Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: "*Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards*", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (<http://www.etsi.org/legal/home.htm>).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Foreword

This Technical Specification (TS) has been produced by ETSI 3rd Generation Partnership Project (3GPP).

The present document may refer to technical specifications or reports using their 3GPP identities, UMTS identities or GSM identities. These should be interpreted as being references to the corresponding ETSI deliverables.

The cross reference between GSM, UMTS, 3GPP and ETSI identities can be found under www.etsi.org/key.

Foreword

This Technical Specification (TS) has been produced by the 3rd Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

- x the first digit:
 - 1 presented to TSG for information;
 - 2 presented to TSG for approval;
 - 3 or greater indicates TSG approved document under change control.
- y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- z the third digit is incremented when editorial only changes have been incorporated in the document.

1 Scope

The present document establishes the minimum RF characteristics of the FDD mode of UTRA for the User Equipment (UE).

2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the same Release as the present document*.

- [1] (void)
- [2] ITU-R Recommendation SM.329-8: "Spurious emissions".
- [3] (void)
- [4] 3GPP TS 25.433: "UTRAN Iub Interface NBAP Signalling".
- [5] ETSI ETR 273: "Electromagnetic compatibility and Radio spectrum Matters (ERM); Improvement of radiated methods of measurement (using test sites) and evaluation of the corresponding measurement uncertainties; Part 1: Uncertainties in the measurement of mobile radio equipment characteristics; Sub-part 2: Examples and annexes".

3 Definitions, symbols and abbreviations

3.1 Definitions

For the purposes of the present document, the following definitions apply:

Maximum Output Power: This is a measure of the maximum power the UE can transmit (i.e. the actual broadband power as would be measured assuming no measurement error).

Nominal Maximum Output Power: This is the nominal power defined by the UE power class.

Average power: The thermal power as measured through a root raised cosine filter with roll-off $\alpha = 0.22$ and a bandwidth equal to the chip rate of the radio access mode. The period of measurement shall be one power control group (timeslot) unless otherwise stated.

3.2 Abbreviations

For the purposes of the present document, the following abbreviations apply:

| | |
|------|--------------------------------------|
| ACLR | Adjacent Channel Leakage power Ratio |
| ACS | Adjacent Channel Selectivity |
| AICH | Acquisition Indication Channel |
| BER | Bit Error Ratio |
| BLER | Block Error Ratio |

| | |
|-------------------------------|--|
| CW | Continuous Wave (un-modulated signal) |
| DCH | Dedicated Channel, which is mapped into Dedicated Physical Channel. |
| DL | Down Link (forward link) |
| DTX | Discontinuous Transmission |
| DPCCH | Dedicated Physical Control Channel |
| DPCH | Dedicated Physical Channel |
| DPCH $_E_c$ | Average energy per PN chip for DPCH. |
| $\frac{DPCH_E_c}{I_{or}}$ | The ratio of the transmit energy per PN chip of the DPCH to the total transmit power spectral density at the Node B antenna connector. |
| DPDCH | Dedicated Physical Data Channel |
| EIRP | Effective Isotropic Radiated Power |
| E_c | Average energy per PN chip. |
| $\frac{E_c}{I_{or}}$ | The ratio of the average transmit energy per PN chip for different fields or physical channels to the total transmit power spectral density. |
| FACH | Forward Access Channel |
| FDD | Frequency Division Duplex |
| FDR | False transmit format Detection Ratio. A false Transport Format detection occurs when the receiver detects a different TF to that which was transmitted, and the decoded transport block(s) for this incorrect TF passes the CRC check(s). |
| F_{uw} | Frequency of unwanted signal. This is specified in bracket in terms of an absolute frequency(s) or a frequency offset from the assigned channel frequency. |
| Information Data Rate | Rate of the user information, which must be transmitted over the Air Interface. For example, output rate of the voice codec. |
| I_o | The total received power spectral density, including signal and interference, as measured at the UE antenna connector. |
| I_{oc} | The power spectral density of a band limited white noise source (simulating interference from cells, which are not defined in a test procedure) as measured at the UE antenna connector. |
| I_{or} | The total transmit power spectral density of the down link at the Node B antenna connector. |
| \hat{I}_{or} | The received power spectral density of the down link as measured at the UE antenna connector. |
| MER | Message Error Ratio |
| Node B | A logical node responsible for radio transmission / reception in one or more cells to/from the User Equipment. Terminates the Iub interface towards the RNC |
| OCNS | Orthogonal Channel Noise Simulator, a mechanism used to simulate the users or control signals on the other orthogonal channels of a downlink link. |
| OCNS $_E_c$ | Average energy per PN chip for the OCNS. |
| $\frac{OCNS_E_c}{I_{or}}$ | The ratio of the average transmit energy per PN chip for the OCNS to the total transmit power spectral density. |
| P-CCPCH | Primary Common Control Physical Channel |
| PCH | Paging Channel |
| $P-CCPCH \frac{E_c}{I_o}$ | The ratio of the received P-CCPCH energy per chip to the total received power spectral density at the UE antenna connector. |
| $\frac{P-CCPCH_E_c}{I_{or}}$ | The ratio of the average transmit energy per PN chip for the P-CCPCH to the total transmit power spectral density. |
| P-CPICH | Primary Common Pilot Channel |
| PICH | Paging Indicator Channel |
| PPM | Parts Per Million |
| RACH | Random Access Channel |
| SCH | Synchronization Channel consisting of Primary and Secondary synchronization channels |
| $S-CCPCH$ | Secondary Common Control Physical Channel. |
| $S-CCPCH_E_c$ | Average energy per PN chip for S-CCPCH. |

| | |
|------|--|
| SIR | Signal to Interference ratio |
| SSDT | Site Selection Diversity Transmission |
| STTD | Space Time Transmit Diversity |
| TDD | Time Division Duplexing |
| TFC | Transport Format Combination |
| TFCI | Transport Format Combination Indicator |
| TPC | Transmit Power Control |
| TSTD | Time Switched Transmit Diversity |
| UE | User Equipment |
| UL | Up Link (reverse link) |
| UTRA | UMTS Terrestrial Radio Access |

4 General

4.1 Relationship between Minimum Requirements and Test Requirements

The Minimum Requirements given in this specification make no allowance for measurement uncertainty. The test specification 34.121 Annex F defines Test Tolerances. These Test Tolerances are individually calculated for each test. The Test Tolerances are used to relax the Minimum Requirements in this specification to create Test Requirements.

The measurement results returned by the test system are compared – without any modification - against the Test Requirements as defined by the shared risk principle.

The Shared Risk principle is defined in ETR 273 Part 1 sub-part 2 section 6.5.

4.2 Power Classes

For UE power classes 1 and 2, a number of RF parameter are not specified. It is intended that these are part of a later release.

5 Frequency bands and channel arrangement

5.1 General

The information presented in this subclause is based on a chip rate of 3.84 Mcps.

NOTE: Other chip rates may be considered in future releases.

5.2 Frequency bands

UTRA/FDD is designed to operate in either of the following paired bands:

- (a) 1920 – 1980 MHz: Up-link (UE transmit, Node B receive)
2110 – 2170 MHz: Down-link (Node B transmit, UE receive)
- (b)* 1850 – 1910 MHz: Up-link (UE transmit, Node B receive)
1930 – 1990 MHz: Down-link (Node B transmit, UE receive)

* Used in Region 2.

Additional allocations in ITU region 2 are FFS.

Deployment in other frequency bands is not precluded.

5.3 TX–RX frequency separation

(a) UTRA/FDD is designed to operate with the following TX-RX frequency separation

| Frequency Band | TX-RX frequency separation |
|---|----------------------------|
| For operation in frequency band as defined in subclause 5.2 (a) | 190 MHz |
| For operation in frequency band as defined in subclause 5.2 (b) | 80 MHz. |

(b) UTRA/FDD can support both fixed and variable transmit to receive frequency separation.

(c) The use of other transmit to receive frequency separations in existing or other frequency bands shall not be precluded.

5.4 Channel arrangement

5.4.1 Channel spacing

The nominal channel spacing is 5 MHz, but this can be adjusted to optimise performance in a particular deployment scenario.

5.4.2 Channel raster

The channel raster is 200 kHz, which means that the centre frequency must be an integer multiple of 200 kHz.

5.4.3 Channel number

The carrier frequency is designated by the UTRA Absolute Radio Frequency Channel Number (UARFCN). The values are defined as follows:

Table 5.1: UARFCN definition

| | | |
|----------|---------------------------------|--|
| Uplink | $N_u = 5 * F_{\text{uplink}}$ | $0.0 \text{ MHz} \leq F_{\text{uplink}} \leq 3276.6 \text{ MHz}$ where F_{uplink} is the uplink frequency in MHz |
| Downlink | $N_d = 5 * F_{\text{downlink}}$ | $0.0 \text{ MHz} \leq F_{\text{downlink}} \leq 3276.6 \text{ MHz}$ where F_{downlink} is the downlink frequency in MHz |

5.4.4 UARFCN

The following UARFCN range shall be supported for each paired band

Table 5.2: UTRA Absolute Radio Frequency Channel Number

| Frequency Band | Uplink UE transmit, Node B receive | Downlink UE receive, Node B transmit |
|---|--|--|
| For operation in frequency band as defined in subclause 5.2 (a) | 9612 to 9888 | 10562 to 10838 |
| For operation in frequency band as defined in subclause 5.2 (b) | 9262 to 9538 | 9662 to 9938 |

6 Transmitter characteristics

6.1 General

Unless detailed the transmitter characteristic are specified at the antenna connector of the UE. For UE with integral antenna only, a reference antenna with a gain of 0 dBi is assumed. Transmitter characteristics for UE(s) with multiple antennas/antenna connectors are FFS.

The UE antenna performance has a significant impact on system performance, and minimum requirements on the antenna efficiency are therefore intended to be included in future versions of the present document. It is recognised that different requirements and test methods are likely to be required for the different types of UE.

All the parameters in clause 6 are defined using the UL reference measurement channel (12.2 kbps) specified in subclause A.2.1 and unless stated with the UL power control ON

6.2 Transmit power

6.2.1 UE maximum output power

The following Power Classes define the nominal maximum output power. The nominal power defined is the broadband transmit power of the UE.

Table 6.1: UE Power Classes

| Power Class | Nominal maximum output power | Tolerance |
|-------------|------------------------------|-----------|
| 1 | +33 dBm | +1/-3 dB |
| 2 | +27 dBm | +1/-3 dB |
| 3 | +24 dBm | +1/-3 dB |
| 4 | +21 dBm | ± 2 dB |

NOTE: The tolerance allowed for the nominal maximum output power applies even for the multi-code transmission mode.

6.3 Frequency Error

The UE modulated carrier frequency shall be accurate to within ± 0.1 PPM observed over a period of one timeslot compared to the carrier frequency received from the Node B. These signals will have an apparent error due to Node B frequency error and Doppler shift. In the later case, signals from the Node B must be averaged over sufficient time that errors due to noise or interference are allowed for within the above ± 0.1 PPM figure. The UE shall use the same frequency source for both RF frequency generation and the chip clock.

Table 6.2: Frequency Error

| AFC | Frequency stability |
|-----|----------------------|
| ON | within ± 0.1 PPM |

6.4 Output power dynamics

Power control is used to limit the interference level.

6.4.1 Open loop power control

Open loop power control is the ability of the UE transmitter to sets its output power to a specific value. The open loop power control tolerance is given in Table 6.3

6.4.1.1 Minimum requirement

The UE open loop power is defined as the average power in a timeslot or ON power duration, whichever is available, and they are measured with a filter that has a Root-Raised Cosine (RRC) filter response with a roll off $\alpha = 0.22$ and a bandwidth equal to the chip rate.

Table 6.3: Open loop power control tolerance

| | |
|--------------------|-------------|
| Normal conditions | ± 9 dB |
| Extreme conditions | ± 12 dB |

6.4.2 Inner loop power control in the uplink

Inner loop power control in the Uplink is the ability of the UE transmitter to adjust its output power in accordance with one or more TPC commands received in the downlink.

6.4.2.1 Power control steps

The power control step is the change in the UE transmitter output power in response to a single TPC command, TPC_cmd, derived at the UE.

6.4.2.1.1 Minimum requirement

The UE transmitter shall have the capability of changing the output power with a step size of 1, 2 and 3 dB according to the value of Δ_{TPC} or $\Delta_{\text{RP-TPC}}$, in the slot immediately after the TPC_cmd can be derived

- (a) The transmitter output power step due to inner loop power control shall be within the range shown in Table 6.4.
- (b) The transmitter average output power step due to inner loop power control shall be within the range shown in Table 6.5. Here a TPC_cmd group is a set of TPC_cmd values derived from a corresponding sequence of TPC commands of the same duration.

