##### 14.4.4.2 Conformance Requirement

See 14.2.4.1 and 7.4.2.1.2.

##### 14.4.4.3 Test purpose

Test to verify establishment and data transfer of reference radio bearer configuration as specified in TS 34.108, clause 6.10.2.4.3.4 for the case when three SCCPCHs are used in this SYSTEM INFORMATION configuration. The first SCCPCH carries the PCH. The second SCCPCH carries the FACH for CTCH (Cell Broadcast Service) and the FACH for SRBs on CCCH/ BCCH for idle mode UEs. The third SCCPCH carries the FACH for Interactive/Background 32 kbps PS RAB and the FACH for SRBs on CCCH/ DCCH/ BCCH for connected mode UEs.

To verify establishment and data transfer of reference radio bearer configuration as specified in TS 34.108, clauses 6.10.2.4.3.3. Data transfer on CTCH is tested similar to testing BMC for a UE in idle mode as specified in TS 34.123-1, clause 7.4.2, data transfer on CCCH is tested by establishing a RRC connection.

##### 14.4.4.4 Method of Test

Initial conditions:

The contents of System Information Block type 5 and 6 shall be as specified in TS 34.108, clause 6.1.2.

The UE is RRC idle mode, the BMC entity is established.

The CB message ID stored on the SIM shall be known for this test (parameter for CBS PDUs). The CBS data type shall be allocated and activated in the UE.

Test Procedure:

- The UE in RRC Idle mode is triggered to wait for the next system information. The UE is activated to receive CBS messages.
- The UE and the SS have configured their RLC, MAC, and PHYs layers with all CB related system information.
- The SS sends the CVS message containing an activated CGS message type according to CB-Data 1 to the UE; this shall be repeated for CPREP times (indicated by the parameter "repetition period").
- The UE indicates in an unambiguous way, that this message was received.

Steps 1 – 4 in the Expected sequence are followed by the steps 2 – 6 of the test procedure according to clause 14.1.1.

Expected sequence

Step	Direction		Message	Comments
	UE	SS		
1		←	SYSTEM INFORMATION	
2				The SS waits for about 10 s to make sure, that the UE is configured to receive CBS data
3		←	BMC CBS Message	Activated CBS message with CB Data 1 message content as described by the manufacturer. This message shall be repeated "CPREP" times, Parameter: - Message_ID, - Serial-No, - Data coding scheme, - CB-Data 1,
4				After having received the BMC CBS message the UE shall indicate the reception of CB Data 1 in a clear way.

#### 14.4.4.5 Test Requirements

At step 4 in the table above, the UE shall store and decode a received activated CBS message.

At step 5 of the test procedure according to clause 14.1.1 the RRC Connection shall be established.

### 14.6.1 Interactive or background / UL:64 DL: [max bit rate depending on UE category] / PS RAB + UL:3.4 DL:3.4 kbps SRBs for DCCH

#### 14.6.1.1 Conformance requirement

For all transmissions of a transport block, the transport block size is derived from the TFRI value as specified below, except only in those cases of retransmissions where the Node-B selects a combination for which no mapping exists between the original transport block size and the selected combination of channelisation Code set and modulation type. In such cases, the transport block size index value signalled to the UE shall be set to 111111, i.e.,  $k_i=63$ .

Let  $k_i$  be the TFRI signalled on the HS-SCCH value and let  $k_{0,i}$  be the value in the table 9.2.3.1 corresponding to the modulation and the number of codes signalled on the HS-SCCH. Let  $K_i$  be the sum of the two values:  $K_i = k_i + k_{0,i}$ . The transport block size  $L(K_i)$  can be obtained by accessing the position  $K_i$  in the table in Annex A (normative) or by using the formula below (informative):

If  $k_i < 40$

$$L(k_i) = 125 + 12 \cdot k_i$$

else

$$L(k_i) = \lfloor L_{\min} p^{k_i} \rfloor$$

$$p = 2085 / 2048$$

$$L_{\min} = 296$$

end

NOTE 1: The SS shall configure the RLC transmission and receiver window size depending on the UE category. The values are set to cope with the number of SDUs used in the sub-test and within the UE capabilities for the actual UE category under test.

NOTE 2: UL\_TFC0, UL\_TFC1 and UL\_TFC5 are part of minimum set of TFCs.

NOTE 3: See TS 34.109 [10] clause 5.3.2.6.2 for details regarding loopback of RLC SDUs.

RB5: The UL RLC SDU size is set to  $N \times \text{UL RLC payload size} - 8$  bits (size of 7 bit length indicator and expansion bit), where N is the number of transport blocks for the UL transport format under test. This will enable the UE to return the data within one UL TTI.

#### 14.6.1.4 Test requirements

See 14.1.3.5 for definition of step 12 and step 18.

1. At step 12 the UE shall send RADIO BEARER SETUP COMPLETE.
2. At step 18 the UE transmitted transport format shall be
  - for sub-test 1: TF1 (1x336).
  - for sub-test 2: TF2 (2x336).
  - for sub-test 3: TF3 (3x336).
  - for sub-test 4: TF4 (4x336).
3. At step 18 the UE shall return
  - for sub-test 1: a RLC SDU having the same content as the first 312 bits of the test data sent by the SS in downlink.
  - for sub-test 2: a RLC SDU having the same content as the first 632 bits of the test data sent by the SS in downlink.
  - for sub-test 3: a RLC SDU having the same content as the first 952 bits of the test data sent by the SS in downlink.
  - for sub-test 4: a RLC SDU having the same content as the first 1272 bits of the test data sent by the SS in downlink.

## Sub-tests:

The principle used to select sub-tests has been to cover all uplink and downlink TFS for the Speech and Interactive Background radio bearer. As the Interactive Background UL:384 kbps radio bearer (RB8) has the highest number of transport formats (5 for TTI=10 ms and excluding TF0) then 5 sub-tests has been defined. The selected UL TFCI to achieve test coverage of TF1 to TF5 for RB8 and for the different speech transport formats are: UL\_TFC4 for TF1, UL\_TFC8 for TF2, UL\_TFC11 for TF3, UL\_TFC13 for TF4 and UL\_TFC17 for TF5.

NOTE 1: The SS shall configure the RLC transmission and receiver window size depending on the UE category. The values are set to cope with the number of SDUs used in the sub-test and within the UE capabilities for the actual UE category under test.

NOTE 2: UL\_TFC0, UL\_TFC1, UL\_TFC2, UL\_TFC3 and UL\_TFC18 are part of minimum set of TFCIs.

NOTE 3: See TS 34.109 [10] clause 5.3.2.6.2 for details regarding loopback of RLC SDUs.  
RB8: The UL RLC SDU size is set to N\*UL RLC payload size minus 8 bits (size of 7 bit length indicator and expansion bit), where N is the number of transport blocks for the UL transport format under test. This will make the UE to return one RLC SDU per UL TTI.

NOTE 4: The test data size for RB8 is dependent on the actual TFRC test point, see the generic test procedure in 14.1.3.5.

The principle used to select sub-tests has been to cover all uplink and downlink TFS for the Speech and Interactive Background radio bearer. As the Interactive Background UL:64 kbps radio bearer (RB8) has the highest number of transport formats (4 excluding TF0) then 4 sub-tests have been defined. The selected UL TFCI to achieve test coverage of TF1 to TF4 for RB8 and for the different speech transport formats are: UL\_TFC4 for TF1, UL\_TFC8 for TF2, UL\_TFC11 for TF3 and UL\_TFC13 for TF4.

NOTE 1: The SS shall configure the RLC transmission and receiver window size depending on the UE category. The values are set to cope with the number of SDUs used in the sub-test and within the UE capabilities for the actual UE category under test.

NOTE 2: UL\_TFC0, UL\_TFC1, UL\_TFC2, and UL\_TFC12 are part of minimum set of TFCIs.

NOTE 3: See TS 34.109 [10] clause 5.3.2.6.2 for details regarding loopback of RLC SDUs.  
RB6: The UL RLC SDU size is set to N\*UL RLC payload size minus 8 bits (size of 7 bit length indicator and expansion bit), where N is the number of transport blocks for the UL transport format under test. This will make the UE to return one RLC SDU per UL TTI.

NOTE 4: The test data size for RB6 is dependent on the actual TFRC test point, see the generic test procedure in 14.1.3.5.

#### 14.6.4.4 Test requirements

See 14.1.3.5 for definition of the referenced step numbers.

1. At step 12 the UE shall send RADIO BEARER SETUP COMPLETE.
2. At steps 17 to 20 the UE transmitted transport format shall be within the set of restricted TFCIs as specified for the actual sub-test.
3. At step 18 the UE shall return
  - for sub-test 1: RLC SDUs on RB5 having the same content as sent by the SS in downlink; and RLC SDUs on RB6 having the same content as the first 312 bits of the test data sent by the SS in downlink.
  - for sub-test 2: RLC SDUs on RB5 having the same content as sent by the SS in downlink; and RLC SDUs on RB6 having the same content as the first 632 bits of the test data sent by the SS in downlink.
  - for sub-test 3: RLC SDUs on RB5 having the same content as sent by the SS in downlink; and RLC SDUs on RB6 having the same content as the first 1272 bits of the test data sent by the SS in downlink;
  - for sub-test 4: RLC SDUs on RB5 having the same content as sent by the SS in downlink; and RLC SDUs on RB6 having the same content as the first 2552 bits of the test data sent by the SS in downlink.
  - for sub-test 5: RLC SDUs on RB5 having the same content as sent by the SS in downlink; and RLC SDUs on RB6 having the same content as the first 3832 bits of the test data sent by the SS in downlink.

## 14.6.4a.3 Method of test

## Initial Conditions

The following RLC Info parameter values shall be set by the SS for the Conversational / unknown / UL:64 DL:64 kbps / CS RAB (RB5):

	<b>RB5 (Conv. 64 kbps)</b>
Uplink RLC TM RLC Segmentation indication Transmission RLC discard CHOICE <i>SDU Discard Mode</i> Timer based no explicit Timer_discard	FALSE  100ms
Downlink RLC TM RLC Segmentation indication	FALSE
NOTE: Timer based discard without explicit signalling is used in uplink to secure that the UE will be able to return data for the case when the UE test loop function will not deliver all the SDUs in one and the same TTI .	

The generic test procedure in 14.1.3.5 is run for each sub-test.

## Sub-tests:

The principle used to select sub-tests has been to cover all uplink and downlink TFS for the Conversational CS and Interactive Background PS radio bearer. As the Interactive Background UL:64 kbps radio bearer (RB6) has the highest number of transport formats (4 excluding TF0) then 4 sub-tests have been defined. The selected UL TFCI to achieve test coverage of TF1 to TF4 for RB6 and for TF1 for RB5 are: UL\_TFC3 for TF1, UL\_TFC5 for TF2, UL\_TFC7 for TF3 and UL\_TFC9 for TF4.

- NOTE 1: The SS shall configure the RLC transmission and receiver window size depending on the UE category. The values are set to cope with the number of SDUs used in the sub-test and within the UE capabilities for the actual UE category under test.
- NOTE 2: UL\_TFC0, UL\_TFC1 and UL\_TFC5 are part of minimum set of TFCIs.
- NOTE 3: See TS 34.109 [10] clause 5.3.2.6.2 for details regarding loopback of RLC SDUs.  
RB5 and RB6: The UL RLC SDU size is set to  $N \times \text{UL RLC payload size} - 8$  bits (size of 7 bit length indicator and expansion bit), where N is the number of transport blocks for the UL transport format under test. This will make the UE to return one RLC SDU per UL TTI.
- NOTE 4: The test data size for RB5 and RB6 is dependent on the actual TFRC test point, see the generic test procedure in 14.1.3.5.

#### 14.6.5a.4 Test requirements

See 14.1.3.5 for definition of the referenced step numbers.

1. At step 12 the UE shall send RADIO BEARER SETUP COMPLETE.
2. At steps 17 to 20 the UE transmitted transport format shall be within the set of restricted TFCIs as specified for the actual sub-test.
3. At step 18 the UE shall return
  - for sub-test 1: RLC SDUs on RB5 and RB6 having the same content as the first 312 bits of the test data sent by the SS in downlink.
  - for sub-test 2: RLC SDUs on RB5 and RB6 having the same content as the first 632 bits of the test data sent by the SS in downlink.
  - for sub-test 3: RLC SDUs on RB5 and RB6 having the same content as the first 952 bits of the test data sent by the SS in downlink;
  - for sub-test 4: RLC SDUs on RB5 and RB6 having the same content as the first 1272 bits of the test data sent by the SS in downlink.

## 16 Short message service (SMS)

Ref.: 3GPP TS 23.040, 3GPP TS 24.011 (point to point)  
3GPP TS 23.041, (cell broadcast)

### General

The purpose of these tests is to verify that the UE can handle Iu mode system functions when submitting or receiving Short Messages (SM) between UE and a short message service centre as described in 3GPP TS 23.040.

The procedures are based upon services provided by the Mobility Management (MM) sublayer and GPRS Mobility Management(GMM) sublayer which are not tested in this case.

The SMS comprises three basic services; SMS point to point services on CS mode, on PS mode and SMS cell broadcast service. The SMS point to point services on CS mode shall work in an active UE at any time independent of whether or not there is a speech or data call in progress. The SMS point to point services on PS mode shall work in an active UE at any time independent of whether or not there is a PDP context in progress. The SMS cell broadcast service only works when the UE is in idle mode.

Since the timer TC1M currently is not standardized, the value of TC1M shall be declared by the manufacturer (to be used in clauses 16.1.1 and 16.1.2).

The manufacturer shall declare whether SMS messages are stored in the USIM and/or the ME. This shall be referred to as the SMS message store in the following tests.

Unless otherwise stated default message contents from 3GPP TS 34.108 applies for following tests.

### 16.1 Short message service point to point on CS mode

All of test cases in this clause are applied to UE supporting CS mode.

#### 16.1.1 SMS mobile terminated

16.1.1.1 Definition

16.1.1.2 Conformance requirements

An active UE shall be able to receive short message TPDU (SMS-DELIVER) at any time, independently of whether or not there is a speech or data call in progress. A report will always be returned to the SC, confirming that the UE has received the short message.

#### Reference

3GPP TS 23.040 clause 3.1.

16.1.1.3 Test purpose

To verify the ability of a UE to receive and decode the SMS where provided for the point to point service.

16.1.1.4 Method of test

#### Initial Conditions

- System simulator:
  - 1 cell, default parameters.

- User Equipment:
  - the UE shall be in MM-state "Idle, updated";
  - the SMS message storage shall be empty.

#### Related ICS/IXIT Statements

Support for Short message MT/PP.

The value of timer TC1M.

Whether SMS messages are stored in the USIM and/or the ME.

Support for call control state U10.

Maximum number of retransmissions of an unacknowledged CP-DATA message.

#### Test procedure

- a) The UE terminates the establishment of Radio Resource Connection. After the completion of the RRC Connection the SS authenticates the UE.  
  
After the SS receives SECURITY MODE COMPLETE, the SS sends a CP-DATA message. The information element of the CP-DATA message will be RP-DATA RPDU (SMS DELIVER TPDU).
- b) The SS waits a maximum of 25 s for the CP-ACK message and then a maximum of 60 s for the CP-DATA message containing the RP-ACK RPDU.
- c) The SS sends a CP-ACK to the UE within TC1M with no further CP-DATA messages and the SS initiates RRC Connection release.
- d) Steps a), b) and c) are repeated but the first CP-DATA message from the UE is not acknowledged. The second CP-DATA message from the UE is acknowledged by a CP-ACK within a time TC1M.
- e) Steps a) and b) are repeated. The SS is configured not to send CP-ACK. Then maximum 3 CP-DATA retransmissions may occur. After a duration of TC1M + 5 s after the last CP-DATA retransmission the SS then initiates the channel release. The 5 s is the appropriate time to wait to verify that the UE does not send more than the maximum allowed (3) CP-DATA retransmissions.
- f) The SMS message store shall be cleared manually by the operator.
- g) A data or speech call is established on a DTCH with the SS and the state U10 of call control is entered.  
  
