Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: "*Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards*", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (<http://ipr.etsi.org>).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Foreword

This Technical Specification (TS) has been produced by the ETSI 3rd Generation Partnership Project (3GPP).

The present document may refer to technical specifications or reports using their 3GPP identities, UMTS identities or GSM identities. These should be interpreted as being references to the corresponding ETSI deliverables.

The cross reference between GSM, UMTS, 3GPP and ETSI identities can be found under <http://webapp.etsi.org/key/queryform.asp>.

| History | 1929 |

Foreword

This Technical Specification has been produced by the 3rd Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

- x the first digit:
 - 1 presented to TSG for information;
 - 2 presented to TSG for approval;
 - 3 or greater indicates TSG approved document under change control.
- y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- z the third digit is incremented when editorial only changes have been incorporated in the document.

Introduction

The present document is part 1 of a multi-parts TS:

3GPP TS 34.121-1: User Equipment (UE) conformance specification; Radio transmission and reception (FDD); Part 1: Conformance specification.

3GPP TS 34.121-2 [32]: User Equipment (UE) conformance specification; Radio transmission and reception (FDD); Part 2: Implementation Conformance Statement (ICS).

NOTE: TS 34.121 has been converted to multipart TS with version 7.0.0. Previous versions are a single part standard 34.121.

1 Scope

The present document specifies the UTRA measurement procedures for the conformance test of the user equipment (UE) that contain transmitting characteristics, receiving characteristics and performance requirements in addition to requirements for support of RRM (Radio Resource Management) in FDD mode. In addition it specifies conformance testing of RRM requirements for support of E-UTRA when the UE operates in UTRA mode.

NOTE: Conformance testing of RRM requirements for support of UTRA when the UE operates in E-UTRA mode are specified in TS 36.521-3 [38].

The requirements are listed in different clauses only if the corresponding parameters deviate. More generally, tests are only applicable to those mobiles that are intended to support the appropriate functionality. To indicate the circumstances in which tests apply, this is noted in the "*definition and applicability*" part of the test.

For example only Release 5 and later UE declared to support HSDPA shall be tested for this functionality. In the event that for some tests different conditions apply for different releases, this is indicated within the text of the test itself.

2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document.
 - For a Release 1999 UE, references to 3GPP documents are to version 3.x.y.
 - For a Release 4 UE, references to 3GPP documents are to version 4.x.y.
 - For a Release 5 UE, references to 3GPP documents are to version 5.x.y.
 - For a Release 6 UE, references to 3GPP documents are to version 6.x.y.
 - For a Release 7 UE, references to 3GPP documents are to version 7.x.y.
 - For a Release 8 UE, references to 3GPP documents are to version 8.x.y.
 - For a Release 9 UE, references to 3GPP documents are to version 9.x.y.

3 Definitions, symbols, abbreviations and equations

3.1 Definitions

Definitions, symbols, abbreviations and equations used in the present document are listed in TR 21.905 [5] and TR 25.990 [6].

Terms are listed in alphabetical order in this clause.

For the purpose of the present document, the following terms and definitions apply:

Maximum Output Power: This is a measure of the maximum power the UE can transmit (i.e. the actual power as would be measured assuming no measurement error) in a bandwidth of at least $(1 + \alpha)$ times the chip rate of the radio access mode. The period of measurement shall be at least one timeslot.

For DC-HSUPA the maximum output power is defined by the sum of the broadband transmit power of each carrier in the UE.

Nominal Maximum Output Power: This is the nominal power defined by the UE power class.

Mean power: When applied to a W-CDMA modulated signal this is the power (transmitted or received) in a bandwidth of at least $(1 + \alpha)$ times the chip rate of the radio access mode. The period of measurement shall be at least one timeslot unless otherwise stated.

RRC filtered mean power: The mean power as measured through a root raised cosine filter with roll-off factor α and a bandwidth equal to the chip rate of the radio access mode.

NOTE 1: The RRC filtered mean power of a perfectly modulated W-CDMA signal is 0.246 dB lower than the mean power of the same signal.

NOTE 2: The roll-off factor α is defined in 3GPP TS 25.101 clause 6.8.1.

RegDTX: Regular DTX. These are the times when the HS-DPCCH ACK/NACK is not expected to be transmitted due to an Inter-TTI period greater than 1.

statDTX: Statistical DTX. These are the times when the HS-DPCCH is expected to transmit an ACK or NACK but none is transmitted due to the UE not being able to decode consistent control information from the HS_SCCH.

Throughput: Number of information bits per second excluding CRC bits successfully received on HS-DSCH by a HSDPA capable UE.

Enhanced performance requirements type 1: This defines performance requirements which are optional for the UE. The requirements are based on UEs which utilise receiver diversity.

Enhanced performance requirements type 2: This defines performance requirements which are optional for the UE. The requirements are based on UEs which utilise a chip equaliser receiver structure.

Enhanced performance requirements type 3: This defines performance requirements which are optional for the UE. The requirements are based on UEs which utilise a chip equaliser receiver structure with receiver diversity.

Enhanced performance requirements type 3i: This defines performance requirements which are optional for the UE. The requirements are based on UEs which utilise an interference-aware chip equaliser receiver structure with receiver diversity.

3.2 Symbols

For the purposes of the present document, the following symbols apply:

[...] Values included in square bracket must be considered for further studies, because it means that a decision about that value was not taken

3.3 Abbreviations

For the purpose of the present document, the following abbreviations apply:

| | |
|-----------------------|---|
| ACLR | Adjacent Channel Leakage power Ratio |
| ACS | Adjacent Channel Selectivity |
| AFC | Automatic Frequency Control |
| AICH | Acquisition Indication Channel |
| ASD | Acceleration Spectral Density |
| ATT | Attenuator |
| BER | Bit Error Ratio |
| BLER | Block Error Ratio |
| BTFD | Blind Transport Format Detection |
| CQI | Channel Quality Indicator |
| CW | Continuous Wave (un-modulated signal) |
| DB-DC-HSDPA | Dual Band Dual Cell HSDPA |
| DC-HSDPA | Dual Cell HSDPA |
| DCH | Dedicated Channel, which is mapped into Dedicated Physical Channel |
| DIP | Dominant Interferer Proportion ratio |
| DL | Down Link (forward link) |
| DTX | Discontinuous Transmission |
| DPCCCH | Dedicated Physical Control Channel |
| DPCH | Dedicated Physical Channel |
| DPDCH | Dedicated Physical Data Channel |
| E-DCH | Enhanced Dedicated Channel |
| E-AGCH | E-DCH Absolute Grant Channel |
| E-HICH | E-DCH HARQ ACK Indicator Channel |
| E-RGCH | E-DCH Relative Grant Channel |
| EIRP | Effective Isotropic Radiated Power |
| EVM | Error Vector Magnitude |
| FACH | Forward Access Channel |
| FDD | Frequency Division Duplex |
| FDR | False transmit format Detection Ratio. A false Transport Format detection occurs when the receiver detects a different TF to that which was transmitted, and the decoded transport block(s) for this incorrect TF passes the CRC check(s) |
| HARQ | Hybrid Automatic Repeat Request |
| HSDPA | High Speed Downlink Packet Access |
| HS-DSCH | High Speed Downlink Shared Channel |
| HS-PDSCH | High Speed Physical Downlink Shared Channel |
| HS-SCCH | High Speed Shared Control Channel |
| HYB | Hybrid |
| Information Data Rate | Rate of the user information, which must be transmitted over the Air Interface. For example, output rate of the voice codec |
| IM | Intermodulation |
| ITP | Initial Transmission Power control mode |
| MBSFN | MBMS over a Single Frequency Network |
| MER | Message Error Ratio |
| MIMO | Multiple Input Multiple Output |
| Node B | A logical node responsible for radio transmission / reception in one or more cells to/from the User Equipment. Terminates the Iub interface towards the RNC |
| OBW | Occupied Bandwidth |
| OCNS | Orthogonal Channel Noise Simulator, a mechanism used to simulate the users or control signals on the other orthogonal channels of a downlink |
| PAR | Peak to Average Ratio |

| | |
|---------|--|
| P-CCPCH | Primary Common Control Physical Channel |
| PCH | Paging Channel |
| P-CPICH | Primary Common Pilot Channel |
| PICH | Paging Indicator Channel |
| PPM | Parts Per Million |
| R | Number of information bits per second excluding CRC bits successfully received on HS-DSCH by a HSDPA capable UE. |
| RACH | Random Access Channel |
| RBW | Resolution Bandwidth |
| PRBS | Pseudo Random Bit Sequence |
| regDTX | Regular DTX |
| RRC | Root-Raised Cosine |
| S-CCPCH | Secondary Common Control Physical Channel |
| S-CPICH | Secondary Common Pilot Channel |
| SCH | Synchronisation Channel consisting of Primary and Secondary synchronisation channels |
| SG | Serving Grant |
| SIR | Signal to Interference ratio |
| SML | Soft Metric Location (Soft channel bit) |
| SS | System Simulator; see Annex A for description |
| statDTX | Statistical DTX |
| STTD | Space Time Transmit Diversity |
| TDD | Time Division Duplexing |
| TFC | Transport Format Combination |
| TFCI | Transport Format Combination Indicator |
| TGCFN | Transmission Gap Connection Frame Number |
| TGD | Transmission Gap Distance |
| TGL | Transmission Gap Length |
| TGPL | Transmission Gap Pattern Length |
| TGPRC | Transmission Gap Pattern Repetition Count |
| TGSN | Transmission Gap Starting Slot Number |
| TPC | Transmit Power Control |
| TSTD | Time Switched Transmit Diversity |
| UE | User Equipment |
| UL | Up Link (reverse link) |
| UTRA | UMTS Terrestrial Radio Access |

3.4 Equations

For the purpose of the present document, the following additional equations apply:

$\frac{CPICH_E_c}{I_{or}}$ The ratio of the received energy per PN chip of the CPICH to the total transmit power spectral density at the Node B (SS) antenna connector.

DPCH $_E_c$ Average energy per PN chip for DPCH.

$\frac{DPCH_E_c}{I_{or}}$ The ratio of the transmit energy per PN chip of the DPCH to the total transmit power spectral density at the Node B (SS) antenna connector.

$\frac{DPCCH_E_c}{I_{or}}$ The ratio of the transmit energy per PN chip of the DPCCH to the total transmit power spectral density at the Node B (SS) antenna connector.

$\frac{DPDCH_E_c}{I_{or}}$ The ratio of the transmit energy per PN chip of the DPDCH to the total transmit power spectral density at the Node B (SS) antenna connector

E_c Average energy per PN chip.

| | |
|----------------------------|--|
| $\frac{E_c}{I_{or}}$ | The ratio of the average transmit energy per PN chip for different fields or physical channels to the total transmit power spectral density. |
| F_{uw} | Frequency of unwanted signal. This is specified in bracket in terms of an absolute frequency(s) or a frequency offset from the assigned channel frequency. For DC-HSDPA, negative offset refers to the assigned channel frequency of the lowest carrier frequency used and positive offset refers to the assigned channel frequency of the highest carrier frequency used. For DB-DC-HSDPA, offset refers to the assigned channel frequencies of the individual cells. |
| I_{Node_B} | Interference signal power level at Node B in dBm, which is broadcasted on BCH. |
| I_o | The total received power spectral density, including signal and interference, as measured at the UE antenna connector. |
| I_{oac} | The power spectral density (integrated in a bandwidth of $(1+\alpha)$ times the chip rate and normalized to the chip rate) of the adjacent frequency channel as measured at the UE antenna connector. |
| I_{oc} | The power spectral density (integrated in a noise bandwidth equal to the chip rate and normalized to the chip rate) of a band limited white noise source (simulating interference from cells, which are not defined in a test procedure) as measured at the UE antenna connector. For DC-HSDPA and DB-DC-HSDPA, I_{oc} is defined for each of the cells individually and is assumed to be equal for both cells unless explicitly stated per cell. |
| I_{oc}' | The received power spectral density (integrated in a noise bandwidth equal to the chip rate and normalized to the chip rate) of the summation of the received power spectral densities of the two strongest interfering cells plus I_{oc} as measured at the UE antenna connector. The respective power spectral density of each interfering cell relative to I_{oc}' is defined by its associated DIP value. |
| I_{or} | The total transmit power spectral density (integrated in a bandwidth of $(1+\alpha)$ times the chip rate and normalized to the chip rate) of the downlink signal at the Node B antenna connect. For DC-HSDPA and DB-DC-HSDPA, I_{or} is defined for each of the cells individually and is assumed to be equal for both cells unless explicitly stated per cell. Or |
| \hat{I}_{or} | The received power spectral density (integrated in a bandwidth of $(1+\alpha)$ times the chip rate and normalized to the chip rate) of the downlink signal as measured at the UE antenna connector For DC-HSDPA and DB-DC-HSDPA, \hat{I}_{or} is defined for each of the cells individually and is assumed to be equal for both cells unless explicitly stated per cell. |
| I_{otx} | The power spectral density (integrated in a noise bandwidth equal to the chip rate and normalized to the chip rate) of a band limited white noise source (simulating Node B transmitter impairments) as measured at the Node B transmit antenna connector(s). For DC-HSDPA and DB-DC-HSDPA, I_{otx} is defined for each of the cells individually and is assumed to be equal for both cells unless explicitly stated per cell.). |
| I_{ouw} | Unwanted signal power level. |
| $OCNS_E_c$ | Average energy per PN chip for the OCNS. |
| $\frac{OCNS_E_c}{I_{or}}$ | The ratio of the average transmit energy per PN chip for the OCNS to the total transmit power spectral density. |
| $P_CCPCH_E_c$ | Average (note) energy per PN chip for P-CCPCH. |
| $P_CCPCH \frac{E_c}{I_o}$ | The ratio of the received P-CCPCH energy per chip to the total received power spectral density at the UE antenna connector. |

| | |
|---------------------------------|---|
| $\frac{P-CCPCH_{-}E_c}{I_{or}}$ | The ratio of the average (note) transmit energy per PN chip for the P-CCPCH to the total transmit power spectral density. |
| $P-CPICH_{-}E_c$ | Average (note) energy per PN chip for P-CPICH. |
| $PICH_{-}E_c$ | Average (note) energy per PN chip for PICH. |
| $\frac{PICH_{-}E_c}{I_{or}}$ | The ratio of the received energy per PN chip of the PICH to the total transmit power spectral density at the Node B (SS) antenna connector. |
| R | Number of information bits per second excluding CRC bits successfully received on HS-DSCH by a HSDPA capable UE. |
| <REFSENS> | Reference sensitivity |
| <REF \hat{I}_{or} > | Reference \hat{I}_{or} |
| $S-CCPCH$ | Secondary Common Control Physical Channel. |
| $S-CCPCH_{-}E_c$ | Average energy per PN chip for S-CCPCH. |
| $SCH_{-}E_c$ | Average (note) energy per PN chip for SCH. |
| $S-CPICH_{-}E_c$ | Average (note) energy per PN chip for S-CPICH. |

NOTE: Averaging period for energy/power of discontinuously transmitted channels should be defined.

NOTE: The units of Power Spectral Density (PSD) are extensively used in this document. PSD is a function of power versus frequency and when integrated across a given bandwidth, the function represents the mean power in such a bandwidth. When the mean power is normalised to (divided by) the chip-rate it represents the mean energy per chip. Some signals are directly defined in terms of energy per chip, (DPCH₋E_c and P-CPICH₋E_c) and others defined in terms of PSD (I_{oac}, I_{oc}, and \hat{I}_{or}). There also exist quantities that are a ratio of energy per chip to PSD (DPCH₋E_c/I_{or}, E_c/I_{or} etc.). This is the common practice of relating energy magnitudes in communication systems.

It can be seen that if both energy magnitudes in the ratio are divided by time, the ratio is converted from an energy ratio to a power ratio, which is more useful from a measurement point of view. It follows that an energy per chip of X dBm/3.84 MHz can be expressed as a mean power per chip of X dBm. Similarly, a signal PSD of Y dBm/3.84 MHz can be expressed as a signal power of Y dBm.

4 Frequency bands and channel arrangement

4.1 General

The information presented in this clause is based on a chip rate of 3.84 Mcps. The normative reference for the frequency bands and channel arrangement are defined in TS 25.101 [1], clause 5 and TS 25.307 [26].

NOTE: Other chip rates may be considered in future releases.

4.2 Frequency bands

a) UTRA/FDD is designed to operate in either of the following paired bands:

| Operating Band | UL Frequencies UE transmit, Node B receive | DL frequencies UE receive, Node B transmit |
|----------------|---|---|
| I | 1920 - 1980 MHz | 2110 - 2170 MHz |
| II | 1850 - 1910 MHz | 1930 - 1990 MHz |
| III | 1710 - 1785 MHz | 1805 - 1880 MHz |
| IV | 1710 - 1755 MHz | 2110 - 2155 MHz |
| V | 824 - 849 MHz | 869 - 894 MHz |
| VI | 830 - 840 MHz | 875 - 885 MHz |
| VII | 2500 - 2570 MHz | 2620 - 2690 MHz |
| VIII | 880 - 915 MHz | 925 - 960 MHz |
| IX | 1749.9 - 1784.9 MHz | 1844.9 - 1879.9 MHz |
| X | 1710 - 1770 MHz | 2110 - 2170 MHz |
| XI | 1427.9 - 1447.9 MHz | 1475.9 - 1495.9 MHz |
| XII | 699 - 716 MHz | 729 - 746 MHz |
| XIII | 777 - 787 MHz | 746 - 756 MHz |
| XIV | 788 - 798 MHz | 758 - 768 MHz |
| XV | Reserved | Reserved |
| XVI | Reserved | Reserved |
| XVII | Reserved | Reserved |
| XVIII | Reserved | Reserved |
| XIX | 830 - 845 MHz | 875 - 890 MHz |
| XX | 832 - 862 MHz | 791 - 821 MHz |
| XXI | 1447.9 - 1462.9 MHz | 1495.9 - 1510.9 MHz |
| XXII | 3410 - 3490 MHz | 3510 - 3590 MHz |
| XXV | 1850 - 1915 MHz | 1930 - 1995 MHz |
| XXVI | 814 - 849 MHz | 859 - 894 MHz |

b) Deployment in other frequency bands is not precluded.

c) DB-DC-HSDPA is designed to operate in the following configurations:

| DB-DC-HSDPA Configuration | UL Band | DL Bands |
|---------------------------|-----------|------------|
| 1 | I or VIII | I and VIII |
| 2 | II or IV | II and IV |
| 3 | I or V | I and V |
| 4 | I or XI | I and XI |
| 5 | II or V | II and V |

d) Single band 4C-HSDPA is designed to operate in the following configurations:

Table 4.0A Single band 4C-HSDPA configurations

| Single band 4C-HSDPA Configuration | Operating Band | Number of DL carriers |
|---|----------------|-----------------------|
| I-3 | I | 3 |
| NOTE: Single band 4C-HSDPA configuration is numbered as (X-M) where X denotes the operating band and M denotes the number of DL carriers. | | |

e) Dual band 4C-HSDPA is designed to operate in the following configurations:

Table 4.0B Dual band 4C-HSDPA configurations

| Dual band 4C-HSDPA Configuration | UL Band | DL Band A | Number of DL carriers in Band A | DL Band B | Number of DL carriers in Band B |
|----------------------------------|-----------|-----------|---------------------------------|-----------|---------------------------------|
| I-2-VIII-1 | I or VIII | I | 2 | VIII | 1 |
| I-3-VIII-1 | I or VIII | I | 3 | VIII | 1 |
| II-1-IV-2 | II or IV | II | 1 | IV | 2 |
| II-2-IV-1 | II or IV | II | 2 | IV | 1 |
| II-2-IV-2 | II or IV | II | 2 | IV | 2 |
| I-1-V-2 | I or V | I | 1 | V | 2 |
| I-2-V-1 | I or V | I | 2 | V | 1 |
| I-2-V-2 | I or V | I | 2 | V | 2 |

NOTE: Dual band 4C-HSDPA configuration is numbered as (X-M-Y-N) where X denotes the DL Band A, M denotes the number DL carriers in the DL Band A, Y denotes the DL Band B, and N denotes the number of DL carriers in the DL Band B.

4.3 TX-RX frequency separation

- a) UTRA/FDD is designed to operate with the following TX-RX frequency separation.

| Operating Band | TX-RX frequency separation |
|----------------|----------------------------|
| I | 190 MHz |
| II | 80 MHz |
| III | 95 MHz |
| IV | 400 MHz |
| V | 45 MHz |
| VI | 45 MHz |
| VII | 120 MHz |
| VIII | 45 MHz |
| IX | 95 MHz |
| X | 400 MHz |
| XI | 48 MHz |
| XII | 30 MHz |
| XIII | 31 MHz |
| XIV | 30 MHz |
| XIX | 45 MHz |
| XX | 41 MHz |
| XXI | 48 MHz |
| XXII | 100 MHz |
| XXV | 80 MHz |
| XXVI | 45 MHz |

- b) UTRA/FDD can support both fixed and variable transmit to receive frequency separation.
- c) The use of other transmit to receive frequency separations in existing or other frequency bands shall not be precluded.
- d) When configured to operate on dual cells, the TX-RX frequency separation shall be applied to UL and DL with the serving HS-DSCH cell. For band XII, XIII and XIV, the TX-RX frequency separation shall be the minimum spacing between UL and any of DL carriers.

4.4 Channel arrangement

4.4.1 Channel spacing

The nominal channel spacing is 5 MHz, but this can be adjusted to optimise performance in a particular deployment scenario. In DC-HSDPA and DB-DC-HSDPA mode, the UE receives two cells simultaneously. In context of DC-HSDPA and DB-DC-HSDPA, a cell is characterized by a combination of scrambling code and a carrier frequency; see TR 21.905 [5].

4.4.2 Channel raster

The channel raster is 200 kHz, for all bands which means that the centre frequency must be an integer multiple of 200 kHz. In addition a number of additional centre frequencies are specified according to table 4.1a, which means that the centre frequencies for these channels are shifted 100 kHz relative to the general raster.

4.4.3 Channel number

The carrier frequency is designated by the UTRA Absolute Radio Frequency Channel Number (UARFCN). For each operating Band, the values of the UARFCN are defined as follows.

Uplink: $N_U = 5 * (F_{UL} - F_{UL_Offset})$, for the carrier frequency range $F_{UL_low} \leq F_{UL} \leq F_{UL_high}$

Downlink: $N_D = 5 * (F_{DL} - F_{DL_Offset})$, for the carrier frequency range $F_{DL_low} \leq F_{DL} \leq F_{DL_high}$

For each operating Band, F_{UL_Offset} , F_{UL_low} , F_{UL_high} , F_{DL_Offset} , F_{DL_low} and F_{DL_high} are defined in Table 4.1 for the general UARFCN. For the additional UARFCN, F_{UL_Offset} , F_{DL_Offset} and the specific F_{UL} and F_{DL} are defined in Table 4.1A.

Table 4.1: UARFCN definition (general)

| Band | UPLINK (UL) UE transmit, Node B receive | | | DOWNLINK (DL) UE receive, Node B transmit | | |
|------|--|---|----------------|--|---|----------------|
| | UARFCN formula offset F_{UL_Offset} [MHz] | Carrier frequency (F_{UL}) range [MHz] | | UARFCN formula offset F_{DL_Offset} [MHz] | Carrier frequency (F_{DL}) range [MHz] | |
| | | F_{UL_low} | F_{UL_high} | | F_{DL_low} | F_{DL_high} |
| I | 0 | 1922.4 | 1977.6 | 0 | 2112.4 | 2167.6 |
| II | 0 | 1852.4 | 1907.6 | 0 | 1932.4 | 1987.6 |

4.4.4 UARFCN

The following UARFCN range shall be supported for each paired band.

Table 4.2: UTRA Absolute Radio Frequency Channel Number

| Band | Uplink (UL) UE transmit, Node B receive | | Downlink (DL) UE receive, Node B transmit | |
|------|--|---|--|--|
| | General | Additional | General | Additional |
| I | 9612 to 9888 | - | 10562 to 10838 | - |
| II | 9262 to 9538 | 12, 37, 62, 87, 112, 137, 162, 187, 212, 237, 262, 287 | 9662 to 9938 | 412, 437, 462, 487, 512, 537, 562, 587, 612, 637, 662, 687 |
| III | 937 to 1288 | - | 1162 to 1513 | - |
| IV | 1312 to 1513 | 1662, 1687, 1712, 1737, 1762, 1787, 1812, 1837, 1862 | 1537 to 1738 | 1887, 1912, 1937, 1962, 1987, 2012, 2037, 2062, 2087 |
| V | 4132 to 4233 | 782, 787, 807, 812, 837, 862 | 4357 to 4458 | 1007, 1012, 1032, 1037, 1062, 1087 |
| VI | 4162 to 4188 | 812, 837 | 4387 to 4413 | 1037, 1062 |

| XXVI | 5537 to 5688 | 5712, 5737, 5762, 5767, 5787, 5792, 5812, 5817, 5837, 5842, 5862 | 5762 to 5913 | 5937, 5962, 5987, 5992, 6012, 6017, 6037, 6042, 6062, 6067, 6087 |

NOTE: If the UE is on a network with Mobile Country Code set to Japan then it may assume that any DL UARFCN sent by the network from the overlapping region of Band V and Band VI is from Band VI. If the UE is on a network with a Mobile Country Code other than Japan then it may assume that any DL UARFCN sent by the network from the overlapping region of Band V and Band VI is from Band V.

4A Reference Conditions

The reference environment used by all test cases in this document is specified in TS 34.108 [3] and TS 36.508 [33]. Where a test requires an environment that is different, this will be specified in the test itself.

4A.1 Generic setup procedures

Test procedures for RF test are defined in TS 34.108 [3] clause 7.3. The initial conditions of this clause also refer to the generic setup procedures defined in TS 34.108 [3] clause 7.2.

4A.2 System information

The reference system information used for test cases specified in this document is defined in TS 34.108 [3] clauses 6.1.0a (Default Master Information Block and Scheduling Block messages) and 6.1.0b (Default System Information Block Messages). For cells other than cell 1 the difference in information elements is defined in TS 34.108 [3] clause 6.1.4. For the generic setup procedures defined in TS 34.108 [3] clause 7.3 some SIB elements override those specific SIB elements from TS 34.108 [3] clause 6.1.0b. Annex I in the present document overwrites specific elements in the Master Information Block and Scheduling Block messages compared to TS 34.108 [3] clause 6.1.0a and specific SIB elements compared to TS 34.108 [3] clauses 6.1.0b and 7.3. In the test description itself specific SIB elements can be overwritten again. This leads to the following places defining Master Information Block, Scheduling Block messages and System Information Block Messages:

1. TS 34.108 [3] clauses 6.1.0a, 6.1.0b and 6.1.4
2. TS 34.108 [3] clause 7.3
3. TS 34.121 Annex I
4. TS 34.121 test case description

When the same Information Element is defined in several places then the place with the higher number according to the above list will override the other definition(s).

The reference system information for E-UTRAN is specified in TS 36.508 [33]

4A.3 Message contents

Default message contents for test cases specified in this document are defined in TS 34.108 [3] clause 9. Most default message contents are specified in TS 34.108 [3] clause 9.2.1, but some default message contents originally defined for signalling test cases are re-used for RF testing and specified in TS 34.108 [3] clause 9.1.1. TS 34.108 [3] clause 7.3 contains additional information regarding the default messages. Annex I in the present document overwrites specific message contents for some test cases. In the test description itself specific information elements can be overwritten again. This leads to the following places defining message contents:

- 1a. TS 34.108 [3] clause 9.1.1 (only if indicated by TS 34.108 [3] clause 7.3 or the test description in TS 34.121)
- 1b. TS 34.108 [3] clause 9.2.1 (as indicated by TS 34.108 [3] clause 7.3 or the test description in TS 34.121)
2. TS 34.108 [3] clause 7.3
3. TS 34.121 Annex I
4. TS 34.121 test case description

When the same Information Element is defined in several places then the place with the higher number according to the above list will override the other definition(s). Default message contents from TS 34.108 [3] clause 9 will be used either from clause 9.1.1 (1a in the list above) or from clause 9.2.1 (1b in the list above). Some messages are not defined in all places, but all messages have to be defined at least in the test description.

Default message contents for E-UTRAN is specified in TS 36.508 [33].

4A.4 Measurement configurations

Measurement configurations defined by system information are specified in TS 34.108 [3]. System Information Block type 11 (SIB 11) configures measurements for cell 1 according to TS 34.108 [3], clause 6.1.0b. See TS 34.108 [3], clause 6.1.4 for the difference in message contents of SIB 11 (FDD) for other cells used in the test. SIB 12 is specified in TS 34.108 [3] clause 6.1.0b, but is currently not used to configure measurements.

Some modifications to specific information elements in SIB 11 are defined in TS 34.121 Annex I or in the test description itself. In this case the priority defined in clause 4A.2 shall be applied.

Note: Currently SIB 11 in TS 34.108 [3] configures Intra-frequency measurement system information to use "Intra-frequency measurement identity=1" (default value), "Intra-frequency measurement identity =CPICH RSCP" with events 1a, 1b and 1c. The Inter-frequency measurement system information and the Inter-RAT measurement system information do not configure measurement identities. Traffic volume measurement system information is not present.

In many test cases the measurement identity as configured by SIB 11 is reused and the Measurement Control message will "Modify" the Measurement Identity configured in SIB 11.

In some test cases additional measurements are used. Then the Measurement Control message will "Setup" a new Measurement Identity with the default value for that measurement quantity as specified in TS 25.331 [8]. If the Measurement Control message uses "Setup" then the new Measurement Identity shall be different to already configured ones. All Inter-frequency measurements and Inter-RAT measurements are first configured by Measurement Control message using "Setup".

All UE measurements are referenced to the UE antenna connector.

Measurement configurations defined by system information for E-UTRAN is specified in TS 36.508 [33].

5 Transmitter Characteristics

5.1 General

Transmitting performance test of the UE is implemented during communicating with the SS via air interface. The procedure is using normal call protocol until the UE is communicating on traffic channel basically. On the traffic channel, the UE provides special function for testing that is called Logical Test Interface and the UE is tested using this function. (Refer to TS 34.109 [4]).

Transmitting or receiving bit/symbol rate for test channel is shown in table 5.1.

Table 5.1: Bit / Symbol rate for Test Channel

| Type of User Information | User bit rate | DL DPCH symbol rate | UL DPCH bit rate | Remarks |
|---|---------------|---------------------|------------------|---------------|
| 12,2 kbps reference measurement channel | 12,2 kbps | 30 ksps | 60 kbps | Standard Test |

Unless detailed the transmitter characteristic are specified at the antenna connector of the UE. For UE with integral antenna only, a reference antenna with a gain of 0 dBi is assumed. Transmitter characteristics for UE(s) with multiple antennas/antenna connectors are FFS.

The UE antenna performance has a significant impact on system performance, and minimum requirements on the antenna efficiency are therefore intended to be included in future versions of the present document. It is recognised that different requirements and test methods are likely to be required for the different types of UE.

All the parameters in clause 5 are defined using the UL reference measurement channel (12,2 kbps) specified in clause C.2.1 and unless stated otherwise, with the UL power control ON.

The common RF test conditions of Tx Characteristics are defined in clause E.3.1, and each test conditions in this clause (clause 5) should refer clause E.3.1. Individual test conditions are defined in the paragraph of each test.

When DCCH has been configured on downlink DCH then DCCH Data shall be continuously transmitted on downlink DCH during the measurement period. When there is no signalling to transmit on downlink DCCH then dummy DCCH transmission as described in Annex C.9 shall be used.

For HSDPA test cases and E-DCH test cases, when DTCH has been configured on downlink DCH then DTCH Data shall be continuously transmitted on downlink DCH during the measurement period.

The MAC header transmission on HS-DSCH for all E-DCH test cases shall use a correct MAC-hs header consistent with the actual HSDPA transmission.

The DL and UL RLC SDU size for all E-DCH tests in clause 5 shall be set according to Annex C.11.3.

For HSDPA test cases without E-DCH, the MAC headers on HS-DSCH shall be according to Annex C.9A.

UEs supporting DC-HSUPA shall support both minimum requirements, as well as additional requirements for DC-HSUPA.

For the additional requirements for DC-HSUPA, all the parameters in clause 6 are defined using the UL E-DCH reference measurement channel, specified in subclause C.2.6. For the additional requirements for DC-HSUPA, the spacing of the carrier frequencies of the two cells shall be 5 MHz.

5.2 Maximum Output Power

5.2.1 Definition and applicability

The nominal maximum output power and its tolerance are defined according to the Power Class of the UE.

The maximum output power is a measure of the maximum power the UE can transmit (i.e. the actual power as would be measured assuming no measurement error) in a bandwidth of at least $(1 + \alpha)$ times the chip rate of the radio access mode. The period of measurement shall be at least one timeslot.

The requirements and this test apply to all types of UTRA for the FDD UE.

5.2.2 Minimum Requirements

The UE maximum output power shall be within the nominal value and tolerance specified in table 5.2.1 even for the multi-code transmission mode.

Table 5.2.1: Nominal Maximum Output Power

| Operating Band | Power Class 1 | | Power Class 2 | | Power Class 3 | | Power Class 3bis | | Power Class 4 | |
|-----------------------|---------------|----------|---------------|----------|---------------|----------|------------------|----------|---------------|----------|
| | Power (dBm) | Tol (dB) | Power (dBm) | Tol (dB) | Power (dBm) | Tol (dB) | Power (dBm) | Tol (dB) | Power (dBm) | Tol (dB) |
| Band I | +33 | +1/-3 | +27 | +1/-3 | +24 | +1/-3 | +23 | +2/-2 | +21 | +2/-2 |
| Band II | - | - | - | - | +24 | +1/-3 | +23 | +2/-2 | +21 | +2/-2 |
| Band III | - | - | - | - | +24 | +1/-3 | +23 | +2/-2 | +21 | +2/-2 |
| Band IV | - | - | - | - | +24 | +1/-3 | +23 | +2/-2 | +21 | +2/-2 |
| Band V | - | - | - | - | +24 | +1/-3 | +23 | +2/-2 | +21 | +2/-2 |
| Band VI | - | - | - | - | +24 | +1/-3 | +23 | +2/-2 | +21 | +2/-2 |
| Band VII | - | - | - | - | +24 | +1/-3 | +23 | +2/-2 | +21 | +2/-2 |
| Band VIII | - | - | - | - | +24 | +1/-3 | +23 | +2/-2 | +21 | +2/-2 |
| Band IX | - | - | - | - | +24 | +1/-3 | +23 | +2/-2 | +21 | +2/-2 |
| Band X | - | - | - | - | +24 | +1/-3 | +23 | +2/-2 | +21 | +2/-2 |
| Band XI | - | - | - | - | +24 | +1/-3 | +23 | +2/-2 | +21 | +2/-2 |
| Band XII | - | - | - | - | +24 | +1/-3 | +23 | +2/-2 | +21 | +2/-2 |
| Band XIII | - | - | - | - | +24 | +1/-3 | +23 | +2/-2 | +21 | +2/-2 |
| Band XIV | - | - | - | - | +24 | +1/-3 | +23 | +2/-2 | +21 | +2/-2 |
| Band XIX | - | - | - | - | +24 | +1/-3 | +23 | +2/-2 | +21 | +2/-2 |
| Band XX | - | - | - | - | +24 | +1/-3 | +23 | +2/-2 | +21 | +2/-2 |
| Band XXI | - | - | - | - | +24 | +1/-3 | +23 | +2/-2 | +21 | +2/-2 |
| Band XXII | - | - | - | - | +24 | +1/-4.5 | +23 | +2/-3.5 | +21 | +2/-3.5 |
| Band XXV | - | - | - | - | +24 | +1/-4 | +23 | +2/-3 | +21 | +2/-3 |
| Band XXVI (Note 1) | - | - | - | - | +24 | +1/-4 | +23 | +2/-3 | +21 | +2/-3 |

NOTE 1: For the UE which supports both Band V and Band XXVI operating frequencies, the UE maximum output power of Band V shall apply for Band XXVI when the carrier frequency of the assigned UTRA channel is within 824-845 MHz.

For the UE which supports E-UTRA inter-band carrier aggregation, the lower side of the tolerance in Table 5.2.1 is allowed to be decreased by the amount given in Table 6.2.5A-3 of TS 36.101[11] for those UTRA operating bands corresponding to the E-UTRA operating bands that belong to the supported inter-band carrier aggregation configurations. The tolerance in Table 6.2.5A-3 of TS 36.101[11] does not apply to supported UTRA operating bands with frequency range below 1 GHz that correspond to the E-UTRA operating bands that belong to the supported inter-band carrier aggregation configurations when such bands are belonging only to band combination(s) where one band is <1GHz and another band is >1.7GHz and there is no harmonic relationship between the low band UL and high band DL.

In case the UE supports DB-DC-HSDPA or dual band 4C-HSDPA configurations and one or more of the E-UTRA inter-band carrier aggregation configurations listed in Table 6.2.5A-3 of TS36.101[11] with a UTRA operating band that belongs to UTRA and E-UTRA carrier aggregation configurations, then

- When the UTRA operating band frequency range is ≤ 1 GHz, the applicable additional tolerance shall be the average of the applicable tolerances, truncated to one decimal place for that operating band among the supported DB-DC-HSDPA, dual band 4C-HSDPA, and E-UTRA CA configurations, with the DB-DC-HSDPA, dual carrier 4C-HSDPA, and E-UTRA CA configurations counted separately. In case there is a harmonic relation between low band UL and high band DL, then the maximum tolerance among the different supported carrier aggregation configurations involving such band shall be applied
- When the UTRA operating band frequency range is >1 GHz, the applicable additional tolerance shall be the maximum tolerance that applies for that operating band among the supported DB-DC-HSDPA, dual band 4C-HSDPA, and E-UTRA CA configurations.

The normative reference for this requirement is TS 25.101 [1], clause 6.2.1.

5.2.3 Test purpose

To verify that the error of the UE maximum output power does not exceed the range prescribed by the nominal maximum output power and tolerance in table 5.2.1.

An excess maximum output power has the possibility to interfere to other channels or other systems. A small maximum output power decreases the coverage area.

5.2.4 Method of test

5.2.4.1 Initial conditions

Test environment: normal, TL/VL, TL/VH, TH/VL, TH/VH; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.1.
- 2) A call is set up according to the Generic call setup procedure in TS34.108 [3], clause 7.3.2.
- 3) Enter the UE into loopback test mode and start the loopback test.

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

5.2.4.2 Procedure

- 1) Set and send continuously Up power control commands to the UE.
- 2) Measure the mean power of the UE in a bandwidth of at least $(1 + \alpha)$ times the chip rate of the radio access mode. The mean power shall be averaged over at least one timeslot.

5.2.5 Test requirements

The maximum output power, derived in step 2), shall not exceed the range prescribed by the nominal maximum output power and tolerance in table 5.2.2.

Table 5.2.2: Nominal Maximum Output Power

| Operating Band | Power Class 1 | | Power Class 2 | | Power Class 3 | | Power Class 3bis | | Power Class 4 | |
|--------------------|---------------|-----------|---------------|-----------|---------------|-----------|------------------|-----------|---------------|-----------|
| | Power (dBm) | Tol (dB) | Power (dBm) | Tol (dB) | Power (dBm) | Tol (dB) | Power (dBm) | Tol (dB) | Power (dBm) | Tol (dB) |
| Band I | +33 | +1,7/-3,7 | +27 | +1,7/-3,7 | +24 | +1,7/-3,7 | +23 | +2,7/-2,7 | +21 | +2,7/-2,7 |
| Band II | - | - | - | - | +24 | +1,7/-3,7 | +23 | +2,7/-2,7 | +21 | +2,7/-2,7 |
| Band III | - | - | - | - | +24 | +1,7/-3,7 | +23 | +2,7/-2,7 | +21 | +2,7/-2,7 |
| Band IV | - | - | - | - | +24 | +1,7/-3,7 | +23 | +2,7/-2,7 | +21 | +2,7/-2,7 |
| Band V | - | - | - | - | +24 | +1,7/-3,7 | +23 | +2,7/-2,7 | +21 | +2,7/-2,7 |
| Band VI | - | - | - | - | +24 | +1,7/-3,7 | +23 | +2,7/-2,7 | +21 | +2,7/-2,7 |
| Band VII | - | - | - | - | +24 | +1,7/-3,7 | +23 | +2,7/-2,7 | +21 | +2,7/-2,7 |
| Band VIII | - | - | - | - | +24 | +1,7/-3,7 | +23 | +2,7/-2,7 | +21 | +2,7/-2,7 |
| Band IX | - | - | - | - | +24 | +1,7/-3,7 | +23 | +2,7/-2,7 | +21 | +2,7/-2,7 |
| Band X | - | - | - | - | +24 | +1,7/-3,7 | +23 | +2,7/-2,7 | +21 | +2,7/-2,7 |
| Band XI | - | - | - | - | +24 | +1,7/-3,7 | +23 | +2,7/-2,7 | +21 | +2,7/-2,7 |
| Band XII | - | - | - | - | +24 | +1,7/-3,7 | +23 | +2,7/-2,7 | +21 | +2,7/-2,7 |
| Band XIII | - | - | - | - | +24 | +1,7/-3,7 | +23 | +2,7/-2,7 | +21 | +2,7/-2,7 |
| Band XIV | - | - | - | - | +24 | +1,7/-3,7 | +23 | +2,7/-2,7 | +21 | +2,7/-2,7 |
| Band XIX | - | - | - | - | +24 | +1,7/-3,7 | +23 | +2,7/-2,7 | +21 | +2,7/-2,7 |
| Band XX | - | - | - | - | +24 | +1,7/-3,7 | +23 | +2,7/-2,7 | +21 | +2,7/-2,7 |
| Band XXI | - | - | - | - | +24 | +1,7/-3,7 | +23 | +2,7/-2,7 | +21 | +2,7/-2,7 |
| Band XXII | - | - | - | - | +24 | +1,7/-5,2 | +23 | +2,7/-4,2 | +21 | +2,7/-4,2 |
| Band XXV | - | - | - | - | +24 | +1,7/-4,7 | +23 | +2,7/-3,7 | +21 | +2,7/-3,7 |
| Band XXVI (Note 1) | - | - | - | - | +24 | +1,7/-4,7 | +23 | +2,7/-3,7 | +21 | +2,7/-3,7 |

NOTE 1: For the UE which supports both Band V and Band XXVI operating frequencies, the UE maximum output power of Band V shall apply for Band XXVI when the carrier frequency of the assigned UTRA channel is within 824-845 MHz.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.2A Maximum Output Power with HS-DPCCH (Release 5 only)

5.2A.1 Definition and applicability

The maximum output power with HS-DPCCH and its tolerance are defined according to the Power Class of the UE.

The maximum output power with HS-DPCCH is a measure of the maximum power the UE can transmit when HS-DPCCH is fully or partially transmitted during a DPCCH timeslot. The measurement period shall be at least one timeslot.

The requirements and this test apply to all types of UTRA for the FDD UE that support HSDPA for Release 5.

5.2A.2 Minimum Requirements

The UE maximum output power with HS-DPCCH shall be within the value and tolerance specified in table 5.2A.1 when HS-DPCCH is fully or partially transmitted during a DPCCH timeslot. The maximum output power where HS-DPCCH is not transmitted shall be within the values and tolerance specified in table 5.2.1.

Table 5.2A.1: Maximum Output Powers with HS-DPCCH

| Ratio of β_c to β_d for all values of β_{hs} | Power Class 3 | | Power Class 4 | |
|--|---------------|----------|---------------|----------|
| | Power (dBm) | Tol (dB) | Power (dBm) | Tol (dB) |
| $1/15 \leq \beta_c/\beta_d \leq 12/15$ | +24 | +1/-3 | +21 | +2/-2 |
| $13/15 \leq \beta_c/\beta_d \leq 15/8$ | +23 | +2/-3 | +20 | +3/-2 |
| $15/7 \leq \beta_c/\beta_d \leq 15/0$ | +22 | +3/-3 | +19 | +4/-2 |

The normative reference for this requirement is TS 25.101 [1], clause 6.2.2.

5.2A.3 Test purpose

To verify that the error of the UE maximum output power with HS-DPCCH does not exceed the range prescribed by the maximum output power and tolerance in table 5.2A.1.

An excess maximum output power may interfere with other channels or other systems. A small maximum output power decreases the coverage area.

5.2A.4 Method of test

5.2A.4.1 Initial conditions

Test environment: normal, TL/VL, TL/VH, TH/VL, TH/VH; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS (node B emulator) to the UE antenna connector as shown in figure A.1.
- 2) The UL Reference Measurement Channel and the Fixed Reference Channels (FRC H-Set 1, QPSK version) are specified in Annex C.10.1 and C.8.1.1 with the beta values set according to table C.10.1.4.
- 3) An HSDPA call is set up according to TS 34.108 [3] clause 7.3.6. RF parameters are set up according to table E.5.1 and table E.5.10. Settings for the serving cell are defined in table 5.2A.1A.
- 4) Enter the UE into loopback test mode in the presence of HSDPA and start the loopback test.

See TS 34.108 [3] and TS 34.109 [4] for details regarding loopback test mode for HSDPA.

Table 5.2A.1A: Settings for the serving cell during the measurement of Maximum Output Power with HS-DPCCH

| Parameter | Unit | Cell 1 |
|--|--------------|-------------------------------|
| Cell type | | Serving cell |
| UTRA RF Channel Number | | As defined in clause 5.2A.4.1 |
| Qqualmin | dB | -24 |
| Qrxlevmin | dBm | -115 |
| UE_TXPWR_MAX_RACH | dBm | +21 |
| \hat{I}_{or} (see notes 1 and 2) | dBm/3.84 MHz | -86 |
| NOTE 1: The power level is specified in terms of \hat{I}_{or} instead of CPICH_RSCP because RSCP is a receiver measurement, whereas the SS can only set \hat{I}_{or} . | | |
| NOTE 2: The cell fulfils TS 25.304, clause 5.2.3.1.2. | | |

5.2A.4.2 Procedure

- 1) Send TRANSPORT CHANNEL RECONFIGURATION message to set the beta values according to table C.10.1.4 and the DPCH frame offset according the HS-DPCCH slot offset required for measurements.
- 2) Set and send continuously Up power control commands to the UE.
- 3) Start transmitting HSDPA Data.
- 4) Measure the mean power of the UE. The mean power shall be averaged over at least one timeslot.
- 5) Repeat the measurement for the different combinations of beta values as given in table C.10.1.4.

Specific Message Contents

All messages indicated above shall use the same content as described in the default message content in clause 9 of TS 34.108 [3], except the TRANSPORT CHANNEL RECONFIGURATION message which is defined in Annex I.

5.2A.5 Test requirements

The maximum output power with HS-DPCCH, derived in step 4), shall not exceed the range prescribed by the maximum output power and tolerance in table 5.2A.2. The maximum output power where HS-DPCCH is not transmitted shall not exceed the range prescribed in table 5.2.2.

The UL reference measurement channel for TX test will be set as defined in C.10.1 with the power ratio between HS-DPCH, DPCCH and DPDCH being set to the values defined in table C.10.1.4.

Table 5.2A.2: Maximum Output Powers with HS-DPCCH for test

| Ratio of β_c to β_d for all values of β_{hs} | Power Class 3 | | Power Class 4 | |
|---|---------------|-----------|---------------|-----------|
| | Power (dBm) | Tol (dB) | Power (dBm) | Tol (dB) |
| $\beta_c/\beta_d = 2/15, 12/15$ | +24 | +1.7/-3.7 | +21 | +2.7/-2.7 |
| $\beta_c/\beta_d = 15/8$ | +23 | +2.7/-3.7 | +20 | +3.7/-2.7 |
| $\beta_c/\beta_d = 15/4$ | +22 | +3.7/-3.7 | +19 | +4.7/-2.7 |
| NOTE: For the purpose of the test Δ_{ACK} , Δ_{NACK} and $\Delta_{CQI} = 30/15$ with $\beta_{hs} = 30/15 * \beta_c$. | | | | |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.2AA Maximum Output Power with HS-DPCCH (Release 6 and later)

5.2AA.1 Definition and applicability

The maximum output power with HS-DPCCH and its tolerance are defined according to the UE Maximum Power Reduction (MPR) for the nominal maximum output power.

The maximum output power with HS-DPCCH is a measure of the maximum power the UE can transmit when HS-DPCCH is fully or partially transmitted during a DPCCH timeslot. The measurement period shall be at least one timeslot.

The requirements and this test apply for Release 6 and later releases to all types of UTRA for the FDD UE that support HSDPA without E-DCH.

5.2AA.2 Minimum Requirements

The UE Maximum Power Reduction (MPR) for the nominal maximum output power shall be within the value and tolerance specified in table 5.2AA.1 for when the values of β_c , β_d , β_{hs} , β_{ec} and β_{ed} is fully or partially transmitted during a DPCCH timeslot.

Table 5.2AA.1: Maximum Output Power with HS-DPCCH and E-DCH

| UE transmit channel configuration | CM (dB) | MPR (dB) |
|---|----------------------|---------------|
| For all combinations of; DPDCH, DPCCH, HS-DPCCH, E-DPDCH and E-DPCCH | $0 \leq CM \leq 3.5$ | MAX (CM-1, 0) |
| NOTE 1: CM = 1 for $\beta_c/\beta_d = 12/15$, $\beta_{hs}/\beta_c = 24/15$. For all other combinations of DPDCH, DPCCH, HS-DPCCH, E-DPDCH and E-DPCCH the MPR is based on the relative CM difference. | | |

Where Cubic Metric (CM) is based on the UE transmit channel configuration and is given by:

$$CM = \text{CEIL} \{ [20 * \log_{10} ((v_{\text{norm}}^3)_{\text{rms}}) - 20 * \log_{10} ((v_{\text{norm_ref}}^3)_{\text{rms}})] / k, 0.5 \}$$

Where:

- CEIL{ x, 0.5 } means rounding upwards to closest 0.5dB, i.e. $CM \in [0, 0.5, 1.0, 1.5, 2.0, 2.5, 3.0, 3.5]$
- k is 1.85 for signals where all channelisations codes meet the following criteria $C_{SF,N}$ where $N < SF/2$
- k is 1.56 for signals where any channelisations codes meet the following criteria $C_{SF,N}$ where $N \geq SF/2$
- v_{norm} is the normalized voltage waveform of the input signal

- $v_{\text{norm_ref}}$ is the normalized voltage waveform of the reference signal (12.2 kbps AMR Speech) and $20 * \log_{10}((v_{\text{norm_ref}}^3)_{\text{rms}}) = 1.52$ dB

The normative reference for this requirement is TS 25.101 [1], clause 6.2.2.

5.2AA.3 Test purpose

To verify that the error of the UE maximum output power with HS-DPCCH does not exceed the range prescribed by the maximum output power and tolerance in table 5.2AA.2.

An excess maximum output power may interfere with other channels or other systems. A small maximum output power decreases the coverage area.

5.2AA.4 Method of test

5.2AA.4.1 Initial conditions

Test environment: normal, TL/VL, TL/VH, TH/VL, TH/VH; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS (node B emulator) to the UE antenna connector as shown in figure A.1.
- 2) The UL Reference Measurement Channel and the Fixed Reference Channels (FRC H-Set 1) are specified in clauses C.10.1 and C.8.1.1.
- 3) An HSDPA call is set up according to TS 34.108 [3] clause 7.3.6. RF parameters are set up according to table E.5.1 and table E.5.10. Settings for the serving cell are defined in table 5.2AA.1A.
- 4) Enter the UE into loopback test mode in the presence of HSDPA and start the loopback test.

See TS 34.108 [3] and TS 34.109 [4] for details regarding loopback test mode for HSDPA.

Table 5.2AA.1A: Settings for the serving cell during the measurement of Maximum Output Power with HS-DPCCH

| Parameter | Unit | Cell 1 |
|--|-----------------|--------------------------------|
| Cell type | | Serving cell |
| UTRA RF Channel Number | | As defined in clause 5.2AA.4.1 |
| Qqualmin | dB | -24 |
| Qrxlevmin | dBm | -115 |
| UE_TXPWR_MAX_RACH | dBm | +21 |
| \hat{I}_{or} (see notes 1 and 2) | dBm/3.84 MHz | -86 |
| NOTE 1: The power level is specified in terms of \hat{I}_{or} instead of CPICH_RSCP because RSCP is a receiver measurement, whereas the SS can only set \hat{I}_{or} . | | |
| NOTE 2: The cell fulfils TS 25.304, clause 5.2.3.1.2. | | |

5.2AA.4.2 Procedure

- 1) Send TRANSPORT CHANNEL RECONFIGURATION message to set the beta values according to table C.10.1.4 and the DPCH frame offset according to the HS-DPCCH slot offset required for measurements.
- 2) Set and send continuously Up power control commands to the UE.
- 3) Start transmitting HSDPA Data.
- 4) Measure the mean power of the UE. The mean power shall be averaged over at least one timeslot.
- 5) Repeat the measurement for the different combinations of beta values as given in table C.10.1.4.

Specific Message Contents

All messages indicated above shall use the same content as described in the default message content in clause 9 of TS 34.108 [3], except the TRANSPORT CHANNEL RECONFIGURATION message which is defined in Annex I.

5.2AA.5 Test requirements

The maximum output power with HS-DPCCH, derived in step 4), shall not exceed the range prescribed by the maximum output power and tolerance in table 5.2AA.2 or 5.2AA.3 depending on tested band. The maximum output power where HS-DPCCH is not transmitted shall not exceed the range prescribed in table 5.2.2.

The UL reference measurement channel for TX test will be set as defined in C.10.1 with the power ratio between HS-DPCH, DPCCH and DPDCH being set to the values defined in table C.10.1.4.

Table 5.2AA.2: Maximum Output Powers with HS-DPCCH for test

| Sub-test in table C.10.1.4 | Power Class 3 | | Power Class 4 | |
|----------------------------|---------------|-----------|---------------|-----------|
| | Power (dBm) | Tol (dB) | Power (dBm) | Tol (dB) |
| 1 | +24 | +1.7/-3.7 | +21 | +2.7/-2.7 |
| 2 | +24 | +1.7/-3.7 | +21 | +2.7/-2.7 |
| 3 | +23.5 | +2.2/-3.7 | +20.5 | +3.2/-2.7 |
| 4 | +23.5 | +2.2/-3.7 | +20.5 | +3.2/-2.7 |

Table 5.2AA.3: Maximum Output Powers with HS-DPCCH for test in bands XXV and XXVI

| Sub-test in table C.10.1.4 | Power Class 3 | | Power Class 4 | |
|----------------------------|---|-----------|---------------|-----------|
| | Power (dBm) | Tol (dB) | Power (dBm) | Tol (dB) |
| 1 | +24 | +1.7/-4.7 | +21 | +2.7/-3.7 |
| 2 | +24 | +1.7/-4.7 | +21 | +2.7/-3.7 |
| 3 | +23.5 | +2.2/-4.7 | +20.5 | +3.2/-3.7 |
| 4 | +23.5 | +2.2/-4.7 | +20.5 | +3.2/-3.7 |
| NOTE: | For the UE which supports both Band V and Band XXVI operating frequencies, the UE maximum output power of Band V shall apply for Band XXVI when the carrier frequency of the assigned UTRA channel is within 824-845 MHz. | | | |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.2AB Maximum Output Power for OLTD

FFS

5.2AC Maximum Output Power for UL CLTD activation state 1

Editor's note: This clause is incomplete. The following aspects are either missing or not yet determined:

- Message Contents are FFS.
- Call Setup procedure, test procedure, test tolerances may need an update.
- Update of Annexure is FFS
- Update to 34.121-2 is FFS

5.2AC.1 Definition and applicability

The nominal maximum output power with UL CLTD and its tolerance are defined according to the Power Class of the UE.

The maximum output power is a measure of the maximum power the UE can transmit (i.e. the actual power as would be measured assuming no measurement error) in a bandwidth of at least $(1 + \alpha)$ times the chip rate of the radio access mode. The period of measurement shall be at least one timeslot.

The requirements and this test apply for Release 11 and later releases to all types of UTRA for the FDD UE that supports UL CLTD.

5.2AC.2 Minimum Requirements

For UE with two active transmit antenna connectors in UL CLTD activation state 1, the nominal maximum output power is specified in Table 5.2AC.1. The nominal transmit power is defined by the sum of transmit power at each transmit antenna connector.

Table 5.2AC.1: Nominal Maximum Output Power for UL CLTD

| Operating Band | Power Class 3 | | Power Class 3bis | |
|--------------------|---|----------|------------------|----------|
| | Power (dBm) | Tol (dB) | Power (dBm) | Tol (dB) |
| Band I | +24 | +1/-4 | 23 | +2/-3 |
| Band II | +24 | +1/-4 | 23 | +2/-3 |
| Band III | +24 | +1/-4 | 23 | +2/-3 |
| Band IV | +24 | +1/-4 | 23 | +2/-3 |
| Band V | +24 | +1/-4 | 23 | +2/-3 |
| Band VI | +24 | +1/-4 | 23 | +2/-3 |
| Band VII | +24 | +1/-4 | 23 | +2/-3 |
| Band VIII | +24 | +1/-4 | 23 | +2/-3 |
| Band IX | +24 | +1/-4 | 23 | +2/-3 |
| Band X | +24 | +1/-4 | 23 | +2/-3 |
| Band XI | +24 | +1/-4 | 23 | +2/-3 |
| Band XII | +24 | +1/-4 | 23 | +2/-3 |
| Band XIII | +24 | +1/-4 | 23 | +2/-3 |
| Band XIV | +24 | +1/-4 | 23 | +2/-3 |
| Band XIX | +24 | +1/-4 | 23 | +2/-3 |
| Band XX | +24 | +1/-4 | 23 | +2/-3 |
| Band XXI | +24 | +1/-4 | 23 | +2/-3 |
| Band XXII | +24 | +1/-5.5 | 23 | +2/-4.5 |
| Band XXV | +24 | +1/-5 | 23 | +2/-4 |
| Band XXVI (Note 1) | +24 | +1/-5 | 23 | +2/-4 |
| Note 1 | For the UE which supports both Band V and Band XXVI operating frequencies, the UE maximum output power of Band V shall apply for Band XXVI when the carrier frequency of the assigned UTRA channel is within 824-845 MHz. | | | |

The normative reference for this requirement is TS 25.101 [1], clause 6.2.1B.

5.2AC.3 Test purpose

To verify that the error of the UE maximum output power for UL CLTD activation state 1 does not exceed the range prescribed by the nominal maximum output power and tolerance in table 5.2AC.1.

An excess maximum output power has the possibility to interfere to other channels or other systems. A small maximum output power decreases the coverage area.

5.2AC.4 Method of test

5.2.4.1 Initial conditions

Test environment: normal, TL/VL, TL/VH, TH/VL, TH/VH; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure FFS.
- 2) The UL Reference Measurement Channel and the Fixed Reference Channels (FRC H-Set 1) are specified in clauses FFS.

- 3) An HSDPA call is set up according to TS 34.108 [3] clause FFS. RF parameters are set up according to table E.5.1 and table E.5.10.
- 4) SS sends a HS-SCCH order activating UL_CLTD activation state 1.
- 5) Enter the UE into loopback test mode in the presence of HSDPA and start the loopback test.

See TS 34.108 [3] and TS 34.109 [4] for details regarding loopback test mode for HSDPA.

5.2.4.2 Procedure

- 1) Set and send continuously Up power control commands to the UE.
- 2) Start transmitting HSDPA Data.
- 3) Measure the mean power of the UE in a bandwidth of at least $(1 + \alpha)$ times the chip rate of the radio access mode. The mean power shall be averaged over at least one timeslot and measured at each transmit antenna connector.

5.2AC.5 Test requirements

For UE with two active transmit antenna connectors in UL CLTD activation state 1, the nominal maximum output power is specified in Table 5.2AC.2. The nominal transmit power is defined by the sum of transmit power at each transmit antenna connector.

The maximum output power, derived in step 3), shall not exceed the range prescribed by the nominal maximum output power and tolerance in table 5.2AC.2.

Table 5.2AC.2: Nominal Maximum Output Power for UL CLTD

| Operating Band | Power Class 3 | | Power Class 3bis | |
|--------------------|---|----------|------------------|----------|
| | Power (dBm) | Tol (dB) | Power (dBm) | Tol (dB) |
| Band I | +24 | +/-TT | 23 | +/-TT |
| Band II | +24 | +/-TT | 23 | +/-TT |
| Band III | +24 | +/-TT | 23 | +/-TT |
| Band IV | +24 | +/-TT | 23 | +/-TT |
| Band V | +24 | +/-TT | 23 | +/-TT |
| Band VI | +24 | +/-TT | 23 | +/-TT |
| Band VII | +24 | +/-TT | 23 | +/-TT |
| Band VIII | +24 | +/-TT | 23 | +/-TT |
| Band IX | +24 | +/-TT | 23 | +/-TT |
| Band X | +24 | +/-TT | 23 | +/-TT |
| Band XI | +24 | +/-TT | 23 | +/-TT |
| Band XII | +24 | +/-TT | 23 | +/-TT |
| Band XIII | +24 | +/-TT | 23 | +/-TT |
| Band IV | +24 | +/-TT | 23 | +/-TT |
| Band XIX | +24 | +/-TT | 23 | +/-TT |
| Band XX | +24 | +/-TT | 23 | +/-TT |
| Band XXI | +24 | +/-TT | 23 | +/-TT |
| Band XXII | +24 | +/-TT | 23 | +/-TT |
| Band XXV | +24 | +/-TT | 23 | +/-TT |
| Band XXVI (Note 1) | +24 | +/-TT | 23 | +/-TT |
| Note 1 | For the UE which supports both Band V and Band XXVI operating frequencies, the UE maximum output power of Band V shall apply for Band XXVI when the carrier frequency of the assigned UTRA channel is within 824-845 MHz. | | | |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause FFS and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause FFS.

5.2AD Maximum Output Power for UL CLTD activation state 2 and 3

Editor's note: This clause is incomplete. The following aspects are either missing or not yet determined:

- Message Contents are FFS.
- Call Setup procedure, test procedure, test tolerances may need an update.
- Update of Annexure is FFS
- Update to 34.121-2 is FFS

5.2AD.1 Definition and applicability

The nominal maximum output power with UL CLTD and its tolerance are defined according to the Power Class of the UE.

The maximum output power is a measure of the maximum power the UE can transmit (i.e. the actual power as would be measured assuming no measurement error) in a bandwidth of at least $(1 + \alpha)$ times the chip rate of the radio access mode. The period of measurement shall be at least one timeslot.

The requirements and this test apply for Release 11 and later releases to all types of UTRA for the FDD UE that supports UL CLTD.

5.2AD.2 Minimum Requirements

For UE configured in UL CLTD activation state 2 or activation state 3, the nominal maximum output power specified in table 5.2AD.1 applies at the active transmit antenna connector.

Table 5.2AD.1: Nominal Maximum Output Power

| Operating Band | Power Class 1 | | Power Class 2 | | Power Class 3 | | Power Class 3bis | | Power Class 4 | |
|--------------------|---------------|----------|---------------|----------|---------------|----------|------------------|----------|---------------|----------|
| | Power (dBm) | Tol (dB) | Power (dBm) | Tol (dB) | Power (dBm) | Tol (dB) | Power (dBm) | Tol (dB) | Power (dBm) | Tol (dB) |
| Band I | +33 | +1/-3 | +27 | +1/-3 | +24 | +1/-3 | +23 | +2/-2 | +21 | +2/-2 |
| Band II | - | - | - | - | +24 | +1/-3 | +23 | +2/-2 | +21 | +2/-2 |
| Band III | - | - | - | - | +24 | +1/-3 | +23 | +2/-2 | +21 | +2/-2 |
| Band IV | - | - | - | - | +24 | +1/-3 | +23 | +2/-2 | +21 | +2/-2 |
| Band V | - | - | - | - | +24 | +1/-3 | +23 | +2/-2 | +21 | +2/-2 |
| Band VI | - | - | - | - | +24 | +1/-3 | +23 | +2/-2 | +21 | +2/-2 |
| Band VII | - | - | - | - | +24 | +1/-3 | +23 | +2/-2 | +21 | +2/-2 |
| Band VIII | - | - | - | - | +24 | +1/-3 | +23 | +2/-2 | +21 | +2/-2 |
| Band IX | - | - | - | - | +24 | +1/-3 | +23 | +2/-2 | +21 | +2/-2 |
| Band X | - | - | - | - | +24 | +1/-3 | +23 | +2/-2 | +21 | +2/-2 |
| Band XI | - | - | - | - | +24 | +1/-3 | +23 | +2/-2 | +21 | +2/-2 |
| Band XII | - | - | - | - | +24 | +1/-3 | +23 | +2/-2 | +21 | +2/-2 |
| Band XIII | - | - | - | - | +24 | +1/-3 | +23 | +2/-2 | +21 | +2/-2 |
| Band XIV | - | - | - | - | +24 | +1/-3 | +23 | +2/-2 | +21 | +2/-2 |
| Band XIX | - | - | - | - | +24 | +1/-3 | +23 | +2/-2 | +21 | +2/-2 |
| Band XX | - | - | - | - | +24 | +1/-3 | +23 | +2/-2 | +21 | +2/-2 |
| Band XXI | - | - | - | - | +24 | +1/-3 | +23 | +2/-2 | +21 | +2/-2 |
| Band XXII | - | - | - | - | +24 | +1/-4.5 | +23 | +2/-3.5 | +21 | +2/-3.5 |
| Band XXV | - | - | - | - | +24 | +1/-4 | +23 | +2/-3 | +21 | +2/-3 |
| Band XXVI (Note 1) | - | - | - | - | +24 | +1/-4 | +23 | +2/-3 | +21 | +2/-3 |

NOTE 1: For the UE which supports both Band V and Band XXVI operating frequencies, the UE maximum output power of Band V shall apply for Band XXVI when the carrier frequency of the assigned UTRA channel is within 824-845 MHz.

The normative reference for this requirement is TS 25.101 [1], clause 6.2.1B.

5.2AD.3 Test purpose

To verify that the error of the UE maximum output power with UL CLTD activation state 2 and 3 does not exceed the range prescribed by the nominal maximum output power and tolerance in table 5.2.AD.1.

An excess maximum output power has the possibility to interfere to other channels or other systems. A small maximum output power decreases the coverage area.

5.2AD.4 Method of test

5.2AD.4.1 Initial conditions

Test environment: normal, TL/VL, TL/VH, TH/VL, TH/VH; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure FFS.
- 2) The UL Reference Measurement Channel and the Fixed Reference Channels (FRC H-Set 1) are specified in clauses FFS.
- 3) An HSDPA call is set up according to TS 34.108 [3] clause FFS. RF parameters are set up according to table E.5.1 and table E.5.10.
- 4) SS sends a HS-SCCH order activating UL_CLTD activation state 2
- 5) Enter the UE into loopback test mode in the presence of HSDPA and start the loopback test.

See TS 34.108 [3] and TS 34.109 [4] for details regarding loopback test mode for HSDPA.

5.2AD.4.2 Procedure

- 1) Set and send continuously up power control commands to the UE.
- 2) Start transmitting HSDPA Data.
- 3) Measure the mean power of the UE in a bandwidth of at least $(1 + \alpha)$ times the chip rate of the radio access mode. The mean power shall be averaged over at least one timeslot and is measured at the active transmit antenna connector.
- 4) SS sends a HS-SCCH order activating UL_CLTD activation state 3
- 5) Repeat step 1 to 3 for activation state 3.

5.2AD.5 Test requirements

For UE configured in UL CLTD activation state 2 or activation state 3, the nominal maximum output power specified in table 5.2AD.2 applies at the active transmit antenna connector.

The maximum output power, derived in step 3) for activation 2 and 3, shall not exceed the range prescribed by the nominal maximum output power and tolerance in table 5.2AD.2.

Table 5.2AD.2: Nominal Maximum Output Power

| Operating Band | Power Class 1 | | Power Class 2 | | Power Class 3 | | Power Class 3bis | | Power Class 4 | |
|--------------------|---------------|----------|---------------|----------|---------------|----------|------------------|----------|---------------|----------|
| | Power (dBm) | Tol (dB) | Power (dBm) | Tol (dB) | Power (dBm) | Tol (dB) | Power (dBm) | Tol (dB) | Power (dBm) | Tol (dB) |
| Band I | +33 | +/-TT | +27 | +/-TT | +24 | +/-TT | +23 | +/-TT | +21 | +/-TT |
| Band II | - | - | - | - | +24 | +/-TT | +23 | +/-TT | +21 | +/-TT |
| Band III | - | - | - | - | +24 | +/-TT | +23 | +/-TT | +21 | +/-TT |
| Band IV | - | - | - | - | +24 | +/-TT | +23 | +/-TT | +21 | +/-TT |
| Band V | - | - | - | - | +24 | +/-TT | +23 | +/-TT | +21 | +/-TT |
| Band VI | - | - | - | - | +24 | +/-TT | +23 | +/-TT | +21 | +/-TT |
| Band VII | - | - | - | - | +24 | +/-TT | +23 | +/-TT | +21 | +/-TT |
| Band VIII | - | - | - | - | +24 | +/-TT | +23 | +/-TT | +21 | +/-TT |
| Band IX | - | - | - | - | +24 | +/-TT | +23 | +/-TT | +21 | +/-TT |
| Band X | - | - | - | - | +24 | +/-TT | +23 | +/-TT | +21 | +/-TT |
| Band XI | - | - | - | - | +24 | +/-TT | +23 | +/-TT | +21 | +/-TT |
| Band XII | - | - | - | - | +24 | +/-TT | +23 | +/-TT | +21 | +/-TT |
| Band XIII | - | - | - | - | +24 | +/-TT | +23 | +/-TT | +21 | +/-TT |
| Band XIV | - | - | - | - | +24 | +/-TT | +23 | +/-TT | +21 | +/-TT |
| Band XIX | - | - | - | - | +24 | +/-TT | +23 | +/-TT | +21 | +/-TT |
| Band XX | - | - | - | - | +24 | +/-TT | +23 | +/-TT | +21 | +/-TT |
| Band XXI | - | - | - | - | +24 | +/-TT | +23 | +/-TT | +21 | +/-TT |
| Band XXII | - | - | - | - | +24 | +/-TT | +23 | +/-TT | +21 | +/-TT |
| Band XXV | - | - | - | - | +24 | +/-TT | +23 | +/-TT | +21 | +/-TT |
| Band XXVI (Note 1) | - | - | - | - | +24 | +/-TT | +23 | +/-TT | +21 | +/-TT |

NOTE 1: For the UE which supports both Band V and Band XXVI operating frequencies, the UE maximum output power of Band V shall apply for Band XXVI when the carrier frequency of the assigned UTRA channel is within 824-845 MHz.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause FFS and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause FFS.

5.2B Maximum Output Power with HS-DPCCH and E-DCH

5.2B.1 Definition and applicability

The maximum output power with HS-DPCCH and E-DCH and its tolerance are defined according to the UE Maximum Power Reduction (MPR) for the nominal maximum output power.

The maximum output power with HS-DPCCH and E-DCH is a measure of the maximum power the UE can transmit when HS-DPCCH and E-DCH is fully or partially transmitted during a DPCCH timeslot. The measurement period shall be at least one timeslot.

The requirements and this test apply for Release 6 and later releases to all types of UTRA for the FDD UE that support HSDPA and E-DCH.

5.2B.2 Minimum Requirements

The UE Maximum Power Reduction (MPR) for the nominal maximum output power shall be within the value and tolerance specified in table 5.2B.1 for when the values of β_c , β_d , β_{hs} , β_{ec} and β_{ed} is fully or partially transmitted during a DPCCH timeslot.

Table 5.2B.1: Maximum Output Power with HS-DPCCH and E-DCH

| UE transmit channel configuration | CM (dB) | MPR (dB) |
|--|----------------------|---------------|
| For all combinations of; DPDCH, DPCCH, HS-DPCCH, E-DPDCH and E-DPCCH | $0 \leq CM \leq 3.5$ | MAX (CM-1, 0) |
| NOTE 1: CM = 1 for $\beta_c/\beta_d = 12/15$, $\beta_{hs}/\beta_{ec} = 24/15$. For all other combinations of DPDCH, DPCCH, HS-DPCCH, E-DPDCH and E-DPCCH the MPR is based on the relative CM difference. | | |

Where Cubic Metric (CM) is based on the UE transmit channel configuration and is given by:

$$CM = \text{CEIL} \{ [20 * \log_{10} ((v_{\text{norm}}^3)_{\text{rms}}) - 20 * \log_{10} ((v_{\text{norm_ref}}^3)_{\text{rms}})] / k, 0.5 \}$$

Where

- CEIL{ x, 0.5 } means rounding upwards to closest 0.5dB, i.e. $CM \in [0, 0.5, 1.0, 1.5, 2.0, 2.5, 3.0, 3.5]$
- k is 1.85 for signals where all channelisations codes meet the following criteria $C_{SF, N}$ where $N < SF/2$
- k is 1.56 for signals where any channelisations codes meet the following criteria $C_{SF, N}$ where $N \geq SF/2$
- v_{norm} is the normalized voltage waveform of the input signal
- $v_{\text{norm_ref}}$ is the normalized voltage waveform of the reference signal (12.2 kbps AMR Speech) and $20 * \log_{10} ((v_{\text{norm_ref}}^3)_{\text{rms}}) = 1.52$ dB

The normative reference for this requirement is TS 25.101 [1], clause 6.2.2.

5.2B.3 Test purpose

To verify that the error of the UE maximum output power with HS-DPCCH and E-DCH does not exceed the range prescribed by the maximum output power and tolerance in table 5.2B.5.

An excess maximum output power may interfere with other channels or other systems. A small maximum output power decreases the coverage area.

5.2B.4 Method of test

5.2B.4.1 Initial conditions

Test environment: normal, TL/VL, TL/VH, TH/VL, TH/VH; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS (node B emulator) to the UE antenna connector as shown in figure A.1.
- 2) The UL Reference Measurement Channel and the Fixed Reference Channels (FRC H-Set 1, QPSK) are specified in Annex C.11.1 and C.8.1.1.
- 3) An E-DCH call is set up according to TS 34.108 [3] 7.3.9 with the following exceptions in the RADIO BEARER SETUP messages. These exceptions allow the beta values to be set according to table C.11.1.3 and each UL physical channel to be at constant power during the measurement. RF parameters are set up according to table E.5A.1. Settings for the serving cell are defined in table 5.2B.4A.
- 4) For sub-test 1 to 4, enter the UE into loopback test mode 1 looping back both the 12.2kbps RMC and HSDPA to E-DCH according to procedure 7.3.9.3.1 in TS 34.108 [3] and start the loopback test. For sub-test 5, enter the UE into loopback test mode 1 looping back HSDPA to E-DCH according to procedure 7.3.9.3.2 in TS 34.108 [3] and start the loopback test.

See TS 34.109 [4] clauses 5.3.2.3 and 5.3.2.6 for details regarding loopback test mode for HSDPA and E-DCH.

| \hat{I}_{or} (see notes 1 and 2) | dBm/3.84 MHz | -86 |
| NOTE 1: The power level is specified in terms of \hat{I}_{or} instead of CPICH_RSCP because RSCP is a receiver measurement, whereas the SS can only set \hat{I}_{or} . | | |
| NOTE 2: The cell fulfils TS 25.304, clause 5.2.3.1.2. | | |

5.2B.4.2 Procedure

5.2B.4.2.1 Procedure for sub-test 1 to 4

- 1) Set the Absolute Grant according to Table C.11.1.3.
- 2) The SS starts transmitting HSDPA and the UE loops the received data back on E-DCH.
- 3) Set the UE power to be at least 7.5dB lower than the maximum output power. Wait 150 ms.
- 4) Send power control bits to give one TPC_cmd = +1 command to the UE.
- 5) The SS checks the received E-TFCI for 150 ms. If UE does not send any decreased E-TFCI (DTX on E-DPDCH is also considered decreased E-TFCI) within the 150ms then go back to step (4) otherwise proceed to step 6).
- 6) Send power control bits to give one TPC_cmd = -1 command to the UE and wait 150ms.
- 7) The SS checks the received E-TFCI for 150 ms. If UE sends any decreased E-TFCI (DTX on E-DPDCH is also considered decreased E-TFCI) within the 150ms, then send new power control bits to give another TPC_cmd = -1 command to the UE and wait 150ms.
- 8) Confirm that the E-TFCI transmitted by the UE is equal to the target E-TFCI in Table C.11.1.3. If the E-TFCI transmitted by the UE is not equal to the target E-TFCI, then fail the UE.
- 9) Measure the mean power of the UE. The mean power shall be averaged over at least one timeslot.
- 10) Repeat the measurement for the different combinations of beta values for sub-test 1 to 4 as given in table C.11.1.3.

5.2B.4.2.2 Procedure for sub-test 5

- 1) Set the Absolute Grant according to sub-test 5 in Table C.11.1.3.
- 2) The SS starts transmitting HSDPA and the UE loops the received data back on E-DCH.
- 3) Set the UE power to be at least 7.5dB lower than the maximum output power. Wait 150ms.
- 4) Set and send continuously Up power control commands to the UE. Wait 150ms.
- 5) Measure the mean power of the UE. The mean power shall be averaged over at least one timeslot.

5.2B.5 Test requirements

The maximum output power with HS-DPCCH and E-DCH, derived in step 9), shall not exceed the range prescribed by the maximum output power and tolerance in table 5.2B.5 or 5.2B.6 depending on tested band. Note:

The UL reference measurement channel for TX test will be set as defined in C.11.1 with the power ratio between HS-DPCH, DPCCH, DPDCH, E-DPCCH and E-DPDCH being set to the values defined in table C.11.1.3.

Table 5.2B.5: Maximum Output Powers with HS-DPCCH and E-DCH for test

| Sub-test in table C.11.1.3 | Power Class 3 | | Power Class 4 | |
|----------------------------|---------------|-----------|---------------|-----------|
| | Power (dBm) | Tol (dB) | Power (dBm) | Tol (dB) |
| 1 | +24 | +1.7/-6.7 | +21 | +2.7/-5.7 |
| 2 | +22 | +3.7/-5.2 | +19 | +4.7/-4.2 |
| 3 | +23 | +2.7/-5.2 | +20 | +3.7/-4.2 |
| 4 | +22 | +3.7/-5.2 | +19 | +4.7/-4.2 |
| 5 | +24 | +1.7/-3.7 | +21 | +2.7/-2.7 |

Table 5.2B.6: Maximum Output Powers with HS-DPCCH and E-DCH for test in bands XXV and XXVI

| Sub-test in table C.11.1.3 | Power Class 3 | | Power Class 4 | |
|---|---------------|-----------|---------------|-----------|
| | Power (dBm) | Tol (dB) | Power (dBm) | Tol (dB) |
| 1 | +24 | +1.7/-7.7 | +21 | +2.7/-6.7 |
| 2 | +22 | +3.7/-6.2 | +19 | +4.7/-5.2 |
| 3 | +23 | +2.7/-6.2 | +20 | +3.7/-5.2 |
| 4 | +22 | +3.7/-6.2 | +19 | +4.7/-5.2 |
| 5 | +24 | +1.7/-4.7 | +21 | +2.7/-3.7 |
| NOTE 1: For the UE which supports both Band V and Band XXVI operating frequencies, the UE maximum output power of Band V shall apply for Band XXVI when the carrier frequency of the assigned UTRA channel is within 824-845 MHz. | | | | |

NOTE 1: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

NOTE 2: The test procedure for sub-test 1 to 4 will result in a power slightly below the maximum, and therefore the lower limits in Table 5.2B.5 are made lower by 1.5 dB.

NOTE 3: The test procedure allows UE to decrease its maximum transmit power for E-TFC selection in sub-test 1, and therefore the lower limits of sub-test 1 in Table 5.2B.5 are made lower by 1.5 dB.

NOTE 4: For subtests 2, 3 and 4, UE may perform E-DPDCH power scaling at max power which could results in slightly smaller MPR values.

5.2BA UE Maximum Output Power for DC-HSUPA (QPSK)

5.2BA.1 Definition and applicability

The maximum output power with DC-HSUPA and its tolerance are defined according to the UE Maximum Power Reduction (MPR) for the nominal maximum output power.

The maximum output power with DC-HSUPA is a measure of the maximum power the UE can transmit when HS-DPCCH and E-DCH is fully or partially transmitted during a DPCCH timeslot. For DC-HSUPA, the nominal transmit power is defined by the sum of the broadband transmit power of each carrier in the UE. The measurement period shall be at least one timeslot.

The requirements and this test apply for Release 9 and later releases to all types of UTRA for the FDD UE that support HSDPA and Dual Cell E-DCH.

5.2BA.2 Minimum Requirements

The Maximum Power Reduction (MPR) for the nominal maximum output power shall be within the value and tolerance specified for the values of β_c , β_d , β_{hs} , β_{ec} and β_{ed} is fully or partially transmitted during a DPCCH timeslot and defined through calculation of the Raw Cubic Metric (Raw CM) which is based on the UE transmit channel configuration and is given by:

$$\text{Raw CM} = 20 * \log_{10} ((v_{\text{norm}}^3)_{\text{rms}}) - 20 * \log_{10} ((v_{\text{norm_ref}}^3)_{\text{rms}})$$

Where:

- v_{norm} is the normalized voltage waveform of the input signal
- $v_{\text{norm_ref}}$ is the normalized voltage waveform of the reference signal (12.2 kbps AMR Speech) and
- $20 * \log_{10} ((v_{\text{norm_ref}}^3)_{\text{rms}}) = 1.52 \text{ dB}$

For any DC-HSUPA signal not employing 16QAM modulation on any of the carriers, and for any DC-HSUPA signal having Raw CM < [2.5], the MPR is specified in Table 5.2BA.1.

Table 5.2BA.1: UE maximum output power for DC-HSUPA signals not employing 16QAM modulation, and DC-HSUPA signals having Raw CM < [2.5]

| UE transmit channel configuration | CM (dB) | MPR (dB) |
|---|---------------------------------|------------------|
| For all combinations of; DPCCH, HS-DPCCH, E-DPDCH and E-DPCCH | $0.22 \leq \text{CM} \leq 3.72$ | MAX (CM-0.72, 0) |

Where Cubic Metric (CM) is based on the Raw Cubic Metric and is given by

$$\text{CM} = \text{CEIL} \{ \text{Raw CM} / k, 0.22 \}$$

Where:

- CEIL { x, 0.22 } means rounding upwards to closest 0.22dB with 0.5 dB granularity, i.e. CM [0.22, 0.72, 1.22, 1.72, 2.22, 2.72, 3.22, 3.72]
- k is 1.66

For any DC-HSUPA signal employing 16QAM modulation on any of the carriers and having Raw CM \geq [2.5], the MPR is specified in Table 5.2BA.2.

Table 5.2BA.2: UE maximum output power for DC-HSUPA signals employing 16QAM modulation and having RAW CM \geq [2.5]

| UE transmit channel configuration | CM (dB) | MPR (dB) |
|---|-------------------------------------|--------------------|
| For all combinations of; DPCCH, HS-DPCCH, E-DPDCH and E-DPCCH | $[2.24] \leq \text{CM} \leq [5.24]$ | MAX (CM-[1.24], 0) |

Where Cubic Metric (CM) is based on the Raw Cubic Metric and is given by:

$$CM = \text{CEIL} \{ \text{Raw CM} / k, [0.24] \}$$

Where:

- CEIL { x, 0.24 } means rounding upwards to closest 0.24dB with 0.5 dB granularity, i.e. CM = [2.24, 2.74, 3.24, 3.74, 4.24, 4.74, 5.24]
- k is [1.23] for DC-HSUPA signals employing 16QAM modulation and having Raw CM \geq [2.5]

It is necessary to verify this requirement only for the DC-HSUPA configurations specified in clause C.2.8.

The normative reference for this requirement is TS 25.101 [1], clause 6.2.2A.

5.2BA.3 Test purpose

To verify that the error of the UE maximum output power with DC-HSUPA does not exceed the range prescribed by the maximum output power and tolerance in table 5.2BA.6.

An excess maximum output power may interfere with other channels or other systems. A small maximum output power decreases the coverage area.

5.2BA.4 Method of test

5.2BA.4.1 Initial conditions

Test environment: normal, TL/VL, TL/VH, TH/VL, TH/VH; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS (node B emulator) to the UE antenna connector as shown in figure A.41.
- 2) The UL Reference Measurement Channel and parameters are specified in clauses C.2.6, C.2.8 and C.11A. The DL Reference Measurement Channel (FRC H-SET 3A, QPSK) is specified in C.8.1.1.
- 3) An E-DCH call is set up according to TS 34.108 [3] 7.3.14. RF parameters are set up according to table E.5A.1A. Settings for the serving cell are defined in table 5.2BA.5.
- 4) Enter the UE into loopback test mode 1 looping back HSDPA to E-DCH according to procedure 7.3.14.3 in TS 34.108 [3] and start the loopback test.
- 5) Repeat for configuration 1, 2 and 3 in table C.2.8.1.

See TS 34.109 [4] clauses 5.3.2.3 and 5.3.2.6 for details regarding loopback test mode for HSDPA and E-DCH.

Table 5.2BA.3: Void

Table 5.2BA.4: Void

Table 5.2BA.5: Settings for the serving cell during the measurement of Maximum Output Power with HS-DPCCH and E-DCH

| Parameter | Unit | Cell 1 |
|--|--------------|--------------------------------|
| Cell type | | Serving cell |
| UTRA RF Channel Number | | As defined in clause 5.2BA.4.1 |
| Qqualmin | dB | -24 |
| Qrxlevmin | dBm | -115 |
| UE_TXPWR_MAX_RACH | dBm | +21 |
| \hat{I}_{or} (see notes 1 and 2) | dBm/3.84 MHz | -86 |
| NOTE 1: The power level is specified in terms of \hat{I}_{or} instead of CPICH_RSCP because RSCP is a receiver measurement, whereas the SS can only set \hat{I}_{or} . | | |
| NOTE 2: The cell fulfils TS 25.304, clause 5.2.3.1.2. | | |

5.2BA.4.2 Procedure

- 1) Set the Absolute Grant according to Table C.11A.1.1.
- 2) The SS starts transmitting HSDPA and the UE loops the received data back on E-DCH.
- 3) Generate suitable TPC commands to each individual carrier from the SS to set the total power in each of the assigned carriers to be equal to each other within ± 1.7 dB and the total output power of the UE to be at least 7.5dB lower than the maximum output power. Wait 150ms.
- 4) Set and send continuously Up power control commands to both carriers to the UE and wait 150ms.
- 5) Measure the mean power of each carrier of the UE. The mean power shall be averaged over at least one timeslot. The maximum output power is the sum of the broadband transmit power of each carrier in the UE.
- 6) The SS shall verify that UE is still in a DC-HSUPA call by verifying that UE transmits signal on each carrier. If UE is not transmitting signal on each carrier the SS shall fail the UE in this test.
- 7) Repeat steps 1-6 for all the different combinations of beta values as given in tables C.11A.1.1.

5.2BA.5 Test requirements

The maximum output power with DC-HSUPA, derived in step 6), shall not exceed the range prescribed by the maximum output power and tolerance in table 5.2BA.6 or 5.2BA.7 depending on tested band.

The UL reference measurement channel for TX test will be set as defined in C.2.6 and C.2.7 with the power ratio between HS-DPCH, DPCCH, DPDCH, E-DPCCH and E-DPDCH being set to the values defined in tables C.11A.1.1.

Table 5.2BA.6: Maximum Output Power for DC-HSUPA test

| Sub-test in table C.11A.1.1 | Power Class 3 | | Power Class 4 | |
|-----------------------------|---------------|-----------|---------------|-----------|
| | Power (dBm) | Tol (dB) | Power (dBm) | Tol (dB) |
| 1 | +22.5 | +3.2/-3.7 | +19.5 | +4.2/-2.7 |

Table 5.2BA.7: Maximum Output Power for DC-HSUPA test in bands XXV and XXVI

| Sub-test in table C.11A.1.1 | Power Class 3 | | Power Class 4 | |
|---|---------------|-----------|---------------|-----------|
| | Power (dBm) | Tol (dB) | Power (dBm) | Tol (dB) |
| 1 | +22.5 | +3.2/-4.7 | +19.5 | +4.2/-3.7 |
| NOTE 1: For the UE which supports both Band V and Band XXVI operating frequencies, the UE maximum output power of Band V shall apply for Band XXVI when the carrier frequency of the assigned UTRA channel is within 824-845 MHz. | | | | |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.2BB UE Maximum Output Power for DC-HSUPA (16QAM)

5.2BB.1 Definition and applicability

The maximum output power with DC-HSUPA and its tolerance are defined according to the UE Maximum Power Reduction (MPR) for the nominal maximum output power.

The maximum output power with DC-HSUPA is a measure of the maximum power the UE can transmit when HS-DPCCH and E-DCH is fully or partially transmitted during a DPCCH timeslot. For DC-HSUPA, the nominal transmit power is defined by the sum of the broadband transmit power of each carrier in the UE. The measurement period shall be at least one timeslot.

The requirements and this test apply for Release 9 and later releases to all types of UTRA for the FDD UE that support HSDPA and Dual Cell E-DCH 16QAM UE capability category 9.

5.2BB.2 Minimum Requirements

The Maximum Power Reduction (MPR) for the nominal maximum output power shall be within the value and tolerance specified for the values of β_c , β_d , β_{hs} , β_{ec} and β_{ed} is fully or partially transmitted during a DPCCH timeslot and defined through calculation of the Raw Cubic Metric (Raw CM) which is based on the UE transmit channel configuration and is given by:

$$\text{Raw CM} = 20 * \log_{10} ((v_{\text{norm}}^3)_{\text{rms}}) - 20 * \log_{10} ((v_{\text{norm_ref}}^3)_{\text{rms}})$$

Where:

- v_{norm} is the normalized voltage waveform of the input signal
- $v_{\text{norm_ref}}$ is the normalized voltage waveform of the reference signal (12.2 kbps AMR Speech) and
- $20 * \log_{10} ((v_{\text{norm_ref}}^3)_{\text{rms}}) = 1.52$ dB

For any DC-HSUPA signal not employing 16QAM modulation on any of the carriers, and for any DC-HSUPA signal having Raw CM < [2.5], the MPR is specified in Table 5.2BB.1.

Table 5.2BB.1: UE maximum output power for DC-HSUPA signals not employing 16QAM modulation, and DC-HSUPA signals having Raw CM < [2.5]

| UE transmit channel configuration | CM (dB) | MPR (dB) |
|---|---------------------------------|------------------|
| For all combinations of; DPCCH, HS-DPCCH, E-DPDCH and E-DPCCH | $0.22 \leq \text{CM} \leq 3.72$ | MAX (CM-0.72, 0) |

Where Cubic Metric (CM) is based on the Raw Cubic Metric and is given by

$$\text{CM} = \text{CEIL} \{ \text{Raw CM} / k, 0.22 \}$$

Where:

- CEIL { x, 0.22 } means rounding upwards to closest 0.22dB with 0.5 dB granularity, i.e. CM [0.22, 0.72, 1.22, 1.72, 2.22, 2.72, 3.22, 3.72]
- k is 1.66

For any DC-HSUPA signal employing 16QAM modulation on any of the carriers and having Raw CM \geq [2.5], the MPR is specified in Table 5.2BB.2.

Table 5.2BB.2: UE maximum output power for DC-HSUPA signals employing 16QAM modulation and having RAW CM \geq [2.5]

| UE transmit channel configuration | CM (dB) | MPR (dB) |
|---|-------------------------------------|--------------------|
| For all combinations of; DPCCH, HS-DPCCH, E-DPDCH and E-DPCCH | $[2.24] \leq \text{CM} \leq [5.24]$ | MAX (CM-[1.24], 0) |

Where Cubic Metric (CM) is based on the Raw Cubic Metric and is given by:

$$CM = \text{CEIL} \{ \text{Raw CM} / k, [0.24] \}$$

Where:

- CEIL { x, 0.24 } means rounding upwards to closest 0.24dB with 0.5 dB granularity, i.e. CM = [2.24, 2.74, 3.24, 3.74, 4.24, 4.74, 5.24]
- k is [1.23] for DC-HSUPA signals employing 16QAM modulation and having Raw CM \geq [2.5]

It is necessary to verify this requirement only for the DC-HSUPA configurations specified in clause C.2.8.

The normative reference for this requirement is TS 25.101 [1], clause 6.2.2A.

5.2BB.3 Test purpose

To verify that the error of the UE maximum output power with DC-HSUPA does not exceed the range prescribed by the maximum output power and tolerance in table 5.2BB.6.

An excess maximum output power may interfere with other channels or other systems. A small maximum output power decreases the coverage area.

5.2BB.4 Method of test

5.2BB.4.1 Initial conditions

Test environment: normal, TL/VL, TL/VH, TH/VL, TH/VH; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS (node B emulator) to the UE antenna connector as shown in figure A.41.
- 2) The UL Reference Measurement Channel and parameters are specified in clauses C.2.6, C.2.8 and C.11A. The DL Reference Measurement Channel (FRC H-SET 3A, QPSK) is specified in C.8.1.1.
- 3) An E-DCH call is set up according to TS 34.108 [3] 7.3.14. RF parameters are set up according to table E.5A.1A. Settings for the serving cell are defined in table 5.2BB.5. E-DPDCH settings according to configuration 4 in Table C.2.8.1.
- 4) Enter the UE into loopback test mode 1 looping back HSDPA to E-DCH according to procedure 7.3.14.3 in TS 34.108 [3] and start the loopback test.

See TS 34.109 [4] clauses 5.3.2.3 and 5.3.2.6 for details regarding loopback test mode for HSDPA and E-DCH.

Table 5.2BB.3: Void

Table 5.2BB.4: Void

Table 5.2BB.5: Settings for the serving cell during the measurement of Maximum Output Power with HS-DPCCH and E-DCH

| Parameter | Unit | Cell 1 |
|--|--------------|--------------------------------|
| Cell type | | Serving cell |
| UTRA RF Channel Number | | As defined in clause 5.2BB.4.1 |
| Qqualmin | dB | -24 |
| Qrxlevmin | dBm | -115 |
| UE_TXPWR_MAX_RACH | dBm | +21 |
| \hat{I}_{or} (see notes 1 and 2) | dBm/3.84 MHz | -86 |
| NOTE 1: The power level is specified in terms of \hat{I}_{or} instead of CPICH_RSCP because RSCP is a receiver measurement, whereas the SS can only set \hat{I}_{or} . | | |
| NOTE 2: The cell fulfils TS 25.304, clause 5.2.3.1.2. | | |

5.2BB.4.2 Procedure

- 1) Set the Absolute Grant according to Table C.11A.1.1.
- 2) The SS starts transmitting HSDPA and the UE loops the received data back on E-DCH.
- 3) Generate suitable TPC commands to each individual carrier from the SS to set the total power in each of the assigned carriers to be equal to each other within ± 1.7 dB and the total output power of the UE to be at least 7.5dB lower than the maximum output power. Wait 150ms.
- 4) Set and send continuously Up power control commands to both carriers to the UE and wait 150ms.
- 5) Measure the mean power of each carrier of the UE. The mean power shall be averaged over at least one timeslot. The maximum output power is the sum of the broadband transmit power of each carrier in the UE..
- 6) The SS shall verify that UE is still in a DC-HSUPA call by verifying that UE transmits signal on each carrier. If UE is not transmitting signal on each carrier the SS shall fail the UE in this test.
- 7) Repeat steps 1-6 for all the different combinations of beta values as given in table C.11A.1.2.

5.2BB.5 Test requirements

The maximum output power with DC-HSUPA, derived in step 6), shall not exceed the range prescribed by the maximum output power and tolerance in table 5.2BB.6 or 5.2BB.7 depending on tested band.

The UL reference measurement channel for TX test will be set as defined in C.2.6 and C.2.7 with the power ratio between HS-DPCH, DPCCH, DPDCH, E-DPCCH and E-DPDCH being set to the values defined in table C.11A.1.2.

Table 5.2BB.6: Maximum Output Power for DC-HSUPA test

| Sub-test in table C.11A.1.1 | Power Class 3 | | Power Class 4 | |
|-----------------------------|---------------|-----------|---------------|-----------|
| | Power (dBm) | Tol (dB) | Power (dBm) | Tol (dB) |
| 1 | +22.5 | +3.2/-3.7 | +19.5 | +4.2/-2.7 |

Table 5.2BB.7: Maximum Output Power for DC-HSUPA test in bands XXV and XXVI

| Sub-test in table C.11A.1.1 | Power Class 3 | | Power Class 4 | |
|---|---------------|-----------|---------------|-----------|
| | Power (dBm) | Tol (dB) | Power (dBm) | Tol (dB) |
| 1 | +22.5 | +3.2/-4.7 | +19.5 | +4.2/-3.7 |
| NOTE 1: For the UE which supports both Band V and Band XXVI operating frequencies, the UE maximum output power of Band V shall apply for Band XXVI when the carrier frequency of the assigned UTRA channel is within 824-845 MHz. | | | | |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.2BC Maximum Output Power with HS-DPCCH and E-DCH for OLTD

FFS

5.2BD Maximum Output Power with HS-DPCCH and E-DCH for UL CLTD activation state 1

Editor's note: This clause is incomplete. The following aspects are either missing or not yet determined:

- Message Contents are FFS.

- Call Setup procedure, test procedure, test tolerances may need an update.
- Update of Annexure is FFS
- Update to 34.121-2 is FFS

5.2BD.1 Definition and applicability

The maximum output power for UL CLTD with HS-DPCCH and E-DCH and its tolerance are defined according to the UE Maximum Power Reduction (MPR) for the nominal maximum output power.

The maximum output power with HS-DPCCH and E-DCH is a measure of the maximum power the UE can transmit when HS-DPCCH and E-DCH is fully or partially transmitted during a DPCCH timeslot. The measurement period shall be at least one timeslot.

The requirements and this test apply for Release 11 and later releases to all types of UTRA for the FDD UE that supports UL CLTD.

5.2BD.2 Minimum Requirements

The Maximum Power Reduction (MPR) for the nominal maximum output power is specified in table 5.2BD.1 for the values of β_c , β_d , β_{hs} , β_{ec} , β_{ed} and β_{sc} defined in [8] fully or partially transmitted during a DPCCH timeslot.

Table 5.2BD.1: Maximum Output Power with HS-DPCCH and E-DCH for UL CLTD

| UE transmit channel configuration | CM (dB) | MPR (dB) |
|---|--------------------|---------------|
| For all combinations of; DPDCH, DPCCH, HS-DPCCH, E-DPDCH, E-DPCCH and S-DPCCH | $0 \leq CM \leq 4$ | MAX (CM-1, 0) |

T Where Cubic Metric (CM) is based on the UE transmit channel configuration and is given by

$$CM = \text{CEIL} \{ [20 * \log_{10} ((v_{\text{norm}})^3)_{\text{rms}}] - 20 * \log_{10} ((v_{\text{norm_ref}})^3)_{\text{rms}} \} / k, 0.5 \}$$

Where:

- CEIL { x, 0.5 } means rounding upwards to closest 0.5dB, i.e. CM = [0, 0.5, 1.0, 1.5, 2.0, 2.5, 3.0, 3.5]
- k is 1.85 for signals where all channelisations codes meet the following criteria $C_{SF, N}$ where $N < SF/2$
- k is 1.56 for signals where any channelisations codes meet the following criteria $C_{SF, N}$ where $N \geq SF/2$
- v_{norm} is the normalized voltage waveform of the input signal
- $v_{\text{norm_ref}}$ is the normalized voltage waveform of the reference signal (12.2 kbps AMR Speech) and
- $20 * \log_{10} ((v_{\text{norm_ref}})^3)_{\text{rms}} = 1.52 \text{ dB}$

For UE with two active transmit antenna connectors in UL CLTD activation state 1, the allowed Maximum Power Reduction (MPR) for the nominal maximum output power of each antenna is specified in Table 5.2BA.1 The amount of applied power reduction on each antenna shall be the same.

NOTE: CM is measured at each transmit antenna connector.

The normative reference for this requirement is TS 25.101 [1], clause 6.2.2C.

5.2BD.3 Test purpose

To verify that the error of the UE maximum output power for UL CLTD activation state 1 with HS-DPCCH and E-DCH does not exceed the range prescribed by the maximum output power and tolerance in table 5.2BD.5.

An excess maximum output power may interfere with other channels or other systems. A small maximum output power decreases the coverage area.

5.2BD.4 Method of test

5.2BD.4.1 Initial conditions

Test environment: normal, TL/VL, TL/VH, TH/VL, TH/VH; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS (node B emulator) to the UE antenna connector as shown in figure FFS.
- 2) The UL Reference Measurement Channel and the Fixed Reference Channels (FRC H-Set 1, QPSK) are specified in Annex FFS.
- 3) An E-DCH call is set up according to TS 34.108 [3] FFS with the following exceptions in the RADIO BEARER SETUP messages. These exceptions allow the beta values to be set according to table C.11.1.3 and each UL physical channel to be at constant power during the measurement. RF parameters are set up according to table E.5A.1. Settings for the serving cell are defined in table 5.2BD.4A.
- 4) SS sends a HS-SCCH order activating UL_CLTD activation state 1.
- 5) For sub-test 1 to 4, enter the UE into loopback test mode 1 looping back both the 12.2kbps RMC and HSDPA to E-DCH according to procedure 7.3.9.3.1 in TS 34.108 [3] and start the loopback test.

See TS 34.109 [4] clauses 5.3.2.3 and 5.3.2.6 for details regarding loopback test mode for HSDPA and E-DCH.

| \hat{I}_{or} (see notes 1 and 2) | dBm/3.84 MHz | -86 |
| NOTE 1: The power level is specified in terms of \hat{I}_{or} instead of CPICH_RSCP because RSCP is a receiver measurement, whereas the SS can only set \hat{I}_{or} . | | |
| NOTE 2: The cell fulfils TS 25.304, clause 5.2.3.1.2. | | |

5.2BD.4.2 Procedure

5.2BD.4.2.1 Procedure for sub-test 1 to 4

- 1) Set the Absolute Grant according to Table C.11.1.3.

- 2) The SS starts transmitting HSDPA and the UE loops the received data back on E-DCH.
- 3) Set the UE power to be at least 7.5dB lower than the maximum output power. Wait 150 ms.
- 4) Send power control bits to give one TPC_cmd = +1 command to the UE.
- 5) The SS checks the received E-TFCI for 150 ms. If UE does not send any decreased E-TFCI (DTX on E-DPDCH is also considered decreased E-TFCI) within the 150ms then go back to step (4) otherwise proceed to step 6).
- 6) Send power control bits to give one TPC_cmd = -1 command to the UE and wait 150ms.
- 7) The SS checks the received E-TFCI for 150 ms. If UE sends any decreased E-TFCI (DTX on E-DPDCH is also considered decreased E-TFCI) within the 150ms, then send new power control bits to give another TPC_cmd = -1 command to the UE and wait 150ms.
- 8) Confirm that the E-TFCI transmitted by the UE is equal to the target E-TFCI in Table C.11.1.3. If the E-TFCI transmitted by the UE is not equal to the target E-TFCI, then fail the UE.
- 9) Measure the mean power of the UE. The mean power shall be averaged over at least one timeslot and measured at each transmit antenna connector.
- 10) Repeat the measurement for the different combinations of beta values for sub-test 1 to 4 as given in table C.11.1.3.

5.2BD.5 Test requirements

The maximum output power with HS-DPCCH and E-DCH, derived in step 9), shall not exceed the range prescribed by the maximum output power and tolerance in table 5.2BD.5 or 5.2BD.6 depending on tested band. Note:

For UE with two active transmit antenna connectors in UL CLTD activation state 1, the nominal transmit power is defined by the sum of transmit power at each transmit antenna connector.

The UL reference measurement channel for TX test will be set as defined in C.11.1 with the power ratio between HS-DPCH, DPCCH, DPDCH, E-DPCCH and E-DPDCH being set to the values defined in table C.11.1.3.

Table 5.2BD.5: Maximum Output Powers with HS-DPCCH and E-DCH for test

| Sub-test in table C.11.1.3 | Power Class 3 | | Power Class 4 | |
|----------------------------|---------------|----------|---------------|----------|
| | Power (dBm) | Tol (dB) | Power (dBm) | Tol (dB) |
| 1 | +24 | +/-TT | +21 | +/-TT |
| 2 | +22 | +/-TT | +19 | +/-TT |
| 3 | +23 | +/-TT | +20 | +/-TT |
| 4 | +22 | +/-TT | +19 | +/-TT |

Table 5.2BD.6: Maximum Output Powers with HS-DPCCH and E-DCH for test in bands XXV and XXVI

| Sub-test in table C.11.1.3 | Power Class 3 | | Power Class 4 | |
|---|---------------|----------|---------------|----------|
| | Power (dBm) | Tol (dB) | Power (dBm) | Tol (dB) |
| 1 | +24 | +/-TT | +21 | +/-TT |
| 2 | +22 | +/-TT | +19 | +/-TT |
| 3 | +23 | +/-TT | +20 | +/-TT |
| 4 | +22 | +/-TT | +19 | +/-TT |
| NOTE 1: For the UE which supports both Band V and Band XXVI operating frequencies, the UE maximum output power of Band V shall apply for Band XXVI when the carrier frequency of the assigned UTRA channel is within 824-845 MHz. | | | | |

NOTE 1: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause FFS and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause FFS.

NOTE 2: The test procedure for sub-test 1 to 4 will result in a power slightly below the maximum, and therefore the lower limits in Table 5.2BD.5 are made lower by 1.5 dB.

NOTE 3: The test procedure allows UE to decrease its maximum transmit power for E-TFC selection in sub-test 1, and therefore the lower limits of sub-test 1 in Table 5.2BD.5 are made lower by 1.5 dB.

NOTE 4: For subtests 2, 3 and 4, UE may perform E-DPDCH power scaling at max power which could results in slightly smaller MPR values.

5.2BE Maximum Output Power with HS-DPCCH and E-DCH for UL CLTD activation state 2 and 3.

Editor's note: This clause is incomplete. The following aspects are either missing or not yet determined:

- Message Contents are FFS.
- Call Setup procedure, test procedure, test tolerances may need an update.
- Update of Annexure is FFS
- Update to 34.121-2 is FFS

5.2BE.1 Definition and applicability

The maximum output power for UL CLTD with HS-DPCCH and E-DCH and its tolerance are defined according to the UE Maximum Power Reduction (MPR) for the nominal maximum output power.

The maximum output power with HS-DPCCH and E-DCH is a measure of the maximum power the UE can transmit when HS-DPCCH and E-DCH is fully or partially transmitted during a DPCCH timeslot. The measurement period shall be at least one timeslot.

The requirements and this test apply for Release 11 and later releases to all types of UTRA for the FDD UE that supports UL CLTD.

5.2BE.2 Minimum Requirements

The UE Maximum Power Reduction (MPR) for the nominal maximum output power shall be within the value and tolerance specified in table 5.2BE.1 for when the values of β_c , β_d , β_{hs} , β_{ec} and β_{ed} is fully or partially transmitted during a DPCCH timeslot.

Table 5.2BE.1: Maximum Output Power with HS-DPCCH and E-DCH

| UE transmit channel configuration | CM (dB) | MPR (dB) |
|--|----------------------|---------------|
| For all combinations of; DPDCH, DPCCH, HS-DPCCH, E-DPDCH and E-DPCCH | $0 \leq CM \leq 3.5$ | MAX (CM-1, 0) |
| NOTE 1: CM = 1 for $\beta_c/\beta_d = 12/15$, $\beta_{hs}/\beta_{ec} = 24/15$. For all other combinations of DPDCH, DPCCH, HS-DPCCH, E-DPDCH and E-DPCCH the MPR is based on the relative CM difference. | | |

Where Cubic Metric (CM) is based on the UE transmit channel configuration and is given by:

$$CM = \text{CEIL} \{ [20 * \log_{10} ((v_{\text{norm}}^3)_{\text{rms}}) - 20 * \log_{10} ((v_{\text{norm_ref}}^3)_{\text{rms}})] / k, 0.5 \}$$

Where:

- CEIL{ x, 0.5 } means rounding upwards to closest 0.5dB, i.e. $CM \in [0, 0.5, 1.0, 1.5, 2.0, 2.5, 3.0, 3.5]$
- k is 1.85 for signals where all channelisations codes meet the following criteria $C_{SF, N}$ where $N < SF/2$
- k is 1.56 for signals were any channelisations codes meet the following criteria $C_{SF, N}$ where $N \geq SF/2$
- v_{norm} is the normalized voltage waveform of the input signal

- $v_{\text{norm_ref}}$ is the normalized voltage waveform of the reference signal (12.2 kbps AMR Speech) and $20 * \log_{10}((v_{\text{norm_ref}}^3)_{\text{rms}}) = 1.52 \text{ dB}$

For UE configured in UL CLTD activation state 2 or activation state 3, the allowed Maximum Power Reduction (MPR) for the nominal maximum output power applies at the active transmit antenna connector.

The normative reference for this requirement is TS 25.101 [1], clause 6.2.2C.

5.2BE.3 Test purpose

To verify that the error of the UE maximum output power for UL CLTD activation state 2 and 3 with HS-DPCCH and E-DCH does not exceed the range prescribed by the maximum output power and tolerance in table 5.2BD.5.

An excess maximum output power may interfere with other channels or other systems. A small maximum output power decreases the coverage area.

5.2BE.4 Method of test

5.2BE.4.1 Initial conditions

Test environment: normal, TL/VL, TL/VH, TH/VL, TH/VH; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS (node B emulator) to the UE antenna connector as shown in figure FFS.
- 2) The UL Reference Measurement Channel and the Fixed Reference Channels (FRC H-Set 1, QPSK) are specified in Annex FFS.
- 3) An E-DCH call is set up according to TS 34.108 [3] FFS with the following exceptions in the RADIO BEARER SETUP messages. These exceptions allow the beta values to be set according to table C.11.1.3 and each UL physical channel to be at constant power during the measurement. RF parameters are set up according to table E.5A.1. Settings for the serving cell are defined in table 5.2BE.4A.
- 4) SS sends a HS-SCCH order activating UL_CLTD activation state 2.
- 5) For sub-test 1 to 4, enter the UE into loopback test mode 1 looping back both the 12.2kbps RMC and HSDPA to E-DCH according to procedure 7.3.9.3.1 in TS 34.108 [3] and start the loopback test.

See TS 34.109 [4] clauses 5.3.2.3 and 5.3.2.6 for details regarding loopback test mode for HSDPA and E-DCH.

| - Ack-Nack repetition factor | 3 (required for continuous HS-DPCCH signal) |
| E-DCH info | |
| - E-DPCCH/DPCCH power offset | Value used in test: see Table C.11.1.3 |
| Downlink HS-PDSCH Information | |
| - Measurement Feedback Info | |
| - CQI Feedback cycle, k | 4 ms |
| - CQI repetition factor | 2 (required for continuous HS-DPCCH signal) |
| - Δ_{CQI} | Value used in test: see Table C.11.1.3 |

Table 5.2BE.4A: Settings for the serving cell during the measurement of Maximum Output Power with HS-DPCCH and E-DCH

| Parameter | Unit | Cell 1 |
|--|--------------|-------------------------------|
| Cell type | | Serving cell |
| UTRA RF Channel Number | | As defined in clause 5.2B.4.1 |
| Qqualmin | dB | -24 |
| Qrxlevmin | dBm | -115 |
| UE_TXPWR_MAX_RACH | dBm | +21 |
| \hat{I}_{or} (see notes 1 and 2) | dBm/3.84 MHz | -86 |
| NOTE 1: The power level is specified in terms of \hat{I}_{or} instead of CPICH_RSCP because RSCP is a receiver measurement, whereas the SS can only set \hat{I}_{or} . | | |
| NOTE 2: The cell fulfils TS 25.304, clause 5.2.3.1.2. | | |

5.2BE.4.2 Procedure

5.2BE.4.2.1 Procedure for sub-test 1 to 4

- 1) Set the Absolute Grant according to Table C.11.1.3.
- 2) The SS starts transmitting HSDPA and the UE loops the received data back on E-DCH.
- 3) Set the UE power to be at least 7.5dB lower than the maximum output power. Wait 150 ms.
- 4) Send power control bits to give one TPC_cmd = +1 command to the UE.
- 5) The SS checks the received E-TFCI for 150 ms. If UE does not send any decreased E-TFCI (DTX on E-DPDCH is also considered decreased E-TFCI) within the 150ms then go back to step (4) otherwise proceed to step 6).
- 6) Send power control bits to give one TPC_cmd = -1 command to the UE and wait 150ms.
- 7) The SS checks the received E-TFCI for 150 ms. If UE sends any decreased E-TFCI (DTX on E-DPDCH is also considered decreased E-TFCI) within the 150ms, then send new power control bits to give another TPC_cmd = -1 command to the UE and wait 150ms.
- 8) Confirm that the E-TFCI transmitted by the UE is equal to the target E-TFCI in Table C.11.1.3. If the E-TFCI transmitted by the UE is not equal to the target E-TFCI, then fail the UE.
- 9) Measure the mean power of the UE. The mean power shall be averaged over at least one timeslot and is measured at the active transmit antenna connector.
- 10) Repeat the measurement for the different combinations of beta values for sub-test 1 to 4 as given in table C.11.1.3.
- 11) SS sends a HS-SCCH order activating UL_CLTD activation state 3.
- 12) Repeat step 1 to 10 for activation state 3.

5.2BE.5 Test requirements

The maximum output power with HS-DPCCH and E-DCH, derived in step 9) for activation 2 and 3, shall not exceed the range prescribed by the maximum output power and tolerance in table 5.2BE.5 or 5.2BE.6 depending on tested band. Note:

For UE configured in UL CLTD activation state 2 or activation state 3, the nominal maximum output power applies at the active transmit antenna connector.

The UL reference measurement channel for TX test will be set as defined in C.11.1 with the power ratio between HS-DPCH, DPCCH, DPDCH, E-DPCCH and E-DPDCH being set to the values defined in table C.11.1.3.

Table 5.2BE.5: Maximum Output Powers with HS-DPCCH and E-DCH for test

| Sub-test in table C.11.1.3 | Power Class 3 | | Power Class 4 | |
|----------------------------|---------------|----------|---------------|----------|
| | Power (dBm) | Tol (dB) | Power (dBm) | Tol (dB) |
| 1 | +24 | +/-TT | +21 | +/-TT |
| 2 | +22 | +/-TT | +19 | +/-TT |
| 3 | +23 | +/-TT | +20 | +/-TT |
| 4 | +22 | +/-TT | +19 | +/-TT |

Table 5.2BE.6: Maximum Output Powers with HS-DPCCH and E-DCH for test in bands XXV and XXVI

| Sub-test in table C.11.1.3 | Power Class 3 | | Power Class 4 | |
|---|---------------|----------|---------------|----------|
| | Power (dBm) | Tol (dB) | Power (dBm) | Tol (dB) |
| 1 | +24 | +/-TT | +21 | +/-TT |
| 2 | +22 | +/-TT | +19 | +/-TT |
| 3 | +23 | +/-TT | +20 | +/-TT |
| 4 | +22 | +/-TT | +19 | +/-TT |
| NOTE 1: For the UE which supports both Band V and Band XXVI operating frequencies, the UE maximum output power of Band V shall apply for Band XXVI when the carrier frequency of the assigned UTRA channel is within 824-845 MHz. | | | | |

NOTE 1: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause FFS and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause FFS.

NOTE 2: The test procedure for sub-test 1 to 4 will result in a power slightly below the maximum, and therefore the lower limits in Table 5.2BE.5 are made lower by 1.5 dB.

NOTE 3: The test procedure allows UE to decrease its maximum transmit power for E-TFC selection in sub-test 1, and therefore the lower limits of sub-test 1 in Table 5.2BE.5 are made lower by 1.5 dB.

NOTE 4: For subtests 2, 3 and 4, UE may perform E-DPDCH power scaling at max power which could results in slightly smaller MPR values.

5.2C UE relative code domain power accuracy

5.2C.1 Definition and applicability

The UE Relative code domain power accuracy is a measure of the ability of the UE to correctly set the level of individual code powers relative to the total power of all active codes. The measure of accuracy is the difference between two dB ratios:

$$\text{UE Relative CDP accuracy} = (\text{Measured CDP ratio}) - (\text{Nominal CDP ratio})$$

where:

$$\text{Measured CDP ratio} = 10 \cdot \log((\text{Measured code power}) / (\text{Measured total power of all active codes}))$$

$$\text{Nominal CDP ratio} = 10 \cdot \log((\text{Nominal CDP}) / (\text{Sum of all nominal CDPs}))$$

The nominal CDP of a code is relative to the total of all codes and is derived from beta factors.

When the UE uses 16QAM modulation a correction factor shall be applied to the β_{ed} value used to compute the Nominal CDP equal to $\{A_1 \cdot (0.4472)^2 + A_2 \cdot (1.3416)^2 + A_3 \cdot (-0.4472)^2 + A_4 \cdot (-1.3416)^2\}^{1/2}$ where A_1 , A_2 , A_3 and A_4 are the fractions of symbols (00, 01, 10, 11 respectively) transmitted during the test.

The sum of all nominal CDPs will equal 1 by definition.

NOTE: The above definition of UE relative CDP accuracy is independent of variations in the actual total power of the signal and of noise in the signal that falls on inactive codes.

The requirements and this test apply for Release 6 and later releases to all types of UTRA for the FDD UE that support HSDPA but not E-DCH.

5.2C.2 Minimum Requirements

The required accuracy of the UE relative CDP is given in table 5.2C.1. The UE relative CDP accuracy shall be maintained over the period during which the total of all active code powers remains unchanged or one timeslot, whichever is the longer.

Table 5.2C.1: UE Relative CDP accuracy

| Nominal CDP ratio | Accuracy (dB) |
|-------------------------|---------------|
| ≥ -10 dB | ± 1.5 |
| -10 dB to ≥ -15 dB | ± 2.0 |
| -15 dB to ≥ -20 dB | ± 2.5 |

The normative reference for this requirement is TS 25.101 [1] clause 6.2.3.

5.2C.3 Test purpose

To verify that the UE relative code domain power accuracy meets the requirements given in table 5.2C.4.

5.2C.4 Method of test

5.2C.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS (node B emulator) to the UE antenna connector as shown in figure A.1.
- 2) The UL Reference Measurement Channel and the Fixed Reference Channels (FRC H-Set 1, QPSK version) are specified in Annex C.10.1 and C.8.1.1.
- 3) An HSDPA call is set up according to TS 34.108 [3] clause 7.3.6. RF parameters are set up according to table E.5.1 and table E.5.10. Settings for the serving cell are defined in table 5.2C.2.
- 4) Enter the UE into loopback test mode 1 in the presence of HSDPA and start the loopback test.

Table 5.2C.2: Settings for the serving cell during the measurement of HS-DPCCH

| Parameter | Unit | Cell 1 |
|--|--------------|-------------------------------|
| Cell type | | Serving cell |
| UTRA RF Channel Number | | As defined in clause 5.2C.4.1 |
| Qqualmin | dB | -24 |
| Qrxlevmin | dBm | -115 |
| UE_TXPWR_MAX_RACH | dBm | +21 |
| \hat{I}_{or} (see notes 1 and 2) | dBm/3.84 MHz | -86 |
| NOTE 1: The power level is specified in terms of \hat{I}_{or} instead of CPICH_RSCP because RSCP is a receiver measurement, whereas the SS can only set \hat{I}_{or} . | | |
| NOTE 2: The cell fulfils TS 25.304, clause 5.2.3.1.2. | | |

See TS 34.108 [3] and TS 34.109 [4] for details regarding loopback test mode for HSDPA.

5.2C.4.2 Procedure

- 1) Send the TRANSPORT CHANNEL RECONFIGURATION message to set the beta values defined in table C.10.1.4 subtest 1 and the DPCH frame offset according the HS-DPCCH half slot offset required for measurements. This will create a signal with a repeat pattern of 12ms. The Uplink DPCH Power Control Info shall specify the Power Control Algorithm as algorithm 2 for interpreting TPC commands.

- 2) Generate suitable TPC commands from the SS to set the output power of the UE, when the HS-DPCCH is not transmitted, measured at the UE antenna connector, to be in the range $0 \text{ dBm} \pm 2\text{dB}$. This is a nominal setting and not part of the test requirements.
- 3) Send alternating "0" and "1" TPC commands in the downlink so as to satisfy the condition of obtaining $\text{TPC_cmd} = 0$.
- 4) Start transmitting HSDPA Data.
- 5) Figure 5.2C.1 shows the 12ms cycle created when using the TRANSPORT CHANNEL RECONFIGURATION message from Annex I with the test specific message content defined below and with $\text{TPC_cmd}=0$. Measure the relative code domain power of each active code at the measurement points specified in figure 5.2C.1. Each measurement is over a half slot period. Point 1 is the half slot prior to the ACK/NACK. Point 2 is the first half slot of the ACK/NACK, point 3 is the first half slot of the CQI and point 4 is the first half slot after the CQI. The 25us transient periods at the end of each half slot period shall not be included. The nominal UE relative code domain power for each active code at each point is defined in table 5.2C.3. The required accuracy which is the difference between the expected and measured code domain power shall meet the test requirements given in table 5.2C.4.

Specific Message Contents

All messages indicated above shall use the same content as described in the default message content in clause 9 of TS 34.108 [3], except the TRANSPORT CHANNEL RECONFIGURATION message which is defined in annex I. The test specific content for the TRANSPORT CHANNEL RECONFIGURATION message is as follows:

| Information Element | Value/remark |
|------------------------------|--------------|
| - Ack-Nack repetition factor | 1 |
| - CQI repetition factor | 1 |

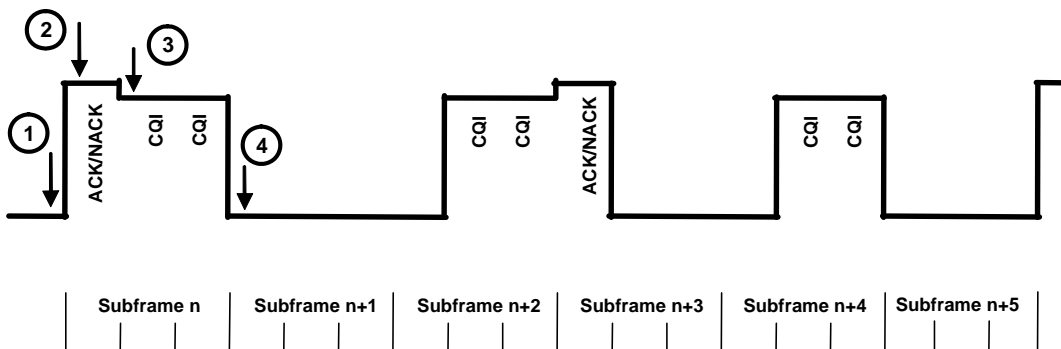

Figure 5.2C.1: Transmit power profile showing measurement points

5.2C.5 Test requirements

For the expected relative code domain power ratios given in table 5.2C.3 the UE shall meet the UE relative code domain power accuracy test requirements given in Table 5.2C.4.

Table 5.2C.3: UE relative code domain power nominal ratios

| Sub-test in table C.10.1.4 | Measurement point | Expected relative code domain power in dB | | |
|----------------------------|-------------------|---|-------|----------|
| | | DPCCH | DPDCH | HS-DPCCH |
| 1 | 1 | -17.6 | -0.08 | OFF |
| | 2 | -17.9 | -0.4 | -11.8 |
| | 3 | -17.8 | -0.3 | -13.7 |
| | 4 | -17.6 | -0.08 | OFF |
| 2 | 1 | -4.1 | -2.1 | OFF |
| | 2 | -8.2 | -6.2 | -2.1 |
| | 3 | -7.1 | -5.2 | -3 |
| | 4 | -4.1 | -2.1 | OFF |
| 3 | 1 | -1.1 | -6.5 | OFF |
| | 2 | -7.2 | -12.7 | -1.2 |
| | 3 | -5.8 | -11.3 | -1.8 |
| | 4 | -1.1 | -6.5 | OFF |
| 4 | 1 | -0.3 | -11.8 | OFF |
| | 2 | -7.1 | -18.5 | -1 |
| | 3 | -5.6 | -17.1 | -1.5 |
| | 4 | -0.3 | -11.8 | OFF |

Table 5.2C.4: UE relative code domain power accuracy test requirements

| Nominal CDP ratio | Accuracy (dB) |
|-------------------------|---------------|
| ≥ -10 dB | ± 1.7 |
| -10 dB to ≥ -15 dB | ± 2.3 |
| -15 dB to ≥ -20 dB | ± 2.9 |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.2CA UE relative code domain power accuracy for OLTD

FFS

5.2CB UE relative code domain power accuracy for UL CLTD activation state 1

Editor's note: This clause is incomplete. The following aspects are either missing or not yet determined:

- Message Contents are FFS.
- Call Setup procedure, test procedure, test tolerances may need an update.
- Update of Annexure is FFS
- Update to 34.121-2 is FFS

5.2CB.1 Definition and applicability

The UE Relative code domain power accuracy is a measure of the ability of the UE to correctly set the level of individual code powers relative to the total power of all active codes. The measure of accuracy is the difference between two dB ratios:

$$\text{UE Relative CDP accuracy} = (\text{Measured CDP ratio}) - (\text{Nominal CDP ratio})$$

where:

$$\text{Measured CDP ratio} = 10 \cdot \log((\text{Measured code power}) / (\text{Measured total power of all active codes}))$$

$$\text{Nominal CDP ratio} = 10 \cdot \log((\text{Nominal CDP}) / (\text{Sum of all nominal CDPs}))$$

The nominal CDP of a code is relative to the total of all codes and is derived from beta factors.

When the UE uses 16QAM modulation a correction factor shall be applied to the β_{ed} value used to compute the Nominal CDP equal to $\{A_1*(0.4472)^2 + A_2*(1.3416)^2 + A_3*(-0.4472)^2 + A_4*(-1.3416)^2\}^{1/2}$ where A_1 , A_2 , A_3 and A_4 are the fractions of symbols (00, 01, 10, 11 respectively) transmitted during the test.

The sum of all nominal CDPs will equal 1 by definition.

NOTE: The above definition of UE relative CDP accuracy is independent of variations in the actual total power of the signal and of noise in the signal that falls on inactive codes.

The requirements and this test apply for Release 11 and later releases to all types of UTRA for the FDD UE that supports UL CLTD.

5.2CB.2 Minimum Requirements

The required accuracy of the UE relative CDP is given in table 5.2CB.1. The UE relative CDP accuracy shall be maintained over the period during which the total of all active code powers remains unchanged or one timeslot, whichever is the longer.

For UE with two active transmit antenna connectors in UL CLTD activation state 1, the relative code domain power accuracy specified in table 5.2CB.1 applies at each transmit antenna connector.

Table 5.2CB.1: UE Relative CDP accuracy

| Nominal CDP ratio | Accuracy (dB) |
|-------------------------|---------------|
| ≥ -10 dB | ± 1.5 |
| -10 dB to ≥ -15 dB | ± 2.0 |
| -15 dB to ≥ -20 dB | ± 2.5 |

The normative reference for this requirement is TS 25.101 [1] clause 6.2.3C.

5.2CB.3 Test purpose

To verify that the UE relative code domain power accuracy for UL CLTD activation state 1 meets the requirements given in table 5.2CB.4.

5.2CB.4 Method of test

5.2CB.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS (node B emulator) to the UE antenna connector as shown in figure FFS.
- 2) The UL Reference Measurement Channel and the Fixed Reference Channels (FRC H-Set 1, QPSK version) are specified in Annex FFS.
- 3) An HSDPA call is set up according to TS 34.108 [3] clause 7.3.6. RF parameters are set up according to table E.5.1 and table E.5.10. Settings for the serving cell are defined in table 5.2CB.2.
- 4) SS sends a HS-SCCH order activating UL_CLTD activation state 1.
- 5) Enter the UE into loopback test mode 1 in the presence of HSDPA and start the loopback test.

Table 5.2CB.2: Settings for the serving cell during the measurement of HS-DPCCH

| Parameter | Unit | Cell 1 |
|--|--------------|-------------------------------|
| Cell type | | Serving cell |
| UTRA RF Channel Number | | As defined in clause 5.2C.4.1 |
| Qqualmin | dB | -24 |
| Qrxlevmin | dBm | -115 |
| UE_TXPWR_MAX_RACH | dBm | +21 |
| \hat{I}_{or} (see notes 1 and 2) | dBm/3.84 MHz | -86 |
| NOTE 1: The power level is specified in terms of \hat{I}_{or} instead of CPICH_RSCP because RSCP is a receiver measurement, whereas the SS can only set \hat{I}_{or} . | | |
| NOTE 2: The cell fulfils TS 25.304, clause 5.2.3.1.2. | | |

See TS 34.108 [3] and TS 34.109 [4] for details regarding loopback test mode for HSDPA.

5.2CB.4.2 Procedure

- 1) Send the TRANSPORT CHANNEL RECONFIGURATION message to set the beta values defined in table C.10.1.4 subtest 1 and the DPCH frame offset according the HS-DPCCH half slot offset required for measurements. This will create a signal with a repeat pattern of 12ms. The Uplink DPCH Power Control Info shall specify the Power Control Algorithm as algorithm 2 for interpreting TPC commands.
- 2) Generate suitable TPC commands from the SS to set the output power of the UE, when the HS-DPCCH is not transmitted, measured at the UE antenna connector, to be in the range 0 dBm \pm 2dB. This is a nominal setting and not part of the test requirements.
- 3) Send alternating "0" and "1" TPC commands in the downlink so as to satisfy the condition of obtaining TPC_cmd = 0.
- 4) Start transmitting HSDPA Data.
- 5) Figure 5.2CB.1 shows the 12ms cycle created when using the TRANSPORT CHANNEL RECONFIGURATION message from Annex I with the test specific message content defined below and with TPC_cmd=0. Measure the relative code domain power of each active code at the measurement points specified in figure 5.2CB.1 at each transmit antenna connector. Each measurement is over a half slot period. Point 1 is the half slot prior to the ACK/NACK. Point 2 is the first half slot of the ACK/NACK, point 3 is the first half slot of the CQI and point 4 is the first half slot after the CQI. The 25us transient periods at the end of each half slot period shall not be included. The nominal UE relative code domain power for each active code at each point is defined in table 5.2CB.3. The required accuracy which is the difference between the expected and measured code domain power shall meet the test requirements given in table 5.2CB.4.

Specific Message Contents

All messages indicated above shall use the same content as described in the default message content in clause 9 of TS 34.108 [3], except the TRANSPORT CHANNEL RECONFIGURATION message which is defined in annex I. The test specific content for the TRANSPORT CHANNEL RECONFIGURATION message is as follows:

| Information Element | Value/remark |
|------------------------------|--------------|
| - Ack-Nack repetition factor | 1 |
| - CQI repetition factor | 1 |

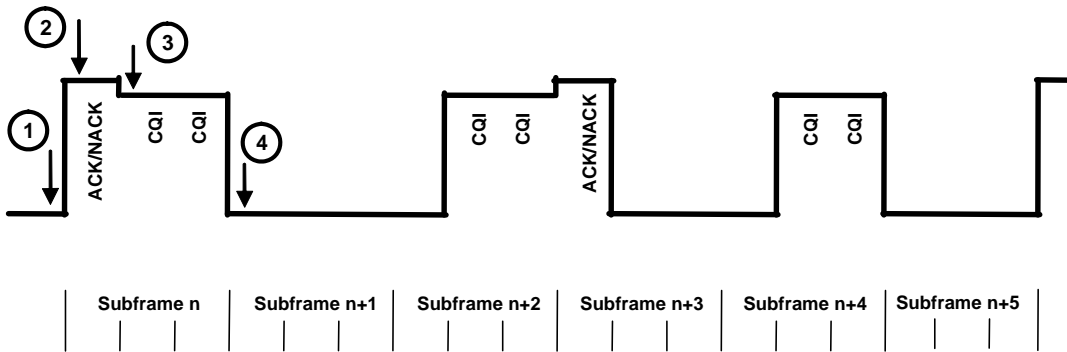

Figure 5.2CB.1: Transmit power profile showing measurement points

5.2CB.5 Test requirements

For the expected relative code domain power ratios given in table 5.2CB.3 the UE shall meet the UE relative code domain power accuracy test requirements given in Table 5.2CB.4.

For UE with two active transmit antenna connectors in UL CLTD activation state 1, the relative code domain power accuracy applies at each transmit antenna connector.

Table 5.2CB.3: UE relative code domain power nominal ratios

| Sub-test in table C.10.1.4 | Measurement point | Expected relative code domain power in dB | | |
|----------------------------|-------------------|---|-------|----------|
| | | DPCCH | DPDCH | HS-DPCCH |
| 1 | 1 | -17.6 | -0.08 | OFF |
| | 2 | -17.9 | -0.4 | -11.8 |
| | 3 | -17.8 | -0.3 | -13.7 |
| | 4 | -17.6 | -0.08 | OFF |
| 2 | 1 | -4.1 | -2.1 | OFF |
| | 2 | -8.2 | -6.2 | -2.1 |
| | 3 | -7.1 | -5.2 | -3 |
| | 4 | -4.1 | -2.1 | OFF |
| 3 | 1 | -1.1 | -6.5 | OFF |
| | 2 | -7.2 | -12.7 | -1.2 |
| | 3 | -5.8 | -11.3 | -1.8 |
| | 4 | -1.1 | -6.5 | OFF |
| 4 | 1 | -0.3 | -11.8 | OFF |
| | 2 | -7.1 | -18.5 | -1 |
| | 3 | -5.6 | -17.1 | -1.5 |
| | 4 | -0.3 | -11.8 | OFF |

Table 5.2CB.4: UE relative code domain power accuracy test requirements

| Nominal CDP ratio | Accuracy (dB) |
|--------------------|---------------|
| ≥ -10 dB | ±1.5 ± TT |
| -10 dB to ≥ -15 dB | ±2.0 ± TT |
| -15 dB to ≥ -20 dB | ±2.5 ± TT |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause FFS and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause FFS.

5.2CC UE relative code domain power accuracy for UL CLTD activation state 2 and 3

Editor's note: This clause is incomplete. The following aspects are either missing or not yet determined:

- Message Contents are FFS.
- Call Setup procedure, test procedure, test tolerances may need an update.
- Update of Annexure is FFS
- Update to 34.121-2 is FFS

5.2CC.1 Definition and applicability

The UE Relative code domain power accuracy is a measure of the ability of the UE to correctly set the level of individual code powers relative to the total power of all active codes. The measure of accuracy is the difference between two dB ratios:

$$\text{UE Relative CDP accuracy} = (\text{Measured CDP ratio}) - (\text{Nominal CDP ratio})$$

where:

$$\text{Measured CDP ratio} = 10 \cdot \log((\text{Measured code power}) / (\text{Measured total power of all active codes}))$$

$$\text{Nominal CDP ratio} = 10 \cdot \log((\text{Nominal CDP}) / (\text{Sum of all nominal CDPs}))$$

The nominal CDP of a code is relative to the total of all codes and is derived from beta factors.

When the UE uses 16QAM modulation a correction factor shall be applied to the β_{cd} value used to compute the Nominal CDP equal to $\{A_1 \cdot (0.4472)^2 + A_2 \cdot (1.3416)^2 + A_3 \cdot (-0.4472)^2 + A_4 \cdot (-1.3416)^2\}^{1/2}$ where A_1 , A_2 , A_3 and A_4 are the fractions of symbols (00, 01, 10, 11 respectively) transmitted during the test.

The sum of all nominal CDPs will equal 1 by definition.

NOTE: The above definition of UE relative CDP accuracy is independent of variations in the actual total power of the signal and of noise in the signal that falls on inactive codes.

The requirements and this test apply for Release 11 and later releases to all types of UTRA for the FDD UE that supports UL CLTD.

5.2CC.2 Minimum Requirements

The required accuracy of the UE relative CDP is given in table 5.2CC.1. The UE relative CDP accuracy shall be maintained over the period during which the total of all active code powers remains unchanged or one timeslot, whichever is the longer.

For UE configured in UL CLTD activation state 2 or activation state 3, the relative code domain power accuracy specified in table 5.2CC.1 applies at the active transmit antenna connector.

Table 5.2CC.1: UE Relative CDP accuracy

| Nominal CDP ratio | Accuracy (dB) |
|-------------------------|---------------|
| ≥ -10 dB | ± 1.5 |
| -10 dB to ≥ -15 dB | ± 2.0 |
| -15 dB to ≥ -20 dB | ± 2.5 |

The normative reference for this requirement is TS 25.101 [1] clause 6.2.3C.

5.2CC.3 Test purpose

To verify that the UE relative code domain power accuracy for UL CLTD activation state 2 and 3 meets the requirements given in table 5.2CC.4.

5.2CC.4 Method of test

5.2CC.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS (node B emulator) to the UE antenna connector as shown in figure FFS.
- 2) The UL Reference Measurement Channel and the Fixed Reference Channels (FRC H-Set 1, QPSK version) are specified in Annex FFS.
- 3) An HSDPA call is set up according to TS 34.108 [3] clause FFS. RF parameters are set up according to table E.5.1 and table E.5.10. Settings for the serving cell are defined in table 5.2CC.2.
- 4) SS sends a HS-SCCH order activating UL_CLTD activation state 2.
- 5) Enter the UE into loopback test mode 1 in the presence of HSDPA and start the loopback test.

Table 5.2CC.2: Settings for the serving cell during the measurement of HS-DPCCH

| Parameter | Unit | Cell 1 |
|--|--------------|-------------------------------|
| Cell type | | Serving cell |
| UTRA RF Channel Number | | As defined in clause 5.2C.4.1 |
| Qqualmin | dB | -24 |
| Qrxlevmin | dBm | -115 |
| UE_TXPWR_MAX_RACH | dBm | +21 |
| \hat{I}_{or} (see notes 1 and 2) | dBm/3.84 MHz | -86 |
| NOTE 1: The power level is specified in terms of \hat{I}_{or} instead of CPICH_RSCP because RSCP is a receiver measurement, whereas the SS can only set \hat{I}_{or} . | | |
| NOTE 2: The cell fulfils TS 25.304, clause 5.2.3.1.2. | | |

See TS 34.108 [3] and TS 34.109 [4] for details regarding loopback test mode for HSDPA.

5.2CC.4.2 Procedure

- 1) Send the TRANSPORT CHANNEL RECONFIGURATION message to set the beta values defined in table C.10.1.4 subtest 1 and the DPCH frame offset according the HS-DPCCH half slot offset required for measurements. This will create a signal with a repeat pattern of 12ms. The Uplink DPCH Power Control Info shall specify the Power Control Algorithm as algorithm 2 for interpreting TPC commands.
- 2) Generate suitable TPC commands from the SS to set the output power of the UE, when the HS-DPCCH is not transmitted, measured at the UE antenna connector, to be in the range 0 dBm \pm 2dB. This is a nominal setting and not part of the test requirements.
- 3) Send alternating "0" and "1" TPC commands in the downlink so as to satisfy the condition of obtaining TPC_cmd = 0.
- 4) Start transmitting HSDPA Data.
- 5) Figure 5.2CC.1 shows the 12ms cycle created when using the TRANSPORT CHANNEL RECONFIGURATION message from Annex I with the test specific message content defined below and with TPC_cmd=0. Measure the relative code domain power of each active code at the measurement points specified in figure 5.2CC.1 at the active transmit antenna connector. Each measurement is over a half slot period. Point 1 is the half slot prior to the ACK/NACK. Point 2 is the first half slot of the ACK/NACK, point 3 is the first half slot of the CQI and point 4 is the first half slot after the CQI. The 25us transient periods at the end of each half slot period shall not be included. The nominal UE relative code domain power for each active code at each point is defined in table 5.2CC.3. The required accuracy which is the difference between the expected and measured code domain power shall meet the test requirements given in table 5.2CC.4.
- 6) S sends a HS-SCCH order activating UL_CLTD activation state 3.
- 7) Repeat step 1 to 5 for activation state 3.

Specific Message Contents

All messages indicated above shall use the same content as described in the default message content in clause 9 of TS 34.108 [3], except the TRANSPORT CHANNEL RECONFIGURATION message which is defined in annex I. The test specific content for the TRANSPORT CHANNEL RECONFIGURATION message is as follows:

| Information Element | Value/remark |
|------------------------------|--------------|
| - Ack-Nack repetition factor | 1 |
| - CQI repetition factor | 1 |

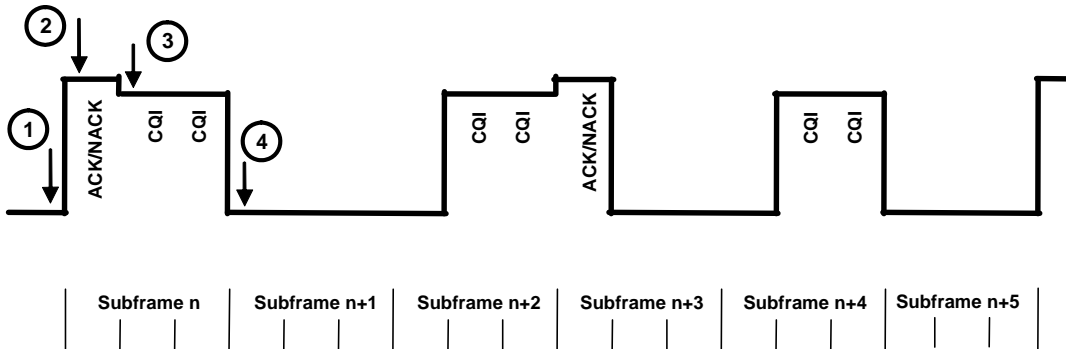

Figure 5.2CC.1: Transmit power profile showing measurement points

5.2CC.5 Test requirements

For the expected relative code domain power ratios given in table 5.2CC.3 the UE shall meet the UE relative code domain power accuracy test requirements given in Table 5.2CC.4.

For UE configured in UL CLTD activation state 2 or activation state 3, the relative code domain power accuracy applies at the active transmit antenna connector.

Table 5.2CC.3: UE relative code domain power nominal ratios

| Sub-test in table C.10.1.4 | Measurement point | Expected relative code domain power in dB | | |
|----------------------------|-------------------|---|-------|----------|
| | | DPCCH | DPDCH | HS-DPCCH |
| 1 | 1 | -17.6 | -0.08 | OFF |
| | 2 | -17.9 | -0.4 | -11.8 |
| | 3 | -17.8 | -0.3 | -13.7 |
| | 4 | -17.6 | -0.08 | OFF |
| 2 | 1 | -4.1 | -2.1 | OFF |
| | 2 | -8.2 | -6.2 | -2.1 |

| | 4 | -4.1 | -2.1 | OFF |
| 3 | 1 | -1.1 | -6.5 | OFF |
| | 2 | -7.2 | -12.7 | -1.2 |
| | 3 | -5.8 | -11.3 | -1.8 |
| | 4 | -1.1 | -6.5 | OFF |
| 4 | 1 | -0.3 | -11.8 | OFF |
| | 2 | -7.1 | -18.5 | -1 |
| | 3 | -5.6 | -17.1 | -1.5 |
| | 4 | -0.3 | -11.8 | OFF |

Table 5.2CC.4: UE relative code domain power accuracy test requirements

| Nominal CDP ratio | Accuracy (dB) |
|--------------------|---------------|
| ≥ -10 dB | ±1.5 ± TT |
| -10 dB to ≥ -15 dB | ±2.0 ± TT |
| -15 dB to ≥ -20 dB | ±2.5 ± TT |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause FFS and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause FFS.

5.2D UE Relative Code Domain Power Accuracy for HS-DPCCH and E-DCH

5.2D.1 Definition and applicability

The UE Relative code domain power accuracy is a measure of the ability of the UE to correctly set the level of individual code powers relative to the total power of all active codes. The measure of accuracy is the difference between two dB ratios:

$$\text{UE Relative CDP accuracy} = (\text{Measured CDP ratio}) - (\text{Nominal CDP ratio})$$

where

$$\text{Measured CDP ratio} = 10 \cdot \log((\text{Measured code power}) / (\text{Measured total power of all active codes}))$$

$$\text{Nominal CDP ratio} = 10 \cdot \log((\text{Nominal CDP}) / (\text{Sum of all nominal CDPs}))$$

The nominal CDP of a code is relative to the total of all codes and is derived from beta factors.

When the UE uses 16QAM modulation a correction factor shall be applied to the β_{ed} value used to compute the Nominal CDP equal to $\{A_1 \cdot (0.4472)^2 + A_2 \cdot (1.3416)^2 + A_3 \cdot (-0.4472)^2 + A_4 \cdot (-1.3416)^2\}^{1/2}$ where A_1 , A_2 , A_3 and A_4 are the fractions of symbols (00, 01, 10, 11 respectively) transmitted during the test.

The sum of all nominal CDPs will equal 1 by definition.

NOTE: The above definition of UE relative CDP accuracy is independent of variations in the actual total power of the signal and of noise in the signal that falls on inactive codes.

The requirements and this test apply for Release 6 and later releases to all types of UTRA for the FDD UE that support HSDPA and E-DCH.

5.2D.2 Minimum Requirements

The required accuracy of the UE relative CDP is given in table 5.2D.1. The UE relative CDP accuracy shall be maintained over the period during which the total of all active code powers remains unchanged or one timeslot, whichever is the longer.

Table 5.2D.1: UE Relative CDP accuracy

| Nominal CDP ratio | Accuracy (dB) |
|--------------------|---------------|
| ≥ -10 dB | ±1.5 |
| -10 dB to ≥ -15 dB | ±2.0 |
| -15 dB to ≥ -20 dB | ±2.5 |

The normative reference for this requirement is TS 25.101 [1] clause 6.2.3.

5.2D.3 Test purpose

To verify that the UE relative code domain power accuracy meets the requirements given in table 5.2D.8.

5.2D.4 Method of test

5.2D.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS (node B emulator) to the UE antenna connector as shown in figure A.1.
- 2) The UL Reference Measurement Channel and the Fixed Reference Channels (FRC H-Set 1, QPSK version) are specified in Annex C.11.1 and C.8.1.1.
- 3) An E-DCH call is set up according to TS 34.108 [3] 7.3.9 with the following exceptions in the RADIO BEARER SETUP messages. These exceptions allow the beta values to be set according to table C.11.1.3 and each UL physical channel to be at constant power at the start of the measurement. RF parameters are set up according to table E.5A.1. Settings for the serving cell are defined in table 5.2D.6.
- 4) Enter the UE into loopback test mode 1 looping back both the 12.2kbps RMC and HSDPA to E-DCH, and start the loopback test.

See TS 34.109 [4] clauses 5.3.2.3 and 5.3.2.6 for details regarding loopback test mode for HSDPA and E-DCH.

| \hat{I}_{or} (see notes 1 and 2) | dBm/3.84 MHz | -86 |
| NOTE 1: The power level is specified in terms of \hat{I}_{or} instead of CPICH_RSCP because RSCP is a receiver measurement, whereas the SS can only set \hat{I}_{or} . | | |
| NOTE 2: The cell fulfils TS 25.304, clause 5.2.3.1.2. | | |

5.2D.4.2 Procedure

- 1) Set the Absolute Grant according to Table C.11.1.3.
- 2) The SS starts transmitting HSDPA and the UE loops the received data back on E-DCH.
- 3) Generate suitable TPC commands from the SS to set the output power of the UE to be in the range 15 dBm \pm 2 dB.
- 4) Confirm that the E-TFCI transmitted by the UE is equal to the target E-TFCI in Table C.11.1.3. If the E-TFCI transmitted by the UE is not equal to the target E-TFCI, then fail the UE.
- 5) Send alternating "0" and "1" TPC commands in the downlink so as to satisfy the condition of obtaining TPC_cmd = 0.
- 6) Send Absolute Grants in a repeating pattern starting with the value according to Table C.11.1.3 and alternating between this value and an Absolute Grant Index of Zero_Grant. This will generate a repeating pattern on the E-DPDCH(s) with a level corresponding to the sending of Scheduling Information every other 10ms E-DCH TTI as shown in Figure 5.2D.1.

Figure 5.2D.1: Transmit power profile showing measurement points

- 7) Measure the relative code domain power of each active code at the measurement points specified in Figure 5.2D.1. Each measurement is made over one timeslot. Measurement point 1 is the last timeslot before TTI1. Measurement point 2 is the first timeslot of TTI1 and measurement point 3 is the first timeslot of TTI2. The 25 us transient periods at the ends of each measured timeslot shall not be included. The nominal UE relative code domain power for each active code at each point is defined in table 5.2D.7. The required accuracy which is the difference between the expected and measured code domain power shall meet the test requirements given in table 5.2D.8.
- 8) Repeat steps 1 through 7 for the other combinations of beta values for sub-tests 1, 2, 3, and 4 as given in Table C.11.1.3.

5.2D.5 Test requirements

For all UE relative code domain power nominal ratios given in table 5.2D.7 ≥ -20 dB the UE shall meet the UE relative code domain power accuracy test requirements given in Table 5.2D.8.

Table 5.2D.7: UE relative code domain power nominal ratios

| Sub-Test in Table C.11.1.3 | Measurement Point | Expected Relative Code Domain Power in dB | | | | | |
|----------------------------|-------------------|---|-------|----------|---------|----------|----------|
| | | DPCCH | DPDCH | HS-DPCCH | E-DPCCH | E-DPDCH1 | E-DPDCH2 |
| 1 | 1 | -9.3 | -6.6 | -3.3 | -7.3 | -18.9 | OFF |
| | 2 | -18.5 | -15.8 | -12.5 | -16.5 | -0.5 | OFF |
| | 3 | -9.3 | -6.6 | -3.3 | -7.3 | -18.9 | OFF |

| | 3 | -17.9 | -0.4 | -11.9 | -17.9 | -27.5 | OFF |

Table 5.2D.8: UE relative code domain power accuracy test requirements

| Nominal CDP ratio | Accuracy (dB) |
|-------------------------|---------------|
| ≥ -10 dB | ± 1.7 |
| -10 dB to ≥ -15 dB | ± 2.3 |
| -15 dB to ≥ -20 dB | ± 2.9 |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.2DA UE Relative Code Domain Power Accuracy for DC-HSUPA with QPSK

5.2DA.1 Definition and applicability

The requirement and corresponding measurements apply to each individual carrier when the total power in each of the assigned carriers is equal to each other. Furthermore, it is necessary to verify this requirement only for β values as specified in Table C.11A.1.1.

The UE Relative code domain power accuracy is a measure of the ability of the UE to correctly set the level of individual code powers in a carrier relative to the total power of all active codes in that carrier. The measure of accuracy is the difference between two dB ratios measured per carrier configured on the uplink:

$$\text{UE Relative CDP accuracy} = (\text{Measured CDP ratio}) - (\text{Nominal CDP ratio})$$

where

$$\text{Measured CDP ratio} = 10 \cdot \log((\text{Measured code power}) / (\text{Measured total power of all active codes}))$$

$$\text{Nominal CDP ratio} = 10 \cdot \log((\text{Nominal CDP}) / (\text{Sum of all nominal CDPs}))$$

The nominal CDP of a code is relative to the total of all codes in each carrier and is derived from beta factors. The sum of all nominal CDPs will equal 1 by definition.

NOTE: The above definition of UE relative CDP accuracy is independent of variations in the actual total power of the signal in each carrier and of noise in the signal that falls on inactive codes.

The requirements and this test apply for Release 9 and later releases to all types of UTRA for the FDD UE that support HSDPA and Dual Cell E-DCH.

5.2DA.2 Minimum Requirements

The required accuracy of the UE relative CDP is given in table 5.2DA.1. The UE relative CDP accuracy shall be maintained over the period during which the total of all active code powers remains unchanged or one timeslot, whichever is the longer.

Table 5.2DA.1: UE Relative CDP accuracy

| Nominal CDP ratio | Accuracy (dB) |
|-------------------------|---------------|
| ≥ -10 dB | ± 1.5 |
| -10 dB to ≥ -15 dB | ± 2.0 |
| -15 dB to ≥ -20 dB | ± 2.5 |
| -20 dB to ≥ -30 dB | ± 3.0 |

The normative reference for this requirement is TS 25.101 [1] clause 6.2.3A.

5.2DA.3 Test purpose

To verify that the UE relative code domain power accuracy for DC-HSUPA meets the requirements given in table 5.2DA.7.

5.2DA.4 Method of test

5.2DA.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS (node B emulator) to the UE antenna connector as shown in figure A.41.
- 2) The UL Reference Measurement Channel and parameters are specified in Annex C.2.6 and C.11A. The DL Reference Measurement Channel (FRC H-SET 3A, QPSK) is specified in C.8.1.1.
- 3) An E-DCH call is set up according to TS 34.108 [3] 7.3.14. RF parameters are set up according to table E.5A.1A. Settings for the serving cell are defined in table 5.2DA.5.
- 4) Enter the UE into loopback test mode 1 looping back HSDPA to E-DCH, and start the loopback test.

See TS 34.109 [4] clauses 5.3.2.3 and 5.3.2.6 for details regarding loopback test mode for HSDPA and E-DCH.

| Cell type | | Serving cell |
| UTRA RF Channel Number | | As defined in clause 5.2BA.4.1 |
| Qqualmin | dB | -24 |
| Qrxlevmin | dBm | -115 |
| UE_TXPWR_MAX_RACH | dBm | +21 |
| \hat{I}_{or} (see notes 1 and 2) | dBm/3.84 MHz | -86 |
| NOTE 1: The power level is specified in terms of \hat{I}_{or} instead of CPICH_RSCP because RSCP is a receiver measurement, whereas the SS can only set \hat{I}_{or} . | | |
| NOTE 2: The cell fulfils TS 25.304, 5.2.3.1.2. | | |

5.2DA.4.2 Procedure

- 1) Set the Absolute Grant according to Table C.11A.1.3.
- 2) The SS starts transmitting HSDPA and the UE loops the received data back on E-DCH.
- 3) Generate suitable TPC commands to each individual carrier from the SS to set the total power in each of the assigned carriers to be equal to each other within ± 1.7 dB and the total output power of the UE to be in the range $15\text{dBm} \pm 2\text{dB}$.
- 4) Confirm that the E-TFCI transmitted by the UE is equal to the target E-TFCI in Table C.11A.1.1. If the E-TFCI transmitted by the UE is not equal to the target E-TFCI, then fail the UE.
- 5) Send alternating "0" and "1" TPC commands in the downlink so as to satisfy the condition of obtaining $\text{TPC_cmd} = 0$. This test step is expected to keep the total power in each of the assigned carriers to be equal to

each other within ± 1.7 dB and the total output power of the UE to be in the range $15\text{dBm} \pm 2\text{dB}$ during the relative code domain power measurements performed at next step.

- 6) Measure the relative code domain power of each active code on each uplink frequency. Each measurement is made over one timeslot. The nominal UE relative code domain power for each active code is defined in table 5.2DA.6. The required accuracy which is the difference between the expected and measured code domain power shall meet the test requirements given in table 5.2DA.7.

5.2DA.5 Test requirements

For all UE relative code domain power nominal ratios given in table 5.2DA.6 the UE shall meet the UE relative code domain power accuracy test requirements given in Table 5.2DA.7.

Table 5.2DA.6: UE relative code domain power nominal ratios

| Sub-Test in Table C.11A.1.3 | Expected Relative Code Domain Power in dB | | | | | | |
|-----------------------------------|---|----------|---------|---------|----------------------------|---------|---------|
| | Primary Uplink Frequency | | | | Secondary Uplink Frequency | | |
| | DPCCH | HS-DPCCH | E-DPCCH | E-DPDCH | DPCCH | E-DPCCH | E-DPDCH |
| 1 | -5.8 | -15.3 | -15.3 | -1.7 | -5.6 | -15.2 | -1.6 |

Table 5.2DA.7: UE relative code domain power accuracy test requirements

| Nominal CDP ratio | Accuracy (dB) |
|-------------------------|---------------|
| ≥ -10 dB | ± 1.7 |
| -10 dB to ≥ -15 dB | ± 2.3 |
| -15 dB to ≥ -20 dB | ± 2.9 |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.2DB UE Relative Code Domain Power Accuracy for HS-DPCCH and E-DCH for OLTD

FFS

5.2DC UE Relative Code Domain Power Accuracy for HS-DPCCH and E-DCH for UL CLTD activation state 1

Editor's note: This clause is incomplete. The following aspects are either missing or not yet determined:

- Message Contents are FFS.
- Call Setup procedure, test procedure, test tolerances may need an update.
- Update of Annexure is FFS
- Update to 34.121-2 is FFS

5.2DC.1 Definition and applicability

The UE Relative code domain power accuracy is a measure of the ability of the UE to correctly set the level of individual code powers relative to the total power of all active codes. The measure of accuracy is the difference between two dB ratios:

$$\text{UE Relative CDP accuracy} = (\text{Measured CDP ratio}) - (\text{Nominal CDP ratio})$$

where:

$$\text{Measured CDP ratio} = 10 \cdot \log\left(\frac{\text{Measured code power}}{\text{Measured total power of all active codes}}\right)$$

$$\text{Nominal CDP ratio} = 10 \cdot \log((\text{Nominal CDP}) / (\text{Sum of all nominal CDPs}))$$

The nominal CDP of a code is relative to the total of all codes and is derived from beta factors.

When the UE uses 16QAM modulation a correction factor shall be applied to the β_{ed} value used to compute the Nominal CDP equal to $\{A_1 \cdot (0.4472)^2 + A_2 \cdot (1.3416)^2 + A_3 \cdot (-0.4472)^2 + A_4 \cdot (-1.3416)^2\}^{1/2}$ where A_1 , A_2 , A_3 and A_4 are the fractions of symbols (00, 01, 10, 11 respectively) transmitted during the test.

The sum of all nominal CDPs will equal 1 by definition.

NOTE: The above definition of UE relative CDP accuracy is independent of variations in the actual total power of the signal and of noise in the signal that falls on inactive codes.

The requirements and this test apply for Release 11 and later releases to all types of UTRA for the FDD UE that supports UL CLTD.

5.2DC.2 Minimum Requirements

The required accuracy of the UE relative CDP is given in table 5.2DC.1. The UE relative CDP accuracy shall be maintained over the period during which the total of all active code powers remains unchanged or one timeslot, whichever is the longer.

For UE with two active transmit antenna connectors in UL CLTD activation state 1, the relative code domain power accuracy specified in table 5.2CB.1 applies at each transmit antenna connector.

Table 5.2DC.1: UE Relative CDP accuracy

| Nominal CDP ratio | Accuracy (dB) |
|-------------------------|---------------|
| ≥ -10 dB | ± 1.5 |
| -10 dB to ≥ -15 dB | ± 2.0 |
| -15 dB to ≥ -20 dB | ± 2.5 |

The normative reference for this requirement is TS 25.101 [1] clause 6.2.3C.

5.2DC.3 Test purpose

To verify that the UE relative code domain power accuracy for UL CLTD activation state 1 meets the requirements given in table 5.2DC.8.

5.2DC.4 Method of test

5.2DC.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS (node B emulator) to the UE antenna connector as shown in figure FFS.
- 2) The UL Reference Measurement Channel and the Fixed Reference Channels (FRC H-Set 1, QPSK version) are specified in Annex FFS.
- 3) An E-DCH call is set up according to TS 34.108 [3] FFS with the following exceptions in the RADIO BEARER SETUP messages. These exceptions allow the beta values to be set according to table C.11.1.3 and each UL physical channel to be at constant power at the start of the measurement. RF parameters are set up according to table E.5A.1. Settings for the serving cell are defined in table 5.2DC.6.
- 4) SS sends a HS-SCCH order activating UL_CLTD activation state 1.
- 5) Enter the UE into loopback test mode 1 looping back both the 12.2kbps RMC and HSDPA to E-DCH, and start the loopback test.

See TS 34.109 [4] clauses 5.3.2.3 and 5.3.2.6 for details regarding loopback test mode for HSDPA and E-DCH.

| Qrxlevmin | dBm | -115 |
| UE_TXPWR_MAX_RACH | dBm | +21 |
| \hat{I}_{or} (see notes 1 and 2) | dBm/3.84 MHz | -86 |
| NOTE 1: The power level is specified in terms of \hat{I}_{or} instead of CPICH_RSCP because RSCP is a receiver measurement, whereas the SS can only set \hat{I}_{or} . | | |
| NOTE 2: The cell fulfils TS 25.304, clause 5.2.3.1.2. | | |

5.2DC.4.2 Procedure

- 1) Set the Absolute Grant according to Table C.11.1.3.
- 2) The SS starts transmitting HSDPA and the UE loops the received data back on E-DCH.
- 3) Generate suitable TPC commands from the SS to set the output power of the UE to be in the range 15 dBm \pm 2 dB.
- 4) Confirm that the E-TFCI transmitted by the UE is equal to the target E-TFCI in Table C.11.1.3. If the E-TFCI transmitted by the UE is not equal to the target E-TFCI, then fail the UE.
- 5) Send alternating "0" and "1" TPC commands in the downlink so as to satisfy the condition of obtaining TPC_cmd = 0.
- 6) Send Absolute Grants in a repeating pattern starting with the value according to Table C.11.1.3 and alternating between this value and an Absolute Grant Index of Zero_Grant. This will generate a repeating pattern on the E-DPDCH(s) with a level corresponding to the sending of Scheduling Information every other 10ms E-DCH TTI as shown in Figure 5.2DC.1.

Figure 5.2DC.1: Transmit power profile showing measurement points

- 7) Measure the relative code domain power of each active code at the measurement points specified in Figure 5.2DC.1 at each transmit antenna connector. Each measurement is made over one timeslot. Measurement point 1 is the last timeslot before TTI1. Measurement point 2 is the first timeslot of TTI1 and measurement point 3 is the first timeslot of TTI2. The 25 μ s transient periods at the ends of each measured timeslot shall not be included. The nominal UE relative code domain power for each active code at each point is defined in table 5.2DC.7. The required accuracy which is the difference between the expected and measured code domain power shall meet the test requirements given in table 5.2DC.8.
- 8) Repeat steps 1 through 7 for the other combinations of beta values for sub-tests 1, 2, 3, and 4 as given in Table C.11.1.3.

5.2DC.5 Test requirements

For all UE relative code domain power nominal ratios given in table 5.2DC.7 ≥ -20 dB the UE shall meet the UE relative code domain power accuracy test requirements given in Table 5.2DC.8.

For UE with two active transmit antenna connectors in UL CLTD activation state 1, the relative code domain power accuracy applies at each transmit antenna connector.

Table 5.2DC.7: UE relative code domain power nominal ratios

| Sub-Test in Table C.11.1.3 | Measurement Point | Expected Relative Code Domain Power in dB | | | | | |
|----------------------------|-------------------|---|-------|----------|---------|----------|----------|
| | | DPCCH | DPDCH | HS-DPCCH | E-DPCCH | E-DPDCH1 | E-DPDCH2 |

Table 5.2DC.8: UE relative code domain power accuracy test requirements

| Nominal CDP ratio | Accuracy (dB) |
|-------------------------|------------------|
| ≥ -10 dB | $\pm 1.5 \pm TT$ |
| -10 dB to ≥ -15 dB | $\pm 2.0 \pm TT$ |
| -15 dB to ≥ -20 dB | $\pm 2.5 \pm TT$ |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause FFS and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause FFS.

5.2DD UE Relative Code Domain Power Accuracy for HS-DPCCH and E-DCH for UL CLTD activation state 2 and 3

Editor's note: This clause is incomplete. The following aspects are either missing or not yet determined:

- Message Contents are FFS.
- Call Setup procedure, test procedure, test tolerances may need an update.
- Update of Annexure is FFS
- Update to 34.121-2 is FFS

5.2DD.1 Definition and applicability

The UE Relative code domain power accuracy is a measure of the ability of the UE to correctly set the level of individual code powers relative to the total power of all active codes. The measure of accuracy is the difference between two dB ratios:

$$\text{UE Relative CDP accuracy} = (\text{Measured CDP ratio}) - (\text{Nominal CDP ratio})$$

where:

$$\text{Measured CDP ratio} = 10 \cdot \log\left(\frac{\text{Measured code power}}{\text{Measured total power of all active codes}}\right)$$

$$\text{Nominal CDP ratio} = 10 \cdot \log((\text{Nominal CDP}) / (\text{Sum of all nominal CDPs}))$$

The nominal CDP of a code is relative to the total of all codes and is derived from beta factors.

When the UE uses 16QAM modulation a correction factor shall be applied to the β_{ed} value used to compute the Nominal CDP equal to $\{A_1 \cdot (0.4472)^2 + A_2 \cdot (1.3416)^2 + A_3 \cdot (-0.4472)^2 + A_4 \cdot (-1.3416)^2\}^{1/2}$ where A_1 , A_2 , A_3 and A_4 are the fractions of symbols (00, 01, 10, 11 respectively) transmitted during the test.

The sum of all nominal CDPs will equal 1 by definition.

NOTE: The above definition of UE relative CDP accuracy is independent of variations in the actual total power of the signal and of noise in the signal that falls on inactive codes.

The requirements and this test apply for Release 11 and later releases to all types of UTRA for the FDD UE that supports UL CLTD.

5.2DD.2 Minimum Requirements

The required accuracy of the UE relative CDP is given in table 5.2DD.1. The UE relative CDP accuracy shall be maintained over the period during which the total of all active code powers remains unchanged or one timeslot, whichever is the longer.

For UE configured in UL CLTD activation state 2 or activation state 3, the relative code domain power accuracy specified in table 5.2CC.1 applies at the active transmit antenna connector.

Table 5.2D.1: UE Relative CDP accuracy

| Nominal CDP ratio | Accuracy (dB) |
|-------------------------|---------------|
| ≥ -10 dB | ± 1.5 |
| -10 dB to ≥ -15 dB | ± 2.0 |
| -15 dB to ≥ -20 dB | ± 2.5 |

The normative reference for this requirement is TS 25.101 [1] clause 6.2.3C.

5.2DD.3 Test purpose

To verify that the UE relative code domain power accuracy for UL CLTD activation state 2 and 3 meets the requirements given in table 5.2DD.8.

5.2DD.4 Method of test

5.2DD.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS (node B emulator) to the UE antenna connector as shown in figure FFS.
- 2) The UL Reference Measurement Channel and the Fixed Reference Channels (FRC H-Set 1, QPSK version) are specified in Annex FFS.
- 3) An E-DCH call is set up according to TS 34.108 [3] FFS with the following exceptions in the RADIO BEARER SETUP messages. These exceptions allow the beta values to be set according to table C.11.1.3 and each UL physical channel to be at constant power at the start of the measurement. RF parameters are set up according to table E.5A.1. Settings for the serving cell are defined in table 5.2DD.6.
- 4) SS sends a HS-SCCH order activating UL_CLTD activation state 2
- 5) Enter the UE into loopback test mode 1 looping back both the 12.2kbps RMC and HSDPA to E-DCH, and start the loopback test.

See TS 34.109 [4] clauses 5.3.2.3 and 5.3.2.6 for details regarding loopback test mode for HSDPA and E-DCH.

| NOTE 2: The cell fulfils TS 25.304, clause 5.2.3.1.2. | | |

5.2DD.4.2 Procedure

- 1) Set the Absolute Grant according to Table C.11.1.3.
- 2) The SS starts transmitting HSDPA and the UE loops the received data back on E-DCH.
- 3) Generate suitable TPC commands from the SS to set the output power of the UE to be in the range 15 dBm \pm 2 dB.
- 4) Confirm that the E-TFCI transmitted by the UE is equal to the target E-TFCI in Table C.11.1.3. If the E-TFCI transmitted by the UE is not equal to the target E-TFCI, then fail the UE.
- 5) Send alternating "0" and "1" TPC commands in the downlink so as to satisfy the condition of obtaining TPC_cmd = 0.
- 6) Send Absolute Grants in a repeating pattern starting with the value according to Table C.11.1.3 and alternating between this value and an Absolute Grant Index of Zero_Grant. This will generate a repeating pattern on the E-DPDCH(s) with a level corresponding to the sending of Scheduling Information every other 10ms E-DCH TTI as shown in Figure 5.2DD.1.