The inner loop power step is defined as the relative power difference between the average power of the original (reference) timeslot and the average power of the target timeslot, not including the transient duration. The transient duration is from 25 μ s before the slot boundary to 25 μ s after the slot boundary. The power is measured with a filter that has a Root-Raised Cosine (RRC) filter response with a roll off $\alpha = 0.22$ and a bandwidth equal to the chip rate

Table 6.4: Transmitter power control range

| TPC_cmd | Transmitter power control range | | | | | |
|---------|---------------------------------|---------|----------------|---------|----------------|---------|
| | 1 dB step size | | 2 dB step size | | 3 dB step size | |
| | Lower | Upper | Lower | Upper | Lower | Upper |
| + 1 | +0.5 dB | +1.5 dB | +1 dB | +3 dB | +1.5 dB | +4.5 dB |
| 0 | -0.5 dB | +0.5 dB | -0.5 dB | +0.5 dB | -0.5 dB | +0.5 dB |
| -1 | -0.5 dB | -1.5 dB | -1 dB | -3 dB | -1.5 dB | -4.5 dB |

Table 6.5: Transmitter average power control range

| TPC_cmd group | Transmitter power control range after 10 equal TPC_cmd groups | | | | Transmitter power control range after 7 equal TPC_cmd groups | |
|---------------|---|--------|----------------|--------|--|--------|
| | 1 dB step size | | 2 dB step size | | 3 dB step size | |
| | Lower | Upper | Lower | Upper | Lower | Upper |
| +1 | +8 dB | +12 dB | +16 dB | +24 dB | +16 dB | +26 dB |
| 0 | -1 dB | +1 dB | -1 dB | +1 dB | -1 dB | +1 dB |
| -1 | -8 dB | -12 dB | -16 dB | -24 dB | -16 dB | -26 dB |
| 0,0,0,0,+1 | +6 dB | +14 dB | N/A | N/A | N/A | N/A |
| 0,0,0,0,-1 | -6 dB | -14 dB | N/A | N/A | N/A | N/A |

The UE shall meet the above requirements for inner loop power control over the power range bounded by the Minimum output power as defined in subclause 6.4.3, and the Maximum output power supported by the UE (i.e. the actual power as would be measured assuming no measurement error). This power shall be in the range specified for the power class of the UE in subclause 6.2.1.

6.4.3 Minimum output power

The minimum controlled output power of the UE is when the power is set to a minimum value.

6.4.3.1 Minimum requirement

The minimum output power is defined as an averaged power in a time slot measured with a filter that has a Root-Raised Cosine (RRC) filter response with a roll off $\alpha = 0.22$ and a bandwidth equal to the chip rate. The minimum output power shall be less than -50 dBm.

6.4.4 Out-of-synchronization handling of output power

The UE shall monitor the DPCCH quality in order to detect a loss of the signal on Layer 1, as specified in TS 25.214. The thresholds Q_{out} and Q_{in} specify at what DPCCH quality levels the UE shall shut its power off and when it shall turn its power on respectively. The thresholds are not defined explicitly, but are defined by the conditions under which the UE shall shut its transmitter off and turn it on, as stated in this subclause.

The DPCCH quality shall be monitored in the UE and compared to the thresholds Q_{out} and Q_{in} for the purpose of monitoring synchronization. The threshold Q_{out} should correspond to a level of DPCCH quality where no reliable detection of the TPC commands transmitted on the downlink DPCCH can be made. This can be at a TPC command error ratio level of e.g. 30%. The threshold Q_{in} should correspond to a level of DPCCH quality where detection of the TPC commands transmitted on the downlink DPCCH is significantly more reliable than at Q_{out} . This can be at a TPC command error ratio level of e.g. 20%.

6.4.4.1 Minimum requirement

When the UE estimates the DPCCH quality over the last 160 ms period to be worse than a threshold Q_{out} , the UE shall shut its transmitter off within 40 ms. The UE shall not turn its transmitter on again until the DPCCH quality exceeds an acceptable level Q_{in} . When the UE estimates the DPCCH quality over the last 160 ms period to be better than a threshold Q_{in} , the UE shall again turn its transmitter on within 40 ms.

The UE transmitter shall be considered “off” if the transmitted power is below the level defined in subclause 6.5.1 (Transmit off power). Otherwise the transmitter shall be considered as “on”.

6.4.4.2 Test case

This subclause specifies a test case, which provides additional information for how the minimum requirement should be interpreted for the purpose of conformance testing.

The quality levels at the thresholds Q_{out} and Q_{in} correspond to different signal levels depending on the downlink conditions DCH parameters. For the conditions in Table 6.6, a signal with the quality at the level Q_{out} can be generated by a DPCCH_Ec/Ior ratio of -25 dB, and a signal with Q_{in} by a DPCCH_Ec/Ior ratio of -21 dB. The DL reference

measurement channel (12.2) kbps specified in subclause A.3.1 and with static propagation conditions. The downlink physical channels, other than those specified in Table 6.6, are as specified in Table C.3 of Annex C.

Figure 6.1 shows an example scenario where the DPCCH_Ec/I_{or} ratio varies from a level where the DPCH is demodulated under normal conditions, down to a level below Q_{out} where the UE shall shut its power off and then back up to a level above Q_{in} where the UE shall turn the power back on.

Table 6.6: DCH parameters for the Out-of-synch handling test case

| Parameter | Unit | Value |
|-----------------------------|--------------|---|
| \hat{I}_{or}/I_{oc} | dB | -1 |
| I_{oc} | dBm/3.84 MHz | -60 |
| $\frac{DPDCH_E_c}{I_{or}}$ | dB | See figure 6.1: Before point A -16.6 After point A Not defined |
| $\frac{DPCCH_E_c}{I_{or}}$ | dB | See figure 6.1 |
| Information Data Rate | kbps | 12.2 |

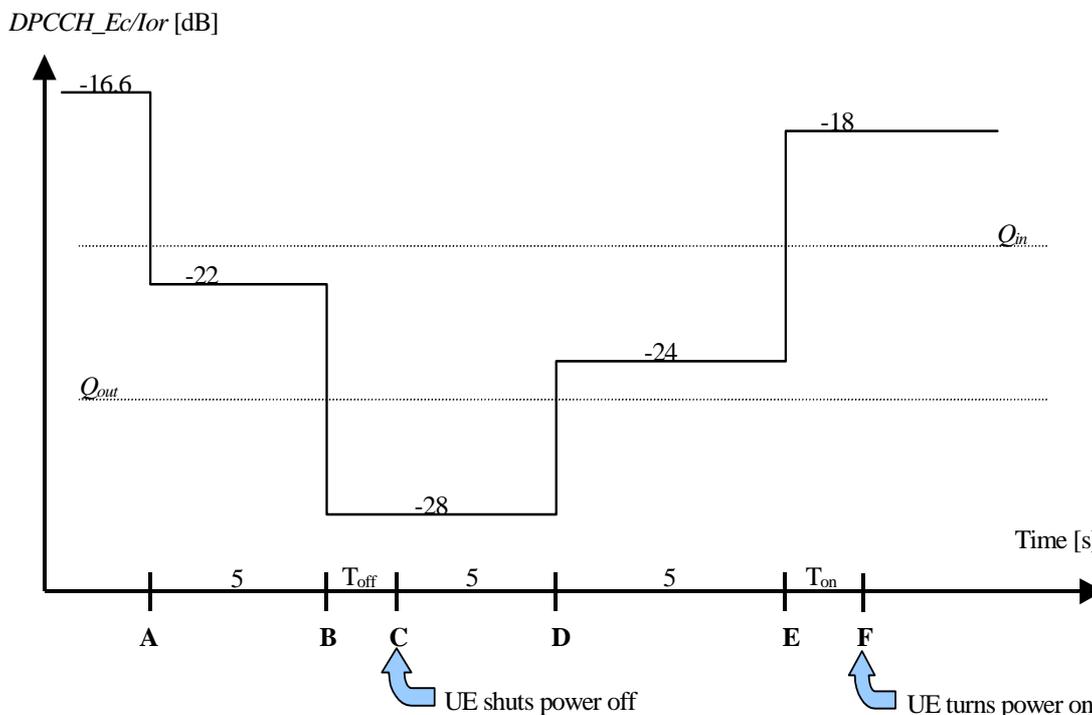

Figure 6.1: Test case for out-of-synch handling in the UE.

In this test case, the requirements for the UE are that:

1. The UE shall not shut its transmitter off before point B.
2. The UE shall shut its transmitter off before point C, which is T_{off} = 200 ms after point B.
3. The UE shall not turn its transmitter on between points C and E.
4. The UE shall turn its transmitter on before point F, which is T_{on} = 200 ms after point E.

6.5 Transmit ON/OFF power

6.5.1 Transmit OFF power

Transmit OFF power is defined as the average power when the transmitter is off. The transmit OFF power state is when the UE does not transmit except during UL compressed mode.

6.5.1.1 Minimum requirement

The transmit OFF power is defined as the average power in a duration of at least one timeslot excluding any transient periods, measured with a filter that has a Root-Raised Cosine (RRC) filter response with a roll off $\alpha = 0.22$ and a bandwidth equal to the chip rate. The requirement for the transmit OFF power shall be less than -56 dBm.

6.5.2 Transmit ON/OFF Time mask

The time mask for transmit ON/OFF defines the ramping time allowed for the UE between transmit OFF power and transmit ON power. Possible ON/OFF scenarios are RACH ,CPCH or UL compressed mode.

6.5.2.1 Minimum requirement

The transmit power levels versus time shall meet the mask specified in figure 6.2 for PRACH preambles and CPCH preambles, and the mask in figure 6.3 for all other cases. The signal is measured with a filter that has a Root-Raised Cosine (RRC) filter response with a roll off $\alpha = 0.22$ and a bandwidth equal to the chip rate.

On power is defined as either case as follows. The specification depends on each possible case.

- First preamble of RACH/CPCH: Open loop accuracy (Table 6.3).
- During preamble ramping of the RACH/CPCH, and between final RACH/CPCH preamble and RACH/CPCH message part: Accuracy depending on size of the required power difference.(Table 6.7). The step in total transmitted power between final RACH/CPCH preamble and RACH/CPCH message (control part + data part) shall be rounded to the closest integer dB value. A power step exactly half-way between two integer values shall be rounded to the closest integer of greater magnitude.
- After transmission gaps in compressed mode: Accuracy as in Table 6.9.
- Power step to Maximum Power: Maximum power accuracy (Table 6.1).

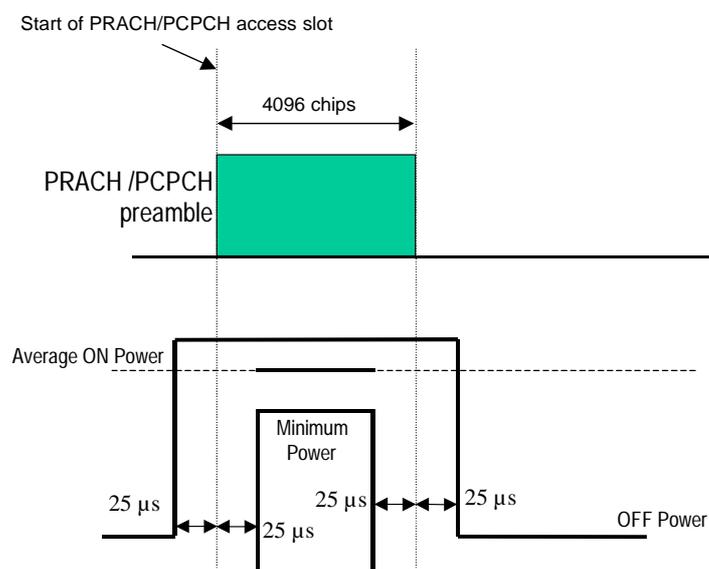

Figure 6.2: Transmit ON/OFF template for PRACH preambles and CPCH preambles

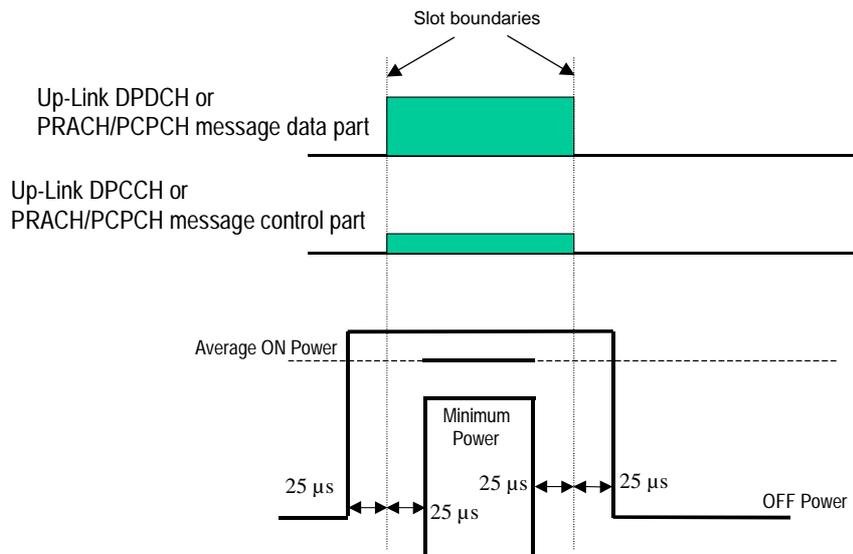

Figure 6.3: Transmit ON/OFF template for all other On/Off cases

Table 6.7: Transmitter power difference tolerance for RACH/CPCH preamble ramping, and between final RACH/CPCH preamble and RACH/CPCH message part

| Power step size (Up or down)* ΔP [dB] | Transmitter power difference tolerance [dB] |
|--|---|
| 0 | +/- 1 dB |
| 1 | +/- 1 dB |
| 2 | +/- 1.5 dB |
| 3 | +/- 2 dB |
| $4 \leq \Delta P \leq 10$ | +/- 2.5 dB |
| $11 \leq \Delta P \leq 15$ | +/- 3.5 dB |
| $16 \leq \Delta P \leq 20$ | +/- 4.5 dB |
| $21 \leq \Delta P$ | +/- 6.5 dB |

NOTE: Power step size for RACH/CPCH preamble ramping is from 1 to 8 dB with 1 dB steps.

6.5.3 Change of TFC

A change of TFC (Transport Format Combination) in uplink means that the power in the uplink varies according to the change in data rate. DTX, where the DPCH is turned off, is a special case of variable data, which is used to minimise the interference between UE(s) by reducing the UE transmit power when voice, user or control information is not present.

