause 14.5.1.2.1.
- Where the D-CALL PROCEEDING, D-CONNECT or the D-ALERT PDU indicates that the offered service is different to the one requested, and if the service offered is acceptable to the user application, the call shall continue. If the service is not acceptable, then the user application shall disconnect the call and the CC shall enter IDLE state, refer to clause 14.5.1.3.

**EXAMPLE:** If the user application has requested a 28,8 kbit/s circuit mode data, but considers that any data rate equal to or greater than 14,4 kbit/s is acceptable, then if a data rate of 14,4 kbit/s is offered the call shall continue. If a data rate of less than 14,4 kbit/s is offered (i.e. 7,2 kbit/s) then the user application shall disconnect the call.

**NOTE:** Handling of the TNCC-SETUP request primitive may be affected by the MS being active in a MM procedure, this being indicated to CC from MLE via the MLE-BUSY indication primitive, refer to clause 18.3.5.4. The exact nature of the interaction between MM/MLE and CC is outside the scope of this part of the present document but it is recommended that CC not accept a TNCC-SETUP request primitive while MM is busy.

#### 14.5.1.1.3 Colliding calls

Call collisions can occur when both the SwMI and the MS simultaneously send a D/U-SETUP PDU. Two call set-ups are colliding when a D-SETUP PDU is received within the window where the CC waits for a Call Identifier from the SwMI after a U-SETUP PDU has been issued. If this occurs and the MS cannot support more concurrent calls, the MS shall behave as follows:

- if the MS wishes to keep its own call attempt then it shall respond to the incoming call with a U-DISCONNECT PDU with a disconnect cause "called party busy"; or
- if the MS wishes to accept the incoming call then the CC shall accept the call as defined in clause 14.5.1.1.1. The CC shall also send a CANCEL request primitive to the lower layers to cancel the sending of the U-SETUP PDU. If the lower layers indicate that the PDU has already been completely sent, then the CC shall send a U-DISCONNECT PDU for its own call set-up.

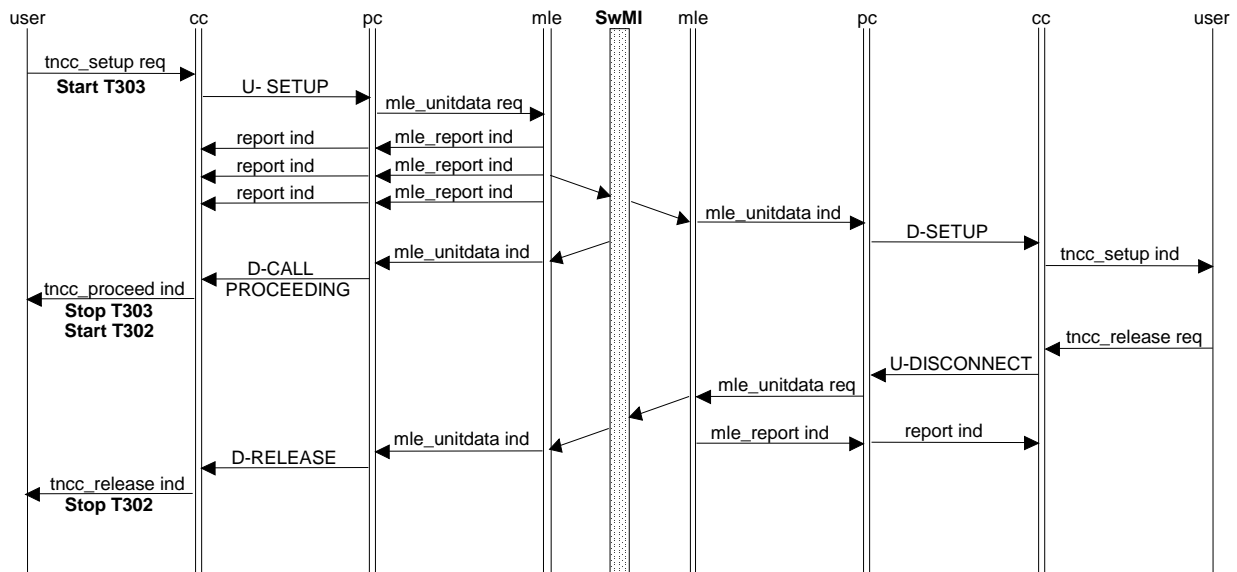

Another case of call collision may sometimes be detected and resolved by the SwMI. If the colliding calls are call set-up attempts between the same user applications and the requested basic services are the same, then the SwMI may merge the calls. The SwMI should inform both parties by a D-CONNECT PDU with an amalgamation indication that the calls are merged together, see the call ownership element. The CC should pass this information on to the application in the TNCC-SETUP confirm primitive.

#### 14.5.1.1.4 Unsuccessful call set-up

Unsuccessful call set-up shall refer specifically to those instances where a circuit mode connection was not successfully established. It shall not refer to call disconnection or call rejection. If a PDU is not responded to prior to the expiry of the corresponding timer the procedure in clause 14.5.1.3.4. shall apply. All timers available are listed in clause 14.6.

When CC receives a REPORT indication primitive, indicating that the lower layers have not been successful (failed transfer) in the sending of any of the call set-up PDUs, then the CC sub-entity shall return to state IDLE and shall inform the user application with a TNCC-RELEASE indication primitive accompanied with a cause of the disconnection.

### 14.5.1.1.5 Call rejection

**Figure 14.11: Individual call set-up phase - called user application rejects the call**

If the user application cannot accept an incoming call as defined in clause 14.5.1.1.1, it shall immediately transfer a TNCC-RELEASE request primitive to the CC sub-entity. The CC sub-entity shall send a U-DISCONNECT PDU along with the disconnection cause "Call Rejected by the called party", see figure 14.11. In case the rejection results from unsupported encryption flag state the disconnect cause shall be "Called party does not support encryption" or "Called party requires encryption". The CC sub-entity shall then change to state IDLE.

**NOTE:** If the SwMI sends the D-RELEASE PDU as the first response to the calling MS, then it should contain the dummy call reference.

For the busy case refer to clause 14.5.6.5.3.

## 14.5.1.2 Call maintenance procedures

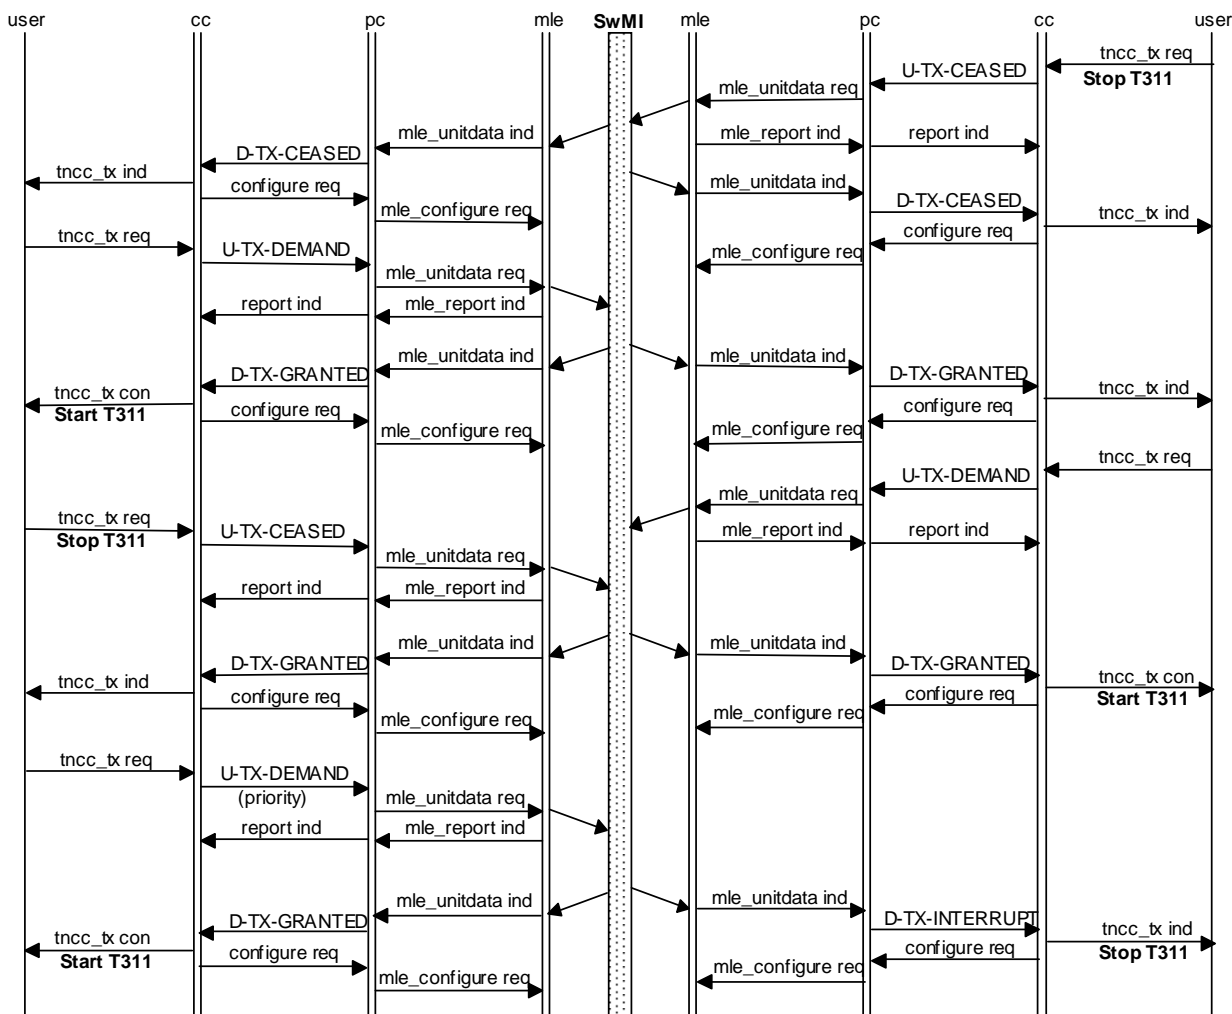

### 14.5.1.2.0 General

The call maintenance procedures described in this clause may be applied when the MS is in states MO-CALL SETUP, MT-CALL SETUP or CALL-ACTIVE. The main state CALL-ACTIVE can comprise several sub-states which are presented in informative figure 14.5.

**NOTE:** The D-INFO PDU can be used for other purposes than those defined in the protocol specifications contained in the present document.

14.5.1.2.1 Transmission control procedures

Only the transmission control procedures defined in clauses 14.5.1.2.1 c) and d) shall apply in duplex call. In a duplex call the SwMI shall grant permission to talk to both parties in the D-CONNECT and D-CONNECT ACKNOWLEDGE PDUs.

NOTE: For the purposes of clarity, only one instance of mle\_report is shown.

Figure 14.12: Individual call request-to-transmit

a) Request-to-Transmit

The SwMI shall fully control which MS is allowed to transmit. To facilitate this the MS shall request permission to transmit from the SwMI and shall receive a permission to transmit before the MS may begin a circuit mode U-plane transmission. If the SwMI allows, in a "transmission request permission" element, then the MS may request a permission to transmit even if the other party is already transmitting. In this case the SwMI should normally wait for that party to finish the transmission before granting the other user application. Pre-emptive priority requests are dealt with in clause 14.5.1.2.1 f).

If on/off hook signalling is used, the normal mode of operation shall be that the called MS shall be given permission to transmit by setting the transmission grant element accordingly in the D-SETUP PDU. However, if desired, the calling MS can ask for permission to transmit by setting the "request to transmit" bit accordingly in the U-SETUP PDU. This is dealt with in clauses 14.5.1.1.1 and 14.5.1.1.2.

If direct set-up signalling is used, the normal mode of operation shall be that the calling MS shall be given the permission to transmit. However the calling user application may in the U-SETUP PDU allow the called user application to request the permission to transmit first by setting the "request to transmit" bit accordingly in the U-SETUP PDU.

An MS restoring a call on a new cell, which was either transmitting in the previous cell or had a transmission request queued in the previous cell, may request to continue to transmit or retain its transmission request in the SwMI's transmission request queue by setting the "request to transmit/send data" element in the U-CALL RESTORE PDU accordingly. This is dealt with in clause 14.5.1.2.4.

When a user application within a call wants to transmit, a TNCC-TX request primitive shall be sent to the CC via the TNCC-SAP. The CC shall send this request in a U-TX DEMAND PDU, see figure 14.12. The TX demand priority should be set to low or high priority, unless this is a pre-emptive request, see clause 14.5.1.2.1 f).

The progress of the transmission of the U-TX DEMAND PDU shall be given locally to the CC in one or more REPORT indication primitives. If the CC receives a REPORT indication primitive with a failed transmission indication as a response to the sending of the U-TX DEMAND PDU the CC shall inform the user application by a TNCC-TX confirm primitive.

If a user application wants to withdraw its request-to-transmit before it has been granted, a TNCC-TX request primitive shall be issued to the TNCC-SAP. The CC shall send this request in a U-TX CEASED PDU or the previous request should be cancelled locally if still possible. The CC shall send the U-TX CEASED PDU with the stealing permission set to "immediate stealing" and stealing repeats flag set, so that the permission to transmit will be released immediately if allocated.

#### b) Response to Request-to-Transmit

During the call set-up phase: the response to the calling MS's request to transmit is dealt with in clauses 14.5.1.1.1 and 14.5.1.1.2. The MS given permission to transmit shall start timer T311.

During call restoration, the response to the restoring MS's request to transmit is dealt with in clause 14.5.1.2.4.

During a call in progress and when SwMI has decided which MS shall be given permission to transmit, the SwMI shall send a D-TX GRANTED PDU to the granted MS with the transmission grant element set to "transmission granted". The CC sub-entity shall send this information further on to the user application in a TNCC-TX confirm primitive. The other MS involved in the call shall also be informed with a D-TX GRANTED PDU indicating that transmission has been granted to another user. This CC sub-entity shall send this information further on to the user application in a TNCC-TX indication primitive, see figure 14.12.

If the SwMI rejects the transmission request this shall be indicated to the MS concerned by the "transmission not granted" parameter value in the D-TX GRANTED PDU.

If the SwMI places the transmission request in a queue this shall be indicated to the MS concerned by the "transmission request queued" parameter value in the D-TX GRANTED PDU. The MS can then assume that the request-to-transmit will be held in the queue until it is either granted by the SwMI or withdrawn by the MS, or the MS receives a D-TX GRANTED PDU containing the "transmission not granted" parameter value.

On reception of a D-TX GRANTED PDU indicating "transmission granted" or "transmission granted to another user", the CC sub-entity shall issue a CONFIGURE request primitive. The primitive shall carry as a parameter whether the transmit permission has been granted to this MS and a parameter to switch the U-Plane on. The MS given permission to transmit shall start timer T311.

Though the MS shall switch to U-Plane receive if it receives a "transmission granted to another user" response to its transmission request, the MS shall require an explicit response to its transmission request: one of "transmission granted", "transmission not granted" or "transmission request queued".

If the CC sends a U-TX DEMAND PDU whilst the other MS is transmitting, then the SwMI should normally wait for that party to finish the transmission (identified by the receipt of a U-TX CEASED message) before granting transmission to the other user application. On receipt of the U-TX DEMAND PDU, the SwMI may send a D-TX GRANTED PDU indicating whether the request-to-transmit is queued or rejected. Pre-emptive requests are dealt with under clause 14.5.1.2.1 f).

The SwMI shall not send an unsolicited D-TX GRANTED PDU but it is recognized that a race/error condition may result in the MS receiving one. The CC may choose to follow an unsolicited individually addressed D-TX GRANTED PDU indicating "transmission granted" but if the CC does not want to transmit/send data then it shall use the U-TX CEASED PDU, as it does normally at the end of a speech or data item, to reject the transmission grant.

#### c) Permission to Transmit withdrawn

The SwMI may decide to interrupt transmission when resources are required for another call or when the SwMI requires that the call should temporarily pause. In this case the SwMI should send a D-TX WAIT PDU to each MS (permitting or denying transmission requests according to the "transmission request permission" element). Upon receipt of the D-TX WAIT PDU, the CC sub-entity shall send a TNCC-TX indication primitive to the user application indicating that the transmission is waiting. The CC shall stop timer T311 if activated, enter state WAIT and send a CONFIGURE request primitive to switch the U-Plane off. The MSs shall accept any layer 2 channel assignment and await further instructions on the channel that they have been directed to.

If a request-to-transmit has been queued at the time when the D-TX WAIT PDU is received, the MS shall be allowed to withdraw its request-to-transmit by means of the U-TX CEASED PDU as described in clause 14.5.1.2.1 e).

If the SwMI sends a D-TX WAIT PDU because it wishes to use an assigned channel for another call, it shall send a layer 2 channel assignment with the D-TX WAIT PDU directing the MS to a signalling channel other than the assigned channel. This is to prevent the change in usage marker associated with re-allocation of the assigned channel to the other call causing the waiting MS to drop the interrupted call.

#### d) Permission to Continue with withdrawn call

When the SwMI has decided that the call can continue, the SwMI should send either a D-TX CONTINUE PDU or a D-TX GRANTED PDU to each MS. When the CC sub-entity receives the notification of the continuation of the call in a D-TX CONTINUE or D-TX GRANTED PDU it shall return to state CALL-ACTIVE.

The D-TX CONTINUE PDU shall contain an indication (the continue element) to specify whether the same transmission permission applies as at the time of the interruption. If the continue element is set to "continue", and if the MS was either transmitting or receiving traffic when it received the D-TX WAIT PDU, then the CC sub-entity shall send a CONFIGURE request primitive to switch the U-plane on and to accept the channel change if requested. The MS granted permission to transmit shall start timer T311. If the continue element is set to "not continue", or if the MS was neither transmitting nor receiving traffic when it received the D-TX WAIT PDU, then the U-plane shall not be switched on and the MS shall assume that any previous transmission permission no longer applies.

If the D-TX CONTINUE PDU contains an indication that the MS is allowed to request transmission permission, it may follow the transmission control procedures described in clause 14.5.1.2.1 a).

There are three cases as follows:

- 1) if no MS was granted transmission at the time when the SwMI sent the D-TX WAIT PDU, or if an MS was granted transmission at the time of the D-TX WAIT PDU but the SwMI does not wish that transmission to continue, then either a D-TX CONTINUE PDU with the continue element set to "not continue" or D-TX GRANTED PDU with transmission grant element set to "not granted" shall be sent individually to both MSs in the call. The CC shall accept any layer 2 channel allocation. All CC sub-entities shall return to state CALL-ACTIVE but the U-plane shall not be switched on and the MS shall assume that any previous transmission permission no longer applies. If the D-TX CONTINUE PDU or D-TX GRANTED PDU contains an indication that the MS is allowed to request transmission permission, it may follow the transmission control procedures described in clause 14.5.1.2.1 a).
- 2) If there was at least one MS granted transmission at the time when the SwMI sent the D-TX WAIT PDU, and if the SwMI wishes the transmission to continue, then either a D-TX CONTINUE PDU with the Continue element set to "continue" or D-TX GRANTED PDU with transmission grant element set to "transmission granted" or "transmission granted to another" shall be sent individually to both MSs and the CC shall accept any layer 2 channel allocation. If a D-TX CONTINUE PDU with the Continue element set to "continue" is sent, it shall give the earlier granted MS permission to continue transmission. The MS granted permission to transmit shall start timer T311. All CC sub-entities shall return to state CALL ACTIVE and shall send a CONFIGURE request primitive to the lower layers to switch the U-plane on.

- 3) If there was one MS granted transmission at the time when the SwMI sent the D-TX WAIT PDU but the SwMI wishes to give the transmission permission to the other party or if no MS was granted transmission at the time when the SwMI sent the D-TX WAIT PDU and the SwMI wishes to give the transmission permission now to another party, the SwMI may first send a D-TX CONTINUE PDU with the Continue element set to "not continue" individually to both MSs. A D-TX GRANTED PDU shall then be sent as an individual message to the granted MS with information element transmission grant set to "transmission granted" and with information element transmission grant set to "transmission granted to another user" to not-granted MS (if any). When receiving either D-TX CONTINUE or D-TX GRANTED PDU the CC sub-entity shall return to state CALL-ACTIVE. In addition when receiving D-TX GRANTED PDU CC shall send a CONFIGURE request primitive to the lower layers to switch the U-plane on.

If the MS is in state WAIT and it receives a D-TX GRANTED PDU then it shall obey the instruction in the D-TX GRANTED PDU.

#### e) End of Transmission

At the end of a transmission, the user application shall send a TNCC-TX request primitive to the TNCC-SAP indicating ceased transmission. The CC sub-entity shall send this information in a U-TX CEASED PDU, remain in state CALL-ACTIVE and stop timer T311. The CC shall send the U-TX CEASED PDU with the stealing permission set to "immediate stealing" and the stealing repeats flag set. Upon receipt of the U-TX CEASED PDU, the SwMI may send a D-TX CEASED PDU to each MS informing them that the transmission has now ceased.

Upon reception of a D-TX CEASED PDU, the CC shall send this information further on to the user application in a TNCC-TX indication primitive (transmission ceased). The CC sub-entity shall send a CONFIGURE request primitive to the lower layers to switch the U-Plane off.

Also, if the CC that is sending the U-TX CEASED PDU receives a REPORT indication primitive of either successful or unsuccessful transmission of that PDU by the lower layers, then it shall behave as if it had received a D-TX CEASED PDU i.e. it shall send a TNCC-TX indication primitive (transmission ceased) to the user application and shall send a CONFIGURE request primitive to the lower layers to switch the U-Plane off.

If there was a request for transmission already queued in the SwMI when the U-TX CEASED PDU was received, then the SwMI should send a D-TX GRANTED PDU to each MS as described in clause 14.5.1.2.1 b), without sending an explicit D-TX CEASED PDU. The CC sub-entity shall send a CONFIGURE request primitive to the lower layers to indicate the change in the transmit permission.

NOTE: The End of Transmission procedure is not valid for a duplex call.

The SwMI shall not send an unsolicited D-TX CEASED PDU but it is recognized that a race/error condition may result in the MS receiving one. If CC receives an unsolicited D-TX CEASED PDU it shall send this information further on to the user application in a TNCC-TX indication primitive (transmission ceased) and shall send a CONFIGURE request primitive to the lower layers to switch the U-Plane off.

#### f) Stop Transmission order

If, during the course of a transmission, a MS wishes to interrupt the transmitting MS, it shall send a U-TX DEMAND PDU indicating the wanted level of pre-emptive priority in the TX demand priority element. If the SwMI supports transmission interruption, it shall then send a D-TX INTERRUPT PDU to the MS that currently has the permission to transmit. Upon reception of a D-TX INTERRUPT PDU, the CC shall stop transmission and remain in state CALL-ACTIVE, stop timer T311, send a TNCC-TX indication primitive to the user application indicating transmission interrupt and send a CONFIGURE request primitive to lower layers to indicate the loss of transmit permission. The SwMI should then send a D-TX GRANTED PDU to the requesting MS indicating that the permission to transmit has been awarded as described in clause 14.5.1.2.1 b).

The D-TX INTERRUPT PDU shall indicate that transmission is granted to another user and then the MS shall switch to U-plane reception. Otherwise, if there is a delay before the pre-emptive priority transmission, the SwMI may indicate "transmission not granted" in the D-TX INTERRUPT PDU. Then the MS shall switch the U-plane off and wait for a D-TX GRANTED PDU.

#### g) Expiry of timer T311; call transmission timer

Upon expiry of timer T311, CC shall remain in state ACTIVE, send a TNCC-TX indication primitive to the user application and a U-TX CEASED PDU to the peer entity. The CC shall send the U-TX CEASED PDU with the stealing permission set to "immediate stealing" and stealing repeats flag set.

#### 14.5.1.2.2 Call status information procedures

The D-INFO PDU can be used for carrying call status messages from SwMI to the MS. When a D-INFO PDU is received, depending on the notification, the following actions are taken by CC.

##### a) Call in queue

When the SwMI has put a call into a queue it may send a D-INFO PDU. If the D-INFO PDU contains a value for the call time-out, set-up phase, the CC shall start timer T301 or T302, as appropriate, using the specified value. The CC shall send the information to the application in a TNCC-NOTIFY indication primitive. If the call is queued at call set-up time the D-INFO PDU should be preceded by a D-CALL PROCEEDING PDU.

##### b) Call is proceeding

This may be sent to the calling user application during the call set-up phase to indicate e.g. that the call set-up time through a gateway will be longer than for a normal call set-up time. The information that the timer value shall be changed is made available to the CC sub-entity in the D-INFO PDU. The CC shall start T302 with the indicated timer value. The CC shall send the information further on to the application in a TNCC-NOTIFY indication primitive.

##### c) SwMI is paging called user

When the SwMI is paging a called user, e.g. when the called user is on another network, the SwMI may send a D-INFO PDU with the call status parameter indicating this situation. If the D-INFO PDU contains a value for the call time-out, call set-up phase element, the CC shall start timer T302 using the specified value.

##### d) Prolonging the call time-out time

The SwMI may decide to change the call time-out time by sending a D-INFO PDU with a new T310 value. Upon reception of the D-INFO PDU containing the "call time-out" element, T310 shall be started using the defined value. If the SwMI supplies a T310 value in the D-INFO PDU, it shall set the value of the "reset call time-out timer" element of the PDU to indicate reset of T310.

The SwMI may also choose to reset the call time-out time and start it again using the current defined value. Upon reception of the D-INFO PDU with the "reset call time-out timer" element indicating that T310 shall be reset, T310 shall be started using the value defined earlier.

In either case, the Timer value shall be sent further on to the application in a TNCC-NOTIFY indication primitive.

The SwMI may also change the call timeout time during call restoration by supplying the "call time-out" element in the D-CALL RESTORE PDU, refer to clause 14.5.1.2.4. If the SwMI supplies a T310 value in the D-CALL RESTORE PDU, it shall set the value of the "reset call time-out timer" element of the PDU to indicate reset of T310.

NOTE 1: This procedure is applicable both in semi-duplex and full-duplex calls.

##### e) Change of call identifier

The SwMI may decide to change the call identifier used by an MS in an on-going call by sending a D-INFO PDU containing a new call identifier. The SwMI may also use this method to change the MS's call identifier in preparation for a type 1 cell reselection (i.e. just before sending the MS the D-NEW CELL PDU granting the type 1 cell reselection) if the new cell uses a different call identifier from the old cell. The individually-addressed D-INFO PDU should be sent using an acknowledged service.

NOTE 2: If the MS and the SwMI have different perceptions of the value of a call identifier the MS could lose the call.

#### f) Imminent call disconnection

The SwMI may also inform MS that the call is about to end by sending D-INFO PDU with notification value "Notice of imminent call disconnection" shortly before the actual call disconnection. Upon reception of notification "Notice of imminent call disconnection" CC may send this notification to the application in a TNCC-NOTIFY indication primitive.

NOTE 3: The time between notification and disconnection is outside the scope of the present document.

Most downlink CC PDUs may contain a Notification indicator information element (in addition to the D-INFO PDU) and SwMI may inform calling/called user about offered or connected service using the Notification indicator information element. CC may send this notification to the application in corresponding TNCC service primitive.

#### 14.5.1.2.3 Call modification procedures

The MS service user may modify the service of an existing call. To initiate a modification the user application shall issue a TNCC-MODIFY request primitive and the CC sub-entity shall send a U-INFO PDU and wait for a D-INFO PDU from the SwMI before changing any of the current service parameters. The SwMI should not send D-INFO PDU to modify a service while an ongoing U-plane transmission is in progress.

When a service has been changed by the SwMI, e.g. when a point-to-point call has been changed to a point-to-multipoint call, the SwMI should indicate this to the calling and called parties by sending a D-INFO PDU. Upon reception of a D-INFO PDU the CC sub-entity shall send it to the application in a TNCC-MODIFY indication primitive. Finally the CC shall send a CONFIGURE request primitive for lower layer configuration.

If the SwMI is unable to provide the requested service, it should either send a D-INFO PDU to the requesting party containing the current service (unchanged), or send a D-INFO PDU to the calling and called parties containing an alternative service. For example, if a user application requests an increase from a 1-slot per frame call to a 4-slots per frame call, and the SwMI is unable to allocate more than 2-slots to the call, it may offer a 2-slots per frame call in the D-INFO PDUs.

If the call has changed from point-to-point to point-to-multipoint, a temporary group address and a group call reference number (call identifier) shall be given. The new group call reference number can be the current call identifier of the including party.

The service may be changed between any combination of one or more of the following:

- duplex operation may be changed to simplex operation; or
- simplex operation may be changed to duplex operation;
- a point-to-point call may be changed to a point-to-multipoint call;
- a clear call may be changed to an encrypted call; or
- an encrypted call may be changed to a clear call;
- a 4-slots per frame call may be changed to a 1-slot, 2-slot or 3-slot call;
- a 3-slot call may be changed to a 1-slot, 2-slot or 4-slot call;
- a 2-slot call may be changed to a 1-slot, 3-slot or 4-slot call;
- a 1-slot call may be changed to a 2-slot, 3-slot or 4-slot call;
- a circuit mode type (TCH/S, TCH/7.2, TCH/4.8 or TCH/2.4) may be changed to a different circuit mode type (with the requested interleaving depth in the case of TCH/4.8 or TCH/2.4);
- a protected circuit mode data type (TCH/4.8 or TCH/2.4) may be changed to a different interleaving depth from the set of permissible values ( $N = 1, 4$  or  $8$ ).

NOTE: The clear and encrypted calls refer to the end-to-end clear and encrypted calls. The end-to-end encryption control is independent of the air interface encryption control.

It is also possible to change between the circuit mode speech teleservices.

The encryption state of each transmission, defined using D-TX GRANTED PDU, can be set independently by the encryption control element in the U-TX DEMAND PDU. The SwMI should not change the requested encryption state in the responding D-TX GRANTED PDU from that requested in the U-TX DEMAND PDU.

If the MS cannot support a new service combination, indicated by D-INFO, D-TX GRANTED or D-TX INTERRUPT PDU, the user application or the CC, as appropriate, shall disconnect the call (see clause 14.5.1.3.1). The U-DISCONNECT PDU shall contain disconnection cause "requested service not available" or in case of incompatible encryption control, the disconnect cause shall be "Called party does not support encryption" or "Called party requires encryption".

#### 14.5.1.2.4 Call restoration procedures

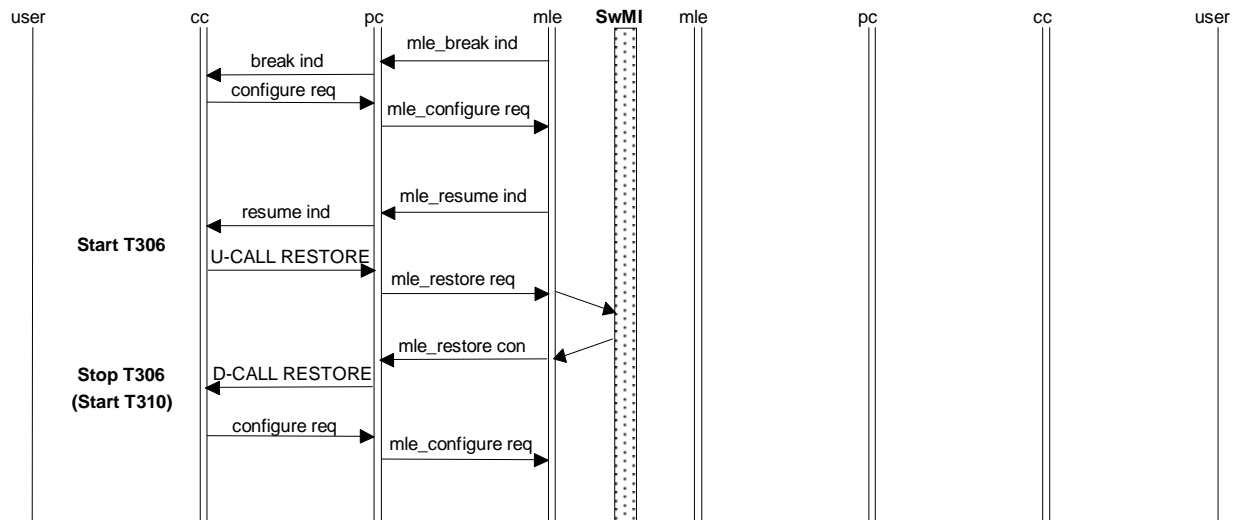

Figure 14.13: Individual call - successful call restoration

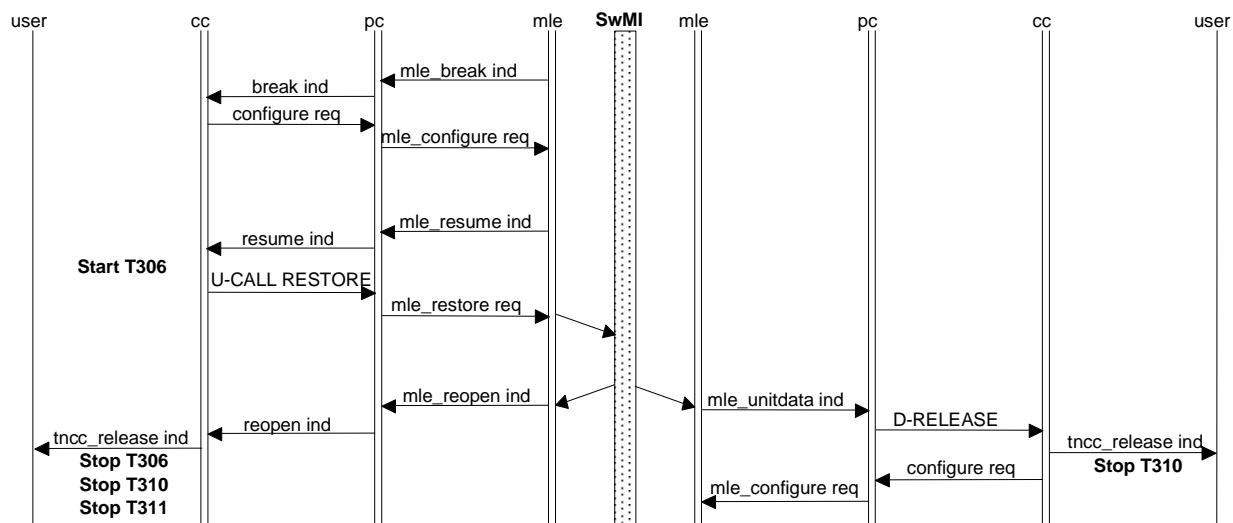

Figure 14.14: Individual call - unsuccessful call restoration

The responsibility of the procedure shall be to restore the call when the temporary break condition has been resolved by lower layers.

When the CC receives a BREAK indication primitive, then the CC sub-entity shall try to restore the call as described in this clause:

- When the CC receives a BREAK indication primitive, the CC shall send a CONFIGURE request primitive to switch the U-plane off as described in clause 14.5.1.4 and remain in state CALL-ACTIVE. If the CC had permission to transmit/send data at that time the CC shall assume that the permission is now ended as if the CC had sent a U-TX CEASED PDU or SwMI had withdrawn permission to talk. If the MS is in state WAIT when it receives a BREAK indication primitive then it shall behave as if it had received a D-TX CONTINUE PDU with the continue element set to "not continue". It shall then obey the instructions in the D-CALL RESTORE PDU.
- If the CC receives a RESUME indication primitive indicating that the C-plane may now be used again, it shall issue a U-CALL RESTORE PDU in a RESTORE request primitive containing the SSI, TSI or SNA of the other party in the individual call and the call identifier of the call which CC wants to restore. If the other party address is not available, then the dummy address (all zeroes) shall be used. The CC shall set the request to transmit/send data information element in the U-CALL RESTORE PDU as indicated below:
  - Duplex call - always request to transmit/send data.
  - Simplex call - an MS that wishes to continue transmission in the new cell shall request to transmit/send data. An MS that has requested for transmit permission on a previous cell and received a "transmission request queued" response or no response at all on that cell, and wishes to refresh the transmission request, shall request to transmit/send data. Otherwise, the MS shall request that the other MS may transmit/send data.

NOTE 1: It is not the intention that the MS uses the transmit/send data information element in the U-CALL RESTORE PDU for a new transmission request in the new cell; it should only be used for refreshing a request in the previous cell or to continue transmission in the new cell. It is outside the scope of the present document if used for a new transmission request but it is likely that a SwMI may deny the request for transmission. The intention is that the transmission request in the new cell is achieved using standard call maintenance signalling after the restoration is complete.

After sending a U-CALL RESTORE PDU, CC shall start timer T306 and wait for a D-CALL RESTORE PDU.

- When the CC receives a D-CALL RESTORE PDU in a RESTORE indication primitive, timer T306 shall be stopped, and the call shall be resumed with the new parameters, see figure 14.13. Timer T310 shall be reset and started only if the "Reset call timeout" information element value is 1 (Reset call time-out timer T310); the T310 value shall be taken from the D-CALL RESTORE PDU call timeout information element and, if not present in the PDU, from the previous value (provided in D-CONNECT, D-CONNECT ACKNOWLEDGE or D-INFO PDU). The CC shall obey the transmission granting in the transmission grant information element for both simplex and duplex calls:
  - Transmission granted: The MS shall switch the U-plane on (refer to clause 14.5.1.4) and the MS is authorized to transmit, and in the case of a duplex call, also authorized to receive.
  - Transmission not granted: This value is only applicable for simplex calls. The MS shall assume that it has neither transmission permission nor a transmission request queued in the SwMI and the U-plane remains switched off.
  - Transmission request queued: The MS shall assume that the request-to-transmit remains queued in the SwMI until it is either granted or withdrawn by the SwMI, or withdrawn by the MS and the U-plane remains switched off.
  - Transmission granted to another user: This value is only applicable for simplex calls. The MS shall switch the U-plane on (refer to clause 14.5.1.4) and the MS is authorized to receive. If the MS requested transmission in the U-CALL RESTORE PDU, the MS shall assume that its transmission request is still queued in the SwMI until it is either granted or withdrawn by the SwMI, or withdrawn by the MS.

If the U-plane is to be switched on, a layer 2 channel allocation shall accompany the D-CALL RESTORE PDU. If the U-plane is not to be switched on, and a traffic channel is available, the layer 2 channel allocation may accompany the D-CALL RESTORE PDU or be attached to later signalling. If a traffic channel is not available, the D-CALL RESTORE PDU shall contain a "Call status" information element with value "Call is queued".

NOTE 2: If the D-CALL RESTORE PDU is sent without a layer 2 channel allocation and includes a new call identifier it should be sent using an acknowledged layer 2 service. (This reduces the possibility of the MS responding to subsequent copies of the D-CALL RESTORE PDU with a U-DISCONNECT PDU, which occurs if the D-CALL RESTORE PDU changes the call identifier - see clause 14.5.6.5.2).

- After processing the D-CALL RESTORE, the call restoration is considered complete; however, if the U-plane remains switched off after the call restoration e.g. due to call is queued, the SwMI would typically send one or more D-TX GRANTED PDUs to continue the call or to award transmission permission. Those D-TX GRANTED PDUs may be a direct result of the call restoration, for example to provide the channel allocation in the new cell in the event of queuing for a channel, or it may be associated with further call maintenance signalling following a transmission request from one of the call participants (refer to clause 14.5.1.2.1). The CC shall obey the transmission granting in the transmission grant information element:
  - Transmission granted: The MS shall switch the U-plane on (refer to clause 14.5.1.4) and the MS is authorized to transmit. If the restored MS has not yet been sent to the traffic channel, the D-TX GRANTED PDU shall be accompanied by a layer 2 channel allocation.
  - Transmission not granted: The MS shall assume that it has neither transmission permission nor a transmission request queued in the SwMI and the U-plane remains switched off. If the restored MS has not yet been sent to the traffic channel, the D-TX GRANTED PDU may be accompanied by a layer 2 channel allocation.
  - Transmission request queued: The MS shall continue to assume that the request-to-transmit remains queued in the SwMI until it is either granted or withdrawn by the SwMI, or withdrawn by the MS and the U-plane remains switched off. If the restored MS has not yet been sent to the traffic channel, the D-TX GRANTED PDU may be accompanied by a layer 2 channel allocation.
  - Transmission granted to another user: The MS shall switch the U-plane on (refer to clause 14.5.1.4) and the MS is authorized to receive. If the restored MS has not yet been sent to the traffic channel, the D-TX GRANTED PDU shall be accompanied by a layer 2 channel allocation.

On expiry of Timer T306, the procedure defined in clause 14.5.1.3.4 shall apply.

The call length timer T310 shall continue running during the call restoration and on expiry of T310, the procedure defined in clause 14.5.1.3.4 shall apply.

If the call cannot be resumed the CC should receive a REOPEN indication primitive indicating that the call is lost. The CC shall then stop Timer T306 and return to state IDLE, and it shall send a TNCC-RELEASE indication primitive to the user application with the cause of disconnection, see figure 14.14.

If the SwMI provides a new call identifier with the D-CALL RESTORE PDU, CC shall use it in all subsequent signalling relating to that call. After a cell change, the MS shall not send any other call related signalling than U-CALL RESTORE PDU until it has received a D-CALL RESTORE PDU (and possible new call identifier) from the SwMI.

A MS which is queueing for a traffic channel during restoration and which has an outstanding transmission request, may cancel that transmission request by sending a U-TX CEASED PDU. A MS which is queueing for a traffic channel during restoration and which does not have an outstanding transmission request, may make a transmission request by sending a U-TX DEMAND PDU, providing the SwMI has not disallowed transmission requests (via the "transmission request permission" element).

If there is more than one circuit mode call active at the time when the MLE-BREAK indication primitive was received, each call shall be restored separately and hence U-CALL RESTORE and D-CALL RESTORE PDUs shall be exchanged one by one for each call.

#### 14.5.1.2.5 DTMF procedures

When a user application requires to transfer DTMF digits to another user application during a circuit mode call, it shall issue a TNCC-DTMF request primitive (DTMF tone delimiter = "DTMF tone start") to the CC entity, followed by a TNCC-DTMF request primitive (DTMF tone delimiter = "DTMF tone end") to the CC entity. The duration of time between the "start" and "end" primitives, and the number of digits contained in the start primitive, shall be application-dependent, though normally generation of the start primitive will correspond with a DTMF key press, generation of the end primitive will correspond with the release of that key and the start primitive will contain the digit corresponding to the key press.

CC shall generate U-INFO PDUs corresponding to the TNCC-DTMF request primitives (see clauses 14.8.19, 14.8.19a and 14.8.19b), the only restriction being that CC shall not send a "DTMF tone end" U-INFO PDU if layer 2 has not indicated successful transmission of the preceding "DTMF tone start" U-INFO PDU.

On the reception of a D-INFO "DTMF tone start" PDU the CC shall forward the DTMF digits contained in the PDU to the user application in a "start" TNCC-DTMF indication primitive. On the reception of a D-INFO "DTMF tone end" PDU the CC shall send an "end" TNCC-DTMF indication primitive to the user application. If CC receives two identical "start" PDUs (i.e. containing the same DTMF digits) without an intervening "end" PDU it shall ignore the second "start" PDU. If CC receives two "end" PDUs without an intervening "start" PDU it shall ignore the second "end" PDU. If CC receives two different "start" PDUs without an intervening "end" PDU it shall forward the digits contained in both PDUs to the user application.

A SwMI may choose to filter repeated "start" and "end" DTMF U-INFO PDUs in the manner described in the previous clause before forwarding DTMF digits to a MS (in a D-INFO PDU) or gateway (see below).

A receiving MS or gateway which does not support or subscribe to DTMF signalling may respond to a DTMF D-INFO PDU with a U-INFO PDU, the DTMF type element (refer clause 14.8.19b) having value "DTMF not supported" or "DTMF not subscribed". The SwMI should forward this response to the addressed MS (i.e. the MS which initiated the DTMF signalling) in a D-INFO PDU.

A receiving SwMI which does not support or subscribe to DTMF signalling may respond to a DTMF U-INFO PDU with a D-INFO PDU, the DTMF type element (refer clause 14.8.19b) having value "DTMF not supported" or "DTMF not subscribed".

On the reception of a D-INFO "DTMF not supported" or "DTMF not subscribed" PDU (refer clause 14.8.19b), CC shall forward the failure to the user application in a TNCC-DTMF indication primitive containing a "DTMF result" parameter specifying the nature of the failure (refer clause 11.3.3.3). Note that a user application should receive such an indication only after having generated DTMF digits itself. It is outside the scope of the present document how the user application should handle the rejection of DTMF signalling.

The U-INFO PDU may be routed to a gateway. In this case, the receiving user application can be for example, either an external network subscriber application or an exchange of the external network that uses two stage dialling to set-up calls in the external network. The gateway shall convert the DTMF digits into dual tone multi-frequency signals towards the external network. The gateway shall support the filtering of repeated "start" and "end" DTMF U-INFO PDUs described above.

A receiving entity (i.e. MS or gateway) shall start generation of one or more DTMF tones at the first reception of a "start" PDU. The receiving entity shall ignore any repeated "start" PDUs. It is outside the scope of the present document how DTMF tones are generated if the receiving entity receives two or more different "start" PDUs without an intervening "end" PDU.

The "end" PDU shall stop the generation of tone or tones after the minimum period of tone/no-tone sequence or sequences as defined for the application e.g. PSTN gateway. When the reception of the "end" PDU is delayed longer than the minimum tone period of the single or last digit in the "start" PDU the tone generating application may continue to generate tone for a predefined time; the generation time is outside the scope of the present document. The receiving entity shall ignore any repeated "end" PDUs.

The next "start" PDU after an "end" PDU shall start generation of the DTMF tone only after a valid no-tone period as defined for the application.

The minimum length of tone generated by the tone generating application, e.g. a gateway, should be suitable for potential applications in analog telecommunication networks.

NOTE 1: The DTMF signalling can be used only after either a D-CONNECT or D-CONNECT ACK PDU has been received and the TETRA call is established.

NOTE 2: DTMF signalling may not function correctly during a circuit mode data call (a data modem signal will seriously disturb and be disturbed by DTMF signalling). The support of DTMF signalling during data calls is outside the scope of the present document.

14.5.1.2.6 Calls to and from external subscribers

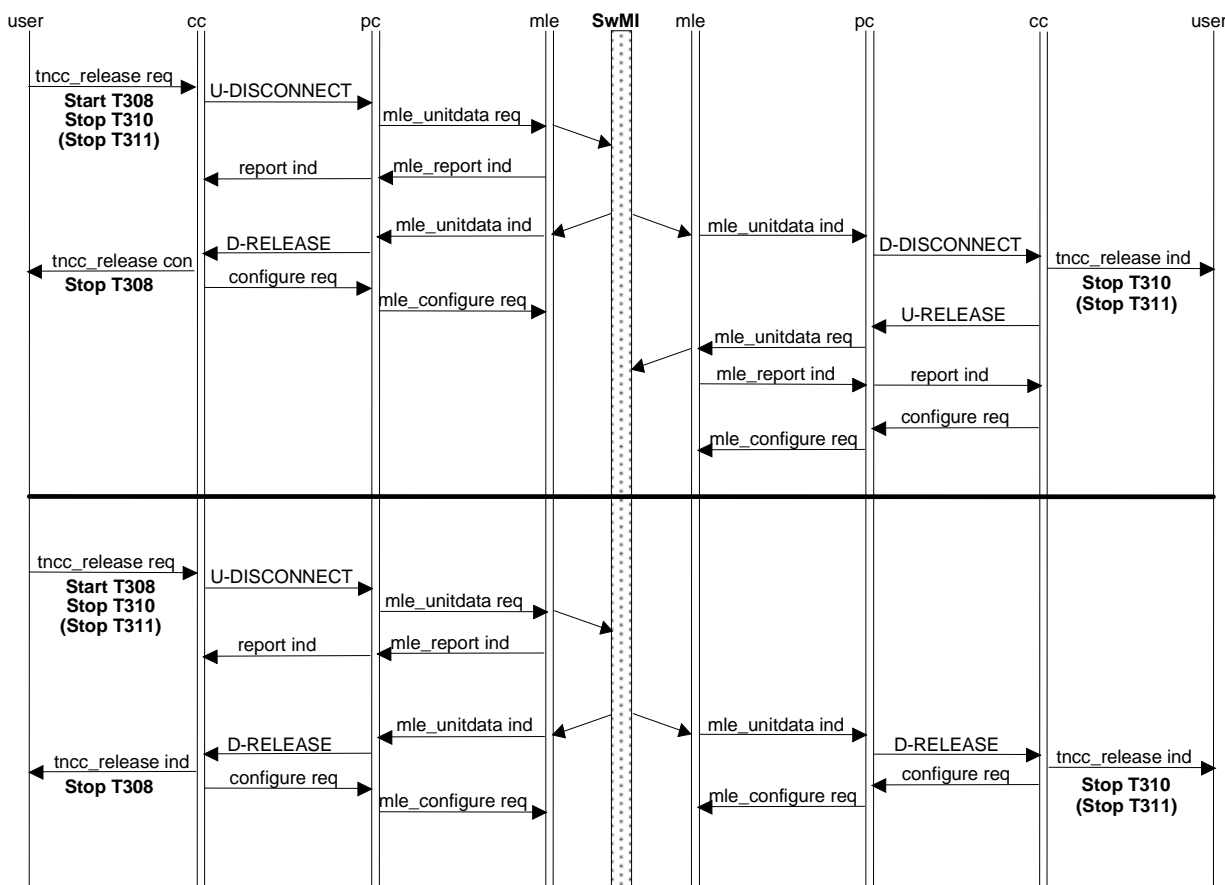

An MS can make a call to a subscriber in an external network using a gateway. The call set-up message shall address the gateway using a particular SSI as the called party address and the U-SETUP PDU shall contain the external network subscriber number in the corresponding element. The gateway shall then set-up the call to the external network subscriber using that number without further call set-up messages from the calling MS.

NOTE 1: The particular SSI address or addresses which identify the gateway or gateways are not defined by this part of the present document.

NOTE 2: Calls from external network subscribers to TETRA subscribers are supported in the air interface including presentation of the external user number, if available. This part of the present document does not describe gateway functions, which are independent of the air interface protocol.

14.5.1.3 Call disconnection procedures

14.5.1.3.0 General

NOTE: For the purposes of clarity, only 1 instance of mle\_report has been shown.

Figure 14.15: Individual call request-to-disconnect

14.5.1.3.1 User initiated disconnection

Either the calling or called user application may initiate a call disconnection at any state of a call. This shall be done by sending a TNCC-RELEASE request primitive to the CC sub-entity.

- During call set-up phase until the U-SETUP PDU has been transmitted to the SwMI, a disconnection can be handled locally using a CANCEL request primitive. Information regarding the local progress of the transmission of a PDU is received in REPORT indication primitives. After a local cancellation the CC sub-entity shall stop timer T303 and return to state IDLE.

- On receipt of a TNCC-RELEASE request primitive the CC sub-entity shall enter state CALL-DISCONNECT, send a U-DISCONNECT PDU, start timer T308 and stop all other T3xx timers. The progress of the disconnection PDU sending shall be reported back to CC with REPORT indication primitives.
- Should the user application disconnect the call during the window between transmission of a U-SETUP and reception of a D-CALL PROCEEDING, D-ALERT or D-CONNECT PDU (i.e. before the MS has received a call identifier for the call), it shall use the dummy call identifier (all zeroes).
- After sending a U-DISCONNECT PDU the CC shall wait for a D-RELEASE PDU. When a D-RELEASE PDU or a REPORT indication primitive with reason PDU transfer failed is received, or timer T308 expires, the CC sub-entity shall clear the call identifier and shall return to state IDLE, issuing a TNCC-RELEASE confirm primitive to the user application, see figure 14.15. The CC sub-entity shall send a CONFIGURE request primitive to the lower layers to switch the U-Plane off, reject any pending channel change response request for that call (refer to clause 14.5.3.2), and leave the assigned channel (if the MS is on an assigned channel when the CONFIGURE request primitive is sent). If a channel change response is required for the D-RELEASE PDU, CC shall accept that channel change (refer to clause 14.5.3.2).

The SwMI should inform the other MS in the call of the call clearance either by a D-DISCONNECT PDU or by a D-RELEASE PDU, see clause 14.5.1.3.3.

#### 14.5.1.3.2 Network initiated disconnection

In the case where the SwMI cannot support a request for a call from the calling MS, the SwMI should send a D-RELEASE PDU, containing the reason for disconnection, to the calling MS.

In the case where the SwMI can no longer support an established call, it should send D RELEASE PDUs to the calling and called MSs containing the reason for disconnection, and should subsequently release the call.

Refer to clause 14.5.1.3.3 for the MS actions.

#### 14.5.1.3.3 Reception of disconnection request

The BS may send a disconnection request at any phase of the call and the MS shall react as follows:

- when the CC sub-entity receives a D-DISCONNECT PDU the CC shall respond by sending a U-RELEASE PDU;
- when the CC sub-entity receives a D-RELEASE PDU the CC shall not send any response;
- in both cases the CC shall inform the user application with a TNCC-RELEASE indication primitive, clear the call identifier, stop all T3xx timers and enter state IDLE, see figure 14.15. The CC sub-entity shall send a CONFIGURE request primitive informing the lower layers to switch the U-Plane off, reject any pending channel change response request for that call (refer to clause 14.5.3.2), and leave the assigned channel (if the MS is on an assigned channel when the CONFIGURE request primitive is sent). If a channel change response is required for the D-RELEASE PDU or D-DISCONNECT PDU, CC shall accept that channel change (refer to clause 14.5.3.2).

#### 14.5.1.3.4 Expiry of timers

##### a) Timer T301; call set-up timer for called MS

Upon expiry of timer T301, CC shall send a TNCC-RELEASE indication primitive to the user application, send a U-DISCONNECT PDU and follow the procedures in clause 14.5.1.3.1. The value of the disconnect cause element shall be set to "expiry of timer".

##### b) Timer T302; call set-up timer for calling MS

Upon expiry of timer T302, CC shall send a TNCC-RELEASE indication primitive to the user application, send a U-DISCONNECT PDU and follow the procedures in clause 14.5.1.3.1. The value of the disconnect cause element shall be set to "expiry of timer".

c) Timer T303; call initiated timer for calling MS

Upon expiry of timer T303, CC shall send a TNCC-RELEASE indication primitive to the user application, send a U-DISCONNECT PDU and follow the procedures in clause 14.5.1.3.1. The value of the Disconnect Cause element shall be set to "expiry of timer".

d) Timer T306; call restoration timer for point-to-point calls

Upon expiry of timer T306, CC shall return to state IDLE, and send a TNCC-RELEASE indication primitive to the user application. The value of the disconnect cause element shall be set to "expiry of timer".

e) Timer T308; call disconnect timer

Upon expiry of timer T308, CC shall return to state IDLE, send a TNCC-RELEASE confirm primitive to the user application and shall send a CANCEL request primitive to the lower layers to cancel the sending of the U-DISCONNECT PDU. The CC sub-entity shall send a CONFIGURE request primitive to the lower layer to switch the U-Plane off, reject any pending channel change response request for that call (refer to clause 14.5.3.2), and leave the assigned channel (if the MS is on an assigned channel when the CONFIGURE request primitive is sent).

f) Timer T310; call length timer

Upon expiry of timer T310, CC shall send a TNCC-RELEASE indication primitive to the user application, send a U-DISCONNECT PDU and follow the procedures in clause 14.5.1.3.1. The value of the disconnect cause element shall be set to "expiry of timer".

g) Timer T311; call transmission timer

Refer to clause 14.5.1.2.1 g).

#### 14.5.1.3.5 Colliding disconnection

Disconnection collision can occur when both sides simultaneously send DISCONNECT PDUs specifying the same call identifier value. If a CC sub-entity receives a D-DISCONNECT PDU when CC has just issued a U-DISCONNECT PDU, the CC sub-entity shall discard the outgoing disconnection request and respond to the incoming D-DISCONNECT PDU as defined in clause 14.5.1.3.3.

If the U-DISCONNECT PDU collides with a D-RELEASE PDU, the CC sub-entity shall release the call immediately as defined in clause 14.5.1.3.3.

In either case the CC shall send a CANCEL request primitive to the lower layers to cancel the sending of the U-DISCONNECT PDU.

#### 14.5.1.4 U-Plane switching

##### 14.5.1.4.0 General

The U-Plane switching procedure ensures that traffic/signalling synchronization between CMCE and MAC is maintained during the lifetime of a call. The CC informs the MAC when it has permission to transmit traffic (i.e. TCH or STCH) and when to stop. The CC also informs the MAC when it may process received traffic (and when to stop). The latter procedure also assists the MAC to interpret when the received bit-stream on the assigned channel is TCH/STCH and when it is SCH.

The CC changes the U-plane operation in the MAC by issuing the CONFIGURE request primitive, indicating "Switch U-plane = On" or "Switch U-plane = Off", "Tx grant = true" or "Tx grant = false" and "simplex/duplex = simplex" or "simplex/duplex = duplex". There shall be only four valid combinations:

- 1) Switch U-plane = On, Tx grant = true, simplex/duplex = simplex:
  - MS is authorized to transmit traffic.

- 2) Switch U-plane = On, Tx grant = false, simplex/duplex = simplex:
  - MS is authorized to receive traffic.
- 3) Switch U-plane = On, Tx grant = true, simplex/duplex = duplex:
  - MS is authorized to transmit and receive traffic.
- 4) Switch U-plane = Off:
  - withdraws previous authorization to transmit and/or receive traffic.

#### 14.5.1.4.1 End of call set-up phase

When the CC in a MO call receives a D-CONNECT PDU, or when the CC in a MT call receives a D-CONNECT ACKNOWLEDGE PDU, it shall issue a CONFIGURE request primitive to the lower layers containing information about the call e.g. the type of traffic, the interleaving depth, the call identifier and whether the call is end-to-end encrypted.

If the transmission grant element in the PDU is set to "transmission granted" then the CONFIGURE request primitive shall contain the parameter value "Switch U-Plane = On" and "Tx grant = true" to indicate that the MAC has permission to transmit traffic. If the transmission grant element is set to "transmission granted to another user" then the CONFIGURE request primitive shall contain the parameter value "Switch U-Plane = On" but shall contain "Tx grant = false" to indicate that the MAC should receive traffic.

For the other values of the transmission grant element, the U-plane shall not be switched on.

#### 14.5.1.4.2 During call maintenance phase

##### a) Transmission grant control

When the CC receives a D-TX GRANTED PDU, and if the transmission grant element is set to "transmission granted" or "transmission granted to another user", then the CC shall issue a CONFIGURE request primitive containing the parameter value "Switch U-Plane = On" and indicating whether the MAC has permission to transmit traffic ("Tx grant = true" or "Tx grant = false" respectively). For the other values of the transmission grant element, the U-plane state shall not be changed.

NOTE: Sometimes consecutive CONFIGURE request primitives issued to the lower layers will both contain the instruction to "Switch U-plane On" but will change the traffic transmit permission.

##### b) Transmission ceased

When CC receives a D-TX CEASED PDU, or on receipt of a REPORT indication primitive of either successful or unsuccessful transmission of a U-TX CEASED PDU, the CC shall issue a CONFIGURE request primitive containing the parameter value "Switch U-Plane = Off".

##### c) Temporary pause

When the CC receives a D-TX WAIT PDU, and if the U-plane is currently switched on for either transmission or reception, the CC shall issue a CONFIGURE request primitive containing the parameter value "Switch U-plane = Off".

When the CC receives a D-TX CONTINUE PDU, and if the Continue element is set to "continue" and the U-plane was switched on at the time of receipt of the D-TX WAIT PDU, then the CC shall issue a CONFIGURE request primitive containing the same parameter values as before the temporary interruption. Otherwise, the U-plane shall not be switched on.

##### d) Interruption

When the CC receives a D-TX INTERRUPT PDU, and if the transmission grant element is set to "transmission granted to another user", the CC shall issue a CONFIGURE request primitive containing the parameter value "Switch U-Plane = On" but shall contain "Tx grant = false" to indicate that the MAC should receive traffic (and no longer has permission to transmit traffic). For the other values of the transmission grant element, the CC shall issue a CONFIGURE request primitive containing the parameter value "Switch U-Plane = Off".

#### e) Call restoration

When CC receives a BREAK indication primitive indicating that a temporary break in the radio link has occurred, the CC shall issue a CONFIGURE request primitive containing the parameter value "Switch U-Plane = Off".

When CC receives a D-CALL RESTORE PDU indicating that the call has now been restored after a temporary break in the radio link, and if the transmission grant element is set to "transmission granted" or "transmission granted to another user", then the CC shall issue a CONFIGURE request primitive containing the parameter value "Switch U-Plane = On" and indicating whether the MS has permission to transmit traffic ("Tx grant = true" or "Tx grant = false" respectively). For the other values of the transmission grant element, the U-plane shall not be switched on.

#### 14.5.1.4.3 Call disconnection phase

When CC receives a D-RELEASE PDU or a D-DISCONNECT PDU, or on receipt of a REPORT indication primitive of either successful or unsuccessful transmission of a U-DISCONNECT PDU, the CC shall issue a CONFIGURE request primitive to the lower layers containing the parameter value "Switch U-Plane = Off".

### 14.5.2 Group CC procedures

#### 14.5.2.0 General

The CC procedures handled by CC shall be applicable for circuit mode calls for both speech and data. The circuit mode speech and data group calls shall be set-up as point-to-multipoint calls. The specification below shall be applicable for the procedures that reside in the MS.

#### 14.5.2.1 Call set-up procedures

##### 14.5.2.1.0 General

##### a) Normal group call

The normal group call procedures provide support for one type of call set-up, where the MS is placed immediately into the call upon receipt of the D-SETUP PDU if the called user application can support the call and with immediate action being taken by the called user application, refer to figure 14.16.

The set-up signalling procedures shall allow immediate communication to take place between the calling and called user applications without the possibility of having an alerting process and without an explicit response from the called user application stating that the user has answered. The call priority may affect whether the user application accepts the call or not.

**NOTE:** The behaviour of the user application between the reception of the incoming set-up signalling and the acceptance/reject of the call is outside the scope of the present document.

The MS does not signal that acceptance or rejection to the BS.

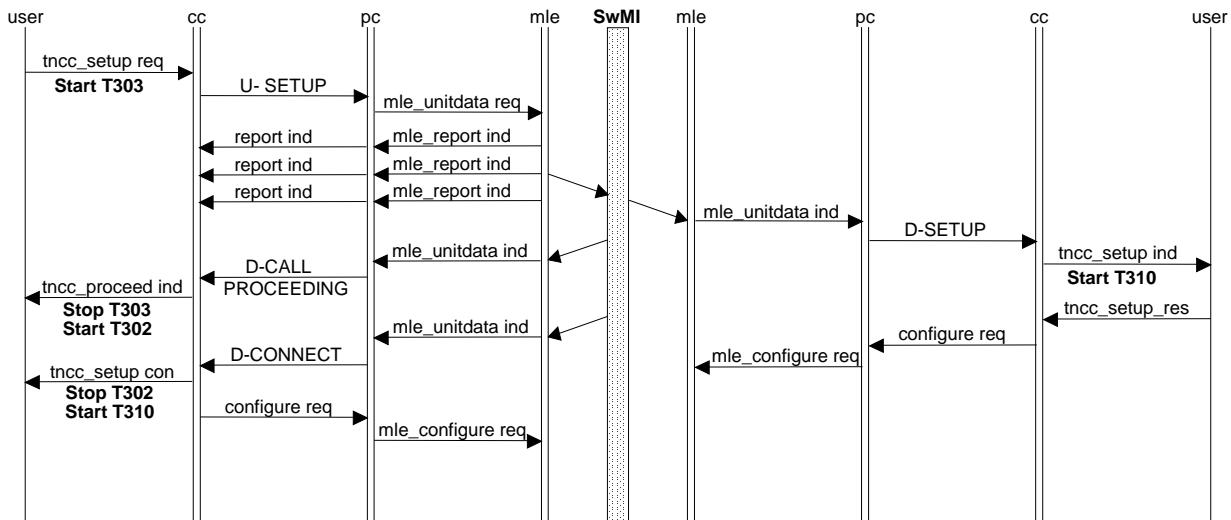

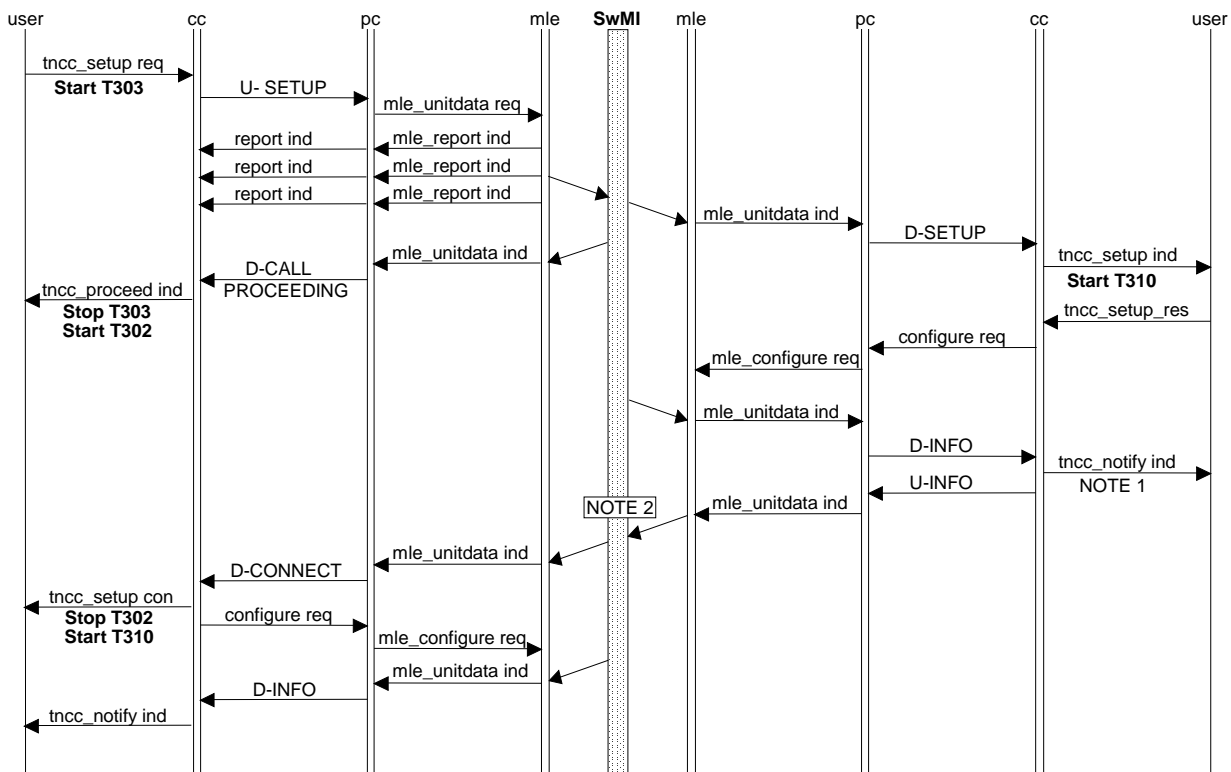

Figure 14.16: Group call - set-up phase

b) Acknowledged group call

An acknowledged group call allows the SwMI to poll members of the called group during the call. The call may be through connected to the calling MS either before polling or after polling has taken place (see clause 14.5.2.6), refer to figure 14.17.

NOTE 1: The Poll request may also be presented to the user for information only.  
 NOTE 2: As an option, the call may not be allowed to proceed until certain criteria have been met.

Figure 14.17: Acknowledged group call - set-up phase

c) Broadcast call

The call set-up procedure for broadcast call shall be the same as that for group call as shown in figure 14.16. However, in this case the called MSs shall not be allowed to subsequently request transmit permission.

#### 14.5.2.1.1 Incoming call

Notification of the arrival of an incoming call to the CC sub-entity shall be made by the reception of a D-SETUP PDU which shall be delivered to the user application in a TNCC-SETUP indication primitive via the TNCC-SAP. The CC shall enter state MT-CALL-SETUP. If the user application can support the call, it shall immediately return a TNCC-SETUP response primitive.

On reception of a TNCC-SETUP response primitive the CC sub-entity shall enter state CALL ACTIVE and take the following actions, which are dependent upon the information contained within the PDU elements, see figure 14.16, right hand side:

- the call identifier shall be used as the reference to this call in subsequent PDUs for the duration of the call;
- when CC receives TNCC-SETUP response primitive indicating that the called user application has accepted the incoming call, the CC sub-entity shall enter state CALL ACTIVE and start timer T310. The D-SETUP PDU shall contain an indication in the transmission grant element whether the MS should switch to U-plane reception. If the D-SETUP PDU contains an indication that the MS is allowed to request transmission permission it may follow the transmission control procedures described in clause 14.5.2.2.1 a). The CC sub-entity shall send a CONFIGURE request primitive for lower layer configuration accepting the channel change;
- where the called user application is unable to accept the request for a certain target service, the call shall be rejected locally by issuing a TNCC-RELEASE request primitive via the TNCC-SAP and the CC shall enter state IDLE. No negotiation with the BS shall be possible. The CC sub-entity shall send a CONFIGURE request primitive for lower layer configuration rejecting the channel change.

#### 14.5.2.1.2 Outgoing call

A user application initiates call establishment by transferring a TNCC-SETUP request primitive across the TNCC-SAP to the CC sub-entity. The TNCC-SETUP request primitive shall be handled by a CC sub-entity that is in state IDLE. The CC shall select a PDU priority based on the requested access priority value as defined in clause 14.5.6.2. The CC shall convert this request into a U-SETUP PDU and send it. The CC sub-entity shall then enter the MO-CALL-SETUP state and start timer T303, see figure 14.16 - left hand side.

The following text describes the normal call set-up procedures:

- to indicate the progress of the transmission of the U-SETUP PDU the CC may receive one or more REPORT indication primitives. If the CC receives a REPORT indication primitive informing that the PDU transmission has failed, timer T303 shall be stopped, and the CC sub-entity shall inform the user application with a TNCC-RELEASE indication primitive and return to state IDLE;
- the SwMI may respond to the reception of the U-SETUP PDU with a D-CALL PROCEEDING PDU. Upon reception of the D-CALL PROCEEDING PDU, the CC shall inform the user application by issuing a TNCC-PROCEED indication primitive, stop timer T303, and start timer T302;
- the D-CALL PROCEEDING PDU shall contain a call identifier which shall be used as the reference to this call in subsequent PDUs for the duration of the call;
- the D-INFO PDU shall not be used to allocate a call identifier;
- on reception of a D-INFO PDU after reception of D-CALL PROCEEDING PDU but before the call set-up is completed, the CC shall start timer T302 from the value indicated in the call time out, set-up phase element if that element is present;
- if the call through connection is ready at the time when the D-CALL PROCEEDING PDU should have been sent, a D-CONNECT PDU should be sent instead. In this instance the D-CONNECT PDU shall allocate the call identifier;

- on receipt of a D-CONNECT PDU, the CC shall enter state CALL-ACTIVE, and inform the user application with a TNCC-SETUP confirm primitive, and stop timer T302 or T303 and start timer T310. The D-CONNECT PDU shall contain an indication as to whether the CC has been given permission to transmit. If transmission is not granted and the D-CONNECT PDU contains an indication that the MS is allowed to request transmission permission it may follow the transmission control procedures defined in clause 14.5.2.2.1. The CC sub-entity shall send a CONFIGURE request primitive for lower layer configuration accepting the channel change. If the CC has been given permission to transmit then it shall start timer T311;
- where the D-CONNECT or D-CALL PROCEEDING PDU indicates that the offered service is different to the one requested, and if the service offered is acceptable to the CC sub-entity according to the selected lowest service in the TNCC-SETUP request primitive, then the call shall continue. If it is not acceptable, then the CC shall disconnect the call using the procedures in clause 14.5.2.3.1;
- the network may support other signalling from the calling MS to the SwMI and vice versa during the call set-up phase using U-INFO and D-INFO PDUs, for example, for the purpose of showing the progress of a call set-up;
- on reception of a group addressed D-SETUP PDU after reception of D-CALL PROCEEDING PDU (and optionally D-INFO PDU), if the call identifier in the D-SETUP is the same as the call identifier in the D-CALL PROCEEDING PDU and the calling party address in the D-SETUP PDU does not contain the MS's own address, the CC sub-entity shall enter state CALL ACTIVE, stop timer T302 and start timer T310. The D-SETUP PDU shall contain an indication in the transmission grant element whether the MS should switch to U-plane reception. If the D-SETUP PDU contains an indication that the MS is allowed to request transmission permission it may follow the transmission control procedures described in clause 14.5.2.2.1 a). The CC sub-entity shall send a CONFIGURE request primitive for lower layer configuration accepting the channel change. CC shall ignore the D-SETUP PDU if the calling party address is the same as the MS's own address and shall send a CONFIGURE request primitive for lower layer configuration ignoring the channel change. A MS following a group addressed D-SETUP in the manner described in this clause shall cancel its request to transmit if it requested to transmit in the U-SETUP PDU.

NOTE 1: The SwMI should either send the D-CONNECT PDU granting transmit permission first or supply the calling party address in the D-SETUP PDU (or both) to prevent the MS that is about to be granted transmit permission following the group addressed D-SETUP PDU.

NOTE 2: Handling of the TNCC-SETUP request primitive may be affected by the MS being active in a MM procedure, this being indicated to CC from MLE via the MLE-BUSY indication primitive, refer to clause 18.3.5.4. The exact nature of the interaction between MM/MLE and CC is outside the scope of this part of the present document but it is recommended that CC not accept a TNCC-SETUP request primitive while MM is busy.

### 14.5.2.1.3 Colliding calls

Call collisions can occur when both the SwMI and the MS simultaneously send a D-SETUP PDU and a U-SETUP PDU. Two call set-ups are colliding when a D-SETUP PDU is received within the window where the CC waits for a call identifier from the SwMI after a U-SETUP PDU has been issued. The MS shall be able to handle two types of call collision:

- if the colliding calls are call set-up attempts for the same group and the requested basic services are compatible and the calling MS is a member of that group and layer 2 has not indicated successful transmission of the U-SETUP PDU, then the MS CC shall attempt to discard the outgoing call set-up attempt by sending a CANCEL request primitive to the lower layers to cancel sending of the U-SETUP PDU. If cancellation is successful, the MS shall accept the incoming call. If cancellation is unsuccessful or if layer 2 has indicated successful transmission of the U-SETUP PDU, the MS shall continue its own call set-up and wait for a D-CALL PROCEEDING and/or D-CONNECT PDU (and/or D-RELEASE PDU);
- if the call set-up attempts are not to the same group, then the MS shall either keep its call attempt or accept the incoming call as defined in clause 14.5.2.1.1. In the latter case the MS shall first cancel its call set-up locally, if still possible, or otherwise send a U-DISCONNECT PDU for its own call set-up, refer clause 14.5.2.3.1. If MAC requested a response with the parameter channel change response required value set to "true" with the CC message the CC shall select the proper radio resource by issuing MLE-CONFIGURE request primitive with value "reject" in the first case or "accept" in the latter case. Refer to clause 14.5.3.2.

#### 14.5.2.1.4 Unsuccessful call set-up

Unsuccessful call set-up shall refer specifically to those instances where a circuit mode connection was not successfully established. It shall not refer to call disconnection or call rejection. If a PDU is not responded to prior to the expiry of the corresponding timer, the procedure in clause 14.5.2.3.5 shall apply. All timers available are listed in clause 14.6.

When CC receives a REPORT indication primitive indicating that the lower layers have not been successful (failed transfer) in the sending of any of the call set-up PDUs, then the CC sub-entity shall return to state IDLE and inform the user application with a TNCC-RELEASE indication primitive accompanied with a cause of the disconnection.

#### 14.5.2.1.5 Call rejection

If the user application decides to reject the incoming call set-up request as defined in clause 14.5.2.1.1, it shall immediately transfer a TNCC-RELEASE request primitive to the CC sub-entity. This request shall locally clear the call identifier. The CC sub-entity shall then change to state IDLE.

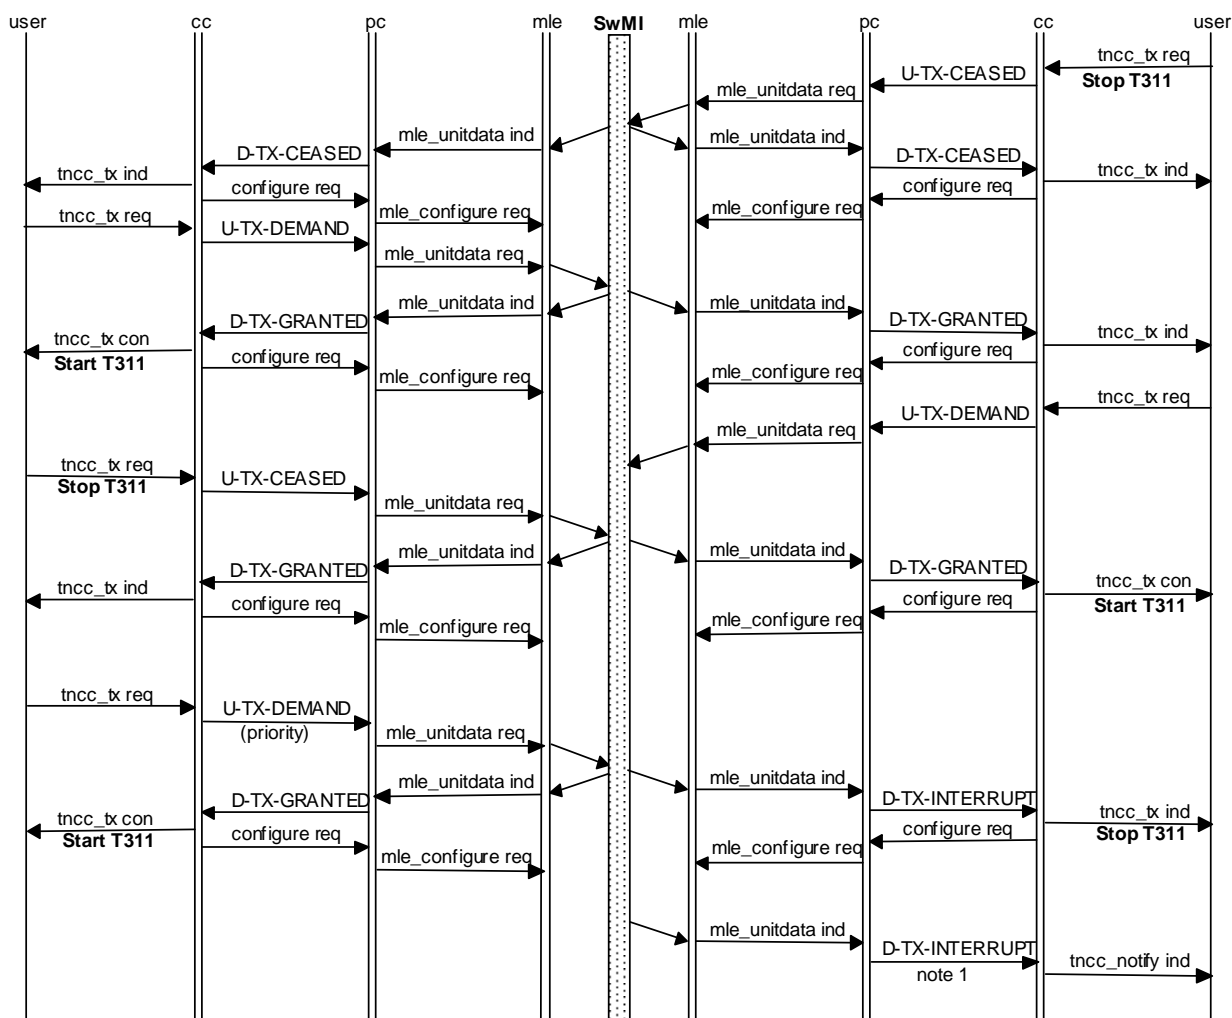

### 14.5.2.2 Call maintenance procedures

#### 14.5.2.2.0 General

The call maintenance procedures described in this clause may be applied when the MS is in states MO-CALL SETUP, MT-CALL SETUP or CALL-ACTIVE. The main state CALL-ACTIVE can comprise several sub-states.

NOTE: The D-INFO PDU can be used for other purposes than those defined in the protocol specifications contained in the present document.

## 14.5.2.2.1 Transmission control procedures

NOTE 1: D-TX INTERRUPT PDU is sent to the remaining members of the group upon permission award to the MS shown on the left hand side of this figure.

NOTE 2: For the purposes of clarity, instances of mle\_report are not shown.

**Figure 14.18: Group call - request-to-transmit**

#### a) Request-to-transmit

The SwMI shall fully control which MS is allowed to transmit. To facilitate this, the MS shall request permission to transmit, and permission shall be granted before the MS can begin circuit mode traffic permission. MSs may request permission to transmit, if the SwMI allows it by a "transmission request permission" element even if another party is transmitting. In this case the SwMI should normally wait for that party to finish the transmission before granting the other user application. Pre-emptive priority requests are dealt with in clause 14.5.2.2.1 f).

The SwMI normally gives the first permission to transmit to the calling MS when a new call has been set-up. However, the calling user application may allow the called users to request permission to transmit first. The calling CC shall in that case set the "request to transmit" bit accordingly in the U-SETUP PDU.

An MS restoring a call on a new cell, which was either transmitting in the previous cell or had a transmission request queued in the previous cell, may request to continue to transmit or retain its transmission request in the SwMI's transmission request queue by setting the "request to transmit/send data" element in the U-CALL RESTORE PDU accordingly. This is dealt with in clause 14.5.2.2.4.

When a user within a call wants to transmit, a TNCC-TX request primitive shall be sent to CC via the TNCC-SAP. The CC shall send this request in a U-TX DEMAND PDU. The TX-DEMAND Priority level should be set to low or high priority, unless this is a pre-emptive priority request, see clause 14.5.2.2.1 f), see figure 14.18.

The progress of the transmission of the U-TX DEMAND PDU shall be given locally to the CC in one or more REPORT indication primitives. If the CC receives a REPORT indication primitive as a response to the sending of the U-TX DEMAND PDU informing that the PDU transmission has failed, the CC shall inform the user application by a TNCC-TX confirm primitive.

If a user application wants to withdraw his request-to-transmit before it has been granted, a TNCC-TX request primitive shall be sent from the user application to the TNCC-SAP. The CC shall send this request in a U-TX CEASED PDU. The CC shall send the U-TX CEASED PDU with the stealing permission set to "immediate stealing" and stealing repeats flag set so that the permission to transmit will be released immediately if allocated. No CC protocol response shall be received from the SwMI for this message.

#### b) Response to request-to-transmit

During the call set-up phase, the response to the calling MS's request to transmit is dealt with in clauses 14.5.2.1.1 and 14.5.2.1.2. The calling MS, if given permission to transmit, shall start timer T311.

During call restoration, the response to the restoring MS's request to transmit is dealt with in clause 14.5.2.2.4.

During a call in progress and when the SwMI has decided which MS shall be given permission to transmit, the SwMI shall send a D-TX GRANTED PDU as an individual message to the granted MS. Upon reception of a D-TX GRANTED PDU indicating "transmission granted", the CC sub-entity shall send this information to the user application in a TNCC-TX confirm primitive. The other MSs involved in the call shall be informed with a D-TX GRANTED PDU addressed with the group address. That D-TX GRANTED PDU shall indicate that permission to transmit has been granted to another user. The CC shall send this information to the user application in a TNCC-TX indication primitive and shall remain in state CALL-ACTIVE, see figure 14.18.

If the SwMI places the transmission request in a queue this shall be indicated to the MS concerned using the "transmission request queued" parameter value in the D-TX GRANTED PDU. If the SwMI rejects the transmission request this may be indicated to the MS concerned using the "transmission not granted" parameter value in the D-TX GRANTED PDU. In either case, the MSs concerned shall remain in state CALL-ACTIVE.

Upon reception of a D-TX GRANTED PDU indicating "transmission granted" or "transmission granted to another user", the CC sub-entity shall issue a CONFIGURE request primitive. The primitive shall carry as a parameter whether the transmit permission has been granted to this CC sub-entity or to another CC sub-entity, and to switch the U-Plane on. The MS given permission to transmit shall start timer T311. If the D-TX GRANTED PDU indicates "transmission granted to another user" and contains the MS's own address as the transmitting party address then that MS should not switch to U-plane reception. However it shall not switch to U-plane transmission until it receives a D-TX GRANTED PDU indicating "transmission granted".

Though the MS shall switch to U-Plane receive if it receives a "transmission granted to another user" response to its transmission request and the transmitting party address in the D-TX GRANTED PDU is not the MS's own address, the MS shall require an explicit response to its transmission request: one of "transmission granted", "transmission not granted" or "transmission queued".

NOTE 1: The SwMI should either send the individually addressed D-TX GRANTED PDU ("transmission granted") first or supply the transmitting party address in the group addressed D-TX GRANTED PDU ("transmission granted to another user") to prevent the MS that is about to be granted transmit permission switching to U-plane receive.

As defined in ETSI EN 300 396-5 [24], clause 9, the recommendation in the note 1 is mandatory for the SwMI when granting transmit permission to a Direct Mode MS which is operating through a Direct Mode gateway. (This mandatory requirement applies only if the SwMI has accepted a request from the gateway to operate as a Direct Mode gateway.)

Upon reception of a D-TX GRANTED PDU indicating "transmission granted to another user", and if the CC sub-entity has issued a U-TX DEMAND PDU to the lower layers and has not yet received a REPORT indication primitive indicating successful or unsuccessful transmission, then the CC sub-entity shall send a CANCEL request primitive to the lower layers to cancel transmission (and retransmissions) of that PDU.

NOTE 2: The above procedure may sometimes stop retransmissions by the awarded MS as well as retransmissions by any other MSs that are requesting transmit permission.

NOTE 3: If the SwMI queues any other transmission requests that it received then it should, at a convenient time, send D-TX GRANTED PDUs containing the "transmit request queued" parameter value to the MSs concerned. For transmission requests that are neither granted nor queued, and if the user application still wishes to transmit, then it has to send another TNCC-TX request primitive to the CC.

After reception of a D-TX GRANTED PDU indicating "transmission granted", and while it still has permission to transmit, the CC shall ignore any group addressed D-TX GRANTED or D-TX INTERRUPT PDUs it may receive (and any layer 2 channel assignment received with those PDUs by issuing an MLE-CONFIGURE request primitive ignoring the channel change, if requested).

If the CC sends a U-TX DEMAND PDU whilst another MS is transmitting, the SwMI should normally wait for that party to finish the transmission (identified by the receipt of a U-TX CEASED PDU), before granting transmission permission to the other user application. On receipt of the U-TX DEMAND PDU, the SwMI may send a D-TX GRANTED PDU indicating whether the request-to-transmit is queued or rejected. Pre-emptive priority requests are dealt with in clause 14.5.2.2.1 f).

The SwMI shall not send an unsolicited D-TX GRANTED PDU but it is recognized that a race/error condition may result in the MS receiving one. The CC may choose to follow an unsolicited individually addressed D-TX GRANTED PDU indicating "transmission granted" but if the CC does not want to transmit/send data then it shall use the U-TX CEASED PDU, as it does normally at the end of a speech or data item, to reject the transmission grant.

#### c) Permission to transmit withdrawn

The SwMI may decide to interrupt transmission when resources are required for another call or when the SwMI requires that the call should temporarily pause. In this case the SwMI should send a D-TX WAIT PDU to all MSs in that call (permitting or denying transmission requests according to the "transmission request permission" element). On reception of the D-TX WAIT PDU the CC sub-entity shall send a TNCC-TX indication primitive to the user application indicating that the transmission is waiting. The CC shall stop timer T311, if activated, enter state WAIT, and send a CONFIGURE request primitive to switch the U-Plane off. The CC shall accept any layer 2 channel allocation and await further instructions on the channel that they have been directed to.

If a request-to-transmit has been queued at the time when the D-TX WAIT PDU is received, the MS shall be allowed to withdraw its request-to-transmit by means of the U-TX CEASED PDU as described in clause 14.5.2.2.1 e).

A group-addressed D-TX WAIT PDU shall apply to all the MSs in the call (including the transmitting MS). Optionally, the D-TX WAIT PDU may also be sent individually addressed to the transmitting MS enabling the SwMI to obtain a layer 2 acknowledgement from that MS.

If the SwMI sends a D-TX WAIT PDU because it wishes to use an assigned channel for another call, it shall send a layer 2 channel allocation with the D-TX WAIT PDU directing the MS to a signalling channel other than the assigned channel. This is to prevent the change in usage marker associated with re-allocation of the assigned channel to the other call causing the waiting MS to drop the interrupted call.

#### d) Permission to continue with withdrawn call

There are three cases as follows:

- 1) If no MS was granted transmission at the time when the SwMI sent the D-TX WAIT PDU, or if an MS was granted transmission at the time of the D-TX WAIT PDU but the SwMI does not wish that transmission to continue, then either a D-TX CONTINUE PDU with the continue element set to "not continue", or a D-TX GRANTED PDU with the transmission grant element set to "transmission not granted", shall be sent as a group message to all MSs in the group. The CC shall accept any layer 2 channel allocation. All CC sub-entities shall return to state CALL-ACTIVE but the U-plane shall not be switched on and the MS shall assume that any previous transmission permission no longer applies. If the D-TX CONTINUE PDU contains an indication that the MS is allowed to request transmission permission, it may follow the transmission control procedures described in clause 14.5.2.2.1 a).

- 2) If there was one MS granted transmission at the time when the SwMI sent the D-TX WAIT PDU, and if the SwMI wishes that transmission to continue, then either a D-TX CONTINUE PDU with the Continue element set to "continue" shall be sent as a group message to the group, or a D-TX GRANTED PDU with the transmission grant element set to "transmission granted" shall be sent to the granted MS and a D-TX GRANTED PDU with the transmission grant element set to "transmission granted to another" shall be sent as a group message to the group. The CC shall accept any layer 2 channel allocation. If a D-TX CONTINUE PDU with the Continue element set to "continue" is sent, it shall give the earlier granted MS permission to continue transmission. The MS granted permission to transmit shall start timer T311. All CC sub-entities shall return to state CALL ACTIVE and shall send a CONFIGURE request primitive to the lower layers to switch the U-plane on.

A group-addressed D-TX CONTINUE PDU shall apply to all the MSs in the call (including the awarded MS). Optionally, the D-TX CONTINUE PDU may also be sent individually addressed to the awarded MS enabling the SwMI to obtain a layer 2 acknowledgement from that MS.

- 3) If there was one MS granted transmission at the time when the SwMI sent the D-TX WAIT PDU but the SwMI wishes to give the transmission permission to the other party or if no MS was granted transmission at the time when the SwMI sent the D-TX WAIT PDU and the SwMI wishes to give the transmission permission now to one party, the SwMI may first send a D-TX CONTINUE PDU. If a MS has requested permission to transmit during the period when the transmission was withdrawn, the SwMI should first send a D-TX CONTINUE PDU as a group message with the Continue element set to "not continue". A D-TX GRANTED PDU should then be sent as an individual message to the granted MS with information element transmission grant set to "transmission granted" and as a group message to the rest of the group with information element transmission grant set to "transmission granted to another user". When receiving either D-TX CONTINUE or D-TX GRANTED PDU the CC sub-entity shall return to state CALL-ACTIVE. In addition when receiving D-TX GRANTED PDU CC shall send a CONFIGURE request primitive to the lower layers to switch the U-plane on.

If the MS is in state WAIT and it receives a D-TX GRANTED PDU, it shall return to state CALL-ACTIVE and obey the instruction in the D-TX GRANTED PDU.

#### e) End of Transmission

At the end of a transmission the user application shall send a TNCC-TX request primitive to the TNCC-SAP indicating ceased transmission. The CC sub-entity shall send this information in a U-TX CEASED PDU and stop timer T311. The CC shall send the U-TX CEASED PDU with the stealing permission set to "immediate stealing" and the stealing repeats flag set. Upon reception of the U-TX CEASED PDU, the SwMI normally sends a D-TX CEASED PDU to the group informing the group members that the transmission has now ceased.

Upon reception of a D-TX CEASED PDU the CC shall send this information to the user application in a TNCC-TX indication primitive (transmission ceased) and the CC shall send a CONFIGURE request primitive to the lower layers to switch the U-Plane off, see figure 14.18.

Also, if the CC that is sending the U-TX CEASED PDU receives a REPORT indication of either successful or unsuccessful transmission of that PDU by the lower layers, then it shall behave as if it had received a D-TX CEASED PDU i.e. it shall send a TNCC-TX indication (transmission ceased) to the user application and shall send a CONFIGURE request primitive to the lower layers to switch the U-Plane off. If a D-TX CEASED PDU is received but no REPORT indication of successful transmission of the U-TX CEASED PDU then the CC shall send a CANCEL request primitive to the lower layers to stop retransmissions of the U-TX CEASED PDU.

NOTE 4: The requirement for the CC to cancel retransmissions may apply if the SwMI sends only a group-addressed D-TX CEASED PDU and the transmitting MS does not receive a layer 2 acknowledgement.

If there was a request for transmission already queued in the SwMI when the U-TX CEASED PDU was received, the SwMI may send a D-TX GRANTED PDU as an individual message to the granted MS and another D-TX GRANTED PDU as a group message to the rest of the group as described in clause 14.5.2.2.1. b), without sending an explicit D-TX CEASED PDU. However, the SwMI should first send at least a layer 2 acknowledgement to the MS that sent the U-TX CEASED PDU so that the MS can stop its U-plane transmission and start accepting group addressed D-TX GRANTED PDUs.

The SwMI shall not send an unsolicited, individually addressed D-TX CEASED PDU but it is recognized that a race/error condition may result in the MS receiving one. If CC receives an unsolicited, individually addressed D-TX CEASED PDU it shall send this information further on to the user application in a TNCC-TX indication primitive (transmission ceased) and shall send a CONFIGURE request primitive to the lower layers to switch the U-Plane off.

#### f) Stop-transmission order

If a MS wishes to interrupt the transmitting MS with a pre-emptive priority request, it shall send a U-TX DEMAND PDU indicating the level of priority in the "TX demand priority" element. If the SwMI supports transmission interruption, it shall send a D-TX INTERRUPT PDU to the MS which currently has permission to transmit. Upon reception of an individually addressed D-TX INTERRUPT PDU the CC sub-entity shall stop transmission and remain in state CALL-ACTIVE, and shall stop timer T311. The CC shall send information to the user application in a TNCC TX indication primitive indicating transmission interrupt and the CC sub-entity shall send a CONFIGURE request primitive to the lower layers to indicate the loss of transmit permission and to switch the U-Plane accordingly (see clause 14.5.2.4).

The SwMI should send a D-TX INTERRUPT PDU as a group message to the rest of the group indicating that the permission to transmit has been (or will be) allocated to another user, see figure 14.18. Upon reception of the D-TX INTERRUPT PDU the CC sub-entity shall remain in state CALL ACTIVE and shall send a TNCC-TX indication primitive to the user application indicating transmission interrupt.

If the pre-emptive priority transmission starts immediately the D-TX INTERRUPT PDUs shall indicate that transmission is granted to another user and then the MS shall switch to (or remain in) U-plane reception and the SwMI shall send a D-TX GRANTED PDU (transmission granted) as an individual message to the MS that requested the priority transmission. If there is a delay before the pre-emptive priority transmission, the SwMI shall indicate "transmission not granted" in the D-TX INTERRUPT PDUs, and the MS shall switch the U-plane off and wait for a D-TX GRANTED PDU. The SwMI should then send a D-TX GRANTED PDU (transmission granted) as an individual message to the MS that requested the priority transmission and a group addressed D-TX GRANTED PDU (transmission granted to another user) for the receiving parties, as described in clause 14.5.2.2.1 b).

#### g) Expiry of timer T311: call transmission timer

Upon expiry of timer T311, CC shall remain in state ACTIVE, shall send a TNCC-TX indication primitive to the user application and a U-TX CEASED PDU to the peer entity.

### 14.5.2.2.2 Call status information procedures

The D-INFO PDU can be used for carrying call status messages from SwMI to the MS. When a D-INFO PDU is received, depending on the notification, the following actions are taken by CC.

#### a) call in queue

When the SwMI has put a call into a queue, if the D-INFO PDU contains a value for the call time-out, set-up phase, the CC shall start timer T302 using that value. The CC shall send the information further on to the application in a TNCC-NOTIFY indication primitive. If the call is queued at call set-up time the D-INFO PDU should be preceded by a D-CALL PROCEEDING PDU.

#### b) call is proceeding

This may be sent to the calling user application during the call set-up phase to indicate that the call set-up time will be longer than for a normal call set-up. The information that the call time-out, set-up phase value shall be changed is made available to the CC sub-entity in the D-INFO PDU. The CC shall start T302 using the new timer value. The CC shall send the information further on to the application in a TNCC-NOTIFY indication primitive.

### c) prolonging the call time-out time

The following text describes prolonging the call time-out time:

- the SwMI may decide to change the call time-out time by sending a D-INFO PDU with a new T310 value. Upon reception of the D-INFO PDU containing the "call time-out" element, T310 shall be started using the defined value. If the SwMI supplies a T310 value in the D-INFO PDU, it shall set the value of the "reset call time-out timer" element of the PDU to indicate reset of T310;
- the SwMI may also choose to reset the call time-out time and start it again using the current defined value. Upon reception of the D-INFO PDU with the "reset call time-out timer" element indicating that T310 shall be reset, T310 shall be started using the value defined earlier;
- in either case, the Timer value shall be sent further on to the application in a TNCC-NOTIFY indication primitive;
- the SwMI may also change the call timeout time during call restoration by supplying the "call time-out" element in the D-CALL RESTORE PDU, refer to clause 14.5.2.2.4. If the SwMI supplies a T310 value in the D-CALL RESTORE PDU, it shall set the value of the "reset call time-out timer" element of the PDU to indicate reset of T310.

### d) Change of call identifier

The SwMI may decide to change the call identifier used by a group of MSs in an on-going call by sending a D-INFO PDU containing a new call identifier. The SwMI may also use this method to change a call identifier in an MS in preparation for a type 1 cell reselection (i.e. just before sending the MS the D-NEW CELL PDU granting the type 1 cell reselection) if the new cell uses a different call identifier from the old cell. If individually addressed, the D-INFO PDU should be sent using an acknowledged service.

NOTE 1: If the MS and the SwMI have different perceptions of the value of a call identifier the MS could experience interruptions in the call or could lose the call.

Most downlink CC PDUs may contain a Notification indicator information element (in addition to the D-INFO PDU) and SwMI may inform calling/called user about offered or connected service using the Notification indicator information element. CC may send this notification to the application in corresponding TNCC service primitive.

When a Notification indication is received following actions are taken by CC.

### e) Limited group coverage

At the call set-up SwMI may inform that it is connecting a group call that covers a smaller area than expected. It may be used during a call to indicate that the group coverage is made smaller. CC may send this notification to the application using TNCC-NOTIFY indicator service primitive.

NOTE 2: The expected area could be pre-defined, defined by the Area selection supplementary service or known by other means that are outside the scope of the present document.

## 14.5.2.2.3 Call modification procedures

The MS service user may modify the service of an existing call. To initiate a modification the user application shall issue a TNCC-MODIFY request primitive and the CC sub-entity shall send a U-INFO PDU and wait for a D-INFO PDU from the SwMI before changing any of the current service parameters. The SwMI should not send D-INFO PDU to modify a service while an ongoing U-Plane transmission is in progress.

When a service has been changed by the SwMI, the SwMI should indicate this to all parties by issuing the D-INFO PDU. Upon reception of a D-INFO PDU indicating an acceptable service modification the CC sub-entity shall send it to the application in a TNCC-MODIFY indication primitive, and the CC sub-entity shall send a CONFIGURE request primitive for lower layer configuration.

If the SwMI is unable to provide the requested service, it should either send a D-INFO PDU to the requesting party containing the current service (unchanged), or send a D-INFO PDU to all parties containing an alternative service. For example, if a user application requests an increase from a 1-slot per frame call to a 4-slots per frame call, and the SwMI is unable to allocate more than 2 slots to the call, it may offer a 2-slots per frame call in the D-INFO PDUs.

The service may be changed between any combination of one or more of the following:

- a clear call may be changed to an encrypted call; or
- an encrypted call may be changed to a clear call;
- a 4-slots-per-frame call may be changed to a 1-slot, 2-slot or 3-slot call;
- a 3-slot call may be changed to a 1-slot, 2-slot or 4-slot call;
- a 2-slot call may be changed to a 1-slot, 3-slot or 4-slot call;
- a 1-slot call may be changed to a 2-slot, 3-slot or 4-slot call;
- a circuit mode type (TCH/S, TCH/7.2, TCH/4.8 or TCH/2.4) may be changed to a different circuit mode type (with the requested interleaving depth in the case of TCH/4.8 or TCH/2.4);
- a protected circuit mode data type (TCH/4.8 or TCH/2.4) may be changed to a different interleaving depth from the set of permissible values ( $N = 1, 4$  or  $8$ ).

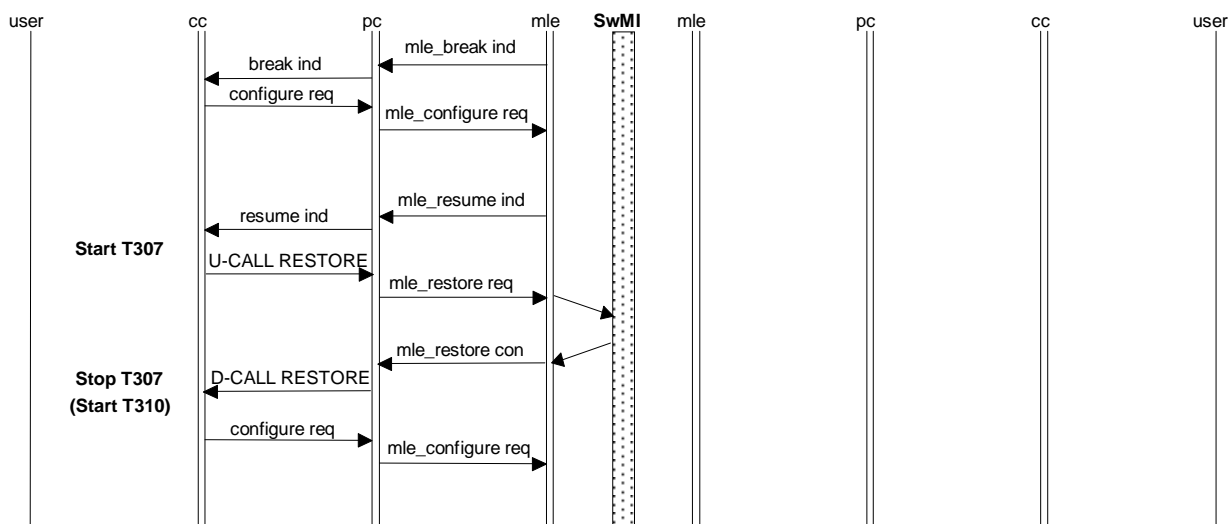

**NOTE:** The clear and encrypted calls refer to the end-to-end clear and encrypted calls. The end-to-end encryption control is independent of the air interface encryption control.

It is also possible to change between the circuit mode speech teleservice and a circuit mode unprotected (speech, encrypted) bearer service.

The encryption state of each transmission, defined using D-TX GRANTED, can be set independently by the encryption control element in the U-TX DEMAND PDU. The SwMI should not change the requested encryption state in the responding D-TX GRANTED PDU from that requested in the U-TX DEMAND PDU.

If the MS cannot support a new service combination indicated by D-INFO, D-TX GRANTED or D-TX INTERRUPT, the user application or the CC as appropriate shall disconnect or leave the call, refer to clause 14.5.2.3. The U-DISCONNECT PDU shall contain disconnection cause "requested service not available". In case the rejection results from unsupported encryption flag state the disconnect cause shall be "Called party does not support encryption" or "Called party requires encryption".

#### 14.5.2.2.4 Call restoration procedures

**Figure 14.19: Group call - successful call restoration**

**Figure 14.20: Group call - unsuccessful call restoration**

Call restoration of a group call shall only take place in the CC sub-entity when the CC has entered state CALL-ACTIVE. The CC sub-entity should keep information on whether it is active in a group call or an individual call.

When the CC receives a BREAK indication primitive, then the CC sub-entity shall try to restore the call as described in this clause:

- When the CC receives a BREAK indication primitive, the CC shall switch the U-Plane off as described in clause 14.5.2.4 and shall remain in state CALL-ACTIVE. If the CC had permission to transmit/send data at that time the CC shall assume that the permission is now ended as if the CC had sent a U-TX CEASED PDU. If the MS is in state WAIT when it receives a BREAK indication primitive then it shall behave as if it had received a D-TX CONTINUE PDU with the continue element set to "not continue". It shall then obey the instructions in the D-CALL RESTORE PDU.
- If the CC receives a RESUME indication primitive indicating that the C-Plane may now be used again, it shall issue a U-CALL RESTORE PDU containing the GSSI or GTSI and the call identifier of the call which CC wants to restore. If a temporary address is used in the call then it shall be used as the GSSI. If the MS is participating in a call within a group that does not belong to current network (e.g. the MS has migrated and the group belongs to its home network) the CC shall use the full GTSI of the group in the U-CALL RESTORE PDU.
- If the CC wishes to continue transmission in the new cell, or keep a queued transmission request valid in the new cell, it shall indicate so in the request to transmit/send data information element in the U-CALL RESTORE PDU. A MS which has requested for transmit permission on a previous cell and has received a "transmission request queued" response or no response at all on that cell, may either refresh the transmission request by requesting for transmit permission in the U-CALL RESTORE PDU on the new cell, or withdraw the transmission request by requesting for receive permission in the U-CALL RESTORE PDU on the new cell.

NOTE 1: It is not the intention that the MS uses the transmit/send data information element in the U-CALL RESTORE PDU for a new transmission request in the new cell; it should only be used for refreshing a request in the previous cell or to continue transmission in the new cell. It is outside the scope of the present document if used for a new transmission request but it is likely that a SwMI may deny the request for transmission. The intention is that the transmission request in the new cell is achieved using standard call maintenance signalling after the restoration is complete.

After sending a U-CALL RESTORE PDU, the CC shall start Timer T307 and wait for a D-CALL RESTORE PDU.

- When the CC receives a D-CALL RESTORE PDU, timer T307 shall be stopped and the call shall be resumed with the new parameters, see figure 14.19. Timer T310 shall be reset and started only if the "Reset call timeout" information element value is 1 (Reset call time-out timer T310); the T310 value shall be taken from the D-CALL RESTORE PDU call timeout information element and, if not present in the PDU, from the previous value (provided in D-CONNECT, D-CONNECT ACKNOWLEDGE, D-SETUP or D-INFO PDU). The CC shall obey the transmission granting in the transmission grant information element:
  - Transmission granted: The MS shall switch the U-plane on (refer to clause 14.5.2.4) and the MS is authorized to transmit;
  - Transmission not granted: The MS shall assume that it has neither transmission permission nor a transmission request queued in the SwMI and the U-plane remains switched off;
  - Transmission request queued: The MS shall assume that the request-to-transmit remains queued in the SwMI until it is either granted or withdrawn by the SwMI, or withdrawn by the MS and the U-plane remains switched off;
  - Transmission granted to another user: The MS shall switch the U-plane on (refer to clause 14.5.2.4) and the MS is authorized to receive. If the MS requested transmission in the U-CALL RESTORE PDU, the MS shall assume that its transmission request is still queued in the SwMI until it is either granted or withdrawn by the SwMI, or withdrawn by the MS.

If the U-plane is to be switched on, a layer 2 channel allocation shall accompany the D-CALL RESTORE PDU. If the U-plane is not to be switched on, and a traffic channel is available, the layer 2 channel allocation may accompany the D-CALL RESTORE PDU or be attached to later signalling. If a traffic channel is not available, the D-CALL RESTORE PDU shall contain a "Call status" information element with value "Call is queued".

NOTE 2: If the D-CALL RESTORE PDU is sent without a layer 2 channel allocation and includes a new call identifier it should be sent using an acknowledged layer 2 service. (This reduces the possibility of the MS responding to subsequent copies of the D-CALL RESTORE PDU with a U-DISCONNECT PDU, which occurs if the D-CALL RESTORE PDU changes the call identifier - see clause 14.5.6.5.2).

- After processing the D-CALL RESTORE PDU, the call restoration is considered complete; however, if the U-plane remains switched off after the call restoration e.g. due to call is queued, the SwMI would typically send one or more D-TX GRANTED PDUs to continue the call or to award transmission permission. These D-TX GRANTED PDUs may be a direct result of the call restoration, for example to provide the channel allocation in the new cell in the event of queuing for a channel, or it may be associated with further call maintenance signalling following a transmission request from one of the call participants (refer to clause 14.5.2.2.1). The CC shall obey the transmission granting in the transmission grant information element:
  - Transmission granted: The MS shall switch the U-plane on (refer to clause 14.5.2.4) and the MS is authorized to transmit. If the restored MS has not yet been sent to the traffic channel, the individually addressed D-TX GRANTED PDU shall be accompanied by a layer 2 channel allocation;
  - Transmission not granted: The MS shall assume that it has neither transmission permission nor a transmission request queued in the SwMI and the U-plane remains switched off. If the restored MS has not yet been sent to the traffic channel, the individually or group addressed D-TX GRANTED PDU may be accompanied by a layer 2 channel allocation;
  - Transmission request queued: The MS shall continue to assume that the request-to-transmit remains queued in the SwMI until it is either granted or withdrawn by the SwMI, or withdrawn by the MS and the U-plane remains switched off. If the restored MS has not yet been sent to the traffic channel, the individually addressed D-TX GRANTED PDU may be accompanied by a layer 2 channel allocation;
  - Transmission granted to another user: The MS shall switch the U-plane on (refer to clause 14.5.2.4) and the MS is authorized to receive. If the restored MS has not yet been sent to the traffic channel, the individually or group addressed D-TX GRANTED PDU shall be accompanied by a layer 2 channel allocation.

The call length timer T310 shall continue running during the call restoration and on expiry of T310, the procedure defined in clause 14.5.2.3.4 shall apply.

If the call cannot be restored the CC shall receive a REOPEN indication primitive indicating that the call is lost.

Upon reception of REOPEN indication primitive or on expiry of timer T307, the CC shall then stop all T3xx timers, clear the call identifier and temporary group address if applicable, and return to state IDLE and it shall send a TNCC-RELEASE indication primitive to the user application with the cause for disconnection, see figure 14.20.

If the SwMI provides a new call identifier with the D-CALL RESTORE PDU, CC shall use it in all subsequent signalling relating to that call. The MS shall not send any other call related signalling than U-CALL RESTORE PDU, after a cell change, before it has received a D-CALL RESTORE PDU (and possible new call identifier) from the SwMI.

A MS which is queueing for a traffic channel during restoration and which has an outstanding transmission request, may cancel that transmission request by sending a U-TX CEASED PDU. A MS which is queueing for a traffic channel during restoration and which does not have an outstanding transmission request, may make a transmission request by sending a U-TX DEMAND PDU, providing the SwMI has not disallowed transmission requests (via the "transmission request permission" element).

If there is more than one circuit mode call active at the time when the MLE-BREAK indication primitive was received, each call shall be restored separately and hence U-CALL RESTORE and D-CALL RESTORE PDUs shall be exchanged one by one for each call.

#### 14.5.2.2.5 DTMF procedures

When a user application requires to transfer DTMF digits to other user applications during a circuit mode call, it shall issue a TNCC-DTMF request primitive to the CC entity. The DTMF protocol to be used is specified in clause 14.5.1.2.5.

NOTE 1: The DTMF signalling can be used only after either a D-CONNECT or D-SETUP PDU has been received and the TETRA call is established.

NOTE 2: DTMF signalling may not function correctly during a group call (group addressed basic link LLC acknowledged service is required). The support of DTMF signalling during group calls is outside the scope of the present document.

#### 14.5.2.2.6 Temporary address handling procedures

The SwMI may allocate a temporary group address for a group call in a D-CONNECT, D-SETUP, D-CALL RESTORE or D-INFO PDU. The temporary address shall be a valid layer 2 address in the MS for reception of group addressed messages for the duration of the call.

In addition, if the MS calls a group that is not attached in the MS (i.e. the group address is not a valid layer 2 address) when it is registered in the home SwMI of that group, and if the D-CONNECT PDU does not contain the temporary address element, then the MS shall implicitly assume temporary membership of the called group address for the duration of the call. This temporary membership shall apply only after receipt of the D-CONNECT PDU. However, if the D-CONNECT PDU contains the basic service information element with the communication type sub-element indicating "point to point" then the MS shall not adopt the called address as a temporary address. If the call was set up using a SNA, the calling MS shall not implicitly assume temporary membership of the called group address to which the SNA corresponds; this restriction is imposed because the MS may not know the called group address to which the SNA corresponds, in which case it cannot assume temporary membership of the group.

NOTE 1: If the SwMI is unsure whether the group address for the call is a valid layer 2 address for the calling MS, the SwMI should allocate the group address as a temporary address to the calling MS; this recommendation is made because if the group address for the call is not a valid layer 2 address, and the SwMI doesn't allocate the group address for the call as a temporary address, the MS will participate in the call but will ignore all group addressed call maintenance signalling.

NOTE 2: In this procedure, if the MS calls a group that it is not a member of (when it is registered in the home SwMI of that group) then it may assume temporary membership of the called group address without having received a temporary address element in the D-CONNECT PDU. If the calling user has made an erroneous selection of communication type then this could result in the calling MS adopting another MS's individual address as a temporary group address. Therefore the SwMI should check that the called address in a requested group call is actually a group address; if it is not then the SwMI should either disconnect the call or correct the communication type to "point to point" when sending the D-CONNECT PDU (the SwMI may also choose to correct the communication type to "point to point" in a D-CALL PROCEEDING, D-INFO or D-ALERT PDU).

NOTE 3: ETSI EN 300 392-7 [8] clause 6.5 includes a note on the choice of temporary address where class 3 air-interface encryption is in use.

The CC sub-entity shall send a CONFIGURE request primitive informing the lower layers of the new temporary address and if required the change of basic service from individual to group call.

When the call is then released, the CC sub-entity shall send a CONFIGURE request primitive informing the lower layers that the temporary group address is not longer valid (see clause 14.5.2.3).

14.5.2.2.7 Calls to and from external subscribers

An external subscriber can call TETRA group numbers. The signalling needed between an external subscriber and a gateway is outside the scope of the present document. The signalling between the SwMI and the called group is the same as that for a mobile originated group call.

14.5.2.3 Call disconnection procedures

14.5.2.3.0 General

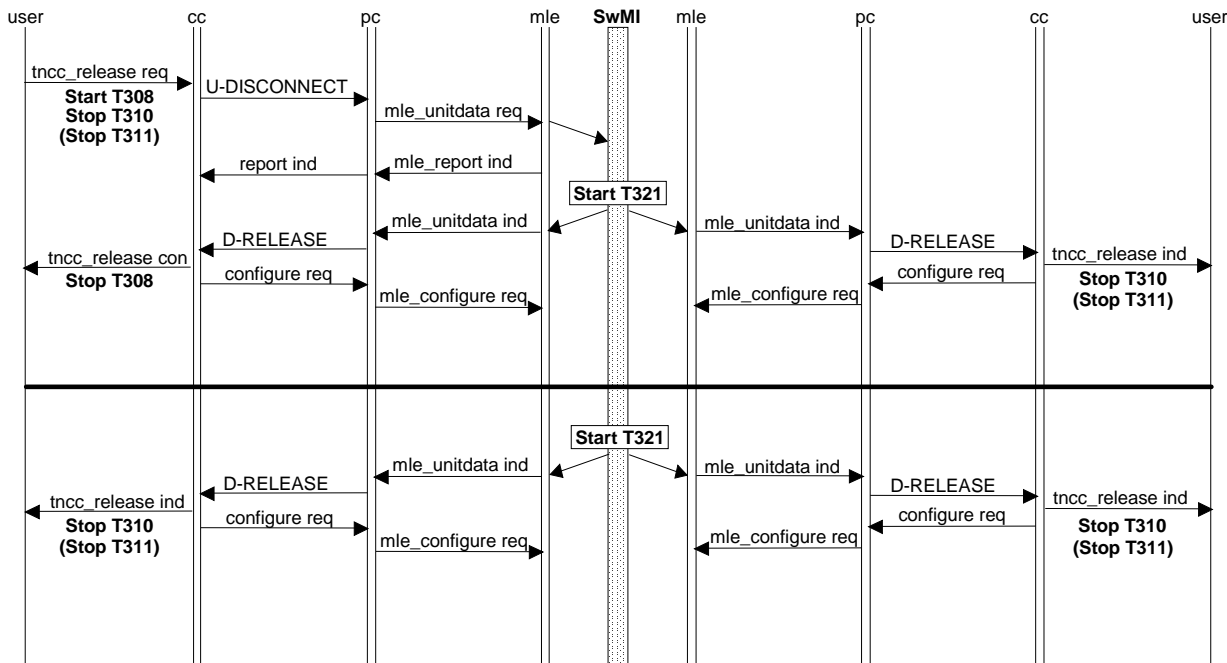

Figure 14.21: Group call - request-to-disconnect

Figure 14.22: Group call - group member leaves ongoing group call

### 14.5.2.3.1 User initiated disconnection

A user application may initiate call disconnection at any state of a call by sending a TNCC-RELEASE request primitive to the CC sub-entity. A call owner shall signal call disconnection to the SwMI by sending a U-DISCONNECT PDU. A non-call owner may either leave the call without disconnecting it or may in exceptional cases try to disconnect it. When the non-call owner leaves the call without disconnecting it there shall not be any disconnection related signalling from the MS to the SwMI. When a non-call owner tries to disconnect the call it shall signal disconnection to the SwMI by sending a U-DISCONNECT PDU with the Disconnect cause set to "Non-call owner requested disconnection".

NOTE 1: A non-call owner should use disconnection possibility only in exceptional cases e.g. when call owner is not available for disconnection. The MS or the user may know whether it is authorized to disconnect the call.

NOTE 2: SwMI may check before call disconnection whether the MS or the user is authorized to disconnect the call.

The disconnect type parameter in the TNCC-RELEASE request primitive indicates whether the CC should disconnect the call or leave the call without disconnection. Refer to clause 14.5.2.7 for the definition of call ownership.

The following procedures shall apply to the user application that is disconnecting the call, figure 14.21 refers:

- during call set-up phase until U-SETUP PDU has been transmitted to the SwMI, a disconnection can be handled locally using a CANCEL request primitive. Information regarding the local progress of the transmission of a PDU is received in REPORT indication primitives. After a local cancellation the CC sub-entity shall stop timer T303 and shall return to state IDLE;
- on receipt of a TNCC-RELEASE request primitive in the CC sub-entity from the user application requesting call disconnection, the CC shall send a U-DISCONNECT PDU, start timer T308 and enter state CALL-DISCONNECT. All other T3xx Timers shall be stopped. The progress of the disconnection shall be reported to the CC with REPORT indication primitive;
- should the user application disconnect the call during the window between transmission of a U-SETUP and reception of a D-CALL PROCEEDING or D-CONNECT PDU (i.e. before the MS has received a call identifier for the call), it shall use the dummy call identifier (all zeroes);
- if a U-DISCONNECT is issued, CC shall await a D-RELEASE PDU. When a D-RELEASE PDU or a REPORT indication primitive with reason PDU transfer failed is received, or timer T308 expires, the CC sub-entity shall clear the call identifier, stop timer T308 and return to state IDLE, issuing a TNCC-RELEASE confirm primitive to the user application. The CC sub-entity shall send a CONFIGURE request primitive to the lower layers to clear the temporary group address (if the temporary address is applicable to the call), switch the U-Plane off, reject any pending channel change response request for that call (refer to clause 14.5.3.2), and leave the assigned channel (if the MS is on an assigned channel when the CONFIGURE request primitive is sent). If a channel change response is required for the D-RELEASE PDU, CC shall accept that channel change (refer to clause 14.5.3.2). The SwMI may also choose to send only a group address D-RELEASE PDU and the CC shall behave as if it had received it individually addressed;
- if a non-call owner requested disconnection and SwMI does not disconnect the call, then SwMI may send D-RELEASE PDU with a disconnect reason set to "Requested service not available" addressed to the non-call owner requesting the disconnection.

The SwMI should inform the other MSs in the call of the call clearance using a D-RELEASE PDU (see clause 14.5.2.3.3 for MS actions).

If a group participant wishes to leave the group call, without disconnecting the call, the user application shall issue a TNCC-RELEASE request primitive with disconnect type parameter equal to "leave call without disconnection":

- if the user leaves the call without disconnection, the CC sub-entity shall clear the call identifier, stop all T3xx Timers and return to state IDLE, see figure 14.22. The CC sub-entity shall send a CONFIGURE request primitive to the lower layers to clear the temporary group address (if the temporary address is applicable to the call), switch the U-Plane off, reject any pending channel change response request for that call (refer to clause 14.5.3.2), and leave the assigned channel (if the MS is on an assigned channel when the CONFIGURE request primitive is sent).

#### 14.5.2.3.2 Network initiated disconnection

In the case where the SwMI cannot support a request for a call from the calling MS, the SwMI shall send a D-RELEASE PDU containing the reason for disconnection, to the calling MS.

In the case where the SwMI can no longer support an established call, the SwMI should send a D-RELEASE PDU to all the MSs in the group containing the reason for disconnection, and subsequently release the call.

The MS actions are defined in clause 14.5.2.3.3.

#### 14.5.2.3.3 Reception of disconnection request

The BS may send a disconnection request at any phase of the call and the MS shall react as follows:

- when the CC sub-entity receives a D-RELEASE PDU the CC shall not send any response;
- the CC shall inform the user application with a TNCC-RELEASE indication primitive, clear the call identifier, stop all T3xx timers and enter state IDLE, refer figure 14.21. The CC sub-entity shall send a CONFIGURE request primitive to the lower layer to clear the temporary group address (if the temporary address is applicable to the call), switch the U-Plane off, reject any pending channel change response request for that call (refer to clause 14.5.3.2), and leave the assigned channel (if the MS is on an assigned channel when the CONFIGURE request primitive is sent). If a channel change response is required for the D-RELEASE PDU, CC shall accept that channel change (refer to clause 14.5.3.2).

#### 14.5.2.3.4 Colliding disconnection

If the CC entity receives a D-RELEASE PDU when CC has just sent a U-DISCONNECT PDU, the CC sub-entity shall release the call immediately as defined in 14.5.2.3.3. In addition, the CC shall issue a CANCEL request primitive to the lower layers to cancel any ongoing re-transmission of the U-DISCONNECT PDU.

#### 14.5.2.3.5 Expiry of timers

##### a) Timer T302: call set-up timer for calling MS

Upon expiry of timer T302, CC shall send a TNCC-RELEASE indication primitive to the user application, send a U-DISCONNECT PDU, and follow the procedures in clause 14.5.2.3.1. The value of the disconnect cause element shall be set to "expiry of timer".

##### b) Timer T303: call initiated timer for calling MS

Upon expiry of timer T303, CC shall send a TNCC-RELEASE indication primitive to the user application, send a U-DISCONNECT PDU, and follow the procedures in clause 14.5.2.3.1. The value of the disconnect cause element shall be set to "expiry of timer".

##### c) Timer T307: call restoration timer for point-to-multipoint calls

Upon expiry of timer T307, CC shall apply procedures described in clause 14.5.2.2.4. The value of the disconnect cause element shall be set to "expiry of timer".

##### d) Timer T308: call disconnect timer

Upon expiry of timer T308, CC shall return to state IDLE, send a TNCC-RELEASE confirm primitive to the user application and shall send a CANCEL request primitive to the lower layers to cancel the sending of the U-DISCONNECT PDU. The CC sub-entity shall send a CONFIGURE request primitive to the lower layers to clear the temporary group address (if the temporary address is applicable to the call), switch the U-Plane off, reject any pending channel change response request for that call (refer to clause 14.5.3.2), and leave the assigned channel (if the MS is on an assigned channel when the CONFIGURE request primitive is sent).

#### e) Timer T310: call length timer

Upon expiry of timer T310, if the MS is the call owner, the CC shall send a TNCC-RELEASE indication primitive to the user application, send a U-DISCONNECT PDU and follow the procedures in clause 14.5.2.3.1. The value of the disconnect cause element shall be set to "expiry of timer".

If the MS is not the call owner, CC shall return to state IDLE, and shall send a TNCC-RELEASE indication primitive to the user application and a CONFIGURE request primitive to the lower layers. The value of the disconnect cause element shall be set to "expiry of timer".

#### f) Timer T311: call transmission timer

Refer to clause 14.5.2.2.1 g).

#### g) Timer T330: call set-up delay timer

Upon expiry of timer T330 CC can no longer accept the corresponding channel change.

### 14.5.2.4 U-Plane switching

#### 14.5.2.4.0 General

The U-Plane switching procedure ensures that traffic/signalling synchronization between the CMCE and the MAC shall be maintained during the lifetime of a call. The CC informs the MAC when it has permission to transmit traffic (i.e. TCH or STCH) and when to stop. The CC also informs the MAC when it may process received traffic (and when to stop). The latter procedure also assists the MAC to interpret when the received bit-stream on the assigned channel is TCH/STCH and when it is SCH.

The CC changes the U-plane operation in the MAC by issuing the CONFIGURE request primitive, indicating "Switch U-plane = On" or "Switch U-plane = Off", "Tx grant = true" or "Tx grant = false" and "Simplex/duplex = simplex". There shall be only three valid combinations.

- 1) Switch U-plane = On, Tx grant = true, Simplex/duplex = simplex:
  - MS is authorized to transmit traffic.
- 2) Switch U-plane = On, Tx grant = false, Simplex/duplex = simplex:
  - MS is authorized to receive traffic.
- 3) Switch U-plane = Off:
  - withdraws previous authorization to transmit and/or receive traffic.

#### 14.5.2.4.1 End of call set-up phase

When the CC in a MO call receives a D-CONNECT PDU or when the CC in a MT call receives a D-SETUP PDU, it shall issue a CONFIGURE request primitive to the lower layers containing information about the call e.g. the type of traffic, the interleaving depth, the call identifier and whether the call is end-to-end encrypted.

If the transmission grant element in the D-CONNECT PDU is set to "transmission granted" then the CONFIGURE request primitive shall contain the parameter value "Switch U-Plane = On" and "Tx grant = true" to indicate that the MAC has permission to transmit traffic. If the transmission grant element is set to "transmission granted to another user" then the CONFIGURE request primitive shall contain the parameter value "Switch U-Plane = On" but shall contain "Tx grant = false" to indicate that the MAC should receive traffic. For the other values of the transmission grant element, the U-plane shall not be switched on.

If the transmission grant element in the D-SETUP PDU is set to "transmission granted to another user" then the CONFIGURE request primitive shall contain the parameter value "Switch U-Plane = On" but shall contain "Tx grant = false" to indicate that the MAC should receive traffic. For the other values of the transmission grant element, the U-plane shall not be switched on.

The only valid values of the transmission grant element in a group-addressed PDU shall be "transmission granted to another user" and "transmission not granted".

#### 14.5.2.4.2 During call maintenance phase

##### a) Transmission grant control

When the CC does not have permission to transmit, and if it receives a D-TX GRANTED PDU with the transmission grant element set to "transmission granted" or "transmission granted to another user", then the CC shall send a CONFIGURE request primitive containing the parameter "Switch U-Plane = On" and indicating whether the MAC has permission to transmit traffic ("Tx grant = true" or "Tx grant = false" respectively). For the other values of the transmission grant element, the U-plane state shall not be changed.

While the CC has permission to transmit, it shall ignore group addressed D-TX GRANTED PDUs (see clause 14.5.2.2.1 b)).

##### b) Transmission ceased

When the CC receives a D-TX CEASED PDU or on receipt of a REPORT indication primitive of either successful or unsuccessful transmission of a U-TX CEASED PDU, the CC shall issue a CONFIGURE request primitive containing the parameter value "Switch U-Plane = Off".

##### c) Temporary pause

When the CC receives a D-TX WAIT PDU, and if the U-plane is currently switched on for either transmission or reception, the CC shall issue a CONFIGURE request primitive containing the parameter value "Switch U-plane = Off".

When the CC receives a D-TX CONTINUE PDU then:

- if the continue element is set to "continue" and the MS had permission to transmit traffic at the time of receipt of the D-TX WAIT PDU, then the CC shall issue a CONFIGURE request primitive containing the parameter values "Switch U-Plane = On" and "Tx grant = true";
- if the continue element is set to "continue" and the MS did not have permission to transmit traffic at the time of receipt of the D-TX WAIT PDU, then the CC shall issue a CONFIGURE request primitive containing the parameter value "Switch U-Plane = On" but containing "Tx grant = false".

If the Continue element is set to "not continue" then the U-plane shall not be switched on.

##### d) Interruption

When the CC receives a D-TX INTERRUPT PDU, and if the transmission grant element is set to "transmission granted to another user", then the CC shall issue a CONFIGURE request primitive containing the parameter value "Switch U-Plane = On" but containing "Tx grant = false" to indicate that the MAC should receive traffic. For the other values of the transmission grant element, the CC shall issue a CONFIGURE request primitive containing the parameter value "Switch U-Plane = Off".

While the CC has permission to transmit, it shall ignore group addressed D-TX INTERRUPT PDUs.

#### e) Call restoration

When CC receives a BREAK indication primitive indicating that a temporary break in the radio link has occurred, the CC shall issue a CONFIGURE request primitive containing the parameter value "Switch U-Plane = Off".

When CC receives a D-CALL RESTORE PDU indicating that the call has now been restored after a temporary break in the radio link, and if the transmission grant element is set to "transmission granted" or "transmission granted to another user", then the CC shall issue a CONFIGURE request primitive containing the parameter value "Switch U-Plane = On" and indicating whether the MS has permission to transmit traffic ("Tx grant = true" or "Tx grant = false" respectively). For the other values of the transmission grant element, the U-plane shall not be switched on.

#### 14.5.2.4.3 Call disconnection phase

When the CC receives a D-RELEASE PDU, or if it receives a REPORT indication primitive of either successful or unsuccessful transmission of a U-DISCONNECT PDU, or if it receives a TNCC-RELEASE request primitive from the user application indicating that the user wishes to leave the call (without disconnecting the call), then the CC shall issue a CONFIGURE request primitive to the lower layers containing the parameter value "Switch U-Plane = Off".

#### 14.5.2.5 Void

#### 14.5.2.6 Acknowledged group call procedures

The MS procedures for handling of an acknowledged group call shall be in accordance with the procedures described for a normal group call in clauses 14.5.2.1 to 14.5.2.4 with the following additions, which for the SwMI side are informative.

The SwMI should poll the individuals within the called group on the traffic channel after call set-up.

It is an operator option defined in the SwMI if the call should proceed immediately by giving the calling user permission to transmit before, during or after the called members of the group have been polled on the traffic channel.

The SwMI may optionally use one of the following criteria for giving the calling user permission to transmit:

- the D-SETUP PDU has been sent to the called users and the polling will take place in parallel with the ongoing call;
- a certain number of users have responded to the poll;
- all users have been polled.

As a poll request, all MS shall be prepared to receive a D-INFO PDU during the call from the SwMI.

Upon reception of a D-INFO PDU indicating a poll request the CC entity shall send this information further on to the user in a TNCC-NOTIFY and send a U-INFO PDU to the SwMI. The U-INFO shall be sent immediately by the CC on receipt of the poll request, see figure 14.17.

As an operator option the SwMI may disconnect the call after a certain time if insufficient number of members are present, before the permission to transmit is given.

It is a SwMI option how and when to inform the calling user or any other user the result of the polling. An MS shall, during the call set-up phase or during an ongoing call, be prepared to receive one or more D-INFO PDU with the following alternative poll results:

- percentage of responding number of group members;
- number of responding group members;
- list of identities of the responding group members.

The CC shall send the poll result in the D-INFO PDU to the user application in a TNCC NOTIFY indication primitive.

### 14.5.2.7 Call ownership

The CC states and state transitions described in this clause are defined in clause 14.4.2.

Upon entry to the MO-CALL-SETUP state from the IDLE state, the MS shall assume it is a call owner.

Upon entry to the MT-CALL-SETUP state from the IDLE state, the MS shall assume it is not a call owner.

Upon entry to the CALL ACTIVE state from the MO-CALL-SETUP state or MT-CALL-SETUP state, the MS shall assume it is not a call owner unless it transitioned to the CALL ACTIVE state as a result of receiving a D-CONNECT PDU with the "Call ownership" element set to "A call owner".

In any non-IDLE state, if a MS which is a call owner receives an individually addressed or group addressed D-INFO PDU with the "Call ownership" element set to "Not a call owner", the MS shall no longer be a call owner. In any non-IDLE state, if a MS which is not a call owner receives an individually addressed or group addressed D-INFO PDU with the "Call ownership" element set to "A call owner", the MS shall become a call owner.

## 14.5.3 Traffic channel assignment procedures

### 14.5.3.1 SwMI related procedures

This clause describes procedures which shall be applicable only to the SwMI. Depending on the traffic case, alternative methods for traffic channel assignment can be used as presented in table 14.1.

**Table 14.1: Traffic channel assignment**

| TRAFFIC CASE  | Early traffic channel assignment | Medium traffic channel assignment | Late traffic channel assignment |
|---|----------------------------------|-----------------------------------|---------------------------------|
| Message trunked system;<br>Individual call;<br>On/Off hook signalling;              | Yes                              | Yes                               | Yes                             |
| Message trunked system;<br>Individual call;<br>Direct set-up signalling;            | Yes                              | No                                | Yes                             |
| Transmission trunked system;<br>Individual call;<br>On/Off hook signalling;         | No                               | No                                | Yes                             |
| Transmission trunked system;<br>Individual call;<br>Direct set-up signalling;       | No                               | No                                | Yes                             |
| Quasi-transmission trunked system;<br>Individual call;<br>On/Off hook signalling;   | No                               | No                                | Yes                             |
| Quasi-transmission trunked system;<br>Individual call;<br>Direct set-up signalling; | No                               | No                                | Yes                             |
| Message trunked system;<br>Group call;  | Yes                              | No                                | Yes                             |
| Transmission trunked system;<br>Group call;   | No                               | No                                | Yes                             |
| Quasi-transmission trunked system;<br>Group call;                                   | No                               | No                                | Yes                             |

For the called MSs in a group call, the traffic channel assignment should always be given along with the D-SETUP PDU.

The following methods are available for assigning a traffic channel to a call:

- Early assignment:
  - the traffic channels are assigned and indicated to the calling and called MS along with the D-CALL PROCEEDING and D-SETUP PDUs respectively (contained in the lower layer part of those messages). In this case the calling MS moves immediately to the traffic channel in anticipation of the call and should receive CC messages on this channel;
- Medium assignment:
  - the traffic channels are assigned and indicated to the calling MS along with the D-ALERT PDU and are indicated to the called MS in a layer 2 acknowledgement to the called MS U-ALERT PDU. In this case the calling MS moves to the traffic channel in anticipation of the call and should receive CC messages on this channel;
- Late assignment individual call:
  - the traffic channels are not assigned until the called MS sends a U-CONNECT PDU. Upon reception of this PDU the traffic channels may be indicated to the calling and called MS along with the D-CONNECT and D-CONNECT ACKNOWLEDGE PDUs respectively. In this case the calling MS shall remain listening on the control channel until it is told to move to the traffic channel;
- Late assignment group call:
  - the traffic channels are not assigned until appropriate conditions are met. These conditions may be as a result of the finite time required to locate group members, or as a result of the call being acknowledged. The traffic channel may be indicated to the calling MS along with the D-CONNECT PDU.

NOTE 1: When a MS is said to be sent to a traffic channel in the text above, it means that the MS is ordered to go to an assigned channel. For early and medium assignment, the assigned channel starts as a FACCH until the MS is instructed to switch the U-plane on. For late assignment, the MS may be instructed to switch the U-plane on when it moves to the assigned channel.

NOTE 2: In this edition of the present document, the implications for the MS-related traffic channel assignment procedures (refer to clause 14.5.3.2) of the traffic channel assignment type used by the SwMI have not been fully considered for the "early" and "medium" channel assignment types.

### 14.5.3.2 MS related procedures

#### 14.5.3.2.1 General procedures

The MAC layer manages radio channel changes as described in clause 23.5.4. It is possible that the MAC layer may receive conflicting channel allocations when the MS is already involved in a service and receives a new service indication. Also, the SwMI may re-allocate radio resources so that concurrent services a MS is using are no longer utilizing resources which are within the capabilities of the MS e.g. sharing the same radio channel. In those situations, the MAC layer needs to ask from the higher layers which channel allocation it will follow so that the preferred service continues or replaces the current service.

The CMCE may receive a "channel change response required" request with any of the following primitives:

##### a) MLE-UNITDATA indication

For this primitive, the channel assignment is associated with a CC PDU; the primitive is derived from a layer 2 TL-DATA indication primitive or TL-UNITDATA indication primitive, refer to clauses 18.3.5.3.1, 20.3.5.1.4, 20.3.5.1.9, 22.2.1.1 and 22.2.1.2.

##### b) MLE-REPORT indication

For this primitive, the channel assignment is associated with a layer 2 acknowledgement; the primitive is derived from a layer 2 TL-DATA confirm primitive, refer to clauses 18.3.5.3.1, 20.3.5.1.4 and 22.2.1.1.

### c) MLE-CONFIGURE indication

For this primitive, the channel assignment is associated with neither a CC PDU nor a layer 2 acknowledgement; the primitive is derived from a layer 2 TL-REPORT indication primitive, refer to clauses 18.3.5.4, 20.3.5.1.9 and 22.3.5.

NOTE 0: Though the SwMI does not have to send a CC PDU with a traffic channel assignment, it is recommended that the SwMI sends a CC PDU with any channel assignment not sent with a layer 2 acknowledgement in order to facilitate routing of the channel assignment to the correct CC instance. It is recommended that the SwMI use the D-INFO PDU if it sends a CC PDU solely for the purpose of associating a channel assignment with a call.

If a channel change response is required the CMCE shall send a MLE-CONFIGURE request primitive with the "channel change accepted" parameter set to one of the following values (refer to clause 17.3.9):

- accept;
- reject;
- ignore.

NOTE 1: "ignore" is reserved for specific call situations and is not available for other purposes, refer to clause 14.5.3.2.3.

The CC will normally immediately return "accept" when it accepts the service, and "reject" when it does not accept the offered service. The CC may need to return "ignore" in response to a group addressed channel allocation, in which case the response will be immediate, refer to clause 14.5.3.2.3 for a description of those scenarios in which "ignore" is used. In group call case the MS may also delay the sending of the MLE-CONFIGURE request primitive for up to time T330. For late traffic channel assignment, CC shall not reject the channel allocation whilst accepting the service.

NOTE 2: How CMCE or CC entity knows which of the offered or existing services it will accept/select or how it negotiates with other network layers or user application to find out the preferred service is outside the scope of this part of the present document.

NOTE 3: The MAC actions for "reject" and "ignore" are generally the same except for specific situations, see clauses 23.5.4.2.3 and 23.5.4.2.4 for details.

NOTE 4: Handling of channel allocations may also be affected by the MS being active in a MM procedure, this being indicated to CC from MLE via the MLE-BUSY indication primitive, refer to clause 18.3.5.4. The exact nature of the interaction between MM/MLC and CC is outside the scope of this part of the present document but it is recommended that CC not accept a channel allocation while MM is busy.

#### 14.5.3.2.2 Procedures for acceptance of individually-addressed channel allocation

As described in clauses 14.5.1.1.1, 14.5.1.1.3 and 14.5.6.5.3, it is optional whether the MS accepts an incoming individual call. Therefore, when the MAC receives a channel allocation addressed to it, it refers to the higher layers for instruction about whether to accept the channel allocation.

The lower layers indicate that instruction is required by setting the "channel change response required" parameter to "true". This parameter is passed (via LLC, MLE and PC) to CC along with the PDU. If the CC decides to accept the channel allocation then it shall return a CONFIGURE request primitive with the parameter "channel change accepted" set to "accept". The CC may also decide to reject a channel allocation in which case CC shall use "channel change accepted" parameter value "reject". The CC shall decide whether to accept or reject a channel allocation by applying the following rules:

- if the PDU relates to an ongoing call (i.e. if the call identifier in the received PDU is the call identifier of any current call that the MS is active in) and if the CC obeys the received PDU then the CC shall accept the channel change;
- if the PDU relates to an ongoing call and if the CC does not obey the received PDU then the CC shall reject the channel change;
- if the PDU relates to a new service and if the CC obeys the received PDU then the CC shall accept the channel change;

- if the PDU relates to a new service and if the CC does not obey the received PDU then the CC shall reject the channel change.

NOTE: The "ignore" value is not used as a response to any individually addressed channel allocation.

#### 14.5.3.2.3 Procedures for acceptance of group-addressed channel allocation

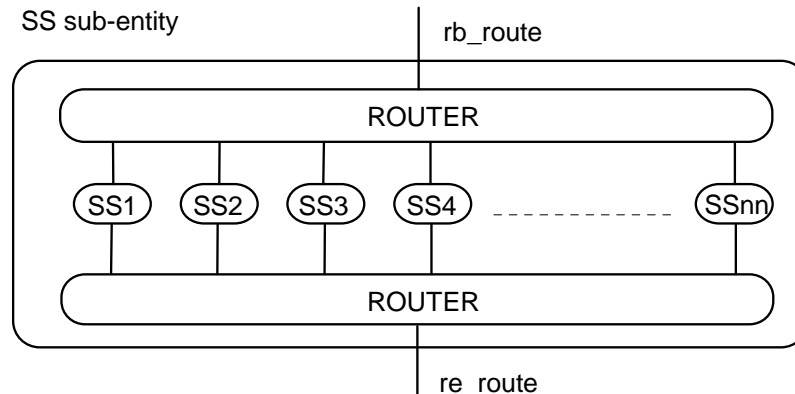

As described in clause 14.5.2.1.1, it is optional whether the MS accepts an incoming group call. Therefore, when the MAC receives a channel allocation addressed to a group that the MS belongs to, it refers to the higher layers for instruction about whether to accept the channel allocation.

The lower layers indicate that instruction is required by setting the "channel change response required" parameter to "true". This parameter is passed (via LLC, MLE and PC) to CC along with the PDU. If the CC decides to accept the channel allocation then it shall return a CONFIGURE request primitive with the parameter "channel change accepted" set to "accept". The CC may also decide to reject a channel allocation in which case CC shall use "channel change accepted" parameter value "reject". The CC shall decide whether to accept, reject or in specific cases ignore a channel allocation by applying the following rules:

- if the PDU is a group addressed D-SETUP PDU then:
  - if the MS is not currently attempting to call this group then the CC shall accept the channel change if the user application accepts the incoming call using TNCC-SETUP response primitive, refer to clauses 14.5.2.1.1 and 14.5.2.1.3 for other actions;
  - if the MS is not currently attempting to call this group then the CC shall reject the channel change if the user application rejects the incoming call using TNCC-RELEASE request primitive;
  - if the MS is currently attempting to call this group, and has not received a REPORT indication primitive of successful transmission of the U-SETUP PDU from the lower layers, then:
    - if it is requesting a "basic service information" compatible with that in the D-SETUP PDU then it shall send a CANCEL request primitive to the lower layers to stop transmission of the U-SETUP PDU then:
      - if cancellation is successful, the MS shall accept the channel change;
      - if cancellation is unsuccessful, the MS shall ignore the channel change and shall wait on the current channel for further signalling: a D-CALL PROCEEDING and/or D-CONNECT PDU (and/or D-RELEASE PDU).
    - if it is requesting a "basic service information" not compatible with that in the D-SETUP PDU then it shall accept the channel change if the user application accepts the incoming call using TNCC-SETUP response primitive, refer to clause 14.5.2.1.3 for other actions;
    - if it is requesting a "basic service information" not compatible with that in the D-SETUP PDU then it shall reject the channel change if the user application rejects the incoming call using TNCC-RELEASE request primitive.
  - if the MS is attempting to call this group and has received a REPORT indication primitive of successful transmission of the USETUP PDU by the LLC but not yet received a call identifier then it shall ignore the channel change and shall wait on the current channel for further signalling: a D-CALL PROCEEDING and/or D-CONNECT PDU (and/or D-RELEASE PDU);
  - if the MS is attempting to call this group and has received D-CALL PROCEEDING PDU and the call identifier in the D-SETUP PDU is the same as the call identifier in the D-CALL PROCEEDING PDU and the calling party address in the D-SETUP PDU does not contain the MS's own address then the CC shall accept the channel change;
  - if the MS is attempting to call this group and has received D\_CALL PROCEEDING PDU and the call identifier in the D-SETUP PDU is the same as the call identifier in the D-CALL PROCEEDING PDU and the calling party address in the D-SETUP PDU contains the MS's own address then the CC shall ignore the channel change.

- if the PDU relates to an ongoing call (i.e. if the call identifier in the received PDU is the call identifier of any current call that the MS is active in) and if the CC obeys the received PDU then the CC shall accept the channel change;
- if the PDU relates to an ongoing call and if the CC does not obey the received PDU then:
  - if the MS is transmitting traffic and the PDU is a group addressed D-TX GRANTED or D-TX INTERRUPT PDU then the CC shall ignore the channel change;
  - in all other cases the CC shall reject the channel change.

#### 14.5.4 SS procedures

**Figure 14.23: Internal view of SS sub-entity**

Figure 14.23 shows the internal architecture of the SS sub-entity. The user application shall communicate with SS entities via the rb-route, when the information of the requested service is not incorporated into TNCC-SAP service primitives, see clauses 11 and 12. All messages to and from PC shall be communicated over the re-route. When a SS message is received from the peer entity, it shall be passed via the SS router to the appropriate SS entity.

Each individual SS entity shall receive and send call related SS messages as facility elements in CC PDUs, or if no other call related PDU is available, in a U/D-INFO PDU. The call identifier element shall link the SS facility element to the related call.

If the SS message is not related to any existing call, it shall be conveyed as a facility element in a U/D-FACILITY PDU.

Some SS messages may be sent or received at any stage of a call, after the call during SS-CC retention time and when no call exists.

#### 14.5.5 SDS procedures

##### 14.5.5.0 General

The SDS procedures handled by the SDS sub-entity shall be applicable for the MS side. The procedures relating to the SwMI are outside the scope of the present document.

In the SDS protocol there is no relationship defined between SDS messages using different transmission directions and the SDS sub-entity shall be able to handle colliding messages, e.g. shall receive messages to be sent to the peer entity and shall deliver received messages from the peer entity at the same time.

##### 14.5.5.1 Incoming short data message

On reception of D-STATUS or D-SDS-DATA PDUs the SDS sub-entity shall inform the user application with a TNSDS-STATUS indication primitive containing the pre-coded status or with a TNSDS-UNITDATA indication primitive containing user defined data, respectively.

### 14.5.5.2 Outgoing short data messages

A user application initiates the SDS message transfer by issuing either a TNSDS-STATUS request primitive or a TNSDS-UNITDATA request primitive. The SDS sub-entity shall select an appropriate PDU priority based on the requested access priority value as described in clause 14.5.6.2.

Upon reception of a TNSDS-STATUS or a TNSDS-UNITDATA request primitive the SDS sub-entity shall send the corresponding U-STATUS or U-SDS-DATA PDU respectively. The SDS sub-entity may suggest the use of an advanced link by using the U-SDS DATA primitive's link identifier parameter.

**NOTE:** The advanced link may use less air interface resource than the basic link in certain conditions when transmitting a long PDU in an imperfect channel. It may be desirable to use an advanced link when the U-SDS-DATA PDU cannot be carried by the basic link within a MAC-ACCESS PDU plus two or three full slots, particularly where the MS may be using a 25 kHz QAM channel.

The SDS sub-entity shall not accept further short data request primitives from the user application before a REPORT indication primitive indicating successful transmission of the PDU has been received. The received report shall be forwarded to the user application in a TNSDS-REPORT indication primitive.

If the SDS entity receives a REPORT indication primitive informing that the PDU transmission was unsuccessful, the SDS sub-entity shall inform the user application using a TNSDS-REPORT indication primitive with parameter "failure" and the SDS sub-entity may continue to accept new SDS service requests.

## 14.5.6 PC procedures

### 14.5.6.0 General

This clause contains various protocol elements which are common to one or more sub-entities within the CMCE. The description does not define or limit implementations to be inside the PC sub-entity.

#### 14.5.6.1 Access to the communication resources

When the MS is powered up all the CMCE sub-entities except the PC sub-entity shall start in state IDLE. The PC sub-entity shall start in state CLOSED. When the PC sub-entity receives a MLE-OPEN indication primitive, the PC sub-entity shall change state to OPEN and inform other sub-entities with an OPEN indication primitive. When the PC is in state CLOSED the other sub-entities shall not send any PDUs. When the PC receives a MLE-CLOSE indication primitive, the PC sub-entity shall change state to CLOSED and shall inform the other sub-entities with a CLOSE indication primitive.

MLE-BREAK indication primitive, REOPEN indication primitive, RESTORE confirm primitive and RESUME indication primitive shall not change the state of the PC, but PC shall pass those to other sub-entities as defined in clause 14.2.6.

#### 14.5.6.2 Access priority handling

##### 14.5.6.2.0 General

When any CMCE sub-entity receives an access priority value in a TNCC, TNSS or TNSDS primitive, the sub-entity shall set the PDU priority value according to the access priority value. If the corresponding PDU priority is not defined by other means, then the sub-entity shall use default values as defined in table 14.2.

**Table 14.2: Low/high/emergency PDU priority default values**

| PDU            | PDU priority | Remark   |
|----------------|--------------|--|
| U-ALERT        | 2/4/7        | Stealing repeats flag not set                    |
| U-CALL-RESTORE | 5            | Stealing repeats flag not set                    |
| U-CONNECT      | 2/4/7        | Stealing repeats flag not set                    |
| U-DISCONNECT   | 6            | Immediate stealing and Stealing repeats flag set |
| U-INFO         | 2/4/7        | Stealing repeats flag not set                    |
| U-RELEASE      | 6            | Stealing repeats flag not set                    |
| U-SETUP        | 0/4/7        | Stealing repeats flag not set                    |
| U-STATUS       | 1/4/7        | Stealing repeats flag not set                    |
| U-SDS DATA     | 1/4/7        | Stealing repeats flag not set                    |
| U-TX CEASED    | 6            | Immediate stealing and Stealing repeats flag set |
| U-TX DEMAND    | 2/4/7        | Stealing repeats flag not set                    |

For PDUs other than U-TX CEASED and U-DISCONNECT, the CC sub-entity shall set the stealing permission parameter according to the following rules:

- if "traffic stealing = steal traffic" and "access priority = emergency" in the service access primitive, the stealing permission parameter shall be set to "steal immediately";
- if "traffic stealing = steal traffic" and access priority is not equal to "emergency" in the service access primitive, the stealing permission parameter shall be set to "steal when convenient";
- otherwise the stealing permission parameter shall be set to "stealing not required".

#### 14.5.6.2.1 Cancel

The cancel procedures may be implemented in an MS and if used the following shall apply:

- the MLE-CANCEL request primitive can minimize the risk of adding extra load to the air interface, e.g. when a user application requests a call set-up and the request is buffered by the lower layers waiting for allowance to make a random access attempt, which in the case of a low priority call and high system load can take a considerable amount of time. If the user application, during this waiting period, changes its decision and wants to disconnect the call, the application shall send a TNCC-RELEASE request primitive to the CC sub-entity. The CC sub-entity shall know the status of the transmission from the REPORT indication primitives received from the lower layers;
- when any sub-entity wishes to stop transmission of a PDU it may use cancel procedure with the limitations defined below. The cancel process shall be controlled by REPORT indication primitives from lower layers;
- incoming MLE-REPORT indication primitives should indicate the following events:
  - a PDU has been stored by the DLL ready for transmission. At this stage the transmission may be cancelled using a CANCEL request primitive and no information will be sent over the air interface;
  - the first transmission of whole PDU. The BS may have received the PDU, but MS has not yet received an acknowledgement. At this stage the layer 2 process may be stopped using a CANCEL request primitive, but the sending sub-entity cannot rely on the cancellation and may receive a response to the sent PDU;
  - the transfer of a PDU has failed in layer 2. Cancellation is no longer possible, but the BS may have received the PDU correctly and the sending sub-entity may receive a response to the sent PDU;
  - a PDU has been successfully transmitted by layer 2. Cancellation is no longer possible.

### 14.5.6.3 CMCE PDU exchange

#### 14.5.6.3.0 General

The PC shall forward PDUs from the other CMCE sub-entities to MLE using a MLE-UNITDATA request primitive without modifying any parameters supplied with the PDU. However the U-CALL RESTORE PDU shall use a MLE-RESTORE request primitive instead of the MLE-UNITDATA request primitive.

The PC shall forward the SDU contained in a received MLE-UNITDATA indication primitive to the corresponding sub-entity as defined by the PDU type element without modifying any parameters. The D-CALL RESTORE PDU should be received in a MLE-RESTORE confirm primitive instead of the MLE-UNITDATA indication primitive.