**Figure 5.2DD.1: Transmit power profile showing measurement points**

- 7) Measure the relative code domain power of each active code at the measurement points specified in Figure 5.2DD.1 at the active transmit antenna connector. Each measurement is made over one timeslot. Measurement point 1 is the last timeslot before TTI1. Measurement point 2 is the first timeslot of TTI1 and measurement point 3 is the first timeslot of TTI2. The 25 μ s transient periods at the ends of each measured timeslot shall not be included. The nominal UE relative code domain power for each active code at each point is defined in table 5.2DD.7. The required accuracy which is the difference between the expected and measured code domain power shall meet the test requirements given in table 5.2DD.8.
- 8) Repeat steps 1 through 7 for the other combinations of beta values for sub-tests 1, 2, 3, and 4 as given in Table C.11.1.3.
- 9) SS sends a HS-SCCH order activating UL_CLTD activation state 3

10) Repeat step 1 to 8 for activation state 3.

5.2DD.5 Test requirements

For all UE relative code domain power nominal ratios given in table 5.2DD.7 ≥ -20 dB the UE shall meet the UE relative code domain power accuracy test requirements given in Table 5.2DD.8.

For UE configured in UL CLTD activation state 2 or activation state 3, the relative code domain power accuracy applies at the active transmit antenna connector.

Table 5.2DD.7: UE relative code domain power nominal ratios

| Sub-Test in Table C.11.1.3 | Measurement Point | Expected Relative Code Domain Power in dB | | | | | |
|----------------------------|-------------------|---|-------|----------|---------|----------|----------|
| | | DPCCH | DPDCH | HS-DPCCH | E-DPCCH | E-DPDCH1 | E-DPDCH2 |
| 1 | 1 | -9.3 | -6.6 | -3.3 | -7.3 | -18.9 | OFF |

Table 5.2DD.8: UE relative code domain power accuracy test requirements

| Nominal CDP ratio | Accuracy (dB) |
|-------------------------|------------------|
| ≥ -10 dB | $\pm 1.5 \pm TT$ |
| -10 dB to ≥ -15 dB | $\pm 2.0 \pm TT$ |
| -15 dB to ≥ -20 dB | $\pm 2.5 \pm TT$ |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause FFS and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause FFS.

5.2E UE Relative Code Domain Power Accuracy for HS-DPCCH and E-DCH with 16QAM

5.2E.1 Definition and applicability

The UE Relative code domain power accuracy is a measure of the ability of the UE to correctly set the level of individual code powers relative to the total power of all active codes. When the UE uses 16QAM modulation on any of the uplink code channels the IQ origin offset power shall be removed from the Measured CDP ratio; however, the removed relative IQ origin offset power (relative carrier leakage power) also has to satisfy the applicable requirement. The measure of accuracy is the difference between two dB ratios:

$$\text{UE Relative CDP accuracy} = (\text{Measured CDP ratio}) - (\text{Nominal CDP ratio})$$

where

$$\text{Measured CDP ratio} = 10 \cdot \log((\text{Measured code power}) / (\text{Measured total power of all active codes}))$$

$$\text{Nominal CDP ratio} = 10 \cdot \log((\text{Nominal CDP}) / (\text{Sum of all nominal CDPs}))$$

The nominal CDP of a code is relative to the total of all codes and is derived from beta factors.

When the UE uses 16QAM modulation a correction factor shall be applied to the β_{ed} value used to compute the Nominal CDP equal to $\{A_1*(0.4472)^2 + A_2*(1.3416)^2 + A_3*(-0.4472)^2 + A_4*(-1.3416)^2\}^{1/2}$ where A_1 , A_2 , A_3 and A_4 are the fractions of symbols (00, 01, 10, 11 respectively) transmitted during the test.

The sum of all nominal CDPs will equal 1 by definition.

NOTE: The above definition of UE relative CDP accuracy is independent of variations in the actual total power of the signal and of noise in the signal that falls on inactive codes.

The requirements apply for Release 7 and later releases for all types of UTRA for the FDD UE that support E-DCH 16QAM UE capability category 7. This test applies only to UE that support HSDPA and E-DCH.

5.2E.2 Minimum Requirements

The required accuracy of the UE relative CDP is given in table 5.2E.1. The UE relative CDP accuracy shall be maintained over the period during which the total of all active code powers remains unchanged or one timeslot, whichever is the longer.

Table 5.2E.1: UE Relative CDP accuracy, HS-DPCCH and E-DCH with 16QAM

| Nominal CDP ratio | Accuracy (dB) |
|-------------------------|---------------|
| ≥ -10 dB | ± 1.5 |
| -10 dB to ≥ -15 dB | ± 2.0 |
| -15 dB to ≥ -20 dB | ± 2.5 |
| -20 dB to ≥ -30 dB | ± 3.0 |

The normative reference for this requirement is TS 25.101 [1] clause 6.2.3.

5.2E.3 Test purpose

To verify that the UE relative code domain power accuracy meets the requirements given in table 5.2E.6.

5.2E.4 Method of test

5.2E.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS (node B emulator) to the UE antenna connector as shown in figure A.1.
- 2) The UL Reference Measurement Channel and the DL Fixed Reference Channels (FRC H-Set 1,16QAM) are specified in Annex C.11.1 and C.8.1.1. The payload of the transport block for the DL Fixed Reference Channels shall be PRBS data.
- 3) An E-DCH call is set up according to TS 34.108 [3] 7.3.9 with the following exceptions in the RADIO BEARER SETUP messages. These exceptions allow the beta values to be set according to table C.11.1.4 and each UL physical channel to be at constant power at the start of the measurement. RF parameters are set up according to table E.5A.1. Settings for the serving cell are defined in table 5.2E.4. Uplink SRB for DCCH mapped on E-DCH and downlink SRB for DCCH on DCH. E-DCH is configured with 2ms TTI.
- 4) Enter the UE into loopback test mode 1 looping back HSDPA to E-DCH, and start the loopback test.

See TS 34.109 [4] clauses 5.3.2.3 and 5.3.2.6 for details regarding loopback test mode for HSDPA and E-DCH.

| NOTE 1: The power level is specified in terms of \hat{I}_{or} instead of CPICH_RSCP because RSCP is a receiver measurement, whereas the SS can only set \hat{I}_{or} . | | |
| NOTE 2: The cell fulfils TS 25.304, clause 5.2.3.1.2. | | |

5.2E.4.2 Procedure

- 1) Set the Absolute Grant according to Table C.11.1.4.
- 2) The SS starts transmitting HSDPA and the UE loops the received data back on E-DCH.
- 3) Generate suitable TPC commands from the SS to set the output power of the UE to be in the range 15 dBm \pm 2 dB.

- 4) Confirm that the E-TFCI transmitted by the UE is equal to the target E-TFCI in Table C.11.1.4. If the E-TFCI transmitted by the UE is not equal to the target E-TFCI, then fail the UE.
- 5) Send alternating "0" and "1" TPC commands in the downlink so as to satisfy the condition of obtaining $TPC_cmd = 0$.
- 6) Send Absolute Grants in a repeating pattern starting with the value according to Table C.11.1.4 and alternating between this value and an Absolute Grant Index of Zero_Grant. This will generate a repeating pattern on the E-DPDCH(s) with a level corresponding to the sending of Scheduling Information every other 2ms E-DCH TTI as shown in Figure 5.2E.1.

Figure 5.2E.1: Transmit power profile showing measurement points

- 7) Measure the relative code domain power of each active code at the measurement points specified in Figure 5.2E.1. Each measurement is made over one timeslot. Measurement point 1 is the last timeslot before TTI1. Measurement point 2 is the first timeslot of TTI1 and measurement point 3 is the first timeslot of TTI2. The 25 us transient periods at the ends of each measured timeslot shall not be included. The nominal UE relative code domain power for each active code at each point is defined in table 5.2E.5. The required accuracy which is the difference between the expected and measured code domain power shall meet the test requirements given in table 5.2E.6.

5.2E.5 Test requirements

For all UE relative code domain power nominal ratios given in table 5.2E.5 ≥ -30 dB the UE shall meet the UE relative code domain power accuracy test requirements given in Table 5.2E.6.

Table 5.2E.5: UE relative code domain power nominal ratios

| Sub-Test in Table C.11.1.4 | Meas Point | Expected Relative Code Domain Power in dB | | | | | |
|----------------------------|------------|---|----------|---------|-----------|-----------|-------------|
| | | DPCCH | HS-DPCCH | E-DPCCH | E-DPDCH 1 | E-DPDCH 2 | E-DPDCH 3,4 |
| 1 | 1 | -9.6 | -3.6 | -3.6 | -19.1 | OFF | OFF |
| | 2 | -13.4 | -7.4 | -7.4 | -7.4 | -7.4 | -9.4 |
| | 3 | -9.6 | -3.6 | -3.6 | -19.1 | OFF | OFF |

Table 5.2E.6: UE relative code domain power accuracy test requirements, HSDPA and E-DCH with 16QAM

| Nominal CDP ratio | Accuracy (dB) |
|-------------------------|---------------|
| ≥ -10 dB | ± 1.7 |
| -10 dB to ≥ -15 dB | ± 2.3 |
| -15 dB to ≥ -20 dB | ± 2.9 |
| -20 dB to ≥ -30 dB | $[\pm 3.5]$ |

NOTE 1: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

NOTE 2: For the measurement points in which UE uses 16QAM modulation the correction factor in the measurements shall be applied to the β_{ed} value used to compute the Nominal CDP equal to $\{A_1*(0.4472)^2 + A_2*(1.3416)^2 + A_3*(-0.4472)^2 + A_4*(-1.3416)^2\}^{1/2}$ where A_1, A_2, A_3 and A_4 are the fractions of symbols (00, 01, 10, 11 respectively) transmitted during the test.

5.2EA UE Relative Code Domain Power Accuracy for DC-HSUPA with 16QAM

5.2EA.1 Definition and applicability

The requirement and corresponding measurements apply to each individual carrier when the total power in each of the assigned carriers is equal to each other.

The UE Relative code domain power accuracy is a measure of the ability of the UE to correctly set the level of individual code powers in a carrier relative to the total power of all active codes in that carrier. When the UE uses 16QAM modulation on any of the uplink code channels in a carrier the IQ origin offset power measured in that carrier shall be removed from the Measured CDP ratio in that carrier; however, the removed relative IQ origin offset power (relative carrier leakage power) measured in that carrier also has to satisfy the applicable requirement in that carrier. The measure of accuracy is the difference between two dB ratios measured per carrier configured on the uplink:

$$\text{UE Relative CDP accuracy} = (\text{Measured CDP ratio}) - (\text{Nominal CDP ratio})$$

where

$$\text{Measured CDP ratio} = 10 \cdot \log((\text{Measured code power}) / (\text{Measured total power of all active codes}))$$

$$\text{Nominal CDP ratio} = 10 \cdot \log((\text{Nominal CDP}) / (\text{Sum of all nominal CDPs}))$$

The nominal CDP of a code is relative to the total of all codes in each carrier and is derived from beta factors. The sum of all nominal CDPs will equal 1 by definition.

NOTE: The above definition of UE relative CDP accuracy is independent of variations in the actual total power of the signal in each carrier and of noise in the signal that falls on inactive codes.

The reference measurement channels for the requirements in this subclause are provided in subclause C.2.7 with additional parameters as specified in Table C.11A.1.2.

The requirements and this test apply for Release 9 and later releases to all types of UTRA for the FDD UE that support Dual Cell E-DCH 16QAM UE capability category 9.

5.2EA.2 Minimum Requirements

The required accuracy of the UE relative CDP is given in table 5.2EA.1. The UE relative CDP accuracy shall be maintained over the period during which the total of all active code powers remains unchanged or one timeslot, whichever is the longer.

Table 5.2EA.1: UE Relative CDP accuracy, HS-DPCCH and E-DCH with 16QAM

| Nominal CDP ratio | Accuracy (dB) |
|-------------------------|---------------|
| ≥ -10 dB | ± 1.5 |
| -10 dB to ≥ -15 dB | ± 2.0 |
| -15 dB to ≥ -20 dB | ± 2.5 |
| -20 dB to ≥ -30 dB | ± 3.0 |

The normative reference for this requirement is TS 25.101 [1] clause 6.2.3A.

5.2EA.3 Test purpose

To verify that the UE relative code domain power accuracy meets the requirements given in table 5.2EA.4.

5.2EA.4 Method of test

5.2EA.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS (node B emulator) to the UE antenna connector as shown in figure A.41.
- 2) The UL Reference Measurement Channel and parameters are specified in Annex C.2.7 and C.11A. The DL Reference Measurement Channel (FRC H-SET 3A, QPSK) is specified in C.8.1.1.
- 3) An E-DCH call is set up according to TS 34.108 [3] 7.3.14 with the exceptions in the RADIO BEARER SETUP message as specified in Table 5.2EA.2. RF parameters are set up according to table E.5A.1A. Settings for the serving cell are defined in table 5.2EA.3.
- 4) Enter the UE into loopback test mode 1 looping back HSDPA to E-DCH, and start the loopback test.

See TS 34.109 [4] clauses 5.3.2.3 and 5.3.2.6 for details regarding loopback test mode for HSDPA and E-DCH.

| Information Element | Value/Remark |
|---|--------------------------------|
| CHOICE channel requirement - Power Control Algorithm | Uplink DPCH info Algorithm2 |

Table 5.2EA.3: Settings for the serving cell during the measurement of UE Relative Code Domain Power Accuracy for DC-HSUPA with 16QAM

| Parameter | Unit | Cell 1 |
|--|--------------|--------------------------------|
| Cell type | | Serving cell |
| UTRA RF Channel Number | | As defined in clause 5.2BA.4.1 |
| Qqualmin | dB | -24 |
| Qrxlevmin | dBm | -115 |
| UE_TXPWR_MAX_RACH | dBm | +21 |
| \hat{I}_{or} (see notes 1 and 2) | dBm/3.84 MHz | -86 |
| NOTE 1: The power level is specified in terms of \hat{I}_{or} instead of CPICH_RSCP because RSCP is a receiver measurement, whereas the SS can only set \hat{I}_{or} . | | |
| NOTE 2: The cell fulfils TS 25.304, 5.2.3.1.2. | | |

5.2EA.4.2 Procedure

- 1) Set the Absolute Grant according to Table C.11A.1.2.
- 2) The SS starts transmitting HSDPA and the UE loops the received data back on E-DCH.
- 3) Generate suitable TPC commands to each individual carrier from the SS to set the total power in each of the assigned carriers to be equal to each other within ± 1.7 dB and the total output power of the UE to be in the range $15\text{dBm} \pm 2\text{dB}$.
- 4) Confirm that the E-TFCI transmitted by the UE is equal to the target E-TFCI in Table C.11A.1.2. If the E-TFCI transmitted by the UE is not equal to the target E-TFCI, then fail the UE.
- 5) Send alternating "0" and "1" TPC commands in the downlink so as to satisfy the condition of obtaining $\text{TPC_cmd} = 0$. This test step is expected to keep the total power in each of the assigned carriers to be equal to each other within ± 1.7 dB and the total output power of the UE to be in the range $15\text{dBm} \pm 2\text{dB}$ during the relative code domain power measurements performed at next step.
- 6) Measure the relative code domain power of each active code on each uplink frequency. Each measurement is made over one timeslot.

5.2EA.5 Test requirements

For all UE relative code domain power nominal ratios given in table 5.2EA.4 the UE shall meet the UE relative code domain power accuracy test requirements given in Table 5.2EA.5.

Table 5.2EA.4: UE relative code domain power nominal ratios

| Expected Relative Code Domain Power in dB | | | | | | | | |
|---|----------|---------|-------------------------------|-------------------------------|----------------------------|---------|-------------------------------|-------------------------------|
| Primary Uplink Frequency | | | | | Secondary Uplink Frequency | | | |
| DPCCH | HS-DPCCH | E-DPCCH | E-DPDCH codes 1 and 2 (2xSF2) | E-DPDCH codes 3 and 4 (2xSF4) | DPCCH | E-DPCCH | E-DPDCH codes 1 and 2 (2xSF2) | E-DPDCH codes 3 and 4 (2xSF4) |
| -24.0 | -21.9 | -15.9 | -4.9 | -7.9 | -23.9 | -15.9 | -4.9 | -7.9 |

Table 5.2EA.5: UE relative code domain power accuracy test requirements, HSDPA and E-DCH with 16QAM

| Nominal CDP ratio | Accuracy (dB) |
|--------------------|---------------|
| ≥ -10 dB | ±1.7 |
| -10 dB to ≥ -15 dB | ±2.3 |
| -15 dB to ≥ -20 dB | ±2.9 |
| -20 dB to ≥ -30 dB | ±3.5 |

NOTE 1: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

NOTE 2: For the measurement points in which UE uses 16QAM modulation the correction factor in the measurements shall be applied to the β_{cd} value used to compute the Nominal CDP equal to $\{A_1*(0.4472)^2 + A_2*(1.3416)^2 + A_3*(-0.4472)^2 + A_4*(-1.3416)^2\}^{1/2}$ where A_1, A_2, A_3 and A_4 are the fractions of symbols (00, 01, 10, 11 respectively) transmitted during the test.

5.2EB FFS

5.2EC UE Relative Code Domain Power Accuracy for HS-DPCCH and E-DCH with 16QAM for UL CLTD activation state 1

Editor's note: This clause is incomplete. The following aspects are either missing or not yet determined:

- Message contents are FFS
- Test procedure, test tolerances may need an update.
- Update of Annexure is FFS
- Code domain power calculation is FFS.

5.2EC.1 Definition and applicability

The UE Relative code domain power accuracy is a measure of the ability of the UE to correctly set the level of individual code powers relative to the total power of all active codes. When the UE uses 16QAM modulation on any of the uplink code channels the IQ origin offset power shall be removed from the Measured CDP ratio; however, the removed relative IQ origin offset power (relative carrier leakage power) also has to satisfy the applicable requirement. The measure of accuracy is the difference between two dB ratios:

$$\text{UE Relative CDP accuracy} = (\text{Measured CDP ratio}) - (\text{Nominal CDP ratio})$$

where

$$\text{Measured CDP ratio} = 10 \cdot \log((\text{Measured code power}) / (\text{Measured total power of all active codes}))$$

$$\text{Nominal CDP ratio} = 10 \cdot \log((\text{Nominal CDP}) / (\text{Sum of all nominal CDPs}))$$

The nominal CDP of a code is relative to the total of all codes and is derived from beta factors.

When the UE uses 16QAM modulation a correction factor shall be applied to the β_{ed} value used to compute the Nominal CDP equal to $\{A_1 \cdot (0.4472)^2 + A_2 \cdot (1.3416)^2 + A_3 \cdot (-0.4472)^2 + A_4 \cdot (-1.3416)^2\}^{1/2}$ where A_1 , A_2 , A_3 and A_4 are the fractions of symbols (00, 01, 10, 11 respectively) transmitted during the test.

The sum of all nominal CDPs will equal 1 by definition.

NOTE: The above definition of UE relative CDP accuracy is independent of variations in the actual total power of the signal and of noise in the signal that falls on inactive codes.

The requirements apply for Release 11 and later releases for all types of UTRA for the FDD UE that support E-DCH 16QAM UE capability category 7 and UL CLTD.

5.2EC.2 Minimum Requirements

The required accuracy of the UE relative CDP is given in table 5.2EC.1. The UE relative CDP accuracy shall be maintained over the period during which the total of all active code powers remains unchanged or one timeslot, whichever is the longer.

For UE with two active transmit antenna connectors in UL CLTD activation state 1, the relative code domain power accuracy specified in table 5.2CB.1 applies at each transmit antenna connector.

Table 5.2EC.1: UE Relative CDP accuracy, HS-DPCCH and E-DCH with 16QAM

| Nominal CDP ratio | Accuracy (dB) |
|-------------------------|---------------|
| ≥ -10 dB | ± 1.5 |
| -10 dB to ≥ -15 dB | ± 2.0 |
| -15 dB to ≥ -20 dB | ± 2.5 |
| -20 dB to ≥ -30 dB | ± 3.0 |

The normative reference for this requirement is TS 25.101 [1] clause 6.2.3C.

5.2EC.3 Test purpose

To verify that the UE relative code domain power accuracy for UL CLTD activation state 1 meets the requirements given in table 5.2EC.6.

5.2EC.4 Method of test

5.2EC.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS (node B emulator) to the UE antenna connector as shown in figure FFS.
- 2) The UL Reference Measurement Channel and the DL Fixed Reference Channels (FRC H-Set 1, 16QAM) are specified in Annex FFS. The payload of the transport block for the DL Fixed Reference Channels shall be PRBS data.
- 3) An E-DCH call is set up according to TS 34.108 [3] 7.3.17 with the following exceptions in the RADIO BEARER SETUP messages. These exceptions allow the beta values to be set according to table FFS and each UL physical channel to be at constant power at the start of the measurement. RF parameters are set up according to FFS. Settings for the serving cell are defined in table 5.2E.4. Uplink SRB for DCCH mapped on E-DCH and downlink SRB for DCCH on DCH. E-DCH is configured with 2ms TTI.
- 4) SS sends a HS-SCCH order activating UL_CLTD activation state 1.
- 5) Enter the UE into loopback test mode 1 looping back HSDPA to E-DCH, and start the loopback test.

See TS 34.109 [4] clauses 5.3.2.3 and 5.3.2.6 for details regarding loopback test mode for HSDPA and E-DCH.

| NOTE 2: The cell fulfils TS 25.304, clause 5.2.3.1.2. | | |

5.2EC.4.2 Procedure

- 1) Set the Absolute Grant according to Table C.11.1.4.
- 2) The SS starts transmitting HSDPA and the UE loops the received data back on E-DCH.

- 3) Generate suitable TPC commands from the SS to set the output power of the UE to be in the range 15 dBm \pm 2 dB.
- 4) Confirm that the E-TFCI transmitted by the UE is equal to the target E-TFCI in Table C.11.1.4. If the E-TFCI transmitted by the UE is not equal to the target E-TFCI, then fail the UE.
- 5) Send alternating "0" and "1" TPC commands in the downlink so as to satisfy the condition of obtaining TPC_cmd = 0.
- 6) Send Absolute Grants in a repeating pattern starting with the value according to Table C.11.1.4 and alternating between this value and an Absolute Grant Index of Zero_Grant. This will generate a repeating pattern on the E-DPDCH(s) with a level corresponding to the sending of Scheduling Information every other 2ms E-DCH TTI as shown in Figure 5.2EC.1.

Figure 5.2EC.1: Transmit power profile showing measurement points

- 7) Measure the relative code domain power of each active code at the measurement points specified in Figure 5.2EC.1 at each transmit antenna connector. Each measurement is made over one timeslot. Measurement point 1 is the last timeslot before TTI1. Measurement point 2 is the first timeslot of TTI1 and measurement point 3 is the first timeslot of TTI2. The 25 μ s transient periods at the ends of each measured timeslot shall not be included. The nominal UE relative code domain power for each active code at each point is defined in table 5.2EC.5. The required accuracy which is the difference between the expected and measured code domain power shall meet the test requirements given in table 5.2EC.6.

5.2EC.5 Test requirements

For all UE relative code domain power nominal ratios given in table 5.2EC.5 \geq -30 dB the UE shall meet the UE relative code domain power accuracy test requirements given in Table 5.2EC.6.

For UE with two active transmit antenna connectors in UL CLTD activation state 1, the relative code domain power accuracy applies at each transmit antenna connector.

Table 5.2EC.5: UE relative code domain power nominal ratios

FFS

Table 5.2EC.6: UE relative code domain power accuracy test requirements, HSDPA and E-DCH with 16QAM

FFS

NOTE 1: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause FFS and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause FFS.

NOTE 2: For the measurement points in which UE uses 16QAM modulation the correction factor in the measurements shall be applied to the β_{ed} value used to compute the Nominal CDP equal to $\{A_1*(0.4472)^2 + A_2*(1.3416)^2 + A_3*(-0.4472)^2 + A_4*(-1.3416)^2\}^{1/2}$ where A_1 , A_2 , A_3 and A_4 are the fractions of symbols (00, 01, 10, 11 respectively) transmitted during the test.

5.2ED UE Relative Code Domain Power Accuracy for HS-DPCCH and E-DCH with 16QAM for UL CLTD activation state 2 and 3

Editor's note: This clause is incomplete. The following aspects are either missing or not yet determined:

- Message contents are FFS
- Call Setup procedure, test procedure, test tolerances may need an update.
- Update of Annexure is FFS
- Code domain power calculation is FFS.

5.2ED.1 Definition and applicability

The UE Relative code domain power accuracy is a measure of the ability of the UE to correctly set the level of individual code powers relative to the total power of all active codes. When the UE uses 16QAM modulation on any of the uplink code channels the IQ origin offset power shall be removed from the Measured CDP ratio; however, the removed relative IQ origin offset power (relative carrier leakage power) also has to satisfy the applicable requirement. The measure of accuracy is the difference between two dB ratios:

$$\text{UE Relative CDP accuracy} = (\text{Measured CDP ratio}) - (\text{Nominal CDP ratio})$$

where

$$\text{Measured CDP ratio} = 10 \cdot \log((\text{Measured code power}) / (\text{Measured total power of all active codes}))$$

$$\text{Nominal CDP ratio} = 10 \cdot \log((\text{Nominal CDP}) / (\text{Sum of all nominal CDPs}))$$

The nominal CDP of a code is relative to the total of all codes and is derived from beta factors.

When the UE uses 16QAM modulation a correction factor shall be applied to the β_{ed} value used to compute the Nominal CDP equal to $\{A_1 \cdot (0.4472)^2 + A_2 \cdot (1.3416)^2 + A_3 \cdot (-0.4472)^2 + A_4 \cdot (-1.3416)^2\}^{1/2}$ where A_1 , A_2 , A_3 and A_4 are the fractions of symbols (00, 01, 10, 11 respectively) transmitted during the test.

The sum of all nominal CDPs will equal 1 by definition.

NOTE: The above definition of UE relative CDP accuracy is independent of variations in the actual total power of the signal and of noise in the signal that falls on inactive codes.

The requirements apply for Release 11 and later releases for all types of UTRA for the FDD UE that support E-DCH 16QAM UE capability category 7 and UL CLTD.

5.2ED.2 Minimum Requirements

The required accuracy of the UE relative CDP is given in table 5.2ED.1. The UE relative CDP accuracy shall be maintained over the period during which the total of all active code powers remains unchanged or one timeslot, whichever is the longer.

For UE configured in UL CLTD activation state 2 or activation state 3, the relative code domain power accuracy specified in table 5.2ED.1 applies at the active transmit antenna connector.

Table 5.2ED.1: UE Relative CDP accuracy, HS-DPCCH and E-DCH with 16QAM

| Nominal CDP ratio | Accuracy (dB) |
|-------------------------|---------------|
| ≥ -10 dB | ± 1.5 |
| -10 dB to ≥ -15 dB | ± 2.0 |
| -15 dB to ≥ -20 dB | ± 2.5 |
| -20 dB to ≥ -30 dB | ± 3.0 |

The normative reference for this requirement is TS 25.101 [1] clause 6.2.3C.

5.2ED.3 Test purpose

To verify that the UE relative code domain power accuracy for UL CLTD activation state 2 and 3 meets the requirements given in table 5.2ED.6.

5.2ED.4 Method of test

5.2ED.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS (node B emulator) to the UE antenna connector as shown in figure FFS.
- 2) The UL Reference Measurement Channel and the DL Fixed Reference Channels (FRC H-Set 1,16QAM) are specified in Annex FFS. The payload of the transport block for the DL Fixed Reference Channels shall be PRBS data.
- 3) An E-DCH call is set up according to TS 34.108 [3] 7.3.17 with the following exceptions in the RADIO BEARER SETUP messages. These exceptions allow the beta values to be set according to table FFS and each UL physical channel to be at constant power at the start of the measurement. RF parameters are set up according to table FFS. Settings for the serving cell are defined in table 5.2ED.4. Uplink SRB for DCCH mapped on E-DCH and downlink SRB for DCCH on DCH. E-DCH is configured with 2ms TTI.
- 4) SS sends a HS-SCCH order activating UL_CLTD activation state 2.
- 5) Enter the UE into loopback test mode 1 looping back HSDPA to E-DCH, and start the loopback test.

See TS 34.109 [4] clauses 5.3.2.3 and 5.3.2.6 for details regarding loopback test mode for HSDPA and E-DCH.

Table 5.2ED.4: Settings for the serving cell during the measurement of UE Relative Code Domain Power Accuracy with HS-DPCCH and E-DCH

| Parameter | Unit | Cell 1 |
|--|--------------|-------------------------------|
| Cell type | | Serving cell |
| UTRA RF Channel Number | | As defined in clause 5.2E.4.1 |
| Qqualmin | dB | -24 |
| Qrxlevmin | dBm | -115 |
| UE_TXPWR_MAX_RACH | dBm | +21 |
| \hat{I}_{or} (see notes 1 and 2) | dBm/3.84 MHz | -86 |
| NOTE 1: The power level is specified in terms of \hat{I}_{or} instead of CPICH_RSCP because RSCP is a receiver measurement, whereas the SS can only set \hat{I}_{or} . | | |
| NOTE 2: The cell fulfils TS 25.304, clause 5.2.3.1.2. | | |

5.2ED.4.2 Procedure

- 1) Set the Absolute Grant according to Table C.11.1.4.
- 2) The SS starts transmitting HSDPA and the UE loops the received data back on E-DCH.
- 3) Generate suitable TPC commands from the SS to set the output power of the UE to be in the range 15 dBm \pm 2 dB.
- 4) Confirm that the E-TFCI transmitted by the UE is equal to the target E-TFCI in Table C.11.1.4. If the E-TFCI transmitted by the UE is not equal to the target E-TFCI, then fail the UE.
- 5) Send alternating "0" and "1" TPC commands in the downlink so as to satisfy the condition of obtaining TPC_cmd = 0.
- 6) Send Absolute Grants in a repeating pattern starting with the value according to Table C.11.1.4 and alternating between this value and an Absolute Grant Index of Zero_Grant. This will generate a repeating pattern on the E-DPDCH(s) with a level corresponding to the sending of Scheduling Information every other 2ms E-DCH TTI as shown in Figure 5.2ED.1.

Figure 5.2ED.1: Transmit power profile showing measurement points

- 7) Measure the relative code domain power of each active code at the measurement points specified in Figure 5.2ED.1 at the active transmit antenna connector. Each measurement is made over one timeslot. Measurement point 1 is the last timeslot before TTI1. Measurement point 2 is the first timeslot of TTI1 and measurement point 3 is the first timeslot of TTI2. The 25 us transient periods at the ends of each measured timeslot shall not be included. The nominal UE relative code domain power for each active code at each point is defined in table 5.2ED.5. The required accuracy which is the difference between the expected and measured code domain power shall meet the test requirements given in table 5.2ED.6.
- 8) SS sends a HS-SCCH order activating UL_CLTD activation state 3
- 9) Repeat step 1 to 7 for activation state 3.

5.2ED.5 Test requirements

For all UE relative code domain power nominal ratios given in table 5.2ED.5 ≥ -30 dB the UE shall meet the UE relative code domain power accuracy test requirements given in Table 5.2ED.6.

For UE configured in UL CLTD activation state 2 or activation state 3, the relative code domain power accuracy applies at the active transmit antenna connector.

Table 5.2ED.5: UE relative code domain power nominal ratios

FFS

Table 5.2ED.6: UE relative code domain power accuracy test requirements, HSDPA and E-DCH with 16QAM

FFS

- NOTE 1: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause FFS and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause FFS.
- NOTE 2: For the measurement points in which UE uses 16QAM modulation the correction factor in the measurements shall be applied to the β_{ed} value used to compute the Nominal CDP equal to $\{A_1*(0.4472)^2 + A_2*(1.3416)^2 + A_3*(-0.4472)^2 + A_4*(-1.3416)^2\}^{1/2}$ where A_1, A_2, A_3 and A_4 are the fractions of symbols (00, 01, 10, 11 respectively) transmitted during the test.

5.3 Frequency Error

5.3.1 Definition and applicability

The frequency error is the difference between the RF modulated carrier frequency transmitted from the UE and the assigned frequency. The UE transmitter tracks to the RF carrier frequency received from the Node B. These signals will have an apparent error due to Node B frequency error and Doppler shift. In the later case, signals from the Node B must be averaged over sufficient time that errors due to noise or interference are allowed for within the minimum requirements specified in 5.3.2.

The UE shall use the same frequency source for both RF frequency generation and the chip clock.

The requirements and this test apply to all types of UTRA for the FDD UE.

5.3.2 Minimum Requirements

The UE modulated carrier frequency shall be accurate to within $\pm 0,1$ ppm observed over a period of one timeslot compared to the carrier frequency received from the Node B.

The normative reference for this requirement is TS 25.101 [1] clause 6.3.

5.3.3 Test purpose

To verify that the UE carrier frequency error does not exceed $\pm 0,1$ ppm. This requirement is tested with the UE receiver at the reference sensitivity.

An excess error of the carrier frequency increases the transmission errors in the up link own channel.

This test verifies the ability of the receiver to derive correct frequency information for the transmitter, when locked to the DL carrier frequency.

5.3.4 Method of test

5.3.4.1 Initial conditions

Test environment for UE without vibration sensitive components: normal, TL/VL, TL/VH, TH/VL, TH/VH; see clauses G.2.1 and G.2.2.

Test environment for other UE: normal, TL/VL, TL/VH, TH/VL, TH/VH, vibration; see clauses G.2.1, G.2.2 and G.2.3.

NOTE: "UE without vibration sensitive components" is declared in table A.12 of [32].

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.1.
- 2) A call is set up according to the Generic call setup procedure in TS34.108 [3] sub clause 7.3.2, and RF parameters (DPCH_Ec and $\hat{\sigma}$) are set up according to table 6.2.2. The relative power level of other downlink physical channels to the DPCH_Ec are set up according to clause E.3.2.
- 3) Enter the UE into loopback test mode and start the loopback test.

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

5.3.4.2 Procedure

- 1) Set and send continuously Up power control commands to the UE until the UE reaches its maximum output power.
- 2) Measure the frequency error Δf , using the Global In-Channel-Tx-test (annex B).

5.3.5 Test Requirements

For all measurements, the frequency error, derived in step 2), shall not exceed $\pm(0,1 \text{ ppm} + 10 \text{ Hz})$.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.3A Frequency Error for DC-HSUPA

5.3A.1 Definition and applicability

The frequency error for DC-HSUPA is the difference, for each carrier, between the RF modulated carrier frequency transmitted from the UE and the assigned frequency. The UE transmitter tracks to the RF carrier frequencies received from the Node B. These signals will have an apparent error due to Node B frequency error and Doppler shift. In the later case, signals from the Node B must be averaged over sufficient time that errors due to noise or interference are allowed for within the minimum requirements specified in clause 5.3A.2.

The UE shall use the same frequency source for both RF frequency generation and the chip clock.

The requirements and this test apply for Release 9 and later releases to all types of UTRA for the FDD UE that support HSDPA and Dual Cell E-DCH.

5.3A.2 Minimum Requirements

The UE modulated carrier frequency per carrier shall be accurate to within $\pm 0,1 \text{ ppm}$ observed over a period of one timeslot compared to the carrier frequencies received from the Node B. If the signal from one Node B cell is out-of-sync, the UE modulated carrier frequency shall be compared to the remaining carrier frequency received from the other Node B cell.

The normative reference for this requirement is TS 25.101 [1] clause 6.3A.

5.3A.3 Test purpose

To verify that the UE carrier frequency error, on each carrier, does not exceed $\pm 0,1 \text{ ppm}$. This requirement is tested with the UE receiver at the reference sensitivity.

An excess error of the carrier frequency increases the transmission errors in the up link own channel.

This test verifies the ability of the receiver to derive correct frequency information for the transmitter, when locked to the DL carrier frequencies.

5.3A.4 Method of test

5.3A.4.1 Initial conditions

Test environment for UE without vibration sensitive components: normal, TL/VL, TL/VH, TH/VL, TH/VH; see clauses G.2.1 and G.2.2.

Test environment for other UE: normal, TL/VL, TL/VH, TH/VL, TH/VH, vibration; see clauses G.2.1, G.2.2 and G.2.3.

NOTE: "UE without vibration sensitive components" is declared in table A.12 of [32].

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.41.
- 2) The UL Reference Measurement Channel and parameters are specified in Annex C.2.6 and C.11A. The DL Reference Measurement Channel (FRC H-SET 3A, QPSK) is specified in C.8.1.1.
- 3) A call is set up according to the Generic call setup procedure specified in TS34.108 [3] sub clause 7.3.14, and RF parameters (HS-PDSCH_Ec and \hat{I}_{or}) are set up according to table 6.2A.1. The other RF parameters are set up according to table E.5A.1A.

4) Enter the UE into loopback test mode and start the loopback test.

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

5.3A.4.2 Procedure

- 1) Set the UE to maximum output power according to 5.2BA.4.2 steps 1 to 4.
- 2) Measure the frequency error Δf on each of the two assigned channel frequencies, using the Global In-Channel-Tx-test (annex B).

5.3A.5 Test Requirements

For all measurements, the frequency error, derived in step 2), shall not exceed $\pm(0,1 \text{ ppm} + 10 \text{ Hz})$.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.3C Frequency Error for UL CLTD Activation state 1

Editor's note: This clause is incomplete. The following aspects are either missing or not yet determined:

- Message Contents are FFS.
- Call Setup procedure and test procedure may need an update.
- Update to 34.121-2 is FFS

5.3C.1 Definition and applicability

The frequency error for UL CLTD is the difference, between the RF modulated carrier frequency transmitted at each antenna connector from the UE and the assigned frequency. The UE transmitter tracks to the RF carrier frequency received from the Node B. These signals will have an apparent error due to Node B frequency error and Doppler shift. In the later case, signals from the Node B must be averaged over sufficient time that errors due to noise or interference are allowed for within the minimum requirements specified in 5.3C.2.

The UE shall use the same frequency source for both RF frequency generation and the chip clock.

The requirements and this test apply for Release 11 and later releases to all types of UTRA for the FDD UE that support UL CLTD.

5.3C.2 Minimum Requirements

The UE modulated carrier frequency at each antenna connector shall be accurate to within $\pm 0,1 \text{ ppm}$ observed over a period of one timeslot compared to the carrier frequency received from the Node B.

The normative reference for this requirement is TS 25.101 [1] clause 6.3C.

5.3C.3 Test purpose

To verify that the UE carrier frequency error at each antenna connector does not exceed $\pm 0,1 \text{ ppm}$. This requirement is tested with the UE receiver at the reference sensitivity.

An excess error of the carrier frequency increases the transmission errors in the up link own channel.

This test verifies the ability of the receiver to derive correct frequency information for the transmitter, when locked to the DL carrier frequency.

5.3C.4 Method of test

5.3C.4.1 Initial conditions

Test environment for UE without vibration sensitive components: normal, TL/VL, TL/VH, TH/VL, TH/VH; see clauses G.2.1 and G.2.2.

Test environment for other UE: normal, TL/VL, TL/VH, TH/VL, TH/VH, vibration; see clauses G.2.1, G.2.2 and G.2.3.

NOTE: "UE without vibration sensitive components" is declared in table A.12 of [32].

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure FFS.
- 2) The UL Reference Measurement Channel and parameters are specified in Annex TBD. The DL Fixed Reference Channels (FRC H-Set 1, QPSK) is specified in Annex C.8.1.1.
- 3) An HSDPA call with CLTD is set up according to TS 34.108 [3] 7.3.17. RF parameters are set up according to table TBD and table TBD.
- 4) SS sends a HS-SCCH order activating UL_CLTD activation state 1.
- 5) Enter the UE into loopback test mode 1 in the presence of HSDPA and start the loopback test.

See TS 34.108 [3] and TS 34.109 [4] for details regarding loopback test mode for HSDPA.

5.3C.4.2 Procedure

- 1) Set and send continuously Up power control commands to the UE until the UE reaches its maximum output power.
- 2) Measure the frequency error Δf at each antenna connector, using the Global In-Channel-Tx-test (annex B).

5.3C.5 Test Requirements

For all measurements, the frequency error at each antenna connector, derived in step 2), shall not exceed $\pm(0,1 \text{ ppm} + 10 \text{ Hz})$.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.3D Frequency Error for UL CLTD Activation state 2 and 3

Editor's note: This clause is incomplete. The following aspects are either missing or not yet determined:

- Message Contents are FFS.
- Call Setup procedure and test procedure may need an update.
- Update to 34.121-2 is FFS

5.3D.1 Definition and applicability

The frequency error for UL CLTD is the difference, between the RF modulated carrier frequency transmitted at each antenna connector from the UE and the assigned frequency. The UE transmitter tracks to the RF carrier frequency received from the Node B. These signals will have an apparent error due to Node B frequency error and Doppler shift. In the later case, signals from the Node B must be averaged over sufficient time that errors due to noise or interference are allowed for within the minimum requirements specified in 5.3D.2.

The UE shall use the same frequency source for both RF frequency generation and the chip clock.

The requirements and this test apply for Release 11 and later releases to all types of UTRA for the FDD UE that support UL CLTD.

5.3D.2 Minimum Requirements

The UE modulated carrier frequency at each antenna connector shall be accurate to within $\pm 0,1$ ppm observed over a period of one timeslot compared to the carrier frequency received from the Node B.

The normative reference for this requirement is TS 25.101 [1] clause 6.3C.

5.3D.3 Test purpose

To verify that the UE carrier frequency error at each antenna connector does not exceed $\pm 0,1$ ppm. This requirement is tested with the UE receiver at the reference sensitivity.

An excess error of the carrier frequency increases the transmission errors in the up link own channel.

This test verifies the ability of the receiver to derive correct frequency information for the transmitter, when locked to the DL carrier frequency.

5.3D.4 Method of test

5.3D.4.1 Initial conditions

Test environment for UE without vibration sensitive components: normal, TL/VL, TL/VH, TH/VL, TH/VH; see clauses G.2.1 and G.2.2.

Test environment for other UE: normal, TL/VL, TL/VH, TH/VL, TH/VH, vibration; see clauses G.2.1, G.2.2 and G.2.3.

NOTE: "UE without vibration sensitive components" is declared in table A.12 of [32].

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure FFS.
- 2) The UL Reference Measurement Channel and parameters are specified in Annex TBD. The DL Fixed Reference Channels (FRC H-Set 1, QPSK) is specified in Annex C.8.1.1.
- 3) An HSDPA call with CLTD is set up according to TS 34.108 [3] 7.3.17. RF parameters are set up according to table TBD and table TBD.
- 4) SS sends a HS-SCCH order activating UL_CLTD activation state 2.
- 5) Enter the UE into loopback test mode 1 in the presence of HSDPA and start the loopback test for state 2.

See TS 34.108 [3] and TS 34.109 [4] for details regarding loopback test mode for HSDPA.

5.3D.4.2 Procedure

- 1) Set and send continuously Up power control commands to the UE until the UE reaches its maximum output power.
- 2) Measure the frequency error Δf at each antenna connector, using the Global In-Channel-Tx-test (annex B).
- 3) SS sends a HS-SCCH order activating UL_CLTD activation state 3.
- 4) Repeat step 1 to 2 for activation state 3.

5.3D.5 Test Requirements

For all measurements, the frequency error at each antenna connector, derived in step 2), shall not exceed $\pm(0,1 \text{ ppm} + 10 \text{ Hz})$.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.4 Output Power Dynamics in the Uplink

Power control is used to limit the interference level.

5.4.1 Open Loop Power Control in the Uplink

5.4.1.1 Definition and applicability

Open loop power control in the uplink is the ability of the UE transmitter to set its output power to a specific value. This function is used for PRACH transmission and based on the information from Node B using BCCH and the downlink received signal power level of the CPICH. The information from Node B includes transmission power of CPICH and uplink interference power level.

The requirements and this test apply to all types of UTRA for the FDD UE.

5.4.1.2 Minimum requirements

The UE open loop power is defined as the mean power in a timeslot or ON power duration, whichever is available.

The UE open loop power control tolerance is given in table 5.4.1.1.

Table 5.4.1.1: Open loop power control tolerance

| | |
|--------------------|---------------------|
| Normal conditions | $\pm 9 \text{ dB}$ |
| Extreme conditions | $\pm 12 \text{ dB}$ |

The reference for this requirement is TS 25.101 [1] clause 6.4.1.

5.4.1.3 Test purpose

The power measured by the UE of the received signal and the signalled BCCH information are used by the UE to control the power of the UE transmitted signal with the target to transmit at the lowest power acceptable for proper communication.

The test stresses the ability of the receiver to measure the received power correctly over the receiver dynamic range.

The test purpose is to verify that the UE open loop power control tolerance does not exceed the described value shown in table 5.4.1.1.

An excess error of the open loop power control decreases the system capacity.

5.4.1.4 Method of test

5.4.1.4.1 Initial conditions

Test environment: normal, TL/VL, TL/VH, TH/VL, TH/VH; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.1.
- 2) Channel conditions are initially set up with received CPICH_RSCP $> -85 \text{ dBm}$. The relative power level of downlink physical channels to Ior are set up according to clause E.2.1. The parameter settings of the cell are set up according to Table 5.4.1.1a.

- 3) Switch on the phone.
- 4) After the UE has performed registration and entered idle mode, \hat{I}_{or} is set up according to table 5.4.1.2. The relative power level of downlink physical channels to I_{or} are set up according to clause E.2.1
- 5) A call is set up according to the Generic call setup procedure in [3] clause 7.3.1 with channel conditions according the test parameters in table 5.4.1.3, The RACH procedure within the call setup is used for the test.

Table 5.4.1.1a: Settings for the serving cell

| Parameter | Unit | Cell 1 |
|------------------------|------|--------------|
| Cell type | | Serving cell |
| UTRA RF Channel Number | | Channel 1 |
| Qqualmin | dB | -24 |
| Qrxlevmin | dBm | -115 |
| UE_TXPWR_MAX_RACH | dBm | 21 |
| Preamble Retrans Max | | 1 |

Table 5.4.1.2: Test parameters for Open Loop Power Control (UE)

| Parameter | Level / Status | Unit |
|----------------|-------------------|----------------|
| \hat{I}_{or} | See table 5.4.1.3 | dBm / 3,84 MHz |

Table 5.4.1.3: Test parameters for Open Loop Power Control (SS)

| Parameter | RX Upper dynamic end | RX-middle | RX-Sensitivity level |
|---|----------------------|----------------------|--|
| \hat{I}_{or} (note 3) | -25,0 dBm / 3,84 MHz | -65,7 dBm / 3,84 MHz | <REF \hat{I}_{or} > dBm / 3,84 MHz |
| CPICH_RSCP (notes 3 and 4) | -28,9 dBm | -69,6 dBm | <REF \hat{I}_{or} > +CPICH_Ec / I_{or} |
| Primary CPICH DL TX power | +19 dBm | +28 dBm | +19 dBm |
| Simulated path loss = Primary CPICH DL TX power - CPICH_RSCP | +47.9 dB | +97.6 dB | Band I, IV, VI, X, XIX, XI, XXI: +128.9 dB Band II, V, VII, XI: +126.9 dB Band III, VIII, XII, XIII, XIV, XX, XXII: +125.9 dB Band IX: +127.9 dB Band XXV, XXVI: +125.4 dB |
| UL interference | -75 dBm | -101 dBm | -110 dBm |
| | | | -108 dBm |
| | | | -107 dBm |
| | | | -109 dBm |
| | | | -106.5 dBm |
| Constant Value | -10 dB | -10 dB | -10 dB |
| Expected nominal UE TX power (note 5) | -37.1 dBm | -13.4 dBm | +8.9 dBm (note 2) |
| NOTE 1: While the SS transmit power shall cover the receiver input dynamic range, the logical parameters: Primary CPICH DL TX power, UL interference, Constant Value are chosen to achieve a UE TX power, located within the TX output power dynamic range of a class 4 UE. | | | |
| NOTE 2: Nominal TX output power <9 dBm allows to check the open loop power algorithm within the entire tolerance range (9 dBm \pm 12 dB; 9 dBm + 12 dB = 21 dBm = max power class 4). | | | |
| NOTE 3: <REF \hat{I}_{or} > is specified in Table 6.2.2, and CPICH_Ec / I_{or} is specified in Table E.2.2. The power level of S-CCPCH should be defined because S-CCPCH is transmitted during Preamble RACH transmission period. The power level of S-CCPCH is set to -5.3 dB relative to I_{or} . | | | |
| NOTE 4: The purpose of this parameter is to calculate the Expected nominal UE TX power. | | | |
| NOTE 5: The Expected nominal UE TX power is calculated by using the equation in the clause 8.5.7 Open Loop Power Control of TS 25.331 [8]. | | | |

5.4.1.4.2 Procedure

- 1) Set the TX output level of the SS to obtain \hat{I}_{or} at the UE antenna connector. \hat{I}_{or} shall be according to table 5.4.1.3 (-25 dBm / 3,84 MHz).
- 2) Measure the first RACH preamble mean power of the UE.
- 3) Repeat the above measurement for all SS levels in table 5.4.1.3.

5.4.1.5 Test requirements

The deviation with respect to the Expected nominal UE TX power (table 5.4.1.3), derived in step 2) shall not exceed the prescribed tolerance in table 5.4.1.4.

Table 5.4.1.4: Open loop power control tolerance

| | |
|--------------------|--------|
| Normal conditions | ±10 dB |
| Extreme conditions | ±13 dB |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.4.1A Open Loop Power Control in the Uplink for DC-HSUPA

5.4.1A.1 Definition and applicability

Open loop power control in the uplink for DC-HSUPA is the ability of the UE transmitter to set its output power, for each carrier, to a specific value. This function is used for initial Dual Cell transmission in CELL_DCH and based on the information from Node B using RADIO BEARER SETUP message and the downlink received signal power level of the CPICH.

The requirements and this test apply for Release 9 and later releases to all types of UTRA for the FDD UE that support HSDPA and Dual Cell E-DCH.

5.4.1A.2 Minimum requirements

The UE open loop power is defined as the mean power in a timeslot or ON power duration, whichever is available.

The UE open loop power control tolerance per carrier is given in table 5.4.1A.1.

Table 5.4.1A.1: Open loop power control tolerance

| | |
|--------------------|--------|
| Normal conditions | ±9 dB |
| Extreme conditions | ±12 dB |

The reference for this requirement is TS 25.101 [1] clause 6.4.1.1A

5.4.1A.3 Test purpose

The power measured by the UE of the received signal and information in RADIO BEARER SETUP message are used by the UE to control the power of the UE transmitted signal with the target to transmit at the lowest power acceptable for proper communication.

The test stresses the ability of the receiver to measure the received power correctly over the receiver dynamic range.

The test purpose is to verify that the UE open loop power control tolerance does not exceed the described value shown in table 5.4.1A.1 during Dual Cell E-DCH.

An excess error of the open loop power control decreases the system capacity.

5.4.1A.4 Method of test

5.4.1A.4.1 Initial conditions

Test environment: normal, TL/VL, TL/VH, TH/VL, TH/VH; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range, see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.41.
- 2) Channel conditions are initially set up with received CPICH_RSCP > -85 dBm. The relative power level of downlink physical channels to I_{or} are set up according to clause E.5.0. The parameter settings of the cell are set up according to Table 5.4.1A.1a.
- 3) Switch on the phone.
- 4) After the UE has performed registration and entered idle mode, I_{or} for primary and secondary serving cells are set up according to table 5.4.1A.2.
- 5) A call is set up according to the Generic call setup procedure in TS34.108 [3] sub clause 7.3.14 with channel conditions, for primary and secondary serving cells, according to the test parameters in table 5.4.1A.3 and exception for information elements in RADIO BEARER SETUP message as specified in table 5.4.1A.4. The uplink DPCCH power control preambles related to the call setup is used for the test.

Table 5.4.1A.1a: Settings for the serving cell

| Parameter | Unit | Cell 1 |
|------------------------|------|--------------|
| Cell type | | Serving cell |
| UTRA RF Channel Number | | Channel 1 |
| Q _{qualmin} | dB | -24 |
| Q _{rxlevmin} | dBm | -115 |
| UE_TXPWR_MAX_RACH | dBm | 21 |
| Preamble Retrans Max | | 1 |

Table 5.4.1A.2: Test parameters for Open Loop Power Control (UE)

| Parameter | Level / Status | Unit |
|-----------------|--------------------|----------------|
| I _{or} | See table 5.4.1A.3 | dBm / 3,84 MHz |

Table 5.4.1A.3: Test parameters for Open Loop Power Control (SS)

| Parameter | RX Upper dynamic end | RX-middle | RX-Sensitivity level |
|--|----------------------|----------------------|--|
| I _{or} (note 3) | -25,0 dBm / 3,84 MHz | -65,7 dBm / 3,84 MHz | <REF _{I_{or}} > dBm / 3,84 MHz |
| CPICH_RSCP (notes 3 and 4) | -28,9 dBm | -69,6 dBm | <REF _{I_{or}} > +CPICH_Ec / I _{or} |
| DPCCH Power offset | -66 dB | -84 dB | Band I, IV, VI, IX, X, XI, XIX, XXI: -108 dB Band II, III, V, VII, VIII, XII, XIII, XIV, XX, XXII: -106 dB |
| Expected nominal UE TX power (note 5) | -37.1 dBm | -14.4 dBm | Band I, II, IV, V, VI, VII, X, XI, XIX, XXI: +8.7 dBm (note 2) Band III, VIII, IX, XII, XIII, XIV, XX, XXII: +7.7 dBm |
| NOTE 1: While the SS transmit power shall cover the receiver input dynamic range, the logical parameter DPCCH Power offset is chosen to achieve a UE TX power, located within the TX output power dynamic range of a class 4 UE. | | | |
| NOTE 2: Nominal TX output power <9 dBm allows to check the open loop power algorithm within the entire tolerance range (9 dBm ± 12 dB; 9 dBm + 12 dB = 21 dBm = max power class 4). | | | |
| NOTE 3: <REF _{I_{or}} > is specified in Table 6.2.2, and CPICH_Ec / I _{or} is specified in Table E.5.0. | | | |
| NOTE 4: The purpose of this parameter is to calculate the Expected nominal UE TX power. | | | |
| NOTE 5: The Expected nominal UE TX power is calculated by using the equation in the clause 8.5.3 Open Loop Power Control of TS 25.331 [8]. | | | |

Table 5.4.1A.4: Contents of RADIO BEARER SETUP message: AM or UM

| Uplink radio resources | |
|----------------------------------|---|
| - Uplink DPCH info | |
| - PC Preamble | 1 |
| - SRB Delay | 7 |
| - Uplink secondary Cell info FDD | |
| - PC Preamble | 1 |

5.4.1A.4.2 Procedure

- 1) Set the TX output level of the SS to obtain \hat{I}_{or} at the UE antenna connector. \hat{I}_{or} shall be according to table 5.4.1A.3 (-25 dBm / 3,84 MHz).
- 2) Measure the Dual Cell transmission mean power from the first slot of uplink DPCCCH PC preamble for each carrier.
- 3) Repeat the above measurement for all SS levels in table 5.4.1A.3.

5.4.1A.5 Test requirements

The deviation at any carrier with respect to the Expected nominal UE TX power (table 5.4.1A.3), derived in step 2) shall not exceed the prescribed tolerance in table 5.4.1A.5.

Table 5.4.1A.5: Open loop power control tolerance per carrier

| | |
|--------------------|-------------|
| Normal conditions | ± 10 dB |
| Extreme conditions | ± 13 dB |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.4.2 Inner Loop Power Control in the Uplink

5.4.2.1 Definition and applicability

Inner loop power control in the uplink is the ability of the UE transmitter to adjust its output power in accordance with one or more TPC commands received in the downlink.

The power control step is the change in the UE transmitter output power in response to a single TPC command, TPC_cmd, derived at the UE.

This clause does not cover all the requirements of compressed mode or soft handover.

The requirements and this test apply to all types of UTRA for the FDD UE.

5.4.2.2 Minimum requirements

The UE transmitter shall have the capability of changing the output power with a step size of 1 dB, 2 dB and 3 dB according to the value of Δ_{TPC} or Δ_{RP-TPC} , in the slot immediately after the TPC_cmd can be derived.

- a) The transmitter output power step due to inner loop power control shall be within the range shown in table 5.4.2.1.
- b) The transmitter aggregate output power step due to inner loop power control shall be within the range shown in table 5.4.2.2. Here a TPC_cmd group is a set of TPC_cmd values derived from a corresponding sequence of TPC commands of the same duration.

The inner loop power step is defined as the relative power difference between the mean power of the original (reference) timeslot and the mean power of the target timeslot, not including the transient duration. The transient duration is from 25 μ s before the slot boundary to 25 μ s after the slot boundary.

Table 5.4.2.1: Transmitter power control range

| TPC_cmd | Transmitter power control range (all units are in dB) | | | | | |
|---------|---|-------|----------------|-------|----------------|-------|
| | 1 dB step size | | 2 dB step size | | 3 dB step size | |
| | Lower | Upper | Lower | Upper | Lower | Upper |
| +1 | +0,5 | +1,5 | +1 | +3 | +1,5 | +4,5 |
| 0 | -0,5 | +0,5 | -0,5 | +0,5 | -0,5 | +0,5 |
| -1 | -0,5 | -1,5 | -1 | -3 | -1,5 | -4,5 |

Table 5.4.2.2: Transmitter aggregate power control tolerance

| TPC_cmd group | Transmitter power control range after 10 equal TPC_cmd group (all units are in dB) | | | | Transmitter power control range after 7 equal TPC_cmd groups (all units are in dB) | |
|---------------|--|-------|----------------|-------|--|-------|
| | 1 dB step size | | 2 dB step size | | 3 dB step size | |
| | Lower | Upper | Lower | Upper | Lower | Upper |
| +1 | +8 | +12 | +16 | +24 | +16 | +26 |
| 0 | -1 | +1 | -1 | +1 | -1 | +1 |
| -1 | -8 | -12 | -16 | -24 | -16 | -26 |
| 0,0,0,0,+1 | +6 | +14 | N/A | N/A | N/A | N/A |
| 0,0,0,0,-1 | -6 | -14 | N/A | N/A | N/A | N/A |

The UE shall meet the above requirements for inner loop power control over the power range bounded by the Minimum output power as defined in clause 5.4.3.2, and the Maximum output power supported by the UE (i.e. the actual power as would be measured assuming no measurement error). This power shall be in the range specified for the power class of the UE in clause 5.2.2.

NOTE: 3 dB inner loop power control steps are only used in compressed mode.

The reference for this requirement is TS 25.101 [1] clause 6.4.2.1.1.

The requirements for the derivation of TPC_cmd are detailed in TS 25.214 [5] clauses 5.1.2.2.2 and 5.1.2.2.3.

5.4.2.3 Test purpose

- To verify that the UE inner loop power control size and response is meet to the described value shown in clause 5.4.2.2.
- To verify that TPC_cmd is correctly derived from received TPC commands.

An excess error of the inner loop power control decreases the system capacity.

The UE shall be tested for the requirements for inner loop power control over the power range bounded by the Min power threshold for test and the Max power threshold for test.

The Min power threshold for test is defined as the Minimum Output Power Test Requirement (clause 5.4.3.5).

The Max power threshold for test is defined as the Measured Maximum output power of the UE in the relevant Step of the test (using the same method as in clause 5.2.4.2 step 2) minus the Test Tolerance specified for test 5.2 Maximum Output Power in table F.2.1.

For the final power step adjacent to the Min or Max power threshold for test, the lower step size requirement does not apply.

5.4.2.4 Method of test

5.4.2.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.1.

- 2) A call is set up according to the Generic call setup procedure specified in TS34.108 [3] sub clause 7.3.2, with the following exception for information elements in RADIO BEARER SETUP message. With this exception, the Power Control Algorithm for the Uplink is set to algorithm 2.

Table 5.4.2.4.1: Contents of RADIO BEARER SETUP message: AM or UM

| Information Element | Value/Remark |
|---|---------------------------------|
| CHOICE channel requirement - Power Control Algorithm | Uplink DPCH info Algorithm 2 |

- 3) Enter the UE into loopback test mode and start the loopback test.

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

5.4.2.4.2 Procedure

Figure 5.4.2.4 Inner Loop Power Control Test Steps

- 1) Before proceeding with paragraph (2) (Step A) below, set the output power of the UE to be in the range -10 ± 9 dBm. This may be achieved by setting the downlink signal (\hat{I}_{or}) to yield an appropriate open loop output power and/or by generating suitable downlink TPC commands from the SS.
- 2) Step A: Transmit a sequence of at least 30 and no more than 60 TPC commands, which shall commence at a frame boundary and last for a whole number of frames, and which shall contain:
 - no sets of 5 consecutive "0" or "1" commands which commence in the 1st, 6th or 11th slots of a frame;
 - at least one set of 5 consecutive "0" commands which does not commence in the 1st, 6th or 11th slots of a frame;
 - at least one set of 5 consecutive "1" commands which does not commence in the 1st, 6th or 11th slots of a frame.

The following is an example of a suitable sequence of TPC commands:

10000010101010111110100000101010101111010000010101010111110

- 3) Step B: Transmit a sequence of 50 TPC commands with the value 1.
- 4) Step C: Transmit a sequence of 50 TPC commands with the value 0.
- 5) Step D: Transmit the PHYSICAL CHANNEL RECONFIGURATION message to reconfigure the uplink channel in order to set the Power Control Algorithm to algorithm 1, and the TPC step size to 1 dB. Contents of the message is specified in the table 5.4.2.4.2.A. After the PHYSICAL CHANNEL RECONFIGURATION

COMPLETE message from the UE is received, transmit a sequence of TPC commands with the value 1 until the UE output power is above the maximum power threshold.

- 6) Step E: Transmit a sequence of 150 (note 1) TPC commands with the value 0.
- 7) Step F: Transmit a sequence of 150 (note 1) TPC commands with the value 1.
- 8) Step G: Transmit the PHYSICAL CHANNEL RECONFIGURATION message to reconfigure the uplink channel in order to set the TPC step size to 2 dB (with the Power Control Algorithm remaining as algorithm 1). Contents of the message is specified in the table 5.4.2.4.2.B. After the PHYSICAL CHANNEL RECONFIGURATION COMPLETE message from the UE is received, transmit a sequence of TPC commands with the value 1 until the UE output power is above the maximum power threshold. Transmit a sequence of 75 (note 1) TPC commands with the value 0.
- 9) Step H: Transmit a sequence of 75 (note 1) TPC commands with the value 1.
- 10) During steps A to H the mean power of every slot shall be measured, with the following exceptions:
 - In steps D and F, measurement of the mean power is not required in slots after the 10th slot after the mean power has exceeded the maximum power threshold;
 - In steps E and G, measurement of the mean power is not required in slots after the 10th slot after the mean power has fallen below the minimum power threshold.

The transient periods of 25 μ s before each slot boundary and 25 μ s after each slot boundary shall not be included in the power measurements.

- NOTE 1: These numbers of TPC commands are given as examples. The actual number of TPC commands transmitted in these steps shall be at least 10 more than the number required to ensure that the UE reaches the relevant maximum or minimum power threshold in each step, as shown in figure 5.4.2.4.
- NOTE 2: In order to make it more practical to measure the entire power control dynamic range (between min power threshold and max power threshold with suitable margins), it is permissible to segment the power control sequences into smaller subsequence. For example, Step-E can be divided into different stages while still fulfilling the purpose of the test to measure the entire dynamic range.

| | Lower | Upper | Lower | Upper | Lower | Upper |
| +1 | +0,4 | +1,6 | +0,85 | +3,15 | +1,3 | +4,7 |
| 0 | -0,6 | +0,6 | -0,6 | +0,6 | -0,6 | +0,6 |
| -1 | -0,4 | -1,6 | -0,85 | -3,15 | -1,3 | -4,7 |

Table 5.4.2.5.2: Transmitter aggregate power control tolerance

| TPC_cmd group | Transmitter power control range after 10 equal TPC_cmd group (all units are in dB) | | | | Transmitter power control range after 7 equal TPC_cmd groups (all units are in dB) | |
|---------------|--|-------|----------------|-------|--|-------|
| | 1 dB step size | | 2 dB step size | | 3 dB step size | |
| | Lower | Upper | Lower | Upper | Lower | Upper |
| +1 | +7,7 | +12,3 | +15,7 | +24,3 | +15,7 | +26,3 |
| 0 | -1,1 | +1,1 | -1,1 | +1,1 | -1,1 | +1,1 |
| -1 | -7,7 | -12,3 | -15,7 | -24,3 | -15,7 | -26,3 |
| 0,0,0,0,+1 | +5,7 | +14,3 | N/A | N/A | N/A | N/A |
| 0,0,0,0,-1 | -5,7 | -14,3 | N/A | N/A | N/A | N/A |

- a) During Step A, the difference in mean power between adjacent slots shall be within the prescribed range for a TPC_cmd of 0, as given in table 5.4.2.5.1.
- b) During Step A, the change in mean power over 10 consecutive slots shall be within the prescribed range for a TPC_cmd group of 0, as given in table 5.4.2.5.2.
- c) During Step B, the difference in mean power between adjacent slots shall be within the prescribed range given in table 5.4.2.5.1, given that every 5th TPC_cmd should have the value +1, with a step size of 1 dB, and all other TPC_cmd should have the value 0.
- d) During Step B, the change in mean power over 50 consecutive slots shall be within the prescribed range for a TPC_cmd group of {0,0,0,0,+1}, as given in table 5.4.2.5.2.
- e) During Step C, the difference in mean power between adjacent slots shall be within the prescribed range given in table 5.4.2.5.1, given that every 5th TPC_cmd should have the value -1, with a step size of 1 dB, and all other TPC_cmd should have the value 0.
- f) During Step C, the change in mean power over 50 consecutive slots shall be within the prescribed range for a TPC_cmd group of {0,0,0,0,-1}, as given in table 5.4.2.5.2.
- g) During Step E, the difference in mean power between adjacent slots shall be within the prescribed range given in table 5.4.2.5.1 for a TPC_cmd of -1 and step size of 1 dB. This applies when the original (reference) timeslot power and the target timeslot power are between the Min power threshold for test and the Max power threshold for test derived from the Measured Maximum output power in Step D. For the power step adjacent to the Min or Max power threshold for test, the lower step size requirement does not apply.
- h) During Step E, the change in mean power over 10 consecutive slots shall be within the prescribed range for a TPC_cmd group of -1, and step size of 1 dB as given in table 5.4.2.5.2. This applies when the original (reference) timeslot power and the target timeslot power are between the Min power threshold for test and the Max power threshold for test derived from the Measured Maximum output power in Step D. The power step adjacent to the Min or Max power threshold for test should not be part of the 10 consecutive slots tested.
- i) During Step F, the difference in mean power between adjacent slots shall be within the prescribed range given in table 5.4.2.5.1 for a TPC_cmd of +1 and step size of 1 dB. This applies when the original (reference) timeslot power and the target timeslot power are between the Min power threshold for test and the Max power threshold for test derived from the Measured Maximum output power in Step F. For the power step adjacent to the Min or Max power threshold for test, the lower step size requirement does not apply.
- j) During Step F, the change in mean power over 10 consecutive slots shall be within the prescribed range for a TPC_cmd group of +1, and step size of 1 dB as given in table 5.4.2.5.2. This applies when the original (reference) timeslot power and the target timeslot power are between the Min power threshold for test and the Max power threshold for test derived from the Measured Maximum output power in Step F. The power step adjacent to the Min or Max power threshold for test should not be part of the 10 consecutive slots tested.

- k) During Step G, the difference in mean power between adjacent slots shall be within the prescribed range given in table 5.4.2.5.1 for a TPC_cmd of -1 and step size of 2 dB. This applies when the original (reference) timeslot power and the target timeslot power are between the Min power threshold for test and the Max power threshold for test derived from the Measured Maximum output power in Step F. For the power step adjacent to the Min or Max power threshold for test, the lower step size requirement does not apply.
- l) During Step G, the change in mean power over 10 consecutive slots shall be within the prescribed range for a TPC_cmd group of -1 , and step size of 2 dB as given in table 5.4.2.5.2. This applies when the original (reference) timeslot power and the target timeslot power are between the Min power threshold for test and the Max power threshold for test derived from the Measured Maximum output power in Step F. The power step adjacent to the Min or Max power threshold for test should not be part of the 10 consecutive slots.
- m) During Step H, the difference in mean power between adjacent slots shall be within the prescribed range given in table 5.4.2.5.1 for a TPC_cmd of $+1$ and step size of 2 dB. This applies when the original (reference) timeslot power and the target timeslot power are between the Min power threshold for test and the Max power threshold for test derived from the Measured Maximum output power in Step H. For the power step adjacent to the Min or Max power threshold for test, the lower step size requirement does not apply.
- n) During Step H, the change in mean power over 10 consecutive slots shall be within the prescribed range for a TPC_cmd group of $+1$, and step size of 2 dB as given in table 5.4.2.5.2. This applies when the original (reference) timeslot power and the target timeslot power are between the Min power threshold for test and the Max power threshold for test derived from the Measured Maximum output power in Step H. The power step adjacent to the Min or Max power threshold for test should not be part of the 10 consecutive slots tested.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.4.2A Inner Loop Power Control in the Uplink for DC-HSUPA

5.4.2A.1 Definition and applicability

Inner loop power control in the uplink for DC-HSUPA is the ability of the UE transmitter to adjust its output power, on each uplink carrier, in accordance with one or more TPC commands received in the downlink.

The power control step is the change in the UE transmitter output power in response to a single TPC command, TPC_cmd, derived at the UE.

This clause does not cover all the requirements of compressed mode or soft handover.

The requirements and this test apply for Release 9 and later releases for the FDD UE that supports HSDPA and Dual Cell E-DCH.

5.4.2A.2 Minimum requirements

The UE transmitter shall have the capability of changing the output power in each assigned carrier in the uplink with a step size of 1, 2 and 3 dB according to the value of Δ_{TPC} or $\Delta_{\text{RP-TPC}}$, in the slot immediately after the TPC_cmd for the corresponding carrier as follows

- a) The transmitter output power step due to inner loop power control in each assigned carrier in the uplink shall be within the range shown in Table 5.4.2A.1, when the total transmit power in each of the assigned carriers is equal to each other.
- b) The transmitter average output power step due to inner loop power control in each assigned carrier in the uplink shall be within the range shown in Table 5.4.2A.2, when the total transmit power in each of the assigned carriers is equal to each other. Here a TPC_cmd group is a set of TPC_cmd values derived from a corresponding sequence of TPC commands of the same duration.
- c) The requirements can be tested by sending the same TPC commands for each of the assigned carriers, assuming that the signal powers for the carriers (in terms of DPCCCH code power and total power) have been aligned prior to the beginning of the test procedure.

The inner loop power step is defined as the relative power difference between the mean power of the original (reference) timeslot and the mean power of the target timeslot in each carrier, not including the transient duration. The transient duration is from 25µs before the slot boundary to 25µs after the slot boundary.

Table 5.4.2A.1: Transmitter power control range

| TPC_cmd | Transmitter power control range (all units are in dB) | | | | | |
|---------|---|-------|----------------|-------|----------------|-------|
| | 1 dB step size | | 2 dB step size | | 3 dB step size | |
| | Lower | Upper | Lower | Upper | Lower | Upper |
| +1 | +0,5 | +1,5 | +1 | +3 | +1,5 | +4,5 |
| 0 | -0,5 | +0,5 | -0,5 | +0,5 | -0,5 | +0,5 |
| -1 | -0,5 | -1,5 | -1 | -3 | -1,5 | -4,5 |

Table 5.4.2A.2: Transmitter aggregate power control tolerance

| TPC_cmd group | Transmitter power control range after 10 equal TPC_cmd group (all units are in dB) | | | | Transmitter power control range after 7 equal TPC_cmd groups (all units are in dB) | |
|---------------|--|-------|----------------|-------|--|-------|
| | 1 dB step size | | 2 dB step size | | 3 dB step size | |
| | Lower | Upper | Lower | Upper | Lower | Upper |

| 0 | -1 | +1 | -1 | +1 | -1 | +1 |
| -1 | -8 | -12 | -16 | -24 | -16 | -26 |
| 0,0,0,0,+1 | +6 | +14 | N/A | N/A | N/A | N/A |
| 0,0,0,0,-1 | -6 | -14 | N/A | N/A | N/A | N/A |

The UE shall meet the above requirements for inner loop power control over the power range bounded by the Minimum output power as defined in clause 5.4.3.2, and the Maximum output power supported by the UE (i.e. the actual power as would be measured assuming no measurement error). This power shall be in the range specified for the power class of the UE in clause 5.2.2.

NOTE: 3 dB inner loop power control steps are only used in compressed mode.

The reference for this requirement is TS 25.101 [1] clause 6.4.2.1.1A.

The requirements for the derivation of TPC_cmd are detailed in TS 25.214 [5] clauses 5.1.2.2.2 and 5.1.2.2.3.

5.4.2A.3 Test purpose

- To verify that the UE inner loop power control size and response, on each carrier, is met to the described value shown in clause 5.4.2A.2.
- To verify that TPC_cmd is correctly derived from received TPC commands.

An excess error of the inner loop power control decreases the system capacity.

The UE shall be tested for the requirements for inner loop power control for DC-HSUPA over the power range bounded by the Min power threshold for test and the Max power threshold for test.

The Min power threshold for test is defined as the Minimum Output Power Test Requirement for DC-HSUPA (clause 5.4.3A.5).

The Max power threshold for test is defined as the Measured Maximum output power for DC-HSUPA of the UE in the relevant Step of the test (using the same method as in clause 5.2BA.4.2) minus the Test Tolerance specified for test 5.2BA Maximum Output Power for DC-HSUPA in table F.2.1.

For the final power step adjacent to the Min or Max power threshold for test, the lower step size requirement does not apply.

5.4.2A.4 Method of test

5.4.2A.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.41.
- 2) The UL Reference Measurement Channel and parameters are specified in Annex C.2.6 and C.11A.1.1. The DL Reference Measurement Channel (FRC H-SET 3A, QPSK) is specified in C.8.1.1.
- 3) A call is set up according to the Generic call setup procedure specified in TS34.108 [3] sub clause 7.3.14, with the following exception for information elements in RADIO BEARER SETUP message. With this exception, the Power Control Algorithm for each carrier in the Uplink is set to algorithm 2.

Table 5.4.2A.4.1: Contents of RADIO BEARER SETUP message: AM or UM

| Information Element | Value/Remark |
|---|---------------------------------|
| CHOICE channel requirement - Power Control Algorithm | Uplink DPCH info Algorithm 2 |

- 4) Enter the UE into loopback test mode and start the loopback test.

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

5.4.2A.4.2 Procedure

Figure 5.4.2A.4 Inner Loop Power Control Test Steps

- 1) Before proceeding with paragraph (2) (Step A) below, set the output power of the assigned carriers equal to each other within ± 1.7 dB and in the range -10 ± 9 dBm. This may be achieved by generating suitable downlink TPC commands from the SS.

- 2) Step A: Transmit a sequence of at least 30 and no more than 60 TPC commands on both cells, which shall commence at a frame boundary and last for a whole number of frames, and which shall contain:
- no sets of 5 consecutive "0" or "1" commands which commence in the 1st, 6th or 11th slots of a frame;
 - at least one set of 5 consecutive "0" commands which does not commence in the 1st, 6th or 11th slots of a frame;
 - at least one set of 5 consecutive "1" commands which does not commence in the 1st, 6th or 11th slots of a frame.

The following is an example of a suitable sequence of TPC commands:

```
10000010101010111110100000101010101111010000010101010111110
```

- 3) Step B: Transmit a sequence of 50 TPC commands with the value 1.
- 4) Step C: Transmit a sequence of 50 TPC commands with the value 0.
- 5) Step D: Transmit the PHYSICAL CHANNEL RECONFIGURATION message to reconfigure the uplink channel, in order to set the Power Control Algorithm to algorithm 1, and the TPC step size to 1 dB. Contents of the information elements are as specified in TS34.108 [3] sub clause 7.3.14.4.2 with the exception as specified in the table 5.4.2A.4.2.A. After the PHYSICAL CHANNEL RECONFIGURATION COMPLETE message from the UE is received, transmit a sequence of TPC commands with the value 1 until the UE output power is above the maximum power threshold.
- 6) Step E: Transmit a sequence of 150 (note 1) TPC commands with the value 0.
- 7) Step F: Transmit a sequence of 150 (note 1) TPC commands with the value 1.
- 8) Step G: Transmit the PHYSICAL CHANNEL RECONFIGURATION message to reconfigure the uplink channel, in order to set the TPC step size to 2 dB (with the Power Control Algorithm remaining as algorithm 1). Contents of the information elements are as specified in TS34.108 [3] sub clause 7.3.14.4.2 with the exception as specified in the table 5.4.2A.4.2.B. After the PHYSICAL CHANNEL RECONFIGURATION COMPLETE message from the UE is received, transmit a sequence of TPC commands with the value 1 until the UE output power is above the maximum power threshold. Transmit a sequence of 75 (note 1) TPC commands with the value 0.
- 9) Step H: Transmit a sequence of 75 (note 1) TPC commands with the value 1.
- 10) During steps A to H the mean power of every slot on each carrier shall be measured, with the following exceptions:
- In steps D and F, measurement of the mean power is not required in slots after the 10th slot after the mean power has exceeded the maximum power threshold;
 - In steps E and G, measurement of the mean power is not required in slots after the 10th slot after the mean power has fallen below the minimum power threshold.

The transient periods of 25 µs before each slot boundary and 25 µs after each slot boundary shall not be included in the power measurements.

NOTE 1: These numbers of TPC commands are given as examples. The actual number of TPC commands transmitted in these steps shall be at least 10 more than the number required to ensure that each carrier reaches the relevant maximum or minimum power threshold in each step, as shown in figure 5.4.2A.4.

NOTE 2: In order to make it more practical to measure the entire power control dynamic range (between min power threshold and max power threshold with suitable margins), it is permissible to segment the power control sequences into smaller subsequence. For example, Step-E can be divided into different stages while still fulfilling the purpose of the test to measure the entire dynamic range.

| 0 | -0,6 | +0,6 | -0,6 | +0,6 | -0,6 | +0,6 |
| -1 | -0,4 | -1,6 | -0,85 | -3,15 | -1,3 | -4,7 |

Table 5.4.2A.5.2: Transmitter aggregate power control tolerance

| TPC_cmd group | Transmitter power control range after 10 equal TPC_cmd group (all units are in dB) | | | | Transmitter power control range after 7 equal TPC_cmd groups (all units are in dB) | |
|---------------|--|-------|----------------|-------|--|-------|
| | 1 dB step size | | 2 dB step size | | 3 dB step size | |
| | Lower | Upper | Lower | Upper | Lower | Upper |
| +1 | +7,7 | +12,3 | +15,7 | +24,3 | +15,7 | +26,3 |
| 0 | -1,1 | +1,1 | -1,1 | +1,1 | -1,1 | +1,1 |
| -1 | -7,7 | -12,3 | -15,7 | -24,3 | -15,7 | -26,3 |
| 0,0,0,0,+1 | +5,7 | +14,3 | N/A | N/A | N/A | N/A |
| 0,0,0,0,-1 | -5,7 | -14,3 | N/A | N/A | N/A | N/A |

- During Step A, the difference in mean power between adjacent slots on each carrier shall be within the prescribed range for a TPC_cmd of 0, as given in table 5.4.2A.5.1.
- During Step A, the change in mean power over 10 consecutive slots on each carrier shall be within the prescribed range for a TPC_cmd group of 0, as given in table 5.4.2A.5.2.
- During Step B, the difference in mean power between adjacent slots on each carrier shall be within the prescribed range given in table 5.4.2A.5.1, given that every 5th TPC_cmd should have the value +1, with a step size of 1 dB, and all other TPC_cmd should have the value 0.
- During Step B, the change in mean power over 50 consecutive slots on each carrier shall be within the prescribed range for a TPC_cmd group of {0,0,0,0,+1}, as given in table 5.4.2A.5.2.
- During Step C, the difference in mean power between adjacent slots on each carrier shall be within the prescribed range given in table 5.4.2A.5.1, given that every 5th TPC_cmd should have the value -1, with a step size of 1 dB, and all other TPC_cmd should have the value 0.
- During Step C, the change in mean power over 50 consecutive slots on each carrier shall be within the prescribed range for a TPC_cmd group of {0,0,0,0,-1}, as given in table 5.4.2A.5.2.

- g) During Step E, the difference in mean power between adjacent slots on each carrier shall be within the prescribed range given in table 5.4.2A.5.1 for a TPC_cmd of -1 and step size of 1 dB. This applies when the original (reference) timeslot power and the target timeslot power are between the Min power threshold for test and the Max power threshold for test derived from the Measured Maximum output power in Step D. For the power step adjacent to the Min or Max power threshold for test, the lower step size requirement does not apply.
- h) During Step E, the change in mean power over 10 consecutive slots on each carrier shall be within the prescribed range for a TPC_cmd group of -1 , and step size of 1 dB as given in table 5.4.2A.5.2. This applies when the original (reference) timeslot power and the target timeslot power are between the Min power threshold for test and the Max power threshold for test derived from the Measured Maximum output power in Step D. The power step adjacent to the Min or Max power threshold for test should not be part of the 10 consecutive slots tested.
- i) During Step F, the difference in mean power between adjacent slots on each carrier shall be within the prescribed range given in table 5.4.2A.5.1 for a TPC_cmd of $+1$ and step size of 1 dB. This applies when the original (reference) timeslot power and the target timeslot power are between the Min power threshold for test and the Max power threshold for test derived from the Measured Maximum output power in Step F. For the power step adjacent to the Min or Max power threshold for test, the lower step size requirement does not apply.
- j) During Step F, the change in mean power over 10 consecutive slots on each carrier shall be within the prescribed range for a TPC_cmd group of $+1$, and step size of 1 dB as given in table 5.4.2A.5.2. This applies when the original (reference) timeslot power and the target timeslot power are between the Min power threshold for test and the Max power threshold for test derived from the Measured Maximum output power in Step F. The power step adjacent to the Min or Max power threshold for test should not be part of the 10 consecutive slots tested.
- k) During Step G, the difference in mean power between adjacent slots on each carrier shall be within the prescribed range given in table 5.4.2A.5.1 for a TPC_cmd of -1 and step size of 2 dB. This applies when the original (reference) timeslot power and the target timeslot power are between the Min power threshold for test and the Max power threshold for test derived from the Measured Maximum output power in Step F. For the power step adjacent to the Min or Max power threshold for test, the lower step size requirement does not apply.
- l) During Step G, the change in mean power over 10 consecutive slots on each carrier shall be within the prescribed range for a TPC_cmd group of -1 , and step size of 2 dB as given in table 5.4.2A.5.2. This applies when the original (reference) timeslot power and the target timeslot power are between the Min power threshold for test and the Max power threshold for test derived from the Measured Maximum output power in Step F. The power step adjacent to the Min or Max power threshold for test should not be part of the 10 consecutive slots.
- m) During Step H, the difference in mean power between adjacent slots on each carrier shall be within the prescribed range given in table 5.4.2A.5.1 for a TPC_cmd of $+1$ and step size of 2 dB. This applies when the original (reference) timeslot power and the target timeslot power are between the Min power threshold for test and the Max power threshold for test derived from the Measured Maximum output power in Step H. For the power step adjacent to the Min or Max power threshold for test, the lower step size requirement does not apply.
- n) During Step H, the change in mean power over 10 consecutive slots on each carrier shall be within the prescribed range for a TPC_cmd group of $+1$, and step size of 2 dB as given in table 5.4.2A.5.2. This applies when the original (reference) timeslot power and the target timeslot power are between the Min power threshold for test and the Max power threshold for test derived from the Measured Maximum output power in Step H. The power step adjacent to the Min or Max power threshold for test should not be part of the 10 consecutive slots tested.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.4.2B FFS

5.4.2C Inner Loop Power Control in the Uplink for UL CLTD activation state 1

Editor's note: This clause is incomplete. The following aspects are either missing or not yet determined:

- Message Contents are FFS.
- Test procedure, test tolerances may need an update.

- Update of Annexure is FFS

5.4.2C.1 Definition and applicability

Inner loop power control in the uplink is the ability of the UE transmitter to adjust its output power in accordance with one or more TPC commands received in the downlink.

The power control step is the change in the UE transmitter output power in response to a single TPC command, TPC_cmd, derived at the UE.

This clause does not cover all the requirements of compressed mode or soft handover.

The requirements and this test apply for Release 11 and later releases to all types of UTRA for the FDD UE that supports UL CLTD.

5.4.2C.2 Minimum requirements

The UE transmitter shall have the capability of changing the output power with a step size of 1 dB, 2 dB and 3 dB according to the value of Δ_{TPC} or $\Delta_{\text{RP-TPC}}$, in the slot immediately after the TPC_cmd can be derived.

- The transmitter output power step due to inner loop power control shall be within the range shown in table 5.4.2C.1.
- The transmitter aggregate output power step due to inner loop power control shall be within the range shown in table 5.4.2C.2. Here a TPC_cmd group is a set of TPC_cmd values derived from a corresponding sequence of TPC commands of the same duration.

For UE with two active transmit antenna connectors in UL CLTD activation state 1, the inner loop power control in the uplink specified in this clause applies at each transmit antenna connector.

The inner loop power step is defined as the relative power difference between the mean power of the original (reference) timeslot and the mean power of the target timeslot, not including the transient duration. The transient duration is from 25 μs before the slot boundary to 25 μs after the slot boundary.

Table 5.4.2C.1: Transmitter power control range

| TPC_cmd | Transmitter power control range (all units are in dB) | | | | | |
|---------|---|-------|----------------|-------|----------------|-------|
| | 1 dB step size | | 2 dB step size | | 3 dB step size | |
| | Lower | Upper | Lower | Upper | Lower | Upper |
| +1 | +0,5 | +1,5 | +1 | +3 | +1,5 | +4,5 |
| 0 | -0,5 | +0,5 | -0,5 | +0,5 | -0,5 | +0,5 |
| -1 | -0,5 | -1,5 | -1 | -3 | -1,5 | -4,5 |

Table 5.4.2C.2: Transmitter aggregate power control tolerance

| TPC_cmd group | Transmitter power control range after 10 equal TPC_cmd group (all units are in dB) | | | | Transmitter power control range after 7 equal TPC_cmd groups (all units are in dB) | |
|---------------|--|-------|----------------|-------|--|-------|
| | 1 dB step size | | 2 dB step size | | 3 dB step size | |
| | Lower | Upper | Lower | Upper | Lower | Upper |
| +1 | +8 | +12 | +16 | +24 | +16 | +26 |
| 0 | -1 | +1 | -1 | +1 | -1 | +1 |
| -1 | -8 | -12 | -16 | -24 | -16 | -26 |
| 0,0,0,0,+1 | +6 | +14 | N/A | N/A | N/A | N/A |
| 0,0,0,0,-1 | -6 | -14 | N/A | N/A | N/A | N/A |

The UE shall meet the above requirements for inner loop power control over the power range bounded by the Minimum output power as defined in clause 5.4.3.2, and the Maximum output power supported by the UE (i.e. the actual power as would be measured assuming no measurement error). This power shall be in the range specified for the power class of the UE in clause 5.2.2.

NOTE: 3 dB inner loop power control steps are only used in compressed mode.

The reference for this requirement is TS 25.101 [1] clause 6.4.2.1.1C.

The requirements for the derivation of TPC_cmd are detailed in TS 25.214 [5] clauses 5.1.2.2.2 and 5.1.2.2.3.

5.4.2C.3 Test purpose

- To verify that the UE inner loop power control size and response with UL CLTD activation state 1 is meet to the described value shown in clause 5.4.2C.2.
- To verify that TPC_cmd is correctly derived from received TPC commands.

An excess error of the inner loop power control decreases the system capacity.

The UE shall be tested for the requirements for inner loop power control over the power range bounded by the Min power threshold for test and the Max power threshold for test.

The Min power threshold for test is defined as the Minimum Output Power Test Requirement (clause 5.4.3.5).

The Max power threshold for test is defined as the Measured Maximum output power of the UE in the relevant Step of the test (using the same method as in clause 5.2.4.2 step 2) minus the Test Tolerance specified for test 5.2 Maximum Output Power in table F.2.1.

For the final power step adjacent to the Min or Max power threshold for test, the lower step size requirement does not apply.

5.4.2C.4 Method of test

5.4.2C.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure FFS.
- 2) A call is set up according to the Generic call setup procedure specified in TS34.108 [3] sub clause 7.3.17, with the following exception for information elements in RADIO BEARER SETUP message. With this exception, the Power Control Algorithm for the Uplink is set to algorithm 2.

Table 5.4.2C.4.1: Contents of RADIO BEARER SETUP message: AM or UM

| Information Element | Value/Remark |
|---|---------------------------------|
| CHOICE channel requirement - Power Control Algorithm | Uplink DPCH info Algorithm 2 |

- 3) SS sends a HS-SCCH order activating UL_CLTD activation state 1.
- 4) Enter the UE into loopback test mode and start the loopback test.

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

5.4.2C.4.2 Procedure

Figure 5.4.2C.4 Inner Loop Power Control Test Steps

- 1) Before proceeding with paragraph (2) (Step A) below, set the output power of the UE to be in the range -10 ± 9 dBm. This may be achieved by setting the downlink signal (\hat{I}_{or}) to yield an appropriate open loop output power and/or by generating suitable downlink TPC commands from the SS.
- 2) Step A: Transmit a sequence of at least 30 and no more than 60 TPC commands, which shall commence at a frame boundary and last for a whole number of frames, and which shall contain:
 - no sets of 5 consecutive "0" or "1" commands which commence in the 1st, 6th or 11th slots of a frame;
 - at least one set of 5 consecutive "0" commands which does not commence in the 1st, 6th or 11th slots of a frame;
 - at least one set of 5 consecutive "1" commands which does not commence in the 1st, 6th or 11th slots of a frame.

The following is an example of a suitable sequence of TPC commands:

```
10000010101010111110100000101010101111010000010101010111110
```

- 3) Step B: Transmit a sequence of 50 TPC commands with the value 1.
- 4) Step C: Transmit a sequence of 50 TPC commands with the value 0.
- 5) Step D: Transmit the PHYSICAL CHANNEL RECONFIGURATION message to reconfigure the uplink channel in order to set the Power Control Algorithm to algorithm 1, and the TPC step size to 1 dB. Contents of the message is specified in the table 5.4.2C.4.2.A. After the PHYSICAL CHANNEL RECONFIGURATION COMPLETE message from the UE is received, transmit a sequence of TPC commands with the value 1 until the UE output power is above the maximum power threshold.
- 6) Step E: Transmit a sequence of 150 (note 1) TPC commands with the value 0.
- 7) Step F: Transmit a sequence of 150 (note 1) TPC commands with the value 1.
- 8) Step G: Transmit the PHYSICAL CHANNEL RECONFIGURATION message to reconfigure the uplink channel in order to set the TPC step size to 2 dB (with the Power Control Algorithm remaining as algorithm 1). Contents of the message is specified in the table 5.4.2C.4.2.B. After the PHYSICAL CHANNEL RECONFIGURATION COMPLETE message from the UE is received, transmit a sequence of TPC commands with the value 1 until the UE output power is above the maximum power threshold. Transmit a sequence of 75 (note 1) TPC commands with the value 0.

9) Step H: Transmit a sequence of 75 (note 1) TPC commands with the value 1.

10) During steps A to H the mean power of every slot shall be measured, with the following exceptions:

- In steps D and F, measurement of the mean power is not required in slots after the 10th slot after the mean power has exceeded the maximum power threshold;
- In steps E and G, measurement of the mean power is not required in slots after the 10th slot after the mean power has fallen below the minimum power threshold.

The transient periods of 25 μ s before each slot boundary and 25 μ s after each slot boundary shall not be included in the power measurements.

NOTE 1: These numbers of TPC commands are given as examples. The actual number of TPC commands transmitted in these steps shall be at least 10 more than the number required to ensure that the UE reaches the relevant maximum or minimum power threshold in each step, as shown in figure 5.4.2C.4.

NOTE 2: In order to make it more practical to measure the entire power control dynamic range (between min power threshold and max power threshold with suitable margins), it is permissible to segment the power control sequences into smaller subsequence. For example, Step-E can be divided into different stages while still fulfilling the purpose of the test to measure the entire dynamic range.

5.4.2C.5 Test requirements

Table 5.4.2C.5.1: Transmitter power control range

| TPC_cmd | Transmitter power control range (all units are in dB) | | | | | |
|---------|---|----------|----------------|----------|----------------|----------|
| | 1 dB step size | | 2 dB step size | | 3 dB step size | |
| | Lower | Upper | Lower | Upper | Lower | Upper |
| +1 | +0,5± TT | +1,5± TT | +1± TT | +3± TT | +1,5± TT | +4,5± TT |
| 0 | -0,5± TT | +0,5± TT | -0,5± TT | +0,5± TT | -0,5± TT | +0,5± TT |
| -1 | -0,5± TT | -1,5± TT | -1± TT | -3± TT | -1,5± TT | -4,5± TT |

Table 5.4.2C.5.2: Transmitter aggregate power control tolerance

| TPC_cmd group | Transmitter power control range after 10 equal TPC_cmd group (all units are in dB) | | | | Transmitter power control range after 7 equal TPC_cmd groups (all units are in dB) | |
|---------------|--|--------|----------------|--------|--|--------|
| | 1 dB step size | | 2 dB step size | | 3 dB step size | |
| | Lower | Upper | Lower | Upper | Lower | Upper |
| +1 | +8±TT | +12±TT | +16±TT | +24±TT | +16±TT | +26±TT |
| 0 | -1±TT | +1±TT | -1±TT | +1±TT | -1±TT | +1±TT |
| -1 | -8±TT | -12±TT | -16±TT | -24±TT | -16±TT | -26±TT |
| 0,0,0,0,+1 | +6±TT | +14±TT | N/A | N/A | N/A | N/A |
| 0,0,0,0,-1 | -6±TT | -14±TT | N/A | N/A | N/A | N/A |

- a) During Step A, the difference in mean power between adjacent slots shall be within the prescribed range for a TPC_cmd of 0, as given in table 5.4.2C.5.1.
- b) During Step A, the change in mean power over 10 consecutive slots shall be within the prescribed range for a TPC_cmd group of 0, as given in table 5.4.2C.5.2.
- c) During Step B, the difference in mean power between adjacent slots shall be within the prescribed range given in table 5.4.2C.5.1, given that every 5th TPC_cmd should have the value +1, with a step size of 1 dB, and all other TPC_cmd should have the value 0.
- d) During Step B, the change in mean power over 50 consecutive slots shall be within the prescribed range for a TPC_cmd group of {0,0,0,0,+1}, as given in table 5.4.2C.5.2.
- e) During Step C, the difference in mean power between adjacent slots shall be within the prescribed range given in table 5.4.2C.5.1, given that every 5th TPC_cmd should have the value -1, with a step size of 1 dB, and all other TPC_cmd should have the value 0.
- f) During Step C, the change in mean power over 50 consecutive slots shall be within the prescribed range for a TPC_cmd group of {0,0,0,0,-1}, as given in table 5.4.2C.5.2.
- g) During Step E, the difference in mean power between adjacent slots shall be within the prescribed range given in table 5.4.2C.5.1 for a TPC_cmd of -1 and step size of 1 dB. This applies when the original (reference) timeslot power and the target timeslot power are between the Min power threshold for test and the Max power threshold for test derived from the Measured Maximum output power in Step D. For the power step adjacent to the Min or Max power threshold for test, the lower step size requirement does not apply.
- h) During Step E, the change in mean power over 10 consecutive slots shall be within the prescribed range for a TPC_cmd group of -1, and step size of 1 dB as given in table 5.4.2C.5.2. This applies when the original (reference) timeslot power and the target timeslot power are between the Min power threshold for test and the Max power threshold for test derived from the Measured Maximum output power in Step D. The power step adjacent to the Min or Max power threshold for test should not be part of the 10 consecutive slots tested.
- i) During Step F, the difference in mean power between adjacent slots shall be within the prescribed range given in table 5.4.2C.5.1 for a TPC_cmd of +1 and step size of 1 dB. This applies when the original (reference) timeslot power and the target timeslot power are between the Min power threshold for test and the Max power threshold for test derived from the Measured Maximum output power in Step F. For the power step adjacent to the Min or Max power threshold for test, the lower step size requirement does not apply.
- j) During Step F, the change in mean power over 10 consecutive slots shall be within the prescribed range for a TPC_cmd group of +1, and step size of 1 dB as given in table 5.4.2C.5.2. This applies when the original (reference) timeslot power and the target timeslot power are between the Min power threshold for test and the Max power threshold for test derived from the Measured Maximum output power in Step F. The power step adjacent to the Min or Max power threshold for test should not be part of the 10 consecutive slots tested.

- k) During Step G, the difference in mean power between adjacent slots shall be within the prescribed range given in table 5.4.2C.5.1 for a TPC_cmd of -1 and step size of 2 dB. This applies when the original (reference) timeslot power and the target timeslot power are between the Min power threshold for test and the Max power threshold for test derived from the Measured Maximum output power in Step F. For the power step adjacent to the Min or Max power threshold for test, the lower step size requirement does not apply.
- l) During Step G, the change in mean power over 10 consecutive slots shall be within the prescribed range for a TPC_cmd group of -1, and step size of 2 dB as given in table 5.4.2C.5.2. This applies when the original (reference) timeslot power and the target timeslot power are between the Min power threshold for test and the Max power threshold for test derived from the Measured Maximum output power in Step F. The power step adjacent to the Min or Max power threshold for test should not be part of the 10 consecutive slots.
- m) During Step H, the difference in mean power between adjacent slots shall be within the prescribed range given in table 5.4.2C.5.1 for a TPC_cmd of +1 and step size of 2 dB. This applies when the original (reference) timeslot power and the target timeslot power are between the Min power threshold for test and the Max power threshold for test derived from the Measured Maximum output power in Step H. For the power step adjacent to the Min or Max power threshold for test, the lower step size requirement does not apply.
- n) During Step H, the change in mean power over 10 consecutive slots shall be within the prescribed range for a TPC_cmd group of +1, and step size of 2 dB as given in table 5.4.2C.5.2. This applies when the original (reference) timeslot power and the target timeslot power are between the Min power threshold for test and the Max power threshold for test derived from the Measured Maximum output power in Step H. The power step adjacent to the Min or Max power threshold for test should not be part of the 10 consecutive slots tested.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause FFS and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause FFS.

5.4.2D Inner Loop Power Control in the Uplink for UL CLTD activation state 2 and 3

Editor's note: This clause is incomplete. The following aspects are either missing or not yet determined:

- Message Contents are FFS.
- Call Setup procedure, test procedure, test tolerances may need an update.
- Update of Annexure is FFS

5.4.2D.1 Definition and applicability

Inner loop power control in the uplink is the ability of the UE transmitter to adjust its output power in accordance with one or more TPC commands received in the downlink.

The power control step is the change in the UE transmitter output power in response to a single TPC command, TPC_cmd, derived at the UE.

This clause does not cover all the requirements of compressed mode or soft handover.

The requirements and this test apply for Release 11 and later releases to all types of UTRA for the FDD UE that supports UL CLTD.

5.4.2D.2 Minimum requirements

The UE transmitter shall have the capability of changing the output power with a step size of 1 dB, 2 dB and 3 dB according to the value of Δ_{TPC} or $\Delta_{\text{RP-TPC}}$, in the slot immediately after the TPC_cmd can be derived.

- a) The transmitter output power step due to inner loop power control shall be within the range shown in table 5.4.2D.1.
- b) The transmitter aggregate output power step due to inner loop power control shall be within the range shown in table 5.4.2D.2. Here a TPC_cmd group is a set of TPC_cmd values derived from a corresponding sequence of TPC commands of the same duration.

For UE configured in UL CLTD activation state 2 or 3, the inner loop power control in the uplink specified in this clause applies at the active transmit antenna connector.

The inner loop power step is defined as the relative power difference between the mean power of the original (reference) timeslot and the mean power of the target timeslot, not including the transient duration. The transient duration is from 25 μ s before the slot boundary to 25 μ s after the slot boundary.

Table 5.4.2D.1: Transmitter power control range

| TPC_cmd | Transmitter power control range (all units are in dB) | | | | | |
|---------|---|-------|----------------|-------|----------------|-------|
| | 1 dB step size | | 2 dB step size | | 3 dB step size | |
| | Lower | Upper | Lower | Upper | Lower | Upper |
| +1 | +0,5 | +1,5 | +1 | +3 | +1,5 | +4,5 |
| 0 | -0,5 | +0,5 | -0,5 | +0,5 | -0,5 | +0,5 |
| -1 | -0,5 | -1,5 | -1 | -3 | -1,5 | -4,5 |

Table 5.4.2D.2: Transmitter aggregate power control tolerance

| TPC_cmd group | Transmitter power control range after 10 equal TPC_cmd group (all units are in dB) | | | | Transmitter power control range after 7 equal TPC_cmd groups (all units are in dB) | |
|---------------|--|-------|----------------|-------|--|-------|
| | 1 dB step size | | 2 dB step size | | 3 dB step size | |
| | Lower | Upper | Lower | Upper | Lower | Upper |
| +1 | +8 | +12 | +16 | +24 | +16 | +26 |
| 0 | -1 | +1 | -1 | +1 | -1 | +1 |
| -1 | -8 | -12 | -16 | -24 | -16 | -26 |
| 0,0,0,0,+1 | +6 | +14 | N/A | N/A | N/A | N/A |
| 0,0,0,0,-1 | -6 | -14 | N/A | N/A | N/A | N/A |

The UE shall meet the above requirements for inner loop power control over the power range bounded by the Minimum output power as defined in clause 5.4.3.2, and the Maximum output power supported by the UE (i.e. the actual power as would be measured assuming no measurement error). This power shall be in the range specified for the power class of the UE in clause 5.2.2.

NOTE: 3 dB inner loop power control steps are only used in compressed mode.

The reference for this requirement is TS 25.101 [1] clause 6.4.2.1.1C.

The requirements for the derivation of TPC_cmd are detailed in TS 25.214 [5] clauses 5.1.2.2.2 and 5.1.2.2.3.

5.4.2D.3 Test purpose

- To verify that the UE inner loop power control size and response with UL CLTD activation state 2 and 3 is meet to the described value shown in clause 5.4.2D.2.
- To verify that TPC_cmd is correctly derived from received TPC commands.

An excess error of the inner loop power control decreases the system capacity.

The UE shall be tested for the requirements for inner loop power control over the power range bounded by the Min power threshold for test and the Max power threshold for test.

The Min power threshold for test is defined as the Minimum Output Power Test Requirement (clause 5.4.3.5).

The Max power threshold for test is defined as the Measured Maximum output power of the UE in the relevant Step of the test (using the same method as in clause 5.2.4.2 step 2) minus the Test Tolerance specified for test 5.2 Maximum Output Power in table F.2.1.

For the final power step adjacent to the Min or Max power threshold for test, the lower step size requirement does not apply.

5.4.2D.4 Method of test

5.4.2D.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure FFS.
- 2) A call is set up according to the Generic call setup procedure specified in TS34.108 [3] sub clause 7.3.17, with the following exception for information elements in RADIO BEARER SETUP message. With this exception, the Power Control Algorithm for the Uplink is set to algorithm 2.

Table 5.4.2D.4.1: Contents of RADIO BEARER SETUP message: AM or UM

| Information Element | Value/Remark |
|---|---------------------------------|
| CHOICE channel requirement - Power Control Algorithm | Uplink DPCH info Algorithm 2 |

- 3) SS sends a HS-SCCH order activating UL_CLTD activation state 2.
- 4) Enter the UE into loopback test mode and start the loopback test.

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

5.4.2D.4.2 Procedure

Figure 5.4.2D.4 Inner Loop Power Control Test Steps

- 1) Before proceeding with paragraph (2) (Step A) below, set the output power of the UE to be in the range -10 ± 9 dBm. This may be achieved by setting the downlink signal (\hat{I}_{or}) to yield an appropriate open loop output power and/or by generating suitable downlink TPC commands from the SS.

2) Step A: Transmit a sequence of at least 30 and no more than 60 TPC commands, which shall commence at a frame boundary and last for a whole number of frames, and which shall contain:

- no sets of 5 consecutive "0" or "1" commands which commence in the 1st, 6th or 11th slots of a frame;
- at least one set of 5 consecutive "0" commands which does not commence in the 1st, 6th or 11th slots of a frame;
- at least one set of 5 consecutive "1" commands which does not commence in the 1st, 6th or 11th slots of a frame.

The following is an example of a suitable sequence of TPC commands:

```
10000010101010111110100000101010101111010000010101010111110
```

- 3) Step B: Transmit a sequence of 50 TPC commands with the value 1.
 - 4) Step C: Transmit a sequence of 50 TPC commands with the value 0.
 - 5) Step D: Transmit the PHYSICAL CHANNEL RECONFIGURATION message to reconfigure the uplink channel in order to set the Power Control Algorithm to algorithm 1, and the TPC step size to 1 dB. Contents of the message is specified in the table 5.4.2D.4.2.A. After the PHYSICAL CHANNEL RECONFIGURATION COMPLETE message from the UE is received, transmit a sequence of TPC commands with the value 1 until the UE output power is above the maximum power threshold.
 - 6) Step E: Transmit a sequence of 150 (note 1) TPC commands with the value 0.
 - 7) Step F: Transmit a sequence of 150 (note 1) TPC commands with the value 1.
 - 8) Step G: Transmit the PHYSICAL CHANNEL RECONFIGURATION message to reconfigure the uplink channel in order to set the TPC step size to 2 dB (with the Power Control Algorithm remaining as algorithm 1). Contents of the message is specified in the table 5.4.2D.4.2.B. After the PHYSICAL CHANNEL RECONFIGURATION COMPLETE message from the UE is received, transmit a sequence of TPC commands with the value 1 until the UE output power is above the maximum power threshold. Transmit a sequence of 75 (note 1) TPC commands with the value 0.
 - 9) Step H: Transmit a sequence of 75 (note 1) TPC commands with the value 1.
- 10) During steps A to H the mean power of every slot shall be measured, with the following exceptions:
- In steps D and F, measurement of the mean power is not required in slots after the 10th slot after the mean power has exceeded the maximum power threshold;
 - In steps E and G, measurement of the mean power is not required in slots after the 10th slot after the mean power has fallen below the minimum power threshold.

The transient periods of 25 µs before each slot boundary and 25 µs after each slot boundary shall not be included in the power measurements.

11) SS sends a HS-SCCH order activating UL_CLTD activation state 3

12) Repeat step 1 to 10 for activation state 3.

NOTE 1: These numbers of TPC commands are given as examples. The actual number of TPC commands transmitted in these steps shall be at least 10 more than the number required to ensure that the UE reaches the relevant maximum or minimum power threshold in each step, as shown in figure 5.4.2D.4.

NOTE 2: In order to make it more practical to measure the entire power control dynamic range (between min power threshold and max power threshold with suitable margins), it is permissible to segment the power control sequences into smaller subsequence. For example, Step-E can be divided into different stages while still fulfilling the purpose of the test to measure the entire dynamic range.

Table 5.4.2D.4.2.A: PHYSICAL CHANNEL RECONFIGURATION message for step D (step 5)

| Information Element | Value/Remark | Version |

| 0,0,0,0,+1 | +6±TT | +14±TT | N/A | N/A | N/A | N/A |
| 0,0,0,0,-1 | -6±TT | -14±TT | N/A | N/A | N/A | N/A |

- a) During Step A, the difference in mean power between adjacent slots shall be within the prescribed range for a TPC_cmd of 0, as given in table 5.4.2D.5.1.
- b) During Step A, the change in mean power over 10 consecutive slots shall be within the prescribed range for a TPC_cmd group of 0, as given in table 5.4.2D.5.2.
- c) During Step B, the difference in mean power between adjacent slots shall be within the prescribed range given in table 5.4.2D.5.1, given that every 5th TPC_cmd should have the value +1, with a step size of 1 dB, and all other TPC_cmd should have the value 0.
- d) During Step B, the change in mean power over 50 consecutive slots shall be within the prescribed range for a TPC_cmd group of {0,0,0,0,+1}, as given in table 5.4.2D.5.2.
- e) During Step C, the difference in mean power between adjacent slots shall be within the prescribed range given in table 5.4.2D.5.1, given that every 5th TPC_cmd should have the value -1, with a step size of 1 dB, and all other TPC_cmd should have the value 0.
- f) During Step C, the change in mean power over 50 consecutive slots shall be within the prescribed range for a TPC_cmd group of {0,0,0,0,-1}, as given in table 5.4.2D.5.2.
- g) During Step E, the difference in mean power between adjacent slots shall be within the prescribed range given in table 5.4.2D.5.1 for a TPC_cmd of -1 and step size of 1 dB. This applies when the original (reference) timeslot power and the target timeslot power are between the Min power threshold for test and the Max power threshold for test derived from the Measured Maximum output power in Step D. For the power step adjacent to the Min or Max power threshold for test, the lower step size requirement does not apply.
- h) During Step E, the change in mean power over 10 consecutive slots shall be within the prescribed range for a TPC_cmd group of -1, and step size of 1 dB as given in table 5.4.2D.5.2. This applies when the original (reference) timeslot power and the target timeslot power are between the Min power threshold for test and the Max power threshold for test derived from the Measured Maximum output power in Step D. The power step adjacent to the Min or Max power threshold for test should not be part of the 10 consecutive slots tested.
- i) During Step F, the difference in mean power between adjacent slots shall be within the prescribed range given in table 5.4.2D.5.1 for a TPC_cmd of +1 and step size of 1 dB. This applies when the original (reference) timeslot power and the target timeslot power are between the Min power threshold for test and the Max power threshold for test derived from the Measured Maximum output power in Step F. For the power step adjacent to the Min or Max power threshold for test, the lower step size requirement does not apply.
- j) During Step F, the change in mean power over 10 consecutive slots shall be within the prescribed range for a TPC_cmd group of +1, and step size of 1 dB as given in table 5.4.2D.5.2. This applies when the original (reference) timeslot power and the target timeslot power are between the Min power threshold for test and the Max power threshold for test derived from the Measured Maximum output power in Step F. The power step adjacent to the Min or Max power threshold for test should not be part of the 10 consecutive slots tested.

- k) During Step G, the difference in mean power between adjacent slots shall be within the prescribed range given in table 5.4.2D.5.1 for a TPC_cmd of -1 and step size of 2 dB. This applies when the original (reference) timeslot power and the target timeslot power are between the Min power threshold for test and the Max power threshold for test derived from the Measured Maximum output power in Step F. For the power step adjacent to the Min or Max power threshold for test, the lower step size requirement does not apply.
- l) During Step G, the change in mean power over 10 consecutive slots shall be within the prescribed range for a TPC_cmd group of -1, and step size of 2 dB as given in table 5.4.2D.5.2. This applies when the original (reference) timeslot power and the target timeslot power are between the Min power threshold for test and the Max power threshold for test derived from the Measured Maximum output power in Step F. The power step adjacent to the Min or Max power threshold for test should not be part of the 10 consecutive slots.
- m) During Step H, the difference in mean power between adjacent slots shall be within the prescribed range given in table 5.4.2D.5.1 for a TPC_cmd of +1 and step size of 2 dB. This applies when the original (reference) timeslot power and the target timeslot power are between the Min power threshold for test and the Max power threshold for test derived from the Measured Maximum output power in Step H. For the power step adjacent to the Min or Max power threshold for test, the lower step size requirement does not apply.
- n) During Step H, the change in mean power over 10 consecutive slots shall be within the prescribed range for a TPC_cmd group of +1, and step size of 2 dB as given in table 5.4.2D.5.2. This applies when the original (reference) timeslot power and the target timeslot power are between the Min power threshold for test and the Max power threshold for test derived from the Measured Maximum output power in Step H. The power step adjacent to the Min or Max power threshold for test should not be part of the 10 consecutive slots tested.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause FFS and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause FFS.

5.4.3 Minimum Output Power

5.4.3.1 Definition and applicability

The minimum controlled output power of the UE is when the power control setting is set to a minimum value. This is when both the inner loop and open loop power control indicate a minimum transmit output power is required.

The requirements and this test apply to all types of UTRA for the FDD UE.

5.4.3.2 Minimum Requirements

The minimum output power is defined as the mean power in one timeslot. The minimum transmit power shall be less than -50 dBm.

The normative reference for this requirement is TS 25.101 [1] clause 6.4.3.1.

5.4.3.3 Test purpose

To verify that the UE minimum transmit power is less than -50 dBm.

An excess minimum output power increases the interference to other channels, and decreases the system capacity.

5.4.3.4 Method of test

5.4.3.4.1 Initial conditions

Test environment: normal, TL/VL, TL/VH, TH/VL, TH/VH; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.1.
- 2) A call is set up according to the Generic call setup procedure in TS34.108 [3] sub clause 7.3.2.
- 3) Enter the UE into loopback test mode and start the loopback test.

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

5.4.3.4.2 Procedure

- 1) Set and send continuously Down power control commands to the UE.
- 2) Measure the mean power of the UE.

5.4.3.5 Test requirements

The measured power, derived in step 2), shall be less than -49 dBm.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.4.3A Minimum Output Power for DC-HSUPA

5.4.3A.1 Definition and applicability

The minimum controlled output power of the UE is when the power control setting is set to a minimum value. This is when both the inner loop and open loop power control indicate a minimum transmit output power is required.

The requirements and this test apply for Release 9 and later releases to all types of UTRA for the FDD UE that support HSDPA and Dual Cell E-DCH.

5.4.3A.2 Minimum Requirements

The minimum output power is defined as the mean power in one time slot in each carrier. The minimum output power in each carrier shall be less than -50 dBm, when both carriers are set to minimum output power.

The normative reference for this requirement is TS 25.101 [1] clause 6.4.3.1A.

5.4.3A.3 Test purpose

To verify that the UE minimum transmit power in each carrier is less than -50 dBm when both carriers are set to minimum output power.

An excess minimum output power increases the interference to other channels, and decreases the system capacity.

5.4.3A.4 Method of test

5.4.3A.4.1 Initial conditions

Test environment: normal, TL/VL, TL/VH, TH/VL, TH/VH; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.41.
- 2) The UL Reference Measurement Channel and parameters are specified in Annex C.2.6 and C.11A. The DL Reference Measurement Channel (FRC H-SET 3A, QPSK) is specified in C.8.1.1.
- 3) An E-DCH call is set up according to TS 34.108 [3] 7.3.14 with the exceptions in the RADIO BEARER SETUP message given in Tables 5.2BA.2, 5.2BA.3 and 5.2BA.4. These exceptions allow the beta values to be set according to table C.11A.1. and each UL physical channel to be at constant power during the measurement. RF parameters are set up according to table E.5A.1A. Settings for the serving cell are defined in table 5.4.3A.
- 4) Enter the UE into loopback test mode 1 looping back HSDPA to E-DCH according to procedure 7.3.14.3 in TS 34.108 [3] and start the loopback test

See TS 34.109 [4] clauses 5.3.2.3 and 5.3.2.6 for details regarding loopback test mode for HSDPA and E-DCH.

Table 5.4.3A: Settings for the serving cell during the measurement of Minimum Output Power with HS-DPCCH and E-DCH

| Parameter | Unit | Cell 1 |
|--|--------------|---------------------------------|
| Cell type | | Serving cell |
| UTRA RF Channel Number | | As defined in clause 5.4.3A.4.1 |
| Qqualmin | dB | -24 |
| Qrxlevmin | dBm | -115 |
| UE_TXPWR_MAX_RACH | dBm | +21 |
| \hat{I}_{or} (see notes 1 and 2) | dBm/3.84 MHz | -86 |
| NOTE 1: The power level is specified in terms of \hat{I}_{or} instead of CPICH_RSCP because RSCP is a receiver measurement, whereas the SS can only set \hat{I}_{or} . | | |
| NOTE 2: The cell fulfils TS 25.304, clause 5.2.3.1.2. | | |

5.4.3A.4.2 Procedure

- 1) Set and send continuously Down power control commands to the UE.
- 2) Measure the mean power in each carrier of the UE.

5.4.3A.5 Test requirements

The measured power in each carrier, derived in step 2), shall be less than -49 dBm.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.4.3B Minimum Output Power for OLTD

FFS

5.4.3C Minimum Output Power for UL CLTD Activation state 1

Editor's Note: : This clause is incomplete. The following aspects are either missing or not yet determined

- Method of Test contains many TBDs.
- Test Tolerances are FFS.
- Call Setup procedure is FFS.
- Update of Annexure is FFS
- Corresponding CR to TS 34.121-2 is missing

5.4.3C.1 Definition and applicability

The minimum controlled output power of the UE is when the power control setting is set to a minimum value. This is when both the inner loop and open loop power control indicate a minimum transmit output power is required.

The requirements and this test apply for Release 11 and later releases to all types of UTRA for the FDD UE that support uplink CLTD.

5.4.3C.2 Minimum Requirements

For UE with two active transmit antenna connectors in UL CLTD activation state 1, the minimum output power specified in sub-clause 5.4.3.2 applies at each transmit antenna connector, when the UE power is set to a minimum value.

The normative reference for this requirement is TS 25.101 [1] clause 6.4.3.1C.

5.4.3C.3 Test purpose

To verify that the UE minimum transmit power at each carrier is less than -50 dBm when the UE power is set to a minimum value.

An excess minimum output power increases the interference to other channels, and decreases the system capacity.

5.4.3C.4 Method of test

5.4.3C.4.1 Initial conditions

Test environment: normal, TL/VL, TL/VH, TH/VL, TH/VH; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure TBD.
- 2) The UL Reference Measurement Channel and parameters are specified in Annex TBD. The DL Reference Measurement Channel (FRC H-Set 1, QPSK) is specified in Annex C.8.1.1.
- 3) An HSDPA call with CLTD is set up according to TS 34.108 [3] 7.3.17.. RF parameters are set up according to table TBD. Settings for the serving cell are defined in table 5.4.3C.1.
- 4) SS sends a HS-SCCH order activating UL_CLTD activation state 1.
- 5) Enter the UE into loopback test mode 1 in the presence of HSDPA and start the loopback test.

Table 5.4.3C.1: Settings for the serving cell

| Parameter | Unit | Cell 1 |
|--|--------------|---------------------------------|
| Cell type | | Serving cell |
| UTRA RF Channel Number | | As defined in clause 5.4.3C.4.1 |
| Qqualmin | dB | -24 |
| Qrxlevmin | dBm | -115 |
| UE_TXPWR_MAX_RACH | dBm | +21 |
| \hat{I}_{or} (see notes 1 and 2) | dBm/3.84 MHz | -86 |
| NOTE 1: The power level is specified in terms of \hat{I}_{or} instead of CPICH_RSCP because RSCP is a receiver measurement, whereas the SS can only set \hat{I}_{or} . | | |
| NOTE 2: The cell fulfils TS 25.304, clause 5.2.3.1.2. | | |

See TS 34.109 [4] for details regarding loopback test mode for HSDPA .

5.4.3C.4.2 Procedure

- 1) Set and send continuously Down power control commands to the UE.
- 2) Measure the mean power at each carrier of the UE.

5.4.3C.5 Test requirements

The measured power at each carrier, derived in step 2), shall be less than $-50 + \text{TBD}$ dBm.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.4.3D Minimum Output Power for UL CLTD Activation state 2 and 3

Editor's Note: : This clause is incomplete. The following aspects are either missing or not yet determined

- Method of Test contains many TBDs.
- Test Tolerances are FFS.
- Call Setup procedure is FFS.

- Update of Annexure is FFS
- Corresponding CR to TS 34.121-2 is missing

5.4.3D.1 Definition and applicability

The minimum controlled output power of the UE is when the power control setting is set to a minimum value. This is when both the inner loop and open loop power control indicate a minimum transmit output power is required.

The requirements and this test apply for Release 11 and later releases to all types of UTRA for the FDD UE that support uplink CLTD.

5.4.3D.2 Minimum Requirements

For UE configured in UL CLTD activation state 2 or activation state 3, the minimum output power specified in sub-clause 5.4.3.2 applies at the active transmit antenna connector, when the UE power is set to a minimum value.

The normative reference for this requirement is TS 25.101 [1] clause 6.4.3.1C.

5.4.3D.3 Test purpose

To verify that the UE minimum transmit power at the active carrier is less than -50 dBm when the UE power is set to a minimum value.

An excess minimum output power increases the interference to other channels, and decreases the system capacity.

5.4.3D.4 Method of test

5.4.3D.4.1 Initial conditions

Test environment: normal, TL/VL, TL/VH, TH/VL, TH/VH; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure TBD.
- 2) The UL Reference Measurement Channel and parameters are specified in Annex TBD. The DL Reference Measurement Channel (F-H-Set 1) is specified in Annex C.8.1.1.
- 3) An HSDPA call with CLTD is set up according to TS 34.108 [3] 7.3.17. RF parameters are set up according to table TBD. Settings for the serving cell are defined in table 5.4.3D.1.
- 4) SS sends a HS-SCCH order activating UL_CLTD activation state 2.5) Enter the UE into loopback test mode 1 in the presence of HSDPA and start the loopback test.

Table 5.4.3D.1: Settings for the serving cell.

| Parameter | Unit | Cell 1 |
|--|--------------|---------------------------------|
| Cell type | | Serving cell |
| UTRA RF Channel Number | | As defined in clause 5.4.3D.4.1 |
| Qqualmin | dB | -24 |
| Qrxlevmin | dBm | -115 |
| UE_TXPWR_MAX_RACH | dBm | +21 |
| \hat{I}_{or} (see notes 1 and 2) | dBm/3.84 MHz | -86 |
| NOTE 1: The power level is specified in terms of \hat{I}_{or} instead of CPICH_RSCP because RSCP is a receiver measurement, whereas the SS can only set \hat{I}_{or} . | | |
| NOTE 2: The cell fulfils TS 25.304, clause 5.2.3.1.2. | | |

See TS 34.109 [4] for details regarding loopback test mode for HSDPA.

5.4.3D.4.2 Procedure

- 1) Set and send continuously Down power control commands to the UE.
- 2) Measure the mean power at active carrier of the UE.
- 3) SS sends a HS-SCCH order activating UL_CLTD activation state 3.

4) Repeat step 1 to 2 for activation state 3.

5.4.3D.5 Test requirements

The measured power at active carrier in activation state 2 or 3, derived in step 2), shall be less than $-50 + \text{TBD}$ dBm.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.4.4 Out-of-synchronisation handling of output power

5.4.4.1 Definition and applicability

The receiver characteristics in this section are specified at the antenna connector of the UE. For UEs with more than one receiver antenna connector the AWGN signals applied to each receiver antenna connector shall be uncorrelated. The levels of the test signal applied to each of the antenna connectors shall be as defined in section 5.4.4.2 below.

The UE shall monitor the DPCCH quality in order to detect a loss of the signal on Layer 1, as specified in TS 25.214 [5]. The thresholds Q_{out} and Q_{in} specify at what DPCCH quality levels the UE shall shut its power off and when it shall turn its power on respectively. The thresholds are not defined explicitly, but are defined by the conditions under which the UE shall shut its transmitter off and turn it on, as stated in this clause.

The DPCCH quality shall be monitored in the UE and compared to the thresholds Q_{out} and Q_{in} for the purpose of monitoring synchronization. The threshold Q_{out} should correspond to a level of DPCCH quality where no reliable detection of the TPC commands transmitted on the downlink DPCCH can be made. This can be at a TPC command error ratio level of e.g. 30%. The threshold Q_{in} should correspond to a level of DPCCH quality where detection of the TPC commands transmitted on the downlink DPCCH is significantly more reliable than at Q_{out} . This can be at a TPC command error ratio level of e.g. 20%.

The requirements of this test apply to all types of UTRA for the FDD UE and not supporting type 1 for DCH.

5.4.4.2 Minimum Requirements

When the UE estimates the DPCCH quality or the quality of the TPC fields of the F-DPCH frame received from the serving HS-DSCH cell over the last 160 ms period or quality of the TPC fields of the F-DPCH from the serving HS-DSCH cell over the previous 240 slots in which the TPC symbols are known to be present when the discontinuous uplink DPCCH transmission operation is enabled to be worse than a threshold Q_{out} , the UE shall shut its transmitter off within 40 ms. The UE shall not turn its transmitter on again until the DPCCH quality exceeds an acceptable level Q_{in} . When the UE estimates the DPCCH quality or the quality of the TPC fields of the F-DPCH frame received from the serving HS-DSCH cell over the last 160 ms period or quality of the TPC fields of the F-DPCH from the serving HS-DSCH cell over the previous 240 slots in which the TPC symbols are known to be present when the discontinuous uplink DPCCH transmission operation is enabled to be better than a threshold Q_{in} , the UE shall again turn its transmitter on within 40 ms.

The UE transmitter shall be considered "off" if the transmitted power is below the level defined in TS 25.101 [1] subclause 6.5.1 (Transmit off power). Otherwise the transmitter shall be considered as "on".

The normative reference for this requirement is TS 25.101 [1] clause 6.4.4.1.

The quality levels at the thresholds Q_{out} and Q_{in} correspond to different signal levels depending on the downlink conditions DCH parameters. For the conditions in table 5.4.4.1, a signal with the quality at the level Q_{out} can be generated by a DPCCH_Ec/Ior ratio of -25 dB, and a signal with Q_{in} by a DPCCH_Ec/Ior ratio of -21 dB. The DL reference measurement channel (12.2) kbps specified in subclause C.3.1 and with static propagation conditions. The downlink physical channels, other than those specified in table 5.4.4.1, are as specified in table E.3.3 of Annex E.

Table 5.4.4.1: DCH parameters for test of Out-of-synch handling test case

| Parameter | Value | Unit |
|-----------------------------|---|----------------|
| \hat{I}_{or}/I_{oc} | -1 | dB |
| I_{oc} | -60 | dBm / 3,84 MHz |
| $\frac{DPDCH_E_c}{I_{or}}$ | See Figure 5.4.4.1: Before point A -16,6 After point A Not defined See note in clause 5.4.4.3 | dB |
| $\frac{DPCCH_E_c}{I_{or}}$ | See table 5.4.4.2 | dB |
| Information Data Rate | 12,2 | kbps |

Table 5.4.4.2: Minimum Requirements for DPCCH_Ec/Ior levels

| Clause from figure 5.4.4.1 | DPCCH_Ec/Ior | Unit |
|----------------------------|--------------|------|
| Before A | -16,6 | dB |
| A to B | -22,0 | dB |
| B to D | -28,0 | dB |
| D to E | -24,0 | dB |
| After E | -18,0 | dB |

Figure 5.4.4.1 shows an example scenario where the DPCCH_Ec/Ior ratio varies from a level where the DPCH is demodulated under normal conditions, down to a level below Q_{out} where the UE shall shut its power off and then back up to a level above Q_{in} where the UE shall turn the power back on.

Figure 5.4.4.1: Test case for out-of-synch handling in the UE.

In this test case, the requirements for the UE are that:

1. The UE shall not shut its transmitter off before point B.
2. The UE shall shut its transmitter off before point C, which is $T_{off} = 200$ ms after point B.
3. The UE shall not turn its transmitter on between points C and E.
4. The UE shall turn its transmitter on before point F, which is $T_{on} = 200$ ms after point E.

The reference for this test case is TS 25.101 [1] clause 6.4.4.2.

5.4.4.3 Test purpose

To verify that the UE monitors the DPCCH quality and turns its transmitter on or off according to DPCCH level diagram specified in figure 5.4.4.1.

NOTE 1: DPDCH_Ec/I_{or} after point A is not defined in table 5.4.4.1. However it is assumed that DPDCH and DPCCH power level are same on DL 12,2 kbps reference measurement channel for testing. (PO1, PO2, and PO3 are zero.)

NOTE 2: The test case covers only the continuous uplink DPCCH transmission scenario.

5.4.4.4 Method of test

5.4.4.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.9.
- 2) A call is set up according to the Generic call setup procedure in TS34.108 [3], clause 7.3.2, with the following exception for information elements in System Information Block type 1 specified in TS 34.108 [3], clause 6.1.0b.

Table 5.4.4.2A: System Information Block type 1 message

| Information Element | Value/Remark |
|---|--------------|
| UE Timers and constants in connected mode | |
| - T313 | 15 seconds |
| - N313 | 200 |

- 3) DCH parameters are set up according to table 5.4.4.1 with DPCCH_Ec/I_{or} ratio level at -16,6 dB. The other RF parameters are set up according to clause E.3.3.
- 4) Enter the UE into loopback test mode and start the loopback test.

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

5.4.4.4.2 Procedure

- 1) The SS sends continuously Up power control commands to the UE until the UE transmitter power reach maximum level.
- 2) The SS controls the DPCCH_Ec/I_{or} ratio level according to clause 'A to B' as defined in table 5.4.4.3. The SS monitors the UE transmitted power for 5 seconds and verifies that the UE transmitter is not switched off during this time.
- 3) The SS controls the DPCCH_Ec/I_{or} ratio level according to clause 'B to D' as defined in table 5.4.4.3. The SS waits 200 ms and then verifies that the UE transmitter has been switched off.
- 4) The SS monitors the UE transmitted power for 5 seconds and verifies that the UE transmitter is not switched on during this time.
- 5) The SS controls the DPCCH_Ec/I_{or} ratio level according to clause 'D to E' as defined in table 5.4.4.3. The SS monitors the UE transmitted power for 5 s and verifies that the UE transmitter is not switched on during this time.
- 6) The SS controls the DPCCH_Ec/I_{or} ratio level according to clause 'After E' as defined in table 5.4.4.3. The SS waits 200 ms and then verifies that the UE transmitter has been switched on.

5.4.4.5 Test requirements

Table 5.4.4.3: Test Requirements for DPCCH_Ec/Ior levels

| Clause from figure 5.4.4.1 | DPCCH_Ec/Ior | Unit |
|----------------------------|--------------|------|
| Before A | -16,6 | dB |
| A to B | -21,6 | dB |
| B to D | -28,4 | dB |
| D to E | -24,4 | dB |
| After E | -17,6 | dB |

To pass the test, steps 1 through 6 of the procedure in clause 5.4.4.4.2 must be fulfilled.

The UE transmitter off criterion and its tolerances is defined in clause 5.5.1 (Transmit off power).

The UE transmitter on criterion and its tolerances is defined in clause 5.4.3 (Minimum Output Power). The UE transmitter is considered to be on if the UE transmitted power is higher than minimum output power.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Test Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.4.4A Out-of-synchronization handling of output power for a UE which supports type1 for DCH

5.4.4A.1 Definition and applicability

The receiver characteristics in this section are specified at the antenna connector of the UE. For UEs with more than one receiver antenna connector the AWGN signals applied to each receiver antenna connector shall be uncorrelated. The levels of the test signal applied to each of the antenna connectors shall be as defined in section 5.4.4A.2 below.

The UE shall monitor the DPCCH quality in order to detect a loss of the signal on Layer 1, as specified in TS 25.214 [5]. The thresholds Q_{out} and Q_{in} specify at what DPCCH quality levels the UE shall shut its power off and when it shall turn its power on respectively. The thresholds are not defined explicitly, but are defined by the conditions under which the UE shall shut its transmitter off and turn it on, as stated in this clause.

The DPCCH quality shall be monitored in the UE and compared to the thresholds Q_{out} and Q_{in} for the purpose of monitoring synchronization. The threshold Q_{out} should correspond to a level of DPCCH quality where no reliable detection of the TPC commands transmitted on the downlink DPCCH can be made. This can be at a TPC command error ratio level of e.g. 30%. The threshold Q_{in} should correspond to a level of DPCCH quality where detection of the TPC commands transmitted on the downlink DPCCH is significantly more reliable than at Q_{out} . This can be at a TPC command error ratio level of e.g. 20%.

The requirements of this test apply to UEs, which support the enhanced receiver performance of type1 for DCH of UTRA for the FDD from Release 7 onwards.

5.4.4A.2 Minimum requirement

When the UE estimates the DPCCH quality or the quality of the TPC fields of the F-DPCH frame received from the serving HS-DSCH cell over the last 160 ms period or quality of the TPC fields of the F-DPCH from the serving HS-DSCH cell over the previous 240 slots in which the TPC symbols are known to be present when the discontinuous uplink DPCCH transmission operation is enabled to be worse than a threshold Q_{out} , the UE shall shut its transmitter off within 40 ms. The UE shall not turn its transmitter on again until the DPCCH quality exceeds an acceptable level Q_{in} . When the UE estimates the DPCCH quality or the quality of the TPC fields of the F-DPCH frame received from the serving HS-DSCH cell over the last 160 ms period or quality of the TPC fields of the F-DPCH from the serving HS-DSCH cell over the previous 240 slots in which the TPC symbols are known to be present when the discontinuous uplink DPCCH transmission operation is enabled to be better than a threshold Q_{in} , the UE shall again turn its transmitter on within 40 ms.

The UE transmitter shall be considered "off" if the transmitted power is below the level defined in TS 25.101 [1] subclause 6.5.1 (Transmit off power). Otherwise the transmitter shall be considered as "on".

The normative reference for this requirement is TS 25.101 [1] clause 6.4.4.1.

The quality levels at the thresholds Q_{out} and Q_{in} correspond to different signal levels depending on the downlink conditions DCH parameters. For the conditions in Table 5.4.4A.1, a signal with the quality at the level Q_{out} can be generated by a $DPCCH_Ec/I_{or}$ ratio of -28 dB, and a signal with Q_{in} by a $DPCCH_Ec/I_{or}$ ratio of -24 dB. The DL reference measurement channel (12.2) kbps specified in subclause C.3.1 and with static propagation conditions. The downlink physical channels, other than those specified in Table 5.4.4A.1, are as specified in Table E.3.3 of Annex E.

Table 5.4.4A.1: DCH parameters for the Out-of-synch handling test case

| Parameter | Unit | Value |
|-----------------------------|--------------|---|
| \hat{I}_{or}/I_{oc} | dB | -1 |
| I_{oc} | dBm/3.84 MHz | -60 |
| $\frac{DPDCH_E_c}{I_{or}}$ | dB | See figure 5.4.4A.1: Before point A -19.6 After point A Not defined |
| $\frac{DPCCH_E_c}{I_{or}}$ | | See table 5.4.4A.2 |
| Information Data Rate | kbps | 12.2 |

Table 5.4.4A.2: Minimum Requirements for DPCCH_Ec/Ior levels

| Clause from figure 5.4.4A.1 | DPCCH_Ec/Ior (UE, supporting enhanced performance requirements type 1 for DCH) | Unit |
|-----------------------------|---|------|
| Before A | -19.6 | dB |
| A to B | -25.0 | dB |
| B to D | -31.0 | dB |
| D to E | -27.0 | dB |
| After E | -21.0 | dB |

Figure 5.4.4A.1 shows an example scenario for a UE which supports the optional enhanced performance requirements type1 for DCH, where the $DPCCH_Ec/I_{or}$ ratio varies from a level where the DPCH is demodulated under normal conditions, down to a level below Q_{out} where the UE shall shut its power off and then back up to a level above Q_{in} where the UE shall turn the power back on.

Figure 5.4.4A.1: Test case for out-of-synch handling in the UE supporting the enhanced performance requirements type1 for DCH

In this test case, the requirements for the UE are that:

1. The UE shall not shut its transmitter off before point B.
2. The UE shall shut its transmitter off before point C, which is $T_{\text{off}} = 200$ ms after point B.
3. The UE shall not turn its transmitter on between points C and E.
4. The UE shall turn its transmitter on before point F, which is $T_{\text{on}} = 200$ ms after point E.

5.4.4A.3 Test purpose

To verify that the UE monitors the DPCCH quality and turns its transmitter on or off according to DPCCH level diagram specified in figure 5.4.4A.1.

NOTE 1: DPDCH_Ec/I_{or} after point A is not defined in table 5.4.4A.1. However it is assumed that DPDCH and DPCCH power level are same on DL 12,2 kbps reference measurement channel for testing. (PO1, PO2, and PO3 are zero.)

NOTE 2: The test case covers only the continuous uplink DPCCH transmission scenario.

5.4.4A.4 Method of test

5.4.4A.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.9 or figure A.26 in case of a UE, supporting enhanced performance requirements type 1 for DCH, equipped with RX-diversity.
- 2) A call is set up according to the Generic call setup procedure in TS34.108 [3], clause 7.3.2, with the following exception for information elements in System Information Block type 1 specified in TS 34.108 [3], clause 6.1.0b.

Table 5.4.4A.2A: System Information Block type 1 message

| Information Element | Value/Remark |
|---|-------------------|
| UE Timers and constants in connected mode - T313 - N313 | 15 seconds 200 |

- 3) DCH parameters are set up according to table 5.4.4A.1 with DPCCH_Ec/Ior ratio level at -19,6 dB. The other RF parameters are set up according to clause E.3.3.
- 4) Enter the UE into loopback test mode and start the loopback test.

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

5.4.4A.4.2 Procedure

- 1) The SS sends continuously Up power control commands to the UE until the UE transmitter power reach maximum level.
- 2) The SS controls the DPCCH_Ec/Ior ratio level according to clause 'A to B' as defined in table 5.4.4A.3. The SS monitors the UE transmitted power for 5 seconds and verifies that the UE transmitter is not switched off during this time.
- 3) The SS controls the DPCCH_Ec/Ior ratio level according to clause 'B to D' as defined in table 5.4.4A.3. The SS waits 200 ms and then verifies that the UE transmitter has been switched off.
- 4) The SS monitors the UE transmitted power for 5 seconds and verifies that the UE transmitter is not switched on during this time.
- 5) The SS controls the DPCCH_Ec/Ior ratio level according to clause 'D to E' as defined in table 5.4.4A.3. The SS monitors the UE transmitted power for 5 s and verifies that the UE transmitter is not switched on during this time.
- 6) The SS controls the DPCCH_Ec/Ior ratio level according to clause 'After E' as defined in table 5.4.4A.3. The SS waits 200 ms and then verifies that the UE transmitter has been switched on.

5.4.4A.5 Test requirements

Table 5.4.4A.3: Test Requirements for DPCCH_Ec/Ior levels

| Clause from figure 5.4.4A.1 | DPCCH_Ec/Ior (UE, supporting enhanced performance requirements type 1) | Unit |
|-----------------------------|--|------|
| Before A | -19.6 | dB |
| A to B | -24.6 | dB |
| B to D | -31.4 | dB |
| D to E | -27.4 | dB |
| After E | -20.6 | dB |

To pass the test, steps 1 through 6 of the procedure in clause 5.4.4A.2 must be fulfilled.

The UE transmitter off criterion and its tolerances is defined in clause 5.5.1 (Transmit off power).

The UE transmitter on criterion and its tolerances is defined in clause 5.4.3 (Minimum Output Power). The UE transmitter is considered to be on if the UE transmitted power is higher than minimum output power.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Test Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.4.4B FFS

5.4.4C Out-of-synchronisation handling of output power for UL CLTD activation state 1

Editor's note: This clause is incomplete. The following aspects are either missing or not yet determined:

- Message Contents are FFS.
- Call Setup procedure, test procedure, test tolerances may need an update.
- Update of Annexure is FFS
- Test procedure is FFS

5.4.4C.1 Definition and applicability

The receiver characteristics in this section are specified at the antenna connector of the UE. For UEs with more than one receiver antenna connector the AWGN signals applied to each receiver antenna connector shall be uncorrelated. The levels of the test signal applied to each of the antenna connectors shall be as defined in section 5.4.4C.2 below.

The UE shall monitor the DPCCH quality in order to detect a loss of the signal on Layer 1, as specified in TS 25.214 [5]. The thresholds Q_{out} and Q_{in} specify at what DPCCH quality levels the UE shall shut its power off and when it shall turn its power on respectively. The thresholds are not defined explicitly, but are defined by the conditions under which the UE shall shut its transmitter off and turn it on, as stated in this clause.

The DPCCH quality shall be monitored in the UE and compared to the thresholds Q_{out} and Q_{in} for the purpose of monitoring synchronization. The threshold Q_{out} should correspond to a level of DPCCH quality where no reliable detection of the TPC commands transmitted on the downlink DPCCH can be made. This can be at a TPC command error ratio level of e.g. 30%. The threshold Q_{in} should correspond to a level of DPCCH quality where detection of the TPC commands transmitted on the downlink DPCCH is significantly more reliable than at Q_{out} . This can be at a TPC command error ratio level of e.g. 20%.

The requirements and this test apply for Release 11 and later releases to all types of UTRA for the FDD UE that supports UL CLTD and not supporting type 1 for DCH.

5.4.4C.2 Minimum Requirements

For UE with two active transmit antenna connectors in UL CLTD activation state 1, the minimum requirements specified below apply at each transmit antenna connector.

When the UE estimates the DPCCH quality or the quality of the TPC fields of the F-DPCH frame received from the serving HS-DSCH cell over the last 160 ms period or quality of the TPC fields of the F-DPCH from the serving HS-DSCH cell over the previous 240 slots in which the TPC symbols are known to be present when the discontinuous uplink DPCCH transmission operation is enabled to be worse than a threshold Q_{out} , the UE shall shut its transmitter off within 40 ms. The UE shall not turn its transmitter on again until the DPCCH quality exceeds an acceptable level Q_{in} . When the UE estimates the DPCCH quality or the quality of the TPC fields of the F-DPCH frame received from the serving HS-DSCH cell over the last 160 ms period or quality of the TPC fields of the F-DPCH from the serving HS-DSCH cell over the previous 240 slots in which the TPC symbols are known to be present when the discontinuous uplink DPCCH transmission operation is enabled to be better than a threshold Q_{in} , the UE shall again turn its transmitter on within 40 ms.

The UE transmitter shall be considered "off" if the transmitted power is below the level defined in TS 25.101 [1] subclause 6.5.1 (Transmit off power). Otherwise the transmitter shall be considered as "on".

The quality levels at the thresholds Q_{out} and Q_{in} correspond to different signal levels depending on the downlink conditions DCH parameters. For the conditions in table 5.4.4C.1, a signal with the quality at the level Q_{out} can be generated by a DPCCH_Ec/Ior ratio of -25 dB, and a signal with Q_{in} by a DPCCH_Ec/Ior ratio of -21 dB. The DL reference measurement channel (12.2) kbps specified in subclause C.3.1 and with static propagation conditions. The downlink physical channels, other than those specified in table 5.4.4C.1, are as specified in table E.3.3 of Annex E.

Table 5.4.4C.1: DCH parameters for test of Out-of-synch handling test case

| Parameter | Value | Unit |
|-----------------------------|---|----------------|
| \hat{I}_{or}/I_{oc} | -1 | dB |
| I_{oc} | -60 | dBm / 3,84 MHz |
| $\frac{DPDCH_E_c}{I_{or}}$ | See Figure 5.4.4C.1: Before point A -16,6 After point A Not defined See note in clause 5.4.4C.3 | dB |
| $\frac{DPCCH_E_c}{I_{or}}$ | See table 5.4.4C.2 | dB |
| Information Data Rate | 12,2 | kbps |

Table 5.4.4C.2: Minimum Requirements for DPCCH_Ec/Ior levels

| Clause from figure 5.4.4C.1 | DPCCH_Ec/Ior | Unit |
|-----------------------------|--------------|------|
| Before A | -16,6 | dB |
| A to B | -22,0 | dB |
| B to D | -28,0 | dB |
| D to E | -24,0 | dB |
| After E | -18,0 | dB |

Figure 5.4.4C.1 shows an example scenario where the DPCCH_Ec/Ior ratio varies from a level where the DPCH is demodulated under normal conditions, down to a level below Q_{out} where the UE shall shut its power off and then back up to a level above Q_{in} where the UE shall turn the power back on.

Figure 5.4.4C.1: Test case for out-of-synch handling in the UE

In this test case, the requirements for the UE are that:

1. The UE shall not shut its transmitter off before point B.
2. The UE shall shut its transmitter off before point C, which is $T_{off} = 200$ ms after point B.
3. The UE shall not turn its transmitter on between points C and E.

4. The UE shall turn its transmitter on before point F, which is $T_{on} = 200$ ms after point E.

The normative reference for this requirement is TS 25.101 [1] clause 6.4.4.1B.

5.4.4C.3 Test purpose

To verify that the UE monitors the DPCCH quality and turns its transmitter on or off according to DPCCH level diagram specified in figure 5.4.4C.1.

NOTE 1: $DPDCH_{Ec}/I_{or}$ after point A is not defined in table 5.4.4C.1. However it is assumed that DPDCH and DPCCH power level are same on DL 12,2 kbps reference measurement channel for testing. (PO1, PO2, and PO3 are zero.)

NOTE 2: The test case covers only the continuous uplink DPCCH transmission scenario.

5.4.4C.4 Method of test

5.4.4C.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure FFS.
- 2) A call is set up according to the Generic call setup procedure in TS34.108 [3], clause FFS, with the following exception for information elements in System Information Block type 1 specified in TS 34.108 [3], clause 6.1.0b.
- 3) SS activates UL_CLTD activation state 1.

Table 5.4.4C.2A: System Information Block type 1 message

| Information Element | Value/Remark |
|---|--------------|
| UE Timers and constants in connected mode | |
| - T313 | 15 seconds |
| - N313 | 200 |

- 4) DCH parameters are set up according to table 5.4.4C.1 with $DPDCH_{Ec}/I_{or}$ ratio level at -16,6 dB. The other RF parameters are set up according to clause E.3.3.
- 5) Enter the UE into loopback test mode and start the loopback test.

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

5.4.4C.4.2 Procedure

1FFS

5.4.4C.5 Test requirements

Table 5.4.4C.3: Test Requirements for DPCCH_Ec/Ior levels

| Clause from figure 5.4.4C.1 | DPCCH_Ec/Ior | Unit |
|-----------------------------|--------------|------|
| Before A | -16,6+TT | dB |
| A to B | -21,6+TT | dB |
| B to D | -28,4+TT | dB |
| D to E | -24,4+TT | dB |
| After E | -17,6+TT | dB |

To pass the test, steps 1 through 6 of the procedure in clause 5.4.4C.4.2 must be fulfilled.

The UE transmitter off criterion and its tolerances is defined in clause 5.5.1 (Transmit off power).

The UE transmitter on criterion and its tolerances is defined in clause 5.4.3 (Minimum Output Power). The UE transmitter is considered to be on if the UE transmitted power is higher than minimum output power.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause FFS and the explanation of how the Test Requirement has been relaxed by the Test Tolerance is given in clause FFS.

5.4.4D Out-of-synchronisation handling of output power for UL CLTD activation state 2 and 3

Editor's note: This clause is incomplete. The following aspects are either missing or not yet determined:

- Message Contents are FFS.
- Call Setup procedure, test procedure, test tolerances may need an update.
- Update of Annexure is FFS
- Test Procedure is FFS

5.4.4D.1 Definition and applicability

The receiver characteristics in this section are specified at the antenna connector of the UE. For UEs with more than one receiver antenna connector the AWGN signals applied to each receiver antenna connector shall be uncorrelated. The levels of the test signal applied to each of the antenna connectors shall be as defined in section 5.4.4D.2 below.

The UE shall monitor the DPCCH quality in order to detect a loss of the signal on Layer 1, as specified in TS 25.214 [5]. The thresholds Q_{out} and Q_{in} specify at what DPCCH quality levels the UE shall shut its power off and when it shall turn its power on respectively. The thresholds are not defined explicitly, but are defined by the conditions under which the UE shall shut its transmitter off and turn it on, as stated in this clause.

The DPCCH quality shall be monitored in the UE and compared to the thresholds Q_{out} and Q_{in} for the purpose of monitoring synchronization. The threshold Q_{out} should correspond to a level of DPCCH quality where no reliable detection of the TPC commands transmitted on the downlink DPCCH can be made. This can be at a TPC command error ratio level of e.g. 30%. The threshold Q_{in} should correspond to a level of DPCCH quality where detection of the TPC commands transmitted on the downlink DPCCH is significantly more reliable than at Q_{out} . This can be at a TPC command error ratio level of e.g. 20%.

The requirements and this test apply for Release 11 and later releases to all types of UTRA for the FDD UE that supports UL CLTD and not supporting type 1 for DCH.

5.4.4D.2 Minimum Requirements

For UE configured in UL CLTD activation state 2 or activation state 3, the minimum requirements specified below apply at the active transmit antenna connector.

When the UE estimates the DPCCH quality or the quality of the TPC fields of the F-DPCH frame received from the serving HS-DSCH cell over the last 160 ms period or quality of the TPC fields of the F-DPCH from the serving HS-DSCH cell over the previous 240 slots in which the TPC symbols are known to be present when the discontinuous uplink DPCCH transmission operation is enabled to be worse than a threshold Q_{out} , the UE shall shut its transmitter off within 40 ms. The UE shall not turn its transmitter on again until the DPCCH quality exceeds an acceptable level Q_{in} . When the UE estimates the DPCCH quality or the quality of the TPC fields of the F-DPCH frame received from the serving HS-DSCH cell over the last 160 ms period or quality of the TPC fields of the F-DPCH from the serving HS-DSCH cell over the previous 240 slots in which the TPC symbols are known to be present when the discontinuous uplink DPCCH transmission operation is enabled to be better than a threshold Q_{in} , the UE shall again turn its transmitter on within 40 ms.

The UE transmitter shall be considered "off" if the transmitted power is below the level defined in TS 25.101 [1] subclause 6.5.1 (Transmit off power). Otherwise the transmitter shall be considered as "on".

The quality levels at the thresholds Q_{out} and Q_{in} correspond to different signal levels depending on the downlink conditions DCH parameters. For the conditions in table 5.4.4D.1, a signal with the quality at the level Q_{out} can be generated by a DPCCH_Ec/Ior ratio of -25 dB, and a signal with Q_{in} by a DPCCH_Ec/Ior ratio of -21 dB. The DL

reference measurement channel (12.2) kbps specified in subclause C.3.1 and with static propagation conditions. The downlink physical channels, other than those specified in table 5.4.4D.1, are as specified in table E.3.3 of Annex E.

Table 5.4.4D.1: DCH parameters for test of Out-of-synch handling test case

| Parameter | Value | Unit |
|-----------------------------|---|----------------|
| \hat{I}_{or}/I_{oc} | -1 | dB |
| I_{oc} | -60 | dBm / 3,84 MHz |
| $\frac{DPDCH_E_c}{I_{or}}$ | See Figure 5.4.4D.1: Before point A -16,6 After point A Not defined See note in clause 5.4.4D.3 | dB |
| $\frac{DPCCH_E_c}{I_{or}}$ | See table 5.4.4D.2 | dB |
| Information Data Rate | 12,2 | kbps |

Table 5.4.4D.2: Minimum Requirements for DPCCH_Ec/Ior levels

| Clause from figure 5.4.4D.1 | DPCCH_Ec/Ior | Unit |
|-----------------------------|--------------|------|
| Before A | -16,6 | dB |
| A to B | -22,0 | dB |
| B to D | -28,0 | dB |
| D to E | -24,0 | dB |
| After E | -18,0 | dB |

Figure 5.4.4D.1 shows an example scenario where the DPCCH_Ec/Ior ratio varies from a level where the DPCCH is demodulated under normal conditions, down to a level below Q_{out} where the UE shall shut its power off and then back up to a level above Q_{in} where the UE shall turn the power back on.

Figure 5.4.4D.1: Test case for out-of-synch handling in the UE.

In this test case, the requirements for the UE are that:

1. The UE shall not shut its transmitter off before point B.
2. The UE shall shut its transmitter off before point C, which is $T_{off} = 200$ ms after point B.

3. The UE shall not turn its transmitter on between points C and E.
4. The UE shall turn its transmitter on before point F, which is $T_{on} = 200$ ms after point E.

The normative reference for this requirement is TS 25.101 [1] clause 6.4.4.1B.

5.4.4D.3 Test purpose

To verify that the UE monitors the DPCCH quality and turns its transmitter on or off according to DPCCH level diagram specified in figure 5.4.4D.1.

NOTE 1: $DPDCH_{Ec}/I_{or}$ after point A is not defined in table 5.4.4D.1. However it is assumed that DPDCH and DPCCH power level are same on DL 12,2 kbps reference measurement channel for testing. (PO1, PO2, and PO3 are zero.)

NOTE 2: The test case covers only the continuous uplink DPCCH transmission scenario.

5.4.4D.4 Method of test

5.4.4D.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure FFS.
- 2) A call is set up according to the Generic call setup procedure in TS34.108 [3], clause FFS, with the following exception for information elements in System Information Block type 1 specified in TS 34.108 [3], clause 6.1.0b.

Table 5.4.4D.2A: System Information Block type 1 message

| Information Element | Value/Remark |
|---|-------------------|
| UE Timers and constants in connected mode - T313 - N313 | 15 seconds 200 |

- 3) SS sends a HS-SCCH order activating UL_CLTD activation state 2.
- 4) DCH parameters are set up according to table 5.4.4D.1 with $DPDCH_{Ec}/I_{or}$ ratio level at -16,6 dB. The other RF parameters are set up according to clause E.3.3.
- 5) Enter the UE into loopback test mode and start the loopback test.

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

5.4.4D.4.2 Procedure

FFS

5.4.4D.5 Test requirements

Table 5.4.4D.3: Test Requirements for $DPDCH_{Ec}/I_{or}$ levels

| Clause from figure 5.4.4D.1 | $DPDCH_{Ec}/I_{or}$ | Unit |
|-----------------------------|---------------------|------|
| Before A | -16,6+TT | dB |
| A to B | -21,6+TT | dB |
| B to D | -28,4+TT | dB |
| D to E | -24,4+TT | dB |
| After E | -17,6+TT | dB |

To pass the test, steps 1 through 6 of the procedure in clause 5.4.4D.4.2 must be fulfilled.

The UE transmitter off criterion and its tolerances is defined in clause 5.5.1 (Transmit off power).

The UE transmitter on criterion and its tolerances is defined in clause 5.4.3 (Minimum Output Power). The UE transmitter is considered to be on if the UE transmitted power is higher than minimum output power.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause FFS and the explanation of how the Test Requirement has been relaxed by the Test Tolerance is given in clause FFS.

5.5 Transmit ON/OFF Power

5.5.1 Transmit OFF Power

5.5.1.1 Definition and applicability

Transmit OFF power is defined as the RRC filtered mean power when the transmitter is off. The transmit OFF power state is when the UE does not transmit or during periods when the UE is not transmitting DPCCCH due to discontinuous uplink DPCCCH transmission. During transmission gaps in UL compressed mode, the UE is not considered to be in the OFF state.

The requirements and this test apply to all types of UTRA for the FDD UE.

5.5.1.2 Minimum Requirements

The requirement for the transmit OFF power shall be less than -56 dBm.

The normative reference for this requirement is TS 25.101 [1] clause 6.5.1.1.

5.5.1.3 Test purpose

To verify that the UE transmit OFF power is less than -56 dBm.

An excess transmit OFF power increases the interference to other channels, and decreases the system capacity.

5.5.1.4 Method of test

This test is covered by clause 5.5.2 Transmit ON/OFF Time mask.

5.5.1.5 Test requirements

The measured RRC filtered mean power shall be less than -55 dBm.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.5.2 Transmit ON/OFF Time mask

5.5.2.1 Definition and applicability

The time mask for transmit ON/OFF defines the ramping time allowed for the UE between transmit OFF power and transmit ON power. Possible ON/OFF scenarios for release 99 and release 4 only are PRACH, CPCH or uplink compressed mode. For release 5 and later the possible ON/OFF scenarios are PRACH, discontinuous uplink DPCCCH transmission or uplink compressed mode.

The requirements and this test apply to all types of UTRA for the FDD UE.

5.5.2.2 Minimum requirements

The mean power of successive slots shall be calculated according to figure 5.5.1 for PRACH preambles, figure 5.5.1A for discontinuous uplink DPCCCH transmission and figure 5.5.2 for all other cases. The off signal is defined as the RRC filtered mean power.

Figure 5.5.1: Transmit ON/OFF template for PRACH preambles

Figure 5.5.1A: Transmit ON/OFF template for discontinuous uplink DPCCH transmission

Figure 5.5.2: Transmit ON/OFF template for all other On/Off cases

OFF Power is defined in clause 5.5.1.2.

ON power is defined as the mean power. The specification depends on each possible case.

- First preamble of PRACH: Open loop accuracy (table 5.4.1.1).
- During preamble ramping of the RACH and between final RACH preamble and RACH message part: Accuracy depending on size of the required power difference (table 5.5.2.1).
- After transmission gap due to discontinuous uplink DPCCH transmission: Accuracy as in table 5.5.2.1A.
- After transmission gaps in compressed mode: Accuracy as in table 5.7.1.
- Power step to Maximum Power: Maximum power accuracy (table 5.2.1).

Table 5.5.2.1: Transmitter power difference tolerance for RACH preamble ramping, and between final RACH preamble and RACH message part

| Power difference size ΔP [dB] | Transmitter power difference tolerance [dB] |
|--|--|
| 0 | ± 1 |
| 1 | ± 1 |
| 2 | $\pm 1,5$ |
| 3 | ± 2 |
| $4 \leq \Delta P \leq 10$ | $\pm 2,5$ |
| $11 \leq \Delta P \leq 15$ | $\pm 3,5$ |
| $16 \leq \Delta P \leq 20$ | $\pm 4,5$ |
| $21 \leq \Delta P$ | $\pm 6,5$ |

Table 5.5.2.1A: Transmitter power difference tolerance after a gap of up to 10 sub-frames due to discontinuous uplink DPCCH transmission

| Last TPC_cmd | Transmitter power step tolerance after discontinuous UL DPCCH transmission gap | | | | | |
|--------------|--|-------|----------------|-------|----------------|-------|
| | 1 dB step size | | 2 dB step size | | 3 dB step size | |
| | Lower | Upper | Lower | Upper | Lower | Upper |
| +1 | -2 dB | +4 dB | -1 dB | +5 dB | 0 dB | +6 dB |
| 0 | -3 dB | +3 dB | -3 dB | +3 dB | -3 dB | +3 dB |
| -1 | -4 dB | +2 dB | -5 dB | +1 dB | -6 dB | 0 dB |

The reference for this requirement is TS 25.101 [1] clause 6.5.2.1.

This is tested using PRACH operation.

5.5.2.3 Test purpose

To verify that the power ON/OFF ratio of the PRACH shown in figure 5.5.1 meets the requirements given in 5.5.2.2.

Transmission of the wrong power increases interference to other channels, or increases transmission errors in the uplink's own channel.

NOTE: The test case covers only the PRACH scenario.

5.5.2.4 Method of test

5.5.2.4.1 Initial conditions

Test environment: normal, TL/VL, TL/VH, TH/VL, TH/VH; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.1.
- 2) Channel conditions are initially set up with received CPICH_RSCP > -85 dBm. The relative power level of downlink physical channels to I_{Or} are set up according to clause E.2.1. The parameter settings of the cell are set up according to table 5.5.2.1A.
- 3) Switch on the phone.
- 4) After the UE has performed registration and entered idle mode, \hat{I}_{Or} is set up according to table 5.5.2.2. The relative power level of downlink physical channels to I_{Or} are set up according to clause E.2.1
- 5) A call is set up according to the Generic call setup procedure, in [3] clause 7.3.1 with channel conditions according the test parameters in table 5.5.2.3.

The RACH procedure within the call setup is used for the test. The number of the available subchannels should be limited to one. This ensures that the preamble sequence is known to the SS. The preamble retransmission shall be at least 3. The power ramping step size shall be 1 dB. Note that the maximum number of preamble retransmissions is limited to 5 due to the fact that the commanded uplink power exceeds the allowed uplink power of more than 6 dB. The SS shall not send either an ACK or a NACK.

Table 5.5.2.1A: Settings for the serving cell

| Parameter | Unit | Cell 1 | | | |
|------------------------|------|---------------|---------------|---------------|---------------|
| | | Power class 1 | Power class 2 | Power class 3 | Power class 4 |
| Cell type | | Serving cell | | | |
| UTRA RF Channel Number | | Channel 1 | | | |
| Qqualmin | dB | -24 | | | |
| Qrxlevmin | dBm | -115 | | | |
| UE_TXPWR_MAX_RACH | dBm | 33 | 27 | 24 | 21 |

Table 5.5.2.2: Test parameters for Transmit ON/OFF Time mask (UE)

| Parameter | Level / Status | Unit |
|----------------|-------------------|----------------|
| \hat{I}_{or} | See table 5.5.2.3 | dBm / 3,84 MHz |

Table 5.5.2.3: Test parameters for Transmit ON/OFF Time mask (SS)

| Parameter | Power Class 1 | Power Class 2 | Power Class 3 | Power Class 4 | Unit |
|---|--|--|--|--|----------------|
| \hat{I}_{or} (note 1) | <REF \hat{I}_{or} > | <REF \hat{I}_{or} > | <REF \hat{I}_{or} > | <REF \hat{I}_{or} > | dBm / 3,84 MHz |
| CPICH_RSCP (notes 1 and 2) | <REF \hat{I}_{or} > + CPICH_Ec / I_{or} | <REF \hat{I}_{or} > + CPICH_Ec / I_{or} | <REF \hat{I}_{or} > + CPICH_Ec / I_{or} | <REF \hat{I}_{or} > + CPICH_Ec / I_{or} | dBm |
| Primary CPICH DL TX power | +19 | +19 | +19 | +19 | dBm |
| Simulated path loss = Primary CPICH DL TX power - CPICH_RSCP | Band I, IV, VI, X, XIX, XI, XXI | 128.9 | 128.9 | 128.9 | dB |
| | Band II, V, VII | 126.9 | 126.9 | 126.9 | |
| | Band III, VIII, XII, XIII, XIV, XX, XXII | 125.9 | 125.9 | 125.9 | |
| | Band IX | 127.9 | 127.9 | 127.9 | |
| | Band XXV, XXVI | 125.4 | 125.4 | 125.4 | |
| UL interference | Band I, IV, VI, X, XIX, XI, XXI | -86 | -92 | -95 | dBm |
| | Band II, V, VII | -84 | -90 | -93 | |
| | Band III, VIII, XII, XIII, XIV, XX, XXII | -83 | -89 | -92 | |
| | Band IX | -85 | -91 | -94 | |
| | Band XXV, XXVI | -83 | -89 | -92 | |
| Constant Value | -10 | -10 | -10 | -10 | dB |
| Expected nominal UE TX power for all bands except bands XXV and XXVI (note 3) | +32.9 | +26.9 | +23.9 | +20.9 | dBm |
| Expected nominal UE TX power for bands XXV and XXVI (note 3) | +32.4 | +26.4 | +23.4 | +20.4 | |
| NOTE 1: <REF \hat{I}_{or} > is specified in Table 6.2.2, and CPICH_Ec / I_{or} is specified in Table E.2.2. The power level of S-CCPCH should be defined because S-CCPCH is transmitted during Preamble RACH transmission period. The power level of S-CCPCH is set to -5.3 dB relative to I_{or} . | | | | | |
| NOTE 2: The purpose of this parameter is to calculate the Expected nominal UE TX power. | | | | | |
| NOTE 3: The Expected nominal UE TX power is calculated by using the equation in the clause 8.5.7 Open Loop Power Control of TS 25.331 [8]. | | | | | |

5.5.2.4.2 Procedure

- 1) Set the TX output level of the SS to obtain \hat{I}_{or} at the UE antenna connector and select the test parameters of table 5.5.2.3 according to the power class. \hat{I}_{or} shall be according to table 5.5.2.3.
- 2) Measure the mean power (ON power) of the UE on the first PRACH preamble according to the timing in figure 5.5.1.
- 3) Measure the RRC filtered mean power (OFF power) in a 2368 chip time interval before a transient period of 25 μ s (96 chips) prior to a RACH preamble (ON power). Measure the RRC filtered mean power (OFF power) in a 2368 chip time interval after a transient period of 25 μ s (96 chips) after a RACH preamble (ON power). Due to the dynamic range between the ON and OFF power measurements, the OFF power measurements can be made on subsequent PRACH preambles rather than adjacent to the first PRACH preamble.

5.5.2.5 Test requirements

The deviation with respect to the Expected nominal UE TX power (table 5.5.2.3), derived in step 2), shall not exceed the prescribed upper tolerance in table 5.2.2 (clause 5.2.5) and lower tolerance in table 5.4.1.4. (clause 5.4.1.5) for the first PRACH preamble.

The measured RRC filtered mean power, derived in step 3), shall be less than -55 dBm. (clause 5.5.1.5).

5.6 Change of TFC

5.6.1 Definition and applicability

A change of TFC (Transport Format Combination) in uplink means that the power in the uplink varies according to the change in data rate. DTX, where the DPDCH is turned off, is a special case of variable data, which is used to minimise the interference between UE(s) by reducing the UE transmit power when voice, user or control information is not present.

The requirements and this test apply to all types of UTRA for the FDD UE.

5.6.2 Minimum requirements

A change of output power is required when the TFC, and thereby the data rate, is changed. The ratio of the amplitude between the DPDCH codes and the DPCCH code will vary. The power step due to a change in TFC shall be calculated in the UE so that the power transmitted on the DPCCH shall follow the inner loop power control. The step in total transmitted power (DPCCH + DPDCH) shall then be rounded to the closest integer dB value. A power step exactly half-way between two integer values shall be rounded to the closest integer of greater magnitude. The accuracy of the power step, given the step size is specified in table 5.6.1. The power change due to a change in TFC is defined as the relative power difference between the mean power of the original (reference) timeslot and the mean power of the target timeslot, not including the transient duration. The transient duration is from $25 \mu\text{s}$ before the slot boundary to $25 \mu\text{s}$ after the slot boundary.

Table 5.6.1: Transmitter power step tolerance

| Power control step size (Up or down) ΔP [dB] | Transmitter power step tolerance [dB] |
|---|---------------------------------------|
| 0 | $\pm 0,5$ |
| 1 | $\pm 0,5$ |
| 2 | $\pm 1,0$ |
| 3 | $\pm 1,5$ |
| $4 \leq \Delta P \leq 10$ | $\pm 2,0$ |
| $11 \leq \Delta P \leq 15$ | $\pm 3,0$ |
| $16 \leq \Delta P \leq 20$ | $\pm 4,0$ |
| $21 \leq \Delta P$ | $\pm 6,0$ |

Clause C.2.1 defines the UL reference measurement channels (12,2 kbps) for TX test and the power ratio between DPCCH and DPDCH as $-5,46$ dB. Therefore, only one power control step size is selected as minimum requirement from table 5.6.1. The accuracy of the power step, given the step size is specified in table 5.6.2.

Table 5.6.2: Transmitter power step tolerance for test

| Quantized amplitude ratios β_c and β_d | Power control step size (Up or down) ΔP [dB] | Transmitter power step tolerance [dB] |
|---|--|---------------------------------------|
| $\beta_c = 0,5333, \beta_d = 1,0$ | 7 | ± 2 |

The mean power of successive slots shall be calculated according to figure 5.6.1.

Figure 5.6.1: Transmit template during TFC change

The UL reference measurement channel (12,2 kbps) is a fixed rate channel. Therefore, DTX, where the DPDCH is turned off, is tested, as shown in figure 5.6.2.

Figure 5.6.2: Transmit template during DTX

The reference for this requirement is TS 25.101 [1] clause 6.5.3.1.

5.6.3 Test purpose

To verify that the tolerance of power control step size does not exceed the described value shown in table 5.6.2.

To verify that the DTX ON/OFF power levels versus time meets the described mask shown in figure 5.6.2.

5.6.4 Method of test

5.6.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.1.
- 2) A call is set up according to the Generic call setup procedure in TS34.108 [3] sub clause 7.3.2. The Uplink DPCH Power Control Info shall specify the Power Control Algorithm as algorithm 2 for interpreting TPC commands.
- 3) Enter the UE into loopback test mode and start the loopback test.

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

5.6.4.2 Procedure

- 1) Set the power level of the UE to , 0 dBm \pm 1 dB.
- 2) Send alternating "0" and "1" TPC commands in the downlink so as to satisfy the condition of obtaining TPC_cmd = 0.
- 3) Measure the mean output power of the UE in two cases, both DPDCH and DPCCH are ON and only DPCCH is ON. The measurements shall not include the transient periods.

5.6.5 Test requirements

The difference in mean power between DPDCH ON and OFF, derived in step 3), shall not exceed the prescribed range in table 5.6.3.

Table 5.6.3: Transmitter power step tolerance for test

| Quantized amplitude ratios β_c and β_d | Power control step size (Up or down) ΔP [dB] | Transmitter power step tolerance [dB] |
|---|---|--|
| $\beta_c = 0,5333, \beta_d = 1,0$ | 7 | $\pm 2,3$ |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.6AA FFS

5.6AB Change of TFC for UL CLTD activation state 1

Editor's note: This clause is incomplete. The following aspects are either missing or not yet determined:

- Message Contents are FFS.
- Test procedure, test tolerances may need an update.
- Update of Annexure is FFS

5.6AB.1 Definition and applicability

A change of TFC (Transport Format Combination) in uplink means that the power in the uplink varies according to the change in data rate. DTX, where the DPDCH is turned off, is a special case of variable data, which is used to minimise the interference between UE(s) by reducing the UE transmit power when voice, user or control information is not present.