6.5.3.1 Minimum requirement

A change of output power is required when the TFC, and thereby the data rate, is changed. The ratio of the amplitude between the DPDCH codes and the DPCCH code will vary. The power step due to a change in TFC shall be calculated in the UE so that the power transmitted on the DPCCH shall follow the inner loop power control. The step in total transmitted power (DPCCH + DPDCH) shall then be rounded to the closest integer dB value. A power step exactly half-way between two integer values shall be rounded to the closest integer of greater magnitude. The accuracy of the power step, given the step size, is specified in Table 6.8. The power change due to a change in TFC is defined as the relative power difference between the average power of the original (reference) timeslot and the average power of the target timeslot, not including the transient duration. The transient duration is from 25μs before the slot boundary to 25μs after the slot boundary. The power is measured with a filter that has a Root-Raised Cosine (RRC) filter response with a roll off $\alpha = 0.22$ and a bandwidth equal to the chip rate.

Table 6.8: Transmitter power step tolerance

| Power step size (Up or down) ΔP [dB] | Transmitter power step tolerance [dB] |
|---|---------------------------------------|
| 0 | +/- 0.5 dB |
| 1 | +/- 0.5 dB |
| 2 | +/- 1.0 dB |
| 3 | +/- 1.5 dB |
| $4 \leq \Delta P \leq 10$ | +/- 2.0 dB |
| $11 \leq \Delta P \leq 15$ | +/- 3.0 dB |
| $16 \leq \Delta P \leq 20$ | +/- 4.0 dB |
| $21 \leq \Delta P$ | +/- 6.0 dB |

The transmit power levels versus time shall meet the mask specified in Figure 6.4.

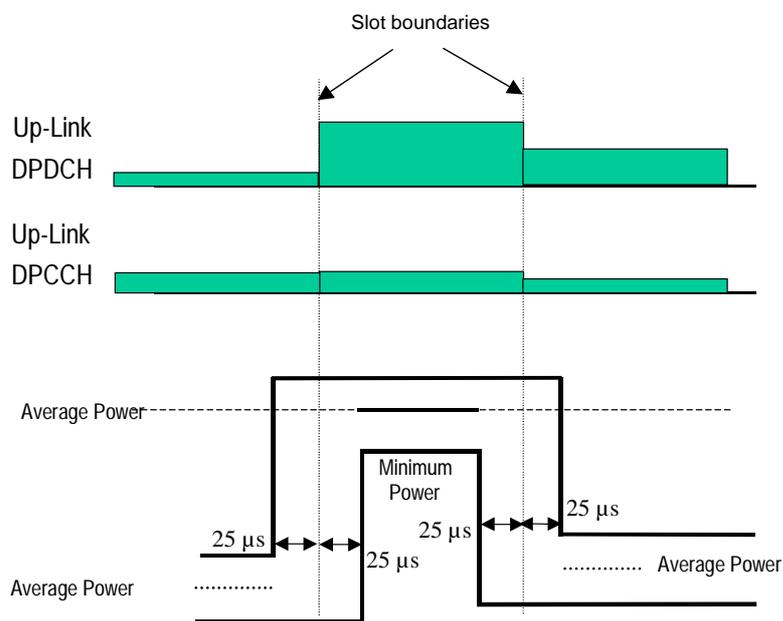

Figure 6.4: Transmit template during TFC change

6.5.4 Power setting in uplink compressed mode

Compressed mode in uplink means that the power in uplink is changed.

6.5.4.1 Minimum requirement

A change of output power is required during uplink compressed frames since the transmission of data is performed in a shorter interval. The ratio of the amplitude between the DPDCH codes and the DPCCH code will also vary. The power step due to compressed mode shall be calculated in the UE so that the energy transmitted on the pilot bits during each transmitted slot shall follow the inner loop power control.

Thereby, the power during compressed mode, and immediately afterwards, shall be such that the power on the DPCCH follows the steps due to inner loop power control combined with additional steps of $10\text{Log}_{10}(N_{\text{pilot,prev}} / N_{\text{pilot,curr}})$ dB where $N_{\text{pilot,prev}}$ is the number of pilot bits in the previously transmitted slot, and $N_{\text{pilot,curr}}$ is the current number of pilot bits per slot.

The resulting step in total transmitted power (DPCCH +DPDCH) shall then be rounded to the closest integer dB value. A power step exactly half-way between two integer values shall be rounded to the closest integer of greatest magnitude. The accuracy of the power step, given the step size, is specified in Table 6.8 in subclause 6.5.3.1. The power step is defined as the relative power difference between the average power of the original (reference) timeslot and the average

power of the target timeslot, when neither the original timeslot nor the reference timeslot are in a transmission gap. The transient duration is not included, and is from 25µs before the slot boundary to 25µs after the slot boundary. The relative power is measured with a filter that has a Root-Raised Cosine (RRC) filter response with a roll off $\alpha = 0.22$ and a bandwidth equal to the chip rate.

In addition to any power change due to the ratio $N_{pilot,prev} / N_{pilot,curr}$, the average power of the DPCCH in the first slot after a compressed mode transmission gap shall differ from the average power in the last slot before the transmission gap by an amount Δ_{RESUME} , where Δ_{RESUME} is calculated as described in clause 5.1.2.3 of TS 25.214.

The resulting difference in the total transmitted power (DPCCH + DPDCH) shall then be rounded to the closest integer dB value. A power difference exactly half-way between two integer values shall be rounded to the closest integer of greatest magnitude. The accuracy of the resulting difference in the total transmitted power (DPCCH + DPDCH) after a transmission gap of up to 14 slots shall be as specified in Table 6.9.

Table 6.9: Transmitter power difference tolerance after a transmission gap of up to 14 slots

| |
|---|
| Tolerance on required difference in total transmitter power after a transmission gap +/- 3 dB |
|---|

The power difference is defined as the relative power difference between the average power of the original (reference) timeslot before the transmission gap and the average power of the target timeslot after the transmission gap, not including the transient durations. The transient durations at the start and end of the transmission gaps are each from 25µs before the slot boundary to 25µs after the slot boundary. The relative power is measured with a filter that has a Root-Raised Cosine (RRC) filter response with a roll off $\alpha = 0.22$ and a bandwidth equal to the chip rate.

The transmit power levels versus time shall meet the mask specified in figure 6.5.

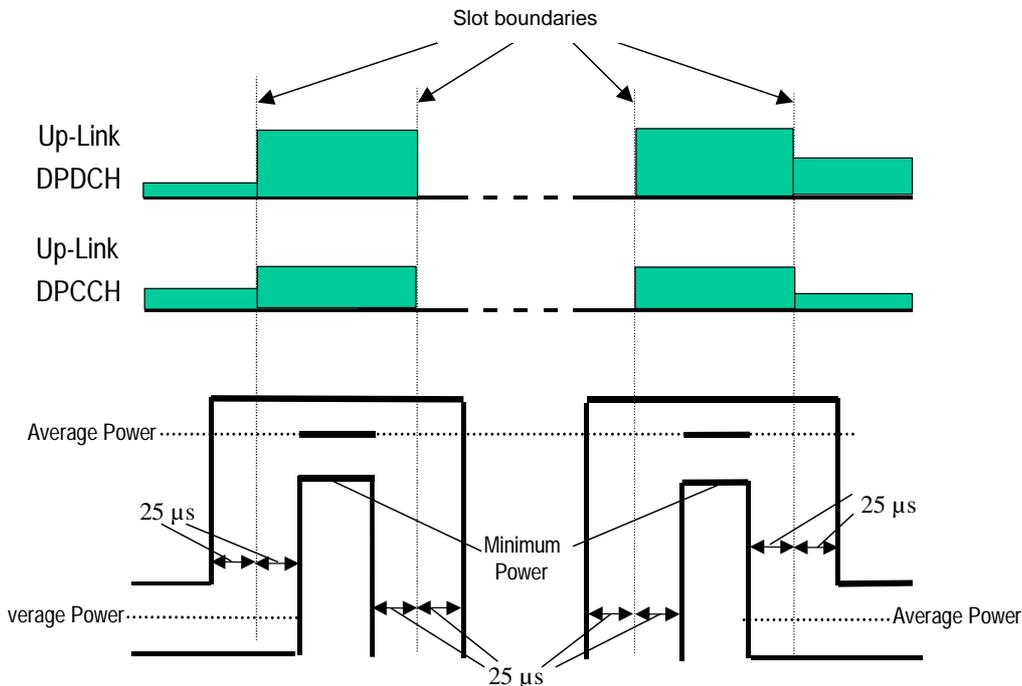

Figure 6.5: Transmit template during Compressed mode

6.6 Output RF spectrum emissions

6.6.1 Occupied bandwidth

Occupied bandwidth is a measure of the bandwidth containing 99 % of the total integrated power of the transmitted spectrum, centered on the assigned channel frequency. The occupied channel bandwidth shall be less than 5 MHz based on a chip rate of 3.84 Mcps.

6.6.2 Out of band emission

Out of band emissions are unwanted emissions immediately outside the nominal channel resulting from the modulation process and non-linearity in the transmitter but excluding spurious emissions. This out of band emission limit is specified in terms of a spectrum emission mask and Adjacent Channel Leakage power Ratio.

6.6.2.1 Spectrum emission mask

The spectrum emission mask of the UE applies to frequencies, which are between 2.5 MHz and 12.5 MHz away from the UE centre carrier frequency. The out of channel emission is specified relative to the UE output power measured in a 3.84 MHz bandwidth.

6.6.2.1.1 Minimum requirement

The power of any UE emission shall not exceed the levels specified in Table 6.10

Table 6.10: Spectrum Emission Mask Requirement

| Δf^* in MHz | Minimum requirement | Measurement bandwidth |
|---|---|-----------------------|
| 2.5 - 3.5 | $\left\{ -35 - 15 \cdot \left(\frac{\Delta f}{\text{MHz}} - 2.5 \right) \right\} \text{dBc}$ | 30 kHz ** |
| 3.5 - 7.5 | $\left\{ -35 - 1 \cdot \left(\frac{\Delta f}{\text{MHz}} - 3.5 \right) \right\} \text{dBc}$ | 1 MHz *** |
| 7.5 - 8.5 | $\left\{ -39 - 10 \cdot \left(\frac{\Delta f}{\text{MHz}} - 7.5 \right) \right\} \text{dBc}$ | 1 MHz *** |
| 8.5 - 12.5 MHz | -49 dBc | 1 MHz *** |
| * Δf is the separation between the carrier frequency and the centre of the measuring filter. | | |
| ** The first and last measurement position with a 30 kHz filter is at Δf equals to 2.515 MHz and 3.485 MHz. | | |
| *** The first and last measurement position with a 1 MHz filter is at Δf equals to 4 MHz and 12 MHz. As a general rule, the resolution bandwidth of the measuring equipment should be equal to the measurement bandwidth. To improve measurement accuracy, sensitivity and efficiency, the resolution bandwidth can be different from the measurement bandwidth. When the resolution bandwidth is smaller than the measurement bandwidth, the result should be integrated over the measurement bandwidth. | | |
| The lower limit shall be $-50 \text{ dBm}/3.84 \text{ MHz}$ or which ever is higher. | | |

6.6.2.2 Adjacent Channel Leakage power Ratio (ACLR)

Adjacent Channel Leakage power Ratio (ACLR) is the ratio of the average power centered on the assigned channel frequency to the average power centered on an adjacent channel frequency. In both cases the average power is measured with a filter that has a Root-Raised Cosine (RRC) filter response with roll-off $\alpha = 0.22$ and a bandwidth equal to the chip rate.

6.6.2.2.1 Minimum requirement

If the adjacent channel power is greater than -50 dBm then the ACLR shall be higher than the value specified in Table 6.11.

Table 6.11: UE ACLR

| Power Class | Adjacent channel frequency relative to assigned channel frequency | ACLR limit |
|-------------|---|------------|
| 3 | + 5 MHz or – 5 MHz | 33 dB |
| 3 | + 10 MHz or – 10 MHz | 43 dB |
| 4 | + 5 MHz or – 5 MHz | 33 dB |
| 4 | + 10 MHz or –10 MHz | 43 dB |

NOTE 1: The requirement shall still be met in the presence of switching transients.

NOTE 2: The ACLR requirements reflect what can be achieved with present state of the art technology.

NOTE 3: Requirement on the UE shall be reconsidered when the state of the art technology progresses.

6.6.3 Spurious emissions

Spurious emissions are emissions which are caused by unwanted transmitter effects such as harmonics emission, parasitic emission, intermodulation products and frequency conversion products, but exclude out of band emissions.

The frequency boundary and the detailed transitions of the limits between the requirement for out band emissions and spectrum emissions are based on ITU-R Recommendations SM.329-8[2].

6.6.3.1 Minimum requirement

These requirements are only applicable for frequencies, which are greater than 12.5 MHz away from the UE centre carrier frequency.

Table 6.12: General spurious emissions requirements

| Frequency Bandwidth | Measurement Bandwidth | Minimum requirement |
|--|-----------------------|---------------------|
| $9 \text{ kHz} \leq f < 150 \text{ kHz}$ | 1 kHz | -36 dBm |
| $150 \text{ kHz} \leq f < 30 \text{ MHz}$ | 10 kHz | -36 dBm |
| $30 \text{ MHz} \leq f < 1000 \text{ MHz}$ | 100 kHz | -36 dBm |
| $1 \text{ GHz} \leq f < 12.75 \text{ GHz}$ | 1 MHz | -30 dBm |

Table 6.13: Additional spurious emissions requirements

| Paired band | Frequency Bandwidth | Measurement Bandwidth | Minimum requirement |
|---|---|-----------------------|---------------------|
| For operation in frequency bands as defined in subclause 5.2(a) | $1893.5 \text{ MHz} < f < 1919.6 \text{ MHz}$ | 300 kHz | -41 dBm |
| | $925 \text{ MHz} \leq f \leq 935 \text{ MHz}$ | 100 kHz | -67 dBm * |
| | $935 \text{ MHz} < f \leq 960 \text{ MHz}$ | 100 kHz | -79 dBm * |
| | $1805 \text{ MHz} \leq f \leq 1880 \text{ MHz}$ | 100 kHz | -71 dBm * |
| *: The measurements are made on frequencies which are integer multiples of 200 kHz. As exceptions, up to five measurements with a level up to the applicable requirements defined in Table 6.12 are permitted for each UARFCN used in the measurement | | | |

6.7 Transmit intermodulation

The transmit intermodulation performance is a measure of the capability of the transmitter to inhibit the generation of signals in its non linear elements caused by presence of the wanted signal and an interfering signal reaching the transmitter via the antenna.

