## Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: *"Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards"*, which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (<http://webapp.etsi.org/IPR/home.asp>).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

## Foreword

This Technical Specification (TS) has been produced by ETSI 3rd Generation Partnership Project (3GPP).

The present document may refer to technical specifications or reports using their 3GPP identities, UMTS identities or GSM identities. These should be interpreted as being references to the corresponding ETSI deliverables.

The cross reference between GSM, UMTS, 3GPP and ETSI identities can be found under [www.etsi.org/key](http://www.etsi.org/key).

## Foreword

This Technical Specification has been produced by the 3<sup>rd</sup> Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

- x the first digit:
  - 1 presented to TSG for information;
  - 2 presented to TSG for approval;
  - 3 or greater indicates TSG approved document under change control.
- y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- z the third digit is incremented when editorial only changes have been incorporated in the document.

---

## Introduction

The present document is part 2 of a multi-part TS covering the 3<sup>rd</sup> Generation Partnership Project: Technical Specification Group Core Network; Open Service Access (OSA); Application Programming Interface (API), as identified below. The **API specification** (3GPP TS 29.198) is structured in the following Parts:

Part 1:	"Overview";	
<b>Part 2:</b>	<b>"Common Data Definitions";</b>	
Part 3:	"Framework";	
Part 4:	"Call Control";	
	Sub-part 1: "Call Control Common Definitions";	(new in 3GPP Release 5)
	Sub-part 2: "Generic Call Control SCF";	(new in 3GPP Release 5)
	Sub-part 3: "Multi-Party Call Control SCF";	(new in 3GPP Release 5)
	Sub-part 4: "Multi-Media Call Control SCF";	(new in 3GPP Release 5)
	Sub-part 5: "Conference Call Control SCF";	(not part of 3GPP Release 5)
Part 5:	"User Interaction SCF";	
Part 6:	"Mobility SCF";	
Part 7:	"Terminal Capabilities SCF";	
Part 8:	"Data Session Control SCF";	
Part 9:	"Generic Messaging SCF";	(not part of 3GPP Release 5)
Part 10:	"Connectivity Manager SCF";	(not part of 3GPP Release 5)
Part 11:	"Account Management SCF";	
Part 12:	"Charging SCF".	
Part 13:	"Policy Management SCF";	(new in 3GPP Release 5)
Part 14:	"Presence and Availability Management SCF";	(new in 3GPP Release 5)

The **Mapping specification of the OSA APIs and network protocols** (3GPP TR 29.998) is also structured as above. A mapping to network protocols is however not applicable for all Parts, but the numbering of Parts is kept. Also in case a Part is not supported in a Release, the numbering of the parts is maintained.

Table: Overview of the OSA APIs &amp; Protocol Mappings 29.198 &amp; 29.998-family

OSA API specifications 29.198-family					OSA API Mapping - 29.998-family	
29.198-01	Overview				29.998-01	Overview
<b>29.198-02</b>	<b>Common Data Definitions</b>				29.998-02	<i>Not Applicable</i>
29.198-03	Framework				29.998-03	<i>Not Applicable</i>
Call Control (CC) SCF	29.198-04-1	29.198-04-2	29.198-04-3	29.198-04-4	29.998-04-1	Generic Call Control – CAP mapping
	Common CC data definitions	Generic CC SCF	Multi-Party CC SCF	Multi-media CC SCF	29.998-04-2	<i>Generic Call Control – INAP mapping</i>
					29.998-04-3	<i>Generic Call Control – Megaco mapping</i>
					29.998-04-4	Multiparty Call Control – SIP mapping
29.198-05	User Interaction SCF				29.998-05-1	User Interaction – CAP mapping
					29.998-05-2	<i>User Interaction – INAP mapping</i>
					29.998-05-3	<i>User Interaction – Megaco mapping</i>
					29.998-05-4	User Interaction – SMS mapping
29.198-06	Mobility SCF				29.998-06	User Status and User Location – MAP mapping
29.198-07	Terminal Capabilities SCF				29.998-07	<i>Not Applicable</i>
29.198-08	Data Session Control SCF				29.998-08	Data Session Control – CAP mapping
29.198-09	<i>Generic Messaging SCF</i>				29.998-09	<i>Not Applicable</i>
29.198-10	<i>Connectivity Manager SCF</i>				29.998-10	<i>Not Applicable</i>
29.198-11	Account Management SCF				29.998-11	<i>Not Applicable</i>
29.198-12	Charging SCF				29.998-12	<i>Not Applicable</i>
29.198-13	Policy Management SCF				29.998-13	<i>Not Applicable</i>
29.198-14	Presence & Availability Management SCF				29.998-14	<i>Not Applicable</i>

---

# 1 Scope

The present document is Part 2 of the Stage 3 specification for an Application Programming Interface (API) for Open Service Access (OSA).

The OSA specifications define an architecture that enables application developers to make use of network functionality through an open standardised interface, i.e. the OSA APIs. The concepts and the functional architecture for the OSA are contained in 3GPP TS 23.127 [3]. The requirements for OSA are contained in 3GPP TS 22.127 [2].

The present document specifies the Common Data definitions of the OSA. The Common Data definitions contain data-types that are common across the rest of the OSA API. All aspects of the Common Data are defined here, these being:

- Data definitions;
- IDL Description of the data types;
- WSDL Description of the data types;
- Reference to the Java API description of the data types.

This specification has been defined jointly between 3GPP TSG CN WG5, ETSI SPAN 12 and the Parlay Consortium, in co-operation with a number of JAIN™ Community member companies.

---

# 2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the same Release as the present document*.

---

## 3 Definitions and abbreviations

### 3.1 Definitions

For the purposes of the present document, the terms and definitions given in TS 29.198-1 [1] apply.

### 3.2 Abbreviations

For the purposes of the present document, the abbreviations given in TS 29.198-1 [1] apply.

---

## 4 Common Data definitions

The following clauses describe each aspect of the Common Data definitions.

The order is as follows:

- The Data definitions clause shows a detailed expansion of each of the data types associated with the methods within the classes.
- IDL description of the data types (normative Annex);
- WSDL description of the data types (informative Annex);
- Reference to the Java API description of the data types (informative Annex).

---

## 5 Common System Data definitions

These data definitions are assumed to be provided by the client operating system.

### 5.1 Standard Data types

The APIs assume that the following Data types can be supported.

#### 5.1.1 TpBoolean

Defines a Boolean data type.

#### 5.1.2 TpInt32

Defines a signed 32-bit integer.

#### 5.1.3 TpFloat

Defines a single precision real number.

#### 5.1.4 TpLongString

Defines a Byte string, comprising length and data. The length shall be at least a 32-bit integer.

#### 5.1.5 TpOctet

Defines an 8-bit quantity that is not translated during transmission.

### 5.1.6 TpOctetSet

Defines a Numbered Set of Data elements of TpOctet.

### 5.1.7 TpString

Defines a Byte string, comprising length and data. The length shall be at least a 16-bit integer.

