1 Scope

The present document describes the protocol to be used on the IMS Application Level Gateway (ALG) – IMS Access Gateway (IMS-AGW) interface. The basis for this protocol is the H.248 protocol as specified in ITU-T. The IMS architecture is described in 3GPP TS 23.228 [2]. The underlying reference model and stage 2 information is described in Annex G of 3GPP TS 23.228 [2] and in 3GPP TS 23.334 [23].

This specification describes the application of H.248 on the Iq interface (see Figure 1). Required extensions use the H.248 standard extension mechanism. In addition certain aspects of the base protocol H.248 are not needed for this interface and thus excluded by this profile.

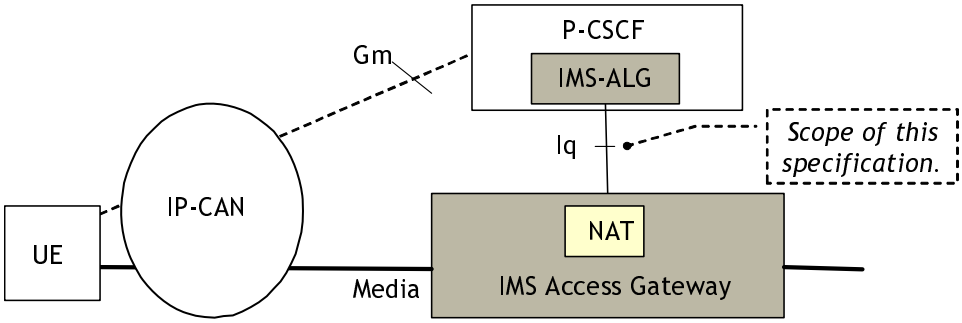

Figure 1: Reference model for IMS access

The reference model for the IMS-ALG and the IMS-AGW supporting the ATCF/ATGW function is shown in Figure 1a below.

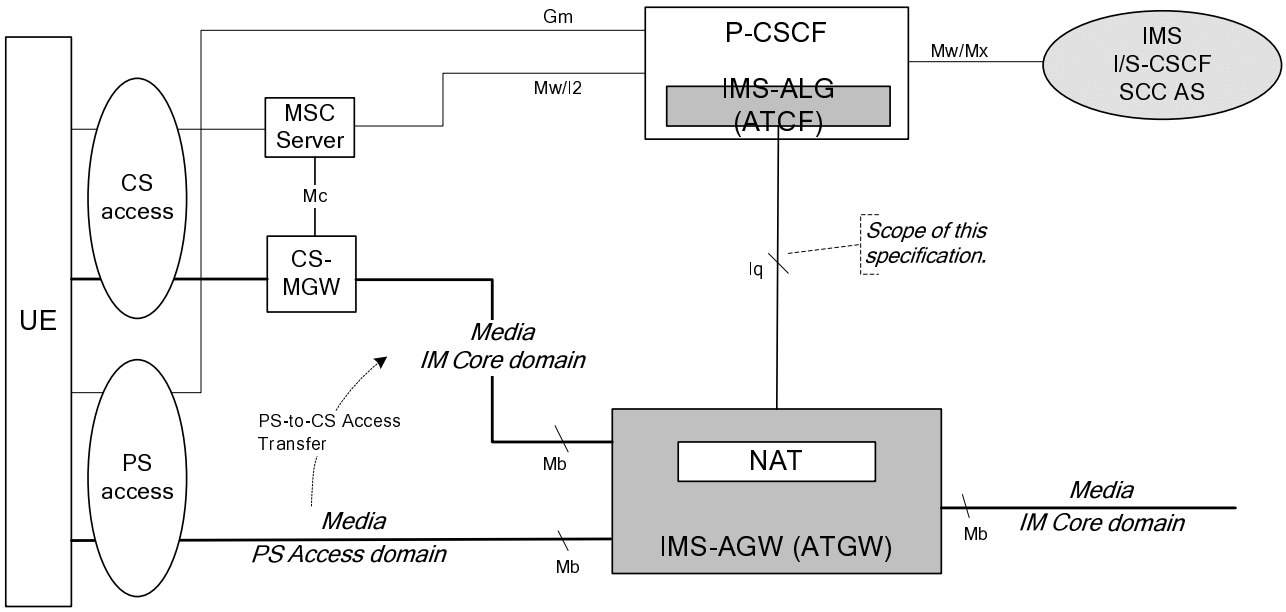

Figure 1a: Reference model for IMS-ALG/IMS-AGW with ATCF/ATGW function

See 3GPP TS 23.237 [38] subclause 5.2 for a comprehensive description of the reference model.