6.7.1 Minimum requirement

User Equipment(s) transmitting in close vicinity of each other can produce intermodulation products, which can fall into the UE, or Node B receive band as an unwanted interfering signal. The UE intermodulation attenuation is defined by the ratio of the output power of the wanted signal to the output power of the intermodulation product when an interfering CW signal is added at a level below the wanted signal. Both the wanted signal power and the IM product power are measured with a filter that has a Root-Raised Cosine (RRC) filter response with roll-off $\alpha = 0.22$ and a bandwidth equal to the chip rate.

The requirement of transmitting intermodulation for a carrier spacing of 5 MHz is prescribed in Table 6.14.

Table 6.14: Transmit Intermodulation

| | | |
|--------------------------------------|--------|--------|
| Interference Signal Frequency Offset | 5MHz | 10MHz |
| Interference CW Signal Level | -40dBc | |
| Intermodulation Product | -31dBc | -41dBc |

6.8 Transmit modulation

6.8.1 Transmit pulse shape filter

The transmit pulse shaping filter is a root-raised cosine (RRC) with roll-off $\alpha = 0.22$ in the frequency domain. The impulse response of the chip impulse filter $RC_0(t)$ is:

$$RC_0(t) = \frac{\sin\left(\pi \frac{t}{T_c}(1-\alpha)\right) + 4\alpha \frac{t}{T_c} \cos\left(\pi \frac{t}{T_c}(1+\alpha)\right)}{\pi \frac{t}{T_c} \left(1 - \left(4\alpha \frac{t}{T_c}\right)^2\right)}$$

Where the roll-off factor $\alpha = 0.22$ and the chip duration is

$$T = \frac{1}{\text{chiprate}} \approx 0.26042 \mu s$$

6.8.2 Error Vector Magnitude

The Error Vector Magnitude is a measure of the difference between the reference waveform and the measured waveform. This difference is called the error vector. Both waveforms pass through a matched Root Raised Cosine filter with bandwidth 3,84 MHz and roll-off $\alpha = 0,22$. Both waveforms are then further modified by selecting the frequency, absolute phase, absolute amplitude and chip clock timing so as to minimise the error vector. The EVM result is defined as the square root of the ratio of the mean error vector power to the mean reference power expressed as a %. The measurement interval is one timeslot.

6.8.2.1 Minimum requirement

The Error Vector Magnitude shall not exceed 17.5 % for the parameters specified in Table 6.15.

Table 6.15: Parameters for Error Vector Magnitude/Peak Code Domain Error

| Parameter | Unit | Level |
|-------------------------|------|-------------------|
| UE Output Power | dBm | ≥ -20 |
| Operating conditions | | Normal conditions |
| Power control step size | dB | 1 |

6.8.3 Peak code domain error

The Peak Code Domain Error is computed by projecting power of the error vector (as defined in 6.8.2) onto the code domain at a specific spreading factor. The Code Domain Error for every code in the domain is defined as the ratio of the mean power of the projection onto that code, to the mean power of the composite reference waveform. This ratio is expressed in dB. The Peak Code Domain Error is defined as the maximum value for the Code Domain Error for all codes. The measurement interval is one power control group (timeslot).

The requirement for peak code domain error is only applicable for multi-code transmission.

6.8.3.1 Minimum requirement

The peak code domain error shall not exceed -15 dB at spreading factor 4 for the parameters specified in Table 6.15 . The requirements are defined using the UL reference measurement channel specified in subclause A.2.5.

7 Receiver characteristics

7.1 General

Unless otherwise stated the receiver characteristics are specified at the antenna connector of the UE. For UE(s) with an integral antenna only, a reference antenna with a gain of 0 dBi is assumed. UE with an integral antenna may be taken into account by converting these power levels into field strength requirements, assuming a 0 dBi gain antenna. Receiver characteristics for UE(s) with multiple antennas/antenna connectors are FFS.

The UE antenna performance has a significant impact on system performance, and minimum requirements on the antenna efficiency are therefore intended to be included in future versions of the present document. It is recognised that different requirements and test methods are likely to be required for the different types of UE.

All the parameters in clause 7 are defined using the DL reference measurement channel (12.2 kbps) specified in subclause A.3.1 and unless stated are with DL power control OFF.

7.2 Diversity characteristics

A suitable receiver structure using coherent reception in both channel impulse response estimation and code tracking procedures is assumed. Three forms of diversity are considered to be available in UTRA/FDD.

Table 7.1: Diversity characteristics for UTRA/FDD

| | |
|----------------------|--|
| Time diversity | Channel coding and interleaving in both up link and down link |
| Multi-path diversity | Rake receiver or other suitable receiver structure with maximum combining. Additional processing elements can increase the delay-spread performance due to increased capture of signal energy. |
| Antenna diversity | Antenna diversity with maximum ratio combining in the Node B and optionally in the UE. Possibility for downlink transmit diversity in the Node B. |

7.3 Reference sensitivity level

The reference sensitivity is the minimum receiver input power measured at the antenna port at which the Bit Error Ratio (BER) does not exceed a specific value.

7.3.1 Minimum requirement

The BER shall not exceed 0.001 for the parameters specified in Table 7.2.

Table 7.2: Test parameters for reference sensitivity

| Parameter | Unit | Level |
|--|--------------|--------|
| DPCH_Ec | dBm/3.84 MHz | -117 |
| \hat{I}_{or} | dBm/3.84 MHz | -106.7 |
| 1. For Power class 3 this shall be at the maximum output power 2. For Power class 4 this shall be at the maximum output power | | |

7.4 Maximum input level

This is defined as the maximum receiver input power at the UE antenna port, which does not degrade the specified BER performance.

7.4.1 Minimum requirement

The BER shall not exceed 0.001 for the parameters specified in Table 7.3.

Table 7.3: Maximum input level

| Parameter | Unit | Level |
|--|--------------|-------|
| $\frac{DPCH_Ec}{I_{or}}$ | dB | -19 |
| \hat{I}_{or} | dBm/3.84 MHz | -25 |
| 1. For Power class 3 the average transmit output power shall be +20 dBm 2. For Power class 4 the average transmit output power shall be +18 dBm | | |

NOTE: Since the spreading factor is large ($10\log(SF)=21\text{dB}$), the majority of the total input signal consists of the OCNS interference. The structure of OCNS signal is defined in Annex C.3.2.

7.5 Adjacent Channel Selectivity (ACS)

Adjacent Channel Selectivity (ACS) is a measure of a receiver's ability to receive a W-CDMA signal at its assigned channel frequency in the presence of an adjacent channel signal at a given frequency offset from the centre frequency of the assigned channel. ACS is the ratio of the receive filter attenuation on the assigned channel frequency to the receive filter attenuation on the adjacent channel(s).

7.5.1 Minimum requirement

The ACS shall be better than the value indicated in Table 7.4 for the test parameters specified in Table 7.5 where the BER shall not exceed 0.001.

Table 7.4: Adjacent Channel Selectivity

| Power Class | Unit | ACS |
|-------------|------|-----|
| 3 | dB | 33 |
| 4 | dB | 33 |

Table 7.5: Test parameters for Adjacent Channel Selectivity

| Parameter | Unit | Level |
|---|--------------|----------|
| DPCH_Ec | dBm/3.84 MHz | -103 |
| \hat{I}_{or} | dBm/3.84 MHz | -92.7 |
| I_{oac} (modulated) | dBm/3.84 MHz | -52 |
| F_{uw} (offset) | MHz | +5 or -5 |
| 1. For Power class 3 the average transmit output power shall be +20 dBm | | |
| 2. For Power class 4 the average transmit output power shall be +18 dBm | | |

NOTE: The I_{oac} (modulated) signal consist of the common channels needed for tests as specified in Table C.7 and 16 dedicated data channels as specified in Table C.6.

7.6 Blocking characteristics

The blocking characteristic is a measure of the receiver's ability to receive a wanted signal at its assigned channel frequency in the presence of an unwanted interferer on frequencies other than those of the spurious response or the adjacent channels, without this unwanted input signal causing a degradation of the performance of the receiver beyond a specified limit. The blocking performance shall apply at all frequencies except those at which a spurious response occur.

7.6.1 Minimum requirement

The BER shall not exceed 0.001 for the parameters specified in Table 7.6 and Table 7.7. For Table 7.7 up to 24 exceptions are allowed for spurious response frequencies in each assigned frequency channel when measured using a 1 MHz step size.

Table 7.6: In-band blocking

| Parameter | Unit | Offset | Offset |
|---|--------------|------------|------------|
| DPCH_Ec | dBm/3.84 MHz | -114 | -114 |
| \hat{I}_{or} | dBm/3.84 MHz | -103.7 | -103.7 |
| $I_{blocking}$ (modulated) | dBm/3.84 MHz | -56 | -44 |
| F_{uw} (offset) | MHz | +10 or -10 | +15 or -15 |
| 1. For Power class 3 the average transmit output power shall be +20 dBm | | | |
| 2. For Power class 4 the average transmit output power shall be +18 dBm | | | |

Note: $I_{blocking}$ (modulated) consist of the common channels needed for tests as specified in Table C.7 and 16 dedicated data channels as specified in Table C.6.

Table 7.7: Out of band blocking

| Parameter | Unit | Band 1 | Band 2 | Band 3 |
|--|--------------|------------------------------|--------------------------------|-----------------------------|
| DPCH_Ec | dBm/3.84 MHz | -114 | -114 | -114 |
| \hat{I}_{or} | dBm/3.84 MHz | -103.7 | -103.7 | -103.7 |
| $I_{blocking}$ (CW) | dBm | -44 | -30 | -15 |
| F_{uw} For operation in frequency bands as defined in subclause 5.2(a) | MHz | 2050<f <2095 2185<f <2230 | 2025 <f <2050 2230 <f <2255 | 1 < f <2025 2255<f<12750 |
| F_{uw} For operation in frequency bands as defined in subclause 5.2(b) | MHz | 1870<f <1915 2005<f <2050 | 1845 <f <1870 2050 <f <2075 | 1 < f <1845 2075<f<12750 |
| 1. For Power class 3 the average transmit output power shall be +20 dBm 2. For Power class 4 the average transmit output power shall be +18 dBm | | | | |
| For operation in bands referenced in 5.2(a), from 2095<f<2110 MHz and 2170<f<2185 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 7.5.1 and table 7.6 shall be applied. | | | | |
| For operation in bands referenced in 5.2(b), 1915<f<1930 MHz and 1990<f<2005 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 7.5.1 and table 7.6 shall be applied | | | | |

7.7 Spurious response

Spurious response is a measure of the receiver's ability to receive a wanted signal on its assigned channel frequency without exceeding a given degradation due to the presence of an unwanted CW interfering signal at any other frequency at which a response is obtained i.e. for which the blocking limit is not met.

7.7.1 Minimum requirement

The BER shall not exceed 0.001 for the parameters specified in Table 7.8.

Table 7.8: Spurious Response

| Parameter | Unit | Level |
|--|--------------|-------------------------------|
| DPCH_Ec | dBm/3.84 MHz | -114 |
| \hat{I}_{or} | dBm/3.84 MHz | -103.7 |
| $I_{blocking}$ (CW) | dBm | -44 |
| F_{uw} | MHz | Spurious response frequencies |
| 1. For Power class 3 the average transmit output power shall be +20 dBm 2. For Power class 4 the average transmit output power shall be +18 dBm | | |

7.8 Intermodulation characteristics

Third and higher order mixing of the two interfering RF signals can produce an interfering signal in the band of the desired channel. Intermodulation response rejection is a measure of the capability of the receiver to receive a wanted signal on its assigned channel frequency in the presence of two or more interfering signals which have a specific frequency relationship to the wanted signal.

7.8.1 Minimum requirement

The BER shall not exceed 0.001 for the parameters specified in Table 7.9.

Table 7.9: Receive intermodulation characteristics

| Parameter | Unit | Level | |
|---|--------------|--------|-----|
| DPCH_Ec | dBm/3.84 MHz | -114 | |
| \hat{I}_{or} | dBm/3.84 MHz | -103.7 | |
| I_{ouw1} (CW) | dBm | -46 | |
| I_{ouw2} (modulated) | dBm/3.84 MHz | -46 | |
| F_{uw1} (offset) | MHz | 10 | -10 |
| F_{uw2} (offset) | MHz | 20 | -20 |
| 1. For Power class 3 the average transmit output power shall be +20 dBm | | | |
| 2. For Power class 4 the average transmit output power shall be +18 dBm | | | |

NOTE: I_{ouw2} (modulated) consist of the common channels needed for tests as specified in Table C.7 and 16 dedicated data channels as specified in Table C.6.

7.9 Spurious emissions

The spurious emissions power is the power of emissions generated or amplified in a receiver that appear at the UE antenna connector.