The requirements and this test apply for Release 11 and later releases to all types of UTRA for the FDD UE that support uplink CLTD.

5.6AB.2 Minimum requirements

A change of output power is required when the TFC, and thereby the data rate, is changed. The ratio of the amplitude between the DPDCH codes and the DPCCH code will vary. The power step due to a change in TFC shall be calculated in the UE so that the power transmitted on the DPCCH shall follow the inner loop power control. The step in total transmitted power (DPCCH + S-DPCCH + DPDCH for UE configured in UL CLTD activation state 1) shall then be rounded to the closest integer dB value. A power step exactly half-way between two integer values shall be rounded to the closest integer of greater magnitude. The accuracy of the power step, given the step size, is specified in Table 5.6AB.1 at each transmit antenna connector. The power change at each transmit antenna connector due to a change in TFC is defined as the relative power difference between the mean power of the original (reference) timeslot and the mean power of the target timeslot, not including the transient duration. The transient duration is from 25 μ s before the slot boundary to 25 μ s after the slot boundary.

Table 5.6AB.1: Transmitter power step tolerance

| Power control step size (Up or down) ΔP [dB] | Transmitter power step tolerance [dB] |
|---|---------------------------------------|
| 0 | $\pm 0,5$ |
| 1 | $\pm 0,5$ |
| 2 | $\pm 1,0$ |
| 3 | $\pm 1,5$ |
| $4 \leq \Delta P \leq 10$ | $\pm 2,0$ |
| $11 \leq \Delta P \leq 15$ | $\pm 3,0$ |
| $16 \leq \Delta P \leq 20$ | $\pm 4,0$ |
| $21 \leq \Delta P$ | $\pm 6,0$ |

Clause FFS defines the UL reference measurement channels for TX test and the power ratio between DPCCH and DPDCH as FFS. Therefore, only one power control step size is selected as minimum requirement from table 5.6AB.1. The accuracy of the power step, given the step size is specified in table 5.6AB.2.

Table 5.6AB.2: Transmitter power step tolerance for test

| Quantized amplitude ratios β_C and β_D | Power control step size (Up or down) ΔP [dB] | Transmitter power step tolerance [dB] |
|---|--|---------------------------------------|
| $\beta_C = 0,5333, \beta_D = 1,0$ | 7 | ± 2 |

The mean power of successive slots shall be calculated according to figure 5.6AB.1.

Figure 5.6AB.1: Transmit template during TFC change

The UL reference measurement channel (12,2 kbps) is a fixed rate channel. Therefore, DTX, where the DPDCH is turned off, is tested, as shown in figure 5.6AB.2.

Figure 5.6AB.2: Transmit template during DTX

The reference for this requirement is TS 25.101 [1] clause 6.5.3.1B.

5.6AB.3 Test purpose

To verify that the tolerance of power control step size does not exceed the described value shown in table 5.6AB.2.

To verify that the DTX ON/OFF power levels versus time meets the described mask shown in figure 5.6AB.2.

5.6AB.4 Method of test

5.6AB.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure FFS.
- 2) A call is set up according to the Generic call setup procedure in TS34.108 [3] sub clause 7.3.17. The Uplink DPCH Power Control Info shall specify the Power Control Algorithm as algorithm 2 for interpreting TPC commands.
- 3) SS sends a HS-SCCH order activating UL_CLTD activation state 1.
- 4) Enter the UE into loopback test mode and start the loopback test.

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

5.6AB.4.2 Procedure

- 1) Set the power level of the UE to , 0 dBm \pm 1 dB.
- 2) Send alternating "0" and "1" TPC commands in the downlink so as to satisfy the condition of obtaining TPC_cmd = 0.
- 3) Measure the mean output power of the UE in two cases, when all DPDCH, S-DPCCH and DPCCH are ON and when only DPCCH is ON. The measurements shall not include the transient periods.

5.6AB.5 Test requirements

The difference in mean power between DPDCH ON and OFF, derived in step 3), shall not exceed the prescribed range in table 5.6AB.3.

Table 5.6AB.3: Transmitter power step tolerance for test

| Quantized amplitude ratios β_C and β_D | Power control step size (Up or down) ΔP [dB] | Transmitter power step tolerance [dB] |
|---|---|--|
| $\beta_C = 0,5333$, $\beta_D = 1,0$ | 7 | $\pm 2.3 + TT$ |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause FFS and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause FFS.

5.6AC Change of TFC for UL CLTD activation state 2 and 3

Editor's note: This clause is incomplete. The following aspects are either missing or not yet determined:

- Message Contents are FFS.
- Call Setup procedure, test procedure, test tolerances may need an update.
- Update of Annexure is FFS

5.6AC.1 Definition and applicability

A change of TFC (Transport Format Combination) in uplink means that the power in the uplink varies according to the change in data rate. DTX, where the DPDCH is turned off, is a special case of variable data, which is used to minimise the interference between UE(s) by reducing the UE transmit power when voice, user or control information is not present.

The requirements and this test apply for Release 11 and later releases to all types of UTRA for the FDD UE that support uplink CLTD.

5.6AC.2 Minimum requirements

A change of output power is required when the TFC, and thereby the data rate, is changed. The ratio of the amplitude between the DPDCH codes and the DPCCH code will vary. The power step due to a change in TFC shall be calculated in the UE so that the power transmitted on the DPCCH shall follow the inner loop power control. The step in total transmitted power (DPCCH + S-DPCCH + DPDCH for UE configured in UL CLTD activation state 1, and DPCCH + DPDCH for UE configured in UL CLTD activation state 2 or activation state 3) shall then be rounded to the closest integer dB value. A power step exactly half-way between two integer values shall be rounded to the closest integer of greater magnitude. The accuracy of the power step, given the step size, is specified in Table 5.6AC.1 at each transmit antenna connector. The power change at each transmit antenna connector due to a change in TFC is defined as the relative power difference between the mean power of the original (reference) timeslot and the mean power of the target timeslot, not including the transient duration. The transient duration is from 25 μ s before the slot boundary to 25 μ s after the slot boundary.

Table 5.6AC.1: Transmitter power step tolerance

| Power control step size (Up or down) ΔP [dB] | Transmitter power step tolerance [dB] |
|---|---------------------------------------|
| 0 | $\pm 0,5$ |
| 1 | $\pm 0,5$ |
| 2 | $\pm 1,0$ |
| 3 | $\pm 1,5$ |
| $4 \leq \Delta P \leq 10$ | $\pm 2,0$ |
| $11 \leq \Delta P \leq 15$ | $\pm 3,0$ |
| $16 \leq \Delta P \leq 20$ | $\pm 4,0$ |
| $21 \leq \Delta P$ | $\pm 6,0$ |

Clause FFS defines the UL reference measurement channels for TX test and the power ratio between DPCCH and DPDCH as FFS. Therefore, only one power control step size is selected as minimum requirement from table 5.6AC.1. The accuracy of the power step, given the step size is specified in table 5.6AC.2.

Table 5.6AC.2: Transmitter power step tolerance for test

| Quantized amplitude ratios β_c and β_d | Power control step size (Up or down) ΔP [dB] | Transmitter power step tolerance [dB] |
|---|--|---------------------------------------|
| $\beta_c = 0,5333, \beta_d = 1,0$ | 7 | ± 2 |

The mean power of successive slots shall be calculated according to figure 5.6AC.1.

Figure 5.6AC.1: Transmit template during TFC change

The UL reference measurement channel (12,2 kbps) is a fixed rate channel. Therefore, DTX, where the DPDCH is turned off, is tested, as shown in figure 5.6AC.2.

Figure 5.6AC.2: Transmit template during DTX

The reference for this requirement is TS 25.101 [1] clause 6.5.3.1B.

5.6AC.3 Test purpose

To verify that the tolerance of power control step size does not exceed the described value shown in table 5.6AC.2.

To verify that the DTX ON/OFF power levels versus time meets the described mask shown in figure 5.6AC.2.

5.6AC.4 Method of test

5.6AC.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure FFS.
- 2) A call is set up according to the Generic call setup procedure in TS34.108 [3] sub clause 7.3.17. The Uplink DPCH Power Control Info shall specify the Power Control Algorithm as algorithm 2 for interpreting TPC commands.
- 3) SS sends a HS-SCCH order activating UL_CLTD activation state 2.
- 4) Enter the UE into loopback test mode and start the loopback test.

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

5.6AC.4.2 Procedure

- 1) Set the power level of the UE to , 0 dBm \pm 1 dB.
- 2) Send alternating "0" and "1" TPC commands in the downlink so as to satisfy the condition of obtaining TPC_cmd = 0.
- 3) Measure the mean output power of the UE in two cases, both DPDCH and DPCCH of the active transmit antenna are ON and only DPCCH is ON. The measurements shall not include the transient periods.

5.6AC.5 Test requirements

The difference in mean power between DPDCH ON and OFF, derived in step 3), shall not exceed the prescribed range in table 5.6AC.3.

Table 5.6AC.3: Transmitter power step tolerance for test

| Quantized amplitude ratios β_C and β_D | Power control step size (Up or down) ΔP [dB] | Transmitter power step tolerance [dB] |
|---|---|--|
| $\beta_C = 0,5333$, $\beta_D = 1,0$ | 7 | $\pm 2,3 + TT$ |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause FFS and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause FFS.

5.7 Power setting in uplink compressed mode

5.7.1 Definition and applicability

Compressed mode in uplink means that the power in uplink is changed.

The requirements and this test apply to all types of UTRA for the FDD UE that support UL or combined UL/DL compressed modes.

5.7.2 Minimum requirements

A change of output power is required during uplink compressed frames since the transmission of data is performed in a shorter interval. The ratio of the amplitude between the DPDCH codes and the DPCCH code will also vary. The power step due to compressed mode shall be calculated in the UE so that the energy transmitted on the pilot bits during each transmitted slot shall follow the inner loop power control.

Thereby, the power during compressed mode, and immediately afterwards, shall be such that the mean power of the DPCCH follows the steps due to inner loop power control combined with additional steps of $10\log_{10}(N_{\text{pilot,prev}} / N_{\text{pilot,curr}})$ dB where $N_{\text{pilot,prev}}$ is the number of pilot bits in the previously transmitted slot, and $N_{\text{pilot,curr}}$ is the current number of pilot bits per slot.

The resulting step in total transmitted power (DPCCH + DPDCH) shall then be rounded to the closest integer dB value. A power step exactly half-way between two integer values shall be rounded to the closest integer of greatest magnitude. The accuracy of the power step, given the step size, is specified in table 5.6.1 in clause 5.6.2. The power step is defined as the relative power difference between the mean power of the original (reference) timeslot and the mean power of the target timeslot, when neither the original timeslot nor the reference timeslot are in a transmission gap. The transient duration is not included, and is from 25 μ s before the slot boundary to 25 μ s after the slot boundary.

In addition to any power change due to the ratio $N_{\text{pilot,prev}} / N_{\text{pilot,curr}}$, the mean power of the DPCCH in the first slot after a compressed mode transmission gap shall differ from the mean power of the DPCCH in the last slot before the transmission gap by an amount Δ_{RESUME} , where Δ_{RESUME} is calculated as described in clause 5.1.2.3 of TS 25.214 [5].

The resulting difference in the total transmitted power (DPCCH + DPDCH) shall then be rounded to the closest integer dB value. A power difference exactly half-way between two integer values shall be rounded to the closest integer of greatest magnitude. The accuracy of the resulting difference in the total transmitted power (DPCCH + DPDCH) after a transmission gap of up to 14 slots shall be as specified in table 5.7.1.

Table 5.7.1: Transmitter power difference tolerance after a transmission gap of up to 14 slots

| Power difference (Up or down) ΔP [dB] | Transmitter power step tolerance after a transmission gap [dB] |
|--|---|
| $\Delta P \leq 2$ | ± 3 |
| 3 | ± 3 |
| $4 \leq \Delta P \leq 10$ | ± 3.5 |
| $11 \leq \Delta P \leq 15$ | ± 4 |
| $16 \leq \Delta P \leq 20$ | ± 4.5 |
| $21 \leq \Delta P$ | ± 6.5 |

The power difference is defined as the difference between the mean power of the original (reference) timeslot before the transmission gap and the mean power of the target timeslot after the transmission gap, not including the transient durations. The transient durations at the start and end of the transmission gaps are each from 25 μ s before the slot boundary to 25 μ s after the slot boundary.

The mean power of successive slots shall be calculated according to figure 5.7.1.

The reference for this requirement is TS 25.101 [1], clause 6.5.4.1.

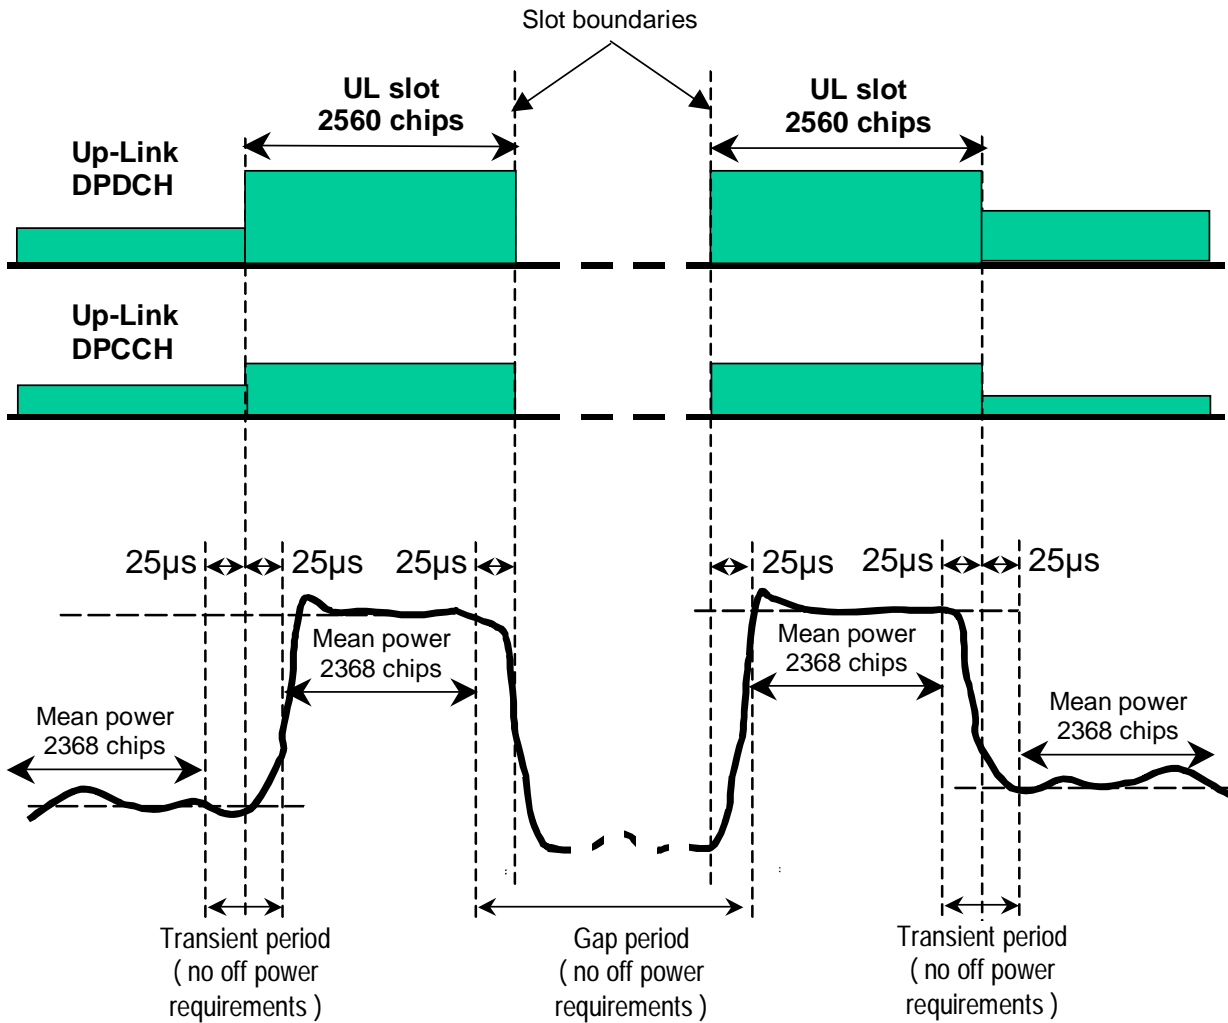

Figure 5.7.1: Transmit template during Compressed mode

For RPL (Recovery Period Length) slots after the transmission gap, where RPL is the minimum out of the transmission gap length and 7 slots, the UE shall use the power control algorithm and step size specified by the signalled Recovery Period Power Control Mode (RPP), as detailed in TS 25.214 [5] clause 5.1.2.3.

When nominal 3 dB power control steps are used in the recovery period, the transmitter mean power steps due to inner loop power control shall be within the range shown in table 5.7.2, and the transmitter aggregate mean power step due to inner loop power control shall be within the range shown in table 5.7.3, excluding any other power changes due, for example, to changes in spreading factor or number of pilot bits.

Table 5.7.2: Transmitter power control range for 3dB step size

| TPC_cmd | Transmitter power control range for 3dB step size | |
|---------|---|---------|
| | Lower | Upper |
| +1 | +1,5 dB | +4,5 dB |
| 0 | -0,5 dB | +0,5 dB |
| -1 | -1,5 dB | -4,5 dB |

Table 5.7.3: Transmitter aggregate power control range for 3dB step size

| TPC_cmd group | Transmitter power control range after 7 equal TPC_cmd groups | |
|---------------|--|--------|
| | Lower | Upper |
| +1 | +16 dB | +26 dB |
| 0 | -1 dB | +1 dB |
| -1 | -16 dB | -26 dB |

The reference for this requirement is TS 25.101 [1] clause 6.4.2.1.1.

5.7.3 Test purpose

To verify that the changes in uplink transmit power in compressed mode are within the prescribed tolerances.

Excess error in transmit power setting in compressed mode increases the interference to other channels, or increases transmission errors in the uplink.

5.7.4 Method of test

5.7.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.1.
- 2) A call is set up according to the Generic call setup procedure in TS34.108 [3] sub clause 7.3.2. The 12,2 kbps UL reference measurement channel is used, with gain factors $\beta_c = 0,5333$ and $\beta_d = 1,0$ in non-compressed frames. Slot formats 0 and 0B are used on the uplink DPCCCH.
- 3) Enter the UE into loopback test mode and start the loopback test.

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

5.7.4.2 Procedure

NOTE: CFNs are given in this procedure for reference as examples only. A fixed offset may be applied to the CFNs.

- 1) Before proceeding with step (3) below, set the output power of the UE to be in the range -36 ± 9 dBm. This may be achieved by setting the downlink signal (\hat{I}_{or}) to yield an appropriate open loop output power and/or by generating suitable downlink TPC commands from the SS.
- 2) Transmit the PHYSICAL CHANNEL RECONFIGURATION message to set the uplink power control parameters to use Algorithm 1 and a step size of 2 dB, and to set the compressed mode parameters shown in table 5.7.5. The contents of the message are specified in table 5.7.9. This set of compressed mode parameters defines the compressed mode pattern which is used to test the implementation of:
 - a) in steps (3) and (4), upward 3 dB output power steps and the implementation of a downward power change when resuming transmission after a compressed mode gap, and
 - b) in steps (7) and (8), downward 3dB output power steps and the implementation of an upward power change when resuming transmission after a compressed mode gap.

Table 5.7.5: Parameters for pattern A for compressed mode test

| Parameter | Meaning | Value |
|---------------------------------|--|---|
| TGPRC | Number of transmission gap patterns within the Transmission Gap Pattern Sequence | 1 |
| TGCFN | Connection Frame Number of the first frame of the first pattern within the Transmission Gap Pattern Sequence | 0 |
| TGSN | Slot number of the first transmission gap slot within the TGCFN | 2 |
| TGL1 | Length of first transmission gap within the transmission gap pattern | 7 slots |
| TGL2 | Length of second transmission gap within the transmission gap pattern | 7 slots |
| TGD | Duration between the starting slots of two consecutive transmission gaps within a transmission gap pattern | 15 slots |
| TGPL1 | Duration of transmission gap pattern 1 | 3 frames |
| TGPL2 | Duration of transmission gap pattern 2 | R99 and Rel-4: Omit Rel-5 and later releases: Not applicable |
| RPP | Recovery Period Power Control Mode | Mode 1 |
| ITP | Initial Transmit Power Mode | Mode 1 |
| UL/DL Mode | Defines whether UL only or combined UL/DL compressed mode is used | UL only or UL/DL |
| Downlink Compressed Mode Method | Method for generating downlink compressed mode gap | SF/2 |
| Uplink Compressed Mode Method | Method for generating uplink compressed mode gap | SF/2 |
| Scrambling code change | Indicates whether the alternative scrambling code is used | No code change |
| Downlink frame type | Downlink compressed frame structure | A |
| DeltaSIR | Delta in DL SIR target value to be set in the UE during compressed frames | 0 |
| DeltaSIRafter | Delta in DL SIR target value to be set in the UE one frame after the compressed frames | 0 |

The resulting compressed mode pattern is shown in figure 5.7.2.

Figure 5.7.2: Pattern A for compressed mode test

- 3) After the PHYSICAL CHANNEL RECONFIGURATION COMPLETE message from the UE is received, transmit TPC commands on the downlink as shown in table 5.7.6.

Table 5.7.6: TPC commands transmitted in downlink

| CFN | TPC commands in downlink |
|-----|-------------------------------|
| 0 | 0 1 - - - - - 1 1 1 1 1 1 |
| 1 | 1 1 - - - - - 1 0 1 0 1 0 |
| 2 | 1 0 1 0 1 0 1 0 1 0 1 0 1 0 1 |

- 4) Measure the mean power in the following slots, not including the 25 μs transient periods at the start and end of each slot:

CFN 0: Slots # 9,10,11,12,13,14
 CFN 1: Slots # 0,1,9

- 5) Re-start the test. Before proceeding with step (7) below, set the output power of the UE to be in the range 2 ± 9 dBm. This may be achieved by setting the downlink signal (\hat{I}_{or}) to yield an appropriate open loop output power and/or by generating suitable downlink TPC commands from the SS.
- 6) Repeat step (2) above, with the exception that TGCFN = 3 in table 5.7.5 and table 5.7.9.
- 7) After the PHYSICAL CHANNEL RECONFIGURATION COMPLETE message from the UE is received, transmit TPC commands on the downlink as shown in table 5.7.7.

Table 5.7.7: TPC commands transmitted in downlink

| CFN | TPC commands in downlink |
|-----|---------------------------|
| 3 | 0 1 - - - - - 0 0 0 0 0 |
| 4 | 0 0 - - - - - 0 1 0 1 0 1 |
| 5 | 0 1 0 1 0 1 0 1 0 1 0 1 0 |

- 8) Measure the mean power in the following slots, not including the 25 μ s transient periods at the start and end of each slot:

CFN 3: Slots # 9,10,11,12,13,14
 CFN 4: Slots # 0,1,9

- 9) Re-start the test. Before proceeding with step (11) below, set the output power of the UE to be in the range -10 ± 9 dBm. This may be achieved by setting the downlink signal (\hat{I}_{or}) to yield an appropriate open loop output power and/or by generating suitable downlink TPC commands from the SS.
- 10) Transmit the PHYSICAL CHANNEL RECONFIGURATION message to set the uplink power control parameters to use Algorithm 1 and a step size of 1 dB, and to set the compressed mode parameters shown in table 5.7.8. The contents of the message are specified in table 5.7.10. This set of compressed mode parameters defines the compressed mode pattern which is used to test the implementation of power steps at the start and end of compressed frames, and the implementation of a zero power change when resuming transmission after a compressed mode gap.

Table 5.7.8: Parameters for pattern B for compressed mode test

| Parameter | Meaning | Value |
|---------------------------------|--|---|
| TGPRC | Number of transmission gap patterns within the Transmission Gap Pattern Sequence | 1 |
| TGCFN | Connection Frame Number of the first frame of the first pattern within the Transmission Gap Pattern Sequence | 7 |
| TGSN | Slot number of the first transmission gap slot within the TGCFN | 8 |
| TGL1 | Length of first transmission gap within the transmission gap pattern | 14 slots |
| TGL2 | Length of second transmission gap within the transmission gap pattern | omit |
| TGD | Duration between the starting slots of two consecutive transmission gaps within a transmission gap pattern | UNDEFINED |
| TGPL1 | Duration of transmission gap pattern 1 | 4 frames |
| TGPL2 | Duration of transmission gap pattern 2 | R99 and Rel-4: Omit Rel-5 and later releases: Not applicable |
| RPP | Recovery Period Power Control Mode | Mode 0 |
| ITP | Initial Transmit Power Mode | Mode 0 |
| UL/DL Mode | Defines whether UL only or combined UL/DL compressed mode is used | UL only or UL/DL |
| Downlink Compressed Mode Method | Method for generating downlink compressed mode gap | SF/2 |
| Uplink Compressed Mode Method | Method for generating uplink compressed mode gap | SF/2 |
| Scrambling code change | Indicates whether the alternative scrambling code is used | No code change |
| Downlink frame type | Downlink compressed frame structure | A |
| DeltaSIR | Delta in DL SIR target value to be set in the UE during compressed frames | 0 |
| DeltaSIRafter | Delta in DL SIR target value to be set in the UE one frame after the compressed frames | 0 |

The resulting compressed mode pattern is shown in figure 5.7.3.

Figure 5.7.3: Pattern B for compressed mode test

11) After the PHYSICAL CHANNEL RECONFIGURATION COMPLETE message from the UE is received, transmit TPC commands on the downlink as shown in table 5.7.8.

Table 5.7.8: TPC commands transmitted in downlink

| CFN | TPC commands in downlink |
|-----|-------------------------------|
| 6 | 0 0 0 0 0 0 0 0 0 0 0 0 1 1 1 |
| 7 | 1 1 1 1 1 1 1 1 1 - - - - - |
| 8 | - - - - - 0 0 0 0 0 0 0 |
| 9 | 0 0 0 1 1 1 1 1 1 1 1 1 1 1 1 |

12) Measure the mean power in the following slots, not including the 25 μ s transient periods at the start and end of each slot:

- CFN 6: Slot # 14
- CFN 7: Slots # 0 and 7
- CFN 8: Slots # 7 and 14
- CFN 9: Slot # 0

5.7.5 Test requirements

For ease of reference, the following uplink output power measurements are defined in figure 5.7.4. In this figure:

- P_g is the RRC filtered mean power in an uplink transmission gap, excluding the 25 μ s transient periods.
- P_a is the mean power in the last slot before a compressed frame (or pair of compressed frames), excluding the 25 μ s transient periods.
- P_b is the mean power in the first slot of a compressed frame, excluding the 25 μ s transient periods.
- P_c is the mean power in the last slot before a transmission gap, excluding the 25 μ s transient periods.

- P_d is the mean power in the first slot after a transmission gap, excluding the 25 μ s transient periods.
- P_e is the mean power in the last slot of a compressed frame, excluding the 25 μ s transient periods.
- P_f is the mean power in the first slot after a compressed frame (or pair of compressed frames), excluding the 25 μ s transient periods.

Figure 5.7.4: Uplink transmit power in uplink compressed mode

1. At the boundary between CFN 6 and CFN 7, $P_b - P_a$ shall be within the range $+4 \pm 2.3$ dB.
2. In slot #9 of CFN 1, the power difference $P_d - P_c$ from the power in slot #1 of CFN 1 shall be within the range -11 ± 4.3 dB.
3. In slot #9 of CFN 4, the power difference $P_d - P_c$ from the power in slot #1 of CFN 4 shall be within the range $+11 \pm 4.3$ dB.
4. In slot #7 of CFN 8, the power difference $P_d - P_c$ from the power in slot #7 of CFN 7 shall be within the range 0 ± 3.2 dB.
5. (void)
6. At the boundary between CFN 8 and CFN 9, $P_f - P_e$ shall be within the range -4 ± 2.3 dB.
7. In the slots between slot #10 of CFN 0 and slot #1 of CFN 1 inclusive, the change in mean power from the previous slot shall be within the range given in table 5.7. 11 for TPC_cmd = +1.
8. The aggregate change in mean power from slot #9 of CFN 0 to slot #1 of CFN 1 shall be within the range given in table 5.7. 12 for TPC_cmd = +1.
9. In the slots between slot #10 of CFN 3 and slot #1 of CFN 4 inclusive, the change in mean power from the previous slot shall be within the range given in table 5.7. 11 for TPC_cmd = -1.
10. The aggregate change in mean power from slot #9 of CFN 3 to slot #1 of CFN 4 shall be within the range given in table 5.7. 12 for TPC_cmd = -1.

Table 5.7.11: Transmitter power control range for 3dB step size

| TPC_cmd | Transmitter power control range for 3dB step size | |
|---------|---|---------|
| | Lower | Upper |
| +1 | +1,3 dB | +4,7 dB |
| 0 | -0,6 dB | +0,6 dB |
| -1 | -1,3 dB | -4,7 dB |

Table 5.7.12: Transmitter aggregate power control range for 3dB step size

| TPC_cmd group | Transmitter power control range after 7 equal TPC_cmd groups | |
|---------------|--|---------|
| | Lower | Upper |
| +1 | +15,7dB | +26,3dB |
| 0 | -1,1dB | +1,1dB |
| -1 | -15,7dB | -26,3dB |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.7A HS-DPCCH power control

5.7A.1 Definition and applicability

The transmission of Ack/Nack or CQI over the HS-DPCCH may cause the transmission power in the uplink to vary. The ratio of the amplitude between the DPCCH and the Ack/Nack and CQI respectively is signalled by higher layers.

The requirements and this test apply for Release 5 and later releases to all types of UTRA for the FDD UE that support HSDPA.

5.7A.2 Minimum requirement

The nominal sum power on DPCCH+DPDCH is independent of the transmission of Ack/Nack and CQI unless the UE output power when Ack/Nack or CQI is transmitted would exceed the maximum value specified in Table 5.2A.1 or fall below the value specified in 5.4.3.2, whereupon the UE may then also apply additional scaling to the total transmit power as defined in section 5.1.2.6 of TS.25.214 [5].

The composite transmitted power (DPCCH + DPDCH+HS-DPCCH) may then also be rounded to the closest integer dB value. If rounding is done a power step exactly half-way between two integer values shall be rounded to the closest integer of greater magnitude.

The nominal power step due to transmission of Ack/Nack or CQI is defined as the difference between the nominal mean powers of two power evaluation periods either side of an HS-DPCCH boundary. The first evaluation period starts 25 μ s after a DPCCH slot boundary and ends 25 μ s before the following HS-DPCCH slot boundary. The second evaluation period starts 25 μ s after the same HS-DPCCH slot boundary and ends 25 μ s before the following DPCCH slot boundary. This is described in figure 5.7A.1.

Figure 5.7A.1: Transmit power template during HS-DPCCH transmission

The tolerance of the power step due to transmission of the HS-DPCCH shall meet the requirements in table 5.7A.1.

Table 5.7A.1: Transmitter power step tolerance

| Power step size (Up or down) ΔP [dB] | Transmitter power step tolerance [dB] |
|---|---------------------------------------|
| 0 | ± 0.5 |
| 1 | ± 0.5 |
| 2 | ± 1.0 |
| 3 | ± 1.5 |
| $4 \leq \Delta P \leq 7$ | ± 2.0 |

The normative reference for this requirement is TS 25.101 [1], clause 6.5.5.1.

5.7A.3 Test purpose

To verify that the changes in uplink transmit power when transmitting the HS-DPCCH (Ack/Nack and CQI) and the power between HS-DPCCH transmissions are within the allowed power step tolerances as shown in table 5.7A.2 and 5.7A.3. The test is carried out at max power with TPC_cmd=1 and at a nominal power of 0 dBm at the minimum point of the 12ms transmit pattern (HS-DPCCH off).

5.7A.4 Method of test

5.7A.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS (node B emulator) to the UE antenna connector as shown in figure A.1.

- 2) The UL Reference Measurement Channel and the Fixed Reference Channels (FRC H-Set 1, QPSK version) are specified in Annex C.10.1 and C.8.1.1.
- 3) An HSDPA call is set up according to TS 34.108 [3] clause 7.3.6. RF parameters are set up according to table E.5.1 and table E.5.10. Settings for the serving cell are defined in table 5.7A.1A.
- 4) Enter the UE into loopback test mode 1 in the presence of HSDPA and start the loopback test.

See TS 34.108 [3] and TS 34.109 [4] for details regarding loopback test mode for HSDPA.

Table 5.7A.1A: Settings for the serving cell during the measurement of HS-DPCCH

| Parameter | Unit | Cell 1 |
|--|--------------|-------------------------------|
| Cell type | | Serving cell |
| UTRA RF Channel Number | | As defined in clause 5.7A.4.1 |
| Qqualmin | dB | -24 |
| Qrxlevmin | dBm | -115 |
| UE_TXPWR_MAX_RACH | dBm | +21 |
| \hat{I}_{or} (see notes 1 and 2) | dBm/3.84 MHz | -86 |
| NOTE 1: The power level is specified in terms of \hat{I}_{or} instead of CPICH_RSCP because RSCP is a receiver measurement, whereas the SS can only set \hat{I}_{or} . | | |
| NOTE 2: The cell fulfils TS 25.304, clause 5.2.3.1.2. | | |

5.7A.4.2 Procedure

- 1) Send TRANSPORT CHANNEL RECONFIGURATION message to set the beta values defined in table C.10.1.4 subtest 3 and the DPCCH frame offset according the HS-DPCCH half slot offset required for measurements. This will create a signal with a repeat pattern of 12ms. The Uplink DPCCH Power Control Info shall initially specify the Power Control Algorithm as algorithm 2 for interpreting TPC commands.
- 2) Generate suitable TPC commands from the SS to set the output power of the UE, measured at the UE antenna connector when the HS-DPCCH is not transmitted, to be in the range 0 dBm \pm 2dB. This is a nominal setting and not part of the test requirements.
- 5) Figure 5.7A.2 shows the 12ms cycle created when using the TRANSPORT CHANNEL RECONFIGURATION message from Annex I with the test specific message content defined below and with TPC_cmd=0. Measure the mean power during the half slot periods either side of the measurement points specified on figure 5.7A.2. The 25us transient periods at the end of each half slot period shall not be included. Measurement points 4, 8 and 11 are at the DPCCH slot boundaries just after and just before the HS-DPCCH transmission. Evaluate the difference in mean power to determine the power steps around the measurement points shown in Figure 5.7A.2. The power steps shall meet the test requirements in table 5.7A.2.
- 6) Reconfigure the uplink DPCCH power control Info to use Algorithm 1 with 1 dB step size. Set and send continuously Up power control commands to the UE until the UE output power during HS-DPCCH ACK/NACK transmission reaches the maximum as defined in table 5.2A.1.
- 7) Figure 5.7A.3 shows the 12ms cycle created when using TPC_cmd=1. Measure the mean power during the half slot periods either side of the measurement points specified on figure 5.7A.3. The 25us transient periods at the end of each half slot period shall not be included. Measurement points 5, 10 and 13 are at the DPCCH slot boundaries in between the HS-DPCCH transmissions. The last downward step prior to the HS-DPCCH transmission is not tested due to the accumulation of tolerances making the test requirement very wide. Evaluate the difference in mean power to determine the power steps around the measurement points shown in Figure 5.7A.3. The transmitter power steps shall meet the test requirements in table 5.7A.3.

Specific Message Contents

All messages indicated above shall use the same content as described in the default message content in clause 9 of TS 34.108 [3], except the TRANSPORT CHANNEL RECONFIGURATION message which is defined in Annex I. The test specific content for the TRANSPORT CHANNEL RECONFIGURATION message is as follows:

| Information Element | Value/remark |
|------------------------------|--------------|
| - Ack-Nack repetition factor | 1 |

5.7A.5 Test requirements

Figure 5.7A.2: Transmit power template below max power with TPC_cmd = 0

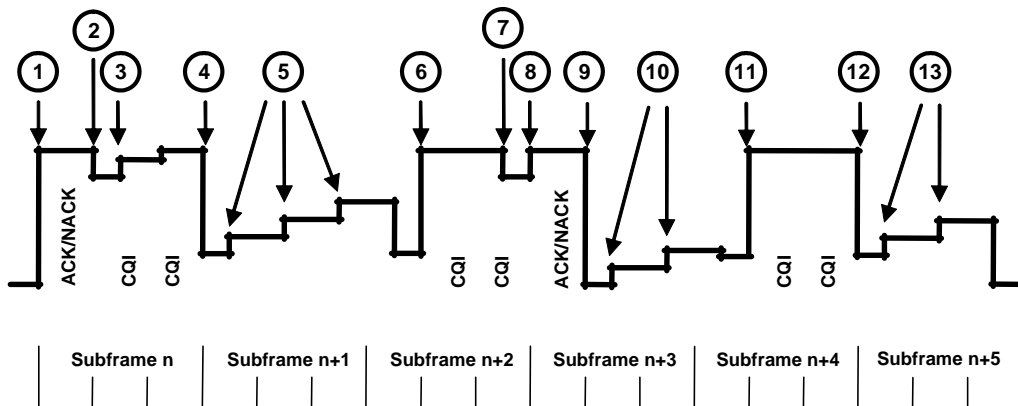

Figure 5.7A.3: Transmit power template at max power with TPC_cmd = 1

The difference in mean power derived in steps 5) and 7), shall not exceed the allowed transmitter power step range in table 5.7A.2 and 5.7A.3 respectively.

The UL reference measurement channel for TX test will be set as defined in C.10.1 with the power ratio between HS-DPCH, DPCCCH and DPDCH being set to the values defined in table C.10.1.4 sub-test 3.

Table 5.7A.2: Transmitter power test requirements for TPC_cmd=0

| Sub-test in table C.10.1.4 | Power step | Nominal Power step size, ΔP [dB] | Rounded Power step size, ΔP [dB] | Transmitter power step Tolerance [dB] | Allowed Transmitter power step range [dB] |
|----------------------------|-----------------|----------------------------------|----------------------------------|---------------------------------------|---|
| 3 | 1 | 6.14 | 6 | +/- 2.3 | 3.7 to 8.44 |
| | 2 | -1.38 | -1 | +/- 0.6 | -1.98 to -0.4 |
| | 3 | -4.76 | -5 | +/- 2.3 | -7.3 to -2.46 |
| | 4 ¹ | 0 | 0 | +/- 0.6 | -0.6 to 0.6 |

| 13 ² | 1 | 1 | +/- 0.6 | 0.4 to 1.6 | |
| NOTE 1: Three test points. NOTE 2: Two test points. NOTE 3: In these test points rel-6 UE performs additional power scaling due to changes in allowed MPR, and therefore there are no requirements specified for transmitter power steps. | | | | | |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.8 Occupied Bandwidth (OBW)

5.8.1 Definition and applicability

Occupied bandwidth is a measure of the bandwidth containing 99 % of the total integrated power of the transmitted spectrum, centred on the assigned channel frequency.

The requirements and this test apply to all types of UTRA for the FDD UE.

5.8.2 Minimum Requirements

The occupied channel bandwidth shall be less than 5 MHz based on a chip rate of 3,84 Mcps.

The normative reference for this requirement is TS 25.101 [1] clause 6.6.1.

5.8.3 Test purpose

To verify that the UE occupied channel bandwidth is less than 5 MHz based on a chip rate of 3,84 Mcps.

Excess occupied channel bandwidth increases the interference to other channels or to other systems.

5.8.4 Method of test

5.8.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.1.
- 2) A call is set up according to the Generic call setup procedure in TS34.108 [3] sub clause 7.3.2.
- 3) Enter the UE into loopback test mode and start the loopback test.

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

5.8.4.2 Procedure

- 1) Set and send continuously Up power control commands to the UE until the UE output power shall be maximum level.
- 2) Measure the power spectrum distribution within two times or more range over the requirement for Occupied Bandwidth specification centring on the current carrier frequency with 30 kHz or less RBW. The characteristic of the filter shall be approximately Gaussian (typical spectrum analyzer filter).
- 3) Calculate the total power within the range of all frequencies measured in '2)' and save this value as "Total Power".
- 4) Sum up the power upward from the lower boundary of the measured frequency range in '2)' and seek the limit frequency point by which this sum becomes 0,5 % of "Total Power" and save this point as "Lower Frequency".
- 5) Sum up the power downward from the upper boundary of the measured frequency range in '2)' and seek the limit frequency point by which this sum becomes 0,5 % of "Total Power" and save this point as "Upper Frequency".
- 6) Calculate the difference ("Upper Frequency" - "Lower Frequency" = "Occupied Bandwidth") between two limit frequencies obtained in '4)' and '5)'.

5.8.5 Test Requirements

The measured Occupied Bandwidth, derived in step 6), shall not exceed 5 MHz.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.8A Occupied Bandwidth (OBW) for DC-HSUPA

5.8A.1 Definition and applicability

In the case dual adjacent carriers are assigned in the uplink, occupied bandwidth is a measure of the bandwidth containing 99 % of the total integrated power of the transmitted spectrum, centred at the centre of the assigned channel frequencies.

The requirements and this test apply for Release 9 and later releases to all types of UTRA for the FDD UE that support HSDPA and Dual Cell E-DCH.

5.8A.2 Minimum Requirements

The occupied channel bandwidth shall be less than 10 MHz on a chip rate of 3.84 Mcps.

The normative reference for this requirement is TS 25.101 [1] clause 6.6.1A.

5.8A.3 Test purpose

To verify that the DC-HSUPA UE occupied channel bandwidth is less than 10 MHz based on a chip rate of 3,84 Mcps.

Excess occupied channel bandwidth increases the interference to other channels or to other systems.

5.8A.4 Method of test

5.8A.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.41.
- 2) The UL Reference Measurement Channel and parameters are specified in Annex C.2.6 and C.11A. The DL Reference Measurement Channel (FRC H-SET 3A, QPSK) is specified in C.8.1.1.

- 3) An E-DCH call is set up according to TS 34.108 [3] 7.3.14 with the exceptions in the RADIO BEARER SETUP message given in Tables 5.2BA.2, 5.2BA.3, 5.2BA.4. These exceptions allow the beta values to be set according to table C.11A.1. and each UL physical channel to be at constant power during the measurement. RF parameters are set up according to table E.5A.1A. Settings for the serving cell are defined in table 5.8A.
- 4) Enter the UE into loopback test mode 1 looping back HSDPA to E-DCH according to procedure 7.3.14.3 in TS 34.108 [3] and start the loopback test

See TS 34.109 [4] clauses 5.3.2.3 and 5.3.2.6 for details regarding loopback test mode for HSDPA and E-DCH.

Table 5.8A: Settings for the serving cell during the measurement of Occupied Bandwidth for with HS-DPCCH and E-DCH

| Parameter | Unit | Cell 1 |
|--|--------------|-------------------------------|
| Cell type | | Serving cell |
| UTRA RF Channel Number | | As defined in clause 5.8A.4.1 |
| Qqualmin | dB | -24 |
| Qrxlevmin | dBm | -115 |
| UE_TXPWR_MAX_RACH | dBm | +21 |
| \hat{I}_{or} (see notes 1 and 2) | dBm/3.84 MHz | -86 |
| NOTE 1: The power level is specified in terms of \hat{I}_{or} instead of CPICH_RSCP because RSCP is a receiver measurement, whereas the SS can only set \hat{I}_{or} . | | |
| NOTE 2: The cell fulfils TS 25.304, clause 5.2.3.1.2. | | |

5.8A.4.2 Procedure

- 1) Set the Absolute Grant according to Table C.11A.1.1.
- 2) The SS starts transmitting HSDPA and the UE loops the received data back on E-DCH.
- 3) Generate suitable TPC commands to each individual carrier from the SS to set the total power in each of the assigned carriers to be equal to each other within ± 1.7 dB and the total output power of the UE to be at least 7.5dB lower than the maximum output power. Wait 150ms.
- 4) Set and send continuously Up power control commands to both carriers to the UE and wait 150ms.
- 5) Measure the power spectrum distribution within two times or more range over the requirement for Occupied Bandwidth specification centring between the two carrier frequencies with 30 kHz or less RBW. The characteristic of the filter shall be approximately Gaussian (typical spectrum analyzer filter).
- 6) Calculate the total power of the two carriers within the range of all frequencies measured in '2)' and save this value as "Total Power".
- 7) Sum up the power upward from the lower boundary of the measured frequency range in '2)' and seek the limit frequency point by which this sum becomes 0,5 % of "Total Power" of the two carriers and save this point as "Lower Frequency".
- 8) Sum up the power downward from the upper boundary of the measured frequency range in '2)' and seek the limit frequency point by which this sum becomes 0,5 % of "Total Power" and save this point as "Upper Frequency".
- 9) Calculate the difference ("Upper Frequency" – "Lower Frequency" = "Occupied Bandwidth") between two limit frequencies obtained in '4)' and '5)'.

5.8A.5 Test Requirements

The measured Occupied Bandwidth, derived in step 6), shall not exceed 10 MHz.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.9 Spectrum emission mask

5.9.1 Definition and applicability

The spectrum emission mask of the UE applies to frequencies, which are between 2,5 MHz and 12,5 MHz away from the UE centre carrier frequency. The out of channel emission is specified relative to the RRC filtered mean power of the UE carrier.

The requirements and this test apply to all types of UTRA for the FDD UE.

5.9.2 Minimum Requirements

The power of any UE emission shall not exceed the levels specified in Table 5.9.1. The absolute requirement is based on a -50 dBm/3.84 MHz minimum power threshold for the UE. This limit is expressed for the narrower measurement bandwidths as -55.8 dBm/1 MHz and -71.1 dBm/30 kHz. The requirements are applicable for all values of β_c , β_d as specified in [5].

Table 5.9.1: Spectrum Emission Mask Requirement

| Δf in MHz (Note 1) | Minimum requirement (note 2) | | Measurement bandwidth |
|-------------------------------|---|----------------------|-----------------------|
| | Relative requirement | Absolute requirement | |
| 2.5 - 3.5 | $\left\{ -35 - 15 \cdot \left(\frac{\Delta f}{\text{MHz}} - 2.5 \right) \right\} \text{dBc}$ | -71.1 dBm | 30 kHz (note 3) |
| 3.5 - 7.5 | $\left\{ -35 - 1 \cdot \left(\frac{\Delta f}{\text{MHz}} - 3.5 \right) \right\} \text{dBc}$ | -55.8 dBm | 1 MHz (note 4) |
| 7.5 - 8.5 | $\left\{ -39 - 10 \cdot \left(\frac{\Delta f}{\text{MHz}} - 7.5 \right) \right\} \text{dBc}$ | -55.8 dBm | 1 MHz (note 4) |
| 8.5 - 12.5 MHz | -49 dBc | -55.8 dBm | 1 MHz (note 4) |

NOTE 1: Δf is the separation between the carrier frequency and the centre of the measurement bandwidth.
NOTE 2: The minimum requirement is calculated from the relative requirement or the absolute requirement, whichever is the higher power.
NOTE 3: The first and last measurement position with a 30 kHz filter is at Δf equals to 2.515 MHz and 3.485 MHz.
NOTE 4: The first and last measurement position with a 1 MHz filter is at Δf equals to 4 MHz and 12 MHz.

For operation in band II, IV, V, X, XII, XIII, XIV, XXV and XXVI the minimum requirement is calculated from the minimum requirement in table 5.9.1 or the applicable additional requirement in Tables 5.9.1A, 5.9.1B or 5.9.1C, whichever is the tighter requirement.

Table 5.9.1A: Additional spectrum emission limits for Bands II, IV, X and XXV

| Δf in MHz (note 1) | Frequency offset of measurement filter centre frequency, f_{offset} | Additional requirements Band II, IV, X | Measurement bandwidth |
|---|--|--|-----------------------|
| $2.5 \text{ MHz} \leq \Delta f < 3.5 \text{ MHz}$ | $2.515 \text{ MHz} \leq f_{\text{offset}} < 3.485 \text{ MHz}$ | -15 dBm | 30 kHz |
| $3.5 \text{ MHz} \leq \Delta f \leq 12.5 \text{ MHz}$ | $4.0 \text{ MHz} \leq f_{\text{offset}} < 12.0 \text{ MHz}$ | -13 dBm | 1 MHz |

NOTE 1: Δf is the separation between the carrier frequency and the centre of the measurement bandwidth.

Table 5.9.1B: Additional spectrum emission limits for Band V and XXVI

| Δf in MHz (note 1) | Frequency offset of measurement filter centre frequency, f_{offset} | Additional requirements Band V | Measurement bandwidth |
|---|--|-----------------------------------|--------------------------|
| $2.5 \text{ MHz} \leq \Delta f < 3.5 \text{ MHz}$ | $2.515 \text{ MHz} \leq f_{\text{offset}} < 3.485 \text{ MHz}$ | -15 dBm | 30 kHz |
| $3.5 \text{ MHz} \leq \Delta f \leq 12.5 \text{ MHz}$ | $3.55 \text{ MHz} \leq f_{\text{offset}} < 12.45 \text{ MHz}$ | -13 dBm | 100 kHz |

NOTE 1: Δf is the separation between the carrier frequency and the centre of the measurement bandwidth.

Table 5.9.1C: Additional spectrum emission limits for Bands XII, XIII and XIV

| Δf in MHz (note 1) | Frequency offset of measurement filter centre frequency, f_{offset} | Additional requirements Band XII, XIII, XIV | Measurement bandwidth |
|--|--|---|--------------------------|
| $2.5 \text{ MHz} \leq \Delta f < 2.6 \text{ MHz}$ | $2.515 \text{ MHz} \leq f_{\text{offset}} < 2.585 \text{ MHz}$ | -13 dBm | 30 kHz |
| $2.6 \text{ MHz} \leq \Delta f \leq 12.45 \text{ MHz}$ | $2.65 \text{ MHz} \leq f_{\text{offset}} < 12.45 \text{ MHz}$ | -13 dBm | 100 kHz |

NOTE 1: Δf is the separation between the carrier frequency and the centre of the measurement bandwidth.

NOTE: As a general rule, the resolution bandwidth of the measuring equipment should be equal to the measurement bandwidth specified in tables 5.9.1, 5.9.1A, 5.9.1B and 5.9.1C. However, to improve measurement accuracy, sensitivity and efficiency, the resolution bandwidth may be smaller than the measurement bandwidth. When the resolution bandwidth is smaller than the measurement bandwidth, the result should be integrated over the measurement bandwidth in order to obtain the equivalent noise bandwidth of the measurement bandwidth.

The normative reference for this requirement is TS 25.101 [1], clause 6.6.2.1.1.

5.9.3 Test purpose

To verify that the power of UE emission does not exceed the prescribed limits shown in table 5.9.1.

Excess emission increases the interference to other channels or to other systems.

5.9.4 Method of test

5.9.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.1.
- 2) A call is set up according to the Generic call setup procedure in TS34.108 [3] sub clause 7.3.2.
- 3) Enter the UE into loopback test mode and start the loopback test.

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

5.9.4.2 Procedure

- 1) Set and send continuously Up power control commands to the UE until the UE output power shall be maximum level.
- 2) Measure the power of the transmitted signal with a measurement filter of bandwidths according to table 5.9.2 and 5.9.2A, 5.9.2B, 5.9.2C if applicable. For measurements using 1 MHz or 100KHz measurement bandwidths the result may be calculated by integrating multiple 50 kHz or narrower filter measurements. The characteristic of the filter shall be approximately Gaussian (typical spectrum analyzer filter). The centre frequency of the filter shall be stepped in contiguous steps according to table 5.9.2. The measured power shall be recorded for each step.
- 3) Measure the RRC filtered mean power centred on the assigned channel frequency.

4) Calculate the ratio of the power 2) with respect to 3) in dBc.

5.9.5 Test requirements

The result of clause 5.9.4.2 step 4) shall fulfil the requirements of table 5.9.2.

For operation in band II, IV, V, X, XII, XIII, XIV, XXV and XXVI both minimum requirement in table 5.9.2 and the applicable additional requirement in Tables 5.9.2A, 5.9.2B, or 5.9.2C need to be satisfied.

Table 5.9.2: Spectrum Emission Mask Requirement

| Δf in MHz (note 1) | Minimum requirement (note 2) | | Measurement bandwidth |
|-------------------------------|---|-------------------------|--------------------------|
| | Relative requirement | Absolute requirement | |
| 2.5 - 3.5 | $\left\{ -33.5 - 15 \cdot \left(\frac{\Delta f}{\text{MHz}} - 2.5 \right) \right\} \text{dBc}$ | -69.6 dBm | 30 kHz (note 3) |
| 3.5 - 7.5 | $\left\{ -33.5 - 1 \cdot \left(\frac{\Delta f}{\text{MHz}} - 3.5 \right) \right\} \text{dBc}$ | -54.3 dBm | 1 MHz (note 4) |
| 7.5 - 8.5 | $\left\{ -37.5 - 10 \cdot \left(\frac{\Delta f}{\text{MHz}} - 7.5 \right) \right\} \text{dBc}$ | -54.3 dBm | 1 MHz (note 4) |
| 8.5 - 12.5 MHz | -47.5 dBc | -54.3 dBm | 1 MHz (note 4) |

NOTE 1: Δf is the separation between the carrier frequency and the centre of the measurement bandwidth.
NOTE 2: The minimum requirement is calculated from the relative requirement or the absolute requirement, whichever is the higher power.
NOTE 3: The first and last measurement position with a 30 kHz filter is at Δf equals to 2.515 MHz and 3.485 MHz.
NOTE 4: The first and last measurement position with a 1 MHz filter is at Δf equals to 4 MHz and 12 MHz.

Table 5.9.2A: Additional spectrum emission limits for Bands II, IV, X, XXV

| Δf in MHz (note 1) | Frequency offset of measurement filter centre frequency, f_{offset} | Additional requirements Band II, IV, X | Measurement bandwidth |
|---|--|--|--------------------------|
| $2.5 \text{ MHz} \leq \Delta f < 3.5 \text{ MHz}$ | $2.515 \text{ MHz} \leq f_{\text{offset}} < 3.485 \text{ MHz}$ | -15 dBm | 30 kHz |
| $3.5 \text{ MHz} \leq \Delta f \leq 12.5 \text{ MHz}$ | $4.0 \text{ MHz} \leq f_{\text{offset}} < 12.0 \text{ MHz}$ | -13 dBm | 1 MHz |

NOTE 1: Δf is the separation between the carrier frequency and the centre of the measurement bandwidth.

Table 5.9.2B: Additional spectrum emission limits for Band V and XXVI

| Δf in MHz (note 1) | Frequency offset of measurement filter centre frequency, f_{offset} | Additional requirements Band V | Measurement bandwidth |
|---|--|-----------------------------------|--------------------------|
| $2.5 \text{ MHz} \leq \Delta f < 3.5 \text{ MHz}$ | $2.515 \text{ MHz} \leq f_{\text{offset}} < 3.485 \text{ MHz}$ | -15 dBm | 30 kHz |
| $3.5 \text{ MHz} \leq \Delta f \leq 12.5 \text{ MHz}$ | $3.55 \text{ MHz} \leq f_{\text{offset}} < 12.45 \text{ MHz}$ | -13 dBm | 100 kHz |

NOTE 1: Δf is the separation between the carrier frequency and the centre of the measurement bandwidth.

Table 5.9.2C: Additional spectrum emission limits for Bands XII, XIII and XIV

| Δf in MHz (note 1) | Frequency offset of measurement filter centre frequency, f_{offset} | Additional requirements Band XII, XIII, XIV | Measurement bandwidth |
|--|--|---|--------------------------|
| $2.5 \text{ MHz} \leq \Delta f < 2.6 \text{ MHz}$ | $2.515 \text{ MHz} \leq f_{\text{offset}} < 2.585 \text{ MHz}$ | -13 dBm | 30 kHz |
| $2.6 \text{ MHz} \leq \Delta f \leq 12.45 \text{ MHz}$ | $2.65 \text{ MHz} \leq f_{\text{offset}} < 12.45 \text{ MHz}$ | -13 dBm | 100 kHz |

NOTE 1: Δf is the separation between the carrier frequency and the centre of the measurement bandwidth.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.9A Spectrum Emission Mask with HS-DPCCH

5.9A.1 Definition and applicability

The spectrum emission mask of the UE applies to frequencies, which are between 2,5 MHz and 12,5 MHz away from the UE centre carrier frequency. The out of channel emission is specified relative to the RRC filtered mean power of the UE carrier.

The requirements and this test apply for Release 5 and later releases to all types of UTRA for the FDD UE that support HSDPA.

5.9A.2 Minimum Requirements

The power of any UE emission shall not exceed the levels specified in Table 5.9A.1. The absolute requirement is based on a -50 dBm/3.84 MHz minimum power threshold for the UE. This limit is expressed for the narrower measurement bandwidths as -55.8 dBm/1 MHz and -71.1 dBm/30 kHz. The requirements are applicable for all values of β_c , β_d , β_{hs} as specified in [5].

Table 5.9A.1: Spectrum Emission Mask Requirement

| Δf in MHz (note 1) | Minimum requirement (note 2) | | Measurement bandwidth |
|-------------------------------|---|----------------------|-----------------------|
| | Relative requirement | Absolute requirement | |
| 2.5 - 3.5 | $\left\{ -35 - 15 \cdot \left(\frac{\Delta f}{\text{MHz}} - 2.5 \right) \right\} \text{dBc}$ | -71.1 dBm | 30 kHz (note 3) |
| 3.5 - 7.5 | $\left\{ -35 - 1 \cdot \left(\frac{\Delta f}{\text{MHz}} - 3.5 \right) \right\} \text{dBc}$ | -55.8 dBm | 1 MHz (note 4) |
| 7.5 - 8.5 | $\left\{ -39 - 10 \cdot \left(\frac{\Delta f}{\text{MHz}} - 7.5 \right) \right\} \text{dBc}$ | -55.8 dBm | 1 MHz (note 4) |
| 8.5 - 12.5 MHz | -49 dBc | -55.8 dBm | 1 MHz (note 4) |

NOTE 1: Δf is the separation between the carrier frequency and the centre of the measurement bandwidth.
NOTE 2: The minimum requirement is calculated from the relative requirement or the absolute requirement, whichever is the higher power.
NOTE 3: The first and last measurement position with a 30 kHz filter is at Δf equals to 2.515 MHz and 3.485 MHz.
NOTE 4: The first and last measurement position with a 1 MHz filter is at Δf equals to 4 MHz and 12 MHz.

For operation in band II, IV, V, X, XII, XIII, XIV, XXV and XXVI the minimum requirement is calculated from the minimum requirement in table 5.9A.1 or the applicable additional requirement in Tables 5.9A.1A, 5.9A.1B or 5.9A.1C, whichever is the tighter requirement.

Table 5.9A.1A: Additional spectrum emission limits for Bands II, IV, X and XXV

|--|--|---|--------------------------|
| $2.5 \text{ MHz} \leq \Delta f < 2.6 \text{ MHz}$ | $2.515 \text{ MHz} \leq f_{\text{offset}} < 2.585 \text{ MHz}$ | -13 dBm | 30 kHz |
| $2.6 \text{ MHz} \leq \Delta f \leq 12.45 \text{ MHz}$ | $2.65 \text{ MHz} \leq f_{\text{offset}} < 12.45 \text{ MHz}$ | -13 dBm | 100 kHz |

NOTE 1: Δf is the separation between the carrier frequency and the centre of the measurement bandwidth.

NOTE: As a general rule, the resolution bandwidth of the measuring equipment should be equal to the measurement bandwidth specified in tables 5.9A.1, 5.9A.1A, 5.9A.1B and 5.9A.1C. However, to improve measurement accuracy, sensitivity and efficiency, the resolution bandwidth may be smaller than the measurement bandwidth. When the resolution bandwidth is smaller than the measurement bandwidth, the result should be integrated over the measurement bandwidth in order to obtain the equivalent noise bandwidth of the measurement bandwidth.

The normative reference for this requirement is TS 25.101 [1], clause 6.6.2.1.1.

5.9A.3 Test purpose

To verify that the power of UE emission does not exceed the prescribed limits shown in table 5.9A.1. even in the presence of the HS-DPCCH. (see note). This is applicable for all values of β_c , β_d and β_{hs} as specified in [5]. The maximum output power with HS-DPCCH is specified in table 5.2A.1.

Excess emission increases the interference to other channels or to other systems.

NOTE: For a static signal, the measurement with a 1MHz filter can be replaced by a narrower filter and integration over the bandwidth. (Note 6 in table 5.9A.1) For a non static signal the above described replacement gives different results, depending on the type of dynamic in the signal and depending on the bandwidth of the filter. Hence the signal is tested only when static.

5.9A.4 Method of test

5.9A.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS (node B emulator) to the UE antenna connector as shown in figure A.1.
- 2) The UL Reference Measurement Channel and the Fixed Reference Channels (FRC H-Set 1, QPSK version) are specified in Annex C.10.1 and C.8.1.1.
- 3) An HSDPA call is set up according to TS 34.108 [3] clause 7.3.6. RF parameters are set up according to table E.5.1 and table E.5.10. Settings for the serving cell are defined in table 5.9A.2.
- 4) Enter the UE into loopback test mode in the presence of HSDPA and start the loopback test.

See TS 34.108 [3] and TS 34.109 [4] for details regarding loopback test mode for HSDPA.

Table 5.9A.2: Settings for the serving cell during the measurement of Spectrum Emission Mask with HS-DPCCH

| Parameter | Unit | Cell 1 |
|--|--------------|-------------------------------|
| Cell type | | Serving cell |
| UTRA RF Channel Number | | As defined in clause 5.9A.4.1 |
| Qqualmin | dB | -24 |
| Qrxlevmin | dBm | -115 |
| UE_TXPWR_MAX_RACH | dBm | +21 |
| \hat{I}_{or} (see notes 1 and 2) | dBm/3.84 MHz | -86 |
| NOTE 1: The power level is specified in terms of \hat{I}_{or} instead of CPICH_RSCP because RSCP is a receiver measurement, whereas the SS can only set \hat{I}_{or} . | | |
| NOTE 2: The cell fulfils TS 25.304, clause 5.2.3.1.2. | | |

5.9A.4.2 Procedure

- 1) Send TRANSPORT CHANNEL RECONFIGURATION message to set the beta values according to table C.10.1.4 and the DPCH frame offset according the HS-DPCCH slot offset required for measurements.
- 2) Set and send continuously Up power control commands to the UE.
- 3) Start transmitting HSDPA Data.
- 4) When UE has reached the maximum power, measure the power of the transmitted signal with a measurement filter of bandwidths according to table 5.9A.3 and 5.9A.3A, 5.9A.3B, 5.9A.3C if applicable. For measurements using 1 MHz or 100KHz measurement bandwidths the result may be calculated by integrating multiple 50 kHz or narrower filter(≥ 3 kHz) measurements. The characteristic of the filter shall be approximately Gaussian (typical spectrum analyzer filter). The centre frequency of the filter shall be stepped in contiguous steps according to table 5.9A.3 and 5.9A.3A, 5.9A.3B, 5.9A.3C if applicable. The measured power shall be recorded for each step. The measurement duration with the filter on one frequency shall last at least the filter settling time and the measurement period shall be inside the HS-DPCCH on-period.
- 5) Measure the RRC filtered mean power centred on the assigned channel frequency.
- 6) Calculate the ratio of the power 4) with respect to 5) in dBc.
- 7) Repeat steps 1-6 for all the different combinations of beta values as given in table C.10.1.4.

All messages indicated above shall use the same content as described in the default message content in clause 9 of TS 34.108 [3], except the TRANSPORT CHANNEL RECONFIGURATION message which is defined in Annex I.

5.9A.5 Test requirements

The result of clause 5.9A.4.2 step 6) shall fulfil the requirements of table 5.9A.3.

For operation in band II, IV, V, X, XII, XIII, XIV, XXV and XXVI both minimum requirement in table 5.9A.3 and the applicable additional requirement in Tables 5.9A.3A, 5.9A.3B, or 5.9A.3C need to be satisfied.

Table 5.9A.3: Spectrum Emission Mask Requirement

| Δf in MHz (note 1) | Minimum requirement (note 2) | | Measurement bandwidth |
|-------------------------------|---|----------------------|-----------------------|
| | Relative requirement | Absolute requirement | |
| 2.5 - 3.5 | $\left\{ -33.5 - 15 \cdot \left(\frac{\Delta f}{\text{MHz}} - 2.5 \right) \right\} \text{dBc}$ | -69.6 dBm | 30 kHz (note 3) |
| 3.5 - 7.5 | $\left\{ -33.5 - 1 \cdot \left(\frac{\Delta f}{\text{MHz}} - 3.5 \right) \right\} \text{dBc}$ | -54.3 dBm | 1 MHz (note 4) |
| 7.5 - 8.5 | $\left\{ -37.5 - 10 \cdot \left(\frac{\Delta f}{\text{MHz}} - 7.5 \right) \right\} \text{dBc}$ | -54.3 dBm | 1 MHz (note 4) |
| 8.5 - 12.5 MHz | -47.5 dBc | -54.3 dBm | 1 MHz (note 4) |

NOTE 1: Δf is the separation between the carrier frequency and the centre of the measurement bandwidth.
NOTE 2: The minimum requirement is calculated from the relative requirement or the absolute requirement, whichever is the higher power.
NOTE 3: The first and last measurement position with a 30 kHz filter is at Δf equals to 2.515 MHz and 3.485 MHz.
NOTE 4: The first and last measurement position with a 1 MHz filter is at Δf equals to 4 MHz and 12 MHz.

Table 5.9A.3A: Additional spectrum emission limits for Bands II, IV, X and XXV

| Δf in MHz (note 1) | Frequency offset of measurement filter centre frequency, f_{offset} | Additional requirements Band II, IV, X | Measurement bandwidth |
|---|--|--|-----------------------|
| $2.5 \text{ MHz} \leq \Delta f < 3.5 \text{ MHz}$ | $2.515 \text{ MHz} \leq f_{\text{offset}} < 3.485 \text{ MHz}$ | -15 dBm | 30 kHz |
| $3.5 \text{ MHz} \leq \Delta f \leq 12.5 \text{ MHz}$ | $4.0 \text{ MHz} \leq f_{\text{offset}} < 12.0 \text{ MHz}$ | -13 dBm | 1 MHz |

NOTE 1: Δf is the separation between the carrier frequency and the centre of the measurement bandwidth.

Table 5.9A.3B: Additional spectrum emission limits for Bands V and XXVI

| Δf in MHz (note 1) | Frequency offset of measurement filter centre frequency, f_{offset} | Additional requirements Band V | Measurement bandwidth |
|---|--|--------------------------------|-----------------------|
| $2.5 \text{ MHz} \leq \Delta f < 3.5 \text{ MHz}$ | $2.515 \text{ MHz} \leq f_{\text{offset}} < 3.485 \text{ MHz}$ | -15 dBm | 30 kHz |
| $3.5 \text{ MHz} \leq \Delta f \leq 12.5 \text{ MHz}$ | $3.55 \text{ MHz} \leq f_{\text{offset}} < 12.45 \text{ MHz}$ | -13 dBm | 100 kHz |

NOTE 1: Δf is the separation between the carrier frequency and the centre of the measurement bandwidth.

Table 5.9A.3C: Additional spectrum emission limits for Bands XII, XIII and XIV

| Δf in MHz (note 1) | Frequency offset of measurement filter centre frequency, f_{offset} | Additional requirements Band XII, XIII, XIV | Measurement bandwidth |
|--|--|---|-----------------------|
| $2.5 \text{ MHz} \leq \Delta f < 2.6 \text{ MHz}$ | $2.515 \text{ MHz} \leq f_{\text{offset}} < 2.585 \text{ MHz}$ | -13 dBm | 30 kHz |
| $2.6 \text{ MHz} \leq \Delta f \leq 12.45 \text{ MHz}$ | $2.65 \text{ MHz} \leq f_{\text{offset}} < 12.45 \text{ MHz}$ | -13 dBm | 100 kHz |

NOTE 1: Δf is the separation between the carrier frequency and the centre of the measurement bandwidth.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.9B Spectrum Emission Mask with E-DCH

5.9B.1 Definition and applicability

The spectrum emission mask of the UE applies to frequencies, which are between 2,5 MHz and 12,5 MHz away from the UE centre carrier frequency. The out of channel emission is specified relative to the RRC filtered mean power of the UE carrier.

The requirements and this test apply for Release 6 and later releases to all types of UTRA for the FDD UE that support HSDPA and E-DCH.

5.9B.2 Minimum Requirements

The power of any UE emission shall not exceed the levels specified in table 5.9B.1. The absolute requirement is based on a -50 dBm/3.84 MHz minimum power threshold for the UE. This limit is expressed for the narrower measurement bandwidths as -55.8 dBm/1 MHz and -71.1 dBm/30 kHz. This is applicable for all values of β_c , β_d , β_{hs} , β_{ec} and β_{ed} as specified in [5].

Table 5.9B.1: Spectrum Emission Mask Requirement

| Δf in MHz (note 1) | Minimum requirement (note 2) | | Measurement bandwidth |
|-------------------------------|---|----------------------|-----------------------|
| | Relative requirement | Absolute requirement | |
| 2.5 - 3.5 | $\left\{ -35 - 15 \cdot \left(\frac{\Delta f}{\text{MHz}} - 2.5 \right) \right\} \text{dBc}$ | -71.1 dBm | 30 kHz (note 3) |
| 3.5 - 7.5 | $\left\{ -35 - 1 \cdot \left(\frac{\Delta f}{\text{MHz}} - 3.5 \right) \right\} \text{dBc}$ | -55.8 dBm | 1 MHz (note 4) |
| 7.5 - 8.5 | $\left\{ -39 - 10 \cdot \left(\frac{\Delta f}{\text{MHz}} - 7.5 \right) \right\} \text{dBc}$ | -55.8 dBm | 1 MHz (note 4) |
| 8.5 - 12.5 MHz | -49 dBc | -55.8 dBm | 1 MHz (note 4) |

NOTE 1: Δf is the separation between the carrier frequency and the centre of the measurement bandwidth.
NOTE 2: The minimum requirement is calculated from the relative requirement or the absolute requirement, whichever is the higher power.
NOTE 3: The first and last measurement position with a 30 kHz filter is at Δf equals to 2.515 MHz and 3.485 MHz.
NOTE 4: The first and last measurement position with a 1 MHz filter is at Δf equals to 4 MHz and 12 MHz.

For operation in band II, IV, V, X, XII, XIII, XIV, XXV and XXVI the minimum requirement is calculated from the minimum requirement in table 5.9B.1 or the applicable additional requirement in Tables 5.9B.1A, 5.9B.1B or 5.9B.1C, whichever is the tighter requirement.

Table 5.9B.1A: Additional spectrum emission limits for Bands II, IV, X and XXV

| Δf in MHz (note 1) | Frequency offset of measurement filter centre frequency, f_{offset} | Additional requirements Band II, IV, X | Measurement bandwidth |
|---|--|--|-----------------------|
| $2.5 \text{ MHz} \leq \Delta f < 3.5 \text{ MHz}$ | $2.515 \text{ MHz} \leq f_{\text{offset}} < 3.485 \text{ MHz}$ | -15 dBm | 30 kHz |
| $3.5 \text{ MHz} \leq \Delta f \leq 12.5 \text{ MHz}$ | $4.0 \text{ MHz} \leq f_{\text{offset}} < 12.0 \text{ MHz}$ | -13 dBm | 1 MHz |

NOTE 1: Δf is the separation between the carrier frequency and the centre of the measurement bandwidth.

Table 5.9B.1B: Additional spectrum emission limits for Bands V and XXVI

| Δf in MHz (note 1) | Frequency offset of measurement filter centre frequency, f_{offset} | Additional requirements Band V | Measurement bandwidth |
|---|--|-----------------------------------|--------------------------|
| $2.5 \text{ MHz} \leq \Delta f < 3.5 \text{ MHz}$ | $2.515 \text{ MHz} \leq f_{\text{offset}} < 3.485 \text{ MHz}$ | -15 dBm | 30 kHz |
| $3.5 \text{ MHz} \leq \Delta f \leq 12.5 \text{ MHz}$ | $3.55 \text{ MHz} \leq f_{\text{offset}} < 12.45 \text{ MHz}$ | -13 dBm | 100 kHz |

NOTE 1: Δf is the separation between the carrier frequency and the centre of the measurement bandwidth.

Table 5.9B.1C: Additional spectrum emission limits for Bands XII, XIII, XIV

| Δf in MHz (Note 1) | Frequency offset of measurement filter centre frequency, f_{offset} | Additional requirements Band XII, XIII, XIV | Measurement bandwidth |
|--|--|---|--------------------------|
| $2.5 \text{ MHz} \leq \Delta f < 2.6 \text{ MHz}$ | $2.515 \text{ MHz} \leq f_{\text{offset}} < 2.585 \text{ MHz}$ | -13 dBm | 30 kHz |
| $2.6 \text{ MHz} \leq \Delta f \leq 12.45 \text{ MHz}$ | $2.65 \text{ MHz} \leq f_{\text{offset}} < 12.45 \text{ MHz}$ | -13 dBm | 100 kHz |

NOTE 1: Δf is the separation between the carrier frequency and the centre of the measurement bandwidth.

NOTE: As a general rule, the resolution bandwidth of the measuring equipment should be equal to the measurement bandwidth specified in tables 5.9B.1, 5.9B.1A, 5.9B.1B and 5.9B.1C. However, to improve measurement accuracy, sensitivity and efficiency, the resolution bandwidth may be smaller than the measurement bandwidth. When the resolution bandwidth is smaller than the measurement bandwidth, the result should be integrated over the measurement bandwidth in order to obtain the equivalent noise bandwidth of the measurement bandwidth.

The normative reference for this requirement is TS 25.101 [1] clause 6.6.2.1.1.

5.9B.3 Test purpose

To verify that the power of UE emission does not exceed the prescribed limits shown in table 5.9B.1. even in the presence of the E-DCH. (see note). This is applicable for all values of β_c , β_d , β_{hs} , β_{ec} and β_{ed} as specified in [5]. The maximum output power with HS-DPCCH and/or E-DCH is specified in table 5.2B.1.

Excess emission increases the interference to other channels or to other systems.

NOTE: For a static signal, the measurement with a 1MHz filter can be replaced by a narrower filter and integration over the bandwidth. (Note 6 in table 5.9B.1) For a non static signal the above described replacement gives different results, depending on the type of dynamic in the signal and depending on the bandwidth of the filter. Hence the signal is tested only when static.

5.9B.4 Method of test

5.9B.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS (node B emulator) to the UE antenna connector as shown in figure A.1.
- 2) The UL Reference Measurement Channel and the Fixed Reference Channels (FRC H-Set 1, QPSK) are specified in Annex C.11.1 and C.8.1.1.
- 3) An E-DCH call is set up according to TS 34.108 [3] 7.3.9 with the exceptions in the RADIO BEARER SETUP messages as given in Tables 5.2B.1A, 5.2B.2, 5.2B.3, 5.2B.3A and 5.2B.4. These exceptions allow the beta values to be set according to table C.11.1.3 and each UL physical channel to be at constant power during the measurement. RF parameters are set up according to table E.5A.1. Settings for the serving cell are defined in table 5.9B.2.

- 4) For sub-test 1 to 4, enter the UE into loopback test mode 1 looping back both the 12.2kbps RMC and HSDPA to E-DCH according to procedure 7.3.9.3.1 in TS 34.108 [3] and start the loopback test. For sub-test 5, enter the UE into loopback test mode 1 looping back HSDPA to E-DCH according to procedure 7.3.9.3.2 in TS 34.108 [3] and start the loopback test.

See TS 34.109 [4] clauses 5.3.2.3 and 5.3.2.6 for details regarding loopback test mode for HSDPA and E-DCH.

Table 5.9B.2: Settings for the serving cell during the measurement of Spectrum Emission Mask with E-DCH

| Parameter | Unit | Cell 1 |
|--|--------------|-------------------------------|
| Cell type | | Serving cell |
| UTRA RF Channel Number | | As defined in clause 5.9B.4.1 |
| Qqualmin | dB | -24 |
| Qrxlevmin | dBm | -115 |
| UE_TXPWR_MAX_RACH | dBm | +21 |
| \hat{I}_{or} (see notes 1 and 2) | dBm/3.84 MHz | -86 |
| NOTE 1: The power level is specified in terms of \hat{I}_{or} instead of CPICH_RSCP because RSCP is a receiver measurement, whereas the SS can only set \hat{I}_{or} . | | |
| NOTE 2: The cell fulfils TS 25.304, 5.2.3.1.2. | | |

5.9B.4.2 Procedure

- 1) For sub-test 1 to 4, set UE to maximum output power according to 5.2B.4.2.1 steps 1 to 8. For sub-test 5, set UE to maximum output power according to 5.2B.4.2.2 step 1 to 4.
- 2) When UE has reached the maximum power, measure the power of the transmitted signal with a measurement filter of bandwidths according to table 5.9B.3 and 5.9B.3A, 5.9B.3B, 5.9B.3C if applicable. For measurements using 1 MHz or 100kHz measurement bandwidths the result may be calculated by integrating multiple 50 kHz or narrower filter (≥ 3 kHz) measurements. The characteristic of the filter shall be approximately Gaussian (typical spectrum analyzer filter). The centre frequency of the filter shall be stepped in contiguous steps according to table 5.9B.3 and 5.9B.3A, 5.9B.3B 5.9B.3C if applicable. The measured power shall be recorded for each step. The measurement duration with the filter on one frequency shall last at least the filter settling time and the measurement period shall be inside the HS-DPCCH on-period.
- 3) Measure the RRC filtered mean power centred on the assigned channel frequency.
- 4) Calculate the ratio of the power 2) with respect to 3) in dBc.
- 5) Repeat steps 1-4 for all the different combinations of beta values as given in table C.11.1.3.

5.9B.5 Test requirements

The result of clause 5.9B.4.2 step 4) shall fulfil the requirements of table 5.9B.3.

For operation in band II, IV, V, X, XII, XIII, XIV, XXV and XXVI both minimum requirement in table 5.9B.3 and the applicable additional requirement in Tables 5.9B.3A, 5.9B.3B or 5.9B.3C need to be satisfied.

Table 5.9B.3: Spectrum Emission Mask Requirement

| Δf in MHz (Note 1) | Minimum requirement (Note 2) | | Measurement bandwidth |
|-------------------------------|---|----------------------|-----------------------|
| | Relative requirement | Absolute requirement | |
| 2.5 - 3.5 | $\left\{ -33.5 - 15 \cdot \left(\frac{\Delta f}{\text{MHz}} - 2.5 \right) \right\} \text{dBc}$ | -69.6 dBm | 30 kHz (Note 3) |
| 3.5 - 7.5 | $\left\{ -33.5 - 1 \cdot \left(\frac{\Delta f}{\text{MHz}} - 3.5 \right) \right\} \text{dBc}$ | -54.3 dBm | 1 MHz (Note 4) |
| 7.5 - 8.5 | $\left\{ -37.5 - 10 \cdot \left(\frac{\Delta f}{\text{MHz}} - 7.5 \right) \right\} \text{dBc}$ | -54.3 dBm | 1 MHz (Note 4) |
| 8.5 - 12.5 MHz | -47.5 dBc | -54.3 dBm | 1 MHz (Note 4) |

NOTE 1: Δf is the separation between the carrier frequency and the centre of the measurement bandwidth.
NOTE 2: The minimum requirement is calculated from the relative requirement or the absolute requirement, whichever is the higher power.
NOTE 3: The first and last measurement position with a 30 kHz filter is at Δf equals to 2.515 MHz and 3.485 MHz.
NOTE 4: The first and last measurement position with a 1 MHz filter is at Δf equals to 4 MHz and 12 MHz.

Table 5.9B.3A: Additional spectrum emission limits for Bands II, IV, X and XXV

| Δf in MHz (Note 1) | Frequency offset of measurement filter centre frequency, f_{offset} | Additional requirements Band II, IV, X | Measurement bandwidth |
|---|--|--|-----------------------|
| $2.5 \text{ MHz} \leq \Delta f < 3.5 \text{ MHz}$ | $2.515 \text{ MHz} \leq f_{\text{offset}} < 3.485 \text{ MHz}$ | -15 dBm | 30 kHz |
| $3.5 \text{ MHz} \leq \Delta f \leq 12.5 \text{ MHz}$ | $4.0 \text{ MHz} \leq f_{\text{offset}} < 12.0 \text{ MHz}$ | -13 dBm | 1 MHz |

NOTE 1: Δf is the separation between the carrier frequency and the centre of the measurement bandwidth.

Table 5.9B.3B: Additional spectrum emission limits for Bands V and XXVI

|--|--|---|-----------------------|
| $2.5 \text{ MHz} \leq \Delta f < 2.6 \text{ MHz}$ | $2.515 \text{ MHz} \leq f_{\text{offset}} < 2.585 \text{ MHz}$ | -13 dBm | 30 kHz |
| $2.6 \text{ MHz} \leq \Delta f \leq 12.45 \text{ MHz}$ | $2.65 \text{ MHz} \leq f_{\text{offset}} < 12.45 \text{ MHz}$ | -13 dBm | 100 kHz |

NOTE 1: Δf is the separation between the carrier frequency and the centre of the measurement bandwidth.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.9C Additional Spectrum Emission Mask for DC-HSUPA (QPSK)

5.9C.1 Definition and applicability

The spectrum emission mask of the UE applies to frequencies, which are between 5 MHz and 20 MHz away from the UE centre frequency of the two assigned channel frequencies. The requirements assume that the UE output power shall be maximum level.

It is necessary to verify the requirements only for the DC-HSUPA configurations specified in subclause C.2.8. The requirements and this test apply for Release 9 and later releases to all types of UTRA for the FDD UE that support HSDPA and Dual Cell E-DCH.

5.9C.2 Minimum Requirements

The power of any UE emission shall not exceed the levels specified in Table 5.9C.1 for the specified channel bandwidth.

Table 5.9C.1: Spectrum emission mask for DC-HSUPA

| Δf (MHz) | Frequency offset of measurement filter centre frequency, f_{offset} | Spectrum emission limit (dBm) | Measurement bandwidth |
|------------------|---|-------------------------------|-----------------------|
| $\pm 5-6$ | $5.015\text{MHz} \leq f_{\text{offset}} < 5.985\text{MHz}$ | -18 | 30 kHz |
| $\pm 6-10$ | $6.5\text{MHz} \leq f_{\text{offset}} < 10.0\text{MHz}$ | -10 | 1 MHz |
| $\pm 10-19$ | $10.0\text{MHz} \leq f_{\text{offset}} < 19.0\text{MHz}$ | -13 | 1 MHz |
| $\pm 19-20$ | $19.0\text{MHz} \leq f_{\text{offset}} < 19.5\text{MHz}$ | -25 | 1 MHz |
| Note: | Δf is the separation between the the center of two assigned channel frequencies and the centre of the measurement bandwidth | | |

The UE shall meet an additional requirement specified in Table 5.9C.1A for band II, IV, V and X.

Table 5.9C.1A: Additional spectrum emission mask for DC-HSUPA in band II, IV, V, X, XXV and XXVI

| Δf (MHz) | Frequency offset of measurement filter centre frequency, f_{offset} | Spectrum emission limit (dBm) | Measurement bandwidth |
|------------------|---|-------------------------------|-----------------------|
| $\pm 5-6$ | $5.015\text{MHz} \leq f_{\text{offset}} < 5.985\text{MHz}$ | -18 | 30 kHz |
| $\pm 6-19$ | $6.5\text{MHz} \leq f_{\text{offset}} < 19.0\text{MHz}$ | -13 | 1 MHz |
| $\pm 19-20$ | $19.0\text{MHz} \leq f_{\text{offset}} < 19.5\text{MHz}$ | -25 | 1 MHz |
| Note: | Δf is the separation between the the center of two assigned channel frequencies and the centre of the measurement bandwidth | | |

The normative reference for this requirement is TS 25.101 [1] clause 6.6.2.1A

5.9C.3 Test purpose

To verify that the power of UE emission, during DC-HSUPA transmission, does not exceed the prescribed limits shown in table 5.9C.1 or 5.9C.1A. This is applicable for all values of β_c , β_d , β_{hs} , β_{ec} and β_{ed} as specified in [5]. The maximum output power with HS-DPCCH and/or E-DCH is specified in table 5.2BA.1.

Excess emission increases the interference to other channels or to other systems.

NOTE: For a static signal, the measurement with a 1MHz filter can be replaced by a narrower filter and integration over the bandwidth. For a non static signal the above described replacement gives different results, depending on the type of dynamic in the signal and depending on the bandwidth of the filter. Hence the signal is tested only when static.

5.9C.4 Method of test

5.9C.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS (node B emulator) to the UE antenna connector as shown in figure A.41.
- 2) The UL Reference Measurement Channel and parameters are specified in Annex C.2.8 and C.11A. The DL Reference Measurement Channel (FRC H-SET 3A, QPSK) is specified in C.8.1.1.
- 3) A call is set up according to the Generic call setup procedure specified in TS34.108 [3] sub clause 7.3.14, with exceptions for information elements in RADIO BEARER SETUP message as given in Table 5.2BA.2, 5.2BA.3 and 5.2BA.4. These exceptions allow the beta values to be set according to table C.11A.1.1 and each UL physical channel to be at constant power during the measurement. RF parameters are set up according to E.5 A.1A. Settings for the serving cell are defined in table 5.9C.2.
- 3) Enter the UE into loopback test mode and start the loopback test.

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

Table 5.9C.2: Settings for the serving cell during the measurement of Spectrum Emission Mask for DC-HSUPA

| Parameter | Unit | Cell 1 |
|--|--------------|-------------------------------|
| Cell type | | Serving cell |
| UTRA RF Channel Number | | As defined in clause 5.9C.4.1 |
| Qqualmin | dB | -24 |
| Qrxlevmin | dBm | -115 |
| UE_TXPWR_MAX_RACH | dBm | +21 |
| \hat{I}_{or} (see notes 1 and 2) | dBm/3.84 MHz | -86 |
| NOTE 1: The power level is specified in terms of \hat{I}_{or} instead of CPICH_RSCP because RSCP is a receiver measurement, whereas the SS can only set \hat{I}_{or} . | | |
| NOTE 2: The cell fulfils TS 25.304, 5.2.3.1.2. | | |

5.9C.4.2 Procedure

- 1) Set the UE to maximum output power according to 5.2BA.4.2 steps 1 to 4.
- 2) When UE has reached the maximum power, measure the power of the transmitted signal with a measurement filter of bandwidths according to table 5.9C.1 and 5.9C.1A. For measurements using 1 MHz or 100kHz measurement bandwidths the result may be calculated by integrating multiple 50 kHz or narrower filter (≥ 3 kHz) measurements. The characteristic of the filter shall be approximately Gaussian (typical spectrum analyzer filter). The centre frequency of the filter shall be stepped in contiguous steps according to table 5.9C.1 and 5.9C.1A. The measured power shall be recorded for each step. The measurement duration with the filter on one frequency shall last at least the filter settling time and the measurement period shall be inside the HS-DPCCH on-period.
- 3) Repeat steps 1-2 for all the different combinations of UL E-DCH reference measurement channels and of beta values as given in clause C.2.8 and table C.11A.1.1.

5.9C.5 Test requirements

The result of clause 5.9C.4.2 step 2) shall fulfil the requirements of table 5.9C.3.

For operation in band II, IV, V and X both minimum requirement in table 5.9C.3 and the applicable additional requirement in Tables 5.9C.3A need to be satisfied.

Table 5.9C.3: Spectrum Emission Mask Requirement

| Δf (MHz) | Frequency offset of measurement filter centre frequency, f_{offset} | Spectrum emission limit (dBm) | Measurement bandwidth |
|---------------------|---|----------------------------------|--------------------------|
| $\pm 5-6$ | $5.015\text{MHz} \leq f_{\text{offset}} < 5.985\text{MHz}$ | -16.5 | 30 kHz |
| $\pm 6-10$ | $6.5\text{MHz} \leq f_{\text{offset}} < 10.0\text{MHz}$ | -8.5 | 1 MHz |
| $\pm 10-19$ | $10.0\text{MHz} \leq f_{\text{offset}} < 19.0\text{MHz}$ | -11.5 | 1 MHz |
| $\pm 19-20$ | $19.0\text{MHz} \leq f_{\text{offset}} < 19.5\text{MHz}$ | -23.5 | 1 MHz |
| Note: | Δf is the separation between the the center of two assigned channel frequencies and the centre of the measurement bandwidth | | |

Table 5.9C.3A: Additional spectrum emission limits for Bands II, IV, V, X, XXV and XXVI

| Δf (MHz) | Frequency offset of measurement filter centre frequency, f_{offset} | Spectrum emission limit (dBm) | Measurement bandwidth |
|---------------------|---|----------------------------------|--------------------------|
| $\pm 5-6$ | $5.015\text{MHz} \leq f_{\text{offset}} < 5.985\text{MHz}$ | -18 | 30 kHz |
| $\pm 6-19$ | $6.5\text{MHz} \leq f_{\text{offset}} < 19.0\text{MHz}$ | -13 | 1 MHz |
| $\pm 19-20$ | $19.0\text{MHz} \leq f_{\text{offset}} < 19.5\text{MHz}$ | -25 | 1 MHz |
| Note: | Δf is the separation between the the center of two assigned channel frequencies and the centre of the measurement bandwidth | | |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.9D Additional Spectrum Emission Mask for DC-HSUPA (16QAM)

5.9D.1 Definition and applicability

The spectrum emission mask of the UE applies to frequencies, which are between 5 MHz and 20 MHz away from the UE centre frequency of the two assigned channel frequencies. The requirements assume that the UE output power shall be maximum level.

It is necessary to verify the requirements only for the DC-HSUPA configurations specified in subclause C.2.8. The requirements and this test apply for Release 9 and later releases to all types of UTRA for the FDD UE that support HSDPA and Dual Cell E-DCH 16QAM UE capability category 9.

5.9D.2 Minimum Requirements

The power of any UE emission shall not exceed the levels specified in Table 5.9D.1 for the specified channel bandwidth.

Table 5.9D.1: Spectrum emission mask for DC-HSUPA

| Δf (MHz) | Frequency offset of measurement filter centre frequency, f_{offset} | Spectrum emission limit (dBm) | Measurement bandwidth |
|---------------------|---|----------------------------------|--------------------------|
| $\pm 5-6$ | $5.015\text{MHz} \leq f_{\text{offset}} < 5.985\text{MHz}$ | -18 | 30 kHz |
| $\pm 6-10$ | $6.5\text{MHz} \leq f_{\text{offset}} < 10.0\text{MHz}$ | -10 | 1 MHz |
| $\pm 10-19$ | $10.0\text{MHz} \leq f_{\text{offset}} < 19.0\text{MHz}$ | -13 | 1 MHz |
| $\pm 19-20$ | $19.0\text{MHz} \leq f_{\text{offset}} < 19.5\text{MHz}$ | -25 | 1 MHz |
| Note: | Δf is the separation between the the center of two assigned channel frequencies and the centre of the measurement bandwidth | | |

The UE shall meet an additional requirement specified in Table 5.9D.1A for band II, IV, V and X.

Table 5.9D.1A: Additional spectrum emission mask for DC-HSUPA in band II, IV, V, X, XXV and XXVI

| Δf (MHz) | Frequency offset of measurement filter centre frequency, f_{offset} | Spectrum emission limit (dBm) | Measurement bandwidth |
|---------------------|---|-------------------------------|-----------------------|
| ± 5 -6 | $5.015\text{MHz} \leq f_{\text{offset}} < 5.985\text{MHz}$ | -18 | 30 kHz |
| ± 6 -19 | $6.5\text{MHz} \leq f_{\text{offset}} < 19.0\text{MHz}$ | -13 | 1 MHz |
| ± 19 -20 | $19.0\text{MHz} \leq f_{\text{offset}} < 19.5\text{MHz}$ | -25 | 1 MHz |
| Note: | Δf is the separation between the the center of two assigned channel frequencies and the centre of the measurement bandwidth | | |

The normative reference for this requirement is TS 25.101 [1] clause 6.6.2.1A

5.9D.3 Test purpose

To verify that the power of UE emission, during DC-HSUPA transmission, does not exceed the prescribed limits shown in table 5.9D.1 or 5.9D.1A. This is applicable for all values of β_c , β_d , β_{hs} , β_{ec} and β_{ed} as specified in [5]. The maximum output power with HS-DPCCH and/or E-DCH is specified in table 5.2BA.1.

Excess emission increases the interference to other channels or to other systems.

NOTE: For a static signal, the measurement with a 1MHz filter can be replaced by a narrower filter and integration over the bandwidth. For a non static signal the above described replacement gives different results, depending on the type of dynamic in the signal and depending on the bandwidth of the filter. Hence the signal is tested only when static.

5.9D.4 Method of test

5.9D.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS (node B emulator) to the UE antenna connector as shown in figure A.41.
- 2) The UL Reference Measurement Channel and parameters are specified in Annex C.2.8 and C.11A. The DL Reference Measurement Channel (FRC H-SET 3A, QPSK) is specified in C.8.1.1.
- 3) A call is set up according to the Generic call setup procedure specified in TS34.108 [3] sub clause 7.3.14, with exceptions for information elements in RADIO BEARER SETUP message as given in Table 5.2BA.2, 5.2BA.3 and 5.2BA.4. These exceptions allow the beta values to be set according to table C.11A.1.1 and each UL physical channel to be at constant power during the measurement. RF parameters are set up according to E.5 A.1A. Settings for the serving cell are defined in table 5.9D.2.
- 3) Enter the UE into loopback test mode and start the loopback test.

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

Table 5.9D.2: Settings for the serving cell during the measurement of Spectrum Emission Mask for DC-HSUPA

| Parameter | Unit | Cell 1 |
|--|--------------|-------------------------------|
| Cell type | | Serving cell |
| UTRA RF Channel Number | | As defined in clause 5.9D.4.1 |
| Qqualmin | dB | -24 |
| Qrxlevmin | dBm | -115 |
| UE_TXPWR_MAX_RACH | dBm | +21 |
| \hat{I}_{or} (see notes 1 and 2) | dBm/3.84 MHz | -86 |
| NOTE 1: The power level is specified in terms of \hat{I}_{or} instead of CPICH_RSCP because RSCP is a receiver measurement, whereas the SS can only set \hat{I}_{or} . | | |
| NOTE 2: The cell fulfils TS 25.304, 5.2.3.1.2. | | |

5.9D.4.2 Procedure

- 1) Set the UE to maximum output power according to 5.2BA.4.2 steps 1 to 4.
- 2) When UE has reached the maximum power, measure the power of the transmitted signal with a measurement filter of bandwidths according to table 5.9D.1 and 5.9D.1A. For measurements using 1 MHz or 100kHz measurement bandwidths the result may be calculated by integrating multiple 50 kHz or narrower filter (≥ 3 kHz) measurements. The characteristic of the filter shall be approximately Gaussian (typical spectrum analyzer filter). The centre frequency of the filter shall be stepped in contiguous steps according to table 5.9D.1 and 5.9D.1A. The measured power shall be recorded for each step. The measurement duration with the filter on one frequency shall last at least the filter settling time and the measurement period shall be inside the HS-DPCCH on-period.
- 3) Repeat steps 1-2 for all the different combinations of UL E-DCH reference measurement channels and of beta values as given in clause C.2.8 and table C.11A.1.2.

5.9D.5 Test requirements

The result of clause 5.9D.4.2 step 2) shall fulfil the requirements of table 5.9D.3.

For operation in band II, IV, V and X both minimum requirement in table 5.9D.3 and the applicable additional requirement in Tables 5.9D.3A need to be satisfied.

Table 5.9D.3: Spectrum Emission Mask Requirement

| Δf (MHz) | Frequency offset of measurement filter centre frequency, f_{offset} | Spectrum emission limit (dBm) | Measurement bandwidth |
|---------------------|---|-------------------------------|-----------------------|
| $\pm 5-6$ | $5.015\text{MHz} \leq f_{\text{offset}} < 5.985\text{MHz}$ | -16.5 | 30 kHz |
| $\pm 6-10$ | $6.5\text{MHz} \leq f_{\text{offset}} < 10.0\text{MHz}$ | -8.5 | 1 MHz |
| $\pm 10-19$ | $10.0\text{MHz} \leq f_{\text{offset}} < 19.0\text{MHz}$ | -11.5 | 1 MHz |
| $\pm 19-20$ | $19.0\text{MHz} \leq f_{\text{offset}} < 19.5\text{MHz}$ | -23.5 | 1 MHz |
| Note: | Δf is the separation between the the center of two assigned channel frequencies and the centre of the measurement bandwidth | | |

Table 5.9D.3A: Additional spectrum emission limits for Bands II, IV, V, X, XXV and XXVI

| Δf (MHz) | Frequency offset of measurement filter centre frequency, f_{offset} | Spectrum emission limit (dBm) | Measurement bandwidth |
|---------------------|---|-------------------------------|-----------------------|
| $\pm 5-6$ | $5.015\text{MHz} \leq f_{\text{offset}} < 5.985\text{MHz}$ | -18 | 30 kHz |
| $\pm 6-19$ | $6.5\text{MHz} \leq f_{\text{offset}} < 19.0\text{MHz}$ | -13 | 1 MHz |
| $\pm 19-20$ | $19.0\text{MHz} \leq f_{\text{offset}} < 19.5\text{MHz}$ | -25 | 1 MHz |
| Note: | Δf is the separation between the the center of two assigned channel frequencies and the centre of the measurement bandwidth | | |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.10 Adjacent Channel Leakage Power Ratio (ACLR)

5.10.1 Definition and applicability

ACLR is the ratio of the RRC filtered mean power centred on the assigned channel frequency to the RRC filtered mean power centred on an adjacent channel frequency.

The requirements and this test apply to all types of UTRA for the FDD UE.

5.10.2 Minimum Requirements

If the adjacent channel RRC filtered mean power is greater than -50dBm then the ACLR shall be higher than the value specified in table 5.10.1.

Table 5.10.1: UE ACLR

| Power Class | UE channel | ACLR limit |
|-------------|-----------------------------|------------|
| 3 | +5 MHz or -5 MHz | 33 dB |
| 3 | +10 MHz or -10 MHz | 43 dB |
| 4 | +5 MHz or -5 MHz | 33 dB |
| 4 | +10 MHz or -10 MHz | 43 dB |

NOTE 1: The requirement shall still be met in the presence of switching transients.

NOTE 2: The ACLR requirements reflect what can be achieved with present state of the art technology.

NOTE 3: Requirement on the UE shall be reconsidered when the state of the art technology progresses.

The normative reference for this requirement is TS 25.101 [1] clause 6.6.2.2.1.

5.10.3 Test purpose

To verify that the UE ACLR does not exceed prescribed limit shown in table 5.10.1.

Excess ACLR increases the interference to other channels or to other systems.

5.10.4 Method of test

5.10.4.1 Initial conditions

Test environment: normal, TL/VL, TL/VH, TH/VL, TH/VH; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.1.
- 2) A call is set up according to the Generic call setup procedure in TS34.108 [3] sub clause 7.3.2.
- 3) Enter the UE into loopback test mode and start the loopback test.

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

5.10.4.2 Procedure

- 1) Set and send continuously Up power control commands to the UE until the UE output power shall be maximum level.
- 2) Measure the RRC filtered mean power.
- 3) Measure the RRC filtered mean power of the first adjacent channels and the second adjacent channels.
- 4) Calculate the ratio of the power between the values measured in '2)' and '3)'.

5.10.5 Test requirements

If the measured adjacent channel RRC filtered mean power, derived in step 3), is greater than $-50,0$ dBm then the measured ACLR, derived in step 4), shall be higher than the limit in table 5.10.2.

Table 5.10.2: UE ACLR

| Power Class | UE channel | ACLR limit |
|-------------|----------------------|------------|
| 3 | +5 MHz or -5 MHz | 32,2 dB |
| 3 | +10 MHz or -10 MHz | 42,2 dB |
| 4 | +5 MHz or -5 MHz | 32,2 dB |
| 4 | +10 MHz or -10 MHz | 42,2 dB |

NOTE 1: The requirement shall still be met in the presence of switching transients.

NOTE 2: The ACLR requirements reflect what can be achieved with present state of the art technology.

NOTE 3: Requirement on the UE shall be reconsidered when the state of the art technology progresses.

NOTE 4: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.10A Adjacent Channel Leakage Power Ratio (ACLR) with HS-DPCCH

5.10A.1 Definition and applicability

ACLR is the ratio of the RRC filtered mean power centred on the assigned channel frequency to the RRC filtered mean power centred on an adjacent channel frequency.

The requirements and this test apply for Release 5 and later releases to all types of UTRA for the FDD UE that support HSDPA.

5.10A.2 Minimum Requirements

If the adjacent channel RRC filtered mean power is greater than -50 dBm then the ACLR shall be higher than the value specified in table 5.10A.1. This is applicable for all values of β_c , β_d and β_{hs} as specified in [5].

Table 5.10A.1: UE ACLR

| Power Class | UE channel | ACLR limit |
|-------------|----------------------|------------|
| 3 | +5 MHz or -5 MHz | 33 dB |
| 3 | +10 MHz or -10 MHz | 43 dB |
| 4 | +5 MHz or -5 MHz | 33 dB |
| 4 | +10 MHz or -10 MHz | 43 dB |

NOTE 1: The requirement shall still be met in the presence of switching transients.

NOTE 2: The ACLR requirements reflect what can be achieved with present state of the art technology.

NOTE 3: Requirement on the UE shall be reconsidered when the state of the art technology progresses.

The normative reference for this requirement is TS 25.101 [1] clause 6.6.2.2.1.

5.10A.3 Test purpose

To verify that the UE ACLR does not exceed prescribed limit shown in table 5.10A.1. This is applicable for all values of β_c , β_d and β_{hs} as specified in [5]. The maximum output power with HS-DPCCH is specified in table 5.2A.1.

Excess ACLR increases the interference to other channels or to other systems.

5.10A.4 Method of test

5.10A.4.1 Initial conditions

Test environment: normal, TL/VL, TL/VH, TH/VL, TH/VH; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS (node B emulator) to the UE antenna connector as shown in figure A.1.
- 2) The UL Reference Measurement Channel and the Fixed Reference Channels (FRC H-Set 1, QPSK version) are specified in Annex C.10.1 and C.8.1.1.
- 3) An HSDPA call is set up according to TS 34.108 [3] clause 7.3.6. RF parameters are set up according to table E.5.1 and table E.5.10. Settings for the serving cell are defined in table 5.10A.2.
- 4) Enter the UE into loopback test mode in the presence of HSDPA and start the loopback test.

See TS 34.108 [3] and TS 34.109 [4] for details regarding loopback test mode for HSDPA.

Table 5.10A.2: Settings for the serving cell during the measurement of Adjacent Channel Leakage Power Ratio (ACLR) with HS-DPCCH

| Parameter | Unit | Cell 1 |
|--|--------------|--------------------------------|
| Cell type | | Serving cell |
| UTRA RF Channel Number | | As defined in clause 5.10A.4.1 |
| Qqualmin | dB | -24 |
| Qrxlevmin | dBm | -115 |
| UE_TXPWR_MAX_RACH | dBm | +21 |
| \hat{I}_{or} (see notes 1 and 2) | dBm/3.84 MHz | -86 |
| NOTE 1: The power level is specified in terms of \hat{I}_{or} instead of CPICH_RSCP because RSCP is a receiver measurement, whereas the SS can only set \hat{I}_{or} . | | |
| NOTE 2: The cell fulfils TS 25.304, 5.2.3.1.2. | | |

5.10A.4.2 Procedure

- 1) Send TRANSPORT CHANNEL RECONFIGURATION message to set the beta values according to table C.10.1.4 and the DPCH frame offset according the HS-DPCCH slot offset required for measurements.
- 2) Set and send continuously Up power control commands to the UE.
- 3) Start transmitting HSDPA Data.
- 4) When UE has reached the maximum power, measure the RRC filtered mean power on the wanted channel. The measurement period shall be inside the HS-DPCCH on-period for the wanted and the adjacent channels.
- 5) Measure the RRC filtered mean power of the first adjacent channels and the second adjacent channels.
- 6) Calculate the ratio of the power between the values measured in step 4) and step 5).
- 7) Repeat steps 1-6 for all the different combinations of beta values as given in table C.10.1.4.

All messages indicated above shall use the same content as described in the default message content in clause 9 of TS 34.108 [3], except the TRANSPORT CHANNEL RECONFIGURATION message which is defined in Annex I.

5.10A.5 Test requirements

The measured ACLR, derived in step 6), shall be higher than the limit in table 5.10A.3.

Table 5.10A.3: UE ACLR

| Power Class | UE channel | ACLR limit |
|-------------|--------------------|------------|
| 3 | +5 MHz or –5 MHz | 32.2 dB |
| 3 | +10 MHz or –10 MHz | 42.2 dB |
| 4 | +5 MHz or –5 MHz | 32.2 dB |
| 4 | +10 MHz or –10 MHz | 42.2 dB |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.10B Adjacent Channel Leakage Power Ratio (ACLR) with E-DCH

5.10B.1 Definition and applicability

ACLR is the ratio of the RRC filtered mean power centred on the assigned channel frequency to the RRC filtered mean power centred on an adjacent channel frequency.

The requirements and this test apply for Release 6 and later releases to all types of UTRA for the FDD UE that support HSDPA and E-DCH.

5.10B.2 Minimum Requirements

If the adjacent channel RRC filtered mean power is greater than –50dBm then the ACLR shall be higher than the value specified in table 5.10B.1. This is applicable for all values of β_c , β_d , β_{hs} , β_{ec} and β_{ed} as specified in [5].

Table 5.10B.1: UE ACLR

| Power Class | UE channel | ACLR limit |
|-------------|--------------------|------------|
| 3 | +5 MHz or –5 MHz | 33 dB |
| 3 | +10 MHz or –10 MHz | 43 dB |
| 4 | +5 MHz or –5 MHz | 33 dB |
| 4 | +10 MHz or –10 MHz | 43 dB |

NOTE 1: The requirement shall still be met in the presence of switching transients.

NOTE 2: The ACLR requirements reflect what can be achieved with present state of the art technology.

NOTE 3: Requirement on the UE shall be reconsidered when the state of the art technology progresses.

The normative reference for this requirement is TS 25.101 [1] clause 6.6.2.2.1.

5.10B.3 Test purpose

To verify that the UE ACLR does not exceed prescribed limit shown in table 5.10B.1. This is applicable for all values of β_c , β_d , β_{hs} , β_{ec} and β_{ed} as specified in [5]. The maximum output power with HS-DPCCH and/or E-DCH is specified in table 5.2B.1.

Excess ACLR increases the interference to other channels or to other systems.

5.10B.4 Method of test

5.10B.4.1 Initial conditions

Test environment: normal, TL/VL, TL/VH, TH/VL, TH/VH; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS (node B emulator) to the UE antenna connector as shown in figure A.1.
- 2) The UL Reference Measurement Channel and the Fixed Reference Channels (FRC H-Set 1, QPSK) are specified in Annex C.11.1 and C.8.1.1.
- 3) An E-DCH call is set up according to TS 34.108 [3] 7.3.9, with the exceptions in the RADIO BEARER SETUP messages as given in Tables 5.2B.1A, 5.2B.2, 5.2B.3, 5.2B.3A and 5.2B.4. These exceptions allow the beta values to be set according to table C.11.1.3 and each UL physical channel to be at constant power during the measurement. RF parameters are set up according to table E.5A.1. Settings for the serving cell are defined in table 5.10B.1A.
- 4) For sub-test 1 to 4, enter the UE into loopback test mode 1 looping back both the 12.2kbps RMC and HSDPA to E-DCH according to procedure 7.3.9.3.1 in TS 34.108 [3] and start the loopback test. For sub-test 5, enter the UE into loopback test mode 1 looping back HSDPA to E-DCH according to procedure 7.3.9.3.2 in TS 34.108 [3] and start the loopback test.

See TS 34.109 [4] clauses 5.3.2.3 and 5.3.2.6 for details regarding loopback test mode for HSDPA and E-DCH.

Table 5.10B.1A: Settings for the serving cell during the measurement of Adjacent Channel Leakage Power Ratio (ACLR) with E-DCH

| Parameter | Unit | Cell 1 |
|--|--------------|--------------------------------|
| Cell type | | Serving cell |
| UTRA RF Channel Number | | As defined in clause 5.10B.4.1 |
| Qqualmin | dB | -24 |
| Qrxlevmin | dBm | -115 |
| UE_TXPWR_MAX_RACH | dBm | +21 |
| \hat{I}_{or} (see notes 1 and 2) | dBm/3.84 MHz | -86 |
| NOTE 1: The power level is specified in terms of \hat{I}_{or} instead of CPICH_RSCP because RSCP is a receiver measurement, whereas the SS can only set \hat{I}_{or} . | | |
| NOTE 2: The cell fulfils TS 25.304, 5.2.3.1.2. | | |

5.10B.4.2 Procedure

- 1) For sub-test 1 to 4, set UE to maximum output power according to 5.2B.4.2.1 steps 1 to 8. For sub-test 5, set UE to maximum output power according to 5.2B.4.2.2 step 1 to 4.
- 2) When UE has reached the maximum power, measure the RRC filtered mean power on the wanted channel. The measurement period shall be inside the HS-DPCCH on-period for the wanted and the adjacent channels.
- 3) Measure the RRC filtered mean power of the first adjacent channels and the second adjacent channels.
- 4) Calculate the ratio of the power between the values measured in step 2) and step 3).
- 5) Repeat steps 1-4 for all the different combinations of beta values as given in table C.11.1.3.

5.10B.5 Test requirements

The measured ACLR, derived in step 4), shall be higher than the limit in table 5.10B.2.

Table 5.10B.2: UE ACLR

| Power Class | UE channel | ACLR limit |
|-------------|--------------------|------------|
| 3 | +5 MHz or –5 MHz | 32.2 dB |
| 3 | +10 MHz or –10 MHz | 42.2 dB |
| 4 | +5 MHz or –5 MHz | 32.2 dB |
| 4 | +10 MHz or –10 MHz | 42.2 dB |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause

5.10C Adjacent Channel Leakage Power Ratio (ACLR) with E-DCH for DC-HSUPA (QPSK)

5.10C.1 Definition and applicability

In the case dual adjacent carriers are assigned on the uplink, ACLR is the ratio of the sum of the RRC filtered mean powers centred on each of the two assigned channel frequencies to the RRC filtered mean power centred on an adjacent channel frequency.

The requirements and this test apply for Release 9 and later releases to all types of UTRA for the FDD UE that support HSDPA and Dual Cell E-DCH.

5.10C.2 Minimum Requirements

If the adjacent channel RRC filtered mean power is greater than –50dBm then the ACLR shall be higher than the value specified in table 5.10C.1. This is applicable for all values of β_c , β_{hs} , β_{ec} and β_{ed} as specified in [5]. However, it is necessary to verify the requirements only for the DC-HSUPA configurations in subclause C.2.8.

Table 5.10C.1: UE ACLR for DC-HSUPA

| Power Class | Adjacent channel frequency relative to the centre of two assigned channel frequencies | ACLR limit |
|-------------|---|------------|
| 3 | + 7.5 MHz or - 7.5 MHz | 33 dB |
| 3 | + 12.5 MHz or - 12.5 MHz | 36 dB |
| 4 | + 7.5 MHz or - 7.5 MHz | 33 dB |
| 4 | + 12.5 MHz or -12.5 MHz | 36 dB |

NOTE 1: The requirement shall still be met in the presence of switching transients.

NOTE 2: The ACLR requirements reflect what can be achieved with present state of the art technology.

NOTE 3: Requirement on the UE shall be reconsidered when the state of the art technology progresses.

The normative reference for this requirement is TS 25.101 [1] clause 6.6.2.2.1A.

5.10C.3 Test purpose

To verify that the UE ACLR does not exceed prescribed limit shown in table 5.10C.1. This is applicable for all values of β_c , β_d , β_{hs} , β_{ec} and β_{ed} as specified in [5].

Excess ACLR increases the interference to other channels or to other systems.

5.10C.4 Method of test

5.10C.4.1 Initial conditions

Test environment: normal, TL/VL, TL/VH, TH/VL, TH/VH; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS (node B emulator) to the UE antenna connector as shown in figure A.41.
- 2) The UL Reference Measurement Channel and parameters are specified in Annex C.2.8 and C.11A. The DL Reference Measurement Channel (FRC H-SET 3A, QPSK) is specified in C.8.1.1.
- 3) An E-DCH call is set up according to TS 34.108 [3] 7.3.14, with the exceptions in the RADIO BEARER SETUP messages as given in Tables 5.2BA.2, 5.2BA.3, 5.2BA.4 and 5.2BA.5. These exceptions allow the beta values to be set according to table C.11A.1.1, table C.11A.1.2 and each UL physical channel to be at constant power during the measurement. RF parameters are set up according to table E.5A.1A. Settings for the serving cell are defined in table 5.10C.2.
- 4) Enter the UE into loopback test mode 1 looping back HSDPA to E-DCH according to procedure 7.3.14.3 in TS 34.108 [3] and start the loopback test.

See TS 34.109 [4] clauses 5.3.2.3 and 5.3.2.6 for details regarding loopback test mode for HSDPA and E-DCH.

Table 5.10C.2: Settings for the serving cell during the measurement of Adjacent Channel Leakage Power Ratio (ACLR) with E-DCH

| Parameter | Unit | Cell 1 |
|--|--------------|--------------------------------|
| Cell type | | Serving cell |
| UTRA RF Channel Number | | As defined in clause 5.10C.4.1 |
| Qqualmin | dB | -24 |
| Qrxlevmin | dBm | -115 |
| UE_TXPWR_MAX_RACH | dBm | +21 |
| \hat{I}_{or} (see notes 1 and 2) | dBm/3.84 MHz | -86 |
| NOTE 1: The power level is specified in terms of \hat{I}_{or} instead of CPICH_RSCP because RSCP is a receiver measurement, whereas the SS can only set \hat{I}_{or} . | | |
| NOTE 2: The cell fulfils TS 25.304, 5.2.3.1.2. | | |

5.10C.4.2 Procedure

- 1) Set UE to maximum output power according to 5.2BA.4.2 step 1 to 4.
- 2) Measure the sum of the RRC filtered mean powers centred on each of the two assigned channel frequencies. The measurement period shall be inside the HS-DPCCH on-period for the wanted and the adjacent channels.
- 3) Measure the RRC filtered mean power of the first adjacent channels and the second adjacent channels.
- 4) Calculate the ratio of the power between the values measured in step 2) and step 3).
- 5) Repeat steps 1-4 for all the different combinations of beta values as given in table C.11A.1.1.

5.10C.5 Test requirements

The measured ACLR, derived in step 4), shall be higher than the limit in table 5.10C.3.

Table 5.10C.3: UE ACLR for DC-HSUPA

| Power Class | Adjacent channel frequency relative to the centre of two assigned channel frequencies | ACLR limit |
|-------------|---|------------|
| 3 | + 7.5 MHz or - 7.5 MHz | 32.2 dB |
| 3 | + 12.5 MHz or - 12.5 MHz | 35.2 dB |
| 4 | + 7.5 MHz or - 7.5 MHz | 32.2 dB |
| 4 | + 12.5 MHz or -12.5 MHz | 35.2 dB |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause

5.10D Adjacent Channel Leakage Power Ratio (ACLR) with E-DCH for DC-HSUPA (16QAM)

5.10D.1 Definition and applicability

In the case dual adjacent carriers are assigned on the uplink, ACLR is the ratio of the sum of the RRC filtered mean powers centred on each of the two assigned channel frequencies to the RRC filtered mean power centred on an adjacent channel frequency.

The requirements and this test apply for Release 9 and later releases to all types of UTRA for the FDD UE that support HSDPA and Dual Cell E-DCH 16QAM UE capability category 9.

5.10D.2 Minimum Requirements

If the adjacent channel RRC filtered mean power is greater than -50dBm then the ACLR shall be higher than the value specified in table 5.10D.1. This is applicable for all values of β_c , β_{hs} , β_{ec} and β_{ed} as specified in [5]. However, it is necessary to verify the requirements only for the DC-HSUPA configurations in subclause C.2.8.

Table 5.10D.1: UE ACLR for DC-HSUPA

| Power Class | Adjacent channel frequency relative to the centre of two assigned channel frequencies | ACLR limit |
|-------------|---|------------|
| 3 | + 7.5 MHz or - 7.5 MHz | 33 dB |
| 3 | + 12.5 MHz or - 12.5 MHz | 36 dB |
| 4 | + 7.5 MHz or - 7.5 MHz | 33 dB |
| 4 | + 12.5 MHz or -12.5 MHz | 36 dB |

NOTE 1: The requirement shall still be met in the presence of switching transients.

NOTE 2: The ACLR requirements reflect what can be achieved with present state of the art technology.

NOTE 3: Requirement on the UE shall be reconsidered when the state of the art technology progresses.

The normative reference for this requirement is TS 25.101 [1] clause 6.6.2.2.1A.

5.10D.3 Test purpose

To verify that the UE ACLR does not exceed prescribed limit shown in table 5.10D.1. This is applicable for all values of β_c , β_d , β_{hs} , β_{ec} and β_{ed} as specified in [5].

Excess ACLR increases the interference to other channels or to other systems.

5.10D.4 Method of test

5.10D.4.1 Initial conditions

Test environment: normal, TL/VL, TL/VH, TH/VL, TH/VH; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS (node B emulator) to the UE antenna connector as shown in figure A.41.
- 2) The UL Reference Measurement Channel and parameters are specified in Annex C.2.8 and C.11A. The DL Reference Measurement Channel (FRC H-SET 3A, QPSK) is specified in C.8.1.1.
- 3) An E-DCH call is set up according to TS 34.108 [3] 7.3.14, with the exceptions in the RADIO BEARER SETUP messages as given in Tables 5.2BA.2, 5.2BA.3, 5.2BA.4 and 5.2BA.5. These exceptions allow the beta values to

be set according to table C.11A.1.1, table C.11A.1.2 and each UL physical channel to be at constant power during the measurement. RF parameters are set up according to table E.5A.1A. Settings for the serving cell are defined in table 5.10D.2.

- 4) Enter the UE into loopback test mode 1 looping back HSDPA to E-DCH according to procedure 7.3.14.3 in TS 34.108 [3] and start the loopback test.

See TS 34.109 [4] clauses 5.3.2.3 and 5.3.2.6 for details regarding loopback test mode for HSDPA and E-DCH.

Table 5.10D.2: Settings for the serving cell during the measurement of Adjacent Channel Leakage Power Ratio (ACLR) with E-DCH

| Parameter | Unit | Cell 1 |
|--|--------------|--------------------------------|
| Cell type | | Serving cell |
| UTRA RF Channel Number | | As defined in clause 5.10D.4.1 |
| Qqualmin | dB | -24 |
| Qrxlevmin | dBm | -115 |
| UE_TXPWR_MAX_RACH | dBm | +21 |
| \hat{I}_{or} (see notes 1 and 2) | dBm/3.84 MHz | -86 |
| NOTE 1: The power level is specified in terms of \hat{I}_{or} instead of CPICH_RSCP because RSCP is a receiver measurement, whereas the SS can only set \hat{I}_{or} . | | |
| NOTE 2: The cell fulfils TS 25.304, 5.2.3.1.2. | | |

5.10D.4.2 Procedure

- 1) Set UE to maximum output power according to 5.2BA.4.2 step 1 to 4.
- 2) Measure the sum of the RRC filtered mean powers centred on each of the two assigned channel frequencies. The measurement period shall be inside the HS-DPCCH on-period for the wanted and the adjacent channels.
- 3) Measure the RRC filtered mean power of the first adjacent channels and the second adjacent channels.
- 4) Calculate the ratio of the power between the values measured in step 2) and step 3).
- 5) Repeat steps 1-4 for all the different combinations of beta values as given in table C.11A.1.2.

5.10D.5 Test requirements

The measured ACLR, derived in step 4), shall be higher than the limit in table 5.10D.3.

Table 5.10D.3: UE ACLR for DC-HSUPA

| Power Class | Adjacent channel frequency relative to the centre of two assigned channel frequencies | ACLR limit |
|-------------|---|------------|
| 3 | + 7.5 MHz or - 7.5 MHz | 32.2 dB |
| 3 | + 12.5 MHz or - 12.5 MHz | 35.2 dB |
| 4 | + 7.5 MHz or - 7.5 MHz | 32.2 dB |
| 4 | + 12.5 MHz or -12.5 MHz | 35.2 dB |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause.

5.11 Spurious Emissions

5.11.1 Definition and applicability

Spurious emissions are emissions which are caused by unwanted transmitter effects such as harmonics emission, parasitic emission, intermodulation products and frequency conversion products, but exclude out of band emissions.

The frequency boundary and the detailed transitions of the limits between the requirement for out band emissions and spectrum emissions are based on ITU-R Recommendations SM.329.

The requirements and this test apply to all types of UTRA for the FDD UE.

5.11.2 Minimum Requirements

These requirements are only applicable for frequencies, which are greater than 12.5 MHz away from the UE centre carrier frequency.

Table 5.11.1a: General spurious emissions requirements

| Frequency Bandwidth | Measurement Bandwidth | Minimum requirement | Note |
|---|-----------------------|---------------------|--------|
| $9 \text{ kHz} \leq f < 150 \text{ kHz}$ | 1 kHz | -36 dBm | |
| $150 \text{ kHz} \leq f < 30 \text{ MHz}$ | 10 kHz | -36 dBm | |
| $30 \text{ MHz} \leq f < 1\,000 \text{ MHz}$ | 100 kHz | -36 dBm | |
| $1 \text{ GHz} \leq f < 12,75 \text{ GHz}$ | 1 MHz | -30 dBm | |
| $12,75 \text{ GHz} \leq f < 5^{\text{th}}$ harmonic of the upper frequency edge of the UL operating band in GHz | 1 MHz | -30 dBm | Note 1 |

NOTE 1: Applies only for Band XXII.

Table 5.11.1b: Additional spurious emissions requirements

| Operating Band | Frequency Bandwidth | Measurement Bandwidth | Minimum requirement |
|-----------------------------------|---------------------------------------|-----------------------|---------------------------------|
| I | 791 MHz \leq f \leq 821 MHz | 3.84 MHz | -60 dBm |
| | 852 MHz \leq f \leq 859 MHz | 1 MHz | -50 dBm |
| | 859 MHz \leq f \leq 895 MHz | 3.84 MHz | -60 dBm |
| | 921 MHz \leq f < 925 MHz | 100 kHz | -60 dBm (see note 1) |
| | 925 MHz \leq f \leq 935 MHz | 100 kHz 3.84 MHz | -67 dBm (see note 1) -60 dBm |
| | 935 MHz < f \leq 960 MHz | 100 kHz | -79 dBm (see note 1) |
| | 1475.9 MHz \leq f \leq 1510.9 MHz | 3.84 MHz | -60 dBm |
| | 1805 MHz \leq f \leq 1880 MHz | 100 kHz | -71 dBm (see note 1) |
| | 1844.9 MHz \leq f \leq 1879.9 MHz | 3.84 MHz | -60 dBm |
| | 1884.5 MHz < f < 1915.7 MHz | 300 kHz | -41 dBm |
| | 2110 MHz \leq f \leq 2170 MHz | 3.84 MHz | -60 dBm |

| Operating Band | Frequency Bandwidth | Measurement Bandwidth | Minimum requirement |
|---|---------------------|-----------------------|---------------------|
| NOTE 1: The measurements are made on frequencies which are integer multiples of 200 kHz. As exceptions, up to five measurements with a level up to the applicable requirements defined in table 5.11.1a are permitted for each UARFCN used in the measurement. | | | |
| NOTE 2: The measurements are made on frequencies which are integer multiples of 200 kHz. As exceptions, measurements with a level up to the applicable requirements defined in Table 5.11.1a are permitted for each UARFCN used in the measurement due to 2 nd or 3 rd harmonic spurious emissions. | | | |
| NOTE 3: This requirement is applicable also for frequencies, which are between 2.5 MHz and 12.5 MHz away from the UE centre carrier frequency. | | | |
| NOTE 4: The frequency bandwidth protection 2585-2690 MHz test requirement for Bands I, III, and VIII deviates from the requirement in TS 25.101 [1] Rel-8 and earlier releases. The present document reflects the frequency bandwidth specified in the EN 301 908-2 [Ref.] which became a mandatory requirement after these earlier TS 25.101 releases were frozen. | | | |

NOTE: The applicability of each line in Table 5.11.1b for UEs of different releases is defined in TS 25.101 [1].

As exceptions, up to five measurements with a level up to the applicable requirements defined in table 5.11.1a are permitted in each of the bands, 925 MHz to 960 MHz and 1805 MHz to 1880 MHz for each UARFCN used in the measurement. The reference is 3GPP TS 45.005 [29].

The normative reference for this requirement is TS 25.101 [1] clause 6.6.3.1.

5.11.3 Test purpose

To verify that the UE spurious emissions do not exceed described value shown in table 5.11.1a and table 5.11.1b.

Excess spurious emissions increase the interference to other systems.

5.11.4 Method of test

5.11.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.8.
- 2) A call is set up according to the Generic call setup procedure in TS34.108 [3] sub clause 7.3.2.
- 3) Enter the UE into loopback test mode and start the loopback test.

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

5.11.4.2 Procedure

- 1) Set and send continuously Up power control commands to the UE until the UE output power shall be maximum level.
- 2) Sweep the spectrum analyzer (or equivalent equipment) over a frequency range and measure the average power of spurious emission.

5.11.5 Test requirements

The measured average power of spurious emission, derived in step 2), shall not exceed the described value in tables 5.11.2a and 5.11.2b.

These requirements are only applicable for frequencies, which are greater than 12,5 MHz away from the UE centre carrier frequency.

Table 5.11.2a: General spurious emissions test requirements

| Frequency Bandwidth | Measurement Bandwidth | Minimum requirement | Note |
|---|-----------------------|---------------------|--------|
| $9 \text{ kHz} \leq f < 150 \text{ kHz}$ | 1 kHz | -36 dBm | |
| $150 \text{ kHz} \leq f < 30 \text{ MHz}$ | 10 kHz | -36 dBm | |
| $30 \text{ MHz} \leq f < 1\,000 \text{ MHz}$ | 100 kHz | -36 dBm | |
| $1 \text{ GHz} \leq f < 12,75 \text{ GHz}$ | 1 MHz | -30 dBm | |
| $12,75 \text{ GHz} \leq f < 5^{\text{th}}$ harmonic of the upper frequency edge of the UL operating band in GHz | 1 MHz | -30 dBm | Note 1 |

NOTE 1: Applies only for Band XXII.

Table 5.11.2b: Additional spurious emissions test requirements

| Operating Band | Frequency Bandwidth | Measurement Bandwidth | Minimum requirement |
|----------------|---|-----------------------|----------------------|
| I | $791 \text{ MHz} \leq f \leq 821 \text{ MHz}$ | 3.84 MHz | -60 dBm |
| | $852 \text{ MHz} \leq f \leq 859 \text{ MHz}$ | 1 MHz | -50 dBm |

| | 3400 MHz ≤ f ≤ 3800 MHz | 1 MHz | -50 dBm |
| NOTE 1: The measurements are made on frequencies which are integer multiples of 200 kHz. As exceptions, up to five measurements with a level up to the applicable requirements defined in table 5.11.2a are permitted for each UARFCN used in the measurement. | | | |
| NOTE 2: The measurements are made on frequencies which are integer multiples of 200 kHz. As exceptions, measurements with a level up to the applicable requirements defined in Table 5.11.2a are permitted for each UARFCN used in the measurement due to 2 nd or 3 rd harmonic spurious emissions. Exception is allowed if bandwidth of the harmonic signal and measurement bandwidth are totally or partially overlapping. - Bandwidth for 2nd harmonic = 2 x 5 MHz. - Bandwidth for 3rd harmonic = 3 x 5 MHz. | | | |
| NOTE 3: For UEs that conform to Release 6 and support Band II, IV or V shall support the defined frequency bandwidth. | | | |
| NOTE 4: For UEs that conform to Release 7 and later releases and support Band II, IV or V shall support the defined frequency bandwidth. | | | |
| NOTE 5: The applicability of each line in Table 5.11.2b for UEs of different releases is defined in TS 25.101 [1]. | | | |
| NOTE 6: This requirement is applicable also for frequencies, which are between 2.5 MHz and 12.5 MHz away from the UE centre carrier frequency. | | | |
| NOTE 7: The frequency bandwidth protection 2585-2690 MHz test requirement for Bands I, III, and VIII deviates from the requirement in TS 25.101 [1] Rel-8 and earlier releases. The present document reflects the frequency bandwidth specified in the European Harmonized Standard EN 301 908-2 [Ref.] which became a mandatory requirement after these earlier TS 25.101 releases were frozen. | | | |

NOTE: The applicability of each line in Table 5.11.2b for UEs of different releases is defined in TS 25.101 [1].

As exceptions, up to five measurements with a level up to the applicable requirements defined in table 5.11.2a are permitted in each of the bands, 925 MHz to 960 MHz and 1805 MHz to 1880 MHz for each UARFCN used in the measurement. The reference is 3GPP TS 45.005 [29].

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.11A Spurious Emissions for DC-HSUPA

5.11A.1 Definition and applicability

Spurious emissions are emissions which are caused by unwanted transmitter effects such as harmonics emission, parasitic emission, intermodulation products and frequency conversion products, but exclude out of band emissions.

The frequency boundary and the detailed transitions of the limits between the requirement for out band emissions and spectrum emissions are based on ITU-R Recommendations SM.329.

The requirements and this test apply for Release 9 and later releases to all types of UTRA for the FDD UE that support HSDPA and Dual Cell E-DCH.

5.11A.2 Minimum Requirements

These requirements are only applicable for frequencies, which are greater than 20 MHz away from the centre of the assigned carrier frequencies when dual adjacent carriers are assigned on the uplink.

Table 5.11A.1: General spurious emissions requirements for DC-HSUPA

| Frequency Bandwidth | Measurement Bandwidth | Minimum requirement | Note |
|---|-----------------------|---------------------|--------|
| $9 \text{ kHz} \leq f < 150 \text{ kHz}$ | 1 kHz | -36 dBm | |
| $150 \text{ kHz} \leq f < 30 \text{ MHz}$ | 10 kHz | -36 dBm | |
| $30 \text{ MHz} \leq f < 1\,000 \text{ MHz}$ | 100 kHz | -36 dBm | |
| $1 \text{ GHz} \leq f < 12,75 \text{ GHz}$ | 1 MHz | -30 dBm | |
| $12.75 \text{ GHz} \leq f < 5^{\text{th}}$ harmonic of the upper frequency edge of the UL operating band in GHz | 1 MHz | -30 dBm | Note 1 |

NOTE 1: Applies only for Band XXII.

The requirements in Table 5.11A.2 are only applicable for frequencies, which are greater than 25 MHz away from the centre of the assigned frequencies when dual adjacent carriers are assigned on the uplink.

Table 5.11A.2: Additional spurious emissions requirements for DC-HSUPA

| Operating Band | Frequency Bandwidth | Measurement Bandwidth | Minimum requirement |
|---|---|-----------------------|---------------------------------|
| I | $791 \text{ MHz} \leq f \leq 821 \text{ MHz}$ | 3.84 MHz | -60 dBm |

| NOTE 1: The measurements are made on frequencies which are integer multiples of 200 kHz. As exceptions, up to five measurements with a level up to the applicable requirements defined in Table 5.11A.1 are permitted for each UARFCN used in the measurement. | | | |
| NOTE 2: The measurements are made on frequencies which are integer multiples of 200 kHz. As exceptions, measurements with a level up to the applicable requirements defined in Table 5.11A.1 are permitted for each UARFCN used in the measurement due to 2nd or 3rd harmonic spurious emissions. | | | |
| NOTE 3: This requirement is applicable also for frequencies, which are between 5 MHz and 25 MHz away from the UE centre carrier frequency. | | | |

NOTE: The applicability of each line in Table 5.11A.2 for UEs of different releases is defined in TS 25.101 [1].

As exceptions, up to five measurements with a level up to the applicable requirements defined in table 5.11A.1 are permitted in each of the bands, 925 MHz to 960 MHz and 1805 MHz to 1880 MHz for each UARFCN used in the measurement. The reference is 3GPP TS 45.005 [29].

The normative reference for this requirement is TS 25.101 [1] clause 6.6.3.1A.

5.11A.3 Test purpose

To verify that the UE spurious emissions do not exceed described value shown in table 5.11A.1 and table 5.11A.2.

Excess spurious emissions increase the interference to other systems.

5.11A.4 Method of test

5.11A.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.41.
- 2) The UL Reference Measurement Channel and parameters are specified in Annex C.2.6 and C.11A. The DL Reference Measurement Channel (FRC H-SET 3A, QPSK) is specified in C.8.1.1.
- 3) An E-DCH call is set up according to TS 34.108 [3] 7.3.14, with the exceptions in the RADIO BEARER SETUP messages as given in Tables 5.2BA.2, 5.2BA.3, 5.2BA.4 and 5.2BA.5. These exceptions allow the beta values to be set according to table C.11A.1 and each UL physical channel to be at constant power during the measurement. RF parameters are set up according to table E.5A.1A.
- 4) Enter the UE into loopback test mode 1 looping back HSDPA to E-DCH according to procedure 7.3.14.3 in TS 34.108 [3] and start the loopback test.

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

5.11A.4.2 Procedure

- 1) Set UE to maximum output power according to 5.2BA.4.2 step 1 to 4.
- 2) Sweep the spectrum analyzer (or equivalent equipment) over a frequency range and measure the average power of spurious emission.

5.11A.5 Test requirements

The measured average power of spurious emission, derived in step 2), shall not exceed the described value in tables 5.11A.3 and 5.11A.4.

These requirements are only applicable for frequencies, which are greater than 20 MHz away from the centre of the assigned carrier frequencies when dual adjacent carriers are assigned on the uplink.

Table 5.11A.3: General spurious emissions test requirements for DC-HSUPA

| Frequency Bandwidth | Measurement Bandwidth | Minimum requirement | Note |
|---|-----------------------|---------------------|--------|
| $9 \text{ kHz} \leq f < 150 \text{ kHz}$ | 1 kHz | -36 dBm | |
| $150 \text{ kHz} \leq f < 30 \text{ MHz}$ | 10 kHz | -36 dBm | |
| $30 \text{ MHz} \leq f < 1\,000 \text{ MHz}$ | 100 kHz | -36 dBm | |
| $1 \text{ GHz} \leq f < 12,75 \text{ GHz}$ | 1 MHz | -30 dBm | |
| $12,75 \text{ GHz} \leq f < 5^{\text{th}}$ harmonic of the upper frequency edge of the UL operating band in GHz | 1 MHz | -30 dBm | Note 1 |

NOTE 1: Applies only for Band XXII.

| Frequency Bandwidth | Measurement Bandwidth | Minimum requirement |
|--|-----------------------|---------------------|
| $9 \text{ kHz} \leq f < 150 \text{ kHz}$ | 1 kHz | -36 dBm |
| $150 \text{ kHz} \leq f < 30 \text{ MHz}$ | 10 kHz | -36 dBm |
| $30 \text{ MHz} \leq f < 1\,000 \text{ MHz}$ | 100 kHz | -36 dBm |
| $1 \text{ GHz} \leq f < 12,75 \text{ GHz}$ | 1 MHz | -30 dBm |

The requirements in Table 5.11A.4 are only applicable for frequencies, which are greater than 25 MHz away from the centre of the assigned frequencies when dual adjacent carriers are assigned on the uplink.

Table 5.11A.4: Additional spurious emissions test requirements for DC-HSUPA

| Operating Band | Frequency Bandwidth | Measurement Bandwidth | Minimum requirement |

| 3400 MHz \leq f \leq 3800 MHz | 1 MHz | -50 dBm | |
| NOTE 1: The measurements are made on frequencies which are integer multiples of 200 kHz. As exceptions, up to five measurements with a level up to the applicable requirements defined in Table 5.11A.3 are permitted for each UARFCN used in the measurement. | | | |
| NOTE 2: The measurements are made on frequencies which are integer multiples of 200 kHz. As exceptions, measurements with a level up to the applicable requirements defined in Table 5.11A.3 are permitted for each UARFCN used in the measurement due to 2nd or 3rd harmonic spurious emissions. | | | |
| NOTE 3: This requirement is applicable also for frequencies, which are between 5 MHz and 25 MHz away from the UE centre carrier frequency. | | | |
| NOTE 4: The applicability of each line in Table 5.11A.4 for UEs of different releases is defined in TS 25.101 [1]. | | | |

As exceptions, up to five measurements with a level up to the applicable requirements defined in table 5.11A.3 are permitted in each of the bands, 925 MHz to 960 MHz and 1805 MHz to 1880 MHz for each UARFCN used in the measurement. The reference is 3GPP TS 45.005 [29].

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.12 Transmit Intermodulation

5.12.1 Definition and applicability

The transmit intermodulation performance is a measure of the capability of the transmitter to inhibit the generation of signals in its non linear elements caused by presence of the wanted signal and an interfering signal reaching the transmitter via the antenna.

UE(s) transmitting in close vicinity of each other can produce intermodulation products, which can fall into the UE, or Node B receive band as an unwanted interfering signal. The UE transmit intermodulation attenuation is defined by the ratio of the RRC filtered mean power of the wanted signal to the RRC filtered mean power of the intermodulation product when an interfering CW signal is added at a level below the wanted signal.

The requirements and this test apply to all types of UTRA for the FDD UE.

5.12.2 Minimum Requirements

The UE transmit intermodulation shall not exceed the described value in table 5.12.1.

Table 5.12.1: Transmit Intermodulation

| CW Signal Frequency Offset from Transmitting Carrier | 5MHz | 10MHz |
|--|---------|---------|
| Interference CW Signal Level | -40 dBc | |
| Intermodulation Product | -31 dBc | -41 dBc |

The normative reference for this requirement is TS 25.101 [1] clause 6.7.1.

5.12.3 Test purpose

To verify that the UE transmit intermodulation does not exceed the described value in table 5.12.1.

An excess transmit intermodulation increases transmission errors in the up link own channel when other transmitter exists nearby.

5.12.4 Method of test

5.12.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.2.
- 2) A call is set up according to the Generic call setup procedure in TS34.108 [3] sub clause 7.3.2.
- 3) Enter the UE into loopback test mode and start the loopback test.

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

5.12.4.2 Procedure

- 1) Set and send continuously Up power control commands to the UE until the UE output power shall be maximum level.
- 2) Set the frequency of the CW generator to the offset 1 or offset 2 as shown in table 5.12.2.
- 3) Measure the RRC filtered mean power of the UE.

- 4) Search the intermodulation product signal, then measure the RRC filtered mean power of transmitting intermodulation, and calculate the ratio with the power measured in step 3).
- 5) Repeat the measurement with another tone offset.

5.12.5 Test requirements

The ratio derived in step 4), shall not exceed the described value in table 5.12.2.

Table 5.12.2: Transmit Intermodulation

| CW Signal Frequency Offset from Transmitting Carrier | 5MHz | 10MHz |
|--|---------|---------|
| Interference CW Signal Level | -40 dBc | |
| Intermodulation Product | -31 dBc | -41 dBc |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.12A Transmit Intermodulation for DC-HSUPA

5.12A.1 Definition and applicability

The transmit intermodulation performance is a measure of the capability of the transmitter to inhibit the generation of signals in its non linear elements caused by presence of the wanted signal and an interfering signal reaching the transmitter via the antenna.

The UE intermodulation attenuation is defined by the ratio of the sum of the RRC filtered mean powers of the wanted signal on the assigned carriers to the sum of the RRC filtered mean powers of the intermodulation product on two adjacent carriers when an interfering CW signal is added at a level below the wanted signal.

The requirements and this test apply for Release 9 and later releases to all types of UTRA for the FDD UE that supports HSDPA and Dual Cell E-DCH.

5.12A.2 Minimum Requirements for DC-HSUPA

The requirement of transmitting intermodulation for a carrier spacing of 5 MHz is prescribed in Table 5.12A.1.

Table 5.12A.1: Transmit Intermodulation requirement for DC-HSUPA

| Interference Signal Frequency Offset | 10MHz | 20MHz |
|--------------------------------------|--------|--------|
| Interference CW Signal Level | -40dBc | |
| Intermodulation Product | -31dBc | -41dBc |

The normative reference for this requirement is TS 25.101 [1] clause 6.7.1A.

5.12A.3 Test purpose

To verify that the UE transmit intermodulation does not exceed the described value in table 5.12A.2.

An excess transmit intermodulation increases transmission errors in the up link when other transmitter exists nearby.

5.12A.4 Method of test

5.12A.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS (node B emulator) to the UE antenna connector as shown in figure A.42.
- 2) The UL Reference Measurement Channel and parameters are specified in Annex C.11A. The DL Reference Measurement Channel (FRC H-SET 3A, QPSK) is specified in C.8.1.1.
- 3) An E-DCH call is set up according to TS 34.108 [3] 7.3.14.
- 4) Enter the UE into loopback test mode 1 looping back HSDPA to E-DCH according to procedure 7.3.14.3 in TS 34.108 [3] and start the loopback test.

See TS 34.109 [4] clauses 5.3.2.3 and 5.3.2.6 for details regarding loopback test mode for HSDPA and E-DCH.

5.12A.4.2 Procedure

- 1) Set the UE to maximum output power according to 5.2BA.4.2 steps 1 to 4.
- 2) Set the frequency of the CW generator to the first offset as shown in table 5.12A.2.
- 3) Measure the sum of the RRC filtered mean powers centred on each of the two assigned channels.
- 4) Search the intermodulation product signal and measure the RRC filtered mean power of transmitting intermodulation.
- 5) Calculate the ratio of the intermodulation product signal power (step 4) with the wanted power (step 3).
- 6) Repeat the measurement to both sides of the two assigned channels and using the second tone offset.

5.12A.5 Test requirements

The ratio derived in step 4), shall not exceed the described value in table 5.12A.2.

Table 5.12A.2: Transmit Intermodulation

| Interference Signal Frequency Offset | 10MHz | 20MHz |
|--------------------------------------|--------|--------|
| Interference CW Signal Level | -40dBc | |
| Intermodulation Product | -31dBc | -41dBc |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.13 Transmit Modulation

Transmit modulation defines the modulation quality for expected in-channel RF transmissions from the UE. The requirements apply to all transmissions including the PRACH/PCPCH pre-amble and message parts and all other expected transmissions for release 99 and release 4 only. For release 5 and later the requirements apply to all transmissions including the PRACH pre-amble and message parts and all other expected transmissions. In cases where the mean power of the RF signal is allowed to change versus time e.g. PRACH, DPCH in compressed mode, change of TFC, inner loop power control and for HSDPA transmissions with non-constant HS-DPCCH code power, the EVM and Peak Code Domain Error requirements do not apply during the 25 us period before and after the nominal time when the mean power is expected to change.

5.13.1 Error Vector Magnitude (EVM)

5.13.1.1 Definition and applicability

The Error Vector Magnitude is a measure of the difference between the reference waveform and the measured waveform. This difference is called the error vector. Both waveforms pass through a matched Root Raised Cosine filter with bandwidth 3,84 MHz and roll-off $\alpha=0,22$. Both waveforms are then further modified by selecting the frequency, absolute phase, absolute amplitude and chip clock timing so as to minimise the error vector. The EVM result is defined as the square root of the ratio of the mean error vector power to the mean reference power expressed as a %.

For Release 99 and Release 4 the measurement interval is one timeslot.

For Release 5 and later releases where tests may include power changes, the measurement interval is further clarified as being one timeslot except when the mean power between slots is expected to change whereupon the measurement interval is reduced by 25 μ s at each end of the slot. The requirements and this test apply to all types of UTRA for the FDD UE.

5.13.1.2 Minimum Requirements

The EVM shall not exceed 17,5 % for the parameters specified in table 5.13.1.

Table 5.13.1: Parameters for EVM

| Parameter | Level / Status | Unit |
|-------------------------|-------------------|------|
| Output power | ≥ -20 | dBm |
| Operating conditions | Normal conditions | |
| Power control step size | 1 | dB |

The normative reference for this requirement is TS 25.101 [1] clause 6.8.3.0.

5.13.1.3 Test purpose

To verify that the EVM does not exceed 17,5 % for the specified parameters in table 5.13.1.

An excess EVM increases transmission errors in the up link own channel.

5.13.1.4 Method of test

5.13.1.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.1.
- 2) A call is set up according to the Generic call setup procedure in TS34.108 [3] sub clause 7.3.2.
- 3) Enter the UE into loopback test mode and start the loopback test.

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

5.13.1.4.2 Procedure

- 1) Set and send continuously Up power control commands to the UE until the UE output power shall be maximum level.
- 2) Measure the EVM using Global In-Channel Tx-Test (annex B).
- 3) Set the power level of UE to -18dBm or send Down power control commands (1dB step size should be used.) to the UE until UE output power shall be -18dBm with ± 2 dB tolerance.
- 4) Repeat step 2).

5.13.1.5 Test requirements

The measured EVM, derived in step 2) and 4), shall not exceed 17,5 % for parameters specified in table 5.13.1 Parameters for EVM.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.13.1A Error Vector Magnitude (EVM) with HS-DPCCH

5.13.1A.1 Definition and applicability

The Error Vector Magnitude is a measure of the difference between the reference waveform and the measured waveform. This difference is called the error vector. Both waveforms pass through a matched Root Raised Cosine filter with bandwidth 3,84 MHz and roll-off $\alpha=0,22$. Both waveforms are then further modified by selecting the frequency, absolute phase, absolute amplitude and chip clock timing so as to minimise the error vector. The EVM result is defined as the square root of the ratio of the mean error vector power to the mean reference power expressed as a %.

The measurement interval is one timeslot except when the mean power between slots is expected to change whereupon the measurement interval is reduced by 25 μ s at each end of the slot.

For signals containing more than one spreading code where the slot alignment of the codes is not the same and the code power is varying, the period over which the nominal mean power remains constant can be less than one timeslot. For such time-varying signals it is not possible to define EVM across one timeslot since this interval contains an expected change in mean power, and the exact timing and trajectory of the power change is not defined. For these signals, the EVM minimum requirements apply only for intervals of at least one half timeslot (less any 25 μ s transient periods) during which the nominal code power of each individual code is constant.

NOTE: The reason for setting a lower limit for the EVM measurement interval is that for any given impaired signal, the EVM would be expected to improve for measurement intervals less than one timeslot while the frequency error would be expected to degrade.

The requirements and this test apply for Release 5 only to all types of UTRA for the FDD UE that support HSDPA.

5.13.1A.2 Minimum Requirements

The EVM shall not exceed 17.5 % for the parameters specified in table 5.13.1A.1. This is applicable for all values of β_c , β_d and β_{hs} as specified in [5].

Table 5.13.1A.1: Parameters for EVM

| Parameter | | Level / Status | Unit |
|--|----------|--------------------------------|-------|
| Output power | | ≥ -20 | dBm |
| Operating conditions | | Normal conditions | |
| Power control step size | | 1 | dB |
| Measurement period ¹ | PRACH | 3904 | Chips |
| | Any DPCH | From 1280 to 2560 ² | |
| NOTE 1: Less any 25 μ s transient periods | | | |
| NOTE 2: The longest period over which the nominal power remains constant | | | |

The normative reference for this requirement is TS 25.101 [1] clause 6.8.3.0.

5.13.1A.3 Test purpose

To verify that the EVM does not exceed 17.5 % for the specified parameters in table 5.13.1A.1 using the values of β_c , β_d and β_{hs} specified in table C.10.1.4 for subtest 3.

5.13.1A.4 Method of test

5.13.1A.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS (node B emulator) to the UE antenna connector as shown in figure A.1.
- 2) The UL Reference Measurement Channel and the Fixed Reference Channels (FRC H-Set 1, QPSK version) are specified in Annex C.10.1 and C.8.1.1.
- 3) An HSDPA call is set up according to TS 34.108 [3] clause 7.3.6. RF parameters are set up according to table E.5.1 and table E.5.10. Settings for the serving cell are defined in table 5.13.1A.2. Set the Default DPCH Offset Value according to the required HS-DPCCH slot offset as specified in TS 25.331 [8] clause 8.6.6.14 and TS 25.211 [19].
- 4) Enter the UE into loopback test mode in the presence of HSDPA and start the loopback test.

See TS 34.108 [3] and TS 34.109 [4] for details regarding loopback test mode for HSDPA.

Table 5.13.1A.2: Settings for the serving cell during the measurement of Error Vector Magnitude (EVM) with HS-DPCCH

| Parameter | Unit | Cell 1 |
|--|--------------|----------------------------------|
| Cell type | | Serving cell |
| UTRA RF Channel Number | | As defined in clause 5.13.1A.4.1 |
| Qqualmin | dB | -24 |
| Qrxlevmin | dBm | -115 |
| UE_TXPWR_MAX_RACH | dBm | +21 |
| \hat{I}_{or} (see notes 1 and 2) | dBm/3.84 MHz | -86 |
| NOTE 1: The power level is specified in terms of \hat{I}_{or} instead of CPICH_RSCP because RSCP is a receiver measurement, whereas the SS can only set \hat{I}_{or} . | | |
| NOTE 2: The cell fulfils TS 25.304, 5.2.3.1.2. | | |

5.13.1A.4.2 Procedure

- 1) Send the TRANSPORT CHANNEL RECONFIGURATION message defined in Annex I to set the beta values according to table C.10.1.4 subtest 3 and the DPCH frame offset according the HS-DPCCH half slot offset required for measurements. This will create a signal with a repeat pattern of 12ms as shown in Figure 5.13.1A.1. The Uplink DPCH Power Control Info shall specify the Power Control Algorithm as algorithm 2 for interpreting TPC commands.
- 2) Generate suitable TPC commands from the SS such that the half slot period with the highest output power for the defined 12ms sequence as measured at the UE antenna connector is the maximum output as defined in table 5.2A.2. Maintain this power level by sending alternating "0" and "1" TPC commands in the downlink so as to satisfy the condition of obtaining $TPC_cmd = 0$.
- 3) Start transmitting HSDPA Data.
- 4) With reference to Figure 5.13.1A.1 measure the EVM using Global In-Channel Tx-Test (annex B) during the last half slot period of the ACK/NACK in subframe n+3 when the UE is at its maximum power in the 12ms cycle (measurement point 3) and in the following half slot period when the CQI is off (measurement point 4) and the UE is at its minimum power in the cycle. Measure the EVM in the last half slot before subframe n when the UE is at its minimum power (measurement point 1) and immediately following in the first half slot of subframe n when the ACK/NACK is transmitting and the UE is at its maximum power in the 12ms cycle (measurement point 2). All measurements shall exclude the 25 us transient periods at the beginning and end of each measurement period.
- 5) Generate suitable TPC commands from the SS such that the half slot period with the lowest output power for the defined 12ms sequence as measured at the UE antenna connector is -18dBm with ± 2 dB tolerance. Maintain this power level by sending alternating "0" and "1" TPC commands in the downlink so as to satisfy the condition of obtaining $TPC_cmd = 0$.

6) Repeat step 4).

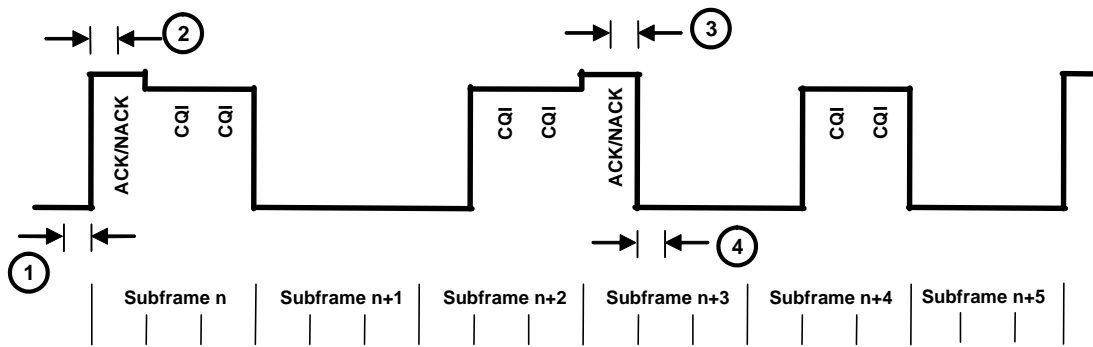

Figure 5.13.1A.1: HS-DPCCH on/off pattern showing measurement positions

All messages indicated above shall use the same content as described in the default message content in clause 9 of TS 34.108 [3], except the TRANSPORT CHANNEL RECONFIGURATION message which is defined in Annex I. The test specific exception for the TRANSPORT CHANNEL RECONFIGURATION message is as follows:

| Information Element | Value/remark |
|------------------------------|--------------|
| - Ack-Nack repetition factor | 1 |
| - CQI repetition factor | 1 |

5.13.1A.5 Test requirements

The measured EVM, derived in steps 4) and 6), shall not exceed 17.5 % for parameters specified in table 5.13.1A.1 parameters for EVM.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.13.1AA Error Vector Magnitude (EVM) and phase discontinuity with HS-DPCCH

5.13.1AA.1 Definition and applicability

The Error Vector Magnitude is a measure of the difference between the reference waveform and the measured waveform. This difference is called the error vector. Both waveforms pass through a matched Root Raised Cosine filter with bandwidth 3,84 MHz and roll-off $\alpha=0,22$. Both waveforms are then further modified by selecting the frequency, absolute phase, absolute amplitude and chip clock timing so as to minimise the error vector. The EVM result is defined as the square root of the ratio of the mean error vector power to the mean reference power expressed as a %.

The measurement interval is one timeslot except when the mean power between slots is expected to change whereupon the measurement interval is reduced by 25 μ s at each end of the slot.

For signals containing more than one spreading code where the slot alignment of the codes is not the same and the code power is varying, the period over which the nominal mean power remains constant can be less than one timeslot. For such time-varying signals it is not possible to define EVM across one timeslot since this interval contains an expected change in mean power, and the exact timing and trajectory of the power change is not defined. For these signals, the EVM minimum requirements apply only for intervals of at least one half timeslot (less any 25 μ s transient periods) during which the nominal code power of each individual code is constant.

NOTE: The reason for setting a lower limit for the EVM measurement interval is that for any given impaired signal, the EVM would be expected to improve for measurement intervals less than one timeslot while the frequency error would be expected to degrade.

Phase discontinuity for HS-DPCCH is the change in phase due to the transmission of the HS-DPCCH. In the case where the HS-DPCCH timeslot is offset from the DPCCH timeslot, the period of evaluation of the phase discontinuity shall be the DPCCH timeslot that contains the HS-DPCCH slot boundary. The phase discontinuity for HS-DPCCH result is defined as the difference between the absolute phase used to calculate the EVM for that part of the DPCCH timeslot prior to the HS-DPCCH slot boundary, and the absolute phase used to calculate the EVM for remaining part of the DPCCH timeslot following the HS-DPCCH slot boundary. In all cases the subslot EVM is measured excluding the transient periods of 25 μ s.

Since subslot EVM is only defined for intervals of at least one half timeslot, the phase discontinuity for HS-DPCCH is only defined for non-aligned timeslots when the offset is 0.5 slots.

The requirements and this test apply for Release 6 and later releases to all types of UTRA for the FDD UE that support HSDPA.

5.13.1AA.2 Minimum Requirements

The EVM shall not exceed 17.5 % for the parameters specified in table 5.13.1AA. This is applicable for all values of β_c , β_d and β_{hs} as specified in [5].

Table 5.13.1AA.1: Parameters for EVM

| Parameter | | Level / Status | Unit |
|--|----------|--------------------------------|-------|
| Output power | | ≥ -20 | dBm |
| Operating conditions | | Normal conditions | |
| Power control step size | | 1 | dB |
| Measurement period ¹ | PRACH | 3904 | Chips |
| | Any DPCH | From 1280 to 2560 ² | |
| NOTE 1: Less any 25 μ s transient periods | | | |
| NOTE 2: The longest period over which the nominal power remains constant | | | |

The phase discontinuity for HS-DPCCH shall not exceed the value specified in table 5.13.1AA.2 90% of the time. When calculating the phase discontinuity, the requirements for frequency error and EVM in sub clauses 6.3 and 6.8.2, of TS 25.101 [1] respectively shall be met.

Table 5.13.1AA.2: Phase discontinuity minimum requirement for HS-DPCCH at HS-DPCCH slot boundary

| | |
|--|------------------------|
| Phase discontinuity for HS-DPCCH $\Delta\theta$ in degrees | $\Delta\theta \leq 30$ |
|--|------------------------|

The normative reference for these requirements is TS 25.101 [1] clause 6.8.3.0 and 6.8.5.1.

5.13.1AA.3 Test purpose

To verify that the EVM does not exceed 17.5 % for the specified parameters in table 5.13.1AA using the values of β_c , β_d and β_{hs} specified in table C.10.1.4 for subtest 3.

To verify that HSDPA phase discontinuity does not exceed the values in table 5.13.1AA.2.

NOTE: The statistical aspect (90% pass rate) of this minimum requirement is not currently tested.

5.13.1AA.4 Method of test

5.13.1AA.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS (node B emulator) to the UE antenna connector as shown in figure A.1.

- 2) The UL Reference Measurement Channel and the Fixed Reference Channels (FRC H-Set 1, QPSK version) are specified in Annex C.10.1 and C.8.1.1.
- 3) An HSDPA call is set up according to TS 34.108 [3] clause 7.3.6. RF parameters are set up according to table E.5.1 and table E.5.10. Settings for the serving cell are defined in table 5.13.1AA.3. Set the Default DPCH Offset Value according to the required HS-DPCCH slot offset as specified in TS 25.331 [8] clause 8.6.6.14 and TS 25.211 [19].
- 4) Enter the UE into loopback test mode in the presence of HSDPA and start the loopback test.

See TS 34.108 [3] and TS 34.109 [4] for details regarding loopback test mode for HSDPA.

Table 5.13.1AA.3: Settings for the serving cell during the measurement of Error Vector Magnitude (EVM) with HS-DPCCH

| Parameter | Unit | Cell 1 |
|--|-----------------|-----------------------------------|
| Cell type | | Serving cell |
| UTRA RF Channel Number | | As defined in clause 5.13.1AA.4.1 |
| Qqualmin | dB | -24 |
| Qrxlevmin | dBm | -115 |
| UE_TXPWR_MAX_RACH | dBm | +21 |
| \hat{I}_{or} (see notes 1 and 2) | dBm/3.84 MHz | -86 |
| NOTE 1: The power level is specified in terms of \hat{I}_{or} instead of CPICH_RSCP because RSCP is a receiver measurement, whereas the SS can only set \hat{I}_{or} . | | |
| NOTE 2: The cell fulfils TS 25.304, 5.2.3.1.2. | | |

5.13.1AA.4.2 Procedure

- 1) Send the TRANSPORT CHANNEL RECONFIGURATION message defined in Annex I to set the beta values according to table C.10.1.4 subtest 3 and the DPCH frame offset according the HS-DPCCH half slot offset required for measurements. This will create a signal with a repeat pattern of 12ms as shown in Figure 5.13.1AA.1. The Uplink DPCH Power Control Info shall specify the Power Control Algorithm as algorithm 2 for interpreting TPC commands.
- 2) Generate suitable TPC commands from the SS such that the half slot period with the highest output power for the defined 12ms sequence as measured at the UE antenna connector is the maximum output as defined in table 5.2AA.2. Maintain this power level by sending alternating "0" and "1" TPC commands in the downlink so as to satisfy the condition of obtaining $TPC_cmd = 0$.
- 3) Start transmitting HSDPA Data.
- 4) With reference to Figure 5.13.1AA.1 measure the EVM using Global In-Channel Tx-Test (annex B) during the last half slot period of the ACK/NACK in subframe n+3 when the UE is at its maximum power in the 12ms cycle (measurement point 3) and in the following half slot period when the CQI is off and the UE is at its minimum power in the cycle (measurement point 4). Compute from these two EVM results the phase discontinuity between the two half slot periods. Measure the EVM in the last half slot before subframe n when the UE is at its minimum power (measurement point 1) and immediately following in the first half slot of subframe n when the ACK/NACK is transmitting and the UE is at its maximum power in the 12ms cycle (measurement point 2). Compute from these two EVM results the phase discontinuity between the two half slot periods. All measurements shall exclude the 25 us transient periods at the beginning and end of each measurement period.
- 5) Generate suitable TPC commands from the SS such that the half slot period with the lowest output power for the defined 12ms sequence as measured at the UE antenna connector is -18dBm with ± 2 dB tolerance. Maintain this power level by sending alternating "0" and "1" TPC commands in the downlink so as to satisfy the condition of obtaining $TPC_cmd = 0$.
- 6) Repeat step 4).

Figure 5.13.1AA.1: HS-DPCCH on/off pattern showing measurement positions

All messages indicated above shall use the same content as described in the default message content in clause 9 of TS 34.108 [3], except the TRANSPORT CHANNEL RECONFIGURATION message which is defined in Annex I. The test specific exception for the TRANSPORT CHANNEL RECONFIGURATION message is as follows:

| Information Element | Value/remark |
|------------------------------|--------------|
| - Ack-Nack repetition factor | 1 |
| - CQI repetition factor | 1 |

5.13.1AA.5 Test requirements

Table 5.13.1AA.4: Phase discontinuity test requirement for HS-DPCCH at HS-DPCCH slot boundary

| | |
|--|------------------------|
| Phase discontinuity for HS-DPCCH $\Delta\theta$ in degrees | $\Delta\theta \leq 36$ |
|--|------------------------|

The measured EVM, derived in steps 4) and 6), shall not exceed 17.5 % for parameters specified in table 5.13.1AA.1 parameters for EVM.

The measured phase discontinuity, derived in steps 4) and 6), shall not exceed the value specified in table 5.13.1AA.4.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.13.1AAA EVM and IQ origin offset for HS-DPCCH and E-DCH with 16 QAM

5.13.1AAA.1 Definition and applicability

The Error Vector Magnitude is a measure of the difference between the reference waveform and the measured waveform. This difference is called the error vector. Both waveforms pass through a matched Root Raised Cosine filter with bandwidth 3,84 MHz and roll-off $\alpha=0,22$. Both waveforms are then further modified by selecting the frequency, absolute phase, absolute amplitude and chip clock timing so as to minimise the error vector. The EVM result is defined as the square root of the ratio of the mean error vector power to the mean reference power expressed as a %. The measurement interval is one timeslot except when the mean power between slots is expected to change whereupon the measurement interval is reduced by 25 μ s at each end of the slot. For the PRACH preamble the measurement interval is 4096 chips less 25 μ s at each end of the burst (3904 chips).

When the UE uses 16QAM modulation on any of the uplink code channels, the error minimization step also includes selecting an IQ origin offset besides selecting the frequency, absolute phase, absolute amplitude and chip clock timing to minimise the error vector. The IQ origin offset shall be removed from the evaluated signal before calculating the EVM; however, the removed relative IQ origin offset power (relative carrier leakage power) also has to satisfy the applicable requirement.

For signals containing more than one spreading code where the slot alignment of the codes is not the same and the code power is varying, the period over which the nominal mean power remains constant can be less than one timeslot. For such time-varying signals it is not possible to define EVM across one timeslot since this interval contains an expected change in mean power, and the exact timing and trajectory of the power change is not defined. For these signals, the EVM minimum requirements apply only for intervals of at least one half timeslot (less any 25 μ s transient periods) during which the nominal code power of each individual code is constant.

NOTE: The reason for setting a lower limit for the EVM measurement interval is that for any given impaired signal, the EVM would be expected to improve for measurement intervals less than one timeslot while the frequency error would be expected to degrade.

The requirements apply for Release 7 and later releases to all types of UTRA for the FDD UE that support E-DCH 16 QAM UE capability category 7. This test applies only to UE that support HSDPA and E-DCH.

5.13.1AAA.2 Minimum requirement

When 16QAM modulation is not used on any of the uplink code channels, the Error Vector Magnitude shall not exceed 17.5 %. This is tested in 5.13.1A.

When 16QAM modulation is used on any of the uplink code channels, the modulation accuracy requirement shall meet one or both of the following requirements:

1. The Error Vector Magnitude does not exceed 14 %. This is not tested
2. The Relative Code Domain Error requirements are met. This is tested in 5.13.2C

When 16QAM modulation is used on any of the uplink code channels, the relative carrier leakage power (IQ origin offset power) shall not exceed the values specified in Table 5.13.1AAA.2

The requirements are applicable for all values of β_c , β_d , β_{hs} , β_{ec} and β_{ed} as specified in [8].

Table 5.13.1AAA.1: Parameters for IQ origin offset

| Parameter | | Unit | Level |
|--|----------|-------|----------------------------|
| UE Output Power, 16QAM | | dBm | ≥ -30 |
| Operating conditions | | | Normal conditions |
| Power control step size | | dB | 1 |
| Measurement period (Note 1) | PRACH | Chips | 3904 |
| | Any DPCH | | From 1280 to 2560 (Note 2) |
| NOTE 1: Less any 25 μ s transient periods | | | |
| NOTE 2: The longest period over which the nominal power remains constant | | | |

Table 5.13.1AAA.2: Relative Carrier Leakage Power

| UE Transmitted Mean Power | Relative Carrier Leakage Power (dB) |
|---------------------------|-------------------------------------|
| $P \geq -30$ dBm | < -17 |

5.13.1AAA.3 Test purpose

To verify that the IQ offset does not exceed the values in table 5.13.1AAA.6 for the specified parameters in Table 5.13.1AAA.1 and for the beta values defined in table C.11.1.4.

5.13.1AAA.4 Method of test

5.13.1AAA.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS (node B emulator) to the UE antenna connector as shown in figure A.1.

- 2) The UL Reference Measurement Channel and the DL Fixed Reference Channels-are specified in Annex C.11.1 and C. 11.2
- 3) An E-DCH call is set up according to TS 34.108 [3] 7.3.9, with the following exceptions in the RADIO BEARER SETUP messages. These exceptions allow the beta values to be set according to table C.11.1.4 and each UL physical channel to be at constant power at the start of the measurement. RF parameters are set up according to table E.5A.1. Settings for the serving cell are defined in table 5.13.1AAA.5. Uplink SRB for DCCH mapped on E-DCH and downlink SRB for DCCH on DCH. E-DCH is configured with 2ms TTI.
- 4) Enter the UE into loopback test mode 1 looping back HSDPA to E-DCH and start the loopback test.

See TS 34.109 [4] clauses 5.3.2.3 and 5.3.2.6 for details regarding loopback test mode for HSDPA and E-DCH.

**Table 5.13.1AAA.3: Contents of RADIO BEARER SETUP message:
AM or UM (E-DCH and HSDPA) for Sub-test 1**

| Information Element | Value/Remark |
|-------------------------------|------------------|
| E-DCH info | Uplink DPCH info |

Table 5.13.1AAA.5: Settings for the serving cell during the measurement of IQ origin offset

| Parameter | Unit | Cell 1 |
|--|--------------|------------------------------------|
| Cell type | | Serving cell |
| UTRA RF Channel Number | | As defined in clause 5.13.1AAA.4.1 |
| Qqualmin | dB | -24 |
| Qrxlevmin | dBm | -115 |
| UE_TXPWR_MAX_RACH | dBm | +21 |
| \hat{I}_{or} (see notes 1 and 2) | dBm/3.84 MHz | -86 |
| NOTE 1: The power level is specified in terms of \hat{I}_{or} instead of CPICH_RSCP because RSCP is a receiver measurement, whereas the SS can only set \hat{I}_{or} . | | |
| NOTE 2: The cell fulfils TS 25.304, 5.2.3.1.2. | | |

5.13.1AAA.4.2 Procedure

- 1) Set the Absolute Grant according to Table C.11.1.4.
- 2) The SS starts transmitting HSDPA and the UE loops the received data back on E-DCH.
- 3) Generate suitable TPC commands from the SS to set the output power of the UE to be in the range -28 dBm \pm 2 dB.
- 4) Confirm that the E-TFCI transmitted by the UE is equal to the target E-TFCI in Table C.11.1.4. If the E-TFCI transmitted by the UE is not equal to the target E-TFCI, then fail the UE.
- 5) Send alternating "0" and "1" TPC commands in the downlink so as to satisfy the condition of obtaining TPC_cmd = 0.
- 6) Measure Relative Carrier Leakage Power (IQ origin offset) according Annex B of the composite signal.