The reference model for the P-CSCF enhanced for WebRTC (eP-CSCF) and the IMS-AGW enhanced for WebRTC (eIMS-AGW) to support WebRTC client access to IMS is shown in Figure 1b as below, see 3GPP TS 23.228 [2] Annex U for a comprehensive description of the reference model.

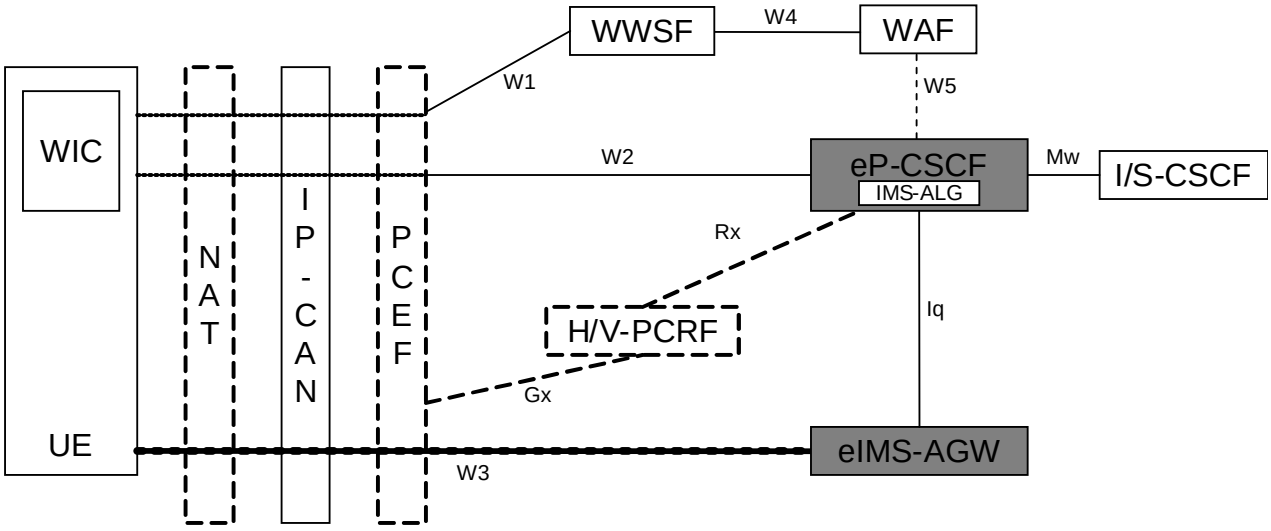

Figure 1b: Reference Architecture for eP-CSCF/eIMS-AGW supporting WebRTC access to IMS

NOTE: The presence of dashed elements in the figure depends on the configuration.
PCC functional elements are present only for EPC access with QoS.
The corresponding PCC elements for fixed access are also optionally supported but not shown.
The NAT in figure 1b is meant for non-cellular access to IMS.

4.1 Architecture

See Annex G and Annex U of 3GPP TS 23.228 [2].

5 Profile Description

5.1 Profile Identification

Table 5.1.1: Profile Identification

Profile name:	threeglq
Version:	3

5.2 Summary

This Profile describes the minimum mandatory settings and procedures required to fulfil the requirements of the Iq interface (see 3GPP TS 23.334 [23]):

- allocation and translation of IP addresses and port numbers (NA(P)T and NA(P)T-PT);
- opening and closing gates (i.e. packets filtering depending on "IP address / port");
- remote NA(P)T traversal;
- policing of incoming traffic;
- QoS packet marking for outgoing traffic;
- IP realm/domain indication;
- Hanging termination detection;
- RTCP handling;

and when ATCF/ATGW is supported:

- handover of bearer connections between PS and CS access networks;
- IP version interworking;
- audio transcoding.

In addition, optional settings and procedures are described which fulfil optional features and where supported, the minimum mandatory settings within the optional procedures and packages are identified that must be supported in order to support that feature.

"Optional" or "O" means that it is optional for either the sender or the receiver to implement an element. If the receiving entity receives an optional element that it has not implemented it should send an Error Code (e.g. 445 "Unsupported or Unknown Property", 501"Not Implemented", etc.). "Mandatory" or "M" means that it is mandatory for the receiver to implement an element. Whether it is mandatory for the sender to implement depends on specific functions; detail of whether elements of the core protocol are mandatory to be sent are defined in the stage 2 procedures, stage 3 procedures and/or the descriptions of individual packages.