7.9.1 Minimum requirement

The power of any narrow band CW spurious emission shall not exceed the maximum level specified in Table 7.10 and Table 7.11

Table 7.10: General receiver spurious emission requirements

| Frequency Band | Measurement Bandwidth | Maximum level | Note |
|---|-----------------------|---------------|------|
| $30\text{MHz} \leq f < 1\text{GHz}$ | 100 kHz | -57 dBm | |
| $1\text{GHz} \leq f \leq 12.75\text{GHz}$ | 1 MHz | -47 dBm | |

Table 7.11: Additional receiver spurious emission requirements

| | Frequency Band | Measurement Bandwidth | Maximum level | Note |
|---|---|-----------------------|---------------|--|
| For operation in frequency bands as defined in subclause 5.2(a) | $1920\text{MHz} \leq f \leq 1980\text{MHz}$ | 3.84 MHz | -60 dBm | Mobile transmit band in URA_PCH, Cell_PCH and idle state |
| | $2110\text{MHz} \leq f \leq 2170\text{MHz}$ | 3.84 MHz | -60 dBm | Mobile receive band |

8 Performance requirement

8.1 General

The performance requirements for the UE in this subclause are specified for the measurement channels specified in Annex A, the propagation conditions specified in Annex B and the Down link Physical channels specified in Annex C. Unless stated DL power control is OFF.

8.2 Demodulation in static propagation conditions

8.2.1 (void)

Table 8.1:(void)

Table 8.2: (void)

8.2.2 Demodulation of Forward Access Channel (FACH)

Table 8.3: (void)

Table 8.4: (void)

8.2.3 Demodulation of Dedicated Channel (DCH)

The receive characteristic of the Dedicated Channel (DCH) in the static environment is determined by the Block Error Ratio (BLER). BLER is specified for each individual data rate of the DCH. DCH is mapped into the Dedicated Physical Channel (DPCH).

8.2.3.1 Minimum requirement

For the parameters specified in Table 8.5 the average downlink $\frac{DPCH_E_c}{I_{or}}$ power shall be below the specified value for the BLER shown in Table 8.6. These requirements are applicable for TFCS size 16.

Table 8.5: DCH parameters in static propagation conditions

| | -5.5 dB | 10^{-2} |

8.3 Demodulation of DCH in multi-path fading propagation conditions

8.3.1 Single Link Performance

The receive characteristics of the Dedicated Channel (DCH) in different multi-path fading environments are determined by the Block Error Ratio (BLER) values. BLER is measured for the each of the individual data rate specified for the DPCH. DCH is mapped into in Dedicated Physical Channel (DPCH).

8.3.1.1 Minimum requirement

For the parameters specified in Table 8.7, 8.9 , 8.11, 8.13 and 8.14A the average downlink $\frac{DPCH - E_c}{I_{or}}$ power shall be below the specified value for the BLER shown in Table 8.8, 8.10, 8.12, 8.14 and 8.14B. These requirements are applicable for TFCS size 16.

Table 8.7: Test Parameters for DCH in multi-path fading propagation conditions (Case 1)

8.4 Demodulation of DCH in moving propagation conditions

8.4.1 Single link performance

The receive single link performance of the Dedicated Channel (DCH) in dynamic moving propagation conditions are determined by the Block Error Ratio (BLER) values. BLER is measured for the each of the individual data rate specified for the DPCH. DCH is mapped into Dedicated Physical Channel (DPCH).

8.4.1.1 Minimum requirement

For the parameters specified in Table 8.15 the average downlink $\frac{DPCH - E_c}{I_{or}}$ power shall be below the specified value for the BLER shown in Table 8.16.

Table 8.15: DCH parameters in moving propagation conditions

| Parameter | Unit | Test 1 | Test 2 |
|-----------------------|--------------|---------|--------|
| Phase reference | | P-CPICH | |
| \hat{I}_{or}/I_{oc} | dB | -1 | |

|-------------|----------------------------|-----------|
| 1 | -14.5 dB | 10^{-2} |
| 2 | -10.9 dB | 10^{-2} |

8.5 Demodulation of DCH in birth-death propagation conditions

8.5.1 Single link performance

The receive single link performance of the Dedicated Channel (DCH) in dynamic birth-death propagation conditions are determined by the Block Error Ratio (BLER) values. BER is measured for the each of the individual data rate specified for the DPCH. DCH is mapped into Dedicated Physical Channel (DPCH).

8.5.1.1 Minimum requirement

For the parameters specified in Table 8.17 the average downlink $\frac{DPCH_E_c}{I_{or}}$ power shall be below the specified value for the BLER shown in Table 8.18.

Table 8.17: DCH parameters in birth-death propagation conditions

| Parameter | Unit | Test 1 | Test 2 |
|-----------------------|--------------|---------|--------|

|-------------|----------------------------|-----------|
| 1 | -12.6 dB | 10^{-2} |
| 2 | -8.7 dB | 10^{-2} |

8.6 Demodulation of DCH in downlink Transmit diversity modes

8.6.1 Demodulation of DCH in open-loop transmit diversity mode

The receive characteristic of the Dedicated Channel (DCH) in open loop transmit diversity mode is determined by the Block Error Ratio (BLER). DCH is mapped into in Dedicated Physical Channel (DPCH).

8.6.1.1 Minimum requirement

For the parameters specified in Table 8.19 the average downlink $\frac{DPCH_E_c}{I_{or}}$ power shall be below the specified value for the BLER shown in Table 8.20.

Table 8.19: Test parameters for DCH reception in an open loop transmit diversity scheme. (Propagation condition: Case 1)

| Parameter | Unit | Test 1 |
|-----------------------|--------------|---------|
| Phase reference | | P-CPICH |

| Test Number | $\frac{DPCH_E_c}{I_{or}}$ (antenna 1/2) | BLER |
|-------------|---|-----------|
| 1 | -16.8 dB | 10^{-2} |

8.6.2 Demodulation of DCH in closed loop transmit diversity mode

The receive characteristic of the dedicated channel (DCH) in closed loop transmit diversity mode is determined by the Block Error Ratio (BLER). DCH is mapped into in Dedicated Physical Channel (DPCH).

8.6.2.1 Minimum requirement

For the parameters specified in Table 8.21 the average downlink $\frac{DPCH_E_c}{I_{or}}$ power shall be below the specified value for the BLER shown in Table 8.22.

Table 8.21: Test Parameters for DCH Reception in closed loop transmit diversity mode (Propagation condition: Case 1)

|-------------|--|-----------|
| 1 | -18.0 dB | 10^{-2} |
| 2 | -18.3 dB | 10^{-2} |
| NOTE: | This is the total power from both antennas. Power sharing between antennas are feedback mode dependent as specified in TS25.214. | |

8.6.3 Demodulation of DCH in Site Selection Diversity Transmission Power Control mode

The bit error characteristics of UE receiver is determined in Site Selection Diversity Transmission power control (SSDT) mode. Two Node B emulators are required for this performance test. The delay profiles of signals received from different Node Bs are assumed to be the same but time shifted by 10 chip periods (2604 ns).

8.6.3.1 Minimum requirements

The downlink physical channels and their relative power to I_{or} are the same as those specified in clause C.3.2 irrespective of Node Bs and the test cases. $DPCH_{Ec}/I_{or}$ value applies whenever DPDCH in the cell is transmitted. In Test 1 and Test 3, the received powers at UE from two Node Bs are the same, while 3dB offset is given to one that comes from one of Node Bs for Test 2 and Test 4 as specified in Table 8.23.

For the parameters specified in Table 8.23 the average downlink $\frac{DPCH_{Ec}}{I_{or}}$ power shall be below the specified value for the BLER shown in Table 8.24.

Table 8.23: DCH parameters in multi-path propagation conditions during SSDT mode (Propagation condition: Case 1)

| Parameter | Unit | Test 1 | Test 2 | Test 3 | Test 4 |

| 1 | -7.5 dB | 10^{-2} |
| 2 | -6.5 dB | 10^{-2} |
| 3 | -10.5 dB | 10^{-2} |
| 4 | -9.2 dB | 10^{-2} |

8.7 Demodulation in Handover conditions

8.7.1 Demodulation of DCH in Inter-Cell Soft Handover

The bit error rate characteristics of UE is determined during an inter-cell soft handover. During the soft handover a UE receives signals from different cells. A UE has to be able to demodulate two PCCPCH channels and to combine the energy of DCH channels. Delay profiles of signals received from different cells are assumed to be the same but time shifted by 10 chips.

The receive characteristics of the different channels during inter-cell handover are determined by the average Block Error Ratio (BLER) values.

8.7.1.1 Minimum requirement

For the parameters specified in Table 8.25 the average downlink $\frac{DPCH_E_c}{I_{or}}$ power shall be below the specified value for the BLER shown in Table 8.26.

Table 8.25: DCH parameters in multi-path propagation conditions during Soft Handoff (Case 3)

| | -5.5 dB | 10^{-2} |

8.7.2 Combining of TPC commands from radio links of different radio link sets

8.7.2.1 Minimum requirement

Test parameters are specified in Table 8.27. The delay profiles of the signals received from the different cells are the same but time-shifted by 10 chips.

For Test 1, the uplink power changes between adjacent slots shall be as shown in Table 8.28 over the 4 consecutive slots. Note that this case is without an additional noise source I_{oc} .

For Test 2, the Cell1 and Cell2 TPC patterns are repeated a number of times. If the transmitted power of a given slot is increased compared to the previous slot, then a variable "Transmitted power UP" is increased by one, otherwise a variable "Transmitted power DOWN" is increased by one. The requirements for "Transmitted power UP" and "Transmitted power DOWN" are shown in Table 8.28A.

Table 8.27: Parameters for TPC command combining

| Parameter | Unit | Test 1 | Test 2 |
|-------------------------------------|--------------|-------------------------------------|--------------------------|

8.8 Power control in downlink

Power control in the downlink is the ability of the UE receiver to converge to required link quality set by the network while using as low power as possible in downlink . If a BLER target has been assigned to a DCCH (See Annex A.3), then it has to be such that outer loop is based on DTCH and not on DCCH.

8.8.1 Power control in the downlink, constant BLER target

8.8.1.1 Minimum requirements

For the parameters specified in Table 8.29 the downlink $\frac{DPCH_Ec}{I_{or}}$ power measured values, which are averaged

over one slot, shall be below the specified value in Table 8.30 more than 90% of the time. BLER shall be as shown in Table 8.30. Power control in downlink is ON during the test.

Table 8.29: Test parameter for downlink power control

| Parameter | Unit | Test 1 | Test 2 |
|--|--------------|------------|--------|
| \hat{I}_{or}/I_{oc} | dB | 9 | -1 |
| I_{oc} | dBm/3.84 MHz | -60 | |
| Information Data Rate | kbps | 12.2 | |

| Minimum_DL_Power * | dB | -18 | |
| DL Power Control step size, Δ_{TPC} | dB | 1 | |
| Limited Power Increase | - | "Not used" | |

NOTE: Power is compared to P-CPICH as specified in [4].

Table 8.30: Requirements in downlink power control

| Parameter | Unit | Test 1 | Test 2 |
|----------------------------|------|----------|----------|
| $\frac{DPCH_E_c}{I_{or}}$ | dB | -16.0 | -9.0 |
| Measured quality on DTCH | BLER | 0.01±30% | 0.01±30% |

8.8.2 Power control in the downlink, initial convergence

This requirement verifies that DL power control works properly during the first seconds after DPCH connection is established

8.8.2.1 Minimum requirements

For the parameters specified in Table 8.31 the downlink DPCH_Ec/I_{or} power measured values, which are averaged over 50 ms, shall be within the range specified in Table 8.32 more than 90% of the time. T1 equals to 500 ms and it starts 10 ms after the DPDCH connection is initiated. T2 equals to 500 ms and it starts when T1 has expired. Power control is ON during the test.

Table 8.31: Test parameters for downlink power control

| Parameter | Unit | Test 1 | Test 2 | Test 3 | Test 4 |
|--|--------------|------------|--------|--------|--------|
| Target quality value on DTCH | BLER | 0.01 | 0.01 | 0.1 | 0.1 |
| Initial DPCH_Ec/I _{or} | dB | -5.9 | -25.9 | -2.1 | -22.1 |
| Information Data Rate | kbps | 12.2 | 12.2 | 64 | 64 |
| \hat{I}_{or}/I_{oc} | dB | -1 | | | |
| I_{oc} | dBm/3.84 MHz | -60 | | | |
| Propagation condition | | Static | | | |
| Maximum_DL_Power | dB | 7 | | | |
| Minimum_DL_Power | dB | -18 | | | |
| DL Power Control step size, Δ_{TPC} | dB | 1 | | | |
| Limited Power Increase | - | "Not used" | | | |

Table 8.32: Requirements in downlink power control

| Parameter | Unit | Test 1 and Test 2 | Test 3 and Test 4 |
|--------------------------------------|------|--------------------------------------|--------------------------------------|
| $\frac{DPCH_E_c}{I_{or}}$ during T1 | dB | $-18.9 \leq DPCH_Ec/lor \leq -11.9$ | $-15.1 \leq DPCH_Ec/lor \leq -8.1$ |
| $\frac{DPCH_E_c}{I_{or}}$ during T2 | dB | $-18.9 \leq DPCH_Ec/lor \leq -14.9$ | $-15.1 \leq DPCH_Ec/lor \leq -11.1$ |

8.8.3 Power control in downlink, wind up effects

8.8.3.1 Minimum requirements

This test is run in three stages where stage 1 is for convergence of the power control loop, in stage two the maximum downlink power for the dedicated channel is limited not to be higher than the parameter specified in Table 8.33. All parameters used in the three stages are specified in Table 8.33. The downlink $\frac{DPCH_E_c}{I_{or}}$ power measured values, which are averaged over one slot, during stage 3 shall be lower than the value specified in Table 8.34 more than 90% of the time.