5.13.1AAA.5 Test requirements

The Relative Carrier Leakage Power shall not exceed the value given in table 5.13.1AAA.6.

Table 5.13.1AAA.6: Relative Carrier Leakage Power

| UE Transmitted Mean Power | Relative Carrier Leakage Power (dB) |
|---------------------------|-------------------------------------|
| -28 dBm | <-16.5 |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.13.2 Peak code domain error

5.13.2.1 Definition and applicability

The Peak Code Domain Error is computed by projecting power of the error vector (as defined in clause 5.13.1.1) onto the code domain at a specific spreading factor. The Code Domain Error for every code in the domain is defined as the ratio of the mean power of the projection onto that code, to the mean power of the composite reference waveform expressed in dB. The Peak Code Domain Error is defined as the maximum value for the Code Domain Error for all codes.

For Release 99 and Release 4 the measurement interval is one timeslot.

For Release 5 and later releases where tests may include power changes, the measurement interval is further clarified as being one timeslot except when the mean power between slots is expected to change whereupon the measurement interval is reduced by 25 μ s at each end of the slot.

The requirements and this test apply only to the UE in which the multi-code DPDCH transmission is provided and therefore does not apply for the PRACH and PCPCH preamble and message parts for R99 and Release 4 only or the PRACH preamble and message parts for Release 5 and later.

5.13.2.2 Minimum Requirements

The peak code domain error shall not exceed -15 dB at spreading factor 4 for the parameters specified in table 5.13.3. The requirements are defined using the UL reference measurement channel (768 kbps) specified in clause C.2.5.

Table 5.13.3: Parameters for Peak code domain error

| Parameter | Level / Status | Unit |
|-------------------------|-------------------|------|
| Output power | ≥ -20 | dBm |
| Operating conditions | Normal conditions | |
| Power control step size | 1 | dB |

The normative reference for this requirement is TS 25.101 [1] clause 6.8.3.1.

5.13.2.3 Test purpose

To verify that the UE peak code domain error does not exceed -15 dB for the specified parameters in table 5.13.3.

An excess peak code domain error increases transmission errors in the up link own channel.

5.13.2.4 Method of test

5.13.2.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.1.
- 2) A call is set up according to the Generic call setup procedure in TS34.108 [3] sub clause 7.3.2, and RF parameters are set up according to table 5.13.4.
- 3) Enter the UE into loopback test mode and start the loopback test.

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

Table 5.13.4: Test parameters for Peak code domain error

| Parameter | Level / Status | Unit |
|-------------------------|-------------------|------|
| Operating conditions | Normal conditions | |
| Uplink signal | multi-code | |
| Information bit rate | 2*384 | kbps |
| Power control step size | 1 | dB |

5.13.2.4.2 Procedure

- 1) Set and send continuously Up power control commands to the UE until the UE output power shall be maximum level.
- 2) Measure the Peak code Domain error using Global In-Channel Tx-Test (annex B).
- 3) Set the power level of UE to -18dBm or send Down power control commands (1dB step size should be used.) to the UE until UE output power shall be -18dBm with ± 2 dB tolerance.
- 4) Repeat step 2).

5.13.2.5 Test requirements

The measured Peak code domain error, derived in step 2) and 4), shall not exceed -14 dB.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4

5.13.2A Relative Code Domain Error with HS-DPCCH

5.13.2A.1 Definition and applicability

The Relative Code Domain Error is computed by projecting the error vector (as defined in TS 25.101 [1] 6.8.2) onto the code domain. Only the code channels with non-zero betas in the composite reference waveform are considered for this requirement. The Relative Code Domain Error for every non-zero beta code in the domain is defined as the ratio of the mean power of the projection onto that non-zero beta code, to the mean power of the non-zero beta code in the composite reference waveform. This ratio is expressed in dB. The measurement interval is one timeslot except when the mean power between slots is expected to change whereupon the measurement interval is reduced by 25 μ s at each end of the slot.

The Relative Code Domain Error is affected by both the spreading factor and beta value of the various code channels in the domain. The Effective Code Domain Power (ECDP) is defined to capture both considerations into one parameter. It uses the Nominal CDP ratio (as defined in TS25101 [1] 6.2.3), and is defined as follows for each used code, k, in the domain:

$$ECDP_k = (\text{Nominal CDP ratio})_k + 10 \cdot \log_{10}(SF_k/256)$$

The requirements for Relative Code Domain Error are not applicable when either or both the following channel combinations occur:

- when the ECDP of any code channel is < -30dB.
- when the nominal code domain power of any code channel is < -20 dB

The requirement for Relative Code Domain Error also does not apply for the PRACH preamble and message parts.

The requirements and this test apply for Release 6 and later releases to all types of UTRA for the FDD UE that support HSDPA but not E-DCH.

5.13.2A.2 Minimum Requirements

The Relative Code Domain Error shall meet the requirements in Table 5.13.2A.1 for the parameters specified in table 5.13.2A.2.

Table 5.13.2A.1: Relative Code Domain Error minimum requirement

| ECDP dB | Relative Code Domain Error dB |
|----------------------------|-------------------------------|
| -21 < ECDP | ≤ -16 |
| -30 \leq ECDP \leq -21 | $\leq -37 - \text{ECDP}$ |
| ECDP < -30 | No requirement |

Table 5.13.2A.2: Parameters for Error Vector Magnitude/Peak Code Domain Error

| Parameter | | Unit | Level |
|--|----------|-------|----------------------------|
| UE Output Power | | dBm | ≥ -20 |
| Operating conditions | | | Normal conditions |
| Power control step size | | dB | 1 |
| Measurement period (Note 1) | PRACH | Chips | 3904 |
| | Any DPCH | | From 1280 to 2560 (Note 2) |
| NOTE 1: Less any 25 μ s transient periods | | | |
| NOTE 2: The longest period over which the nominal power remains constant | | | |

The normative reference for this requirement is TS 25.101 [1] clause 6.8.3a.

5.13.2A.3 Test purpose

To verify that the Relative Code Domain Error does not exceed the values in table 5.13.2A.5 for the beta values defined in table 5.13.2A.4.

5.13.2A.4 Method of test

5.13.2A.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS (node B emulator) to the UE antenna connector as shown in figure A.1.
- 2) The UL Reference Measurement Channel and the Fixed Reference Channels (FRC H-Set 1, QPSK version) are specified in Annex C.10.1 and C.8.1.1 with the beta values set according to table C.10.1.4.
- 3) An HSDPA call is set up according to TS 34.108 [3] clause 7.3.6. RF parameters are set up according to table E.5.1 and table E.5.10. Settings for the serving cell are defined in table 5.13.2A.3.
- 4) Enter the UE into loopback test mode in the presence of HSDPA and start the loopback test.

See TS 34.108 [3] and TS 34.109 [4] for details regarding loopback test mode for HSDPA.

Table 5.13.2A.3: Settings for the serving cell during the measurement of Relative Code Domain Error with HS-DPCCH

| Parameter | Unit | Cell 1 |
|--|--------------|-------------------------------|
| Cell type | | Serving cell |
| UTRA RF Channel Number | | As defined in clause 5.2A.4.1 |
| Qqualmin | dB | -24 |
| Qrxlevmin | dBm | -115 |
| UE_TXPWR_MAX_RACH | dBm | +21 |
| \hat{I}_{or} (see notes 1 and 2) | dBm/3.84 MHz | -86 |
| NOTE 1: The power level is specified in terms of \hat{I}_{or} instead of CPICH_RSCP because RSCP is a receiver measurement, whereas the SS can only set \hat{I}_{or} . | | |
| NOTE 2: The cell fulfils TS 25.304, 5.2.3.1.2. | | |

5.13.2A.4.2 Procedure

- 1) Set and send continuously Up power control commands to the UE and wait until the UE has reached maximum power.
- 2) Send TRANSPORT CHANNEL RECONFIGURATION message to set the beta values according to table C.10.1.4 sub test 1 and the DPCH frame offset according the HS-DPCCH slot offset required for measurements.
- 3) Start transmitting HSDPA Data.
- 4) Measure the Relative Code Domain Error of the DPCCH, DPDCH and HS-DPCCH.
- 5) Repeat step 4 for the other combinations of beta values as given in table 5.13.2A.4.
- 6) Set the power level of UE to -18dBm or send Down power control commands (1dB step size should be used.) to the UE until UE output power shall be -18dBm with ± 2 dB tolerance.
- 7) Repeat step 4 for all the combinations of beta values as given in table 5.13.2A.4.

All messages indicated above shall use the same content as described in the default message content in clause 9 of TS 34.108 [3], except the TRANSPORT CHANNEL RECONFIGURATION message which is defined in Annex I.

5.13.2A.5 Test requirements

For the ECDP of each code measured in step 4 the Relative Code Domain Error shall not exceed the value given in table 5.13.2A.5.

Table 5.13.2A.4: Nominal ECDP ratios

| Sub-test in table C.10.1.4 | Code | Nominal Code Domain Power | Spreading factor | Nominal ECDP |
|----------------------------|----------|---------------------------|------------------|--------------|
| 1 | DPCCH | -17.9 | 256 | -17.9 |
| | DPDCH | -0.4 | 64 | -6.4 |
| | HS-DPCCH | -11.8 | 256 | -11.8 |
| 3 | DPCCH | -7.2 | 256 | -7.2 |
| | DPDCH | -12.7 | 64 | -18.7 |
| | HS-DPCCH | -1.2 | 256 | -1.2 |
| 4 | DPCCH | -7.1 | 256 | -7.1 |
| | DPDCH | -18.5 | 64 | -24.5 |
| | HS-DPCCH | -1 | 256 | -1 |

NOTE: The nominal ECDP ratios given above are calculated from the nominal beta factors and are for general information to indicate the test coverage. The actual ECDP to use in the test for each code shall be based on the measured code domain power. The accuracy of the code domain powers is tested separately in 5.2C.

Table 5.13.2A.5: Relative Code Domain Error test requirement

| ECDP dB | Relative Code Domain Error dB |
|---------------------------------|-------------------------------|
| $-21 < \text{ECDP}$ | ≤ -15.5 |
| $-30 \leq \text{ECDP} \leq -21$ | $\leq -36.5 - \text{ECDP}$ |
| $\text{ECDP} < -30$ | No requirement |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.13.2B Relative Code Domain Error with HS-DPCCH and E-DCH

5.13.2B.1 Definition and applicability

The Relative Code Domain Error is computed by projecting the error vector (as defined in TS 25.101 [1] 6.8.2) onto the code domain. Only the code channels with non-zero betas in the composite reference waveform are considered for this requirement. The Relative Code Domain Error for every non-zero beta code in the domain is defined as the ratio of the mean power of the projection onto that non-zero beta code, to the mean power of the non-zero beta code in the composite reference waveform. This ratio is expressed in dB. The measurement interval is one timeslot except when the mean power between slots is expected to change whereupon the measurement interval is reduced by 25 μ s at each end of the slot.

The Relative Code Domain Error is affected by both the spreading factor and beta value of the various code channels in the domain. The Effective Code Domain Power (ECDP) is defined to capture both considerations into one parameter. It uses the Nominal CDP ratio (as defined in TS25101 [1] 6.2.3), and is defined as follows for each used code, k, in the domain:

$$\text{ECDP}_k = (\text{Nominal CDP ratio})_k + 10 \cdot \log_{10}(\text{SF}_k/256)$$

The requirements for Relative Code Domain Error are not applicable when either or both of the following channel combinations occur:

- when the ECDP of any code channel is < -30 dB.
- when the nominal code domain power of any code channel is < -20 dB

The requirement for Relative Code Domain Error also does not apply for the PRACH preamble and message parts.

The requirements and this test apply for Release 6 and later releases to all types of UTRA for the FDD UE that support HSDPA and E-DCH.

5.13.2B.2 Minimum Requirements

The Relative Code Domain Error shall meet the requirements in Table 5.13.2B.1 for the parameters specified in Table 5.13.2B.2.

Table 5.13.2B.1: Relative Code Domain Error minimum requirement

| ECDP dB | Relative Code Domain Error dB |
|---------------------------------|-------------------------------|
| $-21 < \text{ECDP}$ | ≤ -16 |
| $-30 \leq \text{ECDP} \leq -21$ | $\leq -37 - \text{ECDP}$ |
| $\text{ECDP} < -30$ | No requirement |

Table 5.13.2B.2: Parameters for Relative Code Domain Error with HS-DPCCH and E-DCH

| Parameter | | Unit | Level |
|--|----------|-------|----------------------------|
| UE Output Power | | dBm | ≥ -20 |
| Operating conditions | | | Normal conditions |
| Power control step size | | dB | 1 |
| Measurement period (Note 1) | PRACH | Chips | 3904 |
| | Any DPCH | | From 1280 to 2560 (Note 2) |
| NOTE 1: Less any 25 μ s transient periods | | | |
| NOTE 2: The longest period over which the nominal power remains constant | | | |

The normative reference for this requirement is TS 25.101 [1] clause 6.8.3a.

5.13.2B.3 Test purpose

To verify that the Relative Code Domain Error does not exceed the values in table 5.13.2B.9 for the beta values defined in table 5.13.2B.8.

5.13.2B.4 Method of test

5.13.2B.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS (node B emulator) to the UE antenna connector as shown in figure A.1.
- 2) The UL Reference Measurement Channel and the Fixed Reference Channels (FRC H-Set 1, QPSK) are specified in Annex C.11.1 and C.8.1.1.
- 3) An E-DCH call is set up according to TS 34.108 [3] 7.3.9, with the following exceptions in the RADIO BEARER SETUP messages. These exceptions allow the beta values to be set according to table C.11.1.3 and each UL physical channel to be at constant power at the start of the measurement. RF parameters are set up according to table E.5A.1. Settings for the serving cell are defined in table 5.13.2B.7.
- 4) Enter the UE into loopback test mode 1 looping back both the 12.2kbps RMC and HSDPA to E-DCH and start the loopback test.

See TS 34.109 [4] clauses 5.3.2.3 and 5.3.2.6 for details regarding loopback test mode for HSDPA and E-DCH.

Table 5.13.2B.7: Settings for the serving cell during the measurement of Relative Code Domain Error with HS-DPCCH and E-DCH

| Parameter | Unit | Cell 1 |
|--|--------------|----------------------------------|
| Cell type | | Serving cell |
| UTRA RF Channel Number | | As defined in clause 5.13.2B.4.1 |
| Qqualmin | dB | -24 |
| Qrxlevmin | dBm | -115 |
| UE_TXPWR_MAX_RACH | dBm | +21 |
| \hat{I}_{or} (see notes 1 and 2) | dBm/3.84 MHz | -86 |
| NOTE 1: The power level is specified in terms of \hat{I}_{or} instead of CPICH_RSCP because RSCP is a receiver measurement, whereas the SS can only set \hat{I}_{or} . | | |
| NOTE 2: The cell fulfils TS 25.304, 5.2.3.1.2. | | |

5.13.2B.4.2 Procedure

- 1) Set the Absolute Grant according to Table C.11.1.3.
- 2) The SS starts transmitting HSDPA and the UE loops the received data back on E-DCH.
- 3) Generate suitable TPC commands from the SS to set the output power of the UE to be in the range 15dBm \pm 2dB.
- 4) Confirm that the E-TFCI transmitted by the UE is equal to the target E-TFCI in Table C.11.1.3. If the E-TFCI transmitted by the UE is not equal to the target E-TFCI, then fail the UE.
- 5) Measure the Relative Code Domain Error of the DPCCH, DPDCH, HS-DPCCH, E-DPCCH and E-DPDCH(s).
- 6) Repeat steps 1 through 5 for the other combinations of beta values as given in Table C.11.1.3.
- 7) Set the power level of UE to -18 dBm or send down power control commands (1 dB step size should be used) to the UE until UE output power shall be -18 dBm with \pm 2 dB tolerance.
- 8) Measure the Relative Code Domain Error of the DPCCH, DPDCH, HS-DPCCH, E-DPCCH and E-DPDCH(s).
- 9) Repeat steps 7 and 8 for all the combinations of beta values for sub-tests 1, 2, 3, and 4 as given in Table C.11.1.3.

5.13.2B.5 Test requirements

For the ECDP of each code measured in steps 5 and 8 the Relative Code Domain Error shall not exceed the value given in table 5.13.2B.9.

Table 5.13.2B.8: Nominal ECDP ratios

| Sub-Test in Table C.11.1.3 | Code | Nominal Code Domain Power | Spreading Factor | Nominal ECDP |
|----------------------------|----------|---------------------------|------------------|--------------|
| 1 | DPCCH | -18.5 | 256 | -18.5 |
| | DPDCH | -15.8 | 64 | -21.8 |
| | HS-DPCCH | -12.5 | 256 | -12.5 |
| | E-DPCCH | -16.5 | 256 | -16.5 |
| | E-DPDCH | -0.5 | 4 | -18.6 |
| 2 | DPCCH | -14.0 | 256 | -14.0 |
| | DPDCH | -6.0 | 64 | -12.0 |
| | HS-DPCCH | -8.0 | 256 | -8.0 |
| | E-DPCCH | -8.0 | 256 | -8.0 |
| | E-DPDCH | -4.1 | 4 | -22.2 |
| 3 | DPCCH | -14.6 | 256 | -14.6 |
| | DPDCH | -19.1 | 64 | -25.1 |
| | HS-DPCCH | -8.6 | 256 | -8.6 |
| | E-DPCCH | -8.6 | 256 | -8.6 |
| | E-DPDCH1 | -4.7 | 4 | -22.8 |
| E-DPDCH2 | -4.7 | 4 | -22.8 | |
| 4 | DPCCH | -19.7 | 256 | -19.7 |
| | DPDCH | -2.2 | 64 | -8.2 |
| | HS-DPCCH | -13.7 | 256 | -13.7 |
| | E-DPCCH | -19.7 | 256 | -19.7 |
| | E-DPDCH | -4.7 | 4 | -22.8 |

NOTE: The nominal ECDP ratios given above are calculated from the nominal beta factors and are for general information to indicate the test coverage. The actual ECDP to use in the test for each code shall be based on the measured code domain power. The accuracy of the code domain powers is tested separately in 5.2D.

Table 5.13.2B.9: Relative Code Domain Error test requirement

| ECDP dB | Relative Code Domain Error dB |
|---------------------------------|-------------------------------|
| $-21 < \text{ECDP}$ | ≤ -15.5 |
| $-30 \leq \text{ECDP} \leq -21$ | $\leq -36.5 - \text{ECDP}$ |
| $\text{ECDP} < -30$ | No requirement |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.13.2BA Relative Code Domain Error with HS-DPCCH and E-DCH for DC-HSUPA

5.13.2BA.1 Definition and applicability

The Relative Code Domain Error is computed by projecting the error vector (as defined in TS 25.101 [1] 6.8.2) onto the code domain for each of the two assigned channel frequencies. Only the code channels with non-zero betas in the composite reference waveform are considered for this requirement. The Relative Code Domain Error for every non-zero beta code in the domain is defined as the ratio of the mean power of the projection onto that non-zero beta code, to the mean power of the non-zero beta code in the composite reference waveform. This ratio is expressed in dB. The measurement interval is one timeslot except when the mean power between slots is expected to change whereupon the measurement interval is reduced by 25 μs at each end of the slot.

In the mode of DC-HSUPA, the requirement and corresponding measurements apply to each individual carrier when the total power in each of the assigned carriers is equal to each other. Furthermore, it is necessary to verify the requirements when each carrier is configured according to either of the UL E-DCH reference measurement channel for DC-HSUPA using BPSK or 16QAM modulation, specified in subclause C.2.6, C.2.7 and C.11A.

The Relative Code Domain Error is affected by both the spreading factor and beta value of the various code channels in the domain. The Effective Code Domain Power (ECDP) is defined to capture both considerations into one parameter. It uses the Nominal CDP ratio (as defined in TS25101 [1] 6.2.3), and is defined as follows for each used code, k , in the domain:

$$ECDP_k = (\text{Nominal CDP ratio})_k + 10 \cdot \log_{10}(SF_k/256)$$

The requirements for Relative Code Domain Error are not applicable when either or both of the following channel combinations occur:

- when the ECDP of any code channel is < -30 dB.
- when the nominal code domain power of any code channel is < -20 dB

The requirement for Relative Code Domain Error also does not apply for the PRACH preamble and message parts.

The requirements and this test apply for Release 9 and later releases to all types of UTRA for the FDD UE that support HSDPA and Dual Cell E-DCH.

5.13.2BA.2 Minimum Requirements

The Relative Code Domain Error shall meet the requirements in Table 5.13.2BA.1 for the parameters specified in Table 5.13.2BA.2.

Table 5.13.2BA.1: Relative Code Domain Error minimum requirement

| ECDP dB | Relative Code Domain Error dB |
|--------------------------|-------------------------------|
| $-21 < ECDP$ | ≤ -16 |
| $-30 \leq ECDP \leq -21$ | $\leq -37 - ECDP$ |
| $ECDP < -30$ | No requirement |

Table 5.13.2BA.2: Parameters for Relative Code Domain Error with HS-DPCCH and E-DCH for DC-HSUPA

| Parameter | Unit | Level |
|---------------------------|------|-------------------|
| UE Output Power, no 16QAM | dBm | ≥ -20 |
| Operating conditions | | Normal conditions |
| Power control step size | dB | 1 |

The normative reference for this requirement is TS 25.101 [1] clause 6.8.3a.

5.13.2BA.3 Test purpose

To verify that the Relative Code Domain Error does not exceed the values in table 5.13.2BA.9 for the beta values defined in table 5.13.2BA.8.

5.13.2BA.4 Method of test

5.13.2BA.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS (node B emulator) to the UE antenna connector as shown in figure A.41.
- 2) The UL Reference Measurement Channel and the Fixed Reference Channels (FRC H-Set 3A, QPSK) and parameters are specified in Annex C.2.6 and C.8.1.1.
- 3) An E-DCH call is set up according to TS 34.108 [3] 7.3.14, with the following exceptions in the RADIO BEARER SETUP messages. These exceptions allow the beta values to be set according to table C.11A.1 and each UL physical channel to be at constant power at the start of the measurement. RF parameters are set up according to table E.5A.1A. Settings for the serving cell are defined in table 5.13.2BA.7.

- 4) Enter the UE into loopback test mode 1 looping back HSDPA to E-DCH according to procedure 7.3.14.3 in TS 34.108 [3] and start the loopback test.

See TS 34.109 [4] clauses 5.3.2.3 and 5.3.2.6 for details regarding loopback test mode for HSDPA and E-DCH.

| Parameter | Unit | Cell 1 |
|--|-----------------|-----------------------------------|
| Cell type | | Serving cell |
| UTRA RF Channel Number | | As defined in clause 5.13.2BA.4.1 |
| Qqualmin | dB | -24 |
| Qrxlevmin | dBm | -115 |
| UE_TXPWR_MAX_RACH | dBm | +21 |
| \hat{I}_{or} (see notes 1 and 2) | dBm/3.84 MHz | -86 |
| NOTE 1: The power level is specified in terms of \hat{I}_{or} instead of CPICH_RSCP because RSCP is a receiver measurement, whereas the SS can only set \hat{I}_{or} . | | |
| NOTE 2: The cell fulfils TS 25.304, 5.2.3.1.2. | | |

5.13.2BA.4.2 Procedure

- 1) Set the Absolute Grant according to Table C.11.1.3.
- 2) The SS starts transmitting HSDPA and the UE loops the received data back on E-DCH.
- 3) Generate suitable TPC commands from the SS to set the output power of each of the two carriers to be in the range $15\text{dBm} \pm 2\text{dB}$.
- 4) Confirm that the E-TFCI transmitted by the UE is equal to the target E-TFCI in Table C.11A.1.1. If the E-TFCI transmitted by the UE is not equal to the target E-TFCI, then fail the UE.
- 5) Measure the Relative Code Domain Error of the DPCCH, HS-DPCCH, E-DPCCH and E-DPDCH(s) on each of the two assigned channel frequencies.
- 6) Set the power level of each of the two carriers to -18 dBm or send down power control commands (1 dB step size should be used) to the UE until the power level of each of the two carriers is -18 dBm with ± 2 dB tolerance.
- 7) Measure the Relative Code Domain Error of the DPCCH, HS-DPCCH, E-DPCCH and E-DPDCH(s) on each of the two assigned channel frequencies.

5.13.2BA.5 Test requirements

For the ECDP of each code measured in steps 5 and 8 the Relative Code Domain Error shall not exceed the value given in table 5.13.2BA.9.

Table 5.13.2BA.8: Nominal ECDP ratios

| Sub-Test in Table C.11A.1.1 | UL frequency | Code | Nominal Code Domain Power | Spreading Factor | Nominal ECDP |
|-----------------------------|--------------|----------|---------------------------|------------------|--------------|
| 1 | Primary | DPCCH | -5.8 | 256 | -5.8 |
| | | DPDCH | - | - | - |
| | | HS-DPCCH | -15.3 | 256 | -15.3 |
| | | E-DPCCH | -15.3 | 256 | -15.3 |
| | | E-DPDCH | -1.7 | 16 | -13.7 |

| | | E-DPCCH | -15.2 | 256 | -15.2 |
| | | E-DPDCH | -1.6 | 16 | -13.6 |

NOTE: The nominal ECDP ratios given above are calculated from the nominal beta factors and are for general information to indicate the test coverage. The actual ECDP to use in the test for each code shall be based on the measured code domain power. The accuracy of the code domain powers is tested separately in 5.2DA.

Table 5.13.2BA.9: Relative Code Domain Error test requirement

| ECDP dB | Relative Code Domain Error dB |
|---------------------------------|-------------------------------|
| $-21 < \text{ECDP}$ | ≤ -15.5 |
| $-30 \leq \text{ECDP} \leq -21$ | $\leq -36.5 - \text{ECDP}$ |
| $\text{ECDP} < -30$ | No requirement |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.13.2C Relative Code Domain Error for HS-DPCCH and E-DCH with 16QAM

5.13.2C.1 Definition and applicability

The Relative Code Domain Error is computed by projecting the error vector (as defined in TS 25.101 [1] 6.8.2) onto the code domain. Only the code channels with non-zero betas in the composite reference waveform are considered for this requirement. The Relative Code Domain Error for every non-zero beta code in the domain is defined as the ratio of the mean power of the projection onto that non-zero beta code, to the mean power of the non-zero beta code in the composite reference waveform. This ratio is expressed in dB. The measurement interval is one timeslot except when the mean power between slots is expected to change whereupon the measurement interval is reduced by 25 μs at each end of the slot.

The Relative Code Domain Error is affected by both the spreading factor and beta value of the various code channels in the domain. The Effective Code Domain Power (ECDP) is defined to capture both considerations into one parameter. It uses the Nominal CDP ratio (as defined in TS25101 [1] 6.2.3), and is defined as follows for each used code, k, in the domain:

$$\text{ECDP}_k = (\text{Nominal CDP ratio})_k + 10 \cdot \log_{10}(\text{SF}_k/256)$$

When 16QAM is used on any of the UL code channels, the requirements for Relative Code Domain Error are not applicable when either or both of the following channel combinations occur:

- when the ECDP of any code channel is $< -30\text{dB}$.
- when the nominal code domain power of any code channel is $< -30\text{ dB}$

The requirement for Relative Code Domain Error also does not apply for the PRACH preamble and message parts.

The requirements apply for Release 7 and later releases for all types of UTRA for the FDD UE that support E-DCH 16QAM UE capability category 7. This test applies only to UE that support HSDPA and E-DCH.

5.13.2C.2 Minimum Requirements

When 16QAM is used on any of the UL code channels, the Relative Code Domain Error of the codes not using 16QAM shall meet the requirements in Table 5.13.2C.1 for the parameters specified in Table 5.13.2C.3.

Table 5.13.2C.1: Relative Code Domain Error minimum requirement, codes not using 16QAM

| ECDP dB | Relative Code Domain Error dB |
|---------------------------------|-------------------------------|
| $-22 < \text{ECDP}$ | ≤ -18 |
| $-30 \leq \text{ECDP} \leq -22$ | $\leq -40 - \text{ECDP}$ |
| $\text{ECDP} < -30$ | No requirement |

When 16QAM is used on any of the UL code channels; the Nominal CDP-Ratio-weighted average of the Relative Code Domain Errors measured individually on each of the codes using 16QAM shall meet the requirements in Table 5.13.2C.2 for the parameters specified in Table 5.13.2C.3. The Nominal CDP Ratio-weighted average of the Relative Code Domain Errors means the sum $\sum_k 10^{(\text{Nominal CDP ratio})_k / 10} \cdot 10^{(\text{Relative Code Domain Error})_k / 10}$ over all code k that uses 16QAM.

For the purposes of evaluating the requirements specified in Table 5.13.2C.2, the ECDP value is determined as the minimum of the individual ECDP values corresponding to the codes using 16QAM.

Table 5.13.2C.2: Relative Code Domain Error minimum requirement, with 16QAM used

| ECDP dB | Average Relative Code Domain Error dB |
|-----------------------------------|---------------------------------------|
| $-25.5 < \text{ECDP}$ | ≤ -18 |
| $-30 \leq \text{ECDP} \leq -25.5$ | $\leq -43.5 - \text{ECDP}$ |
| $\text{ECDP} < -30$ | No requirement |

Table 5.13.2C.3: Parameters for Relative Code Domain Error, with 16QAM used

| Parameter | | Unit | Level |
|--|----------|-------|----------------------------|
| UE Output Power, 16QAM | | dBm | ≥ -30 |
| Operating conditions | | | Normal conditions |
| Power control step size | | dB | 1 |
| Measurement period (Note 1) | PRACH | Chips | 3904 |
| | Any DPCH | | From 1280 to 2560 (Note 2) |
| NOTE 1: Less any 25 μ s transient periods | | | |
| NOTE 2: The longest period over which the nominal power remains constant | | | |

The normative reference for this requirement is TS 25.101 [1] clause 6.8.3a.

5.13.2C.3 Test purpose

To verify that the Relative Code Domain Error does not exceed the values in table 5.13.2C.7 for the beta values defined in table 5.13.2C.6.

5.13.2C.4 Method of test

5.13.2C.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS (node B emulator) to the UE antenna connector as shown in figure A.1.
- 2) The UL Reference Measurement Channel and the DL Fixed Reference Channels (FRC H-Set 1, 16QAM) are specified in Annex C.11.1 and C.8.1.1.

3) An E-DCH call is set up according to TS 34.108 [3] 7.3.9, with the following exceptions in the RADIO BEARER SETUP messages. These exceptions allow the beta values to be set according to table C.11.1.4 and each UL physical channel to be at constant power at the start of the measurement. RF parameters are set up according to table E.5A.1. Settings for the serving cell are defined in table 5.13.2C.5. Uplink SRB for DCCH mapped on E-DCH and downlink SRB for DCCH on DCH. E-DCH is configured with 2ms TTI.

4) Enter the UE into loopback test mode 1 looping back HSDPA to E-DCH and start the loopback test.

See TS 34.109 [4] clauses 5.3.2.3 and 5.3.2.6 for details regarding loopback test mode for HSDPA and E-DCH.

Table 5.13.2C.4: Contents of RADIO BEARER SETUP message: AM or UM (E-DCH and HSDPA) for Sub-test 1

| - Δ_{CQI} | Value used in test: see Table C.11.1.4 |

Table 5.13.2C.6: Settings for the serving cell during the measurement of Relative Code Domain Error with HS-DPCCH and E-DCH

| Parameter | Unit | Cell 1 |
|--|--------------|----------------------------------|
| Cell type | | Serving cell |
| UTRA RF Channel Number | | As defined in clause 5.13.2C.4.1 |
| Qqualmin | dB | -24 |
| Qrxlevmin | dBm | -115 |
| UE_TXPWR_MAX_RACH | dBm | +21 |
| \hat{I}_{or} (see notes 1 and 2) | dBm/3.84 MHz | -86 |
| NOTE 1: The power level is specified in terms of \hat{I}_{or} instead of CPICH_RSCP because RSCP is a receiver measurement, whereas the SS can only set \hat{I}_{or} . | | |
| NOTE 2: The cell fulfils TS 25.304, 5.2.3.1.2. | | |

5.13.2C.4.2 Procedure

- 1) Set the Absolute Grant according to Table C.11.1.4.
- 2) The SS starts transmitting HSDPA and the UE loops the received data back on E-DCH.
- 3) Generate suitable TPC commands from the SS to set the output power of the UE to be in the range 15 dBm \pm 2 dB.
- 4) Confirm that the E-TFCI transmitted by the UE is equal to the target E-TFCI in Table C.11.1.4. If the E-TFCI transmitted by the UE is not equal to the target E-TFCI, then fail the UE.
- 5) Send alternating "0" and "1" TPC commands in the downlink so as to satisfy the condition of obtaining TPC_cmd = 0.
- 6) Measure the Relative Code Domain Error of the DPCCH, HS-DPCCH, E-DPCCH and E-DPDCH(s).
- 7) Generate suitable TPC commands from the SS to set the output power of the UE to be in the range -18 dBm \pm 2 dB and repeat steps 4 to 6.5.13.2C.5 Test requirements

For the ECDP of each code measured in step 6) the Relative Code Domain Error shall not exceed the value given in table 5.13.2C.8 and table 5.13.2C.9.

Table 5.13.2C.7: Nominal ECDP ratios

| Sub-Test in Table C.11.1.4 | Code | Nominal Code Domain Power | Spreading Factor | Nominal ECDP |
|----------------------------|----------|---------------------------|------------------|--------------|
| 1 | DPCCH | -13.4 | 256 | -13.4 |
| | HS-DPCCH | -7.4 | 256 | -7.4 |
| | E-DPCCH | -7.4 | 256 | -7.4 |
| | E-DPDCH1 | -7.4 | 2 | -28.5 |
| | E-DPDCH2 | -7.4 | 2 | -28.5 |
| | E-DPDCH3 | -9.4 | 4 | -27.5 |
| | E-DPDCH4 | -9.4 | 4 | -27.5 |

NOTE: The nominal ECDP ratios given above are calculated from the nominal beta factors and are for general information to indicate the test coverage. The actual ECDP to use in the test for each code shall be based on the measured code domain power. The accuracy of the code domain powers is tested separately in 5.2E.

Table 5.13.2C.8: Relative Code Domain Error test requirement, codes not using 16QAM

| ECDP dB | Average Relative Code Domain Error dB |
|----------------------------|---------------------------------------|
| -22 < ECDP | ≤ -17.5 |
| -30 \leq ECDP \leq -22 | $\leq -39.5 - \text{ECDP}$ |
| ECDP < -30 | No requirement |

Table 5.13.2C.9: Relative Code Domain Error test requirement, with 16QAM used

| ECDP dB | Average Relative Code Domain Error dB |
|--------------------|--|
| -25.5 < ECDP | ≤ -17.5 |
| -30 ≤ ECDP ≤ -25.5 | ≤ -43.0 - ECDP |
| ECDP < -30 | No requirement |

NOTE 1: For the measurement points in which UE uses 16QAM modulation the correction factor in the measurements shall be applied to the β_{ed} value used to compute the Nominal CDP equal to $\{A_1*(0.4472)^2 + A_2*(1.3416)^2 + A_3*(-0.4472)^2 + A_4*(-1.3416)^2\}^{1/2}$ where A_1, A_2, A_3 and A_4 are the fractions of symbols (00, 01, 10, 11 respectively) transmitted during the test.

NOTE 2: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.13.2CA Relative Code Domain Error for HS-DPCCH and E-DCH with 16QAM for DC-HSUPA

5.13.2CA.1 Definition and applicability

The Relative Code Domain Error is computed by projecting the error vector (as defined in TS 25.101 [1] 6.8.2) onto the code domain for each of the two assigned channel frequencies. Only the code channels with non-zero betas in the composite reference waveform are considered for this requirement. The Relative Code Domain Error for every non-zero beta code in the domain is defined as the ratio of the mean power of the projection onto that non-zero beta code, to the mean power of the non-zero beta code in the composite reference waveform. This ratio is expressed in dB. The measurement interval is one timeslot except when the mean power between slots is expected to change whereupon the measurement interval is reduced by 25 μ s at each end of the slot.

The Relative Code Domain Error is affected by both the spreading factor and beta value of the various code channels in the domain. The Effective Code Domain Power (ECDP) is defined to capture both considerations into one parameter. It uses the Nominal CDP ratio (as defined in TS25101 [1] 6.2.3), and is defined as follows for each used code, k, in the domain:

$$ECDP_k = (\text{Nominal CDP ratio})_k + 10*\log_{10}(SF_k/256)$$

The requirements for Relative Code Domain Error are not applicable when either or both of the following channel combinations occur:

- when the ECDP of any code channel is < -30dB.
- when the nominal code domain power of any code channel is < -30 dB

The requirement for Relative Code Domain Error also does not apply for the PRACH preamble and message parts.

The requirements and this test apply for Release 9 and later releases to all types of UTRA for the FDD UE that support HSDPA and Dual Cell E-DCH.

5.13.2CA.2 Minimum Requirements

When 16QAM is used on any of the UL code channels, the Relative Code Domain Error of the codes not using 16QAM shall meet the requirements in Table 5.13.2CA.1 for the parameters specified in Table 5.13.2CA.3.

Table 5.13.2CA.1: Relative Code Domain Error minimum requirement, codes not using 16QAM

| ECDP dB | Relative Code Domain Error dB |
|------------------|--------------------------------------|
| -22 < ECDP | ≤ -18 |
| -30 ≤ ECDP ≤ -22 | ≤ -40 - ECDP |
| ECDP < -30 | No requirement |

When 16QAM is used on any of the UL code channels; the Nominal CDP-Ratio-weighted average of the Relative Code Domain Errors measured individually on each of the codes using 16QAM in that carrier shall meet the requirements in Table 5.13.2CA.2 for the parameters specified in Table 5.13.2CA.3. The Nominal CDP Ratio-weighted average of the

Relative Code Domain Errors means the sum $\sum_k 10^{(\text{Nominal CDP ratio})_k / 10} \cdot 10^{(\text{Relative Code Domain Error})_k / 10}$ over all code k that uses 16QAM.

For the purposes of evaluating the requirements specified in Table 5.13.2CA.2, the ECDP value is determined as the minimum of the individual ECDP values corresponding to the codes using 16QAM.

Table 5.13.2CA.2: Relative Code Domain Error minimum requirement, with 16QAM used

| ECDP dB | Average Relative Code Domain Error dB |
|-----------------------------------|---------------------------------------|
| $-25.5 < \text{ECDP}$ | ≤ -18 |
| $-30 \leq \text{ECDP} \leq -25.5$ | $\leq -43.5 - \text{ECDP}$ |
| $\text{ECDP} < -30$ | No requirement |

Table 5.13.2CA.3: Parameters for Relative Code Domain Error, with 16QAM used

| Parameter | | Unit | Level |
|--|----------|-------|----------------------------|
| UE Output Power, 16QAM | | dBm | ≥ -30 |
| Operating conditions | | | Normal conditions |
| Power control step size | | dB | 1 |
| Measurement period (Note 1) | PRACH | Chips | 3904 |
| | Any DPCH | | From 1280 to 2560 (Note 2) |
| NOTE 1: Less any 25 μ s transient periods | | | |
| NOTE 2: The longest period over which the nominal power remains constant | | | |

The normative reference for this requirement is TS 25.101 [1] clause 6.8.3a.

5.13.2CA.3 Test purpose

To verify that the Relative Code Domain Error does not exceed the values in table 5.13.2CA.6 for the beta values defined in table 5.13.2CA.5.

5.13.2CA.4 Method of test

5.13.2CA.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS (node B emulator) to the UE antenna connector as shown in figure A.41.
- 2) The UL Reference Measurement Channel and the DL Fixed Reference Channels (FRC H-Set 3A, 16QAM) are specified in Annex C.2.6 and C.8.1.1.
- 3) An E-DCH call is set up according to TS 34.108 [3] 7.3.14, with the following exceptions in the RADIO BEARER SETUP messages. These exceptions allow the beta values to be set according to table C.11.A.1 and each UL physical channel to be at constant power at the start of the measurement. RF parameters are set up according to table E.5A.1A. Settings for the serving cell are defined in table 5.13.2CA.5. Uplink SRB for DCCH mapped on E-DCH and downlink SRB for DCCH on DCH. E-DCH is configured with 2ms TTI.
- 4) Enter the UE into loopback test mode 1 looping back HSDPA to E-DCH and start the loopback test.

See TS 34.109 [4] clauses 5.3.2.3 and 5.3.2.6 for details regarding loopback test mode for HSDPA and E-DCH.

Table 5.13.2CA.4: Contents of RADIO BEARER SETUP message: AM or UM (E-DCH and HSDPA)

| Information Element | Value/Remark |
|---|--------------------------------|
| CHOICE channel requirement - Power Control Algorithm | Uplink DPCH info Algorithm2 |

Table 5.13.2CA.5: Settings for the serving cell during the measurement of Relative Code Domain Error with HS-DPCCH and E-DCH

| Parameter | Unit | Cell 1 |
|--|--------------|-----------------------------------|
| Cell type | | Serving cell |
| UTRA RF Channel Number | | As defined in clause 5.13.2CA.4.1 |
| Qqualmin | dB | -24 |
| Qrxlevmin | dBm | -115 |
| UE_TXPWR_MAX_RACH | dBm | +21 |
| \hat{I}_{or} (see notes 1 and 2) | dBm/3.84 MHz | -86 |
| NOTE 1: The power level is specified in terms of \hat{I}_{or} instead of CPICH_RSCP because RSCP is a receiver measurement, whereas the SS can only set \hat{I}_{or} . | | |
| NOTE 2: The cell fulfils TS 25.304, 5.2.3.1.2. | | |

5.13.2CA.4.2 Procedure

- 1) Set the Absolute Grant according to Table C.11A.1.2.
- 2) The SS starts transmitting HSDPA and the UE loops the received data back on E-DCH.
- 3) Generate suitable TPC commands from the SS to set the output power of each of the two carriers to be in the range 15dBm \pm 2dB.
- 4) Confirm that the E-TFCI transmitted by the UE is equal to the target E-TFCI in Table C.11A.1.2. If the E-TFCI transmitted by the UE is not equal to the target E-TFCI, then fail the UE.
- 5) Measure the Relative Code Domain Error of the DPCCH, HS-DPCCH, E-DPCCH and E-DPDCH(s) on each of the two assigned channel frequencies.
- 6) Set the power level of each of the two carriers to -18 dBm or send down power control commands (1 dB step size should be used) to the UE until the power level of each of the two carriers is -18 dBm with \pm 2 dB tolerance.
- 7) Measure the Relative Code Domain Error of the DPCCH, HS-DPCCH, E-DPCCH and E-DPDCH(s) on each of the two assigned channel frequencies.

5.13.2CA.5 Test requirements

For the ECDP of each code measured in steps 5) and 7) the Relative Code Domain Error shall not exceed the value given in table 5.13.2CA.7 and table 5.13.2CA.8.

Table 5.13.2CA.6: Nominal ECDP ratios

| Sub-Test in Table C.11A.1.2 | UL frequency | Code | Nominal Code Domain Power | Spreading Factor | Nominal ECDP |
|-----------------------------|----------------|----------------|---------------------------|------------------|--------------|
| 1 | Primary | DPCCH | -24,0 | 256 | -24,0 |
| | | DPDCH | - | - | - |
| | | HS-DPCCH | -21,9 | 256 | -21,9 |
| | | E-DPCCH | -15,9 | 256 | -15,9 |
| | | E-DPDCH (SF/2) | -4,9 | 2 | -26,0 |
| | E-DPDCH (SF/4) | -7,9 | 4 | -26,0 | |
| | Secondary | DPCCH | -23,9 | 256 | -23,9 |
| | | DPDCH | - | - | - |
| | | HS-DPCCH | - | - | - |
| | | E-DPCCH | -15,9 | 256 | -15,9 |
| | | E-DPDCH (SF/2) | -4,9 | 2 | -26,0 |
| E-DPDCH (SF/4) | -7,9 | 4 | -26,0 | | |

NOTE: The nominal ECDP ratios given above are calculated from the nominal beta factors and are for general information to indicate the test coverage. The actual ECDP to use in the test for each code shall be based on the measured code domain power. The accuracy of the code domain powers is tested separately in 5.2E.

Table 5.13.2CA.7: Relative Code Domain Error test requirement, codes not using 16QAM

| ECDP dB | Average Relative Code Domain Error dB |
|------------------|---------------------------------------|
| -22 < ECDP | ≤ -17.5 |
| -30 ≤ ECDP ≤ -22 | ≤ -39.5 - ECDP |
| ECDP < -30 | No requirement |

Table 5.13.2CA.8: Relative Code Domain Error test requirement, with 16QAM used

| ECDP dB | Average Relative Code Domain Error dB |
|--------------------|---------------------------------------|
| -25.5 < ECDP | ≤ -17.5 |
| -30 ≤ ECDP ≤ -25.5 | ≤ -43.0 - ECDP |
| ECDP < -30 | No requirement |

NOTE 1: For the measurement points in which UE uses 16QAM modulation the correction factor in the measurements shall be applied to the β_{ed} value used to compute the Nominal CDP equal to $\{A_1*(0.4472)^2 + A_2*(1.3416)^2 + A_3*(-0.4472)^2 + A_4*(-1.3416)^2\}^{1/2}$ where A_1, A_2, A_3 and A_4 are the fractions of symbols (00, 01, 10, 11 respectively) transmitted during the test.

NOTE 2: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.13.3 UE phase discontinuity

5.13.3.1 Definition and applicability

Phase discontinuity is the change in phase between any two adjacent timeslots. The EVM for each timeslot (excluding the transient periods of 25 μs on either side of the nominal timeslot boundaries) shall be measured according to subclause 5.13.1. The frequency, absolute phase, absolute amplitude and chip clock timing used to minimise the error vector are chosen independently for each timeslot. The phase discontinuity result is defined as the difference between the absolute phase used to calculate EVM for the preceding timeslot, and the absolute phase used to calculate EVM for the succeeding timeslot.

Figure 5.13.3.1 Graphical description of phase discontinuity

The best-fit rate of change of phase for each timeslot is calculated using the same process as used to minimize the EVM. This best-fit rate of change of phase is by definition the frequency error result for the timeslot. Due to the presence of power steps in the test, the data used for the best-fit calculation shall exclude the 25 μ s transition period at the beginning and end of each timeslot. The best-fit rate of change of phase for each timeslot is then extrapolated in both directions onto the timeslot boundaries. The phase discontinuity result at any one slot boundary is the difference between the extrapolated phase at the end of the timeslot preceding the slot boundary and the extrapolated phase at the start of the timeslot following the slot boundary.

The requirements and this test apply to all types of UTRA for the FDD UE for Release 5 and later releases.

5.13.3.2 Minimum requirements

The rate of occurrence of any phase discontinuity on an uplink DPCH for the parameters specified in table 5.13.3.1 shall not exceed the values specified in table 5.13.3.2. Phase shifts that are caused by changes of the UL transport format combination (TFC) and compressed mode are not included. When calculating the phase discontinuity, the requirements for frequency error and EVM in subclauses TS 25.101 [1] 6.3 and TS 25.101 [1] 6.8.2 for each timeslot shall be met.

Table 5.13.3.1: Parameters for Phase discontinuity

| Parameter | Unit | Level |
|-------------------------|------|-------|
| Power control step size | dB | 1 |

Table 5.13.3.2: Phase discontinuity minimum requirement

| Phase discontinuity $\Delta\theta$ in degrees | Maximum allowed rate of occurrence in Hz |
|---|--|
| $\Delta\theta \leq 30$ | 1500 |
| $30 < \Delta\theta \leq 60$ | 300 |
| $\Delta\theta > 60$ | 0 |

The normative reference for this requirement is TS 25.101 [1] clause 6.8.4.

5.13.3.3 Test purpose

To verify that the UE phase discontinuity is within the limits shown in clause 5.13.3.2.

To verify that any timeslot used in the calculation of a phase discontinuity result also passes the frequency error and EVM requirements referenced in clause 5.3.2 and 5.13.3.2.

5.13.3.4 Method of test

5.13.3.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.1.
- 2) A call is set up according to the Generic call setup procedure using power control algorithm 1 as specified in TS34.108 [3] sub clause 7.3.2.
- 3) Enter the UE into loopback test mode and start the loopback test.

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

Procedure

Figure 5.13.3.2: Five down four up hysteresis test pattern

Figure 5.13.3.3: Five up four down hysteresis test pattern

- 1) Set the power of the UE to max power using continuous up TPC commands.
- 2) Transmit a sequence of five down four up TPC commands as shown in figure 5.13.3.2 until the UE has reached the minimum power defined in 5.4.3 with ± 2 dB tolerance.
- 3) During step 2 starting with the slot before the first down power step, measure the EVM of each slot and the phase discontinuity to the next slot.
- 4) Transmit a sequence of five up four down TPC commands as shown in figure 5.13.3.3 until the UE has reached its maximum power defined in 5.2 with ± 2 dB tolerance.
- 5) During step 4 starting with the slot before the first up power step, measure the EVM of each slot and the phase discontinuity to the next slot.

NOTE: In order to make it practical to measure the entire power control dynamic range (between min power threshold and max power threshold with suitable margins), it is permissible to segment the power control sequences into smaller subsequences. Except when within 5 dB of the upper or lower thresholds, segmentation will require sufficient overlap such that every power step in one direction is followed by four steps in the other direction.

5.13.3.5 Test requirements

- a) During 5.13.3.4.2 step 3, and step 5, the EVM of every measured slot which is greater than or equal to -20 dBm shall not exceed 17.5%
- b) During 5.13.3.4.2 step 3, and step 5, the Frequency error of every measured slot shall not exceed $\pm(0,1 \text{ ppm} + 10 \text{ Hz})$.
- c) During 5.13.3.4.2 step 3, and step 5; the phase discontinuity measurements made between any two adjacent slots shall be less than or equal to 36 degrees. If a phase discontinuity measurement is greater than 36 degrees and less than or equal to 66 degrees then the next four measurements shall be less than or equal to 36 degrees. No measurement shall exceed 66 degrees.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.13.4 PRACH preamble quality

5.13.4.1 Definition and applicability

PRACH preamble quality is a measure of the ability of the UE to transmit the PRACH preamble in accordance with the core requirements so that the Node B can reliably decode the PRACH.

This test applies to all types of UTRA for the FDD UE from Release 5 onwards.

5.13.4.2 Minimum requirements

The EVM of the PRACH preamble observed over the interval of 3904 chips (i.e. excluding the transient periods) shall not exceed 17.5%.

The reference for this requirement is TS 25.101 [1] clause 6.8.2.

The UE modulated carrier frequency used to transmit the PRACH preamble observed over the interval of 3904 chips (i.e. excluding the transient periods) shall be within $\pm 0.1 \text{ PPM}$ compared to the carrier frequency received from the Node B.

The reference for this requirement is TS 25.101 [1] clause 6.3.

The PRACH preamble shall be transmitted in the correct access slot using the correct signature as defined by the parameters signalled to the UE.

The reference for this requirement is TS 25.214 [5] clause 6.1 physical random access procedure.

5.13.4.3 Test purpose

The test purpose is to verify that the transmission quality of the first PRACH preamble meets the minimum requirements for modulation quality, carrier frequency, access slot and signature as defined in 5.13.4.2. The UE is tested at nominal maximum output power and nominally 5.6 dB to 8.6 dB above reference sensitivity, which simulates operation towards the cell boundary. The access slot and signature are chosen randomly from the allowed possibilities for each execution of the RACH procedure. There are 384 possible configurations that could be chosen, but only 10 of these are randomly selected for test in order to minimize the test time.

5.13.4.4 Method of test

5.13.4.4.1 Initial conditions

Test environment: normal, TL/VL, TL/VH, TH/VL, TH/VH; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.1.
- 2) A call is set up according to the Generic call setup procedure, using the modified parameters according to table 5.13.4.1 and table 5.13.4.2. The relative power levels of the downlink physical channels to I_{or} are set up according to clause E.2.1. The physical random access procedure within the call setup is used for the test.

See TS 34.108 [3] for details regarding generic call setup procedure and 25.214 [5] for details of the physical random access procedure.

Table 5.13.4.1: Static test parameters for PRACH quality

| Static Parameters | Power Class 1 | Power Class 2 | Power Class 3 | Power Class 4 | Unit |
|--|---------------|---------------|---------------|---------------|----------------|
| \hat{I}_{or} | -98.1 | -98.1 | -98.1 | -98.1 | dBm / 3,84 MHz |
| Nominal CPICH_RSCP | -102 | -102 | -102 | -102 | dBm |
| Primary CPICH TX power | +24 | +24 | +24 | +24 | dBm |
| Simulated path loss = Primary CPICH TX power - CPICH_RSCP | +126 | +126 | +126 | +126 | dB |
| UL interference | -83 | -89 | -92 | -95 | dBm |
| Constant Value | -10 | -10 | -10 | -10 | dB |
| Expected nominal UE TX power ¹ | +33 | +27 | +24 | +21 | dBm |
| Preamble Retrans Max | 1 | | | | |
| NOTE 1: The Expected nominal UE TX power is calculated by using the equation in the clause 8.5.7 Open Loop Power Control of TS 25.331 [8]. | | | | | |

Table 5.13.4.2: Random test parameters for PRACH quality

| Random Parameters ¹ | Value |
|---|---|
| Available RACH Sub Channels | One sub-channel chosen at random from the 12-bit Available sub channel number |
| Available PRACH Signatures | One signature chosen at random from the 16-bit Available signature number |
| ASC Setting | Both Available signature Start Index and Available signature End Index are 0 |
| AICH transmission timing | Chosen at random from the range 0 to 1 |
| NOTE 1: In order to avoid a static test configuration, each time the RACH procedure is executed, the parameters in this table are to be chosen at random from the defined range. The random function used shall be such that each of the allowed selections is chosen with equal probability. | |

Table 5.13.4.3: PAGING TYPE 1 Message content

| Information Element | Value/remark |
|---|---|
| BCCH modification info MIB Value Tag | Set to the same value as the value tag of the MIB after the BCCH modification |
| BCCH Modification time | Not present |

5.13.4.4.2 Procedure

- 1) Set the TX output level of the SS to obtain \hat{I}_{or} at the UE antenna connector. \hat{I}_{or} shall be according to table 5.13.4.1 depending on the power class of the UE.
- 2) The SS shall initiate a call by sending PAGING TYPE 1 message and measure the first RF transmission from the UE.
- 3) The SS shall determine the access slot used, the received signature, the EVM and the frequency error.
- 4) Choose a new set of parameters from table 5.13.4.2
- 5) Send PAGING TYPE 1 message with BCCH modification info as per table 5.13.4.3.
- 6) Wait 5seconds to allow the UE to read the new SIB 5.

7) Repeat from step number 2) ten times.

5.13.4.5 Test requirements

For all the transmitted PRACH preambles measured in 5.13.4.4.2 step 3:

- 1) The EVM shall not exceed 17,5 %.
- 2) The frequency error shall not exceed $\pm(0,1 \text{ ppm} + 10 \text{ Hz})$.
- 3) The detected access slot and signature shall be correct according to the physical random access procedure defined in [5].

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

5.13.5 In-band emission for DC-HSUPA

5.13.5.1 Definition and applicability

The in-band emission is measured as the ratio of the UE output power in one carrier in dual cells to the UE output power in the other carrier, where the power in the former carrier shall be set to the minimum output power and the power in the latter carrier to the maximum output power. It is necessary to verify the requirements when the both carriers are configured according to the UL E-DCH reference measurement channel for DC-HSUPA using BPSK modulation, specified in subclause C.11A. The basic in-band emission measurement interval is defined over one slot in the time domain.

The requirements and this test apply for Release 9 and later releases to all types of UTRA for the FDD UE that support HSDPA and Dual Cell E-DCH.

5.13.5.2 Minimum Requirements

The in-band emission shall not exceed the value specified in Table 5.13.5.1.

Table 5.13.5.1: In-band emission minimum requirements for DC-HSUPA

| Parameter | Description | Unit | Limit |
|-----------|---|------|-------|
| | In-band emission | dBc | -24 |
| NOTE: | The measurement bandwidth is 3.84 MHz centred on each carrier frequency and the limit is expressed as a ratio of RRC filtered mean power in one carrier, transmitting at minimum output power, to the RRC filtered mean power in the other carrier, transmitting at maximum output power. | | |

The normative reference for this requirement is TS 25.101 [1] clause 6.8.3b.1.

5.13.5.3 Test purpose

To verify that the in-band emission, during DC-HSUPA transmission, does not exceed the prescribed limits shown in table 5.13.5.1. This is applicable for all values of β_c , β_d , β_{hs} , β_{ec} and β_{ed} as specified in [5]. The maximum output power with HS-DPCCH and/or E-DCH is specified in table 5.2BA.1.

Excess in-band emission decreases the uplink stability and throughput in DC-HSUPA operation.

NOTE: For a static signal, the measurement with a 3.84 MHz filter can be replaced by a narrower filter and integration over the bandwidth. For a non static signal the above described replacement gives different results, depending on the type of dynamic in the signal and depending on the bandwidth of the filter. Hence the signal is tested only when static.

5.13.5.4 Method of test

5.13.5.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS (node B emulator) to the UE antenna connector as shown in figure A.41.
- 2) The UL Reference Measurement Channel and parameters are specified in Annex C.2.6 and C.11A. The DL Reference Measurement Channel (FRC H-SET 3A, QPSK) is specified in C.8.1.1.
- 3) A call is set up according to the Generic call setup procedure specified in TS34.108 [3] sub clause 7.3.14, with exceptions for information elements in RADIO BEARER SETUP message as given in Table 5.2BA.2, 5.2BA.3 and 5.2BA.4. These exceptions allow the beta values to be set according to table C.11A.1.1 and each UL physical channel to be at constant power during the measurement. RF parameters are set up according to E.5 A.1A. Settings for the serving cell are defined in table 5.13.5.2
- 4) Enter the UE into loopback test mode 1 looping back HSDPA to E-DCH according to procedure 7.3.14.3 in TS 34.108 [3] and start the loopback test.

See TS 34.109 [4] clauses 5.3.2.3 and 5.3.2.6 for details regarding loopback test mode for HSDPA and E-DCH.

Table 5.13.5.2: Settings for the serving cell during the measurement of in-band emission for DC-HSUPA

| Parameter | Unit | Cell 1 |
|--|--------------|-------------------------------------|
| Cell type | | Serving cell |
| UTRA RF Channel Number | | As defined in clause 5.145.13.5.4.1 |
| Qqualmin | dB | -24 |
| Qrxlevmin | dBm | -115 |
| UE_TXPWR_MAX_RACH | dBm | +21 |
| \hat{I}_{or} (see notes 1 and 2) | dBm/3.84 MHz | -86 |
| NOTE 1: The power level is specified in terms of \hat{I}_{or} instead of CPICH_RSCP because RSCP is a receiver measurement, whereas the SS can only set \hat{I}_{or} . | | |
| NOTE 2: The cell fulfils TS 25.304, 5.2.3.1.2. | | |

Table 5.13.5.3: Power Settings of Uplink Carriers for the measurement of in-band emission for DC-HSUPA

| Sub-test | Power of First Carrier | Power of Second Carrier |
|----------|------------------------|-------------------------|
| 1 | Maximum | Minimum |
| 2 | Minimum | Maximum |

5.13.5.4.2 Procedure

- 1) Set the Absolute Grant according to Table C.11A.1.1.
- 2) The SS starts transmitting HSDPA and the UE loops the received data back on E-DCH.
- 3) Set and send continuously Up power control commands to one carrier and Down power control commands to the other carrier to reach the power levels as given in table 5.13.5.3. Wait for 150ms.
- 4) Measure the power of each carrier with a measurement filter of bandwidths according to table 5.13.5.1 and record the power difference. The power may be calculated by integrating multiple narrower filter (≥ 3 kHz) measurements. The characteristic of the filter shall be approximately Gaussian (typical spectrum analyzer filter). The measurement duration with the filter on one frequency shall last at least the filter settling time and the measurement period shall be inside the HS-DPCCH on-period.
- 5) Repeat steps 1-4 for sub-tests as given in table 5.13.5.3.

5.13.5.5 Test requirements

The result of clause 5.13.5.4.2 step 4) shall fulfil the requirements of table 5.13.5.4.

Table 5.13.5.4: In-band Emission Requirement for DC-HSUPA

| Parameter Description | Unit | Limit |
|---|------|-------|
| In-band emission | dBc | -23.2 |
| NOTE: The measurement bandwidth is 3.84 MHz centred on each carrier frequency and the limit is expressed as a ratio of RRC filtered mean power in one carrier, transmitting at minimum output power, to the RRC filtered mean power in the other carrier, transmitting at maximum output power. | | |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

6 Receiver Characteristics

6.1 General

Receiving performance test of the UE is implemented during communicating with the SS via air interface. The procedure is using normal call protocol until the UE is communicating on traffic channel basically. On the traffic channel, the UE provides special function for testing that is called Logical Test Interface and the UE is tested using this function (Refer to TS 34.109 [4]).

Transmitting or receiving bit/symbol rate for test channel is shown in table 6.1.

Table 6.1: Bit / Symbol rate for Test Channel

| Type of User Information | User bit rate | DL DPCH symbol rate | UL DPCH bit rate | Remarks |
|---|---------------|---------------------|------------------|---------------|
| 12,2 kbps reference measurement channel | 12,2 kbps | 30 ksp/s | 60 kbps | Standard Test |

Unless otherwise stated the receiver characteristics are specified at the antenna connector of the UE. For UE(s) with an integral antenna only, a reference antenna with a gain of 0 dBi is assumed. UE with an integral antenna may be taken into account by converting these power levels into field strength requirements, assuming a 0 dBi gain antenna. For UEs with more than one receiver antenna connector the AWGN signals applied to each receiver antenna connector shall be uncorrelated. The levels of the test signals applied to each of the antenna connectors shall be as defined in the respective sections below. The UE antenna performance has a significant impact on system performance, and minimum requirements on the antenna efficiency are therefore intended to be included in future versions of the present document. It is recognised that different requirements and test methods are likely to be required for the different types of UE.

With the exception of clause 6.8, all the parameters in clause 6 are defined using the DL reference measurement channel (12,2 kbps) specified in clause C.3.1 and unless stated otherwise, with DL power control OFF.

The common RF test conditions of Rx Characteristics are defined in clause E.3.2, and each test conditions in this clause (clause 6) should refer clause E.3.2. Individual test conditions are defined in the paragraph of each test.

When DCCH has been configured on downlink DCH then DCCH Data shall be continuously transmitted on downlink DCH during the measurement period. When there is no signalling to transmit on downlink DCCH then dummy DCCH transmission as described in Annex C.9 shall be used.

For HSDPA test cases, when DTCH has been configured on downlink DCH then DTCH Data shall be continuously transmitted on downlink DCH during the measurement period.

All Bit Error ratio (BER) measurements in clause 6 shall be performed according to the general rules for statistical testing in Annex F.6.

For HSDPA test cases without E-DCH, the MAC headers on HS-DSCH shall be according to Annex C.9A.

UEs supporting DC-HSDPA shall support both minimum requirements, as well as additional requirements for DC-HSDPA.

UEs supporting DB-DC-HSDPA shall support both minimum requirements as well as additional requirements for DB-DC-HSDPA.

For the additional requirements for DC-HSDPA or DB-DC-HSDPA, all the parameters in clause 6 are defined using the DL reference measurement channel H-Set 12 unless otherwise stated, specified in subclause C.8.1.12 and the downlink physical channel setup according to table E.5.4B. For the additional requirements for DC-HSDPA, the spacing of the carrier frequencies of the two cells shall be 5 MHz.

6.1A Reference input power adjustment for a dual band device

For the UE which supports DB-DC-HSDPA configuration in clause 4.2, the reference input powers (HS-PDSCH_{Ec} and \hat{I}_{or}) of core requirements specified in test cases 6.5C and 6.7C are allowed to be increased by the amount given in Table 6.1A for the applicable bands.

Table 6.1A: Allowed increase of HS-PDSCH E_c and \hat{I}_{or} for UE which supports DB-DC-HSDPA.

| DB-DC-HSDPA Configuration | Allowed increase of HS-PDSCH E_c and \hat{I}_{or} (dB) | Applicable bands |
|---------------------------|--|------------------|
| 1 | 0.5 | I, VIII |
| 2 | 1 | II, IV |
| 3 | 0.5 | I, V |

For the UE which supports dual band 4C-HSDPA configuration in Table 4.0B, the reference input powers (HS-PDSCH_{Ec} and \hat{I}_{or}) of core requirements specified in clause 6.5C, 6.5E and 6.7C are allowed to be increased by the amount given in Table 6.1B for the applicable bands.

Table 6.1B: Allowed increase of HS-PDSCH E_c and \hat{I}_{or} for UE which supports dual band 4C-HSDPA

| Dual Band 4C-HSDPA Configuration | Allowed increase of HS-PDSCH E_c and \hat{I}_{or} (dB) | Applicable bands |
|-------------------------------------|--|------------------|
| I-2-VIII-1 I-3-VIII-1 | 0.5 | I, VIII |
| II-1-IV-2 II-2-IV-1 II-2-IV-2 | 1 | II, IV |
| I-1-V-2 I-2-V-1 I-2-V-2 | 0.5 | I, V |

6.2 Reference Sensitivity Level

6.2.1 Definition and applicability

The reference sensitivity level <REFSENS> is the minimum mean power received at the UE antenna port at which the Bit Error Ratio (BER) shall not exceed a specific value

The requirements and this test apply to all types of UTRA for the FDD UE.

6.2.2 Minimum Requirements

The BER shall not exceed 0,001 for the parameters specified in table 6.2.1.

Table 6.2.1: Test parameters for Reference Sensitivity Level

| Operating Band | Unit | DPCH_Ec <REFSENS> | <REF \hat{I}_{or} > |
|----------------|--------------|----------------------|-----------------------|
| I | dBm/3.84 MHz | -117 | -106.7 |
| II | dBm/3.84 MHz | -115 | -104.7 |
| III | dBm/3.84 MHz | -114 | -103.7 |
| IV | dBm/3.84 MHz | -117 | -106.7 |
| V | dBm/3.84 MHz | -115 | -104.7 |
| VI | dBm/3.84 MHz | -117 | -106.7 |
| VII | dBm/3.84 MHz | -115 | -104.7 |
| VIII | dBm/3.84 MHz | -114 | -103.7 |
| IX | dBm/3.84 MHz | -116 | -105.7 |
| X | dBm/3.84 MHz | -117 | -106.7 |
| XI | dBm/3.84 MHz | -117 | -106.7 |
| XII | dBm/3.84 MHz | -114 | -103.7 |
| XIII | dBm/3.84 MHz | -114 | -103.7 |
| XIV | dBm/3.84 MHz | -114 | -103.7 |
| XIX | dBm/3.84 MHz | -117 | -106.7 |
| XX | dBm/3.84 MHz | -114 | -103.7 |
| XXI | dBm/3.84 MHz | -117 | -106.7 |
| XXII | dBm/3.84 MHz | -114 | -103.7 |
| XXV | dBm/3.84 MHz | -113.5 | -103.2 |
| XXVI | dBm/3.84 MHz | -113.5 | -103.2 |

NOTE 1: For Power class 3 and 3bis this shall be at the maximum output power.
NOTE 2: For Power class 4 this shall be at the maximum output power.
NOTE 3: For the UE which supports both Band III and Band IX operating frequencies, the reference sensitivity level of -114.5 dBm DPCH_Ec <REFSENS> shall apply for Band IX. The corresponding <REF \hat{I}_{or} > is -104.2 dBm.
NOTE 4: For the UE which supports both Band XI and Band XXI operating frequencies, the reference sensitivity level is FFS.

For the UE which supports DB-DC-HSDPA configuration in Table 6.2.1A, the reference sensitivity level DPCH_Ec <REFSENS> and corresponding <REF \hat{I}_{or} > in Table 6.2.1 are allowed to be increased by the amount given in Table 6.2.1A for the applicable bands.

Table 6.2.1A: Allowed de-sensitization relative to reference sensitivity for UE which supports DB-DC-HSDPA.

| DB-DC-HSDPA Configuration | Allowed de-sensitization (dB) | Applicable bands |
|---------------------------|-------------------------------|------------------|
| 2 | 1 | II, IV |

The normative reference for this requirement is TS 25.101 [1] clause 7.3.1.

6.2.3 Test purpose

To verify that the UE BER shall not exceed 0,001 for the parameters specified in table 6.2.2.

The lack of the reception sensitivity decreases the coverage area at the far side from Node B.

6.2.4 Method of test

6.2.4.1 Initial conditions

Test environment: normal, TL/VL, TL/VH, TH/VL, TH/VH; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.1.

- 2) Channel conditions are initially set up with received CPICH_RSCP >-85 dBm. The relative power level of downlink physical channels to Ior are set up according to clause E.2.1. The parameter settings of the cell are set up according to TS 34.108 [3], clause 6.1.5 for "Default settings for a serving cell in a single cell environment".
- 3) Switch on the phone.
- 4) A call is set up according to the Generic call setup procedure in TS34.108 [3] sub clause 7.3.2.
- 5) The RF parameters are set up according to table 6.2.2.
- 6) Enter the UE into loopback test mode and start the loopback test.

See TS 34.109 [4] for details regarding loopback test.

6.2.4.2 Procedure

- 1) Set and send continuously Up power control commands to the UE until the UE output power shall be maximum level.
- 2) Measure the BER of DCH received from the UE at the SS.

6.2.5 Test requirements

The measured BER, derived in step 2), shall not exceed 0,001.

Table 6.2.2: Test parameters for Reference Sensitivity Level

| Operating Band | Unit | DPCH_Ec <REFSENS> | <REF \hat{I}_{or} > |
|----------------|--------------|----------------------|-----------------------|
| I | dBm/3.84 MHz | -116.3 | -106 |
| II | dBm/3.84 MHz | -114.3 | -104 |
| III | dBm/3.84 MHz | -113.3 | -103 |
| IV | dBm/3.84 MHz | -116.3 | -106 |
| V | dBm/3.84 MHz | -114.3 | -104 |
| VI | dBm/3.84 MHz | -116.3 | -106 |
| VII | dBm/3.84 MHz | -114.3 | -104 |
| VIII | dBm/3.84 MHz | -113.3 | -103 |
| IX | dBm/3.84 MHz | -115.3 | -105 |
| X | dBm/3.84 MHz | -116.3 | -106 |
| XI | dBm/3.84 MHz | -116.3 | -106 |
| XII | dBm/3.84 MHz | -113.3 | -103 |
| XIII | dBm/3.84 MHz | -113.3 | -103 |
| XIV | dBm/3.84 MHz | -113.3 | -103 |
| XIX | dBm/3.84 MHz | -116.3 | -106 |
| XX | dBm/3.84 MHz | -113.3 | -103 |
| XXI | dBm/3.84 MHz | -116.3 | -106 |
| XXII | dBm/3.84 MHz | -113.3 | -103 |
| XXV | dBm/3.84 MHz | -112.8 | -102.5 |
| XXVI | dBm/3.84 MHz | -112.8 | -102.5 |

NOTE 1: For Power class 3 and 3bis this shall be at the maximum output power.
NOTE 2: For Power class 4 this shall be at the maximum output power.
NOTE 3: For the UE which supports both Band III and Band IX operating frequencies, the reference sensitivity level of -113.8 dBm DPCH_Ec <REFSENS> shall apply for Band IX. The corresponding <REF \hat{I}_{or} > is -103.5 dBm.
NOTE 4: For the UE which supports DB-DC-HSDPA configuration 2, the reference sensitivity level of -113.3 dBm/3.84 MHz DPCH_Ec <REFSENS> shall apply for Band II. The corresponding <REF \hat{I}_{or} > is -103 dBm/3.84 MHz.
NOTE 5: For the UE which supports DB-DC-HSDPA configuration 2, the reference sensitivity level of -115.3 dBm/3.84 MHz DPCH_Ec <REFSENS> shall apply for Band IV. The corresponding <REF \hat{I}_{or} > is -105 dBm/3.84 MHz.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

6.2A Reference Sensitivity Level for DC-HSDPA

6.2A.1 Definition and applicability

The reference sensitivity level <REFSENS> is the minimum mean power received at the UE antenna port at which the Block Error Ratio (BLER) on each individual cell shall not exceed a specific value.

The requirements and this test apply for Release 8 and later releases to all types of UTRA for the FDD UE that support DC-HSDPA.

6.2A.2 Minimum Requirements

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 6.2A.1.

Table 6.2A.1: Test parameters for reference sensitivity, additional requirement for DC-HSDPA

| Operating Band | Unit | HS-PDSCH_Ec <REFSENS> | <REF _{or} > |
|----------------|--------------|--------------------------|----------------------|
| I | dBm/3.84 MHz | -113 | -102.7 |
| II | dBm/3.84 MHz | -111 | -100.7 |
| III | dBm/3.84 MHz | -110 | -99.7 |
| IV | dBm/3.84 MHz | -113 | -102.7 |
| V | dBm/3.84 MHz | -111 | -100.7 |
| VI | dBm/3.84 MHz | -113 | -102.7 |
| VII | dBm/3.84 MHz | -111 | -100.7 |
| VIII | dBm/3.84 MHz | -110 | -99.7 |
| IX | dBm/3.84 MHz | -112 | -101.7 |
| X | dBm/3.84 MHz | -113 | -102.7 |
| XI | dBm/3.84 MHz | -113 | -102.7 |
| XII | dBm/3.84 MHz | -110 | -99.7 |
| XIII | dBm/3.84 MHz | -110 | -99.7 |
| XIV | dBm/3.84 MHz | -110 | -99.7 |
| XIX | dBm/3.84 MHz | -113 | -102.7 |
| XX | dBm/3.84 MHz | -110 | -99.7 |
| XXI | dBm/3.84 MHz | -113 | -102.7 |
| XXII | dBm/3.84 MHz | -110 | -99.7 |
| XXV | dBm/3.84 MHz | -109.5 | -99.2 |
| XXVI | dBm/3.84 MHz | -109.5 | -99.2 |

NOTE 1: For Power class 3 and 3bis this shall be at the maximum output power
NOTE 2: For Power class 4 this shall be at the maximum output power
NOTE 3: For the UE which supports both Band III and Band IX operating frequencies, the reference sensitivity level of -110.5 dBm HS-PDSCH_Ec <REFSENS> shall apply for Band IX. The corresponding <REF_{or}> is -100.2 dBm
NOTE 4: For the UE which supports both Band XI and Band XXI operating frequencies, the reference sensitivity level is FFS.

The normative reference for this requirement is TS 25.101 [1] clause 7.3.2.

6.2A.3 Test purpose

To verify that the UE BLER of HS-PDSCH on each individual cell shall not exceed 0,1 for the parameters specified in table 6.2A.3 for the DL reference channel H-Set 12 specified in Annex C.8.1.12.

The lack of the reception sensitivity decreases the HSDPA coverage area at the far side from Node B.

6.2A.4 Method of test

6.2A.4.1 Initial conditions

Test environment: normal, TL/VL, TL/VH, TH/VL, TH/VH; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.30.

- 2) Channel conditions are initially set up with received CPICH_RSCP >-85 dBm. The relative power level of primary downlink physical channels to Ior are set up according to clause E.5.0.
- 3) Switch on the phone.
- 4) A call is set up according to the Generic DC-HSDPA setup procedure in TS34.108 [3] sub clause 7.3.13 with exceptions for information elements listed in table 6.2A.2.
- 5) The RF parameters are set up according to table 6.2A.3 for both primary and secondary serving cells.

Contents of RADIO BEARER SETUP message: AM or UM (DC-HSDPA)

Table 6.2A.2: Specific Message Contents for reference sensitivity, additional requirement for DC-HSDPA

| Information Element | Value/remark | Version |
|----------------------------------|------------------------------|---------|
| Downlink HS-PDSCH Information | | |
| - CHOICE mode | FDD | |
| - Downlink 64QAM configured | Not Present | Rel-7 |
| - HS-DSCH TB size table | octet aligned (for H-Set 12) | Rel-7 |
| Downlink secondary cell info FDD | | Rel-8 |
| - CHOICE Configuration info | New configuration | |
| - Downlink 64QAM configured | Not Present | |
| - HS-DSCH TB size table | octet aligned (for H-Set 12) | |

See TS 34.109 [4] for details regarding loopback test.

6.2A.4.2 Procedure

- 1) Set and send continuously Up power control commands to the UE until the UE output power shall be maximum level.
- 2) Measure the BLER of HS-PDSCH on each individual cell received from the UE at the SS by counting the number of NACK, ACK and statDTX on the UL HS-DPCCH ($BLER = (NACK + statDTX)/(NACK + statDTX + ACK)$).

6.2A.5 Test requirements

The measured BLER, derived in step 2), shall not exceed 0,1 on each individual cell. The minimum number of measurements required for a statistically significant result to this test is clarified in annex F.6.3, Table F.6.3.5.0.

Table 6.2A.3: Test parameters for reference sensitivity, additional requirement for DC-HSDPA

| Operating Band | Unit | HS-PDSCH_Ec <REFSENS> | <REF _{or} > |
|----------------|--------------|--------------------------|----------------------|
| I | dBm/3.84 MHz | -112.3 | -102 |
| II | dBm/3.84 MHz | -110.3 | -100 |
| III | dBm/3.84 MHz | -109.3 | -99 |
| IV | dBm/3.84 MHz | -112.3 | -102 |
| V | dBm/3.84 MHz | -110.3 | -100 |
| VI | dBm/3.84 MHz | -112.3 | -102 |
| VII | dBm/3.84 MHz | -110.3 | -100 |
| VIII | dBm/3.84 MHz | -109.3 | -99 |
| IX | dBm/3.84 MHz | -111.3 | -101 |
| X | dBm/3.84 MHz | -112.3 | -102 |
| XI | dBm/3.84 MHz | -112.3 | -102 |
| XII | dBm/3.84 MHz | -109.3 | -99 |
| XIII | dBm/3.84 MHz | -109.3 | -99 |
| XIV | dBm/3.84 MHz | -109.3 | -99 |
| XIX | dBm/3.84 MHz | -112.3 | -102 |
| XX | dBm/3.84 MHz | -109.3 | -99 |
| XXI | dBm/3.84 MHz | -112.3 | -102 |
| XXII | dBm/3.84 MHz | -119.3 | -99 |
| XXV | dBm/3.84 MHz | -108.8 | -98.5 |
| XXVI | dBm/3.84 MHz | -108.8 | -98.5 |

NOTE 1 For Power class 3 and 3bis this shall be at the maximum output power.
NOTE 2 For Power class 4 this shall be at the maximum output power.
NOTE 3 For the UE which supports both Band III and Band IX operating frequencies, the reference sensitivity level of -109.8 dBm HS-PDSCH_Ec <REFSENS> shall apply for Band IX. The corresponding <REF_{or}> is -99.5 dBm.
NOTE 4: For the UE which supports both Band XI and Band XXI operating frequencies, the reference sensitivity level is FFS.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

6.2B Reference Sensitivity Level for DB-DC-HSDPA

6.2B.1 Definition and applicability

The reference sensitivity level <REFSENS> is the minimum mean power received at the UE antenna port at which the Block Error Ratio (BLER) on each individual cell shall not exceed a specific value.

The requirements and this test apply for Release 9 and later releases to all types of UTRA for the FDD UE that support DB-DC-HSDPA.

DB-DC-HSDPA is designed to operate in configurations specified in clause 4.2.

6.2B.2 Minimum Requirements

For all requirements listed in Table 6.2B.1, corresponding to the specific DB-DC-HSDPA configuration(s) supported by the UE, (see clause 4.2), the BLER measured on each individual cell shall not exceed 0.1.

Table 6.2B.1: Test parameters for reference sensitivity, additional requirement for DB-DC-HSDPA.

| DB-DC-HSDPA configuration | DL Band | UL Band | Unit | HS-PDSCH_Ec <REFSENS> | <REF _{Ior} > |
|---------------------------|---------|---------|--------------|-----------------------|-----------------------|
| 1 | I | I | dBm/3.84 MHz | -113 | -102.7 |
| | VIII | | dBm/3.84 MHz | -110 | -99.7 |
| | I | VIII | dBm/3.84 MHz | -113 | -102.7 |
| | VIII | | dBm/3.84 MHz | -110 | -99.7 |
| 2 | II | II | dBm/3.84 MHz | -110 | -99.7 |
| | IV | | dBm/3.84 MHz | -112 | -101.7 |
| | II | IV | dBm/3.84 MHz | -110 | -99.7 |
| | IV | | dBm/3.84 MHz | -112 | -101.7 |
| 3 | I | I | dBm/3.84 MHz | -113 | -102.7 |
| | V | | dBm/3.84 MHz | -111 | -100.7 |
| | I | V | dBm/3.84 MHz | -113 | -102.7 |
| | V | | dBm/3.84 MHz | -111 | -100.7 |

NOTE 1: For Power class 3 and 3bis this shall be at the maximum output power.
NOTE 2: For Power class 4 this shall be at the maximum output power.

The normative reference for this requirement is TS 25.101 [1] clause 7.3.3.

6.2B.3 Test purpose

To verify that the UE BLER of HS-PDSCH on each individual cell shall not exceed 0,1 for the parameters specified in table 6.2B.2 for the DL reference channel H-Set 12 specified in Annex C.8.1.12.

The lack of the reception sensitivity decreases the HSDPA coverage area at the far side from Node B.

6.2B.4 Method of test

6.2B.4.1 Initial conditions

Test environment: normal, TL/VL, TL/VH, TH/VL, TH/VH; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.30.
- 2) Channel conditions are initially set up with received CPICH_RSCP >-85 dBm. The relative power level of primary downlink physical channels to Ior are set up according to clause E.5.0.
- 3) Switch on the phone.
- 4) A call is set up according to the Generic call setup procedure in TS34.108 [3] sub clause 7.3.13 with exceptions for information elements listed in table 6.2B.2.
- 5) The RF parameters are set up according to table 6.2B.3 for both primary and secondary serving cells.

Contents of RADIO BEARER SETUP message: AM or UM (DC-HSDPA)

Table 6.2B.2: Specific Message Contents for reference sensitivity, additional requirement for DB-DC-HSDPA

| Information Element | Value/remark | Version |
|----------------------------------|------------------------------|---------|

| - Downlink 64QAM configured | Not Present | |
| - HS-DSCH TB size table | octet aligned (for H-Set 12) | |

See TS 34.109 [4] for details regarding loopback test.

6.2B.4.2 Procedure

- 1) Set and send continuously Up power control commands to the UE until the UE output power shall be maximum level.
- 2) Measure the BLER of HS-PDSCH on each individual cell received from the UE at the SS.

6.2B.5 Test requirements

The measured BLER, derived in step 2), shall not exceed 0,1 on each individual cell. The minimum number of measurements required for a statistically significant result to this test is clarified in annex F.6.3, Table F.6.3.5.0.

Table 6.2B.3: Test parameters for reference sensitivity, additional requirement for DB-DC-HSDPA

| DB-DC-HSDPA configuration | DL Band | UL Band | Unit | HS-PDSCH_Ec <REFSENS> | <REF \hat{I}_{or} > |
|---------------------------|---------|---------|--------------|-----------------------|-----------------------|
| 1 | I | I | dBm/3.84 MHz | -112.3 | -102 |
| | VIII | | dBm/3.84 MHz | -109.3 | -99 |
| | I | VIII | dBm/3.84 MHz | -112.3 | -102 |
| | VIII | | dBm/3.84 MHz | -109.3 | -99 |
| 2 | II | II | dBm/3.84 MHz | -109.3 | -99 |

| | IV | | dBm/3.84 MHz | -111.3 | -101 |
| 3 | I | I | dBm/3.84 MHz | -112.3 | -102 |
| | V | | dBm/3.84 MHz | -110.3 | -100 |
| | I | V | dBm/3.84 MHz | -112.3 | -102 |
| | V | | dBm/3.84 MHz | -110.3 | -100 |

NOTE 1: For Power class 3 and 3bis this shall be at the maximum output power.
NOTE 2: For Power class 4 this shall be at the maximum output power.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

6.2C Reference Sensitivity Level for Single band 4C-HSDPA

6.2C.1 Definition and applicability

The reference sensitivity level <REFSENS> is the minimum mean power received at the UE antenna port at which the Block Error Ratio (BLER) on each individual cell shall not exceed a specific value.

The requirements and this test apply for Release 10 and later releases to all types of UTRA for the FDD UE that support Single band 4C-HSDPA and HS-DSCH categories 29 to 32.

Single band 4C-HSDPA is designed to operate in configurations specified in clause 4.2.

6.2C.2 Minimum Requirements

For all requirements listed in Table 6.2C.1, corresponding to the specific single band 4C-HSDPA configuration(s) supported by the UE, (see Table 4.0A), the BLER measured on each individual cell shall not exceed 0.1.

NOTE: The reference sensitivity level <REFSENS> requirement for single band 4C-HSDPA is not applicable for dual uplink operation. However, there might be a substantial Rx de-sensitization for the UE operating in bands which have less than 80 MHz Tx-Rx frequency separation, transmitting on more than one uplink frequency, at maximum power.

Table 6.2C.1: Test parameters for reference sensitivity, additional requirement for single band 4C-HSDPA

| Single band 4C-HSDPA configuration | DL Band | Unit | HS-PDSCH_Ec <REFSENS> | <REFI _{or} > | UL-DL carrier separation |
|---|---------|--------------|-----------------------|-----------------------|--------------------------|
| I-3 | I | dBm/3.84 MHz | -113 | -102.7 | Minimum |
| NOTE 1 For Power class 3, 3bis and 4, this shall be at the maximum output power | | | | | |

For the UE which supports DB-DC-HSDPA configuration in Table 6.2C.2, the reference sensitivity level HS-PDSCH_Ec <REFSENS> and corresponding <REFI_{or}> in Table 6.2C.1 are allowed to be increased by the amount given in Table 6.2C.2 for the applicable bands.

Table 6.2C.2: Allowed de-sensitization relative to reference sensitivity for UE which supports DB-DC-HSDPA

| DB-DC-HSDPA Configuration | Allowed de-sensitization (dB) | Applicable bands |
|---------------------------|-------------------------------|------------------|
| 4 | 1 | I |

The normative reference for this requirement is TS 25.101 [1] clause 7.3.4.

6.2C.3 Test purpose

To verify that the UE BLER of HS-PDSCH on each individual cell shall not exceed 0,1 for the parameters specified in table 6.2C.4 for the DL reference channel H-Set 1B specified in Annex C.8.1.1.

The lack of the reception sensitivity decreases the HSDPA coverage area at the far side from Node B.

This test case tests only 3 carrier configurations.

6.2C.4 Method of test

6.2C.4.1 Initial conditions

Test environment: normal, TL/VL, TL/VH, TH/VL, TH/VH; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.48.
- 2) Channel conditions are initially set up with received CPICH_RSCP >-85 dBm. The relative power level of primary downlink physical channels to I_{or} are set up according to clause E.5.0.
- 3) Switch on the phone.
- 4) A call is set up according to the Generic call setup procedure in TS34.108 [3] sub clause 7.3.16.
- 5) The RF parameters are set up according to table 6.2C.3 for each individual cells.

See TS 34.109 [4] for details regarding loopback test.

6.2C.4.2 Procedure

- 1) Set and send continuously Up power control commands to the UE until the UE output power shall be maximum level.
- 2) Measure the BLER of HS-PDSCH on each individual cell received from the UE at the SS.

6.2C.5 Test requirements

The measured BLER, derived in step 2), shall not exceed 0,1 on each individual cell. The minimum number of measurements required for a statistically significant result to this test is clarified in annex F.6.3, Table F.6.3.5.0.

Table 6.2C.3: Test parameters for reference sensitivity, additional requirement for single band 4C-HSDPA.

| Single band 4C-HSDPA configuration | DL Band | Unit | HS-PDSCH_Ec <REFSENS> | <REF \hat{I}_{or} > | UL-DL carrier separation |
|---|---------|--------------|-----------------------|-----------------------|--------------------------|
| I-3 | I | dBm/3.84 MHz | -112.3 | -102 | Minimum |
| NOTE 1 For Power class 3, 3bis and 4, this shall be at the maximum output power | | | | | |

For the UE which supports DB-DC-HSDPA configuration in Table 6.2C.3, the reference sensitivity level HS-PDSCH_Ec <REFSENS> and corresponding <REF \hat{I}_{or} > in Table 6.2C.3 are allowed to be increased by the amount given in Table 6.2C.4 for the applicable bands.

Table 6.2C.4: Allowed de-sensitization relative to reference sensitivity for UE which supports DB-DC-HSDPA

| DB-DC-HSDPA Configuration | Allowed de-sensitization (dB) | Applicable bands |
|---------------------------|-------------------------------|------------------|
| 4 | 1 | I |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

6.2D Reference Sensitivity Level for Dual band 4C-HSDPA

6.2D.1 Definition and applicability

The reference sensitivity level <REFSENS> is the minimum mean power received at the UE antenna port at which the Block Error Ratio (BLER) on each individual cell shall not exceed a specific value.

The requirements and this test apply for Release 10 and later releases to all types of UTRA for the FDD UE that support dual band 4C-HSDPA and HS-DSCH categories 31 or 32.

Dual band 4C-HSDPA is designed to operate in configurations specified in clause 4.2.

6.2D.2 Minimum Requirements

For all requirements listed in Table 6.2D.1, corresponding to the specific dual band 4C-HSDPA configuration(s) supported by the UE, (see Table 4.0B), the BLER measured on each individual cell shall not exceed 0.1.

Note: The reference sensitivity level <REFSENS> requirement for dual band 4C-HSDPA is not applicable for dual uplink operation. However, there might be a substantial Rx de-sensitization for the UE operating in bands which have less than 80 MHz Tx-Rx frequency separation, transmitting on more than one uplink frequency, at maximum power.

Table 6.2D.1: Test parameters for reference sensitivity, additional requirement for dual band 4C-HSDPA

| Dual band 4C-HSDPA configuration | DL Band | UL Band | Unit | HS-PDSCH_Ec <REFSENS> | <REF _{Ior} > | UL-DL carrier separation |
|---|---------|---------|--------------|-----------------------|-----------------------|--------------------------|
| I-2-VIII-1 I-3-VIII-1 | I | I | dBm/3.84 MHz | -113 | -102.7 | Minimum |
| | VIII | | dBm/3.84 MHz | -110 | -99.7 | Minimum |
| | I | VIII | dBm/3.84 MHz | -113 | -102.7 | Minimum |
| | VIII | | dBm/3.84 MHz | -110 | -99.7 | Minimum |
| II-1-IV-2 II-2-IV-1 II-2-IV-2 | II | II | dBm/3.84 MHz | -110 | -99.7 | Minimum |
| | IV | | dBm/3.84 MHz | -112 | -101.7 | Minimum |
| | II | IV | dBm/3.84 MHz | -110 | -99.7 | Minimum |
| | IV | | dBm/3.84 MHz | -112 | -101.7 | Minimum |
| I-1-V-2 I-2-V-1 I-2-V-2 | I | I | dBm/3.84 MHz | -113 | -102.7 | Minimum |
| | V | | dBm/3.84 MHz | -111 | -100.7 | Minimum |
| | I | V | dBm/3.84 MHz | -113 | -102.7 | Minimum |
| | V | | dBm/3.84 MHz | -111 | -100.7 | Minimum |
| NOTE 1 For Power class 3, 3bis and 4, this shall be at the maximum output power | | | | | | |

The normative reference for this requirement is TS 25.101 [1] clause 7.3.5.

6.2D.3 Test purpose

To verify that the UE BLER of HS-PDSCH on each individual cell shall not exceed 0,1 for the parameters specified in table 6.2D.3 for the DL reference channel H-Set 1C specified in Annex C.8.1.1.

The lack of the reception sensitivity decreases the HSDPA coverage area at the far side from Node B.

This test case tests only 4 carrier configurations.

6.2D.4 Method of test

6.2D.4.1 Initial conditions

Test environment: normal, TL/VL, TL/VH, TH/VL, TH/VH; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.48.
- 2) Channel conditions are initially set up with received CPICH_RSCP >-85 dBm. The relative power level of primary downlink physical channels to Ior are set up according to clause E.5.0.
- 3) Switch on the phone.
- 4) A call is set up according to the Generic call setup procedure in TS34.108 [3] sub clause 7.3.16.
- 5) The RF parameters are set up according to table 6.2D.2 for each individual cells.

See TS 34.109 [4] for details regarding loopback test.

6.2D.4.2 Procedure

- 1) Set and send continuously Up power control commands to the UE until the UE output power shall be maximum level.
- 2) Measure the BLER of HS-PDSCH on each individual cell received from the UE at the SS.

6.2D.5 Test requirements

The measured BLER, derived in step 2), shall not exceed 0,1 on each individual cell. The minimum number of measurements required for a statistically significant result to this test is clarified in annex F.6.3, Table F.6.3.5.0.

Table 6.2D.2: Test parameters for reference sensitivity, additional requirement for dual band 4C-HSDPA

| Dual band 4C-HSDPA configuration | DL Band | UL Band | Unit | HS-PDSCH_Ec <REFSENS> | <REFI _{or} > | UL-DL carrier separation |
|----------------------------------|---------|---------|--------------|-----------------------|-----------------------|--------------------------|
| I-2-VIII-1 | I | I | dBm/3.84 MHz | -112.3 | -102 | Minimum |
| | VIII | | dBm/3.84 MHz | -109.3 | -99 | Minimum |
| I-3-VIII-1 | I | VIII | dBm/3.84 MHz | -112.3 | -102 | Minimum |
| | VIII | | dBm/3.84 MHz | -109.3 | -99 | Minimum |
| II-1-IV-2 | II | II | dBm/3.84 MHz | -109.3 | -99 | Minimum |
| | IV | | dBm/3.84 MHz | -111.3 | -101 | Minimum |
| II-2-IV-1 | II | IV | dBm/3.84 MHz | -109.3 | -99 | Minimum |
| | IV | | dBm/3.84 MHz | -111.3 | -101 | Minimum |
| I-1-V-2 | I | I | dBm/3.84 MHz | -112.3 | -102 | Minimum |
| | V | | dBm/3.84 MHz | -110.3 | -100 | Minimum |
| I-2-V-1 | I | V | dBm/3.84 MHz | -112.3 | -102 | Minimum |
| | V | | dBm/3.84 MHz | -110.3 | -100 | Minimum |

NOTE 1 For Power class 3, 3bis and 4, this shall be at the maximum output power

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

6.2DA Reference Sensitivity Level for Dual band 4C-HSDPA (3 carrier)

6.2DA.1 Definition and applicability

The reference sensitivity level <REFSENS> is the minimum mean power received at the UE antenna port at which the Block Error Ratio (BLER) on each individual cell shall not exceed a specific value.

The requirements and this test apply for Release 10 and later releases to all types of UTRA for the FDD UE that support dual band 4C-HSDPA and HS-DSCH categories 29 to 32.

Dual band 4C-HSDPA is designed to operate in configurations specified in clause 4.2.

6.2DA.2 Minimum Requirements

For all requirements listed in Table 6.2DA.1, corresponding to the specific dual band 4C-HSDPA configuration(s) supported by the UE, (see Table 4.0B), the BLER measured on each individual cell shall not exceed 0.1.

Note: The reference sensitivity level <REFSENS> requirement for dual band 4C-HSDPA is not applicable for dual uplink operation. However, there might be a substantial Rx de-sensitization for the UE operating in bands which have less than 80 MHz Tx-Rx frequency separation, transmitting on more than one uplink frequency, at maximum power.

Table 6.2DA.1: Test parameters for reference sensitivity, additional requirement for dual band 4C-HSDPA

| Dual band 4C-HSDPA configuration | DL Band | UL Band | Unit | HS-PDSCH_Ec <REFSENS> | <REF _{Ior} > | UL-DL carrier separation |
|-------------------------------------|---------|---------|--------------|-----------------------|-----------------------|--------------------------|
| I-2-VIII-1 I-3-VIII-1 | I | I | dBm/3.84 MHz | -113 | -102.7 | Minimum |
| | VIII | | dBm/3.84 MHz | -110 | -99.7 | Minimum |
| | I | VIII | dBm/3.84 MHz | -113 | -102.7 | Minimum |
| | VIII | | dBm/3.84 MHz | -110 | -99.7 | Minimum |
| II-1-IV-2 II-2-IV-1 II-2-IV-2 | II | II | dBm/3.84 MHz | -110 | -99.7 | Minimum |
| | IV | | dBm/3.84 MHz | -112 | -101.7 | Minimum |
| | II | IV | dBm/3.84 MHz | -110 | -99.7 | Minimum |
| | IV | | dBm/3.84 MHz | -112 | -101.7 | Minimum |
| I-1-V-2 I-2-V-1 I-2-V-2 | I | I | dBm/3.84 MHz | -113 | -102.7 | Minimum |
| | V | | dBm/3.84 MHz | -111 | -100.7 | Minimum |
| | I | V | dBm/3.84 MHz | -113 | -102.7 | Minimum |
| | V | | dBm/3.84 MHz | -111 | -100.7 | Minimum |

NOTE 1: For Power class 3, 3bis and 4, this shall be at the maximum output power

The normative reference for this requirement is TS 25.101 [1] clause 7.3.5.

6.2DA.3 Test purpose

To verify that the UE BLER of HS-PDSCH on each individual cell shall not exceed 0,1 for the parameters specified in table 6.2DA.3 for the DL reference channel H-Set 1C specified in Annex C.8.1.1.

The lack of the reception sensitivity decreases the HSDPA coverage area at the far side from Node B.

This test case tests only 3 carrier configurations.

6.2DA.4 Method of test

6.2DA.4.1 Initial conditions

Test environment: normal, TL/VL, TL/VH, TH/VL, TH/VH; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.48.
- 2) Channel conditions are initially set up with received CPICH_RSCP >-85 dBm. The relative power level of primary downlink physical channels to I_{or} are set up according to clause E.5.0.
- 3) Switch on the phone.
- 4) A call is set up according to the Generic call setup procedure in TS34.108 [3] sub clause 7.3.16.
- 5) The RF parameters are set up according to table 6.2DA.2 for each individual cells.

See TS 34.109 [4] for details regarding loopback test.

6.2DA.4.2 Procedure

- 1) Set and send continuously Up power control commands to the UE until the UE output power shall be maximum level.
- 2) Measure the BLER of HS-PDSCH on each individual cell received from the UE at the SS.

6.2DA.5 Test requirements

The measured BLER, derived in step 2), shall not exceed 0,1 on each individual cell. The minimum number of measurements required for a statistically significant result to this test is clarified in annex F.6.3, Table F.6.3.5.0.

Table 6.2DA.2: Test parameters for reference sensitivity, additional requirement for dual band 4C-HSDPA

| Dual band 4C-HSDPA configuration | DL Band | UL Band | Unit | HS-PDSCH_Ec <REFSENS> | <REF _{or} > | UL-DL carrier separation |
|-------------------------------------|---------|---------|--------------|-----------------------|----------------------|--------------------------|
| I-2-VIII-1 I-3-VIII-1 | I | I | dBm/3.84 MHz | -112.3 | -102 | Minimum |
| | VIII | | | | | |
| | I | VIII | dBm/3.84 MHz | -112.3 | -102 | Minimum |
| | VIII | | | | | |
| II-1-IV-2 II-2-IV-1 II-2-IV-2 | II | II | dBm/3.84 MHz | -109.3 | -99 | Minimum |
| | IV | | | | | |
| | II | IV | dBm/3.84 MHz | -109.3 | -99 | Minimum |
| | IV | | | | | |
| I-1-V-2 I-2-V-1 I-2-V-2 | I | I | dBm/3.84 MHz | -112.3 | -102 | Minimum |
| | V | | | | | |
| | I | V | dBm/3.84 MHz | -112.3 | -102 | Minimum |
| | V | | | | | |

NOTE 1 For Power class 3, 3bis and 4, this shall be at the maximum output power

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

6.3 Maximum Input Level

6.3.1 Definition and applicability

This is defined as the maximum mean power received at the UE antenna port, which shall not degrade the specified BER performance.

The requirements and this test apply to all types of UTRA for the FDD UE.

6.3.2 Minimum requirements

The BER shall not exceed 0.001 for the parameters specified in table 6.3.2.

The reference for this requirement is TS 25.101 [1] clause 7.4.1.

NOTE: Since the spreading factor is large ($10\log(SF)=21\text{dB}$), the majority of the total input signal consists of the OCNS interference. The structure of OCNS signal is defined in clause E.3.3.

6.3.3 Test purpose

To verify that the UE BER shall not exceed 0,001 for the parameters specified in table 6.3.3.

An inadequate maximum input level causes loss of coverage near the Node B

6.3.4 Method of test

6.3.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.1.
- 2) RF parameters are set up according to table 6.3.3 and table E.3.3.
- 3) A call is set up according to the Generic call setup procedure specified in TS34.108[3] sub clause 7.3.2, with the following exception for information elements in RADIO BEARER SETUP message. With this exception, the Power Control Algorithm for the Uplink is set to algorithm 2.

- 4) Enter the UE into loopback test mode and start the loopback test.

Table 6.3.1 Contents of RADIO BEARER SETUP message: AM or UM

| Information Element | Value/Remark |
|---|--------------------------------|
| CHOICE channel requirement - Power Control Algorithm | Uplink DPCH info Algorithm2 |

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

Table 6.3.2: Test parameters for Maximum Input Level

| Parameter | Level / Status | Unit |
|----------------------------|--|---------------|
| I_{or} | -25 | dBm / 3,84MHz |
| $\frac{DPCH_E_c}{I_{or}}$ | -19 | dB |
| UE transmitted mean power | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | dBm |

6.3.4.2 Procedure

- 1) Set the power level of UE according to the table 6.3.3 or send the power control commands (1dB step size should be used.) to the UE until UE output power measured by Test System shall be kept at the specified power level with ± 1 dB tolerance.
- 2) Measure the BER of DCH received from the UE at the SS.

6.3.5 Test requirements

The measured BER, derived in step 1), shall not exceed 0,001.

Table 6.3.3: Test requirements for Maximum Input Level

| Parameter | Level / Status | Unit |
|----------------------------|--|---------------|
| I_{or} | -25.7 | dBm / 3,84MHz |
| $\frac{DPCH_E_c}{I_{or}}$ | -19 | dB |
| UE transmitted mean power | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | dBm |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

6.3A Maximum Input Level for HS-PDSCH Reception (16QAM)

6.3A.1 Definition and applicability

Maximum input level for HS-PDSCH reception is defined as the maximum power received at the UE antenna port, which shall not degrade the specified HSDPA throughput performance. The requirements and this test apply to all types of UTRA FDD UE that support HSDPA (16QAM).

6.3A.2 Minimum requirements

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channel H-Set 1 (16QAM version) specified in Annex C.8.1.1 with the addition of the parameters in Table 6.3A.1 and the downlink physical channel setup according to table E.5.1.

Using this configuration the throughput shall meet or exceed the minimum requirements specified in table 6.3A.2.

The reference for this requirement is TS 25.101 [1] clause 7.4.2.

Table 6.3A.1 Minimum requirement parameters for 16QAM Maximum Input Level

| Parameter | Unit | Value |
|--------------------------------------|--------------|---|
| Phase reference | | P-CPICH |
| I_{or} | dBm/3.84 MHz | -25 * |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) |
| DPCH_Ec/I _{or} | dB | -13 |
| HS-SCCH_1_Ec/I _{or} | dB | -13 |
| Redundancy and constellation version | | 6 |
| Maximum number of HARQ transmissions | | 1 |

NOTE: The HS-SCCH and corresponding HS-PDSCH shall be transmitted continuously with constant power but the HS-SCCH shall only use the identity of the UE under test every third TTI.

Table 6.3A.2 Minimum throughput requirement

| HS-PDSCH E_c / I_{or} (dB) | T-put R (kbps) |
|------------------------------|------------------|
| -3 | 700 |

6.3A.3 Test purpose

To verify that the UE HSDPA throughput meets the minimum requirements specified in table 6.3A.2 for the DL reference channel H-Set 1 specified in Annex C.8.1.1 with the addition of the parameters specified in table 6.3A.4.

An inadequate maximum input level causes loss of coverage near the Node B.

6.3A.4 Method of test

6.3A.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

RF parameters are given in tables 6.3A.4 and table E.5.1.

Table 6.3A.3 Contents of RADIO BEARER SETUP message: AM or UM

| Information Element | Value/Remark |
|---|--------------------------------|
| CHOICE channel requirement - Power Control Algorithm | Uplink DPCH info Algorithm2 |

6.3A.4.2 Procedure

Connect the SS to the UE antenna connector as shown in figure A.1.

- 1) The UE is switched on.
- 2) An RRC connection is set-up according to the generic HSDPA set-up procedure with looping back 12.2kbps RMC specified in TS 34.108 [3] clause 7.3.6. Additional radio bearer message definition is in table 6.3A.3
- 3) Set the power level of UE according to the table 6.3A.4 and send power control commands to the UE .The UE output power measured by Test System shall be kept at the specified power level with ± 1 dB tolerance.
- 4) Measure the HS-PDSCH throughput R received by the UE by counting the number of NACK, ACK and statDTX on the UL HS-DPCCH (Throughput = blocksize*number of blocks acknowledged/time).
- 5) The UE is switched off.

6.3A.5 Test requirements

The measured throughput, as derived in step 4), shall meet or exceed 700Kbit/second. The minimum number of measurements required for a statistically significant result to this test is clarified in annex F.6.3, Table F.6.3.5.1.

Table 6.3A.4: Test requirement parameters for 16QAM Maximum Input Level

| Parameter | Unit | Value |
|---|--------------|---|
| Phase reference | | P-CPICH |
| \hat{I}_{or} | dBm/3.84 MHz | -25.7 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) |
| DPCH_Ec/Ior | dB | -13 |
| HS-SCCH_1_Ec/Ior | dB | -13 |
| Redundancy and constellation version | | 6 |
| Maximum number of HARQ transmissions | | 1 |
| NOTE: The HS-SCCH and corresponding HS-DSCH shall be transmitted continuously with constant power but the HS-SCCH shall only use the identity of the UE under test every third TTI. | | |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

6.3B Maximum Input Level for HS-PDSCH Reception (64QAM)

6.3B.1 Definition and applicability

Maximum input level for HS-PDSCH reception is defined as the maximum power received at the UE antenna port, which shall not degrade the specified HSDPA throughput performance. The requirements and this test apply for Release 7 and later releases to all types of UTRA FDD UE that support HSDPA (64QAM).

6.3B.2 Minimum requirements

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channel H-Set 8 (64QAM version) specified in Annex C.8.1.8 with the addition of the parameters in Table 6.3B.1 and the downlink physical channel setup according to table E.5.1A.

Using this configuration the throughput shall meet or exceed the minimum requirements specified in table 6.3B.2.

The reference for this requirement is TS 25.101 [1] clause 7.4.2.

Table 6.3B.1 Minimum requirement parameters for 64QAM Maximum Input Level

| Parameter | Unit | Value |
|--|--------------|---------|
| Phase reference | | P-CPICH |
| \hat{I}_{or} | dBm/3.84 MHz | -25 |
| UE transmitted mean power | dBm | 0 |
| DPCH_Ec/Ior | dB | -13 |
| HS-SCCH_1_Ec/Ior | dB | -13 |
| Redundancy and constellation version | | 6 |
| Maximum number of HARQ transmissions | | 1 |
| NOTE: The HS-SCCH and corresponding HS-PDSCH shall be transmitted continuously with constant power but the HS-SCCH shall only use the identity of the UE under test every third TTI. | | |

Table 6.3B.2 Minimum throughput requirement

| HS-PDSCH E_c / I_{or} (dB) | T-put R (kbps) |
|---------------------------------|------------------|
| -2 | 11800 |

6.3B.3 Test purpose

To verify that the UE HSDPA throughput meets the minimum requirements specified in table 6.3B.2 for the DL reference channel H-Set 8 specified in Annex C.8.1.8 with the addition of the parameters specified in table 6.3B.4.

An inadequate maximum input level causes loss of coverage near the Node B.

6.3B.4 Method of test

6.3B.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

RF parameters are given in tables 6.3B.4 and table E.5.1A.

6.3B.4.2 Procedure

Connect the SS to the UE antenna connector as shown in figure A.1.

- 1) The UE is switched on.
- 2) An RRC connection is set-up according to the generic HSDPA set-up procedure with looping back 12.2kbps RMC specified in TS 34.108 [3] clause 7.3.6, with the exceptions for information elements listed in table 6.3B.3
- 3) Set the power level of UE according to the table 6.3B.4 and send power control commands to the UE .The UE output power measured by Test System shall be kept at the specified power level with ± 1 dB tolerance.
- 4) Measure the HS-PDSCH throughput R received by the UE by counting the number of NACK, ACK and statDTX on the UL HS-DPCCH (Throughput = blocksize*number of blocks acknowledged/time).
- 5) The UE is switched off.

6.3B.5 Test requirements

The measured throughput, as derived in step 4), shall meet or exceed 11800Kbit/second. The minimum number of measurements required for a statistically significant result to this test is clarified in annex F.6.3, Table F.6.3.5.1A.

Table 6.3B.4: Test requirement parameters for 64QAM Maximum Input Level

| Parameter | Unit | Value |
|---|--------------|---------|
| Phase reference | | P-CPICH |
| \hat{I}_{or} | dBm/3.84 MHz | -25.7 |
| UE transmitted mean power | dBm | 0 |
| DPCH_Ec/lor | dB | -13 |
| HS-SCCH_1_Ec/lor | dB | -13 |
| Redundancy and constellation version | | 6 |
| Maximum number of HARQ transmissions | | 1 |
| NOTE: The HS-SCCH and corresponding HS-PDSCH shall be transmitted continuously with constant power but the HS-SCCH shall only use the identity of the UE under test every third TTI | | |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

6.3C Maximum Input Level for DC-HSDPA Reception (16QAM)

6.3C.1 Definition and applicability

Maximum input level for DC-HSDPA reception is defined as the maximum power received at the UE antenna port, which shall not degrade the specified DC-HSDPA throughput performance.

The requirements and this test apply for Release 8 and later releases to all types of UTRA for the FDD UE that support DC-HSDPA with 16QAM.

6.3C.2 Minimum requirements

The additional DC-HSDPA requirements are specified in terms of a minimum information throughput per cell R with the DL reference channel H-Set 1 (16QAM version) specified in Annex C.8.1.1, with the addition of the parameters in Table 6.3C.1, and the downlink physical channel setup according to table E.5.1, applied to both cells simultaneously. Using this configuration the throughput shall meet or exceed the minimum requirements specified in table 6.3C.2.

Table 6.3C.1 Minimum requirement parameters for 16QAM Maximum Input Level (DC-HSDPA)

| Parameter | Unit | Value |
|--|--------------|---|
| Phase reference | | P-CPICH |
| \hat{I}_{or} | dBm/3.84 MHz | -25 * |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) |
| DPCH_Ec/lor | dB | -13 |
| HS-SCCH_1_Ec/lor | dB | -13 |
| Redundancy and constellation version | | 6 |
| Maximum number of HARQ transmissions | | 1 |
| NOTE: The HS-SCCH and corresponding HS-PDSCH shall be transmitted continuously with constant power but the HS-SCCH shall only use the identity of the UE under test every third TTI. | | |

Table 6.3C.2 Minimum throughput requirement (DC-HSDPA)

| HS-PDSCH E_c/I_{or} (dB) | T-put R (kbps) |
|----------------------------|------------------|
| -3 | 700 |

The reference for this requirement is TS 25.101 [1] clause 7.4.3.1

6.3C.3 Test purpose

To verify that the UE DC-HSDPA throughput meets the minimum requirements specified in table 6.3C.2 for the DL reference channel H-Set 1 specified in Annex C.8.1.1 with the addition of the parameters specified in table 6.3C.4.

An inadequate maximum input level causes loss of DC-HSDPA coverage near the Node B.

6.3C.4 Method of test

6.3C.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

RF parameters are given in tables 6.3C.4 and table E.5.1.

6.3C.4.2 Procedure

Connect the SS to the UE antenna connector as shown in figure A.30.

- 1) The UE is switched on.
- 2) An RRC connection is set-up according to the generic HSDPA set-up procedure specified in TS 34.108 [3] clause 7.3.13 with exceptions for information elements listed in table 6.3C.3
- 3) Set the power level of UE according to the table 6.3C.4 and send power control commands to the UE .The UE output power measured by Test System shall be kept at the specified power level with ± 1 dB tolerance.
- 4) Measure the HS-PDSCH throughput R received by the UE on each individual cell by counting the number of NACK, ACK and statDTX on the UL HS-DPCCH (Throughput = blocksize*number of blocks acknowledged/time).
- 5) The UE is switched off.

6.3C.5 Test requirements

The measured throughput, as derived in step 4), shall meet or exceed 700Kbit/second on each individual cell. The minimum number of measurements required for a statistically significant result to this test is clarified in annex F.6.3, Table F.6.3.5.1.

Table 6.3C.4: Test requirement parameters for 16QAM Maximum Input Level (DC-HSDPA)

| Parameter | Unit | Value |
|---|--------------|---|
| Phase reference | | P-CPICH |
| I_{or} | dBm/3.84 MHz | -25.7 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) |

| HS-SCCH_1_Ec/I _{or} | dB | -13 |
| Redundancy and constellation version | | 6 |
| Maximum number of HARQ transmissions | | 1 |
| NOTE: The HS-SCCH and corresponding HS-DSCH shall be transmitted continuously with constant power but the HS-SCCH shall only use the identity of the UE under test every third TTI. | | |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

6.3D Maximum Input Level for DC-HSDPA Reception (64QAM)

6.3D.1 Definition and applicability

Maximum input level for DC-HSDPA reception is defined as the maximum power received at the UE antenna port, which shall not degrade the specified DC-HSDPA throughput performance.

The requirements and this test apply for Release 8 and later releases to all types of UTRA for the FDD UE that support DC-HSDPA with 64QAM.

6.3D.2 Minimum requirements

The additional DC-HSDPA requirements are specified in terms of a minimum information throughput per cell R with the DL reference channel H-Set 8A specified in Annex C.8.1.8, with the addition of the parameters in Table 6.3D.1, and the downlink physical channel setup according to table E.5.1, applied to both cells simultaneously. Using this configuration the throughput shall meet or exceed the minimum requirements specified in table 6.3D.2.

Table 6.3D.1: Minimum requirement parameters for 64QAM Maximum Input Level (DC-HSDPA)

| Parameter | Unit | Value |
|--|--------------|---------|
| Phase reference | | P-CPICH |
| I_{or} | dBm/3.84 MHz | -25 * |
| UE transmitted mean power | dBm | 0 |
| DPCH_Ec/I _{or} | dB | -13 |
| HS-SCCH_1_Ec/I _{or} | dB | -13 |
| Redundancy and constellation version | | 6 |
| Maximum number of HARQ transmissions | | 1 |
| NOTE: The HS-SCCH and corresponding HS-PDSCH shall be transmitted continuously with constant power but the HS-SCCH shall only use the identity of the UE under test every third TTI. | | |

Table 6.3D.2: Minimum throughput requirement (DC-HSDPA)

| HS-PDSCH E_c/I_{or} (dB) | T-put R (kbps) |
|----------------------------|------------------|
| -2 | 11800 |

The reference for this requirement is TS 25.101 [1] clause 7.4.3.2.

6.3D.3 Test purpose

To verify that the UE DC-HSDPA throughput meets the minimum requirements specified in table 6.3D.2 for the DL reference channel H-Set 8A specified in Annex C.8.1.8 with the addition of the parameters specified in table 6.3D.4.

An inadequate maximum input level causes loss of DC-HSDPA coverage near the Node B.

6.3D.4 Method of test

6.3D.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

RF parameters are given in tables 6.3D.4 and table E.5.1.

6.3D.4.2 Procedure

Connect the SS to the UE antenna connector as shown in figure A.30.

- 1) The UE is switched on.
- 2) An RRC connection is set-up according to the generic HSDPA set-up procedure specified in TS 34.108 [3] clause 7.3.13 with exceptions for information elements listed in table 6.3D.3
- 3) Set the power level of UE according to the table 6.3D.4 and send power control commands to the UE. The UE output power measured by Test System shall be kept at the specified power level with ± 1 dB tolerance.
- 4) Measure the HS-PDSCH throughput R received by the UE on each individual cell by counting the number of NACK, ACK and statDTX on the UL HS-DPCCH (Throughput = blocksize*number of blocks acknowledged/time).
- 5) The UE is switched off.

6.3D.5 Test requirements

The measured throughput, as derived in step 4), shall meet or exceed 11800 Kbit/second on each individual cell. The minimum number of measurements required for a statistically significant result to this test is clarified in annex F.6.3, Table F.6.3.5.1A.

Table 6.3D.4: Test requirement parameters for 64QAM Maximum Input Level (DC-HSDPA)

| Maximum number of HARQ transmissions | | 1 |
| NOTE: The HS-SCCH and corresponding HS-DSCH shall be transmitted continuously with constant power but the HS-SCCH shall only use the identity of the UE under test every third TTI. | | |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

6.3E Maximum Input Level for DB-DC-HSDPA Reception (16QAM)

6.3E.1 Definition and applicability

Maximum input level for DB-DC-HSDPA reception is defined as the maximum power received at the UE antenna port, which shall not degrade the specified DB-DC-HSDPA throughput performance.

The requirements and this test apply for Release 9 and later releases to all types of UTRA for the FDD UE that support DB-DC-HSDPA with 16QAM.

DB-DC-HSDPA is designed to operate in configurations specified in clause 4.2.

6.3E.2 Minimum requirements

The additional DB-DC-HSDPA requirements are specified in terms of a minimum information throughput per cell R with the DL reference channel H-Set 1 (16QAM version) specified in Annex C.8.1.1, with the addition of the parameters in Table 6.3E.1, and the downlink physical channel setup according to table E.5.1, applied to both cells simultaneously. Using this configuration the throughput shall meet or exceed the minimum requirements specified in table 6.3E.2.

Table 6.3E.1: Minimum requirement parameters for 16QAM Maximum Input Level (DB-DC-HSDPA)

| Parameter | Unit | Value |
|--------------------------------------|--------------|---|
| Phase reference | | P-CPICH |
| I_{or} | dBm/3.84 MHz | -25 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) |
| DPCH_Ec/I _{or} | dB | -13 |
| HS-SCCH_1_Ec/I _{or} | dB | -13 |
| Redundancy and constellation version | | 6 |
| Maximum number of HARQ transmissions | | 1 |

NOTE: The HS-SCCH and corresponding HS-PDSCH shall be transmitted continuously with constant power but the HS-SCCH shall only use the identity of the UE under test every third TTI.

Table 6.3E.2: Minimum throughput requirement (DB-DC-HSDPA)

| HS-PDSCH E_c / I_{or} (dB) | T-put R (kbps) |
|------------------------------|------------------|
| -3 | 700 |

The reference for this requirement is TS 25.101 [1] clause 7.4.3.1

6.3E.3 Test purpose

To verify that the UE DB-DC-HSDPA throughput meets the minimum requirements specified in table 6.3E.2 for the DL reference channel H-Set 1 specified in Annex C.8.1.1 with the addition of the parameters specified in table 6.3E.4.

An inadequate maximum input level causes loss of DB-DC-HSDPA coverage near the Node B.

6.3E.4 Method of test

6.3E.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

RF parameters are given in tables 6.3E.4 and table E.5.1.

Contents of RADIO BEARER SETUP message: AM or UM (Test Loop Mode1)

6.3E.4.2 Procedure

Connect the SS to the UE antenna connector as shown in figure A.30.

- 1) The UE is switched on.

- 2) An RRC connection is set-up according to the generic HSDPA set-up procedure specified in TS 34.108 [3] clause 7.3.13 with exceptions for information elements listed in table 6.3E.3
- 3) Set the power level of UE according to the table 6.3E.4 and send power control commands to the UE .The UE output power measured by Test System shall be kept at the specified power level with ± 1 dB tolerance.
- 4) Measure the HS-PDSCH throughput R received by the UE on each individual cell by counting the number of NACK, ACK and statDTX on the UL HS-DPCCH (Throughput = blocksize*number of blocks acknowledged/time).
- 5) The UE is switched off.

6.3E.5 Test requirements

The measured throughput, as derived in step 4), shall meet or exceed 700Kbit/second on each individual cell. The minimum number of measurements required for a statistically significant result to this test is clarified in annex F.6.3, Table F.6.3.5.1.

Table 6.3E.4: Test requirement parameters for 16QAM Maximum Input Level (DB-DC-HSDPA)

| Parameter | Unit | Value |
|---|--------------|---|
| Phase reference | | P-CPICH |
| I_{or} | dBm/3.84 MHz | -25.7 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) |
| DPCH E_c/I_{or} | dB | -13 |
| HS-SCCH 1 E_c/I_{or} | dB | -13 |
| Redundancy and constellation version | | 6 |
| Maximum number of HARQ transmissions | | 1 |
| NOTE: The HS-SCCH and corresponding HS-DSCH shall be transmitted continuously with constant power but the HS-SCCH shall only use the identity of the UE under test every third TTI. | | |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

6.3F Maximum Input Level for DB-DC-HSDPA Reception (64QAM)

6.3F.1 Definition and applicability

Maximum input level for DB-DC-HSDPA reception is defined as the maximum power received at the UE antenna port, which shall not degrade the specified DB-DC-HSDPA throughput performance.

The requirements and this test apply for Release 9 and later releases to all types of UTRA for the FDD UE that support DB-DC-HSDPA with 64QAM.

DB-DC-HSDPA is designed to operate in configurations, specified in clause 4.2

6.3F.2 Minimum requirements

The additional DB-DC-HSDPA requirements are specified in terms of a minimum information throughput per cell R with the DL reference channel H-Set 8A specified in Annex C.8.1.8, with the addition of the parameters in Table 6.3F.1, and the downlink physical channel setup according to table E.5.1, applied to both cells simultaneously. Using this configuration the throughput shall meet or exceed the minimum requirements specified in table 6.3F.2.

Table 6.3F.1: Minimum requirement parameters for 64QAM Maximum Input Level (DB-DC-HSDPA)

| Parameter | Unit | Value |
|--------------------------------------|--------------|---------|
| Phase reference | | P-CPICH |
| I_{or} | dBm/3.84 MHz | -25 |
| UE transmitted mean power | dBm | 0 |
| DPCH E_c/I_{or} | dB | -13 |
| HS-SCCH_1 E_c/I_{or} | dB | -13 |
| Redundancy and constellation version | | 6 |
| Maximum number of HARQ transmissions | | 1 |

NOTE: The HS-SCCH and corresponding HS-PDSCH shall be transmitted continuously with constant power but the HS-SCCH shall only use the identity of the UE under test every third TTI.

Table 6.3F.2: Minimum throughput requirement (DB-DC-HSDPA)

| HS-PDSCH E_c / I_{or} (dB) | T-put R (kbps) |
|------------------------------|------------------|
| -2 | 11800 |

The reference for this requirement is TS 25.101 [1] clause 7.4.3.2.

6.3F.3 Test purpose

To verify that the UE DB-DC-HSDPA throughput meets the minimum requirements specified in table 6.3F.2 for the DL reference channel H-Set 8A specified in Annex C.8.1.8 with the addition of the parameters specified in table 6.3F.4.

An inadequate maximum input level causes loss of DB-DC-HSDPA coverage near the Node B.

6.3F.4 Method of test

6.3F.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

RF parameters are given in tables 6.3F.4 and table E.5.1.

6.3F.4.2 Procedure

Connect the SS to the UE antenna connector as shown in figure A.30.

- 1) The UE is switched on.
- 2) An RRC connection is set-up according to the generic HSDPA set-up procedure specified in TS 34.108 [3] clause 7.3.13 with exceptions for information elements listed in table 6.3F.3
- 3) Set the power level of UE according to the table 6.3F.4 and send power control commands to the UE .The UE output power measured by Test System shall be kept at the specified power level with ± 1 dB tolerance.
- 4) Measure the HS-PDSCH throughput R received by the UE on each individual cell by counting the number of NACK, ACK and statDTX on the UL HS-DPCCH (Throughput = blocksize*number of blocks acknowledged/time).
- 5) The UE is switched off.

6.3F.5 Test requirements

The measured throughput, as derived in step 4), shall meet or exceed 11800 Kbit/second on each individual cell. The minimum number of measurements required for a statistically significant result to this test is clarified in annex F.6.3, Table F.6.3.5.1A.

Table 6.3F.4: Test requirement parameters for 64QAM Maximum Input Level (DB-DC-HSDPA)

| Parameter | Unit | Value |
|---|--------------|---------|
| Phase reference | | P-CPICH |
| I_{or} | dBm/3.84 MHz | -25.7 |
| UE transmitted mean power | dBm | 0 |
| DPCH_Ec/Ior | dB | -13 |
| HS-SCCH_1_Ec/Ior | dB | -13 |
| Redundancy and constellation version | | 6 |
| Maximum number of HARQ transmissions | | 1 |
| NOTE: The HS-SCCH and corresponding HS-DSCH shall be transmitted continuously with constant power but the HS-SCCH shall only use the identity of the UE under test every third TTI. | | |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

6.3G Maximum Input Level for 4C-HSDPA Reception (16QAM)

6.3G.1 Definition and applicability

Maximum input level for 4C-HSDPA reception is defined as the maximum power received at the UE antenna port, which shall not degrade the specified 4C-HSDPA throughput performance.

The requirements and this test apply for Release 10 and later releases to all types of UTRA for the FDD UE that support Single band/Dual band 4C-HSDPA with 16QAM and HS-DSCH categories 31 or 32.

Single band/Dual band 4C-HSDPA is designed to operate in configurations specified in clause 4.2.

6.3G.2 Minimum requirements

The additional 4C-HSDPA requirements are specified in terms of a minimum information throughput per cell R with the DL reference channel H-Set 1C (16QAM version) specified in Annex C.8.1.1, with the addition of the parameters in Table 6.3G.1, and the downlink physical channel setup according to table E.5.1, applied to all the cells simultaneously. Using this configuration the throughput shall meet or exceed the minimum requirements specified in table 6.3G.2.

Table 6.3G.1: Minimum requirement parameters for 16QAM Maximum Input Level (4C-HSDPA)

| Parameter | Unit | Value |
|---|---|---|
| Phase reference | | P-CPICH |
| Wanted signal mean power per band (dBm) | dBm/band | -22 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) |
| DPCH_Ec/Ior | dB | -13 |
| HS-SCCH_1_Ec/Ior | dB | -13 |
| Redundancy and constellation version | | 6 |
| Maximum number of HARQ transmissions | | 1 |
| Note 1: | The HS-SCCH and corresponding HS-PDSCH shall be transmitted continuously with constant power but the HS-SCCH shall only use the identity of the UE under test every third TTI | |
| Note 2: | Wanted signal mean power per band is the sum of measured mean power on each carrier in a band over 3.84 MHz. | |

Table 6.3G.2: Minimum throughput requirement (4C-HSDPA)

| HS-PDSCH E_c/I_{or} (dB) | T-put R (kbps) |
|----------------------------|------------------|
| -3 | 700 |

The reference for this requirement is TS 25.101 [1] clause 7.4.4.1

6.3G.3 Test purpose

To verify that the UE DC-HSDPA throughput meets the minimum requirements specified in table 6.3G.2 for the DL reference channel H-Set 1C specified in Annex C.8.1.1 with the addition of the parameters specified in table 6.3G.4.

An inadequate maximum input level causes loss of 4C-HSDPA coverage near the Node B.

This test case tests only 4 carrier configurations.

6.3G.4 Method of test

6.3G.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

RF parameters are given in tables 6.3G.4 and table E.5.1.

Contents of RADIO BEARER SETUP message: AM or UM (Test Loop Mode1)

Table 6.3G.3: Specific Message Contents for 16QAM Maximum Input Level (4C-HSDPA)

6.3G.4.2 Procedure

Connect the SS to the UE antenna connector as shown in figure A.48.

- 1) The UE is switched on.
- 2) An RRC connection is set-up according to the generic HSDPA set-up procedure specified in TS 34.108 [3] clause 7.3.16 with exceptions for information elements listed in table 6.3G.3
- 3) Set the power level of UE according to the table 6.3G.4 and send power control commands to the UE .The UE output power measured by Test System shall be kept at the specified power level with ± 1 dB tolerance.
- 4) Measure the HS-PDSCH throughput R received by the UE on each individual cell by counting the number of NACK, ACK and statDTX on the UL HS-DPCCH (Throughput = blocksize*number of blocks acknowledged/time).
- 5) The UE is switched off.

6.3G.5 Test requirements

The measured throughput, as derived in step 4), shall meet or exceed 700Kbit/second on each individual cell. The minimum number of measurements required for a statistically significant result to this test is clarified in annex F.6.3, Table F.6.3.5.1.

Table 6.3G.4: Test requirement parameters for 16QAM Maximum Input Level (4C-HSDPA)

| Parameter | Unit | Value |
|---|--|---|
| Phase reference | | P-CPICH |
| Wanted signal mean power per band (dBm) | dBm/band | -22.7 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) |
| DPCH_Ec/Ior | dB | -13 |
| HS-SCCH_1_Ec/Ior | dB | -13 |
| Redundancy and constellation version | | 6 |
| Maximum number of HARQ transmissions | | 1 |
| Note 1: | The HS-SCCH and corresponding HS-PDSCH shall be transmitted continuously with constant power but the HS-SCCH shall only use the identity of the UE under test every third TTI. | |
| Note 2: | Wanted signal mean power per band is the sum of measured mean power on each carrier in a band over 3.84 MHz. | |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

6.3GA Maximum Input Level for 4C-HSDPA Reception (16QAM) (3 carrier)

6.3GA.1 Definition and applicability

Maximum input level for 4C-HSDPA reception is defined as the maximum power received at the UE antenna port, which shall not degrade the specified 4C-HSDPA throughput performance.

The requirements and this test apply for Release 10 and later releases to all types of UTRA for the FDD UE that support Single band/Dual band 4C-HSDPA with 16QAM and HS-DSCH UE categories 29 to 32.

Single band/Dual band 4C-HSDPA is designed to operate in configurations specified in clause 4.2.

6.3GA.2 Minimum requirements

The additional 4C-HSDPA requirements are specified in terms of a minimum information throughput per cell R with the DL reference channel H-Set 1B (16QAM version) specified in Annex C.8.1.1, with the addition of the parameters in Table 6.3GA.1, and the downlink physical channel setup according to table E.5.1, applied to all the cells simultaneously. Using this configuration the throughput shall meet or exceed the minimum requirements specified in table 6.3GA.2.

Table 6.3GA.1 Minimum requirement parameters for 16QAM Maximum Input Level (4C-HSDPA)

| Parameter | Unit | Value |
|---|---|---|
| Phase reference | | P-CPICH |
| Wanted signal mean power per band (dBm) | dBm/band | -22 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) |
| DPCH_Ec/lor | dB | -13 |
| HS-SCCH_1_Ec/lor | dB | -13 |
| Redundancy and constellation version | | 6 |
| Maximum number of HARQ transmissions | | 1 |
| Note 1: | The HS-SCCH and corresponding HS-PDSCH shall be transmitted continuously with constant power but the HS-SCCH shall only use the identity of the UE under test every third TTI | |
| Note 2: | Wanted signal mean power per band is the sum of measured mean power on each carrier in a band over 3.84 MHz. | |

Table 6.3GA.2: Minimum throughput requirement (4C-HSDPA)

| HS-PDSCH E_c/I_{or} (dB) | T-put R (kbps) |
|----------------------------|----------------|
| -3 | 700 |

The reference for this requirement is TS 25.101 [1] clause 7.4.4.1

6.3GA.3 Test purpose

To verify that the UE 4C-HSDPA throughput meets the minimum requirements specified in table 6.3GA.2 for the DL reference channel H-Set 1B specified in Annex C.8.1.1 with the addition of the parameters specified in table 6.3GA.4.

An inadequate maximum input level causes loss of 4C-HSDPA coverage near the Node B.

This test case tests only 3 carrier configurations.

6.3GA.4 Method of test

6.3GA.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

RF parameters are given in tables 6.3GA.4 and table E.5.1.

Contents of RADIO BEARER SETUP message: AM or UM (Test Loop Mode1)

Table 6.3GA.3: Specific Message Contents for 16QAM Maximum Input Level (4C-HSDPA)

6.3GA.4.2 Procedure

Connect the SS to the UE antenna connector as shown in figure A.48.

- 1) The UE is switched on.
- 2) An RRC connection is set-up according to the generic HSDPA set-up procedure specified in TS 34.108 [3] clause 7.3.16 with exceptions for information elements listed in table 6.3GA.3
- 3) Set the power level of UE according to the table 6.3GA.4 and send power control commands to the UE .The UE output power measured by Test System shall be kept at the specified power level with ± 1 dB tolerance.
- 4) Measure the HS-PDSCH throughput R received by the UE on each individual cell by counting the number of NACK, ACK and statDTX on the UL HS-DPCCH (Throughput = blocksize*number of blocks acknowledged/time).
- 5) The UE is switched off.

6.3GA.5 Test requirements

The measured throughput, as derived in step 4), shall meet or exceed 700Kbit/second on each individual cell. The minimum number of measurements required for a statistically significant result to this test is clarified in annex F.6.3, Table F.6.3.5.1.

Table 6.3GA.4: Test requirement parameters for 16QAM Maximum Input Level (4C-HSDPA)

| Parameter | Unit | Value |
|---|--|---|
| Phase reference | | P-CPICH |
| Wanted signal mean power per band (dBm) | dBm/band | -22.7 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) |
| DPCH_Ec/lor | dB | -13 |
| HS-SCCH_1_Ec/lor | dB | -13 |
| Redundancy and constellation version | | 6 |
| Maximum number of HARQ transmissions | | 1 |
| Note 1: | The HS-SCCH and corresponding HS-PDSCH shall be transmitted continuously with constant power but the HS-SCCH shall only use the identity of the UE under test every third TTI. | |
| Note 2: | Wanted signal mean power per band is the sum of measured mean power on each carrier in a band over 3.84 MHz. | |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

6.3H Maximum Input Level for 4C-HSDPA Reception (64QAM)

6.3H.1 Definition and applicability

Maximum input level for DC-HSDPA reception is defined as the maximum power received at the UE antenna port, which shall not degrade the specified DC-HSDPA throughput performance.

The requirements and this test apply for Release 10 and later releases to all types of UTRA for the FDD UE that support Single band/Dual band 4C-HSDPA with 64QAM and HS-DSCH categories 31 or 32.

Single band/Dual band 4C-HSDPA is designed to operate in configurations specified in clause 4.2.

6.3H.2 Minimum requirements

The additional 4C-HSDPA requirements are specified in terms of a minimum information throughput per cell R with the DL reference channel H-Set 8C specified in Annex C.8.1.8, with the addition of the parameters in Table 6.3H.1, and the downlink physical channel setup according to table E.5.1, applied to all the cells simultaneously. Using this configuration the throughput shall meet or exceed the minimum requirements specified in table 6.3H.2.

Table 6.3H.1: Minimum requirement parameters for 64QAM Maximum Input Level (4C-HSDPA)

| Parameter | Unit | Value |
|---|---|---------|
| Phase reference | | P-CPICH |
| Wanted signal mean power per band (dBm) | dBm/band | -22 |
| UE transmitted mean power | dBm | 0 |
| DPCH_Ec/lor | dB | -13 |
| HS-SCCH_1_Ec/lor | dB | -13 |
| Redundancy and constellation version | | 6 |
| Maximum number of HARQ transmissions | | 1 |
| Note 1: | The HS-SCCH and corresponding HS-PDSCH shall be transmitted continuously with constant power but the HS-SCCH shall only use the identity of the UE under test every third TTI | |
| Note 2: | Wanted signal mean power per band is the sum of measured mean power on each carrier in a band over 3.84 MHz. | |

Table 6.3H.2: Minimum throughput requirement (4C-HSDPA)

6.3H.4.2 Procedure

Connect the SS to the UE antenna connector as shown in figure A.48.

- 1) The UE is switched on.
- 2) An RRC connection is set-up according to the generic HSDPA set-up procedure specified in TS 34.108 [3] clause 7.3.16 exceptions for information elements listed in table 6.3H.3
- 3) Set the power level of UE according to the table 6.3H.4 and send power control commands to the UE .The UE output power measured by Test System shall be kept at the specified power level with ± 1 dB tolerance.
- 4) Measure the HS-PDSCH throughput R received by the UE on each individual cell by counting the number of NACK, ACK and statDTX on the UL HS-DPCCH (Throughput = blocksize*number of blocks acknowledged/time).
- 5) The UE is switched off.

6.3H.5 Test requirements

The measured throughput, as derived in step 4), shall meet or exceed 11800 Kbit/second on each individual cell. The minimum number of measurements required for a statistically significant result to this test is clarified in annex F.6.3, Table F.6.3.5.1A.

Table 6.3H.4: Test requirement parameters for 64QAM Maximum Input Level (4C-HSDPA)

| Parameter | Unit | Value |
|---|---|---------|
| Phase reference | | P-CPICH |
| Wanted signal mean power per band (dBm) | dBm/band | -22.7 |
| UE transmitted mean power | dBm | 0 |
| DPCH_Ec/lor | dB | -13 |
| HS-SCCH_1_Ec/lor | dB | -13 |
| Redundancy and constellation version | | 6 |
| Maximum number of HARQ transmissions | | 1 |
| Note 1: | The HS-SCCH and corresponding HS-PDSCH shall be transmitted continuously with constant power but the HS-SCCH shall only use the identity of the UE under test every third TTI | |
| Note 2: | Wanted signal mean power per band is the sum of measured mean power on each carrier in a band over 3.84 MHz. | |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

6.3HA Maximum Input Level for 4C-HSDPA Reception (64QAM) (3 carrier)

6.3HA.1 Definition and applicability

Maximum input level for 4C-HSDPA reception is defined as the maximum power received at the UE antenna port, which shall not degrade the specified 4C-HSDPA throughput performance.

The requirements and this test apply for Release 10 and later releases to all types of UTRA for the FDD UE that support Single band/Dual band 4C-HSDPA with 64QAM and HSDPA UE capability categories 29 to 32.

Single band/Dual band 4C-HSDPA is designed to operate in configurations specified in clause 4.2.

6.3HA.2 Minimum requirements

The additional 4C-HSDPA requirements are specified in terms of a minimum information throughput per cell R with the DL reference channel H-Set 8B specified in Annex C.8.1.8, with the addition of the parameters in Table 6.3HA.1, and the downlink physical channel setup according to table E.5.1, applied to all the cells simultaneously. Using this configuration the throughput shall meet or exceed the minimum requirements specified in table 6.3HA.2.

Table 6.3HA.1: Minimum requirement parameters for 64QAM Maximum Input Level (4C-HSDPA)

| Parameter | Unit | Value |
|---|---|---------|
| Phase reference | | P-CPICH |
| Wanted signal mean power per band (dBm) | dBm/band | -22 |
| UE transmitted mean power | dBm | 0 |
| DPCH_Ec/lor | dB | -13 |
| HS-SCCH_1_Ec/lor | dB | -13 |
| Redundancy and constellation version | | 6 |
| Maximum number of HARQ transmissions | | 1 |
| Note 1: | The HS-SCCH and corresponding HS-PDSCH shall be transmitted continuously with constant power but the HS-SCCH shall only use the identity of the UE under test every third TTI | |
| Note 2: | Wanted signal mean power per band is the sum of measured mean power on each carrier in a band over 3.84 MHz. | |

Table 6.3HA.2: Minimum throughput requirement (4C-HSDPA)

| HS-PDSCH E_c/I_{or} (dB) | T-put R (kbps) |
|----------------------------|------------------|
| -2 | 11800 |

The reference for this requirement is TS 25.101 [1] clause 7.4.4.2.

6.3HA.3 Test purpose

To verify that the UE 4C-HSDPA throughput meets the minimum requirements specified in table 6.3HA.2 for the DL reference channel H-Set 8B specified in Annex C.8.1.8 with the addition of the parameters specified in table 6.3HA.4.

An inadequate maximum input level causes loss of 4C-HSDPA coverage near the Node B.

This test case tests only 3 carrier configurations.

6.3HA.4 Method of test

6.3HA.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

RF parameters are given in tables 6.3HA.4 and table E.5.1.

6.3HA.4.2 Procedure

Connect the SS to the UE antenna connector as shown in figure A.48.

- 1) The UE is switched on.
- 2) An RRC connection is set-up according to the generic HSDPA set-up procedure specified in TS 34.108 [3] clause 7.3.16 exceptions for information elements listed in table 6.3HA.3
- 3) Set the power level of UE according to the table 6.3HA.4 and send power control commands to the UE .The UE output power measured by Test System shall be kept at the specified power level with ± 1 dB tolerance.
- 4) Measure the HS-PDSCH throughput R received by the UE on each individual cell by counting the number of NACK, ACK and statDTX on the UL HS-DPCCH (Throughput = blocksize*number of blocks acknowledged/time).
- 5) The UE is switched off.

6.3HA.5 Test requirements

The measured throughput, as derived in step 4), shall meet or exceed 11800 Kbit/second on each individual cell. The minimum number of measurements required for a statistically significant result to this test is clarified in annex F.6.3, Table F.6.3.5.1A.

Table 6.3HA.4: Test requirement parameters for 64QAM Maximum Input Level (4C-HSDPA)

| Parameter | Unit | Value |
|---|---|---------|
| Phase reference | | P-CPICH |
| Wanted signal mean power per band (dBm) | dBm/band | -22.7 |
| UE transmitted mean power | dBm | 0 |
| DPCH_Ec/lor | dB | -13 |
| HS-SCCH_1_Ec/lor | dB | -13 |
| Redundancy and constellation version | | 6 |
| Maximum number of HARQ transmissions | | 1 |
| Note 1: | The HS-SCCH and corresponding HS-PDSCH shall be transmitted continuously with constant power but the HS-SCCH shall only use the identity of the UE under test every third TTI | |
| Note 2: | Wanted signal mean power per band is the sum of measured mean power on each carrier in a band over 3.84 MHz. | |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

6.4 Adjacent Channel Selectivity (ACS) (Rel-99 and Rel-4)

6.4.1 Definition and applicability

Adjacent Channel Selectivity (ACS) is a measure of a receiver's ability to receive a W-CDMA signal at its assigned channel frequency in the presence of an adjacent channel signal at a given frequency offset from the centre frequency of the assigned channel. ACS is the ratio of the receive filter attenuation on the assigned channel frequency to the receive filter attenuation on the adjacent channel(s).

The requirements and this test apply to all types of UTRA for the FDD UE for Release 99 and Release 4.

6.4.2 Minimum Requirements

For the UE of power class 3 and 4, the BER shall not exceed 0,001 for the parameters specified in table 6.4.1. This test condition is equivalent to the ACS value 33 dB.

Table 6.4.1: Test parameters for Adjacent Channel Selectivity for Release 99 and Release 4.

| Parameter | Level / Status | Unit |
|---|--|----------------|
| DPCH_Ec | -103 | dBm / 3,84 MHz |
| I _{or} | -92,7 | dBm / 3,84 MHz |
| I _{oac} mean power (modulated) | -52 | dBm |
| F _{uw} (offset) | -5 or +5 | MHz |
| UE transmitted mean power | 20 (for Power class 3) 18 (for Power class 4) | dBm |

The normative reference for these requirements is TS 25.101 [1] clause 7.5.1.

NOTE: The I_{oac} (modulated) signal consists of the common channels needed for tests as specified in table E.4.1 and 16 dedicated data channels as specified in table E.3.6.

6.4.3 Test purpose

To verify that the UE BER does not exceed 0,001 for the test parameters specified in table 6.4.2.

The lack of the ACS decreases the coverage area when other transmitter exists in the adjacent channel.

6.4.4 Method of test

6.4.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.4.
- 2) RF parameters are set up according to table 6.4.2.
- 3) A call is set up according to the Generic call setup procedure specified in TS34.108[3] sub clause 7.3.2, with the following exception for information elements in RADIO BEARER SETUP message. With this exception, the Power Control Algorithm for the Uplink is set to algorithm 2.
- 4) Enter the UE into loopback test mode and start the loopback test.

Table 6.4.1A Contents of RADIO BEARER SETUP message: AM or UM

| Information Element | Value/Remark |
|---|--------------------------------|
| CHOICE channel requirement - Power Control Algorithm | Uplink DPCH info Algorithm2 |

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

6.4.4.2 Procedure

- 1) Set the parameters of the interference signal generator as shown in table 6.4.2.
- 2) Set the power level of UE according to the table 6.4.2 or send the power control commands (1dB step size should be used.) to the UE until UE output power measured by Test System shall be kept at the specified power level with ± 1 dB tolerance.
- 3) Measure the BER of DCH received from the UE at the SS.

6.4.5 Test requirements

The measured BER, derived in step 1), shall not exceed 0,001.

Table 6.4.2: Test parameters for Adjacent Channel Selectivity for Release 99 and Release 4.

| Parameter | Level / Status | Unit |
|---|--|----------------|
| DPCH_Ec | -103 | dBm / 3,84 MHz |
| I _{or} | -92,7 | dBm / 3,84 MHz |
| I _{oac} mean power (modulated) | -52 | dBm |
| F _{uw} (offset) | -5 or +5 | MHz |
| UE transmitted mean power | 20 (for Power class 3) 18 (for Power class 4) | dBm |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

6.4A Adjacent Channel Selectivity (ACS) (Rel-5 and later releases)

6.4A.1 Definition and applicability

Adjacent Channel Selectivity (ACS) is a measure of a receiver's ability to receive a W-CDMA signal at its assigned channel frequency in the presence of an adjacent channel signal at a given frequency offset from the centre frequency of the assigned channel. ACS is the ratio of the receive filter attenuation on the assigned channel frequency to the receive filter attenuation on the adjacent channel(s).

The requirements and this test apply to all types of UTRA for the FDD UE for Release 5 and later releases.

6.4A.2 Minimum Requirements

For the UE of power class 3, 3bis and 4, the BER shall not exceed 0,001 for the parameters specified in table 6.4A.1. This test condition is equivalent to the ACS value 33 dB.

Table 6.4A.1: Test parameters for Adjacent Channel Selectivity for release 5 and later releases

| Parameter | Unit | Case 1 | Case 2 |
|----------------------------------|--------------|---|---|
| DPCH_Ec | dBm/3.84 MHz | <REFSENS> + 14 dB | <REFSENS> + 41 dB |
| I_{or} | dBm/3.84 MHz | <REF I_{or} > + 14 dB | <REF I_{or} > + 41 dB |
| I_{oac} mean power (modulated) | dBm | -52 | -25 |
| F_{uw} (offset) | MHz | +5 or -5 | +5 or -5 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | 20 (for Power class 3 and 3bis) 18 (for Power class 4) |

The normative reference for these requirements is TS 25.101 [1] clause 7.5.1.

NOTE 1: The I_{oac} (modulated) signal consists of the common channels needed for tests as specified in table E.4.1 and 16 dedicated data channels as specified in table E.3.6.

NOTE 2: <REFSENS> and <REF I_{or} > refers to the DPCH_Ec<REFSENS> and the DPCH<REF I_{or} > as specified in Table 6.2.1.

6.4A.3 Test purpose

To verify that the UE BER does not exceed 0,001 for the test parameters specified in table 6.4A.2.

The lack of the ACS decreases the coverage area when other transmitter exists in the adjacent channel.

6.4A.4 Method of test

6.4A.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.4.
- 2) RF parameters are set up according to table 6.4A.2.
- 3) A call is set up according to the Generic call setup procedure specified in TS34.108[3] sub clause 7.3.2, with the following exception for information elements in RADIO BEARER SETUP message. With this exception, the Power Control Algorithm for the Uplink is set to algorithm 2.
- 4) Enter the UE into loopback test mode and start the loopback test.

Table 6.4A.1A: Contents of RADIO BEARER SETUP message: AM or UM

| Information Element | Value/Remark |
|---|--------------------------------|
| CHOICE channel requirement - Power Control Algorithm | Uplink DPCH info Algorithm2 |

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

6.4A.4.2 Procedure

- 1) Set the parameters of the interference signal generator as shown in table 6.4A.2 case 1.
- 2) Set the power level of UE according to the table 6.4A.2 case 1 or send the power control commands (1dB step size should be used.) to the UE until UE output power measured by Test System shall be kept at the specified power level with ± 1 dB tolerance.
- 3) Measure the BER of DCH received from the UE at the SS.
- 4) Set the parameters of the interference signal generator as shown in table 6.4A.2 case 2.
- 5) Set the power level of UE according to the table 6.4A.2 case 2 or send the power control commands (1dB step size should be used.) to the UE until UE output power measured by Test System shall be kept at the specified power level with ± 1 dB tolerance.
- 6) Measure the BER of DCH received from the UE at the SS.

6.4A.5 Test requirements

The measured BER, derived in step 1) and step 6), shall not exceed 0,001.

Table 6.4A.2: Test parameters for Adjacent Channel Selectivity for Release 5 and later releases

| Parameter | Unit | Case 1 | Case 2 |
|---|--------------|---|---|
| DPCH_Ec | dBm/3.84 MHz | <REFSENS> + 14 dB | <REFSENS> + 41 dB |
| I _{or} | dBm/3.84 MHz | <REFI _{or} > + 14 dB | <REFI _{or} > + 41 dB |
| I _{oac} mean power (modulated) | dBm | -52 | -25 |
| F _{uw} (offset) | MHz | +5 or -5 | +5 or -5 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | 20 (for Power class 3 and 3bis) 18 (for Power class 4) |

NOTE 1: The I_{oac} (modulated) signal consists of the common channels needed for tests as specified in table E.4.1 and 16 dedicated data channels as specified in table E.3.6.

NOTE 2: <REFSENS> and <REFI_{or}> refers to the DPCH_Ec<REFSENS> and the DPCH<REFI_{or}> as specified in Table 6.2.1.

NOTE 3: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

6.4B Adjacent Channel Selectivity (ACS) for DC-HSDPA

6.4B.1 Definition and applicability

Adjacent Channel Selectivity (ACS) is a measure of a receiver's ability to receive a W-CDMA signal at its assigned channel frequency in the presence of an adjacent channel signal at a given frequency offset from the centre frequency of the assigned channel. ACS is the ratio of the receive filter attenuation on the assigned channel frequency to the receive filter attenuation on the adjacent channel(s).

The requirements and this test apply for Release 8 and later releases to all types of UTRA for the FDD UE that support DC-HSDPA.

6.4B.2 Minimum Requirements

The UE shall fulfil the additional requirement specified in Table 6.4B.1 for all values of an adjacent channel interferer up to -25 dBm.

However it is not possible to directly measure the ACS, instead the lower and upper range of test parameters are chosen in Table 6.4B.2, where the HS-PDSCH BLER shall not exceed 0.1.

Table 6.4B.1: Adjacent Channel Selectivity

| Power Class | Unit | ACS |
|-------------|------|-----|
| 3 | dB | 33 |
| 4 | dB | 33 |

Table 6.4B.2: Test parameters for Adjacent Channel Selectivity (DC-HSDPA)

| Parameter | Unit | Case 1 | Case 2 |
|----------------------------------|--------------|---|---|
| HS-PDSCH_Ec | dBm/3.84 MHz | <REFSENS> + 14 dB | <REFSENS> + 41 dB |
| \hat{I}_{or} | dBm/3.84 MHz | <REF \hat{I}_{or} > + 14 dB | <REF \hat{I}_{or} > + 41 dB |
| I_{oac} mean power (modulated) | dBm | -52 | -25 |
| F_{uw} (offset) (note 2) | MHz | +5 or -5 | +5 or -5 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | 20 (for Power class 3 and 3bis) 18 (for Power class 4) |

NOTE 1: The I_{oac} (modulated) signal consists of the common channels needed for tests as specified in Table E.4.1 and 16 dedicated data channels as specified in Table E.3.6.

NOTE 2: Negative offsets refer to the assigned channel frequency of the lowest carrier frequency used and positive offsets refer to the assigned channel frequency of the highest carrier frequency used.

NOTE 3: <REFSENS> and <REF \hat{I}_{or} > refers to the HS-PDSCH_Ec<REFSENS> and the HS-PDSCH<REF \hat{I}_{or} > as specified in Table 6.2A.1.

The normative reference for these requirements is TS 25.101 [1] clause 7.5.2.

6.4B.3 Test purpose

To verify that the UE BLER of HS-PDSCH does not exceed 0.1 for the test parameters specified in table 6.4B.4 for the DL reference channel H-Set 12 specified in Annex C.8.1.12.

The lack of the ACS decreases the DC-HSDPA coverage area when other transmitter exists in the adjacent channel.

6.4B.4 Method of test

6.4B.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.31.
- 2) RF parameters are set up according to table 6.4B.2.
- 3) A call is set up according to the Generic DC-HSDPA setup procedure specified in TS34.108[3] sub clause 7.3.13, with exceptions for information elements listed in Table 6.4B.3. With this exception, the Power Control Algorithm for the Uplink is set to algorithm 2.

| - HS-DSCH TB size table | octet aligned (for H-Set 12) | |

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

6.4B.4.2 Procedure

- 1) Set the parameters of the interference signal generator as shown in table 6.4B.4 case 1.
- 2) Set the power level of UE according to the table 6.4B.4 case 1 or send the power control commands (1dB step size should be used.) to the UE until UE output power measured by Test System shall be kept at the specified power level with ± 1 dB tolerance.
- 3) Measure the BLER of HS-PDSCH received from the UE at the SS by counting the number of NACK, ACK and statDTX on the UL HS-DPCCH ($BLER = (NACK + statDTX)/(NACK + statDTX + ACK)$).
- 4) Set the parameters of the interference signal generator as shown in table 6.4B.4 case 2.
- 5) Set the power level of UE according to the table 6.4B.4 case 2 or send the power control commands (1dB step size should be used.) to the UE until UE output power measured by Test System shall be kept at the specified power level with ± 1 dB tolerance.
- 6) Measure the BLER of HS-PDSCH received from the UE at the SS by counting the number of NACK, ACK and statDTX on the UL HS-DPCCH ($BLER = (NACK + statDTX)/(NACK + statDTX + ACK)$).

6.4B.5 Test requirements

The measured BLER, derived in step 1) and step 6), shall not exceed 0.1 on each individual cell. The minimum number of measurements required for a statistically significant result to this test is clarified in annex F.6.3, Table F.6.3.5.0.

Table 6.4B.4: Test parameters for Adjacent Channel Selectivity (DC-HSDPA)

| Parameter | Unit | Case 1 | Case 2 |
|----------------------------------|--------------|---|---|
| HS-PDSCH_Ec | dBm/3.84 MHz | <REFSENS> + 14 dB | <REFSENS> + 41 dB |
| I_{or} | dBm/3.84 MHz | <REF I_{or} > + 14 dB | <REF I_{or} > + 41 dB |
| I_{oac} mean power (modulated) | dBm | -52 | -25 |
| F_{uw} (offset) | MHz | +5 or -5 | +5 or -5 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | 20 (for Power class 3 and 3bis) 18 (for Power class 4) |

NOTE 1: The I_{oac} (modulated) signal consists of the common channels needed for tests as specified in Table E.4.1 and 16 dedicated data channels as specified in Table E.3.6.

NOTE 2: Negative offsets refer to the assigned channel frequency of the lowest carrier frequency used and positive offsets refer to the assigned channel frequency of the highest carrier frequency used.

NOTE 3: $\langle \text{REFSENS} \rangle$ and $\langle \text{REFI}_{\text{or}} \rangle$ refers to the HS-PDSCH_Ec $\langle \text{REFSENS} \rangle$ and the HS-PDSCH $\langle \text{REFI}_{\text{or}} \rangle$ as specified in Table 6.2A.1.

NOTE 4: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

6.4C Adjacent Channel Selectivity (ACS) for DB-DC-HSDPA

6.4C.1 Definition and applicability

Adjacent Channel Selectivity (ACS) is a measure of a receiver's ability to receive a W-CDMA signal at its assigned channel frequency in the presence of an adjacent channel signal at a given frequency offset from the centre frequency of the assigned channel. ACS is the ratio of the receive filter attenuation on the assigned channel frequency to the receive filter attenuation on the adjacent channel(s).

The requirements and this test apply for Release 9 and later releases to all types of UTRA for the FDD UE that support DB-DC-HSDPA.

DB-DC-HSDPA is designed to operate in configurations specified in clause 4.2.

6.4C.2 Minimum Requirements

The UE shall fulfil the additional requirement specified in Table 6.4C.1 for all values of an adjacent channel interferer up to -25 dBm.

However it is not possible to directly measure the ACS, instead the lower and upper range of test parameters are chosen in Table 6.4.B.2, where the HS-PDSCH BLER shall not exceed 0.1.

Table 6.4C.1: Adjacent Channel Selectivity

| Power Class | Unit | ACS |
|-------------|------|-----|
| 3 | dB | 33 |
| 4 | dB | 33 |

Table 6.4C.2: Test parameters for Adjacent Channel Selectivity (DB-DC-HSDPA)

| Parameter | Unit | Case 1 | Case 2 |
|---|--------------|---|---|
| HS-PDSCH_Ec | dBm/3.84 MHz | $\langle \text{REFSENS} \rangle + 14$ dB | $\langle \text{REFSENS} \rangle + 41$ dB |
| I_{or} | dBm/3.84 MHz | $\langle \text{REFI}_{\text{or}} \rangle + 14$ dB | $\langle \text{REFI}_{\text{or}} \rangle + 41$ dB |
| I_{oac} mean power (modulated) | dBm | -52 | -25 |
| F_{uw} (offset) (note 2) | MHz | +5 or -5 | +5 or -5 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | 20 (for Power class 3 and 3bis) 18 (for Power class 4) |

NOTE 1: The I_{oac} (modulated) signal consists of the common channels needed for tests as specified in Table E.4.1 and 16 dedicated data channels as specified in Table E.3.6.

NOTE 2: For DC-HSDPA, negative offset refers to the assigned channel frequency of the lowest carrier frequency used and positive offset refers to the assigned channel frequency of the highest carrier frequency used. For DB-DC-HSDPA, offset refers to the assigned channel frequencies of the individual cells.

NOTE 3: $\langle \text{REFSENS} \rangle$ and $\langle \text{REFI}_{\text{or}} \rangle$ refers to the HS-PDSCH_Ec $\langle \text{REFSENS} \rangle$ and the HS-PDSCH $\langle \text{REFI}_{\text{or}} \rangle$ as specified in Table 6.2B.1.

The normative reference for these requirements is TS 25.101 [1] clause 7.5.2.

6.4C.3 Test purpose

To verify that the UE BLER of HS-PDSCH does not exceed 0.1 for the test parameters specified in table 6.4C.4 for the DL reference channel H-Set 12 specified in Annex C.8.1.12.

The lack of the ACS decreases the DB-DC-HSDPA coverage area when other transmitter exists in the adjacent channel.

6.4C.4 Method of test

6.4C.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.31.
- 2) RF parameters are set up according to table 6.4C.2.
- 3) A call is set up according to the Generic call setup procedure specified in TS34.108[3] sub clause 7.3.13, with exceptions for information elements listed in Table 6.4C.3. With this exception, the Power Control Algorithm for the Uplink is set to algorithm 2.

Contents of RADIO BEARER SETUP message: AM or UM (Test Loop Mode1)

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

6.4C.4.2 Procedure

- 1) Set the parameters of the interference signal generator as shown in table 6.4C.4 case 1.
- 2) Set the power level of UE according to the table 6.4C.4 case 1 or send the power control commands (1dB step size should be used.) to the UE until UE output power measured by Test System shall be kept at the specified power level with ± 1 dB tolerance.
- 3) Measure the BLER of HS-PDSCH received from the UE at the SS by counting the number of NACK, ACK and statDTX on the UL HS-DPCCH ($BLER = (NACK + statDTX)/(NACK + statDTX + ACK)$).
- 4) Set the parameters of the interference signal generator as shown in table 6.4C.4 case 2.

- 5) Set the power level of UE according to the table 6.4C.4 case 2 or send the power control commands (1dB step size should be used.) to the UE until UE output power measured by Test System shall be kept at the specified power level with ± 1 dB tolerance.
- 6) Measure the BLER of HS-PDSCH received from the UE at the SS by counting the number of NACK, ACK and statDTX on the UL HS-DPCCH ($BLER = (NACK + statDTX)/(NACK + statDTX + ACK)$).

6.4C.5 Test requirements

The measured BLER, derived in step 1) and step 6), shall not exceed 0.1 on each individual cell. The minimum number of measurements required for a statistically significant result to this test is clarified in annex F.6.3, Table F.6.3.5.0.

Table 6.4C.4: Test parameters for Adjacent Channel Selectivity (DB-DC-HSDPA)

| Parameter | Unit | Case 1 | Case 2 |
|----------------------------------|--------------|---|---|
| HS-PDSCH_Ec | dBm/3.84 MHz | <REFSENS> + 14 dB | <REFSENS> + 41 dB |
| I_{or} | dBm/3.84 MHz | <REF I_{or} > + 14 dB | <REF I_{or} > + 41 dB |
| I_{oac} mean power (modulated) | dBm | -52 | -25 |
| F_{uw} (offset) | MHz | +5 or -5 | +5 or -5 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | 20 (for Power class 3 and 3bis) 18 (for Power class 4) |

NOTE 1: The I_{oac} (modulated) signal consists of the common channels needed for tests as specified in Table E.4.1 and 16 dedicated data channels as specified in Table E.3.6.

NOTE 2: Offset refers to the assigned channel frequencies of the individual cells.

NOTE 3: <REFSENS> and <REF I_{or} > refers to the HS-PDSCH_Ec<REFSENS> and the HS-PDSCH<REF I_{or} > as specified in Table 6.2B.1.

NOTE 5: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

6.5 Blocking Characteristics

6.5.1 Definition and applicability

The blocking characteristic is a measure of the receiver's ability to receive a wanted signal at its assigned channel frequency in the presence of an unwanted interferer on frequencies other than those of the spurious response or the adjacent channels, without this unwanted input signal causing a degradation of the performance of the receiver beyond a specified limit. The blocking performance shall apply at all frequencies except those at which a spurious response occur.

The requirements in clause 6.5.2.1 and 6.5.2.2 and this test apply to all types of UTRA for the FDD UE.

The requirements in clause 6.5.2.3 and this test apply to the FDD UE supporting Band II, Band III, Band IV, Band V, Band VIII, Band X, Band XII, Band XIII or Band XIV.

The frequency range 4 requirements do not apply to Release 5 or earlier releases, but only to Release 6 and onwards.

6.5.2 Minimum Requirements

6.5.2.1 Minimum Requirements (In-band blocking)

The BER shall not exceed 0,001 for the parameters specified in table 6.5.1. In-band blocking is defined for an unwanted interfering signal falling into the UE receive band or into the first 15 MHz below or above the UE receive band.

The normative reference for this requirement is TS 25.101 [1] clause 7.6.1.

Table 6.5.1: Test parameters for In-band blocking characteristics

| Parameter | Unit | Level | |
|--|--------------|---|---------------------------------|
| DPCH_Ec | dBm/3.84 MHz | <REFSENS>+3 dB | |
| I _{or} | dBm/3.84 MHz | <REFI _{or} > + 3 dB | |
| I _{blocking} mean power (modulated) | dBm | -56 | -44 |
| F _{uw} offset | | =±10 MHz | ≤-15 MHz & ≥15 MHz |
| F _{uw} (Band I operation) | MHz | 2102.4 ≤ f ≤ 2177.6 (Note 2) | 2095 ≤ f ≤ 2185 |
| F _{uw} (Band II operation) | MHz | 1922.4 ≤ f ≤ 1997.6 (Note 2) | 1915 ≤ f ≤ 2005 |
| F _{uw} (Band III operation) | MHz | 1797.4 ≤ f ≤ 1887.6 (Note 2) | 1790 ≤ f ≤ 1895 |
| F _{uw} (Band IV operation) | MHz | 2102.4 ≤ f ≤ 2162.6 (Note 2) | 2095 ≤ f ≤ 2170 |
| F _{uw} (Band V operation) | MHz | 861.4 ≤ f ≤ 901.6 (Note 2) | 854 ≤ f ≤ 909 |
| F _{uw} (Band VI operation) | MHz | 867.4 ≤ f ≤ 892.6 (Note 2 and 3) | 860 ≤ f ≤ 900 (Note 3) |
| F _{uw} (Band VII operation) | MHz | 2612.4 ≤ f ≤ 2697.6 (Note 2) | 2605 ≤ f ≤ 2705 |
| F _{uw} (Band VIII operation) | MHz | 917.4 ≤ f ≤ 967.6 (Note 2) | 910 ≤ f ≤ 975 |
| F _{uw} (Band IX operation) | MHz | 1837.4 ≤ f ≤ 1887.4 (Note 2) | 1829.9 ≤ f ≤ 1894.9 |
| F _{uw} (Band X operation) | MHz | 2102.4 ≤ f ≤ 2177.6 (Note 2) | 2095 ≤ f ≤ 2185 |
| F _{uw} (Band XI operation) | MHz | 1468.4 ≤ f ≤ 1503.4 (Note 2) | 1460.9 ≤ f ≤ 1510.9 |
| F _{uw} (Band XII operation) | MHz | 721.4 ≤ f ≤ 753.6 (Note 2) | 714 ≤ f ≤ 761 |
| F _{uw} (Band XIII operation) | MHz | 738.4 ≤ f ≤ 763.6 (Note 2) | 731 ≤ f ≤ 771 |
| F _{uw} (Band XIV operation) | MHz | 750.4 ≤ f ≤ 775.6 (Note 2) | 743 ≤ f ≤ 783 |
| F _{uw} (Band XIX operation) | MHz | 867.4 ≤ f ≤ 897.6 (Note 2) | 860 ≤ f ≤ 905 (Note 3) |
| F _{uw} (Band XX operation) | MHz | 783.4 ≤ f ≤ 828.6 (Note 2) | 776 ≤ f ≤ 836 |
| F _{uw} (Band XXI operation) | MHz | 1488.4 ≤ f ≤ 1518.4 (Note 2) | 1480.9 ≤ f ≤ 1525.9 (Note 3) |
| F _{uw} (Band XXII operation) | MHz | 3502.4 ≤ f ≤ 3597.6 | 3495 ≤ f ≤ 3605 |
| F _{uw} (Band XXV operation) | MHz | 1922.4 ≤ f ≤ 2002.6 | 1915 ≤ f ≤ 2010 |
| F _{uw} (Band XXVI operation) | MHz | 851.4 ≤ f ≤ 901.6 | 844 ≤ f ≤ 909 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | |

NOTE 1: I_{blocking} (modulated) consists of the common channels needed for tests as specified in Table E.4.1 and 16 dedicated data channels as specified in Table E.3.6.

NOTE 2: For each carrier frequency the requirement is valid for two frequencies, the carrier frequency +/- 10 MHz.

NOTE 3: For Band VI, Band XIX and Band XXI, the unwanted interfering signal does not fall inside the UE receive band, but within the first 15 MHz below or above the UE receive band.

NOTE 4: <REFSENS> and <REFI_{or}> refers to the DPCH_Ec<REFSENS> and the DPCH<REFI_{or}> as specified in Table 6.2.1.

6.5.2.2 Minimum requirements (Out of-band blocking)

The BER shall not exceed 0.001 for the parameters specified in table 6.5.2. Out-of-band band blocking is defined for an unwanted interfering signal falling more than 15 MHz below or above the UE receive band. For table 6.5.2 in frequency range 1, 2 and 3, up to 24 exceptions are allowed for spurious response frequencies in each assigned frequency channel when measured using a 1 MHz step size.

For Table 6.5.2 in frequency range 4, up to 8 exceptions are allowed for spurious response frequencies in each assigned frequency channel when measured using 1 MHz step size.

The normative reference for this requirement is TS 25.101 [1] clause 7.6.2.