The setting or modification of elements described in the profile under the heading "Used in Command" has the meaning that the property can be set/modified with that command. The property may be present in other commands (in order to preserve its value in accordance with ITU-T Recommendation H.248.1 [10]) when those commands are used for other procedures that affect the same descriptor.

5.3 Gateway Control Protocol Version

Version 2 (ITU-T Recommendation H.248.1 [10]) shall be used as minimum protocol version.

5.4 Connection model

Table 5.4.1: Connection Model

Maximum number of contexts:	Provisioned
Maximum number of terminations per context:	3
Allowed terminations type combinations:	(IP,IP) ; (IP,IP,IP) (NOTE)
NOTE: This is only a temporary context configuration, occurring during bearer access transfer phase (between PS to CS access networks or vice versa) or during the reservation of two sets of transport addresses/resources towards the access network to support the functionalities related to the Alternate Connectivity functionality (see 3GPP TS 23.334 [23]).	

5.5 Context attributes

Table 5.5.1: Context Attributes

Context Attribute	Supported	Values Supported
Topology	Yes (NOTE 1)	See clause 5.7.9
Priority Indicator	Optional (NOTE 2)	0-15 (NOTE 3)
Emergency Indicator	Yes	YES/NO
IEPS Indicator	No	NA
ContextAttribute Descriptor	No	NA
ContextIdList Parameter	No	NA
AND/OR Context Attribute	No	NA
NOTE 1: Stream ID in Topology Descriptor shall not be supported (because only used for SRVCC service support, which is a monomedia type of call ('voice call'). NOTE 2: This Context Attribute parameter is allowed in ETSI TISPAN Ia Profile version 3. It is also used for MPS as specified in 3GPP TS 22.153 [39]. NOTE 3: Priority values 11 – 15 of the Priority Indicator are reserved for MPS.		

5.6 Terminations

5.6.1 Termination names

5.6.1.1 IP Termination

5.6.1.1.1 ABNF Coding Overview and prose specification

The Termination ID structure shall follow the guidelines of H.248 and shall be based on four fields:

- "ip/<group>/<interface>/<id>".

The individual fields are described and defined in table 5.6.1.1.1.1.

Table 5.6.1.1.1.1: IP Termination Fields

Name	Description	Values	CHOOSE Wildcard	ALL Wildcard
Ip	"ip" is a fixed prefix identifying the termination	"ip"	No	No
Group	Group of Interface and Id	Integer (0-65535)	Yes (NOTE 5)	Yes
Interface	Logical or physical interface to a network to/from which the termination will be sending/receiving media. (NOTE 1, NOTE 2)	String of max 51 alphanumeric characters	Yes (NOTE 4)	Yes
Id	Termination specific identifier (NOTE 3)	Non-zero 32 bit integer	Yes (NOTE 4)	Yes
NOTE 1: A specific <Interface> may be used together with different groups. NOTE 2: The generic field <Interface> may relate specifically to an "IP interface", "protocol layer 2 interface" or others. NOTE 3: The combination of Interface and Id is unique. NOTE 4: The MGC shall always use CHOOSE in an ADD request command. If not, the MG shall reply with an error descriptor using error code #501 "Not Implemented". NOTE 5: The CHOOSE wildcard on "Group" is *not* allowed in ETSI TISPAN "Ia Profiles".				

NOTE: The IMS-ALG has the ability to choose the address space in which the IMS-AGW will allocate an IP address for the termination by using the *ipdc/realm* property defined in the ITU-T Recommendation H.248.41 IP domain connection package.

H.248 wildcarding may be applied on IP Termination Identifiers. Wildcarding is limited according the two columns on the right hand side.

The corresponding ABNF grammar is given below.

ABNF (IETF RFC 5234 [15]) is used for the syntax specification. The ABNF for TerminationID and relation to pathNAME is defined in annex B.2/ ITU-T Recommendation H.248.1 [10].

```
pathNAME         = EphToken SLASH EPHsystem
EphToken         = "ip"              ; prefix
EPHsystem        = WildcardALL
                 / WildcardALL SLASH Interface
                 / Group SLASH WildcardALL
                 / (Group / WildcardCHOOSE) SLASH (Interface / WildcardCHOOSE) SLASH (Identifier
                 / WildcardALL / WildcardCHOOSE)
Group            = %d0-65535         ; data type: INT16
Interface        = 1*51ALPHANUM
Identifier       = %d1-4294967295    ; data type: INT32
ALPHANUM         = ALPHA / DIGIT
WildcardCHOOSE   = "$"
WildcardALL      = "*"
```