#### 14.5.6.3.1 Choice of layer 2 service

When sending the following PDUs, the layer 2 service parameter shall be set to "acknowledged response":

- U-ALERT PDU;
- U-CONNECT PDU for direct call set-up;
- U-DISCONNECT PDU when sent as a response to a D-SETUP PDU;
- U-RELEASE.

For other uplink PDUs, the PC should set the layer 2 service parameter to "acknowledged request".

### 14.5.6.4 Control information exchange

CMCE sub-entities exchange local control information with the PC using service primitives.

The PC shall forward service primitives from other CMCE sub-entities to the MLE using MLE service primitives as defined in clause 17.3.4 without any modification of the parameters.

The PC shall forward service primitives from MLE, as defined in clause 17.3.4 to the relevant sub-entity or sub-entities without any modification of parameters.

The primitive names and parameters between the PC and the other sub-entities are same as the primitive names at the MLE-SAP except that the "MLE-" is not present.

The CC protocol cannot support overlapping call set-up signalling within the window where the CC awaits a call identifier from the SwMI after a U-SETUP PDU is issued. A method to prevent concurrent call set-up attempt during the window is described as follows:

- when a CC instance initiates a call set-up, it shall inform PC that a call set-up has been initiated, and the PC shall inform other CC instances that currently no more call set-up attempts are possible;
- when the CC instance either receives a call identifier for the new call or discards the call set-up, it shall inform completion of call set-up to the PC, and the PC shall forward that information to the other CC instances.

This method enables correct mapping between the call identifier and the appropriate CC instance.

### 14.5.6.5 PC protocol error conditions

#### 14.5.6.5.1 PDU type error

When a PDU is received with a PDU type not recognizable, the MS may, if the PDU is individually addressed, send a CMCE FUNCTION NOT SUPPORTED PDU, refer to clause 14.7.3.2. The MS shall ignore the unrecognizable PDU.

If the MS receives an individually addressed CMCE PDU with a valid PDU type but some unrecognized element or element values prevent the MS from interpreting the PDU correctly, the MS may send a CMCE FUNCTION NOT SUPPORTED PDU.

The behaviour of the requesting party when receiving a CMCE FUNCTION NOT SUPPORTED PDU is outside the scope of the present document.

#### 14.5.6.5.2 Invalid call identifier

If a MS receives any individually addressed down link PDU except D-SETUP and D-RELEASE PDUs specifying a call identifier element which is not recognized as relating to a call for which a call identifier exists, the PC shall send a U-DISCONNECT PDU with the received invalid call identifier and with the cause "Invalid call identifier".

In all other cases, no action shall be taken by PC.

#### 14.5.6.5.3 MS busy

If the MS is engaged in another service or services e.g. circuit mode call or packet data service, and cannot support more concurrent calls and the user application, when it receives an individually addressed D-SETUP PDU, does not release any calls and does not reject the incoming call (refer to clause 14.5.1.1.5), the MS shall send a U-DISCONNECT PDU back to the SwMI with cause "Called party busy".

### 14.5.6.6 Temporary Disablement

When the PC receives a MLE-DISABLE indication primitive, CMCE shall cease all communication with MLE apart from:

- reception of MLE-CLOSE indication, MLE-OPEN indication and MLE-ENABLE indication primitives;
- if the MLE-DISABLE indication primitive included LIP as a permitted service:
  - primitives transporting LIP protocol via SDS PDUs;
- if the MLE-DISABLE indication primitive included ambience listening as a permitted service:
  - primitives transporting signalling related to ambience listening.

The method by which CMCE permits only these services while preventing all others is outside the scope of the present document.

When the PC receives a MLE-ENABLE indication primitive, CMCE shall resume full communication with MLE.

PC shall sustain its temporary disablement condition through power cycles, through loss and regain of radio resources, and through switching to DMO and back.

NOTE: An MS that is temporarily disabled during V+D operation remains disabled during DMO operation, but the method by which the MS achieves this is outside the scope of the present document.

### 14.5.7 Subscriber class

Where the CMCE receives a MLE-INFO indication primitive which indicates that the subscriber class associated with the ITSI is not valid on a cell the CMCE shall filter service requests until the subscriber class becomes valid, or a new cell is selected where the subscriber class is valid, this being indicated from MLE to CMCE via the MLE-INFO indication primitive. The CMCE may respond normally to existing circuit mode calls and all SwMI-initiated procedures including, for example, incoming calls, SDS-TL messages and consequent SDS-TL reports and acknowledgements, and SS messages and responses (including, for example, DGNA signalling messages and responses).

Only the following MS-initiated procedures are permitted:

- emergency calls;
- signalling with PDU priority 7;
- restoration of existing circuit mode calls;
- in established circuit mode calls: signalling with any PDU priority (e.g. transmit permission requests) and speech transmission;

- user application responses to incoming SDS-TL messages.

See also clause 16.4.9.

## 14.5.8 Activity handling

PC shall send an MLE-ACTIVITY request primitive to the MLE when it receives an ACTIVITY request primitive from a CC entity.

## 14.5.9 Not-permitted cells

When CMCE receives an MLE-INFO indication primitive which indicates that the present cell is a not-permitted cell (see clause 18.3.5.1.5), the CMCE shall filter service requests until a different cell is selected. When using a not-permitted cell CMCE shall locally terminate existing non-emergency circuit mode calls.

Only the following MS-initiated procedures are permitted:

- emergency calls;
- restoration of existing emergency calls;
- signalling with PDU priority 7.

See also clause 18.3.4.5.7.

NOTE 1: An MS sending LIP and emergency STATUS messages in not-permitted cells should use PDU priority 7 to guarantee that the message is sent.

The MS shall ignore all non-emergency SwMI-initiated procedures including, for example, non-emergency incoming calls, non-emergency SDS-TL messages and consequent SDS-TL reports and acknowledgements, and SS messages and responses (including, for example, DGNA signalling messages and responses).

The MS should accept incoming emergency calls and PDU priority 7 signalling. The MS is permitted to send and receive acknowledgements to signalling related to emergency calls and signalling sent with PDU priority 7.

NOTE 2: There is no requirement for the SwMI to be aware of the MS's not-permitted cells. However, if the SwMI is aware of the MS's not-permitted cells, it may filter out non-emergency signalling when the MS is using a not-permitted cell.

## 14.6 Protocol timers

Table 14.3 lists the protocol timers and the information associated with them.

**Table 14.3: Timers**

| Timer No.            | Timer value  | Call state     | Cause for start                                       | Normally terminated  | Action when timer expires  | I/C side | O/G side |
|----------------------|--------------|----------------|---|--|--|----------|----------|
| T301<br>(see note 1) | Maximum 30 s | MT-CALL-Set-up | On the sending of U-CONNECT,<br>On receipt of D-INFO  | On receipt of D-CONNECT ACK,<br>D-DISCONNECT,<br>D-RELEASE,<br>Report (failed) ind         | Disconnect as specified in clause 14.5.1.3.4 a)                    | M        | -        |
| T302<br>(see note 2) | Max. 60 s    | MO-CALL-Set-up | On receipt of D-CALL PROCEEDING,<br>D-ALERT or D-INFO | On receipt of D-CONNECT,<br>D-SETUP,<br>D-DISCONNECT,<br>D-RELEASE,<br>Report (failed) ind | Disconnect as specified in clauses 14.5.1.3.4 b) and 14.5.2.3.5 a) | -        | M        |

| Timer No.   | Timer value            | Call state     | Cause for start  | Normally terminated   | Action when timer expires  | I/C side | O/G side |
|---|------------------------|----------------|--|---|--|----------|----------|
| T303  | 60 s                   | MO-CALL-Set-up | On the sending of U-SETUP  | On receipt of D-CALL PROCEEDING, D-ALERT, D-CONNECT, D-RELEASE, Report (failed) ind<br>On transmission of U-DISCONNECT                                | Disconnect as specified in clauses 14.5.1.3.4 c) and 14.5.2.3.5 b) | -        | M        |
| T306  | Min 4 sec<br>Max 6 sec | Break          | On sending of U-CALL RESTORE (Pt to Pt calls only)   | On receipt of D-CALL RESTORE, Reopen ind  | Disconnect as specified in clause 14.5.1.3.4 e)                    | M        | M        |
| T307  | Min 2 sec<br>Max 8 sec | Break          | On sending of U-CALL RESTORE (Pt to MtPt calls only)   | Receipt of D-CALL RESTORE, Reopen ind   | Disconnect as specified in clause 14.5.2.3.5 c)                    | M        | M        |
| T308<br>(see note 3)  | Max. 10 sec            | Any State      | On transmission of U-DISCONNECT  | Receipt of D-RELEASE, Report (failed) ind   | Disconnect as specified in clauses 14.5.1.3.4 f) and 14.5.2.3.5 d) | M        | M        |
| T310<br>(see note 4)  | Min 30 sec<br>No Max.  | Call Active    | On receipt of D-CONNECT, D-CONNECT ACKNOWLEDGE, D-TX CONTINUE, D-SETUP (Pt to MtPt calls only), D-INFO, D-CALL RESTORE               | On receipt of D-RELEASE, D-TX WAIT, Report (failed) ind<br>On transmission of U-DISCONNECT, U-RELEASE   | Disconnect as specified in clauses 14.5.1.3.4 g) and 14.5.2.3.5 e) | M        | M        |
| T311  | Max. 300 sec           | Call Active TX | On receipt of D-TX GRANTED (transmit), D-TX CONTINUE (continue) (see note 5), D-CONNECT (transmit), D-CONNECT ACKNOWLEDGE (transmit) | On transmission of U-TX CEASED, U-DISCONNECT<br>On receipt of D-TX INTERRUPT, D-RELEASE, D-TX WAIT, D-TX CONTINUE (not continue), Report (failed) ind | Forced Ceased Transmission. Transmission of U-TX CEASED            | M        | M        |
| T330  | 10 sec                 | MT-CALL-Set-up | On receipt of a channel change response required set to "yes"  | On sending corresponding channel change accepted set to any value   | CC can no longer accept the channel change                         | M        | -        |
| <p>NOTE 1: This timer is started with a fixed duration of 30 s on the sending of U-CONNECT; the timer may be started again on receipt of D-INFO (with the duration specified in the D-INFO).</p> <p>NOTE 2: This timer may be started again during the call on receipt of D-INFO.</p> <p>NOTE 3: This timer may have 0 (zero) duration in which case the MS does not wait for D-RELEASE after having sent U-DISCONNECT.</p> <p>NOTE 4: This timer may be started again during the call on receipt of D-INFO or D-CALL RESTORE.</p> <p>NOTE 5: The timer is started as a result of receiving D-TX CONTINUE (continue) only if the MS had transmit permission when it received D-TX WAIT.</p> |                        |                |  |   |  |          |          |

## 14.7 PDU descriptions

### 14.7.0 General

The PDUs detailed within this clause shall be visible at the Um reference point.

Refer to annex E for PDU encoding rules and examples.

Various supplementary services use the notification information element in some PDUs, refer to ETSI EN 300 392-9 [9].

The information contained in the following PDU description tables corresponds to the following key:

- Length: length of the element in bits;
- Type: element type (1, 2 or 3) as defined above;
- Owner: sub-entity responsible for (or owner of) the element data;
- C/O/M: conditional/optional/mandatory information in the PDU;
- Remark: comment.

## 14.7.1 PDU description tables - downlink

### 14.7.1.1 D-ALERT

- Message: D-ALERT
- Response to: U-SETUP
- Response expected: -
- Short description: This PDU shall be an information to the originating MS that the call is proceeding and the connecting party has been alerted.

**Table 14.4: D-ALERT PDU contents**

| Information element   | Length | Type | Owner | C/O/M | Remark     |
|---|--------|------|-------|-------|------------|
| PDU Type  | 5      | 1    | CC    | M     | D-ALERT    |
| Call identifier   | 14     | 1    | CC    | M     |            |
| Call time-out, set-up phase   | 3      | 1    | CC    | M     |            |
| Reserved  | 1      | 1    | CC    | M     | See note 1 |
| Simplex/duplex selection  | 1      | 1    | CC    | M     |            |
| Call queued   | 1      | 1    | CC    | M     |            |
| Basic service information   | 8      | 2    | CC    | O     | See note 2 |
| Notification indicator  | 6      | 2    | SS    | O     |            |
| Facility  |        | 3    | SS    | O     |            |
| Proprietary   |        | 3    | -     | O     |            |
| NOTE 1: This information element is not used in this edition of the present document and its value shall be set to "1" (equivalent to "Hook on/Hook off signalling" for backwards compatibility with edition 1 of the present document - refer to table 14.62). |        |      |       |       |            |
| NOTE 2: If different from requested.  |        |      |       |       |            |

### 14.7.1.2 D-CALL PROCEEDING

- Message: D-CALL PROCEEDING
- Response to: U-SETUP
- Response expected: -
- Short description: This PDU shall be the acknowledgement from the infrastructure to call set-up request indicating that the call is proceeding.

**Table 14.5: D-CALL PROCEEDING PDU contents**

| Information element         | Length | Type | Owner | C/O/M | Remark            |
|-----------------------------|--------|------|-------|-------|-------------------|
| PDU Type                    | 5      | 1    | CC    | M     | D-CALL PROCEEDING |
| Call identifier             | 14     | 1    | CC    | M     |                   |
| Call time-out, set-up phase | 3      | 1    | CC    | M     |                   |
| Hook method selection       | 1      | 1    | CC    | M     |                   |
| Simplex/duplex selection    | 1      | 1    | CC    | M     |                   |
| Basic service information   | 8      | 2    | CC    | O     | See note          |
| Call status                 | 3      | 2    | CC    | O     |                   |
| Notification indicator      | 6      | 2    | SS    | O     |                   |
| Facility                    |        | 3    | SS    | O     |                   |

## 14.7.2 PDU description tables - uplink

### 14.7.2.1 U-ALERT

- Message: U-ALERT
- Response to: D-SETUP
- Response expected: -
- Short description: This PDU shall be a acknowledgement from the called MS that the called user has been alerted.

**Table 14.21: U-ALERT PDU contents**

| Information element       | Length | Type | Owner | C/O/M | Remark   |
|---------------------------|--------|------|-------|-------|----------|
| PDU Type                  | 5      | 1    | CC    | M     | U-ALERT  |
| Call identifier           | 14     | 1    | CC    | M     |          |
| Reserved                  | 1      | 1    | CC    | M     | See note |
| Simplex/duplex selection  | 1      | 1    | CC    | M     |          |
| Basic service information | 8      | 2    | CC    | O     |          |
| Facility                  |        | 3    | SS    | O     |          |
| Proprietary               |        | 3    | -     | O     |          |

NOTE: This information element is not used in this edition of the present document and its value shall be set to "1" (equivalent to "Hook on/Hook off signalling" for backwards compatibility with edition 1 of the present document - refer to table 14.62).

### 14.7.2.2 U-CALL RESTORE

- Message: U-CALL RESTORE
- Response to: -
- Response expected: D-CALL RESTORE
- Short description: This PDU shall be the order from the MS for restoration of a specific call after a temporary break of the call.

**Table 14.22: U-CALL RESTORE PDU contents**

| Information element              | Length | Type | Owner | C/O/M | Remark            |
|----------------------------------|--------|------|-------|-------|-------------------|
| PDU Type                         | 5      | 1    | CC    | M     | U-CALL RESTORE    |
| Call identifier                  | 14     | 1    | CC    | M     |                   |
| Request to transmit/send data    | 1      | 1    | CC    | M     |                   |
| Other party type identifier      | 2      | 1    | CC    | M     |                   |
| Other party short number address | 8      |      | CC    | C     | See notes 1 and 2 |
| Other party SSI                  | 24     |      | CC    | C     | See note 1        |
| Other party extension            | 24     |      | CC    | C     | See note 1        |
| Basic service information        | 8      | 2    | CC    | M     | See note 3        |
| Facility                         |        | 3    | SS    | O     |                   |
| DM-MS address                    |        | 3    | CC    | O     |                   |
| Proprietary                      |        | 3    | -     | O     |                   |

NOTE 1: Shall be conditional on the value of Other Party Type Identifier (OPTI):  
 - OPTI = 0; Other Party SNA;  
 - OPTI = 1; Other Party SSI;  
 - OPTI = 2; Other Party SSI + Other Party Extension.

NOTE 2: A use of SNA in call restoration is strongly discouraged as all other call maintenance signalling uses SSI and the SS-SNA may not be supported in all networks.

NOTE 3: Although the coding of this information element is of type 2 the element is mandatory. The information element informs the new cell of the basic service of the current call in progress.

### 14.7.2.3 U-CONNECT

- Message: U-CONNECT
- Response to: D-SETUP
- Response expected: D-CONNECT ACKNOWLEDGE
- Short description: This PDU shall be the acknowledgement to the SwMI that the called MS is ready for through-connection.

**Table 14.23: U-CONNECT PDU contents**

| Information element       | Length | Type | Owner | C/O/M | Remark    |
|---------------------------|--------|------|-------|-------|-----------|
| PDU Type                  | 5      | 1    | CC    | M     | U-CONNECT |
| Call identifier           | 14     | 1    | CC    | M     |           |
| Hook method selection     | 1      | 1    | CC    | M     |           |
| Simplex/duplex selection  | 1      | 1    | CC    | M     |           |
| Basic service information | 8      | 2    | CC    | O     |           |
| Facility                  |        | 3    | SS    | O     |           |
| Proprietary               |        | 3    | -     | O     |           |

### 14.7.2.4 U-DISCONNECT

- Message: U-DISCONNECT
- Response to: -
- Response expected: D-DISCONNECT/D-RELEASE
- Short description: This PDU shall be the MS request to the SwMI to disconnect a call.

**Table 14.24: U-DISCONNECT PDU contents**

| Information element | Length | Type | Owner | C/O/M | Remark       |
|---------------------|--------|------|-------|-------|--------------|
| PDU Type            | 5      | 1    | CC    | M     | U-DISCONNECT |
| Call identifier     | 14     | 1    | CC    | M     |              |
| Disconnect cause    | 5      | 1    | CC    | M     |              |
| Facility            |        | 3    | SS    | O     |              |
| Proprietary         |        | 3    | -     | O     |              |

### 14.7.2.5 U-FACILITY

- Message: U-FACILITY
- Response to: -
- Response expected: -
- Short description: This PDU shall be used to send call unrelated SS information.

**Table 14.25: U-FACILITY PDU contents**

| Information element  | Length | Type | Owner | C/O/M | Remark               |
|--|--------|------|-------|-------|----------------------|
| PDU Type   | 5      | 1    | SS    | M     | U-FACILITY, see note |
| NOTE: Contents of this PDU shall be defined by SS protocols. |        |      |       |       |                      |

### 14.7.2.6 U-INFO

- Message: U-INFO
- Response to: -
- Response expected: -
- Short description: This PDU shall be the general information message from the MS.

**Table 14.26: U-INFO PDU contents**

| Information element   | Length | Type | Owner | C/O/M | Remark     |
|---|--------|------|-------|-------|------------|
| PDU Type  | 5      | 1    | CC    | M     | U-INFO     |
| Call identifier   | 14     | 1    | CC    | M     | See note 1 |
| Poll response   | 1      | 1    | CC    | M     | See note 2 |
| Modify  | 9      | 2    | CC    | O     |            |
| DTMF  |        | 3    | CC    | O     |            |
| Facility  |        | 3    | SS    | O     |            |
| Proprietary   |        | 3    | -     | O     |            |
| NOTE 1: If the message is sent connectionless then the call identifier shall be equal to the dummy call identifier. |        |      |       |       |            |
| NOTE 2: Shall be valid for acknowledged group call only. For other types of call it shall be set equal to zero.     |        |      |       |       |            |

### 14.7.2.7 U-STATUS

- Message: U-STATUS
- Response to: -
- Response expected: -
- Short description: This PDU shall be used for sending a pre-coded status message.

**Table 14.27: U-STATUS PDU contents**

| Information element  | Length | Type | Owner | C/O/M | Remark        |
|--|--------|------|-------|-------|---------------|
| PDU Type   | 5      | 1    | SDS   | M     | U-STATUS      |
| Area selection   | 4      | 1    | SS    | M     | See note 1    |
| Called party type identifier   | 2      | 1    | SDS   | M     | Short/SSI/TSI |
| Called party short number address  | 8      |      | SDS   | C     | See note 2    |
| Called party SSI   | 24     |      | SDS   | C     | See note 2    |
| Called party extension   | 24     |      | SDS   | C     | See note 2    |
| Pre-coded status   | 16     | 1    | SDS   | M     |               |
| External subscriber number   |        | 3    | SDS   | O     |               |
| DM-MS address  |        | 3    | CC    | O     |               |
| NOTE 1: This information element is used by SS-AS, refer to ETSI EN 300 392-12-8 [14]. |        |      |       |       |               |
| NOTE 2: Shall be conditional on the value of Called Party Type Identifier (CPTI):      |        |      |       |       |               |
| - CPTI = 0; Called Party SNA; refer to ETSI ETS 300 392-12-7 [13];                     |        |      |       |       |               |
| - CPTI = 1; Called Party SSI;  |        |      |       |       |               |
| - CPTI = 2; Called Party SSI + Called Party Extension.                                 |        |      |       |       |               |

## 14.7.2.8 U-SDS-DATA

- Message: U-SDS-DATA
- Response to: -
- Response expected: -
- Short description: This PDU shall be for sending user defined SDS data.

Table 14.28: U-SDS-DATA PDU contents

| Information element   | Length | Type | Owner | C/O/M | Remark            |
|---|--------|------|-------|-------|-------------------|
| PDU Type  | 5      | 1    | SDS   | M     | U-SDS-DATA        |
| Area selection  | 4      | 1    | SS    | M     | See note 1        |
| Called party type identifier  | 2      | 1    | SDS   | M     | Short/SSI/TSI     |
| Called party short number address   | 8      |      | SDS   | C     | See note 2        |
| Called party SSI  | 24     |      | SDS   | C     | See note 2        |
| Called party extension  | 24     |      | SDS   | C     | See note 2        |
| Short data type identifier  | 2      | 1    | SDS   | M     | See note 4        |
| User defined data-1   | 16     |      | SDS   | C     | See notes 3 and 4 |
| User defined data-2   | 32     |      | SDS   | C     | See notes 3 and 4 |
| User defined data-3   | 64     |      | SDS   | C     | See notes 3 and 4 |
| Length indicator  | 11     |      | SDS   | C     | See note 3        |
| User defined data-4   |        |      | SDS   | C     | See notes 3 and 5 |
| External subscriber number  |        | 3    | SDS   | O     |                   |
| DM-MS address   |        | 3    | CC    | O     |                   |
| <p>NOTE 1: This information element is used by SS-AS, refer to ETSI EN 300 392-12-8 [14].</p> <p>NOTE 2: Shall be conditional on the value of Called Party Type Identifier (CPTI):</p> <ul style="list-style-type: none"> <li>- CPTI = 0; Called Party SNA; refer to ETSI ETS 300 392-12-7 [13];</li> <li>- CPTI = 1; Called Party SSI;</li> <li>- CPTI = 2; Called Party SSI + Called Party Extension.</li> </ul> <p>NOTE 3: Shall be conditional on the value of Short Data Type Identifier (SDTI):</p> <ul style="list-style-type: none"> <li>- SDTI = 0; User Defined Data-1;</li> <li>- SDTI = 1; User Defined Data-2;</li> <li>- SDTI = 2; User Defined Data-3;</li> <li>- SDTI = 3; Length indicator + User Defined Data-4.</li> </ul> <p>NOTE 4: Any combination of address and user defined data type is allowed. However, the intention is to fit TNSDS-UNITDATA request into one subslot when possible. It is recommended that always the shortest appropriate user defined data type is used. One subslot signalling is possible on a <math>\pi/4</math>-DQPSK or D8PSK channel by using one of the following combinations:</p> <ul style="list-style-type: none"> <li>- Short Number Address and User Defined Data 1 or 2;</li> <li>- Short Subscriber Identity and User Defined Data 1.</li> </ul> <p>NOTE 5: The length of user defined data 4 is between 0 and 2 047 bits. However, if the basic link is to be used, then the longest recommended length of the user defined data 4 is 1 017 bits while using Short Subscriber Identity and FCS on a <math>\pi/4</math>-DQPSK channel (see clause 23.4.2.1, see note 2). Clause 23.4.2.1 also indicates the longest recommended size of TM-SDU for fragmentation for other modulations and channel bandwidths; the longest recommended length of the user defined data 4 using the basic link while using Short Subscriber Identity and FCS may be obtained by subtracting 89 bits from the longest recommended size of TM-SDU (subject to the maximum length of 2 047 bits for user defined data 4). In order to avoid needing to know the modulation level to be used to send the SDS data on a D8PSK or QAM channel, the longest recommended length of the user defined data 4 using the basic link on a D8PSK channel may be regarded as being the value for <math>\pi/4</math>-DQPSK modulation, and the longest recommended length of the user defined data 4 using the basic link on a QAM channel may be regarded as being the value for 4-QAM rate = <math>\frac{1}{2}</math> for the appropriate channel bandwidth.</p> |        |      |       |       |                   |

### 14.7.2.9 U-RELEASE

- Message: U-RELEASE
- Response to: D-DISCONNECT
- Response expected: -
- Short description: This PDU shall be the acknowledgement to a disconnection.

**Table 14.29: U-RELEASE PDU contents**

| Information element | Length | Type | Owner | C/O/M | Remark    |

| NOTE:               | This information element is not used in this version of the present document and its value shall be set to "0". |      |       |       |             |

## 14.7.3 PDU description tables - downlink and uplink

### 14.7.3.1 General rules for function not supported

The PDU defined in clause 14.7.3.2 may be used to indicate to the peer entity that the received PDU is not supported. Is shall be used only as a response to individually addressed PDUs.

### 14.7.3.2 CMCE FUNCTION NOT SUPPORTED

- Message: CMCE FUNCTION NOT SUPPORTED
- Response to: Any individually addressed CMCE PDU
- Response expected: -
- Short description: This PDU may be sent by the MS or SwMI to indicate that the received PDU is not supported.

**Table 14.33: CMCE FUNCTION NOT SUPPORTED PDU contents**

| Information element  | Length   | Type | Owner | C/O/M | Remark            |
|--|----------|------|-------|-------|-------------------|
| PDU type   | 5        | 1    | CC    | M     | See note 1        |
| Not-supported PDU type   | 5        | 1    | CC    | M     | See note 2        |
| Call identifier present  | 1        | 1    | CC    | M     |                   |
| Call identifier  | 14       |      | CC    | C     | See note 3        |
| Function-not-supported pointer   | 8        | 1    | CC    | M     | See note 4        |
| Length of received PDU extract   | 8        |      | CC    | C     | See note 5        |
| Received PDU extract   | variable |      | CC    | C     | See notes 5 and 6 |
| NOTE 1: This information element shall have value "CMCE FUNCTION NOT SUPPORTED" as specified in clause 14.8.28.  |          |      |       |       |                   |
| NOTE 2: This information element shall identify the PDU which contains the function which cannot be supported. The element shall have one of the values specified in clause 14.8.28.   |          |      |       |       |                   |
| NOTE 3: This information element shall be present if the value of the Call identifier present information element is "1"; this information element shall not be present if the value of the Call identifier present information element is "0" (zero).   |          |      |       |       |                   |
| NOTE 4: Element can have any value from 0 to 255 <sub>10</sub> ; if non-zero, shall point to the first bit of the element in the received PDU which indicates the function that cannot be supported by the receiving entity. If zero, shall indicate that the PDU type itself (and hence the entire PDU specified by the "Not-supported PDU type" element) cannot be supported.                  |          |      |       |       |                   |
| NOTE 5: Shall be conditional on the value of Function-not-supported pointer: if Function-not-supported pointer is non-zero, this element shall be present; if Function-not-supported pointer is zero, this element shall not be present.   |          |      |       |       |                   |
| NOTE 6: The total length of this element should be not less than the value of Function-not-supported pointer plus enough bits to identify the element in the received PDU which indicates the function that cannot be supported. This element shall not contain the PDU Type element of the received PDU because this is already specified by the "Not-supported PDU type" element (see note 2). |          |      |       |       |                   |

## 14.8 Information elements coding

### 14.8.0 General

Any of the following elements can be coded as Type 1, 2 or 3 depending on the PDU (see clause 14.7).

#### 14.8.1 Area Selection

The area selection information element shall indicate to the SwMI the distribution of the call as defined in table 14.34. The SS-AS uses this information element, refer to ETSI EN 300 392-12-8 [14].

**Table 14.34: Area selection information element contents**

| Information element | Length | Value             | Remark  |
|---------------------|--------|-------------------|---|
| Area Selection      | 4      | 0000 <sub>2</sub> | Area not defined using this information element |
|                     |        | 0001 <sub>2</sub> | Refer to ETSI EN 300 392-12-8 [14]              |
|                     |        | etc.              | etc.  |
|                     |        | 1111 <sub>2</sub> | Refer to ETSI EN 300 392-12-8 [14]              |

## 14.8.2 Basic service information

The basic service information element shall inform the other communication party what basic service is requested as defined in table 14.35. The total element length shall be 8 bits.

**Table 14.35: Basic service information element contents**

| Information sub-element  | Length | Type | C/O/M | Remark   |
|--|--------|------|-------|----------|
| Circuit mode type  | 3      | 1    | M     |          |
| Encryption flag  | 1      | 1    | M     |          |
| Communication type   | 2      | 1    | M     |          |
| Slots per frame  | 2      |      | C     | See note |
| Speech service   | 2      |      | C     | See note |
| NOTE: Shall be conditional on the value of Circuit mode type:    |        |      |       |          |
| - Circuit mode type = 000 <sub>2</sub> (Speech); Speech service; |        |      |       |          |
| - Circuit mode type = any other value; Slots per frame.          |        |      |       |          |

## 14.8.3 Call identifier

The call identifier information element shall uniquely identify a specific call as defined in table 14.36.

**Table 14.36: Call identifier information element contents**

| Information element | Length | Value                                  | Remark                   |
|---------------------|--------|--|--------------------------|
| Call identifier     | 14     | 0                                      | Dummy call identifier    |
|                     |        | 1 <sub>10</sub> - 16 383 <sub>10</sub> | Identifies call uniquely |

### 14.8.3a Call identifier present

The call identifier present information element shall indicate presence or otherwise of the call identifier element, as defined in table 14.37.

**Table 14.37: Call identifier present information element contents**

| Information element     | Length | Value | Remark                              |
|-------------------------|--------|-------|-------------------------------------|
| Call identifier present | 1      | 0     | Call identifier element not present |
|                         |        | 1     | Call identifier element present     |

## 14.8.4 Call ownership

The call ownership information element in a group call shall indicate to the MS whether it is capable to disconnect the call or not as defined in table 14.38. In individual call it indicates to both parties if it is a normal call set-up or if it is amalgamated call.

**Table 14.38: Call ownership information element contents**

| Information element | Length | Value | Remark   |
|---------------------|--------|-------|--|
| Call ownership      | 1      | 0     | Not a call owner (Group call);<br>Normal call set-up (Individual call) |
|                     |        | 1     | A call owner (Group call);<br>Amalgamated call (Individual call)       |

## 14.8.5 Called party type identifier

The called party type identifier information element shall indicate the type of address which shall follow in the PDU as defined in table 14.39.

**Table 14.39: Called party type identifier information element contents**

| Information element          | Length | Value           | Remark                          |
|------------------------------|--------|-----------------|---------------------------------|
| Called party type identifier | 2      | 00 <sub>2</sub> | Short Number Address (SNA)      |
|                              |        | 01 <sub>2</sub> | Short Subscriber Identity (SSI) |
|                              |        | 10 <sub>2</sub> | TETRA Subscriber Identity (TSI) |
|                              |        | 11 <sub>2</sub> | Reserved                        |

## 14.8.6 Called party SNA

The called party SNA element shall indicate to the SwMI the SNA of the called user as defined in table 14.40.

**Table 14.40: Called party SNA information element contents**

| Information element               | Length | Value                 | Remark                         |
|-----------------------------------|--------|-----------------------|--------------------------------|
| Called party Short Number Address | 8      | 0 - 255 <sub>10</sub> | See ETSI ETS 300 392-12-7 [13] |

## 14.8.7 Called party extension

The called party extension information element shall be to indicate to the SwMI the extended part of the TSI address of the called user as defined in table 14.41.

**Table 14.41: Called party extension information element contents**

| Information sub-element | Length | Value | Remark                              |
|-------------------------|--------|-------|-------------------------------------|
| Country Code            | 10     |       | See ETSI EN 300 392-1 [6], clause 7 |
| Network Code            | 14     |       | See ETSI EN 300 392-1 [6], clause 7 |

## 14.8.8 Called party SSI

The Called party SSI information element shall indicate to the SwMI the SSI address of the called user as defined in table 14.42.

**Table 14.42: Called party SSI information element contents**

| Information element             | Length | Value | Remark                              |
|---------------------------------|--------|-------|-------------------------------------|
| Short Subscriber Identity (SSI) | 24     |       | See ETSI EN 300 392-1 [6], clause 7 |

### 14.8.9 Calling party type identifier

The calling party type identifier information element shall indicate the type of address which shall follow in the PDU as defined in table 14.43.

**Table 14.43: Calling party type identifier information element contents**

| Information element           | Length | Value           | Remark                          |
|-------------------------------|--------|-----------------|---------------------------------|
| Calling Party Type Identifier | 2      | 00 <sub>2</sub> | Reserved                        |
|                               |        | 01 <sub>2</sub> | Short Subscriber Identity (SSI) |
|                               |        | 10 <sub>2</sub> | TETRA Subscriber Identity (TSI) |
|                               |        | 11 <sub>2</sub> | Reserved                        |

### 14.8.10 Calling party extension

The calling party extension information element shall indicate the extended part of the TSI address of the calling user as defined in table 14.44.

**Table 14.44: Calling party extension information element contents**

| Information sub-element | Length | Value | Remark                             |
|-------------------------|--------|-------|------------------------------------|
| Country Code            | 10     |       | See ETSI EN 300 392-1 [6] clause 7 |
| Network Code            | 14     |       | See ETSI EN 300 392-1 [6] clause 7 |

### 14.8.11 Calling party SSI

The Calling party SSI information element shall indicate the SSI address of the calling user as defined in table 14.45.

**Table 14.45: Calling party SSI information element contents**

| Information element             | Length | Value | Remark                             |
|---------------------------------|--------|-------|------------------------------------|
| Short Subscriber Identity (SSI) | 24     |       | See ETSI EN 300 392-1 [6] clause 7 |

### 14.8.12 Call priority

The call priority information element shall inform the SwMI or the MS about the call priority as defined in table 14.46. The SS-PC and SS-PPC use this element, refer to ETSI EN 300 392-12-10 [15] and ETSI EN 300 392-12-16 [16].

**Table 14.46: Call priority information element contents**

| Information element | Length                             | Value             | Remark                       |
|---------------------|------------------------------------|-------------------|------------------------------|
| Call priority       | 4                                  | 0000 <sub>2</sub> | Priority not defined         |
|                     |                                    | 0001 <sub>2</sub> | Priority 1 (Lowest Priority) |
|                     |                                    | 0010 <sub>2</sub> | Priority 2                   |
|                     |                                    | etc.              | etc.                         |
|                     |                                    | 1011 <sub>2</sub> | Priority 11                  |
|                     |                                    | 1100 <sub>2</sub> | Pre-emptive priority 1       |
|                     |                                    | 1101 <sub>2</sub> | Pre-emptive priority 2       |
|                     |                                    | 1110 <sub>2</sub> | Pre-emptive priority 3       |
| 1111 <sub>2</sub>   | Pre-emptive priority 4 (Emergency) |                   |                              |

### 14.8.13 Call status

The call status information element shall inform the MS about the status of the call as defined in table 14.47.

**Table 14.47: Call status information element contents**

| Information element | Length | Value            | Remark                        |
|---------------------|--------|------------------|-------------------------------|
| Call status         | 3      | 000 <sub>2</sub> | Call is proceeding            |
|                     |        | 001 <sub>2</sub> | Call is queued                |
|                     |        | 010 <sub>2</sub> | Requested subscriber is paged |
|                     |        | 011 <sub>2</sub> | Call continue                 |
|                     |        | 100 <sub>2</sub> | Hang time expired             |
|                     |        | 101 <sub>2</sub> | Reserved                      |
|                     |        | 110 <sub>2</sub> | Reserved                      |
|                     |        | 111 <sub>2</sub> | Reserved                      |

### 14.8.14 Call queued

The call queued information element shall inform the calling MS that the call has been put in queue as defined in table 14.48.

**Table 14.48: Call queued information element contents**

| Information element | Length | Value | Remark             |
|---------------------|--------|-------|--------------------|
| Call queued         | 1      | 0     | Call is not queued |
|                     |        | 1     | Call is queued     |

### 14.8.15 Continue

The continue information element shall inform the MS if it shall continue after a pause in the same state as before the pause as defined in table 14.49.

**Table 14.49: Continue information element contents**

| Information element | Length | Value | Remark       |
|---------------------|--------|-------|--------------|
| Continue            | 1      | 0     | Not continue |
|                     |        | 1     | Continue     |

### 14.8.16 Call time-out

The call time-out information element shall set the maximum call time (T310) as defined in table 14.50.

**Table 14.50: Call time-out information element contents**

| Information element | Length | Value             | Remark        |
|---------------------|--------|-------------------|---------------|
| Call time-out       | 4      | 0000 <sub>2</sub> | Infinite Time |
|                     |        | 0001 <sub>2</sub> | 30 s          |
|                     |        | 0010 <sub>2</sub> | 45 s          |
|                     |        | 0011 <sub>2</sub> | 60 s          |
|                     |        | 0100 <sub>2</sub> | 2 min         |
|                     |        | 0101 <sub>2</sub> | 3 min         |
|                     |        | 0110 <sub>2</sub> | 4 min         |
|                     |        | 0111 <sub>2</sub> | 5 min         |
|                     |        | 1000 <sub>2</sub> | 6 min         |
|                     |        | 1001 <sub>2</sub> | 8 min         |
|                     |        | 1010 <sub>2</sub> | 10 min        |
|                     |        | 1011 <sub>2</sub> | 12 min        |
|                     |        | 1100 <sub>2</sub> | 15 min        |
|                     |        | 1101 <sub>2</sub> | 20 min        |
|                     |        | 1110 <sub>2</sub> | 30 min        |
|                     |        | 1111 <sub>2</sub> | Reserved      |

### 14.8.17 Call time-out, set-up phase

The call time-out, set-up phase information element (T301 and T302) shall set the maximum set-up time valid for the call set-up phase as defined in table 14.51.

**Table 14.51: Call time-out, set-up phase information element contents**

| Information element         | Length | Value            | Remark                          |
|-----------------------------|--------|------------------|---------------------------------|
| Call time-out, set-up phase | 3      | 000 <sub>2</sub> | Use predefined value (see note) |
|                             |        | 001 <sub>2</sub> | 1 s                             |
|                             |        | 010 <sub>2</sub> | 2 s                             |
|                             |        | 011 <sub>2</sub> | 5 s                             |
|                             |        | 100 <sub>2</sub> | 10 s                            |
|                             |        | 101 <sub>2</sub> | 20 s                            |
|                             |        | 110 <sub>2</sub> | 30 s                            |
|                             |        | 111 <sub>2</sub> | 60 s                            |

NOTE: This value shall indicate that the MS shall use a predefined value for the timer.

### 14.8.17a Circuit mode type

The circuit mode type information element shall indicate the TCH type and the interleaving depth N as defined in table 14.52 (see clause 8).

**Table 14.52: Circuit mode type information element contents**

| Information element | Length | Value            | Remark                          |
|---------------------|--------|------------------|---------------------------------|
| Circuit mode type   | 3      | 000 <sub>2</sub> | Speech: TCH/S                   |
|                     |        | 001 <sub>2</sub> | Unprotected: TCH/7,2            |
|                     |        | 010 <sub>2</sub> | Low Protection: TCH/4,8, N = 1  |
|                     |        | 011 <sub>2</sub> | Low Protection: TCH/4,8, N = 4  |
|                     |        | 100 <sub>2</sub> | Low Protection: TCH/4,8, N = 8  |
|                     |        | 101 <sub>2</sub> | High Protection: TCH/2,4, N = 1 |
|                     |        | 110 <sub>2</sub> | High Protection: TCH/2,4, N = 4 |
|                     |        | 111 <sub>2</sub> | High Protection: TCH/2,4, N = 8 |

### 14.8.17b CLIR control

The CLIR control information element shall define whether the calling user invokes or overrides calling user identity presentation restriction as defined in table 14.53, refer to ETSI EN 300 392-12-1 [11].

**Table 14.53: CLIR control information element contents**

| Information element | Length | Value           | Remark                              |
|---------------------|--------|-----------------|-------------------------------------|
| CLIR control        | 2      | 00 <sub>2</sub> | Not implemented or use default mode |
|                     |        | 01 <sub>2</sub> | Reserved                            |
|                     |        | 10 <sub>2</sub> | Presentation not restricted         |
|                     |        | 11 <sub>2</sub> | Presentation restricted             |

### 14.8.17c Communication type

The communication type information element shall inform the other communication party which type of communication service is requested as defined in table 14.54.

**Table 14.54: Communication type information element contents**

| Information sub-element | Length | Value           | Remark                           |
|-------------------------|--------|-----------------|----------------------------------|
| Communication type      | 2      | 00 <sub>2</sub> | Point-to-point                   |
|                         |        | 01 <sub>2</sub> | Point-to-multipoint              |
|                         |        | 10 <sub>2</sub> | Point-to-multipoint Acknowledged |
|                         |        | 11 <sub>2</sub> | Broadcast                        |

## 14.8.18 Disconnect cause

The disconnect cause information element shall inform the MS or the infrastructure of the reason for the release/disconnection as defined in table 14.55.

**Table 14.55: Disconnect cause information element contents**

| Information element | Length  | Value              | Remark                                    |
|---------------------|---|--------------------|---|
| Disconnect cause    | 5   | 00000 <sub>2</sub> | Cause not defined or unknown              |
|                     |   | 00001 <sub>2</sub> | User requested disconnection              |
|                     |   | 00010 <sub>2</sub> | Called party busy                         |
|                     |   | 00011 <sub>2</sub> | Called party not reachable                |
|                     |   | 00100 <sub>2</sub> | Called party does not support encryption  |
|                     |   | 00101 <sub>2</sub> | Congestion in infrastructure              |
|                     |   | 00110 <sub>2</sub> | Not allowed traffic case                  |
|                     |   | 00111 <sub>2</sub> | Incompatible traffic case                 |
|                     |   | 01000 <sub>2</sub> | Requested service not available           |
|                     |   | 01001 <sub>2</sub> | Pre-emptive use of resource               |
|                     |   | 01010 <sub>2</sub> | Invalid call identifier                   |
|                     |   | 01011 <sub>2</sub> | Call rejected by the called party         |
|                     |   | 01100 <sub>2</sub> | No idle CC entity                         |
|                     |   | 01101 <sub>2</sub> | Expiry of timer                           |
|                     |   | 01110 <sub>2</sub> | SwMI requested disconnection              |
|                     |   | 01111 <sub>2</sub> | Acknowledged service not completed        |
|                     |   | 10000 <sub>2</sub> | Unknown TETRA identity                    |
|                     |   | 10001 <sub>2</sub> | SS-specific disconnection                 |
|                     |   | 10010 <sub>2</sub> | Unknown external subscriber identity      |
|                     |   | 10011 <sub>2</sub> | Call restoration of the other user failed |
|                     |   | 10100 <sub>2</sub> | Called party requires encryption          |
|                     |   | 10101 <sub>2</sub> | Concurrent set-up not supported           |
| 10110 <sub>2</sub>  | Called party is under the same DM-GATE of the calling party |                    |   |
| 10111 <sub>2</sub>  | Non-call owner requested disconnection                      |                    |   |
| 11000 <sub>2</sub>  | Reserved  |                    |   |
| etc.                | etc.  |                    |   |
| 11111 <sub>2</sub>  | Reserved  |                    |   |

## 14.8.18a DM-MS address

For the definition of the DM-MS address information element refer to ETSI EN 300 396-5 [24].

## 14.8.19 DTMF

The DTMF information element shall transfer DTMF digits (n digits where n shall be less than or equal to 254) to another user application as defined in table 14.56.

**Table 14.56: DTMF information element contents**

| Information element   | Length | Type | C/O/M | Remark            |
|---|--------|------|-------|-------------------|
| DTMF type   | 3      | 1    | M     |                   |
| DTMF digit  | 4      |      | C     | See notes 1 and 2 |
| NOTE 1: Shall be conditional on the value of DTMF type:<br>- DTMF type = 000 <sub>2</sub> (DTMF tone start); DTMF digit(s) present;<br>- DTMF type = any other value; DTMF digit information element not present.       |        |      |       |                   |
| NOTE 2: This element, if present, shall be repeated for each digit in the DTMF number.<br>The number of DTMF digits in the DTMF number information element is:<br>(the length of the DTMF information element - 3) / 4. |        |      |       |                   |

### 14.8.19a DTMF digit

The DTMF digit information element shall define the numerical values for DTMF digits as defined in table 14.57.

**Table 14.57: DTMF digit information element contents**

| Information element | Length | Value             | Remark    |
|---------------------|--------|-------------------|-----------|
| DTMF digit          | 4      | 0000 <sub>2</sub> | Digit "0" |
|                     |        | 0001 <sub>2</sub> | Digit "1" |
|                     |        | 0010 <sub>2</sub> | Digit "2" |
|                     |        | 0011 <sub>2</sub> | Digit "3" |
|                     |        | 0100 <sub>2</sub> | Digit "4" |
|                     |        | 0101 <sub>2</sub> | Digit "5" |
|                     |        | 0110 <sub>2</sub> | Digit "6" |
|                     |        | 0111 <sub>2</sub> | Digit "7" |
|                     |        | 1000 <sub>2</sub> | Digit "8" |
|                     |        | 1001 <sub>2</sub> | Digit "9" |
|                     |        | 1010 <sub>2</sub> | Digit "*" |
|                     |        | 1011 <sub>2</sub> | Digit "#" |
|                     |        | 1100 <sub>2</sub> | Digit "A" |
|                     |        | 1101 <sub>2</sub> | Digit "B" |
|                     |        | 1110 <sub>2</sub> | Digit "C" |
|                     |        | 1111 <sub>2</sub> | Digit "D" |

### 14.8.19b DTMF type

The DTMF type information element shall define DTMF tone characteristics as defined in table 14.58.

NOTE: The length of this information element is chosen so that a receiving application can differentiate between the DTMF signalling mechanisms used in edition 1 and this version of the present document based on the total length of the DTMF information element (length is exactly divisible by 4 for the edition 1 mechanism and not exactly divisible by 4 for this version).

**Table 14.58: DTMF type information element contents**

| Information element | Length | Value            | Remark              |
|---------------------|--------|------------------|---------------------|
| DTMF type           | 3      | 000 <sub>2</sub> | DTMF tone start     |
|                     |        | 001 <sub>2</sub> | DTMF tone end       |
|                     |        | 010 <sub>2</sub> | DTMF not supported  |
|                     |        | 011 <sub>2</sub> | DTMF not subscribed |
|                     |        | 100 <sub>2</sub> | Reserved            |
|                     |        | etc.             | etc.                |
|                     |        | 111 <sub>2</sub> | Reserved            |

## 14.8.20 External subscriber number

The external subscriber number information element shall transfer a subscriber number from a TETRA subscriber to a gateway or from a gateway to a TETRA subscriber. The external subscriber number can consist of  $n$  digits where  $n$  shall be less than or equal to 24. The number of digits is indicated by the preceding type 3 element length divided by four.

The digits of the external subscriber number shall be in descending order (as normally dialled in man machine interface) in the information element. Each digit in the external subscriber number information element shall be encoded as defined in table 14.59.

**Table 14.59: Encoding of the digits in the external subscriber number information element**

| Information element              | Length   | Value             | Remark    |
|----------------------------------|----------|-------------------|-----------|
| External subscriber number digit | 4        | 0000 <sub>2</sub> | Digit "0" |
|                                  |          | 0001 <sub>2</sub> | Digit "1" |
|                                  |          | 0010 <sub>2</sub> | Digit "2" |
|                                  |          | 0011 <sub>2</sub> | Digit "3" |
|                                  |          | 0100 <sub>2</sub> | Digit "4" |
|                                  |          | 0101 <sub>2</sub> | Digit "5" |
|                                  |          | 0110 <sub>2</sub> | Digit "6" |
|                                  |          | 0111 <sub>2</sub> | Digit "7" |
|                                  |          | 1000 <sub>2</sub> | Digit "8" |
|                                  |          | 1001 <sub>2</sub> | Digit "9" |
|                                  |          | 1010 <sub>2</sub> | Digit "*" |
|                                  |          | 1011 <sub>2</sub> | Digit "#" |
|                                  |          | 1100 <sub>2</sub> | Digit "+" |
|                                  |          | 1101 <sub>2</sub> | Reserved  |
|                                  |          | 1110 <sub>2</sub> | Reserved  |
| 1111 <sub>2</sub>                | Reserved |                   |           |

## 14.8.21 Encryption control

The encryption control information element shall enable an MS to request for encryption/clear mode and then be informed about the granting result of this request as defined in table 14.60.

**Table 14.60: Encryption control information element contents**

| Information element | Length | Value | Remark               |
|---------------------|--------|-------|----------------------|
| Encryption control  | 1      | 0     | Clear                |
|                     |        | 1     | End-to-end encrypted |

### 14.8.21a Encryption flag

The encryption flag information element shall indicate whether the circuit mode speech or data is end-to-end encrypted as defined in table 14.61.

**Table 14.61: Encryption flag information element contents**

| Information sub-element | Length | Value | Remark                      |
|-------------------------|--------|-------|-----------------------------|
| Encryption flag         | 1      | 0     | Clear Mode                  |
|                         |        | 1     | TETRA end-to-end encryption |

### 14.8.22 Facility

The facility information element shall be an optional variable length element and shall be used to send and receive SS information appended to the PDUs which can carry the facility element.

The size and the structure of the facility information element shall be dependent on each individual SS and shall be further detailed in the SS protocol clauses, refer to ETSI EN/ETS 300 392-12 [10].

There can be multiple facility information elements in the same PDU although a single facility information element can carry multiple supplementary services, refer to ETSI EN 300 392-9 [9].

### 14.8.23 Hook method selection

The hook method selection information element shall inform the infrastructure and the called user(s) of the preferred hook method as defined in table 14.62.

**Table 14.62: Hook method selection information element contents**

| Information element   | Length | Value | Remark                                      |
|-----------------------|--------|-------|---|
| Hook method selection | 1      | 0     | No hook signalling (direct through-connect) |
|                       |        | 1     | Hook on/Hook off signalling                 |

### 14.8.24 Length indicator

The length Indicator information element shall define the length of the user defined data-4 as defined in table 14.63.

**Table 14.63: Length indicator information element contents**

| Information element | Length | Value                | Remark     |
|---------------------|--------|----------------------|------------|
| Length indicator    | 11     | 0                    | 0 bits     |
|                     |        | 1                    | 1 bit      |
|                     |        | etc.                 | etc.       |
|                     |        | (2 <sup>11</sup> -1) | 2 047 bits |

### 14.8.25 New call identifier

The new call identifier information element coding shall be the same as for the call identifier element.

### 14.8.26 Modify

The modify information element shall change an ongoing call either to a new basic service or the behaviour from simplex to duplex or reverse as defined in table 14.64.

**Table 14.64: Modify information element contents**

| Information sub-element   | Length | Value | Remark   |
|---------------------------|--------|-------|--|
| Simplex/duplex selection  | 1      |       | See description of "Simplex/duplex selection" element  |
| Basic service information | 8      |       | See description of "Basic service information" element |

## 14.8.27 Notification indicator

The notification indicator information element shall be used in SSs by the SwMI to inform a MS of various events as defined in table 14.65.

**Table 14.65: Notification indicator information element contents**

| Information element    | Length | Value                 | Remark                                 |
|------------------------|--------|-----------------------|--|
| Notification indicator | 6      | 0 to 63 <sub>10</sub> | Refer to EN 300 392-9 [9] clause 7.2.2 |

### 14.8.27a Other party type identifier

The other party type identifier information element coding shall be the same as for the called party type identifier element, refer to clause 14.8.5.

### 14.8.27b Other party SNA

The other party SNA information element coding shall be the same as for the called party SNA element, refer to clause 14.8.6.

### 14.8.27c Other party extension

The other party extension information element coding shall be the same as for the called party extension element, refer to clause 14.8.7.

### 14.8.27d Other party SSI

The other party SSI information element coding shall be the same as for the called party SSI element, refer to clause 14.8.8.

## 14.8.28 PDU type

The PDU type information element shall identify the type of CMCE PDU sent over the air interface. The PDU type information element shall have separate definitions in the uplink and downlink directions as defined in table 14.66.

**Table 14.66: PDU type information element contents**

| Information element | Length                      | Value                       | Remark                |                |
|---------------------|-----------------------------|-----------------------------|-----------------------|----------------|
|                     |                             |                             | Downlink              | Uplink         |
| PDU Type            | 5                           | 00000 <sub>2</sub>          | D-ALERT               | U-ALERT        |
|                     |                             | 00001 <sub>2</sub>          | D-CALL-PROCEEDING     | Reserved       |
|                     |                             | 00010 <sub>2</sub>          | D-CONNECT             | U-CONNECT      |
|                     |                             | 00011 <sub>2</sub>          | D-CONNECT ACKNOWLEDGE | Reserved       |
|                     |                             | 00100 <sub>2</sub>          | D-DISCONNECT          | U-DISCONNECT   |
|                     |                             | 00101 <sub>2</sub>          | D-INFO                | U-INFO         |
|                     |                             | 00110 <sub>2</sub>          | D-RELEASE             | U-RELEASE      |
|                     |                             | 00111 <sub>2</sub>          | D-SETUP               | U-SETUP        |
|                     |                             | 01000 <sub>2</sub>          | D-STATUS              | U-STATUS       |
|                     |                             | 01001 <sub>2</sub>          | D-TX CEASED           | U-TX CEASED    |
|                     |                             | 01010 <sub>2</sub>          | D-TX CONTINUE         | U-TX DEMAND    |
|                     |                             | 01011 <sub>2</sub>          | D-TX GRANTED          | Reserved       |
|                     |                             | 01100 <sub>2</sub>          | D-TX WAIT             | Reserved       |
|                     |                             | 01101 <sub>2</sub>          | D-TX INTERRUPT        | Reserved       |
|                     |                             | 01110 <sub>2</sub>          | D-CALL-RESTORE        | U-CALL-RESTORE |
|                     |                             | 01111 <sub>2</sub>          | D-SDS-DATA            | U-SDS-DATA     |

|                     |                             | etc.                        | etc.                  | etc.           |
| 11111 <sub>2</sub>  | CMCE FUNCTION NOT SUPPORTED | CMCE FUNCTION NOT SUPPORTED |                       |                |

## 14.8.29 Poll request

This poll request information element shall be used by the SwMI to request a poll response back from the MS when an acknowledged group call has been initiated as defined in table 14.67.

**Table 14.67: Poll request information element contents**

| Information element | Length | Value | Remark                   |
|---------------------|--------|-------|--------------------------|
| Poll request        | 1      | 0     | No poll answer requested |
|                     |        | 1     | Poll answer requested    |

## 14.8.30 Poll response

This poll response information element shall be used by the MS to respond to a poll request in an acknowledged group call from the SwMI as defined in table 14.68.

**Table 14.68: Poll response information element contents**

| Information element | Length | Value | Remark           |
|---------------------|--------|-------|------------------|
| Poll response       | 1      | 0     | No poll response |
|                     |        | 1     | Poll response    |

### 14.8.31 Poll response addresses

The poll response addresses information element shall provide the addresses on responding group members in an acknowledged group call as defined in table 14.69.

**Table 14.69: Poll response addresses information element contents**

| Information element | Length | Value | Remark                              |
|---------------------|--------|-------|-------------------------------------|
| 1st TSI address     | 48     |       | See ETSI EN 300 392-1 [6], clause 7 |
| 2nd TSI address     | 48     |       |                                     |
| etc.                | etc.   |       |                                     |
| nth TSI address     | 48     |       |                                     |

### 14.8.32 Poll response number

The poll response number information element shall provide the number of responding group members in an acknowledged group call as defined in table 14.70.

**Table 14.70: Poll response number information element contents**

| Information element                | Length | Value                 | Remark |
|------------------------------------|--------|-----------------------|--------|
| Number of responding group members | 6      | 0 to 63 <sub>10</sub> |        |

### 14.8.33 Poll response percentage

The poll response percentage information element shall provide the percentage of responding group members in an acknowledged group call as defined in table 14.71.

**Table 14.71: Poll response percentage information element contents**

| Information element                              | Length | Value            | Remark   |
|--|--------|------------------|----------|
| Percentage of responding number of group members | 6      | 0                | 0 %      |
|  |        | 1                | 2 %      |
|  |        | etc.             | etc.     |
|  |        | 50 <sub>10</sub> | 100 %    |
|  |        | 51 <sub>10</sub> | Reserved |
|  |        | etc.             | etc.     |
|  |        | 63 <sub>10</sub> | Reserved |

### 14.8.34 Pre-coded status

The pre-coded status information element shall define general purpose status messages known to all TETRA systems as defined in table 14.72 and shall provide support for the SDS-TL "short reporting" protocol.

**Table 14.72: Pre-coded status information element contents**

| Information element   | Length  | Value                | Remark  |
|---|---|----------------------|---|
| Pre-coded status  | 16  | 0                    | Emergency   |
|   |   | 1                    | Reserved  |
|   |   | etc.                 | etc.  |
|   |   | 19 999 <sub>10</sub> | Reserved  |
|   |   | 20 000 <sub>10</sub> | Status values for International co-operation (see NOTE)   |
|   |   | etc.                 | etc.  |
|   |   | 20 999 <sub>10</sub> | Status values for International co-operation (see NOTE)   |
|   |   | 21 000 <sub>10</sub> | Reserved  |
|   |   | etc.                 | etc.  |
|   |   | 31 743 <sub>10</sub> | Reserved  |
|   |   | 31 744 <sub>10</sub> | Refer to SDS-TL in clause 29                              |
|   |   | etc.                 | etc.  |
|   |   | 32 767 <sub>10</sub> | Refer to SDS-TL in clause 29                              |
|   |   | 32 768 <sub>10</sub> | Available for TETRA network and user specific definitions |
|   |   | etc.                 | etc.  |
| 65 535 <sub>10</sub>  | Available for TETRA network and user specific definitions |                      |   |
| NOTE: The meaning of the status values for international co-operation is outside the scope of the present document. |   |                      |   |

### 14.8.35 Proprietary

Proprietary is an optional, variable length information element and shall be used to send and receive proprietary defined information appended to the PDUs as defined in table 14.73. The proprietary element is terminated in CMCE.

The use, the size and the structure of the proprietary element is outside the scope of the present document.

**Table 14.73: Proprietary information element contents**

| Information element       | Length   | Value    | Remark  |
|---------------------------|----------|----------|---|
| Proprietary element owner | 8        | variable | Refer to annex H                                      |
| Proprietary information   | variable | variable | Contents is outside the scope of the present document |

### 14.8.36 Request to transmit/send data

The request to transmit/send data information element shall inform the infrastructure about immediate request to transmit or data transmission at through-connection as defined in table 14.74.

**Table 14.74: Request to transmit/send data information element contents**

| Information element           | Length | Value | Remark                                       |
|-------------------------------|--------|-------|--|
| Request to transmit/send data | 1      | 0     | Request to transmit/send data                |
|                               |        | 1     | Request that other MS may transmit/send data |

### 14.8.37 Reset call time-out timer (T310)

The reset call time-out timer information element shall reset and start the overall call length timer T310 in the MS as defined in table 14.75.

**Table 14.75: Reset call time-out timer information element contents**

| Information element       | Length | Value | Remark                               |
|---------------------------|--------|-------|--------------------------------------|
| Reset call time-out value | 1      | 0     | No reset of call time-out timer T310 |
|                           |        | 1     | Reset call time-out timer T310       |

### 14.8.38 Short data type identifier

The short data type identifier information element shall identify the length of the user defined data sent to or received from the SwMI as defined in table 14.76.

**Table 14.76: Short data type identifier information element contents**

| Information element        | Length | Value           | Remark  |
|----------------------------|--------|-----------------|---|
| Short data type identifier | 2      | 00 <sub>2</sub> | User Defined Data 1 element is 16 bits long                           |
|                            |        | 01 <sub>2</sub> | User Defined Data 2 element is 32 bits long                           |
|                            |        | 10 <sub>2</sub> | User Defined Data 3 element is 64 bits long                           |
|                            |        | 11 <sub>2</sub> | User Defined Data 4 element is 0 to 2 047 bits long (variable length) |

### 14.8.39 Simplex/duplex selection

The simplex/duplex selection information element shall be to inform the infrastructure the preferred mode of operation as defined in table 14.77.

**Table 14.77: Simplex/duplex selection information element contents**

| Information element      | Length | Value | Remark            |
|--------------------------|--------|-------|-------------------|
| Simplex/duplex selection | 1      | 0     | Simplex requested |
|                          |        | 1     | Duplex requested  |

### 14.8.39a Slots per frame

The slots per frame information element shall indicate the required bit rate for a circuit mode data call as defined in table 14.78. For TCH/7,2, TCH/4,8 and TCH/2,4 the resulting bit rate is the TCH bit rate multiplied by the number of slots per frame. (e.g. TCH/7,2 in four time slots per frame gives a circuit mode data rate of 28,8 kbit/s).

**Table 14.78: Slots per frame information element contents**

| Information sub-element | Length | Value           | Remark      |
|-------------------------|--------|-----------------|-------------|
| Slots per frame         | 2      | 00 <sub>2</sub> | One slot    |
|                         |        | 01 <sub>2</sub> | Two slots   |
|                         |        | 10 <sub>2</sub> | Three slots |
|                         |        | 11 <sub>2</sub> | Four slots  |

### 14.8.40 Speech service

The speech service information element shall indicate the required speech and channel encoding as defined in table 14.79.

**Table 14.79: Speech service information element contents**

| Information element | Length | Value           | Remark                     |
|---------------------|--------|-----------------|----------------------------|
| Speech service      | 2      | 00 <sub>2</sub> | TETRA encoded speech       |
|                     |        | 01 <sub>2</sub> | Reserved                   |
|                     |        | 10 <sub>2</sub> | Reserved                   |
|                     |        | 11 <sub>2</sub> | Proprietary encoded speech |

#### 14.8.41 Temporary address

The temporary address information element coding shall be the same as for the SSI element.

#### 14.8.42 Transmission grant

The transmission grant information element shall inform the MS about permission to transmit as defined in table 14.80.

**Table 14.80: Transmission grant information element contents**

| Information element | Length | Value           | Remark                               |
|---------------------|--------|-----------------|--------------------------------------|
| Transmission grant  | 2      | 00 <sub>2</sub> | Transmission granted                 |
|                     |        | 01 <sub>2</sub> | Transmission not granted             |
|                     |        | 10 <sub>2</sub> | Transmission request queued          |
|                     |        | 11 <sub>2</sub> | Transmission granted to another user |

#### 14.8.43 Transmission request permission

The transmission request permission information element shall inform the MS if it is allowed to request for transmit permission as defined in table 14.81.

**Table 14.81: Transmission request permission information element contents**

| Information element             | Length | Value | Remark                                  |
|---------------------------------|--------|-------|---|
| Transmission request permission | 1      | 0     | Allowed to request for transmission     |
|                                 |        | 1     | Not allowed to request for transmission |

#### 14.8.44 Transmitting party type identifier

The transmitting party type identifier information element coding shall indicate the type of address which shall follow in the PDU as defined in table 14.82.

**Table 14.82: Transmitting party type identifier information element contents**

| Information element                | Length | Value           | Remark                          |
|------------------------------------|--------|-----------------|---------------------------------|
| Transmitting party type identifier | 2      | 00 <sub>2</sub> | Reserved                        |
|                                    |        | 01 <sub>2</sub> | Short Subscriber Identity (SSI) |
|                                    |        | 10 <sub>2</sub> | TETRA Subscriber Identity (TSI) |
|                                    |        | 11 <sub>2</sub> | Reserved                        |

#### 14.8.45 Transmitting party extension

The transmitting party extension information element shall indicate the extended part of the TSI address of the transmitting user as defined in table 14.83.

**Table 14.83: Transmitting party extension information element contents**

| Information sub-element | Length | Value | Remark                              |
|-------------------------|--------|-------|-------------------------------------|
| Country Code            | 10     |       | See ETSI EN 300 392-1 [6], clause 7 |
| Network Code            | 14     |       | See ETSI EN 300 392-1 [6], clause 7 |

#### 14.8.46 Transmitting party SSI

The transmitting party SSI information element shall indicate the SSI address of the transmitting user as defined in table 14.84.

**Table 14.84: Transmitting party SSI information element contents**

| Information element             | Length | Value | Remark                              |
|---------------------------------|--------|-------|-------------------------------------|
| Short Subscriber Identity (SSI) | 24     |       | See ETSI EN 300 392-1 [6], clause 7 |

#### 14.8.47 TX demand priority

The TX demand priority information element shall inform the SwMI about the importance of a TX-Demand as defined in table 14.85.

**Table 14.85: Tx demand priority information element contents**

| Information element | Length | Value           | Remark                               |
|---------------------|--------|-----------------|--------------------------------------|
| TX demand priority  | 2      | 00 <sub>2</sub> | Low priority level                   |
|                     |        | 01 <sub>2</sub> | High priority level                  |
|                     |        | 10 <sub>2</sub> | Pre-emptive priority level           |
|                     |        | 11 <sub>2</sub> | Emergency pre-emptive priority level |

#### 14.8.48 Type 3 element identifier

The type 3 element identifier information element shall indicate the type of the following type 3 element in the PDU as defined in table 14.86.

**Table 14.86: Type 3 element identifier information element contents**

| Information element       | Length      | Value             | Remark   |
|---------------------------|-------------|-------------------|--|
| Type 3 element identifier | 4           | 0000 <sub>2</sub> | Reserved   |
|                           |             | 0001 <sub>2</sub> | DTMF   |
|                           |             | 0010 <sub>2</sub> | External subscriber number                       |
|                           |             | 0011 <sub>2</sub> | Facility   |
|                           |             | 0100 <sub>2</sub> | Poll response addresses                          |
|                           |             | 0101 <sub>2</sub> | Temporary address                                |
|                           |             | 0110 <sub>2</sub> | DM-MS address                                    |
|                           |             | 0111 <sub>2</sub> | Reserved for any future specified Type 3 element |
|                           |             | etc.              | etc.   |
| 1111 <sub>2</sub>         | Proprietary |                   |  |

#### 14.8.49 User defined data-1

The User Defined Data-1 information element shall enable the user applications to determine their own interpretation of the SDS message as defined in table 14.87.

**Table 14.87: User Defined Data-1 information element contents**

| Information element | Length | Value               | Remark  |
|---------------------|--------|---------------------|---|
| User Defined Data-1 | 16     | 0 to $(2^{16} - 1)$ | All values available for the user application |

### 14.8.50 User defined data-2

The User Defined Data-2 information element shall enable the user applications to determine their own interpretation of the SDS message as defined in table 14.88.

**Table 14.88: User Defined Data-2 information element contents**

| Information element | Length | Value               | Remark  |
|---------------------|--------|---------------------|---|
| User Defined Data-2 | 32     | 0 to $(2^{32} - 1)$ | All values available for the user application |

### 14.8.51 User defined data-3

The User Defined Data-3 information element shall enable the user applications to determine their own interpretation of the SDS message as defined in table 14.89.

**Table 14.89: User Defined Data-3 information element contents**

| Information element | Length | Value               | Remark  |
|---------------------|--------|---------------------|---|
| User Defined Data-3 | 64     | 0 to $(2^{64} - 1)$ | All values available for the user application |

### 14.8.52 User defined data-4

The User Defined Data-4 information element shall enable the user applications to determine their own interpretation of the SDS message as defined in table 14.90. The first 8 bits of the user defined data-4 element shall contain a protocol identifier as defined in clause 29.

**Table 14.90: User Defined Data-4 information element contents**

| Information element                    | Length                        | Value    | Remark             |
|--|-------------------------------|----------|--------------------|
| Protocol identifier                    | 8                             | variable | Refer to clause 29 |
| Protocol dependent User Defined Data-4 | variable<br>(0 to 2 039 bits) | variable | Refer to clause 29 |

---

## 15 Mobility Management (MM) service description

### 15.1 Introduction

This clause describes the services offered by the MM entity (see ETSI EN 300 392-1 [6], clause 6) for the V+D TETRA layer 3 air interface. The MM SAP is used in conformance testing as a normative boundary in TETRA MSs.

### 15.2 Services offered

The MM shall be a service provider for mobility service users on the layer 3 MS air interface. The services shall be made available through a TETRA Network Mobility Management Service Access Point (TNMM-SAP) (see ETSI EN 300 392-1 [6], clause 6) which is shown in figure 15.1. The protocol description is defined in clause 16.

The services offered by MM are:

- registration (mandatory), this service shall allow a user to register manually to the network, the user shall be then informed of the result of the registration. When a MS roams or migrates the user application shall be also informed that the MS is ready for use or that registration was not possible (see ETSI EN 300 392-1 [6], clause 9);
- de-registration (detach) (optional), this service allows a user to request cancellation of the registration;
- change of energy saving mode (optional), this service shall allow the user to ask for changing the energy saving mode with confirmation or to receive and to respond to an energy saving mode allocation;
- change of dual watch mode (optional), this service allows the user to ask for dual watch operation with an appropriate energy economy group or to end dual watch operation;
- attachment/detachment of group identities (optional), this service shall allow the user application to either activate or deactivate already defined group identities in the MS/LS. The service shall also inform the user applications of the result of the attachment/detachment of the group identities both when the user application initiates the attachment/detachment or when the SwMI initiates the attachment/detachment;
- information concerning state of the mobile (optional).

NOTE: Enable, disable service is defined in ETSI EN 300 392-7 [8], this service allows a user to be aware of the temporary or permanent disabling asked by the network. The user application is also made aware of the cessation of a temporary disable.

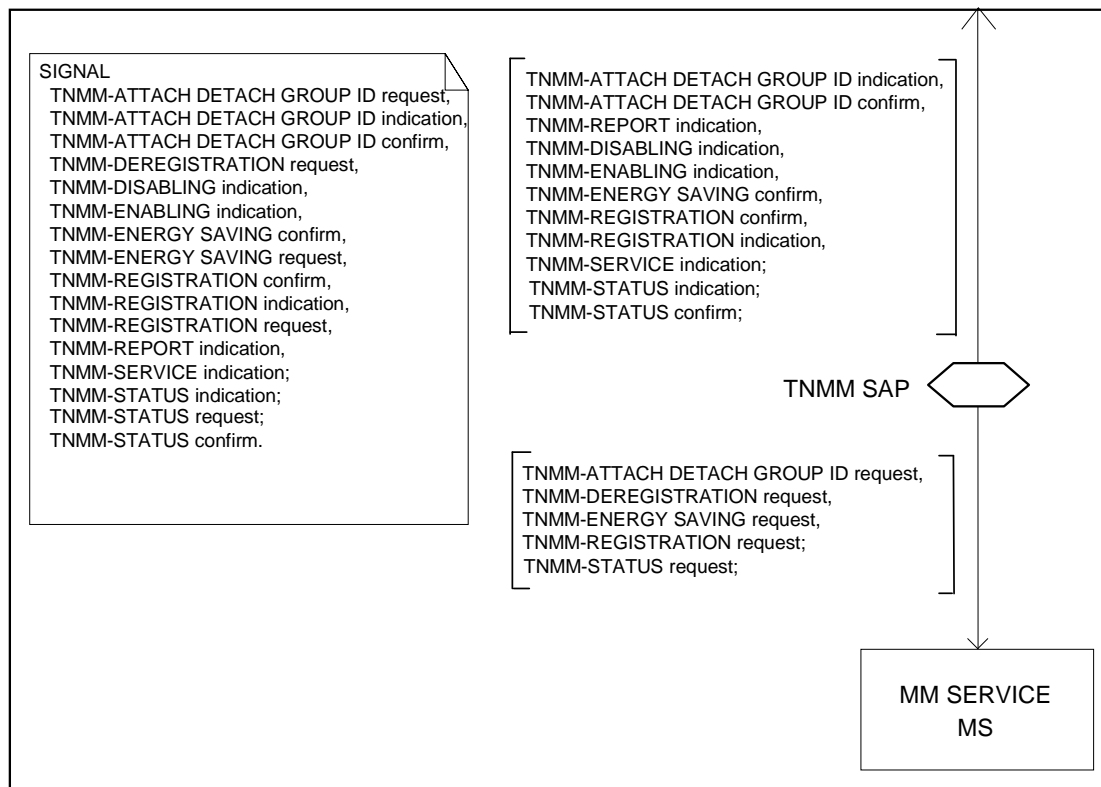

### 15.3 Primitive description

#### 15.3.0 General

The services shall be provided through primitives at the TNMM-SAP. Clauses 15.3.1 to 15.3.4 describe the primitives and their parameters. Clauses 15.3.5 and 15.3.6 describe states and state transitions.

### 15.3.1 Service state model for the MS

The primitives provided at the TNMM-SAP are illustrated in figure 15.1.

NOTE: TNMM-DISABLING and TNMM-ENABLING primitives are defined in ETSI EN 300 392-7 [8].

**Figure 15.1: Services provided at TNMM-SAP/MS-side**

### 15.3.2 Service primitives at the TNMM-SAP, MS/LS side

The set of MM primitives that are available to provide the specified service to the user application shall be:

- **TNMM-ATTACH DETACH GROUP IDENTITY request/indication/confirm:** the primitives shall be used to handle activation and deactivation of defined GTSIs in the MS/LS or to request group report from SwMI;
- **TNMM-DEREGISTRATION request:** the primitive shall be used to handle detachment of attached ITSIs;
- **TNMM-ENERGY SAVING indication /request/confirm:** the primitives shall be used to exchange energy saving mode of operation to the SwMI;
- **TNMM-REGISTRATION request/indication/confirm:** the primitives shall be used to handle attachment of ITSIs and can as well be used for activation/de-activation of GSSIs;
- **TNMM-REPORT indication:** the primitive shall be used to inform the user application of a successful or unsuccessful transmission of U-ITSI DETACH;
- **TNMM-SERVICE indication:** the primitive shall be used as an indication to the user application to reflect the service state of the MS, i.e. whether it shall be possible to initiate or receive communication using the current network;
- **TNMM-STATUS request/indication/response/confirm:** the primitives shall be used for various mobility management services.

### 15.3.3 Primitive description

#### 15.3.3.0 General

The information contained in the primitive description tables which follow corresponds to the following key:

M: Mandatory;

C: Conditional;

O: Optional;

-: Not used.

#### 15.3.3.1 TNMM-ATTACH DETACH GROUP IDENTITY primitive

**TNMM-ATTACH DETACH GROUP IDENTITY request:** the primitive shall be used by the user application to activate or deactivate one or more defined group identities in the MS/LS or ask for group report.

**TNMM-ATTACH DETACH GROUP IDENTITY indication:** the primitive shall be used as an indication to the user application when the SwMI has activated or de-activated one or more defined group identities in the MS/LS.

**TNMM-ATTACH DETACH GROUP IDENTITY confirm:** the primitive shall be used as an indication to the user, that the requested activation or de-activation of group identities is negotiated between the MS/LS and the SwMI.

The parameters shall be as defined in table 15.1.

**Table 15.1: Parameters for the primitive TNMM-ATTACH DETACH GROUP IDENTITY**

| Parameter                         | Request | Indication | Confirm |
|-----------------------------------|---------|------------|---------|
| Group identity attach detach mode | M       | -          | M       |
| Group identity request            | M       | -          | -       |
| Group identity report             | O       | -          | O       |
| Group identities                  | -       | M          | M       |

#### 15.3.3.2 TNMM-DEREGISTRATION primitive

**TNMM-DEREGISTRATION request:** the primitive shall be used to request to cancel the registration, stimulated either by removing the "ITSI identity" or a "log-off" application or automatically in the power off phase.

The parameters shall be as defined in table 15.2.

**Table 15.2: Parameters for the primitive TNMM-DEREGISTRATION**

| Parameter   | Request |
|---|---------|
| ISSI  | O       |
| MCC   | O       |
| MNC   | O       |
| NOTE: In case all the attached ITSIs are detached, the parameters need not to be present. |         |

#### 15.3.3.3 TNMM-DISABLING primitive

Refer to ETSI EN 300 392-7 [8], clause 5.

#### 15.3.3.4 TNMM-ENABLING primitive

Refer to ETSI EN 300 392 7 [8], clause 5.

### 15.3.3.5 TNMM-ENERGY SAVING primitive

**TNMM-ENERGY SAVING indication:** the primitive shall be used to indicate to the user application a start or change of energy economy mode the SwMI wants to use.

**TNMM-ENERGY SAVING request:** the primitive shall be used by the user application to change or re-state to the SwMI what energy economy mode the MS wants to use.

**TNMM-ENERGY SAVING confirm:** the primitive shall be used as a confirmation to the user application that the changed or re-stated energy economy mode has been reported to the SwMI.

The parameters shall be as defined in table 15.3.

**Table 15.3: Parameters for the primitive TNMM-ENERGY SAVING**

| Parameter                  | Request | Confirm | Indication |
|----------------------------|---------|---------|------------|
| Energy economy mode        | M       | M       | O          |
| Energy economy mode status | -       | M       | O          |

### 15.3.3.6 TNMM-REPORT primitive

**TNMM-REPORT indication:** the primitive shall be used to inform the user application of a successful or unsuccessful transmission of U-ITSI DETACH.

The parameters shall be as defined in table 15.4.

**Table 15.4: Parameters for the TNMM-REPORT primitive**

| Parameter       | Indication |
|-----------------|------------|
| Transfer result | M          |

### 15.3.3.7 TNMM-REGISTRATION primitive

**TNMM-REGISTRATION request:** the primitive shall be used by the user application to initiate attachment and registration of the terminal.

**TNMM-REGISTRATION indication:** the primitive shall be used as an indication to the user application that the LS/MS has carried out registration procedure (either successfully or unsuccessfully) or that LA registration is expired.

**TNMM-REGISTRATION confirm:** the primitive shall be used to inform the user application that registration is confirmed. The primitive may be used to inform the user that the MS/LS is ready for use.

The parameters shall be as defined in table 15.5.

**Table 15.5: Parameters for the primitive TNMM-REGISTRATION**

| Parameter  | Request | Indication | Confirm |
|--|---------|------------|---------|
| Registration status  | -       | M          | M       |
| Registration reject cause (see note 1)   | -       | C          | C       |
| Cell type (where registered)   | -       | M          | M       |
| LA (where registered)  | -       | M          | M       |
| MCC (where registered)   | -       | M          | M       |
| MNC (where registered)   | -       | M          | M       |
| Registration type  | M       | -          | -       |
| Required cell type list  | O       | -          | -       |
| Preferred cell type list (see note 4)  | O       | -          | -       |
| SwMI's required cell types (see note 5)  | -       | O          | -       |
| Preferred LA list (see note 2)   | O       | -          | -       |
| Preferred MCC list (see note 3)  | O       | -          | -       |
| Preferred MNC list (see note 3)  | O       | -          | -       |
| ISSI   | M       | -          | -       |
| MCC (of the ISSI)  | M       | -          | -       |
| MNC (of the ISSI)  | M       | -          | -       |
| Energy economy mode  | O       | O          | O       |
| Energy economy mode status   | -       | O          | O       |
| Group identities   | -       | O          | O       |
| Group identity request   | O       | -          | -       |
| Group identity attach/detach mode  | O       | O          | O       |
| NOTE 1: Shall be present if Registration Status = "failure".   |         |            |         |
| NOTE 2: Shall be present if Registration Type = "no new ITSI - forward registration".  |         |            |         |
| NOTE 3: Shall be present if Registration Type = "New ITSI"; or<br>Registration Type = "No new ITSI - forward registration".  |         |            |         |
| NOTE 4: If both the "required cell type list" and the "preferred cell type list" parameters are included, the "preferred cell type list" shall comprise a subset of the "Required cell type list". |         |            |         |
| NOTE 5: Shall be present if Registration Status = "no permitted cell types".   |         |            |         |

### 15.3.3.8 TNMM-SERVICE primitive

**TNMM-SERVICE indication:** the primitive shall be used as an indication to the user application to reflect the service state of the MS, i.e. whether it shall be possible to initiate or receive communication using the current network.

The parameters shall be as defined in table 15.6.

**Table 15.6: Parameters for the primitive TNMM-SERVICE**

| Parameter      | Indication |
|----------------|------------|
| Service status | M          |
| Disable status | M          |

### 15.3.3.9 TNMM-STATUS primitive

**TNMM-STATUS request:** the primitive shall be used to request various mobility management services.

**TNMM-STATUS indication:** the primitive shall indicate to the user application a mobility management service or action request.

**TNMM-STATUS confirm:** the primitive shall indicate to the user application the result of a request.

The parameters shall be as defined in table 15.7.

NOTE: The energy economy mode is also managed by this primitive.

**Table 15.7: Parameters for the primitive TNMM-STATUS**

| Parameter   | Request | Indication | Confirm |
|---|---------|------------|---------|
| Service status  |         | M          |         |
| Disable status  |         | M          |         |
| Direct mode   | O       | -          | -       |
| Dual watch  | O       | O          | O       |
| Energy economy mode (see note)                                    | O       | O          | O       |
| Cell load   | -       | O          | -       |
| NOTE: This parameter is applicable with the dual watch parameter. |         |            |         |

### 15.3.4 Parameters description

Parameters shall be part of the primitives described in clause 15.3.3 and if applied the parameters shall contain the values specified in this clause.

- Cell load =
  - Cell load unknown;
  - Low cell load for CA;
  - Medium cell load for CA;
  - High cell load for CA;
  - Cell load information is not available for CA;
  - Low TCH load DA;
  - Reserved;
  - High TCH load DA;
  - Cell load information is not available for TCH in DA;
  - Low PDCH load DA;
  - High PDCH load DA;
  - Cell load information is not available for PDCH in DA;
  - Low CCH/SDS load DA;
  - High CCH/SDS load DA;
  - Cell load information is not available for CCH/SDS in DA.
- Cell type (where registered) =
  - CA cell;
  - DA cell.

- Class of usage =
  - Class of Usage 1;
  - Class of Usage 2;
  - Class of Usage 3;
  - Class of Usage 4;
  - Class of Usage 5;
  - Class of Usage 6;
  - Class of Usage 7;
  - Class of Usage 8.
- Disable status =
  - enabled;
  - temporary disabled;
  - permanently disabled.
- Dual watch =
  - starting dual watch mode;
  - modify or resume dual watch mode;
  - dual watch mode accepted;
  - dual watch mode rejected;
  - dual watch mode not supported;
  - terminating dual watch mode;
  - terminating dual watch mode response;
  - dual watch energy economy group changed by SwMI;
  - dual watch mode terminated by SwMI.
- Direct mode =
  - start of direct mode operation.

NOTE: A return to trunking mode is a normal registration.

- Energy economy mode =
  - stay alive;
  - energy economy mode 1;
  - energy economy mode 2;
  - energy economy mode 3;
  - energy economy mode 4;
  - energy economy mode 5;
  - energy economy mode 6;
  - energy economy mode 7.

- Energy economy mode status =
  - accepted;
  - rejected.
- Group identities =

**Table 15.8: Group identities parameter**

| Parameter  | C/O/M | Remark   |
|--|-------|----------|
| GTSI   | M     |          |
| Group Identity Attach/detach Type Identifier   | M     |          |
| Group Identity Lifetime  | C     | See note |
| Class of Usage   | C     | See note |
| Group Identity Detachment Reason   | C     | See note |
| NOTE: Shall be conditional on the value of Group Identity Type Identifier (GITI). <ul style="list-style-type: none"> <li>- GITI = Attachment; Group Identity Lifetime + Class of Usage;</li> <li>- GITI = Detachment; Group Identity Detachment Reason.</li> </ul> |       |          |

- Group identity attach/detach mode =
  - amendment;
  - detach the currently active group identities.
- Group identity request =

**Table 15.9: Group identity request parameter**

| Parameter   | C/O/M | Remark   |
|---|-------|----------|
| GTSI  | M     |          |
| Group Identity Attach/detach Type Identifier  | M     |          |
| Class of Usage  | C     | See note |
| Group Identity Detachment Request   | C     | See note |
| NOTE: Shall be conditional on the value of Group Identity Type Identifier (GITI). <ul style="list-style-type: none"> <li>- GITI = Attachment; Class of Usage;</li> <li>- GITI = Detachment; Group Identity Detachment.</li> </ul> |       |          |

- Group identity Attach/detach type identifier =
  - attachment;
  - detachment.
- Group identity lifetime =
  - permanent, attachment not needed;
  - attachment needed for next ITSI-Attach;
  - attachment not allowed after next ITSI-Attach;
  - attachment needed for next location update.
- Group identity detachment =
  - permanently detached;
  - temporary 1 detached;
  - temporary 2 detached;
  - unknown group identity.

- Group identity detachment request =
  - user initiated detachment.
- Group identity report =
  - report requested;
  - report not requested.
- GTSI =
  - Group TETRA Subscriber Identity.
- ISSI =
  - Individual Short Subscriber Identity.
- LA =
  - location area.
- MCC =
  - Mobile Country Code (see ETSI EN 300 392-1 [6], clause 7).
- MNC =
  - MNC (see ETSI EN 300 392-1 [6], clause 7).
- Preferred cell type list =
  - list of cell types.
- Preferred LA list =
  - list of preferred and/or permitted LA identities and associated MCCs and MNCs.
- Preferred MCC list =
  - list of preferred and/or permitted MCC identities.
- Preferred MNC list =
  - list of preferred and/or permitted MNC identities.

- Registration reject cause =
  - ITSI unknown;
  - illegal MS;
  - LA not allowed;
  - LA unknown;
  - network failure;
  - congestion;
  - forward registration failure;
  - service not subscribed;
  - mandatory element error;
  - message consistency error;
  - roaming not supported;
  - migration not supported;
  - no cipher KSG;
  - identified cipher KSG not supported;
  - requested cipher key type not available;
  - identified cipher key not available;
  - ciphering required;
  - authentication failure.
- Registration status =
  - success;
  - failure;
  - LA registration expired;
  - no preferred cell found;
  - no permitted cell types.
- Registration type =
  - periodic registration;
  - registration to indicated cell.
- Required cell type list =
  - list of cell types.

- Service status =
  - in service;
  - in graceful service degradation mode;
  - in service waiting for registration;
  - out of service;
  - MM busy;
  - MM idle.
- Transfer result =
  - transfer successful done;
  - transfer fail.

## 15.3.5 State description for the MS

### 15.3.5.0 General

The following clauses define the status of the different states used within the SDL description given in clause 15.3.6.

#### 15.3.5.1 Not updated

This state shall be used when the MS is ready for a registration request.

#### 15.3.5.2 Wait updating

This shall be an intermediate state while the network is processing the registration request.

#### 15.3.5.3 Updated

This shall be the state that is used while registered. The MS shall be ready for transactions.

#### 15.3.5.4 Temporary disabled

This state shall be used after receiving a <disable> message with parameter "temporary". The only way out of the state shall be a <enable> message.

#### 15.3.5.5 Permanently disabled

This state shall be used after receiving a <disable> message with parameter "permanently". There shall be no way out of the state using the air interface protocol as defined in the present document.

### 15.3.6 Service state diagram for the TNMM-SAP

The service state diagram for the TNMM-SAP shall be as shown in figures 15.2 to 15.5.

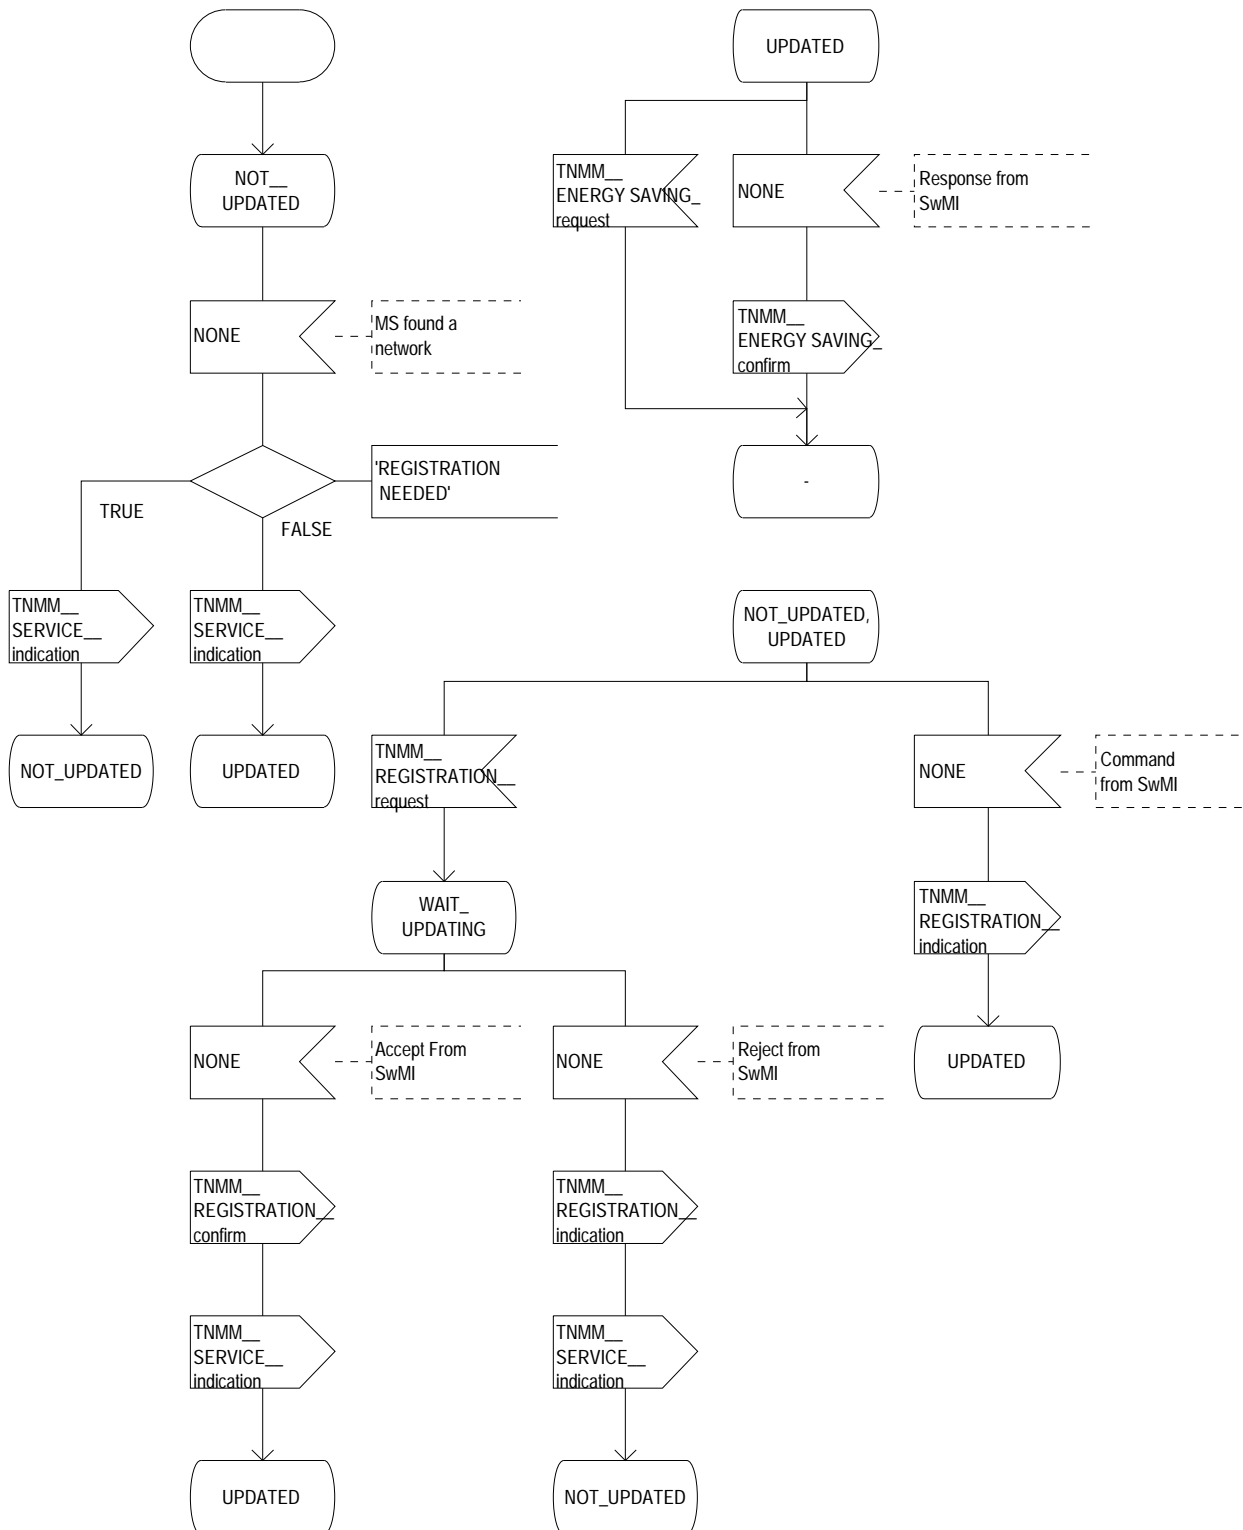

Figure 15.2: MM service state diagram (sheet 1 of 4)

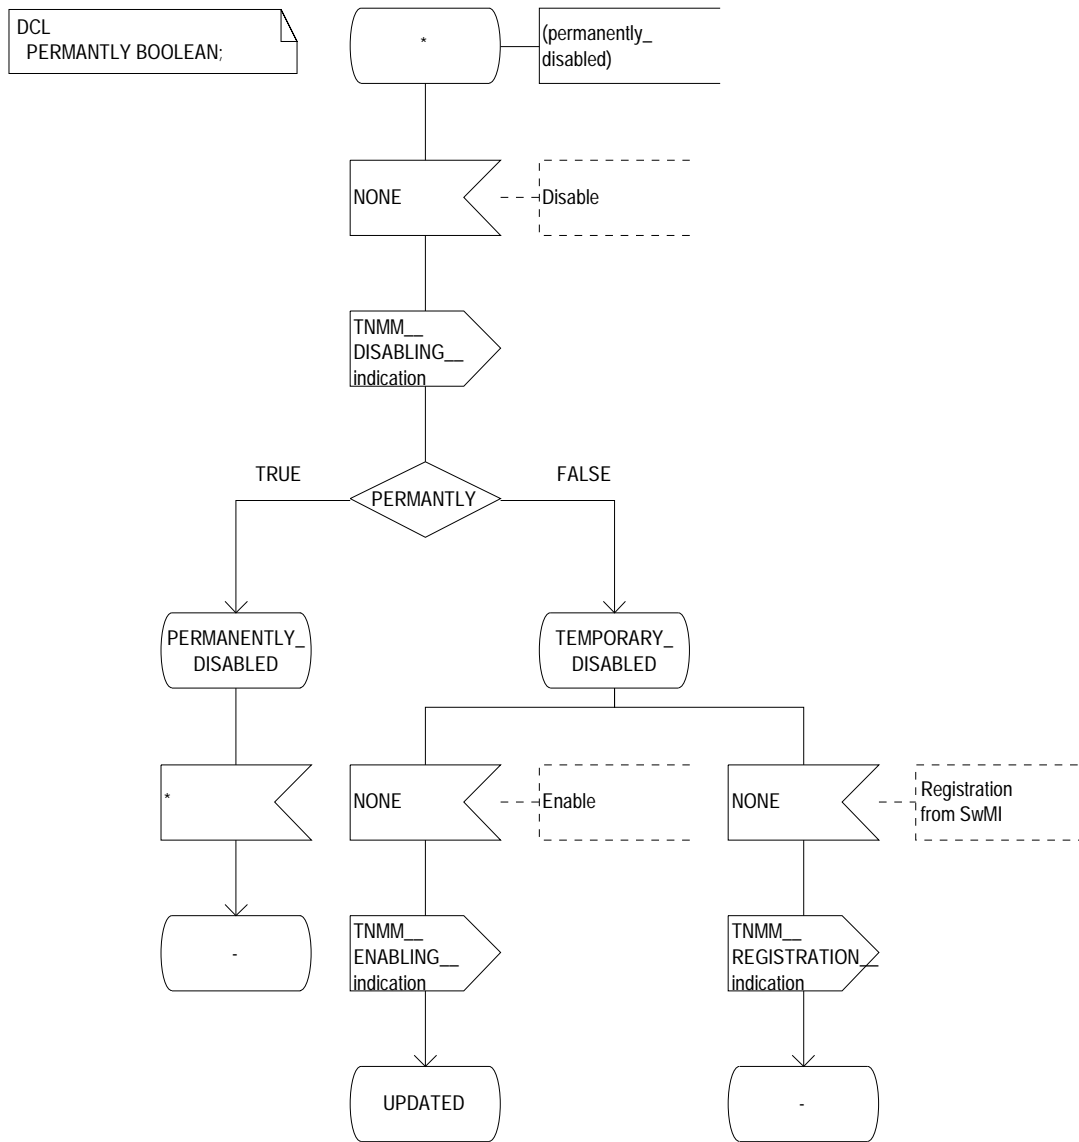

Figure 15.3: MM service state diagram (sheet 2 of 4)

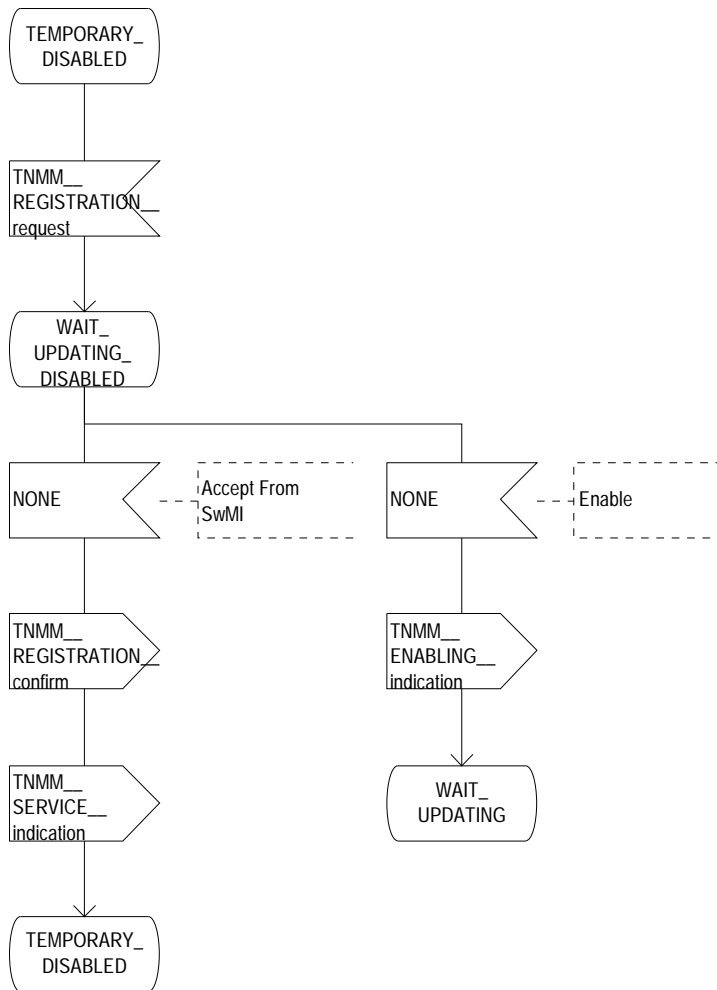

Figure 15.4: MM service state diagram (sheet 3 of 4)

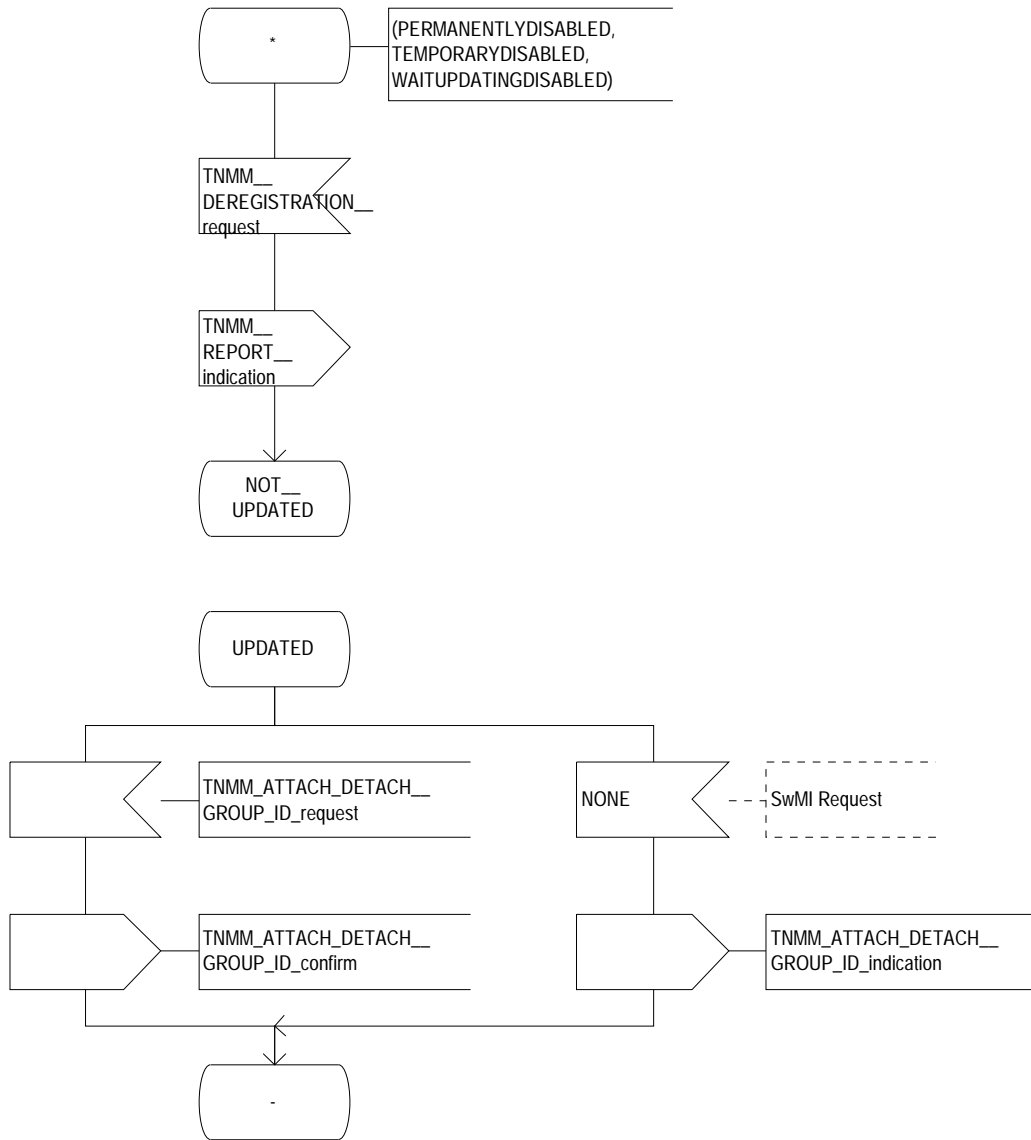

Figure 15.5: MM service state diagram (sheet 4 of 4)

---

## 16 MM protocol

### 16.1 Introduction

This clause defines for the MS the TETRA MM protocol. This is the network layer protocol that shall be used to provide the MM service (see clause 15). This clause defines the protocol functions required for operation as an end system (i.e. providing service to an end user).

This clause specifies:

- procedures for registration and de-registration of a MS;
- procedures for negotiating the energy saving scheme to be used;
- procedures for moving to direct mode and returning to trunking mode operation;
- procedures for requesting direct mode dual watch operation; and
- procedures for attachment/detachment of group identities.

In addition to this clause ETSI EN 300 392-7 [8] specifies security related parts of the MM protocol and ETSI EN 300 396-5 [24] specifies direct mode gateway related parts of the MM protocol.

The procedures are defined in terms of:

- interactions among peer network entities through the exchange of PDUs;
- interactions between a network entity and a network service user through the exchange of network service primitives;
- interaction between a network entity and an underlying service provider through the exchange of service primitives.

The timer actions in the following procedures are defined:

- start: the timer shall be reset and started to measure time as indicated in the timer parameter value (independently of the current timer count); and
- stop: the timer shall be stopped and no further actions shall be taken against that timer any more before next starting of the timer.

NOTE: This clause does not use any timer re-start where the timer is halted for a period of time and then counting continues without resetting the timer.

### 16.2 MM procedures

#### 16.2.1 General

The internal organization of the network layer including the MM entity is described in the V+D protocol architectures (see ETSI EN 300 392-1 [6], clause 6).

The underlying services offered are those of the MLE, refer to clause 17 and ETSI EN 300 392-1 [6], annex H.

## 16.2.2 Services provided by the protocol

The following services offered have been described in clause 15:

- registration on user demand (including at power up);
- registration initiated by MLE (caused by roaming or migration);
- registration requested by SwMI;
- de-registration due to user request;
- energy saving mode change to user request;
- moving to direct mode and returning to trunking mode operation to user request;
- direct mode dual watch operation to user request;
- attachment/detachment of group identities by user request; and
- attachment/detachment of group identities by SwMI request.

In addition to this clause ETSI EN 300 392-7 [8] specifies security related MM services and ETSI EN 300 396-5 [24] specifies direct mode gateway related MM services.

## 16.2.3 Underlying services assumed by the protocol

On the air interface the protocol shall use the MLE as defined in clause 17. The data transferring type when sending MLE-UNITDATA request shall be type "acknowledged" if not defined otherwise in this clause.

## 16.2.4 Services assumed from the local environment

No specific service shall be assumed from the Lower Layer Management Entity (LLME).

# 16.3 Protocol functions

## 16.3.0 General

The basic functions of the protocol defined in the present document for the MS are:

- to initiate PDU composition and decomposition;
- to initiate header error detection;
- to initiate activation of the selection of a cell sent to the MLE through an MLE-ACTIVATE request primitive at power up;
- to send a registration request in response to a request from MLE (passed to MM via the MLE-LINK indication primitive) - this includes conducting a network code check to determine the type of registration required;
- to send a registration request in response to a valid command from the infrastructure (passed to MM via the D-LOCATION UPDATE COMMAND PDU) - this includes conducting a network code check on the validity of the command;
- to send a registration request in response to a user application request for a periodic registration (passed to MM via the TNMM-REGISTRATION request primitive);
- to request MLE to locate a cell with a preferred and/or permitted MCC, MNC, LA and/or cell type in response to a user application request that is not for a periodic registration (passed to MM via the TNMM-REGISTRATION request primitive) sent to the MLE through an MLE-ACTIVATE request primitive at some time other than power up;

- to update the MLE with a new registered area through an MLE-UPDATE request primitive;
- to initiate handling of exceptional procedures reported by the MLE (failures to requests);
- to supply or update the SSI (ASSI or ISSI) to be used to the MLE through MLE-IDENTITIES request primitive. This information may be either in the D-LOCATION PROCEEDING or in the D-LOCATION UPDATE ACCEPT PDU received by the MM;
- to supply or update the complete list of GSSIs to be used to the MLE through MLE-IDENTITIES request primitive. This information shall be either in the D-LOCATION UPDATE ACCEPT, D-ATTACH/DETACH GROUP IDENTITY or D-ATTACH/DETACH GROUP IDENTITY ACKNOWLEDGEMENT PDU received by the MM;
- to send and receive PDUs to and/or from the sub-layer MLE through MLE-UNITDATA request and indication primitive. The received PDUs can be handled locally by the MM or routed to the user application;
- to send and receive PDUs to and/or from the sub-layer MLE through MLE-PREPARE request and indication primitive;
- to initiate the update criteria with the monitoring of other possible cells using an MLE-UPDATE request primitive following an infrastructure request;
- to initiate detach handling through a TNMM-DEREGISTRATION request primitive from the user, the MM shall then send a message to the infrastructure;
- to initiate energy saving mode handling following a change requested by the user: the new value may be negotiated by the MM through transmitting it to the network in a energy saving mode information element;
- to allow the MLE to indicate to other layer 3 entities that MM is involved in an individually addressed signalling exchange with the SwMI by sending (to the MLE) an MLE-BUSY request primitive;
- to allow the MLE to indicate to other layer 3 entities that MM is no longer busy by sending an MLE-IDLE request primitive at the conclusion of such an exchange;
- to request the MLE to place the MS into a state of temporary disablement by sending MLE-DISABLE request primitive;
- to request the MLE to recover the MS from its state of temporary disablement by sending MLE-ENABLE request primitive;
- to allow the MLE to remove access to communication resources for the other layer 3 entities by sending MLE-CLOSE request primitive;
- to allow the MLE to provide access to communication resources for other layer 3 entities after successful registration and after recovery from temporary disablement by sending MLE-OPEN request primitive.

On the infrastructure side, the MM functions should be symmetrical, except activation of the selection of a cell which does not exist. Figure 16.1 summarizes the MM functions.

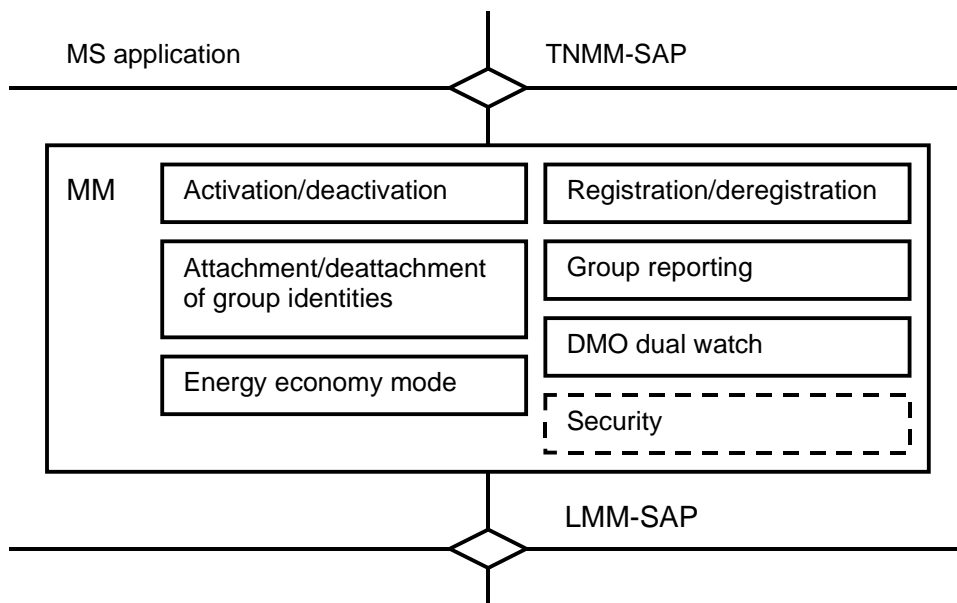

The different protocol procedures are shown in the present document by the primitive sequences and PDU exchanges. The scenarios outlined are:

- de-registration;
- energy saving mode change;
- user request registration;
- network request registration;
- MLE initiated registration;
- user request attachment/detachment of group identities;
- network request attachment/detachment of group identities;

- moving to direct mode and returning to trunking mode operation; and
- requesting direct mode dual watch operation.

Figure 16.1 indicates the main functions of the MM.

NOTE: Security functions are defined in ETSI EN 300 392-7 [8].

Figure 16.1: MM main functions on the MS

### 16.3.1 Activation and control of underlying MLE Service

#### 16.3.1.1 Activation procedure

If the MS has its ITSI or TEI or both permanently disabled the MS shall remain disabled at power up and shall not activate any of the protocol entities, refer to ETSI EN 300 392-7 [8]. The following describes the procedure for MSs that have not been permanently disabled; refer to figure 16.2.

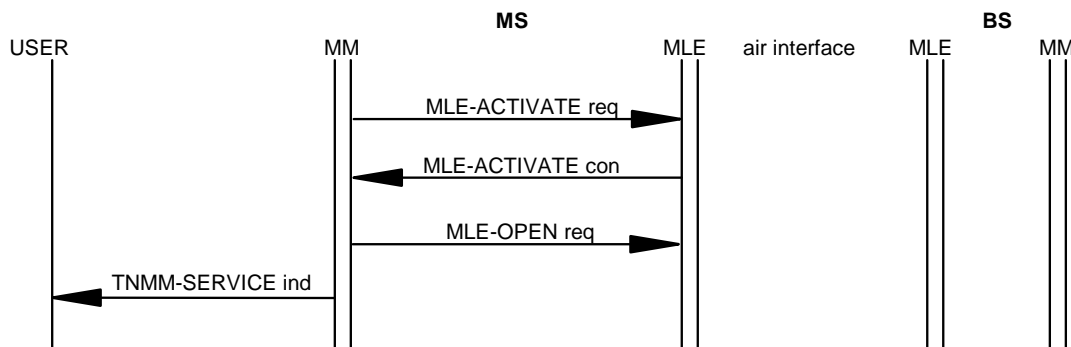

Figure 16.2: MM Activation procedure, successful cell selection

At power up, or similar start up such as a change of SIM card, the MM shall issue an MLE-ACTIVATE request primitive. The MLE-ACTIVATE request primitive shall contain a list of valid mobile network identities, valid LAs and MM's "cell type preference or requirement" (see clause 16.4.12).

When the MS performs initial cell selection (see clause 18.3.4.6), MM shall wait for the reception of either a MLE-ACTIVATE confirm or MLE-ACTIVATE indication primitive.

Upon receipt of an MLE-ACTIVATE indication primitive, the MM entity may issue a new MLE-ACTIVATE request primitive with a revised list of cell selection parameters. If no new parameters for a cell selection are available MM shall then inform the user application with a TNMM-SERVICE indication primitive issuing that the MS is "out of service".

Upon receipt of an MLE-ACTIVATE confirm primitive, the MM entity shall check whether the selected cell requires registration as follows:

- a) registration mandatory:
  - the MM shall inform the user application with TNMM-SERVICE indication primitive issuing that the MS is "in service waiting for registration".
- b) registration is not required:
  - the MM shall open the communication resources to the other higher layer entities by issuing an MLE-OPEN request primitive to MLE which shall pass it to other entities. This MLE-OPEN request primitive shall be accompanied by a list of currently valid subscriber identities (ITSI, GTSI) in an MLE-IDENTITIES request primitive. The MM shall inform the user application with TNMM-SERVICE indication primitive indicating that the MS is "in service". The TNMM-SERVICE indication primitive shall not be issued if the MS has previously been temporarily disabled and not subsequently enabled by the infrastructure.

### 16.3.1.2 Deactivation procedure

This procedure shall be invoked at power down or if the ITSI is detached from the MS. The MM shall issue an MLE-CLOSE request primitive to MLE to indicate that access to the communication resources has been closed to the other higher layer entities; SNDPCP and CMCE. MM shall then issue an MLE-DEACTIVATE request primitive.

### 16.3.1.3 Maintenance procedures

#### 16.3.1.3.1 Report and cancel handling

The cancel and report procedure may be implemented in the MS and if used the following shall apply.

Incoming MLE-REPORT indication primitives should indicate the following events:

- a PDU has been stored by the DLL ready for transmission. At this stage the transmission may be cancelled using a MLE-CANCEL request primitive and no information will be sent over the air interface;
- the first transmission of whole PDU. The BS may have received the PDU, but MS has not yet received an acknowledgement. At this stage the layer 2 process may be stopped using a MLE-CANCEL request primitive, but MM cannot rely on the cancellation and may receive a response to the sent PDU;
- a PDU has not been successfully transmitted by layer 2. Cancellation is no longer possible, but the BS may have received the PDU correctly and MM cannot rely on the cancellation and may receive a response to the sent PDU;
- a PDU has been successfully transmitted by layer 2. Cancellation is no longer possible.

The MLE-CANCEL request primitive can minimize the risk of adding extra load to the air interface, e.g. when a user application initiated registration request is buffered by the lower layers waiting for allowance to make random access attempt, which can take a considerable amount of time. If the user application during this waiting period changes its decision and wants to de-register, the application shall send a TNMM-DEREGISTRATION request primitive which will be converted to a MLE-CANCEL request primitive depending on the status of the transmission as stated above.

#### 16.3.1.3.2 Stealing permission and stealing repeats flag handling

For each PDU sent by MM, stealing permission and stealing repeats flag are set to some value. The values used are outside of the scope of the present document.

### 16.3.1.3.3 Busy handling

An MLE-BUSY request primitive shall be sent to the MLE by the MM when it initiates an individually addressed signalling exchange with the SwMI, e.g. registration, authentication, group management, etc., and an MLE-IDLE request primitive shall be sent to the MLE when the MM has completed any such signalling. This allows the MLE to indicate to other entities that MM is currently busy. MM shall also inform the state to the user application by sending TNMM-SERVICE indication primitive with "MM busy" or "MM idle" indication. The behaviour of the user application is outside the scope of the present document. However it is recommended that the user application does not initiate new signalling exchange (e.g. group attachment) while the MM is busy in another action.

### 16.3.1.3.4 Activity handling

An MLE-ACTIVITY request primitive with indication "stay alive" shall be sent to the MLE by the MM when it initiates a signalling exchange with the SwMI for which it waits for layer 3 response. An MLE-ACTIVITY request primitive with indication "sleep permitted" shall be sent to the MLE when the MM has completed any such signalling. This allows the MLE to temporarily withdraw the energy economy mode when MM is waiting for a response from the SwMI.

## 16.4 Registration procedure

### 16.4.0 General

The registration procedures are illustrated in figures 16.3 to 16.6 respectively. Registration can be initiated by the MLE, by the user application or it can be requested by the infrastructure.

Security related information elements and their usage are defined in ETSI EN 300 392-7 [8].

A MS in the temporarily disabled state shall set the location update type information element to "disabled MS updating" in all registration cases except a request for identity exchange (the first U-LOCATION UPDATE PDU of the two that the MS sends in normal registration case b)). The MS shall remain in the temporarily disabled state (i.e. access to the communication resources shall remain open only for the MM entity and those services in CMCE listed in the "permitted services" parameter of the MLE-DISABLE request primitive that was sent by MM to the MLE to initiate the temporarily disabled state). The temporarily disabled state is defined in ETSI EN 300 392-7 [8].

After the MS has sent a registration request, it shall consider itself unregistered until it receives a response, except in the case of a periodic registration (see clause 16.4.2).

After the MS has sent a forward registration (see clause 16.4.1.2), it may consider itself still attached to the cell from which it sent the forward registration while the registration response timer T351 (see clause 16.4.5) remains active. If the MS receives a rejection to a forward registration request, the MS shall consider itself still attached to the cell from which it sent the forward registration request. If the MS decides to perform a cell reselection before receiving an acknowledgement to the forward registration request, the MS shall consider itself unregistered and shall send a registration request on the new cell. The location update element type applied shall be the same as for the interrupted registration, except in case when MS was performing periodic registration; then MS shall use either value "roaming location updating" or "service restoration roaming location updating" depending whether there is an active circuit mode call. If T351 expires, the MS shall consider itself not attached to a cell (see also clause 18.3.4.7.6).

The behaviour of an MS in case it has to perform cell reselection before receiving acknowledgement to other requests related to MM procedures (e.g. group attachment/detachment), is outside the scope of the present document.

**NOTE:** The SwMI may request and receive the MS's TEI and hardware and software version numbers during the registration process. The procedures are specified in ETSI EN 300 392-7 [8].

## 16.4.1 MLE initiated registration procedure

### 16.4.1.0 General

Clause 18.3.4.7.1a specifies the conditions determining when registration is required during cell reselection. In summary, the MLE initiates normal or forward registration if:

- the new cell does not belong to the same network as the current cell; or
- cell reselection into a location area outside of the current registered area is indicated and the new cell requires registration; or
- the old cell is a conventional access (CA) cell, the new cell is a direct access (DA) cell, or vice versa, and cell type change registration is required; or
- the MS received a temporary registration on the old cell; or
- the MS selects a cell that indicates in the BS service details that "System wide services temporarily not supported" (the MLE indicates a need for normal registration even if the new cell belongs to the registered area of the MS and even if the new cell does not indicate that registration is required).

When the MLE determines that registration is necessary, it notifies MM by sending MM an MLE-LINK indication primitive. The MLE-LINK indication primitive supplies the MNC, MCC, LA and cell type of the new cell.

The registration type can be either normal, forward or periodic registration indicated by registration type parameter received in the MLE-LINK indication primitive from the MLE. The normal registration is described in clause 16.4.1.1, the forward registration in clause 16.4.1.2 and periodic registration in clause 16.4.2. Forward registration shall be applied only in case there is a circuit mode call active and the MS is attempting announced type 1/2 cell reselection.

NOTE: If the status of the cell changes from "Systemwide services temporarily not supported" to "Normal mode" and the MS is temporary registered with the cell (see clause 16.4.8), the MLE indicates a need for periodic registration.

### 16.4.1.1 Normal registration

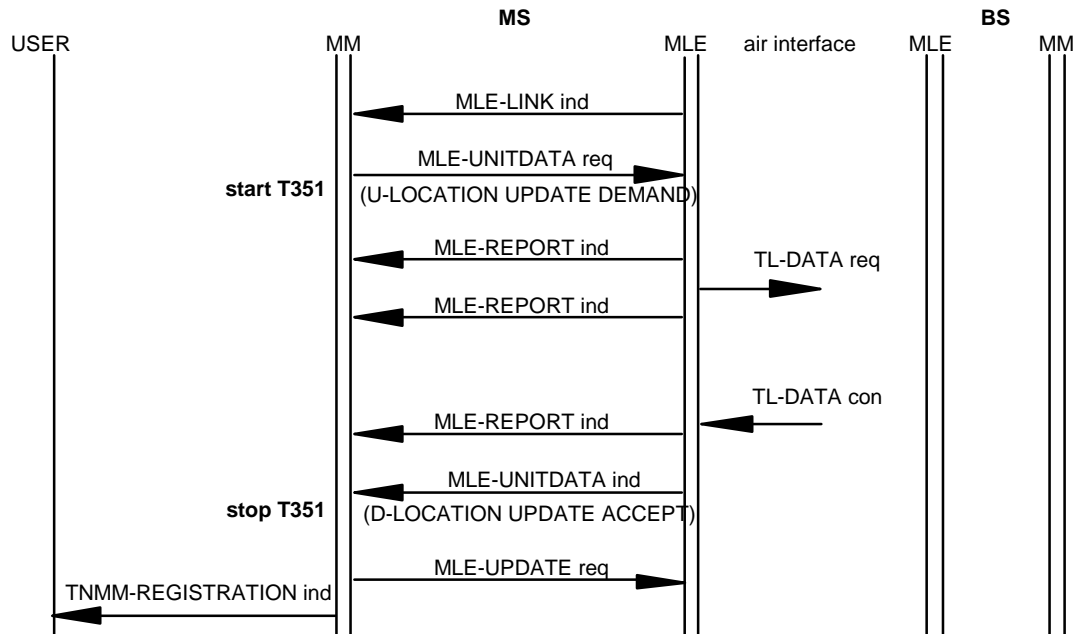

The registration procedure can be carried out with, or without, identity exchange (see ETSI EN 300 392-1 [6], clause 9). Identity exchange shall be required where the MS migrates to a new TETRA network other than the home network.

Normal registration case a) "roaming" shall be applied when the MS has already successfully registered to the network with the same ITSI, refer to figure 16.3.

Normal registration case b) "migrating; MS migrates to other than its home network" shall be applied when the MNC or MCC of the ITSI differ from the LANC and LACC of the new cell to which the MS now registers (visited SwMI) and there is no valid registration of the ITSI to the new network.

Normal registration case c) "migrating; MS migrates back to its home network" shall be applied when the MNC and MCC of the ITSI are the same as the LANC and LACC of the new cell to which the MS now registers (home SwMI) and there is no valid registration of the ITSI to the new network, refer to figure 16.3.

Normal registration case d) "temporarily disabled MS" shall always be applied if the TEI or ITSI of the MS has been temporarily disabled, refer to figure 16.3.

NOTE: MLE-REPORT shown in this figure applies to all scenarios where MM sends a PDU.

**Figure 16.3: MLE initiated registration in cases a), b) and d)**

For all cases a) to d) the information element "Group report response" shall not be present in these registration PDUs.

a) roaming:

- The MM entity shall send a U-LOCATION UPDATE DEMAND PDU to the MLE with an MLE-UNITDATA request primitive. Except when the MS is temporarily disabled (see case d) the location update type information element in the PDU shall be set either to "roaming location updating", or if there was a circuit mode call active, to "service restoration roaming location updating". If "roaming location updating", PDU priority shall be set to 3 and if "service restoration roaming location updating", PDU priority shall be set to 5. Upon sending the U-LOCATION UPDATE DEMAND PDU the MM shall assume that group identities with parameter value "Attachment for next location update required" are no longer attached. If MS wishes to receive signalling on those group identities either the U-LOCATION UPDATE DEMAND PDU may include a request for attachment/detachment of those group identities in the group identity location demand information element or MM may later attach the groups using attach mechanism, see clause 16.8.2. The PDU may contain the SSI (or SSI + address extension) information elements. If present, they shall contain the ISSI of the MS and MNI of the MS, respectively. The PDU may contain characteristics of the MS terminal in the class of MS information element and the extended capabilities information element (e.g. if the MS wishes to change the information it sent to the SwMI in its last successful registration request - but see note 1). The PDU may also contain energy economy mode information in the energy saving mode information element; if so, the timer T352 shall be started. The MS may also request to append the new LA into the current RA in the request to append LA information element. The information element LA information shall not be present in the PDU because this is not a forward registration. The MLE-UNITDATA request primitive parameters shall indicate that the identity to be used shall be the ASSI/(V)ASSI, if one has been issued, or the ISSI in the case where an ASSI/(V)ASSI has not been issued. Timer T351 shall be started.

NOTE 1: The MS is not required to include the extended capabilities information element in the U-LOCATION UPDATE DEMAND PDU if the only change in extended capabilities since the last successful registration request is the type of cell to which the MS is attempting to register.

NOTE 2: If the "class of MS" information element or the "extended capabilities" information element is not included in the U-LOCATION UPDATE DEMAND PDU and the SwMI needs to receive either of those information elements, the SwMI may accept the registration request and then send the MS a D-LOCATION UPDATE COMMAND PDU. (This could happen if, e.g. the SwMI has no record of a previous successful registration by the MS.)

NOTE 3: If ASSI or (V)ASSI is available at layer 2, it is recommended that the MS does not reveal its true identity by sending ISSI in layer 3.

b) Migrating; MS migrates to other than its home network:

- The MM entity shall request identity exchange by sending a U-LOCATION UPDATE DEMAND PDU to the MLE with an MLE-UNITDATA request primitive. The location update type information element in the PDU shall be set either to "migrating location updating", or if there was a circuit mode call active, to "service restoration migrating location updating". The location update type information element shall not be set to "disabled MS updating" in this first U-LOCATION UPDATE DEMAND PDU. If "migrating location updating", PDU priority shall be set to 3 and if "service restoration migrating location updating", PDU priority shall be set to 5. The PDU shall include the MNI of the MS in the address extension information element and may include the ISSI of the MS in the SSI information element. This first U-LOCATION UPDATE DEMAND PDU shall not include optional information elements class of MS, extended capabilities, energy saving mode and group identity location demand. The information element LA information shall not be present in the PDU because this is not a forward registration. The primitive parameters shall indicate to the lower layers that the USSI of the MS shall be used. Timer T351 shall be started.

NOTE 4: The use of the SSI information element in the U-LOCATION UPDATE DEMAND PDU is not recommended. In particular, for migration to a CA cell, inclusion of the SSI information element in the U-LOCATION UPDATE DEMAND PDU would cause the message to exceed the capacity of the MAC layer random access request. (For migration to a DA cell, the U-LOCATION UPDATE DEMAND PDU will always exceed the capacity of the MAC layer random access request.)

- If the SwMI is ready to reject the registration at this stage it shall send a D-LOCATION UPDATE REJECT PDU which shall include the MNI of the MS. The SSI in the layer 2 shall be the USSI. Otherwise the SwMI shall complete the identity exchange by sending a D-LOCATION UPDATE PROCEEDING PDU allocating a (V)ASSI.
- Upon receipt of the D-LOCATION UPDATE PROCEEDING, the MM shall check whether the MCC and MNC, included in the address extension information element, correspond to those values held in the MS. If the MNC or MCC do not correspond to the transmitted values, no further action shall be taken against that PDU. If the MNC and MCC do correspond to the transmitted values, the MM shall extract the (V)ASSI from the SSI field and send this to the MLE by using MLE-IDENTITIES request primitive. Timer T351 shall be stopped. The MS shall immediately change to use the (V)ASSI in all subsequent signalling except for the layer 2 acknowledgement for the received D-LOCATION UPDATE PROCEEDING PDU, where the USSI shall be used.

- The MM entity shall send a second U-LOCATION UPDATE DEMAND PDU to the MLE with an MLE-UNITDATA request primitive. This shall have PDU priority 6. The PDU shall contain the MNI of the MS in the address extension information element and the ISSI of the MS in the SSI information element. The PDU shall contain characteristics of the MS terminal in the class of MS information element. If the MS supports one or more of the items listed in the extended capabilities information element (other than support of CA), the PDU shall also include the extended capabilities information element. The MS should not include the extended capabilities information element if the MS supports none of the items listed in the extended capabilities information element other than support of CA (and the MS is thus requesting registration to a CA cell). The PDU may contain energy economy mode information in the energy saving mode information element; if so, the timer T352 shall be started. Upon sending the U-LOCATION UPDATE DEMAND PDU the MM shall assume that the group identities are no more attached. If MS wishes to receive signalling on those group identities either the U-LOCATION UPDATE DEMAND PDU may include a request for attachment/detachment of those group identities in the group identity location demand information element or MM may later attach the groups using attach mechanism, see clause 16.8.2. The MM shall not request to append the new LA into the current RA in the request to append LA information element. The information element LA information shall not be present in the PDU because this is not a forward registration. The location update type information element in the PDU shall be set to "demand location updating" unless the MS is temporarily disabled, in which case the element shall be set to "disabled MS updating" (see case d). The primitive parameters shall indicate that the identity to be used shall be the SSI ((V)ASSI). Timer T351 shall be started.
- c) Migrating; MS migrates back to its home network:
- The MM entity shall send a U-LOCATION UPDATE DEMAND PDU to the MLE with an MLE-UNITDATA request primitive. Except when the MS is temporarily disabled (see case d) the location update type information element in the PDU shall be set either to "migrating location updating", or if there was a circuit mode call active, to "service restoration migrating location updating". If "migrating location updating", PDU priority shall be set to 3 and if "service restoration migrating location updating", PDU priority shall be set to 5. The PDU shall include the MNI of the MS in the address extension information element and may include the ISSI of the MS in the SSI information element. The PDU shall contain characteristics of the MS terminal in the class of MS information element. If the MS supports one or more of the items listed in the extended capabilities information element (other than support of CA), the PDU shall also include the extended capabilities information element. The MS should not include the extended capabilities information element if the MS supports none of the items listed in the extended capabilities information element other than support of CA (and the MS is thus requesting registration to a CA cell). The PDU may contain energy economy mode information in the energy saving mode information element; if so, the timer T352 shall be started. Upon sending the U-LOCATION UPDATE DEMAND PDU the MM may assume that the group identities which have earlier been attached in the home network with parameter value "Attachment not needed" are attached and shall assume that all other group identities with other parameter values are no more attached. If MS wishes to receive signalling on those unattached group identities either the U-LOCATION UPDATE DEMAND PDU may include request for attachment/detachment of group identities in the group identity location demand information element or MM may later attach the groups using attach mechanism, see clause 16.8.2. The MM should not try to attach the group identities with parameter values "Attachment not allowed for next ITSI attach" or which have been permanently detached in the home network. The MS shall not request to append the new LA into the current RA in the request to append LA information element. The information element LA information shall not present in the PDU because this is not a forward registration. The primitive parameters shall indicate to the lower layers that the address to be appended shall be the ISSI. Timer T351 shall be started.
- d) Temporarily disabled MS:
- a), b) or c) shall apply with the location update type information element set to "disabled MS updating" in every instance except a request for identity exchange (the first U-LOCATION UPDATE DEMAND PDU of case b)). The MS shall remain in the temporarily disabled state (i.e. access to the communication resources shall remain open only for the MM entity and those services in CMCE listed in the "permitted services" parameter of the MLE-DISABLE request primitive that was sent by MM to the MLE to initiate the temporarily disabled state). The temporarily disabled state is defined in ETSI EN 300 392-7 [8]. In the temporarily disabled state group attachments are not allowed.

If SwMI accepts the registration it shall send a D-LOCATION UPDATE ACCEPT PDU.

For cases a), b), c) and d): upon receipt of the D-LOCATION UPDATE ACCEPT PDU received with an MLE-UNITDATA indication primitive, MM shall if present, extract the MNI from the address extension information element and check that it is the same as MNI of the MS ITSI and, if that is the case or the MNI is not present, then the MM shall:

NOTE 5: The address extension information element cannot act as complete safe guard because there is no information element for the ISSI in the PDU.

- If present, extract the ASSI or (V)ASSI from the SSI field.
- If the U-LOCATION UPDATE DEMAND contained a request for attachment/detachment of group identities, the MM shall inspect the group identity location accept information element to find out if the SwMI accepted them. In case the group identity location accept information element is not present in the D-LOCATION UPDATE ACCEPT PDU, the MS shall assume the group attachment/detachment failed. The MS shall treat the failure as equivalent to T353 timer expiry. If the group attachment acknowledgement does not contain explicit group lifetime, then the applied lifetime is outside the scope of the present document.
- The MM shall inform the MLE of ASSI or (V)ASSI and the accepted and thus attached group identities with related (V)GSSIs when applicable and shall command MLE to remove detached group identities with an MLE-IDENTITIES request primitive, see clause 16.8. The MS shall immediately change to use the ASSI or (V)ASSI in layer 2 in all subsequent signalling except for the layer 2 acknowledgement for the received D-LOCATION UPDATE ACCEPT PDU, where the SSI used shall be the same as the layer 2 address used to transfer the D-LOCATION UPDATE ACCEPT PDU.
- Timer T351 shall be stopped.
- MM shall, if information elements are present, extract from the PDU the information concerning SCCHs and minimum mode (18<sup>th</sup> frame) monitoring, energy saving information, subscriber class and new registered area information, and inform these to the lower layers in an MLE-INFO request primitive, refer to clauses 16.7.1 and 16.4.9.
- If the new registered area information element is not present in the PDU, the MS shall consider the current RA to include only the current LA the MS just registered on with no registration timeout.
- If the new registered area information element is present, then the new RA is that defined by the LAs in the New Registered Area information element and the LA timer associated with each LA shall be started. SwMI shall include the LA into which the registration was made in the New registered area information element. Refer to clause 16.4.6 for LA time-out.
- MM shall update its "cell type preference or requirement" as described in clause 16.4.12.
- The MS MM shall issue an MLE-UPDATE request primitive indicating a registration result of "Success" or "Temporary registration", the LAs in the RA, and MM's "cell type preference or requirement". MM shall inform the user application that the MS is ready for use by issuing a TNMM-REGISTRATION indication primitive containing registration, group attachment/detachment and cell type information.
- Where an energy economy mode has been requested and the MS is not informed of the outcome of this request in the D-LOCATION UPDATE ACCEPT PDU, the information shall be conveyed in a separate D-MM STATUS PDU as described in clause 16.7.1.
- For subscriber class procedures, see clause 16.4.9.

For cases b) and c) (MS migration to other than its home network, or MS migrates back to its home network), the optional Default group attachment lifetime information element may be present in the D-LOCATION UPDATE ACCEPT PDU. If the element is not present, the MS shall assume the lifetime "Attachment for next ITSI-Attach required" to be the default lifetime.

If SwMI rejects the registration it shall send a D-LOCATION UPDATE REJECT PDU. Upon receipt of a D-LOCATION UPDATE REJECT PDU MM shall if present, extract the MNI from the address extension information element and check that it is the same as MNI of the MS ITSI and shall check if timers T351 or T354 are active. If either timer T351 or T354 is active and either the MNI is present in the PDU and matches the MNI of the MS's ITSI or the MNI is not present, then the MM shall:

NOTE 6: The address extension information element cannot act as complete safe guard because there is no information element for the ISSI in the PDU.

- stop timers T351 and T352, if started;
- inform the user application about registration failure by issuing a TNMM-REGISTRATION indication primitive containing "failure" and the reject cause;
- analyse the reject cause:
  - in the event that a Congestion or Network failure is reported, MM may re-try registration after a suitable time or issue an MLE-UPDATE request primitive with a registration result of "cell rejection" in order that the MLE initiates cell reselection procedures as defined in clause 18.3.4.7;
  - in the event that "use of CA cell not permitted" or "use of DA cell not permitted" is reported, MM shall update its "cell type preference or requirement" as described in clause 16.4.12 and shall issue an MLE-UPDATE request primitive with a registration result of "cell type rejection" in order that the MLE initiates cell reselection procedures as defined in clause 18.3.4.7;
  - in the event that "LA not allowed", "Service not subscribed" or "Roaming not supported" is reported, MM shall issue an MLE-UPDATE request primitive with a registration result of "LA rejection" in order that the MLE initiates cell reselection procedures as defined in clause 18.3.4.7;
  - in the event that a ITSI/ATSI unknown is reported, if the MAC header contains ASSI or (V)ASSI, the MS shall re-try registration using the USSI or ISSI in layer 2 depending whether the MS is registering to its home network. In case MS is registering to its home network, it shall perform registration as defined in clause 16.4.2 case b) new ITSI. In case MS is registering to foreign network, it shall perform registration as defined in clause 16.4.1.1 case b) migrating; MS migrates to other than its home network. If the MAC header contains ISSI or USSI, then:
    - if the MS has received fewer than N351 registration results of type "system rejection" without a successful registration, MM shall issue an MLE-UPDATE request primitive with a registration result of "LA rejection"; or
    - if the MS has received N351 registration results of type "system rejection" without a successful registration, MM shall issue an MLE-UPDATE request primitive with a registration result of "system rejection" in order that the MLE initiates cell reselection procedures as defined in clause 18.3.4.7;
  - in the event of a Mandatory element error or Message inconsistency error is reported, the MS shall be allowed at least one registration re-try;
  - in the event of an Illegal MS or Migration not supported is reported, then:
    - if the MS has received fewer than N351 registration results of type "system rejection" without a successful registration, MM shall issue an MLE-UPDATE request primitive with a registration result of "LA rejection"; or
    - if the MS has received N351 registration results of type "system rejection" without a successful registration, MM shall issue an MLE-UPDATE request primitive with a registration result of "system rejection" in order that the MLE initiates cell reselection procedures as defined in clause 18.3.4.7;
  - the reject cause Forward registration failure is not applicable to normal registration;

The location update type information element in the U-LOCATION UPDATE DEMAND PDU shall be set to "service restoration roaming location updating" or "service restoration migrating location updating" unless the MS is temporarily disabled, in which case the element shall be set to "disabled MS updating". The U-LOCATION UPDATE DEMAND PDU may contain energy economy mode information in the energy saving mode information element; if so, the timer T352 shall be started. The PDU may contain the SSI and address extension information elements, if present, the information elements shall contain the ISSI of the MS and MNI of the MS, respectively. The PDU may also contain characteristics of the MS terminal in the class of MS information element and the extended capabilities information element (e.g. if the MS wishes to change the information it sent to the SwMI in its last successful registration request - but see note 1). The MS may also request to append the new LA into the current RA in the request to append LA information element. The PDU shall contain the location area identification of the new cell, where to the MS is forward registering, in the LA information element. Upon sending the U-LOCATION UPDATE DEMAND PDU the MM shall assume that group identities with parameter value "Attachment for next location update required" are not attached on the new LA. If MS wishes to receive signalling on those group identities the U-LOCATION UPDATE DEMAND PDU shall include a request for attachment/detachment of those group identities in the group identity location demand information element or MM may later attach the groups using attach mechanism, see clause 16.8.2. The MLE-UNITDATA request primitive parameters shall indicate that the identity to be used shall be the ASSI/(V)ASSI, if one has been issued, or the ISSI in the case where an ASSI/(V)ASSI has not been issued. Timer T351 shall be started.

NOTE 1: The MS should not include the extended capabilities information element in the U-LOCATION UPDATE DEMAND PDU if the only change in extended capabilities since the last successful registration request is the type of cell to which the MS is attempting to register.

NOTE 2: If the "class of MS" information element or the "extended capabilities" information element is not included in the U-LOCATION UPDATE DEMAND PDU and the SwMI needs to receive either of those information elements, the SwMI may accept the registration request and then send the MS a D-LOCATION UPDATE COMMAND PDU.

NOTE 3: If ASSI or (V)ASSI is available at layer 2, it is recommended that the MS does not reveal its true identity by sending ISSI in layer 3.

NOTE 4: If a temporarily disabled MS was engaged in an ambience listening call at the time that it issued the forward registration and the SwMI does not direct the MS to a traffic channel, the MS should initiate restoration of the ambience listening call on the new cell by sending a U-RESTORE PDU.

NOTE 5: In the temporarily disabled state group attachments are not allowed.

"Group report response" shall not be present in forward registration PDUs.

If the SwMI accepts the registration it shall send a D-LOCATION UPDATE ACCEPT PDU in an MLE D-NEW-CELL PDU as defined in clause 18.3.4.

Upon receipt of the D-LOCATION UPDATE ACCEPT PDU by the MLE-PREPARE confirm primitive the MM shall, if present, extract the MNI from the address extension information element and check that it is the same as MNI of the MS ITSI and, if that is either the case or the MNI is not present, then the MM shall:

- Extract the ASSI or (V)ASSI from the SSI field. The MS shall immediately change to use the ASSI/(V)ASSI in layer 2 in all subsequent signalling except for the layer 2 acknowledgement for the received D-LOCATION UPDATE ACCEPT PDU, where the same SSI shall be used as was used in layer 2 in the D-LOCATION UPDATE ACCEPT PDU. MM shall, if present, extract the MNI of the MS from the address extension information element. If the U-LOCATION UPDATE DEMAND contained request for attachment/detachment of group identities, the MM shall inspect the group identity location accept information element to find out if the SwMI accepted them. In case the group identity location accept information element is not present in the D-LOCATION UPDATE ACCEPT PDU, the MS shall assume the group attachment/detachment failed. The MS shall treat the failure as equivalent to T353 timer expiry. If the group attachment acknowledgement does not contain explicit group lifetime, then the applied lifetime is outside the scope of the present document. MM shall inform the MLE of ASSI or (V)ASSI and accepted and thus attached group identities and related (V)GSSI, when applicable with an MLE-IDENTITIES request primitive. MM shall, if information element is present, extract from the PDU the information concerning new registered area information, and inform these to the lower layers in an MLE-INFO request primitive.

NOTE 6: The address extension information element cannot act as complete safe guard because there is no information element for the ISSI in the PDU.

- If the new registered area information element is not present in the PDU, the MS shall consider the current RA to include only the current LA the MS just registered on with no registration timeout.
- If the new registered area information element is present, then the new RA is that defined by the LA's in the New registered area information element and the LA timer associated with each new LA shall be started.

NOTE 7: The LA from which the MS is roaming is not part of the new RA unless that LA is included in the New registered area information element.

- MM shall update its "cell type preference or requirement" as described in clause 16.4.12.
- Timer T351 shall be stopped. MM shall, if information elements are present, extract from the PDU the information concerning SCCH, energy saving information (economy mode, and minimum mode (18<sup>th</sup> frame) monitoring), subscriber class, if present, and inform these to the lower layers in an MLE-INFO request primitive, refer to clauses 16.7.1 and 16.4.9.
- For subscriber class procedures see clause 16.4.9.

The MS MM shall issue an MLE-UPDATE request primitive indicating a registration result of "Success" or "Temporary registration", the LAs in the RA and MM's "cell type preference or requirement". MM shall inform the user application that the MS is ready for use by issuing a TNMM-REGISTRATION indication primitive containing registration, group attachment/detachment and cell type information. Where an energy economy mode has been requested and the MS is not informed of the outcome of this request in the D-LOCATION UPDATE ACCEPT PDU, the information shall be conveyed in a separate D-MM STATUS PDU as described in clause 16.7.1.

If the SwMI rejects the registration it shall send a D-LOCATION UPDATE REJECT PDU. Upon receipt of a D-LOCATION UPDATE REJECT, MM shall if present, extract the MNI from the address extension information element and check that it is the same as MNI of the MS ITSI and shall check if timers T351 or T354 are active. If either timer T351 or T354 is active and either the MNI is present in the PDU and matches the MNI of the MS's ITSI or the MNI is not present, then the MM shall:

NOTE 8: The address extension information element cannot act as complete safe guard because there is no information element for the ISSI in the PDU.

- stop timers T351 and T352, if started;
- inform the user application about registration failure by issuing a TNMM-REGISTRATION indication primitive containing "failure" and the reject cause;
- remain registered in the current cell with previous ASSI, (V)ASSI, GSSIs and (V)GSSIs as appropriate;
- analyse the reject cause:
  - in the event that a "forward registration failure" is reported, MM shall issue an MLE-UPDATE request primitive with a registration result of "forward registration failure", refer to clause 17.3.9, in order that the MLE initiates cell reselection procedures as defined in clause 18.3.4.7;
  - in the event that "LA unknown" is reported, MM shall issue an MLE-UPDATE request primitive with a registration result of "LA rejection" in order that the MLE initiates cell reselection procedures as defined in clause 18.3.4.7;
  - all other reject causes are analysed and acted similarly as with normal registration (clause 16.4.1.1).

If neither timer T351 nor T354 was active when the MS MM received the D-LOCATION UPDATE PDU, MM shall discard the PDU without making a response at layer 3.

The SwMI should not cancel an existing registration for a particular ITSI if that ITSI fails a new authentication challenge by the SwMI.

In the temporary disabled state service restoration and forward registration are applicable only in the case of ambience listening.

## 16.4.2 User application initiated registration procedure

User application initiated registration shall be available whenever the MS is camped on a cell, i.e. has received TNMM-SERVICE indication primitive stating that the MS is "in service waiting for registration" or "in service". It shall be applied whenever an identity is attached to the MS. The user application initiated registration can be used at power up and at any time provided that an ITSI is available either within the MS, and shall be applied using the TNMM-REGISTRATION request primitive, see figure 16.5.

In case the status of the BS changes from "system wide services temporarily not supported " to "normal mode" and the MS has a temporary registration to the cell, the MLE indicates a need for periodic registration to MM by sending an MLE-LINK indication primitive. In such a case or if a LA timer expires and the LA is the current LA, the MM shall inform the user application by sending a TNMM-REGISTRATION indication primitive with registration status parameter set to "LA registration expired", LA parameter to the current LA and cell type parameter to the current cell type, so that the application could initiate registration in a suitable time e.g. after completing on-going call.

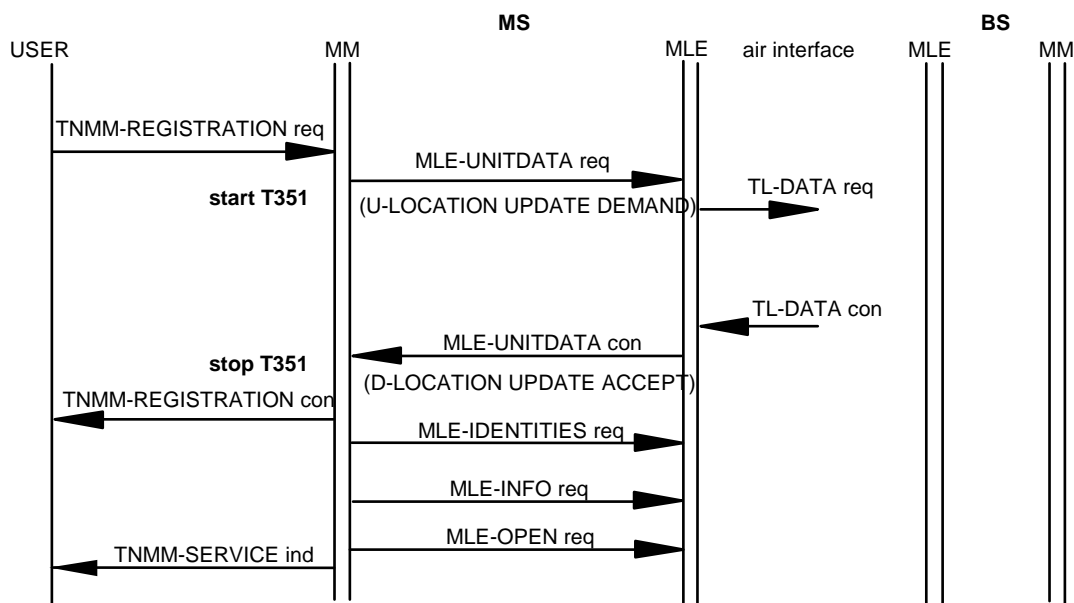

Figure 16.5: User application initiated registration in cases a) and b)

MM shall check whether the TNMM-REGISTRATION request primitive contains a request to perform a periodic registration or to select a specified MCC and MNC, LA(s) and/or cell type(s). In case the TNMM-REGISTRATION request primitive is not a periodic registration request, MM shall send the preferred network/LA list and its "cell type preference or requirement" (see clause 16.4.12) in an MLE-LINK request primitive to MLE and shall wait for MLE-LINK indication primitive. If MM receives MLE-ACTIVATE indication primitive from MLE indicating "no cell available for any service" (because MLE is not able to select from the requested MCC, MNC, LA(s) or cell types), MM shall inform the user application by issuing a TNMM-REGISTRATION confirm primitive indicating "no preferred cell found". The user application may then provide new MCC, MNC, LA information and/or cell type information to MM using a TNMM-REGISTRATION request primitive.

If MM has sent the user application a TNMM-SERVICE indication primitive stating that the MS is "in service" and the user application was not requesting periodic registration, MM shall wait for an MLE-LINK indication primitive from the MLE and perform registration as specified in clause 16.4.1. See also note 1.

If MM has sent the user application a TNMM-SERVICE indication primitive stating that the MS is "in service waiting for registration", MM shall send an MLE-LINK request primitive to MLE and wait for MLE-LINK indication primitive.

For a periodic registration request or after receiving an MLE-LINK indication primitive from the MLE, MM shall ascertain whether there is a new ITSI being attached as follows:

- case a) "no new ITSI" shall be applied when the MS with the same ITSI has already successfully registered to the same location area (home and visited SwMI) (see note 1);
- case b) "new ITSI" shall be applied at power up registration or when there is no valid registration of the ITSI to the network and the MNC and MCC of the ITSI are the same as the LANC and LACC of the cell the MS is camped on (home SwMI);
- case c) "new un-exchanged ITSI" shall be applied at power up registration or when there is no valid registration of the ITSI to the network and the MNC or MCC of the ITSI differ from the LANC or LACC of the cell the MS is camped on (visited SwMI).

In addition a temporarily disabled MS shall follow case d).

NOTE 1: When MM makes a "no new ITSI" registration request to a different location area from that where the ITSI is already successfully registered the MS performs registration as specified in clause 16.4.1.

a) no new ITSI:

- MM shall send a U-LOCATION UPDATE DEMAND PDU to the MLE with an MLE-UNITDATA request primitive. This shall have PDU priority 3.
- The location update type information element in the PDU shall be set to "periodic location updating" unless the MS is temporarily disabled, in which case the element shall be set to "disabled MS updating" (see case d).
- The PDU may contain the SSI and address extension information elements, if present, the information elements shall contain the ISSI of the MS and MNI of the MS, respectively. The PDU may also contain the class of MS information element and the extended capabilities information element (e.g. if the MS wishes to change the information it sent the SwMI in a previous successful registration request). The PDU may include the energy saving mode information element; if so, the timer T352 shall be started. Upon sending the U-LOCATION UPDATE DEMAND PDU the MM shall assume that group identities with parameter value "Attachment for next location update required" are no more attached. If MS wishes to receive signalling on those group identities either the U-LOCATION UPDATE DEMAND PDU may include request for attachment of those group identities in the group identity location demand information element or MM may later attach the groups using attach mechanism, see clause 16.8.2. The MLE-UNITDATA request primitive parameters shall indicate that the identity to be used shall be the ASSI/(V)ASSI, if one has been issued, or the ISSI in the case where an ASSI/(V)ASSI has not been issued. Timer T351 shall be started.

NOTE 2: If the "class of MS" information element or the "extended capabilities" information element is not included in the U-LOCATION UPDATE DEMAND PDU and the SwMI needs to receive either of those information elements, the SwMI may accept the registration request and then send the MS a D-LOCATION UPDATE COMMAND PDU. (This could happen if, e.g. the SwMI has no record of a previous successful registration by the MS or if the SwMI has any uncertainty about the type of cell to which the MS is registering.)

