

ETSI TS 125 222 V9.1.0 (2010-04)

Technical Specification

**Universal Mobile Telecommunications System (UMTS);
Multiplexing and channel coding (TDD)
(3GPP TS 25.222 version 9.1.0 Release 9)**

ReferenceRTS/TSGR-0125222v910

Important notice

Individual copies of the present document can be downloaded from:

<http://www.etsi.org>

The present document may be made available in more than one electronic version or in print. In any case of existing or perceived difference in contents between such versions, the reference version is the Portable Document Format (PDF). In case of dispute, the reference shall be the printing on ETSI printers of the PDF version kept on a specific network drive within ETSI Secretariat.

Users of the present document should be aware that the document may be subject to revision or change of status. Information on the current status of this and other ETSI documents is available at

<http://portal.etsi.org/tb/status/status.asp>

If you find errors in the present document, please send your comment to one of the following services:

DECTTM, **PLUGTESTS**TM, **UMTS**TM, **TIPHON**TM, the TIPHON logo and the ETSI logo are Trade Marks of ETSI registered for the benefit of its Members.

3GPPTM is a Trade Mark of ETSI registered for the benefit of its Members and of the 3GPP Organizational Partners.

LTETM is a Trade Mark of ETSI currently being registered

for the benefit of its Members and of the 3GPP Organizational Partners.

GSM[®] and the GSM logo are Trade Marks registered and owned by the GSM Association.

Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: "*Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards*", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (<http://webapp.etsi.org/IPR/home.asp>).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Foreword

This Technical Specification (TS) has been produced by ETSI 3rd Generation Partnership Project (3GPP).

The present document may refer to technical specifications or reports using their 3GPP identities, UMTS identities or GSM identities. These should be interpreted as being references to the corresponding ETSI deliverables.

The cross reference between GSM, UMTS, 3GPP and ETSI identities can be found under <http://webapp.etsi.org/key/queryform.asp>.

Contents

Intellectual Property Rights	2
Foreword.....	2
Foreword.....	10
1 Scope	11
2 References	11
3 Definitions, symbols and abbreviations	11
3.1 Definitions	11
3.2 Symbols.....	12
3.3 Abbreviations	12
4 Multiplexing, channel coding and interleaving for the 1.28 Mcps, 3.84 Mcps and 7.68 Mcps options	14
4.1 General	14
4.2 General coding/multiplexing of TrCHs	14
4.2.1 CRC attachment.....	18
4.2.1.1 CRC calculation	18
4.2.1.2 Relation between input and output of the CRC attachment block.....	18
4.2.2 Transport block concatenation and code block segmentation.....	19
4.2.2.1 Concatenation of transport blocks.....	19
4.2.2.2 Code block segmentation	19
4.2.3 Channel coding	20
4.2.3.1 Convolutional coding	21
4.2.3.2 Turbo coding.....	22
4.2.3.2.1 Turbo coder	22
4.2.3.2.2 Trellis termination for Turbo coder	23
4.2.3.2.3 Turbo code internal interleaver.....	23
4.2.3.2.3.1 Bits-input to rectangular matrix with padding	24
4.2.3.3 Concatenation of encoded blocks.....	27
4.2.4 Radio frame size equalisation	27
4.2.5 1st interleaving.....	27
4.2.5.1 Relation between input and output of 1 st interleaving.....	28
4.2.6 Radio frame segmentation	28
4.2.7 Rate matching	29
4.2.7.1 Determination of rate matching parameters	30
4.2.7.1.1 Uncoded and convolutionally encoded TrCHs	31
4.2.7.1.2 Turbo encoded TrCHs	31
4.2.7.2 Bit separation and collection for rate matching.....	32
4.2.7.2.1 Bit separation.....	34
4.2.7.2.2 Bit collection	35
4.2.7.3 Rate matching pattern determination	35
4.2.8 TrCH multiplexing.....	36
4.2.9 Bit Scrambling	37
4.2.10 Physical channel segmentation	37
4.2.11 2nd interleaving	37
4.2.11.1 Frame related 2nd interleaving.....	38
4.2.11.2 Timeslot related 2 nd interleaving	39
4.2.11A Sub-frame segmentation for the 1.28 Mcps option.....	41
4.2.12 Physical channel mapping	41
4.2.12.1 Physical channel mapping for the 3.84 Mcps and 7.68Mcps options	41
4.2.12.1.1 Mapping scheme.....	42
4.2.12.2 Physical channel mapping for the 1.28 Mcps option	43
4.2.12.2.1 Mapping scheme.....	43
4.2.13 Multiplexing of different transport channels onto one CCTrCH, and mapping of one CCTrCH onto physical channels	44

4.2.13.1	Allowed CCTrCH combinations for one UE	45
4.2.13.1.1	Allowed CCTrCH combinations on the uplink	45
4.2.13.1.2	Allowed CCTrCH combinations on the downlink	45
4.2.14	Transport format detection.....	45
4.2.14.1	Blind transport format detection	45
4.2.14.2	Explicit transport format detection based on TFCI	45
4.2.14.2.1	Transport Format Combination Indicator (TFCI).....	45
4.3	Coding for layer 1 control for the 3.84 Mcps and 7.68Mcps TDD options.....	46
4.3.1	Coding of transport format combination indicator (TFCI)	46
4.3.1.1	Coding of long TFCI lengths	46
4.3.1.2	Coding of short TFCI lengths.....	47
4.3.1.2.1	Coding very short TFCIs by repetition.....	47
4.3.1.2.2	Coding short TFCIs using bi-orthogonal codes.....	47
4.3.1.3	Mapping of TFCI code word.....	48
4.3.2	Coding and Bit Scrambling of the Paging Indicator	48
4.3.3	Coding and Bit Scrambling of the MBMS Notification Indicator	49
4.4	Coding for layer 1 control for the 1.28 Mcps option.....	49
4.4.1	Coding of transport format combination indicator (TFCI) for QPSK and 16QAM.....	49
4.4.1.1	Mapping of TFCI code word.....	49
4.4.2	Coding of transport format combination indicator (TFCI) for 8PSK	51
4.4.2.1	Coding of long TFCI lengths	51
4.4.2.2	Coding of short TFCI lengths.....	53
4.4.2.2.1	Coding very short TFCIs by repetition.....	53
4.4.2.2.2	Coding short TFCIs using bi-orthogonal codes.....	53
4.4.2.3	Mapping of TFCI code word.....	54
4.4.3	Coding and Bit Scrambling of the Paging Indicator	55
4.4.4	Coding of the Fast Physical Access Channel (FPACH) information bits	55
4.4.5	Coding and Bit Scrambling of the MBMS Notification Indicator	56
4.4.6	Coding of PLCCCH	56
4.5	Coding for HS-DSCH	57
4.5.1	CRC attachment for HS-DSCH	59
4.5.2	Code block segmentation for HS-DSCH	59
4.5.3	Channel coding for HS-DSCH.....	60
4.5.4	Hybrid ARQ for HS-DSCH.....	60
4.5.4.1	HARQ bit separation.....	60
4.5.4.2	HARQ First Rate Matching Stage.....	60
4.5.4.3	HARQ Second Rate Matching Stage	61
4.5.4.4	HARQ bit collection	62
4.5.5	Bit scrambling.....	63
4.5.6	Interleaving for HS-DSCH	63
4.5.7	Constellation re-arrangement for 16 QAM and 64 QAM.....	64
4.5.8	Physical channel mapping for HS-DSCH.....	65
4.6	Coding/Multiplexing for HS-SCCH.....	67
4.6.1	HS-SCCH information field mapping	69
4.6.1.1	Channelisation code set information mapping	69
4.6.1.1.1	1.28Mcps TDD and 3.84Mcps TDD.....	69
4.6.1.1.2	7.68Mcps TDD.....	70
4.6.1.2	Timeslot information mapping.....	71
4.6.1.2.1	1.28 Mcps TDD.....	71
4.6.1.2.2	3.84 Mcps TDD and 7.68Mcps TDD	71
4.6.1.3	Modulation scheme information mapping	72
4.6.1.4	Redundancy and constellation version information mapping	73
4.6.1.5	HS-SCCH cyclic sequence number.....	73
4.6.1.6	UE identity	73
4.6.1.7	HARQ process identifier mapping.....	73
4.6.1.8	Transport block size index mapping	73
4.6.2	Multiplexing of HS-SCCH information.....	73
4.6.3	CRC attachment for HS-SCCH	74
4.6.4	Channel coding for HS-SCCH.....	74
4.6.5	Rate matching for HS-SCCH.....	74
4.6.6	Interleaving for HS-SCCH.....	74
4.6.7	Physical Channel Segmentation for HS-SCCH	74

4.6.8	Physical channel mapping for HS-SCCH	74
4.6A	Coding/Multiplexing for HS-SCCH orders type A	75
4.6A.1	HS-SCCH orders type A information field mapping	75
4.6A.1.1	Order type mapping	75
4.6A.1.2	UE identity mapping	75
4.6B	Coding/Multiplexing for HS-SCCH type 2 (1.28 Mcps TDD only)	75
4.6B.1	HS-SCCH type 2 information field mapping	77
4.6B.1.1	Type flag 1 mapping	77
4.6B.1.2	Resource repetition pattern index mapping	77
4.6B.1.3	Type flag 2 mapping	78
4.6B.1.4	Transport block size index mapping	78
4.6B.1.5	Timeslot information mapping	78
4.6B.1.6	Channelisation code set information mapping	78
4.6B.1.7	Modulation scheme information mapping	78
4.6B.1.8	HS-SICH indicator mapping	78
4.6B.1.9	HS-SCCH cyclic sequence number	79
4.6B.1.10	UE identity	79
4.6B.2	Multiplexing of HS-SCCH type 2 information	79
4.6B.3	CRC attachment for HS-SCCH type 2	79
4.6B.4	Channel coding for HS-SCCH type 2	80
4.6B.5	Rate matching for HS-SCCH type 2	80
4.6B.6	Interleaving for HS-SCCH type 2	80
4.6B.7	Physical Channel Segmentation for HS-SCCH type 2	80
4.6B.8	Physical channel mapping for HS-SCCH type 2	80
4.6C	Coding/Multiplexing for HS-SCCH type 3 (1.28 Mcps TDD only)	80
4.6C.1	HS-SCCH type 3 information field mapping	81
4.6C.1.1	Type flag 1 mapping	81
4.6C.1.2	Resource repetition pattern index mapping	82
4.6C.1.3	Type flag 2 mapping	82
4.6C.1.4	Transport block size index mapping	82
4.6C.1.5	Timeslot information mapping	82
4.6C.1.6	Channelisation code set information mapping	82
4.6C.1.7	Modulation scheme information mapping	82
4.6C.1.8	Redundancy version information mapping	82
4.6C.1.9	Pointer to the previous transmission mapping	82
4.6C.1.10	HS-SCCH cyclic sequence number	83
4.6C.1.11	UE identity	83
4.6C.2	Multiplexing of HS-SCCH type 3 information	83
4.6C.3	CRC attachment for HS-SCCH type 3	83
4.6C.4	Channel coding for HS-SCCH type 3	83
4.6C.5	Rate matching for HS-SCCH type 3	83
4.6C.6	Interleaving for HS-SCCH type 3	84
4.6C.7	Physical Channel Segmentation for HS-SCCH type 3	84
4.6C.8	Physical channel mapping for HS-SCCH type 3	84
4.6D	Coding/Multiplexing for HS-SCCH type 4 (1.28 Mcps TDD only)	84
4.6D.1	HS-SCCH type 4 information field mapping	85
4.6D.1.1	Type flag 1 mapping	85
4.6D.1.2	Type flag 2 mapping	85
4.6D.1.3	Channelisation code set information mapping	85
4.6D.1.4	Timeslot information mapping	85
4.6D.1.5	Modulation scheme information mapping	86
4.6D.1.6	Transport block size index mapping	86
4.6D.1.7	HARQ process identifier mapping	86
4.6D.1.8	Redundancy version information mapping	86
4.6D.1.9	HS-SCCH cyclic sequence number	86
4.6D.1.10	UE identity	86
4.6D.2	Multiplexing of HS-SCCH type 4 information	86
4.6D.3	CRC attachment for HS-SCCH type 4	87
4.6D.4	Channel coding for HS-SCCH type 4	87
4.6D.5	Rate matching for HS-SCCH type 4	87
4.6D.6	Interleaving for HS-SCCH type 4	87
4.6D.7	Physical Channel Segmentation for HS-SCCH type 4	87

4.6D.8	Physical channel mapping for HS-SCCH type 4	87
4.6E	Coding/Multiplexing for HS-SCCH type 5 (1.28 Mcps TDD only)	87
4.6E.1	HS-SCCH type 5 information field mapping	88
4.6E.1.1	Type flag 1 mapping	88
4.6E.1.2	Type flag 2 mapping	89
4.6E.1.3	Timeslot information mapping	89
4.6E.1.4	Modulation scheme information mapping	89
4.6E.1.5	Transport block size offset information mapping	89
4.6E.1.6	Transport block size index mapping	89
4.6E.1.7	HARQ process identifier mapping	89
4.6E.1.8	Redundancy version information mapping	89
4.6E.1.9	HS-SCCH cyclic sequence number	89
4.6E.1.10	UE identity	89
4.6E.2	Multiplexing of HS-SCCH type 5 information	89
4.6E.3	CRC attachment for HS-SCCH type 5	90
4.6E.4	Channel coding for HS-SCCH type 5	90
4.6E.5	Rate matching for HS-SCCH type 5	90
4.6E.6	Interleaving for HS-SCCH type 5	90
4.6E.7	Physical Channel Segmentation for HS-SCCH type 5	90
4.6E.8	Physical channel mapping for HS-SCCH type 5	90
4.6F	Coding/Multiplexing for HS-SCCH type 6 (1.28 Mcps TDD only)	91
4.6F.1	HS-SCCH type 6 information field mapping	92
4.6F.1.1	Type flag mapping	92
4.6F.1.2	Channelisation code set information mapping	92
4.6F.1.3	Timeslot information mapping	92
4.6F.1.4	Modulation scheme information mapping	92
4.6F.1.5	Resource repetition pattern index mapping	92
4.6F.1.6	Transport block size index mapping	93
4.6F.1.7	HS-SICH indicator mapping	93
4.6F.1.8	HS-SCCH cyclic sequence number	93
4.6F.1.9	UE identity	93
4.6F.2	Multiplexing of HS-SCCH type 6 information	93
4.6F.3	CRC attachment for HS-SCCH type 6	93
4.6F.4	Channel coding for HS-SCCH type 6	93
4.6F.5	Rate matching for HS-SCCH type 6	94
4.6F.6	Interleaving for HS-SCCH type 6	94
4.6F.7	Physical Channel Segmentation for HS-SCCH type 6	94
4.6F.8	Physical channel mapping for HS-SCCH type 6	94
4.6G	Coding/Multiplexing for HS-SCCH type 7 (1.28 Mcps TDD only)	94
4.6G.1	HS-SCCH type 7 information field mapping	95
4.6G.1.1	Type flag mapping	95
4.6G.1.2	Channelisation code set information mapping	95
4.6G.1.3	Timeslot information mapping	95
4.6G.1.4	Modulation scheme information mapping	95
4.6G.1.5	Resource repetition pattern index mapping	96
4.6G.1.6	Transport block size index mapping	96
4.6G.1.7	Redundancy version information mapping	96
4.6G.1.8	Pointer to the previous transmission mapping	96
4.6G.1.9	HS-SCCH cyclic sequence number	96
4.6G.1.10	UE identity	96
4.6G.2	Multiplexing of HS-SCCH type 7 information	96
4.6G.3	CRC attachment for HS-SCCH type 7	96
4.6G.4	Channel coding for HS-SCCH type 7	97
4.6G.5	Rate matching for HS-SCCH type 7	97
4.6G.6	Interleaving for HS-SCCH type 7	97
4.6G.7	Physical Channel Segmentation for HS-SCCH type 7	97
4.6G.8	Physical channel mapping for HS-SCCH type 7	97
4.6H	Coding/Multiplexing for HS-SCCH type 8 (1.28 Mcps TDD only)	97
4.6H.1	HS-SCCH type 8 information field mapping	98
4.6H.1.1	Channelisation code set information mapping	98
4.6H.1.2	Transport block size index mapping	99
4.6H.1.3	Modulation scheme information mapping	99

4.6H.1.4	Timeslot information mapping.....	99
4.6H.1.5	Redundancy version information mapping	99
4.6H.1.6	Type flag mapping	99
4.6H.1.7	Field flag mapping	99
4.6H.1.8	Special Information mapping	99
4.6H.1.9	HARQ process identifier mapping	99
4.6H.1.10	HS-SCCH cyclic sequence number.....	100
4.6H.1.11	UE identity	100
4.6H.2	Multiplexing of HS-SCCH type 8 information.....	100
4.6H.3	CRC attachment for HS-SCCH type 8.....	100
4.6H.4	Channel coding for HS-SCCH type 8.....	100
4.6H.5	Rate matching for HS-SCCH type 8.....	100
4.6H.6	Interleaving for HS-SCCH type 8.....	100
4.6H.7	Physical Channel Segmentation for HS-SCCH type 8.....	101
4.6H.8	Physical channel mapping for HS-SCCH type 8	101
4.6I	Coding/Multiplexing for HS-SCCH type 9 (1.28 Mcps TDD only)	101
4.6I.1	HS-SCCH type 9 information field mapping.....	102
4.6I.1.1	Channelisation code set information mapping	102
4.6I.1.2	Transport block size offset information mapping	103
4.6I.1.3	Modulation scheme information mapping	103
4.6I.1.4	Timeslot information mapping.....	103
4.6I.1.5	Redundancy version information mapping	103
4.6I.1.6	HARQ process identifier mapping	103
4.6I.1.9	HS-SCCH cyclic sequence number.....	103
4.6I.1.10	UE identity	103
4.6I.2	Multiplexing of HS-SCCH type 9 information.....	103
4.6I.3	CRC attachment for HS-SCCH type 9.....	104
4.6I.4	Channel coding for HS-SCCH type 9.....	104
4.6I.5	Rate matching for HS-SCCH type 9.....	104
4.6I.6	Interleaving for HS-SCCH type 9.....	104
4.6I.7	Physical Channel Segmentation for HS-SCCH type 9.....	104
4.6I.8	Physical channel mapping for HS-SCCH type 9	104
4.6J	Coding/Multiplexing for HS-SCCH orders type B (1.28Mcps TDD only).....	104
4.6J.1	HS-SCCH orders type B information field mapping	105
4.6J.1.1	Order type mapping.....	105
4.6J.1.2	UE identity mapping	105
4.7	Coding for HS-SICH.....	105
4.7.1	HS-SICH information field mapping.....	106
4.7.1.1	RMF information mapping	106
4.7.1.2	RTBS information mapping	106
4.7.1.3	ACK/NACK information mapping	106
4.7.2	Coding for HS-SICH	107
4.7.2.1	Field Coding of ACK/NACK.....	107
4.7.2.2	Field Coding of CQI.....	107
4.7.2.2.1	Field Coding of CQI for 1.28 Mcps TDD	107
4.7.2.2.2	Field Coding of CQI for 3.84 Mcps TDD and 7.68Mcps TDD.....	108
4.7.3	Multiplexing of HS-SICH information fields	108
4.7.4	Interleaver for HS-SICH.....	108
4.7.5	Physical channel mapping for HS-SICH	108
4.7A	Coding for HS-SICH type 2 (1.28 Mcps TDD only).....	108
4.7A.1	HS-SICH type 2 information field mapping	109
4.7A.1.1	RMF information mapping	109
4.7A.1.2	RTBS information mapping	109
4.7A.1.3	ACK/NACK information mapping	110
4.7A.2	Coding for HS-SICH type 2.....	110
4.7A.2.1	Field Coding of ACK/NACK.....	110
4.7A.2.2	Field Coding of CQI.....	110
4.7A.3	Multiplexing of HS-SICH type 2 information fields	110
4.7A.4	Interleaver for HS-SICH type 2.....	111
4.7A.5	Physical channel mapping for HS-SICH type 2.....	111
4.8	Coding for E-DCH	111
4.8.1	CRC attachment for E-DCH	112

4.8.2	Code block segmentation for E-DCH	112
4.8.3	Channel coding for E-DCH	113
4.8.4	Physical layer HARQ functionality and rate matching for E-DCH	113
4.8.4.1	Determination of SF, modulation and number of physical channels.....	113
4.8.4.2	HARQ bit separation.....	113
4.8.4.3	HARQ Rate Matching Stage	113
4.8.4.4	HARQ bit collection	114
4.8.5	Bit scrambling.....	114
4.8.6	Interleaving for E-DCH	114
4.8.7	Constellation re-arrangement for 16 QAM.....	114
4.8.8	Physical channel mapping for E-DCH.....	114
4.9	Coding for E-UCCH.....	115
4.9.1	Coding for E-UCCH for the 3.84Mcps and 7.68Mcps TDD options.....	115
4.9.1.1	Overview	115
4.9.1.2	E-UCCH part 1.....	116
4.9.1.2.1	Information field mapping of E-TFCI	116
4.9.1.2.2	Channel coding for E-UCCH part 1	116
4.9.1.2.3	Physical channel mapping for E-UCCH part 1.....	116
4.9.1.3	E-UCCH part 2.....	116
4.9.1.3.1	Information field mapping of retransmission sequence number.....	116
4.9.1.3.2	Information field mapping of HARQ process ID	116
4.9.1.3.3	Multiplexing of E-UCCH part 2 information	117
4.9.1.3.4	Channel coding for E-UCCH part 2	117
4.9.1.3.5	Physical channel mapping for E-UCCH part 2.....	117
4.9.2	Coding for E-UCCH for the 1.28Mcps TDD option.....	117
4.9.2.1	E-UCCH information field mapping.....	118
4.9.2.1.1	Information field mapping of E-TFCI	118
4.9.2.1.2	RSN information mapping.....	118
4.9.2.1.3	HARQ information mapping	119
4.9.2.2	Multiplexing for E-UCCH	119

Foreword

This Technical Specification (TS) has been produced by the 3rd Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

- x the first digit:
 - 1 presented to TSG for information;
 - 2 presented to TSG for approval;
 - 3 or greater indicates TSG approved document under change control.
- y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- z the third digit is incremented when editorial only changes have been incorporated in the document.

1 Scope

The present document describes multiplexing, channel coding and interleaving for UTRA Physical Layer TDD mode.

2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the same Release as the present document*.

3 Definitions, symbols and abbreviations

3.1 Definitions

For the purposes of the present document, the following terms and definitions apply.

TrCH number: The transport channel number identifies a TrCH in the context of L1. The L3 transport channel identity (TrCH ID) maps onto the L1 transport channel number. The mapping between the transport channel number and the

TrCH ID is as follows: TrCH 1 corresponds to the TrCH with the lowest TrCH ID, TrCH 2 corresponds to the TrCH with the next lowest TrCH ID and so on.

3.2 Symbols

For the purposes of the present document, the following symbols apply:

$\lceil x \rceil$	round towards ∞ , i.e. integer such that $x \leq \lceil x \rceil < x+1$
$\lfloor x \rfloor$	round towards $-\infty$, i.e. integer such that $x-1 < \lfloor x \rfloor \leq x$
$ x $	absolute value of x

Unless otherwise is explicitly stated when the symbol is used, the meaning of the following symbols are:

i	TrCH number
j	TFC number
k	Bit number
l	TF number
m	Transport block number
n	Radio frame number
p	PhCH number
r	Code block number
I	Number of TrCHs in a CCTrCH.
C_i	Number of code blocks in one TTI of TrCH i .
F_i	Number of radio frames in one TTI of TrCH i .
M_i	Number of transport blocks in one TTI of TrCH i .
$N_{TFCI \text{ code word}}$	Number of TFCI code word bits after TFCI encoding
P	Number of PhCHs used for one CCTrCH.
PL	Puncturing Limit. Signalled from higher layers
RM_i	Rate Matching attribute for TrCH i . Signalled from higher layers.

Temporary variables, i.e. variables used in several (sub)clauses with different meaning.

x, X
 y, Y
 z, Z

3.3 Abbreviations

For the purposes of the present document, the following abbreviations apply:

<ACRONYM>	<Explanation>
ARQ	Automatic Repeat on Request
BCH	Broadcast Channel
BER	Bit Error Rate
BS	Base Station
BSS	Base Station Subsystem
CBR	Constant Bit Rate
CCCH	Common Control Channel
CCTrCH	Coded Composite Transport Channel
CDMA	Code Division Multiple Access
CFN	Connection Frame Number
CQI	Channel Quality Indicator
CRC	Cyclic Redundancy Check
DCA	Dynamic Channel Allocation
DCCH	Dedicated Control Channel
DCH	Dedicated Channel
DL	Downlink
DRX	Discontinuous Reception
DSCH	Downlink Shared Channel
DTX	Discontinuous Transmission
E-AGCH	E-DCH Absolute Grant Channel

ECSN	E-AGCH Cyclic Sequence Number
E-DCH	Enhanced Dedicated Channel
E-HICH	E-DCH Hybrid ARQ Indicator Channel
E-PUCH	E-DCH Physical Uplink Channel
E-RUCCH	E-DCH Random Access Uplink Control Channel
E-TFCI	E-DCH Transport Format Combination Indicator
E-UCCH	E-DCH Uplink Control Channel
FACH	Forward Access Channel
FDD	Frequency Division Duplex
FDMA	Frequency Division Multiple Access
FEC	Forward Error Control
FER	Frame Error Rate
GF	Galois Field
HARQ	Hybrid Automatic Repeat reQuest
HS-DSCH	High Speed Downlink Shared Channel
HS-PDSCH	High Speed Physical Downlink Shared Channel
HS-SCCH	Shared Control Channel for HS-DSCH
HS-SICH	Shared Information Channel for HS-DSCH
IMB	Integrated Mobile Broadcast
JD	Joint Detection
L1	Layer 1
L2	Layer 2
LLC	Logical Link Control
MA	Multiple Access
MAC	Medium Access Control
MBSFN	MBMS over a Single Frequency Network
MICH	MBMS Indicator Channel
MIMO	Multiple Input Multiple Output
MS	Mobile Station
MT	Mobile Terminated
NRT	Non-Real Time
OVSF	Orthogonal Variable Spreading Factor
PC	Power Control
PCCC	Parallel Concatenated Convolutional Code
PICH	Paging Indicator Channel
PCH	Paging Channel
PhCH	Physical Channel
PI	Paging Indicator (value calculated by higher layers)
PLCCH	Physical Layer Common Control Channel
P_q	Paging Indicator (indicator set by physical layer)
QoS	Quality of Service
QPSK	Quaternary Phase Shift Keying
RACH	Random Access Channel
RF	Radio Frequency
RLC	Radio Link Control
RMF	Recommended Modulation Format
RRC	Radio Resource Control
RRM	Radio Resource Management
RSC	Recursive Systematic Convolutional Coder
RSN	Retransmission Sequence Number
RT	Real Time
RTBS	Recommended Transport Block Size
RU	Resource Unit
RV	Redundancy Version
SCCC	Serial Concatenated Convolutional Code
SCH	Synchronization Channel
SNR	Signal to Noise Ratio
TCH	Traffic channel
TDD	Time Division Duplex
TDMA	Time Division Multiple Access
TFC	Transport Format Combination
TFCI	Transport Format Combination Indicator

TFRI	Transport Format Resource Indicator
TPC	Transmit Power Control
TrBk	Transport Block
TrCH	Transport Channel
TTI	Transmission Time Interval
UE	User Equipment
UL	Uplink
UMTS	Universal Mobile Telecommunications System
USCH	Uplink Shared Channel
UTRA	UMTS Terrestrial Radio Access
VBR	Variable Bit Rate

4 Multiplexing, channel coding and interleaving for the 1.28 Mcps, 3.84 Mcps and 7.68 Mcps options

In the case of the 3.84 Mcps option, clause 4 applies only for non-MBSFN-IMB operation. Multiplexing, channel coding and interleaving for 3.84 Mcps MBSFN IMB operation is described in sub-clause 5.

4.1 General

Data stream from/to MAC and higher layers (Transport block / Transport block set) is encoded/decoded to offer transport services over the radio transmission link. Channel coding scheme is a combination of error detection, error correcting (including rate matching), and interleaving and transport channels mapping onto/splitting from physical channels.

In the UTRA-TDD mode for the 1.28 Mcps, 3.84 Mcps and 7.68 Mcps options, the total number of basic physical channels (a certain time slot one spreading code on a certain carrier frequency) per frame is given by the maximum number of time slots and the maximum number of CDMA codes per time slot.

4.2 General coding/multiplexing of TrCHs

This section only applies to the transport channels: DCH, RACH, DSCH, USCH, BCH, FACH and PCH. Other transport channels which do not use the general method are described separately below.

Figure 1 illustrates the overall concept of transport-channel coding and multiplexing. Data arrives to the coding/multiplexing unit in form of transport block sets, once every transmission time interval. The transmission time interval is transport-channel specific from the set {5 ms^(*), 10 ms, 20 ms, 40 ms, 80 ms}.

Note: ^(*) may be applied for PRACH for 1.28 Mcps TDD

The following coding/multiplexing steps can be identified:

- add CRC to each transport block (see subclause 4.2.1);
- TrBk concatenation / Code block segmentation (see subclause 4.2.2);
- channel coding (see subclause 4.2.3);
- radio frame size equalization (see subclause 4.2.4);
- interleaving (two steps, see subclauses 4.2.5 and 4.2.11);
- radio frame segmentation (see subclause 4.2.6);
- rate matching (see subclause 4.2.7);
- multiplexing of transport channels (see subclause 4.2.8);
- bit scrambling (see subclause 4.2.9);

- physical channel segmentation (see subclause 4.2.10);
- sub-frame segmentation(see subclause 4.2.11A only for 1.28Mcps TDD)
- mapping to physical channels (see subclause 4.2.12).

The coding/multiplexing steps for uplink and downlink are shown in figures 1 and 1A.

Figure 1: Transport channel multiplexing structure for uplink and downlink for 3.84Mcps and 7.68 Mcps TDD

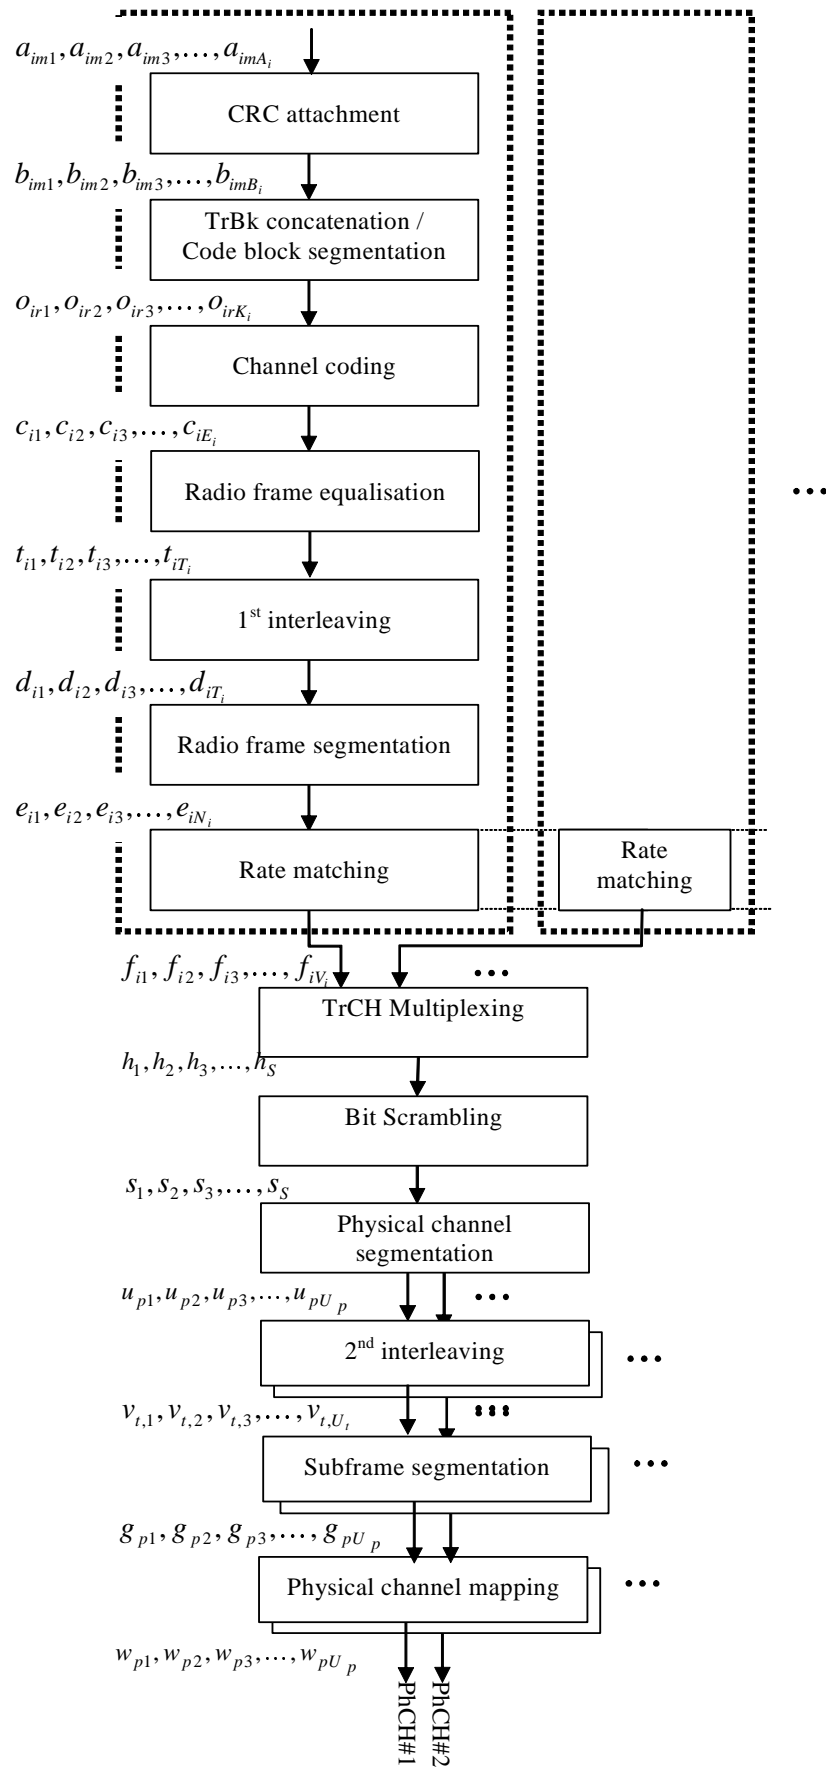

Figure 1A: Transport channel multiplexing structure for uplink and downlink of 1.28Mcps TDD

Primarily, transport channels are multiplexed as described above, i.e. into one data stream mapped on one or several physical channels. However, an alternative way of multiplexing services is to use multiple CCTrCHs (Coded Composite Transport Channels), which corresponds to having several parallel multiplexing chains as in figures 1 and 1A, resulting in several data streams, each mapped to one or several physical channels.

4.2.1 CRC attachment

Error detection is provided on transport blocks through a Cyclic Redundancy Check (CRC). The size of the CRC is 24, 16, 12, 8 or 0 bits and it is signalled from higher layers what CRC size that should be used for each transport channel.

4.2.1.1 CRC calculation

The entire transport block is used to calculate the CRC parity bits for each transport block. The parity bits are generated by one of the following cyclic generator polynomials:

$$g_{\text{CRC24}}(D) = D^{24} + D^{23} + D^6 + D^5 + D + 1$$

$$g_{\text{CRC16}}(D) = D^{16} + D^{12} + D^5 + 1$$

$$g_{\text{CRC12}}(D) = D^{12} + D^{11} + D^3 + D^2 + D + 1$$

$$g_{\text{CRC8}}(D) = D^8 + D^7 + D^4 + D^3 + D + 1$$

Denote the bits in a transport block delivered to layer 1 by $a_{im1}, a_{im2}, a_{im3}, \dots, a_{imA_i}$, and the parity bits by $p_{im1}, p_{im2}, p_{im3}, \dots, p_{imL_i}$. A_i is the size of a transport block of TrCH i , m is the transport block number, and L_i is the number of parity bits. L_i can take the values 24, 16, 12, 8, or 0 depending on what is signalled from higher layers.

The encoding is performed in a systematic form, which means that in GF(2), the polynomial:

$$a_{im1}D^{A_i+23} + a_{im2}D^{A_i+22} + \dots + a_{imA_i}D^{24} + p_{im1}D^{23} + p_{im2}D^{22} + \dots + p_{im23}D^1 + p_{im24}$$

yields a remainder equal to 0 when divided by $g_{\text{CRC24}}(D)$, polynomial:

$$a_{im1}D^{A_i+15} + a_{im2}D^{A_i+14} + \dots + a_{imA_i}D^{16} + p_{im1}D^{15} + p_{im2}D^{14} + \dots + p_{im15}D^1 + p_{im16}$$

yields a remainder equal to 0 when divided by $g_{\text{CRC16}}(D)$, polynomial:

$$a_{im1}D^{A_i+11} + a_{im2}D^{A_i+10} + \dots + a_{imA_i}D^{12} + p_{im1}D^{11} + p_{im2}D^{10} + \dots + p_{im11}D^1 + p_{im12}$$

yields a remainder equal to 0 when divided by $g_{\text{CRC12}}(D)$ and the polynomial:

$$a_{im1}D^{A_i+7} + a_{im2}D^{A_i+6} + \dots + a_{imA_i}D^8 + p_{im1}D^7 + p_{im2}D^6 + \dots + p_{im7}D^1 + p_{im8}$$

yields a remainder equal to 0 when divided by $g_{\text{CRC8}}(D)$.

If no transport blocks are input to the CRC calculation ($M_i = 0$), no CRC attachment shall be done. If transport blocks are input to the CRC calculation ($M_i \neq 0$) and the size of a transport block is zero ($A_i = 0$), CRC shall be attached, i.e. all parity bits equal to zero.

4.2.1.2 Relation between input and output of the CRC attachment block

The bits after CRC attachment are denoted by $b_{im1}, b_{im2}, b_{im3}, \dots, b_{imB_i}$, where $B_i = A_i + L_i$. The relation between a_{imk} and b_{imk} is:

$$b_{imk} = a_{imk} \quad k = 1, 2, 3, \dots, A_i$$

$$b_{imk} = p_{im(L_i+1-(k-A_i))} \quad k = A_i + 1, A_i + 2, A_i + 3, \dots, A_i + L_i$$

4.2.2 Transport block concatenation and code block segmentation

All transport blocks in a TTI are serially concatenated. If the number of bits in a TTI is larger than the maximum size of a code block, then code block segmentation is performed after the concatenation of the transport blocks. The maximum size of the code blocks depends on whether convolutional, turbo coding or no coding is used for the TrCH.

4.2.2.1 Concatenation of transport blocks

The bits input to the transport block concatenation are denoted by $b_{im1}, b_{im2}, b_{im3}, \dots, b_{imB_i}$ where i is the TrCH number, m is the transport block number, and B_i is the number of bits in each block (including CRC). The number of transport blocks on TrCH i is denoted by M_i . The bits after concatenation are denoted by $x_{i1}, x_{i2}, x_{i3}, \dots, x_{iX_i}$, where i is the TrCH number and $X_i = M_i B_i$. They are defined by the following relations:

$$x_{ik} = b_{i1k} \quad k = 1, 2, \dots, B_i$$

$$x_{ik} = b_{i,2,(k-B_i)} \quad k = B_i + 1, B_i + 2, \dots, 2B_i$$

$$x_{ik} = b_{i,3,(k-2B_i)} \quad k = 2B_i + 1, 2B_i + 2, \dots, 3B_i$$

...

$$x_{ik} = b_{i,M_i,(k-(M_i-1)B_i)} \quad k = (M_i - 1)B_i + 1, (M_i - 1)B_i + 2, \dots, M_i B_i$$

4.2.2.2 Code block segmentation

Segmentation of the bit sequence from transport block concatenation is performed if $X_i > Z$. The code blocks after segmentation are of the same size. The number of code blocks on TrCH i is denoted by C_i . If the number of bits input to the segmentation, X_i , is not a multiple of C_i , filler bits are added to the beginning of the first block. If turbo coding is selected and $X_i < 40$, filler bits are added to the beginning of the code block. The filler bits are transmitted and they are always set to 0. The maximum code block sizes are:

- convolutional coding: $Z = 504$;
- turbo coding: $Z = 5114$;
- no channel coding: $Z = \text{unlimited}$.

The bits output from code block segmentation, for $C_i \neq 0$, are denoted by $o_{ir1}, o_{ir2}, o_{ir3}, \dots, o_{irK_i}$, where i is the TrCH number, r is the code block number, and K_i is the number of bits per code block.

Number of code blocks:

$$C_i = \begin{cases} \lceil X_i / Z \rceil & \text{when } Z \neq \text{unlimited} \\ 0 & \text{when } Z = \text{unlimited} \text{ and } X_i = 0 \\ 1 & \text{when } Z = \text{unlimited} \text{ and } X_i \neq 0 \end{cases}$$

Number of bits in each code block (applicable for $C_i \neq 0$ only):

if $X_i < 40$ and Turbo coding is used, then

$$K_i = 40$$

else

$$K_i = \lceil X_i / C_i \rceil$$

end if

Number of filler bits: $Y_i = C_i K_i - X_i$

for $k = 1$ to Y_i -- Insertion of filler bits

$$o_{ilk} = 0$$

end for

for $k = Y_i + 1$ to K_i

$$o_{ilk} = x_{i,(k-Y_i)}$$

end for

$r = 2$ -- Segmentation

while $r \leq C_i$

for $k = 1$ to K_i

$$o_{irk} = x_{i,(k+(r-1) \cdot K_i - Y_i)}$$

end for

$r = r + 1$

end while

4.2.3 Channel coding

Code blocks are delivered to the channel coding block. They are denoted by $o_{ir1}, o_{ir2}, o_{ir3}, \dots, o_{irK_i}$, where i is the TrCH number, r is the code block number, and K_i is the number of bits in each code block. The number of code blocks on TrCH i is denoted by C_i . After encoding the bits are denoted by $y_{ir1}, y_{ir2}, y_{ir3}, \dots, y_{irY_i}$, where Y_i is the number of encoded bits. The relation between o_{irk} and y_{irk} and between K_i and Y_i is dependent on the channel coding scheme.

The following channel coding schemes can be applied to transport channels:

- convolutional coding;
- turbo coding;
- no coding.

Usage of coding scheme and coding rate for the different types of TrCH is shown in tables 1 and 1A. The values of Y_i in connection with each coding scheme:

- convolutional coding with rate 1/2: $Y_i = 2 * K_i + 16$; rate 1/3: $Y_i = 3 * K_i + 24$;
- turbo coding with rate 1/3: $Y_i = 3 * K_i + 12$;
- no coding: $Y_i = K_i$.

Table 1: Usage of channel coding scheme and coding rate for 3.84Mcps TDD

Type of TrCH	Coding scheme	Coding rate
BCH	Turbo coding	1/3
PCH	Convolutional coding	1/2
RACH		
DCH, DSCH, FACH, USCH	Turbo coding	1/3, 1/2
	Turbo coding	1/3
	No coding	

Note: Rate 1/3 Turbo coding is only applied to BCH when the beacon timeslot uses burst type 4; rate 1/2 convolutional coding is only applied to BCH when the beacon timeslot uses burst type 1. For the MBSFN FACH, only rate 1/3 Turbo coding shall be applied.