### 5.1.8 TpAssignmentID

Defines an assignment ID with a value that is at least unique within the context of the implementation of the interface creating this ID. This ID is used to identify single or multiple event notifications enabled by the requesting interface implementation. This ID can also be used by the requesting interface implementation to modify or stop further event notifications.

Example 1, myIpUserLocation may implement the IpUserLocation interface. If so, myIpUserLocation may receive multiple Req methods, and will generate a single assignment ID per request that is unique within the context of myIpUserLocation.

Example 2, myIpMultiPartyCallControlManager may implement the IpMultiPartyCallControlManager interface. If so, myIpMultiPartyCallControlManager may receive multiple createNotification method invocations, and will generate a single assignment ID per request that is unique within the context of myIpMultiPartyCallControlManager. myIpMultiPartyCallControlManager may also receive changeNotification or destroyNotification methods that will contain an assignment ID used to correlate these methods with the original createNotification method.

The assignment ID is identical to a [TpInt32](#) type.

### 5.1.9 TpSessionID

Defines a session ID with a value that is at least unique within the context of a specific instance of an SCF. An instance of an SCF is a single service manager instance plus the associated subordinate instances. For example, a single MultiPartyCallControlManager instance plus all associated MultiPartyCall and MultiPartyCallLeg instances. The session ID is used to identify different sessions (e.g. different call or call leg sessions) of an interface capable of handling multiple sessions.

Example 1, myCallObject may implement the IpCall interface. If so, myCallObject may handle multiple call sessions, and each call session will be identified by a call session ID value (e.g. 1, 2, 3) that is unique within the context of the SCF instance.

Example 2, myCallAndCallLegObject may implement the IpCall and IpCallLeg interfaces. If so, myCallAndCallLegObject may handle multiple call sessions and multiple call leg sessions. Each call session will be identified by a call session ID value (e.g. 1, 2, 3) that is unique within the context of the SCF instance. Similarly, each call leg session will be identified by a call leg session ID value (e.g. 1, 2, 3, 4, 5, 6) that is also unique within the context of the SCF instance. Because call session IDs and call leg session IDs are different data types, overlapping values are permitted and their uniqueness still remains.

The session ID is identical to a [TpInt32](#) type.

### 5.1.10 TpSessionIDSet

Defines a Numbered Set of Data Elements of [TpSessionID](#).

### 5.1.11 TpAny

Defines a type that can hold any type. This is not restricted to only the primitive types.

## 5.1.12 TpAttribute

This is a Sequence of Data Elements containing the attribute name, type, and value. The attribute Value is interpreted based on the value of the attribute Type.

Sequence Element Name	Sequence Element Type	Notes
AttributeName	TpString	The name of the attribute.
AttributeType	TpAttributeType	The type of the attribute. Valid values for Type must include at least TpString, TpInt32 and TpFloat.
AttributeValue	TpAny	The values for the attribute. This model allows multi-valued attributes. Cannot be an empty list.

## 5.1.13 TpAttributeType

This data type is identical to a TpString, and is defined as a string of characters that uniquely identifies the type of an attribute. Other Network operator specific capabilities may also be used, but should be preceded by the string "SP\_". The following values are defined.

Character String Value	Description
NULL	An empty (NULL) string indicates no attribute type
P_STRING	Attribute type is type TpString.
P_INT32	Attribute type is type TpInt32.
P_FLOAT	Attribute type is type TpFloat.

## 5.1.14 TpAttributeList

This is a Numbered List of Data Elements of type TpAttribute.

## 5.1.15 TpAttributeSet

This is a Numbered Set of Data Elements of type TpAttribute.

## 5.1.16 TpInt64

Defines a signed 64-bit integer.

## 5.1.17 TpVersion

This data type is identical to [TpString](#). It is used to uniquely identify the implemented version of the framework or an SCF. The syntax for this datatype is defined as:

**P\_<publishing body>\_<version number>**

Where:

**<publishing body>** is one of the strings listed in the table below.

Character String Value	Description
PARLAY	Specification released by The Parlay Group.
ETSI	Specification released by ETSI.
3GPP	Specification released by 3GPP.

**<version number>** consists of numbers separated by underscores (e.g. 3\_1). It is recommended that not more than the two most significant numbers (major and minor version) of the version are used.

Examples of version strings are:

Character String Value	Description
P_PARLAY_3_1	Parlay v3.1
P_ETSI_2_0	ETSI v2.0
P_3GPP_4_3	3GPP Release 4.3

Note that different version strings can be aliases of each other all pointing to the same SCF/Framework version.

### 5.1.18 TpStringSet

Defines a Numbered Set of Data Elements of type TpString.

### 5.1.19 TpStringList

Defines a Numbered List of Data Elements of type TpString.

## 5.2 Other Data sorts

The APIs assumes that the following data syntaxes can be supported:

### 5.2.1 Sequence of Data Elements

This describes a sequence of data types. This may be defined as a structure (for example, in C++) or simply a sequence of data elements within a structure.

EXAMPLE: The [TpAddress](#) data type may be defined in C++ as:

```
typedef struct {
    TpAddressPlan      Plan;
    TpString           AddrString;
    TpString           Name;
    TpAddressPresentation....Presentation;
    ...TpAddressScreening.....Screening;
    ...TpString.....SubAddressString;
} TpAddress;
```

### 5.2.2 Tagged Choice of Data Elements

This describes a data type which actually evaluates to one of a choice of a number of data elements. This data element contains two parts: a tag data type (the *tag* part) which is used to identify the chosen data type, and the chosen data type itself (the *union* part). This form of data type is also referred to as a tagged union.

This data type can be implemented (for example, in C++) as a structure containing an integer for the *tag* part, and a union for the *union* part.

This data type is implementation specific. Please refer to the appropriate IDL documents (and the resulting language mappings) to see how this data type is implemented.

EXAMPLE: The `TpCallError` data type may be defined in C++ as:

```
typedef struct {
    TpCallErrorType Tag;
    union {
        TpCallErrorInfoUndefined      Undefined;
        TpCallErrorInfoRoutingAborted RoutingAborted;
        TpCallErrorInfoCallAbandoned  CallAbandoned;
        TpCallErrorInfoInvalidAddress  InvalidAddress;
        TpCallErrorInfoInvalidState   InvalidState;
        TpCallErrorInfoInvalidCriteria InvalidCriteria;
    } callErrorInfo;
} TpCallError;
```

## 5.2.3 Numbered Set of Data Elements

This describes a data type which comprises an integer which indicates the total number of data elements in the set (the *number* part), and an **unordered** set of data elements (the *data* part). *Set* data types do not contain duplicate data elements.

EXAMPLE: The [TpAddressSet](#) data type may be defined in C++ as:

```
typedef struct {
    TpInt32 Number;
    TpAddress Set[Number];
} TpAddressSet;
```

## 5.2.4 Reference

This describes a reference (or pointer) to a data type.

## 5.3 Interface Related Data definitions

### 5.3.1 IpInterface

Defines the address of a generic interface instance.

### 5.3.2 IpInterfaceRef

Defines a Reference to type IpInterface.

## 5.4 Exception Classes

### 5.4.1 Underlying Technology Exceptions

All methods contain a signature showing, amongst other things, the explicit exceptions that they may throw. In addition to these exceptions, all methods can throw a number of implicit exceptions. These exceptions do not need to be included within the method signatures and are given below.