Table 6.5.2: Test parameters for Out of band blocking characteristics

| Parameter | Unit | Frequency range 1 | Frequency range 2 | Frequency range 3 | Frequency range 4 |
|--------------------------------|--------------|--|--|--------------------------------------|------------------------------|
| DPCH_Ec | dBm/3.84 MHz | <REFSENS>+3 dB | <REFSENS>+3 dB | <REFSENS>+3 dB | <REFSENS> +3 dB |
| \hat{I}_{or} | dBm/3.84 MHz | <REF \hat{I}_{or} > + 3 dB | <REF \hat{I}_{or} > + 3 dB | <REF \hat{I}_{or} > + 3 dB | <REF \hat{I}_{or} > + 3 dB |
| $I_{blocking}$ (CW) | dBm | -44 | -30 | -15 | -15 |
| F_{uw} (Band I operation) | MHz | 2050 < f < 2095 2185 < f < 2230 | 2025 < f ≤ 2050 2230 ≤ f < 2255 | 1 < f ≤ 2025 2255 ≤ f < 12750 | - |

| F_{uw} Band XIX operation) | MHz | 815 < f < 860 905 < f < 950 | 790 < f ≤ 815 950 ≤ f < 975 | 1 < f ≤ 790 975 ≤ f < 12750 | - |

| Parameter | Unit | Frequency range 1 | Frequency range 2 | Frequency range 3 | Frequency range 4 |
|-----------------------------------|--|---|--|--------------------------------------|-------------------|
| F_{uw} (Band XX operation) | MHz | 731 < f < 776 836 < f < 881 | 706 < f ≤ 731 881 ≤ f < 906 | 1 < f ≤ 706 906 ≤ f < 12750 | - |
| F_{uw} (Band XXI operation) | MHz | 1435.9 < f < 1480.9 1525.9 < f < 1570.9 | 1410.9 < f ≤ 1435.9 1570.9 ≤ f < 1595.9 | 1 < f ≤ 1410.9 1595.9 ≤ f < 12750 | - |
| F_{uw} (Band XXII operation) | MHz | 3450 < f < 3495 3605 < f < 3650 | 3425 < f ≤ 3450 3650 ≤ f < 3675 | 1 < f ≤ 3425 3675 ≤ f < 12750 | - |
| F_{uw} (Band XXV operation) | MHz | 1870 < f < 1915 2010 < f < 2055 | 1845 < f ≤ 1870 2055 ≤ f < 2080 | 1 < f ≤ 1845 2080 ≤ f < 12750 | 1850 ≤ f ≤ 1915 |
| F_{uw} (Band XXVI operation) | MHz | 799 < f < 844 909 < f < 954 | 774 < f ≤ 799 954 ≤ f < 979 | 1 < f ≤ 774 979 ≤ f < 12750 | 814 ≤ f ≤ 849 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | | | |
| Band I operation | For 2095 ≤ f ≤ 2185 MHz, the appropriate in-band blocking or adjacent channel selectivity in clause 6.5.2 and clause 6.4.2 shall be applied. | | | | |
| Band II operation | For 1915 ≤ f ≤ 2005 MHz, the appropriate in-band blocking or adjacent channel selectivity in clause 6.5.2 and clause 6.4.2 shall be applied | | | | |
| Band III operation | For 1790 ≤ f ≤ 1895 MHz, the appropriate in-band blocking or adjacent channel selectivity in clause 6.5.2 and clause 6.4.2 shall be applied. | | | | |
| Band IV operation | For 2095 ≤ f ≤ 2170 MHz, the appropriate in-band blocking or adjacent channel selectivity in clause 6.5.2 and clause 6.4.2 shall be applied. | | | | |
| Band V operation | For 854 ≤ f ≤ 909 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.5.2 and subclause 6.4.2 shall be applied. | | | | |
| Band VI operation | For 860 ≤ f ≤ 900 MHz, the appropriate in-band blocking or adjacent channel selectivity in clause 6.5.2 and clause 6.4.2 shall be applied. | | | | |
| Band VII operation | For 2605 ≤ f ≤ 2705 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.5.2 and subclause 6.4.2 shall be applied. | | | | |
| Band VIII operation | For 910 ≤ f ≤ 975 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.5.2 and subclause 6.4.2 shall be applied. | | | | |
| Band IX operation | For 1829.9 ≤ f ≤ 1894.9 MHz, the appropriate in-band blocking or adjacent channel selectivity in clause 6.5.2 and clause 6.4.2 shall be applied. | | | | |
| Band X operation | For 2095 ≤ f ≤ 2185 MHz, the appropriate in-band blocking or adjacent channel selectivity in clause 6.5.2 and clause 6.4.2 shall be applied. | | | | |
| Band XI operation | For 1460.9 ≤ f ≤ 1510.9 MHz, the appropriate in-band blocking or adjacent channel selectivity in clause 6.5.2 and clause 6.4.2 shall be applied. | | | | |
| Band XII operation | For 714 ≤ f ≤ 761 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.5.2 and subclause 6.4.2 shall be applied. | | | | |
| Band XIII operation | For 731 ≤ f ≤ 771 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.5.2 and subclause 6.4.2 shall be applied. | | | | |
| Band XIV operation | For 743 ≤ f ≤ 783 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.5.2 and subclause 6.4.2 shall be applied. | | | | |
| Band XIX operation | For 860 ≤ f ≤ 905 MHz, the appropriate in-band blocking or adjacent channel selectivity in clause 6.5.2 and clause 6.4.2 shall be applied. | | | | |
| Band XX operation | For 776 ≤ f ≤ 836 MHz, the appropriate in-band blocking or adjacent channel selectivity in clause 6.5.2 and clause 6.4.2 shall be applied. | | | | |
| Band XXI operation | For 1480.9 ≤ f ≤ 1525.9 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.5.2 and subclause 6.4.2 shall be applied. | | | | |
| Band XXII operation | For 3495 ≤ f ≤ 3605 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.5.2 and subclause 6.4.2 shall be applied. | | | | |
| Band XXV operation | For 1915 ≤ f ≤ 2010 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.5.2 and subclause 6.4.2 shall be applied | | | | |
| Band XXVI operation | For 844 ≤ f ≤ 909 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.5.2 and subclause 6.4.2 shall be applied. | | | | |
| NOTE: | For the UE which supports both Band XI and Band XXI operating frequencies, the Out of band blocking is FFS. | | | | |

NOTE: <REFSENS> and <REF_{or}> refers to the DPCH_Ec<REFSENS> and the DPCH<REF_{or}> as specified in Table 6.2.1.

6.5.2.3 Minimum requirements (Narrow band blocking)

The BER shall not exceed 0.001 for the parameters specified in table 6.5.3. This requirement is measure of a receiver's ability to receive a W-CDMA signal at its assigned channel frequency in the presence of an unwanted narrow band interferer at a frequency, which is less than the nominal channel spacing. The requirements and this test apply to UTRA for the FDD UE supporting band II, band III, band IV, band V, band VIII, band X, band XII, band XIII or band XIV.

The normative reference for this requirement is TS 25.101 [1] clause 7.6.3

Table 6.5.3: Test parameters for narrow band blocking

| Parameter | Unit | Band II, IV, V, X, XXV, XXVI | Band III, VIII, XII, XIII, XIV |
|---------------------------|--------------|---|--------------------------------|
| DPCH_Ec | dBm/3.84 MHz | <REFSENS> + 10 dB | <REFSENS> + 10 dB |
| \hat{I}_{or} | dBm/3.84 MHz | <REF \hat{I}_{or} > + 10 dB | <REF \hat{I}_{or} > + 10 dB |
| $I_{blocking}$ (GMSK) | dBm | -57 | -56 |
| F_{uw} (offset) | MHz | 2.7 | 2.8 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | |

NOTE 1: $I_{blocking}$ (GMSK) is an interfering signal as defined in TS 45.004. It is a continuous GMSK modulated carrier following the structure of the GSM signals, but with all modulating bits (including the midamble period) derived directly from a random or any pseudo random data stream.

NOTE 2: <REFSENS> and <REF \hat{I}_{or} > refers to the DPCH_Ec<REFSENS> and the DPCH<REF \hat{I}_{or} > as specified in Table 6.2.1.

6.5.3 Test purpose

To verify that the UE BER does not exceed 0,001 for the parameters specified in table 6.5.4, table 6.5.5 and table 6.5.6. For Table 6.5.5 in frequency range 1, 2 and 3, up to (24) exceptions are allowed for spurious response frequencies in each assigned frequency channel when measured using a 1 MHz step size.

For Table 6.5.5 in frequency range 4, up to 8 exceptions are allowed for spurious response frequencies in each assigned frequency channel when measured using a 1 MHz step size.

The lack of the blocking ability decreases the coverage area when other transmitter exists (except in the adjacent channels and spurious response).

6.5.4 Method of test

6.5.4.1 Initial conditions

For in-band case:

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

For out-of-band case:

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequency to be tested: 1 arbitrary frequency chosen from the low, mid or high range; see clause G.2.4.

For narrow-band case:

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.5.
- 2) RF parameters are set up according to table 6.5.4, table 6.5.5 and table 6.5.6.

- 3) A call is set up according to the Generic call setup procedure specified in TS34.108[3] sub clause 7.3.2, with the following exception for information elements in RADIO BEARER SETUP message. With this exception, the Power Control Algorithm for the Uplink is set to algorithm 2.
- 4) Enter the UE into loopback test mode and start the loopback test.

Table 6.5.3A Contents of RADIO BEARER SETUP message: AM or UM

| Information Element | Value/Remark |
|---|--------------------------------|
| CHOICE channel requirement - Power Control Algorithm | Uplink DPCH info Algorithm2 |

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

6.5.4.2 Procedure

- 1) Set the parameters of the CW generator or the interference signal generator as shown in table 6.5.4, 6.5.5 and table 6.5.6. For table 6.5.5, the frequency step size is 1 MHz.
- 2) Set the power level of UE according to the table 6.5.4, table 6.5.5, and table 6.5.6, or send the power control commands (1dB step size should be used.) to the UE until UE output power measured by Test System shall be kept at the specified power level with ± 1 dB tolerance.
- 3) Measure the BER of DCH received from the UE at the SS.
- 4) For table 6.5.5, record the frequencies for which BER exceed the test requirements.

6.5.5 Test requirements

For table 6.5.4, the measured BER, derived in step 2), shall not exceed 0.001. For table 6.5.5, the measured BER, derived in step 2) shall not exceed 0,001 except for the spurious response frequencies, recorded in step 3). The number of spurious response frequencies, recorded in step 3) shall not exceed 24 for frequency range 1, 2 and 3. The number of spurious response frequencies, recorded in step 3) shall not exceed 8 for frequency range 4 . For table 6.5.6, the measured BER, derived in step 2), shall not exceed 0.001.

Table 6.5.4: Test parameters for In-band blocking characteristics

| Parameter | Unit | Level | |
|--|--------------|---|--------------------------------------|
| DPCH_Ec | dBm/3.84 MHz | <REFSENS>+3 dB | |
| I _{or} | dBm/3.84 MHz | <REFI _{or} > + 3 dB | |
| I _{blocking} mean power (modulated) | dBm | -56 | -44 |
| F _{uw} offset | | ± 10 MHz | ≤ -15 MHz & ≥ 15 MHz |
| F _{uw} (Band I operation) | MHz | $2102.4 \leq f \leq 2177.6$ (Note 2) | $2095 \leq f \leq 2185$ |
| F _{uw} (Band II operation) | MHz | $1922.4 \leq f \leq 1997.6$ (Note 2) | $1915 \leq f \leq 2005$ |
| F _{uw} (Band III operation) | MHz | $1797.4 \leq f \leq 1887.6$ (Note 2) | $1790 \leq f \leq 1895$ |
| F _{uw} (Band IV operation) | MHz | $2102.4 \leq f \leq 2162.6$ (Note 2) | $2095 \leq f \leq 2170$ |
| F _{uw} (Band V operation) | MHz | $861.4 \leq f \leq 901.6$ (Note 2) | $854 \leq f \leq 909$ |
| F _{uw} (Band VI operation) | MHz | $867.4 \leq f \leq 892.6$ (Note 2 and 3) | $860 \leq f \leq 900$ (Note 3) |
| F _{uw} (Band VII operation) | MHz | $2612.4 \leq f \leq 2697.6$ (Note 2) | $2605 \leq f \leq 2705$ |
| F _{uw} (Band VIII operation) | MHz | $917.4 \leq f \leq 967.6$ (Note 2) | $910 \leq f \leq 975$ |
| F _{uw} (Band IX operation) | MHz | $1837.4 \leq f \leq 1887.4$ (Note 2) | $1829.9 \leq f \leq 1894.9$ |
| F _{uw} (Band X operation) | MHz | $2102.4 \leq f \leq 2177.6$ (Note 2) | $2095 \leq f \leq 2185$ |

| Parameter | Unit | Level | |
|-----------------------------------|------|---|---|
| F_{UW} (Band XI operation) | MHz | $1468.4 \leq f \leq 1503.4$ (Note 2) | $1460.9 \leq f \leq 1510.9$ |
| F_{UW} (Band XII operation) | MHz | $721.4 \leq f \leq 753.6$ (Note 2) | $714 \leq f \leq 761$ |
| F_{UW} (Band XIII operation) | MHz | $738.4 \leq f \leq 763.6$ (Note 2) | $731 \leq f \leq 771$ |
| F_{UW} (Band XIV operation) | MHz | $750.4 \leq f \leq 775.6$ (Note 2) | $743 \leq f \leq 783$ |
| F_{UW} (Band XIX operation) | MHz | $867.4 \leq f \leq 897.6$ (Note 2) | $860 \leq f \leq 905$ (Note 3) |
| F_{UW} (Band XX operation) | MHz | $783.4 \leq f \leq 828.6$ (Note 2) | $776 \leq f \leq 836$ |
| F_{UW} (Band XXI operation) | MHz | $1488.4 \leq f \leq 1518.4$ (Note 2) | $1480.9 \leq f \leq 1525.9$ (Note 3) |
| F_{UW} (Band XXII operation) | MHz | $3502.4 \leq f \leq 3597.6$ | $3495 \leq f \leq 3605$ |
| F_{UW} (Band XXV operation) | MHz | $1922.4 \leq f \leq 2002.6$ | $1915 \leq f \leq 2010$ |
| F_{UW} (Band XXVI operation) | MHz | $851.4 \leq f \leq 901.6$ | $844 \leq f \leq 909$ |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | |

NOTE 1: I_{blocking} (modulated) consists of the common channels needed for tests as specified in Table E.4.1 and 16 dedicated data channels as specified in Table E.3.6.

NOTE 2: For each carrier frequency the requirement is valid for two frequencies, the carrier frequency +/- 10 MHz.

NOTE 3: For Band VI, Band XIX and Band XXI and Band XIX, the unwanted interfering signal does not fall inside the UE receive band, but within the first 15 MHz below or above the UE receive band.

NOTE 4: $\langle \text{REFSENS} \rangle$ and $\langle \text{REF}_{\text{or}} \hat{I} \rangle$ refers to the DPCH_Ec $\langle \text{REFSENS} \rangle$ and the DPCH $\langle \text{REF}_{\text{or}} \hat{I} \rangle$ as specified in Table 6.2.1.

Table 6.5.5: Test parameters for Out of band blocking characteristics

| Parameter | Unit | Frequency range 1 | Frequency range 2 | Frequency range 3 | Frequency range 4 |
|----------------------------------|--------------|---|---|---|---|
| DPCH_Ec | dBm/3.84 MHz | $\langle \text{REFSENS} \rangle + 3 \text{ dB}$ | $\langle \text{REFSENS} \rangle + 3 \text{ dB}$ | $\langle \text{REFSENS} \rangle + 3 \text{ dB}$ | $\langle \text{REFSENS} \rangle + 3 \text{ dB}$ |
| \hat{I}_{or} | dBm/3.84 MHz | $\langle \text{REF}_{\text{or}} \hat{I} \rangle + 3 \text{ dB}$ | $\langle \text{REF}_{\text{or}} \hat{I} \rangle + 3 \text{ dB}$ | $\langle \text{REF}_{\text{or}} \hat{I} \rangle + 3 \text{ dB}$ | $\langle \text{REF}_{\text{or}} \hat{I} \rangle + 3 \text{ dB}$ |
| I_{blocking} (CW) | dBm | -44 | -30 | -15 | -15 |
| F_{UW} (Band I operation) | MHz | $2050 < f < 2095$ $2185 < f < 2230$ | $2025 < f \leq 2050$ $2230 \leq f < 2255$ | $1 < f \leq 2025$ $2255 \leq f < 12750$ | - |

| F_{uw} (Band XXVI operation) | MHz | 799 < f < 844 909 < f < 954 | 774 < f ≤ 799 954 ≤ f < 979 | 1 < f ≤ 774 979 ≤ f < 12750 | 814 ≤ f ≤ 849 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | | | |
| Band I operation | For 2095 ≤ f ≤ 2185 MHz, the appropriate in-band blocking or adjacent channel selectivity in clause 6.5.2 and clause 6.4.2 shall be applied. | | | | |
| Band II operation | For 1915 ≤ f ≤ 2005 MHz, the appropriate in-band blocking or adjacent channel selectivity in clause 6.5.2 and clause 6.4.2 shall be applied. | | | | |
| Band III operation | For 1790 ≤ f ≤ 1895 MHz, the appropriate in-band blocking or adjacent channel selectivity in clause 6.5.2 and clause 6.4.2 shall be applied. | | | | |
| Band IV operation | For 2095 ≤ f ≤ 2170 MHz, the appropriate in-band blocking or adjacent channel selectivity in clause 6.5.2 and clause 6.4.2 shall be applied. | | | | |
| Band V operation | For 854 ≤ f ≤ 909 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.5.2 and subclause 6.4.2 shall be applied. | | | | |
| Band VI operation | For 860 < f < 875 MHz and 885 < f < 900 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.5.2 and subclause 6.4.2 shall be applied. | | | | |
| Band VII operation | For 2605 ≤ f ≤ 2705 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.5.2 and subclause 6.4.2 shall be applied. | | | | |
| Band VIII operation | For 910 ≤ f ≤ 975 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.5.2 and subclause 6.4.2 shall be applied. | | | | |
| Band IX operation | For 1830 ≤ f ≤ 1895 MHz, the appropriate in-band blocking or adjacent channel selectivity in clause 6.5.2 and clause 6.4.2 shall be applied. | | | | |
| Band X operation | For 2095 ≤ f ≤ 2185 MHz, the appropriate in-band blocking or adjacent channel selectivity in clause 6.5.2 and clause 6.4.2 shall be applied. | | | | |
| Band XI operation | For 1461 ≤ f ≤ 1511 MHz, the appropriate in-band blocking or adjacent channel selectivity in clause 6.5.2 and clause 6.4.2 shall be applied. | | | | |
| Band XII operation | For 714 ≤ f ≤ 761 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.5.2 and subclause 6.4.2 shall be applied. | | | | |
| Band XIII | For 731 ≤ f ≤ 771 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause | | | | |

| Parameter | Unit | Frequency range 1 | Frequency range 2 | Frequency range 3 | Frequency range 4 |
|---|------|--|-------------------|-------------------|-------------------|
| operation | | 6.5.2 and subclause 6.4.2 shall be applied. | | | |
| Band XIV operation | | For $743 \leq f \leq 783$ MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.5.2 and subclause 6.4.2 shall be applied. | | | |
| Band XIX operation | | For $860 \leq f \leq 905$ MHz, the appropriate in-band blocking or adjacent channel selectivity in clause 6.5.2 and clause 6.4.2 shall be applied. | | | |
| Band XX operation | | For $776 \leq f \leq 836$ MHz, the appropriate in-band blocking or adjacent channel selectivity in clause 6.5.2 and clause 6.4.2 shall be applied. | | | |
| Band XXI operation | | For $1480.9 \leq f \leq 1525.9$ MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.5.2 and subclause 6.4.2 shall be applied. | | | |
| Band XXII operation | | For $3495 \leq f \leq 3605$ MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.5.2 and subclause 6.4.2 shall be applied. | | | |
| Band XXV operation | | For $1915 \leq f \leq 2010$ MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.5.2 and subclause 6.4.2 shall be applied. | | | |
| Band XXVI operation | | For $844 \leq f \leq 909$ MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.5.2 and subclause 6.4.2 shall be applied. | | | |
| NOTE: For the UE which supports both Band XI and Band XXI operating frequencies, the Out of band blocking is FFS. | | | | | |

NOTE 1: $\langle \text{REFSENS} \rangle$ and $\langle \text{REF}_{\text{or}} \hat{I} \rangle$ refers to the $\text{DPCH_Ec} \langle \text{REFSENS} \rangle$ and the $\text{DPCH} \langle \text{REF}_{\text{or}} \hat{I} \rangle$ as specified in Table 6.2.1.

Table 6.5.6: Test parameters for narrow band blocking

| Parameter | Unit | Band II, IV, V, X, XXV, XXVI | Band III, VIII, XII, XIII, XIV |
|------------------------------------|--------------|---|--|
| DPCH_Ec | dBm/3.84 MHz | $\langle \text{REFSENS} \rangle + 10$ dB | $\langle \text{REFSENS} \rangle + 10$ dB |
| \hat{I}_{or} | dBm/3.84 MHz | $\langle \text{REF}_{\text{or}} \hat{I} \rangle + 10$ dB | $\langle \text{REF}_{\text{or}} \hat{I} \rangle + 10$ dB |
| $I_{\text{blocking}}(\text{GMSK})$ | dBm | -57 | -56 |
| $F_{\text{uw}}(\text{offset})$ | MHz | 2.7 | 2.8 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | |

NOTE 2: $I_{\text{blocking}}(\text{GMSK})$ is an interfering signal as defined in TS 45.004. It is a continuous GMSK modulated carrier following the structure of the GSM signals, but with all modulating bits (including the midamble period) derived directly from a random or any pseudo random data stream.

NOTE 3: $\langle \text{REFSENS} \rangle$ and $\langle \text{REF}_{\text{or}} \hat{I} \rangle$ refers to the $\text{DPCH_Ec} \langle \text{REFSENS} \rangle$ and the $\text{DPCH} \langle \text{REF}_{\text{or}} \hat{I} \rangle$ as specified in Table 6.2.1.

NOTE 4: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

6.5A Blocking Characteristics for DC-HSDPA

6.5A.1 Definition and applicability

The blocking characteristic is a measure of the receiver's ability to receive a wanted signal at its assigned channel frequency in the presence of an unwanted interferer on frequencies other than those of the spurious response or the adjacent channels, without this unwanted input signal causing a degradation of the performance of the receiver beyond a specified limit. The blocking performance shall apply at all frequencies except those at which a spurious response occur.

The requirements in clause 6.5A.2.1 and 6.5A.2.2 and this test apply for Release 8 and later releases to all types of UTRA for the FDD UE that support DC-HSDPA.

The requirements in clause 6.5A.2.3 and this test apply for Release 8 and later releases to the FDD UE that support DC-HSDPA and are supporting Band II, Band III, Band IV, Band V, Band VIII, Band X, Band XII, Band XIII or Band XIV.

6.5A.2 Minimum Requirements

6.5A.2.1 Minimum Requirements (In-band blocking)

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 6.5A.1. In-band blocking is defined for an unwanted interfering signal falling into the UE receive band or into the first 15 MHz below or above the UE receive band.

Table 6.5A.1: In-band blocking for DC-HSDPA

| Parameter | Unit | Level | |
|---------------------------------------|--------------|---|---|
| HS-PDSCH_Ec | dBm/3.84 MHz | <REFSENS>+3 dB | |
| I_{or} | dBm/3.84 MHz | <REF I_{or} > + 3 dB | |
| $I_{blocking}$ mean power (modulated) | dBm | -56 | -44 |
| F_{uw} offset (note 4) | | ± 10 MHz | ≤ 15 MHz & ≥ 15 MHz |
| F_{uw} (Band I operation) | MHz | $2102.4 \leq f \leq 2177.6$ (Note 2) | $2095 \leq f \leq 2185$ |
| F_{uw} (Band II operation) | MHz | $1922.4 \leq f \leq 1997.6$ (Note 2) | $1915 \leq f \leq 2005$ |
| F_{uw} (Band III operation) | MHz | $1797.4 \leq f \leq 1887.6$ (Note 2) | $1790 \leq f \leq 1895$ |
| F_{uw} (Band IV operation) | MHz | $2102.4 \leq f \leq 2162.6$ (Note 2) | $2095 \leq f \leq 2170$ |
| F_{uw} (Band V operation) | MHz | $861.4 \leq f \leq 901.6$ (Note 2) | $854 \leq f \leq 909$ |
| F_{uw} (Band VI operation) | MHz | $867.4 \leq f \leq 892.6$ (Note 2 and 3) | $860 \leq f \leq 900$ (Note 3) |
| F_{uw} (Band VII operation) | MHz | $2612.4 \leq f \leq 2697.6$ (Note 2) | $2605 \leq f \leq 2705$ |
| F_{uw} (Band VIII operation) | MHz | $917.4 \leq f \leq 967.6$ (Note 2) | $910 \leq f \leq 975$ |
| F_{uw} (Band IX operation) | MHz | $1837.4 \leq f \leq 1887.4$ (Note 2) | $1829.9 \leq f \leq 1894.9$ |
| F_{uw} (Band X operation) | MHz | $2102.4 \leq f \leq 2177.6$ (Note 2) | $2095 \leq f \leq 2185$ |
| F_{uw} (Band XI operation) | MHz | $1468.4 \leq f \leq 1503.4$ (Note 2) | $1460.9 \leq f \leq 1510.9$ |
| F_{uw} (Band XII operation) | MHz | $721.4 \leq f \leq 753.6$ (Note 2) | $714 \leq f \leq 761$ |
| F_{uw} (Band XIII operation) | MHz | $738.4 \leq f \leq 763.6$ (Note 2) | $731 \leq f \leq 771$ |
| F_{uw} (Band XIV operation) | MHz | $750.4 \leq f \leq 775.6$ (Note 2) | $743 \leq f \leq 783$ |
| F_{uw} (Band XIX operation) | MHz | $867.4 \leq f \leq 897.6$ (Note 2) | $860 \leq f \leq 905$ (Note 3) |
| F_{uw} (Band XX operation) | MHz | $783.4 \leq f \leq 828.6$ (Note 2) | $776 \leq f \leq 836$ |
| F_{uw} (Band XXI operation) | MHz | $1488.4 \leq f \leq 1518.4$ (Note 2) | $1480.9 \leq f \leq 1525.9$ (Note 3) |
| F_{uw} (Band XXII operation) | MHz | $3502.4 \leq f \leq 3597.6$ (Note 2) | $3495 \leq f \leq 3605$ |
| F_{uw} (Band XXV operation) | MHz | $1922.4 \leq f \leq 2002.6$ | $1915 \leq f \leq 2010$ |
| F_{uw} (Band XXVI operation) | MHz | $851.4 \leq f \leq 901.6$ | $844 \leq f \leq 909$ |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | |

NOTE 1: $I_{blocking}$ (modulated) consists of the common channels needed for tests as specified in Table E.4.1 and 16 dedicated data channels as specified in Table E.3.6.

NOTE 2: For each carrier frequency the requirement is valid for two frequencies, the carrier frequency +/- 10 MHz.

NOTE 3: For Band VI, Band XIX and Band XXI, the unwanted interfering signal does not fall inside the UE receive band, but within the first 15 MHz below or above the UE receive band.

NOTE 4: Negative offsets refer to the assigned channel frequency of the lowest carrier frequency used and positive offsets refer to the assigned channel frequency of the highest carrier frequency used.

NOTE 5: <REFSENS> and <REF_{or}> refers to the HS-PDSCH_Ec<REFSENS> and the HS-PDSCH<REF_{or}> as specified in Table 6.2A.1.

The normative reference for this requirement is TS 25.101 [1] clause 7.6.1A.

6.5A.2.2 Minimum requirements (Out of-band blocking)

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 6.5A.2. Out-of-band band blocking is defined for an unwanted interfering signal falling more than 15 MHz below or above the UE receive band.

For Table 6.5A.2 in frequency range 1, 2 and 3, up to 24 exceptions per received cell are allowed for spurious response frequencies in each assigned frequency channel when measured using a 1 MHz step size. For these exceptions the requirements of clause 6.6A spurious response are applicable.

For Table 6.5A.2 in frequency range 4, up to 8 exceptions per received cell are allowed for spurious response frequencies in each assigned frequency channel when measured using a 1 MHz step size. For these exceptions the requirements of clause 6.6A spurious response are applicable.

Table 6.5A.2: Out of band blocking for DC-HSDPA

| Parameter | Unit | Frequency range 1 | Frequency range 2 | Frequency range 3 | Frequency range 4 |
|---|-------------------|--|--|--------------------------------------|-----------------------------|

| Band I operation | For 2095 ≤ f ≤ 2185 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.4A.2 and subclause 6.5.2.1 shall be applied. | | | | |
| Band II operation | For 1915 ≤ f ≤ 2005 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.4A.2 and subclause 6.5.2.1 shall be applied. | | | | |
| Band III operation | For 1790 ≤ f ≤ 1895 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.4A.2 and subclause 6.5.2.1 shall be applied. | | | | |
| Band IV operation | For 2095 ≤ f ≤ 2170 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.4A.2 and subclause 6.5.2.1 shall be applied. | | | | |
| Band V operation | For 854 ≤ f ≤ 909 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.4A.2 and subclause 6.5.2.1 shall be applied. | | | | |
| Band VI operation | For 860 ≤ f ≤ 900 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.4A.2 and subclause 6.5.2.1 shall be applied. | | | | |
| Band VII operation | For 2605 ≤ f ≤ 2705 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.4A.2 and subclause 6.5.2.1 shall be applied. | | | | |
| Band VIII operation | For 910 ≤ f ≤ 975 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.4A.2 and subclause 6.5.2.1 shall be applied. | | | | |
| Band IX operation | For 1829.9 ≤ f ≤ 1894.9 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.4A.2 and subclause 6.5.2.1 shall be applied. | | | | |
| Band X operation | For 2095 ≤ f ≤ 2185 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.4A.2 and subclause 6.5.2.1 shall be applied. | | | | |
| Band XI operation | For 1460.9 ≤ f ≤ 1510.9 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.4A.2 and subclause 6.5.2.1 shall be applied. | | | | |
| Band XII operation | For 714 ≤ f ≤ 761 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.4A.2 and subclause 6.5.2.1 shall be applied. | | | | |
| Band XIII operation | For 731 ≤ f ≤ 771 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.4A.2 and subclause 6.5.2.1 shall be applied. | | | | |
| Band XIV operation | For 743 ≤ f ≤ 783 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.4A.2 and subclause 6.5.2.1 shall be applied. | | | | |
| Band XX operation | For 776 ≤ f ≤ 836 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.4A.2 and subclause 6.5.2.1 shall be applied. | | | | |
| Band XIX operation | For 860 ≤ f ≤ 905 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.4A.2 and subclause 6.5.2.1 shall be applied. | | | | |

| Parameter | Unit | Frequency range 1 | Frequency range 2 | Frequency range 3 | Frequency range 4 |
|---------------------|---|---|-------------------|-------------------|-------------------|
| Band XXI operation | | For $1480.9 \leq f \leq 1525.9$ MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.4A.2 and subclause 6.5.2.1 shall be applied. | | | |
| Band XXII operation | | For $3495 \leq f \leq 3605$ MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.4A.2 and subclause 6.5.2.1 shall be applied. | | | |
| Band XXV operation | | For $1915 \leq f \leq 2010$ MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.4A.2 and subclause 6.5.2.1 shall be applied. | | | |
| Band XXVI operation | | For $844 \leq f \leq 909$ MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.4A.2 and subclause 6.5.2.1 shall be applied. | | | |
| NOTE: | For the UE which supports both Band XI and Band XXI operating frequencies, the Out of band blocking is FFS. | | | | |

NOTE: $\langle \text{REFSENS} \rangle$ and $\langle \text{REFI}_{\text{or}} \rangle$ refers to the HS-PDSCH_Ec $\langle \text{REFSENS} \rangle$ and the HS-PDSCH $\langle \text{REFI}_{\text{or}} \rangle$ as specified in Table 6.2A.1

The normative reference for this requirement is TS 25.101 [1] clause 7.6.2A.

6.5A.2.3 Minimum requirements (Narrow band blocking)

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 6.5A.3. This requirement is measure of a receiver's ability to receive a W-CDMA signal at its assigned channel frequency in the presence of an unwanted narrow band interferer at a frequency, which is less than the nominal channel spacing.

Table 6.5A.3: Narrow band blocking characteristics for DC-HSDPA

| Parameter | Unit | Band II, IV, V, X, XXV, XXVI | Band III, VIII, XII, XIII, XIV |
|-----------------------------------|--------------|---|---|
| HS-PDSCH_Ec | dBm/3.84 MHz | $\langle \text{REFSENS} \rangle + 10$ dB | $\langle \text{REFSENS} \rangle + 10$ dB |
| I_{or} | dBm/3.84 MHz | $\langle \text{REFI}_{\text{or}} \rangle + 10$ dB | $\langle \text{REFI}_{\text{or}} \rangle + 10$ dB |
| I_{blocking} (GMSK) | dBm | -57 | -56 |
| F_{uw} (offset) (NOTE 2) | MHz | ± 2.7 | ± 2.8 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | |

NOTE 1: I_{blocking} (GMSK) is an interfering signal as defined in TS 45.004.

NOTE 2: Negative offsets refer to the assigned channel frequency of the lowest carrier frequency used and positive offsets refer to the assigned channel frequency of the highest carrier frequency used.

NOTE 3: $\langle \text{REFSENS} \rangle$ and $\langle \text{REFI}_{\text{or}} \rangle$ refers to the HS-PDSCH_Ec $\langle \text{REFSENS} \rangle$ and the HS-PDSCH $\langle \text{REFI}_{\text{or}} \rangle$ as specified in Table 6.2A.1.

The normative reference for this requirement is TS 25.101 [1] clause 7.6.3A.

6.5A.3 Test purpose

To verify that the UE BLER of HS-PDSCH on each individual cell does not exceed 0.1 for the parameters specified in table 6.5A.5, table 6.5A.6 and table 6.5A.7 for the DL reference channel H-Set 12 specified in Annex C.8.1.12.

The lack of the blocking ability decreases the DC-HSDPA coverage area when other transmitter exists (except in the adjacent channels and spurious response).

6.5A.4 Method of test

6.5A.4.1 Initial conditions

For in-band case:

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

For out-of-band case:

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequency to be tested: 1 arbitrary frequency chosen from the low, mid or high range; see clause G.2.4.

For narrow-band case:

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.32.
- 2) RF parameters are set up according to table 6.5A.5, table 6.5A.6 and table 6.5A.7.
- 3) A call is set up according to the Generic DC-HSDPA setup procedure specified in TS34.108[3] sub clause 7.3.13, with exceptions for information elements listed in Table 6.5A.4. With this exception, the Power Control Algorithm for the Uplink is set to algorithm 2.

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

6.5A.4.2 Procedure

- 1) Set the parameters of the CW generator or the interference signal generator as shown in table 6.5A.5, table 6.5A.6 and table 6.5A.6. For table 6.5A.6, the frequency step size is 1 MHz.
- 2) Set the power level of UE according to the table 6.5A.5, table 6.5A.6, and table 6.5A.7, or send the power control commands (1dB step size should be used.) to the UE until UE output power measured by Test System shall be kept at the specified power level with ± 1 dB tolerance.
- 3) Measure the BLER of HS-PDSCH received from the UE at the SS by counting the number of NACK, ACK and statDTX on the UL HS-DPCCH (BLER = (NACK + statDTX)/(NACK + statDTX + ACK)).
- 4) For table 6.5A.6, record the frequencies for which BLER exceed the test requirements.

6.5A.5 Test requirements

For table 6.5A.5, the measured BLER, derived in step 2), shall not exceed 0.1 on each individual cell. For table 6.5A.6, the measured BLER, derived in step 2) shall not exceed 0.1 on each individual cell except for the spurious response frequencies, recorded in step 3). The number of spurious response frequencies, recorded in step 3) shall not exceed 24 for frequency range 1, 2 and 3. The number of spurious response frequencies, recorded in step 3) shall not exceed 8 for frequency range 4. For table 6.5A.7, the measured BLER, derived in step 2), shall not exceed 0.1 on each individual cell. The minimum number of measurements required for a statistically significant result to this test is clarified in annex F.6.3, Table F.6.3.5.0.

Table 6.5A.5: Test parameters for In-band blocking characteristics for DC-HSDPA

| Parameter | Unit | Level | |
|--|--------------|---|---------------------------------|

| F _{uw} (Band XXV operation) | MHz | 1922.4 ≤ f ≤ 2002.6 | 1915 ≤ f ≤ 2010 |
| F _{uw} (Band XXVI operation) | MHz | 851.4 ≤ f ≤ 901.6 | 844 ≤ f ≤ 909 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | |

NOTE 1: I_{blocking} (modulated) consists of the common channels needed for tests as specified in Table E.4.1 and 16 dedicated data channels as specified in Table E.3.6.

NOTE 2: For each carrier frequency the requirement is valid for two frequencies, the carrier frequency +/- 10 MHz.

NOTE 3: For Band VI, Band XIX and Band XXI, the unwanted interfering signal does not fall inside the UE receive band, but within the first 15 MHz below or above the UE receive band.

NOTE 4: Negative offsets refer to the assigned channel frequency of the lowest carrier frequency used and positive offsets refer to the assigned channel frequency of the highest carrier frequency used.

NOTE 5: <REFSENS> and <REF_{or}> refers to the HS-PDSCH_Ec<REFSENS> and the HS-PDSCH<REF_{or}> as specified in Table 6.2A.1.

Table 6.5A.6: Test parameters for Out of band blocking characteristics for DC-HSDPA

| Parameter | Unit | Frequency range 1 | Frequency range 2 | Frequency range 3 | Frequency range 4 |

| Band XI operation | For 1461 ≤ f ≤ 1516 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.4A.2 and subclause 6.5.2.1 shall be applied. | | | | |
| Band XII operation | For 714 ≤ f ≤ 761 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.4A.2 and subclause 6.5.2.1 shall be applied. | | | | |
| Band XIII operation | For 731 ≤ f ≤ 771 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.4A.2 and subclause 6.5.2.1 shall be applied. | | | | |
| Band XIV operation | For 743 ≤ f ≤ 783 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.4A.2 and subclause 6.5.2.1 shall be applied. | | | | |
| Band XIX operation | For 860 ≤ f ≤ 905 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.4A.2 and subclause 6.5.2.1 shall be applied. | | | | |
| Band XXI operation | For 1481 ≤ f ≤ 1526 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.4A.2 and subclause 6.5.2.1 shall be applied. | | | | |
| Band XXII operation | For 3495 ≤ f ≤ 3605 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.4A.2 and subclause 6.5.2.1 shall be applied. | | | | |
| Band XXV operation | For 1915 ≤ f ≤ 2010 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.4A.2 and subclause 6.5.2.1 shall be applied. | | | | |
| Band XXVI operation | For 844 ≤ f ≤ 909 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.4A.2 and subclause 6.5.2.1 shall be applied. | | | | |
| NOTE | For the UE which supports both Band XI and Band XXI operating frequencies, the Out of band blocking is FFS. | | | | |

NOTE 6: <REFSENS> and <REF_{or}> refers to the HS-PDSCH_{Ec}<REFSENS> and the HS-PDSCH<REF_{or}> as specified in Table 6.2A.1

Table 6.5A.7: Test parameters for narrow band blocking for DC-HSDPA

| Parameter | Unit | Band II, IV, V, X, XXV, XXVI | Band III, VIII, XII, XIII, XIV |
|-------------------------------|--------------|---|--------------------------------|
| HS-PDSCH_Ec | dBm/3.84 MHz | <REFSENS> + 10 dB | <REFSENS> + 10 dB |
| I_{or} | dBm/3.84 MHz | <REF I_{or} > + 10 dB | <REF I_{or} > + 10 dB |
| $I_{blocking}$ (GMSK) | dBm | -57 | -56 |
| F_{uw} (offset) (NOTE 2) | MHz | ±2.7 | ±2.8 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | |

NOTE 7: $I_{blocking}$ (GMSK) is an interfering signal as defined in TS 45.004.

NOTE 8: Negative offsets refer to the assigned channel frequency of the lowest carrier frequency used and positive offsets refer to the assigned channel frequency of the highest carrier frequency used.

NOTE 9: <REFSENS> and <REF I_{or} > refers to the HS-PDSCH_Ec<REFSENS> and the HS-PDSCH<REF I_{or} > as specified in Table 6.2A.1.

NOTE 10: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

6.5B Blocking Characteristics for DB-DC-HSDPA

6.5B.1 Definition and applicability

The blocking characteristic is a measure of the receiver's ability to receive a wanted signal at its assigned channel frequency in the presence of an unwanted interferer on frequencies other than those of the spurious response or the adjacent channels, without this unwanted input signal causing a degradation of the performance of the receiver beyond a specified limit. The blocking performance shall apply at all frequencies except those at which a spurious response occur.

The requirements in this test apply for Release 9 and later releases to all types of UTRA for the FDD UE that support DB-DC-HSDPA.

DB-DC-HSDPA is designed to operate in configurations specified in clause 4.2.

6.5B.2 Minimum Requirements

6.5B.2.1 Minimum Requirements (In-band blocking)

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 6.5B.1. In-band blocking is defined for an unwanted interfering signal falling into the UE receive band or into the first 15 MHz below or above the UE receive band.

Table 6.5B.1: In-band blocking for DB-DC-HSDPA

| Parameter | Unit | Level | |
|--|--------------|---|------------------------------|
| HS-PDSCH_Ec | dBm/3.84 MHz | <REFSENS>+3 dB | |
| I _{or} | dBm/3.84 MHz | <REFI _{or} > + 3 dB | |
| I _{blocking} mean power (modulated) | dBm | -56 | -44 |
| F _{uw} offset (NOTE 4) | | =±10 MHz | ≤-15 MHz & ≥15 MHz |
| F _{uw} (Band I operation) | MHz | 2102.4 ≤ f ≤ 2177.6 | 2095 ≤ f ≤ 2185 |
| F _{uw} (Band II operation) | MHz | 1922.4 ≤ f ≤ 1997.6 | 1915 ≤ f ≤ 2005 |
| F _{uw} (Band III operation) | MHz | 1797.4 ≤ f ≤ 1887.6 | 1790 ≤ f ≤ 1895 |
| F _{uw} (Band IV operation) | MHz | 2102.4 ≤ f ≤ 2162.6 | 2095 ≤ f ≤ 2170 |
| F _{uw} (Band V operation) | MHz | 861.4 ≤ f ≤ 901.6 | 854 ≤ f ≤ 909 |
| F _{uw} (Band VI operation) | MHz | 867.4 ≤ f ≤ 892.6 (Note3) | 860 ≤ f ≤ 900 (Note 3) |
| F _{uw} (Band VII operation) | MHz | 2612.4 ≤ f ≤ 2697.6 | 2605 ≤ f ≤ 2705 |
| F _{uw} (Band VIII operation) | MHz | 917.4 ≤ f ≤ 967.6 | 910 ≤ f ≤ 975 |
| F _{uw} (Band IX operation) | MHz | 1837.4 ≤ f ≤ 1887.4 | 1829.9 ≤ f ≤ 1894.9 |
| F _{uw} (Band X operation) | MHz | 2102.4 ≤ f ≤ 2177.6 | 2095 ≤ f ≤ 2185 |
| F _{uw} (Band XI operation) | MHz | 1468.4 ≤ f ≤ 1503.4 | 1460.9 ≤ f ≤ 1510.9 |
| F _{uw} (Band XII operation) | MHz | 721.4 ≤ f ≤ 753.6 | 714 ≤ f ≤ 761 |
| F _{uw} (Band XIII operation) | MHz | 738.4 ≤ f ≤ 763.6 | 731 ≤ f ≤ 771 |
| F _{uw} (Band XIV operation) | MHz | 750.4 ≤ f ≤ 775.6 | 743 ≤ f ≤ 783 |
| F _{uw} (Band XIX operation) | MHz | 867.4 ≤ f ≤ 897.6 | 860 ≤ f ≤ 905 (Note 3) |
| F _{uw} (Band XX operation) | MHz | 783.4 ≤ f ≤ 828.6 | 776 ≤ f ≤ 836 |
| F _{uw} (Band XXI operation) | MHz | 1488.4 ≤ f ≤ 1518.4 | 1480.9 ≤ f ≤ 1525.9 (Note 3) |
| F _{uw} (Band XXII operation) | MHz | 3502.4 ≤ f ≤ 3597.6 | 3495 ≤ f ≤ 3605 |
| F _{uw} (Band XXV operation) | MHz | 1922.4 ≤ f ≤ 2002.6 | 1915 ≤ f ≤ 2010 |
| F _{uw} (Band XXVI operation) | MHz | 851.4 ≤ f ≤ 901.6 | 844 ≤ f ≤ 909 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | |

NOTE 1: I_{blocking} (modulated) consists of the common channels needed for tests as specified in Table E.4.1 and 16 dedicated data channels as specified in Table E.3.6.

NOTE 2: For each carrier frequency the requirement is valid for two frequencies, the carrier frequency +/- 10 MHz.

NOTE 3: For Band VI, Band XIX and Band XXI, the unwanted interfering signal does not fall inside the UE receive band, but within the first 15 MHz below or above the UE receive band.

NOTE 4: For DC-HSDPA, negative offset refers to the assigned channel frequency of the lowest carrier frequency used and positive offset refers to the assigned channel frequency of the highest carrier frequency used. For DB-DC-HSDPA, offset refers to the assigned channel frequencies of the individual cells.

NOTE 5: <REFSENS> and <REF_{or}[↑]> refers to the HS-PDSCH_Ec<REFSENS> and the HS-PDSCH<REF_{or}[↑]> as specified in Table 6.2B.1.

The normative reference for this requirement is TS 25.101 [1] clause 7.6.1A.

6.5B.2.2 Minimum requirements (Out of-band blocking)

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 6.5B.2. Out-of-band blocking is defined for an unwanted interfering signal falling at frequencies outside of frequency regions defined as the UE receive bands extended by 15 MHz at their lower and upper ends. For Table 6.5B.2 in frequency range 1, 2 and 3, up to 24 exceptions per received cell are allowed for spurious response frequencies in each assigned frequency channel when measured using a 1 MHz step size. For these exceptions the requirements of clause 6.6B Spurious response are applicable.

For Table 6.5B.2 in frequency range 4, up to 8 exceptions per received cell are allowed for spurious response frequencies in each assigned frequency channel when measured using a 1 MHz step size. For these exceptions the requirements of clause 6.6B Spurious response for DB-DC-HSDPA are applicable.

Table 6.5B.2: Out of band blocking for DB-DC-HSDPA

| Parameter | Unit | Frequency range 1 | Frequency range 2 | Frequency range 3 | Frequency range 4 |
|--|--|---|--|--|--|
| HS-PDSCH_Ec | dBm / 3.84 MHz | <REFSENS>+3 dB | <REFSENS>+3 dB | <REFSENS>+3 dB | <REFSENS> +3 dB |
| \hat{I}_{or} | dBm / 3.84 MHz | <REF _{or} [↑] > + 3 dB | <REF _{or} [↑] > + 3 dB | <REF _{or} [↑] > + 3 dB | <REF _{or} [↑] > + 3 dB |
| $I_{blocking}(CW)$ | dBm | -44 | -30 | -15 | -15 |
| F_{uw} (DB-DC-HSDPA Configuration 1) | MHz | 865 < f < 910 975 < f < 1020 2050 < f < 2095 2185 < f < 2230 | 840 < f ≤ 865 1020 ≤ f < 1045 2025 < f ≤ 2050 2230 ≤ f < 2255 | 1 < f ≤ 840 1045 ≤ f < 2025 2255 < f ≤ 12750 | - |
| F_{uw} (DB-DC-HSDPA Configuration 2) | MHz | 1870 < f < 1915 2005 < f < 2095 2170 < f < 2215 | 1845 < f ≤ 1870 2215 ≤ f < 2240 | 1 < f ≤ 1845 2240 ≤ f < 12750 | 1850 ≤ f ≤ 1910 |
| F_{uw} (DB-DC-HSDPA Configuration 3) | MHz | 809 < f < 854 909 < f < 954 2050 < f < 2095 2185 < f < 2230 | 784 < f ≤ 809 954 ≤ f < 979 2025 < f ≤ 2050 2230 ≤ f < 2255 | 1 < f ≤ 784 979 ≤ f < 2025 2255 < f ≤ 12750 | 824 ≤ f ≤ 849 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | | | |
| DB-DC-HSDPA Configuration 1 | For 910 ≤ f ≤ 975 MHz and 2095 ≤ f ≤ 2185 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.4C.2 and subclause 6.5.B2.1 shall be applied. | | | | |
| DB-DC-HSDPA Configuration 2 | For 1915 ≤ f ≤ 2005 MHz and 2095 ≤ f ≤ 2070 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.4C.2 and subclause 6.5.B2.1 shall be applied. | | | | |
| DB-DC-HSDPA Configuration 3 | For 854 ≤ f ≤ 909 MHz and 2095 ≤ f ≤ 2185 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.4C.2 and subclause 6.5.B2.1 shall be applied. | | | | |

NOTE: <REFSENS> and <REF_{or}[↑]> refers to the HS-PDSCH_Ec<REFSENS> and the HS-PDSCH<REF_{or}[↑]> as specified in Table 6.2B.1

The normative reference for this requirement is TS 25.101 [1] clause 7.6.2B.

6.5B.2.3 Minimum requirements (Narrow band blocking)

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 6.5B.3. This requirement is measure of a receiver's ability to receive a W-CDMA signal at its assigned channel frequency in the presence of an unwanted narrow band interferer at a frequency, which is less than the nominal channel spacing.

Table 6.5B.3: Narrow band blocking characteristics for DB-DC-HSDPA

| Parameter | Unit | Band II, IV, V, X, XXV, XXVI | Band III, VIII, XII, XIII, XIV |
|-------------------------------|--------------|---|--------------------------------|
| HS-PDSCH_Ec | dBm/3.84 MHz | <REFSENS> + 10 dB | <REFSENS> + 10 dB |
| \hat{I}_{or} | dBm/3.84 MHz | <REF \hat{I}_{or} > + 10 dB | <REF \hat{I}_{or} > + 10 dB |
| $I_{blocking}$ (GMSK) | dBm | -57 | -56 |
| F_{uw} (offset) (NOTE 2) | MHz | ± 2.7 | ± 2.8 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | |

NOTE 1: $I_{blocking}$ (GMSK) is an interfering signal as defined in TS 45.004.

NOTE 2: For DC-HSDPA, negative offset refers to the assigned channel frequency of the lowest carrier frequency used and positive offset refers to the assigned channel frequency of the highest carrier frequency used. For DB-DC-HSDPA, offset refers to the assigned channel frequencies of the individual cells.

NOTE 3: <REFSENS> and <REF \hat{I}_{or} > refers to the HS-PDSCH_Ec<REFSENS> and the HS-PDSCH<REF \hat{I}_{or} > as specified in Table 6.2B.1.

The normative reference for this requirement is TS 25.101 [1] clause 7.6.3A.

6.5B.3 Test purpose

To verify that the UE BLER of HS-PDSCH on each individual cell does not exceed 0.1 for the parameters specified in table 6.5B.5, table 6.5B.6 and table 6.5B.7 for the DL reference channel H-Set 12 specified in Annex C.8.1.12.

The lack of the blocking ability decreases the DB-DC-HSDPA coverage area when other transmitter exists (except in the adjacent channels and spurious response).

6.5B.4 Method of test

6.5B.4.1 Initial conditions

For in-band case:

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

For out-of-band case:

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequency to be tested: 1 arbitrary frequency chosen from the low, mid or high range; see clause G.2.4.

For narrow-band case:

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.32.
- 2) RF parameters are set up according to table 6.5B.5, table 6.5B.6 and table 6.5B.7.
- 3) A call is set up according to the Generic call setup procedure specified in TS34.108[3] sub clause 7.3.13, with exceptions for information elements listed in Table 6.5B.4. With this exception, the Power Control Algorithm for the Uplink is set to algorithm 2.

6.5B.4.2 Procedure

- 1) Set the parameters of the CW generator or the interference signal generator as shown in table 6.5B.5, table 6.5B.6 and table 6.5B.6. For table 6.5B.6, the frequency step size is 1 MHz.
- 2) Set the power level of UE according to the table 6.5B.5, table 6.5B.6, and table 6.5B.7, or send the power control commands (1dB step size should be used.) to the UE until UE output power measured by Test System shall be kept at the specified power level with ± 1 dB tolerance.
- 3) Measure the BLER of HS-PDSCH received from the UE at the SS by counting the number of NACK, ACK and statDTX on the UL HS-DPCCH ($BLER = (NACK + statDTX)/(NACK + statDTX + ACK)$).
- 4) For table 6.5B.6, record the frequencies for which BLER exceed the test requirements.

6.5B.5 Test requirements

For table 6.5B.5, the measured BLER, derived in step 2), shall not exceed 0.1 on each individual cell. For table 6.5B.6, the measured BLER, derived in step 2) shall not exceed 0.1 on each individual cell except for the spurious response frequencies, recorded in step 3). The number of spurious response frequencies, recorded in step 3) shall not exceed 24 for frequency range 1, 2 and 3. The number of spurious response frequencies, recorded in step 3) shall not exceed 8 for frequency range 4. For table 6.5B.7, the measured BLER, derived in step 2), shall not exceed 0.1 on each individual cell. The minimum number of measurements required for a statistically significant result to this test is clarified in annex F.6.3, Table F.6.3.5.0.

Table 6.5B.5: Test parameters for In-band blocking characteristics for DB-DC-HSDPA

| Parameter | Unit | Level | |
|--|--------------|---|--------------------------|
| HS-PDSCH_Ec | dBm/3.84 MHz | <REFSENS>+3 dB | |
| I _{or} | dBm/3.84 MHz | <REFI _{or} > + 3 dB | |
| I _{blocking} mean power (modulated) | dBm | -56 | -44 |
| F _{uw} offset (NOTE 3) | | ±10 MHz | ≤-15 MHz & ≥15 MHz |
| F _{uw} (Band I operation) | MHz | 2102.4 ≤ f ≤ 2177.6 (Note 2) | 2095 ≤ f ≤ 2185 |
| F _{uw} (Band II operation) | MHz | 1922.4 ≤ f ≤ 1997.6 (Note 2) | 1915 ≤ f ≤ 2005 |
| F _{uw} (Band IV operation) | MHz | 2102.4 ≤ f ≤ 2162.6 (Note 2) | 2095 ≤ f ≤ 2170 |
| F _{uw} (Band V operation) | MHz | 861.4 ≤ f ≤ 901.6 (Note 2) | 854 ≤ f ≤ 909 |
| F _{uw} (Band VIII operation) | MHz | 917.4 ≤ f ≤ 967.6 (Note 2) | 910 ≤ f ≤ 975 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | |

NOTE 1: I_{blocking} (modulated) consists of the common channels needed for tests as specified in Table E.4.1 and 16 dedicated data channels as specified in Table E.3.6.

NOTE 2: For each carrier frequency the requirement is valid for two frequencies, the carrier frequency +/- 10 MHz.

NOTE 3: Offset refers to the assigned channel frequencies of the individual cells.

NOTE 4: <REFSENS> and <REFI_{or}> refers to the HS-PDSCH_Ec<REFSENS> and the HS-PDSCH<REFI_{or}> as specified in Table 6.2B.1.

Table 6.5B.6: Test parameters for Out of band blocking characteristics for DB-DC-HSDPA

| Parameter | Unit | Frequency range 1 | Frequency range 2 | Frequency range 3 | Frequency range 4 |
|---|--|---|--|--|------------------------------|
| HS-PDSCH_Ec | dBm / 3.84 MHz | <REFSENS>+3 dB | <REFSENS>+3 dB | <REFSENS>+3 dB | <REFSENS> +3 dB |
| I _{or} | dBm / 3.84 MHz | <REFI _{or} > + 3 dB | <REFI _{or} > + 3 dB | <REFI _{or} > + 3 dB | <REFI _{or} > + 3 dB |
| I _{blocking} (CW) | dBm | -44 | -30 | -15 | -15 |
| F _{uw} (DB-DC-HSDPA Configuration 1) | MHz | 865 < f < 910 975 < f < 1020 2050 < f < 2095 2185 < f < 2230 | 840 < f ≤ 865 1020 ≤ f < 1045 2025 < f ≤ 2050 2230 ≤ f < 2255 | 1 < f ≤ 840 1045 ≤ f < 2025 2255 < f ≤ 12750 | - |
| F _{uw} (DB-DC-HSDPA Configuration 2) | MHz | 1870 < f < 1915 2005 < f < 2095 2170 < f < 2215 | 1845 < f ≤ 1870 2215 ≤ f < 2240 | 1 < f ≤ 1845 2240 ≤ f < 12750 | 1850 ≤ f ≤ 1910 |
| F _{uw} (DB-DC-HSDPA Configuration 3) | MHz | 809 < f < 854 909 < f < 954 2050 < f < 2095 2185 < f < 2230 | 784 < f ≤ 809 954 ≤ f < 979 2025 < f ≤ 2050 2230 ≤ f < 2255 | 1 < f ≤ 784 979 ≤ f < 2025 2255 < f ≤ 12750 | 824 ≤ f ≤ 849 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | | | |
| DB-DC-HSDPA Configuration 1 | For 910 ≤ f ≤ 975 MHz and 2095 ≤ f ≤ 2185 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.4C.2 and subclause 6.5B.2.1 shall be applied. | | | | |
| DB-DC-HSDPA Configuration 2 | For 1915 ≤ f ≤ 2005 MHz and 2095 ≤ f ≤ 2070 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.4C.2 and subclause 6.5B.2.1 shall be applied. | | | | |
| DB-DC-HSDPA Configuration 3 | For 854 ≤ f ≤ 909 MHz and 2095 ≤ f ≤ 2185 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause 6.4C.2 and subclause 6.5B.2.1 shall be applied. | | | | |

NOTE 5: <REFSENS> and <REFI_{or}> refers to the HS-PDSCH_Ec<REFSENS> and the HS-PDSCH<REFI_{or}> as specified in Table 6.2B.1

Table 6.5B.7: Test parameters for narrow band blocking for DB-DC-HSDPA

| Parameter | Unit | Band II, IV, V | Band VIII |
|-------------------------------|--------------|---|-------------------------|
| HS-PDSCH_Ec | dBm/3.84 MHz | <REFSENS> + 10 dB | <REFSENS> + 10 dB |
| I_{or} | dBm/3.84 MHz | <REF I_{or} > + 10 dB | <REF I_{or} > + 10 dB |
| $I_{blocking}$ (GMSK) | dBm | -57 | -56 |
| F_{uw} (offset) (NOTE 2) | MHz | ±2.7 | ±2.8 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | |

NOTE 6: $I_{blocking}$ (GMSK) is an interfering signal as defined in TS 45.004.

NOTE 7: Offset refers to the assigned channel frequencies of the individual cells.

NOTE 8: <REFSENS> and <REF I_{or} > refers to the HS-PDSCH_Ec<REFSENS> and the HS-PDSCH<REF I_{or} > as specified in Table 6.2B.1.

NOTE 9: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

6.5C Blocking Characteristics for DC-HSUPA

6.5C.1 Definition and applicability

The blocking characteristic is a measure of the receiver's ability to receive a wanted signal at its assigned channel frequency in the presence of an unwanted interferer on frequencies other than those of the spurious response or the adjacent channels, without this unwanted input signal causing a degradation of the performance of the receiver beyond a specified limit. The blocking performance shall apply at all frequencies except those at which a spurious response occur.

The requirements and this test apply for Release 9 and later releases for the FDD UE that supports HSDPA and Dual Cell E-DCH.

6.5C.2 Minimum Requirements

6.5C.2.1 Minimum Requirements (In-band blocking)

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 6.5C.1 and Table 6.5C.2. In-band blocking is defined for an unwanted interfering signal falling into the UE receive band or into the first 15 MHz below or above the UE receive band.

Table 6.5C.1: In-band blocking for DC-HSUPA

| Parameter | Unit | Level | |
|--|------|---|---|
| | | -56 | -44 |
| I_{blocking} mean power (modulated) | dBm | -56 | -44 |
| F_{uw} offset (NOTE 4) | | ± 10 MHz | ≤ 15 MHz & ≥ 15 MHz |
| F_{uw} (Band I operation) | MHz | $2102.4 \leq f \leq 2177.6$ (Note 2) | $2095 \leq f \leq 2185$ |
| F_{uw} (Band II operation) | MHz | $1922.4 \leq f \leq 1997.6$ (Note 2) | $1915 \leq f \leq 2005$ |
| F_{uw} (Band III operation) | MHz | $1797.4 \leq f \leq 1887.6$ (Note 2) | $1790 \leq f \leq 1895$ |
| F_{uw} (Band IV operation) | MHz | $2102.4 \leq f \leq 2162.6$ (Note 2) | $2095 \leq f \leq 2170$ |
| F_{uw} (Band V operation) | MHz | $861.4 \leq f \leq 901.6$ (Note 2) | $854 \leq f \leq 909$ |
| F_{uw} (Band VI operation) | MHz | $867.4 \leq f \leq 892.6$ (Note 3) | $860 \leq f \leq 900$ (Note 3) |
| F_{uw} (Band VII operation) | MHz | $2612.4 \leq f \leq 2697.6$ (Note 2) | $2605 \leq f \leq 2705$ |
| F_{uw} (Band VIII operation) | MHz | $917.4 \leq f \leq 967.6$ (Note 2) | $910 \leq f \leq 975$ |
| F_{uw} (Band IX operation) | MHz | $1837.4 \leq f \leq 1887.4$ (Note 2) | $1829.9 \leq f \leq 1894.9$ |
| F_{uw} (Band X operation) | MHz | $2102.4 \leq f \leq 2177.6$ (Note 2) | $2095 \leq f \leq 2185$ |
| F_{uw} (Band XI operation) | MHz | $1468.4 \leq f \leq 1503.4$ (Note 2) | $1460.9 \leq f \leq 1510.9$ |
| F_{uw} (Band XII operation) | MHz | $721.4 \leq f \leq 753.6$ (Note 2) | $714 \leq f \leq 761$ |
| F_{uw} (Band XIII operation) | MHz | $738.4 \leq f \leq 763.6$ (Note 2) | $731 \leq f \leq 771$ |
| F_{uw} (Band XIV operation) | MHz | $750.4 \leq f \leq 775.6$ (Note 2) | $743 \leq f \leq 783$ |
| F_{uw} (Band XIX operation) | MHz | $867.4 \leq f \leq 897.6$ (Note 2) | $860 \leq f \leq 905$ (Note 3) |
| F_{uw} (Band XX operation) | MHz | $783.4 \leq f \leq 828.6$ (Note 2) | $776 \leq f \leq 836$ (Note 3) |
| F_{uw} (Band XXI operation) | MHz | $1488.4 \leq f \leq 1518.4$ (Note 2) | $1480.9 \leq f \leq 1525.9$ (Note 3) |
| F_{uw} (Band XXII operation) | MHz | $3502.4 \leq f \leq 3597.6$ (Note 2) | $3495 \leq f \leq 3605$ (Note 3) |
| F_{uw} (Band XXV operation) | MHz | $1922.4 \leq f \leq 2002.6$ (Note 2) | $1915 \leq f \leq 2010$ (Note 3) |
| F_{uw} (Band XXVI operation) | MHz | $851.4 \leq f \leq 901.6$ | $844 \leq f \leq 909$ |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | |

NOTE 1: I_{blocking} (modulated) consists of the common channels needed for tests as specified in Table E.4.1 and 16 dedicated data channels as specified in Table E.3.6.

NOTE 2: For each carrier frequency the requirement is valid for two frequencies, the carrier frequency +/- 10 MHz.

NOTE 3: For Band VI, Band XIX and Band XXI, the unwanted interfering signal does not fall inside the UE receive band, but within the first 15 MHz below or above the UE receive band.

NOTE 4: Negative offsets refer to the assigned channel frequency of the lowest carrier frequency used and positive offsets refer to the assigned channel frequency of the highest carrier frequency used.

Table 6.5C.2: Reference input powers for in-band blocking, DC-HSUPA

| Operating Band | Unit | HS-PDSCH E_c | \hat{I}_{or} |
|---|--------------|----------------|----------------|
| I | dBm/3.84 MHz | -110 | -99.7 |
| II | dBm/3.84 MHz | -108 | -97.7 |
| III | dBm/3.84 MHz | -107 | -96.7 |
| IV | dBm/3.84 MHz | -110 | -99.7 |
| V | dBm/3.84 MHz | -104.3 | -94 |
| VI | dBm/3.84 MHz | -104.7 | -94.4 |
| VII | dBm/3.84 MHz | -108 | -97.7 |
| VIII | dBm/3.84 MHz | -101.1 | -90.8 |
| IX | dBm/3.84 MHz | -109 | -98.7 |
| X | dBm/3.84 MHz | -110 | -99.7 |
| XI | dBm/3.84 MHz | -101.4 | -91.1 |
| XII | dBm/3.84 MHz | N/A | N/A |
| XIII | dBm/3.84 MHz | N/A | N/A |
| XIV | dBm/3.84 MHz | N/A | N/A |
| XIX | dBm/3.84 MHz | -104.7 | -94.4 |
| XX | dBm/3.84 MHz | TBD | TBD |
| XXI | dBm/3.84 MHz | -101.4 | -91.1 |
| XXII | dBm/3.84 MHz | TBD | TBD |
| XXV | dBm/3.84 MHz | -106.5 | -96.2 |
| XXVI | dBm/3.84 MHz | -101.1 | -90.8 |
| NOTE 1: For the UE which supports both Band III and Band IX operating frequencies, the reference sensitivity level of TBD dBm <REF_ E_c ,in-band> shall apply for Band IX. The corresponding <REF \hat{I}_{or} ,in-band> is TBD dBm | | | |
| NOTE 2: For the UE which supports both Band XI and Band XXI operating frequencies, the reference input power level is FFS. | | | |
| NOTE 3: For the UE which supports DB-DC-HSDPA configuration in clause 4.2 the < HS-PDSCH E_c > and < \hat{I}_{or} > are allowed to be increased by an amount defined in Table 6.1A | | | |

The normative reference for this requirement is TS 25.101 [1] clause 7.6.1B.

6.5C.2.2 Minimum requirements (Narrow band blocking)

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 6.5C.3 and Table 6.5C.4. This requirement is measure of a receiver's ability to receive a W-CDMA signal at its assigned channel frequency in the presence of an unwanted narrow band interferer at a frequency, which is less than the nominal channel spacing.

Table 6.5C.3: Narrow band blocking characteristics for DC-HSUPA

| Parameter | Unit | Band II, IV, V, X, XXV, XXVI | Band III, VIII, XII, XIII, XIV |
|----------------------------|------|---|--------------------------------|
| $I_{blocking}$ (GMSK) | dBm | -57 | -56 |
| F_{uw} (offset) (NOTE 2) | MHz | ± 2.7 | ± 2.8 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | |

NOTE 1: $I_{blocking}$ (GMSK) is an interfering signal as defined in TS 45.004.

NOTE 2: Negative offsets refer to the assigned channel frequency of the lowest carrier frequency used and positive offsets refer to the assigned channel frequency of the highest carrier frequency used.

Table 6.5C.4: Reference input powers for narrow-band blocking, DC-HSUPA

| Operating Band | Unit | HS-PDSCH_Ec | I _{or} |
|----------------|--------------|-------------|-----------------|
| II | dBm/3.84 MHz | -101 | -90.7 |
| III | dBm/3.84 MHz | -100 | -89.7 |
| IV | dBm/3.84 MHz | -102.8 | -92.5 |
| V | dBm/3.84 MHz | -100.9 | -90.6 |
| VIII | dBm/3.84 MHz | -98.5 | -88.2 |
| X | dBm/3.84 MHz | -102.8 | -92.5 |
| XII | dBm/3.84 MHz | N/A | N/A |
| XIII | dBm/3.84 MHz | N/A | N/A |
| XIV | dBm/3.84 MHz | N/A | N/A |
| XXV | dBm/3.84 MHz | -99.5 | -89.2 |
| XXVI | dBm/3.84 MHz | -98.5 | -88.2 |

NOTE 1: For the UE which supports DB-DC-HSDPA configuration in clause 4.2 the < HS-PDSCH_Ec > and < I_{or} > are allowed to be increased by an amount defined in Table 6.1A

The normative reference for this requirement is TS 25.101 [1] clause 7.6.3B.

6.5C.3 Test purpose

To verify that the UE BLER of HS-PDSCH on each individual cell does not exceed 0.1 for the parameters specified in table 6.5C.6, table 6.5C.7, table 6.5C.8 and table 6.5C.9 for the DL reference channel H-Set 12 specified in Annex C.8.1.12.

The lack of the blocking ability decreases the DC-HSUPA coverage area when other transmitter exists (except in the adjacent channels and spurious response).

6.5C.4 Method of test

6.5C.4.1 Initial conditions

For in-band case:

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

For out-of-band case:

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequency to be tested: 1 arbitrary frequency chosen from the low, mid or high range; see clause G.2.4.

For narrow-band case:

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.43.
- 2) RF parameters are set up according to table 6.5C.6, table 6.5C.7, table 6.5C.8 and table 6.5C.9.
- 3) A call is set up according to the Generic call setup procedure specified in TS34.108[3] sub clause 7.3.14, with exceptions for information elements listed in Table 6.5C.5. With this exception, the Power Control Algorithm for the Uplink is set to algorithm 2.

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

6.5C.4.2 Procedure

- 1) Set the parameters of the CW generator or the interference signal generator as shown in table 6.5C.6 and table 6.5C.8.
- 2) Set the power level of UE according to the table 6.5C.6, table 6.5C.7, table 6.5C.8 and table 6.5C.9 or send the power control commands (1dB step size should be used.) to the UE until UE output power measured by Test System shall be kept at the specified power level with ± 1 dB tolerance.
- 3) Measure the BLER of HS-PDSCH received from the UE at the SS by counting the number of NACK, ACK and statDTX on the UL HS-DPCCH ($BLER = (NACK + statDTX)/(NACK + statDTX + ACK)$).

6.5C.5 Test requirements

For table 6.5C.6, the measured BLER, derived in step 2), shall not exceed 0.1 on each individual cell. For table 6.5C.8, the measured BLER, derived in step 2), shall not exceed 0.1 on each individual cell. The minimum number of measurements required for a statistically significant result to this test is clarified in annex F.6.3, Table F.6.3.5.0.

Table 6.5C.6: Test parameters for In-band blocking characteristics for DC-HSUPA

| Parameter | Unit | Level | |
|--|------|---|---|
| | | -56 | -44 |
| I_{blocking} mean power (modulated) | dBm | -56 | -44 |
| F_{uw} offset (NOTE 4) | | ± 10 MHz | ≤ 15 MHz & ≥ 15 MHz |
| F_{uw} (Band I operation) | MHz | $2102.4 \leq f \leq 2177.6$ (Note 2) | $2095 \leq f \leq 2185$ |
| F_{uw} (Band II operation) | MHz | $1922.4 \leq f \leq 1997.6$ (Note 2) | $1915 \leq f \leq 2005$ |
| F_{uw} (Band III operation) | MHz | $1797.4 \leq f \leq 1887.6$ (Note 2) | $1790 \leq f \leq 1895$ |
| F_{uw} (Band IV operation) | MHz | $2102.4 \leq f \leq 2162.6$ (Note 2) | $2095 \leq f \leq 2170$ |
| F_{uw} (Band V operation) | MHz | $861.4 \leq f \leq 901.6$ (Note 2) | $854 \leq f \leq 909$ |
| F_{uw} (Band VI operation) | MHz | $867.4 \leq f \leq 892.6$ (Note 3) | $860 \leq f \leq 900$ (Note 3) |
| F_{uw} (Band VII operation) | MHz | $2612.4 \leq f \leq 2697.6$ (Note 2) | $2605 \leq f \leq 2705$ |
| F_{uw} (Band VIII operation) | MHz | $917.4 \leq f \leq 967.6$ (Note 2) | $910 \leq f \leq 975$ |
| F_{uw} (Band IX operation) | MHz | $1837.4 \leq f \leq 1887.4$ (Note 2) | $1829.9 \leq f \leq 1894.9$ |
| F_{uw} (Band X operation) | MHz | $2102.4 \leq f \leq 2177.6$ (Note 2) | $2095 \leq f \leq 2185$ |
| F_{uw} (Band XI operation) | MHz | $1468.4 \leq f \leq 1503.4$ (Note 2) | $1460.9 \leq f \leq 1510.9$ |
| F_{uw} (Band XII operation) | MHz | $721.4 \leq f \leq 753.6$ (Note 2) | $714 \leq f \leq 761$ |
| F_{uw} (Band XIII operation) | MHz | $738.4 \leq f \leq 763.6$ (Note 2) | $731 \leq f \leq 771$ |
| F_{uw} (Band XIV operation) | MHz | $750.4 \leq f \leq 775.6$ (Note 2) | $743 \leq f \leq 783$ |
| F_{uw} (Band XIX operation) | MHz | $867.4 \leq f \leq 897.6$ (Note 2) | $860 \leq f \leq 905$ (Note 3) |
| F_{uw} (Band XX operation) | MHz | $783.4 \leq f \leq 828.6$ (Note 2) | $776 \leq f \leq 836$ (Note 3) |
| F_{uw} (Band XXI operation) | MHz | $1488.4 \leq f \leq 1518.4$ (Note 2) | $1480.9 \leq f \leq 1525.9$ (Note 3) |
| F_{uw} (Band XXII operation) | MHz | $3502.4 \leq f \leq 3597.6$ (Note 2) | $3495 \leq f \leq 3605$ (Note 3) |
| F_{uw} (Band XXV operation) | MHz | $1922.4 \leq f \leq 2002.6$ (Note 2) | $1915 \leq f \leq 2010$ (Note 3) |
| F_{uw} (Band XXVI operation) | MHz | $851.4 \leq f \leq 901.6$ | $844 \leq f \leq 909$ |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | |

NOTE 1: I_{blocking} (modulated) consists of the common channels needed for tests as specified in Table E.4.1 and 16 dedicated data channels as specified in Table E.3.6.

NOTE 2: For each carrier frequency the requirement is valid for two frequencies, the carrier frequency +/- 10 MHz.

NOTE 3: For Band VI, Band XIX and Band XXI, the unwanted interfering signal does not fall inside the UE receive band, but within the first 15 MHz below or above the UE receive band.

NOTE 4: Negative offsets refer to the assigned channel frequency of the lowest carrier frequency used and positive offsets refer to the assigned channel frequency of the highest carrier frequency used.

Table 6.5C.7: Test parameters for reference input powers for in-band blocking characteristics, DC-HSUPA

| Operating Band | Unit | HS-PDSCH_Ec | I _{or} |
|----------------|--------------|-------------|-----------------|
| I | dBm/3.84 MHz | -110 | -99.7 |
| II | dBm/3.84 MHz | -108 | -97.7 |
| III | dBm/3.84 MHz | -107 | -96.7 |
| IV | dBm/3.84 MHz | -110 | -99.7 |
| V | dBm/3.84 MHz | -104.3 | -94 |
| VI | dBm/3.84 MHz | -104.7 | -94.4 |
| VII | dBm/3.84 MHz | -108 | -97.7 |
| VIII | dBm/3.84 MHz | -101.1 | -90.8 |
| IX | dBm/3.84 MHz | -109 | -98.7 |
| X | dBm/3.84 MHz | -110 | -99.7 |
| XI | dBm/3.84 MHz | -101.4 | -91.1 |
| XII | dBm/3.84 MHz | N/A | N/A |
| XIII | dBm/3.84 MHz | N/A | N/A |
| XIV | dBm/3.84 MHz | N/A | N/A |
| XIX | dBm/3.84 MHz | -104.7 | -94.4 |
| XX | dBm/3.84 MHz | TBD | TBD |
| XXI | dBm/3.84 MHz | -101.4 | -91.1 |
| XXII | dBm/3.84 MHz | TBD | TBD |
| XXV | dBm/3.84 MHz | -106.5 | -96.2 |
| XXVI | dBm/3.84 MHz | -101.1 | -90.8 |

NOTE 1: For the UE which supports both Band III and Band IX operating frequencies, the reference sensitivity level of TBD dBm <REF_Ec,in-band> shall apply for Band IX. The corresponding <REF_I_{or},in-band> is TBD dBm

NOTE 2: For the UE which supports both Band XI and Band XXI operating frequencies, the reference input power level is FFS.

NOTE 3: For the UE which supports DB-DC-HSDPA configuration in clause 4.2 the < HS-PDSCH_Ec > and < I_{or} > are allowed to be increased by an amount defined in Table 6.1A

Table 6.5C.8: Test parameters for narrow band blocking for DC-HSUPA

| Parameter | Unit | Band II, IV, V, X, XXV, XXVI | Band III, VIII, XII, XIII, XIV |
|-----------------------------------|------|---|--------------------------------|
| I _{blocking} (GMSK) | dBm | -57 | -56 |
| F _{uw} (offset) (NOTE 2) | MHz | ±2.7 | ±2.8 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | |

NOTE 5: I_{blocking} (GMSK) is an interfering signal as defined in TS 45.004.

NOTE 6: Offset refers to the assigned channel frequencies of the individual cells.

Table 6.5C.9: Test parameters for reference input powers for narrow-band blocking, DC-HSUPA

| Operating Band | Unit | HS-PDSCH_Ec | I _{or} |
|----------------|--------------|-------------|-----------------|
| II | dBm/3.84 MHz | -101 | -90.7 |
| III | dBm/3.84 MHz | -100 | -89.7 |
| IV | dBm/3.84 MHz | -102.8 | -92.5 |
| V | dBm/3.84 MHz | -100.9 | -90.6 |
| VIII | dBm/3.84 MHz | -98.5 | -88.2 |
| X | dBm/3.84 MHz | -102.8 | -92.5 |
| XII | dBm/3.84 MHz | N/A | N/A |
| XIII | dBm/3.84 MHz | N/A | N/A |
| XIV | dBm/3.84 MHz | N/A | N/A |
| XXV | dBm/3.84 MHz | -99.5 | -89.2 |
| XXVI | dBm/3.84 MHz | -98.5 | -88.2 |

NOTE: For the UE which supports DB-DC-HSDPA configuration in clause 4.2 the < HS-PDSCH_Ec > and < I_{or} > are allowed to be increased by an amount defined in Table 6.1A

NOTE 7: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

6.5D Blocking Characteristics for single Uplink Single band 4C-HSDPA

6.5D.1 Definition and applicability

The blocking characteristic is a measure of the receiver's ability to receive a wanted signal at its assigned channel frequency in the presence of an unwanted interferer on frequencies other than those of the spurious response or the adjacent channels, without this unwanted input signal causing a degradation of the performance of the receiver beyond a specified limit. The blocking performance shall apply at all frequencies except those at which a spurious response occur.

The requirements in clause 6.5D.2.1 and 6.5D.2.2 and this test apply for Release 10 and later releases to all types of UTRA for the FDD UE that support single band single uplink 4C-HSDPA.

Single band 4C-HSDPA is designed to operate in configurations specified in clause 4.2.

6.5D.2 Minimum Requirements

6.5D.2.1 Minimum Requirements (In-band blocking)

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 6.5D.1 and 6.5D.2. In-band blocking is defined for an unwanted interfering signal falling into the UE receive band or into the first 15 MHz below or above the UE receive band.

Table 6.5D.1: Test parameters for in-band blocking, single band 4C-HSDPA, single uplink operation

| Parameter | Unit | Level | |
|--|------|---|--------------------------|
| I _{blocking} mean power (modulated) | dBm | -56 | -44 |
| F _{uw} offset (NOTE 2) | | ±10 MHz | ≤-15 MHz & ≥15 MHz |
| F _{uw} (Band I operation) | MHz | 2102.4 ≤ f ≤ 2177.6 | 2095 ≤ f ≤ 2185 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | |

NOTE 1: I_{blocking} (modulated) consists of the common channels needed for tests as specified in Table E.4.1 and 16 dedicated data channels as specified in Table E.3.6.

NOTE 2: For single band 4C-HSDPA, negative offset refers to the assigned channel frequency of the lowest carrier frequencies, and positive offset refers to the assigned channel frequency of the highest carrier frequencies.

Table 6.5D.2: In-band blocking requirements, single band 4C-HSDPA, single uplink operation

| Single band 4C-HSDPA Configuration | DL Band | HS-PDSCH E_c (dBm/3.84MHz) | \hat{I}_{or} (dBm/3.84MHz) | UL-DL carrier separation |
|------------------------------------|---------|------------------------------|------------------------------|--------------------------|
| I-3 | I | <REFSENS>+3 dB | <REF \hat{I}_{or} >+3 dB | Minimum |

NOTE 3: <REFSENS> and <REF \hat{I}_{or} > refer to the HS-PDSCH_ E_c <REFSENS> and the HS-PDSCH<REF \hat{I}_{or} > as specified in Table 6.2C.1 for single band 4C-HSDPA.

The normative reference for this requirement is TS 25.101 [1] clause 7.6.1C.1.

6.5D.2.2 Minimum requirements (Out of-band blocking)

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 6.5D.3 and 6.5D.4. Out-of-band band blocking is defined for an unwanted interfering signal falling more than 15 MHz below or above the UE receive band.

For Table 6.5D.3 in frequency range 1, 2 and 3, up to 24 exceptions per received cell are allowed for spurious response frequencies in each assigned frequency channel when measured using a 1 MHz step size. For these exceptions the requirements of clause 6.6C spurious response are applicable.

For Table 6.5D.4 in frequency range 4, up to 8 exceptions per received cell are allowed for spurious response frequencies in each assigned frequency channel when measured using a 1 MHz step size. For these exceptions the requirements of clause 6.6C spurious response are applicable.

Table 6.5D.3: Test parameters for out of band blocking, single band 4C-HSDPA

| Parameter | Unit | Frequency range 1 | Frequency range 2 | Frequency range 3 | Frequency range 4 |
|--|---|---|--------------------------------|----------------------------|-------------------|
| $I_{blocking}$ (CW) | dBm | -44 | -30 | -15 | -15 |
| F_{uw} (Single band 4C-HSDPA Configuration I-3) | MHz | 2050<f <2095 2185<f <2230 | 2025 <f ≤2050 2230 ≤f <2255 | 1< f ≤2025 2255≤f<12750 | - |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | | | |
| Single band 4C-HSDPA Configuration I-3 | For 2095≤f ≤2185 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause [6.4D.2] and subclause 6.5D.2.1 shall be applied. | | | | |

Table 6.5D.4: Out of band blocking requirements, single band 4C-HSDPA

| Single band 4C-HSDPA Configuration | Parameter | Frequency range 1 | Frequency range 2 | Frequency range 3 | Frequency range 4 | UL-DL carrier separation |
|------------------------------------|-------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|--------------------------|
| I-3 | HS-PDSCH_ E_c (dBm/3.84MHz) | <REFSENS> +3 dB | <REFSENS> +3 dB | <REFSENS> +3 dB | <REFSENS> +3 dB | Minimum |
| | \hat{I}_{or} (dBm/3.84MHz) | <REF \hat{I}_{or} > + 3 dB | <REF \hat{I}_{or} > + 3 dB | <REF \hat{I}_{or} > + 3 dB | <REF \hat{I}_{or} > + 3 dB | |

NOTE: <REFSENS> and <REF \hat{I}_{or} > refers to the HS-PDSCH_ E_c <REFSENS> and the HS-PDSCH<REF \hat{I}_{or} > as specified in Table 6.2C.1.

The normative reference for this requirement is TS 25.101 [1] clause 7.6.2C.

6.5D.3 Test purpose

To verify that the UE BLER of HS-PDSCH on each individual cell does not exceed 0.1 for the parameters specified in table 6.5D.6, table 6.5D.7, table 6.5D.8 and table 6.5D.10 for the DL reference channel H-Set 1B specified in Annex C.8.1.1.

The lack of the blocking ability decreases the 4C-HSDPA coverage area when other transmitter exists (except in the adjacent channels and spurious response).

6.5D.4 Method of test

6.5D.4.1 Initial conditions

For in-band case:

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

For out-of-band case:

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequency to be tested: 1 arbitrary frequency chosen from the low, mid or high range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.49.
- 2) RF parameters are set up according to table 6.5D.6, table 6.5D.7, table 6.5D.8 and table 6.5D.9.
- 3) A call is set up according to the Generic 4C-HSDPA setup procedure specified in TS34.108[3] sub clause 7.3.16, with exceptions for information elements listed in Table 6.5D.5. With this exception, the Power Control Algorithm for the Uplink is set to algorithm 2.

Contents of RADIO BEARER SETUP message: AM or UM (Test Loop Mode1)

| Information Element | Value/Remark | Version |
|----------------------------------|--------------|---------|
| Uplink DPCH info | | Rel-6 |
| - Uplink DPCH power control info | | |
| - CHOICE mode | FDD | |
| - Power Control Algorithm | Algorithm2 | |

6.5D.4.2 Procedure

- 1) Set the parameters of the CW generator or the interference signal generator as shown in table 6.5D.6 and table 6.5D.7, for inbanding measurements and table 6.5D.8 and table 6.5D.9 for out of band measurements. For table 6.5D.8 and 6.5D.9, the frequency step size is 1 MHz.
- 2) Set the power level of UE according to the table 6.5D.6, table 6.5D.7, table 6.5D.8 and table 6.5D.9, or send the power control commands (1dB step size should be used.) to the UE until UE output power measured by Test System shall be kept at the specified power level with ± 1 dB tolerance.
- 3) Measure the BLER of HS-PDSCH received from the UE at the SS by counting the number of NACK, ACK and statDTX on the UL HS-DPCCH ($BLER = (NACK + statDTX)/(NACK + statDTX + ACK)$).
- 4) For table 6.5D.8 and 6.5D.9, record the frequencies for which BLER exceed the test requirements.

6.5D.5 Test requirements

For table 6.5D.6 and 6.5D.7, the measured BLER, derived in step 2), shall not exceed 0.1 on each individual cell. For table 6.5D.8 and 6.5D.9, the measured BLER, derived in step 2) shall not exceed 0.1 on each individual cell except for the spurious response frequencies, recorded in step 3). The number of spurious response frequencies, recorded in step 3) shall not exceed 24 for frequency range 1, 2 and 3. The number of spurious response frequencies, recorded in step 3) shall not exceed 8 for frequency range 4. The minimum number of measurements required for a statistically significant result to this test is clarified in annex F.6.3, Table F.6.3.5.0.

Table 6.5D.6: Test parameters for in-band blocking, single band 4C-HSDPA, single uplink operation

| | \hat{I}_{or} (dBm/3.84MHz) | <REF \hat{I}_{or} > + 3 dB | <REF \hat{I}_{or} > + 3 dB | <REF \hat{I}_{or} > + 3 dB | <REF \hat{I}_{or} > + 3 dB | |

NOTE 4: <REFSENS> and <REF \hat{I}_{or} > refers to the HS-PDSCH_Ec<REFSENS> and the HS-PDSCH<REF \hat{I}_{or} > as specified in Table 6.2C.1.

NOTE 5: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

6.5E Blocking Characteristics for dual uplink single band 4C-HSDPA

6.5E.1 Definition and applicability

The blocking characteristic is a measure of the receiver's ability to receive a wanted signal at its assigned channel frequency in the presence of an unwanted interferer on frequencies other than those of the spurious response or the adjacent channels, without this unwanted input signal causing a degradation of the performance of the receiver beyond a specified limit. The blocking performance shall apply at all frequencies except those at which a spurious response occur.

The requirements in clause 6.5E.2.1 and 6.5E.2.2 and this test apply for Release 10 and later releases to all types of UTRA for the FDD UE that support single band dual uplink 4C-HSDPA.

Single band 4C-HSDPA is designed to operate in configurations specified in clause 4.2.

6.5E.2 Minimum Requirements

6.5E.2.1 Minimum Requirements (In-band blocking)

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 6.5E.1 and 6.5E.2. In-band blocking is defined for an unwanted interfering signal falling into the UE receive band or into the first 15 MHz below or above the UE receive band.

Table 6.5E.1: Test parameters for in-band blocking, single band 4C-HSDPA, dual uplink operation

| Parameter | Unit | Level | |
|--|------|-----------------------------|-------------------------------------|
| I_{blocking} mean power (modulated) | dBm | -56 | -44 |
| F_{uw} offset (NOTE 2) | | ± 10 MHz | ≤ 15 MHz & ≥ 15 MHz |
| F_{uw} (Band I operation) | MHz | $2102.4 \leq f \leq 2177.6$ | $2095 \leq f \leq 2185$ |

NOTE 1: I_{blocking} (modulated) consists of the common channels needed for tests as specified in Table E.4.1 and 16 dedicated data channels as specified in Table E.3.6.

NOTE 2: For single band 4C-HSDPA, negative offset refers to the assigned channel frequency of the lowest carrier frequencies, and positive offset refers to the assigned channel frequency of the highest carrier frequencies.

Table 6.5E.2: In-band blocking requirements, single band 4C-HSDPA, dual uplink operation

| Single band 4C-HSDPA Configuration | DL Band | HS-PDSCH_Ec (dBm/3.84MHz) | \hat{I}_{or} (dBm/3.84MHz) | UE transmitted mean power (dBm) | UL-DL carrier separation |
|--|---------|---------------------------|-------------------------------------|---|--------------------------|
| I-3 | I | -110 | -99.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| NOTE 1: For the UE which supports DB-DC-HSDPA configuration in section 4.2 the < HS-PDSCH_Ec > and < \hat{I}_{or} > are allowed to be increased by an amount defined in Table 6.1A. | | | | | |
| NOTE 2: For the UE which supports dual band 4C-HSDPA configuration in Table 4.0B the < HS-PDSCH_Ec > and < \hat{I}_{or} > are allowed to be increased by an amount defined in Table 6.1B. | | | | | |

The normative reference for this requirement is TS 25.101 [1] clause 7.6.1C.2.

6.5E.3 Test purpose

To verify that the UE BLER of HS-PDSCH on each individual cell does not exceed 0.1 for the parameters specified in table 6.5E.4 and table 6.5E.5 for the DL reference channel H-Set 1B specified in Annex C.8.1.1.

The lack of the blocking ability decreases the 4C-HSDPA coverage area when other transmitter exists (except in the adjacent channels and spurious response).

6.5E.4 Method of test

6.5E.4.1 Initial conditions

For in-band case:

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

For out-of-band case:

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequency to be tested: 1 arbitrary frequency chosen from the low, mid or high range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.49.
- 2) RF parameters are set up according to table 6.5E.4 and table 6.5E.5.
- 3) A call is set up according to the Generic 4C-HSDPA setup procedure specified in TS34.108[3] sub clause 7.3.16, with exceptions for information elements listed in Table 6.5E.3. With this exception, the Power Control Algorithm for the Uplink is set to algorithm 2.

| - Uplink DPCH power control info | | |
| - CHOICE mode | FDD | |
| - Power Control Algorithm | Algorithm2 | |

6.5E.4.2 Procedure

- 1) Set the parameters of the CW generator or the interference signal generator as shown in table 6.5E.4 and table 6.5E.5, for inblocking measurements.
- 2) Set the power level of UE according to the table 6.5E.4 and table 6.5E.5, or send the power control commands (1dB step size should be used.) to the UE until UE output power measured by Test System shall be kept at the specified power level with ± 1 dB tolerance.
- 3) Measure the BLER of HS-PDSCH received from the UE at the SS by counting the number of NACK, ACK and statDTX on the UL HS-DPCCH ($BLER = (NACK + statDTX)/(NACK + statDTX + ACK)$).
- 4) For table 6.5E.5, record the frequencies for which BLER exceed the test requirements.

6.5E.5 Test requirements

For table 6.5E.4 and 6.5E.5, the measured BLER, derived in step 2), shall not exceed 0.1 on each individual cell. The minimum number of measurements required for a statistically significant result to this test is clarified in annex F.6.3, Table F.6.3.5.0.

Table 6.5E.4: Test parameters for in-band blocking, single band 4C-HSDPA, dual uplink operation

| Parameter | Unit | Level | |
|--|------|-----------------------------|--------------------------------------|
| I_{blocking} mean power (modulated) | dBm | -56 | -44 |
| F_{uw} offset (NOTE 2) | | ± 10 MHz | ≤ -15 MHz & ≥ 15 MHz |
| F_{uw} (Band I operation) | MHz | $2102.4 \leq f \leq 2177.6$ | $2095 \leq f \leq 2185$ |

NOTE 1: I_{blocking} (modulated) consists of the common channels needed for tests as specified in Table E.4.1 and 16 dedicated data channels as specified in Table E.3.6.

NOTE 2: For single band 4C-HSDPA, negative offset refers to the assigned channel frequency of the lowest carrier frequencies, and positive offset refers to the assigned channel frequency of the highest carrier frequencies.

Table 6.5E.5: In-band blocking requirements, single band 4C-HSDPA, dual uplink operation

| Single band 4C-HSDPA Configuration | DL Band | HS-PDSCH_Ec (dBm/3.84MHz) | \hat{I}_{or} (dBm/3.84MHz) | UE transmitted mean power (dBm) | UL-DL carrier separation |
|--|---------|---------------------------|-------------------------------------|---|--------------------------|
| I-3 | I | -110 | -99.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| NOTE 1: For the UE which supports DB-DC-HSDPA configuration in section 4.2 the $\langle \text{HS-PDSCH_Ec} \rangle$ and $\langle \hat{I}_{\text{or}} \rangle$ are allowed to be increased by an amount defined in Table 6.1A. | | | | | |
| NOTE 2: For the UE which supports dual band 4C-HSDPA configuration in Table 4.0B the $\langle \text{HS-PDSCH_Ec} \rangle$ and $\langle \hat{I}_{\text{or}} \rangle$ are allowed to be increased by an amount defined in Table 6.1B. | | | | | |

NOTE 3: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

6.5F Blocking Characteristics for single Uplink dual band 4C-HSDPA

6.5F.1 Definition and applicability

The blocking characteristic is a measure of the receiver's ability to receive a wanted signal at its assigned channel frequency in the presence of an unwanted interferer on frequencies other than those of the spurious response or the adjacent channels, without this unwanted input signal causing a degradation of the performance of the receiver beyond a specified limit. The blocking performance shall apply at all frequencies except those at which a spurious response occur.

The requirements in clause 6.5F.2.1 and 6.5F.2.2 and this test apply for Release 10 and later releases to all types of UTRA for the FDD UE that support dual band single uplink 4C-HSDPA and HS-DSCH categories 31 or 32.

Dual band 4C-HSDPA is designed to operate in configurations specified in clause 4.2.

6.5F.2 Minimum Requirements

6.5F.2.1 Minimum Requirements (In-band blocking)

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 6.5F.1 and 6.5F.2. In-band blocking is defined for an unwanted interfering signal falling into the UE receive band or into the first 15 MHz below or above the UE receive band.

Table 6.5F.1: Test parameters for in-band blocking, dual band 4C-HSDPA, single uplink operation

| Parameter | Unit | Level | |
|--|------|---|--------------------------------------|
| I_{blocking} mean power (modulated) | dBm | -56 | -44 |
| F_{uw} offset (NOTE 2) | | ± 10 MHz | ≤ -15 MHz & ≥ 15 MHz |
| F_{uw} (Band I operation) | MHz | $2102.4 \leq f \leq 2177.6$ | $2095 \leq f \leq 2185$ |
| F_{uw} (Band II operation) | MHz | $1922.4 \leq f \leq 1997.6$ | $1915 \leq f \leq 2005$ |
| F_{uw} (Band IV operation) | MHz | $2102.4 \leq f \leq 2162.6$ | $2095 \leq f \leq 2170$ |
| F_{uw} (Band V operation) | MHz | $861.4 \leq f \leq 901.6$ | $854 \leq f \leq 909$ |
| F_{uw} (Band VIII operation) | MHz | $917.4 \leq f \leq 967.6$ | $910 \leq f \leq 975$ |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | |

NOTE 1: I_{blocking} (modulated) consists of the common channels needed for tests as specified in Table E.4.1 and 16 dedicated data channels as specified in Table E.3.6.

NOTE 2: For dual band 4C-HSDPA, negative offset refers to the assigned channel frequency of the lowest carrier frequencies, and positive offset refers to the assigned channel frequency of the highest carrier frequencies.

Table 6.5F.2: In-band blocking requirements, dual band 4C-HSDPA, single uplink operation

| Dual band 4C-HSDPA Configuration | DL Band | UL Band | HS-PDSCH_Ec (dBm/3.84MHz) | \hat{I}_{or} (dBm/3.84MHz) | UL-DL carrier separation |
|-------------------------------------|---------|---------|---------------------------|-------------------------------------|--------------------------|
| I-2-VIII-1 I-3-VIII-1 | I | I | <REFSENS>+3 dB | <REF \hat{I}_{or} >+3 dB | Minimum |
| | VIII | | <REFSENS>+3 dB | <REF \hat{I}_{or} >+3 dB | Minimum |
| | I | VIII | <REFSENS>+3 dB | <REF \hat{I}_{or} >+3 dB | Minimum |
| | VIII | | <REFSENS>+3 dB | <REF \hat{I}_{or} >+3 dB | Minimum |
| II-1-IV-2 II-2-IV-1 II-2-IV-2 | II | II | <REFSENS>+3 dB | <REF \hat{I}_{or} >+3 dB | Minimum |
| | IV | | <REFSENS>+3 dB | <REF \hat{I}_{or} >+3 dB | Minimum |
| | II | IV | <REFSENS>+3 dB | <REF \hat{I}_{or} >+3 dB | Minimum |
| | IV | | <REFSENS>+3 dB | <REF \hat{I}_{or} >+3 dB | Minimum |
| I-1-V-2 I-2-V-1 I-2-V-2 | I | I | <REFSENS>+3 dB | <REF \hat{I}_{or} >+3 dB | Minimum |
| | V | | <REFSENS>+3 dB | <REF \hat{I}_{or} >+3 dB | Minimum |
| | I | V | <REFSENS>+3 dB | <REF \hat{I}_{or} >+3 dB | Minimum |
| | V | | <REFSENS>+3 dB | <REF \hat{I}_{or} >+3 dB | Minimum |

NOTE 3: <REFSENS> and <REF \hat{I}_{or} > refers to the HS-PDSCH_Ec<REFSENS> and the HS-PDSCH<REF \hat{I}_{or} > as specified in Table 6.2D.1

The normative reference for this requirement is TS 25.101 [1] clause 7.6.1D.1.

6.5F.2.2 Minimum requirements (Out of-band blocking)

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 6.5F.3 and 6.5F.4. Out-of-band band blocking is defined for an unwanted interfering signal falling more than 15 MHz below or above the UE receive band.

For Table 6.5F.3 in frequency range 1, 2 and 3, up to 24 exceptions per received cell are allowed for spurious response frequencies in each assigned frequency channel when measured using a 1 MHz step size. For these exceptions the requirements of clause 6.6D spurious response are applicable.

For Table 6.5F.4 in frequency range 4, up to 8 exceptions per received cell are allowed for spurious response frequencies in each assigned frequency channel when measured using a 1 MHz step size. For these exceptions the requirements of clause 6.6D spurious response are applicable.

Table 6.5F.3: Test parameters for out of band blocking, dual band 4C-HSDPA

| Parameter | Unit | Frequency range 1 | Frequency range 2 | Frequency range 3 | Frequency range 4 |
|---|--|---|--|--|-------------------|
| $I_{\text{blocking}}(\text{CW})$ | dBm | -44 | -30 | -15 | -15 |
| F_{uw} (Dual band 4C-HSDPA Configuration I-2-VIII-1, I-3-VIII-1) | MHz | 865 < f < 910 975 < f < 1020 2050 < f < 2095 2185 < f < 2230 | 840 < f ≤ 865 1020 ≤ f < 1045 2025 < f ≤ 2050 2230 ≤ f < 2255 | 1 < f ≤ 840 1045 ≤ f < 2025 2255 < f ≤ 12750 | - |
| F_{uw} (Dual band 4C-HSDPA Configuration II-1-IV-2, II-2-IV-1, II-2-IV-2) | MHz | 1870 < f < 1915 2005 < f < 2095 2170 < f < 2215 | 1845 < f ≤ 1870 2215 ≤ f < 2240 | 1 < f ≤ 1845 2240 ≤ f < 12750 | 1850 ≤ f ≤ 1910 |
| F_{uw} (Dual band 4C-HSDPA Configuration I-1-V-2, I-2-V-1, I-2-V-2) | MHz | 809 < f < 854 909 < f < 954 2050 < f < 2095 2185 < f < 2230 | 784 < f ≤ 809 954 ≤ f < 979 2025 < f ≤ 2050 2230 ≤ f < 2255 | 1 < f ≤ 784 979 ≤ f < 2025 2255 < f ≤ 12750 | 824 ≤ f ≤ 849 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | | | |
| Dual band 4C-HSDPA Configuration I-2-VIII-1, I-3-VIII-1 | For 910 ≤ f ≤ 975 MHz and 2095 ≤ f ≤ 2185 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause [6.4D.2] and subclause 6.5F.2.1 shall be applied. | | | | |
| Dual band 4C-HSDPA Configuration II-1-IV-2, II-2-IV-1, II-2-IV-2 | For 1915 ≤ f ≤ 2005 MHz and 2095 ≤ f ≤ 2070 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause [6.4D.2] and subclause 6.5F.2.1 shall be applied. | | | | |
| Dual band 4C-HSDPA Configuration I-1-V-2, I-2-V-1, I-2-V-2 | For 854 ≤ f ≤ 909 MHz and 2095 ≤ f ≤ 2185 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause [6.4D.2] and subclause 6.5F.2.1 shall be applied. | | | | |

Table 6.5F.4: Out of band blocking requirements, dual band 4C-HSDPA

| Dual band 4C-HSDPA Configuration | DL Band | UL Band | Parameter | Frequency range 1 | Frequency range 2 | Frequency range 3 | Frequency range 4 | UL-DL carrier separation |
|-------------------------------------|---------|---------|-------------------------------|---------------------------------|---------------------------------|---------------------------------|---------------------------------|--------------------------|
| I-2-VIII-1 I-3-VIII-1 | I | I | HS-PDSCH_Ec (dBm/3.84MHz) | <REFSENS> +3 dB | <REFSENS> +3 dB | <REFSENS> +3 dB | <REFSENS> +3 dB | Minimum |
| | VIII | | I_{or} (dBm/3.84MHz) | <REF I_{or} > +3 dB | <REF I_{or} > +3 dB | <REF I_{or} > +3 dB | <REF I_{or} > +3 dB | Minimum |
| | I | VIII | HS-PDSCH_Ec (dBm/3.84MHz) | <REFSENS> +3 dB | <REFSENS> +3 dB | <REFSENS> +3 dB | <REFSENS> +3 dB | Minimum |
| | VIII | | I_{or} (dBm/3.84MHz) | <REF I_{or} > +3 dB | <REF I_{or} > +3 dB | <REF I_{or} > +3 dB | <REF I_{or} > +3 dB | Minimum |
| II-1-IV-2 II-2-IV-1 II-2-IV-2 | II | II | HS-PDSCH_Ec (dBm/3.84MHz) | <REFSENS> +3 dB | <REFSENS> +3 dB | <REFSENS> +3 dB | <REFSENS> +3 dB | Minimum |
| | IV | | I_{or} (dBm/3.84MHz) | <REF I_{or} > +3 dB | <REF I_{or} > +3 dB | <REF I_{or} > +3 dB | <REF I_{or} > +3 dB | Minimum |
| | II | IV | HS-PDSCH_Ec (dBm/3.84MHz) | <REFSENS> +3 dB | <REFSENS> +3 dB | <REFSENS> +3 dB | <REFSENS> +3 dB | Minimum |
| | IV | | I_{or} (dBm/3.84MHz) | <REF I_{or} > +3 dB | <REF I_{or} > +3 dB | <REF I_{or} > +3 dB | <REF I_{or} > +3 dB | Minimum |
| I-1-V-2 I-2-V-1 I-2-V-2 | I | I | HS-PDSCH_Ec (dBm/3.84MHz) | <REFSENS> +3 dB | <REFSENS> +3 dB | <REFSENS> +3 dB | <REFSENS> +3 dB | Minimum |
| | V | | I_{or} (dBm/3.84MHz) | <REF I_{or} > +3 dB | <REF I_{or} > +3 dB | <REF I_{or} > +3 dB | <REF I_{or} > +3 dB | Minimum |
| | I | V | HS-PDSCH_Ec (dBm/3.84MHz) | <REFSENS> +3 dB | <REFSENS> +3 dB | <REFSENS> +3 dB | <REFSENS> +3 dB | Minimum |
| | V | | I_{or} (dBm/3.84MHz) | <REF I_{or} > +3 dB | <REF I_{or} > +3 dB | <REF I_{or} > +3 dB | <REF I_{or} > +3 dB | Minimum |

NOTE: <REFSENS> and <REF I_{or} > refers to the HS-PDSCH_Ec<REFSENS> and the HS-PDSCH<REF I_{or} > as specified in Table 6.2D.1.

The normative reference for this requirement is TS 25.101 [1] clause 7.6.2D.

6.5F.2.3 Minimum requirements (Narrow band blocking)

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 6.5F.5 and 6.5F.6. This requirement is measure of a receiver's ability to receive a W-CDMA signal at its assigned channel frequency in the presence of an unwanted narrow band interferer at a frequency, which is less than the nominal channel spacing.

Table 6.5F.5: Test parameters for narrow band blocking characteristics, dual band 4C-HSDPA, single uplink operation

| Parameter | Unit | Band II, IV, V | Band VIII |
|--------------------------------------|------|---|-----------|
| I_{blocking} (GMSK) | dBm | -57 | -56 |
| F_{uw} (offset) (NOTE 2) | MHz | ± 2.7 | ± 2.8 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | |

NOTE 1: I_{blocking} (GMSK) is an interfering signal as defined in TS 45.004.

NOTE 2: For dual band 4C-HSDPA, negative offset refers to the assigned channel frequency of the lowest carrier frequency(ies) in each band, and positive offset refers to the assigned channel frequency of the highest carrier frequency(ies) in each band.

Table 6.5F.6: Narrow band blocking requirements, dual band 4C-HSDPA, single uplink operation

| Dual band 4C-HSDPA Configuration | DL Band | UL Band | HS-PDSCH_Ec (dBm/3.84MHz) | \hat{I}_{or} (dBm/3.84MHz) | UL-DL carrier separation |
|----------------------------------|---------|---------|---------------------------|-------------------------------------|--------------------------|
| I-2-VIII-1 | VIII | I | <REFSENS>+10 dB | <REF \hat{I}_{or} >+10 dB | Minimum |
| I-3-VIII-1 | VIII | VIII | <REFSENS>+10 dB | <REF \hat{I}_{or} >+10 dB | Minimum |
| II-1-IV-2 | II | II | <REFSENS>+10 dB | <REF \hat{I}_{or} >+10 dB | Minimum |
| II-2-IV-1 | IV | | <REFSENS>+10 dB | <REF \hat{I}_{or} >+10 dB | Minimum |
| II-2-IV-2 | II | IV | <REFSENS>+10 dB | <REF \hat{I}_{or} >+10 dB | Minimum |
| | IV | | <REFSENS>+10 dB | <REF \hat{I}_{or} >+10 dB | Minimum |
| I-1-V-2 | V | I | <REFSENS>+10 dB | <REF \hat{I}_{or} >+10 dB | Minimum |
| I-2-V-1 | V | V | <REFSENS>+10 dB | <REF \hat{I}_{or} >+10 dB | Minimum |
| I-2-V-2 | | | | | |

NOTE 3: <REFSENS> and <REF \hat{I}_{or} > refer to the HS-PDSCH_Ec<REFSENS> and the HS-PDSCH<REF \hat{I}_{or} > as specified in Table 6.2D.1 for dual band 4C-HSDPA.

The normative reference for this requirement is TS 25.101 [1] clause 7.6.3D.1.

6.5F.3 Test purpose

To verify that the UE BLER of HS-PDSCH on each individual cell does not exceed 0.1 for the parameters specified in table 6.5F.8, table 6.5F.9, table 6.5F.10, table 6.5F.11, table 6.5F.12 and table 6.5F.13 for the DL reference channel H-Set 1C specified in Annex C.8.1.1.

The lack of the blocking ability decreases the 4C-HSDPA coverage area when other transmitter exists (except in the adjacent channels and spurious response).

This test case tests only 4 carrier configurations.

6.5F.4 Method of test

6.5F.4.1 Initial conditions

For in-band case:

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

For out-of-band case:

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequency to be tested: 1 arbitrary frequency chosen from the low, mid or high range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.49.
- 2) RF parameters are set up according to table 6.5F.8 through table 6.5F.13.
- 3) A call is set up according to the Generic 4C-HSDPA setup procedure specified in TS34.108[3] sub clause 7.3.16, with exceptions for information elements listed in Table 6.5F.5. With this exception, the Power Control Algorithm for the Uplink is set to algorithm 2.

Contents of RADIO BEARER SETUP message: AM or UM (Test Loop Mode1)

Table 6.5F.7: Specific Message Contents for In-band blocking characteristics for Single band 4C-HSDPA, Single uplink operation

| Information Element | Value/Remark | Version |
|----------------------------------|--------------|---------|
| Uplink DPCH info | | Rel-6 |
| - Uplink DPCH power control info | | |
| - CHOICE mode | FDD | |
| - Power Control Algorithm | Algorithm2 | |

6.5F.4.2 Procedure

- 1) Set the parameters of the CW generator or the interference signal generator as shown in table 6.5F.8 and table 6.5F.9, for inband measurements, Table 6.5F.10 and table 6.5F.11 for out of band measurements and Table 6.5F.12 and table 6.5F.13 for narrow band blocking. For table 6.5F.8 and 6.5F.9, the frequency step size is 1 MHz.
- 2) Set the power level of UE according to the table 6.5F.8 through table 6.5F.13, or send the power control commands (1dB step size should be used.) to the UE until UE output power measured by Test System shall be kept at the specified power level with ± 1 dB tolerance.
- 3) Measure the BLER of HS-PDSCH received from the UE at the SS by counting the number of NACK, ACK and statDTX on the UL HS-DPCCH ($BLER = (NACK + statDTX)/(NACK + statDTX + ACK)$).
- 4) For table 6.5F.9, table 6.5F.11 and table 6.5F.13, record the frequencies for which BLER exceed the test requirements.

6.5F.5 Test requirements

For table 6.5F.8 and 6.5F.9, the measured BLER, derived in step 2), shall not exceed 0.1 on each individual cell. For table 6.5F.10 and 6.5F.11, the measured BLER, derived in step 2) shall not exceed 0.1 on each individual cell except for the spurious response frequencies, recorded in step 3). The number of spurious response frequencies, recorded in step 3) shall not exceed 24 for frequency range 1, 2 and 3. The number of spurious response frequencies, recorded in step 3) shall not exceed 8 for frequency range 4. For table 6.5F.12 and 6.5F.13, the measured BLER, derived in step 2), shall not exceed 0.1 on each individual cell. The minimum number of measurements required for a statistically significant result to this test is clarified in annex F.6.3, Table F.6.3.5.0.

Table 6.5F.8: Test parameters for in-band blocking, dual band 4C-HSDPA, single uplink operation

| Parameter | Unit | Level | |
|--|------|---|--------------------------------------|
| I_{blocking} mean power (modulated) | dBm | -56 | -44 |
| F_{UW} offset (NOTE 2) | | ± 10 MHz | ≤ -15 MHz & ≥ 15 MHz |
| F_{UW} (Band I operation) | MHz | $2102.4 \leq f \leq 2177.6$ | $2095 \leq f \leq 2185$ |
| F_{UW} (Band II operation) | MHz | $1922.4 \leq f \leq 1997.6$ | $1915 \leq f \leq 2005$ |
| F_{UW} (Band IV operation) | MHz | $2102.4 \leq f \leq 2162.6$ | $2095 \leq f \leq 2170$ |
| F_{UW} (Band V operation) | MHz | $861.4 \leq f \leq 901.6$ | $854 \leq f \leq 909$ |
| F_{UW} (Band VIII operation) | MHz | $917.4 \leq f \leq 967.6$ | $910 \leq f \leq 975$ |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | |

NOTE 1: I_{blocking} (modulated) consists of the common channels needed for tests as specified in Table E.4.1 and 16 dedicated data channels as specified in Table E.3.6.

NOTE 2: For dual band 4C-HSDPA, negative offset refers to the assigned channel frequency of the lowest carrier frequencies, and positive offset refers to the assigned channel frequency of the highest carrier frequencies.

Table 6.5F.9: In-band blocking requirements, dual band 4C-HSDPA, single uplink operation

| Dual band 4C-HSDPA Configuration | DL Band | UL Band | HS-PDSCH_Ec (dBm/3.84MHz) | \hat{I}_{or} (dBm/3.84MHz) | UL-DL carrier separation |

Table 6.5F.12: Test parameters for narrow band blocking characteristics, dual band 4C-HSDPA, single uplink operation

| Parameter | Unit | Band II, IV, V | Band VIII |
|--------------------------------------|------|---|-----------|
| I_{blocking} (GMSK) | dBm | -57 | -56 |
| F_{uw} (offset) (NOTE 2) | MHz | ± 2.7 | ± 2.8 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | |

NOTE 5: I_{blocking} (GMSK) is an interfering signal as defined in TS 45.004

NOTE 6: For dual band 4C-HSDPA, negative offset refers to the assigned channel frequency of the lowest carrier frequency(ies) in each band, and positive offset refers to the assigned channel frequency of the highest carrier frequency(ies) in each band.

Table 6.5F.13: Narrow band blocking requirements, dual band 4C-HSDPA, single uplink operation

| Dual band 4C-HSDPA Configuration | DL Band | UL Band | HS-PDSCH E_c (dBm/3.84MHz) | \hat{I}_{or} (dBm/3.84MHz) | UL-DL carrier separation |
|-------------------------------------|---------|---------|------------------------------|-------------------------------------|--------------------------|
| I-2-VIII-1 I-3-VIII-1 | VIII | I | <REFSENS>+10 dB | <REF \hat{I}_{or} >+10 dB | Minimum |
| | VIII | VIII | <REFSENS>+10 dB | <REF \hat{I}_{or} >+10 dB | Minimum |
| II-1-IV-2 II-2-IV-1 II-2-IV-2 | II | II | <REFSENS>+10 dB | <REF \hat{I}_{or} >+10 dB | Minimum |
| | IV | | <REFSENS>+10 dB | <REF \hat{I}_{or} >+10 dB | Minimum |
| | II | IV | <REFSENS>+10 dB | <REF \hat{I}_{or} >+10 dB | Minimum |
| | IV | | <REFSENS>+10 dB | <REF \hat{I}_{or} >+10 dB | Minimum |
| I-1-V-2 I-2-V-1 I-2-V-2 | V | I | <REFSENS>+10 dB | <REF \hat{I}_{or} >+10 dB | Minimum |
| | V | V | <REFSENS>+10 dB | <REF \hat{I}_{or} >+10 dB | Minimum |

NOTE 7: <REFSENS> and <REF \hat{I}_{or} > refer to the HS-PDSCH E_c <REFSENS> and the HS-PDSCH<REF \hat{I}_{or} > as specified in Table 6.2D.1 for dual band 4C-HSDPA.

NOTE 8: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

6.5FA Blocking Characteristics for single Uplink dual band 4C-HSDPA (3 carrier)

6.5FA.1 Definition and applicability

The blocking characteristic is a measure of the receiver's ability to receive a wanted signal at its assigned channel frequency in the presence of an unwanted interferer on frequencies other than those of the spurious response or the adjacent channels, without this unwanted input signal causing a degradation of the performance of the receiver beyond a specified limit. The blocking performance shall apply at all frequencies except those at which a spurious response occur.

The requirements in clause 6.5FA.2.1 and 6.5FA.2.2 and this test apply for Release 10 and later releases to all types of UTRA for the FDD UE that support dual band single uplink 4C-HSDPA and HS-DSCH categories 29 to 32.

Dual band 4C-HSDPA is designed to operate in configurations specified in clause 4.2.

6.5FA.2 Minimum Requirements

6.5FA.2.1 Minimum Requirements (In-band blocking)

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 6.5FA.1 and 6.5FA.2. In-band blocking is defined for an unwanted interfering signal falling into the UE receive band or into the first 15 MHz below or above the UE receive band.

Table 6.5FA.1: Test parameters for in-band blocking, dual band 4C-HSDPA, single uplink operation

| Parameter | Unit | Level | |
|--|------|---|--------------------------------------|
| I_{blocking} mean power (modulated) | dBm | -56 | -44 |
| F_{uw} offset (NOTE 2) | | ± 10 MHz | ≤ -15 MHz & ≥ 15 MHz |
| F_{uw} (Band I operation) | MHz | $2102.4 \leq f \leq 2177.6$ | $2095 \leq f \leq 2185$ |
| F_{uw} (Band II operation) | MHz | $1922.4 \leq f \leq 1997.6$ | $1915 \leq f \leq 2005$ |
| F_{uw} (Band IV operation) | MHz | $2102.4 \leq f \leq 2162.6$ | $2095 \leq f \leq 2170$ |
| F_{uw} (Band V operation) | MHz | $861.4 \leq f \leq 901.6$ | $854 \leq f \leq 909$ |
| F_{uw} (Band VIII operation) | MHz | $917.4 \leq f \leq 967.6$ | $910 \leq f \leq 975$ |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | |

NOTE 1: I_{blocking} (modulated) consists of the common channels needed for tests as specified in Table E.4.1 and 16 dedicated data channels as specified in Table E.3.6.

NOTE 2: For dual band 4C-HSDPA, negative offset refers to the assigned channel frequency of the lowest carrier frequencies, and positive offset refers to the assigned channel frequency of the highest carrier frequencies.

Table 6.5FA.2: In-band blocking requirements, dual band 4C-HSDPA, single uplink operation

| Dual band 4C-HSDPA Configuration | DL Band | UL Band | HS-PDSCH E_c (dBm/3.84MHz) | \hat{I}_{or} (dBm/3.84MHz) | UL-DL carrier separation |
|-------------------------------------|---------|---------|---|--|--------------------------|
| I-2-VIII-1 I-3-VIII-1 | I | I | $\langle \text{REFSENS} \rangle + 3$ dB | $\langle \text{REF}\hat{I}_{\text{or}} \rangle + 3$ dB | Minimum |
| | VIII | | $\langle \text{REFSENS} \rangle + 3$ dB | $\langle \text{REF}\hat{I}_{\text{or}} \rangle + 3$ dB | Minimum |
| | I | VIII | $\langle \text{REFSENS} \rangle + 3$ dB | $\langle \text{REF}\hat{I}_{\text{or}} \rangle + 3$ dB | Minimum |
| | VIII | | $\langle \text{REFSENS} \rangle + 3$ dB | $\langle \text{REF}\hat{I}_{\text{or}} \rangle + 3$ dB | Minimum |
| II-1-IV-2 II-2-IV-1 II-2-IV-2 | II | II | $\langle \text{REFSENS} \rangle + 3$ dB | $\langle \text{REF}\hat{I}_{\text{or}} \rangle + 3$ dB | Minimum |
| | IV | | $\langle \text{REFSENS} \rangle + 3$ dB | $\langle \text{REF}\hat{I}_{\text{or}} \rangle + 3$ dB | Minimum |
| | II | IV | $\langle \text{REFSENS} \rangle + 3$ dB | $\langle \text{REF}\hat{I}_{\text{or}} \rangle + 3$ dB | Minimum |
| | IV | | $\langle \text{REFSENS} \rangle + 3$ dB | $\langle \text{REF}\hat{I}_{\text{or}} \rangle + 3$ dB | Minimum |
| I-1-V-2 I-2-V-1 I-2-V-2 | I | I | $\langle \text{REFSENS} \rangle + 3$ dB | $\langle \text{REF}\hat{I}_{\text{or}} \rangle + 3$ dB | Minimum |
| | V | | $\langle \text{REFSENS} \rangle + 3$ dB | $\langle \text{REF}\hat{I}_{\text{or}} \rangle + 3$ dB | Minimum |
| | I | V | $\langle \text{REFSENS} \rangle + 3$ dB | $\langle \text{REF}\hat{I}_{\text{or}} \rangle + 3$ dB | Minimum |
| | V | | $\langle \text{REFSENS} \rangle + 3$ dB | $\langle \text{REF}\hat{I}_{\text{or}} \rangle + 3$ dB | Minimum |

NOTE 3: $\langle \text{REFSENS} \rangle$ and $\langle \text{REF}\hat{I}_{\text{or}} \rangle$ refers to the HS-PDSCH $E_c \langle \text{REFSENS} \rangle$ and the HS-PDSCH $\langle \text{REF}\hat{I}_{\text{or}} \rangle$ as specified in Table 6.2DA.1

The normative reference for this requirement is TS 25.101 [1] clause 7.6.1D.1.

6.5FA.2.2 Minimum requirements (Out of-band blocking)

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 6.5FA.3 and 6.5FA.4. Out-of-band band blocking is defined for an unwanted interfering signal falling more than 15 MHz below or above the UE receive band.

For Table 6.5FA.3 in frequency range 1, 2 and 3, up to 24 exceptions per received cell are allowed for spurious response frequencies in each assigned frequency channel when measured using a 1 MHz step size. For these exceptions the requirements of clause 6.6DA spurious response are applicable.

For Table 6.5FA.4 in frequency range 4, up to 8 exceptions per received cell are allowed for spurious response frequencies in each assigned frequency channel when measured using a 1 MHz step size. For these exceptions the requirements of clause 6.6DA spurious response are applicable.

Table 6.5FA.3: Test parameters for out of band blocking, dual band 4C-HSDPA

| Parameter | Unit | Frequency range 1 | Frequency range 2 | Frequency range 3 | Frequency range 4 |
|---|---|---|--|--|-------------------|
| $I_{\text{blocking}}(\text{CW})$ | dBm | -44 | -30 | -15 | -15 |
| F_{uw} (Dual band 4C-HSDPA Configuration I-2-VIII-1, I-3-VIII-1) | MHz | 865 < f < 910 975 < f < 1020 2050 < f < 2095 2185 < f < 2230 | 840 < f ≤ 865 1020 ≤ f < 1045 2025 < f ≤ 2050 2230 ≤ f < 2255 | 1 < f ≤ 840 1045 ≤ f < 2025 2255 < f ≤ 12750 | - |
| F_{uw} (Dual band 4C-HSDPA Configuration II-1-IV-2, II-2-IV-1, II-2-IV-2) | MHz | 1870 < f < 1915 2005 < f < 2095 2170 < f < 2215 | 1845 < f ≤ 1870 2215 ≤ f < 2240 | 1 < f ≤ 1845 2240 ≤ f < 12750 | 1850 ≤ f ≤ 1910 |
| F_{uw} (Dual band 4C-HSDPA Configuration I-1-V-2, I-2-V-1, I-2-V-2) | MHz | 809 < f < 854 909 < f < 954 2050 < f < 2095 2185 < f < 2230 | 784 < f ≤ 809 954 ≤ f < 979 2025 < f ≤ 2050 2230 ≤ f < 2255 | 1 < f ≤ 784 979 ≤ f < 2025 2255 < f ≤ 12750 | 824 ≤ f ≤ 849 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | | | |
| Dual band 4C-HSDPA Configuration I-2-VIII-1, I-3-VIII-1 | For 910 ≤ f ≤ 975 MHz and 2095 ≤ f ≤ 2185 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause [6.4D.2] and subclause 6.5FA.2.1 shall be applied. | | | | |
| Dual band 4C-HSDPA Configuration II-1-IV-2, II-2-IV-1, II-2-IV-2 | For 1915 ≤ f ≤ 2005 MHz and 2095 ≤ f ≤ 2070 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause [6.4D.2] and subclause 6.5FA.2.1 shall be applied. | | | | |
| Dual band 4C-HSDPA Configuration I-1-V-2, I-2-V-1, I-2-V-2 | For 854 ≤ f ≤ 909 MHz and 2095 ≤ f ≤ 2185 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause [6.4D.2] and subclause 6.5FA.2.1 shall be applied. | | | | |

Table 6.5FA.4: Out of band blocking requirements, dual band 4C-HSDPA

| Dual band 4C-HSDPA Configuration | DL Band | UL Band | Parameter | Frequency range 1 | Frequency range 2 | Frequency range 3 | Frequency range 4 | UL-DL carrier separation |
|-------------------------------------|---------|---------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|--------------------------|
| I-2-VIII-1 I-3-VIII-1 | I | I | HS-PDSCH_Ec (dBm/3.84MHz) | <REFSENS> +3 dB | <REFSENS> +3 dB | <REFSENS> +3 dB | <REFSENS> +3 dB | Minimum |
| | VIII | | \hat{I}_{or} (dBm/3.84MHz) | <REF \hat{I}_{or} > + 3 dB | <REF \hat{I}_{or} > + 3 dB | <REF \hat{I}_{or} > + 3 dB | <REF \hat{I}_{or} > + 3 dB | Minimum |
| | I | VIII | HS-PDSCH_Ec (dBm/3.84MHz) | <REFSENS> +3 dB | <REFSENS> +3 dB | <REFSENS> +3 dB | <REFSENS> +3 dB | Minimum |
| | VIII | | \hat{I}_{or} (dBm/3.84MHz) | <REF \hat{I}_{or} > + 3 dB | <REF \hat{I}_{or} > + 3 dB | <REF \hat{I}_{or} > + 3 dB | <REF \hat{I}_{or} > + 3 dB | Minimum |
| II-1-IV-2 II-2-IV-1 II-2-IV-2 | II | II | HS-PDSCH_Ec (dBm/3.84MHz) | <REFSENS> +3 dB | <REFSENS> +3 dB | <REFSENS> +3 dB | <REFSENS> +3 dB | Minimum |
| | IV | | \hat{I}_{or} (dBm/3.84MHz) | <REF \hat{I}_{or} > + 3 dB | <REF \hat{I}_{or} > + 3 dB | <REF \hat{I}_{or} > + 3 dB | <REF \hat{I}_{or} > + 3 dB | Minimum |
| | II | IV | HS-PDSCH_Ec (dBm/3.84MHz) | <REFSENS> +3 dB | <REFSENS> +3 dB | <REFSENS> +3 dB | <REFSENS> +3 dB | Minimum |
| | IV | | \hat{I}_{or} (dBm/3.84MHz) | <REF \hat{I}_{or} > + 3 dB | <REF \hat{I}_{or} > + 3 dB | <REF \hat{I}_{or} > + 3 dB | <REF \hat{I}_{or} > + 3 dB | Minimum |
| I-1-V-2 I-2-V-1 I-2-V-2 | I | I | HS-PDSCH_Ec (dBm/3.84MHz) | <REFSENS> +3 dB | <REFSENS> +3 dB | <REFSENS> +3 dB | <REFSENS> +3 dB | Minimum |
| | V | | \hat{I}_{or} (dBm/3.84MHz) | <REF \hat{I}_{or} > + 3 dB | <REF \hat{I}_{or} > + 3 dB | <REF \hat{I}_{or} > + 3 dB | <REF \hat{I}_{or} > + 3 dB | Minimum |
| | I | V | HS-PDSCH_Ec (dBm/3.84MHz) | <REFSENS> +3 dB | <REFSENS> +3 dB | <REFSENS> +3 dB | <REFSENS> +3 dB | Minimum |
| | V | | \hat{I}_{or} (dBm/3.84MHz) | <REF \hat{I}_{or} > + 3 dB | <REF \hat{I}_{or} > + 3 dB | <REF \hat{I}_{or} > + 3 dB | <REF \hat{I}_{or} > + 3 dB | Minimum |

NOTE: <REFSENS> and <REF \hat{I}_{or} > refers to the HS-PDSCH_Ec<REFSENS> and the HS-PDSCH<REF \hat{I}_{or} > as specified in Table 6.2DA.1.

The normative reference for this requirement is TS 25.101 [1] clause 7.6.2DA.

6.5FA.2.3 Minimum requirements (Narrow band blocking)

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 6.5FA.5 and 6.5FA.6. This requirement is measure of a receiver's ability to receive a W-CDMA signal at its assigned channel frequency in the presence of an unwanted narrow band interferer at a frequency, which is less than the nominal channel spacing.

Table 6.5FA.5: Test parameters for narrow band blocking characteristics, dual band 4C-HSDPA, single uplink operation

| Parameter | Unit | Band II, IV, V | Band VIII |
|-----------------------------------|------|---|-----------|
| I_{blocking} (GMSK) | dBm | -57 | -56 |
| F_{uw} (offset) (NOTE 2) | MHz | ± 2.7 | ± 2.8 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | |

NOTE 1: I_{blocking} (GMSK) is an interfering signal as defined in TS 45.004.

NOTE 2: For dual band 4C-HSDPA, negative offset refers to the assigned channel frequency of the lowest carrier frequency(ies) in each band, and positive offset refers to the assigned channel frequency of the highest carrier frequency(ies) in each band.

Table 6.5FA.6: Narrow band blocking requirements, dual band 4C-HSDPA, single uplink operation

| Dual band 4C-HSDPA Configuration | DL Band | UL Band | HS-PDSCH_Ec (dBm/3.84MHz) | \hat{I}_{or} (dBm/3.84MHz) | UL-DL carrier separation |
|----------------------------------|---------|---------|---------------------------|------------------------------|--------------------------|
| I-2-VIII-1 | VIII | I | <REFSENS>+10 dB | <REF \hat{I}_{or} >+10 dB | Minimum |
| I-3-VIII-1 | VIII | VIII | <REFSENS>+10 dB | <REF \hat{I}_{or} >+10 dB | Minimum |
| II-1-IV-2 | II | II | <REFSENS>+10 dB | <REF \hat{I}_{or} >+10 dB | Minimum |
| II-2-IV-1 | IV | | <REFSENS>+10 dB | <REF \hat{I}_{or} >+10 dB | Minimum |
| II-2-IV-2 | II | IV | <REFSENS>+10 dB | <REF \hat{I}_{or} >+10 dB | Minimum |
| | IV | | <REFSENS>+10 dB | <REF \hat{I}_{or} >+10 dB | Minimum |
| I-1-V-2 | V | I | <REFSENS>+10 dB | <REF \hat{I}_{or} >+10 dB | Minimum |
| I-2-V-1 | V | V | <REFSENS>+10 dB | <REF \hat{I}_{or} >+10 dB | Minimum |
| I-2-V-2 | | | | | |

NOTE 3: <REFSENS> and <REF \hat{I}_{or} > refer to the HS-PDSCH_Ec<REFSENS> and the HS-PDSCH<REF \hat{I}_{or} > as specified in Table 6.2DA.1 for dual band 4C-HSDPA.

The normative reference for this requirement is TS 25.101 [1] clause 7.6.3D.1.

6.5FA.3 Test purpose

To verify that the UE BLER of HS-PDSCH on each individual cell does not exceed 0.1 for the parameters specified in table 6.5FA.8, table 6.5FA.9, table 6.5FA.10, table 6.5FA.11, table 6.5FA.12 and table 6.5FA.13 for the DL reference channel H-Set 1B specified in Annex C.8.1.1.

The lack of the blocking ability decreases the 4C-HSDPA coverage area when other transmitter exists (except in the adjacent channels and spurious response).

This test case tests only 3 carrier configurations.

6.5FA.4 Method of test

6.5FA.4.1 Initial conditions

For in-band case:

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

For out-of-band case:

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequency to be tested: 1 arbitrary frequency chosen from the low, mid or high range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.49.
- 2) RF parameters are set up according to table 6.5FA.8 through table 6.5FA.13.
- 3) A call is set up according to the Generic 4C-HSDPA setup procedure specified in TS34.108[3] sub clause 7.3.16, with exceptions for information elements listed in Table 6.5FA.5. With this exception, the Power Control Algorithm for the Uplink is set to algorithm 2.

Contents of RADIO BEARER SETUP message: AM or UM (Test Loop Mode1)

Table 6.5FA.7: Specific Message Contents for In-band blocking characteristics for Single band 4C-HSDPA, Single uplink operation

| Information Element | Value/Remark | Version |
|----------------------------------|--------------|---------|
| Uplink DPCH info | | Rel-6 |
| - Uplink DPCH power control info | | |
| - CHOICE mode | FDD | |
| - Power Control Algorithm | Algorithm2 | |

6.5FA.4.2 Procedure

- 1) Set the parameters of the CW generator or the interference signal generator as shown in table 6.5FA.8 and table 6.5FA.9, for inblocking measurements, Table 6.5FA.10 and table 6.5FA.11 for out of band measurements and Table 6.5FA.12 and table 6.5FA.13 for narrow band blocking. For table 6.5FA.8 and 6.5FA.9, the frequency step size is 1 MHz.
- 2) Set the power level of UE according to the table 6.5FA.8 through table 6.5FA.13, or send the power control commands (1dB step size should be used.) to the UE until UE output power measured by Test System shall be kept at the specified power level with ± 1 dB tolerance.
- 3) Measure the BLER of HS-PDSCH received from the UE at the SS by counting the number of NACK, ACK and statDTX on the UL HS-DPCCH ($BLER = (NACK + statDTX)/(NACK + statDTX + ACK)$).
- 4) For table 6.5FA.9, table 6.5FA.11 and table 6.5FA.13, record the frequencies for which BLER exceed the test requirements.

6.5FA.5 Test requirements

For table 6.5FA.8 and 6.5FA.9, the measured BLER, derived in step 2), shall not exceed 0.1 on each individual cell. For table 6.5FA.10 and 6.5FA.11, the measured BLER, derived in step 2) shall not exceed 0.1 on each individual cell except for the spurious response frequencies, recorded in step 3). The number of spurious response frequencies, recorded in step 3) shall not exceed 24 for frequency range 1, 2 and 3. The number of spurious response frequencies, recorded in step 3) shall not exceed 8 for frequency range 4. For table 6.5FA.12 and 6.5FA.13, the measured BLER, derived in step 2), shall not exceed 0.1 on each individual cell. The minimum number of measurements required for a statistically significant result to this test is clarified in annex F.6.3, Table F.6.3.5.0.

Table 6.5FA.8: Test parameters for in-band blocking, dual band 4C-HSDPA, single uplink operation

| Parameter | Unit | Level | |
|--|------|---|--------------------------------------|
| I_{blocking} mean power (modulated) | dBm | -56 | -44 |
| F_{uw} offset (NOTE 2) | | ± 10 MHz | ≤ -15 MHz & ≥ 15 MHz |
| F_{uw} (Band I operation) | MHz | $2102.4 \leq f \leq 2177.6$ | $2095 \leq f \leq 2185$ |
| F_{uw} (Band II operation) | MHz | $1922.4 \leq f \leq 1997.6$ | $1915 \leq f \leq 2005$ |
| F_{uw} (Band IV operation) | MHz | $2102.4 \leq f \leq 2162.6$ | $2095 \leq f \leq 2170$ |
| F_{uw} (Band V operation) | MHz | $861.4 \leq f \leq 901.6$ | $854 \leq f \leq 909$ |
| F_{uw} (Band VIII operation) | MHz | $917.4 \leq f \leq 967.6$ | $910 \leq f \leq 975$ |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | |

NOTE 1: I_{blocking} (modulated) consists of the common channels needed for tests as specified in Table E.4.1 and 16 dedicated data channels as specified in Table E.3.6.

NOTE 2: For dual band 4C-HSDPA, negative offset refers to the assigned channel frequency of the lowest carrier frequencies, and positive offset refers to the assigned channel frequency of the highest carrier frequencies.

Table 6.5FA.9: In-band blocking requirements, dual band 4C-HSDPA, single uplink operation

| Dual band 4C-HSDPA Configuration | DL Band | UL Band | HS-PDSCH_Ec (dBm/3.84MHz) | \hat{I}_{or} (dBm/3.84MHz) | UL-DL carrier separation |

Table 6.5FA.12: Test parameters for narrow band blocking characteristics, dual band 4C-HSDPA, single uplink operation

| Parameter | Unit | Band II, IV, V | Band VIII |
|-----------------------------------|------|---|-----------|
| I_{blocking} (GMSK) | dBm | -57 | -56 |
| F_{uw} (offset) (NOTE 2) | MHz | ±2.7 | ±2.8 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | |

NOTE 5: I_{blocking} (GMSK) is an interfering signal as defined in TS 45.004

NOTE 6: For dual band 4C-HSDPA, negative offset refers to the assigned channel frequency of the lowest carrier frequency(ies) in each band, and positive offset refers to the assigned channel frequency of the highest carrier frequency(ies) in each band.

Table 6.5FA.13: Narrow band blocking requirements, dual band 4C-HSDPA, single uplink operation

| Dual band 4C-HSDPA Configuration | DL Band | UL Band | HS-PDSCH_Ec (dBm/3.84MHz) | \hat{I}_{or} (dBm/3.84MHz) | UL-DL carrier separation |
|-------------------------------------|---------|---------|---------------------------|------------------------------|--------------------------|
| I-2-VIII-1 I-3-VIII-1 | VIII | I | <REFSENS>+10 dB | <REF \hat{I}_{or} >+10 dB | Minimum |
| | VIII | VIII | <REFSENS>+10 dB | <REF \hat{I}_{or} >+10 dB | Minimum |
| II-1-IV-2 II-2-IV-1 II-2-IV-2 | II | II | <REFSENS>+10 dB | <REF \hat{I}_{or} >+10 dB | Minimum |
| | IV | | <REFSENS>+10 dB | <REF \hat{I}_{or} >+10 dB | Minimum |
| | II | IV | <REFSENS>+10 dB | <REF \hat{I}_{or} >+10 dB | Minimum |
| | IV | | <REFSENS>+10 dB | <REF \hat{I}_{or} >+10 dB | Minimum |
| I-1-V-2 I-2-V-1 I-2-V-2 | V | I | <REFSENS>+10 dB | <REF \hat{I}_{or} >+10 dB | Minimum |
| | V | V | <REFSENS>+10 dB | <REF \hat{I}_{or} >+10 dB | Minimum |

NOTE 7: <REFSENS> and <REF \hat{I}_{or} > refer to the HS-PDSCH_Ec<REFSENS> and the HS-PDSCH<REF \hat{I}_{or} > as specified in Table 6.2DA.1 for dual band 4C-HSDPA.

NOTE 8: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

6.5G Blocking Characteristics for dual uplink dual band 4C-HSDPA

6.5G.1 Definition and applicability

The blocking characteristic is a measure of the receiver's ability to receive a wanted signal at its assigned channel frequency in the presence of an unwanted interferer on frequencies other than those of the spurious response or the adjacent channels, without this unwanted input signal causing a degradation of the performance of the receiver beyond a specified limit. The blocking performance shall apply at all frequencies except those at which a spurious response occur.

The requirements in clause 6.5G.2.1 and 6.5G.2.2 and this test apply for Release 10 and later releases to all types of UTRA for the FDD UE that support dual band dual uplink 4C-HSDPA and HS-DSCH categories 31 or 32.

Dual band 4C-HSDPA is designed to operate in configurations specified in clause 4.2.

6.5G.2 Minimum Requirements

6.5G.2.1 Minimum Requirements (In-band blocking)

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 6.5G.1 and 6.5G.2. In-band blocking is defined for an unwanted interfering signal falling into the UE receive band or into the first 15 MHz below or above the UE receive band.

Table 6.5G.1: Test parameters for in-band blocking, dual band 4C-HSDPA, dual uplink operation

| Parameter | Unit | Level | |
|--|------|-----------------------------|--------------------------------------|
| I_{blocking} mean power (modulated) | dBm | -56 | -44 |
| F_{uw} offset (NOTE 2) | | ± 10 MHz | ≤ -15 MHz & ≥ 15 MHz |
| F_{uw} (Band I operation) | MHz | $2102.4 \leq f \leq 2177.6$ | $2095 \leq f \leq 2185$ |
| F_{uw} (Band II operation) | MHz | $1922.4 \leq f \leq 1997.6$ | $1915 \leq f \leq 2005$ |
| F_{uw} (Band IV operation) | MHz | $2102.4 \leq f \leq 2162.6$ | $2095 \leq f \leq 2170$ |
| F_{uw} (Band V operation) | MHz | $861.4 \leq f \leq 901.6$ | $854 \leq f \leq 909$ |
| F_{uw} (Band VIII operation) | MHz | $917.4 \leq f \leq 967.6$ | $910 \leq f \leq 975$ |

NOTE 1: I_{blocking} (modulated) consists of the common channels needed for tests as specified in Table E.4.1 and 16 dedicated data channels as specified in Table E.3.6.

NOTE 2: For single band 4C-HSDPA, negative offset refers to the assigned channel frequency of the lowest carrier frequencies, and positive offset refers to the assigned channel frequency of the highest carrier frequencies.

Table 6.5G.2: In-band blocking requirements, dual band 4C-HSDPA, dual uplink operation

| Dual band 4C-HSDPA Configuration | DL Band | UL Band | HS-PDSCH_Ec (dBm/3.84MHz) | \hat{I}_{or} (dBm/3.84MHz) | UE transmitted mean power (dBm) | UL-DL carrier separation |
|----------------------------------|---------|---------|---------------------------|------------------------------|---|--------------------------|
| I-2-VIII-1 I-3-VIII-1 | I | I | -110 | -99.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| | VIII | | -107 | -96.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| II-1-IV-2 | II | IV | -107 | -96.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| | IV | | -109 | -98.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| II-2-IV-1 | II | II | -107 | -96.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| | IV | | -109 | -98.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| II-2-IV-2 | II | II | -107 | -96.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| | IV | | -109 | -98.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| | II | IV | -107 | -96.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| | IV | | -109 | -98.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| I-1-V-2 | I | V | -110 | -99.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| | V | | -103.2 | -92.9 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| I-2-V-1 | I | I | -110 | -99.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| | V | | -108 | -97.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| I-2-V-2 | I | I | -110 | -99.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| | V | | -108 | -97.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| | I | V | -110 | -99.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| | V | | -103.2 | -92.9 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |

NOTE 3: <REFSENS> and <REF \hat{I}_{or} > refer to the HS-PDSCH_Ec<REFSENS> and the HS-PDSCH<REF \hat{I}_{or} > as specified in Table 6.2D.1 for single band 4C-HSDPA.

The normative reference for this requirement is TS 25.101 [1] clause 7.6.1D.2.

6.5G.2.2 Minimum requirements (Narrow band blocking)

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 6.5G.3 and Table 6.5G.4. This requirement is measure of a receiver's ability to receive a W-CDMA signal at its assigned channel frequency in the presence of an unwanted narrow band interferer at a frequency, which is less than the nominal channel spacing.

Table 6.5G.3: Test parameters for narrow band blocking characteristics for dual band 4C-HSDPA, dual uplink operation

| Parameter | Unit | Band II, IV, V | Band VIII |
|-----------------------------------|------|----------------|-----------|
| I_{blocking} (GMSK) | dBm | -57 | -56 |
| F_{uw} (offset) (NOTE 2) | MHz | ±2.7 | ±2.8 |

NOTE 1: I_{blocking} (GMSK) is an interfering signal as defined in TS 45.004

NOTE 2: For dual band 4C-HSDPA, negative offset refers to the assigned channel frequency of the lowest carrier frequency(ies) in each band, and positive offset refers to the assigned channel frequency of the highest carrier frequency(ies) in each band.

Table 6.5G.4: Narrow band blocking requirements, dual band 4C-HSDPA, dual uplink operation

| Dual band 4C-HSDPA Configuration | DL Band | UL Band | HS-PDSCH E_c (dBm/3.84MHz) | \hat{I}_{or} (dBm/3.84MHz) | UE transmitted mean power (dBm) | UL-DL carrier separation |
|----------------------------------|---------|---------|------------------------------|------------------------------|---|--------------------------|
| I-2-VIII-1 I-3-VIII-1 | VIII | I | -100 | -89.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| II-1-IV-2 | II | IV | -100 | -89.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| | IV | | -101 | -90.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| II-2-IV-1 | II | II | -100 | -89.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| | IV | | -101 | -90.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| II-2-IV-2 | II | II | -100 | -89.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| | IV | | -101 | -90.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| | II | IV | -100 | -89.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| | IV | | -101 | -90.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| I-1-V-2 | V | V | -99.8 | -89.5 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| I-2-V-1 | V | I | -101 | -90.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| I-2-V-2 | V | I | -101 | -90.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| | V | V | -99.8 | -89.5 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |

The normative reference for this requirement is TS 25.101 [1] clause 7.6.3D.2.

6.5G.3 Test purpose

To verify that the UE BLER of HS-PDSCH on each individual cell does not exceed 0.1 for the parameters specified in table 6.5G.6, table 6.5G.7, table 6.5G.8 and table 6.5G.9 for the DL reference channel H-Set 1C specified in Annex C.8.1.1.

The lack of the blocking ability decreases the 4C-HSDPA coverage area when other transmitter exists (except in the adjacent channels and spurious response).

This test case tests only 4 carrier configurations.

6.5G.4 Method of test

6.5G.4.1 Initial conditions

For in-band case:

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

For out-of-band case:

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequency to be tested: 1 arbitrary frequency chosen from the low, mid or high range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.49.
- 2) RF parameters are set up according to table 6.5G.6, table 6.5G.7, table 6.5G.8 and table 6.5G.9.
- 3) A call is set up according to the Generic 4C-HSDPA setup procedure specified in TS34.108[3] sub clause 7.3.16, with exceptions for information elements listed in Table 6.5G.5. With this exception, the Power Control Algorithm for the Uplink is set to algorithm 2.

Contents of RADIO BEARER SETUP message: AM or UM (Test Loop Mode1)

Table 6.5G.5: Specific Message Contents for In-band blocking characteristics for Single band 4C-HSDPA, Single uplink operation

| Information Element | Value/Remark | Version |
|----------------------------------|--------------|---------|
| Uplink DPCH info | | Rel-6 |
| - Uplink DPCH power control info | | |
| - CHOICE mode | FDD | |
| - Power Control Algorithm | Algorithm2 | |

6.5G.4.2 Procedure

- 1) Set the parameters of the CW generator or the interference signal generator as shown in table 6.5G.6 and table 6.5G.7, for inband blocking measurements and table 6.5G.8 and table 6.5G.9 for narrow band measurements. For table 6.5G.8 and 6.5G.9, the frequency step size is 1 MHz.
- 2) Set the power level of UE according to the table 6.5G.6, table 6.5G.7, table 6.5G.8 and table 6.5G.9, or send the power control commands (1dB step size should be used.) to the UE until UE output power measured by Test System shall be kept at the specified power level with ± 1 dB tolerance.
- 3) Measure the BLER of HS-PDSCH received from the UE at the SS by counting the number of NACK, ACK and statDTX on the UL HS-DPCCH ($BLER = (NACK + statDTX)/(NACK + statDTX + ACK)$).
- 4) For table 6.5G.8 and 6.5G.9, record the frequencies for which BLER exceed the test requirements.

6.5G.5 Test requirements

For table 6.5G.6 and 6.5G.7, the measured BLER, derived in step 2), shall not exceed 0.1 on each individual cell. For table 6.5G.8 and 6.5G.9, the measured BLER, derived in step 2) shall not exceed 0.1 on each individual cell except for the spurious response frequencies, recorded in step 3). The number of spurious response frequencies, recorded in step 3) shall not exceed 24 for frequency range 1, 2 and 3. The number of spurious response frequencies, recorded in step 3) shall not exceed 8 for frequency range 4. The minimum number of measurements required for a statistically significant result to this test is clarified in annex F.6.3, Table F.6.3.5.0.

Table 6.5G.6: Test parameters for in-band blocking, dual band 4C-HSDPA, dual uplink operation

| Parameter | Unit | Level | |
|--|------|-----------------------------|--------------------------------------|
| I_{blocking} mean power (modulated) | dBm | -56 | -44 |
| F_{uw} offset (NOTE 2) | | ± 10 MHz | ≤ -15 MHz & ≥ 15 MHz |
| F_{uw} (Band I operation) | MHz | $2102.4 \leq f \leq 2177.6$ | $2095 \leq f \leq 2185$ |
| F_{uw} (Band II operation) | MHz | $1922.4 \leq f \leq 1997.6$ | $1915 \leq f \leq 2005$ |
| F_{uw} (Band IV operation) | MHz | $2102.4 \leq f \leq 2162.6$ | $2095 \leq f \leq 2170$ |
| F_{uw} (Band V operation) | MHz | $861.4 \leq f \leq 901.6$ | $854 \leq f \leq 909$ |
| F_{uw} (Band VIII operation) | MHz | $917.4 \leq f \leq 967.6$ | $910 \leq f \leq 975$ |

NOTE 1: I_{blocking} (modulated) consists of the common channels needed for tests as specified in Table E.4.1 and 16 dedicated data channels as specified in Table E.3.6.

NOTE 2: For single band 4C-HSDPA, negative offset refers to the assigned channel frequency of the lowest carrier frequencies, and positive offset refers to the assigned channel frequency of the highest carrier frequencies.

Table 6.5G.7: In-band blocking requirements, dual band 4C-HSDPA, dual uplink operation

| I-2-V-1 | I | I | -110 | -99.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| | V | | -108 | -97.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| I-2-V-2 | I | I | -110 | -99.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| | V | | -108 | -97.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| | I | V | -110 | -99.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| | V | | -103.2 | -92.9 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |

NOTE 3: $\langle \text{REFSENS} \rangle$ and $\langle \text{REF}\hat{I}_{or} \rangle$ refer to the HS-PDSCH $E_c \langle \text{REFSENS} \rangle$ and the HS-PDSCH $\langle \text{REF}\hat{I}_{or} \rangle$ as specified in Table 6.2D.1 for single band 4C-HSDPA.

Table 6.5G.8: Test parameters for narrow band blocking characteristics for dual band 4C-HSDPA, dual uplink operation

| Parameter | Unit | Band II, IV, V | Band VIII |
|------------------------------|------|----------------|-----------|
| I_{blocking} (GMSK) | dBm | -57 | -56 |
| F_{uw} (offset) (NOTE 2) | MHz | ± 2.7 | ± 2.8 |

NOTE 4: I_{blocking} (GMSK) is an interfering signal as defined in TS 45.004.

NOTE 5: For dual band 4C-HSDPA, negative offset refers to the assigned channel frequency of the lowest carrier frequency(ies) in each band, and positive offset refers to the assigned channel frequency of the highest carrier frequency(ies) in each band.

Table 6.5G.9: Narrow band blocking requirements, dual band 4C-HSDPA, dual uplink operation

| Dual band 4C-HSDPA Configuration | DL Band | UL Band | HS-PDSCH_Ec (dBm/3.84MHz) | \hat{I}_{or} (dBm/3.84MHz) | UE transmitted mean power (dBm) | UL-DL carrier separation |
|----------------------------------|---------|---------|---------------------------|------------------------------|---|--------------------------|
| I-2-VIII-1 I-3-VIII-1 | VIII | I | -100 | -89.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| II-1-IV-2 | II | IV | -100 | -89.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| | IV | | -101 | -90.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| II-2-IV-1 | II | II | -100 | -89.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| | IV | | -101 | -90.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| II-2-IV-2 | II | II | -100 | -89.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| | IV | | -101 | -90.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| | II | IV | -100 | -89.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| | IV | | -101 | -90.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| I-1-V-2 | V | V | -99.8 | -89.5 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| I-2-V-1 | V | I | -101 | -90.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| I-2-V-2 | V | I | -101 | -90.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| | V | V | -99.8 | -89.5 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |

NOTE 6: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

6.5GA Blocking Characteristics for dual uplink dual band 4C-HSDPA (3 carrier)

6.5GA.1 Definition and applicability

The blocking characteristic is a measure of the receiver's ability to receive a wanted signal at its assigned channel frequency in the presence of an unwanted interferer on frequencies other than those of the spurious response or the adjacent channels, without this unwanted input signal causing a degradation of the performance of the receiver beyond a specified limit. The blocking performance shall apply at all frequencies except those at which a spurious response occur.

The requirements in clause 6.5GA.2.1 and 6.5GA.2.2 and this test apply for Release 10 and later releases to all types of UTRA for the FDD UE that support dual band dual uplink 4C-HSDPA and HS-DSCH categories 29 to 32.

Dual band 4C-HSDPA is designed to operate in configurations specified in clause 4.2.

6.5GA.2 Minimum Requirements

6.5GA.2.1 Minimum Requirements (In-band blocking)

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 6.5GA.1 and 6.5GA.2. In-band blocking is defined for an unwanted interfering signal falling into the UE receive band or into the first 15 MHz below or above the UE receive band.

Table 6.5GA.1: Test parameters for in-band blocking, dual band 4C-HSDPA, dual uplink operation

| Parameter | Unit | Level | |
|--|------|-----------------------------|--------------------------------------|
| I_{blocking} mean power (modulated) | dBm | -56 | -44 |
| F_{uw} offset (NOTE 2) | | ± 10 MHz | ≤ -15 MHz & ≥ 15 MHz |
| F_{uw} (Band I operation) | MHz | $2102.4 \leq f \leq 2177.6$ | $2095 \leq f \leq 2185$ |
| F_{uw} (Band II operation) | MHz | $1922.4 \leq f \leq 1997.6$ | $1915 \leq f \leq 2005$ |
| F_{uw} (Band IV operation) | MHz | $2102.4 \leq f \leq 2162.6$ | $2095 \leq f \leq 2170$ |
| F_{uw} (Band V operation) | MHz | $861.4 \leq f \leq 901.6$ | $854 \leq f \leq 909$ |
| F_{uw} (Band VIII operation) | MHz | $917.4 \leq f \leq 967.6$ | $910 \leq f \leq 975$ |

NOTE 1: I_{blocking} (modulated) consists of the common channels needed for tests as specified in Table E.4.1 and 16 dedicated data channels as specified in Table E.3.6.

NOTE 2: For single band 4C-HSDPA, negative offset refers to the assigned channel frequency of the lowest carrier frequencies, and positive offset refers to the assigned channel frequency of the highest carrier frequencies.

Table 6.5GA.2: In-band blocking requirements, dual band 4C-HSDPA, dual uplink operation

| Dual band 4C-HSDPA Configuration | DL Band | UL Band | HS-PDSCH_Ec (dBm/3.84MHz) | \hat{I}_{or} (dBm/3.84MHz) | UE transmitted mean power (dBm) | UL-DL carrier separation |
|----------------------------------|---------|---------|---------------------------|------------------------------|---|--------------------------|
| I-2-VIII-1 I-3-VIII-1 | I | I | -110 | -99.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| | VIII | | -107 | -96.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| II-1-IV-2 | II | IV | -107 | -96.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| | IV | | -109 | -98.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| II-2-IV-1 | II | II | -107 | -96.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| | IV | | -109 | -98.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| II-2-IV-2 | II | II | -107 | -96.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| | IV | | -109 | -98.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| | II | IV | -107 | -96.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| | IV | | -109 | -98.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| I-1-V-2 | I | V | -110 | -99.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| | V | | -103.2 | -92.9 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| I-2-V-1 | I | I | -110 | -99.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| | V | | -108 | -97.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| I-2-V-2 | I | I | -110 | -99.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| | V | | -108 | -97.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| | I | V | -110 | -99.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| | V | | -103.2 | -92.9 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |

NOTE 3: <REFSENS> and <REF \hat{I}_{or} > refer to the HS-PDSCH_Ec<REFSENS> and the HS-PDSCH<REF \hat{I}_{or} > as specified in Table 6.2DA.1 for single band 4C-HSDPA.

The normative reference for this requirement is TS 25.101 [1] clause 7.6.1D.2.

6.5GA.2.2 Minimum requirements (Narrow band blocking)

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 6.5GA.3 and Table 6.5GA.4. This requirement is measure of a receiver's ability to receive a W-CDMA signal at its assigned channel frequency in the presence of an unwanted narrow band interferer at a frequency, which is less than the nominal channel spacing.

Table 6.5GA.3: Test parameters for narrow band blocking characteristics for dual band 4C-HSDPA, dual uplink operation

| Parameter | Unit | Band II, IV, V | Band VIII |
|----------------------------|------|----------------|-----------|
| $I_{blocking}$ (GMSK) | dBm | -57 | -56 |
| F_{uw} (offset) (NOTE 2) | MHz | ±2.7 | ±2.8 |

NOTE 1: $I_{blocking}$ (GMSK) is an interfering signal as defined in TS 45.004

NOTE 2: For dual band 4C-HSDPA, negative offset refers to the assigned channel frequency of the lowest carrier frequency(ies) in each band, and positive offset refers to the assigned channel frequency of the highest carrier frequency(ies) in each band.

Table 6.5GA.4: Narrow band blocking requirements, dual band 4C-HSDPA, dual uplink operation

| Dual band 4C-HSDPA Configuration | DL Band | UL Band | HS-PDSCH E_c (dBm/3.84MHz) | \hat{I}_{or} (dBm/3.84MHz) | UE transmitted mean power (dBm) | UL-DL carrier separation |
|----------------------------------|---------|---------|------------------------------|------------------------------|---|--------------------------|
| I-2-VIII-1 I-3-VIII-1 | VIII | I | -100 | -89.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| II-1-IV-2 | II | IV | -100 | -89.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| | IV | | -101 | -90.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| II-2-IV-1 | II | II | -100 | -89.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| | IV | | -101 | -90.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| II-2-IV-2 | II | II | -100 | -89.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| | IV | | -101 | -90.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| | II | IV | -100 | -89.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| | IV | | -101 | -90.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| I-1-V-2 | V | V | -99.8 | -89.5 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| I-2-V-1 | V | I | -101 | -90.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| I-2-V-2 | V | I | -101 | -90.7 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |
| | V | V | -99.8 | -89.5 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |

The normative reference for this requirement is TS 25.101 [1] clause 7.6.3D.2.

6.5GA.3 Test purpose

To verify that the UE BLER of HS-PDSCH on each individual cell does not exceed 0.1 for the parameters specified in table 6.5GA.6, table 6.5GA.7, table 6.5GA.8 and table 6.5GA.9 for the DL reference channel H-Set 1B specified in Annex C.8.1.1.

The lack of the blocking ability decreases the 4C-HSDPA coverage area when other transmitter exists (except in the adjacent channels and spurious response).

This test case tests only 3 carrier configurations.

6.5GA.4 Method of test

6.5GA.4.1 Initial conditions

For in-band case:

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

For out-of-band case:

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequency to be tested: 1 arbitrary frequency chosen from the low, mid or high range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.49.
- 2) RF parameters are set up according to table 6.5GA.6, table 6.5GA.7, table 6.5GA.8 and table 6.5GA.9.
- 3) A call is set up according to the Generic 4C-HSDPA setup procedure specified in TS34.108[3] sub clause 7.3.16, with exceptions for information elements listed in Table 6.5GA.5. With this exception, the Power Control Algorithm for the Uplink is set to algorithm 2.

Contents of RADIO BEARER SETUP message: AM or UM (Test Loop Mode1)

Table 6.5GA.5: Specific Message Contents for In-band blocking characteristics for Single band 4C-HSDPA, Single uplink operation

| Information Element | Value/Remark | Version |
|----------------------------------|--------------|---------|
| Uplink DPCH info | | Rel-6 |
| - Uplink DPCH power control info | | |
| - CHOICE mode | FDD | |
| - Power Control Algorithm | Algorithm2 | |

6.5GA.4.2 Procedure

- 1) Set the parameters of the CW generator or the interference signal generator as shown in table 6.5GA.6 and table 6.5GA.7, for inblocking measurements and table 6.5GA.8 and table 6.5GA.9 for narrow band measurements. For table 6.5GA.8 and 6.5GA.9, the frequency step size is 1 MHz.
- 2) Set the power level of UE according to the table 6.5GA.6, table 6.5GA.7, table 6.5GA.8 and table 6.5GA.9, or send the power control commands (1dB step size should be used.) to the UE until UE output power measured by Test System shall be kept at the specified power level with ± 1 dB tolerance.
- 3) Measure the BLER of HS-PDSCH received from the UE at the SS by counting the number of NACK, ACK and statDTX on the UL HS-DPCCH ($BLER = (NACK + statDTX)/(NACK + statDTX + ACK)$).
- 4) For table 6.5GA.8 and 6.5GA.9, record the frequencies for which BLER exceed the test requirements.

6.5GA.5 Test requirements

For table 6.5GA.6 and 6.5GA.7, the measured BLER, derived in step 2), shall not exceed 0.1 on each individual cell. For table 6.5GA.8 and 6.5GA.9, the measured BLER, derived in step 2) shall not exceed 0.1 on each individual cell except for the spurious response frequencies, recorded in step 3). The number of spurious response frequencies, recorded in step 3) shall not exceed 24 for frequency range 1, 2 and 3. The number of spurious response frequencies, recorded in step 3) shall not exceed 8 for frequency range 4. The minimum number of measurements required for a statistically significant result to this test is clarified in annex F.6.3, Table F.6.3.5.0.

Table 6.5GA.6: Test parameters for in-band blocking, dual band 4C-HSDPA, dual uplink operation

| Parameter | Unit | Level | |
|--|------|-----------------------------|--------------------------------------|
| I_{blocking} mean power (modulated) | dBm | -56 | -44 |
| F_{uw} offset (NOTE 2) | | ± 10 MHz | ≤ -15 MHz & ≥ 15 MHz |
| F_{uw} (Band I operation) | MHz | $2102.4 \leq f \leq 2177.6$ | $2095 \leq f \leq 2185$ |
| F_{uw} (Band II operation) | MHz | $1922.4 \leq f \leq 1997.6$ | $1915 \leq f \leq 2005$ |
| F_{uw} (Band IV operation) | MHz | $2102.4 \leq f \leq 2162.6$ | $2095 \leq f \leq 2170$ |
| F_{uw} (Band V operation) | MHz | $861.4 \leq f \leq 901.6$ | $854 \leq f \leq 909$ |
| F_{uw} (Band VIII operation) | MHz | $917.4 \leq f \leq 967.6$ | $910 \leq f \leq 975$ |

NOTE 1: I_{blocking} (modulated) consists of the common channels needed for tests as specified in Table E.4.1 and 16 dedicated data channels as specified in Table E.3.6.

NOTE 2: For single band 4C-HSDPA, negative offset refers to the assigned channel frequency of the lowest carrier frequencies, and positive offset refers to the assigned channel frequency of the highest carrier frequencies.

Table 6.5GA.7: In-band blocking requirements, dual band 4C-HSDPA, dual uplink operation

| Dual band 4C-HSDPA Configuration | DL Band | UL Band | HS-PDSCH E_c (dBm/3.84MHz) | \hat{I}_{or} (dBm/3.84MHz) | UE transmitted mean power (dBm) | UL-DL carrier separation |

| | V | V | -99.8 | -89.5 | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | Minimum |

NOTE 6: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

6.6 Spurious Response

6.6.1 Definition and applicability

Spurious response is a measure of the receiver's ability to receive a wanted signal on its assigned channel frequency without exceeding a given degradation due to the presence of an unwanted CW interfering signal at any other frequency at which a response is obtained i.e. for which the out of band blocking limit is not met.

The requirements and this test apply to all types of UTRA for the FDD UE.

6.6.2 Minimum Requirements

The BER shall not exceed 0,001 for the parameters specified in table 6.6.1.

The normative reference for this requirement is TS 25.101 [1] clause 7.7.1.

Table 6.6.1: Test parameters for Spurious Response

| Parameter | Level | Unit |
|---------------------------|---|---------------|
| DPCH_Ec | <REFSENS> +3 dB | dBm / 3,84MHz |
| \hat{I}_{or} | <REF \hat{I}_{or} > +3 dB | dBm / 3,84MHz |
| $I_{blocking}(CW)$ | -44 | dBm |
| F_{uw} | Spurious response frequencies | MHz |
| UE transmitted mean power | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | dBm |

6.6.3 Test purpose

To verify that the UE BER does not exceed 0,001 for the parameters specified in table 6.6.2.

The lack of the spurious response ability decreases the coverage area when other unwanted interfering signal exists at any other frequency.

6.6.4 Method of test

6.6.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequency to be tested: the same frequency as chosen in clause 6.5.4.1 for Blocking characteristics out-of-band case.

- 1) Connect the SS to the UE antenna connector as shown in figure A.6.
- 2) RF parameters are set up according to table 6.6.2.
- 3) A call is set up according to the Generic call setup procedure specified in TS 34.108 [3] sub clause 7.3.2, with the following exception for information elements in RADIO BEARER SETUP message. With this exception, the Power Control Algorithm for the Uplink is set to algorithm 2.
- 4) Enter the UE into loopback test mode and start the loopback test.

Table 6.6.1A Contents of RADIO BEARER SETUP message: AM or UM

| Information Element | Value/Remark |
|---|--------------------------------|
| CHOICE channel requirement - Power Control Algorithm | Uplink DPCH info Algorithm2 |

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

6.6.4.2 Procedure

- 1) Set the parameter of the CW generator as shown in table 6.6.2. The spurious response frequencies are determined in step 3) of clause 6.5.4.2.
- 2) Set the power level of UE according to the table 6.6.2 or send the power control commands (1dB step size should be used.) to the UE until UE output power measured by Test System shall be kept at the specified power level with ± 1 dB tolerance.
- 3) Measure the BER of DCH received from the UE at the SS.

6.6.5 Test requirements

The measured BER, derived in step 3), shall not exceed 0,001.

Table 6.6.2: Test parameters for Spurious Response

| Parameter | Level | Unit |
|----------------------------|---|---------------|
| DPCH_Ec | <REFSENS> +3 dB | dBm / 3,84MHz |
| I _{or} | <REFI _{or} > +3 dB | dBm / 3,84MHz |
| I _{blocking} (CW) | -44 | dBm |
| F _{uw} | Spurious response frequencies | MHz |
| UE transmitted mean power | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | dBm |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

6.6A Spurious Response for DC-HSDPA

6.6A.1 Definition and applicability

Spurious response is a measure of the receiver's ability to receive a wanted signal on its assigned channel frequency without exceeding a given degradation due to the presence of an unwanted CW interfering signal at any other frequency at which a response is obtained i.e. for which the out of band blocking limit as specified in subclause 6.5A.2.2 is not met.

The requirements and this test apply for Release 8 and later releases to all types of UTRA for the FDD UE that support DC-HSDPA.

6.6A.2 Minimum Requirements

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 6.6A.1.

Table 6.6A.1: Test Parameters for Spurious Response (DC-HSDPA)

| Parameter | Unit | Level |
|---------------------------|--------------|---|
| HS-PDSCH_Ec | dBm/3.84 MHz | <REFSENS> +3 dB |
| \hat{I}_{or} | dBm/3.84 MHz | <REF \hat{I}_{or} > +3 dB |
| $I_{blocking}$ (CW) | dBm | -44 |
| F_{uw} | MHz | Spurious response frequencies |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) |

NOTE: <REFSENS> and <REF \hat{I}_{or} > refers to the HS-PDSCH_Ec<REFSENS> and the HS-PDSCH<REF \hat{I}_{or} > as specified in Table 7.2A.

The normative reference for this requirement is TS 25.101 [1] clause 7.7.2.

6.6A.3 Test purpose

To verify that the UE BLER of HS-PDSCH does not exceed 0.1 for the parameters specified in table 6.6A.3 for the DL reference channel H-Set 12 specified in Annex C.8.1.12.

The lack of the spurious response ability decreases the DC-HSDPA coverage area when other unwanted interfering signal exists at any other frequency.

6.6A.4 Method of test

6.6A.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequency to be tested: the same frequency as chosen in clause 6.5A.4.1 for Blocking characteristics out-of-band case.

- 1) Connect the SS to the UE antenna connector as shown in figure A.33.
- 2) RF parameters are set up according to table 6.6A.3.
- 3) A call is set up according to the Generic DC-HSDPA setup procedure specified in TS 34.108 [3] sub clause 7.3.13, with exceptions for information elements listed in Table 6.6A.2. With this exception, the Power Control Algorithm for the Uplink is set to algorithm 2.

| - HS-DSCH TB size table | octet aligned (for H-Set 12) | |

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

6.6A.4.2 Procedure

- 1) Set the parameter of the CW generator as shown in table 6.6A.3. The spurious response frequencies are determined in step 3) of clause 6.5A.4.2.
- 2) Set the power level of UE according to the table 6.6A.3 or send the power control commands (1dB step size should be used.) to the UE until UE output power measured by Test System shall be kept at the specified power level with ± 1 dB tolerance.
- 3) Measure the BLER of HS-PDSCH received from the UE at the SS by counting the number of NACK, ACK and statDTX on the UL HS-DPCCH ($BLER = (NACK + statDTX)/(NACK + statDTX + ACK)$).

6.6A.5 Test requirements

The measured BLER, derived in step 3), shall not exceed 0.1 on each individual cell. The minimum number of measurements required for a statistically significant result to this test is clarified in annex F.6.3, Table F.6.3.5.0.