Table 1A: Usage of channel coding scheme and coding rate for 1.28Mcps TDD

Type of TrCH	Coding scheme	Coding rate
BCH	Convolutional coding	1/3
PCH		1/3, 1/2
RACH		1/2
DCH, DSCH, FACH, USCH		1/3, 1/2
	Turbo coding	1/3
	No coding	

Note: For the MBSFN FACH, only rate 1/3 Turbo coding shall be applied.

4.2.3.1 Convolutional coding

Convolutional codes with constraint length 9 and coding rates 1/3 and 1/2 are defined.

The configuration of the convolutional coder is presented in figure 2.

Output from the rate 1/3 convolutional coder shall be done in the order output 0, output 1, output 2, output 0, output 1, output 2, output 0, ..., output 2. Output from the rate 1/2 convolutional coder shall be done in the order output 0, output 1, output 0, output 1, output 0, ..., output 1.

8 tail bits with binary value 0 shall be added to the end of the code block before encoding.

The initial value of the shift register of the coder shall be "all 0" when starting to encode the input bits.

Figure 2: Rate 1/2 and rate 1/3 convolutional coders

4.2.3.2 Turbo coding

4.2.3.2.1 Turbo coder

The scheme of Turbo coder is a Parallel Concatenated Convolutional Code (PCCC) with two 8-state constituent encoders and one Turbo code internal interleaver. The coding rate of Turbo coder is 1/3. The structure of Turbo coder is illustrated in figure 3.

The transfer function of the 8-state constituent code for PCCC is:

$$G(D) = \begin{bmatrix} 1, & g_1(D) \\ & g_0(D) \end{bmatrix},$$

where

$$g_0(D) = 1 + D^2 + D^3,$$

$$g_1(D) = 1 + D + D^3.$$

The initial value of the shift registers of the 8-state constituent encoders shall be all zeros when starting to encode the input bits.

Output from the Turbo coder is , Y'(0), X(1), Y(1), Y'(1), etc:

$$x_1, z_1, z'_1, x_2, z_2, z'_2, \dots, x_K, z_K, z'_K,$$

where x_1, x_2, \dots, x_K are the bits input to the Turbo coder i.e. both first 8-state constituent encoder and Turbo code internal interleaver, and K is the number of bits, and z_1, z_2, \dots, z_K and z'_1, z'_2, \dots, z'_K are the bits output from first and second 8-state constituent encoders, respectively.

The bits output from Turbo code internal interleaver are denoted by x'_1, x'_2, \dots, x'_K , and these bits are to be input to the second 8-state constituent encoder.

Figure 3: Structure of rate 1/3 Turbo coder (dotted lines apply for trellis termination only)

4.2.3.2.2 Trellis termination for Turbo coder

Trellis termination is performed by taking the tail bits from the shift register feedback after all information bits are encoded. Tail bits are padded after the encoding of information bits.

The first three tail bits shall be used to terminate the first constituent encoder (upper switch of figure 3 in lower position) while the second constituent encoder is disabled. The last three tail bits shall be used to terminate the second constituent encoder (lower switch of figure 3 in lower position) while the first constituent encoder is disabled.

The transmitted bits for trellis termination shall then be:

$$x_{K+1}, z_{K+1}, x_{K+2}, z_{K+2}, x_{K+3}, z_{K+3}, x'_{K+1}, z'_{K+1}, x'_{K+2}, z'_{K+2}, x'_{K+3}, z'_{K+3}.$$

4.2.3.2.3 Turbo code internal interleaver

The Turbo code internal interleaver consists of bits-input to a rectangular matrix with padding, intra-row and inter-row permutations of the rectangular matrix, and bits-output from the rectangular matrix with pruning. The bits input to the Turbo code internal interleaver are denoted by $x_1, x_2, x_3, \dots, x_K$, where K is the integer number of the bits and takes one value of $40 \leq K \leq 5114$. The relation between the bits input to the Turbo code internal interleaver and the bits input to the channel coding is defined by $x_k = o_{irk}$ and $K = K_i$.

The following subclause specific symbols are used in subclauses 4.2.3.2.3.1 to 4.2.3.2.3.3 :

- K Number of bits input to Turbo code internal interleaver
- R Number of rows of rectangular matrix
- C Number of columns of rectangular matrix
- p Prime number
- v Primitive root
- $\langle s(j) \rangle_{j \in \{0,1,\dots,p-2\}}$ Base sequence for intra-row permutation
- q_i Minimum prime integers
- r_i Permuted prime integers

$\langle T(i) \rangle_{i \in \{0,1,\dots,R-1\}}$	Inter-row permutation pattern
$\langle U_i(j) \rangle_{j \in \{0,1,\dots,C-1\}}$	Intra-row permutation pattern of i -th row
i	Index of row number of rectangular matrix
j	Index of column number of rectangular matrix
k	Index of bit sequence

4.2.3.2.3.1 Bits-input to rectangular matrix with padding

The bit sequence $x_1, x_2, x_3, \dots, x_K$ input to the Turbo code internal interleaver is written into the rectangular matrix as follows.

- (1) Determine the number of rows of the rectangular matrix, R , such that:

$$R = \begin{cases} 5, & \text{if } (40 \leq K \leq 159) \\ 10, & \text{if } ((160 \leq K \leq 200) \text{ or } (481 \leq K \leq 530)) \\ 20, & \text{if } (K = \text{any other value}) \end{cases} .$$

The rows of rectangular matrix are numbered 0, 1, ..., $R - 1$ from top to bottom.

- (2) Determine the prime number to be used in the intra-permutation, p , and the number of columns of rectangular matrix, C , such that:

if $(481 \leq K \leq 530)$ then

$$p = 53 \text{ and } C = p.$$

else

Find minimum prime number p from table 2 such that

$$K \leq R \times (p + 1),$$

and determine C such that

$$C = \begin{cases} p - 1 & \text{if } K \leq R \times (p - 1) \\ p & \text{if } R \times (p - 1) < K \leq R \times p \\ p + 1 & \text{if } R \times p < K \end{cases}$$

end if

The columns of rectangular matrix are numbered 0, 1, ..., $C - 1$ from left to right.

Table 2: List of prime number p and associated primitive root v

p	v	p	v	p	v	p	v	p	v
7	3	47	5	101	2	157	5	223	3
11	2	53	2	103	5	163	2	227	2
13	2	59	2	107	2	167	5	229	6
17	3	61	2	109	6	173	2	233	3
19	2	67	2	113	3	179	2	239	7
23	5	71	7	127	3	181	2	241	7
29	2	73	5	131	2	191	19	251	6
31	3	79	3	137	3	193	5	257	3
37	2	83	2	139	2	197	2		
41	6	89	3	149	2	199	3		
43	3	97	5	151	6	211	2		

(3) Write the input bit sequence $x_1, x_2, x_3, \dots, x_K$ into the $R \times C$ rectangular matrix row by row starting with bit y_1 in column 0 of row 0:

$$\begin{bmatrix} y_1 & y_2 & y_3 & \dots & y_C \\ y_{(C+1)} & y_{(C+2)} & y_{(C+3)} & \dots & y_{2C} \\ \vdots & \vdots & \vdots & \dots & \vdots \\ y_{((R-1)C+1)} & y_{((R-1)C+2)} & y_{((R-1)C+3)} & \dots & y_{R \times C} \end{bmatrix}$$

where $y_k = x_k$ for $k = 1, 2, \dots, K$ and if $R \times C > K$, the dummy bits are padded such that $y_k = 0$ or 1 for $k = K + 1, K + 2, \dots, R \times C$. These dummy bits are pruned away from the output of the rectangular matrix after intra-row and inter-row permutations.

4.2.3.2.3.2 Intra-row and inter-row permutations

After the bits-input to the $R \times C$ rectangular matrix, the intra-row and inter-row permutations for the $R \times C$ rectangular matrix are performed stepwise by using the following algorithm with steps (1) – (6).

- (1) Select a primitive root v from table 2 in section 4.2.3.2.3.1, which is indicated on the right side of the prime number p .
- (2) Construct the base sequence $\langle s(j) \rangle_{j \in \{0,1,\dots,p-2\}}$ for intra-row permutation as:
 $s(j) = (v \times s(j-1)) \bmod p, j = 1, 2, \dots (p - 2),$ and $s(0) = 1.$
- (3) Assign $q_0 = 1$ to be the first prime integer in the sequence $\langle q_i \rangle_{i \in \{0,1,\dots,R-1\}}$, and determine the prime integer q_i in the sequence $\langle q_i \rangle_{i \in \{0,1,\dots,R-1\}}$ to be a least prime integer such that $\text{g.c.d}(q_i, p - 1) = 1, q_i > 6,$ and $q_i > q_{(i-1)}$ for each $i = 1, 2, \dots, R - 1.$ Here g.c.d. is greatest common divisor.

(4) Permute the sequence $\langle q_i \rangle_{i \in \{0,1,\dots,R-1\}}$ to make the sequence $\langle r_i \rangle_{i \in \{0,1,\dots,R-1\}}$ such that

$$r_{T(i)} = q_i, \quad i = 0, 1, \dots, R - 1,$$

where $\langle T(i) \rangle_{i \in \{0,1,\dots,R-1\}}$ is the inter-row permutation pattern defined as the one of the four kind of patterns, which are shown in table 3, depending on the number of input bits K .

Table 3: Inter-row permutation patterns for Turbo code internal interleaver

Number of input bits K	Number of rows R	Inter-row permutation patterns $\langle T(0), T(1), \dots, T(R - 1) \rangle$
$(40 \leq K \leq 159)$	5	$\langle 4, 3, 2, 1, 0 \rangle$
$(160 \leq K \leq 200)$ or $(481 \leq K \leq 530)$	10	$\langle 9, 8, 7, 6, 5, 4, 3, 2, 1, 0 \rangle$

$(2281 \leq K \leq 2480)$ or $(3161 \leq K \leq 3210)$	20	<19, 9, 14, 4, 0, 2, 5, 7, 12, 18, 16, 13, 17, 15, 3, 1, 6, 11, 8, 10>
$K = \text{any other value}$	20	<19, 9, 14, 4, 0, 2, 5, 7, 12, 18, 10, 8, 13, 17, 3, 1, 16, 6, 15, 11>

(5) Perform the i -th ($i = 0, 1, \dots, R - 1$) intra-row permutation as:

if ($C = p$) then

$$U_i(j) = s((j \times r_i) \bmod (p-1)), \quad j = 0, 1, \dots, (p-2), \text{ and } U_i(p-1) = 0,$$

where $U_i(j)$ is the original bit position of j -th permuted bit of i -th row.

end if

if ($C = p + 1$) then

$$U_i(j) = s((j \times r_i) \bmod (p-1)), \quad j = 0, 1, \dots, (p-2). \quad U_i(p-1) = 0, \text{ and } U_i(p) = p,$$

where $U_i(j)$ is the original bit position of j -th permuted bit of i -th row, and

if ($K = R \times C$) then

Exchange $U_{R-1}(p)$ with $U_{R-1}(0)$.

end if

end if

if ($C = p - 1$) then

$$U_i(j) = s((j \times r_i) \bmod (p-1)) - 1, \quad j = 0, 1, \dots, (p-2),$$

where $U_i(j)$ is the original bit position of j -th permuted bit of i -th row.

end if

(6) Perform the inter-row permutation for the rectangular matrix based on the pattern $\langle T(i) \rangle_{i \in \{0, 1, \dots, R-1\}}$,

where $T(i)$ is the original row position of the i -th permuted row.

4.2.3.2.3.3 Bits-output from rectangular matrix with pruning

After intra-row and inter-row permutations, the bits of the permuted rectangular matrix are denoted by y'_k :

$$\begin{bmatrix} y'_1 & y'_{(R+1)} & y'_{(2R+1)} & \cdots & y'_{((C-1)R+1)} \\ y'_2 & y'_{(R+2)} & y'_{(2R+2)} & \cdots & y'_{((C-1)R+2)} \\ \vdots & \vdots & \vdots & \cdots & \vdots \\ y'_R & y'_{2R} & y'_{3R} & \cdots & y'_{C \times R} \end{bmatrix}$$

The output of the Turbo code internal interleaver is the bit sequence read out column by column from the intra-row and inter-row permuted $R \times C$ rectangular matrix starting with bit y'_1 in row 0 of column 0 and ending with bit y'_{CR} in row $R - 1$ of column $C - 1$. The output is pruned by deleting dummy bits that were padded to the input of the rectangular matrix before intra-row and inter row permutations, i.e. bits y'_k that corresponds to bits y_k with $k > K$ are removed from the output. The bits output from Turbo code internal interleaver are denoted by x'_1, x'_2, \dots, x'_K , where x'_1 corresponds to the bit y'_k with smallest index k after pruning, x'_2 to the bit y'_k with second smallest index k after pruning, and so on. The number of bits output from Turbo code internal interleaver is K and the total number of pruned bits is:

$$R \times C - K.$$

4.2.3.3 Concatenation of encoded blocks

After the channel coding for each code block, if C_i is greater than 1, the encoded blocks are serially concatenated so that the block with lowest index r is output first from the channel coding block, otherwise the encoded block is output from channel coding block as it is. The bits output are denoted by $c_{i1}, c_{i2}, c_{i3}, \dots, c_{iE_i}$, where i is the TrCH number and $E_i = C_i Y_i$. The output bits are defined by the following relations:

$$c_{ik} = y_{i1k} \quad k = 1, 2, \dots, Y_i$$

$$c_{ik} = y_{i,2,(k-Y_i)} \quad k = Y_i + 1, Y_i + 2, \dots, 2Y_i$$

$$c_{ik} = y_{i,3,(k-2Y_i)} \quad k = 2Y_i + 1, 2Y_i + 2, \dots, 3Y_i$$

...

$$c_{ik} = y_{i,C_i,(k-(C_i-1)Y_i)} \quad k = (C_i - 1)Y_i + 1, (C_i - 1)Y_i + 2, \dots, C_i Y_i$$

If no code blocks are input to the channel coding ($C_i = 0$), no bits shall be output from the channel coding, i.e. $E_i = 0$.

4.2.4 Radio frame size equalisation

Radio frame size equalisation is padding the input bit sequence in order to ensure that the output can be segmented in F_i data segments of same size as described in the subclause 4.2.6.

The input bit sequence to the radio frame size equalisation is denoted by $c_{i1}, c_{i2}, c_{i3}, \dots, c_{iE_i}$, where i is TrCH number and E_i the number of bits. The output bit sequence is denoted by $t_{i1}, t_{i2}, t_{i3}, \dots, t_{iT_i}$, where T_i is the number of bits. The output bit sequence is derived as follows:

$$t_{ik} = c_{ik}, \text{ for } k = 1 \dots E_i \text{ and}$$

$$t_{ik} = \{0, 1\} \text{ for } k = E_i + 1 \dots T_i, \text{ if } E_i < T_i$$

where

$$T_i = F_i * N_i \text{ and}$$

$$N_i = \lceil E_i / F_i \rceil \text{ is the number of bits per segment after size equalisation.}$$

4.2.5 1st interleaving

The 1st interleaving is a block interleaver with inter-column permutations. The input bit sequence to the block interleaver is denoted by $x_{i,1}, x_{i,2}, x_{i,3}, \dots, x_{i,X_i}$, where i is TrCH number and X_i the number of bits. Here X_i is guaranteed to be an integer multiple of the number of radio frames in the TTI. The output bit sequence from the block interleaver is derived as follows:

- 1) select the number of columns C1 from table 4 depending on the TTI. The columns are numbered 0, 1, ..., C1 - 1 from left to right.

- 2) determine the number of rows of the matrix, R1 defined as

$$R1 = X_i / C1.$$

The rows of the matrix are numbered 0, 1, ..., R1 - 1 from top to bottom.

- 3) write the input bit sequence into the $R1 \times C1$ matrix row by row starting with bit $x_{i,1}$ in column 0 of row 0 and ending with bit $x_{i,(R1 \times C1)}$ in column C1 - 1 of row R1 - 1:

$$\begin{bmatrix} x_{i,1} & x_{i,2} & x_{i,3} & \dots & x_{i,C1} \\ x_{i,(C1+1)} & x_{i,(C1+2)} & x_{i,(C1+3)} & \dots & x_{i,(2 \times C1)} \\ \vdots & \vdots & \vdots & \dots & \vdots \\ x_{i,((R1-1) \times C1+1)} & x_{i,((R1-1) \times C1+2)} & x_{i,((R1-1) \times C1+3)} & \dots & x_{i,(R1 \times C1)} \end{bmatrix}$$

- 4) Perform the inter-column permutation for the matrix based on the pattern $\langle P1_{C1}(j) \rangle_{j \in \{0,1,\dots,C1-1\}}$ shown in table 4, where $P1_{C1}(j)$ is the original column position of the j -th permuted column. After permutation of the columns, the bits are denoted by $y_{i,k}$:

$$\begin{bmatrix} y_{i,1} & y_{i,(R1+1)} & y_{i,(2 \times R1+1)} & \dots & y_{i,((C1-1) \times R1+1)} \\ y_{i,2} & y_{i,(R1+2)} & y_{i,(2 \times R1+2)} & \dots & y_{i,((C1-1) \times R1+2)} \\ \vdots & \vdots & \vdots & \dots & \vdots \\ y_{i,R1} & y_{i,(2 \times R1)} & y_{i,(3 \times R1)} & \dots & y_{i,(C1 \times R1)} \end{bmatrix}$$

- 5) Read the output bit sequence $y_{i,1}, y_{i,2}, y_{i,3}, \dots, y_{i,(C1 \times R1)}$ of the block interleaver column by column from the inter-column permuted $R1 \times C1$ matrix. Bit $y_{i,1}$ corresponds to row 0 of column 0 and bit $y_{i,(R1 \times C1)}$ corresponds to row $R1 - 1$ of column $C1 - 1$.

Table 4 Inter-column permutation patterns for 1st interleaving

TTI	Number of columns C1	Inter-column permutation patterns $\langle P1_{C1}(0), P1_{C1}(1), \dots, P1_{C1}(C1-1) \rangle$
5ms ^(*) , 10 ms	1	$\langle 0 \rangle$
20 ms	2	$\langle 0, 1 \rangle$
40 ms	4	$\langle 0, 2, 1, 3 \rangle$
80 ms	8	$\langle 0, 4, 2, 6, 1, 5, 3, 7 \rangle$

^(*) can be used for PRACH for 1.28 Mcps TDD

4.2.5.1 Relation between input and output of 1st interleaving

The bits input to the 1st interleaving are denoted by $t_{i,1}, t_{i,2}, t_{i,3}, \dots, t_{i,T_i}$, where i is the TrCH number and T_i the number of bits. Hence, $x_{i,k} = t_{i,k}$ and $X_i = T_i$.

The bits output from the 1st interleaving are denoted by $d_{i,1}, d_{i,2}, d_{i,3}, \dots, d_{i,T_i}$, and $d_{i,k} = y_{i,k}$.

4.2.6 Radio frame segmentation

When the transmission time interval is longer than 10 ms, the input bit sequence is segmented and mapped onto consecutive F_i radio frames. Following radio frame size equalisation the input bit sequence length is guaranteed to be an integer multiple of F_i .

The input bit sequence is denoted by $x_{i,1}, x_{i,2}, x_{i,3}, \dots, x_{i,X_i}$ where i is the TrCH number and X_i is the number bits. The F_i output bit sequences per TTI are denoted by $y_{i,n_1}, y_{i,n_2}, y_{i,n_3}, \dots, y_{i,n_{Y_i}}$ where n_i is the radio frame number in current TTI and Y_i is the number of bits per radio frame for TrCH i . The output sequences are defined as follows:

$$y_{i,n,k} = x_{i,((n-1)Y_i)+k}, n_i = 1 \dots F_i, k = 1 \dots Y_i$$

where

$$Y_i = (X_i / F_i) \text{ is the number of bits per segment.}$$

The n_i -th segment is mapped to the n_i -th radio frame of the transmission time interval.

The input bit sequence to the radio frame segmentation is denoted by $d_{i1}, d_{i2}, d_{i3}, \dots, d_{iT_i}$, where i is the TrCH number and T_i the number of bits. Hence, $x_{ik} = d_{ik}$ and $X_i = T_i$.

The output bit sequence corresponding to radio frame n_i is denoted by $e_{i1}, e_{i2}, e_{i3}, \dots, e_{iN_i}$, where i is the TrCH number and N_i is the number of bits. Hence, $e_{i,k} = y_{i,n_i,k}$ and $N_i = Y_i$.

4.2.7 Rate matching

Rate matching means that bits on a TrCH are repeated or punctured. Higher layers assign a rate-matching attribute for each TrCH. This attribute is semi-static and can only be changed through higher layer signalling. The rate-matching attribute is used when the number of bits to be repeated or punctured is calculated.

The number of bits on a TrCH can vary between different transmission time intervals. When the number of bits between different transmission time intervals is changed, bits are repeated to ensure that the total bit rate after TrCH multiplexing is identical to the total channel bit rate of the allocated physical channels.

If no bits are input to the rate matching for all TrCHs within a CCTrCH, the rate matching shall output no bits for all TrCHs within the CCTrCH.

Notation used in subclause 4.2.7 and subclauses:

- N_{ij} : Number of bits in a radio frame before rate matching on TrCH i with transport format combination j .
- $\Delta N_{i,j}$: If positive – number of bits to be repeated in each radio frame on TrCH i with transport format combination j .
If negative – number of bits to be punctured in each radio frame on TrCH i with transport format combination j .
- RM_i : Semi-static rate matching attribute for TrCH i . Signalled from higher layers.
- PL : Puncturing limit. This value limits the amount of puncturing that can be applied in order to minimise the number of physical channels. Signalled from higher layers. The allowed puncturing in % is actually equal to $(1-PL)*100$.
- $N_{data,j}$: Total number of bits that are available for a CCTrCH in a radio frame with transport format combination j .
- P : number of physical channels used in the current frame.
- P_{max} : maximum number of physical channels allocated for a CCTrCH.
- U_p : Number of data bits in the physical channel p with $p = 1 \dots P$ during a radio frame.
- I : Number of TrCHs in a CCTrCH.
- Z_{ij} : Intermediate calculation variable.
- F_i : Number of radio frames in the transmission time interval of TrCH i .
- n_i : Radio frame number in the transmission time interval of TrCH i ($0 \leq n_i < F_i$).
- q : Average puncturing or repetition distance (normalised to only show the remaining rate matching on top of an integer number of repetitions).
- $PI_F(n_i)$: The column permutation function of the 1st interleaver, $PI_F(x)$ is the original position of column with number x after permutation. PI is defined on table 4 of section 4.2.5 (note that PI_F self-inverse).
- $S[n]$: The shift of the puncturing or repetition pattern for radio frame n_i when $n = PI_{F_i}(n_i)$.
- $TF_i(j)$: Transport format of TrCH i for the transport format combination j .
- $TFS(i)$: The set of transport format indexes l for TrCH i .

- e_{ini} : Initial value of variable e in the rate matching pattern determination algorithm of subclause 4.2.7.3.
- e_{plus} : Increment of variable e in the rate matching pattern determination algorithm of subclause 4.2.7.3.
- e_{minus} : Decrement of variable e in the rate matching pattern determination algorithm of subclause 4.2.7.3.
- b : Indicates systematic and parity bits.
- $b=1$: Systematic bit. $X(t)$ in subclause 4.2.3.2.1.
- $b=2$: 1st parity bit (from the upper Turbo constituent encoder). $Y(t)$ in subclause 4.2.3.2.1.
- $b=3$: 2nd parity bit (from the lower Turbo constituent encoder). $Y'(t)$ in subclause 4.2.3.2.1.

Note: when the TTI is 5msec for 1.28Mcps, the above notation refers to a sub-frame rather than a radio frame. In this case, $F_i = 1$ and $n_i = 0$.

4.2.7.1 Determination of rate matching parameters

The following relations, defined for all TFC j , are used when calculating the rate matching pattern:

$$Z_{0,j} = 0$$

$$Z_{i,j} = \left\lfloor \frac{\left(\left(\sum_{m=1}^i RM_m \times N_{m,j} \right) \times N_{data,j} \right)}{\sum_{m=1}^I RM_m \times N_{m,j}} \right\rfloor \quad \text{for all } i = 1 \dots I(1)$$

$$\Delta N_{i,j} = Z_{i,j} - Z_{i-1,j} - N_{i,j} \quad \text{for all } i = 1 \dots I$$

Puncturing can be used to minimise the required transmission capacity. The maximum amount of puncturing that can be applied is 1-PL, PL is signalled from higher layers. The possible values for N_{data} depend on the number of physical channels P_{max} , allocated to the respective CCTrCH, and on their characteristics (spreading factor, length of midamble and TFCI code word, usage of TPC and multiframe structure), which is given in [7].

For each physical channel an individual minimum spreading factor Sp_{min} is transmitted by means of the higher layers. Denote the number of data bits in each physical channel by $U_{p,Sp}$, where p indicates the sequence number $1 \leq p \leq P_{max}$ and Sp indicates the spreading factor of this physical channel: Sp takes the possible values $\{16, 8, 4, 2, 1\}$ for 1.28Mcps TDD and 3.84Mcps TDD, Sp takes the possible values $\{32, 16, 8, 4, 2, 1\}$ for 7.68Mcps TDD. The index p is described in section 4.2.12 with the following modifications: spreading factor (Q) is replaced by the minimum spreading factor Sp_{min} and k is replaced by the channelization code index at $Q = Sp_{min}$. Then, for N_{data} one of the following values in ascending order can be chosen:

$$\left\{ U_{1,Sp_{min}}, U_{1,Sp_{min}} + U_{2,Sp_{min}}, U_{1,Sp_{min}} + U_{2,Sp_{min}} + \dots + U_{P_{max},(Sp_{max})_{min}} \right\}$$

Optionally, if indicated by higher layers for the UL the UE shall vary the spreading factor autonomously, so that N_{data} is one of the following values in ascending order:

$$\left\{ U_{1,16}, \dots, U_{1,Sp_{min}}, U_{1,Sp_{min}} + U_{2,16}, \dots, U_{1,Sp_{min}} + U_{2,Sp_{min}}, \dots, U_{1,Sp_{min}} + U_{2,Sp_{min}} + \dots + U_{P_{max},16}, \dots, U_{1,Sp_{min}} + U_{2,Sp_{min}} + \dots + U_{P_{max},(Sp_{max})_{min}} \right\}$$

$N_{data,j}$ for the transport format combination j is determined by executing the following algorithm:

$$\text{SET1} = \left\{ N_{data} \text{ such that } \left(\min_{1 \leq y \leq I} \{ RM_y \} \right) \times N_{data} - PL \times \sum_{x=1}^I RM_x \times N_{x,j} \text{ is non negative} \right\}$$

$$N_{data,j} = \min \text{SET1}$$

The number of bits to be repeated or punctured, $\Delta N_{i,j}$, within one radio frame (one sub-frame when the TTI is 5msec) for each TrCH i is calculated with the relations given at the beginning of this subclause for all possible transport format combinations j and selected every radio frame (sub-frame). The number of physical channels corresponding to $N_{\text{data},j}$, shall be denoted by P .

If $\Delta N_{i,j} = 0$ then the output data of the rate matching is the same as the input data and the rate matching algorithm of subclause 4.2.7.3 does not need to be executed.

Otherwise, the rate matching pattern is calculated with the algorithm described in subclause 4.2.7.3. For this algorithm the parameters e_{ini} , e_{plus} , e_{minus} , and X_i are needed, which are calculated according to the equations in subclauses 4.2.7.1.1 and 4.2.7.1.2.

4.2.7.1.1 Uncoded and convolutionally encoded TrCHs

$$a = 2$$

$$\Delta N_i = \Delta N_{i,j}$$

$$X_i = N_{i,j}$$

$$R = \Delta N_{i,j} \bmod N_{i,j} \text{ -- note: in this context } \Delta N_{i,j} \bmod N_{i,j} \text{ is in the range of } 0 \text{ to } N_{i,j}-1 \text{ i.e. } -1 \bmod 10 = 9.$$

if $R \neq 0$ and $2 \times R \leq N_{i,j}$

$$\text{then } q = \lceil N_{i,j} / R \rceil$$

else

$$q = \lceil N_{i,j} / (R - N_{i,j}) \rceil$$

endif

NOTE 1: q is a signed quantity.

If q is even

$$\text{then } q' = q + \text{gcd}(|q|, F_i) / F_i \text{ -- where } \text{gcd}(|q|, F_i) \text{ means greatest common divisor of } |q| \text{ and } F_i$$

NOTE 2: q' is not an integer, but a multiple of 1/8.

else

$$q' = q$$

endif

for $x = 0$ to F_i-1

$$S[\lfloor x \times q' \rfloor \bmod F_i] = (\lfloor x * q' \rfloor \text{ div } F_i)$$

end for

$$e_{\text{ini}} = (a \times S[\text{P1}_{F_i}(n_i)] \times |\Delta N_i| + 1) \bmod (a \times N_{i,j})$$

$$e_{\text{plus}} = a \times X_i$$

$$e_{\text{minus}} = a \times |\Delta N_i|$$

puncturing for $\Delta N_i < 0$, repetition otherwise.

4.2.7.1.2 Turbo encoded TrCHs

If repetition is to be performed on turbo encoded TrCHs, i.e. $\Delta N_{i,j} > 0$, the parameters in subclause 4.2.7.1.1 are used.

If puncturing is to be performed, the parameters below shall be used. Index b is used to indicate systematic ($b=1$), 1st parity ($b=2$), and 2nd parity bit ($b=3$).

$a = 2$ when $b=2$

$a = 1$ when $b=3$

$$\Delta N_i = \begin{cases} \lfloor \Delta N_{i,j} / 2 \rfloor, & b = 2 \\ \lfloor \Delta N_{i,j} / 2 \rfloor, & b = 3 \end{cases}$$

If ΔN_i is calculated as 0 for $b=2$ or $b=3$, then the following procedure and the rate matching algorithm of subclause 4.2.7.3 don't need to be performed for the corresponding parity bit stream.

$X_i = \lfloor N_{i,j} / 3 \rfloor$,

$q = \lfloor X_i / |\Delta N_i| \rfloor$

if($q \leq 2$)

for $r=0$ to F_i-1

$S[(3 \times r + b - 1) \bmod F_i] = r \bmod 2$;

end for

else

if q is even

then $q' = q - \gcd(q, F_i) / F_i$ -- where $\gcd(q, F_i)$ means greatest common divisor of q and F_i

NOTE: q' is not an integer, but a multiple of $1/8$.

else $q' = q$

endif

for $x=0$ to $F_i - 1$

$r = \lceil x \times q' \rceil \bmod F_i$;

$S[(3 \times r + b - 1) \bmod F_i] = \lceil x \times q' \rceil \div F_i$;

endfor

endif

For each radio frame, the rate-matching pattern is calculated with the algorithm in subclause 4.2.7.3, where:

X_i is as above,

$e_{ini} = (a \times S[P1 \ F_i(n_i)] \times |\Delta N_i| + X_i) \bmod (a \times X_i)$, if $e_{ini} = 0$ then $e_{ini} = a \times X_i$

$e_{plus} = a \times X_i$

$e_{minus} = a \times |\Delta N_i|$

4.2.7.2 Bit separation and collection for rate matching

The systematic bits of turbo encoded TrCHs shall not be punctured, the other bits may be punctured. The systematic bits, first parity bits, and second parity bits in the bit sequence input to the rate matching block are therefore separated into three sequences.

The first sequence contains:

- All of the systematic bits that are from turbo encoded TrCHs.

- From 0 to 2 first and/or second parity bits that are from turbo encoded TrCHs. These bits come into the first sequence when the total number of bits in a block after radio frame segmentation is not a multiple of three.
- Some of the systematic, first parity and second parity bits that are for trellis termination.

The second sequence contains:

- All of the first parity bits that are from turbo encoded TrCHs, except those that go into the first sequence when the total number of bits is not a multiple of three.
- Some of the systematic, first parity and second parity bits that are for trellis termination.

The third sequence contains:

- All of the second parity bits that are from turbo encoded TrCHs, except those that go into the first sequence when the total number of bits is not a multiple of three.
- Some of the systematic, first parity and second parity bits that are for trellis termination.

The second and third sequences shall be of equal length, whereas the first sequence can contain from 0 to 2 more bits. Puncturing is applied only to the second and third sequences.

The bit separation function is transparent for uncoded TrCHs, convolutionally encoded TrCHs, and for turbo encoded TrCHs with repetition. The bit separation and bit collection are illustrated in figures 4 and 5.

Figure 4: Puncturing of turbo encoded TrCHs

Figure 5: Rate matching for uncoded TrCHs, convolutionally encoded TrCHs, and for turbo encoded TrCHs with repetition

The bit separation is dependent on the 1st interleaving and offsets are used to define the separation for different TTIs. b indicates the three sequences defined in this section, with $b=1$ indicating the first sequence, $b = 2$ the second one, and $b = 3$ the third one.

The offsets α_b for these sequences are listed in table 5.

Table 5: TTI dependent offset needed for bit separation

TTI (ms)	α_1	α_2	α_3
5, 10, 40	0	1	2
20, 80	0	2	1

The bit separation is different for different radio frames in the TTI. A second offset is therefore needed. The radio frame number for TrCH i is denoted by n_i , and the offset by β_{n_i} .

Table 6: Radio frame dependent offset needed for bit separation

TTI (ms)	β_0	β_1	β_2	β_3	β_4	β_5	β_6	β_7
5, 10	0	NA	NA	NA	NA	NA	NA	NA
20	0	1	NA	NA	NA	NA	NA	NA
40	0	1	2	0	NA	NA	NA	NA
80	0	1	2	0	1	2	0	1

4.2.7.2.1 Bit separation

The bits input to the rate matching are denoted by $e_{i,1}, e_{i,2}, e_{i,3}, \dots, e_{i,N_i}$, where i is the TrCH number and N_i is the number of bits input to the rate matching block. Note that the transport format combination number j for simplicity has been left out in the bit numbering, i.e. $N_i=N_{ij}$. The bits after separation are denoted by $x_{b,i,1}, x_{b,i,2}, x_{b,i,3}, \dots, x_{b,i,X_i}$. For turbo encoded TrCHs with puncturing, b indicates the three sequences defined in section 4.2.7.2, with $b=1$ indicating the first sequence, and so forth. For all other cases b is defined to be 1. X_i is the number of bits in each separated bit sequence. The relation between $e_{i,k}$ and $x_{b,i,k}$ is given below.

For turbo encoded TrCHs with puncturing:

$$x_{1,i,k} = e_{i,3(k-1)+1+(\alpha_1+\beta_{n_i}) \bmod 3} \quad k = 1, 2, 3, \dots, X_i \quad X_i = \lfloor N_i / 3 \rfloor$$

$$x_{1,i,\lfloor N_i/3 \rfloor+k} = e_{i,3\lfloor N_i/3 \rfloor+k} \quad k = 1, \dots, N_i \bmod 3 \quad \text{Note: When } (N_i \bmod 3) = 0 \text{ this row is not needed.}$$

$$x_{2,i,k} = e_{i,3(k-1)+1+(\alpha_2+\beta_{n_i}) \bmod 3} \quad k = 1, 2, 3, \dots, X_i \quad X_i = \lfloor N_i/3 \rfloor$$

$$x_{3,i,k} = e_{i,3(k-1)+1+(\alpha_3+\beta_{n_i}) \bmod 3} \quad k = 1, 2, 3, \dots, X_i \quad X_i = \lfloor N_i/3 \rfloor$$

For uncoded TrCHs, convolutionally encoded TrCHs, and turbo encoded TrCHs with repetition:

$$x_{1,i,k} = e_{i,k} \quad k = 1, 2, 3, \dots, X_i \quad X_i = N_i$$

4.2.7.2.2 Bit collection

The bits $x_{b,i,k}$ are input to the rate matching algorithm described in subclause 4.2.7.3. The bits output from the rate matching algorithm are denoted $y_{b,i,1}, y_{b,i,2}, y_{b,i,3}, \dots, y_{b,i,Y_i}$.

Bit collection is the inverse function of the separation. The bits after collection are denoted by

$z_{b,i,1}, z_{b,i,2}, z_{b,i,3}, \dots, z_{b,i,Y_i}$. After bit collection, the bits indicated as punctured are removed and the bits are then denoted by $f_{i,1}, f_{i,2}, f_{i,3}, \dots, f_{i,V_i}$, where i is the TrCH number and $V_i = N_{i,j} + \Delta N_{i,j}$. The relations between $y_{b,i,k}$, $z_{b,i,k}$, and $f_{i,k}$ are given below.

For turbo encoded TrCHs with puncturing ($Y_i = X_i$):

$$z_{i,3(k-1)+1+(\alpha_1+\beta_{n_i}) \bmod 3} = y_{1,i,k} \quad k = 1, 2, 3, \dots, Y_i$$

$$z_{i,3\lfloor N_i/3 \rfloor+k} = y_{1,i,\lfloor N_i/3 \rfloor+k} \quad k = 1, \dots, N_i \bmod 3 \quad \text{Note: When } (N_i \bmod 3) = 0 \text{ this row is not needed.}$$

$$z_{i,3(k-1)+1+(\alpha_2+\beta_{n_i}) \bmod 3} = y_{2,i,k} \quad k = 1, 2, 3, \dots, Y_i$$

$$z_{i,3(k-1)+1+(\alpha_3+\beta_{n_i}) \bmod 3} = y_{3,i,k} \quad k = 1, 2, 3, \dots, Y_i$$

After the bit collection, bits $z_{i,k}$ with value δ , where $\delta \notin \{0, 1\}$, are removed from the bit sequence. Bit $f_{i,1}$ corresponds to the bit $z_{i,k}$ with smallest index k after puncturing, bit $f_{i,2}$ corresponds to the bit $z_{i,k}$ with second smallest index k after puncturing, and so on.

For uncoded TrCHs, convolutionally encoded TrCHs, and turbo encoded TrCHs with repetition:

$$z_{i,k} = y_{1,i,k} \quad k = 1, 2, 3, \dots, Y_i$$

When repetition is used, $f_{i,k} = z_{i,k}$ and $Y_i = V_i$.

When puncturing is used, $Y_i = X_i$ and bits $z_{i,k}$ with value δ , where $\delta \notin \{0, 1\}$, are removed from the bit sequence. Bit $f_{i,1}$ corresponds to the bit $z_{i,k}$ with smallest index k after puncturing, bit $f_{i,2}$ corresponds to the bit $z_{i,k}$ with second smallest index k after puncturing, and so on.

4.2.7.3 Rate matching pattern determination

The bits input to the rate matching are denoted by $x_{i,1}, x_{i,2}, x_{i,3}, \dots, x_{i,X_i}$, where i is the TrCH and X_i is the parameter given in subclauses 4.2.7.1.1 and 4.2.7.1.2.

NOTE: The transport format combination number j for simplicity has been left out in the bit numbering.

The rate matching rule is as follows:

if puncturing is to be performed

```

e = eini    -- initial error between current and desired puncturing ratio
m = 1        -- index of current bit
do while m <= Xi
    e = e - eminus    -- update error
    if e <= 0 then    -- check if bit number m should be punctured
        set bit xi,m to  $\delta$  where  $\delta \notin \{0, 1\}$ 
        e = e + eplus    -- update error
    end if
    m = m + 1        -- next bit
end do
else
e = eini    -- initial error between current and desired puncturing ratio
m = 1        -- index of current bit
do while m <= Xi
    e = e - eminus    -- update error
    do while e <= 0    -- check if bit number m should be repeated
        repeat bit xi,m
        e = e + eplus    -- update error
    end do
    m = m + 1        -- next bit
end do
end if

```

A repeated bit is placed directly after the original one.

4.2.8 TrCH multiplexing

Every 10 ms, one radio frame from each TrCH is delivered to the TrCH multiplexing. These radio frames are serially multiplexed into a coded composite transport channel (CCTrCH). If the TTI is smaller than 10ms, then no TrCH multiplexing is performed.

The bits input to the TrCH multiplexing are denoted by $f_{i,1}, f_{i,2}, f_{i,3}, \dots, f_{i,V_i}$, where i is the TrCH id number and V_i is the number of bits in the radio frame of TrCH i . The number of TrCHs is denoted by I . The bits output from TrCH multiplexing are denoted by $h_1, h_2, h_3, \dots, h_S$, where S is the number of bits, i.e. $S = \sum_i V_i$. The TrCH multiplexing is defined by the following relations:

$$h_k = f_{1,k} \quad k = 1, 2, \dots, V_1$$

$$h_k = f_{2,(k-V_1)} \quad k = V_1+1, V_1+2, \dots, V_1+V_2$$

$$h_k = f_{3,(k-(V_1+V_2))} \quad k = (V_1+V_2)+1, (V_1+V_2)+2, \dots, (V_1+V_2)+V_3$$

...

$$h_k = f_{I,(k-(V_1+V_2+\dots+V_{I-1}))} \quad k = (V_1+V_2+\dots+V_{I-1})+1, (V_1+V_2+\dots+V_{I-1})+2, \dots, (V_1+V_2+\dots+V_{I-1})+V_I$$

4.2.9 Bit Scrambling

The bits output from the TrCH multiplexer are scrambled in the bit scrambler. The bits input to the bit scrambler are denoted by $h_1, h_2, h_3, \dots, h_S$, where S is the number of bits input to the bit scrambling block equal to the total number of bits on the CCTrCH. The bits after bit scrambling are denoted $s_1, s_2, s_3, \dots, s_S$.

Bit scrambling is defined by the following relation:

$$s_k = h_k \oplus p_k \quad k = 1, 2, \dots, S$$

and p_k results from the following operation:

$$p_k = \left(\sum_{i=1}^{16} g_i \cdot p_{k-i} \right) \bmod 2; \quad p_k = 0; k < 1; \quad p_1 = 1; \quad g = \{0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 1, 0, 1, 1, 0, 1\}$$

4.2.10 Physical channel segmentation

When more than one PhCH is used, physical channel segmentation divides the bits among the different PhCHs. The bits input to the physical channel segmentation are denoted by $s_1, s_2, s_3, \dots, s_S$, where S is the number of bits input to the physical channel segmentation block. The number of PhCHs after rate matching is denoted by P , as defined in subclause 4.2.7.1.

The bits after physical channel segmentation are denoted $u_{p,1}, u_{p,2}, u_{p,3}, \dots, u_{p,U_p}$, where p is PhCH number and U_p is the in general variable number of bits in the respective radio frame for each PhCH. The relation between s_k and $u_{p,k}$ is given below.

Bits on first PhCH after physical channel segmentation:

$$u_{1,k} = s_k \quad k = 1, 2, \dots, U_1$$

Bits on second PhCH after physical channel segmentation:

$$u_{2,k} = s_{(k+U_1)} \quad k = 1, 2, \dots, U_2$$

...

Bits on the P^{th} PhCH after physical channel segmentation:

$$u_{P,k} = s_{(k+U_1+\dots+U_{P-1})} \quad k = 1, 2, \dots, U_P$$

4.2.11 2nd interleaving

The 2nd interleaving is a block interleaver and consists of bits input to a matrix with padding, the inter-column permutation for the matrix and bits output from the matrix with pruning. The 2nd interleaving can be applied jointly to all data bits transmitted during one frame, or separately within each timeslot, on which the CCTrCH is mapped. The selection of the 2nd interleaving scheme is controlled by higher layer.

4.2.11.1 Frame related 2nd interleaving

In case of frame related 2nd interleaving, the bits input to the block interleaver are denoted by $x_1, x_2, x_3, \dots, x_U$, where U is the total number of bits after TrCH multiplexing transmitted during the respective radio frame with

$$S=U = \sum_p U_p .$$

The relation between x_k and the bits $u_{p,k}$ in the respective physical channels is given below:

$$x_k = u_{1,k} \quad k = 1, 2, \dots, U_1$$

$$x_{(k+U_1)} = u_{2,k} \quad k = 1, 2, \dots, U_2$$

...

$$x_{(k+U_1+\dots+U_{p-1})} = u_{p,k} \quad k = 1, 2, \dots, U_p$$

The following steps have to be performed once for each CCTrCH:

- (1) Assign $C2 = 30$ to be the number of columns of the matrix. The columns of the matrix are numbered $0, 1, 2, \dots, C2 - 1$ from left to right.
- (2) Determine the number of rows of the matrix, $R2$, by finding minimum integer $R2$ such that:

$$U \leq R2 \times C2.$$

The rows of rectangular matrix are numbered $0, 1, 2, \dots, R2 - 1$ from top to bottom.