The SS sends a CP-DATA message. The information element of the CP-DATA message will be RP-DATA RPDU (SMS DELIVER TPDU). The SS waits a maximum of 25 s for the CP-ACK message and then a maximum of 60 s for the CP-DATA message containing the RP-ACK RPDU.
- h) The SS sends a CP-ACK to the UE within TC1M with no further CP-DATA messages. **SS will wait for a period of 120ms. for the UE to send acknowledgement to the CP-ACK prior to the SS initiating the DISCONNECT. The SS initiates** RRC Connection release. The SMS message store shall be cleared manually by the operator.
- i) Steps g) and h) are repeated but the first CP-DATA message from the UE is not acknowledged. The second CP-DATA message from the UE is acknowledged by a CP-ACK within a time TC1M.
- j) Step g) is repeated. The SS is configured not to send CP-ACK. Then maximum 3 CP-DATA retransmissions may occur. After a duration of TC1M + 15 s after the last CP-DATA retransmission the SS initiates the channel release. The 15 s is the appropriate time to wait to verify that the UE does not send more than the maximum allowed (3) CP-DATA retransmissions (during a call in progress).

- k) A data or speech call is established on a DTCH with the SS and the state U10 of call control shall be entered. The speech call is cleared by the SS with a disconnect message. (The call clearing is continued on the DCCH in parallel to the following exchange of messages related to SMS).

The SS sends a CP-DATA RPDU (SMS DELIVER TPDU) message. The information element of the CP-DATA message is RP-DATA.

The SS waits a maximum of 25 s for the CP-ACK message and then a maximum of 60 s for the CP-DATA message containing the RP-ACK RPDU.

The SS sends a CP-ACK to the UE within TC1M with no further CP-DATA messages and the SS initiates channel release.

The SMS message store shall be cleared manually by the operator.

- l) A data or speech call is established with the SS and the state U10 of call control is entered. The speech call shall be cleared from the UE. (The call clearing is continued in parallel to the following exchange of messages related to SMS).

The SS sends a CP-DATA message. The information element of the CP-DATA message is RP-DATA RPDU (SMS DELIVER TPDU).

The SS waits a maximum of 25 s for the CP-ACK message and then a maximum of 60 s for the CP-DATA message containing the RP-ACK RPDU.

The SS sends a CP-ACK to the UE within TC1M with no further CP-DATA messages and the SS initiates RRC Connection release.

The SMS message store shall be cleared manually by the operator.

## 16.1.2 SMS mobile originated

### 16.1.2.1 Definition

### 16.1.2.2 Conformance requirements

An active UE shall be able to submit short message TPDU (SMS-SUBMIT) at any time, independently of whether or not there is a speech or data call in progress.

### Reference

3GPP TS 23.040 clause 3.1.

### 16.1.2.3 Test purpose

To verify that the UE is able to correctly send a short message where the SMS is provided for the point to point service.

### 16.1.2.4 Method of test

#### Initial Conditions

- System simulator:
  - 1 cell, default parameters.
- User Equipment:
  - the UE shall be in MM-state "Idle, updated";
  - the SMS message storage shall be empty.

#### Related ICS/IXIT Statements

Support for Short message MO/PP.

Support for state U10 of call control.

The value of timer TC1M.

Whether SMS messages are stored in the USIM and/or the ME.

Maximum length (characters) of a mobile originated short message.

Maximum number of retransmissions of an unacknowledged CP-DATA message.

#### Test procedure

- a) The UE shall be set up to send an SM to the SS. The UE establishes successfully an RRC connection.
- b) The SS performs authentication and after that, the SS starts integrity protection.
- c) The SS responds to the CP-DATA containing RP-DATA RPDU (SMS SUBMIT TPDU) from the UE with a CP-ACK message within TC1M followed by a CP-DATA message containing the correct RP-ACK RPDU. The SS waits a maximum of 25 s for the CP-ACK message.
- d) The SS sends a channel release message to the UE.
- e) Steps a) and b) are repeated. The SS is configured not to send the CP-ACK message. Then maximum 3 CP-DATA retransmissions may occur. After a duration of TC1M + 5 s after the last CP-DATA retransmission the SS initiates channel release. The 5 s is the appropriate time to wait to verify that the UE does not send more than the maximum CP-DATA retransmissions.

- f) Steps a) and b) are repeated. On receipt of the CP-DATA from the UE the SS sends a CP-ERROR message within TC1M containing a "Network Failure" cause. Then the SS initiates channel release.
- g) A data or speech call is established with the SS and the state U10 of call control is entered. The UE is set up to send an SM to the SS. After the reception of the CM SERVICE REQUEST, the SS sends a CM SERVICE ACCEPT message.
- h) The SS responds to the CP-DATA containing RP-DATA RPDU (SMS SUBMIT TPDU) from the UE with a CP-ACK message within TC1M followed by a CP-DATA message containing the correct RP-ACK RPDU. The SS waits a maximum of 25 s for the CP-ACK message. Then the SS sends a channel release message to the UE.
- i) Step g) is repeated. The SS is configured not to send the CP-ACK message. Then maximum 3 CP-DATA retransmissions may occur. After a duration of TC1M + 15 s after the last CP-DATA retransmission the SS initiates channel release. The 15 s is the appropriate time to wait to verify that the UE does not send more than the maximum CP-DATA retransmissions (during a call in progress).
- j) (void)
- k) The UE is set up to send an SM to the SS. On receipt of the CM SERVICE REQUEST the SS sends a CM SERVICE REJECT message with the reject cause set to "Service Option not supported" or "Service Option temporarily out of order". After 5 s the SS initiates channel release.

TP-UDL TP-UD (140 octets max)	as applicable maximum number of characters (text of message) as defined by the manufacturer (see ICS/IXIT)

## 16.1.2.5 Test requirements

After step 10 UE shall send a CP-DATA containing RP-data. The RP-DATA shall contain SMS SUBMIT TPDU.

After step 27 UE shall retransmit a CP-DATA containing RP-data. The RP-DATA shall contain SMS SUBMIT TPDU.

After step 50 UE shall send a CP-DATA containing RP-data. The RP-DATA shall contain SMS SUBMIT TPDU.

After step 62 UE shall repeat CP-DATA retransmissions as many times as the decided maximum number.

After step 85 UE shall not send any CP-DATA.

## 16.1.3 Test of memory full condition and memory available notification:

The Memory Available Notification provides a means for the UE to notify the network that it has memory available to receive one or more short messages. The SMS status field in the USIM contains status information on the "memory available" notification flag.

## 16.1.3.1 Definition

## 16.1.3.2 Conformance requirement

1. When a mobile terminated message is Class 2, the UE shall ensure that the message has been transferred to the SMS data field in the USIM before sending an acknowledgement to the SC. The UE shall return a protocol error message if the short message cannot be stored in the USIM and there is other short message storage available in the UE. If all the short message storage in the UE is already in use, the UE shall return "memory capability exceeded".
2. When the UE rejects a short message due to lack of available memory capability the need to transfer notification shall be stored in the USIM.
3. If the memory capability becomes available because memory is cleared, the value of the memory capability exceeded notification flag in the USIM is read. If the flag is set, the UE notifies the network that memory capability is now available. After a positive acknowledgement from the network, the ME unsets the memory capability exceeded notification flag in the USIM.

## 16.1.3.3 Test purpose

1. To verify that the UE sends the correct acknowledgement when its memory in the USIM becomes full.
2. To verify that the UE sends the correct acknowledgement when its memory in the ME and the USIM becomes full, and sets the "memory exceeded" notification flag in the USIM.
3. To verify that the UE performs the "memory available" procedure when its message store becomes available for receiving short messages, and only at this moment.

## 16.1.3.4 Method of test

## Initial conditions

- System Simulator:
  - 1 cell, default parameters.
- User Equipment:
  - the UE shall be in MM-state "Idle, updated";
  - the SMS message storage shall be empty;
  - the UE shall be connected to the USIM simulator. The following shall be present in the USIM simulator:
    - EF<sub>SMS</sub> with at least one record;
    - EF<sub>SMS</sub>, with SMS "Memory Cap. Exceed" notification flag set to "memory available";
    - Service no. 10 (SMS) in EF<sub>UST</sub> set to allocated and activated.
  - for storing of Class 1 Short Messages the UE shall be set up to store Short Messages in the ME memory (by way of MMI, as described in ICS/IXIT statement).

## Related ICS/IXIT Statements

Support for Short message MT/PP.

## Test procedure

- a) step a) of clause 16.1.5.3 (test of Class 2 Short Messages) is repeated until the UE sends a negative acknowledgement (RP-ERROR). The USIM simulator shall indicate if the "memory capability exceeded" notification flag has been set on the USIM.
- b) a Class 1 Short Message is sent to the UE.
- c) step b) is repeated until the UE sends a negative acknowledgement (RP-ERROR). The USIM simulator shall indicate if the "memory capability exceeded" notification flag has been set on the USIM.
- d) a Short Message is sent to the UE with the DCS field of the SMS-DELIVER TPDU set to 0.
- e) the SS prompts the operator to read a short message and to remove it from the message store of the UE.
- f) the SS waits for a RRC CONNECTION REQUEST from the UE, and sends a RRC CONNECTION SETUP.
- g) after the SS receives a RRC CONNECTION SETUP COMPLETE, the SS authenticates the UE and activates ciphering.
- h) the SS answers to the RP-SMMA from the UE with a CP-DATA containing a RP-ACK RPDU.
- i) after the UE has acknowledged the CP-DATA with a CP-ACK, the SS releases the RRC connection. The USIM simulator shall indicate if the "memory capability exceeded" notification flag has been unset on the USIM.
- j) step e) is repeated.

## 16.1.4 Test of the status report capabilities and of SMS-COMMAND:

This test applies to UEs which support the status report capabilities.

### 16.1.4.1 Definition

### 16.1.4.2 Conformance requirement

The SMS offers the SC the capabilities of informing the UE of the status of a previously sent mobile originated short message. This is achieved by the SC returning a status report TPDU (SMS-STATUS-REPORT) to the originating UE.

SMS-COMMAND enables an UE to invoke an operation at the SC.

The UE shall increment TP-MR by 1 for each SMS-SUBMIT or SMS-COMMAND being submitted.

### 16.1.4.3 Test purpose

- 1) To verify that the UE is able to accept a SMS-STATUS-REPORT TPDU.

## 16.1.5 Test of message class 0 to 3

### 16.1.5.1 Short message class 0

#### 16.1.5.1.1 Definition

#### 16.1.5.1.2 Conformance requirement

When a mobile terminated message is class 0 and the UE has the capability of indicating short messages, the UE shall indicate the message immediately and send an acknowledgement to the SC when the message has successfully reached the UE irrespective of whether there is memory available in the USIM or ME. The message shall not be automatically stored in the USIM or ME.

#### Reference

3GPP TS 23.038 clause 4.

#### 16.1.5.1.3 Test purpose

To verify that the UE will accept and indicate but not store a class 0 message, and that it will accept and indicate a class 0 message if its message store is full.

NOTE: failure of this test in a UE could cause it to reject a class 0 message when its SMS memory becomes full. This could lead to unwanted repetitions between the UE and the service centre.

#### 16.1.5.1.4 Method of test

#### Initial conditions

- System Simulator:
  - 1 cell, default parameters.
- User Equipment:
  - the UE shall be in MM-state "Idle, updated";
  - the UE message store shall be empty.

#### Related ICS/IXIT Statements

Support for Short message MT/PP.

The value of timer TC1M.

Whether SMS messages are stored in the USIM and/or the ME.

#### Test procedure

- a) The SS sends a class 0 message by using the method described in step a) of clause 16.1.1 but with the TPDU described in this clause.
- b) The UE message store shall be filled (for example by using the method of clause 16.1.3 test of the memory available notification) with the same SMS-DELIVER TPDU except that TP-DCS is set to class 1.
- c) The SS sends a class 0 message as in step a).

##### 16.1.5.3.1 Definition

Class 2 Short Messages are defined as USIM specific, and the UE shall ensure that a message of this class is stored on the USIM.

##### 16.1.5.3.2 Conformance requirement

When a mobile terminated message is Class 2, the UE shall ensure that the message has been correctly transferred to the SMS data field in the USIM before sending an acknowledgement to the SC. The UE shall return a "protocol error, unspecified" error message if the short message cannot be stored in the USIM and there is other short message storage available at the UE. If all the short message storage at the UE is already in use, the UE shall return "memory capacity exceeded".

- 3GPP TS 23.038 clause 4.
- 3GPP TS 34.108 clause 8.3.2.28.

##### 16.1.5.3.3 Test purpose

This procedure verifies that the UE acts correctly on receiving a class 2 message, i.e. that it stores the message correctly in the USIM, and if this is not possible, returns a protocol error message, with the correct error cause, to the network.

There are 2 cases:

- 1) if the UE supports storing of short messages in the USIM and in the ME, and storage in the ME is not full, and the short message cannot be stored in the USIM, the error cause shall be "protocol error, unspecified";
- 2) if the UE supports storing of short messages in the USIM and not in the ME, and storage in the ME is not full, and the short message cannot be stored in the USIM, the error cause shall be "memory capacity exceeded".

NOTE: If the UE supports storing of short messages in the USIM and the ME, and storage in the ME is full, and the short message cannot be stored in the USIM, the error cause shall be "memory capacity exceeded". This case is not tested in this test.

#### 16.1.5.3.4 Method of test

##### Initial conditions

- System Simulator:
  - 1 cell, default parameters.
- User Equipment:
  - the UE shall be in MM-state "Idle, updated";
  - the ME message store shall be empty;
  - the ME shall be connected to the USIM simulator. The following shall be present in the USIM simulator:
    - EF<sub>SMS</sub> with at least two free records and one full record;
    - EF<sub>SMSS</sub>, with SMS "Memory Cap. Exceed" notification flag set to "memory available";
    - Service no. 10 (SMS) in EF<sub>UST</sub> set to allocated and activated;
    - for storing of Class 1 Short Messages the UE shall be set up to store Short Messages in the ME memory (by way of MMI, as described in ICS/IXIT statement).

##### Related ICS/IXIT Statements

Whether SMS messages are stored in the USIM and/or the ME.

##### Test procedure

- a) The SS delivers a Short Message of class 2 to the UE as specified in clause 16.1.1, step b).
- b) Following an attempt by the ME to store the short message in a free record of EF<sub>SMS</sub> in the USIM, the USIM simulator returns the status response "OK" ("90 00").
- c) Step a) is repeated.
- d) Following an attempt by the ME to store the short message in a free record of EF<sub>SMS</sub> in the USIM, the USIM simulator returns the status response "memory problem" ("92 40").
- e) The USIM simulator indicates if an attempt was made in steps a) and c) to store the messages and if the messages are stored according to the requirement.

## 16.1.6 Test of short message type 0 (R99 and REL-4 UE)

## 16.1.6.1 Definition and applicability

This tests that the UE correctly acknowledges the receipt of the short message type 0 to the SC in Circuit Switched mode. It is highly recommended that the UE discards the contents of the short message type 0.

This test shall apply to all R99 and REL-4 UEs supporting receipt of short messages in CS mode.

## 16.1.6.2 Conformance requirement

When a mobile terminated message is type 0, the UE shall acknowledge receipt of the short message to the SC but may discard its contents.

**Note:** It is highly recommended that the UE discards the type 0 short message. This means that the UE is able to receive the type 0 short message irrespective of whether there is memory available in the (U)SIM or ME or not, the UE does not indicate the receipt of the type 0 short message to the user, and the message is not stored in the (U)SIM or ME.

## Reference(s)

## 16.1.6.3 Test purpose

To verify that the UE will acknowledge receipt of the short message to the SC. The UE should discard its contents.

**NOTE:** failure of this test in a UE could cause it to reject a type 0 message when the network is trying to reach the UE. This could lead to unwanted repetitions between the UE and the service centre.

## 16.1.6a Test of short message type 0 ( $\geq$ REL-5 UE)

### 16.1.6a.1 Definition and applicability

This tests that the UE correctly acknowledges the receipt of the short message type 0 to the SC in Circuit Switched mode. The UE shall discard the contents of the short message type 0.

This test shall apply to all  $\geq$  REL-5 UEs supporting receipt of short messages in CS mode.