5.6.1.1.2 ASN.1 Coding Overview and prose specification

The following general structure of termination ID shall be used:

4 octets shall be used for the termination ID. The following defines the general structure for the termination ID:

Table 5.6.1.1.2.1: ASN.1 coding

Termination type	X

Termination type:

Length 3 bits

Values:

000 Reserved

001 IP (Ephemeral) termination

010 Reserved (in 3GPP Mc and Mn profile used for TDM termination)

011 - 110 Reserved

111 Reserved for ROOT termination Id (ROOT Termination ID = 0xFFFFFFFF)

X:

Length 29 bits.

For IP termination, its usage is un-specified.

5.6.2 Multiplexed terminations

5.7 Descriptors

5.7.1 TerminationState Descriptor

Table 5.7.1.1: ServiceState property

ServiceState property used:	Yes (InService/OutofService) NOTE 1, NOTE 2
NOTE 1: This is restricted to the ROOT termination (for MGW audit).	
NOTE 2: Ephemeral H.248 Terminations have a ServiceState property according to ITU-T Recommendation H.248.1 [10], but explicit usage of the TerminationState Descriptor ServiceState property is not required by this Profile. ServiceState changes can still occur, however, and can be indicated in ServiceChange Commands (i.e. this means that the value of the ServiceState property may be implicitly changed by ServiceChange procedures).

EventBufferControl property used:	No

5.7.2 Stream Descriptor

5.7.2.0 General

Table 5.7.2.1: Stream descriptors

Maximum number of streams per termination type	IP	Unspecified (NOTE)
NOTE : At least one stream for each media component (e.g. video+audio = 2 streams). If only one stream is applicable, then the IMS-ALG may omit the Stream Descriptor and the IMS-AGW shall assume that StreamID = 1.		

Table 5.7.2.2: Stream configuration

Stream configuration:	ALL configurations are allowed

5.7.2.1 LocalControl Descriptor

Table 5.7.2.1.1: Local Control Descriptor

		Termination Type	**Stream Type**
ReserveGroup used:	No	NA	NA
ReserveValue used:	Yes	IP	Audio, Video (NOTE 1, NOTE 2)

NOTE 1: The value of the H.248 Stream Type is given here by the SDP 'm=' line element media type (in contrast to the SDP 'm=' line element transport protocol in Table 5.7.2.1.2). Usage of ReserveValue implies thus media type aware Local and Remote Descriptors.
NOTE 2: Not used (at this profile version (see clause 5.1 for the version number)) for TCP transport (IETF RFC 793 [51]) and media types:
a) "Message" (for MSRP (IETF RFC 4975 [18]) and
b) "Application" (for BFCP (IETF RFC 4582 [52])
because the application control will not use them in context ReserveValue.

Table 5.7.2.1.2: Allowed Stream Modes

Termination Type	**Stream Type**	**Allowed StreamMode Values**
IP	RTP/AVP	SendOnly, RecvOnly, SendRecv, Inactive
	RTP/SAVP	SendOnly, RecvOnly, SendRecv, Inactive
	RTP/AVPF	SendOnly, RecvOnly, SendRecv, Inactive
	RTP/SAVPF	SendOnly, RecvOnly, SendRecv, Inactive
	TCP (NOTE 1)	SendRecv, Inactive

	UDPTL	SendRecv, Inactive
	UDP	SendOnly, RecvOnly, SendRecv, Inactive
	UDP/DTLS	SendOnly, RecvOnly, SendRecv, Inactive

NOTE 1: The H.248 StreamMode does not affect protocol control information at the bearer interface. See clause 7.1.7.1.1 in ITU-T Recommendation H.248.1 [10] and:
a) TCP: ITU-T Recommendation H.248.89 [47], clause 8.6.4.1, Table "*Impact of StreamMode on TCP bearer traffic at external MG interface*"
b) TLS: ITU-T Recommendation H.248.90 [48], clause 8.6.4.1, Table "*Impact of StreamMode on TLS bearer traffic at external MG interface*".
NOTE 2: Conditional support, dependent on support of application-aware interworking.