These exceptions would be thrown by the underlying technology (e.g. CORBA, Java) as a result of problems encountered, for example, with the way the API method is invoked. They are a minimum set of exceptions that must be throwable by the underlying technology. Depending upon the underlying technology, additional method exceptions may also be thrown.

Description
Invalid Parameter: A method has been passed an invalid parameter argument
Invalid Parameter Value: A method parameter has been passed a value that is out of range
Parameter Missing: A method has not been passed a mandatory parameter argument

### 5.4.2 TpCommonExceptions

Defines the structure of the exception class which is applicable to all methods.

Structure Element Name	Structure Element Type	Structure Element Description
ExceptionType	TpInt32	Carries a constant from the list in the table below
ExtraInformation	TpString	Carries extra information to help identify the source of the exception, e.g. a parameter name

### 5.4.3 Constants associated with TpCommonExceptions

Name	Value	Description
P_RESOURCES_UNAVAILABLE	000Dh	The required resources in the network are not available
P_TASK_REFUSED	000Eh	The requested method has been refused
P_TASK_CANCELLED	000Fh	The requested method has been cancelled
P_NO_CALLBACK_ADDRESS_SET	0011h	The requested method is refused because no callback address has been set (this may be the result of a timing issue between setting the callback address and invoking the method)
P_METHOD_NOT_SUPPORTED	0016h	The method is not allowed or supported within the context of the current service agreement.
P_INVALID_STATE	0306h	Unexpected sequence of methods, i.e., the sequence does not match the specified state diagrams.

### 5.4.4 Exceptions available to all methods on all interfaces

The following are the list of exception classes which are available to all interfaces of the API.

Name	Description
P_APPLICATION_NOT_ACTIVATED	An application is unauthorised to access information and request services with regards to users that have deactivated that particular application.  In case the request was for information related to multiple user identities the reference to user identities that are causing this exception will be returned in the extra information of the exception.
P_INFORMATION_NOT_AVAILABLE	The requested information is not available. A reason might be that the information is unavailable in the core network or that the application is unauthorised to access the information. An application is unauthorised to access information and request services with regards to users that have set their privacy flag regarding that particular service. In case the request was for information related to multiple user identities, the reference to user identities that are causing this exception will be returned in the extra information of the exception.
P_INVALID_ADDRESS	Invalid address specified
P_INVALID_AMOUNT	Invalid amount specified.
P_INVALID_ASSIGNMENT_ID	The assignment ID is invalid
P_INVALID_CRITERIA	Invalid criteria specified
P_INVALID_CURRENCY	Invalid currency specified.
P_INVALID_EVENT_TYPE	Invalid event type
P_INVALID_INTERFACE_NAME	Invalid interface name
P_INVALID_INTERFACE_TYPE	The interface reference supplied by the client is the wrong type.
P_INVALID_NETWORK_STATE	Although the sequence of method calls is allowed by the gateway, the underlying protocol can not support it.  E.g., in some protocols some methods are only allowed by the protocol, when the call processing is suspended, e.g., after reporting an event that was monitored in interrupt mode.
P_INVALID_SESSION_ID	Invalid session ID.
P_INVALID_TIME_AND_DATE_FORMAT	Invalid date and time format provided
P_UNAUTHORISED_PARAMETER_VALUE	A method parameter value violates the Service Level Agreement
P_UNKNOWN_SUBSCRIBER	The subscriber is not known in the network or the application is unauthorised to access information and request services with regards to users that are not subscribed to the application.  In case the request was for information related to multiple user identities, the reference to user identities that are causing this exception will be returned in the extra information of the exception.
P_UNSUPPORTED_ADDRESS_PLAN	An address contains an address plan which is not supported
P_INVALID_VERSION	An invalid version is specified.

## 5.5 Date- and Time-related Data definitions

### 5.5.1 TpDate

This data type is identical to a [TpString](#). It specifies the data in accordance with International Standard ISO 8601 [4]. This is defined as the string of characters in the following format:

**YYYY-MM-DD**

where the date is specified as:

YYYY            four digits year

MM              two digits month

DD              two digits day

The date elements are separated by a hyphen character (-).

EXAMPLE:      The 4 December 1998, is encoded as the string:  
1998-12-04

### 5.5.2 TpTime

This data type is identical to a [TpString](#). It specifies the time in accordance with International Standard ISO 8601 [4]. This is defined as the string of characters in the following format:

**HH:MM:SS.mmm**

or

**HH:MM:SS.mmmZ**

where the time is specified as:

HH              two digits hours (24h notation)

MM              two digits minutes

SS              two digits seconds

mmm            three digits fractions of a second (i.e. milliseconds)

The time elements are separated by a colon character (:). The date and time are separated by a space. Optionally, a capital letter Z may be appended to the time field to indicate Universal Time Co-ordinated (UTC). Otherwise, local time is assumed.

EXAMPLE:      10:30 and 15 seconds is encoded as the string:  
10:30:15.000  
for local time, or in UTC it would be: 10:30:15.000Z

### 5.5.3 TpDateAndTime

This data type is identical to a [TpString](#). It specifies the data and time in accordance with International Standard ISO 8601 [4]. This is defined as the string of characters in the following format:

**YYYY-MM-DD HH:MM:SS.mmm**

or

**YYYY-MM-DD HH:MM:SS.mmmZ**

where the date is specified as:

YYYY	four digits year
MM	two digits month
DD	two digits day

The date elements are separated by a hyphen character (-).

The time is specified as:

HH	two digits hours (24h notation)
MM	two digits minutes
SS	two digits seconds
mmm	three digits fractions of a second (i.e. milliseconds)

The time elements are separated by a colon character (:). The date and time are separated by a space. Optionally, a capital letter Z may be appended to the time field to indicate Universal Time Co-ordinated (UTC). Otherwise, local time is assumed.

EXAMPLE: The 4 December 1998, at 10:30 and 15 seconds is encoded as the string:

```
1998-12-04 10:30:15.000
```

for local time, or in UTC it would be:

```
1998-12-04 10:30:15.000Z
```

## 5.5.4 TpDuration

This data type is a [TpInt32](#) representing a time interval in milliseconds. A value of "-1" defines infinite duration and a value of "-2" represents a default duration.

## 5.5.5 TpTimeInterval

Defines the Sequence of Data Elements that specify a time interval.

Sequence Element Name	Sequence Element Type
StartTime	<a href="#">TpDateAndTime</a>
StopTime	<a href="#">TpDateAndTime</a>

## 5.6 Address-related Data definitions

### 5.6.1 TpAddress

Defines the Sequence of Data Elements that specify an address.

Sequence Element Name	Sequence Element Type
Plan	<a href="#">TpAddressPlan</a>
AddrString	<a href="#">TpString</a>
Name	<a href="#">TpString</a>
Presentation	<a href="#">TpAddressPresentation</a>
Screening	<a href="#">TpAddressScreening</a>
SubAddressString	<a href="#">TpString</a>

The `AddrString` defines the actual address information and the structure of the string depends on the Plan. The following table gives an overview of the format of the `AddrString` for the different address plans.