NOTE 3: If ASSI or (V)ASSI is available at layer 2, it is recommended that the MS does not reveal its true identity by sending ISSI in layer 3.

## b) new ITSI:

- in this case at the beginning the communication resources are closed. The MM shall register with the home network using ISSI. MM shall send a U-LOCATION UPDATE DEMAND PDU to the MLE with an MLE-UNITDATA request primitive. This shall have PDU priority 6. The location update type information element in the PDU shall be set to "ITSI attach" unless the MS is temporarily disabled, in which case the element shall be set to "disabled MS updating" (see case d). The PDU shall contain the characteristics of the MS terminal in the class of MS information element. If the MS supports one or more of the items listed in the extended capabilities information element (other than support of CA), the PDU shall also include the extended capabilities information element. The MS should not include the extended capabilities information element if the MS supports none of the items listed in the extended capabilities information element other than support of CA (and the MS is thus requesting registration to a CA cell). The PDU may contain the SSI and address extension information elements, if present, the information elements shall contain the ISSI of the MS and MNI of the MS, respectively. The PDU may also contain energy economy mode information in the energy saving mode information element; if so, the timer T352 shall be started. Upon sending the U-LOCATION UPDATE DEMAND PDU the MM may assume that group identities which have earlier been attached in the home network with parameter value "Attachment not needed" are attached and shall assume that all other group identities are no more attached. If MS wishes to receive signalling on the unattached group identities either the U-LOCATION UPDATE DEMAND PDU may include request for attachment/detachment of those group identities in the group identity location demand information element or MM may later attach the groups using attach mechanism, see clause 16.8.2. The MM should not try to attach the group identities with parameter values "Attachment not allowed for next ITSI attach" or which have been permanently detached in the home network. The MS shall not request to append the new LA into the current RA in the request to append LA information element. The information element LA information is not present in the PDU because this is not a forward registration. The primitive parameters shall indicate that the identity to be appended by the MAC shall be the SSI (ISSI). Timer T351 shall be started;

## c) new un-exchanged ITSI:

- in this case at the beginning the communication resources are closed. The MM shall register on a visited network using identity exchange. The MM entity shall request identity exchange by sending a U-LOCATION UPDATE DEMAND PDU with PDU priority 3 to the MLE with an MLE-UNITDATA request primitive and issue an MLE-BUSY request primitive to the MLE. The location update type information element in the PDU shall be set to "migrating location updating". The location update type information element shall not be set to "disabled MS updating" in this first U-LOCATION UPDATE DEMAND PDU. The PDU shall include the MNI of the MS in the address extension information element and may include the ISSI of the MS in the SSI information element. There shall be no optional information elements class of MS, extended capabilities, energy saving mode and group identity location demand in the PDU because they shall be present in the second U-LOCATION UPDATE DEMAND PDU, if needed. The information element LA information shall not be present in the PDU because this is not a forward registration. The primitive parameters shall indicate to the lower layers that the USSI of the MS shall be used. Timer T351 shall be started;

NOTE 4: The use of the SSI information element in the U-LOCATION UPDATE DEMAND PDU is not recommended. In particular, for migration to a CA cell, inclusion of the SSI information element in the U-LOCATION UPDATE DEMAND PDU would cause the message to exceed the capacity of the MAC layer random access request. (For migration to a DA cell, the U-LOCATION UPDATE DEMAND PDU will always exceed the capacity of the MAC layer random access request.)

- if SwMI is ready to reject the registration at this stage it shall send D-LOCATION UPDATE REJECT PDU which shall include the MNI of the MS. The SSI in the layer 2 shall be the USSI. Otherwise SwMI shall send D-LOCATION UPDATE PROCEEDING PDU allocating (V)ASSI;
- upon receipt of the D-LOCATION UPDATE PROCEEDING PDU, the MM shall, if present, extract the MNI from the address extension information element and check that it is the same as MNI of the MS ITSI and, if that is either the case or the MNI is not present, then MM shall:
  - extract the (V)ASSI from the SSI field and send this to the MLE by using MLE-IDENTITIES request primitive. The MS shall immediately change to use the (V)ASSI in all subsequent signalling except for the layer 2 acknowledgement for the received D-LOCATION UPDATE PROCEEDING PDU, where the USSI shall be used;

- stop timer T351;
- as the message is a response to a request made using the USSI, MM shall check that the MCC and the MNC included in the address extension information element, correspond to the MNI of the MS. This shall be used to ensure that if two mobiles request registrations using the same USSI that MM can distinguish between them:
  - if the MNIs do not match no action shall be taken;
  - if the MCC and the MNC do correspond the transmitted values, the MM entity shall reply with a second U-LOCATION UPDATE DEMAND PDU containing the MNI of the MS in the address extension information element and ISSI of the MS in the SSI information element, thus comprising the full ITSI to the MLE with an MLE-UNITDATA request primitive. The PDU shall contain the class of MS information element. If the MS supports one or more of the items listed in the extended capabilities information element (other than support of CA), the PDU shall also include the extended capabilities information element. The MS should not include the extended capabilities information element if the MS supports none of the items listed in the extended capabilities information element other than support of CA (and the MS is thus requesting registration to a CA cell). The PDU may also contain economy mode information in the energy saving mode information element; if so, the timer T352 shall be started. Upon sending the U-LOCATION UPDATE DEMAND PDU the MM shall assume that all group identities are no more attached. If MS wishes to receive signalling on those unattached group identities either the U-LOCATION UPDATE DEMAND PDU may include request for attachment/detachment of group identities in the group identity location demand information element or MM may later attach the groups using attach mechanism, see clause 16.8.2. The MS shall not request to append the new LA into the current RA in the request to append LA information element. The information element LA information is not present in the PDU because this is not a forward registration. This shall have PDU priority 6. The location update type information element in the PDU shall be set to "demand location updating" unless the MS is temporarily disabled, in which case the element shall be set to "disabled MS updating" (see case d). The primitive parameters shall indicate that the address to be appended by the MAC shall be the SSI ((V)ASSI). Timer T351 shall be started.

d) Temporarily disabled MS:

- a), b) or c) shall apply with the location update type set to "disabled MS updating" in every instance except a request for identity exchange (the first U-LOCATION UPDATE DEMAND PDU of case c)) but there shall be no group attachment or reporting signalling. The MS shall remain in the temporarily disabled state (i.e. access to the communication resources shall remain open only for the MM entity and those services in CMCE listed in the "permitted services" parameter of the MLE-DISABLE request primitive that was sent by MM to the MLE to initiate the temporarily disabled state). The temporarily disabled state is defined in ETSI EN 300 392-7 [8]. In the temporarily disabled state group attachments are not allowed.

If SwMI accepts the registration it shall send a D-LOCATION UPDATE ACCEPT PDU.

For cases a), b), c) and d) upon receipt of the D-LOCATION UPDATE ACCEPT PDU, which shall be received with an MLE-UNITDATA indication primitive, MM shall, if present, extract the MNI of the MS from the address extension information element and check that it is the same as MNI of the MS ITSI and, if that is the case or the MNI is not present, then the MM shall:

NOTE 5: The address extension information element cannot act as safe guard because there is no information element for the ISSI in the PDU.

- stop timer T351;

- extract any ASSI or (V)ASSI from the SSI field. If the U-LOCATION UPDATE DEMAND PDU contained request for attachment/detachment of group identities, the MM shall inspect the group identity location accept information element to find out if the SwMI accepted them. In case the group identity location accept information element is not present in the D-LOCATION UPDATE ACCEPT PDU, the MS shall assume the group attachment/detachment failed. The MS shall treat the failure as equivalent to T353 timer expiry. If the group attachment acknowledgement does not contain explicit group lifetime, then the applied lifetime is outside the scope of the present document. MM shall inform the MLE of ASSI or (V)ASSI and attached group identities with related (V)GSSIs when applicable with an MLE-IDENTITIES request primitive, see clause 16.8. The MS shall immediately change to use the ASSI or (V)ASSI in layer 2 in all subsequent signalling except for the layer 2 acknowledgement for the received D-LOCATION UPDATE ACCEPT PDU, where the SSI used shall be the same as the layer 2 address used to transfer the D-LOCATION UPDATE ACCEPT PDU;
- extract from the PDU, if information elements are present, the information concerning SCCHs and minimum mode (18<sup>th</sup> frame) monitoring, energy saving information, subscriber class and new registered area and pass these to the lower layers in an MLE-INFO request primitive, refer to clauses 16.7.1 and 16.4.9. If the new registered area information element is not present in the PDU, the MS shall consider the current RA to include only the current LA the MS just registered on with no registration timeout. If the new registered area information element is present, then the new RA is that defined by the LAs in the New registered area information element and the LA timer associated with each new LA shall be started (if applicable; i.e. if the LA Timer value is not 111<sub>2</sub>). SwMI shall include the LA into which registration was made in the New registered area information element;
- update its "cell type preference or requirement" as described in clause 16.4.12;
- issue an MLE-UPDATE request primitive indicating a registration result of "Success" or "Temporary registration", the LAs in the RA and MM's "cell type preference or requirement". MM shall inform the user application that the MS is ready for use by issuing a TNMM-REGISTRATION confirm primitive indicating "success" and containing registration, group attachment/detachment and cell type information. Where an energy economy mode has been requested and the MS is not informed of the outcome of this request in the D-LOCATION UPDATE ACCEPT PDU, the information shall be conveyed in a separate D-MM STATUS PDU as described in clause 16.7.1;
- if registration is successful and communication resources were closed, then the MM shall open the communication resources to the other higher layer entities by issuing an MLE-OPEN request primitive. The MM shall inform the user application with TNMM-SERVICE indication primitive stating that the MS is "in service" unless the MS has previously been temporarily disabled and not subsequently enabled by the infrastructure.

In cases b) (new ITSI) and c) (new unexchanged ITSI) the D-LOCATION UPDATE ACCEPT PDU may contain the optional Default group attachment lifetime information element. If the element is not present, the MS shall assume the lifetime "Attachment for next ITSI-Attach required" to be the default lifetime.

If the SwMI rejects the registration it shall send a D-LOCATION UPDATE REJECT PDU.

Upon receipt of the D-LOCATION UPDATE REJECT PDU, MM shall, if present, extract the MNI from the address extension information element and check that it is the same as MNI of the MS ITSI and shall check if timers T351 or T354 are active. If either timer T351 or T354 is active and either the MNI is present in the PDU and matches the MNI of the MS's ITSI or the MNI is not present, then MM shall:

NOTE 6: The address extension information element cannot act as complete safe guard because there is no information element for the ISSI in the PDU.

- stop timers T351 and T352, if started;
- inform the user application about registration failure by issuing a TNMM-REGISTRATION indication primitive containing "failure" and the reject cause;
- analyse the reject cause and act similarly as in normal registration, see clause 16.4.1.1.
- further registration requests can be made in response to the receipt of further TNMM-REGISTRATION requests primitive from the user application, once a new cell has been selected.

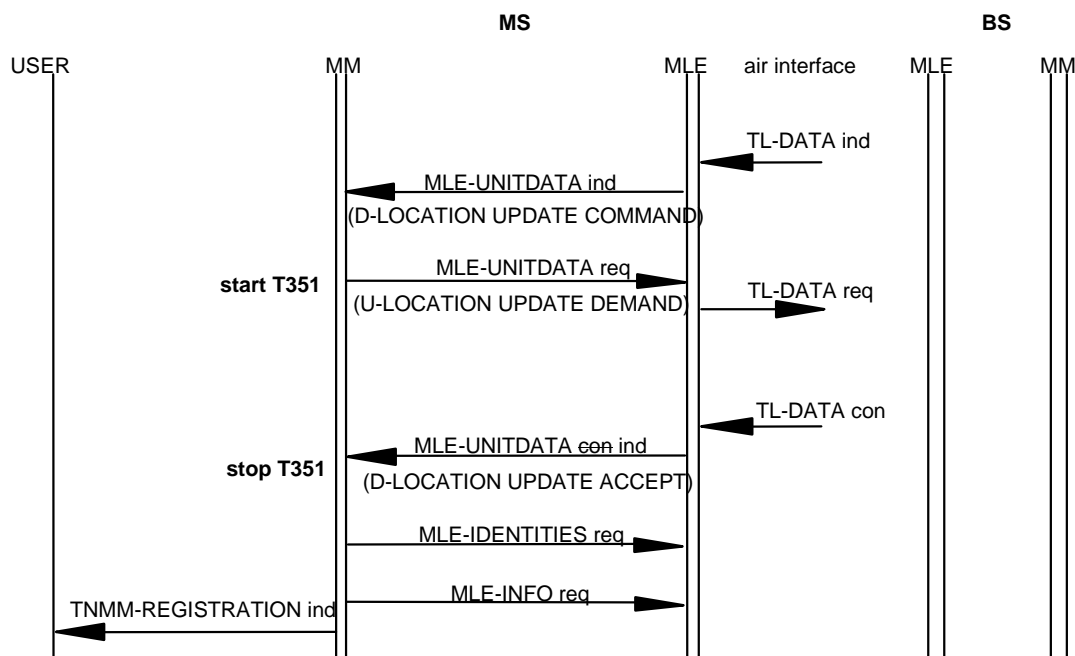

In the event that a registration failure leaves the MS with no available cells, MLE sends MM an MLE-ACTIVATE indication primitive indicating "no cell available for any service" in response to an MLE-UPDATE request primitive from MM that includes a registration failure result. On receipt of an MLE-ACTIVATE indication primitive from MLE indicating "no cell available for any service", MM shall issue an MLE-CLOSE request primitive to the MLE and shall issue a TNMM-SERVICE indication primitive to the TNMM-SAP indicating that the MS is "out of service". The MM shall consider the MS to be de-registered and hence apply the activation procedure as defined in clause 16.3.1.1 in order to get into service again.

NOTE 7: When to apply the activation procedure, after no service is obtained is outside the scope of the present document.

If neither timer T351 nor T354 was active when the MS MM received the D-LOCATION UPDATE PDU, MM shall discard the PDU without making a response at layer 3.

The SwMI should not cancel an existing registration for a particular ITSI if that ITSI fails a new authentication challenge by the SwMI.

### 16.4.3 Infrastructure initiated registration procedure

NOTE: Infrastructure initiated registration is carried out following information given by the MLE through an MLE-UNITDATA indication primitive.

**Figure 16.6: Infrastructure initiated registration**

The SwMI may initiate registration at any time by sending a D-LOCATION UPDATE COMMAND PDU, which may contain a group report request.

Upon receipt of the D-LOCATION UPDATE COMMAND PDU, the MM shall, if present, extract the MNI from the address extension information element. If the MNI is the same as the MNI of the MS ITSI (or the MNI is not present), then:

- if the "cell type control" information element is present, MM shall update its "cell type preference or requirement" as described in clause 16.4.12;

- if MM's updated "cell type preference or requirement" does not permit use of the serving cell, MM shall issue an MLE-LINK request primitive containing MM's "cell type preference or requirement", thus causing MLE to attempt to reselect a cell that matches MM's updated "cell type preference or requirement". If MM then receives an MLE-ACTIVATE indication primitive from MLE indicating "no cell available for any service" (because MLE is not able to select from the specified cell types), MM shall issue an MLE-CLOSE request primitive to the MLE and shall issue a TNMM-SERVICE indication primitive to the TNMM-SAP indicating that the MS is "out of service". MM shall consider the MS to be de-registered and hence apply the activation procedure as defined in clause 16.3.1.1 in order to get into service again.
- If MM's updated "cell type preference or requirement" permits use of the serving cell, then:
  - MM shall send a U-LOCATION UPDATE DEMAND PDU which shall contain the MNI of the MS in the address extension information element and the ISSI of the MS in the SSI information element, thus providing the true ITSI. This shall have PDU priority 6. The location update type information element in the PDU shall be set to "demand location updating" or "disabled MS updating" depending whether the MS is enabled or disabled. The MLE-UNITDATA request primitive parameters shall indicate that the identity to be used shall be the ASSI/(V)ASSI, if one has been issued, or the ISSI in the case where an ASSI/(V)ASSI has not been issued;
  - upon receipt of the D-LOCATION UPDATE COMMAND PDU including a group report request from the MLE, the MM shall regard all the group identities no more attached. If the MS wishes to receive signalling on those group identities, the MM may include group attachments to the U-LOCATION UPDATE DEMAND PDU or re-attach all the groups using U-ATTACH/DETACH GROUP IDENTITY PDUs (but see note 3). If the MS has no groups to attach, it shall send U-LOCATION UPDATE DEMAND PDU containing a group report response information element indicating "group report complete". When sending the first group attachment, either in U-LOCATION UPDATE DEMAND PDU or U-ATTACH/DETACH GROUP IDENTITY PDU, the group identity attach/detach mode information element shall be set to "detach all currently attached group identities and attach group identities defined in the group identity..." and the group identity report information element to "not report request". If all the reported groups are sent in this one PDU it shall contain a group report response information element indicating "group report complete", or otherwise not include this information element. The PDU priority shall be set to 3. Timer T353 shall be started. For further discussion of the use of the U-ATTACH/DETACH GROUP IDENTITY PDU in this context see clause 16.8.3;
  - upon receipt of the D-LOCATION UPDATE COMMAND PDU without a group report request, the MM shall assume that group identities with parameter value "Attachment for next location update required" are no more attached. If MS wishes to receive signalling on those group identities either the U-LOCATION UPDATE DEMAND PDU may include request for attachment of those group identities in the group identity location demand information element or MM may later attach the groups using attach mechanism, see clause 16.8.2 (but see note 3);
  - the U-LOCATION UPDATE DEMAND PDU shall contain the class of MS element. If the MS supports one or more of the items listed in the extended capabilities information element (other than support of CA), the PDU shall also include the extended capabilities information element. The MS should not include the extended capabilities information element if the MS supports none of the items listed in the extended capabilities information element other than support of CA (and the MS is thus requesting registration to a CA cell);
  - the U-LOCATION UPDATE DEMAND PDU shall contain economy mode information in the energy saving mode information element if energy saving is activated; if so, timer T352 shall be started;
  - the MS shall not request to append the new LA into the current RA in the request to append LA information element. The information element LA information shall not be present in the PDU because this is not a forward registration;
  - timer T351 shall be started.

- Upon receipt of the D-LOCATION UPDATE ACCEPT PDU MM shall, if present, extract the MNI from the address extension information element and check that it is the same as MNI of the MS ITSI and, if that is either the case or the MNI is not present, then MM shall:
  - extract any ASSI or (V)ASSI from the SSI field. The MS shall immediately change to use the ASSI/(V)ASSI in layer 2 in all subsequent signalling except for the layer 2 acknowledgement for the received D-LOCATION UPDATE ACCEPT PDU, where the same SSI shall be used as was used in layer 2 in the D-LOCATION UPDATE ACCEPT PDU;
  - if the U-LOCATION UPDATE DEMAND PDU contained request for attachment/detachment of group identities, the MM shall inspect the group identity location accept information element to find out if the SwMI accepted them. In case the group identity location accept information element is not present in the D-LOCATION UPDATE ACCEPT PDU, the MS shall assume the group attachment/detachment failed. The MS shall treat the failure as equivalent to T353 timer expiry. If the group attachment acknowledgement does not contain explicit group lifetime, then the applied lifetime is outside the scope of the present document. MM shall inform the MLE of ASSI or V(ASSI) and accepted and thus attached group identities and related (V)GSSIs with an MLE-IDENTITIES request primitive, see clause 16.8. The MS shall immediately change to use the ASSI or (V)ASSI in all subsequent signalling except for the layer 2 acknowledgement for the received D-LOCATION UPDATE ACCEPT PDU, where the SSI used shall be the same as in D-LOCATION UPDATE ACCEPT PDU;
  - stop timer T351;
  - update its "cell type preference or requirement" as described in clause 16.4.12;
  - if information elements are present, extract from the PDU the information concerning SCCHs and minimum mode (18<sup>th</sup> frame) monitoring, energy saving information, subscriber class and new registered area information and inform these to the lower layers in an MLE-INFO request primitive, refer to clauses 16.7.1 and 16.4.9. If the new registered area information element is not present in the PDU, the MS shall consider the current RA to include only the current LA the MS just registered on with no registration timeout. If the new registered area information element is present, then the new RA is that defined by the LAs in the New registered area information element and the LA timer associated with each LA shall be started. The LA into which the registration was made shall be included in the New registered area information element;
  - issue an MLE-UPDATE request primitive indicating a registration result of "Success" or "Temporary registration", the LAs in the RA and MM's "cell type preference or requirement". MM shall inform the user application about infrastructure initiated registration by issuing a TNMM-REGISTRATION indication primitive containing registration, group attachment/detachment and cell type information.
- If the SwMI rejects the registration it shall send a D-LOCATION UPDATE REJECT PDU. Upon receipt of a D-LOCATION UPDATE REJECT PDU, MM shall, if present, extract the MNI from the address extension information element and check that it is the same as MNI of the MS ITSI and shall check if timers T351 or T354 are active. If either timer T351 or T354 is active and either the MNI is present in the PDU and matches the MNI of the MS's ITSI, or the MNI is not present, then MM shall:

NOTE 1: The address extension information element cannot act as complete safe guard because there is no information element for the ISSI in the PDU:

- stop and reset timer T351 and T352, if started;
- inform the user application about registration failure by issuing a TNMM-REGISTRATION indication primitive containing "failure" and the reject cause;
- analyse the reject cause and act similarly as in normal registration, see clause 16.4.1.1.

In the event that a registration failure leaves the MS with no available cells, MLE sends MM an MLE-ACTIVATE indication primitive indicating "no cell available for any service" in response to an MLE-UPDATE request primitive from MM that includes a registration failure result. On receipt of an MLE-ACTIVATE indication primitive from MLE indicating "no cell available for any service", MM shall issue an MLE-CLOSE request primitive to the MLE and shall issue a TNMM-SERVICE indication primitive to the TNMM-SAP indicating that the MS is "out of service". The MM shall consider the MS to be de-registered and hence apply the activation procedure as defined in clause 16.3.1.1 in order to get into service again.

NOTE 2: When to apply the activation procedure after no service is obtained is outside the scope of the present document.

If neither timer T351 nor T354 was active when the MS MM received the D-LOCATION UPDATE PDU, MM shall discard the PDU without making a response at layer 3.

The SwMI should not cancel an existing registration for a particular ITSI if that ITSI fails a new authentication challenge by the SwMI.

NOTE 3: In the temporarily disabled state group attachments are not allowed.

#### 16.4.4 Colliding registrations

In the event that the MS MM requests registration at the same time that the infrastructure demands that the MS MM registers, the MS MM should respond to the D-LOCATION UPDATE COMMAND PDU using the procedure defined in clause 16.4.3. On successful outcome, MM shall inform the user application with a TNMM-REGISTRATION indication primitive containing registration, group attachment/detachment and cell type information.

#### 16.4.5 Expiry of timer T351

This timer is intended to control how often an MS may try to register to a BS. On the expiry of timer T351, if it is still possible to solely cancel the outstanding PDU according to clause 16.3.1.3, MM shall issue an MLE-CANCEL request primitive with the handle of the transmission request it corresponds to.

If it is no longer possible to solely cancel the outstanding PDU according to clause 16.3.1.3, MM may issue a U-ITSI DETACH PDU using the de-registration procedures described in clause 16.6 or resend the U-LOCATION UPDATE DEMAND PDU using the procedures described in clauses 16.4.1 and 16.4.2. The MS may wish to select a new serving cell before further registration attempts should be made.

#### 16.4.6 Expiry of LA timers

The LA timer is intended to clear out LAs from the current RA. LA timer shall be mandatory for MS. If SwMI utilizes optional LA timer and it expires in the SwMI it may no more page the MS on that LA. The optional LA timer in SwMI should have a longer timeout value than the value attached to the MS. If a LA timer expires and the LA is not the current LA, then the LA shall be removed from the current RA in the MS and the MM shall issue an MLE-UPDATE request primitive to the MLE containing the valid LAs of the RA. If a LA timer expires and the LA is the current LA, MM shall inform user application by sending an TNMM-REGISTRATION indication primitive with registration status parameter set to "LA registration expired", LA parameter to the current LA and cell type parameter to the current cell type, so that the application could initiate registration in a suitable time e.g. after completing on-going call as defined in clause 16.4.2 a).

#### 16.4.7 Lifetime of ASSI/(V)ASSI

##### 16.4.7.0 General

Only one alias SSI (ASSI or (V)ASSI) shall be valid per ITSI at one time. When the SwMI allocates a new ASSI or VASSI to MS (ITSI), the previous ASSI or (V)ASSI becomes invalid.

If SwMI allocates ISSI of the MS as ASSI, the previous ASSI, if any, becomes invalid.

Once ASSI or (V)ASSI has been allocated, MS shall use it as defined in clauses 23.4.1.2.1 and 23.4.1.2.2. Even if ASSI has been allocated, SwMI may send PDUs using ISSI in home network (refer to clause 23.4.1.2.1, note 4) in which case the layer 2 acknowledgement sent by MS shall contain ISSI.

### 16.4.7.1 ASSI/(V)ASSI validity at migration

The ASSI/(V)ASSI is valid only within the SwMI which allocated it. When MS migrates (i.e. MS sends location update with type "migrating location updating" or "service restoration migrating location updating") the previous ASSI/(V)ASSI becomes invalid and the migrated to SwMI shall allocate a new (V)ASSI or may allocate an ASSI as appropriate.

### 16.4.7.2 ASSI/(V)ASSI validity by MS initiative

Whenever MS makes an "ITSI Attach" registration attempt (either successful or unsuccessful), the current ASSI, if any, becomes invalid. Whenever MS makes de-registration (sends U-ITSI DETACH PDU), the current ASSI/(V)ASSI, if any, becomes invalid.

### 16.4.7.3 ASSI/(V)ASSI validity at registration rejection

If SwMI rejects the registration attempt either with reason "Migration not supported", "ITSI/ATSI unknown", "Illegal MS" or "Authentication failure", the current ASSI/(V)ASSI, if any, shall become invalid for this MS. With any other reject reason the ASSI/(V)ASSI remains valid, if the MS has a valid registration in this SwMI as described in clauses 16.4.1 and 16.4.2.

NOTE 1: If the authentication of the MS fails the SwMI is supposed to use the reject cause "Authentication failure". In that case the V-ASSI for this MS is not anymore valid, but SwMI still keeps the V-ASSI valid for the MS, which was earlier successfully authenticated, even if the MS has the same V-ASSI allocated.

NOTE 2: It is useful not to withdraw the ASSI / (V)ASSI in every case when registration is rejected. For example in case the SwMI rejects the registration attempt because the LA is not allowed for the MS, the MS may send next registration (to some other LA) using the ASSI/(V)ASSI and thus not revealing its own identity (ISSI).

However, in case SwMI wants to reject visiting MS permanently the (V)ASSI shall be withdrawn.

NOTE 3: There are no means for SwMI to withdraw the ASSI explicitly within registration rejection because D-LOCATION UPDATE REJECT PDU does not contain ASSI/(V)ASSI information element.

## 16.4.8 Temporary registration

In case the status of the BS changes from "normal mode" to "system wide services temporarily not supported " the MSs which have already registered there stay normally registered (no action needed).

In case MS registers to a BS which is in state "system wide services temporarily not supported" and gets a registration accepted response with status "Temporary registration", the MS shall consider its registration to be temporarily accepted in the system. The MM shall pass this "Temporary registration" information to MLE within "Registration status" parameter in MLE-UPDATE request primitive.

NOTE 1: In "system wide services temporarily not supported " state, the SwMI may either accept the registration normally or use the "temporary registration" acknowledgement.

In case the status of the BS changes from "system wide services temporarily not supported" to "normal mode" the MSs which have received a "Temporary registration" response have to register again (with type "periodic location updating"). The MLE detects the change to normal mode and indicates the need for periodic registration to MM by sending MLE-LINK indication primitive. Those MSs that have received a normal registration accept acknowledgement shall not register again.

In case MS, which has received a "Temporary registration" acknowledgement, makes a cell reselection it has to register to the new cell even if the cell belongs to the Registered area of the MS. In this case MLE indicates the need for registration to MM by sending MLE-LINK indication primitive.

NOTE 2: SwMI should use the "Temporary registration" acknowledge only in case the BS is in state "system wide services temporarily not supported".

## 16.4.9 Subscriber class procedures

Upon reception of a D-LOCATION UPDATE ACCEPT PDU which contains the subscriber class information element:

- if a network provides a subscriber class profile in the subscriber class information element, this shall override any previous subscriber class information previously supplied for this network (at subscription or earlier registration) and the MS will inform this to MLE in an MLE-INFO request primitive as defined registration protocols;
- if the home network provides no subscriber class information in a subscriber class information element, the MS shall use the subscriber class profile allocated at subscription;
- if a visited network provides no subscriber class information in a subscriber class information element, the MS should use the subscriber class profile most recently supplied (if any) for this visited network (configured for this visited network or provided at an earlier migration). If no subscriber class profile has been provided for this network, the MS shall assume that all subscriber classes are valid.

NOTE 1: A subscriber class profile is valid only within the network which allocated it.

NOTE 2: Class 1 and/or class 2 membership may be reserved by the SwMI for AGA MSs (see clauses O.4.4 and O.7.1.2).

Upon receiving an MLE-INFO indication primitive indicating no match between the subscriber class being broadcast by the SwMI and the subscriber class of the MS, the MM shall respond to all SwMI-initiated procedures normally but shall restrict the MS-initiated requests so that only the following MS-initiated procedures are permitted:

- location updating (including migration and type 1/2 cell reselection requests);
- group attachment signalling (together with or separately from location updating PDUs);
- de-registration;
- security related procedures described in ETSI EN 300 392-7 [8].

All the other MS initiated procedures are rejected and MM shall send a failure report to the SAP and the user application should assume that the requested service has failed.

## 16.4.10 Frequency band capability procedures

After reception of a D-LOCATION UPDATE ACCEPT PDU the MS may send a U-MM STATUS PDU carrying a U-MS FREQUENCY BANDS INFORMATION PDU to inform which frequency bands it supports.

The SwMI may at any time send a D-MM STATUS PDU carrying a D-MS FREQUENCY BANDS REQUEST PDU. When receiving this PDU the MS should respond with sending a U-MM STATUS PDU carrying a U-MS FREQUENCY BANDS INFORMATION PDU to inform which frequency bands it supports. In addition MS should re-send the U-MS FREQUENCY BANDS INFORMATION PDU at the occasions specified in the "Re-send interval" element of the D-MS FREQUENCY BANDS REQUEST PDU.

The frequency of the lower and upper edge carrier shall be defined by the following information elements:

- lower/upper edge carrier;
- lower/upper edge frequency band;
- duplex spacing;
- reverse operation.

The upper/lower edge frequency band field shall map to a specific frequency which shall map to a defined base frequency (in MHz) for the carrier numbering scheme. The lower/upper edge carrier field shall indicate the carrier frequency relative to the base frequency defined by the corresponding frequency band field. The frequency so defined shall be the approximate downlink frequency of the lower/upper carrier. This calculation shall be summarized by the following equation:

- downlink lower/upper edge carrier frequency = base frequency + (upper/lower edge carrier \* 25 kHz).

The uplink frequency of the lower/upper edge carrier shall be determined using the duplex spacing and reverse operation fields. The duplex spacing field shall map to a defined duplex spacing (in MHz) for the carrier numbering scheme. The duplex spacing shall be dependent on the frequency band element. The reverse operation field shall indicate whether to add or subtract the duplex spacing to arrive at the uplink frequency of the main carrier. If normal operation, the duplex spacing shall be subtracted. If reverse operation, the duplex spacing shall be added. This calculation is summarized by the following equations:

- normal operation:
  - uplink upper/lower edge carrier frequency = downlink main carrier frequency - duplex spacing.
- reverse operation:
  - uplink upper/lower edge carrier frequency = downlink main carrier frequency + duplex spacing.

The mapping of the frequency band field values to actual base frequencies and the duplex spacing field values to actual duplex frequency spacing are defined in annex F.

NOTE 1: These rules for calculation of uplink and downlink carrier frequency are also used for calculation of the carrier frequency in clause 21 with an exception of the offset.

NOTE 2: An MS may support a frequency range which may be larger or smaller than the actual frequency allocation defines in each country.

SwMI actions due to this information are outside the scope of the present document.

### 16.4.11 Air to ground reporting procedure

The SwMI may at any time send a D-MM STATUS PDU carrying a D-DISTANCE REPORTING REQUEST PDU. If the MS supports this optional procedure it shall upon reception of the D-DISTANCE REPORTING REQUEST PDU start the reporting timer with value defined by the Distance reporting timer information element unless MM has received an MLE-CONFIGURE indication primitive from MLE containing a distance reporting time. If the value received from the SwMI in a D-DISTANCE REPORTING REQUEST PDU is "No reporting / stop reporting" the MS shall not start or continue reporting unless requested by an MLE-CONFIGURE indication primitive from MLE.

If MM receives an MLE-CONFIGURE indication primitive from MLE containing a distance reporting time, MM shall start (or restart) distance reporting using the distance reporting time provided in the MLE-CONFIGURE indication primitive. If MM receives an MLE-CONFIGURE indication primitive from MLE containing the value "use periodic reporting time requested by SwMI", MM shall set the distance reporting time to the value indicated by the most recently received D-DISTANCE REPORTING REQUEST PDU (if still valid) or, if the MM does not possess a valid distance reporting time sent by the SwMI, the MS shall stop distance reporting.

While the MS is starting transmission for any reason it shall stop the distance reporting timer and upon ceasing the transmission MS shall start the distance reporting timer.

Upon expiry of the distance reporting timer the MS shall send a Null PDU unless there is something else already waiting for sending.

After each location update the MS shall check, whether the reporting is to be continued based on the distance reporting validity.

NOTE 1: The protocol model supports various implementation possibilities:

- the MM sends null PDUs to the lower layers at reporting intervals and the MAC layer may send the null PDUs without taking into account any other transmissions or the MAC may discard sending of the Null PDU when it has some else to be sent at the time the Null PDU is due to sending. In those options a usage of the MLE-CONFIGURE request primitive is not needed;
- the MM informs the MAC layer by the MLE-CONFIGURE request primitive the periodic reporting timer value and the MAC layer manages the sending of the Null PDUs. In that case the MM need not send Null PDUs.

If the MS does not support this procedure it should respond to the D-DISTANCE REPORTING REQUEST PDU by a U-MM PDU/FUNCTION NOT SUPPORTED PDU as defined in clause 16.8.8.

NOTE 2: There is no MM protocol confirmation that the MS has accepted the distance reporting request.

## 16.4.12 Cell type preference or requirement

This clause applies only to MSs or SwMIs that support more than one cell type.

The user application may provide MM with a "required cell type list" and a "preferred cell type list" in the TNMM-REGISTRATION request primitive. These two lists comprise the user application's "cell type preferences and requirements". If the MS indicated during registration that it supports more than one cell type, the SwMI may provide MM with "required cell type" and "preferred cell type" information by including the "cell type control" information element in a D-LOCATION UPDATE ACCEPT, D-LOCATION UPDATE COMMAND or D-LOCATION UPDATE REJECT PDU. (The SwMI should not send a "cell type control" information element to an MS that indicated during registration that it supports only one cell type.) The SwMI's "required cell type" and "preferred cell type" information comprise the SwMI's "cell type preferences and requirements".

MM shall determine its "cell type preference or requirement" as described below:

- a) MM shall retain any record it may have of the SwMI's "cell type preferences and requirements" until SIM replacement or power-off, until changing to direct mode or a different SwMI, or until receipt of a D-LOCATION UPDATE ACCEPT, D-LOCATION UPDATE COMMAND or D-LOCATION UPDATE REJECT PDU that contains the "cell type control" information element;
- b) at power up or SIM replacement, or on return to the present SwMI after changing to direct mode or a different SwMI, MM shall delete any record it may have of the SwMI's "cell type preferences and requirements" and shall set MM's "cell type preference or requirement" to the user application's "cell type preferences and requirements" (if any);
- c) on receipt of a D-LOCATION UPDATE ACCEPT, D-LOCATION UPDATE COMMAND or D-LOCATION UPDATE REJECT PDU that contains the "cell type control" information element:
  - MM shall delete any previous record of the SwMI's "cell type preferences and requirements"; then
  - if the "cell type control" information element indicates "revert to user application's cell type preferences and requirements", MM shall set its "cell type preference or requirement" in accordance with the user application's "cell type preferences and requirements" (if any); or
  - if the "cell type control" information element indicates "use SwMI's cell type preferences and requirements", MM shall record any included SwMI "cell type preferences and requirements" and shall set its "cell type preference or requirement" to a combination of the SwMI's and the user application's "cell type preferences and requirements" as described in item d) of the present clause;
- d) MM shall combine the SwMI's and the user application's "cell type preferences and requirements" as follows:
  - if neither the SwMI nor the user application has specified a cell type requirement, MM's "cell type preference or requirement" shall not include a cell type requirement, meaning that the MS is permitted to use a cell of any cell type;

- if MM has received and recorded the SwMI's required cell types and the user application has provided MM with a "required cell type list", MM shall set its "cell type preference or requirement" to include only cell types that are common to both the SwMI's required cell types and the user application's "required cell type list". If there are no common cell types, MM shall inform the user application by issuing a TNMM-REGISTRATION confirm primitive containing the registration status "no permitted cell types". The user application may then provide a new "required cell type list" to MM using a TNMM-REGISTRATION request primitive;
  - the MM's "cell type preference or requirement" shall give the SwMI's preferred cell types precedence over the user application's "preferred cell type list";
- e) if the SwMI rejects a registration request with reject cause "use of CA cell not permitted" or "use of DA cell not permitted" and the D-LOCATION UPDATE REJECT PDU does not include a "cell type control" information element, MM shall reduce the level of preference of the rejecting cell type in MM's "cell type preference or requirement";
- f) if the SwMI rejects a registration request and the D-LOCATION UPDATE REJECT PDU includes a "cell type control" information element, MM shall follow the procedure given in item c) of the present clause;
- g) if the SwMI accepts a registration request to a previously rejecting cell type, MM shall restore the level of preference of the previously rejecting cell type in MM's "cell type preference or requirement" to a combination of the SwMI's and the user application's "cell type preferences and requirements", as described in item d) of the present clause.

NOTE: If MM's "cell type preference or requirement" does not include any required cell types, the MS is permitted to use a cell of any type. If MM's "cell type preference or requirement" includes required cell types the MS is only permitted to use cells of the required types.

### 16.4.13 Cell load

When MLE-INFO indication service primitive informs a change in the cell load parameters of the serving cell MM may pass that information to network layer users in a MM-STATUS indication primitive using the "Cell load" parameter.

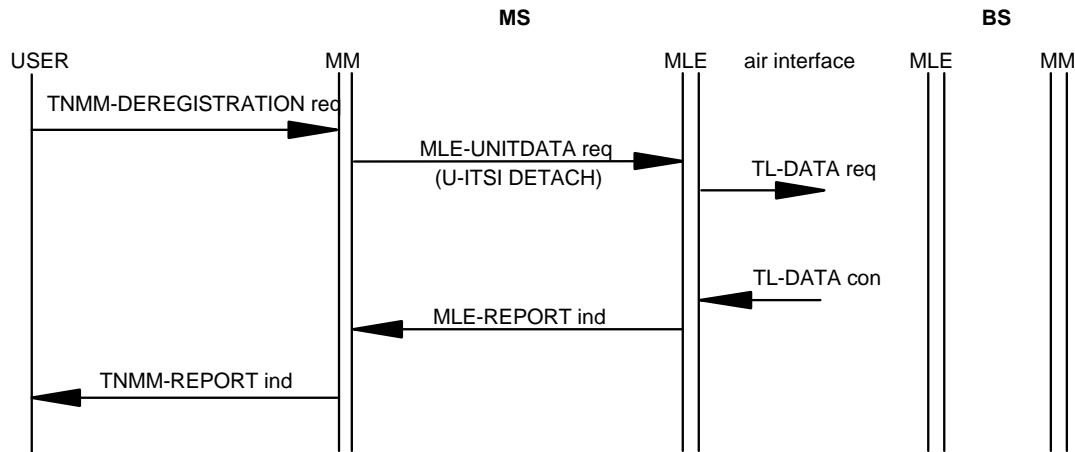

## 16.5 Enable and disable procedures

MS enable and disable utilizes MM procedures, refer to ETSI EN 300 392-7 [8] clause 5.

## 16.6 De-registration procedure

### 16.6.1 Trunking mode de-registration

The de-registration procedure need not be applied. Examples of where the user application may request de-registration can be at power down, or if the user specific information, including the ITSI, is removed from the TE.

**Figure 16.7: De registration of MS (detach)**

Upon receipt of a TNMM-DEREGISTRATION request primitive from the user application the MS MM shall send a U-ITSI DETACH PDU to the MLE with an MLE-UNITDATA request primitive. This shall have PDU priority 3. MM may include the MNI of the MS in the address extension information element the U-ITSI DETACH PDU.

**NOTE:** The address extension information element cannot act as complete safe guard because there is no information element for the ISSI in the PDU.

Upon receipt of the MLE-REPORT indication primitive indicating that the U-ITSI DETACH PDU has been successfully or unsuccessfully transmitted by the DLL, MM shall inform the user application of this by issuing a TNMM-REPORT indication primitive.

A MS in the temporarily disabled state shall remain in this state after de-registration. The temporarily disabled state is defined in ETSI EN 300 392-7 [8].

### 16.6.2 Direct mode related de-registration

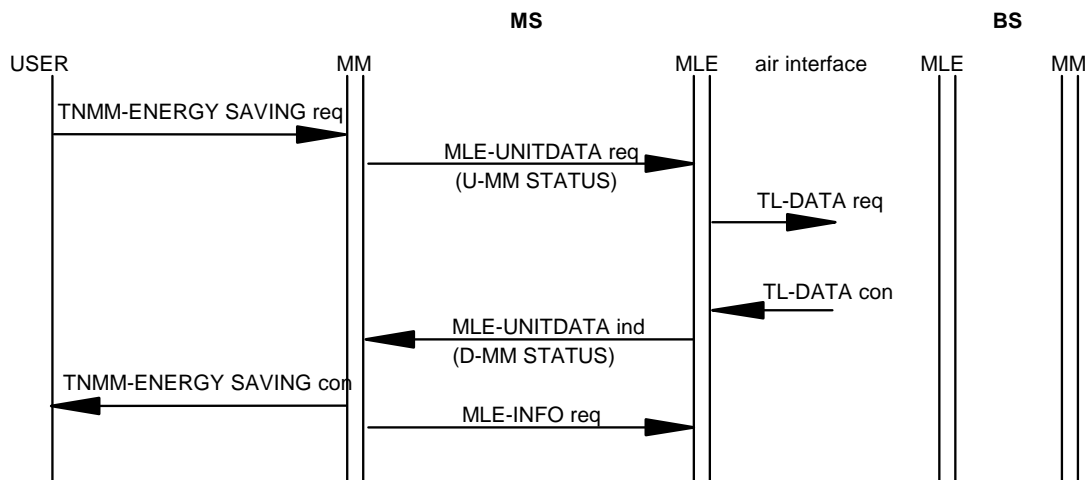

MS station may optionally inform SwMI that it leaves trunking mode and goes to direct mode operation without dual watch operation and in effect will be no more reachable in the trunking mode.

Upon reception TNMM-STATUS request primitive with value "Start of direct mode operation" MS shall inform SwMI that it is leaving to direct mode operation by sending a U-MM STATUS PDU with status "Start of direct mode operation" in a MLE-UNITDATA request PDU. The information element DMO carrier may indicate the DMO RF channel to which MS is moving for direct mode operation and the information elements start of direct mode operation cause and mode change information may provide further information. The PDU shall use PDU priority 3. MM should wait for a MLE-REPORT indication primitive before leaving trunking mode.

Return to trunking mode operation shall use appropriate registration such as user application initiated periodic registration or MLE initiated registration in case the MS has camped on a new cell outside the current RA.

## 16.7 Energy economy

### 16.7.1 Energy economy mode procedure

**Figure 16.8: Change energy economy mode**

MS shall initiate this procedure upon receipt of a TNMM-ENERGY SAVING request primitive and the MS MM shall issue an MLE-UNITDATA request primitive with a U-MM STATUS PDU carrying U-CHANGE OF ENERGY SAVING MODE REQUEST sub-PDU to the infrastructure to request a specific energy economy mode. This PDU shall have PDU priority 1. Timer T352 shall be started. The MS shall inform MAC that no energy economy mode is applicable by sending an MLE-INFO request primitive with value "stay alive".

The energy economy mode may also be requested at registration using U-LOCATION UPDATE DEMAND PDU as defined in clauses 16.4.1.1, 16.4.1.2, 16.4.2 and 16.4.3. The BS may respond to this by either normal registration PDU or after registration by a D-MM STATUS PDU carrying a D-CHANGE OF ENERGY SAVING MODE RESPONSE sub-PDU.

Upon receipt of a D-MM STATUS PDU carrying a D-CHANGE OF ENERGY SAVING MODE RESPONSE sub-PDU or a D-LOCATION UPDATE ACCEPT PDU containing an energy saving information element, timer T352 shall be stopped and MM shall:

- if the received information element energy saving mode has another value than "stay alive" MM shall inform the lower layers of the energy economy parameters in an MLE-INFO request primitive. The energy economy parameters are in the energy economy mode configuration parameter, which shall contain the energy saving mode and energy economy start point, the latter shall define the absolute frame and multiframe number of the start point. MM shall inform the user application the start of the energy saving mode and its value with a TNMM-ENERGY SAVING confirm primitive;

NOTE 1: The BS may allocate a different energy saving mode than requested and the BS assumes that the allocated value will be used.

- if the received information element energy saving mode has value "stay alive" MM shall inform the user application with a TNMM-ENERGY SAVING confirm primitive by setting the energy economy mode status parameter value to "rejected" (except in the case of a request to stay alive) and the energy economy mode parameter value to "stay alive".

NOTE 2: If the BS rejected the energy saving mode the MS may try to invoke energy saving mode upon next registration.

BS may change (i.e. modify or stop) or allocate an energy saving mode of an MS at any time by sending a D-MM STATUS PDU carrying a D-CHANGE OF ENERGY SAVING MODE REQUEST sub-PDU.

Upon reception of the D-MM STATUS PDU carrying the D-CHANGE OF ENERGY SAVING MODE REQUEST sub-PDU the MS shall respond to the allocation by sending a U-CHANGE OF ENERGY SAVING MODE RESPONSE PDU. In the response the MS shall use the same energy saving mode value as in the D-CHANGE OF ENERGY SAVING MODE REQUEST sub-PDU or reject the allocation by using energy saving mode value "stay alive". The MM shall inform the user application the start or a change of the energy saving mode and its value with a TNMM-ENERGY SAVING indication primitive. Energy economy mode may be applicable to a MS in the temporarily disabled state.

MM shall assume that the energy economy mode is lost when RA is changed, and the MS will then need to re-request an energy economy mode if it wishes to apply energy saving.

## 16.7.2 Procedures for requesting Direct Mode dual watch operation

### 16.7.2.1 Introduction

Dual watch may be performed by an MS that is capable of both V+D and TETRA Direct Mode operation (see ETSI EN 300 396-3 [22]). A full dual watch MS is capable of periodically receiving the V+D common control channel while in a Direct Mode call, a Direct Mode RF carrier while in a V+D call and, when idle, it periodically receives both the Direct Mode RF carrier and the V+D common control channel. In order for the MS to periodically receive the V+D common control channel while in a Direct Mode call, the MS needs to negotiate with the SwMI to use a periodic reception procedure similar to energy economy mode with an appropriate energy economy group. See also clause 23.7.7.

An MS supporting idle dual watch is capable of periodically receiving both the Direct Mode RF carrier and the V+D common control channel when idle. The MS may not be capable of receiving the V+D common control channel while in a Direct Mode call or a Direct Mode RF carrier while in a V+D call. An MS may be forced to operate in idle dual watch mode in the case that the MS cannot negotiate a satisfactory energy economy mode with the SwMI or it may be totally dependent on the capabilities of the MS. When requesting idle dual watch mode, the MS may negotiate with the SwMI to use a periodic reception procedure similar to energy economy mode. When the MS requests direct mode dual watch operation, it indicates whether it is requesting full dual watch or idle dual watch by using the "dual watch mode" information element of the U-DUAL WATCH MODE REQUEST sub-PDU.

**NOTE:** SwMI designers should note that also a full dual watching MS will not always be able to receive in the V+D slots corresponding to the agreed energy economy group and, even if the MS receives a V+D message, it may not always be able to send a layer 3 response e.g. if it is currently in a Direct Mode call. Also, the MS sometimes may not be able to send even a layer 2 response e.g. if it is currently in an emergency Direct Mode call. Therefore, if a dual watching MS does not respond to any V+D messages, the SwMI should not assume that the MS has left the V+D network unless the MS fails to transmit or respond to V+D messages over a long period of time. This time may be longer for an MS that is using idle dual watch mode. See also clause 23.7.7.

The MS shall inform the SwMI when it wishes to start or resume full dual watch operation with an appropriate energy economy group, when it wishes to change the energy economy group associated with its full dual watch operation and when it wishes to stop full dual watch operation. The MS may inform the SwMI when it wishes to start or resume idle dual watch operation and shall inform the SwMI when it wishes to change the energy economy group associated with its dual watch operation; also, if the MS informed the SwMI when it started or resumed idle dual watch operation then it shall inform the SwMI when it wishes to stop idle dual watch operation. The procedures defined in the remainder of this clause, and in clauses 16.7.2.2 to 16.7.2.6, relate to the full dual watching procedure; they relate also to the idle dual watching procedure in the case when the MS informs the SwMI that it is performing idle dual watch. Clause 16.7.2.7 describes the idle dual watching procedure in the case when the MS does not inform the SwMI that it is performing idle dual watch.

When the MS wishes to start or resume full or idle dual watch operation with an appropriate energy economy group, or when it wishes to start or resume idle dual watch operation without using an energy economy group, or when it wishes to change the energy economy group associated with its dual watch operation, it uses a U-MM STATUS PDU carrying a U-DUAL WATCH MODE REQUEST sub-PDU (see clause 16.7.2.2). When the MS wishes to stop dual watch operation, it uses a U-MM STATUS PDU carrying a U-TERMINATING DUAL WATCH MODE REQUEST sub-PDU (see clause 16.7.2.3).

When the MS is in dual watch mode, the SwMI may at any time change the energy economy group associated with the MS's dual watch operation or withdraw its acceptance of the MS's dual watch request by sending a D-MM STATUS PDU carrying a D-CHANGE OF DUAL WATCH MODE REQUEST sub-PDU (see clause 16.7.2.4).

### 16.7.2.2 MS requesting to start, modify or resume dual watch mode

Upon receipt of a TNMM-STATUS request primitive with the "dual watch" parameter value set to "starting dual watch mode" or "modify or resume dual watch mode", the MS MM shall issue an MLE-UNITDATA request primitive with a U-MM STATUS PDU carrying a U-DUAL WATCH MODE REQUEST sub-PDU. If the MS is requesting full dual watch mode, the MM shall set the "energy saving mode" information element to request an appropriate energy economy group. If the MS is requesting idle dual watch mode, it may include a request for an energy economy group in the PDU; alternatively it may set the "energy saving mode" information element to "stay alive". MM shall set the "dual watch mode" information element according to the MS capabilities.

The U-DUAL WATCH MODE REQUEST sub-PDU shall have PDU priority 3. When MM sends the PDU, timer T352 shall be started and MM shall instruct the MAC to "stay alive" by issuing an MLE-INFO request primitive.

On receiving a D-MM STATUS PDU carrying a D-DUAL WATCH MODE RESPONSE sub-PDU, timer T352 shall be stopped and MM shall perform the following procedure a), b), c) or d) as appropriate:

- a) If the MS requested for full dual watch and the "result of dual watch request" information element indicates "Request accepted ..." and the received information element "energy saving mode" has a value appropriate for full dual watch, MM shall inform the lower layers of the dual watch parameters in an MLE-INFO request primitive. The dual watch parameters are in the "dual watch mode configuration" parameter, which shall contain the energy saving mode and the starting frame and multiframe. The energy saving mode shall define the dual watch energy economy group and the frame number and multiframe number shall define the dual watch start point. The D-DUAL WATCH MODE RESPONSE sub-PDU may contain the "SCCH information and distribution on 18<sup>th</sup> frame" information element, in which case MM shall include the information concerning SCCHs and minimum mode configuration in the MLE-INFO request primitive. MM shall inform the user application of the acceptance of the dual watch and the value of the energy saving mode with a TNMM-STATUS confirm primitive.

NOTE 1: The SwMI may allocate a different energy saving mode than requested and the SwMI assumes that the allocated value will be used. However, the SwMI should not allocate a value of energy saving mode that is not appropriate for full dual watch operation (as defined in ETSI EN 300 396-3 [22], ETSI EN 300 396-4 [23] and ETSI EN 300 396-7 [25]).

NOTE 2: For a dual watch activation:

- the SwMI should assign a starting point to a full dual watching MS such that the MS's reception cycle includes V+D frame 18;
- the SwMI may need to include the "SCCH information and distribution on 18<sup>th</sup> frame" information element in the D-MM STATUS PDU because it should assign the same common control channel to all full dual watching MSs on the same direct mode RF carrier on a cell.

This allows MSs to maintain V+D synchronization and enables compatible cycles for all full dual watching MSs on a Direct Mode RF carrier.

- b) If the MS requested for full dual watch and the "result of dual watch request" information element indicates "Request accepted ..." but the received information element "energy saving mode" has a value not appropriate for full dual watch, MM may either convert to idle dual watch procedures or abandon the dual watch mode completely.

If the MS converts to idle dual watch mode, MM shall inform the lower layers of the dual watch parameters in an MLE-INFO request primitive. The dual watch parameters are in the "dual watch mode configuration" parameter, which shall contain the energy saving mode and the starting frame and multiframe. The energy saving mode shall define the dual watch energy economy group and the frame number and multiframe number shall define the dual watch start point. The D-DUAL WATCH MODE RESPONSE sub-PDU may contain the "SCCH information and distribution on 18<sup>th</sup> frame" information element, in which case MM shall include the information concerning SCCHs and minimum mode configuration in the MLE-INFO request primitive. MM shall inform the user application of the offered idle dual watch and the value of the energy saving mode with a TNMM-STATUS confirm primitive.

NOTE 3: If the SwMI cannot support an energy saving mode appropriate for full dual watch mode, the SwMI should not reject the dual watch request but offer a different energy saving mode or no energy saving mode ("stay alive") to the MS. This allows the MS to perform idle dual watch procedures. If the SwMI allocates a value of energy saving mode that is not appropriate for full dual watch operation, the SwMI should assume that the MS is only capable of the idle dual watch procedure.

If the user application abandons the offered idle dual watch mode it may either stay in V+D mode or go totally to direct mode. If the MS wishes to stay in V+D mode, the MM shall send a U-MM STATUS PDU carrying a U-TERMINATING DUAL WATCH MODE REQUEST sub-PDU (see clause 16.7.2.3). If MS wants to go to the direct mode, the MM may send a U-MM STATUS PDU carrying a U-START OF DIRECT MODE OPERATION sub-PDU (see clause 16.6.2).

- c) If the MS requested for idle dual watch and the "result of dual watch request" information element indicates "Request accepted ...", MM shall inform the lower layers of the dual watch parameters in an MLE-INFO request primitive. The dual watch parameters are in the "dual watch mode configuration" parameter, which shall contain the energy saving mode and the starting frame and multiframe. The energy saving mode shall define the dual watch energy economy group and the frame number and multiframe number shall define the dual watch start point. The D-DUAL WATCH MODE RESPONSE sub-PDU may contain the "SCCH information and distribution on 18<sup>th</sup> frame" information element, in which case MM shall include the information concerning SCCHs and minimum mode configuration in the MLE-INFO request primitive. MM shall inform the user application of the acceptance of the idle dual watch and the value of the energy saving mode with a TNMM-STATUS confirm primitive.

NOTE 4: The SwMI may allocate a different energy saving mode than requested and the SwMI assumes that the allocated value will be used.

NOTE 5: If the SwMI cannot support the requested energy saving mode, the SwMI should not reject the dual watch request but offer a different energy saving mode or no energy saving mode ("stay alive") to the MS. An MS is able to perform idle dual watch procedures with a different energy saving mode or with no energy saving mode.

- d) If the "result of dual watch request" information element indicates "Request rejected for undefined reason" or "Dual watch not supported", MM shall inform the user application of the rejection of the dual watch request with a TNMM-STATUS confirm primitive with the "dual watch" parameter value set appropriately and the "energy economy mode" parameter value set according to received "energy saving information" information element.

If the SwMI rejects the dual watch request then the user application may choose to leave V+D operation and go to Direct Mode operation, or remain in V+D operation, or use the idle dual watching procedure described in clause 16.7.2.7. If the MS leaves V+D operation and goes to Direct Mode operation then the MM may send a U-MM STATUS PDU carrying a U-START OF DIRECT MODE OPERATION sub-PDU (see clause 16.6.2). If the MS remains in V+D operation then the user application may choose to request normal energy economy mode, as defined in clause 16.7.1. The MS may try to request dual watch again after its next registration.

### 16.7.2.3 MS terminating dual watch mode

Upon receipt of a TNMM-STATUS request primitive with the "dual watch" parameter value set to "terminating dual watch mode", the MS MM shall issue an MLE-UNITDATA request primitive with a U-MM STATUS PDU carrying a U-TERMINATING DUAL WATCH MODE REQUEST sub-PDU containing the "energy saving mode" information element set to "stay alive". This PDU shall have PDU priority 3. Timer T352 shall be started. MM shall instruct the MAC to "stay alive" by issuing an MLE-INFO request primitive.

On receiving a D-MM STATUS PDU carrying a D-TERMINATING DUAL WATCH MODE RESPONSE sub-PDU, timer T352 shall be stopped and MM shall inform the user application with a TNMM-STATUS confirm primitive with the "dual watch" parameter value set to "terminating dual watch mode response" and the "energy economy mode" parameter value set to "stay alive".

NOTE: The procedure if the MS wishes to start normal energy economy mode when it terminates dual watch mode is described in clause 16.7.2.5 b).

#### 16.7.2.4 SwMI modifying or terminating dual watch mode

If an MS in dual watch mode receives a D-MM STATUS PDU carrying a D-CHANGE OF DUAL WATCH MODE REQUEST sub-PDU, the MS MM shall respond to the PDU by sending a U-MM STATUS PDU carrying a U-CHANGE OF DUAL WATCH MODE RESPONSE sub-PDU. In the response the MS shall use the same "energy saving mode" value as in the D-CHANGE OF DUAL WATCH MODE REQUEST sub-PDU.

If the "reason for dual watch change by SwMI" information element contains value "change of dual watch energy economy group" then the MS shall perform procedure a) or b) as appropriate:

- a) If the MS performs full dual watch and the received "energy saving information" information element contains a value appropriate for full dual watch, or the MS performs idle dual watch, MM shall inform the lower layers of the modified dual watch parameters in an MLE-INFO request primitive. MM shall inform the user application of the modified value of the energy saving mode with a TNMM-STATUS indication primitive.
- b) If the MS performs full dual watch and the received "energy saving information" information element contains a value not appropriate for full dual watch, MM may either convert to idle dual watch procedures or abandon the dual watch mode completely.

If the MS converts to idle dual watch mode, MM shall inform the lower layers of the modified dual watch parameters in an MLE-INFO request primitive. MM shall inform the user application of the change to idle dual watch and the modified value of the energy saving mode with a TNMM-STATUS primitive.

If the user application abandons the offered idle dual watch mode it may either stay in V+D mode or go totally to direct mode. If the MS wishes to stay in V+D mode, the MM shall send a U-MM STATUS PDU carrying a U-TERMINATING DUAL WATCH MODE REQUEST sub-PDU (see clause 16.7.2.3). If MS wants to go to the direct mode, the MM may send a U-MM STATUS PDU carrying a U-START OF DIRECT MODE OPERATION sub-PDU (see clause 16.6.2).

NOTE 1: If the SwMI allocates a value of energy saving mode that is not appropriate for full dual watch operation, the SwMI should assume that the MS is only capable of the idle dual watch procedure.

NOTE 2: In the case that the user application abandons the offered idle dual watch mode, the MM is not allowed to respond to the D-CHANGE OF DUAL WATCH MODE REQUEST PDU by sending a U-TERMINATING DUAL WATCH MODE REQUEST sub-PDU or U-START OF DIRECT MODE OPERATION sub-PDU without first sending U-CHANGE OF DUAL WATCH MODE RESPONSE sub-PDU.

If the "reason for dual watch change by SwMI" information element contains value "dual watch terminated for undefined reason" then MM shall inform the user application of the termination of dual watch mode by issuing a TNMM-STATUS indication primitive and shall instruct the MAC to "stay alive" by issuing an MLE-INFO request primitive. The user application may choose to leave V+D operation and go to Direct Mode operation, or remain in V+D operation, or use the idle dual watching procedure described in clause 16.7.2.7. If the MS leaves V+D operation and goes to Direct Mode operation then the MM may send a U-MM STATUS PDU carrying a U-START OF DIRECT MODE OPERATION sub-PDU (see clause 16.6.2). If the MS remains in V+D operation then the user application may choose to request normal energy economy mode, as defined in clause 16.7.1. The MS may try to request dual watch again after its next registration.

If an MS not in dual watch mode receives a D-MM STATUS PDU carrying a D-CHANGE OF DUAL WATCH MODE REQUEST sub-PDU, the MS MM shall respond to the PDU by sending a U-MM STATUS PDU carrying a U-CHANGE OF DUAL WATCH MODE RESPONSE sub-PDU with the "energy saving mode" value set to "stay alive". This requirement applies only for an MS capable of dual watch operation.

#### 16.7.2.5 Changing between modes

An MS cannot operate in both normal energy economy mode and dual watch mode at one time. If the MS wishes to change from one mode to the other mode, it shall perform procedure a) or b) as appropriate:

- a) If an MS in energy economy mode receives a TNMM-STATUS request primitive with the "dual watch" parameter value set to "starting dual watch mode" then it needs to send only a U-MM STATUS PDU carrying a U-DUAL WATCH MODE REQUEST sub-PDU requesting to start dual watch mode (without first sending a PDU requesting to end energy economy mode). The procedure shall be as defined in clause 16.7.2.2.

- b) If an MS in dual watch mode receives a TNMM-ENERGY SAVING request primitive indicating a request to start energy economy mode then it shall send a U-MM STATUS PDU carrying a U-TERMINATING DUAL WATCH MODE REQUEST sub-PDU containing the "energy saving mode" information element set to the value requested for the energy economy mode. This PDU shall have PDU priority 3. Timer T352 shall be started. The procedure on receiving a D-MM STATUS PDU carrying a D-TERMINATING DUAL WATCH MODE RESPONSE sub-PDU shall then be as defined in clause 16.7.1 for receipt of a D-MM STATUS PDU carrying a D-CHANGE OF ENERGY SAVING MODE RESPONSE sub-PDU.

At the time of sending the PDU requesting the new mode, MM shall instruct the MAC to end the old reception cycle by issuing an MLE-INFO request primitive for the old mode indicating "stay alive". Then, if it receives a PDU accepting its request, MM shall inform the MAC of the new parameters by issuing an MLE-INFO request primitive for the new mode.

### 16.7.2.6 General dual watch procedures

Dual watch mode may be applicable to an MS in the temporarily disabled state.

NOTE 1: An enable or disable applied to a subscription or an equipment in V+D will also apply in Direct Mode and vice versa (see ETSI EN 300 392-7 [8] and ETSI EN 300 396-6 [i.6]).

Thus, if a dual watching MS receives a disable message then that disable message applies to both V+D and Direct Mode. In the case of a temporary disablement, the MS should then continue to receive, looking for an enable message; during this time, the MS may continue to use the dual watch periodic reception procedure on the V+D control channel. If the MS receives an enable message then that enable message applies to both V+D and Direct Mode.

MM shall assume that the dual watch mode is lost when the RA is changed or if the MS needs to re-register for any reason other than for a periodic registration. Having successfully re-registered, the MS then needs to send again the U-MM STATUS PDU carrying a U-DUAL WATCH MODE REQUEST sub-PDU if it wishes to resume dual watch operation.

NOTE 2: Unlike normal energy economy mode (see clause 16.7.1), the MS cannot use the U-LOCATION UPDATE DEMAND PDU to request dual watch operation.

Both in full and idle dual watch mode the MS may not be able to receive the V+D common control channel while in a Direct Mode call, see clause 23.7.7. It is assumed that in both modes, when the MS is participating in a V+D call or packet data transfer, it shall receive all the required V+D slots.

An idle dual watching MS shall obey the normal criteria for registration as if it had been receiving the V+D common control channel throughout Direct Mode calls in which it participates. So, at the end of a Direct Mode call, the MS is not required to re-register unless the RA has changed or the LA timer has expired (or the MS has received a D-LOCATION UPDATE COMMAND PDU from the SwMI). This applies also to a full dual watching MS.

### 16.7.2.7 Idle dual watch without informing SwMI

The procedures defined in clauses 16.7.2.2 to 16.7.2.6 relate to the full dual watching procedure. They relate also to the idle dual watching procedure, but only in the case when the MS informs the SwMI that it is performing idle dual watch.

Alternatively, upon receipt of a TNMM-STATUS request primitive with the "dual watch" parameter value set to "starting dual watch mode", the MS may perform the idle dual watching procedure without informing the SwMI that it is performing idle dual watch. As in normal idle dual watch, an MS using this form of idle dual watch:

- is capable of periodically receiving both the Direct Mode RF carrier and the V+D common control channel when idle; and
- may not be capable of receiving the V+D common control channel while it is in a Direct Mode call or a Direct Mode RF carrier while it is in a V+D call.

It is assumed that, when the MS is participating in a V+D call or packet data transfer, it shall receive all the required V+D slots.

When performing this form of idle dual watch, the MS shall obey the normal V+D procedures except that it is not required to receive the V+D common control channel while it is in a Direct Mode call.

An MS using this form of idle dual watch shall obey the normal criteria for registration as if it had been receiving the V+D common control channel throughout Direct Mode calls in which it participates. So, at the end of a Direct Mode call, the MS is not required to re-register unless the RA has changed or the LA timer has expired (or the MS has received a D-LOCATION UPDATE COMMAND PDU from the SwMI).

An MS using this form of idle dual watch may choose to request normal energy economy mode, as defined in clause 16.7.1.

This form of idle dual watch mode may be applicable to an MS in the temporarily disabled state. The description in clause 16.7.2.6, note 1 applies also to this form of idle dual watch.

### 16.7.3 Expiry of timer T352

On the expiry of timer T352, if it is still possible to solely cancel the outstanding PDU according to clause 16.3.1.3, MM shall issue an MLE-CANCEL request primitive with the handle of the transmission request it corresponds to. If it is no longer possible to solely cancel the outstanding PDU according to clause 16.3.1.3, MM shall return a TNMM-ENERGY SAVING or TNMM-STATUS confirm primitive with energy saving mode value "stay alive" and a failure report to the SAP and the user application should assume that the requested service has failed.

## 16.8 Attachment/detachment of group identities and group reporting procedures

### 16.8.0 General

The attachment/detachment of group identities procedures are illustrated in figures 16.9 and 16.10. Group reporting procedures are illustrated in figures 16.11 and 16.12. Attachment/detachment of group identities and group reporting can be initiated by the user application or it can be requested by the infrastructure.

The attached group identities, used as valid layer 2 group addresses, shall be defined as follows:

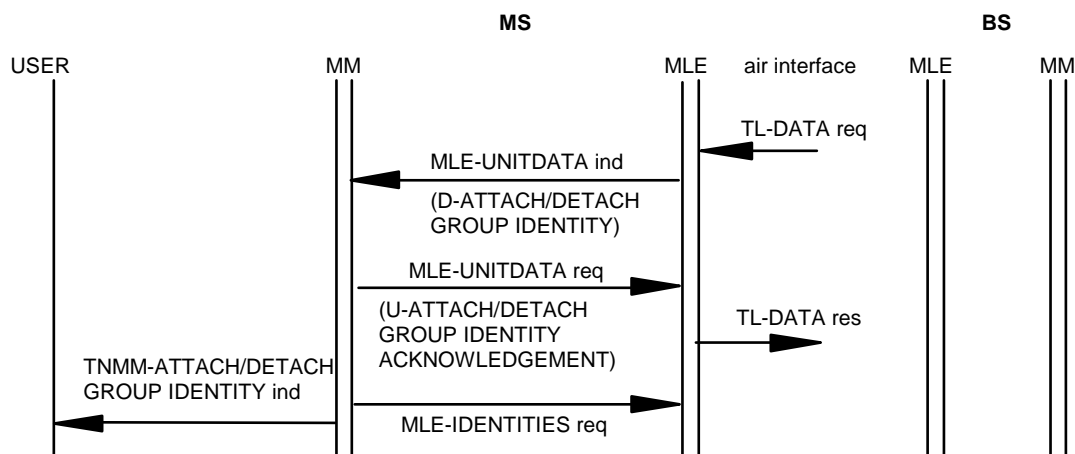

- 1) attached by the SwMI, by using D-ATTACH/DETACH GROUP IDENTITY PDU and accepted by the MS using the corresponding U-ATTACH/DETACH GROUP IDENTITY ACKNOWLEDGEMENT PDU;
- 2) previously attached group identities if the attachment/detachment mode in the D-ATTACH/DETACH GROUP IDENTITY PDU were an "amendment";
- 3) previously attached group identities which were not detached by the SwMI in the D-ATTACH/DETACH GROUP IDENTITY PDU;
- 4) attachment requested by the MS by using U-ATTACH/DETACH GROUP IDENTITY or U-LOCATION UPDATE DEMAND PDU, and accepted by the SwMI in the corresponding D-ATTACH/DETACH GROUP IDENTITY ACKNOWLEDGEMENT or D-LOCATION UPDATE ACCEPT PDU;
- 5) previously attached group identities if the attachment/detachment mode in the U-ATTACH/DETACH GROUP IDENTITY PDU or U-LOCATION UPDATE DEMAND PDU were an "amendment";
- 6) previously attached group identities which were not detached by the MS by using U-ATTACH/DETACH GROUP IDENTITY or U-LOCATION UPDATE DEMAND PDU;
- 7) defined with the attachment mode "attachment is not needed". This may be defined either by using group identity attachment lifetime information element in the attachment/detachment PDUs or by using other means outside of the scope of the present document;
- 8) defined to be temporary group address, active during a call (see CMCE protocol in clause 14);
- 9) defined and attached by SS-DGNA, refer to ETSI EN 300 392-12-22 [17] and not detached by any of the previous actions;
- 10) previously attached group identities whose group identity attachment lifetime is still valid.

The MS shall always use a (V)GSSI as lower layer receiving address instead of the GSSI when the (V)GSSI is assigned for the MS in the currently registered SwMI. GSSI shall not be used as an active group identity if the currently registered network MCC and MNC is not the same as the MCC and MNC related to the GSSI.

In case the MS has been temporarily disabled and then enabled by the SwMI, the MS may assume that the groups that were attached at the time when the temporary disabling was done are still attached if not otherwise defined by the attachment lifetime. However, after enabling the MS shall re-attach the groups having lifetime "Attachment for next location update required" if the MS wishes the groups to remain attached. MS may also re-attach any groups.

Examples of group attachment/detachment message flows are in annex G.

### 16.8.1 Infrastructure initiated attachment/detachment of group identities procedure

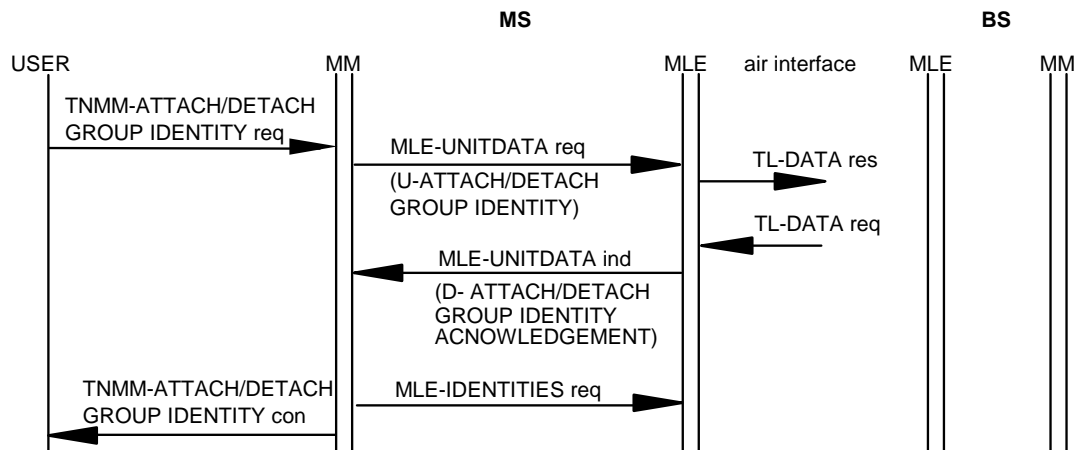

**Figure 16.9: SwMI initiated attachment/detachment of group identities**

When SwMI initiates group attachment/detachment by sending a D-ATTACH/DETACH GROUP IDENTITY PDU it shall set the group identity report to "not report request" and the group report response information element shall not be included into the PDU. If SwMI wishes to add to or remove some of the group identities attached in the MS it shall set the group identity attach/detach mode information element to "amendment". If SwMI wishes to detach all attached group identities from the MS and replace the attached group identities by new ones it shall set the group identity attach/detach mode information element to "detach all currently attached group identities and attach group identities defined in the group identity".

Upon receipt the D-ATTACH/DETACH GROUP IDENTITY PDU, MM shall inspect the attachment/detachment requests for group identities from the PDU. MM shall send valid group identities and related (V)GSSIs with an MLE-IDENTITIES request primitive to the MLE. If the group identity acknowledgement request field is set to acknowledgement requested, then the MM shall send a U-ATTACH/DETACH GROUP IDENTITY ACKNOWLEDGEMENT PDU to the MLE in an MLE-UNITDATA request primitive. The U-ATTACH/DETACH GROUP IDENTITY ACKNOWLEDGEMENT PDU shall contain rejected attachments and may contain accepted attachments and detachments, refer to annex F. Those group identities which were in the D-ATTACH/DETACH GROUP IDENTITY PDU but are not contained in the U-ATTACH/DETACH GROUP IDENTITY ACKNOWLEDGEMENT PDU are accepted. PDU priority shall be set to 6. Finally the MM shall inform the user application about changes in attached/detached group identities by issuing a TNMM-ATTACH/DETACH GROUP IDENTITY indication primitive. The MM shall inform the user application using only the GTSIs while the (V)GSSIs is not known by the user application.

Infrastructure initiated attachment/detachment of group identities is not applicable to a MS in the temporarily disabled state and MS shall not send U-ATTACH/DETACH GROUP IDENTITY ACKNOWLEDGEMENT PDU or modify group information.

## 16.8.2 MS initiated attachment/detachment of group identities procedure

**Figure 16.10: MS initiated attachment/detachment of group identities, acknowledgement requested**

Upon receipt of a TNMM-ATTACH/DETACH GROUP IDENTITY request primitive from the user application the MM shall send a U-ATTACH/DETACH GROUP IDENTITY PDU to the MLE in an MLE-UNITDATA request primitive using parameters defined in the TNMM-ATTACH/DETACH GROUP IDENTITY request primitive (see clause 17). MM shall set the group identity report to "not report request" and the group report response information element shall not be included into the PDU. If MS wishes to add to or remove some of the group identities attached in the MS it shall set the group identity attach/detach mode information element to "amendment". If MS wishes to detach all attached group identities from the MS and replace the attached group identities by new ones it shall set the group identity attach/detach mode information element to "detach all currently attached group identities and attach group identities defined in the group identity". PDU priority shall be set to 3. Timer T353 shall be started.

The MM should not try to attach those group identities which have been permanently detached by the current network. In addition the MM should not try to attach those group identities which have earlier been attached in the current network with parameter values "Attachment not allowed for next ITSI attach" if the group is not already attached.

**NOTE:** Independently of the attachment lifetime the MS is allowed to re-attach a group which is currently attached, when the user application within MS for example changes the class of usage value of the group.

Upon receipt of a D-ATTACH/DETACH GROUP IDENTITY ACKNOWLEDGEMENT PDU, timer T353 shall be stopped. The D-ATTACH/DETACH GROUP IDENTITY ACKNOWLEDGEMENT PDU shall indicate those group identities which were not accepted with a rejection reason in the group identity detachment downlink information element, refer to clause 16.10.20, and it may contain also accepted group identities. The SwMI may reject group identity detachment by adding the group attachment into the D-ATTACH/DETACH GROUP IDENTITY ACKNOWLEDGEMENT PDU.

If the MS requested attachment/detachment of group identities, the MM shall examine whether the attachments and/or detachments requested were accepted by the SwMI. The MM shall send the attached group identities and related (V)GSSIs with MLE-IDENTITIES request primitive to the MLE.

If the group identity downlink information element does not explicitly contain the group attachment lifetime information element, then the applied lifetime is outside the scope of the present document.

Finally the MM shall inform the user application by issuing a TNMM-ATTACH/DETACH GROUP IDENTITY confirm primitive. The MM shall inform the user application using only the GTSIs since the (V)GSSIs is not known by the user application.

MS initiated attachment/detachment of group identities is not applicable to a MS in the temporarily disabled state. In the temporary disabled state upon receipt of a TNMM-ATTACH/DETACH GROUP IDENTITY request primitive MM shall not send a U-ATTACH/DETACH GROUP IDENTITY PDU and may issue a TNMM-DISABLING indication primitive to the user application.

### 16.8.3 SwMI initiated group report procedure

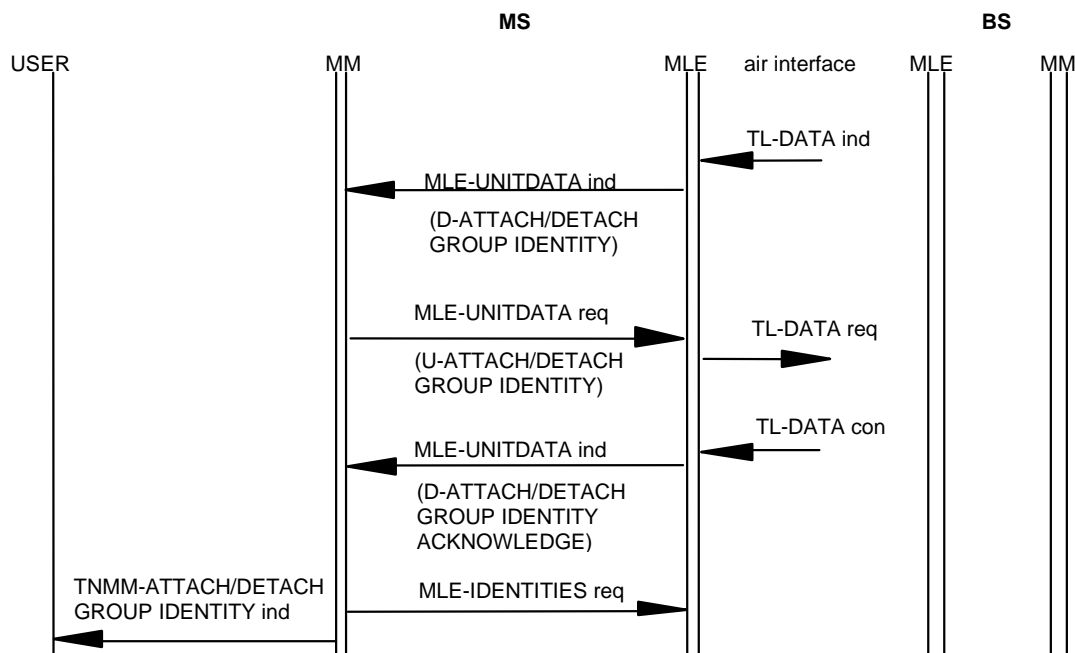

Figure 16.11: SwMI initiated group report

In the SwMI initiated group report procedure, the SwMI requests the MS to start group attachment and the MS shall re-attach those groups it wishes to remain valid, including group identities with lifetime parameter value "attachment not needed". When receiving the group report request, the MM shall regard all the group identities no more attached. If the MS wishes to receive signalling on those group identities, the MM has to re-attach them. The MM should not try to attach those group identities which have been permanently detached by the current network. In addition the MM should not try to attach those group identities which have earlier been attached in the current network with parameter values "attachment not allowed for next ITSI attach" if the group is not already attached. The attachment request may also contain group identities which were temporarily detached or indicated as unknown by the SwMI, refer to clause 16.10.20.

Upon receipt of the D-ATTACH/DETACH GROUP IDENTITY PDU from the MLE, MM shall check that the group identity report information element indicates that a "group report" is requested. The group identity acknowledgement request information element value shall be "acknowledgement not requested", MS shall ignore the value of the group identity attach/detach mode information element and group identity downlink information elements shall not be present in the PDU. As the response MM shall send a U-ATTACH/DETACH GROUP IDENTITY PDU containing the reported groups, the group identity attach/detach mode information element shall be set to "detach all currently attached group identities and attach group identities defined in the group identity" and the group identity report information element to "not report request" and if all the reported groups do fit into one U-ATTACH/DETACH GROUP IDENTITY PDU it shall contain a group report response information element indicating "group report complete". The PDU priority shall be set to 3. Timer T353 shall be started. If the reported groups do not fit in one U-ATTACH/DETACH GROUP IDENTITY PDU, the group report response information element shall not be included and subsequent groups shall be reported using U-ATTACH/DETACH GROUP IDENTITY PDUs as presented above except that the group identity attach/detach mode information element shall be set to "amendment". The PDU priority shall be set to 3. Timer T353 shall be started. MM shall expect that each U-ATTACH/DETACH GROUP IDENTITY PDU is acknowledged individually before sending next U-ATTACH/DETACH GROUP IDENTITY PDU by the corresponding D-ATTACH/DETACH GROUP IDENTITY ACKNOWLEDGEMENT PDU.

Upon receipt of each D-ATTACH/DETACH GROUP IDENTITY ACKNOWLEDGEMENT PDU, timer T353 shall be stopped. MM shall send the accepted and thus attached group identities and related (V)GSSIs with the MLE-IDENTITIES request primitive to the MLE.

In the last U-ATTACH/DETACH GROUP IDENTITY PDU containing the last reported group, the "group report response" information element shall be present and set to "group report complete".

If the MS has no groups to report, the "group report response" information element shall be present and set to "group report complete", the "group identity uplink" information element shall not be present and the "group identity attach/detach mode" information element shall be set to "detach all currently attached group identities and attach group identities defined in the group identity".

Infrastructure initiated group reporting is not applicable to a MS in the temporarily disabled state and MS shall not send U-ATTACH/DETACH GROUP IDENTITY PDU or modify group information.

#### 16.8.4 MS initiated group report procedure

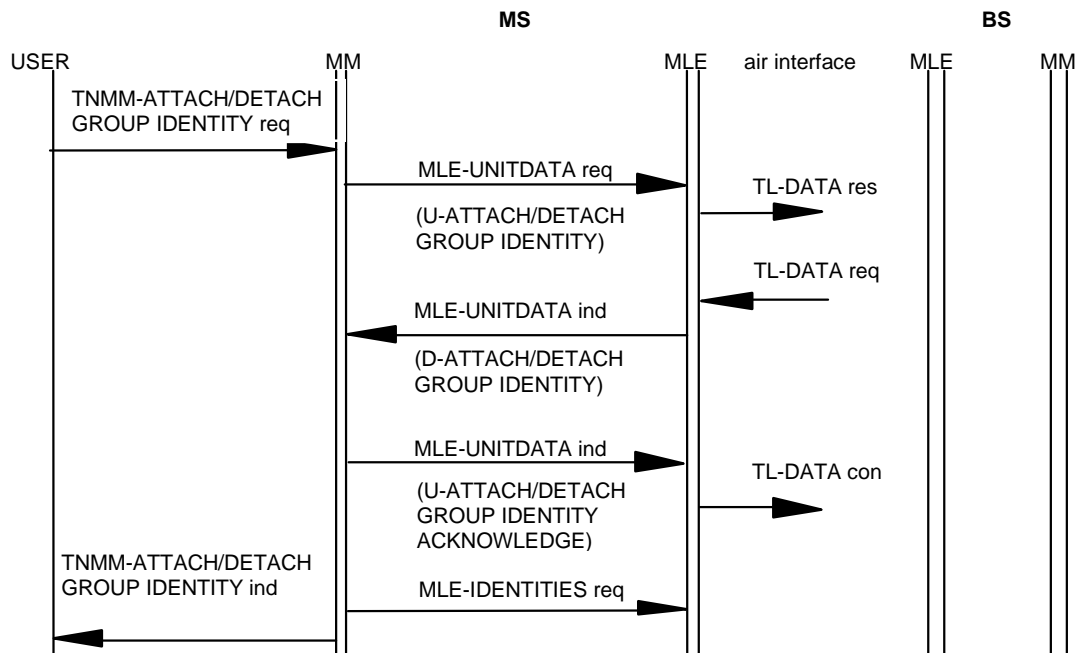

Figure 16.12: MS initiated group report

In the MS initiated group report procedure MS requests SwMI to start group attachment and the SwMI shall re-attach those groups it wishes to be attached in the MS and thus be valid downlink identities.

Upon receipt of a TNMM-ATTACH/DETACH GROUP IDENTITY request primitive containing group report request from the user application the MM shall send a U-ATTACH/DETACH GROUP IDENTITY PDU containing the value "report request" in the "group identity report" information element. The "group identity attach/detach mode" information element value shall be "amendment", and "group identity uplink" information elements shall not be present in the PDU. The PDU priority shall be set to 3. Timer T353 shall be started.

If the SwMI accepts the group report request it shall send a D-ATTACH/DETACH GROUP IDENTITY PDU containing the "group identity attach/detach mode" information element set to "detach all currently attached group identities and attach group identities defined in the group identity..." and the "group identity acknowledgement request" information element set either to "acknowledgement requested" or "acknowledgement not requested" and if all reported groups fit into one D-ATTACH/DETACH GROUP IDENTITY PDU, the group report response information element shall be included and indicate "group report complete".

If the "group identity downlink" information element is not present and the "group report response" information element indicates "group report complete", then the SwMI has no groups to report.

If the reported groups do not fit in one D-ATTACH/DETACH GROUP IDENTITY PDU, the "group report response" information element shall not be included and subsequent groups shall be reported using D-ATTACH/DETACH GROUP IDENTITY PDUs as presented above except that the "group identity attach/detach mode" information element shall be set to "amendment".

In the last D-ATTACH/DETACH GROUP IDENTITY PDU the "group report response" information element shall be included and shall indicate "group report complete".

Upon receipt of each D-ATTACH/DETACH GROUP IDENTITY PDU, T353 shall be stopped, if running. The MS shall check that the "group identity attach/detach mode" information element is "detach all currently attached group identities and attach group identities defined in the group identity...". The MM shall send the attached group identities and related (V)GSSIs with MLE-IDENTITIES request to the MLE. When the "group report response" information element indicates that the group report is complete MS knows that it has received the whole group information. If the "group identity acknowledgement request" information element was set to "acknowledgement requested", MM shall individually acknowledge each D-ATTACH/DETACH GROUP IDENTITY PDU by sending the corresponding U-ATTACH/DETACH GROUP IDENTITY ACKNOWLEDGEMENT PDU. PDU priority shall be set to 6.

If the MS initiated group reporting collides with a SwMI initiated group attachment the MS can detect it when the attach/detach mode is "amendment" and the MS shall assume that the actual report will follow later and shall not send the corresponding U-ATTACH/DETACH GROUP IDENTITY ACKNOWLEDGEMENT PDU as long as the timer T353 is running.

MS initiated group reporting is not applicable to a MS in the temporarily disabled state. In the temporary disabled state upon receipt of a TNMM-ATTACH/DETACH GROUP IDENTITY request primitive MM shall not send a U-ATTACH/DETACH GROUP IDENTITY PDU and may issue a TNMM-DISABLING indication primitive to the user application.

### 16.8.5 Expiry of timer T353

On the expiry of timer T353, if it is still possible to solely cancel the outstanding PDU according to clause 16.3.1.3, MM shall issue an MLE-CANCEL request primitive with the handle of the transmission request it corresponds to. If it is no longer possible to solely cancel the outstanding PDU according to clause 16.3.1.3, MM shall return a failure report to the SAP and the user application should assume that the requested service has failed.

### 16.8.6 Colliding requests for group attachment/detachment and group reporting

In the event that one party (MS / SwMI) sends attachment/detachment requests by its own initiative at the same time as the other party is requesting group report, the report request shall override the other requests. Therefore MS/SwMI shall respond to the report request and abandon its own attachment/detachment request.

In case MS is attempting registration or SwMI is initiating registration at the same time as the other party is sending group report request or attachment/detachment requests, the registration shall override the other requests.

### 16.8.7 Group Identity Address Type (GIAT) usage in group identity downlink/uplink

The Group Identity Address Type (GIAT) shall be used in the "group identity downlink" and "group identity uplink" information elements to signify the group address information present for each group.

The group address information present in the "group identity uplink" information element shall be as follows:

- if MS attaches/acknowledges groups belonging to its home network, i.e. MNI of the group is the same as MNI of the home network of MS:
  - if the MS is registered to its home system, the GSSI information element shall be present (GIAT shall be set to 0);
  - if the MS is registered to a foreign system and the SwMI has not previously allocated a (V)GSSI to the group, the GSSI and address extension information elements shall be present (GIAT shall be set to 1);
  - if the MS is registered to a foreign system and the SwMI has previously allocated (V)GSSI, the (V)GSSI information element shall be present (GIAT shall be set to 2).
- if the MS is registered to a foreign network and attaches/acknowledges groups belonging to the current network, i.e. MNI of the group is the same as MNI of the foreign network MS is registered to:
  - the GSSI information element shall be present (GIAT shall be set to 0); or
  - the GSSI and address extension information elements shall be present (GIAT shall be set to 1).

The group address information present in the "group identity downlink" information element shall be as follows:

- if SwMI attaches/acknowledges groups belonging to the home network of MS, i.e. MNI of the group is the same as MNI of the home network of MS:
  - if the MS is registered to its home system, the GSSI information element shall be present (GIAT shall be set to 0);
  - if the MS is registered to a foreign network, the GSSI and address extension information elements were present in the "group identity uplink" information element and the SwMI rejected the attachment then the GSSI and address extension information elements shall be present (GIAT shall be set to 1);
  - if the MS is registered to a foreign network and the (V)GSSI was present in the "group identity uplink" information element, the (V)GSSI information element (which shall be the same (V)GSSI as present in the "group identity uplink" information element) shall be present (GIAT shall be set to 2);
  - if the MS is registered to a foreign network and the SwMI is initiating a group attachment/detachment and a (V)GSSI has not yet been allocated to the group, the GSSI, address extension and (V)GSSI information elements shall be present (GIAT shall be set to 3);
  - if the MS is registered to a foreign network and the SwMI is initiating a group attachment/detachment, and a (V)GSSI has already been allocated to the group, then either the (V)GSSI information element shall be present (GIAT shall be set to 2) or the GSSI, address extension and (V)GSSI information elements shall be present (GIAT shall be set to 3);
  - if the MS is registered to a foreign network, the GSSI and address extension information elements were present in the "group identity uplink" information element and the SwMI accepted the attachment then the GSSI, address extension and (V)GSSI information elements shall be present (GIAT shall be set to 3);
  - if the MS is registered to a foreign network and the SwMI requires to allocate a new (V)GSSI to a GTSI which has previously been allocated a (V)GSSI (i.e. the new (V)GSSI replaces the existing (V)GSSI) then the GSSI, address extension and (V)GSSI information elements shall be present (GIAT shall be set to 3);
  - if the MS is registered to a foreign network and the MS has initiated a group report for a GTSI and the SwMI has previously allocated a (V)GSSI for the GTSI, then the GSSI, address extension and (V)GSSI information elements shall be present (GIAT shall be set to 3).
- if the MS is registered to a foreign network and SwMI attaches/acknowledges groups belonging to the current network, i.e. MNI of the group is the same as MNI of the current network MS is registered to:
  - the GSSI information element shall be present (GIAT shall be set to 0); or
  - the GSSI and address extension information elements shall be present (GIAT shall be set to 1).

### 16.8.8 PDU or function not supported

In case MS/SwMI receives an individually addressed unknown MM PDU or a request for a MM function which is not supported, the receiving entity may send MM PDU/FUNCTION NOT SUPPORTED PDU. The behaviour of the requesting party when receiving MM PDU/FUNCTION NOT SUPPORTED PDU is outside the scope of the present document.

NOTE: The same PDU may be used for several functions, e.g. by sending U-LOCATION UPDATE DEMAND PDU the MS may request either group attachment/detachment or group report and D-LOCATION UPDATE COMMAND PDU may also include a group report request in addition to the registration request.

## 16.9 MM PDU structures and contents

### 16.9.1 MM PDU general description

Refer to annex E for PDU encoding rules and examples. The usage of security related information elements is presented in ETSI EN 300 392-7 [8] and the usage of DMO gateway related information elements is presented in ETSI EN 300 396-5 [24].

The information contained in the PDU description tables which follow corresponds to the following key:

- Length: length of the information element in bits;
- Type: information element type (1, 2 or 3) as defined below;
- C/O/M: conditional/optional/mandatory information in the PDU;
- Remark: comment.

### 16.9.2 MM PDU description tables - downlink

#### 16.9.2.1 D-ATTACH/DETACH GROUP IDENTITY

- Message: D-ATTACH/DETACH GROUP IDENTITY
- Response to: -/U-ATTACH/DETACH GROUP IDENTITY (report request)
- Response expected: -/U-ATTACH/DETACH GROUP IDENTITY ACKNOWLEDGEMENT
- Short description: The infrastructure sends this message to the MS to indicate attachment/detachment of group identities for the MS or to initiate a group report request or give a group report response.

**Table 16.1: D-ATTACH/DETACH GROUP IDENTITY PDU contents**

| Information element   | Length | Type | C/O/M | Remark                             |
|---|--------|------|-------|------------------------------------|
| PDU type  | 4      | 1    | M     | D-ATTACH/DETACH GROUP IDENTITY     |
| Group identity report   | 1      | 1    | M     |                                    |
| Group identity acknowledgement request  | 1      | 1    | M     |                                    |
| Group identity attach/detach mode   | 1      | 1    | M     |                                    |
| Proprietary   |        | 3    | O     | See note                           |
| Group report response   |        | 3    | O     | See note                           |
| Group identity downlink   |        | 4    | O     | See note                           |
| Group Identity Security Related Information   |        | 4    | O     | See ETSI EN 300 392-7 [8] and note |
| NOTE: The MS shall accept the type 3/4 information elements both in the numerical order as described in annex E and in the order shown in this table. |        |      |       |                                    |

### 16.9.2.2 D-ATTACH/DETACH GROUP IDENTITY ACKNOWLEDGEMENT

- Message: D-ATTACH/DETACH GROUP IDENTITY ACKNOWLEDGEMENT
- Response to: U-ATTACH/DETACH GROUP IDENTITY
- Response expected: -
- Short description: The infrastructure sends this message to the MS to acknowledge MS initiated attachment/detachment of group identities.

**Table 16.2: D-ATTACH/DETACH GROUP IDENTITY ACKNOWLEDGEMENT PDU contents**

| Information element   | Length | Type | C/O/M | Remark   |
|---|--------|------|-------|--|
| PDU type  | 4      | 1    | M     | D-ATTACH/DETACH GROUP IDENTITY ACKNOWLEDGEMENT |
| Group identity accept/reject  | 1      | 1    | M     |  |
| Reserved  | 1      | 1    | M     |  |
| Proprietary   |        | 3    | O     | See note                                       |
| Group identity downlink   |        | 4    | O     | See note                                       |
| Group Identity Security Related Information   |        | 4    | O     | See ETSI EN 300 392-7 [8] and note             |
| NOTE: The MS shall accept the type 3/4 information elements both in the numerical order as described in annex E and in the order shown in this table. |        |      |       |  |

16.9.2.3 Void

16.9.2.4 Void

### 16.9.2.5 D-MM STATUS

#### 16.9.2.5.1 D-MM STATUS generic structure

- Message: D-MM STATUS
- Response to: -/U-MM STATUS
- Response expected: -/U-MM STATUS
- Short description: The infrastructure sends this message to the MS to request or indicate/reject a change of an operation mode.

**Table 16.3: D-MM STATUS PDU generic contents**

| Information element   | Length   | Type | C/O/M | Remark            |
|---|----------|------|-------|-------------------|
| PDU type  | 4        | 1    | M     | D-MM STATUS       |
| Status downlink   | 6        | 1    | M     | See notes 1 and 3 |
| Status downlink dependant information   | variable |      |       | See note 2        |
| NOTE 1: This information element shall indicate the requested service or a response to a request and the sub-type of the D-MM STATUS PDU.   |          |      |       |                   |
| NOTE 2: This information element or set of information elements shall be as defined by the status downlink information element, refer to clauses 16.9.2.5.1 to 16.9.2.5.7.  |          |      |       |                   |
| NOTE 3: This Status downlink element is indicating which sub-PDU this D-MM STATUS PDU contains. In case the receiving party does not support indicated function but is able to recognize this PDU structure, it should set the received value of Status downlink element to Not-supported sub PDU type element. |          |      |       |                   |

### 16.9.2.5.2 D-CHANGE OF ENERGY SAVING MODE REQUEST

The status downlink information element value "Change of energy saving mode request" defines the D-CHANGE OF ENERGY SAVING MODE REQUEST PDU and the D-MM STATUS PDU shall contain information elements as defined in table 16.4.

- Message: D-CHANGE OF ENERGY SAVING MODE REQUEST
- Response to: -
- Response expected: U-CHANGE OF ENERGY SAVING MODE RESPONSE
- Short description: The infrastructure sends this message to the MS to modify or stop a current energy economy mode, or allocate an energy economy mode.

**Table 16.4: D-CHANGE OF ENERGY SAVING MODE REQUEST PDU contents**

| Information element       | Length   | Type | C/O/M | Remark                                 |
|---------------------------|----------|------|-------|--|
| PDU type                  | 4        | 1    | M     | D-MM STATUS                            |
| Status downlink           | 6        | 1    | M     | D-CHANGE OF ENERGY SAVING MODE REQUEST |
| Energy saving information | 14       | 1    | M     |  |
| Proprietary               | variable | 3    | O     |  |

### 16.9.2.5.3 D-CHANGE OF ENERGY SAVING MODE RESPONSE

The status downlink information element value "Change of energy saving mode response" defines the D-CHANGE OF ENERGY SAVING MODE RESPONSE PDU and the D-MM STATUS PDU shall contain information elements as defined in table 16.5.

- Message: D-CHANGE OF ENERGY SAVING MODE RESPONSE
- Response to: U-CHANGE OF ENERGY SAVING MODE REQUEST
- Response expected: -
- Short description: The infrastructure sends this message to the MS to indicate the start point of an accepted energy economy mode or to reject a request for energy economy mode.

**Table 16.5: D-CHANGE OF ENERGY SAVING MODE RESPONSE PDU contents**

| Information element       | Length   | Type | C/O/M | Remark                                  |
|---------------------------|----------|------|-------|---|
| PDU type                  | 4        | 1    | M     | D-MM STATUS                             |
| Status downlink           | 6        | 1    | M     | D-CHANGE OF ENERGY SAVING MODE RESPONSE |
| Energy saving information | 14       | 1    | M     |   |
| Proprietary               | variable | 3    | O     |   |

#### 16.9.2.5.4 D-DUAL WATCH MODE RESPONSE

The status downlink information element value "Dual watch mode response" defines the D-DUAL WATCH MODE RESPONSE PDU and the D-MM STATUS PDU shall contain information elements as defined in table 16.6.

- Message: D-DUAL WATCH MODE RESPONSE
- Response to: U-DUAL WATCH MODE REQUEST
- Response expected: -
- Short description: The infrastructure sends this message to the MS to indicate the start point of an accepted dual watch energy economy mode or to reject a request for dual watch mode.

**Table 16.6: D-DUAL WATCH MODE RESPONSE PDU contents**

| Information element   | Length | Type | C/O/M | Remark                                |
|---|--------|------|-------|---------------------------------------|
| PDU type  | 4      | 1    | M     | D-MM STATUS                           |
| Status downlink   | 6      | 1    | M     | D-DUAL WATCH MODE RESPONSE            |
| Energy saving information                                   | 14     | 1    | M     |                                       |
| Result of dual watch request                                | 3      | 1    | M     |                                       |
| Reserved  | 8      | 1    | M     | Default value = 00000000 <sub>2</sub> |
| SCCH information and distribution on 18 <sup>th</sup> frame | 6      | 2    | O     |                                       |
| Proprietary   |        | 3    | O     |                                       |

#### 16.9.2.5.5 D-TERMINATING DUAL WATCH MODE RESPONSE

The status downlink information element value "Terminating dual watch mode response" defines the D-TERMINATING DUAL WATCH MODE RESPONSE PDU and the D-MM STATUS PDU shall contain information elements as defined in table 16.7.

- Message: D-TERMINATING DUAL WATCH MODE RESPONSE
- Response to: U-TERMINATING DUAL WATCH MODE REQUEST
- Response expected: -
- Short description: The infrastructure sends this message to the MS to accept a request to terminate dual watch and may optionally indicate the start point of an accepted energy economy mode after dual watch operation.

**Table 16.7: D-TERMINATING DUAL WATCH MODE RESPONSE PDU contents**

| Information element   | Length | Type | C/O/M | Remark                                 |
|---|--------|------|-------|--|
| PDU type  | 4      | 1    | M     | D-MM STATUS                            |
| Status downlink   | 6      | 1    | M     | D-TERMINATING DUAL WATCH MODE RESPONSE |
| Reserved  | 8      | 1    | M     | Default value = 00000000 <sub>2</sub>  |
| Energy saving information                                   | 14     | 2    | O     |  |
| SCCH information and distribution on 18 <sup>th</sup> frame | 6      | 2    | O     |  |
| Proprietary   |        | 3    | O     |  |

### 16.9.2.5.6 D-CHANGE OF DUAL WATCH MODE REQUEST

The status downlink information element value "Change of dual watch mode request" defines the D-CHANGE OF DUAL WATCH MODE REQUEST PDU and the D-MM STATUS PDU shall contain information elements as defined in table 16.8.

- Message: D-CHANGE OF DUAL WATCH MODE REQUEST
- Response to: -
- Response expected: U-CHANGE OF DUAL WATCH MODE RESPONSE
- Short description: The infrastructure sends this message to the MS to change the energy economy group associated with the MS's dual watch operation or to withdraw its previous acceptance of the MS's dual watch request.

**Table 16.8: D-CHANGE OF DUAL WATCH MODE REQUEST PDU contents**

| Information element   | Length | Type | C/O/M | Remark                                |
|---|--------|------|-------|---------------------------------------|
| PDU type  | 4      | 1    | M     | D-MM STATUS                           |
| Status downlink   | 6      | 1    | M     | D-CHANGE OF DUAL WATCH MODE REQUEST   |
| Energy saving information                                   | 14     | 1    | M     |                                       |
| Reason for dual watch change by SwMI                        | 3      | 1    | M     |                                       |
| Reserved  | 8      | 1    | M     | Default value = 00000000 <sub>2</sub> |
| SCCH information and distribution on 18 <sup>th</sup> frame | 6      | 2    | O     |                                       |
| Proprietary   |        | 3    | O     |                                       |

### 16.9.2.5.7 Direct mode gateway related D-MM STATUS

The status downlink information element the values in the range 010000<sub>2</sub> to 011111<sub>2</sub> indicate a DMO gateway function and the D-MM STATUS PDU shall contain information elements as defined in ETSI EN 300 396-5 [24], annex B.

### 16.9.2.5.8 D-MS FREQUENCY BANDS REQUEST

The status downlink information element value "MS frequency bands request" defines the D-FREQUENCY BANDS REQUEST PDU and the D-MM STATUS PDU shall contain information elements as defined in table 16.9.

- Message: D-MS FREQUENCY BANDS REQUEST
- Response to: -
- Response expected: U-MS FREQUENCY BANDS INFORMATION
- Short description: The infrastructure sends this message to the MS to interrogate the frequency bands that are supported by the MS.

**Table 16.9: D-MS FREQUENCY BANDS REQUEST PDU contents**

| Information element | Length   | Type | C/O/M | Remark                       |
|---------------------|----------|------|-------|------------------------------|
| PDU type            | 4        | 1    | M     | D-MM STATUS                  |
| Status downlink     | 6        | 1    | M     | D-MS FREQUENCY BANDS REQUEST |
| Proprietary         | variable | 3    | O     |                              |

## 16.9.2.5.9 DISTANCE REPORTING REQUEST

The status downlink information element value "Distance reporting request" defines the D-DISTANCE REPORTING REQUEST PDU and the D-MM STATUS PDU shall contain information elements as defined in table 16.10.

- Message: D-DISTANCE REPORTING REQUEST
- Response to: -
- Response expected: -
- Short description: The infrastructure sends this message request that the MS shall send a Null PDU, if the timer has elapsed. The Null PDU will be used to measure the path delay for that MS.

Table 16.10: D-DISTANCE REPORTING REQUEST PDU contents

| Information element         | Length | Type | C/O/M | Remark                       |
|-----------------------------|--------|------|-------|------------------------------|
| PDU type                    | 4      | 1    | M     | D-MM STATUS                  |
| Status downlink             | 6      | 1    | M     | D-DISTANCE REPORTING REQUEST |
| Distance reporting timer    | 7      | 1    | M     |                              |
| Distance reporting validity | 1      | 1    | M     |                              |
| Proprietary                 |        | 3    | O     |                              |

## 16.9.2.6 Void

## 16.9.2.7 D-LOCATION UPDATE ACCEPT

- Message: D-LOCATION UPDATE ACCEPT
- Response to: U-LOCATION UPDATE DEMAND
- Response expected: -
- Short description: The infrastructure sends this message to the MS to indicate that updating in the network has been completed.

Table 16.11: D-LOCATION UPDATE ACCEPT PDU contents

| Information element   | Length | Type | C/O/M | Remark                    |
|---|--------|------|-------|---------------------------|
| PDU type  | 4      | 1    | M     | D-LOCATION UPDATE ACCEPT  |
| Location update accept type   | 3      | 1    | M     |                           |

| Cell type control   |        | 3    | O     |                           |
| Proprietary   |        | 3    | O     |                           |
| NOTE: Information element "Ciphering parameters" is not present if "Cipher control" is set to "0", "ciphering off".<br>Information element "ciphering parameters" is present if "Cipher control" is set to "1", "ciphering on". |        |      |       |                           |

### 16.9.2.9 D-LOCATION UPDATE REJECT

- Message: D-LOCATION UPDATE REJECT
- Response to: U-LOCATION UPDATE DEMAND
- Response expected: -
- Short description: The infrastructure sends this message to the MS to indicate that updating in the network is not accepted.

**Table 16.13: D-LOCATION UPDATE REJECT PDU contents**

| Information element   | Length | Type | C/O/M | Remark                   |
|---|--------|------|-------|--------------------------|
| PDU type  | 4      | 1    | M     | D-LOCATION UPDATE REJECT |
| Location update type  | 3      | 1    | M     |                          |
| Reject cause  | 5      | 1    | M     |                          |
| Cipher control  | 1      | 1    | M     |                          |
| Ciphering parameters  | 10     |      | C     | See note                 |
| Address extension   | 24     | 2    | O     | MNI of the MS            |

| Proprietary   |        | 3    | O     |                          |
| NOTE: Information element "Ciphering parameters" is not present if "Cipher control" is set to "0", "ciphering off".<br>Information element "Ciphering parameters" is present if "Cipher control" is set to "1", "ciphering on". |        |      |       |                          |

### 16.9.2.10 D-LOCATION UPDATE PROCEEDING

- Message: D-LOCATION UPDATE PROCEEDING
- Response to: U-LOCATION UPDATE DEMAND
- Response expected: -
- Short description: The infrastructure sends this message to the MS on registration at accepted migration to assign a (V) ASSI.

**Table 16.14: D-LOCATION UPDATE PROCEEDING PDU contents**

| Information element | Length | Type | C/O/M | Remark                       |
|---------------------|--------|------|-------|------------------------------|
| PDU type            | 4      | 1    | M     | D-LOCATION UPDATE PROCEEDING |
| SSI                 | 24     | 1    | M     | (V)ASSI of the MS            |
| Address extension   | 24     | 1    | M     | MNI of the MS                |
| Proprietary         |        | 3    | O     |                              |

## 16.9.3 MM PDU descriptions - uplink

### 16.9.3.1 U-ATTACH/DETACH GROUP IDENTITY

- Message: U-ATTACH/DETACH GROUP IDENTITY
- Response to: -/D-ATTACH/DETACH GROUP IDENTITY (report request)
- Response expected: D-ATTACH/DETACH GROUP IDENTITY ACKNOWLEDGEMENT
- Short description: The MS sends this message to the infrastructure to indicate attachment/detachment of group identities in the MS or to initiate a group report request or give a group report response.

**Table 16.15: U-ATTACH/DETACH GROUP IDENTITY PDU contents**

| Information element               | Length | Type | C/O/M | Remark                         |
|-----------------------------------|--------|------|-------|--------------------------------|
| PDU type                          | 4      | 1    | M     | U-ATTACH/DETACH GROUP IDENTITY |
| Group identity report             | 1      | 1    | M     |                                |
| Group identity attach/detach mode | 1      | 1    | M     |                                |
| Group report response             |        | 3    | O     |                                |
| Group identity uplink             |        | 4    | O     |                                |
| Proprietary                       |        | 3    | O     |                                |

### 16.9.3.2 U-ATTACH/DETACH GROUP IDENTITY ACKNOWLEDGEMENT

- Message: U-ATTACH/DETACH GROUP IDENTITY ACKNOWLEDGEMENT
- Response to: D-ATTACH/DETACH GROUP IDENTITY
- Response expected: -
- Short description: The MS sends this message to the infrastructure to acknowledge SwMI initiated attachment/detachment of group identities.

**Table 16.16: U-ATTACH/DETACH GROUP IDENTITY ACKNOWLEDGEMENT PDU contents**

| Information element                 | Length | Type | C/O/M | Remark   |
|-------------------------------------|--------|------|-------|--|
| PDU type                            | 4      | 1    | M     | U-ATTACH/DETACH GROUP IDENTITY ACKNOWLEDGEMENT |
| Group identity acknowledgement type | 1      | 1    | M     |  |
| Group identity uplink               |        | 4    | O     |  |
| Proprietary                         |        | 3    | O     |  |

### 16.9.3.3 U-ITSI DETACH

- Message: U-ITSI DETACH
- Response to: -
- Response expected: -/D-MM STATUS
- Short description: The MS sends this message to the infrastructure to announce that the MS will be de-activated.

**Table 16.17: U-ITSI DETACH PDU contents**

| Information element | Length | Type | C/O/M | Remark        |
|---------------------|--------|------|-------|---------------|
| PDU type            | 4      | 1    | M     | U-ITSI DETACH |
| Address extension   | 24     | 2    | O     | MNI of the MS |
| Proprietary         |        | 3    | O     |               |

### 16.9.3.4 U-LOCATION UPDATE DEMAND

- Message: U-LOCATION UPDATE DEMAND
- Response to: -/D-LOCATION UPDATE COMMAND
- Response expected: D-LOCATION UPDATE ACCEPT/D-LOCATION UPDATE REJECT
- Short description: The MS sends this message to the infrastructure to request update of its location registration.

**Table 16.18: U-LOCATION UPDATE DEMAND PDU contents**

| Information element  | Length | Type | C/O/M | Remark                    |
|--|--------|------|-------|---------------------------|
| PDU type   | 4      | 1    | M     | U-LOCATION UPDATE DEMAND  |
| Location update type   | 3      | 1    | M     |                           |
| Request to append LA   | 1      | 1    | M     |                           |
| Cipher control   | 1      | 1    | M     |                           |
| Ciphering parameters   | 10     |      | C     | See note 1                |
| Class of MS  | 24     | 2    | O     | See note 2                |
| Energy saving mode   | 3      | 2    | O     |                           |
| LA information   |        | 2    | O     |                           |
| SSI  | 24     | 2    | O     | ISSI of the MS            |
| Address extension  | 24     | 2    | O     | MNI of the MS             |
| Group identity location demand   |        | 3    | O     |                           |
| Group report response  |        | 3    | O     |                           |

| Extended capabilities  |        | 3    | O     | See note 2                |
| Proprietary  |        | 3    | O     |                           |
| NOTE 1: Information element "Ciphering parameters" is not present if "Cipher control" is set to "0", "ciphering off". Information element "ciphering parameters" is present if "Cipher control" is set to "1", "ciphering on".   |        |      |       |                           |
| NOTE 2: If the "class of MS" or the "extended capabilities" element is not included in this PDU and the SwMI needs to receive either of those information elements, the SwMI may accept the registration request and then send the MS a D-LOCATION UPDATE COMMAND PDU. (This could happen if, e.g. the SwMI has no record of a previous successful registration by the MS or if the SwMI has any uncertainty about the type of cell to which the MS is registering.) |        |      |       |                           |

### 16.9.3.5 U-MM STATUS

#### 16.9.3.5.1 U-MM STATUS generic construction

- Message: U-MM STATUS
- Response to: -/D-MM STATUS
- Response expected: -/D-MM STATUS
- Short description: The MS sends this message to the infrastructure to request or respond to a mode change.

**Table 16.19: U-MM STATUS PDU generic contents**

| Information element   | Length   | Type | C/O/M | Remark            |
|---|----------|------|-------|-------------------|
| PDU type  | 4        | 1    | M     | U-MM STATUS       |
| Status uplink   | 6        | 1    | M     | See notes 1 and 3 |
| Status uplink dependent information   | variable |      |       | See note 2        |
| NOTE 1: This information element shall indicate the requested service or a response to a request and the sub-type of the U-MM STATUS PDU.   |          |      |       |                   |
| NOTE 2: This information element or set of information elements shall be as defined by the status uplink information element, refer to clauses 16.9.3.5.1 to 16.9.3.5.8.  |          |      |       |                   |
| NOTE 3: This Status uplink element is indicating which sub-PDU this U-MM STATUS PDU contains. In case the receiving party does not support indicated function but is able to recognize this PDU structure, it should set the received value of Status uplink element to Not-supported sub PDU type element. |          |      |       |                   |

#### 16.9.3.5.2 U-CHANGE OF ENERGY SAVING MODE REQUEST

The status uplink information element value "Change of energy saving mode request" indicates the U-CHANGE OF ENERGY SAVING MODE REQUEST PDU and the U-MM STATUS PDU shall contain information elements as defined in table 16.20.

- Message: U-CHANGE OF ENERGY SAVING MODE REQUEST
- Response to: -
- Response expected: D-CHANGE OF ENERGY SAVING MODE RESPONSE
- Short description: The MS sends this message to the infrastructure to change its energy economy mode i.e. to start or end energy economy operation or to change the energy economy group.

**Table 16.20: U-CHANGE OF ENERGY SAVING MODE REQUEST PDU contents**

| Information element | Length   | Type | C/O/M | Remark                                 |
|---------------------|----------|------|-------|--|
| PDU type            | 4        | 1    | M     | U-MM STATUS                            |
| Status uplink       | 6        | 1    | M     | U-CHANGE OF ENERGY SAVING MODE REQUEST |
| Energy saving mode  | 3        | 1    | M     |  |
| Proprietary         | variable | 3    | O     |  |

### 16.9.3.5.3 U-CHANGE OF ENERGY SAVING MODE RESPONSE

The status uplink information element value "Change of energy saving mode response" indicates the U-CHANGE OF ENERGY SAVING MODE RESPONSE PDU and the U-MM STATUS PDU shall contain information elements as defined in table 16.21.

- Message: U-CHANGE OF ENERGY SAVING MODE RESPONSE
- Response to: D-CHANGE OF ENERGY SAVING MODE REQUEST
- Response expected: -
- Short description: The MS sends this message to the infrastructure to accept or reject a change of its energy economy mode.

**Table 16.21: U-CHANGE OF ENERGY SAVING MODE RESPONSE PDU contents**

| Information element | Length   | Type | C/O/M | Remark                                  |
|---------------------|----------|------|-------|---|
| PDU type            | 4        | 1    | M     | U-MM STATUS                             |
| Status uplink       | 6        | 1    | M     | U-CHANGE OF ENERGY SAVING MODE RESPONSE |
| Energy saving mode  | 3        | 1    | M     |   |
| Proprietary         | variable | 3    | O     |   |

### 16.9.3.5.4 U-DUAL WATCH MODE REQUEST

The status uplink information element value "Dual watch mode request" indicates the U-DUAL WATCH MODE REQUEST PDU and the U-MM STATUS PDU shall contain information elements as defined in table 16.22.

- Message: U-DUAL WATCH MODE REQUEST
- Response to: -
- Response expected: D-DUAL WATCH MODE RESPONSE
- Short description: The MS sends this message to the infrastructure to request start of dual watch operation with an appropriate energy economy group or to change the energy economy group associated with its dual watch operation or to re-request dual watch operation after a re-registration.

**Table 16.22: U-DUAL WATCH MODE REQUEST PDU contents**

| Information element                  | Length | Type | C/O/M | Remark                    |
|--------------------------------------|--------|------|-------|---------------------------|
| PDU type                             | 4      | 1    | M     | U-MM STATUS               |
| Status uplink                        | 6      | 1    | M     | U-DUAL WATCH MODE REQUEST |
| Energy saving mode                   | 3      | 1    | M     |                           |
| MS operating with type 2 repeater    | 1      | 1    | M     |                           |
| Dual watch mode                      | 1      | 1    | M     |                           |
| DMO carrier                          | 13/25  | 2    | O     |                           |
| Start of Direct Mode Operation cause | 3      | 2    | O     |                           |
| Mode change information              | 6      | 2    | O     |                           |
| Proprietary                          |        | 3    | O     |                           |

### 16.9.3.5.5 U-TERMINATING DUAL WATCH MODE REQUEST

The status uplink information element value "Terminating dual watch mode request" indicates the U-TERMINATING DUAL WATCH MODE REQUEST PDU and the U-MM STATUS PDU shall contain information elements as defined in table 16.23.

- Message: U-TERMINATING DUAL WATCH MODE REQUEST
- Response to: -
- Response expected: D-TERMINATING DUAL WATCH MODE RESPONSE
- Short description: The MS sends this message to the infrastructure to indicate an end of dual watch mode and, optionally, requesting energy economy operation.

**Table 16.23: U-TERMINATING DUAL WATCH MODE REQUEST PDU contents**

| Information element | Length | Type | C/O/M | Remark                                |
|---------------------|--------|------|-------|---------------------------------------|
| PDU type            | 4      | 1    | M     | U-MM STATUS                           |
| Status uplink       | 6      | 1    | M     | U-TERMINATING DUAL WATCH MODE REQUEST |
| Reserved            | 8      | 1    | M     | Default value = 00000000 <sub>2</sub> |
| Energy saving mode  | 3      | 2    | O     |                                       |
| Proprietary         |        | 3    | O     |                                       |

### 16.9.3.5.6 U-CHANGE OF DUAL WATCH MODE RESPONSE

The status uplink information element value "Change of dual watch mode response" indicates the U-CHANGE OF DUAL WATCH MODE RESPONSE PDU and the U-MM STATUS PDU shall contain information elements as defined in table 16.24.

- Message: U-CHANGE OF DUAL WATCH MODE RESPONSE
- Response to: D-CHANGE OF DUAL WATCH MODE REQUEST
- Response expected: -
- Short description: The MS sends this message to the infrastructure to accept a change to its dual watch operation (or to reject the change if it is not currently operating in dual watch).

**Table 16.24: U-CHANGE OF DUAL WATCH MODE RESPONSE PDU contents**

| Information element | Length | Type | C/O/M | Remark                                |
|---------------------|--------|------|-------|---------------------------------------|
| PDU type            | 4      | 1    | M     | U-MM STATUS                           |
| Status uplink       | 6      | 1    | M     | U-CHANGE OF DUAL WATCH MODE RESPONSE  |
| Energy saving mode  | 3      | 1    | M     |                                       |
| Reserved            | 8      | 1    | M     | Default value = 00000000 <sub>2</sub> |
| Proprietary         |        | 3    | O     |                                       |

### 16.9.3.5.7 U-START OF DIRECT MODE OPERATION

The status uplink information element value "Start of direct mode operation" indicates the U-START OF DIRECT MODE OPERATION PDU and the U-MM STATUS PDU shall contain information elements as defined in table 16.25.

- Message: U-START OF DIRECT MODE OPERATION
- Response to: -
- Response expected: -
- Short description: The MS sends this message to the infrastructure to indicate a start of direct mode operation without dual watch.

**Table 16.25: U-START OF DIRECT MODE OPERATION PDU contents**

| Information element                  | Length | Type | C/O/M | Remark                             |
|--------------------------------------|--------|------|-------|------------------------------------|
| PDU type                             | 4      | 1    | M     | U-MM STATUS                        |
| Status uplink                        | 6      | 1    | M     | U-START OF DIRECT MODE OPERATION   |
| Reserved                             | 5      | 1    | M     | Default value = 00000 <sub>2</sub> |
| DMO carrier                          | 13/25  | 2    | O     |                                    |
| Start of direct mode operation cause | 3      | 2    | O     |                                    |
| Mode change information              | 6      | 2    | O     |                                    |
| Proprietary                          |        | 3    | O     |                                    |

### 16.9.3.5.8 Direct mode gateway related U-MM STATUS

For the status uplink information element the values in the range 010000<sub>2</sub> to 011111<sub>2</sub> indicate a DMO gateway function and the U-MM STATUS PDU shall contain information elements as defined in ETSI EN 300 396-5 [24], annex B.

### 16.9.3.5.9 U-MS FREQUENCY BANDS INFORMATION

The status uplink information element value "MS frequency bands information" defines the U-MS FREQUENCY BANDS INFORMATION PDU and the U-MM STATUS PDU shall contain information elements as defined in table 16.26.

- Message: U-MS FREQUENCY BANDS INFORMATION
- Response to: -/D-MS FREQUENCY BANDS REQUEST
- Response expected: -
- Short description: The MS sends this message to the infrastructure to indicate which frequency bands it supports.

**Table 16.26: U-MS FREQUENCY BANDS PDU contents**

| Information element                  | Length  | Type | C/O/M | Remark                     |
|--------------------------------------|---|------|-------|----------------------------|
| PDU type                             | 4   | 1    | M     | U-MM STATUS                |
| Status uplink                        | 6   | 1    | M     | MS FREQUENCY BANDS REQUEST |
| Number of frequency band definitions | 3   | 1    | M     |                            |
| Frequency band definition            | 37  |      | C     | See note                   |
| Proprietary                          |   | 3    | O     |                            |
| NOTE:                                | This information element shall be present as many times as defined by the number of frequency band definitions information element. If the element has value 0, the Frequency band definition element is not present. |      |       |                            |

## 16.9.4 PDU description tables - downlink and uplink

### 16.9.4.1 MM PDU/FUNCTION NOT SUPPORTED

- Message: MM PDU/FUNCTION NOT SUPPORTED
- Response to: Any individually addressed MM PDU
- Response expected: -
- Short description: This PDU may be sent by the MS/LS or SwMI to indicate that the received MM PDU or the function indicated in the PDU is not supported.

**Table 16.27: MM PDU/FUNCTION NOT SUPPORTED PDU contents**

| Information element   | Length   | Type | Owner | C/O/M | Remark                        |
|---|----------|------|-------|-------|-------------------------------|
| PDU type  | 4        | 1    | MM    | M     | MM PDU/FUNCTION NOT SUPPORTED |
| Not-supported PDU type  | 4        | 1    | MM    | M     | See note 1                    |
| Not-supported sub PDU type  | variable | 2    | MM    | O     | See note 2                    |
| Length of the copied PDU  | 8        | 2    | MM    | O     |                               |
| Received PDU contents   | variable |      | MM    | C     | See notes 3 and 4             |
| NOTE 1: This information element shall identify the received PDU which contains the function which cannot be supported.   |          |      |       |       |                               |
| NOTE 2: In case the receiving party recognizes the PDU and the PDU contains a sub-PDU field (like in U/M-MM STATUS PDU, U/D-OTAR, U/D-ENABLE, etc.) this element contains the element indicating which sub-PDU this is. |          |      |       |       |                               |
| NOTE 3: The length of this element is indicated by the Length of the copied PDU element. This element is not present if the Length of the copied PDU element is not present.  |          |      |       |       |                               |
| NOTE 4: This element contains the received PDU beginning from and excluding the PDU type element.   |          |      |       |       |                               |

## 16.10 MM information elements coding

### 16.10.1 Address extension

The address extension information element shall indicate the extended part of TSI address as defined in table 16.28.

**Table 16.28: Address extension information element contents**

| Information sub-element   | Length | Type | C/O/M | Remark |
|---------------------------|--------|------|-------|--------|
| Mobile Country Code (MCC) | 10     | 1    | M     |        |
| Mobile Network Code (MNC) | 14     | 1    | M     |        |

## 16.10.1a Cell type control

The cell type control information element permits the SwMI to alter the MS's preferred or required cell types, as defined in table 16.29.

**Table 16.29: Cell type control information element contents**

| Information sub-element   | Length | Type | C/O/M | Remark   |
|---|--------|------|-------|--|
| Revert to user application setting  | 1      | 1    | M     |  |
| Required cell type list control   | 4      |      | C     | See notes 1 and 2.                             |
| Required cell type  | 3      |      | C     | See notes 1, 3 and 4.                          |
| Preferred cell type list control  | 4      |      | C     | See notes 1 and 5.                             |
| Preferred cell type   | 3      |      | C     | See notes 1, 6 and 7.                          |
| Reserved  | 4      | 2    | O     | Shall not be included in the present document. |
| NOTE 1: This element shall be included only if the "revert to user application setting" element has the value "use SwMI's cell type preference or requirement".                         |        |      |       |  |
| NOTE 2: Refer to clause 16.10.43b for the meaning of the values.  |        |      |       |  |
| NOTE 3: This element shall be present as many times as indicated by the "required cell type list control" element.  |        |      |       |  |
| NOTE 4: The "required cell type list control" element indicates whether repeated "required cell type" elements are given in order of decreasing preference or in no particular order.   |        |      |       |  |
| NOTE 5: Refer to clause 16.10.40b for the meaning of the values.  |        |      |       |  |
| NOTE 6: This element shall be present as many times as indicated by the "preferred cell type list control" element.   |        |      |       |  |
| NOTE 7: The "preferred cell type list control" element indicates whether repeated "preferred cell type" elements are given in order of decreasing preference or in no particular order. |        |      |       |  |

NOTE: If the "cell type control" information element includes an ordered list of "required cell type" information elements, there is no benefit in also including "preferred cell type" information elements. However, there may be benefit in including both a list of "preferred cell type" information elements and an unordered list of "required cell type" information elements. For example, if a short ordered preferred list is included with an unordered required list, cell types that are included in both the required list and the preferred list should be given preferences in the order they appear in the ordered preferred list; cell types that are included only in the required list should be given a lower preference than the cell types that are included in both the preferred list and the required list. If a short unordered preferred list is included with an unordered required list, cell types that are included in both the required list and the preferred list should be regarded as having a higher preference than cell types that are included in the required list but not in the preferred list. (If both a required list and a preferred list are included in the "cell type control" information element, the cell types in the preferred list should be included in the required list.)

## 16.10.2 Cipher control

The cipher control information element shall indicate whether ciphering is on or off as defined in table 16.30.

**Table 16.30: Cipher control information element contents**

| Information element | Length | Value | Remark                         |
|---------------------|--------|-------|--------------------------------|
| Cipher Control      | 1      | 0     | Ciphering off                  |
|                     |        | 1     | Refer to ETSI EN 300 392-7 [8] |

### 16.10.3 Ciphering parameters

For the ciphering parameters information element refer to ETSI EN 300 392-7 [8].

### 16.10.4 Void

### 16.10.5 Class of MS

The class of MS information element shall indicate to the infrastructure the characteristics of the MS terminal, both hardware and software. The total information element length is 24 bits and the values can be given both as a bit map and as values. The decoding shall be as defined in table 16.31.

**Table 16.31: Class of MS information element contents**

| Information sub-element   | Length | Value | Remark   |
|---|--------|-------|--|
| Frequency simplex/duplex  | 1      | 0     | Frequency simplex supported                                  |
|   |        | 1     | Frequency duplex and simplex supported                       |
| Single/multislot for phase modulation<br>(see notes 6, 7 and 8) | 1      | 0     | Single slot supported  |
|   |        | 1     | Multislot and single slot supported                          |
| Concurrent multicarrier operation                               | 1      | 0     | Single carrier operation supported                           |
|   |        | 1     | Multi and single carrier operation supported                 |
| Voice (see note 3)  | 1      | 0     | No voice calls supported                                     |
|   |        | 1     | Voice calls supported  |
| End-to-end encryption   | 1      | 0     | End-to-end encryption supported                              |
|   |        | 1     | End-to-end encryption not supported                          |
| Circuit mode data (see note 3)                                  | 1      | 0     | No circuit mode data supported                               |
|   |        | 1     | Circuit mode data supported                                  |
| TETRA packet data<br>(see notes 4 and 5)                        | 1      | 0     | TETRA packet data not supported                              |
|   |        | 1     | TETRA packet data supported                                  |
| Fast switching on a phase-modulated<br>channel                  | 1      | 0     | Fast switching not supported on a phase-modulated<br>channel |
|   |        | 1     | Fast switching supported on a phase-modulated<br>channel     |
| DCK air interface encryption                                    | 1      | 0     | DCK air interface encryption not supported                   |
|   |        | 1     | DCK air interface encryption supported                       |
| CLCH needed on carrier change                                   | 1      | 0     | No CLCH needed on carrier change                             |
|   |        | 1     | CLCH needed on carrier change                                |
| Concurrent circuit mode services<br>(see note 1)                | 1      | 0     | Concurrent circuit mode services not supported               |
|   |        | 1     | Concurrent circuit mode services supported                   |
| Original advanced link  | 1      | 0     | Original advanced link not supported                         |
|   |        | 1     | Original advanced link supported                             |
| Minimum mode  | 1      | 0     | Minimum mode not supported                                   |
|   |        | 1     | Minimum mode supported                                       |
| Carrier specific signalling channel                             | 1      | 0     | Carrier specific signalling channel not supported            |
|   |        | 1     | Carrier specific signalling channel supported                |
| Authentication  | 1      | 0     | Authentication not supported                                 |
|   |        | 1     | Authentication supported                                     |
| SCK air interface encryption                                    | 1      | 0     | SCK air interface encryption not supported                   |
|   |        | 1     | SCK air interface encryption supported                       |

| Information sub-element  | Length | Value            | Remark   |
|--|--------|------------------|--|
| TETRA air interface standard version number  | 3      | 000 <sub>2</sub> | ETSI ETS 300 392-2 (edition 1), no security functions  |
|  |        | 001 <sub>2</sub> | ETSI ETS 300 392-2 (edition 1) and ETSI EN 300 392-7 [8] V2.1.1  |
|  |        | 010 <sub>2</sub> | ETSI EN 300 392-2 V2.3.2 to V2.6.1 and ETSI EN 300 392-7 [8] V2.1.1 to V2.4.1  |
|  |        | 011 <sub>2</sub> | ETSI EN 300 392-2 V3.1.1 to the version of the present document and ETSI EN 300 392-7 [8] V3.1.1 to V3.2.1, see note 2 |
|  |        | 100 <sub>2</sub> | Reserved   |
|  |        | etc.             | etc.   |
|  |        | 111 <sub>2</sub> | Reserved   |
| Common SCCH  | 1      | 0                | Common SCCH not supported  |
|  |        | 1                | Common SCCH supported  |
| Reserved   | 1      | 0                | Default value  |
|  |        | 1                | Reserved for future expansion  |
| MAC-D-BLCK PDU and augmented channel allocation  | 1      | 0                | MAC-D-BLCK PDU not supported and augmented channel allocations not supported   |
|  |        | 1                | MAC-D-BLCK PDU supported and augmented channel allocations supported   |
| Extended advanced link(s)  | 1      | 0                | Extended advanced link(s) not supported  |
|  |        | 1                | Extended advanced link(s) supported  |
| D8PSK  | 1      | 0                | D8PSK modulation mode not supported  |
|  |        | 1                | D8PSK modulation mode supported  |
| NOTE 1: If concurrent circuit mode services are supported it is implicit that concurrent channels are supported. If concurrent circuit mode services are not supported concurrent channels are implicitly supported if the Packet Data MS type is of type "A" see clause 28.3.3.4.1.   |        |                  |  |
| NOTE 2: The version of the present document and ETSI EN 300 392-7 [8] may change in future enhancements of these documents without a change of the TETRA air interface standard version number.  |        |                  |  |
| NOTE 3: Voice and circuit mode data refer to the $\pi/4$ -DQPSK circuit mode voice and circuit mode data services.   |        |                  |  |
| NOTE 4: "TETRA packet data" refers to the MS's support for the Sndcp service. This applies to all modulation types supported by the MS, except that a DA MS indicates separately its support for $\pi/4$ -DQPSK packet data (see clause 16.10.10a).  |        |                  |  |
| NOTE 5: In the present document, a DA MS should indicate that it supports the Sndcp service.   |        |                  |  |
| NOTE 6: "Single/multislot for phase modulation" refers to the MS's support of multislot channels for those phase modulation types that it supports i.e. it refers to support of multislot $\pi/4$ -DQPSK channels (if $\pi/4$ -DQPSK is supported) and multislot D8PSK channels (if D8PSK is supported).   |        |                  |  |
| NOTE 7: If the MS indicates that it supports both multislot and single-slot phase modulation channels, it shall support at least one-slot and two-slot channels (for those phase modulation types that it supports); and it is recommended that the MS supports three-slot and four-slot channels (for those phase modulation types that it supports). |        |                  |  |
| NOTE 8: In a previous version of the present document, this element indicated the MS's single/multislot capability for both phase modulation and QAM.  |        |                  |  |

## 16.10.6 Class of usage

The class of usage information element shall define priority of the group identity as defined in table 16.32. The class of usage has meaning only for the user application.

**Table 16.32: Class of Usage information element contents**

| Information element | Length | Value            | Remark           |
|---------------------|--------|------------------|------------------|
| Class of usage      | 3      | 000 <sub>2</sub> | Class of usage 1 |
|                     |        | 001 <sub>2</sub> | Class of usage 2 |
|                     |        | 010 <sub>2</sub> | Class of usage 3 |
|                     |        | 011 <sub>2</sub> | Class of usage 4 |
|                     |        | 100 <sub>2</sub> | Class of usage 5 |
|                     |        | 101 <sub>2</sub> | Class of usage 6 |
|                     |        | 110 <sub>2</sub> | Class of usage 7 |
|                     |        | 111 <sub>2</sub> | Class of usage 8 |

## 16.10.7 Disabling type

For the disabling type information element refer to ETSI EN 300 392-7 [8].

### 16.10.7a Default group attachment lifetime

The default group attachment lifetime information element shall indicate the default lifetime of the attachment of all group identities attached by the infrastructure for a MS as defined in table 16.33.

**Table 16.33: Default group attachment lifetime information element contents**

| Information element               | Length | Value           | Remark                                       |
|-----------------------------------|--------|-----------------|--|
| Default group attachment lifetime | 2      | 00 <sub>2</sub> | Attachment not needed                        |
|                                   |        | 01 <sub>2</sub> | Attachment for next ITSI attach required     |
|                                   |        | 10 <sub>2</sub> | Attachment not allowed for next ITSI attach  |
|                                   |        | 11 <sub>2</sub> | Attachment for next location update required |

### 16.10.7b Distance reporting timer

The distance reporting timer information element shall indicate the maximum time between MS transmissions as defined in table 16.34.

**Table 16.34: Distance reporting timer information element contents**

| Information element      | Length | Value | Remark                        |
|--------------------------|--------|-------|-------------------------------|
| Distance reporting timer | 7      | 0     | No reporting / stop reporting |
|                          |        | 1     | 15 s                          |
|                          |        | 2     | 30 s                          |
|                          |        | etc.  | etc.                          |
|                          |        | 127   | 31 min 45 s                   |

### 16.10.7c Distance reporting validity

The distance reporting validity information element shall indicate the reporting validity as defined in table 16.35.

**Table 16.35: Distance reporting validity information element contents**

| Information element         | Length | Value | Remark                                     |
|-----------------------------|--------|-------|--|
| Distance reporting validity | 1      | 0     | Report until next location update          |
|                             |        | 1     | Report until next ITSI attach or migration |

## 16.10.8 Distribution on 18<sup>th</sup> frame

The distribution on 18<sup>th</sup> frame information element shall indicate on which of the 4 time slots the MS shall monitor down link information in the case of minimum mode as defined in table 16.36.

**Table 16.36: Distribution on 18<sup>th</sup> frame information element contents**

| Information element                    | Length | Value           | Remark      |
|--|--------|-----------------|-------------|
| Distribution on 18 <sup>th</sup> frame | 2      | 00 <sub>2</sub> | Time slot 1 |
|  |        | 01 <sub>2</sub> | Time slot 2 |
|  |        | 10 <sub>2</sub> | Time slot 3 |
|  |        | 11 <sub>2</sub> | Time slot 4 |

## 16.10.8a DMO carrier

The DMO carrier information element shall indicate the DMO radio channel as defined in table 16.37.

**Table 16.37: DMO carrier**

| Information sub-element   | Length | Type | C/O/M | Value           | Remark   |
|---|--------|------|-------|-----------------|--|
| Carrier number  | 12     | 1    | M     |                 | Carrier frequency number (see note 1)  |
| Extended carrier numbering flag   | 1      | 1    | M     | 0               | No extended carrier numbering  |
|   |        |      |       | 1               | Extended carrier numbering   |
| Frequency band  | 4      |      | C     |                 | Provision for different frequency bands (see notes 1 and 2)                        |
| Offset  | 2      |      | C     |                 | Provision for different offsets, (see notes 2 and 3)                               |
| Duplex spacing  | 3      |      | C     |                 | Provision for different duplex spacing (see notes 1, 2 and 4)                      |
| DMO normal/reverse operation  | 1      |      | C     | 0               | DMO uplink frequency = DMO downlink frequency + duplex spacing (see notes 2 and 4) |
|   |        |      |       | 1               | DMO uplink frequency = DMO downlink frequency - duplex spacing (see notes 2 and 4) |
| Reserved  | 2      |      | C     | 00 <sub>2</sub> | Default value = 00 <sub>2</sub> (see note 2)                                       |
| NOTE 1: Refer to annex F for meaning of the values.   |        |      |       |                 |  |
| NOTE 2: These information elements shall be present only when the extended carrier numbering flag has value "extended carrier numbering".   |        |      |       |                 |  |
| NOTE 3: Refer to clause 21.4.4.1, table 21.65 for the meaning of the offset values.   |        |      |       |                 |  |
| NOTE 4: When an MS requesting dual watch mode or indicating start of Direct Mode operation transmits the DMO carrier information element, it shall set the carrier number to indicate the Direct Mode RF carrier where it intends to receive. If using extended carrier numbering, the MS shall set the duplex spacing information element to indicate 0,0 MHz duplex value unless the MS expects to use a two-frequency Direct Mode repeater during its dual watch operation in which case it may set the duplex spacing information element with the DMO normal/reverse operation information element to indicate the uplink Direct Mode RF carrier. When a Direct Mode gateway transmits the DMO carrier information element (see ETSI EN 300 396-5 [24]), it shall indicate the Direct Mode RF carrier where it intends to transmit. In the case of a two-frequency combined repeater/gateway, the repeater/gateway shall set the duplex spacing information element with the DMO normal/reverse operation information element to indicate the uplink Direct Mode RF carrier. |        |      |       |                 |  |

## 16.10.8b Dual watch mode

The dual watch mode information element shall indicate whether the MS is requesting to use full dual watch or idle dual watch as defined in table 16.38.

**Table 16.38: Dual watch mode information element contents**

| Information element | Length | Value | Remark          |
|---------------------|--------|-------|-----------------|
| Dual watch mode     | 1      | 0     | Full dual watch |
|                     |        | 1     | Idle dual watch |

## 16.10.9 Energy saving mode

The energy saving mode information element shall indicate which energy saving or dual watch scheme is requested (if any) as defined in table 16.39, refer to clause 23.7.6 for the meaning of the values.

**Table 16.39: Energy saving mode information element contents**

| Information element | Length | Value            | Remark               |
|---------------------|--------|------------------|----------------------|
| Energy saving mode  | 3      | 000 <sub>2</sub> | Stay Alive           |
|                     |        | 001 <sub>2</sub> | Economy mode 1 (EG1) |
|                     |        | 010 <sub>2</sub> | Economy mode 2 (EG2) |
|                     |        | 011 <sub>2</sub> | Economy mode 3 (EG3) |
|                     |        | 100 <sub>2</sub> | Economy mode 4 (EG4) |
|                     |        | 101 <sub>2</sub> | Economy mode 5 (EG5) |
|                     |        | 110 <sub>2</sub> | Economy mode 6 (EG6) |
|                     |        | 111 <sub>2</sub> | Economy mode 7 (EG7) |

## 16.10.10 Energy saving information

The energy saving information element shall indicate which energy saving or dual watch scheme is allocated (if any) and starting point of the energy economy mode as defined in table 16.40.

**Table 16.40: Energy saving information element contents**

| Information sub-element  | Length | Type | C/O/M | Remark     |
|--|--------|------|-------|------------|
| Energy saving mode   | 3      | 1    | M     |            |
| Frame Number   | 5      | 1    | M     | See note 1 |
| Multiframe Number  | 6      | 1    | M     | See note 2 |
| NOTE 1: When the Energy saving mode information element value is "Stay alive" this information element has no meaning and it shall be set to "00000 <sub>2</sub> ".  |        |      |       |            |
| NOTE 2: When the Energy saving mode information element value is "Stay alive" this information element has no meaning and it shall be set to "000000 <sub>2</sub> ". |        |      |       |            |

## 16.10.10a Extended capabilities

The extended capabilities information element shall be a collection of sub-elements as defined in table 16.41. It shall indicate to the infrastructure additional capabilities supported by the MS terminal, both hardware and software.

**Table 16.41: Extended capabilities information element contents**

| Information sub-element                       | Length  | Type | C/O/M | Value            | Remark  |
|---|---|------|-------|------------------|---|
| Air to ground                                 | 1   | 1    | M     | 0                | MS does not support air to ground service   |
|   |   |      |       | 1                | MS supports air to ground service   |
| Cell type request<br>(see note 1)             | 3   | 1    | M     | 000 <sub>2</sub> | Conventional access registration request  |
|   |   |      |       | 001 <sub>2</sub> | Direct access registration request  |
|   |   |      |       | 010 <sub>2</sub> | Reserved  |

| Reserved                                      | 16  | 2    | O     |                  | Shall not be included in the present document   |
| Reserved                                      | 16  | 2    | O     |                  | Shall not be included in the present document   |
| Reserved                                      | 16  | 2    | O     |                  | Shall not be included in the present document   |
| Reserved                                      | 16  | 2    | O     |                  | Shall not be included in the present document   |
| NOTE 1:                                       | In the case of a forward registration request, this element refers to the new cell (not the present cell).  |      |       |                  |   |
| NOTE 2:                                       | This element shall be included only if "cell type request" = "direct access registration request".  |      |       |                  |   |
| NOTE 3:                                       | If the MS supports the use of part-time reception but does not wish to use it, the MS may indicate that it does not support part-time reception.  |      |       |                  |   |
| NOTE 4:                                       | If the MS indicates that it supports part-time reception, it may also use enhanced energy economy if it requests energy economy mode or dual watch mode with an energy economy group. If the MS indicates that it does not support part-time reception, it shall not use enhanced energy economy if it requests energy economy mode or dual watch mode with an energy economy mode. |      |       |                  |   |
| NOTE 5:                                       | This element shall be included only if "cell type request" is not equal to "direct access registration request".  |      |       |                  |   |
| NOTE 6:                                       | If the MS requests a conventional access registration and also indicates that conventional access is not supported, the SwMI shall treat this as meaning that conventional access is supported (this combination may occur in the case of some older conventional access MSs).  |      |       |                  |   |

## 16.10.11 Frame Number

The Frame Number (FN) information element shall indicate TDMA frame number as defined in table 16.42.

**Table 16.42: Frame number information element contents**

| Information element | Length | Value              | Remark   |
|---------------------|--------|--------------------|----------|
| Frame Number        | 5      | 00000 <sub>2</sub> | Reserved |
|                     |        | 00001 <sub>2</sub> | FN1      |
|                     |        | 00010 <sub>2</sub> | FN2      |
|                     |        | etc.               | etc.     |
|                     |        | 10010 <sub>2</sub> | FN18     |
|                     |        | 10011 <sub>2</sub> | Reserved |
|                     |        | etc.               | etc.     |
|                     |        | 11111 <sub>2</sub> | Reserved |

## 16.10.11a Frequency band definition

The frequency band definition information element shall indicate the frequency capabilities of the MS as defined in table 16.43.

**Table 16.43: Frequency band definition information element contents**

| Information element       | Length | Type | C/O/M | Value           | Remark                            |
|---------------------------|--------|------|-------|-----------------|-----------------------------------|
| Lower edge carrier        | 12     | 1    | M     |                 | See notes 1 and 2                 |
| Lower edge frequency band | 4      | 1    | M     |                 | See note 1                        |
| Upper edge carrier        | 12     | 1    | M     |                 | See notes 1 and 2                 |
| Upper edge frequency band | 4      | 1    | M     |                 | See note 1                        |
| Duplex spacing            | 3      | 1    | M     |                 | See note 1                        |
| Reverse operation types   | 2      | 1    | M     | 00 <sub>2</sub> | Reserved                          |
|                           |        |      |       | 01 <sub>2</sub> | Reverse operation only            |
|                           |        |      |       | 10 <sub>2</sub> | Normal operation only             |
|                           |        |      |       | 11 <sub>2</sub> | Both normal and reverse operation |

NOTE 1: Refer to ETSI TS 100 392-15 [18].  
 NOTE 2: The frequency band shall be defined as the BS transmitter frequency range.

## 16.10.12 Group identity accept/reject

The group identity accept/reject information element shall indicate the infrastructure response type to the MS initiated attachment/detachment of group identities as defined in table 16.44.

**Table 16.44: Group identity accept/reject information element contents**

| Information element          | Length | Value | Remark                                      |
|------------------------------|--------|-------|---|
| Group identity accept/reject | 1      | 0     | All attachment/detachments accepted         |
|                              |        | 1     | At least one attachment/detachment rejected |

### 16.10.13 Group identity acknowledgement request

The group identity acknowledgement request information element shall indicate the MS response to the infrastructure initiated attachment/detachment of group identities as defined in table 16.45.

**Table 16.45: Group identity acknowledgement request information element contents**

| Information element                    | Length | Value | Remark                        |
|--|--------|-------|-------------------------------|
| Group identity acknowledgement request | 1      | 0     | Acknowledgement not requested |
|  |        | 1     | Acknowledgement requested     |

### 16.10.14 Group identity acknowledgement type

The group identity acknowledgement type information element shall indicate the MS response type to the infrastructure initiated attachment/detachment of group identities as defined in table 16.46.

**Table 16.46: Group identity acknowledgement type information element contents**

| Information element                 | Length | Value | Remark                              |
|-------------------------------------|--------|-------|-------------------------------------|
| Group identity acknowledgement type | 1      | 0     | All attachment/detachments accepted |
|                                     |        | 1     | At least one attachment rejected    |

### 16.10.15 Group identity address type

The group identity address type information element shall indicate type of group identity address type in the attachment/detachment of group identities as defined in table 16.47.

**Table 16.47: Group identity address type information element contents**

| Information element         | Length | Value           | Remark       |
|-----------------------------|--------|-----------------|--------------|
| Group identity address type | 2      | 00 <sub>2</sub> | GSSI         |
|                             |        | 01 <sub>2</sub> | GTSI         |
|                             |        | 10 <sub>2</sub> | (V)GSSI      |
|                             |        | 11 <sub>2</sub> | GTSI+(V)GSSI |

### 16.10.16 Group identity attachment lifetime

The group identity attachment lifetime information element shall indicate a lifetime of the attachment of the group identity defined by the infrastructure for a MS as defined in table 16.48.

**Table 16.48: Group identity attachment lifetime information element contents**

| Information element                | Length | Value           | Remark                                       |
|------------------------------------|--------|-----------------|--|
| Group identity attachment lifetime | 2      | 00 <sub>2</sub> | Attachment not needed                        |
|                                    |        | 01 <sub>2</sub> | Attachment for next ITSI attach required     |
|                                    |        | 10 <sub>2</sub> | Attachment not allowed for next ITSI attach  |
|                                    |        | 11 <sub>2</sub> | Attachment for next location update required |

### 16.10.17 Group identity attach/detach mode

The group identity attach/detach mode information element shall indicate a mode of the attachment/detachment of group identities as defined in table 16.49.

**Table 16.49: Group identity attach/detach mode information element contents**

| Information element               | Length | Value | Remark  |
|-----------------------------------|--------|-------|---|
| Group identity attach/detach mode | 1      | 0     | Amendment   |
|                                   |        | 1     | Detach all currently attached group identities and attach group identities defined in the group identity (downlink/uplink) element (if any) |

### 16.10.18 Group identity attach/detach type identifier

The group identity attach/detach type identifier information element shall indicate the whether a group identity is attached or detached as defined in table 16.50.

**Table 16.50: Group identity attach/detach type identifier information element contents**

| Information element                          | Length | Value | Remark     |
|--|--------|-------|------------|
| Group identity attach/detach type identifier | 1      | 0     | Attachment |
|  |        | 1     | Detachment |

### 16.10.19 Group identity attachment

The group identity attachment information element shall be a collection of sub elements and defined in table 16.51.

**Table 16.51: Group identity attachment information element contents**

| Information sub-element            | Length | Type | C/O/M | Remark |
|------------------------------------|--------|------|-------|--------|
| Group identity attachment lifetime | 2      | 1    | M     |        |
| Class of Usage                     | 3      | 1    | M     |        |

### 16.10.20 Group identity detachment downlink

The group identity detachment downlink information element shall indicate the infrastructure detachment reasons as defined in table 16.52.

**Table 16.52: Group identity detachment downlink information element contents**

| Information element                       | Length | Value           | Remark                            |
|---|--------|-----------------|-----------------------------------|
| Group identity detachment downlink        | 2      | 00 <sub>2</sub> | Unknown group identity            |
|   |        | 01 <sub>2</sub> | Temporary 1 detachment (see note) |
|   |        | 10 <sub>2</sub> | Temporary 2 detachment (see note) |
|   |        | 11 <sub>2</sub> | Permanent detachment              |
| NOTE: These values are network dependent. |        |                 |                                   |

## 16.10.21 Group identity detachment uplink

The group identity detachment uplink information element shall indicate the MS detachment reasons as defined in table 16.53.

**Table 16.53: Group identity detachment uplink information element contents**

| Information element              | Length | Value           | Remark                               |
|----------------------------------|--------|-----------------|--------------------------------------|
| Group identity detachment uplink | 2      | 00 <sub>2</sub> | Unknown group identity               |
|                                  |        | 01 <sub>2</sub> | No valid encryption key (end-to-end) |
|                                  |        | 10 <sub>2</sub> | User initiated                       |
|                                  |        | 11 <sub>2</sub> | Capacity exceeded                    |

## 16.10.22 Group identity downlink

The group identity downlink information element shall be a collection of sub elements and defined in table 16.54.

**Table 16.54: Group identity downlink information element contents**

| Information sub-element   | Length | Type | C/O/M | Remark     |
|---|--------|------|-------|------------|
| Group identity attach/detach type identifier  | 1      | 1    | M     |            |
| Group identity attachment   | 5      |      | C     | See note 1 |
| Group identity detachment downlink  | 2      |      | C     | See note 1 |
| Group identity address type   | 2      | 1    | M     |            |
| GSSI  | 24     |      | C     | See note 2 |
| Address EXTENSION   | 24     |      | C     | See note 2 |
| (V) GSSI  | 24     |      | C     | See note 2 |
| NOTE 1: Shall be conditional on the value of Group Identity Attach/Detach Type Identifier (GIADTI): |        |      |       |            |
| - GIADTI = 0; Group Identity Attachment;  |        |      |       |            |
| - GIADTI = 1; Group Identity Detachment Downlink.   |        |      |       |            |
| NOTE 2: Shall be conditional on the value of Group Identity Address Type (GIAT):                    |        |      |       |            |
| - GIAT = 0; GSSI;   |        |      |       |            |
| - GIAT = 1; GSSI + Address Extension (GTSI);  |        |      |       |            |
| - GIAT = 2; Visitor Group Short Subscriber Identity ((V)GSSI);                                      |        |      |       |            |
| - GIAT = 3; GSSI + Extension + Visitor Group Short Subscriber Identity (GTSI-V(GSSI)).              |        |      |       |            |

## 16.10.23 Group identity location accept

The group identity location accept information element shall be a collection of sub elements and defined in table 16.55.