Handoff (NOTE 2, NOTE 3)	"903 MGC Directed Change" (Optional, NOTE 4)
Restart (NOTE 2)	"901 Cold Boot" (Optional) "902 Warm Boot" (Optional)
Forced (NOTE 2)	"905 Termination Taken Out Of Service" (Optional)
Graceful (NOTE 2)	"905 Termination Taken Out Of Service" (Optional)

NOTE 1: When a Service Change command on the Root termination with a method other than Graceful is sent, the command shall always be sent as the only command in a message. The sending node shall always wait for the reply to a Service Change command on the Root termination with a method other than Graceful before sending further command requests. A Service Change command on the Root termination with method Graceful may be combined with other commands in a single message.
NOTE 2: ROOT Only.
NOTE 3: Not involving more than 1 IMS-ALG. This does not preclude the use of the MGCId in a ServiceChange (Handoff) scenario, nor does it change the expected IMS-AGW behaviour upon receipt of such a message, as the IMS-AGW has actually no means to differentiate whether the ServiceChangeMgcId parameter that may be received in a ServiceChange (handoff) message relates to a logical IMS-ALG inside the same IMS-ALG server or is part of another IMS-ALG.
NOTE 4: Support of this procedure is mandatory in the IMS-AGW.

A Service Change command on the Root termination with method Graceful may be combined with other commands in a single message. NOTE 2: ROOT Only. 5.11 Messages

It is recommended that IMS-AGW and IMS-ALG names are in the form of fully qualified domain name. For example the domain name of the IMS-ALG may be of the form: "ALG1.whatever.net." and the name of the IMS-AGW may be of the form: "mg1.whatever.net.".

The fully qualified domain name will be used by the IMS-AGW and IMS-ALG as part of the "Message Identifier" in the H.248 messages which identifies the originator of the message.

The IMS-ALG domain name is provisioned in the IMS-AGW or retrieved from the DNS using SRV records.

The use of a domain name provides the following benefits:

- IMS-AGWs and IMS-ALGs are identified by their domain name, not their network addresses. Several addresses can be associated with a domain name. If a command cannot be forwarded to one of the network addresses, implementations shall retry the transmission using another address.

  NOTE: There are then e.g. multiple numerical address entries per single MGC entity in the "MG database of MGC entries"; see Table 5 in ITU-T H.Sup7 [29].

- IMS-AGWs and IMS-ALGs may move to another platform. The association between a logical name (domain name) and the actual platform are kept in the Domain Name Service (DNS). IMS-AGW and IMS-ALG shall keep track of the record's time-to-live read from the DNS. They shall query the DNS to refresh the information if the time-to-live has expired.

The domain name may be used by IMS-ALG/IMS-AGW for authentication purposes.

5.12 Transport

Specifies what H.248 subseries transports are supported by the profile.

Table 5.12.1: Transport

Supported transports:	1. IPv4-based network control plane: • SCTP/IPv4 (Recommended) • UDP/IPv4 (Optional) 2. IPv6-based network control plane: • SCTP/IPv6 (Recommended) • UDP/IPv6 (Optional)
NOTE 1: When using SCTP as defined in IETF RFC 4960 [16] the IMS-AGW shall always be the node to perform the "Initiation".	

Table 5.12.2: Segmentation

Segmentation supported:	SCTP: Inherent in Transport UDP: No

Table 5.12.3: Control Association

Control Association Monitoring supported:	Monitoring mechanism is dependent on used H.248 transport (see above table 5.12/1): **SCTP**: inherent capability of SCTP. **UDP:** H.248.14 (MG-driven monitoring). Empty AuditValue on ROOT (MGC-driven monitoring).

5.13 Security

Table 5.13.1: Security

Supported Security:	None
NOTE: IPsec shall not be used by the IMS-ALG or IMS-AGW for the Iq interface. Normally the Iq interface lies within a single operator's secure domain. If this is not the case then a Za interface (Security Gateway deploying IPSec) may be required, however this is a separate logical function/entity and thus is not applicable to the Iq profile, the IMS-ALG or the IMS-AGW. For further details see 3GPP TS 33.210 [27].

NOTE 1: If the MGC uses an IP Realm Identifier (*ipdc/realm*) property exceeding the maximum length limitation defined in ITU-T Recommendation H.248.41 [8], the MG shall reply with an error descriptor using error code #410: "Incorrect identifier".

NOTE 2: The MODIFY command is listed due to the fact that subsequent Streams may be 'added' by MODIFY requests in case of multi-Stream-per-Termination structures. The subsequent Streams shall then carry the same IP Realm Identifier (*ipdc/realm*) property value as the very first Stream.

These two options result in different normalisations of the overload event rate as an indicator of the level of MG overload.