- (3) Write the input bit sequence $x_1, x_2, x_3, \dots, x_U$ into the $R2 \times C2$ matrix row by row starting with bit y_1 in column 0 of row 0:

$$\begin{bmatrix} y_1 & y_2 & y_3 & \dots & y_{C2} \\ y_{(C2+1)} & y_{(C2+2)} & y_{(C2+3)} & \dots & y_{(2 \times C2)} \\ \vdots & \vdots & \vdots & \dots & \vdots \\ y_{((R2-1) \times C2+1)} & y_{((R2-1) \times C2+2)} & y_{((R2-1) \times C2+3)} & \dots & y_{(R2 \times C2)} \end{bmatrix}$$

where $y_k = x_k$ for $k = 1, 2, \dots, U$ and if $R2 \times C2 > U$, the dummy bits are padded such that $y_k = 0$ or 1 for $k = U + 1, U + 2, \dots, R2 \times C2$. These dummy bits are pruned away from the output of the matrix after the inter-column permutation.

- (4) Perform the inter-column permutation for the matrix based on the pattern $\langle P_2(j) \rangle_{j \in \{0,1,\dots,C2-1\}}$ that is shown in table 7, where $P_2(j)$ is the original column position of the j -th permuted column. After permutation of the columns, the bits are denoted by y'_k .

$$\begin{bmatrix} y'_1 & y'_{(R2+1)} & y'_{(2 \times R2+1)} & \dots & y'_{((C2-1) \times R2+1)} \\ y'_2 & y'_{(R2+2)} & y'_{(2 \times R2+2)} & \dots & y'_{((C2-1) \times R2+2)} \\ \vdots & \vdots & \vdots & \dots & \vdots \\ y'_{R2} & y'_{(2 \times R2)} & y'_{(3 \times R2)} & \dots & y'_{(C2 \times R2)} \end{bmatrix}$$

- (5) The output of the block interleaver is the bit sequence read out column by column from the inter-column permuted $R2 \times C2$ matrix. The output is pruned by deleting dummy bits that were padded to the input of the matrix before the inter-column permutation, i.e. bits y'_k that corresponds to bits y_k with $k > U$ are removed from the output. The bits at the output of the block interleaver are denoted by z_1, z_2, \dots, z_U , where z_1

corresponds to the bit y'_k with smallest index k after pruning, z_2 to the bit y'_k with second smallest index k after pruning, and so on.

The bits z_1, z_2, \dots, z_U shall be segmented as follows:

$$u_{1,k} = z_k \quad k = 1, 2, \dots, U_1$$

$$u_{2,k} = z_{(k+U_1)} \quad k = 1, 2, \dots, U_2$$

...

$$u_{p,k} = z_{(k+U_1+\dots+U_{p-1})} \quad k = 1, 2, \dots, U_p$$

The bits after frame related 2nd interleaving are denoted by $v_{t,1}, v_{t,2}, \dots, v_{t,U_t}$, where t refers to the timeslot sequence number and U_t is the number of bits transmitted in this timeslot during the respective radio frame.

Let T be the number of time slots in a CCTrCH during the respective radio frame (where for 1.28Mcps TDD, the respective radio frame includes subframes 1 and 2), and $t = 1, \dots, T$. The physical layer shall assign the time slot sequence number t in ascending order of the allocated time slots in the CCTrCH in the respective radio frame. In time slot t , R_t refers to the number of physical channels within the respective time slot and $r = 1, \dots, R_t$. The relation between r and t and the physical channel sequence number p as detailed in 4.2.12.1 is given by:

$$p = r \quad t = 1$$

$$p = R_1 + R_2, \dots, R_{t-1} + r \quad 1 < t \leq T$$

Defining the relation $u_{t,r,k} = u_{p,k}$ and denoting U_{tr} as the number of bits for physical channel r in time slot t , the relation between $v_{t,k}$ and $u_{t,r,k}$ is given below:

$$v_{t,k} = u_{t,1,k} \quad k = 1, 2, \dots, U_{t1}$$

$$v_{t,(k+U_{t1})} = u_{t,2,k} \quad k = 1, 2, \dots, U_{t2}$$

...

$$v_{t,(k+U_{t1}+\dots+U_{t(R_t-1)})} = u_{t,R_t,k} \quad k = 1, 2, \dots, U_{tR_t}$$

4.2.11.2 Timeslot related 2nd interleaving

In case of timeslot related 2nd interleaving, the bits input to the block interleaver are denoted by

$x_{t,1}, x_{t,2}, x_{t,3}, \dots, x_{t,U_t}$, where t is the timeslot sequence number, and U_t is the number of bits transmitted in this timeslot during the respective radio frame.

Let T be the number of time slots in a CCTrCH during the respective radio frame (where for 1.28Mcps TDD, the respective radio frame includes subframes 1 and 2), and $t = 1, \dots, T$. The physical layer shall assign the time slot sequence number t in ascending order of the allocated time slots in the CCTrCH in the respective radio frame. In timeslot t , R_t refers to the number of physical channels within the respective timeslot and $r = 1, \dots, R_t$. The relation between r and t and the physical channel sequence number p as detailed in 4.2.12.1 is given by:

$$p = r \quad t = 1$$

$$p = R_1 + R_2, \dots, R_{t-1} + r \quad 1 < t \leq T$$

Defining the relation $u_{t,r,k} = u_{p,k}$ and denoting U_{tr} as the number of bits for physical channel r in time slot t , the relation between $x_{t,k}$ and $u_{t,r,k}$ is given below:

$$\begin{aligned} x_{t,k} &= u_{t,1,k} & k &= 1, 2, \dots, U_{t1} \\ x_{t,(k+U_{t1})} &= u_{t,2,k} & k &= 1, 2, \dots, U_{t2} \\ &\dots & & \\ x_{t,(k+U_{t1}+\dots+U_{t(R_t-1)})} &= u_{t,R_t,k} & k &= 1, 2, \dots, U_{tR_t} \end{aligned}$$

The following steps have to be performed for each timeslot t , on which the respective CCTrCH is mapped:

(1) Assign $C2 = 30$ to be the number of columns of the matrix. The columns of the matrix are numbered $0, 1, 2, \dots, C2 - 1$ from left to right.

(2) Determine the number of rows of the matrix, $R2$, by finding minimum integer $R2$ such that:

$$U_t \leq R2 \times C2.$$

The rows of rectangular matrix are numbered $0, 1, 2, \dots, R2 - 1$ from top to bottom.

(3) Write the input bit sequence $x_{t,1}, x_{t,2}, x_{t,3}, \dots, x_{t,U_t}$ into the $R2 \times C2$ matrix row by row starting with bit $y_{t,1}$ in column 0 of row 0:

$$\begin{bmatrix} y_{t,1} & y_{t,2} & y_{t,3} & \dots & y_{t,C2} \\ y_{t,(C2+1)} & y_{t,(C2+2)} & y_{t,(C2+3)} & \dots & y_{t,(2 \times C2)} \\ \vdots & \vdots & \vdots & \dots & \vdots \\ y_{t,((R2-1) \times C2+1)} & y_{t,((R2-1) \times C2+2)} & y_{t,((R2-1) \times C2+3)} & \dots & y_{t,(R2 \times C2)} \end{bmatrix}$$

where $y_{t,k} = x_{t,k}$ for $k = 1, 2, \dots, U_t$ and if $R2 \times C2 > U_t$, the dummy bits are padded such that $y_{t,k} = 0$ or 1 for $k = U_t + 1, U_t + 2, \dots, R2 \times C2$. These dummy bits are pruned away from the output of the matrix after the inter-column permutation.

(4) Perform the inter-column permutation for the matrix based on the pattern $\langle P2(j) \rangle_{j \in \{0,1,\dots,C2-1\}}$ that is shown in table 7, where $P2(j)$ is the original column position of the j -th permuted column. After permutation of the columns, the bits are denoted by $y'_{t,k}$.

$$\begin{bmatrix} y'_{t,1} & y'_{t,(R2+1)} & y'_{t,(2 \times R2+1)} & \dots & y'_{t,((C2-1) \times R2+1)} \\ y'_{t,2} & y'_{t,(R2+2)} & y'_{t,(2 \times R2+2)} & \dots & y'_{t,((C2-1) \times R2+2)} \\ \vdots & \vdots & \vdots & \dots & \vdots \\ y'_{t,R2} & y'_{t,(2 \times R2)} & y'_{t,(3 \times R2)} & \dots & y'_{t,(C2 \times R2)} \end{bmatrix}$$

(5) The output of the block interleaver is the bit sequence read out column by column from the inter-column permuted $R2 \times C2$ matrix. The output is pruned by deleting dummy bits that were padded to the input of the matrix before the inter-column permutation, i.e. bits $y'_{t,k}$ that corresponds to bits $y_{t,k}$ with $k > U_t$ are removed from the output. The bits after time slot 2nd interleaving are denoted by $v_{t,1}, v_{t,2}, \dots, v_{t,U_t}$, where $v_{t,1}$ corresponds to the bit $y'_{t,k}$ with smallest index k after pruning, $v_{t,2}$ to the bit $y'_{t,k}$ with second smallest index k after pruning, and so on.

Table 7 Inter-column permutation pattern for 2nd interleaving

Number of Columns C2	Inter-column permutation pattern < P2(0), P2(1), ..., P2(C2-1) >
30	<0, 20, 10, 5, 15, 25, 3, 13, 23, 8, 18, 28, 1, 11, 21, 6, 16, 26, 4, 14, 24, 19, 9, 29, 12, 2, 7, 22, 27, 17>

4.2.11A Sub-frame segmentation for the 1.28 Mcps option

In the 1.28Mcps TDD, it is needed to add a sub-frame segmentation unit between 2nd interleaving unit and physical channel mapping unit when the TTI of the CCTrCh is greater than 5msec. In this case, the operation of rate-matching guarantees that the size of bit streams is an even number and can be subdivided into 2 sub-frames. The transport channel multiplexing structure for uplink and downlink is shown in figure 1A.

The input to the sub-frame segmentation unit is segmented into timeslot chunks, where each timeslot chunk contains all of the bits that are to be transmitted in a given timeslot position in both of the sub-frames.

The input bit sequence is denoted by $x_{i1}, x_{i2}, x_{i3}, \dots, x_{iX_i}$ where i is the timeslot number and X_i is the number of bits transmitted in timeslot i in a radio frame. The two output bit sequences per radio frame are denoted by $y_{i,n,1}, y_{i,n,2}, y_{i,n,3}, \dots, y_{i,n,Y_i}$ where n is the sub-frame number in current radio frame and Y_i is the number of bits per sub-frame for timeslot i . The output sequences are defined as follows:

$$y_{i,n,k} = x_{i,((n-1)Y_i)+k}, \quad n = 1 \text{ or } 2, \quad k = 1 \dots Y_i$$

where

$Y_i = (X_i / 2)$ is the number of bits in timeslot i per sub-frame,

x_{ik} is the k^{th} bit of the input bit sequence and

$y_{i,n,k}$ is the k^{th} bit of the output bit sequence corresponding to the n^{th} sub-frame

4.2.12 Physical channel mapping

4.2.12.1 Physical channel mapping for the 3.84 Mcps and 7.68Mcps options

The PhCH for both uplink and downlink is defined in [7]. The bits after physical channel mapping are denoted by $w_{p,1}, w_{p,2}, \dots, w_{p,U_p}$, where p is the PhCH number corresponding to the sequence number $1 \leq p \leq P$ of this physical channel as detailed below, U_p is the number of bits in one radio frame for the respective PhCH, and $P \leq P_{max}$. The bits $w_{p,k}$ are mapped to the PhCHs so that the bits for each PhCH are transmitted over the air in ascending order with respect to k .

The physical layer shall assign the physical channel sequence number p to the physical channels of the CCTrCH in the respective radio frame, treating each allocated timeslot in ascending order. If within a timeslot there are multiple physical channels they shall first be ordered in ascending order of the spreading factor (Q) and subsequently by channelisation code index (k), as shown in [9].

The mapping of the bits $v_{t,1}, v_{t,2}, \dots, v_{t,U_t}$ is performed like block interleaving, writing the bits into columns, but a PhCH with an odd number is filled in forward order, whereas a PhCH with an even number is filled in reverse order.

The mapping scheme, as described in the following subclause, shall be applied individually for each timeslot t used in the current frame. Therefore, the bits $v_{t,1}, v_{t,2}, \dots, v_{t,U_t}$ are assigned to the bits of the physical channels

$w_{t,1,1 \dots U_{t1}}, w_{t,2,1 \dots U_{t2}}, \dots, w_{t,P,1 \dots U_{tP}}$ in each timeslot.

In uplink there are at most two codes allocated ($P \leq 2$). If there is only one code, the same mapping as for downlink is applied. Denote SF1 and SF2 the spreading factors used for code 1 and 2, respectively. For the number of consecutive bits to assign per code bs_k the following rule is applied:

```
if
    SF1 >= SF2 then  $bs_1 = 1$  ;  $bs_2 = SF1/SF2$  ;
```

```
else
```

```
    SF2 > SF1 then  $bs_1 = SF2/SF1$ ;  $bs_2 = 1$  ;
```

```
end if
```

In the downlink case bs_p is 1 for all physical channels.

4.2.12.1.1 Mapping scheme

Notation used in this subclause:

P_t : number of physical channels for timeslot t , $P_t = 1..2$ for uplink ; $P_t = 1..16$ for downlink for 1.28Mcps TDD and 3.84Mcps TDD, $P_t = 1..32$ for 7.68Mcps TDD

$U_{t,p}$: capacity in bits for the physical channel p in timeslot t

U_t : total number of bits to be assigned for timeslot t

bs_p : number of consecutive bits to assign per code

for downlink all $bs_p = 1$

for uplink if $SF1 \geq SF2$ then $bs_1 = 1$; $bs_2 = SF1/SF2$;

if $SF2 > SF1$ then $bs_1 = SF2/SF1$; $bs_2 = 1$;

fb_p : number of already written bits for each code

pos: intermediate calculation variable

```
for  $p=1$  to  $P_t$  -- reset number of already written bits for every physical channel
```

```
     $fb_p = 0$ 
```

```
end for
```

```
 $p = 1$  -- start with PhCH #1
```

```
for  $k=1$  to  $U_t$ 
```

```
    do while ( $fb_p == U_{t,p}$ ) -- physical channel filled up already ?
```

```
         $p = (p \bmod P_t) + 1$ ;
```

```
    end do
```

```
    if ( $p \bmod 2 == 0$ )
```

```
         $pos = U_{t,p} - fb_p$  -- reverse order
```

```
    else
```

```
         $pos = fb_p + 1$  -- forward order
```

```
    endif
```

```
     $w_{t,p,pos} = v_{t,k}$  -- assignment
```

```
     $fb_p = fb_p + 1$  -- Increment number of already written bits
```

```

if (fbp mod bsp) == 0          -- Conditional change to the next physical channel
    p = (p mod Pt) + 1;
end if

```

```

end for

```

4.2.12.2 Physical channel mapping for the 1.28 Mcps option

The bit streams from the sub-frame segmentation unit are mapped onto code channels of time slots in sub-frames.

The bits after physical channel mapping are denoted by $w_{p1}, w_{p2}, \dots, w_{pU_p}$, where p is the PhCH number and U_p is the number of bits in one sub-frame for the respective PhCH. The bits w_{pk} are mapped to the PhCHs so that the bits for each PhCH are transmitted over the air in ascending order with respect to k .

The mapping of the bits $y_{t,n,1}, y_{t,n,2}, y_{t,n,3}, \dots, y_{t,n,U_t}$ is performed like block interleaving, writing the bits into columns, but a PhCH with an odd number is filled in forward order, were as a PhCH with an even number is filled in reverse order.

The mapping scheme, as described in the following subclause, shall be applied individually for each timeslot t used in the current subframe. Therefore, the bits $y_{t,n,1}, y_{t,n,2}, y_{t,n,3}, \dots, y_{t,n,U_t}$ are assigned to the bits of the physical channels $w_{t1,1\dots U_{t1}}, w_{t2,1\dots U_{t2}}, \dots, w_{tP_t,1\dots U_{tP_t}}$ in each timeslot.

In uplink there are at most two codes allocated ($P \leq 2$). If there is only one code, the same mapping as for downlink is applied. Denote SF1 and SF2 the spreading factors used for code 1 and 2, respectively. For the number of consecutive bits to assign per code bs_k the following rule is applied:

```

if
SF1 >= SF2 then bs1 = 1 ; bs2 = SF1/SF2 ;
else
SF2 > SF1 then bs1 = SF2/SF1; bs2 = 1 ;
end if

```

In the downlink case bs_p is 1 for all physical channels.

4.2.12.2.1 Mapping scheme

Notation used in this subclause:

P_t : number of physical channels for timeslot t , $P_t = 1..2$ for uplink ; $P_t = 1..16$ for downlink

U_{tp} : capacity in bits for the physical channel p in timeslot t in the current sub-frame

U_t : total number of bits to be assigned for timeslot t in the current sub-frame

n = index of the current sub-frame (1 or 2)

bs_p : number of consecutive bits to assign per code

for downlink all $bs_p = 1$

for uplink if SF1 >= SF2 then $bs_1 = 1$; $bs_2 = SF1/SF2$;

if SF2 > SF1 then $bs_1 = SF2/SF1$; $bs_2 = 1$;

fb_p : number of already written bits for each code

pos : intermediate calculation variable

for $p=1$ to P_t -- reset number of already written bits for every physical channel

```

fbp = 0
end for
p = 1          -- start with PhCH #1
for k=1 to Ut
do while (fbp == Ut,p)  -- physical channel filled up already ?
p = (p mod Pt) + 1 ;
end do
if (p mod 2) == 0
pos = Ut,p - fbp      -- reverse order
else
pos = fbp + 1        -- forward order
end if
wtp,pos = yt,n,k      -- assignment
fbp = fbp + 1      -- Increment number of already written bits
If (fbp mod bsp) == 0  -- Conditional change to the next physical channel
p = (p mod Pt) + 1 ;
end if
end for

```

4.2.13 Multiplexing of different transport channels onto one CCTrCH, and mapping of one CCTrCH onto physical channels

Different transport channels can be encoded and multiplexed together into one Coded Composite Transport Channel (CCTrCH). The following rules shall apply to the different transport channels which are part of the same CCTrCH:

- 1) Transport channels multiplexed into one CCTrCh shall have co-ordinated timings. When the TFCS of a CCTrCH is changed because one or more transport channels are added to the CCTrCH or reconfigured within the CCTrCH, or removed from the CCTrCH, the change may only be made at the start of a radio frame with CFN fulfilling the relation

$$\text{CFN} \bmod F_{\max} = 0,$$

where F_{\max} denotes the maximum number of radio frames within the transmission time intervals of all transport channels which are multiplexed into the same CCTrCH, including any transport channels i which are added reconfigured or have been removed, and CFN denotes the connection frame number of the first radio frame of the changed CCTrCH.

After addition or reconfiguration of a transport channel i within a CCTrCH, the TTI of transport channel i may only start in radio frames with CFN fulfilling the relation

$$\text{CFN}_i \bmod F_i = 0.$$

- 2) Different CCTrCHs cannot be mapped onto the same physical channel.
- 3) One CCTrCH shall be mapped onto one or several physical channels.
- 4) Dedicated Transport channels and common transport channels cannot be multiplexed into the same CCTrCH.
- 5) For the common transport channels, only the FACH and PCH may belong to the same CCTrCH.

6) Each CCTrCH carrying a BCH shall carry only one BCH and shall not carry any other Transport Channel.

7) Each CCTrCH carrying a RACH shall carry only one RACH and shall not carry any other Transport Channel.

Hence, there are two types of CCTrCH.

CCTrCH of dedicated type, corresponding to the result of coding and multiplexing of one or several DCH.

CCTrCH of common type, corresponding to the result of the coding and multiplexing of a common channel, i.e. RACH and USCH in the uplink and DSCH, BCH, FACH or PCH in the downlink, respectively.

Transmission of TFCI is possible for CCTrCH containing Transport Channels of:

- dedicated type;
- USCH type;
- DSCH type;
- FACH and/or PCH type.

4.2.13.1 Allowed CCTrCH combinations for one UE

4.2.13.1.1 Allowed CCTrCH combinations on the uplink

The following CCTrCH combinations for one UE are allowed, also simultaneously:

- 1) several CCTrCH of dedicated type;
- 2) several CCTrCH of common type.

4.2.13.1.2 Allowed CCTrCH combinations on the downlink

The following CCTrCH combinations for one UE are allowed, also simultaneously:

- 3) several CCTrCH of dedicated type;
- 4) several CCTrCH of common type.

4.2.14 Transport format detection

Transport format detection can be performed both with and without Transport Format Combination Indicator (TFCI). If a TFCI is transmitted, the receiver detects the transport format combination from the TFCI. When no TFCI is transmitted, so called blind transport format detection may be used, i.e. the receiver side uses the possible transport format combinations as a priori information.

4.2.14.1 Blind transport format detection

Blind Transport Format Detection is optional both in the UE and the UTRAN. Therefore, for all CCTrCH a TFCI shall be transmitted, including the possibility of a TFCI code word length zero, if only one TFC is defined.

4.2.14.2 Explicit transport format detection based on TFCI

4.2.14.2.1 Transport Format Combination Indicator (TFCI)

The Transport Format Combination Indicator (TFCI) informs the receiver of the transport format combination of the CCTrCHs. As soon as the TFCI is detected, the transport format combination, and hence the individual transport channels' transport formats are known, and decoding of the transport channels can be performed.

4.3 Coding for layer 1 control for the 3.84 Mcps and 7.68Mcps TDD options

4.3.1 Coding of transport format combination indicator (TFCI)

Encoding of the TFCI depends on its length. If there are 6-10 bits of TFCI the channel encoding is done as described in subclause 4.3.1.1. Also specific coding of less than 6 bits is possible as explained in subclause 4.3.1.2.

4.3.1.1 Coding of long TFCI lengths

The TFCI is encoded using a (32, 10) sub-code of the second order Reed-Muller code. The coding procedure is as shown in figure 6.

Figure 6: Channel coding of the TFCI bits

If the TFCI consists of less than 10 bits, it is padded with zeros to 10 bits, by setting the most significant bits to zero. TFCI is encoded by the (32,10) sub-code of second order Reed-Muller code. The code words of the (32,10) sub-code of second order Reed-Muller code are linear combination of some among 10 basis sequences. The basis sequences are as follows in table 8.

Table 8: Basis sequences for (32,10) TFCI code

l	M_{i,0}	M_{i,1}	M_{i,2}	M_{i,3}	M_{i,4}	M_{i,5}	M_{i,6}	M_{i,7}	M_{i,8}	M_{i,9}
0	1	0	0	0	0	1	0	0	0	0
1	0	1	0	0	0	1	1	0	0	0
2	1	1	0	0	0	1	0	0	0	1

4	1	0	1	0	0	1	0	0	0	1
5	0	1	1	0	0	1	0	0	1	0
6	1	1	1	0	0	1	0	1	0	0
7	0	0	0	1	0	1	0	1	1	0
8	1	0	0	1	0	1	1	1	1	0
9	0	1	0	1	0	1	1	0	1	1
10	1	1	0	1	0	1	0	0	1	1
11	0	0	1	1	0	1	0	1	1	0
12	1	0	1	1	0	1	0	1	0	1
13	0	1	1	1	0	1	1	0	0	1
14	1	1	1	1	0	1	1	1	1	1
15	1	0	0	0	1	1	1	1	0	0
16	0	1	0	0	1	1	1	1	0	1
17	1	1	0	0	1	1	1	0	1	0
18	0	0	1	0	1	1	0	1	1	1
19	1	0	1	0	1	1	0	1	0	1
20	0	1	1	0	1	1	0	0	1	1
21	1	1	1	0	1	1	0	1	1	1
22	0	0	0	1	1	1	0	1	0	0
23	1	0	0	1	1	1	1	1	0	1
24	0	1	0	1	1	1	1	0	1	0
25	1	1	0	1	1	1	1	0	0	1
26	0	0	1	1	1	1	0	0	1	0
27	1	0	1	1	1	1	1	1	0	0
28	0	1	1	1	1	1	1	1	1	0
29	1	1	1	1	1	1	1	1	1	1
30	0	0	0	0	0	1	0	0	0	0
31	0	0	0	0	1	1	1	0	0	0

The TFCI bits $a_0, a_1, a_2, a_3, a_4, a_5, a_6, a_7, a_8, a_9$ (where a_0 is LSB and a_9 is MSB) shall correspond to the TFC index (expressed in unsigned binary form) defined by the RRC layer to reference the TFC of the CCTrCH in the associated radio frame.

The output TFCI code word bits b_i are given by:

$$b_i = \sum_{n=0}^9 (a_n \times M_{i,n}) \text{ mod } 2$$

where $i = 0, \dots, 31$. $N_{\text{TFCI code word}} = 32$.

4.3.1.2 Coding of short TFCI lengths

4.3.1.2.1 Coding very short TFCIs by repetition

If the number of TFCI bits is 1 or 2, then repetition will be used for coding. In this case each bit is repeated to a total of 4 times giving 4-bit transmission ($N_{\text{TFCI code word}}=4$) for a single TFCI bit and 8-bit transmission ($N_{\text{TFCI code word}}=8$) for 2 TFCI bits. The TFCI bit(s) a_0 (or a_0 and a_1 where a_0 is the LSB) shall correspond to the TFC index (expressed in unsigned binary form) defined by the RRC layer to reference the TFC of the CCTrCH in the associated radio frame.

In the case of $N_{\text{TFCI code word}}=4$, the TFCI codeword $\{b_0, b_1, b_2, b_3\}$ is equal to the sequence $\{a_0, a_0, a_0, a_0\}$.

In the case of $N_{\text{TFCI code word}}=8$, the TFCI codeword $\{b_0, b_1, \dots, b_7\}$ is equal to the sequence $\{a_0, a_1, a_0, a_1, a_0, a_1, a_0, a_1\}$.

4.3.1.2.2 Coding short TFCIs using bi-orthogonal codes

If the number of TFCI bits is in the range 3 to 5 the TFCI is encoded using a (16, 5) bi-orthogonal (or first order Reed-Muller) code. The coding procedure is as shown in figure 7.

Figure 7: Channel coding of short length TFCI bits

If the TFCI consists of less than 5 bits, it is padded with zeros to 5 bits, by setting the most significant bits to zero. The code words of the (16,5) bi-orthogonal code are linear combinations of 5 basis sequences as defined in table 9.

Table 9: Basis sequences for (16,5) TFCI code

i	$M_{i,0}$	$M_{i,1}$	$M_{i,2}$	$M_{i,3}$	$M_{i,4}$
0	1	0	0	0	1
1	0	1	0	0	1
2	1	1	0	0	1
3	0	0	1	0	1
4	1	0	1	0	1
5	0	1	1	0	1
6	1	1	1	0	1
7	0	0	0	1	1
8	1	0	0	1	1
9	0	1	0	1	1
10	1	1	0	1	1
11	0	0	1	1	1
12	1	0	1	1	1
13	0	1	1	1	1
14	1	1	1	1	1
15	0	0	0	0	1

The TFCI bits a_0, a_1, a_2, a_3, a_4 (where a_0 is LSB and a_4 is MSB) shall correspond to the TFC index (expressed in unsigned binary form) defined by the RRC layer to reference the TFC of the CCTrCH in the associated radio frame.

The output code word bits b_j are given by:

$$b_i = \sum_{n=0}^4 (a_n \times M_{i,n}) \text{ mod } 2$$

where $i = 0, \dots, 15$. $N_{\text{TFCI code word}} = 16$.

4.3.1.3 Mapping of TFCI code word

The mapping of the TFCI code word to the TFCI bit positions in a timeslot shall be as follows.

Denote the number of bits in the TFCI code word by $N_{\text{TFCI code word}}$, denote the TFCI code word bits by b_k where $k=0 \dots N_{\text{TFCI code word}}-1$.

Figure 8: Mapping of TFCI code word bits to timeslot

The locations of the first and second parts of the TFCI code word in the timeslot is defined in [7].

If the shortest transmission time interval of any constituent TrCH is at least 20 ms the successive TFCI code words in the frames in the TTI shall be identical. If TFCI is transmitted on multiple timeslots in a frame each timeslot shall have the same TFCI code word.

4.3.2 Coding and Bit Scrambling of the Paging Indicator

The paging indicator $P_q, q = 0, \dots, N_{PI}-1, P_q \in \{0, 1\}$ is an identifier to instruct the UE whether there is a paging message for the groups of mobiles that are associated to the PI, calculated by higher layers, and the associated paging indicator P_q . The length L_{PI} of the paging indicator is $L_{PI}=2, L_{PI}=4$ or $L_{PI}=8$ symbols. $N_{PIB} = 2 * N_{PI} * L_{PI}$ bits are used for the paging indicator transmission in one radio frame. The mapping of the paging indicators to the bits $e_i, i = 1, \dots, N_{PIB}$ is shown in table 10.

Table 10: Mapping of the paging indicator

P_q	Bits $\{e_{2L_{PI} \cdot q+1}, e_{2L_{PI} \cdot q+2}, \dots, e_{2L_{PI} \cdot (q+1)}\}$	Meaning
0	$\{0, 0, \dots, 0\}$	There is no necessity to receive the PCH
1	$\{1, 1, \dots, 1\}$	There is the necessity to receive the PCH

If the number S of bits in one radio frame available for the PICH is bigger than the number N_{PIB} of bits used for the transmission of paging indicators, the sequence $e = \{e_1, e_2, \dots, e_{N_{PIB}}\}$ is extended by $S-N_{PIB}$ bits that are set to zero, resulting in a sequence $h = \{h_1, h_2, \dots, h_S\}$:

$$h_k = e_k, \quad k = 1, \dots, N_{PIB}$$

$$h_k = 0, \quad k = N_{PIB} + 1, \dots, S$$

The bits $h_k, k = 1, \dots, S$ on the PICH then undergo bit scrambling as defined in section 4.2.9.

The bits $s_k, k = 1, \dots, S$ output from the bit scrambler are then transmitted over the air as shown in [7].

4.3.3 Coding and Bit Scrambling of the MBMS Notification Indicator

The MBMS notification indicator $N_q, q = 0, \dots, N_n-1, N_q \in \{0, 1\}$, is an identifier to instruct UEs whether there is an MBMS notification indication for the groups of MBMS services that are associated to the NI, calculated by higher layers, and the associated MBMS notification indicator N_q . The length L_{NI} of the MBMS notification indicator is $L_{NI}=2, L_{NI}=4$ or $L_{NI}=8$ symbols. $N_{NIB} = 2 * N_n * L_{NI}$ bits are used for the MBMS notification indicator transmission in one MICH. The mapping of the MBMS notification indicators to the bits $e_i, i = 1, \dots, N_{NIB}$ is shown in table 10A.

Table 10A: Mapping of the MBMS notification indicator

N_q	Bits $\{e_{2L_{NI} * q + 1}, e_{2L_{NI} * q + 2}, \dots, e_{2L_{NI} * (q+1)}\}$
0	$\{0, 0, \dots, 0\}$
1	$\{1, 1, \dots, 1\}$

If the number S of bits available for the MICH is bigger than the number N_{NIB} of bits used for the transmission of MBMS notification indicators, the sequence $e = \{e_1, e_2, \dots, e_{N_{NIB}}\}$ is extended by $S - N_{NIB}$ bits that are set to zero, resulting in a sequence $h = \{h_1, h_2, \dots, h_S\}$:

$$h_k = e_k, \quad k = 1, \dots, N_{NIB}$$

$$h_k = 0, \quad k = N_{NIB} + 1, \dots, S$$

The bits $h_k, k = 1, \dots, S$ on the MICH then undergo bit scrambling as defined in section 4.2.9.

The bits $s_k, k = 1, \dots, S$ output from the bit scrambler are then transmitted over the air as shown in [7].

4.4 Coding for layer 1 control for the 1.28 Mcps option

4.4.1 Coding of transport format combination indicator (TFCI) for QPSK and 16QAM

The coding of TFCI for 1.28Mcps TDD is same as that of 3.84Mcps TDD.cf.[4.3.1 'Coding of transport format combination indicator'].

4.4.1.1 Mapping of TFCI code word

Denote the number of bits in the TFCI code word by $N_{TFCI \text{ code word}}$, and denote the TFCI code word bits by b_k , where $k = 0, \dots, N_{TFCI \text{ code word}} - 1$

When the number of bits in the TFCI code word is 8, 16, 32, the mapping of the TFCI code word to the TFCI bit positions shall be as follows:

Figure 9: Mapping of TFCI code word bits to TFCI position in 1.28 Mcps TDD option, where $N = N_{TFCI \text{ code word}}$

For MBSFN transmissions with 16QAM, the coded bits b_k , are mapped to the transmitted TFCI bits according to the following two group formulas:

Formula a, mapping onto the outer-corners of the 16QAM constellation

$$d_{4k} = b_{2k},$$

$$d_{4k+1} = b_{2k+1},$$

$$d_{4k+2} = 1,$$

$$d_{4k+3} = 1,$$

Formula b, mapping onto the inner-corners of the 16QAM constellation

$$d_{4k} = b_{2k},$$

$$d_{4k+1} = b_{2k+1},$$

$$d_{4k+2} = 0,$$

$$d_{4k+3} = 0,$$

The 1st, the 3rd, the 5th and the 7th part of TFCI code word will use the Mapping Formula a, and the 2nd, the 4th, the 6th and the 8th part of TFCI code word will use the Mapping Formula b. As the TTI of S-CCPCH is 40ms or 80ms, the TFCI bits will be repeated with a period of 20ms frame. In the second 20ms frame, the 1st, the 3rd, the 5th and the 7th part of TFCI code word will use the Mapping Formula b, and the 2nd, the 4th, the 6th and 8th part of TFCI code word will use the Mapping Formula a, and so on for the consecutive frames. The mapping of the TFCI code word to the TFCI bit positions shall be as follows:

Figure 9A: Mapping of TFCI code word bits to TFCI position in 1.28 Mcps TDD option for downlink MBSFN, where $N = N_{\text{TFCI code word}}$

When the number of bits of the TFCI code word is 4, then the TFCI code word is equally divided into two parts for the consecutive two subframe and mapped onto the end of the first data field in each of the consecutive subframes. The mapping for $N_{\text{TFCI code word}}=4$ is shown in figure 10:

Figure 10: Mapping of TFCI code word bits to TFCI position in 1.28 Mcps TDD option, when $N_{\text{TFCI code word}}=4$

The location of the 1st to 4th parts of the TFCI code word in the timeslot is defined in [7].

If the shortest transmission time interval of any constituent TrCH is at least 20 ms, then successive TFCI code words in the frames within the TTI shall be identical. If a TFCI is transmitted on multiple timeslots in a frame each timeslot shall have the same TFCI code word.

4.4.2 Coding of transport format combination indicator (TFCI) for 8PSK

Encoding of TFCI bits depends on the number of them and the modulation in use. When 2 Mcps service is transmitted, 8PSK modulation is applied in 1.28 Mcps TDD option. The encoding scheme for TFCI when the number of bits are 6 – 10, and less than 6 bits is described in section 4.4.2.1 and 4.4.2.2, respectively.

4.4.2.1 Coding of long TFCI lengths

When the number of TFCI bits is 6 – 10, the TFCI bits are encoded by using a (64,10) sub-code of the second order Reed-Muller code, then 16 bits out of 64 bits are punctured (Puncturing positions are 0, 4, 8, 13, 16, 20, 27, 31, 34, 38, 41, 44, 50, 54, 57, 61st bits). The coding procedure is shown in Figure 11.

Figure 11: Channel coding of long TFCI bits for 8PSK

If the TFCI consists of less than 10 bits, it is padded with zeros to 10 bits, by setting the most significant bits to zero. The code words of the punctured (48,10) sub-code of the second order Reed-Muller codes are linear combination of 10 basis sequences. The basis sequences are shown in Table 11.

Table 11: Basis sequences for (48,10) TFCI code

I	M_{i,0}	M_{i,1}	M_{i,2}	M_{i,3}	M_{i,4}	M_{i,5}	M_{i,6}	M_{i,7}	M_{i,8}	M_{i,9}
0	1	0	0	0	0	0	1	0	1	0
1	0	1	0	0	0	0	1	1	0	0

27	0	0	1	0	0	1	1	0	1	1
28	1	0	1	0	0	1	1	1	0	1
29	1	1	1	0	0	1	1	0	1	1
30	0	0	0	1	0	1	1	0	0	1
31	0	1	0	1	0	1	1	0	0	1
32	1	1	0	1	0	1	1	1	1	1
33	1	0	1	1	0	1	1	0	0	1
34	0	1	1	1	0	1	1	1	1	0
35	1	1	1	1	0	1	1	1	0	1
36	0	0	0	0	1	1	1	1	1	0
37	1	0	0	0	1	1	1	0	1	1
38	1	1	0	0	1	1	1	1	1	1
39	0	0	1	0	1	1	1	1	0	0
40	1	0	1	0	1	1	1	1	0	0
41	1	1	1	0	1	1	1	1	1	1
42	0	0	0	1	1	1	1	1	1	1
43	0	1	0	1	1	1	1	0	1	0
44	1	1	0	1	1	1	1	0	1	0
45	0	0	1	1	1	1	1	0	1	1
46	0	1	1	1	1	1	1	0	0	1
47	1	1	1	1	1	1	1	1	0	0

Let's define the TFCI bits as $a_0, a_1, a_2, a_3, a_4, a_5, a_6, a_7, a_8, a_9$, where a_0 is the LSB and a_9 is the MSB. The TFCI bits shall correspond to the TFC index (expressed in unsigned binary form) defined by the RRC layer to reference the TFC of the CCTrCH in the associated radio frame.

The output TFCI code word bits b_i are given by:

$$b_i = \sum_{n=0}^9 (a_n \times M_{i,n}) \bmod 2$$

where $i=0 \dots 47$. $N_{\text{TFCI code word}}=48$.

4.4.2.2 Coding of short TFCI lengths

4.4.2.2.1 Coding very short TFCIs by repetition

When the number of TFCI bits is 1 or 2, then repetition will be used for the coding. In this case, each bit is repeated to a total of 6 times giving 6-bit transmission ($N_{\text{TFCI code word}} = 6$) for a single TFCI bit and 12-bit transmission ($N_{\text{TFCI code word}} = 12$) for 2 TFCI bits. The TFCI bit(s) a_0 (or a_0 and a_1 where a_0 is the LSB) shall correspond to the TFC index (expressed in unsigned binary form) defined by the RRC layer to reference the TFC of the CCTrCH in the associated radio frame.

In the case of $N_{\text{TFCI code word}}=6$, the TFCI codeword $\{b_0, b_1, b_2, b_3, b_4, b_5\}$ is equal to the sequence $\{a_0, a_0, a_0, a_0, a_0, a_0\}$.

In the case of $N_{\text{TFCI code word}}=12$, the TFCI codeword $\{b_0, b_1, \dots, b_{11}\}$ is equal to the sequence $\{a_0, a_1, a_0, a_1, a_0, a_1, a_0, a_1, a_0, a_1, a_0, a_1\}$.

4.4.2.2.2 Coding short TFCIs using bi-orthogonal codes

If the number of TFCI bits is in the range of 3 to 5, the TFCI bits are encoded using a (32,5) first order Reed-Muller code, then 8 bits out of 32 bits are punctured (Puncturing positions are 0, 1, 2, 3, 4, 5, 6, 7th bits). The coding procedure is shown in Figure 12.

Figure 12: Channel coding of short TFCI bits for 8PSK

If the TFCI consists of less than 5 bits, it is padded with zeros to 5 bits, by setting the most significant bits to zero. The code words of the punctured (32,5) first order Reed-Muller codes are linear combination of 5 basis sequences shown in Table 12.

Table 12: Basis sequences for (24,5) TFCI code

i	M_{i,0}	M_{i,1}	M_{i,2}	M_{i,3}	M_{i,4}
0	0	0	0	1	0
1	1	0	0	1	0
2	0	1	0	1	0
3	1	1	0	1	0
4	0	0	1	1	0
5	1	0	1	1	0
6	0	1	1	1	0
7	1	1	1	1	0
8	0	0	0	0	1
9	1	0	0	0	1
10	0	1	0	0	1
11	1	1	0	0	1
12	0	0	1	0	1
13	1	0	1	0	1
14	0	1	1	0	1
15	1	1	1	0	1
16	0	0	0	1	1
17	1	0	0	1	1
18	0	1	0	1	1
19	1	1	0	1	1
20	0	0	1	1	1
21	1	0	1	1	1
22	0	1	1	1	1
23	1	1	1	1	1

Let's define the TFCI bits as a_0, a_1, a_2, a_3, a_4 , where a_0 is the LSB and a_4 is the MSB. The TFCI bits shall correspond to the TFC index (expressed in unsigned binary form) defined by the RRC layer to reference the TFC of the CCTrCH in the associated radio frame.

The output code word bits b_i are given by:

$$b_i = \sum_{n=0}^4 (a_n \times M_{i,n}) \text{ mod } 2$$

where $i=0 \dots 23$. $N_{\text{TFCI code word}} = 24$.

4.4.2.3 Mapping of TFCI code word

Denote the number of bits in the TFCI code word by $N_{\text{TFCI code word}}$, and denote the TFCI code word bits by b_k , where $k = 0, \dots, N_{\text{TFCI code word}} - 1$.

When the number of bits in the TFCI code word is 12, 24 or 48, the mapping of the TFCI code word to the TFCI bit positions in a time slot shall be as follows.

Figure 13: Mapping of TFCI code word bits to timeslot in 1.28 Mcps TDD option, where $N = N_{\text{TFCI code word}}$

When the number of bits in the TFCI code word is 6, the TFCI code word is equally divided into two parts for the consecutive two sub-frames and mapped onto the first data field in each of the consecutive sub-frames. The mapping of the TFCI code word to the TFCI bit positions in a time slot shall be as shown in figure 14.

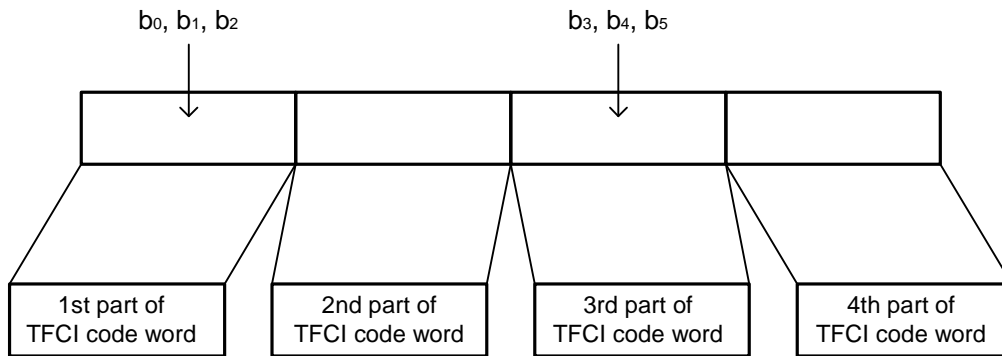

Figure 14: Mapping of TFCI code word bits to timeslot in 1.28 Mcps TDD option when $N_{\text{TFCI code word}} = 6$

The location of the 1st to 4th parts of the TFCI code word in the timeslot is defined in [7].