**Table 16.55: Group identity location accept information element contents**

| Information sub-element  | Length | Type | C/O/M | Remark   |
|--|--------|------|-------|----------|
| Group identity accept/reject   | 1      | 1    | M     | See note |
| Reserved   | 1      | 1    | M     |          |
| Group identity downlink  |        | 4    | O     |          |
| NOTE: Accept/reject has meaning only when acknowledging MS group identity attachment/detachment. |        |      |       |          |

## 16.10.24 Group identity location demand

The group identity location demand information element shall be a collection of sub elements and defined in table 16.56.

**Table 16.56: Group identity location demand information element contents**

| Information sub-element           | Length | Type | C/O/M | Remark |
|-----------------------------------|--------|------|-------|--------|
| Reserved                          | 1      | 1    | M     |        |
| Group identity attach/detach mode | 1      | 1    | M     |        |
| Group identity uplink             |        | 4    | O     |        |

## 16.10.25 Void

## 16.10.26 Group identity report

The group identity report information element shall indicate that all MS's active group identities shall be reported as defined in table 16.57.

**Table 16.57: Group identity report information element contents**

| Information element   | Length | Value | Remark             |
|-----------------------|--------|-------|--------------------|
| Group identity report | 1      | 0     | Not report request |
|                       |        | 1     | Report request     |

## 16.10.27 Group identity uplink

The group identity uplink information element shall be a collection of sub elements and defined in table 16.58.

**Table 16.58: Group identity uplink information element contents**

| Information sub-element   | Length | Type | C/O/M | Remark     |
|---|--------|------|-------|------------|
| Group identity attach/detach type identifier  | 1      | 1    | M     |            |
| Class of usage  | 3      |      | C     | See note 1 |
| Group identity detachment uplink  | 2      |      | C     | See note 1 |
| Group identity address type   | 2      | 1    | M     |            |
| GSSI  | 24     |      | C     | See note 2 |
| Address extension   | 24     |      | C     | See note 2 |
| (V) GSSI  | 24     |      | C     | See note 2 |
| NOTE 1: Shall be conditional on the value of Group Identity Attach/Detach Type Identifier (GIADTI): |        |      |       |            |
| - GIADTI = 0; Class of Usage;   |        |      |       |            |
| - GIADTI = 1; Group Identity Detachment uplink.   |        |      |       |            |
| NOTE 2: Shall be conditional on the value of Group Identity Address Type (GIAT):                    |        |      |       |            |
| - GIAT = 0; GSSI;   |        |      |       |            |
| - GIAT = 1; GSSI + Address Extension (GTSI);  |        |      |       |            |
| - GIAT = 2; Visitor Group Short Subscriber Identity ((V)GSSI);                                      |        |      |       |            |
| - GIAT = 3; Reserved.   |        |      |       |            |

## 16.10.27a Group report response

The group report response information element shall indicate that the group report is complete as defined in table 16.59.

**Table 16.59: Group report response information element contents**

| Information element   | Length | Value | Remark                |
|-----------------------|--------|-------|-----------------------|
| Group report response | 1      | 0     | Group report complete |
|                       |        | 1     | Reserved              |

## 16.10.28 Group Short Subscriber Identity (GSSI)

The GSSI information element shall indicate the GSSI or (V)GSSI that the MS shall use in subsequent contacts with the SwMI. It is also used during attachment/detachment to explicitly inform the full GTSI when used in conjunction with the extension element as defined in table 16.60.

**Table 16.60: GSSI information element contents**

| Information element | Length | Value | Remark                              |
|---------------------|--------|-------|-------------------------------------|
| GSSI                | 24     |       | See ETSI EN 300 392-1 [6], clause 7 |

## 16.10.29 KSG number

For the KSG number information element refer to ETSI EN 300 392-7 [8].

## 16.10.30 LA

The LA information element shall indicate the area in which a cell is located, either the serving cell or a neighbour cell as defined in table 16.61.

**Table 16.61: LA information element contents**

| Information element | Length | Value | Remark |
|---------------------|--------|-------|--------|
| LA                  | 14     |       |        |

## 16.10.31 LACC

The LACC information element shall indicate which LACC the MS wants to use as defined in table 16.62. The element shall only be signalled if it is different from the country code used in the network, i.e. the MS is migrating.

**Table 16.62: Location Area Country Code information element contents**

| Information element        | Length | Value | Remark                                    |
|----------------------------|--------|-------|---|
| Location Area Country Code | 10     |       | See ETSI EN 300 392-1 [6], clause 7 (MCC) |

## 16.10.32 LANC

The LANC information element shall indicate which LANC the MS wants to use as defined in table 16.63. The element is only signalled if it is different from the network code used in the network, i.e. the MS is roaming.

**Table 16.63: LANC information element contents**

| Information element        | Length | Value | Remark                                   |
|----------------------------|--------|-------|--|
| Location Area Network Code | 14     |       | See ETSI EN 300 392-1 [6] clause 7 (MNC) |

### 16.10.33 LA timer

The LA timer information element shall indicate the time a LA is valid as defined in table 16.64.

**Table 16.64: LA timer information element contents**

| Information element | Length | Value            | Remark    |
|---------------------|--------|------------------|-----------|
| LA timer            | 3      | 000 <sub>2</sub> | 10 min    |
|                     |        | 001 <sub>2</sub> | 30 min    |
|                     |        | 010 <sub>2</sub> | 1 hour    |
|                     |        | 011 <sub>2</sub> | 2 hours   |
|                     |        | 100 <sub>2</sub> | 4 hours   |
|                     |        | 101 <sub>2</sub> | 8 hours   |
|                     |        | 110 <sub>2</sub> | 24 hours  |
|                     |        | 111 <sub>2</sub> | no timing |

### 16.10.34 LA information

The LA information element shall be a collection of information elements as defined in table 16.65.

**Table 16.65: LA information element contents**

| Information sub-element | Length | Type | C/O/M | Remark |
|-------------------------|--------|------|-------|--------|
| Location Area (LA)      | 14     | 1    | M     |        |
| Zero bit                | 1      | 1    | M     |        |

### 16.10.34a Length of the copied PDU

The Length of the copied PDU information element shall indicate the length of the Received PDU contents information element as defined in table 16.66.

**Table 16.66: Length of the copied PDU information element contents**

| Information sub-element  | Length | Value                 | Remark   |
|--------------------------|--------|-----------------------|----------|
| Length of the copied PDU | 8      | 00000000 <sub>2</sub> | 0 bit    |
|                          |        | 00000001 <sub>2</sub> | 1 bit    |
|                          |        | 00000010 <sub>2</sub> | 2 bits   |
|                          |        | etc.                  | etc.     |
|                          |        | 11111111 <sub>2</sub> | 255 bits |

### 16.10.35 Location update type

The purpose of the location updating type Information element shall indicate what type of registration is wanted as defined in table 16.67.

**Table 16.67: Location update type information element contents**

| Information element  | Length | Value            | Remark  |
|----------------------|--------|------------------|---|
| Location update type | 3      | 000 <sub>2</sub> | Roaming location updating                       |
|                      |        | 001 <sub>2</sub> | Migrating location updating                     |
|                      |        | 010 <sub>2</sub> | Periodic location updating                      |
|                      |        | 011 <sub>2</sub> | ITSI attach                                     |
|                      |        | 100 <sub>2</sub> | Service restoration roaming location updating   |
|                      |        | 101 <sub>2</sub> | Service restoration migrating location updating |
|                      |        | 110 <sub>2</sub> | Demand location updating                        |
|                      |        | 111 <sub>2</sub> | Disabled MS updating                            |

### 16.10.35a Location update accept type

The location update accept type information element shall indicate the type of registration in the D-LOCATION UPDATE ACCEPT PDU as defined in table 16.68.

**Table 16.68: Location update accept type information element contents**

| Information element         | Length | Value            | Remark   |
|-----------------------------|--------|------------------|--|
| Location update accept type | 3      | 000 <sub>2</sub> | Roaming location updating                                    |
|                             |        | 001 <sub>2</sub> | Temporary registration                                       |
|                             |        | 010 <sub>2</sub> | Periodic location updating                                   |
|                             |        | 011 <sub>2</sub> | ITSI attach  |
|                             |        | 100 <sub>2</sub> | Service restoration roaming location updating                |
|                             |        | 101 <sub>2</sub> | Migrating or service restoration migrating location updating |
|                             |        | 110 <sub>2</sub> | Demand location updating                                     |
|                             |        | 111 <sub>2</sub> | Disabled MS updating   |

### 16.10.36 Mobile Country Code (MCC)

The MCC information element shall indicate to which MCC the MS is subscribed as defined in table 16.69.

**Table 16.69: MCC information element contents**

| Information element | Length | Value | Remark                                    |
|---------------------|--------|-------|---|
| MCC                 | 10     |       | See ETSI EN 300 392-1 [6], clause 7 (MCC) |

### 16.10.37 Mobile Network Code (MNC)

The MNC information element shall indicate to which MNC the MS is subscribed as defined in table 16.70.

**Table 16.70: MNC information element contents**

| Information element | Length | Value | Remark                                    |
|---------------------|--------|-------|---|
| MNC                 | 14     |       | See ETSI EN 300 392-1 [6], clause 7 (MNC) |

### 16.10.37a Mode change information

Mode change information element shall indicate additional information related to a direct mode or dual watch invocation as defined in table 16.71.

**Table 16.71: Mode change information element contents**

| Information element     | Length | Value               | Remark   |
|-------------------------|--------|---------------------|----------|
| Mode change information | 6      | 000000 <sub>2</sub> | Reserved |
|                         |        | etc.                | etc.     |
|                         |        | 111111 <sub>2</sub> | Reserved |

### 16.10.37b MS operating with type 2 repeater

The MS operating with type 2 repeater information element shall indicate whether the MS expects to use a type 2 Direct Mode repeater during its dual watch operation, as defined in table 16.72. This may affect the appropriate energy economy groups (see ETSI EN 300 396-7 [25]).

**Table 16.72: MS operating with type 2 repeater information element contents**

| Information element               | Length | Value | Remark  |
|-----------------------------------|--------|-------|---|
| MS operating with type 2 repeater | 1      | 0     | MS does not expect to use a type 2 Direct Mode repeater |
|                                   |        | 1     | MS expects to use a type 2 Direct Mode repeater         |

### 16.10.38 Multiframe Number (MN)

The Multiframe Number (MN) information element shall indicate TDMA multiframe number as defined in table 16.73.

**Table 16.73: Multiframe number information element contents**

| Information element    | Length | Value               | Remark   |
|------------------------|--------|---------------------|----------|
| Multiframe Number (MN) | 6      | 000000 <sub>2</sub> | Reserved |
|                        |        | 000001 <sub>2</sub> | MN1      |
|                        |        | 000010 <sub>2</sub> | MN2      |
|                        |        | etc.                | etc.     |
|                        |        | 111100 <sub>2</sub> | MN60     |
|                        |        | 111101 <sub>2</sub> | Reserved |
|                        |        | etc.                | etc.     |
|                        |        | 111111 <sub>2</sub> | Reserved |

### 16.10.38a Not-supported PDU type

See clause 16.10.39 PDU type element.

### 16.10.38b Number of frequency band definitions

The Number of the frequency band definitions information element shall indicate the how many frequency band definitions the PDU contains as defined in table 16.74.

**Table 16.74: Number of the frequency band definitions information element contents**

| Information sub-element                  | Length | Value            | Remark |
|--|--------|------------------|--------|
| Number of the frequency band definitions | 3      | 000 <sub>2</sub> | 0      |
|  |        | 001 <sub>2</sub> | 1      |
|  |        | 010 <sub>2</sub> | 2      |
|  |        | etc.             | etc.   |
|  |        | 111 <sub>2</sub> | 7      |

### 16.10.39 PDU type

The PDU type information element shall identify an up-link and down-link message. The PDU type information element shall have a separate definition in the uplink and downlink directions as defined in table 16.75.

**Table 16.75: PDU type information element contents**

| Information element | Length                        | Value                         | Remark  |  |
|---------------------|-------------------------------|-------------------------------|---|--|
|                     |                               |                               | Downlink                                      | Uplink   |
| PDU type            | 4                             | 0000 <sub>2</sub>             | D-OTAR, see ETSI EN 300 392-7 [8].            | U-AUTHENTICATION, see ETSI EN 300 392-7 [8]      |
|                     |                               | 0001 <sub>2</sub>             | D-AUTHENTICATION, see ETSI EN 300 392-7 [8]   | U-ITSI DETACH                                    |
|                     |                               | 0010 <sub>2</sub>             | D-CK CHANGE DEMAND, see ETSI EN 300 392-7 [8] | U-LOCATION UPDATE DEMAND                         |
|                     |                               | 0011 <sub>2</sub>             | D-DISABLE, see ETSI EN 300 392-7 [8]          | U-MM STATUS                                      |
|                     |                               | 0100 <sub>2</sub>             | D-ENABLE, see ETSI EN 300 392-7 [8]           | U-CK CHANGE RESULT, see ETSI EN 300 392-7 [8]    |
|                     |                               | 0101 <sub>2</sub>             | D-LOCATION UPDATE ACCEPT                      | U-OTAR, see ETSI EN 300 392-7 [8]                |
|                     |                               | 0110 <sub>2</sub>             | D-LOCATION UPDATE COMMAND                     | U-INFORMATION PROVIDE, see ETSI EN 300 392-7 [8] |
|                     |                               | 0111 <sub>2</sub>             | D-LOCATION UPDATE REJECT                      | U-ATTACH/DETACH GROUP IDENTITY                   |
|                     |                               | 1000 <sub>2</sub>             | Reserved                                      | U-ATTACH/DETACH GROUP IDENTITY ACK               |
|                     |                               | 1001 <sub>2</sub>             | D-LOCATION UPDATE PROCEEDING                  | U-TEI PROVIDE, see ETSI EN 300 392-7 [8]         |

## 16.10.40 New registered area

The new registered area information element shall be a collection of information elements as defined in table 16.76.

**Table 16.76: New registered area information element contents**

| Information sub-element                                 | Length | Type | C/O/M | Remark   |
|---|--------|------|-------|----------|
| LA timer  | 3      | 1    | M     |          |
| LA  | 14     | 1    | M     |          |
| LACC  | 10     | 2    | O     | See note |
| LANC  | 14     | 2    | O     | See note |
| NOTE: Not used in this version of the present document. |        |      |       |          |

## 16.10.40a Preferred cell type

The preferred cell type information element shall indicate a type of cell, as defined in table 16.77.

**Table 16.77: Preferred cell type information element contents**

| Information element | Length | Value            | Remark   |
|---------------------|--------|------------------|----------|
| Preferred cell type | 3      | 000 <sub>2</sub> | CA cell  |
|                     |        | 001 <sub>2</sub> | DA cell  |
|                     |        | 010 <sub>2</sub> | Reserved |
|                     |        | etc.             | etc.     |
|                     |        | 111 <sub>2</sub> | Reserved |

## 16.10.40b Preferred cell type list control

The preferred cell type list control information element shall indicate how many preferred cell types are listed after this element, and whether the list of cell types is unordered or whether the list of cell types is given in order of decreasing preference, as defined in table 16.78.

**Table 16.78: Preferred cell type list control information element contents**

| Information element              | Length                              | Value             | Remark  |
|----------------------------------|-------------------------------------|-------------------|---|
| Preferred cell type list control | 4                                   | 0000 <sub>2</sub> | No cell types listed                                      |
|                                  |                                     | 0001 <sub>2</sub> | One cell type listed                                      |
|                                  |                                     | 0010 <sub>2</sub> | Two cell types listed in order of decreasing preference   |
|                                  |                                     | 0011 <sub>2</sub> | Three cell types listed in order of decreasing preference |
|                                  |                                     | 0100 <sub>2</sub> | Four cell types listed in order of decreasing preference  |
|                                  |                                     | 0101 <sub>2</sub> | Five cell types listed in order of decreasing preference  |
|                                  |                                     | 0110 <sub>2</sub> | Six cell types listed in order of decreasing preference   |
|                                  |                                     | 0111 <sub>2</sub> | Seven cell types listed in order of decreasing preference |
|                                  |                                     | 1000 <sub>2</sub> | Eight cell types listed in order of decreasing preference |
|                                  |                                     | 1001 <sub>2</sub> | Reserved (shall not be used in the present document)      |
|                                  |                                     | 1010 <sub>2</sub> | Two cell types listed (unordered)                         |
|                                  |                                     | 1011 <sub>2</sub> | Three cell types listed (unordered)                       |
|                                  |                                     | 1100 <sub>2</sub> | Four cell types listed (unordered)                        |
|                                  |                                     | 1101 <sub>2</sub> | Five cell types listed (unordered)                        |
|                                  |                                     | 1110 <sub>2</sub> | Six cell types listed (unordered)                         |
| 1111 <sub>2</sub>                | Seven cell types listed (unordered) |                   |   |

## 16.10.41 Proprietary

Proprietary is an optional, variable length information element and shall be used to send and receive proprietary defined information appended to the PDUs.

The use, the size and the structure of the proprietary information element is outside the scope of the present document except the first octet which shall indicate the owner of the proprietary information element as defined in annex H.

### 16.10.41a QAM capabilities

The QAM capabilities information element shall be a collection of information elements as defined in table 16.79.

**Table 16.79: QAM capabilities information element contents**

| Information sub-element  | Length | Type | C/O/M | Value            | Remark   |
|--|--------|------|-------|------------------|--|
| Maximum downlink QAM modulation level (see note 1)   | 3      | 1    | M     | 000 <sub>2</sub> | Reserved   |
|  |        |      |       | 001 <sub>2</sub> | 16-QAM   |
|  |        |      |       | 010 <sub>2</sub> | 64-QAM   |
|  |        |      |       | 011 <sub>2</sub> | Reserved   |
|  |        |      |       | etc.             | etc.   |
|  |        |      |       | 111 <sub>2</sub> | Reserved   |
| QAM fast switching   | 1      | 1    | M     | 0                | QAM fast switching not supported   |
|  |        |      |       | 1                | QAM fast switching supported   |
| QAM in 25 kHz bandwidth  | 1      | 1    | M     | 0                | QAM in 25 kHz bandwidth not supported                                      |
|  |        |      |       | 1                | QAM in 25 kHz bandwidth supported  |
| QAM in 50 kHz bandwidth  | 1      | 1    | M     | 0                | QAM in 50 kHz bandwidth not supported                                      |
|  |        |      |       | 1                | QAM in 50 kHz bandwidth supported  |
| QAM in 100 kHz bandwidth   | 1      | 1    | M     | 0                | QAM in 100 kHz bandwidth not supported                                     |
|  |        |      |       | 1                | QAM in 100 kHz bandwidth supported   |
| QAM in 150 kHz bandwidth   | 1      | 1    | M     | 0                | QAM in 150 kHz bandwidth not supported                                     |
|  |        |      |       | 1                | QAM in 150 kHz bandwidth supported   |
| Reserved   | 6      | 1    | M     |                  | Shall be set to 000000 <sub>2</sub> in the present document                |
| Multislot/single-slot for QAM (see notes 3, 4 and 5)   | 1      | 1    | M     | 0                | Multislot and single slot supported  |
|  |        |      |       | 1                | Only single slot supported   |
| CLCH-Q needed on carrier change  | 1      | 1    | M     | 0                | CLCH-Q not needed on carrier change except in the case described in note 2 |
|  |        |      |       | 1                | CLCH-Q needed on carrier change  |
| NOTE 1: If the BS does not understand the value of this element, it should assume the MS supports all downlink modulation levels up to the maximum downlink modulation level supported by the BS.  |        |      |       |                  |  |
| NOTE 2: If the MS indicates in the "class of MS" element that CLCH is needed on carrier change but indicates here that CLCH-Q is not needed on carrier change, the SwMI shall treat this as meaning that CLCH-Q is needed on carrier change (this combination may occur in the case of some older conventional access MSs).  |        |      |       |                  |  |
| NOTE 3: It is optional for a CA MS to be capable of using a multislot QAM channel; therefore a QAM-capable CA MS shall set the "multislot/single-slot for QAM" element to indicate whether it supports both multislot and single-slot QAM channels or only single-slot QAM channels. It is mandatory for a DA MS to be capable of using a multislot QAM channel (see clauses 23.1.2.5 and 23.1.3.3); therefore a DA MS shall indicate that it supports both multislot and single-slot QAM channels i.e. it shall set the "multislot/single-slot for QAM" element to value 0 to indicate "Multislot and single slot supported". |        |      |       |                  |  |
| NOTE 4: If the MS indicates that it supports both multislot and single-slot QAM channels, it shall support one-slot, two-slot, three-slot and four-slot QAM channels.  |        |      |       |                  |  |
| NOTE 5: The polarity of this element is different from the polarity of the "single/multislot for phase modulation" element in the "class of MS" element.   |        |      |       |                  |  |

## 16.10.41b Reason for dual watch change by SwMI

The reason for dual watch change by SwMI information element shall inform the MS of the reason why the SwMI is changing the MS's dual watch operation, as defined in table 16.80.

**Table 16.80: Reason for dual watch change by SwMI information element contents**

| Information element                  | Length | Value            | Remark                                     |
|--------------------------------------|--------|------------------|--|
| Reason for dual watch change by SwMI | 3      | 000 <sub>2</sub> | Dual watch terminated for undefined reason |
|                                      |        | 001 <sub>2</sub> | Change of dual watch energy economy group  |
|                                      |        | 010 <sub>2</sub> | Reserved                                   |
|                                      |        | etc.             | etc.                                       |
|                                      |        | 111 <sub>2</sub> | Reserved                                   |

## 16.10.42 Reject cause

The reject cause information element shall indicate what type of rejection has been detected as defined in table 16.81.

**Table 16.81: Reject cause information element contents**

| Information element | Length   | Value              | Remark   |
|---------------------|----------|--------------------|--|
| Reject cause        | 5        | 00000 <sub>2</sub> | Reserved   |
|                     |          | 00001 <sub>2</sub> | ITSI/ATSI unknown (system rejection)                     |
|                     |          | 00010 <sub>2</sub> | Illegal MS (system rejection)                            |
|                     |          | 00011 <sub>2</sub> | LA not allowed (LA rejection)                            |
|                     |          | 00100 <sub>2</sub> | LA unknown (LA rejection)                                |
|                     |          | 00101 <sub>2</sub> | Network failure (cell rejection)                         |
|                     |          | 00110 <sub>2</sub> | Congestion (cell rejection)                              |
|                     |          | 00111 <sub>2</sub> | Forward registration failure (cell rejection)            |
|                     |          | 01000 <sub>2</sub> | Service not subscribed (LA rejection)                    |
|                     |          | 01001 <sub>2</sub> | Mandatory element error (system rejection)               |
|                     |          | 01010 <sub>2</sub> | Message consistency error (system rejection)             |
|                     |          | 01011 <sub>2</sub> | Roaming not supported (LA rejection)                     |
|                     |          | 01100 <sub>2</sub> | Migration not supported (system rejection)               |
|                     |          | 01101 <sub>2</sub> | No cipher KSG (cell rejection)                           |
|                     |          | 01110 <sub>2</sub> | Identified cipher KSG not supported (cell rejection)     |
|                     |          | 01111 <sub>2</sub> | Requested cipher key type not available (cell rejection) |
|                     |          | 10000 <sub>2</sub> | Identified cipher key not available (cell rejection)     |
|                     |          | 10001 <sub>2</sub> | Reserved   |
|                     |          | 10010 <sub>2</sub> | Ciphering required (cell rejection)                      |
|                     |          | 10011 <sub>2</sub> | Authentication failure (system rejection)                |
|                     |          | 10100 <sub>2</sub> | Use of CA cell not permitted (cell type rejection)       |
|                     |          | 10101 <sub>2</sub> | Use of DA cell not permitted (cell type rejection)       |
|                     |          | 10110 <sub>2</sub> | Reserved   |
| etc.                | etc.     |                    |  |
| 11111 <sub>2</sub>  | Reserved |                    |  |

### 16.10.43 Request to append LA

The request to append LA information element shall indicate whether the MS user wants to append the new LA into the current registered area or not as defined in table 16.82.

**Table 16.82: Request to Append LA information element contents**

| Information element  | Length | Value | Remark  |
|----------------------|--------|-------|---|
| Request to append LA | 1      | 0     | No request to append LA to registered area (i.e. Registered area to include only this new LA) |
|                      |        | 1     | Request to append LA to registered area   |

### 16.10.43a Required cell type

The required cell type information element shall indicate a type of cell, as defined in table 16.83.

**Table 16.83: Required cell type information element contents**

| Information element | Length | Value            | Remark   |
|---------------------|--------|------------------|----------|
| Required cell type  | 3      | 000 <sub>2</sub> | CA cell  |
|                     |        | 001 <sub>2</sub> | DA cell  |
|                     |        | 010 <sub>2</sub> | Reserved |
|                     |        | etc.             | etc.     |
|                     |        | 111 <sub>2</sub> | Reserved |

### 16.10.43b Required cell type list control

The required cell type list control information element shall indicate how many required cell types are listed following this element, and whether the list of cell types is unordered or whether the list of cell types is given in order of decreasing preference, as defined in table 16.84.

**Table 16.84: Required cell type list control information element contents**

| Information element             | Length                              | Value             | Remark  |
|---------------------------------|-------------------------------------|-------------------|---|
| Required cell type list control | 4                                   | 0000 <sub>2</sub> | No cell types listed                                      |
|                                 |                                     | 0001 <sub>2</sub> | One cell type listed                                      |
|                                 |                                     | 0010 <sub>2</sub> | Two cell types listed in order of decreasing preference   |
|                                 |                                     | 0011 <sub>2</sub> | Three cell types listed in order of decreasing preference |
|                                 |                                     | 0100 <sub>2</sub> | Four cell types listed in order of decreasing preference  |
|                                 |                                     | 0101 <sub>2</sub> | Five cell types listed in order of decreasing preference  |
|                                 |                                     | 0110 <sub>2</sub> | Six cell types listed in order of decreasing preference   |
|                                 |                                     | 0111 <sub>2</sub> | Seven cell types listed in order of decreasing preference |
|                                 |                                     | 1000 <sub>2</sub> | Eight cell types listed in order of decreasing preference |
|                                 |                                     | 1001 <sub>2</sub> | Reserved (shall not be used in the present document)      |
|                                 |                                     | 1010 <sub>2</sub> | Two cell types listed (unordered)                         |
|                                 |                                     | 1011 <sub>2</sub> | Three cell types listed (unordered)                       |
|                                 |                                     | 1100 <sub>2</sub> | Four cell types listed (unordered)                        |
|                                 |                                     | 1101 <sub>2</sub> | Five cell types listed (unordered)                        |
|                                 |                                     | 1110 <sub>2</sub> | Six cell types listed (unordered)                         |
| 1111 <sub>2</sub>               | Seven cell types listed (unordered) |                   |   |

### 16.10.43c Re-send interval

The re-send interval information element shall indicate the occasion when the MS should re-send the U-MS FREQUENCY BANDS INFORMATION PDU as defined in table 16.85.

**Table 16.85: Re-send interval information element contents**

| Information element | Length | Value           | Remark   |
|---------------------|--------|-----------------|--|
| Re-send interval    | 2      | 00 <sub>2</sub> | Re-sending not needed                          |
|                     |        | 01 <sub>2</sub> | Re-send after each ITSI-Attach location update |
|                     |        | 10 <sub>2</sub> | Re-send after each location update             |
|                     |        | 11 <sub>2</sub> | Reserved                                       |

### 16.10.43d Result of dual watch request

The result of dual watch request information element shall inform the MS of the result of its dual watch request as defined in table 16.86.

**Table 16.86: Result of dual watch request information element contents**

| Information element          | Length | Value            | Remark   |
|------------------------------|--------|------------------|--|
| Result of dual watch request | 3      | 000 <sub>2</sub> | Request rejected for undefined reason  |
|                              |        | 001 <sub>2</sub> | Dual watch not supported   |
|                              |        | 010 <sub>2</sub> | Request accepted with the dual watch energy economy group given in the "energy saving information" information element |
|                              |        | 011 <sub>2</sub> | Reserved   |
|                              |        | etc.             | etc.   |
|                              |        | 111 <sub>2</sub> | Reserved   |

### 16.10.43e Revert to user application setting

The revert to user application setting information element indicates if MM shall set its "cell type preference or requirement" (see clause 16.4.12) to that provided by the user application, or if MM shall also use requirements and preferences provided by the SwMI, as defined in table 16.87.

**Table 16.87: Revert to user application setting information element contents**

| Information element                | Length | Value | Remark   |
|------------------------------------|--------|-------|--|
| Revert to user application setting | 1      | 0     | Use SwMI's cell type preference or requirement                   |
|                                    |        | 1     | Revert to user application's cell type preference or requirement |

### 16.10.44 SSI

The SSI information element shall indicate the ASSI or (V)ASSI that the MS shall use in subsequent contacts with the SwMI as defined in table 16.88. It can also be used during registration to explicitly inform the SwMI of the full ITSI when used in conjunction with the MCC and MNC.

**Table 16.88: SSI information element contents**

| Information element             | Length | Value | Remark                              |
|---------------------------------|--------|-------|-------------------------------------|
| Short Subscriber Identity (SSI) | 24     |       | See ETSI EN 300 392-1 [6], clause 7 |

### 16.10.45 SCCH information

The SCCH information element shall assign a parameter used by the MAC to calculate which common control channel to use when common SCCHs are in operation as defined in table 16.89. See clauses 23.3.1.2.1.2 and 23.3.1.2.1.3.

The parameter in the SCCH information element may also be used by the MAC in a Direct Access MS on a multi-slot MCCH-Q if enhanced energy economy is available:

- when the MS is in energy economy mode, the SCCH information parameter is used by the MAC to calculate its reception slot in the reception TDMA frames when in the sleeping cycle (see clause 23.7.6); or
- when the MS is in dual watch mode with an energy economy group, the SCCH information parameter is used by the MAC to calculate its reception slot in the reception TDMA frames when in the dual watch reception cycle (see clause 23.7.7).

The parameter in the SCCH information element may also be used by the MAC in a Direct Access MS if part-time reception on a multi-slot MCCH-Q is permitted. When the MS is using part-time reception on a multi-slot MCCH-Q, the SCCH information parameter is used by the MAC to calculate its reception slot (see clause 23.7.8).

**Table 16.89: SCCH information element contents**

| Information element | Length | Value             | Remark                |
|---------------------|--------|-------------------|-----------------------|
| SCCH information    | 4      | 0000 <sub>2</sub> | MS SCCH allocation 0  |
|                     |        | 0001 <sub>2</sub> | MS SCCH allocation 1  |
|                     |        | etc.              | etc.                  |
|                     |        | 1011 <sub>2</sub> | MS SCCH allocation 11 |
|                     |        | 1100 <sub>2</sub> | Reserved              |
|                     |        | etc.              | etc.                  |
|                     |        | 1111 <sub>2</sub> | Reserved              |

### 16.10.46 SCCH information and distribution on 18<sup>th</sup> frame

The SCCH information and distribution on 18<sup>th</sup> frame information element shall inform the MS of any SCCH information and on which of the 4 time slots the MS shall monitor down link information in the case of minimum mode as defined in table 16.90.

**Table 16.90: SCCH information and distribution on 18<sup>th</sup> frame information element contents**

| Information sub-element                | Length | Type | C/O/M | Remark |
|--|--------|------|-------|--------|
| SCCH information                       | 4      | 1    | M     |        |
| Distribution on 18 <sup>th</sup> frame | 2      | 1    | M     |        |

### 16.10.47 SCK number

For the SCK number information element refer to ETSI EN 300 392-7 [8].

### 16.10.47a Start of direct mode operation cause

Start of direct mode operation cause information element shall indicate the reason for entering direct mode operation as defined in table 16.91.

**Table 16.91: Start of direct mode operation cause information element contents**

| Information element                  | Length | Value            | Remark  |
|--------------------------------------|--------|------------------|---|
| Start of direct mode operation cause | 3      | 000 <sub>2</sub> | User initiated mode change  |
|                                      |        | 001 <sub>2</sub> | MS initiated mode change due to a potential loss of SwMI coverage |
|                                      |        | 010 <sub>2</sub> | MS initiated mode change due to SwMI load                         |
|                                      |        | 011 <sub>2</sub> | Reserved  |
|                                      |        | etc.             | etc.  |
|                                      |        | 111 <sub>2</sub> | Reserved  |

### 16.10.48 Status downlink

The status downlink information element shall indicate the requested service or a response to a request, and the sub-type of the D-MM STATUS PDU as defined in table 16.92.

**Table 16.92: Status downlink information element contents**

| Information element | Length   | Value               | Remark  |
|---------------------|----------|---------------------|---|
| Status downlink     | 6        | 000000 <sub>2</sub> | Reserved  |
|                     |          | 000001 <sub>2</sub> | Change of energy saving mode request                      |
|                     |          | 000010 <sub>2</sub> | Change of energy saving mode response                     |
|                     |          | 000011 <sub>2</sub> | Dual watch mode response                                  |
|                     |          | 000100 <sub>2</sub> | Terminating dual watch mode response                      |
|                     |          | 000101 <sub>2</sub> | Change of dual watch mode request                         |
|                     |          | 000110 <sub>2</sub> | Reserved (for an energy saving or dual watch purpose)     |
|                     |          | 000111 <sub>2</sub> | MS frequency bands request                                |
|                     |          | 001000 <sub>2</sub> | Periodic distance reporting                               |
|                     |          | 001001 <sub>2</sub> | Reserved  |
|                     |          | etc.                | etc.  |
|                     |          | 001111 <sub>2</sub> | Reserved  |
|                     |          | 010000 <sub>2</sub> | Refer to ETSI EN 300 396-5 [24]                           |
|                     |          | etc.                | etc.  |
|                     |          | 011111 <sub>2</sub> | Refer to ETSI EN 300 396-5 [24]                           |
|                     |          | 100000 <sub>2</sub> | Available for TETRA network and user specific definitions |
|                     |          | etc.                | etc.  |
|                     |          | 101111 <sub>2</sub> | Available for TETRA network and user specific definitions |
|                     |          | 110000 <sub>2</sub> | Reserved  |
|                     |          | etc.                | etc.  |
| 111111 <sub>2</sub> | Reserved |                     |   |

## 16.10.48a Status uplink

Status uplink information element shall indicate the requested service or a response to a request and the sub-type of the U-MM STATUS PDU as defined in table 16.93.

**Table 16.93: Status uplink information element contents**

| Information element | Length | Value               | Remark  |
|---------------------|--------|---------------------|---|
| Status uplink       | 6      | 000000 <sub>2</sub> | Reserved  |
|                     |        | 000001 <sub>2</sub> | Change of energy saving mode request                      |
|                     |        | 000010 <sub>2</sub> | Change of energy saving mode response                     |
|                     |        | 000011 <sub>2</sub> | Dual watch mode request                                   |
|                     |        | 000100 <sub>2</sub> | Terminating dual watch mode request                       |
|                     |        | 000101 <sub>2</sub> | Change of dual watch mode response                        |
|                     |        | 000110 <sub>2</sub> | Start of direct mode operation                            |
|                     |        | 000111 <sub>2</sub> | MS frequency bands information                            |
|                     |        | 001000 <sub>2</sub> | Reserved  |
|                     |        | etc.                | etc.  |
|                     |        | 001111 <sub>2</sub> | Reserved  |
|                     |        | 010000 <sub>2</sub> | Refer to ETSI EN 300 396-5 [24]                           |
|                     |        | etc.                | etc.  |
|                     |        | 011111 <sub>2</sub> | Refer to ETSI EN 300 396-5 [24]                           |
|                     |        | 100000 <sub>2</sub> | Available for TETRA network and user specific definitions |
|                     |        | etc.                | etc.  |
|                     |        | 101111 <sub>2</sub> | Available for TETRA network and user specific definitions |
|                     |        | 110000 <sub>2</sub> | Reserved  |
|                     |        | etc.                | etc.  |
|                     |        | 111111 <sub>2</sub> | Reserved  |

## 16.10.49 Subscriber class

The subscriber class information element shall subdivide the MS population in up to 16 classes (see definition) represented as a bit map as defined in table 16.94.

**Table 16.94: Subscriber class information element contents**

| Information element  | Length | Value | Remark                   |
|--|--------|-------|--------------------------|
| Class 1 (see note)   | 1      | 0     | Not a member of class 1  |
|  |        | 1     | Member of class 1        |
| Class 2 (see note)   | 1      | 0     | Not a member of class 2  |
|  |        | 1     | Member of class 2        |
| Class 3  | 1      | 0     | Not a member of class 3  |
|  |        | 1     | Member of class 3        |
| Class 4  | 1      | 0     | Not a member of class 4  |
|  |        | 1     | Member of class 4        |
| etc.   | 1      | 0     | etc.                     |
|  |        | 1     | etc.                     |
| Class 16   | 1      | 0     | Not a member of class 16 |
|  |        | 1     | Member of class 16       |
| NOTE: Class 1 and/or class 2 membership may be reserved by the SwMI for AGA MSs (see clauses O.4.4 and O.7.1.2). |        |       |                          |

## 16.10.50 Void

## 16.10.51 Type 3/4 element identifier

The Type 3/4 element identifier information element for downlink shall indicate the type of the following Type 3/4 element in the PDU as defined in table 16.95.

**Table 16.95: Type 3/4 element identifier information element contents for downlink**

| Information element         | Length      | Value             | Remark   |
|-----------------------------|-------------|-------------------|--|
| Type 3/4 element identifier | 4           | 0000 <sub>2</sub> | Reserved for future extension  |
|                             |             | 0001 <sub>2</sub> | Default group attachment lifetime                                      |
|                             |             | 0010 <sub>2</sub> | New registered area  |
|                             |             | 0011 <sub>2</sub> | Security downlink, see ETSI EN 300 392-7 [8]                           |
|                             |             | 0100 <sub>2</sub> | Group report response  |
|                             |             | 0101 <sub>2</sub> | Group identity location accept   |
|                             |             | 0110 <sub>2</sub> | DM-MS address, see ETSI EN 300 396-5 [24]                              |
|                             |             | 0111 <sub>2</sub> | Group identity downlink  |
|                             |             | 1000 <sub>2</sub> | Reserved for any future specified Type 3/4 element                     |
|                             |             | 1001 <sub>2</sub> | Reserved for any future specified Type 3/4 element                     |
|                             |             | 1010 <sub>2</sub> | Authentication downlink, see ETSI EN 300 392-7 [8]                     |
|                             |             | 1011 <sub>2</sub> | Reserved for any future specified Type 3/4 element                     |
|                             |             | 1100 <sub>2</sub> | Group Identity Security Related Information, see ETSI EN 300 392-7 [8] |
|                             |             | 1101 <sub>2</sub> | Cell type control  |
|                             |             | 1110 <sub>2</sub> | Reserved for any future specified Type 3/4 element                     |
| 1111 <sub>2</sub>           | Proprietary |                   |  |

The Type 3/4 element identifier information element for uplink shall indicate the type of the following Type 3/4 element in the PDU as defined in table 16.95a.

**Table 16.95a: Type 3/4 element identifier information element contents for uplink**

| Information element         | Length      | Value             | Remark   |
|-----------------------------|-------------|-------------------|--|
| Type 3/4 element identifier | 4           | 0000 <sub>2</sub> | Reserved for future extension                      |
|                             |             | 0001 <sub>2</sub> | Reserved for any future specified Type 3/4 element |
|                             |             | 0010 <sub>2</sub> | Reserved for any future specified Type 3/4 element |
|                             |             | 0011 <sub>2</sub> | Group identity location demand                     |
|                             |             | 0100 <sub>2</sub> | Group report response                              |
|                             |             | 0101 <sub>2</sub> | Reserved for any future specified Type 3/4 element |
|                             |             | 0110 <sub>2</sub> | DM-MS address, see ETSI EN 300 396-5 [24]          |
|                             |             | 0111 <sub>2</sub> | Reserved for any future specified Type 3/4 element |
|                             |             | 1000 <sub>2</sub> | Group identity uplink                              |
|                             |             | 1001 <sub>2</sub> | Authentication uplink, see ETSI EN 300 392-7 [8]   |
|                             |             | 1010 <sub>2</sub> | Reserved for any future specified Type 3/4 element |
|                             |             | 1011 <sub>2</sub> | Extended capabilities                              |
|                             |             | 1100 <sub>2</sub> | Reserved for any future specified Type 3/4 element |
|                             |             | 1101 <sub>2</sub> | Reserved for any future specified Type 3/4 element |
|                             |             | 1110 <sub>2</sub> | Reserved for any future specified Type 3/4 element |
| 1111 <sub>2</sub>           | Proprietary |                   |  |

## 16.10.52 (V)GSSI

The (V)GSSI information element shall indicate the (V)GSSI that the MS shall use in subsequent contacts with the SwMI as defined in table 16.96.

**Table 16.96: (V)GSSI information element contents**

| Information element                     | Length | Value | Remark                              |
|---|--------|-------|-------------------------------------|
| Visitor Group Short Subscriber Identity | 24     |       | See ETSI EN 300 392-1 [6], clause 7 |

## 16.10.53 Zero bit

The Zero bit information element shall be as defined in table 16.97.

**Table 16.97: Zero bit information element contents**

| Information element | Length | Value | Remark  |
|---------------------|--------|-------|---|
| Zero bit            | 1      | 0     | This guarantees the backward compatibility to edition 1 |

## 16.11 Parameters

### 16.11.1 Timers

#### 16.11.1.1 Timer T351: Registration response time

This shall be the maximum time MM is waiting for a response for a registration request. The timer T351 value shall be 10 s.

#### 16.11.1.2 Timer T352: Energy mode response time

This shall be the maximum time MM is waiting for a response for an energy saving or dual watch mode request. The timer T352 value shall be 30 s.

#### 16.11.1.3 Timer T353: Attach/Detach response time

This shall be the maximum time MM is waiting for a response for a U-Attach/Detach Group Identity PDU. The timer T353 value shall be 10 s.

#### 16.11.1.4 Timer T354: Authentication protocol time

Refer to ETSI EN 300 392-7 [8].

### 16.11.2 Constants

#### 16.11.2.1 N351: Maximum system rejection count

When an MS has received N351 registration rejections of type "system rejection" without a successful registration on a system, it shall leave the system and shall not attempt to register again on that system until after a power cycle. N351 shall have a value in the range 1 to 4 with a default value of 4.

## 17 MLE service description

### 17.1 Introduction

This clause describes the services offered by the MLE.

The assumed underlying protocol is a MLE protocol, which is assumed to be positioned in the lowest sub-layer of layer 3 of the air interface stack.

The MLE services are provided through a set of SAPs, with each SAP corresponding to one type of service user (one upper layer 3 protocol).

The MLE protocol has been designed to hide most of the radio aspects of the air interface, and the resulting MLE services are intended to be comparable to non-radio (line) layer 2 protocols.

**NOTE:** Identical service definitions should also be used for LSs to allow the use of identical upper layer 3 protocols in LSs.

The MLE service boundary is an internal sub-layer boundary that is defined to clarify the description of the air interface layer 3. It is not intended to be a testable boundary. Conformance to this service should be achieved by providing conformance to one of the assumed MLE protocols.

### 17.2 Summary of services offered by MLE protocol

The MLE provides services to MLE service users. These services should be made available through SAPs. This relationship is shown in figure 17.1.

**Figure 17.1: Relationship between a service user and a service provider**

The entities listed below shall be permitted to use MLE services:

- Mobility Management (MM) entity (see clause 16);
- Circuit Mode Control Entity (CMCE) (see clause 14);
- Subnetwork Dependent Convergence Protocol (SNDCP) entity (see clause 28).

All of the permitted MLE service users need not be present. However, in order that the MLE services may be requested, at least some of the permitted MLE service users should be present. For example, a V+D MS may choose not to implement the SNDCP entity. The MLE shall not be required to support the MLE service users which are not present.

The MLE services are represented by the set of MLE service primitives which are available via the various SAPs listed in table 17.1.

**Table 17.1: MLE SAPs**

| SAP name | Upper layer 3 protocol (service user)             | Reference                 |
|----------|---|---------------------------|
| LMM-SAP  | Mobility Management (MM)                          | Clauses 17.3.1 and 17.3.2 |
| LCMC-SAP | Circuit Mode Control Entity (CMCE)                | Clauses 17.3.3 and 17.3.4 |
| LTPD-SAP | Subnetwork Dependent Convergence Protocol (SNDCP) | Clauses 17.3.5 and 17.3.6 |

With the exception of the LMM-SAP, the services offered at each SAP should be independent of each other, and the service at each of the other SAPs should operate using an independent set of primitives. The LMM-SAP can act as a "master SAP", enabling and disabling service provision at the other SAPs.

The LTPD-SAP may support multiple independent instances of higher protocol (multiple instances of SNDCP, each with an independent set of primitives) but each instance shall be associated with a different TSI family. All TSI families associated with SNDCP within 1 MS/LS shall be associated with a single instance of MM protocol.

NOTE: Multiple TSI families are the normal situation on the TETRA infrastructure side. Most MSs contain only one TSI family, but multiple TSI families may co-exist in one MS (see ETSI EN 300 392-1 [6], clause 7).

Figure 17.2 shows the service relationships relating to the MLE services.

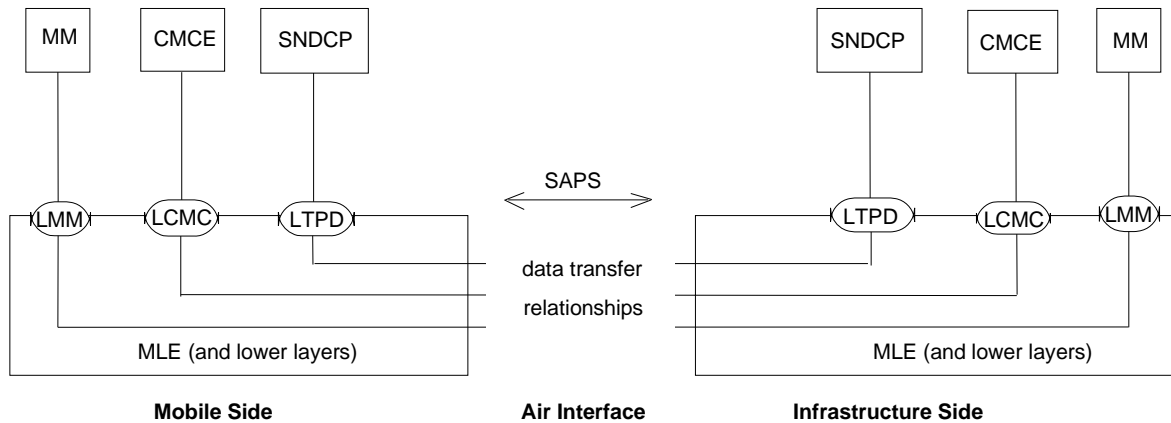

Figure 17.2: Services relationships offered by the MLE in the air interface

## 17.3 Service descriptions

### 17.3.0 General

The following service descriptions describe the MLE services provided to the higher layers in the MS protocol stack. The services are described for the protocol model purposes and present no testable requirements.

#### 17.3.1 Service state diagram for the LMM-SAP

The primitives provided by the MLE to the MM entity shall be as shown in table 17.2.

Table 17.2: Primitives and parameters at the LMM-SAP

| Primitives generic name | Specific name | Parameters  |
|-------------------------|---------------|---|
| MLE-ACTIVATE            | Request       | List of MCC<br>List of MNC<br>List of LA<br>Cell type preference or requirement |
|                         | Confirm       | Registration required<br>LA<br>Cell type  |
|                         | Indication    | Cell availability   |
| MLE-ACTIVITY            | Request       | Sleep mode  |
| MLE-BUSY                | Request       | -   |
| MLE-CANCEL              | Request       | Handle  |
| MLE-CLOSE               | Request       | -   |
| MLE-CONFIGURE           | Request       | Periodic reporting timer  |
|                         | Indication    | Periodic reporting timer  |
| MLE-DEACTIVATE          | Request       | -   |
| MLE-DISABLE             | Request       | Permitted services in temporary disabled mode                                   |
| MLE-ENABLE              | Request       | -   |

| Primitives generic name   | Specific name | Parameters   |
|---|---------------|--|
| MLE-IDENTITIES  | Request       | ISSI<br>ASSI<br>Attached GSSIs<br>Detached GSSIs   |
| MLE-IDLE  | Request       | -  |
| MLE-INFO  | Request       | Subscriber class<br>SCCH configuration<br>Energy economy mode configuration<br>Minimum mode configuration<br>Dual watch mode configuration                             |
|   | Indication    | Broadcast parameters<br>Subscriber class match   |
| MLE-LINK  | request       | MCC<br>MNC<br>List of LA<br>Cell type preference or requirement  |
|   | indication    | MCC<br>MNC<br>LA<br>Registration type<br>Security parameters<br>Cell type  |
| MLE-OPEN  | request       | -  |
| MLE-PREPARE   | request       | SDU<br>Handle<br>Layer 2 service<br>PDU priority<br>Stealing permission<br>Stealing repeats flag   |
|   | confirm       | SDU<br>Handle  |
| MLE-REPORT  | indication    | Handle<br>Transfer result  |
| MLE-UNITDATA  | request       | SDU<br>Handle<br>Address type<br>Address<br>Layer 2 service<br>PDU priority<br>Stealing permission<br>Stealing repeats flag<br>Encryption flag<br>Null PDU, (see note) |
|   | indication    | SDU<br>Handle<br>Received address<br>Received address type   |
| MLE-UPDATE  | request       | MCC<br>MNC<br>RA<br>Cell type preference or requirement<br>Registration result   |
| NOTE: When a null PDU is indicated then the PDU priority shall be the lowest value and stealing shall not be permitted. The SDU, Layer 2 service and Stealing repeats flag parameters are not applicable with a null PDU. |               |  |

The transactions between the states shall be as shown in figure 17.3.

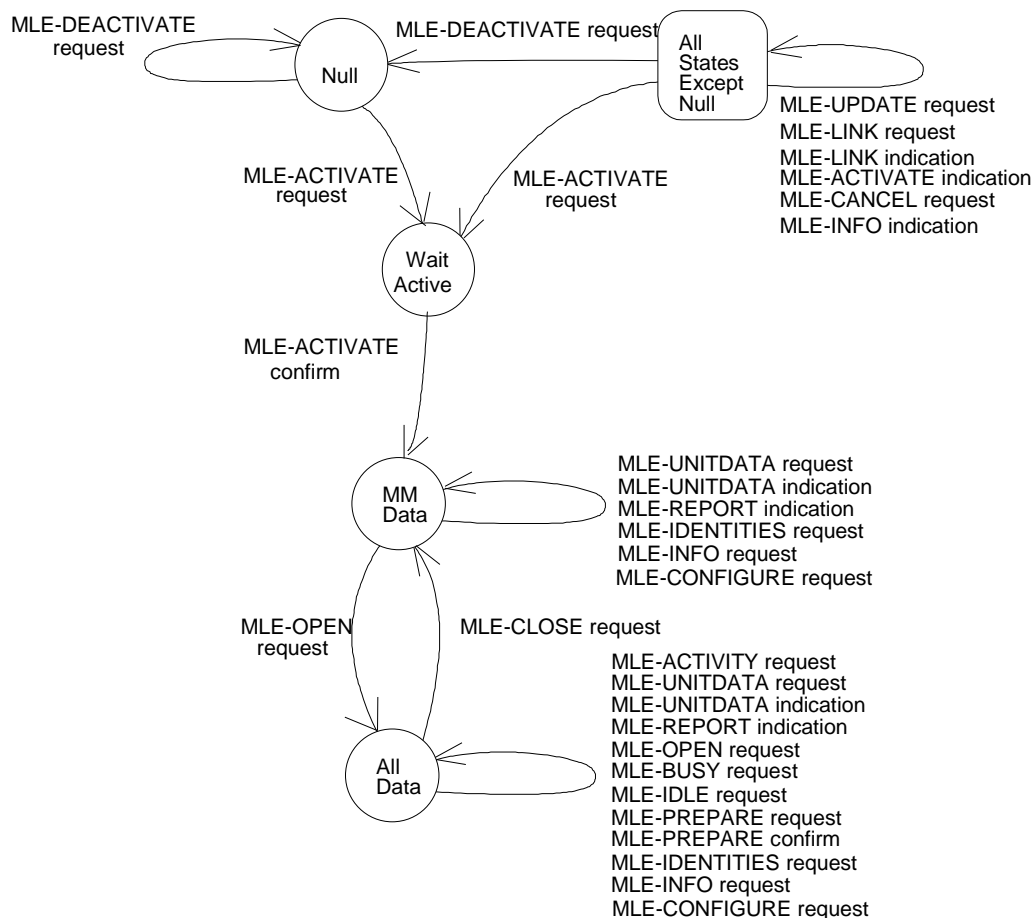

Figure 17.3: LMM-SAP state transition diagram

### 17.3.2 Service primitives for the LMM-SAP

**MLE-ACTIVATE request:** this shall be used as a request to initiate the selection of a cell for communications. The request shall always be made after power on and may be made at any time thereafter.

**MLE-ACTIVATE confirm:** this shall be used as a confirmation to the MM entity that a cell has been selected with the required characteristics.

**MLE-ACTIVATE indication:** this shall be used as an invitation to the MM to react as no suitable cell is available. It may be used indicate that MLE is in graceful service degradation mode.

**MLE-ACTIVITY request:** this shall be used by the MM entity to inform the MLE when the MS is to "stay alive" and when sleeping is permitted. It is used during a signalling exchange with the SwMI, which requires a layer 3 response.

**MLE-BUSY request:** this shall be used by the MM entity to indicate to MLE that a MM protocol exchange is in progress.

**MLE-CANCEL request:** this may be used by the MM to delete a previous request issued but not yet transmitted. The ability to cancel shall be removed when the MLE-REPORT indication is received, indicating transmission of the MM PDU.

**MLE-CLOSE request:** this shall be used by the MM entity to instruct the MLE to remove access to communication resources for the other layer 3 entities, but keeping access to the communication resources for the MM entity.

**MLE-CONFIGURE request:** this primitive shall be used by the MM entity to pass inter layer management information relating to mobility management.

**MLE-DEACTIVATE request:** this shall be used by the MM entity to request the de-activation of all MLE procedures and to return to the NULL state. No communication resources are available for use after this primitive has been issued.

**MLE-DISABLE request:** this primitive shall be used by the MM entity to request MLE to put the MS into the temporarily disabled state.

**MLE-ENABLE request:** this primitive shall be used by the MM entity to request MLE to recover the MS from the temporarily disabled state.

**MLE-IDENTITIES request:** this primitive shall be used to transfer the identities that have been received from the SwMI to the MLE, and layer 2.

**MLE-IDLE request:** this shall be used by the MM entity to indicate to MLE that a MM protocol exchange has completed.

**MLE-INFO request:** this primitive shall be used to transfer control parameters received from the SwMI to the MLE and layer 2. These control parameters include information on energy economy modes, control channel configurations and subscriber class.

**MLE-INFO indication:** this primitive shall be used by MLE to inform the MM of a change in system broadcast parameters or to indicate whether there is any match between the subscriber class being broadcast by the SwMI and the subscriber class of the MS.

**MLE-LINK request:** this shall be used by the MM entity to request that MLE select a specified MCC, MNC and possible LA.

**MLE-LINK indication:** this shall be used by the MLE to indicate to the MM entity that the MS has selected or is about to select a cell and registration is needed on the new cell, or the MS is required to re-register on the current cell.

**MLE-OPEN request:** this shall be used by the MM entity to instruct the MLE to provide access to communication resources for other layer 3 entities after successful registration.

**MLE-PREPARE request:** this shall be used by the MM entity to instruct the MLE to forward register during announced type 1 cell reselection.

**MLE-PREPARE confirm:** this shall be used by the MLE to confirm forward registration during announced type 1 cell reselection.

**MLE-REPORT indication:** this shall be used by the MLE to report on the completion of an MLE-UNITDATA request procedure. The result of the transfer attempt is passed as a parameter. Errors detected during the MLE-UNITDATA request procedure are indicated using this primitive.

**MLE-UNITDATA request:** this shall be used by the MM entity to request a data transmission A parameter indicates which layer 2 service is required.

**MLE-UNITDATA indication:** this shall be used by the MLE to pass to the MM entity data which has been received from the SwMI.

**MLE-UPDATE request:** this shall be used by the MM entity to inform the MLE about new criteria concerned with the monitoring of other possible cells.

### 17.3.3 Service state diagram for the LCMC-SAP

The primitives provided by the MLE to the CMCE shall be as shown in table 17.3.

**Table 17.3: Primitives and parameters at the LCMC-SAP**

| Generic name   | Specific name | Parameters   |
|----------------|---------------|--|
| MLE-ACTIVITY   | request       | Call state   |
| MLE-BREAK      | indication    | Permitted services in MS graceful service degradation mode   |
| MLE-BUSY       | indication    | -  |
| MLE-CANCEL     | request       | Handle   |
| MLE-CLOSE      | indication    | -  |
| MLE-CONFIGURE  | request       | Endpoint identifier<br>Channel change accepted<br>Channel change handle<br>Call release<br>Encryption flag<br>Circuit mode type<br>Simplex/duplex<br>Add temporary GSSI<br>Delete temporary GSSI<br>Tx grant<br>Switch U Plane |
| MLE-CONFIGURE  | indication    | Endpoint identifier<br>Channel change response required<br>Channel change handle<br>Reason for configuration indication<br>Conflicting endpoint identifier   |
| MLE-DISABLE    | indication    | Permitted services in temporary disabled mode  |
| MLE-ENABLE     | indication    | -  |
| MLE-IDENTITIES | request       | List of GSSIs  |
| MLE-IDLE       | indication    | -  |
| MLE-INFO       | indication    | Broadcast parameters<br>Subscriber class match<br>Permitted cell information   |
| MLE-OPEN       | indication    | MCC (current network)<br>MNC (current network)   |
| MLE-REOPEN     | indication    | -  |
| MLE-REPORT     | indication    | Handle<br>Transfer result<br>Channel change response required<br>Channel change handle   |
| MLE-RESTORE    | request       | SDU<br>Handle<br>Layer 2 service<br>PDU priority<br>Stealing permission<br>Stealing repeats flag   |
|                | confirm       | SDU<br>Handle  |
| MLE-RESUME     | indication    | MCC (current network)<br>MNC (current network)   |

| Generic name | Specific name | Parameters   |
|--------------|---------------|--|
| MLE-UNITDATA | request       | SDU<br>Handle<br>Endpoint identifier<br>Link identifier<br>Layer 2 service<br>PDU priority<br>Quality of Service (QoS) for layer 2<br>Stealing permission<br>Stealing repeats flag<br>Eligible for graceful service degradation mode |
|              | indication    | SDU<br>Handle<br>Endpoint identifier<br>Link identifier<br>Received TETRA address (ITSI/GTSI)<br>Received address type<br>Channel change response required<br>Channel change handle  |

The state transitions visible at this SAP shall be as shown in figure 17.4.

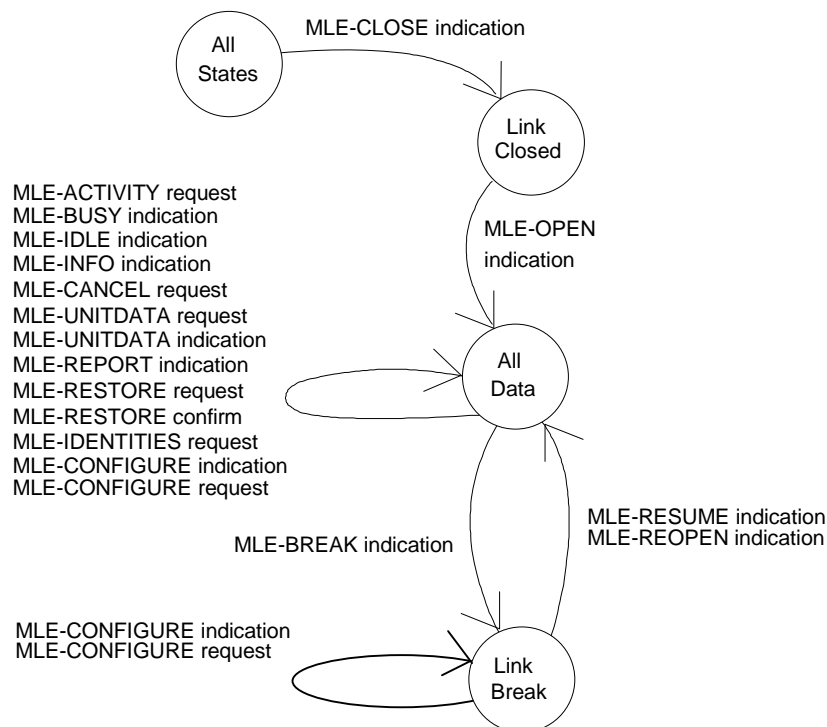

Figure 17.4: State transition diagram of LCMC-SAP

### 17.3.4 Service primitives for LCMC-SAP

**MLE-ACTIVITY request:** this primitive shall be used by the CMCE to inform the MLE of the state of any circuit mode call(s).

**MLE-BREAK indication:** this primitive shall be used by the MLE to inform the CMCE that access to the communication resources is temporarily unavailable and that the data transfer service cannot be used. In the graceful service degradation mode this primitive indicates which services can access communication resources.

**MLE-BUSY indication:** this shall be used by the MLE to inform the CMCE that a MM protocol exchange is in progress.

**MLE-CANCEL request:** this primitive shall be used by the CMCE to delete a previous request issued but not yet transmitted.

NOTE: The ability to cancel is removed when an MLE-REPORT indication is received indicating transmission of the CMCE PDU.

**MLE-CLOSE indication:** this primitive shall be used by the MLE to indicate to the CMCE that access to the communications resources has been removed and that data transfer service cannot be used.

**MLE-CONFIGURE request:** this primitive shall be used to pass inter layer management information relating to circuit mode calls, e.g. whether Tx grant has been given, type of traffic, etc.

**MLE-CONFIGURE indication:** this primitive shall be used to pass inter layer management information relating to circuit mode calls and packet data conflicts.

**MLE-DISABLE indication:** this primitive shall be used by the MLE entity to instruct the CMCE entity to enter the temporarily disabled state.

**MLE-ENABLE indication:** this primitive shall be used by the MLE entity to instruct the CMCE entity to recover from the temporarily disabled state.

**MLE-IDENTITIES request:** this primitive shall be used by the CMCE to inform the MLE and layer 2 of a change to the list of group identities.

**MLE-IDLE indication:** this shall be used by the MLE to inform the CMCE that a MM protocol exchange has completed.

**MLE-INFO indication:** this primitive shall be used by MLE to inform the CMCE of a change in system broadcast parameters, to indicate whether there is any match between the subscriber class being broadcast by the SwMI and the subscriber class of the MS, and to indicate if the present cell is a permitted cell.

**MLE-OPEN indication:** this primitive shall be used by the MLE to inform the CMCE that it has access to the communication resources and that the data transfer service can be used.

**MLE-REOPEN indication:** this primitive shall be used by the MLE to inform the CMCE that access to the communication resources is once again available. MLE-REOPEN indication indicates the failure of current call restoration to CMCE but does not prevent CMCE from restoring other circuit-mode calls. The data transfer service can now be used.

**MLE-REPORT indication:** this shall be used by the MLE to report on the completion of an MLE-UNITDATA request procedure. The result of the transfer attempt shall be passed as a parameter.

**MLE-RESTORE request:** this primitive shall be used by the CMCE to restore a call after a successful cell reselection.

**MLE-RESTORE confirm:** this primitive indicates the success or failure of call restoration to the CMCE as a result of a previously issued MLE-RESTORE request.

**MLE-RESUME indication:** this primitive shall be used by the MLE to inform the CMCE that access to the communication resources is once again available. The data transfer service can now be used and the CMCE may attempt to restore any circuit mode calls.

**MLE-UNITDATA request:** this primitive shall be used by the CMCE to send unconfirmed data to a peer entity on the TETRA infrastructure side. Parameter indicates which layer 2 service is required.

**MLE-UNITDATA indication:** this primitive shall be used by the MLE to pass to the CMCE entity data which has been received from a peer entity on the TETRA infrastructure side.

### 17.3.5 Service state diagram for the LTPD-SAP

The primitives provided by the MLE to the SNDCP entities shall be as shown in table 17.4.

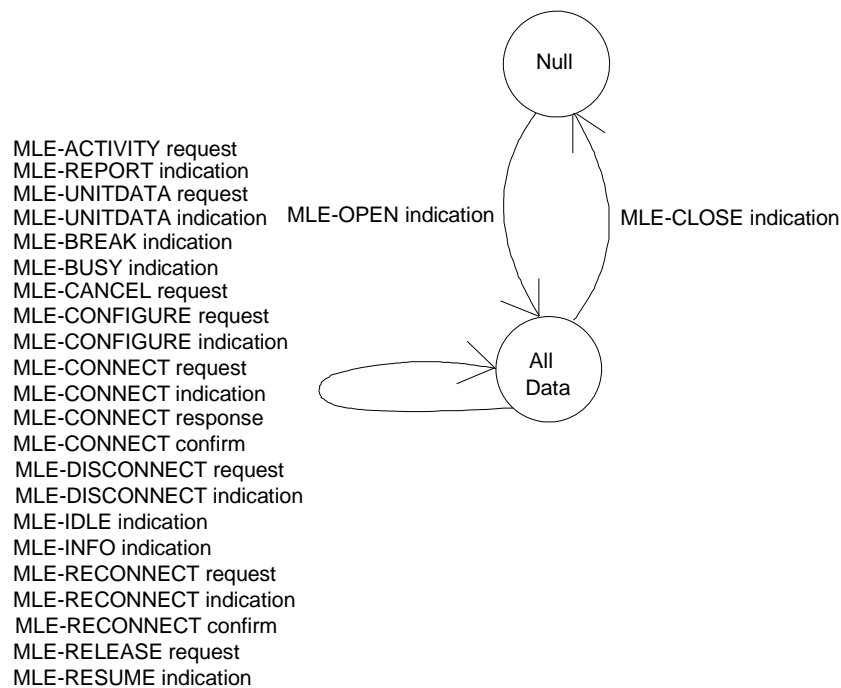

**Table 17.4: Primitives and parameters at the LTPD-SAP**

| Generic name  | Specific name | Parameters  |
|---------------|---------------|---|
| MLE-ACTIVITY  | request       | Sleep mode  |
| MLE-BREAK     | indication    | -   |
| MLE-BUSY      | indication    | -   |
| MLE-CANCEL    | request       | Handle  |
| MLE-CLOSE     | indication    | -   |
| MLE-CONFIGURE | request       | Channel change accepted<br>Channel change handle<br>Call release<br>Endpoint identifier<br>Encryption flag<br>MS default data priority<br>Layer 2 data priority lifetime<br>Layer 2 data priority signalling delay<br>Data priority random access delay factor<br>Data class information<br>Schedule repetition information<br>SNDCP status |

The state transitions visible at the LTPD-SAP should be as shown in figure 17.5.

**Figure 17.5: State transition diagram of LTPD-SAP**

### 17.3.6 Service primitives for LTPD-SAP

The service primitives at the LTPD-SAP shall be the following:

**MLE-ACTIVITY request:** this primitive shall be used by the SNDCP to inform the MLE when the MS is to "stay alive" and when sleeping is permitted. It is used during MS initiated signalling exchanges with the SwMI.

**MLE-BREAK indication:** this shall be used by the MLE to inform the SNDCP entity that the resources needed for communication are temporarily not available. This can be due to a lower layer failure, or due to a MLE controlled cell change.

**MLE-BUSY indication:** this shall be used by the MLE to inform the SNDCP entity that a MM protocol exchange is in progress.

**MLE-CANCEL request:** this primitive shall be used by the SNDCP to delete a previous request issued but not yet transmitted.

NOTE: The ability to cancel is removed when an MLE-REPORT indication is received indicating transmission of the SNDCP PDU.

**MLE-CLOSE indication:** this shall be used by the MLE to indicate to the SNDCP entity that access to the communications resources has been removed and the SNDCP entity is not permitted to communicate with its peer entity.

**MLE-CONFIGURE request:** this primitive shall be used by the SNDCP entity to pass inter layer management information relating to packet data.

**MLE-CONFIGURE indication:** this primitive shall be used to pass inter layer management information relating to circuit mode calls and packet data conflicts.

**MLE-CONNECT request:** this primitive shall be used by the SNDCP entity to convey QoS parameters used in the advanced link set up. It also shall be used to trigger the MLE to reset the advanced link. It also applies as a cancel request which deletes previous requests issued and not yet transmitted.

**MLE-CONNECT indication:** this primitive shall be used by the MLE entity to inform the SNDCP entity that the establishment of an advanced link with a certain quality of service or the reset of the current advanced link has been requested.

**MLE-CONNECT response:** this primitive may be used by the SNDCP entity to accept the establishment or reset of the advanced link with a certain quality of service. According to the available resources, the value of the service parameters may be modified (lower grade of service) in the response. In such a case the advanced link characteristics will match these new features.

**MLE-CONNECT confirm:** this primitive shall be used by the MLE entity to inform the SNDCP entity that the establishment or reset of the advanced link has been completed with a certain quality of service as indicated in the confirm primitive.

**MLE-DISABLE indication:** this primitive shall be used by the MLE entity to instruct the SNDCP entity to enter the temporarily disabled state.

**MLE-DISCONNECT request:** this primitive shall be used by the SNDCP entity to trigger MLE to disconnect the advanced link. It also applies as a CANCEL Request which deletes previous requests issued and not yet transmitted.

**MLE-DISCONNECT indication:** this primitive shall be used by the MLE entity to inform the SNDCP entity on advanced link disconnection for any reason.

**MLE-ENABLE indication:** this primitive shall be used by the MLE entity to instruct the SNDCP entity to recover from the temporarily disabled state.

**MLE-IDLE indication:** this shall be used by the MLE to inform the SNDCP entity that a MM protocol exchange has completed.

**MLE-INFO indication:** this primitive shall be used by MLE to inform the SNDCP of a change in system broadcast parameters or to indicate whether there is any match between the subscriber class being broadcast by the SwMI and the subscriber class of the MS, and to indicate if the present cell is a permitted cell.

**MLE-OPEN indication:** this primitive shall be used by the MLE to inform the SNDCP that it has access to the communication resources and that the data transfer service can be used.

**MLE-RECEIVE indication:** this primitive shall be used by the MLE entity to inform the SNDCP entity that the reception of data from the peer entity on the LLC has started or is ongoing. This primitive is valid for SwMI only.

**MLE-RECONNECT request:** this primitive shall be used by the MS SNDCP entity after cell reselection to request the reconnection of the advanced link.

**MLE-RECONNECT confirm:** this primitive shall be used by the MS MLE entity to inform the SNDCP entity of the success or failure of an attempt to reconnect the advanced link.

**MLE-RECONNECT indication:** this primitive shall be used by the SwMI MLE entity to inform the SNDCP entity of the success or failure of an attempt by a MS to reconnect an advanced link.

**MLE-RELEASE request:** this primitive shall be used by the MS SNDCP entity to request the local disconnection of an advanced link.

**MLE-REPORT indication:** this shall be used by the MLE to report on the completion of a MLE-UNITDATA request procedure. The result of the transfer attempt shall be passed as a parameter. Errors detected during the MLE-UNITDATA request procedure shall be indicated using this primitive.

**MLE-RESUME indication:** this shall be used to indicate that a temporary break in access to the communications resources has been recovered. All previous MLE associations between peer MLE entity have been successfully recovered.

**MLE-UNITDATA request:** this shall be used by the SNDCP entity to send data to a peer entity. Parameters indicate whether layer 2 acknowledged or unacknowledged service is required.

**MLE-UNITDATA indication:** this shall be used by the MLE to pass to the SNDCP entity data which has been received from a peer entity.

### 17.3.7 Void

### 17.3.8 Void

### 17.3.9 Parameter summary

The following list summarizes the parameters used in the primitives described in this clause.

- Add temporary GSSI =
  - GSSI.
- Address =
  - TETRA address (ISSI,ASSI or USSI).
- Address type =
  - individual short subscriber identity (ISSI);
  - aliased short subscriber identity (ASSI);
  - unexchanged short subscriber identity (USSI).
- ASSI =
  - TETRA address.
- Attached GSSIs =
  - TETRA address.

- Broadcast parameters =
  - Broadcast information extracted from SYNC, SYNC-DA, SYSINFO, SYSINFO-Q and SYSINFO-DA PDUs. Refer to clauses 18.4.2.1, 18.4.2.1a, 18.4.2.2, 18.4.2.2a, 18.4.2.3, 21.4.4.1, 21.4.4.1a, 21.4.4.1b, 21.4.4.2 and 21.4.4.2a.
- Call release =
  - true;
  - false.
- Call state =
  - idle;
  - group call with transmit permission;
  - group call without transmit permission;
  - individual call with transmit permission;
  - individual call without transmit permission.
- Cell availability =
  - no cell available for any service;
  - current cell available for graceful service degradation mode;
  - current cell available for normal service mode.

NOTE 1: The "no cell available for any service" is the only value used, when the graceful service degradation mode is not supported.

- Cell type =
  - CA;
  - DA.
- Cell type preference or requirement =
  - CA preferred;
  - CA required;
  - DA preferred;
  - DA required;
  - any.
- Channel advice flag =
  - channel advice not requested;
  - channel advice requested.
- Channel change accepted =
  - accept;
  - reject;
  - ignore.

- Channel change handle =
  - an identifier of a "channel change response required" request.
- Channel change response required =
  - true;
  - false.
- Circuit mode type =
  - speech (TCH/S);
  - unprotected data (TCH/7,2);
  - low protection data (TCH/4,8), N = 1;
  - low protection data (TCH/4,8), N = 4;
  - low protection data (TCH/4,8), N = 8;
  - high protection data (TCH/2,4), N = 1;
  - high protection data (TCH/2,4), N = 4;
  - high protection data (TCH/2,4), N = 8.
- Conflicting endpoint identifier =
  - conflicting radio resource identifier.
- Data class information =
  - Background class data;
  - Telemetry class data;
  - Real-time class data;
  - other data (see note 2).

NOTE 2: In an implementation, the "other data" may be subdivided into multiple classes.

- Data priority =
  - nine possible values, 0 to 7 and "undefined".
- Data priority random access delay factor =
  - eight possible values, 0 to 7.
- Delete temporary GSSI =
  - GSSI.
- Detached GSSIs =
  - TETRA address(es).
- Dual watch mode configuration =
  - a set of group (0 to 7), start frame (1 to 18) and start multiframe (1 to 60).

- Eligible for graceful service degradation mode =
  - not eligible for graceful service degradation mode; or
  - eligible for graceful service degradation mode.
- Encryption flag =
  - on;
  - off.
- Endpoint identifier =
  - radio resource identifier.
- Energy economy mode configuration =
  - a set of group (0 to 7), start frame (1 to 18) and start multiframe (1 to 60).
- FCS flag=
  - use FCS;
  - do not use FCS.
- Handle
  - a local SDU identifier.
- ISSI =
  - TETRA address.
- LA.
- Layer 2 data priority lifetime =
  - a value ranging from 2 to 126 multiframe.
- Layer 2 data priority signalling delay =
  - a value ranging from 6 to 90 TDMA frames.
- Layer 2 service =
  - acknowledged request;
  - acknowledged response;
  - unacknowledged.
- Link identifier =
  - A local identifier of the layer 2 basic link, a specified advanced link or an unspecified (i.e. any) advanced link.
- List of GSSIs =
  - TETRA address(es).
- List of LA=
  - a list of preferred and/or permitted LAs, or "any LA".
- List of MCC =
  - a list of preferred and/or permitted MCCs, or "any MCC".

- List of MNC =
  - a list of preferred and/or permitted MNCs, or "any MNC".
- Maximum schedule interval =
  - number of timeslot durations (5 to 834).
- MLE data priority flag =
  - MLE data priority signalling not required;
  - MLE data priority signalling required.
- Minimum mode configuration =
  - frame 18 timeslot (1 to 4).
- MCC (see ETSI EN 300 392-1 [6], clause 7).
- MNC (see ETSI EN 300 392-1 [6], clause 7).
- MS default data priority =
  - nine possible values, 0 to 7 and "not applicable".
- New endpoint identifier:
  - a new endpoint identifier shall refer to a new resource allocation (typically in addition to an existing resource allocation).
- Null PDU =
  - a null PDU is due to sending;
  - an SDU is due to sending.
- Packet data flag =
  - PDU does not contain packet data;
  - PDU contains packet data.
- PDU priority =
  - eight possible values, 0 to 7.
- Periodic reporting timer =
  - no reporting/stop reporting;
  - values 15 s to 31 min 45 s;
  - use periodic reporting time requested by SwMI (only used by an "indication" primitive).
- Permitted cell information =
  - the present cell is a permitted cell;
  - the present cell is not a not-permitted cell.

- Permitted services in graceful service degradation mode =
  - none;
  - SDS-TL for callout service;
  - LIP.

NOTE 3: It is outside the scope of the present document which other SDS services may be allowed in the graceful service degradation mode.

- Permitted services in temporary disabled mode =
  - none; or
  - a list of one or more of :
    - ambience listening;
    - LIP protocol via CMCE (see ETSI TS 100 392-18-1 [19]).
- Quality of Service (QoS) for layer 2 =
  - A set of:
    - Throughput information; and
    - Original or extended advanced link; and
    - Acknowledged advanced link window size (1 to 15); and
    - Maximum number of TL-SDU retransmissions (0 to 7); and
    - Maximum number of segment retransmissions (0 to 15).
- RA =
  - a set of one or more LAs.
- Reason for configuration indication =
  - reception stopped;
  - transmission stopped;
  - usage marker mismatch;
  - loss of radio resources;
  - recovery of radio resources.
- Received TETRA address =
  - TETRA address (ITSI or GTSI).
- Received address type =
  - individual allocated identity (ITSI);
  - individual un-exchanged identity (ITSI);
  - group (GTSI).

NOTE 4: The individual un-exchanged identity is valid only in some migration PDUs, refer to clause 23.4.1.2.5.

- Reconnection result =
  - success;
  - reject.
- Registration type =
  - normal;
  - forward;
  - periodic.
- Registration required =
  - true;
  - false.
- Registration Result =
  - success;
  - cell rejection;
  - cell type rejection;
  - LA rejection;
  - system rejection;
  - forward registration failure;
  - temporary registration.
- Reservation information =
  - amount of data available for sending, refer to clause 28.3.4.2 a).
- Report
  - report shall generally indicate the progress of information transfer. Refer to clause 20.2.4.57.
- Set-up report =
  - this shall be used to report on the setup phase of an advanced link.
- SCCH configuration =
  - 0 to 11.
- Schedule repetition information =
  - set of NSAPI (1 to 14), "start-stop flag" (start or stop) and "schedule repetition period" (4 to 706).
- Schedule timing prompt =
  - NSAPI (1 to 14).
- Scheduled data status =
  - not scheduled;
  - initial scheduled data;
  - scheduled data.

- SDU.
- Security parameters =
  - Security related broadcast information extracted from SYSINFO PDU. Refer to see ETSI EN 300 392-7 [8].
- Simplex/duplex =
  - simplex;
  - duplex.
- Sleep mode =
  - stay alive;
  - sleep permitted.
- SNDCP status =
  - idle, standing-by or ready.
- Stealing permission =
  - steal immediately;
  - steal when convenient;
  - stealing not required.
- Stealing repeats flag =
  - set;
  - not set.
- Subscriber class
  - a set of classes 1 to 16.
- Subscriber class match =
  - true;
  - false.
- Switch U-plane =
  - on;
  - off.
- Transfer result =
  - success, more data in the LLC buffer;
  - success, LLC buffer empty;
  - delayed transmission due to the graceful service degradation mode, still trying transmit;
  - failure, data item removed from LLC buffer;
  - transfer rejected due to an emergency call.

- Tx-grant =
  - true;
  - false.
- Unacknowledged basic link repetitions
  - 0 to 5.

---

## 18 MLE protocol

### 18.1 Introduction

This clause defines the protocol for the V+D MLE. This shall be the lowest sub-layer of the network layer as described in ETSI EN 300 392-1 [6]. It may be used to provide sub-network services to higher network layer entities at the air interface according to the MLE service description (see clause 17). This clause defines the MLE protocol functions required for MS operation.

This clause specifies:

- the protocol procedures;
- the protocol services;
- the PDUs and associated information elements.

See clause 17 for the MLE service description (SAPs, services and primitives).

### 18.2 Overview of the sub-layer

#### 18.2.0 General

The MLE protocol should be used to mask mobility and radio resources from the higher entities.

It shall provide a sub-network dependent protocol (convergence) and a sub-network access protocol to the V+D layer 2 (see clause 20).

#### 18.2.1 Protocol environment

The V+D MLE shall be the layer 3, sub-layer 3.1 which provides services to the layer 3, sub-layer 3.2, as shown in figure 18.1. This protocol shall provide services to the following higher entities:

- MM entity (see clause 16);
- CMCE entity (see clause 14);
- SNDTCP entity (see clause 28).

The MLE services shall be represented by the MLE service primitives which shall apply to the following SAPs:

- LCMC-SAP for CMCE;
- LTPD-SAP for SNDTCP; and
- LMM-SAP for MM.

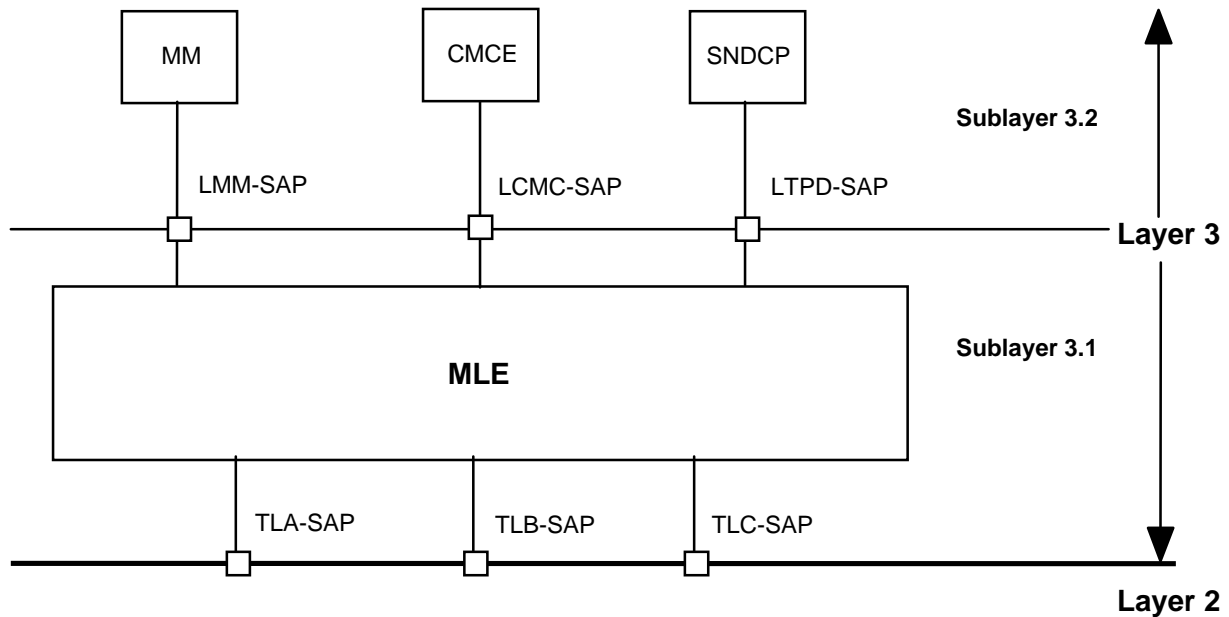

The services offered at the MM SAP may interact with the services offered at the CMCE and SNDTCP SAPs.

The underlying protocol should be the V+D layer 2 (see clauses 22 and 23).

The MLE protocol may also interface to the Lower Layer Management Entity (LLME) and the interface is defined by the C-SAP. However, the exact implementation of the interface is outside the scope of the present document.

The protocol architecture can be similar on the BS side of the air interface.

**Figure 18.1: The MLE (sub-layer 3.1) in the MS protocol stack**

The MS-MLE shall establish the basis for communication with a cell (BS) by camping on the cell and the MS-MLE shall check the quality using the information received from the layer 2. Once the cell has been found suitable by the MS-MLE, the MM entity may intervene in order to register the MS. When the cell has been registered, the MS is said to be attached and the MLE can now offer data transfer services to the CMCE and SNDCP entities as well. Data transfer shall be regulated by the MM entity which may allow access for MM only or for all entities.

The MLE shall perform surveillance of the quality of the radio communication path. It may report any break or loss of the path and, when necessary it should try to re-establish the communication with the same or another BS in either the same or a different LA.

## 18.2.2 Services and primitives offered by the MLE to the MM entity

The services and primitives offered to the MM entity are described in clause 17.

The services offered shall be:

- a) activation of MLE procedures:
  - MLE-ACTIVATE request/confirm/indication.
- b) opening of link access to other layer 3 entities:
  - MLE-OPEN request.
- c) data transfer:
  - MLE-UNITDATA request/indication;
  - MLE-REPORT indication.
- d) closing the access to other entities:
  - MLE-CLOSE request.
- e) deactivation of the MLE procedures:
  - MLE-DEACTIVATE request.

- f) information on a network, cell or LA:
  - MLE-LINK request/indication.
- g) updating current registered area:
  - MLE-UPDATE request.
- h) cancellation of issued primitive requests:
  - MLE-CANCEL request.
- i) informing MLE that MM signalling exchange is in progress:
  - MLE-BUSY request.
- j) informing MLE that MM signalling exchange has completed:
  - MLE-IDLE request.
- k) informing MLE when the MS is to "stay alive" and when sleeping is permitted by MM:
  - MLE-ACTIVITY request.
- l) performing forward registration during cell reselection:
  - MLE-PREPARE request/confirm.
- m) exchange of information between layers:
  - MLE-IDENTITIES request;
  - MLE-INFO request/indication.
- n) informing MLE of the air to ground periodic reporting timer value:
  - MLE-CONFIGURE request.
- o) requesting temporary disablement:
  - MLE-DISABLE request.
- p) requesting recovery from temporary disablement:
  - MLE-ENABLE request.

### 18.2.3 Services and primitives offered by the MLE to the CMCE entities

The services and primitives offered to the CMCE entity are described in clause 17.

The services offered shall be:

- a) indication that access to resources is enabled:
  - MLE-OPEN indication.
- b) indication that access to resources is disabled:
  - MLE-CLOSE indication.
- c) indicating a temporary break in the access to the communication resources:
  - MLE-BREAK indication.

- d) indicating resumption (or reopening) in the access to the communication resources:
  - MLE-RESUME indication;
  - MLE-REOPEN indication.
- e) restoration of circuit mode calls after cell reselection:
  - MLE-RESTORE request/confirm.
- f) data transfer:
  - MLE-UNITDATA request/indication;
  - MLE-REPORT indication.
- g) cancellation of issued primitive requests:
  - MLE-CANCEL request.
- h) exchange of information between layers:
  - MLE-CONFIGURE request;
  - MLE-CONFIGURE indication;
  - MLE-IDENTITIES request;
  - MLE-INFO indication.
- i) indicating that MM signalling exchange is in progress:
  - MLE-BUSY indication.
- j) indicating that MM signalling exchange has completed:
  - MLE-IDLE indication.
- k) informing MLE when the MS is to "stay alive" and when sleeping is permitted by CMCE:
  - MLE-ACTIVITY request.
- l) indicating that CMCE shall become temporarily disabled:
  - MLE-DISABLE indication.
- m) indicating that CMCE shall recover from temporary disablement:
  - MLE-ENABLE indication.

#### 18.2.4 Services and primitives offered by the MLE to the SNDSCP entity

The services and primitives offered to the SNDSCP entity are described in clause 17.

The service offered shall be:

- a) indication that access to resources is enabled:
  - MLE-OPEN indication.
- b) indication that access to resources is disabled:
  - MLE-CLOSE indication.
- c) indicating a temporary break in the access to the communication resources:
  - MLE-BREAK indication.

- d) indicating resumption in the access to the communication resources:
  - MLE-RESUME indication.
- e) advanced link setup/ advanced link reset:
  - MLE-CONNECT request/indication/response/confirm.
- f) advanced link disconnection:
  - MLE-DISCONNECT request/indication;
  - MLE-RELEASE request.
- g) data transfer:
  - MLE-UNITDATA request/indication;
  - MLE-RECEIVE indication;
  - MLE-REPORT indication.
- h) exchange of information between layers:
  - MLE-CONFIGURE request;
  - MLE-CONFIGURE indication;
  - MLE-INFO indication.
- i) advanced link reconnection:
  - MLE-RECONNECT request/indication/confirm.
- j) indicating that MM signalling exchange is in progress:
  - MLE-BUSY indication.
- k) indicating that MM signalling exchange has completed:
  - MLE-IDLE indication.
- l) informing MLE when the MS is to "stay alive" and when sleeping is permitted by SNDTCP:
  - MLE-ACTIVITY request.
- m) cancellation of issued primitive requests:
  - MLE-CANCEL request.
- n) indicating that SNDTCP shall become temporarily disabled:
  - MLE-DISABLE indication.
- o) indicating that SNDTCP shall recover from temporary disablement:
  - MLE-ENABLE indication.

## 18.2.5 Void

## 18.2.6 Services and primitives offered by layer 2 to MLE

Layer 2 shall provide the MLE with different services, which enable the MLE to provide the services requested by its services users. The following primitives are defined for that purpose.

On the TLA-SAP the following services and primitives should be available, depending on the supported services (see clause 20 for service definitions):

- a) establishing a data link connection by using the LLC advanced link mechanism:
  - TL-CONNECT request/indication/response/confirm.
- b) reconnection of an established data link connection (i.e. an LLC advanced link) after a cell reselection:
  - TL-RECONNECT request/confirm.
- c) transfer of data using a layer 2 acknowledged service:
  - TL-DATA request/indication/response/confirm.
- d) disconnection of an established data link connection, i.e. an LLC advanced link:
  - TL-DISCONNECT request/indication/confirm.
- e) transfer of data using a layer 2 unacknowledged service:
  - TL-UNITDATA request/indication.
- f) receive report information on the progress of issued request primitives and unrecoverable transmission errors detected in the data link:
  - TL-REPORT indication.
- g) cancellation of issued request primitives:
  - TL-CANCEL request.
- h) release or loss of radio resources:
  - TL-RELEASE request;
  - TL-RELEASE indication (optional).

On the TLB-SAP the following service and primitives should be available, see clause 20 for service definitions:

- reception of layer 3 information in the synchronization broadcast and system information broadcast. The broadcast shall be recognized by layer 2 and forwarded to layer 3 as SDU information elements inside primitives:
  - TL-SYNC indication;
  - TL-SYNC-DA indication;
  - TL-SYSINFO indication;
  - TL-SYSINFO-Q indication;
  - TL-SYSINFO-DA indication.

## 18.2.7 Services and primitives between the MLE and the LLME

The LLME may be used for exchanging layer-to-layer information. In the protocol stack (see figure 18.1) the access to the LLME is modelled in the TLC-SAP.

The following primitives should be defined for this SAP:

- a) control of scanning (MS side only):
  - TL-SCAN request/confirm;
  - TL-SCAN-REPORT indication.
- b) receive additional information on a DA neighbour cell (MS side only):
  - TL-CELL-READ request/confirm.
- c) selecting cell for attachment (MS side only):
  - TL-SELECT request/indication/response/confirm.
- d) control of neighbour cell monitoring and channel monitoring (MS side only):
  - TL-MONITOR-LIST request;
  - TL-MONITOR indication.
- e) control of channel assessment (MS side only):
  - TL-ASSESSMENT-LIST request;
  - TL-ASSESSMENT indication.
- f) receive quality information on the serving cell and current channel (MS side only):
  - TL-MEASUREMENT indication.
- g) receive path loss information (MS side only):
  - TL-REPORT indication.
- h) set up and configure layer 2 according to commands from service SAP users (MS side only):
  - TL-CONFIGURE request/confirm.
- i) layer 2 configuration information to service SAP users (MS side only):
  - TL-CONFIGURE indication.

## 18.2.8 Protocol sequences

The basic protocol primitive sequences are shown in figures 18.2 to 18.4. The operation of the protocol should be modelled as a finite state automaton governed by a state variable. A transition of the automaton should be prompted by the occurrence of an event at one of three interfaces:

- a) the interface to any of the service users (MM, CMCE, SNDSCP);
- b) the interface to the underlying service which is the V+D layer 2;
- c) the interface to the LLME.

**Break and resume communication on a MLE connection**

**Opening or closing of network access**

**Setup of advanced Link or Reset of advanced link**

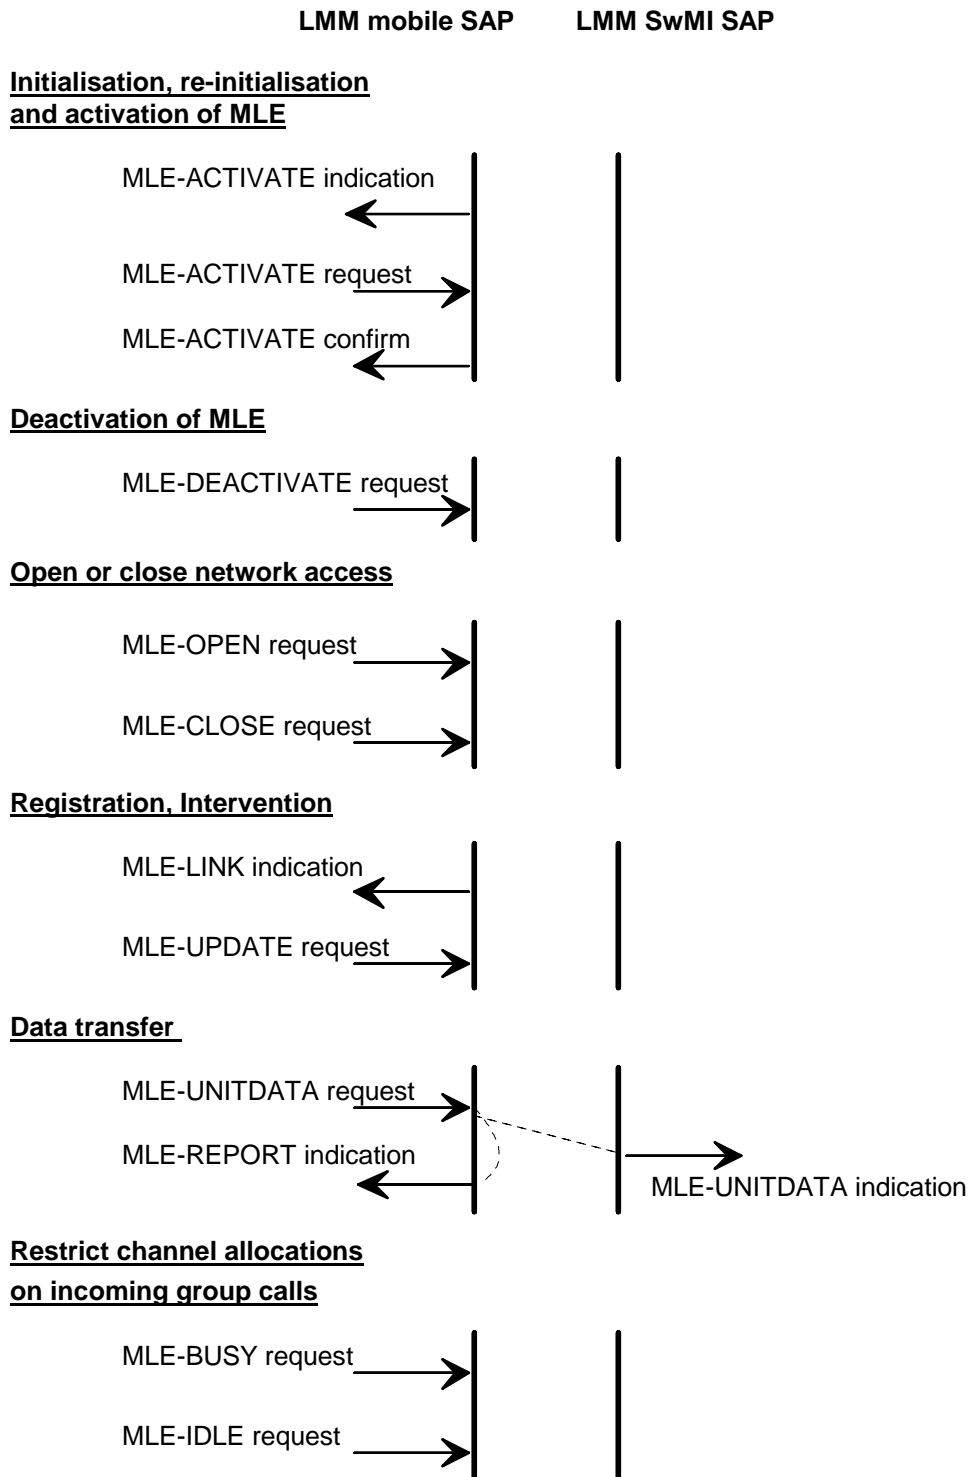

**Disconnection of advanced link**

**Data transfer**

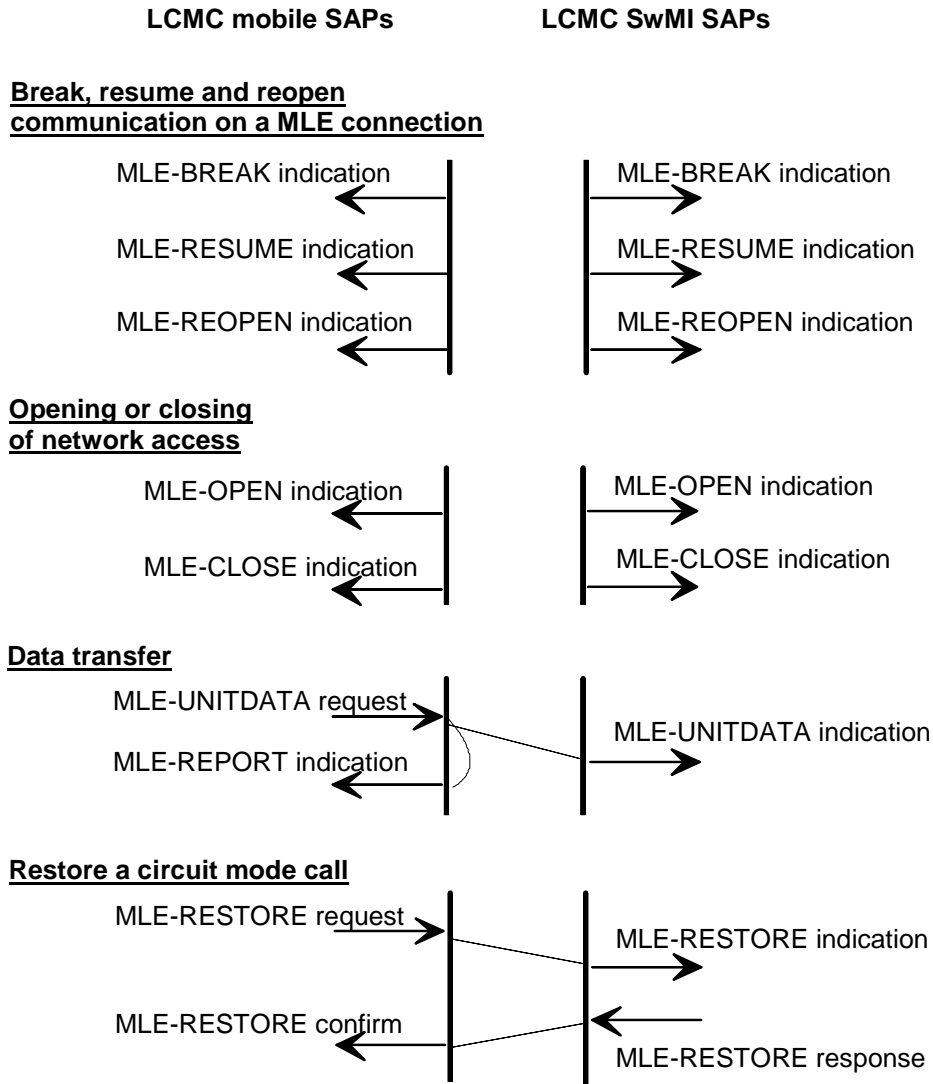

**Figure 18.2: Primitive time sequence at the LTPD-SAP**

**Figure 18.3: Primitive time sequence at the LMM-SAP**

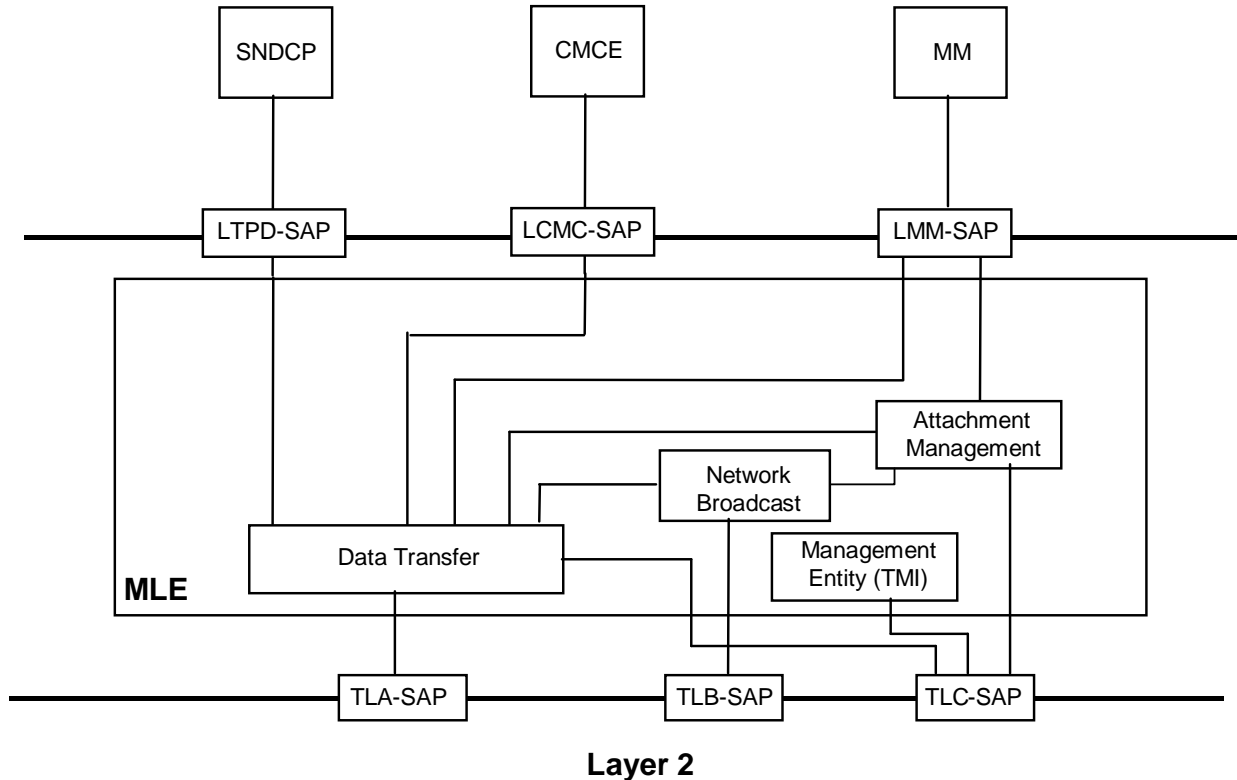

**Figure 18.4: Primitive time sequence at the LCMC-SAP**

## 18.3 MLE functions

### 18.3.1 Overview

The MLE functional groups are shown in figure 18.5.

**Figure 18.5: MLE functional model**

The MLE functional entities are:

- a) attachment management:
  - management of monitoring and scanning procedures;
  - surveillance of the serving cell quality;
  - management of the ranking procedure;
  - management of the cell relinquishable, improvable and usable radio criteria;
  - management of the channel relinquishable, improvable and usable radio criteria;
  - management of the roaming announcements and declarations;
  - informing upper entities CMCE and SNDCP of broken and restored MLE connections via the data transfer sub-entity;
  - informing the SwMI about usable irregular channels and channel classes.

- b) data transfer:
  - selection of underlying LLC service;
  - address handling (ISSI, GSSI and TMI);
  - informing the upper entities CMCE and SNDPCP of enabled and disabled access to the communication resources;
  - routing and multiplexing to layer 2 service end points and links (including addition/removal of MLE protocol control information);
  - routing and multiplexing to MLE SAPs and other MLE functional entities;
  - quality of service mapping (e.g. PDU priority, data priority, throughput, delay, reliability, data class, scheduled access and transfer service).
- c) network broadcast:
  - formatting and broadcasting of the network information (SwMI);
  - reception and analysis of network information (MS/LS);
  - configuring of MAC layer 2 with synchronization and system information broadcast.
- d) management:
  - handling network management procedures, e.g. addressed to the TETRA Management Identity (TMI);
  - handling local management information from the management entity to the lower layers.

### 18.3.2 Access to the communication resources and activation of the MLE

Access to all communication resources is controlled by the MLE, according to requests received from the MM entity.

At power on or other start-up, there is no requirement that the MLE shall have any prior knowledge of the suitability of any cell. In order that the MS can communicate, the MLE shall select a suitable cell. A suitable cell should be one in which the MS can reliably decode downlink data, and which has a high probability of uplink communication, and that the MS may request and obtain service.

The procedures defined in the following clauses describe methods by which the MS can select a cell.

The MLE cell selection procedure is initiated by the MM entity defining the cell selection criteria (e.g. mobile network identity) in an MLE-ACTIVATE request primitive. When a suitable cell has been found the MLE issues an MLE-ACTIVATE confirm primitive to the MM to report the cell details. Initially the radio communications link may only be used for MM data transfer until the MM issues an MLE-OPEN request primitive thereby instructing the MLE to open access to the other layer 3 entities. The MM entity issues the MLE-OPEN request primitive after completion of any MM procedures (e.g. registration). An MLE-OPEN request primitive is received by both the attachment management and the data transfer sub-entities within the MLE. The opening of link access is reported to the CMCE and SNDPCP with an MLE-OPEN indication primitive.

NOTE 1: If no MM procedures are required, the MM may issue the MLE-OPEN request primitive immediately after the MLE-ACTIVATE confirm primitive is received.

The MLE on the MS side can take the decision to change cell from measurement processing and threshold comparisons. MM shall be informed with an MLE-LINK indication primitive in the event that the cell reselection results in the selection of a cell in a LA that is not in the current registration area or in the event that a change of cell type occurs and the new cell requires the MS to register when changing cell type. The parameters associated with the MLE-LINK indication primitive inform the MM of the LA, MNC, MCC and cell type of the new cell.

NOTE 2: The current registration area consists of all of the LAs in which the MS is currently registered.

If the MLE is unable to find a suitable cell, it issues an MLE-ACTIVATE indication primitive to MM.

### 18.3.3 Deactivation of the MLE

Upon receipt of an MLE-DEACTIVATE request primitive the MLE shall cease all functions. The MLE-DEACTIVATE request primitive should be preceded by an MLE-CLOSE request primitive to the data transfer sub-entity.

### 18.3.4 Attachment management sub-entity

#### 18.3.4.0a General

The attachment management sub-entity shall be responsible for the initial cell selection and cell reselection procedures. The initial cell selection and cell reselection procedures comprise the functions listed below. These following functions shall be activated at power on:

- management of the monitoring and scanning procedures;
- surveillance of the serving cell quality;
- management of the neighbour cell ranking procedure;
- management of the cell reselection criteria;
- management of the cell reselection announcements and declarations;
- informing upper entities CMCE and SMDCP of broken and restored MLE connections via the data transfer sub-entity.

Cell selection and reselection shall only be carried out using the individual or alias subscriber identities. Cell reselection shall not be carried out using group addresses. Any cell reselection messages received on a GSSI shall be ignored.

Where the MS is engaged in more than one call, the MS shall only apply the cell reselection procedures once and not for each call in progress. Once a cell has been re-selected the CMCE may restore the calls.

#### 18.3.4.0b Cell types and identifiers

##### 18.3.4.0b.1 Conventional Access and Direct Access cells

In the present document there are two types of cell: Conventional Access (CA) cells and Direct Access (DA) cells.

A CA cell's main carrier (the CA main carrier) uses phase modulation and occupies a bandwidth of 25 kHz. The MCCH is a single slot  $\pi/4$ -DQPSK channel that occupies slot 1 of the CA main carrier in normal mode. A DA cell's main carrier (the DA main carrier) uses QAM modulation and occupies a bandwidth of 25 kHz, 50 kHz, 100 kHz or 150 kHz. The MCCH-Q may occupy one, two, three or four slots of the DA main carrier.

The MS's access to a CA cell is through the CA main carrier (except when the SwMI uses the type 1 announced cell reselection procedure to send the MS directly to an assigned channel on a CA cell). When a CA MS returns to common control mode, it returns to the CA main carrier.

The MS's access to a DA cell is through the DA main carrier (except when the SwMI uses the type 1 announced cell reselection procedure to send the MS directly to an assigned channel on a DA cell). When a DA MS returns to common control mode, it returns to the DA main carrier.

See also clause 23.3.1.1.1.

##### 18.3.4.0b.2 Conventional Access and Direct Access MSs

An MS may support using only CA cells or using only DA cells, or may support using both types of cell. An MS that supports using CA cells is a "CA capable MS". An MS that supports using DA cells is a "DA capable MS".

A CA MS is an MS that is currently camped on a CA cell. A DA MS is an MS that is currently camped on a DA cell. An MS may switch between being a CA MS and a DA MS (depending on the cells currently available to it), or may permanently use only one type of cell.

The SwMI may require the MS to register when it changes between a CA cell and a DA cell or vice versa (as indicated by the "cell type change registration" information element in the D-MLE-SYSINFO-DA PDU).

#### 18.3.4.0b.3 Co-sited cells

Co-sited cells share a common base station site. They may have different transmitter powers, ranges and azimuthal extent, and may have different coverage areas.

#### 18.3.4.0b.4 Shared channels

Cells may share channels. The following rules apply:

- a channel may be shared by multiple DA cells (but no CA cells), or by one DA cell and one CA cell, or by multiple DA cells and one CA cell – the CA cell, if present, is called the "local CA cell";
- cells that share channels shall be either:
  - co-sited; or
  - within the permitted separation for eccentric channels i.e. the shared channel's transmitter site shall be within 4 km of the main carrier's transmitter site for each of the sharing cells (see clause 7.7);
- cells that share channels shall use the same scrambling code (indicated in the SYNC and SYNC-DA PDUs);
- cells that share channels and use air-interface encryption shall use the same static cipher key or common cipher key (indicated in the SYSINFO, SYSINFO-Q and SYSINFO-DA PDUs) - see also ETSI EN 300 392-7 [8];
- MSs camped on the local CA cell and MSs camped on different DA cells may use a shared channel (provided that the sharing cells are co-sited or within the permitted separation for eccentric channels);
- CA MSs camped on the local CA cell may be assigned to a channel that is being used in common control mode by DA MSs camped on one DA cell;
- the present document does not support use of any channel on a DA main carrier as an assigned channel for MSs that are camped on a different DA cell.

NOTE 1: The present document does not provide a general method for sharing of an assigned channel by MSs that are camped on different CA cells. However, annex S notes a restricted method that SwMIs may be able to use without the MSs being aware of the usage.

NOTE 2: When channels are shared by cells from more than one LA, the SwMI should take care in interpreting MS registration attempts and other MS requests that may depend on the LA where the MS is presently camped.

When MSs assigned to a shared channel revert to common control mode they return to their appropriate common control channels (see clause 23.3.1).

A cell may broadcast information about neighbouring cells (see clause 18.3.6). The D-NWRK-BROADCAST PDU may inform MSs about the frequencies of the CA main carriers of neighbouring CA cells. The D-NWRK-BROADCAST-DA PDU may inform MSs about the frequencies and bandwidths of the DA main carriers of neighbouring DA cells. The D-NWRK-BROADCAST-DA PDU may also inform DA MSs about the main carrier frequency of the (if any) local CA cell.

NOTE 3: Information about the main carrier frequency of the (if any) local CA cell is not included in the D-NWRK-BROADCAST PDU to avoid having CA MSs accidentally reselect their present serving cell.

NOTE 4: If a DA MS obtains information about different local CA cells (i.e. about local CA cells with different "cell identifier CA" values) in different D-NWRK BROADCAST-DA PDUs received on the same DA serving cell, the DA MS should store the details of all the local CA cells that it received on the serving cell. The DA MS should not overwrite the details about one local CA cell with the details of another local CA cell (with a different cell identifier CA) received on the same DA serving cell.

The SwMI may include the DA serving cell identifier in D-NWRK-BROADCAST-DA PDUs sent on channels that are not shared with MSs from other DA cells. The DA serving cell identifier shall not be included in D-NWRK-BROADCAST-DA PDUs sent on channels that are used by MSs from more than one DA cell. The D-NWRK-BROADCAST-DA PDU shall include only information common to all DA cells using that channel.

NOTE 5: A DA MS needs to know its serving cell's identifier when interpreting "neighbour cell information for DA" information elements received on a channel shared by other DA cells (e.g. to avoid having the MS accidentally reselect its present serving cell). To ensure the MS receives the correct value, the identifier of a DA serving cell is sent only on channels not shared by other DA cells (e.g. it is sent on the DA main carrier).

NOTE 6: When a channel is used by MSs from more than one DA cell, a DA MS using that channel may receive a D-NWRK-BROADCAST-DA PDU containing information about its serving cell either in the serving cell information (if present) or in neighbour cell information. (The BS does not include serving cell information on a channel shared by MSs from more than one DA cell unless the information is appropriate to all DA cells using the channel.) A DA MS can recognize a "neighbour cell information for DA" information element describing its serving cell by inspecting the included "cell identifier DA" information element. The DA MS may use any contained channel class or channel information, but it should not attempt to reselect to its serving cell.

#### 18.3.4.0b.5 Cell identifiers

Certain MLE PDUs (e.g. the D-NWRK-BROADCAST, D-NWRK-BROADCAST-DA, U-PREPARE and U-PREPARE-DA PDUs) refer to neighbour cells. CA cells are referenced by a "cell identifier CA". DA cells are referenced by a "cell identifier DA".

When a cell does not share channels with other cells, the "cell identifier CA" and the "cell identifier DA" values used by that cell may be independent of those used by other cells.

Cells that share channels with each other shall use the same "cell identifier CA" values to identify the same CA neighbour cells and the same "cell identifier DA" values to identify the same DA neighbour cells.

A DA cell that shares channels with other cells shall identify itself (in D-NWRK-BROADCAST-DA PDUs on its main carrier) using the "cell identifier DA" value used by the other cells to identify it, so that the cells that share channels are uniquely and consistently identified within those sharing cells.

NOTE 1: This allows the BS to identify a neighbour cell referenced by an uplink PDU without having to first identify the sending MS's serving cell.

NOTE 2: It is recommended that the SwMI should, where possible, identify each cell within an LA by a different cell identifier. This helps an MS to recognize when it has returned to a cell it has previously used (see clause 18.3.6.6).

#### 18.3.4.0b.6 Channel class identifiers and channel identifiers

Certain MLE PDUs reference channel classes and irregular channels (see clause 18.3.4.9.1) by channel class identifiers and channel identifiers. The following rules apply to the values used for these identifiers:

- when a channel class or irregular channel is available only to MSs from a single cell, the value of the channel class identifier or channel identifier may be local to that cell;
- when one or more of the channels comprising a channel class are shared by more than one cell, the cells that share those channels shall all use the same channel class identifier for that channel class;
- when an irregular channel is shared by more than one cell, the cells that share that irregular channel shall use the same channel identifier for that irregular channel.

NOTE: This avoids the need for the SwMI to identify the sending MS's cell when it receives a PDU containing channel class identifiers or channel identifiers on a shared channel.

### 18.3.4.1 Scanning of cells

Scanning is where an MS is synchronized to a cell, directly measures the received power of that cell and directly obtains the broadcast and synchronization information for that cell by decoding the SYNC and SYSINFO PDUs (in the case of a CA cell) or the SYNC-DA PDU (in the case of a DA cell). The scanning sub-function enables the MLE to directly obtain the path loss measurements from the cells. To obtain the C1 path loss parameter from layer 2, the MS-MLE shall per cell issue a TL-SCAN request primitive to the TLC-SAP along with the parameters indicating which cell is to be scanned and the characteristics of the RF channel that is to be scanned. The MS may find it useful to also decode the SYSINFO-DA PDU if it happens to be included in the same burst (i.e. in dataset B).

The MS-MLE shall know locally which channels the MS is capable of scanning and shall not instruct the lower layers to scan any channel that the MS-MLE knows to be outside the capabilities of the equipment. When layer 2 has completed scanning of one cell, the C1 path loss shall be part of the report parameter of the TL-SCAN confirm primitive or of the TL-SCAN-REPORT indication primitive, both given by layer 2. The C1 formula is defined in clause 23. The MS-MLE may use the list of neighbour cells in the D-NWRK-BROADCAST PDU or the D-NWRK-BROADCAST-DA PDU (or both) to specify the channels to be scanned. There are three types of scanning defined in clause 23. These are:

- foreground, where scanning is the only activity;
- background, where communications with the current serving cell are maintained in parallel with the scanning, and the scanning causes no interruption to that service;
- interrupting, where communications with the current serving cell are maintained in parallel with the scanning, but the scanning causes limited interruptions to that service.

Scanning shall have been performed within the last 60 s for a scanning measurement to be considered valid.

If the "main control channel modulation mode" information element in the "neighbour cell information for DA" information element is not set to "QAM" the MS shall not use the cell indicated by the "neighbour cell information for DA" information element in this version of the present document.

NOTE: It is possible that the MLE may request scanning of a channel that the MS is currently receiving, for example, if a CA MS is currently receiving an assigned channel on a DA main carrier, or if a DA MS is currently receiving an assigned channel on the (if any) local CA main carrier.

### 18.3.4.2 Monitoring of neighbour cells

Neighbour cell monitoring is where the MS calculates the path loss parameter C2 of neighbour cells using information about the neighbour cells broadcast by the serving cell. It differs from C1 in that the serving cell provides the cell selection parameters for the neighbour cell. However, the MS is still required to directly measure the received power of the neighbour cell.

In order to be able to monitor the neighbour cells the MS-MLE shall have received a D-NWRK-BROADCAST PDU or a D-NWRK-BROADCAST-DA PDU containing a list of the neighbour cells. The procedures concerning network broadcast PDUs are dealt with in clause 18.3.6. Once the network broadcast information has been received, the monitoring can be started by issuing a TL-MONITOR-LIST request primitive through the TLC-SAP. The TL-MONITOR-LIST request primitive informs layer 2 of the cells to be monitored. The parameters passed down with the TL-MONITOR-LIST request primitive shall be a list of channels corresponding to main carriers. The MS-MLE shall know locally which channels the MS is capable of monitoring and shall not instruct the lower layers to monitor any channel that the MS-MLE knows to be outside the capabilities of the equipment. For each channel the lower layers return a TL-MONITOR indication primitive containing the C2 path loss parameter or a TL-SCAN-REPORT indication primitive containing the C1 path loss parameter. C1 and C2 are defined in clause 23. Neighbour cell monitoring is a background procedure and is defined in clause 23. Monitoring of neighbour cells shall have been performed during the last 60 s for a monitoring measurement to be considered valid.

If it is required to stop the neighbour cell monitoring process, the MLE shall issue a TL-MONITOR-LIST request primitive with an empty list of neighbour cell channels as parameter.

NOTE: It is possible that the MLE may request neighbour cell monitoring of a channel that the MS is currently receiving, for example, if a CA MS is currently receiving an assigned channel on a DA main carrier, or if a DA MS is currently receiving an assigned channel on the (if any) local CA main carrier.

### 18.3.4.3 Surveillance of the serving cell

Serving cell surveillance is the procedure whereby the MS analyses the received information on the quality of the link to the serving cell's main carrier. Once the MS-MLE has chosen the serving cell, the MLE shall select that cell by issuing a TL-SELECT request primitive to the TLC-SAP. Once the cell has been selected the lower layers return a TL-SELECT confirm primitive and periodically send TL-MEASUREMENT indication primitives containing the C1 path loss parameter for the current channel. If the current channel is a non-conforming concentric channel or a sectored channel (see clause 18.3.4.9.1), the lower layers include the C3 path loss parameter for the main carrier in the TL-MEASUREMENT indication primitive.

If the current channel is a conforming channel (clause 18.3.4.9.1), the MS-MLE shall assess the quality of the link to the serving cell's main carrier using the C1 path loss parameter for the conforming channel or channels.

If the current channel is a non-conforming concentric channel or a sectored channel (indicated in the channel information parameter of the TL-SELECT indication primitive), the MS-MLE shall assess the quality of the link to the serving cell's main carrier using either the C3 path loss parameter or the C2 path loss parameter. The MS-MLE may obtain the C2 path loss parameter by requesting layer 2 to monitor the serving cell's main carrier using the TL-MONITOR-LIST request primitive. When the MS-MLE receives the C2 path loss parameter for the main carrier, it shall use C2 in preference to C3 for determining the quality of the link to the serving cell. (Whereas C2 gives a direct measurement of the main carrier's performance, C3 predicts the main carrier performance from measurements made on the current channel.) The C1, C2 and C3 path loss parameters are described in clause 23.

NOTE 1: On a sectored channel, the C2 path loss parameter is more reliable than the C3 path loss parameter. For example, C3 may be lower than C2 (i.e. the C3 path loss may be overestimated) when the MS is near the azimuthal boundary of a sectored channel. If the MS-MLE relies on the C3 path loss parameter near an azimuthal boundary, the MS-MLE might decide to perform a cell reselection at a time when a sectored channel change would be more appropriate. To take account of this, the MS-MLE could request C2 measurements (i.e. monitoring of the serving cell's main carrier) when the C3 path loss parameter suggests that the main carrier may be failing. When the MS is monitoring the main carrier, the MS-MLE could use comparisons between the C2 and C3 path loss parameters to decide if the MS can cease monitoring the main carrier.

NOTE 2: The MS may choose to monitor the serving cell's main carrier when using a non-conforming concentric channel.

If the current channel is a super-sectored channel or an eccentric channel (indicated in the channel information parameter of the TL-SELECT indication primitive), or if the MS did not understand the conforming channel status for the channel, the MS-MLE shall assess the quality of the link to the serving cell's main carrier using the C2 path loss parameter. The MS-MLE shall obtain the C2 path loss parameter by requesting layer 2 to monitor the serving cell's main carrier using the TL-MONITOR-LIST request primitive.

NOTE 3: If the current channel is a super-sectored channel or an eccentric channel, or if the MS did not understand the conforming channel status for the channel, the MS cannot predict the main carrier performance from measurements made on the current channel. Therefore the MS needs to monitor the serving cell's main carrier (path loss parameter C2) instead of estimating a path loss parameter C3 for the main carrier from measurements made on the current channel.

Additionally the surveillance sub-function shall be responsible for the analysis of any network broadcast information received from the serving cell via the network broadcast sub-entity.

If a serving cell radio link failure occurs (see clause 18.3.4.5.3), the MLE shall inform the upper entities SND CP and CMCE by issuing an MLE-BREAK indication primitive via the data transfer sub-entity.

If a current channel radio link failure occurs (see clause 18.3.4.5.3), the MLE shall send layer 2 a TL-SELECT request primitive requesting selection of the common control channel. The MLE data transfer sub-entity shall send an MLE-CONFIGURE indication primitive containing "loss of radio resource" to the service user(s) who is using this radio resource as indicated by the endpoint identifier parameter.

If the MLE receives a TL-REPORT indication primitive from the lower layers indicating "usage marker failure" then a TL-CONFIGURE request primitive shall be generated to move the MS to the common control channel and the upper entities CMCE and SND CP shall be informed via a MLE-CONFIGURE indication primitive containing "loss of radio resource".

If the MLE receives a TL-SELECT indication primitive via the TLC-SAP, outside of cell reselection, indicating that the MAC has been instructed to change channels and no response is required, the surveillance function shall note the new serving cell channel.

If the MS is using concurrent channels, layer 2 may send the MS-MLE a C1 path loss parameter for each separate channel. If none of the concurrent channels are conforming channels, and one or more of the concurrent channels are non-conforming concentric or sectored channels, layer 2 shall send the MS-MLE one or more C3 values for the main carrier. The MS-MLE should combine multiple C3 values for the purposes of assessing the performance of the main carrier. The method of combining multiple C3 values is outside the scope of the present document.

### 18.3.4.4 Ranking of neighbour cells

#### 18.3.4.4.0 General

The ranking sub-function can use the path loss measurements C1 and C2 to maintain a ranked list of neighbour cells.

The ranking algorithm shall rank the neighbour cells which have been monitored or scanned in strict order of downlink radio connection quality. The results of this algorithm can be used to determine when a cell is deemed to be radio usable, radio relinquishable or radio improvable according to clauses 18.3.4.5.4, 18.3.4.5.5 and 18.3.4.5.6. The use of a ranking algorithm based only on C1 or C2 is essential in order to facilitate network coverage planning.

NOTE 1: If there is more than one suitable neighbour cell when the MS initiates cell reselection, the MS chooses the cell which has the highest ranking in the ranking list and which best satisfies the service requirements for the MS (see clause 18.3.4.5.7).

A cell shall meet the following minimum criteria in order to be included in the ranking list of neighbour cells:

- $C1 > 0$  or  $C2 > 0$ ;
- if the neighbour cell has a different MCC or MNC, the neighbour cell shall support migration (which is broadcast as part of the "BS service details" or "BS service details DA" information element).

If these criteria are not satisfied, an MS shall not include that cell in the ranking list and so shall not consider that cell for cell reselection.

If the information about the MCC or MNC is not broadcast by the serving cell as part of the neighbour cell information, the MS may assume that it is free to include that cell in its ranking list provided the  $C1 > 0$  or  $C2 > 0$  criterion is met.

An MS may build a valid ranking list by obtaining the cell reselection parameters for the neighbour cells from the D-NWRK-BROADCAST PDUs or the D-NWRK-BROADCAST-DA PDUs (or both) transmitted on the serving cell. In this case, the MS shall monitor the neighbour cells specified by the D-NWRK-BROADCAST PDUs or the D-NWRK-BROADCAST-DA PDUs (or both) and shall calculate C2 for each one using the cell reselection parameters for the neighbour cell sent in the D-NWRK-BROADCAST PDU or the D-NWRK-BROADCAST-DA PDU (or both) on the serving cell. A valid ranking list can then be derived using the C2 measurements.

An MS may also build a valid ranking list by scanning the neighbour cells to obtain the cell reselection parameters directly. In this case, the MS shall calculate C1 for each of the neighbour cells and shall derive a valid ranking list using the C1 measurements.

NOTE 2: When an MS leaves a cell, it may update the ranking list with information about the cell it is leaving.

#### 18.3.4.4.1 Ranking of monitored cells

Ranking of monitored neighbour cells shall be based upon the received path loss parameter C2 from the layer 2 monitoring process, issued in a TL-MONITOR indication primitive.

The ranking should produce a ranked cell list which can be used as a scanning list, if the scanning function is applied. This ranked cell list may be used for making the decision of whether and when to change cell, according to clause 18.3.4.7.

#### 18.3.4.4.2 Ranking of scanned cells

Ranking of scanned neighbour cells shall be based upon the received path loss parameter C1 from the layer 2 scanning process, issued in a TL-SCAN confirm primitive or a TL-SCAN-REPORT indication primitive.

The ranking should produce a ranked cell list which may be used for making the decision of whether and when to change cell, according to clause 18.3.4.7.

#### 18.3.4.5 Criteria used during cell reselection

##### 18.3.4.5.0 General

The following clauses define the criteria which shall be used to initiate the cell reselection procedures described in clause 18.3.4.6.

##### 18.3.4.5.1 Criterion for starting the neighbour cell monitoring process

The neighbour cell monitoring process may be permanently enabled or enabled only when some criterion is met, e.g. the serving cell ceases to support the service level required by the MS, or the serving cell quality falls below a pre-determined threshold. In the latter case it is assumed that the neighbour cell monitoring process would be disabled when the serving cell quality rises above the threshold plus some hysteresis factor.

The exact method for the selection of the thresholds and hysteresis values is outside the scope of the present document.

Where the neighbour cell monitoring process is not permanently enabled and the MS-MLE receives system broadcast information informing it that the service level required by that MS is no longer supported, e.g. that the subscriber class that the MS belongs to is no longer able to access the system, the neighbour cell monitoring process should be started.

Where the neighbour cell monitoring process is not permanently enabled, but started when a threshold value is crossed, the threshold value should be chosen to be a value greater than the threshold parameters, FAST\_RESELECT\_THRESHOLD, SLOW\_RESELECT\_THRESHOLD, to allow the MS enough time to successfully select a new cell prior to the complete loss of service from the current serving cell.

If the ranking list contains at least one neighbour cell that recommends expedited cell reselection in the "cell reselection types supported" or "cell reselection types supported DA" information element, then the MS should use a higher threshold for starting to monitor those neighbour cells that are recommended for expedited cell reselection, or the MS may monitor those neighbour cells continuously.

##### 18.3.4.5.2 Criterion for starting scanning

The individual criteria for starting scanning in the different selection and reselection procedures are defined in clauses 18.3.4.6 and 18.3.4.7.1 to 18.3.4.7.6.

##### 18.3.4.5.3 Criterion for radio link failure

Radio link failure occurs when the quality of the uplink or downlink radio connection falls below a certain level. A radio link failure shall be declared if any of the following events occur:

- layer 2 declares C1 path loss parameter failure ( $C1 < 0$ ) via the TL-MEASUREMENT indication primitive:
  - if the current channel is a non-conforming channel (see clause 18.3.4.9.1) this shall be considered a current channel radio link failure; or
  - if the current channel is a conforming channel (see clause 18.3.4.9.1) this shall be considered a serving cell radio link failure and a current channel radio link failure;
- layer 2 reports path loss parameter  $C3 < 0$  for the serving cell's main carrier via the TL-MEASUREMENT indication primitive:
  - this shall be considered a serving cell radio link failure unless the MS-MLE immediately initiates or has already initiated monitoring of the main carrier;

- layer 2 reports path loss parameter  $C2 < 0$  for the serving cell's main carrier via the TL-MONITOR indication primitive:
  - this shall be considered a serving cell radio link failure;
- layer 2 reports an AACH or AACH-Q decoding failure as described in clause 23 for a current channel via the TL-REPORT indication primitive (downlink failure); then:
  - if the current channel is a non-conforming channel (see clause 18.3.4.9.1) this shall be considered a current channel radio link failure; or
  - if the current channel is a conforming  $\pi/4$ -DQPSK or D8PSK channel:
    - a CA MS shall consider this to be a serving cell radio link failure and a current channel radio link failure;
    - a DA MS shall consider this to be a current channel radio link failure;
  - if the current channel is a conforming QAM channel:
    - a CA MS shall consider this to be a current channel radio link failure;
    - if the current channel is not on the main carrier, a DA MS shall consider this to be a current channel radio link failure; or
    - if the current channel is on the main carrier, a DA MS shall consider this to be a serving cell radio link failure and a current channel radio link failure;
- an error is reported via the TL-REPORT indication primitive indicating either:
  - that the maximum path delay has been exceeded - this shall be considered a serving cell radio link failure and a current channel radio link failure; or
  - that an uplink failure has occurred; then:
    - if the channel on which the uplink failure occurred is a non-conforming channel this shall be considered a current channel radio link failure; or
    - if the channel on which the uplink failure occurred is a conforming channel this shall be considered a serving cell radio link failure and a current channel radio link failure;
- layer 2 declares that the BS has entered no service mode for the serving cell via the TL-REPORT indication primitive (common channel deallocated); this shall be considered a serving cell radio link failure and a current channel radio link failure.

NOTE: The maximum path delay exceeded condition and the uplink failure condition can be reported to the MS MAC from the SwMI in a MAC-RESOURCE PDU.

#### 18.3.4.5.4 Criterion for radio relinquishable cell

A serving cell becomes radio relinquishable when there is a neighbour cell which has a downlink radio connection of sufficient quality and either the quality of the serving cell's main carrier downlink radio connection falls below a certain level or the MS receives a TL-REPORT indication primitive reporting "maximum path delay almost exceeded".

Following receipt of a TL-REPORT indication primitive reporting "maximum path delay almost exceeded" the MS shall start the air cell margin timer T375 and shall send MM an MLE-CONFIGURE indication primitive setting the distance reporting time to a value of 15 s.

NOTE: The "maximum path delay almost exceeded" report is only used by an MS that supports the AGA service (see annex O).

The following conditions shall be met simultaneously in order to declare the serving cell radio relinquishable:

- the main carrier path loss parameter, C1 or C2, of at least one of the neighbour cells in the ranking list has exceeded by FAST\_RESELECT\_HYSTERESIS the main carrier path loss parameter, C1, C2 or C3 of the current serving cell for the last 5 s (where C2, if available, takes precedence over C3); and

- no successful cell reselection has taken place within the last 15 s (unless MM requested a cell reselection); and
- either:
  - the serving cell main carrier path loss parameter C1, C2 or C3 has for the last 5 s been below FAST\_RESELECT\_THRESHOLD (where C2, if available, takes precedence over C3); or
  - the air cell margin timer T375 is active;

If the air cell margin timer T375 expires, the above "air cell margin timer T375 is active" condition is no longer fulfilled and the MS shall send MM an MLE-CONFIGURE indication primitive instructing MM to use the periodic reporting time requested by the SwMI.

The MS-MLE shall check the criterion for serving cell relinquishment as often as one neighbour cell is scanned or monitored.

#### 18.3.4.5.5 Criterion for radio improvable cell

A serving cell becomes radio improvable when the quality of a neighbour cell downlink radio connection exceeds that of the serving cell by a certain amount. The following conditions shall be met simultaneously in order to declare the serving cell radio improvable:

- the serving cell main carrier path loss parameter C1, C2 or C3 shall, for a period of 5 s, fall below SLOW\_RESELECT\_THRESHOLD (where C2, if available, takes precedence over C3);
- the main carrier path loss parameter, C1 or C2, of at least one of the neighbour cells in the ranking list shall exceed by SLOW\_RESELECT\_HYSTERESIS the main carrier path loss parameter C1, C2 or C3 of the current serving cell for a period of 5 s (where C2, if available, takes precedence over C3);
- no successful cell reselection shall have taken place within the previous 15 s unless MM requests a cell reselection.

The MS-MLE shall check the criterion for improving the serving cell as often as one neighbour cell is scanned or monitored.

#### 18.3.4.5.6 Criterion for radio usable cell

A neighbour cell becomes radio usable when it has a downlink main carrier radio connection of sufficient quality. The following condition shall be met in order to declare a neighbour cell radio usable:

- the neighbour cell shall for a period of 5s have a main carrier path loss parameter, C1 or C2, which is greater than (FAST\_RESELECT\_THRESHOLD + FAST\_RESELECT\_HYSTERESIS);
- no successful cell reselection shall have taken place within the previous 15 s unless MM requests a cell reselection.

The MS-MLE shall check the criterion for a neighbour cell being usable each time the neighbour cell is scanned or monitored.

#### 18.3.4.5.6a Criterion for radio tolerable cell

A neighbour cell becomes radio tolerable when it has a downlink main carrier radio connection of sufficient quality. The following condition shall be met in order to declare a neighbour cell radio tolerable:

- The neighbour cell shall have a main carrier path loss parameter, C1 or C2, which is greater than a threshold above zero.

NOTE: The threshold should lie in the range between 0 and (FAST\_RESELECT\_THRESHOLD + FAST\_RESELECT\_HYSTERESIS).

The MS-MLE shall check the criterion for a neighbour cell being radio tolerable each time the neighbour cell is scanned or monitored.

### 18.3.4.5.6b Criterion for expedited cell reselection

A neighbour cell becomes a candidate for expedited cell reselection when the following conditions are met simultaneously:

- the main carrier path loss parameter, C1 or C2, of at least one of the neighbour cells in the ranking list shall exceed by FAST\_RESELECT\_HYSTERESIS the main carrier path loss parameter, C1, C2 or C3 of the current serving cell for a period of 2 s (where C2, if available, takes precedence over C3);
- the neighbour cell in question is indicated to recommend expedited cell reselection (in the "cell reselection types supported" information element of the D-NWRK-BROADCAST PDU or the "cell reselection types supported DA" information element of the D-NWRK-BROADCAST-DA PDU)); and
- no successful cell reselection shall have taken place within the previous 15 s unless MM requests a cell reselection.

NOTE 1: In order to successfully perform an expedited cell reselection to the cells that are recommended for expedited cell reselection the MS implementation should consider the following aspects:

- The required time for a cell reselection criterion to be in effect should be reduced from 5 s to 2 s for the cells that are recommended for expedited cell reselection.
- The neighbour cell monitoring of the cells that are recommended for expedited cell reselection should be performed at the fastest available rate.
- If the MS attempts announced cell reselection the waiting time for D-NEW-CELL, T370, should be shortened to 3 s for the cells that are recommended for expedited cell reselection.
- Reduce the filtering of RSSI and C1/C2 measurements for the cells that are recommended for expedited cell reselection.

NOTE 2: Where encryption is used, either DCK forwarding should be used with a reduced T370 timer of 3 s or DCK retrieval should be used to avoid clear location update on the new cell.

### 18.3.4.5.7 Criteria for initiating the cell reselection procedures

Cell reselection shall be initiated by the MLE if the serving cell is declared radio improvable (as defined in clause 18.3.4.5.5) and the service criteria as defined below are the same on both the serving cell and the neighbour cell. If the service provided by the neighbour cell is lower than that provided by the serving cell, the cell reselection may be postponed until the serving cell is declared radio relinquishable (as defined in clause 18.3.4.5.4). If the neighbour cell does not provide all essential service requirements for the MS and the serving cell does provide all essential service requirements, the MS should postpone cell reselection even after the serving cell becomes radio relinquishable. If the service provided by the neighbour cell is higher than that provided by the serving cell, then the cell reselection may be performed as soon as the neighbour cell is declared radio usable (as defined in clause 18.3.4.5.6).

If cell reselection is initiated by the user application (see clause 16.4.2), the MLE receives a MLE-LINK request primitive from MM containing the MCC and MNC and possibly also the LA and cell type preference or requirement of the desired cell. If, within the MCC, MNC, LA(s) and cell type(s) specified in the MLE-LINK primitive request, the MLE is able to find a cell fulfilling the criterion where service provided by the neighbour cell is the same or higher than provided by the serving cell, then the cell reselection may be performed as soon as the neighbour cell is declared radio usable (as defined in clause 18.3.4.5.6). Upon selection of the new cell, or if the present serving cell satisfies the requirements of the MLE-LINK request primitive, the MLE shall send a MLE-LINK indication primitive to MM. If the MLE is unable to find a suitable cell, it shall respond to MM with a MLE-ACTIVATE indication primitive.

The MLE shall maintain a record of the most recent cell type preference or requirement requested by MM, and shall use that cell type preference or requirement in future cell reselections unless modified by MM in an MLE-ACTIVATE request, MLE-LINK request or MLE-UPDATE request primitive. The same may apply for the MCC, MNC and LA(s), if provided by the user application.

The following service criteria may be used to compare the service provided by a serving cell and a neighbour cell:

- support for subscriber class (broadcast as part of the D-MLE-SYSINFO, D-MLE-SYSINFO-Q, D-MLE-SYNC-DA and D-MLE-SYSINFO-DA PDUs and may be broadcast as part of the D-NWRK-BROADCAST and the D-NWRK-BROADCAST-DA PDUs for neighbour cells);

- preference level of the supported subscriber class(es) (see clause R.2);
- support for system wide services (broadcast as part of the "BS service details" information element and the "BS service details DA" information element);
- priority cell indication (broadcast as part of the "BS service details" information element and the "BS service details DA" information element);
- support for TETRA voice service (broadcast as part of the "BS service details" information element and the "BS service details DA" information element);
- support for TETRA circuit mode data service (broadcast as part of the "BS service details" information element and the "BS service details DA" information element);
- support for TETRA packet data (SNDCP) service (broadcast by CA cells as part of the "BS service details" information element; always supported by DA cells when indicating "normal mode" (system wide services supported) in the "BS service details DA" information element);
- support for air interface encryption (broadcast as part of the "BS service details" information element and the "BS service details DA" information element);
- cell load (broadcast as part of the D-MLE-SYNC, D-MLE-SYSINFO-Q, D-MLE-SYNC-DA, D-MLE-SYSINFO-DA, D-NWRK-BROADCAST and (optionally) D-NWRK-BROADCAST-DA PDUs for the serving cell and may be broadcast as part of the D-NWRK-BROADCAST and the D-NWRK-BROADCAST-DA PDUs for neighbour cells);
- whether or not the LA of the current serving cell is preferred over the LA of the neighbour cell and whether or not the MS is permitted to use the LA of the neighbour cell (either or both of which may be stored in the MS at subscription; a list of preferred and/or permitted MCCs, MNCs and LAs may be provided to MLE in the MLE-ACTIVATE request primitive) - see note 1;
- whether or not a circuit mode call or C-plane signalling transfer is in progress;
- support for the QAM modulation mode (broadcast by CA cells as part of the "extended services broadcast" information element; always supported by DA cells);
- support for the  $\pi/4$ -DQPSK modulation mode (support for the  $\pi/4$ -DQPSK TETRA circuit mode voice and TETRA circuit mode data services is broadcast by DA cells as part of the "BS service details DA" information element; support for the  $\pi/4$ -DQPSK TETRA packet data (SNDCP) service is broadcast by DA cells as part of the "extended services broadcast section 1da" element; CA cells always support  $\pi/4$ -DQPSK modulation);
- support for the D8PSK modulation mode (broadcast as part of the "extended services broadcast" element and the "extended DA services broadcast" element);
- the bandwidths supported (broadcast in the "extended services broadcast section 2" element);
- support for QoS negotiation during PDP context activation (broadcast by CA cells as part of the "extended services broadcast" element; always supported by DA cells when indicating "normal mode" (system wide services supported) in the "BS service details DA" information element);
- a recognized system code (see clauses 21.4.4.2 and 21.4.4.2a);
- whether the MS prefers to use a CA cell or a DA cell;
- whether or not the neighbour cell or serving cell is a wide-area cell (broadcast in the D-MLE-SYNC-DA PDU and the "neighbour cell information for DA" information element).

The MS shall not use an unrecognized system code (i.e. a value defined as reserved according to all system codes known by the MS) in the V + D range to identify the service provided by a cell. The MS shall not reject the cell based only on an unrecognized system code in the V+D range.

NOTE 1: A preferred LA belongs to a specific MCC and a specific MNC. A permitted LA belongs to a specific MCC and a specific MNC (see also clause 18.3.5.1.5).

NOTE 2: The system code is a shorthand indication for what the system is supporting or more accurately what the system is not supporting. The system code may vary between cells belonging to the same system.

NOTE 3: Clause O.7.2.3 describes the criteria that may be used by MSs supporting the air-ground-air service to compare the service provided by a serving cell and a neighbour cell.

The "BS service details" information element for a CA serving cell is broadcast in the D-MLE-SYSINFO PDU and the D-MLE-SYSINFO-Q PDU. The "BS service details DA" element for a DA serving cell is broadcast in the D-MLE-SYNC-DA PDU and the D-MLE-SYSINFO-DA PDU. The "cell load CA" information element for a CA serving cell is broadcast in the D-MLE-SYNC PDU, and the D-MLE-SYSINFO-Q PDU. The "cell load DA" information element for a DA serving cell is broadcast in the D-MLE-SYNC-DA PDU and the D-MLE-SYSINFO-DA PDU. The "extended services broadcast" element for a CA serving cell is broadcast in the MAC SYSINFO PDU and the MAC SYSINFO-Q PDU. The "extended DA services broadcast" element for a DA serving cell is broadcast in the MAC SYSINFO-DA PDU. The "extended services broadcast section 2" element is broadcast in the MAC SYSINFO, MAC SYSINFO-Q, MAC SYSINFO-DA and MAC SYNC-DA PDUs. The "extended services broadcast section 1da" element is broadcast in the "extended DA services broadcast" element of the MAC SYSINFO-DA PDU.

The "BS service details" and the "cell load CA" information elements for CA neighbour cells may be included in "neighbour cell information for CA" information elements which may be broadcast in the D-NWRK-BROADCAST PDU.

The "BS service details DA" and the "cell load DA" information elements for DA neighbour cells may be included in "neighbour cell information for DA" information elements which may be broadcast in the D-NWRK-BROADCAST-DA PDU.

The D-MLE-SYNC PDU and the D-MLE-SYSINFO PDU shall be transmitted on all phase modulation carriers. The D-MLE-SYSINFO-Q may be transmitted on any QAM channel of a CA cell.

The D-MLE-SYSINFO-DA PDU may be transmitted on any channel that is not being used by MS(s) from more than one DA cell. The D-MLE-SYNC-DA PDU may be transmitted on any QAM channel that is not being used by MS(s) from more than one DA cell. The D-MLE-SYNC-DA PDU and the D-MLE-SYSINFO-DA PDU shall be transmitted on the main carrier of the DA cell.

The D-NWRK-BROADCAST and the D-NWRK-BROADCAST-DA PDUs may be transmitted on any channel.

Using the above criteria, an MS may decide whether or not a neighbour cell can be considered to offer better service than the current serving cell. The following conditions shall cause the MS to rate a neighbour cell to have better service than the current serving cell:

- the neighbour cell satisfies all essential service requirements for the MS and the serving cell does not;
- the neighbour cell is a priority cell and the serving cell is not a priority cell;
- the neighbour cell supports a service (i.e. TETRA voice, circuit mode data or TETRA packet data (SND)CP services) which is not supported by the serving cell and the MS prefers that service to be available;
- the neighbour cell supports a modulation mode (e.g.  $\pi/4$ -DQPSK, D8PSK, QAM) which is not supported by the serving cell and the MS prefers that modulation mode to be available;
- the neighbour cell supports a higher bandwidth matching the MS's capabilities than does the serving cell, and the MS prefers the ability to use that higher bandwidth;
- the neighbour cell supports QoS negotiation during PDP context activation and the serving cell does not, and the MS prefers the use of services accessed via QoS negotiation (e.g. scheduled access or any QoS other than background class with unspecified throughput, reliability and delay);
- the neighbour cell supports air interface encryption, the serving cell does not, and the MS prefers that air interface encryption is available;
- the neighbour cell supports system wide services and the serving cell does not;
- the cell load indicates that the neighbour cell is more lightly loaded than the serving cell (see notes 4 and 5);
- the neighbour cell belongs to a preferred LA and the serving cell does not;

- the neighbour cell is a CA cell, the present cell is a DA cell and the MS prefers to use a CA cell;
- the neighbour cell is a DA cell, the present cell is a CA cell and the MS prefers to use a DA cell;
- the neighbour cell is a wide-area cell, the present cell is not a wide-area cell, and the MS prefers to use a wide-area cell (see note 6 and example 1);
- the neighbour cell is not a wide-area cell, the present cell is a wide-area cell, and the MS prefers not to use a wide-area cell (see note 6 and example 1);
- the neighbour cell supports subscriber class(es) of higher preference level (see clause R.2) in the MS's subscriber class profile than does the current serving cell, and the MS supports the use of subscriber class preference levels;

NOTE 4: The "roaming control for individual services" and the "roaming control for group services and idle MSs" information elements in the D-MLE-SYSINFO-DA PDU indicate whether a DA MS is permitted to perform a cell reselection because the neighbour cell is more lightly loaded than the serving cell.

NOTE 5: The method by which an MS compares the cell load of a CA cell with the cell load of a DA cell is outside the scope of the present document.

NOTE 6: An MS may be configured to prefer using wide-area cells or to prefer not using wide-area cells. Or it may have no particular preference. Or its preference may depend on its present activities.

EXAMPLE 1: The MS might give preference to a wide-area cell if the MS is aware that it is travelling at high speed or using wide-area group calls. An MS might prefer not to use a wide-area cell if the MS is a hand-held device or if the MS wishes to set up an individually addressed circuit mode call.

In these cases the MS may choose to initiate cell reselection as soon as the neighbour cell becomes radio usable as defined in clause 18.3.4.5.6. If there is more than one neighbour cell which is radio usable, the MS should choose the one which has the highest ranking in the ranking list and which best satisfies the service requirements for the MS.

If the service provided by a radio usable neighbour cell is higher than that provided by the serving cell, but an assigned channel on the serving cell provides a better service than any neighbour cell channel that is currently radio usable, the MS-MLE may postpone cell reselection (the MS-MLE discovers this by monitoring the neighbour cell irregular channels and assessing the quality of the neighbour cell channel classes - see clauses 18.3.4.9.4 to 18.3.4.9.8).

The following conditions shall cause the MS to rate a neighbour cell to have lower service than the current serving cell:

- the serving cell satisfies all essential services requirements for the MS and the neighbour cell does not;
- the serving cell supports subscriber class(es) of higher preference level (see clause R.2) in the MS's subscriber class profile than does the neighbour cell, and the MS supports the use of subscriber class preference levels;
- the serving cell is a priority cell and the neighbour cell is not a priority cell;
- the serving cell supports a service (i.e. TETRA voice, circuit mode data or TETRA packet data (SND)CP services) which is not supported by the neighbour cell and the MS prefers that service to be available;
- the serving cell supports a modulation mode (e.g.  $\pi/4$ -DQPSK, D8PSK, QAM) which is not supported by the neighbour cell and the MS prefers that modulation mode to be available;
- the serving cell supports a higher bandwidth matching the MS's capabilities than does the neighbour cell, and the MS prefers the ability to use that higher bandwidth;
- the serving cell supports QoS negotiation during PDP context activation and the neighbour cell does not, and the MS prefers the use of services accessed via QoS negotiation (e.g. scheduled access or any QoS other than background class with unspecified throughput, reliability and delay);
- the serving cell supports air interface encryption, the neighbour cell does not, and the MS prefers that air interface encryption is available;
- the serving cell supports system wide services and the neighbour cell does not;
- the cell load indicates that the serving cell is loaded more lightly than the neighbour cell (see note 5);

- the serving cell belongs to a preferred LA and the neighbour cell does not;
- the neighbour cell is a CA cell, the present cell is a DA cell and the MS prefers to use a DA cell;
- the neighbour cell is a DA cell, the present cell is a CA cell and the MS prefers to use a CA cell;
- the neighbour cell is not a wide-area cell, the present cell is a wide-area cell, and the MS prefers to use a wide-area cell (see note 6 and example 1);
- the neighbour cell is a wide-area cell, the present cell is not a wide-area cell, and the MS prefers not to use a wide-area cell (see note 6 and example 1).

NOTE 7: See also clause O.7.2.3 concerning the air-ground-air service.

In these cases the MS should postpone cell reselection until the serving cell becomes radio relinquishable as defined in clause 18.3.4.5.4.

EXAMPLE 2: An example is that the MS should postpone cell re-selection until the serving cell becomes radio relinquishable as defined in clause 18.3.4.5.4, if the serving cell is a priority cell and the neighbour cell is not a priority cell.

The following conditions should cause the MS to rate a cell as not satisfying an essential service requirement for the MS:

- the MS subscriber class is not supported on the cell and the MS requires the support of the MS subscriber class;
- the cell does not support a service (i.e. TETRA voice, circuit mode data or TETRA packet data services) and the MS requires that service to be available;
- the cell does not support a modulation mode (e.g.  $\pi/4$ -DQPSK, D8PSK, QAM) and the MS requires that modulation mode to be available;
- the cell does not support a particular bandwidth and the MS requires that particular bandwidth;
- the cell does not support air interface encryption and the MS requires that air interface encryption is available;
- the cell does not support system wide services and the MS requires system wide services to be supported.
- the cell is a not-permitted cell (i.e. the cell does not belong to a permitted LA - see clause 18.3.5.1.5).

In the case where the current serving cell satisfies essential service requirements for the MS and there is no neighbour cell that satisfies essential service requirements for the MS, the MS should postpone cell reselection even after the serving cell becomes radio relinquishable.

EXAMPLE 3: An example of MS specific combination of cell re-selection criteria and service requirements for a neighbour cell is that an MS should choose not to perform cell re-selection to a cell with a subscriber class mismatch, or it may select a cell with subscriber class mismatch only if there is no cell with a subscriber class match in its ranking list, and then only after an initial cell selection procedure involving at least one full scan of all of its prearranged frequencies (or frequency lists) where no other cell is found with  $C1 > 0$  that has a matching subscriber class.

If there is more than one neighbour cell which satisfies the MS specific combination of cell re-selection criteria and service requirements, the MS should choose the highest ranked cell in the ranking list which satisfies the MS's specific combination of cell re-selection criteria and service requirements.

In the case where the current serving cell does not satisfy essential service requirements for the MS and there is a neighbour cell that satisfies essential service requirements for the MS, the MS should initiate cell reselection when the neighbour cell becomes radio tolerable i.e. even before the neighbour cell becomes radio usable.