Table 6.6A.3: Test parameters for Spurious Response (DC-HSDPA)

| Parameter | Level | Unit |
|----------------------------|---|---------------|
| HS-PDSCH_Ec | <REFSENS> +3 dB | dBm / 3,84MHz |
| I _{or} | <REFI _{or} > +3 dB | dBm / 3,84MHz |
| I _{blocking} (CW) | -44 | dBm |
| F _{uw} | Spurious response frequencies | MHz |
| UE transmitted mean power | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | dBm |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

6.6B Spurious Response for DB-DC-HSDPA

6.6B.1 Definition and applicability

Spurious response is a measure of the receiver's ability to receive a wanted signal on its assigned channel frequency without exceeding a given degradation due to the presence of an unwanted CW interfering signal at any other frequency at which a response is obtained i.e. for which the out of band blocking limit as specified in subclause 6.5B.2.2 is not met.

The requirements and this test apply for Release 9 and later releases to all types of UTRA for the FDD UE that support DB-DC-HSDPA.

DB-DC-HSDPA is designed to operate in configurations specified in clause 4.2.

6.6B.2 Minimum Requirements

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 6.6B.1.

Table 6.6B.1: Test Parameters for Spurious Response (DB-DC-HSDPA)

| Parameter | Unit | Level |
|---------------------------|--------------|---|
| HS-PDSCH_Ec | dBm/3.84 MHz | <REFSENS> +3 dB |
| \hat{I}_{or} | dBm/3.84 MHz | <REF \hat{I}_{or} > +3 dB |
| $I_{blocking}$ (CW) | dBm | -44 |
| F_{uw} | MHz | Spurious response frequencies |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) |

NOTE: <REFSENS> and <REF \hat{I}_{or} > refers to the HS-PDSCH_Ec<REFSENS> and the HS-PDSCH<REF \hat{I}_{or} > as specified in Table 6.2B.1.

The normative reference for this requirement is TS 25.101 [1] clause 7.7.2.

6.6B.3 Test purpose

To verify that the UE BLER of HS-PDSCH does not exceed 0.1 for the parameters specified in table 6.6B.3 for the DL reference channel H-Set 12 specified in Annex C.8.1.12.

The lack of the spurious response ability decreases the DB-DC-HSDPA coverage area when other unwanted interfering signal exists at any other frequency.

6.6B.4 Method of test

6.6B.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequency to be tested: the same frequency as chosen in clause 6.5B.4.1 for Blocking characteristics out-of-band case.

- 1) Connect the SS to the UE antenna connector as shown in figure A.33.
- 2) RF parameters are set up according to table 6.6B.3.
- 3) A call is set up according to the Generic call setup procedure specified in TS 34.108 [3] sub clause 7.3.13, with exceptions for information elements listed in Table 6.6B.2. With this exception, the Power Control Algorithm for the Uplink is set to algorithm 2.

Contents of RADIO BEARER SETUP message: AM or UM (Test Loop Mode1)

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

6.6B.4.2 Procedure

- 1) Set the parameter of the CW generator as shown in table 6.6B.3. The spurious response frequencies are determined in step 3) of clause 6.5B.4.2.
- 2) Set the power level of UE according to the table 6.6B.3 or send the power control commands (1dB step size should be used.) to the UE until UE output power measured by Test System shall be kept at the specified power level with ± 1 dB tolerance.
- 3) Measure the BLER of HS-PDSCH received from the UE at the SS by counting the number of NACK, ACK and statDTX on the UL HS-DPCCH ($BLER = (NACK + statDTX)/(NACK + statDTX + ACK)$).

6.6B.5 Test requirements

The measured BLER, derived in step 3), shall not exceed 0.1 on each individual cell. The minimum number of measurements required for a statistically significant result to this test is clarified in annex F.6.3, Table F.6.3.5.0.

Table 6.6B.3: Test parameters for Spurious Response (DB-DC-HSDPA)

| Parameter | Level | Unit |
|----------------------------|---|---------------|
| HS-PDSCH_Ec | <REFSENS> +3 dB | dBm / 3,84MHz |
| I _{or} | <REFI _{or} > +3 dB | dBm / 3,84MHz |
| I _{blocking} (CW) | -44 | dBm |
| F _{uw} | Spurious response frequencies | MHz |
| UE transmitted mean power | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | dBm |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

6.6C Spurious Response for single band 4C-HSDPA

6.6C.1 Definition and applicability

Spurious response is a measure of the receiver's ability to receive a wanted signal on its assigned channel frequency without exceeding a given degradation due to the presence of an unwanted CW interfering signal at any other frequency at which a response is obtained i.e. for which the out of band blocking limit as specified in subclause 6.5D.2.2 is not met.

The requirements and this test apply for Release 10 and later releases to all types of UTRA for the FDD UE that support single band 4C-HSDPA.

Single band 4C-HSDPA is designed to operate in configurations specified in clause 4.2.

6.6C.2 Minimum Requirements

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 6.6C.1.

Table 6.6C.1: Test Parameters for Spurious Response single band 4C-HSDPA

| Parameter | Unit | Level |
|---------------------------|--------------|---|
| HS-PDSCH_Ec | dBm/3.84 MHz | <REFSENS> +3 dB |
| I_{or} | dBm/3.84 MHz | <REF I_{or} > +3 dB |
| $I_{blocking}$ (CW) | dBm | -44 |
| F_{uw} | MHz | Spurious response frequencies |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) |

NOTE: <REFSENS> and <REF I_{or} > refers to the HS-PDSCH_Ec<REFSENS> and the HS-PDSCH<REF I_{or} > as specified in Table 6.2C.1.

The normative reference for this requirement is TS 25.101 [1] clause 7.7.2.

6.6C.3 Test purpose

To verify that the UE BLER of HS-PDSCH does not exceed 0.1 for the parameters specified in table 6.6C.3 for the DL reference channel H-Set 1B specified in Annex C.8.1.1.

The lack of the spurious response ability decreases the 4C-HSDPA coverage area when other unwanted interfering signal exists at any other frequency.

6.6C.4 Method of test

6.6C.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequency to be tested: the same frequency as chosen in clause 6.5D.4.1 for Blocking characteristics out-of-band case.

- 1) Connect the SS to the UE antenna connector as shown in figure A.50.
- 2) RF parameters are set up according to table 6.6C.3.
- 3) A call is set up according to the Generic call setup procedure specified in TS 34.108 [3] sub clause 7.3.16, with exceptions for information elements listed in Table 6.6C.2. With this exception, the Power Control Algorithm for the Uplink is set to algorithm 2.

Contents of RADIO BEARER SETUP message: AM or UM (Test Loop Mode1)

| Information Element | Value/Remark | Version |
|----------------------------------|--------------|---------|
| Uplink DPCH info | | Rel-6 |
| - Uplink DPCH power control info | | |
| - CHOICE mode | FDD | |
| - Power Control Algorithm | Algorithm2 | |

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

6.6C.4.2 Procedure

- 1) Set the parameter of the CW generator as shown in table 6.6C.3. The spurious response frequencies are determined in step 3) of clause 6.5D.4.2.
- 2) Set the power level of UE according to the table 6.6C.3 or send the power control commands (1dB step size should be used.) to the UE until UE output power measured by Test System shall be kept at the specified power level with ± 1 dB tolerance.
- 3) Measure the BLER of HS-PDSCH received from the UE at the SS by counting the number of NACK, ACK and statDTX on the UL HS-DPCCH ($BLER = (NACK + statDTX)/(NACK + statDTX + ACK)$).

6.6C.5 Test requirements

The measured BLER, derived in step 3), shall not exceed 0.1 on each individual cell. The minimum number of measurements required for a statistically significant result to this test is clarified in annex F.6.3, Table F.6.3.5.0.

Table 6.6C.3: Test parameters for Spurious Response (single band 4C-HSDPA)

| Parameter | Level | Unit |
|---------------------------|---|---------------|
| HS-PDSCH_Ec | <REFSENS> +3 dB | dBm / 3,84MHz |
| I _{or} | <REFI _{or} > +3 dB | dBm / 3,84MHz |
| I _{blocking(CW)} | -44 | dBm |
| F _{uw} | Spurious response frequencies | MHz |
| UE transmitted mean power | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | dBm |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

6.6D Spurious Response for dual band 4C-HSDPA

6.6D.1 Definition and applicability

Spurious response is a measure of the receiver's ability to receive a wanted signal on its assigned channel frequency without exceeding a given degradation due to the presence of an unwanted CW interfering signal at any other frequency at which a response is obtained i.e. for which the out of band blocking limit as specified in subclause 6.5B.2.2 is not met.

The requirements and this test apply for Release 10 and later releases to all types of UTRA for the FDD UE that support dual band 4C-HSDPA and HS-DSCH categories 31 or 32.

Dual band 4C-HSDPA is designed to operate in configurations specified in clause 4.2.

6.6D.2 Minimum Requirements

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 6.6D.1.

Table 6.6D.1: Test Parameters for Spurious Response (Dual band 4C-HSDPA)

| Parameter | Unit | Level |
|---------------------------|--------------|---|
| HS-PDSCH_Ec | dBm/3.84 MHz | <REFSENS> +3 dB |
| \hat{I}_{or} | dBm/3.84 MHz | <REF \hat{I}_{or} > +3 dB |
| $I_{blocking}$ (CW) | dBm | -44 |
| F_{uw} | MHz | Spurious response frequencies |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) |

NOTE: <REFSENS> and <REF \hat{I}_{or} > refers to the HS-PDSCH_Ec<REFSENS> and the HS-PDSCH<REF \hat{I}_{or} > as specified in Table 6.2D.1.

The normative reference for this requirement is TS 25.101 [1] clause 7.7.2.

6.6D.3 Test purpose

To verify that the UE BLER of HS-PDSCH does not exceed 0.1 for the parameters specified in table 6.6D.3 for the DL reference channel H-Set 1C specified in Annex C.8.1.1.

The lack of the spurious response ability decreases the 4C-HSDPA coverage area when other unwanted interfering signal exists at any other frequency.

This test case tests only 4 carrier configurations.

6.6D.4 Method of test

6.6D.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequency to be tested: the same frequency as chosen in clause 6.5F.4.1 for Blocking characteristics out-of-band case.

- 1) Connect the SS to the UE antenna connector as shown in figure A.50.
- 2) RF parameters are set up according to table 6.6D.3.
- 3) A call is set up according to the Generic call setup procedure specified in TS 34.108 [3] sub clause 7.3.16, with exceptions for information elements listed in Table 6.6D.2. With this exception, the Power Control Algorithm for the Uplink is set to algorithm 2.

Contents of RADIO BEARER SETUP message: AM or UM (Test Loop Mode1)

Table 6.6D.2: Specific Message Contents for Spurious Response (Dual band 4C-HSDPA)

| Information Element | Value/Remark | Version |
|----------------------------------|--------------|---------|
| Uplink DPCH info | | Rel-6 |
| - Uplink DPCH power control info | | |
| - CHOICE mode | FDD | |
| - Power Control Algorithm | Algorithm2 | |

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

6.6D.4.2 Procedure

- 1) Set the parameter of the CW generator as shown in table 6.6D.3. The spurious response frequencies are determined in step 3) of clause 6.5F.4.2.

- 2) Set the power level of UE according to the table 6.6D.3 or send the power control commands (1dB step size should be used.) to the UE until UE output power measured by Test System shall be kept at the specified power level with ± 1 dB tolerance.
- 3) Measure the BLER of HS-PDSCH received from the UE at the SS by counting the number of NACK, ACK and statDTX on the UL HS-DPCCH ($BLER = (NACK + statDTX)/(NACK + statDTX + ACK)$).

6.6D.5 Test requirements

The measured BLER, derived in step 3), shall not exceed 0.1 on each individual cell. The minimum number of measurements required for a statistically significant result to this test is clarified in annex F.6.3, Table F.6.3.5.0.

Table 6.6D.3: Test parameters for Spurious Response (Dual band 4C-HSDPA)

| Parameter | Level | Unit |
|----------------------------|---|---------------|
| HS-PDSCH_Ec | <REFSENS> +3 dB | dBm / 3,84MHz |
| I _{or} | <REFI _{or} > +3 dB | dBm / 3,84MHz |
| I _{blocking} (CW) | -44 | dBm |
| F _{uw} | Spurious response frequencies | MHz |
| UE transmitted mean power | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | dBm |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

6.6DA Spurious Response for dual band 4C-HSDPA (3 carrier)

6.6DA.1 Definition and applicability

Spurious response is a measure of the receiver's ability to receive a wanted signal on its assigned channel frequency without exceeding a given degradation due to the presence of an unwanted CW interfering signal at any other frequency at which a response is obtained i.e. for which the out of band blocking limit as specified in subclause 6.5B.2.2 is not met.

The requirements and this test apply for Release 10 and later releases to all types of UTRA for the FDD UE that support dual band 4C-HSDPA and HS-DSCH categories 29 to 32.

Dual band 4C-HSDPA is designed to operate in configurations specified in clause 4.2.

6.6DA.2 Minimum Requirements

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 6.6DA.1.

Table 6.6DA.1: Test Parameters for Spurious Response (Dual band 4C-HSDPA)

| Parameter | Unit | Level |
|----------------------------|--------------|---|
| HS-PDSCH_Ec | dBm/3.84 MHz | <REFSENS> +3 dB |
| I _{or} | dBm/3.84 MHz | <REFI _{or} > +3 dB |
| I _{blocking} (CW) | dBm | -44 |
| F _{uw} | MHz | Spurious response frequencies |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) |

NOTE: <REFSENS> and <REFI_{or}> refers to the HS-PDSCH_Ec<REFSENS> and the HS-PDSCH<REFI_{or}> as specified in Table 6.2DA.1.

The normative reference for this requirement is TS 25.101 [1] clause 7.7.2.

6.6DA.3 Test purpose

To verify that the UE BLER of HS-PDSCH does not exceed 0.1 for the parameters specified in table 6.6DA.3 for the DL reference channel H-Set 1B specified in Annex C.8.1.1.

The lack of the spurious response ability decreases the 4C-HSDPA coverage area when other unwanted interfering signal exists at any other frequency.

This test case tests only 3 carrier configurations.

6.6DA.4 Method of test

6.6DA.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequency to be tested: the same frequency as chosen in clause 6.5FA.4.1 for Blocking characteristics out-of-band case.

- 1) Connect the SS to the UE antenna connector as shown in figure A.50.
- 2) RF parameters are set up according to table 6.6DA.3.
- 3) A call is set up according to the Generic call setup procedure specified in TS 34.108 [3] sub clause 7.3.16, with exceptions for information elements listed in Table 6.6DA.2. With this exception, the Power Control Algorithm for the Uplink is set to algorithm 2.

Contents of RADIO BEARER SETUP message: AM or UM (Test Loop Mode1)

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

6.6DA.4.2 Procedure

- 1) Set the parameter of the CW generator as shown in table 6.6DA.3. The spurious response frequencies are determined in step 3) of clause 6.5FA.4.2.
- 2) Set the power level of UE according to the table 6.6DA.3 or send the power control commands (1dB step size should be used.) to the UE until UE output power measured by Test System shall be kept at the specified power level with ± 1 dB tolerance.
- 3) Measure the BLER of HS-PDSCH received from the UE at the SS by counting the number of NACK, ACK and statDTX on the UL HS-DPCCH ($BLER = (NACK + statDTX)/(NACK + statDTX + ACK)$).

6.6DA.5 Test requirements

The measured BLER, derived in step 3), shall not exceed 0.1 on each individual cell. The minimum number of measurements required for a statistically significant result to this test is clarified in annex F.6.3, Table F.6.3.5.0.

Table 6.6DA.3: Test parameters for Spurious Response (Dual band 4C-HSDPA)

| Parameter | Level | Unit |
|----------------------------|---|---------------|
| HS-PDSCH_Ec | <REFSENS> +3 dB | dBm / 3,84MHz |
| I _{or} | <REFI _{or} > +3 dB | dBm / 3,84MHz |
| I _{blocking} (CW) | -44 | dBm |
| F _{uw} | Spurious response frequencies | MHz |
| UE transmitted mean power | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | dBm |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

6.7 Intermodulation Characteristics

6.7.1 Definition and applicability

Third and higher order mixing of the two interfering RF signals can produce an interfering signal in the band of the desired channel. Intermodulation response rejection is a measure of the capability of the receiver to receive a wanted signal on its assigned channel frequency in the presence of two or more interfering signals which have a specific frequency relationship to the wanted signal.

The requirements and this test apply to all types of UTRA for the FDD UE. The test parameters in tables 6.7.2 and 6.7.4 applies to the FDD UE supporting Band II, Band III, Band IV, Band V, Band VIII, Band X, Band XII, Band XIII or Band XIV.

6.7.2 Minimum Requirements

The BER shall not exceed 0,001 for the parameters specified in table 6.7.1 and in table 6.7.2.

The normative reference for this requirement is TS 25.101 [1] clause 7.8.1 and clause 7.8.2.

Table 6.7.1: Test parameters for Intermodulation Characteristics

| Parameter | Level | Unit |
|--|---|----------------|
| DPCH_Ec | <REFSENS> +3 dB | dBm / 3,84 MHz |
| I _{or} | <REFI _{or} > +3 dB | dBm / 3,84 MHz |
| I _{ouw1} (CW) | -46 | dBm |
| I _{ouw2} mean power (modulated) | -46 | dBm |
| F _{uw1} (offset) | 10 -10 | MHz |
| F _{uw2} (offset) | 20 -20 | MHz |
| UE transmitted mean power | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | dBm |

NOTE 1: I_{ouw2} (modulated) consists of the common channels needed for tests as specified in table E.4.1 and 16 dedicated data channels as specified in table E.3.6.

NOTE 2: <REFSENS> and <REFI_{or}> refers to the DPCH_Ec<REFSENS> and the DPCH<REFI_{or}> as specified in Table 6.2A.1.

Table 6.7.2: Test parameters for narrow band intermodulation characteristics

| Parameter | Unit | Band II, IV, V, X | | Band III, VIII, XII, XIII, XIV | |
|---------------------------|--------------|---|------|--------------------------------|------|
| DPCH_Ec | dBm/3.84 MHz | <REFSENS>+ 10 dB | | <REFSENS>+ 10 dB | |
| I _{or} | dBm/3.84 MHz | <REFI _{or} > + 10 dB | | [<REFI _{or} > +10 dB | |
| I _{ouw1} (CW) | dBm | -44 | | -43 | |
| I _{ouw2} (GMSK) | dBm | -44 | | -43 | |
| F _{uw1} (offset) | MHz | 3.5 | -3.5 | 3.6 | -3.6 |
| F _{uw2} (offset) | MHz | 5.9 | -5.9 | 6.0 | -6.0 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | | | |

NOTE 3: I_{ouw2} (GMSK) is an interfering signal as defined in TS 45.004. It is a continuous GMSK modulated carrier following the structure of the GSM signals, but with all modulating bits (including the midamble period) derived directly from a random or any pseudo random data stream.

NOTE 4: <REFSENS> and <REFI_{or}> refers to the DPCH_Ec<REFSENS> and the DPCH<REFI_{or}> as specified in Table 6.2.1A.

6.7.3 Test purpose

To verify that the UE BER does not exceed 0,001 for the parameters specified in table 6.7.3 and in table 6.7.4.

The lack of the intermodulation response rejection ability decreases the coverage area when two or more interfering signals, which have a specific frequency relationship to the wanted signal, exist.

6.7.4 Method of test

6.7.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.7.
- 2) RF parameters are set up according to table 6.7.3 and table 6.7.4.
- 3) A call is set up according to the Generic call setup procedure specified in TS 34.108 [3] sub clause 7.3.2, with the following exception for information elements in RADIO BEARER SETUP message. With this exception, the Power Control Algorithm for the Uplink is set to algorithm 2.
- 4) Enter the UE into loopback test mode and start the loopback test.

Table 6.7.2A Contents of RADIO BEARER SETUP message: AM or UM

| Information Element | Value/Remark |
|---|--------------------------------|
| CHOICE channel requirement - Power Control Algorithm | Uplink DPCH info Algorithm2 |

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

6.7.4.2 Procedure

- 1) Set the parameters of the CW generator and interference signal generator as shown in table 6.7.3 and in table 6.7.4.
- 2) Set the power level of UE according to the tables 6.7.3, and table 6.7.4 or send the power control commands (1dB step size should be used.) to the UE until UE output power measured by Test System shall be kept at the specified power level with ± 1 dB tolerance.
- 3) Measure the BER of DCH received from the UE at the SS.

6.7.5 Test requirements

The measured BER, derived in step 3), shall not exceed 0,001.

Table 6.7.3: Test parameters for Intermodulation Characteristics

| Parameter | Level | | Unit |
|-----------------------------------|---|-----|----------------|
| DPCH_Ec | <REFSENS> +3 dB | | dBm / 3.84 MHz |
| \hat{I}_{or} | <REF \hat{I}_{or} > +3 dB | | dBm / 3.84 MHz |
| I_{ouw1} (CW) | -46 | | dBm |
| I_{ouw2} mean power (modulated) | -46 | | dBm |
| F_{uw1} (offset) | 10 | -10 | MHz |
| F_{uw2} (offset) | 20 | -20 | MHz |
| UE transmitted mean power | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | | dBm |

NOTE 1: I_{ouw2} (modulated) consists of the common channels needed for tests as specified in table E.4.1 and 16 dedicated data channels as specified in table E.3.6.

NOTE 2: <REFSENS> and <REF \hat{I}_{or} > refers to the DPCH_Ec<REFSENS> and the DPCH<REF \hat{I}_{or} > as specified in Table 6.2A.1.

Table 6.7.4: Test parameters for narrow band intermodulation characteristics

| Parameter | Unit | Band II, IV, V, X | | Band III, VIII, XII, XIII, XIV | |
|---------------------------|---------------|---|------|--------------------------------|------|
| DPCH_Ec | DdBm/3.84 MHz | <REFSENS>+ 10 dB | | <REFSENS>+ 10 dB | |
| \hat{I}_{or} | DdBm/3.84 MHz | <REF \hat{I}_{or} > + 10 dB | | [<REF \hat{I}_{or} > +10 dB | |
| I_{ouw1} (CW) | dBm | -44 | | -43 | |
| I_{ouw2} (GMSK) | dBm | -44 | | -43 | |
| F_{uw1} (offset) | MHz | 3.5 | -3.5 | 3.6 | -3.6 |
| F_{uw2} (offset) | MHz | 5.9 | -5.9 | 6.0 | -6.0 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | | | |

NOTE 3: I_{ouw2} (GMSK) is an interfering signal as defined in TS 45.004. It is a continuous GMSK modulated carrier following the structure of the GSM signals, but with all modulating bits (including the midamble period) derived directly from a random or any pseudo random data stream.

NOTE 4: <REFSENS> and <REF \hat{I}_{or} > refers to the DPCH_Ec<REFSENS> and the DPCH<REF \hat{I}_{or} > as specified in Table 6.2.1A.

NOTE 5: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

6.7A Intermodulation Characteristics for DC-HSDPA

6.7A.1 Definition and applicability

Third and higher order mixing of the two interfering RF signals can produce an interfering signal in the band of the desired channel. Intermodulation response rejection is a measure of the capability of the receiver to receive a wanted signal on its assigned channel frequency in the presence of two or more interfering signals which have a specific frequency relationship to the wanted signal.

The test parameters in Tables 6.7A.1 and 6.7.A.4 apply for Release 8 and later releases to all types of UTRA for the FDD UE that support DC-HSDPA.

The test parameters in Tables 6.7A.2 and 6.7A.5 apply to all types of UTRA for the FDD UE that support DC-HSDPA and are supporting Band II, Band III, Band IV, Band V, Band VIII, Band X, Band XII, Band XIII or Band XIV.

6.7A.2 Minimum Requirements

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 6.7A.1.

Table 6.7A.1: Test Parameters for Receive intermodulation characteristics (DC-HSDPA)

| Parameter | Unit | Level | |
|-----------------------------------|--------------|---|-----|
| HS-PDSCH_Ec | dBm/3.84 MHz | <REFSENS> +3 dB | |
| \hat{I}_{or} | dBm/3.84 MHz | <REF \hat{I}_{or} > +3 dB | |
| I_{ouw1} (CW) | dBm | -46 | |
| I_{ouw2} mean power (modulated) | dBm | -46 | |
| F_{uw1} (offset) (NOTE 2) | MHz | 10 | -10 |
| F_{uw2} (offset) (NOTE 2) | MHz | 20 | -20 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | |

NOTE 1: I_{ouw2} (modulated) consists of the common channels needed for tests as specified in Table E.4.1 and 16 dedicated data channels as specified in Table E.3.6.

NOTE 2: Negative offsets refer to the assigned channel frequency of the lowest carrier frequency used and positive offsets refer to the assigned channel frequency of the highest carrier frequency used.

NOTE 3: <REFSENS> and <REF \hat{I}_{or} > refers to the HS-PDSCH_Ec<REFSENS> and the HS-PDSCH<REF \hat{I}_{or} > as specified in Table 6.2A.1.

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 6.7A.2.

Table 6.7A.2: Test Parameters for narrow band intermodulation characteristics (DC-HSDPA)

| Parameter | Unit | Band II, IV, V, X, XXV, XXVI | | Band III, VIII, XII, XIII, XIV | |
|-----------------------------|--------------|---|------|--------------------------------|------|
| | | | | | |
| HS-PDSCH_Ec | dBm/3.84 MHz | <REFSENS>+ 10 dB | | <REFSENS>+ 10 dB | |
| \hat{I}_{or} | dBm/3.84 MHz | <REF \hat{I}_{or} > + 10 dB | | [<REF \hat{I}_{or} > +10 dB | |
| I_{ouw1} (CW) | dBm | -44 | | -43 | |
| I_{ouw2} (GMSK) | dBm | -44 | | -43 | |
| F_{uw1} (offset) (NOTE 2) | MHz | 3.5 | -3.5 | 3.6 | -3.6 |
| F_{uw2} (offset) (NOTE 2) | MHz | 5.9 | -5.9 | 6.0 | -6.0 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | | | |

NOTE 4: I_{ouw2} (GMSK) is an interfering signal as defined in TS 45.004 [6].

NOTE 5: Negative offsets refer to the assigned channel frequency of the lowest carrier frequency used and positive offsets refer to the assigned channel frequency of the highest carrier frequency used.

NOTE 6: <REFSENS> and <REF \hat{I}_{or} > refers to the HS-PDSCH_Ec<REFSENS> and the HS-PDSCH<REF \hat{I}_{or} > as specified in Table 6.2A.1.

The normative reference for this requirement is TS 25.101 [1] clause 7.8.1A and clause 7.8.2A.

6.7A.3 Test purpose

To verify that the UE BLER of HS-PDSCH does not exceed 0.1 for the parameters specified in table 6.7A.4 and in table 6.7A.5 for the DL reference channel H-Set 12 specified in Annex C.8.1.12.

The lack of the intermodulation response rejection ability decreases the DC-HSDPA coverage area when two or more interfering signals, which have a specific frequency relationship to the wanted signal, exist.

6.7A.4 Method of test

6.7A.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.34.
- 2) RF parameters are set up according to table 6.7A.4 and table 6.7A.5.
- 3) A call is set up according to the Generic DC-HSDPA setup procedure specified in TS 34.108 [3] sub clause 7.3.13, with exceptions for information elements listed in Table 6.7A.3. With this exception, the Power Control Algorithm for the Uplink is set to algorithm 2.

Contents of RADIO BEARER SETUP message: AM or UM (Test Loop Mode1)

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

6.7A.4.2 Procedure

- 1) Set the parameters of the CW generator and interference signal generator as shown in table 6.7A.4 and in table 6.7A.5.
- 2) Set the power level of UE according to the tables 6.7A.4, and table 6.7A.5 or send the power control commands (1dB step size should be used.) to the UE until UE output power measured by Test System shall be kept at the specified power level with ± 1 dB tolerance.
- 3) Measure the BLER of HS-PDSCH received from the UE at the SS by counting the number of NACK, ACK and statDTX on the UL HS-DPCCH ($BLER = (NACK + statDTX)/(NACK + statDTX + ACK)$).

6.7A.5 Test requirements

The measured BLER, derived in step 3), shall not exceed 0.1 on each individual cell. The minimum number of measurements required for a statistically significant result to this test is clarified in annex F.6.3, Table F.6.3.5.0.

Table 6.7A.4: Test parameters for Intermodulation Characteristics (DC-HSDPA)

| Parameter | Unit | Level | |
|-----------------------------------|--------------|---|-----|
| HS-PDSCH_Ec | dBm/3.84 MHz | <REFSENS> +3 dB | |

| I_{ouw1} (CW) | dBm | -44 | | -43 | |
| I_{ouw2} (GMSK) | dBm | -44 | | -43 | |
| F_{uw1} (offset) (NOTE 2) | MHz | 3.5 | -3.5 | 3.6 | -3.6 |
| F_{uw2} (offset) (NOTE 2) | MHz | 5.9 | -5.9 | 6.0 | -6.0 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | | | |

NOTE 4: I_{ouw2} (GMSK) is an interfering signal as defined in TS 45.004 [6].

NOTE 5: Negative offsets refer to the assigned channel frequency of the lowest carrier frequency used and positive offsets refer to the assigned channel frequency of the highest carrier frequency used.

NOTE 6: <REFSENS> and <REF \hat{I}_{or} > refers to the HS-PDSCH_Ec<REFSENS> and the HS-PDSCH<REF \hat{I}_{or} > as specified in Table 6.2A.1.

NOTE 7: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

6.7B Intermodulation Characteristics for DB-DC-HSDPA

6.7B.1 Definition and applicability

Third and higher order mixing of the two interfering RF signals can produce an interfering signal in the band of the desired channel. Intermodulation response rejection is a measure of the capability of the receiver to receive a wanted signal on its assigned channel frequency in the presence of two or more interfering signals which have a specific frequency relationship to the wanted signal.

The requirements and this test apply for Release 9 and later releases to all types of UTRA for the FDD UE that support DB-DC-HSDPA.

DB-DC-HSDPA is designed to operate in configurations specified in clause 4.2.

6.7B.2 Minimum Requirements

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 6.7B.1.

Table 6.7B.1: Test Parameters for Receive intermodulation characteristics (DB-DC-HSDPA)

| Parameter | Unit | Level | |
|-----------------------------------|--------------|---|-----|
| HS-PDSCH_Ec | dBm/3.84 MHz | <REFSENS> +3 dB | |
| \hat{I}_{or} | dBm/3.84 MHz | <REF \hat{I}_{or} > +3 dB | |
| I_{ouw1} (CW) | dBm | -46 | |
| I_{ouw2} mean power (modulated) | dBm | -46 | |
| F_{uw1} (offset) (NOTE 2) | MHz | 10 | -10 |
| F_{uw2} (offset) (NOTE 2) | MHz | 20 | -20 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | |

NOTE 1: I_{ouw2} (modulated) consists of the common channels needed for tests as specified in Table E.4.1 and 16 dedicated data channels as specified in Table E.3.6.

NOTE 2: For DC-HSDPA, negative offset refers to the assigned channel frequency of the lowest carrier frequency used and positive offset refers to the assigned channel frequency of the highest carrier frequency used. For DB-DC-HSDPA, offset refers to the assigned channel frequencies of the individual cells.

NOTE 3: <REFSENS> and <REF \hat{I}_{or} > refers to the HS-PDSCH_Ec<REFSENS> and the HS-PDSCH<REF \hat{I}_{or} > as specified in Table 6.2B.1.

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 6.7B.2.

Table 6.7B.2: Test Parameters for narrow band intermodulation characteristics (DB-DC-HSDPA)

| Parameter | Unit | Band II, IV, V, X | | Band III, VIII, XII, XIII, XIV | |
|-----------------------------|--------------|---|------|--------------------------------|------|
| HS-PDSCH_Ec | dBm/3.84 MHz | <REFSENS>+ 10 dB | | <REFSENS>+ 10 dB | |
| \hat{I}_{or} | dBm/3.84 MHz | <REF \hat{I}_{or} > + 10 dB | | [<REF \hat{I}_{or} > +10 dB | |
| I_{ouw1} (CW) | dBm | -44 | | -43 | |
| I_{ouw2} (GMSK) | dBm | -44 | | -43 | |
| F_{uw1} (offset) (NOTE 2) | MHz | 3.5 | -3.5 | 3.6 | -3.6 |
| F_{uw2} (offset) (NOTE 2) | MHz | 5.9 | -5.9 | 6.0 | -6.0 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | | | |

NOTE 4: I_{ouw2} (GMSK) is an interfering signal as defined in TS 45.004 [6].

NOTE 5: For DC-HSDPA, negative offset refers to the assigned channel frequency of the lowest carrier frequency used and positive offset refers to the assigned channel frequency of the highest carrier frequency used. For DB-DC-HSDPA, offset refers to the assigned channel frequencies of the individual cells.

NOTE 6: <REFSENS> and <REF \hat{I}_{or} > refers to the HS-PDSCH_Ec<REFSENS> and the HS-PDSCH<REF \hat{I}_{or} > as specified in Table 6.2B.1.

The normative reference for this requirement is TS 25.101 [1] clause 7.8.1A and clause 7.8.2A.

6.7B.3 Test purpose

To verify that the UE BLER of HS-PDSCH does not exceed 0.1 for the parameters specified in table 6.7B.4 and in table 6.7B.5 for the DL reference channel H-Set 12 specified in Annex C.8.1.12.

The lack of the intermodulation response rejection ability decreases the DB-DC-HSDPA coverage area when two or more interfering signals, which have a specific frequency relationship to the wanted signal, exist.

6.7B.4 Method of test

6.7B.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.34.
- 2) RF parameters are set up according to table 6.7B.4 and table 6.7B.5.
- 3) A call is set up according to the Generic call setup procedure specified in TS 34.108 [3] sub clause 7.3.13, with exceptions for information elements listed in Table 6.7B.3. With this exception, the Power Control Algorithm for the Uplink is set to algorithm 2.

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

6.7B.4.2 Procedure

- 1) Set the parameters of the CW generator and interference signal generator as shown in table 6.7B.4 and in table 6.7B.5.
- 2) Set the power level of UE according to the tables 6.7B.4, and table 6.7B.5 or send the power control commands (1dB step size should be used.) to the UE until UE output power measured by Test System shall be kept at the specified power level with ± 1 dB tolerance.
- 3) Measure the BLER of HS-PDSCH received from the UE at the SS by counting the number of NACK, ACK and statDTX on the UL HS-DPCCH ($BLER = (NACK + statDTX)/(NACK + statDTX + ACK)$).

6.7B.5 Test requirements

The measured BLER, derived in step 3), shall not exceed 0.1 on each individual cell. The minimum number of measurements required for a statistically significant result to this test is clarified in annex F.6.3, Table F.6.3.5.0.

Table 6.7B.4: Test parameters for Intermodulation Characteristics (DB-DC-HSDPA)

| Parameter | Unit | Level | |
|--|--------------|---|-----|
| HS-PDSCH_Ec | dBm/3.84 MHz | <REFSENS> +3 dB | |
| I _{or} | dBm/3.84 MHz | <REFI _{or} > +3 dB | |
| I _{ouw1} (CW) | dBm | -46 | |
| I _{ouw2} mean power (modulated) | dBm | -46 | |
| F _{uw1} (offset) (NOTE 2) | MHz | 10 | -10 |
| F _{uw2} (offset) (NOTE 2) | MHz | 20 | -20 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | |

NOTE 1: I_{ouw2} (modulated) consists of the common channels needed for tests as specified in Table E.4.1 and 16 dedicated data channels as specified in Table E.3.6.

NOTE 2: Offset refers to the assigned channel frequencies of the individual cells.

NOTE 3: <REFSENS> and <REFI_{or}> refers to the HS-PDSCH_Ec<REFSENS> and the HS-PDSCH<REFI_{or}> as specified in Table 6.2B.1.

Table 6.7B.5: Test parameters for narrow band intermodulation characteristics (DB-DC-HSDPA)

| Parameter | Unit | Band II, IV, V | | Band VIII | |
|------------------------------------|--------------|---|------|-------------------------------|------|
| HS-PDSCH_Ec | dBm/3.84 MHz | <REFSENS>+ 10 dB | | <REFSENS>+ 10 dB | |
| I _{or} | dBm/3.84 MHz | <REFI _{or} > + 10 dB | | [<REFI _{or} > +10 dB | |
| I _{ouw1} (CW) | dBm | -44 | | -43 | |
| I _{ouw2} (GMSK) | dBm | -44 | | -43 | |
| F _{uw1} (offset) (NOTE 2) | MHz | 3.5 | -3.5 | 3.6 | -3.6 |
| F _{uw2} (offset) (NOTE 2) | MHz | 5.9 | -5.9 | 6.0 | -6.0 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | | | |

NOTE 4: I_{ouw2} (GMSK) is an interfering signal as defined in TS 45.004 [6].

NOTE 5: Offset refers to the assigned channel frequencies of the individual cells.

NOTE 6: <REFSENS> and <REFI_{or}> refers to the HS-PDSCH_Ec<REFSENS> and the HS-PDSCH<REFI_{or}> as specified in Table 6.2B.1.

NOTE 7: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

NOTE 8: Band II and band IV correspond to DB-DC-HSDPA configuration 2, band V corresponds to DB-DC-HSDPA configuration 3 and band VIII corresponds to DB-DC-HSDPA configuration 1 as given in clause 4.2.

6.7C Intermodulation Characteristics for DC-HSUPA

6.7C.1 Definition and applicability

Third and higher order mixing of the two interfering RF signals can produce an interfering signal in the band of the desired channel. Intermodulation response rejection is a measure of the capability of the receiver to receive a wanted signal on its assigned channel frequency in the presence of two or more interfering signals which have a specific frequency relationship to the wanted signal.

The requirements and this test apply for Release 9 and later releases for the FDD UE that supports HSDPA and Dual Cell E-DCH.

6.7C.2 Minimum Requirements

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 6.7C.1 and Table 6.7C.2.

Table 6.7C.1: Receive intermodulation characteristics (DC-HSUPA)

| Parameter | Unit | Level | |
|--|------|---|-----|
| I_{ouw1} (CW) | dBm | -46 | |
| I_{ouw2} mean power (modulated) | dBm | -46 | |
| F_{uw1} (offset) (NOTE 2) | MHz | 10 | -10 |
| F_{uw2} (offset) (NOTE 2) | MHz | 20 | -20 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | |

NOTE 1: I_{ouw2} (modulated) consists of the common channels needed for tests as specified in Table E.4.1 and 16 dedicated data channels as specified in Table E.3.6.

NOTE 2: Negative offsets refer to the assigned channel frequency of the lowest carrier frequency used and positive offsets refer to the assigned channel frequency of the highest carrier frequency used.

Table 6.7C.2: Reference input powers for intermodulation (DC-HSUPA)

| Operating Band | Unit | HS-PDSCH_Ec | \hat{I}_{or} |
|----------------|--------------|-------------|-----------------------|
| I | dBm/3.84 MHz | -104.7 | -94.4 |
| II | dBm/3.84 MHz | -104.4 | -94.1 |
| III | dBm/3.84 MHz | -104.1 | -93.8 |
| IV | dBm/3.84 MHz | -104.7 | -94.4 |
| V | dBm/3.84 MHz | -102 | -91.7 |
| VI | dBm/3.84 MHz | -102.2 | -91.9 |
| VII | dBm/3.84 MHz | -104.4 | -94.1 |
| VIII | dBm/3.84 MHz | -99.8 | -89.5 |
| IX | dBm/3.84 MHz | -104.6 | -94.3 |
| X | dBm/3.84 MHz | -104.7 | -94.4 |
| XI | dBm/3.84 MHz | -100 | -89.7 |
| XII | dBm/3.84 MHz | N/A | N/A |
| XIII | dBm/3.84 MHz | N/A | N/A |
| XIV | dBm/3.84 MHz | N/A | N/A |
| XIX | dBm/3.84 MHz | -102.2 | -91.9 |
| XX | dBm/3.84 MHz | TBD | TBD |
| XXI | dBm/3.84 MHz | -100 | -89.7 |
| XXII | dBm/3.84 MHz | TBD | TBD |
| XXV | dBm/3.84 MHz | -103.5 | -93.2 |
| XXVI | dBm/3.84 MHz | -99.8 | -89.5 |

NOTE 1: For the UE which supports both Band III and Band IX operating frequencies, the reference sensitivity level of TBD dBm <REF_Ec_intermod> shall apply for Band IX. The corresponding <REF_I_or_intermod> is TBD dBm.

NOTE 2: For the UE which supports both Band XI and Band XXI operating frequencies, the reference input power level is FFS.

NOTE 3: For the UE which supports DB-DC-HSDPA configuration in clause 4.2 the <HS-PDSCH_Ec> and <I_or> are allowed to be increased by an amount defined in Table 7.12 of TS 25.101[1] clause 7.10.

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 6.7C.3 and Table 6.7C.4.

Table 6.7C.3: Receive intermodulation for narrow band (DC-HSUPA)

| Parameter | Unit | Band II, IV, V, X, XXV, XXVI | | Band III, VIII, XII, XIII, XIV | |
|---------------------------------------|------|---|------|--------------------------------|------|
| I_{ouw1} (CW) | dBm | -44 | | -43 | |
| I_{ouw2} (GMSK) | dBm | -44 | | -43 | |
| F_{uw1} (offset) (NOTE 2) | MHz | 3.5 | -3.5 | 3.6 | -3.6 |
| F_{uw2} (offset) (NOTE 2) | MHz | 5.9 | -5.9 | 6.0 | -6.0 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | | | |

NOTE 1: I_{ouw2} (GMSK) is an interfering signal as defined in TS 45.004 [6].

NOTE 2: Negative offsets refer to the assigned channel frequency of the lowest carrier frequency used and positive offsets refer to the assigned channel frequency of the highest carrier frequency used.

Table 6.7C.4: Reference input powers for intermodulation, narrow band, (DC-HSUPA)

| Operating Band | Unit | HS-PDSCH_Ec | \hat{I}_{or} |
|----------------|--------------|-------------|-----------------------|
| II | dBm/3.84 MHz | -86.7 | -76.4 |
| III | dBm/3.84 MHz | -85.7 | -75.4 |
| IV | dBm/3.84 MHz | -86.7 | -76.4 |
| V | dBm/3.84 MHz | -86.7 | -76.4 |
| VIII | dBm/3.84 MHz | -85.6 | -75.3 |
| X | dBm/3.84 MHz | -86.7 | -76.4 |
| XII | dBm/3.84 MHz | N/A | N/A |
| XIII | dBm/3.84 MHz | N/A | N/A |
| XIV | dBm/3.84 MHz | N/A | N/A |
| XXV | dBm/3.84 MHz | -84.7 | -74.4 |
| XXVI | dBm/3.84 MHz | -85.6 | -75.3 |

NOTE 1: For the UE which supports DB-DC-HSDPA configuration in clause 4.2 the $\langle \text{HS-PDSCH_Ec} \rangle$ and $\langle \hat{I}_{\text{or}} \rangle$ are allowed to be increased by an amount defined in Table 6.1A.

The normative reference for this requirement is TS 25.101 [1] clause 7.8.1B and clause 7.8.2B.

6.7C.3 Test purpose

To verify that the UE BLER of HS-PDSCH does not exceed 0.1 for the parameters specified in table 6.7C.6, table 6.7C.7 table 6.7C.8 and in table 6.7C.9 for the DL reference channel H-Set 12 specified in Annex C.8.1.12.

The lack of the intermodulation response rejection ability decreases the DC-HSUPA coverage area when two or more interfering signals, which have a specific frequency relationship to the wanted signal, exist.

6.7C.4 Method of test

6.7C.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.44.
- 2) RF parameters are set up according to table 6.7C.6, table 6.7C.7 table 6.7C.8 and table 6.7C.9.
- 3) A call is set up according to the Generic call setup procedure specified in TS 34.108 [3] sub clause 7.3.14, with exceptions for information elements listed in Table 6.7C.5. With this exception, the Power Control Algorithm for the Uplink is set to algorithm 2.

Contents of RADIO BEARER SETUP message: AM or UM (Test Loop Mode1)

| Downlink secondary cell info FDD | | Rel-8 |
| - CHOICE Configuration info | New configuration | |
| - Downlink 64QAM configured | Not Present | |
| - HS-DSCH TB size table | octet aligned (for H-Set 12) | |

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

6.7C.4.2 Procedure

- 1) Set the parameters of the CW generator and interference signal generator as shown in table 6.7C.6 and in table 6.7C.8.
- 2) Set the power level of UE according to the table 6.7C.6, table 6.7C.7 table 6.7C.8 and table 6.7C.9 or send the power control commands (1dB step size should be used.) to the UE until UE output power measured by Test System shall be kept at the specified power level with ± 1 dB tolerance.
- 3) Measure the BLER of HS-PDSCH received from the UE at the SS by counting the number of NACK, ACK and statDTX on the UL HS-DPCCH ($BLER = (NACK + statDTX)/(NACK + statDTX + ACK)$).

6.7C.5 Test requirements

The measured BLER, derived in step 3), shall not exceed 0.1 on each individual cell. The minimum number of measurements required for a statistically significant result to this test is clarified in annex F.6.3, Table F.6.3.5.0.

Table 6.7C.6: Test parameters for Intermodulation Characteristics (DC-HSUPA)

| Parameter | Unit | Level | |
|-----------------------------------|------|---|-----|
| I_{ouw1} (CW) | dBm | -46 | |
| I_{ouw2} mean power (modulated) | dBm | -46 | |
| F_{uw1} (offset) (NOTE 2) | MHz | 10 | -10 |
| F_{uw2} (offset) (NOTE 2) | MHz | 20 | -20 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | |

NOTE 1: I_{ouw2} (modulated) consists of the common channels needed for tests as specified in Table E.4.1 and 16 dedicated data channels as specified in Table E.3.6.

NOTE 2: Offset refers to the assigned channel frequencies of individual cells.

Table 6.7C.7: Test Parameters for reference input powers for intermodulation characteristics (DC-HSUPA)

| Operating Band | Unit | HS-PDSCH_Ec | I _{or} |
|----------------|--------------|-------------|-----------------|
| I | dBm/3.84 MHz | -104.7 | -94.4 |
| II | dBm/3.84 MHz | -104.4 | -94.1 |
| III | dBm/3.84 MHz | -104.1 | -93.8 |
| IV | dBm/3.84 MHz | -104.7 | -94.4 |
| V | dBm/3.84 MHz | -102 | -91.7 |
| VI | dBm/3.84 MHz | -102.2 | -91.9 |
| VII | dBm/3.84 MHz | -104.4 | -94.1 |
| VIII | dBm/3.84 MHz | -99.8 | -89.5 |
| IX | dBm/3.84 MHz | -104.6 | -94.3 |
| X | dBm/3.84 MHz | -104.7 | -94.4 |
| XI | dBm/3.84 MHz | -100 | -89.7 |
| XII | dBm/3.84 MHz | N/A | N/A |
| XIII | dBm/3.84 MHz | N/A | N/A |
| XIV | dBm/3.84 MHz | N/A | N/A |
| XIX | dBm/3.84 MHz | -102.2 | -91.9 |
| XX | dBm/3.84 MHz | TBD | TBD |
| XXI | dBm/3.84 MHz | -100 | -89.7 |
| XXII | dBm/3.84 MHz | TBD | TBD |
| XXV | dBm/3.84 MHz | -103.5 | -93.2 |

NOTE 1: For the UE which supports both Band III and Band IX operating frequencies, the reference sensitivity level of TBD dBm <REF_Ec_{intermod}> shall apply for Band IX. The corresponding <REF_I_{or,intermod}> is TBD dBm

NOTE 2: For the UE which supports both Band XI and Band XXI operating frequencies, the reference input power level is FFS.

NOTE 3: For the UE which supports DB-DC-HSDPA configuration in clause 4.2 the < HS-PDSCH_Ec > and < I_{or} > are allowed to be increased by an amount defined in Table 6.1A

Table 6.7C.8: Test Parameters for narrow band intermodulation characteristics (DC-HSUPA)

| Parameter | Unit | Band II, IV, V, X | | Band III, VIII, XII, XIII, XIV | |
|------------------------------------|------|---|------|--------------------------------|------|
| I _{ouw1} (CW) | dBm | -44 | | -43 | |
| I _{ouw2} (GMSK) | dBm | -44 | | -43 | |
| F _{uw1} (offset) (NOTE 2) | MHz | 3.5 | -3.5 | 3.6 | -3.6 |
| F _{uw2} (offset) (NOTE 2) | MHz | 5.9 | -5.9 | 6.0 | -6.0 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | | | |

NOTE 1: I_{ouw2} (GMSK) is an interfering signal as defined in TS 45.004 [6].

NOTE 2: Offset refers to the assigned channel frequencies of the individual cells.

NOTE 3: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

Table 6.7C.9: Test Parameters for reference input powers for narrow band intermodulation characteristics (DC-HSUPA)

| Operating Band | Unit | HS-PDSCH_Ec | I _{or} |
|----------------|--------------|-------------|-----------------|
| II | dBm/3.84 MHz | -86.7 | -76.4 |
| III | dBm/3.84 MHz | -85.7 | -75.4 |
| IV | dBm/3.84 MHz | -86.7 | -76.4 |
| V | dBm/3.84 MHz | -86.7 | -76.4 |
| VIII | dBm/3.84 MHz | -85.6 | -75.3 |
| X | dBm/3.84 MHz | -86.7 | -76.4 |
| XII | dBm/3.84 MHz | N/A | N/A |
| XIII | dBm/3.84 MHz | N/A | N/A |
| XIV | dBm/3.84 MHz | N/A | N/A |
| XXV | dBm/3.84 MHz | -84.7 | -74.4 |

NOTE 1: For the UE which supports DB-DC-HSDPA configuration in clause 4.2 the < HS-PDSCH_Ec > and < I_{or} > are allowed to be increased by an amount defined in Table 6.1A.

6.7D Intermodulation Characteristics for single uplink single band 4C-HSDPA

6.7D.1 Definition and applicability

Third and higher order mixing of the two interfering RF signals can produce an interfering signal in the band of the desired channel. Intermodulation response rejection is a measure of the capability of the receiver to receive a wanted signal on its assigned channel frequency in the presence of two or more interfering signals which have a specific frequency relationship to the wanted signal.

The test parameters in Tables 6.7D.1 and 6.7D.4 apply for Release 10 and later releases to all types of UTRA for the FDD UE that support single band 4C-HSDPA, single uplink operation.

Single band 4C-HSDPA is designed to operate in configurations specified in clause 4.2.

6.7D.2 Minimum Requirements

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 6.7D.1 and 6.7D.2.

Table 6.7D.1: Test parameters for receive intermodulation characteristics, single band 4C-HSDPA, single uplink operation

| Parameter | Unit | Level | |
|--|------|---|-----|
| I _{ouw1} (CW) | dBm | -46 | |
| I _{ouw2} mean power (modulated) | dBm | -46 | |
| F _{uw1} (offset) (NOTE 2) | MHz | 10 | -10 |
| F _{uw2} (offset) (NOTE 2) | MHz | 20 | -20 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | |

NOTE 1: I_{ouw2} (modulated) consists of the common channels needed for tests as specified in Table E.4.1 and 16 dedicated data channels as specified in Table E.3.6.

NOTE 2: Negative offsets refer to the assigned channel frequency of the lowest carrier frequency used and positive offsets refer to the assigned channel frequency of the highest carrier frequency used.

Table 6.7D.2: Intermodulation requirements, single band 4C-HSDPA, single uplink operation

| Single band 4C-HSDPA Configuration | DL Band | HS-PDSCH_Ec (dBm/3.84MHz) | \hat{I}_{or} (dBm/3.84MHz) | UL-DL carrier separation |
|------------------------------------|---------|---------------------------|------------------------------|--------------------------|
| I-3 | I | <REFSENS>+3 dB | <REF \hat{I}_{or} >+3 dB | Minimum |

NOTE 3: <REFSENS> and <REF \hat{I}_{or} > refers to the HS-PDSCH_Ec<REFSENS> and the HS-PDSCH<REF \hat{I}_{or} > as specified in Table 6.2C.1.

The normative reference for this requirement is TS 25.101 [1] clause 7.8.1C.1.

6.7D.3 Test purpose

To verify that the UE BLER of HS-PDSCH does not exceed 0.1 for the parameters specified in table 6.7D.4 and in table 6.7D.5 for the DL reference channel H-Set 1B/1C specified in Annex C.8.1.1.

The lack of the intermodulation response rejection ability decreases the 4C-HSDPA coverage area when two or more interfering signals, which have a specific frequency relationship to the wanted signal, exist.

6.7D.4 Method of test

6.7D.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.51.
- 2) RF parameters are set up according to table 6.7D.4 and table 6.7D.5.
- 3) A call is set up according to the Generic 4C-HSDPA setup procedure specified in TS 34.108 [3] sub clause 7.3.16, with exceptions for information elements listed in Table 6.7D.3. With this exception, the Power Control Algorithm for the Uplink is set to algorithm 2.

Contents of RADIO BEARER SETUP message: AM or UM (Test Loop Mode1)

Table 6.7D.3: Specific Message Contents for Intermodulation Characteristics (Single Uplink Single band 4C-HSDPA)

| Information Element | Value/Remark | Version |
|----------------------------------|--------------|---------|
| Uplink DPCH info | | Rel-6 |
| - Uplink DPCH power control info | | |
| - CHOICE mode | FDD | |
| - Power Control Algorithm | Algorithm2 | |

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

6.7D.4.2 Procedure

- 1) Set the parameters of the CW generator and interference signal generator as shown in table 6.7D.4 and in table 6.7D.5.
- 2) Set the power level of UE according to the tables 6.7D.4, and table 6.7D.5 or send the power control commands (1dB step size should be used.) to the UE until UE output power measured by Test System shall be kept at the specified power level with ± 1 dB tolerance.
- 3) Measure the BLER of HS-PDSCH received from the UE at the SS by counting the number of NACK, ACK and statDTX on the UL HS-DPCCH (BLER = (NACK + statDTX)/(NACK + statDTX + ACK)).

6.7D.5 Test requirements

The measured BLER, derived in step 3), shall not exceed 0.1 on each individual cell. The minimum number of measurements required for a statistically significant result to this test is clarified in annex F.6.3, Table F.6.3.5.0.

Table 6.7D.4: Test parameters for receive intermodulation characteristics, single band 4C-HSDPA, single uplink operation

| Parameter | Unit | Level | |
|-----------------------------------|------|---|-----|
| I_{ouw1} (CW) | dBm | -46 | |
| I_{ouw2} mean power (modulated) | dBm | -46 | |
| F_{uw1} (offset) (NOTE 2) | MHz | 10 | -10 |
| F_{uw2} (offset) (NOTE 2) | MHz | 20 | -20 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | |

NOTE 1: I_{ouw2} (modulated) consists of the common channels needed for tests as specified in Table E.4.1 and 16 dedicated data channels as specified in Table E.3.6.

NOTE 2: Negative offsets refer to the assigned channel frequency of the lowest carrier frequency used and positive offsets refer to the assigned channel frequency of the highest carrier frequency used.

Table 6.7D.5: Intermodulation requirements, single band 4C-HSDPA, single uplink operation

| Single band 4C-HSDPA Configuration | DL Band | HS-PDSCH_Ec (dBm/3.84MHz) | \hat{I}_{or} (dBm/3.84MHz) | UL-DL carrier separation |
|------------------------------------|---------|---------------------------|------------------------------|--------------------------|
| I-3 | I | <REFSENS>+3 dB | <REF \hat{I}_{or} >+3 dB | Minimum |

NOTE 3: <REFSENS> and <REF \hat{I}_{or} > refers to the HS-PDSCH_Ec<REFSENS> and the HS-PDSCH<REF \hat{I}_{or} > as specified in Table 6.2C.1.

NOTE 4: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

6.7E Intermodulation Characteristics for single uplink dual band 4C-HSDPA

6.7E.1 Definition and applicability

Third and higher order mixing of the two interfering RF signals can produce an interfering signal in the band of the desired channel. Intermodulation response rejection is a measure of the capability of the receiver to receive a wanted signal on its assigned channel frequency in the presence of two or more interfering signals which have a specific frequency relationship to the wanted signal.

The test parameters in Tables 6.7E.1 and 6.7E.4 apply for Release 10 and later releases to all types of UTRA for the FDD UE that support dual band 4C-HSDPA, single uplink operation and HSDPA UE capability categories 31 or 32.

Dual band 4C-HSDPA is designed to operate in configurations specified in clause 4.2.

6.7E.2 Minimum Requirements

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 6.7E.1 and 6.7E.2.

Table 6.7E.1: Test parameters for receive intermodulation characteristics, dual band 4C-HSDPA, single uplink operation

| Parameter | Unit | Level | |
|-----------------------------------|------|---|-----|
| I_{ouw1} (CW) | dBm | -46 | |
| I_{ouw2} mean power (modulated) | dBm | -46 | |
| F_{uw1} (offset) (NOTE 2) | MHz | 10 | -10 |
| F_{uw2} (offset) (NOTE 2) | MHz | 20 | -20 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | |

NOTE 1: I_{ouw2} (modulated) consists of the common channels needed for tests as specified in Table E.4.1 and 16 dedicated data channels as specified in Table E.3.6.

NOTE 2: Negative offsets refer to the assigned channel frequency of the lowest carrier frequency used and positive offsets refer to the assigned channel frequency of the highest carrier frequency used.

Table 6.7E.2: Intermodulation requirements, dual band 4C-HSDPA, single uplink operation

| Dual band 4C-HSDPA Configuration | DL Band | UL Band | HS-PDSCH E_c (dBm/3.84MHz) | \hat{I}_{or} (dBm/3.84MHz) | UL-DL carrier separation |
|-------------------------------------|---------|---------|------------------------------|------------------------------|--------------------------|
| I-2-VIII-1 I-3-VIII-1 | I | I | <REFSENS>+3 dB | <REF \hat{I}_{or} >+3 dB | Minimum |
| | VIII | | <REFSENS>+3 dB | <REF \hat{I}_{or} >+3 dB | Minimum |
| | I | VIII | <REFSENS>+3 dB | <REF \hat{I}_{or} >+3 dB | Minimum |
| | VIII | | <REFSENS>+3 dB | <REF \hat{I}_{or} >+3 dB | Minimum |
| II-1-IV-2 II-2-IV-1 II-2-IV-2 | II | II | <REFSENS>+3 dB | <REF \hat{I}_{or} >+3 dB | Minimum |
| | IV | | <REFSENS>+3 dB | <REF \hat{I}_{or} >+3 dB | Minimum |
| | II | IV | <REFSENS>+3 dB | <REF \hat{I}_{or} >+3 dB | Minimum |
| | IV | | <REFSENS>+3 dB | <REF \hat{I}_{or} >+3 dB | Minimum |
| I-1-V-2 I-2-V-1 I-2-V-2 | I | I | <REFSENS>+3 dB | <REF \hat{I}_{or} >+3 dB | Minimum |
| | V | | <REFSENS>+3 dB | <REF \hat{I}_{or} >+3 dB | Minimum |
| | I | V | <REFSENS>+3 dB | <REF \hat{I}_{or} >+3 dB | Minimum |
| | V | | <REFSENS>+3 dB | <REF \hat{I}_{or} >+3 dB | Minimum |

NOTE 3: <REFSENS> and <REF \hat{I}_{or} > refers to the HS-PDSCH E_c <REFSENS> and the HS-PDSCH<REF \hat{I}_{or} > as specified in Table 6.2D.1.

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 6.7E.3 and Table 6.7E.4.

Table 6.7E.3: Test parameters for receive narrow-band intermodulation characteristics, dual band 4C-HSDPA, single uplink operation

| Parameter | Unit | Band II, IV, V | | Band VIII | |
|-----------------------------|------|---|------|-----------|------|
| I_{ouw1} (CW) | dBm | -44 | | -43 | |
| I_{ouw2} (GMSK) | dBm | -44 | | -43 | |
| F_{uw1} (offset) (NOTE 2) | MHz | 3.5 | -3.5 | 3.6 | -3.6 |
| F_{uw2} (offset) (NOTE 2) | MHz | 5.9 | -5.9 | 6.0 | -6.0 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | | | |

NOTE 1: I_{ouw2} (GMSK) is an interfering signal as defined in TS 45.004.

NOTE 2: For dual band 4C-HSDPA, negative offset refers to the assigned channel frequency of the lowest carrier frequency(ies) in each band, and positive offset refers to the assigned channel frequency of the highest carrier frequency(ies) in each band.

Table 6.7E.4: Narrow-band intermodulation requirements, dual band 4C-HSDPA, single uplink operation

| Dual band 4C-HSDPA Configuration | DL Band | UL Band | HS-PDSCH_Ec (dBm/3.84MHz) | \hat{I}_{or} (dBm/3.84MHz) | UL-DL carrier separation |
|-------------------------------------|---------|---------|---------------------------|-------------------------------|--------------------------|
| I-2-VIII-1 I-3-VIII-1 | VIII | I | <REFSENS>+16.6 dB | <REF \hat{I}_{or} >+16.6 dB | Minimum |
| | VIII | VIII | <REFSENS>+16.6 dB | <REF \hat{I}_{or} >+16.6 dB | Minimum |
| II-1-IV-2 II-2-IV-1 II-2-IV-2 | II | II | <REFSENS>+17 dB | <REF \hat{I}_{or} >+17 dB | Minimum |
| | IV | | <REFSENS>+18.9 dB | <REF \hat{I}_{or} >+18.9 dB | Minimum |
| | II | IV | <REFSENS>+17 dB | <REF \hat{I}_{or} >+17 dB | Minimum |
| | IV | | <REFSENS>+18.9 dB | <REF \hat{I}_{or} >+18.9 dB | Minimum |
| I-1-V-2 I-2-V-1 I-2-V-2 | V | I | <REFSENS>+17 dB | <REF \hat{I}_{or} >+17 dB | Minimum |
| | V | V | <REFSENS>+17 dB | <REF \hat{I}_{or} >+17 dB | Minimum |

NOTE 3: <REFSENS> and <REF \hat{I}_{or} > refers to the HS-PDSCH_Ec<REFSENS> and the HS-PDSCH<REF \hat{I}_{or} > as specified in Table 6.2D.1 for dual band 4C-HSDPA.

The normative reference for this requirement is TS 25.101 [1] clause 7.8.1D.1 and clause 7.8.2D.1.

6.7E.3 Test purpose

To verify that the UE BLER of HS-PDSCH does not exceed 0.1 for the parameters specified in table 6.7E.6 through 6.7E.9 for the DL reference channel H-Set 1C specified in Annex C.8.1.1.

The lack of the intermodulation response rejection ability decreases the 4C-HSDPA coverage area when two or more interfering signals, which have a specific frequency relationship to the wanted signal, exist.

This test case tests only 4 carrier configurations.

6.7E.4 Method of test

6.7E.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.51.
- 2) RF parameters are set up according to table 6.7E.6 and table 6.7E.8.
- 3) A call is set up according to the Generic 4C-HSDPA setup procedure specified in TS 34.108 [3] sub clause 7.3.16, with exceptions for information elements listed in Table 6.7E.5. With this exception, the Power Control Algorithm for the Uplink is set to algorithm 2.

Contents of RADIO BEARER SETUP message: AM or UM (Test Loop Mode1)

Table 6.7E.5: Specific Message Contents for Intermodulation Characteristics (Single Uplink Single band 4C--HSDPA)

| Information Element | Value/Remark | Version |
|----------------------------------|--------------|---------|
| Uplink DPCH info | | Rel-6 |
| - Uplink DPCH power control info | | |
| - CHOICE mode | FDD | |
| - Power Control Algorithm | Algorithm2 | |

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

6.7E.4.2 Procedure

- 1) Set the parameters of the CW generator and interference signal generator as shown in table 6.7E.4 and in table 6.7E.5.
- 2) Set the power level of UE according to the tables 6.7E.6, 6.7E.7, 6.7E.8 and table 6.7E.9 or send the power control commands (1dB step size should be used.) to the UE until UE output power measured by Test System shall be kept at the specified power level with ± 1 dB tolerance.
- 3) Measure the BLER of HS-PDSCH received from the UE at the SS by counting the number of NACK, ACK and statDTX on the UL HS-DPCCH (BLER = (NACK + statDTX)/(NACK + statDTX + ACK)).

6.7E.5 Test requirements

The measured BLER, derived in step 3), shall not exceed 0.1 on each individual cell. The minimum number of measurements required for a statistically significant result to this test is clarified in annex F.6.3, Table F.6.3.5.0.

Table 6.7E.6: Test parameters for receive intermodulation characteristics, dual band 4C-HSDPA, single uplink operation

| Parameter | Unit | Level | |
|-----------------------------------|------|---|-----|
| I_{ouw1} (CW) | dBm | -46 | |
| I_{ouw2} mean power (modulated) | dBm | -46 | |
| F_{uw1} (offset) (NOTE 2) | MHz | 10 | -10 |
| F_{uw2} (offset) (NOTE 2) | MHz | 20 | -20 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | |

NOTE 1: I_{ouw2} (modulated) consists of the common channels needed for tests as specified in Table E.4.1 and 16 dedicated data channels as specified in Table E.3.6.

NOTE 2: Negative offsets refer to the assigned channel frequency of the lowest carrier frequency used and positive offsets refer to the assigned channel frequency of the highest carrier frequency used.

Table 6.7E.7: Intermodulation requirements, dual band 4C-HSDPA, single uplink operation

| Dual band 4C-HSDPA Configuration | DL Band | UL Band | HS-PDSCH E_c (dBm/3.84MHz) | \hat{I}_{or} (dBm/3.84MHz) | UL-DL carrier separation |

| | IV | | <REFSENS>+18.9 dB | <REF _{or} [†] >+18.9 dB | Minimum |
| | II | IV | <REFSENS>+17 dB | <REF _{or} [†] >+17 dB | Minimum |
| | IV | | <REFSENS>+18.9 dB | <REF _{or} [†] >+18.9 dB | Minimum |
| I-1-V-2 I-2-V-1 I-2-V-2 | V | I | <REFSENS>+17 dB | <REF _{or} [†] >+17 dB | Minimum |
| | V | V | <REFSENS>+17 dB | <REF _{or} [†] >+17 dB | Minimum |

NOTE 3: <REFSENS> and <REF_{or}[†]> refers to the HS-PDSCH E_c <REFSENS> and the HS-PDSCH<REF_{or}[†]> as specified in Table 6.2D.1 for dual band 4C-HSDPA.

NOTE 4: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

6.7EA Intermodulation Characteristics for single uplink dual band 4C-HSDPA (3 carrier)

6.7EA.1 Definition and applicability

Third and higher order mixing of the two interfering RF signals can produce an interfering signal in the band of the desired channel. Intermodulation response rejection is a measure of the capability of the receiver to receive a wanted signal on its assigned channel frequency in the presence of two or more interfering signals which have a specific frequency relationship to the wanted signal.

The test parameters in Tables 6.7EA.1 and 6.7EA.4 apply for Release 10 and later releases to all types of UTRA for the FDD UE that support dual band 4C-HSDPA, single uplink operation and HS-DSCH categories 29 to 32.

Dual band 4C-HSDPA is designed to operate in configurations specified in clause 4.2.

6.7EA.2 Minimum Requirements

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 6.7EA.1 and 6.7EA.2.

Table 6.7EA.1: Test parameters for receive intermodulation characteristics, dual band 4C-HSDPA, single uplink operation

| Parameter | Unit | Level | |
|-----------------------------------|------|---|-----|
| I_{ouw1} (CW) | dBm | -46 | |
| I_{ouw2} mean power (modulated) | dBm | -46 | |
| F_{uw1} (offset) (NOTE 2) | MHz | 10 | -10 |
| F_{uw2} (offset) (NOTE 2) | MHz | 20 | -20 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | |

NOTE 1: I_{ouw2} (modulated) consists of the common channels needed for tests as specified in Table E.4.1 and 16 dedicated data channels as specified in Table E.3.6.

NOTE 2: Negative offsets refer to the assigned channel frequency of the lowest carrier frequency used and positive offsets refer to the assigned channel frequency of the highest carrier frequency used.

Table 6.7EA.2: Intermodulation requirements, dual band 4C-HSDPA, single uplink operation

| Dual band 4C-HSDPA Configuration | DL Band | UL Band | HS-PDSCH_Ec (dBm/3.84MHz) | \hat{I}_{or} (dBm/3.84MHz) | UL-DL carrier separation |
|-------------------------------------|---------|---------|---------------------------|------------------------------|--------------------------|
| I-2-VIII-1 I-3-VIII-1 | I | I | <REFSENS>+3 dB | <REF \hat{I}_{or} >+3 dB | Minimum |
| | VIII | | <REFSENS>+3 dB | <REF \hat{I}_{or} >+3 dB | Minimum |
| | I | VIII | <REFSENS>+3 dB | <REF \hat{I}_{or} >+3 dB | Minimum |
| | VIII | | <REFSENS>+3 dB | <REF \hat{I}_{or} >+3 dB | Minimum |
| II-1-IV-2 II-2-IV-1 II-2-IV-2 | II | II | <REFSENS>+3 dB | <REF \hat{I}_{or} >+3 dB | Minimum |
| | IV | | <REFSENS>+3 dB | <REF \hat{I}_{or} >+3 dB | Minimum |
| | II | IV | <REFSENS>+3 dB | <REF \hat{I}_{or} >+3 dB | Minimum |
| | IV | | <REFSENS>+3 dB | <REF \hat{I}_{or} >+3 dB | Minimum |
| I-1-V-2 I-2-V-1 I-2-V-2 | I | I | <REFSENS>+3 dB | <REF \hat{I}_{or} >+3 dB | Minimum |
| | V | | <REFSENS>+3 dB | <REF \hat{I}_{or} >+3 dB | Minimum |
| | I | V | <REFSENS>+3 dB | <REF \hat{I}_{or} >+3 dB | Minimum |
| | V | | <REFSENS>+3 dB | <REF \hat{I}_{or} >+3 dB | Minimum |

NOTE 3: <REFSENS> and <REF \hat{I}_{or} > refers to the HS-PDSCH_Ec<REFSENS> and the HS-PDSCH<REF \hat{I}_{or} > as specified in Table 6.2DA.1.

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 6.7EA.3 and Table 6.7EA.4.

Table 6.7EA.3: Test parameters for receive narrow-band intermodulation characteristics, dual band 4C-HSDPA, single uplink operation

| Parameter | Unit | Band II, IV, V | | Band VIII | |
|--------------------------------|------|---|------|-----------|------|
| I_{ouw1} (CW) | dBm | -44 | | -43 | |
| I_{ouw2} (GMSK) | dBm | -44 | | -43 | |
| F_{uw1} (offset) (NOTE 2) | MHz | 3.5 | -3.5 | 3.6 | -3.6 |
| F_{uw2} (offset) (NOTE 2) | MHz | 5.9 | -5.9 | 6.0 | -6.0 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | | | |

NOTE 1: I_{ouw2} (GMSK) is an interfering signal as defined in TS 45.004.

NOTE 2: For dual band 4C-HSDPA, negative offset refers to the assigned channel frequency of the lowest carrier frequency(ies) in each band, and positive offset refers to the assigned channel frequency of the highest carrier frequency(ies) in each band.

Table 6.7EA.4: Narrow-band intermodulation requirements, dual band 4C-HSDPA, single uplink operation

| Dual band 4C-HSDPA Configuration | DL Band | UL Band | HS-PDSCH E_c (dBm/3.84MHz) | \hat{I}_{or} (dBm/3.84MHz) | UL-DL carrier separation |
|-------------------------------------|---------|---------|------------------------------|-------------------------------|--------------------------|
| I-2-VIII-1 I-3-VIII-1 | VIII | I | <REFSENS>+16.6 dB | <REF \hat{I}_{or} >+16.6 dB | Minimum |
| | VIII | VIII | <REFSENS>+16.6 dB | <REF \hat{I}_{or} >+16.6 dB | Minimum |
| II-1-IV-2 II-2-IV-1 II-2-IV-2 | II | II | <REFSENS>+17 dB | <REF \hat{I}_{or} >+17 dB | Minimum |
| | IV | | <REFSENS>+18.9 dB | <REF \hat{I}_{or} >+18.9 dB | Minimum |
| | II | IV | <REFSENS>+17 dB | <REF \hat{I}_{or} >+17 dB | Minimum |
| | IV | | <REFSENS>+18.9 dB | <REF \hat{I}_{or} >+18.9 dB | Minimum |
| I-1-V-2 I-2-V-1 I-2-V-2 | V | I | <REFSENS>+17 dB | <REF \hat{I}_{or} >+17 dB | Minimum |
| | V | V | <REFSENS>+17 dB | <REF \hat{I}_{or} >+17 dB | Minimum |

NOTE 3: <REFSENS> and <REF \hat{I}_{or} > refers to the HS-PDSCH E_c <REFSENS> and the HS-PDSCH<REF \hat{I}_{or} > as specified in Table 6.2DA.1 for dual band 4C-HSDPA.

The normative reference for this requirement is TS 25.101 [1] clause 7.8.1D.1 and clause 7.8.2D.1.

6.7EA.3 Test purpose

To verify that the UE BLER of HS-PDSCH does not exceed 0.1 for the parameters specified in table 6.7EA.6 through 6.7EA.9 for the DL reference channel H-Set 1B specified in Annex C.8.1.1.

The lack of the intermodulation response rejection ability decreases the 4C-HSDPA coverage area when two or more interfering signals, which have a specific frequency relationship to the wanted signal, exist.

This test case tests only 4 carrier configurations.

6.7EA.4 Method of test

6.7EA.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.51.
- 2) RF parameters are set up according to table 6.7EA.6 and table 6.7EA.8.
- 3) A call is set up according to the Generic 4C-HSDPA setup procedure specified in TS 34.108 [3] sub clause 7.3.16, with exceptions for information elements listed in Table 6.7EA.5. With this exception, the Power Control Algorithm for the Uplink is set to algorithm 2.

Contents of RADIO BEARER SETUP message: AM or UM (Test Loop Mode1)

Table 6.7EA.5: Specific Message Contents for Intermodulation Characteristics (Single Uplink Single band 4C--HSDPA)

| Information Element | Value/Remark | Version |
|----------------------------------|--------------|---------|
| Uplink DPCH info | | Rel-6 |
| - Uplink DPCH power control info | | |
| - CHOICE mode | FDD | |
| - Power Control Algorithm | Algorithm2 | |

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

6.7EA.4.2 Procedure

- 1) Set the parameters of the CW generator and interference signal generator as shown in table 6.7EA.4 and in table 6.7EA.5.
- 2) Set the power level of UE according to the tables 6.7EA.6, 6.7EA.7, 6.7EA.8 and table 6.7EA.9 or send the power control commands (1dB step size should be used.) to the UE until UE output power measured by Test System shall be kept at the specified power level with ± 1 dB tolerance.
- 3) Measure the BLER of HS-PDSCH received from the UE at the SS by counting the number of NACK, ACK and statDTX on the UL HS-DPCCH ($BLER = (NACK + statDTX)/(NACK + statDTX + ACK)$).

6.7EA.5 Test requirements

The measured BLER, derived in step 3), shall not exceed 0.1 on each individual cell. The minimum number of measurements required for a statistically significant result to this test is clarified in annex F.6.3, Table F.6.3.5.0.

Table 6.7EA.6: Test parameters for receive intermodulation characteristics, dual band 4C-HSDPA, single uplink operation

| Parameter | Unit | Level | |
|-----------------------------------|------|---|-----|
| I_{ouw1} (CW) | dBm | -46 | |
| I_{ouw2} mean power (modulated) | dBm | -46 | |
| F_{uw1} (offset) (NOTE 2) | MHz | 10 | -10 |
| F_{uw2} (offset) (NOTE 2) | MHz | 20 | -20 |
| UE transmitted mean power | dBm | 20 (for Power class 3 and 3bis) 18 (for Power class 4) | |

NOTE 1: I_{ouw2} (modulated) consists of the common channels needed for tests as specified in Table E.4.1 and 16 dedicated data channels as specified in Table E.3.6.

NOTE 2: Negative offsets refer to the assigned channel frequency of the lowest carrier frequency used and positive offsets refer to the assigned channel frequency of the highest carrier frequency used.

|-------------------------------------|------|------|-------------------|-------------------------------|---------|
| I-2-VIII-1 I-3-VIII-1 | VIII | I | <REFSENS>+16.6 dB | <REF \hat{I}_{or} >+16.6 dB | Minimum |
| | VIII | VIII | <REFSENS>+16.6 dB | <REF \hat{I}_{or} >+16.6 dB | Minimum |
| II-1-IV-2 II-2-IV-1 II-2-IV-2 | II | II | <REFSENS>+17 dB | <REF \hat{I}_{or} >+17 dB | Minimum |
| | IV | | <REFSENS>+18.9 dB | <REF \hat{I}_{or} >+18.9 dB | Minimum |
| | II | IV | <REFSENS>+17 dB | <REF \hat{I}_{or} >+17 dB | Minimum |
| | IV | | <REFSENS>+18.9 dB | <REF \hat{I}_{or} >+18.9 dB | Minimum |
| I-1-V-2 I-2-V-1 I-2-V-2 | V | I | <REFSENS>+17 dB | <REF \hat{I}_{or} >+17 dB | Minimum |
| | V | V | <REFSENS>+17 dB | <REF \hat{I}_{or} >+17 dB | Minimum |

NOTE 3: <REFSENS> and <REF \hat{I}_{or} > refers to the HS-PDSCH_{Ec}<REFSENS> and the HS-PDSCH<REF \hat{I}_{or} > as specified in Table 6.2DA.1 for dual band 4C-HSDPA.

NOTE 4: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

6.8 Spurious Emissions

6.8.1 Definition and applicability

The spurious emissions power is the power of emissions generated or amplified in a receiver that appear at the UE antenna connector. The spurious emission is verified per antenna connector with the other(s) terminated.

The requirements and this test apply to all types of UTRA for the FDD UE.

6.8.2 Minimum Requirements

The power of any narrow band CW spurious emission shall not exceed the maximum level specified in table 6.8.1 and table 6.8.2.

Table 6.8.1: General receiver spurious emission requirements

| Frequency Band | Measurement Bandwidth | Maximum level | Note |
|-----------------------|-----------------------|---------------|------|
| 30 MHz ≤ f < 1 GHz | 100 kHz | -57 dBm | |
| 1 GHz ≤ f ≤ 12,75 GHz | 1 MHz | -47 dBm | |

Table 6.8.2: Additional receiver spurious emission requirements

| Operating band | Frequency Band | Measurement Bandwidth | Maximum level | Note |
|---|---|-----------------------|----------------------|--|
| I | $791 \text{ MHz} \leq f \leq 821 \text{ MHz}$ | 3.84 MHz | -60 dBm | |
| | $1475.9 \text{ MHz} \leq f \leq 1510.9 \text{ MHz}$ | 3.84 MHz | -60 dBm | |
| | $1844.9 \text{ MHz} \leq f \leq 1879.9 \text{ MHz}$ | 3.84 MHz | -60 dBm | |
| | $1\ 920 \text{ MHz} \leq f \leq 1\ 980 \text{ MHz}$ | 3,84 MHz | -60 dBm | UE transmit band in URA_PCH, Cell_PCH and idle state |
| | $2\ 110 \text{ MHz} \leq f \leq 2\ 170 \text{ MHz}$ | 3,84 MHz | -60 dBm | UE receive band |
| | $2585 \text{ MHz} \leq f \leq 2690 \text{ MHz}$ | 3.84 MHz | -60 dBm | |
| II | $1850 \text{ MHz} \leq f \leq 1910 \text{ MHz}$ | 3.84 MHz | -60 dBm | UE transmit band in URA_PCH, Cell_PCH and idle state |
| | $1930 \text{ MHz} \leq f \leq 1990 \text{ MHz}$ | 3.84 MHz | -60 dBm | UE receive band |
| III | $791 \text{ MHz} \leq f \leq 821 \text{ MHz}$ | 3.84 MHz | -60 dBm | |
| | $1710 \text{ MHz} \leq f \leq 1785 \text{ MHz}$ | 3.84 MHz | -60 dBm | UE transmit band in URA_PCH, Cell_PCH and idle state |
| | $1805 \text{ MHz} \leq f \leq 1880 \text{ MHz}$ | 3.84 MHz | -60 dBm | UE receive band |
| | $2585 \text{ MHz} \leq f \leq 2690 \text{ MHz}$ | 3.84 MHz | -60 dBm | |
| IV | $869 \text{ MHz} \leq f < 894 \text{ MHz}$ | 3.84 MHz | -60 dBm | |
| | $1710 \text{ MHz} \leq f < 1755 \text{ MHz}$ | 3.84 MHz | -60 dBm | UE transmit band in URA_PCH, Cell_PCH and idle state |
| | $1930 \text{ MHz} \leq f \leq 1990 \text{ MHz}$ | 3.84 MHz | -60 dBm | |
| | $2110 \text{ MHz} \leq f \leq 2170 \text{ MHz}$ | 3.84 MHz | -60 dBm | UE receive band |
| V | $824 \text{ MHz} \leq f \leq 849 \text{ MHz}$ | 3.84 MHz | -60 dBm | UE transmit band in URA_PCH, Cell_PCH and idle state |
| | $869 \text{ MHz} \leq f < 894 \text{ MHz}$ | 3.84 MHz | -60 dBm | UE receive band |
| VI | $815 \text{ MHz} \leq f \leq 850 \text{ MHz}$ | 3.84 MHz | -60 dBm | UE in URA_PCH, Cell_PCH and idle state |
| | $860 \text{ MHz} \leq f \leq 895 \text{ MHz}$ | 3.84 MHz | -60 dBm | UE in URA_PCH, Cell_PCH and idle state |
| | $1475.9 \text{ MHz} \leq f \leq 1510.9 \text{ MHz}$ | 3.84 MHz | -60 dBm | |
| | $1844.9 \text{ MHz} \leq f \leq 1879.9 \text{ MHz}$ | 3.84 MHz | -60 dBm | |
| | $2110 \text{ MHz} \leq f \leq 2170 \text{ MHz}$ | 3.84 MHz | -60 dBm | |
| VII | $791 \text{ MHz} \leq f \leq 821 \text{ MHz}$ | 3.84 MHz | -60 dBm | |
| | $921 \text{ MHz} \leq f < 925 \text{ MHz}$ | 100 kHz | -60 dBm (see note 1) | |
| | $925 \text{ MHz} \leq f \leq 935 \text{ MHz}$ | 100 kHz | -67 dBm (see note 1) | |
| | $935 \text{ MHz} < f \leq 960 \text{ MHz}$ | -3.84 MHz | -60 dBm | |
| | $935 \text{ MHz} < f \leq 960 \text{ MHz}$ | 100 kHz | -79 dBm (see note 1) | |
| | $1805 \text{ MHz} \leq f \leq 1880 \text{ MHz}$ | 100 kHz | -71 dBm (see note 1) | |
| | $2110 \text{ MHz} \leq f \leq 2170 \text{ MHz}$ | 3.84 MHz | -60 dBm | |
| | $2500 \text{ MHz} \leq f \leq 2570 \text{ MHz}$ | 3.84 MHz | -60 dBm | UE transmit band in URA_PCH, Cell_PCH and idle state |
| $2620 \text{ MHz} \leq f \leq 2690 \text{ MHz}$ | 3.84 MHz | -60 dBm | UE receive band | |
| VIII | $791 \text{ MHz} \leq f \leq 821 \text{ MHz}$ | 3.84 MHz | -60 dBm | |
| | $880 \text{ MHz} \leq f \leq 915 \text{ MHz}$ | 3.84 MHz | -60 dBm | |
| | $921 \text{ MHz} \leq f < 925 \text{ MHz}$ | 100 kHz | -60 dBm (see note 1) | |
| | $925 \text{ MHz} \leq f \leq 935 \text{ MHz}$ | 100 kHz | -67 dBm (see note 1) | UE receive band |
| | $935 \text{ MHz} < f \leq 960 \text{ MHz}$ | 3.84 MHz | -60 dBm | |
| | $935 \text{ MHz} < f \leq 960 \text{ MHz}$ | 100 kHz | -79 dBm (see note 1) | UE receive band |
| | $1805 \text{ MHz} < f \leq 1880 \text{ MHz}$ | 3.84 MHz | -60 dBm | |
| | $2110 \text{ MHz} \leq f \leq 2170 \text{ MHz}$ | 3.84 MHz | -60 dBm | |
| $2585 \text{ MHz} \leq f \leq 2690 \text{ MHz}$ | 3.84 MHz | -60 dBm | | |

| | 2496 MHz ≤ f ≤ 2690 MHz | 1 MHz | -50 dBm (see note 2) | |
| 3400 MHz ≤ f ≤ 3800 MHz | 1 MHz | -50 dBm | | |
| NOTE 1: The measurements are made on frequencies which are integer multiples of 200 kHz. As exceptions, up to five measurements with a level up to the applicable requirements defined in Table 6.8.1 are permitted for each UARFCN used in the measurement. | | | | |
| NOTE 2: The frequency bandwidth protection 2585-2690 MHz test requirement for Bands I, III, and VIII deviates from the requirement in TS 25.101 [1] Rel-8 and earlier releases. The present document reflects the frequency bandwidth specified in the European Harmonized Standard EN 301 908-2 [Ref.] which became a mandatory requirement after these earlier TS 25.101 releases were frozen. | | | | |

The reference for this requirement is TS 25.101 [1] clause 7.9.1.

6.8.3 Test purpose

To verify that the UE spurious emission meets the specifications described in clause 6.8.5.

Excess spurious emissions increase the interference to other systems.

6.8.4 Method of test

6.8.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: low range, mid range, high range; see clause G.2.4.

- 1) Connect a spectrum analyzer (or other suitable test equipment) to the UE antenna connector as shown in figure A.8.
- 2) RF parameters are setup according to table E.3.2.2. Settings for the serving cell are defined in table 6.8.2A.
- 3) A call is set up according to the setup procedure specified in TS34.108 [3] sub clause 7.3.5, with the following exceptions for information elements in System Information Block type3.

| SIB 3 Information Element | Value/Remark |
|--|-----------------------------------|
| - Cell selection and re-selection info | |
| - CHOICE mode | FDD |
| - Sintrasearch | 0 dB |
| - Sintersearch | 0 dB |
| - RAT List | This parameter is not present |
| - Maximum allowed UL TX power | Power level where Pcompensation=0 |

The exceptions for SIB1 are defined in TS 34.108 [3] clause 7.3.5.2.

NOTE: The setup procedure (3) sets the UE into the CELL_FACH state. With this state and the SS level (2) it is ensured that UE continuously monitors the S-CCPCH and no cell reselections are performed [see 3GPP TS 25.304, clauses 5.2.3 and 5.2.6]. The UE will not be transmitting, and therefore will not interfere with the measurement.

Table 6.8.2A: Settings for the serving cell during the measurement of Rx Spurious Emissions

| Parameter | Unit | Cell 1 |
|---|--------------|------------------------------|
| Cell type | | Serving cell |
| UTRA RF Channel Number | | As defined in clause 6.8.4.1 |
| Qqualmin | dB | -24 |
| Qrxlevmin | dBm | -115 |
| UE_TXPWR_MAX_RACH | dBm | +21 |
| CPICH Ec (see notes 1 and 2) | dBm/3.84 MHz | As defined in table E.3.2.2 |
| NOTE 1: The power level is specified in terms of CPICH_Ec instead of CPICH_RSCP as RSCP is a receiver measurement and only CPICH_Ec can be directly controlled by the SS. | | |
| NOTE 2: The cell fulfils TS 25.304, 5.2.3.1.2. | | |

6.8.4.2 Procedure

- 1) Sweep the spectrum analyzer (or equivalent equipment) over a frequency range and measure the average power of spurious emission.

6.8.5 Test requirements

It shall be verified that the RRC connection release at the end of the procedure described in 34.108 [3] clause 7.3.5.3 shall be completed successfully indicating that the UE has stayed in CELL_FACH state during the measurement of the spurious emissions.

The measured spurious emissions, derived in step 1), shall not exceed the maximum level specified in table 6.8.3 and table 6.8.4.

Table 6.8.3: General receiver spurious emission requirements

| Frequency Band | Measurement Bandwidth | Maximum level | Note |
|-----------------------|-----------------------|---------------|------|
| 30 MHz ≤ f < 1 GHz | 100 kHz | -57 dBm | |
| 1 GHz ≤ f ≤ 12,75 GHz | 1 MHz | -47 dBm | |

Table 6.8.4: Additional receiver spurious emission requirements

| Operating Band | Frequency Band | Measurement Bandwidth | Maximum level | Note |
|----------------|-----------------------------|-----------------------|---------------|------------------------------|
| I | 791 MHz ≤ f ≤ 821 MHz | 3.84 MHz | -60 dBm | |
| | 1475.9 MHz ≤ f ≤ 1510.9 MHz | 3.84 MHz | -60 dBm | |
| | 1844.9 MHz ≤ f ≤ 1879.9 MHz | 3.84 MHz | -60 dBm | |

| $3400 \text{ MHz} \leq f \leq 3800 \text{ MHz}$ | 1 MHz | -50 dBm | | |

NOTE 1: The measurements are made on frequencies which are integer multiples of 200 kHz. As exceptions, up to five measurements with a level up to the applicable requirements defined in Table 6.8.3 are permitted for each UARFCN used in the measurement.

NOTE 2: For UEs that conform to Release 6 and support Band IV shall support the defined frequency bandwidth.

NOTE 3: For UEs that conform to Release 7 and later releases and support Band IV shall support the defined frequency bandwidth.

NOTE 4: The frequency bandwidth protection 2585-2690 MHz test requirement for Bands I, III, and VIII deviates from the requirement in TS 25.101 [1] Rel-8 and earlier releases. The present document reflects the frequency bandwidth specified in the European Harmonized Standard EN 301 908-2 [Ref.] which became a mandatory requirement after these earlier TS 25.101 releases were frozen.

NOTE 5: The applicability of each line in Table 6.8.4 for UEs of different releases is defined in TS 25.101, Clause 7.9, Table 7.11.

NOTE 1: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

NOTE 2: The Test Requirements are measured in the CELL_FACH state instead of in the UE states defined in the Minimum Requirement because the CELL_FACH state ensures that the UE receiver is continuously on and the UE transmitter is off whilst the spectrum analyser searches for spurious emissions. The UE states defined in the Minimum Requirement allow the UE receiver to be in discontinuous reception, and using those UE states during the measurement would have resulted in a complicated and significantly lengthened test procedure since the UE receiver would be allowed to be switched off part of the time.

7 Performance requirements

7.1 General

The performance requirements for the UE in this clause are specified for the measurement channels specified in annex C and table 7.1.1, the propagation conditions specified in clause 7.1.2 and the Down link Physical channels specified in annex D. Unless stated otherwise, DL power control is OFF. Unless otherwise stated the performance requirements are specified at the antenna connector of the UE. For UE(s) with more than one receive antenna connector the fading of the signals and the AWGN signals applied to each receiver antenna connector shall be uncorrelated. The levels of the test signal applied to each of the antenna connectors shall be as defined in the respective sections below.

When DCCH has been configured on downlink DCH then DCCH Data shall be continuously transmitted on downlink DCH during the measurement period. When there is no signalling to transmit on downlink DCCH then dummy DCCH transmission as described in Annex C.9 shall be used.

The method for Block Error Ratio (BLER) measurement is specified in Annex C.6. See 3GPP TS 34.109 [4] for details regarding the UE test loop.

Table 7.1.1: Bit / Symbol rate for Test Channel

| Type of User Information | User bit rate | DL DPCH symbol rate | DL DPCH bit rate | TTI (ms) |
|---|---------------|---------------------|------------------|----------|
| 12,2 kbps reference measurement channel | 12,2 kbps | 30 ksps | 60 kbps | 20 |
| 64 kbps reference measurement channel | 64 kbps | 120 ksps | 240 kbps | 20 |
| 144kbps reference measurement channel | 144 kbps | 240 ksps | 480 kbps | 20 |
| 384 kbps reference measurement channel | 384 kbps | 480 ksps | 960 kbps | 10 |

The common RF test conditions of Performance requirement are defined in clause E.3.3, and each test conditions in this clause (clause 7) should refer clause E.3.3. Individual test conditions are defined in the paragraph of each test.

All Block Error ratio (BLER) measurements in clause 7 shall be performed according to the general rules for statistical testing in Annex F.6

7.1.1 Measurement Configurations

It is assumed that fields inside DPCH have the same energy per PN chip. Also, if the power of S-CCPCH is not specified in the test parameter table, it should be set to zero. The power of OCNS should be adjusted that the power ratios (E_c/I_{or}) of all specified downlink channels add up to one.

Unless otherwise stated, the UE output power for the tests shall be greater than -10 dBm.

NOTE 1: If tests are performed with maximum UE output power it is known that this may cause a good UE to fail at least for tests in sections 7.7 and 7.10.

7.1.2 Definition of Additive White Gaussian Noise (AWGN) Interferer

See clause D.1.1.

7.2 Demodulation in Static Propagation conditions

7.2.1 Demodulation of Dedicated Channel (DCH)

7.2.1.1 Definition and applicability

The receive characteristic of the Dedicated Channel (DCH) in the static environment is determined by the Block Error Ratio (BLER). BLER is specified for each individual data rate of the DCH. DCH is mapped into the Dedicated Physical Channel (DPCH).

The UE shall be tested only according to the data rate, supported. The data-rate-corresponding requirements shall apply to the UE.

7.2.1.2 Minimum requirements

For the parameters specified in table 7.2.1.1 the average downlink $\frac{DPCH_E_c}{I_{or}}$ power ratio shall be below the specified value for the BLER shown in table 7.2.1.2. These requirements are applicable for TFCS size 16.

Table 7.2.1.1: DCH parameters in static propagation conditions

| Parameter | Test 1 | Test 2 | Test 3 | Test 4 | Unit |
|-----------------------|---------|--------|--------|--------|----------------|
| Phase reference | P-CPICH | | | | |
| \hat{I}_{or}/I_{oc} | -1 | | | | dB |
| I_{oc} | -60 | | | | dBm / 3,84 MHz |
| Information Data Rate | 12,2 | 64 | 144 | 384 | kbps |

Table 7.2.1.2: DCH requirements in static propagation conditions

| Test Number | $\frac{DPCH_E_c}{I_{or}}$ | BLER |
|-------------|----------------------------|-----------|
| 1 | -16,6 dB | 10^{-2} |
| 2 | -13,1 dB | 10^{-1} |
| | -12,8 dB | 10^{-2} |
| 3 | -9,9 dB | 10^{-1} |
| | -9,8 dB | 10^{-2} |
| 4 | -5,6 dB | 10^{-1} |
| | -5,5 dB | 10^{-2} |

The reference for this requirement is TS 25.101 [1] clause 8.2.3.1.

7.2.1.3 Test purpose

To verify the ability of the receiver to receive a predefined test signal, representing a static propagation channel for the wanted and for the co-channel signals from serving and adjacent cells, with a BLER not exceeding a specified value.

7.2.1.4 Method of test

7.2.1.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

1. Connect the SS and an AWGN noise source to the UE antenna connector as shown in figure A.9. In case of UE-receive diversity connect according to figure A.26.
2. Set up a call according to the Generic call setup procedure TS 34.108 [3] sub clause 7.3.2.

3. Set the test parameters for test 1-4 as specified in table 7.2.1.3.
4. Enter the UE into loopback test mode and start the loopback test.

7.2.1.4.2 Procedures

1. Measure BLER of DCH.

7.2.1.5 Test requirements

For the parameters specified in table 7.2.1.3 the average downlink $\frac{DPCH_E_c}{I_{or}}$ power ratio shall be below the specified value for the BLER shown in table 7.2.1.4. These requirements are applicable for TFCS size 16.

NOTE: The test case is executed with TFCS size 4 according to the Reference Measurement Channels defined in Annex C.

Table 7.2.1.3: DCH parameters in static propagation conditions

| Parameter | Test 1 | Test 2 | Test 3 | Test 4 | Unit |
|-----------------------|---------|--------|--------|--------|----------------|
| Phase reference | P-CPICH | | | | |
| \hat{I}_{or}/I_{oc} | -0,7 | | | | dB |
| I_{oc} | -60 | | | | dBm / 3,84 MHz |
| Information Data Rate | 12,2 | 64 | 144 | 384 | kbps |

Table 7.2.1.4: DCH requirements in static propagation conditions

| Test Number | $\frac{DPCH_E_c}{I_{or}}$ | BLER |
|-------------|----------------------------|-----------|
| 1 | -16,5 dB | 10^{-2} |
| 2 | -13,0 dB | 10^{-1} |
| | -12,7 dB | 10^{-2} |
| 3 | -9,8 dB | 10^{-1} |
| | -9,7 dB | 10^{-2} |
| 4 | -5,5 dB | 10^{-1} |
| | -5,4 dB | 10^{-2} |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

7.3 Demodulation of DCH in Multi-path Fading Propagation conditions

7.3.1 Single Link Performance

7.3.1.1 Definition and applicability

The receive characteristics of the Dedicated Channel (DCH) in different multi-path fading environments are determined by the Block Error Ratio (BLER) values. BLER is measured for the each of the individual data rate specified for the DPCH. DCH is mapped into in Dedicated Physical Channel (DPCH).

The UE shall be tested only according to the data rate, supported. The data-rate-corresponding requirements shall apply to the UE.

7.3.1.2 Minimum requirements

For the parameters specified in tables 7.3.1.1, 7.3.1.3, 7.3.1.5, 7.3.1.7 and 7.3.1.9 the average downlink $\frac{DPCH_E_c}{I_{or}}$ power ratio shall be below the specified value for the BLER shown in tables 7.3.1.2, 7.3.1.4, 7.3.1.6, 7.3.1.8 and 7.3.1.10. These requirements are applicable for TFCS size 16.

Table 7.3.1.1: DCH parameters in multi-path fading propagation conditions (Case 1)

| Parameter | Test 1 | Test 2 | Test 3 | Test 4 | Unit |
|-----------------------|---------|--------|--------|--------|----------------|
| Phase reference | P-CPICH | | | | |
| \hat{I}_{or}/I_{oc} | 9 | | | | dB |
| I_{oc} | -60 | | | | dBm / 3,84 MHz |
| Information Data Rate | 12,2 | 64 | 144 | 384 | kbps |

Table 7.3.1.2: DCH requirements in multi-path fading propagation conditions (Case 1)

| Test Number | $\frac{DPCH_E_c}{I_{or}}$ | BLER |
|-------------|----------------------------|-----------|
| 1 | -15,0 dB | 10^{-2} |
| 2 | -13,9 dB | 10^{-1} |
| | -10,0 dB | 10^{-2} |
| 3 | -10,6 dB | 10^{-1} |
| | -6,8 dB | 10^{-2} |
| 4 | -6,3 dB | 10^{-1} |
| | -2,2 dB | 10^{-2} |

Table 7.3.1.3: DCH parameters in multi-path fading propagation conditions (Case 2)

| Parameter | Test 5 | Test 6 | Test 7 | Test 8 | Unit |

| 20 | -2,9 dB | 10^{-1} |
| | -2,1 dB | 10^{-2} |
| | -1,4 dB | 10^{-3} |

The reference for this requirement is TS 25.101 [1] clause 8.3.1.1.

7.3.1.3 Test purpose

To verify the ability of the receiver to receive a predefined test signal, representing a multi-path fading propagation channel for the wanted and for the co-channel signals from serving and adjacent cells, with a BLER not exceeding a specified value.

7.3.1.4 Method of test

7.3.1.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

1. Connect the SS, multi-path fading simulator and an AWGN noise source to the UE antenna connector as shown in figure A.10. In case of UE-receive diversity connect according to figure A.21.
2. Set up a call according to the Generic call setup procedure TS34.108 [3] sub clause 7.3.2.
3. Set the test parameters for test 1-20 as specified table 7.3.1.11, table 7.3.1.13, table 7.3.1.15, table 7.3.1.17 and table 7.3.1.19.
4. Enter the UE into loopback test mode and start the loopback test.
5. Setup fading simulators as fading condition case 1, case 2, case 3 and case 6, which are described in table D.2.2.1.

7.3.1.4.2 Procedures

1. Measure BLER of DCH.

7.3.1.5 Test requirements

For the parameters specified in tables 7.3.1.11, 7.3.1.13, 7.3.1.15, 7.3.1.17 and 7.3.1.19 the average downlink $\frac{DPCH_E_c}{I_{or}}$ power ratio shall be below the specified value for the BLER shown in tables 7.3.1.12, 7.3.1.14, 7.3.1.16, 7.3.1.18 and 7.3.1.20. These requirements are applicable for TFCS size 16.

NOTE: The test case is executed with TFCS size 4 according to the Reference Measurement Channels defined in Annex C.

Table 7.3.1.11: DCH parameters in multi-path fading propagation conditions (Case 1)

| Parameter | Test 1 | Test 2 | Test 3 | Test 4 | Unit |
|-----------------------|---------|--------|--------|--------|----------------|

| | -1,3 dB | 10^{-3} |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

7.4 Demodulation of DCH in Moving Propagation conditions

7.4.1 Single Link Performance

7.4.1.1 Definition and applicability

The receive single link performance of the Dedicated Channel (DCH) in dynamic moving propagation conditions are determined by the Block Error Ratio (BLER) values. BLER is measured for the each of the individual data rate specified for the DPCH. DCH is mapped into Dedicated Physical Channel (DPCH).

The UE shall be tested only according to the data rate, supported. The data-rate-corresponding requirements shall apply to the UE.

7.4.1.2 Minimum requirements

For the parameters specified in table 7.4.1.1 the average downlink $\frac{DPCH - E_c}{I_{or}}$ power ratio shall be below the specified value for the BLER shown in table 7.4.1.2.

Table 7.4.1.1: DCH parameters in moving propagation conditions

| Parameter | Test 1 | Test 2 | Unit |
|-----------------------|---------|--------|----------------|
| Phase reference | P-CPICH | | |
| \hat{I}_{or}/I_{oc} | -1 | | dB |
| I_{oc} | -60 | | dBm / 3,84 MHz |
| Information Data Rate | 12,2 | 64 | kbps |

Table 7.4.1.2: DCH requirements in moving propagation conditions

| Test Number | $\frac{DPCH - E_c}{I_{or}}$ | BLER |
|-------------|-----------------------------|-----------|
| 1 | -14,5 dB | 10^{-2} |
| 2 | -10,9 dB | 10^{-2} |

The reference for this requirement is TS 25.101 [1] clause 8.4.1.1.

7.4.1.3 Test purpose

To verify the ability of the receiver to receive a predefined test signal, representing a moving propagation channel for the wanted and for the co-channel signals from serving and adjacent cells, with a BLER not exceeding a specified value.

7.4.1.4 Method of test

7.4.1.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

1. Connect the SS and an AWGN noise source to the UE antenna connector as shown in figure A.10. In case of UE-receive diversity connect according to figure A.21.
2. Set up a call according to the Generic call setup procedure TS34.108 [3] sub clause 7.3.2.
3. Set the test parameters as specified in table 7.4.1.3.
4. Enter the UE into loopback test mode and start the loopback test.
5. Setup fading simulator as moving propagation condition, which is described in clause D.2.3.

7.4.1.4.2 Procedures

1. Measure BLER of DCH.

7.4.1.5 Test requirements

For the parameters specified in table 7.4.1.3 the average downlink $\frac{DPCH_E_c}{I_{or}}$ power ratio shall be below the specified value for the BLER shown in table 7.4.1.4.

Table 7.4.1.3: DCH parameters in moving propagation conditions

| Parameter | Test 1 | Test 2 | Unit |
|-----------------------|---------|--------|----------------|
| Phase reference | P-CPICH | | |
| \hat{I}_{or}/I_{oc} | -0,4 | | dB |
| I_{oc} | -60 | | dBm / 3,84 MHz |
| Information Data Rate | 12,2 | 64 | kbps |

Table 7.4.1.4: DCH requirements in moving propagation conditions

| Test Number | $\frac{DPCH_E_c}{I_{or}}$ | BLER |
|-------------|----------------------------|-----------|
| 1 | -14,4 dB | 10^{-2} |
| 2 | -10,8 dB | 10^{-2} |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

7.5 Demodulation of DCH in Birth-Death Propagation conditions

7.5.1 Single Link Performance

7.5.1.1 Definition and applicability

The receive single link performance of the Dedicated Channel (DCH) in dynamic birth-death propagation conditions are determined by the Block Error Ratio (BLER) values. BLER is measured for the each of the individual data rate specified for the DPCH. DCH is mapped into Dedicated Physical Channel (DPCH).

The UE shall be tested only according to the data rate, supported. The data-rate-corresponding requirements shall apply to the UE.

7.5.1.2 Minimum requirements

For the parameters specified in table 7.5.1.1 the average downlink $\frac{DPCH - E_c}{I_{or}}$ power ratio shall be below the specified value for the BLER shown in table 7.5.1.2.

Table 7.5.1.1: DCH parameters in birth-death propagation conditions

| Parameter | Test 1 | Test 2 | Unit |
|-----------------------|---------|--------|----------------|
| Phase reference | P-CPICH | | |
| \hat{I}_{or}/I_{oc} | -1 | | dB |
| I_{oc} | -60 | | dBm / 3,84 MHz |
| Information Data Rate | 12,2 | 64 | kbps |

Table 7.5.1.2: DCH requirements in birth-death propagation conditions

| Test Number | $\frac{DPCH - E_c}{I_{or}}$ | BLER |
|-------------|-----------------------------|-----------|
| 1 | -12,6 dB | 10^{-2} |
| 2 | -8,7 dB | 10^{-2} |

The reference for this requirement is TS 25.101 [1] clause 8.5.1.1.

7.5.1.3 Test purpose

To verify the ability of the receiver to receive a predefined test signal, representing a birth-death propagation channel for the wanted and for the co-channel signals from serving and adjacent cells, with a BLER not exceeding a specified value.

7.5.1.4 Method of test

7.5.1.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

1. Connect the SS and an AWGN noise source to the UE antenna connector as shown in figure A.10. In case of UE-receive diversity connect according to figure A.21.
2. Set up a call according to the Generic call setup procedure TS34.108 [3] sub clause 7.3.2.
3. Set the test parameters as specified in table 7.5.1.3.
4. Enter the UE into loopback test mode and start the loopback test.
5. Setup fading simulator as birth-death propagation condition, which is described in clause D.2.4.

7.5.1.4.2 Procedures

1. Measure BLER of DCH.

7.5.1.5 Test requirements

For the parameters specified in table 7.5.1.3 the average downlink $\frac{DPCH_E_c}{I_{or}}$ power ratio shall be below the specified value for the BLER shown in table 7.5.1.4.

Table 7.5.1.3: DCH parameters in birth-death propagation conditions

| Parameter | Test 1 | Test 2 | Unit |
|-----------------------|---------|--------|----------------|
| Phase reference | P-CPICH | | |
| \hat{I}_{or}/I_{oc} | -0,4 | | dB |
| I_{oc} | -60 | | dBm / 3,84 MHz |
| Information Data Rate | 12,2 | 64 | kbps |

Table 7.5.1.4: DCH requirements in birth-death propagation conditions

| Test Number | $\frac{DPCH_E_c}{I_{or}}$ | BLER |
|-------------|----------------------------|-----------|
| 1 | -12,5 dB | 10^{-2} |
| 2 | -8,6 dB | 10^{-2} |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

7.5A Demodulation of DCH in high speed train condition

7.5A.1 Single Link Performance

7.5A.1.1 Definition and applicability

The receive single link performance of the Dedicated Channel (DCH) in high speed train conditions are determined by the Block Error Ratio (BLER) values. BLER is measured for the each of the individual data rate specified for the DPCH. DCH is mapped into Dedicated Physical Channel (DPCH).

The data-rate-corresponding requirements shall apply to the UE for Release 7 and later releases.

7.5A.1.2 Minimum requirement

For the parameters specified in Table 7.5A.1.1 the average downlink $\frac{DPCH_E_c}{I_{or}}$ power ratio shall be below the specified value for the BLER shown in Table 7.5A.2.

Table 7.5A.1.1: DCH parameters in high speed train condition

| Parameter | Unit | Test 1 |
|-----------------------|--------------|---------|
| Phase reference | | P-CPICH |
| \hat{I}_{or}/I_{oc} | dB | 5 |
| I_{oc} | dBm/3.84 MHz | -60 |
| Information Data Rate | kbps | 12.2 |

Table 7.5A.1.2: DCH requirements in high speed train condition

| Test Number | $\frac{DPCH_E_c}{I_{or}}$ | BLER |
|-------------|----------------------------|-----------|
| 1 | -21.8 | 10^{-2} |

The reference for this requirement is TS 25.101 [1] clause 8.5A.1.1.

7.5A.1.3 Test purpose

To verify the ability of the receiver to receive a predefined test signal, representing a high speed train channel for the wanted and for the co-channel signals from serving and adjacent cells, with a BLER not exceeding a specified value.

7.5A.1.4 Method of test

7.5A.1.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

1. Connect the SS and an AWGN noise source to the UE antenna connector as shown in figure A.10. In case of UE-receive diversity connect according to figure A.21.
2. Set up a call according to the Generic call setup procedure in TS34.108[3] sub clause 7.3.2.
3. Set the test parameters as specified in table 7.5A.1.3.
4. Enter the UE into loopback test mode and start the loopback test.
5. Setup fading simulator as High speed train conditions, which is described in clause D.2.4A.

7.5A.1.4.2 Procedures

1. Measure BLER of DCH.

7.5A.1.5 Test requirements

For the parameters specified in table 7.5A.1.3 the average downlink $\frac{DPCH_E_c}{I_{or}}$ power ratio shall be below the specified value for the BLER shown in table 7.5A.1.4.

Table 7.5A.1.3: DCH parameters in high speed train condition

| Parameter | Unit | Test 1 |
|-----------------------|--------------|---------|
| Phase reference | | P-CPICH |
| \hat{I}_{or}/I_{oc} | dB | 5.6 |
| I_{oc} | dBm/3.84 MHz | -60 |
| Information Data Rate | kbps | 12.2 |

Table 7.5A.1.4: DCH requirements in high speed train condition

| Test Number | $\frac{DPCH_E_c}{I_{or}}$ | BLER |
|-------------|----------------------------|-----------|
| 1 | -21.7 | 10^{-2} |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

7.6 Demodulation of DCH in downlink Transmit diversity modes

7.6.1 Demodulation of DCH in open-loop transmit diversity mode

7.6.1.1 Definition and applicability

The receive characteristic of the Dedicated Channel (DCH) in open loop transmit diversity mode is determined by the Block Error Ratio (BLER). DCH is mapped into in Dedicated Physical Channel (DPCH).

The requirements and this test apply to all types of UTRA for the FDD UE.

7.6.1.2 Minimum requirements

For the parameters specified in table 7.6.1.1 the average downlink $\frac{DPCH_E_c}{I_{or}}$ power ratio shall be below the specified value for the BLER shown in table 7.6.1.2.

Table 7.6.1.1: Test parameters for DCH reception in a open-loop transmit diversity scheme (Propagation condition: Case 1)

| Parameter | Test 1 | Unit |
|-----------------------|---------|----------------|
| Phase reference | P-CPICH | |
| \hat{I}_{or}/I_{oc} | 9 | dB |
| I_{oc} | -60 | dBm / 3,84 MHz |
| Information data rate | 12,2 | kbps |

Table 7.6.1.2: Test requirements for DCH reception in open-loop transmit diversity scheme

| Test Number | $\frac{DPCH_E_c}{I_{or}}$ (antenna 1/2) | BLER |
|-------------|---|-----------|
| 1 | -16,8 dB | 10^{-2} |

The reference for this requirement is TS 25.101 [1] clause 8.6.1.1.

7.6.1.3 Test purpose

To verify that UE reliably demodulates the DPCH of the Node B while open loop transmit diversity is enabled during the connection.

7.6.1.4 Method of test

7.6.1.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect SS, multi-path fading simulators and an AWGN source to the UE antenna connector as shown in figure A.12. In case of UE-receive diversity connect according to figure A.22.
- 2) Set up a call according to the Generic call setup procedure specified in TS 34.108 [3] clause 7.3.2, with the exceptions for information elements listed in table 7.6.1.3. With these exceptions, open-loop transmit diversity mode is activated.
- 3) RF parameters are set up according to table 7.6.1.4 and table E 3.4.
- 4) Enter the UE into loopback test mode and start the loopback test.
- 5) Set up fading simulators as fading condition case 1, which is described in table D.2.2.1.

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

7.6.1.4.2 Procedure

- 1) Measure BLER in points specified in table 7.6.1.5.

7.6.1.5 Test Requirements

For the parameters specified in table 7.6.1.4 the average downlink $\frac{DPCH - E_c}{I_{or}}$ power ratio shall be below the specified value for the BLER shown in table 7.6.1.5.

Table 7.6.1.4: Test parameters for DCH reception in a open-loop transmit diversity scheme (Propagation condition: Case 1)

| Parameter | Test 1 | Unit |
|-----------------------|---------|----------------|
| Phase reference | P-CPICH | |
| \hat{I}_{or}/I_{oc} | 9,8 | dB |
| I_{oc} | -60 | dBm / 3,84 MHz |
| Information data rate | 12,2 | kbps |

Table 7.6.1.5: Test requirements for DCH reception in open-loop transmit diversity scheme

| Test Number | $\frac{DPCH_E_c}{I_{or}}$ (antenna 1/2) | BLER |
|-------------|---|-----------|
| 1 | -16,7 dB | 10^{-2} |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

7.6.2 Demodulation of DCH in closed loop transmit diversity mode

7.6.2.1 Definition and applicability

The receive characteristic of the dedicated channel (DCH) in closed loop transmit diversity mode is determined by the Block Error Ratio (BLER). DCH is mapped into in Dedicated Physical Channel (DPCH).

The requirements for Closed loop mode 1 and test 1 apply to all types of UTRA for the FDD UE. The requirements for Closed loop mode 2 and test 2 apply to all types of UTRA for the FDD UE for Release 99 and Release 4 only.

7.6.2.2 Minimum requirements

For the parameters specified in table 7.6.2.1 the average downlink $\frac{DPCH_E_c}{I_{or}}$ power ratio shall be below the specified value for the BLER shown in table 7.6.2.2.

Table 7.6.2.1: Test Parameters for DCH Reception in closed loop transmit diversity mode (Propagation condition: Case 1)

| Parameter | Test 1 (Mode 1) | Test 2 (Mode 2) | Unit |
|------------------------------------|--------------------|--------------------|----------------|
| \hat{I}_{or}/I_{oc} | 9 | 9 | dB |
| I_{oc} | -60 | -60 | dBm / 3,84 MHz |
| Information data rate | 12,2 | 12,2 | kbps |
| Feedback error ratio | 4 | 4 | % |
| Closed loop timing adjustment mode | 1 | 1 | - |

Table 7.6.2.2: Test requirements for DCH reception in closed loop transmit diversity mode

| Test Number | $\frac{DPCH_E_c}{I_{or}}$ (see note) | BLER |
|--|---------------------------------------|-----------|
| 1 | -18,0 dB | 10^{-2} |
| 2 | -18,3 dB | 10^{-2} |
| NOTE: This is the total power from both antennas. Power sharing between antennas are closed loop mode dependent as specified in TS 25.214 [5]. | | |

The reference for this requirement is TS 25.101 [1] clause 8.6.2.1.

7.6.2.3 Test purpose

To verify that UE reliably demodulates the DPCH of the Node B while closed loop transmit diversity is enabled during the connection.

7.6.2.4 Method of test

7.6.2.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect SS, multi-path fading simulators and an AWGN source to the UE antenna connector as shown in figure A.12. In case of UE-receive diversity connect according to figure A.22.
- 2) Set up a call according to the Generic call setup procedure specified in TS 34.108 [3] clause 7.3.2, with the exceptions for information elements listed in table 7.6.2.3. With these exceptions, closed loop transmit diversity mode is activated.
- 3) RF parameters are set up according to table 7.6.2.1 and table E 3.5.
- 4) Enter the UE into loopback test mode and start the loopback test.
- 5) Set up fading simulators as fading condition case 1, which is described in table D.2.2.1.

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

7.6.2.4.2 Procedure

- 1) Measure BLER in points specified in table 7.6.2.2.

7.6.2.5 Test Requirements

For the parameters specified in table 7.6.2.4 the average downlink $\frac{DPCH - E_c}{I_{or}}$ power ratio shall be below the specified value for the BLER shown in table 7.6.2.5.

Table 7.6.2.4: Test Parameters for DCH Reception in closed loop transmit diversity mode (Propagation condition: Case 1)

| Parameter | Test 1 (Mode 1) | Test 2 (Mode 2) | Unit |
|--|-----------------|-----------------|----------------|
| \hat{I}_{or}/I_{oc} | 9,8 | 9,8 | dB |
| I_{oc} | -60 | -60 | dBm / 3,84 MHz |
| Information data rate | 12,2 | 12,2 | kbps |
| Feedback error ratio (*) | 4 | 4 | % |
| Closed loop timing adjustment mode | 1 | 1 | - |
| * Note: As the uplink is error free, the feedback error ratio is generated by the SS internally as follows: 4% of the feedback bits, received by the SS on the uplink, shall be inverted prior to being processed. The inverted bits shall occur at random, e.g. controlled by a random generator. | | | |

Table 7.6.2.5: Test requirements for DCH reception in closed loop transmit diversity mode

| Test Number | $\frac{DPCH_E_c}{I_{or}}$ (see note) | BLER |
|--|---------------------------------------|-----------|
| 1 | -17,9 dB | 10^{-2} |
| 2 | -18,2 dB | 10^{-2} |
| NOTE: This is the total power from both antennas. Power sharing between antennas are closed loop mode dependent as specified in TS 25.214 [5]. | | |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

7.6.3 Demodulation of DCH in Site Selection Diversity Transmission Power Control mode

7.6.3.1 Definition and applicability

The bit error characteristics of UE receiver is determined in Site Selection Diversity Transmission Power Control (SSDT) mode. Two Node B emulators are required for this performance test. The delay profiles of signals received from different base stations are assumed to be the same but time shifted by 10 chip periods.

The requirements and this test apply to all types of UTRA for the Release 99 and Release 4 FDD UE.

7.6.3.2 Minimum requirements

The downlink physical channels and their relative power to I_{or} are the same as those specified in clause E.3.3 irrespective of Node Bs and the test cases. $DPCH_E_c/I_{or}$ value applies whenever DPDCH in the cell is transmitted. In Test 1 and Test 3, the received powers at UE from two Node Bs are the same, while 3dB offset is given to one that comes from one of Node Bs for Test 2 and Test 4 as specified in table 7.6.3.1.

For the parameters specified in table 7.6.3.1 the average downlink $\frac{DPCH_E_c}{I_{or}}$ power ratio shall be below the specified value for the BLER shown in table 7.6.3.2.

Table 7.6.3.1: DCH parameters in multi-path propagation conditions during SSDT mode (Propagation condition: Case 1)

| Parameter | Test 1 | Test 2 | Test 3 | Test 4 | Unit |
|--|---------|--------|--------|--------|----------------|
| Phase reference | P-CPICH | | | | |
| \hat{I}_{or1}/I_{oc} | 0 | -3 | 0 | 0 | dB |
| \hat{I}_{or2}/I_{oc} | 0 | 0 | 0 | -3 | dB |
| I_{oc} | -60 | | | | dBm / 3,84 MHz |
| Information Data Rate | 12,2 | 12,2 | 12,2 | 12,2 | kbps |
| Cell ID code word error ratio in uplink (note) | 1 | 1 | 1 | 1 | % |
| Number of FBI bits assigned to "S" Field | 1 | 1 | 2 | 2 | |
| Code word Set | Long | Long | Short | Short | |
| UL DPCCH slot Format | #2 | | #5 | | |
| NOTE: The code word errors are introduced independently in both uplink channels. | | | | | |

Table 7.6.3.2: DCH requirements in multi-path propagation conditions during SSDT Mode

| Test Number | $\frac{DPCH_E_c}{I_{or}}$ | BLER |
|-------------|----------------------------|-----------|
| 1 | -6,0 dB | 10^{-2} |
| 2 | -5,0 dB | 10^{-2} |
| 3 | -10,5 dB | 10^{-2} |
| 4 | -9,2 dB | 10^{-2} |

The reference for this requirement is TS 25.101 [1] clause 8.6.3.1.

7.6.3.3 Test purpose

To verify that UE reliably demodulates the DPCH of the selected Node B while site selection diversity is enabled during soft handover.

7.6.3.4 Method of test

7.6.3.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect two SS's, multi-path fading simulators and an AWGN source to the UE antenna connector as shown in figure A.11 In case of UE-receive diversity connect according to figure A.24.
- 2) Activate one of two cells (Cell 1).
- 3) Set up a call according to the Generic call setup procedure specified in TS 34.108 [3] clause 7.3.2, with the exceptions for information elements listed in table 7.6.3.3A. With these exceptions, necessary information for SSDT mode is sent to the UE.
- 4) Activate the other cell (Cell 2) on the other SS.
- 5) RF parameters are set up according to table 7.6.3.4 and table 7.6.3.5
- 6) After receiving MEASUREMENT REPORT message from the UE, send the ACTIVESET UPDATE message from Cell 1 to the UE in order to activate SSDT mode. Contents of the message is specified in table 7.6.3.3B
- 7) Enter the UE into loopback test mode and start the loopback test.
- 8) Set up fading simulators as fading condition case 1, which is described in table D.2.2.1.

7.6.3.4.2 Procedure

Measure BLER in points specified in table 7.6.3.4.

7.6.3.5 Test Requirements

For the parameters specified in table 7.6.3.4 the average downlink $\frac{DPCH - E_c}{I_{or}}$ power ratio shall be below the specified value for the BLER shown in table 7.6.3.5.

Table 7.6.3.4: DCH parameters in multi-path propagation conditions during SSDT mode (Propagation condition: Case 1)

| Parameter | Test 1 | Test 2 | Test 3 | Test 4 | Unit |
|--|---------|--------|--------|--------|----------------|
| Phase reference | P-CPICH | | | | |
| \hat{I}_{or1}/I_{oc} | 0,8 | -2,2 | 0,8 | 0,8 | dB |
| \hat{I}_{or2}/I_{oc} | 0,8 | 0,8 | 0,8 | -2,2 | dB |

| Code word Set | Long | Long | Short | Short | |
| UL DPCCH slot Format | #2 | | #5 | | |
| NOTE: The code word errors are introduced independently in both uplink channels. | | | | | |

Table 7.6.3.5: DCH requirements in multi-path propagation conditions during SSDT mode

| Test Number | $\frac{DPCH_E_c}{I_{or}}$ | BLER |
|-------------|----------------------------|-----------|
| 1 | -5,9 dB | 10^{-2} |
| 2 | -4,9 dB | 10^{-2} |
| 3 | -10,4 dB | 10^{-2} |
| 4 | -9,1 dB | 10^{-2} |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

7.7 Demodulation in Handover conditions

7.7.1 Demodulation of DCH in Inter-Cell Soft Handover (Release 5 and earlier)

7.7.1.1 Definition and applicability

The bit error ratio characteristics of UE is determined during an inter-cell soft handover. During the soft handover a UE receives signals from different Base Stations. A UE has to be able to demodulate two P-CCPCH channels and to combine the energy of DCH channels. Delay profiles of signals received from different Base Stations are assumed to be the same but time shifted by 10 chips.

The receive characteristics of the different channels during inter-cell handover are determined by the Block Error Ratio (BLER) values.

The UE shall be tested only according to the data rate, supported. The data-rate-corresponding requirements shall apply to the UE. This test is applicable for Release 5 and earlier releases only.

7.7.1.2 Minimum requirements

For the parameters specified in table 7.7.1.1 the average downlink $\frac{DPCH_E_c}{I_{or}}$ power ratio shall be below the specified value for the BLER shown in table 7.7.1.2.

Table 7.7.1.1: DCH parameters in multi-path propagation conditions during Soft Handoff (Case 3)

| Parameter | Test 1 | Test 2 | Test 3 | Test 4 | Unit |
|---|---------|--------|--------|--------|----------------|
| Phase reference | P-CPICH | | | | |
| \hat{I}_{or1}/I_{oc} and \hat{I}_{or2}/I_{oc} | 0 | 0 | 3 | 6 | dB |
| I_{oc} | -60 | | | | dBm / 3,84 MHz |
| Information Data Rate | 12,2 | 64 | 144 | 384 | kbps |

Table 7.7.1.2: DCH requirements in multi-path propagation conditions during Soft Handoff (Case 3)

| Test Number | $\frac{DPCH_E_c}{I_{or}}$ | BLER |
|-------------|----------------------------|-----------|
| 1 | -15,2 dB | 10^{-2} |
| 2 | -11,8 dB | 10^{-1} |
| | -11,3 dB | 10^{-2} |
| 3 | -9,6 dB | 10^{-1} |
| | -9,2 dB | 10^{-2} |
| 4 | -6,0 dB | 10^{-1} |
| | -5,5 dB | 10^{-2} |

The reference for this requirement is TS 25.101 [1] clause 8.7.1.1.

7.7.1.3 Test purpose

To verify that the BLER does not exceed the value at the $DPCH_E_c/I_{or}$ specified in table 7.7.1.2.

7.7.1.4 Method of test

7.7.1.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

7.7.1.4.2 Procedures

- 1) Connect the SS, multi-path fading simulator and an AWGN noise source to the UE antenna connector as shown in figure A.11. In case of UE-receive diversity connect according to figure A.24.
- 2) Set up the call according to the Generic call setup procedure specified in TS 34.108 [3] clause 7.3.2.
- 3) Set the test parameters for test 1-4 as specified in table 7.7.1.3.
- 4) Count, at the SS, the number of information blocks transmitted and the number of correctly received information blocks at the UE.
- 5) Measure BLER of DCH channel.

7.7.1.5 Test requirements

For the parameters specified in table 7.7.1.3 the average downlink $\frac{DPCH_E_c}{I_{or}}$ power ratio shall be below the specified value for the BLER shown in table 7.7.1.4.

Table 7.7.1.3: DCH parameters in multi-path propagation conditions during Soft Handoff (Case 3)

| Parameter | Test 1 | Test 2 | Test 3 | Test 4 | Unit |
|---|---------|--------|--------|--------|----------------|
| Phase reference | P-CPICH | | | | |
| \hat{I}_{or1}/I_{oc} and \hat{I}_{or2}/I_{oc} | 0,6 | 0,6 | 3,6 | 6,6 | dB |
| I_{oc} | -60 | | | | dBm / 3,84 MHz |
| Information Data Rate | 12,2 | 64 | 144 | 384 | kbps |

Table 7.7.1.4: DCH requirements in multi-path propagation conditions during Soft Handoff (Case 3)

| Test Number | $\frac{DPCH_E_c}{I_{or}}$ | BLER |
|-------------|----------------------------|-----------|
| 1 | -15,1 dB | 10^{-2} |
| 2 | -11,7 dB | 10^{-1} |
| | -11,2 dB | 10^{-2} |
| 3 | -9,5 dB | 10^{-1} |
| | -9,1 dB | 10^{-2} |
| 4 | -5,9 dB | 10^{-1} |
| | -5,4 dB | 10^{-2} |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

7.7.1A Demodulation of DCH in Inter-Cell Soft Handover (Release 6 and later)

7.7.1A.1 Definition and applicability

The bit error ratio characteristics of UE is determined during an inter-cell soft handover. During the soft handover a UE receives signals from different Base Stations. A UE has to be able to demodulate two P-CCPCH channels and to combine the energy of DCH channels. Delay profiles of signals received from different Base Stations are assumed to be the same but time shifted by 10 chips.

The receive characteristics of the different channels during inter-cell handover are determined by the Block Error Ratio (BLER) values.

The UE shall be tested only according to the data rate, supported. The data-rate-corresponding requirements shall apply to the UE. This test is applicable for Release 6 and later releases only.

7.7.1A.2 Minimum requirements

For the parameters specified in table 7.7.1A.1 the average downlink $\frac{DPCH_E_c}{I_{or}}$ power ratio shall be below the specified value for the BLER shown in table 7.7.1A.2.

Table 7.7.1A.1: DCH parameters in multi-path propagation conditions during Soft Handoff (Case 3)

| Parameter | Test 1 | Test 2 | Test 3 | Test 4 | Unit |
|---|---------|--------|--------|--------|----------------|
| Phase reference | P-CPICH | | | | |
| \hat{I}_{or1}/I_{oc} and \hat{I}_{or2}/I_{oc} | 0 | 0 | 3 | 6 | dB |
| I_{oc} | -60 | | | | dBm / 3,84 MHz |
| Information Data Rate | 12,2 | 64 | 144 | 384 | kbps |

Table 7.7.1A.2: DCH requirements in multi-path propagation conditions during Soft Handoff (Case 3)

| Test Number | $\frac{DPCH_Ec}{I_{or}}$ | BLER |
|-------------|---------------------------|-----------|
| 1 | -15,2 dB | 10^{-2} |
| 2 | -11,8 dB | 10^{-1} |
| | -11,3 dB | 10^{-2} |
| 3 | -9,9 dB | 10^{-1} |
| | -9,5 dB | 10^{-2} |
| 4 | -6,3 dB | 10^{-1} |
| | -5,8 dB | 10^{-2} |

The reference for this requirement is TS 25.101 [1] clause 8.7.1A.1.

7.7.1A.3 Test purpose

To verify that the BLER does not exceed the value at the $DPCH_Ec/I_{or}$ specified in table 7.7.1A.2.

7.7.1A.4 Method of test

7.7.1A.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

7.7.1A.4.2 Procedures

- 1) Connect the SS, multi-path fading simulator and an AWGN noise source to the UE antenna connector as shown in figure A.11. In case of UE-receive diversity connect according to figure A.24.
- 2) Set up the call according to the Generic call setup procedure specified in TS 34.108 [3] clause 7.3.2.
- 3) Set the test parameters for test 1-4 as specified in table 7.7.1A.3.
- 4) Count, at the SS, the number of information blocks transmitted and the number of correctly received information blocks at the UE.
- 5) Measure BLER of DCH channel.

7.7.1A.5 Test requirements

For the parameters specified in table 7.7.1A.3 the average downlink $\frac{DPCH_Ec}{I_{or}}$ power ratio shall be below the specified value for the BLER shown in table 7.7.1A.4.

Table 7.7.1A.3: DCH parameters in multi-path propagation conditions during Soft Handoff (Case 3)

| Parameter | Test 1 | Test 2 | Test 3 | Test 4 | Unit |
|---|---------|--------|--------|--------|----------------|
| Phase reference | P-CPICH | | | | |
| \hat{I}_{or1}/I_{oc} and \hat{I}_{or2}/I_{oc} | 0,6 | 0,6 | 3,6 | 6,6 | dB |
| I_{oc} | -60 | | | | dBm / 3,84 MHz |
| Information Data Rate | 12,2 | 64 | 144 | 384 | kbps |

Table 7.7.1A.4: DCH requirements in multi-path propagation conditions during Soft Handoff (Case 3)

| Test Number | $\frac{DPCH_Ec}{I_{or}}$ | BLER |
|-------------|---------------------------|-----------|
| 1 | -15,1 dB | 10^{-2} |
| 2 | -11,7 dB | 10^{-1} |
| | -11,2 dB | 10^{-2} |
| 3 | -9,8 dB | 10^{-1} |
| | -9,4 dB | 10^{-2} |
| 4 | -6,2 dB | 10^{-1} |
| | -5,7 dB | 10^{-2} |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

7.7.2 Combining of TPC commands from radio links of different radio link sets

7.7.2.1 Definition and applicability

When a UE is in soft handover, multiple TPC commands may be received in each slot from different cells in the active set. In general, the TPC commands transmitted in the same slot in the different cells may be different and need to be combined to give TPC_cmd as specified in TS 25.214 [5], in order to determine the required uplink power step.

The requirements and this test apply to all types of UTRA for the FDD UE.

7.7.2.2 Minimum requirements

Test parameters are specified in table 7.7.2.1. The delay profiles of the signals received from the different cells are the same but time-shifted by 10 chips.

For Test 1, the sequence of uplink power changes between adjacent slots shall be as shown in table 7.7.2.2 over the 4 consecutive slots more than 99% of the time. Note that this case is without an additional noise source I_{oc} .

For Test 2, the Cell1 and Cell2 TPC patterns are repeated a number of times. If the transmitted power of a given slot is increased compared to the previous slot, then a variable "Transmitted power UP" is increased by one, otherwise a variable "Transmitted power DOWN" is increased by one. The requirements for "Transmitted power UP" and "Transmitted power DOWN" are shown in table 7.7.2.3.

Table 7.7.2.1: Parameters for TPC command combining

| Parameter | Test 1 | Test 2 | Unit |
|-------------------------------------|--|--------------------------|----------------|
| Phase reference | P-CPICH | | - |
| DPCH_Ec/I _{or} | -12 | | dB |
| \hat{I}_{or1} and \hat{I}_{or2} | -60 | | dBm / 3,84 MHz |
| I_{oc} | - | -60 | dBm / 3,84 MHz |
| Power-Control-Algorithm | Algorithm 1 | | - |
| Cell 1 TPC commands over 4 slots | {0,0,1,1} | | - |
| Cell 2 TPC commands over 4 slots | {0,1,0,1} | | - |
| Information Data Rate | 12,2 | | Kbps |
| Propagation condition | Static without AWGN source I_{oc} | Multi-path fading case 3 | - |

Table 7.7.2.2: Requirements for Test 1

| Test Number | Required power changes over the 4 consecutive slots |
|-------------|---|
| 1 | Down, Down, Down, Up |

Table 7.7.2.3: Requirements for Test 2

| Test Number | Ratio (Transmitted power UP) / (Total number of slots) | Ratio (Transmitted power DOWN) / (Total number of slots) |
|-------------|--|--|
| 2 | $\geq 0,25$ | $\geq 0,5$ |

The reference for this requirement is TS 25.101 [1] clause 8.7.2.1.

7.7.2.3 Test purpose

To verify that the combining of TPC commands received in soft handover results in TPC_cmd being derived so as to meet the requirements stated in tables 7.7.2.2 and 7.7.2.3.

7.7.2.4 Method of test

7.7.2.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect two SS's to the UE antenna connector as shown in figure A.13. In case of UE-receive diversity connect according to figure A.27. In case of UE-receive diversity connect according to figure A.27. In test 1 the AWGN generators in figure A.13 and A.27 are switched off.
- 2) Set the test parameters as specified in table 7.7.2.4 for Test 1.
- 3) Set up a call according to the Generic Call Setup procedure TS34.108 [3] sub clause 7.3.2.
- 4) Signal the uplink DPCCH power control parameters to use Algorithm 1 and a step size of 1dB.
- 5) Enter the UE into loopback test mode and start the loopback test.

See TS 34.108 [3] and TS 34.109 [4] for details regarding the generic call setup procedure and loopback test.

7.7.2.4.2 Procedures

- 1) Before proceeding with paragraph (2), set the output power of the UE to be in the range -10 ± 9 dBm. This may be achieved by setting the downlink signal (\hat{I}_{Or}) to yield an appropriate open loop output power and/or by generating suitable downlink TPC commands from the SSs.
- 2) Send the following sequences of TPC commands in the downlink from each SS over a period of 5 timeslots:

| | Downlink TPC commands | | | | |
|-----|-----------------------|---------|---------|---------|---------|
| | Slot #0 | Slot #1 | Slot #2 | Slot #3 | Slot #4 |
| SS1 | 0 | 0 | 0 | 1 | 1 |
| SS2 | 0 | 0 | 1 | 0 | 1 |

- 3) Measure the mean output power of the UE in timeslots # 0, 1, 2, 3 and 4, not including the 25 μ s transient periods at the start and end of each slot.
- 4) Repeat steps 1) to 3) according to Annex F.6.2 Table F.6.2.8.
- 5) End test 1 and disconnect UE.
- 6) Connect two SS's and an AWGN source to the UE antenna connector as shown in figure A.11. In case of UE-receive diversity connect according to figure A.24.

- 7) Initialise variables "Transmitted power UP" and "Transmitted power DOWN" to zero.
- 8) Set the test parameters as specified in table 7.7.2.4 for Test 2.
- 9) Set up a call according to the Generic Call Setup procedure.
- 10) Signal the uplink DPCH power control parameters to use Algorithm 1 and a step size of 1 dB.
- 11) Enter the UE into loopback test mode and start the loopback test.
- 12) Perform the following steps a) to d) 193 times:
 - a) Before proceeding with step b), set the output power of the UE to be in the range -10 ± 9 dBm. This may be achieved by generating suitable downlink TPC commands from the SSs.
 - b) Send the following sequences of TPC commands in the downlink from each SS over a period of 33 timeslots:

| | Downlink TPC commands |
|-----|---|
| SS1 | 1 0 0 1 1 0 0 1 1 0 0 1 1 0 0 1 1 0 0 1 1 0 0 1 1 0 0 1 1 0 0 1 1 0 0 1 1 |
| SS2 | 1 0 1 0 1 0 1 0 1 0 1 0 1 0 1 0 1 0 1 0 1 0 1 0 1 0 1 0 1 0 1 0 1 0 1 0 1 0 1 |

- c) Measure the mean output power of the UE in each timeslot, not including the 25 μ s transient periods at the start and end of each slot.
- d) For each timeslot from the 2nd timeslot to the 33rd timeslot inclusive:
 - if the mean power in that timeslot is greater than or equal to the mean power in the previous timeslot plus 0.4 dB, increment "Transmitted power UP" by 1;
 - if the mean power in that timeslot is less than or equal to the mean power in the previous timeslot minus 0.4 dB, increment "Transmitted power DOWN" by 1.

7.7.2.5 Test requirements

Test parameters are specified in table 7.7.2.4. The delay profiles of the signals received from the different cells are the same but time-shifted by 10 chips.

Table 7.7.2.4: Parameters for TPC command combining

| Parameter | Test 1 | Test 2 | Unit |
|-------------------------------------|---------------------|------------------------|----------------|
| Phase reference | P-CPICH | | - |
| DPCH_Ec/I _{or} | -11,9 | | dB |
| \hat{I}_{or1} and \hat{I}_{or2} | -60 | -59.4 | dBm / 3,84 MHz |
| I_{oc} | - | -60 | dBm / 3,84 MHz |
| Power-Control-Algorithm | Algorithm 1 | | - |
| Cell 1 TPC commands over 4 slots | {0,0,1,1} | | - |
| Cell 2 TPC commands over 4 slots | {0,1,0,1} | | - |
| Information Data Rate | 12,2 | | Kbps |
| Propagation condition | Static without AWGN | Multi-path fading case | - |
| | source I_{oc} | 3 | |

- 1) In Step 3) of clause 7.7.2.4.2, the mean power in slot #1 shall be less than or equal to the mean power in slot #0 minus 0.4 dB.
- 2) In Step 3) of clause 7.7.2.4.2, the mean power in slot #2 shall be less than or equal to the mean power in slot #1 minus 0.4 dB.
- 3) In Step 3) of clause 7.7.2.4.2, the mean power in slot #3 shall be less than or equal to the mean power in slot #2 minus 0.4 dB.
- 4) In Step 3) of clause 7.7.2.4.2, the mean power in slot #4 shall be greater than or equal to the mean power in slot #3 plus 0.4 dB.

- 5) The sequence of test requirements 1-4 shall be fulfilled more than 99% of the time.
- 6) At the end of the test, "Transmitted power UP" shall be greater than or equal to 1443(23.36% of Total number of slots) and "Transmitted power DOWN" shall be greater than or equal to 2971(48.10% of total number of slots).

NOTE 1: The test limits in requirement (6) have been computed to give a confidence level of 99,7 % that a UE which follows the core requirements will pass while meeting the minimum test duration in Annex F table F.6.1.6.2 for multi-path fading environments. The number of timeslots has been chosen to get a good compromise between the test time and the risk of passing a bad UE.

NOTE 2: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

7.7.3 Combining of reliable TPC commands from radio links of different radio link sets

7.7.3.1 Definition and applicability

When a UE is in soft handover, reliable TPC commands may be received in each slot from different cells in the active set. In general, the TPC commands transmitted in the same slot in the different cells may be different and need to be combined to give TPC_cmd as specified in TS 25.214 [5], in order to determine the required uplink power step.

The requirements and this test apply to all types of UTRA for the FDD UE.

7.7.3.2 Minimum requirements

Test parameters are specified in Table 7.7.3.1. Before the start of the tests, the UE transmit power shall be initialised to -15 dBm. An actual UE transmit power may vary from the target level of -15 dBm due to inaccurate UE output power step.

Test 1 verifies that the UE follows only the reliable TPC commands in soft handover. Test 2 verifies that the UE follows all the reliable TPC commands in soft handover.

During tests 1 and 2 the UE transmit power samples, which are defined as the mean power over one timeslot, shall stay 90% of the time within the range defined in Table 7.7.3.2.

Table 7.7.3.1: Parameters for reliable TPC command combining

| Parameter | Unit | Test 1 | Test 2 |
|-------------------------|---|-------------------|------------------|
| Phase reference | - | P-CPICH | |
| DPCH_Ec/Ior1 | dB | Note 1 | Note 1 & Note 3 |
| DPCH_Ec/Ior2 | dB | DPCH_Ec/Ior1 - 10 | DPCH_Ec/Ior1 + 6 |
| DPCH_Ec/Ior3 | dB | DPCH_Ec/Ior1 - 10 | - |
| I_{or1}/I_{oc} | dB | -1 | -1 |
| I_{or2}/I_{oc} | dB | -1 | -1 |
| I_{or3}/I_{oc} | dB | -1 | - |
| I_{oc} | dBm/3.84 MHz | -60 | |
| Power-Control-Algorithm | - | Algorithm 1 | |
| Cell 1 TPC commands | - | Note 2 | Note 2 |
| Cell 2 TPC commands | - | "1" | "1" |
| Cell 3 TPC commands | - | "1" | - |
| Information data Rate | Kbps | 12.2 | |
| Propagation condition | - | Static | |
| Note 1: | The DPCH_Ec/Ior1 is set at the level corresponding to 5% TPC error rate. | | |
| Note 2: | The uplink power control from cell1 shall be such that the UE transmit power would stay at -15 dBm. | | |
| Note 3: | The maximum DPCH_Ec/Ior1 level in cell1 is -9 dB. | | |

Table 7.7.3.2: Test requirements for reliable TPC command combining

| Parameter | Unit | Test 1 | Test 2 |
|-----------------|------|------------|------------|
| UE output power | dBm | -15 ± 5 dB | -15 ± 3 dB |

The reference for this requirement is TS 25.101 [1] clause 8.7.3.1.

7.7.3.3 Test purpose

To verify that the combining of reliable TPC commands received in soft handover results in TPC_cmd being derived so as to meet the requirements stated in tables 7.7.3.2 and 7.7.3.3.

7.7.3.4 Method of test

7.7.3.4.1 Test 1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect three SS's to the UE antenna connector as shown in figure A.18. In case of UE-receive diversity connect according to figure A.28.
- 2) Activate Cell 1.

7.7.3.4.2 Test 1 Procedures

- 1) Set up a call according to the Generic Call Setup procedure TS34.108 [3] sub clause 7.3.2. Signal the uplink DPCH power control parameters to use Algorithm 1 and a step size of 1dB. Enter the UE into loopback test mode and start the loopback test.
- 2) Activate the other two cells (Cell 2 and Cell 3) on the other SS's.
- 3) Set the test parameters as specified in table 7.7.3.3 for Test 1.
- 4) The downlink DPCH E_c/I_{or1} level is adjusted so that 5 +/-1%. downlink TPC error is maintained from E_c/I_{or1} . Cell 1 transmits a known pattern of TPC commands and for each slot detect the power step. Thereby the TPC error rate can be measured. The downlink DPCH E_c/I_{or1} is adjusted so that the TPC error rate is equal to 5 +/- 1%.
- 5) Send power control commands to the UE until the UE output power measured by Test System is adjusted to the specified power level with ± 1.5 dB tolerance due to power control step size.
- 6) Set up the UE in soft handover between Cell 1, Cell 2 and Cell 3. The downlink TPC commands from Cell 2 and Cell 3 shall continuously have the value "1" during the test while Cell 1 use the UE Output power = -15 dBm as the power control target.
- 7) The DPCH E_c/I_{or2} and DPCH E_c/I_{or3} are adjusted to be 10 dB lower than DPCH_ E_c/I_{or1} .
- 8) Measure the mean output power of the UE, not including the 25 μ s transient periods at the start and end of each slot.
- 9) Repeat step 8) according to Annex F.6.2 Table F.6.2.8.
- 10) End test 1 and disconnect UE.

See TS 34.108 [3] and TS 34.109 [4] for details regarding the generic call setup procedure and loopback test.

7.7.3.4.3 Test 2 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect two SS's to the UE antenna connector as shown in figure A.13. In case of UE-receive diversity connect according to figure A.27.
- 2) Activate Cell 1.

7.7.3.4.4 Test 2 Procedures

- 1) Set up a call according to the Generic Call Setup procedure TS34.108 [3] sub clause 7.3.2. Signal the uplink DPCH power control parameters to use Algorithm 1 and a step size of 1dB. Enter the UE into loopback test mode and start the loopback test.
- 2) Activate the other cell (Cell 2) on the other SS
- 3) Set the test parameters as specified in table 7.7.3.3 for Test 2.
- 4) The downlink DPCH Ec/Ior1 level is adjusted so that 5 +/-1%. downlink TPC error is maintained from Ec/Ior1. Cell 1 transmits a known pattern of TPC commands and for each slot detect the power step. Thereby the TPC error rate can be measured. The downlink DPCH Ec/Ior1 is adjusted so that the TPC error rate is equal to 5 +/-1%.
- 5) Send power control commands to the UE until the UE output power measured by Test System is adjusted to the specified power level with ±1.5 dB tolerance due to power control step size.
- 6) Set up the UE in soft handover between Cell 1 and Cell 2. The downlink TPC commands from Cell 2 shall continuously have the value "1" during the test while Cell 1 use the UE Output power = -15 dBm as the power control target.
- 7) The DPCH Ec/Ior2 is adjusted to be 6 dB higher than DPCH_Ec/Ior1.
- 8) Measure the mean output power of the UE, not including the 25 μs transient periods at the start and end of each slot.
- 9) Repeat step 8) according to Annex F.6.2 Table F.6.2.8.
- 10) End test 2 and disconnect UE.

See TS 34.108 [3] and TS 34.109 [4] for details regarding the generic call setup procedure and loopback test.

7.7.3.5 Test requirements

Test parameters are specified in Table 7.7.3.3. Before the start of the tests, the UE transmit power shall be initialised to -15 dBm. An actual UE transmit power may vary from the target level of -15 dBm due to inaccurate UE output power step.

Table 7.7.3.3: Parameters for reliable TPC command combining

| Parameter | Unit | Test 1 | Test 2 |
|--|--------------|-------------------|------------------|
| Phase reference | - | P-CPICH | |
| DPCH_Ec/Ior1 | dB | Note 1 | Note 1 & Note 3 |
| DPCH_Ec/Ior2 | dB | DPCH_Ec/Ior1 - 10 | DPCH_Ec/Ior1 + 6 |
| DPCH_Ec/Ior3 | dB | DPCH_Ec/Ior1 - 10 | - |
| I_{or1}/I_{oc} | dB | -1 | -1 |
| I_{or2}/I_{oc} | dB | -1 | -1 |
| I_{or3}/I_{oc} | dB | -1 | - |
| I_{oc} | dBm/3.84 MHz | -60 | |
| Power-Control-Algorithm | - | Algorithm 1 | |
| Cell 1 TPC commands | - | Note 2 | Note 2 |
| Cell 2 TPC commands | - | "1" | "1" |
| Cell 3 TPC commands | - | "1" | - |
| Information data Rate | Kbps | 12.2 | |
| Propagation condition | - | Static | |
| NOTE 1: The DPCH_Ec/Ior1 is configured to a level such that the TPC error rate is set to 5+/-1% (with 95% confidence). | | | |
| NOTE 2: The uplink power control from cell1 shall be such that the UE transmit power would stay at -15 dBm. | | | |
| NOTE 3: The maximum DPCH_Ec/Ior1 level in cell1 is -9 dB. | | | |

NOTE 1: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

- 1) In step 8) of clause 7.7.3.4.2, the UE transmit power samples, which are defined as the mean power over one timeslot, shall stay 90% of the time within the range defined in Table 7.7.3.2.
- 2) In step 8) of clause 7.7.3.4.4, the UE transmit power samples, which are defined as the mean power over one timeslot, shall stay 90% of the time within the range defined in Table 7.7.3.2.

7.8 Power control in downlink

Power control in the downlink is the ability of the UE receiver to converge to required link quality set by the network while using as low power as possible in downlink. If a BLER target has been assigned to a DCCH (See clause C.3), then it has to be such that outer loop is based on DTCH and not on DCCH.

Note: The above implies that the BLER target for the DCCH should be set low enough so that it does not dominate the one for the DTCH.

The minimum requirements in this subclause were derived with the assumption that the UTRAN responds immediately to the uplink TPC commands by adjusting the power of the first pilot field of the DL DPCCCH that commences after end of the received TPC command.

However, for downlink power control tests introduced to the specifications in Release 99, Release 4 and Release 5, (and for those same tests that exist unmodified in Release 6 and later releases), it is permitted to use an SS implementation which has an additional one slot delay in responding to TPC commands. In such cases, there are two sets of test requirements and the choice of which set to use is a function only of the implementation of the SS and not a function of the UE.

NOTE: The additional delay in TPC response time shifts the expected UE performance. Simulations have predicted the expected change and rather than provide two alternative minimum requirements, for convenience the change in expected performance is covered by altering the test tolerance. This change in test tolerance does not imply the alternative implementation is less accurate.

NOTE: The possibility of removing the alternative test method for release 7 and later is for further study. If an SS implementation is upgraded to use the immediate TPC response time it will be necessary to modify the test implementation to use the applicable test requirements.

7.8.1 Power control in the downlink, constant BLER target (Release 5 and earlier)

7.8.1.1 Definition and applicability

Power control in the downlink is the ability of the UE receiver to converge to required link quality set by the network while using as low power as possible in downlink. If a BLER target has been assigned to a DCCH (See clause C.3), then it has to be such that outer loop is based on DTCH and not on DCCH. The requirements and this test apply to all types of UTRA for the FDD UE for Release 5 and earlier releases.

7.8.1.2 Minimum requirements

For the parameters specified in table 7.8.1.1 the downlink $\frac{DPCH_E_c}{I_{or}}$ power ratio measured values, which are averaged over one slot, shall be below the specified value in table 7.8.1.2 more than 90% of the time. BLER shall be as shown in table 7.8.1.2. Power control in downlink is ON during the test.

Table 7.8.1.1: Test parameter for downlink power control, constant BLER target

| Parameter | Test 1 | Test 2 | Unit |
|---|------------|--------|----------------|
| \hat{I}_{or}/I_{oc} | 9 | -1 | dB |
| I_{oc} | -60 | | dBm / 3,84 MHz |
| Information Data Rate | 12,2 | | kbps |
| Target quality on DTCH | 0,01 | | BLER |
| Propagation condition | Case 4 | | |
| Maximum_DL_Power (note) | 7 | | dB |
| Minimum_DL_Power (note) | -18 | | dB |
| DL Power Control step size, Δ_{TPC} | 1 | | dB |
| Limited Power Increase | "Not used" | | - |
| NOTE: Power is compared to P-CPICH as specified in [9]. | | | |

Table 7.8.1.2: Requirements in downlink power control, constant BLER target

| Parameter | Test 1 | Test 2 | Unit |
|----------------------------|-----------------|-----------------|------|
| $\frac{DPCH_E_c}{I_{or}}$ | -16,0 | -9,0 | dB |
| Measured quality on DTCH | 0,01 \pm 30 % | 0,01 \pm 30 % | BLER |

The reference for this requirement is TS 25.101 [1] clause 8.8.1.1.

7.8.1.3 Test purpose

To verify that the UE receiver is capable of converging to required link quality set by network while using as low power as possible.

7.8.1.4 Method of test

7.8.1.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect SS, multipath fading simulator and an AWGN source to the UE antenna connector as shown in figure A.10. In case of UE-receive diversity connect according to figure A.21.
- 2) Set up a call according to the Generic call setup procedure specified in TS 34.108 [3] clause 7.3.2, with the exception of the information element of Target quality on DCCH as 1(100%) in the RRC CONNECTION SETUP message. With this exception, the outer loop is based on DTCH and not on DCCH.
- 3) RF parameters are set up according to table 7.8.1.3.
- 4) Enter the UE into loopback test mode and start the loopback test.
- 5) SS will vary the physical channel power in downlink according to the TPC commands from UE. Downlink power control mode (DPC_MODE) 0 shall be used.

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

7.8.1.4.2 Procedure

- 1) After call set up, the SS waits 15 seconds.
- 2) After this period, BLER is measured. Simultaneously the downlink $\frac{DPCH - E_c}{I_{or}}$ power ratio averaged over one slot is measured.

7.8.1.5 Test Requirements

The test parameters are specified in table 7.8.1.3.

Table 7.8.1.3: Test parameter for downlink power control, constant BLER target

| Parameter | Test 1 | Test 2 | Unit |
|---|------------|--------|----------------|
| \hat{I}_{or}/I_{oc} | 9,6 | -0,4 | dB |
| I_{oc} | -60 | | dBm / 3,84 MHz |
| Information Data Rate | 12,2 | | kbps |
| Target quality on DTCH | 0,01 | | BLER |
| Propagation condition | Case 4 | | |
| Maximum_DL_Power (note) | 7 | | dB |
| Minimum_DL_Power (note) | -18 | | dB |
| DL Power Control step size, Δ_{TPC} | 1 | | dB |
| Limited Power Increase | "Not used" | | - |
| NOTE: Power is compared to P-CPICH as specified in [9]. | | | |

- a) The measured quality on DTCH does not exceed the values in table 7.8.1.4 for SS supporting immediate TPC response time or the values in 7.8.1.4A for SS supporting an additional one slot delay in TPC response time. BLER measurements shall be performed according to the statistical testing in Annex F.6.1.10.
- b) The downlink $\frac{DPCH - E_c}{I_{or}}$ power ratio values, which are averaged over one slot, shall be below the values in table 7.8.1.4 more than 90 % of the time for SS supporting immediate TPC response time or the values in 7.8.1.4A for SS supporting an additional one slot delay in TPC response time.

Table 7.8.1.4: Requirements in downlink power control, constant BLER target

| Parameter | Test 1 | Test 2 | Unit |
|-----------------------------|-------------|-------------|------|
| $\frac{DPCH - E_c}{I_{or}}$ | -15,9 | -8,9 | dB |
| Measured quality on DTCH | 0,01 ± 30 % | 0,01 ± 30 % | BLER |

Table 7.8.1.4A: Requirements in downlink power control, constant BLER target using SS with an additional one slot delay in power control response time

| Parameter | Test 1 | Test 2 | Unit |
|-----------------------------|-------------|-------------|------|
| $\frac{DPCH - E_c}{I_{or}}$ | -15,6 | -8,7 | dB |
| Measured quality on DTCH | 0,01 ± 30 % | 0,01 ± 30 % | BLER |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

7.8.1A Power control in the downlink, constant BLER target (Release 6 and later)

7.8.1A.1 Definition and applicability

Power control in the downlink is the ability of the UE receiver to converge to required link quality set by the network while using as low power as possible in downlink. If a BLER target has been assigned to a DCCH (See clause C.3), then it has to be such that outer loop is based on DTCH and not on DCCH. The requirements and this test apply to Release 6 and later release for all types of UTRA for the FDD UE.

7.8.1A.2 Minimum requirements

For the parameters specified in table 7.8.1A.1 the downlink $\frac{DPCH_E_c}{I_{or}}$ power ratio measured values, which are averaged over one slot, shall be below the specified value in table 7.8.1A.2 more than 90% of the time. BLER shall be as shown in table 7.8.1A.2. Power control in downlink is ON during the test.

Table 7.8.1A.1: Test parameter for downlink power control, constant BLER target

| Parameter | Test 1 | Test 2 | Test 3 | Test 4 | Unit |
|--|--------|------------|--------|--------|----------------|
| \hat{I}_{or}/I_{oc} | 9 | -1 | 4 | 9 | dB |
| I_{oc} | | -60 | | | dBm / 3,84 MHz |
| Information Data Rate | 12.2 | | 64 | | kbps |
| Reference channel (See clause C.3) | C.3.1 | | C.3.5 | | - |
| Target quality on DTCH | 0.01 | | 0.1 | 0.001 | BLER |
| Target quality on DCCH | - | | 0.1 | 0.1 | BLER |
| Propagation condition | | Case 4 | | | |
| Maximum_DL_Power (note) | | 7 | | | dB |
| Minimum_DL_Power (note) | | -18 | | | dB |
| DL Power Control step size, Δ_{TPC} | | 1 | | | dB |
| Limited Power Increase | | "Not used" | | | - |

NOTE: Power is compared to P-CPICH as specified in [9].

Table 7.8.1A.2: Requirements in downlink power control, constant BLER target

| Parameter | Test 1 | Test 2 | Test 3 | Test 4 | Unit |
|----------------------------|-------------|-------------|------------|--------------|------|
| $\frac{DPCH_E_c}{I_{or}}$ | -16,0 | -9,0 | -9,0 | -10,3 | dB |
| Measured quality on DTCH | 0.01 ± 30 % | 0.01 ± 30 % | 0.1 ± 30 % | 0.001 ± 30 % | BLER |

The reference for this requirement is TS 25.101 [1] clause 8.8.1.1.

7.8.1A.3 Test purpose

To verify that the UE receiver is capable of converging to required link quality set by network while using as low power as possible.

7.8.1A.4 Method of test

7.8.1A.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect SS, multipath fading simulator and an AWGN source to the UE antenna connector as shown in figure A.10. In case of UE-receive diversity connect according to figure A.21.s
- 2) Set up a call according to the Generic call setup procedure specified in TS 34.108 [3] clause 7.3.2.

- 3) RF parameters are set up according to table 7.8.1A.3.
- 4) Enter the UE into loopback test mode and start the loopback test.
- 5) SS will vary the physical channel power in downlink according to the TPC commands from UE. Downlink power control mode (DPC_MODE) 0 shall be used.

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

7.8.1A.4.2 Procedure

- 1) After call set up, the SS waits 15 seconds.
- 2) After this period, BLER is measured. Simultaneously the downlink $\frac{DPCH - E_c}{I_{or}}$ power ratio averaged over one slot is measured.

7.8.1A.5 Test Requirements

The test parameters are specified in table 7.8.1A.3.

Table 7.8.1A.3: Test parameter for downlink power control, constant BLER target

| Parameter | Test 1 | Test 2 | Test 3 | Test 4 | Unit |
|--|--------|------------|--------|--------|----------------|
| \hat{I}_{or}/I_{oc} | 9.6 | -0.4 | 4.6 | 9.6 | dB |
| I_{oc} | | -60 | | | dBm / 3,84 MHz |
| Information Data Rate | 12.2 | | | 64 | kbps |
| Reference channel (See clause C.3) | C.3.1 | | | C.3.5 | - |
| Target quality on DTCH | 0.01 | | 0.1 | 0.001 | BLER |
| Target quality on DCCH | - | | 0.1 | 0.1 | BLER |
| Propagation condition | | Case 4 | | | |
| Maximum_DL_Power (note) | | 7 | | | dB |
| Minimum_DL_Power (note) | | -18 | | | dB |
| DL Power Control step size, Δ_{TPC} | | 1 | | | dB |
| Limited Power Increase | | "Not used" | | | - |

NOTE: Power is compared to P-CPICH as specified in [9].
Target quality on DCCH as 1(100%) for Test 1 and Test2.

- a) The measured quality on DTCH does not exceed the values in table 7.8.1A.4. BLER measurements shall be performed according to the statistical testing in Annex F.6.1.10.
- b) The downlink $\frac{DPCH - E_c}{I_{or}}$ power ratio values, which are averaged over one slot, shall be below the values in table 7.8.1A.4 more than 90 % of the time.

Table 7.8.1A.4: Requirements in downlink power control, constant BLER target

| Parameter | Test 1 | Test 2 | Test 3 | Test 4 | Unit |
|-----------------------------|-------------|-------------|------------|--------------|------|
| $\frac{DPCH - E_c}{I_{or}}$ | -15,9 | -8,9 | -8,9 | -10,2 | dB |
| Measured quality on DTCH | 0.01 ± 30 % | 0.01 ± 30 % | 0.1 ± 30 % | 0.001 ± 30 % | BLER |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

7.8.2 Power control in the downlink, initial convergence

7.8.2.1 Definition and applicability

This requirement verifies that DL power control works properly during the first seconds after DPCH connection is established. The requirements and this test apply to all types of UTRA for the FDD UE.

7.8.2.2 Minimum requirements

For the parameters specified in table 7.8.2.1 the downlink DPCH_Ec/Ior power ratio measured values, which are averaged over 50 ms, shall be within the range specified in table 7.8.2.2 more than 90 % of the time. T1 equals to 500 ms and it starts 10 ms after the uplink DPDCH physical channel is considered established. T2 equals to 500 ms and it starts when T1 has expired. Power control is ON during the test.

The first 10 ms shall not be used for averaging, i.e. the first sample to be input to the averaging filter is at the beginning of T1. The averaging shall be performed with a sliding rectangular window averaging filter. The window size of the averaging filter is linearly increased from 0 up to 50 ms during the first 50 ms of T1, and then kept equal to 50ms.

Table 7.8.2.1: Test parameters for downlink power control, initial convergence

| Parameter | Test 1 | Test 2 | Test 3 | Test 4 | Unit |
|---|------------|--------|--------|--------|--------------|
| Target quality value on DTCH | 0,01 | 0,01 | 0,1 | 0,1 | BLER |
| Initial DPCH_Ec/Ior | -5,9 | -25,9 | -3 | -22,8 | dB |
| Information Data Rate | 12,2 | 12,2 | 64 | 64 | kbps |
| \hat{I}_{or}/I_{oc} | -1 | | | | dB |
| I_{oc} | -60 | | | | dBm/3,84 MHz |
| Propagation condition | Static | | | | |
| Maximum_DL_Power (note) | 7 | | | | dB |
| Minimum_DL_Power (note) | -18 | | | | dB |
| DL Power Control step size, Δ_{TPC} | 1 | | | | dB |
| Limited Power Increase | "Not used" | | | | |
| NOTE: Power is compared to P-CPICH as specified in [9]. | | | | | |

Table 7.8.2.2: Requirements in downlink power control, initial convergence

| Parameter | Test 1 and Test 2 | Test 3 and Test 4 | Unit |
|--------------------------------------|--|--|------|
| $\frac{DPCH_E_c}{I_{or}}$ during T1 | $-18,9 \leq DPCH_E_c/I_{or} \leq -11,9$ | $-15,1 \leq DPCH_E_c/I_{or} \leq -8,1$ | dB |
| $\frac{DPCH_E_c}{I_{or}}$ during T2 | $-18,9 \leq DPCH_E_c/I_{or} \leq -14,9$ | $-15,1 \leq DPCH_E_c/I_{or} \leq -11,1$ | dB |

NOTE: The low limit is decreased by 3 dB for a UE with more than one antenna connector.

The reference for this requirement is TS 25.101 [1] clause 8.8.2.1.

NOTE: DTCH shall be transmitted during the whole test.

7.8.2.3 Test purpose

To verify that DL power control works properly during the first seconds after DPCH connection is established.

7.8.2.4 Method of test

7.8.2.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect SS and an AWGN source to the UE antenna connector as shown in figure A.9. In case of UE-receive diversity connect according to figure A.26.

7.8.2.4.2 Procedure

- 1) Enter the UE into loopback test mode according to the Generic call setup procedure specified in TS 34.108 [3] clause 7.3.2, with the exception of the information element of Target quality on DCCH as 1(100%) in the RRC CONNECTION SETUP message. With this exception, the outer loop is based on DTCH and not on DCCH. System simulator shall activate power control at the activation time of the Radio Bearer Setup message (At RRC connection setup only DCCH is established). The uplink DPCH physical channel is considered established at the activation time of the Radio Bearer Setup message.
- 2) RF parameters are set up according to table 7.8.2.3 for the test running. After the transmission of Radio Bearer Setup message, Initial DPCH_Ec/I_{or} is set to the specified level at the activation time.
- 3) SS will vary the physical channel power in downlink according to the TPC commands from UE. Downlink power control mode (DPC_MODE) 0 shall be used.
- 4) Measure $\frac{DPCH_E_c}{I_{or}}$ power ratio averaged over 50 ms during T1. T1 starts 10 ms after the uplink DPDCH physical channel is considered established and T1 equals to 500 ms. The first 10 ms shall not be used for averaging, i.e. the first sample to be input to the averaging filter is at the beginning of T1. The averaging shall be performed with a sliding rectangular window averaging filter. The window size of the averaging filter is linearly increased from 0 up to 50 ms during the first 50 ms of T1, and then kept equal to 50ms. At the first slot where the averaging window crosses the T1 - T2 boundary, the average power level within the window begins to test against the T2 requirements.
- 5) Measure $\frac{DPCH_E_c}{I_{or}}$ power ratio averaged over 50 ms during T2. T2 starts, when T1 has expired and T2 equals to 500 ms.

The reception of the "RB setup complete" and the "CLOSE UE TEST LOOP COMPLETE" messages is not necessary to pass this test.

7.8.2.5 Test Requirements

The test parameters are specified in table 7.8.2.3.

Table 7.8.2.3: Test parameters for downlink power control, initial convergence

| Parameter | Test 1 | Test 2 | Test 3 | Test 4 | Unit |
|---|----------------|----------------|----------------|----------------|--------------|
| Target quality value on DTCH | 0,01 | 0,01 | 0,1 | 0,1 | BLER |
| Initial DPCH_Ec/I _{or} | -5,9 | -25,9 | -3 | -22,8 | dB |
| Down Link Information Data Rate | 12,2 | 12,2 | 64 | 64 | kbps |
| Up Link Information Data Rate | 12,2 Note 2 | 12,2 Note 2 | 12,2 Note 3 | 12,2 Note 3 | kbps |
| \hat{I}_{or}/I_{oc} | -1 | | | | dB |
| I_{oc} | -60 | | | | dBm/3,84 MHz |
| Propagation condition | Static | | | | |
| Maximum_DL_Power (note 1) | 7 | | | | dB |
| Minimum_DL_Power (note 1) | -18 | | | | dB |
| DL Power Control step size, Δ_{TPC} | 1 | | | | dB |
| Limited Power Increase | "Not used" | | | | |
| NOTE 1: Power is compared to P-CPICH as specified in [9]. | | | | | |
| NOTE 2: UL TM AUXMC 12.2 kbps, no CRC. See C.6.3. | | | | | |
| NOTE 3: UL AM AUXMC 12.2 kbps. See C.6.7. | | | | | |

- a) The downlink $\frac{DPCH_E_c}{I_{or}}$ power ratio values shall be within the range specified in table 7.8.2.4 during T1 more than 90 % of the time or, when using an SS with an additional one slot delay in power control response, within the range specified in table 7.8.2.4A during T1 more than 90 % of the time.

- b) The downlink $\frac{DPCH_E_c}{I_{or}}$ power ratio values shall be within the range specified in table 7.8.2.4 during T2 more than 90 % of the time or, when using an SS with an additional one slot delay in power control response, within the range specified in table 7.8.2.4A during T2 more than 90 % of the time.

Table 7.8.2.4: Requirements in downlink power control, initial convergence

| Parameter | Test 1 and Test 2 | Test 3 and Test 4 | Unit |
|--------------------------------------|--------------------------------------|--------------------------------------|------|
| $\frac{DPCH_E_c}{I_{or}}$ during T1 | $-19,5 \leq DPCH_Ec/lor \leq -11,3$ | $-15,7 \leq DPCH_Ec/lor \leq -7,5$ | dB |
| $\frac{DPCH_E_c}{I_{or}}$ during T2 | $-19,5 \leq DPCH_Ec/lor \leq -14,3$ | $-15,7 \leq DPCH_Ec/lor \leq -10,5$ | dB |

NOTE: The low limit is decreased by 3 dB for a UE with more than one antenna connector.

