Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in SR 000 314: "*Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards*", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (<http://www.etsi.org/ipr>).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Foreword

This Technical Specification (TS) has been produced by the ETSI 3rd Generation Partnership Project (3GPP).

The present document may refer to technical specifications or reports using their 3GPP identities or GSM identities. These should be interpreted as being references to the corresponding ETSI deliverables. The mapping of document identities is as follows:

For 3GPP documents:

3G TS | TR nn.nnn "<title>" (with or without the prefix 3G)

is equivalent to

ETSI TS | TR 1nn nnn "[Digital cellular telecommunications system (Phase 2+) (GSM);] Universal Mobile Telecommunications System; <title>

For GSM document identities of type "GSM xx.yy", e.g. GSM 01.04, the corresponding ETSI document identity may be found in the Cross Reference List on www.etsi.org/key

Foreword

This Technical Specification has been produced by the 3rd Generation Partnership Project, Technical Specification Group Services and System Aspects, Working Group 4 (Codec).

The contents of this TS may be subject to continuing work within the 3GPP and may change following formal TSG-S4 approval. Should the TSG-S4 modify the contents of this TS, it will be re-released with an identifying change of release date and an increase in version number as follows:

Version m.t.e

where:

- m indicates [major version number]
- x the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- y the third digit is incremented when editorial only changes have been incorporated into the specification.

1 Scope

The present document describes a generic frame format for the Adaptive Multi-Rate (AMR) speech codec. This format shall be used as a common reference point when interfacing speech frames between different elements of the 3G system and between different systems. Appropriate mappings to and from this generic frame format will be used within and between each system element.

Annex A describes a second frame format which shall be used when octet alignment of AMR frames is required.

2 Normative references

This TS incorporates by dated and undated reference, provisions from other publications. These normative references are cited at the appropriate places in the text and the publications are listed hereafter. For dated references, subsequent amendments to or revisions of any of these publications apply to this TS only when incorporated in it by amendment or revision. For undated references, the latest edition of the publication referred to applies.

- [1] TS 26.090: "AMR Speech Codec; Speech Transcoding Functions".
- [2] TS 26.093: "AMR Speech Codec; Source Controlled Rate Operation".
- [3] TS 26.092: "AMR Speech Codec; Comfort Noise Aspects".

3 Definitions and abbreviations

3.1 Definitions

AMR mode: One of the eight AMR codec bit-rates denoted also with indices 0 to 7 where 0 maps to the 4.75 kbis/s mode and 7 maps to the 12.2 kbit/s mode

AMR codec mode: Same as AMR mode

RX_TYPE: Classification of the received frame as defined in [2].

TX_TYPE: Classification of the transmitted frame as defined in [2].

3.2 Abbreviations

For the purposes of the present document, the following abbreviations apply:

CRC	Cyclic Redundancy Check
FQI	Frame Quality Indicator
LSB	Least Significant Bit
MSB	Most Significant Bit
RX	Receive
SCR	Source Controlled Rate operation
SID	Silence Descriptor
TX	Transmit

4 AMR codec frame format (AMR IF1)

This section describes the generic frame format for both the speech and comfort noise frames of the AMR speech codec. This format is referred to as AMR Interface Format 1 (AMR IF1). Annex A describes AMR Interface Format 2 (AMR IF2).

Each AMR codec mode follows the generic frame structure depicted in Figure 1 below. The frame is divided into three parts: AMR Header, AMR Auxiliary Information, and AMR Core Frame. The AMR Header part includes the Frame Type and the Frame Quality Indicator fields. The AMR auxiliary information part includes the Mode Indication, Mode Request, and Codec CRC fields. The AMR Core Frame part consists of the speech parameter bits or, in case of a comfort noise frame, the comfort noise parameter bits. In case of a comfort noise frame, the comfort noise parameters replace Class A bits of AMR Core Frame while Class B and C bits are omitted.