### 16.1.6a.2 Conformance requirement

When a mobile terminated message is type 0, the UE shall acknowledge receipt of the short message to the SC but shall discard its contents. This means that

- the UE shall be able to receive the type 0 short message irrespective of whether there is memory available in the (U)SIM or ME or not,
- the UE shall not indicate the receipt of the type 0 short message to the user,
- the short message shall neither be stored in the (U)SIM nor ME.

### 16.1.6a.3 Test purpose

#### 16.1.7.1 Definition

#### 16.1.7.2 Conformance requirement

On receipt of a short message, the UE shall check to see if the associated Protocol Identifier contains a Replace Short Message Type code. When submitting the reply mobile originated short message, the replying UE should use parameters as follows:

- TP-Destination Address in SMS-SUBMIT TPDU = originating SME;

- RP-Destination Address in RP-MO-DATA = original SC.

Release 1999:

If another short message or a memory available notification is to be sent, an originating SMR entity in the UE may choose to continue to use the same RRC connection. When the UE chooses to use the same RRC connection, then:

- the UE shall transmit a CM SERVICE REQUEST for the new CM connection before the final CP-ACK (e.g. the one that acknowledges the CP-DATA that carried the RP-ACK) for the old MM connection is transmitted;
- before transmission of the first CP-DATA on the new MM connection, the UE shall transmit the CP-ACK for the old MM connection;
- the Transaction Identifier used on the new MM connection shall be different to that used on the old MM connection; and
- the UE shall not initiate establishment of the new MM connection before the final CP-DATA (e.g. the one carrying the RP-ACK) has been received.

Release 4 or later release:

In the case of a SMS transfer via the CS domain, when the UE chooses to use the same RR or CS signalling connection, then:

- the UE shall transmit a CM SERVICE REQUEST for the new CM connection before the final CP-ACK (i.e. the one that acknowledges the CP-DATA that carried the RP-ACK) for the old MM connection is transmitted;
- before transmission of the first CP-DATA on the new MM connection, the UE may transmit the CP-ACK for the old MM connection; the UE shall not transmit the final CP-ACK after the new CP-DATA;

- the Transaction Identifier used on the new MM connection shall be different to that used on the old MM connection; and
- the UE shall not initiate establishment of the new MM connection before the final CP-DATA (e.g. the one carrying the RP-ACK) has been received.

#### 16.1.9.1.3 Test purpose

To verify that the UE is able to correctly send multiple short messages on the same RRC connection when using a DCCH.

#### 16.1.9.1.4 Method of test

##### Initial conditions

- System simulator:
  - 1 cell, default parameters.
- User Equipment:
  - the UE shall be in MM-state "Idle, updated";
  - the SMS message storage shall be empty.

##### Related ICS/IXIT statements

Support for multiple short message MO/PP on the same RRC connection.

Description of how to enter multiple SMS.

Whether SMS messages are stored in the USIM and/or the ME.

##### Foreseen final state of UE

Idle, updated.

##### Test procedure

- a) The UE shall be set up to send 3 short messages as multiple SM to the SS. The UE establishes successfully an RRC connection and then the SS performs the authentication.
- b) The SS starts integrity protection.
- c) The SS responds to the CP-DATA containing RP-DATA RPDU (SMS SUBMIT TPDU) from the UE with a CP-ACK message followed by a CP-DATA message containing the correct RP-ACK RPDU. The Transaction Identifier used on this MM connection is 'x'.
- d) The UE shall transmit a CM SERVICE REQUEST for the new CM connection (for the second short message) before the final CP-ACK (the one that acknowledges the CP-DATA that carried the RP-ACK before) for the old MM connection is transmitted. The UE shall not initiate establishment of the new MM connection before the final CP-DATA (i.e. the one carrying the RP-ACK for the first short message) has been received. Before transmission of the first CP-DATA on the new MM connection:
  - For R99: The UE shall transmit the CP-ACK for the old MM connection. The Transaction Identifier used on the new MM connection shall be y, where  $y < x$  (see step c)). Thereby, the UE can transmit the final CP-ACK after either the sending of the CM SERVICE REQUEST for the new CM connection or the reception of

the CM SERVICE ACCEPT for the new CM connection, thus two branches for the transmission of the final CP-ACK are possible which are specified in the expected sequence table like A and B respectively. The SS waits for the UE to transmit the final CP-ACK. If received within 5 s then the SS transmits the CM SERVICE ACCEPT and waits for the UE to transmit the first CP-DATA on the new MM connection (branch A). If the final CP-ACK is not received within 5 s then the SS transmits the CM SERVICE ACCEPT and waits for the UE to send the final CP-ACK followed by the first CP-DATA on the new MM connection (branch B).

- For Rel-4 or later release: The UE may transmit the CP-ACK for the old MM connection. The Transaction Identifier used on the new MM connection shall be  $y$ , where  $y < x$  (see step c)). Thereby, the UE can transmit the final CP-ACK after either the sending of the CM SERVICE REQUEST for the new CM connection or the reception of the CM SERVICE ACCEPT for the new CM connection or not to send a CP-ACK at all, thus three cases are possible. These cases are specified using two branches for the transmission of the final CP-ACK where the transmission of the final CP-ACK for the old MM connection is optional. The two branches are specified in the expected sequence table like A and B respectively. The SS waits for the UE to transmit the final CP-ACK. If received within 5 s then the SS transmits the CM SERVICE ACCEPT and waits for the UE to transmit the first CP-DATA on the new MM connection (branch A). If the final CP-ACK is not received within 5 s then the SS transmits the CM SERVICE ACCEPT and then waits for the UE to send the final CP-ACK (optional) and/or the first CP-DATA on the new MM connection (branch B).
- e) Void.
- f) The SS responds to the CP-DATA containing RP-DATA RPDU (SMS SUBMIT TPDU) from the UE with a CP-ACK message followed by a CP-DATA message containing the correct RP-ACK RPDU.
- g) The UE shall transmit a CM SERVICE REQUEST for the new CM connection (for the third short message) before the final CP-ACK (the one that acknowledges the CP-DATA that carried the RP-ACK before) for the old MM connection is transmitted. Before transmission of the first CP-DATA on the new MM connection:
- For R99: The UE shall transmit the CP-ACK for the old MM connection. The Transaction Identifier used on the new MM connection shall be  $z$ , where  $z < y$  (see step d)). The UE shall not initiate establishment of the new MM connection before the final CP-DATA (i.e. the one carrying the RP-ACK for the second short message) has been received. Thereby, the UE can transmit the final CP-ACK after either the sending of the CM SERVICE REQUEST for the new CM connection or the reception of the CM SERVICE ACCEPT for the new CM connection, thus two branches for the transmission of the final CP-ACK are possible which are specified in the expected sequence table like A and B respectively. The SS waits for the UE to transmit the final CP-ACK. If received within 5 s then the SS transmits the CM SERVICE ACCEPT and waits for the UE to transmit the first CP-DATA on the new MM connection (branch A). If the final CP-ACK is not received within 5 s then the SS transmits the CM SERVICE ACCEPT and waits for the UE to send the final CP-ACK followed by the first CP-DATA on the new MM connection (branch B).
  - For Rel-4 or later release: The UE may transmit the CP-ACK for the old MM connection. The Transaction Identifier used on the new MM connection shall be  $z$ , where  $z < y$  (see step d)). Thereby, the UE can transmit the final CP-ACK after either the sending of the CM SERVICE REQUEST for the new CM connection or the reception of the CM SERVICE ACCEPT for the new CM connection or not to send a CP-ACK at all, thus three cases are possible. These cases are specified using two branches for the transmission of the final CP-ACK where the transmission of the final CP-ACK for the old MM connection is optional. The two branches are specified in the expected sequence table like A and B respectively. The SS waits for the UE to transmit the final CP-ACK. If received within 5 s then the SS transmits the CM SERVICE ACCEPT and waits for the UE to transmit the first CP-DATA on the new MM connection (branch A). If the final CP-ACK is not received within 5 s then the SS transmits the CM SERVICE ACCEPT and then waits for the UE to send the final CP-ACK (optional) and/or the first CP-DATA on the new MM connection (branch B).
- h) Void.
- i) The SS responds to the CP-DATA containing RP-DATA RPDU (SMS SUBMIT TPDU) from the UE with a CP-ACK message followed by a CP-DATA message containing the correct RP-ACK RPDU.
- j) The SS waits a maximum of 5 s after sending CP-DATA for the CP-ACK message from the UE.
- k) The SS sends a RRC CONNECTION RELEASE to the UE.

NOTE 1: 5 s have been agreed to be a reasonable value to secure that the UE have enough time to respond to the different messages.				
NOTE 2: The CP-ACK for the old MM connection can be received either before or after the reception of the CM SERVICE ACCEPT message. For Release 4 or later release the UE transmission of the final CP-ACK is optional.				

#### 16.1.9.1.5 Test requirements

In step 13 the UE shall transmit a CM SERVICE REQUEST for the new CM connection (for the second short message) before the final CP-ACK for the old MM connection is transmitted.

##### 16.1.9.2.1 Definition

##### 16.1.9.2.2 Conformance requirements

Release 1999:

If another short message or a memory available notification is to be sent, an originating SMR entity in the UE may choose to continue to use the same RRC connection. When the UE chooses to use the same RRC connection, then:

- the UE shall transmit a CM SERVICE REQUEST for the new CM connection before the final CP-ACK (e.g. the one that acknowledges the CP-DATA that carried the RP-ACK) for the old MM connection is transmitted;
- before transmission of the first CP-DATA on the new MM connection, the UE shall transmit the CP-ACK for the old MM connection;
- the Transaction Identifier used on the new MM connection shall be different to that used on the old MM connection; and
- the UE shall not initiate establishment of the new MM connection before the final CP-DATA (e.g. the one carrying the RP-ACK) has been received.

Release 4 or later release:

In the case of a SMS transfer via the CS domain, when the UE chooses to use the same RR or CS signalling connection, then:

- the UE shall transmit a CM SERVICE REQUEST for the new CM connection before the final CP-ACK (i.e. the one that acknowledges the CP-DATA that carried the RP-ACK) for the old MM connection is transmitted;
- before transmission of the first CP-DATA on the new MM connection, the UE may transmit the CP-ACK for the old MM connection; the UE shall not transmit the final CP-ACK after the new CP-DATA;
- the Transaction Identifier used on the new MM connection shall be different to that used on the old MM connection; and
- the UE shall not initiate establishment of the new MM connection before the final CP-DATA (e.g. the one carrying the RP-ACK) has been received.

#### 16.1.10.1 Definition

#### 16.1.10.2 Conformance requirements

An active UE shall be able to receive a short message TPDU (SMS-DELIVER) at any time, independently of whether or not there is an SMS mobile originated call (SMS-SUBMIT or SMS-COMMAND) in progress.

#### 16.1.10.4 Method of test

#### Initial Conditions

- System simulator:
  - 1 cell, default parameters.

#### Test procedure

- a) The SS is configured to receive a mobile originated SM. In clause 16.1.2 steps a) and b) are repeated and, using the end of the CP-DATA message from the UE as a trigger, the SS sends a SM to the UE. In this case a new transaction identifier shall be used in the CP messages of SMS mobile terminated.

### 16.2.1 SMS mobile terminated

16.2.1.1 Definition

16.2.1.2 Conformance requirements

An active UE shall be able to receive short message TPDU (SMS-DELIVER) at any time, independently of whether or not there is a PDP context in progress. A report will always be returned to the SC, confirming that the UE has received the short message.

### 16.2.1.3 Test purpose

To verify the ability of a UE to receive and decode the SMS where provided for the point to point service.

### 16.2.1.4 Method of test

#### Initial Conditions

- System simulator:
  - 1 cell, default parameters.
- User Equipment:
  - the UE shall be in GMM-state "GMM-REGISTERED";
  - the SMS message storage shall be empty.

#### Related ICS/IXIT Statements

Support for Short message MT/PP.

The value of timer TC1M.

Whether SMS messages are stored in the USIM and/or the ME.

Support for session management state "PDP-ACTIVE".

Maximum number of retransmissions of an unacknowledged CP-DATA message.

#### Test procedure

- a) Mobile terminates establishment of Radio Resource Connection. After the completion of RRC Connection the SS authenticates the UE and activates ciphering.  
  
After the SS receives SECURITY MODE COMPLETE, the SS sends a CP-DATA message. The information element of the CP-DATA message will be RP-DATA RPDU (SMS DELIVER TPDU).
- b) The SS waits a maximum of 25 s for the CP-ACK message and then a maximum of 60 s for the CP-DATA message containing the RP-ACK RPDU.
- c) The SS sends a CP-ACK to the UE within TC1M with no further CP-DATA messages and the SS initiates channel release.
- d) Steps a), b) and c) are repeated but the first CP-DATA message from the UE is not acknowledged. The second CP-DATA message from the UE is acknowledged by a CP-ACK within a time TC1M.
- e) Steps a) and b) are repeated. The SS is configured not to send CP-ACK. Then maximum 3 CP-DATA retransmissions may occur. After a duration of TC1M + 5 s after the last CP-DATA retransmission the SS then initiates the channel release. The 5 s is the appropriate time to wait to verify that the UE does not send more than the maximum allowed (3) CP-DATA retransmissions.
- f) The SMS message store shall be cleared manually by the operator.
- g) A PDP context is established with the SS and the state PDP-ACTIVE of session management is entered.  
  
The SS sends a CP-DATA message. The information element of the CP-DATA message will be RP-DATA RPDU (SMS DELIVER TPDU). The SS waits a maximum of 25 s for the CP-ACK message and then a maximum of 60 s for the CP-DATA message containing the RP-ACK RPDU.
- h) The SS sends a CP-ACK to the UE within TC1M with no further CP-DATA messages and the SS initiates channel release. The SMS message store shall be cleared manually by the operator.
- i) Steps g) and h) are repeated but the first CP-DATA message from the UE is not acknowledged. The second CP-DATA message from the UE is acknowledged by a CP-ACK within a time TC1M.

- j) Step g) is repeated. The SS is configured not to send CP-ACK. Then maximum 3 CP-DATA retransmissions may occur. After a duration of TC1M + 15 s after the last CP-DATA retransmission the SS initiates the channel release. The 15 s is the appropriate time to wait to verify that the UE does not send more than the maximum allowed (3) CP-DATA retransmissions (during PDP context in progress).
- k) A PDP context is established with the SS and the state PDP-ACTIVE of session management is entered. The PDP context is cleared by the SS with a disconnect message. (The PDP context deactivating is continued in parallel to the following exchange of messages related to SMS).

The SS sends a CP-DATA RPDU (SMS DELIVER TPDU) message. The information element of the CP-DATA message is RP-DATA.

The SS waits a maximum of 25 s for the CP-ACK message and then a maximum of 60 s for the CP-DATA message containing the RP-ACK RPDU.

The SS sends a CP-ACK to the UE within TC1M with no further CP-DATA messages and the SS initiates channel release.

The SMS message store shall be cleared manually by the operator.

- l) A PDP context is established with the SS and the state PDP-ACTIVE of session management is entered. The PDP context shall be cleared from the UE. (The PDP context deactivating is continued in parallel to the following exchange of messages related to SMS).

The SS sends a CP-DATA message. The information element of the CP-DATA message is RP-DATA RPDU (SMS DELIVER TPDU).

The SS waits a maximum of 25 s for the CP-ACK message and then a maximum of 60 s for the CP-DATA message containing the RP-ACK RPDU.

The SS sends a CP-ACK to the UE within TC1M with no further CP-DATA messages and the SS initiates channel release.

The SMS message store shall be cleared manually by the operator.

### 16.2.2.3 Test purpose

To verify that the UE is able to correctly send a short message where the SMS is provided for the point to point service.

### 16.2.2.4 Method of test

#### Initial Conditions

- System simulator:
  - 1 cell, default parameters.
- User Equipment:
  - the UE shall be in GMM-state "GMM-REGISTERED";
  - the SMS message storage shall be empty.

#### Related ICS/IXIT Statements

Support for Short message MO/PP.

Support for state PDP-ACTIVE of session management.

The value of timer TC1M.

Whether SMS messages are stored in the USIM and/or the ME.

Maximum length (characters) of a mobile originated short message.

Maximum number of retransmissions of an unacknowledged CP-DATA message.