4.4.3 Coding and Bit Scrambling of the Paging Indicator

The paging indicator P_q , $q = 0, \dots, N_{\text{PI}}-1$, $P_q \in \{0, 1\}$ is an identifier to instruct the UE whether there is a paging message for the groups of mobiles that are associated to the PI, calculated by higher layers, and the associated paging indicator P_q . The length L_{PI} of the paging indicator is $L_{\text{PI}}=2$, $L_{\text{PI}}=4$ or $L_{\text{PI}}=8$ symbols. $N_{\text{PIB}} = 2 * N_{\text{PI}} * L_{\text{PI}}$ bits are used for the paging indicator transmission in one radio frame. The mapping of the paging indicators to the bits e_i , $i = 1, \dots, N_{\text{PIB}}$ is shown in table 13.

Table 13: Mapping of the paging indicator

P_q	Bits $\{e_{2L_{\text{PI}}*q+1}, e_{2L_{\text{PI}}*q+2}, \dots, e_{2L_{\text{PI}}*(q+1)}\}$	Meaning
0	$\{0, 0, \dots, 0\}$	There is no necessity to receive the PCH
1	$\{1, 1, \dots, 1\}$	There is the necessity to receive the PCH

If the number S of bits in one radio frame available for the PICH is bigger than the number N_{PIB} of bits used for the transmission of paging indicators, the sequence $e = \{e_1, e_2, \dots, e_{N_{\text{PIB}}}\}$ is extended by $S - N_{\text{PIB}}$ bits that are set to zero, resulting in a sequence $h = \{h_1, h_2, \dots, h_S\}$:

$$h_k = e_k, \quad k = 1, \dots, N_{\text{PIB}}$$

$$h_k = 0, \quad k = N_{\text{PIB}} + 1, \dots, S$$

The bits h_k , $k = 1, \dots, S$ on the PICH then undergo bit scrambling as defined in section 4.2.9.

The bits s_k , $k = 1, \dots, S$ output from the bit scrambler are then transmitted over the air as shown in [7].

4.4.4 Coding of the Fast Physical Access Channel (FPACH) information bits

The FPACH burst is composed by 32 information bits which are block coded and convolutional coded, and then delivered in one sub-frame as follows:

1. The 32 information bits are protected by 8 parity bits for error detection as described in sub-clause 4.2.1.1.
2. Convolutional code with constraint length 9 and coding rate $\frac{1}{2}$ is applied as described in sub-clause 4.2.3.1. The size of data block $c(k)$ after convolutional encoder is 96 bits.
3. To adjust the size of the data block $c(k)$ to the size of the FPACH burst, 8 bits are punctured as described in sub-clause 4.2.7 with the following clarifications:

- $N_{i,j}=96$ is the number of bits in a radio sub-frame before rate matching
- $\Delta N_{i,j} = -8$ is the number of bits to punctured in a radio sub-frame
- $e_{ini} = a \times N_{ij}$

The 88 bits after rate matching are then delivered to the intra-frame interleaving.

4. The bits in input to the interleaving unit are denoted as $\{x(0), \dots, x(87)\}$. The coded bits are block rectangular interleaved according to the following rule: the input is written row by row, the output is read column by column.

$$\begin{bmatrix} x(0) & x(1) & x(2) & \dots & x(7) \\ x(8) & x(9) & x(10) & \dots & x(15) \\ \vdots & \vdots & \vdots & \dots & \vdots \\ x(80) & x(81) & x(82) & \dots & x(87) \end{bmatrix}$$

Hence, the interleaved sequence is denoted by $y(i)$ and are given by:

$$y(0), y(1), \dots, y(87) = x(0), x(8), \dots, x(80), x(1), \dots, x(87).$$

4.4.5 Coding and Bit Scrambling of the MBMS Notification Indicator

The MBMS notification indicator N_q , $q = 0, \dots, N_n - 1$, $N_q \in \{0, 1\}$ is an identifier to instruct the UE whether there is an MBMS notification indication for the groups of MBMS services that are associated to the NI, calculated by higher layers, and the associated MBMS notification indicator N_q . The length L_{NI} of the MBMS notification indicator is $L_{NI}=2$, $L_{NI}=4$ or $L_{NI}=8$ symbols. $N_{NIB} = 2 * N_n * L_{NI}$ bits are used for the MBMS notification indicator transmission in one MICH. The mapping of the MBMS notification indicators to the bits e_i , $i = 1, \dots, N_{NIB}$ is shown in table 13A.

Table 13A: Mapping of the MBMS notification indicator

N_q	Bits $\{e_{2L_{NI} \cdot q + 1}, e_{2L_{NI} \cdot q + 2}, \dots, e_{2L_{NI} \cdot (q+1)}\}$
0	$\{0, 0, \dots, 0\}$
1	$\{1, 1, \dots, 1\}$

If the number S of bits available for the MICH is bigger than the number N_{NIB} of bits used for the transmission of MBMS notification indicators, the sequence $e = \{e_1, e_2, \dots, e_{N_{NIB}}\}$ is extended by $S - N_{NIB}$ bits that are set to zero, resulting in a sequence $h = \{h_1, h_2, \dots, h_S\}$:

$$\begin{aligned} h_k &= e_k, & k &= 1, \dots, N_{NIB} \\ h_k &= 0, & k &= N_{NIB} + 1, \dots, S \end{aligned}$$

The bits h_k , $k = 1, \dots, S$ on the MICH then undergo bit scrambling as defined in section 4.2.9.

The bits s_k , $k = 1, \dots, S$ output from the bit scrambler are then transmitted over the air as shown in [7].

4.4.6 Coding of PLCCH

The PLCCH is a Node-B terminated channel used to carry dedicated (UE-specific) TPC and SS information to multiple UEs. Each TPC/SS command pair for a given UE is mapped to 3 bits as shown in table 13B.

Table 13B: Mapping of the TPC/SS pair

3-bit TPC/SS command (MSB on left)	TPC command	SS command
000	"DOWN"	"DOWN"
100	"UP"	"DOWN"
011	"DOWN"	"UP"
111	"UP"	"UP"
001	"DOWN"	"Do Nothing"
101	"UP"	"Do Nothing"

Let $I=14$ be the number of TPC/SS command pairs that can be carried by a single PLCCCH. The 3 bits corresponding to the i^{th} TPC/SS command pair ($i=1\dots I$), are denoted $\{B_0^i, B_1^i, B_2^i\}$ where B_0^i is the MSB.

The bit sequence corresponding to the $I=14$ TPC/SS command pairs is denoted α_k ($k=0,1,2,\dots,41$). B_n^i ($n=0,1,2$) is mapped to α_k such that:

$$\alpha_{3(i-1)+n} = B_n^i$$

The PLCCCH burst is composed of 44 information bits $\{b_{plcch}(0), b_{plcch}(1), \dots, b_{plcch}(43)\}$ which are repetition coded, and then delivered in one sub-frame as follows:

1. $b_{plcch}(m) = \alpha_m$ (for $m=0,1,\dots,41$) and $b_{plcch}(m) = 0$ (for $m=42,43$)
2. Repetition coding with code rate $\frac{1}{2}$ is applied to the sequence $\{b_{plcch}(0), \dots, b_{plcch}(43)\}$ in order to form the sequence $\{x(0), x(1), x(2), x(3), \dots, x(86), x(87)\}$. The size of the data block after the repetition encoder is 88 bits. The encoded codeword $\{x(0), x(1), x(2), x(3), \dots, x(86), x(87)\}$ is equal to $\{b_{plcch}(0), b_{plcch}(0), b_{plcch}(1), b_{plcch}(1), \dots, b_{plcch}(43), b_{plcch}(43)\}$.
3. The bits output from the repetition encoder $\{x(0), \dots, x(87)\}$ are input to an interleaving unit. The coded bits are block rectangular interleaved according to the following rule: the input is written row by row, the output is read column by column.

$$\begin{bmatrix} x(0) & x(1) & x(2) & \dots & x(7) \\ x(8) & x(9) & x(10) & \dots & x(15) \\ \vdots & \vdots & \vdots & \dots & \vdots \\ x(80) & x(81) & x(82) & \dots & x(87) \end{bmatrix}$$

Hence, the interleaved sequence is denoted by $y(i)$ and is given by:

$$y(0), y(1), \dots, y(87) = x(0), x(8), \dots, x(80), x(1), \dots, x(87).$$

The bit sequence $y(0), y(1), \dots, y(87)$ is mapped to the PLCCCH burst in order of bit index, with the lowest bit index being the first bit (in time) to be transmitted.

4.5 Coding for HS-DSCH

Figure 15 illustrates the overall concept of transport-channel coding for HS-DSCH. Data arrives at the coding unit in the form of one transport block once every TTI. The TTI is 5 ms for 1.28 Mcps TDD and 10 ms for 3.84 Mcps TDD / 7.68 Mcps TDD.

For 1.28 Mcps TDD, in the case of multiple-frequency transmission in one TTI, a number of transport blocks arrive at the coding unit, in which the number of transport blocks equals the number of frequencies used. Each transport block for each frequency shall be coded separately as the following coding step.

For 1.28 Mcps TDD, in the case of MIMO dual stream transmission in one TTI, two transport blocks arrive at the coding unit. Each transport block for each data stream shall be coded separately as the following coding step.

The following coding steps for HS-DSCH can be identified:

- add CRC to each transport block (see subclause 4.5.1);
- code block segmentation (see subclause 4.5.2);
- channel coding (see subclause 4.5.3);
- hybrid ARQ (see subclause 4.5.4);
- bit scrambling (see subclause 4.5.5);
- interleaving for HS-DSCH (see subclause 4.5.6);
- constellation re-arrangement for 16QAM and 64QAM (see subclause 4.5.7);
- mapping to physical channels (see subclause 4.5.8).

The coding steps for HS-DSCH are shown in figure 15.

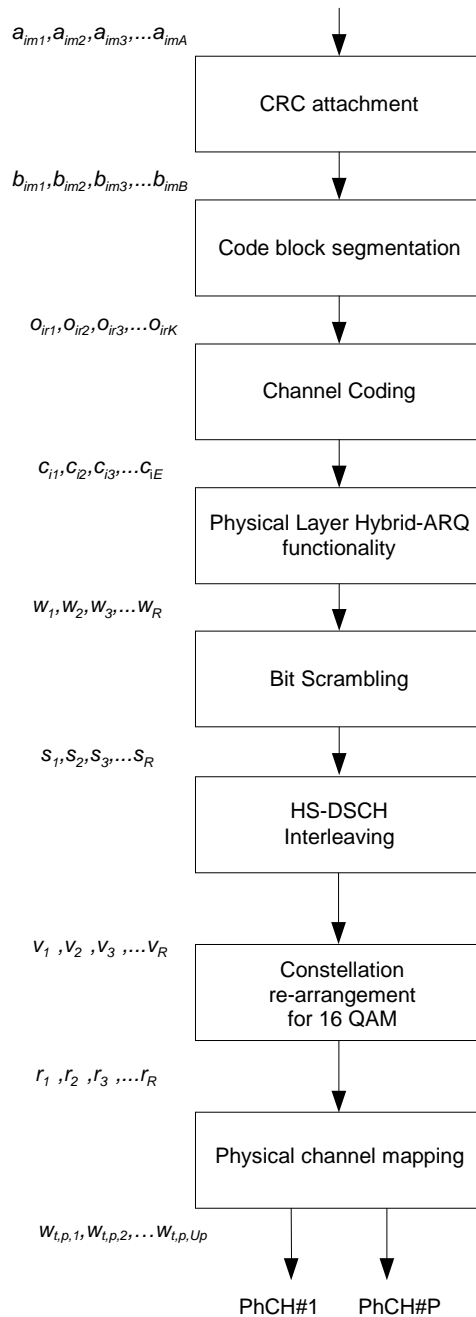

Figure 15: Coding chain for HS-DSCH

In the following the number of transport blocks is always one. When referencing non HS-DSCH formulae which are used in correspondence with HS-DSCH formulae the convention is used that transport block subscripts may be omitted (e.g. X_i when i is always 1 may be written X).

4.5.1 CRC attachment for HS-DSCH

A CRC of size 24 bits is calculated and added per HS-DSCH TTI. The CRC polynomial is defined in 4.2.1.1 with the following specific parameters: $i = 1$, $L_i = 24$ bits.

4.5.2 Code block segmentation for HS-DSCH

Code block segmentation for the HS-DSCH transport channel shall be done with the general method described in 4.2.2.2 above with the following specific parameters.

There will only be one transport block, $i = 1$. The bits $b_{im1}, b_{im2}, b_{im3}, \dots, b_{imB}$ input to the block are mapped to the bits $x_{i1}, x_{i2}, x_{i3}, \dots, x_{iXL}$ directly. It follows that $X_I = B$. Note that the bits x referenced here refer only to the internals of the code block segmentation function. The output bits from the code block segmentation function are $O_{ir1}, O_{ir2}, O_{ir3}, \dots, O_{irK}$.

The value of $Z = 5114$ for turbo coding shall be used.

4.5.3 Channel coding for HS-DSCH

Channel coding for the HS-DSCH transport channel shall be done with the general method described in 4.2.3 above with the following specific parameters.

There will be a maximum of one transport block, $i = 1$. The rate 1/3 turbo coding shall be used.

4.5.4 Hybrid ARQ for HS-DSCH

The hybrid ARQ functionality matches the number of bits at the output of the channel coder to the total number of bits of the HS-PDSCH set to which the HS-DSCH is mapped. The hybrid ARQ functionality is controlled by the redundancy version (RV) parameters. The exact set of bits at the output of the hybrid ARQ functionality depends on the number of input bits, the number of output bits, and the RV parameters.

The hybrid ARQ functionality consists of two rate-matching stages and a virtual buffer as shown in the figure below.

The first rate matching stage matches the number of input bits to the virtual IR buffer, information about which is provided by higher layers. Note that, if the number of input bits does not exceed the virtual IR buffering capability, the first rate-matching stage is transparent.

The second rate matching stage matches the number of bits after first rate matching stage to the number of physical channel bits available in the HS-PDSCH set in the TTI.

Figure 16: HS-DSCH hybrid ARQ functionality

4.5.4.1 HARQ bit separation

The HARQ bit separation function shall be performed in the same way as bit separation for turbo encoded TrCHs in 4.2.7.2 above.

4.5.4.2 HARQ First Rate Matching Stage

HARQ first stage rate matching for the HS-DSCH transport channel shall be done with the general method described in 4.2.7.1.2 above with the following specific parameters.

The maximum number of soft channel bits available in the virtual IR buffer is N_{IR} which is signalled from higher layers for each HARQ process. The number of coded bits in a TTI before rate matching is N^{TTI} this is deduced from

information signalled from higher layers and parameters signalled on the HS-SCCH for each TTI. Note that HARQ processing and physical layer storage occurs independently for each HARQ process currently active.

If N_{IR} is greater than or equal to N^{TTI} (i.e. all coded bits of the corresponding TTI can be stored) the first rate matching stage shall be transparent. This can, for example, be achieved by setting $e_{minus} = 0$. Note that no repetition is performed.

If N_{IR} is smaller than N^{TTI} the parity bit streams are punctured as in 4.2.7.1.2 above by setting the rate matching parameter $\Delta N_{il}^{TTI} = N_{IR} - N^{TTI}$ where the subscripts i and l refer to transport channel and transport format in the referenced sub-clause. Note the negative value is expected when the rate matching implements puncturing. Bits selected for puncturing which appear as δ in the algorithm in 4.2.7 above shall be discarded and not counted in the totals for the streams through the virtual IR buffer.

4.5.4.3 HARQ Second Rate Matching Stage

HARQ second stage rate matching for the HS-DSCH transport channel shall be done with the general method described in 4.2.7.3 above with the following specific parameters. Bits selected for puncturing which appear as δ in the algorithm in 4.2.7.3 above shall be discarded and are not counted in the streams towards the bit collection.

The parameters of the second rate matching stage depend on the value of the RV parameters s and r . The parameter s can take the value 0 or 1 to distinguish between transmissions that prioritise systematic bits ($s = 1$) and non systematic bits ($s = 0$). The parameter r (range 0 to $r_{max}-1$) changes the initial error variable e_{ini} in the case of puncturing. In case of repetition both parameters r and s change the initial error variable e_{ini} . The parameters X_i , e_{plus} and e_{minus} are calculated as per table 14 below.

Denote the number of bits before second rate matching as N_{sys} for the systematic bits, N_{p1} for the parity 1 bits, and N_{p2} for the parity 2 bits, respectively. For the HS-DSCH, denote the number of timeslots used as T , the number of codes per timeslot as C and the number of bits available in timeslot t as U_t , where $U_t = \sum_{p=1}^C U_{t,p}$ and $U_{t,p}$ is the number of bits available in physical channel p of timeslot t as defined in [7]. N_{data} is the number of bits available to the HS-DSCH in one TTI and is defined as $N_{data} = \sum_{t=1}^T U_t$. The rate matching parameters are determined as follows.

For $N_{data} \leq N_{sys} + N_{p1} + N_{p2}$, puncturing is performed in the second rate matching stage. The number of transmitted systematic bits in a transmission is $N_{t,sys} = \min\{N_{sys}, N_{data}\}$ for a transmission that prioritises systematic bits and $N_{t,sys} = \max\{N_{data} - (N_{p1} + N_{p2}), 0\}$ for a transmission that prioritises non systematic bits.

For $N_{data} > N_{sys} + N_{p1} + N_{p2}$ repetition is performed in the second rate matching stage. A similar repetition rate in all bit streams is achieved by setting the number of transmitted systematic bits to $N_{t,sys} = \left\lfloor N_{sys} \cdot \frac{N_{data}}{N_{sys} + 2N_{p1}} \right\rfloor$.

The number of parity bits in a transmission is: $N_{t,p1} = \left\lfloor \frac{N_{data} - N_{t,sys}}{2} \right\rfloor$ and $N_{t,p2} = \left\lfloor \frac{N_{data} - N_{t,sys}}{2} \right\rfloor$ for

the parity 1 and parity 2 bits, respectively.

Table 14 below summarizes the resulting parameter choice for the second rate matching stage.

Table 14: Parameters for HARQ second rate matching

	X_i	e_{plus}	e_{minus}
Systematic RMS	N_{sys}	N_{sys}	$ N_{sys} - N_{t,sys} $
Parity 1 RM P1_2	N_{p1}	$2 \cdot N_{p1}$	$2 \cdot N_{p1} - N_{t,p1} $
Parity 2 RM P2_2	N_{p2}	N_{p2}	$ N_{p2} - N_{t,p2} $

The rate matching parameter e_{ini} is calculated for each bit stream according to the RV parameters r and s using

$$e_{ini}(r) = \left\{ \left(X_i - \left\lfloor r \cdot e_{plus} / r_{max} \right\rfloor - 1 \right) \bmod e_{plus} \right\} + 1 \text{ in the case of puncturing, i.e., } N_{data} \leq N_{sys} + N_{p1} + N_{p2},$$

and

$$e_{ini}(r) = \left\{ \left(X_i - \left\lfloor (s + 2 \cdot r) \cdot e_{plus} / (2 \cdot r_{max}) \right\rfloor - 1 \right) \bmod e_{plus} \right\} + 1 \text{ for repetition, i.e., } N_{data} > N_{sys} + N_{p1} + N_{p2}.$$

Where $r \in \{0, 1, \dots, r_{max} - 1\}$ and r_{max} is the total number of redundancy versions allowed by varying r as defined in 4.6.1.4.

Note that r_{max} varies depending on the modulation mode, i.e. for 16QAM and 64QAM $r_{max} = 2$ and for QPSK $r_{max} = 4$.

Note: For the modulo operation the following clarification is used: the value of $(x \bmod y)$ is strictly in the range of 0 to $y-1$ (i.e. $-1 \bmod 10 = 9$).

4.5.4.4 HARQ bit collection

The HARQ bit collection is achieved using a rectangular interleaver of size $N_{row} \times N_{col}$.

The number of rows and columns are determined from:

$$N_{row} = 6 \text{ for 64QAM}$$

$$N_{row} = 4 \text{ for 16QAM}$$

$$N_{row} = 2 \text{ for QPSK}$$

$$N_{col} = N_{data} / N_{row}$$

where N_{data} is used as defined in 4.5.4.3 above.

Data is written into the interleaver column by column, and read out of the interleaver column by column, starting from the first column.

$N_{t,sys}$ is the number of transmitted systematic bits. Intermediate values N_r and N_c are calculated using:

$$N_r = \left\lfloor \frac{N_{t,sys}}{N_{col}} \right\rfloor \text{ and } N_c = N_{t,sys} - N_r \cdot N_{col}.$$

If $N_c = 0$ and $N_r > 0$, the systematic bits are written into rows $1 \dots N_r$.

Otherwise systematic bits are written into rows $1 \dots N_r + 1$ in the first N_c columns and, if $N_r > 0$, also into rows $1 \dots N_r$ in the remaining $N_{col} - N_c$ columns.

The remaining space is filled with parity bits. The parity bits are written column wise into the remaining rows of the respective columns. Parity 1 and 2 bits are written in alternating order, starting with a parity 2 bit in the first available column with the lowest index number.

In the case of 64QAM for each column the bits are read out of the interleaver in the order row1, row2, row3, row4, row5, row6. In the case of 16QAM for each column the bits are read out of the interleaver in the order row 1, row 2, row 3, row 4. In the case of QPSK for each column the bits are read out of the interleaver in the order row1, row2.

4.5.5 Bit scrambling

The bit scrambling for HS-DSCH shall be done with the general method described in subclause 4.2.9.

4.5.6 Interleaving for HS-DSCH

The interleaving for TDD is done over all bits in the TTI, as shown in figure 17 when QPSK modulation is being used for the HS-DSCH, and figure 18 when 16-QAM modulation is being used, and figure 18a when 64QAM modulation is being used. The bits input to the block interleaver are denoted by $s_1, s_2, s_3, \dots, s_R$, where R is the number of bits in one TTI.

Figure 17: Interleaver structure for HS-DSCH with QPSK modulation

For QPSK, the interleaver is a block interleaver and consists of bits input to a matrix with padding, the inter-column permutation for the matrix and bits output from the matrix with pruning. The output bit sequence from the block interleaver is derived as follows:

- (1) The number of columns of the matrix is 30. The columns of the matrix are numbered 0, 1, 2, ..., 29 from left to right.
- (2) Determine the number of rows of the matrix, $R2$, by finding minimum integer $R2$ such that $R \leq 30 \times R2$. The rows of rectangular matrix are numbered 0, 1, 2, ..., $R2 - 1$ from top to bottom.
- (3) Write the input bit sequence $s_1, s_2, s_3, \dots, s_R$ into the $R2 \times 30$ matrix row by row starting with bit y_1 in column 0 of row 0:

$$\begin{bmatrix} y_1 & y_2 & y_3 & \dots & y_{30} \\ y_{31} & y_{32} & y_{33} & \dots & y_{60} \\ \vdots & \vdots & \vdots & & \vdots \\ y_{30 \cdot (R2-1)+1} & y_{30 \cdot (R2-1)+2} & y_{30 \cdot (R2-1)+3} & \dots & y_{30 \cdot R2} \end{bmatrix}$$

where $y_k = s_k$ for $k = 1, 2, \dots, R$ and, if $R < 30 \times R2$, dummy bits are inserted for $k = R+1, R+2, \dots, 30 \times R2$. These dummy bits are pruned away from the output of the matrix after the inter-column permutation.

- (4) Perform the inter-column permutation for the matrix based on the pattern $\langle P2(j) \rangle_{j \in \{0,1,\dots,29\}}$ that is shown in Table 7, where $P2(j)$ is the original column position of the j -th permuted column. After permutation of the columns, the bits are denoted by y''_k .

$$\begin{bmatrix} y'_1 & y'_{R2+1} & y'_{2 \cdot R2+1} & \dots & y'_{29 \cdot R2+1} \\ y'_2 & y'_{R2+2} & y'_{2 \cdot R2+2} & \dots & y'_{29 \cdot R2+2} \\ \vdots & \vdots & \vdots & & \vdots \\ y'_{R2} & y'_{2 \cdot R2} & y'_{3 \cdot R2} & \dots & y'_{30 \cdot R2} \end{bmatrix}$$

- (5) The output of the block interleaver is the bit sequence read out column by column from the inter-column permuted $R2 \times 30$ matrix. The output is pruned by deleting dummy bits that were padded to the input of the matrix before the inter-column permutation, i.e. bits y''_k that corresponds to bits y_k with $k > R$ are removed from the output. The bits after interleaving are denoted by $v_1, v_2, v_3, \dots, v_R$, where v_1 corresponds to the bit y''_k with smallest index k after pruning, v_2 to the bit y''_k with second smallest index k after pruning, and so on.

Figure 18: Interleaver structure for HS-DSCH with 16-QAM modulation

For 16QAM, a second identical interleaver operates in parallel to the first. For both interleavers, $R2$ is chosen to be the minimum integer that satisfies $R \leq 60 \times R2$. The output bits from the bit scrambling operation are divided pairwise between the interleavers: bits s_k and s_{k+1} go to the first interleaver and bits s_{k+2} and s_{k+3} go to the second interleaver, where $k \bmod 4 = 1$. Bits are collected pairwise from the interleavers: bits v_k and v_{k+1} are obtained from the first interleaver and bits v_{k+2} and v_{k+3} are obtained from the second interleaver, where again $k \bmod 4 = 1$.

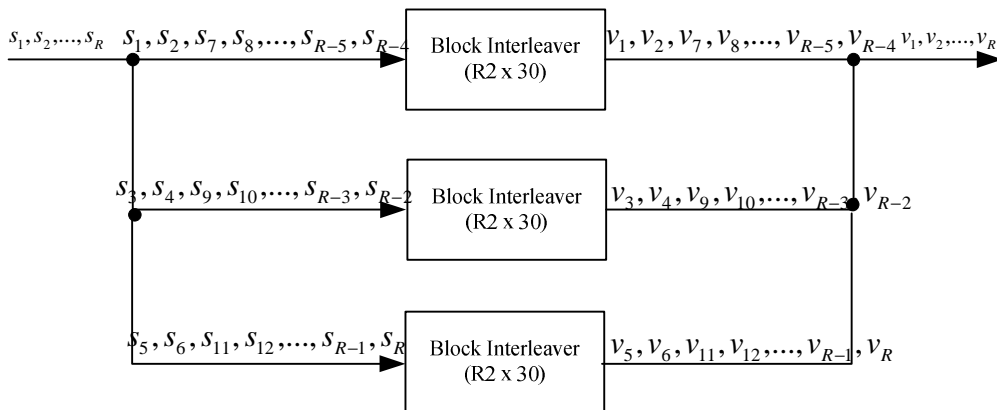

Figure 18a: Interleaver structure for HS-DSCH with 64-QAM modulation

The interleaving for TDD is done over all bits in the TTI, as shown in figure 18a when 64QAM modulation is being used for the HS-DSCH. The bits input to the block interleaver are denoted by $s_1, s_2, s_3, \dots, s_R$, where R is the number of bits in one TTI.

For 64QAM, two identical interleavers operate in parallel to the first. For all interleavers, $R2$ is chosen to be the minimum integer that satisfies $R \leq 90 \times R2$. The output bits from the bit scrambling operation are divided into three parts of different interleavers: bits s_k and s_{k+1} go to the first interleaver, bits s_{k+2} and s_{k+3} go to the second interleaver and bits s_{k+4} and s_{k+5} go to the third interleaver, where $k \bmod 6 = 1$. Bits are collected accordingly from the interleavers: bits v_k and v_{k+1} are obtained from the first interleaver, bits v_{k+2} and v_{k+3} are obtained from the second interleaver and bits v_{k+4} and v_{k+5} are obtained from the third interleaver, where again $k \bmod 6 = 1$.

4.5.7 Constellation re-arrangement for 16 QAM and 64 QAM

This function only applies to 16 QAM modulated bits. In case of QPSK it is transparent.

The following table 15 describes the operations that produce the different rearrangements.

The bits of the input sequence are mapped in groups of 4 so that $v_k, v_{k+1}, v_{k+2}, v_{k+3}$ are used, where $k \bmod 4 = 1$.

Table 15: Constellation re-arrangement for 16 QAM

Constellation version parameter b	Output bit sequence	Operation
0	$v_k v_{k+1} v_{k+2} v_{k+3}$	None
1	$v_{k+2} v_{k+3} v_k v_{k+1}$	Swapping MSBs with LSBs
2	$v_k v_{k+1} v_{k+2} v_{k+3}$	Inversion of the logical values of LSBs
3	$v_{k+2} v_{k+3} v_k v_{k+1}$	Swapping MSBs with LSBs, and inversion of the logical values of LSBs

The output bit sequences from the table above map to the output bits in groups of 4, i.e. $r_k, r_{k+1}, r_{k+2}, r_{k+3}$, where $k \bmod 4 = 1$.

The following table 15a describes the operations that produce the different rearrangements of 64 QAM.

The bits of the input sequence are mapped in groups of 6 so that $v_k, v_{k+1}, v_{k+2}, v_{k+3}, v_{k+4}, v_{k+5}$ are used, where $k \bmod 6 = 1$.

Table 15a: Constellation re-arrangement for 64 QAM

Constellation version parameter b	Output bit sequence	Operation
0	$v_k v_{k+1} v_{k+2} v_{k+3} v_{k+4} v_{k+5}$	None
1	$v_{k+4} v_{k+5} v_{k+2} v_{k+3} v_k v_{k+1}$	Swapping MSBs and LSBs. Inversion of Middle SBs
2	$v_{k+2} v_{k+3} v_{k+4} v_{k+5} v_k v_{k+1}$	Left circular shift of pair of SBs. Inversion of Middle SBs
3	$v_k v_{k+1} v_{k+2} v_{k+3} v_{k+4} v_{k+5}$	Inversion of Middle SBs

The output bit sequences from the table above map to the output bits in groups of 6, i.e. $r_k, r_{k+1}, r_{k+2}, r_{k+3}, r_{k+4}, r_{k+5}$, where $k \bmod 6 = 1$.

4.5.8 Physical channel mapping for HS-DSCH

The HS-PDSCH is defined in [7]. The bits input to the physical channel mapping are denoted by r_1, r_2, \dots, r_R , where R is the number of physical channel bits in the allocation for the current TTI. These bits are mapped to the physical channel bits, $\{w_{t,p,j} : t = 1, 2, \dots, T; p = 1, 2, \dots, C; j = 1, 2, \dots, U_{t,p}\}$, where t is the timeslot index, T is the number of timeslots in the allocation message, p is the physical channel index, C is the number of codes per timeslot in the allocation message, j is the physical channel bit index and $U_{t,p}$ is the number of bits for the physical channel p in timeslot t . The timeslot index, t , increases with increasing timeslot number; the physical channel index, p , increases with increasing channelisation code index, and the physical channel bit index, j , increases with increasing physical channel bit position in time.

The bits r_k shall be mapped to the PhCHs according to the following rule :

Define $\{y_{t,k} : k = 1, 2, \dots, \sum_{p=1}^C U_{t,p}\}$ to be the set of bits to be transmitted in timeslot t as follows :

$$y_{1,k} = r_k \quad \text{for } k = 1, 2, \dots, \sum_{p=1}^C U_{1,p}$$

$$y_{2,k} = r_{k + \sum_{p=1}^C U_{1,p}} \quad \text{for } k = 1, 2, \dots, \sum_{p=1}^C U_{2,p}$$

...

$$y_{T,k} = r_{k + \sum_{t=1}^{T-1} \sum_{p=1}^C U_{t,p}} \quad \text{for } k = 1, 2, \dots, \sum_{p=1}^C U_{T,p}$$

When the modulation level applied to the physical channels is 16-QAM :

The physical channel p used to transmit the k^{th} bit in the sequence $y_{t,k}$ is :

if ($k \leq U_{t,l} \cdot C$)

$$p = \left\lfloor \frac{k-1}{4} \right\rfloor \bmod C + 1$$

If p is odd then :

$$w_{t,p,j} = y_{t,k} \quad \text{where } j = 4 \cdot \left\lfloor \frac{k-1}{4 \cdot C} \right\rfloor + (k-1) \bmod 4 + 1$$

If p is even then :

$$w_{t,p,j} = y_{t,k} \quad \text{where } j = U_{t,p} - 4 \cdot \left\lfloor \frac{k-1}{4 \cdot C} \right\rfloor - 3 + (k-1) \bmod 4$$

else

$$p = \left\lfloor \frac{k - U_{t,l} \cdot C - 1}{4} \right\rfloor \bmod (C-1) + 2$$

If p is odd then :

$$w_{t,p,j} = y_{t,k} \quad \text{where } j = 4 \cdot \left\lfloor \frac{k - U_{t,l} \cdot C - 1}{4 \cdot (C-1)} \right\rfloor + (k - U_{t,l} \cdot C - 1) \bmod 4 + U_{t,l} + 1$$

If p is even then :

$$w_{t,p,j} = y_{t,k} \quad \text{where } j = U_{t,p} - 4 \cdot \left\lfloor \frac{k - U_{t,l} \cdot C - 1}{4 \cdot (C-1)} \right\rfloor - 3 - U_{t,l} + (k - U_{t,l} \cdot C - 1) \bmod 4$$

Otherwise, when the modulation level applied to the physical channels is QPSK :

The physical channel p used to transmit the k^{th} bit in the sequence $y_{t,k}$ is :

if ($k \leq U_{t,l} \cdot C$)

$$p = (k-1) \bmod C + 1$$

If p is odd then :

$$w_{t,p,j} = y_{t,k} \quad \text{where } j = \left\lfloor \frac{k-1}{C} \right\rfloor + 1$$

If p is even then :

$$w_{t,p,j} = y_{t,k} \quad \text{where } j = U_{t,p} - \left\lfloor \frac{k-1}{C} \right\rfloor \quad j = U_t - \left\lfloor \frac{k-1}{C} \right\rfloor$$

else

$$p = (k - U_{t,1} \cdot C - 1) \bmod (C - 1) + 2$$

If p is odd then :

$$w_{t,p,j} = y_{t,k} \text{ where } j = \left\lfloor \frac{k - U_{t,1} \cdot C - 1}{C - 1} \right\rfloor + U_{t,1} + 1$$

If p is even then :

$$w_{t,p,j} = y_{t,k} \text{ where } j = U_{t,p} - \left\lfloor \frac{k - U_{t,1} \cdot C - 1}{C - 1} \right\rfloor - U_{t,1}$$

When the modulation level applied to the physical channels is 64-QAM:

The physical channel p used to transmit the k^{th} bit in the sequence $y_{t,k}$ is:

$$p = \left\lfloor \frac{k - 1}{6} \right\rfloor \bmod C + 1$$

If p is odd then :

$$w_{t,p,j} = y_{t,k} \text{ where } j = U_{t,p} - 6 \cdot \left\lfloor \frac{k - 1}{6 \cdot C} \right\rfloor - 5 + (k - 1) \bmod 6$$

If p is even then :

$$w_{t,p,j} = y_{t,k} \text{ where } j = U_t - 6 \cdot \left\lfloor \frac{k - 1}{6 \cdot C} \right\rfloor - 5 + (k - 1) \bmod 6$$

4.6 Coding/Multiplexing for HS-SCCH

For 1.28 Mcps TDD, HS-SCCH shall be of type 1 when the following two conditions are both true:

- the UE is not configured in MIMO mode, and
- the variable HS_DSCH_SPS_STATUS is FALSE.

HS-SCCH type 1 may be used when the following two conditions are both true:

- the UE is not configured in MIMO mode, and
- the variable HS_DSCH_SPS_STATUS is TRUE.

In this section, the terms 'HS-SCCH' and 'HS-SCCH type 1' are used interchangeably.

The following information, provided by higher layers, is transmitted by means of the HS-SCCH physical channel.

For 1.28 Mcps TDD, in the case of multi-frequency HS-DSCH transmission in one TTI, HS-PDSCH on each frequency shall be configured with associated HS-SCCH(s) which is coded and multiplexed as following.

- Channelisation-code-set information (q bits where $q = 8$ for 1.28Mcps TDD / 3.84Mcps TDD and $q = 10$ for 7.68Mcps TDD): $x_{ccs,1}, x_{ccs,2}, \dots, x_{ccs,q}$
- Time slot information (n bits where $n = 5$ for 1.28 Mcps TDD and $n = 13$ for 3.84 Mcps TDD / 7.68Mcps TDD): $x_{ts,1}, x_{ts,2}, \dots, x_{ts,n}$
- Modulation scheme information (1 bit): $x_{ms,l}$
- Transport-block size information (m bits where $m = 6$ for 1.28 Mcps TDD and $m = 9$ for 3.84 Mcps TDD / 7.68Mcps TDD): $x_{tbs,1}, x_{tbs,2}, \dots, x_{tbs,m}$

- Hybrid-ARQ process information (3 bits): $x_{hap,1}$, $x_{hap,2}$, $x_{hap,3}$
- Redundancy version information (3 bits): $x_{rv,1}$, $x_{rv,2}$, $x_{rv,3}$
- New data indicator (1 bit): $x_{nd,1}$
- HS-SCCH cyclic sequence number (3 bits): $x_{hcsn,1}$, $x_{hcsn,2}$, $x_{hcsn,3}$
- UE identity (16 bits): $x_{ue,1}$, $x_{ue,2}$, ..., $x_{ue,16}$

For an HS-SCCH order type A for 1.28Mcps TDD,

- $x_{ccs,1}$, $x_{ccs,2}$, ..., $x_{ccs,q}$ are reserved
- $x_{ts,1}$, $x_{ts,2}$, ..., $x_{ts,n}$ shall be set to "00000"
- $x_{ms,1}$, $x_{tbs,1}$, $x_{tbs,2}$ shall be set to $x_{odt,1}$, $x_{odt,2}$, $x_{odt,3}$
- $x_{tbs,3}$, $x_{tbs,4}$, ..., $x_{tbs,m}$, $x_{hap,1}$, $x_{hap,2}$, $x_{hap,3}$, $x_{rv,1}$, $x_{rv,2}$, $x_{rv,3}$, $x_{nd,1}$, $x_{hcsn,1}$, $x_{hcsn,2}$, $x_{hcsn,3}$ are reserved

where $x_{odt,1}$, $x_{odt,2}$, $x_{odt,3}$ are defined in subclause 4.6A.

The following coding/multiplexing steps can be identified:

- multiplexing of HS-SCCH information (see subclause 4.6.2)
- CRC attachment (see subclause 4.6.3);
- channel coding (see subclause 4.6.4);
- rate matching (see subclause 4.6.5);
- interleaving for HS-SCCH (see subclause 4.6.6);
- mapping to physical channels (see subclauses 4.6.7 and 4.6.8).

The general coding/multiplexing flow is shown in Figure 19.

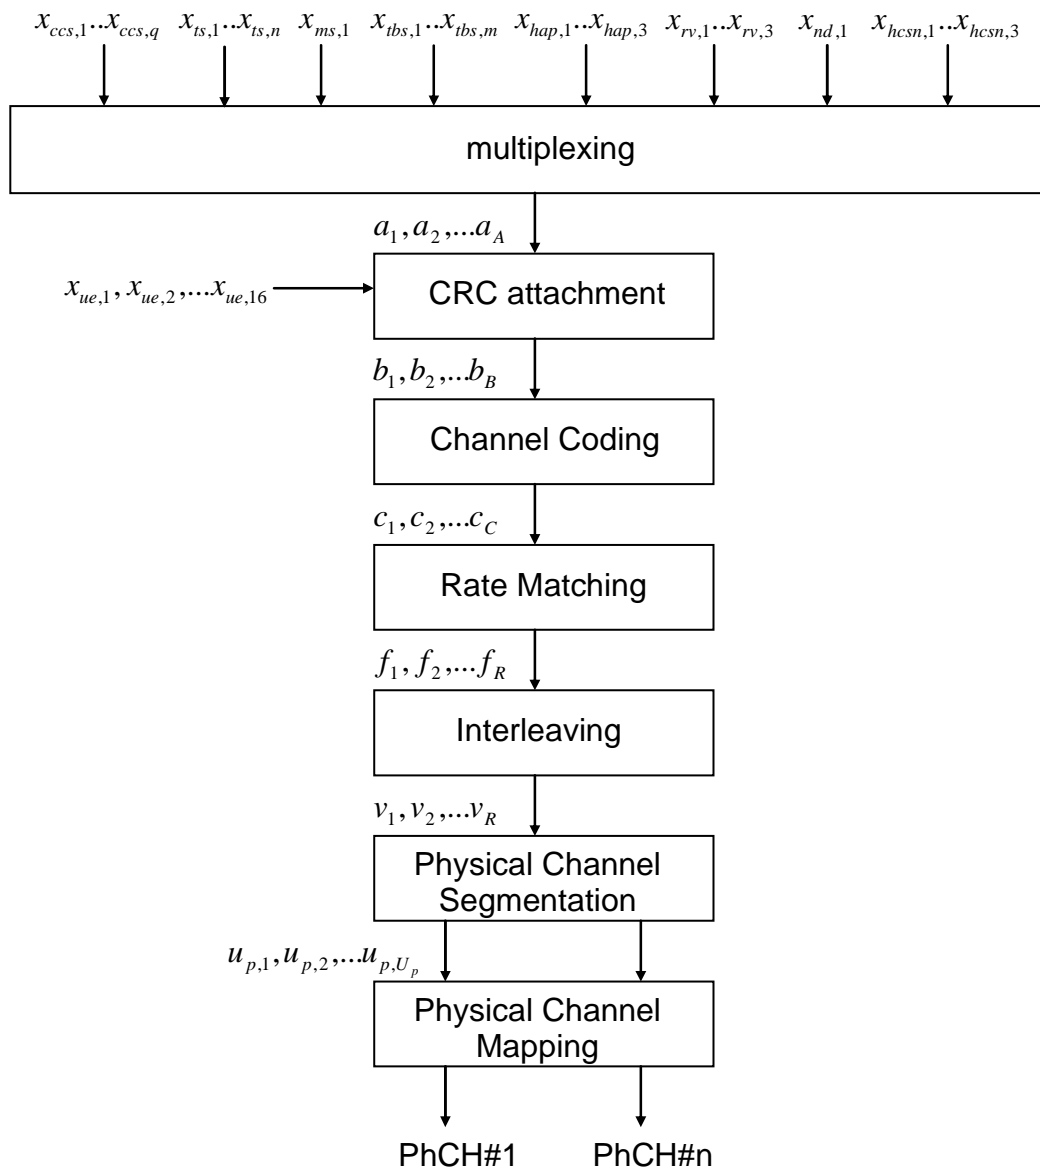

Figure 19 Coding and Multiplexing for HS-SCCH

4.6.1 HS-SCCH information field mapping

4.6.1.1 Channelisation code set information mapping

4.6.1.1.1 1.28Mcps TDD and 3.84Mcps TDD

HS-PDSCH channelisation codes are allocated contiguously from a signalled start code to a signalled stop code, and the allocation includes both the start and stop code. The start code k_{start} is signalled by the bits $x_{ccs,1}$, $x_{ccs,2}$, $x_{ccs,3}$, $x_{ccs,4}$ and the stop code k_{stop} by the bits $x_{ccs,5}$, $x_{ccs,6}$, $x_{ccs,7}$, $x_{ccs,8}$. The mapping in Table 16 below applies.