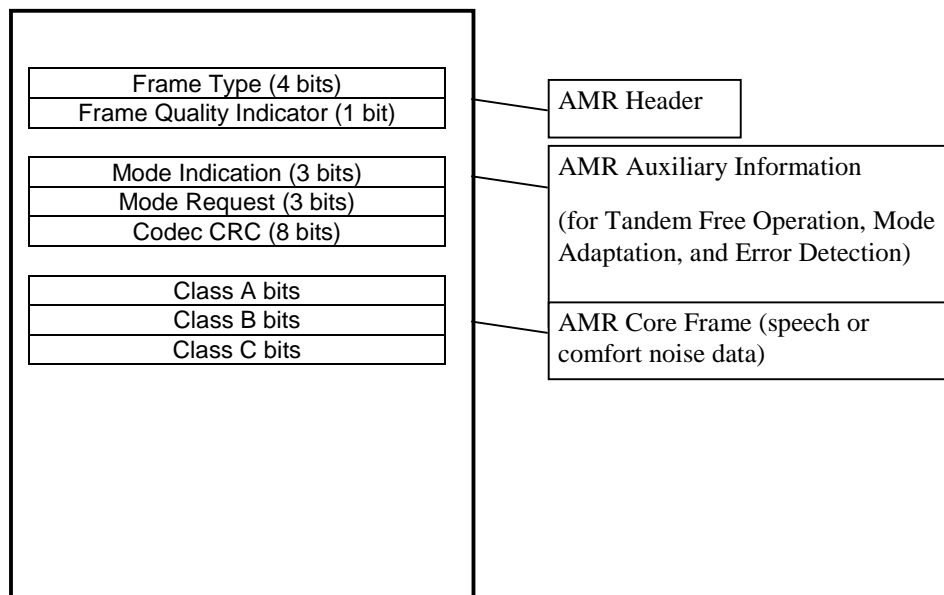

Figure 1. Generic AMR frame structure

4.1 AMR Header and AMR Auxiliary Information

This section describes the AMR Header of Figure 1.

4.1.1 Frame Type, Mode Indication, and Mode Request

Table 1a below defines the 4-bit Frame Type field. Frame Type can indicate the use of one of the eight AMR codec modes, one of four different comfort noise frames, or an empty frame. In addition, three Frame Type Indices are reserved for future use. The same table is reused for the Mode Indication and Mode Request fields which are 3-bit fields each and use only the Frame Type Indices 0...7 to specify one of the eight AMR codec modes.

Frame Type Index	Frame content (AMR mode, comfort noise, or other)
0	4.75 kbit/s
1	5.15 kbit/s
2	5.90 kbit/s
3	6.70 kbit/s (PDC-EFR)
4	7.40 kbit/s (IS-641)
5	7.95 kbit/s
6	10.2 kbit/s
7	12.2 kbit/s (GSM EFR)
8	AMR Comfort Noise Frame
9	GSM-EFR Comfort Noise Frame
10	IS-641 Comfort Noise frame
11	PDC-EFR Comfort Noise Frame
12-14	For future use
15	No transmission/No reception

Table 1a. Interpretation of Frame Type Index used for the Frame Type, Mode Indication, and Mode Request fields of AMR Header

4.1.2 Frame Quality Indicator

The content of the Frame Quality Indicator field is defined in Table 1b. The field length is one bit which indicates whether the data in the frame contains errors.

Frame Quality Indicator (FQI)	Quality of data
0	Corrupted frame (bits may be used to assist error concealment)
1	Good frame

Table 1b. Definition of Frame Quality Indicator

4.1.3 Mapping to TX_TYPE and RX_TYPE

Table 1c shows how the AMR Header data (FQI and Frame Type) maps to the TX_TYPE and RX_TYPE frames defined in [2].

Frame Quality Indicator	Frame Type Index	TX_TYPE or RX_TYPE	Comment
1	0-7	SPEECH_GOOD	The specific Frame Type Index depends on the bit-rate being used.
0	0-7	SPEECH_BAD	The specific Frame Type Index depends on the bit-rate being used. The corrupted data may be used to assist error concealment.
1	8 8	SID_FIRST or SID_UPDATE	SID_FIRST and SID_UPDATE are differentiated using Class A bits.
0	8	SID_BAD	
1	9-11	SID_UPDATE	
0	9-11	SID_BAD	
1	15	NO_DATA	Typically a non-transmitted frame or an erased or stolen frame with no data usable to assist error concealment.