#### Test procedure

- a) The UE shall be set up to send an SM to the SS. The UE establishes successfully an RRC connection.
- b) The SS performs authentication and after that, the SS starts integrity protection.
- c) The SS responds to the CP-DATA containing RP-DATA RPDU (SMS SUBMIT TPDU) from the UE with a CP-ACK message within TC1M followed by a CP-DATA message containing the correct RP-ACK RPDU. The SS waits a maximum of 25 s for the CP-ACK message.
- d) The SS sends a channel release message to the UE.
- e) Steps a) and b) are repeated. The SS is configured not to send the CP-ACK message. Then maximum 3 CP-DATA retransmissions may occur. After a duration of TC1M + 5 s after the last CP-DATA retransmission the SS initiates channel release. The 5 s is the appropriate time to wait to verify that the UE does not send more than the maximum CP-DATA retransmissions.
- f) Steps a) and b) are repeated. On receipt of the CP-DATA from the UE the SS sends a CP-ERROR message within TC1M containing a "Network Failure" cause. Then the SS initiates channel release.
- g) A PDP context is established with the SS and the state PDP-ACTIVE of session management is entered. The UE is set up to send an SM to the SS.
- h) The SS responds to the CP-DATA containing RP-DATA RPDU (SMS SUBMIT TPDU) from the UE with a CP-ACK message within TC1M followed by a CP-DATA message containing the correct RP-ACK RPDU. The SS waits a maximum of 25 s for the CP-ACK message. Then the SS sends a channel release message to the UE.
- i) Step g) is repeated. The SS is configured not to send the CP-ACK message. Then maximum 3 CP-DATA retransmissions may occur. After a duration of TC1M + 15 s after the last CP-DATA retransmission the SS initiates channel release. The 15 s is the appropriate time to wait to verify that the UE does not send more than the maximum CP-DATA retransmissions (during a PDP context in progress).
- j) (void)

- k) The UE is set up to send an SM to the SS. On receipt of the SERVICE REQUEST the SS sends a SERVICE REJECT message with the reject cause set to "GPRS services not allowed". After 5 s the SS initiates channel release.

## 16.2.2.5 Test requirements

After step 10 UE shall send a CP-DATA containing RP-data. The RP-DATA shall contain SMS SUBMIT TPDU.

After step 26 UE shall retransmit a CP-DATA containing RP-data. The RP-DATA shall contain SMS SUBMIT TPDU.

After step 49 UE shall send a CP-DATA containing RP-data. The RP-DATA shall contain SMS SUBMIT TPDU.

After step 61 UE shall repeat CP-DATA retransmissions as many times as the decided maximum number.

After step 82 UE shall not send CP-DATA.

## 16.2.3 Test of memory full condition and memory available notification:

The Memory Available Notification provides a means for the UE to notify the network that it has memory available to receive one or more short messages. The SMS status field in the USIM contains status information on the "memory available" notification flag.

## 16.2.3.1 Definition

## 16.2.3.2 Conformance requirement

1. When a mobile terminated message is Class 2, the UE shall ensure that the message has been transferred to the SMS data field in the USIM before sending an acknowledgement to the SC. The UE shall return a protocol error message if the short message cannot be stored in the USIM and there is other short message storage available in the UE. If all the short message storage in the UE is already in use, the UE shall return "memory capability exceeded".
2. When the UE rejects a short message due to lack of available memory capability the need to transfer notification shall be stored in the USIM.
3. If the memory capability becomes available because memory is cleared, the value of the memory capability exceeded notification flag in the USIM is read. If the flag is set, the UE notifies the network that memory capability is now available. After a positive acknowledgement from the network, the ME unsets the memory capability exceeded notification flag in the USIM.

- 3GPP TS 23.040 clauses 9.2.3.10, 10.3 (operation 14).

## 16.2.3.3 Test purpose

1. To verify that the UE sends the correct acknowledgement when its memory in the USIM becomes full.
2. To verify that the UE sends the correct acknowledgement when its memory in the ME and the USIM becomes full, and sets the "memory exceeded" notification flag in the USIM.
3. To verify that the UE performs the "memory available" procedure when its message store becomes available for receiving short messages, and only at this moment.

## 16.2.3.4 Method of test

## Initial conditions

- System Simulator:
  - 1 cell, default parameters.
- User Equipment:
  - the UE shall be in GMM-state "GMM-REGISTERED";
  - the SMS message storage shall be empty;
  - the UE shall be connected to the USIM simulator. The following shall be present in the USIM simulator:
    - EF<sub>SMS</sub> with at least one record;
    - EF<sub>SMS</sub>, with SMS "Memory Cap. Exceed" notification flag set to "memory available";
    - Service no. 10 (SMS) in EF<sub>UST</sub> set to allocated and activated.
  - for storing of Class 1 Short Messages the UE shall be set up to store Short Messages in the ME memory (by way of MMI, as described in ICS/IXIT statement).

## Related ICS/IXIT Statements

Support for Short message MT/PP.

Whether SMS messages are stored in the USIM and/or the ME.

The value of timer TC1M.

## Test procedure

- a) step a) of clause 16.2.5.3 (test of Class 2 Short Messages) is repeated until the UE sends a negative acknowledgement (RP-ERROR). The USIM simulator shall indicate if the "memory capability exceeded" notification flag has been set on the USIM.
- b) a Class 1 Short Message is sent to the UE.
- c) step b) is repeated until the UE sends a negative acknowledgement (RP-ERROR). The USIM simulator shall indicate if the "memory capability exceeded" notification flag has been set on the USIM.
- d) a Short Message is sent to the UE with the DCS field of the SMS-DELIVER TPDU set to 0.
- e) the SS prompts the operator to read a short message and to remove it from the message store of the UE.
- f) the SS waits for a RRC CONNECTION REQUEST from the UE, and sends a RRC CONNECTION SETUP.
- g) after the SS receives a RRC CONNECTION SETUP COMPLETE, the SS authenticates the UE and activates ciphering.
- h) the SS answers to the RP-SMMA from the UE with a CP-DATA containing a RP-ACK RPDU.
- i) after the UE has acknowledged the CP-DATA with a CP-ACK, the SS releases the RRC connection. The USIM simulator shall indicate if the "memory capability exceeded" notification flag has been unset on the USIM.
- j) step e) is repeated.

## 16.2.4 Test of the status report capabilities and of SMS-COMMAND:

This test applies to UEs which support the status report capabilities.

### 16.2.4.1 Definition

### 16.2.4.2 Conformance requirement

The SMS offers the SC the capabilities of informing the UE of the status of a previously sent mobile originated short message. This is achieved by the SC returning a status report TPDU (SMS-STATUS-REPORT) to the originating UE.

SMS-COMMAND enables an UE to invoke an operation at the SC.

The UE shall increment TP-MR by 1 for each SMS-SUBMIT or SMS-COMMAND being submitted.

### 16.2.4.3 Test purpose

- 1) To verify that the UE is able to accept a SMS-STATUS-REPORT TPDU.
- 2) To verify that the UE is able to use the SMS-COMMAND functionality correctly and sends an SMS-COMMAND TPDU with the correct TP-Message-Reference.

### 16.2.4.4 Method of test

#### 16.2.4.5 Test requirements

After step 23 UE accept a SMS-STATUS-REPORT TPDU.

After step 39 UE shall send a SMS-COMMAND TPDU with the correct TP-Message-Reference.

After step 54 UE shall send a SMS-COMMAND TPDU with the correct TP-Message-Reference.

### 16.2.5 Test of message class 0 to 3

#### 16.2.5.1 Short message class 0

##### 16.2.5.1.1 Definition

##### 16.2.5.1.2 Conformance requirement

When a mobile terminated message is class 0 and the UE has the capability of indicating short messages, the UE shall indicate the message immediately and send an acknowledgement to the SC when the message has successfully reached the UE irrespective of whether there is memory available in the USIM or ME. The message shall not be automatically stored in the USIM or ME.

#### Reference

3GPP TS 23.038 clause 4.

##### 16.2.5.1.3 Test purpose

To verify that the UE will accept and indicate but not store a class 0 message, and that it will accept and indicate a class 0 message if its message store is full.

NOTE: failure of this test in a UE could cause it to reject a class 0 message when its SMS memory becomes full. This could lead to unwanted repetitions between the UE and the service centre.

##### 16.2.5.1.4 Method of test

#### Initial conditions

- System Simulator:
  - 1 cell, default parameters.
- User Equipment:
  - the UE shall be in GMM-state "GMM-REGISTERED";
  - the UE message store shall be empty.

#### Related ICS/IXIT Statements

Support for Short message MT/PP.

The value of timer TC1M.

Whether SMS messages are stored in the USIM and/or the ME.

#### Test procedure

- a) The SS sends a class 0 message by using the method described in step a) of clause 16.2.1 but with the TPDU described in this clause.
- b) The UE message store shall be filled (for example by using the method of clause 16.2.3 test of the memory available notification) with the same SMS-DELIVER TPDU except that TP-DCS is set to class 1.

c) The SS sends a class 0 message as in step a).

#### Initial conditions

- System Simulator:

- User Equipment:
  - the UE shall be in GMM-state "GMM-REGISTERED";

#### 16.2.5.2.5 Test requirements

After step 7 UE shall store the message in the ME or USIM and send an acknowledgement.

### 16.2.5.3 Test of class 2 short messages

#### 16.2.5.3.1 Definition

Class 2 Short Messages are defined as USIM specific, and the UE shall ensure that a message of this class is stored on the USIM.

#### 16.2.5.3.2 Conformance requirement

When a mobile terminated message is Class 2, the UE shall ensure that the message has been correctly transferred to the SMS data field in the USIM before sending an acknowledgement to the SC. The UE shall return a "protocol error, unspecified" error message if the short message cannot be stored in the USIM and there is other short message storage available at the UE. If all the short message storage at the UE is already in use, the UE shall return "memory capacity exceeded".

3GPP TS 23.038 clause 4.3

3GPP TS 34.108 clause 8.3.2.28.

### 16.2.5.3.3 Test purpose

This procedure verifies that the UE acts correctly on receiving a class 2 message, i.e. that it stores the message correctly in the USIM, and if this is not possible, returns a protocol error message, with the correct error cause, to the network.

There are 2 cases:

- 1) if the UE supports storing of short messages in the USIM and in the ME, and storage in the ME is not full, and the short message cannot be stored in the USIM, the error cause shall be "protocol error, unspecified";
- 2) if the UE supports storing of short messages in the USIM and not in the ME, and storage in the ME is not full, and the short message cannot be stored in the USIM, the error cause shall be "memory capacity exceeded".

NOTE: If the UE supports storing of short messages in the USIM and the ME, and storage in the ME is full, and the short message cannot be stored in the USIM, the error cause shall be "memory capacity exceeded". This case is not tested in this test.

### 16.2.5.3.4 Method of test

#### Initial conditions

- System Simulator:
  - 1 cell, default parameters.
- User Equipment:
  - the UE shall be in GMM-state "GMM-REGISTERED";
  - the ME message store shall be empty;
  - the ME shall be connected to the USIM simulator. The following shall be present in the USIM simulator:
    - EF<sub>SMS</sub> with at least two free records and one full record;
    - EF<sub>SMSS</sub>, with SMS "Memory Cap. Exceed" notification flag set to "memory available";
    - Service no. 10 (SMS) in EF<sub>UST</sub> set to allocated and activated;
    - for storing of Class 1 Short Messages the UE shall be set up to store Short Messages in the ME memory (by way of MMI, as described in ICS/IXIT statement).

#### Related ICS/IXIT Statements

Support for Short message MT/PP.

The value of timer TC1M.

Whether SMS messages are stored in the USIM and/or the ME.

#### Test procedure

- a) The SS delivers a Short Message of class 2 to the UE as specified in clause 16.2.1, step b).
- b) Following an attempt by the ME to store the short message in a free record of EF<sub>SMS</sub> in the USIM, the USIM simulator returns the status response "OK" ("90 00").
- c) Step a) is repeated.
- d) Following an attempt by the ME to store the short message in a free record of EF<sub>SMS</sub> in the USIM, the USIM simulator returns the status response "memory problem" ("92 40").
- e) The USIM simulator indicates if an attempt was made in steps a) and c) to store the messages and if the messages are stored according to the requirement.

## 16.2.6 Test of short message type 0 (R99 and REL-4 UE)

## 16.2.6.1 Definition and applicability

This tests that the UE correctly acknowledges the receipt of the short message type 0 to the SC in Packet Switched mode. It is highly recommended that the UE discards the contents of the short message type 0.

This test shall apply to all R99 and REL-4 UEs supporting receipt of short messages in PS mode.

## 16.2.6.2 Conformance requirement

When a mobile terminated message is type 0, the UE shall acknowledge receipt of the short message to the SC but may discard its contents.

Note: It is highly recommended that the UE discards the type 0 short message. This means that the UE is able to receive the type 0 short message irrespective of whether there is memory available in the (U)SIM or ME or not, the UE does not indicate the receipt of the type 0 short message to the user, and the message is not stored in the (U)SIM or ME.

## 16.2.6a Test of short message type 0 ( $\geq$ REL-5 UE)

### 16.2.6a.1 Definition and applicability

This tests that the UE correctly acknowledges the receipt of the short message type 0 to the SC in Packet Switched mode. The UE discards the contents of the short message type 0.

This test shall apply to all  $\geq$  REL-5 UEs supporting receipt of short messages in PS mode.

### 16.2.6a.2 Conformance requirement

When a mobile terminated message is type 0, the UE shall acknowledge receipt of the short message to the SC but shall discard its contents. This means that

- the UE shall be able to receive the type 0 short message irrespective of whether there is memory available in the (U)SIM or ME or not,
- the UE shall not indicate the receipt of the type 0 short message to the user,
- the short message shall neither be stored in the (U)SIM nor ME.

### 16.2.6a.3 Test purpose

- the UE shall not indicate the receipt of the type 0 short message to the user,
- the short message shall neither be stored in the (U)SIM nor ME.

NOTE: failure of this test in a UE could cause it to reject a type 0 message when the network is trying to reach the UE. This could lead to unwanted repetitions between the US and the service centre. In addition service affecting restrictions could happen to the customer.

After step 23 (ME- and (U)SIM message store filled) UE shall send CP-DATA containing RP-ACK RPDU (TP-Protocol-Identifier: type 0 Short Message).

After step 27 UE shall discard the type 0 short message (it is impossible to retrieve any short messages from the ME- and (U)SIM message store).

## 16.2.7 Test of the replace mechanism for SM type 1-7

### 16.2.7.1 Definition

### 16.2.7.2 Conformance requirement

On receipt of a short message, the UE shall check to see if the associated Protocol Identifier contains a Replace Short Message Type code. If such a code is present, then the UE will check the associated originating address (TP-OA) and replace any existing stored message having the same Protocol Identifier code and originating address with the new short message.

### 16.2.7.3 Test purpose

This procedure verifies the correct implementation of the replace mechanism for Replace Short Messages.

### 16.2.7.4 Method of test

#### Initial conditions

- System Simulator:
  - 1 cell, default parameters.
- User Equipment:
  - the UE shall be in GMM-state "GMM-REGISTERED";

- the UE message store shall be empty.

#### Related ICS/IXIT Statements

Support for Short message MT/PP.

The value of timer TC1M.

#### Test procedure

- Two different numbers n and m are drawn randomly between 1 and 7. Two different addresses for TP-Originating-Address (TPOA1 and TPOA2) are drawn.
- The SS delivers a short message to the UE as specified in clause 16.2.1 step a). In the SMS-DELIVER TPDU, the TP-Protocol-Identifier parameter is "Replace Short Message Type n", the TP-Originating-Address is TPOA1, and the RP-Originating-Address is RPOA.
- Step b) is repeated but with a different TP-Originating-Address (TPOA2), and different contents of TP-User-Data in the SMS-DELIVER TPDU. The other parameters are the same as in step b).
- 
- Step c) is repeated but with the TP-Protocol-Identifier equal to "Replace Short Message Type m", and contents of TP-User-Data different from the former two messages. The other parameters are the same as in step c).
- Step e) is repeated but the contents of TP-User-Data are different from that used in step e).
- The SS prompts the operator to indicate the Short Messages stored in the UE.

- original SC = RP-Originating Address in the RP-MT-DATA.