Power control of the UE is ON during the test.

Table 8.33: Test parameter for downlink power control, wind-up effects

| Parameter | Unit | Test 1 | | |
|--|--------------|------------|---------|---------|
| | | Stage 1 | Stage 2 | Stage 3 |
| Time in each stage | s | >15 | 5 | 0.5 |
| \hat{I}_{or}/I_{oc} | dB | 5 | | |
| I_{oc} | dBm/3.84 MHz | -60 | | |
| Information Data Rate | kbps | 12.2 | | |
| Quality target on DTCH | BLER | 0.01 | | |
| Propagation condition | | Case 4 | | |
| Maximum_DL_Power | dB | 7 | -6.2 | 7 |
| Minimum_DL_Power | dB | -18 | | |
| DL Power Control step size, Δ_{TPC} | dB | 1 | | |
| Limited Power Increase | - | "Not used" | | |

Table 8.34: Requirements in downlink power control, wind-up effects

| Parameter | Unit | Test 1, stage 3 |
|----------------------------|------|-----------------|
| $\frac{DPCH_E_c}{I_{or}}$ | dB | -13.3 |

8.9 Downlink compressed mode

Downlink compressed mode is used to create gaps in the downlink transmission, to allow the UE to make measurements on other frequencies.

8.9.1 Single link performance

The receiver single link performance of the Dedicated Traffic Channel (DCH) in compressed mode is determined by the Block Error Ratio (BLER) and transmitted DPCH_Ec/Ior power in the downlink.

The compressed mode parameters are given in clause A.5. Tests 1 and 2 are using Set 1 compressed mode pattern parameters from Table A.21 in clause A.5 while tests 3 and 4 are using Set 2 compressed mode patterns from the same table.

8.9.1.1 Minimum requirements

For the parameters specified in Table 8.35 the downlink $\frac{DPCH_E_c}{I_{or}}$ power measured values, which are averaged over one slot, shall be below the specified value in Table 8.36 more than 90% of the time. The measured quality on DTCH shall be as required in Table 8.36.

Downlink power control is ON during the test. Uplink TPC commands shall be error free. System simulator shall increase the transmitted power during compressed frames by the same amount that UE is expected to increase its SIR target during those frames.

Table 8.35: Test parameter for downlink compressed mode

| Parameter | Unit | Test 1 | Test 2 | Test 3 | Test 4 |
|--|--------------|------------|--------|--------|--------|
| Delta SIR1 | dB | 0 | 3 | 0 | 3 |
| Delta SIR after1 | dB | 0 | 3 | 0 | 3 |
| Delta SIR2 | dB | 0 | 0 | 0 | 0 |
| Delta SIR after2 | dB | 0 | 0 | 0 | 0 |
| \hat{I}_{or}/I_{oc} | dB | 9 | | | |
| I_{oc} | dBm/3.84 MHz | -60 | | | |
| Information Data Rate | kbps | 12.2 | | | |
| Propagation condition | | Case 2 | | | |
| Target quality value on DTCH | BLER | 0.01 | | | |
| Maximum_DL_Power | dB | 7 | | | |
| Minimum_DL_Power | dB | -18 | | | |
| DL Power Control step size, Δ_{TPC} | dB | 1 | | | |
| Limited Power Increase | - | "Not used" | | | |

Table 8.36: Requirements in downlink compressed mode

| Parameter | Unit | Test 1 | Test 2 | Test 3 | Test 4 |
|--|------|-----------------|-----------------|-----------------|-----------------|
| $\frac{DPCH_E_c}{I_{or}}$ | dB | -15.4 | No requirements | -15.4 | No requirements |
| Measured quality of compressed and recovery frames | BLER | No requirements | <0.001 | No requirements | <0.001 |
| Measured quality on DTCH | BLER | 0.01 ± 30 % | | | |

8.10 Blind transport format detection

Performance of Blind transport format detection is determined by the Block Error Ratio (BLER) values and by the measured average transmitted $DPCH_E_c/I_{or}$ value.

8.10.1 Minimum requirement

For the parameters specified in Table 8.37 the average downlink $\frac{DPCH_E_c}{I_{or}}$ power shall be below the specified value for the BLER shown in Table 8.38.

Table 8.37: Test parameters for Blind transport format detection

| Parameter | Unit | Test 1 | Test 2 | Test 3 | Test 4 | Test 5 | Test 6 |
|-----------------------|--------------|------------------|------------------|------------------|--------------------------|------------------|------------------|
| \hat{I}_{or}/I_{oc} | dB | -1 | | | -3 | | |
| I_{oc} | dBm/3.84 MHz | -60 | | | | | |
| Information Data Rate | kbps | 12.2 (rate 1) | 7.95 (rate 2) | 1.95 (rate 3) | 12.2 (rate 1) | 7.95 (rate 2) | 1.95 (rate 3) |
| propagation condition | - | static | | | multi-path fading case 3 | | |
| TFCI | - | off | | | | | |

Table 8.38: The Requirements for DCH reception in Blind transport format detection

| Test Number | $\frac{DPCH_E_c}{I_{or}}$ | BLER | FDR |
|-------------|----------------------------|-----------|-----------|
| 1 | -17.7 dB | 10^{-2} | 10^{-4} |
| 2 | -17.8 dB | 10^{-2} | 10^{-4} |
| 3 | -18.4 dB | 10^{-2} | 10^{-4} |
| 4 | -13.0 dB | 10^{-2} | 10^{-4} |
| 5 | -13.2 dB | 10^{-2} | 10^{-4} |
| 6 | -13.8 dB | 10^{-2} | 10^{-4} |

* The value of DPCH_Ec/Ior, Ioc, and Ior/Ioc are defined in case of DPCH is transmitted

NOTE: In this test, 9 different Transport Format Combinations (Table 8.39) are sent during the call set up procedure, so that the UE has to detect the correct transport format from these 9 candidates.

Table 8.39: Transport format combinations informed during the call set up procedure in the test

| | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
|------|-------|-------|-------|------|------|------|-------|-------|-------|
| DTCH | 12.2k | 10.2k | 7.95k | 7.4k | 6.7k | 5.9k | 5.15k | 4.75k | 1.95k |
| DCCH | 2.4k | | | | | | | | |

8.11 Detection of Broadcast channel (BCH)

The receiver characteristics of Broadcast Channel (BCH) are determined by the Block Error Ratio (BLER) values. BCH is mapped into the primary common control physical channel (P-CCPCH).

8.11.1 Minimum requirement

For the parameters specified in Table 8.40 the average downlink power P-CCPCH_Ec/Ior shall be below the specified value for the BLER shown in Table 8.41.

This requirement doesn't need to be tested.

Table 8.40: Parameters for BCH detection

| Parameter | Unit | Test 1 | Test 2 |
|-----------------------|--------------|---------|--------|
| Phase reference | - | P-CPICH | |
| I_{oc} | dBm/3.84 MHz | -60 | |
| \hat{I}_{or}/I_{oc} | dB | -1 | -3 |
| Propagation condition | | Static | Case 3 |

Table 8.41: Test requirements for BCH detection

| Test Number | P-CCPCH_Ec/Ior | BLER |
|-------------|----------------|------|
| 1 | -18.5 dB | 0.01 |
| 2 | -12.8 dB | 0.01 |

8.12 Demodulation of Paging Channel (PCH)

The receiver characteristics of paging channel are determined by the probability of missed paging message (Pm-p). PCH is mapped into the S-CCPCH and it is associated with the transmission of Paging Indicators (PI) to support efficient sleep-mode procedures.

8.12.1 Minimum requirement

For the parameters specified in Table 8.42 the average probability of missed paging (Pm-p) shall be below the specified value in Table 8.43. Power of downlink channels other than S-CCPCH and PICH are as defined in Table C.3 of Annex C. S-CCPCH structure is as defined in Annex A.6.

Table 8.42: Parameters for PCH detection

| Parameter | Unit | Test 1 | Test 2 |
|--|--------------|---------|--------|
| Number of paging indicators per frame (Np) | - | 72 | |
| Phase reference | - | P-CPICH | |
| I_{oc} | dBm/3.84 MHz | -60 | |
| \hat{I}_{or}/I_{oc} | dB | -1 | -3 |
| Propagation condition | | Static | Case 3 |

Table 8.43: Test requirements for PCH detection

| Test Number | S-CCPCH_Ec/Ior | PICH_Ec/Ior | Pm-p |
|-------------|----------------|-------------|------|
| 1 | -14.8 | -19.2 | 0.01 |
| 2 | -9.8 | -12.2 | 0.01 |

8.13 Detection of Acquisition Indicator (AI)

The receiver characteristics of Acquisition Indicator (AI) are determined by the probability of false alarm Pfa and probability of correct detection Pd. Pfa is defined as a conditional probability of detection of AI signature given that a AI signature was not transmitted. Pd is defined as a conditional probability of correct detection of AI signature given that the AI signature is transmitted.

8.13.1 Minimum requirement

For the parameters specified in Table 8.44 the Pfa and 1-Pd shall not exceed the specified values in Table 8.45. Power of downlink channels other than AICH is as defined in Table C.3 of Annex C.

Table 8.44: Parameters for AI detection

| Parameter | Unit | Test 1 |
|---|--------------|---------|
| Phase reference | - | P-CPICH |
| I_{oc} | dBm/3.84 MHz | -60 |
| Number of other transmitted AI signatures on AICH | - | 0 |
| \hat{I}_{or}/I_{oc} | dB | -1 |
| AICH_Ec/Ior | dB | -22.0 |
| AICH Power Offset | dB | -12.0 |
| Propagation condition | - | Static |

Note that AICH_Ec/Ior can not be set. Its value is calculated from other parameters and it is given for information only. (AICH_Ec/Ior = AICH Power Offset + CPICH_Ec/Ior)

Table 8.45: Test requirements for AI detection

| Test Number | Pfa | 1-Pd |
|--------------------|------------|-------------|
| 1 | 0.01 | 0.01 |

Annex A (normative): Measurement channels

A.1 General

The measurement channels in this annex are defined to derive the requirements in clauses 6, 7 and 8. The measurement channels represent example configuration of radio access bearers for different data rates.

The measurement channel for 12.2 kbps shall be supported by any UE both in up- and downlink. Support for other measurement channels is depending on the UE Radio Access capabilities.

A.2 UL reference measurement channel

A.2.1 UL reference measurement channel (12.2 kbps)

The parameters for the 12.2 kbps UL reference measurement channel are specified in Table A.1 and Table A.2. The channel coding for information is shown in figure A.1.

Table A.1: UL reference measurement channel physical parameters (12.2 kbps)

| Parameter | Unit | Level |
|---|------|-------|
| Information bit rate | kbps | 12.2 |
| DPDCH | kbps | 60 |
| DPCCH | kbps | 15 |
| DPCCH Slot Format #i | - | 0 |
| DPCCH/DPDCH power ratio | dB | -5.46 |
| TFCI | - | On |
| Repetition | % | 23 |
| NOTE: Slot Format #2 is used for closed loop tests in subclause 8.6.2. Slot Format #2 and #5 are used for site selection diversity transmission tests in subclause 8.6.3 | | |

Table A.2: UL reference measurement channel, transport channel parameters (12.2 kbps)

| Parameters | DTCH | DCCH |
|----------------------------|--------------------|--------------------|

Figure A.11 (Informative): Channel coding of DL reference measurement channel for BTFD (Rate 3)

A.5 DL reference compressed mode parameters

Parameters described in Table A.21 are used in some test specified in TS 25.101 while parameters described in Table A.22 are used in some tests specified in TS 25.133.

Set 1 parameters in Table A.21 are applicable when compressed mode by spreading factor reduction is used in downlink. Set 2 parameters in Table A.21 are applicable when compressed mode by puncturing is used in downlink.

Table A.21: Compressed mode reference pattern 1 parameters

| Parameter | Set 1 | Set 2 | Note |
|---|---------|------------|---|
| TGSN (Transmission Gap Starting Slot Number) | 11 | 11 | |
| TGL1 (Transmission Gap Length 1) | 7 | 7 | |
| TGL2 (Transmission Gap Length 2) | - | - | Only one gap in use. |
| TGD (Transmission Gap Distance) | 0 | 0 | Only one gap in use. |
| TGPL1 (Transmission Gap Pattern Length) | 4 | 4 | |
| TGPL2 (Transmission Gap Pattern Length) | - | - | Only one pattern in use. |
| TGPRC (Transmission Gap Pattern Repetition Count) | NA | NA | Defined by higher layers |
| TGCFN (Transmission Gap Connection Frame Number): | NA | NA | Defined by higher layers |
| UL/DL compressed mode selection | DL & UL | DL & UL | 2 configurations possible DL & UL / DL |
| UL compressed mode method | SF/2 | SF/2 | |
| DL compressed mode method | SF/2 | Puncturing | |
| Downlink frame type and Slot format | 11B | 11A | |
| Scrambling code change | No | No | |
| RPP (Recovery period power control mode) | 0 | 0 | |
| ITP (Initial transmission power control mode) | 0 | 0 | |

Table A.22: Compressed mode reference pattern 2 parameters

| Parameter | Set 1 | Set 2 | Note |
|---|---------|---------|--|
| TGSN (Transmission Gap Starting Slot Number) | 4 | 4 | |
| TGL1 (Transmission Gap Length 1) | 7 | 7 | |
| TGL2 (Transmission Gap Length 2) | - | - | Only one gap in use. |
| TGD (Transmission Gap Distance) | 0 | 0 | |
| TGPL1 (Transmission Gap Pattern Length) | 3 | 12 | |
| TGPL2 (Transmission Gap Pattern Length) | - | - | Only one pattern in use. |
| TGPRC (Transmission Gap Pattern Repetition Count) | NA | NA | Defined by higher layers |
| TGCFN (Transmission Gap Connection Frame Number): | NA | NA | Defined by higher layers |
| UL/DL compressed mode selection | DL & UL | DL & UL | 2 configurations possible. DL & UL / DL |
| UL compressed mode method | SF/2 | SF/2 | |
| DL compressed mode method | SF/2 | SF/2 | |
| Downlink frame type and Slot format | 11B | 11B | |
| Scrambling code change | No | No | |
| RPP (Recovery period power control mode) | 0 | 0 | |
| ITP (Initial transmission power control mode) | 0 | 0 | |

A.6 DL reference parameters for PCH tests

The parameters for the PCH demodulation tests are specified in Table A.23 and Table A.24.