Table 1c. Mapping of Frame Quality Indicator and Frame Type to TX_TYPE and RX_TYPE [2], respectively.

4.1.4 Codec CRC

AMR codec frames with Frame Type 0..11 are associated with an 8-bit CRC for error-detection purposes. The Codec CRC field of AMR Auxiliary Information in Figure 1 contains the value of this CRC. These eight parity bits are generated by the cyclic generator polynomial

$$G(x)=D^8 + D^6 + D^5 + D^4 + 1$$

which is computed over all Class A bits of AMR Core Frame. Class A bits for Frame Types 0..7 are defined in Section 4.2.2 (for speech bits) and for Frame Types 8..11 in Section 4.2.3 (for comfort noise bits).

When Frame Type Index of Table 1a is 15 the CRC field is not included in the AMR frame.

4.2 AMR Core Frame

This section contains the description of AMR Core Frame of Figure 1. The descriptions for AMR Core Frame with speech bits and with comfort noise bit are given separately.

4.2.1 AMR Core Frame with speech bits: Bit ordering

This section describes how AMR Core Frame carries the coded speech data. The bits produced by the speech encoder are denoted as $\{s(1),s(2),\dots,s(K)\}$, where K refers to the number of bits produced by the speech encoder as shown in Table 2 below. The notation $s(i)$ follows that of [1]. The speech encoder output bits are ordered according to their subjective importance. This bit ordering can be utilized for error protection purposes when the speech data is, for example, carried over a radio interface. Tables B.1 to B.8 in Annex B define the AMR IF1 bit ordering for all the eight AMR codec modes. In these tables the speech bits are numbered in the order they are produced by the corresponding speech encoder as described in the relevant tables of TS 26.090 [1]. The reordered bits are denoted below, in the order of decreasing importance, as $\{d(0),d(1),\dots,d(K-1)\}$.

The ordering algorithm is described in pseudo code as

for $j = 0$ to $K-1$

$$d(j) := s(\text{table}_m(j)+1);$$

where $table_m(j)$ refers to the relevant table in Annex B depending on the AMR mode $m=0..7$. The Annex B tables should be read line by line from left to right. The first element of the table has the index 0.

4.2.2 AMR Core Frame with speech bits: Class division

The reordered bits are further divided into three indicative classes according to their subjective importance. This class division is only informative and provides supporting information for mapping this generic format into specific formats. The three different importance classes can then be subject to different error protection in the network.

The importance classes are Class A, Class B, and Class C. Class A contains the bits most sensitive to errors and any error in these bits typically results in a corrupted speech frame which should not be decoded without applying appropriate error concealment. This class is protected by the CRC in AMR Auxiliary Information. Classes B and C contain bits where increasing error rates gradually reduce the speech quality, but decoding of an erroneous speech frame is usually possible without annoying artifacts. Class B bits are more sensitive to errors than Class C bits. The importance ordering applies also within the three different classes and there are no significant step-wise changes in subjective importance between neighboring bits at the class borders.

The number of speech bits in each class (Class A, Class B, and Class C) for each AMR mode is shown in Table 2 below. The classification in Table 2 and the importance ordering $d(j)$, together, are sufficient to assign all speech bits to their correct classes. For example, when the AMR codec mode is 4.75, then the Class A bits are $d(1)..d(42)$, Class B bits are $d(43)..d(95)$, and there are no Class C bits.

Frame Type Index	AMR codec mode	Total number of bits	Class A	Class B	Class C
0	4.75	95	42	53	0
1	5.15	103	49	54	0
2	5.90	118	55	63	0
3	6.70	134	58	76	0
4	7.40	148	61	87	0
5	7.95	159	75	84	0
6	10.2	204	65	99	40
7	12.2	244	81	103	60

Table 2. Number of bits in Classes A, B, and C for each AMR codec mode

4.2.3 AMR Core Frame with comfort noise bits

The AMR Core Frame content for the additional frame types with Type Indices 8-15 in Table 1a are described in this section. These mainly consist of the frames related to Source Controlled Rate Operation specified in [2].

The data content (comfort noise bits) of the additional frame types is carried in AMR Core Frame. The comfort noise bits are all mapped to Class A of AMR Core Frame and Classes B and C are not used. This is a notation convention only and the class division has no meaning for comfort noise bits.