When submitting the reply mobile originated short message, the replying UE should use parameters as follows:

- TP-Destination Address in SMS-SUBMIT TPDU = originating SME;
- RP-Destination Address in RP-MO-DATA = original SC.

## 17 Specific features

### 17.1 Test of autocalling restrictions

#### 17.1.1 General

It is essential that all autocalling apparatus is prevented from continuously dialling a given number, to avoid machines repeatedly disturbing PSTN subscribers in error, or numerous repeat attempts to unobtainable numbers which cause waste of valuable network resources. Therefore autocalling restrictions are defined by TS 22.001.

The tests shall be performed using all of the call methods specified by the supplier in the IXIT statement TS 34.123-2. The supplier shall state any autocalling procedures implemented and how many times they can be repeated to a single number and the minimum re-attempt interval(s), i.e. the complete re-try schedule or algorithm with parameter values. The supplier shall further describe any automatic methods for making repeated calls to a single number. The supplier

shall also state in the IXIT statement the number of B-party numbers that can be stored on the list of blacklisted numbers as described in TS 22.001, annex E.

For an external R-interface the supplier shall state in the IXIT statement the procedure for autocalling restrictions for that interface and the possible parameter settings for the number of times the LTE can make a re-attempt and the minimum accepted time between re-attempts accepted by the UE. The conditions for clearing the autocalling constraints shall be stated in the IXIT statement.

For external interfaces the LTE must be programmed so that it clearly attempts to violate the autocalling constraints.

For all the tests in this clause the call setup procedure uses the Generic Setup Procedure for Circuit Switched connection as specified in TS 34.108 clause 7. A Radio Access Bearer to set up shall be selected from one of the speech or CS data bearers within the capability of the UE as specified in the ICS statement. Unless otherwise indicated, this procedure shall only run to the transmission by the SS or UE of the SETUP message (CC).

## 17.1.2 Constraining the access to a single number (TS 22.001 category 3)

### 17.1.2.1 Definition

This test checks that when an auto-dialled call to a B-party number fails due to a category 3 cause, only one retry to that number is permitted.

During this test the SETUP messages shall contain the same B-party number.

No manual intervention shall be performed except to initiate and end the test.

### 17.1.2.2 Conformance requirement

A repeat call attempt may be made when a call attempt is unsuccessful for the reasons listed below (as defined in TS 24.008).

These reasons are classified in three major categories:

1. "Busy destination";
2. "Unobtainable destination - temporary";
3. "Unobtainable destination - permanent/long term".

NOTE: Cause values for each category are defined in TS 22.001, annex E.

The table below describes a repeat call restriction pattern to any B number. This pattern defines a maximum number (n) of call repeat attempts; when this number n is reached, the associated B number shall be blacklisted by the UE until a manual re-set at the UE is performed in respect of that B number. When a repeat attempt to any one B number fails, or is blacklisted, this does not prevent calls being made to other B numbers.

For the categories 1 and 2 above, n shall be 10; for category 3, n shall be 1.

Call attempt	Minimum duration between call attempts
Initial call attempt	-
1st repeat attempt	5 s
2nd repeat attempt	1 min
3rd repeat attempt	1 min
4th repeat attempt	1 min
5th repeat attempt	3 min
.	
.	
nth repeat attempt	3 min

3GPP TS 22.001 annex E.

## 17.1.2.3 Test purpose

To ensure the correct behaviour of the UE to TS 22.001 Category 3.

## 17.1.2.4 Method of test

Initial condition.

There shall be no numbers in the list of blacklisted numbers in the UE. The time set between the first re-attempt and the next re-attempt is set to the minimum value possible. The number of re-attempts is set to the lowest possible number, greater than 1, that is supported by the UE. The autocalling function is invoked for the B-party number to be used during the test.

## Related ICS/IXIT Statement(s)

ICS: TBD.

IXIT: Description of auto calling management:

- selection of the auto calling;
- indication that the call failed and a re-try is attempted;
- indication that a call finally failed.

This test checks that when an auto-dialled call to a B-party number fails due to a category 2 cause, the time between of retries complies with the requirements, and the number of retries does not exceed that declared by the UE manufacturer, and is never more than 10.

During this test the SETUP messages shall contain the same B-party number.

No manual intervention shall be performed except to initiate and end the test.

### 17.1.3.2 Conformance requirement

The UE must fulfil the requirements for category 1 and 2, see clause 17.1.2.2.

#### Reference:

3GPP TS 22.001 annex E.

### 17.1.3.3 Test purpose

To ensure the correct behaviour of the UE to TS 22.001 Categories 1 and 2.

### 17.1.3.4 Method of test

#### Initial condition

There shall be no numbers in the list of blacklisted numbers in the UE. The re-try scheme is set to give the shortest possible intervals between re-tries. The number of re-attempts is set to the maximum possible number (N), that is supported by the UE. The autocalling function is invoked for the B-party number to be used during the test.

#### Related ICS/IXIT Statement(s)

ICS: TBD

IXIT: Description of auto calling management:

- selection of the auto calling;
- indication that the call failed and a re-try is attempted;
- indication that a call finally failed.

#### Test Procedure

A, UE originated, generic call setup is performed up to the SETUP message. The SS then releases the establishment with a cause value from category 1 or 2 (TS 22.001, annex E).

The UE is continuously making new generic call setup attempts invoked by the auto calling function after each RRC CONNECTION RELEASE from the SS.

Step	Direction		Message	Comments

1	UE			"called number" entered
2	→		GENERIC SETUP PROCEDURE MOBILE ORIGINATED, CS (Up to SETUP)	Establishment cause indicates "originating call".
3	←		RELEASE COMPLETE	Cause value from category 1 or 2 of TS 22.001, Annex E. This shall be chosen randomly, from both categories. Cause no. 27 shall be excluded if the UE has implemented in category 3 of TS 22.001, as declared in IXIT statement
4	←		RRC CONNECTION RELEASE	The UE is invoking the auto calling function. 1: At the first re-attempt the time between step 4 and 7 must be minimum 5 sec. 2: At the 2 <sup>nd</sup> , 3 <sup>rd</sup> and 4 <sup>th</sup> re-attempt the time between step 4 and 7 must be minimum 1 min. 3: At the 5 <sup>th</sup> to 10 <sup>th</sup> re-attempt the time between step 4 and 7 must be minimum 3 min.

6	→		RRC CONNECTION RELEASE COMPLETE	The signalling link is released
7	→		GENERIC SETUP PROCEDURE MOBILE ORIGINATED, CS (Up to SETUP)	Establishment cause indicates "originating call".
8	←		RELEASE COMPLETE	Cause value from category 1 or 2 of TS 22.001, Annex E. This shall be chosen randomly, from both categories. Cause no. 27 shall be excluded if the UE has implemented in category 3 of TS 22.001, as declared in PIXIT statement
9	←		RRC CONNECTION RELEASE	The signalling link is released.
10	→		RRC CONNECTION RELEASE COMPLETE	
11				The auto calling function shall repeat step 5 to 9 (N-1) times. The UE shall not make more than maximum 10 re-attempts.
12	UE			Clear the auto calling constraint by manual intervention after a minimum of 4 minutes from step 11. Following the final completion of step 11 the UE initiate a call prior to manual intervention.

### 17.1.3.5 Test requirements

1: At the first re-attempt the time between step 4 and 7 must be minimum 5 sec. 2: At the 2<sup>nd</sup>, 3<sup>rd</sup> and 4<sup>th</sup> re-attempt the time between step 4 and 7 must be minimum 1 min. 3: At the 5<sup>th</sup> to 10<sup>th</sup> re-attempt the time between step 4 and 7 must be minimum 3 min.

The UE shall not make more than maximum 10 re-attempts.

## 17.1.4 Behaviour of the UE when its list of blacklisted numbers is full

### 17.1.4.1 Definition and applicability

This tests that the UE does not allow autocalling when its list of blacklisted numbers is full.

The number of B-party numbers that can be stored in the list of blacklisted numbers, as stated in the IXIT statement, is M.

This test shall only apply to UE that are capable of autocalling more than M B-party numbers.

### 17.1.4.2 Conformance requirement

The number of B numbers that can be held in the blacklist is at the manufacturers discretion but there shall be at least 8. However, when the blacklist is full the UE shall prohibit further automatic call attempts to any one number until the blacklist is manually cleared at the UE in respect of one or more B numbers.

## Reference

TS 22.001, Annex E.

### 17.1.4.3 Test purpose

To ensure the correct behaviour of the UE when its list of blacklisted numbers is full.

### 17.1.4.4 Method of test

#### Initial condition

The list of blacklisted numbers, in the UE, shall be full. This may be achieved as described in the procedure in clause 17.1.2, applied to M B-party numbers.

#### Related ICS/IXIT Statement(s)

PICS: TBD.

PIXIT: Description of auto calling management:

- selection of the auto calling;
- indication that the call failed and a re-try is attempted;
- indication that a call finally failed.

#### Test Procedure

The autocalling function is invoked for a B-party number that is not in the list of blacklisted numbers.

Clear the autocalling constraint by manual intervention after a minimum of 10 s.

### 17.1.4.5 Test requirements

The UE must not initiate a call.

## 17.2 Location Services

This subclause contains test cases for Location Services (LCS).

### 17.2.1 Default conditions during LCS tests

#### 17.2.1.1 Default system information

Default system information, as specified in TS 34.108 subclause 6.1, is broadcasted. SIB15/SIB15.x are not broadcasted unless otherwise stated in the specific test cases.

#### 17.2.1.2 Simulated A-GPS environment

During A-GPS tests the SS shall generate satellite signals that are of a sufficient number and strength not to prevent the UE from responding to a positioning request with a valid measurement response. Any assistance data provided during these tests shall be consistent with the satellite signals generated during these tests.

It is considered that six satellite signals with the level of the simulated satellites all at -125dBm +/- 6dB should be suitable, however this does not imply any conformance requirements on the UE.

A suitable GPS scenario together with associated assistance data is defined in TS 34.108 clause 10.7.

The accuracy of the GPS time-of-week in the provided assistance data shall be within +/- 2 s relative to the GPS time in the system simulator.

### 17.2.1.3 A-GPS assistance data sets

This section defines the assistance data sets supplied by the SS in A-GPS test cases.

Throughout this section, “adequate assistance data” means the assistance data used in test cases where it is expected that a UE supporting A-GPS will be able to perform the requested positioning operation using the supplied assistance data, and “inadequate assistance data” is the assistance data used in test cases that expect that the UE will be unable to perform the requested operation. The values of all the fields in all cases are defined in TS 34.108 clause 10.7.

#### 17.2.1.3.1 Adequate assistance data for UE-based A-GPS

#### 17.2.2.1.2 Conformance requirements

- 1) A MM connection for an emergency call may be established in all states of the mobility management sublayer which allow MM connection establishment for a normal originating call.

When a user requests an emergency call establishment the UE will send a CM SERVICE REQUEST message to the network with a CM service type information element indicating emergency call establishment.

- 2) Having entered the "MM connection pending" state, upon MM connection establishment, the call control entity of the UE sends a setup message to its peer entity. This setup message is
  - a SETUP message, if the call to be established is a basic call; and

- an EMERGENCY SETUP message, if the call to be established is an emergency call.
- 3) If the IE "UE positioning GPS reference time" is included, the UE shall:

- 4) If the IE "UE positioning GPS reference UE position" is included, the UE shall:
- 1> store this IE in the IE "UE positioning GPS reference UE position" in variable UE\_POSITIONING\_GPS\_DATA; and
  - 1> use it as a priori knowledge of the approximate location of the UE.
- 5) The UE shall when a measurement report is triggered:
- 2> if the UE has been able to calculate a position after performing measurements on the cells included in the variable UE\_POSITIONING\_OTDOA\_DATA\_UE\_BASED in case of OTDOA or on the list of satellites included in the variable UE\_POSITIONING\_GPS\_DATA in case of GPS positioning:
    - 3> include IE "UE positioning Position Estimate Info" in the MEASUREMENT REPORT and set the contents of the IE as follows:

          - 6> if the UE has been able to calculate a 3-dimensional position:
            - 7> include IE "Ellipsoid point with altitude and uncertainty ellipsoid" as the position estimate.
          - 6> if the UE has not been able to calculate a 3-dimensional position:

#### 17.2.2.1.3 Test Purpose

To verify when an emergency call is initiated by a UE with a USIM, and the network performs a location request using the RRC measurement control procedure by sending Measurement Control message, then the UE responds with a Measurement Report containing UE location.

#### 17.2.2.1.4 Method of Test

##### Initial Conditions

- System Simulator:
  - 1 cell, default parameters.
  - Satellites: As specified in 17.2.1.2
- User Equipment:
  - the UE is in state "MM idle" with valid TMSI and CKSN.

##### Related PICS/PIXIT Statements

- Emergency speech call      yes/no
- UE Based Network Assisted GPS

##### Test procedure

The UE is made to initiate an emergency call.

After the call has been through-connected in both directions, the SS orders an A-GPS positioning measurement using two MEASUREMENT CONTROL messages. The last MEASUREMENT CONTROL message orders periodical reporting by sending a MEASUREMENT CONTROL message requesting periodical measurement reporting (1 report, interval 64s).

The UE then performs positioning measurements, calculates "UE Positioning Position Estimate Info" and responds with this in the RRC message MEASUREMENT REPORT.

## 17.2.2.2 LCS Network Induced location request/ UE-Based GPS/ Emergency Call / without USIM

### 17.2.2.2.1 Definition

This test case applies to all UEs supporting UE-Based GPS Location Service capabilities.

### 17.2.2.2.2 Conformance requirements

- 1) A MM connection for an emergency call may be established in all states of the mobility management sublayer which allow MM connection establishment for a normal originating call.

When a user requests an emergency call establishment the UE will send a CM SERVICE REQUEST message to the network with a CM service type information element indicating emergency call establishment.

Normally, the UE will be identified by an IMSI or a TMSI. However, if none of these identifiers is available in the UE, then the UE shall use the IMEI for identification purposes.

- 2) As a serving network option, emergency calls may be established without the network having to apply the security mode procedure as defined in TS 24.008.

The following are the only cases where the "security procedure not applied" option may be used:

- a) Authentication is impossible because the USIM is absent.
- 3) Having entered the "MM connection pending" state, upon MM connection establishment, the call control entity of the UE sends a setup message to its peer entity. This setup message is
  - a SETUP message, if the call to be established is a basic call; and
  - an EMERGENCY SETUP message, if the call to be established is an emergency call.
- 4) If the IE "UE positioning GPS reference time" is included, the UE shall:
  - 1> store the IE "GPS Week" in "UE positioning GPS reference time" in variable UE\_POSITIONING\_GPS\_DATA and use it as the current GPS week;
  - 1> store the IE "GPS TOW msec" in the IE "UE positioning GPS reference time" in variable UE\_POSITIONING\_GPS\_DATA and use it as an estimate of the GPS Time-of-Week at the time of reception of the complete message containing the IE "GPS TOW msec";

NOTE: The UE does not need to apply any compensation on the GPS Time-of-Week.

- 5) If the IE "UE positioning GPS reference UE position" is included, the UE shall:

- 1> store this IE in the IE "UE positioning GPS reference UE position" in variable UE\_POSITIONING\_GPS\_DATA; and
- 1> use it as a priori knowledge of the approximate location of the UE.

- 6) The UE shall when a measurement report is triggered:

- 2> if the UE has been able to calculate a position after performing measurements on the cells included in the variable UE\_POSITIONING\_OTDOA\_DATA\_UE\_BASED in case of OTDOA or on the list of satellites included in the variable UE\_POSITIONING\_GPS\_DATA in case of GPS positioning:

- 3> include IE "UE positioning Position Estimate Info" in the MEASUREMENT REPORT and set the contents of the IE as follows:

- 4> if the UE does not support the capability to perform the UE GPS timing of cell frames measurement;  
or

- 4> if the IE "GPS timing of Cell wanted" is set to FALSE:

- 5> include the IE "GPS TOW msec".