In the case where the current serving cell does not support system wide services and the MS is unable to locate a cell that does support system wide services, the MS may either go out of service or remain in the current cell and offer reduced services. The MS behaviour in this case i.e. decision between the two alternatives should be configurable but is outside the scope of the present document. However if the MS supports emergency voice calls and the level of service offered by the current cell includes voice calls, the MS should not go out of service.

NOTE 8: An MS that supports emergency voice calls should be capable of remaining in service as long as the current cell supports voice calls, even if system wide services are not currently available, so that emergency calls can be received by any MSs in the area where voice calls can be routed. However some users may prefer the MS to go out of service if the current cell supports local voice calls but does not support system wide voice calls. For example, a user may choose to configure the MS to go out of service if it is not possible to route voice calls to the user's control room. (It may be noted that if the MS goes out of service it will not be able to make an emergency call even to other local MSs.)

If the service provided by a radio usable neighbour cell is lower than that provided by the serving cell, but the neighbour cell is advertising a radio usable irregular channel or a radio usable channel class which offers a higher service than is available on a currently assigned channel (the MS-MLE discovers this by monitoring the neighbour cell irregular channels and assessing the neighbour cell channel classes - see clauses 18.3.4.9.4 to 18.3.4.9.8), the MS-MLE may initiate cell reselection immediately if more than 15 s has elapsed since a previous cell reselection.

If the neighbour cell is deemed to offer neither better service nor lower service than the serving cell, the service shall be deemed to be equal and the MS shall initiate the cell reselection procedures as soon as a neighbour cell becomes radio improvable over the current serving cell as defined in clause 18.3.4.5.5. A neighbour cell shall be deemed to be equal with respect to the above service criteria if the information is not available for either the serving or neighbour cell e.g. the cell load of a neighbour cell may be declared "unknown" in the D-NWRK-BROADCAST PDU or the D-NWRK-BROADCAST-DA PDU, causing the service to be deemed equal with respect to cell load.

If a neighbour cell is deemed to provide equal or better service than the current serving cell and the neighbour does not recommend expedited cell reselection, the cell reselection should be postponed if there is a circuit mode call or ongoing signalling currently in progress. In this case, the cell reselection should be postponed until the serving cell becomes radio relinquishable, even if there are neighbour cells which meet the radio improvable or radio usable criteria.

If serving cell radio link failure occurs (which can occur when there are no neighbour cells of sufficient radio connection quality to make the serving cell relinquishable), the MS may re-select any neighbour cell in the ranking list whose main carrier path loss parameter, C1 or C2, is greater than zero. If there are multiple cells in the ranking list which meet this radio criterion, the MS should choose the highest ranked cell which satisfies the service requirement for the MS. If there are no cells which meet this minimum radio criterion, the initial cell selection procedure shall be invoked.

#### 18.3.4.6 Initial cell selection

The MS shall implement the initial cell selection procedure when the MS-MLE receives an MLE-ACTIVATE request primitive from MM e.g. when not attached to a cell, at power on, or after a previous deactivation has taken place. The exact detailed implementation of the procedure and any associated algorithms is outside the scope of the present document. The MS shall be required to fulfil certain conditions as stated below. The procedure shall be referred to as the "initial cell selection" procedure. This does not imply that the procedure shall necessarily be different from any procedures applied for cell reselection.

The initial cell selection procedure shall ensure that the MS selects a cell in which it can reliably decode downlink data, i.e. on a main control channel (MCCH or MCCH-Q), and which has a high probability of uplink communication. The minimum conditions that shall have to be met are that  $C1 > 0$ . Access to the network shall be conditional on the successful selection of a cell.

The procedure shall be initiated by the receipt of the MLE-ACTIVATE request primitive from the MM entity. This primitive has parameters which include the MCC and the MNC of the particular network and the cell type (e.g. CA, DA or any type) which the MS should select. The MS-MLE shall then use this information, and initiate the foreground scanning procedure and thus obtain the path loss parameter C1 and the network broadcast information for each cell. This information can be used to produce a list of preferred cells. These cells shall then be ranked by the MS-MLE. The ranking algorithm is outside the scope of the present document.

In the event that there are no suitable cells available when all cells in the list have been scanned, the MLE shall inform the MM entity with an MLE-ACTIVATE indication primitive that no suitable cell has been found. The MLE shall continue the scanning of cells until a suitable cell is found, or until the MS is powered down. The exact procedures, algorithms and parameters applied for the continued scanning of cells are outside the scope of the present document.

The MS shall select a cell which has  $C1 > 0$ . The MS should choose the cell which has the highest ranking according to the initial cell selection ranking procedure.

NOTE: The initial cell selection ranking procedure is not defined by the present document.

The cell shall be selected by issuing a TL-SELECT request primitive to the TLC-SAP, to cause the MAC to switch to the main carrier of the cell. The parameters of the TL-SELECT request primitive inform the lower layers of the channel and the parameters, "maximum MS transmit power" and "minimum RX access level" for the cell. Once the cell has been selected the lower layers return a TL-SELECT confirm primitive. The MLE shall issue an MLE-ACTIVATE confirm primitive to the MM. If registration is required in the cell, the MM shall then register. If the registration is successful or if no registration is required, the MLE may receive an MLE-UPDATE request primitive from MM supplying information regarding updated search areas or cell types for further monitoring.

If the registration is to a cell which has its "System wide services" parameter set to "System wide services temporarily not supported" and the registration is accepted with a Location update accept type value of "Temporary registration" then the MS shall consider itself to be temporarily registered.

If the MS has received a "Temporary registration" acknowledgement and then initiates a cell reselection, it shall register to the new cell even if the cell belongs to the Registered Area of the MS.

In the event that the initial cell selection is unsuccessful as a result of registration or authentication failure, MM shall instruct the MLE attachment management sub-entity, using an MLE-UPDATE request primitive, to suspend the ranking of that cell. This shall result in the selection of a different cell by the MLE, unless all opportunities have been used, in which case MM shall close the MLE service.

Upon receipt of the MLE-OPEN request primitive from MM, the MLE shall send MLE-OPEN indication primitive to the higher layer 3 entities (CMCE and SNDCCP) and shall initiate the serving cell surveillance procedures for the new cell as defined in clause 18.3.4.3 and may also initiate monitoring or background/interrupting scanning of neighbour cells.

See also ETSI EN 300 392-7 [8], clause 6.6.2.2.

### 18.3.4.7 Cell reselection

#### 18.3.4.7.0 Overview of cell reselection

This clause defines the overall process of the cell reselection procedure.

The cell reselection procedure shall ensure that the MS selects a cell in which it can reliably decode downlink data, i.e. on a main control channel, and in which it has a high probability of uplink communication according to the criteria in clause 18.3.4.5.7. The minimum conditions which shall have to be met are that  $C1 > 0$  and that the maximum path delay is not exceeded.

NOTE 1: The SwMI informs the MS that maximum path delay is exceeded in a MAC-RESOURCE PDU.

If the cell reselection procedure is unsuccessful, such that the MLE is left with no usable radio channels, the MS-MLE shall indicate this to the MM using an MLE-ACTIVATE indication primitive. MM may give further instructions, e.g. new LAs or cell types, or, if all opportunities have been used, MM shall close the MLE services (see clause 16). When the MM eventually opens up the services again, MS-MLE shall be activated and the initial cell selection procedures as specified in clause 18.3.4.6 shall apply.

Cell reselection can be performed by the MS-MLE when a MS is attached to a cell in idle or traffic mode. The procedure can handle the following categories as listed below:

- undeclared;
- unannounced;
- announced type 3;
- announced type 2;
- announced type 1.

Where an MS is not involved in any voice or circuit mode data calls, then the MS-MLE shall perform undeclared cell reselection. Where a MS is involved in a voice or circuit mode data call, then cell reselection shall be performed based on the criteria set out below and in figure 18.6. In the case where there are one or more advanced links established and the MS does not support advanced link roaming, it is recommended that the MS-MLE disconnects these advanced links prior to performing cell reselection.

Undeclared cell reselection is performed by the MLE when there are no calls in progress. The MS may attempt to recover SNDTCP and/or advanced link connections on the new cell unless a subscriber class mismatch has occurred on the new cell (see clause 28.2.5b) or the new cell is a not-permitted cell (see clause 18.3.5.1.5).

Unannounced cell reselection is used when the MS is unable to or, in the case of listening to group calls, has no need to send the announcement signalling to the serving cell prior to performing the cell reselection. The MS should perform unannounced cell reselection also when the selected neighbour cell's "cell reselection types supported" or "cell reselection types supported DA" indicates that expedited cell reselection is recommended. The MS may attempt to recover any CMCE emergency connections on the new cell. The MS may attempt to recover any non-emergency CMCE connections unless the new cell is a not-permitted cell (see clause 18.3.5.1.5). The MS may attempt to recover SNDTCP and/or advanced link connections on the new cell unless a subscriber class mismatch has occurred on the new cell (see clause 28.2.5b) or the new cell is a not-permitted cell (see clause 18.3.5.1.5).

Announced cell reselection is used when the MS informs the serving cell prior to the cell change, and attempts to restore the call(s) upon arrival at the new serving cell. This maximizes the probability of restoring the CMCE and SNDTCP connections on the new cell. Announced cell reselection is divided into three categories to reflect different levels of SwMI and MS functionality. The MS may attempt to recover CMCE connections on the new cell (if they were not recovered automatically), The MS may attempt to recover SNDTCP (and /or advanced link connections) on the new cell unless a subscriber class mismatch has occurred on the new cell (see clause 28.2.5b).

Type 3 reselection is provided for MSs which are unable to perform background scanning of a selected neighbour cell, and which therefore have to break the call(s) for a period and perform foreground scanning in order to acquire broadcast and synchronization information for the new cell. Upon selecting the new cell, call restoration signalling can be used to restore the call(s).

Type 2 reselection requires that the MS has performed background scanning of a selected neighbour cell and, in the case that the selected cell is a DA cell, has received a SYSINFO-DA PDU from the selected cell, so is therefore in a position to immediately switch to the new cell. In type 2 the SwMI does not direct the MS to a channel in the new cell. The MS selects the MCCH or MCCH-Q on the new cell and performs call restoration signalling and may then be allocated a traffic channel upon successful completion of this signalling.

Type 1 reselection requires that the MS has performed background scanning and, in the case that the selected cell is a DA cell, has received a SYSINFO-DA PDU from the selected cell, and that the SwMI is able to direct the MS from the traffic channel on the original cell to the MCCH or MCCH-Q or directly to a traffic channel on the new cell. If the SwMI directs the MS to the MCCH or MCCH-Q, the SwMI may later allocate a traffic channel; no call restoration signalling is required from the MS.

NOTE 2: The MS does not explicitly attempt either type 1 or type 2 cell reselection. The MS includes the cell to which it intends to move in the cell reselection request. If the MS is required to register on the new cell, and both the MS and the SwMI support forward registration, then the MS also includes a forward registration request with the cell reselection request. It is the SwMI, not the MS, which determines whether type 1 or type 2 cell reselection is to be applied. For this reason the following clauses refer to the MS initiating "type 1/2 cell reselection"; this indicates that the MS has included the cell to which it intends to move in the cell reselection request.

NOTE 3: The MS cannot request a type 1/2 cell reselection if it has been unable to scan a suitable cell by the time that the cell reselection is required. In the case that the suitable cell is a DA cell, the MS needs to have also received a SYSINFO-DA PDU on that cell before requesting the type 1/2 cell reselection.

Unannounced and the three types of announced cell reselection shall apply to an MS engaged in a circuit mode call.

All MS-MLE shall support undeclared, unannounced and announced type 3 cell reselection. An MS-MLE may also support announced type 1/2 cell reselection. It is not necessary for the SwMI to know which type of cell reselection procedures the MS can support in order for these procedures to work. The MS may determine if forward registration is supported by the SwMI and if expedited cell reselection is recommended from the "neighbour cell information for CA" information element transmitted in the D-NWRK-BROADCAST PDU and the D-NWRK-BROADCAST-DA PDU, and the "neighbour cell information for DA" information element transmitted in the D-NWRK-BROADCAST-DA PDU.

If the SwMI does not support neighbour cell information in the D-NWRK-BROADCAST PDU or D\_NWRK-BROADCAST-DA PDU transmissions (see clause 18.3.6.1), the SwMI shall only be able to support undeclared, unannounced and announced type 3 cell reselection.

If the SwMI supports neighbour cell information in the D-NWRK-BROADCAST PDU or D-NWRK-BROADCAST-DA PDU transmissions, the MS shall attempt announced type 1/2 cell reselection only to a neighbour cell that it has received neighbour cell information about in a D-NWRK-BROADCAST PDU or D-NWRK-BROADCAST-DA PDU on the current cell.

If the SwMI provides neighbour cell information, it shall support at least type 2 cell reselection to those cells included in the neighbour cell information i.e. if an MS requests type 1/2 cell reselection to a cell included in the neighbour cell information, the SwMI shall apply either type 1 or type 2 cell reselection (but see note 4).

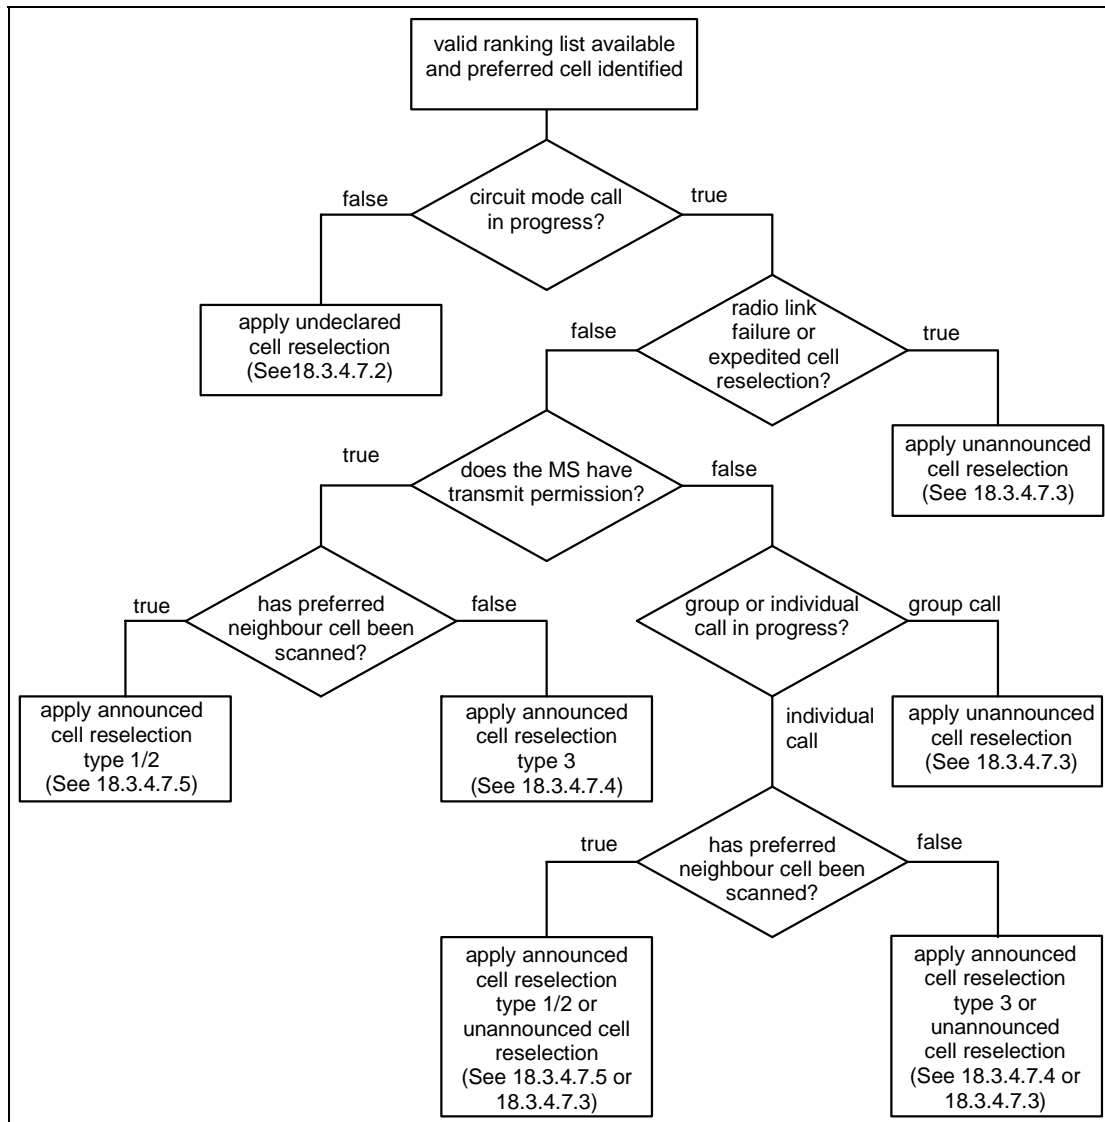

NOTE 4: If, in exceptional circumstances, a temporary failure occurs, the SwMI may reject a valid type 1/2 cell reselection request with fail cause "cell reselection type not supported" (see clauses 18.4.1.4.3 and 18.5.7).

If the air cell margin timer T375 is active when MLE initiates a cell reselection, MM shall stop the T375 and shall send MM an MLE-CONFIGURE indication primitive instructing MM to use the periodic reporting time requested by the SwMI.

NOTE 5: T375 is only used by an MS that supports the AGA service (see annex O).

## 18.3.4.7.1 Determination of which type of reselection to apply

Figure 18.6 recommends a method for choosing a cell reselection type.

NOTE: If there is no circuit mode in progress, MLE applies undeclared cell reselection and, if SMDCP is in the READY-temporary break state and has data awaiting transmission, the MS SMDCP sends the SwMI an SN-RECONNECT PDU, refer to clause 28.3.4.2.

**Figure 18.6: Recommended decision tree for choosing a cell reselection type**

The MS shall normally perform cell reselection as a result of building a ranking list from monitoring or scanning of neighbour cells. From the neighbour cell measurements, one of the cell reselection criteria defined in clause 18.3.4.7.0 may be met causing cell reselection to be initiated. The cell chosen as the one to which the MS will attempt to select is known as the preferred neighbour cell.

In the case where the MS has knowledge of the neighbour cells (e.g. from the D-NWRK-BROADCAST or D-NWRK-BROADCAST-DA PDU or from scanning or pre-programmed at subscription), but has not yet built a valid ranking list, serving cell radio link failure may occur or the maximum path delay may be exceeded. If this happens, the MS shall apply undeclared cell reselection if not currently participating in a circuit mode call. If the MS is participating in a call or data transfer, the MS shall apply unannounced cell reselection.

If the MS has no knowledge of neighbour cells, the MS should apply cell reselection according to initial cell selection procedures, and then on the new cell the MS shall apply undeclared cell reselection procedure if not currently participating in a circuit mode call. If the MS is participating in a call, the MS may apply either unannounced or undeclared cell reselection procedure.

The MS shall initiate cell reselection subject to the criteria specified in clause 18.3.4.7.0. It should determine which type of reselection is to be applied from figure 18.6. The type of reselection to be employed shall depend on the following criteria:

- whether or not a circuit mode call is in progress;
- whether the preferred neighbour cell is a permitted cell or a not-permitted cell (see clause 18.3.5.1.5);
- whether radio link failure has occurred or expedited cell reselection is recommended;
- whether the call is an individual or group call;
- whether or not transmit permission has been granted;
- whether or not the MS has scanned the preferred neighbour cell.

The cell reselection procedure is usually initiated after the MS has built a valid ranking list and one of the cell reselection criteria as defined in clause 18.3.4.7.0 has resulted in selection of a preferred neighbour cell. An MS shall scan the preferred neighbour cell before it can select that cell. If the MS has performed background scanning of a preferred neighbour cell and, in the case that the preferred neighbour cell is a DA cell, has received a SYSINFO-DA PDU from the preferred neighbour cell, then it may attempt to use announced type 1/2 cell reselection.

If a circuit mode call is in progress and the preferred neighbour cell is a not-permitted cell, the MS shall use unannounced cell reselection.

If a circuit mode call is in progress and the MS has not performed background scanning of a preferred neighbour cell or, in the case that the preferred neighbour cell is a DA cell, the MS has not received a SYSINFO-DA PDU from that cell, the MS shall use unannounced or announced type 3 cell reselection.

If the MS has performed background scanning of a preferred neighbour cell and, in the case that the preferred neighbour cell is a DA cell, has received a SYSINFO-DA PDU from the preferred neighbour cell, and the decision tree in figure 18.6 indicates that announced type 1/2 cell reselection may be used, then it is recommended that the MS uses announced type 1/2 cell reselection. Otherwise, the MS shall use unannounced or announced type 3 cell reselection.

The SwMI chooses if type 1 or 2 cell reselection is to be applied, depending on its capabilities. If the new cell does not support forward registration (as indicated in the "cell reselection types supported" or "cell reselection types supported DA" information element broadcast as part of the D-NWRK-BROADCAST and D-NWRK-BROADCAST-DA PDUs), or the MS does not support forward registration, and registration is required on the new cell, and the MS requests announced type 1/2 cell reselection, the SwMI shall apply type 2 cell reselection or shall reject the request with a suitable fail cause.

Where the decision tree indicates that the MS should choose type 1/2 cell reselection, and the MS attempts type 1/2 cell reselection, the SwMI may either:

- respond with a type 2 cell reselection procedure causing the MS to select the MCCH or MCCH-Q and perform call restoration on the neighbour cell; or
- direct the MS to a traffic channel (or the MCCH or MCCH-Q) on the new cell: the MS is not required to perform call restoration on the new cell. This is the type 1 cell reselection procedure.

If the new cell supports forward registration, and registration is required, but the MS does not support forward registration the SwMI will apply type 2 cell reselection caused by the MS omitting to supply a forward registration request in the cell reselection request.

### 18.3.4.7.1a Conditions determining when registration is required during cell reselection

An MS shall be required to register when any of the following conditions are satisfied:

- the preferred neighbour cell does not belong to the same network as the current cell;
- the preferred neighbour cell is in a LA which is outside the current registered area of the MS and registration is required in the new cell as indicated in the "BS service details" information element for a new CA cell or the D-MLE-SYSINFO-DA PDU broadcast by a new DA cell. (The "BS service details" information element for a new CA cell is either received as part of the neighbour cell information in the D-NWRK-BROADCAST PDU or in the D-MLE-SYSINFO PDU or D-MLE-SYSINFO-Q PDU broadcast on the new cell);
- the MS has reselected from a CA cell to a DA cell (or vice versa) and registration is required when the MS changes cell type, as indicated by the "cell type change registration" information element in the D-MLE-SYSINFO-DA PDU received on the DA cell;
- the MS has received a "temporary registration" on the serving cell i.e. MS is temporarily registered - the MS shall register to the new cell even if the new cell belongs to the registered area of the MS and even if the new cell does not indicate that registration is required (in the "BS service details" information element for a new CA cell or the D-MLE-SYSINFO-DA PDU broadcast by a new DA cell);
- the preferred neighbour cell has its "System wide services" parameter set to "System wide services temporarily not supported" - the MS shall register to the new cell even if the new cell belongs to the registered area of the MS and even if the new cell does not indicate that registration is required (in the "BS service details" information element for a new CA cell or the D-MLE-SYSINFO-DA PDU broadcast by a new DA cell).

NOTE 1: The registered area consists of all the LAs in which the MS is currently registered.

NOTE 2: If the MS leaves a first cell and then returns to the first cell after a failed registration attempt sent on a second cell, or if the MS decides to stay on the first cell after requesting an announced type 3 cell reselection on the first cell for a second cell, it is recommended that the MS should regard the first cell as "the preferred neighbour cell" and should register if any of the normal conditions for registration apply. If the MS returns to a first cell type after a failed registration attempt sent on a second cell type (i.e. after attempting to change from CA to DA or vice versa), the MS should regard the return to the first cell type as a change of cell type and should register if any of the normal conditions for registration apply.

See also clause 16.4.1.

### 18.3.4.7.2 Undeclared cell reselection

Undeclared cell reselection shall be initiated by an MS if it is not currently involved in any circuit mode calls and one of the cell reselection criteria described in clause 18.3.4.7.0 is met causing a preferred neighbour cell to be selected. If cell reselection is initiated as a result of a radio relinquishable, radio improvable or radio usable condition, a preferred neighbour cell shall have been identified by the MS-MLE. This preferred neighbour cell may or may not have been scanned by the MS-MLE before cell reselection is initiated. If cell reselection is initiated as a result of serving cell radio link failure, a preferred neighbour cell may not yet have been identified.

Upon initiation of the undeclared cell reselection procedure, the MS-MLE shall perform the following actions:

- a) issue MLE-BREAK indication primitive, informing the higher layer 3 entities, SNDTCP and CMCE, that the radio link to the current serving cell is unavailable for C-plane signalling;
- b) where the MS does not support advanced link roaming, locally disconnect any advanced links by issuing TL-RELEASE request primitive via the TLA-SAP to layer 2;
- c) if no preferred neighbour cell has been selected, initiate foreground scanning of neighbour cells to select a preferred neighbour cell;
- d) if a preferred neighbour cell has been selected and background scanning of the preferred neighbour cell has not been performed, initiate foreground scanning of the preferred neighbour cell to confirm the selection;
- e) issue TL-SELECT request primitive via the TLC-SAP to cause the MAC to switch to the main carrier of the new cell; the MAC responds with TL-SELECT confirm primitive once the new cell has been selected;

- f) if the selected cell has a subscriber class mismatch (see clause 18.3.5.1.4), inform CMCE and SNDCP that there is no subscriber class match on the selected cell by sending MLE-INFO indication primitives;
- g) if the selected cell is a not-permitted cell (see clause 18.3.5.1.5), inform CMCE and SNDCP that the selected cell is a not-permitted cell by sending MLE-INFO indication primitives.

NOTE 1: If a DA cell is selected as the preferred neighbour cell then, in addition to the scanning in c) or d) above, the MS needs to obtain information necessary to use the cell by receiving a SYSINFO-DA PDU from the preferred neighbour cell. The MS may obtain this before issuing the TL-SELECT request primitive (including concurrently with scanning) by issuing a TL-CELL-READ request primitive via the TLC-SAP. The cell reselection will generally proceed more quickly if the MS has received a recent SYSINFO-DA PDU on the preferred neighbour cell before the MS-MLE issues the TL-SELECT request as otherwise layer 2 will wait until it receives a SYSINFO-DA PDU on a new DA cell before completing selection of the new cell.

NOTE 2: Some contents of the SYSINFO-DA PDU may change quite frequently. If the MS misses a change in the preferred neighbour cell's SYSINFO-DA PDU (e.g. if the CCK identifier changes), the MS may initially miss signalling addressed to itself on the new cell. So the MS may choose to periodically refresh its record of the preferred neighbour cell's SYSINFO-DA PDU.

Registration shall be required if the conditions specified in clause 18.3.4.7.1a are satisfied.

If registration is required, MLE shall issue an MLE-LINK indication primitive to MM. MM indicates the registration result by issuing MLE-UPDATE request primitive to MLE confirming or rejecting the cell. If registration was successful or if no registration was necessary, MLE shall send MLE-REOPEN indication primitive to the upper layer 3 entity CMCE, to indicate that the radio link is once again available for C-plane signalling. MLE shall send MLE-RESUME indication primitive to SNDCP, to indicate that the radio link is once again available for C-plane signalling.

If the registration is to a cell which has its "System wide services" parameter set to "System wide services temporarily not supported" and the registration is accepted with a Location update accept type value of "Temporary registration" then the MS shall consider itself to be temporarily registered.

If the registration result indicates "cell rejection":

- if the rejecting cell was the only cell available, the MLE shall send to MM an MLE-ACTIVATE indication primitive indicating "no cell available for any service"; or
- if the rejecting cell was not the only cell available, the MLE may attempt to select another cell from the ranking list.

The rejecting cell shall not be included in the ranking list again until the MLE has attempted reselection to another cell on the same SwMI or to a different SwMI, or until the MS is next powered on or goes to and returns from direct mode.

If the registration result indicates "cell type rejection" the MLE shall remove the rejecting cell from the ranking list. Then:

- if the rejecting cell was the only cell available, the MLE shall send to MM an MLE-ACTIVATE indication primitive indicating "no cell available for any service"; or
- if the rejecting cell was not the only cell available, the MLE may attempt to select another cell from the ranking list.

The rejecting cell shall not be included in the ranking list again until MLE receives a primitive from MM indicating that the rejecting cell type is a preferred cell type, or until MLE has attempted reselection to another cell on the same SwMI or to a different SwMI, or until the MS is next powered on or goes to and returns from direct mode.

NOTE 3: MM may advise MLE that the rejecting cell type is not a preferred cell type in the MLE-UPDATE request primitive that informs MLE of a cell type rejection. Following successful reselection to a different cell of the rejecting cell type, MM may advise MLE that the rejecting cell type is once more a preferred cell type (see clause 16.4.12).

If the registration result indicates "LA rejection", the MLE shall remove all cells with the LA in this MNC/MCC from the ranking list. The MLE may attempt to select another cell from the ranking list and re-apply cell reselection procedures. In all registration cases, cells with the rejecting LA may be included in the ranking list again when one of the following conditions apply:

- after successful location update to a cell in a different LA;
- the MS is next powered on;
- the MS goes to and returns from direct mode.

NOTE 4: Cells with the rejecting LA may also be included in the ranking list again after a suitable time or when the LA becomes available through the use of a "denied LA list". An MS may manage such a list, for example, to avoid oscillating between two rejecting cells.

If no cells remain in the ranking list after cells from the rejecting LA have been removed, the MLE shall send to MM an MLE-ACTIVATE indication primitive indicating "no cell available for any service".

If the registration result indicates "system rejection", the MLE shall remove all cells with the rejecting MNC/MCC from the ranking list. The MLE may attempt to select another cell from the ranking list and re-apply cell reselection procedures. In all registration cases, cells with the rejecting MNC/MCC may be included in the ranking list again after an attempted reselection to a cell with a different MNC/MCC or when the MS is next powered on or when the MS goes to and returns from direct mode.

If no cells remain in the ranking list after cells from the rejecting MNC/MCC have been removed, the MLE shall send to MM an MLE-ACTIVATE indication primitive indicating "no cell available for any service".

SNDCP may re-establish packet data communications as described in clause 28.3.4.2 (unless there is a subscriber class mismatch on the new cell or the new cell is a not-permitted cell), by re-establishing advanced links on the new cell. Where the MS supports advanced link roaming, SNDCP may attempt to reconnect the advanced links as described in clause 28.3.4.4 unless there is a subscriber class mismatch on the new cell or the new cell is a not-permitted cell.

See also ETSI EN 300 392-7 [8], clause 6.6.2.2.

### 18.3.4.7.3 Unannounced cell reselection

Unannounced cell reselection shall be initiated by an MS if one of the cell reselection criteria described in clause 18.3.4.7.0 is met and unannounced cell reselection is chosen according to the decision tree in figure 18.6. If cell reselection is initiated as a result of a radio relinquishable, radio improvable or radio usable condition, a preferred neighbour cell shall have been identified by the MS-MLE. This preferred neighbour cell may or may not have been scanned by the MS-MLE before cell reselection is initiated. If cell reselection is initiated as a result of serving cell radio link failure, a preferred neighbour cell may not yet have been identified.

Upon initiation of the unannounced cell reselection procedure, the MS-MLE shall perform the following actions:

- a) issue MLE-BREAK indication primitive, informing the higher layer 3 entities, SNDCP and CMCE, that the radio link to the current serving cell is unavailable for C-plane signalling;
- b) where the MS does not support advanced link roaming, locally disconnect any advanced links by issuing TL-RELEASE request primitive via the TLA-SAP to layer 2;
- c) if no preferred neighbour cell has been selected, initiate foreground scanning of neighbour cells to select a preferred neighbour cell;
- d) if a preferred neighbour cell has been selected and background scanning of the preferred neighbour cell has not been performed, initiate foreground scanning of the preferred neighbour cell to confirm the selection;
- e) issue TL-SELECT request primitive via the TLC-SAP to cause the MAC to switch to the main carrier of the new cell; the MAC responds with TL-SELECT confirm primitive once the new cell has been selected;
- f) if the selected cell has a subscriber class mismatch (see clause 18.3.5.1.4), inform CMCE and SNDCP that there is no subscriber class match on the selected cell by sending MLE-INFO indication primitives;
- g) if the selected cell is a not-permitted cell (see clause 18.3.5.1.5), inform CMCE and SNDCP that the selected cell is a not-permitted cell by sending MLE-INFO indication primitives.

NOTE 1: If a DA cell is selected as the preferred neighbour cell then, in addition to the scanning as in c) or d) above, the MS needs to obtain information necessary to use the cell by receiving a SYSINFO-DA PDU from the preferred neighbour cell. The MS may obtain this before issuing the TL-SELECT request primitive (including concurrently with scanning) by issuing a TL-CELL-READ request primitive via the TLC-SAP. The cell reselection will generally proceed more quickly if the MS has received a recent SYSINFO-DA PDU on the preferred neighbour cell before the MS-MLE issues the TL-SELECT request as otherwise layer 2 will wait until it receives a SYSINFO-DA PDU on a new DA cell before completing selection of the new cell.

NOTE 2: Some contents of the SYSINFO-DA PDU may change quite frequently. If the MS misses a change in the preferred neighbour cell's SYSINFO-DA PDU (e.g. if the CCK identifier changes), the MS may initially miss signalling addressed to itself on the new cell. So the MS may choose to periodically refresh its record of the preferred neighbour cell's SYSINFO-DA PDU.

Registration shall be required if the conditions specified in clause 18.3.4.7.1a are satisfied.

If registration is required, MLE shall issue an MLE-LINK indication primitive to MM.

If the registration is to a cell which has its "System wide services" parameter set to "System wide services temporarily not supported" and the registration is accepted with a Location update accept type value of "Temporary registration" then the MS shall consider itself to be temporarily registered.

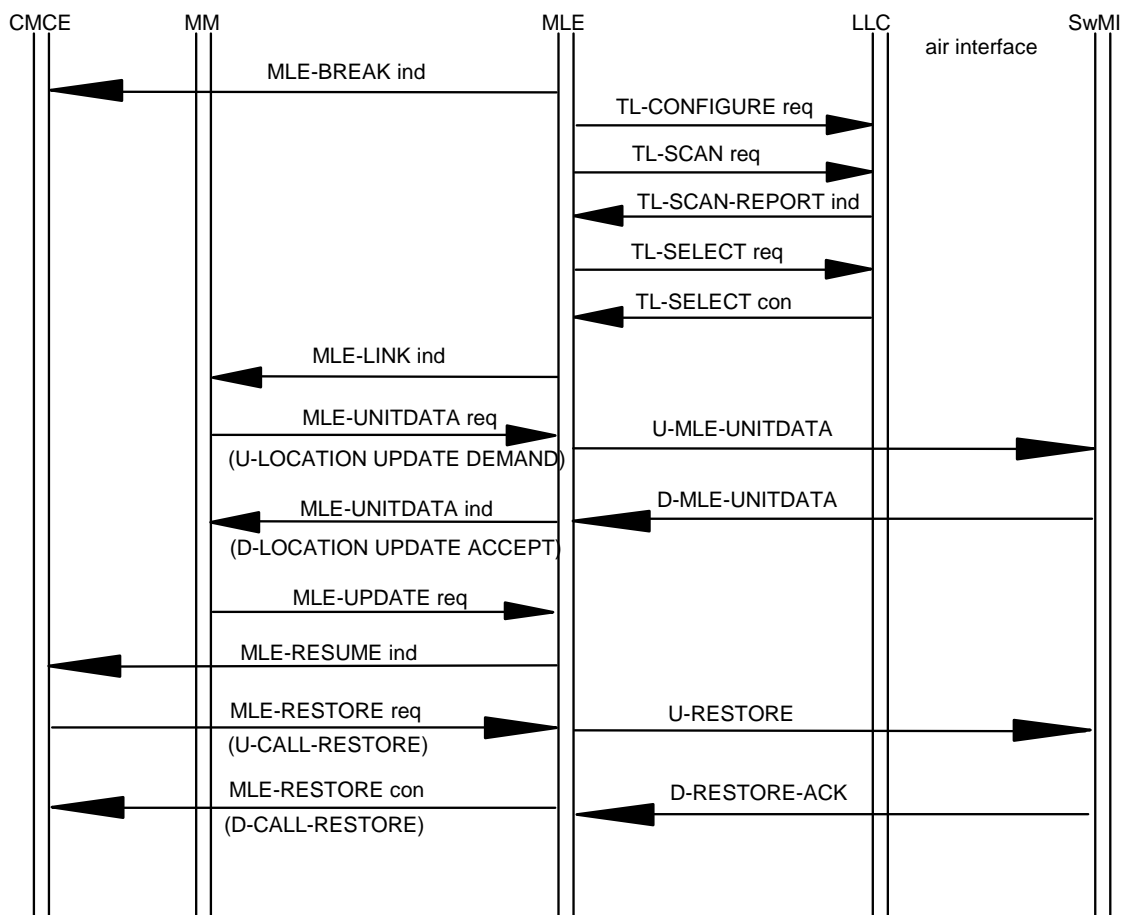

Figure 18.7: Unannounced cell reselection procedure

If the registration result indicates "cell rejection":

- if the rejecting cell was the only cell available, the MLE shall send to MM an MLE-ACTIVATE indication primitive indicating "no cell available for any service"; or
- if the rejecting cell was not the only cell available, the MLE may attempt to select another cell from the ranking list.

The rejecting cell shall not be included in the ranking list again until the MLE has attempted reselection to another cell on the same SwMI or to a different SwMI, or until the MS is next powered on or goes to and returns from direct mode.

If the registration result indicates "cell type rejection" the MLE shall remove the rejecting cell from the ranking list. Then:

- if the rejecting cell was the only cell available, the MLE shall send to MM an MLE-ACTIVATE indication primitive indicating "no cell available for any service"; or
- if the rejecting cell was not the only cell available, the MLE may attempt to select another cell from the ranking list.

The rejecting cell shall not be included in the ranking list again until MLE receives a primitive from MM indicating that the rejecting cell type is a preferred cell type, or until MLE has attempted reselection to another cell on the same SwMI or to a different SwMI, or until the MS is next powered on or goes to and returns from direct mode.

NOTE 3: MM may advise MLE that the rejecting cell type is not a preferred cell type in the MLE-UPDATE request primitive that informs MLE of a cell type rejection. Following successful reselection to a different cell of the rejecting cell type, MM may advise MLE that the rejecting cell type is once more a preferred cell type (see clause 16.4.12).

If the registration result indicates "LA rejection", the MLE shall remove all cells with the LA in this MNC/MCC from the ranking list. The MLE may attempt to select another cell from the ranking list and re-apply cell reselection procedures. In all registration cases, cells with the rejecting LA may be included in the ranking list again when one of the following conditions apply:

- after a successful location update to a cell in a different LA;
- the MS is next powered on;
- the MS goes to and returns from direct mode.

NOTE 4: Cells with the rejecting LA may also be included in the ranking list again after a suitable time or when the LA becomes available through the use of a "denied LA list". An MS may manage such a list, for example, to avoid oscillating between two rejecting cells.

If no cells remain in the ranking list after cells from the rejecting LA have been removed, the MLE shall send to MM an MLE-ACTIVATE indication primitive indicating "no cell available for any service".

If the registration result indicates "system rejection", the MLE shall remove all cells with the rejecting MNC/MCC from the ranking list. The MLE may attempt to select another cell from the ranking list and re-apply cell reselection procedures. In all registration cases, cells with the rejecting MNC/MCC may be included in the ranking list again after an attempted reselection to a cell with a different MNC/MCC or when the MS is next powered on or when the MS goes to and returns from direct mode.

If no cells remain in the ranking list after cells from the rejecting MNC/MCC have been removed, the MLE shall send to MM an MLE-ACTIVATE indication primitive indicating "no cell available for any service".

MM shall indicate successful registration by issuing MLE-UPDATE request primitive to MLE confirming the cell. If registration was successful or if no registration was necessary, MLE shall send MLE-RESUME indication primitive to the upper layer 3 entities, CMCE and SNDPCP, to indicate that the radio link is once again available for C-plane signalling.

- CMCE may attempt to restore any circuit mode calls which were in existence before the cell change (unless the present cell is a not-permitted cell, in which case CMCE may only restore emergency circuit mode calls). CMCE shall restore a call by responding to the MLE-RESUME indication primitive with MLE-RESTORE request primitive, containing a CMCE call restoration PDU. MLE shall send a U-RESTORE PDU, containing the CMCE call restoration.

NOTE 5: The MCC, MNC and LA refer to the old cell.

If call restoration is successful, MLE shall receive a D-RESTORE ACK PDU from the SwMI which shall contain the CMCE downlink call restoration signalling PDU. Upon receipt of the D-RESTORE ACK PDU indicating successful call restoration, MLE shall issue MLE-RESTORE confirm primitive to the CMCE. The MLE-RESTORE confirm primitive which is passed to CMCE shall contain the CMCE restoration signalling PDU.

NOTE 6: CMCE may attempt to restore multiple circuit mode calls using the above restoration procedure for each call. Calls are restored one at a time with a call restoration signalling sequence for each one.

NOTE 7: A successful call restoration, indicated by a D-CALL RESTORE/D-RESTORE ACK PDU, should include a channel allocation in the MAC header if the restored call currently has a traffic channel allocation.

If the D-RESTORE FAIL PDU is received instead, it shall indicate that call restoration was unsuccessful. The "fail cause" information element of the D-RESTORE FAIL PDU shall contain value "Restoration cannot be done on cell". MLE shall then issue MLE-REOPEN indication primitive to the CMCE to indicate that the radio path is restored, but that the calls have not been restored. The D-RESTORE FAIL PDU shall not carry an SDU for any of the higher layer 3 entities.

SNDCP may re-establish packet data communications as described in clause 28.3.4.2 (unless there is a subscriber class mismatch on the new cell, or the new cell is a not-permitted cell), by re-establishing advanced links on the new cell. Where the MS supports advanced link roaming, SNDCP may attempt to reconnect the advanced links as described in clause 28.3.4.4 unless there is a subscriber class mismatch on the new cell or the new cell is a not-permitted cell.

See also ETSI EN 300 392-7 [8], clause 6.6.2.3.

#### 18.3.4.7.4 Announced cell reselection - type 3

Announced type 3 cell reselection shall be initiated by an MS if one of the cell reselection criteria described in clause 18.3.4.7.0 is met and announced type 3 cell reselection is chosen according to the decision tree in figure 18.6. If cell reselection is initiated as a result of a radio relinquishable, radio improvable or radio usable condition, a preferred neighbour cell shall have been identified by the MS-MLE. This preferred neighbour cell may or may not have been scanned by the MS-MLE before cell reselection is initiated. If cell reselection is initiated as a result of serving cell radio link failure and current channel radio link failure (see clause 18.3.4.5.3), or expedited cell reselection is recommended on the new cell (as indicated in a D-NWRK-BROADCAST or D-NWRK-BROADCAST-DA PDU), announced type 3 cell reselection shall not be attempted by the MS.

NOTE 1: If cell reselection is initiated as a result of serving cell radio link failure when the current channel has not failed, the MS may attempt announced type 3 cell selection.

Upon initiation of the announced type 3 cell reselection procedure, the MS-MLE of an MS presently using a CA cell shall send a U-PREPARE PDU to the SwMI. The U-PREPARE PDU shall not contain the "cell identifier CA" information element and the PDU shall not carry an SDU. The MS-MLE of an MS presently using a DA cell shall send a U-PREPARE-DA PDU to the SwMI. The U-PREPARE-DA PDU shall not contain the "cell identifier DA" information element or an SDU.

NOTE 2: The fact that the "cell identifier CA" or "cell identifier DA" information element is not present in the PDU informs the SwMI that a preferred neighbour cell has not yet been selected and that the MS-MLE is attempting announced type 3 cell reselection.

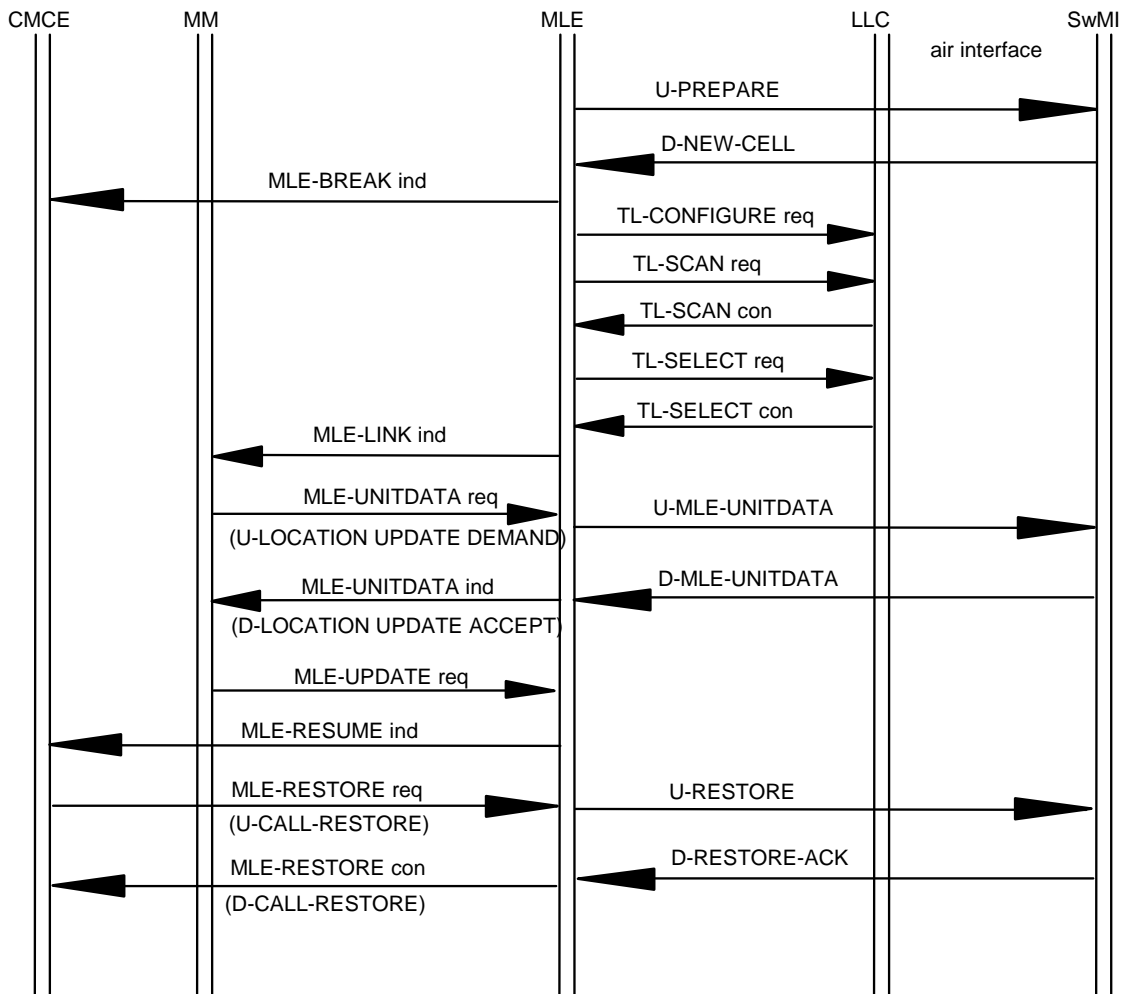

MLE shall send the U-PREPARE or U-PREPARE-DA PDU by issuing TL-DATA request primitive to layer 2 with the primitive parameters set as follows:

- PDU priority shall be set to 6;
- stealing permission shall be set to "steal immediately";
- the stealing repeats flag shall not be set.

NOTE 3: By transmitting the U-PREPARE or U-PREPARE-DA PDU, the MS informs the SwMI that it is about to change cell. The SwMI should also recognize the effect of the cell change on any circuit mode calls that the MS is currently involved in.

MLE shall start timer, T370, and shall await the response from the SwMI. The SwMI shall respond with a D-NEW-CELL PDU with the channel command valid information element set either to "Change channel immediately" or "No channel change". If set to "Change channel immediately", MLE shall reset timer T370 and initiate the cell change procedure described below. If set to "No channel change", MLE shall restart timer, T370, and wait for another D-NEW-CELL PDU from the SwMI. If, while waiting for a D-NEW-CELL PDU from the SwMI, current channel radio link failure occurs, the MS shall abandon the announcement signalling and initiate the unannounced cell reselection procedure immediately.

NOTE 4: The value "Follow MAC Channel Change" cannot be used for type 3 reselection. It can be used only for type 1 reselection.

**Figure 18.8: Announced type 3 cell reselection procedure**

If timer T370 expires, the MS shall immediately initiate the cell change procedure as described below.

The SwMI shall not respond to U-PREPARE or U-PREPARE-DA PDU with a D-PREPARE-FAIL PDU in the case where the MS-MLE has not indicated a preferred neighbour cell in the U-PREPARE or U-PREPARE-DA PDU. Therefore a D-PREPARE-FAIL PDU shall not be a valid response for announced type 3 cell reselection.

#### Initiation of the cell change procedure

Upon initiation of the cell change procedure, the MS-MLE shall:

- issue MLE-BREAK indication primitive, informing the higher layer 3 entities, SNDCP and CMCE, that the radio link to the current serving cell is unavailable for C-plane signalling;
- where the MS does not support advanced link roaming, locally disconnect any advanced links by issuing TL-RELEASE request primitive via the TLA-SAP to layer 2;
- initiate foreground scanning of the preferred neighbour cell (which has been selected as a result of monitoring and ranking) to confirm selection;
- issue TL-SELECT request primitive via the TLC-SAP to cause the MAC to switch to the main carrier of the new cell; the MAC responds with TL-SELECT confirm primitive once the new cell has been selected;
- if the selected cell has a subscriber class mismatch (see clause 18.3.5.1.4), inform CMCE and SNDCP that there is no subscriber class match on the selected cell by sending MLE-INFO indication primitives.

NOTE 5: If the BS receives a U-PREPARE or U-PREPARE-DA PDU from an MS transmitting in a circuit mode call, the BS may remove the transmit permission by sending D-TX CEASED PDU to the other MS(s) in the cell. Alternatively, the BS may allow the MS changing cell to keep the transmit permission for a period of time or until it selects a new cell and restores the call on that cell.

NOTE 6: If a DA cell is selected as the preferred neighbour cell then, in addition to the scanning in c) above, the MS needs to obtain information necessary to use the cell by receiving a SYSINFO-DA PDU from the preferred neighbour cell. The MS may obtain this before issuing the TL-SELECT request primitive (including concurrently with scanning) by issuing a TL-CELL-READ request primitive via the TLC-SAP. The cell reselection will generally proceed more quickly if the MS has received a recent SYSINFO-DA PDU on the preferred neighbour cell before the MS-MLE issues the TL-SELECT request as otherwise layer 2 will wait until it receives a SYSINFO-DA PDU on a new DA cell before completing selection of the new cell.

NOTE 7: Some contents of the SYSINFO-DA PDU may change quite frequently. If the MS misses a change in the preferred neighbour cell's SYSINFO-DA PDU (e.g. if the CCK identifier changes), the MS may initially miss signalling addressed to itself on the new cell. So the MS may choose to periodically refresh its record of the preferred neighbour cell's SYSINFO-DA PDU.

Registration shall be required if the conditions specified in clause 18.3.4.7.1a are satisfied:

- If registration is required, MLE shall issue an MLE-LINK indication primitive to MM.
- If the registration is to a cell which has its "System wide services" parameter set to "System wide services temporarily not supported" and the registration is accepted with a Location update accept type value of "Temporary registration" then the MS shall consider itself to be temporarily registered.
- If the registration result indicates "cell rejection":
  - if the rejecting cell was the only cell available, the MLE shall send to MM an MLE-ACTIVATE indication primitive indicating "no cell available for any service"; or
  - if the rejecting cell was not the only cell available, the MLE may attempt to select another cell from the ranking list.

The rejecting cell shall not be included in the ranking list again until the MLE has attempted reselection to another cell on the same SwMI or to a different SwMI, or until the MS is next powered on or goes to and returns from direct mode.

If the registration result indicates "cell type rejection" the MLE shall remove the rejecting cell from the ranking list. Then:

- if the rejecting cell was the only cell available, the MLE shall send to MM an MLE-ACTIVATE indication primitive indicating "no cell available for any service"; or
- if the rejecting cell was not the only cell available, the MLE may attempt to select another cell from the ranking list.

The rejecting cell shall not be included in the ranking list again until MLE receives a primitive from MM indicating that the rejecting cell type is a preferred cell type, or until MLE has attempted reselection to another cell on the same SwMI or to a different SwMI, or until the MS is next powered on or goes to and returns from direct mode.

NOTE 8: MM may advise MLE that the rejecting cell type is not a preferred cell type in the MLE-UPDATE request primitive that informs MLE of a cell type rejection. Following successful reselection to a different cell of the rejecting cell type, MM may advise MLE that the rejecting cell type is once more a preferred cell type (see clause 16.4.12).

If the registration result indicates "LA rejection", the MLE shall remove all cells with the LA in this MNC/MCC from the ranking list. The MLE may attempt to select another cell from the ranking list and re-apply cell reselection procedures. In all registration cases, cells with the rejecting LA may be included in the ranking list again when one of the following conditions apply:

- after a successful location update to a cell in a different LA;
- the MS is next powered on;

- the MS goes to and returns from direct mode.

NOTE 9: Cells with the rejecting LA may also be included in the ranking list again after a suitable time or when the LA becomes available through the use of a "denied LA list". An MS may manage such a list, for example, to avoid oscillating between two rejecting cells.

If no cells remain in the ranking list after cells from the rejecting LA have been removed, the MLE shall send to MM an MLE-ACTIVATE indication primitive indicating "no cell available for any service".

If the registration result indicates "system rejection", the MLE shall remove all cells with the rejecting MNC/MCC from the ranking list. The MLE may attempt to select another cell from the ranking list and re-apply cell reselection procedures. In all registration cases, cells with the rejecting MNC/MCC may be included in the ranking list again after an attempted reselection to a cell with a different MNC/MCC or when the MS is next powered on or when the MS goes to and returns from direct mode.

If no cells remain in the ranking list after cells from the rejecting MNC/MCC have been removed, the MLE shall send to MM an MLE-ACTIVATE indication primitive indicating "no cell available for any service".

MM shall indicate successful registration by issuing MLE-UPDATE request primitive to MLE confirming the cell. If registration was successful or if no registration was necessary, MLE shall send MLE-RESUME indication primitive to the upper layer 3 entities, CMCE and SNDCP, to indicate that the radio link is once again available for C-plane signalling.

CMCE may attempt to restore any circuit mode calls which were in existence before the cell change. CMCE shall restore calls by responding to the MLE-RESUME indication primitive with MLE-RESTORE request primitive, containing a CMCE call restoration PDU. MLE shall send a U-RESTORE PDU, containing the CMCE call restoration SDU using the LLC acknowledged service. The U-RESTORE PDU shall contain each of the following information elements only if the value on the new cell is different from that on the old cell:

- MNC;
- MCC;
- LA.

If call restoration is successful, MLE shall receive a D-RESTORE ACK PDU from the SwMI which shall contain the CMCE downlink call restoration signalling PDU. Upon receipt of the D-RESTORE ACK PDU indicating successful call restoration, MLE shall issue MLE-RESTORE confirm primitive to the CMCE. The MLE-RESTORE confirm primitive which is passed to CMCE shall contain the CMCE restoration signalling PDU.

NOTE 10: CMCE may attempt to restore multiple circuit mode calls using the above restoration procedure for each call. Calls are restored one at a time with a call restoration signalling sequence for each one.

If the D-RESTORE FAIL PDU is received instead, it shall indicate that call restoration was unsuccessful. The "fail cause" information element of the D-RESTORE FAIL PDU shall contain value "Restoration cannot be done on cell". MLE shall then issue MLE-REOPEN indication primitive to the CMCE to indicate that the radio path is restored, but that the call has not been restored. The D-RESTORE FAIL PDU shall not carry an SDU for any of the higher layer 3 entities.

SNDCP may re-establish packet data communications as described in clause 28.3.4.2 (unless there is a subscriber class mismatch on the new cell), by re-establishing advanced links on the new cell. Where the MS supports advanced link roaming, SNDCP may attempt to reconnect the advanced links as described in clause 28.3.4.4 unless there is a subscriber class mismatch on the new cell.

See also ETSI EN 300 392-7 [8], clause 6.6.2.4.

### 18.3.4.7.5 Announced cell reselection types 1 and 2

Announced type 1/2 cell reselection shall be initiated by an MS if one of the cell reselection criteria described in clause 18.3.4.7.0 is met and announced type 1/2 cell reselection is chosen according to the decision tree in figure 18.6. A preferred neighbour cell shall have been identified by the MS-MLE and shall have been scanned prior to initiating the cell reselection procedure. If the preferred neighbour cell is a DA cell, the MS shall also have received a SYSINFO-DA PDU from that cell prior to initiating the cell reselection procedure.

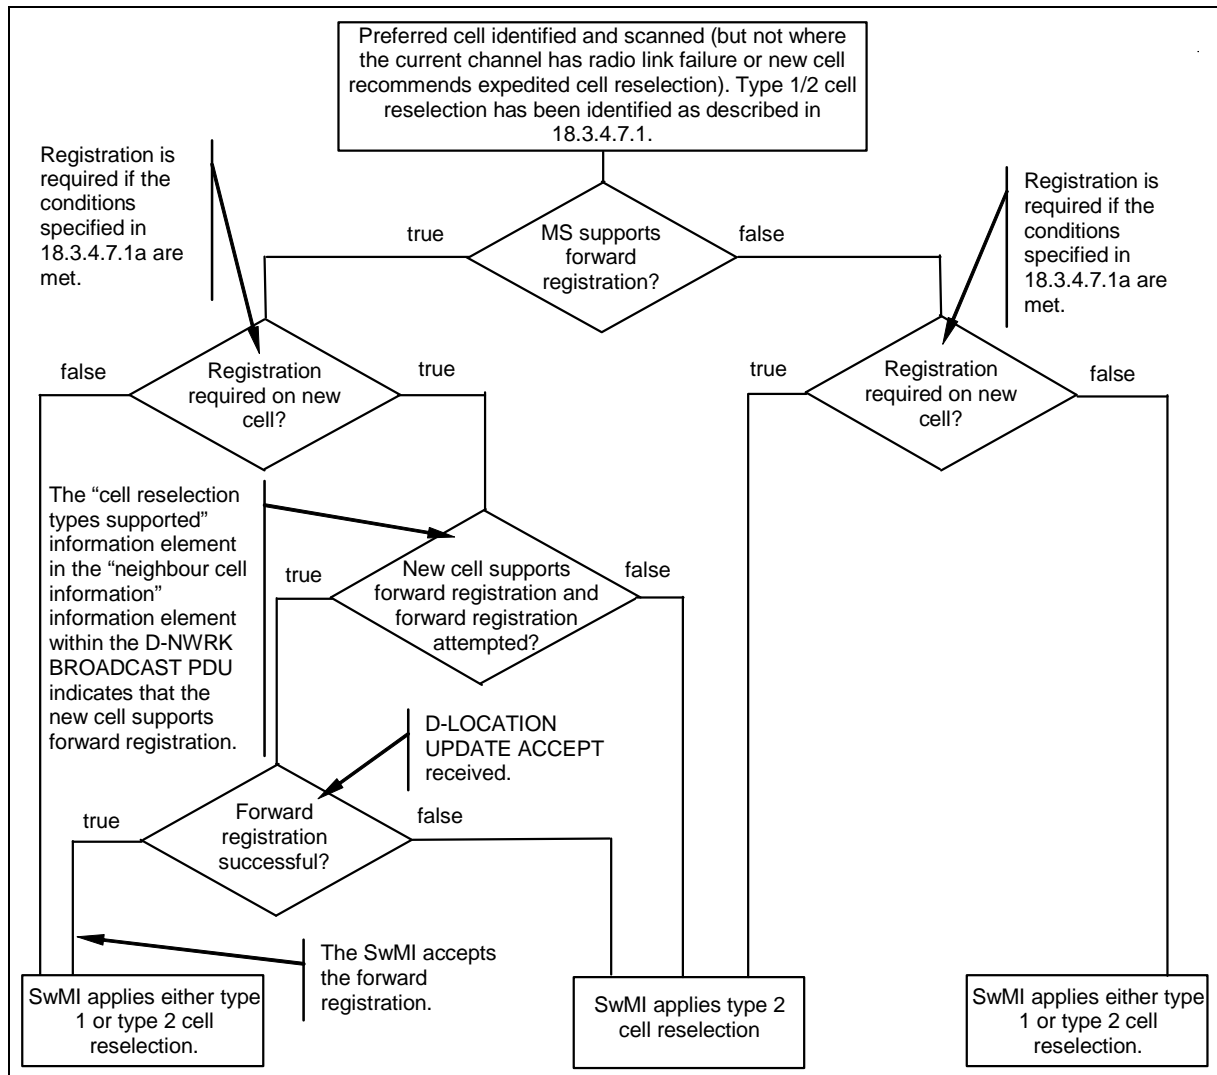

NOTE 1: When the MS scans a CA cell the MS receives both the SYNC and SYSINFO PDUs transmitted by that cell. When the MS scans a DA cell the MS receives the SYNC-DA PDU transmitted by that cell. It is possible that the MS may also receive a SYSINFO-DA PDU during scanning; however, the MS does not need to receive a SYSINFO-DA PDU during scanning.

If a SYSINFO-DA PDU was not received during scanning then, prior to initiating the cell reselection procedure, the MS-MLE shall request that the MAC attempts to receive a SYSINFO-DA PDU from the preferred DA neighbour cell by issuing a TL-CELL-READ request primitive via the TLC-SAP.

NOTE 2: Some contents of the SYSINFO-DA PDU may change quite frequently. If the MS misses a change in the preferred neighbour cell's SYSINFO-DA PDU (e.g. if the CCK identifier changes), the MS may be unable to rejoin its ongoing circuit mode calls when it reaches the new cell. So the MS may choose to periodically refresh its record of the preferred neighbour cell's SYSINFO-DA PDU. (The cell reselection will generally proceed more quickly if the MS has received a recent SYSINFO-DA PDU on the preferred neighbour cell before the MS-MLE issues the TL-SELECT request as otherwise layer 2 may wait until it receives a SYSINFO-DA PDU on a new DA cell before completing selection of the new cell.)

If cell reselection is initiated as a result of serving cell and current channel radio link failure (see clause 18.3.4.5.3), if expedited cell reselection is recommended on the new cell (as indicated in a D-NWRK-BROADCAST or D-NWRK-BROADCAST-DA PDU), or if the preferred neighbour cell has not yet been scanned, announced type 1/2 cell reselection shall not be attempted by the MS.

NOTE 3: If cell reselection is initiated as a result of serving cell radio link failure when the current channel has not failed, the MS may attempt announced type 1/2 cell selection.

**Figure 18.9: Decision tree to identify the type 1/2 reselection type applied by the SwMI**

Upon initiation of the announced type 1/2 cell reselection procedure, the MS shall determine if registration is required in the new cell, refer to figure 18.9.

Registration shall be required if the conditions specified in clause 18.3.4.7.1a are satisfied.

If registration is required, the MS supports forward registration, and the new cell supports forward registration (see note 4), then the MLE shall issue MLE-LINK indication primitive to MM which shall have the following parameters:

- MCC of the preferred neighbour cell;
- MNC of the preferred neighbour cell;
- LA of the preferred neighbour cell;
- cell type of the preferred neighbour cell;
- registration type shall be set to "forward" to indicate that forward registration (i.e. registration in a cell other than the current serving cell) is required.

NOTE 4: The new cell's support for forward registration is indicated in the "cell reselection types supported" information element (in the "neighbour cell information for CA" information element within the D-NWRK BROADCAST PDU and the D-NWRK BROADCAST-DA PDU) and the "cell reselection types supported DA" information element (in the "neighbour cell information for DA" information element within the D-NWRK BROADCAST-DA PDU).

Upon initiation of the announced cell reselection type 1/2 procedure, the MS-MLE of an MS wishing to reselect to a CA cell shall send a U-PREPARE PDU to the SwMI. The MS-MLE of an MS wishing to reselect to a DA cell shall send a U-PREPARE-DA PDU. If registration is required, the MS supports forward registration, and the new cell supports forward registration (see note 4), then the U-PREPARE or U-PREPARE-DA PDU shall carry a U-LOCATION UPDATE DEMAND SDU. The U-PREPARE PDU shall contain the "cell identifier CA" information element which shall uniquely identify a cell defined by the D-NWRK-BROADCAST or D-NWRK-BROADCAST-DA PDU. The U-PREPARE-DA PDU shall contain a "cell identifier DA" information element referencing a cell announced by a D-NWRK-BROADCAST-DA PDU.

The MS may combine an OTAR CCK request with the cell reselection either by including a U-OTAR CCK DEMAND PDU within the U-PREPARE or U-PREPARE-DA PDU or by requesting the CCK within the U-LOCATION UPDATE DEMAND PDU as described in clause 4.5.1.3 of ETSI EN 300 392-7 [8].

NOTE 5: The fact that the U-PREPARE or U-PREPARE-DA PDU contains details which identify a preferred neighbour cell informs the SwMI that the MS is attempting announced type 1/2 cell reselection.

MLE shall send the U-PREPARE or U-PREPARE-DA PDU by issuing TL-DATA request primitive to layer 2 with the primitive parameters set as follows:

- PDU priority shall be set to 6;
- stealing permission shall be set to "steal immediately";
- the stealing repeats flag shall not be set.

NOTE 6: By transmitting the U-PREPARE or U-PREPARE-DA PDU, the MS informs the SwMI that it is about to change cell. The SwMI should also recognize the effect of the cell change on any circuit mode calls that the MS is currently involved in.

MLE shall start timer, T370, and shall await the response from the SwMI. The SwMI shall respond with a D-NEW-CELL PDU with the channel command valid information element set either to "Change channel immediately", "No channel change" or "Follow MAC channel change" or with a D-PREPARE-FAIL PDU (see clause 18.3.4.7.6).

If the SwMI decides to grant a type-1 cell reselection and the call identifier on the new cell differs from the call identifier on the present cell, the SwMI should send the MS the new call identifier in a D-INFO PDU before sending the MS a D-NEW-CELL PDU indicating "Follow MAC channel change" (i.e. granting a type 1 cell reselection). The D-INFO PDU should be sent using an acknowledged service and the BS should await receipt of a layer 2 acknowledgement to the D-INFO PDU before sending the D-NEW CELL PDU.

NOTE 7: The call identifier for the new cell should not be sent to the MS until the SwMI is ready to grant a type 1 cell reselection. The D-NEW-CELL PDU granting the type 1 cell reselection should be sent as soon as possible after the MS acknowledges the new call identifier because during the gap between receiving the new call identifier and receiving the D-NEW-CELL PDU the MS could receive group-addressed call related signalling using the old call identifier which would interrupt the MS's reception of the ongoing call. (If the BS uses an unacknowledged service to send the D-INFO PDU, it should send the D-INFO PDU several times before sending the D-NEW-CELL PDU.)

If forward registration was requested, the SwMI may or may not accept registration on the new cell. If forward registration was requested, and the SwMI accepts the registration, the D-NEW-CELL PDU shall contain an MM SDU accepting registration on the new cell. On receipt in the MS, the MM SDU shall be passed to MM using a MLE-PREPARE confirm primitive. A MLE-UPDATE request primitive shall then indicate successful registration to MLE.

NOTE 8: The SwMI controls whether type 1 or type 2 cell reselection is to be applied: generally, this is independent of whether the MS attempts forward registration. If the MS is required to register on the new cell, and it does not attempt to forward register, then the SwMI applies type 2 cell reselection: the MS registers on arrival in the new cell prior to call restoration.

The MS may receive OTAR CCK information from either a D-OTAR CCK PROVIDE PDU or D-LOCATION UPDATE ACCEPT PDU within the D-NEW-CELL PDU, and process it as described in clause 4.5.1.3 of ETSI EN 300 392-7 [8].

If the SwMI responds to the U-PREPARE or U-PREPARE-DA PDU with a D-NEW-CELL PDU which has the "Channel command valid" information element set to "No channel change", MLE shall restart timer T370 and shall wait for a further D-NEW-CELL PDU from the SwMI. The "No channel change" D-NEW-CELL PDU shall not contain a MM SDU.

Following the initial "No channel change" D-NEW-CELL PDU, the SwMI may continue to refresh timer T370 by sending further "No channel change" D-NEW-CELL PDUs. A "Change channel immediately" or "Follow MAC channel change" D-NEW-CELL PDU, received after a "No channel change" D-NEW-CELL PDU, shall contain a MM SDU and cause processing to continue, as described below, as if only a single D-NEW-CELL PDU containing "Change channel immediately" or "Follow MAC channel change" respectively has been received.

If cell reselection is successful, the SwMI responds to the cell reselection preparation with a D-NEW-CELL PDU, that shall contain a MM SDU. The "Channel command valid" information element is set to either "Change channel immediately" or "Follow MAC channel change". The content of the "Channel command valid" information element of the D-NEW-CELL PDU defines the type of cell reselection that the SwMI is applying. These options are described below:

1) Successful type 2 cell reselection:

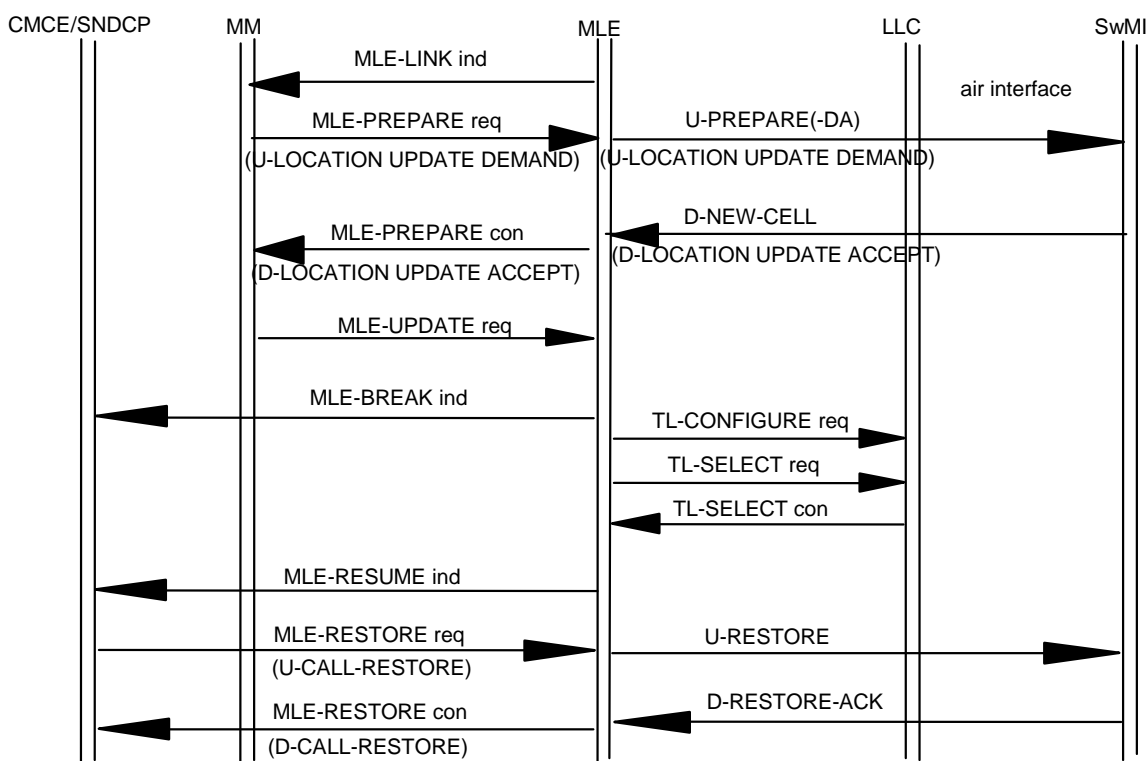

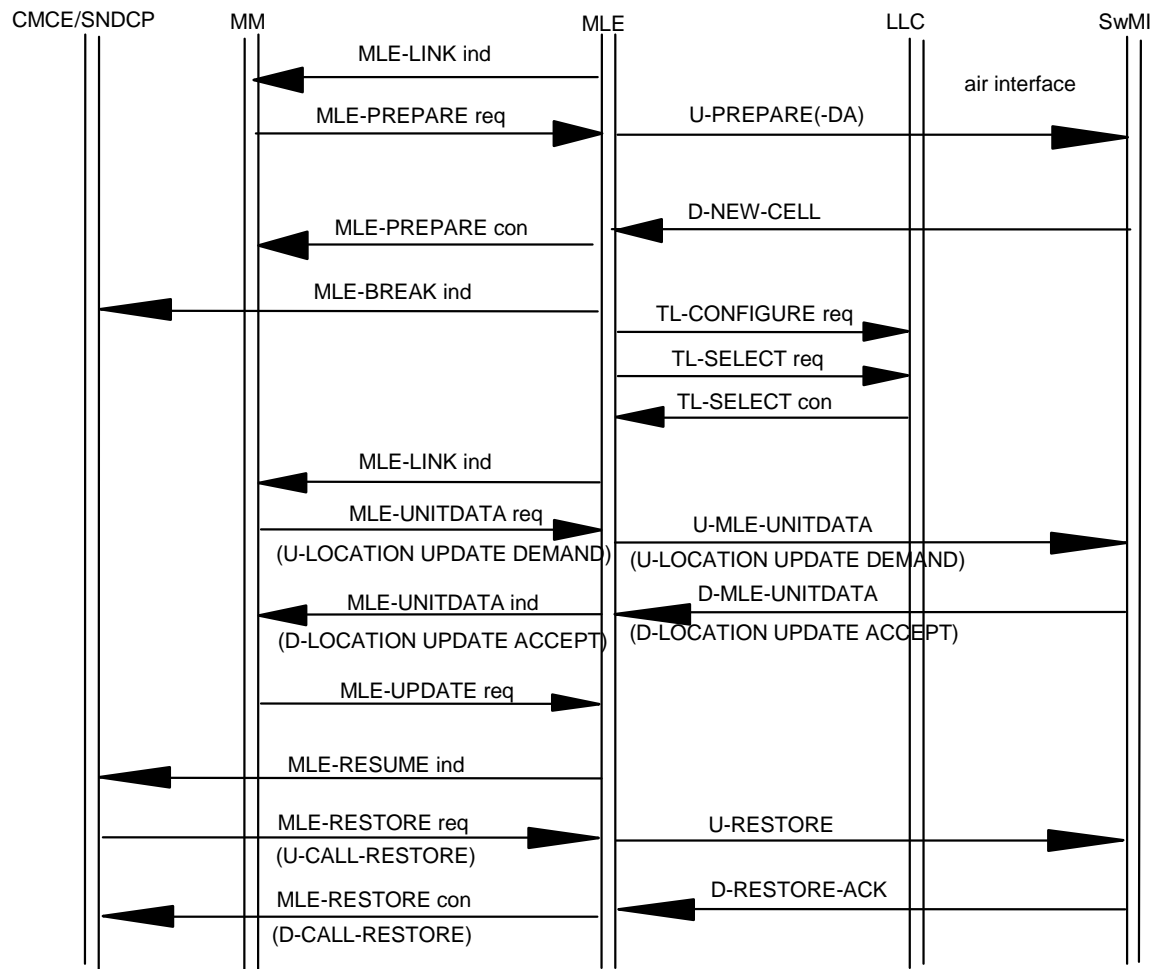

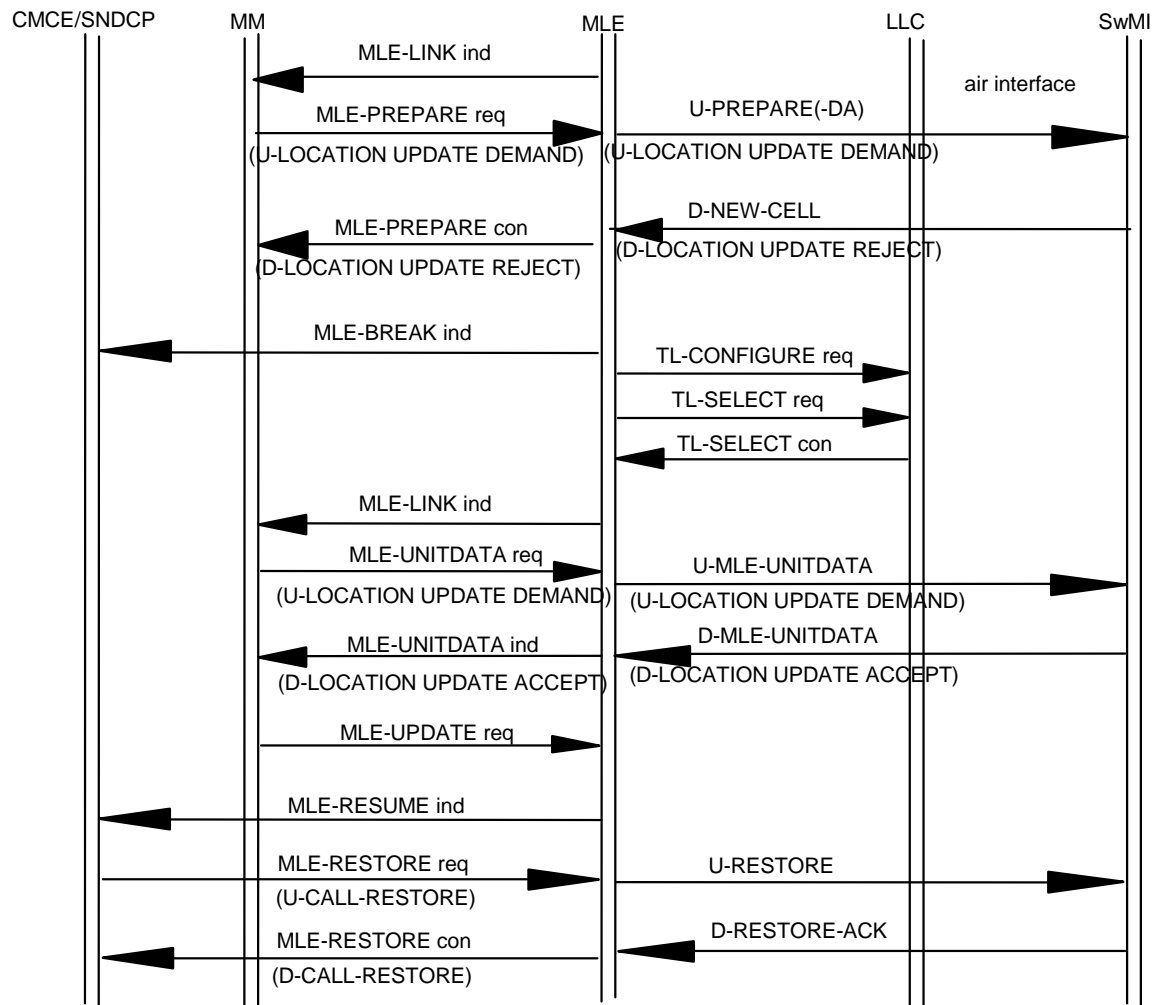

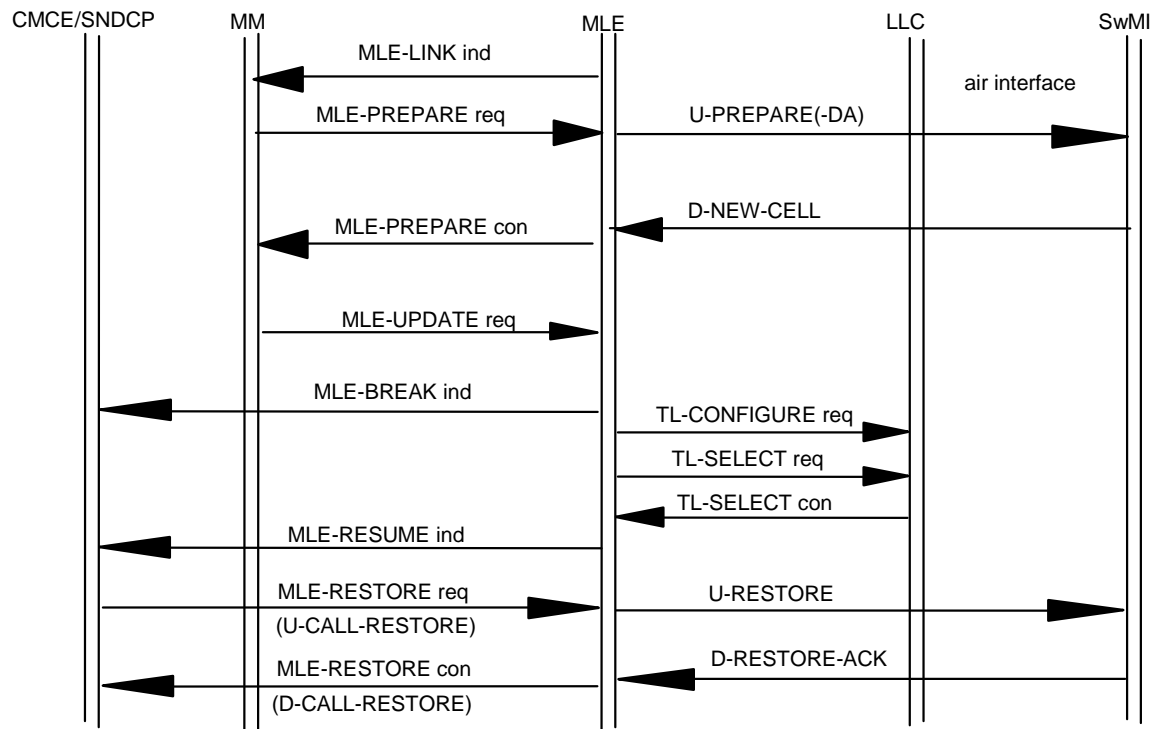

Figure 18.10: Announced type 2 cell reselection procedure, registration required, successful forward registration

**Figure 18.11: Announced type 2 cell reselection procedure, registration required, no forward registration**

**Figure 18.12: Announced type 2 cell reselection procedure, registration required, failed forward registration**

**Figure 18.13: Announced type 2 cell reselection procedure, no registration required**

If the "channel command valid" information element in the D-NEW-CELL PDU is set to "Change channel immediately" this shall cause the MS to switch autonomously to the MCCH or MCCH-Q of the new cell, reset T370 and initiate the cell change procedure as follows:

- issue MLE-BREAK indication primitive, informing the higher layer 3 entities, SNDCP and CMCE, that the radio link to the current serving cell is unavailable for C-plane signalling;
- where the MS does not support advanced link roaming, locally disconnect any advanced links by issuing TL-RELEASE request primitive via the TLA-SAP to layer 2;
- issue TL-SELECT request primitive via the TLC-SAP to cause the MAC to switch to the main carrier of the new cell; the MAC responds with TL-SELECT confirm primitive once the new cell has been selected;
- issue MLE-RESUME indication primitive to the upper layer 3 entities, CMCE and SNDCP to indicate that the radio link is once again available for C-plane signalling;
- if the selected cell has a subscriber class mismatch (see clause 18.3.5.1.4), inform CMCE and SNDCP that there is no subscriber class match on the selected cell by sending MLE-INFO indication primitives.

If registration is required and the MS did not attempt forward registration, MLE shall issue an MLE-LINK indication primitive to MM.

If the registration is to a cell which has its "System wide services" parameter set to "System wide services temporarily not supported" and the registration is accepted with a Location update accept type value of "Temporary registration" then the MS shall consider itself to be temporarily registered.

If the registration result indicates "cell rejection":

- if the rejecting cell was the only cell available, the MLE shall send to MM an MLE-ACTIVATE indication primitive indicating "no cell available for any service"; or
- if the rejecting cell was not the only cell available, the MLE may attempt to select another cell from the ranking list.

The rejecting cell shall not be included in the ranking list again until the MLE has attempted reselection to another cell on the same SwMI or to a different SwMI, or until the MS is next powered on or goes to and returns from direct mode.

If the registration result indicates "cell type rejection" the MLE shall remove the rejecting cell from the ranking list. Then:

- if the rejecting cell was the only cell available, the MLE shall send to MM an MLE-ACTIVATE indication primitive indicating "no cell available for any service"; or
- if the rejecting cell was not the only cell available, the MLE may attempt to select another cell from the ranking list.

The rejecting cell shall not be included in the ranking list again until MLE receives a primitive from MM indicating that the rejecting cell type is a preferred cell type, or until MLE has attempted reselection to another cell on the same SwMI or to a different SwMI, or until the MS is next powered on or goes to and returns from direct mode.

NOTE 9: MM may advise MLE that the rejecting cell type is not a preferred cell type in the MLE-UPDATE request primitive that informs MLE of a cell type rejection. Following successful reselection to different cell of the rejecting cell type, MM may advise MLE that the rejecting cell type is once more a preferred cell type (see clause 16.4.12).

If the registration result indicates "LA rejection", the MLE shall remove all cells with the LA in this MNC/MCC from the ranking list. The MLE may attempt to select another cell from the ranking list and re-apply cell reselection procedures. In all registration cases, cells with the rejecting LA may be included in the ranking list again when one of the following conditions apply:

- after successful location update to a cell in a different LA;
- the MS is next powered on;
- the MS goes to and returns from direct mode.

NOTE 10: Cells with the rejecting LA may also be included in the ranking list again after a suitable time or when the LA becomes available through the use of a "denied LA list". An MS may manage such a list, for example, to avoid oscillating between two rejecting cells.

If no cells remain in the ranking list after cells from the rejecting LA have been removed, the MLE shall send to MM an MLE-ACTIVATE indication primitive indicating "no cell available for any service".

If the registration result indicates "system rejection", the MLE shall remove all cells with the rejecting MNC/MCC from the ranking list. The MLE may attempt to select another cell from the ranking list and re-apply cell reselection procedures. In all registration cases, cells with the rejecting MNC/MCC may be included in the ranking list again after an attempted reselection to a cell with a different MNC/MCC or when the MS is next powered on or when the MS goes to and returns from direct mode.

If no cells remain in the ranking list after cells from the rejecting MNC/MCC have been removed, the MLE shall send to MM an MLE-ACTIVATE indication indicating "no cell available for any service".

MM shall indicate successful registration by issuing MLE-UPDATE request primitive to MLE confirming the cell. If registration was successful or if no registration was necessary, MLE shall send MLE-RESUME indication primitive to the upper layer 3 entities, CMCE and SND CP, to indicate that the radio link is once again available for C-plane signalling.

CMCE may attempt to restore any circuit mode calls which were in existence before the cell change. CMCE shall restore calls by responding to the MLE-RESUME indication primitive with MLE-RESTORE request primitive, containing a CMCE call restoration PDU. MLE shall send a U-RESTORE PDU, containing the CMCE call restoration SDU using the LLC acknowledged service. The U-RESTORE PDU shall contain each of the following information elements only if the value on the new cell is different from that on the old cell:

- MCC;
- MNC;
- LA.

If call restoration is successful, MLE shall receive a D-RESTORE ACK PDU from the SwMI which shall contain the CMCE downlink call restoration signalling PDU. Upon receipt of the D-RESTORE ACK PDU indicating successful call restoration, MLE shall issue a MLE-RESTORE confirm primitive to CMCE. The MLE-RESTORE confirm primitive which is passed to CMCE shall contain the CMCE restoration signalling PDU.

NOTE 11: CMCE may attempt to restore multiple circuit mode calls using the above restoration procedure for each call. Calls are restored one at a time with a call restoration signalling sequence for each one.

If the D-RESTORE FAIL PDU is received instead, it shall indicate that call restoration was unsuccessful. The "fail cause" information element of the D-RESTORE FAIL PDU shall contain value "Restoration cannot be done on cell". MLE shall then issue MLE-REOPEN indication primitive to the CMCE to indicate that the radio path is restored, but that the call has not been restored. The D-RESTORE FAIL PDU shall not carry an SDU for any of the higher layer 3 entities.

SNDCP may re-establish packet data communications as described in clause 28.3.4.2 (unless there is a subscriber class mismatch on the new cell), by re-establishing advanced links on the new cell. Where the MS supports advanced link roaming, SNDCP may attempt to reconnect the advanced links as described in clause 28.3.4.4 unless there is a subscriber class mismatch on the new cell.

## 2) Successful type 1 cell reselection:

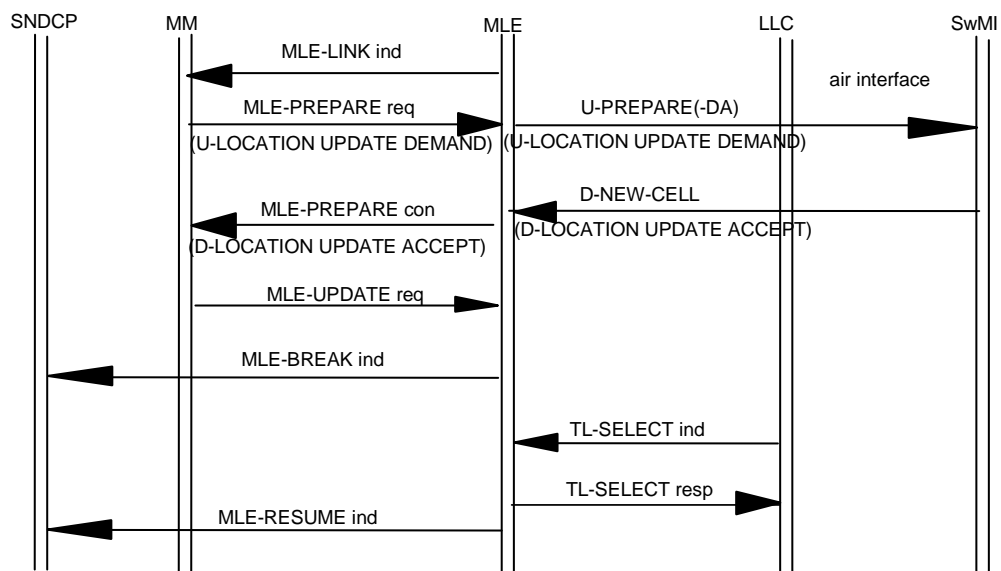

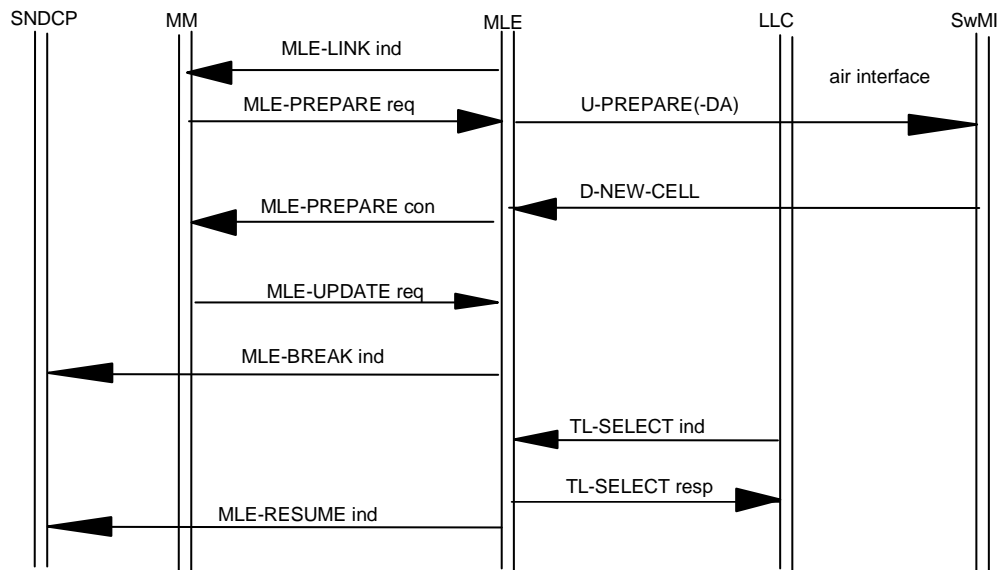

Figure 18.14: Announced type 1 cell reselection procedure, with forward registration

**Figure 18.15: Announced type 1 cell reselection procedure, forward registration not required**

If the "channel command valid" information element in the D-NEW-CELL PDU is set to "Follow MAC channel allocation" this indicates that a TCH has been allocated on the new cell to continue the circuit mode call, or that the MS has to switch to the MCCH or MCCH-Q of the new cell to continue the call. Upon reception of a D-NEW-CELL PDU, MS-MLE shall initiate the cell change procedure as follows:

- issue MLE-BREAK indication primitive, informing the higher layer 3 entity, SNDCP, that the radio link to the current serving cell is unavailable for C-plane signalling;
- where the MS does not support advanced link roaming, locally disconnect any advanced links by issuing TL-RELEASE request primitive via the TLA-SAP to layer 2;
- receive a TL-SELECT indication, indicating the channel change, and respond with a TL-SELECT response;
- issue MLE-RESUME indication primitive to SNDCP to indicate that the radio link is once again available for C-plane signalling;
- if the selected cell has a subscriber class mismatch (see clause 18.3.5.1.4), inform CMCE and SNDCP that there is no subscriber class match on the selected cell by sending MLE-INFO indication primitives.

The MAC shall automatically follow the channel allocation in the MAC header. The MAC indicates the channel change using TL-SELECT indication primitive to which the MLE shall respond with TL-SELECT response primitive containing a parameter to inform the MAC of the main carrier frequency on the new cell (see clause 20.3.5.4.8). On receiving TL-SELECT indication primitive indicating that the channel change has been completed by the MAC, the MLE shall send indication to SNDCP to indicate that the radio link is once again available for C-plane signalling. The MS shall continue the call on the new cell assuming the same U-plane/C-plane mode and transmit permission as it had on the old cell unless it has been directed to the MCCH or MCCH-Q on the new cell (i.e. the MS shall not assume that U-plane mode continues on MCCH or MCCH-Q);

**NOTE 12:** In this case, there is no need for the MS to send call restoration signalling on the new cell. If the SwMI directs the MS to the MCCH or MCCH-Q, the SwMI should then later complete the call restoration by directing the MS to a traffic channel.

SNDCP may re-establish packet data communications as described in clause 28.3.4.2 of the present document (unless there is a subscriber class mismatch on the new cell) by re-establishing advanced links on the new cell. Where the MS supports advanced link roaming, SNDCP may attempt to reconnect the advanced links as described in clause 28.3.4.4 of the present document unless there is a subscriber class mismatch on the new cell.

See also ETSI EN 300 392-7 [8], clauses 6.6.2.5 and 6.6.2.6.

### 18.3.4.7.6 Unsuccessful type 1/2 cell reselection

If, while waiting for a D-NEW-CELL PDU from the SwMI, current channel radio link failure occur or timer T370 expires, the MS shall abandon the announcement signalling and shall immediately initiate the unannounced cell reselection procedure described in clause 18.3.4.7.3.

Following the initial "No channel change" D-NEW-CELL PDU, the SwMI may continue to refresh timer T370 by sending further "No channel change" D-NEW-CELL PDUs. However, it is recommended that the total amount of time the SwMI keeps the MS waiting for a D-NEW-CELL PDU with "channel command valid" information element set to "Change channel immediately" or "Follow MAC channel change" is less than the duration of timer T351 (the registration response time) - refer to clause 16.11.1.1. When the timer T351 or timer T354 expires the MS shall abandon the announcement signalling and shall immediately initiate the unannounced cell reselection described in clause 18.3.4.7.3.

NOTE 1: Timer T354 would not normally be running during a type 1/2 cell reselection. However there may be exception conditions that result in T354 replacing T351 (refer to ETSI EN 300 392-7 [8]).

If the SwMI does not accept the cell reselection request (i.e. U-PREPARE or U-PREPARE-DA PDU) it shall respond to the MS with a D-PREPARE FAIL PDU. The "fail cause" information element of the D-PREPARE FAIL PDU may contain any of the values specified in clause 18.5.7, "Fail cause".

If forward registration was attempted, the D-PREPARE FAIL PDU shall carry an MM PDU rejecting registration on the new cell:

- If the "fail cause" information element of the D-PREPARE-FAIL PDU contains the value "Temporary break in service", "Cell reselection type not supported" or "Restoration cannot be done on cell", the "Reject cause" information element of the D-LOCATION UPDATE REJECT PDU shall have value "Forward registration failure".
- If the "fail cause" information element of the D-PREPARE-FAIL PDU contains the value "MS not allowed on cell" then the "reject cause" information element of the D-LOCATION UPDATE REJECT PDU shall have any value other than "Forward Registration failure".

The MM SDU shall be passed to MM using an MLE-PREPARE confirm primitive. MLE-UPDATE request primitive shall then inform MLE that the cell reselection was not successful.

If the MS-MLE receives a D-PREPARE-FAIL PDU with the fail cause value "MS not allowed on cell", "Restoration cannot be done on cell" or "Temporary break in service" from the SwMI, the MS-MLE may attempt announced cell reselection to another neighbour cell in the ranking list which meets one of the cell reselection criteria described in clause 18.3.4.7.0.

If the fail cause is "MS not allowed on cell":

- If forward registration was not attempted, or the reject cause in the MLE-UPDATE request primitive indicates "cell rejection" or "cell type rejection" (refer to clause 16.10.42), MM shall stay registered on the current serving cell. MLE shall remove the rejecting cell from the ranking list; if, following this action, the ranking list still contains other cells, MLE may attempt to select another cell from the list. The rejecting cell shall not be included in the ranking list again until one of the following events occurs:
  - an attempted reselection to another cell on the same SwMI or to a different SwMI; or
  - the MS is next powered on; or
  - the MS goes to and returns from direct mode; or
  - (only in the case of a "cell type rejection") MLE receives a primitive from MM indicating that the rejecting cell type is a preferred cell type.

NOTE 2: MM may advise MLE that a rejecting cell type is not a preferred cell type in the MLE-UPDATE request primitive that informs MLE of a cell type rejection. Following successful reselection to different cell of the rejecting cell type, MM may advise MLE that the rejecting cell type is once more a preferred cell type (see clause 16.4.12).

- If forward registration was attempted, and the reject cause in the MLE-UPDATE request primitive indicates "LA rejection" (refer to clause 16.10.42), the MLE shall remove all cells in the LA with this MNC/MCC from the ranking list. The MM shall stay registered on the current serving cell. The MLE may attempt to select another cell from the ranking list and re-apply cell reselection procedures. In all registration cases, cells with the rejecting LA may be included in the ranking list again when one of the following conditions apply:
  - after a successful location update to a cell in a different LA;
  - the MS is next powered on;
  - the MS goes to and returns from direct mode.

NOTE 3: Cells with the rejecting LA may also be included in the ranking list again after a suitable time or when the LA becomes available through the use of a "denied LA list". An MS may manage such a list, for example, to avoid oscillating between two rejecting cells.

- If forward registration was attempted, and the reject cause in the MLE-UPDATE request primitive indicates "system rejection" (refer to clause 16.10.42), the MLE shall remove all cells, with the rejecting MNC/MCC, from the ranking list. The MS remains registered on the current serving cell. The MLE may attempt to select another cell from the ranking list and re-apply cell reselection procedures. In all registration cases, cells with the rejecting MNC/MCC may be included in the ranking list again after an attempted reselection to a cell with a different MNC/MCC or when the MS is next powered on or when the MS goes to and returns from direct mode.

If the fail cause is "Restoration cannot be done on cell" (i.e. cell reselection has failed for call-related reasons), either:

- MM shall stay registered on the current serving cell and, if the rejecting cell is not the only cell in the ranking list, MLE may attempt to select another cell from the list and re-apply cell reselection procedures. MLE shall not remove the rejecting cell from the ranking list but if the rejecting cell is chosen as the preferred neighbour cell again during this cell reselection procedure, announced or unannounced cell reselection should not be attempted to that cell; or
- MLE may, if the rejecting cell is the only cell in the ranking list, force the call associated with the cell reselection to be dropped and then select the rejecting cell using the undeclared cell reselection procedures defined in clause 18.3.4.7.2.

NOTE 4: If the call is dropped, the MS should send a U-DISCONNECT PDU on the old cell in case the MS is the call owner of a group call or a party in an individual call.

If the fail cause is "Temporary break in service", (i.e. cell reselection has failed for network related reasons e.g. there are no free traffic channels on the new cell) either:

- MM shall stay registered on the current serving cell and, if the rejecting cell is not the only cell in the ranking list, MLE may attempt to select another cell from the list and re-apply cell reselection procedures. MLE shall not remove the rejecting cell from the ranking list but if the rejecting cell is chosen as the preferred neighbour cell again during this cell reselection procedure, announced cell reselection type 1/2 should not be attempted to that cell; or
- MLE may, if the rejecting cell is the only cell in the ranking list, attempt announced type 3 or unannounced cell reselection to the rejecting cell using the procedures defined in clauses 18.3.4.7.4 or 18.3.4.7.3.

If the MS-MLE receives a D-PREPARE-FAIL PDU with the fail cause value "Cell reselection type not supported", (i.e. forward registration has failed for network related reasons), either:

- MLE shall attempt unannounced cell reselection to the rejected cell using the procedure defined in clause 18.3.4.7.3; or
- MM shall stay registered on the current serving cell and MLE may attempt to select another cell from the ranking list and re-apply cell reselection procedures. MLE shall not remove the rejected cell from the ranking list but if the rejected cell is chosen as the preferred neighbour cell again during this cell reselection procedure, MLE should attempt neither announced cell reselection type 1/2 nor announced cell reselection type 3 to that cell.

NOTE 5: In the case of the MS attempting an unannounced cell reselection to the rejected cell, the U-PREPARE or U-PREPARE-DA PDU sent to the SwMI during the MS's failed announced type 1/2 cell reselection request may be used by the SwMI in restoring the CMCE and SNDCP connections on the new cell.

NOTE 6: If, in exceptional circumstances, a temporary failure occurs, the SwMI may reject a valid type 1/2 cell reselection request with fail cause "cell reselection type not supported" (see clauses 18.4.1.4.3 and 18.5.7).

All other combinations of the D-NEW-CELL/D-PREPARE-FAIL PDU and MM registration PDUs shall not be sent by the SwMI during announced type 1/2 cell reselection.

### 18.3.4.8 Change of broadcast parameters by the SwMI

Changes in broadcast parameters by the SwMI affect the behaviour of the MS. The broadcast parameters that affect MLE and the other layer 3 entities are obtained from the SYNC, SYNC-DA, SYSINFO, SYSINFO-DA and SYSINFO-Q PDUs. The parameters fall into two categories:

- information about the general services that are supported by the SwMI on a particular cell e.g. BS service details;
- information concerning the security services that are supported by the SwMI on a particular cell e.g. security information in extended services broadcast.

The behaviour of the MS is dependent upon the broadcast parameter that has changed. MLE shall determine if the parameter(s) that has changed requires the MS to re-register, whereon MLE shall issue an MLE-LINK indication primitive to MM.

If the status of the cell changes from "System wide services temporarily not supported" to "Normal mode" (system wide services supported) and the MS is temporarily registered with the cell then the MLE shall indicate a need for periodic registration to MM.

The behaviour of the MS when there is a change in the security parameters is defined in ETSI EN 300 392-7 [8].

The behaviour of a DA MS when there is a change in the cell identifier of its serving cell is defined in clause 18.3.6.6.

In addition to the above, MLE shall inform MM, CMCE and SNDCP of the change in broadcast parameter(s) via a MLE-INFO indication primitive.

### 18.3.4.9 Assigned channel replacement on the serving cell

#### 18.3.4.9.0 General

This clause describes when and how an MS may request the SwMI to replace an assigned channel on the serving cell. Clauses 18.3.4.9 to 18.3.4.9.10 apply only to MSs which support the use of non-conforming channels.

Clause 18.3.4.9.11 applies to MSs which support the use of non-conforming channels and also applies to MSs which support data priority.

#### 18.3.4.9.1 Types of assigned channels

##### 18.3.4.9.1.1 General description of types of assigned channels

The assigned channel replacement request procedure allows the MS to request replacement of an assigned channel by a channel offering greater packet data throughput (e.g. at short range) or greater reliability (e.g. at long range). It also enables the MS to request a change of channel in cells using irregular channels (e.g. a change of sector in the case of a cell using sectored channels).

NOTE 1: Also, when an MS is on an assigned channel, the SwMI may choose to move the MS to a different channel at any time (for example, from one QAM channel to another QAM channel with a different bandwidth) - based on its observations of the performance of the current channel and the MS's capabilities.

A SwMI may offer the following types of assigned channels:

- A "conforming channel" has the same azimuthal radiation pattern as the main carrier, is radiated from the same site as the main carrier and has the same range (measured by the C1 path loss parameter) as the main carrier. It is a special case of a concentric channel. A channel which is not a conforming channel is called a non-conforming channel.
- A "concentric channel" has the same azimuthal radiation pattern as the main carrier and is radiated from the same site. It may use a different modulation mode, RF bandwidth and RF power to the main carrier and may have a higher or lower range and coverage area than the main carrier (i.e. it may be a non-conforming channel). Where the SwMI offers multiple concentric channels with different RF characteristics, a concentric channel offering a higher bandwidth will generally have a shorter range.
- A "channel class" is defined as a set of values indicating the general RF characteristics of a concentric channel or fully super-sectored channel (see clause 18.5.5b). A cell may offer more than one channel belonging to the same channel class. The MS predicts the performance of a channel class from measurements on a current channel (see clause 18.3.4.9.2) or by monitoring the main carrier (see clause 18.3.4.9.3) and advises the SwMI of the channel classes which it can currently use (see clauses 18.3.4.9.10 and 18.3.4.9.11).
- A "sectored channel" has an azimuthal extent that is smaller than, and contained entirely within, the azimuthal extent of the main carrier, and is radiated from the same site as the main carrier. It is a non-conforming channel and is not a concentric channel. The MS cannot predict the performance of a sectored channel by measurements on any other channel. The MS discovers which sectored channels it can use by monitoring each sectored channel (see clause 18.3.4.9.6) and advises the SwMI of the sectored channels which it can currently use (see clauses 18.3.4.9.10 and 18.3.4.9.11).
- A "super-sectored channel" has an azimuthal extent that exceeds the azimuthal extent of the main carrier in at least one azimuthal direction, and is radiated from the same site as the main carrier; it is a non-conforming channel and is not a concentric or sectored channel. A super-sectored channel may be either a semi-super-sectored channel or a fully super-sectored channel:
  - A "semi-super-sectored channel" is radiated from the same site as the main carrier, and has an azimuthal extent that exceeds the azimuthal extent of the main carrier in one azimuthal direction and is less than the azimuthal extent of the main carrier in the other azimuthal direction. Since the azimuthal extent of a semi-super-sectored channel is less than the azimuthal extent of the main carrier in one azimuthal direction, the MS cannot predict the performance of a semi-super-sectored channel by measurements on any other channel. The MS discovers which semi-super-sectored channels it can use by monitoring each semi-super-sectored channel (see clause 18.3.4.9.6) and advises the SwMI of the semi-super-sectored channels which it can currently use (see clauses 18.3.4.9.10 and 18.3.4.9.11).
  - A "fully super-sectored channel" is radiated from the same site as the main carrier, and has an azimuthal extent that is greater than, and entirely contains, the azimuthal extent of the main carrier. The BS may choose whether to broadcast information about fully super-sectored channels individually or as a channel class. (Broadcast is not needed if the channel fully covers the area covered by the main carrier i.e. if the radial range of the channel is the same as, or larger than, the radial range of the main carrier; see note 4.)
- An "eccentric channel" is a channel that is not radiated from the same site as the main carrier; it is a non-conforming channel and is not a concentric, sectored or super-sectored channel. The MS cannot predict the performance of an eccentric channel by measurements on any other channel. The MS discovers which eccentric channels it can use by monitoring each eccentric channel (if the SwMI broadcasts information about the channel, for example, if the channel does not fully cover the area covered by the main carrier). The MS then advises the SwMI of the eccentric channels which it can currently use. The present document supports up to a maximum separation of 4 km between the eccentric channel's transmitter site and the main carrier's transmitter site; see clauses 7.7 and 7.8.

NOTE 2: On a CA cell, a  $\pi/4$ -DQPSK channel is normally a conforming channel.

NOTE 3: The present document does not support use of channels for which there is a greater separation than 4 km between the assigned channel's transmitter site and the main carrier's transmitter site.

An "irregular channel" is a non-conforming channel that needs to be monitored by the MS in order for the MS to discover whether the channel would be usable as an assigned channel. Sectored channels and semi-super-sectored channels are irregular channels. An eccentric channel is an irregular channel (if it does not fully cover the area covered by the main carrier). The SwMI may broadcast information about a fully super-sectored channel as either a channel class or an irregular channel. (Broadcast is not needed if the channel fully covers the area covered by the main carrier.)

NOTE 4: The SwMI does not need to broadcast information about conforming channels or those non-conforming channels that fully cover the area covered by the main carrier, since the MS does not normally need to assess or monitor these channels or inform the SwMI that these channels would be usable as an assigned channel. Nevertheless, the SwMI may choose to broadcast information about channels that fully cover the area covered by the main carrier; for example, in some cases, this may aid MSs that are sending or receiving real-time class data. (An MS that is sending or receiving real-time class data might prefer a channel that is more reliable than conforming when it is near the edge of the service area of the cell.)

The MS-MLE discovers if a cell supports the use of non-conforming channels by reception of a D-NWRK-BROADCAST-EXTENSION or D-NWRK-BROADCAST-DA PDU indicating the presence of non-conforming channels on that cell. The MS-MLE is informed by layer 2 about whether an assigned channel is a conforming channel, a non-conforming concentric channel, a sectored channel, a super-sectored channel or an eccentric channel (or whether the MS does not understand the conforming channel status of the channel); this information is provided by the channel information parameter in the TL-SELECT indication primitive.

The MS-MLE discovers which channel classes and irregular channels are available by inspection of D-NWRK-BROADCAST EXTENSION and D-NWRK-BROADCAST-DA PDUs.

The characteristics of available channel classes are given in the "channel class", "neighbour cell channel class for CA" and "neighbour cell channel class for DA" information elements. A cell may possess more than one channel of a particular channel class, but the MS-MLE is only interested in the existence of a channel class, not in the individual channels of that channel class.

The characteristics of irregular channels are given in the "irregular channel detail", "neighbour cell irregular channel detail for CA" and "neighbour cell irregular channel detail for DA" information elements. Each irregular channel is described individually so that the MS has enough information to monitor it.

CA MSs discover if the following cells provide non-conforming channels as described below:

- serving cell:
  - reception in D-NWRK-BROADCAST EXTENSION PDUs of "channel class" and "irregular channel detail" information elements;
- CA neighbour cells:
  - reception in D-NWRK-BROADCAST EXTENSION PDUs of "neighbour cell channel class for CA" and "neighbour cell irregular channel detail for CA" information elements;
- DA neighbour cells:
  - reception in D-NWRK-BROADCAST-DA PDUs of "neighbour cell channel class for DA" and "neighbour cell irregular channel detail for DA" information elements;
  - reception of serving cell "channel class" and "irregular channel detail" information elements in D-NWRK-BROADCAST-DA PDUs that contain a "cell identifier DA" information element. If the "cell identifier DA" information element is not present in the PDU, CA MSs shall not use the serving cell "channel class" and "irregular channel detail" information elements. If the "cell identifier DA" information element is present in the PDU, CA MSs shall interpret serving cell "channel class" and "irregular channel detail" information elements as channels available on the cell identified by the "cell identifier DA" information element. (However, a CA MS cannot use the indicated DA cell unless it receives a "neighbour cell information for DA" information element about that cell in a D-NWRK-BROADCAST-DA PDU. The CA MS requires that information before it can scan or monitor the relevant cell.)

DA MSs discover if the following cells provide non-conforming channels as described below:

- serving cell:
  - reception in D-NWRK-BROADCAST-DA PDUs of serving cell "channel class" and "irregular channel detail" information elements (see note 5);
  - reception in D-NWRK-BROADCAST-DA PDUs of "neighbour cell channel class for DA" or "neighbour cell irregular channel detail for DA" information elements containing "cell identifier DA" information elements that match the DA MS's serving cell (see note 6);
- CA neighbour cells:
  - reception in D-NWRK-BROADCAST EXTENSION PDUs of "neighbour cell channel class for CA" and "neighbour cell irregular channel detail for CA" information elements;
  - reception in D-NWRK-BROADCAST EXTENSION PDUs of serving cell "channel class" and "irregular channel detail" information elements. These shall be interpreted by DA MSs as channel classes and channels available on the local CA cell identified by a D-NWRK-BROADCAST-DA PDU;
- DA neighbour cells:
  - reception in D-NWRK-BROADCAST-DA PDUs of "neighbour cell channel class for DA" and "neighbour cell irregular channel detail for DA" information elements.

NOTE 5: When serving cell non-conforming channel information is included in a D-NWRK-BROADCAST-DA PDU on a channel used by MSs from more than one DA cell, each DA MS assumes the information relates to its own serving cell. (The "cell identifier DA" information element is not included in D-NWRK-BROADCAST-DA PDUs sent on channels used by MSs from more than one DA cell.) The SwMI can use this to broadcast common non-conforming channel information to MSs from more than one DA cell; however, the main carriers of the affected DA cells all have to operate at the same BS transmit power if channel class information is to be shared in this way. Otherwise, the SwMI can send out the information separately for each DA cell in "neighbour cell channel class for DA" and "neighbour cell irregular channel detail for DA" information elements.

NOTE 6: When a DA MS receives a D-NWRK-BROADCAST-DA PDU containing a "cell identifier DA" information element, it interprets that as the identifier of its serving cell.

There is no requirement for the SwMI to advertise the existence of channel classes with the same or greater coverage area than the main carrier (including conforming channel classes) in the D-NWRK-BROADCAST EXTENSION or D-NWRK-BROADCAST-DA PDUs. The SwMI assigns the MS to channels in these channel classes without assistance from the MS. When the MS-MLE wishes to make an assigned channel replacement request, it may assume that a conforming channel class is available.

There is also no requirement for the SwMI to advertise the existence of fully super-sectored and eccentric channels that fully cover the area covered by the main carrier in the D-NWRK-BROADCAST EXTENSION or D-NWRK-BROADCAST-DA PDUs. The SwMI may assign the MS to these channels without assistance from the MS.

NOTE 7: The SwMI does not need to broadcast information about conforming channels or those non-conforming channels that fully cover the area covered by the main carrier. Nevertheless, the SwMI may choose to broadcast information about non-conforming channels that fully cover the area covered by the main carrier; for example, in some cases, this may aid MSs that are sending or receiving real-time class data.

#### 18.3.4.9.1.2 Umbrella channels

An umbrella channel is an assignable channel that fully covers the areas of multiple cells:

- A concentric channel that covers the radial extent of all its associated cells may be used as a umbrella channel.
- A fully super-sectored channel that also covers the radial extent of all its associated cells may be used as a umbrella channel.
- An eccentric channel that fully covers the areas of all its associated cells may be used as an umbrella channel. (Conversely an eccentric channel could cover a smaller area than its associated cell, for example, with several short-range eccentric channels between them covering the area covered by the associated cell.)

A case of usage of a fully super-sectored channel might be for a channel that is radiated from the same site as the main carrier and exceeds the azimuthal extent of the main carrier in both azimuthal directions and also has at least the same range as the main carrier, so fully encompasses the coverage of the main carrier. This could allow an assigned channel to fully cover the areas of multiple cells, as an umbrella channel, allowing a multi-cell group call to use a single assigned channel throughout the cells covered by the channel. For example, if three co-sited DA cells each have an azimuthal extent of 120° covering different azimuths and are co-sited with a CA cell with 360° azimuthal extent, a single  $\pi/4$ -DQPSK assigned channel with 360° azimuthal extent could be used for a group speech call involving MSs from all four cells. (In this example, the  $\pi/4$ -DQPSK assigned channel is concentric with the CA main carrier, so the CA MSs joining the group call would receive a channel allocation indicating that the channel is a conforming or non-conforming concentric channel.)

#### 18.3.4.9.2 Serving cell channel class assessment

Serving cell channel class assessment is the procedure whereby the MS assesses the quality of channel classes on the serving cell from measurements made on the current channel or channels. The current channel(s) may be either conforming channel(s) or non-conforming concentric or sectored channel(s) (see note).

**NOTE:** If the current channel is a super-sectored or eccentric channel, or if the MS did not understand the conforming channel status for the current channel, the MS cannot assess the quality of channel classes on the serving cell based on measurements made on the current channel. Therefore, if the MS is currently receiving only super-sectored and/or eccentric channel(s) and/or channel(s) for which it does not understand the conforming channel status, and it wishes to assess the quality of channel classes, it needs to perform main carrier monitoring with assessment of channel classes (see clause 18.3.4.9.3).

Serving cell channel class assessment is not required for conforming channel classes or channel classes with greater coverage area (at the lowest modulation level) than the main carrier.

The criteria for starting and using serving cell channel class assessment are defined in clause 18.3.4.9.8.

If the criteria are fulfilled, the serving cell channel class assessment is started by issuing a TL-ASSESSMENT-LIST request primitive through the TLC-SAP informing layer 2 of the channel classes to be assessed. The parameters passed down with the TL-ASSESSMENT-LIST request primitive, for each channel class to be assessed, shall be a channel class label and the characteristics of the channel class that is to be assessed (obtained from the "channel class" information element in the D-NWRK-BROADCAST EXTENSION or D-NWRK-BROADCAST-DA PDU). The lower layers return a TL-ASSESSMENT indication primitive containing the C4 path loss parameter for each channel class which has been assessed. C4 is defined in clause 23.

Serving cell channel class assessment shall have been performed during the last 60 s for a measurement to be considered valid.

If it is required to stop the serving cell channel class assessment process, the MLE shall issue a TL-ASSESSMENT-LIST request primitive which does not contain a serving cell channel class as a parameter.

#### 18.3.4.9.3 Main carrier monitoring with assessment of channel classes

Main carrier monitoring with assessment of channel classes is the procedure which allows the MS to assess the quality of channel classes on the serving cell from monitoring measurements on the serving cell's main carrier.

The criteria for starting and using main carrier monitoring with assessment of channel classes are defined in clause 18.3.4.9.8.

If the criteria are fulfilled, the main carrier monitoring with assessment of channel classes is started by issuing a TL-MONITOR-LIST request primitive through the TLC-SAP informing layer 2 of the channel to be monitored (the main carrier) and the channel classes to be assessed. The parameters passed down with the TL-MONITOR-LIST request primitive shall include the channel number of the main carrier and, for each channel class to be assessed, a channel class label and the characteristics of the channel class that is to be assessed (obtained from the "channel class" information element in the D-NWRK-BROADCAST EXTENSION or D-NWRK-BROADCAST-DA PDU). The lower layers return a TL-MONITOR indication primitive containing the C2 path loss for the main carrier and the C5 path loss parameter for each channel class which has been assessed. C5 is defined in clause 23.

Main carrier monitoring with assessment of channel classes shall have been performed during the last 60 s for a measurement to be considered valid.

If it is required to stop assessing a particular channel class within the main carrier monitoring with assessment of channel classes process, the MS-MLE shall issue a TL-MONITOR-LIST request primitive which does not contain the channel class for which assessment is to be stopped. If it is also required to stop monitoring the main carrier, the MS-MLE shall issue a TL-MONITOR-LIST request primitive which does not contain the channel number of the main carrier.

#### 18.3.4.9.4 Neighbour cell channel class assessment

Neighbour cell channel class assessment is the procedure whereby the MS assesses the quality of channel classes on a neighbour cell.

Neighbour cell channel class assessment is not required for conforming channel classes or channel classes with greater coverage area than the main carrier of that neighbour cell.

The criteria for starting and using neighbour cell channel class assessment are defined in clause 18.3.4.9.8.

If the criteria are fulfilled, the neighbour cell channel class assessment is started by issuing a TL-MONITOR-LIST request primitive or a TL-SCAN request primitive through the TLC-SAP informing layer 2 of the main carrier of the neighbour cell to be monitored or scanned and the channel classes to be assessed.

The parameters passed down with the TL-MONITOR-LIST request primitive shall include the channel number and the RF characteristics of the neighbour cell main carrier to be monitored and, for each channel class to be assessed, a channel class label and the characteristics of the channel class that is to be assessed. The lower layers return a TL-MONITOR indication primitive or a TL-SCAN-REPORT indication primitive containing the C5 path loss parameter for each channel class. C5 is defined in clause 23. The parameters passed down with the TL-SCAN request primitive shall include the channel number and the RF characteristics of the neighbour cell main carrier to be scanned and, for each channel class to be assessed, a channel class label and the characteristics of the channel class to be assessed. The lower layers return a TL-SCAN confirm primitive containing the C5 path loss parameter for each channel class.

The channel number and RF characteristics of a CA neighbour cell's main carrier may be obtained from D-NWRK-BROADCAST PDUs and (for the local CA cell) D-NWRK-BROADCAST-DA PDUs. The channel class labels and characteristics of the channel classes may be obtained from D-NWRK-BROADCAST EXTENSION PDUs.

The channel number and RF characteristics of a DA neighbour cell's main carrier, the channel class labels and the characteristics of the channel classes may be obtained from D-NWRK-BROADCAST-DA PDUs.

Channel class assessment shall have been performed during the last 60 s for a measurement to be considered valid.

If it is required to stop assessing a particular channel class within the neighbour cell channel class monitoring with assessment of channel classes process, the MS-MLE shall issue a TL-MONITOR-LIST request primitive which does not contain the channel class for which assessment is to be stopped. If it is also required to stop monitoring the neighbour cell main carrier, the MS-MLE shall issue a TL-MONITOR-LIST request primitive which does not contain the channel number of the neighbour cell main carrier.

**NOTE:** The MS-MLE may decide to use the TL-SCAN request primitive instead of the TL-MONITOR-LIST request primitive to initiate channel class assessment on a neighbour cell if the MS-MLE needs to scan the neighbour cell main carrier for another reason.

#### 18.3.4.9.5 Ranking of channel classes

Ranking of channel classes shall be based upon the received path loss parameters C1, C4 and C5 for the channel classes.

The ranking should produce a ranked channel class list. The list should always include a conforming channel class ranked by the path loss parameter C1 or C3 derived from serving cell surveillance measurements (refer to clause 18.3.4.3).

This ranked list may be used for making the decision of whether and when to change channel or cell, as described in clause 18.3.4.9.5.

#### 18.3.4.9.6 Irregular channel monitoring

Irregular channel monitoring allows the MS to measure the path loss parameters C2 of irregular channels using information about the irregular channels broadcast by the serving cell. The MS is required to directly measure the received power of a monitored irregular channel. The irregular channels may be on the serving cell or on a neighbour cell.

In order to be able to monitor irregular channels, the MS-MLE shall have received a D-NWRK-BROADCAST EXTENSION or D-NWRK-BROADCAST-DA PDU containing a list of the irregular channels. The procedures concerning network broadcast PDUs are dealt with in clause 18.3.6. The criteria for starting and using irregular channel monitoring are defined in clause 18.3.4.9.8. If the criteria are fulfilled, the irregular channel monitoring is started by issuing a TL-MONITOR-LIST request primitive through the TLC-SAP. The TL-MONITOR-LIST request primitive informs layer 2 of the irregular channels to be monitored. The parameters passed down with the TL-MONITOR-LIST request primitive shall include the channel number and the RF characteristics of each channel to be monitored. The MS-MLE shall know locally which channels the MS is capable of monitoring and shall not instruct the lower layers to monitor any channel that the MS-MLE knows to be outside the capabilities of the equipment. For each channel the lower layers return a TL-MONITOR indication containing the C2 path loss parameter. C2 is defined in clause 23.

The channel numbers and RF characteristics of irregular channels on CA cells may be obtained from D-NWRK-BROADCAST EXTENSION PDUs. The channel numbers and RF characteristics of irregular channels on DA cells may be obtained from D-NWRK-BROADCAST-DA PDUs (see clause 18.3.4.9.1).

Monitoring is a background procedure and is defined in clause 23. Irregular channel monitoring shall have been performed during the last 60 s for an irregular channel monitoring measurement to be considered valid.

If it is required to stop the irregular channel monitoring process, the MLE shall issue a TL-MONITOR-LIST which does not contain an irregular channel as a parameter.

#### 18.3.4.9.7 Ranking of monitored irregular channels

Ranking of monitored irregular channels shall be based upon the received path loss parameters C2 from the layer 2 monitoring process, issued in a TL-MONITOR indication primitive.

The ranking should produce a ranked irregular channel list. This ranked channel list may be used for making the decision of whether and when to change irregular channel (see clause 18.3.4.9.9.5) or cell.

#### 18.3.4.9.8 Criterion for starting and using the channel class assessment and channel monitoring processes

This clause applies only to MSs which support the use of non-conforming channels.

The MS determines whether non-conforming channels exist on a CA cell from inspection of D-NWRK-BROADCAST EXTENSION and (for the local CA cell) D-NWRK-BROADCAST-DA PDUs. The MS determines whether non-conforming channels exist on a DA cell from inspection of D-NWRK-BROADCAST-DA PDUs (see clause 18.3.4.9.1).

The MS should assess the non-conforming channel classes (see clause 18.3.4.9.2) and monitor the irregular channels (see clause 18.3.4.9.6) on the serving cell if the MS SMDCP has requested the MS-MLE to prepare for transmitting or receiving packet data (as advised by a MLE-CONFIGURE request primitive from SMDCP containing an SMDCP status parameter set to "standing-by").

When the MS SMDCP advises the MLE that it is actively transmitting or receiving packet data (SMDCP status parameter set to "ready") the channel class assessment and irregular channel monitoring processes for channels on the serving cell should either be permanently enabled or should be enabled when some criterion is met, e.g. when the assigned channel path loss value C1 falls below a pre-determined threshold, or when a TL-REPORT indication primitive from layer 2 indicates that channel replacement is advisable or channel replacement may be beneficial.

When the MS-MLE needs to assess the quality of available channel classes, the MS-MLE may request layer 2 to perform main carrier monitoring with assessment of channel classes (see clause 18.3.4.9.3) in addition to, or instead of, serving cell channel class assessment.

NOTE 1: When the current channel is a sectored channel (indicated in the channel information parameter of the TL-SELECT indication primitive), main carrier monitoring with assessment of channel classes results (C5) are more reliable than channel class assessment results (C4). For example, C4 may be lower than C5 (i.e. the C4 path loss may be overestimated) when the MS is near the azimuthal boundary of a sectored channel. If the MS-MLE relies on the C4 path loss parameter near an azimuthal boundary, the MS-MLE could fail to detect channel classes that are radio usable. The MS-MLE may periodically initiate main carrier monitoring with assessment and compare the C4 and C5 path loss parameters to decide if it is necessary to continue to use main carrier monitoring with assessment.

NOTE 2: The MS is not precluded from using main carrier monitoring with channel class assessment on a concentric channel.

NOTE 3: If the current channel is a super-sectored or eccentric channel, or if the MS did not understand the conforming channel status, the MS cannot perform serving cell channel class assessment. Therefore, if the MS is currently receiving only super-sectored and/or eccentric channel(s) and/or channel(s) for which it does not understand the conforming channel status, and it wishes to assess the quality of channel classes, it needs to perform main carrier monitoring with assessment of channel classes.

It is assumed that the channel class assessment and irregular channel monitoring processes may be disabled when the quality of the currently-selected channel rises above the threshold plus some hysteresis factor, and a TL-REPORT indication primitive from layer 2 indicates that the current channel performance is acceptable. However, the MS may choose to continue channel class assessment or irregular channel monitoring if the MS requires a better service (see clause 18.3.4.9.9.5) than that provided by the current assigned channel.

To assist a cell reselection decision (clause 18.3.4.5.7) and to speed selection of a suitable packet data channel after a cell reselection, the MS may decide to assess any channel classes on neighbour cells and monitor any irregular channels on neighbour cells if the MS has received a D-NWRK-BROADCASTTEXTENSION or D-NWRK-BROADCAST-DA PDU indicating their existence and the SNDPCP status is "ready" or "standing-by" and the quality of the main carrier (as indicated by C1, C2 or C3 for the main carrier) falls below a pre-determined threshold.

MLE should terminate channel class assessment, main carrier monitoring with channel assessment, and irregular channel monitoring when SNDPCP advises MLE that the SNDPCP status is "idle".

It is a designer choice for the MS to assess channel classes and monitor irregular channels on the serving cell and neighbour cells at other times.

Where the channel class assessment and irregular channel monitoring processes are not permanently enabled, but started when a threshold value is crossed on a current channel, the threshold value should be chosen to be a value greater than the threshold parameters, FAST\_CHANNEL\_CHANGE\_THRESHOLD, SLOW\_CHANNEL\_CHANGE\_THRESHOLD, to allow the MS enough time to assess the channel classes and monitor the irregular channels and propose a new channel class or irregular channel prior to the complete loss of service from the current channel.

The exact method for the selection of the thresholds and hysteresis values for starting and stopping assessment and monitoring is outside the scope of the present document.

### 18.3.4.9.9 Criteria used for requesting an assigned channel replacement

#### 18.3.4.9.9.0 General

The following clauses, and also clause 18.3.4.5.3, define the criteria which shall be used to initiate the assigned channel replacement procedure described in clause 18.3.4.9.10.

#### 18.3.4.9.9.1 Data class offset

The DATA\_CLASS\_OFFSET is used to adjust the decision threshold for using a channel to take account of the differing reliability requirements of the various data classes being transmitted and received by SNDPCP. The value of DATA\_CLASS\_OFFSET depends on the data class most recently advised to the MS-MLE by SNDPCP in the data class information parameter of the MLE-CONFIGURE request primitive. The data class information parameter in the MLE-CONFIGURE primitive indicates the most demanding data class currently in active use by the MS. The value of the DATA\_CLASS\_OFFSET for each data class is a MS designer choice, and may be zero, but shall not be negative.

NOTE: The real-time data class is more demanding than the telemetry data class, and the telemetry data class is more demanding than the background data class.

#### 18.3.4.9.9.2 Criterion for radio relinquishable assigned channel

An assigned channel becomes radio relinquishable when the quality of the downlink radio connection falls below a certain level and there is another channel class or irregular channel in the same cell which has a downlink radio connection of sufficient quality. The assigned channel may also be regarded as radio relinquishable when the MS-MAC indicates that channel replacement is advisable. The following conditions shall be met in order to declare the assigned channel radio relinquishable:

- the MS has been on the current assigned channel for at least time T372; and
- either:
  - a) the assigned channel path loss parameter C1 shall, for period T374, fall below (FAST\_CHANNEL\_CHANGE\_THRESHOLD + DATA\_CLASS\_OFFSET) and the path loss parameter C2, C4 or C5 of at least one of the sectored channels or channel classes in the ranking lists for the serving cell shall exceed by FAST\_CHANNEL\_CHANGE\_HYSTERESIS the path loss parameter C1 of the assigned channel for period T374; or
  - b) the MS-MLE is informed by a TL-REPORT indication primitive that channel replacement is advisable (see note 2).

The MS-MLE shall check the criterion for channel relinquishment as often as one channel class is assessed or one irregular channel is monitored and on receipt of a TL-REPORT indication primitive indicating that channel replacement is advisable or may be beneficial.

NOTE 1: The values of FAST\_CHANNEL\_CHANGE\_THRESHOLD and FAST\_CHANNEL\_CHANGE\_HYSTERESIS may be set equal or relative to cell reselect parameters FAST\_RESELECT\_THRESHOLD and FAST\_RESELECT\_HYSTERESIS (see clause 18.5.4).

NOTE 2: In case b), the MS-MLE may regard the assigned channel as radio relinquishable even if none of the irregular channels or channel classes in the ranking lists for the serving cell exceed by FAST\_CHANNEL\_CHANGE\_HYSTERESIS the path loss parameter C1 of the assigned channel. For example, this scenario could apply if the SwMI does not broadcast information about channels that fully cover the area covered by the main carrier and the MS is sending or receiving real-time class data and would like a more reliable channel when it is near the edge of the service area of the cell.

#### 18.3.4.9.9.3 Criterion for radio improvable assigned channel

An assigned channel becomes radio improvable when the quality of another channel downlink radio connection on the serving cell exceeds that of the assigned channel by a certain amount. The following conditions shall be met in order to declare the assigned channel radio improvable:

- the MS has been on the current assigned channel for at least time T372; and
- the assigned channel path loss parameter C1 shall, for period T374, fall below (SLOW\_CHANNEL\_CHANGE\_THRESHOLD + DATA\_CLASS\_OFFSET) and the path loss parameter C2, C4 or C5 of at least one of the irregular channels or channel classes in the ranking list for the serving cell shall exceed by SLOW\_CHANNEL\_CHANGE\_HYSTERESIS the path loss parameter C1 of the assigned channel for period T374.

The MS-MLE shall check the criterion for improving the assigned channel or channels as often as one channel class is assessed or one irregular channel is monitored and on receipt of a TL-REPORT indication primitive indicating that channel replacement is advisable or may be beneficial.

NOTE: The values of SLOW\_CHANNEL\_CHANGE\_THRESHOLD and SLOW\_CHANNEL\_CHANGE\_HYSTERESIS may be set equal or relative to cell reselect parameters SLOW\_RESELECT\_THRESHOLD and SLOW\_RESELECT\_HYSTERESIS (see clause 18.5.4).

#### 18.3.4.9.9.4 Criterion for radio usable channel or channel class

An irregular channel or a channel class becomes radio usable when it has a downlink radio connection of sufficient quality. The following conditions shall be met in order to declare an irregular channel or a channel class radio usable:

- the MS has been on the current assigned channel for at least time T372; and
- the irregular channel or channel class shall, for period T374, have a path loss parameter, C2, C4 or C5, which is greater than (FAST\_CHANNEL\_CHANGE\_THRESHOLD + DATA\_CLASS\_OFFSET + FAST\_CHANNEL\_CHANGE\_HYSTERESIS).

The MS-MLE shall check the criterion for a channel class being usable each time the channel class is assessed and shall check the criterion for an irregular channel being usable each time the irregular channel is monitored.

#### 18.3.4.9.9.5 Criteria for initiating the assigned channel replacement procedures

Assigned channel replacement may be requested by the MS-MLE if an assigned channel is declared radio relinquishable (as defined in clause 18.3.4.9.9.2) and the SNDCP status is "ready" (as advised by the SNDCP status parameter in an MLE-CONFIGURE request primitive).

Assigned channel replacement may be requested by the MS-MLE if an assigned channel is declared radio improvable (as defined in clause 18.3.4.9.9.3), the SNDCP status is "ready" (as advised by the SNDCP status parameter in an MLE-CONFIGURE request primitive) and the service criteria as defined below are the same on both the assigned channel and another radio usable channel or channel class.

If the service provided by other channels on the present cell is lower than that provided by an assigned channel, the assigned channel replacement request may be postponed until the assigned channel is declared radio relinquishable (as defined in clause 18.3.4.9.9.2).

If the service provided by another irregular channel or channel class is higher than that provided by an assigned channel, then a channel replacement may be requested by the MS as soon as the other irregular channel or channel class is declared radio usable (as defined in clause 18.3.4.9.9.4).

Assigned channel replacement shall not be requested by the MS-MLE if the SNDCP status is not "ready".

The following service criteria may be used to compare the service provided by an assigned channel and another channel:

- bandwidth;
- modulation mode.

The bandwidth and modulation mode of available channel classes and individual irregular channels which do not cover all the area covered by the main carrier are broadcast in the D-NWRK-BROADCAST EXTENSION and D-NWRK-BROADCAST-DA PDUs.

Using the above criteria, an MS may decide whether another irregular channel or channel class on the present cell can be considered to offer better service than an assigned channel. The following conditions shall cause the MS to rate another irregular channel or channel class to have better service than an assigned channel:

- the other irregular channel or channel class has a higher bandwidth than the assigned channel, and the MS prefers that higher bandwidth;
- the other irregular channel or channel class uses the QAM modulation mode, the assigned channel uses the D8PSK or  $\pi/4$ -DQPSK modulation mode and the MS prefers the use of the QAM modulation mode;
- the other irregular channel or channel class uses the D8PSK modulation mode, the assigned channel uses the  $\pi/4$ -DQPSK modulation mode and the MS prefers the use of the D8PSK modulation mode;
- the other irregular channel or channel class uses the  $\pi/4$ -DQPSK modulation mode, the assigned channel uses the QAM modulation mode and the MS prefers the use of the  $\pi/4$ -DQPSK modulation mode.

The following conditions shall cause the MS to rate another channel to have lower service than an assigned channel:

- the other irregular channel or channel class has a lower bandwidth than the assigned channel, and the lower bandwidth is supported by the MS but the MS prefers not to use the lower bandwidth;
- the other irregular channel or channel class uses the  $\pi/4$ -DQPSK or the D8PSK (if supported by the MS) modulation mode, the assigned channel uses the QAM modulation mode and the MS prefers the use of the QAM modulation mode;
- the other irregular channel or channel class uses the  $\pi/4$ -DQPSK modulation mode, the assigned channel uses the D8PSK modulation mode and the MS prefers the use of the D8PSK modulation mode;
- the other irregular channel or channel class uses the QAM modulation mode, the assigned channel uses the D8PSK modulation mode and the MS prefers the use of the D8PSK or  $\pi/4$ -DQPSK modulation mode;
- the other irregular channel or channel class uses the QAM modulation mode, the assigned channel uses the  $\pi/4$ -DQPSK modulation mode and the MS prefers the use of the  $\pi/4$ -DQPSK modulation mode.

In these cases the MS may postpone requesting a channel replacement until the assigned channel becomes radio relinquishable as defined in clause 18.3.4.9.9.2.

If an irregular channel or channel class uses a modulation mode or bandwidth which is not supported by the MS, the MS shall rate that irregular channel or channel class as providing no service to the MS.

If the other channel is deemed to offer neither better service or lower service than an assigned channel, the service shall be deemed to equal and the MS shall initiate the assigned channel replacement procedures as soon as another irregular channel or channel class becomes radio improvable over the assigned channel as defined in clause 18.3.4.9.9.3.

#### 18.3.4.9.10 Assigned channel replacement request procedure

The assigned channel replacement procedure permits the MS to propose channel replacement by irregular channels and channel classes where it can reliably decode downlink data and where it has a high probability of uplink communication according to the criteria in clause 18.3.4.9.9.5.

An assigned channel replacement request may be made by the MS-MLE if one of the channel replacement criteria described in clause 18.3.4.9.9.5 is met, causing one or more irregular channels or channel classes to be selected by the MS-MLE. MS-MLE makes the request by sending a U-CHANNEL REQUEST PDU to the SwMI indicating a list of acceptable irregular channels and channel classes.

NOTE 1: If the MS requires replacement of the present channel but none of the channel classes or irregular channels broadcast by the SwMI are usable, the MS should send a U-CHANNEL REQUEST PDU with:

- a) the "channel class identifier" information element set to "conforming channel class", if the MS wishes to propose channel replacement by a conforming channel; or
- b) the "channel class identifier" information element set to "unspecified channel class", if the MS wishes to propose channel replacement by either a conforming channel or another channel that fully covers the area of the main carrier.

In case b), if the SwMI accepts the request, it should attempt to give the MS a channel with better coverage than the current channel. For example, if the current channel is a conforming channel, the SwMI should allocate a channel class with greater coverage than the main carrier or a fully super-sectored or eccentric channel that fully covers the area covered by the main carrier. This scenario could apply if the MS is sending or receiving real-time class data and would like a channel that is more reliable than conforming when it is near the edge of the service area of the cell.

The SwMI should respond to the request by sending the D-CHANNEL RESPONSE PDU, indicating acceptance or rejection of the request. If the response indicates that the request has been accepted, the D-CHANNEL RESPONSE PDU should be accompanied by a channel assignment which need not be to an irregular channel or channel class requested by the MS.

NOTE 2: For example, in some cases, it may be appropriate for the SwMI to allocate a channel whose existence has not been broadcast to MSs because the channel fully covers the area covered by the main carrier (i.e. a channel class with the same or greater coverage area than the main carrier or a fully super-sectored or eccentric channel that fully covers the area covered by the main carrier).

The following conditions determine when the MS-MLE may transmit a U-CHANNEL REQUEST PDU:

- the MS shall have been on the current assigned channel for time T372; and
- the time T373 shall have elapsed after transmission of a previous U-CHANNEL REQUEST PDU; and
- if a D-CHANNEL RESPONSE PDU received since the MS switched to the current channel contained the same value of "reason for the channel request" as that in the new U-CHANNEL REQUEST PDU, the MS-MLE shall not transmit the U-CHANNEL REQUEST PDU until the time "channel request retry delay" that was included in the D-CHANNEL RESPONSE PDU has elapsed since reception of that D-CHANNEL RESPONSE PDU.

NOTE 3: The MS is not required to remember old "channel request retry delay" values after the current channel has been replaced.

#### 18.3.4.9.11 Channel class and irregular channel advice procedure

This clause applies to MSs which support the use of non-conforming channels and also applies to MSs which support data priority.

When non-conforming channels exist on a cell, and the MS wishes to be able to use one (e.g. for the transmission or reception of packet data), it should advise the SwMI which channel classes or irregular channels the MS can currently use. The advice is provided to the SwMI in a U-CHANNEL CLASS ADVICE or U-IRREGULAR CHANNEL ADVICE PDU.

The SwMI should use the MS's advice on usable channel classes and irregular channels when assigning the MS to a channel. However, the channel assignment need not be to a channel class or irregular channel included in the MS's advice PDU. For example, in some cases, it may be appropriate for the BS to allocate a channel whose existence has not been broadcast to MSs because the channel fully covers the area covered by the main carrier.

The method by which the MS-MLE is either requested or required by SNDCCP to send a U-CHANNEL CLASS ADVICE or U-IRREGULAR CHANNEL ADVICE PDU with certain SNDCCP PDUs is described in clause 18.3.5.3.1 item c).

When the MS-MLE is requested by the MS SNDCCP to transmit a U-CHANNEL CLASS ADVICE PDU or U-IRREGULAR CHANNEL ADVICE PDU, the MS-MLE should examine its ranked channel class list and its ranked irregular channel list for channel classes and channels which are radio usable, and determine its preferred channel classes and its preferred irregular channels. Then:

- if the MS-MLE has not received an indication that the current cell supports non-conforming channels (see clause 18.3.4.9.1), or if no radio usable non-conforming channel class or irregular channel has been advertised by broadcast on the current cell (see clause 18.3.4.9.9.4), the MS-MLE shall transmit the SNDCCP PDU without an attached U-CHANNEL CLASS ADVICE or U-IRREGULAR CHANNEL ADVICE PDU; or
- if the MS-MLE has received an indication that the current cell supports non-conforming channels (see clause 18.3.4.9.1) and the MS-MLE wishes to use a non-conforming concentric channel (or fully super-sectored channel), the MS-MLE should transmit the SNDCCP PDU with a U-CHANNEL CLASS ADVICE PDU identifying at least the channel class that offers the best service of those channel classes that are currently radio usable (see clause 18.3.4.9.9.5 for the definition of service criteria); or
- if the MS-MLE has received an indication that the current cell supports non-conforming channels (see clause 18.3.4.9.1) and the MS-MLE wishes to use an irregular channel, the MS-MLE should transmit the SNDCCP PDU with a U-IRREGULAR CHANNEL ADVICE PDU indicating one or more radio usable channels which offer the best service of those irregular channels that are currently radio usable.

When the MS-MLE is required by SNDSCP to transmit a U-CHANNEL CLASS ADVICE PDU or U-IRREGULAR CHANNEL ADVICE PDU (this occurs when SNDSCP requires the MS-MLE to send the "data priority" information element), the MS-MLE should determine its preferred channel classes and its preferred irregular channels, if any exist. Then:

- if the MS-MLE has not received an indication that the current cell supports non-conforming channels (see clause 18.3.4.9.1), or if the MS does not support the use of non-conforming channels, the MS-MLE shall transmit the SNDSCP PDU with a U-CHANNEL CLASS ADVICE PDU and shall set the "channel class identifier" information element to "unspecified channel class"; or
- if the MS-MLE has received an indication that the current cell supports non-conforming channels (see clause 18.3.4.9.1), but no radio usable non-conforming channel class or irregular channel has been advertised by broadcast on the current cell (see clause 18.3.4.9.9.4), and the MS supports the use of non-conforming channels, the MS-MLE shall transmit the SNDSCP PDU with a U-CHANNEL CLASS ADVICE PDU and shall set the "channel class identifier" information element to "unspecified channel class" or "conforming channel class"; or
- if the MS-MLE has received an indication that the current cell supports non-conforming channels (see clause 18.3.4.9.1) on the current cell and the MS-MLE wishes to use a non-conforming concentric channel (or fully super-sectored channel), the MS-MLE shall transmit the SNDSCP PDU with a U-CHANNEL CLASS ADVICE PDU and should indicate at least the channel class that offers the best service of those channel classes that are currently radio usable (see clause 18.3.4.9.9.5 for the definition of service criteria); or
- if the MS-MLE has received an indication that the current cell supports non-conforming channels (see clause 18.3.4.9.1) and the MS-MLE wishes to use an irregular channel, the MS-MLE shall transmit the SNDSCP PDU with a U-IRREGULAR CHANNEL ADVICE PDU identifying at least the irregular channel that offers the best service of those irregular channels that are currently radio usable (see clause 18.3.4.9.9.5 for the definition of service criteria).

The U-CHANNEL CLASS ADVICE and U-IRREGULAR CHANNEL ADVICE PDUs shall be transmitted attached to an SNDSCP PDU using the method described in clause 18.3.5.3.1 item c).

## 18.3.5 Data transfer sub-entity

### 18.3.5.0 General

The services and primitives offered by the MLE are described in clause 17.

### 18.3.5.1 Address handling

#### 18.3.5.1.0 General

The MLE manages all of the subscriber addresses (i.e. ITSIs and GTSIs) plus the management identity (i.e. TMI). These addresses and identities are described in ETSI EN 300 392-1 [6], clause 7.

System subscriber Identities which are received or attached and detached by the MM entity should be transferred to MLE in an MLE-IDENTITIES request primitive. After being recorded locally and any lists amended, the list of currently valid short subscriber and management identities shall be transferred to the lower layers via the TLC-SAP in a TL-CONFIGURE request primitive as described in clause 18.3.5.1.2.

Active group system subscriber identities which are received by the SS sub-entity shall be transferred to MLE in an MLE-IDENTITIES request primitive. After being recorded locally and any lists amended, the list of currently valid short subscriber and management identities shall be transferred to the lower layers via the TLC-SAP in a TL-CONFIGURE request primitive as described in clause 18.3.5.1.2. The MLE-IDENTITIES request primitive from the LCMC-SAP contains request to add and/or remove group identities

Temporary group addresses allocated by SwMI or assumed by MS when setting up a group call, is informed to MLE by CMCE using the MLE-CONFIGURE request primitive. The MLE-CONFIGURE request primitive from the LCMC-SAP contains request to add and/or remove temporary group identities. The updated lists shall be transferred to the lower layers via the TLC-SAP in a TL-CONFIGURE request primitive as described in clause 18.3.5.1.2.

### 18.3.5.1.1 Link addressing

The MLE defines the MAIN ADDRESS and the ADDRESS TYPE parameters in all TL-CONNECT, TL-DATA, TL-DISCONNECT, TL-RECONNECT and TL-UNITDATA primitives issued to layer 2. The MAIN ADDRESS shall comprise of a valid SSI.

For messages containing higher layer information, the MLE sets the MAIN ADDRESS SSI parameter to a valid SSI, as defined in ETSI EN 300 392-1 [6], clause 7. During migration, exchanged addresses shall be used, using the exchanged addresses issued by the MM in the MLE-IDENTITIES request primitive.

If there is no valid SSI the MLE shall use an un-exchanged SSI (USSSI) as defined in ETSI EN 300 392-1 [6], clause 7. An un-exchanged SSI may only be used for MM messages, refer clause 23.4.1.2.5.

For messages from the MLE management entity, the MLE shall always add the SMI. The SMI is defined in ETSI EN 300 392-1 [6], clause 7.

The MLE shall remove the MAIN ADDRESS and the ADDRESS TYPE parameters from all primitives received from layer 2. These parameters can be used for upward routing. In the service primitives to layer 3 MLE shall use ITSI or GTSI as appropriate.

### 18.3.5.1.2 Link addresses to be placed in layer 2

In order to be able to filter, in layer 2, those messages received by the MS that are not applicable, layer 2 requires to be informed of all addresses that are valid for the MS. The MLE shall inform layer 2 by means of a TL-CONFIGURE request primitive the short subscriber and management identities that are valid for the MS.

In the event that a SSI ceases to be valid, then the MLE shall inform layer 2 by means of a TL-CONFIGURE request primitive via the TLC-SAP.

### 18.3.5.1.3 Layer 2 end point identifier

The MLE may receive the layer 2 endpoint identifier in primitives exchanged with the layer 2. Endpoint identifier is assumed to be a local layer-to-layer matter, and is not defined in the present document.

Endpoint identifiers uniquely identify radio resources, not fixed radio channels or timeslots.

### 18.3.5.1.4 Subscriber class

The MM informs the MLE of the MS subscriber class membership for a particular ITSI using an MLE-INFO request primitive. The MLE shall then use this value to determine if there is a match between the subscriber class being broadcasted by the SwMI and the subscriber class of the MS. The subscriber class is a bit mapped field which shall indicate which subscriber classes the MS is a member of. The values are specified in clause 18.5. The subscriber class parameter may be allocated at subscription or registration. If the MS does not have a subscriber class from registration or subscription, the MS shall assume membership of all subscriber classes. The indication of whether there is a subscriber class match shall be indicated by MLE to the other layer 3 entities via the MLE-INFO indication service primitive.

### 18.3.5.1.5 Permitted LAs, permitted cells and not-permitted cells

An MS may be limited by its application to using only certain specified LAs. If such a limitation exists, MM informs MLE about the permitted LAs (including their MNCs and MCCs) in the MLE-ACTIVATE request primitive. Cells within permitted LAs are called "permitted cells". If MM provides MLE with a list of permitted LAs, MLE shall regard all other LAs as "not-permitted LAs". Cells in not-permitted LAs are called "not-permitted" cells.

If MM does not provide MLE with a list of permitted LAs, MLE shall regard all LAs as permitted LAs and shall regard all cells as permitted cells.

MLE may select a not-permitted cell only if there is no available permitted cell, as described in clause 18.3.4.5.7. When MLE selects a not-permitted cell, MLE shall advise the CMCE and SNDCP entities with MLE-INFO indication primitives.

NOTE: The MS's preferred LAs, if they exist, are a subset of the MS's permitted LAs.

## 18.3.5.2 MLE connection handling

### 18.3.5.2.0 Data transfer states

An MLE connection is the logical association of the MLE peer entities in the MS/LS and the SwMI. The association is made by the mobile when it acquires a radio channel and camps on a cell. No explicit signalling is required in order to establish the connection.

#### 18.3.5.2.1 Data transfer states

The following states shall exist in the data transfer entity.

NOTE 1: In the state machine the states themselves are provided for information, but conformance to the signalling specified for the output of the state machine is a requirement.

NOTE 2: These states are the MLE state machine states, which are different to the service states presented in clause 17.

a) Closed:

- the data transfer sub-entity shall enter state Closed after initial start up. This state shall also be entered after an MLE-CLOSE request primitive has been received from the MM entity indicating that there shall be no access to communication resources allowed.

b) All Data:

- the data transfer sub-entity shall enter the state All Data if it has received an MLE-OPEN request primitive and has not subsequently received an MLE-CLOSE request primitive or MLE-BREAK indication primitive.

c) Broken:

- the data transfer sub-entity enters this state upon receipt of an MLE-BREAK indication primitive from the attachment management sub-entity and indicates that the connection is temporarily broken. Upon receiving an MLE-RESUME indication primitive or an MLE-REOPEN indication primitive the data transfer sub-entity shall return to the all data state.

## 18.3.5.3 Selection of LLC services

### 18.3.5.3.1 Selection of LLC services via TLA-SAP

Two types of data transfer are available at the layer 2 TLA-SAP:

- acknowledged PDU transfer; and
- unacknowledged PDU transfer.

The acknowledged service provides bidirectional data transfer, the unacknowledged service is unidirectional.

The required service shall be interpreted from the information contained in the primitives from the higher entities according to the procedures specified below.

The PDU priority, stealing permission and stealing repeats flag parameters shall be set by the sending higher layer 3 entity and simply passed on to layer 2 by the MLE. The data priority of SN-DATA and SN-UNITDATA PDUs shall be set by the MS SNDCP and passed on to layer 2 by the MLE. In addition, for TL-CONNECT request and response primitives and TL-DISCONNECT request primitives which are issued by the MLE, the stealing permission parameter shall be set to "stealing not required" and the stealing repeats flag shall not be set. The PDU priority shall be equal to 3 for TL-CONNECT request and response primitives and 6 for the TL-DISCONNECT request primitive.

SNDCP uses both basic and advanced link services in the layer 2. The discrimination between the link types is based on the SN-PDU type and it is defined in clause 28. The following clauses define the SNDCP data transfer functionality for basic link and advanced link separately.