The number of bits in each class (Class A, Class B, and Class C) for the AMR comfort noise bits (Frame Type Index 8) is shown in Table 3. The contents of SID_UPDATE and SID_FIRST are divided into three parts (SID Type Indicator, Mode Indication, and Comfort Noise Parameters) as defined in [2].

Frame Type Index	FQI	AMR TX_TYPE or RX_TYPE	Total number of bits	Class A			Class B	Class C
				SID Type Indicator (K_t)	Mode Indication (K_m)	Comfort Noise Parameters (K_{CN})		
8	1	SID_UPDATE	39	1 (= "1")	3	35	0	0
8	1	SID_FIRST	39	1 (= "0")	3	35 (= "0")	0	0
8	0	SID_BAD	39	1	3	35	0	0

Table 3. Bit classification for Frame Type 8 (AMR Comfort Noise Frame)

The number of bits in each class (Class A, Class B, and Class C) for the comfort noise bits of Frame Types 9-11 is shown in Table 4.

TABLE FOR FURTHER STUDY

Table 4. Bit classification for Frame Types 9-11

4.3 AMR frame composition

The compound AMR frame is formed as a concatenation of AMR Header, AMR Auxiliary Information, and AMR Core Frame, in this order. The first bit of the AMR frame is the first bit of the Frame Type field. The last bit of the AMR frame is the last bit of AMR Core Frame which is the last bit of speech bits or the last bit of comfort noise bits.

Table 5 below summarizes all possible AMR frame format combinations in terms of number of bits in each field.

Frame Type Index	Frame Type	Frame Quality Indicator	Mode Indication	Mode Request	Codec CRC	Class A	Class B	Class C	Total
0	4	1	3	3	8	42	53	0	114
1	4	1	3	3	8	49	54	0	122
2	4	1	3	3	8	55	63	0	137
3	4	1	3	3	8	58	76	0	153
4	4	1	3	3	8	61	87	0	167
5	4	1	3	3	8	75	84	0	178
6	4	1	3	3	8	65	99	40	223
7	4	1	3	3	8	81	103	60	263
8	4	1	3	3	8	39	0	0	58
9	4	1	3	3	8	43	0	0	62
10	4	1	3	3	8	38	0	0	57
11	4	1	3	3	8	37	0	0	56
12	Not used								
13	Not used								
14	Not used								
15	4	0	0	0	0	0	0	0	4

Table 5. Number of bits for different fields in different AMR frame compositions

Annex A: AMR Interface Format 2 (with octet alignment)

This section defines an octet-aligned frame format for the AMR codec. This format is useful, for example, when the AMR codec is used in connection with applicable ITU-T H-series of recommendations. The format is referred to as AMR Interface Format 2 (AMR IF2).

The AMR IF2 frame is formed by concatenation of the 4-bit Frame Type field (as defined for AMR IF1 in Section 4.1.1) and the AMR Core Frame (as defined for AMR IF1 in Section 4.2) as shown in Figure A.1 below. The length of the AMR Core Frame field depends on the particular Frame Type. The total number of bits in the AMR IF2 speech frames in the different modes is typically not a multiple of eight and bit stuffing is needed to achieve an octet structure.