5.15 Mandatory support of SDP and Annex C information elements

Table 5.15.1: Mandatory Annex C and SDP information elements

Information Element	Annex C Support	SDP Support
v-line	"SDP_V "	The value must always be equal to zero: v=0
c-line	"SDP_C "	<nettype> <addrtype> and <connection address> are required. The network type shall be set to "IN". The address type may be IPv4 or IPv6. The MGC may apply parameter underspecification to the <connection address> subfield.
m-line	"SDP_M "	There are four fields (or SDP values) <media>, <port>, <proto> and <fmt> in the "m=" line (see IETF RFC 4566 [17];NOTE 1). The "m=" line may be omitted from SDP. <media>, <port>, <proto > and <fmt-list> are required if the "m=" line is included. Media type <media> : The <media> field shall be set to "audio", "video", "message", "application" or "-". When "-" is used for the *media* value then no media resources are required to be reserved at this stage (NOTE 1). If the MG does not support the requested media value it shall reject the command with error code 515. Transport port <port> The *port* value may be underspecified with CHOOSE wildcard. Transport protocol <proto> As in table 5.15.2. Media format <fmt> Various values may be used for media-format, dependent on the related <media>. "-" may be used for the *format list* value if no media reservation is required at this stage. If the MG does not support the requested media format value the MG shall reject the command with error code 449.
b-line	"SDP_B "	Shall not be used without a "m=" line. The *modifier* values shall be "AS", "RS" and "RR". The AS *modifier* implies that the *bandwidth-value* represents the ""maximum bandwidth" (see clause 5.8/ IETF RFC 4566 [17]). The *bandwidth-value* relates therefore to the *peak bitrate* (NOTE 2). The *bandwidth-value* value defines the IP layer bandwidth for the specific H.248 Stream. For RTP flows, where RTCP resources are reserved together with the RTP resources using the "RTP Specific Behaviour" property of the Gate Management package (gm) property, the IMS-ALG may also supply additional RTCP bandwidth modifiers (i.e. RR and RS, see IETF RFC 3556 [28]). The AS *bandwidth* value will include the bandwidth used by RTP. In the absence of the RTCP bandwidth modifiers the IMS-AGW shall allow an additional 5% of the AS bandwidth value for the bandwidth for RTCP, in accordance with IETF RFC 3556 [28].

o-line	"SDP_O"	The origin line consists of six fields: (<username>, <sess-id>, <sess-version>, <nettype>, <addrtype> and <unicast-address>). The MGC is not required to supply this line but shall accept it (see clause 7.1.8/ITU-T Recommendation H.248.1 [10]). The MG shall return the value received from the MGC or if there is no o-line sent by the MGC, the MG shall populate this line as follows: - <user name> should contain an hyphen - <session ID> and <version> should contain one or mode digits as described in IETF RFC 4566 [17] - <network type> shall be set to IN - <address type> shall be set to IP4 or IP6 The Address Type shall be set to "IP4" or "IP6' depending on the addressing scheme used by the network to which the MG is connected. - <address> should contain the fully qualified domain name or IP address of the gateway.
s-line	"SDP_S"	The session name "s=" line contains a single field s= <session name>. The MGC is not required to supply this line but shall accept it (see clause 7.1.8/ITU-T Recommendation H.248.1 [10]). The MG shall return the value received from the MGC or if there is no s-line sent by the MGC, the MG shall populate this line as follows: - "s=-"
t-line	"SDP_T"	The time "t=" line consists of two fields *t*= <start time> and <stop time>. The MGC is not required to supply this line but shall accept it (see clause 7.1.8/ITU-T Recommendation H.248.1 [10]). The MG shall return the value received from the MGC or if there is no t-line sent by the MGC, the MG shall populate this line as follows: "t=0 0"
NOTE 1: IETF RFC 4566 [17] enables "-" as a valid character. NOTE 2: The unit for the *bandwidth-value* (peak bitrate) is "kbit/s". The "b=" line is not providing any information about the traffic characteristic, i.e. whether the traffic flow has a Constant BitRate (CBR) or Variable BitRate (VBR). The *bandwidth-value* is thus independent of the traffic characteristic and relates to the peak bitrate for CBR and VBR traffic.		