Table A.23: Physical channel parameters for S-CCPCH.

| Parameter | Unit | Level |
|---|------|-------|
| Channel bit rate | kbps | 60 |
| Channel symbol rate | ksps | 30 |
| Slot Format #i | - | 4 |
| TFCI | - | OFF |
| Power offsets of TFCI and Pilot fields relative to data field | dB | 0 |

Table A.24: Transport channel parameters for S-CCPCH

| Parameter | PCH |
|---------------------------------|--------------------|
| Transport Channel Number | 1 |
| Transport Block Size | 240 |
| Transport Block Set Size | 240 |
| Transmission Time Interval | 10 ms |
| Type of Error Protection | Convolution Coding |
| Coding Rate | 1/2 |
| Rate Matching attribute | 256 |
| Size of CRC | 16 |
| Position of TrCH in radio frame | fixed |

Annex B (normative): Propagation conditions

B.1 General

B.2 Propagation Conditions

B.2.1 Static propagation condition

The propagation for the static performance measurement is an Additive White Gaussian Noise (AWGN) environment. No fading and multi-paths exist for this propagation model.

B.2.2 Multi-path fading propagation conditions

Table B1 shows propagation conditions that are used for the performance measurements in multi-path fading environment. All taps have classical Doppler spectrum.

Table B.1: Propagation Conditions for Multi path Fading Environments

| Case 1, speed 3km/h | | Case 2, speed 3 km/h | | Case 3, speed 120 km/h | | Case 4, speed 3 km/h | | * Case 5, speed 50 km/h | | Case 6, speed 250 km/h | |
|------------------------|--------------------|-------------------------|--------------------|---------------------------|--------------------|-------------------------|--------------------|----------------------------|--------------------|---------------------------|--------------------|
| Relative Delay [ns] | Average Power [dB] | Relative Delay [ns] | Average Power [dB] | Relative Delay [ns] | Average Power [dB] | Relative Delay [ns] | Average Power [dB] | Relative Delay [ns] | Average Power [dB] | Relative Delay [ns] | Average Power [dB] |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 976 | -10 | 976 | 0 | 260 | -3 | 976 | 0 | 976 | -10 | 260 | -3 |
| | | 20000 | 0 | 521 | -6 | | | | | 521 | -6 |
| | | | | 781 | -9 | | | | | 781 | -9 |

NOTE: Case 5 is only used in TS25.133.

B.2.3 Moving propagation conditions

The dynamic propagation conditions for the test of the baseband performance are non fading channel models with two taps. The moving propagation condition has two tap, one static, Path0, and one moving, Path1. The time difference between the two paths is according Equation (B.1). The taps have equal strengths and equal phases.

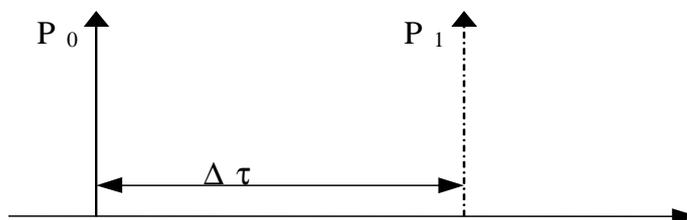

Figure B.1: The moving propagation conditions

$$\Delta \tau = B + \frac{A}{2} (1 + \sin(\Delta \omega \cdot t)) \tag{B.1}$$

The parameters in the equation are shown in the following table.

Table B.2

| Parameter | Value |
|----------------|-----------------------------------|
| A | 5 μs |
| B | 1 μs |
| $\Delta\omega$ | $40 \cdot 10^{-3} \text{ s}^{-1}$ |

B.2.4 Birth-Death propagation conditions

The dynamic propagation conditions for the test of the base band performance is a non fading propagation channel with two taps. The moving propagation condition has two taps, Path1 and Path2 which alternate between 'birth' and 'death'. The positions the paths appear are randomly selected with an equal probability rate and is shown in Figure B.2.

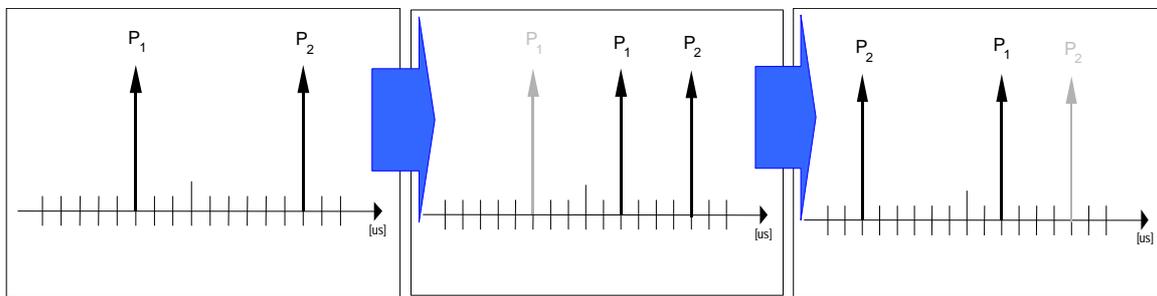

Figure B.2: Birth death propagation sequence

1. Two paths, Path1 and Path2 are randomly selected from the group $[-5, -4, -3, -2, -1, 0, 1, 2, 3, 4, 5]$ μs . The paths have equal magnitudes and equal phases.
2. After 191 ms, Path1 vanishes and reappears immediately at a new location randomly selected from the group $[-5, -4, -3, -2, -1, 0, 1, 2, 3, 4, 5]$ μs but excludes the point Path 2. The magnitudes and the phases of the tap coefficients of Path 1 and Path 2 shall remain unaltered.
3. After an additional 191 ms, Path2 vanishes and reappears immediately at a new location randomly selected from the group $[-5, -4, -3, -2, -1, 0, 1, 2, 3, 4, 5]$ μs but excludes the point Path 1. The magnitudes and the phases of the tap coefficients of Path 1 and Path 2 shall remain unaltered.

The sequence in 2) and 3) is repeated.

Annex C (normative): Downlink Physical Channels

C.1 General

This annex specifies the downlink physical channels that are needed for setting a connection and channels that are needed during a connection.

C.2 Connection Set-up

Table C.1 describes the downlink Physical Channels that are required for connection set up.

Table C.1. Downlink Physical Channels required for connection set-up

| Physical Channel |
|------------------|
| P-CPICH |
| P-CCPCH |
| SCH |
| S-CCPCH |
| PICH |
| AICH |
| DPCH |

C.3 During connection

The following clauses, describes the downlink Physical Channels that are transmitted during a connection i.e., when measurements are done. For these measurements the offset between DPCH and SCH shall be zero chips at Node B meaning that SCH is overlapping with the first symbols in DPCH in the beginning of DPCH slot structure.

C.3.1 Measurement of Rx Characteristics

Table C.2 is applicable for measurements on the Receiver Characteristics (clause 7) with the exception of subclause 7.4 (Maximum input level).

Table C.2: Downlink Physical Channels transmitted during a connection

| Physical Channel | Power |
|------------------|--|
| P-CPICH | $P\text{-CPICH_Ec} / DPCH_Ec = 7 \text{ dB}$ |
| P-CCPCH | $P\text{-CCPCH_Ec} / DPCH_Ec = 5 \text{ dB}$ |
| SCH | $SCH_Ec / DPCH_Ec = 5 \text{ dB}$ |
| PICH | $PICH_Ec / DPCH_Ec = 2 \text{ dB}$ |
| DPCH | Test dependent power |

C.3.2 Measurement of Performance requirements

Table C.3 is applicable for measurements on the Performance requirements (clause 8), including subclause 7.4 (Maximum input level) and subclause 6.4.4 (Out-of-synchronization handling of output power).

Table C.3: Downlink Physical Channels transmitted during a connection¹

| Physical Channel | Power | NOTE |
|------------------|--|--|
| P-CPICH | P-CPICH_Ec/Ior = -10 dB | Use of P-CPICH or S-CPICH as phase reference is specified for each requirement and is also set by higher layer signalling. |
| S-CPICH | S-CPICH_Ec/Ior = -10 dB | When S-CPICH is the phase reference in a test condition, the phase of S-CPICH shall be 180 degrees offset from the phase of P-CPICH. When S-CPICH is not the phase reference, it is not transmitted. |
| P-CCPCH | P-CCPCH_Ec/Ior = -12 dB | |
| SCH | SCH_Ec/Ior = -12 dB | This power shall be divided equally between Primary and Secondary Synchronous channels |
| PICH | PICH_Ec/Ior = -15 dB | |
| DPCH | Test dependent power | When S-CPICH is the phase reference in a test condition, the phase of DPCH shall be 180 degrees offset from the phase of P-CPICH. |
| OCNS | Necessary power so that total transmit power spectral density of Node B (Ior) adds to one ¹ | OCNS interference consists of 16 dedicated data channels as specified in table C.6. |

NOTE 1 For dynamic power correction required to compensate for the presence of transient channels, e.g. control channels, a subset of the DPCH channels may be used.

C.3.3 Connection with open-loop transmit diversity mode

Table C.4 is applicable for measurements for subclause 8.6.1 (Demodulation of DCH in open loop transmit diversity mode).

Table C.4: Downlink Physical Channels transmitted during a connection¹

| Physical Channel | Power | NOTE |
|---------------------|--|---|
| P-CPICH (antenna 1) | P-CPICH_Ec1/lor = -13 dB | 1. Total P-CPICH_Ec/lor = -10 dB |
| P-CPICH (antenna 2) | P-CPICH_Ec2/lor = -13 dB | |
| P-CCPCH (antenna 1) | P-CCPCH_Ec1/lor = -15 dB | 1. STTD applied 2. Total P-CCPCH_Ec/lor = -12 dB |
| P-CCPCH (antenna 2) | P-CCPCH_Ec2/lor = -15 dB | |
| SCH (antenna 1 / 2) | SCH_Ec/lor = -12 dB | 1. TSTD applied. 2. This power shall be divided equally between Primary and Secondary Synchronous channels |
| PICH (antenna 1) | PICH_Ec1/lor = -18 dB | 1. STTD applied 2. Total PICH_Ec/lor = -15 dB |
| PICH (antenna 2) | PICH_Ec2/lor = -18 dB | |
| DPCH | Test dependent power | 1. STTD applied 2. Total power from both antennas |
| OCNS | Necessary power so that total transmit power spectral density of Node B (lor) adds to one ¹ | 1. This power shall be divided equally between antennas 2. OCNS interference consists of 16 dedicated data channels as specified in Table C.6. |

NOTE 1 For dynamic power correction required to compensate for the presence of transient channels, e.g. control channels, a subset of the DPCH channels may be used.

C.3.4 Connection with closed loop transmit diversity mode

Table C.5 is applicable for measurements for subclause 8.6.2 (Demodulation of DCH in closed loop transmit diversity mode).

Table C.5: Downlink Physical Channels transmitted during a connection¹

| Physical Channel | Power | NOTE |
|---------------------|--|--|
| P-CPICH (antenna 1) | P-CPICH_Ec1/lor = -13 dB | 1. Total P-CPICH_Ec/lor = -10 dB |
| P-CPICH (antenna 2) | P-CPICH_Ec2/lor = -13 dB | |
| P-CCPCH (antenna 1) | P-CCPCH_Ec1/lor = -15 dB | 1. STTD applied |
| P-CCPCH (antenna 2) | P-CCPCH_Ec2/lor = -15 dB | 1. STTD applied, 2. total P-CCPCH_Ec/lor = -12 dB |
| SCH (antenna 1 / 2) | SCH_Ec/lor = -12 dB | 1. TSTD applied |
| PICH (antenna 1) | PICH_Ec1/lor = -18 dB | 1. STTD applied 2. STTD applied, total PICH_Ec/lor = -15 dB |
| PICH (antenna 2) | PICH_Ec2/lor = -18 dB | |
| DPCH | Test dependent power | 1. Total power from both antennas |
| OCNS | Necessary power so that total transmit power spectral density of Node B (lor) adds to one ¹ | 1. This power shall be divided equally between antennas 2. OCNS interference consists of 16 dedicated data channels. as specified in Table C.6. |

NOTE 1 For dynamic power correction required to compensate for the presence of transient channels, e.g. control channels, a subset of the DPCH channels may be used.

Table C.6: DPCH Channelization Code and relative level settings for OCNS signal.

| Channelization Code at SF=128 | Relative Level setting (dB) | DPCH Data |
|-------------------------------|-----------------------------|---|
| 2 | -1 | The DPCH data for each channelization code shall be uncorrelated with each other and with any wanted signal over the period of any measurement. |
| 11 | -3 | |
| 17 | -3 | |
| 23 | -5 | |
| 31 | -2 | |
| 38 | -4 | |
| 47 | -8 | |
| 55 | -7 | |
| 62 | -4 | |
| 69 | -6 | |
| 78 | -5 | |
| 85 | -9 | |
| 94 | -10 | |
| 125 | -8 | |
| 113 | -6 | |
| 119 | 0 | |

NOTE: The DPCH Channelization Codes and relative level settings are chosen to simulate a signal with realistic Peak to Average Ratio.