- 4> if IE "Vertical Accuracy" has been included in IE "UE positioning reporting quantity":
  - 5> if the IE "Vertical Accuracy" has been assigned to a value unequal to "0":
    - 6> if the UE has been able to calculate a 3-dimensional position:
      - 7> include IE "Ellipsoid point with altitude and uncertainty ellipsoid" as the position estimate.
    - 6> if the UE has not been able to calculate a 3-dimensional position:
      - 7> act as if IE "Vertical Accuracy" has not been included in IE "UE positioning reporting quantity".
- 4> if IE "Vertical Accuracy" has not been included in IE "UE positioning reporting quantity":
  - 5> if IE "Horizontal Accuracy" in IE "UE positioning reporting quantity" has been assigned to a value unequal to 0:
    - 6> include either IE "Ellipsoid point with uncertainty circle" or IE "Ellipsoid point with uncertainty ellipse" or IE "Ellipsoid point with altitude and uncertainty ellipsoid" as the position estimate.

## 17.2.2.2.5 Test requirements

After step 10 the UE shall have through connected the DTCH in both directions.

After step 13 the UE shall respond with a MEASUREMENT REPORT message containing a position estimate.

### 17.2.2.3 LCS Network induced location request/ UE-Assisted GPS/ Emergency call/ With USIM

#### 17.2.2.3.1 Definition

This test case applies to all UEs supporting UE-Assisted GPS Location Service capabilities.

#### 17.2.2.3.2 Conformance requirements

- 1) A MM connection for an emergency call may be established in all states of the mobility management sublayer which allow MM connection establishment for a normal originating call.

When a user requests an emergency call establishment the UE will send a CM SERVICE REQUEST message to the network with a CM service type information element indicating emergency call establishment.

- 2) Having entered the "MM connection pending" state, upon MM connection establishment, the call control entity of the UE sends a setup message to its peer entity. This setup message is

- a SETUP message, if the call to be established is a basic call; and
- an EMERGENCY SETUP message, if the call to be established is an emergency call.

- 3) if the IE "Measurement command" has the value "setup":

- 2> store this measurement in the variable MEASUREMENT\_IDENTITY according to the IE "measurement identity", first releasing any previously stored measurement with that identity if that exists;

...

- 2> for any other measurement type:

- 3> if the measurement is valid in the current RRC state of the UE:

- 4> begin measurements according to the stored control information for this measurement identity.

- 4) The UE shall:

- 1> when a measurement report is triggered:

- 2> if the UE was able to perform measurements on at least one neighbour cell included in the variable UE\_POSITIONING\_OTDOA\_DATA\_UE\_ASSISTED in case of OTDOA or one satellite included in the variable UE\_POSITIONING\_GPS\_DATA in case of GPS positioning or one cell from the active set in case of CELL ID:

- 3> if the IE "Vertical Accuracy" is included:

- 4> interpret the presence of this IE to indicate that the UTRAN desires to compute a 3-dimensional position estimate.

- 3> if the IE "Positioning Methods" is set to "GPS":

- 4> include the IE "UE positioning GPS measured results" in the measurement report and set the contents of the IE as follows:

- 5> if the UE supports the capability to provide the GPS timing of the cell frames measurement:

- 6> if the IE "GPS timing of Cell wanted" is set to TRUE:

- 7> perform the UE GPS timing of cell frames measurement on the serving cell or on one cell of the active set.

- 7> include the IE "Primary CPICH Info" for FDD or the IE "cell parameters id" for TDD; and

- 7> include the IE "Reference SFN" and the IE "UE GPS timing of cell frames".

- 6> if the IE "GPS timing of Cell wanted" is set to FALSE:

7> include the IE "GPS TOW msec".

5> if the UE does not support the capability to provide the GPS timing of the cell:

6> include the IE "GPS TOW msec".

### 17.2.2.3.3 Test Purpose

To verify when an emergency call is initiated by a UE with a USIM, and the network performs a location request using the RRC measurement control procedure by sending Measurement Control message , then the UE respond with a Measurement Report containing "UE positioning GPS measured results".

### 17.2.2.3.4 Method of Test

#### Initial Conditions

System Simulator (SS):

1 cell, default parameters

Satellites: As specified in 17.2.1.2

UE:

- the UE is in state "MM idle" with valid TMSI and CKSN.

#### Related PICS/PIXIT Statements

- Emergency speech call    yes/no
- UE Assisted Network Assisted GPS

#### Test Procedure

The UE is made to initiate an emergency call.

After the call has been through-connected in both directions, the SS orders an A-GPS positioning measurement using a MEASUREMENT CONTROL message, including assistance data as specified in section 17.2.1.3.3. The UE may request additional assistance data by sending a MEASUREMENT REPORT message containing a positioning error indication with the IE "Error reason" set to "Assistance Data Missing". If the UE requests additional assistance data, the SS provides the requested assistance data in one or more MEASUREMENT CONTROL messages.

The UE then performs positioning measurements and responds with the RRC message MEASUREMENT REPORT.

Finally the SS clears the call.

#### 17.2.2.4 LCS Network induced location request/ UE-Assisted GPS/ Emergency call/ Without USIM

##### 17.2.2.4.1 Definition

##### 17.2.2.4.2 Conformance requirements

- 1) A MM connection for an emergency call may be established in all states of the mobility management sublayer which allow MM connection establishment for a normal originating call.

When a user requests an emergency call establishment the UE will send a CM SERVICE REQUEST message to the network with a CM service type information element indicating emergency call establishment.

Normally, the UE will be identified by an IMSI or a TMSI. However, if none of these identifiers is available in the UE, then the UE shall use the IMEI for identification purposes.

- 2) As a serving network option, emergency calls may be established without the network having to apply the security mode procedure as defined in TS 24.008.

The following are the only cases where the "security procedure not applied" option may be used:

- a) Authentication is impossible because the USIM is absent.
- 3) Having entered the "MM connection pending" state, upon MM connection establishment, the call control entity of the UE sends a setup message to its peer entity. This setup message is
  - a SETUP message, if the call to be established is a basic call; and

#### Test Procedure

The UE invokes call independent supplementary service through a CM SERVICE REQUEST. The SS initiates authentication and ciphering.

The UE invokes a MO-LR request through the Facility IE in a REGISTER message. The MO-LR request is of type "locationEstimate". The IE "LCSClientExternalID" is set to the ID of a valid external LCS client.

## 17.2.4.1.1 Definition

This test case applies to all UEs supporting UE-Based GPS Location Service capabilities.

## 17.2.4.1.2 Conformance requirements

- 1) The network invokes a location notification procedure by sending a REGISTER message containing a LCS-LocationNotification invoke component to the UE. This may be sent either to request verification for MT-LR or to notify about already authorized MT-LR.

In the case of location notification no response is required from the UE, the UE shall terminate the dialogue by sending a RELEASE COMPLETE message containing a LocationNotification return result.

- 2) if the IE "Measurement command" has the value "modify":
  - 2> for all IEs present in the MEASUREMENT CONTROL message:
    - 3> if a measurement was stored in the variable MEASUREMENT\_IDENTITY associated to the identity by the IE "measurement identity":
      - 4> if measurement type is set to "UE positioning measurement" and the IE "UE positioning GPS assistance data" is present, for any of the optional IEs "UE positioning GPS reference time", "UE positioning GPS reference UE position", "UE positioning GPS DGPS corrections", "UE positioning GPS ionospheric model", "UE positioning GPS UTC model", "UE positioning GPS acquisition assistance", "UE positioning GPS real-time integrity" that are present in the MEASUREMENT CONTROL message:

  - 1> use IE "Satellite Status" to determine if an update of IE "UE positioning GPS Ephemeris and Clock Correction parameters" has been provided for the satellite indicated by the IE "SatID";
  - 1> if an update has been provided for this satellite:

2> act as specified in subclause 8.6.7.19.3.4 of TS 25.331.

6) If the IE "UE positioning GPS reference UE position" is included, the UE shall:

1> store this IE in the IE "UE positioning GPS reference UE position" in variable UE\_POSITIONING\_GPS\_DATA; and

1> use it as a priori knowledge of the approximate location of the UE.

2> if the UE has been able to calculate a position after performing measurements on the cells included in the variable UE\_POSITIONING\_OTDOA\_DATA\_UE\_BASED in case of OTDOA or on the list of satellites included in the variable UE\_POSITIONING\_GPS\_DATA in case of GPS positioning:

3> include IE "UE positioning Position Estimate Info" in the MEASUREMENT REPORT and set the contents of the IE as follows:

4> if the UE does not support the capability to perform the UE GPS timing of cell frames measurement;  
or

4> if the IE "GPS timing of Cell wanted" is set to FALSE:

5> include the IE "GPS TOW msec".

4> if IE "Vertical Accuracy" has been included in IE "UE positioning reporting quantity":

##### Test Procedure

The stored GPS assistance data in the UE shall be cleared.

The SS sends an SS REGISTER message containing a Facility IE containing a DTAP LCS Location Notification Invoke message set to notifyLocationAllowed. The LCS Client Name contained in the USSD text string of the lcs-LocationNotification shall be displayed. The UE then responds with a RELEASE COMPLETE message containing a LocationNotification return to terminate the dialogue.

The SS response with one or more MEASUREMENT CONTROL messages that include the requested assistance data and instructs the UE not to repeat the request for assistance data. The final MEASUREMENT CONTROL message orders periodic reporting.

The UE performs positioning measurements and responds with a MEASUREMENT REPORT message containing a valid position estimate in the IE "UE Positioning Position Estimate Info".

#### Test Procedure

The stored GPS assistance data in the UE shall be cleared.

The SS sends an SS REGISTER message containing a Facility IE containing a DTAP LCS Location Notification Invoke message set to notifyLocationAllowed. The LCS Client Name contained in the USSD text string of the lcs-LocationNotification shall be displayed. The UE then responds with a RELEASE COMPLETE message containing a LocationNotification return to terminate the dialogue.

The SS orders an A-GPS positioning measurement using a MEASUREMENT CONTROL message. The assistance data is as described in section 17.2.1.3.2 (Inadequate assistance data for UE-assisted A-GPS). The MEASUREMENT CONTROL message orders periodical reporting.

The UE then initiates periodic measurement reporting and sends a MEASUREMENT REPORT message including a request for additional assistance data. The SS responds with one or more MEASUREMENT CONTROL messages containing assistance data as specified in section 17.2.1.3.5 (Response to additional assistance data requests from UE). The UE sends a MEASUREMENT REPORT message including the IE "UE positioning GPS measured results".

### 17.2.4.6.3 Test Purpose

To verify that when the UE receives a REGISTER message, containing a LCS Location Notification Invoke component set to notifyAndVerify-LocationAllowedIfNoResponse, the UE notifies the user of the request and indicates that the default response is location allowed if no response and providing the opportunity to accept or deny the request and sends a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionDenied or permissionGranted as appropriate.

## 17.2.4.6.4 Method of Test

## Initial Conditions

## System Simulator (SS):

- 1 cell, default parameters
- Satellites: As specified in 17.2.1.2

## Test Procedure

The SS sends a REGISTER message containing a Facility IE containing a LCS Location Notification Invoke message set to notifyAndVerify-LocationAllowedIfNoResponse.

The LCS Client Name contained in the USSD text string of the lcs-LocationNotification should be displayed with the option to accept or deny the request and an indication that location will be allowed if no user response is received.

The user accepts the location request. The UE responds with a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionGranted.

The SS orders an A-GPS positioning measurement using MEASUREMENT CONTROL messages.

The UE sends a MEASUREMENT REPORT message including a location estimate.

The SS sends a REGISTER message containing a Facility IE containing a LCS Location Notification Invoke message set to notifyAndVerify-LocationAllowedIfNoResponse.

The user denies the location request. The UE responds with a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionDenied.

The SS sends a REGISTER message containing a Facility IE containing a LCS Location Notification Invoke message set to notifyAndVerify-LocationAllowedIfNoResponse.

The user ignores the location request by taking no action.

The SS orders an A-GPS positioning measurement using MEASUREMENT CONTROL messages.

The UE then sends a MEASUREMENT REPORT message including a location estimate.

### 17.2.4.7.3 Test Purpose

To verify that when the UE receives a REGISTER message, containing a LCS Location Notification Invoke component set to notifyAndVerify-LocationNotAllowedIfNoResponse, the UE notifies the user of the request and indicates that the default response is location not allowed if no response and providing the opportunity to accept or deny the request and sends a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionDenied or permissionGranted as appropriate.

### 17.2.4.7.4 Method of Test

#### Initial Conditions

System Simulator (SS):

- 1 cell, default parameters
- Satellites: As specified in 17.2.1.2

UE:

- State CS-DCCCH+DTCH (state 6-9) as specified in clause 7.4 of TS 34.108

#### Test Procedure

The SS sends a REGISTER message containing a Facility IE containing a LCS Location Notification Invoke message set to notifyAndVerify-LocationNotAllowedIfNoResponse.

The LCS Client Name contained in the USSD text string of the lcs-LocationNotification should be displayed with the option to accept or deny the request and an indication that location will be not allowed if no user response is received.

The user accepts the location request. The UE responds with a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionGranted.

The SS orders an A-GPS positioning measurement using MEASUREMENT CONTROL messages.

The UE sends a MEASUREMENT REPORT message including a location estimate.

The SS sends a REGISTER message containing a Facility IE containing a LCS Location Notification Invoke message set to notifyAndVerify-LocationNotAllowedIfNoResponse.

The user denies the location request. The UE responds with a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionDenied.

The SS sends a REGISTER message containing a Facility IE containing a LCS Location Notification Invoke message set to notifyAndVerify-LocationNotAllowedIfNoResponse.

The user ignores the location request by taking no action. If the timer expires in the SS before any response from the UE is received, the SS interprets this by applying the default treatment LocationNotAllowed.

## 17.2.4.8 LCS Mobile terminated location request/ UE-Assisted GPS/ Privacy Verification/ Location Allowed if No Response

### 17.2.4.8.1 Definition

This test case applies to all UEs supporting UE-Assisted GPS Location Service capabilities.

### 17.2.4.8.2 Conformance requirements

- 1) The network invokes a location notification procedure by sending a REGISTER message containing a LCS-LocationNotification invoke component to the UE. This may be sent either to request verification for MT-LR or to notify about already authorized MT-LR.
- 2) In case of privacy verification the MS shall respond to the request by sending a RELEASE COMPLETE message containing the mobile subscriber's response in a return result component.
- 3) If the timer expires in the network before any response from the MS (e.g. due to no response from the user), the network shall interpret this by applying the default treatment defined in GSM 03.71 for GSM and TS 23.171 for UMTS (i.e. disallow location if barred by subscription and allow location if allowed by subscription).
- 4) if the IE "Measurement command" has the value "setup":
  - 2> store this measurement in the variable MEASUREMENT\_IDENTITY according to the IE "measurement identity", first releasing any previously stored measurement with that identity if that exists;
  - ...
  - 2> for any other measurement type:
    - 3> if the measurement is valid in the current RRC state of the UE:
      - 4> begin measurements according to the stored control information for this measurement identity.
- 5) The UE shall:
  - 1> when a measurement report is triggered:
    - 2> if the UE was able to perform measurements on at least one neighbour cell included in the variable UE\_POSITIONING\_OTDOA\_DATA\_UE\_ASSISTED in case of OTDOA or one satellite included in the variable UE\_POSITIONING\_GPS\_DATA in case of GPS positioning or one cell from the active set in case of CELL ID:
      - 3> if the IE "Vertical Accuracy" is included:
        - 4> interpret the presence of this IE to indicate that the UTRAN desires to compute a 3-dimensional position estimate.
      - 3> if the IE "Positioning Methods" is set to "GPS":
        - 4> include the IE "UE positioning GPS measured results" in the measurement report and set the contents of the IE as follows:
          - 5> if the UE supports the capability to provide the GPS timing of the cell frames measurement:
            - 6> if the IE "GPS timing of Cell wanted" is set to TRUE:
              - 7> perform the UE GPS timing of cell frames measurement on the serving cell or on one cell of the active set.
              - 7> include the IE "Primary CPICH Info" for FDD or the IE "cell parameters id" for TDD; and
              - 7> include the IE "Reference SFN" and the IE "UE GPS timing of cell frames".
            - 6> if the IE "GPS timing of Cell wanted" is set to FALSE:
              - 7> include the IE "GPS TOW msec".