Table 5.15.2: Transport Protocol

Transport Protocol <proto> in m-line:	If the MG does not support the requested transport protocol, it shall reject the command with error code 449.
RTP/AVP	RTP profile according IETF RFC 3551 [19]. Allow only L4 protocol = UDP (see NOTE 1).
RTP/AVPF	Extended RTP profile for RTCP-based Feedback (RTP/AVPF) according IETF RFC 4585 [25]. See 3GPP TS 26.114 [26]. Allow only L4 protocol = UDP (see NOTE 1).
RTP/SAVP	SRTP profile according IETF RFC 3711 [30] (NOTE 3). Allow only L4 protocol = UDP (see NOTE 1).
RTP/SAVPF	Extended SRTP profile for RTCP-based Feedback (RTP/SAVPF) according IETF RFC 5124 [31] (NOTE 3). Allow only L4 protocol = UDP (see NOTE 1).
TCP	Allow only L4 protocol = TCP (NOTE 2)
TCP/MSRP	Message service using IETF RFC 4975 [18] (NOTE 6).
TCP/TLS	Application agnostic indication with L4 protocol = TCP (NOTE 4).
TCP/TLS/MSRP	Application-specific indication with L4 protocol = TCP and TLS-based

	transport security (SDP codepoint see IETF RFC 4975 [18]) (NOTE 6).
udptl	Allow only L4 protocol = UDP
udp	Allow only L4 protocol = UDP (NOTE 1).
UDP/DTLS	Application agnostic indication with L4 protocol = UDP and DTLS-based transport security (NOTE 5).

NOTE 1: Parameter "udp" is introduced by IETF RFC 4566 [17].
NOTE 2: Upper case TCP is defined by IETF RFC 4145 [20] and registered by IANA.
NOTE 3: The IMS AGW does not need to reserve resources for end-to-access edge media (e2ae) security en-/decryption at this stage if RTP profile identifiers "RTP/SAVP" or "RTP/SAVPF" are signalled without the 'a=crypto' property for that stream. For e2e media security either "RTP/SAVP" is signalled at all terminations in a context, or "RTP/SAVPF" is signalled at all terminations in a context and no media attribute will be signalled; the IMS AGW shall then not terminate the SRTP / SRTCP protocol, but shall pass the encrypted media and control flows (as indicated with the rtcph/rsb property) transparently.
NOTE 4: Parameter "TCP/TLS" is defined by IETF RFC 4572 [55] for the TLS protocol according to IETF RFC 5246 [53].
NOTE 5: Parameter "UDP/DTLS" is introduced by IETF draft-schwarz-mmusic-sdp-for-gw [54] (based on ITU-T Recommendation H.248.93 [50]).
NOTE 6: Conditional support, dependent on application-aware interworking.

5.16 Optional support of SDP and Annex C information elements

Specifies what SDP attributes and Annex C information elements may be supported.

Table 5.16.1: Optional Annex C and SDP information elements

Information Element	Annex C Support	SDP Support
a-line	"SDP_A "	1) Application "RTCP transport address control": The attribute "a=rtcp" line may either contain (a=rtcp: <port>) or (a=rtcp: <port> <network type> <address type> <connection address>) when the "a=" line is used for RTCP transport port and optionally network address transmission (see IETF RFC 3605 [21]). . The MGC shall supply the "a=rtcp" line in the RD when non-default RTCP network address or transport port values are used by the peer media entity. "RTCP transport address control" should be supported by MG (NOTE 2). 2) Media related parameters in general: The "a=" line provides the complementary information for the "m=" line with regards to a specified media type/format (e.g. an optional SDP „a=ptime" line for a particular media format). For a dynamic RTP payload type, for each media information on the codec type shall be provided in a separate SDP "a=rtpmap"line and possibly additional SDP "a=fmtp"-line(s). 3) Application " Media interworking (transcoding)": See "a=" line specification in (2). Media interworking is limited to audio transcoding only (NOTE 1). 4) IMS media plane security related parameters: 4.1) SRTP-specific security parameters: The attribute "a=crypto" (see IETF RFC 4568 [29]) shall be provided for an m-line in the local and remote descriptor of an access network termination if the IMS-ALG wants that the corresponding media is encrypted, decrypted and/or integrity protected by the IMS-AGW (IMS end-to-access-edge media plane security). For each m-line, only a single "a=crypto" attribute shall be provisioned (i.e. only information related to a single crypto suite is provisioned to the IMS-AGW). The "a=crypto" attribute may contain several master keys. An IMS-AGW supporting end-to-access-edge media plane security shall support parameters within the "a=crypto" attribute in accordance with the profile in Annex of 3GPP TS 33.328 [34]. 4.2) (D)TLS-specific security parameters: The attribute "a=fingerprint" (see IETF RFC 4572 [55]) shall be provided in accordance with ITU-T Recommendation H.248.90 [48] for an "m="-line in the local and remote descriptor of an access network termination if the IMS-ALG wants that the corresponding media is encrypted, decrypted and/or integrity protected by the IMS-AGW (IMS end-to-access-edge media plane security). 5) Coordination of Video Orientation The attribute "a=extmap" (see IETF RFC 5285 [41]) may be provided for an m-line in the local and remote descriptor if the IMS-AGW supports the extended RTP header with Coordination of Video Orientation information, see also 3GPP TS 26.114 [26]. 6) Generic Image Attribute The attribute "a=imageattr" (see IETF RFC 6236 [42]) may be provided for an m-line in the local and remote descriptor if the IMS-AGW supports the generic image attributes, see also 3GPP TS 26.114 [26]. The local descriptor indicates the image sizes which the IMS-AGW supports in the receiving direction for the selected payload type and corresponds to the "recv" keyword (see IETF RFC 6236 [42]) in the "a=imageattr" that the IMS-ALG will send within the SDP body on the Mw/Mx interface. The remote descriptor indicates the image sizes which the IMS-AGW supports in the sending direction for the selected payload type and corresponds to the "send" keyword (see IETF RFC 6236 [42]) in the "a=imageattr" that the IMS-ALG will send within the SDP body on the Mw/Mx interface. 7) ICE support