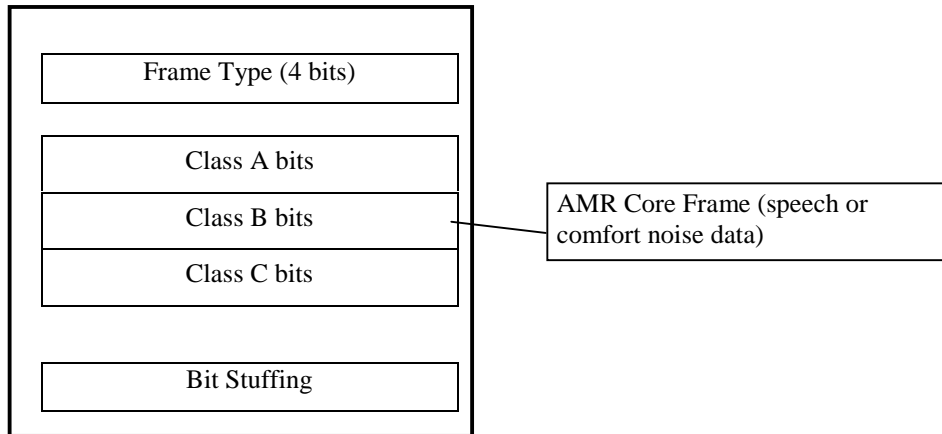

Figure A.1. Frame structure for AMR IF2

Table A.1a shows an example how the AMR 6.7 kbit/s mode is mapped into AMR IF2. The four LSBs of the first octet b_0 consist of the Frame Type Index 3 for the AMR 6.7 kbit/s mode (see Table 1a in AMR IF1 specification). This data field is followed by the 134 AMR Core Frame speech bits ($d(0)\dots d(133)$) which consist of 58 Class A bits and 76 Class B bits as described in Table 2 for AMR IF1. This results in a total of 138 bits and 6 bits are needed for Bit Stuffing to arrive to the closest multiple of 8 which is 144 bits.

Octet	MSB	Octet structure						LSB
b_0	$d(3)$	$d(2)$	$d(1)$	$d(0)$	0	0	1	1
b_1	$d(11)$	$d(10)$	$d(9)$	$d(8)$	$d(7)$	$d(6)$	$d(5)$	$d(4)$
b_2	$d(12)$
b_{17}	UB	UB	UB	UB	UB	UB	$d(133)$	$d(132)$

Table A.1a: Example mapping of the AMR speech coding mode 6.7kbit/s into AMR IF2. The bits used for Bit Stuffing are denoted as UB (for "unused bit").

Table A.1b shows the composition of AMR IF2 frames for all Frame Types in terms of how many bits are used for each field of Figure A.1.

Tables A.2 to A.5 specify how the AMR Core Frame comfort noise bits of Frame Types 8-11 are mapped to AMR IF2. Table A.6 specifies the mapping for an empty frame ("no transmission").

Frame Type	Number of bits	Number of Bits in	Bit Stuffing	Number of
------------	----------------	-------------------	--------------	-----------

Index	in Frame Type	AMR Core Frame		octets (N)
0	4	95	5	13
1	4	103	5	14
2	4	118	6	16
3	4	134	6	18
4	4	148	0	19
5	4	159	5	21
6	4	204	0	26
7	4	244	0	31
8	4	39	5	6
9	4	43	1	6
10	4	38	6	6
11	4	37	7	6
12-14	-	-	-	-
15	4	0	4	1

Table A.1b: Mapping of the AMR speech coding modes defined in TS 26.090 to mode index bits in transmitted octets.

	UB	UB	UB	UB	mi(3)	mi(2)	mi(1)	mi(0)

Table A.6: Mapping of the "no transmission" frame (Frame Type 15) to octets.

Annex B: Tables for AMR Core Frame bit ordering

This section contains the tables required for ordering the AMR Core Frame speech bits corresponding to the different AMR modes. These tables represent $table_m(j)$ in Section 4.2.1 where $m=0..7$ is the AMR mode. The tables are read from left to right so that the first element (top left corner) of the table has index 0 and the last element (the rightmost element of the last row) has the index $K-1$ where K is the total number of speech bits in the specific mode. For example, $table_1(20)=27$, as defined in Table B.1.

0	1	2	3	4	5	6	7	8	9
10	11	12	13	14	15	23	24	25	26
27	28	48	49	61	62	82	83	47	46
45	44	81	80	79	78	17	18	20	22
77	76	75	74	29	30	43	42	41	40
38	39	16	19	21	50	51	59	60	63
64	72	73	84	85	93	94	32	33	35
36	53	54	56	57	66	67	69	70	87
88	90	91	34	55	68	89	37	58	71
92	31	52	65	86					

Table B.1: Ordering of the speech encoder bits for the 4.75 kbit/s mode: $table_1(j)$

7	6	5	4	3	2	1	0	15	14
13	12	11	10	9	8	23	24	25	26
27	46	65	84	45	44	43	64	63	62
83	82	81	102	101	100	42	61	80	99
