## Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: "*Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards*", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (<https://ipr.etsi.org/>).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

## Foreword

This Technical Specification (TS) has been produced by ETSI Technical Committee Electronic Signatures and Infrastructures (ESI).

The present document is part 2 of a multi-part deliverable covering XAdES digital signatures - Testing Conformance and Interoperability. Full details of the entire series can be found in part 1 [i.3].

---

## Modal verbs terminology

In the present document "**shall**", "**shall not**", "**should**", "**should not**", "**may**", "**need not**", "**will**", "**will not**", "**can**" and "**cannot**" are to be interpreted as described in clause 3.2 of the [ETSI Drafting Rules](#) (Verbal forms for the expression of provisions).

# 1 Scope

The present document defines a number of test suites to assess the interoperability between implementations claiming conformance to XAdES baseline signatures as specified in ETSI EN 319 132-1 [1].

The test suites are defined with four different layers reflecting the four different levels of XAdES baseline signatures:

- Tests suite addressing interoperability between applications claiming B-B level conformance.
- Tests suite addressing interoperability between applications claiming B-T level conformance.
- Tests suite addressing interoperability between applications claiming B-LT level conformance.
- Tests suite addressing interoperability between applications claiming B-LTA level conformance.

Test suites also cover augmentation of XAdES baseline and negative test cases.

These test suites are agnostic of the PKI infrastructure. Any PKI infrastructure can be used including the one based on EU Member States Trusted Lists.

## 4 Overview

This clause describes the overall approach used throughout the present document to specify test suites for testing interoperability of XAdES baseline signature as specified in ETSI EN 319 132-1 [1].

ETSI EN 319 132-1 [1] defines four different levels of XAdES baseline signatures.

The test suites are defined with different layers reflecting the levels of XAdES signatures specified in ETSI EN 319 132-1 [1]:

- Testing XAdES signatures interoperability between applications claiming B-B level conformance.
- Testing XAdES signatures interoperability between applications claiming B-T level conformance. .
- Testing XAdES signatures interoperability between applications claiming B-LT T level conformance.
- Testing XAdES signatures interoperability between applications claiming B-LTA T level conformance.

Table 1 shows the prefixes used throughout the present document to refer to specific elements in the XAdES signature associated to the URIs of the corresponding namespaces.

**Table 1: Prefixes used**

## 8 Test-suite for testing interoperability of XAdES-B-LTA signatures

The test cases in this clause have been defined for different combinations of XAdES-B-LTA signatures properties.

Mandatory properties for XAdES B-LTA signatures described in ETSI EN 319 132-1 [1] profile, clause 6.3, shall be present.

Table 6 shows the test suite for testing interoperability of XAdES-B-LTA signatures as specified in ETSI EN 319 132-1 [1].

## 9 Test-suite for augmentation of XAdES baseline signatures

This clause describes the so called augmentation tests cases. For running them a certain signer generates a XAdES baseline signature of a certain level. After that a verifier validates the signature and augments it to a higher level by adding a number of unsigned qualifying properties. Finally, a third entity validates the augmented signature.

The test cases in this clause have been defined for testing augmentation of XAdES-B-T signatures to XAdES-B-LTA signatures and subsequent validation of the augmented signatures.

Table 7 shows which properties are required to augment XAdES-B-T signatures to XAdES-B-LTA signatures for each test case.

## 10 Test suites with negative test cases

### 10.1 Introduction

The present clause distinguishes two different types of negative test cases:

- 1) Test cases leading to valid XAdES signatures that nevertheless, are not XAdES baseline signatures.
- 2) Test cases leading to XAdES baseline signatures whose validation according to ETSI EN 319 102-1 [i.4] would not result in TOTAL\_PASSED.

### 10.2 Test cases generating non XAdES baseline signatures

The present clause defines test cases that do not generate XAdES baseline signatures.

**Table 8: Test cases generating non XAdES baseline signatures**

TC ID	Description	Pass criteria	Signature qualifying properties
XAdES/NB/1	A XAdES signature signing one data object (a text file) and the <code>xades:SignedProperties</code> element. Incorporates the <code>xades:SigningCertificateV2</code> qualifying property. It does not incorporate the mandatory <code>xades:SigningTime</code> qualifying property. It incorporates <code>xades:DataObjectFormat</code> qualifying property.