Table 16: Channelisation code set information mapping for 1.28Mcps and 3.84Mcps TDD

k_{start}	$x_{ccs,1}$	$x_{ccs,2}$	$x_{ccs,3}$	$x_{ccs,4}$	k_{stop}	$x_{ccs,5}$	$x_{ccs,6}$	$x_{ccs,7}$	$x_{ccs,8}$
1	0	0	0	0	1	0	0	0	0
2	0	0	0	1	2	0	0	0	1
3	0	0	1	0	3	0	0	1	0

15	1	1	1	0	15	1	1	1	0
16	1	1	1	1	16	1	1	1	1

If a value of $k_{start} = 16$ and $k_{stop} = 1$ is signalled, a spreading factor of SF=1 shall be used for the HS-PDSCH resources. Other than this case, $k_{start} > k_{stop}$ shall be treated as an error by the UE.

4.6.1.1.2 7.68Mcps TDD

HS-PDSCH channelisation codes are allocated contiguously from a signalled start code to a signalled stop code, and the allocation includes both the start and stop code. The start code k_{start} is signalled by the bits $x_{ccs,1}$, $x_{ccs,2}$, $x_{ccs,3}$, $x_{ccs,4}$, $x_{ccs,5}$ and the stop code k_{stop} by the bits $x_{ccs,6}$, $x_{ccs,7}$, $x_{ccs,8}$, $x_{ccs,9}$, $x_{ccs,10}$. The mapping in Table 16A below applies.

Table 16A: Channelisation code set information mapping for 7.68Mcps TDD

k_{start}	$x_{ccs,1}$	$x_{ccs,2}$	$x_{ccs,3}$	$x_{ccs,4}$	$x_{ccs,5}$	k_{stop}	$x_{ccs,6}$	$x_{ccs,7}$	$x_{ccs,8}$	$x_{ccs,9}$	$x_{ccs,10}$
1	0	0	0	0	0	1	0	0	0	0	0
2	0	0	0	0	1	2	0	0	0	0	1
3	0	0	0	1	0	3	0	0	0	1	0
4	0	0	0	1	1	4	0	0	0	1	1
5	0	0	1	0	0	5	0	0	1	0	0
6	0	0	1	0	1	6	0	0	1	0	1
7	0	0	1	1	0	7	0	0	1	1	0
8	0	0	1	1	1	8	0	0	1	1	1
9	0	1	0	0	0	9	0	1	0	0	0
10	0	1	0	0	1	10	0	1	0	0	1
11	0	1	0	1	0	11	0	1	0	1	0
12	0	1	0	1	1	12	0	1	0	1	1
13	0	1	1	0	0	13	0	1	1	0	0
14	0	1	1	0	1	14	0	1	1	0	1
15	0	1	1	1	0	15	0	1	1	1	0
16	0	1	1	1	1	16	0	1	1	1	1
17	1	0	0	0	0	17	1	0	0	0	0
18	1	0	0	0	1	18	1	0	0	0	1
19	1	0	0	1	0	19	1	0	0	1	0
20	1	0	0	1	1	20	1	0	0	1	1
21	1	0	1	0	0	21	1	0	1	0	0
22	1	0	1	0	1	22	1	0	1	0	1
23	1	0	1	1	0	23	1	0	1	1	0
24	1	0	1	1	1	24	1	0	1	1	1
25	1	1	0	0	0	25	1	1	0	0	0
26	1	1	0	0	1	26	1	1	0	0	1
27	1	1	0	1	0	27	1	1	0	1	0
28	1	1	0	1	1	28	1	1	0	1	1
29	1	1	1	0	0	29	1	1	1	0	0
30	1	1	1	0	1	30	1	1	1	0	1
31	1	1	1	1	0	31	1	1	1	1	0
32	1	1	1	1	1	32	1	1	1	1	1

If a value of $k_{start} = 32$ and $k_{stop} = 1$ is signalled, a spreading factor of SF=1 shall be used for the HS-PDSCH resources. Other than this case, $k_{start} > k_{stop}$ shall be treated as an error by the UE.

4.6.1.2 Timeslot information mapping

4.6.1.2.1 1.28 Mcps TDD

For 1.28 Mcps, the timeslots to be used for HS-PDSCH resources are signalled by the bits $x_{ts,1}, x_{ts,2}, \dots, x_{ts,5}$, where bit $x_{ts,n}$ carries the information for timeslot n+1. Timeslot 1 cannot be used for HS-PDSCH resources. If the signalling bit is set (i.e. equal to 1), then the corresponding timeslot shall be used for HS-PDSCH resources. Otherwise, the timeslot shall not be used. All used timeslots shall use the same channelisation code set, as signalled by the channelisation code set information bits.

When indicated by the higher layer that Timeslot 0 can be used for HS-PDSCH, bit $x_{ts,l}$ carries the information for timeslot 0. If $x_{ts,l}$ is set (i.e. equal to 1), Timeslot 0 shall be used for HS-PDSCH resource. Otherwise, Timeslot 0 shall not be used.

4.6.1.2.2 3.84 Mcps TDD and 7.68Mcps TDD

For 3.84 Mcps, the timeslots to be used for HS-PDSCH resources are signalled by the bits $x_{ts,1}, x_{ts,2}, \dots, x_{ts,l3}$, where bit $x_{ts,n}$ carries the information for the nth available timeslot for HS-PDSCH resources, where the order of the timeslots available for HS-PDSCH resources shall be the same as the order of the 15 time slots within each frame with the following two slots removed:

- The slot containing the P-CCPCH
- The first slot in a frame containing the PRACH

If the P-CCPCH and/or PRACH are assigned to some, but not all frames, then the corresponding time slots shall remain unavailable for these frames as well..

If the bit is set (i.e. equal to 1), then the corresponding timeslot shall be used for HS-PDSCH resources. Otherwise, the timeslot shall not be used. All used timeslots shall use the same channelisation code set, as signalled by the channelisation code set information bits.

4.6.1.3 Modulation scheme information mapping

The modulation scheme to be used by the HS-PDSCH resources shall be signalled by bit $x_{ms,l}$. If 64QAM is not supported by the UE, the mapping scheme in Table 17 shall apply.

Table 17: Modulation scheme information mapping

$x_{ms,l}$	Modulation Scheme
0	QPSK
1	16-QAM

If 64QAM is supported by the UE, the mapping scheme in Table 17a shall apply.

Table 17a: Modulation scheme information mapping

$x_{ms,l}$	Modulation Scheme
0	QPSK or 64QAM
1	16-QAM

The method of determining the modulation scheme by UE with 64QAM capability is as following:

If $x_{ms,l} = 1$, then modulation scheme is 16QAM;

Else if $x_{ms,l} = 0$, then

Step 1, UE first calculates the physical resource bearer capability and the transmission bit rate. The physical resource bearer capability is the maximum bit rate at which RAN can transmit with the physical resources assigned in HS-SCCH and the QPSK modulation. The physical resource bearer capability can be calculated by the channelization-code-set information and time slot information of HS-SCCH.

The transmission bit rate is the bit rate to which the transport-block size indicated in HS-SCCH corresponds.

Step 2, if the physical resource bearer capability multiplied by R is less than the transmission bit rate, and R belongs to $[0, 1]$,

then modulation scheme is 64QAM;

else modulation scheme is QPSK.

Note: According to the simulation results the value of the transmission bit rate divided by the physical resource bearer capability according to 64QAM should be more than 1/3, where the value of R is equal to 1.

If 64QAM is configured by UE, the method of determining recommended modulation scheme by NodeB can be similar to 64QAM indication in HS-SCCH. The details are:

If $x_{ms,l} = 1$, NodeB should determine the recommended modulation scheme as 16QAM,

Else if $x_{ms,l} = 0$, NodeB calculates the physical resource bearer capability assigned in HS-SCCH corresponding to RMF and RTBS in HS-SICH, and calculates the transmission bit rate according to the RTBS in HS-SICH, and then determines whether the recommended modulation scheme is 64QAM or QPSK.

4.6.1.4 Redundancy and constellation version information mapping

The redundancy version (RV) parameters r , s and constellation version parameter b are mapped jointly to produce the value X_{rv} . X_{rv} is alternatively represented as the sequence $x_{rv,1}, x_{rv,2}, x_{rv,3}$ where $x_{rv,1}$ is the MSB. This is done according to the following tables according to the modulation mode used:

Table 18: RV mapping for 16 QAM and 64 QAM

X_{rv} (value)	s	r	b
0	1	0	0
1	0	0	0
2	1	1	1
3	0	1	1
4	1	0	1
5	1	0	2
6	1	0	3
7	1	1	0

Table 19: RV mapping for QPSK

X_{rv} (value)	s	r
0	1	0
1	0	0
2	1	1
3	0	1
4	1	2
5	0	2
6	1	3
7	0	3

4.6.1.5 HS-SCCH cyclic sequence number

The HS-SCCH cyclic sequence number is mapped such that $x_{hcsn,1}$ corresponds to the MSB and $x_{hcsn,3}$ to the LSB.

4.6.1.6 UE identity

The UE identity is the HS-DSCH Radio Network Identifier (H-RNTI) defined in [12]. This is mapped such that $x_{ue,1}$ corresponds to the MSB and $x_{ue,16}$ to the LSB, cf. [14].

4.6.1.7 HARQ process identifier mapping

The hybrid-ARQ process information $x_{hap,1}, x_{hap,2}, x_{hap,3}$ is unsigned binary representation of the HARQ process identifier where $x_{hap,1}$ is MSB.

4.6.1.8 Transport block size index mapping

The transport-block size information $x_{tbs,1}, x_{tbs,2}, \dots, x_{tbs,m}$ is unsigned binary representation of the transport block size index where $x_{tbs,1}$ is MSB.

4.6.2 Multiplexing of HS-SCCH information

The information carried on the HS-SCCH is multiplexed onto the bits a_1, a_2, \dots, a_A according to the following rule :

$$a_1, a_2, \dots, a_q = x_{ccs,1}, x_{ccs,2}, \dots, x_{ccs,q}$$

$$a_{q+1}, a_{q+2}, \dots, a_{q+n} = x_{ts,1}, x_{ts,2}, \dots, x_{ts,n}$$

$$a_{q+n+1} = x_{ms,1}$$

$$a_{q+n+2}, a_{q+n+3}, \dots, a_{q+n+m+1} = x_{tbs,1}, x_{tbs,2}, \dots, x_{tbs,m}$$

$$a_{q+n+m+2}, a_{q+n+m+3}, a_{q+n+m+4} = x_{hap,1}, x_{hap,2}, x_{hap,3}$$

$$a_{q+n+m+5}, a_{q+n+m+6}, a_{q+n+m+7} = x_{rv,1}, x_{rv,2}, x_{rv,3}$$

$$a_{q+n+m+8} = x_{nd,1}$$

$$a_{q+n+m+9}, a_{q+n+m+10}, a_{q+n+m+11} = x_{hcsn,1}, x_{hcsn,2}, x_{hcsn,3}$$

4.6.3 CRC attachment for HS-SCCH

From the sequence of bits a_1, a_2, \dots, a_A a 16 bit CRC is calculated according to Section 4.2.1.1. This gives a sequence of bits y_1, y_2, \dots, y_{16} where

$$y_k = P_{im(17-k)} \quad k = 1, 2, \dots, 16$$

This latter sequence of bits is then masked with the UE identity and appended to the sequence of bits a_1, a_2, \dots, a_A . The bits at the output of the CRC attachment block is the sequence of bits b_1, b_2, \dots, b_B , where

$$b_i = a_i \quad i=1, 2, \dots, A$$

$$b_i = (y_{i-A} + x_{ue,i-A}) \bmod 2 \quad i=A+1 \dots B$$

4.6.4 Channel coding for HS-SCCH

Channel coding for the HS-SCCH shall be done with the general method described in 4.2.3 with the following specific parameters:

The rate 1/3 convolutional coding shall be used for HS-SCCH.

4.6.5 Rate matching for HS-SCCH

Rate matching for HS-SCCH shall be done with the general method described in 4.2.7.

4.6.6 Interleaving for HS-SCCH

Interleaving for HS-SCCH shall be done with the general method described in 4.2.11.1.

4.6.7 Physical Channel Segmentation for HS-SCCH

Physical channel segmentation for HS-SCCH shall be done with the general method described in 4.2.10. For 1.28 Mcps TDD, the HS-SCCH consists of two physical channels HS-SCCH1 and HS-SCCH2; for 3.84 Mcps TDD and 7.68 Mcps TDD the HS-SCCH only uses one physical channel, see [7].

4.6.8 Physical channel mapping for HS-SCCH

Physical channel mapping for the HS-SCCH shall be done with the general method described in subclause 4.2.12.

4.6A Coding/Multiplexing for HS-SCCH orders type A

HS-SCCH orders type A are commands sent to the UE using HS-SCCH. No HS-PDSCH is associated with HS-SCCH orders.

For 1.28 Mcps TDD, HS-SCCH order type A may be used when any of the following conditions is true:

- HS_DSCH_RECEPTION_CELL_FACH_STATE is TRUE;
- CONTROL_CHANNEL_DRX_STATUS is TRUE, and UE is not configured in MIMO mode;
- CONTROL_CHANNEL_DRX_STATUS is TRUE, and UE is configured in MIMO mode while the variable MIMO SF mode for HS-PDSCH dual stream is SF1
- the variable HS_DSCH_SPS_STATUS is TRUE, and UE is not configured in MIMO mode;
- the variable HS_DSCH_SPS_STATUS is TRUE, and UE is configured in MIMO mode while the variable MIMO SF mode for HS-PDSCH dual stream is SF1.

The following information is transmitted by means of the HS-SCCH order type A physical channel.

- Order type (3 bits): $x_{odt,1}, x_{odt,2}, x_{odt,3}$
- UE identity (16 bits): $x_{ue,1}, x_{ue,2}, \dots, x_{ue,16}$

The coding for HS-SCCH orders type A is specified in subclause 4.6.

4.6A.1 HS-SCCH orders type A information field mapping

4.6A.1.1 Order type mapping

If $x_{odt,1}, x_{odt,2}, x_{odt,3} = "000"$, then the HS-SCCH order is an uplink synchronization establishment order when UE is in CELL_FACH or CELL_PCH state.

If $x_{odt,1}, x_{odt,2}, x_{odt,3} = "001"$, then the HS-SCCH order is an order to release the allocated semi-persistent HS-PDSCH resources when UE is in CELL_DCH state.

If $x_{odt,1}, x_{odt,2}, x_{odt,3} = "010"$, then the HS-SCCH order is DRX Activation order when UE is in CELL_DCH state.

If $x_{odt,1}, x_{odt,2}, x_{odt,3} = "011"$, then the HS-SCCH order is DRX De-activation order when UE is in CELL_DCH state.

4.6A.1.2 UE identity mapping

The UE identity is the HS-DSCH Radio Network Identifier (H-RNTI) defined in [12]. This is mapped such that $x_{ue,1}$ corresponds to the MSB and $x_{ue,16}$ to the LSB, cf. [14].

4.6B Coding/Multiplexing for HS-SCCH type 2 (1.28 Mcps TDD only)

HS-SCCH shall be of type 2 when any of the following conditions is met:

- the variable HS_DSCH_SPS_STATUS is TRUE, and UE is not configured in MIMO mode;
- the variable HS_DSCH_SPS_STATUS is TRUE, and UE is configured in MIMO mode while the variable MIMO SF mode for HS-PDSCH dual stream is SF1.

HS-SCCH type 2 is used to allocate semi-persistent HS-PDSCH resources for the initial transmissions. The following information is transmitted by means of the HS-SCCH type 2 physical channels.

- Type flag 1 (2 bits): $x_{flag1,1}, x_{flag1,2}$
- Resource repetition pattern index (2bits): $x_{rrpi,1}, x_{rrpi,2}$

- Type flag 2 (2 bits): $x_{flag2,1}, x_{flag2,2}$
- Transport-block size information (2 bits): $x_{tbs,1}, x_{tbs,2}$
- Time slot information (5bits): $x_{ts,1}, x_{ts,2}, \dots, x_{ts,5}$
- Channelisation-code-set information (6 bits): $x_{ccs,1}, x_{ccs,2}, \dots, x_{ccs,6}$
- Modulation scheme information (1 bit): $x_{ms,1}$
- HS-SICH indicator (2bits): $x_{HI,1}, x_{HI,2}$
- HS-SCCH cyclic sequence number (3 bits): $x_{hcsn,1}, x_{hcsn,2}, x_{hcsn,3}$
- UE identity (16 bits): $x_{ue,1}, x_{ue,2}, \dots, x_{ue,16}$
- Redundancy and constellation version (0 bit): $X_{rv} = 0$ (see subclause 4.6.1.4)
- Reserved (5 bits): $x_{res,1}, x_{res,2}, \dots, x_{res,5}$

For an HS-SCCH order type A,

- $x_{flag1,1}, x_{flag1,2}, x_{rrpi,1}, x_{rrpi,2}, x_{flag2,1}, x_{flag2,2}, x_{tbs,1}, x_{tbs,2}$ are reserved
- $x_{ts,1}, x_{ts,2}, \dots, x_{ts,5}$ shall be set to "00000"
- $x_{ccs,1}, x_{ccs,2}, x_{ccs,3}$ shall be set to $x_{odt,1}, x_{odt,2}, x_{odt,3}$
- $x_{ccs,4}, x_{ccs,5}, x_{ccs,6}, x_{ms,1}, x_{HI,1}, x_{HI,2}, x_{hcsn,1}, x_{hcsn,2}, x_{hcsn,3}, x_{res,1}, x_{res,2}, x_{res,3}, x_{res,4}, x_{res,5}$ are reserved

where $x_{odt,1}, x_{odt,2}, x_{odt,3}$ are defined in subclause 4.6A.

The following coding/multiplexing steps for HS-SCCH type 2 can be identified:

- multiplexing of HS-SCCH type 2 information (see subclause 4.6B.2)
- CRC attachment for HS-SCCH type 2 (see subclause 4.6B.3);
- channel coding for HS-SCCH type 2 (see subclause 4.6B.4);
- rate matching for HS-SCCH type 2 (see subclause 4.6B.5);
- interleaving for HS-SCCH type 2 (see subclause 4.6B.6);
- mapping to physical channels for HS-SCCH type 2 (see subclauses 4.6B.7 and 4.6B.8).

The general coding/multiplexing flow for HS-SCCH type 2 is shown in Figure 19A.

Figure 19A: Coding and Multiplexing for HS-SCCH type 2

4.6B.1 HS-SCCH type 2 information field mapping

4.6B.1.1 Type flag 1 mapping

The type flag 1 $x_{flag1,1}$, $x_{flag1,2}$ are mapped such that $x_{flag1,1} = "1"$ corresponds to the MSB and $x_{flag1,2} = "1"$ to the LSB. The type flag 1 is used to distinguish HS-SCCH type 2 from other types.

4.6B.1.2 Resource repetition pattern index mapping

The resource repetition pattern index $x_{rrpi,1}$, $x_{rrpi,2}$ is the unsigned binary representation of a reference to one of repetition patterns of the assigned semi-persistent HS-PDSCH resources configured by higher layers. The resource repetition pattern index $x_{rrpi,1}$, $x_{rrpi,2}$ are mapped such that $x_{rrpi,1}$ corresponds to the MSB and $x_{rrpi,2}$ to the LSB. The mapping of $x_{rrpi,1} x_{rrpi,2} = "00"$ is not used.

$x_{rrpi,1}$, $x_{rrpi,2}$	Resource repetition pattern index as signalled in the variable HS_DSCH_SPS_PARAMS[12]
"01"	1 st entry
"10"	2 nd entry
"11"	3 rd entry

4.6B.1.3 Type flag 2 mapping

The type flag 2 $x_{flag2,1}$, $x_{flag2,2}$ are mapped such that $x_{flag2,1} = "1"$ corresponds to the MSB and $x_{flag2,2} = "0"$ to the LSB. The type flag 2 is used to distinguish HS-SCCH type 2 from other types.

4.6B.1.4 Transport block size index mapping

The transport-block size information $x_{tbs,1}$, $x_{tbs,2}$ is the unsigned binary representation of a reference to one of the four Transport-block sizes configured by higher layers.

$x_{tbs,1}$, $x_{tbs,2}$	Transport Block size as signalled in the variable HS_DSCH_SPS_PARAMS[12]
"00"	1 st entry
"01"	2 nd entry
"10"	3 rd entry
"11"	4 th entry

4.6B.1.5 Timeslot information mapping

The mapping of the time slot information $x_{ts,1}$, $x_{ts,2}$, ... $x_{ts,5}$ is performed according to section 4.6.1.2.1.

4.6B.1.6 Channelisation code set information mapping

HS-PDSCH channelisation codes are allocated contiguously from a signalled start code to a signalled stop code, and the allocation includes both the start and stop code. The start code k_{start} is signalled by the bits $x_{ccs,1}$, $x_{ccs,2}$, $x_{ccs,3}$ and the stop code k_{stop} by the bits $x_{ccs,4}$, $x_{ccs,5}$, $x_{ccs,6}$. The mapping in Table 16B below applies.

If a value of $k_{start} = 9$ and $k_{stop} = 6$ is signalled, a spreading factor of SF=1 shall be used for the HS-PDSCH resources. Other than this case, $k_{start} > k_{stop}$ are not used.

Table 16B: Channelisation code set information mapping

k_{start}	$x_{ccs,1}$	$x_{ccs,2}$	$x_{ccs,3}$	k_{stop}	$x_{ccs,4}$	$x_{ccs,5}$	$x_{ccs,6}$
1	0	0	0	2	0	0	0
3	0	0	1	4	0	0	1
5	0	1	0	6	0	1	0
7	0	1	1	8	0	1	1
9	1	0	0	10	1	0	0
11	1	0	1	12	1	0	1
13	1	1	0	14	1	1	0
15	1	1	1	16	1	1	1

4.6B.1.7 Modulation scheme information mapping

The mapping of the modulation scheme information $x_{ms,1}$ is performed according to table 17 in section 4.6.1.3.

4.6B.1.8 HS-SICH indicator mapping

The HS-SICH indicator consists of 2 bits used to indicate the UE which HS-SICH will be used to convey the CQI and the acknowledgement indicator for the received data on the semi-persistent HS-PDSCH resources. The bits $x_{HI,1}$, $x_{HI,2}$ are mapped such that $x_{HI,1}$ corresponds to the MSB and $x_{HI,2}$ to the LSB.

$X_{HI,1}, X_{HI,2}$	HS-SICH indicator as signalled in the variable HS_DSCH_SPS_PARAMS[12]
"00"	1 st entry
"01"	2 nd entry
"10"	3 rd entry
"11"	4 th entry

4.6B.1.9 HS-SCCH cyclic sequence number

The HS-SCCH cyclic sequence number $x_{hcsn,1}, x_{hcsn,2}, x_{hcsn,3}$ is mapped such that $x_{hcsn,1}$ corresponds to the MSB and $x_{hcsn,3}$ to the LSB.

4.6B.1.10 UE identity

The UE identity is the HS-DSCH Radio Network Identifier (H-RNTI) defined in [12]. This is mapped such that $x_{ue,1}$ corresponds to the MSB and $x_{ue,16}$ to the LSB, cf. [14].

4.6B.2 Multiplexing of HS-SCCH type 2 information

The information carried on the HS-SCCH type 2 is multiplexed onto the bits a_1, a_2, \dots, a_A according to the following rule :

$$a_1, a_2 = x_{flag1,1}, x_{flag1,2}$$

$$a_3, a_4 = x_{rrpi,1}, x_{rrpi,2}$$

$$a_5, a_6 = x_{flag2,1}, x_{flag2,2}$$

$$a_7, a_8 = x_{tbs,1}, x_{tbs,2}$$

$$a_9, a_{10} \dots a_{13} = x_{ts,1}, x_{ts,2} \dots x_{ts,5}$$

$$a_{14}, a_{15} \dots a_{19} = x_{ccs,1}, x_{ccs,2} \dots x_{ccs,6}$$

$$a_{20} = x_{ms,1}$$

$$a_{21}, a_{22} = x_{HI,1}, x_{HI,2}$$

$$a_{23}, a_{24}, a_{25} = x_{hcsn,1}, x_{hcsn,2}, x_{hcsn,3}$$

$$a_{26}, a_{27} \dots a_{30} = x_{res,1}, x_{res,2} \dots x_{res,5}$$

4.6B.3 CRC attachment for HS-SCCH type 2

The sequence of bits b_1, b_2, \dots, b_B , is calculated according to subclause 4.6.3.

4.6B.4 Channel coding for HS-SCCH type 2

Channel coding for the HS-SCCH type 2 shall be done with the general method described in 4.2.3 with the following specific parameters:

The rate 1/3 convolutional coding shall be used for HS-SCCH type 2.

4.6B.5 Rate matching for HS-SCCH type 2

Rate matching for HS-SCCH type 2 shall be done with the general method described in 4.6.5.

4.6B.6 Interleaving for HS-SCCH type 2

Interleaving for HS-SCCH type 2 shall be done with the general method described in 4.2.11.1.

4.6B.7 Physical Channel Segmentation for HS-SCCH type 2

Physical channel segmentation for HS-SCCH type 2 shall be done with the general method described in 4.2.10. The HS-SCCH consists of two physical channels HS-SCCH1 and HS-SCCH2.

4.6B.8 Physical channel mapping for HS-SCCH type 2

Physical channel mapping for the HS-SCCH type 2 shall be done with the general method described in subclause 4.2.12.

4.6C Coding/Multiplexing for HS-SCCH type 3 (1.28 Mcps TDD only)

HS-SCCH shall be of type 3 when any of the following conditions is met:

- the variable HS_DSCH_SPS_STATUS is TRUE, and UE is not configured in MIMO mode;
- the variable HS_DSCH_SPS_STATUS is TRUE, and UE is configured in MIMO mode while the variable MIMO SF mode for HS-PDSCH dual stream is SF1.

HS-SCCH type 3 is used to allocate one subframe HS-PDSCH resources for retransmissions of HS-DSCH semi-persistent scheduling operation. The following information is transmitted by means of the HS-SCCH type 3 physical channels.

- Type flag 1 (2 bits): $x_{flag1,1}, x_{flag1,2}$
- Resource repetition pattern index (2bits): $x_{rrpi,1}, x_{rrpi,2}$
- Type flag 2 (2 bits): $x_{flag2,1}, x_{flag2,2}$
- Transport-block size information (2 bits): $x_{tbs,1}, x_{tbs,2}$
- Time slot information (5bits): $x_{ts,1}, x_{ts,2}, \dots, x_{ts,5}$
- Channelisation-code-set information (6 bits): $x_{ccs,1}, x_{ccs,2}, \dots, x_{ccs,6}$
- Modulation scheme information (1 bit): $x_{ms,1}$
- Redundancy version information (2 bits): $x_{rv,1}, x_{rv,2}$
- Pointer to the previous transmission (4 bits): $x_{ptr,1}, x_{ptr,2}, x_{ptr,3}, x_{ptr,4}$
- HS-SCCH cyclic sequence number (3 bits): $x_{hcsn,1}, x_{hcsn,2}, x_{hcsn,3}$
- Reserved (1 bit): $x_{res,1}$

- UE identity (16 bits): $x_{ue,1}, x_{ue,2}, \dots, x_{ue,16}$

The following coding/multiplexing steps for HS-SCCH type 3 can be identified:

- multiplexing of HS-SCCH type 3 information (see subclause 4.6C.2)
- CRC attachment for HS-SCCH type 3 (see subclause 4.6C.3);
- channel coding for HS-SCCH type 3 (see subclause 4.6C.4);
- rate matching for HS-SCCH type 3 (see subclause 4.6C.5);
- interleaving for HS-SCCH type 3 (see subclause 4.6C.6);
- mapping to physical channels for HS-SCCH type 3 (see subclauses 4.6C.7 and 4.6C.8).

The general coding/multiplexing flow for HS-SCCH type 3 is shown in Figure 19B.

Figure 19B: Coding and Multiplexing for HS-SCCH type 3

4.6C.1 HS-SCCH type 3 information field mapping

4.6C.1.1 Type flag 1 mapping

The type flag 1 $x_{flag1,1}, x_{flag1,2}$ are mapped such that $x_{flag1,1} = "1"$ corresponds to the MSB and $x_{flag1,2} = "1"$ to the LSB. The type flag 1 is used to distinguish HS-SCCH type 3 from other types.

4.6C.1.2 Resource repetition pattern index mapping

The resource repetition pattern index $x_{rrpi,1}$, $x_{rrpi,2}$ are mapped such that $x_{rrpi,1}$ corresponds to the MSB and $x_{rrpi,2}$ to the LSB. The mapping $x_{rrpi,1}, x_{rrpi,2} = "00"$ is used to indicate one subframe HS-PDSCH resources assigned for retransmissions of semi-persistent scheduling operation.

4.6C.1.3 Type flag 2 mapping

The type flag 2 $x_{flag2,1}$, $x_{flag2,2}$ are mapped such that $x_{flag2,1} = "1"$ corresponds to the MSB and $x_{flag2,2} = "0"$ to the LSB. The type flag 2 is used to distinguish HS-SCCH type 3 from other types.

4.6C.1.4 Transport block size index mapping

The transport-block size information $x_{tbs,1}$, $x_{tbs,2}$ is the unsigned binary representation of a reference to one of the four Transport-block sizes configured by higher layers. The mapping is performed according to section 4.6B.1.4.

4.6C.1.5 Timeslot information mapping

The mapping of the time slot information $x_{ts,1}$, $x_{ts,2}$, ... $x_{ts,5}$ is performed according to section 4.6.1.2.1.

4.6C.1.6 Channelisation code set information mapping

The mapping of the channelisation code set information $x_{ccs,1}$, $x_{ccs,2}$, $x_{ccs,3}$, $x_{ccs,4}$, $x_{ccs,5}$, $x_{ccs,6}$ is performed according to section 4.6B.1.6.

4.6C.1.7 Modulation scheme information mapping

The mapping of the modulation scheme information $x_{ms,1}$ is performed according to table 17 in section 4.6.1.3.

4.6C.1.8 Redundancy version information mapping

The redundancy version (RV) parameters r , s and constellation version parameter b are mapped jointly to produce the value X_{rv} . X_{rv} is alternatively represented as the sequence $x_{rv,1}$, $x_{rv,2}$ where $x_{rv,1}$ is the MSB. This is done according to the following tables according to the modulation mode used.

Table 18A: RV mapping for 16QAM and 64QAM

X_{rv} (value)	$N_{sys} / N_{data} < 1/2$			$N_{sys} / N_{data} \geq 1/2$		
	s	r	b	s	r	b
0	1	0	0	1	0	0
1	1	1	1	0	1	1
2	1	0	2	0	0	0
3	1	0	3	1	0	2

Table 19A: RV mapping for QPSK

X_{rv} (value)	$N_{sys} / N_{data} < 1/2$		$N_{sys} / N_{data} \geq 1/2$	
	s	r	s	r
0	1	0	1	0
1	1	1	0	1
2	1	2	0	3
3	1	3	1	2

4.6C.1.9 Pointer to the previous transmission mapping

Pointer to the previous transmission $x_{ptr,1}$, $x_{ptr,2}$, $x_{ptr,3}$, $x_{ptr,4}$ is the unsigned binary representation of s , such that the previous transmission of the same transport block started $(4+s)$ subframes before the start of this transmission. And $x_{ptr,1}$ corresponds to the MSB and $x_{ptr,4}$ to the LSB.

4.6C.1.10 HS-SCCH cyclic sequence number

The HS-SCCH cyclic sequence number $x_{hcsn,1}$, $x_{hcsn,2}$, $x_{hcsn,3}$ is mapped such that $x_{hcsn,1}$ corresponds to the MSB and $x_{hcsn,3}$ to the LSB.

4.6C.1.11 UE identity

The UE identity is the HS-DSCH Radio Network Identifier (H-RNTI) defined in [12]. This is mapped such that $x_{ue,1}$ corresponds to the MSB and $x_{ue,16}$ to the LSB, cf. [14].

4.6C.2 Multiplexing of HS-SCCH type 3 information

The information carried on the HS-SCCH type 3 is multiplexed onto the bits a_1, a_2, \dots, a_A according to the following rule :

$$a_1, a_2 = x_{flag,1,1}, x_{flag,1,2}$$

$$a_3, a_4 = x_{rrpi,1}, x_{rrpi,2}$$

$$a_5, a_6 = x_{flag,2,1}, x_{flag,2,2}$$

$$a_7, a_8 = x_{tbs,1}, x_{tbs,2}$$

$$a_9, a_{10} \dots a_{13} = x_{ts,1}, x_{ts,2} \dots x_{ts,5}$$

$$a_{14}, a_{15} \dots a_{19} = x_{ccs,1}, x_{ccs,2} \dots x_{ccs,6}$$

$$a_{20} = x_{ms,1}$$

$$a_{21}, a_{22} = x_{rv,1}, x_{rv,2}$$

$$a_{23}, a_{24} \dots a_{26} = x_{ptr,1}, x_{ptr,2} \dots x_{ptr,4}$$

$$a_{27}, a_{28}, a_{29} = x_{hcsn,1}, x_{hcsn,2}, x_{hcsn,3}$$

$$a_{30} = x_{res,1}$$

4.6C.3 CRC attachment for HS-SCCH type 3

The sequence of bits b_1, b_2, \dots, b_B , is calculated according to subclause 4.6.3.

4.6C.4 Channel coding for HS-SCCH type 3

Channel coding for the HS-SCCH type 3 shall be done with the general method described in 4.2.3 with the following specific parameters:

The rate 1/3 convolutional coding shall be used for HS-SCCH type 3.

4.6C.5 Rate matching for HS-SCCH type 3

Rate matching for HS-SCCH type 3 shall be done with the general method described in 4.6.5.

4.6C.6 Interleaving for HS-SCCH type 3

Interleaving for HS-SCCH type 3 shall be done with the general method described in 4.2.11.1.

4.6C.7 Physical Channel Segmentation for HS-SCCH type 3

Physical channel segmentation for HS-SCCH type 3 shall be done with the general method described in 4.2.10. The HS-SCCH consists of two physical channels HS-SCCH1 and HS-SCCH2.

4.6C.8 Physical channel mapping for HS-SCCH type 3

Physical channel mapping for the HS-SCCH type 3 shall be done with the general method described in subclause 4.2.12.

4.6D Coding/Multiplexing for HS-SCCH type 4 (1.28 Mcps TDD only)

HS-SCCH shall be of type 4 when the following two conditions are both true:

- the UE is configured in MIMO mode, and
- the variable MIMO SF mode for HS-PDSCH dual stream is SF1.

HS-SCCH type 4 is used for single stream transmission in MIMO mode. The following information is transmitted by means of the HS-SCCH type 4 physical channels.

- Type flag 1 (1 bit): $x_{flag1,1}$
- Channelisation-code-set information (6 bits): $x_{ccs,1}, x_{ccs,2}, \dots, x_{ccs,6}$
- Type flag 2 (1 bit): $x_{flag2,1}$
- Time slot information (5bits): $x_{ts,1}, x_{ts,2}, \dots, x_{ts,5}$
- Modulation scheme information (1 bit): $x_{ms,1}$
- Transport-block size information (6 bits): $x_{tbs,1}, x_{tbs,2}, \dots, x_{tbs,6}$
- Hybrid-ARQ process information (4 bits): $x_{hap,1}, x_{hap,2}, x_{hap,3}, x_{hap,4}$,
- Redundancy version information (2 bits): $x_{rv,1}, x_{rv,2}$
- HS-SCCH cyclic sequence number (3 bits): $x_{hcsn,1}, x_{hcsn,2}, x_{hcsn,3}$
- Reserved (1 bit): $x_{res,1}$
- UE identity (16 bits): $x_{ue,1}, x_{ue,2}, \dots, x_{ue,16}$

The following coding/multiplexing steps for HS-SCCH type 4 can be identified:

- multiplexing of HS-SCCH type 4 information (see subclause 4.6D.2)
- CRC attachment for HS-SCCH type 4 (see subclause 4.6D.3);
- channel coding for HS-SCCH type 4 (see subclause 4.6D.4);
- rate matching for HS-SCCH type 4 (see subclause 4.6D.5);
- interleaving for HS-SCCH type 4 (see subclause 4.6D.6);
- mapping to physical channels for HS-SCCH type 4 (see subclauses 4.6D.7 and 4.6D.8).

The general coding/multiplexing flow for HS-SCCH type 4 is shown in Figure 19C.

Figure 19C: Coding and Multiplexing for HS-SCCH type 4

4.6D.1 HS-SCCH type 4 information field mapping

4.6D.1.1 Type flag 1 mapping

The type flag 1 bit $x_{flag1,1}$ is mapped as $x_{flag1,1} = "0"$. The type flag 1 is used to distinguish HS-SCCH type 4 from other types.

4.6D.1.2 Type flag 2 mapping

The type flag 2 $x_{flag2,1}$ is mapped as $x_{flag2,1} = "1"$. The type flag 2 is used to distinguish HS-SCCH type 4 from other types.

4.6D.1.3 Channelisation code set information mapping

The mapping of the channelisation code set information $x_{ccs,1}, x_{ccs,2}, x_{ccs,3}, x_{ccs,4}, x_{ccs,5}, x_{ccs,6}$ is performed according to section 4.6B.1.6.

4.6D.1.4 Timeslot information mapping

The mapping of the time slot information $x_{ts,1}, x_{ts,2}, \dots, x_{ts,5}$ is performed according to section 4.6.1.2.1.

4.6D.1.5 Modulation scheme information mapping

The mapping of the modulation scheme information $x_{ms,1}$ is performed according to section 4.6.1.3.

4.6D.1.6 Transport block size index mapping

The transport-block size information $x_{tbs,1}, x_{tbs,2}, \dots, x_{tbs,6}$ is the unsigned binary representation of the transport block size index where $x_{tbs,1}$ is MSB. The mapping is performed according to section 4.6.1.8.

4.6D.1.7 HARQ process identifier mapping

The hybrid-ARQ process information $x_{hap,1}, x_{hap,2}, x_{hap,3}, x_{hap,4}$ is unsigned binary representation of the HARQ process identifier where $x_{hap,1}$ is MSB.

4.6D.1.8 Redundancy version information mapping

The redundancy version (RV) parameters r, s and constellation version parameter b are mapped jointly to produce the value X_{rv} . X_{rv} is alternatively represented as the sequence $x_{rv,1}, x_{rv,2}$ where $x_{rv,1}$ is the MSB. The mapping is performed according to section 4.6C.1.8. If $X_{rv} = 0$, the UE shall treat the corresponding transport block as an initial transmission.

4.6D.1.9 HS-SCCH cyclic sequence number

The HS-SCCH cyclic sequence number $x_{hcsn,1}, x_{hcsn,2}, x_{hcsn,3}$ is mapped such that $x_{hcsn,1}$ corresponds to the MSB and $x_{hcsn,3}$ to the LSB.

4.6D.1.10 UE identity

The UE identity is the HS-DSCH Radio Network Identifier (H-RNTI) defined in [12]. This is mapped such that $x_{ue,1}$ corresponds to the MSB and $x_{ue,16}$ to the LSB, cf. [14].

4.6D.2 Multiplexing of HS-SCCH type 4 information

The information carried on the HS-SCCH type 4 is multiplexed onto the bits a_1, a_2, \dots, a_A according to the following rule :

$$a_1 = x_{flag,1,1}$$

$$a_2, a_3, a_4 = x_{ccs,1}, x_{ccs,2}, x_{ccs,3}$$

$$a_5 = x_{flag,2,1}$$

$$a_6, a_7, a_8 = x_{ccs,4}, x_{ccs,5}, x_{ccs,6}$$

$$a_9, a_{10} \dots a_{13} = x_{ts,1}, x_{ts,2} \dots x_{ts,5}$$

$$a_{14} = x_{ms,1}$$

$$a_{15}, a_{16} \dots a_{20} = x_{tbs,1}, x_{tbs,2} \dots x_{tbs,6}$$

$$a_{21}, a_{22} \dots a_{24} = x_{hap,1}, x_{hap,2} \dots x_{hap,4}$$

$$a_{25}, a_{26} = x_{rv,1}, x_{rv,2}$$

$$a_{27}, a_{28}, a_{29} = x_{hcsn,1}, x_{hcsn,2}, x_{hcsn,3}$$

$$a_{30} = x_{res,1}$$

4.6D.3 CRC attachment for HS-SCCH type 4

The sequence of bits b_1, b_2, \dots, b_B , is calculated according to subclause 4.6.3.

4.6D.4 Channel coding for HS-SCCH type 4

Channel coding for the HS-SCCH type 4 shall be done with the general method described in 4.2.3 with the following specific parameters:

The rate 1/3 convolutional coding shall be used for HS-SCCH type 4.

4.6D.5 Rate matching for HS-SCCH type 4

Rate matching for HS-SCCH type 4 shall be done with the general method described in 4.6.5.

4.6D.6 Interleaving for HS-SCCH type 4

Interleaving for HS-SCCH type 4 shall be done with the general method described in 4.2.11.1.

4.6D.7 Physical Channel Segmentation for HS-SCCH type 4

Physical channel segmentation for HS-SCCH type 4 shall be done with the general method described in 4.2.10. The HS-SCCH consists of two physical channels HS-SCCH1 and HS-SCCH2.

4.6D.8 Physical channel mapping for HS-SCCH type 4

Physical channel mapping for the HS-SCCH type 4 shall be done with the general method described in subclause 4.2.12.

4.6E Coding/Multiplexing for HS-SCCH type 5 (1.28 Mcps TDD only)

HS-SCCH shall be of type 5 when the following two conditions are both true:

- the UE is configured in MIMO mode, and
- the variable MIMO SF mode for HS-PDSCH dual stream is SF1.

HS-SCCH type 5 is used for dual stream transmission in MIMO mode. The following information is transmitted by means of the HS-SCCH type 5 physical channels.

- Type flag 1 (1 bit): $x_{flag1,1}$
- Modulation scheme information for stream 2 (1 bit): $x_{ms2,1}$
- Transport-block size offset information for stream 2 (5 bits): $x_{tbs2,1}, x_{tbs2,2}, \dots, x_{tbs2,5}$
- Type flag 2 (1 bit): $x_{flag2,1}$
- Time slot information (5bits): $x_{ts,1}, x_{ts,2}, \dots, x_{ts,5}$
- Transport-block size information for stream 1 (6 bits): $x_{tbs1,1}, x_{tbs1,2}, \dots, x_{tbs1,6}$
- Modulation scheme information for stream 1 (1 bit): $x_{ms1,1}$
- Hybrid-ARQ process information (3 bits): $x_{hap,1}, x_{hap,2}, x_{hap,3}$

- Redundancy version information for stream 1 (2 bits): $x_{rv1,1}, x_{rv1,2}$
- Redundancy version information for stream 2 (2 bits): $x_{rv2,1}, x_{rv2,2}$
- HS-SCCH cyclic sequence number (3 bits): $x_{hcsn,1}, x_{hcsn,2}, x_{hcsn,3}$
- UE identity (16 bits): $x_{ue,1}, x_{ue,2}, \dots, x_{ue,16}$

The following coding/multiplexing steps for HS-SCCH type 5 can be identified:

- multiplexing of HS-SCCH type 5 information (see subclause 4.6E.2)
- CRC attachment for HS-SCCH type 5 (see subclause 4.6E.3);
- channel coding for HS-SCCH type 5 (see subclause 4.6E.4);
- rate matching for HS-SCCH type 5 (see subclause 4.6E.5);
- interleaving for HS-SCCH type 5 (see subclause 4.6E.6);
- mapping to physical channels for HS-SCCH type 5 (see subclauses 4.6E.7 and 4.6E.8).

The general coding/multiplexing flow for HS-SCCH type 5 is shown in Figure 19D.

Figure 19D: Coding and Multiplexing for HS-SCCH type 5

4.6E.1 HS-SCCH type 5 information field mapping

4.6E.1.1 Type flag 1 mapping

The type flag 1 bit $x_{flag1,1}$ is mapped as $x_{flag1,1} = "1"$. The type flag 1 is used to distinguish HS-SCCH type 5 from other types.