Address Plan	AddrString Format Description	Example
P_ADDRESS_PLAN_NOT_PRESENT	Not applicable	
P_ADDRESS_PLAN_UNDEFINED	Not applicable	
P_ADDRESS_PLAN_IP	For Ipv4 the dotted quad notation is used. Also for IPv6 the dotted notation is used. The address can optionally be followed by a port number separated by a colon.	"127.0.0.1:42"
P_ADDRESS_PLAN_MULTICAST	An Ipv4 class D address or Ipv6 equivalent in dotted notation.	"224.0.0.0"
P_ADDRESS_PLAN_UNICAST	A non-multicast or broadcast IP address in dotted notation.	"127.0.0.1"
P_ADDRESS_PLAN_E164	An international number without the international access code, including the country code and excluding the leading zero of the area code.	"31161249111"
P_ADDRESS_PLAN_AESA	The ATM End System Address in binary format (40 bytes)	01234567890ABCDEF01234567890ABCDEF01234567
P_ADDRESS_PLAN_URL	A uniform resource locator as defined in IETF RFC 1738 [6]	"http://www.parlay.org"
P_ADDRESS_PLAN_NSAP	The binary representation of the Network Service Access Point	490001AA000400010420
P_ADDRESS_PLAN_SMTP	An e-mail address as specified in IETF RFC822 [7]	"webmaster@parlay.org"
P_ADDRESS_PLAN_X400	The X400 address structured as a set of attribute value pairs separated by semicolons.	"C=nl;ADMD=;PRMD=uninet;O=parlay;S=Doe;l=S;G=John"
P_ADDRESS_PLAN_SIP (Note 1)	Any valid address string allowed in RFC 3261 "SIP: Session Initiation Protocol"	"sip:user@parlay.org" "tel:+358-555-1234567;postd=pp22" <sip:enquiries@1.2.3.4:5060>Enquiries"
P_ADDRESS_PLAN_ANY (Note 2)	Not applicable	
NOTE 1: It should be noted that two SIP addresses will be regarded as equivalent by a gateway if they correspond to the same user at the same network address. The textual form of the two addresses need not be the same. For example, <code>sip:enquiries@parlay.org</code> will be deemed to match <code>&lt;sip:Enquiries@1.2.3.4:5060&gt;Enquiries</code> (if <code>parlay.org</code> resolves to 1.2.3.4).		
NOTE 2: This is only to be used with <code>TpAddressRange</code>		

## 5.6.2 TpAddressSet

Defines a Numbered Set of Data Elements of [TpAddress](#).

## 5.6.3 TpAddressPresentation

Defines whether an address can be presented to an end user.

Name	Value	Description
P_ADDRESS_PRESENTATION_UNDEFINED	0	Undefined
P_ADDRESS_PRESENTATION_ALLOWED	1	Presentation Allowed
P_ADDRESS_PRESENTATION_RESTRICTED	2	Presentation Restricted
P_ADDRESS_PRESENTATION_ADDRESS_NOT_AVAILABLE	3	Address not available for presentation

## 5.6.4 TpAddressScreening

Defines whether an address can be presented to an end user.

Name	Value	Description
P_ADDRESS_SCREENING_UNDEFINED	0	Undefined
P_ADDRESS_SCREENING_USER_VERIFIED_PASSED	1	user provided address verified and passed
P_ADDRESS_SCREENING_USER_NOT_VERIFIED	2	user provided address not verified
P_ADDRESS_SCREENING_USER_VERIFIED_FAILED	3	user provided address verified and failed
P_ADDRESS_SCREENING_NETWORK	4	Network provided address (see Note)
NOTE: Even though the application may provide the address to the gateway, from the end-user point of view it is still regarded as a network provided address.		

## 5.6.5 TpAddressPlan

Defines the address plan (or numbering plan) used. It is also used to indicate whether an address is actually defined in a [TpAddress](#) data element.

Name	Value	Description
P_ADDRESS_PLAN_NOT_PRESENT	0	No Address Present
P_ADDRESS_PLAN_UNDEFINED	1	Undefined
P_ADDRESS_PLAN_IP	2	IP
P_ADDRESS_PLAN_MULTICAST	3	Multicast
P_ADDRESS_PLAN_UNICAST	4	Unicast
P_ADDRESS_PLAN_E164	5	E.164
P_ADDRESS_PLAN_AESA	6	AESA
P_ADDRESS_PLAN_URL	7	URL
P_ADDRESS_PLAN_NSAP	8	NSAP
P_ADDRESS_PLAN_SMTP	9	SMTP
<<deprecated>> P_ADDRESS_PLAN_MSMAIL (see Note)	10	Microsoft Mail
P_ADDRESS_PLAN_X400	11	X.400
P_ADDRESS_PLAN_SIP	12	Any URL scheme which is allowed in RFC 3261 "SIP: Session Initiation Protocol"
P_ADDRESS_PLAN_ANY	13	Any address plan is deemed to match (This is only used for TpAddressRange)
NOTE: This value is not to be used.		

For the case where the P\_ADDRESS\_PLAN\_NOT\_PRESENT and P\_ADDRESS\_PLAN\_ANY are indicated, the rest of the information in the TpAddress is not valid.

## 5.6.6 TpAddressError

Defines the reasons why an address is invalid.

Name	Value	Description
P_ADDRESS_INVALID_UNDEFINED	0	Undefined error
P_ADDRESS_INVALID_MISSING	1	Mandatory address not present
P_ADDRESS_INVALID_MISSING_ELEMENT	2	Mandatory address element not present
P_ADDRESS_INVALID_OUT_OF_RANGE	3	Address is outside of the valid range
P_ADDRESS_INVALID_INCOMPLETE	4	Address is incomplete
P_ADDRESS_INVALID_CANNOT_DECODE	5	Address cannot be decoded

## 5.6.7 TpAddressRange

Defines the Sequence of Data Elements that specify a range of addresses.

Sequence Element Name	Sequence Element Type
Plan	<a href="#">TpAddressPlan</a>
AddrString	<a href="#">TpString</a>
Name	<a href="#">TpString</a>
SubAddressString	<a href="#">TpString</a>

The AddrString defines the actual address information and the structure of the string depends on the Plan.

An overview of the AddrString formats can be found at the description of the TpAddress data-type.

The difference with TpAddress is that there are no Presentation and Screening elements, the AddrString can contain wildcards and Plan may contain P\_ADDRESS\_PLAN\_ANY.

If P\_ADDRESS\_PLAN\_ANY is set then the TpAddressRange will be deemed by the gateway to match any TpAddress. If a specific Plan is set (including P\_ADDRESS\_PLAN\_NOT\_PRESENT) then the address plan of the range must be identical to the plan contained in an address for the two to match.

Two wildcards are allowed: \* which matches zero or more characters and ? which matches exactly one character. For E.164 addresses, \* which matches zero or more characters and ? are allowed at the beginning or end.