### a) Outgoing messages from MM and CMCE

All outgoing messages shall be subject to the following handshake procedure with the LLC.

MLE shall allocate a handle to all TL-DATA request primitives. Upon receipt of the TL-DATA request primitive the LLC immediately acknowledges this with a TL-REPORT indication primitive containing the same handle as in the request, refer to clause 22.3.2.3. The handle shall be retained locally and used for routing subsequent MLE-REPORT indication primitives. The handle remains valid until a TL-DATA confirm primitive is received indicating that the PDU has been (successfully) transmitted, or until a TL-REPORT indication primitive is received indicating that the PDU transmission has failed or been aborted; the handle is then deleted.

TL-CANCEL request primitives may be issued until the receipt of the TL-DATA confirm primitive or until receipt of a TL-REPORT indication primitive indicating that the PDU transmission has failed.

NOTE 1: The normal sequence of primitives received from LLC after MLE issues a basic link TL-DATA request primitive is: TL-REPORT (contains handle but no particular report), TL-REPORT (reporting "first complete transmission") and finally TL-DATA confirm.

On receipt of the TL-DATA confirm primitive indicating successful transmission, the MLE shall issue an MLE-REPORT indication primitive to the SAP which sent the MLE-UNITDATA request primitive initiating the original TL-DATA request primitive (as indicated by the "handle to the request" parameter), to inform the higher layer 3 entity that the PDU has been successfully transmitted by layer 2. If the TL-DATA confirm primitive contains an SDU, the data transfer sub-entity shall then remove and analyse the SDU's MLE PDU header. The PDU header indicates the protocol to which the PDU belongs. MLE protocol PDUs are processed by the MLE protocol entity and TETRA management entity PDUs are processed by the TETRA management functional entity. For other protocols, the SDU contained in the TL-DATA indication primitive shall be routed to the correct SAP as an MLE-UNITDATA indication primitive.

On receipt of an MLE-UNITDATA request primitive, the data transfer sub-entity shall append prefix the SDU in the MLE-UNITDATA request primitive with an MLE header comprising a protocol discriminator information element indicating the originating SAP (i.e. MM or CMCE) as described in clause 18.4.1.3. The data transfer sub-entity shall determine the length of the PDU and pass that information to the LLC as a primitive parameter.

The underlying service selected shall be the basic link or advanced link and determined according to the layer 2 service parameter in the MLE-UNITDATA request primitive. The MLE shall set up an advanced link when needed by MM and/or CMCE.

If the layer 2 service parameter has the value "acknowledged request" then the MLE UNITDATA PDU shall be transferred to the LLC in a TL-DATA request primitive.

If the layer 2 service parameter has the value "acknowledged response" then the MLE UNITDATA PDU shall be transferred to the LLC in a TL-DATA response primitive.

If the layer 2 service parameter has the value "unacknowledged" then the MLE UNITDATA PDU shall be transferred to the LLC in a TL-UNITDATA request primitive.

On receipt of an MLE-CANCEL request primitive from the CMCE or MM SAP, the data transfer sub-entity shall issue a TL-CANCEL request primitive to the TLA-SAP.

The basic link shall be used for all MM signalling and CMCE call related signalling. The FCS flag may be set to indicate the use of the optional FCS for basic link transfer. Whether or not the optional FCS is selected for basic link transfer is not defined in the present document.

The advanced link may also be used for transfer of long SDUs. This may be required for the short data service which can send up to 2 047 bits of data or for transfer of SS information. A separate or the same advanced link can be used by MM and/or CMCE to that used by SNDPCP for packet data transfer.

NOTE 2: CMCE SDS and SS information may be up-linked to the BS and down-linked to the MS on an existing advanced link which was negotiated on behalf of packet data entity at some earlier time.

NOTE 3: The MLE may negotiate an advanced link specifically for the up-linking of CMCE SDS and SS signalling.

NOTE 4: The BS may negotiate an advanced link specifically for the down-linking of CMCE SDS and SS signalling.

NOTE 5: The MLE should take into account the QoS requirements of other advanced link users when selecting a particular advanced link for the up-linking of CMCE SDS and SS signalling. The MLE should, if possible, select an advanced link adapted to the transport of background class data.

#### b) Incoming messages to MM and CMCE

On receipt of a TL-UNITDATA indication primitive, the data transfer sub-entity shall remove and analyse the MLE PDU header and address. The PDU header indicates the destination SAP. The address may indicate that this is a network broadcast message. The data contained in the TL-UNITDATA indication primitive shall then be routed to the correct SAP or sub-entity as an MLE-UNITDATA indication primitive. Network broadcast PDUs (D-NWRK-BROADCAST, D-NWRK-BROADCAST EXTENSION and D-NWRK-BROADCAST-DA) shall be routed by the data transfer sub-entity to the network broadcast sub-entity. Late entry supported information from the D-MLE-SYNC PDU, the D-MLE-SYSINFO-Q PDU and the D-MLE-SYSINFO-DA PDU shall be routed to the CMCE SAP.

On receipt of a TL-DATA indication primitive, the data transfer sub-entity shall remove and analyse the MLE PDU header. The PDU header indicates the destination SAP. The data contained in the TL-DATA indication primitive shall then be routed to the correct SAP or sub-entity as an MLE-UNITDATA indication primitive.

On receipt of a TL-DATA confirm primitive containing an SDU, the MLE shall issue an MLE-REPORT indication primitive as described in a). The data transfer sub-entity shall then transfer the SDU to the appropriate entity or sub-entity as described in a).

#### c) Outgoing basic link messages from SND CP

The data transfer sub-entity shall reject service requests when in state closed. When in the broken state, messages shall not be passed by the MLE.

All outgoing messages shall be subject to the following handshake procedure with the LLC.

MLE shall allocate a handle to all TL-DATA and TL-UNITDATA request primitives. Upon receipt of the TL-DATA, or TL-UNITDATA request primitive the LLC may immediately acknowledge this with a TL-REPORT indication primitive containing the handle, refer to clauses 22.3.2.3 and 22.3.2.4.1. The handle shall be retained locally and used for routing subsequent MLE-REPORT indication primitives.

Where the outgoing message has resulted in the MLE requesting an unacknowledged service from the LLC, the handle remains valid until a further TL-REPORT indication primitive is received indicating that the PDU has been transmitted, has failed, or has been aborted; the handle is then deleted. Where the outgoing message has resulted in the MLE requesting an acknowledged service from the LLC, the handle remains valid until a TL-DATA confirm primitive is received indicating that the PDU has been successfully transmitted, or until a TL-REPORT indication primitive is received indicating that the PDU has failed or has been aborted; the handle is then deleted.

TL-CANCEL request primitives may be issued until the receipt of a TL-DATA confirm or TL-REPORT indication primitive indicating that the PDU has been transmitted, or until receipt of a TL-REPORT indication primitive reporting that the PDU has failed.

NOTE 6: The normal sequence of primitives received from LLC after MLE issues a basic link TL-DATA request primitive is: TL-REPORT (handle but no report), TL-REPORT (reporting "first complete transmission") and finally TL-DATA confirm. The normal sequence of primitives received from LLC after MLE issues a basic link TL-UNITDATA request primitive is: TL-REPORT (optional, contains handle but no particular report) and TL-REPORT (reporting "transfer completed" or "failed transfer").

On receipt of a TL-DATA confirm primitive, the MLE shall issue an MLE-REPORT indication primitive to SND CP indicating successful transmission of the PDU transmitted as a result of the previous TL-DATA request primitive on that endpoint identifier and link identifier. If the TL-DATA confirm primitive contains an SDU, the data transfer sub-entity shall then remove and analyse the SDU's MLE PDU header. The PDU header indicates the protocol to which the PDU belongs. MLE protocol PDUs are processed by the MLE protocol entity and TETRA management entity PDUs are processed by the TETRA management functional entity. For other protocols, the SDU contained in the TL-DATA indication primitive shall be routed to the correct SAP or sub-entity as an MLE-UNITDATA indication primitive.

On receipt of an MLE-UNITDATA request primitive, the data transfer sub-entity shall determine the state of the MLE data priority flag parameter and the state of the channel advice request flag parameter. Then:

- If MLE data priority signalling is not required by the MLE data priority flag parameter, and channel advice is not requested by the channel advice request flag parameter, the data transfer sub-entity shall prefix the SN-SDU with an MLE header comprising a protocol discriminator information element indicating that the originating SAP is SNDCCP as described in clause 18.4.1.3.
- If MLE data priority signalling is required and channel advice is not requested, the MS-MLE is required to transmit a U-CHANNEL CLASS ADVICE PDU indicating a single channel class with value "0000<sub>2</sub>" (i.e. an unspecified channel class). The data transfer sub-entity shall set the "discriminator for SDU protocol present" information element to "0", shall insert the SN-PDU into the "SDU" information element of a U-CHANNEL CLASS ADVICE PDU (see clause 18.3.4.9.11), shall include the value of the data priority parameter from the MLE-UNITDATA request primitive in the U-CHANNEL CLASS ADVICE PDU, and shall prefix the U-CHANNEL CLASS ADVICE PDU with an MLE PDU header comprising a protocol discriminator information element indicating that the originating SAP is MLE, as described in clauses 18.4.1.1 and 18.4.1.4.
- If MLE data priority signalling is required and channel advice is requested, the MS-MLE is required to transmit a U-CHANNEL CLASS ADVICE or U-IRREGULAR CHANNEL ADVICE PDU. The data transfer sub-entity shall set the "discriminator for SDU protocol present" information element to "0", shall insert the SN-PDU into the "SDU" information element of a U-CHANNEL CLASS ADVICE PDU or a U-IRREGULAR CHANNEL ADVICE PDU (see clause 18.3.4.9.11), shall include the value of the data priority parameter from the MLE-UNITDATA request primitive in the U-CHANNEL CLASS ADVICE or U-IRREGULAR CHANNEL ADVICE PDU, and shall prefix the U-CHANNEL CLASS ADVICE or U-IRREGULAR CHANNEL ADVICE PDU with an MLE header comprising a protocol discriminator information element indicating that the originating SAP is MLE as described in clauses 18.4.1.1 and 18.4.1.4.
- If MLE data priority signalling is not required and channel advice is requested, the MS-MLE is requested to transmit a U-CHANNEL CLASS ADVICE or U-IRREGULAR CHANNEL ADVICE PDU if the MS-MLE has received an indication that the current cell supports non-conforming channels (see clause 18.3.4.9.1). The data transfer sub-entity may insert the SN-PDU into the "SDU" information element of a U-CHANNEL CLASS ADVICE PDU or U-IRREGULAR CHANNEL ADVICE PDU (see clause 18.3.4.9.11). In this case, the MS-MLE shall set the "discriminator for SDU protocol present" information element to "0" but shall not include a "data priority" information element. The MS-MLE shall prefix the U-CHANNEL CLASS ADVICE or U-IRREGULAR CHANNEL ADVICE PDU with an MLE header comprising a protocol discriminator indicating that the originating SAP is MLE as described in clauses 18.4.1.1 and 18.4.1.4.

The data transfer sub-entity shall determine the length of the PDU and pass that information to the LLC as a primitive parameter.

If the layer 2 service parameter has the value "acknowledged request" then the MLE UNITDATA PDU shall be transferred to the LLC in a TL-DATA request primitive.

If the layer 2 service parameter has the value "acknowledged response" then the MLE UNITDATA PDU shall be transferred to the LLC in a TL-DATA response primitive.

If the layer 2 service parameter has the value "unacknowledged" then the MLE UNITDATA PDU shall be transferred to the LLC in a TL-UNITDATA request primitive.

Whether or not the optional FCS is selected in basic link transfer is not defined in the present document.

The SDU shall be sent to the TLA SAP in a TL-DATA request primitive unless an unacknowledged data transfer is specifically requested, in which case the SDU shall be sent in a TL-UNITDATA request primitive.

#### d) Incoming basic link messages to SNDCCP

On receipt of a TL-UNITDATA indication primitive, the data transfer sub-entity shall remove and analyse the MLE PDU header and address. The PDU header indicates the destination SAP. The data contained in the TL-UNITDATA indication primitive shall then be routed to the correct SAP or sub-entity as an MLE-UNITDATA indication primitive.

On receipt of a TL-DATA indication primitive, the data transfer sub-entity shall remove and analyse the MLE PDU header. The PDU header indicates the destination SAP. The data contained in the TL-DATA indication primitive shall then be routed to the correct SAP or sub-entity as an MLE-UNITDATA indication primitive.

On receipt of a TL-DATA confirm primitive containing an SDU, the MLE shall issue an MLE-REPORT indication primitive to SNDPCP as described in c). The data transfer sub-entity shall then transfer the SDU to the appropriate entity or sub-entity as described in c).

#### e) Outgoing advanced link messages from SNDPCP

The data transfer sub-entity shall reject service requests when in state closed. When in the broken state, messages shall not be passed by the MLE.

All outgoing messages shall be subject to the following handshake procedure with the LLC.

Upon receipt of the TL-CONNECT, TL-DISCONNECT, TL-DATA, TL-RECONNECT or TL-UNITDATA request primitive the LLC will immediately acknowledge this with a TL-REPORT indication primitive containing the handle. The handle shall be retained locally and used for routing subsequent REPORT indication primitives.

Where the outgoing message has resulted in the MLE requesting an unacknowledged service from the LLC, the handle remains valid until LLC informs MLE that the PDU has been transmitted, has failed, or has been aborted; the handle is then deleted.

Where the outgoing message has resulted in the MLE requesting an acknowledged service from the LLC, the handle remains valid until a TL-DATA confirm primitive is received or until a TL-REPORT indication primitive is received indicating that the PDU transmission has failed or been aborted; the handle is then deleted.

TL-CANCEL request primitives may be issued until LLC informs MLE that the PDU has been transmitted or has failed. If the LLC responds with a TL-REPORT indication primitive containing the report "Layer two transmission activities continuing", transmission of the PDU can only be stopped by resetting the advanced link.

NOTE 7: In the case of the acknowledged advanced link, the normal sequence of primitives received from LLC after MLE issues an advanced link TL-DATA request primitive is: TL-REPORT (optional, contains handle but no particular report) followed by TL-DATA confirm or TL-REPORT ("failed transfer").

On receipt of a TL-DATA confirm primitive, the MLE shall issue an MLE-REPORT indication primitive to SNDPCP indicating successful transmission of the PDU transmitted as a result of the previous TL-DATA request primitive on that endpoint identifier and link identifier.

When sending background class and telemetry class data, the SNDPCP shall use the advanced link to ensure reliable transmission of long packets (i.e. longer than about 3 TDMA slots worth of data). The MS shall only attempt to set up an advanced link if both the SwMI supports SNDPCP operation and if the advanced link is supported by the SwMI on this cell. Information about the support by a CA cell for the original advanced link is indicated in the "BS service details" information element broadcast as part of the D-MLE SYSINFO and D-MLE SYSINFO-Q PDUs. Information about the support by a CA cell for extended advanced links is broadcast in section 1 of the "extended services broadcast" information element of the MAC SYSINFO and MAC SYSINFO-Q PDUs. A DA cell always supports original and extended advanced links when the "system wide services" information element in the D-MLE-SYSINFO-DA (and D-MLE-SYNC-DA) PDU indicates "normal mode" (system wide services supported). When the "system wide services" information element in the D-MLE-SYSINFO-DA (and D-MLE-SYNC-DA) PDU indicates "system wide services temporarily not supported", it is optional for the DA cell to support original and extended advanced links.

NOTE 8: When sending real-time class data, the MS SNDPCP uses the unacknowledged basic link.

If the SwMI indicates that it does not support SNDPCP on this cell, the MS shall not send SNDPCP PDUs on this cell. If the SwMI indicates that it does not support advanced links on this cell, the MS shall not attempt to use an advanced link on this cell.

The quality of service parameters passed down by SNDPCP using MLE-CONNECT request and response primitives shall be used by the MS in negotiating the advanced link service during set up. How the "Quality of Service (QoS) for layer 2" parameters in the MLE-CONNECT request and response primitives map onto the advanced link quality of service selection in the AL-SETUP PDU is not defined by the present document.

On receipt of a MLE-CONNECT request primitive from SNDPCP, the data transfer sub-entity shall issue a TL-CONNECT request primitive to the TLA-SAP. Upon receipt of the corresponding TL-CONNECT confirm primitive, the data transfer sub-entity shall issue a MLE-CONNECT confirm primitive to SNDPCP.

On receipt of a MLE-CONNECT response primitive from SNDCP, the data transfer sub-entity shall issue a TL-CONNECT response primitive to the TLA-SAP.

On receipt of a MLE-DISCONNECT request primitive from SNDCP, the data transfer sub-entity shall issue a TL-DISCONNECT request primitive to the TLA-SAP. Upon receipt of the corresponding TL-DISCONNECT confirm primitive, the data transfer sub-entity shall issue a MLE-DISCONNECT indication primitive to SNDCP.

On receipt of a MLE-RECONNECT request primitive from SNDCP, the data transfer sub-entity shall issue a TL-RECONNECT request primitive to the TLA-SAP. Upon receipt of the corresponding TL-RECONNECT confirm primitive, the data transfer sub-entity shall issue a MLE-RECONNECT confirm primitive to SNDCP.

On receipt of an MLE-UNITDATA request primitive, the data transfer sub-entity shall prefix the SDU in the MLE-UNITDATA request primitive with an MLE header comprising a protocol discriminator information element indicating that the originating SAP is SNDCP as described in clause 18.4.1.3. The data transfer sub-entity shall determine the length of the PDU and pass that information to the LLC as a primitive parameter.

If the layer 2 service parameter has the value "acknowledged request" then the MLE UNITDATA PDU shall be transferred to the LLC in a TL-DATA request primitive.

For messages using the advanced link, the layer 2 service parameter shall not be set to "acknowledged response".

If the layer 2 service parameter has the value "unacknowledged" then the MLE UNITDATA PDU shall be transferred to the LLC in a TL-UNITDATA request primitive.

On receipt of a MLE-RELEASE request primitive from SNDCP, the data transfer sub-entity shall issue a TL-RELEASE request primitive to the TLA-SAP. All references to the advanced link in question shall be deleted.

#### f) Incoming advanced link messages to SNDCP

On receipt of a TL-CONNECT indication primitive, the data transfer sub-entity shall issue MLE-CONNECT indication primitive to the SNDCP.

On receipt of a TL-CONNECT confirm primitive, the data transfer sub-entity shall issue MLE-CONNECT confirm primitive to the SNDCP.

On receipt of a TL-RECONNECT confirm primitive, the data transfer sub-entity shall issue MLE-RECONNECT confirm primitive to the SNDCP.

On receipt of a TL-DISCONNECT indication primitive, the data transfer sub-entity shall issue MLE-DISCONNECT indication primitive to the SNDCP if the TL-DISCONNECT indication primitive refers to an established advanced link. This can be established by using the link identifier. If it does refer to an established advanced link, any local reference to that advanced link shall be deleted.

On receipt of a TL-DISCONNECT confirm primitive, the data transfer sub-entity shall issue MLE-DISCONNECT indication primitive to the SNDCP.

On receipt of a TL-UNITDATA indication primitive, the data transfer sub-entity shall remove and analyse the MLE PDU header and address. The PDU header indicates the destination SAP. The data contained in the TL-UNITDATA indication primitive shall then be routed to the correct SAP or sub-entity as an MLE-UNITDATA indication primitive.

On receipt of a TL-DATA indication primitive, the data transfer sub-entity shall remove and analyse the MLE PDU header. The PDU header indicates the destination SAP. The data contained in the TL-DATA indication primitive shall then be routed to the correct SAP or sub-entity as an MLE-UNITDATA indication primitive.

On receipt of a TL-DATA confirm primitive, the MLE shall issue an MLE-REPORT indication primitive as described in e).

#### 18.3.5.3.2 Selection of LLC services via TLB-SAP

There are no services available at the TLB-SAP in the MS.

Data received via the TLB-SAP is routed to the network broadcast sub-entity and is dealt with in clause 18.3.6.

### 18.3.5.3.3 Selection of LLC services via TLC-SAP

#### a) Locally generated TL-CONFIGURE request primitives

The data transfer sub-entity shall supply TL-CONFIGURE request primitives to the TLC-SAP to inform the lower layers of the state of any MM signalling, SMDCP signalling or circuit mode calls in progress. The MLE activity indicator parameter in the TL-CONFIGURE request primitive allows the lower layers to decide when to apply the energy economy sleeping cycle (see clause 23.7.6), the dual watch reception cycle (see clause 23.7.7) or part-time reception on a multi-slot MCCH-Q (see clause 23.7.8).

NOTE 1: It is possible to apply an energy economy group that has been notified to, and agreed by, the SwMI for energy economy or dual watch mode. The SwMI broadcasts whether part-time reception on a multi-slot MCCH-Q is permitted.

The TL-CONFIGURE request primitive shall be sent with the MLE-Activity indicator parameter set to "stay alive" when there is any explicit or implicit connection active. The TL-CONFIGURE request primitive may only be sent with the MLE activity indicator parameter set to "sleep permitted" when there is no MM, SMDCP or CMCE e.g. circuit mode call activity.

MM indicates its activity by an MLE-ACTIVITY request primitive with sleep mode value "stay alive", and its non-activity with sleep mode value "sleep permitted" as defined in clause 16.3.1.3.4.

SMDCP indicates its activity by an MLE-ACTIVITY request primitive with sleep mode set to "stay alive", and its non-activity with sleep mode value "sleep permitted", see clauses 28.2.4.4, 28.2.4.6, 28.2.4.7, 28.2.4.8 and 28.2.5.

CMCE indicates its activity by an MLE-ACTIVITY request primitive with call state value "group call with transmit permission", "group call without transmit permission", "individual call with transmit permission" and "individual call without transmit permission", and its non-activity with call state value "idle", see clauses 14.2.7.7.0 and 14.4.2.

NOTE 2: The MLE-ACTIVITY request primitive with call state values "group call without transmit permission" or "individual call without transmit permission" are sent at the beginning of a call set-up and the CMCE activity covers also the call set-up period before the voice communication is possible.

MLE shall combine activity indications from upper layers and inform using TL-CONFIGURE request primitive MLE activity indicator parameter, when sleeping is permitted.

Advanced link, on its own is active during set up, reset, reconnection and disconnection phases, see clause 22.3.6.

#### b) Locally received TL-SELECT indication primitives

Where the MLE receives a TL-SELECT indication primitive via the TLC-SAP indicating that the MAC has been instructed to change channels and no response is required, this is dealt with in clause 18.3.4.3.

The only case where the MLE is required to respond to a channel change TL-SELECT indication primitive is in the case of cell change in announced type 1 cell reselection. In this case the MLE shall respond with TL-SELECT response primitive containing a parameter which gives the frequency of the main carrier on the new cell.

#### c) Outgoing messages from MM

These are generally routed via the attachment management sub-entity (see clause 18.3.4).

There are two exceptions to this.

The first is the MLE-IDENTITIES request primitive which contains the valid ISSI(s) and attached/detached GSSIs. The procedures for dealing with this are described in clause 18.3.5.1.

The second is the MLE-INFO request primitive which after the local recording of the subscriber class within the data transfer sub-entity is transferred further to the lower layers in a TL-CONFIGURE request primitive.

#### d) Incoming messages to MM

These are routed via the attachment management sub-entity (see clause 18.3.4).

e) Outgoing messages from SND CP

On receipt of a MLE-CONFIGURE request primitive, the MLE shall pass on relevant information contained in its parameters to layer 2 using TL-CONFIGURE request primitive.

f) Incoming messages to SND CP

There are no messages routed from the TLC-SAP to SND CP.

g) Outgoing messages from CMCE

On receipt of an MLE-CONFIGURE request primitive, MLE shall pass on the information contained in its parameters to layer 2 using TL-CONFIGURE request primitive.

On receipt of an MLE-IDENTITIES request primitive, MLE shall pass on the information contained in its parameters to layer 2 using TL-CONFIGURE request primitive.

h) Incoming messages to CMCE

There are no CMCE primitives received on the TLC-SAP.

#### 18.3.5.4 Routing of local control information

On receipt of an MLE-OPEN request primitive from the MM SAP, the data transfer sub-entity shall issue an MLE-OPEN indication primitive to the CMCE and SND CP SAPs. The data transfer sub-entity shall then open the SAPs and shall permit the transfer of data between layers. If the MLE-OPEN request primitive is received whilst the data transfer sub-entity is in state closed then the data transfer sub-entity shall enter state all data. In all other states it shall remain in that state.

On receipt of an MLE-CLOSE request primitive from the MM SAP the data transfer sub-entity shall relay this as an MLE-CLOSE indication primitive to the CMCE and SND CP SAPs. The data transfer sub-entity shall then close the SAPs and shall not permit the transfer of data between layers. The data transfer sub-entity shall enter state closed, and shall remain in that state until it receives an MLE-OPEN indication primitive.

On receipt of an MLE-DISABLE request primitive from the MM SAP, the data transfer sub-entity shall issue an MLE-DISABLE indication primitive to the CMCE SAP and the SND CP SAP.

On receipt of an MLE-ENABLE request primitive from the MM SAP, the data transfer sub-entity shall issue an MLE-ENABLE indication primitive to the CMCE SAP and the SND CP SAP.

On receipt of an MLE-BREAK indication primitive from the attachment management sub-entity, the data transfer sub-entity shall relay this MLE-BREAK indication primitive to the CMCE and SND CP SAPs. The data transfer sub-entity shall enter state broken. During a temporary link break data may be buffered in the data transfer sub-entity.

On receipt of an MLE-RESUME indication primitive from the attachment management sub-entity, the data transfer sub-entity shall relay this MLE-RESUME indication primitive to the CMCE and SND CP SAPs. The data transfer sub-entity shall return to its previous state. Any data buffered in the data transfer sub-entity during the temporary link break should now be (re)submitted for transmission.

On receipt of an MLE-REOPEN indication primitive from the attachment management sub-entity, the data transfer sub-entity shall relay this MLE-REOPEN indication primitive to the CMCE SAP. The data transfer sub-entity shall enter state idle. Any data buffered in the data transfer sub-entity during the temporary link break should now be discarded.

On receipt of an MLE-BUSY request primitive from the MM SAP, the data transfer sub-entity shall issue a MLE-BUSY indication primitive to the CMCE and SND CP SAPs.

On receipt of an MLE-IDLE request primitive from the MM SAP, the data transfer sub-entity shall issue a MLE-IDLE indication primitive to the CMCE and SND CP SAPs.

On receipt of a TL-REPORT indication primitive from LLC layer containing the reason "channel change", "transmission stopped", "reception stopped" the data transfer sub-entity shall relay it in an MLE-CONFIGURE indication primitive to the entity which is using the radio resource as indicated by the endpoint identifier parameter.

NOTE: The channel change is also conveyed in MLE-DATA and MLE-UNITDATA indication primitives.

On receipt of a TL-CONFIGURE indication primitive with "loss of radio resource" from lower layers the data transfer sub-entity shall relay it in an MLE-CONFIGURE indication primitive into the service user(s) who is using this radio resource as indicated by the endpoint identifier parameter.

## 18.3.6 Network broadcast sub-entity

### 18.3.6.1 Summary

The system broadcast function broadcasts system information from the SwMI to all MSs.

There are two formats for this system information:

- immediate system information;
- network broadcast system information.

The immediate system information is supplied to layer 2 in the SwMI and broadcast in the SYNC, SYNC-DA, SYSINFO, SYSINFO-Q and SYSINFO-DA PDUs as defined in clause 23. The exact method by which the information is supplied to layer 2 is outside the scope of the present document. At the MS, the MLE-PDUs containing immediate system information shall be received by the network broadcast sub-entity in TL-SYNC, TL-SYNC-DA, TL-SYSINFO, TL-SYSINFO-Q and TL-SYSINFO-DA indication primitives via the TLB-SAP.

The network broadcast system information and late entry information is supplied to layer 2 in the SwMI and broadcast as requested. The exact method by which the information is supplied to layer 2 is outside the scope of the present document. At the MS the MLE-PDUs shall be received by the network broadcast sub-entity as D-NWRK-BROADCAST, D-NWRK-BROADCAST EXTENSION and D-NWRK-BROADCAST-DA PDUs with a TL-UNITDATA indication primitive via the TLA-SAP and data transfer sub-entity. The MLE is able to route the network broadcast system information to the network broadcast sub-entity by virtue of the PDU header it arrives with, and the late entry information to CMCE-SAP by virtue of the PDU header it arrives with.

The D-NWRK-BROADCAST and D-NWRK-BROADCAST EXTENSION PDUs convey information to CA MSs about CA serving cells and to CA and DA MSs about CA neighbour cells. The D-NWRK-BROADCAST-DA PDU conveys information to DA MSs about DA serving cells and to CA and DA MSs about DA neighbour cells and may contain information for DA MSs about the (if any) local CA cell. CA MSs may obtain information about their serving cells from D-NWRK-BROADCAST and D-NWRK-BROADCAST EXTENSION PDUs. DA MSs may obtain information about their serving cells from D-NWRK-BROADCAST-DA PDUs. This serving cell information includes the cell reselect parameters and the cell load. On a DA cell, the serving cell information may additionally include the "cell identifier DA" information element (a DA MS needs to know its serving cell's cell identifier when interpreting D-NWRK-BROADCAST-DA PDUs sent on a channel used by MSs from more than one DA cell).

Only serving cell information common to all DA MSs using the channel shall be included in a D-NWRK-BROADCAST-DA PDU. In particular, the SwMI shall only include the "cell identifier DA" information element in the D-NWRK-BROADCAST-DA PDU when the "cell identifier DA" information element represents the serving cell of all DA MSs using the channel - this is always the case when sent on a DA main carrier.

The SwMI shall indicate whether or not it supports transmission of the D-NWRK-BROADCAST or D-NWRK-BROADCAST-DA PDUs using the "neighbour cell broadcast" information element which is transmitted as part of the D-MLE-SYNC, D-MLE-SYSINFO-Q and D-MLE-SYSINFO-DA PDUs.

System broadcast information can be received whilst the MS is scanning or is camped on a cell. The MS-MLE shall ensure that system broadcast information received whilst scanning is applied to the correct cell.

An MS may also prompt the SwMI to transmit the network broadcast system information by using the neighbour cell enquiry procedure as described in clause 18.3.6.5.

See clause 18.3.4.0b for a description of cell types and cell identifiers.

### 18.3.6.2 System information

The system information is a series of messages that are broadcast at regular intervals from the SwMI to the MS-MLEs.

The immediate system information contains the following information:

- MNC;
- MCC;
- LA Code (LAC);
- subscriber class;
- cell load; and
- late entry information availability.

The network broadcast system information in the D-NWRK-BROADCAST PDUs contain a combination of the following information:

- frequencies of adjacent CA cells for cell selection and reselection;
- parameters for roaming (measurement levels, intervals) to be used by CA MSs;
- the cell load on the CA serving cell.

The network broadcast system information in the D-NWRK-BROADCAST EXTENSION PDUs may include a combination of the following information:

- the modulation modes and bandwidths of channel classes available on the CA serving cell;
- frequencies, modulation modes and bandwidths of irregular channels available on the CA serving cell;
- the modulation modes and bandwidths of channel classes available on CA neighbour cells;
- frequencies, modulation modes and bandwidths of irregular channels available on CA neighbour cells.

NOTE 1: DA MSs interpret "serving cell" information in the D-NWRK-BROADCAST EXTENSION PDUs as information about the local CA cell.

The network broadcast system information in the D-NWRK-BROADCAST-DA PDUs may include a combination of the following information:

- the cell identifier of the present DA cell - see note 2;
- parameters for roaming (measurement levels, intervals) to be used by DA MSs on the DA serving cell - see note 3;
- the cell load on the DA serving cell - see note 3;
- details of the (if any) local CA cell (not used by CA MSs);
- the modulation modes and bandwidths of channel classes available on the DA serving cell - see notes 3, 4 and 5;
- frequencies, modulation modes and bandwidths of irregular channels available on the DA serving cell - see notes 3, 4 and 5;
- frequencies and bandwidths of the main carriers of DA neighbour cells - but see note 6;
- parameters to be used for channel quality assessment (measurement levels) on DA neighbour cells;
- the modulation modes and bandwidths of channel classes available on DA neighbour cells;
- frequencies, modulation modes and bandwidths of irregular channels available on DA neighbour cells.

NOTE 2: The cell identifier of the present DA cell is sent only on channels that are not being used by MSs from another DA cell.

NOTE 3: If more than one DA cell is using the present channel, the following items about the DA serving cell are included only when their values are appropriate to all DA cells using the present channel:

- parameters for roaming;
- cell load of the DA serving cell;
- modulation modes and bandwidths of channel classes available on the DA serving cell;
- frequencies, modulation modes and bandwidths of irregular channels available on the DA serving cell.

NOTE 4: If the "cell identifier DA" information element is included in the PDU, CA MSs interpret serving cell channel class and irregular channel information in a D-NWRK-BROADCAST-DA PDU as being information about a DA cell. If the "cell identifier DA" information element is not included in the PDU, the CA MS does not use serving cell channel class and irregular channel information.

NOTE 5: When non-conforming channel information is included in a D-NWRK-BROADCAST-DA PDU on a channel used by MSs from more than one DA cell, each MS assumes the channel class and irregular channel information relates to its own serving cell. (The "cell identifier DA" information element is not included in D-NWRK-BROADCAST-DA PDUs sent on channels used by MSs from more than one DA cell.) The SwMI can use this to broadcast common non-conforming channel information to MSs from more than one DA cell; however, the main carriers of the affected DA cells all need to operate at the same BS transmit power if channel class information is to be shared in this way. Otherwise, the SwMI can send out the information separately for each DA cell in "neighbour cell channel class for DA" and "neighbour cell irregular channel detail for DA" information elements.

NOTE 6: When a channel is used by MSs from more than one DA cell, a DA MS may receive information about its serving cell in the information about neighbour cells. The DA MS should detect this (from the cell identifier included in the information about the neighbour cell) and should not attempt to reselect to its serving cell.

This information should be used by the MSs to guide the cell reselection and assigned channel replacement request procedures.

### 18.3.6.3 Message formats for system information

System information messages shall be constructed according to the rules described in clause 18.4. Each network broadcast system information may contain any combination of information elements, unless indicated otherwise in the individual PDU definitions.

### 18.3.6.4 Network broadcast procedures

On receiving a TL-SYNC, a TL-SYNC-DA, a TL-SYSINFO, a TL-SYSINFO DA or a TL-SYSINFO-Q indication primitive via the TLB-SAP, the network broadcast sub-entity shall analyse the contents. The information contained within shall either be passed to attachment management, e.g. to update cell rankings, or, in the case of a new subscriber class bit map, shall be passed to the data transfer sub-entity.

### 18.3.6.5 Neighbour cell enquiry procedure

The SwMI shall indicate whether or not the neighbour cell enquiry service is supported using the "neighbour cell broadcast" information element which is transmitted as part of the D-MLE-SYNC, D-MLE-SYSINFO-Q and D-MLE-SYSINFO-DA PDUs.

If the SwMI supports the neighbour cell enquiry service, an MS may prompt the SwMI to transmit the D-NWRK-BROADCAST PDU and the D-NWRK-BROADCAST EXTENSION PDU by sending a U-PREPARE or U-PREPARE-DA PDU to the SwMI. An MS may prompt the SwMI to transmit the D-NWRK-BROADCAST-DA PDU by sending a U-PREPARE-DA PDU to the SwMI.

The U-PREPARE PDU shall not contain an SDU. The U-PREPARE PDU shall contain the "cell identifier CA" information element which shall be set to "00000<sub>2</sub>" and which shall indicate to the SwMI that the MS is requesting transmission of the D-NWRK-BROADCAST PDU and (if supported) the D-NWRK-BROADCAST EXTENSION PDU.

The U-PREPARE-DA PDU shall not contain an SDU. The U-PREPARE-DA PDU shall contain the "cell identifier DA" information element which shall be set either to "00000000<sub>2</sub>", indicating that the MS is requesting transmission of the D-NWRK-BROADCAST-DA PDU, or to "11111111<sub>2</sub>", indicating that the MS is requesting D-NWRK-BROADCAST-DA, D-NWRK-BROADCAST and D-NWRK-BROADCAST EXTENSION PDUs.

NOTE: The MS may request transmission of the D-NWRK-BROADCAST and D-NWRK-BROADCAST EXTENSION PDUs and/or the D-NWRK-BROADCAST-DA PDU because it has not yet received the neighbour cell or channel class or irregular channel information on the current serving cell and the MS needs this in order to initiate cell reselection or assigned channel replacement request procedures. This may occur if the current serving cell or assigned channel signal level is falling and the MS cannot wait for the normal D-NWRK-BROADCAST PDU, D-NWRK-BROADCAST EXTENSION PDU or D-NWRK-BROADCAST-DA PDU broadcast to be sent.

An MS may not receive the normal D-NWRK-BROADCAST PDU broadcast, for example, as a result of being in energy economy and sleeping while the D-NWRK-BROADCAST PDU is being transmitted by the SwMI.

MLE shall send the U-PREPARE or U-PREPARE-DA PDU by issuing a TL-DATA request primitive to layer 2 with the primitive parameters set as follows:

- PDU priority shall be set to 3;
- stealing permission shall be set to "steal immediately";
- the stealing repeats flag shall not be set.

MLE shall, if supported, start timer T371 and shall await the response from the SwMI. If the SwMI supports the neighbour cell enquiry service, the SwMI shall respond to the U-PREPARE PDU by transmitting the D-NWRK-BROADCAST PDU and, if supported, the D-NWRK-BROADCAST EXTENSION PDU. If supported, the SwMI shall respond to the U-PREPARE-DA PDU by transmitting the D-NWRK-BROADCAST-DA PDU and, if requested by use of a "cell identifier DA" information element set to "11111111<sub>2</sub>", shall also transmit the D-NWRK-BROADCAST and D-NWRK-BROADCAST EXTENSION PDUs. These PDUs may be individually addressed to the MS using the layer 2 acknowledged service or may be sent unacknowledged to a group address or to the broadcast address ("all ones" address).

On reception of the D-NWRK-BROADCAST PDU or D-NWRK-BROADCAST-DA PDU, the MLE shall reset timer T371. If timer T371 expires the MS shall assume that the cell enquiry service has failed and may resend the U-PREPARE PDU or U-PREPARE-DA PDU.

If the neighbour cell enquiry service is not supported, the MS shall not attempt to send the U-PREPARE PDU with the "cell identifier CA" information element set to "00000<sub>2</sub>" or the U-PREPARE-DA PDU with the "cell identifier DA" information element set to "00000000<sub>2</sub>" or "11111111<sub>2</sub>". If the the SwMI does not support the neighbour cell enquiry service, the SwMI may respond to the U-PREPARE PDU or U-PREPARE-DA with a D-PREPARE-FAIL PDU which has the "fail cause" information element set equal to "Neighbour cell enquiry not available".

### 18.3.6.6 Addition and replacement of neighbour cell information

The MS constructs a record of neighbour cells available from its present serving cell from information in D-NWRK-BROADCAST, D-NWRK-BROADCAST EXTENSION and D-NWRK-BROADCAST-DA PDUs, as follows:

- if the PDU contains information that the MS has not previously recorded about a neighbour cell (identified by a cell identifier) or a non-conforming channel or channel class on the serving cell, the MS shall record the new information;

- if the PDU contains an item of information about a neighbour cell (identified by a cell identifier) or about a non-conforming channel or channel class on the serving cell, and the MS has previously recorded different information about this item, the MS shall replace the old information about this item with the new information.

The MS should retain its record of information about neighbour cells, channel classes and irregular channels until it leaves the cell, is powered off, or is requested by the SwMI to remove the information (whichever occurs first). The MS shall not use the information received on one cell when camped on another cell.

The MS may retain its record of information about neighbour cells, channel classes and irregular channels received on a particular cell after it leaves that cell, for re-use when it returns to that cell (as identified by the cell identifier and LA).

**EXAMPLE:** The ability to store broadcast information for use on return to the cell where it was received may be useful to train-mounted MSs which repeatedly follow the same route.

The method by which the MS recognizes that it has returned to a previously used cell is outside the scope of the present document.

**NOTE 1:** The method could include a prearrangement with the MS that the SwMI uses only one cell per LA.

**NOTE 2:** The MS may be able to recognize that it has returned to a previously used DA cell by comparing the cell identifier of its serving cell (included in a D-NWRK-BROADCAST-DA PDU) with the cell identifiers of DA cells it has previously used within the present LA (see clause 18.3.4.0b.5). The method could include a prearrangement with the MS that the SwMI uses stable cell identifiers for DA cells that are unique per LA.

As a further aid to a DA MS, the "local cell identifier DA" information element may be included in the "neighbour cell information for DA" information element. This indicates the cell identifier that a DA neighbour cell is using to identify itself to MSs that are camped on that DA neighbour cell. The MS may be able to use this (in combination with the LA of the DA neighbour cell) to recognize that it is returning to a DA cell for which it has retained neighbour cell information, and may use it for other purposes where the MS needs to know the cell identifier of its serving cell in advance of receiving it in a D-NWRK-BROADCAST-DA PDU. The "local cell identifier DA" information element thus indicates the value that the DA neighbour cell uses for the "cell identifier DA" information element when the DA neighbour cell sends a D-NWRK-BROADCAST-DA PDU that includes the "cell identifier DA" information element.

**NOTE 3:** Cell identifiers and neighbour cell information may change, so the MS's previous record of information about neighbour cells, channel classes and irregular channels received on a particular cell may not be useful when it returns to that cell.

**NOTE 4:** A future edition of the present document may provide a method for the MS to determine if the information about a DA serving cell and its DA neighbour cells has remained stable since the MS's previous visit to the cell.

If a DA MS detects a change in the cell identifier of its serving cell, the MS shall delete its previous record of serving cell and neighbour cell information for the present cell. It may then build up a new record of serving cell and neighbour cell information, referenced by the new cell identifier.

### 18.3.6.7 Removal of neighbour cell information

The SwMI may instruct MSs to delete information about neighbour cells and/or information about channel classes and irregular channels on the serving cell. The instruction is sent using the D-NWRK-BROADCAST REMOVE PDU. It applies only to information that the MS stores about neighbour cells of its present serving cell and the channel classes and irregular channels of its present serving cell. The D-NWRK-BROADCAST REMOVE PDU cannot be used to remove information that was received on cells other than the present serving cell.

When sent on a channel used by MSs from multiple cells, each MS interprets the PDU as relating to the neighbour cell and channel information it has received on its present serving cell. The "removal data for serving cell" information element shall not be included unless its value is appropriate to all cells using the channel on which the PDU is sent.

If the PDU indicates "remove this neighbour cell", the MS should remove the indicated neighbour cell from its record of neighbour cells of the present serving cell.

If the PDU indicates "remove channel classes or channels", the MS should remove the indicated channel classes and/or channels from its record of information about the indicated cell.

If the PDU includes the "removal data for serving cell" information element, the MS should remove the indicated channel classes and/or channels from its record of information about its present serving cell.

If the cell identifier of a neighbour cell to be removed matches the cell identifier of a DA MS's serving cell (this could happen when the DA MS is using a channel shared by MSs from other cells), the DA MS should delete all its information about channel classes and channels of its present serving cell.

If the cell identifier of a neighbour cell with channel classes or channels to be removed matches the cell identifier of a DA MS's serving cell (this could happen when the DA MS is using a channel shared by MSs from other cells), the DA MS should delete its information about the indicated channel classes and/or channels of its present serving cell.

See clause 18.3.6.6 for the case where a DA MS detects a change in the cell identifier of its serving cell.

### 18.3.7 Management sub-entity

The management sub-entity shall be responsible for communication of management information between the MS and the SwMI. MLE PDUs to and from the management sub-entity shall have a protocol discriminator set to "110<sub>2</sub>". The PDUs shall be transferred between the MS and the SwMI using the TMI as the source address on the uplink and as the destination address on the downlink.

No TETRA management PDUs are defined in the present document.

## 18.4 PDU descriptions

### 18.4.0 General

The following PDU descriptions contain a mapping of the information elements into an MLE PDU specifying the length of the information element, the type of the information element and whether the information element is mandatory, conditional or optional. The contents of the information elements themselves are further detailed in clause 18.5.

The information contained in the PDU description tables corresponds to the following key:

- Length: length of the information element in bits;
- Type: information element type 1 or 2 as defined below;
- C/O/M: conditional/optional/mandatory information in the PDU;
- Remark: comment.

### 18.4.1 Data transfer PDUs at the TLA-SAP

#### 18.4.1.1 Protocol discriminator

The contents of an MLE PDU sent and received at the TLA-SAP shall be determined by a 3 bit protocol discriminator. The discriminator shall be the first information element field in the MLE PDU.

The protocol discriminator shall determine the MLE user SAP endpoint, i.e. it is used as routing information within the MLE data transfer sub-entity.

If the protocol discriminator indicates CMCE, MM, or SNDCCP, then the MLE shall remove the protocol discriminator and route the SDU to the relevant upper layer 3 protocol entity.

If the protocol discriminator indicates TETRA management entity, then the MLE shall remove the protocol discriminator and route the SDU to the TETRA management functional entity within the MLE protocol entity.

If the protocol discriminator indicates MLE, then the MLE shall remove the protocol discriminator and process the remainder of the PDU according to the MLE protocol.

### 18.4.1.2 PDU type

When the protocol discriminator indicates the MLE protocol, a "PDU type" information element shall follow which shall indicate the particular MLE protocol PDU type.

### 18.4.1.3 MLE service user PDUs

PDUs which have the protocol discriminator equal to one of the following: MM, SNDTCP, CMCE or TETRA Management Entity shall be defined as in table 18.1.

**Table 18.1: MLE service PDU layout**

| Information element    | Length   | Value | Remark                                    |
|------------------------|----------|-------|---|
| Protocol discriminator | 3        |       | See clause 18.5.21 for element definition |
| SDU                    | variable |       | MM, CMCE, SNDTCP or Management Entity SDU |

The SDUs sent/received at the LMM-SAP, LTPD-SAP, LCMC-SAP and to/from the management entity shall be transparent to the MLE. The MLE shall simply route these SDUs according to the protocol discriminator.

### 18.4.1.4 MLE protocol PDUs

#### 18.4.1.4.0 General

MLE PDUs which have the protocol discriminator MLE protocol shall comprise both cell change PDUs and network broadcast PDUs.

Refer to annex E for description of the general format of the MLE protocol PDU.

#### 18.4.1.4.1 D-NWRK-BROADCAST

- Message: D-NWRK-BROADCAST
- Response to: -/U-PREPARE/U-PREPARE-DA
- Response expected: -
- Short description: Upon receipt from the SwMI, the message shall inform the MS-MLE about parameters for the CA serving cell and parameters for one or more CA neighbour cells.

**Table 18.2: D-NWRK-BROADCAST PDU**

| Information element  | Length   | Type | C/O/M | Remark           |
|--|----------|------|-------|------------------|
| PDU type   | 3        | 1    | M     | D-NWRK-BROADCAST |
| Cell re-select parameters  | 16       | 1    | M     | See note 1       |
| Cell load CA   | 2        | 1    | M     | See note 1       |
| TETRA network time   | 48       | 2    | O     |                  |
| Number of CA neighbour cells   | 3        | 2    | O     | See note 2       |
| Neighbour cell information for CA  | variable |      |       | See note 3       |
| NOTE 1: This element shall not be used by a DA MS.   |          |      |       |                  |
| NOTE 2: If present, the element shall indicate how many "Neighbour cell information for CA" elements follow. If not present, no neighbour cell information shall follow.   |          |      |       |                  |
| NOTE 3: The element definition is contained in clause 18.5 which gives the type and length for each sub-element which is included in this element. The element shall be present as many times as indicated by the "number of CA neighbour cells" element. There shall be no P-bit preceding each "neighbour cell information for CA" element which is carried by this PDU. |          |      |       |                  |

## 18.4.1.4.1a D-NWRK-BROADCAST-DA

- Message: D-NWRK-BROADCAST-DA
- Response to: -/U-PREPARE-DA
- Response expected: -
- Short description: Upon receipt from the SwMI, the message shall inform the MS-MLE about parameters for the DA serving cell, one or more DA neighbour cells and the (if any) local CA cell.

Table 18.3: D-NWRK-BROADCAST-DA PDU

| Information element   | Length   | Type | C/O/M | Remark                           |
|---|----------|------|-------|----------------------------------|
| PDU type  | 3        | 1    | M     | Extended PDU                     |
| PDU type extension  | 4        | 1    | M     | D-NWRK-BROADCAST-DA              |
| Reserved  | 3        | 1    | M     | See note 1                       |
| Reserved  | 14       | 2    | O     | See note 2                       |
| Cell identifier DA  | 8        | 2    | O     | See note 3                       |
| Cell re-select parameters   | 16       | 2    | O     | See notes 4 and 5                |
| Cell load DA  | 3        | 2    | O     | See notes 4 and 5                |
| TETRA network time  | 48       | 2    | O     |                                  |
| Neighbour cell information for CA   | variable | 2    | O     | See notes 5 and 6                |
| Number of DA neighbour cells  | 3        | 2    | O     | See note 7                       |
| Neighbour cell information for DA   | variable |      |       | See note 8                       |
| Number of channel classes (for serving cell)  | 4        | 2    | O     | For DA serving cell. See note 9  |
| Channel class   | variable |      |       | See notes 10, 11 and 12          |
| Number of DA neighbour cell channel classes   | 5        | 2    | O     | See note 13                      |
| Neighbour cell channel class for DA   | variable |      |       | See note 14                      |
| Number of irregular channel details (for serving cell)  | 5        | 2    | O     | For DA serving cell. See note 15 |
| Irregular channel detail  | variable |      |       | See notes 10, 12 and 16          |
| Number of DA neighbour cell irregular channel details   | 6        | 2    | O     | See note 17                      |
| Neighbour cell irregular channel detail for DA  | variable |      |       | See note 18                      |
| Reserved  | 32       | 2    | O     | See note 2                       |
| Reserved  | 32       | 2    | O     | See note 2                       |
| NOTE 1: Shall be set to '000 <sub>2</sub> ' in the present document.  |          |      |       |                                  |
| NOTE 2: Shall not be used in the present document.  |          |      |       |                                  |
| NOTE 3: This element shall not be included if the channel on which this PDU is sent is being used by MSs from more than one DA cell.  |          |      |       |                                  |
| NOTE 4: This element shall be included only if its value is appropriate to all DA cells using the channel on which this PDU is sent.  |          |      |       |                                  |
| NOTE 5: This element shall not be used by CA MSs.   |          |      |       |                                  |
| NOTE 6: If present, this element shall contain information about the local CA cell.   |          |      |       |                                  |
| NOTE 7: If present, the element shall indicate how many "neighbour cell information for DA" elements follow. If not present, no "neighbour cell information for DA" elements shall follow.  |          |      |       |                                  |
| NOTE 8: The element definition is contained in clause 18.5 which gives the type and length for each sub-element which is included in this element. The element shall be present as many times as indicated by the "number of DA neighbour cells" element. There shall be no P-bit preceding each "neighbour cell information for DA" element carried by this PDU.       |          |      |       |                                  |
| NOTE 9: If present, the element shall indicate how many "channel class" elements follow. If not present, no "channel class" elements shall follow.  |          |      |       |                                  |
| NOTE 10: This element shall not be included unless its value is appropriate to all DA cells using the channel on which this PDU is sent.  |          |      |       |                                  |
| NOTE 11: The element definition is contained in clause 18.5 which gives the type and length for each sub-element which is included in this element. The element shall be present as many times as indicated by the "number of channel classes (for serving cell)" element. There shall be no P-bit preceding each "channel class" element which is carried by this PDU. |          |      |       |                                  |

|  |
|--|
| <p>NOTE 12: If the "cell identifier DA" element is present, CA MSs shall regard this element as containing information about the cell identified by the "cell identifier DA" element. If the "cell identifier DA" element is not present, CA MSs shall not use this element.</p> <p>NOTE 13: If present, the element shall indicate how many "neighbour cell channel class for DA" elements follow. If not present, no "neighbour cell channel class for DA" elements shall follow.</p> <p>NOTE 14: The element definition is contained in clause 18.5 which gives the type and length for each sub-element which is included in this element. The element shall be present as many times as indicated by the "number of DA neighbour cell channel classes" element. The element shall be present as many times as indicated by the "number of DA neighbour cell irregular channel details" element. There shall be no P-bit preceding each "neighbour cell irregular channel detail for DA" element which is carried by this PDU.</p> |
|--|

NOTE: The "neighbour cell information for CA" information element may be included in this PDU to enable DA MSs to discover the details of the (if any) local CA cell. Information about other CA neighbour cells is broadcast in the D-NWRK-BROADCAST PDU.

## 18.4.1.4.1b D-NWRK-BROADCAST EXTENSION

- Message: D-NWRK-BROADCAST EXTENSION
- Response to: -/U-PREPARE/U-PREPARE-DA
- Response expected: -
- Short description: Upon receipt from the SwMI, the message shall inform the MS-MLE about parameters for the CA serving cell and parameters for one or more CA neighbour cells.

Table 18.4: D-NWRK-BROADCAST EXTENSION PDU

| Information element   | Length   | Type | C/O/M | Remark                          |
|---|----------|------|-------|---------------------------------|
| PDU type  | 3        | 1    | M     | D-NWRK-BROADCAST EXTENSION      |
| Number of channel classes (for serving cell)  | 4        | 2    | O     | For CA serving cell. See note 1 |
| Channel class   | variable |      |       | See notes 2 and 3               |
| Number of CA neighbour cell channel classes   | 5        | 2    | O     | See note 4                      |
| Neighbour cell channel class for CA   | variable |      |       | See note 5                      |
| Number of irregular channel details (for serving cell)  | 5        | 2    | O     | For CA serving cell. See note 6 |
| Irregular channel detail  | variable |      |       | See notes 2 and 7               |
| Number of CA neighbour cell irregular channel details   | 6        | 2    | O     | See note 8                      |
| Neighbour cell irregular channel detail for CA  | variable |      |       | See note 9                      |
| Reserved  | 32       | 2    | O     | See note 10                     |
| Reserved  | 32       | 2    | O     | See note 10                     |
| NOTE 1: If present, the element shall indicate how many "channel class" elements follow. If not present, no "channel class" elements shall follow.  |          |      |       |                                 |
| NOTE 2: DA MSs shall regard this as information about the local CA cell.  |          |      |       |                                 |
| NOTE 3: The element definition is contained in clause 18.5 which gives the type and length for each sub-element which is included in this element. The element shall be present as many times as indicated by the "Number of channel classes (for serving cell)" element. There shall be no P-bit preceding each channel class element carried by this PDU.   |          |      |       |                                 |
| NOTE 4: If present, the element shall indicate how many "neighbour cell channel class for CA" elements follow. If not present, no "neighbour cell channel class for CA" elements shall follow.  |          |      |       |                                 |
| NOTE 5: The element definition is contained in clause 8.5 which gives the type and length for each sub-element which is included in this element. The element shall be present as many times as indicated by the "Number of CA neighbour cell channel classes" element. There shall be no P-bit preceding each "neighbour cell channel class for CA" information element carried by this PDU.           |          |      |       |                                 |
| NOTE 6: If present, the element shall indicate how many "irregular channel detail" elements follow. If not present, no "irregular channel detail" elements shall follow.  |          |      |       |                                 |
| NOTE 7: The element definition is contained in clause 18.5 which gives the type and length for each sub-element which is included in this element. The element shall be present as many times as indicated by the "Number of irregular channel details (for serving cell)" element. There shall be no P-bit preceding each "irregular channel detail" information element carried by this PDU.          |          |      |       |                                 |
| NOTE 8: If present, the element shall indicate how many "neighbour cell irregular channel detail for CA" elements follow. If not present, no "neighbour cell irregular channel detail for CA" elements shall follow.  |          |      |       |                                 |
| NOTE 9: The element definition is contained in clause 18.5 which gives the type and length for each sub-element which is included in this element. The element shall be present as many times as indicated by the "Number of CA neighbour cell irregular channel details" element. There shall be no P-bit preceding each "neighbour cell irregular channel detail for CA" element carried by this PDU. |          |      |       |                                 |
| NOTE 10: Shall not be used in the present document.   |          |      |       |                                 |

## 18.4.1.4.1c D-NWRK-BROADCAST REMOVE

- Message: D-NWRK-BROADCAST REMOVE
- Response to: -
- Response expected: -
- Short description: Upon receipt from the SwMI, the message shall inform the MS-MLE about broadcast neighbour cell and channel information received on the present cell that is to be removed from the MS's memory.

Table 18.5: D-NWRK-BROADCAST REMOVE PDU

| Information element   | Length   | Type | C/O/M | Remark                  |
|---|----------|------|-------|-------------------------|
| PDU type  | 3        | 1    | M     | Extended PDU            |
| PDU type extension  | 4        | 1    | M     | D-NWRK-BROADCAST REMOVE |
| Number of CA cells for removal  | 5        | 2    | O     | See note 1              |
| Removal data for CA cell  | variable |      |       | See note 2              |
| Number of DA cells for removal  | 8        | 2    | O     | See note 3              |
| Removal data for DA cell  | variable |      |       | See note 4              |
| Removal data for serving cell   | variable | 2    | O     | See note 5              |
| Reserved  | 8        | 2    | O     | See note 6              |
| Reserved  | 8        | 2    | O     | See note 6              |
| Reserved  | 16       | 2    | O     | See note 6              |
| Reserved  | 32       | 2    | O     | See note 6              |
| NOTE 1: If present, the element shall indicate how many "removal data for CA cell" elements follow. If not present, no "removal data for CA cell " elements shall follow.   |          |      |       |                         |
| NOTE 2: The element definition is contained in clause 18.5 which gives the type and length for each sub-element which is included in this element. The element shall be present as many times as indicated by the "number of CA cells for removal" element. There shall be no P-bit preceding each "removal data for CA cell" element which is carried by this PDU. |          |      |       |                         |
| NOTE 3: If present, the element shall indicate how many "removal data for DA cell" elements follow. If not present, no "removal data for DA cell " elements shall follow.   |          |      |       |                         |
| NOTE 4: The element definition is contained in clause 18.5 which gives the type and length for each sub-element which is included in this element. The element shall be present as many times as indicated by the "number of DA cells for removal" element. There shall be no P-bit preceding each "removal data for DA cell" element which is carried by this PDU. |          |      |       |                         |
| NOTE 5: This element shall not be included unless its value is appropriate to all cells using the channel on which this PDU is sent.  |          |      |       |                         |
| NOTE 6: Shall not be used in the present document.  |          |      |       |                         |

## 18.4.1.4.2 D-NEW-CELL

- Message: D-NEW-CELL
- Response to: U-PREPARE/U-PREPARE-DA
- Response expected: -
- Short description: Upon receipt from the SwMI the message shall inform the MS-MLE that it can select a new cell as previously indicated in the U-PREPARE or U-PREPARE-DA PDU.

Table 18.6: D-NEW-CELL PDU

| Information element  | Length | Type | C/O/M | Remark     |
|--|--------|------|-------|------------|
| PDU type   | 3      | 1    | M     | D-NEW-CELL |
| Channel command valid  | 2      | 1    | M     |            |
| SDU  |        |      |       | See note   |
| NOTE: The SDU may carry an MM registration PDU which is used to forward register to a new cell during announced type 1 cell reselection or a D-OTAR CCK PROVIDE PDU which is used to identify the current CCK, it may also provide the future CCK for the LA which the MS has indicated in the U-OTAR CCK DEMAND PDU and whether the CCK provided is in use in other LAs or is used throughout the SwMI. The SDU is coded according to the MM protocol description. There shall be no P-bit in the PDU coding preceding the SDU information element. |        |      |       |            |

## 18.4.1.4.3 D-PREPARE-FAIL

- Message: D-PREPARE-FAIL
- Response to: U-PREPARE/U-PREPARE-DA
- Response expected: -
- Short description: Upon receipt from the SwMI the message shall be used by the MS-MLE as a preparation failure, while announcing cell reselection to the old cell.

Table 18.7: D-PREPARE-FAIL PDU

| Information element   | Length | Type | C/O/M | Remark         |
|---|--------|------|-------|----------------|
| PDU type  | 3      | 1    | M     | D-PREPARE-FAIL |
| Fail cause  | 2      | 1    | M     |                |
| SDU   |        |      |       | See note       |
| NOTE: The SDU may carry an MM registration PDU. The SDU is coded according to the MM protocol description. There shall be no P-bit in the PDU coding preceding the SDU information element. |        |      |       |                |

## 18.4.1.4.4 D-RESTORE-ACK

- Message: D-RESTORE-ACK
- Response to: U-RESTORE
- Response expected: -
- Short description: Upon receipt from the SwMI, the message shall indicate to the MS-MLE an acknowledgement of the C-Plane restoration on the new selected cell.

**Table 18.8: D-RESTORE-ACK PDU**

| Information element  | Length | Type | C/O/M | Remark        |
|--|--------|------|-------|---------------|
| PDU type   | 3      | 1    | M     | D-RESTORE-ACK |
| SDU  |        |      |       | See note      |
| NOTE: This PDU shall carry a CMCE D-CALL RESTORE PDU which can be used to restore a call after cell reselection. The SDU is coded according to the CMCE protocol description. There shall be no P-bit in the PDU coding preceding the SDU information element. |        |      |       |               |

## 18.4.1.4.5 D-RESTORE-FAIL

- Message: D-RESTORE-FAIL
- Response to: U-RESTORE
- Response expected: -
- Short description: Upon receipt from the SwMI, the message shall indicate to the MS-MLE a failure in the restoration of the C-Plane on the new selected cell.

**Table 18.9: D-RESTORE-FAIL PDU**

| Information element | Length | Type | C/O/M | Remark         |
|---------------------|--------|------|-------|----------------|
| PDU type            | 3      | 1    | M     | D-RESTORE-FAIL |
| Fail cause          | 2      | 1    | M     |                |

## 18.4.1.4.5a D-CHANNEL RESPONSE

- Message: D-CHANNEL RESPONSE
- Response to: U-CHANNEL REQUEST
- Response expected: -
- Short description: The message shall be sent by the SwMI in response to an MS request for an assigned channel replacement.

**Table 18.10: D-CHANNEL RESPONSE PDU**

| Information element  | Length | Type | C/O/M | Remark             |
|--|--------|------|-------|--------------------|
| PDU type   | 3      | 1    | M     | D-CHANNEL RESPONSE |
| Channel response type  | 1      | 1    | M     |                    |
| Reason for the channel request                                     | 3      | 1    | M     |                    |
| Channel request retry delay  | 4      | 1    | M     |                    |
| Reserved   | 8      | 2    | O     | See note           |
| Reserved   | 8      | 2    | O     | See note           |
| NOTE: In the present document, this element shall not be included. |        |      |       |                    |

## 18.4.1.4.6 U-PREPARE

- Message: U-PREPARE
- Response to: -
- Response expected: D-NEW-CELL/D-NWRK-BROADCAST /D-PREPARE-FAIL
- Short description: The message shall be sent on the serving cell to the SwMI by the MS-MLE, when preparation of cell reselection to a neighbour cell is in progress.

Table 18.11: U-PREPARE PDU

| Information element   | Length | Type | C/O/M | Remark    |
|---|--------|------|-------|-----------|
| PDU type  | 3      | 1    | M     | U-PREPARE |
| Cell identifier CA  | 5      | 2    | O     |           |
| SDU   |        |      |       | See note  |
| NOTE: The SDU may carry an MM registration PDU which is used to forward register to a new CA cell during announced type 1 cell reselection or a U-OTAR CCK DEMAND PDU which is used to request the Common Cipher Key (CCK) of the new cell. The SDU is coded according to the MM protocol description. There shall be no P-bit in the PDU coding preceding the SDU information element. |        |      |       |           |

## 18.4.1.4.6a U-PREPARE-DA

- Message: U-PREPARE-DA
- Response to: -
- Response expected: D-NEW-CELL/D-NWRK-BROADCAST/  
D-NWRK-BROADCAST-DA/D-PREPARE-FAIL
- Short description: The message shall be sent on the serving cell to the SwMI by the MS-MLE, when preparation of cell reselection to a neighbour cell is in progress.

Table 18.12: U-PREPARE-DA PDU

| Information element   | Length | Type | C/O/M | Remark       |
|---|--------|------|-------|--------------|
| PDU type  | 3      | 1    | M     | U-PREPARE-DA |
| Cell identifier DA  | 8      | 2    | O     |              |
| SDU   |        |      |       | See note     |
| NOTE: The SDU may carry an MM registration PDU which is used to forward register to a new DA cell during announced type 1 cell reselection or a U-OTAR CCK DEMAND PDU which is used to request the Common Cipher Key (CCK) of the new cell. The SDU is coded according to the MM protocol description. There shall be no P-bit in the PDU coding preceding the "SDU" information element. |        |      |       |              |

## 18.4.1.4.7 U-RESTORE

- Message: U-RESTORE
- Response to: -
- Response expected: D-RESTORE-ACK/D-RESTORE-FAIL
- Short description: The message shall be sent by the MS-MLE, when restoration of the C-Plane towards a new cell is in progress.

Table 18.13: U-RESTORE PDU

| Information element  | Length | Type | C/O/M | Remark            |
|--|--------|------|-------|-------------------|
| PDU type   | 3      | 1    | M     | U-RESTORE         |
| MCC  | 10     | 2    | O     | See notes 1 and 2 |
| MNC  | 14     | 2    | O     | See notes 1 and 2 |
| LA   | 14     | 2    | O     | See notes 1 and 2 |
| SDU  |        |      |       | See note 3        |
| NOTE 1: The element is present in the PDU if its value on the new cell is different from that on the old cell.   |        |      |       |                   |
| NOTE 2: When included, this element gives the value for the old cell.  |        |      |       |                   |
| NOTE 3: This PDU shall carry a CMCE U-CALL RESTORE PDU which shall be used to restore a call after cell reselection. The SDU is coded according to the CMCE protocol. There shall be no P-bit in the PDU coding preceding the "SDU" information element. |        |      |       |                   |

## 18.4.1.4.8 U-CHANNEL CLASS ADVICE

- Message: U-CHANNEL CLASS ADVICE
- Response to: -
- Response expected: -
- Short description: The message advises the SwMI of usable channel classes and the data priority of SN PDUs awaiting access to a packet data channel.

Table 18.14: U-CHANNEL CLASS ADVICE PDU

| Information element   | Length | Type | C/O/M | Remark                 |
|---|--------|------|-------|------------------------|
| PDU type  | 3      | 1    | M     | U-CHANNEL CLASS ADVICE |
| Number of channel class identifiers   | 2      | 1    | M     | See note 1             |
| Channel class identifier  | 4      |      | C     | Repeatable, see note 2 |
| Discriminator for SDU protocol present  | 1      | 1    | M     | See note 4             |
| Protocol discriminator  | 3      |      | C     | See notes 5 and 6      |
| Data priority   | 3      | 2    | O     |                        |
| SDU   |        |      |       | See note 3             |
| NOTE 1: Shall indicate the number of "channel class identifier" information elements: <ul style="list-style-type: none"> <li>- 00<sub>2</sub> means one "channel class identifier" information element i.e. four bits;</li> <li>- 01<sub>2</sub> means two "channel class identifier" information elements i.e. eight bits;</li> <li>- 10<sub>2</sub> means three "channel class identifier" information elements i.e. 12 bits;</li> <li>- 11<sub>2</sub> means four "channel class identifier" information elements i.e. 16 bits.</li> </ul> |        |      |       |                        |
| NOTE 2: Shall be present as many times as indicated by the "number of channel class identifiers" information element.   |        |      |       |                        |
| NOTE 3: There shall be no P-bit in the PDU coding preceding the "SDU" information element.  |        |      |       |                        |
| NOTE 4: If the "discriminator for SDU protocol present" information element has the value "0", the SwMI shall decode the SDU using the SMDCP protocol. If the "discriminator for SDU protocol present" information element has the value "1", the SwMI shall decode the SDU using the protocol indicated by the "protocol discriminator" information element.   |        |      |       |                        |
| NOTE 5: This instance of the "protocol discriminator" information element shall be present only if the "discriminator for SDU protocol present" information element is set to "1".  |        |      |       |                        |
| NOTE 6: If present, this instance of the "protocol discriminator" information element indicates the SDU protocol.   |        |      |       |                        |

NOTE: This PDU uses a minimum of 14 bits before the SDU, including the MLE protocol identifier and the O-bit. It uses 18 bits (including a P-bit) when the "data priority" information element is present. For example, this allows the following U-CHANNEL CLASS ADVICE PDU plus SN-DATA TRANSMIT REQUEST PDU combinations to be transmitted with an SSI without fragmentation:

- In SCH-Q/RA:
  - one channel class identifier with data priority, without SNEI, without resource request, without the 20-bit reserved information element and without a reservation requirement from layer 2; or
  - two channel class identifiers without data priority, without SNEI, without resource request, without the 20-bit reserved information element and without a reservation requirement from layer 2; or
- In SCH/HU:
  - one channel class identifier without data priority, with SNEI, with the 10-bit resource request, without the 20-bit reserved information element and without a reservation requirement from layer 2; or
  - two channel class identifiers with data priority, without SNEI, without resource request, with the 20-bit reserved information element and without a reservation requirement from layer 2; or
  - four channel class identifiers without data priority, without SNEI, with the 10-bit resource request, without the 20-bit reserved information element and with a reservation requirement from layer 2.

#### 18.4.1.4.9 U-CHANNEL REQUEST

- Message: U-CHANNEL REQUEST
- Response to: -
- Response expected: -
- Short description: The message shall be sent by the MS-MLE to request replacement of an assigned channel.

**Table 18.15: U-CHANNEL REQUEST PDU**

| Information element  | Length | Type | C/O/M | Remark            |
|--|--------|------|-------|-------------------|
| PDU type   | 3      | 1    | M     | U-CHANNEL REQUEST |
| Reason for the channel request   | 3      | 1    | M     |                   |
| Number of requested channel class identifiers  | 3      | 2    | O     |                   |
| Channel class identifier   | 4      |      |       | See note 1        |
| Number of requested channel identifiers  | 3      | 2    | O     |                   |
| Channel identifier   | 5      |      |       | See note 2        |
| Reserved   | 6      | 2    | O     | See note 3        |
| NOTE 1: The element shall be included as many times as indicated by the "number of requested channel class identifiers" element. It shall not be included if the "number of requested channel class identifiers" element is not present. There shall be no P-bit preceding each "channel class identifier" element which is carried by this PDU. |        |      |       |                   |
| NOTE 2: The element shall be included as many times as indicated by the "number of requested channel identifiers" element. It shall not be included if the "number of requested channel identifiers" element is not present. There shall be no P-bit preceding each "channel identifier" element which is carried by this PDU.                   |        |      |       |                   |
| NOTE 3: Shall not be used in the present document.   |        |      |       |                   |

## 18.4.1.4.10 U-IRREGULAR CHANNEL ADVICE

- Message: U-IRREGULAR CHANNEL ADVICE
- Response to: -
- Response expected: -
- Short description: The message advises the SwMI of irregular channels on the current cell which the MS can use from its current location.

Table 18.16: U-IRREGULAR CHANNEL ADVICE PDU

| Information element  | Length | Type | C/O/M | Remark                     |
|--|--------|------|-------|----------------------------|
| PDU type   | 3      | 1    | M     | U-IRREGULAR CHANNEL ADVICE |
| Number of channel identifiers  | 2      | 1    | M     | See note 1                 |
| Channel identifier   | 5      |      | C     | Repeatable, see note 2     |
| Discriminator for SDU protocol present   | 1      | 1    | M     | See note 4                 |
| Protocol discriminator   | 3      |      | C     | See notes 5 and 6          |
| Data priority  | 3      | 2    | O     |                            |
| SDU  |        |      |       | See note 3                 |
| <p>NOTE 1: Shall indicate the number of "channel identifier" information elements:</p> <ul style="list-style-type: none"> <li>- 00<sub>2</sub> means one "channel identifier" information element i.e. five bits;</li> <li>- 01<sub>2</sub> means two "channel identifier" information elements i.e. 10 bits;</li> <li>- 10<sub>2</sub> means three "channel identifier" information elements i.e. 15 bits;</li> <li>- 11<sub>2</sub> means four "channel identifier" information elements i.e. 20 bits.</li> </ul> <p>NOTE 2: Shall be present as many times as indicated by the "number of channel identifiers" information element.</p> <p>NOTE 3: There shall be no P-bit in the PDU coding preceding the "SDU" information element.</p> <p>NOTE 4: If the "discriminator for SDU protocol present" information element has the value "0", the SwMI shall decode the SDU using the SND CP protocol. If the "discriminator for SDU protocol present" information element has the value "1", the SwMI shall decode the SDU using the protocol indicated by the "protocol discriminator" information element.</p> <p>NOTE 5: The "protocol discriminator" information element shall be present only if the "discriminator for SDU protocol present" information element is set to "1".</p> <p>NOTE 6: If present, this instance of the "protocol discriminator" information element indicates the SDU protocol.</p> |        |      |       |                            |

NOTE: This PDU uses a minimum of 15 bits before the SDU, including the MLE protocol identifier and the O-bit. It uses 19 bits (including a P-bit) when the "data priority" information element is present. For example, this allows the following U-IRREGULAR CHANNEL ADVICE PDU plus SN-DATA TRANSMIT REQUEST PDU combinations to be transmitted with an SSI without fragmentation:

- in SCH-Q/RA:
  - with one suggested channel, with data priority, without SNEI, without resource request, without the 20-bit reserved information element, without NSAPI additional and without a reservation requirement from layer 2; or
- in SCH/HU:
  - with one suggested channel, without data priority, with SNEI, with the 10-bit resource request, without the 20-bit reserved element, without NSAPI additional and without a reservation requirement from layer 2; or
  - with one suggested channel, without data priority, without SNEI, without resource request, with the 20-bit reserved information element, without NSAPI additional and with a reservation requirement from layer 2; or
  - with four suggested channels, with data priority, without SNEI, with the 10-bit resource request, without the 20-bit reserved information element, without NSAPI additional and without a reservation requirement from layer 2.

## 18.4.2 Broadcast PDUs at the TLB-SAP

### 18.4.2.0 General

PDUs at the TLB SAP shall be transported using the layer 2 SYNC, SYNC-DA, SYSINFO, SYSINFO-Q and SYSINFO-DA PDUs. D-MLE-SYNC shall use the SYNC PDU, D-MLE-SYNC-DA shall use the SYNC-DA PDU, D-MLE-SYSINFO shall use the SYSINFO PDU, D-MLE-SYSINFO-Q shall use the SYSINFO-Q PDU and D-MLE-SYSINFO-DA shall use the SYSINFO-DA PDU.

### 18.4.2.1 D-MLE-SYNC

- Message: D-MLE-SYNC
- Response to: -
- Response expected: -
- Short description: This message informs CA MSs on a phase modulation channel about MLE information for the CA serving cell and gives CA (and DA) MSs information necessary for performing reselection to the CA cell on which the PDU is sent. The message can only be recognized within a MAC to MAC message on the  $\pi/4$ -DQPSK Broadcast Synchronization CHannel (BSCH). The message is contained within a MAC SYNC PDU.

**Table 18.17: D-MLE-SYNC PDU**

| Information element      | Length | Type | C/O/M | Remark |
|--------------------------|--------|------|-------|--------|
| MCC                      | 10     | 1    | M     |        |
| MNC                      | 14     | 1    | M     |        |
| Neighbour cell broadcast | 2      | 1    | M     |        |
| Cell load CA             | 2      | 1    | M     |        |
| Late entry supported     | 1      | 1    | M     |        |

This PDU shall not contain an "O" bit and shall be 29 bits in length.

When received on its serving cell, a CA MS shall use the information in this message to update its record of information about its serving cell. A DA MS shall not use the information in this message to alter its record of information about its serving cell.

## 18.4.2.1a D-MLE-SYNC-DA

- Message: D-MLE-SYNC-DA
- Response to: -
- Response expected: -
- Short description: This message informs DA MSs on a QAM channel about MLE information for the DA serving cell and gives DA (and CA) MSs information necessary for performing reselection to the DA cell on which the PDU is sent. The message is contained within a MAC SYNC-DA PDU.

Table 18.18: D-MLE-SYNC-DA PDU

| Information element   | Length | Type | C/O/M | Remark  |
|-----------------------|--------|------|-------|---|
| MCC                   | 10     | 1    | M     |   |
| MNC                   | 14     | 1    | M     |   |
| Cell load DA          | 3      | 1    | M     |   |
| Subscriber class      | 16     | 1    | M     |   |
| BS service details DA | 7      | 1    | M     |   |
| Wide-area cell        | 1      | 1    | M     |   |
| C/I path measurements | 2      | 1    | M     | See note  |
| Reserved              | 1      | 1    | M     | Reserved for future use. Shall be set to 0 in the present document. |

NOTE: If the "C/I path measurements" element is set to "10<sub>2</sub>" or "11<sub>2</sub>", the MS shall not use this cell in this version of the present document.

This PDU shall not contain an "O" bit and shall be 54 bits in length.

When received on its serving cell, a DA MS may use the information in this message to update its record of information about its serving cell. A CA MS shall not use this message to alter its record of information about its serving cell.

## 18.4.2.2 D-MLE-SYSINFO

- Message: D-MLE-SYSINFO
- Response to: -
- Response expected: -
- Short description: This message is used for informing CA MSs on a phase modulation channel about MLE information for the CA serving cell and for giving CA (and DA) MSs information necessary for performing reselection to the CA cell on which the PDU is sent. The message is contained within a MAC SYSINFO PDU.

Table 18.19: D-MLE-SYSINFO PDU

| Information element | Length | Type | C/O/M | Remark |
|---------------------|--------|------|-------|--------|
| Location area (LA)  | 14     | 1    | M     |        |
| Subscriber class    | 16     | 1    | M     |        |
| BS service details  | 12     | 1    | M     |        |

This PDU shall not contain an "O" bit and shall be 42 bits in length.

When received on its serving cell, a CA MS shall use the information in this message to update its record of information about its serving cell. A DA MS shall not use this message to alter its record of information about its serving cell. However, a DA MS shall regard the "air interface encryption service" information element in BS service details as being relevant to its operation on the current channel - see also clause 23.6.9.

## 18.4.2.2a D-MLE-SYSINFO-DA

- Message: D-MLE-SYSINFO-DA
- Response to: -
- Response expected: -
- Short description: This message is used for informing DA MSs on a QAM (or phase modulation) channel about MLE information for the DA serving cell. It is also used for giving DA (and CA) MSs information necessary for performing reselection to the DA cell on which the PDU is sent. The message is contained within a MAC SYSINFO-DA PDU.

Table 18.20: D-MLE-SYSINFO-DA PDU

| Information element  | Length | Type | C/O/M | Remark   |
|--|--------|------|-------|--|
| Neighbour cell broadcast   | 2      | 1    | M     |  |
| Cell load DA   | 3      | 1    | M     |  |
| Roaming control for individual services  | 1      | 1    | M     |  |
| Roaming control for group services and idle MSs  | 1      | 1    | M     |  |
| Late entry supported   | 1      | 1    | M     |  |
| Subscriber class included  | 1      | 1    | M     |  |
| Subscriber class   | 16     |      | C     | See notes 1 and 3  |
| Location Area (LA)   | 14     |      | C     | See notes 2 and 3  |
| Reserved   | 2      |      | C     | See note 2   |
| BS service details DA  | 7      | 1    | M     |  |
| Registration   | 1      | 1    | M     |  |
| De-registration  | 1      | 1    | M     |  |
| Cell type change registration  | 1      | 1    | M     |  |
| AL roaming supported   | 1      | 1    | M     |  |
| Reserved   | 11     | 1    | M     | Reserved for future use. Shall be set to zero in the present document. |
| NOTE 1: Shall be included only if "Subscriber class included" = 1.   |        |      |       |  |
| NOTE 2: Shall be included only if "Subscriber class included" = 0.   |        |      |       |  |
| NOTE 3: If either subscriber class or LA changes, the SwMI may wish to send the changed element several times in succession. |        |      |       |  |

This PDU shall not contain an "O" bit and shall be 47 bits in length.

When received on its serving cell, a DA MS shall use the information in this message to update its record of information about its serving cell. A CA MS shall not use this message to alter its record of information about its serving cell or current channel.

### 18.4.2.3 D-MLE-SYSINFO-Q

- Message: D-MLE-SYSINFO-Q
- Response to: -
- Response expected: -
- Short description: This message is used for informing CA MSs on a QAM channel about MLE information for the CA serving cell. The message is contained within a MAC SYSINFO-Q PDU.

**Table 18.21: D-MLE-SYSINFO-Q PDU**

| Information element      | Length | Type | C/O/M | Remark |
|--------------------------|--------|------|-------|--------|
| Neighbour cell broadcast | 2      | 1    | M     |        |
| Cell load CA             | 2      | 1    | M     |        |
| Late entry supported     | 1      | 1    | M     |        |
| Location Area (LA)       | 14     | 1    | M     |        |
| Subscriber class         | 16     | 1    | M     |        |
| BS service details       | 12     | 1    | M     |        |

This PDU shall not contain an "O" bit and shall be 47 bits in length.

When received on its serving cell, a CA MS shall use the information in this message to update its record of information about the serving cell. A DA MS shall not use this message.

## 18.5 Information elements coding

### 18.5.1 Cell reselection types supported

The "cell reselection types supported" information element shall define whether SwMI supports forward registration and if expedited cell reselection is recommended on the neighbour cell as defined in table 18.22.

**Table 18.22: Cell reselection types supported information element**

| Information element              | Length | Value           | Remark  |
|----------------------------------|--------|-----------------|---|
| Cell reselection types supported | 2      | 00 <sub>2</sub> | Forward registration is not supported   |
|                                  |        | 01 <sub>2</sub> | Forward registration is not supported, expedited cell reselection recommended |
|                                  |        | 10 <sub>2</sub> | Forward registration is supported   |
|                                  |        | 11 <sub>2</sub> | Forward registration is supported, expedited cell reselection recommended     |

#### 18.5.1a Cell reselection types supported DA

The "cell reselection types supported DA" information element shall define whether the SwMI supports forward registration and if expedited cell reselection is recommended on the neighbour cell as defined in table 18.23.

**Table 18.23: Cell reselection types supported DA information element**

| Information element        | Length | Value | Remark  |
|----------------------------|--------|-------|---|
| Forward registration       | 1      | 0     | Forward registration not supported            |
|                            |        | 1     | Forward registration supported                |
| Expedited cell reselection | 1      | 0     | Expedited cell reselection not recommended    |
|                            |        | 1     | Expedited cell reselection recommended        |
| Reserved                   | 6      | 0     | Shall be set to zero in the present document. |

### 18.5.1b AL roaming supported

The "AL roaming supported" information element shall indicate to the MS whether or not this cell supports AL roaming, as defined in table 18.24.

**Table 18.24: AL roaming supported information element**

| Information element  | Length | Value          | Remark                                |
|----------------------|--------|----------------|---------------------------------------|
| AL roaming supported | 1      | 0 <sub>2</sub> | AL roaming not supported on this cell |
|                      |        | 1 <sub>2</sub> | AL roaming supported on this cell     |

### 18.5.1c Bandwidth

The "bandwidth" information element shall indicate the RF bandwidth of a channel or channel class, as defined in table 18.25.

**Table 18.25: Bandwidth information element**

| Information element | Length | Value            | Remark   |
|---------------------|--------|------------------|----------|
| Bandwidth           | 3      | 000 <sub>2</sub> | 25 kHz   |
|                     |        | 001 <sub>2</sub> | 50 kHz   |
|                     |        | 010 <sub>2</sub> | 100 kHz  |
|                     |        | 011 <sub>2</sub> | 150 kHz  |
|                     |        | 100 <sub>2</sub> | Reserved |
|                     |        | etc.             | etc.     |
|                     |        | 111 <sub>2</sub> | Reserved |

## 18.5.2 BS service details and related information elements

### 18.5.2.1 BS service details

The "BS service details" information element shall contain information about which services are supported by the SwMI on a particular CA cell as defined in table 18.26.

**Table 18.26: BS Service details information element**

| Information element   | Length | Value | Remark   |
|---|--------|-------|--|
| Registration  | 1      | 0     | Registration not required on this cell                   |
|   |        | 1     | Registration mandatory on this cell                      |
| De-registration   | 1      | 0     | De-registration not required on this cell                |
|   |        | 1     | De-registration requested on this cell                   |
| Priority cell   | 1      | 0     | Cell is not a priority cell                              |
|   |        | 1     | Cell is a priority cell                                  |
| Minimum mode service  | 1      | 0     | Cell may use minimum mode                                |
|   |        | 1     | Cell never uses minimum mode                             |
| Migration   | 1      | 0     | Migration is not supported by this cell                  |
|   |        | 1     | Migration is supported by this cell                      |
| System wide services  | 1      | 0     | System wide services temporarily not supported           |
|   |        | 1     | Normal mode (system wide services supported)             |
| TETRA voice service<br>(see note 1)   | 1      | 0     | TETRA voice service is not supported on this cell        |
|   |        | 1     | TETRA voice service is supported on this cell            |
| Circuit mode data service<br>(see note 1)   | 1      | 0     | Circuit mode data service is not supported on this cell  |
|   |        | 1     | Circuit mode data service is supported on this cell      |
| Reserved  | 1      | 0     | Default value  |
|   |        | 1     | Reserved for future expansion                            |
| SNDTCP service  | 1      | 0     | SNDTCP service is not available on this cell             |
|   |        | 1     | SNDTCP service is available on this cell                 |
| Air interface encryption<br>service   | 1      | 0     | Air interface encryption is not available on this cell   |
|   |        | 1     | Air interface encryption is available on this cell       |
| Advanced link supported   | 1      | 0     | Advanced link is not supported on this cell (see note 2) |
|   |        | 1     | Advanced link is supported on this cell (see note 3)     |
| NOTE 1: TETRA voice service and circuit mode data service refer to the $\pi/4$ -DQPSK circuit mode service.<br>NOTE 2: If "0", neither the original advanced link nor the extended advanced link is supported on this cell.<br>NOTE 3: If "1", the original advanced link is supported on this cell, and the extended advanced link may be supported on this cell (see the "extended services broadcast section 1" information element in clause 21.4.4.1). |        |       |  |

## 18.5.2.2 BS service details DA

The "BS service details DA" information element shall contain information about which services are supported by the SwMI on a particular DA cell as defined in table 18.27.

**Table 18.27: BS Service details DA information element**

| Information element  | Length | Value | Remark  |
|--|--------|-------|---|
| Priority cell  | 1      | 0     | Cell is not a priority cell                             |
|  |        | 1     | Cell is a priority cell                                 |
| Migration  | 1      | 0     | Migration is not supported by this cell                 |
|  |        | 1     | Migration is supported by this cell                     |
| System wide services<br>(see note 1)   | 1      | 0     | System wide services temporarily not supported          |
|  |        | 1     | Normal mode (system wide services supported)            |
| TETRA voice service<br>(see note 2)  | 1      | 0     | TETRA voice service is not supported on this cell       |
|  |        | 1     | TETRA voice service is supported on this cell           |
| Circuit mode data service<br>(see note 2)  | 1      | 0     | Circuit mode data service is not supported on this cell |
|  |        | 1     | Circuit mode data service is supported on this cell     |
| Reserved   | 1      | 0     | Default value   |
|  |        | 1     | Reserved for future expansion                           |
| Air interface encryption<br>service  | 1      | 0     | Air interface encryption is not available on this cell  |
|  |        | 1     | Air interface encryption is available on this cell      |
| NOTE 1: DA cells shall support the SMDCP service and original and extended advanced links (unless the "system wide services" element in the D-MLE-SYSINFO-DA (and D-MLE-SYNC-DA) PDU indicates "system wide services temporarily not supported", in which case support of the SMDCP service and advanced links by the BS is optional). |        |       |   |
| NOTE 2: TETRA voice service and circuit mode data service refer to the $\pi/4$ -DQPSK circuit mode service.  |        |       |   |

## 18.5.2a BS transmit power relative to the main carrier

The "BS transmit power relative to the main carrier" information element shall be used to give the ratio of the BS transmit power on an RF channel or channel class to the BS transmit power on the MCCH or MCCH-Q controlling use of that RF channel or channel class, as defined in table 18.28.

**Table 18.28: BS transmit power relative to the main carrier information element**

| Information element                            | Length   | Value              | Remark   |
|--|----------|--------------------|----------|
| BS transmit power relative to the main carrier | 5        | 00000 <sub>2</sub> | Reserved |
|  |          | etc.               | etc.     |
|  |          | 00100 <sub>2</sub> | Reserved |
|  |          | 00101 <sub>2</sub> | -22 dB   |
|  |          | 00110 <sub>2</sub> | -20 dB   |
|  |          | 00111 <sub>2</sub> | -18 dB   |
|  |          | 01000 <sub>2</sub> | -16 dB   |
|  |          | 01001 <sub>2</sub> | -14 dB   |
|  |          | 01010 <sub>2</sub> | -12 dB   |
|  |          | 01011 <sub>2</sub> | -10 dB   |
|  |          | 01100 <sub>2</sub> | -8 dB    |
|  |          | 01101 <sub>2</sub> | -6 dB    |
|  |          | 01110 <sub>2</sub> | -4 dB    |
|  |          | 01111 <sub>2</sub> | -2 dB    |
|  |          | 10000 <sub>2</sub> | 0 dB     |
|  |          | 10001 <sub>2</sub> | 2dB      |
|  |          | 10010 <sub>2</sub> | 4 dB     |
|  |          | 10011 <sub>2</sub> | 6 dB     |
|  |          | 10100 <sub>2</sub> | 8 dB     |
|  |          | 10101 <sub>2</sub> | 10 dB    |
|  |          | 10110 <sub>2</sub> | 12 dB    |
|  |          | 10111 <sub>2</sub> | 14 dB    |
|  |          | 11000 <sub>2</sub> | 16 dB    |
|  |          | 11001 <sub>2</sub> | 18 dB    |
| 11010 <sub>2</sub>                             | 20 dB    |                    |          |
| 11011 <sub>2</sub>                             | 22 dB    |                    |          |
| 11100 <sub>2</sub>                             | Reserved |                    |          |
| etc.   | etc.     |                    |          |
| 11111 <sub>2</sub>                             | Reserved |                    |          |

The value of the BS transmit power relative to the main carrier information element shall include the BS relative antenna gains; i.e. it is the BS effective radiated power (ERP) into the RF channel or channel class relative to the BS ERP of the main carrier.

### 18.5.2b C/I path measurements

The "C/I path measurements" information element shall indicate to the MS whether or not this cell requires the MS to conduct C/I path measurements, as defined in table 18.29.

**Table 18.29: C/I path measurements information element**

| Information element   | Length | Value           | Remark   |
|---|--------|-----------------|--|
| C/I path measurements   | 2      | 00 <sub>2</sub> | RSSI measurements shall be used                              |
|   |        | 01 <sub>2</sub> | Either RSSI or C/I path measurements may be used. See note 1 |
|   |        | 10 <sub>2</sub> | C/I path measurements shall be used. See note 2              |
|   |        | 11 <sub>2</sub> | Reserved. See note 2   |
| NOTE 1: If the "C/I path measurements" element is set to "01 <sub>2</sub> ", MSs shall not use C/I measurements on this cell in the present document. |        |                 |  |
| NOTE 2: This value shall not be used in the present document.   |        |                 |  |

### 18.5.2c Carrier number

The "carrier number" information element shall define the carrier number for a channel as defined in table 18.30. See the "channel allocation" information element in clause 21 and ETSI TS 100 392-15 [18] for a full description of carrier numbering.

**Table 18.30: Carrier number information element**

| Information element | Length | Value | Remark  |
|---------------------|--------|-------|---|
| Carrier number      | 12     |       | Carrier number of channel as defined in clause 21 and ETSI TS 100 392-15 [18] |

### 18.5.2d Carrier number extension

The "carrier number extension" information element shall define extended carrier numbering information as defined in table 18.31. See the channel allocation information element in clause 21 and ETSI TS 100 392-15 [18] for a full description of carrier numbering.

**Table 18.31: Carrier number extension information element**

| Information element | Length | Value           | Remark  |
|---------------------|--------|-----------------|---|
| Frequency band      | 4      |                 | Provision for different frequency bands as defined in clause 21 and ETSI TS 100 392-15 [18] |
| Offset              | 2      | 00 <sub>2</sub> | No offset   |
|                     |        | 01 <sub>2</sub> | +6,25 kHz offset  |
|                     |        | 10 <sub>2</sub> | -6,25 kHz offset  |
|                     |        | 11 <sub>2</sub> | +12,5 kHz offset  |
| Duplex spacing      | 3      |                 | Provision for different duplex spacing as defined in clause 21 and ETSI TS 100 392-15 [18]  |
| Reverse operation   | 1      | 0               | Normal  |
|                     |        | 1               | Reverse   |

### 18.5.2e Carrier number extension flag

The "carrier number extension flag" information element shall determine whether the "carrier number extension" information element is present, as defined in table 18.32.

**Table 18.32: Carrier number extension flag information element**

| Information element           | Length | Value | Remark                                |
|-------------------------------|--------|-------|---------------------------------------|
| Carrier number extension flag | 1      | 0     | Carrier number extension not included |
|                               |        | 1     | Carrier number extension included     |

### 18.5.3 Cell identifier CA

The "cell identifier CA" information element shall be used to identify a CA neighbour cell as defined in table 18.33. The serving cell shall attach a cell identifier CA to each CA neighbour cell whenever the serving cell broadcasts information about that neighbour cell. The cell identifier CA can then be used subsequently to refer to that CA neighbour cell. When the SwMI assigns a cell identifier CA, it shall then be able to map this identifier to a physical CA cell whenever the MS uses the cell identifier CA (for example, in a U-PREPARE PDU).

The cell identifier CA may also be set equal to "00000<sub>2</sub>" in a U-PREPARE PDU to initiate the neighbour cell enquiry procedure which prompts the SwMI to send the D-NWRK-BROADCAST and, if relevant, the D-NWRK-BROADCAST EXTENSION PDU when the MS does not yet have the CA neighbour cell information.

**Table 18.33: Cell identifier CA information element**

| Information element | Length | Value              | Remark                   |
|---------------------|--------|--------------------|--------------------------|
| Cell identifier CA  | 5      | 00000 <sub>2</sub> | Neighbour cell enquiry   |
|                     |        | 00001 <sub>2</sub> | Valid cell identifier CA |
|                     |        | etc.               | etc.                     |
|                     |        | 11111 <sub>2</sub> | Valid cell identifier CA |

### 18.5.3a Cell identifier DA

The "cell identifier DA" information element shall be used to identify a DA neighbour cell as defined in table 18.34. The serving cell shall attach a cell identifier DA to each DA neighbour cell whenever the serving cell broadcasts information about that DA neighbour cell. The cell identifier DA may then be used subsequently to refer to that DA neighbour cell. When the SwMI assigns a cell identifier DA, it shall then be able to map this identifier to a physical DA cell whenever the MS uses the cell identifier DA (for example, in a U-PREPARE-DA PDU).

A DA cell may also use the "cell identifier DA" information element (in the D-NWRK-BROADCAST-DA PDU) to broadcast its own identity.

The cell identifier DA may be set equal to "00000000<sub>2</sub>" in a U-PREPARE-DA PDU to initiate the neighbour cell enquiry procedure which prompts the SwMI to send the D-NWRK-BROADCAST-DA PDU when the MS does not yet have the DA neighbour cell information. It may be set equal to "11111111<sub>2</sub>" in a U-PREPARE-DA PDU to elicit D-NWRK-BROADCAST-DA, D-NWRK-BROADCAST and, if relevant, the D-NWRK-BROADCAST EXTENSION PDUs.

**Table 18.34: Cell identifier DA information element**

| Information element | Length | Value                 | Remark  |
|---------------------|--------|-----------------------|---|
| Cell identifier DA  | 8      | 00000000 <sub>2</sub> | DA neighbour cell enquiry                       |
|                     |        | 00000001 <sub>2</sub> | Valid cell identifier DA                        |
|                     |        | etc.                  | etc.  |
|                     |        | 01111111 <sub>2</sub> | Valid cell identifier DA                        |
|                     |        | 10000000 <sub>2</sub> | Reserved  |
|                     |        | etc.                  | etc.  |
|                     |        | 11111110 <sub>2</sub> | Reserved  |
|                     |        | 11111111 <sub>2</sub> | CA neighbour cell and DA neighbour cell enquiry |

### 18.5.3b Cell load CA

The "cell load CA" information element shall define the level of service an MS may receive in a CA cell as defined in table 18.35. It may relate to the TCH and PDCH loading in a cell.

**Table 18.35: Cell load CA information element**

| Information element | Length | Value           | Remark            |
|---------------------|--------|-----------------|-------------------|
| Cell load CA        | 2      | 00 <sub>2</sub> | Cell load unknown |
|                     |        | 01 <sub>2</sub> | Low cell load     |
|                     |        | 10 <sub>2</sub> | Medium cell load  |
|                     |        | 11 <sub>2</sub> | High cell load    |

NOTE: This information element was formerly known as "cell service level".

### 18.5.3c Cell load DA

The "cell load DA" information element shall define the level of service an MS may receive in a DA cell as defined in table 18.36.

**Table 18.36: Cell load DA information element**

| Information element      | Length | Value | Remark                        |
|--------------------------|--------|-------|-------------------------------|
| TCH load                 | 1      | 0     | Low TCH load                  |
|                          |        | 1     | High TCH load                 |
| PDCH load                | 1      | 0     | Low PDCH load                 |
|                          |        | 1     | High PDCH load                |
| Control channel/SDS load | 1      | 0     | Low Control channel/SDS load  |
|                          |        | 1     | High Control channel/SDS load |

### 18.5.3d Cell load known

The "cell load known" information element shall indicate whether the cell load is known or unknown as defined in table 18.37.

**Table 18.37: Cell load known information element**

| Information element | Length | Value | Remark            |
|---------------------|--------|-------|-------------------|
| Cell load known     | 1      | 0     | Cell load unknown |
|                     |        | 1     | Cell load known   |

### 18.5.4 Cell re-select parameters

The "cell re-select parameters" information element shall define the threshold parameters for the cell reselection procedures in the MS as defined in table 18.38.

SLOW\_RESELECT\_THRESHOLD is the maximum level above the FAST\_RESELECT\_THRESHOLD for a radio improvable link i.e.  $SLOW\_RESELECT\_THRESHOLD = FAST\_RESELECT\_THRESHOLD + SLOW\_RESELECT\_THRESHOLD\_ABOVE\_FAST$ .

FAST\_RESELECT\_THRESHOLD is the maximum level above C1 = "0" for a radio relinquishable link.

SLOW\_RESELECT\_HYSTERESIS is the hysteresis for a radio improvable link.

FAST\_RESELECT\_HYSTERESIS is the hysteresis for a radio relinquishable link.

**Table 18.38: Cell re-select parameters information element**

| Information element                | Length | Value             | Remark |
|------------------------------------|--------|-------------------|--------|
| SLOW_RESELECT_THRESHOLD_ABOVE_FAST | 4      | 0000 <sub>2</sub> | 0 dB   |
|                                    |        | 0001 <sub>2</sub> | 2 dB   |
|                                    |        | etc.              | etc.   |
|                                    |        | 1111 <sub>2</sub> | 30 dB  |
| FAST_RESELECT_THRESHOLD            | 4      | 0000 <sub>2</sub> | 0 dB   |
|                                    |        | 0001 <sub>2</sub> | 2 dB   |
|                                    |        | etc.              | etc.   |
|                                    |        | 1111 <sub>2</sub> | 30 dB  |
| SLOW_RESELECT_HYSTERESIS           | 4      | 0000 <sub>2</sub> | 0 dB   |
|                                    |        | 0001 <sub>2</sub> | 2 dB   |
|                                    |        | etc.              | etc.   |
|                                    |        | 1111 <sub>2</sub> | 30 dB  |
| FAST_RESELECT_HYSTERESIS           | 4      | 0000 <sub>2</sub> | 0 dB   |
|                                    |        | 0001 <sub>2</sub> | 2 dB   |
|                                    |        | etc.              | etc.   |
|                                    |        | 1111 <sub>2</sub> | 30 dB  |

### 18.5.5 Cell type change registration

The "cell type change registration" information element indicates whether the MS is required to register with the SwMI if the MS reselects to a different cell type, as defined in table 18.39.

**Table 18.39: Cell type change registration information element**

| Information element           | Length | Value          | Remark  |
|-------------------------------|--------|----------------|---|
| Cell type change registration | 1      | 0 <sub>2</sub> | Registration not required on cell type change within the RA |
|                               |        | 1 <sub>2</sub> | Registration required on cell type change                   |

### 18.5.5a Channel characteristics

The "channel characteristics" information element shall indicate the characteristics of an RF channel or channel class, as defined in table 18.40.

**Table 18.40: Channel characteristics information element**

| Information element       | Length | Type | C/O/M | Remark |
|---------------------------|--------|------|-------|--------|
| Modulation mode           | 3      | 1    | M     |        |
| Bandwidth                 | 3      | 1    | M     |        |
| Maximum MS transmit power | 3      | 1    | M     |        |
| Minimum RX access level   | 4      | 1    | M     |        |
| Reserved                  | 5      | 1    | M     |        |

### 18.5.5b Channel class

The "channel class" information element shall indicate a channel class, as defined in table 18.41.

**Table 18.41: Channel class information element**

| Information element                        | Length | Type | C/O/M | Remark |
|--|--------|------|-------|--------|
| Channel class identifier                   | 4      | 1    | M     |        |
| Channel characteristics                    | 18     | 1    | M     |        |
| BS transmit power relative to main carrier | 5      | 1    | M     |        |

### 18.5.5c Channel class identifier

The "channel class identifier" information element provides a reference label to a channel class, as defined in table 18.42.

**Table 18.42: Channel class identifier information element**

| Information element      | Length | Value             | Remark                             |
|--------------------------|--------|-------------------|------------------------------------|
| Channel class identifier | 4      | 0000 <sub>2</sub> | The channel class is not specified |
|                          |        | 0001 <sub>2</sub> | Conforming channel class           |
|                          |        | 0010 <sub>2</sub> | Valid channel class identifier     |
|                          |        | etc.              | etc.                               |
|                          |        | 1111 <sub>2</sub> | Valid channel class identifier     |

### 18.5.6 Channel command valid

The "channel command valid" information element shall indicate to the MS-MLE when to initiate a channel change as a result of cell reselection as defined in table 18.43.

**Table 18.43: Channel command valid information element**

| Information element   | Length | Value           | Remark  |
|-----------------------|--------|-----------------|---|
| Channel command valid | 2      | 00 <sub>2</sub> | Follow MAC channel change (follow channel allocation in MAC header) |
|                       |        | 01 <sub>2</sub> | Change channel immediately  |
|                       |        | 10 <sub>2</sub> | No channel change - wait for next D-NEW-CELL                        |
|                       |        | 11 <sub>2</sub> | Reserved  |

### 18.5.6a Channel identifier

The "channel identifier" information element provides a reference label to a channel, as defined in table 18.44.

**Table 18.44: Channel identifier information element**

| Information element | Length | Value              | Remark                   |
|---------------------|--------|--------------------|--------------------------|
| Channel identifier  | 5      | 0000 <sub>2</sub>  | Reserved                 |
|                     |        | 00001 <sub>2</sub> | Valid channel identifier |
|                     |        | etc.               | etc.                     |
|                     |        | 11111 <sub>2</sub> | Valid channel identifier |

### 18.5.6b Channel request retry delay

The "channel request retry delay" information element shall indicate the minimum delay, as defined in table 18.45, before the MS is permitted to transmit a U-CHANNEL REQUEST PDU containing the same value of "reason for the channel request" information element as used in a previously transmitted U-CHANNEL REQUEST PDU.

**Table 18.45: Channel request retry delay information element**

| Information element         | Length                       | Value             | Remark   |
|-----------------------------|------------------------------|-------------------|----------|
| Channel request retry delay | 4                            | 0000 <sub>2</sub> | No delay |
|                             |                              | 0001 <sub>2</sub> | 5 s      |
|                             |                              | 0010 <sub>2</sub> | 10 s     |
|                             |                              | 0011 <sub>2</sub> | 15 s     |
|                             |                              | 0100 <sub>2</sub> | 20 s     |
|                             |                              | 0101 <sub>2</sub> | 25 s     |
|                             |                              | 0110 <sub>2</sub> | 30 s     |
|                             |                              | 0111 <sub>2</sub> | 40 s     |
|                             |                              | 1000 <sub>2</sub> | 50 s     |
|                             |                              | 1001 <sub>2</sub> | 60 s     |
|                             |                              | 1010 <sub>2</sub> | 80 s     |
|                             |                              | 1011 <sub>2</sub> | 120 s    |
|                             |                              | 1100 <sub>2</sub> | 300 s    |
|                             |                              | 1101 <sub>2</sub> | Reserved |
|                             |                              | etc.              | etc.     |
|                             |                              | 1110 <sub>2</sub> | Reserved |
| 1111 <sub>2</sub>           | Retransmission not permitted |                   |          |

### 18.5.6c Channel response type

The "channel response type" information element shall indicate the type of response, as defined in table 18.46.

**Table 18.46: Channel response type information element**

| Information element   | Length | Value          | Remark           |
|-----------------------|--------|----------------|------------------|
| Channel response type | 1      | 0 <sub>2</sub> | Request accepted |
|                       |        | 1 <sub>2</sub> | Request rejected |

### 18.5.6d Data priority

The "data priority" information element shall indicate to the SwMI the data priority of SN PDUs waiting for access to a packet data channel as defined in table 18.47.

**Table 18.47: Data priority information element**

| Information element | Length | Value            | Remark                                  |
|---------------------|--------|------------------|---|
| Data priority       | 3      | 000 <sub>2</sub> | Data priority 0 (lowest data priority)  |
|                     |        | 001 <sub>2</sub> | Data priority 1                         |
|                     |        | etc.             | etc.                                    |
|                     |        | 111 <sub>2</sub> | Data priority 7 (highest data priority) |

### 18.5.6e De-registration

The "de-registration" information element shall indicate to the MS whether or not the MS is requested to de-register when it leaves the cell, as defined in table 18.48.

**Table 18.48: De-registration information element**

| Information element | Length | Value          | Remark                                    |
|---------------------|--------|----------------|---|
| De-registration     | 1      | 0 <sub>2</sub> | De-registration not required on this cell |
|                     |        | 1 <sub>2</sub> | De-registration requested on this cell    |

### 18.5.6f Discriminator for SDU protocol present

The "discriminator for SDU protocol present" information element shall be set to "0" in the present document, as defined in table 18.48a.

**Table 18.48a: Discriminator for SDU protocol present information element**

| Information element                    | Length | Value          | Remark   |
|--|--------|----------------|--|
| Discriminator for SDU protocol present | 1      | 0 <sub>2</sub> | Protocol discriminator information element not present |
|  |        | 1 <sub>2</sub> | Protocol discriminator information element follows     |

### 18.5.7 Fail cause

The "fail cause" information element shall indicate to the MS the failure cause as a result of requesting an MLE service in the SwMI as defined in table 18.49.

**Table 18.49: Fail cause information element**

| Information element | Length | Value           | Remark  |
|---------------------|--------|-----------------|---|
| Fail cause          | 2      | 00 <sub>2</sub> | Neighbour cell enquiry not available (neighbouring cell enquiry);<br>Temporary break in service (cell reselection); |
|                     |        | 01 <sub>2</sub> | Cell reselection type not supported   |
|                     |        | 10 <sub>2</sub> | MS not allowed on cell  |
|                     |        | 11 <sub>2</sub> | Restoration cannot be done on cell  |

## 18.5.8 Late entry supported

The "late entry supported" information element shall indicate to the MS whether or not late entry can be supported by the cell as defined in table 18.50.

**Table 18.50: Late entry supported information element**

| Information element  | Length | Value | Remark                   |
|----------------------|--------|-------|--------------------------|
| Late entry supported | 1      | 0     | Late entry not supported |
|                      |        | 1     | Late entry available     |

## 18.5.8a Local cell identifier DA

The "local cell identifier DA" information element indicates the cell identifier used by a DA neighbour cell to identify itself to MSs that are camped on that DA neighbour cell. The MS may be able to use this (in combination with the LA of the DA neighbour cell) to recognize a cell that it has used before (see clause 18.3.6.6). The "local cell identifier DA" information element is defined in table 18.51.

**Table 18.51: Local cell identifier DA information element**

| Information element      | Length | Value                 | Remark                   |
|--------------------------|--------|-----------------------|--------------------------|
| Local cell identifier DA | 8      | 00000000 <sub>2</sub> | Reserved                 |
|                          |        | 00000001 <sub>2</sub> | Valid cell identifier DA |
|                          |        | etc.                  | etc.                     |
|                          |        | 01111111 <sub>2</sub> | Valid cell identifier DA |
|                          |        | 10000000 <sub>2</sub> | Reserved                 |
|                          |        | etc.                  | etc.                     |
|                          |        | 11111111 <sub>2</sub> | Reserved                 |

## 18.5.9 Location Area (LA)

The "Location Area (LA)" information element shall define the LA in which a cell is located, either the serving cell or a neighbour cell as defined in table 18.52.

**Table 18.52: Location Area (LA) information element**

| Information element | Length | Value | Remark |
|---------------------|--------|-------|--------|
| Location Area (LA)  | 14     |       |        |

## 18.5.10 Main carrier number

The "main carrier number" information element shall define the main carrier number for a neighbour cell as defined in table 18.53. See the "channel allocation" element in clause 21 and ETSI TS 100 392-15 [18] for a full description of carrier numbering.

**Table 18.53: Main carrier number information element**

| Information element | Length | Value | Remark  |
|---------------------|--------|-------|---|
| Main carrier        | 12     |       | Main carrier number of neighbour cell as defined in clause 21 and ETSI TS 100 392-15 [18] |

### 18.5.11 Main carrier number extension

The "main carrier number extension" information element shall define extended carrier numbering information as defined in table 18.54. See the "channel allocation" element in clause 21 and ETSI TS 100 392-15 [18] for a full description of carrier numbering.

**Table 18.54: Main carrier number extension information element**

| Information element | Length | Value           | Remark  |
|---------------------|--------|-----------------|---|
| Frequency band      | 4      |                 | Provision for different frequency bands as defined in clause 21 and ETSI TS 100 392-15 [18] |
| Offset              | 2      | 00 <sub>2</sub> | No offset   |
|                     |        | 01 <sub>2</sub> | +6,25 kHz offset  |
|                     |        | 10 <sub>2</sub> | -6,25 kHz offset  |
|                     |        | 11 <sub>2</sub> | +12,5 kHz offset  |
| Duplex spacing      | 3      |                 | Provision for different duplex spacing as defined in clause 21 and ETSI TS 100 392-15 [18]  |
| Reverse operation   | 1      | 0               | Normal  |
|                     |        | 1               | Reverse   |

### 18.5.11a Main control channel modulation mode

The "main control channel modulation mode" information element indicates the neighbour cell's main control channel modulation mode as defined in table 18.55.

**Table 18.55: Main control channel modulation mode information element**

| Information element                  | Length | Value            | Remark   |
|--------------------------------------|--------|------------------|----------|
| Main control channel modulation mode | 3      | 000 <sub>2</sub> | Reserved |
|                                      |        | 001 <sub>2</sub> | Reserved |
|                                      |        | 010 <sub>2</sub> | QAM      |
|                                      |        | 011 <sub>2</sub> | Reserved |
|                                      |        | etc.             | etc.     |
|                                      |        | 111 <sub>2</sub> | Reserved |

### 18.5.12 Minimum Rx access level

The "minimum RX access level" is the sum of the minimum power level at which the BS wishes to receive MSs and the link imbalance for an MS transmitting at "maximum MS transmit power" on a main carrier or assigned channel or channel class. It shall be encoded as defined in table 18.56. It is used by the MS for path loss calculation as defined in clauses 23.7.1.2, 23.7.1.4 and 23.7.1.5, where its values may be adjusted due to bandwidth differences before being used in the calculation.

**Table 18.56: Minimum RX access level information element**

| Information element  | Length | Value             | Remark               |
|--|--------|-------------------|----------------------|
| Minimum RX access level<br>(see notes 1, 2 and 3)  | 4      | 0000 <sub>2</sub> | -125 dBm             |
|  |        | 0001 <sub>2</sub> | -120 dBm             |
|  |        | etc.              | etc.                 |
|  |        | 1111 <sub>2</sub> | -50 dBm (5 dB steps) |
| NOTE 1: When received in a "neighbour cell information for CA" or "neighbour cell information for DA" element, the "minimum RX access level" element refers to the main carrier of the neighbour cell; when received in a "channel characteristics" element, the "minimum RX access level" element refers to the channel described by the "channel characteristics" element. |        |                   |                      |
| NOTE 2: This parameter is used in the calculation of path loss parameter C2 (clause 23.7.1.2), where it is called RXLEV_ACCESS_MIN_MCELL(n) and path loss parameters C4 and C5 (clauses 23.7.1.4 and 23.7.1.5), where it is called RXLEV_ACCESS_MIN_MCELL(m).  |        |                   |                      |
| NOTE 3: The BS may use the "minimum RX access level" to limit the range of the cell or channel or channel class.   |        |                   |                      |

### 18.5.13 Maximum MS transmit power

The "maximum MS transmit power" information element shall indicate to the MS the maximum power that is allowed to be transmitted in either a neighbour cell, or in an RF channel or channel class . It shall be encoded as defined in table 18.57.

**Table 18.57: Maximum MS transmit power information element**

| Information element   | Length | Value            | Remark   |
|---|--------|------------------|----------|
| Maximum MS transmit power<br>(see note)   | 3      | 000 <sub>2</sub> | Reserved |
|   |        | 001 <sub>2</sub> | 15 dBm   |
|   |        | 010 <sub>2</sub> | 20 dBm   |
|   |        | 011 <sub>2</sub> | 25 dBm   |
|   |        | 100 <sub>2</sub> | 30 dBm   |
|   |        | 101 <sub>2</sub> | 35 dBm   |
|   |        | 110 <sub>2</sub> | 40 dBm   |
|   |        | 111 <sub>2</sub> | 45 dBm   |
| NOTE: This parameter is used in the calculation of path loss parameter C2 (clause 23.7.1.2), where it is called MS_TXPWR_MAX_MCELL(n) and path loss parameters C4 and C5 (clauses 23.7.1.4 and 23.7.1.5), where it is called MS_TXPWR_MAX_MCELL(m). |        |                  |          |

### 18.5.14 MCC

The "MCC" information element shall indicate which country a cell is located in as defined in table 18.58. Refer to ETSI EN 300 392-1 [6], clause 7.2.5 for an explanation of how it is coded and refer to Recommendation ITU-T E.218 [42], <http://www.itu.int/>, for country code values.

**Table 18.58: MCC information element**

| Information element | Length | Value | Remark |
|---------------------|--------|-------|--------|
| MCC                 | 10     |       |        |

### 18.5.15 MNC

The "MNC" information element shall indicate which network a cell is located in as defined in table 18.59.

**Table 18.59: MNC information element**

| Information element | Length | Value | Remark                              |
|---------------------|--------|-------|-------------------------------------|
| MNC                 | 14     |       | See ETSI EN 300 392-1 [6] clause 7. |

### 18.5.15a Modulation mode

The "modulation mode" information element shall indicate to the MS the modulation mode of an RF channel or channel class, as defined in table 18.60.

**Table 18.60: Modulation mode information element**

| Information element | Length | Value            | Remark                         |
|---------------------|--------|------------------|--------------------------------|
| Modulation mode     | 3      | 000 <sub>2</sub> | $\pi/4$ -DQPSK modulation mode |
|                     |        | 001 <sub>2</sub> | D8PSK modulation mode          |
|                     |        | 010 <sub>2</sub> | QAM modulation mode            |
|                     |        | 011 <sub>2</sub> | Reserved                       |
|                     |        | etc.             | etc.                           |
|                     |        | 111 <sub>2</sub> | Reserved                       |

## 18.5.16 Neighbour cell broadcast

The "neighbour cell broadcast" information element shall indicate how an MS can obtain information about neighbour cells as defined in table 18.61. The neighbour cell information may be broadcast by the SwMI using the D-NWRK-BROADCAST, D-NWRK-BROADCAST EXTENSION or D-NWRK-BROADCAST-DA PDUs, or the MS may use the U-PREPARE or U-PREPARE-DA PDU to enquire for the neighbour cell broadcast information.

**Table 18.61: Neighbour cell broadcast information element**

| Information element   | Length | Value | Remark        |
|---|--------|-------|---------------|
| D-NWRK-BROADCAST or<br>D-NWRK-BROADCAST-DA<br>broadcast supported | 1      | 0     | Not supported |
|   |        | 1     | Supported     |
| D-NWRK-BROADCAST or<br>D-NWRK-BROADCAST-DA<br>enquiry supported   | 1      | 0     | Not supported |
|   |        | 1     | Supported     |

### 18.5.16a Neighbour cell channel class for CA

The "neighbour cell channel class for CA" information element shall indicate a channel class available on a CA neighbour cell, as defined in table 18.62.

**Table 18.62: Neighbour cell channel class for CA information element**

| Information element | Length | Type | C/O/M | Remark |
|---------------------|--------|------|-------|--------|
| Cell identifier CA  | 5      | 1    | M     |        |
| Channel class       | 27     | 1    | M     |        |

### 18.5.16b Neighbour cell channel class for DA

The "neighbour cell channel class for DA" information element shall indicate a channel class available on a DA neighbour cell, as defined in table 18.63.

**Table 18.63: Neighbour cell channel class for DA information element**

| Information element | Length | Type | C/O/M | Remark |
|---------------------|--------|------|-------|--------|
| Cell identifier DA  | 8      | 1    | M     |        |
| Channel class       | 27     | 1    | M     |        |

## 18.5.17 Neighbour cell information for CA

The "neighbour cell information for CA" information element shall contain information about a CA neighbour cell as defined in table 18.64.

**Table 18.64: Neighbour cell information for CA element**

| Information element  | Length | Type | C/O/M | Remark     |
|--|--------|------|-------|------------|
| Cell identifier CA   | 5      | 1    | M     |            |
| Cell reselection types supported   | 2      | 1    | M     |            |
| Neighbour cell synchronized  | 1      | 1    | M     |            |
| Cell load CA   | 2      | 1    | M     |            |
| Main carrier number  | 12     | 1    | M     |            |
| Main carrier number extension  | 10     | 2    | O     | See note 1 |
| MCC  | 10     | 2    | O     | See note 2 |
| MNC  | 14     | 2    | O     | See note 2 |
| Location Area (LA)   | 14     | 2    | O     | See note 2 |
| Maximum MS transmit power  | 3      | 2    | O     | See note 2 |
| Minimum RX access level  | 4      | 2    | O     | See note 2 |
| Subscriber class   | 16     | 2    | O     | See note 2 |
| BS service details   | 12     | 2    | O     | See note 2 |
| Timeshare cell information or security parameters  | 5      | 2    | O     | See note 3 |
| TDMA frame offset  | 6      | 2    | O     | See note 4 |
| <p>NOTE 1: If not present, the "Main carrier number" element shall fully define the frequency of the neighbour cell main carrier. The neighbour cell extended carrier numbering information shall be assumed to be the same as that of the serving cell.</p> <p>NOTE 2: If not present, the neighbour cell parameter shall be assumed to be the same as that of the serving cell.</p> <p>NOTE 3: If not present, it shall be assumed that the neighbour cell is not operating in a discontinuous mode of operation and that the neighbour cell's security information is the same as that of the serving cell. If the element contains "reserved frames per two multiframes" (i.e. timeshare cell information), then the security information shall not be changed in the MS. If the element contains security parameters, then the timeshare cell information shall not be changed in the MS.</p> <p>NOTE 4: If present, the neighbour cell shall be synchronized to the serving cell and this element shall indicate the frame offset for the neighbour cell. If the cells are synchronized and this element is not present, it shall be assumed by the MS that the TDMA frame offset = 0.</p> |        |      |       |            |

For this information element there shall be a P-bit for each type 2 element contained within.

## 18.5.17a Neighbour cell information for DA

The "neighbour cell information for DA" information element shall contain information about a DA neighbour cell as defined in table 18.65.

**Table 18.65: Neighbour cell information for DA information element**

| Information element                  | Length | Type | C/O/M | Remark                        |
|--------------------------------------|--------|------|-------|-------------------------------|
| Cell identifier DA                   | 8      | 1    | M     |                               |
| Cell reselection types supported DA  | 8      | 1    | M     |                               |
| Neighbour cell synchronized          | 1      | 1    | M     |                               |
| Wide-area cell                       | 1      | 1    | M     |                               |
| C/I path measurements                | 2      | 1    | M     | See note 1                    |
| Cell load known                      | 1      | 1    | M     |                               |
| Cell load DA                         | 3      |      | C     | See note 2                    |
| Main carrier number                  | 12     | 1    | M     |                               |
| Main control channel modulation mode | 3      | 1    | M     | See note 3                    |
| Bandwidth                            | 3      | 1    | M     | Bandwidth of the main carrier |
| Main carrier number extension        | 10     | 2    | O     | See note 4                    |
| MCC                                  | 10     | 2    | O     | See note 5                    |
| MNC                                  | 14     | 2    | O     | See note 5                    |
| Location Area (LA)                   | 14     | 2    | O     | See note 5                    |
| Local cell identifier DA             | 8      | 2    | O     | See note 6                    |
| Maximum MS transmit power            | 3      | 2    | O     | See note 5                    |
| Minimum RX access level              | 4      | 2    | O     | See note 5                    |
| Subscriber class                     | 16     | 2    | O     | See note 5                    |
| BS service details DA                | 7      | 2    | O     | See note 7                    |
| Security parameters                  | 3      | 2    | O     | See notes 5 and 8             |
| TDMA frame offset                    | 6      | 2    | O     | See note 9                    |
| Reserved                             | 3      | 2    | O     | See note 10                   |
| Reserved                             | 4      | 2    | O     | See note 10                   |
| Reserved                             | 8      | 2    | O     | See note 10                   |

NOTE 1: If the "C/I path measurements" element is set to "10<sub>2</sub>" or "11<sub>2</sub>" the MS shall not use the indicated cell in this version of the present document.

NOTE 2: Shall be present only if "cell load known" element is set to value "cell load known".

NOTE 3: If the "main control channel modulation mode" is not set to "QAM" the MS shall not use the indicated cell in this version of the present document.

NOTE 4: If not present, the "Main carrier number" element shall fully define the frequency of the neighbour cell main carrier. The neighbour cell extended carrier numbering information shall be assumed to be the same as that of the serving cell. The SwMI should take this into account when this element is sent on a channel that is used by MSs from more than one cell.

NOTE 5: If not present, this neighbour cell element shall be assumed by the MS to be the same as for the serving cell. The SwMI should take this into account when this element is sent on a channel that is used by MSs from more than one cell.

NOTE 6: The "local cell identifier DA" element indicates the cell identifier that the DA neighbour cell uses to identify itself to MSs that are camped on that DA neighbour cell. The "local cell identifier DA" element thus indicates the value that the DA neighbour cell uses for the "cell identifier DA" element when the DA neighbour cell sends D-NWRK-BROADCAST-DA PDUs. The MS may be able to use this (in combination with the LA of the DA neighbour cell) to recognize a cell that it has used before (see clause 18.3.6.6).

NOTE 7: If not present, DA MSs shall assume that this neighbour cell element is the same as for the DA serving cell, and CA MSs shall assume that its constituent elements are the same as the equivalent elements in "BS service details" for the CA serving cell. The SwMI should take this into account when this element is sent on a channel that is used by MSs from more than one cell.

NOTE 8: The information element shall be used as defined in ETSI EN 300 392-7 [8].

NOTE 9: If present, the neighbour cell shall be synchronized to the serving cell and this element shall indicate the frame offset for the neighbour cell. If the cells are synchronized and this element is not present, it shall be assumed by the MS that the TDMA frame offset = 0.

NOTE 10: The reserved element shall not be used in the present document.

For this information element there shall be a P-bit for each type 2 information element contained within.

NOTE: When a channel is used by MSs from more than one DA cell, a DA MS may receive information about its serving cell in the "neighbour cell information for DA" information element. The DA MS should detect this and should not attempt to reselect to its serving cell.

### 18.5.17b Neighbour cell irregular channel detail for CA

The "neighbour cell irregular channel detail for CA" information element shall indicate an irregular channel available on a CA neighbour cell, as defined in table 18.66.

**Table 18.66: Neighbour cell irregular channel detail for CA information element**

| Information element      | Length   | Type | C/O/M | Remark |
|--------------------------|----------|------|-------|--------|
| Cell identifier CA       | 5        | 1    | M     |        |
| Irregular channel detail | variable | 1    | M     |        |

### 18.5.17c Neighbour cell irregular channel detail for DA

The "neighbour cell irregular channel detail for DA" information element shall indicate an irregular channel available on a DA neighbour cell, as defined in table 18.67.

**Table 18.67: Neighbour cell irregular channel detail for DA information element**

| Information element      | Length   | Type | C/O/M | Remark |
|--------------------------|----------|------|-------|--------|
| Cell identifier DA       | 8        | 1    | M     |        |
| Irregular channel detail | variable | 1    | M     |        |

### 18.5.18 Neighbour cell synchronized

The "neighbour cell synchronized" information element shall indicate whether or not the neighbour cell is synchronized to the serving cell as defined in table 18.68.

**Table 18.68: Neighbour cell synchronized information element**

| Information element         | Length | Value | Remark                             |
|-----------------------------|--------|-------|------------------------------------|
| Neighbour cell synchronized | 1      | 0     | Neighbour cell is not synchronized |
|                             |        | 1     | Neighbour cell is synchronized     |

NOTE: See clause 7.7 for the meaning of "synchronized" in this context.

### 18.5.18a Number of CA cells for removal

The "number of CA cells for removal" information element shall indicate how many "removal data for CA cell" elements follow as defined in table 18.69.

**Table 18.69: Number of CA cells for removal information element**

| Information element            | Length | Value              | Remark  |
|--------------------------------|--------|--------------------|---|
| Number of CA cells for removal | 5      | 00000 <sub>2</sub> | No "removal data for CA cell" elements contained in this PDU        |
|                                |        | 00001 <sub>2</sub> | Number of "removal data for CA cell" elements contained in this PDU |
|                                |        | etc.               | etc.  |
|                                |        | 11111 <sub>2</sub> | Number of "removal data for CA cell" elements contained in this PDU |

### 18.5.18b Number of CA neighbour cell channel classes

The "number of CA neighbour cell channel classes" information element shall indicate how many "Neighbour cell channel class for CA" information elements follow as defined in table 18.70.

**Table 18.70: Number of CA neighbour cell channel classes information element**

| Information element                         | Length | Value              | Remark   |
|---|--------|--------------------|--|
| Number of CA neighbour cell channel classes | 5      | 00000 <sub>2</sub> | No CA neighbour cell channel classes available                                 |
|   |        | 00001 <sub>2</sub> | Number of "Neighbour cell channel class for CA" elements contained in this PDU |
|   |        | etc.               | etc.   |
|   |        | 11111 <sub>2</sub> | Number of "Neighbour cell channel class for CA" elements contained in this PDU |

### 18.5.18c Number of CA neighbour cells

The "number of CA neighbour cells" information element shall indicate how many "neighbour cell information for CA" elements follow as defined in table 18.71.

**Table 18.71: Number of CA neighbour cells information element**

| Information element          | Length | Value            | Remark   |
|------------------------------|--------|------------------|--|
| Number of CA neighbour cells | 3      | 000 <sub>2</sub> | No CA neighbour cell information available                                   |
|                              |        | 001 <sub>2</sub> | Number of "Neighbour cell information for CA" elements contained in this PDU |
|                              |        | etc.             | etc.   |
|                              |        | 111 <sub>2</sub> | Number of "Neighbour cell information for CA" elements contained in this PDU |

### 18.5.18d Number of CA neighbour cell irregular channel details

The "number of CA neighbour cell irregular channel details" information element shall indicate how many "neighbour cell irregular channel detail for CA" information elements follow as defined in table 18.72.

**Table 18.72: Number of CA neighbour cell irregular channel details information element**

| Information element                                   | Length | Value               | Remark  |
|---|--------|---------------------|---|
| Number of CA neighbour cell irregular channel details | 6      | 000000 <sub>2</sub> | No CA neighbour cell irregular channel details available                                  |
|   |        | 000001 <sub>2</sub> | Number of "neighbour cell irregular channel detail for CA" elements contained in this PDU |
|   |        | etc.                | etc.  |
|   |        | 111111 <sub>2</sub> | Number of "neighbour cell irregular channel detail for CA" elements contained in this PDU |

### 18.5.18e Number of channel classes (for serving cell)

The "number of channel classes (for serving cell)" information element shall indicate how many "channel class" information elements follow as defined in table 18.73.

**Table 18.73: Number of channel classes (for serving cell) information element**

| Information element                          | Length | Value             | Remark   |
|--|--------|-------------------|--|
| Number of channel classes (for serving cell) | 4      | 0000 <sub>2</sub> | No channel classes available                             |
|  |        | 0001 <sub>2</sub> | Number of "channel class" elements contained in this PDU |
|  |        | etc.              | etc.   |
|  |        | 1111 <sub>2</sub> | Number of "channel class" elements contained in this PDU |

### 18.5.18f Number of channel class identifiers

The "number of channel class identifiers" information element shall indicate how many "channel class identifier" information elements follow, as defined in table 18.74.

**Table 18.74: Number of channel class identifiers information element**

| Information element                 | Length | Value           | Remark   |
|-------------------------------------|--------|-----------------|--|
| Number of channel class identifiers | 2      | 00 <sub>2</sub> | One "channel class identifier" element is included in this PDU     |
|                                     |        | 01 <sub>2</sub> | Two "channel class identifier" elements are included in this PDU   |
|                                     |        | 10 <sub>2</sub> | Three "channel class identifier" elements are included in this PDU |
|                                     |        | 11 <sub>2</sub> | Four "channel class identifier" elements are included in this PDU  |

### 18.5.18g Number of channel classes for removal

The "number of channel classes for removal" information element shall indicate how many "channel class identifier" information elements follow, as defined in table 18.75.

**Table 18.75: Number of channel classes for removal information element**

| Information element                   | Length | Value             | Remark   |
|---------------------------------------|--------|-------------------|--|
| Number of channel classes for removal | 4      | 0000 <sub>2</sub> | No "channel class identifiers" elements follow this element            |
|                                       |        | 0001 <sub>2</sub> | Number of "channel class identifier" elements that follow this element |
|                                       |        | etc.              | etc.   |
|                                       |        | 1111 <sub>2</sub> | Number of "channel class identifier" elements that follow this element |

### 18.5.18h Number of channel identifiers

The "number of channel identifiers" information element shall indicate how many "channel identifier" information elements follow, as defined in table 18.76.

**Table 18.76: Number of channel identifiers information element**

| Information element           | Length | Value           | Remark   |
|-------------------------------|--------|-----------------|--|
| Number of channel identifiers | 2      | 00 <sub>2</sub> | One "channel identifier" element is included in this PDU     |
|                               |        | 01 <sub>2</sub> | Two "channel identifier" elements are included in this PDU   |
|                               |        | 10 <sub>2</sub> | Three "channel identifier" elements are included in this PDU |
|                               |        | 11 <sub>2</sub> | Four "channel identifier" elements are included in this PDU  |

### 18.5.18i Number of channels for removal

The "number of channels for removal" information element shall indicate how many "channel identifier" information elements follow, as defined in table 18.77.

**Table 18.77: Number of channels for removal information element**

| Information element            | Length | Value              | Remark  |
|--------------------------------|--------|--------------------|---|
| Number of channels for removal | 5      | 00000 <sub>2</sub> | No "channel identifiers" elements follow this element.            |
|                                |        | 00001 <sub>2</sub> | Number of "channel identifier" elements that follow this element. |
|                                |        | etc.               | etc.  |
|                                |        | 11111 <sub>2</sub> | Number of "channel identifier" elements that follow this element. |

### 18.5.19 Number of DA cells for removal

The "number of DA cells for removal" information element shall indicate how many "removal data for DA cell" information elements follow as defined in table 18.78.

**Table 18.78: Number of DA cells for removal information element**

| Information element            | Length | Value                 | Remark   |
|--------------------------------|--------|-----------------------|--|
| Number of DA cells for removal | 8      | 00000000 <sub>2</sub> | No "removal data for DA cell" elements contained in this PDU.        |
|                                |        | 00000001 <sub>2</sub> | Number of "removal data for DA cell" elements contained in this PDU. |
|                                |        | etc.                  | etc.   |
|                                |        | 11111111 <sub>2</sub> | Number of "removal data for DA cell" elements contained in this PDU. |

### 18.5.19a Number of DA neighbour cells

The "number of DA neighbour cells" information element shall indicate how many "neighbour cell information for DA" information elements follow as defined in table 18.79.

**Table 18.79: Number of DA neighbour cells information element**

| Information element          | Length | Value            | Remark   |
|------------------------------|--------|------------------|--|
| Number of DA neighbour cells | 3      | 000 <sub>2</sub> | No DA neighbour cell information available                                   |
|                              |        | 001 <sub>2</sub> | Number of "neighbour cell information for DA" elements contained in this PDU |
|                              |        | etc.             | etc.   |
|                              |        | 111 <sub>2</sub> | Number of "neighbour cell information for DA" elements contained in this PDU |

### 18.5.19b Number of DA neighbour cell channel classes

The "number of DA neighbour cell channel classes" information element shall indicate how many "neighbour cell channel class for DA" information elements follow as defined in table 18.80.

**Table 18.80: Number of DA neighbour cell channel classes information element**

| Information element                         | Length | Value              | Remark   |
|---|--------|--------------------|--|
| Number of DA neighbour cell channel classes | 5      | 00000 <sub>2</sub> | No DA neighbour cell channel classes available                                 |
|   |        | 00001 <sub>2</sub> | Number of "neighbour cell channel class for DA" elements contained in this PDU |
|   |        | etc.               | etc.   |
|   |        | 11111 <sub>2</sub> | Number of "neighbour cell channel class for DA" elements contained in this PDU |

### 18.5.19c Number of DA neighbour cell irregular channel details

The "number of DA neighbour cell irregular channel details" information element shall indicate how many "neighbour cell irregular channel detail for DA" information elements follow as defined in table 18.81.

**Table 18.81: Number of DA neighbour cell irregular channel details information element**

| Information element                                   | Length | Value               | Remark  |
|---|--------|---------------------|---|
| Number of DA neighbour cell irregular channel details | 6      | 000000 <sub>2</sub> | No DA neighbour cell irregular channel details available                                  |
|   |        | 000001 <sub>2</sub> | Number of "neighbour cell irregular channel detail for DA" elements contained in this PDU |
|   |        | etc.                | etc.  |
|   |        | 111111 <sub>2</sub> | Number of "neighbour cell irregular channel detail for DA" elements contained in this PDU |

### 18.5.19d Number of requested channel class identifiers

The "number of requested channel class identifiers" information element shall indicate how many "channel class identifier" information elements follow, as defined in table 18.82.

**Table 18.82: Number of requested channel class identifiers information element**

| Information element                           | Length | Value            | Remark   |
|---|--------|------------------|--|
| Number of requested channel class identifiers | 3      | 000 <sub>2</sub> | One "channel class identifier" element is included in this PDU     |
|   |        | 001 <sub>2</sub> | Two "channel class identifier" elements are included in this PDU   |
|   |        | etc.             | etc.   |
|   |        | 111 <sub>2</sub> | Eight "channel class identifier" elements are included in this PDU |

### 18.5.19e Number of requested channel identifiers

The "number of requested channel identifiers" information element shall indicate how many "channel identifier" information elements follow, as defined in table 18.83.

**Table 18.83: Number of requested channel identifiers information element**

| Information element           | Length | Value            | Remark   |
|-------------------------------|--------|------------------|--|
| Number of channel identifiers | 3      | 000 <sub>2</sub> | One "channel identifier" element is included in this PDU     |
|                               |        | 001 <sub>2</sub> | Two "channel identifier" elements are included in this PDU   |
|                               |        | etc.             | etc.   |
|                               |        | 111 <sub>2</sub> | Eight "channel identifier" elements are included in this PDU |

### 18.5.19f Number of irregular channels details (for serving cell)

The "number of irregular channel details" information element shall indicate how many "irregular channel details (for serving cell)" information elements follow as defined in table 18.84.

**Table 18.84: Number of irregular channel details (for serving cell) information element**

| Information element                                    | Length | Value              | Remark   |
|--|--------|--------------------|--|
| Number of irregular channel details (for serving cell) | 5      | 00000 <sub>2</sub> | No irregular channel details available   |
|  |        | 00001 <sub>2</sub> | Number of "irregular channel detail" elements for serving cell contained in this PDU |
|  |        | etc.               | etc.   |
|  |        | 11111 <sub>2</sub> | Number of "irregular channel detail" elements for serving cell contained in this PDU |

## 18.5.20 PDU type

The "PDU type" information element shall indicate the PDU type for each of the MLE protocol PDUs. The "PDU type" information element has separate definitions for the uplink and downlink directions as shown in the table 18.85.

**Table 18.85: PDU type information element**

| Information element   | Length | Value            | Remark                     |                            |
|---|--------|------------------|----------------------------|----------------------------|
|   |        |                  | DOWNLINK                   | UPLINK                     |
| PDU type  | 3      | 000 <sub>2</sub> | D-NEW-CELL                 | U-PREPARE                  |
|   |        | 001 <sub>2</sub> | D-PREPARE-FAIL             | U-PREPARE-DA               |
|   |        | 010 <sub>2</sub> | D-NWRK-BROADCAST           | U-IRREGULAR CHANNEL ADVICE |
|   |        | 011 <sub>2</sub> | D-NWRK-BROADCAST EXTENSION | U-CHANNEL CLASS ADVICE     |
|   |        | 100 <sub>2</sub> | D-RESTORE-ACK              | U-RESTORE                  |
|   |        | 101 <sub>2</sub> | D-RESTORE-FAIL             | Reserved                   |
|   |        | 110 <sub>2</sub> | D-CHANNEL RESPONSE         | U-CHANNEL REQUEST          |
|   |        | 111 <sub>2</sub> | Extended PDU (see note)    | Extended PDU (see note)    |
| NOTE: Extended PDUs are differentiated by the "PDU type extension" information element. |        |                  |                            |                            |

## 18.5.20a PDU type extension

The "PDU type extension" information element shall indicate the PDU type extension for each extended PDU (i.e. MLE protocol PDUs with PDU type value "111<sub>2</sub>"). The "PDU type extension" information element has separate definitions for the uplink and downlink directions as shown in table 18.86.

**Table 18.86: PDU type extension information element**

| Information element | Length | Value             | Remark                  |          |
|---------------------|--------|-------------------|-------------------------|----------|
|                     |        |                   | DOWNLINK                | UPLINK   |
| PDU type extension  | 4      | 0000 <sub>2</sub> | D-NWRK-BROADCAST-DA     | Reserved |
|                     |        | 0001 <sub>2</sub> | D-NWRK-BROADCAST REMOVE | Reserved |
|                     |        | 0010 <sub>2</sub> | Reserved                | Reserved |
|                     |        | etc.              | etc.                    | etc.     |
|                     |        | 1111 <sub>2</sub> | Reserved                | Reserved |

## 18.5.21 Protocol discriminator

The "protocol discriminator" information element shall indicate which protocol the PDU belongs to as defined in table 18.87. MM, CMCE and SNDCP PDUs are routed by the MLE to the relevant SAP. MLE protocol PDUs are processed by the MLE protocol entity and TETRA management entity PDUs by the TETRA management functional entity within the MLE.

**Table 18.87: Protocol discriminator information element**

| Information element    | Length | Value            | Remark                           |
|------------------------|--------|------------------|----------------------------------|
| Protocol discriminator | 3      | 000 <sub>2</sub> | Reserved                         |
|                        |        | 001 <sub>2</sub> | MM protocol                      |
|                        |        | 010 <sub>2</sub> | CMCE protocol                    |
|                        |        | 011 <sub>2</sub> | Reserved                         |
|                        |        | 100 <sub>2</sub> | SNDCP protocol                   |
|                        |        | 101 <sub>2</sub> | MLE protocol                     |
|                        |        | 110 <sub>2</sub> | TETRA management entity protocol |
|                        |        | 111 <sub>2</sub> | Reserved for testing             |

### 18.5.21a Reason for the channel request

The "reason for the channel request" information element shall indicate the reason for the MS's assigned channel replacement request, as defined in table 18.88.

**Table 18.88: Reason for the channel request information element**

| Information element            | Length | Value            | Remark                                  |
|--------------------------------|--------|------------------|---|
| Reason for the channel request | 3      | 000 <sub>2</sub> | Unspecified reason                      |
|                                |        | 001 <sub>2</sub> | Current channel is radio relinquishable |
|                                |        | 010 <sub>2</sub> | Current channel is radio improvable     |
|                                |        | 011 <sub>2</sub> | Higher level of service is requested    |
|                                |        | 100 <sub>2</sub> | Reserved                                |
|                                |        | etc.             | etc.                                    |
|                                |        | 111 <sub>2</sub> | Reserved                                |

### 18.5.21b Registration

The "registration" information element shall indicate to the MS whether or not registration is required on this cell, as defined in table 18.89.

**Table 18.89: Registration information element**

| Information element | Length | Value          | Remark                                 |
|---------------------|--------|----------------|--|
| Registration        | 1      | 0 <sub>2</sub> | Registration not required on this cell |
|                     |        | 1 <sub>2</sub> | Registration mandatory on this cell    |

### 18.5.21c Removal data for CA cell

The "removal data for CA cell" information element shall indicate CA neighbour cell information to be removed from the MS's records as defined in table 18.90.

**Table 18.90: Removal data for CA cell information element**

| Information element  | Length | Type | C/O/M | Remark     |
|--|--------|------|-------|------------|
| Cell identifier CA   | 5      |      | M     |            |
| Remove cell or channels  | 1      |      | M     |            |
| Number of channel classes for removal  | 4      |      | C     | See note 1 |
| Channel class identifier   | 4      |      | C     | See note 2 |
| Number of channels for removal   | 5      |      | C     | See note 1 |
| Channel identifier   | 5      |      | C     | See note 3 |
| NOTE 1: Shall be present only if "remove cell or channels" has value "remove channel classes or channels". |        |      |       |            |
| NOTE 2: Shall be present as many times as indicated by "number of channel classes for removal".            |        |      |       |            |
| NOTE 3: Shall be present as many times as indicated by "number of channels for removal".                   |        |      |       |            |

### 18.5.21d Removal data for DA cell

The "removal data for DA cell" information element shall indicate DA neighbour cell information to be removed from the MS's records as defined in table 18.91.

**Table 18.91: Removal data for DA cell information element**

| Information element  | Length | Type | C/O/M | Remark     |
|--|--------|------|-------|------------|
| Cell identifier DA   | 8      |      | M     |            |
| Remove cell or channels  | 1      |      | M     |            |
| Number of channel classes for removal  | 4      |      | C     | See note 1 |
| Channel class identifier   | 4      |      | C     | See note 2 |
| Number of channels for removal   | 5      |      | C     | See note 1 |
| Channel identifier   | 5      |      | C     | See note 3 |
| NOTE 1: Shall be present only if "remove cell or channels" has value "remove channel classes or channels". |        |      |       |            |
| NOTE 2: Shall be present as many times as indicated by "number of channel classes for removal".            |        |      |       |            |
| NOTE 3: Shall be present as many times as indicated by "number of channels for removal".                   |        |      |       |            |

### 18.5.21e Removal data for serving cell

The "removal data for serving cell" information element shall indicate serving cell channel class and channel information to be removed from the MS's records as defined in table 18.92.

**Table 18.92: Removal data for serving cell information element**

| Information element   | Length | Type | C/O/M | Remark     |
|---|--------|------|-------|------------|
| Number of channel classes for removal   | 4      |      | M     |            |
| Channel class identifier  | 4      |      | C     | See note 1 |
| Number of channels for removal  | 5      |      | M     |            |
| Channel identifier  | 5      |      | C     | See note 2 |
| NOTE 1: Shall be present as many times as indicated by "number of channel classes for removal". |        |      |       |            |
| NOTE 2: Shall be present as many times as indicated by "number of channels for removal".        |        |      |       |            |

### 18.5.21f Remove cell or channels

The "remove cell or channels" information element shall indicate if a neighbour cell is to be totally removed from the MS's record of neighbour cell information relative to a particular cell, or if channel class and/or channel information is to be removed, as defined in table 18.93.

**Table 18.93: Remove cell or channels information element**

| Information element     | Length | Value          | Remark                             |
|-------------------------|--------|----------------|------------------------------------|
| Remove cell or channels | 1      | 0 <sub>2</sub> | Remove channel classes or channels |
|                         |        | 1 <sub>2</sub> | Remove this neighbour cell         |

### 18.5.21g Roaming control for individual services

The "roaming control for individual services" element shall indicate if an MS is permitted to initiate cell reselection in response to a change in cell load on the serving cell or a neighbour cell when using (or preparing to use) an individual service, as defined in table 18.94.

**Table 18.94: Roaming control for individual services information element**

| Information element                     | Length | Value          | Remark   |
|---|--------|----------------|--|
| Roaming control for individual services | 1      | 0 <sub>2</sub> | Cell load based roaming not permitted for individual service users |
|   |        | 1 <sub>2</sub> | Cell load based roaming permitted for individual service users     |

NOTE: If the MS is currently using (or preparing to use) both individual services and group services at the same time, it is permitted to perform cell load based roaming if either the "roaming control for individual services" information element or the "roaming control for group services and idle MSs" information element permits cell load based roaming.

### 18.5.21h Roaming control for group services and idle MSs

The "roaming control for group services and idle MSs" information element shall indicate if an MS is permitted to initiate cell reselection in response to a change in cell load on the serving cell or a neighbour cell when idle or using (or preparing to use) a group service, as defined in table 18.95.

**Table 18.95: Roaming control for group services and idle MSs information element**

| Information element                             | Length | Value          | Remark   |
|---|--------|----------------|--|
| Roaming control for group services and idle MSs | 1      | 0 <sub>2</sub> | Cell load based roaming not permitted for group service users and idle MSs |
|   |        | 1 <sub>2</sub> | Cell load based roaming permitted for group service users and idle MSs     |

NOTE: If the MS is currently using (or preparing to use) both individual services and group services at the same time, it is permitted to perform cell load based roaming if either the "roaming control for individual services" information element or the "roaming control for group services and idle MSs" information element permits cell load based roaming.

### 18.5.21i Irregular channel detail

The "irregular channel detail" information element shall indicate the details of an individual irregular channel, as defined in table 18.96.

**Table 18.96: Irregular channel detail information element**

| Information element  | Length | Type | C/O/M | Remark            |
|--|--------|------|-------|-------------------|
| Channel identifier   | 5      | 1    | M     |                   |
| Channel characteristics  | 18     | 1    | M     |                   |
| Carrier number   | 12     | 1    | M     |                   |
| Carrier number extension flag  | 1      | 1    | M     |                   |
| Carrier number extension   | 10     |      | C     | See notes 1 and 2 |
| NOTE 1: Shall be present only if carrier number extension flag has value "1" (carrier number extension included).  |        |      |       |                   |
| NOTE 2: If not present, the "Carrier number" element shall fully define the frequency of the channel's RF carrier. The channel's extended carrier numbering information shall be assumed to be the same as that of the serving cell. |        |      |       |                   |

## 18.5.22 Subscriber class

The "subscriber class" information element shall be used by the SwMI to indicate which subscriber classes are allowed to use this cell as defined in table 18.97.

**Table 18.97: Subscriber class information element**

| Information element   | Length | Value | Remark                               |
|---|--------|-------|--------------------------------------|
| Class 1 (see note)  | 1      | 0     | Subscriber class not allowed on cell |
|   |        | 1     | Subscriber class allowed on cell     |
| Class 2 (see note)  | 1      | 0     | Subscriber class not allowed on cell |
|   |        | 1     | Subscriber class allowed on cell     |
| Class 3   | 1      | 0     | Subscriber class not allowed on cell |
|   |        | 1     | Subscriber class allowed on cell     |
| Class 4   | 1      | 0     | Subscriber class not allowed on cell |
|   |        | 1     | Subscriber class allowed on cell     |
| Class 5   | 1      | 0     | Subscriber class not allowed on cell |
|   |        | 1     | Subscriber class allowed on cell     |
| Class 6   | 1      | 0     | Subscriber class not allowed on cell |
|   |        | 1     | Subscriber class allowed on cell     |
| Class 7   | 1      | 0     | Subscriber class not allowed on cell |
|   |        | 1     | Subscriber class allowed on cell     |
| Class 8   | 1      | 0     | Subscriber class not allowed on cell |
|   |        | 1     | Subscriber class allowed on cell     |
| Class 9   | 1      | 0     | Subscriber class not allowed on cell |
|   |        | 1     | Subscriber class allowed on cell     |
| Class 10  | 1      | 0     | Subscriber class not allowed on cell |
|   |        | 1     | Subscriber class allowed on cell     |
| Class 11  | 1      | 0     | Subscriber class not allowed on cell |
|   |        | 1     | Subscriber class allowed on cell     |
| Class 12  | 1      | 0     | Subscriber class not allowed on cell |
|   |        | 1     | Subscriber class allowed on cell     |
| Class 13  | 1      | 0     | Subscriber class not allowed on cell |
|   |        | 1     | Subscriber class allowed on cell     |
| Class 14  | 1      | 0     | Subscriber class not allowed on cell |
|   |        | 1     | Subscriber class allowed on cell     |
| Class 15  | 1      | 0     | Subscriber class not allowed on cell |
|   |        | 1     | Subscriber class allowed on cell     |
| Class 16  | 1      | 0     | Subscriber class not allowed on cell |
|   |        | 1     | Subscriber class allowed on cell     |
| NOTE: The SwMI may reserve class 1 and/or class 2 for use by air cells (see clauses O.4.4 and O.7.1.2). |        |       |                                      |

## 18.5.22a Subscriber class included

The "subscriber class included" information element shall indicate to the MS whether the subscriber class or the location area (LA) information element is included in a PDU, as defined in table 18.98.

**Table 18.98: Subscriber class included information element**

| Information element       | Length | Value          | Remark                        |
|---------------------------|--------|----------------|-------------------------------|
| Subscriber class included | 1      | 0 <sub>2</sub> | Subscriber class not included |
|                           |        | 1 <sub>2</sub> | Subscriber class included     |

### 18.5.23 TDMA frame offset

The "TDMA frame offset" information element shall indicate the TDMA frame offset between the serving cell and a neighbour cell when both cells have synchronized carriers as defined in table 18.99. The information element may be used for the time-shared mode of operation or to indicate the TDMA frame offset for synchronized cells operating in continuous mode.

**Table 18.99: TDMA frame offset information element**

| Information element | Length | Value               | Remark          |
|---------------------|--------|---------------------|-----------------|
| TDMA frame offset   | 6      | 000000 <sub>2</sub> | 0 frame offset  |
|                     |        | 000001 <sub>2</sub> | 1 frame offset  |
|                     |        | etc.                | etc.            |
|                     |        | 100011 <sub>2</sub> | 35 frame offset |
|                     |        | 100100 <sub>2</sub> | Reserved        |
|                     |        | etc.                | etc.            |
|                     |        | 111111 <sub>2</sub> | Reserved        |

If  $FN_n$  and  $FN_s$  denote the TDMA frame number of the neighbour cell and of the serving cell respectively, then:

$$FN_n = (FN_s - 1 + \text{TDMA frame offset}) \bmod 18 + 1; \quad (18.1)$$

where  $FN_n = 1$  to 18 and  $FN_s = 1$  to 18.

NOTE: See clause 7.7 for the meaning of "synchronized cells" in this context.

### 18.5.24 TETRA network time

The "TETRA network time" information element shall indicate the absolute TETRA network time to be used for time stamping as defined in table 18.100.

**Table 18.100: TETRA network time information element**

| Information element    | Length | Value | Remark            |
|------------------------|--------|-------|-------------------|
| UTC time               | 24     |       | See note 1        |
| Local time offset sign | 1      |       | See note 2        |
| Local time offset      | 6      |       | See notes 2 and 3 |
| Year                   | 6      |       | See note 4        |
| Reserved               | 11     |       | See note 5        |

NOTE 1: Zero time (000000<sub>16</sub>) is defined as 00:00 hours, Universal Time Co-ordinates (UTC time) on January 1st of every year. Each increment of this element above a value of zero shall correspond to a two-second increment of the absolute network time. The values, F142FF<sub>16</sub> to FFFFFE<sub>16</sub>, are reserved. The value, FFFFFFF<sub>16</sub>, is reserved and shall be used to indicate an invalid value of time and timestamps in the event of network malfunction.

NOTE 2: The local time offset is coded as a signed integer containing information elements Local time offset sign and Local time offset. The value "0" shall indicate a positive offset and the value "1" shall indicate a negative offset. Zero offset shall be encoded with sign value "0".

NOTE 3: The Local time offset information element shall indicate the difference between the local time (including daylight saving) and the UTC time. The step size is 15 minutes, the maximum permissible offset shall be ±14 hours. The values 39<sub>16</sub> to 3E<sub>16</sub> are reserved. 3F<sub>16</sub> shall be used to indicate an invalid offset.