5> if the UE does not support the capability to provide the GPS timing of the cell:

6> include the IE "GPS TOW msec".

### 17.2.4.8.3 Test Purpose

To verify that when the UE receives a REGISTER message, containing a LCS Location Notification Invoke component set to notifyAndVerify-LocationAllowedIfNoResponse, the UE notifies the user of the request and indicates that the default response is location allowed if no response and providing the opportunity to accept or deny the request and sends a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionDenied or permissionGranted as appropriate.

#### Test Procedure

The SS sends a REGISTER message containing a Facility IE containing a LCS Location Notification Invoke message set to notifyAndVerify-LocationAllowedIfNoResponse.

The LCS Client Name contained in the USSD text string of the lcs-LocationNotification should be displayed with the option to accept or deny the request and an indication that location will be allowed if no user response is received.

The user accepts the location request. The UE responds with a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionGranted.

The SS orders an A-GPS positioning measurement using a MEASUREMENT CONTROL message, including assistance data as specified in section 17.2.1.3.3. The UE may request additional assistance data by sending a MEASUREMENT REPORT message containing a positioning error indication with the IE "Error reason" set to "Assistance Data Missing". If the UE requests additional assistance data, the SS provides the requested assistance data in one or more MEASUREMENT CONTROL messages.

The UE sends a MEASUREMENT REPORT message including IE "UE positioning GPS measured results".

The SS sends a REGISTER message containing a Facility IE containing a LCS Location Notification Invoke message set to notifyAndVerify-LocationAllowedIfNoResponse.

The SS sends a REGISTER message containing a Facility IE containing a LCS Location Notification Invoke message set to notifyAndVerify-LocationAllowedIfNoResponse.

The user denies the location request. The UE responds with a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionDenied.

The SS sends a REGISTER message containing a Facility IE containing a LCS Location Notification Invoke message set to notifyAndVerify-LocationAllowedIfNoResponse.

The user ignores the location request by taking no action. If the timer expires in the SS before any response from the UE is received, the SS interprets this by applying the default treatment LocationAllowed.

The SS orders an A-GPS positioning measurement using a MEASUREMENT CONTROL message, including assistance data as specified in section 17.2.1.3.3. The UE may request additional assistance data by sending a MEASUREMENT REPORT message containing a positioning error indication with the IE "Error reason" set to "Assistance Data Missing". If the UE requests additional assistance data, the SS provides the requested assistance data in one or more MEASUREMENT CONTROL messages.

The UE then sends a MEASUREMENT REPORT message including IE "UE positioning GPS measured results".

#### 17.2.4.9 LCS Mobile terminated location request/ UE-Assisted GPS/ Privacy Verification/ Location Not Allowed if No Response

##### 17.2.4.9.1 Definition

This test case applies to all UEs supporting UE-Assisted GPS Location Service capabilities.

##### 17.2.4.9.2 Conformance requirements

- 1) The network invokes a location notification procedure by sending a REGISTER message containing a LCS-LocationNotification invoke component to the UE. This may be sent either to request verification for MT-LR or to notify about already authorized MT-LR.
- 2) In case of privacy verification the MS shall respond to the request by sending a RELEASE COMPLETE message containing the mobile subscriber's response in a return result component.
- 3) If the timer expires in the network before any response from the MS (e.g. due to no response from the user), the network shall interpret this by applying the default treatment defined in GSM 03.71 for GSM and TS 23.171 for UMTS (i.e. disallow location if barred by subscription and allow location if allowed by subscription).

- 4) if the IE "Measurement command" has the value "setup":
  - 2> store this measurement in the variable MEASUREMENT\_IDENTITY according to the IE "measurement identity", first releasing any previously stored measurement with that identity if that exists;
  - ...
  - 2> for any other measurement type:
    - 3> if the measurement is valid in the current RRC state of the UE:
      - 4> begin measurements according to the stored control information for this measurement identity.
- 5) The UE shall:
  - 1> when a measurement report is triggered:
    - 2> if the UE was able to perform measurements on at least one neighbour cell included in the variable UE\_POSITIONING\_OTDOA\_DATA\_UE\_ASSISTED in case of OTDOA or one satellite included in the variable UE\_POSITIONING\_GPS\_DATA in case of GPS positioning or one cell from the active set in case of CELL ID:
      - 3> if the IE "Vertical Accuracy" is included:
        - 4> interpret the presence of this IE to indicate that the UTRAN desires to compute a 3-dimensional position estimate.
      - 3> if the IE "Positioning Methods" is set to "GPS":
        - 4> include the IE "UE positioning GPS measured results" in the measurement report and set the contents of the IE as follows:
          - 5> if the UE supports the capability to provide the GPS timing of the cell frames measurement:
            - 6> if the IE "GPS timing of Cell wanted" is set to TRUE:
              - 7> perform the UE GPS timing of cell frames measurement on the serving cell or on one cell of the active set.
              - 7> include the IE "Primary CPICH Info" for FDD or the IE "cell parameters id" for TDD; and
              - 7> include the IE "Reference SFN" and the IE "UE GPS timing of cell frames".
            - 6> if the IE "GPS timing of Cell wanted" is set to FALSE:
              - 7> include the IE "GPS TOW msec".
          - 5> if the UE does not support the capability to provide the GPS timing of the cell:
            - 6> include the IE "GPS TOW msec".

### 17.2.4.9.3 Test Purpose

To verify that when the UE receives a REGISTER message, containing a LCS Location Notification Invoke component set to notifyAndVerify-LocationNotAllowedIfNoResponse, the UE notifies the user of the request and indicates that the default response is location not allowed if no response and providing the opportunity to accept or deny the request and sends a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionDenied or permissionGranted as appropriate.

#### 17.2.4.9.4 Method of Test

##### Initial Conditions

##### System Simulator (SS):

- 1 cell, default parameters
- Satellites: As specified in 17.2.1.2

##### UE:

- State CS-DCCH+DTCH (state 6-9) as specified in clause 7.4 of TS 34.108

##### Test Procedure

The SS sends a REGISTER message containing a Facility IE containing a LCS Location Notification Invoke message set to notifyAndVerify-LocationNotAllowedIfNoResponse.

The LCS Client Name contained in the USSD text string of the lcs-LocationNotification should be displayed with the option to accept or deny the request and an indication that location will be allowed if no user response is received.

The user accepts the location request. The UE responds with a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionGranted.

The SS orders an A-GPS positioning measurement using a MEASUREMENT CONTROL message, including assistance data as specified in section 17.2.1.3.3.. The UE may request additional assistance data by sending a MEASUREMENT REPORT message containing a positioning error indication with the IE "Error reason" set to "Assistance Data Missing". If the UE requests additional assistance data, the SS provides the requested assistance data in one or more MEASUREMENT CONTROL messages.

The UE sends a MEASUREMENT REPORT message including IE "UE positioning GPS measured results".

The SS sends a REGISTER message containing a Facility IE containing a LCS Location Notification Invoke message set to notifyAndVerify-LocationNotAllowedIfNoResponse.

The user denies the location request. The UE responds with a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionDenied.

The SS sends a REGISTER message containing a Facility IE containing a LCS Location Notification Invoke message set to notifyAndVerify-LocationNotAllowedIfNoResponse.

The user ignores the location request by taking no action. If the timer expires in the SS before any response from the UE is received, the SS interprets this by applying the default treatment LocationNotAllowed.

NOTE: See TS 34.109 [10] clause 5.3.2.6.2 for details regarding loopback of RLC SDUs. The UL RLC SDU size have been chosen such that the UE will return all data received in downlink and that the UL RLC SDU will fill up the uplink transport format set under test over one or several transmission time intervals.						

See 18.1.1.1 for test procedure.

#### 18.1.2.36.1.4 Test requirements

See 18.1.1.1 for definition of step 10 and step 15.

1. At step 10 the UE shall send RADIO BEARER SETUP COMPLETE.
2. At step 15 the UE transmitted transport format shall be
  - for sub-test 1: RB5/TF1 (1x336).
  - for sub-test 2: RB5/TF2 (2x336).
  - for sub-test 3: RB5/TF3 (4x336).
  - for sub-test 4 to 10: RB5/TF4 (8x336).
3. At step 15 the UE shall return
  - for sub-test 1 to 10: an RLC SDU on RB5 having the same content as the DL RLC SDU sent by the SS.

RB8: Test data size has been set to DL TFS size under test minus 8 bits (size of 7 bit length indicator and expansion bit). As the uplink TTI for RB8 is 10 ms while the downlink TTI is 20 ms then, to achieve continous data transmission in uplink the size of the uplink RLC SDU has been set such that it will be transmitted over two subsequent TTIs, i.e. UL RLC SDU SIZE has been set to two times the uplink TFS size minus 8 bits (size of 7 bit length indicator and expansion bit).</p>

RB8: Test data size has been set to the payload size of the DL TF under test minus 8 bits (size of 7 bit length indicator and expansion bit). As the TTI for RB8 is the same for both downlink and uplink then UL RLC SDU size has been set to achieve UE to return one SDU per TTI, i.e. the UL RLC SDU size has been set equal to the the payload size of the UL TF under test minus 8 bits (size of 7 bit length indicator and expansion bit).</p>

NOTE: See TS 34.109 [10] clause 5.3.2.6.2 for details regarding loopback of RLC SDUs. RB8: Test data size has been set to DL TFS size under test minus 8 bits (size of 7 bit length indicator and expansion bit). As the uplink TTI for RB8 is 20 ms while the downlink TTI is 10 ms then, to achieve continuous data transmission in uplink the size of the uplink RLC SDU has been set such that it will be transmitted over each TTIs, i.e. UL RLC SDU SIZE has been set to the uplink TFS size under test minus 8 (the size of a 7 bit length indicator and expansion bit).

##### 18.1.2.43.1 Conversational / speech / UL:12.2 DL:12.2 kbps / CS RAB + Interactive or background / UL:64 DL:384 kbps / PS RAB / 10 ms TTI

###### 18.1.2.43.1.1 Conformance requirement

See 18.1.2.4.1.

###### 18.1.2.43.1.2 Test purpose

Test to verify establishment and data transfer of reference radio bearer configuration as specified in TS 34.108, clause 6.11.5.4.1.43 for the downlink 10 ms TTI case.

###### 18.1.2.43.1.3 Method of test

See 18.1.1.2 for test procedure.

For the PS DL:384/UL:64 kbps radio bearer the downlink TTI is 10ms while the uplink TTI is 20ms. As the SS will send one DL SDU every 10 ms then the UE test loop function will return 2 UL SDUs per uplink TTI. To not cause uplink transmission buffer overflow then the UL RLC SDU size should be chosen such that the UE will transmit 2 RLC SDUs per uplink TTI. For the case when the transport format under test does not allow for 2 SDUs to fit into the transport format size without requiring concatenation then the UL RLC SDU size shall be chosen such that one SDU is returned per uplink TTI.

The following RLC parameter value is used in the RADIO BEARER SETUP message used to setup the PS DL:384/UL:64 kbps radio bearer:

Uplink RLC Transmission window size	512
--	-----

NOTE The transmission window size value have been chosen to avoid that UE transmission buffer becomes full during the test.

Sub-test	Downlink TFCs Under Test	Uplink TFCs Under test	Implicitely tested	Restricted UL TFCIs	UL RLC SDU size (bits) (note 1)	Test data size (bits) (note 1)
<p>NOTE 1: See TS 34.109 [10] clause 5.3.2.6.2 for details regarding loopback of RLC SDUs. RB8: Test data size has been set to the payload size of the DL TF under test minus 8 bits (size of 7 bit length indicator and expansion bit).</p> <p>NOTE 2: RB8 (TF1/TF3): For sub-tests where uplink transport format TF1 (1x336) or TF3 (3x336) are used then no adaptation to the difference in downlink TTI (10 ms) and uplink TTI (20ms) is possible as this would require the UE to concatenate 2 SDUs into one PDU for TF1; or into three PDUs for TF3. For these sub-tests the UL RLC SDU size is set equal to the payload size of the UL TF under test minus 8 bits (the size of 7 bit length indicator and expansion bit).</p> <p>NOTE 3: RB8 (TF2/TF4): For sub-tests where uplink transport formats TF2 (2x336) or TF4 (4x336) is used then to adopt to the difference in downlink TTI (10 ms) and uplink TTI (20ms) the UL RLC SDU size has been chosen such that 2 SDUs will be returned per uplink TTI. I.e. the UL RLC SDU size is set equal to half the payload size of the UL TF under test minus 8 bits (the size of 7 bit length indicator and expansion bit).</p>

NOTE:	See TS 34.109 [10] clause 5.3.2.6.2 for details regarding loopback of RLC SDUs. RB8: Test data size has been set to DL TFS size under test minus 8 bits (size of 7 bit length indicator and expansion bit). As the TTI for RB8 is the same for both downlink and uplink then UL RLC SDU size has been set to achieve UE to return one SDU per TTI, i.e. the UL RLC SDU size has been set equal to the uplink TFS size under test minus 8 bits (size of 7 bit length indicator and expansion bit).					

#### 18.1.2.43.2.4 Test requirements

See 18.1.1.2 for definition of step 10 and step 15.

1. At step 10 the UE shall send RADIO BEARER SETUP COMPLETE.
2. At step 15a and 15b the UE transmitted transport format shall be within the set of restricted TFCIs as specified for the actual sub-test.
3. At step 15 the UE shall return
  - for sub-test 1: an RLC SDU on RB5 having the same content as sent by SS; and no data shall be received on RB6, RB7 and RB8.
  - for sub-test 2: an RLC SDU on RB5, RB6 and RB7 having the same content as sent by SS; and no data shall be received on RB8.
  - for sub-test 3: an RLC SDU on RB8 having the content equal to the content of the test data sent by the SS in downlink; and no data shall be received on RB5, RB6 and RB7.

- for sub-test 25: an RLC SDU on RB8 having the content equal to the first 1272 bits of the test data sent by the SS in downlink; an RLC SDU on RB5 having the same content as sent by SS; and no data shall be received on RB6 and RB7.
- for sub-test 26: an RLC SDU on RB8 having the content equal to the first 1272 bits of the test data sent by the SS in downlink; an RLC SDU on RB5, RB6 and RB7 having the same content as sent by SS.

4. At step 15b the UE shall send at least one MEASUREMENT REPORT message.

NOTE:	See TS 34.109 [10] clause 5.3.2.6.2 for details regarding loopback of RLC SDUs. RB8: Test data size has been set to DL TFS size under test minus 8 bits (size of 7 bit length indicator and expansion bit). As the uplink TTI for RB8 is 20 ms while the downlink TTI is 10 ms then, to achieve continous data transmission in uplink the size of the uplink RLC SDU has been set such that it will be transmitted over each TTI, ie the uplink TFS size minus 8 bits (size of 7 bit length indicator and expansion bit).					

#### 18.1.2.44.1.4 Test requirements

See 18.1.1.2 for definition of step 10 and step 15.

1. At step 10 the UE shall send RADIO BEARER SETUP COMPLETE.
2. At step 15a and step 15b the UE transmitted transport format shall be within the set of restricted TFCIs as specified for the actual sub-test.
3. At step 15 the UE shall return
  - for sub-test 1: an RLC SDU on RB5 having the same content as sent by SS; and no data shall be received on RB6, RB7 and RB8.
  - for sub-test 2: an RLC SDU on RB5, RB6 and RB7 having the same content as sent by SS; and no data shall be received on RB8.
  - for sub-test 3: an RLC SDU on RB8 having the content equal to the first 312 bits of the test data sent by the SS in downlink; and no data shall be received on RB5, RB6 and RB7.
  - for sub-test 4: an RLC SDU on RB8 having the content equal to the first 312 bits of the test data sent by the SS in downlink; an RLC SDU on RB5 having the same content as sent by SS; and no data shall be received on RB6 and RB7.
  - for sub-test 5: an RLC SDU on RB8 having the content equal to the first 312 bits of the test data sent by the SS in downlink; an RLC SDU on RB5, RB6 and RB7 having the same content as sent by SS.