4.6E.1.2 Type flag 2 mapping

The type flag 2 bits $x_{flag2,1}$ is mapped as $x_{flag2,1} = "0"$. The type flag 2 is used to distinguish HS-SCCH type 5 from other types.

4.6E.1.3 Timeslot information mapping

The mapping of the time slot information $x_{ts,1}, x_{ts,2}, \dots, x_{ts,5}$ is performed according to section 4.6.1.2.1.

4.6E.1.4 Modulation scheme information mapping

The mapping of the modulation scheme information for each stream ($x_{ms1,1}$ for stream 1 or $x_{ms2,1}$ for stream 2) is performed according to section 4.6.1.3.

4.6E.1.5 Transport block size offset information mapping

The transport-block size offset information for stream 2 $x_{tbs2,1}, x_{tbs2,2}, \dots, x_{tbs2,5}$ is the unsigned binary representation of the transport block size index offset for the stream 2 where $x_{tbs2,1}$ is MSB. The transport-block size offset for the stream 2 subtracted from the transport-block size for the stream 1 gives the transport-block size for stream 2.

4.6E.1.6 Transport block size index mapping

The transport-block size information for stream 1 $x_{tbs1,1}, x_{tbs1,2}, \dots, x_{tbs1,6}$ is the unsigned binary representation of the transport block size index where $x_{tbs,1}$ is MSB. The mapping is performed according to section 4.6.1.8.

4.6E.1.7 HARQ process identifier mapping

The hybrid-ARQ process information $x_{hap,1}, x_{hap,2}, x_{hap,3}$ is unsigned binary representation of the HARQ process identifier HAP_1 for stream 1 where $x_{hap,1}$ is MSB. The HARQ process identifier for stream 2 is $HAP_1 + N_{proc} / 2$, where N_{proc} is the number of HARQ processes configured by higher layers.

4.6E.1.8 Redundancy version information mapping

The redundancy version (RV) parameters r, s and constellation version parameter b are mapped jointly to produce the value X_{rv} . X_{rv1} is alternatively represented as the sequence for stream 1 $x_{rv1,1}, x_{rv1,2}$ where $x_{rv1,1}$ is the MSB. X_{rv2} is alternatively represented as the sequence for stream 2 $x_{rv2,1}, x_{rv2,2}$ where $x_{rv2,1}$ is the MSB. The mapping of the redundancy version for each stream is performed according to section 4.6C.1.8. If $X_{rv1} = 0$ or $X_{rv2} = 0$, the UE shall treat the corresponding transport block as an initial transmission.

4.6E.1.9 HS-SCCH cyclic sequence number

The HS-SCCH cyclic sequence number $x_{hcsn,1}, x_{hcsn,2}, x_{hcsn,3}$ is mapped such that $x_{hcsn,1}$ corresponds to the MSB and $x_{hcsn,3}$ to the LSB.

4.6E.1.10 UE identity

The UE identity is the HS-DSCH Radio Network Identifier (H-RNTI) defined in [12]. This is mapped such that $x_{ue,1}$ corresponds to the MSB and $x_{ue,16}$ to the LSB, cf. [14].

4.6E.2 Multiplexing of HS-SCCH type 5 information

The information carried on the HS-SCCH type 5 is multiplexed onto the bits a_1, a_2, \dots, a_A according to the following rule :

$$a_1 = x_{flag1,1}$$

$$a_2 = x_{ms2,1}$$

$$a_3, a_4 = x_{tbs2,1}, x_{tbs2,2}$$

$$a_5 = x_{flag2,1}$$

$$a_6, a_7, a_8 = x_{tbs2,3}, x_{tbs2,4}, x_{tbs2,5}$$

$$a_9, a_{10} \dots a_{13} = x_{ts,1}, x_{ts,2} \dots x_{ts,5}$$

$$a_{14}, a_{15} \dots a_{19} = x_{tbs1,1}, x_{tbs1,2} \dots x_{tbs1,6}$$

$$a_{20} = x_{ms1,1}$$

$$a_{21}, a_{22}, a_{23} = x_{hap,1}, x_{hap,2}, x_{hap,3}$$

$$a_{24}, a_{25} = x_{rv1,1}, x_{rv1,2}$$

$$a_{26}, a_{27} = x_{rv2,1}, x_{rv2,2}$$

$$a_{28}, a_{29}, a_{30} = x_{hcsn,1}, x_{hcsn,2}, x_{hcsn,3}$$

4.6E.3 CRC attachment for HS-SCCH type 5

The sequence of bits b_1, b_2, \dots, b_B , is calculated according to subclause 4.6.3.

4.6E.4 Channel coding for HS-SCCH type 5

Channel coding for the HS-SCCH type 5 shall be done with the general method described in 4.2.3 with the following specific parameters:

The rate 1/3 convolutional coding shall be used for HS-SCCH type 5.

4.6E.5 Rate matching for HS-SCCH type 5

Rate matching for HS-SCCH type 5 shall be done with the general method described in 4.6.5.

4.6E.6 Interleaving for HS-SCCH type 5

Interleaving for HS-SCCH type 5 shall be done with the general method described in 4.2.11.1.

4.6E.7 Physical Channel Segmentation for HS-SCCH type 5

Physical channel segmentation for HS-SCCH type 5 shall be done with the general method described in 4.2.10. The HS-SCCH consists of two physical channels HS-SCCH1 and HS-SCCH2.

4.6E.8 Physical channel mapping for HS-SCCH type 5

Physical channel mapping for the HS-SCCH type 5 shall be done with the general method described in subclause 4.2.12.

4.6F Coding/Multiplexing for HS-SCCH type 6 (1.28 Mcps TDD only)

HS-SCCH shall be of type 6 when the following two conditions are both met:

- the variable HS_DSCH_SPS_STATUS is TRUE, and
- UE is configured in MIMO mode while the variable MIMO SF mode for HS-PDSCH dual stream is SF1/SF16.

HS-SCCH type 6 is used to allocate semi-persistent HS-PDSCH resources for the initial transmissions. The following information is transmitted by means of the HS-SCCH type 6 physical channels.

- Type flag (3 bits): $x_{flag,1}, x_{flag,2}, x_{flag,3}$
- Channelisation-code-set information (8 bits): $x_{ccs,1}, x_{ccs,2}, \dots, x_{ccs,8}$
- Time slot information (5bits): $x_{ts,1}, x_{ts,2}, \dots, x_{ts,5}$
- Modulation scheme information (1 bit): $x_{ms,1}$
- Resource repetition pattern index (2bits): $x_{rrpi,1}, x_{rrpi,2}$
- Transport-block size information (2 bits): $x_{tbs,1}, x_{tbs,2}$
- HS-SICH indicator (2bits): $x_{HI,1}, x_{HI,2}$
- HS-SCCH cyclic sequence number (3 bits): $x_{hcsn,1}, x_{hcsn,2}, x_{hcsn,3}$
- Reserved (8 bits): $x_{res,1}, x_{res,2}, \dots, x_{res,8}$
- UE identity (16 bits): $x_{ue,1}, x_{ue,2}, \dots, x_{ue,16}$
- Redundancy and constellation version (0 bit) : $X_{rv}=0$ (see 4.6.1.4)

For an HS-SCCH order type B,

- $x_{flag,1}, x_{flag,2}, x_{flag,3}, x_{ccs,1}, x_{ccs,2}, x_{ccs,3}, x_{ccs,4}, x_{ccs,5}, x_{ccs,6}, x_{ccs,7}, x_{ccs,8}$ are reserved
- $x_{ts,1}, x_{ts,2}, \dots, x_{ts,5}$ shall be set to "00000"
- $x_{ms,1}, x_{rrpi,1}, x_{rrpi,2}$ shall be set to $x_{odt,1}, x_{odt,2}, x_{odt,3}$
- $x_{tbs,1}, x_{tbs,2}, x_{HI,1}, x_{HI,2}, x_{hcsn,1}, x_{hcsn,2}, x_{hcsn,3}, x_{res,1}, x_{res,2}, x_{res,3}, x_{res,4}, x_{res,5}, x_{res,6}, x_{res,7}, x_{res,8}$ are reserved

where $x_{odt,1}, x_{odt,2}, x_{odt,3}$ are defined in subclause 4.6J.

The following coding/multiplexing steps for HS-SCCH type 6 can be identified:

- multiplexing of HS-SCCH type 6 information (see subclause 4.6F.2)
- CRC attachment for HS-SCCH type 6 (see subclause 4.6F.3);
- channel coding for HS-SCCH type 6 (see subclause 4.6F.4);
- rate matching for HS-SCCH type 6 (see subclause 4.6F.5);
- interleaving for HS-SCCH type 6 (see subclause 4.6F.6);
- mapping to physical channels for HS-SCCH type 6 (see subclauses 4.6F.7 and 4.6F.8).

The general coding/multiplexing flow for HS-SCCH type 6 is shown in Figure 19E.

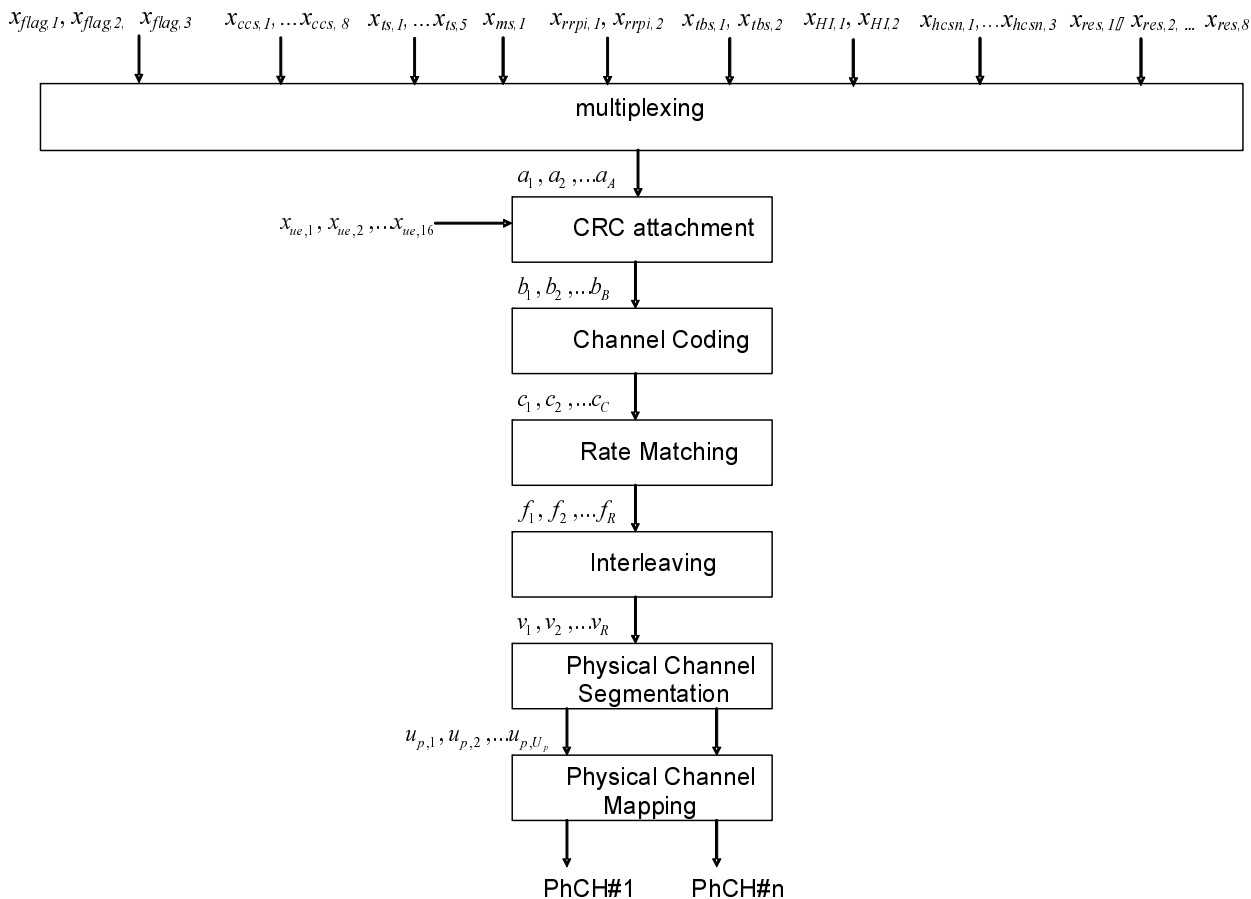

Figure 19E: Coding and Multiplexing for HS-SCCH type 6

4.6F.1 HS-SCCH type 6 information field mapping

4.6F.1.1 Type flag mapping

The type flag $x_{flag,1}$, $x_{flag,2}$, $x_{flag,3}$ are mapped such that $x_{flag,1} = "1"$ corresponds to the MSB and $x_{flag,3} = "0"$ to the LSB. The bit $x_{flag,2}$ is reserved. The type flag is used to distinguish HS-SCCH type 6 from other types.

4.6F.1.2 Channelisation code set information mapping

The mapping of the channelisation code set information $x_{ccs,1}$, $x_{ccs,2}$, $x_{ccs,3}$, $x_{ccs,4}$, $x_{ccs,5}$, $x_{ccs,6}$, $x_{ccs,7}$, $x_{ccs,8}$ is performed according to section 4.6.1.1.1.

4.6F.1.3 Timeslot information mapping

The mapping of the time slot information $x_{ts,1}$, $x_{ts,2}$, ... $x_{ts,5}$ is performed according to section 4.6.1.2.1.

4.6F.1.4 Modulation scheme information mapping

The mapping of the modulation scheme information $x_{ms,1}$ is performed according to table 17 in section 4.6.1.3.

4.6F.1.5 Resource repetition pattern index mapping

The mapping of the resource repetition pattern index $x_{rrpi,1}$, $x_{rrpi,2}$ is performed according to section 4.6B.1.2.

4.6F.1.6 Transport block size index mapping

The mapping of the transport-block size information $x_{tbs,1}$, $x_{tbs,2}$ is performed according to section 4.6B.1.4.

4.6F.1.7 HS-SICH indicator mapping

The mapping of the HS-SICH indicator $x_{HI,1}$, $x_{HI,2}$ is performed according to section 4.6B.1.9.

4.6F.1.8 HS-SCCH cyclic sequence number

The HS-SCCH cyclic sequence number $x_{hcsn,1}$, $x_{hcsn,2}$, $x_{hcsn,3}$ is mapped such that $x_{hcsn,1}$ corresponds to the MSB and $x_{hcsn,3}$ to the LSB.

4.6F.1.9 UE identity

The UE identity is the HS-DSCH Radio Network Identifier (H-RNTI) defined in [12]. This is mapped such that $x_{ue,1}$ corresponds to the MSB and $x_{ue,16}$ to the LSB, cf. [14].

4.6F.2 Multiplexing of HS-SCCH type 6 information

The information carried on the HS-SCCH type 6 is multiplexed onto the bits a_1, a_2, \dots, a_A according to the following rule :

$$a_1, a_2, a_3 = x_{flag,1}, x_{flag,2}, x_{flag,3}$$

$$a_4, a_5, \dots, a_{11} = x_{ccs,1}, x_{ccs,2}, \dots, x_{ccs,8}$$

$$a_{12}, a_{13}, \dots, a_{16} = x_{ts,1}, x_{ts,2}, \dots, x_{ts,5}$$

$$a_{17} = x_{ms,1}$$

$$a_{18}, a_{19} = x_{rrpi,1}, x_{rrpi,2}$$

$$a_{20}, a_{21} = x_{tbs,1}, x_{tbs,2}$$

$$a_{22}, a_{23} = x_{HI,1}, x_{HI,2}$$

$$a_{24}, a_{25}, a_{26} = x_{hcsn,1}, x_{hcsn,2}, x_{hcsn,3}$$

$$a_{27}, a_{28}, \dots, a_{34} = x_{res,1}, x_{res,2}, \dots, x_{res,8}$$

4.6F.3 CRC attachment for HS-SCCH type 6

The sequence of bits b_1, b_2, \dots, b_B , is calculated according to subclause 4.6.3.

4.6F.4 Channel coding for HS-SCCH type 6

Channel coding for the HS-SCCH type 6 shall be done with the general method described in 4.2.3 with the following specific parameters:

The rate 1/3 convolutional coding shall be used for HS-SCCH type 6.

4.6F.5 Rate matching for HS-SCCH type 6

Rate matching for HS-SCCH type 6 shall be done with the general method described in 4.6.5.

4.6F.6 Interleaving for HS-SCCH type 6

Interleaving for HS-SCCH type 6 shall be done with the general method described in 4.2.11.1.

4.6F.7 Physical Channel Segmentation for HS-SCCH type 6

Physical channel segmentation for HS-SCCH type 6 shall be done with the general method described in 4.2.10. The HS-SCCH consists of two physical channels HS-SCCH1 and HS-SCCH2.

4.6F.8 Physical channel mapping for HS-SCCH type 6

Physical channel mapping for the HS-SCCH type 6 shall be done with the general method described in subclause 4.2.12.

4.6G Coding/Multiplexing for HS-SCCH type 7 (1.28 Mcps TDD only)

HS-SCCH shall be of type 7 when the following two conditions are both met:

- the variable HS_DSCH_SPS_STATUS is TRUE, and
- UE is configured in MIMO mode while the variable MIMO SF mode for HS-PDSCH dual stream is SF1/SF16.

HS-SCCH type 7 is used to allocate one subframe HS-PDSCH resources for retransmissions of HS-DSCH semi-persistent scheduling operation. The following information is transmitted by means of the HS-SCCH type 7 physical channels.

- Type flag (3 bits): $x_{flag,1}, x_{flag,2}, x_{flag,3}$
- Channelisation-code-set information (8 bits): $x_{ccs,1}, x_{ccs,2}, \dots, x_{ccs,8}$
- Time slot information (5bits): $x_{ts,1}, x_{ts,2}, \dots, x_{ts,5}$
- Modulation scheme information (1 bit): $x_{ms,1}$
- Resource repetition pattern index (2bits): $x_{rrpi,1}, x_{rrpi,2}$
- Transport-block size information (2 bits): $x_{tbs,1}, x_{tbs,2}$
- Redundancy version information (2 bits): $x_{rv,1}, x_{rv,2}$
- Pointer to the previous transmission (4 bits): $x_{ptr,1}, x_{ptr,2}, x_{ptr,3}, x_{ptr,4}$
- HS-SCCH cyclic sequence number (3 bits): $x_{hcsn,1}, x_{hcsn,2}, x_{hcsn,3}$
- Reserved (4 bits): $x_{res,1}, x_{res,2}, x_{res,3}, x_{res,4}$
- UE identity (16 bits): $x_{ue,1}, x_{ue,2}, \dots, x_{ue,16}$

The following coding/multiplexing steps for HS-SCCH type 7 can be identified:

- multiplexing of HS-SCCH type 7 information (see subclause 4.6G.2)
- CRC attachment for HS-SCCH type 7 (see subclause 4.6G.3);
- channel coding for HS-SCCH type 7 (see subclause 4.6G.4);
- rate matching for HS-SCCH type 7 (see subclause 4.6G.5);

- interleaving for HS-SCCH type 7 (see subclause 4.6G.6);
- mapping to physical channels for HS-SCCH type 7 (see subclauses 4.6G.7 and 4.6G.8).

The general coding/multiplexing flow for HS-SCCH type 7 is shown in Figure 19F.

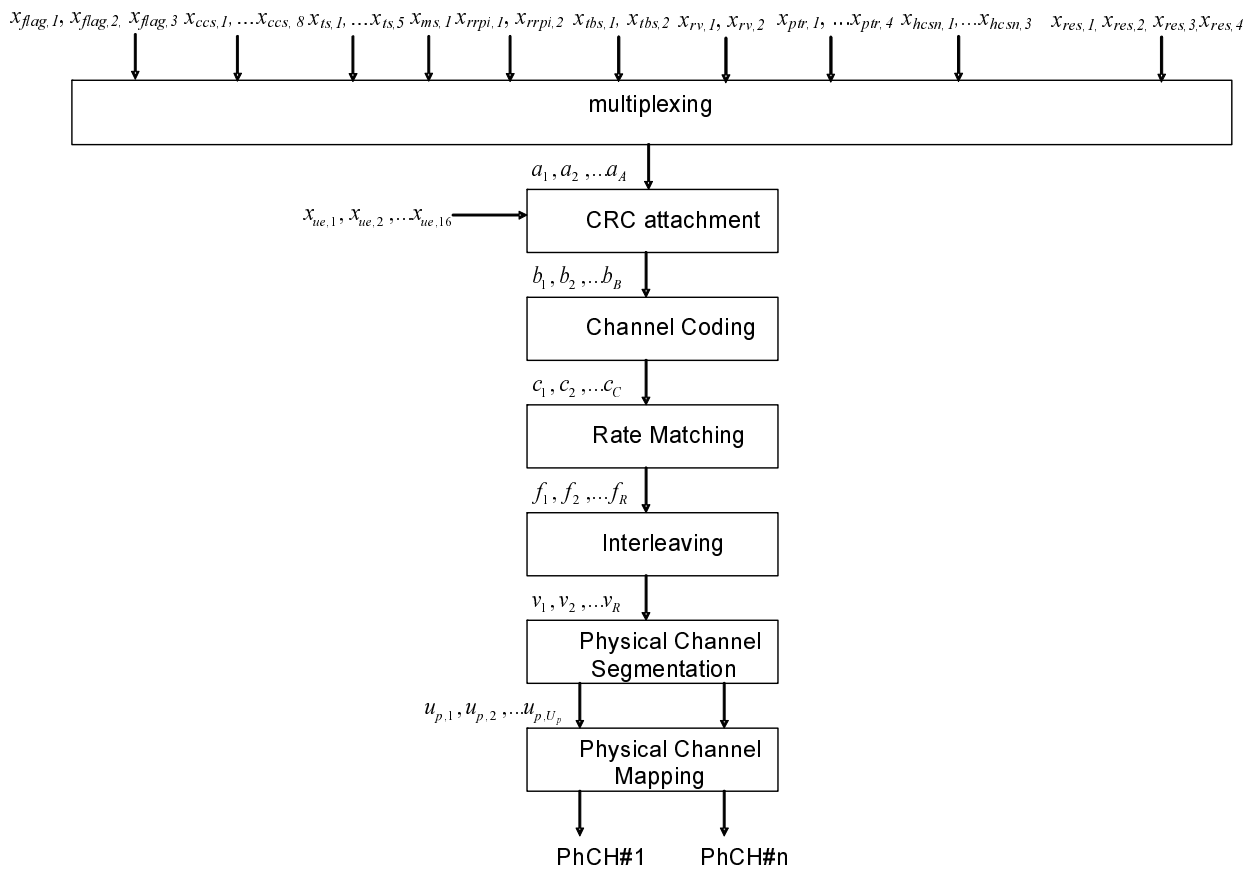

Figure 19F: Coding and Multiplexing for HS-SCCH type 7

4.6G.1 HS-SCCH type 7 information field mapping

4.6G.1.1 Type flag mapping

The type flag $x_{flag,1}$, $x_{flag,2}$, $x_{flag,3}$ are mapped such that $x_{flag,1} = "1"$ corresponds to the MSB and $x_{flag,3} = "0"$ to the LSB. The bit $x_{flag,2}$ is reserved. The type flag is used to distinguish HS-SCCH type 7 from other types.

4.6G.1.2 Channelisation code set information mapping

The mapping of the channelisation code set information $x_{ccs,1}$, $x_{ccs,2}$, $x_{ccs,3}$, $x_{ccs,4}$, $x_{ccs,5}$, $x_{ccs,6}$, $x_{ccs,7}$, $x_{ccs,8}$ is performed according to section 4.6.1.1.1.

4.6G.1.3 Timeslot information mapping

The mapping of the time slot information $x_{ts,1}$, $x_{ts,2}$, ... $x_{ts,5}$ is performed according to section 4.6.1.2.1.

4.6G.1.4 Modulation scheme information mapping

The mapping of the modulation scheme information $x_{ms,1}$ is performed according to table 17 in section 4.6.1.3.

4.6G.1.5 Resource repetition pattern index mapping

The mapping of the resource repetition pattern index bits $x_{rrpi,1}$, $x_{rrpi,2}$ is performed according to section 4.6C.1.2.

4.6G.1.6 Transport block size index mapping

The mapping of the transport-block size information $x_{tbs,1}$, $x_{tbs,2}$ is performed according to section 4.6B.1.4.

4.6G.1.7 Redundancy version information mapping

The mapping of the redundancy version $x_{rv,1}$, $x_{rv,2}$ is performed according to section 4.6C.1.8.

4.6G.1.8 Pointer to the previous transmission mapping

The mapping of the pointer to the previous transmission $x_{ptr,1}$, $x_{ptr,2}$, $x_{ptr,3}$ is performed according to section 4.6C.1.9.

4.6G.1.9 HS-SCCH cyclic sequence number

The HS-SCCH cyclic sequence number $x_{hcsn,1}$, $x_{hcsn,2}$, $x_{hcsn,3}$ is mapped such that $x_{hcsn,1}$ corresponds to the MSB and $x_{hcsn,3}$ to the LSB.

4.6G.1.10 UE identity

The UE identity is the HS-DSCH Radio Network Identifier (H-RNTI) defined in [12]. This is mapped such that $x_{ue,1}$ corresponds to the MSB and $x_{ue,16}$ to the LSB, cf. [14].

4.6G.2 Multiplexing of HS-SCCH type 7 information

The information carried on the HS-SCCH type 7 is multiplexed onto the bits a_1, a_2, \dots, a_A according to the following rule :

$$a_1, a_2, a_3 = x_{flag,1}, x_{flag,2}, x_{flag,3}$$

$$a_4, a_5 \dots a_{11} = x_{ccs,1}, x_{ccs,2} \dots x_{ccs,8}$$

$$a_{12}, a_{13} \dots a_{16} = x_{ts,1}, x_{ts,2} \dots x_{ts,5}$$

$$a_{17} = x_{ms,1}$$

$$a_{18}, a_{19} = x_{rrpi,1}, x_{rrpi,2}$$

$$a_{20}, a_{21} = x_{tbs,1}, x_{tbs,2}$$

$$a_{22}, a_{23} = x_{rv,1}, x_{rv,2}$$

$$a_{24}, a_{25} \dots a_{27} = x_{ptr,1}, x_{ptr,2} \dots x_{ptr,4}$$

$$a_{28}, a_{29}, a_{30} = x_{hcsn,1}, x_{hcsn,2}, x_{hcsn,3}$$

$$a_{31}, a_{32}, a_{33}, a_{34} = x_{res,1}, x_{res,2}, x_{res,3}, x_{res,4}$$

4.6G.3 CRC attachment for HS-SCCH type 7

The sequence of bits b_1, b_2, \dots, b_B , is calculated according to subclause 4.6.3.

4.6G.4 Channel coding for HS-SCCH type 7

Channel coding for the HS-SCCH type 7 shall be done with the general method described in 4.2.3 with the following specific parameters:

The rate 1/3 convolutional coding shall be used for HS-SCCH type 7.

4.6G.5 Rate matching for HS-SCCH type 7

Rate matching for HS-SCCH type 7 shall be done with the general method described in 4.6.5.

4.6G.6 Interleaving for HS-SCCH type 7

Interleaving for HS-SCCH type 7 shall be done with the general method described in 4.2.11.1.

4.6G.7 Physical Channel Segmentation for HS-SCCH type 7

Physical channel segmentation for HS-SCCH type 7 shall be done with the general method described in 4.2.10. The HS-SCCH consists of two physical channels HS-SCCH1 and HS-SCCH2.

4.6G.8 Physical channel mapping for HS-SCCH type 7

Physical channel mapping for the HS-SCCH type 7 shall be done with the general method described in subclause 4.2.12.

4.6H Coding/Multiplexing for HS-SCCH type 8 (1.28 Mcps TDD only)

HS-SCCH shall be of type 8 when the following conditions are true:

- the UE is configured in MIMO mode, and
- the variable MIMO SF mode for HS-PDSCH dual stream is SF1/SF16.

HS-SCCH type 8 is used for single stream transmission in MIMO mode. The following information is transmitted by means of the HS-SCCH type 8 physical channels.

- Channelisation-code-set information (4 bits): $x_{ccs,1}, x_{ccs,2}, \dots, x_{ccs,4}$
- Transport-block size information (6 bits): $x_{tbs,1}, x_{tbs,2}, \dots, x_{tbs,6}$
- Modulation scheme information (1 bit): $x_{ms,1}$
- Time slot information (5bits): $x_{ts,1}, x_{ts,2}, \dots, x_{ts,5}$
- Redundancy version information (2 bits): $x_{rv,1}, x_{rv,2}$
- Type flag 1 (6 bits): $x_{flag1,1}, x_{flag1,2}, x_{flag1,3}, x_{flag1,4}, x_{flag1,5}, x_{flag1,6}$,
- Field flag 2 (1 bit): $x_{flag2,1}$
- Special Information (2 bits): $x_{info,1}, x_{info,2}$
- Hybrid-ARQ process information (4 bits): $x_{hap,1}, x_{hap,2}, x_{hap,3}, x_{hap,4}$,
- HS-SCCH cyclic sequence number (3 bits): $x_{hcsn,1}, x_{hcsn,2}, x_{hcsn,3}$
- UE identity (16 bits): $x_{ue,1}, x_{ue,2}, \dots, x_{ue,16}$

The following coding/multiplexing steps for HS-SCCH type 8 can be identified:

- multiplexing of HS-SCCH type 8 information (see subclause 4.6H.2)

- CRC attachment for HS-SCCH type 8 (see subclause 4.6H.3);
- channel coding for HS-SCCH type 8 (see subclause 4.6H.4);
- rate matching for HS-SCCH type 8 (see subclause 4.6H.5);
- interleaving for HS-SCCH type 8 (see subclause 4.6H.6);
- mapping to physical channels for HS-SCCH type 8 (see subclauses 4.6H.7 and 4.6H.8).

The general coding/multiplexing flow for HS-SCCH type 8 is shown in Figure 19G.

Figure 19G: Coding and Multiplexing for HS-SCCH type 8

4.6H.1 HS-SCCH type 8 information field mapping

4.6H.1.1 Channelisation code set information mapping

HS-PDSCH channelisation codes are allocated contiguously from a signalled start code to a signalled stop code, and the allocation includes both the start and stop code.

If the field flag $x_{flag2,1} = "0"$, the special information $x_{info,1}$, $x_{info,2}$ are comprised of the channelisation code set extended information $x_{ccs,5}$, $x_{ccs,6}$ and $x_{info,1} = x_{ccs,5}$, $x_{info,2} = x_{ccs,6}$. The start code k_{start} is signalled by the bits $x_{ccs,1}$, $x_{ccs,2}$, $x_{ccs,5}$ and the stop code k_{stop} by the bits $x_{ccs,3}$, $x_{ccs,4}$, $x_{ccs,6}$. The mapping in Table 16Ba below applies.

If a value of $k_{start} = 5$ and $k_{stop} = 2$ is signalled, a spreading factor of SF=1 shall be used for the HS-PDSCH resources. Other than this case, $k_{start} > k_{stop}$ are not used.

The field flag $x_{flag2,1}="1"$ is reserved.

Table 16Ba: Channelisation code set information mapping

k_{start}	$x_{ccs,1}$	$x_{ccs,2}$	$x_{ccs,5}$	k_{stop}	$x_{ccs,3}$	$x_{ccs,4}$	$x_{ccs,6}$
1	0	0	0	2	0	0	0
3	0	0	1	4	0	0	1
5	0	1	0	6	0	1	0
7	0	1	1	8	0	1	1
9	1	0	0	10	1	0	0
11	1	0	1	12	1	0	1
13	1	1	0	14	1	1	0
15	1	1	1	16	1	1	1

4.6H.1.2 Transport block size index mapping

The transport-block size information $x_{tbs,1}, x_{tbs,2}, \dots, x_{tbs,6}$ is the unsigned binary representation of the transport block size index where $x_{tbs,1}$ is MSB. The mapping is performed according to section 4.6.1.8.

4.6H.1.3 Modulation scheme information mapping

The mapping of the modulation scheme information $x_{ms,1}$ is performed according to section 4.6.1.3.

4.6H.1.4 Timeslot information mapping

The mapping of the time slot information $x_{ts,1}, x_{ts,2}, \dots, x_{ts,5}$ is performed according to section 4.6.1.2.1.

4.6H.1.5 Redundancy version information mapping

The redundancy version (RV) parameters r, s and constellation version parameter b are mapped jointly to produce the value X_{rv} . X_{rv} is alternatively represented as the sequence $x_{rv,1}, x_{rv,2}$ where $x_{rv,1}$ is the MSB. The mapping is performed according to section 4.6C.1.8. If $X_{rv}=0$, the UE shall treat the corresponding transport block as an initial transmission.

4.6H.1.6 Type flag mapping

The type flag $x_{flag1,1}, x_{flag1,2}, x_{flag1,3}, x_{flag1,4}, x_{flag1,5}, x_{flag1,6}$ is mapped as "000000". The type flag is used to distinguish HS-SCCH type 8 from other types.

4.6H.1.7 Field flag mapping

The field flag is used to distinguish the mapping of special information $x_{info,1}, x_{info,2}$.

If $x_{flag2,1}="0"$, the special information $x_{info,1}, x_{info,2}$ are comprised of the channelisation code set extended information $x_{ccs,5}, x_{ccs,6}$ and $x_{info,1}=x_{ccs,5}, x_{info,2}=x_{ccs,6}$.

The field flag $x_{flag2,1}="1"$ and the special information $x_{info,1}, x_{info,2}$ are reserved.

4.6H.1.8 Special Information mapping

The special information $x_{info,1}, x_{info,2}$ is mapped such that $x_{info,1}$ corresponds to the MSB and $x_{info,2}$ to the LSB.

If $x_{flag2,1}="0"$, the special information $x_{info,1}, x_{info,2}$ are comprised of the channelisation code set extended information $x_{ccs,5}, x_{ccs,6}$ and $x_{info,1}=x_{ccs,5}, x_{info,2}=x_{ccs,6}$.

The field flag $x_{flag2,1}="1"$ and the special information $x_{info,1}, x_{info,2}$ are reserved.

4.6H.1.9 HARQ process identifier mapping

The hybrid-ARQ process information $x_{hap,1}, x_{hap,2}, x_{hap,3}, x_{hap,4}$ is unsigned binary representation of the HARQ process identifier where $x_{hap,1}$ is MSB.

4.6H.1.10 HS-SCCH cyclic sequence number

The HS-SCCH cyclic sequence number $x_{hcsn,1}$, $x_{hcsn,2}$, $x_{hcsn,3}$ is mapped such that $x_{hcsn,1}$ corresponds to the MSB and $x_{hcsn,3}$ to the LSB.

4.6H.1.11 UE identity

The UE identity is the HS-DSCH Radio Network Identifier (H-RNTI) defined in [12]. This is mapped such that $x_{ue,1}$ corresponds to the MSB and $x_{ue,16}$ to the LSB, cf. [14].

4.6H.2 Multiplexing of HS-SCCH type 8 information

The information carried on the HS-SCCH type 8 is multiplexed onto the bits a_1, a_2, \dots, a_A according to the following rule:

$$a_1, a_2, \dots, a_4 = x_{ccs,1}, x_{ccs,2}, \dots, x_{ccs,4}$$

$$a_5, a_6, \dots, a_{10} = x_{tbs,1}, x_{tbs,2}, \dots, x_{tbs,6}$$

$$a_{11} = x_{ms,1}$$

$$a_{12}, a_{13}, \dots, a_{16} = x_{ts,1}, x_{ts,2}, \dots, x_{ts,5}$$

$$a_{17}, a_{18} = x_{rv,1}, x_{rv,2}$$

$$a_{19}, a_{20}, \dots, a_{24} = x_{flag1,1}, x_{flag1,2}, \dots, x_{flag1,6}$$

$$a_{25} = x_{flag2,1}$$

$$a_{26}, a_{27} = x_{info,1}, x_{info,2}$$

$$a_{28}, a_{29}, \dots, a_{31} = x_{hap,1}, x_{hap,2}, \dots, x_{hap,4}$$

$$a_{32}, a_{33}, a_{34} = x_{hcsn,1}, x_{hcsn,2}, x_{hcsn,3}$$

4.6H.3 CRC attachment for HS-SCCH type 8

The sequence of bits b_1, b_2, \dots, b_B , is calculated according to subclause 4.6.3.

4.6H.4 Channel coding for HS-SCCH type 8

Channel coding for the HS-SCCH type 8 shall be done with the general method described in 4.2.3 with the following specific parameters:

The rate 1/3 convolutional coding shall be used for HS-SCCH type 8.

4.6H.5 Rate matching for HS-SCCH type 8

Rate matching for HS-SCCH type 8 shall be done with the general method described in 4.6.5.

4.6H.6 Interleaving for HS-SCCH type 8

Interleaving for HS-SCCH type 8 shall be done with the general method described in 4.2.11.1.

4.6H.7 Physical Channel Segmentation for HS-SCCH type 8

Physical channel segmentation for HS-SCCH type 8 shall be done with the general method described in 4.2.10. The HS-SCCH consists of two physical channels HS-SCCH1 and HS-SCCH2.

4.6H.8 Physical channel mapping for HS-SCCH type 8

Physical channel mapping for the HS-SCCH type 8 shall be done with the general method described in subclause 4.2.12.

4.6I Coding/Multiplexing for HS-SCCH type 9 (1.28 Mcps TDD only)

HS-SCCH shall be of type 9 when the following conditions are true:

- the UE is configured in MIMO mode, and
- the variable MIMO SF mode for HS-PDSCH dual stream is SF1/SF16.

HS-SCCH type 9 is used for dual stream transmission in MIMO mode. The following information is transmitted by means of the HS-SCCH type 9 physical channels.

- Channelisation-code-set information (4 bits): $x_{ccs,1}, x_{ccs,2}, \dots, x_{ccs,4}$
- Transport-block size information for stream 1 (6 bits): $x_{tbs1,1}, x_{tbs1,2}, \dots, x_{tbs1,6}$
- Modulation scheme information for stream 1 (1 bit): $x_{ms1,1}$
- Time slot information (5bits): $x_{ts,1}, x_{ts,2}, \dots, x_{ts,5}$
- Redundancy version information for stream 1 (2 bits): $x_{rv1,1}, x_{rv1,2}$
- Transport-block size information for stream 2 (6 bits): $x_{tbs2,1}, x_{tbs2,2}, \dots, x_{tbs2,6}$
- Modulation scheme information for stream 2 (1 bit): $x_{ms2,1}$
- Redundancy version information for stream 2 (2 bits): $x_{rv2,1}, x_{rv2,2}$
- Hybrid-ARQ process information (4 bits): $x_{hap,1}, x_{hap,2}, x_{hap,3}, x_{hap,4}$,
- HS-SCCH cyclic sequence number (3 bits): $x_{hcsn,1}, x_{hcsn,2}, x_{hcsn,3}$
- UE identity (16 bits): $x_{ue,1}, x_{ue,2}, \dots, x_{ue,16}$

The following coding/multiplexing steps for HS-SCCH type 9 can be identified:

- multiplexing of HS-SCCH type 9 information (see subclause 4.6I.2)
- CRC attachment for HS-SCCH type 9 (see subclause 4.6I.3);
- channel coding for HS-SCCH type 9 (see subclause 4.6I.4);
- rate matching for HS-SCCH type 9 (see subclause 4.6I.5);
- interleaving for HS-SCCH type 9 (see subclause 4.6I.6);
- mapping to physical channels for HS-SCCH type 9 (see subclauses 4.6I.7 and 4.6I.8).

The general coding/multiplexing flow for HS-SCCH type 9 is shown in Figure 19H.

Figure 19H: Coding and Multiplexing for HS-SCCH type 9

4.6I.1 HS-SCCH type 9 information field mapping

4.6I.1.1 Channelisation code set information mapping

HS-PDSCH channelisation codes are allocated contiguously from a signalled start code to a signalled stop code, and the allocation includes both the start and stop code. The start code k_{start} is signalled by the bits $x_{ccs,1}, x_{ccs,2}$ and the stop code k_{stop} by the bits $x_{ccs,3}, x_{ccs,4}$. The mapping in Table 16 C below applies.

If a value of $k_{start} = 5$ and $k_{stop} = 4$ is signalled, a spreading factor of SF=1 shall be used for the HS-PDSCH resources. Other than this case, $k_{start} > k_{stop}$ are not used.

Table 16C: Channelisation code set information mapping

k_{start}	$x_{ccs,1}$	$x_{ccs,2}$	k_{stop}	$x_{ccs,3}$	$x_{ccs,4}$
1	0	0	4	0	0
5	0	1	8	0	1
9	1	0	12	1	0
13	1	1	16	1	1

4.6l.1.2 Transport block size offset information mapping

The transport-block size information for stream 1 $x_{tbs1,1}, x_{tbs1,2}, \dots, x_{tbs1,6}$ is the unsigned binary representation of the transport block size index where $x_{tbs1,1}$ is MSB. The mapping is performed according to section 4.6.1.8.

The transport-block size information for stream 2 $x_{tbs2,1}, x_{tbs2,2}, \dots, x_{tbs2,6}$ is the unsigned binary representation of the transport block size index where $x_{tbs2,1}$ is MSB. The mapping is performed according to section 4.6.1.8.

4.6l.1.3 Modulation scheme information mapping

The mapping of the modulation scheme information for each stream ($x_{ms1,1}$ for stream 1 or $x_{ms2,1}$ for stream 2) is performed according to section 4.6.1.3.

4.6l.1.4 Timeslot information mapping

The mapping of the time slot information $x_{ts,1}, x_{ts,2}, \dots, x_{ts,5}$ is performed according to section 4.6.1.2.1.

4.6l.1.5 Redundancy version information mapping

The mapping of the redundancy version for each stream ($x_{rv1,1}, x_{rv1,2}$ for stream 1 and $x_{rv2,1}, x_{rv2,2}$ for stream 2) is performed according to section 4.6E.1.8.

4.6l.1.6 HARQ process identifier mapping

The hybrid-ARQ process information $x_{hap,1}, x_{hap,2}, x_{hap,3}, x_{hap,4}$ is unsigned binary representation of the HARQ process identifier where $x_{hap,1}$ is MSB.

For dual stream transmission, two transport blocks are transmitted on the associated HS-PDSCH(s), and the mapping relationship between the hybrid-ARQ processes and the transport blocks is such that when the HARQ-process with identifier HAP_1 is mapped to the transport block on stream 1, the HARQ-process with the identifier given by $(HAP_1 + N_{proc}/2) \bmod(N_{proc})$ shall be mapped to the transport block on stream 2, where N_{proc} is the number of HARQ processes configured by higher layers.

4.6l.1.9 HS-SCCH cyclic sequence number

The HS-SCCH cyclic sequence number $x_{hcsn,1}, x_{hcsn,2}, x_{hcsn,3}$ is mapped such that $x_{hcsn,1}$ corresponds to the MSB and $x_{hcsn,3}$ to the LSB.

4.6l.1.10 UE identity

The UE identity is the HS-DSCH Radio Network Identifier (H-RNTI) defined in [12]. This is mapped such that $x_{ue,1}$ corresponds to the MSB and $x_{ue,16}$ to the LSB, cf. [14].