Some examples for E.164 addresses:

- "123" matches specified number;
- "123\*" matches all numbers starting with 123 (including 123 itself);
- "123??\*" matches all numbers starting with 123 and at least 5 digits long;
- "123???" matches all numbers starting with 123 and exactly 6 digits long;
- "\*" matches any address

The following address ranges are illegal:

- "1?3"
- "1\*3"
- "?123\*"
- ""

Legal occurrences of the '\*' and '?' characters in AddrString should be escaped by a '\' character. To specify a '\' character '\\' shall be used.

For e-mail style addresses, the wildcards are allowed at the beginning of the AddrString:

- "\*@parlay.org" matches all email addresses in the parlay.org domain.

For SIP addresses, wildcards are allowed between the 'sip:' and the '@' in the AddrString, e.g.

- "sip:\*@parlay.org" matches all SIP addresses at parlay.org:5060.

## 5.6.8 TpURL

This data type is identical to a [TpString](#) and contains a URL address. The usage of this type is distinct from [TpAddress](#), which can also hold a URL. The latter contains a user address which can be specified in many ways: IP, e-mail, URL etc. On the other hand, the TpURL type does not hold the address of a user and always represents a URL. This type is used in user interaction and defines the URL of the test or stream to be sent to an end-user. It is therefore inappropriate to use a general address here.

## 5.7 Price-related Data definitions

### 5.7.1 TpPrice

This data type is identical to a [TpString](#). It specifies price information. This is defined as a string of characters (digits) in the following format:

DDDDDD.DD

### 5.7.2 TpAoCInfo

Defines the Sequence of Data Elements that specify the Advice Of Charge information to be sent to the terminal.

Sequence Element Name	Sequence Element Type	Description
ChargeOrder	TpAoCOrder	Charge order
Currency	TpString	Currency unit according to ISO-4217:1995 [8]

### 5.7.3 TpAoCOrder

Defines the Tagged Choice of Data Elements that specify the charge plan for the call.

Tag Element Type
TpCallAoCOrderCategory

Tag Element Value	Choice Element Type	Choice Element Name
P_CHARGE_ADVICE_INFO	TpChargeAdviceInfo	ChargeAdviceInfo
P_CHARGE_PER_TIME	TpChargePerTime	ChargePerTime
P_CHARGE_NETWORK	TpString	NetworkCharge

### 5.7.4 TpCallAoCOrderCategory

Name	Value	Description
P_CHARGE_ADVICE_INFO	0	Set of GSM Charge Advice Information elements according to 3GPP TS 22.024 [5]
P_CHARGE_PER_TIME	1	Charge per time
P_CHARGE_NETWORK	2	Operator specific charge plan specification, e.g. charging table name / charging table entry

### 5.7.5 TpChargeAdviceInfo

Defines the Sequence of Data Elements that specify the two sets of Advice of Charge parameters. The first set defines the current tariff. The second set may be used in case of a tariff switch in the network.

Sequence Element Name	Sequence Element Type	Description
CurrentCAI	TpCAIElements	Current tariff
NextCAI	TpCAIElements	Next tariff after tariff switch

## 5.7.6 TpCAIElements

Defines the Sequence of Data Elements that specify the Charging Advice Information elements according to 3GPP TS 22.024 [5].

Sequence Element Name	Sequence Element Type	Description
UnitsPerInterval	TpInt32	Units per interval
SecondsPerTimeInterval	TpInt32	Seconds per time interval
ScalingFactor	TpInt32	Scaling factor
UnitIncrement	TpInt32	Unit increment
UnitsPerDataInterval	TpInt32	Units per data interval
SegmentsPerDataInterval	TpInt32	Segments per data interval
InitialSecsPerTimeInterval	TpInt32	Initial secs per time interval

## 5.7.7 TpChargePerTime

Defines the Sequence of Data Elements that specify the time based charging information.

Sequence Element Name	Sequence Element Type	Description
InitialCharge	TpInt32	Initial charge amount (in currency units * 0.0001)
CurrentChargePerMinute	TpInt32	Current tariff (in currency units * 0.0001)
NextChargePerMinute	TpInt32	Next tariff (in currency units * 0.0001) after tariff switch Only used in setAdviceOfCharge()

## 5.7.8 TpLanguage

This data type is identical to a TpString, and defines the language. In case an indication for the language is not needed an empty string shall be used. In other cases valid language strings are defined in ISO 639 [11].

---

## Annex A (normative): OMG IDL Description of the Common Data definitions

The OMG IDL representation of the present document is contained in a text file (osa.idl contained in archive 2919802IDL.ZIP) which accompanies the present document.

---

## Annex B (informative): W3C WSDL Description of the Common Data definitions

The W3C WSDL representation of this specification is contained in a text file (osa.wsdl contained in archive 2919802WSDL.ZIP) which accompanies the present document.

---

## Annex C (informative): Java API Description of the Common Data definitions

The Java API representation of this specification can be obtained from the following URL:

- JAIN Common (<http://jcp.org/jsr/detail/145.jsp>)

Each JSR webpage contains a table identifying the relationships between the different versions of the Parlay, ETSI/OSA, 3GPP/OSA and JAIN SPA specifications. In addition, each JAIN SPA specification version indicates to which Parlay, ETSI/OSA and 3GPP/OSA specification versions it corresponds to.

# Annex D (normative): Exception Hierarchy

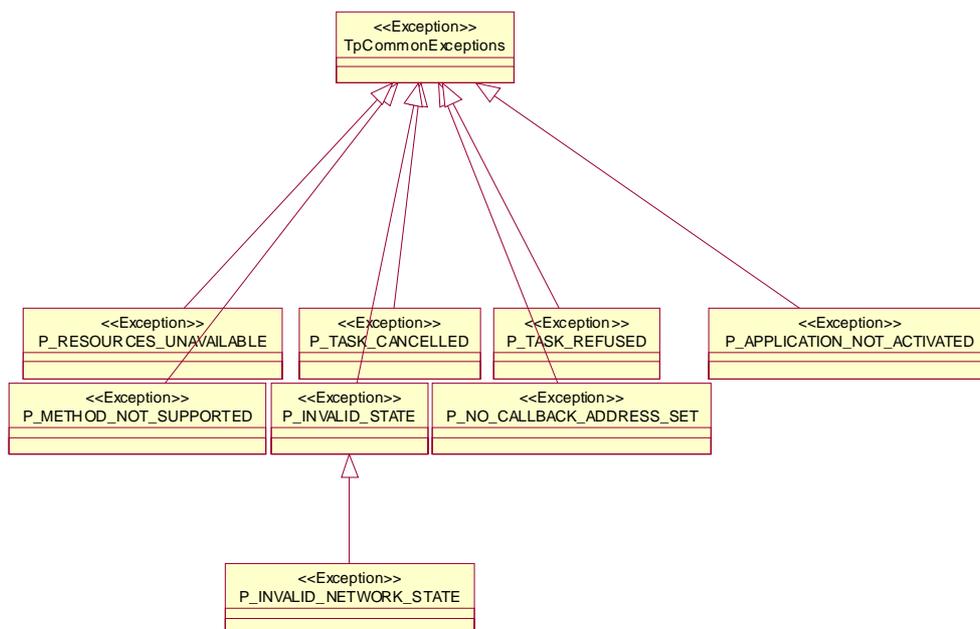

This clause arranges the OSA exceptions as a set of hierarchies that, depending upon the technology realisation, may or may not be utilised to simplify method signatures and software developers' code.