Table 7.8.2.4A: Requirements in downlink power control, initial convergence target using SS with an additional one slot delay in power control response time

| Parameter | Test 1 and Test 2 | Test 3 and Test 4 | Unit |
|--------------------------------------|--------------------------------------|--------------------------------------|------|
| $\frac{DPCH_E_c}{I_{or}}$ during T1 | $-19,7 \leq DPCH_Ec/lor \leq -11,1$ | $-15,9 \leq DPCH_Ec/lor \leq -7,3$ | dB |
| $\frac{DPCH_E_c}{I_{or}}$ during T2 | $-19,7 \leq DPCH_Ec/lor \leq -14,1$ | $-15,9 \leq DPCH_Ec/lor \leq -10,3$ | dB |

NOTE: The low limit is decreased by 3 dB for a UE with more than one antenna connector.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

7.8.3 Power control in the downlink, wind up effects (Release 5 and earlier)

7.8.3.1 Definition and applicability

This requirement verifies that, after the downlink maximum power is limited in the UTRAN and it has been released again, the downlink power control in the UE does not have a wind up effect, i.e. the required DL power has increased during time period the DL power was limited. The requirements and this test apply to all types of UTRA for the FDD UE for Release 5 and earlier releases.

7.8.3.2 Minimum requirements

This test is run in three stages where stage 1 is for convergence of the power control loop, in stage two the maximum downlink power for the dedicated channel is limited not to be higher than the parameter specified in table 7.8.3.1. All parameters used in the three stages are specified in table 7.8.3.1. The downlink $\frac{DPCH_E_c}{I_{or}}$ power ratio measured values, which are averaged over one slot, during stage 3 shall be lower than the value specified in table 7.8.3.2 more than 90 % of the time. Power control of the UE is ON during the test.

Table 7.8.3.1: Test parameter for downlink power control, wind-up effects

| Parameter | Test 1 | | | Unit |
|---|---|---------|---------|--------------|
| | Stage 1 | Stage 2 | Stage 3 | |
| Time in each stage | >15 | 5 | 0,5 | s |
| \hat{I}_{or}/I_{oc} | 5 | | | dB |
| I_{oc} | -60 | | | dBm/3,84 MHz |
| Information Data Rate | 12,2 | | | kbps |
| Quality target on DTCH | 0,01 | | | BLER |
| Propagation condition | Case 4 | | | |
| Maximum_DL_Power (note) | 7 | -6,2 | 7 | dB |
| Minimum_DL_Power (note) | -18 | | | dB |
| DL Power Control step size, Δ_{TPC} | 1 | | | dB |
| Limited Power Increase | "Not used" | | | - |
| NOTE: | Power is compared to P-CPICH as specified in [9]. | | | |

Table 7.8.3.2: Requirements in downlink power control, wind-up effects

| Parameter | Test 1, stage 3 | Unit |
|----------------------------|-----------------|------|
| $\frac{DPCH_E_c}{I_{or}}$ | -13,3 | dB |

The reference for this requirement is TS 25.101 [1] clause 8.8.3.1.

7.8.3.3 Test purpose

To verify that the UE downlink power control does not require too high downlink power during a period after the downlink power is limited by the UTRAN.

7.8.3.4 Method of test

7.8.3.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect SS, multipath fading simulator and an AWGN source to the UE antenna connector as shown in figure A.10. In case of UE-receive diversity connect according to figure A.21.
- 2) Set up a call according to the Generic call setup procedure specified in TS 34.108 [3] clause 7.3.2, with the exception of the information element of Target quality on DCCH as 1(100%) in the RRC CONNECTION SETUP message. With this exception, the outer loop is based on DTCH and not on DCCH.
- 3) Enter the UE into loopback test mode and start the loopback test.

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

7.8.3.4.2 Procedure

- 1) RF parameters are set up according to table 7.8.3.3. Stage 1 is used for the power control to converge and during Stage 2 the maximum downlink power is limited by UTRAN.
- 2) SS will vary the physical channel power in downlink according to the TPC commands from UE during stages 1, 2, and 3. Downlink power control mode (DPC_MODE) 0 shall be used.
- 3) Measure $\frac{DPCH_E_c}{I_{or}}$ power ratio during stage 3 according to table 7.8.3.3.
- 4) Repeat steps 1 - 3 328 times.

NOTE: The number of repetitions (328) is derived from minimum testing time for 3 km/h fading channels (Table F.6.1.6.2; 164 seconds).

7.8.3.5 Test Requirements

The test parameters are specified in table 7.8.3.3.

Table 7.8.3.3: Test parameter for downlink power control, wind-up effects

| Parameter | Test 1 | | | Unit |
|---|------------|---------|---------|--------------|
| | Stage 1 | Stage 2 | Stage 3 | |
| Time in each stage | >15 | 5 | 0,5 | s |
| \hat{I}_{or}/I_{oc} | 5,6 | | | dB |
| I_{oc} | -60 | | | dBm/3,84 MHz |
| Information Data Rate | 12,2 | | | kbps |
| Quality target on DTCH | 0,01 | | | BLER |
| Propagation condition | Case 4 | | | |
| Maximum_DL_Power (note) | 7 | -6,2 | 7 | dB |
| Minimum_DL_Power (note) | -18 | | | dB |
| DL Power Control step size, Δ_{TPC} | 1 | | | dB |
| Limited Power Increase | "Not used" | | | - |
| NOTE: Power is compared to P-CPICH as specified in [9]. | | | | |

The downlink $\frac{DPCH_E_c}{I_{or}}$ power ratio values, which are averaged over one slot during stage 3, shall be lower than the level specified in table 7.8.3.4 during stage 3 more than 90 % of the time for SS supporting immediate TPC response time or the values in 7.8.3.4A for SS supporting an additional one slot delay in TPC response time.

Table 7.8.3.4: Requirements in downlink power control, wind-up effects

| Parameter | Test 1, stage 3 | Unit |
|----------------------------|-----------------|------|
| $\frac{DPCH_E_c}{I_{or}}$ | -13,2 | dB |

Table 7.8.3.4A: Requirements in downlink power control, wind-up effects with an additional one slot delay in power control response time

| Parameter | Test 1, stage 3 | Unit |
|----------------------------|-----------------|------|
| $\frac{DPCH_E_c}{I_{or}}$ | -12.9 | dB |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

7.8.3A Power control in the downlink, wind up effects (Release 6 and later)

7.8.3A.1 Definition and applicability

This requirement verifies that, after the downlink maximum power is limited in the UTRAN and it has been released again, the downlink power control in the UE does not have a wind up effect, i.e. the required DL power has increased during time period the DL power was limited. The requirements and this test apply to Release 6 and later release for all types of UTRA for the FDD UE.

7.8.3A.2 Minimum requirements

This test is run in three stages where stage 1 is for convergence of the power control loop. In stage two the maximum downlink power for the dedicated channel is limited not to be higher than the parameter specified in table 7.8.3A.1. All

parameters used in the three stages are specified in table 7.8.3A.1. The downlink $\frac{DPCH - E_c}{I_{or}}$ power ratio measured values, which are averaged over one slot, during stage 3 shall be lower than the value specified in table 7.8.3A.2 more than 90 % of the time. Power control of the UE is ON during the test.

Table 7.8.3A.1: Test parameter for downlink power control, wind-up effects

| Parameter | Test 1 | | | Unit |
|--|------------|---------------------|---------|--------------|
| | Stage 1 | Stage 2 | Stage 3 | |
| Time in each stage | 5 | 5 | 0,5 | S |
| \hat{I}_{or}/I_{oc} | 5 | | | dB |
| I_{oc} | -60 | | | dBm/3,84 MHz |
| Information Data Rate | 12,2 | | | Kbps |
| Quality target on DTCH | 0,01 | | | BLER |
| Propagation condition | Case 4 | | | |
| Maximum_DL_Power (Note 2) | 7 | min(-6,2, P) Note 1 | 7 | dB |
| Minimum_DL_Power (Note 2) | -18 | | | dB |
| DL Power Control step size, Δ_{TPC} | 1 | | | dB |
| Limited Power Increase | "Not used" | | | - |
| <p style="text-align: center;">$\frac{DPCH - E_c}{I_{or}}$</p> <p>NOTE 1: P is the level corresponding to the average $\frac{DPCH - E_c}{I_{or}}$ power ratio - 2 dB compared to the P-CPICH level. The average $\frac{DPCH - E_c}{I_{or}}$ power ratio is measured during the initialisation stage after the power control loop has converged before the actual test starts.</p> <p>NOTE 2: Power is compared to P-CPICH as specified in [9].</p> | | | | |

Table 7.8.3A.2: Requirements in downlink power control, wind-up effects

| Parameter | Test 1, stage 3 | Unit |
|-----------------------------|-----------------|------|
| $\frac{DPCH - E_c}{I_{or}}$ | -13,3 | dB |

The reference for this requirement is TS 25.101 [1] clause 8.8.3.1.

7.8.3A.3 Test purpose

To verify that the UE downlink power control does not require too high downlink power during a period after the downlink power is limited by the UTRAN.

7.8.3A.4 Method of test

7.8.3A.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect SS, multipath fading simulator and an AWGN source to the UE antenna connector as shown in figure A.10. In case of UE-receive diversity connect according to figure A.21
- 2) Set up a call according to the Generic call setup procedure specified in TS 34.108 [3] clause 7.3.2.
- 3) Enter the UE into loopback test mode and start the loopback test. RF parameters are set up according to table

7.8.3A.3. SS waits 15 seconds and then collects the $\frac{DPCH - E_c}{I_{or}}$ power ratio measured values, which are averaged over one slot, over 10 second period. The average of these $\frac{DPCH - E_c}{I_{or}}$ values is then calculated and 2 dB is subtracted from it to get the power value P, which will then be used during the stage 2 in the test procedure.

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

7.8.3A.4.2 Procedure

- 1) RF parameters are set up according to table 7.8.3A.3. Stage 1 is used for the power control to converge and During Stage 2 the maximum downlink power is limited by UTRAN.
- 2) SS will vary the physical channel power in downlink according to the TPC commands from UE during stages 1, 2, and 3. Downlink power control mode (DPC_MODE) 0 shall be used.

- 3) Measure $\frac{DPCH - E_c}{I_{or}}$ power ratio during stage 3 according to table 7.8.3A.3.
- 4) Repeat steps 1) to 3) 328 times.

NOTE: The number of repetitions (328) is derived from minimum testing time for 3 km/h fading channels (Table F.6.1.6.2; 164 seconds).

Table 7.8.3A.3: Test parameter for downlink power control, wind-up effects

| Parameter | Test 1 | | | Unit |
|--|------------|---------------------|---------|--------------|
| | Stage 1 | Stage 2 | Stage 3 | |
| Time in each stage | 5 | 5 | 0,5 | s |
| \hat{I}_{or}/I_{oc} | 5,6 | | | dB |
| I_{oc} | -60 | | | dBm/3,84 MHz |
| Information Data Rate | 12,2 | | | kbps |
| Quality target on DTCH | 0,01 | | | BLER |
| Propagation condition | Case 4 | | | |
| Maximum_DL_Power (Note 2) | 7 | min(-6,2, P) Note 1 | 7 | dB |
| Minimum_DL_Power (Note 2) | -18 | | | dB |
| DL Power Control step size, Δ_{TPC} | 1 | | | dB |
| Limited Power Increase | "Not used" | | | - |
| <p>NOTE 1: P is the level corresponding to the average $\frac{DPCH - E_c}{I_{or}}$ power ratio - 2 dB compared to the P-CPICH level. The average $\frac{DPCH - E_c}{I_{or}}$ power ratio is measured during the initialisation stage after the power control loop has converged before the actual test starts.</p> <p>NOTE 2: Power is compared to P-CPICH as specified in [9]. Target quality on DCCH as 1(100%) for Test1.</p> | | | | |

The downlink $\frac{DPCH - E_c}{I_{or}}$ power ratio values, which are averaged over one slot during stage 3, shall be lower than the level specified in table 7.8.3A.4 during stage 3 more than 90 % of the time.

Table 7.8.3A.4: Requirements in downlink power control, wind-up effects

| Parameter | Test 1, stage 3 | Unit |
|-----------------------------|-----------------|------|
| $\frac{DPCH - E_c}{I_{or}}$ | -13,2 | dB |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

7.8.4 Power control in the downlink, different transport formats

7.8.4.1 Definition and applicability

This requirement verifies that UE outer loop power control has proper behaviour with different transport formats. The requirements and this test apply for Release 5 and later releases to all types of UTRA for the FDD UE.

7.8.4.2 Minimum requirements

Test 1 verifies that UE outer loop power control has proper behaviour with different transport formats.

The downlink reference measurement channel used in this subclause shall have two different transport formats. The different transport formats of the downlink reference measurement channel used shall correspond to the measurement channels specified in Annex C.3.1A. The different transport formats of the uplink reference measurement channel used shall correspond to the measurement channels specified in Annex C.6.3A. The transport format used in downlink reference measurement channel during different stages of the test shall be set according to the information data rates specified in Table 7.8.4.1. During stage 1 a downlink transport format combination using the 12.2kbps information data rate DTCH shall be used, and during stage 2 the downlink transport format combination shall be changed such that a 0kbps information data rate transport format combination is then used.

For the parameters specified in Table 7.8.4.1 the downlink $\frac{DPCH - E_c}{I_{or}}$ power ratio measured values, which are averaged over one slot, shall be below the specified value in Table 7.8.4.2 more than 90% of the time. BLER shall be as shown in Table 7.8.4.2. Power control in downlink is ON during the test.

Table 7.8.4.1: Parameters for downlink power control in case of different transport formats

| Parameter | Unit | Test 1 | |
|--|--------------|------------|---------|
| | | Stage 1 | Stage 2 |
| Time in each stage | S | Note 1 | Note 1 |
| \hat{I}_{or}/I_{oc} | dB | 9 | |
| I_{oc} | dBm/3.84 MHz | -60 | |
| Information Data Rate | Kbps | 12.2 | 0 |
| Quality target on DTCH | BLER | 0.01 | |
| Quality target on DCCH | BLER | 1 | |
| Propagation condition | | Case4 | |
| Maximum_DL_Power | dB | 7 | |
| Minimum_DL_Power | dB | -18 | |
| DL Power Control step size, Δ_{TPC} | dB | 1 | |
| Limited Power Increase | - | "Not used" | |
| NOTE 1: The stage lasts until the DTCH quality has converged to the quality target | | | |

NOTE: Power is compared to P-CPICH as specified in [9].

Table 7.8.4.2: Requirements in downlink power control in case of different transport formats

| Parameter | Unit | Test 1, stage 1 | Test 1, stage 2 |
|----------------------------|------|-----------------|-----------------|
| $\frac{DPCH_E_c}{I_{or}}$ | dB | -16.0 | -18.0 |
| Measured quality on DTCH | BLER | 0.01±30% | 0.01±30% |

The reference for this requirement is TS 25.101 [1] clause 8.8.4.1.

7.8.4.3 Test purpose

To verify that the UE outer loop power control works properly with different transport formats.

7.8.4.4 Method of test

7.8.4.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect SS, multipath fading simulator and an AWGN source to the UE antenna connector as shown in figure A.10. In case of UE-receive diversity connect according to figure A.21
- 2) Set up a call according to the Generic call setup procedure specified in TS 34.108 [3] clause 7.3.2, with the exception of the information elements of Target quality on DCCH as 1(100%) in the RRC CONNECTION SETUP message. With this exception, the outer loop is based on DTCH and not on DCCH. Downlink power control mode (DPC_MODE) 0 shall be used.
- 3) Enter the UE into loopback test mode 2 and start the loopback test.

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

7.8.4.4.2 Procedure

- 1) RF parameters are set up according to table 7.8.4.3.
- 2) SS will vary the physical channel power in downlink according to the TPC commands from UE during stage 1 and 2.
- 3) Stage 1. The SS waits 15 seconds before it performs the measurement in step 4.
- 4) Measure quality on DTCH according to statistical significance in Annex F.6.1.10 and $\frac{DPCH_E_c}{I_{or}}$ power ratio according to table 7.8.4.3.
- 5) Stage 2. The SS waits 15 seconds before it performs the measurement in step 6.
- 6) Measure quality on DTCH according to statistical significance in Annex F.6.1.10 and $\frac{DPCH_E_c}{I_{or}}$ power ratio according to table 7.8.4.3. Note: The measurement should not start until after power control has converged.

7.8.4.5 Test Requirements

The test parameters are specified in table 7.8.4.3.

Table 7.8.4.3: Parameters for downlink power control in case of different transport formats

| Parameter | Unit | Test 1 | |
|---|--------------|------------|---------|
| | | Stage 1 | Stage 2 |
| Time in each stage | S | Note 1 | Note 1 |
| \hat{I}_{or}/I_{oc} | dB | 9.6 | |
| I_{oc} | dBm/3.84 MHz | -60 | |
| Information Data Rate | Kbps | 12.2 | 0 |
| Quality target on DTCH | BLER | 0.01 | |
| Quality target on DCCH | BLER | 1 | |
| Propagation condition | | Case4 | |
| Maximum_DL_Power | dB | 7 | |
| Minimum_DL_Power | dB | -18 | |
| DL Power Control step size, Δ_{TPC} | dB | 1 | |
| Limited Power Increase | - | "Not used" | |
| NOTE 1: The stage lasts until the DTCH quality has converged to the quality target. | | | |

NOTE: Power is compared to P-CPICH as specified in [9].

- a) The measured quality on DTCH does not exceed the values in table 7.8.4.4 or in table 7.8.4.5.
- b) The downlink $\frac{DPCH - E_c}{I_{or}}$ power ratio values, which are averaged over one slot, shall be below the values in table 7.8.4.4 more than 90 % of the time for SS supporting immediate power control response time or below the values in 7.8.4.5 for SS supporting an additional one slot delay in power control response time.

Table 7.8.4.4: Requirements in downlink power control in case of different transport formats

| Parameter | Unit | Test 1, stage 1 | Test 1, stage 2 |
|-----------------------------|------|-----------------|-----------------|
| $\frac{DPCH - E_c}{I_{or}}$ | dB | -15.9 | -17.9 |
| Measured quality on DTCH | BLER | 0.01±30% | 0.01±30% |

Table 7.8.4.5: Requirements in downlink power control in case of different transport formats with an additional one slot delay in power control response time

| Parameter | Unit | Test 1, stage 1 | Test 1, stage 2 |
|-----------------------------|------|-----------------|-----------------|
| $\frac{DPCH - E_c}{I_{or}}$ | dB | -15.6 | -17.7 |
| Measured quality on DTCH | BLER | 0.01±30% | 0.01±30% |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

7.8.5 Power control in the downlink for F-DPCH

7.8.5.1 Definition and applicability

Power control in the downlink is the ability of the UE receiver to converge to required link quality set by the network while using as low power as possible in downlink.

The requirements and this test apply to release 6 and later releases for all types of UTRA for the FDD UE that support F-DPCH and HSDPA.

7.8.5.2 Minimum requirements

For the parameters specified in table 7.8.5.1 the downlink $\frac{F - DPCH - E_c}{I_{or}}$ power ratio measured values, which are averaged over TPC symbols of the F-DPCH frame, shall be below the specified value in table 7.8.5.2 more than 90% of the time. TPC Command Error Ratio shall be in the limits given by table 7.8.5.2. Power control in downlink is ON during the test.

Table 7.8.5.1: Test parameter for downlink power control for F-DPCH

| Parameter | Test 1 | Test 2 | Unit |
|---|-------------|--------|----------------|
| \hat{I}_{or}/I_{oc} | 9 | -1 | dB |
| I_{oc} | -60 | | dBm / 3,84 MHz |
| Spreading Factor (SF) | 256 | | |
| Target quality value on Fractional DPCH (F-DPCH) | 0.01 | 0.05 | |
| Propagation condition | Case 4 | | |
| Maximum_DL_Power (note) | 7 | | dB |
| Minimum_DL_Power (note) | -18 | | dB |
| DL Power Control step size, Δ_{TPC} | 1 | | dB |
| Limited Power Increase | "Not used" | | - |
| Power Control Algorithm | Algorithm 1 | | |
| NOTE: Power is compared to P-CPICH as specified in [9]. | | | |

Table 7.8.5.2: Requirements in downlink power control for F-DPCH

| Parameter | Test 1 | Test 2 | Unit |
|---------------------------------|--------|--------|------|
| $\frac{F - DPCH - E_c}{I_{or}}$ | -15,9 | -12,0 | dB |
| TPC Command Error Ratio high | 0,015 | 0,065 | - |
| TPC Command Error Ratio low | 0,005 | 0,035 | - |

The reference for this requirement is TS 25.101 [1] clause 8.8.1.1.

7.8.5.3 Test purpose

To verify that the UE receiver is capable of converging to required link quality set by network while using as low power as possible.

7.8.5.4 Method of test

7.8.5.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect SS, multipath fading simulator and an AWGN source to the UE antenna connector as shown in figure A.10. In case of UE-receive diversity connect according to figure A.21.
- 2) The Fixed Reference Channels (FRC H-Set 1, QPSK) are specified in Annex C.8.1.1.3) Set up a HSDPA call according to the call setup procedure specified in TS 34.108 [3] clause 7.3.11 with levels according to table E.5C.1.
- 3) Once the HSDPA connection is setup, and start transmitting HSDPA Data.
- 4) Additional RF parameters are set up according to table 7.8.5.3.

- 5) Set the uplink DPCH power control parameters to use Algorithm 1 with a step size of 1 dB and the uplink HS-DPCCH to be continuous.
- 6) SS will vary the physical channel power in downlink according to the TPC commands from UE. Downlink power control mode (DPC_MODE) 0 shall be used.

See TS 34.108 [3] for details regarding generic call setup procedure.

7.8.5.4.2 Procedure

- 1) After call set up generate suitable TPC commands from the SS to set the output power of the UE, measured at the UE antenna connector, to be in the range 0 dBm +/-2 dB. This is a nominal setting and not part of the test requirements.
- 2) SS waits 15 seconds and then sends repetitive UP/DOWN/UP/DOWN TPC pattern to the UE. During the measurements it may be possible that UE output power drifts far away from the nominal setting (0 dBm) due to erroneously received TPC commands. If power drift causes problems for the SS to continue the measurements, then the SS shall send suitable TPC commands to set UE output power back to its nominal setting. Same as the regular UP/DOWN/UP/DOWN TPCs, the deviating TPCs with the corresponding power steps are counted as samples.
- 3) After this period, measure TPC Command Error Rate according to statistical significance in Annex F.6.1.10. This is done as follows: The SS shall measure the mean output power of the UE in each timeslot, not including the 25 µs transient periods at the start and end of each slot. For each timeslot
 - if TPC command corresponding to this timeslot was UP, and the mean power in that timeslot is greater than or equal to the mean power in the previous timeslot plus 0.4 dB, increment a counter of correct samples. Otherwise increment a counter of wrong samples.
 - if TPC command corresponding to this timeslot was DOWN, and the mean power in that timeslot is less than or equal to the mean power in the previous timeslot minus 0.4 dB, increment a counter of correct samples. Otherwise increment a counter of wrong samples.

Simultaneously the downlink $\frac{F - DPCH - E_c}{I_{or}}$ power ratio averaged over TPC symbols of the F-DPCH frame is measured..

7.8.5.5 Test Requirements

The test parameters are specified in table 7.8.5.3.

Table 7.8.5.3: Test parameter for downlink power control for F-DPCH

| Parameter | Test 1 | Test 2 | Unit |
|---|-------------|--------|----------------|
| \hat{I}_{or}/I_{oc} | 9,6 | -0,4 | dB |
| I_{oc} | -60 | | dBm / 3,84 MHz |
| Spreading Factor (SF) | 256 | | |
| Target quality value on Fractional DPCH (F-DPCH) | 0,01 | 0,05 | - |
| Propagation condition | Case 4 | | |
| Maximum_DL_Power (note) | 7 | | dB |
| Minimum_DL_Power (note) | -18 | | dB |
| DL Power Control step size, Δ_{TPC} | 1 | | dB |
| Limited Power Increase | "Not used" | | - |
| Power Control Algorithm | Algorithm 1 | | |
| NOTE: Power is compared to P-CPICH as specified in [9]. | | | |

- a) The measured quality on F-DPCH shall be in the limits given by table 7.8.5.4. TPC Command Error Rate shall be performed as specified in TS 25.214 [9].
- b) The downlink $\frac{F - DPCH - E_c}{I_{or}}$ power ratio values, which are averaged over TPC symbols of the F-DPCH frame, shall be below the values in table 7.8.5.4 more than 90 % of the time.

Table 7.8.5.4: Requirements in downlink power control for F- DPCH

| Parameter | Test 1 | Test 2 | Unit |
|---------------------------------|--------|--------|------|
| $\frac{F - DPCH - E_c}{I_{or}}$ | -15,8 | -11,9 | dB |
| TPC Command Error Ratio high | 0,015 | 0,065 | - |
| TPC Command Error Ratio low | 0,005 | 0,035 | - |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

7.9 Downlink compressed mode

Downlink compressed mode is used to create gaps in the downlink transmission, to allow the UE to make measurements on other frequencies.

7.9.1 Single link performance (Release 5 and earlier)

7.9.1.1 Definition and applicability

The receiver single link performance of the Dedicated Traffic Channel (DCH) in compressed mode is determined by the Block Error Ratio (BLER) and transmitted DPCH_Ec/I_{or} power ratio in the downlink. If a BLER target has been assigned to a DCCH (See clause C.3), then it has to be such that outer loop is based on DTCH and not on DCCH.

NOTE: The above implies that the BLER target for the DCCH should be set low enough so that it does not dominate the one for the DTCH.

The compressed mode parameters are given in clause C.5. Tests 1 and 2 are using Set 1 compressed mode pattern parameters from table C.5.1 in clause C.5 while tests 3 and 4 are using Set 2 compressed mode patterns from the same table.

The requirements for compressed mode by spreading factor reduction (tests 1 and 2) apply to all types of UTRA for the FDD UE from Release 5 and earlier releases only. The requirements for compressed mode by puncturing (tests 3 and 4) apply to all types of UTRA for the FDD UE for Release 99 and Release 4 only.

7.9.1.2 Minimum requirements

For the parameters specified in table 7.9.1 the downlink $\frac{DPCH_Ec}{I_{or}}$ power ratio measured values, which are averaged over one slot, shall be below the specified value in table 7.9.2 more than 90% of the time. The measured quality on DTCH shall be as required in table 7.9.2.

Downlink power control is ON during the test. Uplink TPC commands shall be error free.

Table 7.9.1: Test parameter for downlink compressed mode

| Parameter | Test 1 | Test 2 | Test 3 | Test 4 | Unit |
|--|------------|--------|--------|--------|----------------|
| Delta SIR1 | 0 | 3 | 0 | 3 | dB |
| Delta SIR after1 | 0 | 3 | 0 | 3 | dB |

| Minimum DL Power (note) | -18 | | | | dB |
| DL Power Control step size, Δ_{TPC} | 1 | | | | dB |
| Limited Power Increase | "Not used" | | | | - |

NOTE: Power is compared to P-CPICH as specified in [9].

Table 7.9.2: Requirements in downlink compressed mode

| Parameter | Test 1 | Test 2 | Test 3 | Test 4 | Unit |
|--|-----------------|-----------------|-----------------|-----------------|------|
| $\frac{DPCH_Ec}{I_{or}}$ | -14,6 | No requirements | -15,2 | No requirements | dB |
| Measured quality of compressed and recovery frames | No requirements | < 0,001 | No requirements | < 0,001 | BLER |
| Measured quality on DTCH | 0,01 ± 30 % | | | | BLER |

The reference for this requirement is TS 25.101 [1] clause 8.9.1.1.

7.9.1.3 Test purpose

The purpose of this test is to verify the reception of DPCH in a UE while downlink is in a compressed mode. The UE needs to preserve the BLER using sufficient low DL power. It is also verified that UE applies the Delta SIR values, which are signalled from network, in its outer loop power control algorithm.

7.9.1.4 Method of test

7.9.1.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect SS, multipath fading simulator and an AWGN source to the UE antenna connector as shown in figure A.10. In case of UE-receive diversity connect according to figure A.21.
- 2) Set up a call according to the Generic call setup procedure, specified in TS 34.108 [3] clause 7.3.2, with the exception of the information element of Target quality on DCCH as 1(100%) in the RRC CONNECTION SETUP message. With this exception, the outer loop is based on DTCH and not on DCCH..
- 3) RF parameters are set up according to table 7.9.3.
- 4) Set compressed mode parameters according to table C.5.1. Tests 1 and 2 are using Set 1 compressed mode pattern parameters and while tests 3 and 4 are using Set 2 compressed mode pattern parameters.

NOTE: Set 2 is applicable to Release 99 and Release 4 only.

- 5) Enter the UE into loopback test mode and start the loopback test.
- 6) SS will vary the physical channel power in downlink according to the TPC commands from UE. Downlink power control mode (DPC_MODE) 0 shall be used. SS response time for UE TPC commands shall be one slot.
- 7) The SS waits 15 seconds before it performs measurements as described in 7.9.1.4.2.

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

7.9.1.4.2 Procedure

- 1) Test 1: Measure quality on DTCH and $\frac{DPCH - E_c}{I_{or}}$ power ratio values averaged over one slot.
- 2) Test 2: Measure quality on DTCH and quality of compressed and recovery frames.
- 3) Test 3: Measure quality on DTCH and $\frac{DPCH - E_c}{I_{or}}$ power ratio values averaged over one slot.
- 4) Test 4: Measure quality on DTCH and quality of compressed and recovery frames.

7.9.1.5 Test requirements

The test parameters are specified in table 7.9.3.

Table 7.9.3: Test parameter for downlink compressed mode

| Parameter | Test 1 | Test 2 | Test 3 | Test 4 | Unit |
|---|------------|--------|--------|--------|----------------|
| Delta SIR1 | 0 | 3 | 0 | 3 | dB |
| Delta SIR after1 | 0 | 3 | 0 | 3 | dB |
| Delta SIR2 (note 2) | 0 | 0 | 0 | 0 | dB |
| Delta SIR after2 (note 2) | 0 | 0 | 0 | 0 | dB |
| \hat{I}_{or}/I_{oc} | 9,6 | | | | dB |
| I_{oc} | -60 | | | | dBm / 3,84 MHz |
| Information Data Rate | 12,2 | | | | kbps |
| Propagation condition | Case 2 | | | | |
| Target quality value on DTCH | 0,01 | | | | BLER |
| Maximum DL Power (note 1) | 7 | | | | dB |
| Minimum DL Power (note 1) | -18 | | | | dB |
| DL Power Control step size, Δ_{TPC} | 1 | | | | dB |
| Limited Power Increase | "Not used" | | | | - |
| NOTE 1: Power is compared to P-CPICH as specified in [9]. | | | | | |
| NOTE 2: Delta SIR2 is not present in Test 1, Test 2, Test 3 and Test 4. | | | | | |

- a) Test 1: The downlink $\frac{DPCH - E_c}{I_{or}}$ power ratio values averaged over one slot shall be below the values in table 7.9.4 more than 90 % of the time. The measured quality on DTCH shall be as required in table 7.9.4. BLER measurements based on measured quality on DTCH shall be performed according to the statistical testing in Annex F.6.1.10.
- b) Test 2: Measured quality on DTCH and measured quality of compressed and recovery frames do not exceed the values in table 7.9.4. BLER measurements based on measured quality on DTCH shall be performed according to the statistical testing in Annex F.6.1.10.
- c) Test3: The downlink $\frac{DPCH - E_c}{I_{or}}$ power ratio values averaged over one slot shall be below the values in table 7.9.2 more than 90 % of the time. The measured quality on DTCH shall be as required in table 7.9.4. BLER measurements based on measured quality on DTCH shall be performed according to the statistical testing in Annex F.6.1.10.
- d) Test 4: Measured quality on DTCH and measured quality of compressed and recovery frames do not exceed the values in table 7.9.4. BLER measurements based on measured quality on DTCH shall be performed according to the statistical testing in Annex F.6.1.10.

Table 7.9.4: Requirements in downlink compressed mode

| Parameter | Test 1 | Test 2 | Test 3 | Test 4 | Unit |
|--|-----------------|-----------------|-----------------|-----------------|------|
| $\frac{DPCH - E_c}{I_{or}}$ | -14,5 | No requirements | -15,1 | No requirements | dB |
| Measured quality of compressed and recovery frames | No requirements | < 0,001 | No requirements | < 0,001 | BLER |
| Measured quality on DTCH | 0,01 ± 30 % | | | | BLER |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

7.9.1A Single link performance (Release 6 and later)

7.9.1A.1 Definition and applicability

The receiver single link performance of the Dedicated Traffic Channel (DCH) in compressed mode is determined by the Block Error Ratio (BLER) and transmitted DPCH_Ec/I_{or} power ratio in the downlink. If a BLER target has been assigned to a DCCH (See clause C.3), then it has to be such that outer loop is based on DTCH and not on DCCH.

NOTE: The above implies that the BLER target for the DCCH should be set low enough so that it does not dominate the one for the DTCH.

The compressed mode parameters are given in clause C.5. Test 1 is using Set 2A compressed mode pattern parameters from table C.5.1 and Test 2 is using Set 1 compressed mode patterns from the same table.

The requirements for compressed mode by spreading factor reduction (tests 1 and 2) apply to all types of UTRA for the FDD UE from Release 6 and later releases.

7.9.1A.2 Minimum requirements

For the parameters specified in table 7.9.1A the downlink $\frac{DPCH_Ec}{I_{or}}$ power ratio measured values, which are averaged over one slot, shall be below the specified value in table 7.9.2A more than 90% of the time. The measured quality on DTCH shall be as required in table 7.9.2A.

Downlink power control is ON during the test. Uplink TPC commands shall be error free.

Table 7.9.1A: Test parameter for downlink compressed mode

| Parameter | Test 1 | Test 2 | Unit |
|--|--------------|-------------|----------------|
| Delta SIR1 | 0 | 3 | dB |
| Delta SIR after1 | 0 | 3 | dB |
| Delta SIR2 | 0 | 0 | dB |
| Delta SIR after2 | 0 | 0 | dB |
| Compressed Mode Patterns | C.5.1 Set 2A | C.5.1 Set 1 | dB |
| \hat{I}_{or}/I_{oc} | 9 | | dB |
| I_{oc} | -60 | | dBm / 3,84 MHz |
| Information Data Rate | 12,2 | | kbps |
| Propagation condition | Case 3 | Case 2 | |
| Target quality value on DTCH | 0,01 | | BLER |
| Maximum DL Power (note) | 7 | | dB |
| Minimum DL Power (note) | -18 | | dB |
| DL Power Control step size, Δ_{TPC} | 1 | | dB |
| Limited Power Increase | "Not used" | | - |
| NOTE : Power is compared to P-CPICH as specified in [9]. | | | |

Table 7.9.2A: Requirements in downlink compressed mode

| Parameter | Test 1 | Test 2 | Unit |
|--|-----------------|-----------------|------|
| $\frac{DPCH_Ec}{I_{or}}$ | -13.7 | No requirements | dB |
| Measured quality of compressed and recovery frames | No requirements | < 0,001 | BLER |
| Measured quality on DTCH | 0,01 ± 30 % | | BLER |

The reference for this requirement is TS 25.101 [1] clause 8.9.1.1.

7.9.1A.3 Test purpose

The purpose of this test is to verify the reception of DPCH in a UE while downlink is in a compressed mode. The UE needs to preserve the BLER using sufficient low DL power. It is also verified that UE applies the Delta SIR values, which are signalled from network, in its outer loop power control algorithm.

7.9.1A.4 Method of test

7.9.1A.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect SS, multipath fading simulator and an AWGN source to the UE antenna connector as shown in figure A.10. In case of UE-receive diversity connect according to figure A.21.
- 2) Set up a call according to the Generic call setup procedure, specified in TS 34.108 [3] clause 7.3.2, with the exception of the information element of Target quality on DCCH as 1(100%) in the RRC CONNECTION SETUP message. With this exception, the outer loop is based on DTCH and not on DCCH.
- 3) RF parameters are set up according to table 7.9.3A.
- 4) Set compressed mode parameters according to table C.5.1. Test 1 is using Set 2A compressed mode pattern parameters and test 2 is using Set 1 compressed mode pattern parameters.
- 5) Enter the UE into loopback test mode and start the loopback test.
- 6) SS will vary the physical channel power in downlink according to the TPC commands from UE. Downlink power control mode (DPC_MODE) 0 shall be used. SS response time for UE TPC commands shall be one slot.
- 7) The SS waits 15 seconds before it performs measurements as described in 7.9.1A.4.2.

See TS 34.108 [3] and TS 34.109 [4] for details regarding generic call setup procedure and loopback test.

7.9.1A.4.2 Procedure

- 1) Test 1: Measure quality on DTCH and $\frac{DPCH - E_c}{I_{or}}$ power ratio values averaged over one slot.
- 2) Test 2: Measure quality on DTCH and quality of compressed and recovery frames.

7.9.1A.5 Test requirements

The test parameters are specified in table 7.9.3A.

Table 7.9.3A: Test parameter for downlink compressed mode

| Parameter | Test 1 | Test 2 | Unit |
|--|--------------|-------------|----------------|
| Delta SIR1 | 0 | 3 | dB |
| Delta SIR after1 | 0 | 3 | dB |
| Delta SIR2 (note 2) | 0 | 0 | dB |
| Delta SIR after2 (note 2) | 0 | 0 | dB |
| Compressed Mode Patterns | C.5.1 Set 2A | C.5.1 Set 1 | dB |
| \hat{I}_{or}/I_{oc} | 9,6 | | dB |
| I_{oc} | -60 | | dBm / 3,84 MHz |
| Information Data Rate | 12,2 | | kbps |
| Propagation condition | Case 3 | Case 2 | |
| Target quality value on DTCH | 0,01 | | BLER |
| Maximum DL Power (note 1) | 7 | | dB |
| Minimum DL Power (note 1) | -18 | | dB |
| DL Power Control step size, Δ_{TPC} | 1 | | dB |
| Limited Power Increase | "Not used" | | - |

NOTE 1: Power is compared to P-CPICH as specified in [9].
NOTE 2: Delta SIR2 is not present in Test 1 and Test 2.

- a) Test 1: The downlink $\frac{DPCH_E_c}{I_{or}}$ power ratio values averaged over one slot shall be below the values in table 7.9.4A more than 90 % of the time. The measured quality on DTCH shall be as required in table 7.9.4A. BLER measurements based on measured quality on DTCH shall be performed according to the statistical testing in Annex F.6.1.10.
- b) Test 2: Measured quality on DTCH and measured quality of compressed and recovery frames do not exceed the values in table 7.9.4A. BLER measurements based on measured quality on DTCH shall be performed according to the statistical testing in Annex F.6.1.10.

Table 7.9.4A: Requirements in downlink compressed mode

| Parameter | Test 1 | Test 2 | Unit |
|--|-----------------|-----------------|------|
| $\frac{DPCH_E_c}{I_{or}}$ | -13.6 | No requirements | dB |
| Measured quality of compressed and recovery frames | No requirements | < 0,001 | BLER |
| Measured quality on DTCH | 0,01 ± 30 % | | BLER |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

7.10 Blind transport format detection

7.10.1 Definition and applicability

Performance of Blind transport format detection is determined by the Block Error Ratio (BLER) values and by the measured average transmitted $DPCH_E_c/I_{or}$ value.

7.10.2 Minimum requirements

For the parameters specified in table 7.10.1 the average downlink $\frac{DPCH_E_c}{I_{or}}$ power ratio shall be below the specified value for the BLER and FDR shown in table 7.10.2. Table 7.10.3 defines the Transport Format Combinations Set for the downlink. The reference measurement channel used in this test case is defined in Annex C.4.

Table 7.10.1: Test parameters for Blind transport format detection

| Parameter | Test 1 | Test 2 | Test 3 | Test 4 | Test 5 | Test 6 | Unit |
|-----------------------|------------------|------------------|------------------|--------------------------|------------------|------------------|----------------|
| \hat{I}_{or}/I_{oc} | -1 | | -3 | | | | dB |
| I_{oc} | -60 | | | | | | dBm / 3.84 MHz |
| Information Data Rate | 12,2 (rate 1) | 7,95 (rate 2) | 1,95 (rate 3) | 12,2 (rate 1) | 7,95 (rate 2) | 1,95 (rate 3) | kbps |
| Propagation condition | static | | | multi-path fading case 3 | | | - |
| TFCI | off | | | | | | - |

Table 7.10.2: The Requirements for DCH reception in Blind transport format detection

| Test Number | $\frac{DPCH_E_c}{I_{or}}$ | BLER | FDR |
|--|----------------------------|-----------|-----------|
| 1 | -17,7dB | 10^{-2} | 10^{-4} |
| 2 | -17,8dB | 10^{-2} | 10^{-4} |
| 3 | -18,4dB | 10^{-2} | 10^{-4} |
| 4 | -13,0dB | 10^{-2} | 10^{-4} |
| 5 | -13,2dB | 10^{-2} | 10^{-4} |
| 6 | -13,8dB | 10^{-2} | 10^{-4} |
| NOTE: The value of DPCH_Ec/lor, loc, and lor/loc are defined in case of DPCH is transmitted. | | | |

NOTE: In the test, 9 different Transport Format Combinations (table 7.10.3) are sent during the call set up procedure, so that the UE has to detect the correct transport format from these 9 candidates.

Table 7.10.3: Transport format combinations informed during the call set up procedure in the test

| | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
|------|--------|--------|--------|-------|-------|-------|--------|--------|--------|
| DTCH | 12,2 k | 10,2 k | 7,95 k | 7,4 k | 6,7 k | 5,9 k | 5,15 k | 4,75 k | 1,95 k |
| DCCH | 2,4 k | | | | | | | | |

7.10.3 Test purpose

To verify the ability of the blind transport format detection to receive a predefined test signal, representing a static propagation channel for the wanted and for the co-channel signals from serving and adjacent cells, with a block error ratio (BLER) and false transport format detection ratio (FDR) not exceeding a specified value.

To verify the ability of the blind transport format detection to receive a predefined test signal, representing a multi-path propagation channel for the wanted and for the co-channel signals from serving and adjacent cells, with a block error ratio (BLER) and false transport format detection ratio (FDR) not exceeding a specified value.

7.10.4 Method of test

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

1. For test 1-3 connect the SS and AWGN noise source to the UE antenna connector as shown in figure A.9. In case of UE-receive diversity connect according to figure A.26. For test 4-6 connect the SS, multipath fading simulator and an AWGN noise source to the UE antenna connector as shown in figure A.10. In case of UE-receive diversity connect according to figure A.21.
2. Set up a call according to the Generic call setup procedure TS34.108 [3] sub clause 7.3.2.
3. Set the test parameters for test 1-6 as specified table 7.10.4 and table 7.10.5.
4. Enter the UE into loopback test mode 2 and start the loopback test.
5. In the case of test 4-6, Setup fading simulator as fading condition case 3 which are described in table D.2.2.1.

NOTE: In loopback test mode 2 the UE may return any valid uplink Transport Format Combination.

7.10.4.2 Procedure

Measure BLER and FDR of DCH.

For FDR, the SS shall check the TFI of the UE transmitted transport format to verify that the UE has detected the correct downlink transport format.

In this test TF0 and TF10 on uplink DTCH shall be counted as block errors.

During the measurements downlink DCCH shall be continuously transmitted. When there is no signalling to transmit on downlink DCCH then dummy DCCH transmission as described in Annex C.9 shall be used.

NOTE: The TFCS size used in this test shall be 18 and not 9 as implied by TS 25.101 (and the NOTE above Table 7.10.3). Since the DCCH will be continuously transmitted and the DCCH is not used in the BTFD for the DTCH this does not have an impact on the BTFD performance.

7.10.5 Test requirements

The test parameters are specified in table 7.10.4.

Table 7.10.4: Test parameters for Blind transport format detection

| Parameter | Test 1 | Test 2 | Test 3 | Test 4 | Test 5 | Test 6 | Unit |
|-----------------------|------------------|------------------|------------------|--------------------------|------------------|------------------|----------------|
| \hat{I}_{or}/I_{oc} | -0,7 | | | -2,4 | | | dB |
| I_{oc} | -60 | | | | | | dBm / 3.84 MHz |
| Information Data Rate | 12,2 (rate 1) | 7,95 (rate 2) | 1,95 (rate 3) | 12,2 (rate 1) | 7,95 (rate 2) | 1,95 (rate 3) | kbps |
| propagation condition | Static | | | multi-path fading case 3 | | | - |
| TFCI | off | | | | | | - |

BLER and FDR shall not exceed the values at the DPCH_Ec/Ior specified in table 7.10.5.

Table 7.10.5: The Requirements for DCH reception in Blind transport format detection

| Test Number | $\frac{DPCH_E_c}{I_{or}}$ | BLER | FDR |
|--|----------------------------|-----------|-----------|
| 1 | -17,6dB | 10^{-2} | 10^{-4} |
| 2 | -17,7dB | 10^{-2} | 10^{-4} |
| 3 | -18,3dB | 10^{-2} | 10^{-4} |
| 4 | -12,9dB | 10^{-2} | 10^{-4} |
| 5 | -13,1dB | 10^{-2} | 10^{-4} |
| 6 | -13,7dB | 10^{-2} | 10^{-4} |
| NOTE: The value of DPCH_Ec/Ior, Ioc, and Ior/Ioc are defined in case of DPCH is transmitted. | | | |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

7.11 Demodulation of Paging Channel (PCH)

7.11.1 Definition and applicability

The receiver characteristics of paging channel are determined by the probability of missed paging message (Pm-p). PCH is mapped into the S-CCPCH and it is associated with the transmission of Paging Indicators (PI) to support efficient sleep-mode procedures.

The requirements and this test apply to all types of UTRA for the FDD UE for Release 4 and later releases.

7.11.2 Minimum requirements

For the parameters specified in table 7.11.1 the average probability of missed paging (Pm-p) shall be below the specified value in table 7.11.2. Power of downlink channels other than S-CCPCH and PICH are as defined in Table E.3.3.1 of Annex E. S-CCPCH structure is as defined in Annex C.7.

Table 7.11.1: Parameters for PCH detection

| Parameter | Unit | Test 1 | Test 2 |
|---|--------------|---------|--------|
| Number of paging indicators per frame (N_p) | - | 72 | |
| Phase reference | - | P-CPICH | |
| I_{oc} | dBm/3.84 MHz | -60 | |
| \hat{I}_{or}/I_{oc} | dB | -1 | -3 |
| Propagation condition | | Static | Case 3 |

Table 7.11.2: Test requirements for PCH detection

| Test Number | S-CCPCH E_c/I_{or} | PICH E_c/I_{or} | Pm-p |
|-------------|----------------------|-------------------|------|
| 1 | -14.8 | -19 | 0.01 |
| 2 | -9.8 | -12 | 0.01 |

The reference for this requirement is TS 25.101 [1] clause 8.12.1.

7.11.3 Test purpose

To verify that average probability of missed paging (P_{m-p}) does not exceed a specified value.

7.11.4 Method of test

7.11.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) For test 1 connect the SS and AWGN noise source to the UE antenna connector as shown in figure A.9. In case of UE-receive diversity connect according to figure A.26. For test 2 connect the SS, multipath fading simulator and an AWGN noise source to the UE antenna connector as shown in figure A.10. In case of UE-receive diversity connect according to figure A.21.
- 2) Set the test parameters for test 1-2 as specified in tables 7.11.3 and 7.11.4. In the case of test 2, Setup fading simulator as fading condition case 3 which are described in table D.2.2.1. Power of downlink channels other than S-CCPCH and PICH are as defined in table E.3.3.1. The S-CCPCH structure is as defined in Annex C.7 and includes 2 S-CCPCH according to TS 34.108 [3] section 6.1.1. The SCCPCH E_c/I_{or} for the S-CCPCH carrying FACH is -7.0 dB while the SCCPCH E_c/I_{or} for the S-CCPCH carrying PCH is defined in table 7.11.4.

7.11.4.2 Procedure

- 1) The UE is switched on.
- 2) An RRC connection is set up according to the generic set-up procedure specified in TS 34.108 [3] subclause 7.3.3 to place the UE in the CELL_PCH state.
- 3) The SS transmits the Paging type 1 message with used paging identity being a UTRAN identity and including the UE's assigned U-RNTI
- 4) If the UE responds with a CELL UPDATE message within 8 seconds, then a success is recorded. If the UE does not respond with a CELL UPDATE message within 8 seconds, a failure is recorded. On reception of the CELL UPDATE message the SS transmits 3 identical CELL UPDATE CONFIRM messages using CCCH on downlink FACH. Then the SS waits for 3 seconds to allow the UE time to move back to CELL_PCH state.
- 5) Repeat steps 3-4 according to Annex F.6.2 table 6.2.8.

NOTE: In the Step 4 above, the 3 identical CELL UPDATE CONFIRM messages are transmitted with the same RRC message sequence number. Transmitting 3 identical CELL UPDATE CONFIRM messages is done to increase the probability of correct message reception at the UE.

Specific Message Contents

All messages indicated above shall use the same content as described in the default message content in clause 9 of TS 34.108 [3] and clause 6.1.1 based on 6.1.0a.3 SIB default schedule of 34.108 [3], with the following exceptions:

PHYSICAL CHANNEL RECONFIGURATION (STEP 2)

7.11.5 Test requirements

For the parameters specified in table 7.11.3 the average probability of missed paging (P_{m-p}) shall be below the specified value in table 7.11.4. Power of downlink channels other than S-CCPCH and PICH are as defined in Table E.3.3.1 of Annex E. S-CCPCH structure is as defined in Annex C.7.

Table 7.11.3: Parameters for PCH detection

| Parameter | Unit | Test 1 | Test 2 |
|---|--------------|---------|--------|
| Number of paging indicators per frame (N_p) | - | 72 | |
| Phase reference | - | P-CPICH | |
| I_{oc} | dBm/3.84 MHz | -60 | |
| \hat{I}_{or}/I_{oc} | dB | -0.6 | -2.3 |
| Propagation condition | | Static | Case 3 |

Table 7.11.4: Test requirements for PCH detection

| Test Number | S-CCPCH_Ec/Ior | PICH_Ec/Ior | Pm-p |
|-------------|----------------|-------------|------|
| 1 | -14.8 | -19 | 0.01 |
| 2 | -9.8 | -12 | 0.01 |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

7.12 Detection of Acquisition Indicator (AI)

7.12.1 Definition and applicability

The receiver characteristics of Acquisition Indicator (AI) are determined by the probability of false alarm P_{fa} and probability of correct detection P_d . P_{fa} is defined as a conditional probability of detection of AI signature given that a AI signature was not transmitted. P_d is defined as a conditional probability of correct detection of AI signature given that the AI signature is transmitted.

The requirements and this test apply to all types of UTRA for the FDD UE for Release 4 and later releases.

7.12.2 Minimum requirements

For the parameters specified in table 7.12.1 the Pfa and 1-Pd shall not exceed the specified values in table 7.12.2. Power of downlink channels other than AICH is as defined in Table E.3.3.1 of Annex E.

Table 7.12.1: Parameters for AI detection

| Parameter | Unit | Test 1 |
|---|--------------|---------|
| Phase reference | - | P-CPICH |
| I_{oc} | dBm/3.84 MHz | -60 |
| Number of other transmitted AI signatures on AICH | - | 0 |
| \hat{I}_{or}/I_{oc} | dB | -1 |
| AICH_Ec/Ior | dB | -22.0 |
| AICH Power Offset | dB | -12.0 |
| Propagation condition | - | Static |

Note that AICH_Ec/Ior can not be set. Its value is calculated from other parameters and it is given for information only. (AICH_Ec/Ior = AICH Power Offset + CPICH_Ec/Ior)

Table 7.12.2: Test requirements for AI detection

| Test Number | Pfa | 1-Pd |
|-------------|------|------|
| 1 | 0.01 | 0.01 |

The reference for this requirement is TS 25.101 [1] clause 8.13.1.

7.12.3 Test purpose

To verify that average probability of false detection of AI (Pfa) and average probability of missed AI (1-Pd) do not exceed specified values.

7.12.4 Method of test

7.12.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS and AWGN noise source to the UE antenna connector as shown in figure A.9. In case of UE-receive diversity connect according to figure A.26.
- 2) Set the test parameters for test 1 as specified in tables 7.12.4 and 7.12.5. Power of downlink channels other than AICH are as defined in Table E.3.3.1 of Annex E.

Table 7.12.3 UE parameters for AI test

| Parameter | Unit | Set 1 | Set 2 |
|---|------|-------|-------|
| Maximum number of preamble ramping cycles(Mmax) | | 2 | 2 |
| Maximum number of preambles in one preamble cycle (preamble retrans max) | | 32 | 12 |
| Back-off time (Tb01=10ms*NB01) (NB01min=NB01max=10) | ms | 100 | 100 |
| Power ramp step when no acquisition indicator is received (power offset p0) | dB | 1 | 3 |

Table 7.12.4 SS parameters for AI test

| Parameter | Unit | Value |
|---|------|-------|
| Primary CPICH DL TX power | dBm | -8 |
| UL interference | dBm | -82 |
| SIR in open loop power control (Constant value) | dB | -10 |

See reference TS25.331 [8] clause 8.5.7 Open loop power control to calculate Pinitial. See also reference TS25.214 [5] subclause 6 step 6.3.

7.12.4.2 Procedure

- 1) The UE is switched on.
- 2) The SS and the UE shall perform location registration procedure as specified in TS34.108 [3] clause 7.2.2. UE parameters are set as defined in table 7.12.3 Set 1.
- 3) SS sends the Paging type 1 message in idle mode with used paging identity being a CN identity and including the UE's assigned IMSI.
- 4) UE starts transmitting RACH preambles at level $P=P_{initial}$.
- 5) SS does not send AI. If UE sends a new preamble a success for calculating Pfa is recorded. This step is repeated until UE stops sending preambles. SS does not calculate Pfa for the first preamble of every preamble cycles.
- 6) UE stops sending preambles. If number of sent preambles in the preamble cycle $< preamble_retrans_max$ a failure for calculating Pfa is recorded and test continues from step 3. If number of preamble cycles $M \neq M_{max}$, a new preamble cycle is initiated and test continues from step 4. If number of preamble cycles $M = M_{max}$ then test continues from step 3.
- 7) Repeat steps 5-6 according to Annex F.6.2 table 6.2.8.
- 8) UE parameters are set as defined in table 7.12.3 Set 2 by modification of system information block 5.
- 9) SS sends the Paging type 1 message in idle mode with used paging identity being a CN identity and including the UE's assigned IMSI.
- 10) UE starts transmitting RACH preambles.
- 11) SS responds with AI signature containing NACK in AICH.
- 12) If UE stops sending preambles, a success for calculating Pd is recorded. If UE does not stop sending preambles, a failure for calculating Pd is recorded.
- 13) Repeat steps 9-12 according to Annex F.6.2 table 6.2.8.

Specific Message Contents

All messages indicated above shall use the same content as described in the default message content in clause 9 of 34.108 [3] and clause 6.1.0b of 34.108 [3], with the following exceptions:

SYSTEM INFORMATION BLOCK TYPE 1

| Information Element | Value/remark |
|--|--------------|
| - UE timers and constants in idle mode | |
| - T300 | 1000 ms |

SYSTEM INFORMATION BLOCK TYPE 5

| Information Element | Value/remark |

| AICH Power Offset | -12 |

7.12.5 Test requirements

For the parameters specified in table 7.12.5 the Pfa and 1-Pd shall not exceed the specified values in table 7.12.6. Power of downlink channels other than AICH are as defined in Table E.3.3.1 of Annex E.

Table 7.12.5: Parameters for AI detection

| Parameter | Unit | Test 1 |
|---|--------------|---------|
| Phase reference | - | P-CPICH |
| I_{oc} | dBm/3.84 MHz | -60 |
| Number of other transmitted AI signatures on AICH | - | 0 |
| \hat{I}_{or}/I_{oc} | dB | -0.6 |
| AICH_Ec/Ior | dB | -22.0 |
| AICH Power Offset | dB | -12.0 |
| Propagation condition | - | Static |

Table 7.12.6: Test requirements for AI detection

| Test Number | Pfa | 1-Pd |
|-------------|------|------|
| 1 | 0.01 | 0.01 |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

7.12A Detection of E-DCH Acquisition Indicator (E-AI)

7.12A.1 Definition and applicability

The receiver characteristics of E-DCH Acquisition Indicator (E-AI) are determined by the probability of correct detection Pde. Pde is defined as a conditional probability of correct detection of E-AI signature given that the E-AI signature is transmitted and AI signature was correctly received.

The requirements and this test apply to all types of UTRA for the FDD UE for Release 8 and later releases supporting Enhanced Uplink in CELL_FACH state.

7.12A.2 Minimum requirements

For the parameters specified in Table 7.12A.1 the 1-Pde shall not exceed the specified value in Table 7.12A.2. The power settings for downlink channels other than AICH and E-AICH are set as defined in Table E.3.3.1 of Annex E.

Table 7.12A.1: Parameters for E-AI detection

| Parameter | Unit | Test 1 |
|---|--------------|---------|
| Phase reference | - | P-CPICH |
| I_{oc} | dBm/3.84 MHz | -60 |
| Number of other transmitted AI signatures on AICH | - | 0 |
| Number of resources assumed for E-DCH random access | - | 32 |
| \hat{I}_{or}/I_{oc} | dB | -1 |
| AICH_Ec/Ior | dB | -22.0 |
| AICH Power Offset | dB | -12.0 |
| E-AICH_Ec/Ior | dB | -22.0 |
| E-AICH Power Offset | dB | -12.0 |
| Propagation condition | - | Static |

Note that AICH_Ec/Ior and E-AICH_Ec/Ior can not be set; their values are calculated from other parameters and are given for information only.

Table 7.12A.2: Test requirements for E-AI detection

| Test Number | 1- Pde |
|-------------|--------|
| 1 | 0.005 |

The reference for this requirement is TS 25.101 [1] clause 8.13A.1.

7.12A.3 Test purpose

To verify that average probability of missed E-AI detection (1-Pde) does not exceed specified value.

7.12A.4 Method of test

7.12A.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS and AWGN noise source to the UE antenna connector as shown in figure A.9. In case of UE-receive diversity connect according to figure A.26.
- 2) Set the test parameters for test 1 as specified in tables 7.12A.4 and 7.12A.5. Power of downlink channels other than AICH are as defined in Table E.3.3.1 of Annex E.

Table 7.12A.3: UE parameters for E-AI test

| Parameter | Unit | Set 1 |
|---|------|-------|
| Maximum number of preamble ramping cycles(Mmax) | | 2 |
| Maximum number of preambles in one preamble cycle (preamble retrans max) | | 12 |
| Back-off time (Tb01=10ms*NB01) (NB01min=NB01max=10) | ms | 100 |
| Power ramp step when no acquisition indicator is received (power offset p0) | dB | 3 |

Table 7.12A.4: SS parameters for E-AI test

| Parameter | Unit | Value |
|--|------|-------|
| Primary CPICH DL TX power | dBm | -8 |
| UL interference | dBm | -82 |
| SIR in open loop power control (Constant value) | dB | -10 |

See reference TS25.331 [8] clause 8.5.7 Open loop power control to calculate Pinitial. See also reference TS25.214 [5] subclause 6 step 6.3.

7.12A.4.2 Procedure

- 1) The UE is switched on.
- 2) The SS and the UE shall perform location registration procedure as specified in TS34.108 [3] clause 7.2.2. UE parameters are set as defined in table 7.12A.3 Set 1 by modification of system information block 5.
- 3) SS sends the Paging type 1 message in idle mode with used paging identity being a CN identity and including the UE's assigned IMSI.
- 4) UE starts transmitting RACH preambles at level P=Pinitial.
- 5) SS responds with AI signature containing NACK in AICH and (-1) on E-AI corresponding to ACK on E-AICH. For E-AI SS can use any signature.

- 6) If UE stops sending preambles, and transmits a E-DCH on default resource block in CELL_FACH state then this is an indication that UE has falsely detected NACK on AI as ACK. However SS is not counting this as a false sample and tester goes back to step 3.
- 7) If UE sends another preamble then this is an indication that UE has falsely detected NACK on AI as No ACK/NACK. However SS is not counting this as a false sample and tester goes back to step 5.
- 8) If UE transmits a E-DCH on some other resource block than on a default value then this is an indication that UE has received correctly AI. Then tester checks whether the used E-DCH resource block corresponds to (-1) on transmitted E-AI signature or to some other combination of E-AI and signature using the E-AI resource configuration mapping table as specified in TS 25.211 [19] clause 5.3.3.7. If the used resource block corresponds (-1) on transmitted signature then a success for calculating Pde is recorded. Otherwise a failure for calculating Pde is recorded.
- 9) Repeat steps 3-8 according to Annex F.6.2 table 6.2.8.

Specific Message Contents

All messages indicated above shall use the same content as described in the default message content in clause 9 of TS 34.108 [3] and clause 6.1.0b of 34.108 [3], with the following exceptions:

SYSTEM INFORMATION BLOCK TYPE1

| Information Element | Value/remark |
|--|--------------|
| - UE timers and constants in idle mode | |
| - T300 | 1000 ms |

SYSTEM INFORMATION BLOCK TYPE5

| Information Element | Value/remark |

| AICH Power Offset | -12 |

7.12A.5 Test requirements

For the parameters specified in Table 7.12A.5 the 1-Pde shall not exceed the specified value in Table 7.12A.6. The power settings for downlink channels other than AICH and E-AICH are set as defined in Table E.3.3.1 of Annex E.

Table 7.12A.5: Parameters for E-AI detection

| Parameter | Unit | Test 1 |
|---|--------------|---------|
| Phase reference | - | P-CPICH |
| I_{oc} | dBm/3.84 MHz | -60 |
| Number of other transmitted AI signatures on AICH | - | 0 |
| Number of resources assumed for E-DCH random access | - | 32 |
| \hat{I}_{or}/I_{oc} | dB | -0.6 |
| AICH_Ec/Ior | dB | -22.0 |
| AICH Power Offset | dB | -12.0 |
| E-AICH_Ec/Ior | dB | -22.0 |
| E-AICH Power Offset | dB | -12.0 |
| Propagation condition | - | Static |

Table 7.12A.6: Test requirements for E-AI detection

| Test Number | 1- Pde |
|-------------|--------|
| 1 | 0.005 |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

7.13 UE UL power control operation with discontinuous UL DPCCH transmission operation

7.13.1 Definition and applicability

This test verifies that the UE follows only those TPC commands that correspond to the UL DPCCH slots which are transmitted.

The requirements and this test apply to all types of UTRA for the FDD UE for Release 7 and later releases supporting Discontinuous UL DPCCH transmission.

Editor's note: This test case is not complete

7.13.2 Minimum requirement

Test parameters are specified in Table 7.13.1. The discontinuous UL DPCCH transmission is enabled during the test. The parameters for discontinuous UL DPCCH transmission operation are as specified in Table C.4.3.1. Before the start of the tests, the UE transmit power shall be initialised to -15 dBm. An actual UE transmit power may vary from the target level of -15 dBm due to inaccurate UE output power step.

After transmission gaps due to discontinuous uplink DPCCH transmission the uplink transmitter power difference shall be within the range as defined in Table 7.13.2. The transmit power difference is defined as the difference between the power of the last slot transmitted before the gap and the power of first slot transmitted after the gap. The on power observation period is defined as the mean power over one timeslot excluding any transient periods.

Table 7.13.1: Parameters for UE UL power control operation with discontinuous UL DPCCH transmission

| Parameter | Unit | Test 1 |
|---|--------------|--|
| Phase reference | - | P-CPICH |
| HS-SCCH_1 E_c/I_{or} | dB | -10 |
| F-DPCH E_c/I_{or} | dB | -10 |
| F-DPCH slot format | - | 0 |
| I_{or1} | dBm/3.84 MHz | -60 |
| Power-Control-Algorithm | - | Algorithm 1 |
| UL Power Control step size, ΔTPC | dB | 1 |
| Uplink TPC commands corresponding to the UL DPCCH slots which are transmitted | - | {0,1,0,1,0,1 } Note 1 |
| Propagation condition | - | Static without AWGN source I_{oc} |
| NOTE 1: The sequence of uplink TPC commands corresponds to the UL DPCCH slots that are transmitted. During those slots which correspond to UL DPCCH slots that are not transmitted, UP-commands shall be transmitted. | | |

Table 7.13.2: Minimum requirements for UE UL power control operation with discontinuous UL DPCCH transmission

| Parameter | Unit | Test 1 | |
|--------------------------------------|------|--------|-------|
| | | Lower | Upper |
| UE output power difference tolerance | dB | -2 | +4 |

The reference for this requirement is TS 25.101 [1] clause 8.14.1.

7.13.3 Test purpose

To verify that the UE follows only those TPC commands that correspond to the UL DPCCH slots which are transmitted.

7.13.4 Method of test

7.13.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

1. Connect the SS and AWGN noise source to the UE antenna connector as shown in figure A.9. In case of UE-receive diversity connect according to figure A.26.
2. Set up a HSDPA call according to the call setup procedure specified in TS 34.108 [3] clause 7.3.11 with levels according to Table E.5D.0.
3. Set the test parameters for the test as specified in tables 7.13.1. Power of downlink channels other than F-DPCH and HS-SCCH are as defined in Table E.5D.1.
4. Set the uplink DPCH power control parameters to use Algorithm 1 with a step size of 1 dB and the uplink HS-DPCCH to be discontinuous as specified in Table C.4.3.1.

See TS 34.108 [3] for details regarding generic call setup procedure.

7.13.4.2 Procedure

1. After call set up generate suitable TPC commands from the SS to set the output power of the UE, measured at the UE antenna connector, to be in the range -15 dBm +2 dB. This is a nominal setting and not part of the test requirements.
2. SS shall not send any data on HS-DSCH.
3. SS then sends UP/DOWN/UP/DOWN TPC pattern as specified in Table 7.13.3 during those slots which correspond to UL DPCH slots that are transmitted. During those slots which correspond to UL DPCH slots that are not transmitted the SS shall send UP commands to the UE.

NOTE: Test requirements assume that SS sends UP command during the slot which corresponds to the first UL DPCH slot which is transmitted after the gap. The SS implementation of this feature may require further studies.

4. The SS shall measure the uplink transmitter power difference. The transmit power difference is defined as the difference between the power of the last slot transmitted before the gap and the power of the first slot transmitted after the gap. The on power observation period is defined as the mean power over one timeslot excluding any transient periods.
5. The measured uplink transmitter power difference shall be within the range as defined in Table 7.13.4.

Specific Message Contents

All message indicated above shall use the same content as described in the default message content in clause 9 of TS 34.108 [3] with the following exceptions.

| Propagation condition | - | Static without AWGN source I_{oc} |
| NOTE 1: The sequence of uplink TPC commands corresponds to the UL DPCCCH slots that are transmitted. During those slots which correspond to UL DPCCCH slots that are not transmitted, UP-commands shall be transmitted. | | |

Table 7.13.4: Test requirements for UE UL power control operation with discontinuous UL DPCCCH transmission

| Parameter | Unit | Test 1 | |
|--------------------------------------|------|--------|--------|
| | | Lower | Upper |
| UE output power difference tolerance | dB | -[2.3] | +[4.3] |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

8 Requirements for support of RRM

8.1 General

The cell configuration mapping between cells as defined in TS 34.121-1 and cells as defined in TS 34.108 [3] section 6.1.4 is described in Annex K. E-UTRA cells are defined in TS 36.521-3 [38] and 36.508 [33].

When DCCH has been configured on downlink DCH then DCCH Data shall be continuously transmitted on downlink DCH. When there is no signalling to transmit on downlink DCCH then dummy DCCH transmission as described in Annex C.9 shall be used.

The MAC header transmission on HS-DSCH for all E-DCH test cases shall use a correct MAC-hs header consistent with the actual HSDPA transmission.

For HSDPA test cases without E-DCH, the MAC headers on HS-DSCH shall be according to Annex C.9A.

The DL and UL RLC SDU size for all E-DCH tests in clause 8 shall be set according to Annex C.11.3.

For MBMS test cases which require invalid MAC header to be transmitted during the test, the configuration of invalid MAC header for MTCH transmission shall use the value "1111" for the MBMS-Id field. The UE shall discard PDU's with this invalid MAC header according TS 25.321 [13] section 10.

For the UE which supports both Band I and Band VI operating frequencies, the inter-frequency requirements for Band VI shall apply to the multi-band UE by measuring a Band I frequency while in Band VI to prevent interference. Otherwise, the Band VI inter-frequency requirements cannot be tested.

Parameters given in table 8.1 will be used throughout this section, unless otherwise stated by the test case.

Table 8.1: Test parameters for UTRAN Cell (FDD)

| Parameter | Unit | UTRAN Cells |
|-----------|------|-------------|
| Qrxlevmin | dBm | -115 |

For testing a UE with multiple UTRA receive diversity antenna connectors, test signals from each cell shall be generated with independent fading and applied to each antenna port. For each carrier frequency specified in the test case, independent noise shall be generated and applied to each antenna port. The received power spectral density at each antenna connector n , denoted as $\hat{I}_{or,n}$ shall be the same as to the received power spectral density \hat{I}_{or} specified for testing a UE with a single antenna connector. The noise spectral density at each antenna connector n , denoted as $I_{oc,n}$ shall be the same as the noise spectral density I_{oc} specified for testing a UE with a single antenna connector.

8.1.1 Definition of Additive White Gaussian Noise (AWGN) Interferer

See clause D.1.1.

8.2 Idle Mode Tasks

8.2.1 Cell Selection

Void.

8.2.2 Cell Re-Selection

8.2.2.1 Scenario 1: Single carrier case

8.2.2.1.1 Definition and applicability

The cell re-selection delay is defined as the time from a change of cell levels to the moment when this change makes the UE camp on a new cell, and starts to send preambles on the PRACH for the RRC CONNECTION REQUEST message to perform a Location Updating procedure (MM) or Routing Area Updating procedure (GMM) on the new cell.

The requirements and this test apply to the FDD UE.

8.2.2.1.2 Minimum requirement

The cell re-selection delay shall be less than 8 s with a DRX cycle length of 1.28 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90% with a confidence level of 95 %.

NOTE: The cell re-selection delay can be expressed as: $T_{\text{evaluateFDD}} + T_{\text{SI}}$, where:

| | |
|--------------------------|---|
| $T_{\text{evaluateFDD}}$ | See table 4.1 in TS 25.133 [2] clause 4.2.2. |
| T_{SI} | Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell. 1280 ms is assumed in this test case. |

This gives a total of 7.68 s, allow 8s in the test case.

The normative reference for this requirement is TS 25.133 [2] clauses 4.2.2.2 and A.4.2.1.

8.2.2.1.3 Test purpose

To verify that the UE meets the minimum requirement.

8.2.2.1.4 Method of test

8.2.2.1.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

This scenario implies the presence of 1 carrier and 6 cells as given in tables 8.2.2.1.1 to 8.2.2.1.3. The UE is requested to monitor neighbouring cells on 1 carrier. The maximum repetition period of the relevant system info blocks that needs to be received by the UE to camp on a cell shall be 1 280 ms. Cell 1 and cell 2 shall belong to different Location Areas.

Table 8.2.2.1.1: Scenario 1: General test parameters for Cell Re-selection single carrier multi-cell case

| Parameter | | Unit | Value | Comment |
|---|-----------------|------|--|---|
| Initial condition | Active cell | | Cell2 | |
| | Neighbour cells | | Cell1, Cell3, Cell4, Cell5, Cell6 | |
| Final condition | Active cell | | Cell1 | |
| SYSTEM INFORMATION BLOCK TYPE 1 - CN common GSM-MAP NAS system information | | - | 00 80(H) → Cell 1 00 81(H) → Cell 2 | This identity should be set as different value from the neighbour cell so that a Location Updating procedure(MM) or a Routing Area Updating procedure(GMM) is performed when UE selects more suitable cell in idle state. |
| Access Service Class (ASC#0) - Persistence value | | - | 1 | Selected so that no additional delay is caused by the random access procedure. The value shall be used for all cells in the test. |
| HCS | | | | Not used |
| T_{SI} | | ms | 1280 | See Annex I for the SIB repetition period of system information blocks. |
| DRX cycle length | | s | 1,28 | The value shall be used for all cells in the test. |
| T1 | | s | 15 | T1 need to be defined so that cell re-selection reaction time is taken into account. |
| T2 | | s | 15 | T2 need to be defined so that cell re-selection reaction time is taken into account. |

NOTE 1: The nominal \hat{I}_{or} values, although not explicitly defined in 25.133 [2] are added here since they are implied and need to be identified so that the test equipment can be configured.

8.2.2.1.4.2 Procedure

- 1) The SS activates cell 1-6 with T1 defined parameters in table 8.2.2.1.3 and monitors cell 1 and 2 for random access requests from the UE.
- 2) The UE is switched on.
- 3) The SS and the UE shall perform a first registration procedure on cell2.
- 4) 15 s after step 3 has completed, the parameters are changed to that as described for T2 in table 8.2.2.1.3.
- 5) The SS waits for random access requests from the UE. If the UE responds on cell 1 within 8 s from the beginning of time period T2 then the number of successful tests is increased by one. The SS and the UE shall perform a Location Updating procedure (MM) or a Routing Area Updating procedure (GMM) on cell1.
- 6) After 15 s from the beginning of time period T2, the parameters are changed to that as described for T1 in table 8.2.2.1.3.
- 7) The SS waits for random access requests from the UE. If the UE responds on cell 2 within 8 s from the beginning of time period T1 then the number of successful tests is increased by one. The SS and the UE shall perform a Location Updating procedure(MM) or a Routing Area Updating procedure (GMM) on cell2.
- 8) After 15 s from the beginning of time period T1, the parameters are changed to that as described for T2.
- 9) Repeat step 5) to 8) until the confidence level according to annex F.6.2 is achieved.

NOTE 1: The time required for receiving all the relevant system information data according to the reception procedure and the RRC procedure delay of system information blocks defined in 25.331 for a UTRAN cell. Since the maximum time to read the relevant system info blocks that needs to be received by the UE to camp on a cell is 1420ms (see note 2) and the maximum RRC procedure delay for reception system information block is 100ms, 1520 ms is assumed in this test case. Therefore this gives a total of 7.92s.(Minimum requirement + 240ms), allow 8s in the test case.

NOTE 2: The maximum repetition period of the relevant system info blocks that needs to be received by the UE to camp on a cell is 1280ms. The Master Information Block (MIB) is repeated every 8 frame and SIB5 (and SIB11) is segmented into 4 segments where the first segment is scheduled adjacent to the MIB at SIB_POS=40 and the other three segments are scheduled after the MIB (SIB_POS=42, 44 and 46). The maximum time for a UE to read SIB5 will occur if the UE start reading the BCH at the SFN after the MIB located prior to the first segment of SIB5 (SIB_POS 32). Then the UE will not be able to read SIB5 until the second occurrence of SIB5, which will happen at SIB_POS 46 + 1280ms. This gives that the maximum time for the UE to read the relevant system info will be 1420ms ((SIB_POS 46 – SIB_POS 32)*10ms +1280ms).

8.2.2.1.5 Test requirements

For the test to pass, the total number of successful attempts shall be more than 90% of the cases with a confidence level of 95 %.

Table 8.2.2.1.3: Scenario 1: Test requirements for Cell re-selection single carrier multi cell

| Parameter | Unit | Cell 1 | | Cell 2 | | Cell 3 | | Cell 4 | | Cell 5 | | Cell 6 | |
|--------------------------------|----------------------|----------|-------|----------|-------|----------|----|----------|----|----------|----|----------|----|

| \hat{I}_{or} | dBm | -63.0 | -59.6 | -59.6 | -63.0 | -69.7 | | -69.7 | | -69.7 | | -69.7 | |
| I_{oc} | dBm / 3,84 MHz | -70 | | | | | | | | | | | |
| CPICH_Ec/I _o Note 1 | dB | -15.7 | -12.3 | -12.3 | -15.7 | -23.5 | | -23.5 | | -23.5 | | -23.5 | |

All other parameters and conditions specified in table 8.2.2.1.2 are unchanged.

NOTE 1: These parameters are not directly settable, but are derived by calculation from the settable parameters.

NOTE 2: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

8.2.2.2 Scenario 2: Multi carrier case

8.2.2.2.1 Definition and applicability

The cell re-selection delay is defined as the time from a change of cell levels to the moment when this change makes the UE camp on a new cell, and starts to send preambles on the PRACH for the RRC CONNECTION REQUEST message to perform a Location Updating procedure(MM) or Routing Area Updating procedure (GMM) on the new cell.

The requirements and this test apply to the FDD UE.

8.2.2.2.2 Minimum requirement

The cell re-selection delay shall be less than 8 s with a DRX cycle length of 1.28 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90% with a confidence level of 95 %.

NOTE: The cell re-selection delay can be expressed as: $T_{\text{evaluateFDD}} + T_{\text{SI}}$, where:

| | |
|--------------------------|---|
| $T_{\text{evaluateFDD}}$ | See table 4.1 in TS 25.133 [2] clause 4.2.2. |
| T_{SI} | Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell. 1280 ms is assumed in this test case. |

This gives a total of 7.68 s, allow 8s in the test case.

The normative reference for this requirement is TS 25.133 [2] clauses 4.2.2.3 and A.4.2.2.

8.2.2.2.3 Test purpose

To verify that the UE meets the minimum requirement.

8.2.2.2.4 Method of test

8.2.2.2.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

This scenario implies the presence of 2 carriers and 6 cells as given in tables 8.2.2.2.1 to 8.2.2.2.3. The UE is requested to monitor neighbouring cells on 2 carriers. The maximum repetition period of the relevant system info blocks that needs to be received by the UE to camp on a cell shall be 1 280 ms. Cell 1 and cell 2 shall belong to different Location Areas.

Table 8.2.2.2.1: Scenario 2: General test parameters for Cell Re-selection in multi carrier case

| Parameter | Unit | Value | Comment |
|---|-----------------|--|---|
| Initial condition | Active cell | Cell2 | |
| | Neighbour cells | Cell1, Cell3, Cell4, Cell5, Cell6 | |
| Final condition | Active cell | Cell1 | |
| SYSTEM INFORMATION BLOCK TYPE 1 - CN common GSM-MAP NAS system information | - | 00 80(H) → Cell 1 00 81(H) → Cell 2 | This identity should be set as different value from the neighbour cell so that a Location Updating procedure (MM) or a Routing Area Updating procedure (GMM) is performed when UE selects more suitable cell in idle state. |
| Access Service Class (ASC#0) - Persistence value | - | 1 | Selected so that no additional delay is caused by the random access procedure. The value shall be used for all cells in the test. |
| HCS | | | Not used |

NOTE 1 The nominal \hat{I}_{or} values, although not explicitly defined in 25.133 [2] are added here since they are implied and need to be identified so that the test equipment can be configured.

8.2.2.2.4.2 Procedures

- 1) The SS activates cell 1-6 with T1 defined parameters in table 8.2.2.2.3 and monitors cell 1 and 2 for random access requests from the UE.
- 2) The UE is switched on.
- 3) The SS and the UE shall perform a first location registration procedure on cell2.
- 4) 30 s after step3 has completed, the parameters are changed to that as described for T2 in table 8.2.2.2.3.
- 5) The SS waits for random access request from the UE. If the UE responds on cell 1 within 8 s from the beginning of time period T2 then the number of successful tests is increased by one. The SS and the UE shall perform a Location Updating procedure (MM) or a Routing Area Updating procedure (GMM) on cell1.
- 6) After another 15 s from the beginning of time period T2, the parameters are changed to that as described for T1 in table 8.2.2.2.3.
- 7) The SS waits for random access requests from the UE. If the UE responds on cell 2 within 8 s from the beginning of time period T1 then the number of successful tests is increased by one. The SS and the UE shall perform a Location Updating procedure (MM) or a Routing Area Updating procedure (GMM) on cell2.
- 8) After 15 s from the beginning of time period T1, the parameters are changed as described for T2.
- 9) Repeat step 5) to 8) until the confidence level according to annex F.6.2 is achieved.

NOTE 1: T1 is initially 30 s to allow enough time for the UE to search for cells as it has no prior knowledge of these.

NOTE 2: The time required for receiving all the relevant system information data according to the reception procedure and the RRC procedure delay of system information blocks defined in 25.331 for a UTRAN cell. Since the maximum time to read the relevant system info blocks that needs to be received by the UE to camp on a cell is 1420ms (see note 3) and the maximum RRC procedure delay for reception system information block is 100ms, 1520 ms is assumed in this test case. Therefore this gives a total of 7.92s (Minimum requirement + 240ms), allow 8s in the test case.

NOTE 3: The maximum repetition period of the relevant system info blocks that needs to be received by the UE to camp on a cell is 1280ms. The Master Information Block (MIB) is repeated every 8 frame and SIB5 (and SIB11) is segmented into 4 segments where the first segment is scheduled adjacent to the MIB at SIB_POS=40 and the other three segments are scheduled after the MIB (SIB_POS=42, 44 and 46). The maximum time for a UE to read SIB5 will occur if the UE start reading the BCH at the SFN after the MIB located prior to the first segment of SIB5 (SIB_POS 32). Then the UE will not be able to read SIB5 until the second occurrence of SIB5, which will happen at SIB_POS 46 + 1280ms. This gives that the maximum time for the UE to read the relevant system info will be 1420ms ((SIB_POS 46 – SIB_POS 32)*10ms +1280ms).

8.2.2.2.5 Test requirements

For the test to pass, the total number of successful tests shall be more than 90% of the cases with a confidence level of 95 %.

Table 8.2.2.3: Scenario 2: Test parameters for Cell re-selection multi carrier multi cell

| Parameter | Unit | Cell 1 | | Cell 2 | | Cell 3 | | Cell 4 | | Cell 5 | | Cell 6 | |

All other parameters and conditions specified in table 8.2.2.2 are unchanged.

NOTE 1: These parameters are not directly settable, but are derived by calculation from the settable parameters.

NOTE 2: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

8.2.3 UTRAN to GSM Cell Re-Selection

8.2.3.1 Scenario 1: Both UTRA and GSM level changed

8.2.3.1.1 Definition and applicability

The cell re-selection delay is defined as the time from a change of cell levels to the moment when this change makes the UE camp on a new cell and starts to send the RR Channel Request message for location update to the new cell.

The requirements and this test apply to the combined FDD and GSM UE.

8.2.3.1.2 Minimum requirement

The cell re-selection delay shall be less than $26\text{ s} + T_{\text{BCCH}}$, where T_{BCCH} is the maximum time allowed to read BCCH data from GSM cell, see TS 05.08 [20] for R99 and TS 45.008 [30] for Rel-4 and later releases.

The rate of correct cell reselections observed during repeated tests shall be at least 90% with a confidence level of 95 %.

NOTE: The cell re-selection delay can be expressed as: $4 * T_{\text{measureGSM}} + T_{\text{BCCH}}$, where:

| | |
|-------------------------|---|
| $T_{\text{measureGSM}}$ | See table 4.1 in TS 25.133 [2] clause 4.2.2. |
| T_{BCCH} | Maximum time allowed to read BCCH data from GSM cell, see TS 05.08 [20] for R99 and TS 45.008 [30] for Rel-4 or later releases. According to [20] and [30], the maximum time allowed to read the BCCH data, when being synchronized to a BCCH carrier, is 1.9 s. |

This gives a total of $25.6\text{ s} + T_{\text{BCCH}}$, allow $26\text{ s} + T_{\text{BCCH}}$ in the test case.

The normative reference for this requirement is TS 25.133 [2] clauses 4.2.2 and A.4.3.1.

8.2.3.1.3 Test purpose

To verify that the UE meets the minimum requirement.

8.2.3.1.4 Method of test

8.2.3.1.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

This scenario implies the presence of 1 UTRAN serving cell, and 1 GSM cell to be re-selected, as given in tables 8.2.3.1.1 to 8.2.3.1.5. The UE is requested to monitor neighbouring cells on 1 UMTS carrier and 12 GSM cells. Cell 1 and cell 2 shall belong to different Location Areas.

Specific 2 quarter Message Contents

All messages indicated shall use the same content as described in the default message content in TS 05.08 [20] clause 9 for R99 and in TS45.008 [30] clause 9 for Rel-4 and later releases, with the above exceptions.

8.2.3.1.4.2 Procedure

- 1) The SS activates cell 1 and 2 with T1 defined parameters in tables 8.2.3.1.4 and 8.2.3.1.5 and monitors cell 1 and 2 for random access requests from the UE.
- 2) The UE is switched on.
- 3) The SS and the UE shall perform a location registration procedure on cell 1.
- 4) After 45 s from the end of step 3, the parameters are changed as described for T2 in tables 8.2.3.1.4 and 8.2.3.1.5.
- 5) The SS waits for a location registration procedure from the UE. If the UE begins transmitting on cell 2 within 27.9 s then the number of successful tests is increased by one.
- 6) After 35 s from the beginning of T2, the parameters are changed as described for T1 in tables 8.2.3.1.4 and 8.2.3.1.5.
- 7) The SS and the UE shall perform a location registration procedure on cell 1.
- 8) After 45 s from the end of step 6, the parameters are changed as described for T2 in tables 8.2.3.1.4 and 8.2.3.1.5.

9) Repeat step 5) to 8) until the confidence level according to annex F.6.2 is achieved.

8.2.3.1.5 Test requirements

Table 8.2.3.1.4: Scenario 1: Cell re-selection UTRAN to GSM cell case (cell 1), test requirements

Table 8.2.3.1.5: Scenario 1: Cell re-selection UTRAN to GSM cell case (cell 2), test requirements

| Parameter | Unit | Cell 2 (GSM) | |
|----------------------------|------|--|-----|
| | | T1 | T2 |
| Absolute RF Channel Number | | BCCH ARFCN of cell A as defined in the initial conditions in clause 26.6.5.1 of TS 51.010-1 [25] for the GSM band under test. BCCH ARFCN is 744 for FDD Band II and PCS1900 under test. BCCH ARFCN is 241 for FDD Band V, VI or XIX and GSM850 under test. BCCH ARFCN is 114 for FDD Band VIII and GSM900 under test. | |
| RXLEV | dBm | -91 | -74 |
| RXLEV_ACCESS_MIN | dBm | -104 | |
| MS_TXPWR_MAX_CCH | dBm | 33 | |
| FDD_Qmin | dB | -14 | |
| Qsearch_I | - | always | |

NOTE 1: CPICH_Ec/Io and CPICH_RSCP levels have been calculated from other parameters for information purposes. They are not settable parameters themselves.

For the test to pass, the total number of successful tests shall be at least 90% of the cases with a confidence level of 95 %.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

8.2.3.2 Scenario 2: Only UTRA level changed

8.2.3.2.1 Definition and applicability

The cell re-selection delay is defined as the time from a change of cell levels to the moment when this change makes the UE camp on a new cell and starts to send the RR Channel Request message for location update to the new cell.

The requirements and this test apply to the combined FDD and GSM UE.

8.2.3.2.2 Minimum requirement

The cell re-selection delay shall be less than $7.7 \text{ s} + T_{\text{BCCH}}$, where T_{BCCH} is the maximum time allowed to read BCCH data from GSM cell, see TS 05.08 [20] for R99 and TS 45.008 [30] for Rel-4 and later releases.

The rate of correct cell reselections observed during repeated tests shall be at least 90% with a confidence level of 95 %.

NOTE: The cell re-selection delay can be expressed as: $\text{Max}(3 * T_{\text{measureFDD}}, T_{\text{measureGSM}} + \text{DRX cycle length}) + T_{\text{BCCH}}$, where:

| | |
|-------------------------|--|
| $T_{\text{measureFDD}}$ | See table 4.1 in TS 25.133 [2] clause 4.2.2. |
| $T_{\text{measureGSM}}$ | See table 4.1 in TS 25.133 [2] clause 4.2.2. |
| DRX cycle length | 1.28s see Table A.4.7.A in TS 25.133 [2] clause A.4.3.2. |
| T_{BCCH} | Maximum time allowed to read BCCH data from GSM cell, see TS 05.08 [20] for R99 and TS 45.008 [30] for Rel-4 and later releases. According to [20] and [30], the maximum time allowed to read the BCCH data, when being synchronized to a BCCH carrier, is 1.9 s. |

This gives a total of $7.68 \text{ s} + T_{\text{BCCH}}$, allow $7.7 \text{ s} + T_{\text{BCCH}}$ in the test case.

The normative reference for this requirement is TS 25.133 [2] clauses 4.2.2 and A.4.3.2.

8.2.3.2.3 Test purpose

To verify that the UE meets the minimum requirement.

8.2.3.2.4 Method of test

8.2.3.2.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

This scenario implies the presence of 1 UTRAN serving cell, and 1 GSM cell to be re-selected, as given in tables 8.2.3.2.1 to 8.2.3.2.5. The UE is requested to monitor neighbouring cells on 1 UMTS carrier and 12 GSM cells. Cell 1 and cell 2 shall belong to different Location Areas.

Specific 2 quarter Message Contents

All messages indicated shall use the same content as described in the default message content in TS 05.08 [20] clause 9 for R99 and in TS45.008 [30] clause 9 for Rel-4 and later releases, with the above exceptions.

8.2.3.2.4.2 Procedure

- 1) The SS activates cell 1 and 2 with T1 defined parameters in tables 8.2.3.2.4 and 8.2.3.2.5 and monitors cell 1 and 2 for random access requests from the UE.
- 2) The UE is switched on.
- 3) The SS and the UE shall perform a location registration procedure on cell 1.
- 4) After 45 s from the end of step 3, the parameters are changed as described for T2 in tables 8.2.3.2.4 and 8.2.3.2.5.
- 5) The SS waits for a location registration procedure from the UE. If the UE begins transmitting on cell 2 within 9.6 s then the number of successful tests is increased by one.
- 6) After 12 s from the beginning of T2, the parameters are changed as described for T1 in tables 8.2.3.2.4 and 8.2.3.2.5.
- 7) The SS and the UE shall perform a location registration procedure on cell 1.
- 8) After 45 s from the end of step 6, the parameters are changed as described for T2 in tables 8.2.3.2.4 and 8.2.3.2.5.

9) Repeat step 5) to 8) until the confidence level according to annex F.6.2 is achieved.

8.2.3.2.5 Test requirements

| RXLEV_ACCESS_MIN | dBm | -104 | |
| MS_TXPWR_MAX_CCH | dBm | 33 | |
| Qsearch_I | - | always | |

NOTE 1: CPICH_Ec/Io and CPICH_RSCP levels have been calculated from other parameters for information purposes. They are not settable parameters themselves.

For the test to pass, the total number of successful tests shall be at least 90% of the cases with a confidence level of 95%.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

8.2.3.3 Scenario 3: HCS with only UTRA level changed

8.2.3.3.1 Definition and applicability

The cell re-selection delay is defined as the time from a change of cell levels to the moment when this change makes the UE camp on a new cell and starts to send the RR Channel Request message for location update to the new cell.

The requirements and this test apply to Release 6 and later releases for the combined FDD and GSM UE.

8.2.3.3.2 Minimum requirement

The cell re-selection delay shall be less than $37.7 \text{ s} + T_{\text{BCCH}}$, where T_{BCCH} is the maximum time allowed to read BCCH data from GSM cell, see TS 45.008 [30].

The rate of correct cell reselections observed during repeated tests shall be at least 90% with a confidence level of 95 %.

NOTE: The cell re-selection delay can be expressed as: $30 \text{ s} + T_{\text{measureGSM}} + \text{DRX cycle length} + T_{\text{BCCH}}$, where:

| | |
|-------------------------|--|
| $T_{\text{measureFDD}}$ | See Table 4.1 in TS 25.133 [2] clause 4.2.2. |
| $T_{\text{measureGSM}}$ | See Table 4.1 in TS 25.133 [2] clause 4.2.2. |
| DRX cycle length | 1.28s see Table A.4.7.D in TS 25.133 [2] clause A.4.3.3. |
| T_{BCCH} | Maximum time allowed to read BCCH data from GSM cell, see TS 45.008 [30]. According to [20] and [30], the maximum time allowed to read the BCCH data, when being synchronized to a BCCH carrier, is 1.9 s. |

This gives a total of $37.68 \text{ s} + T_{\text{BCCH}}$, allow $37.7 \text{ s} + T_{\text{BCCH}}$ in the test case.

The normative reference for this requirement is TS 25.133 [2] clauses 4.2.2 and A.4.3.3.

8.2.3.3.3 Test purpose

To verify that the UE meets the minimum requirement.

8.2.3.3.4 Method of test

8.2.3.3.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

This scenario implies the presence of 1 UTRAN serving cell, and 1 GSM cell to be re-selected, as given in tables 8.2.3.3.1 to 8.2.3.3.5. The UE is requested to monitor neighbouring cells on 1 UMTS carrier and 12 GSM cells. Cell 1 and cell 2 shall belong to different Location Areas.

Table 8.2.3.3.1: Scenario 3: General test parameters for UTRAN to GSM Cell Re-selection

Specific 2 quarter Message Contents

All messages indicated shall use the same content as described in the default message content in TS45.008 [30] clause 9, with the above exceptions.

8.2.3.3.4.2 Procedure

- 1) The SS activates cell 1 and 2 with T1 defined parameters in tables 8.2.3.3.4 and 8.2.3.3.5 and monitors cell 1 and 2 for random access requests from the UE.
- 2) The UE is switched on.
- 3) The SS and the UE shall perform a location registration procedure on cell 1.
- 4) After 45 s from the end of step 3, the parameters are changed as described for T2 in tables 8.2.3.3.4 and 8.2.3.3.5.
- 5) The SS waits for a location registration procedure from the UE. If the UE begins transmitting on cell 2 within 39.6 s then the number of successful tests is increased by one.

- 6) After 45 s from the beginning of T2, the parameters are changed as described for T1 in tables 8.2.3.3.4 and 8.2.3.3.5.
- 7) The SS and the UE shall perform a location registration procedure on cell 1.
- 8) After 45 s from the end of step 6, the parameters are changed as described for T2 in tables 8.2.3.3.4 and 8.2.3.3.5.
- 9) Repeat step 5) to 8) until the confidence level according to annex F.6.2 is achieved.

Specific Message Contents

All messages indicated above shall use the same content as described in the default message content in clause 6.1.0b of 34.108 [3], with the above and the following exceptions:

| Absolute RF Channel Number | | BCCH ARFCN of cell A as defined in the initial conditions in clause 26.6.5.1 of TS 51.010-1 [25] for the GSM band under test. BCCH ARFCN is 744 for FDD Band II and PCS1900 under test. BCCH ARFCN is 241 for FDD Band V, VI or XIX and GSM850 under test. BCCH ARFCN is 114 for FDD Band VIII and GSM900 under test. | |
| RXLEV | dBm | -81 | -79 |
| RXLEV_ACCESS_MIN | dBm | -104 | |
| MS_TXPWR_MAX_CCH | dBm | 33 | |
| Qsearch_I | - | always | |

NOTE 1: CPICH_Ec/Io and CPICH_RSCP levels have been calculated from other parameters for information purposes. They are not settable parameters themselves.

For the test to pass, the total number of successful tests shall be at least 90% of the cases with a confidence level of 95 %.

NOTE 2: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

8.2.4 FDD/TDD Cell Re-selection

8.2.4.1 Definition and applicability

The cell re-selection delay is defined as the time from the cell quality levels change to the moment when this change makes the UE reselect a better ranked cell, and starts to send the RRC CONNECTION REQUEST message to perform a Location Registration on the new cell.

This test is for the case where the UE camps on an FDD cell and reselects to a TDD cell.

The requirements and this test apply to UEs supporting both FDD and TDD.

8.2.4.1.1 3.84 Mcps TDD Option

The cell re-selection delay is defined as the time from the cell quality levels change to the moment when this change makes the UE reselect a better ranked cell, and starts to send the RRC CONNECTION REQUEST message to perform a Location Registration on the new cell.

This test is for the case where the UE camps on an FDD cell and reselects to a 3.84Mcps TDD cell.

The requirements and this test apply to UEs supporting both FDD and 3.84Mcps TDD.

8.2.4.1.2 1.28 Mcps TDD Option

The cell re-selection delay is defined as the time from the cell quality levels change to the moment when this change makes the UE reselect a better ranked cell, and starts to send SYNCH-UL sequence in the UpPTS for sending RRC CONNECTION REQUEST message to perform a Location Registration on the new cell.

This test is for the case where the UE camps on a FDD cell and reselects to a 1.28Mcps TDD cell.

The requirements and this test apply to UEs supporting both FDD and 1.28Mcps TDD.

8.2.4.2 Minimum requirement

The cell re-selection delay shall be less than 8 s with a DRX cycle length of 1,28 s. This shall be verified in more than 90 % of the cases with a confidence level of 95 %.

The normative reference for this requirement is TS 25.133 [2] clauses 4.2.2.4 and A.4.4.

8.2.4.3 Test purpose

To verify that the UE meets the minimum requirement for the case where the UE camps on an FDD cell and reselects to a TDD cell.

8.2.4.4 Method of test

8.2.4.4.1 Initial conditions

8.2.4.4.1.1 3.84 Mcps TDD Option

This scenario implies the presence of UTRA FDD and 1 3.84Mcps TDD cell as given in tables 8.2.4.1, 8.2.4.2 and 8.2.4.3. The maximum repetition period of the relevant system information blocks that need to be received by the UE to camp on a cell shall be 1280 ms.

Cell 1 and cell 2 shall belong to different Location Areas.

Table 8.2.4.1: General test parameters for FDD/TDD Cell Re-selection

| Parameter | | Unit | Value | Comment |
|---|-----------------|------|-------|---|
| Initial condition | Active cell | | Cell1 | FDD cell |
| | Neighbour cells | | Cell2 | TDD cell |
| Final condition | Active cell | | Cell2 | TDD cell |
| UE_TXPWR_MAX_RACH | | dBm | 21 | The value shall be used for all cells in the test. |
| Access Service Class (ASC#0) - Persistence value | | | 1 | Selected so that no additional delay is caused by the random access procedure. The value shall be used for all cells in the test. |
| HCS | | | | Not used |
| DRX cycle length | | S | 1.28 | The value shall be used for all cells in the test. |
| T1 | | S | 15 | |
| T2 | | S | 15 | |

8.2.4.4.2 Procedures

- The SS activates cell 1 and cell 2 with T1 defined parameters and monitors them for random access requests from the UE.
- The UE is switched on.
- The SS waits for random access requests from the UE.
- After 15 s, the parameters are changed as described for T2.
- The SS waits for random access request from the UE.
- After another 15 s, the parameters are changed as described for T1.
- The SS waits for random access requests from the UE.
- Repeat step d) to g) until the confidence level according to annex F.6.2 is achieved.

8.2.4.5 Test requirements

- In step c), after the UE has responded on cell 1, it shall not respond on any other cell (cell selection).
- In step e), the UE shall respond on cell 2 within 8 s in more than 90 % of the cases.
- In step g), the UE shall respond on cell 1.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

8.2.5 UTRAN to E-UTRA Cell Re-Selection

8.2.5.1 E-UTRA is of higher priority

Editor's note: This Test case is incomplete for frequencies above 3GHz

- The Test system uncertainties applicable above 3GHz are undefined
- The Test Tolerances and Test Requirements applicable above 3GHz are undefined

8.2.5.1.1 Definition and applicability

The cell re-selection delay is defined as the time from a change of cell levels, to the moment when the UE camps on a new cell, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on the new cell.

The requirements and this test apply to **Release 8 and later releases UTRA FDD UE that support E-UTRA FDD.**

8.2.5.1.2 Minimum requirement

The cell re-selection delay shall be less than 81 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay can be expressed as: $T_{\text{higher_priority_search}} + T_{\text{evaluateEUTRA}} + T_{\text{SI}}$, where:

$T_{\text{higher_priority_search}}$ See section 4.2.2 of TS 25.133 [2]

$T_{\text{evaluateEUTRA}}$ See Table 4.2 in section 4.2.2.5a of TS 25.133 [2]

T_{SI} Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 80.48 s, within the allowance of 81 s for the test case.

The normative reference for this requirement is TS 25.133 [2] clauses 4.2.2 and A.4.5.1.

8.2.5.1.3 Test purpose

To verify that the UE meets the minimum requirement.

8.2.5.1.4 Method of test

8.2.5.1.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: see table K.2 in Annex K.

The test scenario comprises two different cells, with cell 1 being the UTRA serving cell and cell 2 being the E-UTRA cell to be re-selected to. Test parameters are given in Table 8.2.5.1.1. The test consists of three successive time periods, with time duration of T1, T2, and T3 respectively. UTRA cell 1 is already identified by the UE prior to the start of the test. Cell 2 is of higher priority than cell 1.

Cell 1 and cell 2 shall belong to different tracking areas. Furthermore, UE has not registered with network for the tracking area containing cell 2.

Table 8.2.5.1.1: General test parameters for UTRAN to E-UTRA Cell Reselection

| Parameter | | Unit | Value | Comment |
|-------------------|-------------|------|-------|--|
| Initial condition | Active cell | | Cell1 | |
| T2 end condition | Active cell | | Cell2 | UE shall perform reselection to cell 2 during T2 |

| Parameter | Unit | Value | Comment |
|-----------------------------------|----------------|----------|--|
| T3 end condition | Neighbour cell | Cell1 | |
| | Active cell | Cell1 | UE shall perform reselection to cell 1 during T3 |
| | Neighbour cell | Cell2 | |
| DRX cycle length | s | 1.28 | |
| HCS | | | Not used |
| E-UTRA PRACH configuration | | 4 | As specified in table 5.7.1-2 in TS 36.211 |
| E-UTRA access barring information | | Not sent | No additional delays in random access procedure |
| T1 | s | >20 | During T1, cell 2 shall be powered off, and during the off time its physical cell identity shall be changed. The intention is to ensure that cell 2 has not been detected by the UE prior to the start of period T2. |
| T2 | s | 85 | T2 needs to be defined so that cell re-selection reaction time is taken into account. |
| T3 | s | 25 | T3 needs to be defined so that cell re-selection reaction time is taken into account. |

Table 8.2.5.1.2: Cell specific test parameters for UTRAN to E-UTRA cell reselection (cell 1)

| Parameter | Unit | Cell 1 (UTRA) | | |

| Thresh _{serv, low} | dB | 44 | | | | | |
| Thresh _{x, low} (Note 2) | dB | 42 | | | | | |
| Propagation Condition | | AWGN | | | | | |
| NOTE 1: OCNG shall be used such that cell 2 is fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols. | | | | | | | |
| NOTE 2: This refers to the value of Thresh _{x, low} which is included in E-UTRA system information, and is a threshold for the UTRA target cell. | | | | | | | |

8.2.5.1.4.2 Procedure

- 1) The SS activates cell 1 and 2 with T1 defined parameters in tables 8.2.5.1.4 and 8.2.5.1.5 and monitors cell 1 and 2 for random access requests from the UE.
- 2) The UE is switched on.
- 3) The SS and the UE shall perform a location / routing area update procedure on cell 1.
- 4) After T1 from the end of step 3, the parameters are changed as described for T2 in tables 8.2.5.1.4 and 8.2.5.1.5.
- 5) The SS waits for random access request information from the UE to perform cell re-selection procedure on cell 2.
- 6) If the UE camps on cell 2, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure or an Attach Procedure for Rel-10 and higher UEs on cell 2 within 81 s then the number of successful tests is increased by one. Otherwise, the number of failure tests is increased by one.
- 7) After the re-selection or when T2 expires, the parameters are changed as described for T3 as specified in tables 8.2.5.1.4 and 8.2.5.1.5.
- 8) The SS and the UE shall perform a location / routing area update procedure on cell 1.
- 9) After the re-selection or when T3 expires, the parameters are changed as described for T1 in tables 8.2.5.1.4 and 8.2.5.1.5. During T1, Cell 2 shall be powered off and the SS shall set Cell 2 physical cell identity = ((current cell 2 physical cell identity + 1) mod 14 + 2).
- 10) If UE failed to complete the location / routing area update on cell 1 in step 8) then switch OFF the UE and go to step 2).
- 11) When T1 expires, the parameters are changed as described for T2 in tables 8.2.5.1.4 and 8.2.5.1.5.
- 12) Repeat step 5) to 11) until the confidence level according to Table G.2.3-1 in TS36.521-3 [38] is achieved.

| NOTE 2: This refers to the value of Thresh _{x, low} which is included in E-UTRA system information, and is a threshold for the UTRA target cell. | | | | |
| NOTE 3: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves. | | | | |

For the test to pass, the total number of successful tests shall be at least 90% of the cases with a confidence level of 95 %.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

8.2.5.2 E-UTRA is of lower priority

Editor's note: This Test case is incomplete for frequencies above 3GHz

- The Test system uncertainties applicable above 3GHz are undefined
- The Test Tolerances and Test Requirements applicable above 3GHz are undefined

8.2.5.2.1 Definition and applicability

The cell re-selection delay is defined as the time from a change of cell levels, to the moment when the UE camps on a new cell, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on the new cell.

The requirements and this test apply to Release 8 and later releases UTRA FDD UE that support E-UTRA FDD.

8.2.5.2.2 Minimum requirement

The cell re-selection delay shall be less than 21 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay can be expressed as: $T_{\text{evaluateEUTRA}} + T_{\text{SI-EUTRA}}$, where:

$T_{\text{evaluateEUTRA}}$ See Table 4.2 in section 4.2.2 of TS 25.133 [2].

$T_{\text{SI-EUTRA}}$ Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 20.48 s, within the allowance of 21 s in the test case.

The normative reference for this requirement is TS 25.133 [2] clauses 4.2.2 and A.4.5.2.

8.2.5.2.3 Test purpose

To verify that the UE meets the minimum requirement.

8.2.5.2.4 Method of test

8.2.5.2.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: see table K.2 in Annex K.

This scenario implies the presence of 1 UTRAN serving cell, and 1 E-UTRAN cell to be re-selected. The UE is requested to monitor neighbouring cells on 1 UTRAN carrier and 1 E-UTRAN carrier. Test parameters are given in Table 8.2.5.2.1 to 8.2.5.2.5. The test consists of two successive time periods, with time duration of T1 and T2, respectively. Both UTRA cell 1 and E-UTRA cell 2 are already identified by the UE prior to the start of the test. Cell 2 is of lower priority than cell 1. Cell 1 and cell 2 shall belong to different tracking areas.

Table 8.2.5.2.1: General test parameters for UTRAN to E-UTRAN Cell Re-selection

| Parameter | | Unit | Value | Comment |
|-----------------------------------|----------------|------|----------|--|
| Initial condition | Active cell | | Cell 1 | UTRAN cell |

8.2.5.2.4.2

Procedure

- 1) The SS activates cell 1 with T1 parameters defined in tables 8.2.5.2.4 and monitors cell 1 for random access requests from the UE.
- 2) The UE is switched on.
- 3) The SS and the UE shall perform a location / routing area update procedure on cell 1 and apply the cell 2 parameters with T1 defined in table 8.2.5.2.5. T1 starts.
- 4) After the re-selection or when T1 expires, the parameters are changed as described for T2 in tables 8.2.5.2.4 and 8.2.5.2.5.
- 5) The SS waits for random access request information from the UE to perform cell re-selection procedure on cell 2.
- 6) If the UE camps on cell 2 and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure or an Attach Procedure for Rel-10 and higher UEs on cell 2 within 21 s, then the number of successful tests is increased by one. Otherwise, the number of failure tests is increased by one.
- 7) After the re-selection or when T2 expires, the parameters are changed as defined for T1 in tables 8.2.5.2.4 and 8.2.5.2.5.
- 8) The SS and the UE shall perform a location / routing area update procedure on cell 1.
- 9) If UE failed to complete the location / routing area update on cell 1 in step 8) then switch OFF the UE and go to step 1).
- 10) Repeat step 4) to 9) until the confidence level according to Table G.2.3-1 in TS36.521-3 [38] is achieved.

NOTE 2: This refers to the value of $\text{Thresh}_{x, \text{high}}$ which is included in E-UTRA system information, and is a threshold for the UTRA target cell

For the test to pass, the total number of successful tests shall be at least 90% of the cases with a confidence level of 95 %.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

8.2.5.3 RSRQ based reselection when E-UTRA FDD is of higher priority

Editor's notes: The following items are missing or incomplete:

- Message contents are undefined.
- The Test system uncertainties are undefined

8.2.5.3.1 Definition and applicability

The cell re-selection delay is defined as the time from a change of cell levels, to the moment when the UE camps on a new cell, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on the new cell.

The requirements and this test apply to Release 11 and later releases UTRA FDD UE that support E-UTRA FDD.

8.2.5.3.2 Minimum requirement

The cell re-selection delay shall be less than 21 s. The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay can be expressed as: $T_{\text{higher_priority_search}} + T_{\text{evaluateEUTRA}} + T_{\text{SI}}$, where:

$T_{\text{higher_priority_search}}$ See section 4.2.2 of TS 25.133 [2], where, this value should be 0s, since the cell2 shall be already indentified at the beginning of T3

$T_{\text{evaluateEUTRA}}$ See Table 4.2 in section 4.2.2.5a of TS 25.133 [2]

T_{SI} Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 20.48 s, allow 21 s in the test case.

The normative reference for this requirement is TS 25.133 [2] clauses 4.2.2 and A.4.5.3.

8.2.5.3.3 Test purpose

To verify that the UE meets the minimum requirement.

8.2.5.3.4 Method of test

8.2.5.3.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: see table K.2 in Annex K.

The test scenario comprises two different cells, with cell 1 being the UTRA serving cell, cell 2 being the E-UTRA cell to be re-selected to. Test parameters are given in Tables 8.2.5.3.1, 8.2.5.3.2, 8.2.5.3.3. The test consists of four successive time periods, with time duration of T1, T2, T3 and T4, respectively. UTRA cell 1 is already identified by the UE prior to the start of the test. Cell 2 is of higher priority than cell 1.

Cell 1 and cell 2 shall belong to different tracking areas. Furthermore, UE has not registered with network for the tracking area containing cell 2.

Table 8.2.5.3.1: General test parameters for UTRAN to E-UTRA Cell Reselection

| Parameter | | Unit | Value | Comment |
|-----------------------------------|----------------|------|----------|--|
| Initial condition | Active cell | | Cell1 | |
| T2 end condition | Active cell | | Cell1 | UE shall not perform reselection to cell 2 during T2 |
| | Neighbour cell | | Cell2 | |
| T3 end condition | Active cell | | Cell2 | UE shall perform reselection to cell 2 during T3 |
| | Neighbour cell | | Cell1 | |
| T4 end condition | Active cell | | Cell1 | UE shall perform reselection to cell 1 during T4 |
| | Neighbour cell | | Cell2 | |
| DRX cycle length | | s | 1.28 | |
| HCS | | | | Not used |
| E-UTRA PRACH configuration | | | 4 | As specified in table 5.7.1-2 in TS 36.211 |
| E-UTRA access barring information | | | Not sent | No additional delays in random access procedure |
| T1 | | s | >20 | During T1, cell 2 shall be powered off, and during the off time its physical cell identity shall be changed. The intention is to ensure that cell 2 has not been detected by the UE prior to the start of period T2. |
| T2 | | s | 85 | T2 needs to be defined, in order to ensure UE do not conduct cell reselect to Cell2 |
| T3 | | s | 25 | T3 needs to be defined so that cell re-selection reaction time is taken into account. |
| T4 | | s | 25 | T4 needs to be defined, in order to ensure UE conducting cell reselection to Cell 1 by end of the T4. |

8.2.5.3.4.2 Procedure

- 1) The SS activates cell 1 with T1 parameters defined in tables 8.2.5.3.4 and monitors cell 1 for random access requests from the UE.
- 2) The UE is switched on.
- 3) The SS and the UE shall perform a location / routing area update procedure on cell 1. T1 starts.
- 4) After T1 from the end of step 3, the parameters are changed as described for T2 in tables 8.2.5.3.4 and 8.2.5.3.5.
- 5) The SS waits for no uplink from the UE during T2. If the UE camps on cell 2 and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure or an Attach Procedure for Rel-10 and higher UEs on cell 2 during T2, then the number of failure tests is increased by one.

- 6) When T2 expires, the parameters are changed as described for T3 in tables 8.2.5.3.4 and 8.2.5.3.5.
- 7) The SS waits for random access request information from the UE to perform cell re-selection procedure on cell 2.
- 8) If the UE camps on cell 2, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure or an Attach Procedure for Rel-10 and higher UEs on cell 2 within 21 s then the number of successful tests is increased by one. Otherwise, the number of failure tests is increased by one.
- 9) After the re-selection or when T3 expires, the parameters are changed as defined for T4 in tables 8.2.5.3.4 and 8.2.5.3.5.
- 10) The SS and the UE shall perform a location / routing area update procedure on cell 1.
- 11) If UE failed to complete the location / routing area update on cell 1 in step 10) then switch OFF the UE and go to step 1).
- 12) Repeat step 5) to 11) until the confidence level according to Table G.2.3-1 in TS 36.521-3 [38] is achieved.

8.2.5.3.4.3 Message contents

All messages indicated above shall use the same content as described in the default message content in TS 36.508 [33] clause 4.4 and 4.6 with the following exceptions:

FFS

8.2.5.3.5 Test requirements

| Thresh _{serv, lowQ} | | 5 | | | |
| Thresh _{x, lowQ} (Note 2) | | 5 | | | |
| Propagation Condition | | AWGN | | | |
| Note 1: OCNG shall be used such that cell 2 is fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols. | | | | | |
| Note 2: This refers to the value of Thresh _{x, lowQ} which is included in E-UTRA system information, and is a threshold for the UTRA target cell. | | | | | |

For the test to pass, the total number of successful tests shall be at least 90% of the cases with a confidence level of 95 %.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

8.3 UTRAN Connected Mode Mobility

8.3.1 FDD/FDD Soft Handover

8.3.1.1 Definition and applicability

The active set update delay of the UE is defined as the time from the end of the last TTI containing an RRC message implying soft handover to the switch off of the old downlink DPCH.

The requirements and this test apply to the FDD UE.

8.3.1.2 Minimum requirement

The active set update delay is defined as the time from when the UE has received the ACTIVE SET UPDATE message from UTRAN, or at the time stated through the activation time when to perform the active set update, to the time when the UE successfully uses the set of radio links stated in that message for power control.

The active set update delay is depending on the number of known cells referred to in the ACTIVE SET UPDATE message. A cell is known if it has been measured by the UE during the last 5 seconds and the SFN of the cell has been decoded by the UE.

And the phase reference is the primary CPICH.

The active set update delay shall be less than $50+10*KC+100*OC$ ms, where

KC is the number of known cells in the active set update message.

OC is the number of cells that are not known in the active set update message.

If the UE have radio links in the active set that it can not use for data detection (due to low signal level), the UE shall at least every 150 ms search for the radio link.

The normative reference for this requirement is TS 25.133 [2] clauses 5.1.2 and A.5.1.1. The active set update delay shall be less than 60 ms in CELL_DCH state when using test parameters as given in table 8.3.1.1.1.

8.3.1.3 Test purpose

To verify that the UE meets the minimum requirement.

8.3.1.4 Method of test

8.3.1.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

The test parameters are given in table 8.3.1.1.1 and 8.3.1.1.2 below. In the measurement control information it is indicated to the UE that event-triggered reporting with Event 1A shall be used, and that CPICH Ec/Io and SFN-CFN observed time difference shall be reported together with Event 1A. The test consists of six successive time periods, with a time duration of T1, T2, T3, T4, T5 and T6 respectively. At the start of time duration T1, the UE may not have any timing information of cell 2.

Table 8.3.1.1.1: General test parameters for Soft handover

| Parameter | Unit | Value | Comment |
|----------------------------------|-------------------|---|--|
| DCH parameters | | DL Reference Measurement Channel 12.2 kbps and UL Auxiliary Measurement Channel 12.2 kbps | DL Measurement Channel as specified in clause C.3.1 UL Auxiliary Measurement Channel as specified in clause C.6.3 |
| Power Control | | On | |
| Target quality value on DTCH | BLER | 0.01 | |
| Initial conditions | Active cell | | Cell 1 |
| | Neighbouring cell | | Cell 2 |
| Final condition | Active cell | | Cell 2 |
| Reporting range | dB | 3 | Applicable for event 1A and 1B |
| Hysteresis | dB | 0 | |
| W | | 1 | Applicable for event 1A and 1B |
| Reporting deactivation threshold | | 0 | Applicable for event 1A |

| | | | |
|--------------------|----|-----|--|
| Time to Trigger | ms | 0 | |
| Filter coefficient | | 0 | |
| T0 | s | 10 | |
| T1 | s | 5 | |
| T2 | s | 3 | |
| T3 | s | 0.5 | |
| T4 | ms | 60 | This is the requirement on active set update delay, see clause 8.3.1.2, where KC=1 and OC=0. |
| T5 | ms | 20 | |
| T6 | s | 2 | |

Table 8.3.1.1.1A: Cell specific test parameters for Soft handover (T0)

| Parameter | Unit | Cell 1 | | Cell 2 | |
|-----------------------|---------------|--------|--|--------|--|
| | | T0 | | T0 | |
| CPICH_Ec/lor | dB | -10 | | -10 | |
| PCCPCH_Ec/lor | dB | -12 | | -12 | |
| SCH_Ec/lor | dB | -12 | | -12 | |
| PICH_Ec/lor | dB | -15 | | -15 | |
| DPCH_Ec/lor | dB | Note1 | | N/A | |
| OCNS_Ec/lor | dB | Note2 | | -0.94 | |
| \hat{I}_{or}/I_{oc} | dB | 0 | | -Inf | |
| I_{oc} | dBm/ 3.84 MHz | -70 | | | |
| CPICH_Ec/lo | dB | -13 | | -Inf | |
| Propagation Condition | | AWGN | | | |

NOTE 1: The DPCH level is controlled by the power control loop.
 NOTE 2: The power of the OCNS channel that is added shall make the total power from the cell to be equal to I_{or} .

Table 8.3.1.1.2: Cell specific test parameters for Soft handover

| Parameter | Unit | Cell 1 | | | | | | Cell 2 | | | | | |
|---|--------------|--------------------------|-------|-------|-------|-------|-------|--------|-------|-------|-------|-------|----|
| | | T1 | T2 | T3 | T4 | T5 | T6 | T1 | T2 | T3 | T4 | T5 | T6 |
| CPICH_Ec/lor | dB | -10 | | | | | | -10 | | | | | |

| SCH_Ec/lor | dB | -12 | | | | | | -12 | | | | | |
| PICH_Ec/lor | dB | -15 | | | | | | -15 | | | | | |
| DPCH_Ec/lor | dB | Note1 | Note1 | Note1 | N/A | N/A | N/A | N/A | Note3 | Note1 | Note1 | Note1 | |
| OCNS_Ec/lor | dB | Note2 | Note2 | Note2 | -0.94 | -0.94 | -0.94 | -0.94 | Note2 | Note2 | Note2 | Note2 | |
| \hat{I}_{or}/I_{oc} | dB | 0 | 2.91 | 2.91 | 2.91 | 2.91 | -Inf | 2.91 | 2.91 | 2.91 | 2.91 | 2.91 | |
| I_{oc} | dBm/3.84 MHz | -70 | | | | | | | | | | | |
| CPICH_Ec/lo | dB | -13 | -14 | -14 | -14 | -14 | -14 | -Inf | -14 | -14 | -14 | -14 | |
| Propagation Condition | | AWGN | | | | | | | | | | | |
| Relative delay of paths received from cell 2 with respect to cell 1 | chips | {-148 ... 148} Note 4 | | | | | | | | | | | |

NOTE 1: The DPCH level is controlled by the power control loop
 NOTE 2: The power of the OCNS channel that is added shall make the total power from the cell to be equal to I_{or}
 NOTE 3: The DPCH level is controlled by the power control loop. The initial power shall be set equal to the DPCH_Ec/lor of Cell 1 at the end of T2.
 NOTE 4: The relative delay of the path from cell 2 with respect to cell 1 shall always be within ± 148 chip.

8.3.1.4.2 Procedure

- 1) The RF parameters are set up according to T0 in table 8.3.1.1.2A.
- 2) The UE is switched on.

- 3) A call is set up according to the test procedure specified in TS 34.108 [3] subclause 7.3.4 without compressed mode parameters and test loop mode 2 is used. See TS 34.109 [4] for details regarding loopback test. 10 seconds after call setup is completed, the power settings will be set according to T1.
 - 4) SS shall transmit a MEASUREMENT CONTROL message.
 - 5) 5 seconds after power settings have been changed to T1, the SS shall switch the power settings from T1 to T2.
 - 6) UE shall transmit a MEASUREMENT REPORT message triggered by event 1A containing the CFN-SFN observed time difference between cell 1 and cell 2.
 - 7) At the beginning of T3 the downlink DPCH of cell 2 shall be activated.
 - 8) SS shall send an ACTIVE SET UPDATE message with activation time "now ", adding cell 2 to the active set. The start of T4 is defined as the end of the last TTI containing the ACTIVE SET UPDATE message.
 - 9) At the beginning of T5 the DPCH from cell 1 shall be switched off.
 - 10) The UE downlink BLER shall be measured during time period T6.
 - 11) If the UE sends a Cell Update message with the cell update cause as radio link failure, the SS shall re-establish the radio link on the first cell and shall continue the test. The BLER values measured for this loop will be discarded while maintaining the BLER values measured for the previous loops,
- NOTE: The Radio link could be setup either by switching off the UE and restarting the test or by re-establishing the Radio Link directly using additional signalling procedures. However this decision is left up to the SS manufacturer
- 12) After step 10 has completed, the DPCH from cell 1 shall be switched on. The SS shall send ACTIVE SET UPDATE message with activation time "now" to remove cell 2 from the active set. The RF parameters will be set according to T1.
 - 13) BLER is measured during concatenated time periods T6. Repeat step 4-12 until the confidence level for BLER is achieved. This is defined in annex F.6.1.10.

Specific Message Contents

All messages indicated above shall use the same content as described in the default message content in clause 9 of 34.108 [3], with the following exceptions:

Contents of RRC CONNECTION SETUP message: UM (step 3):

| Information Element | Value/remark | Version |
|--|--------------|---------|
| Added or Reconfigured DL TrCH information list | 1 | |
| - Added or Reconfigured DL TrCH information | | |

| Relative delay of paths received from cell 2 with respect to cell 1 | chips | {-147.5 ... 147.5} Note 4 | | | | | | | | | | | |
| NOTE 1: The DPCH level is controlled by the power control loop | | | | | | | | | | | | | |
| NOTE 2: The power of the OCNS channel that is added shall make the total power from the cell to be equal to I _{or} | | | | | | | | | | | | | |
| NOTE 3: The DPCH level is controlled by the power control loop. The initial power shall be set equal to the DPCH_Ec/I _{or} of Cell 1 at the end of T2. | | | | | | | | | | | | | |
| NOTE 4: The relative delay of the path from cell 2 with respect to cell 1 shall always be within -147.5 ... 147.5 chip. | | | | | | | | | | | | | |

The average measured quality on the DTCH of the UE downlink during T6 shall be BLER = 0.01±30%. (The final BLER shall be achieved by integrating over a number of repetitions of procedure step 10).

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

8.3.2 FDD/FDD Hard Handover

8.3.2.1 FDD/FDD Hard Handover to intra-frequency cell

8.3.2.1.1 Definition and applicability

The hard handover delay of the UE is defined as the time from the end of the last TTI containing an RRC message implying hard handover to the transmission of the new uplink DPCH.

The requirements and this test apply to the FDD UE.

8.3.2.1.2 Minimum requirement

The interruption time shall be less than 110 ms in CELL_DCH state in the single carrier case. The rate of correct handovers observed during repeated tests shall be at least 90% with a confidence level of 95 %.

The hard handover delay $D_{handover}$ equals the RRC procedure delay defined in TS 25.331 clause 13.5.2 plus the interruption time stated in TS 25.133 [2] clause 5.2.2.2 as follows:

The interruption time, i.e. the time between the last TTI containing a transport block on the old DPDCH and the time the UE starts transmission of the new uplink DPCCH, is depending on whether the target cell is known for the UE or not.

If intra-frequency hard handover is commanded or inter-frequency hard handover is commanded when the UE does not need compressed mode to perform inter-frequency measurements, the interruption time shall be less than $T_{\text{interrupt1}}$

For Release 99, Release 4 and Release 5 $T_{\text{interrupt1}}$ is the following equation:

$$T_{\text{interrupt1}} = T_{\text{IU}} + 40 + 20 * \text{KC} + 150 * \text{OC} + 10 * F_{\text{max}} \text{ ms}$$

where:

T_{IU} is the interruption uncertainty when changing the timing from the old to the new cell. T_{IU} can be up to one frame (10 ms).

KC is the number of known target cells in the message, and

OC is the number of target cells that are not known in the message.

F_{max} denotes the maximum number of radio frames within the transmission time intervals of all transport channels that are multiplexed into the same CCTrCH.

NOTE: The figure 40 ms is the time required for measuring the downlink DPCCH channel as stated in TS 25.214 clause 4.3.1.2.

For Release 6 and later releases $T_{\text{interrupt1}}$ is the following equation:

$$T_{\text{interrupt1}} = T_{\text{IU}} + T_{\text{sync}} + 20 * \text{KC} + 150 * \text{OC} + 10 * F_{\text{max}} \text{ ms}$$

where

T_{IU} is the interruption uncertainty when changing the timing from the old to the new cell. T_{IU} can be up to one frame (10 ms).

KC is the number of known target cells in the message, and

OC is the number of target cells that are not known in the message.

F_{max} denotes the maximum number of radio frames within the transmission time intervals of all transport channels that are multiplexed into the same CCTrCH.

T_{sync} is the time required for measuring the downlink DPCCH channel as stated in TS 25.214 section 4.3.1.2. In case higher layers indicate the usage of a post-verification period $T_{\text{sync}}=0$ ms. Otherwise $T_{\text{sync}}=40$ ms.

In the interruption requirement $T_{\text{interrupt1}}$ a cell is known if it has been measured by the UE during the last 5 seconds and the SFN of the cell has been decoded by the UE.

The normative reference for this requirement is TS 25.133 [2] clauses 5.2.2 and A.5.2.1.

8.3.2.1.3 Test purpose

To verify that the UE meets the minimum requirement.

8.3.2.1.4 Method of test

8.3.2.1.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

The test parameters are given in tables 8.3.2.1.1 to 8.3.2.1.3 below. In the measurement control information it is indicated to the UE that event-triggered reporting with Event 1A and 1B shall be used, and that CPICH Ec/Io and SFN-CFN observed timed difference shall be reported together with Event 1A. The test consists of three successive time

periods, with a time duration of T1, T2 and T3 respectively. At the start of time duration T1, the UE may not have any timing information of cell 2.

UTRAN shall send a PHYSICAL CHANNEL RECONFIGURATION with activation time "now" with one active cell, cell 2. The Physical Channel reconfiguration message shall be sent to the UE during period T2, after the UE has reported event 1A. The start of T3 is defined as the end of the last TTI containing the Physical Channel reconfiguration message.

N312 shall have the smallest possible value i.e. only one insync is required.

Table 8.3.2.1.1: General test parameters for Handover to intra-frequency cell

| Parameter | | Unit | Value | Comment |
|----------------------------------|-------------------|------|---|--|
| DCH parameters | | | DL and UL Reference Measurement Channel 12.2 kbps | As specified in clause C.3.1 and C.2.1 |
| Power Control | | | On | |
| Target quality value on DTCH | | BLER | 0.001 | |
| Initial conditions | Active cell | | Cell 1 | |
| | Neighbouring cell | | Cell 2 | |
| Final condition | Active cell | | Cell 2 | |
| Reporting range | | dB | 3 | Applicable for event 1A and 1B |
| Hysteresis | | dB | 0 | |
| W | | | 1 | Applicable for event 1A and 1B |
| Reporting deactivation threshold | | | 0 | Applicable for event 1A |
| Time to Trigger | | ms | 0 | |
| Filter coefficient | | | 0 | |
| T1 | | s | 5 | |
| T2 | | s | ≤5 | |
| T3 | | s | 1 | |

Table 8.3.2.1.2: Cell specific test parameters for Handover to intra-frequency cell

| Parameter | Unit | Cell 1 | | | Cell 2 | | |
|--|--------------|--------|--------|-------|-----------|--------|-------|
| | | T1 | T2 | T3 | T1 | T2 | T3 |
| CPICH_Ec/lor | dB | -10 | | | -10 | | |
| PCCPCH_Ec/lor | dB | -12 | | | -12 | | |

| \hat{I}_{or} (Note 4) | dBm | -70.00 | -63.03 | | -Infinity | -64.03 | |
| I_{oc} | dBm/3.84 MHz | -70 | | | | | |
| CPICH_Ec/lo | dB | -13 | | | -Infinity | -14 | |
| Propagation Condition | | AWGN | | | | | |
| NOTE 1: The DPCH level is controlled by the power control loop | | | | | | | |
| NOTE 2: The power of the OCNS channel that is added shall make the total power from the cell to be equal to I_{or} . | | | | | | | |
| NOTE 3: The DPCH may not be power controlled by the power control loop. | | | | | | | |
| NOTE 4: The nominal \hat{I}_{or} values, although not explicitly defined in 25.133 [2] are added here since they are implied and need to be identified so that the test equipment can be configured. | | | | | | | |

8.3.2.1.4.2 Procedure

- 1) The RF parameters are set up according to T1 in table 8.3.2.1.3.
- 2) The UE is switched on.

- 3) A call is set up according to the test procedure specified in TS 34.108 [3] subclause 7.3.4. Data shall be sent on the DTCH throughout the call.
- 4) SS shall transmit a MEASUREMENT CONTROL message on cell 1.
- 5) 5 seconds after step 4 has completed, the SS shall switch the power settings from T1 to T2 in table 8.3.2.1.3.
- 6) UE shall transmit a MEASUREMENT REPORT message triggered by event 1A
- 7) SS shall transmit a PHYSICAL CHANNEL RECONFIGURATION message with activation time set to "now". The start of T3 is defined as the end of the last TTI containing the physical channel reconfiguration message.
- 8) The SS shall switch the power settings from T2 to T3 in table 8.3.2.1.3.
- 9) If the UE transmits the UL DPCCH to cell 2 less than 190 ms from the beginning of time period T3 then the number of successful tests is increased by one. The UE shall transmit a PHYSICAL CHANNEL RECONFIGURATION COMPLETE message on the UL DCCH of cell 2.
- 10) After 1 seconds from the beginning of time period T3, the UE is switched off. Any timing information of cell 2 is deleted in the UE.
- 11) Repeat step 1-10 until the confidence level according to annex F.6.2 is achieved

Specific Message Contents

All messages indicated above shall use the same content as described in the default message content in clause 9 of 34.108 [3], with the following exceptions:

| NOTE 1: The DPCH level is controlled by the power control loop | | | | | | | |
| NOTE 2: The power of the OCNS channel that is added shall make the total power from the cell to be equal to I_{or} . | | | | | | | |
| NOTE 3: The DPCH may not be power controlled by the power control loop. | | | | | | | |
| NOTE 4: These parameters are not directly settable, but are derived by calculation from the settable parameters. | | | | | | | |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

8.3.2.2 FDD/FDD Hard Handover to inter-frequency cell

8.3.2.2.1 Definition and applicability

The hard handover delay is defined as the time from the end of the last TTI containing an RRC message implying hard handover to the transmission of the new uplink DPCCCH.

The requirements and this test apply to the FDD UE.

8.3.2.2.2 Minimum requirement

The interruption time shall be less than 140 ms in CELL_DCH state in the dual carrier case. The rate of correct handovers observed during repeated tests shall be at least 90% with a confidence level of 95 %.

The hard handover delay $D_{handover}$ equals the RRC procedure delay defined in TS 25.331 clause 13.5.2 plus the interruption time stated in TS 25.133 [2] clause 5.2.2.2 as follows:

If inter-frequency hard handover is commanded and the UE needs compressed mode to perform inter-frequency measurements, the interruption time shall be less than $T_{interrupt2}$

For Release 99, Release 4 and Release 5 $T_{interrupt2}$ is the following equation:

$$T_{interrupt2} = T_{IU} + 40 + 50 * KC + 150 * OC + 10 * F_{max} \text{ ms}$$

For Release 6 and later releases $T_{interrupt2}$ is the following equation:

$$T_{interrupt2} = T_{IU} + T_{sync} + 50 * KC + 150 * OC + 10 * F_{max} \text{ ms}$$

In the interruption requirement $T_{interrupt2}$ a cell is known if:

- the cell has been measured by the UE during the last 5 seconds.

The phase reference is the primary CPICH.

The normative reference for this requirement is TS 25.133 [2] clauses 5.2.2 and A.5.2.2.

8.3.2.2.3 Test purpose

To verify that the UE meets the minimum requirement.

8.3.2.2.4 Method of test

8.3.2.2.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

The test parameters are given in tables 8.3.2.2.1 to 8.3.2.2.3 below. The test consists of three successive time periods, with a time duration of T1, T2 and T3 respectively. In the measurement control information it is indicated to the UE that event-triggered reporting with Event 2C shall be used. The CPICH E_c/I_0 of the best cell on the unused frequency shall be reported together with Event 2C reporting. At the start of time duration T1, the UE may not have any timing information of cell 2.

UTRAN shall send a PHYSICAL CHANNEL RECONFIGURATION with activation time "now" with one active cell, cell 2. The Physical Channel reconfiguration message shall be sent to the UE during period T2, after the UE has reported event 2C. The start of T3 is defined as the end of the last TTI containing the Physical Channel reconfiguration message.

N312 shall have the smallest possible value i.e. only one insync is required.

Table 8.3.2.2.1: General test parameters for Handover to inter-frequency cell

| Parameter | | Unit | Value | Comment |
|------------------------------|----------------|------|---|---|
| DCH parameters | | | DL and UL Reference Measurement Channel 12.2 kbps | As specified in clause C.3.1 and C.2.1 |
| Power Control | | | On | |
| Target quality value on DTCH | | BLER | 0.001 | |
| Compressed mode | | | A.22 set 1 | As specified in TS 34.121 clause C.5. |
| Initial conditions | Active cell | | Cell 1 | |
| | Neighbour cell | | Cell 2 | |
| Final conditions | Active cell | | Cell 2 | |
| Threshold non used frequency | | dB | -18 | Absolute E_c/I_0 threshold for event 2C |
| Hysteresis | | dB | 0 | |
| W non-used frequency | | | 1 | Applicable for event 2C |
| Time to Trigger | | ms | 0 | |
| Filter coefficient | | | 0 | |
| T1 | | s | 5 | |
| T2 | | s | ≤ 5 | |
| T3 | | s | 1 | |

| Propagation Condition | | AWGN | | | | | |
| NOTE 1: The DPCH level is controlled by the power control loop | | | | | | | |
| NOTE 2: The power of the OCNS channel that is added shall make the total power from the cell to be equal to I_{or} . | | | | | | | |
| NOTE 3: The DPCH may not be power controlled by the power control loop. | | | | | | | |
| NOTE 4: The nominal \hat{I}_{or} values, although not explicitly defined in 25.133 [2] are added here since they are implied and need to be identified so that the test equipment can be configured. | | | | | | | |

8.3.2.2.4.2 Procedure

- 1) The RF parameters are set up according to T1 in table 8.3.2.2.3.
- 2) The UE is switched on.
- 3) A call is set up according to the test procedure specified in TS 34.108 [3] subclause 7.3.4 with Compressed mode parameters as in Table 8.3.2.2.1. Data shall be sent on the DTCH throughout the call.
- 4) SS shall transmit a MEASUREMENT CONTROL message on cell 1.
- 5) 5 seconds after step 4 has completed, the SS shall switch the power settings from T1 to T2 in table 8.3.2.2.3.
- 6) UE shall transmit a MEASUREMENT REPORT message triggered by event 2C
- 7) SS shall transmit a PHYSICAL CHANNEL RECONFIGURATION message with activation time "now". The start of T3 is defined as the end of the last TTI containing the physical channel reconfiguration message.
- 8) The SS shall switch the power settings from T2 to T3 in table 8.3.2.2.3.
- 9) If the UE transmits the UL DPCCCH to cell 2 less than 220 ms from the beginning of time period T3 then the number of successful tests is increased by one. The UE shall transmit a PHYSICAL CHANNEL RECONFIGURATION COMPLETE message on the UL DCCH of cell 2.
- 10) After 1 seconds from the beginning of time period T3, the UE is switched off. Any timing information of cell 2 is deleted in the UE.
- 11) Repeat step 1-10 until the confidence level according to annex F.6.2 is achieved

Specific Message Contents

All messages indicated below above shall use the same content as described in the default message content in clause 9 of 34.108 [3], with the following exceptions:

MEASUREMENT CONTROL message, event 2C (step 4):

MEASUREMENT REPORT message for Inter frequency test cases

| Information Element | Value/remark |
|--|--|
| Message Type | The presence of this IE is dependent on IXIT statements in TS 34.123-2. If integrity protection is indicated to be active, this IE shall be present with the values of the sub IEs as stated below. Else, this IE and the sub-IEs shall be absent. |
| Integrity check info | |
| - Message authentication code | This IE is checked to see if it is present. The value is compared against the XMAC-I value computed by SS. |
| - RRC Message sequence number | This IE is checked to see if it is present. The value is used by SS to compute the XMAC-I value. |
| Measurement identity | 2 |
| Measured Results | |
| - Inter-frequency measured results | Checked that this IE is present |
| - Frequency Info | |
| - Inter-freqcell measured results list | Not present |
| - Cell measured results | |
| - Cell Identity | Checked that this IE is present |
| - Cell synchronisation information | |
| - Tm | FDD |
| - CHOICE mode | Checked that this IE is present |
| - Primary CPICH info | |
| - Primary scrambling code | 250 |
| - CPICH Ec/N0 | Checked that this IE is present |
| - CPICH RSCP | Checked that this IE is present |
| - Pathloss | Checked that this IE is absent |
| Measured results on RACH | Checked that this IE is absent |
| Additional measured results | Checked that this IE is absent |
| Event results | Checked that this IE is present |

8.3.2.2.5 Test requirements

For the test to pass, the total number of successful tests shall be more than 90% of the cases with a confidence level of 95 %.

Table 8.3.2.2.3: Test requirements for Handover to inter-frequency cell

| Parameter | Unit | Cell 1 | | | Cell 2 | | |
|--|--------------|-----------|-------|-------|-----------|-------|-------|
| | | T1 | T2 | T3 | T1 | T2 | T3 |
| UTRA RF Channel Number | | Channel 1 | | | Channel 2 | | |
| CPICH_Ec/Ior | dB | -9.2 | | | -9.2 | | |
| PCCPCH_Ec/Ior | dB | -11.2 | | | -11.2 | | |
| SCH_Ec/Ior | dB | -11.2 | | | -11.2 | | |
| PICH_Ec/Ior | dB | -14.2 | | | -14.2 | | |
| DPCH_Ec/Ior | dB | Note1 | Note1 | Note3 | N/A | N/A | Note1 |
| OCNS_Ec/Ior | dB | Note2 | Note2 | Note2 | -1.16 | -1.16 | Note2 |
| \hat{I}_{or} / I_{oc} (Note 4) | dB | 0 | | | -Infinity | -1.8 | -1.8 |
| I_{or} | dBm | -70.0 | | | -Infinity | -71.8 | -71.8 |
| I_{oc} | dBm/3.84 MHz | -70 | | | | | |
| CPICH_Ec/Io (Note 4) | dB | -12.2 | | | -Infinity | -13.2 | |
| Propagation Condition | | AWGN | | | | | |
| NOTE 1: The DPCH level is controlled by the power control loop | | | | | | | |
| NOTE 2: The power of the OCNS channel that is added shall make the total power from the cell to be equal to I_{or} . | | | | | | | |
| NOTE 3: The DPCH may not be power controlled by the power control loop. | | | | | | | |
| NOTE 4: These parameters are not directly settable, but are derived by calculation from the settable parameters. | | | | | | | |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

8.3.3 FDD/TDD Handover

8.3.3.1 Definition and applicability

The hard handover delay is defined as the time from the end of the last TTI containing an RRC message implying hard handover to the transmission of the new uplink DPCH.

The requirements and this test apply to the combined FDD and TDD UE for Release 99 and Release 4 only.

8.3.3.2 Minimum requirement

The hard handover delay shall be less than 110 ms in CELL_DCH state in the dual carrier case. The rate of correct handovers observed during repeated tests shall be at least 90% with a confidence level of 95 %.

The hard handover delay D_{handover} equals the RRC procedure delay defined in TS 25.331 clause 13.5.2 plus the interruption time stated in TS 25.133 [2] clause 5.3.2.2 as follows:

If FDD/TDD handover is commanded, the interruption time shall be less than:

$$T_{\text{interrupt}} = T_{\text{offset}} + T_{\text{UL}} + 30 * F_{\text{SFN}} + 20 * \text{KC} + 180 * \text{UC} + 10 * F_{\text{max}} \text{ ms}$$

where,

| | |
|---------------------|---|
| T_{offset} | Equal to 10 ms, the frame timing uncertainty between the old cell and the target cell and the time that can elapse until the appearance of a Beacon channel |
| T_{UL} | Equal to 10 ms, the time that can elapse until the appearance of the UL timeslot in the target cell |
| F_{SFN} | Equal to 1 if SFN decoding is required and equal to 0 otherwise |
| KC | Equal to 1 if a known target cell is indicated in the RRC message implying FDD/TDD handover and equal to 0 otherwise |
| UC | Equal to 1 if an unknown target cell is indicated in the RRC message implying FDD/TDD handover and equal to 0 otherwise |
| F_{max} | Denotes the maximum number of radio frames within the transmission time intervals of all transport channels that are multiplexed into the same CCTrCH. |

An inter-frequency TDD target cell shall be considered known by the UE, if the target cell has been measured by the UE during the last 5 seconds.

The phase reference is the primary CPICH.

The normative reference for this requirement is TS 25.133 [2] clauses 5.3.2 and A.5.3.2.

8.3.3.3 Test purpose

To verify that the UE meets the minimum requirement.

8.3.3.4 Method of test

8.3.3.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

The test parameters are given in Table 8.3.2.2.1 and 8.3.2.2.2 below. The test consists of three successive time periods, with a time duration of T1, T2 and T3 respectively. In the measurement control information it is indicated to the UE that event-triggered reporting with Event 2C shall be used. The Primary CCPCH RSCP of the best cell on the unused frequency shall be reported together with Event 2C reporting. At the start of time duration T1, the UE may not have any timing information of cell 2.

UTRAN shall send a PHYSICAL CHANNEL RECONFIGURATION with activation time "now" with one active cell, cell 2. The Physical Channel reconfiguration message shall be sent to the UE so that the whole message is available at the UE the RRC procedure delay prior to the beginning of T3. The RRC procedure delay is defined in TS 25.133 [2].

The UL DPCH in cell 2 shall be transmitted in timeslot 10.

Table 8.3.3.1: General test parameters for Handover to TDD cell

| Parameter | | Unit | Value | Comment |
|------------------------------|----------------|------|--|---|
| DCH parameters | | | DL and UL Reference Measurement Channel 12.2 kbps | As specified in TS 34.121 clause C.3.1 and in TS 34.122 clause C.2.2 |
| Power Control | | | On | |
| Target quality value on DTCH | | BLER | 0.001 | |
| Compressed mode | | | A.22 set 3 | As specified in TS 34.121 clause C.5 |
| Initial conditions | Active cell | | Cell 1 | FDD cell |
| | Neighbour cell | | Cell 2 | TDD cell |
| Final condition | Active cell | | Cell 2 | TDD cell |
| O | | dB | 0 | Cell individual offset. This value shall be used for all cells in the test. |
| Hysteresis | | dB | 0 | Hysteresis parameter for event 2C |
| Time to Trigger | | ms | 0 | |
| Threshold non-used frequency | | dBm | -75 | Applicable for Event 2C |
| Filter coefficient | | | 0 | |
| Monitored cell list size | | | 6 FDD neighbours on Channel 1 6 TDD neighbours on Channel 2 | |
| T _{SI} | | s | 1.28 | The value shall be used for all cells in the test |
| T1 | | s | 5 | |
| T2 | | s | 15 | |
| T3 | | s | 1 | |

Table 8.3.3.2: Cell Specific parameters for Handover to TDD cell (cell 1)

| Parameter | Unit | Cell 1 | |
|---|--------------|-----------|------|
| | | T1, T2 | T3 |
| UTRA RF Channel Number | | Channel 1 | |
| CPICH_Ec/I _{or} | dB | -10 | |
| P-CCPCH_Ec/I _{or} | dB | -12 | |
| SCH_Ec/I _{or} | dB | -12 | |
| PICH_Ec/I _{or} | dB | -15 | |
| DPCH_Ec/I _{or} | dB | Note 1 | n.a. |
| OCNS_Ec/I _{or} | dB | Note 2 | |
| \hat{I}_{or}/I_{oc} | dB | 0 | |
| I _{oc} | dBm/3.84 MHz | -70 | |
| CPICH_Ec/I _o | dB | -13 | |
| Propagation Condition | | AWGN | |
| NOTE 1: The DPCH level is controlled by the power control loop | | | |
| NOTE 2: The power of the OCNS channel that is added shall make the total power from the cell to be equal to I _{or} | | | |

Table 8.3.3.3: Cell Specific parameters for Handover to TDD cell (cell 2)

| Parameter | Unit | Cell 2 | | | | | | | | |
|--|---------------------|-----------|-----|----|------|----|--------|-------|----|----|
| | | 0 | | | 2 | | | 8 | | |
| DL timeslot number | | T1 | T2 | T3 | T1 | T2 | T3 | T1 | T2 | T3 |
| UTRA RF Channel Number | | Channel 2 | | | | | | | | |
| P-CCPCH_Ec/lor | dB | -3 | | | n.a. | | | n.a. | | |
| PICH_Ec/lor | dB | n.a. | | | n.a. | | | -3 | | |
| SCH_Ec/lor | dB | -9 | | | n.a. | | | -9 | | |
| SCH_t_offset | dB | 5 | | | n.a. | | | 5 | | |
| DPCH_Ec/lor | dB | n.a. | | | n.a. | | Note 1 | n.a. | | |
| OCNS_Ec/lor | dB | -3.12 | | | 0 | | Note 2 | -3.12 | | |
| \hat{I}_{or}/I_{oc} | dB | -Inf | 6 | | -Inf | 6 | | -Inf | 6 | |
| P-CCPCH RSCP | dBm | -Inf | -67 | | n.a. | | | n.a. | | |
| I_{oc} | dBm/3, 84 MHz | -70 | | | | | | | | |
| Propagation Condition | | AWGN | | | | | | | | |
| NOTE 1: The DPCH level is controlled by the power control loop | | | | | | | | | | |
| NOTE 2: The power of the OCNS channel that is added shall make the total power from the cell to be equal to lor. | | | | | | | | | | |
| Note that the transmit energy per PN chip for the SCH is averaged over the 256 chip duration when the SCH is present in the time slot. | | | | | | | | | | |

8.3.3.4.2 Procedure

- 1) The RF parameters are set up according to T1.
- 2) The UE is switched on.
- 3) A call is set up according to the test procedure specified in TS 34.108 [3] subclause 7.3.4 with Compressed mode parameters as in Table 8.3.2.2.1. Data shall be sent on the DTCH throughout the call.
- 4) SS shall transmit a MEASUREMENT CONTROL message.
- 5) After 5 seconds, the SS shall switch the power settings from T1 to T2.
- 6) UE shall transmit a MEASUREMENT REPORT message triggered by event 2C.
- 7) SS shall transmit a PHYSICAL CHANNEL RECONFIGURATION message with activation time "now".
- 8) After 10 seconds, the SS shall switch the power settings from T2 to T3.
- 9) UE shall transmit a PHYSICAL CHANNEL RECONFIGURATION COMPLETE message on the UL DCCH of cell 2. If the UE transmits the UL DPCCH to cell 2 less than 110 ms from the beginning of time period T3 then the number of successful tests is increased by one.
- 10) After 1 seconds, the UE is switched off. Any timing information of cell 2 is deleted in the UE.
- 11) Repeat step 1-10 until the confidence level according to annex F.6.2 is achieved.

Specific Message Contents

All messages indicated above shall use the same content as described in the default message content in clause 9 of 34.108 [3], with the following exceptions:

MEASUREMENT REPORT message for Inter frequency test cases

This message is common for all inter frequency test cases in clause 8.7 and is described in Annex I.

8.3.3.5 Test requirements

For the test to pass, the total number of successful tests shall be more than 90% of the cases with a confidence level of 95 %.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

8.3.4 Inter-system Handover from UTRAN FDD to GSM

8.3.4.1 Definition and applicability

The UTRAN to GSM cell handover delay is defined as the time from the end of the last TTI containing an RRC message implying hard handover to the transmission on the channel of the new RAT.

The requirements and this test apply to the combined FDD and GSM UE.

8.3.4.2 Minimum requirement

The UE shall begin to send access bursts on the new DCCH of the target cell less than 100 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The test requirement in this case is expressed as:

$$T_{\text{Handover delay}} = 90 \text{ ms (Table 8.3.4.1)} + T_{\text{offset}} + T_{\text{UL}}$$

T_{offset} : Equal to 4.65 ms, GSM timing uncertainty between the time from when the UE is ready to transmit until the start of the next time-slot in GSM 26 multiframe structure

T_{UL} : Equal to 4.65 ms, the time the UE has to wait in case the next timeslot is an idle frame or a SACCH frame.

This gives a total of 99.3 ms, allow 100 ms in the test case.

Table 8.3.4.1: FDD/GSM handover - handover delay

| UE synchronisation status | handover delay [ms] |
|--|---------------------|
| The UE has synchronised to the GSM cell before the HANDOVER FROM UTRAN COMMAND is received | 90 |
| The UE has not synchronised to the GSM cell before the HANDOVER FROM UTRAN COMMAND is received | 190 |

Table 8.3.4.2: FDD/GSM handover - interruption time

| Synchronisation status | Interruption time [ms] |
|--|------------------------|
| The UE has synchronised to the GSM cell before the HANDOVER FROM UTRAN COMMAND is received | 40 |
| The UE has not synchronised to the GSM cell before the HANDOVER FROM UTRAN COMMAND is received | 140 |

The normative reference for this requirement is TS 25.133 [2] clauses 5.4.2 and A.5.4.

8.3.4.3 Test purpose

To verify that the UE meets the minimum requirement.

8.3.4.4 Method of test

8.3.4.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

The test parameters are given in table 8.3.4.3, 8.3.4.4 and 8.3.4.5 below. In the measurement control information it is indicated to the UE that event-triggered reporting with Event 3C shall be used.. The test consists of three successive time periods, with a time duration of T1, T2 and T3 respectively. At the start of time duration T1, the UE may not have any timing information of cell 2.

The UTRAN shall send a HANOVER FROM UTRAN COMMAND with activation time "now". In the GSM Handover command contained in that message, the IE starting time shall not be included. The RRC HANOVER FROM UTRAN COMMAND message shall be sent to the UE. The start of T3 is defined as the end of the last TTI, containing the HO command.

The requirements are also applicable for a UE not requiring compressed mode, in which case no compressed mode pattern should be sent for the parameters specified in table 8.3.4.3.

Table 8.3.4.3: General test parameters for Correct reporting of GSM neighbours in AWGN propagation condition

| Parameter | Unit | Value | Comment |
|--------------------------------------|------|---|---|
| DCH parameters | | Conversational / speech / UL:12.2 DL:12.2 kbps / CS RAB + UL:3.4 DL:3.4 kbps | As specified in TS 34.108 clause 6.10.2.4.1.4 |
| Power Control | | On | |
| Target quality value on DTCH | BLER | 0.001 | |
| Compressed mode patterns | | | Only applicable for UE requiring compressed mode patterns |
| - GSM carrier RSSI measurement | | DL Compressed mode reference pattern 2 in Set 2 | As specified in clause C.5, table C.5.2 |
| - GSM Initial BSIC identification | | Pattern 2 | As specified in clause TS 25.133 [2] 8.1.2.5.2.1 table 8.7. |
| - GSM BSIC re- confirmation | | Pattern 2 | As specified in clause TS 25.133 [2] 8.1.2.5.2.2 table 8.8. |
| Active cell | | Cell 1 | |
| Inter-RAT measurement quantity | | GSM Carrier RSSI | |
| BSIC verification required | | Required | |
| Threshold other system | dBm | -80 | Absolute GSM carrier RSSI threshold for event 3B and 3C. |
| Hysteresis | dB | 0 | |
| Time to Trigger | ms | 0 | |
| Filter coefficient | | 0 | |
| Monitored cell list size | | 24 FDD neighbours on Channel 1 6 GSM neighbours including the ARFCN of cell 2 | NOTE: See Annex I for cell information . The information is sent before the compressed mode patterns starts. |
| N Identify abort | | 66 | Taken from TS 25.133 [2] 8.1.2.5.2.1 table 8.7. |
| T Reconfirm abort | | 5.5 | Based on TS 25.133 [2] 8.1.2.5.2.2 table 8.8, rounded up due to 0.5 seconds quantization, as specified in section 10.3.6.33 of TS 25.331 [8] |
| T1 | s | 20 | |
| T2 | s | 5 | |
| T3 | s | 1 | |

Table 8.3.4.4: Cell Specific Parameters for Handover UTRAN to GSM cell case (cell 1)

| Parameter | Unit | Cell 1 (UTRA) |
|--|--------------|---------------|
| | | T1, T2, T3 |
| CPICH_Ec/I _{or} | dB | -10 |
| PCCPCH_Ec/I _{or} | dB | -12 |
| SCH_Ec/I _{or} | dB | -12 |
| PICH_Ec/I _{or} | dB | -15 |
| DCH_Ec/I _{or} | dB | Note 1 |
| OCNS_Ec/I _{or} | dB | Note 2 |
| \hat{I}_{or}/I_{oc} | dB | 0 |
| I_{oc} | dBm/3.84 MHz | -70 |
| CPICH_Ec/I _o | dB | -13 |
| Propagation Condition | | AWGN |
| Qrxlevmin | dBm | -115 |
| NOTE 1: The DPCH level is controlled by the power control loop | | |
| NOTE 2: The power of the OCNS channel that is added shall make the total power from the cell to be equal to I_{or} . | | |

Table 8.3.4.5: Cell Specific Parameters for Handover UTRAN to GSM cell case (cell 2)

| Parameter | Unit | Cell 2 (GSM) | |
|----------------------------|------|--------------|--------|
| | | T1 | T2, T3 |
| Absolute RF Channel Number | | ARFCN 1 | |
| RXLEV | dBm | -85 | -75 |

8.3.4.4.2 Procedure

- 1) The RF parameters for cell 1 are set up according to T1 in Table 8.3.4.4.
- 2) The UE is switched on.
- 3) A call is set up according to the test procedure specified in TS 34.108 [3] subclause 7.3.7. For UEs that require compressed mode, the compressed mode parameters are configured as in the table 8.3.4.3. The compressed mode shall remain inactive. Data shall be sent on the DTCH on the UTRA cell throughout the call.
- 4) The RF parameters for cell 2 are set up according to T1 in Table 8.3.4.6 and the SS configures a traffic channel.
- 5) The start of T1 is TTI aligned.
- 6) If Compressed mode is required, SS shall transmit PHYSICAL CHANNEL RECONFIGURATION message. Otherwise, Go to Step8.
- 7) UE shall transmit PHYSICAL CHANNEL RECONFIGURATION COMPLETE message.
- 8) The SS shall transmit a MEASUREMENT CONTROL message on cell 1.
- 9) At the T1-T2 transition, the SS shall switch the power of cell 2 as in Table 8.3.4.6.
- 10) The UE shall transmit a MEASUREMENT REPORT message triggered by event 3C.
- 11) The SS shall transmit a HANDOVER FROM UTRAN COMMAND message with activation time "now" and indicating the traffic channel of the target GSM cell to the UE through DCCH of the serving UTRAN cell. The start of T3 is defined as the end of the last TTI, containing the HANDOVER command.
- 12) The UE shall transmit a burst on the traffic channel of cell 2 implying that it has switched to the GSM cell. The UE sends a HANDOVER ACCESS message. If the UE transmits access bursts on the new DCCH of the target cell less than 100 ms from the beginning of time period T3, then the number of successful tests is increased by one.
- 13) At the end of T3 SS shall end the call and UE is switched off. Any timing information of cell 2 is deleted in the UE.

14) Repeat step 1-13 until the confidence level according to annex F.6.2 is achieved.

Specific Message Contents

All messages indicated above shall use the same content as described in the default message content in clause 9 of 34.108 [3], with the following exceptions:

PHYSICAL CHANNEL RECONFIGURATION message for Inter Rat measurement (step 6):

MEASUREMENT REPORT message for Inter-RAT test cases

This message is common for all inter RAT-frequency test cases and is described in Annex I.

8.3.4.5 Test requirements

Table 8.3.4.6: Cell Specific Parameters for Handover UTRAN to GSM cell case (cell 2), test requirements

| Parameter | Unit | Cell 2 (GSM) | |
|----------------------------|------|--|--------|
| | | T1 | T2, T3 |
| Absolute RF Channel Number | | BCCH ARFCN of cell A as defined in the initial conditions in clause 26.6.5.1 of TS 51.010-1 [25] for the GSM band under test. BCCH ARFCN is 744 for FDD Band II and PCS1900 under test. BCCH ARFCN is 241 for FDD Band V, VI or XIX and GSM850 under test. BCCH ARFCN is 114 for FDD Band VIII and GSM900 under test. | |
| RXLEV | dBm | -85 | -74 |

For the test to pass, the total number of successful tests shall be more than 90% of the cases with a confidence level of 95 %.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

8.3.4a Inter-system Handover from UTRAN FDD to E-UTRAN FDD

Editor's note: This Test case is incomplete for frequencies above 3GHz

- The Test system uncertainties applicable above 3GHz are undefined
- The Test Tolerances and Test Requirements applicable above 3GHz are undefined

8.3.4a.1 Definition and applicability

The UTRAN to E-UTRAN cell handover delay is defined as the time from the end of the last TTI containing an RRC message implying handover to the transmission on the channel of the new RAT.

The requirements and this test apply to Release 8 and later releases UTRA FDD UE that support E-UTRA FDD and inter-RAT PS handover to E-UTRA(FDD) from UTRA. Applicability requires support for EUTRA FGI bit 2.

8.3.4a.2 Minimum requirement

The UE shall start to transmit the PRACH to Cell 2 less than 85ms from the beginning of time period T3.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE:

The total HO delay is the sum of the RRC procedure delay and interruption time:

The RRC procedure delay is 50 ms

The interruption time is $T_{interrupt} = T_{search} + T_{IU} + 20\text{ ms}$

Where:

T_{search} : 0 ms since the target cell is known.

T_{IU} : 15 ms since the PRACH configuration used in the target cell (E-UTRAN) is assumed to be 4 for FDD and 53 for TDD respectively as specified in table 5.7.1-2 and 5.7.1-4 in TS 36.211 [35]. T_{SI} Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 85 ms for the test case.

The normative reference for this requirement is TS 25.133 [2] clauses 5.4a and A.5.4a

8.3.4a.3 Test purpose

To verify that the UE meets the minimum requirement.

8.3.4a.4 Method of test

8.3.4a.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: see table K.2 in Annex K.

The test parameters are given in Table 8.3.4a.1, 8.3.4a.2 and 8.3.4a.3 below. In the measurement control information it is indicated to the UE that event-triggered reporting with Event 3A shall be used. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE does not have any timing information of Cell 2. Starting T2, Cell 2 becomes detectable and the UE is expected to detect and send a measurement report.

The UTRAN shall send a Handover from UTRAN command with activation time "now" with a new active cell, cell 2. In the E-UTRAN Handover command contained in that message, the IE starting time shall not be included. The RRC HANDOVER FROM UTRAN COMMAND message shall be sent to the UE. The start of T3 is defined as the end of last TTI containing the HO command.

The requirements are also applicable for a UE not requiring compressed mode, in which case no compressed mode pattern should be sent for the parameters specified in table 8.3.4a.1.

Table 8.3.4a.1: General test parameters for UTRAN FDD to E-UTRAN FDD handover test case

| Parameter | Unit | Value | Comment |
|--|------|---|---|

| Propagation Condition | | AWGN | | |
| NOTE 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols. | | | | |
| NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled. | | | | |
| NOTE 3: RSRP and l_o levels have been derived from other parameters for information purposes. They are not settable parameters themselves. | | | | |

8.3.4a.4.2 Procedure

- 1) The RF parameters for cell 1 are set up according to T1 in Table 8.3.4a.2.
- 2) The UE is switched on.
- 3) A call is set up according to the test procedure specified in TS 34.108 [3] subclause 7.3.4. For UEs that require compressed mode, the compressed mode parameters are configured as in the Table 8.3.4a.1. The compressed mode shall remain inactive. Data shall be sent on the DTCH on the UTRA cell throughout the call.
- 4) The RF parameters for cell 2 are set up according to T1 in Table 8.3.4a.3 and the SS configures a traffic channel.
- 5) The start of T1 is TTI aligned.
- 6) If Compressed mode is required, SS shall transmit PHYSICAL CHANNEL RECONFIGURATION message. Otherwise , Go to Step8.
- 7) UE shall transmit PHYSICAL CHANNEL RECONFIGURATION COMPLETE message.
- 8) The SS shall transmit a MEASUREMENT CONTROL message on cell 1.
- 9) After T1 expired, the SS shall switch the power of cell 2 from T1 to T2 as in Table 8.3.4a.3.
- 10)The UE shall transmit a MEASUREMENT REPORT message triggered by event 3A.
- 11)The SS shall transmit a HANDOVER FROM UTRAN COMMAND message with activation time "now" and indicating the traffic channel of the target E-UTRAN FDD cell to the UE through DCCH of the serving UTRAN cell. The start of T3 is defined as the end of the last TTI, containing the HANDOVER COMMAND, at that instant the SS shall switch the power setting from T2 to T3 as specified in Table 8.3.4a.2 and Table 8.3.4a.3.
- 12)The UE shall transmit a PRACH to cell 2 implying that it has switched to the E-UTRAN FDD cell. If the UE transmits the PRACH to cell2 less than 85 ms from the beginning of time period T3, then the number of successful tests is increased by one.
- 13)At the end of T3 SS shall end the call and UE is switched off. Any timing information of cell 2 is deleted in the UE.
- 14)Repeat step 1-13 until the confidence level according to Tables G.2.3-1 in TS 36.521-3 [38] is achieved.

Specific Message Contents

All messages indicated above shall use the same content as described in the default message content in clause 9 of TS 34.108 [3] and clause 4.6.1, 4.6.3, 4.6.4 and 4.7B.1 of TS 36.508 [33], with the following exceptions:

| Propagation Condition | | AWGN | | |
| NOTE 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols. | | | | |
| NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled. | | | | |
| NOTE 3: RSRP and I_o levels have been derived from other parameters for information purposes. They are not settable parameters themselves. | | | | |

For the test to pass, the total number of successful tests shall be at least 90% of the cases with a confidence level of 95 %.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

8.3.4b Inter-system Handover from UTRAN FDD to E-UTRAN TDD

Editor's note: This Test case is incomplete for frequencies above 3GHz

- The Test system uncertainties applicable above 3GHz are undefined
- The Test Tolerances and Test Requirements applicable above 3GHz are undefined

8.3.4b.1 Definition and applicability

The UTRAN FDD to E-UTRAN TDD cell handover delay is defined as the time from the end of the last TTI containing an RRC message implying hard handover to the transmission on the channel of the new RAT.

The requirements and this test apply to Release 8 and later releases the combined UTRAN FDD and E-UTRAN TDD UE and inter-RAT PS handover to E-UTRA(TDD) from UTRA. Applicability requires support for EUTRA FGI bit 2.

8.3.4b.2 Minimum requirement

The UE shall begin to send PRACH to the target cell less than [80][85] ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The test requirement in this case is expressed as:

- The total HO delay is the sum of the RRC procedure delay and interruption time.
- The RRC procedure delay is 50 ms.
- The interruption time is defined as follows:

$$T_{\text{interrupt}} = T_{\text{search}} + T_{\text{IU}} + 20 \text{ ms}$$

Where:

- T_{search} : is the time required to search the target cell when the target cell is not already known when the handover command is received by the UE. If the target cell is known, then $T_{\text{search}} = 0$ ms
- T_{IU} : is the interruption uncertainty in acquiring the first available PRACH occasion in the new cell. T_{IU} can be up to 30 ms. It is chosen 10 ms since the PRACH configuration used in the target cell (E-UTRAN TDD) is assumed to be 53 as specified in table 5.7.1-3 and 5.7.1-4 in TS 36.211 [35].

Thus the total interruption time is 30 ms.

The UE shall start to transmit the PRACH to Cell 2 with a handover delay less than 80 ms.

The normative reference for this requirement is TS 25.133 [2] clauses 5.4b.2 and A.5.4b.

8.3.4b.3 Test purpose

To verify that the UE meets the minimum requirement.

8.3.4b.4 Method of test

8.3.4b.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: see table K.2 in Annex K.

The test parameters are given in table 8.3.4b.1, 8.3.4b.2 and 8.3.4b.3 below. In the measurement control information it is indicated to the UE that event-triggered reporting with Event 3A shall be used. The test consists of three successive time periods, with a time duration of T1, T2 and T3 respectively. At the start of time duration T1, the UE may not have any timing information of cell 2. Starting T2, cell2 becomes detectable and the UE is expected to detect and send a measurement report.

The UTRAN shall send a HANDOVER FROM UTRAN COMMAND with activation time "now" with a new active cell, cell2. In the E-UTRAN TDD Handover command contained in that message, the IE starting time shall not be included. The RRC HANDOVER FROM UTRAN COMMAND message shall be sent to the UE. The start of T3 is defined as the end of the last TTI, containing the HO command.

The requirements are also applicable for a UE not requiring compressed mode, in which case no compressed mode pattern should be sent for the parameters specified in table 8.3.4b.1.

Table 8.3.4b.1: General test parameters for UTRAN FDD to E-UTRAN TDD handover test case

| Parameter | Unit | Value | Comment |
|--|------|---|---|

| N_{oc} ^{Note 2} | dBm/15 kHz | -98 | | |
| \hat{E}_s / N_{oc} ^{Note 3} | dB | -infinity | 7 | 7 |
| l_o ^{Note 3} | dBm/9 MHz | -70.22 | -62.43 | -62.43 |
| RSRP ^{Note 3} | dBm/15 KHz | -infinity | -91 | -91 |
| Propagation Condition | | AWGN | | |
| NOTE 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols. | | | | |
| NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled. | | | | |
| NOTE 3: RSRP and l_o levels have been derived from other parameters for information purposes. They are not settable parameters themselves. | | | | |

8.3.4b.4.2 Procedure

- 1) The RF parameters for cell 1 are set up according to T1 in Table 8.3.4b.2.
- 2) The UE is switched on.
- 3) A call is set up according to the test procedure specified in TS 34.108 [3] subclause 7.3.4. For UEs that require compressed mode, the compressed mode parameters are configured as in the table 8.3.4b.1. The compressed mode shall remain inactive. Data shall be sent on the DTCH on the UTRA cell throughout the call.
- 4) The RF parameters for cell 2 are set up according to T1 in Table 8.3.4b.3 and the SS configures a traffic channel.
- 5) The start of T1 is TTI aligned.
- 6) If Compressed mode is required, SS shall transmit PHYSICAL CHANNEL RECONFIGURATION message. Otherwise , Go to Step8.
- 7) UE shall transmit PHYSICAL CHANNEL RECONFIGURATION COMPLETE message.
- 8) The SS shall transmit a MEASUREMENT CONTROL message on cell 1.

- 9) At the T1-T2 transition, the SS shall switch the power of cell 2 as in Table 8.3.4b.3.
- 10) The UE shall transmit a MEASUREMENT REPORT message triggered by event 3A.
- 11) The SS shall transmit a HANDOVER FROM UTRAN COMMAND message with activation time "now" and indicating the traffic channel of the target E-UTRAN TDD cell to the UE through DCCH of the serving UTRAN cell. The start of T3 is defined as the end of the last TTI, containing the HANDOVER command.
- 12) The UE shall transmit a PRACH to cell 2 implying that it has switched to the E-UTRAN TDD cell. If the UE transmits the PRACH to cell2 less than 80 ms from the beginning of time period T3, then the number of successful tests is increased by one.
- 13) At the end of T3 SS shall end the call and UE is switched off. Any timing information of cell 2 is deleted in the UE.
- 14) Repeat step 1-13 until the confidence level according to Tables G.2.3-1 in TS36.521-3 [38] is achieved.