4.6l.2 Multiplexing of HS-SCCH type 9 information

The information carried on the HS-SCCH type 9 is multiplexed onto the bits a_1, a_2, \dots, a_A according to the following rule :

$$a_1, a_2, \dots, a_4 = x_{ccs,1}, x_{ccs,2}, \dots, x_{ccs,4}$$

$$a_5, a_6, \dots, a_{10} = x_{tbs1,1}, x_{tbs1,2}, \dots, x_{tbs1,6}$$

$$a_{11} = x_{ms1,1}$$

$$a_{12}, a_{13}, \dots, a_{16} = x_{ts,1}, x_{ts,2}, \dots, x_{ts,5}$$

$$a_{17}, a_{18} = x_{rv1,1}, x_{rv1,2}$$

$$a_{19}, a_{20}, \dots, a_{24} = x_{tbs2,1}, x_{tbs2,2}, \dots, x_{tbs2,6}$$

$$a_{25} = x_{ms2,1}$$

$$a_{26}, a_{27} = x_{rv2,1}, x_{rv2,2}$$

$$a_{28}, a_{29} \dots a_{31} = x_{hap,1}, x_{hap,2} \dots x_{hap,4}$$

$$a_{32}, a_{33}, a_{34} = x_{hcsn,1}, x_{hcsn,2}, x_{hcsn,3}$$

4.6I.3 CRC attachment for HS-SCCH type 9

The sequence of bits b_1, b_2, \dots, b_B , is calculated according to subclause 4.6.3.

4.6I.4 Channel coding for HS-SCCH type 9

Channel coding for the HS-SCCH type 9 shall be done with the general method described in 4.2.3 with the following specific parameters:

The rate 1/3 convolutional coding shall be used for HS-SCCH type 9.

4.6I.5 Rate matching for HS-SCCH type 9

Rate matching for HS-SCCH type 9 shall be done with the general method described in 4.6.5.

4.6I.6 Interleaving for HS-SCCH type 9

Interleaving for HS-SCCH type 9 shall be done with the general method described in 4.2.11.1.

4.6I.7 Physical Channel Segmentation for HS-SCCH type 9

Physical channel segmentation for HS-SCCH type 9 shall be done with the general method described in 4.2.10. The HS-SCCH consists of two physical channels HS-SCCH1 and HS-SCCH2.

4.6I.8 Physical channel mapping for HS-SCCH type 9

Physical channel mapping for the HS-SCCH type 9 shall be done with the general method described in subclause 4.2.12.

4.6J Coding/Multiplexing for HS-SCCH orders type B (1.28Mcps TDD only)

HS-SCCH orders type B are commands sent to the UE using HS-SCCH. No HS-PDSCH is associated with HS-SCCH orders.

HS-SCCH order type B may be used when any of the following two conditions is met:

- CONTROL_CHANNEL_DRX_STATUS is TRUE and UE is configured in MIMO mode while the variable MIMO SF mode for HS-PDSCH dual stream is SF1/SF16;
- The variable HS_DSCH_SPS_STATUS is TRUE, and UE is configured in MIMO mode while the variable MIMO SF mode for HS-PDSCH dual stream is SF1/SF16.

The following information is transmitted by means of the HS-SCCH order type B physical channel.

- Order type (3 bits): $x_{odt,1}, x_{odt,2}, x_{odt,3}$
- UE identity (16 bits): $x_{ue,1}, x_{ue,2}, \dots, x_{ue,16}$

The coding for HS-SCCH orders type B is specified in subclause 4.6F.

4.6J.1 HS-SCCH orders type B information field mapping

4.6J.1.1 Order type mapping

If $x_{odt,1}, x_{odt,2}, x_{odt,3} = "001"$, then the HS-SCCH order is an order to release the allocated semi-persistent HS-PDSCH resources when UE is in CELL_DCH state.

If $x_{odt,1}, x_{odt,2}, x_{odt,3} = "010"$, then the HS-SCCH order is DRX Activation order when UE is in CELL_DCH state.

If $x_{odt,1}, x_{odt,2}, x_{odt,3} = "011"$, then the HS-SCCH order is DRX De-activation order when UE is in CELL_DCH state.

4.6J.1.2 UE identity mapping

The UE identity is the HS-DSCH Radio Network Identifier (H-RNTI) defined in [12]. This is mapped such that $x_{ue,1}$ corresponds to the MSB and $x_{ue,16}$ to the LSB, cf. [14].

4.7 Coding for HS-SICH

The following information, provided by higher layers, is transmitted by means of the HS-SICH physical channel.

For 1.28 Mcps TDD, HS-SICH type 1 is not used for dual stream transmission when UE is configured in MIMO mode.

In this section, the terms 'HS-SICH' and 'HS-SICH type 1' are used interchangeably.

For 1.28 Mcps TDD, in the case of multi-frequency HS-DSCH transmission in one TTI, HS-PDSCH on each frequency shall be configured with associated HS-SICH(s) which is coded as following.

- Recommended Modulation Format (RMF) (1 bit): $x_{rmf,1}$
- Recommended Transport-block size (RTBS) (n bits where n = 6 for 1.28 Mcps TDD and n = 9 for 3.84 Mcps TDD and 7.68 Mcps TDD): $x_{tbs,1}, x_{tbs,2}, \dots, x_{tbs,n}$
- Hybrid-ARQ information ACK/NACK (1 bit): $x_{an,1}$

The following coding/multiplexing steps can be identified:

- separate coding of RMF, RTBS and ACK/NACK (see subclause 4.7.2);
- multiplexing of HS-SICH information (see subclause 4.7.3);
- interleaving for HS-SICH (see subclause 4.7.4);
- mapping to physical channels (see subclause 4.7.5).

The general coding/multiplexing flow is shown in the figure 20.

Figure 20: Coding and multiplexing for HS-SICH

4.7.1 HS-SICH information field mapping

4.7.1.1 RMF information mapping

The RMF information bit, $x_{rmf,1}$, shall be mapped according to the mapping specified in subclause 4.6.1.3.

4.7.1.2 RTBS information mapping

The RTBS information bits, $x_{tbs,1}, x_{tbs,2}, \dots, x_{tbs,n}$, shall be mapped according to the same mapping as is used for the transport block size information bits in subclause 4.6. This mapping is defined by higher layers [12].

4.7.1.3 ACK/NACK information mapping

The ACK/NACK information bit $x_{an,1}$ shall be mapped according to the mapping given in Table 20 below.

Table 20: ACK/NACK information mapping

ACK/NACK	$x_{an,1}$
ACK	1
NACK	0

4.7.2 Coding for HS-SICH

4.7.2.1 Field Coding of ACK/NACK

The ACK/NACK bit $x_{an,l}$ shall be repetition coded to 36 bits. The coded bits are defined as $c_1 \dots c_{36}$.

4.7.2.2 Field Coding of CQI

4.7.2.2.1 Field Coding of CQI for 1.28 Mcps TDD

The quality information consists of Recommended Transport Block Size (RTBS) and Recommended Modulation Format (RMF) fields. The 6 bits of the RTBS field are coded to 32 bits using a (32, 6) 1st order Reed-Muller code. The coding procedure is as shown in figure 21.

Figure 21: Field coding of RTBS information bits

The coding uses a subset basis sequences as the TFCI coder as described in subclause 4.3.1.1. The basis sequences that are used for RTBS coding are as follows in table 21.

Table 21: Basis sequences for (32,6) RTBS code

i	M _{i,0}	M _{i,1}	M _{i,2}	M _{i,3}	M _{i,4}	M _{i,5}
0	1	0	0	0	0	1
1	0	1	0	0	0	1
2	1	1	0	0	0	1
3	0	0	1	0	0	1
4	1	0	1	0	0	1
5	0	1	1	0	0	1
6	1	1	1	0	0	1
7	0	0	0	1	0	1
8	1	0	0	1	0	1
9	0	1	0	1	0	1
10	1	1	0	1	0	1
11	0	0	1	1	0	1
12	1	0	1	1	0	1
13	0	1	1	1	0	1
14	1	1	1	1	0	1
15	1	0	0	0	1	1
16	0	1	0	0	1	1
17	1	1	0	0	1	1
18	0	0	1	0	1	1
19	1	0	1	0	1	1
20	0	1	1	0	1	1
21	1	1	1	0	1	1
22	0	0	0	1	1	1
23	1	0	0	1	1	1
24	0	1	0	1	1	1
25	1	1	0	1	1	1
26	0	0	1	1	1	1
27	1	0	1	1	1	1
28	0	1	1	1	1	1
29	1	1	1	1	1	1
30	0	0	0	0	0	1
31	0	0	0	0	1	1

The output RTBS code word bits $\{z_i : i = 1, \dots, 32\}$ are given by:

$$z_i = \left(\sum_{n=1}^6 x_{tbs,n} \cdot M_{i-1,n-1} \right) \bmod 2$$

The RMF bit $x_{rmf,1}$ is repetition coded to 16 bits to produce the bits $z_{33}, z_{34}, \dots, z_{n_{CQI}}$ where $n_{CQI} = 48$.

4.7.2.2.2 Field Coding of CQI for 3.84 Mcps TDD and 7.68 Mcps TDD

RTBS and RMF bits are multiplexed onto the bits $y_1, y_2 \dots y_{10}$ according to the following rule :

$$y_1 = x_{rmf,1}$$

$$y_2, y_3 \dots y_{10} = x_{tbs,1}, x_{tbs,2} \dots x_{tbs,9}$$

The bits $y_1, y_2 \dots y_{10}$ are coded to produce the bits w_1, w_2, \dots, w_{32} using a (32,10) sub-code of the second order Reed-Muller code as defined in subclause 4.3.1.1..

The bits w_1, w_2, \dots, w_{32} are used to produce the CQI bits $z_1, z_2 \dots z_{n_{CQI}}$ using a (4,1) repetition code, where $n_{CQI} = 128$, such that:

$$z_n, z_{n+32}, z_{n+64}, z_{n+96} = w_n \quad n=1 \dots 32$$

4.7.3 Multiplexing of HS-SICH information fields

The CQI bits $z_1, z_2 \dots z_{n_{CQI}}$ are multiplexed with the repetition coded ACK/NACK bits $c_1 \dots c_{36}$ to produce the bits $d_1, d_2 \dots d_U$ where U is the number of physical channel bits carried by HS-SICH, according to the following rule.:

$$d_1, d_2 \dots d_{n_{CQI}} = z_1, z_2 \dots z_{n_{CQI}}$$

$$d_{n_{CQI}+1}, d_{n_{CQI}+2} \dots d_{n_{CQI}+36} = c_1, c_2 \dots c_{36}$$

$$d_{n_{CQI}+37}, d_{n_{CQI}+38} \dots d_U = 0, 0 \dots 0$$

4.7.4 Interleaver for HS-SICH

Interleaver for HS-SICH shall be done with the general method described in 4.2.11.1.

4.7.5 Physical channel mapping for HS-SICH

Physical channel mapping for HS-SICH shall be done with the general method described in 4.2.12.

4.7A Coding for HS-SICH type 2 (1.28 Mcps TDD only)

HS-SICH type 2 is used for dual stream transmission when UE is configured in MIMO mode.

The following information, provided by higher layers, is transmitted by means of the HS-SICH type 2 physical channels.

- Recommended Modulation Format (RMF) for stream 1 (1 bit): $x_{rmf1,1}$
- Recommended Modulation Format (RMF) for stream 2 (1 bit): $x_{rmf2,1}$
- Recommended Transport-block size (RTBS) for stream 1 (n=6 bits): $x_{tbs1,1}, x_{tbs1,2}, \dots, x_{tbs1,n}$
- Recommended Transport-block size (RTBS) for stream 2 (n=6 bits): $x_{tbs2,1}, x_{tbs2,2}, \dots, x_{tbs2,n}$
- Hybrid-ARQ information ACK/NACK for stream 1 (1 bit): $x_{an1,1}$
- Hybrid-ARQ information ACK/NACK for stream 2 (1 bit): $x_{an2,1}$

The following coding/multiplexing steps can be identified:

- separate coding of RMF, RTBS and ACK/NACK (see subclause 4.7A.2);
- multiplexing of HS-SICH information (see subclause 4.7A.3);
- interleaving for HS-SICH (see subclause 4.7A.4);
- mapping to physical channels (see subclause 4.7A.5).

The general coding/multiplexing flow for HS-SICH type 2 is shown in the figure 20A.

Figure 20A: Coding and multiplexing for HS-SICH type 2

4.7A.1 HS-SICH type 2 information field mapping

4.7A.1.1 RMF information mapping

The RMF information bit for each stream, $x_{rmf1,1}$ for stream 1 or $x_{rmf2,1}$ for stream 2, shall be mapped according to the mapping given in subclause 4.7.1.1 respectively.

4.7A.1.2 RTBS information mapping

The RTBS information bits for each stream, $x_{tbs1,1}, x_{tbs1,2}, \dots, x_{tbs1,n}$ for stream 1 or $x_{tbs2,1}, x_{tbs2,2}, \dots, x_{tbs2,n}$ for stream 2, shall be mapped according to the mapping given in subclause 4.7.1.2 respectively.

4.7A.1.3 ACK/NACK information mapping

The ACK/NACK information bit for each stream, $x_{an1,1}$ for stream 1 or $x_{an2,1}$ for stream 2, shall be mapped according to the mapping given in subclause 4.7.1.3 respectively.

4.7A.2 Coding for HS-SICH type 2

4.7A.2.1 Field Coding of ACK/NACK

The ACK/NACK bit for stream 1, $x_{an1,1}$, shall be repetition coded to 36 bits. The coded bits are defined as $c_{1,1} \dots c_{1,36}$.

The ACK/NACK bit for stream 2, $x_{an2,1}$, shall be repetition coded to 36 bits. The coded bits are defined as $c_{2,1} \dots c_{2,36}$.

4.7A.2.2 Field Coding of CQI

The quality information for each stream consists of Recommended Transport Block Size (RTBS) and Recommended Modulation Format (RMF) fields. The 6 bits of the RTBS field for each stream are coded to 32 bits using a (32, 6) 1st order Reed-Muller code respectively. The coding procedure for each stream is performed according to section 4.7.2.2 shown in figure 21A and figure 21B.

Figure 21A: Field coding of RTBS information bits for stream 1

Figure 21B: Field coding of RTBS information bits for stream 2

The RMF bit for stream 1, $x_{rmf1,1}$, is repetition coded to 16 bits to produce the bits $z_{1,33}, z_{1,34}, \dots, z_{1,n_{CQI}}$ where $n_{CQI} = 48$.

The RMF bit for stream 2, $x_{rmf2,1}$, is repetition coded to 16 bits to produce the bits $z_{2,33}, z_{2,34}, \dots, z_{2,n_{CQI}}$ where $n_{CQI} = 48$.

4.7A.3 Multiplexing of HS-SICH type 2 information fields

The CQI bits for each stream, $z_{1,1}, z_{1,2} \dots z_{1,n_{CQI}}$ or $z_{2,1}, z_{2,2} \dots z_{2,n_{CQI}}$, are multiplexed with the repetition coded ACK/NACK bits for each stream, $c_{1,1} \dots c_{1,36}$ or $c_{2,1} \dots c_{2,36}$, to produce the bits $d_1, d_2 \dots d_U$ where U is the number of physical channel bits carried by HS-SICH, according to the following rule:

$$d_1, d_2 \dots d_{n_{CQI}} = z_{1,1}, z_{1,2} \dots z_{1,n_{CQI}}$$

$$d_{n_{CQI}+1}, d_{n_{CQI}+2} \dots d_{n_{CQI}+36} = c_{1,1}, c_{1,2} \dots c_{1,36}$$

$$d_{n_{CQI}+37}, d_{n_{CQI}+38} \dots d_{2*n_{CQI}+36} = z_{2,1}, z_{2,2} \dots z_{2,n_{CQI}}$$

$$d_{2*n_{CQI}+37}, d_{2*n_{CQI}+38} \dots d_{2*n_{CQI}+72} = c_{2,1}, c_{2,2} \dots c_{2,36}$$

$$d_{2^{*n_{CQI}+73}}, d_{2^{*n_{CQI}+74}} \dots d_U = 0, 0, \dots, 0$$

4.7A.4 Interleaver for HS-SICH type 2

Interleaver for HS-SICH shall be done with the general method described in 4.2.11.1.

4.7A.5 Physical channel mapping for HS-SICH type 2

Physical channel mapping for HS-SICH shall be done with the general method described in 4.2.12.

4.8 Coding for E-DCH

Figure 22 shows the processing structure for the E-DCH transport channel mapped onto a separate CCH. Data arrives to the coding unit in form of a maximum of one transport block once every transmission time interval (TTI). A 10ms TTI is used for E-DCH for 3.84Mcps and 7.68Mcps TDD whilst for 1.28Mcps TDD, a TTI of 5ms will be used. The following coding steps for E-DCH can be identified:

- add CRC to each transport block (see subclause 4.8.1);
- code block segmentation (see subclause 4.8.2);
- channel coding (see subclause 4.8.3);
- hybrid ARQ (see subclause 4.8.4);
- bit scrambling (see subclause 4.8.5);
- interleaving for E-DCH (see subclause 4.8.6);
- constellation re-arrangement for 16QAM (see subclause 4.8.7);
- mapping to physical channels (see subclause 4.8.8).

Figure 22. Coding chain for E-DCH

In the following the number of transport blocks is always one. When referencing non E-DCH formulae which are used in correspondence with E-DCH formulae the convention is used that transport block subscripts may be omitted (e.g. X_i when i is always 1 may be written X).

4.8.1 CRC attachment for E-DCH

CRC attachment for the E-DCH transport channel shall be performed according to the general method described in 4.2.1 above with the following specific parameters.

The CRC length shall always be $L_c=24$ bits.

4.8.2 Code block segmentation for E-DCH

Code block segmentation for the E-DCH transport channel shall be performed according to the general method described in 4.2.2.2 with the following specific parameters.

There is a maximum of one transport block. The bits $b_{im1}, b_{im2}, b_{im3}, \dots, b_{imB_i}$ input to the block are mapped to the bits $x_{i1}, x_{i2}, x_{i3}, \dots, x_{iX_i}$ directly. It follows that $X_i = B_i$. Note that the bits x referenced here refer only to the internals of the code block segmentation function. The output bits from the code block segmentation function are $o_{ir1}, o_{ir2}, o_{ir3}, \dots, o_{irK}$.

The value of $Z = 5114$ for turbo coding shall be used.

4.8.3 Channel coding for E-DCH

Channel coding for the E-DCH transport channel shall be performed according to the general method described in section 4.2.3 above with the following specific parameters.

There is a maximum of one transport block, $i=1$. The rate 1/3 turbo coding shall be used.

4.8.4 Physical layer HARQ functionality and rate matching for E-DCH

The hybrid ARQ functionality matches the number of bits at the output of the channel coder to the total number of bits of the E-PUCH set to which the E-DCH transport channel is mapped. The hybrid ARQ functionality is controlled by the redundancy version (RV) parameters.

Figure 23: E-DCH hybrid ARQ functionality

4.8.4.1 Determination of SF, modulation and number of physical channels

The SF, modulation type and number of E-PUCHs in the E-PUCH set is determined by higher layers (see [15]). These correspond to a value of $N_{e,data,j}$.

4.8.4.2 HARQ bit separation

The HARQ bit separation function shall be performed in the same way as bit separation for turbo encoded TrCHs with puncturing in 4.2.7.2.1 above.

4.8.4.3 HARQ Rate Matching Stage

The hybrid ARQ rate matching for the E-DCH transport channel shall be done with the general method described in 4.2.7.3 with the following specific parameters.

The parameters of the rate matching stage depend on the value of the RV parameters s and r . The s and r combinations corresponding to each RV allowed for the E-DCH are listed in table 22 below.

Table 22: RV for E-DCH

E-DCH RV Index	<i>s</i>	<i>r</i>
0	1	0
1	0	0
2	1	1
3	0	1

The parameter e_{plus} , e_{minus} and e_{ini} are calculated with the general method described in 4.5.4.3 above. The following parameters are used as input:

$$N_{sys} = N_{p1} = N_{p2} = N_{e,j}/3$$

$$N_{data} = N_{e,data,j}$$

$$r_{max} = 2 \text{ (for both QPSK and 16-QAM)}$$

4.8.4.4 HARQ bit collection

HARQ bit collection for E-DCH shall be performed according to the general method described for HS-DSCH in subclause 4.5.4.4.

4.8.5 Bit scrambling

The bit scrambling for E-DCH shall be performed in accordance with the general method described in subclause 4.2.9.

4.8.6 Interleaving for E-DCH

Interleaving for E-DCH shall be performed in accordance with the general method described for HS-DSCH in subclause 4.5.6.

4.8.7 Constellation re-arrangement for 16 QAM

Constellation rearrangement shall be performed in the case of 16-QAM in accordance with the general method described for HS-DSCH in subclause 4.5.7. For QPSK this function is transparent.

For 3.84Mcps and 7.68Mcps, the constellation version parameter b is associated with the E-DCH RV index as shown in table 23 below.

Table 23: Mapping of RV to constellation rearrangement parameter b for E-DCH (3.84Mcps and 7.68Mcps options)

E-DCH RV Index	b
0	0
1	1
2	2
3	3

For 1.28Mcps option, the constellation version parameter b is associated with the retransmission sequence number (RSN). The mapping between RSN and b parameters for constellation re-arrangement is listed in table 25A in subclause 4.9.2.1.2.

4.8.8 Physical channel mapping for E-DCH

The E-PUCH is defined in [7]. The bits input to the physical channel mapping are denoted by r_1, r_2, \dots, r_R , where $R = N_{e,data,j}$ and is the number of physical channel data bits to be transmitted in the current TTI. These bits are mapped to the physical channel bits, $\{w_{t,k} : t = 1, 2, \dots, T; \text{ and } k = 1, 2, \dots, U_t\}$, where t is the timeslot index, T is the number of timeslots in the allocation message, k is the physical channel bit index and U_t is the number of bits in the E-PUCH physical channel in timeslot t . The timeslot index, t , increases with increasing timeslot number and the physical channel bit index, k , increases with increasing physical channel bit position in time.

The bits r_1, r_2, \dots, r_R shall be mapped to the physical channel bits $w_{t,k}$ according to the following rule :

$$w_{1,k} = r_k \quad \text{for } k = 1, 2, \dots, U_1$$

$$w_{2,k} = r_{k+U_1} \quad \text{for } k = 1, 2, \dots, U_2$$

...

$$w_{T,k} = r_{k + \sum_{i=1}^{T-1} U_i} \quad \text{for } k = 1, 2, \dots, U_T$$

4.9 Coding for E-UCCH

4.9.1 Coding for E-UCCH for the 3.84Mcps and 7.68Mcps TDD options

E-UCCH is coded in two parts, E-UCCH part 1 and E-UCCH part 2. Both parts of the E-UCCH are transmitted on the E-PUCH (see [7]).

The following information is transmitted by means of E-UCCH part 1:

- E-TFCI information: $x_{tfc1,1}, x_{tfc1,2}, \dots, x_{tfc1,7}$

The following information is transmitted by means of E-UCCH part 2:

- Retransmission sequence number (RSN): $x_{rsn,1}, x_{rsn,2}$
- HARQ process ID (HARQ_ID): $x_{harq,1}, x_{harq,2}$

4.9.1.1 Overview

Figure 24 below illustrates the overall coding chain for E-UCCH.

Figure 24: Coding chain for E-UCCH parts 1 and 2

4.9.1.2 E-UCCH part 1

4.9.1.2.1 Information field mapping of E-TFCI

The E-TFCI is mapped such that $x_{tfc,i,1}$ corresponds to the MSB.

4.9.1.2.2 Channel coding for E-UCCH part 1

The E-TFCI bits $x_{tfc,i,1}, x_{tfc,i,2}, \dots, x_{tfc,i,7}$ are zero-padded and coded to produce the bits y_0, y_1, \dots, y_{31} using a (32,10) sub-code of the second order Reed-Muller code as defined in subclause 4.3.1.1. Bits $x_{tfc,i,1}, x_{tfc,i,2}, \dots, x_{tfc,i,7}$ correspond to bits a_6, a_5, \dots, a_0 of subclause 4.3.1.1, and bits a_9, a_8, a_7 of subclause 4.3.1.1 are set to zero.

4.9.1.2.3 Physical channel mapping for E-UCCH part 1

E-UCCH part 1 is described in [7]. The sequence of bits y_0, y_1, \dots, y_{31} output from the E-UCCH part 1 channel coding is mapped to the E-UCCH part 1 indicator field of each E-PUCH of the E-DCH TTI configured to carry E-UCCH. The bits $y_i \{i=0,1,\dots,31\}$ are mapped in an identical manner to that described for TFCI in subclause 4.3.1.3 such that they are transmitted over the air in ascending order with respect to i .

4.9.1.3 E-UCCH part 2

4.9.1.3.1 Information field mapping of retransmission sequence number

To indicate the redundancy version (RV) of each HARQ transmission and to assist the Node B soft buffer management a two bit retransmission sequence number (RSN) is signalled from the UE to the Node B. The Node B can avoid soft buffer corruption by flushing the soft buffer associated to one HARQ process in case the last received RSN for that HARQ process is incompatible with the current one.

The RSN is set by higher layers as described in [15]. For a given HARQ process, once the maximum RSN value of 3 is reached, the RSN alternates between the values of 2 and 3 for any further retransmissions. The RSN thus follows the pattern 0,1,2,3,2,3,2,3,2,3,.... The RSN is transmitted by the physical layer in E-UCCH part 2.

The bits ($x_{rsn,1}, x_{rsn,2}$) of the RSN field of E-UCCH part 2 are mapped such that $x_{rsn,1}$ corresponds to the MSB of the RSN and $x_{rsn,2}$ corresponds to the LSB of the RSN.

The applied E-DCH RV index specifying the used RV (s and r parameter) and in the case of 16-QAM, also the used constellation rearrangement parameter (b) both depend only on the values of RSN, and on $N_{sys} / N_{e,data,j}$ as shown in table 25 below.

Table 25: Relation between RSN value and E-DCH RV Index

RSN Value	$N_{sys} / N_{e,data,j} < 1/2$	$1/2 \leq N_{sys} / N_{e,data,j}$
	E-DCH RV Index	E-DCH RV Index
0	0	0
1	2	3
2	0	2
3	2	1

The UE shall use either:

- an RV index as indicated in Table 25 and according to the value of RSN
- or, if signalled by higher layers only E-DCH RV index 0 independently of the value of RSN.

4.9.1.3.2 Information field mapping of HARQ process ID

The HARQ process ID bits ($x_{harq,1}, x_{harq,2}$) transmitted on E-UCCH part 2 correspond to the two LSBs of the 3-bit HARQ ID indicated by higher layers (the MSB of the higher layer HARQ ID is not transmitted). Thus, with the higher layer HARQ ID represented as h_1, h_2, h_3 (with h_1 as the MSB), bits $x_{harq,1}, x_{harq,2}$ correspond to bits h_2, h_3 .

4.9.1.3.3 Multiplexing of E-UCCH part 2 information

The retransmission sequence number information ($x_{rsn,1}$, $x_{rsn,2}$) and the HARQ process ID information ($x_{harq,1}$, $x_{harq,2}$) are multiplexed together to give a sequence of bits x_1 , x_2 , ..., x_4 where:

$$x_k = x_{rsn,k} \quad k=1,2$$

$$x_k = x_{harq,k-2} \quad k=3,4$$

4.9.1.3.4 Channel coding for E-UCCH part 2

The bits x_1, x_2, \dots, x_4 are zero-padded and coded to produce the bits z_0, z_1, \dots, z_{31} using a (32,10) sub-code of the second order Reed-Muller code as defined in subclause 4.3.1.1. Bits x_1, x_2, \dots, x_4 correspond to bits a_3, a_2, \dots, a_0 of subclause 4.3.1.1, and bits a_9, a_8, \dots, a_4 of subclause 4.3.1.1 are set to zero.

4.9.1.3.5 Physical channel mapping for E-UCCH part 2

E-UCCH part 2 is described in [7]. The sequence of bits z_0, z_1, \dots, z_{31} output from the E-UCCH part 2 channel coding is mapped to the E-UCCH part 2 indicator field of each E-PUCH of the E-DCH TTI configured to carry E-UCCH. The bits $z_i \{i=0,1,\dots,31\}$ are mapped such that they are transmitted over the air in ascending order with respect to i .

4.9.2 Coding for E-UCCH for the 1.28Mcps TDD option

The E-UCCH is used to convey the following information:

- The modulation type of the selected E-TFC – 0 bits (see note 1)
- The transport block size of the selected E-TFC – 6 bits
- The retransmission sequence number (RSN) – 2 bits
- The HARQ process ID – 2 bits

Note 1: The occupied modulation type is not explicitly signaled, which is inferred from the transport block size.

The E-UCCH is transmitted on the E-PUCH and is coded using a (32, 10) sub code of the second order Reed Muller code as defined in subclause 4.3.1.1

Figure 24A below illustrates the overall coding chain for E-UCCH.

Figure 24A: Coding chain for E-UCCH

4.9.2.1 E-UCCH information field mapping

4.9.2.1.1 Information field mapping of E-TFCI

The E-TFCI is mapped such that $x_{tfc1,1}$ corresponds to the MSB.

4.9.2.1.2 RSN information mapping

To indicate the redundancy version (RV) of each HARQ transmission and to assist the Node B soft buffer management a two bit retransmission sequence number (RSN) is signalled from the UE to the Node B. The Node B can avoid soft buffer corruption by flushing the soft buffer associated to one HARQ process in case the last received RSN for that HARQ process is incompatible with the current one.

The RSN is set by higher layers as described in [15]. For a given HARQ process, once the maximum RSN value of 3 is reached, the RSN alternates between the values of 2 and 3 for any further retransmissions. The RSN thus follows the pattern 0,1,2,3,2,3,2,3,2,3,...

The bits ($x_{rsn,1}$, $x_{rsn,2}$) of the RSN field are mapped such that $x_{rsn,1}$ corresponds to the MSB of the RSN and $x_{rsn,2}$ corresponds to the LSB of the RSN.

The used RV is implicitly linked to the transmitted RSN, as such the Node-B is always able to determine the correct RV if the RSN information is correctly obtained.

The constellation rearrangement parameter linkage with RSN is shown in Table 25A below

Table 25A: mapping between RSN and b parameters for CoRe

RSN	$N_{sys} / N_{e,data,j} < 1/2$	$1/2 \leq N_{sys} / N_{e,data,j}$
	b	b
0	0	0
1	2	3
2	3	0
3	1	1

In addition to being associated with the value of RSN, the redundancy version (RV) of the E-DCH transmission is also associated with the coding rate of the E-DCH transmission according to Table 25B and Table 25C below.

Table 25B: Relation between RSN and E-DCH RV index for QPSK

RSN	$N_{sys} / N_{e,data,j} < 1/2$	$1/2 \leq N_{sys} / N_{e,data,j}$
	E-DCH RV Index	E-DCH RV Index
0	0	0
1	2	3
2	0	2
3	2	1

Table 25C: Relation between RSN and E-DCH RV index for 16QAM

RSN	$N_{sys} / N_{e,data,j} < 1/2$	$1/2 \leq N_{sys} / N_{e,data,j}$
	E-DCH RV Index	E-DCH RV Index
0	0	0
1	0	3
2	2	1
3	2	2

The UE shall use either:

- an RV index as indicated in Table 25A, 25B, 25C and according to the value of RSN
- or, if signalled by higher layers only E-DCH RV index 0 independently of the value of RSN.

4.9.2.1.3 HARQ information mapping

The bits $(x_{harq,1}, x_{harq,2})$ of the HARQ field are mapped such that $x_{harq,1}$ corresponds to the MSB of the HARQ process ID and $x_{harq,2}$ corresponds to the LSB of the HARQ process ID.

4.9.2.2 Multiplexing for E-UCCH

The transport block size information $(x_{tbs,1}, \dots, x_{tbs,6})$, retransmission sequence number information $(x_{rsn,1}, x_{rsn,2})$ and the HARQ process ID information $(x_{harq,1}, x_{harq,2})$ are multiplexed together to give a sequence of bits x_1, x_2, \dots, x_{10} where:

$$x_k = x_{tbs,k} \quad k=1,2,3,4,5,6$$

$$x_k = x_{rsn,k-6} \quad k=7,8$$

$$x_k = x_{harq,k-8} \quad k=9,10$$

4.9.2.3 Coding for E-UCCH

The bits x_1, x_2, \dots, x_{10} are coded to produce the bits z_0, z_1, \dots, z_{31} using a (32,10) sub-code of the second order Reed-Muller code as defined in subclause 4.3.1.1.

4.9.2.4 Physical channel mapping for E-UCCH

The E-UCCH is described in [7]. The sequence of bits z_0, z_1, \dots, z_{31} output from the E-UCCH channel coding is mapped with E-DCH to E-PUCH of the E-DCH TTI configured to carry E-UCCH.

4.10 Coding for E-AGCH

For the 1.28 Mcps TDD, E-AGCH type 1 is used when the variable E_DCH_SPS_STATUS=FALSE for a UE (as defined in [12]).

In this section, the terms 'E-AGCH' and 'E-AGCH type 1' are used interchangeably.

The E-AGCH carries the following fields multiplexed into w bits $x_{ag,1}, x_{ag,2}, \dots, x_{ag,w}$. w is within the range 14 to 28 bits (for the 3.84Mcps option) and 15 to 29 bits (for the 7.68Mcps option) and 23 to 26 bits (for the 1.28Mcps option)

- Absolute grant (power) value ($x_{pg,1}, x_{pg,2}, \dots, x_{pg,5}$) {5 bits},
- Code resource related information ($x_{c,1}, x_{c,2}, \dots, x_{c,N_c}$), $\{N_c=5$ bits for the 1.28Mcps and 3.84Mcps options, $N_c=6$ bits for the 7.68Mcps option}
- Timeslot resource related information ($x_{t,1}, x_{t,2}, \dots, x_{t,n_{TRRI}}$), $\{n_{TRRI}$ bits} [$n_{TRRI}=5$ for 1.28Mcps, and is configured by higher layers for 3.84Mcps and 7.68Mcps options]
- E-AGCH Cyclic Sequence Number (ECSN) ($x_{e,1}, x_{e,2}, x_{e,3}$) (3 bits)
- Resource duration indicator (3 bits if present) ($x_{r,1}, x_{r,2}, x_{r,3}$) – [the presence of this field is configured by higher layers]
- E-HICH Indicator ($x_{EI,1}, x_{EI,2}$) (2 bits) (for 1.28Mcps TDD only)
- E-UCCH Number Indicator ($x_{ENI,1}, x_{ENI,2}, x_{ENI,3}$) (3 bits) (for 1.28Mcps TDD only)

Figure 25 illustrates the overall coding chain for the E-AGCH.

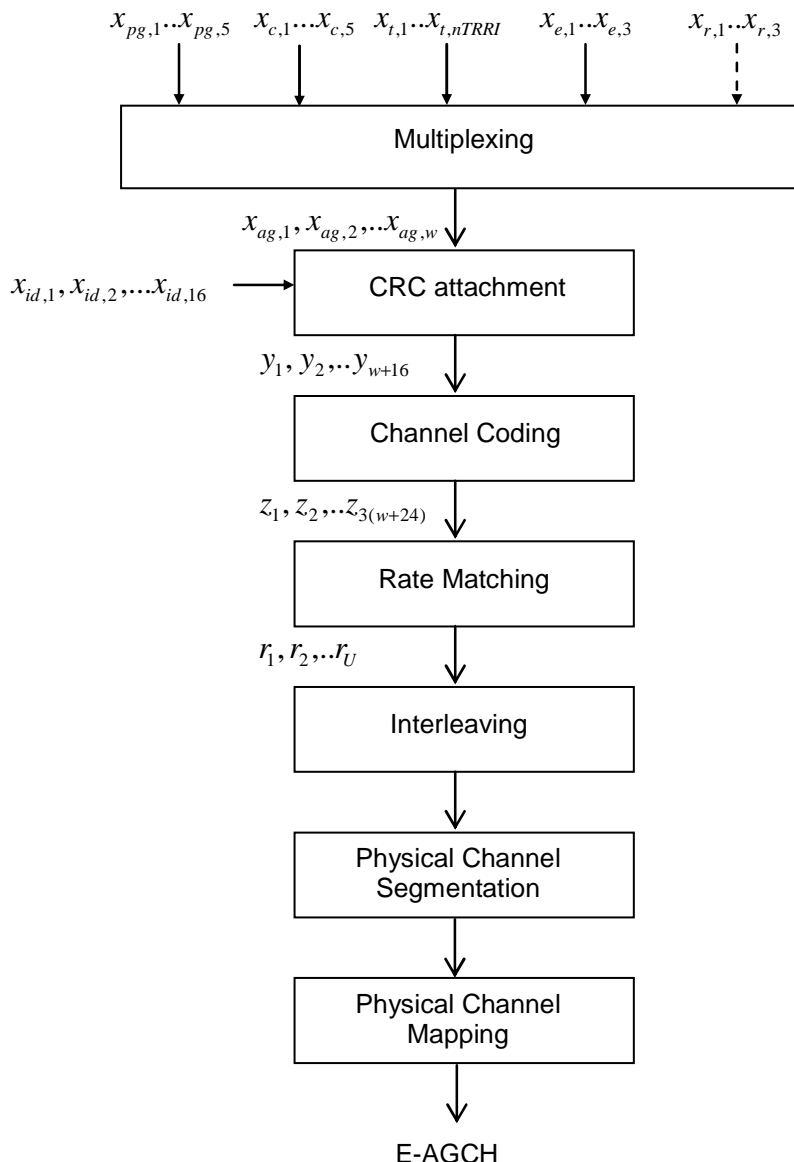

Figure 25 – TrCH processing of E-AGCH

4.10.1 Information Field Mapping

4.10.1.1 Mapping of the Absolute Grant (Power) Value

The absolute grant (power) value ($x_{pg,1}, x_{pg,2}, \dots, x_{pg,5}$) is represented by 5 bits and corresponds to a dB value as specified in table 26 for 3.84Mcps and 7.68 Mcps TDD and in table 26A for 1.28Mcps TDD below. The values are mapped such that $x_{pg,1}$ corresponds to the MSB of the index.

4.10.1.2 Mapping of the Code Resource Related Information

The code resource related information $(x_{c,1}, x_{c,2}, \dots, x_{c,N_c})$ indicates which node on the OVSF code tree has been allocated and is represented by N_c bits where $N_c=5$ for 1.28Mcps and 3.84Mcps and $N_c=6$ for 7.68Mcps. The mapping between the allocated OVSF and the enumerated node 0...30 (for 1.28Mcps and 3.84Mcps) and 0...62 (for 7.68Mcps) on the OVSF code tree is as given in table 27 below, in which channelisation code 'i' with spreading factor 'Q' is denoted as $C_i^{(Q)}$. $x_{c,i}$ corresponds to the MSB of the enumerated node. The right-most column of table 27 is only applicable for the 7.68Mcps option.

Table 27 – Channelisation code mapping

			$C_1^{(16)}$ [15]	$C_1^{(32)}$ [31]
		$C_1^{(8)}$ [7]		$C_2^{(32)}$ [32]
			$C_2^{(16)}$ [16]	$C_3^{(32)}$ [33]

4.10.1.3 Mapping of the Timeslot Resource Related Information

For 3.84Mcsp and 7.68Mcps options, the timeslot resource related information ($x_{t,1}, x_{t,2}, \dots, x_{t,n_{TRRI}}$) is a bitmap of length n_{TRRI} indicating which of the timeslots configured for E-DCH use by higher layers have been allocated. The length of the field (n_{TRRI}) is configured by higher layers up to a maximum of 12 bits. The bitmap is arranged such that the corresponding timeslots are in ascending numerical order, with $x_{t,1}$ corresponding to LSB and lowest-numbered timeslot configured for E-DCH use.

For 1.28Mcps option, the timeslot resource related information ($x_{t,1}, x_{t,2}, \dots, x_{t,n_{TRRI}}$) is also a bitmap of length 5 indicating the allocation for E-DCH resources from TS1 to TS5. If the bit is set (i.e. equal to 1), then the corresponding timeslot shall be used for E-DCH resources. The bitmap is arranged such that the corresponding timeslots are in ascending numerical order, with $x_{t,1}$ corresponding to MSB.

4.10.1.4 Mapping of the E-AGCH Cyclic Sequence Number (ECSN)

The E-AGCH cyclic sequence number is mapped such that $x_{e,1}$ corresponds to the MSB and $x_{e,3}$ to the LSB.

4.10.1.5 Mapping of the Resource Duration Indicator

The resource duration indicator ($x_{r,1}, x_{r,2}, x_{r,3}$) is mapped such that $x_{r,1}$ corresponds to the MSB of the resource duration index described in [15].

4.10.1.6 Mapping of the E-HICH Indicator (1.28Mcps option only)

The E-HICH indicator consists of 2 bits used to indicate the UE which E-HICH will be used to convey the acknowledgement indicator in the following schedule period for 1.28Mcps TDD only. The bits ($x_{EI,1}, x_{EI,2}$) are mapped such that $x_{EI,1}$ corresponds to the MSB and $x_{EI,2}$ to the LSB.

4.10.1.7 Mapping of the E-UCCH Number Indicator (1.28Mcps option only)

The E-UCCH number indicator is composed of 3bits which is used to calculate the number of E-UCCH for 1.28Mcps TDD only. The bits ($x_{ENI,1}, x_{ENI,2}, x_{ENI,3}$) are mapped such that $x_{ENI,1}$ corresponds to the MSB and $x_{ENI,3}$ to the LSB. The number of the used E-UCCH is equal to $ENI+1$.

4.10.2 Field Multiplexing

The absolute grant (power) value, code resource related information, timeslot resource related information, resource duration indicator (if present), ECSN, E-HICH indicator (for 1.28Mcps TDD only) and E-UCCH number indicator (for 1.28Mcps TDD only) are multiplexed together to give a sequence of bits $x_{ag,1}, x_{ag,2}, \dots, x_{ag,w}$ where:

For the 1.28Mcps option:

$$X_{ag,k} = X_{pg,k} \quad k=1, 2, \dots, 5$$

$$X_{ag,k} = X_{c,k-5} \quad k=6, 7, \dots, 10$$

$$X_{ag,k} = X_{t,k-10} \quad k=11, \dots, 15$$

$$X_{ag,k} = X_{e,k-15} \quad k=16,17,18$$

if resource duration indicator (RDI) present:

$$X_{ag,k} = X_{r,k-18} \quad k=19,20,21$$

$$X_{ag,k} = X_{EI,k-21} \quad k=22,23$$

$$X_{ag,k} = X_{ENI,k-23} \quad k=24,25,26$$

or if resource duration indicator (RDI) does not present:

$$X_{ag,k} = X_{EI,k-18} \quad k=19,20$$

$$X_{ag,k} = X_{ENI,k-20} \quad k=21,22,23$$

For the 3.84Mcps option:

$$X_{ag,k} = X_{pg,k} \quad k=1, 2, \dots, 5$$

$$X_{ag,k} = X_{c,k-5} \quad k=6, 7, \dots, 10$$

$$X_{ag,k} = X_{t,k-10} \quad k=11, \dots, 10+n_{TRRI}$$

$$X_{ag,k} = X_{e,k-10-n_{TRRI}} \quad k=11+n_{TRRI}, \dots, 13+n_{TRRI}$$

$$X_{ag,k} = X_{r,k-13-n_{TRRI}} \quad k=14+n_{TRRI}, \dots, 16+n_{TRRI} \text{ \{if resource duration indicator present\}}$$

and for the 7.68Mcps option:

$$X_{ag,k} = X_{pg,k} \quad k=1, 2, \dots, 5$$

$$X_{ag,k} = X_{c,k-5} \quad k=6, 7, \dots, 11$$

$$X_{ag,k} = X_{t,k-11} \quad k=12, \dots, 11+n_{TRRI}$$

$$X_{ag,k} = X_{e,k-11-n_{TRRI}} \quad k=12+n_{TRRI}, \dots, 14+n_{TRRI}$$

$$X_{ag,k} = X_{r,k-14-n_{TRRI}} \quad k=15+n_{TRRI}, \dots, 17+n_{TRRI} \text{ \{if resource duration indicator present\}}$$

4.10.3 CRC attachment

The E-RNTI ($x_{id,1}, x_{id,2}, \dots, x_{id,16}$) is the E-DCH Radio Network Identifier defined in [12]. It is mapped such that $x_{id,1}$ corresponds to the MSB.