C.4 W-CDMA Modulated Interferer

Table C.7 describes the downlink Physical Control Channels that are transmitted as part of the W-CDMA modulated interferer.

Table C.7: Spreading Code, Timing offsets and relative level settings for W-CDMA Modulated Interferer signal control channels.

| Channel Type | Spreading Factor | Channelization Code | Timing offset ($\times 256T_{\text{chip}}$) | Relative level setting (dB) | NOTE |
|--------------|------------------|---------------------|---|-----------------------------|---|
| P-CCPCH | 256 | 1 | 0 | -1 | |
| SCH | 256 | - | 0 | -1 | The SCH power shall be divided equally between Primary and Secondary Synchronous channels |
| P-CPICH | 256 | 0 | 0 | -1 | |
| PICH | 256 | 16 | 16 | -6 | |

See table C.6 for the definition of the 16 DPCH portion of the W-CDMA modulated interferer.

Annex D (normative): Environmental conditions

D.1 General

This normative annex specifies the environmental requirements of the UE. Within these limits the requirements of the present documents shall be fulfilled.

D.2 Environmental requirements

The requirements in this clause apply to all types of UE(s).

D.2.1 Temperature

The UE shall fulfil all the requirements in the full temperature range of:

Table D.1

| | |
|------------------|---|
| +15 °C to +35 °C | for normal conditions (with relative humidity of 25 % to 75 %) |
| -10 °C to +55 °C | for extreme conditions (see IEC publications 68-2-1 and 68-2-2) |

Outside this temperature range the UE, if powered on, shall not make ineffective use of the radio frequency spectrum. In no case shall the UE exceed the transmitted levels as defined in TS 25.101 for extreme operation.

D.2.2 Voltage

The UE shall fulfil all the requirements in the full voltage range, i.e. the voltage range between the extreme voltages.

The manufacturer shall declare the lower and higher extreme voltages and the approximate shutdown voltage. For the equipment that can be operated from one or more of the power sources listed below, the lower extreme voltage shall not be higher, and the higher extreme voltage shall not be lower than that specified below.

Table D.2

| Power source | Lower extreme voltage | Higher extreme voltage | Normal conditions voltage |
|---|----------------------------------|------------------------|---------------------------|
| AC mains | 0,9 * nominal | 1,1 * nominal | nominal |
| Regulated lead acid battery | 0,9 * nominal | 1,3 * nominal | 1,1 * nominal |
| Non regulated batteries: Leclanché / lithium Mercury/nickel & cadmium | 0,85 * nominal 0,90 * nominal | Nominal Nominal | Nominal Nominal |

Outside this voltage range the UE if powered on, shall not make ineffective use of the radio frequency spectrum. In no case shall the UE exceed the transmitted levels as defined in TS 25.101 for extreme operation. In particular, the UE shall inhibit all RF transmissions when the power supply voltage is below the manufacturer declared shutdown voltage.

D.2.3 Vibration

The UE shall fulfil all the requirements when vibrated at the following frequency/amplitudes.

Table D.3

| Frequency | ASD (Acceleration Spectral Density) random vibration |
|-----------------|---|
| 5 Hz to 20 Hz | 0,96 m ² /s ³ |
| 20 Hz to 500 Hz | 0,96 m ² /s ³ at 20 Hz, thereafter -3 dB/Octave |

Outside the specified frequency range the UE, if powered on, shall not make ineffective use of the radio frequency spectrum. In no case shall the UE exceed the transmitted levels as defined in TS 25.101 for extreme operation

Annex F (informative): UE capabilities (FDD)

This annex provides the UE capabilities related to TS 25.101.

NOTES:

This annex shall be aligned with TR25.926, UE Radio Access Capabilities regarding FDD RF parameters. These RF UE Radio Access capabilities represent options in the UE, that require signalling to the network.

In addition there are options in the UE that do not require any signalling. They are designated as UE baseline capabilities, according to TR 21.904, Terminal Capability Requirements.

Table F.1 provides the list of UE radio access capability parameters and possible values for TS 25.101.

Table F.1: RF UE Radio Access Capabilities

| | UE radio access capability parameter | Value range |
|-------------------|--|---|
| FDD RF parameters | UE power class (TS 25.101, subclause 6.2.1) | 3, 4 |
| | Tx/Rx frequency separation for frequency band a) (TS 25.101, subclause 5.3) | 190 MHz, 174.8-205.2 MHz, 134.8-245.2 MHz |
| | Not applicable if UE is not operating in frequency band a) | |

Table F.2 provides the UE baseline implementation capabilities for TS 25.101.

Table F.2: UE RF Baseline Implementation Capabilities

| UE implementation capability | Value range |
|---|--------------------|
| Radio frequency bands (25.101 subclause 5.2) | a), b), a+b) |

Table G.4: Inclusion of CRs approved by TSG-RAN#9

| RAN Doc | Spec | CR | R | Ph | Subject | Cat | Curr | New |
|-----------|--------|----|---|-----|---|-----|-------|-------|
| RP-000394 | 25.101 | 71 | | R99 | Downlink power control, wind up effects | F | 3.3.1 | 3.4.0 |
| RP-000394 | 25.101 | 72 | | R99 | Inclusion of OCNS definition for performance tests | F | 3.3.1 | 3.4.0 |
| RP-000394 | 25.101 | 63 | | R99 | Corrections to DL compressed mode tests in TS 25.101 | F | 3.3.1 | 3.4.0 |
| RP-000394 | 25.101 | 64 | | R99 | Combining of TPC commands in soft handover | F | 3.3.1 | 3.4.0 |
| RP-000394 | 25.101 | 65 | | R99 | Clarifications for power steps in RACH/CPCH message transmission | F | 3.3.1 | 3.4.0 |
| RP-000394 | 25.101 | 66 | | R99 | Editorial corrections for TS 25.101 | F | 3.3.1 | 3.4.0 |
| RP-000394 | 25.101 | 67 | | R99 | Corrections to power control | F | 3.3.1 | 3.4.0 |
| RP-000394 | 25.101 | 68 | | R99 | Corrections for compressed mode patterns | F | 3.3.1 | 3.4.0 |
| RP-000394 | 25.101 | 69 | | R99 | Editorial modification for BTFD measurement channels | F | 3.3.1 | 3.4.0 |
| RP-000394 | 25.101 | 75 | | R99 | Editorial modification to Annex A.5 of TS 25.101 | F | 3.3.1 | 3.4.0 |
| RP-000394 | 25.101 | 76 | | R99 | Tap magnitudes and phases for Birth-Death propagation conditions | F | 3.3.1 | 3.4.0 |
| RP-000394 | 25.101 | 73 | | R99 | Removal of confidence levels | F | 3.3.1 | 3.4.0 |
| RP-000394 | 25.101 | 74 | | R99 | Corrections to all tests with power control ON in TS 25.101 | F | 3.3.1 | 3.4.0 |
| RP-000394 | 25.101 | 70 | | R99 | Definition of period for frequency error | F | 3.3.1 | 3.4.0 |
| RP-000394 | 25.101 | 77 | | R99 | UE emission mask measurement filter definition correction for TS 25.101 | F | 3.3.1 | 3.4.0 |
| RP-000394 | 25.101 | 78 | | R99 | Handling of measurement uncertainties in UE radio conformance testing (FDD) | F | 3.3.1 | 3.4.0 |
| | | | | | Re-inclusion of reference [4] which had been accidentally deleted. | | 3.4.0 | 3.4.1 |

Table G.5: CRs approved at RAN#10

| RAN Doc | Spec | CR | R | Ph | Subject | Cat | Curr | New |
|-----------|--------|----|---|-----|---|-----|-------|-------|
| R4-000885 | 25.101 | 79 | | R99 | Proposed CR to TS 25.101 on subclause 7.8 RX Intermodulation | F | 3.4.1 | 3.5.0 |
| R4-000901 | 25.101 | 80 | | R99 | Corrections to DL compressed mode tests in TS 25.101 | F | 3.4.1 | 3.5.0 |
| R4-000902 | 25.101 | 81 | | R99 | Correction to DL 384 kbps and BTFD measurement channels | F | 3.4.1 | 3.5.0 |
| R4-000917 | 25.101 | 82 | | R99 | Compressed mode, proposal for specification | F | 3.4.1 | 3.5.0 |
| R4-000973 | 25.101 | 82 | | R99 | RX spurious emissions | F | 3.4.1 | 3.5.0 |
| R4-000982 | 25.101 | 84 | | R99 | Correction for 25.101 concerning the channel number calculation | F | 3.4.1 | 3.5.0 |
| R4-000990 | 25.101 | 85 | | R99 | Definition of multi-code OCNS signal for receiver and performance tests | F | 3.4.1 | 3.5.0 |

Table G.6: CRs approved at RAN#11

| RAN Doc | Spec | CR | R | Ph | Subject | Cat | Curr | New |
|-----------|--------|----|---|-----|---|-----|-------|-------|
| RP-010085 | 25.101 | 86 | | R99 | CR to 25.101 for Test Tolerances | F | 3.5.0 | 3.6.0 |
| RP-010085 | 25.101 | 87 | | R99 | Proposed CR to TS 25.101 on subclause 3.2 Abbreviations | F | 3.5.0 | 3.6.0 |
| RP-010085 | 25.101 | 88 | | R99 | Correction of version number of the ITU-R Recommendation SM.329 | F | 3.5.0 | 3.6.0 |
| RP-010085 | 25.101 | 89 | | R99 | REL 99 Corrections | F | 3.5.0 | 3.6.0 |
| RP-010085 | 25.101 | 90 | | R99 | Tx power during measurement on Rx characteristics | F | 3.5.0 | 3.6.0 |
| RP-010085 | 25.101 | 91 | | R99 | Removal of square brackets and TBDs from TS 25.101 | F | 3.5.0 | 3.6.0 |
| RP-010085 | 25.101 | 92 | | R99 | Correction of Definition of multi-code OCNS signal | F | 3.5.0 | 3.6.0 |
| RP-010085 | 25.101 | 93 | | R99 | Performance requirement for 250km/h | F | 3.5.0 | 3.6.0 |
| RP-010085 | 25.101 | 94 | | R99 | TS25.101 Rel 99 Clarification of UARFCN (channel number) | F | 3.5.0 | 3.6.0 |

Table G.7: Release 4 CRs approved at RAN#11

| RAN Doc | Spec | CR | R | Ph | Subject | Cat | Curr | New |
|-----------|--------|----|---|----|---|-----|-------|-------|
| RP-010100 | 25.101 | 96 | | R4 | Performance requirements BCH | B | 3.6.0 | 4.0.0 |
| RP-010100 | 25.101 | 97 | | R4 | Performance requirements for paging channel | B | 3.6.0 | 4.0.0 |
| RP-010100 | 25.101 | 98 | | R4 | Performance requirements for AI channel | B | 3.6.0 | 4.0.0 |

Table G.8: Release 4 CRs approved at RAN#12

| RAN Doc | Spec | CR | R | Ph | Title | Cat | Curr | New |
|-----------|--------|-----|---|-------|---|-----|-------|-------|
| RP-010347 | 25.101 | 100 | | Rel-4 | Correction for SSDT test parameters | A | 4.0.0 | 4.1.0 |
| RP-010347 | 25.101 | 104 | | Rel-4 | UL DPCCCH slot format for performance tests | A | 4.0.0 | 4.1.0 |
| RP-010347 | 25.101 | 108 | | Rel-4 | Terminology for power definition | A | 4.0.0 | 4.1.0 |
| RP-010347 | 25.101 | 110 | | Rel-4 | out of synchronization handling | A | 4.0.0 | 4.1.0 |
| RP-010347 | 25.101 | 112 | | Rel-4 | Clarification of limits for inner loop power control | A | 4.0.0 | 4.1.0 |
| RP-010347 | 25.101 | 114 | | Rel-4 | UE EVM definition | A | 4.0.0 | 4.1.0 |
| RP-010347 | 25.101 | 116 | | Rel-4 | CR on the Modification to OCNS code channels to allow for 384 kbps allocation | A | 4.0.0 | 4.1.0 |
| RP-010358 | 25.101 | 117 | | Rel-4 | Correction of AICH performance | F | 4.0.0 | 4.1.0 |

Table G.9: Release 4 CRs approved at RAN#13

| RAN Tdoc | Spec | CR | R | Ph | Title | Cat | Curr | New |
|-----------|--------|-----|---|-------|---|-----|-------|-------|
| RP-010614 | 25.101 | 119 | | Rel-4 | Compressed mode, correction of reference pattern 1, Set1 | A | 4.1.0 | 4.2.0 |
| RP-010614 | 25.101 | 121 | | Rel-4 | DL Power Control Step Size in performance requirements | A | 4.1.0 | 4.2.0 |
| RP-010614 | 25.101 | 123 | | Rel-4 | Correction for test numbers in fading propagation tests | A | 4.1.0 | 4.2.0 |
| RP-010614 | 25.101 | 125 | | Rel-4 | Correction of frequency range for receiver spurious emission requirements | A | 4.1.0 | 4.2.0 |
| RP-010614 | 25.101 | 127 | | Rel-4 | UE Maximum Output Power | A | 4.1.0 | 4.2.0 |
| RP-010614 | 25.101 | 129 | | Rel-4 | Clarification of definition of Df | A | 4.1.0 | 4.2.0 |
| RP-010614 | 25.101 | 131 | | Rel-4 | CR to TS25.101 for clarification of modulated interferer | A | 4.1.0 | 4.2.0 |