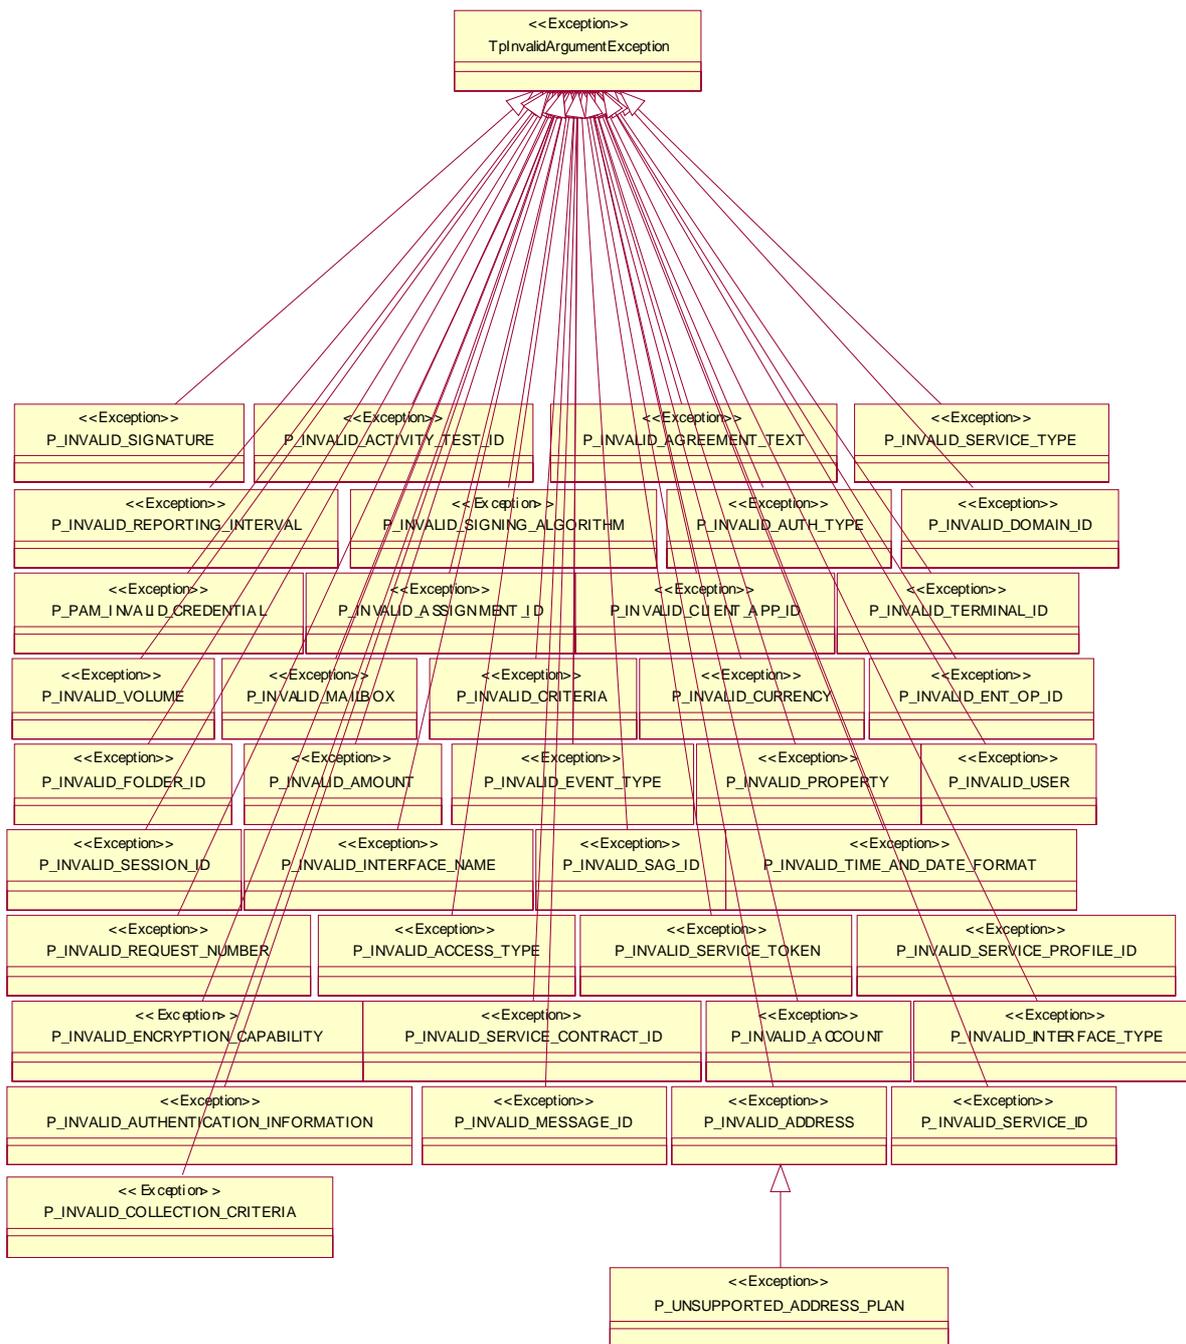

If the exception hierarchy is used in a particular realisation, the following lists all the OSA abstract exceptions:

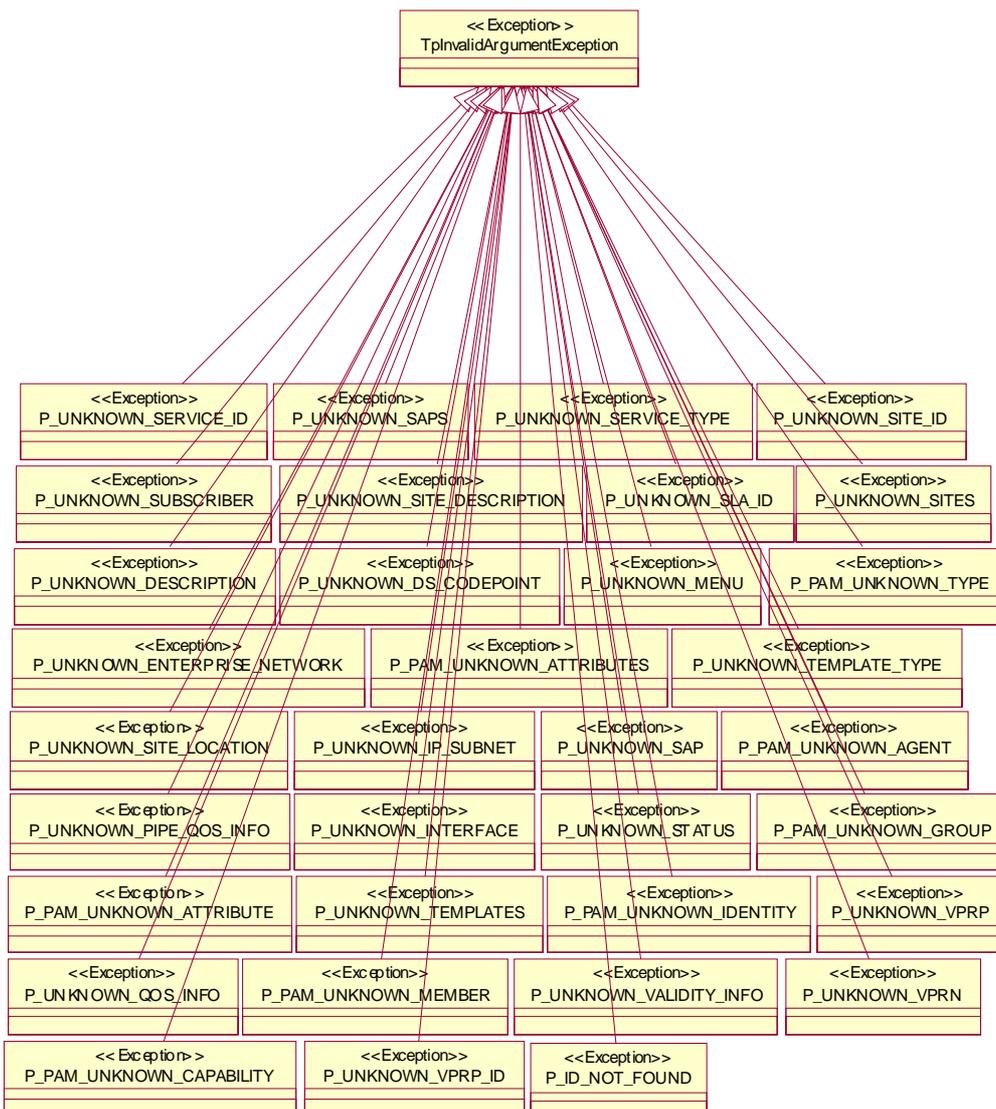

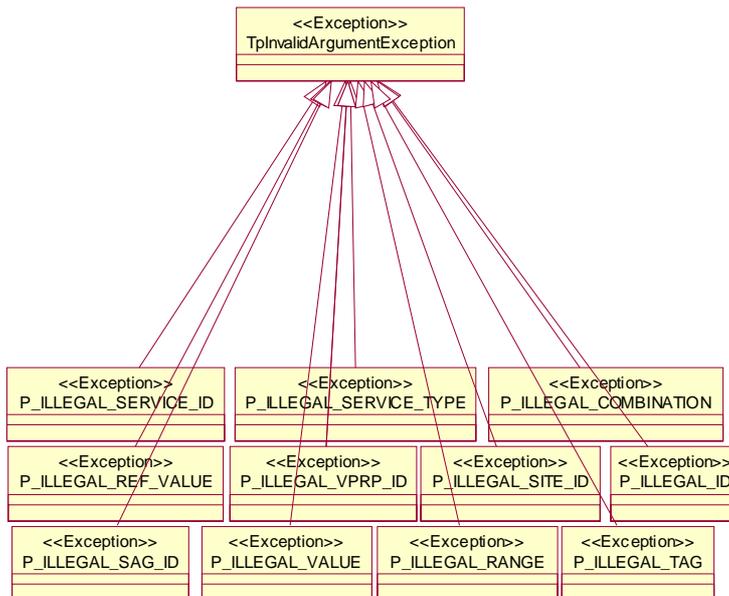

- TpCommonExceptions
- TpInvalidArgumentException
- TpDataSessionException
- TpAccountException
- TpConnectivityException
- TpFrameworkException
- TpMobilityException
- TpMessagingException
- TpPamException
- TpPolicyException