From the sequence of bits $x_{ag,1}, x_{ag,2}, \dots, x_{ag,w}$ a 16 bit CRC is calculated according to section 4.2.1.1. This gives the sequence of bits c_1, c_2, \dots, c_{16} where:

$$c_k = P_{im(17-k)} \quad k=1,2,\dots,16$$

This sequence of bits is then masked with $x_{id,1}, x_{id,2}, \dots, x_{id,16}$ and appended to the sequence of bits $x_{ag,1}, x_{ag,2}, \dots, x_{ag,w}$ to form the sequence of bits $y_1, y_2, \dots, y_{w+16}$ where

$$y_i = x_{ag,i} \quad i=1,2, \dots, w$$

$$y_i = (c_{i-w} + x_{id,i-w}) \bmod 2 \quad i=w+1, \dots, w+16$$

4.10.4 Channel Coding

1/3 rate convolutional channel coding is applied to the sequence $y_1, y_2, \dots, y_{w+16}$ in accordance with section 4.2.3.1, resulting in the sequence of bits $z_1, z_2, \dots, z_{3(w+24)}$.

4.10.5 Rate Matching

Rate matching is applied to the input sequence $z_1, z_2, \dots, z_{3(w+24)}$ to obtain the output sequence r_1, r_2, \dots, r_U , where $U = 242$ for burst type 1 and $U = 274$ for burst type 2 for 3.84Mcps and 7.68Mcps options while $U=172$ for 1.28Mcps option.

4.10.6 Interleaving

Interleaving is performed as per section 4.2.11.1 (frame-related 2nd interleaving).

4.10.7 Physical Channel Segmentation

Physical channel segmentation is performed as per section 4.2.10. For 1.28Mcps TDD, the E-AGCH consists of two physical channels E-AGCH1 and E-AGCH2, whereas for 3.84Mcps and 7.68Mcps TDD the E-AGCH only uses one physical channel, see [7]. Note that physical channel segmentation is transparent when only one physical channel exists

4.10.8 Physical Channel Mapping

Physical channel mapping is performed as per section 4.2.12.

4.10A Coding for E-AGCH type 2 (1.28Mcps TDD only)

For the 1.28 Mcps TDD, E-AGCH type 2 is used when the variable $E_DCH_SPS_STATUS = TRUE$ for a UE (as defined in [12]). The E-AGCH type 2 carries the following fields multiplexed into w bits $x_{ag,1}, x_{ag,2}, \dots, x_{ag,w}$ and w is 30 bits.

- Absolute grant (power) value $(x_{pg,1}, x_{pg,2}, \dots, x_{pg,5})$ {5 bits}
- Code resource related information $(x_{c,1}, x_{c,2}, \dots, x_{c,N_c})$, $\{N_c=4 \text{ bits}\}$
- Timeslot resource related information $(x_{t,1}, x_{t,2}, \dots, x_{t,n_{TRRI}})$, $\{n_{TRRI}=5 \text{ bits}\}$
- E-AGCH Cyclic Sequence Number (ECSN) $(x_{e,1}, x_{e,2}, x_{e,3})$ (3 bits)
- Field flag $(x_{flag,1}, x_{flag,2})$ {2 bits}
- Special information 1 $(x_{info1,1}, x_{info1,2})$ {2 bits}
- Special information 2 $(x_{info2,1}, x_{info2,2}, x_{info2,3}, x_{info2,4}, x_{info2,5})$ {5 bits}
- E-UCCH Number Indicator $(x_{ENI,1}, x_{ENI,2}, x_{ENI,3})$ {3 bits}
- Reserved $(x_{res,1})$ {1 bit}

For an E-AGCH order,

- $x_{pg,1}, x_{pg,2}, x_{pg,3}, x_{pg,4}, x_{pg,5}, x_{c,1}, x_{c,2}, x_{c,3}, x_{c,N_c}$ are reserved
- $x_{t,1}, x_{t,2}, \dots, x_{t,n_{TRRI}}$ shall be set to "00000"
- $x_{e,1}, x_{e,2}, x_{e,3}$ shall be set to $x_{odt,1}, x_{odt,2}, x_{odt,3}$
- $x_{flag,1}, x_{flag,2}, x_{info1,1}, x_{info1,2}, x_{info2,1}, x_{info2,2}, x_{info2,3}, x_{info2,4}, x_{info2,5}, x_{ENI,1}, x_{ENI,2}, x_{ENI,3}, x_{res,1}$ are reserved

where $x_{odt,1}$, $x_{odt,2}$, $x_{odt,3}$ are defined in subclause 4.10B.

Figure 25A illustrates the overall coding chain for the E-AGCH type 2.

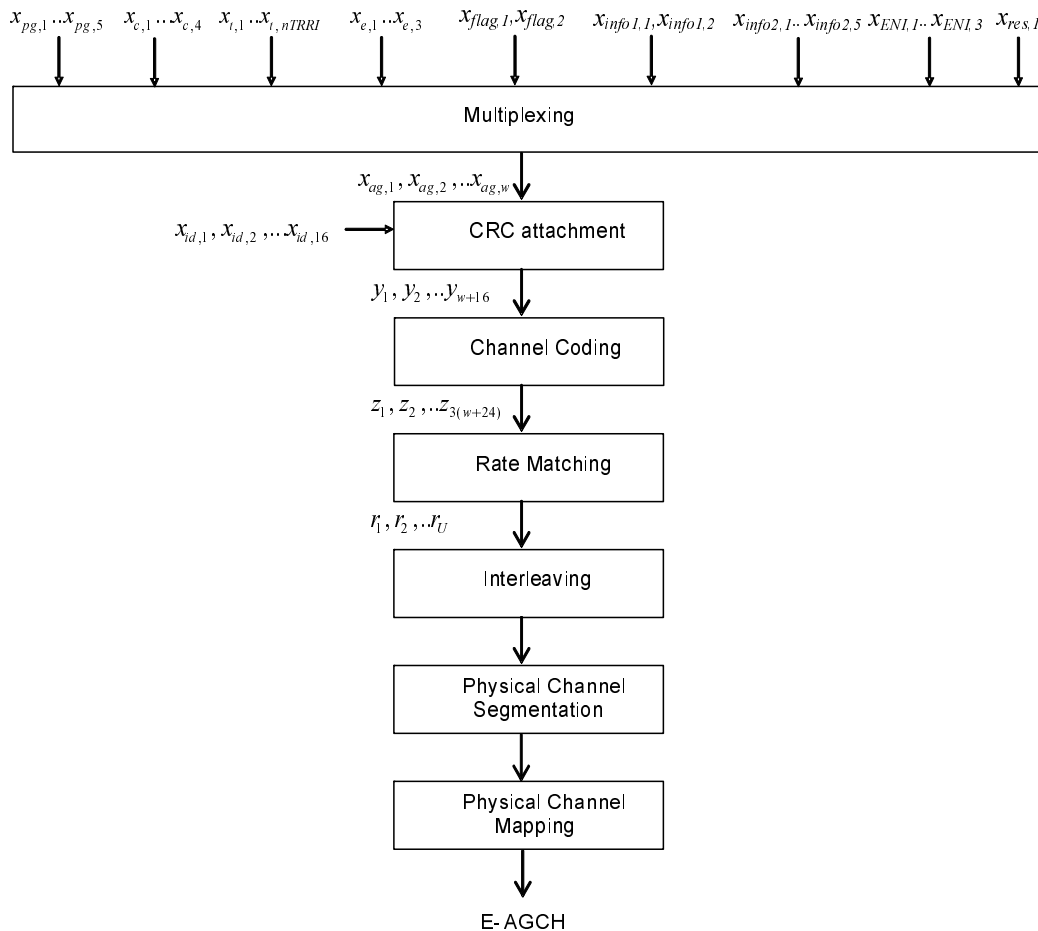

Figure 25A– TrCH processing of E-AGCH type2

4.10A.1 E-AGCH type 2 Information Field Mapping

4.10A.1.1 Mapping of the Absolute Grant (Power) Value

The mapping of the absolute grant (power) value ($x_{pg,1}, x_{pg,2}, \dots, x_{pg,5}$) is performed as per section 4.10.1.1.

4.10A.1.2 Mapping of the Code Resource Related Information

The code resource related information ($x_{c,1}, x_{c,2}, \dots, x_{c,N_c}$) indicates which node on the OVFS code tree has been allocated and is represented by N_c bits where $N_c=4$. The mapping between the allocated OVFS and the enumerated node 0...14 on the OVFS code tree is as given in table 27, in which channelisation code 'i' with spreading factor 'Q' is denoted as $C_i^{(Q)}$. $x_{c,1}$ corresponds to the MSB of the enumerated node.

4.10A.1.3 Mapping of the Timeslot Resource Related Information

The mapping of the timeslot resource related information ($x_{i,1}, x_{i,2}, \dots, x_{i,nTRRI}$) is performed as per section 4.10.1.3.

4.10A.1.4 Mapping of the E-AGCH Cyclic Sequence Number (ECSN)

The mapping of E-AGCH cyclic sequence number ($x_{e,1}, x_{e,2}, x_{e,3}$) is performed as per section 4.10.1.4.

4.10A.1.5 Mapping of the Field Flag

The field flag is used to distinguish the mapping of special information 1 and special information 2. The bits ($x_{flag,1}$, $x_{flag,2}$) are mapped such that $x_{flag,1}$ corresponds to the MSB and $x_{flag,2}$ to the LSB.

If $x_{flag,1}$, $x_{flag,2} = "00"$, the special information 1 ($x_{info1,1}$, $x_{info1,2}$) are comprised of the E-HICH indicator ($x_{EI,1}$, $x_{EI,2}$) and the special information 2 ($x_{info2,1}$, $x_{info2,2}$, $x_{info2,3}$, $x_{info2,4}$, $x_{info2,5}$) are comprised of the resource duration indicator ($x_{r,1}$, $x_{r,2}$, $x_{r,3}$) and $x_{info2,4}$, $x_{info2,5}$ are reserved.

Otherwise, the special information 1 ($x_{info1,1}$, $x_{info1,2}$) are comprised of the resource repetition pattern index ($x_{rrpi,1}$, $x_{rrpi,2}$) and the special information 2 ($x_{info2,1}$, $x_{info2,2}$, $x_{info2,3}$, $x_{info2,4}$, $x_{info2,5}$) are reserved.

4.10A.1.6 Mapping of the Special Information 1

The special information 1 ($x_{info1,1}$, $x_{info1,2}$) is mapped such that $x_{info1,1}$ corresponds to the MSB and $x_{info1,2}$ to the LSB.

If the special information 1 are comprised of the E-HICH indicator ($x_{EI,1}$, $x_{EI,2}$), then $x_{info1,1} = x_{EI,1}$ and $x_{info1,2} = x_{EI,2}$. And the mapping of the E-HICH indicator is performed as per section 4.10.1.6.

If the special information 1 are comprised of the resource repetition pattern index ($x_{rrpi,1}$, $x_{rrpi,2}$), then $x_{info1,1} = x_{rrpi,1}$ and $x_{info1,2} = x_{rrpi,2}$. The resource repetition pattern index $x_{rrpi,1}$, $x_{rrpi,2}$ is the unsigned binary representation of a reference to one of repetition patterns of the assigned semi-persistent E-PUCH resources configured by higher layers. The resource repetition pattern index $x_{rrpi,1}$, $x_{rrpi,2}$ are mapped such that $x_{rrpi,1}$ corresponds to the MSB and $x_{rrpi,2}$ to the LSB. And if $x_{rrpi,1}$, $x_{rrpi,2} = "00"$, one subframe E-PUCH resource is assigned.

$x_{rrpi,1}$, $x_{rrpi,2}$	Resource repetition pattern index as signalled in the variable E_DCH_SPS_PARAMS[12]
"01"	1 st entry
"10"	2 nd entry
"11"	3 rd entry

4.10A.1.7 Mapping of the Special Information 2

The special information 2 ($x_{info2,1}$, $x_{info2,2}$, $x_{info2,3}$, $x_{info2,4}$, $x_{info2,5}$) is mapped such that $x_{info2,1}$ corresponds to the MSB and $x_{info2,5}$ to the LSB.

If the special information 2 ($x_{info2,1}$, $x_{info2,2}$, $x_{info2,3}$, $x_{info2,4}$, $x_{info2,5}$) are comprised of the resource duration indicator ($x_{r,1}$, $x_{r,2}$, $x_{r,3}$) and $x_{info2,4}$, $x_{info2,5}$ are reserved. Then $x_{info2,1} = x_{r,1}$, $x_{info2,2} = x_{r,2}$ and $x_{info2,3} = x_{r,3}$.

The mapping of the resource duration indicator is performed as per section 4.10.1.5.

4.10A.1.8 Mapping of the E-UCCH Number Indicator

The mapping of E-UCCH number indicator ($x_{ENI,1}$, $x_{ENI,2}$, $x_{ENI,3}$) is performed as per section of 4.10.1.7.

4.10A.2 Field Multiplexing of E-AGCH type 2

The absolute grant (power) value, code resource related information, timeslot resource related information, ECSN, field flag, special information 1, special information 2 and E-UCCH number indicator are multiplexed together to give a sequence of bits $x_{ag,1}$, $x_{ag,2}$, ..., $x_{ag,w}$ where:

$$x_{ag,k} = x_{pg,k} \quad k=1, 2, \dots, 5$$

$X_{ag,k} = X_{c,k-5}$	$k=6, 7, \dots, 9$
$X_{ag,k} = X_{t,k-9}$	$k=10,11, \dots, 14$
$X_{ag,k} = X_{e,k-14}$	$k=15,16,17$
$X_{ag,k} = X_{flag,k-17}$	$k=18,19$
$X_{ag,k} = X_{info1,k-19}$	$k=20,21$
$X_{ag,k} = X_{info2,k-21}$	$k=22,23,\dots,26$
$X_{ag,k} = X_{ENI,k-26}$	$k=27,28,29$
$X_{ag,k} = X_{res,k-29}$	$k=30$

4.10A.3 CRC attachment for E-AGCH type 2

The E-RNTI ($x_{id,1}, x_{id,2}, \dots, x_{id,16}$) is the E-DCH Radio Network Identifier defined in [12]. It is mapped such that $x_{id,1}$ corresponds to the MSB.

The sequence of bits $y_1, y_2, \dots, y_{w+16}$, is calculated according to section 4.10.3.

4.10A.4 Channel Coding for E-AGCH type 2

Channel coding is performed as per section 4.10.4.

4.10A.5 Rate Matching for E-AGCH type 2

Rate matching is performed as per section 4.10.5.

4.10A.6 Interleaving for E-AGCH type 2

Interleaving is performed as per section 4.10.6.

4.10A.7 Physical Channel Segmentation for E-AGCH type 2

Physical channel segmentation is performed as per section 4.10.7.

4.10A.8 Physical Channel Mapping for E-AGCH type 2

Physical channel mapping is performed as per section 4.10.8.

4.10B Coding for E-AGCH orders

E-AGCH orders are commands sent to the UE using E-AGCH. No E-PUCH resources grants are associated with E-AGCH orders.

The following information is transmitted by means of the E-AGCH order physical channel.

- Order type (3 bits): $x_{odt,1}, x_{odt,2}, x_{odt,3}$
- UE identity (16 bits): $x_{id,1}, x_{id,2}, \dots, x_{id,16}$

The coding for E-AGCH orders is specified in subclause 4.10A.

4.10B.1 E-AGCH orders information field mapping

4.10B.1.1 Order type mapping

If $x_{odt,1}, x_{odt,2}, x_{odt,3} = "000"$, then the E-AGCH order is an order to release the allocated semi-persistent E-PUCH resources when UE is in CELL_DCH state.

4.10B.1.2 UE identity mapping

The E-RNTI ($x_{id,1}, x_{id,2}, \dots, x_{id,16}$) is the E-DCH Radio Network Identifier defined in [12]. It is mapped such that $x_{id,1}$ corresponds to the MSB.

4.11 Coding for E-HICH ACK/NACK

4.11.1 Coding for E-HICH ACK/NACK for the 3.84Mcps and 7.68Mcps options

4.11.1.1 Overview

The ACK/NACK is transmitted on the E-HICH as described in [7].

The value of a binary HARQ acknowledgement indicator for user h is denoted ' a_h ' and may assume the value 0 or 1. The value of the indicator is mapped as shown in table 28.

Table 28 – Mapping of HARQ acknowledgement indicator

Command	HARQ acknowledgement indicator value (a_h)
NACK	0
ACK	1

A HARQ acknowledgement indicator is mapped to one of 240 signature sequences of length 240 bits and represented by the bit sequence $b_{h,0}, b_{h,1}, \dots, b_{h,239}$ for the h^{th} acknowledgement indicator. The signature sequence number ' r ' is selected as described in [7].

The signature sequence $b_{h,0}, b_{h,1}, \dots, b_{h,239}$ is constructed via coding of a_h followed by bit scrambling. Spare bits are inserted during the physical channel mapping stage to produce the output sequence $d_{h,0}, d_{h,1}, \dots, d_{h,U}$.

4.11.1.2 Coding of the HARQ acknowledgement indicator

Bit a_h is used to form the sequence $s_{2,v}$ ($v=0,1,\dots,239$) via a two-stage serialised binary spreading process as shown in figure 26.

Figure 26

The output of the first spreading stage is $s_{1,k} = a_h \oplus C_{1,i,k}$, where $k=0, 1, 2, \dots, 19$.

The output of the second spreading stage is $s_{2,v} = s_{1,w} \oplus C_{2,j,m}$, where $v=0, 1, \dots, 239$ and where $w = \left\lfloor \frac{v}{12} \right\rfloor$ and, $m = v \bmod 12$.

The binary sequences selected for the first ($C_{1,i,k}$) and second ($C_{2,j,m}$) spreading operations are derived as a function of the HARQ acknowledgement sequence number r (see [7]) such that:

$$i = \left\lfloor \frac{r}{12} \right\rfloor$$

$$j = r \bmod 12$$

The first orthogonal sequence set ($C_{1,i,k}$) is given by table 29 and the second orthogonal sequence set ($C_{2,j,m}$) is given by table 30.

Table 29 – Primary code sequences for HARQ acknowledgement indicator

k	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19

4.11.1.3 Bit scrambling of the E-HICH

The bit sequence $b_{h,0}, b_{h,1}, \dots, b_{h,239}$ is formed by applying bit scrambling (as defined in subclause 4.2.9) to the sequence $s_{2,v}$.

4.11.1.4 Physical channel mapping of the E-HICH

The bit sequence $b_{h,0}, b_{h,1}, \dots, b_{h,239}$ is segmented into two halves, $b_{h,0}, \dots, b_{h,119}$, and $b_{h,120}, \dots, b_{h,239}$. A sequence of U spare bits z_u ($u=0 \dots U-1$) are inserted between the first and second half of the sequence to form:

$$d_h = \{b_{h,0}, b_{h,1}, \dots, b_{h,119}, z_0, z_1, \dots, z_{U-1}, b_{h,120}, b_{h,121}, \dots, b_{h,239}\}$$

U is equal to 4 or 36 dependant on the burst type (see [7]). The spare bit sequence z_u is not defined.

4.11.2 Coding for E-HICH for the 1.28 Mcps option only

4.11.2.1 Overview

The scheduled and non-scheduled transmissions on different E-HICHs are described in [7]. The acknowledgement indicators for the E-DCH semi-persistent scheduling operation can be transmitted on the same E-HICH carrying indicators for scheduled traffic or the E-HICH carrying indicators for non-scheduled traffic as described in [7].

The value of a binary HARQ acknowledgement indicator for user h is denoted ' a_h ' and may assume the value 0 or 1. The value of the indicator is mapped as same as that of 3.84 Mcps shown in subclause 4.11.1.1.

Construction of the bit sequence for the h^{th} acknowledgement indicator is achieved via a spreading process using an orthogonal sequence which is the row of an orthogonal matrix of order 80. This orthogonal matrix (C_{80}) is Kronecker tensor product of one Hadamard matrix of order 20 (C_{20}) and another Hadamard matrix of order 4 (C_4),

$$C_{80} = C_{20} \otimes C_4$$

\otimes is Kronecker tensor product. (note: Kronecker product is not commutative, i.e. $A \otimes B \neq B \otimes A$). The element '0' in Hadamard C_{20} and C_4 shall be replaced by '-1' before the Kronecker tensor product operation. And after the operation the elements '-1' in C_{80} should be converted back into '0'.

These two Hadamard matrices are given by table 31 and table 32.

Table 31: Hadamard matrix of order 4

m	0	1	2	3
$C_{4,0,m}$	1	1	1	1
$C_{4,1,m}$	1	0	1	0
$C_{4,2,m}$	1	1	0	0
$C_{4,3,m}$	0	1	1	0

Table 32: Hadamard matrix of order 20

$C_{20,18,k}$	0	0	1	0	1	1	1	0	0	0	0	0	0	1	0	0	0	0	1	0
$C_{20,19,k}$	1	0	0	1	0	0	1	1	0	0	0	0	0	0	1	0	0	0	0	1

The binary orthogonal sequence ($C_{80,r,n}$) used for spreading operation is selected from the r^{th} row of the orthogonal matrix of order 80 (C_{80}). A HARQ acknowledgement indicator is synchronously linked with the E-DCH TTI transmission to which it relates. There is thus a one-to-one association between an E-DCH TTI transmission and its respective HARQ acknowledgement indicator.

4.11.2.2 Coding of the HARQ acknowledgement indicator and TPC/SS

For scheduled transmissions, E-HICHs carry HARQ acknowledgement indicators only.

A logical allocation resource tag ID 'r' ($r=0, 1, 2, \dots, 79$) is calculated first for the E-DCH resource allocation associated with the HARQ acknowledgement indicator.

$$r = 16(t_0 - 1) + (q_0 - 1) \frac{16}{Q_0}$$

where:

t_0 is the last (highest-numbered) allocated timeslot (1,2,...,5)

q_0 is the lowest-numbered channelisation code index allocated in timeslot t_0 (1,2,..., Q_0)

Q_0 is the spreading factor of the lowest-numbered channelisation code index allocated in timeslot t_0

The logical resource tag ID r is then mapped to a physical allocation resource tag ID r' ,

$$r' = P(r, SFN', MidambleCode),$$

where P is a permutation function depends on the logical signature index r , system sub-frame number SFN' of E-HICH and the cell specific basic midamble code sequence. A 7-tap linear feedback shift register (LFSR) is used to generate pseudo-random numbers which are then used to generate the pseudo-random permutation P . The generator polynomial of the 7-tap LFSR is $g(x) = 1 + x^3 + x^7$, as shown in Figure 27.

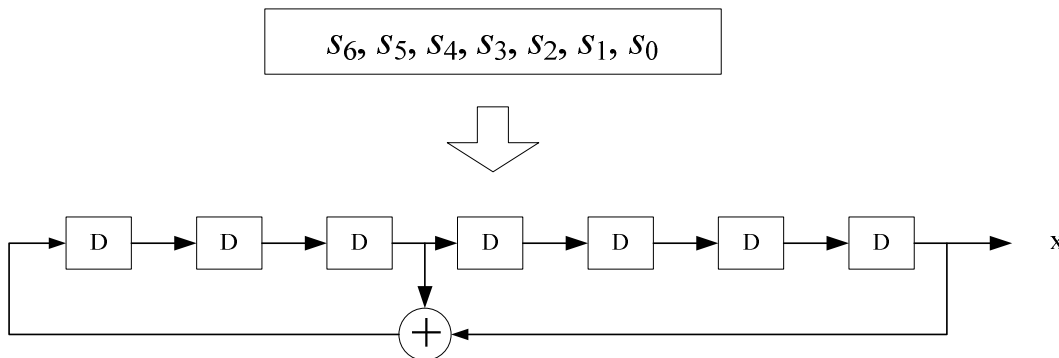

Figure 27: Structure of PN register

The pseudo-random permutation is generated according to the following procedures:

1. Initialization

(a) Initialize $M = 80$, initialize P as $P(m) = m, m = 0, 1, \dots, M-1$;

(b) Initialize $N = 7$;

(c) Initialize PN register with seed s , where $s = \text{LSB}(SFN', N) \oplus \text{LSB}(\text{MidambleCode}, N)$ and s_6, s_5, \dots, s_0 are put into the register in the order as shown in figure 27;

(d) Initialize $i = 0$.

2. Repeat the following steps while $i \leq M - 3$.

(a) Find the smallest p such that $M - i - 1 < 2^p$;

(b) Clock the PN register N times to obtain an N -bit pseudorandom number x . Set $k = \text{LSB}(x, p)$;

(c) If $k > M - i - 1$, set $k = k - (M - i)$;

(d) Swap the i -th and the $(k+i)$ -th element of P , i.e., $\text{tmp} = P(i), P(i) = P(k+i), P(k+i) = \text{tmp}$;

(e) Increment i by 1.

where ' $\text{LSB}(x, n)$ ' means the right most n bits of x , ' \oplus ' means modulo 2 addition, and the first output bit from the PN register is the MSB, while the final output bit is the LSB. The resulting P is the output permutation and the physical signature sequence index is given by $r' = P(r)$.

The output of the spreading stage is equal to $b_{h,n} = a_h \Theta C_{80,r',n}$, where $n=0,1,\dots,79$ and Θ is the Xor operation.

For Non-Scheduled transmissions and E-DCH semi-persistent scheduling operation,, E-HICHs carry HARQ acknowledgement indicators and TPC/SS commands. The 80 orthogonal sequences are divided into 20 groups while each group includes 4 sequences of contiguous logical resource tag ID. The mapping between the logical resource tag ID and the physical tag ID is same as scheduled transmissions. Each non-scheduled user is assigned one group by higher layer to indicate the HARQ acknowledgement indicator and TPC/SS command. The first one of the four

sequences is used for the acknowledgement indicator's spreading operation and one of the other three is used to indicate TPC/SS command implicitly. The mapping relations between them are described in [7].

The HARQ acknowledgement indicator is spread by the assigned orthogonal sequence ($C_{80,s',n}$), where s' is the physical resource tag ID. The output of the spreading stage is equal to $c_{h,n} = a_h \Theta C_{80,s',n}$, where $n=0,1,\dots,79$. The sequence chosen to indicate TPC/SS command is denoted as ' $e_{h,n}$ ', $e_{h,n} = p_h \Theta C_{80,t',n}$, where p_h is the same as the parameter B defined in [7].

4.11.2.3 Bit scrambling and Physical channel mapping of the E-HICH

For scheduled transmission, the bit sequence $b_{h,0}, b_{h,1}, \dots, b_{h,79}$ is segmented into two halves, $b_{h,0}, \dots, b_{h,39}$, and $b_{h,40}, \dots, b_{h,79}$. 8 spare bits z_u ($u=0\dots 7$) are inserted between the first and second half of the sequence to form:

$$d_h = \{b_{h,0}, b_{h,1}, \dots, b_{h,39}, z_0, z_1, \dots, z_7, b_{h,40}, b_{h,41}, \dots, b_{h,79}\}$$

The spare bit sequence z_u is not defined. For Non-Scheduled transmission, the corresponding output bit sequences are:

$$d_{h1} = \{c_{h,0}, c_{h,1}, \dots, c_{h,39}, z_0, z_1, \dots, z_7, c_{h,40}, c_{h,41}, \dots, c_{h,79}\}$$

$$d_{h2} = \{e_{h,0}, e_{h,1}, \dots, e_{h,39}, z_0, z_1, \dots, z_7, e_{h,40}, e_{h,41}, \dots, e_{h,79}\}$$

Then the corresponding bit sequence d_h or d_{h1}/d_{h2} is formed by applying bit scrambling (as defined in subclause 4.2.9) to the sequence $s_{h,n}$ or $s_{h1,n}/s_{h2,n}$, $n=0,1,\dots,87$.

4.12 Coding for E-RUCCH

For 1.28Mcps TDD, E-RUCCH supports both a 5ms and a 10ms TTI. For 3.84Mcps and 7.68Mcps TDD, E-RUCCH supports a TTI of 10ms only. The sequence of 39 information bits to be transmitted on one E-RUCCH as supplied by higher layers is defined as bits $x_{e-rucch,1}, a_{e-rucch,2}, \dots, a_{e-rucch,39}$.

The following processing steps (in sequential order) are defined for E-RUCCH:

- CRC attachment
- Channel coding
- Rate matching
- Bit scrambling
- Frame related 2^{nd} interleaving
- Mapping to physical channels

4.12.1 CRC attachment for E-RUCCH

From the sequence of $A_i=39$ bits ($x_{e-rucch,1}, a_{e-rucch,2}, \dots, a_{e-rucch,39}$) a CRC of length $L_i=16$ is appended according to Section 4.2.1.1. The bits output from CRC attachment are denoted $b_{im,k}$, where $k=1,2,3, \dots, A_i+L_i$ and $A_i=39$

For 3.84Mcps and 7.68Mcps TDD, each parity bit $b_{im,k}$, (where $k=A_i+1, A_i+2, \dots, A_i+L_i$) is then XOR'd with 1 such that its polarity is reversed.

4.12.2 Channel coding for E-RUCCH

1/3 rate convolutional channel coding is applied to the sequence $b_1, b_2, \dots, b_{im,k}$ in accordance with section 4.2.3.1, resulting in the sequence of bits $z_1, z_2, \dots, z_{3(k+8)}$.

4.12.3 Rate matching for E-RUCCH

Rate matching for E-RUCCH shall be applied to the input sequence $z_1, z_2, \dots, z_{3(k+8)}$ to obtain the output sequence r_1, r_2, \dots, r_U , where $U = 176$ for 1.28Mcps and $U = 232$ for 3.84Mcps and 7.68Mcps TDD, according to the general method described in subclause 4.2.7.

4.12.4 Bit scrambling for E-RUCCH

Bit scrambling for E-RUCCH shall be performed in accordance with the general method described in subclause 4.2.9.

4.12.5 Interleaving for E-RUCCH

Frame-related 2nd interleaving for E-RUCCH shall be performed in accordance with the general method described in subclause 4.2.11.1.

4.12.6 Physical channel mapping for E-RUCCH

Physical channel mapping for the E-RUCCH shall be performed in accordance with the general method described in subclause 4.2.12.1.

5 Multiplexing, channel coding and interleaving for the 3.84 Mcps MBSFN IMB option

5.1 General

Data streams from/to MAC and higher layers (Transport block / Transport block set) are encoded/decoded to offer transport services over the radio transmission link. The channel coding scheme is a combination of error detection, error correcting, rate matching, interleaving and the mapping of transport channels onto physical channels.

5.2 General coding/multiplexing of TrCHs

This section only applies to the transport channels BCH and FACH.

Data arrives to the coding/multiplexing unit in form of transport block sets once every transmission time interval. The transmission time interval is transport-channel specific from the set {10 ms, 20 ms, 40 ms, 80 ms}. An overview of the coding/multiplexing steps applicable to MBSFN IMB is shown in figure 2 of subclause 4.2 in [3].

5.2.1 CRC attachment

Error detection is provided on transport blocks through a Cyclic Redundancy Check (CRC). CRC attachment shall be performed in accordance with the general method described in subclause 4.2.1 of [3].

5.2.2 Transport block concatenation and code block segmentation

Transport blocks, with attached CRCs, are concatenated and segmented into code blocks. Transport block concatenation and code block segmentation shall be performed in accordance with the general method described in subclause 4.2.2 of [3].

5.2.3 Channel coding

Code blocks are delivered to the channel coding. Channel coding shall be performed in accordance with the general method described in subclause 4.2.3 of [3]. The following restrictions apply:

- Convolutional coding shall be applied to FACH transport channel mapped on S-CCPCH frame type 1 only.
- Turbo coding shall be applied to FACH transport channels mapped on S-CCPCH frame type 2 only.

5.2.4 1st Interleaving

First interleaving shall be performed in accordance with the general methods described in subclause 4.2.5 of [3].

5.2.5 Radio frame segmentation

Radio frame segmentation shall be performed in accordance with the general method described in subclause 4.2.6 of [3].

5.2.6 Rate matching

Rate matching shall be performed in accordance with the general method described in subclause 4.2.7 of [3], in which the downlink description is only relevant. Only flexible positions of TrCHs are supported for the MBSFN IMB option.

For S-CCPCH frame type 2, the number of bits available to the CCTrCH in one radio frame using P physical channels is defined as $N_{data,*} = 3 \times N_{data1} + (P-1) \times 3 \times N''_{data1}$, where N_{data1} is defined in [2] and N''_{data1} is the data size of the corresponding slot format with zero TFCI bits.

5.2.7 TrCH multiplexing

Transport channel multiplexing shall be performed in accordance with the general method described in subclause 4.2.8 of [3].

5.2.8 Insertion of discontinuous transmission (DTX) indication bits

DTX is used to fill up the radio frame with bits. The DTX indication bits inserted in this step shall be placed at the end of the radio frame, corresponding to flexible positions of TrCHs in the radio frame [3]. Note that the DTX indication bits will be distributed over all slots after 2nd interleaving.

The bits input to the DTX insertion block are denoted by $s_1, s_2, s_3, \dots, s_S$, where S is the number of bits from TrCH multiplexing. The bits output from the DTX insertion block are denoted by $w_1, w_2, w_3, \dots, w_W$ and defined by the following relations:

$$w_k = s_k \quad k = 1, 2, 3, \dots, S$$

$$w_k = \delta \quad k = S+1, S+2, S+3, \dots, W$$

where DTX indication bits are denoted by δ . Note that bits w_k are three valued and that $W = N_{data,*}$.

5.2.9 Physical channel segmentation

For the 3.84 Mcps MBSFN IMB option, physical channel segmentation is applicable to S-CCPCH frame type 2 only.

When more than one PhCH is used, physical channel segmentation divides the bits among the different PhCHs. The bits input to the physical channel segmentation are denoted by $w_1, w_2, w_3, \dots, w_W$, where W is the number of bits input to the physical channel segmentation block. The number of PhCHs is denoted by P .

The bits after physical channel segmentation are denoted $u_{p,1}, u_{p,2}, u_{p,3}, \dots, u_{p,U_p}$, where p is PhCH number and U_p is the number of bits in one radio frame of the p^{th} PhCH. The relation between w_k and $u_{p,k}$ is given below.

Bits on first PhCH after physical channel segmentation:

$$u_{1,k} = w_k \quad k = 1, 2, \dots, U_1$$

Bits on second PhCH after physical channel segmentation:

$$u_{2,k} = w_{(k+U_1)} \quad k = 1, 2, \dots, U_2$$

...

Bits on the P^{th} PhCH after physical channel segmentation:

$$u_{P,k} = w_{(k+U_1+\dots+U_{P-1})} \quad k = 1, 2, \dots, U_P$$

The number of bits U_p in one radio frame of the p^{th} PhCH is $3 \times N_{\text{data1}}$ for $p=1$ and $3 \times N''_{\text{data1}}$ for $p = 2, 3, \dots, P$, where N_{data1} is defined in [2] and N''_{data1} is the data size of the corresponding slot format with zero TFCI bits.

5.2.10 2nd Interleaving

Second interleaving is performed in accordance with the general method described in section 4.2.11 of [3]. For S-CCPCH frame type 2, 2nd interleaving is performed per physical channel of the CCTrCH.

5.2.11 Physical channel mapping

Physical channel mapping shall be performed in accordance with the general method described in subclause 4.2.12 in [3], in which the downlink description is only relevant.

5.2.12 Restrictions on different types of CCTrCHs

Restrictions on the different types of CCTrCHs are described in general terms in [16]. In this subclause those restrictions are given with layer 1 notation.

5.2.12.1 Broadcast channel (BCH)

The restrictions of subclause 4.2.13.6 of [3] apply.

5.2.12.2 Forward access channel (FACH)

- The maximum value of the number of TrCHs I in a CCTrCH and the maximum value of the number of transport blocks M_i on each transport channel are given from the UE capability class.
- Only one Secondary CCPCH frame type 1 is used per CCTrCH.
- The maximum number of Secondary CCPCHs of frame type 2 used per CCTrCH is defined in [17].

5.2.13 Multiplexing of different TrCHs into one CCTrCH, and mapping of one CCTrCH onto physical channels

Multiplexing of different transport channels into one coded composite transport channel shall be performed in accordance with the general method described in 4.2.14 of [3].

5.3 Transport format detection

For MBSFN IMB operations, the transport format combination is signalled using the TFCI field of an S-CCPCH slot and only TFCI based detection shall be used.

5.3.1 Transport format detection based on TFCI

When a TFCI is available, then TFCI based detection shall be applicable to all TrCHs within the CCTrCH. The TFCI informs the receiver about the transport format combination of the CCTrCHs. As soon as the TFCI is detected, the transport format combination, and hence the transport formats of the individual transport channels are known.

5.3.2 Coding of Transport-Format-Combination Indicator (TFCI)

The number of TFCI bits to be encoded per CCTrCH shall always be within the range 1 to 5. These bits shall be encoded according to the general method of subclause 4.3.1.2.2 to produce 16 encoded bits b_0 to b_{15} . This procedure is valid also for the case where the number of TFCI bits to be encoded is less than 3.

5.3.3 Mapping of TFCI words

5.3.3.1 Mapping of TFCI bits for Secondary CCPCH

The 16 encoded TFCI bits are directly mapped to the S-CCPCH slots of the radio frame. Within a slot the bit with lower index is transmitted before the bit with higher index. The coded bits b_k , are mapped to the transmitted TFCI bits d_k , according to the following formula:

$$d_k = b_{k \bmod 16}$$

For S-CCPCH frame type 1, $k = 0, 1, 2, \dots, 29$. For S-CCPCH frame type 2 using QPSK data modulation, $k = 0, 1, 2, \dots, 47$ whilst for S-CCPCH frame type 2 using 16-QAM data modulation, $k = 0, 1, 2, \dots, 23$.

The set of TFCI bits d_k shall be modulated as defined in [9] and mapped to slots of the radio frame such that they are transmitted in ascending order of k .

13/03/07	RAN_35	RP-070118	0131	2	Introduction of E-DCH for 1.28Mcps TDD	7.1.0	7.2.0
30/05/07	RAN_36	RP-070385	0132	1	Support for MBSFN operation	7.2.0	7.3.0
30/05/07	RAN_36	RP-070383	0133	1	Modification on HARQ process ID signalling for 1.28Mcps TDD	7.2.0	7.3.0
30/05/07	RAN_36	RP-070385	0135	-	Support for 1.28Mcps TDD MBSFN operation	7.2.0	7.3.0
11/09/07	RAN_37	RP-070650	0136	-	Introduction of multi-frequency operation for 1.28Mcps TDD	7.3.0	7.4.0
11/09/07	RAN_37	RP-070647	0137	-	TFCI mapping for S-CCPCH and 16QAM for 1.28Mcps TDD MBSFN	7.3.0	7.4.0
11/09/07	RAN_37	RP-070640	0138	1	Improved E-HICH signature sequence allocation for LCR TDD	7.3.0	7.4.0
27/11/07	RAN_38	RP-070943	0141	1	More improvement on dedicated carrier for 1.28Mcps TDD MBMS	7.4.0	7.5.0
04/03/08	RAN_39	RP-080140	0144	1	Some corrections for 1.28Mcps TDD EUL	7.5.0	7.6.0
04/03/08	RAN_39	RP-080141	0145	1	Clarification on TFCI mapping for 1.28Mcps TDD MBMS	7.5.0	7.6.0
04/03/08	RAN_39	-	-	-	Creation of Release 8 further to RAN_39 decision	7.6.0	8.0.0
28/05/08	RAN_40	RP-080356	0150	1	Introduction 64QAM for 1.28Mcps TDD HSDPA	8.0.0	8.1.0
09/09/08	RAN_41	RP-080661	151	1	Clarification on E-HICH coding for 1.28Mcps TDD	8.1.0	8.2.0
09/09/08	RAN_41	RP-080661	153	1	Clarification of E-UCCH Number indicator on E-AGCH for 1.28Mcps TDD	8.1.0	8.2.0
09/09/08	RAN_41	RP-080661	154	-	Clarification of TRRI on E-AGCH for 1.28Mcps TDD EUL	8.1.0	8.2.0
09/09/08	RAN_41	RP-080661	155	-	Correction of E-HICH coding for 1.28 Mcps TDD EUL	8.1.0	8.2.0
03/12/08	RAN_42	RP-080976	159	-	Clarification of E-DCH RV index selection for 1.28Mcps TDD	8.2.0	8.3.0
03/12/08	RAN_42	RP-080980	161	1	Correction of description about 64QAM for LCR TDD	8.2.0	8.3.0
03/12/08	RAN_42	RP-080987	162	-	Introduction of the Enhanced CELL_FACH, CELL_PCH, URA_PCH state for 1.28Mcps TDD	8.2.0	8.3.0
03/12/08	RAN_42	RP-081118	163	1	Support for 3.84 Mcps MBSFN IMB operation	8.2.0	8.3.0
03/03/09	RAN_43	RP-090230	165	-	Correction of the absolute grant (power) value mapping for 1.28Mcps TDD EUL	8.3.0	8.4.0
03/03/09	RAN_43	RP-090240	166	1	Introducing of CPC for 1.28Mcps TDD	8.3.0	8.4.0
03/03/09	RAN_43	RP-090241	167	1	Introducing of MIMO for 1.28Mcps TDD	8.3.0	8.4.0
03/03/09	RAN_43	RP-090239	168	-	Corrections to 25.222 for 3.84Mcps MBSFN IMB	8.3.0	8.4.0
03/03/09	RAN_43	RP-090239	169	-	TFCI for Secondary CCPCH frame type 2 with 16QAM	8.3.0	8.4.0
03/03/09	RAN_43	RP-090231	173	-	Editorial correction for 1.28Mcps TDD	8.3.0	8.4.0
26/05/09	RAN_44	RP-090533	174	-	Modification of CCS information mapping tables for LCR TDD	8.4.0	8.5.0
26/05/09	RAN_44	RP-090526	175	1	Corrections to the coding of E-RUCCH for 1.28 Mcps TDD	8.4.0	8.5.0
26/05/09	RAN_44	RP-090530	177	-	Clarification of HS-DSCH coding for MIMO dual stream transmission for 1.28Mcps TDD	8.4.0	8.5.0
15/09/09	RAN_45	RP-090893	178	2	Correction to the channel mapping and rate matching for HS-DSCH in CPC for 1.28Mcs TDD	8.5.0	8.6.0
15/09/09	RAN_45	RP-090893	180	-	Modification of HS-SCCH types for CPC in 1.28Mcps TDD	8.5.0	8.6.0
15/09/09	RAN_45	RP-090893	182	1	Correction to Xptr field definition for LCR TDD	8.5.0	8.6.0
15/09/09	RAN_45	RP-090893	183	1	Correction to HS-SCCH Type 2 definition for LCR TDD	8.5.0	8.6.0
15/09/09	RAN_45	RP-090893	184	-	Clarification of HS-SCCH Order types against HS-SCCH types	8.5.0	8.6.0
01/12/09	RAN_46	RP-091166	185	1	Correction to the Resource repetition period of SPS operation for 1.28Mcps TDD	8.6.0	8.7.0
01/12/09	RAN_46	RP-091176	192	1	Modification to HS-SCCH for TS0 for 1.28Mcps TDD	8.7.0	9.0.0
16/03/10	RAN_47	RP-100202	195	-	Correction to the resource repetition period index for 1.28Mcps TDD	9.0.0	9.1.0
16/03/10	RAN_47	RP-100202	201	-	Corrections to the Physical channel mapping for HS-DSCH for 1.28Mcps TDD	9.0.0	9.1.0