Specific Message Contents

All messages indicated above shall use the same content as described in the default message content in clause 9 of TS 34.108 [3] and clause 4.6.1, 4.6.3, 4.6.4 and 4.7B.1 of TS 36.508 [33], with the following exceptions:

PHYSICAL CHANNEL RECONFIGURATION message for Inter RAT measurement (step 6):

| I_o ^{Note 3} | dBm/9 MHz | -70.22 | -61.75 | -61.75 |
| Propagation Condition | | AWGN | | |
| NOTE 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols. | | | | |
| NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled. | | | | |
| NOTE 3: RSRP and I_o levels have been derived from other parameters for information purposes. They are not settable parameters themselves. | | | | |

For the test to pass, the total number of successful tests shall be more than 90% of the cases with a confidence level of 95 %.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

8.3.4c Inter-system Handover from UTRAN FDD to E-UTRAN FDD: Unknown Target Cell

Editor's note: This Test case is incomplete for frequencies above 3GHz

- The Test system uncertainties applicable above 3GHz are undefined
- The Test Tolerances and Test Requirements applicable above 3GHz are undefined

8.3.4c.1 Definition and applicability

The UTRAN to E-UTRAN cell handover delay is defined as the time from the end of the last TTI containing an RRC message implying handover to the transmission on the channel of the new RAT.

The requirements and this test apply to Release 8 and later releases UTRA FDD UE that support E-UTRA FDD and inter-RAT PS handover to E-UTRA(FDD) from UTRA. Applicability requires support for EUTRA FGI bit 2.

8.3.4c.2 Minimum requirement

The UE shall start to transmit the PRACH to Cell 2 less than 165 ms from the beginning of time period T2.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE:

The total HO delay is the sum of the RRC procedure delay and interruption time:

The RRC procedure delay is 50 ms

The interruption time is $T_{interrupt} = T_{search} + T_{IU} + 20\text{ ms}$

Where:

T_{search} : 80 ms in case the target cell is unknown.

T_{IU} : 15 ms since the PRACH configuration used in the target cell (E-UTRAN) is assumed to be 4 for FDD and 53 for TDD respectively as specified in table 5.7.1-2 and 5.7.1-4 in TS 36.211 [35]. T_{SI} Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 165 ms for the test case.

The normative reference for this requirement is TS 25.133 [2] clauses 5.4a and A.5.4c

8.3.4c.3 Test purpose

To verify that the UE meets the minimum requirement.

8.3.4c.4 Method of test

8.3.4c.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: see table K.2 in Annex K.

The test parameters are given in Table 8.3.4c.1, 8.3.4c.2 and 8.3.4c.3 below. The test consists of two successive time periods, with time durations of T1 and T2 respectively. At the start of time duration T1, the UE does not have any timing information of Cell 2. No compressed mode patterns are configured in the test case.

The UTRAN shall send a Handover from UTRAN command with activation time "now" with a new active cell, cell 2. In the E-UTRAN Handover command contained in that message, the IE starting time shall not be included. The RRC HANDOVER FROM UTRAN COMMAND message shall be sent to the UE towards the end of the time period T1. The start of T2 is defined as the end of last TTI containing the handover command.

Table 8.3.4c.1: General test parameters for UTRAN FDD to E-UTRAN FDD handover test case; unknown target E-UTRAN FDD cell

| Parameter | Unit | Value | Comment |
|-------------------------------|-------------------|--|--|
| DCH parameters | | DL Reference Measurement Channel 12.2 kbps | As specified in TS 25.101 [1] section A.3.1 |

| Propagation Condition | | AWGN | |
| NOTE 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols. | | | |
| NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled. | | | |
| NOTE 3: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves. | | | |

8.3.4c.4.2 Procedure

- 1) The RF parameters for cell 1 are set up according to T1 in Table 8.3.4c.2.
- 2) The UE is switched on.
- 3) A call is set up according to the test procedure specified in TS 34.108 [3] subclause 7.3.4.
- 4) The RF parameters for cell 2 are set up according to T1 in Table 8.3.4 c.4 and the SS configures a traffic channel. T1 starts.
- 5) After T1 expired, the SS shall transmit a HANOVER FROM UTRAN COMMAND message with activation time "now" and indicating the traffic channel of the target E-UTRAN FDD cell to the UE through DCCH of the serving UTRAN cell. The start of T2 is defined as the end of the last TTI, containing the HANOVER COMMAND, at that instant the SS shall switch the power setting from T1 to T2 as specified in Table 8.3.4c.2 and Table 8.3.4c.4.
- 6) The UE shall transmit a PRACH to cell 2 implying that it has switched to the E-UTRAN FDD cell. If the UE transmits the PRACH to cell2 less than 165 ms from the beginning of time period T2, then the number of successful tests is increased by one.
- 7) At the end of T2 SS shall end the call and UE is switched off. Any timing information of cell 2 is deleted in the UE.
- 8) Repeat step 1-7 until the confidence level according to Tables G.2.3-1 in TS 36.521-3 [38] is achieved.

Specific Message contents

All messages indicated above shall use the same content as described in the default message content in clause 9 of TS 34.108 [3] and in clause 4.6.1, 4.6.3, 4.6.4 and 4.7B.1 of TS 36.508 [33], with the following exceptions:

8.3.4c.5 Test requirements

Table 8.3.4c.4: Test requirement for Cell specific test parameters for UTRAN FDD to E-UTRAN FDD handover test case (cell 2)

| Parameter | Unit | Cell 2 (E-UTRA FDD) | |
|--|------------|---------------------|----------|
| | | T1 | T2 |
| E-UTRA RF Channel number | | 1 | |
| $BW_{channel}$ | MHz | 10 | |
| OCNG Patterns defined in TS 36.521-3 [38] D.1.1 (OP.1 FDD) and in D.1.2 (OP.2 FDD) | | OP.2 FDD | OP.1 FDD |
| PBCH_RA | dB | 0 | |
| PBCH_RB | dB | | |
| PSS_RA | dB | | |
| SSS_RA | dB | | |
| PCFICH_RB | dB | | |
| PHICH_RA | dB | | |
| PHICH_RB | dB | | |
| PDCCH_RA | dB | | |
| PDCCH_RB | dB | | |
| PDSCH_RA | dB | | |
| PDSCH_RB | dB | | |
| OCNG_RA ^{Note 1} | dB | | |
| OCNG_RB ^{Note 1} | dB | | |
| \hat{E}_s / I_{ot} | dB | -infinity | 0 |
| N_{oc} ^{Note 2} | dBm/15 kHz | -98 | |
| \hat{E}_s / N_{oc} | dB | -infinity | 0 |
| RSRP ^{Note 3} | dBm/15 KHz | -infinity | -98 |
| Propagation Condition | | AWGN | |
| NOTE 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols. | | | |
| NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled. | | | |
| NOTE 3: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves. | | | |

For the test to pass, the total number of successful tests shall be at least 90% of the cases with a confidence level of 95%.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

8.3.4d Inter-system Handover from UTRAN FDD to E-UTRAN TDD; Unknown Target Cell

Editor's note: This Test case is incomplete for frequencies above 3GHz

- The Test system uncertainties applicable above 3GHz are undefined
- The Test Tolerances and Test Requirements applicable above 3GHz are undefined

8.3.4d.1 Definition and applicability

The UTRAN FDD to E-UTRAN TDD cell handover delay is defined as the time from the end of the last TTI containing an RRC message implying hard handover to the transmission on the channel of the new RAT.

The requirements and this test apply to Release 8 and later releases the combined UTRAN FDD and E-UTRAN TDD UE and inter-RAT PS handover to E-UTRA(TDD) from UTRA. Applicability requires support for EUTRA FGI bit 2.

8.3.4d.2 Minimum requirement

The UE shall begin to send PRACH to the target cell less than 160 ms from the beginning of time period T2.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The test requirement in this case is expressed as:

- The total HO delay is the sum of the RRC procedure delay and interruption time.
- The RRC procedure delay is 50 ms.
- The interruption time is defined as follows:

$$T_{\text{interrupt}} = T_{\text{search}} + T_{\text{IU}} + 20 \text{ ms}$$

Where:

- T_{search} : is the time required to search the target cell when the target cell is not already known when the handover command is received by the UE. T_{search} is 80 ms if the target cell is unknown and signal quality is sufficient for successful cell detection on the first attempt.
- T_{IU} : is the interruption uncertainty in acquiring the first available or PRACH occasion in the new cell. T_{IU} can be up to 30 ms. It is chosen 10 ms since the PRACH configuration used in the target cell (E-UTRAN TDD) is assumed to be 53 as specified in table 5.7.1-3 and 5.7.1-4 in TS 36.211 [35].

The total interruption time is 110 ms.

Thus the total HO delay is 160 ms.

The UE shall start to transmit the PRACH to Cell 2 with a handover delay less than 160ms.

The normative reference for this requirement is TS 25.133 [2] clauses 5.4b.2 and A.5.4d.

8.3.4d.3 Test purpose

To verify that the UE meets the minimum requirement.

8.3.4d.4 Method of test

8.3.4d.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: see table K.2 in Annex K.

The test parameters are given in Table 8.3.4d.1, 8.3.4d.2 and 8.3.4d.3 below. The test consists of two successive time periods, with time durations of T1 and T2 respectively. At the start of time duration T1, the UE does not have any timing information of Cell 2. No compressed mode patterns are configured in the test case.

The UTRAN shall send a Handover from UTRAN command with activation time "now" with a new active cell, cell 2. In the E-UTRAN Handover command contained in that message, the IE starting time shall not be included. The RRC HANDOVER FROM UTRAN COMMAND message shall be sent to the UE towards the end of the time period T1. The start of T2 is defined as the end of last TTI containing the handover command.

Table 8.3.4d.1: General test parameters for UTRAN FDD to E-UTRAN TDD handover test case

| Parameter | Unit | Value | Comment |
|--------------------------------|-------------------|---|--|
| DCH parameters | | DL Reference Measurement Channel 12.2 kbps | As specified in TS 25.101 [1] section A.3.1 |

| NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N_{oc} to be fulfilled. | | | |
| NOTE 3: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves. | | | |

8.3.4d.4.2 Procedure

- 1) The RF parameters for cell 1 are set up according to T1 in Table 8.3.4d.2.
- 2) The UE is switched on.
- 3) A call is set up according to the test procedure specified in TS 34.108 [3] subclause 7.3.4. Data shall be sent on the DTCH on the UTRA cell throughout the call.
- 4) The RF parameters for cell 2 are set up according to T1 in Table 8.3.4d.3. The start of T1 is TTI aligned.
- 5) At the T1-T2 transition, the SS shall switch the power of cell 2 to T2 as in Table 8.3.4d.3.
- 6) The SS shall transmit a HANDOVER FROM UTRAN COMMAND message with activation time "now" with a new active cell, cell 2. The IE starting time shall not be included in the E-UTRAN handover command. The start of T2 is defined as the end of the last TTI, containing the HANDOVER command.
- 7) The UE shall transmit a PRACH to cell 2 implying that it has switched to the E-UTRAN TDD cell. If the UE transmits the PRACH to cell2 less than 160 ms from the beginning of time period T2, then the number of successful tests is increased by one.
- 8) At the end of T2 SS shall end the call and UE is switched off. Any timing information of cell 2 is deleted in the UE.
- 9) Repeat step 1-8 until the confidence level according to Tables G.2.3-1 in TS 36.521-3 [38] is achieved.

Specific Message Contents

All messages indicated above shall use the same content as described in the default message content in clause 9 of TS 34.108 [3] and in clause 4.6.1, 4.6.3, 4.6.4 and 4.7B.1 of TS 36.508 [33], with the following exceptions:

HANDOVER FROM UTRAN COMMAND message (step 6):

| Information Element | Value/remark |
|------------------------------------|--|
| Message Type (10.2.15 in TS25.331) | |
| UE information elements | |
| -RRC transaction identifier | 0 |
| -Integrity check info | |
| -message authentication code | SS calculates the value of MAC-I for this message and writes to this IE. The first/ leftmost bit of the bit string contains the most significant bit of the MAC-I. |
| -RRC message sequence number | SS provides the value of this IE, from its internal counter. |
| -Activation time | Now |
| RB information elements | |
| -RAB information list | 1 |
| -RAB Info | |
| - RAB identity | 0000 0001B The first/ leftmost bit of the bit string contains the most significant bit of the RAB identity. |

8.3.4d.5 Test requirements

For the test to pass, the total number of successful tests shall be more than 90% of the cases with a confidence level of 95 %.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

8.3.5 Cell Re-selection in CELL_FACH

8.3.5.1 One frequency present in neighbour list

8.3.5.1.1 Definition and applicability

The cell re-selection delay is defined as the time between the occurrence of an event which will trigger Cell Reselection process and the moment in time when the UE starts sending the preambles on the PRACH for sending RRC CELL UPDATE message to the UTRAN.

The requirements and this test apply to the FDD UE.

8.3.5.1.2 Minimum requirements

The cell re-selection delay shall be less than 1.6 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

If a cell has been detectable at least $T_{\text{identify,intra}}$, the cell reselection delay in CELL_FACH state to a cell in the same frequency shall be less than

$$T_{\text{reselection,intra}} = T_{\text{Measurement_Period Intra}} + T_{\text{IU}} + 20 + T_{\text{SI}} + T_{\text{RA}} \text{ ms}$$

where

$$T_{\text{Measurement_Period Intra}} = 200 \text{ ms.}$$

T_{IU} is the interruption uncertainty when changing the timing from the old to the new cell. T_{IU} can be up to one frame (10 ms).

T_{SI} = The time required for receiving all the relevant system information data according to the reception procedure and the RRC procedure delay of system information blocks defined in 25.331 for a UTRAN cell. 1280 ms is assumed in this test case.

T_{RA} = The additional delay caused by the random access procedure. T_{RA} is a delay is caused by the physical random access procedure described in TS 25.214 clause 6.1. A persistence value is assumed to be 1 in this test case and therefore T_{RA} in this test case is 40 ms.

These requirements assume radio conditions to be sufficient, so reading of system information can be done without errors.

The normative reference for this requirement is TS 25.133 [2] clauses 5.5.2.1.1 and A.5.5.1.

8.3.5.1.3 Test purpose

The purpose of this test is to verify the requirement for the cell re-selection delay in CELL_FACH state in the single carrier case

8.3.5.1.4 Method of test

8.3.5.1.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

The test parameters are given in table 8.3.5.1.1 to 8.3.5.1.5. The UE is requested to monitor neighbouring cells on 1 carrier. The maximum repetition period of the relevant system info blocks that needs to be received by the UE to camp on a cell shall be 1280 ms.

Table 8.3.5.1.1: General test parameters for Cell Re-selection in CELL_FACH, one freq. in neighbour list

| Parameter | | Unit | Value | Comment |
|--|-----------------|------|-----------------------------------|---|
| Initial condition | Active cell | | Cell2 | |
| | Neighbour cells | | Cell1, Cell3, Cell4, Cell5, Cell6 | |
| Final condition | Active cell | | Cell1 | |
| Access Service Class (ASC#0) – Persistence value | | - | 1 | Selected so that no additional delay is caused by the random access procedure. The value shall be used for all cells in the test. |
| HCS | | | | Not used |
| T_{SI} | | ms | 1280 | See Annex I for the SIB repetition period of system information blocks. |
| T1 | | s | 15 (initial), 5 (repetition) | |
| T2 | | s | 5 | |

The transport and physical parameters of the S-CCPCH carrying the FACH are defined in TS 34.108 [3] clause 6.1.0b (Contents of System Information Block type 5 (FDD)).

8.3.5.1.4.2 Procedure

- 1) The SS activates cell 1-6 with RF parameters set up according to T1 in table 8.3.5.1.5.
- 2) The UE is switched on.
- 3) An RRC connection is set up according to the signalling sequence in the generic set-up procedure specified in TS 34.108 [3] subclause 7.3.5 to place the UE in the CELL_FACH state on Cell 2 and the SS waits for this process to complete.
- 4) After 15 seconds at initial or 5 seconds for repeated case from completion of step 3 or the beginning of T1, the parameters are changed to those defined for T2 in table 8.3.5.1.5.

- 5) If the UE responds on Cell 1 with a PRACH (CELL UPDATE message cause "cell reselection") within 1.84 s, then the success is recorded, the SS shall transmit a CELL UPDATE CONFIRM message and then the procedure moves to step 7.
- 6) Since the UE has failed to respond with the correct message within the allowed time, a failure is recorded. The SS shall then wait for a total of 5 s from the beginning of T2 and if no response is received, the UE shall be switched off and the procedure returns to step 1. Otherwise the SS shall transmit a CELL UPDATE CONFIRM message and then the procedure continues with step 7.
- 7) After total of 5 s from the beginning of T2, the parameters are changed to those defined for T1 in table 8.3.5.1.5.
- 8) If the UE responds on Cell 2 with a PRACH (CELL UPDATE message cause "cell reselection") within 1.84 s, then a success is recorded and the procedure moves to step 10.
- 9) Since the UE has failed to respond with the correct message within the allowed time, a failure is recorded. The SS shall then wait for a total of 15 s at initial or 5 s for repeated case from the beginning of T1 and if no response is received the UE shall be switched off and the procedure returns to step 1. Otherwise the SS shall transmit a CELL UPDATE CONFIRM message and then the procedure continues with step 10.
- 10) Steps 4 to 10 are repeated until the confidence level according to annex F.6.2 is achieved .

NOTE 1: The time required for receiving all the relevant system information data according to the reception procedure and the RRC procedure delay of system information blocks defined in 25.331 for a UTRAN cell. Since the maximum time to read the relevant system info blocks that needs to be received by the UE to camp on a cell is 1420ms (see note 2) and the maximum RRC procedure delay for reception system information block is 100ms, 1520 ms is assumed in this test case. Therefore the cell re-selection delay shall be less than 1.84 s.(Minimum requirement + 240ms). Specific Message Contents

NOTE 2: The maximum repetition period of the relevant system info blocks that needs to be received by the UE to camp on a cell is 1280ms. The Master Information Block (MIB) is repeated every 8 frame and SIB5 (and SIB11) is segmented into 4 segments where the first segment is scheduled adjacent to the MIB at SIB_POS=40 and the other three segments are scheduled after the MIB (SIB_POS=42, 44 and 46). The maximum time for a UE to read SIB5 will occur if the UE start reading the BCH at the SFN after the MIB located prior to the first segment of SIB5 (SIB_POS 32). Then the UE will not be able to read SIB5 until the second occurrence of SIB5, which will happen at SIB_POS 46 + 1280ms. This gives that the maximum time for the UE to read the relevant system info will be 1420ms ((SIB_POS 46 – SIB_POS 32)*10ms +1280ms).

All messages indicated above shall use the same content as described in the default message content in clause 9 of 34.108 [3], with the following exceptions:

Contents of CELL UPDATE CONFIRM message for CELL_FACH

| Information Element | Value/remark |
|----------------------------|--------------------|
| RRC transaction identifier | 0 |
| Activation time | Not Present |

All other parameters and conditions specified in table 8.3.5.1.4 are unchanged.

NOTE 1: These parameters are not directly settable, but are derived by calculation from the settable parameters.

NOTE 2: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

8.3.5.2 Two frequencies present in the neighbour list

8.3.5.2.1 Definition and applicability

The cell re-selection delay is defined as the time between the occurrence of an event which will trigger Cell Reselection process and the moment in time when the UE starts sending the preambles on the PRACH for sending RRC CELL UPDATE message to the UTRAN.

The requirements and this test apply to the FDD UE.

8.3.5.2.2 Minimum requirements

The cell re-selection delay shall be less than 1.9 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

If a cell has been detectable at least $T_{\text{identify,inter}}$, the cell reselection delay in CELL_FACH state to a FDD cell on a different frequency shall be less than

$$T_{\text{reselection,inter}} = T_{\text{Measurement inter}} + T_{\text{IU}} + 20 + T_{\text{SI}} + T_{\text{RA}} \text{ ms}$$

where

$T_{\text{Measurement inter}}$ is 480 ms in this case

T_{IU} is the interruption uncertainty when changing the timing from the old to the new cell. T_{IU} can be up to one frame (10 ms).

T_{SI} = The time required for receiving all the relevant system information data according to the reception procedure and the RRC procedure delay of system information blocks defined in 25.331 for a UTRAN cell. 1280 ms is assumed in this test case.

T_{RA} = The additional delay caused by the random access procedure. T_{RA} is a delay is caused by the physical random access procedure described in TS 25.214 clause 6.1. A persistence value is assumed to be 1 in this test case and therefore T_{RA} in this test case is 40 ms.

These requirements assume radio conditions to be sufficient, so that reading of system information can be done without errors.

The normative reference for this requirement is TS 25.133 [2] clauses 5.5.2.1.2 and A.5.5.2.

8.3.5.2.3 Test purpose

The purpose of this test is to verify the requirement for the cell re-selection delay in CELL_FACH state in the single carrier case

8.3.5.2.4 Method of test

8.3.5.2.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

The test parameters are given in table 8.3.5.2.1 to 8.3.5.2.5. The UE is requested to monitor neighbouring cells on 2 carriers. The maximum repetition period of the relevant system info blocks that needs to be received by the UE to camp on a cell shall be 1 280 ms

Table 8.3.5.2.1: General test parameters for Cell Re-selection in CELL_FACH, two frequencies in neighbour list

| Parameter | | Unit | Value | Comment |
|---|-----------------|------|-----------------------------------|---|
| Initial condition | Active cell | | Cell2 | |
| | Neighbour cells | | Cell1, Cell3, Cell4, Cell5, Cell6 | |
| Final condition | Active cell | | Cell1 | |
| Access Service Class (ASC#0) – Persistence value | | - | 1 | Selected so that no additional delay is caused by the random access procedure. The value shall be used for all cells in the test. |
| HCS | | | | Not used |
| T _{SI} | | ms | 1280 | See Annex I for the SIB repetition period of system information blocks. |
| T1 | | s | 15 (initial), 5 (repetition) | |
| T2 | | s | 5 | |
| NOTE: Monitored cell list size has 6 cells on 2 carriers. See Annex I for the cell information. | | | | |

The transport and physical parameters of the S-CCPCH carrying the FACH are defined in TS 34.108 [3] clause 6.1.0b (Contents of System Information Block type 5 (FDD)).

8.3.5.2.4.2 Procedure

- 1) The RF parameters for cell 1 are set up according to T1 in table 8.3.5.2.5.
- 2) The UE is switched on.
- 3) An RRC connection is set up according to the signalling sequence in the generic set-up procedure specified in TS 34.108 [3] subclause 7.3.5 to place the UE in the CELL_FACH state on Cell 2 and the SS waits for this process to complete.
- 4) After 15 seconds at initial or 5 seconds for repeated case from completion of step3 or the beginning of T1, the parameters are changed to those defined for T2 in table 8.3.5.2.5.
- 5) If the UE responds on Cell 1 with a PRACH (CELL UPDATE message cause "cell reselection") within 2.14 s, then the success is recorded, the SS shall transmit a CELL UPDATE CONFIRM message and then the procedure moves to step 7.
- 6) Since the UE has failed to respond with the correct message within the allowed time, a failure is recorded. The SS shall then wait for a total of 5 s from the beginning of T2 and if no response is received, the UE shall be switched off and the procedure returns to step 1. Otherwise the SS shall transmit a CELL UPDATE CONFIRM message and then the procedure continues with step 7.
- 7) After total of 5 s from the beginning of T2, the parameters are changed to those defined for T1 in table 8.3.5.2.5.
- 8) If the UE responds on Cell 2 with a PRACH (CELL UPDATE message cause "cell reselection") within 2.14 s, then a success is recorded and the procedure moves to step 10.
- 9) Since the UE has failed to respond with the correct message within the allowed time, a failure is recorded. The SS shall then wait for a total of 15 s at initial or 5 s for repeated case from the beginning of T1 and if no response is received the UE shall be switched off and the procedure returns to step 1. Otherwise the SS shall transmit a CELL UPDATE CONFIRM message and then the procedure continues with step 10.
- 10) Steps 4 to 10 are repeated until the confidence level according to annex F.6.2 is achieved.

NOTE 1: The time required for receiving all the relevant system information data according to the reception procedure and the RRC procedure delay of system information blocks defined in 25.331 for a UTRAN cell. Since the maximum time to read the relevant system info blocks that needs to be received by the UE to camp on a cell is 1420ms (see note 2) and the maximum RRC procedure delay for reception system information block is 100ms, 1520 ms is assumed in this test case. Therefore the cell re-selection delay shall be less than 2.14 s. (Minimum requirement + 240ms).

NOTE 2: The maximum repetition period of the relevant system info blocks that needs to be received by the UE to camp on a cell is 1280ms. The Master Information Block (MIB) is repeated every 8 frame and SIB5 (and SIB11) is segmented into 4 segments where the first segment is scheduled adjacent to the MIB at SIB_POS=40 and the other three segments are scheduled after the MIB (SIB_POS=42, 44 and 46). The maximum time for a UE to read SIB5 will occur if the UE start reading the BCH at the SFN after the MIB located prior to the first segment of SIB5 (SIB_POS 32). Then the UE will not be able to read SIB5 until the second occurrence of SIB5, which will happen at SIB_POS 46 + 1280ms. This gives that the maximum time for the UE to read the relevant system info will be 1420ms ((SIB_POS 46 – SIB_POS 32)*10ms +1280ms).

Specific Message Contents

All messages indicated above shall use the same content as described in the default message content in clause 9 of 34.108 [3], with the following exceptions:

Contents of CELL UPDATE CONFIRM message for CELL_FACH

All other parameters and conditions specified in table 8.3.5.2.4 are unchanged.

NOTE 1: These parameters are not directly settable, but are derived by calculation from the settable parameters.

NOTE 2: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

8.3.5.3 Cell Reselection to GSM

8.3.5.3.1 Definition and applicability

The cell re-reselection delay is defined as the time from the beginning of time period T2, to the moment when the UE starts to transmit the random access in Cell 2 (the GSM cell).

This requirements and this test apply to UE supporting FDD PS and GSM GPRS.

8.3.5.3.2 Minimum requirements

The cell re-selection delay shall be less than $5.5 + T_{RA}$ s.

The rate of correct reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay can be expressed

$$T_{\text{reselection, GSM}} = T_{\text{identify, GSM}} + T_{\text{measurement, GSM}} + 40 + T_{\text{BCCH}} + T_{\text{RA}} \text{ ms}$$

where:

$T_{\text{identify, GSM}}$ Specified in TS 25.133 [2] clause 8.4.2.5.2.1, here it is 2880 ms

$T_{\text{measurement, GSM}}$ Specified in TS 25.133 [2] clause 5.5.2.1.4, here it is 640 ms

T_{BCCH} According to TS 05.08 [20] for R99 and TS 45.008 [30] for Rel-4 and later releases, the maximum time allowed to read the BCCH data, when being synchronized to a BCCH carrier, is 1.9 s.

T_{RA} The additional delay caused by the random access procedure in the GSM cell, is 10 ms (2 GSM radio frames).

These requirements assume radio conditions to be sufficient, so reading of system information can be done without errors.

The normative reference for this requirement is TS 25.133 [2] clauses 5.5.2.1.4 and A.5.5.3.

8.3.5.3.3 Test purpose

The purpose of this test is to verify the requirement for the cell re-selection delay in CELL_FACH state.

8.3.5.3.4 Method of test

8.3.5.3.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

The test parameters are given in table 8.3.5.3.1 to 8.3.5.3.5. This scenario implies the presence of 1 UTRAN serving cell, and 1 GSM cell to be re-selected. The UTRAN cell and the GSM cell are set to belong to different location areas. The GSM cell shall be set up to allow the UE to transmit radio access bursts in every GSM radio frame. The UE is requested to monitor neighbouring cells on 1 UMTS carrier and 6 GSM cells. The GSM cell is configured as GSM only (GPRS not active).

Table 8.3.5.3.1: General test parameters for UTRAN to GSM Cell Re-selection

| Parameter | | Unit | Value | Comment |
|--------------------------|----------------|------|--|---|
| Initial condition | Active cell | | Cell1 | |
| | Neighbour cell | | Cell2 | |
| Final condition | Active cell | | Cell2 | |
| HCS | | | | Not used |
| Neighbour cell list size | | | 24 FDD neighbours on Channel 1 6 GSM neighbours including the ARFCN of cell 2 | NOTE: See Annex I for cell information. |
| T1 | | s | 5 | |
| T2 | | s | 10 | |

The transport and physical parameters of the S-CCPCH carrying the FACH are defined in TS 34.108 [3] clause 6.1.0b (Contents of System Information Block type 5 (FDD)).

Specific 2 quarter Message Contents

All messages indicated shall use the same content as described in the default message content in TS 05.08 [20] clause 9 for R99 and in TS45.008 [30] clause 9 for Rel-4 and later releases, with the above exceptions.

In order to ensure that all system information can be sent to the UE in one multiframe if all three of the SYSTEM INFORMATION TYPE 2 bis, SYSTEM INFORMATION TYPE 2 quarter, and SYSTEM INFORMATION TYPE 2 ter are broadcasted SYSTEM INFORMATION TYPE 2 quarter message is sent on BCCH Ext.

8.3.5.3.4.2 Procedure

- 1) The SS activates cell 1-2 with RF parameters set up according to T1 in tables 8.3.5.3.6 and 8.3.5.3.7.
- 2) The UE is switched on.
- 3) An RRC connection is set up according to the signalling sequence in the generic set-up procedure specified in TS 34.108 [3] subclause 7.3.8 to place the UE in CELL_FACH and the SS waits for this process to complete. T1 starts.
- 4) After 5 seconds from the beginning of T1, the parameters are changed to those defined for T2 in tables 8.3.5.3.6 and 8.3.5.3.7.
- 5) The SS waits for random access requests from the UE. If the UE responds on cell 2 within 5.51 s ($=5.5 \text{ s} + T_{\text{RAS}}$) from the beginning of time period T2 then a success is recorded and the SS completes the location update procedure in GSM and the procedure continues with step 7.
- 6) Since the UE has failed to respond with the correct message within the allowed time, a failure is recorded. The SS shall then wait for a total of 10s from the beginning of T2 and if no response is received, the UE shall be switched off and the procedure returns to step 1. Otherwise the SS completes the location update procedure in GSM and the procedure continues with step 7.
- 7) After 10 s from the beginning of time period T2, the parameters are changed to those defined for T1 in tables 8.3.5.3.6 and 8.3.5.3.7.
- 8) The SS waits for random access requests from the UE on cell 1. The SS completes the routing area update procedure in UTRA. T1 starts.
- 9) Repeat step 4) to 8) until the confidence level according to annex F.6.2 is achieved.

8.3.5.3.5 Test requirements

Table 8.3.5.3.6: Cell re-selection UTRAN to GSM cell case (cell 1) Test Requirements

Table 8.3.5.3.7: Cell re-selection UTRAN to GSM cell case (cell 2) Test Requirements

| Parameter | Unit | Cell 2 (GSM) | |
|----------------------------|------|--|-----|
| | | T1 | T2 |
| Absolute RF Channel Number | | BCCH ARFCN of cell A as defined in the initial conditions in clause 26.6.5.1 of TS 51.010-1 [25] for the GSM band under test. BCCH ARFCN is 744 for FDD Band II and PCS1900 under test. BCCH ARFCN is 241 for FDD Band V, VI or XIX and GSM850 under test. BCCH ARFCN is 114 for FDD Band VIII and GSM900 under test. | |
| RXLEV | dBm | -91 | -74 |
| RXLEV_ACCESS_MIN | dBm | -104 | |
| MS_TXPWR_MAX_CCH | dBm | 33 | |
| FDD_Qmin | dB | -14 | |
| Qsearch_I | - | always | |

NOTE 1: CPICH_Ec/No and CPICH_RSCP levels have been calculated from other parameters for information purposes. They are not settable parameters themselves.

For the test to pass, the total number of successful attempts shall be more than 90% of the cases with a confidence level of 95 %.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

8.3.5.4 Cell Reselection during an MBMS session, two frequencies present in neighbour list

8.3.5.4.1 Definition and applicability

The purpose of this test is to verify the requirement for the cell identification for UEs in an MBMS PTM session and the required functionality on measurement occasions by use of a cell re-selection test case.

The requirements and this test apply to release 6 and later releases for FDD UE that supports MBMS.

8.3.5.4.2 Minimum requirements

The UE is requested to receive the MBMS service and monitor neighbouring cells on 2 carriers. The maximum repetition period of the relevant system info blocks that needs to be received by the UE to camp on a cell shall be 1280 ms.

The cell re-selection delay shall be less than 1.9s.

During T1 and T2 the MTCH SDU ER shall not exceed 4.0%.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay in this case is expressed as:

$$T_{\text{reselection, inter}} = T_{\text{Measurement, inter}} + T_{\text{IU}} + 20 + T_{\text{SI}} + T_{\text{RA}} \text{ ms,}$$

where:

$T_{\text{Measurement, inter}}$ Specified in TS 25.133 [2] section 8.4.2.3.2 as 480ms

$T_{\text{Identify, inter}}^i$ Specified in TS 25.133 [2] section 8.4.2.3.1 as 2.72 s in this case, thus 3sec for T2 is sufficient for identification of cell 1.

Note: The calculation based on the S-CCPCH carrying the FACH provides a measurement occasion of 20ms repeated every 80ms. As the MTCH TTI length is only 40ms this has to be shortened to a gap of 10ms every 80ms, the re-selection delay is based upon.

T_{SI} : The time required for receiving all the relevant system information data according to the reception procedure and the RRC procedure delay of system information blocks defined in 25.331 [8] for a UTRAN cell. 1280 ms is assumed in this test case.

Note: Since 1280 ms is one of the typical values for repeating system information blocks, T_{SI} of 1280 ms could be increased by the RRC procedure delay in order to allow the SIB repetition period of 1280 ms.

T_{RA} : T_{RA} is a delay is caused by the physical random access procedure described in TS 25.214 [5] section 6.1. A persistence value is assumed to be 1 in this test case and therefore T_{RA} in this test case is 40 ms.

Note: The maximum allowed time to be used to perform the measurements for a UE in an MBMS session may be smaller than the duration of the measurement occasion to fulfil the MBMS demodulation performance.

This gives a total of 1.83 s, allow 1.9s in the test case.

The reference for this requirement is TS 25.133 [2] clause A.5.5.4.1.

8.3.5.4.3 Test purpose

The purpose of this test is to verify the requirement for the cell identification for UEs in an MBMS PTM session and the required functionality on measurement occasions by use of a cell re-selection test case.

8.3.5.4.4 Method of test

8.3.5.4.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

For the test parameters given in tables 8.3.5.4.4.1, 8.3.5.4.4.2, 8.3.5.4.4.3, 8.3.5.4.4.4, 8.3.5.4.4.5 and 8.3.5.4.4.6. The UE is requested to receive the MBMS service and monitor neighbouring cells on 2 carriers. The maximum repetition period of the relevant system info blocks that needs to be received by the UE to camp on a cell shall be 1280 ms.

Table 8.3.5.4.4.1: General test parameters for Cell Re-selection in CELL_FACH

| Parameter | | Unit | Value | Comment |
|---|-------------|------|-----------------------------|---|
| initial condition | Active cell | | Cell2 | UMTS cell providing the MBMS session |
| final condition | Active cell | | Cell1 | UMTS inter-frequency neighbour cell (no MBMS session) |
| Access Service Class (ASC#0) - Persistence value | | - | 1 | Selected so that no additional delay is caused by the random access procedure. The value shall be used for all cells in the test. |
| HCS | | | | Not used |
| MBMS preferred frequency layer | | | | Not used |
| T1 | | s | 15(initial), 5 (repetition) | |
| T2 | | s | 3 | |
| T3 | | s | 3 | |

The transport and physical parameters of the S-CCPCH carrying the FACH are defined in Table 8.3.5.4.4.2 and Table 8.3.5.4.4.3.

Table 8.3.5.4.4.2: Physical channel parameters for S-CCPCH_1 carrying the FACH.

| Parameter | Unit | Level |
|---|------|-------|
| Channel bit rate | Kbps | 120 |
| Channel symbol rate | Ksps | 60 |
| Slot Format #l | - | 8 |

The cell re-selection delay is defined as the time from the beginning of time period T3, to the moment when the UE camps on Cell 1, and starts to send preambles on the PRACH for sending the CELL UPDATE message with cause value "cell reselection" in Cell 1.

8.3.5.4.4.2 Procedure

Initiation

- 1) The SS activates cell 1-2 with T1 defined parameters in table 8.3.5.4.5 and monitors cell 2 for random access requests from the UE. The SS broadcast the cell reselection parameters according to table 8.3.5.4.5.
- 2) The UE is switched on. The UE has selected the broadcast service provided by the SS (included in the MBMS_ACTIVATED_SERVICES VARIABLE).
- 3) Set up a call according to the generic call setup procedure TS34.108 [3] clause 7.3.10 to configure and activate an MBMS broadcast session, and transition to CELL_FACH state on Cell 2. The SS waits for this procedure to be completed.
- 4) Initiate the variables N_UEOK_PREV, N_UEOK_TEMP, N_UEOK_ACC, N_SS_ACC to 0. (The variables N_UEOK_ACC, N_SS_ACC shall not be initiated when returning back from step 15.)

T1

- 5) Start T1, and simultaneously start transmitting valid MAC headers on MTCH.
- 6) After 5 s (15 s in the first iteration) from the start of T1, start transmitting invalid MAC headers on MTCH.

T2

- 7) The parameters are changed as described for T2 in table 8.3.5.4.5 and the SS start sending valid MAC headers on MTCH.
- 8) After 3 s from the start of T2, start transmitting invalid MAC headers on MTCH and store N_SS.

Read out UE counter

Note: Steps 9 to 13 below implies that the duration of T2 is longer than specified in the core requirement. The active measurement period is however correct.

- 9) The SS sends a "UE TEST LOOP MODE 3 RLC SDU COUNTER REQUEST" message.
- 10) The UE to respond by a "UE TEST LOOP MODE 3 RLC SDU COUNTER RESPONSE" message reporting the number of received RLC SDUs on MTCH. Store this in the variable N_UEOK_TEMP.
- 11) The SS calculate the following:

N_SS: Number of SS transmitted RLC SDUs with valid MAC headers during T1 and T2.

N_UEOK_TEMP: UE received RLC SDUs as reported in the "UE TEST LOOP MODE 3 RLC SDU COUNTER RESPONSE" message in step 10.

N_UEOK: UE received RLC SDUs during T1 and T2. This is calculated as $N_UEOK_TEMP - N_UEOK_PREV$.

N_UEOK_ACC: Accumulated sum of N_UEOK during T1 and T2 periods tested so far.

N_SS_ACC: Accumulated sum of N_SS during T1 and T2 periods tested so far.

- 12) The SS sets the value of N_UEOK_TEMP to N_UEOK_PREV.

T3

- 13) The parameters are changed as described for T3 in table 8.3.5.4.5.
- 14) If the UE responds on Cell 1 with a PRACH (CELL UPDATE message cause "cell reselection") within 1.9 s, then a success is recorded for the delay requirement, the SS shall transmit a CELL UPDATE CONFIRM message and the procedure moves to step 16.

15) Since the UE has failed to respond with the correct message within the allowed time, a failure for the delay requirement is recorded. The SS shall then wait for a total of 3 s from the beginning of T3 and if no response is received, the UE shall be switched off and the procedure returns to step 1. Otherwise the SS shall transmit a CELL UPDATE CONFIRM message and then the procedure continues with step 16.

16) After the cell update procedure, the parameters are changed to those defined for T1 in table 8.3.5.4.5.

17) The SS waits for PRACH (CELL UPDATE message cause "cell reselection") from the UE on cell 2. The SS completes the cell update procedure.

Repeat step 5) to 17) until the confidence level for the delay requirement according to annex F.6.2 are achieved. This includes the confidence level for the RLC SDU error ratio. Refer Annex F.6.1 Table F.6.1.8-3.

Post procedure

18) End the call according to the generic call setup procedure TS34.108 [3] clause 7.3.10.

SDU error rate is measured during T1 and T2, as follows:

$$SDU_ER_ACC = (N_SS_ACC - N_UEOK_ACC) / N_SS_ACC$$

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

The cell re-selection delay defined as the time from the beginning of time period T3, to the moment when the UE camps on Cell 1, and starts to send preambles on the PRACH for sending the CELL UPDATE message with cause value "cell reselection" in Cell 1.

For the test to pass, the following need to be fulfilled:

- the SDU error rate during T1 and T2 (SDU_ER_ACC) shall not exceed 4.0 %,
- the total number of successful tests of the cell re-selection delay requirement shall be more than 90% of the cases with a confidence level of 95 %.

8.3.6 Cell Re-selection in CELL_PCH

8.3.6.1 One frequency present in the neighbour list

8.3.6.1.1 Definition and applicability

The cell re-selection delay is defined as the time from a change of cell levels to the moment when this change makes the UE camp on a new cell, and starts to send preambles on the PRACH for the CELL UPDATE message with cause value "cell reselection" in the new cell.

The requirements and this test apply to the FDD UE.

8.3.6.1.2 Minimum requirements

The cell re-selection delay shall be less than 8 s with a DRX cycle length of 1.28 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90% with a confidence level of 95 %.

NOTE: The cell re-selection delay can be expressed as: $T_{\text{evaluateFDD}} + T_{\text{SI}}$, where:

| | |
|--------------------------|---|
| $T_{\text{evaluateFDD}}$ | See table 4.1 in TS 25.133 [2] clause 4.2.2. |
| T_{SI} | Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell. 1280 ms is assumed in this test case. |

This gives a total of 7.68 s, allow 8s in the test case.

The normative reference for this requirement is TS 25.133 [2] clauses 5.6.2 and A.5.6.1.

8.3.6.1.3 Test purpose

To verify that the UE meets the minimum requirements and is capable of camping on to a new cell, within the required time, when the preferred cell conditions change.

8.3.6.1.4 Method of test

8.3.6.1.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

This scenario implies the presence of 1 carrier and 6 cells as given in tables 8.3.6.1.1 to 8.3.6.1.3. The UE is requested to monitor neighbouring cells on 1 carrier. The maximum repetition period of the relevant system info blocks that needs to be received by the UE to camp on a cell shall be 1280 ms.

Table 8.3.6.1.1: General test parameters for Cell Re-selection in CELL_PCH, one freq. in neighbour list

| Parameter | | Unit | Value | Comment |
|--|-----------------|------|-----------------------------------|---|
| initial condition | Active cell | | Cell2 | |
| | Neighbour cells | | Cell1, Cell3, Cell4, Cell5, Cell6 | |
| final condition | Active cell | | Cell1 | |
| Access Service Class (ASC#0) - Persistence value | | - | 1 | Selected so that no additional delay is caused by the random access procedure. The value shall be used for all cells in the test. |
| HCS | | | | Not used |
| T_{SI} | | ms | 1280 | See Annex I for the SIB repetition period of system information blocks. |
| DRX cycle length | | s | 1.28 | The value shall be used for all cells in the test. |
| T1 | | s | 15 | T1 need to be defined so that cell re-selection reaction time is taken into account. |
| T2 | | s | 15 | T2 need to be defined so that cell re-selection reaction time is taken into account. |

NOTE 1: The nominal \hat{I}_{or} values, although not explicitly defined in 25.133 [2] are added here since they are implied and need to be identified so that the test equipment can be configured.

8.3.6.1.4.2 Procedure

- 1) The SS activates cell 1-6 with T1 defined parameters in table 8.3.6.1.3 and monitors cell 1 and 2 for random access requests from the UE.
- 2) The UE is switched on.
- 3) An RRC connection is set up according to the generic set-up procedure specified in TS 34.108 [3] subclause 7.3.3 to place the UE in the CELL_PCH state on Cell 2 and then the SS waits for this process to complete.
- 4) After 15 s from the completion of step 3 or the beginning of T1, the parameters are changed to those defined for T2 in table 8.3.6.1.3.
- 5) If the UE responds on Cell 1 with a PRACH (CELL UPDATE message cause "cell reselection") within 8s, then a success is recorded, the SS shall transmit a CELL UPDATE CONFIRM message and then the procedure moves to step 7.
- 6) Since the UE has failed to respond with the correct message within the allowed time, a failure is recorded. The SS shall then wait for a total of 15s from the beginning of T2 and if no response is received, the UE shall be switched off and the procedure returns to step 1. Otherwise the SS shall transmit a CELL UPDATE CONFIRM message and then the procedure continues with step 7.
- 7) After a total of 15 s from the beginning of T2, the parameters are changed to those defined for T1 in table 8.3.6.1.3.
- 8) If the UE responds on Cell 2 with a PRACH (CELL UPDATE message cause "cell reselection") within 8s, then a success is recorded and the procedure moves to step 10.
- 9) Since the UE has failed to respond with the correct message within the allowed time, a failure is recorded. The SS shall then wait for a total of 15s from the beginning of T1 and if no response is received the UE shall be switched off and the procedure returns to step 1. Otherwise the SS shall transmit a CELL UPDATE CONFIRM message and then the procedure continues with step 10.
- 10) Steps 4 to 10 are repeated until the confidence level according to annex F.6.2 is achieved.

NOTE 1: The time required for receiving all the relevant system information data according to the reception procedure and the RRC procedure delay of system information blocks defined in 25.331 for a UTRAN cell. Since the maximum time to read the relevant system info blocks that needs to be received by the UE to camp on a cell is 1420ms (see note 2) and the maximum RRC procedure delay for reception system information block is 100ms, 1520 ms is assumed in this test case. Therefore this gives a total of 7.92s (Minimum requirement + 240ms), allow 8s in the test case.

NOTE 2: The maximum repetition period of the relevant system info blocks that needs to be received by the UE to camp on a cell is 1280ms. The Master Information Block (MIB) is repeated every 8 frame and SIB5 (and SIB11) is segmented into 4 segments where the first segment is scheduled adjacent to the MIB at SIB_POS=40 and the other three segments are scheduled after the MIB (SIB_POS=42, 44 and 46). The maximum time for a UE to read SIB5 will occur if the UE start reading the BCH at the SFN after the MIB located prior to the first segment of SIB5 (SIB_POS 32). Then the UE will not be able to read SIB5 until the second occurrence of SIB5, which will happen at SIB_POS 46 + 1280ms. This gives that the maximum time for the UE to read the relevant system info will be 1420ms ((SIB_POS 46 – SIB_POS 32)*10ms +1280ms).

All other parameters and conditions specified in table 8.3.6.1.2 are unchanged.

NOTE 1: These parameters are not directly settable, but are derived by calculation from the settable parameters.

NOTE 2: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

8.3.6.2 Two frequencies present in the neighbour list

8.3.6.2.1 Definition and applicability

The cell re-selection delay is defined as the time from a change of cell levels to the moment when this change makes the UE camp on a new cell, and starts to send preambles on the PRACH for the CELL UPDATE message with cause value "cell reselection" in the new cell.

The requirements and this test apply to the FDD UE.

8.3.6.2.2 Minimum requirement

The cell re-selection delay shall be less than 8 s with a DRX cycle length of 1.28 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90% with a confidence level of 95 %.

NOTE: The cell re-selection delay can be expressed as: $T_{\text{evaluateFDD}} + T_{\text{SI}}$, where:

| | |
|--------------------------|---|
| $T_{\text{evaluateFDD}}$ | See table 4.1 in TS 25.133 [2] clause 4.2.2. |
| T_{SI} | Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell. 1280 ms is assumed in this test case. |

This gives a total of 7.68 s, allow 8s in the test case.

The normative reference for this requirement is TS 25.133 [2] clauses 5.6.2 and A.5.6.2.

8.3.6.2.3 Test purpose

To verify that the UE meets the minimum requirement and is capable of camping on to a new cell, within the required time, when the preferred cell conditions change.

8.3.6.2.4 Method of test

8.3.6.2.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

This scenario implies the presence of 2 carriers and 6 cells as given in tables 8.3.6.2.1 to 8.3.6.2.3. The UE is requested to monitor neighbouring cells on 2 carriers. The maximum repetition period of the relevant system info blocks that needs to be received by the UE to camp on a cell shall be 1 280 ms.

Table 8.3.6.2.1: General test parameters for Cell Re-selection in CELL_PCH, two freqs. in neighbour list

| Parameter | | Unit | Value | Comment |
|---|-----------------|------|-----------------------------------|---|
| initial condition | Active cell | | Cell2 | |
| | Neighbour cells | | Cell1, Cell3, Cell4, Cell5, Cell6 | |
| final condition | Active cell | | Cell1 | |
| Access Service Class (ASC#0) - Persistence value | | - | 1 | Selected so that no additional delay is caused by the random access procedure. The value shall be used for all cells in the test. |
| HCS | | | | Not used |
| T _{SI} | | ms | 1280 | See Annex I for the SIB repetition period of system information blocks. |
| DRX cycle length | | s | 1.28 | The value shall be used for all cells in the test. |
| T1 | | s | 30 | T1 need to be defined so that cell re-selection reaction time is taken into account. |
| T2 | | s | 15 | T2 need to be defined so that cell re-selection reaction time is taken into account. |
| NOTE: Monitored cell list size has 6 cells on 2 carriers. See Annex I for the cell information. | | | | |

NOTE 1: The nominal \hat{I}_{or} values, although not explicitly defined in 25.133 [2] are added here since they are implied and need to be identified so that the test equipment can be configured.

8.3.6.2.4.2 Procedure

- 1) The SS activates cell 1-6 with T1 defined parameters in table 8.3.6.2.3 and monitors cell 1 and 2 for random access requests from the UE.
- 2) The UE is switched on.
- 3) A RRC connection is set up according the generic set-up procedure specified in TS 34.108 [3] subclause 7.3.3 to place the UE in CELL_PCH state on cell 2. The SS waits for this process to complete.
- 4) After 30 s from the completion of step 3 or the beginning of T1, the parameters are changed to those defined for T2 in table 8.3.6.2.3.
- 5) If the UE responds on Cell 1 with a PRACH (CELL UPDATE message cause "cell reselection") within 8s, then a success is recorded, the SS shall transmit a CELL UPDATE CONFIRM message and then the procedure moves to step 7.
- 6) Since the UE has failed to respond with the correct message within the allowed time, a failure is recorded. The SS shall then wait for a total of 15s from the beginning of T2 and if no response is received the UE shall be switched off and the procedure returns to step 1. Otherwise the SS shall transmit a CELL UPDATE CONFIRM message and then the procedure continues with step 7.
- 7) After a total of 15 s from the beginning of T2, the parameters are changed to those defined for T1 in table 8.3.6.2.3.
- 8) If the UE responds on Cell 2 with a PRACH (CELL UPDATE message cause "cell reselection") within 8s, then a success is recorded and the procedure moves to step 10.
- 9) Since the UE has failed to respond with the correct message within the allowed time, a failure is recorded. The SS shall then wait for a total of 15s from the beginning of T1 and if no response is received the UE shall be switched off and the procedure returns to step 1. Otherwise the SS shall transmit a CELL UPDATE CONFIRM message and then the procedure continues with step 10.
- 10) After a total of 15 s from the beginning of T1, the parameters are changed to those defined for T2 in table 8.3.6.2.3.
- 11) Steps 5 to 10 are repeated until the confidence level according to annex F.6.2 is achieved.

NOTE 1: T1 is initially 30 s to allow enough time for the UE to search for cells as it has no prior knowledge of these.

NOTE 2: The time required for receiving all the relevant system information data according to the reception procedure and the RRC procedure delay of system information blocks defined in 25.331 for a UTRAN cell. Since the maximum repetition period of the relevant system info blocks that needs to be received by the UE to camp on a cell is 1420ms (see note 3) and the maximum RRC procedure delay for reception system information block is 100ms, 1520 ms is assumed in this test case. Therefore this gives a total of 7.82s (Minimum requirement + 240ms), allow 8s in the test case.

NOTE 3: The maximum repetition period of the relevant system info blocks that needs to be received by the UE to camp on a cell is 1280ms. The Master Information Block (MIB) is repeated every 8 frame and SIB5 (and SIB11) is segmented into 4 segments where the first segment is scheduled adjacent to the MIB at SIB_POS=40 and the other three segments are scheduled after the MIB (SIB_POS=42, 44 and 46). The maximum time for a UE to read SIB5 will occur if the UE start reading the BCH at the SFN after the MIB located prior to the first segment of SIB5 (SIB_POS 32). Then the UE will not be able to read SIB5 until the second occurrence of SIB5, which will happen at SIB_POS 46 + 1280ms. This gives that the maximum time for the UE to read the relevant system info will be 1420ms ((SIB_POS 46 – SIB_POS 32)*10ms + 1280ms).

Specific Message Contents

All messages indicated above shall use the same content as described in the default message content in clause 9 of 34.108 [3], with the following exceptions:

All other parameters and conditions specified in table 8.3.6.2.2 are unchanged.

NOTE 1: These parameters are not directly settable, but are derived by calculation from the settable parameters.

NOTE 2: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

8.3.6.3 Cell re-selection during an MBMS session, one UTRAN inter-frequency and 2 GSM cells present in the neighbour list

8.3.6.3.1 Definition and applicability

The cell re-selection delay is defined as the time from a change of cell levels to the moment when this change makes the UE camp on a new cell, and starts to send preambles on the PRACH for the CELL UPDATE message with cause value "cell reselection" in the new cell.

The requirements and this test apply to a Release 6 and later releases for UE supporting GSM and MBMS.

8.3.6.3.2 Minimum requirement

The cell re-selection delay is defined as the time from the beginning of time period T3, to the moment when the UE camps on Cell 3, and starts to send the RR Channel Request message for location update to Cell 3.

The cell re-selection delay shall be less than $2.75 \text{ s} + T_{\text{BCCH}}$, where T_{BCCH} is the maximum time allowed to read BCCH data from GSM cell, see TS 45.008 [30].

During T1 and T2 the MTCH SDU ER shall not exceed 4.0%.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay can be expressed as: $\text{Max}(3 * T_{\text{measureFDD}}, T_{\text{measureGSM}} + \text{DRX cycle length}) + T_{\text{BCCH}}$, where:

$T_{\text{measureFDD}}$ See table 4.1 in TS 25.133 [2] clause 4.2.2.

$T_{\text{measureGSM}}$ See table 4.1 in TS 25.133 [2] clause 4.2.2.

DRX cycle length 160ms see Table A.4.7.A

T_{BCCH} Maximum time allowed to read BCCH data from GSM cell, see TS 45.008 [30]. According to [20] and [30], the maximum time allowed to read the BCCH data, when being synchronized to a BCCH carrier, is 1.9 s.

This gives a total of $2.72 \text{ s} + T_{\text{BCCH}}$, allow $2.75 \text{ s} + T_{\text{BCCH}}$ in the test case.

The normative reference for this requirement is TS 25.133 [2] clauses 4.2.2 and A.5.6.3.

8.3.6.3.3 Test purpose

To verify that the UE meets the minimum requirement and is capable of camping on to a new cell, within the required time, when the preferred cell conditions change.

8.3.6.3.4 Method of test

8.3.6.3.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

This scenario implies the presence of 1 UTRAN serving cell, 1 UTRAN inter-frequency cell and 2 GSM cells of which one is to be re-selected. The UE is requested to monitor neighbour cells on 2 UMTS carriers (Channel 1, Channel 2) and 12 GSM cells. Test parameters are given in Tables 8.3.6.3.1 to 8.3.6.3.5.

Table 8.3.6.3.1: General test parameters for Cell Re-selection

| Parameter | | Unit | Value | Comment |
|--------------------------------|-----------------|------|---|--|
| Initial condition | Active cell | | Cell2 | UMTS cell providing the MBMS session |
| | Neighbour cells | | Cell1 | UMTS inter-frequency neighbour cell |
| | | | Cell3, Cell4 | GSM cells |
| Final condition | Active cell | | Cell3 | |
| DRX cycle length | | ms | 160 | |
| HCS | | | | Not used |
| MBMS preferred frequency layer | | | | Not used |
| Monitored cell list size | | | 2 UMTS cells and 12 GSM cells, including the UARFCN of UMTS cells 1, 2 and the ARFCN of the GSM cells 3,4 | NOTE: See Annex I for cell information |
| T1 | | s | 15 (initial), 5 repeated | |
| T2 | | s | 45 | |
| T3 | | s | 7 | |

The transport and physical channel parameters of the S-CCPCH_2 carrying the MTCH are defined in Tables 8.3.6.3.2 and 8.3.6.3.3.

The transport and physical parameters of the S-CCPCH_1 carrying the PCH/FACH/MCCH are defined in TS 34.108 [3] clause 6.1.0b (Contents of System Information Block type 5 (FDD)) with M2 condition.

Table 8.3.6.3.2: Physical channel parameters for S-CCPCH_2 carrying the MTCH.

| Parameter | Unit | Level |
|---|------|-------|
| Channel bit rate | kbps | 960 |
| Channel symbol rate | ksps | 480 |
| Slot Format #1 | - | 14 |
| TFCI | - | ON |
| Power offsets of TFCI and Pilot fields relative to data field | dB | 0 |

Table 8.3.6.3.3: Transport channel parameters for S-CCPCH_2

| Parameter | FACH |
|---------------------------------|--------------|
| Transport Channel Number | 1 |
| Transport Block Size | 2536 |
| Transport Block Set Size | 10144 |
| Transmission Time Interval | 40ms |
| Type of Error Protection | Turbo Coding |
| Coding Rate | 1/3 |
| Rate Matching attribute | 256 |
| Size of CRC | 16 |
| Position of TrCH in radio frame | Flexible |

Table 8.3.6.3.4: Cell specific test parameters for serving Cell2 and inter-frequency neighbour Cell1

Specific 2 quarter Message Contents

All messages indicated shall use the same content as described in the default message content in TS45.008 [30] clause 9, with the above exceptions.

8.3.6.3.4.2 Procedure

Initiation

- 1) Initiate the variables N_UEOK, N_UEOK_ACC, N_SS_ACC to 0.
- 2) The SS activates cell 1 to 4 with T1 defined parameters in tables 8.3.6.3.6 and 8.3.6.3.7 and monitors cell 2 and 3 for random access requests from the UE. The SS broadcast the cell reselection parameters according to tables 8.3.6.3.6 and 8.3.6.3.7.

- 3) The UE is switched on. The UE has selected the broadcast service provided by the SS (included in the MBMS_ACTIVATED_SERVICES VARIABLE).
- 4) Set up a call according to the generic call setup procedure TS34.108 [3] clause 7.3.10 to configure and activate an MBMS broadcast session, and transition to CELL_PCH state. The SS waits for this procedure to be completed.

T1

- 5) Start T1, and simultaneously start transmitting valid MAC headers on MTCH
- 6) After 5 s (15 s in the first iteration) from the start of T1, start transmitting invalid MAC headers on MTCH.

T2

- 7) The parameters are changed as described for T2 in tables 8.3.6.3.6 and 8.3.6.3.7 and the SS start sending valid MAC headers on MTCH.
- 8) After 45 s from the start of T2, start transmitting invalid MAC headers on MTCH and store N_SS.

Go to CELL_FACH and read out UE counter

NOTE: Steps 9 to 16 below implies that the duration of T2 is longer than specified in the core requirement. The active measurement period is however correct.

- 9) The SS transmits a PAGING TYPE 1 message specified in TS 34.108 [3] clause 7.3.10.4 to the UE on the PCH and the UE moves to CELL_FACH state, sending a CELL UPDATE message. The SS replies with a CELL UPDATE CONFIRM message.
- 10) UE confirms the received C-RNTI to be used in CELL_FACH state by transmitting a UTRAN MOBILITY INFORMATION CONFIRM message on the uplink DCCH.
- 11) The SS sends a "UE TEST LOOP MODE 3 RLC SDU COUNTER REQUEST" message.
- 12) The UE to respond by a "UE TEST LOOP MODE 3 RLC SDU COUNTER RESPONSE" message reporting the number of received RLC SDUs on MTCH. Store this in the variable N_UEOK.
- 13) The SS calculate the following:

N_SS: Number of SS transmitted RLC SDUs with valid MAC headers during T1 and T2

N_UEOK: UE received RLC SDUs as reported in the "UE TEST LOOP MODE 3 RLC SDU COUNTER RESPONSE" message in step 12

N_UEOK_ACC: Accumulated sum of N_UEOK during T1 and T2 periods tested so far.

N_SS_ACC: Accumulated sum of N_SS during T1 and T2 periods tested so far.

Go back to CELL_PCH

- 14) The SS orders the UE to move to CELL_PCH state by transmitting a PHYSICAL CHANNEL RECONFIGURATION message with the RRC state indicator set to "CELL_PCH".
- 15) The UE send a PHYSICAL CHANNEL RECONFIGURATION COMPLETE message

T3

- 16) The parameters are changed as described for T3 in tables 8.3.6.3.6 and 8.3.6.3.7.
- 17) The SS waits for a location registration procedure from the UE. If the UE begins transmitting on cell 3 (GSM cell) within 4.65 s then a success is recorded for the delay requirement, the SS completes the location update procedure in GSM and the procedure continues with step 19.
- 18) Since the UE has failed to respond with the correct message within the allowed time, a failure for the delay requirement is recorded. The SS shall then wait for a total of 7s from the beginning of T3 and if no response is received, the UE shall be switched off and the procedure returns to step 2. Otherwise the SS completes the location update procedure in GSM and the procedure continues with step 19.

19) After the location update procedure in GSM, the parameters are changed to those defined for T1 in tables 8.3.6.3.6 and 8.3.6.3.7.

20) The SS waits for random access requests from the UE on cell 2. The SS completes the routing area update procedure in UTRA.

Repeat step 4) to 20) until the confidence level for the delay requirement according to annex F.6.2 are achieved. This includes the confidence level for the RLC SDU error ratio. Refer Annex F.6.1 Table F.6.1.8-3

SDU error rate is measured during T1 and T2, as follows:

$$SDU_ER_ACC = (N_SS_ACC - N_UEOK_ACC) / N_SS_ACC$$

Specific Message Contents

All messages indicated above shall use the same content as described in the default message content in clause 9 of 34.108 [3], with the exceptions stated in clause 7.3.10 of 34.108 [3].

Contents of PHYSICAL CHANNEL RECONFIGURATION message: AM (Step 4 and 14)

| Information Element | Value/remark |
|------------------------------------|--------------|
| UTRAN DRX cycle length coefficient | 4 |

Content of CELL UPDATE CONFIRM message for CELL_FACH (Step 9)

| Information Element | Value/remark |
|----------------------------|--------------------|

| Activation time | Not Present |
| New C-RNTI | 0000000000000001 B |
| RRC State indicator | CELL_FACH |

8.3.6.3.5 Test requirements

For the test to pass, the following need to be fulfilled:

- the SDU error rate during T1 and T2 (SDU_ER_ACC) shall not exceed 4.0 %,
- the total number of successful tests of the cell re-selection delay requirement shall be more than 90% of the cases with a confidence level of 95 %.

Table 8.3.6.3.6: Cell specific test requirements for serving Cell2 and inter-frequency neighbour Cell1

| FDD_Qmin | dB | -14 | | | -14 | | |
| Qsearch_I | - | always | | | always | | |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

8.3.7 Cell Re-selection in URA_PCH

8.3.7.1 One frequency present in the neighbour list

8.3.7.1.1 Definition and applicability

The cell re-selection delay is defined as the time from a change of cell levels to the moment when this change makes the UE camp on a new cell, and starts to send preambles on the PRACH for the URA UPDATE message with cause value "URA reselection" in the new cell.

The requirements and this test apply to the FDD UE.

8.3.7.1.2 Minimum requirement

The cell re-selection delay shall be less than 8 s with a DRX cycle length of 1.28 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90% with a confidence level of 95 %.

NOTE: The cell re-selection delay can be expressed as: $T_{\text{evaluateFDD}} + T_{\text{SI}}$, where:

| | |
|--------------------------|---|
| $T_{\text{evaluateFDD}}$ | See table 4.1 in TS 25.133 [2] clause 4.2.2. |
| T_{SI} | Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell. 1280 ms is assumed in this test case. |

This gives a total of 7.68 s, allow 8s in the test case.

The normative reference for this requirement is TS 25.133 [2] clauses 5.7.2 and A.5.7.1.

8.3.7.1.3 Test purpose

To verify that the UE meets the minimum requirement and is capable of camping on to a new cell, within the required time, when the preferred cell conditions change.

8.3.7.1.4 Method of test

8.3.7.1.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

This scenario implies the presence of 1 carrier and 6 cells as given in tables 8.3.7.1.1 to 8.3.7.1.3. The UE is requested to monitor neighbouring cells on 1 carrier. The maximum repetition period of the relevant system info blocks that needs to be received by the UE to camp on a cell shall be 1 280 ms. In System Information Block Type 2 cell1 and cell 2 URA identity is set to a different value.

Table 8.3.7.1.1: General test parameters for Cell Re-selection in URA_PCH, one freq. in neighbour list

| Parameter | | Unit | Value | Comment |
|--|-----------------|------|--|---|
| Initial condition | Active cell | | Cell2 | |
| | Neighbour cells | | Cell1, Cell3, Cell4, Cell5, Cell6 | |

NOTE 1: The nominal \hat{I}_{or} values, although not explicitly defined in 25.133 [2] are added here since they are implied and need to be identified so that the test equipment can be configured.

8.3.7.1.4.2 Procedure

- 1) The SS activates cell 1-6 with T1 defined parameters in table 8.3.7.1.3 and monitors cell 1 and 2 for random access requests from the UE.
- 2) The UE is switched on.
- 3) An RRC connection is set up according to the generic set-up procedure specified in TS 34.108 [3] subclause 7.3.3 to place the UE in the URA_PCH state on Cell 2 and then the SS waits for this process to complete.
- 4) After 15 s from the completion of step 3 or the beginning of T1, the parameters are changed to those defined for T2 in table 8.3.7.1.3.
- 5) If the UE responds on Cell 1 with a PRACH (URA UPDATE message cause "URA reselection") within 8s, then a success is recorded, the SS shall transmit a URA UPDATE CONFIRM message and then the procedure moves to step 7.
- 6) Since the UE has failed to respond with the correct message within the allowed time, a failure is recorded. The SS shall then wait for a total of 15s from the beginning of T2 and if no response is received, the UE shall be switched off and the procedure returns to step 1. Otherwise the SS shall transmit a URA UPDATE CONFIRM message and then the procedure continues with step 7.
- 7) After a total of another 15 s from the beginning of T2, the parameters are changed to those defined for T1 in table 8.3.7.1.3.
- 8) If the UE responds on Cell 2 with a PRACH (URA UPDATE message cause "URA reselection") within 8s, then a success is recorded and the procedure moves to step 10.
- 9) Since the UE has failed to respond with the correct message within the allowed time, a failure is recorded. The SS shall then wait for a total of 15s from the beginning of T1 and if no response is received the UE shall be switched off and the procedure returns to step 1. Otherwise the SS shall transmit a URA UPDATE CONFIRM message and then the procedure continues with step 10.
- 10) Steps 4 to 10 are repeated until the confidence level according to annex F.6.2 is achieved.

NOTE 1: The time required for receiving all the relevant system information data according to the reception procedure and the RRC procedure delay of system information blocks defined in 25.331 for a UTRAN cell. Since the maximum time to read the relevant system info blocks that needs to be received by the UE to camp on a cell is 1420ms and the maximum RRC procedure delay for reception system information block is 100ms, 1520 ms is assumed in this test case. Therefore this gives a total of 7.92s (Minimum requirement + 240ms), allow 8s in the test case.

NOTE 2: The maximum repetition period of the relevant system info blocks that needs to be received by the UE to camp on a cell is 1280ms. The Master Information Block (MIB) is repeated every 8 frame and SIB5 (and SIB11) is segmented into 4 segments where the first segment is scheduled adjacent to the MIB at SIB_POS=40 and the other three segments are scheduled after the MIB (SIB_POS=42, 44 and 46). The maximum time for a UE to read SIB5 will occur if the UE start reading the BCH at the SFN after the MIB located prior to the first segment of SIB5 (SIB_POS 32). Then the UE will not be able to read SIB5 until the second occurrence of SIB5, which will happen at SIB_POS 46 + 1280ms. This gives that the maximum time for the UE to read the relevant system info will be 1420ms ((SIB_POS 46 – SIB_POS 32)*10ms +1280ms).

Specific Message Contents

All messages indicated above shall use the same content as described in the default message content in clause 9 of 34.108 [3], with the following exceptions:

PHYSICAL CHANNEL RECONFIGURATION (Step 3)

| Information Element | Value/remark |
|------------------------------------|--------------|
| RRC State Indicator | URA PCH |
| UTRAN DRX cycle length coefficient | 7 |

Contents of URA UPDATE CONFIRM message for URA_PCH

| Information Element | Value/remark |
|------------------------------------|---------------------------------|
| RRC transaction identifier | 0 |
| RRC state indicator | URA_PCH |
| UTRAN DRX cycle length coefficient | 7 |
| URA identity | As specified in Table 8.3.7.1.1 |

8.3.7.1.5 Test requirements

For the test to pass, the total number of successful attempts shall be more than 90% with a confidence level of 95 % of the cases.

Table 8.3.7.1.3: Cell specific test requirements for Cell re-selection in URA_PCH state, one freq. in neighbour list

All other parameters and conditions specified in table 8.3.7.1.2 are unchanged.

NOTE 1: These parameters are not directly settable, but are derived by calculation from the settable parameters.

NOTE 2: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

8.3.7.2 Two frequencies present in the neighbour list

8.3.7.2.1 Definition and applicability

The cell re-selection delay is defined as the time from a change of cell levels to the moment when this change makes the UE camp on a new cell, and starts to send preambles on the PRACH for the URA UPDATE message with cause value "URA reselection" in the new cell.

The requirements and this test apply to the FDD UE.

8.3.7.2.2 Minimum requirement

The cell re-selection delay shall be less than 8 s with a DRX cycle length of 1.28 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90% with a confidence level of 95 %.

NOTE: The cell re-selection delay can be expressed as: $T_{\text{evaluateFDD}} + T_{\text{SI}}$, where:

| | |
|--------------------------|---|
| $T_{\text{evaluateFDD}}$ | See table 4.1 in TS 25.133 [2] clause 4.2.2. |
| T_{SI} | Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell. 1280 ms is assumed in this test case. |

This gives a total of 7.68 s, allow 8s in the test case.

The normative reference for this requirement is TS 25.133 [2] clauses 5.7.2 and A.5.7.2.

8.3.7.2.3 Test purpose

To verify that the UE meets the minimum requirement and is capable of camping on to a new cell, within the required time, when the preferred cell conditions change.

8.3.7.2.4 Method of test

8.3.7.2.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

This scenario implies the presence of 2 carriers and 6 cells as given in tables 8.3.7.2.1 to 8.3.7.2.3. The UE is requested to monitor neighbouring cells on 2 carriers. The maximum repetition period of the relevant system info blocks that needs to be received by the UE to camp on a cell shall be 1 280 ms. In System Information Block Type 2 in cell 1 and cell 2 URA identity is set to different value.

Table 8.3.7.2.1: General test parameters for Cell Re-selection in URA_PCH, two freqs. in neighbour list

NOTE 1: The nominal \hat{I}_{or} values, although not explicitly defined in 25.133 [2] are added here since they are implied and need to be identified so that the test equipment can be configured.

8.3.7.2.4.2 Procedures

- 1) The SS activates cell 1-6 with T1 defined parameters in table 8.3.7.2.3 and monitors cell 1 and 2 for random access requests from the UE.
- 2) The UE is switched on.
- 3) An RRC connection is set up according the generic set-up procedure specified in TS 34.108 [3] subclause 7.3.3 to place the UE in URA_PCH state on cell 2. The SS waits for this process to complete.
- 4) After 30 s from the completion of step 3 or the beginning of T1, the parameters are changed to those defined for T2 in table 8.3.7.2.3.
- 5) If the UE responds on Cell 1 with a PRACH (URA UPDATE message cause "URA reselection") within 8s, then a success is recorded, the SS shall transmit a URA UPDATE CONFIRM message and then the procedure moves to step 7.
- 6) Since the UE has failed to respond with the correct message within the allowed time, a failure is recorded. The SS shall then wait for a total of 15s from the beginning of T2 and if no response is received the UE shall be switched off and the procedure returns to step 1. Otherwise the SS shall transmit a URA UPDATE CONFIRM message and then the procedure continues with step 7.
- 7) After a total of 15 s from the beginning of T2, the parameters are changed to those defined for T1 in table 8.3.7.2.3.
- 8) If the UE responds on Cell 2 with a PRACH (URA UPDATE message cause "URA reselection") within 8s, then a success is recorded and the procedure moves to step 10.
- 9) Since the UE has failed to respond with the correct message within the allowed time, a failure is recorded. The SS shall then wait for a total of 15s from the beginning of T1 and if no response is received the UE shall be switched off and the procedure returns to step 1. Otherwise the SS shall transmit a URA UPDATE CONFIRM message and then the procedure continues with step 10.
- 10) After a total of 15 s from the beginning of T1, the parameters are changed to those defined for T2 in table 8.3.7.2.3.
- 11) Steps 5 to 10 are repeated until the confidence level according to annex F.6.2 is achieved.

NOTE 1: T1 is initially 30 s to allow enough time for the UE to search for cells as it has no prior knowledge of these.

NOTE 2: The time required for receiving all the relevant system information data according to the reception procedure and the RRC procedure delay of system information blocks defined in 25.331 for a UTRAN cell. Since the maximum time to read the relevant system info blocks that needs to be received by the UE to camp on a cell is 1420ms (see note 3) and the maximum RRC procedure delay for reception system information block is 100ms, 1520 ms is assumed in this test case. Therefore this gives a total of 7.82s (Minimum requirement + 240ms), allow 8s in the test case.

NOTE 3: The maximum repetition period of the relevant system info blocks that needs to be received by the UE to camp on a cell is 1280ms. The Master Information Block (MIB) is repeated every 8 frame and SIB5 (and SIB11) is segmented into 4 segments where the first segment is scheduled adjacent to the MIB at SIB_POS=40 and the other three segments are scheduled after the MIB (SIB_POS=42, 44 and 46). The maximum time for a UE to read SIB5 will occur if the UE start reading the BCH at the SFN after the MIB located prior to the first segment of SIB5 (SIB_POS 32). Then the UE will not be able to read SIB5 until the second occurrence of SIB5, which will happen at SIB_POS 46 + 1280ms. This gives that the maximum time for the UE to read the relevant system info will be 1420ms ((SIB_POS 46 – SIB_POS 32)*10ms + 1280ms).

Specific Message Contents

All messages indicated above shall use the same content as described in the default message content in clause 9 of 34.108 [3], with the following exceptions:

PHYSICAL CHANNEL RECONFIGURATION (Step 3)

All other parameters and conditions specified in table 8.3.7.2.2 are unchanged.

NOTE 1: These parameters are not directly settable, but are derived by calculation from the settable parameters.

NOTE 2: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

8.3.8 Serving HS-DSCH cell change

8.3.8.1 Definition and applicability

When the UE receives a RRC message implying HS-DSCH cell change with the activation time "now" or earlier than RRC procedure delay seconds from the end of the last TTI containing the RRC command, the UE shall be ready to receive the HS-SCCH channel from the new cell within $D_{\text{cell_change}}$ seconds from the end of the last TTI containing the RRC command.

The requirements and this test apply to Release 6 and later releases for all types of UTRA for the FDD UE that support HSDPA (all categories).

8.3.8.2 Minimum requirement

The UE shall start to transmit the CQI to cell 2 based on the quality of cell 2 less than 74 ms from the beginning of time period T4.

The UE shall also be able to start to receive the first HS-SCCH message from cell 2 less than 74 ms from the beginning of time period T4 and transmit the ACK or NAK which corresponds to the HS-SCCH message.

NOTE: The delay $D_{\text{cell_change}}$ equals the RRC procedure delay defined in TS25.331 Section 13.5.2 plus the interruption time of receiving HS-DSCH data stated in section 5.10.2.2 of TS 25.133.
The RRC procedure delay is 50 ms and the interruption time is given by $T_{\text{interrupt1}} = T_{\text{IU}} + 22 \text{ ms} = 24 \text{ ms}$.

The total delay $D_{\text{cell_change}} = 50 + 24 \text{ ms} = 74 \text{ ms}$

The reference for this requirement is TS 25.133 [2] clauses 5.10.2 and A.5.8.

8.3.8.3 Test purpose

The purpose of this test is to verify the requirement for the delay when performing the serving HS-DSCH cell change in CELL_DCH state specified in section 8.3.8.2.

8.3.8.4 Method of test

The test parameters are given in Table 8.3.8.1, 8.3.8.1a, and 8.3.8.2 below. The test consists of 4 successive time periods, with a time duration of T1, T2, T3 and T4 respectively. At the start of time duration T1 the UE have cell 1 and cell 2 in active set and cell 1 as the serving HS-DSCH cell.

Data shall be transmitted continuously to the UE on the HS-DSCH channel.

Table 8.3.8.1: General test parameters for serving HS-DSCH cell change

| Parameter | | Unit | Value | Comment |
|----------------------------------|----------------------|----------|---|---------------------------------|
| DCH parameters | | | DL Reference Measurement Channel 12.2 kbps | As specified in section C.3.1 |
| Power Control | | | On | |
| Target quality value on DTCH | | BLER | 0.001 | |
| HSDPA parameters | | | Fixed Reference Channel Definition H-Set 1, with QPSK modulation only. | As specified in section C.8.1.1 |
| Initial conditions | Active cells | | Cell 1 and Cell 2 | |
| | Serving HS-DSCH cell | | Cell 1 | |
| Final condition | Active cell | | Cell 1 and Cell 2 | |
| | Serving HS-DSCH cell | | Cell 2 | |
| Hysteresis | | dB | 0 | |
| Time to Trigger | | ms | 0 | |
| Filter coefficient | | | 0 | |
| CQI Feedback cycle, k | | ms | 2 (0 for cell 1) | |
| CQI repetition factor | | | 1 | |
| HS-SCCH-1 signalling pattern | | - | The six sub-frame HS-SCCH-1 signalling pattern shall be "...XOOXOO...", where "X" indicates TTI in which the HS-SCCH-1 uses the identity of the UE under test, and "O" indicates TTI in which the HS-SCCH-1 uses a different UE identity. | |
| DPCH Frame offset | | 256*chip | 0 | |
| Default DPCH Offset Value (DOFF) | | 512*chip | 0 | |
| T1 | | s | 5 | |
| T2 | | s | 3 | |
| T3 | | s | 0.5 | |
| T4 | | ms | 100 | |

Table 8.3.8.1a: Cell specific test parameters for serving HS-DSCH cell change, initial conditions

| Parameter | Unit | Cell 1 | Cell 2 |

| Propagation Condition | | AWGN | | | | | | | |
| Relative delay of paths received from cell 2 with respect to cell 1 | Chips | {-148 ... 148} Note 4 | | | | | | | |
| NOTE 1: The DPCH level is controlled by the power control loop. | | | | | | | | | |
| NOTE 2: The power of the OCNS channel that is added shall make the total power from the cell to be equal to I _{or} . | | | | | | | | | |
| NOTE 3: The DPCH level is controlled by the power control loop. The initial power shall be set equal to the DPCH_Ec/I _{or} of Cell 1 at the end of T2. | | | | | | | | | |
| NOTE 4: The relative delay of the path from cell 2 with respect to cell 1 shall always be within ±148 chip. | | | | | | | | | |

8.3.8.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS (node B emulator) and fader and AWGN noise source to the UE antenna connector as shown in figure A.14.
- 2) Set up an HSDPA call according to TS 34.108 [3] clause 7.3.6 with levels according to T0 in table 8.3.8.1a with cell 1 as serving HS-DSCH cell.
- 3) The information bit data shall be pseudo random and not repeated before 10 different information bit payload blocks are processed. (e.g. Fixed reference Channel Definition H-set 1 (QPSK): The information bit payload block is 9377 bits long. Hence the PRBSequence must be at least $9377 * 10$ bits long.) Use a PRBS from ITU-T O.153 Ref [27]
- 4) Once the HSDPA connection is setup, start transmitting HSDPA Data.

8.3.8.4.2 Procedure

- 1) Turn on cell 2 and set the levels for both cells according to T1 in table 8.3.8.3.
- 2) SS shall send a MEASUREMENT CONTROL message (event 1A, 1B)
- 3) SS shall send a MEASUREMENT CONTROL message (event 1D)
- 4) UE shall send a MEASUREMENT REPORT message triggered by event 1A containing the CFN-SFN observed time difference between cell1 and cell2.
- 5) SS shall send an ACTIVE SET UPDATE message with activation time "now ", adding cell 2 to the active set
- 6) UE shall send a ACTIVE SET UPDATE COMPLETE message
- 7) After 5 seconds from the beginning of T1, the SS shall switch the power settings from T1 to T2 according to the parameters defined in table 8.3.8.3.
- 8) During time period T2, UE shall transmit a MEASUREMENT REPORT message (intra frequency) triggered by event 1D for cell 2.
- 9) After 3 seconds from the beginning of T2, the SS shall switch the power settings from T2 to T3 according to the parameters defined in table 8.3.8.3.
- 10) During T3, no CQI measurements shall be reported by the UE.
- 11) SS shall transmit a PHYSICAL CHANNEL RECONFIGURATION message (cell 2 HS-DSCH serving cell) with activation time set to "now" changing serving HS-DSCH from cell 1 to cell 2. The start of T4 is defined as the end of the last TTI containing the physical channel reconfiguration message.
- 12) The SS shall switch the power settings from T3 to T4 in table 8.3.8.3 and immediately start transmitting HSDPA Data on cell 2. The SS shall not send any HSDPA data on cell 1 after the start of T4.
- 13) The SS shall measure the time from start of T4 until the start of the HS-DPCCH subframe where the UE starts transmitting CQI measurements on cell 2
- 14) The SS shall measure the time from start of T4 until the start of the HS-DPCCH subframe where the UE starts transmitting ACK/NAK. The SS shall not start to monitor the HS-DPCCH for ACK/NAK until one frame after the start of T4 to eliminate the risk of detecting the ACK/NAK for cell 1.
- 15) If steps 10, 13 and 14 fulfil the test requirements, then the number of successful tests is increased by one.
- 16) The UE shall transmit a PHYSICAL CHANNEL RECONFIGURATION COMPLETE message on the UL DCCH of cell 2.
- 17) SS shall transmit a PHYSICAL CHANNEL RECONFIGURATION message (cell 1 HS-DSCH serving cell) with activation time set to "now" changing serving HS-DSCH back to cell 1.

- 18) The SS shall switch the power settings from T4 to T1 in table 8.3.8.3. The start of T1 is defined as the end of the last TTI containing the physical channel reconfiguration message.
- 19) The SS shall start transmitting HSDPA Data on cell 1 and shall not send any HSDPA data on cell 2.
- 20) During T1, the UE may transmit a MEASUREMENT REPORT message (intra frequency) triggered by event 1D for cell 1 and may also transmit a MEASUREMENT REPORT message (intra frequency) triggered by event 1B for cell 2.
- 21) During T2, T3 and T4, the UE may transmit MEASUREMENT REPORT messages (intra frequency) triggered by event 1B for cell 1.
- 22) Repeat step 7-21 until the confidence level according to annex F.6.2 is achieved

Specific Message Contents

The default messages for SIB11 and SIB12 as specified for Cell 1 and Cell 2 in clause 6.1.4 of 34.108 [3] are used.

Default parameters according to Cell 1 and Cell 2 in clause 6.1.4.

All messages indicated above shall use the same content as described in the default message content in clause 9 of 34.108 [3], with the following exceptions:

MEASUREMENT CONTROL message (event 1A, 1B)

| I_{oc} | dBm/3.84 MHz | -70 | | | | | | | |
| CPICH_Ec/I _o | dB | -12.3 | -14.8 | | | -14.8 | -12.3 | | |
| Propagation Condition | | AWGN | | | | | | | |
| Relative delay of paths received from cell 2 with respect to cell 1 | Chips | {-147.5 ... 147.5} Note 4 | | | | | | | |
| NOTE 1: The DPCH level is controlled by the power control loop | | | | | | | | | |
| NOTE 2: The power of the OCNS channel that is added shall make the total power from the cell to be equal to I _{or} | | | | | | | | | |
| NOTE 3: The DPCH level is controlled by the power control loop. The initial power shall be set equal to the DPCH_Ec/I _{or} of Cell 1 at the end of T2. | | | | | | | | | |
| NOTE 4: The relative delay of the path from cell 2 with respect to cell 1 shall always be within ±147.5 chip. | | | | | | | | | |
| NOTE 5: E_c/I_{or} value represent the per code power for HS-PDSCH channel. | | | | | | | | | |
| NOTE 6: HS-SCCH-2, HS-SCCH-3, and HS-SCCH-4 are DTX. | | | | | | | | | |

The delay from the start of the HS-DSCH sub frame until the start of the corresponding UL HS-DPCCH is 5.3 ms. The test requirement for ACK/NAK shall be increased by this delay. This delay is not relevant for CQI reporting.

The maximum uncertainty of delay due to not scheduling any data to the UE is 2 HS-SCCH sub frames for HS-SCCH signalling pattern used (up to 2 consecutive sub frames not allocated to the UE), the test requirement for ACK/NAK shall be increased by this delay. This delay is not relevant for CQI reporting.

Step 10: No CQI reports shall be sent prior to serving cell change. The reason is that the source of the CQI reports (which cell it is calculated from) can not be determined, and the test must therefore verify that no CQI reports are transmitted based on cell 1 measurements.

Step 13: Time from end of last frame of the serving cell change command to the sub frame of HS-DPCCH where CQI is starting shall be less than $74 \text{ ms} + T_0 * T_{\text{chip}} = 74.3 \text{ ms}$. Allow 75 ms in the test.

Step 14: Time from end of last frame of the serving cell change command to the sub frame of HS-DPCCH where ACK/NAK is starting shall be less than $74 \text{ ms} + 7.5 * T_{\text{slot}} + T_0 * T_{\text{chip}} + 2 * T_{\text{subframe}} = 74 + 9.3 = 83.3 \text{ ms}$. Allow 85 ms in the test.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

8.3.9 Enhanced Serving HS-DSCH cell change

8.3.9.1 Definition and applicability

The enhanced serving HS-DSCH cell change procedure is initiated from UTRAN either with a RRC message that implies a change of the serving HS-DSCH cell or through an HS-SCCH order sent on the target cell (target cell is the cell which becomes the serving cell after the enhanced serving HS-DSCH cell change procedure).

The requirements and this test apply to Release 8 and later releases for all types of UTRA for the FDD UE that indicate support for HSDPA and Target Cell Pre-Configuration (all HSDPA categories).

8.3.9.2 Minimum requirement

When the UE receives an HS-SCCH order from the target cell that implies enhanced HS-DSCH serving cell change:

- if the activation time is not equal to "now", the UE shall be ready to receive the full configured HS-SCCH set from the target cell within $\text{MAX}\{40 \text{ ms}, \text{activation time} - \text{the end of the TTI containing the HS-SCCH order}\}$ from the end of the TTI containing the HS-SCCH order.
- if the activation time is set to "now", the UE shall be ready to receive the full configured HS-SCCH set within 40 ms from the end of the TTI containing the HS-SCCH order.

The UE shall start to receive the first HS-SCCH message on HS-SCCH-2 from cell 2 within no more than 40 ms from the beginning of time period T4 and transmit the ACK or NACK which corresponds to the HS-SCCH message.

Note: Since HS-SCCH-2 on cell 2 is the only HS-SCCH which is being transmitted from the start of T4, either ACK or NACK transmission from the UE after the start of T4 implies that the enhanced serving cell change has been completed.

The rate of correct serving cell changes observed during repeated tests shall be at least 90%.

The reference for this requirement is TS 25.133 [2] clauses 5.1.1.2 and A.5.9.

8.3.9.3 Test purpose

The purpose of this test is to verify the requirement for the delay when performing the enhanced serving HS-DSCH cell change in CELL_DCH state specified in section 8.3.9.2.

8.3.9.4 Method of test

The test parameters are given in Table 8.3.9.1 and 8.3.9.2 below. The test consists of 4 successive time periods, with time durations of T1, T2, T3 and T4 respectively. At the start of time duration T1 the UE has cell 1 and cell 2 in the active set and cell 1 as the serving HS-DSCH cell. Target cell preconfiguration is provided for cell 2 in the active set update. The target cell preconfiguration shall not contain the optional IE "Activation time offset". After sending event 1D during time period T2, the UE should start to monitor HS-SCCH-1 from cell 2. A single HS-SCCH order implying serving cell change starts to be transmitted from cell 2 during T3. By the start of T4, the single HS-SCCH order implying serving cell change completes transmission, and within the time specified in section 8.3.9.2 the UE shall also be monitoring the HS-SCCH-2 on target cell 2.

Data shall be transmitted continuously to the UE on the HS-DSCH channel of cell 1 during T1 and T2, and on the HS-DSCH channel of cell2 during T4.

Table 8.3.9.1: General test parameters for enhanced serving HS-DSCH cell change

| Parameter | | Unit | Value | Comment |
|--------------------------------|-------------------------|------------|---|--|
| F-DPCH slot format | | | 0 | |
| Power Control | | | On | |
| Target quality value on F-DPCH | | TPC BER | 0.05 | 5% |
| HSDPA parameters | | | Fixed Reference Channel Definition H-Set 1, with QPSK modulation only | As specified in TS 34.121-1 section C.8.1.1 |
| Initial conditions | Active cells | | Cell 1 and Cell 2 | |
| | Serving HS-DSCH cell | | Cell 1 | |
| Final condition | Active cell | | Cell 1 and Cell 2 | |
| | Serving HS-DSCH cell | | Cell 2 | |
| Hysteresis | | dB | 0 | |
| Time to Trigger | | ms | 0 | |
| Filter coefficient | | | 0 | |
| T1 | | s | 5 | |
| T2 | | s | 1 | |
| T3 | | ms | 100 | |
| T4 | | ms | 100 | |

Table 8.3.9.2: Cell specific test parameters for enhanced serving HS-DSCH cell change

| Parameter | Unit | Cell 1 | | | | Cell 2 | | | |

| Propagation Condition | | AWGN | | | | | | | |
| Relative delay of paths received from cell 2 with respect to cell 1 | Chips | {-148 ... 148} Note 3 | | | | | | | |
| NOTE 1: The F-DPCH level is controlled by the power control loop | | | | | | | | | |
| NOTE 2: The power of the OCNS channel that is added shall make the total power from the cell to be equal to I_{or} . | | | | | | | | | |
| NOTE 3: The relative delay of the path from cell 2 with respect to cell 1 shall always be within ± 148 chip. | | | | | | | | | |

8.3.9.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS (node B emulator) and fader and AWGN noise source to the UE antenna connector as shown in figure A.14.
- 2) Set up an HSDPA call according to TS 34.108 [3] clause 7.3.6 with levels according to T1 in table 8.3.9.3 with cell 1 as serving HS-DSCH cell.
- 3) Once the HSDPA connection is setup, start transmitting HSDPA Data on cell 1.
- 4) The information bit data shall be pseudo random and not repeated before 10 different information bit payload blocks are processed. (e.g. Fixed reference Channel Definition H-set 1 (QPSK): The information bit payload block is 9377 bits long. Hence the PRBS sequence must be at least $9377 * 10$ bits long.) Use a PRBS from ITU-T O.153 Ref [27]
- 5) SS shall send a MEASUREMENT CONTROL message (event 1A)
- 6) UE shall send a MEASUREMENT REPORT message triggered by event 1A containing the CFN-SFN observed time difference between cell1 and cell2.
- 7) SS shall send an ACTIVE SET UPDATE message with activation time "now", adding cell 2 to the active set
- 8) UE shall send a ACTIVE SET UPDATE COMPLETE message

8.3.9.4.2 Procedure

- 1) T1 starts
- 2) SS shall send a MEASUREMENT CONTROL message (event 1D)
- 3) After 5 seconds from the beginning of T1, the SS shall switch the power settings from T1 to T2 according to the parameters defined in table 8.3.9.3.

- 4) During time period T2, UE shall transmit a MEASUREMENT REPORT message (intra frequency) triggered by event 1D for cell 2.
- 5) After 1 second from the beginning of T2, the SS shall switch the power settings from T2 to T3 according to the parameters defined in table 8.3.9.3. The SS shall not send any HSDPA data on cell 1 after the start of T3.
- 6) During time period T3 UTRAN shall send an HS-SCCH order on HS-SCCH-1 from cell 2 implying enhanced serving HS-DSCH from cell 1 to cell 2. The HS-SCCH order message shall be sent to the UE so that the end of the TTI containing the HS-SCCH order corresponds to the beginning of T4.
- 7) At the start of T4 the SS shall switch the power settings from T3 to T4 according to the parameters defined in table 8.3.9.3 and the SS shall transmit data to the UE using HS-SCCH-2 and HS-PDSCH on cell 2.
- 8) The SS shall measure the time from start of T4 until the start of the HS-DPCCH subframe where the UE starts transmitting ACK/NAK. The first ACK corresponds to HS-SCCH order on HS-SCCH-1. Then any following ACK/NAK received from the UE indicates that the UE is monitoring HS-SCCH-2.
- 9) If step 8 fulfils the test requirements, then the number of successful tests is increased by one.
- 10) SS shall transmit a PHYSICAL CHANNEL RECONFIGURATION message (cell 1 HS-DSCH serving cell) with activation time set to "now" changing serving HS-DSCH back to cell 1.
- 11) The UE shall transmit a PHYSICAL CHANNEL RECONFIGURATION COMPLETE message
- 12) The SS shall switch the power settings from T4 to T1 in table 8.3.9.3. The start of T1 is defined as the end of the last TTI containing the physical channel reconfiguration message.
- 13) The SS shall start transmitting HSDPA Data on cell 1 and shall not send any HSDPA data on cell 2.
- 14) Repeat step 3-13 until the confidence level according to annex F.6.2 is achieved

Specific Message Contents

The default messages for SIB11 and SIB12 as specified for Cell 1 and Cell 2 in clause 6.1.4 of 34.108 [3] are used.

Default parameters according to Cell 1 and Cell 2 in clause 6.1.4.

All messages indicated above shall use the same content as described in the default message content in clause 9 of 34.108 [3], with the following exceptions:

MEASUREMENT CONTROL message (event 1A)

| Information Element/Group name | Value/Remark |
|---|---|
| Message Type (10.2.17) | |
| UE information elements | |
| -RRC transaction identifier | 0 |
| -Integrity check info | |
| -message authentication code | SS calculates the value of MAC-I for this message and writes to this IE. The first/leftmost bit of the bit string contains the most significant bit of the MAC-I. |
| -RRC message sequence number | SS provides the value of this IE, from its internal counter. |
| Measurement Information elements | |
| -Measurement Identity | 1 |

MEASUREMENT REPORT message for Intra frequency event 1A

This message is common for all intra-frequency test cases and are described in Annex I.

MEASUREMENT REPORT message for Intra frequency, event 1D test cases

| Information Element | Value/remark |
|--|--|
| Message Type Integrity check info | The presence of this IE is dependent on IXIT statements in TS 34.123-2. If integrity protection is indicated to be active, this IE shall be present with the values of the sub IEs as stated below. Else, this IE and the sub-IEs shall be absent. |
| - Message authentication code | This IE is checked to see if it is present. The value is compared against the XMAC-I value computed by SS. |
| - RRC Message sequence number | This IE is checked to see if it is present. The value is used by SS to compute the XMAC-I value. |
| Measurement identity | 2 |

8.3.9.5 Test requirements

For the test to pass, the total number of successful tests shall be more than 90% of the cases with a confidence level of 95 %.

Table 8.3.9.3: Cell specific test parameters for enhanced serving HS-DSCH cell change

| Parameter | Unit | Cell 1 | | | | Cell 2 | | | |
|--|---------------------|------------------------------|--------|--------|--------|-----------|--------|--------|--------|
| | | T1 | T2 | T3 | T4 | T1 | T2 | T3 | T4 |

| HS-SCCH-1_Ec/I _{or} | dB | -12.3 | | -inf | | -inf | | -12.3 | -inf |
| HS-SCCH-2_Ec/I _{or} | dB | -inf | | -inf | | -inf | | -12.3 | |
| OCNS | | Note 2 | Note 2 | Note 2 | Note 2 | Note 2 | Note 2 | Note 2 | Note 2 |
| \hat{I}_{or}/I_{oc} | dB | 3.64 | 1.14 | | | 1.14 | 3.64 | | |
| I_{oc} | dBm/ 3,84 MHz | -70 | | | | | | | |
| CPICH_Ec/I _o | dB | -12.3 | -14.8 | | -14.8 | | -12.3 | | |
| Propagation Condition | | AWGN | | | | | | | |
| Relative delay of paths received from cell 2 with respect to cell 1 | Chips | {-147.5 ... 147.5} Note 3 | | | | | | | |
| NOTE 1: The F-DPCH level is controlled by the power control loop | | | | | | | | | |
| NOTE 2: The power of the OCNS channel that is added shall make the total power from the cell to be equal to I_{or} . | | | | | | | | | |
| NOTE 3: The relative delay of the path from cell 2 with respect to cell 1 shall always be within ± 147.5 chip. | | | | | | | | | |
| NOTE 4: E_c/I_{or} value represent the per code power for HS-PDSCH channel. | | | | | | | | | |

Step 8: Time from the start of T4 to the sub frame of HS-DPCCH where ACK/NAK corresponding to HS-SCCH-2 is starting shall be less than $40 \text{ ms} + 7.5 * T_{\text{slot}} + T_0 * T_{\text{chip}} + 2 * T_{\text{subframe}} = 40 + 9.3 = 49.3 \text{ ms}$. Allow 50 ms in the test.

NOTE 1: The first ACK that UE sends after the start of T4 corresponds to HS-SCCH order on HS-SCCH-1. After that either ACK or NACK transmission from the UE implies that the enhanced serving cell change has been completed and UE is monitoring HS-SCCH-2.

NOTE 2: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

8.3.10 System information acquisition for CSG cell

8.3.10.1 Intrafrequency System information acquisition for CSG cell

8.3.10.1.1 Definition and applicability

For intra frequency CSG cells, CSG SI decoding is typically triggered when a cell with primary scrambling code in a preconfigured range meets the criteria for measurement reporting. For intra frequency system information acquisition, interruption in downlink reception or uplink transmission shall not be performed to acquire system information.

The requirements in this section apply to a FDD UE release 9 and forward which supports CSG and intra-frequency system information acquisition of a CSG cell in preparation for handover.

8.3.10.1.2 Minimum requirement

The CSG SI reporting delay shall not be more than $T_{\text{CSG-SI-Report}}$ where $T_{\text{CSG-SI-Report}}$ in ms is given by

$$T_{\text{CSG-SI-Report}} = [630] + 40 * \text{SIB3_REP}$$

SIB3_REP is the repetition period at which the CSG cell schedules SIB3 blocks in units of frames

This requirement is applicable for CSG target cell configurations where the information required to make the SI report can be determined from the MIB and SIB3 alone, and SIB3 is not segmented into multiple TTI. Additionally, for the requirement to be applicable, the reception conditions shall be [TBD] such that the system frame number of the target CSG cell, the MIB and SIB3 can each be successfully decoded in no more than four attempts.

Reporting delay results from delay uncertainty when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is twice the TTI of the uplink DCCH.

The UE shall transmit an Event 1A-triggered measurement report containing the cell identity and CSG identity of cell 2 and membership indication set to false within [2.71] seconds from the start of T2

$$\begin{aligned} \text{Test requirement} &= T_{\text{identify intra}} + T_{\text{CSG-SI-Report}} \\ &= 800 + [630] + 40 * 32 \text{ from the start of T2} \\ &= [2.71] \text{ seconds.} \end{aligned}$$

The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled..

The rate of correct events observed during repeated tests shall be at least 90%.

NOTE: The actual overall delays measured in the test may be up to $2 \times TTI_{\text{UL DCCH}}$ higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in the UL DCCH.

The measured quality on the DTCH of the UE downlink during T2 shall not exceed $\text{BLER} = 0.01 \pm 30\% = 0.013$

The reference for this requirement is TS 25.133 [2] clauses 5.13 and A.5.10.

8.3.10.1.3 Test purpose

The purpose of this test is to verify the requirement for intra frequency CSG SI acquisition in section 8.3.10.1.2.

8.3.10.1.4 Method of test

8.3.10.1.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

The test parameters are given in Table 8.3.10.1.1 and 8.3.10.1.2 below. In the measurement control information cell 2 shall be included in the "Intra-frequency SI Acquisition" IE. The test consists of two successive time periods, with time duration of T1 and T2 respectively. At the start of time duration T1, the UE may not have any timing information of cell 2.

Table 8.3.10.1.1: General test parameters for intra frequency CSG SI acquisition

| Parameter | | Unit | Value | Comment |
|----------------------------------|-------------------|--------|---|---|
| DCH parameters | | | DL and UL Reference Measurement Channel 12.2 kbps | As specified in TS 25.101 section A.3.1 and A.2.1 |
| Power Control | | | On | |
| Target quality value on DTCH | | BLER | 0.01 | |
| Initial conditions | Active cell | | Cell 1 | |
| | Neighbouring cell | | Cell 2 | |
| Final condition | Active cell | | Cell 1 | Handover to cell 2 is not requested |
| Reporting range | | dB | 3 | Applicable for event 1A |
| Hysteresis | | dB | 0 | |
| W | | | 1 | Applicable for event 1A |
| Reporting deactivation threshold | | | 0 | Applicable for event 1A |
| Time to Trigger | | Ms | 0 | |
| SIB3_REP | | Frames | 32 | Applicable for cell 2 SIB3 scheduling |
| SIB3_SEG_COUNT | | | 1 | Applicable for cell 2 SIB3 scheduling |
| UE whitelist | | | Empty | |
| Monitored cell list size | | | 24 on channel 1 | Measurement control information is sent before the start of the test |
| CSG id (of cell 2) | | | Set to any non-empty value (In this test case, it is set to 2) | |
| Filter coefficient | | | 0 | |
| T1 | | S | 5 | |
| T2 | | S | 5 | |

Table 8.3.10.1.2: Cell specific test parameters for intra frequency CSG SI acquisition

| Parameter | Unit | Cell 1 | | Cell 2 | |
|--|------------------|--------|--------|-----------|--------|
| | | T1 | T2 | T1 | T2 |
| CPICH_Ec/lor | dB | | -10 | | -10 |
| PCCPCH_Ec/lor | dB | | -12 | | -12 |
| SCH_Ec/lor | dB | | -12 | | -12 |
| PICH_Ec/lor | dB | | -15 | | -15 |
| DPCH_Ec/lor | dB | | Note 1 | | N/A |
| OCNS | | | Note 2 | | -0.941 |
| \hat{I}_{or}/I_{oc} | dB | 0 | 6.97 | -Infinity | 5.97 |
| I_{oc} | dBm/ 3,84 MHz | -63.01 | -70 | Note 3 | Note 3 |
| CPICH_Ec/lo | dB | -13 | | -Infinity | -14 |
| Propagation Condition | | AWGN | | | |
| NOTE 1: The DPCH level is controlled by the power control loop | | | | | |
| NOTE 2: The power of the OCNS channel that is added shall make the total power from the cell to be equal to I_{or} . | | | | | |
| NOTE 3: The I_{oc} level is common for cell 1 and cell 2 | | | | | |

8.3.10.1.4.2 Procedure

- 1) The RF parameters are set up according to T1 in Table 8.3.10.1.3.
- 2) The UE is switched on.
- 3) A call is set up according to the test procedure specified in TS 34.108 [3] subclause 7.3.4.
- 4) SS shall send a MEASUREMENT CONTROL message (event 1A) on Cell 1. Cell 2 is included in the "Intra-frequency SI Acquisition" IE. T1 starts.
- 5) After 5 seconds from the beginning of T1, the SS shall switch the power settings from T1 to T2 according to the parameters defined in table 8.3.10.1.3.
- 6) SS shall measure the time and the UE downlink BLER from the start of T2 until receiving the MEASUREMENT REPORT message.

- 7) If the MEASUREMENT REPORT message containing the cell identity, CSG identity of cell 2 and not containing membership indication within 2.71 seconds from the start of T2 and BLER shall not exceed 0.013, then the number of successful tests is increased by one.
- 8) After 5 seconds from the beginning of time period T2, the UE is switched off. Any timing information of cell 2 is deleted in the UE.
- 9) Repeat step 1-8 until the confidence level according to annex F.6.2 is achieved

Specific Message Contents

The default messages for SIB11 and SIB12 as specified for Cell 1 and Cell 2 in clause 6.1.4 of 34.108 [3] are used.

Default parameters according to Cell 1 and Cell 2 in clause 6.1.4, with the following exceptions:

The "CSG Indicator" in MIB of the Cell 2 is set to TRUE.

The "CSG Identity" in SIB3 of the Cell 2 is 2. "CSG PSC Split Information" is also included in SIB3 with "Start PSC" set to 144 and "Number of PSCs" set to 10.

All messages indicated above shall use the same content as described in the default message content in clause 9 of 34.108 [3], with the following exceptions:

MEASUREMENT CONTROL message, event 1A (step 4):

| Information Element/Group name | Value/Remark |

8.3.10.1.5 Test requirements

For the test to pass, the total number of successful tests shall be at least 90% of the cases with a confidence level of 95 %.

Table 8.3.10.1.3: Cell specific test parameters for intra frequency CSG SI acquisition

| Parameter | Unit | Cell 1 | | Cell 2 | |
|--|---------------|--------|-----|-----------|--------|
| | | T1 | T2 | T1 | T2 |
| CPICH_Ec/lor | dB | -9.3 | | -9.3 | |
| PCCPCH_Ec/lor | dB | -11.3 | | -11.3 | |
| SCH_Ec/lor | dB | -11.3 | | -11.3 | |
| PICH_Ec/lor | dB | -14.3 | | -14.3 | |
| DPCH_Ec/lor | dB | Note 1 | | N/A | |
| OCNS | | Note 2 | | -1.13 | |
| \hat{I}_{or}/I_{oc} | dB | 0 | 7.0 | -Infinity | 6.0 |
| I_{oc} | dBm/ 3,84 MHz | -63.01 | -70 | Note 3 | Note 3 |
| CPICH_Ec/lo | dB | -12.3 | | -Infinity | -13.3 |
| Propagation Condition | | AWGN | | | |
| NOTE 1: The DPCH level is controlled by the power control loop | | | | | |
| NOTE 2: The power of the OCNS channel that is added shall make the total power from the cell to be equal to I_{or} . | | | | | |
| NOTE 3: The I_{oc} level is common for cell 1 and cell 2 | | | | | |

Step 7: Time from the start of T2 to the time UE sending measurement report shall be less than 2.71 seconds and BLER shall not exceed 0.013.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

8.3.10.2 Inter frequency System information acquisition for CSG cell

8.3.10.2.1 Definition and applicability

For inter frequency CSG cells, CSG SI decoding is explicitly requested by RRC signalling. For the inter frequency case the UE may make autonomous gaps in both downlink reception and uplink transmission.

The requirements in this section apply to a FDD UE release 9 and forward which supports CSG and inter-frequency system information acquisition of a CSG cell in preparation for handover.

8.3.10.2.2 Minimum requirement

When inter frequency CSG SI decoding of a neighbour cell is requested by UTRAN, the UE may interrupt ongoing downlink reception, and uplink transmission to perform the decoding on another frequency. The total of the gaps in reception and the total of the gaps in transmission during the period $T_{\text{CSG-SI-Report}}$ shall not exceed $T_{\text{CSG-SI-Interruption}}$ where $T_{\text{CSG-SI-Interruption}} = [600\text{ms}]$. This requirement is applicable for CSG target cell configurations where the information required to make the SI report can be determined from the MIB and SIB3 alone, and SIB3 is not segmented into multiple TTI. Additionally, for the requirement to be applicable, the reception conditions shall be [TBD] such that the system frame number of the target CSG cell, the MIB and SIB3 can each be successfully decoded in no more than four attempts

The UE shall transmit a measurement report containing the cell identity, CSG identity of cell 2 and membership indication set to FALSE within [1.96] seconds from the start of T3.

Test requirement = RRC Procedure delay + $T_{\text{CSG-SI-Report}}$

$$= 50 + [630] + 40 * 32 \text{ from the start of T3}$$

$$= [1.96] \text{ seconds.}$$

The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled..

The rate of correct events observed during repeated tests shall be at least 90%.

NOTE 1: The actual overall delays measured in the test may be up to $2 \times TTI_{UL_DCCH}$ higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in the UL DCCH.

The measured quality on the DTCH of the UE downlink measured from the start of T3 until 1.96 seconds after the start of T3 using loopback shall not exceed BLER= 0.612

NOTE 2: The test BLER is defined from the requirements as follows:

- 600ms of downlink interruption and 600ms of uplink interruption may occur = 30 DTCH TTI
- Due to loopback delay (up to 10 TTI), this means that $30 + 30 = 60$ TTI loopback throughput may be lost due to gaps in uplink and downlink
- There are 98 TTI in the test interval (1.96 seconds)
- The remaining $98-60 = 38$ TTI should have a BLER not exceeding $0.001+30\% = 0.0013$

Overall maximum allowed BLER is $(38/98)*0.0013 + (60/98)*1 = 0.612$

The reference for this requirement is TS 25.133 [2] clauses 5.13 and A.5.11.

8.3.10.2.3 Test purpose

The purpose of this test is to verify the requirement for inter frequency CSG SI acquisition in section 8.3.10.2.2.

8.3.10.2.4 Method of test

8.3.10.2.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

The test parameters are given in Table 8.3.10.2.1 and 8.3.10.2.2 below. The test consists of three successive time periods, with a time duration T1, T2 and T3. In the measurement control information it is indicated to the UE that event-triggered reporting with Event 2C shall be used. The CPICH E_c/I_0 of the best cell on the unused frequency shall be reported together with Event 2C reporting. At the start of time duration T1, the UE may not have any timing information of cell 2.

During T2, the UE shall transmit a measurement report with event 2C, and UTRAN shall respond with a measurement control message which reconfigures inter frequency measurements with the Inter-frequency SI Acquisition IE containing the PSC of cell 2. The start of T3 is defined as the end of the last TTI containing this measurement control message

Table 8.3.10.2.1: General test parameters for Handover to inter-frequency cell

| Parameter | Unit | Value | Comment |
|------------------------------|----------------|--|---|
| DCH parameters | | DL and UL Reference Measurement Channel 12.2 kbps | As specified in TS 25.101 section A.3.1 and A.2.1 |
| Power Control | | On | |
| Target quality value on DTCH | BLER | 0.001 | |
| Compressed mode | | A.22 set 1 | As specified in TS 25.101 section A.5. |
| Initial conditions | Active cell | Cell 1 | |
| | Neighbour cell | Cell 2 | |
| Final conditions | Active cell | Cell 1 | Handover to cell 2 is not requested |
| Threshold non used frequency | dB | -18 | Absolute E_c/I_0 threshold for event 2C |
| Hysteresis | dB | 0 | |
| W non-used frequency | | 1 | Applicable for event 2C |
| Time to Trigger | Ms | 0 | |
| Filter coefficient | | 0 | |
| SIB3_REP | Frames | 32 | Applicable for cell 2 SIB3 scheduling |
| SIB3_SEG_COUNT | | 1 | Applicable for cell 2 SIB3 scheduling |
| CSG id (of cell 2) | | Set to any non-empty value (In this test case ,it is set to 2) | |

| Parameter | Unit | Value | Comment |
|---------------------------|------|------------------------------------|--|
| CSG Indicator (of cell 2) | | Set to TRUE | |
| UE whitelist | | Empty | |
| Monitored cell list size | | 24 on channel 1 16 on channel 2 | Measurement control information is sent before the compressed mode pattern starts. |
| T1 | S | 5 | |
| T2 | S | ≤5 | |
| T3 | S | 5 | |

| \hat{I}_{or}/I_{oc} | dB | 0 | | | -Infinity | -1.8 | -1.8 |
| I_{oc} | dBm/3,84 MHz | -70 | | | | | |
| CPICH_Ec/lo | dB | -13 | | | -Infinity | -14 | -14 |
| Propagation Condition | | AWGN | | | | | |
| NOTE 1: The DPCH level is controlled by the power control loop | | | | | | | |
| NOTE 2: The power of the OCNS channel that is added shall make the total power from the cell to be equal to I_{or} . | | | | | | | |

8.3.10.2.4.2 Procedure

- 1) The RF parameters are set up according to T1 in Table 8.3.10.2.3.
- 2) The UE is switched on.
- 3) A call is set up according to the test procedure specified in TS 34.108 [3] subclause 7.3.4 with Compressed mode parameters as in Table 8.3.10.2.1. The compressed mode shall remain inactive. Data shall be sent on the DTCH throughout the call.
- 4) SS shall send a MEASUREMENT CONTROL message (event 2C) on Cell 1. T1 starts.
- 5) 5 seconds after step 4 has completed, the SS shall switch the power settings from T1 to T2 according to the parameters defined in table 8.3.10.2.3.
- 6) SS shall transmit PHYSICAL CHANNEL RECONFIGURATION message to active the compressed mode.
- 7) UE shall transmit PHYSICAL CHANNEL RECONFIGURATION COMPLETE message.
- 8) UE shall transmit a MEASUREMENT REPORT message triggered by event 2C during T2.
- 9) SS shall transmit a MEASUREMENT CONTROL message with the Inter-frequency SI Acquisition IE containing the PSC of Cell 2. The start of T3 is defined as the end of the last TTI containing this measurement control message.
- 10) SS shall measure the time and the BLER from the start of T3 until receiving the MEASUREMENT REPORT message.
- 11) If the MEASUREMENT REPORT message containing the cell identity, CSG identity of Cell 2 and not containing membership indication within 1.96 seconds from the start of T3 and BLER is less than 0.612, then the number of successful tests is increased by one.

12) After 5 seconds from the beginning of time period T3, the UE is switched off. Any timing information of Cell 2 is deleted in the UE.

13) Repeat step 1-12 until the confidence level according to annex F.6.2 is achieved

Specific Message Contents

The default messages for SIB11 and SIB12 as specified for Cell 1 and Cell 2 in clause 6.1.4 of 34.108 [3] are used.

Default parameters according to Cell 1 and Cell 2 in clause 6.1.4, with the following exceptions:

The "CSG Identity" in SIB3 of the Cell 2 is 2. "CSG PSC Split Information" is also included in SIB3 with "Start PSC" set to 248 and "Number of PSCs" set to 10.

All messages indicated above shall use the same content as described in the default message content in clause 9 of 34.108 [3], with the following exceptions:

| I_{oc} | dBm/3,84 MHz | -70 | | | | | |
| CPICH_Ec/I _o | dB | -12.2 | | | -Infinity | -13.2 | -13.2 |
| Propagation Condition | | AWGN | | | | | |
| NOTE 1: The DPCH level is controlled by the power control loop | | | | | | | |
| NOTE 2: The power of the OCNS channel that is added shall make the total power from the cell to be equal to I_{or} . | | | | | | | |

Step 11: Time from the start of T3 to the time UE sending measurement report shall be less than 1.96 seconds and the BLER during this time shall be less than 0.612.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

8.4 RRC Connection Control

8.4.1 RRC Re-establishment delay

8.4.1.1 Test 1

8.4.1.1.1 Definition and applicability

The UE Re-establishment delay requirement ($T_{UE-RE-ESTABLISH-REQ}$) is defined as the time between the moment when radio link failure is considered by the UE, to when the UE starts to send preambles on the PRACH.

$T_{UE-RE-ESTABLISH-REQ}$ is depending on whether the target cell is known by the UE or not. A cell is known if either or both of the following conditions are true:

- the UE has had radio links connected to the cell in the previous (old) active set.
- the cell has been measured by the UE during the last 5 seconds.

The phase reference is the primary CPICH.

The requirements of this test apply to the FDD UE.

8.4.1.1.2 Minimum requirement

The Re-establishment delay $T_{RE-ESTABLISH}$ to a known cell shall be less than 1.9 s.

The rate of correct RRC re-establishments observed during repeated tests shall be at least 90%.

NOTE: The Re-establishment delay in this case can be expressed as

$$T_{RE-ESTABLISH} = T_{RRC-RE-ESTABLISH} + T_{UE-RE-ESTABLISH-REQ-KNOWN}$$

where

$$T_{RRC-RE-ESTABLISH} = 160\text{ms} + (N_{313} - 1) * 10\text{ms} + T_{313}$$

$$T_{UE-RE-ESTABLISH-REQ-KNOWN} = 50\text{ms} + T_{\text{search}} + T_{SI} + T_{RA}$$

$$N_{313} = 20$$

$$T_{313} = 0\text{s}$$

$$T_{\text{search}} = 100\text{ms}$$

$$T_{RA} = \text{The additional delay caused by the random access procedure. 40 ms is assumed in this test case.}$$

$$T_{SI} \text{ is the time required for receiving all the relevant system information data according to the reception procedure and the RRC procedure delay of system information blocks defined in 25.331 for a UTRAN cell (ms). 1280 ms is assumed in this test case.}$$

This gives a total of 1820ms, allow 1.9s in the test case.

8.4.1.1.3 Test purpose

To verify that the UE meets the minimum requirement.

8.4.1.1.4 Method of test

8.4.1.1.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

The test parameters are given in table 8.4.1.1, table 8.4.1.1.A, and table 8.4.1.2 below. The maximum repetition period of the relevant system info blocks that needs to be received by the UE to camp on a cell shall be 1280 ms. And DRX cycle length shall be 1280ms. In the measurement control information it is indicated to the UE that periodic reporting shall be used. The test consist of 2 successive time periods, with a time duration of T1 and T2 respectively. At the start of time period T2, the dedicated channel is removed.

Table 8.4.1.1 General test parameters for RRC re-establishment delay, Test 1

| Parameter | Unit | Value | Comment |
|--------------------------------|---------|--|--|
| DCH Parameters | | DL and UL Reference measurement channel 12.2 kbps | As specified in clause C.3.1 and C.2.1 |

8.4.1.1.4.2 Procedure

- 1) The RF parameters are set up according to T0.
- 2) The UE is switched on.
- 3) A call is set up according to the test procedure specified in TS 34.108 [3] subclause 7.3.4 without Compressed mode parameters.
- 4) The RF parameters are setup according to T1.
- 5) 10 s after step4 has completed, the parameters are changed to that as described for T2.
- 6) If the UE responds on cell 2 within 2.1 s from the beginning of time period T2 with a CELL_UPDATE command then the number of successful tests is increased by one.
- 7) SS shall transmit a RRC CONNECTION RELEASE message to make the UE transit to idle mode.
- 8) After 6 seconds from the beginning of time period T2, the RF parameters are set up according to T0.
- 9) The SS shall wait for 30s to make the UE complete cell reselection to cell1.
- 10) Repeat step 3-9 until the confidence level according to annex F.6.2 is achieved.

NOTE 1: The time required for receiving all the relevant system information data according to the reception procedure and the RRC procedure delay of system information blocks is defined in 25.331 for a UTRAN cell. Since the maximum time to read the relevant system info blocks that needs to be received by the UE to camp on a cell is 1420ms (see note 2) and the maximum RRC procedure delay for reception system information block is 100ms, 1520ms is assumed in this test case. Therefore this gives a total of 2060ms (Minimum requirement + 240ms), allow 2.1s in the test case.

NOTE 2: The maximum repetition period of the relevant system info blocks that needs to be received by the UE to camp on a cell is 1280ms. The Master Information Block (MIB) is repeated every 8 frame and SIB5 (and SIB11) is segmented into 4 segments where the first segment is scheduled adjacent to the MIB at SIB_POS=40 and the other three segments are scheduled after the MIB (SIB_POS=42, 44 and 46). The maximum time for a UE to read SIB5 will occur if the UE start reading the BCH at the SFN after the MIB located prior to the first segment of SIB5 (SIB_POS 32). Then the UE will not be able to read SIB5 until the second occurrence of SIB5, which will happen at SIB_POS 46 + 1280ms. This gives that the maximum time for the UE to read the relevant system info will be 1420ms ((SIB_POS 46 – SIB_POS 32)*10ms +1280ms).

All messages indicated above shall use the same content as described in the default message content in clause 9 of 34.108 [3], with the following exceptions:

Contents of RRC CONNECTION RELEASE message UM (Step 7):

| Information Element | Value/remark | Version |
|---------------------|-------------------------|---------|
| Release cause | Re-establishment Reject | |

8.4.1.1.5 Test requirements

For the test to pass, the total number of successful tests shall be more than 90% of the cases with a confidence level of 95%.

Note: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

8.4.1.2 Test 2

8.4.1.2.1 Definition and applicability

The UE Re-establishment delay requirement ($T_{UE-E-ESTABLISH-REQ}$) is defined as the time between the moment when radio link failure is considered by the UE, to when the UE starts to send preambles on the PRACH.

$T_{UE-RE-ESTABLISH-REQ}$ is depending on whether the target cell is known by the UE or not. A cell is known if either or both of the following conditions are true:

- the UE has had radio links connected to the cell in the previous (old) active set.
- the cell has been measured by the UE during the last 5 seconds.

The phase reference is the primary CPICH.

The requirements of this test apply to the FDD UE.

8.4.1.2.2 Minimum requirement

The rate of correct RRC re-establishments observed during repeated tests shall be at least 90%.

NOTE: The Re-establishment delay in this case can be expressed as

$$T_{RE-ESTABLISH} = T_{RRC-RE-ESTABLISH} + T_{UE-RE-ESTABLISH-REQ-UNKNOWN}$$

where

$$T_{RRC-RE-ESTABLISH} = 160\text{ms} + (N_{313} - 1) * 10\text{ms} + T_{313}$$

$$T_{UE-RE-ESTABLISH-REQ-UNKNOWN} = 50\text{ms} + T_{\text{search}} * NF + T_{SI} + T_{RA}$$

$$N_{313} = 20$$

$$T_{313} = 0\text{s}$$

$$T_{\text{search}} = 800\text{ms}$$

NF is the number of different frequencies in the monitored set. 3 frequencies are assumed in this test case.

T_{RA} = The additional delay caused by the random access procedure. 40 ms is assumed in this test case.

T_{SI} is the time required for receiving all the relevant system information data according to the reception procedure and the RRC procedure delay of system information blocks defined in 25.331 for a UTRAN cell (ms). 1280 ms is assumed in this test case.

This gives a total of 4120ms, allow 4.2s in the test case.

8.4.1.2.3 Test purpose

To verify that the UE meets the minimum requirement.

8.4.1.2.4 Method of test

8.4.1.2.4.1 Initial conditions

Test environment: normal; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

The test parameters are given in table 8.4.1.3 and table 8.4.1.4 below. The maximum repetition period of the relevant system info blocks that needs to be received by the UE to camp on a cell shall be 1280 ms. And DRX cycle length shall be 1280ms. In the measurement control information it is indicated to the UE that periodic reporting shall be used. The test consists of 2 successive time periods, with a time duration of T1 and T2 respectively. At the start of time period T2, the dedicated channel is removed.

Table 8.4.1.3 General test parameters for RRC re-establishment delay, Test 2

| Parameter | Unit | Value | Comment |
|--------------------------------|---------|---|--|
| DCH Parameters | | DL and UL Reference measurement channel 12.2 kbps | As specified in clause C.3.1 and C.2.1 |
| Power Control | | On | |
| Active cell, initial condition | | Cell 1 | |
| Active cell, final condition | | Cell 2 | |
| N313 | | 20 | |
| N315 | | 1 | |
| T313 | Seconds | 0 | |
| Monitored cell list size | | 24 | Monitored set shall include 2 additional frequencies. NOTE: See Annex I for cell information. |
| Cell 2 | | | Cell 2 is not included in the monitored set. Cell 2 is located on one of the 2 additional frequencies of the monitored set. NOTE: Cell 2 is included in the monitored cell list (SIB 11), but not known by the UE. |
| T _{SI} | ms | 1280 | See Annex I for the SIB repetition period of system information blocks. |
| Reporting frequency | Seconds | 4 | |
| T1 | s | 10 | |
| T2 | s | 6 | |

Table 8.4.1.4 Cell specific parameters for RRC re-establishment delay test, Test 2

| Parameter | Unit | Cell 1 | | Cell 2 | |
|---------------------------|---------------|--------|-----------|----------------|------|
| | | T1 | T2 | T1 | T2 |
| Cell Frequency | ChNr | 1 | | 2 | |
| CPICH_Ec/I _{or} | dB | -10 | | -10 | |
| PCCPCH_Ec/I _{or} | dB | -12 | | -12 | |
| SCH_Ec/I _{or} | dB | -12 | | -12 | |
| PICH_Ec/I _{or} | dB | -15 | | -15 | |
| DCH_Ec/I _{or} | dB | Note 1 | -Infinity | Not applicable | |
| OCNS_Ec/I _{or} | dB | Note 2 | -0.941 | -0.941 | |
| \hat{I}_{or}/I_{oc} | dB | -3,35 | -Infinity | -Infinity | 0,02 |
| I_{oc} | dBm/ 3.84 MHz | -70 | | | |
| CPICH_Ec/I _o | dB | -15 | -Infinity | -Infinity | -13 |
| Propagation Condition | | AWGN | | | |

NOTE 1: The DPCH level is controlled by the power control loop.
NOTE 2: The power of the OCNS channel that is added shall make the total power from the cell to be equal to I_{or} .

8.4.1.2.4.2 Procedure

- 1) The RF parameters are set up according to T1.
- 2) The UE is switched on.
- 3) A call is set up according to the test procedure specified in TS 34.108 [3] subclause 7.3.4 without Compressed mode parameters.
- 4) 10 s after step3 has completed, the parameters are changed to that as described for T2.
- 5) If the UE responds on cell 2 within 4.4 s from the beginning of time period T2 with a CELL_UPDATE command then the number of successful tests is increased by one.
- 6) SS shall transmit a RRC CONNECTION RELEASE message to make the UE transit to idle mode.
- 7) After 6 seconds the RF parameters are set up according to T1.
- 8) The SS shall wait for 30s to make the UE complete cell reselection to cell1.
- 9) Repeat step 3-8 until the confidence level according to annex F.6.2 is achieved.

NOTE 1: The time required for receiving all the relevant system information data according to the reception procedure and the RRC procedure delay of system information blocks is defined in 25.331 for a UTRAN cell. Since the maximum time to read the relevant system info blocks that needs to be received by the UE to camp on a cell is 1420ms (see note 2) and the maximum RRC procedure delay for reception system information block is 100ms, 1520ms is assumed in this test case. Therefore this gives a total of 4360ms (Minimum requirement + 240ms), allow 4.4s in the test case.

NOTE 2: The maximum repetition period of the relevant system info blocks that needs to be received by the UE to camp on a cell is 1280ms. The Master Information Block (MIB) is repeated every 8 frame and SIB5 (and SIB11) is segmented into 4 segments where the first segment is scheduled adjacent to the MIB at SIB_POS=40 and the other three segments are scheduled after the MIB (SIB_POS=42, 44 and 46). The maximum time for a UE to read SIB5 will occur if the UE start reading the BCH at the SFN after the MIB located prior to the first segment of SIB5 (SIB_POS 32). Then the UE will not be able to read SIB5 until the second occurrence of SIB5, which will happen at SIB_POS 46 + 1280ms. This gives that the maximum time for the UE to read the relevant system info will be 1420ms ((SIB_POS 46 – SIB_POS 32)*10ms +1280ms).

All messages indicated above shall use the same content as described in the default message content in clause 9 of 34.108 [3], with the following exceptions:

Contents of RRC CONNECTION RELEASE message UM (Step 6):

| Information Element | Value/remark | Version |
|---------------------|-------------------------|---------|
| Release cause | Re-establishment Reject | |

8.4.1.2.5 Test requirements

For the test to pass, the total number of successful tests shall be more than 90% of the cases with a confidence level of 95%.

Note: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

8.4.2 Random Access

8.4.2.1 Correct behaviour when receiving an ACK (Release 5 and earlier)

8.4.2.1.1 Definition and applicability

The random access procedure is used when establishing the layer 1 communication between the UE and UTRAN. The random access shall provide a fast access but without disturbing ongoing connections. The random access is specified in clause 6 of TS 25.214 [5] and the control of the RACH transmission is specified in clause 11.2 of TS 25.321. A random access transmit sequence is described in clause 6.7.2 of TS 25.303.

This test is applicable for Release 5 and earlier releases only. See subclause 8.4.2.1A for later releases.

8.4.2.1.2 Minimum Requirements

The UE shall have capability to calculate initial power according to the open loop algorithm and apply this power level at the first preamble and increase the power on additional preambles. The absolute power applied to the first preamble shall have an accuracy as specified in table 6.3 of TS 25.101 [1]. The relative power applied to additional preambles shall have an accuracy as specified in clause 6.5.2.1 of 25.101 [1].

The absolute power applied to the first preamble shall be -30 dBm with an accuracy as specified in clause 6.4.1.1 of TS 25.101 [1]. The accuracy is ± 9 dB in the case of normal condition or ± 12 dB in the case of extreme condition.

There are two relative powers, one is the power difference for preamble ramping and another is the power difference between last preamble part and message part. From the test parameter in the table 8.4.2.1.2, the test requirement of the power difference for all preamble ramping is 3dB (Power offset P₀). The accuracy is ± 2 dB as specified in clause 6.5.2.1 of 25.101 [1]. The test requirement of the power difference between 10th preamble PRACH and message part is 3 dB (note). The accuracy is ± 2 dB as specified in clause 6.5.2.1 of 25.101 [1].

NOTE: In order to calculate the power difference between 10th preamble PRACH and message part by using Power offset P_{p-m} in the table 8.4.2.1.2, the gain factors of PRACH message part are needed. The gain factor β_d is set to 15. The temporary gain factor β_c is set to 15.

The UE shall stop transmitting preambles upon a ACK on the AICH has been received and then transmit a message. The UE shall transmit 10 preambles and 1 message.

The normative reference for this requirements is TS 25.133 [2] clauses 6.3.2 and A.6.2.2.1.

8.4.2.1.3 Test purpose

The purpose of this test is to verify that the behaviour of the random access procedure is according to the requirements and that the PRACH power settings are within specified limits.

8.4.2.1.4 Method of test

8.4.2.1.4.1 Initial conditions

Test environment: normal, TL/VL, TL/VH, TH/VL, TH/VH; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.1 in the case of the PRACH power measurement. And in the case of the function test of the random access procedure, connect the SS to the UE antenna connector as shown in figure A.8. A spectrum analyzer is set to 0 span mode.

See TS 34.108 [3] for details regarding generic call setup procedure.

Table 8.4.2.1.1: RF Parameters for Random Access test

| Parameter | Unit | Cell 1 |
|--|--------------|-----------|
| UTRA RF Channel Number | | Channel 1 |
| CPICH_Ec/Ior | dB | -10 |
| PCCPCH_Ec/Ior | dB | -12 |
| SCH_Ec/Ior | dB | -12 |
| Number of other transmitted Acquisition Indicators | - | 0 |
| AICH_Ec/Ior | dB | -10 |
| PICH_Ec/Ior | dB | -15 |
| OCNS_Ec/Ior when an AI is not transmitted | dB | -0,941 |
| OCNS_Ec/Ior when an AI is transmitted | dB | -1,516 |
| \hat{I}_{or}/I_{oc} | dB | 0 |
| I_{oc} | dBm/3.84 MHz | -70 |
| CPICH_Ec/Io | dB | -13 |
| Propagation Condition | | AWGN |

The test parameters "System Information Block (SIB) type 5 (ASC #0)" defined in clause 6.1 of TS 34.108 [3], shall be used in all random access tests (see note). Crucial parameters for the test requirements are repeated in tables 8.4.2.1.2 and 8.4.2.1.3 and these overrule the parameters defined in SIB type 5.

NOTE: A parameter of AC-to-ASC mapping(AC0-9) in SIB5 of clause 6.1 of TS 34.108 [3] shall be set to 0 in the case of all random access tests. The EFACC of Type A, which is specified in clause 8.3.2.15 of TS 34.108 [3], shall be selected.

Table 8.4.2.1.2: UE parameters for Random Access test

| Parameter | Unit | Value |
|--|------------|-----------|
| Access Service Class (ASC#0) | | |
| - Persistence value | 0..1 | 1 |
| Maximum number of preamble ramping cycles (M_{max}). | | 2 |
| Maximum number of preambles in one preamble ramping cycle (Preamble Retrans Max) | | 12 |
| The backoff time T_{B01} $N_{B01min}=N_{B01max}$ | ms #TTI | N/A 10 |
| Power step when no acquisition indicator is received (Power offset P_0) | dB | 3 |
| Power offset between the last transmitted preamble and the control part of the message (Power offset P_{p-m}) | dB | 0 |
| Maximum allowed UL TX power | DBm | 21 |

Table 8.4.2.1.3: SS parameters for Random Access test

| Parameter | Unit | Value |
|---|------|-------|
| Primary CPICH DL TX power | dBm | -8 |
| UL interference | dBm | -92 |
| SIR in open loop power control (Constant value) | dB | -10 |
| AICH Power Offset | dB | 0 |

8.4.2.1.4.2 Procedure

- 1) A call is set up according to the Generic call setup procedure. The test parameters are set up according to table 8.4.2.1.1, table 8.4.2.1.2 and table 8.4.2.1.3. The PRACH procedure within the call setup is used for the test. It is necessary that an ACK on the AICH shall be transmitted after 10 preambles have been received by the SS
- 2) Measure the first PRACH preamble output power, the each power difference for preamble ramping and the power difference between 10th preamble PRACH and message part of the UE according to annex B.
- 3) Measure the number of the preamble part and the message part by using a spectrum analyzer.

8.4.2.1.5 Test requirements

The accuracy of the first preamble as specified in clause 6.4.1.1 of TS 25.101 [1] shall not be verified in this test. It is verified under the section 5.4.1, Open loop power control.

There are two relative powers, one is the power difference for preamble ramping and another is the power difference between last preamble part and message part. From the test parameter in the table 8.4.2.1.2, the test requirement of the power difference for all preamble ramping is 3dB (Power offset P₀). The accuracy is ± 3 dB. The test requirement of the power difference between 10th preamble PRACH and message part (control + data) is 3 dB (note). The accuracy is ± 3 dB

**Table 8.4.2.1.4:
Test requirement for power difference**

| | Power difference for all preambles | | Power difference between 10th preamble PRACH and message part (control+data) | |
|------------------|------------------------------------|------------|--|------------|
| Test requirement | 3dB | ± 3 dB | 3dB | ± 3 dB |

NOTE: In order to calculate the power difference between 10th preamble PRACH and message part by using Power offset P_{p-m} in the table 8.4.2.1.2, the gain factors of PRACH message part are needed. The gain factor β_d is set to 15. The temporary gain factor β_c is set to 15.

The UE shall stop transmitting preambles upon a ACK on the AICH has been received and then transmit a message. The UE shall transmit 10 preambles and 1 message.

Table 8.4.2.1.5: RF Parameters for Random Access test

| Parameter | Unit | Cell 1 |
|--|--------------|-----------|
| UTRA RF Channel Number | | Channel 1 |
| CPICH_Ec/lor | dB | -10 |
| PCCPCH_Ec/lor | dB | -12 |
| SCH_Ec/lor | dB | -12 |
| Number of other transmitted Acquisition Indicators | - | 0 |
| AICH_Ec/lor | dB | -10 |
| PICH_Ec/lor | dB | -15 |
| OCNS_Ec/lor when an AI is not transmitted | dB | -0,941 |
| OCNS_Ec/lor when an AI is transmitted | dB | -1,516 |
| \hat{I}_{or}/I_{oc} | dB | 0 |
| I_{oc} | dBm/3.84 MHz | -70 |
| CPICH_Ec/lo | dB | -13 |
| Propagation Condition | | AWGN |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

8.4.2.1A Correct behaviour when receiving an ACK (Release 6 and later)

8.4.2.1A.1 Definition and applicability

The random access procedure is used when establishing the layer 1 communication between the UE and UTRAN. The random access shall provide a fast access but without disturbing ongoing connections. The random access is specified in clause 6 of TS 25.214 [5] and the control of the RACH transmission is specified in clause 11.2 of TS 25.321. A random access transmit sequence is described in clause 6.7.2 of TS 25.303.

This test is applicable for Release 6 and later releases only. This test includes measurement of PRACH timing. See subclause 8.4.2.1 for the PRACH test for earlier releases that does not include PRACH timing.

8.4.2.1A.2 Minimum Requirements

The UE shall have capability to calculate initial power according to the open loop algorithm and apply this power level at the first preamble and increase the power on additional preambles. The absolute power applied to the first preamble shall have an accuracy as specified in table 6.3 of TS 25.101 [1]. The relative power applied to additional preambles shall have an accuracy as specified in clause 6.5.2.1 of 25.101 [1].

The absolute power applied to the first preamble shall be -30 dBm with an accuracy as specified in clause 6.4.1.1 of TS 25.101 [1]. The accuracy is ± 9 dB in the case of normal condition or ± 12 dB in the case of extreme condition.

There are two relative powers, one is the power difference for preamble ramping and another is the power difference between last preamble part and message part. From the test parameter in the table 8.4.2.1A.2, the test requirement of the power difference for all preamble ramping is 3dB (Power offset P₀). The accuracy is ± 2 dB as specified in clause 6.5.2.1 of 25.101 [1]. The test requirement of the power difference between 10th preamble PRACH and message part is 3 dB (note). The accuracy is ± 2 dB as specified in clause 6.5.2.1 of 25.101 [1].

NOTE: In order to calculate the power difference between 10th preamble PRACH and message part by using Power offset P_{p-m} in the table 8.4.2.1A.2, the gain factors of PRACH message part are needed. The gain factor β_d is set to 15. The temporary gain factor β_c is set to 15.

The UE shall stop transmitting preambles upon an ACK on the AICH has been received and then transmit a message. The UE shall transmit 10 preambles and 1 message.

The UE PRACH burst timing error shall be less than or equal to ± 3.5 Chips. The reference point shall be the expected timing calculated from the UE's reference detected path of the P-CCPCH.

The normative reference for this requirement is TS 25.133 [2] clauses 6.3.2, 7.4.2 and A.6.2.2.1.

8.4.2.1A.3 Test purpose

The purpose of this test is to verify that the behaviour of the random access procedure is according to the requirements and that the PRACH power settings and timing are within specified limits.

8.4.2.1A.4 Method of test

8.4.2.1A.4.1 Initial conditions

Test environment: normal, TL/VL, TL/VH, TH/VL, TH/VH; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.1 in the case of the PRACH power measurement. And in the case of the function test of the random access procedure, connect the SS to the UE antenna connector as shown in figure A.8.

See TS 34.108 [3] for details regarding generic call setup procedure.

Table 8.4.2.1A.1: RF Parameters for Random Access test

| Parameter | Unit | Cell 1 |
|--|--------------|-----------|
| UTRA RF Channel Number | | Channel 1 |
| CPICH_Ec/lor | dB | -10 |
| PCCPCH_Ec/lor | dB | -12 |
| SCH_Ec/lor | dB | -12 |
| Number of other transmitted Acquisition Indicators | - | 0 |
| AICH_Ec/lor | dB | -10 |
| PICH_Ec/lor | dB | -15 |
| OCNS_Ec/lor when an AI is not transmitted | dB | -0,941 |
| OCNS_Ec/lor when an AI is transmitted | dB | -1,516 |
| \hat{I}_{or}/I_{oc} | dB | 0 |
| I_{oc} | dBm/3.84 MHz | -70 |
| CPICH_Ec/lo | dB | -13 |
| Propagation Condition | | AWGN |

The test parameters "System Information Block (SIB) type 5 (ASC #0)" defined in clause 6.1 of TS 34.108 [3], shall be used in all random access tests (see note). Crucial parameters for the test requirements are repeated in tables 8.4.2.1A.2 and 8.4.2.1A.3 and these overrule the parameters defined in SIB type 5.

NOTE: A parameter of AC-to-ASC mapping (AC0-9) in SIB5 of clause 6.1 of TS 34.108 [3] shall be set to 0 in the case of all random access tests. The EFACC of Type A, which is specified in clause 8.3.2.15 of TS 34.108 [3], shall be selected.

Table 8.4.2.1A.2: UE parameters for Random Access test

| Parameter | Unit | Value |
|--|------------|-----------|
| Access Service Class (ASC#0) | | |
| - Persistence value | 0..1 | 1 |
| Maximum number of preamble ramping cycles (M_{max}). | | 2 |
| Maximum number of preambles in one preamble ramping cycle (Preamble Retrans Max) | | 12 |
| The backoff time T_{B01} $N_{B01min}=N_{B01max}$ | ms #TTI | N/A 10 |
| Power step when no acquisition indicator is received (Power offset P_0) | dB | 3 |
| Power offset between the last transmitted preamble and the control part of the message (Power offset P_{p-m}) | dB | 0 |
| Maximum allowed UL TX power | DBm | 21 |

Table 8.4.2.1A.3: SS parameters for Random Access test

| Parameter | Unit | Value |
|---|------|-------|
| Primary CPICH DL TX power | dBm | -8 |
| UL interference | dBm | -92 |
| SIR in open loop power control (Constant value) | dB | -10 |
| AICH Power Offset | dB | 0 |

8.4.2.1A.4.2 Procedure

- 1) A call is set up according to the Generic call setup procedure. The test parameters are set up according to table 8.4.2.1A.1, table 8.4.2.1A.2 and table 8.4.2.1A.3. The PRACH procedure within the call setup is used for the test. It is necessary that an ACK on the AICH shall be transmitted after 10 preambles have been received by the SS
- 2) Measure the first PRACH preamble output power and timing, the each power difference for preamble ramping and the power difference between 10th preamble PRACH and message part of the UE according to annex B.
- 3) Measure the number and timing of the preamble part and the message part by using a spectrum analyzer.

8.4.2.1A.5 Test requirements

The power accuracy of the first preamble as specified in clause 6.4.1.1 of TS 25.101 [1] shall not be verified in this test. It is verified under the section 5.4.1, Open loop power control.

The timing accuracy of all measured PRACH preamble and PRACH message bursts shall be within ± 4 chips of the reference timing for the used access slot for PRACH preambles or slot for PRACH messages. The reference timing shall be the expected timing calculated from the UE's reference detected path of the P-CCPCH.

There are two relative powers, one is the power difference for preamble ramping and another is the power difference between last preamble part and message part. From the test parameter in the table 8.4.2.1A.2, the test requirement of the power difference for all preamble ramping is 3dB (Power offset P₀). The accuracy is ± 3 dB. The test requirement of the power difference between 10th preamble PRACH and message part (control + data) is 3 dB (note). The accuracy is ± 3 dB

**Table 8.4.2.1A.4:
Test requirement for power difference**

| | Power difference for all preambles | | Power difference between 10th preamble PRACH and message part (control+data) | |
|------------------|------------------------------------|------------|--|------------|
| Test requirement | 3dB | ± 3 dB | 3dB | ± 3 dB |

NOTE: In order to calculate the power difference between 10th preamble PRACH and message part by using Power offset P_{p-m} in the table 8.4.2.1A.2, the gain factors of PRACH message part are needed. The gain factor β_d is set to 15. The temporary gain factor β_c is set to 15.

The UE shall stop transmitting preambles upon an ACK on the AICH has been received and then transmit a message. The UE shall transmit 10 preambles and 1 message.

Table 8.4.2.1A.5: RF Parameters for Random Access test

| Parameter | Unit | Cell 1 |
|---|------------------|-----------|
| UTRA RF Channel Number | | Channel 1 |
| CPICH_Ec/I _{or} | dB | -10 |
| PCCPCH_Ec/I _{or} | dB | -12 |
| SCH_Ec/I _{or} | dB | -12 |
| Number of other transmitted Acquisition Indicators | - | 0 |
| AICH_Ec/I _{or} | dB | -10 |
| PICH_Ec/I _{or} | dB | -15 |
| OCNS_Ec/I _{or} when an AI is not transmitted | dB | -0,941 |
| OCNS_Ec/I _{or} when an AI is transmitted | dB | -1,516 |
| \hat{I}_{or}/I_{oc} | dB | 0 |
| I_{oc} | dBm/3.8 4 MHz | -70 |
| CPICH_Ec/I _o | dB | -13 |
| Propagation Condition | | AWGN |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

8.4.2.2 Correct behaviour when receiving an NACK

8.4.2.2.1 Definition and applicability

The random access procedure is used when establishing the layer 1 communication between the UE and UTRAN. The random access shall provide a fast access but without disturbing ongoing connections. The random access is specified in clause 6 of TS 25.214 and the control of the RACH transmission is specified in clause 11.2 of TS 25.321. A random access transmit sequence is described in clause 6.7.2 of TS 25.303.

8.4.2.2.2 Minimum Requirements

The UE shall stop transmitting preambles upon a NACK on the AICH has been received and then repeat the ramping procedure when the back off timer T_{B01} expires.

The UE shall transmit 10 preambles in the first ramping cycle and no transmission shall be done by the UE within 100 ms after the NACK has been transmitted by the SS. Then the UE shall start the second preamble ramping cycle.

The normative reference for this requirements is TS 25.133 [2] clauses 6.3.2 and A.6.2.2.2.

8.4.2.2.3 Test purpose

The purpose of this test is to verify that the behaviour of the random access procedure is according to the requirements.

8.4.2.2.4 Method of test

8.4.2.2.4.1 Initial conditions

Test environment: normal, TL/VL, TL/VH, TH/VL, TH/VH; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.8. A spectrum analyzer is set to 0 span mode.

See TS 34.108 [3] for details regarding generic call setup procedure.

8.4.2.2.4.2 Procedure

- 1) A call is set up according to the Generic call setup procedure. The test parameters are set up according to table 8.4.2.1.1, table 8.4.2.1.2 and table 8.4.2.1.3. The PRACH procedure within the call setup is used for the test. It is necessary that a NACK on the AICH shall be transmitted after 10 preambles have been received by the SS
- 2) Measure the number of the preamble part and the time delay between 10th preamble in the first ramping cycle and first preamble in the second ramping cycle by using a spectrum analyzer.

8.4.2.2.5 Test requirements

The UE shall stop transmitting preambles upon a NACK on the AICH has been received and then repeat the ramping procedure when the back off timer T_{B01} expires.

The UE shall transmit 10 preambles in the first ramping cycle and no transmission shall be done by the UE within 100 ms after the NACK has been transmitted by the SS. Then the UE shall start the second preamble ramping cycle.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

8.4.2.3 Correct behaviour at Time-out

8.4.2.3.1 Definition and applicability

The random access procedure is used when establishing the layer 1 communication between the UE and UTRAN. The random access shall provide a fast access but without disturbing ongoing connections. The random access is specified in clause 6 of TS 25.214 and the control of the RACH transmission is specified in clause 11.2 of TS 25.321. A random access transmit sequence is described in clause 6.7.2 of TS 25.303.

8.4.2.3.2 Minimum Requirements

The UE shall stop transmit preambles when reaching the maximum number of preambles allowed in a cycle. The UE shall then repeat the ramping procedure until the maximum number of preamble ramping cycles are reached. No ACK/NACK shall be sent by SS during this test.

The UE shall transmit 2 preambles cycles, consisting of 12 preambles in each preamble cycle.

The normative reference for this requirements is TS 25.133 [2] clauses 6.3.2 and A.6.2.2.3.

8.4.2.3.3 Test purpose

The purpose of this test is to verify that the behaviour of the random access procedure is according to the requirements.

8.4.2.3.4 Method of test

8.4.2.3.4.1 Initial conditions

Test environment: normal, TL/VL, TL/VH, TH/VL, TH/VH; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.8. A spectrum analyzer is set to 0 span mode.

See TS 34.108 [3] for details regarding generic call setup procedure.

8.4.2.3.4.2 Procedure

- 1) A call is set up according to the Generic call setup procedure. The test parameters are set up according to table 8.4.2.1.1, table 8.4.2.1.2, and table 8.4.2.1.3. The PRACH procedure within the call setup is used for the test. It is necessary that SS shall transmit no AICH.
- 2) Measure the number of the preamble part by using a spectrum analyzer.

8.4.2.3.5 Test requirements

The UE shall stop transmit preambles when reaching the maximum number of preambles allowed in a cycle. The UE shall then repeat the ramping procedure until the maximum number of preamble ramping cycles are reached. No ACK/NACK shall be sent by SS during this test.

The UE shall transmit 2 preambles cycles, consisting of 12 preambles in each preamble cycle.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

8.4.2.4 Correct behaviour when reaching maximum transmit power

8.4.2.4.1 Definition and applicability

The random access procedure is used when establishing the layer 1 communication between the UE and UTRAN. The random access shall provide a fast access but without disturbing ongoing connections. The random access is specified in clause 6 of TS 25.214 [5] and the control of the RACH transmission is specified in clause 11.2 of TS 25.321 [13]. A random access transmit sequence is described in clause 6.7.2 of TS 25.303 [12].

8.4.2.4.2 Minimum Requirements

The UE shall not exceed the maximum allowed UL TX power, which is specified in Table 8.4.2.4.1 and configured by the SS, with more than the accuracy tolerances as defined in section 6.5 of TS 25.133 [2].

Section 6.5 of TS25.133 [2] states that for UE output powers that are outside the range covered by the UE transmitted power measurement the UE output power shall not exceed the Maximum allowed UL TX Power with more than the tolerances specified for the Open loop power control in TS 25.101 [1] section 6.4.1.

No ACK/NACK shall be sent by SS during this test.

8.4.2.4.3 Test purpose

The purpose of this test is to verify that the PRACH power behaviour when reaching Maximum allowed UL TX power is correct.

8.4.2.4.4 Method of test

8.4.2.4.4.1 Initial condition

Test environment: normal, TL/VL, TL/VH, TH/VL, TH/VH; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

- 1) Connect the SS to the UE antenna connector as shown in figure A.1.

See TS 34.108 [3] for details regarding generic call setup procedure.

Table 8.4.2.4.1: UE parameters for correct behaviour when reaching maximum transmit power

| Parameter | Unit | Value |
|---|------------|-----------|
| Access Service Class (ASC#0) | | |
| - Persistence value | 0..1 | 1 |
| Maximum number of preamble ramping cycles (M_{max}). | | 2 |
| Maximum number of preambles in one preamble ramping cycle (Preamble Retrans Max) | | 12 |
| The backoff time T_{B01} $N_{B01min}=N_{B01max}$ | ms #TTI | N/A 10 |
| Power step when no acquisition indicator is received (Power offset P0) | dB | 6 |
| Power offset between the last transmitted preamble and the control part of the message (Power offset P _{p-m}) | dB | 0 |
| Maximum allowed UL TX power | dBm | 0 |

8.4.2.4.4.2 Procedure

- 1) A call is set up according to the Generic call setup procedure. The test parameters are set up according to table 8.4.2.1.1, table 8.4.2.4.1 and table 8.4.2.1.3. The PRACH procedure within the call setup is used for the test. It is necessary that SS shall transmit no AICH.
- 2) Set the TX output level of the SS to obtain \hat{I}_{or} at the UE antenna connector. \hat{I}_{or} shall be according to table 8.4.2.1.4.
- 3) Measure all PRACH preamble output power of the UE according to annex B.

8.4.2.4.5 Test requirements

The UE shall not exceed the Maximum allowed UL TX power configured by the SS with more than the tolerance specified in Table 8.4.2.4.2.

Table 8.4.2.4.2: Test requirement for maximum preamble power

| | Maximum preamble power | |
|---------------------------|------------------------|--------|
| Test requirement(normal) | 0dBm | ±10 dB |
| Test requirement(extreme) | 0dBm | ±13 dB |

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

8.4.3 Transport format combination selection in UE

8.4.3.1 Interactive or Background, PS, UL: 64 kbps

8.4.3.1.1 Definition and applicability

When the UE estimates that a certain TFC would require more power than the maximum transmit power, it shall limit the usage of transport format combinations for the assigned transport format set, according to the functionality specified in section 11.4 in TS25.321 [13]. This in order to make it possible for the network operator to maximise the coverage. Transport format combination selection is described in section 11.4 of TS 25.321 [13].

The requirements and this test apply to all types of UTRA for the FDD UE for Release 99, Release 4, Release 5 and later releases.

8.4.3.1.2 Minimum requirements

The UE shall continuously evaluate based on the *Elimination*, *Recovery* and *Blocking* criteria defined below, how TFCs on an uplink DPDCH can be used for the purpose of TFC selection. The evaluation shall be performed for every TFC in the TFCS using the estimated UE transmit power of a given TFC. The UE transmit power estimation for a given TFC shall be made using the UE transmitted power measured over the measurement period, defined in 9.1.6.1 of TS 25.133 [2] as one slot, and the gain factors of the corresponding TFC.

The UE shall consider the *Elimination* criterion for a given TFC to be detected if the estimated UE transmit power needed for this TFC is greater than the Maximum UE transmitter power for at least X out of the last Y successive measurement periods immediately preceding evaluation. The MAC in the UE shall consider that the TFC is in Excess-Power state for the purpose of TFC selection.

MAC in the UE shall indicate the available bit rate for each logical channel to upper layers within T_{notify} from the moment the *Elimination* criterion was detected.

The UE shall consider the *Recovery* criterion for a given TFC to be detected if the estimated UE transmit power needed for this TFC has not been greater than the Maximum UE transmitter power for the last Z successive measurement periods immediately preceding evaluation. The MAC in the UE shall consider that the TFC is in Supported state for the purpose of TFC selection.

MAC in the UE shall indicate the available bit rate for each logical channel to upper layers within T_{notify} from the moment the *Recovery* criterion was detected.

The evaluation of the *Elimination* criterion and the *Recovery* criterion shall be performed at least once per radio frame.

The definitions of the parameters X,Y and Z which shall be used when evaluating the *Elimination* and the *Recovery* criteria when no compressed mode patterns are activated are given in Table 8.4.3.1.1.

Table 8.4.3.1.1: X, Y, Z parameters for TFC selection

| X | Y | Z |
|----|----|----|
| 15 | 30 | 30 |

The UE shall consider the *Blocking* criterion for a given TFC to be fulfilled at the latest at the start of the longest uplink TTI after the moment at which the TFC will have been in Excess-Power state for a duration of:

$$(T_{\text{notify}} + T_{\text{modify}} + T_{\text{L1_proc}})$$

where:

T_{notify} equals 15 ms

T_{modify} equals $\text{MAX}(T_{\text{adapt_max}}, T_{\text{TTI}})$

$T_{\text{L1_proc}}$ equals 15 ms

$T_{\text{adapt_max}}$ equals $\text{MAX}(T_{\text{adapt_1}}, T_{\text{adapt_2}}, \dots, T_{\text{adapt_N}})$

N equals the number of logical channels that need to change rate

For Release 99 and Release 4, $T_{\text{adapt_n}}$ equals the time it takes for higher layers to provide data to MAC in a new supported bit rate, for logical channel n. Table 8.4.3.1.2 defines T_{adapt} times for different services. For services where no codec is used T_{adapt} shall be considered to be equal to 0 ms.

Table 8.4.3.1.2: T_{adapt}

| Service | T_{adapt} [ms] |
|-----------|-------------------------|
| UMTS AMR | 40 |
| UMTS AMR2 | 60 |

For Release 5 and later releases $T_{\text{adapt_n}}$ equals the time it takes for higher layers to provide data to MAC in a new supported bit rate, for logical channel n. For services where no codec is used T_{adapt} shall be considered to be equal to 0 ms. For services where either UMTS_AMR2 or UMTS_AMR_WB is used, T_{adapt} shall be considered to be equal to the time required to switch from the current codec mode to a new supported codec mode. In that case T_{adapt} equals 20 ms + 40 ms per codec mode switch. E.g. T_{adapt} equals 60ms if one codec mode switch is necessary and T_{adapt} equals 140ms if 3 codec mode switches are necessary.

T_{TTI} equals the longest uplink TTI of the selected TFC (ms).

The Maximum UE transmitter power is defined as follows

Maximum UE transmitter power = $\text{MIN}(\text{Maximum allowed UL TX Power}, \text{UE maximum transmit power})$

where

Maximum allowed UL TX Power is set by SS and defined in TS 25.331 [8], and

UE maximum transmit power is defined by the UE power class, and specified in TS 25.101 [1].

The normative reference for these requirements is TS 25.133 [2] clauses 6.4.2 and A.6.4.1.

8.4.3.1.3 Test purpose

The purpose is to verify the UE blocks (stops using) a currently used TFC when the UE output power is not sufficient to support that TFC. The test will verify the general requirement on TFC selection in section 8.4.3.1.2 for a RAB intended for packet data services, i.e. Interactive or Background, PS, UL: 64kbps as defined in TS 34.108 [3].

8.4.3.1.4 Method of test

8.4.3.1.4.1 Initial conditions

Test environment: normal, TL/VL, TL/VH, TH/VL, TH/VH; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

The test parameters are given in Tables 8.4.3.1.3, 8.4.3.1.4, 8.4.3.1.5 and 8.4.3.1.6 below. The test consists of 2 successive time periods, with a time duration of T1 and T2 respectively.

Details on the UL reference RAB in table 8.4.3.1.3 and 8.4.3.1.4 can be found in TS 34.108 [3] section "Interactive or background / UL:64 DL: 64 kbps / PS RAB + UL:3.4 DL:3.4 kbps SRBs for DCCH".

Table 8.4.3.1.3: UL reference RAB, Interactive or Background

| | TFI | 64 kbps RAB (20ms TTI) | DCCH 3.4kbps (40ms TTI) |
|-----|-----------|------------------------|-------------------------|
| TFS | TF0, bits | 0x336 | 0x148 |
| | TF1, bits | 1x336 | 1x148 |
| | TF2, bits | 2x336 | N/A |
| | TF3, bits | 3x336 | N/A |

| CPICH_Ec/Io | dB | -13 | | |
| Propagation Condition | | AWGN | | |
| NOTE 1: The DPCH level is controlled by the power control loop | | | | |
| NOTE 2: The power of the OCNS channel that is added shall make the total power from the cell to be equal to lor . | | | | |

The amount of available user data shall be sufficient to allow uplink transmission at the highest bit rate (UL_TFC8 or UL_TFC9) during the entire test and it shall be ensured that the UE is using UL_TFC8 or UL_TFC9 at the end of T1.

8.4.3.1.4.2 Procedure

- 1) The SS activates cell 1 with T0 parameters defined in table 8.4.3.1.6.
- 2) The UE is switched on.
- 3) An RRC connection is set up according to the generic set-up procedure specified in TS 34.108 [3] subclause 7.3.2, using the test procedure to setup a PS call using the parameters defined in tables 8.4.3.1.3, 8.4.3.1.4 and 8.4.3.1.5.
- 4) SS shall transmit a MEASUREMENT CONTROL message.
- 5) For T1=30 secs the SS shall command the UE output power to be between 14 and 15 dB below the UE Maximum allowed UL Tx power (table 8.4.3.1.5).
- 6) The SS shall start sending continuously TPC_cmd=1 to the UE for T2=2 secs (see NOTE).
- 7) The time from the beginning of T2 until the UE blocks (stops using) UL_TFC8 and UL_TFC9 shall be measured by the SS. The UE shall stop using UL_TFC8 and UL_TFC9 within 140 ms from beginning of time period T2. A success is counted, if the UE stops within 140ms. An error is counted otherwise.
- 8) Repeat steps 5-7 until the confidence level according to annex F.6.2 is achieved.

NOTE: This will emulate that UL_TFC8 to UL_TFC9 can not be supported because the UE reaches the maximum UL Tx power and still SS is sending power-up commands. .

Specific Message Contents

All messages indicated above shall use the same content as described in the default message content in clause 9 of 34.108 [3], with the following exceptions:

RRC CONNECTION SETUP message is defined in clause 9.1.1, "Contents of RRC CONNECTION SETUP message: UM (Transition to CELL_DCH)" using condition A1.

RADIO BEARER SETUP message is defined in clause 9.1.1, "Contents of RADIO BEARER SETUP message: AM or UM " using condition A3.

MEASUREMENT CONTROL message:

| Information Element | Value/Remark |
|---|---|
| Message Type | |
| UE information elements | |
| -RRC transaction identifier | 0 |
| -Integrity check info | |
| -message authentication code | SS calculates the value of MAC-I for this message and writes to this IE. The first/leftmost bit of the bit string contains the most significant bit of the MAC-I. |
| -RRC message sequence number | SS provides the value of this IE, from its internal counter. |
| Measurement Information elements | |
| -Measurement Identity | 1 |
| -Measurement Command | Modify |
| -Measurement Reporting Mode | |
| - Measurement Report Transfer Mode | Acknowledged mode RLC |
| - Periodical Reporting / Event Trigger Reporting Mode | Periodical reporting |
| -Additional measurement list | Not Present |
| -CHOICE Measurement Type | Intra-frequency measurement |
| -Intra-frequency measurement | |
| - Intra-frequency measurement objects list | Not Present |
| -Intra-frequency measurement quantity | |
| -Filter coefficient | 0 |
| -CHOICE mode | FDD |

| Information Element | Value/Remark |
|---|--|
| -Measurement quantity | CPICH RSCP |
| -Intra-frequency reporting quantity | |
| -Reporting quantities for active set cells | |
| -Cell synchronisation information reporting indicator | TRUE |
| -Cell Identity reporting indicator | TRUE |
| -CHOICE mode | FDD |
| -CPICH Ec/N0 reporting indicator | TRUE |
| -CPICH RSCP reporting indicator | TRUE |
| -Pathloss reporting indicator | FALSE |
| -Reporting quantities for monitored set cells | |
| -Cell synchronisation information reporting indicator | FALSE |
| -Cell Identity reporting indicator | TRUE |
| -CHOICE mode | FDD |
| -CPICH Ec/N0 reporting indicator | TRUE |
| -CPICH RSCP reporting indicator | TRUE |
| -Pathloss reporting indicator | FALSE |
| -Reporting quantities for detected set cells | Not Present |
| -Reporting cell status | |
| -CHOICE reported cell | Report all active set cells + cells within monitored set on used frequency |
| -Maximum number of reported cells | Virtual/active set cells + 2 |
| -Measurement validity | Not Present |
| -CHOICE report criteria | Periodical reporting criteria |
| -Amount of reporting | Infinity |
| -Reporting interval | 250 ms |
| Physical channel information elements | |
| -DPCH compressed mode status info | Not Present |

8.4.3.1.5 Test requirements

For the test to pass, the total number of successful tests shall be more than 90% of the cases with a confidence level of 95%.

NOTE: If the above Test Requirement differs from the Minimum Requirement then the Test Tolerance applied for this test is non-zero. The Test Tolerance for this test is defined in clause F.2 and the explanation of how the Minimum Requirement has been relaxed by the Test Tolerance is given in clause F.4.

8.4.3.1A Interactive or Background, PS, UL: 64 kbps + Conversational / speech, CS, UL: 12.2kbps

8.4.3.1A.1 Definition and applicability

When the UE estimates that a certain TFC would require more power than the maximum transmit power, it shall limit the usage of transport format combinations for the assigned transport format set, according to the functionality specified in section 11.4 in TS25.321 [13]. This in order to make it possible for the network operator to maximise the coverage. Transport format combination selection is described in section 11.4 of TS 25.321 [13].

The requirements and this test apply to all types of UTRA for the FDD UE for Release 10 and later releases.

8.4.3.1A.2 Minimum requirements

The UE shall continuously evaluate based on the *Elimination*, *Recovery* and *Blocking* criteria defined below, how TFCs on an uplink DPDCH can be used for the purpose of TFC selection. The evaluation shall be performed for every TFC in the TFCS using the estimated UE transmit power of a given TFC. The UE transmit power estimation for a given TFC shall be made using the UE transmitted power measured over the measurement period, defined in 9.1.6.1 of TS 25.133 [2] as one slot, and the gain factors of the corresponding TFC.

The UE shall consider the *Elimination* criterion for a given TFC to be detected if the estimated UE transmit power needed for this TFC is greater than the Maximum UE transmitter power for at least X out of the last Y successive measurement periods immediately preceding evaluation. The MAC in the UE shall consider that the TFC is in Excess-Power state for the purpose of TFC selection.

MAC in the UE shall indicate the available bit rate for each logical channel to upper layers within T_{notify} from the moment the *Elimination* criterion was detected.

The UE shall consider the *Recovery* criterion for a given TFC to be detected if the estimated UE transmit power needed for this TFC has not been greater than the Maximum UE transmitter power for the last Z successive measurement periods immediately preceding evaluation. The MAC in the UE shall consider that the TFC is in Supported state for the purpose of TFC selection.

MAC in the UE shall indicate the available bit rate for each logical channel to upper layers within T_{notify} from the moment the *Recovery* criterion was detected.

The evaluation of the *Elimination* criterion and the *Recovery* criterion shall be performed at least once per radio frame.

The definitions of the parameters X, Y and Z which shall be used when evaluating the *Elimination* and the *Recovery* criteria when no compressed mode patterns are activated are given in Table 8.4.3.1A.1.

Table 8.4.3.1A.1: X, Y, Z parameters for TFC selection

| X | Y | Z |
|----|----|----|
| 15 | 30 | 30 |

The UE shall consider the *Blocking* criterion for a given TFC to be fulfilled at the latest at the start of the longest uplink TTI after the moment at which the TFC will have been in Excess-Power state for a duration of:

$$(T_{\text{notify}} + T_{\text{modify}} + T_{\text{L1_proc}})$$

where:

T_{notify} equals 15 ms

T_{modify} equals $\text{MAX}(T_{\text{adapt_max}}, T_{\text{TTI}})$

$T_{\text{L1_proc}}$ equals 15 ms

$T_{\text{adapt_max}}$ equals $\text{MAX}(T_{\text{adapt_1}}, T_{\text{adapt_2}}, \dots, T_{\text{adapt_N}})$

N equals the number of logical channels that need to change rate

For Release 99 and Release 4, $T_{\text{adapt_n}}$ equals the time it takes for higher layers to provide data to MAC in a new supported bit rate, for logical channel n . Table 8.4.3.1A.2 defines T_{adapt} times for different services. For services where no codec is used T_{adapt} shall be considered to be equal to 0 ms.

Table 8.4.3.1A.2: T_{adapt}

| Service | T_{adapt} [ms] |
|-----------|-------------------------|
| UMTS AMR | 40 |
| UMTS AMR2 | 60 |

For Release 5 and later releases $T_{\text{adapt_n}}$ equals the time it takes for higher layers to provide data to MAC in a new supported bit rate, for logical channel n . For services where no codec is used T_{adapt} shall be considered to be equal to 0 ms. For services where either UMTS_AMR2 or UMTS_AMR_WB is used, T_{adapt} shall be considered to be equal to the time required to switch from the current codec mode to a new supported codec mode. In that case T_{adapt} equals 20 ms + 40 ms per codec mode switch. E.g. T_{adapt} equals 60ms if one codec mode switch is necessary and T_{adapt} equals 140ms if 3 codec mode switches are necessary.

T_{TTI} equals the longest uplink TTI of the selected TFC (ms).

The Maximum UE transmitter power is defined as follows

Maximum UE transmitter power = $\text{MIN}(\text{Maximum allowed UL TX Power}, \text{UE maximum transmit power})$

where

Maximum allowed UL TX Power is set by SS and defined in TS 25.331 [8], and

UE maximum transmit power is defined by the UE power class, and specified in TS 25.101 [1].

The normative reference for these requirements is TS 25.133 [2] clauses 6.4.2 and A.6.4.1.

8.4.3.1A.3 Test purpose

The purpose is to verify the UE blocks (stops using) a currently used TFC when the UE output power is not sufficient to support that TFC. The test will verify the general requirement on TFC selection in section 8.4.3.1A.2 for a RAB intended for circuit switched and packet data services, i.e. Interactive or Background, PS, UL: 64kbps + Conversational / speech / CS UL:12.2kbps as defined in TS 34.108 [3].

8.4.3.1A.4 Method of test

8.4.3.1A.4.1 Initial conditions

Test environment: normal, TL/VL, TL/VH, TH/VL, TH/VH; see clauses G.2.1 and G.2.2.

Frequencies to be tested: mid range; see clause G.2.4.

The test parameters are given in Tables 8.4.3.1A.3, 8.4.3.1A.4, 8.4.3.1A.5 and 8.4.3.1A.6 below. The test consists of 2 successive time periods, with a time duration of T1 and T2 respectively.

Details on the UL reference RAB in table 8.4.3.1A.3 and 8.4.3.1A.4 can be found in TS 34.108 [3] section “Conversational / speech / UL:12.2 DL:12.2 kbps / CS RAB + Interactive or background / UL:64 DL:64 kbps / PS RAB+ UL:3.4 DL: 3.4 kbps SRBs for DCCH”.