NOTE 4: Year is year since 2000 (e.g. year 2001 is encoded as 1). Maximum year value shall be 3E<sub>16</sub>. The value 3F<sub>16</sub> shall be used to indicate an invalid year.

NOTE 5: This field shall be set to all ones (7FF<sub>16</sub>).

### 18.5.25 Timeshare cell information or security parameters

The "timeshare cell information or security parameters" information element shall indicate the mode of discontinuous operation for a CA neighbour cell or the security parameters as defined in table 18.101.

The "Discontinuous mode" field shall indicate whether security parameters are present, or which of the three types of discontinuous mode is in use.

If the discontinuous mode is "security parameters" the security parameters information element shall be present. Usage of the security parameters information element shall be as defined in ETSI EN 300 392-7 [8], clause A.8.77a.

If the mode is "MCCH sharing", the "Reserved frames per two multiframe" information element shall be present and shall indicate how many frames are reserved for that neighbour cell.

If the mode is "Carrier sharing" or "Traffic carrier sharing" sharing, the "Reserved frames per two multiframe" information element shall be present, but shall be ignored by the MS.

**Table 18.101: Timeshare cell information or security parameters information element**

| Information element  | Length             | Type | C/O/M | Value            | Remark                       |
|--|--------------------|------|-------|------------------|------------------------------|
| Discontinuous mode   | 2                  | 1    | M     | 00 <sub>2</sub>  | Security parameters included |
|  |                    |      |       | 01 <sub>2</sub>  | Carrier sharing              |
|  |                    |      |       | 10 <sub>2</sub>  | MCCH sharing                 |
|  |                    |      |       | 11 <sub>2</sub>  | Traffic carrier sharing      |
| Security parameters (see note 1)   | 3                  |      | C     | See note 2       | See note 2                   |
| Reserved frames per two multiframe (see note 3)  | 3                  |      | C     | 000 <sub>2</sub> | 1 frame reserved             |
|  |                    |      |       | 001 <sub>2</sub> | 2 frames reserved            |
|  |                    |      |       | 010 <sub>2</sub> | 3 frames reserved            |
|  |                    |      |       | 011 <sub>2</sub> | 4 frames reserved            |
|  |                    |      |       | 100 <sub>2</sub> | 6 frames reserved            |
|  |                    |      |       | 101 <sub>2</sub> | 9 frames reserved            |
|  |                    |      |       | 110 <sub>2</sub> | 12 frames reserved           |
| 111 <sub>2</sub>   | 18 frames reserved |      |       |                  |                              |
| NOTE 1: Shall be present only if the discontinuous mode is "Security parameters included".     |                    |      |       |                  |                              |
| NOTE 2: The information element shall be used as defined in ETSI EN 300 392-7 [8].             |                    |      |       |                  |                              |
| NOTE 3: Shall be present only if the discontinuous mode is not "Security parameters included". |                    |      |       |                  |                              |

### 18.5.26 Wide-area cell

The "wide-area cell" information element shall indicate to the MS whether or not this cell is a wide-area cell, as defined in table 18.102.

**Table 18.102: Wide-area cell information element**

| Information element | Length | Value          | Remark                            |
|---------------------|--------|----------------|-----------------------------------|
| Wide-area cell      | 1      | 0 <sub>2</sub> | This cell is not a wide-area cell |
|                     |        | 1 <sub>2</sub> | This cell is a wide-area cell     |

NOTE: A wide-area cell is expected to have a larger coverage area than some other cells in the area, and may overlap with and/or fully cover the area covered by one or more of these cells. For example, the MS might give preference to a wide-area cell if the MS is aware that it is travelling at high speed or using wide-area group calls, or an MS might prefer not to use a wide-area cell if the MS is a hand-held device or if the MS wishes to set up an individually addressed circuit mode call.

## 18.6 Timers

### 18.6.1 Timer related actions

Timer related actions are defined in the protocols which use the timer.

### 18.6.2 Timer T370 - cell reselection preparation response time

This timer shall define the maximum time MLE shall wait for a response to sending a U-PREPARE or U-PREPARE-DA PDU that requests an announced type 1/2 or an announced type 3 cell selection. The timer T370 shall be of 5 s duration.

### 18.6.3 Timer T371 - Neighbour cell broadcast enquiry response time

This timer shall define the maximum time MLE shall wait for a D-NWRK-BROADCAST or D-NWRK-BROADCAST EXTENSION PDU in response to sending a U-PREPARE PDU, or for a D-NWRK-BROADCAST-DA, D-NWRK-BROADCAST or D-NWRK-BROADCAST EXTENSION PDU in response to sending a U-PREPARE-DA PDU. The timer T371 shall be of 15 s duration.

### 18.6.4 Timer T372 - new channel pause time

This timer shall define the minimum time MLE shall wait following assignment to a channel before transmitting a first U-CHANNEL REQUEST PDU on that channel. The timer T372 shall be of 15 s duration.

### 18.6.5 Timer T373 - repeat channel request delay time

This timer shall define the minimum time MLE shall wait following transmission of a U-CHANNEL REQUEST before MLE may transmit a further U-CHANNEL REQUEST PDU. The timer T373 shall be of 5 s duration.

### 18.6.6 Timer T374 - threshold-crossing pause time

This timer shall define the minimum time MLE shall wait following the threshold-crossing of an assigned channel path loss measurement before MLE may declare a change in the state of the channel path loss criterion. The timer T374 shall be of 5 s duration.

### 18.6.7 Timer T375 - air cell margin timer

Timer 375 defines the period for which MLE shall consider the serving cell to be "radio relinquishable" following receipt of a "maximum path delay almost exceeded" report. This timer shall be started (or restarted) whenever MLE receives a "maximum path delay almost exceeded" report. It shall be stopped when MLE performs a cell reselection. The recommended duration of T375 is 50 s.

NOTE: T375 is only used by MSs that support the AGA service (see annex O).

---

## 19 Layer 2 overview

### 19.1 Introduction

Clause 19 gives an overview of the V+D air interface layer 2 (Data Link Layer (DLL)) which is further defined in clauses 20, 21, 22 and 23. Clause 19 does not imply any requirement for the testability of any of the functions described.

The descriptions throughout clause 19 do not imply a specific implementation, but are provided for the guidance of the reader in understanding the operation of layer 2.

### 19.2 Layer 2 architecture

#### 19.2.0 General

The model of the DLL comprises two sub-layers: the LLC entity and the MAC entity. The basic functionalities of these entities are as summarized in ETSI EN 300 392-1 [6], clause 6, and the services offered to the upper layer (the MLE) are explained in detail in clause 20. The error control schemes (FEC, CRC) are described in clause 8.

The following description applies to the protocol model of the DLL. The internal boundaries between the layers and sub-layers are not testable and do not imply any specific implementation, but are rather used for the description of the model. Throughout clause 19 the word "shall" is used for describing the SAPs for traceability reasons in the protocol model, but those SAPs are not testable.

#### 19.2.1 Access to the DLL

Figure 19.1 shows the model of the DLL, its internal subdivision and its interaction with the upper layer (MLE) and lower layer (physical layer).

In the protocol model, the DLL shall provide services to the MLE through SAPs supporting different functions:

- TLA-SAP for all signalling messages;
- TLB-SAP for broadcasting system information; and
- TLC-SAP for layer management, status and configuration via data base access.

Internal communication between LLC and MAC shall use SAPs, namely TMA-SAP, TMB-SAP and TMC-SAP, for services provided by the MAC to the LLC. They shall correspond to the separation between signalling, broadcast and layer management, as can be seen from the upper layer (MLE). Internal communication between LLC and MAC may also use an additional SAP, namely TLE-SAP, for the layer 2 signalling service that the LLC may provide to the MAC. Primitives and parameters are used for protocol description to exchange information at this internal boundary (LLC-MAC). The upper MAC layer shall contain MAC protocol functions (see clause 23).

There shall be a (virtual) SAP TMV-SAP inside the MAC layer to allow a protocol description using primitives and logical channels. The selection of a specific logical channel triggers specific channel coding at the lower MAC, which is devoted to the channel coding (see clause 8). The selection of a specific logical channel also triggers a specific modulation.

The SAP TP-SAP shall be used for communication between MAC and Physical Layer (PL). To exchange information at the TP-SAP, pre-formed subslots and blocks with burst type indication shall be used (see clause 9).

The TMD-SAP shall be used to support traffic in circuit mode. It shows clearly that no LLC functionality shall be expected in circuit mode. However, clause 19.4.3.2 describes how some traffic capacity may be stolen for signalling purposes in circuit mode.

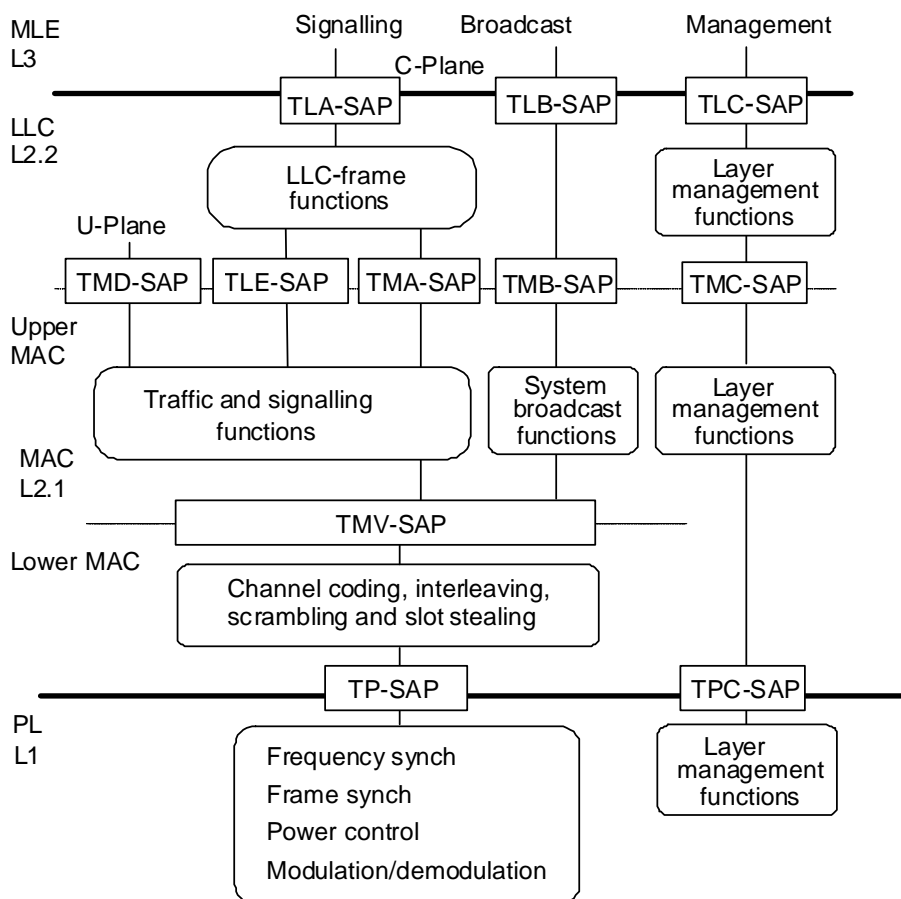

Figure 19.1: Layer 2 reference architecture

## 19.2.2 Information flow inside the DLL

### 19.2.2.0 General

The two types of communications links for TLA-SAP support on the DLL each have a specific quality of service. Before any communication establishment, one link shall exist whenever BS control channel reception is possible. This link is called the basic link and it offers a pre-defined quality of service which minimizes the LLC overhead over the air interface. A more powerful link may exist upon request. It is called the advanced link and it offers a more reliable and better service, especially for packet data transfer (see clause 22). When an advanced link is established, the basic link shall remain available. They may share the same timeslot in the multiframe structure.

Illustrations of the layer 2 functions applied to the information content present at the TLA-SAP are given on figures 19.2 and 19.3. On the left hand side, references to the relevant protocol layers are provided. The "other parameters" from the MLE may either be mapped into the LLC PDU or used by the DLL (e.g. PDU priority).

The advanced link offers segmentation and error control using a Frame Check Sequence (FCS). The advanced link may be used for more reliable and efficient exchange of large amount of data as in, for example, packet data transfer. There are two variants of advanced link: the original advanced link and the extended advanced link.

It is mandatory for the MS to support the basic link, whereas it is optional for the MS to support either or both variants of the advanced link.

NOTE 1: The MAC scheme on figures 19.2 and 19.3 does not display the exact multiframe structure nor the random access procedure (see clause 23).

NOTE 2: The CRC is added only to the completed "MAC block", which may contain multiple TM-SDUs (MAC messages) on figures 19.2 and 19.3.

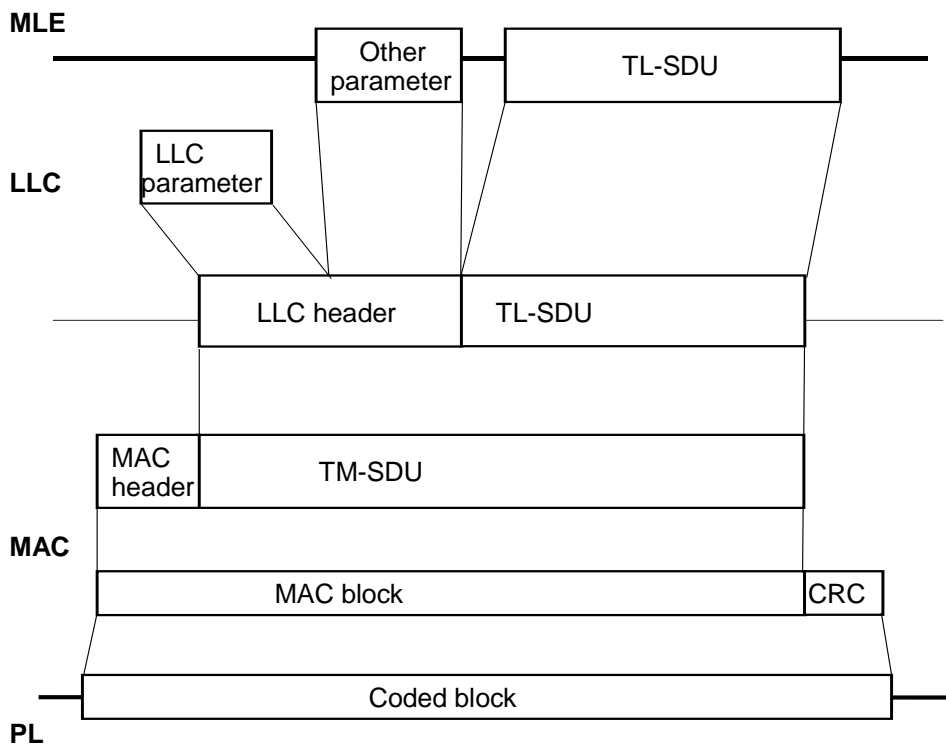

Figure 19.2: Layer 2 data structure for basic link (typically layer 3 signalling messages)

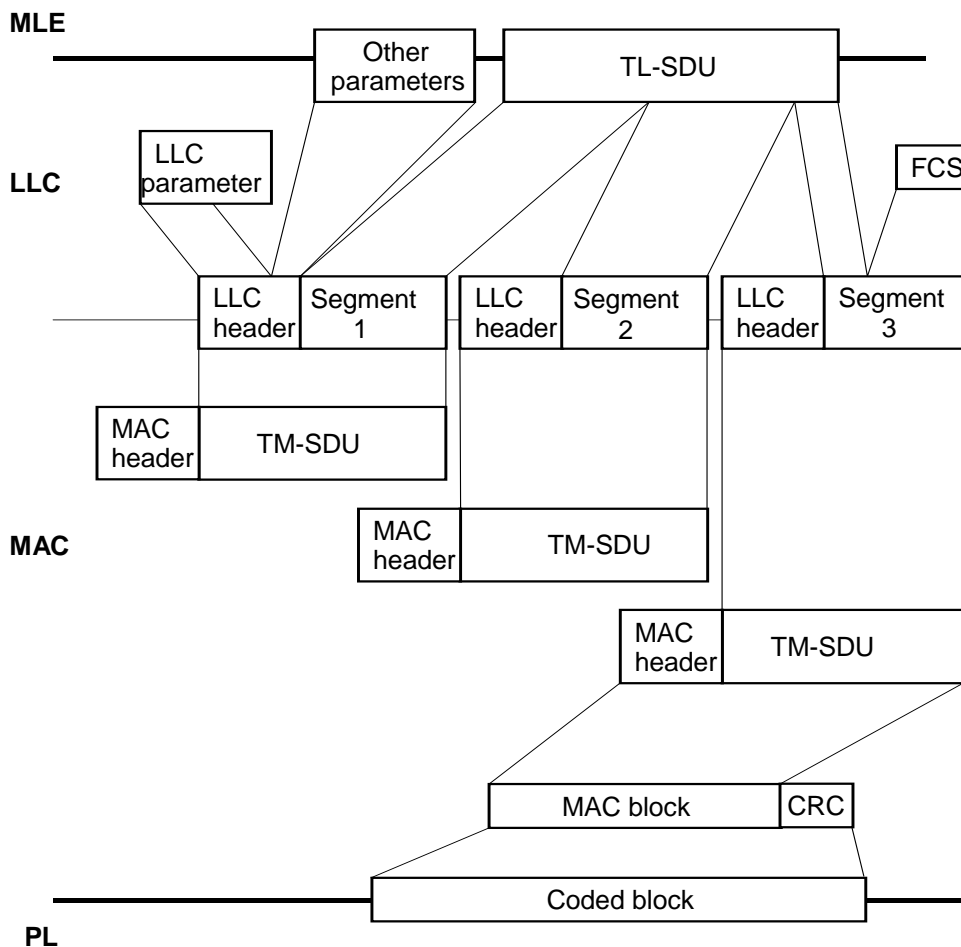

Figure 19.3: Layer 2 data structure for advanced link (e.g. packet data)

### 19.2.2.1 Basic link

The basic link should be used for general signalling messages (e.g. from the CMCE or MM). The unacknowledged basic link may be used by the SMDCP for some packet data messages (e.g. for real-time class data).

The basic link offers the following services:

- acknowledged message transmission;
- unacknowledged message transmission;
- un-numbered fragmentation of longer messages;
- optional extended error control using an FCS (e.g. for long messages that require fragmentation).

The principal basic link data structure without fragmentation is shown in figure 19.2. The protocol is defined in detail in clauses 22 and 23.

### 19.2.2.2 Advanced link

An advanced link should be used if a larger amount of data is to be transferred (e.g. for packet data transmission) or if a better service is required. The service of an advanced link is negotiable at the set-up phase. The advanced link offers the following services:

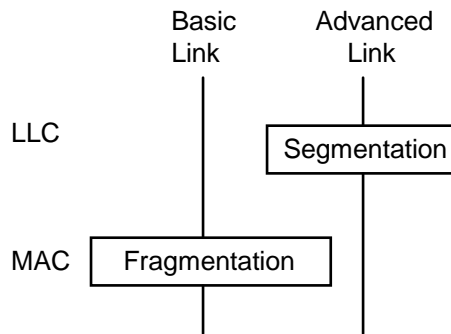

- acknowledged message transmission;
- unacknowledged message transmission for point-to-multipoint transfer in the downlink;
- window mechanism:
  - window size of up to 3 for the original advanced link;
  - window size of up to 15 for the extended advanced link;
- numbered segmentation of longer messages;
- selective re-transmission for point-to-point transfer;
- selective re-assembly for point-to-multipoint transfer;
- extended error control using an FCS:
  - always provided for the original advanced link;
  - optional for the extended advanced link.

The advanced link data structure is shown in figure 19.3. The protocol is defined in detail in clauses 22 and 23.

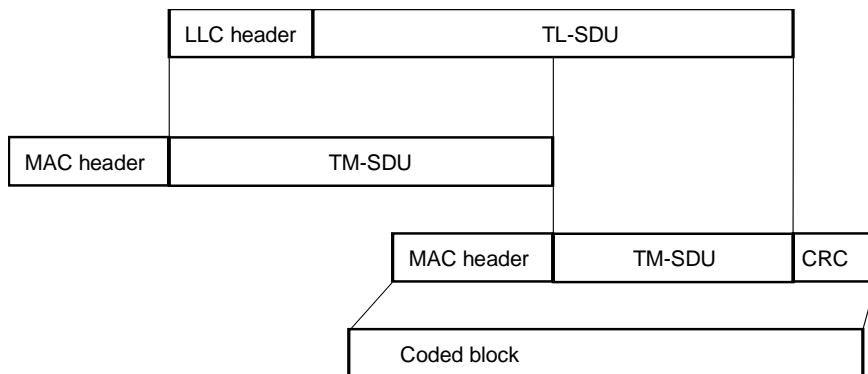

### 19.2.2.3 Segmentation and fragmentation

There are two methods of sending a long TL-SDU defined in the present document: fragmentation and segmentation, which are defined in detail in clauses 22 and 23. Fragmentation may be performed in the MAC for a basic link, while segmentation may be performed in the LLC for an advanced link (see figure 19.4).

Fragmentation shall be used for the basic link in case of an SDU exceeding the available capacity in the MAC (see figure 19.5). Fragments are not numbered so they shall be sent in sequence. No segmentation shall be performed by the LLC for the basic link.

**Figure 19.4: Segmentation and fragmentation in the DLL**

**Figure 19.5: Fragmentation of long SDU in the MAC layer**

For the advanced link, the LLC shall divide long data into segments (see figure 19.3). Each segment shall be individually recognizable by its LLC header. The segment size depends on the modulation mode of the channel (see clause 19.3.2.2).

- On a  $\pi/4$ -DQPSK or D8PSK channel, the segment size should match the MAC transmission unit (MAC block). Therefore, on a D8PSK channel, segments may be of different sizes, depending on whether they are cut to be sent using  $\pi/4$ -DQPSK or  $\pi/8$ -D8PSK modulation for the first transmission of that segment.
- On a 25 kHz or 50 kHz QAM channel, the segment size is normally determined by the available space in a full-slot MAC block using 4-QAM with coding rate  $r = 1/2$  at the current RF bandwidth; on a 100 kHz or 150 kHz QAM channel, the segment size is normally determined by the available space in half of a full-slot MAC block using 4-QAM with coding rate  $r = 1/2$  at the current RF bandwidth. The first and last segment of a TL-SDU may be of different size.

The segment is defined as the unit of re-transmission. Therefore:

- on a  $\pi/4$ -DQPSK channel, fragmentation should not be used for advanced link messages;
- on a D8PSK channel, fragmentation is needed when a segment cut for transmission using  $\pi/8$ -D8PSK modulation is re-transmitted using  $\pi/4$ -DQPSK modulation;
- on a QAM channel, fragmentation should not normally be used for advanced link messages (except for re-transmissions after a reduction of the RF bandwidth).

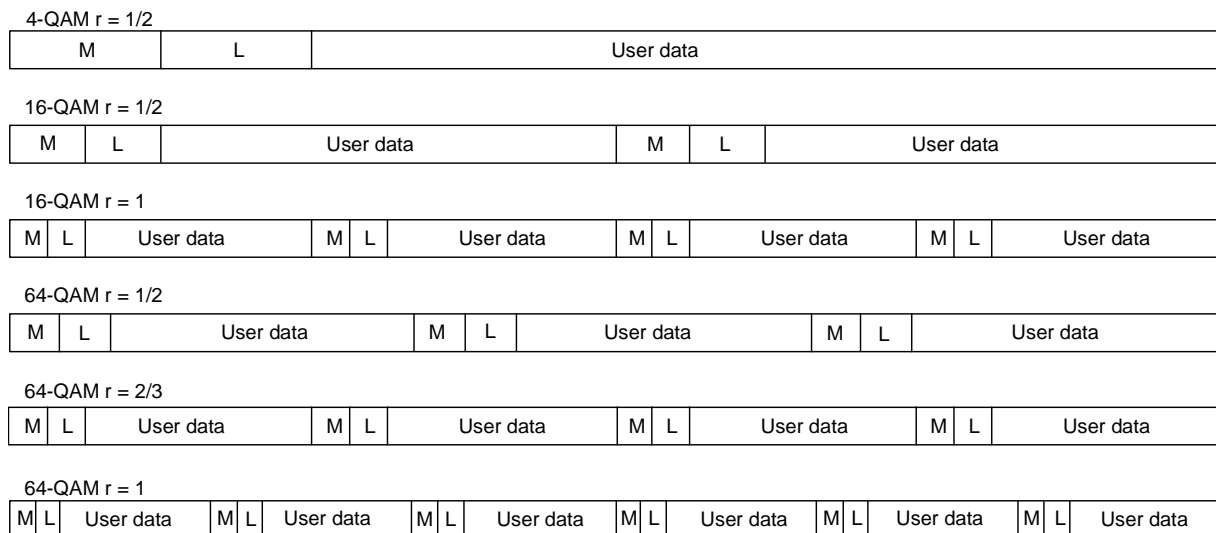

Use of these segment sizes on a QAM channel means that, on a 25 kHz or 50 kHz QAM channel:

- a full slot using 4-QAM with coding rate  $r = 1/2$  can contain one advanced link segment;
- a full slot using 16-QAM with coding rate  $r = 1/2$  can contain two advanced link segments;
- a full slot using 16-QAM with coding rate  $r = 1$  can contain four advanced link segments;
- a full slot using 64-QAM with coding rate  $r = 1/2$  can contain three advanced link segments;

- a full slot using 64-QAM with coding rate  $r = 2/3$  can contain four advanced link segments;
- a full slot using 64-QAM with coding rate  $r = 1$  can contain six advanced link segments.

This is illustrated in figure 19.6. Choice of the segment size corresponding to the smallest full-slot MAC block size (i.e. 4-QAM with coding rate  $r = 1/2$ ) enables segments to be re-transmitted without fragmentation even if the modulation level and/or coding rate is changed.

NOTE: The same principle applies on a 100 kHz or 150 kHz QAM channel except that the segment size corresponds to half the size of the smallest full-slot MAC block, so that segments do not become too large.

NOTE: In this figure, M represents MAC header and L represents LLC header.

**Figure 19.6: Advanced link segments on a 25 kHz or 50 kHz QAM channel**

#### 19.2.2.4 Layer 2 signalling

In addition to the basic link and advanced link, the LLC may send and receive layer 2 signalling PDUs; these PDUs carry various types of general signalling information relating to layer 2 functions. The layer 2 functions may be either LLC or MAC functions. However, for the purposes of the data exchange mechanisms, the layer 2 signalling PDUs are treated as LLC PDUs.

The layer 2 signalling offers the following services:

- unacknowledged message transmission;
- un-numbered fragmentation of longer messages.

The current uses of layer 2 signalling are:

- for the MAC in the MS to indicate short-term variations in the MS's required data priority (temporarily modifying the default data priority negotiated with the SwMI by the SNDPCP);
- for the BS to send schedule synchronization information; and
- for the MAC in the MS and BS to send link adaptation feedback information on a D8PSK or QAM channel. Link adaptation feedback from the MS may aid the BS in its choice of the appropriate modulation (and coding rate for QAM) to use for transmission to that MS; link adaptation feedback from the BS may aid the MS in its choice of the appropriate modulation (and coding rate for QAM) to use for transmission; see clause 19.3.2.2.

Where a layer 2 signalling PDU relates to a MAC function, the LLC provides the layer 2 signalling service to the MAC through the TLE-SAP.

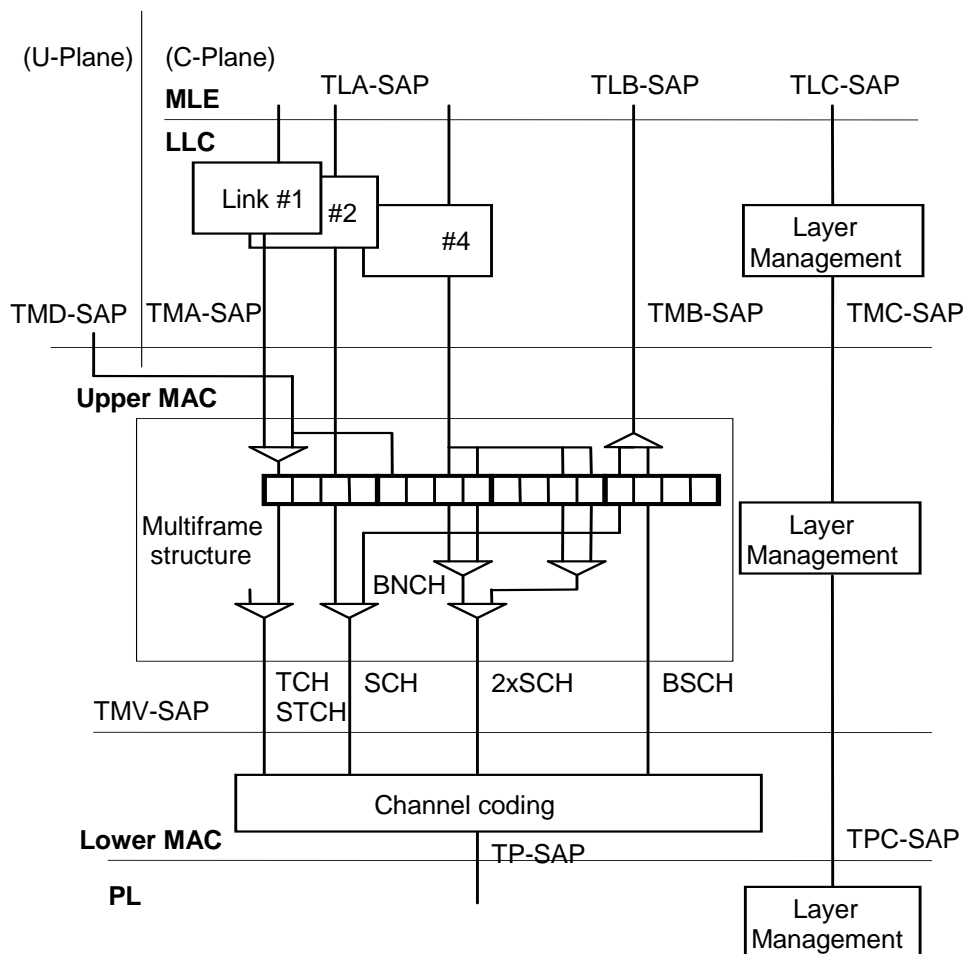

When the LLC sends or receives a layer 2 signalling PDU (relating to either an LLC or MAC function), it uses the data transfer service primitives offered by the MAC at the TMA-SAP.

## 19.2.3 Sub-layers

### 19.2.3.0 General

A detailed DLL illustration for peer-to-peer information exchange is presented in figure 19.7. The path followed by the information flow is shown from the C-plane SAPs - namely TLA and TLB. Information shall enter the MAC through the corresponding TMA and TMB SAP. The U-Plane information shall enter the MAC directly through the TMD-SAP. In either case, by using the TMV-SAP service primitive, the information shall then be placed into the appropriate logical channel and transmitted to the physical layer on the assigned timeslot in the multiframe.

NOTE 1: Layer 2 signalling is not used in this illustration so, for clarity, the TLE-SAP is not shown.

**Figure 19.7: DLL protocol illustration for the MS side for  $\pi/4$ -DQPSK operation**

The information for layer management flows through the TLC-SAP to the LLC and MAC and further down to the physical layer.

In figure 19.7 an example is shown in which some LLC links (numbered from 1 to 4) are set up on the MS side.

NOTE 2: In figure 19.7 three links are considered as a possible scenario, but it is not mandatory for an MS to support multiple links.

Link 1 uses the timeslot 1 in the multiframe structure in the upper MAC. Timeslot 1 is used for traffic coming from the TMD-SAP. The first occurrence of this traffic is stolen by link 1. Link 2 is used to send a signalling message in the uplink on timeslot 3 (in this example a set-up of an advanced link). After that message exchange, link 4 is the newly set-up advanced link using timeslots 3 and 4 to increase the throughput. Finally, some broadcast information are received under the TxB-SAP in timeslots 1 and 2 of the last shown frame.

The various logical channels involved in this communication exchange are shown at the TMV-SAP. At the lower MAC, a specific channel coding is applied for each of them. All information in the MAC not related to layer management shall be exchanged to/from the physical layer through the TP-SAP.

Each sub-layer should contain its own layer management.

### 19.2.3.1 LLC sub-layer

The LLC shall deal with the LLC link establishment and maintenance for the C-plane under the TLA-SAP. From the MLE point of view, there may be multiple LLC instances, each dealing with a specific quality of service and identified by a number corresponding to the link identifier, see figure 19.7. The basic link shall be available when the MS is camped on the BS. In addition to the basic link, the MLE may request a higher quality of service from the LLC, and the LLC then may set up an advanced link or links as required depending on the capabilities of the MS. Each advanced link normally uses a fixed resource at the MAC layer, which may be shared by the basic link.

The number of simultaneous links in an MS depends on its capability. The MS may have up to four independent advanced links per service (i.e. acknowledged service or unacknowledged service) as either:

- one original advanced link per service plus up to three extended advanced links per service; or
- up to four extended advanced links per service.

If the MS has multiple simultaneous advanced links, some or all of the advanced links may share the same resource at the MAC layer, in which case there is only one basic link associated with those advanced links. Alternatively, the advanced links may use different resources at the MAC layer, in which case up to four basic links may be associated with the corresponding advanced links. (Scanning a different frequency or cell in search for a control channel uses a different link.)

Under the TLB-SAP, there is no LLC functionality and the MLE SDU is passed directly to/from the TMB-SAP. Therefore, peer-to-peer information exchange between LLC entities does not exist and there exists no LLC PDU for the broadcast under the TLB-SAP.

The TLC-SAP shall be used for layer management and layer-to-layer control communication.

### 19.2.3.2 MAC sub-layer

The main functionalities of the MAC are channel access control, radio resource control, data transfer and error detection, and also link adaptation on a D8PSK or QAM channel. Encryption over the air interface shall be performed in the upper MAC when required.

The LLC links defined at the TLA-SAP shall enter into the MAC using the TMA-SAP. Logical channel allocation and multiplexing shall be performed internally by the MAC. From the protocol point of view, the upper MAC shall communicate with the lower MAC by means of primitives through logical channels. From the architecture point of view, the choice of the logical channels permits selecting among different means of data protection (channel coding) and modulation which are part of the lower MAC and physical layer.

After the set-up of a circuit mode speech or data call, signalling messages may use the Associated Control Channel (ACCH) or may use the traffic channel stealing mechanism (Stealing Channel STCH).

Figure 19.7 illustrates how signalling from the LLC link 1 shares a timeslot with user traffic from U-plane by stealing and using the STCH logical channel. The user plane traffic uses the TCH logical channel. The broadcast information flowing via TMB-SAP may use specific BSCH logical channel or signalling logical channel SCH. The MAC layer allocates 2 timeslots ( $2 \times \text{SCH}$ ) for the LLC instance 4 using an advanced link providing a higher transfer rate. All logical channels are then encoded at the lower MAC layer as defined by the logical channel (refer to clause 8).

## 19.2.4 Logical channels

### 19.2.4.1 Logical channels at the LLC-SAP

The MLE communicates to the LLC by using the relevant SAPs. Multiple LLC instances may be seen through the TLA-SAP. The MLE may choose to send a request on any available link, taking into account the associated quality of service.

Also the MAC communicates to the LLC through the TLE-SAP for the layer 2 signalling service.

### 19.2.4.2 Logical channels at the MAC-SAP

The LLC and U-plane shall communicate with the MAC via the relevant SAPs. The TMA-SAP shall be used for signalling, the TMB-SAP shall be used for downlink broadcast, the TMC-SAP shall be used for layer management and the TMD-SAP shall be used for circuit mode traffic and user signalling.

### 19.2.4.3 MAC internal logical channels

The logical channels may be separated into two categories:

- 1) traffic channels carrying U-plane information (circuit mode data and voice) plus end-to-end user signalling information; these shall carry information which is exchanged via the TMD-SAP at the MAC boundary;
- 2) control channels carrying C-plane information (control messages and packet data); these shall carry information which is exchanged via the TMA- and TMB-SAP at the boundary between MAC and LLC.

The following logical channels are defined within the upper MAC:

- Control Channel comprising:
  - Main Control Channel (MCCH or MCCH-Q);
  - Common Secondary Control Channel (Common SCCH);
  - Assigned Secondary Control Channel (Assigned SCCH).

These channels shall carry control information appearing at the TMA-SAP addressed to MS(s) not involved in a circuit mode call. Refer to clause 23.

- Associated Control Channel (ACCH) comprising:
  - Fast Associated Control Channel (FACCH);
  - Stealing Channel (STCH);
  - Slow Associated Control Channel (SACCH).

These channels shall carry control information appearing at the TMA-SAP intended for MS(s) involved in a circuit mode call.

- Broadcast Common Control Channel (BCCH) comprising:
  - Broadcast Synchronization Channel (BSCH or BSCH-Q);
  - Broadcast Network Channel (BNCH or BNCH-Q).

These channels shall carry the system broadcast information appearing at the TMB-SAP.

#### 19.2.4.4 Logical channels at the lower MAC

Logical channels shall offer different physical paths to the information depending on the chosen error control scheme among those defined in clause 8.

The following generic logical channels shall be available at the lower MAC boundary for phase modulation (see figures 19.8 and 19.9):

- Access Assignment Channel (AACH);
- Broadcast Synchronization Channel (BSCH);
- Signalling Channel (SCH);
- Traffic Channel (TCH);
- Stealing Channel (STCH);
- Common Linearization Channel (CLCH).

The following generic logical channels shall be available at the lower MAC boundary for QAM (see figures 19.10 and 19.11):

- QAM Access Assignment Channel (AACH-Q);
- QAM Slot Information Channel (SICH-Q/D or SICH-Q/U);
- QAM Broadcast Synchronization Channel (BSCH-Q);
- QAM Signalling Channel (SCH-Q);
- QAM Common Linearization Channel (CLCH-Q).

As far as possible, the present document avoids defining specific physical architectures, but proposes instead to explain operation of the MAC sub-layer in terms of the functional blocks and logical channels. This reference model architecture applies equally to MSs and BSs. MSs transmission and reception for phase modulation are shown in figures 19.8 and 19.9 respectively. MSs transmission and reception for QAM are shown in figures 19.10 and 19.11 respectively.

**NOTE:** The only SAPs shown on these figures are the upper MAC, lower MAC and physical layer SAPs. The TLE-SAP, through which the LLC may provide a layer 2 signalling service to the MAC, is not shown.

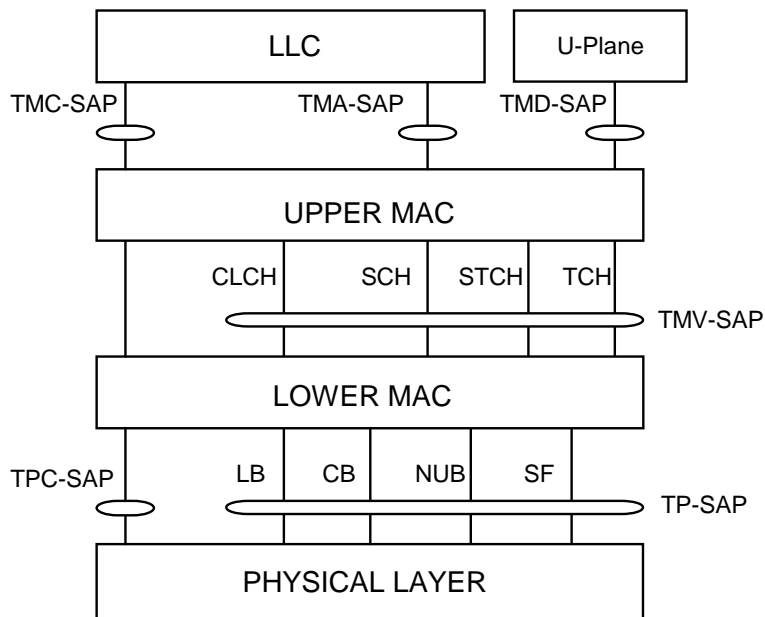

Figure 19.8: MAC sub-layers and logical channels for MS uplink transmission using phase modulation

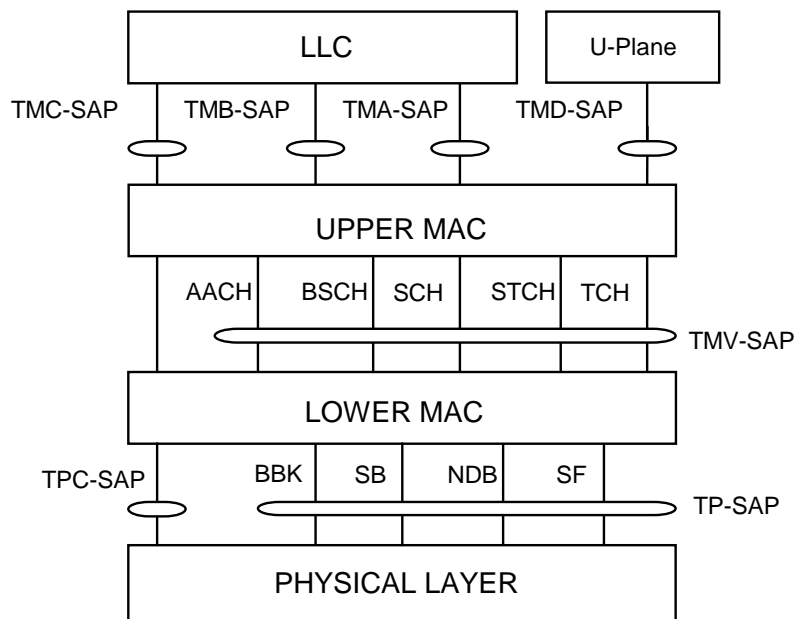

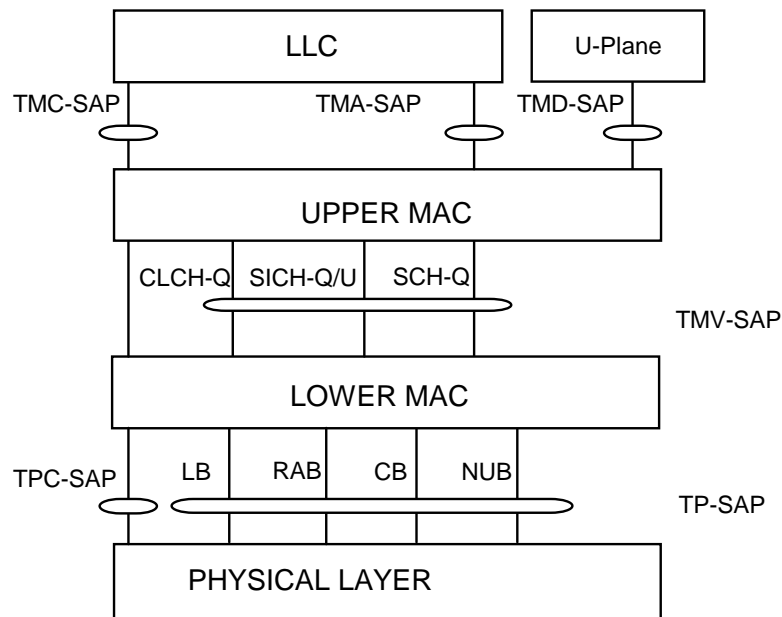

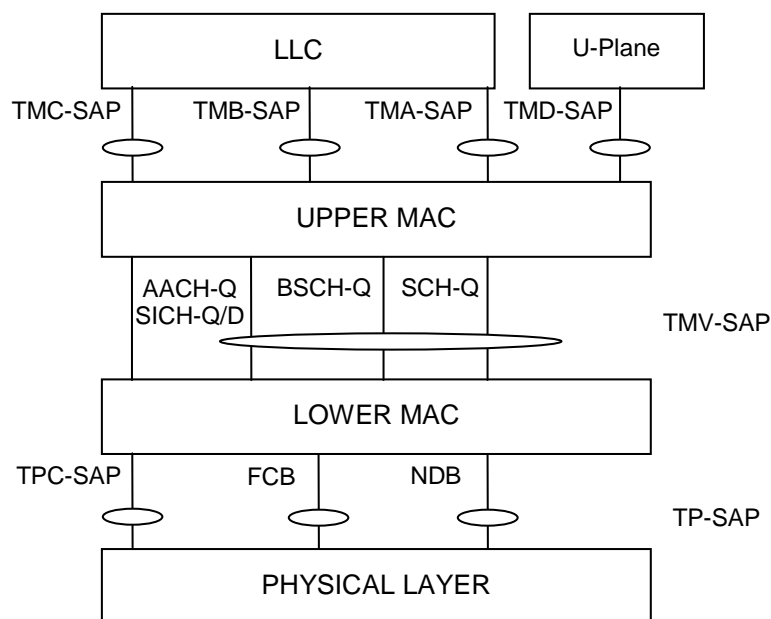

Figure 19.9: MAC sub-layers and logical channels for MS downlink reception using phase modulation

**Figure 19.10: MAC sub-layers and logical channels for MS uplink transmission using QAM**

**Figure 19.11: MAC sub-layers and logical channels for MS downlink reception using QAM**

Tables 19.1, 19.2, 19.3 and 19.4 provide a summary of the logical channels shown in figures 19.8, 19.9, 19.10 and 19.11. The information mapping on these logical channels is presented starting with the MAC layer SAPs down to the physical bursts and blocks.

Table 19.1: Mapping between TMx-SAP and MAC logical channels for phase modulation

| SAP  | Definition   | Logical channel in TMV-SAP                                      | Definition (see note)  |
|--|--|---|--|

| -   | QAM common linearization channel (generated inside the upper MAC) | CLCH-Q  | QAM common linearization channel   |

**Table 19.4: Mapping between MAC logical channels and physical layer bursts for QAM**

| Logical channel in TMV-SAP   | Definition                                 | QAM physical burst                                       | Definition  |
|--|--|--|---|
| SCH-Q/D  | QAM full slot downlink signalling channel  | NDB  | QAM normal downlink burst   |
| SCH-Q/B  | QAM data set B downlink signalling channel | FCB (see note)   | QAM frequency correction burst  |
| SCH-Q/U  | QAM full slot uplink signalling channel    | NUB  | QAM normal uplink burst   |
| SCH-Q/HU   | QAM half slot uplink signalling channel    | CB   | QAM control uplink burst  |
| SCH-Q/RA   | QAM random access signalling channel       | RAB  | QAM random access uplink burst  |
| BSCH-Q   | QAM broadcast synchronization channel      | FCB (see note)   | QAM frequency correction burst  |
| AACH-Q   | QAM access assignment channel              | Transmitted in the header symbols within the NDB and FCB | Transmitted in the header symbols within the QAM normal downlink burst and QAM frequency correction burst |
| SICH-Q/D   | QAM downlink slot information channel      | Transmitted in the header symbols within the NDB and FCB | Transmitted in the header symbols within the QAM normal downlink burst and QAM frequency correction burst |
| SICH-Q/U   | QAM uplink slot information channel        | Transmitted in the header symbols within the NUB and CB  | Transmitted in the header symbols within the QAM normal uplink burst and QAM control uplink burst         |
| CLCH-Q   | QAM common linearization channel           | LB   | QAM linearization burst   |
| NOTE: On a 50 kHz, 100 kHz or 150 kHz QAM channel, the FCB contains both the BSCH-Q and SCH-Q/B logical channels. On a 25 kHz QAM channel, the FCB contains only the BSCH-Q logical channel. |  |  |   |

### 19.2.5 Lower layer management at the DLL

The TETRA protocol architecture, ETSI EN 300 392-1 [6], clause 6 shows how the lower layer management entity is incorporated into all lower layers and is accessible via SAPs Tx-C-SAP as shown in figures 19.1 and 19.7 for the lowest layers. Those access points enable access to information such as measured values, status, general information. The services related to the management of LLC and MAC are described in clause 20.

The DLL should have its own set of functions and measured values. These parameters shall be exchanged using a set of primitives as described in the appropriate clause, namely clauses 22 and 23.

## 19.3 System modes of operation

### 19.3.0 General

Clauses 19.3.1 to 19.3.6 provide an outline description of system modes of operation and their impact on layer 2.

### 19.3.1 Normal mode

#### 19.3.1.0 General

In the present document there are two types of cell: Conventional Access (CA) cells and Direct Access (DA) cells.

A CA cell is a cell on which the main carrier uses phase modulation. The bandwidth of the CA main carrier is 25 kHz.

A CA MS is an MS that is currently camped on a CA cell.

A DA cell is a cell on which the main carrier uses QAM. The bandwidth of the DA main carrier is 25 kHz, 50 kHz, 100 kHz or 150 kHz. A DA MS is an MS that is currently camped on a DA cell.

**NOTE:** An MS may be both CA-capable and DA-capable. In that case it may sometimes be a CA MS and at other times a DA MS, depending on whether its current serving cell is a CA cell or a DA cell.

#### 19.3.1.1 Normal mode for Conventional Access (CA)

In the normal mode of operation on a CA cell, the common control channel on the main carrier shall always be the MCCH and shall always be present in timeslot 1 of all frames 1 to 18. This common control channel is a single-slot  $\pi/4$ -DQPSK channel that shall be used for all common control signalling on that CA cell. All CA MSs shall be able to locate and listen to the downlink transmissions of the MCCH. The BS shall transmit on all downlink slots of the main carrier during normal mode.

#### 19.3.1.2 Normal mode for Direct Access (DA)

In the normal mode of operation on a DA cell, the common control channel on the main carrier shall always be the MCCH-Q and shall always be present in at least timeslot 1 of all frames 1 to 18. This common control channel is a one-slot, two-slot, three-slot or four-slot QAM channel that shall be used for all common control signalling on that DA cell. All DA MSs shall be able to locate and listen to the downlink transmissions of the MCCH-Q. The BS shall transmit on all downlink slots of the DA main carrier.

## 19.3.2 Extended mode

### 19.3.2.1 Usage of extended mode

#### 19.3.2.1.1 Extended mode for Conventional Access (CA)

A BS may have more than one control channel (common or assigned) operational at a time. For CA, the ways to operate this may be as follows:

- in addition to the MCCH, the BS may have from one to three common SCCHs, which have the same functionality as the MCCH but are used only by a sub-set of the user population;
- in addition to the MCCH, the BS may have one or several assigned SCCHs used to continue control signalling and packet mode signalling after the initial random access or paging message;
- in minimum mode (without MCCH), the BS may have one or several assigned SCCHs used to continue control and packet mode signalling after the initial random access or paging message;
- in addition to the MCCH, the BS may have from one to three common SCCHs and one or several assigned SCCHs used to continue control and packet mode signalling after the initial random access or paging message.

The MCCH and common SCCHs cannot be extended to more than one timeslot per TDMA frame. For CA, the MCCH and common SCCHs are  $\pi/4$ -DQPSK channels.

Assigned SCCH can be from one up to four timeslots per TDMA frame. An assigned SCCH may be allocated as a  $\pi/4$ -DQPSK, D8PSK or QAM channel (see clause 19.3.2.2).

Common SCCHs for CA shall be in the same carrier as the MCCH. Assigned SCCHs may be allocated from any carrier.

NOTE: The extended mode does not necessarily increase the control channel capacity of an individual MS; only a multislot or D8PSK or QAM assigned SCCH provides a higher transfer rate.

### 19.3.2.1.2 Extended mode for Direct Access (DA)

A BS may have more than one control channel (common or assigned) operational at a time. For DA, the ways to operate this may be as follows:

- if the BS is using a single-slot MCCH-Q then, in addition to the MCCH-Q, the BS may have from one to three common SCCHs, which have the same functionality as the MCCH-Q but may be used only by a sub-set of the user population;

NOTE: The BS is not permitted to use QAM common SCCHs if it is using a multi-slot MCCH-Q. For DA, if the BS wishes to use more than one timeslot per TDMA frame for common control signalling, it may use either a single multi-slot MCCH-Q or multiple single-slot QAM common control channels.

- in addition to the MCCH-Q, the BS may have one or several assigned SCCHs used to continue control signalling and packet mode signalling after the initial random access or paging message;
- if the BS is using a single-slot MCCH-Q then, in addition to the MCCH-Q, the BS may have from one to three common SCCHs and one or several assigned SCCHs used to continue control and packet mode signalling after the initial random access or paging message.

The MCCH-Q can be from one up to four timeslots per TDMA frame, whereas common SCCHs cannot be extended to more than one timeslot per TDMA frame. For DA, the MCCH-Q and common SCCHs are QAM channels.

Assigned SCCH can be from one up to four timeslots per TDMA frame. An assigned SCCH may be allocated as a QAM,  $\pi/4$ -DQPSK or D8PSK channel (see clause 19.3.2.2).

Common SCCHs for DA shall be in the same carrier as the MCCH-Q. Assigned SCCHs may be allocated from any carrier.

For DA, the BS may allocate the MCCH-Q physical channel(s) as a QAM assigned SCCH for some MSs that are camped on the cell. Then the MSs in common mode and the MSs in assigned mode share the channel. Similarly, the BS may allocate a physical channel used as a QAM common SCCH also as a QAM assigned SCCH for some MSs that are camped on the cell, with the channel shared between the MSs in common mode and the MSs in assigned mode.

### 19.3.2.1.3 Extended mode with sharing between cells

As described above, a CA MS is an MS that is currently camped on a CA cell, so it receives a  $\pi/4$ -DQPSK common control channel (i.e. the MCCH or a  $\pi/4$ -DQPSK common SCCH) unless it is directed by the BS to an assigned channel. A DA MS is an MS that is currently camped on a DA cell, so it receives a QAM common control channel (i.e. the MCCH-Q or a QAM common SCCH) unless it is directed by the BS to an assigned channel. From the perception of the MS, at any one time it is camped on either a CA cell or a DA cell.

However, for cells that share the same mobile country code, mobile network code, colour code and static cipher key or common cipher key (see ETSI EN 300 392-7 [8]), the same channel may sometimes be used by more than one cell (if within the permitted physical separation i.e. if the assigned channel's transmitter site is within 4 km of the main carrier's transmitter site for each of the sharing cells (see clause 7)). Then:

- MSs camped on a CA cell might be assigned to a channel used also by DA MSs. For example:
  - A channel on a carrier other than either main carrier might be used as an assigned channel shared by both CA MSs and DA MSs. This may apply for both phase modulation carriers and QAM carriers.

- If a channel on either main carrier is not being used for common control, it might be used as an assigned channel shared by both CA MSs and DA MSs.
- The MCCH-Q or a QAM common SCCH might be used as an assigned SCCH for CA MSs. As described in clause 19.3.2.1.2, the MCCH-Q or a QAM common SCCH might also be used as an assigned SCCH for DA MSs camped on the DA cell. Thus the channel could be shared between the DA MSs in common mode, DA MSs in assigned mode and CA MSs in assigned mode.
- In some cases, DA MSs might be assigned to a channel used also by DA MSs that are camped on a different DA cell as follows:
  - A channel on a carrier other than either DA main carrier might be used as an assigned channel shared by MSs from different DA cells. (The channel could also be shared by MSs from a CA cell.)

NOTE: The present document does not provide a general method for sharing of an assigned channel by MSs from different CA cells. However, annex S notes a restricted method that SwMIs may be able to use without the MSs being aware of the usage.

### 19.3.2.2 Modulation modes

#### 19.3.2.2.0 General

There are three possible modulation modes for channels:  $\pi/4$ -DQPSK, D8PSK and QAM. The signalling operation with the three modulation modes is outlined in clauses 19.3.2.2.1, 19.3.2.2.2 and 19.3.2.2.3.

#### 19.3.2.2.1 $\pi/4$ -DQPSK channel

All signalling and data messages and traffic on a  $\pi/4$ -DQPSK channel are sent using  $\pi/4$ -DQPSK modulation.

The RF bandwidth of a  $\pi/4$ -DQPSK channel is 25 kHz.

#### 19.3.2.2.2 D8PSK channel

A "D8PSK channel" is the generic term for a channel on which signalling and data messages may be sent using either  $\pi/4$ -DQPSK bursts or  $\pi/8$ -D8PSK bursts. The transmitting BS or MS chooses whether to use a  $\pi/4$ -DQPSK burst or a  $\pi/8$ -D8PSK burst on a slot-by-slot basis. The receiving MS or BS determines whether a slot (or subslot) contains a  $\pi/4$ -DQPSK burst or a  $\pi/8$ -D8PSK burst by determining whether the training sequence uses the  $\pi/4$ -DQPSK form or the  $\pi/8$ -D8PSK form.

The RF bandwidth of a D8PSK channel is 25 kHz.

#### 19.3.2.2.3 QAM channel

All signalling and data messages on a QAM channel are sent using QAM modulation. The transmitting BS or MS chooses which modulation level and coding rate to use on a slot-by-slot basis. There are six valid combinations:

- 4-QAM, coding rate  $r = 1/2$ ;
- 16-QAM, coding rate  $r = 1/2$  or 1;
- 64-QAM, coding rate  $r = 1/2, 2/3, \text{ or } 1$ .

The access assignment channel AACH-Q (in a QAM normal downlink burst or QAM frequency correction burst), and the slot information channels SICH-Q/D (in a QAM normal downlink burst or QAM frequency correction burst) and SICH-Q/U (in a QAM normal uplink burst or QAM control uplink burst), always use 4-QAM with coding rate  $r = 1/2$ . The downlink slot information channel SICH-Q/D indicates the modulation and coding rate used in the remainder of the downlink slot and indicates whether the burst is a frequency correction burst. The uplink slot information channel SICH-Q/U indicates the modulation and coding rate used in the remainder of the uplink slot or subslot.

The RF bandwidth of a QAM channel is 25 kHz, 50 kHz, 100 kHz or 150 kHz.

The random access burst always uses 4-QAM, coding rate  $r = 1/2$  with a 25 kHz bandwidth - irrespective of the RF bandwidth of the QAM channel. For the purposes of the random access procedure, each subslot (i.e. half slot) that is available for random access is divided into 25 kHz frequency blocks. This provides 2, 4 or 6 parallel "random access uplink RF channel subslots" within a single subslot on a 50 kHz, 100 kHz or 150 kHz channel respectively.

### 19.3.3 Minimum mode

For CA, minimum mode allows a BS to assign all four timeslots on the CA main carrier for traffic or dedicated control purpose. In this mode, only frame 18 can be used for common control without disturbing the established services. A BS enters minimum mode when all four downlink timeslots on the CA main carrier are assigned so that there is no common control channel available in timeslot 1.

Minimum mode is not supported for DA.

### 19.3.4 Discontinuous transmission mode

A BS may transmit discontinuously on a CA main carrier when it operates in one of the following time sharing modes.

NOTE: Discontinuous downlink transmission is not supported on radio resources currently being used for QAM.

### 19.3.5 Time sharing mode

#### 19.3.5.0 General

In the time shared mode, multiple BSs may use the same phase modulation radio resource for control channel purposes in a co-ordinated manner.

#### 19.3.5.1 Carrier sharing mode

In carrier sharing mode, one carrier frequency used for phase modulation shall be shared among up to four cells, each cell being allocated at least one timeslot of the TDMA frame (see clause 9 for more details).

#### 19.3.5.2 MCCH sharing mode

In the MCCH sharing mode, the MCCH shall be shared among several CA cells in a manner under the control of the infrastructure (see clause 9 for more details).

### 19.3.6 No service mode

A BS may be in a mode where it is not able to provide any services. In this mode, the BS may transmit unallocated physical channel (UP) on all of the timeslots of its main carrier.

For CA, the BS should also set the "BS Service Details" information element of the D-MLE-SYSINFO PDU to 000000000000<sub>2</sub>, to further indicate that the BS does not provide any TETRA services in this mode. For DA, the BS should set the "BS Service Details DA" information element of the D-MLE-SYNC-DA and D-MLE-SYSINFO-DA PDUs to 0000000<sub>2</sub>.

NOTE: A BS that is in this mode is not in normal mode.

## 19.4 MS modes of operation

### 19.4.1 Idle mode

The idle mode shall be the state of the registered MS not involved in any particular transmission. It shall consist of listening to the MCCH (for CA) or MCCH-Q (for DA) or to any signalling channel the MS could have been told by the SwMI. The MS shall be capable of monitoring adjacent cells in this mode as described in clause 23.

## 19.4.2 Signalling and packet mode

### 19.4.2.1 Common control channel

This channel shall support common signalling for all MSs (see clause 23). In a system, there may be in addition to the MCCH or MCCH-Q one or more common secondary control channels (common SCCHs). By default, the MS shall listen to the MCCH (for CA) or MCCH-Q (for DA) for paging and other signalling (see clause 19.4.5 for energy economy).

### 19.4.2.2 Secondary control channels

These channels may be used to supplement the capacity of the common control channel. They may have the same functionality as the MCCH (for CA) or MCCH-Q (for DA) for a subdivision of the population, or they may be devoted to support only certain type of transmission e.g. packet mode data. In that respect, they may serve as a control channel dedicated to packet data transmission (see clause 23). The BS shall command the MS to use the appropriate control channel by allocating additional resources or by commanding the MS to go to a certain control channel (refer to clause 19.3.2). The BS shall command MSs to use the appropriate control channel, either by a broadcast message indicating the number and location of common SCCHs in operation, or by commanding certain MSs to go to an assigned SCCH.

An assigned SCCH may be allocated as a  $\pi/4$ -DQPSK, D8PSK or QAM channel. For CA, it is optional for the MS or BS to support D8PSK and/or QAM channels. For DA, it is optional for the MS or BS to support  $\pi/4$ -DQPSK and/or D8PSK channels.

**NOTE:** A BS could use an assigned SCCH for continuing signalling for circuit mode call set-up.

The BS may decide to assign an SCCH for advanced link packet data transmission. There are different possible methods of usage.

**EXAMPLE:**

- a) The BS may use an assigned SCCH for only one advanced link (i.e. similar to the usage of a channel for a circuit mode call); or
- b) the BS may use an assigned SCCH as a general packet data channel, supporting advanced links for many MSs, where each MS may be offering/receiving data packets at a low rate or intermittently.

MS operation is the same in both cases. The channel usage is scheduled by the BS, and MSs transmit only under BS control (by random access or reserved access). When appropriate, an MS may be permitted to remain on the channel while its advanced link is connected, even though the MS is not necessarily using the link all the time. After a pause, the MS uses random access when it wishes to continue transmission.

An advanced link can also use a common control channel or, for MSs in a circuit mode call, an ACCH. However, if advanced links are used on a common control channel, the normal control channel performance may be degraded.

### 19.4.2.3 Associated Control Channel (ACCH)

This channel shall be used for signalling in conjunction with an established circuit (traffic channel). That signalling may be independent of the call the control channel is associated with. The lower MAC should be configured as shown in figure 19.12. Depending on the circuit mode call type and the capabilities of MS, the ACCH may be available during timeslots in frames 1 to 18 (if they are not being used for traffic), and it is always available during the 18th frame; refer to clause 23. The former is called Fast Associated Control Channel (FACCH) (frames 1 to 18), and the latter is called Slow Associated Control Channel (SACCH) (frame 18). The MS shall listen to the ACCH under control of the BS; refer to clause 19.4.4.

Circuit mode traffic transmissions apply only on  $\pi/4$ -DQPSK channels. Therefore signalling on the ACCH is sent using  $\pi/4$ -DQPSK modulation.

#### 19.4.2.4 Full and half slot signalling

##### 19.4.2.4.1 Full and half slot signalling on a $\pi/4$ -DQPSK channel

In figures 19.12 and 19.13, full slot ( $SF = 0$ ) or half slot ( $SF = 1$ ) downlink signalling shall be indicated by the appropriate slot flag (SF). The slot flag (SF) shall be a change between two training sequences, as described in clause 9. Downlink control messages may usually occupy a full slot, but the system Broadcast channels (BSCH and BNCH) shall be all one half slot long to enable them to be transmitted in frame 18 (BSCH, or BNCH on SCH/HD; see clause 9).

For the MS transmission on the uplink for initial access, a subslot is used - corresponding to the logical channel SCH/HU as described in clause 9.

Uplink control messages may be sent within a subslot using the logical channel SCH/HU. However, for packet data or when using fragmentation, the MS may need to use reserved full slots or subslots for the transmissions subsequent to the initial access. The allocation of MS reserved uplink slots and subslots shall be under the control of the BS.

Once the MS has switched into traffic mode, all transmissions shall be done over an entire timeslot. Distinction between full slot for traffic and half slot to indicate that the first half slot has been stolen for signalling purposes shall be indicated by a change between the two training sequence, in a manner identical to that used for the downlink.

Figure 19.12: Configuration in signalling and packet mode on a  $\pi/4$ -DQPSK channel

#### 19.4.2.4.2 Full and half slot signalling on a D8PSK channel

For downlink signalling on a D8PSK channel, full slot ( $SF = 0$ ) or half slot ( $SF = 1$ ) downlink signalling shall be indicated by the appropriate Slot Flag (SF). The slot flag (SF) shall be a change between two training sequences, as described in clause 9. The training sequence also indicates whether the slot contains a  $\pi/4$ -DQPSK normal downlink burst or a  $\pi/8$ -D8PSK normal downlink burst. Thus there are four possible normal training sequences in a downlink slot on a D8PSK channel. (A further training sequence is used for the synchronization downlink burst.)

For the MS transmission on the uplink for initial access, a  $\pi/4$ -DQPSK subslot is used - corresponding to the logical channel SCH/HU as described in clause 9.

Subsequent to the initial access, the MS may need to use full slots or subslots, reserved for that MS by the BS. Either a  $\pi/4$ -DQPSK or  $\pi/8$ -D8PSK normal uplink burst may be used in a reserved slot - corresponding to logical channel SCH/F or SCH-P8/F. Either a  $\pi/4$ -DQPSK or  $\pi/8$ -D8PSK control uplink burst may be used in a reserved subslot - corresponding to logical channel SCH/HU or SCH-P8/HU. For both reserved slots and subslots, the training sequence indicates the modulation of the burst.

#### 19.4.2.4.3 Full and half slot signalling on a QAM channel

Full slot signalling is used on the downlink of a QAM channel - corresponding to logical channel SCH-Q/D in the QAM normal downlink burst or to logical channels BSCH-Q and SCH-Q/B in the QAM frequency correction burst. These bursts use the full RF bandwidth of the QAM channel.

NOTE: For 25 kHz channels:

- the BSCH-Q logical channel is contained within the QAM frequency correction burst;
- there is no SCH-Q/B logical channel in the QAM frequency correction burst.

For 50 kHz, 100 kHz and 150 kHz channels:

- the BSCH-Q logical channel is contained within the central 25 kHz of the QAM frequency correction burst;
- the SCH-Q/B logical channel is carried in the outer parts of the QAM frequency correction burst.

The BS chooses which modulation level and coding rate to use on a slot-by-slot basis for SCH-Q/D. The BS always uses 4-QAM, coding rate  $r = 1/2$  for BSCH-Q and SCH-Q/B.

For the MS transmission on the uplink for initial access, a random access uplink RF channel subslot is used - corresponding to the logical channel SCH/RA as described in clause 9. The random access transmission uses a 25 kHz bandwidth, irrespective of the RF bandwidth of the QAM channel, and always uses 4-QAM, coding rate  $r = 1/2$ .

Subsequent to the initial access, the MS may need to use full slots or subslots, reserved for that MS by the BS - corresponding to the logical channel SCH-Q/U for a full slot or SCH-Q/HU for a reserved subslot. These use the full RF bandwidth of the QAM channel. The transmitting MS chooses which modulation level and coding rate to use in each slot or subslot.

### 19.4.3 Traffic mode

#### 19.4.3.0 General

Traffic mode applies only on  $\pi/4$ -DQPSK channels.

### 19.4.3.1 Normal operation

The traffic mode may be either speech or data circuit operation. The logical channels in use shall be TCH (traffic channels) for frames 1 to 17. Full slots (Slot Flag = 0) shall normally be used for traffic. Frame 18 shall be used for signalling only.

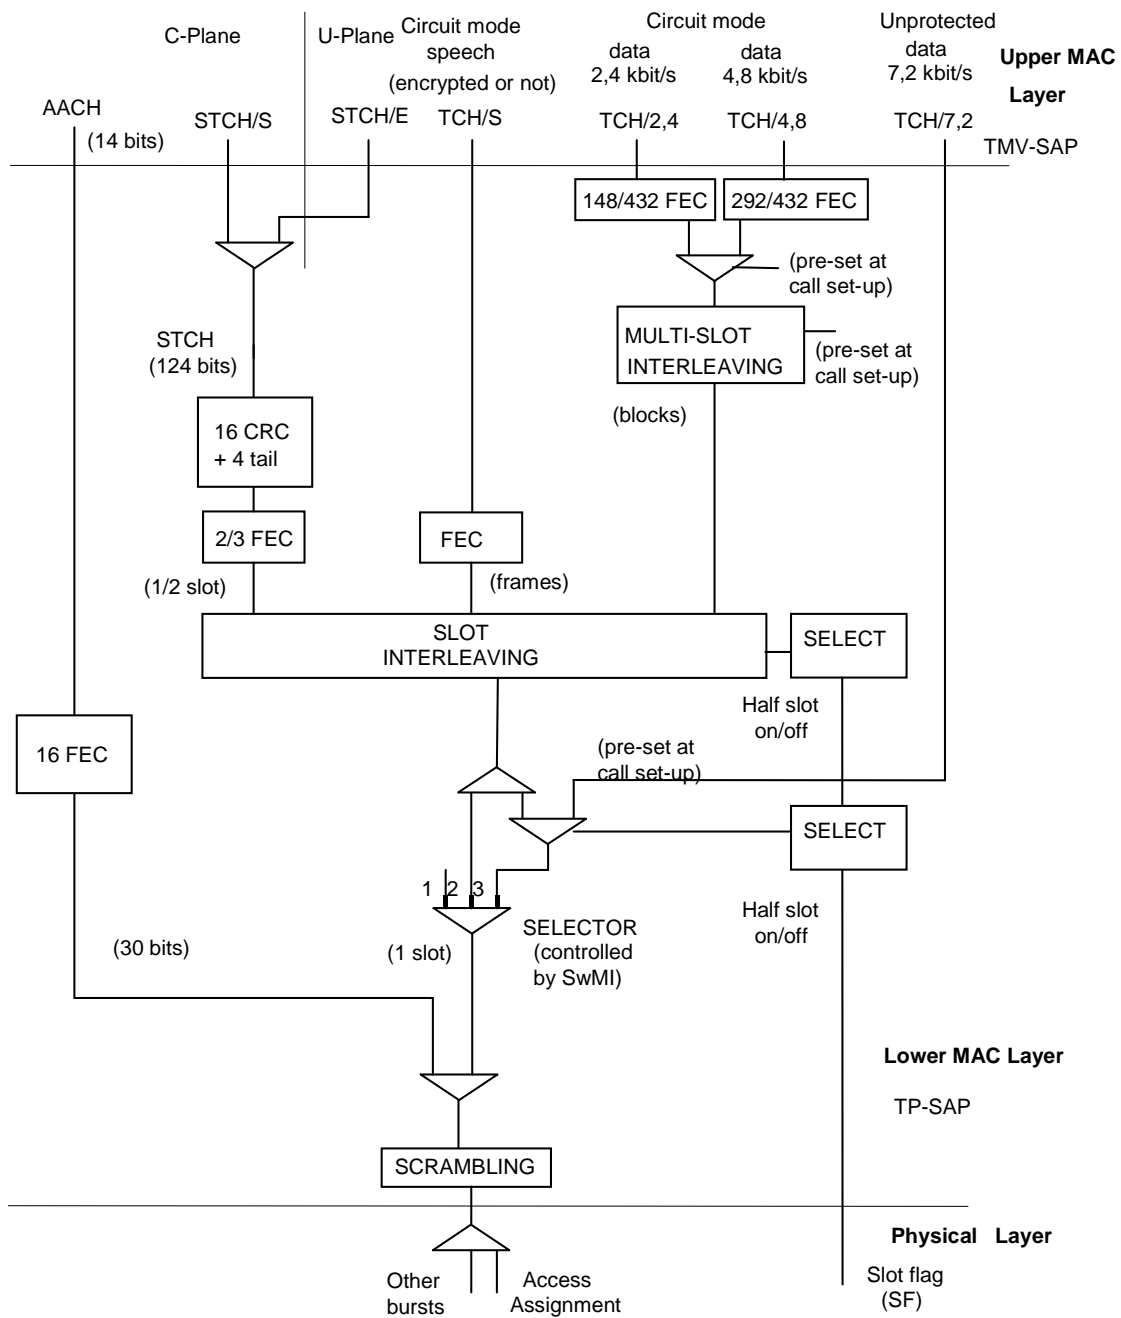

Figure 19.13: Configuration in traffic mode for frames 1 to 17 on a  $\pi/4$ -DQPSK channel

### 19.4.3.2 Stealing mechanism

When in traffic mode (either speech or data circuit), capacity may be stolen for signalling purposes. This shall leave the current mode of operation unchanged. The appearance of half slot ( $SF = 1$ ) in the transmission shall indicate that stealing has occurred. Half slot ( $SF = 1$ ) operation shall be indicated by a change in the appropriate training sequence as described in clause 9. The MAC header of the first half of the slot shall indicate whether the other half has also been stolen or if it belongs to the normal traffic circuit. The MAC header shall contain an information on the intended destination of the signalling message: either C-plane or U-plane signalling. Stealing occurrence shall be locally reported to the U-plane application at the TMD-SAP (see figure 19.13).

This mechanism shall apply to both BS and MS transmissions.

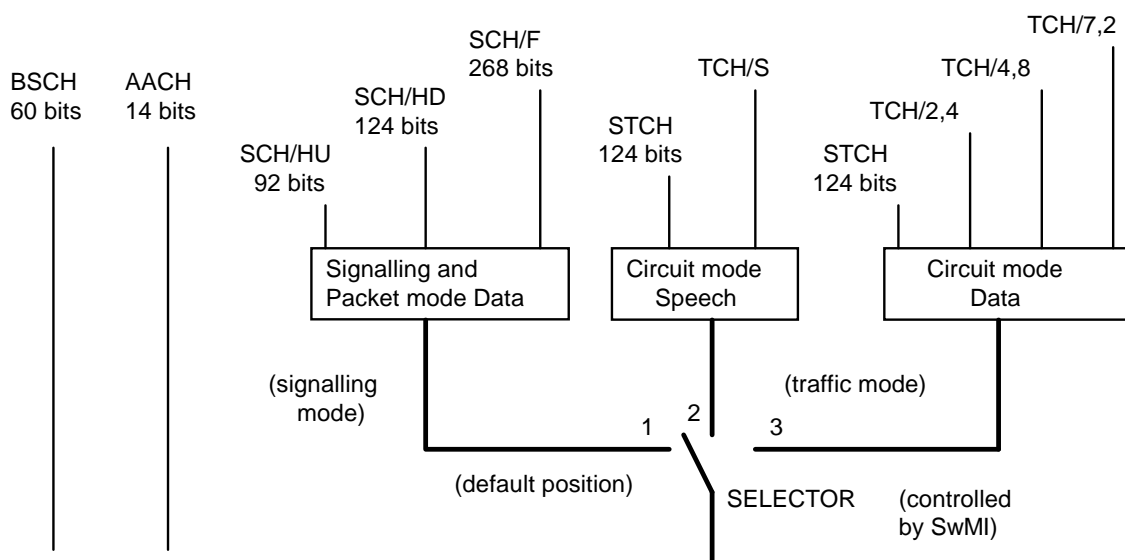

### 19.4.4 Selection of the mode of operation

During a transaction on a  $\pi/4$ -DQPSK channel, the MAC shall be considered to be switched into one of the following modes of operation:

- signalling mode; or
- traffic mode.

The selection mechanism is presented in figure 19.14. The default mode of the MAC layer shall be signalling mode (selector in position 1 on figure 19.14). The BS shall send CC messages to change the mode of operation in the MS MAC layer. This change shall be reflected from the CC into the MAC using layer management communication internal to the MS. In case of accidental loss of the CC message, a fall-back mechanism is specified using the AACH indications.

When stealing is initiated in circuit mode operation (either by the MS or the SwMI), the logical channel shall be temporarily taken (fully or partially) on a half slot by half slot basis for signalling purposes.

**Figure 19.14: Selection of configuration for the current mode of operation on a  $\pi/4$ -DQPSK channel**

If traffic mode is selected, then the mode selector switch shall be considered to be set accordingly in the MS and in the SwMI.

In case of independent uplink and downlink assignment (e.g. to cover inter-site calls), the selector may be duplicated for uplink and downlink operation (i.e. for MS transmission and reception). Still, the selectors shall be set accordingly in the MS and SwMI.

NOTE: Traffic mode applies only to frames 1 to 17. Both MS and BS are in signalling mode on frame 18.

### 19.4.5 Energy economy mode

On the MS request, the BS MM may command the MS to energy economy mode on the MCCH or MCCH-Q or on a common SCCH. The start of the energy economy shall be indicated by the BS. Then:

- when the MS is idle on a single-slot common control channel, it follows a regular cycle of sleeping for N TDMA frames and then receiving in one timeslot;
- when a DA MS is idle on a multi-slot MCCH-Q:
  - if the BS does not permit enhanced energy economy, the MS follows a regular cycle of sleeping for N TDMA frames and then receiving all timeslots comprising the MCCH-Q in one TDMA frame;
  - if the BS permits enhanced energy economy, the MS may follow a regular cycle of sleeping for N TDMA frames and then receiving one of the MCCH-Q timeslots in one TDMA frame.

During energy economy mode, the MS shall remain synchronized to the BS transmission.

The part-time reception procedure is an alternative procedure which may apply on a multi-slot MCCH-Q. If part-time reception is permitted by the BS, this allows DA MSs when idle to receive just one downlink slot per TDMA frame.

Also, when the BS allocates an assigned channel, it may indicate that, when appropriate, MS "napping" is permitted on that assigned channel according to the specified napping reception pattern and napping reception frames. When the MS is in napping mode, it receives at least the downlink slot(s) indicated by the napping reception pattern in the napping reception frames.

### 19.4.6 Support of concurrent calls

Depending on the class of the mobile, concurrent calls may be supported by LLC (see clause 22) and MAC (see clause 23) protocols.

### 19.4.7 Support of air-interface encryption

The support of encryption is optional and shall be indicated as part of the MS capabilities (i.e. in the class of MS).

If this mode is supported, the MAC shall encrypt signalling messages as instructed by the upper layers on a message basis. Encrypted messages shall be indicated in the MAC header in order to enable the receiving end to decrypt the message content.

The MAC may in addition encrypt the content of the half slots coming from the TMD-SAP. This may also apply to an established encrypted call. The encrypted speech shall then be encrypted once more in the MAC. In this case, encryption synchronization messages shall also be encrypted at the MAC level and decrypted before being passed through the TMD-SAP at the receiving side.

## 19.5 Scenarios for primitives and PDU transfer on the air interface

Figures 19.15, 19.16, 19.17 and 19.18 show example scenarios illustrating message exchanges for set-up of a circuit mode call on a CA cell. Figures 19.15 and 19.16 show the primitives and PDUs on a calling MS air interface. Figures 19.17 and 19.18 show the primitives and PDUs on a called MS air interface.

NOTE 1: Some features represented here may be optional.

NOTE 2: Figures 19.15, 19.16, 19.17 and 19.18 illustrate message exchanges for set-up of a circuit mode call on a CA cell. Similar signalling applies for set-up of a circuit mode call on a DA cell. However, for example, different logical channels are used for signalling on the DA main carrier; and the U-SETUP PDU exceeds the available capacity in the QAM random access uplink burst, so the calling MS uses fragmentation.

Refer to clause 20 for definition of primitives and elements, and clause 21 for PDUs. Refer to clauses 11 and 14 for the call set-up definition. The involved MLE, LLC and MAC protocols are found in clauses 18, 22 and 23 respectively.

Calling MS Side

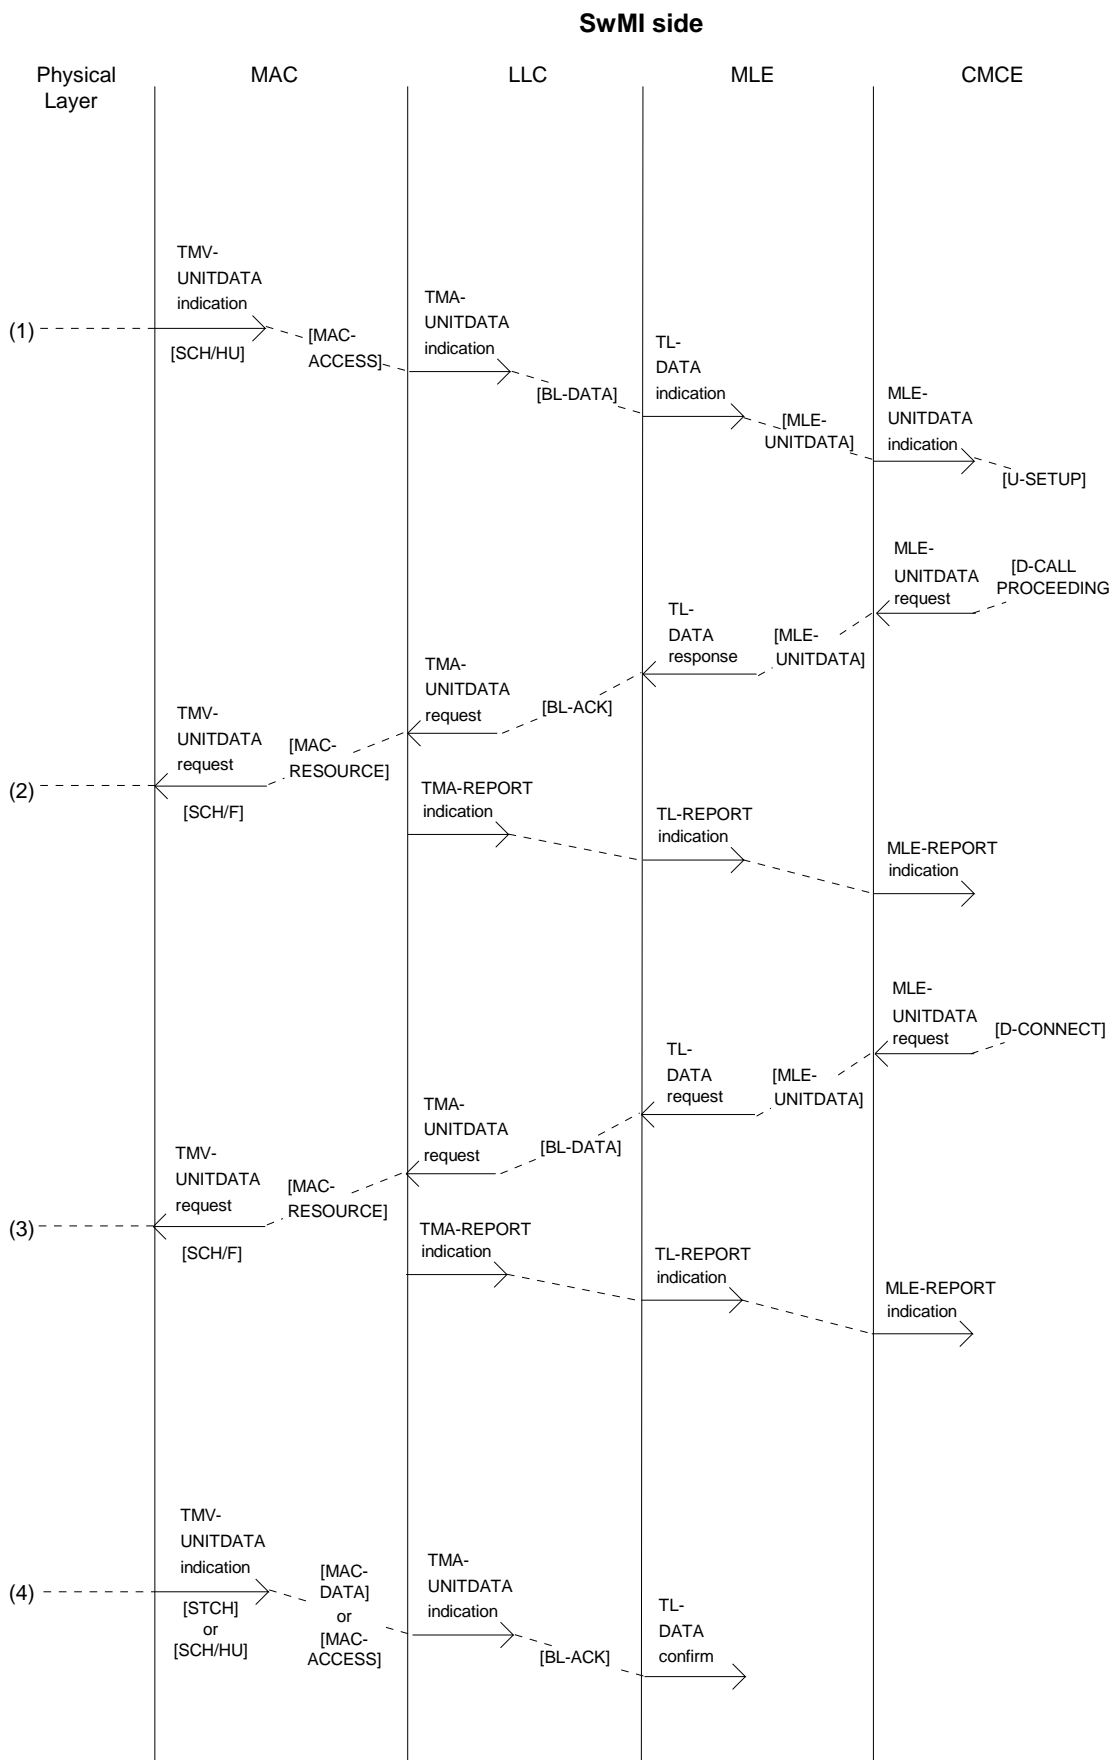

Figure 19.15: Primitives and PDUs on the calling MS air interface on a CA cell for an individual call with direct set-up signalling - Calling MS side

**Figure 19.16: Primitives and PDUs on the calling MS air interface on a CA cell for an individual call with direct set-up signalling - SwMI side**

SwMI Side

Figure 19.17: Primitives and PDUs on the called MS air interface on a CA cell for an individual call with direct set-up signalling - SwMI side

**Figure 19.18: Primitives and PDUs on the called MS air interface on a CA cell for an individual call with direct set-up signalling - Called MS side**

## 20 Layer 2 service description

### 20.1 Introduction

Clause 20 describes the services offered by layer 2 (see clauses 22 and 23) of the V+D TETRA air interface (see ETSI EN 300 392-1 [6], clause 6). The service description is done in terms of SAPs, primitives and their parameters. Throughout clause 20 the word "shall" is used with SAPs, service primitives and parameters for traceability reasons in the protocol model, but those SAPs and primitives are not testable. As this applies inside an MS at non-specified reference points (see ETSI EN 300 392-1 [6], clauses 4 and 5), the following description does not imply any specific implementation.

### 20.2 Layer 2 service description

#### 20.2.1 LLC SAPs

The model of the DLL comprises two sub-layers: the LLC and the MAC. The layer architecture is presented in clause 19.

Layer 2 shall provide services to the MLE through three SAPs: TLA, TLB, TLC as shown in figure 20.1. These services are defined in terms of primitive actions and events of the service, parameters associated with each primitive action and event, interrelationship between primitives and the valid sequences of those actions following the ISO model ISO/IEC 8348 [i.7].

NOTE 1: The MLE layer is also called "service user" in the layer 2 descriptions.

**Figure 20.1: SAPs at the MLE-LLC boundary**

The SAPs in this model are:

- TLA-SAP for signalling:
  - this SAP shall be used for data transfer and for control of the data transfer; the services are described in tables 20.8 and 20.9;
- TLB-SAP for broadcast:
  - this SAP shall be used for broadcasting purposes;
- TLC-SAP for layer management:
  - this SAP shall be used for the local control related to the cell selection/reselection in the MLE. In this model it is also used for local layer management inside one protocol stack. For example, it may be used for passing values (e.g. valid addresses, MNC, MCC) between the service user and the protocol layer 2.

NOTE 2: The peer-to-peer services provided by the TLA-SAP and the TLB-SAP correspond to services between one BS and one or several MSs. The services provided by the TLC-SAP correspond to the services within an MS.

In addition to these services to the MLE, the LLC may provide an additional SAP: the TLE-SAP. This is the layer 2 signalling SAP. The LLC offers layer 2 signalling services to the MAC through this SAP.

## 20.2.2 MAC SAPs

The MAC shall provide three SAPs to the LLC: TMA-SAP, TMB-SAP and TMC-SAP. Their role is the same as the corresponding TLA-SAP, TLB-SAP and TLC-SAP.

In addition to these, the MAC shall provide an additional SAP to the U-plane application: the TMD-SAP. The services offered at this SAP are illustrated in clause 19 and described in clause 23.

## 20.2.3 Generic primitive types

Four different types of primitives are used in this protocol model as defined in ISO/IEC 8348 [i.7] and further explained in ETSI ETS 300 125 [5]. TETRA specific explanations are shown below in the notes.

The REQUEST primitive type shall be used when a higher layer is requesting a service from the lower layer.

The INDICATION primitive type shall be used by a layer providing a service to notify the higher layer of any specific activity which is service related. The INDICATION primitive may be the result of an activity of the lower layer related to the primitive type REQUEST at the peer entity.

NOTE 1: Primitives at the TxC-SAP are not normally directly related to any data transfer service.

The RESPONSE primitive type shall be used by a layer to acknowledge receipt, from a lower layer, of the primitive type INDICATION.

NOTE 2: In TETRA, a RESPONSE primitive may be used with upper layer data in order to force transportation of acknowledgement and service user data (TL-SDU) in the same transmission. The TL-SDU will then be placed in the PDU containing the acknowledgement.

The CONFIRM primitive type shall be used by the layer providing the requested service to confirm that the activity has been completed.

NOTE 3: The CONFIRM primitive may be the result of an activity of the lower layer related to the primitive type RESPONSE at the peer entity and in that case it may contain service user data (TL-SDU).

### 20.2.3a Usage of primitives at the TLE-SAP

In TETRA, the TLE-SAP is an exceptional case where the LLC provides a service to a lower layer (i.e. the MAC). Two primitive types are used at this SAP.

The REQUEST primitive type shall be used when the MAC is requesting a service from the LLC.

The INDICATION primitive type shall be used by the LLC to notify the MAC of any specific activity which is service related. The INDICATION primitive may be the result of an activity of the LLC related to the primitive type REQUEST at the peer entity.

Additionally the CONFIRM primitive type may be used by the LLC to confirm that a requested activity has been completed.

## 20.2.4 Parameters definition for LLC and MAC service primitives

### 20.2.4.1 Address type

Address type shall be used by the service user to indicate to the MAC which address type will be used for transmission. It shall be used to distinguish between a user address (i.e. SSI), a management address (i.e. SMI) or an un-exchanged address (i.e. USSI).

#### 20.2.4.2 Advanced link service

Advanced link service shall define which advanced link service is used:

- acknowledged; or
- unacknowledged.

#### 20.2.4.3 Call release

This parameter shall indicate call release to the MS-MAC e.g. when a user within a group call wishes to leave that group call.

#### 20.2.4.4 Channel number

The channel number parameter shall identify the frequency of the RF channel that the MS shall use for the requested service or that layer 2 has used for the indicated service.

#### 20.2.4.5 Channel change accepted

The channel change accepted parameter shall be used by the higher layers to indicate whether the MAC should accept or not the channel allocation indicated by the "channel change handle" parameter, see clause 20.2.4.6.

#### 20.2.4.6 Channel change handle

This parameter shall be a local identifier which acts as a reference to a particular channel allocation when the MAC requires an instruction about whether to accept that channel allocation (i.e. when the MAC sets the "channel change response required" parameter to "true"). Its implementation is outside the scope of the present document.

#### 20.2.4.7 Channel change response required

This parameter shall be used for the MAC to indicate to the higher layers that a channel allocation command was received with a particular SDU and that the MAC requires an instruction about whether to accept the channel allocation. In this case the parameter shall be set to "true"; otherwise it shall be set to "false".

#### 20.2.4.8 Channel class label

This parameter shall be a local identifier which acts as a reference to a particular channel class when the higher layers (i.e. MLE) request assessment of the path loss for that channel class. Its implementation is outside the scope of the present document.

NOTE: A channel class is defined as a set of values indicating the RF characteristics of a concentric channel or fully super-sectored channel.

#### 20.2.4.9 Channel information

This parameter may be used for the MAC to provide information about a channel to the higher layers. For example, it may indicate the modulation mode and the bandwidth of the channel, and whether the channel is a conforming channel, non-conforming concentric channel, sectored channel, super-sectored channel or eccentric channel (or whether the MAC does not understand the conforming channel status of the channel).

NOTE: A conforming channel is a special case of a concentric channel. All sectored, super-sectored and eccentric channels are non-conforming channels.

This parameter may also be used to provide information to the MAC when the higher layers instruct the MAC to change channel (or when the higher layers provide information about the main carrier of a new cell). For example, it may indicate the modulation mode and the bandwidth of the channel.

#### 20.2.4.10 Characteristics of channel class to be assessed

This parameter shall be used for the higher layers (i.e. MLE) to provide information to the MAC about a channel class that is to be assessed. It includes the following information:

- modulation mode for that channel class;
- maximum MS transmit power for that channel class;
- minimum RX access level for that channel class; and
- BS transmit power relative to main carrier (see note 1).

NOTE 1: For an assessment of a channel class on the serving cell, this refers to the BS transmit power for that channel class relative to the BS transmit power on the main carrier of the serving cell. For an assessment of a channel class on a neighbour cell, this refers to the BS transmit power for that channel class relative to the BS transmit power on the main carrier of that neighbour cell.

NOTE 2: Assessment of a channel class on the serving cell is performed by using measurements on the current channel or on the main carrier of the serving cell, together with the characteristics of the channel class to be assessed, to predict the path loss on channel(s) corresponding to that channel class. Assessment of a channel class on a neighbour cell is performed by using measurements on the main carrier of that neighbour cell, together with the characteristics of the channel class to be assessed, to predict the path loss on channel(s) corresponding to that channel class.

NOTE 3: The main carrier is a phase modulation carrier for a Conventional Access (CA) cell or a QAM carrier for a Direct Access (DA) cell.

#### 20.2.4.10a Characteristics of RF channel to be cell-read

This parameter may be used for the higher layers (i.e. MLE) to provide information to the MAC about an RF channel on which the MAC is to read the SYSINFO-DA PDU. The RF channel is the main carrier of a DA neighbour cell. This parameter may include the following information:

- bandwidth of RF channel on which the MAC is to read the SYSINFO-DA PDU.

NOTE: The main carrier of the DA neighbour cell is a QAM carrier.

#### 20.2.4.11 Characteristics of RF channel to be monitored

This parameter shall be used for the higher layers (i.e. MLE) to provide information to the MAC about an RF channel that is to be monitored. It may include the following information:

- modulation mode for RF channel to be monitored;
- bandwidth of RF channel to be monitored;
- maximum MS transmit power on RF channel to be monitored;
- minimum RX access level for RF channel to be monitored; and
- information about the discontinuous mode on the RF channel to be monitored.

It may also indicate whether the RF channel that is to be monitored is the main carrier of a neighbour cell, or an irregular carrier, or the main carrier of the serving cell.

NOTE: The main carrier is a phase modulation carrier for a CA cell or a QAM carrier for a DA cell.

### 20.2.4.11a Characteristics of RF channel to be scanned

This parameter shall be used for the higher layers (i.e. MLE) to provide information to the MAC about an RF channel that is to be scanned. The RF channel that is to be scanned is the main carrier of a neighbour cell. This parameter may include the following information:

- modulation mode for RF channel to be scanned;
- bandwidth of RF channel to be scanned.

NOTE: The main carrier of the neighbour cell is a phase modulation carrier for a CA neighbour cell or a QAM carrier for a DA neighbour cell.

### 20.2.4.12 CSS endpoint identifier

This parameter shall be an endpoint identifier which refers to a Carrier Specific Signalling (CSS) channel that has been allocated to the MS. Alternatively, it may refer to a common channel (MCCH or common SCCH) if a CA MS is allocated an assigned channel on the CA main carrier and is permitted to use the common channel.

### 20.2.4.13 Data category

This parameter may be used to indicate information about the type of data in the TM-SDU and the required reliability level for the transmission, enabling the MAC to make appropriate decisions about:

- the modulation to use to send the TM-SDU on a D8PSK channel; or
- the modulation level and coding rate to use to send the TM-SDU on a QAM channel.

This parameter is also used to indicate information about the data in the LLC sending buffer.

For example, this parameter may indicate whether the data is:

- background class data - reliability level 1; or
- background class data - reliability level 2; or
- background class data - reliability level 3; or
- telemetry class data - reliability level 1; or
- telemetry class data - reliability level 2; or
- telemetry class data - reliability level 3; or
- real-time class data; or
- non-classified data (i.e. TM-SDU does not contain packet data) - reliability level 1; or
- non-classified data (i.e. TM-SDU does not contain packet data) - reliability level 2; or
- non-classified data (i.e. TM-SDU does not contain packet data) - reliability level 3.

NOTE 1: In this example of possible data categories, it is intended that reliability level 3 refers to better (i.e. higher) reliability than reliability level 2, and reliability level 2 refers to better (i.e. higher) reliability than reliability level 1.

NOTE 2: In this example of possible data categories, three reliability levels are used for background class data, telemetry class data and non-classified data. In an implementation, fewer than three reliability levels could be used if preferred. For instance, if preferred, two reliability levels could be used for background class data and/or telemetry class data and/or non-classified data.

NOTE 3: In an implementation, the "non-classified data" may be subdivided into multiple classes.

#### 20.2.4.14 Data class activity information

This parameter may be used for the higher layers to inform the MAC about the most demanding data class for currently active PDP contexts. It may indicate whether the most demanding data class is the background data class, the telemetry data class or the real-time data class (or no data class).

NOTE 1: The real-time data class is more demanding than the telemetry data class, and the telemetry data class is more demanding than the background data class.

NOTE 2: If the MS is using concurrent channels, the higher layers may provide data class activity information independently for each endpoint identifier i.e. specifying the most demanding data class for currently active PDP contexts using each endpoint identifier.

#### 20.2.4.15 Data class information

This parameter may be used to indicate information about the type of data in the TL-SDU, enabling the DLL to make appropriate decisions about the modulation (and coding rate for QAM) to use to send the TL-SDU and any segment retransmissions on a D8PSK or QAM channel.

This parameter may indicate whether the data in the TL-SDU is:

- background class data; or
- telemetry class data; or
- real-time class data; or
- non-classified data (i.e. TL-SDU does not contain packet data).

NOTE: In an implementation, the "non-classified data" may be subdivided into multiple classes.

#### 20.2.4.16 Data priority

The data priority parameter indicates the packet data priority. The data priority parameter may take one of eight defined values of data priority (0 to 7) or may contain the value "undefined".

NOTE: The data priority requirements for the data in the LLC's sending buffer may be used by the MAC to send the MS's current short-term data priority requirements for reserved access to the BS. Data priority may also be used in the LLC to define the sending order of TL-SDUs (together with the PDU priority).

#### 20.2.4.17 Data priority random access delay factor

This parameter may be used for the higher layers to provide the MAC layer with the value of the data priority random access delay factor (in the range 0 to 7). The value of this parameter is sent by the SwMI to the MS at SND CP level, but is used by the MAC in its data priority procedures.

#### 20.2.4.18 Distribution on the 18th frame

In the case of minimum mode, this parameter shall define on which timeslot the MS shall listen to the downlink on the frame 18. It may be received by the MS at subscription or at registration.

#### 20.2.4.19 Dual watch energy economy group

This shall be one of the allowed dual watch energy economy duty cycles.

#### 20.2.4.20 Dual watch startpoint

The dual watch startpoint shall be the absolute frame and multiframe number to which the MS shall listen (if practicable) before entering the duty cycle defined by the dual watch energy economy group.

#### 20.2.4.21 Encryption, air interface

This parameter shall define whether the signalling message is to be encrypted (using air interface encryption) by the MAC before its transmission over the air interface. At the receiving side, it shall define whether the message has been encrypted for transmission over the air interface.

#### 20.2.4.22 Endpoint identifier

This local identifier shall be used to distinguish between multiple concurrent MAC resources (i.e. MAC channels). It refers to which MAC resource may be used for that service. Its implementation is outside the scope of the present document.

NOTE: Refer to the handle to the request described in clause 20.2.4.31.

#### 20.2.4.23 Energy economy group

This shall be one of the eight allowed energy economy duty cycles as defined in clause 23.

#### 20.2.4.24 Energy economy startpoint

This shall be the absolute frame and multiframe number to which the MS shall listen before entering the duty cycle defined by the energy economy group.

#### 20.2.4.25 FCS flag

The FCS flag shall be used to indicate to the LLC whether extended error protection shall be applied (for basic link and extended advanced link).

#### 20.2.4.25a Graceful service degradation mode

This shall instruct LLC and MAC layers whether the SDU is eligible for graceful service degradation mode.

#### 20.2.4.25b Graceful service degradation mode control

This shall instruct LLC and MAC layers on start and ending of the graceful service degradation mode and the repetition strategy of the messages during graceful service degradation mode.

#### 20.2.4.26 Half slot condition

This shall indicate whether a half traffic slot was received successfully.

#### 20.2.4.27 Half slot content

This shall define the U-plane information content that is to be carried (or was received) in a half slot in a circuit mode transmission.

#### 20.2.4.28 Half slot importance

This shall define the importance of the U-plane information that is to be carried in the circuit. It may be defined according to table 20.1.

**Table 20.1: Definition of half slot importance**

| Half slot importance | Meaning  |
|----------------------|--|
| 0                    | No importance (could be used for discontinuous TX) |
| 1                    | Low  |
| 2                    | Medium   |
| 3                    | High   |

#### 20.2.4.29 Half slot position

This shall define the position of the U-plane information within the timeslot (i.e. first or second half slot).

#### 20.2.4.30 Half slot synchronization

This shall be a local signal provided by the MS MAC to the U-plane application so that the first half slot and second half slot parameters correspond to the first and, respectively, second half slot of the timeslot. It is provided for the purpose of this description and does not imply any particular implementation. It requires that the application keeps synchronized to the half slot in the MAC transmission.

#### 20.2.4.31 Handle to the request

This shall be a local identifier which acts as a reference to a specific service request (parent) and its children. Its implementation is outside the scope of the present document. It is considered that the handle to the request is unique over all link identifiers and endpoint identifiers and is independent of the link identifier and endpoint identifier. The handle to the request is also used on received data to link a potential acknowledgement to it.

#### 20.2.4.32 Layer 2 data priority lifetime

This parameter may be used for the higher layers to provide the MAC layer with the value of the layer 2 data priority lifetime. The value of this timer is sent by the SwMI to the MS at SND CP level, but is used by the MAC in its data priority procedures.

#### 20.2.4.33 Layer 2 data priority signalling delay

This parameter may be used for the higher layers to provide the MAC layer with the value of the layer 2 data priority signalling delay. The value of this timer is sent by the SwMI to the MS at SND CP level, but is used by the MAC in its data priority procedures.

#### 20.2.4.34 Layer 2 signalling message

The layer 2 signalling message is the service user data message from the MAC layer to the LLC layer. It shall be the layer 2 signalling information in a layer 2 signalling PDU, including the layer 2 signalling subtype. It is considered here as a parameter of the service primitive.

#### 20.2.4.35 Layer 2 signalling message length

The layer 2 signalling message length shall be the number of bits of the layer 2 signalling message.

#### 20.2.4.36 Link identifier

This local identifier shall be used to distinguish between multiple concurrent service instances in the LLC. It indicates on which link the message shall be sent from the different basic and advanced links. Its implementation is outside the scope of the present document.

NOTE: Refer to the handle to the request described in clause 20.2.4.31.

#### 20.2.4.37 Link performance information

This parameter may be used for the LLC to provide information to the MAC about current advanced link performance, in order to aid the MAC to make appropriate decisions about the modulation (and coding rate for QAM) to use to send TM-SDUs on a D8PSK or QAM channel for some data categories. For example, the LLC may provide information derived from the acknowledgement bit maps in received AL-ACK, AL-RNR, AL-X-ACK and AL-X-RNR PDUs. The method for derivation of this information is outside the scope of the present document.

#### 20.2.4.38 LLC timer status

This parameter is used for the LLC to indicate to the MAC whether any of its timers that are measured in downlink signalling frames are currently running. The LLC timers that are measured in downlink signalling frames are timers T.251, T.252, T.261, T.263 and T.265; see annex A.

NOTE: The LLC timer status information may be used by the MAC in its napping procedures.

#### 20.2.4.39 Lower layer resource availability

The lower layer resource availability shall indicate when MAC layer has lost physical resources identified by the endpoint identifier. It may be used when the physical resource is regained.

#### 20.2.4.40 MAC broadcast information

This parameter shall indicate information in the MAC header of the SYSINFO, SYSINFO-Q, SYSINFO-DA or SYNC-DA PDU that is relevant to the higher layers.

EXAMPLE 1: Information in the SYSINFO, SYSINFO-Q and SYSINFO-DA PDU about support of data priority by the BS is used by the MAC in the MS but is also used by the SNDTCP.

EXAMPLE 2: Information about the Location Area (LA) is included in the MAC's SYNC-DA PDU (when the PDU is sent on the DA main carrier) but is used by the MLE in the MS.

#### 20.2.4.41 Main address

The main address shall refer to the ASSI, ISSI, GSSI, SMI or USSI value as defined in ETSI EN 300 392-1 [6], clause 7. It shall consist of the MS source address for the uplink except for the low level group presence indication, for which the GSSI shall be used (refer to clause 23.5.2.3.2). It shall consist of the destination address for the downlink.

#### 20.2.4.42 Maximum schedule interval

This parameter shall be used in the case of scheduled data to indicate the maximum valid schedule interval for this schedule. (This is the sum of the schedule repetition period and the schedule timing error negotiated for this schedule.)

#### 20.2.4.43 MLE activity indicator

This parameter indicates whether any of the layer 3 entities or advanced links are currently active. Where the MS-MAC is capable of performing the energy economy or dual watch procedure, or the procedure for part-time reception on a multi-slot MCCH-Q, the MLE activity indicator shall be used by the MS-MAC in the management of these procedures.

#### 20.2.4.44 MS default data priority

This parameter may indicate the MS default data priority that the higher layers have negotiated with the SwMI; in this case, the MS default data priority parameter takes one of eight defined values of data priority (0 to 7). Otherwise this parameter may contain the value "not applicable" to indicate that:

- the MS does not currently have an MS default data priority; or
- the SNDTCP is not in the READY state; or
- the current BS does not support data priority.

#### 20.2.4.45 New endpoint identifier

This parameter shall be an endpoint identifier which refers to an additional resource allocation that has been given to the MS.

#### 20.2.4.46 Number of $\pi/4$ -DQPSK timeslots

The number of  $\pi/4$ -DQPSK timeslots shall be used to define the throughput of a circuit mode service (with the selected error protection). It may be used to define the maximum throughput of a packet mode service.

#### 20.2.4.47 Number of repetitions of layer 2 signalling message

The number of repetitions of layer 2 signalling message may be used for the MAC to define the required number of repetitions. If it is not included, the LLC uses a predefined number.

#### 20.2.4.48 Number of repetitions of TL-SDU

The number of repetitions of TL-SDU may be used for the higher layers to define the required number of repetitions of a TL-SDU on the unacknowledged basic link. If it is not included, the LLC uses a predefined number.

#### 20.2.4.49 Operating mode

The operating mode shall be used for the higher layers (i.e. CMCE) to give instructions to the MS MAC to switch between signalling and traffic mode. It may comprise the following indications:

- switch U-plane on/off;
- TX-grant flag;
- simplex/duplex flag;
- type of circuit (i.e. TCH/S, TCH/7,2, TCH/4,8, TCH/2,4);
- interleaving depth N;
- end-to-end encryption flag;
- user device;
- endpoint identifier.

#### 20.2.4.50 Packet data flag

This parameter shall indicate whether the TL-SDU contains packet data from the SNDCP or other signalling information. For example, it may be used by the LLC when it is deciding on the sending order of TL-SDUs.

#### 20.2.4.51 Path loss

Related to the cell selection/reselection mechanism and the channel class / irregular channel advice and assigned channel replacement procedures, and based on measurements, the path loss consists of five variables (C1, C2, C3, C4 and C5) that may be calculated. Their definition and the formulas are in clause 23 together with the different procedures.

#### 20.2.4.52 PDU priority

This priority field shall be used within the LLC and MAC local to one MS. It shall not be transported to the peer entity. It may be used in the LLC to define the sending order of TL-SDUs. It shall be used in the MAC as the priority in the random access protocol. The number of supported priority levels for random access control purposes shall be eight. PDU priority ordering in a queuing process is an optional feature. The random access procedure and PDU priorities are defined in clause 23.

#### 20.2.4.53 Periodic reporting timer

The periodic reporting timer shall indicate the longest time between any transmissions from the MS to the BS, refer to clause 16.10.7b for definition of the values.

#### 20.2.4.54 Quality indication

This quality indication may be used to indicate locally what the reception quality is.

#### 20.2.4.55 Quality of Service (QoS)

The QoS parameters shall be used to facilitate the negotiation of the quality of service as defined in ETSI EN 300 392-1 [6]. The quality of service in this model is defined at the DLL as a set of TETRA specific parameters.

NOTE 1: Most of the parameters and selection of their values are either MS or network dependent.

NOTE 2: TETRA specific parameters may or may not control all aspects of each QoS parameter at the network layer SAP.

Parameter values for the throughput for constant delay services shall be as defined in table 20.2.

**Table 20.2: Throughput for constant delay services**

| Parameter         | Values   | Remarks              |
|-------------------|--|----------------------|
| Transmission rate | 2 400 bit/s, 4 800 bit/s or 7 200 bit/s times the Number of $\pi/4$ -DQPSK timeslots | TMD-SAP (negotiable) |

Parameter values for the throughput for variable delay services shall be as defined in table 20.3.

**Table 20.3: Throughput for variable delay services**

| Parameter  | Values                                    | Remarks                   |
|--|---|---------------------------|
| Maximum transmission rate (optional at the DLL - see note)   | Number of $\pi/4$ -DQPSK timeslots 1 to 4 | AL-SETUP PDU (negotiable) |
| Mean transmission rate (optional at the DLL - see note)  | See clause 21 for definition              | AL-SETUP PDU (negotiable) |
| Maximum length of TL-SDU   | N.251 for basic link                      | Predefined                |
|  | N.271 for advanced link                   | AL-SETUP PDU (negotiable) |
| Advanced link type   | Original, extended                        | AL-SETUP PDU (negotiable) |
| TL-SDU window size   | N.272                                     | AL-SETUP PDU (negotiable) |
| NOTE: The maximum transmission rate and mean transmission rate may be negotiated in the AL-SETUP PDU, in terms of $\pi/4$ -DQPSK timeslots. Or the AL-SETUP PDU may indicate a request for any phase modulation channel (within the capabilities of that MS). Or, alternatively, the AL-SETUP PDU may provide no information related to radio resources (for example, if the MS wishes the BS to choose any appropriate channel (within the capabilities of that MS and using any QoS information negotiated by the SNDCP during PDP context activation)). |   |                           |

The parameters for the residual error rate and residual error probability shall be as defined in table 20.4.

**Table 20.4: Residual error rate**

| Parameter      | Values                 | Remarks  |
|----------------|------------------------|--|
| The use of FCS | Included, not included | Local selection in the basic link services and the extended advanced link services |

Parameters for the transfer failure probability shall be as defined in table 20.5.

**Table 20.5: Transfer failure probability**

| Parameter                                 | Values                            | Remarks  |
|---|-----------------------------------|--|
| Maximum number of TL-SDU retransmissions  | N.252 and N.253 for basic link    | Predefined or, for N.253, optionally indicated by the service user for each TL-SDU |
|   | N.273 and N.282 for advanced link | AL-SETUP PDU (negotiable)  |
|   | N.293 for layer 2 signalling      | Predefined or indicated by the MAC for each layer 2 signalling message             |
| Maximum number of segment retransmissions | N.274                             | AL-SETUP PDU (negotiable)  |

Parameters for the NC Release failure probability shall be as defined in table 20.6.

**Table 20.6: NC Release failure probability**

| Parameter                       | Values | Remarks    |
|---------------------------------|--------|------------|
| Number of disconnection repeats | N.263  | Predefined |

#### 20.2.4.56 Reconnection result

Reconnection result shall be used to indicate the result of the LLC advanced link reconnection. The values shall be:

- success;
- random access failure;
- reconnection failure;
- reject.

#### 20.2.4.57 Report

Report shall generally indicate the progress or failure of information transfer and the cause of it.

The protocol model uses the report parameters in the protocol description at the A-SAP, C-SAP, D-SAP and E-SAP. The A-SAP, C-SAP and E-SAP reports (TLA-SAP, TLC-SAP, TLE-SAP, TMA-SAP and TMC-SAP) are defined in table 20.7.

**Table 20.7: Reports at TMA-, TMC-, TLA-, TLC- and TLE-SAPs**

| Report   | SAP           |
|--|---------------|
| Aborted, SDU not completely sent                                   | TMA, TLA, TLE |
| Aborted, SDU sent at least once                                    | TMA, TLA, TLE |
| Channel replacement is advisable                                   | TMC, TLC      |
| Channel replacement may be beneficial                              | TMC, TLC      |
| Close  | TLA           |
| Common channel deallocated   | TMC, TLC      |
| Complete transmission by stealing or by reserved access            | TMA           |
| Current channel performance is acceptable                          | TMC, TLC      |
| Disconnection failure  | TLA           |
| Downlink failure   | TMC, TLC      |
| Failed transfer (e.g. maximum number of re-transmissions exceeded) | TLA, TLE      |
| First complete transmission  | TLA, TLE      |
| First complete transmission by random access                       | TMA           |
| Fragmentation failure  | TMA           |

| Report   | SAP           |
|--|---------------|
| Incoming disconnection   | TLA           |
| Layer two transmission activities continuing   | TLA           |
| Local disconnection  | TLA           |
| Maximum path delay exceeded  | TMC, TLC      |
| Maximum path delay almost exceeded (see note)  | TMC, TLC      |
| Network broadcast not received   | TMC, TLC      |
| Network broadcast received   | TMC, TLC      |
| Random access failure  | TMA, TLA, TLE |
| Reject   | TLA           |
| Reset  | TLA           |
| Schedule timing prompt   | TMC, TLC      |
| Service change   | TLA           |
| Service definition   | TLA           |
| Service not supported  | TLA           |
| Service temporarily unavailable  | TLA           |
| Set-up failure   | TLA           |
| Successful complete transmission by random access  | TMA, TLE      |
| Success, successful transfer   | TLA, TLE      |
| Usage marker mismatch  | TMC, TLC      |
| Uplink failure   | TMC, TLC      |
| NOTE: The report "maximum path delay almost exceeded" is applicable only to an MS that supports the AGA service (see annex O). |               |

NOTE: The report parameter may be used to indicate a cause or a reason and possibly position of an error.

#### 20.2.4.58 Scanning measurement method

This parameter shall specify which of the several methods of measurement the MAC shall use for the scanning process.

#### 20.2.4.59 SCCH information

This parameter shall be used in the MAC to calculate which common control channel to use when common SCCHs are in operation. It may also be used by the MAC in a DA MS on a multi-slot MCCH-Q to derive the reception slot if the MS is using energy economy or dual watch mode on a BS that permits enhanced energy economy or if the MS is using the procedure for part-time reception on a multi-slot MCCH-Q.

This parameter may be received by the MS at subscription or at registration.

#### 20.2.4.60 Scheduled data status

This parameter shall be used to indicate whether the TL-SDU should be treated as:

- not scheduled data; or
- initial scheduled data; or
- scheduled data.

NOTE: Within layer 2, a TL-SDU labelled as "initial scheduled data" is treated in the same way as "scheduled data" for the purposes of LLC ordering of TL-SDUs, but is treated in the same way as "not scheduled data" for the purposes of deciding when the MAC may use random access.

#### 20.2.4.61 Schedule repetition information

This parameter shall be used for the higher layers (i.e. SNDCP) to instruct the MS MAC to start giving timing prompts at the specified intervals for the schedule corresponding to the specified NSAPI. It may also be used for the higher layers to instruct the MS MAC to stop giving timing prompts for the schedule corresponding to the specified NSAPI. It comprises the following subparameters:

- NSAPI;
- start-stop flag (start or stop);
- schedule repetition period (as a number of slot durations).

#### 20.2.4.62 Scrambling code

This shall contain the Mobile Network Identity (MNI) as described in ETSI EN 300 392-1 [6], clause 7. It shall be given to the scrambling process in the lower MAC together with the colour code.

#### 20.2.4.63 Set-up report

This shall be used to report set-up phase with the higher layer:

- success;
- service change (proposed parameters);
- parameters acceptable; and
- parameters not acceptable.

#### 20.2.4.64 Stealing permission

This parameter shall define whether the MAC may use stealing to send this SDU. Within layer 2 it may have the following meanings:

- steal immediately;
- steal within time T.214;
- steal when convenient; or
- stealing not required.

The value "steal within time T.214" should be used for the reply to a BS message received while the MS is transmitting traffic.

#### 20.2.4.65 Stealing repeats flag

This shall be used by the higher layers in the MS to trigger a special stealing method in the MAC (see clause 23). This method should only be used for signalling at the end of an uplink traffic transmission (e.g. for U-TX-CEASED or possibly U-DISCONNECT).

#### 20.2.4.66 Stolen indication

This shall indicate whether or not the information content of a half slot is stolen for signalling purposes. At the transmitting side, this parameter may be used to force signalling mode in the MAC for either the first or both half slots within a timeslot to be transmitted. At the receiving side, this parameter shall be available to the U-plane application to enable correct handling of stolen information.

#### 20.2.4.67 Subscriber class

A subscriber class shall define a population subdivision e.g. for random access control. The operator may define the values and meaning of each class. The subscriber class information is received by the MS at subscription or at registration. If the MS receives subscriber class information at subscription, and is then also assigned subscriber class information at registration, then the information given at registration shall be used.

The subscriber class parameter as supplied in primitives from layer 3 is a bit-mapped field which indicates for each class whether the MS belongs to that class.

#### 20.2.4.68 Threshold level

Based on measurements as defined in clause 23, this shall be the calculated value of some global variable used in the MLE in the process of cell selection/reselection.

#### 20.2.4.69 Threshold values

The values shall be thresholds imposed in the MAC by the MLE to take a relevant action (e.g. inform MLE using suitable primitive) if some measured and/or calculated MAC parameters exceed these limits.

#### 20.2.4.70 TL-SDU

The TL-SDU is the service user data message from the MLE layer. It shall be the MLE PDU including the MLE header. It is considered here as a parameter of the service primitive.

#### 20.2.4.71 TL-SDU length

The TL-SDU length shall be the number of bits of the TL-SDU.

#### 20.2.4.72 TM-SDU

The TM-SDU is the service user data message from the LLC. It shall be the LLC PDU including the LLC header and optional FCS. It is considered here as a parameter of the service primitive.

#### 20.2.4.73 TM-SDU length

The TM-SDU length shall be the number of bits of the TM-SDU.

#### 20.2.4.74 User device

This parameter may indicate to which U-plane device the primitive is intended. The usage of user devices is outside the scope of the present document.

#### 20.2.4.75 Valid addresses

Valid addresses are the addresses that the MS MAC shall recognize as the ones attached to the MS.

### 20.3 Services provided by LLC

#### 20.3.1 Services at the TLA-SAP

The SAP may provide one or more logical channels marked by link identifiers. The service user shall select the wanted service by using a service request primitive with a link identifier as a parameter. The direction of the information flow can be from BS to MS, from MS to BS or both; it can also be local control information inside the MS or BS.

The TLA-SAP shall be used for addressed signalling and data transfer. Table 20.8 shows the relationship for one LLC instance. There shall be an individual instance of LLC for each valid address.

**Table 20.8: Services provided at the TLA-SAP**

| Service description for TLA-SAP              | Address          | Direction of the information flow |
|--|------------------|-----------------------------------|
| Point-to-point acknowledged                  | individual SSI   | Bi-directional                    |
| Point-to-point unacknowledged                | individual SSI   | Bi-directional                    |
| Point-to-multipoint unacknowledged           | group SSI (GSSI) | Downlink                          |
| Point-to-multipoint with presence indication | group SSI (GSSI) | Bi-directional                    |

NOTE: In the present document only the BS may initiate the presence indication service.

Under the TLA-SAP, the LLC shall use the TMA-SAP for transferring the information down to the MAC.

The LLC may offer basic link (connectionless mode) service and advanced link (connection orientated mode) service. Within each of these services both an acknowledged and an unacknowledged data transfer is defined in the protocol. These possibilities and normal usage are shown in table 20.9.

**Table 20.9: Data transfer relationships available in the LLC**

| Service offered | Acknowledged data transfer  | Unacknowledged data transfer  |
|-----------------|---|---|
| Basic link      | Point-to-point signalling message or data transfer (short messages uplink and downlink) | Point-to-point signalling or data transfer (short messages uplink and downlink); and broadcast or point-to-multipoint signalling message or data transfer (short messages downlink) |
| Advanced link   | Point-to-point signalling or data transfer (long messages uplink and downlink)          | Point-to-multipoint signalling or data transfer (long messages downlink)  |

Downlink transmissions addressed to an individual MS, in most cases, use the acknowledged service. Uplink transmissions with a valid address, in most cases, use acknowledged transfer. However, the unacknowledged basic link may be used for some types of point-to-point signalling or data transfer on the request of the service user.

EXAMPLE: The SNDCP uses the unacknowledged basic link service for sending point-to-point real-time class data on both uplink and downlink.

Normal information transfer addressed to a group of MSs shall use unacknowledged transfer on the downlink. In the case of presence indication request the BS shall use a kind of acknowledged data transfer, with reserved access for the acknowledgement, knowing that if there are multiple responses from the MSs in the group, there is a risk of collision that will make the responses un-decodeable. If the message can be decoded, the BS will know that there was at least one responding MS. If the message cannot be decoded, the BS may assume presence of MSs from the measured RSSI on the uplink. How this measurement is done is outside the scope of the present document.

The advanced link acknowledged mode may be used in all cases where an acknowledged service is required for a point-to-point data transfer. The advanced link may also be used for point-to-multipoint data transfer in unacknowledged mode. In this case data transfer normally consists of set-up phase, data transfer phase possibly with repetition and selective re-assembly of received data and disconnection phase.

### 20.3.2 Services at the TLB-SAP

The TLB-SAP shall be used for un-addressed data transfer as presented in table 20.10. This includes the system information broadcast messages. In the protocol model there are no LLC functions under the TLB-SAP, and the LLC shall convey information directly to the MAC using the TMB-SAP.

**Table 20.10: Services provided at the TLB-SAP**

| Service description for TLB-SAP    | Address | Direction |
|------------------------------------|---------|-----------|
| Point-to-multipoint unacknowledged | none    | Downlink  |

### 20.3.3 Services at the TLC-SAP

The TLC-SAP shall be used in this model for all local layer management control, such as scanning control and signal quality measurements (see table 20.11). TLC-SAP does not provide any data transfer service over the air interface.

**Table 20.11: Services provided at the TLC-SAP**

| Service description for TLC-SAP | Address | Direction                                   |
|---------------------------------|---------|---|
| Local management and control    | None    | Bi-directional within the MS protocol stack |

### 20.3.3a Services at the TLE-SAP

The TLE-SAP shall be used for layer 2 signalling, for which the LLC may offer an unacknowledged data transfer service to the MAC (see table 20.12).

**Table 20.12: Services provided at the TLE-SAP**

| Service description for TLE-SAP    | Address          | Direction of the information flow |
|------------------------------------|------------------|-----------------------------------|
| Point-to-point unacknowledged      | individual SSI   | Bi-directional                    |
| Point-to-multipoint unacknowledged | group SSI (GSSI) | Downlink                          |

### 20.3.4 LLC service primitives

Tables 20.13 to 20.16 summarize LLC service primitives. If the service primitive is provided or not provided in both the basic and advanced links, then yes and no are used respectively. In other cases the LLC link type is mentioned.

**Table 20.13: TLA-SAP service primitives**

| Service primitive | Request       | Indication    | Response      | Confirm       |
|-------------------|---------------|---------------|---------------|---------------|
| TL-CANCEL         | yes           | no            | no            | no            |
| TL-CONNECT        | advanced link | advanced link | advanced link | advanced link |
| TL-DATA           | yes           | yes           | basic link    | yes           |
| TL-DISCONNECT     | advanced link | advanced link | no            | advanced link |
| TL-RECEIVE        | no            | advanced link | no            | no            |
| TL-RELEASE        | advanced link | yes           | no            | no            |
| TL-RECONNECT      | advanced link | no            | no            | advanced link |
| TL-REPORT         | no            | yes           | no            | no            |
| TL-UNITDATA       | yes           | yes           | no            | optional      |

NOTE: TL-RECEIVE primitive is valid for the BS only.

**Table 20.14: TLB-SAP service primitives**

| Service primitive | Request | Indication | Response | Confirm |
|-------------------|---------|------------|----------|---------|
| TL-SYNC           | yes, BS | yes, MS    | no       | no      |
| TL-SYSINFO        | yes, BS | yes, MS    | no       | no      |
| TL-SYSINFO-Q      | yes, BS | yes, MS    | no       | no      |
| TL-SYNC-DA        | yes, BS | yes, MS    | no       | no      |
| TL-SYSINFO-DA     | yes, BS | yes, MS    | no       | no      |

Table 20.15: TLC-SAP service primitives

| Service primitive  | Request | Indication | Response | Confirm |
|--------------------|---------|------------|----------|---------|
| TL-ASSESSMENT      | no      | yes        | no       | no      |
| TL-ASSESSMENT-LIST | yes     | no         | no       | no      |
| TL-CELL-READ       | yes     | no         | no       | yes     |
| TL-CONFIGURE       | yes     | yes        | no       | yes     |
| TL-MEASUREMENT     | no      | yes        | no       | no      |
| TL-MONITOR         | no      | yes        | no       | no      |
| TL-MONITOR-LIST    | yes     | no         | no       | no      |
| TL-REPORT          | no      | yes        | no       | no      |
| TL-SCAN            | yes     | no         | no       | yes     |
| TL-SCAN-REPORT     | no      | yes        | no       | no      |
| TL-SELECT          | yes     | yes        | yes      | yes     |

Table 20.16: TLE-SAP service primitives

| Service primitive | Request | Indication | Response | Confirm  |
|-------------------|---------|------------|----------|----------|
| TLE-CANCEL        | yes     | no         | no       | no       |
| TLE-REPORT        | no      | yes        | no       | no       |
| TLE-UNITDATA      | yes     | yes        | no       | optional |

## 20.3.5 Service primitive descriptions

### 20.3.5.0 General

In tables 20.17 to 20.46 inclusive, which define parameters for the primitives, the following keys are used:

M: Mandatory;

C: Conditional;

-: Not used.

NOTE: The exact conditions of the presence for some conditional parameters are implied by the corresponding information flows and are not detailed in the service descriptions.

### 20.3.5.1 Primitives at the TLA-SAP (MLE-LLC)

#### 20.3.5.1.1 TL-CANCEL primitive

**TL-CANCEL request:** this primitive may be used locally for an MS or BS to cancel a previous request. This primitive shall not send messages over the air interface. The parameters shall be as defined in table 20.17.

Table 20.17: Parameters used in the TL-CANCEL primitive

| Parameter                              | Request |
|--|---------|
| Handle to the request (see note)       | M       |
| NOTE: Not sent over the air interface. |         |

#### 20.3.5.1.2 TL-CONNECT primitive

The connection primitives, if required prior to a transfer, shall be used to establish a LLC advanced link. The parameters shall be as defined in table 20.18.

**TL-CONNECT request:** this primitive shall be used by the layer 2 service user to initiate the establishment of an advanced link with a certain quality of service. It may also reset the established link.

**TL-CONNECT indication:** this primitive shall be used by the layer 2 to inform the layer 2 service users that the establishment of an advanced link with a certain quality of service or the reset of the current advanced link has been requested.

**TL-CONNECT response:** this primitive shall be used by the layer 2 service users to accept the establishment or the reset of the advanced link with a certain quality of service. According to the available resources, the value of the service parameters may also be modified (lower grade of service) in the response. In such a case, the advanced link characteristics will match these new features.

**TL-CONNECT confirm:** this primitive shall be used by the layer 2 to inform the layer 2 service users that the establishment or re-establishment (reset) of the advanced link has been completed with a certain quality of service as indicated in the request primitive.

**Table 20.18: Parameters used in the TL-CONNECT primitive**

| Parameter                                   | Request | Indication | Response | Confirm |
|---|---------|------------|----------|---------|
| Address type                                | M       | M          | M        | M       |
| Main address                                | M       | M          | M        | M       |
| Scrambling code (see note)                  | M       | M          | M        | M       |
| Link identifier (see note)                  | M       | M          | M        | M       |
| Endpoint identifier (see note)              | M       | M          | M        | M       |
| New endpoint identifier (see note)          | -       | C          | -        | C       |
| CSS endpoint identifier (see note)          | -       | C          | -        | C       |
| PDU priority (see note)                     | M       | -          | M        | -       |
| Stealing permission (see note)              | M       | -          | M        | -       |
| Subscriber class (see note)                 | M       | -          | M        | -       |
| Quality of Service                          | M       | M          | M        | M       |
| Advanced link service                       | M       | M          | M        | M       |
| Encryption, air interface                   | M       | M          | M        | M       |
| Channel change response required (see note) | -       | M          | -        | M       |
| Channel change handle (see note)            | -       | C          | -        | C       |
| Channel information                         | -       | C          | -        | C       |
| Handle to the request (see note)            | M       | M          | M        | M       |
| Set-up report                               | M       | M          | M        | M       |
| NOTE: Not sent over the air interface.      |         |            |          |         |

NOTE: The usage of the advanced link service type indication in confirm primitive applies only to the BS side of the protocol.

### 20.3.5.1.3 TL-DATA primitive for the advanced link

Parameters in acknowledged advanced link service for the following primitives shall be as defined in table 20.19.

**TL-DATA request:** this primitive shall be used by the layer 2 service user to request transmission of a TL-SDU.

**TL-DATA indication:** this primitive shall be used by the layer 2 to deliver the received TL-SDU to the layer 2 service user.

**TL-DATA confirm:** this primitive shall be used by the layer 2 to inform the layer 2 service user that it has completed successfully the transmission of the requested TL-SDU.

**Table 20.19: Parameters used in the TL-DATA primitive for advanced link**

| Parameter   | Request | Indication | Confirm |
|---|---------|------------|---------|
| Address type  | M       | M          | M       |
| Main address  | M       | M          | M       |
| Link identifier (see note 1)  | M       | M          | M       |
| Endpoint identifier (see note 1)  | M       | M          | M       |
| New endpoint identifier (see note 1)  | -       | C          | C       |
| CSS endpoint identifier (see note 1)  | -       | C          | C       |
| TL-SDU  | M       | C          | -       |
| TL-SDU length (see note 1)  | M       | C          | -       |
| Scrambling code   | M       | M          | M       |
| PDU priority (see note 1)   | M       | -          | -       |
| Stealing permission (see note 1)  | M       | -          | -       |
| Subscriber class (see note 1)   | M       | -          | -       |
| FCS flag  | C       | C          | C       |
| Encryption, air interface   | M       | M          | M       |
| Data priority (see note 2)  | M       | -          | -       |
| Packet data flag (see note 1)   | M       | -          | -       |
| Scheduled data status (see note 1)  | M       | -          | -       |
| Maximum schedule interval (see note 1)  | C       | -          | -       |
| Data class information (see note 1)   | C       | -          | -       |
| Channel change response required (see note 1)   | -       | M          | M       |
| Channel change handle (see note 1)  | -       | C          | C       |
| Channel information   | -       | C          | C       |
| Handle to the request (see note 1)  | M       | -          | M       |
| Report  | -       | -          | M       |
| Graceful service degradation mode (see note 1)  | C       | -          | -       |
| NOTE 1: Not sent over the air interface.  |         |            |         |
| NOTE 2: May be signalled over the air interface, collated with other data priority information. |         |            |         |

#### 20.3.5.1.4 TL-DATA primitive for the basic link

In the acknowledged basic link data transfer service the parameters for the following primitives shall be as defined in table 20.20.

**TL-DATA request:** this primitive shall be used by the layer 2 service user to request transmission of a TL-SDU. The TL-SDU will be acknowledged by the peer entity.

**TL-DATA indication:** this primitive shall be used by the layer 2 to deliver the received TL-SDU to the layer 2 service user.

**TL-DATA response:** this primitive shall be used by the layer 2 service user to respond to the previous TL-DATA indication primitive. The TL-DATA response primitive may contain a TL-SDU. That TL-SDU will be sent without an explicit acknowledgement from the peer entity.

**TL-DATA confirm:** this primitive shall be used by the layer 2 to inform the layer 2 service user that it has completed successfully the transmission of the requested TL-SDU. Depending on the availability of the response primitive at the peer entity before transmission of the acknowledgement, the confirm primitive may or may not carry a TL-SDU.

**Table 20.20: Parameters used in the TL-DATA primitive for basic link**

| Parameter                                    | Request | Indication | Response | Confirm |
|--|---------|------------|----------|---------|
| Address type                                 | M       | M          | M        | M       |
| Main address                                 | M       | M          | M        | M       |
| Link identifier (see note)                   | M       | M          | M        | M       |
| Endpoint identifier (see note)               | M       | M          | M        | M       |
| New endpoint identifier (see note)           | -       | C          | -        | C       |
| CSS endpoint identifier (see note)           | -       | C          | -        | C       |
| TL-SDU                                       | M       | C          | M        | C       |
| TL-SDU length (see note)                     | M       | C          | M        | C       |
| Scrambling code                              | M       | M          | M        | M       |
| PDU priority (see note)                      | M       | -          | M        | -       |
| Stealing permission (see note)               | M       | -          | M        | -       |
| Subscriber class (see note)                  | M       | -          | M        | -       |
| FCS flag                                     | M       | M          | M        | M       |
| Encryption, air interface                    | M       | M          | M        | M       |
| Stealing repeats flag (see note)             | C       | -          | C        | -       |
| Data class information (see note)            | C       | -          | C        | -       |
| Channel change response required (see note)  | -       | M          | -        | M       |
| Channel change handle (see note)             | -       | C          | -        | C       |
| Channel information                          | -       | C          | -        | C       |
| Handle to the request (see note)             | M       | M          | M        | M       |
| Report                                       | -       | -          | -        | M       |
| Graceful service degradation mode (see note) | C       | -          | -        | -       |

NOTE: Not sent over the air interface.

#### 20.3.5.1.5 TL-DISCONNECT primitive

The disconnection primitives shall be used to disconnect a LLC advanced link. The parameters shall be as defined in table 20.21.

**Table 20.21: Parameters used in the TL-DISCONNECT primitive**

| Parameter                                   | Request | Indication | Confirm |
|---|---------|------------|---------|
| Address type                                | M       | M          | M       |
| Main address                                | M       | M          | M       |
| Link identifier (see note)                  | M       | M          | M       |
| Endpoint identifier (see note)              | M       | M          | M       |
| New endpoint identifier (see note)          | -       | C          | C       |
| CSS endpoint identifier (see note)          | -       | C          | C       |
| Scrambling code                             | M       | M          | M       |
| PDU priority (see note)                     | M       | -          | -       |
| Stealing permission (see note)              | M       | -          | -       |
| Subscriber class (see note)                 | M       | -          | -       |
| Advanced link service                       | M       | M          | M       |
| Encryption, air interface                   | M       | M          | M       |
| Channel change response required (see note) | -       | M          | M       |
| Channel change handle (see note)            | -       | C          | C       |
| Channel information                         | -       | C          | C       |
| Handle to the request (see note)            | M       | -          | M       |
| Report                                      | M       | M          | M       |

NOTE: Not sent over the air interface.

NOTE 1: The only valid value for the report field in TL-DISCONNECT request primitive is "Close".

NOTE 2: The usage of the advanced link service type indication in confirm primitive applies only to the BS side of the protocol.

### 20.3.5.1.5a TL-RECEIVE primitive

**TL-RECEIVE indication:** this primitive shall be used by the layer 2 to report to the layer 2 service user that the reception of a TL-SDU has started or is ongoing on the layer 2. This primitive is valid for the BS only.

Parameters for this primitive shall be as defined in table 20.22.

**Table 20.22: Parameters used in the TL-RECEIVE primitive (TLA-SAP)**

| Parameter                              | Indication |
|--|------------|
| Address type                           | M          |
| Main address                           | M          |
| Endpoint identifier (see note)         | M          |
| NOTE: Not sent over the air interface. |            |

### 20.3.5.1.6 TL-RECONNECT primitive

The reconnection primitives shall be used for LLC reconnection of an advanced link after a cell reselection. The parameters shall be as defined in table 20.23.

**TL-RECONNECT request:** this primitive shall be used by the layer 2 service user in the MS after a cell reselection to initiate the LLC reconnection of an advanced link which was being used in the previous cell. If successful, all parameters agreed for the advanced link in the previous cell shall apply in the new cell.

**TL-RECONNECT confirm:** this primitive shall be used by the LLC to inform the layer 2 service user that the attempt to reconnect the advanced link has been successfully completed. A successful reconnection shall result in no change to the parameters which were agreed during the establishment of the advanced link in question.

**Table 20.23: Parameters used in the TL-RECONNECT primitive**

| Parameter                              | Request | Confirm |
|--|---------|---------|
| Address type                           | M       | M       |
| Main address                           | M       | M       |
| Link identifier (see note)             | M       | M       |
| Endpoint identifier (see note)         | M       | M       |
| New endpoint identifier (see note)     | -       | C       |
| CSS endpoint identifier (see note)     | -       | C       |
| Scrambling code                        | M       | M       |
| PDU priority (see note)                | M       | -       |
| Stealing permission (see note)         | M       | -       |
| Subscriber class (see note)            | M       | -       |
| Encryption, air interface              | M       | M       |
| Handle to the request (see note)       | M       | M       |
| Reconnection result                    | -       | M       |
| NOTE: Not sent over the air interface. |         |         |

### 20.3.5.1.7 TL-RELEASE primitive

**TL-RELEASE:** this primitive shall be used to disconnect locally an LLC advanced link, when a disconnection is recognized by the service user and LLC might no longer perform a disconnection with the peer entity.

It may also be used when the MAC has indicated that the connection on this channel has been lost.

The parameters in this primitive shall be as defined in table 20.24.

**Table 20.24: Parameters used in the TL-RELEASE primitive**

| Parameter                              | Request | Indication |
|--|---------|------------|
| Address type (see note)                | M       | M          |
| Main address (see note)                | M       | M          |
| Link identifier (see note)             | M       | C          |
| Endpoint identifier (see note)         | -       | M          |
| NOTE: Not sent over the air interface. |         |            |

#### 20.3.5.1.8 TL-REPORT primitive (TLA-SAP)

**TL-REPORT indication:** this primitive shall be used by the layer 2 to report to the layer 2 service user the progress or failure of a request procedure. The progress indication shall be passed as the "Report" parameter. This primitive may be issued to the layer 2 service user as an indication that an unrecoverable error has occurred.

This primitive is also used to indicate that the MAC has received a channel change command without an SDU and cannot decide whether it should obey the request or not as the change will affect other concurrent services.

Parameters for this primitive shall be as defined in table 20.25.

NOTE: The completion of the requested service is indicated by the same primitive name with the type confirm.

**Table 20.25: Parameters used in the TL-REPORT primitive (TLA-SAP)**

| Parameter   | Indication     |
|---|----------------|
| Handle to the request (see note 1)                    | C (see note 2) |
| Report (see note 1)                                   | M              |
| Channel change response required (see note 1)         | C (see note 3) |
| Channel change handle (see note 1)                    | C (see note 3) |
| Channel information                                   | C              |
| Endpoint identifier (see note 1)                      | C (see note 3) |
| NOTE 1: Not sent over the air interface.              |                |
| NOTE 2: Mandatory when data transmission is reported. |                |
| NOTE 3: Mandatory when a channel change is reported.  |                |

#### 20.3.5.1.9 TL-UNITDATA primitive

In the unacknowledged data transfer service the parameters for the following primitives shall be as defined in table 20.26 for the basic link and as defined in table 20.27 for the advanced link.

**TL-UNITDATA request:** this primitive shall be used by the layer 2 service user to request layer 2 to transmit a TL-SDU.

**TL-UNITDATA indication:** this primitive shall be used to deliver the received TL-SDU to the layer 2 service user.

**TL-UNITDATA confirm:** this primitive may be used to indicate completion of sending of the requested TL-SDU.

**Table 20.26: Parameters used in the TL-UNITDATA primitive in basic link**

| Parameter   | Request | Indication | Confirm<br>(see note 2) |
|---|---------|------------|-------------------------|
| Address type  | M       | M          | M                       |
| Main address  | M       | M          | M                       |
| Link identifier (see note 1)  | M       | M          | M                       |
| Endpoint identifier (see note 1)  | M       | M          | M                       |
| New endpoint identifier (see note 1)  | -       | C          | -                       |
| CSS endpoint identifier (see note 1)  | -       | C          | -                       |
| TL-SDU  | M       | C          | -                       |
| TL-SDU length (see note 1)  | M       | C          | -                       |
| Scrambling code   | M       | M          | -                       |
| PDU priority (see note 1)   | M       | -          | -                       |
| Stealing permission (see note 1)  | M       | -          | -                       |
| Subscriber class (see note 1)   | M       | -          | -                       |
| FCS flag  | M       | M          | -                       |
| Encryption, air interface   | M       | M          | -                       |
| Data priority (see note 3)  | M       | -          | -                       |
| Packet data flag (see note 1)   | M       | -          | -                       |
| Number of repetitions of TL-SDU<br>(see note 1)   | C       | -          | -                       |
| Scheduled data status (see note 1)  | M       | -          | -                       |
| Maximum schedule interval (see note 1)  | C       | -          | -                       |
| Data class information (see note 1)   | C       | -          | -                       |
| Channel change response required<br>(see note 1)  | -       | M          | -                       |
| Channel change handle (see note 1)  | -       | C          | -                       |
| Channel information   | -       | C          | -                       |
| Handle to the request (see note 1)  | M       | -          | M                       |
| Report  | -       | C          | C                       |
| NOTE 1: Not sent over the air interface.  |         |            |                         |
| NOTE 2: In this case, the confirm is a local knowledge of the sending entity.                   |         |            |                         |
| NOTE 3: May be signalled over the air interface, collated with other data priority information. |         |            |                         |

**Table 20.27: Parameters used in the TL-UNITDATA primitive in advanced link**

| Parameter   | Request | Indication | Confirm<br>(see note 2) |
|---|---------|------------|-------------------------|
| Address type  | M       | M          | M                       |
| Main address  | M       | M          | M                       |
| Link identifier (see note 1)  | M       | M          | M                       |
| Endpoint identifier (see note 1)  | M       | M          | M                       |
| New endpoint identifier (see note 1)  | -       | C          | -                       |
| CSS endpoint identifier (see note 1)  | -       | C          | -                       |
| TL-SDU  | M       | M          | -                       |
| TL-SDU length (see note 1)  | M       | M          | -                       |
| Scrambling code   | M       | M          | -                       |
| PDU priority (see note 1)   | M       | -          | -                       |
| Stealing permission (see note 1)  | M       | -          | -                       |
| Subscriber class (see note 1)   | M       | -          | -                       |
| FCS flag  | C       | C          | -                       |
| Encryption, air interface   | M       | M          | -                       |
| Data class information (see note 1)   | C       | -          | -                       |
| Channel change response required<br>(see note 1)                              | -       | M          | -                       |
| Channel change handle (see note 1)  | -       | C          | -                       |
| Channel information   | -       | C          | -                       |
| Handle to the request (see note 1)  | M       | -          | M                       |
| Report  | -       | C          | C                       |
| NOTE 1: Not sent over the air interface.                                      |         |            |                         |
| NOTE 2: In this case, the confirm is a local knowledge of the sending entity. |         |            |                         |

### 20.3.5.2 Signals at the TLA-SAP (MLE-LLC)

The TLA-SAP signals (FLOW-READY signal and FLOW-NOT-READY signal) are used in the protocol description of the MS's message-buffering interface between the LLC service user (MLE) and LLC. As this is purely local to an MS, the following description is provided for information only.

The **FLOW-READY signal** shall be used by the LLC service user in the MS to indicate to the LLC when it is capable of receiving more user data TL-SDUs in TL-DATA indication primitives.

The **FLOW-NOT-READY signal** shall be used by the LLC service user in the MS to indicate to the LLC when it is not capable of receiving more user data TL-SDUs in TL-DATA indication primitives.

**NOTE:** The validity time of one FLOW-NOT-READY signal at the LLC is limited by T.271 and T.272 in the data sending and data receiving entities respectively.

The parameters in the flow control signal shall be:

- address type;
- main address; and
- link identifier.

The link identifier will not be sent over the air.

### 20.3.5.3 Primitives at the TLB-SAP (MLE-LLC)

#### 20.3.5.3.0 General

In the present document the LLC layer does not have any TMB-SAP related functions. The request primitives at the TLB-SAP are directly mapped as request primitives at the TMB-SAP, and the indication primitives at the TMB-SAP are directly transported to TLB-SAP indication primitives.

#### 20.3.5.3.1 TL-SYNC primitive

**TL-SYNC request:** this primitive shall be used in the BS to broadcast synchronization information on  $\pi/4$ -DQPSK and D8PSK channels.

**TL-SYNC indication:** this primitive shall be used in the MS to transport the received TM-SDU part of the synchronization information via LLC to MLE.

The BS MAC will broadcast the information at suitable intervals. Every new request primitive may change the content of the broadcast information. The parameters shall be as defined in table 20.28.

**Table 20.28: Parameters used in the TL-SYNC primitive**

| Parameter                                  | Request | Indication |
|--|---------|------------|
| Endpoint identifier                        | M       | M          |
| TL-SDU                                     | M       | M          |
| TL-SDU length                              | M       | M          |
| Priority (not sent over the air interface) | M       | -          |

#### 20.3.5.3.2 TL-SYSINFO primitive

**TL-SYSINFO request:** this primitive shall be used in the BS to broadcast system related information (needed, for example, in the process of CA cell selection) on  $\pi/4$ -DQPSK and D8PSK channels.

**TL-SYSINFO indication:** this primitive shall be used in the MS to transport the received TM-SDU via LLC to MLE.

The BS MAC will broadcast the information at suitable intervals. Every new request primitive may change the content of the broadcast information. The parameters shall be as defined in table 20.29.

**Table 20.29: Parameters used in the TL-SYSINFO primitive**

| Parameter                                  | Request | Indication |
|--|---------|------------|
| Endpoint identifier                        | M       | M          |
| TL-SDU                                     | M       | M          |
| TL-SDU length                              | M       | M          |
| MAC broadcast information                  | C       | C          |
| Priority (not sent over the air interface) | M       | -          |

#### 20.3.5.3.3 TL-SYSINFO-Q primitive

**TL-SYSINFO-Q request:** this primitive may be used in the BS to broadcast system related information to CA MSs on QAM channels.

**TL-SYSINFO-Q indication:** this primitive shall be used in CA MSs to transport the received TM-SDU via LLC to MLE.

The BS MAC will broadcast the information at suitable intervals. Every new request primitive may change the content of the broadcast information. The parameters shall be as defined in table 20.30.

**Table 20.30: Parameters used in the TL-SYSINFO-Q primitive**

| Parameter                                  | Request | Indication |
|--|---------|------------|
| Endpoint identifier                        | M       | M          |
| TL-SDU                                     | M       | M          |
| TL-SDU length                              | M       | M          |
| MAC broadcast information                  | C       | C          |
| Priority (not sent over the air interface) | M       | -          |

#### 20.3.5.3.4 TL-SYNC-DA primitive

**TL-SYNC-DA request:** this primitive shall be used in the BS to broadcast synchronization information needed for MSs to operate using DA. This synchronization information shall be sent on the DA main carrier and may be sent on other QAM carriers.

**TL-SYNC-DA indication:** this primitive shall be used in the MS to transport the received TM-SDU part of the synchronization information via LLC to MLE.

The BS MAC will broadcast the information at suitable intervals. Every new request primitive may change the content of the broadcast information. The parameters shall be as defined in table 20.31.

**Table 20.31: Parameters used in the TL-SYNC-DA primitive**

| Parameter                                  | Request | Indication |
|--|---------|------------|
| Endpoint identifier                        | M       | M          |
| TL-SDU                                     | M       | M          |
| TL-SDU length                              | M       | M          |
| MAC broadcast information                  | C       | C          |
| Priority (not sent over the air interface) | M       | -          |

### 20.3.5.3.5 TL-SYSINFO-DA primitive

**TL-SYSINFO-DA request:** this primitive shall be used in the BS to broadcast system related information needed for MSs to operate using DA. This system related information shall be sent on the DA main carrier and may be sent on other carriers.

**TL-SYSINFO-DA indication:** this primitive shall be used in the MS to transport the received TM-SDU via LLC to MLE.

The BS MAC will broadcast the information at suitable intervals. Every new request primitive may change the content of the broadcast information. The parameters shall be as defined in table 20.32.

**Table 20.32: Parameters used in the TL-SYSINFO-DA primitive**

| Parameter                                  | Request | Indication |
|--|---------|------------|
| Endpoint identifier                        | M       | M          |
| TL-SDU                                     | M       | M          |
| TL-SDU length                              | M       | M          |
| MAC broadcast information                  | C       | C          |
| Priority (not sent over the air interface) | M       | -          |

### 20.3.5.4 Primitives at the TLC-SAP (MLE-LLC)

#### 20.3.5.4.0 General

In the present document the LLC layer does not have any TLC-SAP related functions. The request and response primitives at the TLC-SAP are directly mapped as request and response primitives at the TMC-SAP, and the indication and confirm primitives at the TMC-SAP are directly transported to TLC-SAP indication and confirm primitives.

#### 20.3.5.4.1 TL-ASSESSMENT primitive

**TL-ASSESSMENT indication:** this primitive shall be used at the TLC-SAP to indicate the result of the assessment of the path loss for one or more channel classes on the serving cell. This shall be a consequence of the action started by a TL-ASSESSMENT-LIST request primitive. The parameters shall be as defined in table 20.33.

**Table 20.33: Parameters used in the TL-ASSESSMENT primitive**

| Parameter  | Indication (see note 1) |
|--|-------------------------|
| Channel class label                                    | M                       |
| Path loss C4   | M                       |
| Channel class label (see note 2)                       | C                       |
| Path loss C4 (see note 2)                              | C                       |
| NOTE 1: Not sent over the air interface.               |                         |
| NOTE 2: These two parameters may be repeated as a set. |                         |

## 20.3.5.4.1a TL-ASSESSMENT-LIST primitive

**TL-ASSESSMENT-LIST request:** this primitive shall be used at the TLC-SAP to start the assessment of the path loss for a list of channel classes on the serving cell, given as parameters. The assessment is based on measurements made on the current channel, together with information about the characteristics of the channel class to be assessed. The parameters shall be as defined in table 20.34.

**Table 20.34: Parameters used in the TL-ASSESSMENT-LIST primitive**

| Parameter  | Request (see note 1) |
|--|----------------------|
| Channel class label  | M                    |
| Characteristics of channel class to be assessed              | M                    |
| Channel class label (see note 2)                             | C                    |
| Characteristics of channel class to be assessed (see note 2) | C                    |
| NOTE 1: Not sent over the air interface.                     |                      |
| NOTE 2: These two parameters may be repeated as a set.       |                      |

NOTE: If the MS is on a super-sectored or eccentric channel, or if the MS did not understand the conforming channel status for the current channel, it cannot perform assessment of the path loss of channel classes on the serving cell based on the measurements made on the current channel. Therefore, if the MS is currently receiving only super-sectored and/or eccentric channel(s) and/or channel(s) for which it does not understand the conforming channel status, and it wishes to perform assessment of channel classes, it needs to perform main carrier monitoring with assessment of channel classes instead of performing the assessment based on measurements made on the current channel(s).

## 20.3.5.4.1b TL-CELL-READ primitive

**TL-CELL-READ request, confirm:** this primitive shall be used at the TLC-SAP to request that the SYSINFO-DA PDU is read on a DA neighbour cell. The parameters shall be as defined in table 20.35.

The RF channel on which the SYSINFO-DA PDU is to be read is the main carrier of the DA neighbour cell.

**Table 20.35: Parameters used in the TL-CELL-READ primitive**

| Parameter                                     | Request (see note) | Confirm (see note) |
|---|--------------------|--------------------|
| Channel number                                | M                  | M                  |
| Characteristics of RF channel to be cell-read | C                  | -                  |
| Report  | -                  | M                  |
| NOTE: Not sent over the air interface.        |                    |                    |

## 20.3.5.4.1c TL-CONFIGURE primitive

**TL-CONFIGURE indication:** this primitive shall be used to indicate when lower layer resources are lost. It may be used to indicate when the resources are regained. The parameters shall be as defined in table 20.36.