		The attributes "a=candidate", "a=ice-pwd", and "a=ice-ufrag" (see IETF RFC 5245 [44]) may be provided for an SDP m-line in the local and remote descriptor if the IMS-AGW supports ICE, see also 3GPP TS 24.229 [45]. In the local descriptor, the IMS-ALG shall provide "a=ice-pwd", and "a=ice-ufrag" with wildcard sign "$" to request the allocation of a password and user name fragment, and the "a=candidate" of type "host" with the transport, port and priority parameters with wildcard sign "$" to request the allocation of a host candidate. The IMS-AGW shall then reply with completed "a=ice-pwd", and "a=ice-ufrag" and "a=candidate" attributes in the local descriptor, and shall include "a=ice-lite" if it only supports ICE lite. In the remote descriptor, the IMS-ALG may provide the "a=candidate", "a=ice-pwd", and "a=ice-ufrag". 8) state-agnostic and state-aware TCP handling: The attribute "a=setup" (see IETF RFC 4145 [20]) shall be provided for TCP-based media, in accordance with ITU-T Recommendation H.248.84 [46], when triggering an end-to-end TCP simultaneous open (leading to a TCP merge mode in the IMS-AGW) or other TCP modes of operation. 9) Application-aware interworking for MSRP traffic: The attribute "a=path" (see IETF RFC 4975 [11]) shall be provided, when enabling a bearer level application gateway (B-ALG) function for MSRP traffic, according to ITU-T Recommendation H.248.78 [56]. 10) Handling of RTCP APP messages when transcoding between EVS and non EVS codecs: The attribute "a=3gpp_mtsi_app_adapt" (see 3GPP TS 26.114 [26]) containing the allowed RTCP APP message types shall be provided when the IMS-AGW is allowed to send RTCP APP messages.
NOTE 1: Media Interworking is optional. NOTE 2: Table 1 in ITU-T Recommendation H.248.57 [5] provides the correspondent RTCP port allocation rules.		

Editor's Note: The support for video transcoding is required for vSRVCC but should be changed from Rel-11, separate CRs would be required for this change.

5.17 Procedures

5.17.1 Formats and Codes

Table 5.17.1.1 shows the parameters which are required for the procedures defined in the following clauses.

The coding rules applied in ITU-T Recommendation H.248.1 [10] for the applicable coding technique shall be followed for the UMTS capability set.

The binary encoding rules which are applicable to the defined Abstract Syntaxes are the Basic Encoding Rules for Abstract Syntax Notation One, defined in ITU-T Recommendation X.690 [22]. Specifically in accordance with ITU-T Recommendation X.690 [22] section 7.3, alternative encodings based on the definite and indefinite form of length are permitted by the basic encoding rules as a sender's option. Receivers shall support both alternatives.

Unsupported values of parameters or properties may be reported by the IMS-AGW and shall be supported by the IMS-ALG as such by using H.248.1 error code #449 " Unsupported or Unknown Parameter or Property Value ". The unsupported or unknown value is included in the error text in the error descriptor.