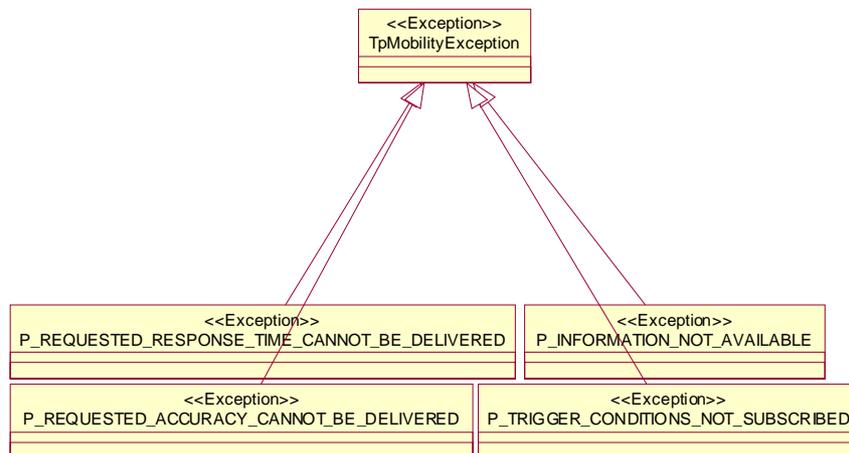

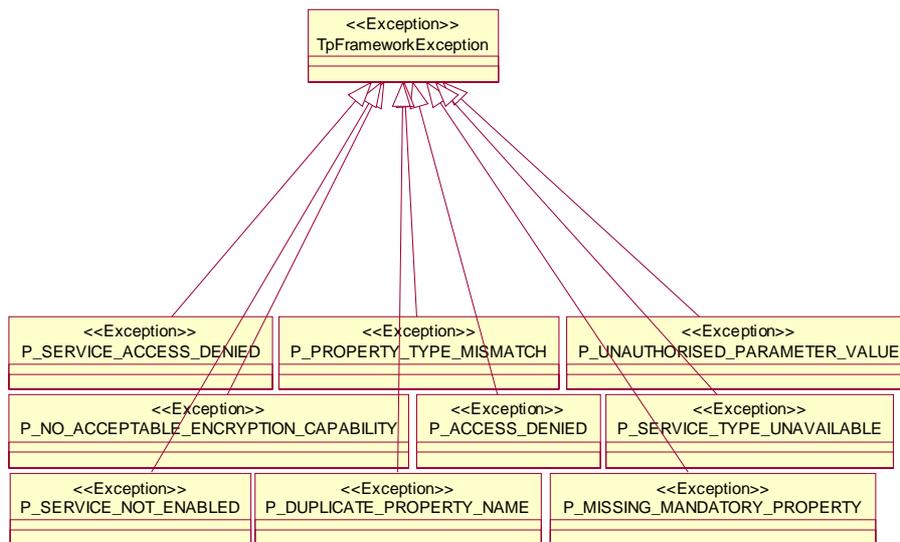

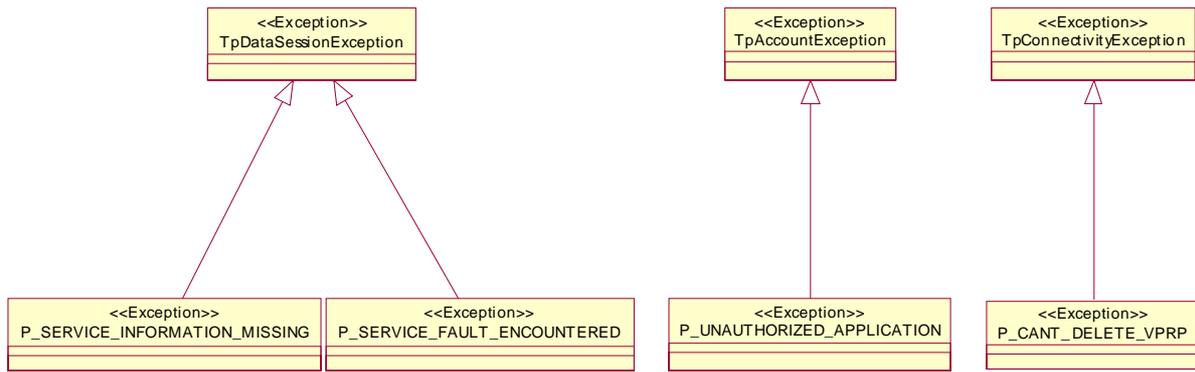

If the exception hierarchy is being used in a particular realisation, these abstract exceptions are the only types of exceptions that may be raised by the OSA methods. All abstract exceptions should be packaged in the org.csapi namespace.

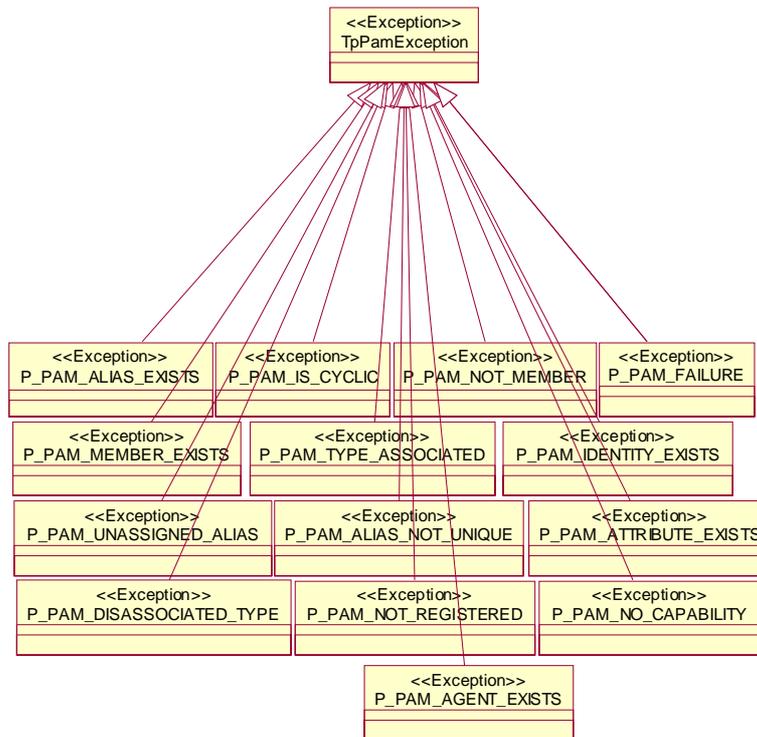

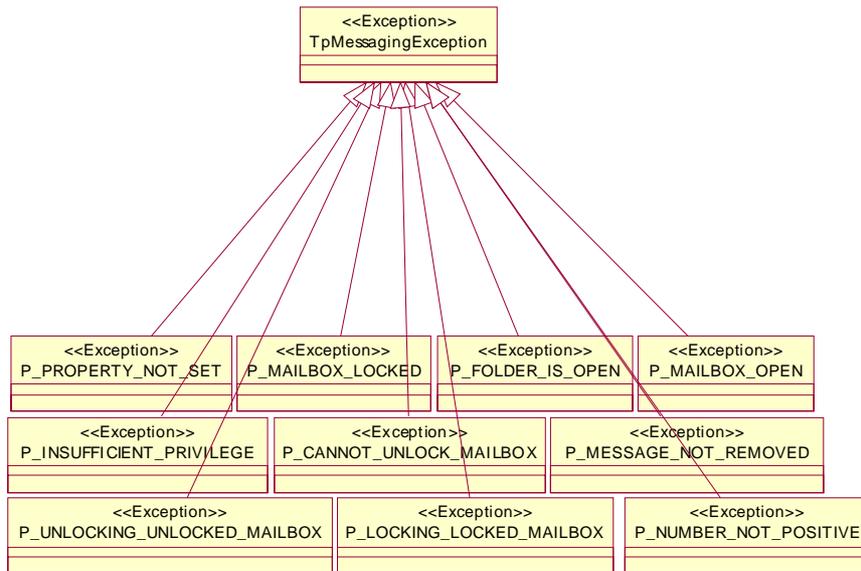

The following diagrams show all the OSA detailed exceptions, and how they relate to the abstract exceptions shown previously. If the exception hierarchy is being used in a particular realisation, the detailed exceptions should not be part of any of the OSA method signatures. If an OSA method needs to raise a detailed exception, it is done so by raising the corresponding abstract exception. It should be noted that for those OSA methods that raise TpCommonExceptions, the P\_RESOURCES\_UNAVAILABLE, P\_TASK\_CANCELLED, P\_TASK\_REFUSED, P\_METHOD\_NOT\_SUPPORTED, P\_INVALID\_STATE and P\_NO\_CALLBACK\_ADDRESS\_SET detailed exceptions should be raised by raising the TpCommonExceptions abstract exception.

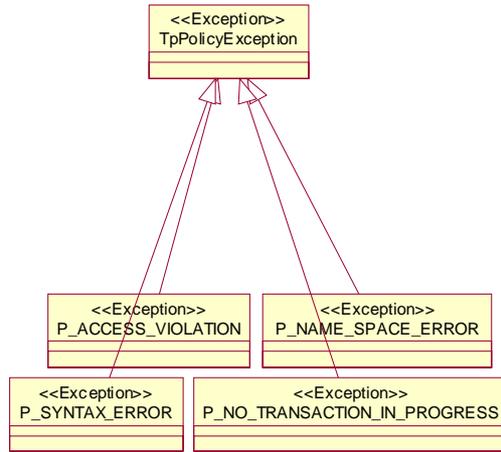

## Annex E (informative): Change history

Change history							
Date	TSG #	TSG Doc.	CR	Rev	Subject/Comment	Old	New
Mar 2001	CN_11	NP-010134	047	--	CR 29.198: for moving TS 29.198 from R99 to Rel 4 (N5-010158)	3.2.0	4.0.0
Jun 2001	CN_12	NP-010330	001	--	Corrections to OSA API Rel4 (Exception handling mechanism without ambiguity - Replace TpGeneralException and TpResultInfo with detailed exception classes which can be thrown for each method (N5-010261)	4.0.0	4.1.0
Jun 2001	CN_12	NP-010333	002	--	Introduction of TpOctet (In order to make sure that some data is sent over the "distributed wire" untouched a new data type is needed) (N5-010304)	4.0.0	4.1.0