**TL-CONFIGURE request, confirm:** this primitive shall be used to set up and configure the layer 2 according to the chosen cell parameters and the current state of the MS. It may also be used to provide the LLC and MAC with retransmission strategy in graceful service degradation mode. The parameters shall be as defined in table 20.36.

Table 20.36: Parameters used in the TL-CONFIGURE primitive

| Parameter                                 | Request<br>(see note) | Indication<br>(see note) | Confirm<br>(see note) |
|---|-----------------------|--------------------------|-----------------------|
| Threshold values                          | C                     | -                        | C                     |
| Distribution on 18th frame                | C                     | -                        | C                     |
| SCCH information                          | C                     | -                        | C                     |
| Energy economy group                      | C                     | -                        | C                     |
| Energy economy startpoint                 | C                     | -                        | C                     |
| Dual watch energy economy group           | C                     | -                        | C                     |
| Dual watch startpoint                     | C                     | -                        | C                     |
| MLE activity indicator                    | C                     | -                        | -                     |
| Channel change accepted                   | C                     | -                        | -                     |
| Channel change handle                     | C                     | -                        | -                     |
| Operating mode                            | C                     | -                        | C                     |
| Call release                              | C                     | -                        | C                     |
| Valid addresses                           | C                     | -                        | C                     |
| MS default data priority                  | C                     | -                        | C                     |
| Layer 2 data priority lifetime            | C                     | -                        | C                     |
| Layer 2 data priority signalling delay    | C                     | -                        | C                     |
| Data priority random access delay factor  | C                     | -                        | C                     |
| Schedule repetition information           | C                     | -                        | C                     |
| Data class activity information           | C                     | -                        | C                     |
| Endpoint identifier                       | C                     | M                        | C                     |
| Lower layer resource availability         | -                     | M                        | -                     |
| Periodic reporting timer                  | C                     | -                        | -                     |
| Graceful service degradation mode control | C                     | -                        | -                     |
| NOTE: Not sent over the air interface.    |                       |                          |                       |

## 20.3.5.4.2 TL-MEASUREMENT primitive

**TL-MEASUREMENT indication:** this primitive shall be used to indicate to the upper layer the quality of the link of the current channel on the serving cell, based on the weighted result of the measured and acquired parameters; also, if the MS is not receiving a conforming channel, and is on a non-conforming concentric or sectorized channel, it indicates the result of assessment of the path loss on the main carrier of the serving cell (see note). The parameters shall be as defined in table 20.37.

Table 20.37: Parameters used in the TL-MEASUREMENT primitive

| Parameter   | Indication (see note 1) |
|---|-------------------------|
| Endpoint identifier   | M                       |
| Path loss C1  | M                       |
| Quality indication  | C                       |
| Path loss C3 on main carrier (see note 2)   | C                       |
| NOTE 1: Not sent over the air interface.  |                         |
| NOTE 2: Included when the MS is not receiving a conforming channel, and is on a non-conforming concentric or sectorized channel (see note). |                         |

NOTE: If the MS is on a super-sectored or eccentric channel, or if the MS did not understand the conforming channel status for the current channel, it cannot perform assessment of the path loss on the main carrier based on the measurements made on the current channel. Therefore, if the MS is currently receiving only super-sectored and/or eccentric channel(s) and/or channel(s) for which it does not understand the conforming channel status, it needs to perform main carrier monitoring on the serving cell instead of performing assessment of the main carrier.

#### 20.3.5.4.3 TL-MONITOR primitive

**TL-MONITOR indication:** this primitive shall be used at the TLC-SAP to indicate the result of the monitoring of one particular RF channel; it may also indicate the result of assessment of the path loss for one or more channel classes (using the measurements made on the monitored RF channel). This shall be a consequence of the action started by a TL-MONITOR-LIST request primitive. The parameters shall be as defined in table 20.38.

**Table 20.38: Parameters used in the TL-MONITOR primitive**

| Parameter  | Indication (see note 1) |
|--|-------------------------|
| Channel number   | M                       |
| Path loss C2   | M                       |
| Quality indication                                     | C                       |
| Channel class label                                    | C                       |
| Path loss C5   | C                       |
| Channel class label (see note 2)                       | C                       |
| Path loss C5 (see note 2)                              | C                       |
| NOTE 1: Not sent over the air interface.               |                         |
| NOTE 2: These two parameters may be repeated as a set. |                         |

#### 20.3.5.4.4 TL-MONITOR-LIST primitive

**TL-MONITOR-LIST request:** this primitive shall be used at the TLC-SAP to start the monitoring of a list of RF channels given as parameters; also, in the case of a request to monitor the main carrier of a neighbour cell or the main carrier of the serving cell, it may request the assessment of the path loss for a list of channel classes (using the measurements made on the monitored RF channel).

The listed RF channels may be on the serving cell and/or on neighbour cells, for example:

- the main carrier of neighbour cells, in which case the higher layers (i.e. MLE) may also request the assessment of the path loss for a list of channel classes on that neighbour cell; and/or
- the main carrier of the serving cell, in which case the higher layers (i.e. MLE) may also request the assessment of the path loss for a list of channel classes on the serving cell; and/or
- irregular RF channels on the serving cell; and/or
- irregular RF channels on neighbour cells.

The parameters shall be as defined in table 20.39.

**Table 20.39: Parameters used in the TL-MONITOR-LIST primitive**

| Parameter  | Request (see note 1) |
|--|----------------------|
| Channel number   | M                    |
| Characteristics of RF channel to be monitored  | M                    |
| Information about channel class(es) to be assessed:  |                      |
| Channel class label  | C                    |
| Characteristics of channel class to be assessed  | C                    |
| Channel class label (see note 2)   | C                    |
| Characteristics of channel class to be assessed (see note 2)   | C                    |
| Channel number (see note 3)  | C                    |
| Characteristics of RF channel to be monitored (see note 3)   | C                    |
| Information about channel class(es) to be assessed:  |                      |
| Channel class label  | C                    |
| Characteristics of channel class to be assessed  | C                    |
| Channel class label (see note 2)   | C                    |
| Characteristics of channel class to be assessed (see note 2)   | C                    |
| NOTE 1: Not sent over the air interface.   |                      |
| NOTE 2: These two parameters may be repeated as a set.   |                      |
| NOTE 3: These two parameters, together with the optional information about channel class(es) to be assessed, may be repeated as a set. |                      |

#### 20.3.5.4.5 TL-REPORT primitive (TLC-SAP)

**TL-REPORT indication:** this primitive shall be used to report locally to the MLE about the status of an action undertaken at the reception of a request primitive. It may also be used to report usage marker mismatch, downlink failure, uplink failure or when the maximum path delay has been exceeded. It is used to give schedule timing prompts to the higher layers. It may also be used to report that a channel replacement is advisable or may be beneficial, or that the current channel performance is acceptable. The parameters shall be as defined in table 20.40.

**Table 20.40: Parameters used in the TL-REPORT primitive (TLC-SAP)**

| Parameter   | Indication (see note 1) |
|---|-------------------------|
| Handle to the request   | C                       |
| Report  | M                       |
| Endpoint identifier   | C (see note 2)          |
| NSAPI   | C (see note 3)          |
| NOTE 1: Not sent over the air interface.                                      |                         |
| NOTE 2: Used to identify concurrent MAC resources.                            |                         |
| NOTE 3: Used to identify the NSAPI to which a schedule timing prompt applies. |                         |

#### 20.3.5.4.6 TL-SCAN primitive

**TL-SCAN request, confirm:** this primitive shall be used at the TLC-SAP to start the scanning of a defined RF channel given as a parameter, together with the type of scanning (e.g. interrupting or not). It may also request the assessment of the path loss for a list of channel classes on the scanned cell (using the measurements made on the scanned RF channel). The parameters shall be as defined in table 20.41.

The RF channel that is to be scanned is the main carrier of a neighbour cell. The main carrier of the neighbour cell is a phase modulation carrier for a CA neighbour cell or a QAM carrier for a DA neighbour cell.

**Table 20.41: Parameters used in the TL-SCAN primitive**

| Parameter   | Request<br>(see note 1) | Confirm<br>(see note 1) |
|---|-------------------------|-------------------------|
| Channel number  | M                       | M                       |
| Scanning measurement method   | M                       | M                       |
| Characteristics of RF channel to be scanned                                     | C                       | -                       |
| Threshold level   | C                       | M                       |
| Report  | -                       | M                       |
| Channel class label   | C                       | C                       |
| Characteristics of channel class to be assessed                                 | C                       | -                       |
| Path loss C5  | -                       | C                       |
| Channel class label (see notes 2 and 3)   | C                       | C                       |
| Characteristics of channel class to be assessed (see note 2)                    | C                       | -                       |
| Path loss C5 (see note 3)   | -                       | C                       |
| NOTE 1: Not sent over the air interface.  |                         |                         |
| NOTE 2: These two parameters may be repeated as a set in the request primitive. |                         |                         |
| NOTE 3: These two parameters may be repeated as a set in the confirm primitive. |                         |                         |

#### 20.3.5.4.7 TL-SCAN-REPORT primitive

**TL-SCAN-REPORT indication:** this primitive shall be used at the TLC-SAP to report locally the updated measurement of the path loss parameter after scanning has been completed. It shall be based on the updated signal strength measurements. It may also indicate the result of assessment of the path loss for one or more channel classes (using the measurements made on the scanned RF channel). The parameters shall be as defined in table 20.42.

NOTE: The TL-SCAN-REPORT indication primitive is used when the MLE has requested monitoring but the MS has already acquired synchronization on the neighbour cell and has decoded the broadcast parameters needed to calculate C1. Layer 2 then reports the value of C1 for the neighbour cell (and C5 values if appropriate) using the TL-SCAN-REPORT indication primitive instead of reporting C2 for that cell (and C5 values if appropriate).

The TL-SCAN confirm primitive is used to report the path loss measurements when the MLE has requested scanning (see clause 20.3.5.4.6).

**Table 20.42: Parameters used in the TL-SCAN-REPORT primitive**

| Parameter  | Indication<br>(see note 1) |
|--|----------------------------|
| Channel number   | M                          |
| Threshold level (path loss C1)                         | M                          |
| Report   | C                          |
| Channel class label                                    | C                          |
| Path loss C5   | C                          |
| Channel class label (see note 2)                       | C                          |
| Path loss C5 (see note 2)                              | C                          |
| NOTE 1: Not sent over the air interface.               |                            |
| NOTE 2: These two parameters may be repeated as a set. |                            |

### 20.3.5.4.8 TL-SELECT primitive

**TL-SELECT request, indication, response, confirm:** these primitives shall be used at the TLC-SAP to choose the RF channel onto which the radio will have to tune. The request and confirm primitives shall be used when the MLE instructs the MAC to change channel. The indication primitive shall be used by the MAC to inform the MLE of a channel change under the control of the BS. The response primitive shall be used for a cell change. The parameters shall be as defined in table 20.43.

**Table 20.43: Parameters used in the TL-SELECT primitive**

| Parameter                                       | Request | Indication | Response | Confirm |
|---|---------|------------|----------|---------|
| Channel number (see note)                       | M       | M          | M        | M       |
| Channel information                             | C       | M          | -        | -       |
| Threshold level (see note)                      | C       | C          | C        | C       |
| Main carrier number (see note)                  | C       | -          | C        | C       |
| Channel information for main carrier (see note) | C       | -          | C        | -       |
| Report (see note)                               | -       | C          | C        | C       |
| NOTE: Not sent over the air interface.          |         |            |          |         |

NOTE: The main carrier number is generally only used for announced type 1 cell reselection when a channel change directs the MS to a traffic channel on a new cell. On receiving the TL-SELECT indication primitive for a cell change channel allocation, the MLE returns a TL-SELECT response primitive indicating the main carrier of the new cell and enabling the MAC to reference the SYNC/SYSINFO or SYNC-DA/SYSINFO-DA information received when it previously scanned that main carrier (and, for DA, when it read the SYSINFO-DA PDU).

### 20.3.5.5 Primitives at the TLE-SAP (MAC-LLC)

#### 20.3.5.5.0 General

In addition to the services provided to the MLE through the TLA-SAP, TLB-SAP and TLC-SAP, the LLC may provide an additional SAP: the TLE-SAP. This is the layer 2 signalling SAP. The LLC offers the layer 2 signalling service to the MAC through this SAP.

NOTE: The following description refers to the protocol definition, but does not imply any implementation. The LLC-MAC boundary and TLE-SAP are internal layer boundaries defined to clarify the protocol description. They are not testable boundaries.

#### 20.3.5.5.1 TLE-CANCEL primitive

**TLE-CANCEL request:** this primitive may be used locally for the MAC to cancel a previous request. This primitive shall not send messages over the air interface. The parameters shall be as defined in table 20.44.

**Table 20.44: Parameters used in the TLE-CANCEL primitive**

| Parameter                              | Request |
|--|---------|
| Handle to the request (see note)       | M       |
| NOTE: Not sent over the air interface. |         |

### 20.3.5.5.2 TLE-REPORT primitive

**TLE-REPORT indication:** this primitive shall be used by the LLC to report to the MAC the progress or result of a request procedure. The progress or result indication shall be passed as the Report parameter.

Parameters for this primitive shall be as defined in table 20.45.

**Table 20.45: Parameters used in the TLE-REPORT primitive**

| Parameter                              | Indication |
|--|------------|
| Handle to the request (see note)       | M          |
| Report (see note)                      | M          |
| NOTE: Not sent over the air interface. |            |

### 20.3.5.5.3 TLE-UNITDATA primitive

In the layer 2 signalling service the parameters for the following primitives shall be as defined in table 20.46.

**TLE-UNITDATA request:** this primitive shall be used by the MAC to request the LLC to transmit a layer 2 signalling message.

**TLE-UNITDATA indication:** this primitive shall be used to deliver a received layer 2 signalling message to the MAC.

**TLE-UNITDATA confirm:** this primitive may be used to indicate completion of sending of the requested layer 2 signalling message.

**Table 20.46: Parameters used in the TLE-UNITDATA primitive**

| Parameter   | Request | Indication | Confirm (see note 2) |
|---|---------|------------|----------------------|
| Address type  | M       | M          | M                    |
| Main address  | M       | M          | M                    |
| Endpoint identifier (see note 1)  | M       | M          | M                    |
| Layer 2 signalling message  | M       | M          | -                    |
| Layer 2 signalling message length (see note 1)                                | M       | M          | -                    |
| Scrambling code   | M       | M          | -                    |
| PDU priority (see note 1)   | M       | -          | -                    |
| Stealing permission (see note 1)  | M       | -          | -                    |
| Subscriber class (see note 1)   | M       | -          | -                    |
| Encryption, air interface   | M       | M          | -                    |
| Number of repetitions of layer 2 signalling message (see note 1)              | C       | -          | -                    |
| Data category (see note 1)  | C       | -          | -                    |
| Handle to the request (see note 1)  | M       | -          | M                    |
| Report  | -       | -          | M                    |
| NOTE 1: Not sent over the air interface.                                      |         |            |                      |
| NOTE 2: In this case, the confirm is a local knowledge of the sending entity. |         |            |                      |

## 20.4 Services provided by the MAC

### 20.4.0 General

The MAC shall provide services to higher layers in the protocol architecture via four SAPs. These are TMA-SAP, TMB-SAP, TMC-SAP and TMD-SAP. The first three correspond to the TLA-SAP, TLB-SAP and TLC-SAP in the LLC. TMD-SAP shall be used for transfer of user information in circuit mode. The MAC layer service primitives shall be as listed in tables 20.47 to 20.50 inclusive.

NOTE: The following description refers to the protocol definition, but does not imply any implementation. The LLC-MAC boundary and TMD-SAP are internal layer boundaries defined to clarify the protocol description. They are not testable boundaries.

Table 20.47: TMA-SAP service primitives

| Service primitive | Request | Indication | Response | Confirm |
|-------------------|---------|------------|----------|---------|
| TMA-CANCEL        | yes     | no         | no       | no      |
| TMA-RELEASE       | no      | yes        | no       | no      |
| TMA-REPORT        | no      | yes        | no       | no      |
| TMA-UNITDATA      | yes     | yes        | no       | no      |

Table 20.48: TMB-SAP service primitives

| Service primitive | Request | Indication | Response | Confirm |
|-------------------|---------|------------|----------|---------|
| TMB-SYNC          | yes, BS | yes, MS    | no       | no      |
| TMB-SYSINFO       | yes, BS | yes, MS    | no       | no      |
| TMB-SYSINFO-Q     | yes, BS | yes, MS    | no       | no      |
| TMB-SYNC-DA       | yes, BS | yes, MS    | no       | no      |
| TMB-SYSINFO-DA    | yes, BS | yes, MS    | no       | no      |

Table 20.49: TMC-SAP service primitives

| Service primitive   | Request | Indication | Response | Confirm |
|---------------------|---------|------------|----------|---------|
| TMC-ASSESSMENT      | no      | yes        | no       | no      |
| TMC-ASSESSMENT-LIST | yes     | no         | no       | no      |
| TMC-CELL-READ       | yes     | no         | no       | yes     |
| TMC-CONFIGURE       | yes     | yes        | no       | yes     |
| TMC-MEASUREMENT     | no      | yes        | no       | no      |
| TMC-MONITOR         | no      | yes        | no       | no      |
| TMC-MONITOR-LIST    | yes     | no         | no       | no      |
| TMC-REPORT          | no      | yes        | no       | no      |
| TMC-SCAN            | yes     | no         | no       | yes     |
| TMC-SCAN-REPORT     | no      | yes        | no       | no      |
| TMC-SELECT          | yes     | yes        | yes      | yes     |

Table 20.50: TMD-SAP service primitives

| Service primitive | Request | Indication | Response | Confirm |
|-------------------|---------|------------|----------|---------|
| TMD-REPORT        | no      | yes        | no       | no      |
| TMD-UNITDATA      | yes     | yes        | no       | no      |

## 20.4.1 Services at the TMA-SAP

### 20.4.1.0 General

The TMA-SAP shall be used for transfer of signalling and packet data information on the air interface. The TMA-SAP provides the following services to the LLC layer:

- data manipulation (PDU composition/decomposition);
- transfer of PDUs as indicated in the following clauses.

### 20.4.1.1 Service primitives at the TMA-SAP

#### 20.4.1.1.1 TMA-CANCEL primitive

**TMA-CANCEL request:** this primitive shall be used to cancel a TMA-UNITDATA request primitive that was submitted by the LLC. The parameters shall be as defined in table 20.51.

Table 20.51: Parameters used in the TMA-CANCEL primitive

| Parameter                              | Request (see note) |
|--|--------------------|
| Handle to the request                  | M                  |
| NOTE: Not sent over the air interface. |                    |

#### 20.4.1.1.2 TMA-RELEASE primitive

**TMA-RELEASE indication:** this primitive may be used when the MAC leaves a channel in order to indicate that the connection on that channel is lost (e.g. to indicate local disconnection of any advanced links on that channel). The parameters in this primitive shall be as defined in table 20.52.

Table 20.52: Parameters used in the TMA-RELEASE primitive

| Parameter                              | Indication |
|--|------------|
| Endpoint identifier (see note)         | M          |
| NOTE: Not sent over the air interface. |            |

### 20.4.1.1.3 TMA-REPORT primitive

**TMA-REPORT indication:** this primitive shall be used by the MAC to report on the progress or failure of a request procedure. The result of the transfer shall be passed as a report parameter. The parameters shall be as defined in table 20.53.

**Table 20.53: Parameters used in the TMA-REPORT primitive**

| Parameter                              | Indication (see note) |
|--|-----------------------|
| Handle to the request                  | M                     |
| Report                                 | M                     |
| NOTE: Not sent over the air interface. |                       |

### 20.4.1.1.4 TMA-UNITDATA primitive

**TMA-UNITDATA request:** this primitive shall be used to request the MAC to transmit a TM-SDU.

**TMA-UNITDATA indication:** this primitive shall be used by the MAC to deliver a received TM-SDU. This primitive may also be used with no TM-SDU if the MAC needs to inform the higher layers of a channel allocation received without an associated TM-SDU.

The parameters shall be as defined in table 20.54.

**Table 20.54: Parameters used in the TMA-UNITDATA primitive**

| Parameter  | Request | Indication |
|--|---------|------------|
| Handle to the request (see note 1)   | M       | -          |
| TM-SDU   | M       | C          |
| TM-SDU length (see note 2)   | M       | C          |
| Main address   | M       | M          |
| Address type   | M       | M          |
| Scrambling code  | M       | M          |
| Endpoint identifier (see note 1)   | M       | M          |
| New endpoint identifier (see note 1)   | -       | C          |
| CSS endpoint identifier (see note 1)   | -       | C          |
| PDU priority (see note 1)  | M       | -          |
| Stealing permission (see note 1)   | M       | -          |
| Subscriber class (see note 1)  | M       | -          |
| Encryption, air interface  | M       | M          |
| Stealing repeats flag (see note 1)   | C       | -          |
| Data category (see note 1)   | C       | -          |
| Channel change response required (see note 1)  | -       | M          |
| Channel change handle (see note 1)   | -       | C          |
| Channel information  | -       | C          |
| NOTE 1: Not sent over the air interface.   |         |            |
| NOTE 2: If the length indicates a Null PDU, then PDU priority shall be the lowest value and stealing shall not be permitted. |         |            |

### 20.4.1.2 Signals at the TMA-SAP

The TMA-SAP signals (DATA-IN-BUFFER signal and MAC-READY signal) are used in the protocol description of the MS's message-buffering interface between LLC and MAC. As this is purely local to an MS, the following description is provided for information only.

The **DATA-IN-BUFFER signal** is used by the LLC in the MS to indicate to the MAC when it has signalling messages to send, and to indicate the amount of data outstanding.

The parameters in the DATA-IN-BUFFER signal are as follows:

- a) address type;
- b) main address;

c) amount of data in LLC buffer:

- this is the total amount of outstanding data ready to be sent with this address (on the channel corresponding to the specified endpoint identifier), and not yet given to the MAC;

NOTE 1: It is the total amount of data ready to be sent with this address for both basic link and advanced link messages, including acknowledgements.

d) highest stealing permission:

- this is the highest stealing permission parameter for messages in the LLC message buffer for this address (for the specified endpoint identifier);

e) PDU priority of highest priority unscheduled message:

- this is the highest PDU priority for unscheduled messages in the LLC message buffer for this address (for the specified endpoint identifier);

f) if the MS supports data priority:

- the data priority of the highest data-priority message:
  - this is the highest data priority for messages in the LLC message buffer for this address (for the specified endpoint identifier);
- information about type of data expected to be sent next:
  - this indicates whether or not the next message expected to be sent with this address (on the channel corresponding to the specified endpoint identifier) contains packet data;

g) if the channel corresponding to the specified endpoint identifier is a  $\pi/4$ -DQPSK channel and the MS supports data priority:

- amount of data in LLC buffer per data priority:
  - this is the amount of outstanding data, for each data priority, to be sent with this address (on the channel corresponding to the specified endpoint identifier), and not yet given to the MAC;

NOTE 2: When indicating the amount of outstanding data for each data priority, the LLC may include all data in its queue for this address and endpoint identifier (including data that is not yet ready to be sent).

h) if the channel corresponding to the specified endpoint identifier is a D8PSK or QAM channel:

- amount of data in LLC buffer per data category:
  - this is the amount of outstanding data, for each data category, ready to be sent with this address (on the channel corresponding to the specified endpoint identifier), and not yet given to the MAC;

i) if the channel corresponding to the specified endpoint identifier is a D8PSK or QAM channel and the MS supports data priority:

- amount of data in LLC buffer per data category and per data priority:
  - this is the amount of outstanding data, for each data category and data priority, to be sent with this address (on the channel corresponding to the specified endpoint identifier), and not yet given to the MAC;

j) fully scheduled or unscheduled data information:

- this indicates whether all, some or none of the data in the LLC message buffer for this address (for the specified endpoint identifier) is fully scheduled data;

k) lowest value of maximum schedule interval:

- this indicates the lowest value of the maximum schedule interval for any fully scheduled data in the LLC message buffer for this address (for the specified endpoint identifier);

- l) PDU priority of highest priority fully scheduled message:
  - this is the highest PDU priority for fully scheduled messages in the LLC message buffer for this address (for the specified endpoint identifier);
- m) endpoint identifier.

The **MAC-READY signal** is issued by the MAC in the MS to the LLC when the MAC is ready to send a MAC block. Then the LLC will usually issue a TMA-UNITDATA request primitive to the MAC, containing a TM-SDU to be sent in the MAC block.

The parameters in the MAC-READY signal are as follows:

- a) address type;
- b) main address;
- c) size of TM-SDU in this MAC block:
  - this parameter is included if the MS is on a  $\pi/4$ -DQPSK channel; it is the maximum size of TM-SDU that can be carried in the current MAC block (i.e. the maximum size without requiring fragmentation);
- d) normal advanced link segment size:
  - this parameter is included if the MS is on a QAM channel; it indicates the current normal segment size for new advanced link data segments;

NOTE 3: On a 25 kHz or 50 kHz QAM channel, the normal advanced link segment size is determined by the available space in a 4-QAM rate = 1/2 full-slot MAC block at the current bandwidth; on a 100 kHz or 150 kHz QAM channel, the normal advanced link segment size is determined by the available space in half of a 4-QAM rate = 1/2 full-slot MAC block at the current bandwidth.

- e) data categories for which a normal advanced link data segment may be sent in this MAC block:
  - this information is included if the MS is on a QAM channel; it indicates the data categories for which a normal advanced link data segment may be sent in the current MAC block;
- f) data categories for which a TM-SDU may be sent in this MAC block:
  - this information is included if the MS is on a D8PSK or QAM channel; it indicates the data categories for which a TM-SDU may be sent in the current MAC block;
- g) size of TM-SDU per data category in this MAC block:
  - this information is included if the MS is on a D8PSK channel; it indicates the maximum size of TM-SDU that can be carried in the current MAC block for each data category for which a TM-SDU may be sent (i.e. the maximum size without requiring fragmentation);
  - this information should be included for some or all categories if the MS is on a QAM channel; it indicates the maximum size of TM-SDU that can be carried in the current MAC block for appropriate data categories for which a TM-SDU may be sent (i.e. the maximum size without requiring fragmentation);

NOTE 4: The information in g) is needed on a D8PSK channel, for example, so that the data sending LLC knows what advanced link segment size to use when cutting a new segment of TL-SDU. Segments may be of different size, depending on whether the MAC considers that  $\pi/4$ -DQPSK or  $\pi/8$ -D8PSK modulation is currently appropriate for first transmissions of segments for this data category.

On a QAM channel, the information in d) and e) normally enables the data sending LLC to process advanced link segments correctly. However the information in g) is useful in some cases, for example:

- in order for the LLC to decide whether to use BL-ADATA or BL-ACK (see clause 22.3.2.3); or
- if the MS chooses not to fragment AL-ACK, AL-RNR, AL-X-ACK or AL-X-RNR PDUs (using multiple PDUs instead - see clauses 22.3.3.2.3 and 22.3.3.2a); or
- if the MS sends a first segment of TL-SDU in a random access message; or

- in order to facilitate transmissions or re-transmissions of short final segments or segment re-transmissions after a change of bandwidth.
- h) maximum size of TM-SDU:
- this is the maximum size of TM-SDU that can be handled in the MAC at this time (e.g. the maximum size of fragmented TM-SDU);
- i) endpoint identifier.

### 20.4.1.3 Mapping of the service primitives between LLC and MAC at the TMA-SAP

The LLC shall control the relationships between the LLC data transfer service primitives offered to the MLE and the data transfer service primitives offered by the MAC to the LLC. Table 20.55 shows these relationships at the TLA-SAP (MLE-LLC) and the TMA-SAP (LLC-MAC).

According to the protocol model, the LLC may offer a data transfer service to the MAC through the TLE-SAP, for layer 2 signalling. The LLC then uses the data transfer service primitives offered by the MAC at the TMA-SAP in order to send or receive layer 2 signalling PDUs. The LLC shall control the relationships between the LLC data transfer service primitives offered to the MAC for layer 2 signalling at the TLE-SAP and the data transfer service primitives offered by the MAC to the LLC at the TMA-SAP. Table 20.55 shows these relationships at the TLE-SAP (MAC-LLC) and the TMA-SAP (LLC-MAC).

**Table 20.55: Correspondence between MAC and LLC at the TMA-SAP, TLA-SAP and TLE-SAP**

| LLC Service Primitives (TLA-SAP and TLE-SAP)   | MAC Service Primitive (TMA-SAP)                                    |
|--|--|
| TL-CONNECT request<br>TL-CONNECT response<br>TL-DATA request<br>TL-DATA response<br>TL-DISCONNECT request<br>TL-RECONNECT request<br>TL-UNITDATA request<br>TLE-UNITDATA request                                       | TMA-UNITDATA request   |
| TL-CONNECT indication<br>TL-CONNECT confirm<br>TL-DATA indication<br>TL-DATA confirm<br>TL-DISCONNECT indication<br>TL-DISCONNECT confirm<br>TL-RECONNECT confirm<br>TL-UNITDATA indication<br>TLE-UNITDATA indication | TMA-UNITDATA indication  |
| TL-CANCEL request<br>TLE-CANCEL request  | TMA-CANCEL request   |
| TL-RELEASE indication  | TMA-RELEASE indication   |
| TL-RELEASE request   | None   |
| TL-REPORT indication<br>TLE-REPORT indication  | TMA-UNITDATA indication or TMA-REPORT indication or not applicable |
| NOTE 1: All the service primitives at the TMA-SAP use signalling channels (SCH or STCH), except for the local primitives (CANCEL, RELEASE, REPORT).  |  |
| NOTE 2: A TL-REPORT may be generated in the LLC without a report from the lower layer.   |  |

## 20.4.2 Service provided at the TMB-SAP

The TMB-SAP shall be used for the transfer of un-addressed system broadcast messages, which carry network or system organization information from the BS to the MS.

In the present document the LLC layer does not have any TMB-SAP related functions. The request primitives at the TLB-SAP are directly mapped as request primitives at the TMB-SAP, and the indication primitives at the TMB-SAP are directly transported to TLB-SAP indication primitives. The service descriptions for the TLB-SAP are therefore valid for the TMB-SAP and are not repeated.

Table 20.56 shows these relationships at the TLB-SAP (MLE-LLC) and the TMB-SAP (LLC-MAC).

**Table 20.56: Correspondence between MAC and LLC at the TMB-SAP and TLB-SAP**

| LLC Service Primitives (TLB-SAP)   | MAC Service Primitive (TMB-SAP)    | MAC Logical Channel (TMV-SAP)                               |
|--|------------------------------------|---|
| TL-SYNC request, indication  | TMB-SYNC request, indication       | BSCH  |
| TL-SYSINFO request, indication   | TMB-SYSINFO request, indication    | BNCH on SCH/HD, STCH, SCH-P8/HD, SCH-P8/F                   |
| TL-SYSINFO-Q request, indication   | TMB-SYSINFO-Q request, indication  | BNCH-Q on SCH-Q/D   |
| TL-SYNC-DA request, indication   | TMB-SYNC-DA request, indication    | BSCH-Q  |
| TL-SYSINFO-DA request, indication  | TMB-SYSINFO-DA request, indication | BNCH-Q on SCH-Q/D or on SCH-Q/B, SCH/F, SCH-P8/HD, SCH-P8/F |
| NOTE: The received system synchronization and information messages in the MS are conveyed to the MLE via the LLC using the TxB-SAP. Parameters calculated when receiving broadcast information are conveyed using the TxC-SAP. |                                    |   |

## 20.4.3 Service provided at the TMC-SAP

The TMC-SAP shall be used for the transfer of local layer management information. It does not provide data transfer services over the air interface. The request and response primitives at the TLC-SAP shall be directly mapped as request and response primitives at the TMC-SAP, and the indication and confirm primitives at the TMC-SAP shall be directly transported to the TLC-SAP as indication and confirm primitives. The service descriptions for the TLC-SAP are therefore valid for the TMC-SAP and are not repeated. The LLC also may use the TMC-CONFIGURE request primitive.

**TMC-CONFIGURE indication:** this primitive shall be used to indicate loss of lower layer resources. It may be used to indicate regain of lower layer resources. The parameters shall be as defined in table 20.57.

**TMC-CONFIGURE request:** this primitive shall be used to accept or reject a channel change. It is also used for the LLC to provide the MAC with information about activity. It is used for the LLC to provide the MAC with timer information that may be needed in the napping procedure. It may also be used for the LLC to provide the MAC with information that the MAC may use to make choices about link adaptation. It may also be used to provide the MAC with retransmission strategy in graceful service degradation mode. The parameters shall be as defined in table 20.57.

**Table 20.57: Parameters used in the TMC-CONFIGURE primitive**

| Parameter   | Request | Indication |
|---|---------|------------|
| Channel change handle (see notes 1 and 2)   | C       | -          |
| Channel change accepted (see notes 1 and 2)   | C       | -          |
| MLE activity indicator (see notes 1 and 2)  | C       | -          |
| LLC timer status (see note 1)   | C       | -          |
| Link performance information (see note 1)   | C       | -          |
| Endpoint identifier (see note 1)  | C       | M          |
| Lower layer resource availability (see note 1)  | -       | M          |
| Graceful service degradation mode control   | C       | -          |
| NOTE 1: Not sent over the air interface.  |         |            |
| NOTE 2: These parameters are a subset of those TMC-CONFIGURE request parameters which are used when TL-CONFIGURE request primitive is mapped into TMC-CONFIGURE request primitive, refer to clause 20.3.5.4.1b. |         |            |

Table 20.58 shows relationships at the TLC-SAP (MLE-LLC) and the TMC-SAP (LLC-MAC).

**Table 20.58: Correspondence between MAC and LLC at the TMC-SAP and TLC-SAP**

| LLC service primitives (TLC-SAP) | MAC service primitive (TMC-SAP) |
|----------------------------------|---------------------------------|
| TL-ASSESSMENT                    | TMC-ASSESSMENT                  |
| TL-ASSESSMENT-LIST               | TMC-ASSESSMENT-LIST             |
| TL-CELL-READ                     | TMC-CELL-READ                   |
| TL-CONFIGURE                     | TMC-CONFIGURE                   |
| TL-MEASUREMENT                   | TMC-MEASUREMENT                 |
| TL-MONITOR                       | TMC-MONITOR                     |
| TL-MONITOR-LIST                  | TMC-MONITOR-LIST                |
| TL-REPORT                        | TMC-REPORT                      |
| TL-SCAN                          | TMC-SCAN                        |
| TL-SCAN-REPORT                   | TMC-SCAN-REPORT                 |
| TL-SELECT                        | TMC-SELECT                      |

## 20.4.4 Service provided at the TMD-SAP

### 20.4.4.0 General

The TMD-SAP shall be used in the MS in circuit mode for the transfer of speech frames and/or synchronization information for end-to-end encryption purpose, and/or the transfer of data. It shall provide the interface between the MAC and the TETRA speech CODEC, and between the MAC and the other circuit mode applications.

The speech frames may contain either clear or end-to-end encrypted speech, but their actual information content (as also for data transported in circuit mode) is irrelevant to the MAC. Speech frames may be stolen by the MAC according to the parameter definition and the procedures as explained in clause 23. The same parameters may be used for circuit mode data.

Before transmission, speech frames and user data shall be coded and protected in the MAC in a way depending on whether they contain only speech or user data related information, one stolen half slot or two stolen half slots. Stolen half slots shall contain signalling information, either from C-plane or from U-plane (e.g. for end-to-end encryption synchronization).

For the purpose of the description in the rest of this clause, the unit of exchange at the TMD-SAP is always a half slot. Under normal circumstances in traffic mode, two primitive exchanges each containing the equivalent of half a slot capacity are required to fill the physical MAC block going to be transmitted over the air interface.

### 20.4.4.1 Service primitives and parameters at the TMD-SAP

#### 20.4.4.1.1 TMD-REPORT primitive

**TMD-REPORT indication:** this primitive shall be used by the MAC to report on the progress of a request procedure. For example, it shall be used by the sending MAC to report to the U-plane application when the MAC has stolen traffic capacity.

The half slot synchronization shall be a parameter (or any local signal) that the MS MAC shall give internally to the U-plane application to enable a distinction between the first and the second half slot, i.e. a proper use of first half slot and second half parameters by the U-plane application. For the purpose of this description, a TMD-REPORT indication primitive shall be sent before any TMD-UNITDATA request primitive as an initial synchronization for the U-plane application.

The parameters shall be as defined in table 20.59.

**Table 20.59: Parameters used in the TMD-REPORT primitive**

| Parameter                                     | Indication (see note) |
|---|-----------------------|
| Half slot synchronization                     | C                     |
| TCH type and interleaving depth               | C                     |
| Number of $\pi/4$ -DQPSK slots per TDMA frame | C                     |
| End-to-end encryption flag                    | C                     |
| User device                                   | C                     |
| Report  | M                     |
| NOTE: Not sent over the air interface.        |                       |

#### 20.4.4.1.2 TMD-UNITDATA primitive

**TMD-UNITDATA request:** this primitive shall be used to request the MAC to transmit one half slot.

**TMD-UNITDATA indication:** this primitive shall be used by the MAC to deliver one half slot.

The parameters shall be as defined in table 20.60.

**Table 20.60: Parameters used in the TMD-UNITDATA primitive**

| Parameter                              | Request | Indication |
|--|---------|------------|
| Half slot content                      | M       | M          |
| Half slot position (see note)          | C       | C          |
| Half slot importance (see note)        | M       | -          |
| Stolen indication                      | M       | M          |
| Half slot condition (see note)         | -       | M          |
| User device (see note)                 | C       | C          |
| NOTE: Not sent over the air interface. |         |            |

NOTE: The half slot position may be implicit after the first synchronization phase.

The user device number shall identify the circuit which the information shall be transferred to, and from.

## 21 Layer 2 PDU description

### 21.0 General

This clause describes the PDUs for the V+D air interface at layer 2. An overview of the DLL architecture can be found in clause 19. The sub-layer interactions between MAC and LLC are described herein by the protocol elements.

This clause is intended to be read together with the MAC protocol (see clause 23) and LLC protocol (see clause 22). A detailed service description is provided in clause 20.

Binary values are indicated in this clause by a subscript 2, thus:  $10110_2$ .

### 21.1 DLL PDU structure

#### 21.1.1 DLL overhead

The DLL overhead contains independent LLC and MAC headers. Therefore, the following description distinguishes first LLC overhead and then MAC overhead. Overhead shall be added by a sub-layer independently of the overhead attached by the other sub-layer.

#### 21.1.2 LLC PDU structure

##### 21.1.2.0 General

The LLC adds an LLC header to TL-SDUs to create LLC PDUs. The LLC PDU shall have the format illustrated in figure 21.1.

**Figure 21.1: Construction of an LLC PDU (shown with optional FCS)**

##### 21.1.2.1 LLC header

The LLC header discriminates between various PDUs, see table 21.1. The uses of the different LLC PDUs are specified in clause 22.

##### 21.1.2.2 Format of LLC header

The LLC PDU type illustrated in figure 21.2 is defined in clause 21.2.1. The LLC PDU type element shall have a length of 4 bits. The length of the LLC information structure depends on the PDU type.

**Figure 21.2: General format of an LLC header before the TL-SDU content**

### 21.1.2.3 LLC FCS

For the original advanced link, and on request for the basic link or extended advanced link, the LLC shall calculate and add an FCS to the information being transmitted. Its size shall be 32 bits. This provides a Probability of Undetected Erroneous Message (PUEM) of about  $10^{-13}$  or better. This may be requested for packet data transmission whereas the MAC error detection mechanism (16 bits CRC) guarantees a PUEM of  $10^{-6}$  only. The LLC FCS shall be placed immediately after the end of the TL-SDU as shown in figure 21.1. The FCS as defined in clause 22 shall be used.

### 21.1.3 MAC PDU structure

#### 21.1.3.1 MAC overhead

Each TM-SDU to be transmitted shall have a MAC header added as shown in figure 21.3.

**Figure 21.3: General format of the MAC PDU**

#### 21.1.3.2 Format of the MAC header

##### 21.1.3.2.0 General

The MAC header enables the receiving MAC entity to identify the functions to be performed on the MAC PDU. The MAC type defines the structure of the MAC information. The MAC header shall have the format shown in figure 21.4.

**Figure 21.4: General format of a MAC header**

Generally, the MAC header shall contain three types of element, the MAC type, the MAC address and some MAC information. In order to keep the overhead as small as possible, continuations and the end of fragmented data (MAC-FRAG and MAC-END) shall not contain any address.

The MAC header structure enables the MAC to associate and transmit several independent MAC PDUs in one MAC block. Unused bits should be filled with a NULL PDU as illustrated in figure 21.5, or fill bits may be used (not shown) (see clause 23).

**NOTE:** On uplink the Null PDU contains the normal MAC addressing and air interface encryption of the sending MS.

**Figure 21.5: Association of several MAC PDUs in one MAC block**

##### 21.1.3.2.1 MAC type

The MAC type identifies the different PDUs and the different SAPs to which the receiving MAC should route the TM-SDU.

### 21.1.3.2.2 MAC information

The location and format of the MAC information is defined in the relevant MAC section for each MAC type.

### 21.1.3.2.3 MAC address

The location and format of the MAC address is defined in the relevant MAC section for each MAC type. For the layer 2 addressing particularities, refer to ETSI EN 300 392-1 [6], clause 7 and to clause 23 of the present document.

## 21.1.4 DLL PDU building

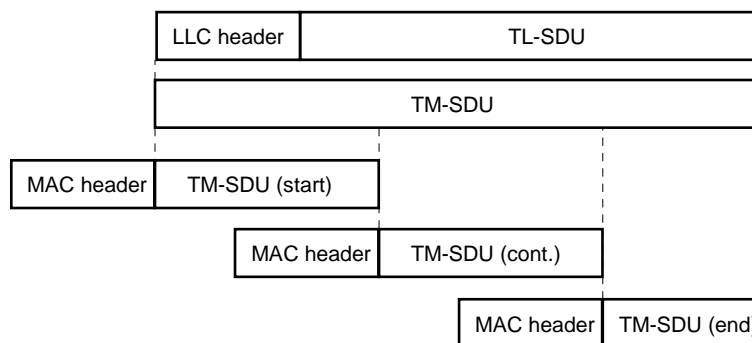

### 21.1.4.1 Basic link illustration

Figure 21.6 illustrates the method when a message (MAC header and TM-SDU) fits within the MAC block size.

**Figure 21.6: Building of DLL PDU (with no fragmentation)**

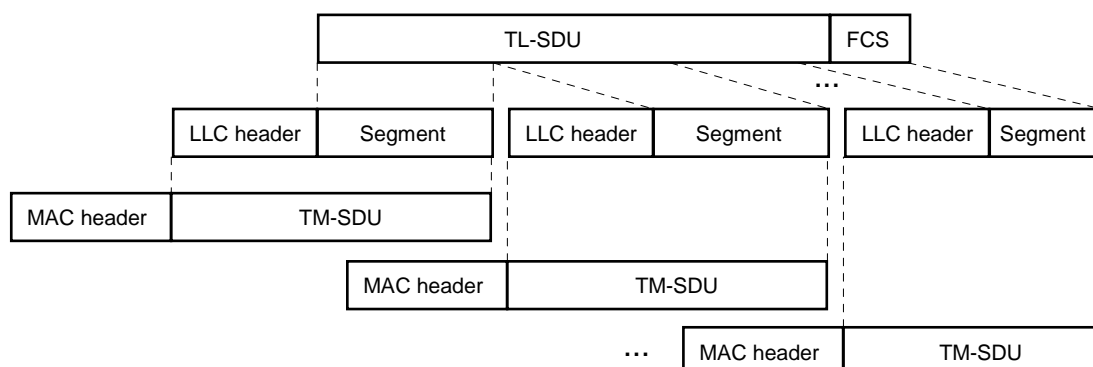

If the size of the TM-SDU exceeds the available capacity in a MAC block, MAC fragmentation shall occur as shown in figure 21.7.

**Figure 21.7: MAC fragmentation of a long TM-SDU**

Optionally, the LLC may add a FCS as part of the TM-SDU. (This is not shown in figures 21.6 and 21.7, but is illustrated on figure 21.1. The whole TM-SDU contains only a single LLC header. Therefore, if an error occurs during transmission, the whole TM-SDU has to be re-transmitted. This is not the case for the advanced link illustrated in figure 21.8.

### 21.1.4.2 Advanced link illustration

**Figure 21.8: Segmentation provided by the advanced link**

As opposed to fragmentation performed by the MAC, LLC segmentation shall label each segment with a sent segment sequence number  $S(S)$  so that each of the segments shall be uniquely identified and used as the re-transmission unit (selective rejection applies under the advanced link, refer to clause 22). Figure 21.8 shows that each TM-SDU has its own LLC header in addition to the MAC header. For the original advanced link, the LLC shall add an FCS at the end of the last segment; for the extended advanced link, optionally the LLC may add an FCS at the end of the last segment. This FCS shall be calculated over the entire TL-SDU.

## 21.1.5 PDU description format

The following clauses contain descriptions of the LLC and MAC protocol PDUs and the information elements contained in the PDUs. The structure of the PDU definitions represented by the tables is as follows:

- The information element column is the name of the element.
- The element length column defines the length of the element in bits.
- The element types (C/O/M) are:
  - Mandatory (M): this element shall always be present and shall appear in the order shown;
  - Optional (O): these elements are optional and if they are used, then they shall appear in the order shown;
  - Conditional (C): this element is conditional depending on another field before that element. If this is used, then it shall appear in the order shown.

NOTE: Unlike the layer 3 PDUs, layer 2 PDUs do not use any "O" bits or "P" bits to indicate the presence of optional fields. Whether or not optional fields are present in the PDU can be derived by context.

- The value column denotes fixed values or a range of valid values. If this field is empty all bit combinations are valid.
- The remarks column defines meanings of the values or it may contain other information on the information element.

## 21.2 Logical Link Control (LLC) PDUs description

### 21.2.0 General

The information contained in the following PDU descriptions shall be read from top to bottom. The content within an information element shall start with the most significant bit (i.e. the leftmost bit shown in the information element descriptions) and shall continue until it reaches the least significant bit.

## 21.2.1 LLC PDU types

**Table 21.1: Definition of LLC PDU types**

| LLC PDU type      | PDU associated   |
|-------------------|--|
| 0000 <sub>2</sub> | BL-ADATA without FCS   |
| 0001 <sub>2</sub> | BL-DATA without FCS  |
| 0010 <sub>2</sub> | BL-UDATA without FCS   |
| 0011 <sub>2</sub> | BL-ACK without FCS   |
| 0100 <sub>2</sub> | BL-ADATA with FCS  |
| 0101 <sub>2</sub> | BL-DATA with FCS   |
| 0110 <sub>2</sub> | BL-UDATA with FCS  |
| 0111 <sub>2</sub> | BL-ACK with FCS  |
| 1000 <sub>2</sub> | AL-SETUP   |
| 1001 <sub>2</sub> | AL-DATA/AL-DATA-AR/AL-FINAL/AL-FINAL-AR  |
| 1010 <sub>2</sub> | AL-UDATA/AL-UFINAL   |
| 1011 <sub>2</sub> | AL-ACK/AL-RNR  |
| 1100 <sub>2</sub> | AL-RECONNECT   |
| 1101 <sub>2</sub> | Supplementary LLC PDU: the PDU associated is given by the supplementary LLC PDU subtype (see table 21.3)   |
| 1110 <sub>2</sub> | Layer 2 signalling PDU: the PDU associated is given by the layer 2 signalling PDU subtype (see table 21.2) |
| 1111 <sub>2</sub> | AL-DISC  |

The PDU type field shall have a length of 4 bits. The PDU type values shall be according to table 21.1. The names reflect the functionality inside the LLC. PDUs having the same LLC PDU type values are discriminated by additional information elements. Basic link PDUs start with prefix BL, advanced link PDUs start with prefix AL.

For LLC PDU type 1110<sub>2</sub>, the PDU associated is given by the 4-bit layer 2 signalling PDU subtype field according to table 21.2. The name of each PDU reflects the functionality of that PDU within layer 2.

**Table 21.2: Definition of layer 2 signalling PDU subtypes for LLC PDU type 1110<sub>2</sub>**

| Layer 2 signalling PDU subtype | PDU associated                                   |
|--------------------------------|--|
| 0000 <sub>2</sub>              | L2-DATA-PRIORITY                                 |
| 0001 <sub>2</sub>              | L2-SCHEDULE-SYNC                                 |
| 0010 <sub>2</sub>              | L2-LINK-FEEDBACK-CONTROL                         |
| 0011 <sub>2</sub>              | L2-LINK-FEEDBACK-INFO                            |
| 0100 <sub>2</sub>              | L2-LINK-FEEDBACK-INFO-AND-RESIDUAL-DATA-PRIORITY |
| 0101 <sub>2</sub>              | Reserved   |
| 0110 <sub>2</sub>              | Reserved   |
| 0111 <sub>2</sub>              | Reserved   |
| 1000 <sub>2</sub>              | Reserved   |
| 1001 <sub>2</sub>              | Reserved   |
| 1010 <sub>2</sub>              | Reserved   |
| 1011 <sub>2</sub>              | Reserved   |
| 1100 <sub>2</sub>              | Reserved   |
| 1101 <sub>2</sub>              | Reserved   |
| 1110 <sub>2</sub>              | Reserved   |
| 1111 <sub>2</sub>              | Reserved   |

For LLC PDU type 1101<sub>2</sub>, the PDU associated is given by the 2-bit supplementary LLC PDU subtype field according to table 21.3. PDUs having the same supplementary LLC PDU subtype values are discriminated by additional information elements.

**Table 21.3: Definition of supplementary LLC PDU subtypes for LLC PDU type 1101<sub>2</sub>**

| Supplementary LLC PDU subtype   | PDU associated                                  |
|---|---|
| 00 <sub>2</sub>   | AL-X-DATA/AL-X-DATA-AR/AL-X-FINAL/AL-X-FINAL-AR |
| 01 <sub>2</sub>   | AL-X-UDATA/AL-X-UFINAL                          |
| 10 <sub>2</sub>   | AL-X-ACK/AL-X-RNR                               |

| NOTE: If supplementary LLC PDU subtype 11 <sub>2</sub> is used in future editions of the present document, it is intended that a sub-subtype will be defined to indicate the PDU associated - thereby enabling further extension of the LLC PDUs. |   |

## 21.2.2 Basic link PDU definitions

### 21.2.2.0 General

The following 8 PDUs are defined for the basic link:

- BL-ACK without FCS for the acknowledgement of the previous transmission (BL-DATA or BL-ADATA);
- BL-ACK with FCS for the acknowledgement of the previous transmission (BL-DATA or BL-ADATA);
- BL-ADATA without FCS for acknowledgement and the transmission of acknowledged information;
- BL-ADATA with FCS for acknowledgement and the transmission of acknowledged information;
- BL-DATA without FCS for the transmission of acknowledged information;
- BL-DATA with FCS for the transmission of acknowledged information;
- BL-UDATA without FCS for the transmission of unacknowledged information;
- BL-UDATA with FCS for the transmission of unacknowledged information.

#### 21.2.2.1 BL-ACK

- PDU: BL-ACK;
- service provided: Acknowledgement and optional data transfer in basic link;
- response to: BL-DATA or BL-ADATA;
- response expected: None;
- short description: This PDU shall be used to acknowledge one TL-SDU. There are 2 PDUs defined, one without and another one with a FCS. The BL-ACK PDUs can carry service user data from a TL-DATA response primitive.

The elements of BL-ACK PDU without FCS shall be as defined in table 21.4.

The elements of BL-ACK PDU with FCS shall be as defined in table 21.5. This PDU shall be used only if a TL-SDU is present.

**Table 21.4: BL-ACK PDU without FCS contents**

| Information element | Length   | Type | Value          | Remark                               |
|---------------------|----------|------|----------------|--------------------------------------|
| LLC PDU type        | 4        | M    | see table 21.1 | BL-ACK without FCS                   |
| N(R)                | 1        | M    |                | Received TL-SDU number               |
| TL-SDU              | variable | O    |                | Data from TL-DATA response primitive |

**Table 21.5: BL-ACK PDU with FCS contents**

| Information element | Length   | Type | Value          | Remark                               |
|---------------------|----------|------|----------------|--------------------------------------|
| LLC PDU type        | 4        | M    | see table 21.1 | BL-ACK with FCS                      |
| N(R)                | 1        | M    |                | Received TL-SDU number               |
| TL-SDU              | variable | M    |                | Data from TL-DATA response primitive |
| FCS                 | 32       | M    |                | Frame Check Sequence                 |

### 21.2.2.2 BL-ADATA

- PDU: BL-ADATA;
- service provided: Basic link (acknowledged service in connectionless mode);
- response to: BL-DATA or BL-ADATA;
- response expected: BL-ADATA or BL-ACK;
- short description: There are two PDUs defined, one without and another one with FCS. These PDUs shall be used to acknowledge one TL-SDU and send acknowledged data.

The elements of BL-ADATA PDU without FCS shall be as defined in table 21.6.

The elements of BL-ADATA PDU with FCS shall be as defined in table 21.7.

**Table 21.6: BL-ADATA PDU without FCS contents**

| Information element | Length   | Type | Value          | Remark                              |
|---------------------|----------|------|----------------|-------------------------------------|
| LLC PDU type        | 4        | M    | see table 21.1 | BL-ADATA without FCS                |
| N(R)                | 1        | M    |                | Received TL-SDU number              |
| N(S)                | 1        | M    |                | Sent TL-SDU number                  |
| TL-SDU              | variable | M    |                | Data from TL-DATA request primitive |

**Table 21.7: BL-ADATA PDU with FCS contents**

| Information element | Length   | Type | Value          | Remark                              |
|---------------------|----------|------|----------------|-------------------------------------|
| LLC PDU type        | 4        | M    | see table 21.1 | BL-ADATA with FCS                   |
| N(R)                | 1        | M    |                | Received TL-SDU number              |
| N(S)                | 1        | M    |                | Sent TL-SDU number                  |
| TL-SDU              | variable | M    |                | Data from TL-DATA request primitive |
| FCS                 | 32       | M    |                | Frame Check Sequence                |

### 21.2.2.3 BL-DATA

- PDU: BL-DATA;
- service provided: Basic link (acknowledged service in connectionless mode);
- response to: -;
- response expected: BL-ACK or BL-ADATA;
- short description: There are two PDUs defined, one without and another one with FCS. These PDUs shall be used to send acknowledged data.

The elements of BL-DATA PDU without FCS shall be as defined in table 21.8.

The elements of BL-DATA PDU with FCS shall be as defined in table 21.9.

**Table 21.8: BL-DATA PDU without FCS contents**

| Information element | Length   | Type | Value          | Remark                              |
|---------------------|----------|------|----------------|-------------------------------------|
| LLC PDU type        | 4        | M    | see table 21.1 | BL-DATA without FCS                 |
| N(S)                | 1        | M    |                | Sent TL-SDU number                  |
| TL-SDU              | variable | M    |                | Data from TL-DATA request primitive |

**Table 21.9: BL-DATA PDU with FCS contents**

| Information element | Length   | Type | Value          | Remark                              |
|---------------------|----------|------|----------------|-------------------------------------|
| LLC PDU type        | 4        | M    | see table 21.1 | BL-DATA with FCS                    |
| N(S)                | 1        | M    |                | Sent TL-SDU number                  |
| TL-SDU              | variable | M    |                | Data from TL-DATA request primitive |
| FCS                 | 32       | M    |                | Frame Check Sequence                |

### 21.2.2.4 BL-UDATA

- PDU: BL-UDATA;
- service provided: Basic link (unacknowledged service in connectionless mode);
- response to: -;
- response expected: None;
- short description: These PDUs shall be used to send unacknowledged data. There are two separate PDUs having a different LLC type to indicate whether the PDU contains the FCS or not.

The elements of BL-UDATA PDU without FCS shall be as defined in table 21.10.

The elements of BL-UDATA PDU with FCS shall be as defined in table 21.11.

**Table 21.10: BL-UDATA PDU without FCS contents**

| Information element | Length   | Type | Value          | Remark                                  |
|---------------------|----------|------|----------------|---|
| LLC PDU type        | 4        | M    | see table 21.1 | BL-UDATA without FCS                    |
| TL-SDU              | variable | M    |                | Data from TL-UNITDATA request primitive |

Table 21.11: BL-UDATA PDU with FCS contents

| Information element | Length   | Type | Value          | Remark                                  |
|---------------------|----------|------|----------------|---|
| LLC PDU type        | 4        | M    | see table 21.1 | BL-UDATA with FCS                       |
| TL-SDU              | variable | M    |                | Data from TL-UNITDATA request primitive |
| FCS                 | 32       | M    |                | Frame Check Sequence                    |

## 21.2.3 Advanced link PDU definitions

### 21.2.3.0 General

The original advanced link uses 11 PDUs:

- AL-ACK for an acknowledgement of received information with receive ready flow control indication;
- AL-RNR for an acknowledgement of received information with receive not ready flow control indication;
- AL-FINAL for transmission of the last segment of an acknowledged information;
- AL-FINAL-AR for transmission of the last segment of an acknowledged information with an acknowledgement request;
- AL-DATA for transmission of an acknowledged information segment;
- AL-DATA-AR for transmission of an acknowledged information segment with acknowledgement request;
- AL-DISC for disconnecting the advanced link;
- AL-SETUP for establishment or reset of the advanced link with quality of service negotiation;
- AL-RECONNECT for LLC reconnection of an advanced link after cell reselection;
- AL-UDATA for transmission of a segment of an unacknowledged information;
- AL-UFINAL for transmission of the last segment of an unacknowledged information.

NOTE 1: The 11 different PDUs are presented by 6 different LLC PDU types; see table 21.1.

AL-DATA, AL-DATA-AR and AL-UDATA shall never contain an entire FCS and shall not be used as the last segment of a TL-SDU, while AL-FINAL, AL-FINAL-AR and AL-UFINAL shall always contain a FCS or the last part of it and shall be used as the last segment of a TL-SDU.

The extended advanced link uses the AL-SETUP, AL-RECONNECT and AL-DISC PDUs for establishment, reset, reconnection and disconnection of the advanced link. However, it uses different PDUs from the original advanced link for the data transmission and acknowledgements. The PDUs for data transmission and acknowledgements on the extended advanced link are as follows:

- AL-X-ACK for an acknowledgement of received information with receive ready flow control indication;
- AL-X-RNR for an acknowledgement of received information with receive not ready flow control indication;
- AL-X-FINAL for transmission of the last segment of an acknowledged information;
- AL-X-FINAL-AR for transmission of the last segment of an acknowledged information with an acknowledgement request;
- AL-X-DATA for transmission of an acknowledged information segment;
- AL-X-DATA-AR for transmission of an acknowledged information segment with acknowledgement request;
- AL-X-UDATA for transmission of a segment of an unacknowledged information;

- AL-X-UFINAL for transmission of the last segment of an unacknowledged information.

NOTE 2: These eight PDUs share a single LLC PDU type (supplementary LLC PDU) and are presented by three different supplementary LLC PDU subtypes; see tables 21.1 and 21.3.

Inclusion of an FCS is optional for the extended advanced link.

### 21.2.3.1 AL-ACK, AL-RNR

- PDU: AL-ACK (receiver ready with acknowledgement);  
AL-RNR (receiver not ready with acknowledgement);
- service provided: acknowledgement in original advanced link (connection mode) flow control;
- response to: AL-DATA, AL-DATA-AR, AL-FINAL and AL-FINAL-AR;
- response expected: none;
- short description: these PDUs shall be used to acknowledge TL-SDUs and/or segments of TL-SDUs sent in the original advanced link. They support flow control by reporting "receiver ready" or "receiver not ready" to the peer sender.

The elements of AL-ACK and AL-RNR PDUs shall be as defined in table 21.12.

**Table 21.12: AL-ACK and AL-RNR PDUs contents**

| Information element  | Length   | Type | Value          | Remark  |
|--|----------|------|----------------|---|
| LLC PDU type   | 4        | M    | see table 21.1 | AL-ACK and AL-RNR   |
| Flow control   | 1        | M    | 0              | Receiver not ready (AL-RNR)   |
|  |          |      | 1              | Receiver ready (AL-ACK)   |
| First Acknowledgement Block  | variable | M    |                | Acknowledgement block for the eldest TL-SDU being acknowledged  |
| Other Acknowledgement Blocks   | variable | O    |                | Acknowledgement blocks for the same TL-SDU or the next TL-SDUs being acknowledged; may be repeated for up to window size N.272 TL-SDUs (see note) |
| NOTE: When appropriate, an acknowledgement block may contain a continuation of the previous acknowledgement block; refer to note 4 in table 21.13. |          |      |                |   |

The acknowledgement block shall be as defined in table 21.13.

**Table 21.13: Acknowledgement block information element contents in AL-ACK and AL-RNR PDUs**

| Information element  | Length                               | Type | Value                 | Remark  |
|--|--------------------------------------|------|-----------------------|---|
| N(R)   | 3                                    | M    |                       | The number of the TL-SDU (see note 4)   |
| Acknowledgement length   | 6                                    | M    | 000000 <sub>2</sub>   | SDU correctly received  |
|  |                                      |      | 000001 <sub>2</sub>   | Number of acknowledged segments   |
|  |                                      |      | etc.                  | etc.  |
|  |                                      |      | 111110 <sub>2</sub>   | Number of acknowledged segments   |
|  |                                      |      | 111111 <sub>2</sub>   | Repeat the entire SDU (see note 5)  |
| S(R)   | 8<br>see note 1                      | C    | 00000000 <sub>2</sub> | Sequence number of the eldest not yet correctly received segment (see note 4) |
|  |                                      |      | etc.                  | etc.  |
|  |                                      |      | 11111001 <sub>2</sub> | Sequence number of the eldest not yet correctly received segment (see note 4) |
|  |                                      |      | 11111010 <sub>2</sub> | Rest of SDU correctly received (see notes 6 and 7)                            |
|  |                                      |      | 11111011 <sub>2</sub> | Reserved  |
|  |                                      |      | etc.                  | etc.  |
|  |                                      |      | 11111111 <sub>2</sub> | Reserved  |
| Acknowledgement bit map  | Variable<br>see note 2<br>see note 3 | C    | 0                     | Incorrectly or not yet received segment                                       |
|  |                                      |      | 1                     | Correctly received segment  |
| NOTE 1: The element is present if the acknowledgement length is in the range from 000001 <sub>2</sub> to 111110 <sub>2</sub> .   |                                      |      |                       |   |
| NOTE 2: Length of the bit map is variable, each bit is set as defined.   |                                      |      |                       |   |
| NOTE 3: The element is present if the acknowledgement length is in the range from 000010 <sub>2</sub> to 111110 <sub>2</sub> . The length of the bit map is acknowledgement length minus one.  |                                      |      |                       |   |
| NOTE 4: On a π/4-QPSK or D8PSK channel, when the maximum size of the TL-SDU is 4 096 octets, two acknowledgement blocks may refer to the same TL-SDU. On a QAM channel, when the available room in an acknowledgement block is not sufficient to indicate the reception status of the segments in a TL-SDU, two or more acknowledgement blocks may refer to the same TL-SDU. Thus an acknowledgement block may contain a continuation of the previous acknowledgement block, in which case the N(R) shall indicate the same number of the TL-SDU as in the previous acknowledgement block and the S(R) shall indicate the sequence number of the eldest not yet correctly received segment after the segments indicated by the previous acknowledgement block. |                                      |      |                       |   |
| NOTE 5: This value is used in case of FCS failure. Implementations may use this value to indicate that no segments of a TL-SDU have been received: however this could result in N.273 being exceeded without any segment retransmissions having taken place if N.273 is set to 0.  |                                      |      |                       |   |
| NOTE 6: When using this value, the acknowledgement length shall be set to 000001 <sub>2</sub> .  |                                      |      |                       |   |
| NOTE 7: This value shall only be used when multiple acknowledgement blocks refer to the same TL-SDU, and shall only be used in the last acknowledgement block for such a TL-SDU.   |                                      |      |                       |   |

The correct reception of an entire TL-SDU shall be indicated by the acknowledgement length set to zero (000000<sub>2</sub>). A TL-SDU FCS failure shall be indicated by the acknowledgement length set to 111111<sub>2</sub> binary. In these cases the acknowledgement block shall not contain the fields S(R) and acknowledgement bit map.

In the other cases the total number of the acknowledged segments shall be equal to the number in the acknowledgement length field. The "total number of the acknowledged segments" refers to the number of segments, which are incorporated into the acknowledgement PDU. In the case of 000001<sub>2</sub> binary, only S(R) is present and the bit map is empty. Because the segment indicated by S(R) is implicitly not acknowledged (not correctly received), the length of the bit map is Acknowledgement length minus one. The acknowledgement bit map shall indicate the reception status (STATUS) of each segment starting from the next segment after the S(R) and moving forwards one segment at a time, up to the segment with the highest sequence number that is covered by the acknowledgement block. The status of the segment shall be set to "1" if it is correctly received and to "0" if it is not correctly received. All segments prior to the one referred to by the S(R) shall be correctly received in the indicated TL-SDU except when more than one acknowledgement block refers to the same TL-SDU, see note 4 in table 21.13. When more than one acknowledgement block refers to the same TL-SDU in the same AL-ACK or AL-RNR PDU, there may be a range of correctly received segments between the segments indicated in the acknowledgement blocks (see note 1). Furthermore, if there are no missing segments to indicate in the last acknowledgement block, the S(R) shall be set to "Rest of SDU correctly received".

If only a single acknowledgement block refers to the TL-SDU, the acknowledgement block shall include the reception status for the first incorrectly received segment and all following segments up to the segment with highest sequence number that has been correctly received, if permitted by the available room in the AL-ACK or AL-RNR PDU.

If multiple acknowledgement blocks refer to the same TL-SDU, then:

- the first acknowledgement block shall include the reception status for the first incorrectly received segment, and may include a bitmap with the reception status of following segments (see note 1);
- the following (including the last) acknowledgement block(s) shall include the reception status for the first incorrectly received segment after the last segment for which the previous acknowledgement block indicated the reception status, and may include a bitmap with the reception status of following segments (see note 1);
- the data receiving entity shall complete the acknowledgement of the current TL-SDU in preference to including acknowledgement blocks for other TL-SDUs. I.e. when multiple acknowledgement blocks refer to a TL-SDU, the data receiving entity is not allowed to move to the next TL-SDU before completing the acknowledgement of the current TL-SDU (by including the reception status for the last correctly received segment of the current TL-SDU).

NOTE 1: In the multiple acknowledgement blocks case, the acknowledgement length of each block may be optimized so that as few bits as possible are used to send the acknowledgement information referring to the same TL-SDU.

EXAMPLE: If only segments 0 and 58 are missing of a TL-SDU consisting of 60 segments, the data receiving entity may either send: a) one acknowledgement block including a bitmap of length 59 bits to indicate the successful reception of segments 1 to 57 and 59, or b) two acknowledgement blocks with S(R) set to 0 for the first acknowledgement block and 58 for the second acknowledgement block, and not include a bitmap in the first acknowledgement block. In this case the gap between the two acknowledgement blocks indicates that segments 1 to 57 are correctly received. Method a) uses 76 bits; method b) uses 35 bits.

If the number of segments in the TL-SDU being acknowledged is unknown (i.e. the AL-FINAL segment has not been received), then:

- if the highest segment number received is N and all segments up to segment N have been received, then one acknowledgement block indicating segment N + 1 as not received shall be sent. This shall be done by setting "Acknowledgement length" to 1, and S(R) equal to N + 1;
- if the highest segment number received is N and there are missing segments below segment N, then one or more acknowledgement blocks shall be sent indicating the reception status of segments up to and including segment N, if permitted by the available room in the AL-ACK or AL-RNR PDU. In this case, the status of segment N + 1 shall not be included in any acknowledgement bitmap;
- if no segments have been received, then segment 0 may be indicated as not received ("Acknowledgement length" set to 1, and S(R) set to 0). Alternatively, the data receiving entity may set "Acknowledgement length" to "Repeat the entire SDU"; however this could result in N.273 being exceeded without any segment retransmissions having taken place if N.273 is set to 0.

On a  $\pi/4$ -DQPSK or D8PSK channel, when the maximum size of the TL-SDU is 2 048 octets or less, then two acknowledgement blocks in the same AL-ACK or AL-RNR PDU shall not refer to the same TL-SDU.

NOTE 2: The use of "Rest of SDU correctly received" is not applicable on a  $\pi/4$ -DQPSK or D8PSK channel, when the maximum size of the TL-SDU is 2 048 octets or less.

For the data sending entity on a  $\pi/4$ -DQPSK or D8PSK channel, the support of two acknowledgement blocks which refer to the same TL-SDU, in the same AL-ACK or AL-RNR PDU, is mandatory when it supports 4 096 octets as the maximum size of the TL-SDU.

For the data sending entity on a QAM channel, the support of more than one acknowledgement block which refers to the same TL-SDU, in the same AL-ACK or AL-RNR PDU, is mandatory.

NOTE 3: Instead of using more than one acknowledgement block which refers to the same TL-SDU in the same AL-ACK or AL-RNR PDU, the acknowledging entity may wait for re-reception of the incorrectly received segments before including further segments into the acknowledgements.

If the acknowledging entity wishes to send more than one acknowledgement block which refers to the same TL-SDU, those acknowledgement blocks shall be included within the same AL-ACK or AL-RNR PDU (using fragmentation if necessary); the acknowledging entity shall not divide acknowledgement blocks which refer to the same TL-SDU between multiple AL-ACK or AL-RNR PDUs.

The AL-ACK or AL-RNR PDU may also contain acknowledgement for multiple TL-SDUs being sent on this advanced link. The AL-ACK or AL-RNR PDU contains acknowledgement blocks for TL-SDUs up to the number of TL-SDUs in the window for this advanced link.

### 21.2.3.1a AL-X-ACK, AL-X-RNR

- PDU: AL-X-ACK (receiver ready with acknowledgement);  
AL-X-RNR (receiver not ready with acknowledgement);
- service provided: Acknowledgement in extended advanced link (connection mode) flow control;
- response to: AL-X-DATA, AL-X-DATA-AR, AL-X-FINAL and AL-X-FINAL-AR;
- response expected: None;
- short description: These PDUs shall be used to acknowledge TL-SDUs and/or segments of TL-SDUs sent in an extended advanced link. They support flow control by reporting "receiver ready" or "receiver not ready" to the peer sender.

The elements of AL-X-ACK and AL-X-RNR PDUs shall be as defined in table 21.14.

**Table 21.14: AL-X-ACK and AL-X-RNR PDUs contents**

| Information element  | Length   | Type | Value           | Remark  |
|--|----------|------|-----------------|---|
| LLC PDU type   | 4        | M    | see table 21.1  | Supplementary LLC PDU   |
| Supplementary LLC PDU subtype  | 2        | M    | see table 21.3  | AL-X-ACK and AL-X-RNR   |
| Flow control   | 1        | M    | 0               | Receiver not ready (AL-X-RNR)   |
|  |          |      | 1               | Receiver ready (AL-X-ACK)   |
| Advanced link number   | 2        | M    | 00 <sub>2</sub> | Advanced link number 1  |
|  |          |      | 01 <sub>2</sub> | Advanced link number 2  |
|  |          |      | 10 <sub>2</sub> | Advanced link number 3  |
|  |          |      | 11 <sub>2</sub> | Advanced link number 4  |
| Link feedback information flag   | 1        | M    | 0               | "Link feedback information" information element not present   |
|  |          |      | 1               | "Link feedback information" information element present   |
| Link feedback information (see note 1)   | 13       | C    |                 | See table 21.16   |
| First Acknowledgement Block  | variable | M    |                 | Acknowledgement block for the eldest TL-SDU being acknowledged  |
| Other Acknowledgement Blocks   | variable | O    |                 | Acknowledgement blocks for the same TL-SDU or the next TL-SDUs being acknowledged; may be repeated for up to window size N.272 TL-SDUs (see note 2) |
| NOTE 1: This element shall be present only if the link feedback information flag is set to 1.                                      |          |      |                 |   |
| NOTE 2: An acknowledgement block may contain a continuation of the previous acknowledgement block; refer to note 4 in table 21.15. |          |      |                 |   |

The acknowledgement block shall be as defined in table 21.15.

**Table 21.15: Acknowledgement block information element contents in AL-X-ACK and AL-X-RNR PDUs**

| Information element   | Length                               | Type | Value                 | Remark  |
|---|--------------------------------------|------|-----------------------|---|
| N(R)  | 5                                    | M    |                       | The number of the TL-SDU (see note 4)   |
| Acknowledgement length  | 6                                    | M    | 000000 <sub>2</sub>   | SDU correctly received  |
|   |                                      |      | 000001 <sub>2</sub>   | Number of acknowledged segments   |
|   |                                      |      | etc.                  | etc.  |
|   |                                      |      | 111110 <sub>2</sub>   | Number of acknowledged segments   |
|   |                                      |      | 111111 <sub>2</sub>   | Repeat the entire SDU (see note 5)  |
| S(R)  | 8<br>see note 1                      | C    | 00000000 <sub>2</sub> | Sequence number of the eldest not yet correctly received segment (see note 4) |
|   |                                      |      | etc.                  | etc.  |
|   |                                      |      | 11111001 <sub>2</sub> | Sequence number of the eldest not yet correctly received segment (see note 4) |
|   |                                      |      | 11111010 <sub>2</sub> | Rest of SDU correctly received (see notes 6 and 7)                            |
|   |                                      |      | 11111011 <sub>2</sub> | Rest of SDU not received (see note 6)   |
|   |                                      |      | 11111100 <sub>2</sub> | All SDUs prior to this SDU correctly received (see note 6)                    |
|   |                                      |      | 11111101 <sub>2</sub> | Reserved  |
|   |                                      |      | etc.                  | etc.  |
|   |                                      |      | 11111111 <sub>2</sub> | Reserved  |
| Acknowledgement bit map   | Variable<br>see note 2<br>see note 3 | C    | 0                     | Incorrectly or not yet received segment                                       |
|   |                                      |      | 1                     | Correctly received segment  |
| NOTE 1: The element is present if the acknowledgement length is in the range from 000001 <sub>2</sub> to 111110 <sub>2</sub> .  |                                      |      |                       |   |
| NOTE 2: Length of the bit map is variable, each bit is set as defined.  |                                      |      |                       |   |
| NOTE 3: The element is present if the acknowledgement length is in the range from 000010 <sub>2</sub> to 111110 <sub>2</sub> .The length of the bit map is acknowledgement length minus one.  |                                      |      |                       |   |
| NOTE 4: When the available room in an acknowledgement block is not sufficient to indicate the reception status of the segments in a TL-SDU, more than one acknowledgement block may refer to the same TL-SDU. Thus an acknowledgement block may contain a continuation of the previous acknowledgement block, in which case the N(R) shall indicate the same number of the TL-SDU as in the previous acknowledgement block and the S(R) shall indicate the sequence number of the eldest not yet correctly received segment after the segments indicated by the previous acknowledgement block. |                                      |      |                       |   |
| NOTE 5: This value shall only be used in case of FCS failure.   |                                      |      |                       |   |
| NOTE 6: When using this value, the acknowledgement length shall be set to 000001 <sub>2</sub> .   |                                      |      |                       |   |
| NOTE 7: This value shall only be used when multiple acknowledgement blocks refer to the same TL-SDU, and shall only be used in the last acknowledgement block for such a TL-SDU.  |                                      |      |                       |   |

The "link feedback information" information element (if included) shall be as defined in table 21.16.

**Table 21.16: "Link feedback information" information element contents**

| Information element   | Length | Type | Value                  | Remark   |
|---|--------|------|------------------------|--|
| Channel metric type   | 3      | M    | 000 <sub>2</sub>       | Bit rate feedback  |
|   |        |      | 001 <sub>2</sub>       | E <sub>s</sub> /N <sub>0</sub> feedback  |
|   |        |      | 010 <sub>2</sub>       | Reserved   |
|   |        |      | etc.                   | etc.   |
|   |        |      | 111 <sub>2</sub>       | Reserved   |
| Bit rate feedback information (see note 1)  | 10     | C    |                        | See "bit rate feedback information" information element definition                       |
| E <sub>s</sub> /N <sub>0</sub> feedback information (see note 2)  | 10     | C    |                        | See "E <sub>s</sub> /N <sub>0</sub> feedback information" information element definition |
| Reserved (see note 3)   | 10     | C    | 000000000 <sub>2</sub> | Not used in the present document   |
|   |        |      | etc.                   | etc.   |
|   |        |      | 111111111 <sub>2</sub> | Not used in the present document   |
| NOTE 1: This element shall be present only in the case of bit rate feedback i.e. channel metric type element set to 000 <sub>2</sub> .                        |        |      |                        |  |
| NOTE 2: This element shall be present only in the case of E <sub>s</sub> /N <sub>0</sub> feedback i.e. channel metric type element set to 001 <sub>2</sub> .  |        |      |                        |  |
| NOTE 3: This element shall be present only in the case of channel metric type element greater than 001 <sub>2</sub> . It is not used in the present document. |        |      |                        |  |

The correct reception of an entire TL-SDU shall be indicated by the acknowledgement length set to zero (000000<sub>2</sub>). A TL-SDU FCS failure shall be indicated by the acknowledgement length set to 111111<sub>2</sub> binary. In these cases the acknowledgement block shall not contain the fields S(R) and acknowledgement bit map.

In the other cases the total number of the acknowledged segments shall be equal to the number in the acknowledgement length field. The "total number of the acknowledged segments" refers to the number of segments, which are incorporated into the acknowledgement PDU. In the case of 000001<sub>2</sub> binary, only S(R) is present and the bit map is empty. Because the segment indicated by S(R) is implicitly not acknowledged (not correctly received), the length of the bit map is Acknowledgement length minus one. The acknowledgement bit map shall indicate the reception status (STATUS) of each segment starting from the next segment after the S(R) and moving forwards one segment at a time, up to the segment with the highest sequence number that is covered by the acknowledgement block. The status of the segment shall be set to "1" if it is correctly received and to "0" if it is not correctly received. All segments prior to the one referred to by the S(R) shall be correctly received in the indicated TL-SDU except when more than one acknowledgement block refers to the same TL-SDU, see note 4 in table 21.15. When more than one acknowledgement block refers to the same TL-SDU in the same AL-X-ACK or AL-X-RNR PDU, there may be a range of correctly received segments between the segments indicated in the acknowledgement blocks (see note). Furthermore, if there are no missing segments to indicate in the last acknowledgement block, the S(R) shall be set to "Rest of SDU correctly received".

The data receiving entity shall complete the acknowledgement of a TL-SDU in preference to including acknowledgement information for other TL-SDUs. I.e. the data receiving entity is not allowed to move to the next TL-SDU before completing the acknowledgement of the current TL-SDU (by including the reception status for the last correctly received segment of the current TL-SDU). If the number of segments to be acknowledged for the TL-SDU exceeds the maximum number of segments for one acknowledgement block, the data receiving entity shall include multiple acknowledgement blocks until the reception status for the segment with highest sequence number that has been correctly received has been indicated, in preference to including acknowledgement information for other TL-SDUs.

If only a single acknowledgement block refers to the TL-SDU, the acknowledgement block shall include the reception status for the first incorrectly received segment and all following segments up to the segment with highest sequence number that has been correctly received, if permitted by the available room in the AL-X-ACK or AL-X-RNR PDU.

If multiple acknowledgement blocks refer to the same TL-SDU, then:

- the first acknowledgement block shall include the reception status for the first incorrectly received segment, and may include a bitmap with the reception status of following segments (see note);
- the following (including the last) acknowledgement block(s) shall include the reception status for the first incorrectly received segment after the last segment for which the previous acknowledgement block indicated the reception status, and may include a bitmap with the reception status of following segments (see note).

The data receiving entity may use multiple acknowledgement blocks referring to the same TL-SDU instead of a single acknowledgement block, even in the case where the acknowledgement information could have fitted within one acknowledgement block.

**NOTE:** In the multiple acknowledgement blocks case, the acknowledgement length of each block may be optimized so that as few bits as possible are used to send the acknowledgement information referring to the same TL-SDU.

**EXAMPLE 1:** If only segments 0 and 58 are missing of a TL-SDU consisting of 60 segments, the data receiving entity may either send: a) one acknowledgement block including a bitmap of length 59 bits to indicate the successful reception of segments 1 to 57 and 59, or b) two acknowledgement blocks with S(R) set to 0 for the first acknowledgement block and 58 for the second acknowledgement block, and not include a bitmap in the first acknowledgement block. In this case the gap between the two acknowledgement blocks indicates that segments 1 to 57 are correctly received. Method a) uses 78 bits; method b) uses 39 bits.

If the number of segments in the TL-SDU being acknowledged is unknown (i.e. the AL-X-FINAL segment has not been received), then:

- if the highest segment number received is N and all segments up to segment N have been received, then one acknowledgement block indicating segment N + 1 as not received shall be sent. This shall be done by setting "Acknowledgement length" to 1, and S(R) equal to N + 1. This shall be followed by an acknowledgement block indicating "Rest of SDU not received", if permitted by the available room in the AL-X-ACK or AL-X-RNR PDU;
- if the highest segment number received is N and there are missing segments below segment N, then one or more acknowledgement blocks shall be sent indicating the reception status of segments up to segment N, if permitted by the available room in the AL-X-ACK or AL-X-RNR PDU. In this case, the status of segment N + 1 shall not be included in any acknowledgement bitmap. This shall be followed by an acknowledgement block indicating "Rest of SDU not received", if permitted by the available room in the AL-X-ACK or AL-X-RNR PDU;
- if no segments have been received, the data receiving entity shall include an acknowledgement block indicating "Rest of SDU not received" as the only acknowledgement block for the TL-SDU.

The data receiving entity may wish to inform the data transmitting entity about its current lower receive window boundary. In this case, an acknowledgement block for the oldest TL-SDU that has not been completely received shall be included, setting the S(R) to "All SDUs prior to this SDU correctly received". Such acknowledgement block may only be included once and only as the first acknowledgement block in an AL-X-ACK or AL-X-RNR. This acknowledgement block does not indicate anything about the TL-SDU itself (i.e. the N(R) TL-SDU); one or more additional acknowledgement blocks for the TL-SDU shall be included in the AL-X-ACK or AL-X-RNR for this purpose.

**EXAMPLE 2:** If the data receiving entity receives the AL-X-FINAL-AR for TL-SDU 7 and has completely received TL-SDU 7 and all older TL-SDUs, the data receiving entity may send an AL-X-ACK containing a first acknowledgement block for TL-SDU 7 indicating "All SDUs prior to this SDU correctly received" and a second acknowledgement block for TL-SDU 7 indicating "SDU correctly received" (the procedures in clause 22.3.3.2.7 first sends the acknowledgement, then updates the window).

**EXAMPLE 3:** If the data receiving entity receives the AL-X-FINAL-AR for TL-SDU 7 and has completely received TL-SDU 6 and all older TL-SDUs but not received all segments of TL-SDU 7, the data receiving entity may send an AL-X-ACK containing a first acknowledgement block for TL-SDU 7 indicating "All SDUs prior to this SDU correctly received" and a further acknowledgement block (or blocks) for TL-SDU 7 indicating which segments are missing for TL-SDU 7.

**EXAMPLE 4:** If the data receiving entity has completely received TL-SDU 7 and all older TL-SDUs, but not received any segments of TL-SDU 8 or newer TL-SDUs, and wishes to send an AL-X-ACK (for example for flow control reasons), the data receiving entity may send an AL-X-ACK containing an acknowledgement block for TL-SDU 7 indicating "All SDUs prior to this SDU correctly received" followed by an acknowledgement block for TL-SDU 7 indicating "SDU correctly received". The data receiving entity should not include any further acknowledgement blocks for TL-SDU 8 in this case.

For the data sending entity, the support of more than one acknowledgement block which refers to the same TL-SDU, in the same AL-X-ACK or AL-X-RNR PDU, is mandatory.

If the acknowledging entity wishes to send more than one acknowledgement block which refers to the same TL-SDU, those acknowledgement blocks shall be included within the same AL-X-ACK or AL-X-RNR PDU (using fragmentation if necessary); the acknowledging entity shall not divide acknowledgement blocks which refer to the same TL-SDU between multiple AL-X-ACK or AL-X-RNR PDUs.

The AL-X-ACK or AL-X-RNR PDU may also contain acknowledgement for multiple TL-SDUs being sent on this extended advanced link. The AL-X-ACK or AL-X-RNR PDU contains acknowledgement blocks for TL-SDUs up to the number of TL-SDUs in the window for this advanced link.

### 21.2.3.2 AL-FINAL, AL-FINAL-AR

- PDU: AL-FINAL (last data of a TL-SDU);  
AL-FINAL-AR (last data of a TL-SDU with immediate acknowledgement required);
- service provided: Data transfer in original advanced link (connection mode);
- response to: -;
- response expected: AL-ACK to the AL-FINAL-AR;
- short description: These PDUs shall be used to send the last segment in a TL-SDU or a whole TL-SDU in the original advanced link. When an immediate response is required, AL-FINAL-AR shall be used.

The elements of AL-FINAL and AL-FINAL-AR PDUs shall be as defined in table 21.17.

**Table 21.17: AL-FINAL and AL-FINAL-AR PDUs contents**

| Information element   | Length                 | Type | Value          | Remark   |
|---|------------------------|------|----------------|--|
| LLC PDU type  | 4                      | M    | see table 21.1 | AL-DATA, AL-DATA-AR, AL-FINAL and AL-FINAL-AR    |
| FINAL   | 1                      | M    | 1              | Last segment with FCS (AL-FINAL and AL-FINAL-AR) |
| AR  | 1                      | M    | 0              | No immediate response (AL-FINAL)                 |
|   |                        |      | 1              | Immediate response required (AL-FINAL-AR)        |
| N(S)  | 3                      | M    |                | Sent TL-SDU number                               |
| S(S)  | 8                      | M    |                | Sent segment sequence number                     |
| The last segment of TL-DATA SDU   | Variable<br>see note 1 | O    |                | The last segment of TL-DATA SDU                  |
| FCS   | 32<br>see note 2       | M    |                | Frame Check Sequence                             |
| NOTE 1: This PDU may contain no data from the TL-DATA request primitive, see note 2.                                |                        |      |                |  |
| NOTE 2: The size shown is the upper limit of the FCS field; a part of the FCS could be in the previous AL-DATA PDU. |                        |      |                |  |

## 21.2.3.2a AL-X-FINAL, AL-X-FINAL-AR

- PDU: AL-X-FINAL (last data of a TL-SDU);  
AL-X-FINAL-AR (last data of a TL-SDU with immediate acknowledgement required);
- service provided: Data transfer in extended advanced link (connection mode);
- response to: -;
- response expected: AL-X-ACK to the AL-X-FINAL-AR;
- short description: These PDUs shall be used to send the last segment in a TL-SDU or a whole TL-SDU in an extended advanced link. When an immediate response is required, AL-X-FINAL-AR shall be used.

The elements of AL-X-FINAL and AL-X-FINAL-AR PDUs shall be as defined in table 21.18.

**Table 21.18: AL-X-FINAL and AL-X-FINAL-AR PDUs contents**

| Information element   | Length                 | Type | Value           | Remark   |
|---|------------------------|------|-----------------|--|
| LLC PDU type  | 4                      | M    | see table 21.1  | Supplementary LLC PDU  |
| Supplementary LLC PDU subtype   | 2                      | M    | see table 21.3  | AL-X-DATA, AL-X-DATA-AR, AL-X-FINAL and AL-X-FINAL-AR            |
| FINAL   | 1                      | M    | 1               | Last segment, optionally with FCS (AL-X-FINAL and AL-X-FINAL-AR) |
| AR  | 1                      | M    | 0               | No immediate response (AL-X-FINAL)                               |
|   |                        |      | 1               | Immediate response required (AL-X-FINAL-AR)                      |
| Advanced link number  | 2                      | M    | 00 <sub>2</sub> | Advanced link number 1   |
|   |                        |      | 01 <sub>2</sub> | Advanced link number 2   |
|   |                        |      | 10 <sub>2</sub> | Advanced link number 3   |
|   |                        |      | 11 <sub>2</sub> | Advanced link number 4   |
| N(S)  | 5                      | M    |                 | Sent TL-SDU number   |
| S(S)  | 8                      | M    |                 | Sent segment sequence number                                     |
| FCS flag  | 1                      | M    | 0               | No FCS   |
|   |                        |      | 1               | FCS used   |
| The last segment of TL-DATA SDU   | Variable<br>see note 1 | O    |                 | The last segment of TL-DATA SDU                                  |
| FCS   | 32<br>see note 2       | C    |                 | Frame Check Sequence.<br>Included when FCS flag is set to 1      |
| NOTE 1: This PDU may contain no data from the TL-DATA request primitive. This may occur in some cases when the FCS is used, see note 2. It may also occur occasionally even if the FCS is not used. |                        |      |                 |  |
| NOTE 2: The size shown is the upper limit of the FCS field (when used); a part or all of the FCS could be in the previous AL-X-DATA PDU.  |                        |      |                 |  |

The LLC header of AL-X-FINAL and AL-X-FINAL-AR is one bit longer than the LLC header of AL-X-DATA and AL-X-DATA-AR. Therefore there are occasional cases when the last part of the TL-SDU (and FCS when used) just fits within an AL-X-DATA or AL-X-DATA-AR PDU but would not fit within an AL-X-FINAL or AL-X-FINAL-AR PDU. In these cases, the data sending entity should send the last part of the TL-SDU (and FCS when used) within an AL-X-DATA or AL-X-DATA-AR PDU and then send an empty AL-X-FINAL or AL-X-FINAL-AR PDU (i.e. containing no information after the FCS flag) to complete the TL-SDU transmission.

### 21.2.3.3 AL-DATA, AL-DATA-AR

- PDU: AL-DATA (acknowledged information transfer);  
AL-DATA-AR (acknowledged information transfer with immediate response);
- service provided: Data transfer in original advanced link (connection mode);
- response to: -;
- response expected: AL-ACK to the AL-DATA-AR;
- short description: These PDUs shall be used to send all other segments than the last one of a TL-SDU in the original advanced link. When the data sending entity requests an immediate acknowledgement, AL-DATA-AR shall be used. For the transmission of the last segment, see AL-FINAL/AL-FINAL-AR PDU.

The elements of AL-DATA and AL-DATA-AR PDUs shall be as defined in table 21.19.

**Table 21.19: AL-DATA and AL-DATA-AR PDUs contents**

| Information element | Length | Type | Value          | Remark   |
|---------------------|--------|------|----------------|--|
| LLC PDU type        | 4      | M    | see table 21.1 | AL-DATA, AL-DATA-AR, AL-FINAL and AL-FINAL-AR                                      |
| FINAL               | 1      | M    | 0              | Not the last segment (AL-DATA and AL-DATA-AR)                                      |
| AR                  | 1      | M    | 0              | No immediate response (AL-DATA)  |
|                     |        |      | 1              | Immediate response required (AL-DATA-AR)   |
| N(S)                | 3      | M    |                | Sent TL-SDU number   |
| S(S)                | 8      | M    |                | Sent segment sequence number   |
| Segment of TL-SDU   | Varies | M    |                | A segment of TL-SDU. The length depends on the MAC block used (see clause 21.3.2). |

### 21.2.3.3a AL-X-DATA, AL-X-DATA-AR

- PDU: AL-X-DATA (acknowledged information transfer);  
AL-X-DATA-AR (acknowledged information transfer with immediate response);
- service provided: data transfer in extended advanced link (connection mode);
- response to: -;
- response expected: AL-X-ACK to the AL-X-DATA-AR;
- short description: these PDUs shall be used to send all other segments than the last one of a TL-SDU in an extended advanced link. When the data sending entity requests an immediate acknowledgement, AL-X-DATA-AR shall be used. For the transmission of the last segment, see AL-X-FINAL/AL-X-FINAL-AR PDU.

The elements of AL-X-DATA and AL-X-DATA-AR PDUs shall be as defined in table 21.20.

**Table 21.20: AL-X-DATA and AL-X-DATA-AR PDUs contents**

| Information element           | Length | Type | Value           | Remark  |
|-------------------------------|--------|------|-----------------|---|
| LLC PDU type                  | 4      | M    | see table 21.1  | Supplementary LLC PDU   |
| Supplementary LLC PDU subtype | 2      | M    | see table 21.3  | AL-X-DATA, AL-X-DATA-AR, AL-X-FINAL and AL-X-FINAL-AR                             |
| FINAL                         | 1      | M    | 0               | Not the last segment (AL-X-DATA and AL-X-DATA-AR)                                 |
| AR                            | 1      | M    | 0               | No immediate response (AL-X-DATA)   |
|                               |        |      | 1               | Immediate response required (AL-X-DATA-AR)  |
| Advanced link number          | 2      | M    | 00 <sub>2</sub> | Advanced link number 1  |
|                               |        |      | 01 <sub>2</sub> | Advanced link number 2  |
|                               |        |      | 10 <sub>2</sub> | Advanced link number 3  |
|                               |        |      | 11 <sub>2</sub> | Advanced link number 4  |
| N(S)                          | 5      | M    |                 | Sent TL-SDU number  |
| S(S)                          | 8      | M    |                 | Sent segment sequence number  |
| Segment of TL-SDU             | Varies | M    |                 | A segment of TL-SDU. The length depends on the MAC block used (see clause 21.3.2) |

#### 21.2.3.4 AL-DISC

- PDU: AL-DISC (disconnection phase of the advanced link);
- service provided: disconnection of an advanced link (connection mode);
- response to: AL-DISC, see protocol definition for parameters;
- response expected: AL-DISC or none, see protocol definition for parameters;
- short description: this PDU is used to disconnect an advanced link.

The elements of AL-DISC PDU shall be as defined in table 21.21.

**Table 21.21: AL-DISC PDU contents**

| Information element   | Length | Type | Value            | Remark                          |
|-----------------------|--------|------|------------------|---------------------------------|
| LLC PDU type          | 4      | M    | see table 21.1   | AL-DISC                         |
| Advanced link service | 1      | M    | 0                | Unacknowledged service          |
|                       |        |      | 1                | Acknowledged service            |
| Advanced link number  | 2      | M    | 00 <sub>2</sub>  | Advanced link number 1          |
|                       |        |      | 01 <sub>2</sub>  | Advanced link number 2          |
|                       |        |      | 10 <sub>2</sub>  | Advanced link number 3          |
|                       |        |      | 11 <sub>2</sub>  | Advanced link number 4          |
| Report                | 3      | M    | 000 <sub>2</sub> | Success                         |
|                       |        |      | 001 <sub>2</sub> | Close                           |
|                       |        |      | 010 <sub>2</sub> | Reject                          |
|                       |        |      | 011 <sub>2</sub> | Service not supported           |
|                       |        |      | 100 <sub>2</sub> | Service temporarily unavailable |
|                       |        |      | 101 <sub>2</sub> | Reserved                        |
|                       |        |      | 110 <sub>2</sub> | Reserved                        |
|                       |        |      | 111 <sub>2</sub> | Reserved                        |

The advanced link number is used locally between MS and BS to distinguish concurrent advanced links. The link identifier in the MLE primitives is mapped against an advanced link number.

### 21.2.3.4a AL-RECONNECT

- PDU: AL-RECONNECT;
- service provided: LLC reconnection of advanced link after cell reselection;
- response to: AL-RECONNECT, see protocol definition for parameters;
- response expected: AL-RECONNECT, see protocol definition for parameters;
- short description: This PDU is used by the LLC in the MS to request that an advanced link which was used on the previous cell is reconnected on the current cell and all the advanced link parameters are maintained.

The elements of AL-RECONNECT PDU shall be as defined in table 21.22.

**Table 21.22: AL-RECONNECT PDU contents**

| Information element  | Length | Type | Value           | Remark                            |
|--|--------|------|-----------------|-----------------------------------|
| LLC PDU type   | 4      | M    | see table 21.1  | AL-RECONNECT                      |
| Advanced link service  | 1      | M    | 0               | Unacknowledged service (see note) |
|  |        |      | 1               | Acknowledged service              |
| Advanced link number N.261   | 2      | M    | 00 <sub>2</sub> | Advanced link number 1            |
|  |        |      | 01 <sub>2</sub> | Advanced link number 2            |
|  |        |      | 10 <sub>2</sub> | Advanced link number 3            |
|  |        |      | 11 <sub>2</sub> | Advanced link number 4            |
| Reconnect report   | 2      | M    | 00 <sub>2</sub> | Propose                           |
|  |        |      | 01 <sub>2</sub> | Reject                            |
|  |        |      | 10 <sub>2</sub> | Accept                            |
|  |        |      | 11 <sub>2</sub> | Reserved                          |
| NOTE: The present document does not support reconnection of an unacknowledged advanced link. |        |      |                 |                                   |

### 21.2.3.5 AL-SETUP

- PDU: AL-SETUP (acknowledged or unacknowledged information containing advanced link set-up parameters);
- service provided: Advanced link establishment or reset;
- response to: AL-SETUP in point-to-point case, see protocol;
- response expected: AL-SETUP or none in point-to-multipoint case, see protocol;
- short description: This PDU is used to establish the advanced link and to reset an established advanced link.

The elements of AL-SETUP PDU shall be as defined in table 21.23.

**Table 21.23: AL-SETUP PDU contents**

| Information element  | Length  | Type | Value            | Remark   |
|--|---------|------|------------------|--|
| LLC PDU type   | 4       | M    | see table 21.1   | AL-SETUP   |
| Advanced link service  | 1       | M    | 0                | Unacknowledged service   |
|  |         |      | 1                | Acknowledged service   |
| Advanced link number N.261   | 2       | M    | 00 <sub>2</sub>  | Advanced link number 1   |
|  |         |      | 01 <sub>2</sub>  | Advanced link number 2   |
|  |         |      | 10 <sub>2</sub>  | Advanced link number 3   |
|  |         |      | 11 <sub>2</sub>  | Advanced link number 4   |
| Maximum length of a TL-SDU N.271   | 3       | M    | 000 <sub>2</sub> | 32 octets  |
|  |         |      | 001 <sub>2</sub> | 64 octets  |
|  |         |      | 010 <sub>2</sub> | 128 octets   |
|  |         |      | 011 <sub>2</sub> | 256 octets   |
|  |         |      | 100 <sub>2</sub> | 512 octets   |
|  |         |      | 101 <sub>2</sub> | 1 024 octets   |
|  |         |      | 110 <sub>2</sub> | 2 048 octets   |
| Connection width (see note 11)   | 1       | M    | 0                | Single-slot phase modulation connection (if the "Data transfer throughput" element is not set to 110 <sub>2</sub> ); or<br>No information about radio resources (if the "Data transfer throughput" element is set to 110 <sub>2</sub> )                          |
|  |         |      | 1                | Specified multislot phase modulation connection (if the "Data transfer throughput" element is not set to 110 <sub>2</sub> ); or<br>Unspecified phase modulation connection (if the "Data transfer throughput" element is set to 110 <sub>2</sub> ) (see note 12) |
| Advanced link symmetry (see note 11)   | 1       | M    | 0                | Symmetric phase modulation advanced link, or unspecified phase modulation connection, or no information about radio resources  |
|  |         |      | 1                | Asymmetric phase modulation advanced link  |
| Number of $\pi/4$ -DQPSK timeslots per TDMA frame on uplink or on uplink and downlink N.264 (see notes 1, 11 and 13) | 2       | C    | 00 <sub>2</sub>  | 1 timeslot   |
|  |         |      | 01 <sub>2</sub>  | 2 timeslots  |
|  |         |      | 10 <sub>2</sub>  | 3 timeslots  |
|  |         |      | 11 <sub>2</sub>  | 4 timeslots  |
| Number of $\pi/4$ -DQPSK timeslots per TDMA frame on downlink N.264 (see notes 2 and 11)                             | 2       | C    | 00 <sub>2</sub>  | 1 timeslot   |
|  |         |      | 01 <sub>2</sub>  | 2 timeslots  |
|  |         |      | 10 <sub>2</sub>  | 3 timeslots  |
|  |         |      | 11 <sub>2</sub>  | 4 timeslots  |
| Data transfer throughput (mean value) (see notes 3 and 11)   | 3       | M    | 000 <sub>2</sub> | Network dependent minimum  |
|  |         |      | 001 <sub>2</sub> | 1/32 of maximum  |
|  |         |      | 010 <sub>2</sub> | 1/16 of maximum  |
|  |         |      | 011 <sub>2</sub> | 1/8 of maximum   |
|  |         |      | 100 <sub>2</sub> | 1/4 of maximum   |
|  |         |      | 101 <sub>2</sub> | 1/2 of maximum   |
|  |         |      | 110 <sub>2</sub> | No information about radio resources (if the "Connection width" element is set to "0"); or<br>Unspecified phase modulation connection (if the "Connection width" element is set to "1")  |
| 111 <sub>2</sub>   | Maximum |      |                  |  |

| Information element  | Length   | Type | Value             | Remark                            |
|--|----------|------|-------------------|-----------------------------------|
| TL-SDU window size N.272 or N.281 (see note 4)   | 2        | M    | 00 <sub>2</sub>   | Augmented AL-SETUP                |
|  |          |      | 01 <sub>2</sub>   | SDU window size = 1               |

|  |          |      | etc.              | etc.                              |
|  |          |      | 111 <sub>2</sub>  | Not used in the present document  |
| <p>NOTE 1: This element shall be present only for a specified multislot phase modulation connection or unspecified phase modulation connection (i.e. this element shall be present if the "Connection width" element is set to "1"). In case of a symmetric specified phase modulation advanced link, the "Number of <math>\pi/4</math>-DQPSK timeslots per TDMA frame on uplink or on uplink and downlink" element defines the number of phase modulation timeslots requested per TDMA frame on both uplink and downlink.</p> <p>NOTE 2: This element shall be present only for a specified multislot phase modulation connection with asymmetric phase modulation advanced link (i.e. "Connection width" element set to "1" and "Advanced link symmetry" element set to "1"). If present, this element defines the number of phase modulation timeslots requested per TDMA frame on the downlink. The usage of asymmetric phase modulation advanced link is outside the scope of the present document.</p> |          |      |                   |                                   |

| Information element | Length | Type | Value | Remark  |
|---------------------|--------|------|-------|---|
| NOTE 3:             |        |      |       | The BS may use a control channel as a general packet data channel, supporting advanced links for many MSs, where each MS may be offering/receiving data packets at a low rate or intermittently. When the "Data transfer throughput" element is not set to 110 <sub>2</sub> , it gives the BS the necessary information for planning its resource allocations; this data transfer throughput information is specified relative to the requested number of $\pi/4$ -DQPSK timeslots per TDMA frame. When the "Data transfer throughput" element is set to 110 <sub>2</sub> and the "Connection width" element is set to "1", the AL-SETUP PDU is requesting a phase modulation connection without specifying the requested number of timeslots per frame or the mean data transfer throughput. In this case the BS should choose any phase modulation channel within the capabilities of that MS. (If a phase modulation channel is not available and the MS is QAM-capable, the BS may choose a QAM channel within the MS's capabilities.) When the "Data transfer throughput" element is set to 110 <sub>2</sub> and the "Connection width" element is set to "0", the AL-SETUP PDU provides no information relating to radio resources, in which case the BS should choose any appropriate channel (within the capabilities of that MS and using any throughput information negotiated by the SNDCP during PDP context activation). |
| NOTE 4:             |        |      |       | TL-SDU window sizes N.272 and N.281 are for the acknowledged and unacknowledged services respectively.  |
| NOTE 5:             |        |      |       | For the acknowledged service N.273 defines how many times the TL-SDU may be re-transmitted and, for the unacknowledged (point-to-multipoint) service, N.282 means the number of times the TL-SDU will be repeated by the sender.  |
| NOTE 6:             |        |      |       | This element shall be present only for the unacknowledged service (i.e. "advanced link service" element set to "0").  |
| NOTE 7:             |        |      |       | This element shall be present only for an augmented AL-SETUP (i.e. "TL-SDU window size" element set to 00 <sub>2</sub> ).   |
| NOTE 8:             |        |      |       | In the present document there is no reason to use an augmented AL-SETUP for the original advanced link; however, the possibility is supported in order that the Reserved element can be used in the future for both types of advanced link. An augmented AL-SETUP is needed in the case of an extended advanced link.   |
| NOTE 9:             |        |      |       | This element shall be present only for an augmented AL-SETUP for the original advanced link (i.e. "TL-SDU window size" element set to 00 <sub>2</sub> and "Advanced link type" element set to "0").   |
| NOTE 10:            |        |      |       | This element shall be present only for an augmented AL-SETUP for an extended advanced link (i.e. "TL-SDU window size" element set to 00 <sub>2</sub> and "Advanced link type" element set to "1").  |
| NOTE 11:            |        |      |       | In the case of a request for a phase modulation connection, the BS should regard this as a request for either a $\pi/4$ -DQPSK connection or a D8PSK connection (if the MS has indicated that it supports D8PSK channels).  |
| NOTE 12:            |        |      |       | An MS that cannot use a multislot phase modulation channel shall not request an unspecified phase modulation connection. (A request for an unspecified phase modulation connection is indicated by setting the "Connection width" element to "1" and the "Data transfer throughput" element to 110 <sub>2</sub> .)  |
| NOTE 13:            |        |      |       | If the MS requests an unspecified phase modulation connection (i.e. "Connection width" element set to "1" and "Data transfer throughput" element set to 110 <sub>2</sub> ), the "Number of $\pi/4$ -DQPSK timeslots per TDMA frame on uplink or on uplink and downlink" element shall be set equal to the MS's maximum phase modulation capability.   |

The advanced link number is used locally between MS and BS to distinguish concurrent advanced links. The link identifier in the MLE primitives is mapped against an advanced link number.

The AL-SETUP PDU may contain information related to radio resources (for example, if an MS that supports QAM modulation specifically requires a phase modulation channel or if an MS that supports only phase modulation wishes to request a specific number of timeslots per TDMA frame). This facility in the AL-SETUP PDU provides radio resource information only in terms of  $\pi/4$ -DQPSK timeslots:

- Inclusion of information requesting a specific number of phase modulation timeslots per TDMA frame is indicated by setting the "Data transfer throughput" element to a value other than 110<sub>2</sub>. Then the combination of the "Connection width", "Advanced link symmetry", "Number of  $\pi/4$ -DQPSK timeslots per TDMA frame on uplink or on uplink and downlink" and "Number of  $\pi/4$ -DQPSK timeslots per TDMA frame on downlink" elements indicate the requested radio resources in terms of  $\pi/4$ -DQPSK timeslots. The "Data transfer throughput" element indicates how much of the total throughput of the requested radio resources ( $\pi/4$ -DQPSK timeslots) should be available for the advanced link. Maximum throughput will be realized when there is only one MS using the whole capacity of the radio resource allocation. The lower values indicate that the same radio resources may be used for multiple advanced links for one or more MSs. The values are mean values and the usage allocation during the lifetime of an advanced link is outside of the scope of the present document.

- A request for a phase modulation channel without requesting a specific number of timeslots per TDMA frame is indicated by setting the "Connection width" element to "1" and the "Data transfer throughput" element to  $110_2$  ("Unspecified phase modulation connection"). In this case the "Number of  $\pi/4$ -DQPSK timeslots per TDMA frame on uplink or on uplink and downlink" element shall be set equal to the MS's maximum phase modulation capability and the "Advanced link symmetry" element shall be set to "0".

Alternatively (for example, if the MS wishes the BS to choose any appropriate channel (within the capabilities of that MS and using any QoS information negotiated by the SMDCP during PDP context activation)), the AL-SETUP PDU may provide no information related to radio resources. This is indicated by setting the "Connection width" element to "0" and the "Data transfer throughput" element to  $110_2$  ("No information about radio resources"). In this case the "Advanced link symmetry" element shall be set to "0".

If the AL-SETUP PDU provided no information related to radio resources and the SwMI SMDCP has a complete record of the QoS information for the MS, the SwMI LLC shall respond with the "Set-up report" information element in the responding AL-SETUP PDU set to "Success" ( $000_2$ ).

If the AL-SETUP PDU provided no information related to radio resources and the SwMI SMDCP might have an incomplete record of the QoS information for the MS, the SwMI LLC shall respond with the "Set-up report" information element in the responding AL-SETUP PDU set to "Success, but SMDCP QoS incomplete" ( $100_2$ ).

Values  $01_2$ ,  $10_2$ , and  $11_2$  in the "TL-SDU window size" element indicate the SDU window size. Value  $00_2$  in the "TL-SDU window size" element indicates that this is an augmented AL-SETUP. In this case the following conditional elements shall be included:

- advanced link type;
- TL-SDU window size for original or extended advanced link using augmented AL-SETUP; and
- a reserved element.

If the AL-SETUP is not augmented, the recipient shall assume that the AL-SETUP is for the original advanced link.

### 21.2.3.6 AL-UDATA

- PDU: AL-UDATA (unacknowledged information transfer);
- service provided: Unacknowledged data transfer in original advanced link;
- response to: -;
- response expected: None;
- short description: This PDU is used to send one segment of unacknowledged TL-SDU in the original advanced link.

The elements of AL-UDATA PDU shall be as defined in table 21.24.

**Table 21.24: AL-UDATA PDU contents**

| Information element    | Length   | Type | Value          | Remark                          |
|------------------------|----------|------|----------------|---------------------------------|
| LLC PDU type           | 4        | M    | see table 21.1 | AL-UDATA and AL-UFINAL          |
| FINAL                  | 1        | M    | 0              | Not the last segment (AL-UDATA) |
| N(S)                   | 8        | M    |                | Sent TL-SDU number              |
| S(S)                   | 8        | M    |                | Sent segment sequence number    |
| Segment of TL-UNITDATA | Variable | M    |                | Segment of TL-UNITDATA          |

### 21.2.3.6a AL-X-UDATA

- PDU: AL-X-UDATA (unacknowledged information transfer);
- service provided: Unacknowledged data transfer in extended advanced link;
- response to: -;
- response expected: None;
- short description: This PDU is used to send one segment of unacknowledged TL-SDU in an extended advanced link.

The elements of AL-X-UDATA PDU shall be as defined in table 21.25.

**Table 21.25: AL-X-UDATA PDU contents**

| Information element           | Length   | Type | Value           | Remark                            |
|-------------------------------|----------|------|-----------------|-----------------------------------|
| LLC PDU type                  | 4        | M    | see table 21.1  | Supplementary LLC PDU             |
| Supplementary LLC PDU subtype | 2        | M    | see table 21.3  | AL-X-UDATA and AL-X-UFINAL        |
| FINAL                         | 1        | M    | 0               | Not the last segment (AL-X-UDATA) |
| Advanced link number          | 2        | M    | 00 <sub>2</sub> | Advanced link number 1            |
|                               |          |      | 01 <sub>2</sub> | Advanced link number 2            |
|                               |          |      | 10 <sub>2</sub> | Advanced link number 3            |
|                               |          |      | 11 <sub>2</sub> | Advanced link number 4            |
| N(S)                          | 8        | M    |                 | Sent TL-SDU number                |
| S(S)                          | 8        | M    |                 | Sent segment sequence number      |
| Segment of TL-UNITDATA        | Variable | M    |                 | Segment of TL-UNITDATA            |

### 21.2.3.7 AL-UFINAL

- PDU: AL-UFINAL (unacknowledged information transfer);
- service provided: Unacknowledged data transfer in original advanced link;
- response to: -;
- response expected: None;
- short description: This PDU is used to send the last segment of an unacknowledged TL-SDU in the original advanced link.

The elements of AL-UFINAL PDU shall be as defined in table 21.26.

**Table 21.26: AL-UFINAL PDU contents**

| Information element  | Length                 | Type | Value          | Remark                            |
|--|------------------------|------|----------------|-----------------------------------|
| LLC PDU type   | 4                      | M    | see table 21.1 | AL-UDATA and AL-UFINAL            |
| FINAL  | 1                      | M    | 1              | Last segment with FCS (AL-UFINAL) |
| N(S)   | 8                      | M    |                | Sent TL-SDU number                |
| S(S)   | 8                      | M    |                | Sent segment sequence number      |
| Last segment of TL-UNITDATA  | Variable<br>see note 1 | O    |                | Last segment of TL-UNITDATA       |
| FCS  | 32<br>see note 2       | M    |                | Frame Check Sequence              |
| NOTE 1: This PDU may contain no data from the TL-UNITDATA request primitive, see note 2.                             |                        |      |                |                                   |
| NOTE 2: The size shown is the upper limit of the FCS field; a part of the FCS could be in the previous AL-UDATA PDU. |                        |      |                |                                   |

### 21.2.3.7a AL-X-UFINAL

- PDU: AL-X-UFINAL (unacknowledged information transfer);
- service provided: Data transfer in extended advanced link;
- response to: -;
- response expected: None;
- short description: This PDU is used to send the last segment of an unacknowledged TL-SDU in an extended advanced link.

The elements of AL-X-UFINAL PDU shall be as defined in table 21.27.

**Table 21.27: AL-X-UFINAL PDU contents**

| Information element   | Length                 | Type | Value           | Remark  |
|---|------------------------|------|-----------------|---|
| LLC PDU type  | 4                      | M    | see table 21.1  | Supplementary LLC PDU                                       |
| Supplementary LLC PDU subtype   | 2                      | M    | see table 21.3  | AL-X-UDATA and AL-X-UFINAL                                  |
| FINAL   | 1                      | M    | 1               | Last segment, optionally with FCS (AL-X-UFINAL)             |
| Advanced link number  | 2                      | M    | 00 <sub>2</sub> | Advanced link number 1                                      |
|   |                        |      | 01 <sub>2</sub> | Advanced link number 2                                      |
|   |                        |      | 10 <sub>2</sub> | Advanced link number 3                                      |
|   |                        |      | 11 <sub>2</sub> | Advanced link number 4                                      |
| N(S)  | 8                      | M    |                 | Sent TL-SDU number  |
| S(S)  | 8                      | M    |                 | Sent segment sequence number                                |
| FCS flag  | 1                      | M    | 0               | No FCS  |
|   |                        |      | 1               | FCS used  |
| Last segment of TL-UNITDATA   | Variable<br>see note 1 | O    |                 | Last segment of TL-UNITDATA                                 |
| FCS   | 32<br>see note 2       | C    |                 | Frame Check Sequence.<br>Included when FCS flag is set to 1 |
| NOTE 1: This PDU may contain no data from the TL-UNITDATA request primitive. This may occur in some cases when the FCS is used, see note 2. It may also occur occasionally even if the FCS is not used. |                        |      |                 |   |
| NOTE 2: The size shown is the upper limit of the FCS field (when used); a part or all of the FCS could be in the previous AL-X-UDATA PDU.   |                        |      |                 |   |

The LLC header of AL-X-UFINAL is one bit longer than the LLC header of AL-X-UDATA. Therefore there are occasional cases when the last part of the TL-SDU (and FCS when used) just fits within an AL-X-UDATA PDU but would not fit within an AL-X-UFINAL PDU. In these cases, the data sending entity should send the last part of the TL-SDU (and FCS when used) within an AL-X-UDATA PDU and then send an empty AL-X-UFINAL PDU (i.e. containing no information after the FCS flag) to complete the TL-SDU transmission.

## 21.2.4 Layer 2 signalling PDU definitions

### 21.2.4.0 General

The layer 2 signalling PDUs carry various types of general signalling information relating to layer 2 functions - either LLC or MAC functions.

NOTE: For convenience, the layer 2 signalling PDUs are treated as LLC PDUs in the PDU structures. Where a layer 2 signalling PDU relates to a MAC function:

- in the case of transmission, information to be included in the layer 2 signalling PDU is passed locally from the MAC to the LLC using the TLE-UNITDATA request primitive;
- in the case of reception, information that has been received in the layer 2 signalling PDU is passed locally from the LLC to the MAC using the TLE-UNITDATA indication primitive.

The following layer 2 signalling PDUs are defined:

- L2-DATA-PRIORITY;
- L2-SCHEDULE-SYNC;
- L2-LINK-FEEDBACK-CONTROL;
- L2-LINK-FEEDBACK-INFO;
- L2-LINK-FEEDBACK-INFO-AND-RESIDUAL-DATA-PRIORITY.

#### 21.2.4.1 L2-DATA-PRIORITY

- PDU: L2-DATA-PRIORITY;
- response to: -;
- response expected: None;
- short description: This PDU is used for the MS to indicate its current short-term data priority requirements to the BS.

The elements of L2-DATA-PRIORITY PDU shall be as defined in table 21.28.

**Table 21.28: L2-DATA-PRIORITY PDU contents**

| Information element  | Length | Type | Value            | Remark                  |
|--|--------|------|------------------|-------------------------|
| LLC PDU type   | 4      | M    | see table 21.1   | Layer 2 signalling PDU  |
| Layer 2 signalling PDU subtype   | 4      | M    | see table 21.2   | L2-DATA-PRIORITY        |
| Number of data priority blocks   | 3      | M    | 000 <sub>2</sub> | No data priority blocks |
|  |        |      | 001 <sub>2</sub> | One data priority block |
|  |        |      | etc.             | etc.                    |
|  |        |      | 111 <sub>2</sub> | 7 data priority blocks  |
| Data priority block  | 7      | C    |                  | See notes 1 and 2       |
| Residual data priority<br>(see note 3)   | 3      | M    | 000 <sub>2</sub> | Priority 0 (lowest)     |
|  |        |      | etc.             | etc.                    |
|  |        |      | 111 <sub>2</sub> | Priority 7 (highest)    |
| NOTE 1: This element shall be present as many times as indicated by the "number of data priority blocks" element. If the "number of data priority blocks" element has value 000 <sub>2</sub> , the data priority block element is not present. |        |      |                  |                         |
| NOTE 2: The data priority blocks shall be included in decreasing order of data priority (i.e. highest data priority first).  |        |      |                  |                         |
| NOTE 3: This is the data priority for slots following those enumerated in the data priority blocks.  |        |      |                  |                         |

The data priority block shall be as defined in table 21.29.

**Table 21.29: Data priority block information element contents in L2-DATA-PRIORITY PDU**

| Information element   | Length            | Type | Value             | Remark               |
|---|-------------------|------|-------------------|----------------------|
| Temporary data priority   | 3                 | M    | 000 <sub>2</sub>  | Priority 0 (lowest)  |
|   |                   |      | etc.              | etc.                 |
|   |                   |      | 111 <sub>2</sub>  | Priority 7 (highest) |
| Number of slots (see note)  | 4                 | M    | 0000 <sub>2</sub> | 1 subslot required   |
|   |                   |      | 0001 <sub>2</sub> | 1 slot required      |
|   |                   |      | 0010 <sub>2</sub> | 2 slots required     |
|   |                   |      | 0011 <sub>2</sub> | 3 slots required     |
|   |                   |      | 0100 <sub>2</sub> | 4 slots required     |
|   |                   |      | 0101 <sub>2</sub> | 5 slots required     |
|   |                   |      | 0110 <sub>2</sub> | 6 slots required     |
|   |                   |      | 0111 <sub>2</sub> | 8 slots required     |
|   |                   |      | 1000 <sub>2</sub> | 10 slots required    |
|   |                   |      | 1001 <sub>2</sub> | 13 slots required    |
|   |                   |      | 1010 <sub>2</sub> | 17 slots required    |
|   |                   |      | 1011 <sub>2</sub> | 24 slots required    |
|   |                   |      | 1100 <sub>2</sub> | 34 slots required    |
|   |                   |      | 1101 <sub>2</sub> | 51 slots required    |
| 1110 <sub>2</sub>   | 68 slots required |      |                   |                      |
| 1111 <sub>2</sub>   | Reserved          |      |                   |                      |
| NOTE: This element indicates the number of slots required with the specified temporary data priority. |                   |      |                   |                      |

#### 21.2.4.2 L2-SCHEDULE-SYNC

- PDU: L2-SCHEDULE-SYNC;
- response to: -;
- response expected: None;
- short description: This PDU is used for the BS to give schedule synchronization to the MS for the specified NSAPI.

The elements of L2-SCHEDULE-SYNC PDU shall be as defined in table 21.30.

**Table 21.30: L2-SCHEDULE-SYNC PDU contents**

| Information element   | Length | Type | Value               | Remark                 |
|---|--------|------|---------------------|------------------------|
| LLC PDU type  | 4      | M    | see table 21.1      | Layer 2 signalling PDU |
| Layer 2 signalling PDU subtype  | 4      | M    | see table 21.2      | L2-SCHEDULE-SYNC       |
| NSAPI   | 4      | M    | 0000 <sub>2</sub>   | Reserved               |
|   |        |      | 0001 <sub>2</sub>   | NSAPI 1                |
|   |        |      | etc.                | etc.                   |
|   |        |      | 1110 <sub>2</sub>   | NSAPI 14               |
|   |        |      | 1111 <sub>2</sub>   | Reserved               |
| Timeslot number (see note)  | 2      | M    | 00 <sub>2</sub>     | Timeslot 1             |
|   |        |      | 01 <sub>2</sub>     | Timeslot 2             |
|   |        |      | 10 <sub>2</sub>     | Timeslot 3             |
|   |        |      | 11 <sub>2</sub>     | Timeslot 4             |
| Frame number (see note)   | 5      | M    | 00000 <sub>2</sub>  | Reserved               |
|   |        |      | 00001 <sub>2</sub>  | Frame 1                |
|   |        |      | etc.                | etc.                   |
|   |        |      | 10010 <sub>2</sub>  | Frame 18               |
|   |        |      | Others              | Reserved               |
| Multiframe number (see note)  | 6      | M    | 000000 <sub>2</sub> | Reserved               |
|   |        |      | 000001 <sub>2</sub> | Multiframe 1           |
|   |        |      | etc.                | etc.                   |
|   |        |      | 111100 <sub>2</sub> | Multiframe 60          |
|   |        |      | Others              | Reserved               |
| NOTE: The timeslot number, frame number and multiframe number together comprise the schedule synchronization point for the specified NSAPI. |        |      |                     |                        |

### 21.2.4.3 L2-LINK-FEEDBACK-CONTROL

- PDU: L2-LINK-FEEDBACK-CONTROL;
- response to: -;
- response expected: L2-LINK-FEEDBACK-INFO / -;
- short description: This PDU is used for the control of link adaptation feedback on a D8PSK or QAM channel; in the present document it is sent only by the BS.

The elements of L2-LINK-FEEDBACK-CONTROL PDU shall be as defined in table 21.31.

**Table 21.31: L2-LINK-FEEDBACK-CONTROL PDU contents**

| Information element  | Length   | Type | Value            | Remark                   |
|--|----------|------|------------------|--------------------------|
| LLC PDU type   | 4        | M    | see table 21.1   | Layer 2 signalling PDU   |
| Layer 2 signalling PDU subtype   | 4        | M    | see table 21.2   | L2-LINK-FEEDBACK-CONTROL |
| Link feedback control type   | 3        | M    | 000 <sub>2</sub> | Feedback request         |
|  |          |      | 001 <sub>2</sub> | Feedback termination     |
|  |          |      | 010 <sub>2</sub> | Reserved                 |
|  |          |      | etc.             | etc.                     |
|  |          |      | 111 <sub>2</sub> | Reserved                 |
| Feedback request (see note 1)  | variable | C    |                  | See table 21.32          |
| Feedback termination (see note 2)  | variable | C    |                  | See table 21.33          |
| NOTE 1: This element shall be present only in the case of a feedback request i.e. link feedback control type element set to 000 <sub>2</sub> .     |          |      |                  |                          |
| NOTE 2: This element shall be present only in the case of a feedback termination i.e. link feedback control type element set to 001 <sub>2</sub> . |          |      |                  |                          |

The feedback request information element shall be as defined in table 21.32.

**Table 21.32: Feedback request information element contents**

| Information element                          | Length | Type | Value               | Remark                                     |
|--|--------|------|---------------------|--|
| Channel metric type (see note 1)             | 3      | M    | 000 <sub>2</sub>    | Bit rate feedback                          |

| Feedback duration T.230 (see note 2)         | 6      | M    | 000000 <sub>2</sub> | No unsolicited feedback messages permitted |
|  |        |      | 000001 <sub>2</sub> | 2 multiframe                               |
|  |        |      | 000010 <sub>2</sub> | 4 multiframe                               |
|  |        |      | etc.                | etc.                                       |
|  |        |      | 111111 <sub>2</sub> | 126 multiframe                             |
| Minimum feedback interval T.231 (see note 3) | 3      | C    | 000 <sub>2</sub>    | 6 TDMA frames                              |
|  |        |      | 001 <sub>2</sub>    | 9 TDMA frames                              |
|  |        |      | 010 <sub>2</sub>    | 12 TDMA frames                             |
|  |        |      | 011 <sub>2</sub>    | 18 TDMA frames                             |
|  |        |      | 100 <sub>2</sub>    | 27 TDMA frames                             |
|  |        |      | 101 <sub>2</sub>    | 36 TDMA frames                             |
|  |        |      | 110 <sub>2</sub>    | 54 TDMA frames                             |
|  |        |      | 111 <sub>2</sub>    | Predefined (see note 4)                    |

| Information element   | Length | Type | Value            | Remark           |
|---|--------|------|------------------|------------------|
| Data class linkage<br>(see note 5)  | 3      | C    | 000 <sub>2</sub> | Background class |
|   |        |      | 001 <sub>2</sub> | Telemetry class  |
|   |        |      | 010 <sub>2</sub> | Real-time class  |
|   |        |      | 011 <sub>2</sub> | Reserved         |
|   |        |      | etc.             | etc.             |
|   |        |      | 111 <sub>2</sub> | Reserved         |
| NOTE 1: This element indicates the preferred type of channel performance metric to which the feedback request applies.  |        |      |                  |                  |
| NOTE 2: This element indicates whether unsolicited feedback messages may be sent after the immediate response to this feedback request; if the element is not set to 000000 <sub>2</sub> , it indicates the maximum time for which unsolicited feedback messages may be sent relating to this feedback request. |        |      |                  |                  |
| NOTE 3: This element shall be present only if unsolicited feedback messages are permitted i.e. feedback duration element not set to 000000 <sub>2</sub> . It indicates the minimum permitted time since the last feedback message for unsolicited feedback messages.  |        |      |                  |                  |
| NOTE 4: This value indicates that the MS shall use a predefined value for timer T.231; see annex B.   |        |      |                  |                  |
| NOTE 5: This element shall be present only in the case of a feedback request relating to bit rate feedback i.e. channel metric type element set to 000 <sub>2</sub> . It indicates the specific data class to which the feedback request applies.   |        |      |                  |                  |

The feedback termination information element shall be as defined in table 21.33.

**Table 21.33: Feedback termination information element contents**

| Information element   | Length          | Type | Value                              | Remark             |
|---|-----------------|------|------------------------------------|--------------------|
| Channel metric type<br>(see note 1)   | 3               | M    | 000 <sub>2</sub>                   | Bit rate feedback  |
|   |                 |      | 001 <sub>2</sub>                   | $E_s/N_0$ feedback |

|   |                 |      | etc.                               | etc.               |
|   |                 |      | 111 <sub>2</sub>                   | Reserved           |
|   |                 |      | Data class linkage<br>(see note 2) | 3                  |
| 001 <sub>2</sub>  | Telemetry class |      |                                    |                    |
| 010 <sub>2</sub>  | Real-time class |      |                                    |                    |
| 011 <sub>2</sub>  | Reserved        |      |                                    |                    |
| etc.  | etc.            |      |                                    |                    |
| 111 <sub>2</sub>  | Reserved        |      |                                    |                    |
| NOTE 1: This element indicates the type of channel performance metric to which the feedback termination applies.  |                 |      |                                    |                    |
| NOTE 2: This element shall be present only in the case of a feedback termination relating to bit rate feedback i.e. channel metric type element set to 000 <sub>2</sub> . It indicates the specific data class to which the feedback termination applies. |                 |      |                                    |                    |

#### 21.2.4.4 L2-LINK-FEEDBACK-INFO

- PDU: L2-LINK-FEEDBACK-INFO;
- response to: L2-LINK-FEEDBACK-CONTROL/-;
- response expected: -;
- short description: This PDU is used for the BS or MS to send link adaptation feedback information on a D8PSK or QAM channel.

The elements of L2-LINK-FEEDBACK-INFO PDU shall be as defined in table 21.34.

**Table 21.34: L2-LINK-FEEDBACK-INFO PDU contents**

| Information element   | Length | Type | Value            | Remark   |
|---|--------|------|------------------|--|
| LLC PDU type  | 4      | M    | See table 21.1   | Layer 2 signalling PDU   |
| Layer 2 signalling PDU subtype  | 4      | M    | See table 21.2   | L2-LINK-FEEDBACK-INFO  |
| Channel metric type   | 3      | M    | 000 <sub>2</sub> | Bit rate feedback  |
|   |        |      | 001 <sub>2</sub> | E <sub>s</sub> /N <sub>0</sub> feedback  |
|   |        |      | 010 <sub>2</sub> | Reserved (see note 1)  |
|   |        |      | etc.             | etc.   |
|   |        |      | 111 <sub>2</sub> | Reserved (see note 1)  |
| Bit rate feedback information (see note 2)  | 10     | C    |                  | See "bit rate feedback information" information element definition                       |
| E <sub>s</sub> /N <sub>0</sub> feedback information (see note 3)  | 10     | C    |                  | See "E <sub>s</sub> /N <sub>0</sub> feedback information" information element definition |
| NOTE 1: The lengths of the feedback information for the reserved values of the channel metric type element in this PDU are not defined in the present document. If any reserved values of the channel metric type are used in future editions of the present document, the length of that feedback information in this PDU may be 10 bits, or it may be longer (or shorter) - whereas the length of each type of feedback information that can be sent within the AL-X-ACK or AL-X-RNR PDU is restricted to a fixed length of 10 bits (see clause 21.2.3.1a). |        |      |                  |  |
| NOTE 2: This element shall be present only in the case of bit rate feedback i.e. channel metric type element set to 000 <sub>2</sub> .  |        |      |                  |  |
| NOTE 3: This element shall be present only in the case of E <sub>s</sub> /N <sub>0</sub> feedback i.e. channel metric type element set to 001 <sub>2</sub> .  |        |      |                  |  |

#### 21.2.4.5 L2-LINK-FEEDBACK-INFO-AND-RESIDUAL-DATA-PRIORITY

- PDU: L2-LINK-FEEDBACK-INFO-AND-RESIDUAL-DATA-PRIORITY;
- response to: L2-LINK-FEEDBACK-CONTROL / -;
- response expected: -;
- short description: this PDU is used for the MS to send link adaptation feedback information and residual data priority on a D8PSK or QAM channel.

The elements of L2-LINK-FEEDBACK-INFO-AND-RESIDUAL-DATA-PRIORITY PDU shall be as defined in table 21.35.

Table 21.35: L2-LINK-FEEDBACK-INFO-AND-RESIDUAL-DATA-PRIORITY PDU contents

| Information element   | Length | Type | Value            | Remark   |
|---|--------|------|------------------|--|
| LLC PDU type  | 4      | M    | see table 21.1   | Layer 2 signalling PDU   |
| Layer 2 signalling PDU subtype  | 4      | M    | see table 21.2   | L2-LINK-FEEDBACK-INFO-AND-RESIDUAL-DATA-PRIORITY   |
| Residual data priority  | 3      | M    | 000 <sub>2</sub> | Priority 0 (lowest)  |
|   |        |      | etc.             | etc.   |
|   |        |      | 111 <sub>2</sub> | Priority 7 (highest)   |
| Channel metric type   | 3      | M    | 000 <sub>2</sub> | Bit rate feedback  |

|   |        |      | etc.             | etc.   |
|   |        |      | 111 <sub>2</sub> | Reserved (see note 1)  |
| Bit rate feedback information (see note 2)  | 10     | C    |                  | See "bit rate feedback information" information element definition                       |
| E <sub>s</sub> /N <sub>0</sub> feedback information (see note 3)  | 10     | C    |                  | See "E <sub>s</sub> /N <sub>0</sub> feedback information" information element definition |
| NOTE 1: The lengths of the feedback information for the reserved values of the channel metric type element in this PDU are not defined in the present document. If any reserved values of the channel metric type are used in future editions of the present document, the length of that feedback information in this PDU may be 10 bits, or it may be longer (or shorter) - whereas the length of each type of feedback information that can be sent within the AL-X-ACK or AL-X-RNR PDU is restricted to a fixed length of 10 bits (see clause 21.2.3.1a). |        |      |                  |  |
| NOTE 2: This element shall be present only in the case of bit rate feedback i.e. channel metric type element set to 000 <sub>2</sub> .  |        |      |                  |  |
| NOTE 3: This element shall be present only in the case of E <sub>s</sub> /N <sub>0</sub> feedback i.e. channel metric type element set to 001 <sub>2</sub> .  |        |      |                  |  |

## 21.3 LLC elements

### 21.3.1 FCS

This element is 32 bits long.

These bits shall be placed in decreasing order for the power of  $x$ . The co-efficient of  $x^{31}$  shall be mapped onto the most significant bit. The co-efficient of  $x^0$  shall be mapped onto the least significant bit. The FCS calculation is defined in clause 22.

### 21.3.2 TL-SDU size

In the various LLC PDUs, one element often appears generally at the end of the PDU variously called "TL-SDU", "segment of TL-SDU" and "last segment of TL-SDU". This indicates the layer 3 information content which does not have a fixed length. Sometimes, this element is optional, which means that PDUs shall be exchanged even without layer 3 specific information. This is generally the case for responses, where the acknowledgement PDU is generated by the LLC and may be sent independently from the layer 3 message.

On the other hand, the segments in an advanced link shall be calculated so that:

- when using  $\pi/4$ -DQPSK or  $\pi/8$ -D8PSK modulation, they fit in the MAC offered capacity; or
- when using QAM modulation:
  - in the case of a 25 kHz or 50 kHz channel, the segment size (except possibly for the first and last segment of a TL-SDU) is determined by the available space in a 4-QAM rate = 1/2 full-slot MAC block at the current bandwidth;
  - in the case of a 100 kHz or 150 kHz channel, the segment size (except possibly for the first and last segment of a TL-SDU) is determined by the available space in half of a 4-QAM rate = 1/2 full-slot MAC block at the current bandwidth.

### 21.3.3 Bit rate feedback information

The "bit rate feedback information" information element shall be as defined in table 21.36.

**Table 21.36: "Bit rate feedback information" information element contents**

| Information element   | Length | Type | Value              | Remark   |
|---|--------|------|--------------------|--|
| Preferred bit rate  | 5      | M    | 00000 <sub>2</sub> | 4-QAM rate = 1/2 or $\pi/4$ -DQPSK (see note 1)  |
|   |        |      | 00001 <sub>2</sub> | 16-QAM rate = 1/2 or $\pi/8$ -D8PSK (see note 1) |
|   |        |      | 00010 <sub>2</sub> | 16-QAM rate = 1                                  |
|   |        |      | 00011 <sub>2</sub> | 64-QAM rate = 1/2                                |
|   |        |      | 00100 <sub>2</sub> | 64-QAM rate = 2/3                                |
|   |        |      | 00101 <sub>2</sub> | 64-QAM rate = 1                                  |
|   |        |      | 00110 <sub>2</sub> | Reserved   |
|   |        |      | etc.               | etc.   |
|   |        |      | 11111 <sub>2</sub> | Reserved   |
| Data class linkage<br>(see note 2)  | 3      | M    | 000 <sub>2</sub>   | Background class                                 |
|   |        |      | 001 <sub>2</sub>   | Telemetry class                                  |
|   |        |      | 010 <sub>2</sub>   | Real-time class                                  |
|   |        |      | 011 <sub>2</sub>   | Reserved   |
|   |        |      | etc.               | etc.   |
|   |        |      | 111 <sub>2</sub>   | Reserved   |
| Reserved  | 2      | M    | 00 <sub>2</sub>    | Default value                                    |
|   |        |      | 01 <sub>2</sub>    | Not used in the present document                 |
|   |        |      | 10 <sub>2</sub>    | Not used in the present document                 |
|   |        |      | 11 <sub>2</sub>    | Not used in the present document                 |
| NOTE 1: QAM bit rates apply only on a QAM channel; $\pi/4$ -DQPSK and $\pi/8$ -D8PSK bit rates apply only on a D8PSK channel. |        |      |                    |  |
| NOTE 2: The data class linkage element indicates the data class to which the preferred bit rate applies.                      |        |      |                    |  |

### 21.3.4 $E_s/N_0$ feedback information

The " $E_s/N_0$  feedback information" information element shall be as defined in table 21.37.

**Table 21.37: " $E_s/N_0$  feedback information" information element contents**

| Information element | Length   | Type | Value             | Remark        |
|---------------------|----------|------|-------------------|---------------|
| $E_s/N_0$ estimate  | 4        | M    | 0000 <sub>2</sub> | Not specified |
|                     |          |      | 0001 <sub>2</sub> | 0 dB          |
|                     |          |      | 0010 <sub>2</sub> | 3 dB          |
|                     |          |      | 0011 <sub>2</sub> | 6 dB          |
|                     |          |      | 0100 <sub>2</sub> | 9 dB          |
|                     |          |      | 0101 <sub>2</sub> | 12 dB         |
|                     |          |      | 0110 <sub>2</sub> | 15 dB         |

## 21.4 MAC PDU description

### 21.4.0 General

The following clauses 21.4.1 to 21.4.8.2 describe the information content of the MAC PDUs.

The information contained in the following PDU descriptions shall be read from left to right, starting at the top and going down. The information content shall start with the most significant bit and shall continue until it reaches the least significant bit.

A MAC PDU is composed of a MAC header and a TM-SDU which is passed to the MAC from the LLC layer. The MAC header contains information about the content of the PDU. One MAC block (either a half or full timeslot) may contain several independent MAC PDUs, each with their own MAC header. The TM-SDU is transported by the MAC, but the MAC shall not have any visibility or knowledge of the SDU content.

### 21.4.1 MAC PDU types

These MAC PDU types as shown in table 21.38 shall be used for C-plane signalling messages, C-plane broadcast messages and end-to-end U-plane signalling.

**Table 21.38: MAC PDU types for SCH/F, SCH/HD, STCH, SCH-P8/F, SCH-P8/HD, SCH-Q/D, SCH-Q/B and SCH-Q/U**

| Information element  | Length | Type | Value           | Remark  |
|--|--------|------|-----------------|---|
| MAC PDU type   | 2      | M    | 00 <sub>2</sub> | TMA-SAP: MAC-DATA (uplink)<br>or MAC-RESOURCE (downlink)                                |
|  |        |      | 01 <sub>2</sub> | TMA-SAP: MAC-END or MAC-FRAG  |
|  |        |      | 10 <sub>2</sub> | TMB-SAP: Broadcast  |
|  |        |      | 11 <sub>2</sub> | TMA-SAP: Supplementary MAC PDU (see note)<br>TMD-SAP: MAC-U-SIGNAL (U-plane signalling) |
| NOTE: The supplementary MAC PDUs shall not be sent on STCH, SCH/HD or SCH-P8/HD.<br>The MAC-U-SIGNAL PDU shall only be sent on STCH. |        |      |                 |   |

A PDU subtype bit distinguishes between the supplementary MAC PDUs as shown in table 21.39.

**Table 21.39: Supplementary MAC PDU subtype**

| Information element           | Length | Type | Value | Remark   |
|-------------------------------|--------|------|-------|--|
| Supplementary MAC PDU subtype | 1      | M    | 0     | TMA-SAP: MAC-U-BLCK (uplink)<br>or MAC-D-BLCK (downlink) |
|                               |        |      | 1     | Reserved   |

The MAC PDU types shown in table 21.38 may be used for the transmission of signalling information in full slots on the uplink and downlink and in half slots on the downlink and in SCH-Q/B in the QAM frequency correction burst on the downlink. Under normal operation, the MS shall use MAC-DATA or MAC-U-BLCK for transmission on the uplink and the BS shall use MAC-RESOURCE or MAC-D-BLCK for transmission on the downlink. MAC-FRAG and MAC-END shall be used on the uplink and downlink for transmission of continuations and end of a fragmented SDU. Several types of broadcast PDU are defined, namely SYNC, SYNC-DA, SYSINFO, SYSINFO-Q, SYSINFO-DA and ACCESS-DEFINE. These PDUs shall be used by the BS to transmit broadcast information on the downlink. MAC-U-SIGNAL shall be used by both MS and BS for the transmission of U-plane signalling information.

**Table 21.40: MAC PDU types for SCH/HU, SCH-P8/HU, SCH-Q/RA and SCH-Q/HU**

| Information element     | Length | Type | Value | Remark              |
|-------------------------|--------|------|-------|---------------------|
| MAC PDU type in subslot | 1      | M    | 0     | TMA-SAP: MAC-ACCESS |
|                         |        |      | 1     | TMA-SAP: MAC-END-HU |

The MAC PDU types shown in table 21.40 may be used for the transmission of signalling information in half slots (i.e. subslots) on the uplink. The MS may transmit signalling information in an uplink subslot using the MAC-ACCESS PDU. The MS may also use the MAC-END-HU PDU for transmission of the end of a fragmented SDU.

The following clauses describe the contents of each of these uplink, downlink and broadcast PDUs.

## 21.4.2 TMA-SAP: MAC PDU structure for the uplink

### 21.4.2.0 General

The following clauses describe the MAC PDUs which may be sent on the uplink and which contain C-plane signalling information from the TMA-SAP in the MS.

#### 21.4.2.1 MAC-ACCESS

This PDU may be used to send C-plane signalling data on the uplink in a subslot (SCH/HU, SCH-P8/HU, SCH-Q/RA or SCH-Q/HU). It shall be used for random access (SCH/HU or SCH-Q/RA) and may also be used for reserved access in a subslot (SCH/HU, SCH-P8/HU or SCH-Q/HU). Its contents shall be as shown in table 21.41.

**Table 21.41: MAC-ACCESS PDU contents**

| Information element                   | Length | Type | Value           | Remark   |
|---------------------------------------|--------|------|-----------------|--|
| MAC PDU type in subslot               | 1      | M    | 0               | MAC-ACCESS   |
| Fill bit indication                   | 1      | M    | 0               | No fill bits present   |
|                                       |        |      | 1               | Fill bit(s) present  |

| TM-SDU   | varies | C    |                    |   |
| NOTE 1: The address length of the other address types is 24.   |        |      |                    |   |
| NOTE 2: For values of length indication up to 01110 <sub>2</sub> , the unit of the length indication is Y <sub>1</sub> octets whereas, for higher values, the incremental unit of the length indication is Z <sub>1</sub> octets. The values of Y <sub>1</sub> and Z <sub>1</sub> depend on the bandwidth, modulation and coding rate with which the PDU is sent; the values of Y <sub>1</sub> and Z <sub>1</sub> are given in clause 21.6 for each combination. |        |      |                    |   |
| NOTE 3: The length of MAC PDU indicated by length indication 11111 <sub>2</sub> is set to correspond to the normal size of an advanced link data segment on a QAM channel.   |        |      |                    |   |

The first bit of the MAC header distinguishes between the two possible PDU types which can be sent in a subslot.

The fill bit indication shall indicate if there are any fill bits, which shall be added whenever the size of the TM-SDU is less than the available capacity of the MAC block or less than the size of the TM-SDU indicated by the length indication field. The TM-SDU length is equal to the MAC PDU length minus the MAC PDU header length.

The encrypted flag shall indicate whether or not the TM-SDU contents are encrypted. The MAC header shall not be encrypted except that the address is encrypted when appropriate if the encrypted flag is set to 1 (for details of the address encryption method and when it is used, see ETSI EN 300 392-7 [8]). In the case of fragmentation, the setting of the encrypted flag in the MAC-ACCESS PDU shall apply to all fragments of that TM-SDU.

The address type field shall indicate the type of address contained in the address field. The length of the address field shall be 10 bits for an event label or 24 bits for SSI, USSI or SMI.

The optional field flag shall indicate whether any of the optional fields are present in the PDU header. If optional fields are present the next bit (length indication or capacity request) shall indicate whether the PDU header contains a length indication field or a capacity request field. If length indication is indicated, then the next field shall be length indication. Length indication shall refer to the length of the MAC PDU (which comprises the MAC PDU header and the TM-SDU) and should be used only if association within the uplink subslot is required or for transmission of the null PDU.

The units used for the length indication depend on the bandwidth, modulation and coding rate with which the PDU is sent; see clause 21.6. The defined values of the length indication cover up to the size of the MAC block or the maximum size of a MAC-ACCESS PDU (2 668 bits), whichever is the lesser.

The header length of a MAC-ACCESS PDU depends on the type of address in use and whether or not there is a length indication or capacity request. The header length is shown in table 21.42 for each of the possible combinations. Then the maximum TM-SDU length is shown in table 21.43 for each of the possible header lengths and logical channels.

**Table 21.42: Length of MAC-ACCESS PDU header**

| Content of Header Fields  | Header Length [bits] |
|---|----------------------|
| Address = Event Label<br>No length indication nor capacity request      | 16                   |
| Address = SSI, USSI or SMI<br>No length indication nor capacity request | 30                   |
| Address = Event Label<br>Length indication or capacity request          | 22                   |
| Address = SSI, USSI or SMI<br>Length indication or capacity request     | 36                   |

The length indication field may be used to indicate a null PDU. If a null PDU is indicated, there shall be no further information in the PDU after the length indication field. The length of the null PDU, therefore, shall be 22 bits if an event label is used as an address or 36 bits if an SSI, USSI or SMI is used as an address. The null PDU, if it appears in a MAC block, shall always be the last PDU in that block. Any spare capacity after the null PDU shall be filled with fill bits.

NOTE 1: The null PDU information elements before the length indication field are used as for any other MAC PDU e.g. encryption state is the same as for the other MAC PDUs.

If capacity request is indicated in the length indication or capacity request bit, the next field shall be fragmentation flag followed by reservation requirement. Capacity request shall be used when the MS has further signalling to send, which may or may not be subsequent fragments of a fragmented SDU (as indicated by the fragmentation flag). The PDU may only contain either the length indication field or the capacity request field (comprising fragmentation flag and reservation requirement), but not both.

NOTE 2: An MS generally sets the "Optional field flag" to "1" only for transmission of the Null PDU or if PDU association is required within the subslot or if the MS has further signalling messages ready to be sent. Otherwise the flag is set to "0". For example, when the MAC-ACCESS PDU is sent on SCH/HU (i.e. using  $\pi/4$ -DQPSK), this gives a maximum TM-SDU length of 62 bits (or 76 bits if an event label is used).

NOTE 3: The "Optional field flag" is provided in the PDU in order to economize on the use of bits for the most usual cases. It is not provided in the MAC-END-HU, MAC-DATA or MAC-END PDUs, in which the size constraint is less critical.

NOTE 4: For example, the defined structure of the MAC-ACCESS PDU allows the CMCE U-SETUP PDU to be sent within a  $\pi/4$ -DQPSK subslot (i.e. using SCH/HU), provided that:

- (a) the full TSI of the called party is not needed in the U-SETUP PDU; and
- (b) the FCS is not added by the LLC; and
- (c) the MAC does not include a capacity request so that the optional field flag = "0" (or an event label is used for addressing).

Table 21.43: Maximum length of TM-SDU in MAC-ACCESS PDU

| Logical channel | Maximum TM-SDU length [bits]                                    |  |  |   |
|-----------------|---|--|--|---|

| SCH-Q/HU50-64M  | 605   | 591  | 599  | 585   |
| SCH-Q/HU50-64U  | 928   | 914  | 922  | 908   |
| SCH-Q/HU100-4H  | 293   | 279  | 287  | 273   |
| SCH-Q/HU100-16H | 621   | 607  | 615  | 601   |
| SCH-Q/HU100-16U | 1 280   | 1 266  | 1 274  | 1 260   |
| SCH-Q/HU100-64H | 949   | 935  | 943  | 929   |
| SCH-Q/HU100-64M | 1 277   | 1 263  | 1 271  | 1 257   |
| SCH-Q/HU100-64U | 1 936   | 1 922  | 1 930  | 1 916   |
| SCH-Q/HU150-4H  | 461   | 447  | 455  | 441   |
| SCH-Q/HU150-16H | 957   | 943  | 951  | 937   |
| SCH-Q/HU150-16U | 1 952   | 1 938  | 1 946  | 1 932   |
| SCH-Q/HU150-64H | 1 453   | 1 439  | 1 447  | 1 433   |
| SCH-Q/HU150-64M | 1 949   | 1 935  | 1 943  | 1 929   |
| SCH-Q/HU150-64U | 2 632 (see note)  | 2 632 (see note)   | 2 632 (see note)   | 2 632 (see note)  |

NOTE: The maximum length of TM-SDU in this MAC block is constrained by the maximum permitted size of TM-SDU (N.202) rather than by the size of the MAC block.

### 21.4.2.2 MAC-END-HU

This PDU shall be used to send the last fragment of fragmented C-plane signalling data on the uplink using a reserved subslot (SCH/HU, SCH-P8/HU or SCH-Q/HU). Its contents shall be as shown in table 21.44.

Table 21.44: MAC-END-HU PDU contents

| Information element                   | Length | Type | Value             | Remark   |
|---------------------------------------|--------|------|-------------------|--|
| MAC PDU type in subslot               | 1      | M    | 1                 | MAC-END-HU   |
| Fill bit indication                   | 1      | M    | 0                 | No fill bits present   |
|                                       |        |      | 1                 | Fill bit(s) present  |
| Length indication or capacity request | 1      | M    | 0                 | Length indication  |
|                                       |        |      | 1                 | Reservation requirement (i.e. Capacity request)              |
| Length indication                     | 4      | C    | 0000 <sub>2</sub> | Reserved   |
|                                       |        |      | 0001 <sub>2</sub> | Length of MAC PDU = value × Z <sub>1</sub> octets (see note) |
|                                       |        |      | etc.              | etc.   |
|                                       |        |      | 1111 <sub>2</sub> | Length of MAC PDU = value × Z <sub>1</sub> octets            |
| Reservation requirement               | 4      | C    |                   | See reservation requirement information element definition   |
| TM-SDU                                | varies | C    |                   |  |

NOTE: The unit of the length indication is Z<sub>1</sub> octets. The value of Z<sub>1</sub> depends on the bandwidth, modulation and coding rate with which the PDU is sent; the value of Z<sub>1</sub> is given in clause 21.6 for each combination.

The first bit of the MAC header distinguishes between the two possible PDU types which can be sent in a subslot.

The fill bit indication shall indicate if there are any fill bits, which shall be added whenever the size of the TM-SDU is less than the available capacity of the MAC block or less than the size of the TM-SDU indicated by the length indication field. The TM-SDU length is equal to the MAC PDU length minus the MAC PDU header length.

The length indication or capacity request field shall indicate whether the PDU header contains a length indication field or a capacity request field. If length indication is indicated, then the next field shall be length indication. Length indication shall refer to the length of the MAC PDU which comprises the MAC PDU header and the TM-SDU. The length indicator shall be used if association within the uplink subslot is required or if the MS has no further signalling to send. If reservation requirement is indicated, the next field shall be reservation requirement which shall be used when the MS has further C-plane signalling messages ready to send. In that case the length of the TM-SDU is defined by the fill bit mechanism. The PDU may only contain either the length indication field or the reservation requirement field.

The units used for the length indication depend on the bandwidth, modulation and coding rate with which the PDU is sent; see clause 21.6. The defined values of the length indication cover up to the size of the MAC block or the maximum size of a MAC-END-HU PDU (2 638 bits), whichever is the lesser.

The header length of a MAC-END-HU PDU shall be equal to 7 bits. The maximum TM-SDU length is shown in table 21.45.

**Table 21.45: Maximum length of TM-SDU in MAC-END-HU PDU**

| Logical channel   | Maximum TM-SDU length [bits] |
|---|------------------------------|
| SCH/HU  | 85                           |
| SCH-P8/HU   | 141                          |
| SCH-Q/HU25-4H   | 50                           |

| SCH-Q/HU150-16U   | 1 961                        |
| SCH-Q/HU150-64H   | 1 462                        |
| SCH-Q/HU150-64M   | 1 958                        |
| SCH-Q/HU150-64U   | 2 631 (see note)             |
| NOTE: The maximum length of TM-SDU in this MAC block is constrained by the maximum permitted size of TM-SDU (N.202) rather than by the size of the MAC block. |                              |

### 21.4.2.3 MAC-DATA

This PDU may be used to send C-plane signalling data on the uplink in a full slot (SCH/F, SCH-P8/F or SCH-Q/U).

It may also be used to send C-plane signalling data in the first half of a full uplink slot using the stealing channel (STCH). If the second half of a full uplink slot is also stolen, the MAC-DATA PDU may be used to send another C-plane PDU in the second half slot.

The contents of the MAC-DATA PDU shall be as shown in table 21.46.

**Table 21.46: MAC-DATA PDU contents**

| Information element   | Length                          | Type | Value               | Remark  |
|---|---------------------------------|------|---------------------|---|
| MAC PDU type  | 2                               | M    | 00 <sub>2</sub>     | MAC-DATA  |
| Fill bit indication   | 1                               | M    | 0                   | No fill bit present   |
|   |                                 |      | 1                   | Fill bit(s) present   |
| Encrypted flag  | 1                               | M    | 0                   | Not encrypted   |