- for sub-test 26: an RLC SDU on RB8 having the content equal to the first 2552 bits of the test data sent by the SS in downlink; an RLC SDU on RB5, RB6 and RB7 having the same content as sent by SS.
- for sub-test 27: an RLC SDU on RB8 having the content equal to the first 2552 bits of the test data sent by the SS in downlink; and no data shall be received on RB5, RB6 and RB7.
- for sub-test 28: an RLC SDU on RB8 having the content equal to the first 2552 bits of the test data sent by the SS in downlink; an RLC SDU on RB5 having the same content as sent by SS; and no data shall be received on RB6 and RB7.
- for sub-test 29: an RLC SDU on RB8 having the content equal to the first 2552 bits of the test data sent by the SS in downlink; an RLC SDU on RB5, RB6 and RB7 having the same content as sent by SS.
- for sub-test 30: an RLC SDU on RB8 having the content equal to the first 2552 bits of the test data sent by the SS in downlink; and no data shall be received on RB5, RB6 and RB7.
- for sub-test 31: an RLC SDU on RB8 having the content equal to the first 2552 bits of the test data sent by the SS in downlink; an RLC SDU on RB5 having the same content as sent by SS; and no data shall be received on RB6 and RB7.
- for sub-test 32: an RLC SDU on RB8 having the content equal to the first 2552 bits of the test data sent by the SS in downlink; an RLC SDU on RB5, RB6 and RB7 having the same content as sent by SS.

4. At step 15b the UE shall send at least one MEASUREMENT REPORT message.

## 18.1.2.49.2.4 Test requirements

See 18.1.1.2 for definition of step 10 and step 15.

1. At step 10 the UE shall send RADIO BEARER SETUP COMPLETE.
2. At step 15a and 15b the UE transmitted transport format shall be within the set of restricted TFCIs as specified for the actual subtest.
3. At step 15 the UE shall return
  - for sub-test 1: an RLC SDU on RB5 having the same content as sent by SS; and no data shall be received on RB6, RB7 and RB8.
  - for sub-test 2: an RLC SDU on RB5, RB6 and RB7 having the same content as sent by SS; and no data shall be received on RB8.
  - for sub-test 3: four RLC SDUs on RB8 having the same content as sent by SS; and no data shall be received on RB5, RB6 and RB7.
  - for sub-test 4: an RLC SDU on RB5 and four RLC SDUs on RB8 having the same content as sent by SS; and no data shall be received on RB6 and RB7.
  - - for sub-test 5: an RLC SDU on RB5, RB6 and RB7; and four RLC SDUs on RB8 having the same content as sent by SS.
4. At step 15b the UE shall send at least one MEASUREMENT REPORT message.

#### 18.1.2.52.2.4 Test requirements

See 18.1.1.2 for definition of step 10 and step 15.

1. At step 10 the UE shall send RADIO BEARER SETUP COMPLETE.
2. At step 15a and 15b the UE transmitted transport format shall be within the set of restricted TFCIs as specified for the actual subtest.
3. At step 15 the UE shall return
  - for sub-test 1, 2, 3, 4: an RLC SDU on RB6 having the same content as sent by SS; and no data shall be received on RB5.
  - for sub-test 5: four RLC SDUs on RB5 having the same content as sent by SS; and no data shall be received on RB6.
  - for sub-test 6: four RLC SDUs on RB5 and one RLC SDU on RB6 having the same content as sent by SS.
  - For sub-test 3: RLC SDU on RB6 having the content equal to the first 652 bits of the test data sent by the SS in downlink;

- For sub-test 4: RLC SDU on RB6 having the content equal to the first 1272 bits of the test data sent by the SS in downlink;
- for sub-test 8: an RLC SDU on RB6 having the content equal to the first 652 bits of the test data sent by the SS in downlink; an RLC SDU on RB5 having the same content as sent by SS.
- for sub-test 9: an RLC SDU on RB6 having the content equal to the first 1272 bits of the test data sent by the SS in downlink; an RLC SDU on RB5 having the same content as sent by SS.

4. At step 15b the UE shall send at least one MEASUREMENT REPORT message.

### 18.1.3 Combinations on SCCPCH

#### 18.1.3.1 Stand-alone signalling RB for PCCH

Implicitly tested.

NOTE The stand-alone signalling radio bearer for PCCH in TS 34.108, clause 6.11.5.4.4.1 is used in RRC test case 8.1.2.2.

#### 18.1.3.2 Interactive/Background 32 kbps PS RAB + SRBs for CCCH + SRB for DCCH + SRB for BCCH

Test to verify establishment and data transfer of reference radio bearer configuration as specified in TS 34.108, clause 6.11.5.4.4.2.

This radio bearer configuration is tested with three different SYSTEM INFORMATION (BCCH) configurations:

1. The contents of System Information Block type 5 and 6 as specified in TS 34.108, clause 6.1.1.

Two SCCPCHs are used in this SYSTEM INFORMATION configuration. The first SCCPCH carries the PCH and the second SCCPCH carries the FACH for Interactive/Background 32 kbps PS RAB and the FACH for SRBs on CCCH/ DCCH/ BCCH.

This configuration is verified in test case 18.1.3.2.1.

2. The contents of System Information Block type 5 as specified in TS 34.108, clause 6.1.3.

Three SCCPCHs are used in this SYSTEM INFORMATION configuration. The first SCCPCH carries the PCH and both the second and third SCCPCHs carry the FACH for Interactive/Background 32 kbps PS RAB and the FACH for SRBs on CCCH/ DCCH/ BCCH.

This configuration is verified in test case 18.1.3.2.2.

3. The contents of System Information Block type 5 and 6 as specified in TS 34.108, clause 6.1.2.

Three SCCPCHs are used in this SYSTEM INFORMATION configuration. The first SCCPCH carries the PCH. The second SCCPCH carries the FACH for CTCH (Cell Broadcast Service) and the FACH for SRBs on CCCH/ BCCH for idle mode UEs. The third SCCPCH carries the FACH for Interactive/Background 32 kbps PS RAB and the FACH for SRBs on CCCH/ DCCH/ BCCH for connected mode UEs.

This configuration is verified in test case 18.1.3.2.3.

## 18.1.4 Combinations on PRACH

### 18.1.4.1 Interactive/Background 32 kbps PS RAB + SRB for CCCH + SRB for DCCH

The reference radio bearer configuration as specified in TS 34.108, clause 6.11.5.4.5.1 is implicitly tested by the test cases 18.1.3.2.1, 18.1.3.2.2, 18.1.3.2.3 and 18.1.3.3.

## 18.2 Radio Bearer Tests for 3.84 Mcps TDD option

### 18.2.1 General information for radio bearer tests (3.84 Mcps TDD)

The purpose of these radio bearer test cases is to test properly the Reference Radio Bearer configurations included in TS34.108 [9], clause 6.10.3 for 3.84 Mcps TDD option.

The applicability of radio bearer tests is dependent on the UE uplink and downlink radio access capabilities and UE support tele- and bearer-services.

#### 18.2.1.1 Generic radio bearer test procedure for Single RB configuration

See 14.1.1 for test procedure

#### 18.2.1.2 Generic test procedure for testing multi-RB configuration and simultaneous signalling

See 14.1.2 for test procedure

#### 18.2.1.2a Generic test procedure for testing multi-RB combinations and simultaneous signalling in case of DSCH

This procedure is used to test multiple radio bearer combinations where PS data goes on the DSCH. This procedure is also used to verify simultaneous transmission and reception of user data and signalling data.

Initial conditions

UE in idle mode

Test procedure

- a) The SS establish the reference radio bearer configuration as specified in TS 34.108, clause 6.10 for the actual radio bearer test. For the case when the reference radio bearer configuration includes radio bearers for both CS and PS domain then the radio bearer setup procedure has to be performed once per domain. The first radio bearer setup procedure shall perform configuration of the physical channel for the radio bearer combination under test as well as the transport channels for the CS radio bearer(s), also the transport format combination set for only CS radio bearers has to be provided. The second radio bearer procedure shall perform the configuration for the transport channel for the PS radio bearers.
- b) The SS limits the UE allowed uplink transport format combinations according to the "Restricted UL TFCIs", as specified for the sub-test of the actual radio bearer test, using the RRC transport format combination control procedure. Here first time only the TFCs for the data on CS RAB and the data on PS RAB are restricted.
- c) The SS closes the test loop using UE test loop mode 1 and setting the UL RLC SDU size parameter, for all radio bearers under test, according to the "UL RLC SDU size" value as specified for the sub-test of the actual radio bearer test. See note 1.

- d) The SS transmits test data on all radio bearers under test. The number of RLC SDUs to transmit every TTI and the size "Test data size" is specified for each sub-test of the actual radio bearer test. See note 2.
- e) The SS checks that UE has looped back the data on the CS and PS Radio bearer.
- f) The SS opens the UE test loop.
- g) SS uses the RRC transport format combination control procedure. And now restricts the TFCs for the data on CS RAB and the data on PS RAB and also on SRB.
- h) The SS closes the test loop using UE test loop mode 1 and setting the UL RLC SDU size parameter, for all radio bearers under test, according to the "UL RLC SDU size" value as specified for the sub-test of the actual radio bearer test. See note 2.
- i) SS transmit data on the CS RAB a MEASUREMENT CONTROL message requesting periodic reporting with a period of T2.
- j) SS transmits the data on PS RAB.
- k) SS waits the time equal to 2 times T2
- l) SS checks that, for all radio bearers under test, the content of the received RLC SDUs have the correct content and is received having the correct transport format. See TS 34.109 [10] clause 5.3.2.6.2 for details regarding the UE loop back of RLC SDUs.
- m) The SS opens the UE test loop.
- n) (Void)
- o) Steps b) to m) are repeated for all sub-tests
- p) The SS may optionally release the radio bearer.
- q) The SS may optionally deactivate the radio bearer test mode.

NOTE 1: Selection of UL RLC SDU size parameter:

For the case when the reference radio bearer configuration under test uses RLC transparent mode in downlink and is not configured for segmented operation then the radio bearer test case shall set the UL RLC SDU size equal to the UL RLC PDU size. See [7] TS 25.322 for details regarding UE operation in RLC transparent mode. Selection of UL RLC SDU size for the different radio bearers under test should be such that the UE returns data in sub-sequent TTIs without causing the UE transmission buffer to become full. To achieve this the UL RLC SDU size shall be set to UL TF payload size under test, minus the size of length indicator and expansion bit, and divided by the ratio between downlink and uplink TTI. E.g. for a AM radio bearer having the uplink RLC payload size equal to 320, the downlink TTI equal to 10 ms, and the uplink TTI equal to 20 ms, then for the transport format 4x336 (TF payload size =  $4 \times 320 = 1280$  bits) the UL RLC SDU size parameter should be set to 632 bits ( $= 1280 \text{ bits} / (20 \text{ ms} / 10 \text{ ms}) - 8$  bits).

NOTE 2: Selection of test data size:

For the case when the reference radio bearer configuration under test uses RLC transparent mode in downlink and is not configured for segmented operation then the radio bearer test case shall use a DL RLC SDU size (defined by the "Test data size" parameter) equal to the DL RLC PDU size. See [7] TS 25.322 for details regarding UE operation in RLC transparent mode. In case the reference radio bearer configuration under test does not use RLC transparent mode in downlink, the DL RLC SDU size/ test data size shall be set equal to the payload size of the DL TF under test minus the size of the length indicator and the expansion bit.

NOTE 3: The restricted set of TFCIs shall contain all possible TFCI that could happen in a sub-test. The actual TTI of the different radio bearers and signalling radio bearers as well as the possible UE processing delays shall be taken into consideration. The restricted set of TFCIs must comply with the minimum set of TFCIs as specified in TS 25.331, clause 8.6.5.2.

## NOTE 1:

Here using the test steps 11 to 14d, the simultaneous data on the CS and PS RAB can be tested.

And using the steps 15a to 15f, the simultaneous data on CS RAB, PS RAB and SRB can be tested.

For testing the simultaneous data on CS RAB, PS RAB and SRB, following procedure is used.

First data on the CS RAB is sent. Then in the next step Measurement Control message is sent.

In the Downlink the restricted transport format combination will be (1 1), that SS MAC has to send the data on CS RAB and the measurement control message on SRB simultaneously.

Here it is assumed that, since the transport format combination (1, 0) (that is send only data) will not be available in the DL, the MAC has to wait until it gets something to transmit on the SRB.

Then data on the PS RAB is sent.

With this on the UE UL Side, the data will be available on both CS and PS RAB and also on the SRB. With this the transport format combination (1,1, 1) that is simultaneous data on RAB and SRB can be tested in the uplink.

### 18.2.1.3 Generic test procedure for testing Single Speech Radio Bearers on USCH/DSCH channels and multiple radio configuration signalling on RACH/FACH

This procedure is used to test single speech only PS radio bearer on DSCH and USCH and multiple configuration signal bearers on RACH/FACH

Initial conditions

UE in idle mode

Test procedure

- a) The SS establish the reference radio bearer configuration as specified in TS 34.108, clause 6.10 for the actual radio bearer test.
- b) The SS limits the UE allowed uplink transport format combinations according to the "Restricted UL TFCIs", as specified for the sub-test of the actual radio bearer test, using the RRC transport format combination control procedure.

- c) The SS closes the test loop using UE test loop mode 1 and setting the UL RLC SDU size parameter, for all radio bearers under test, according to the "UL RLC SDU size" value as specified for the sub-test of the actual radio bearer test. See note 1.
- d) The SS transmits test data on all radio bearers under test. The number of RLC SDUs to transmit every TTI and the size "Test data size" is specified for each sub-test of the actual radio bearer test. See note 2.
- e) The SS checks that, for all radio bearers under test, the content of the received RLC SDU has the correct content and is received having the correct transport format.
- f) The SS opens the UE test loop.
- g) SS uses the RRC transport format combination control procedure. And now restricts the TFCs for the data on CS RAB and the data on PS RAB and also on SRB.
- h) The SS closes the test loop using UE test loop mode 1 and setting the UL RLC SDU size parameter, for all radio bearers under test, according to the "UL RLC SDU size" value as specified for the sub-test of the actual radio bearer test. See note 2.
- i) SS transmit data on the CS RAB a MEASUREMENT CONTROL message requesting periodic reporting with a period of T2.
- j) SS transmits the data on PS RAB.
- k) SS waits the time equal to 2 times T2
- l) SS checks that, for all radio bearers under test, the content of the received RLC SDUs have the correct content and is received having the correct transport format. See TS 34.109 [10] clause 5.3.2.6.2 for details regarding the UE loop back of RLC SDUs.
- m) The SS opens the UE test loop.
- n) (Void)
- o) Steps b) to m) are repeated for all sub-tests
- p) The SS may optionally release the radio bearer.
- q) The SS may optionally deactivate the radio bearer test mode.

**NOTE 1:** Selection of UL RLC SDU size parameter:

For the case when the reference radio bearer configuration under test uses RLC transparent mode in downlink and is not configured for segmented operation then the radio bearer test case shall set the UL RLC SDU size equal to the UL RLC PDU size. See [7] TS 25.322 for details regarding UE operation in RLC transparent mode. Selection of UL RLC SDU size for the different radio bearers under test should be such that the UE returns data in sub-sequent TTIs without causing the UE transmission buffer to become full. To achieve this the UL RLC SDU size shall be set to UL TF payload size under test, minus the size of length indicator and expansion bit, and divided by the ratio between downlink and uplink TTI. E.g. for a AM radio bearer having the uplink RLC payload size equal to 320, the downlink TTI equal to 10 ms, and the uplink TTI equal to 20 ms, then for the transport format 4x336 (TF payload size =  $4 \times 320 = 1280$  bits) the UL RLC SDU size parameter should be set to 632 bits ( $= 1280 \text{ bits} / (20 \text{ ms} / 10 \text{ ms}) - 8$  bits).

**NOTE 2:** Selection of test data size:

For the case when the reference radio bearer configuration under test uses RLC transparent mode in downlink and is not configured for segmented operation then the radio bearer test case shall use a DL RLC SDU size (defined by the "Test data size" parameter) equal to the DL RLC PDU size. See [7] TS 25.322 for details regarding UE operation in RLC transparent mode. In case the reference radio bearer configuration under test does not use RLC transparent mode in downlink, the DL RLC SDU size/ test data size shall be set equal to the payload size of the DL TF under test minus the size of the length indicator and the expansion bit.

NOTE 3: The restricted set of TFCIs shall contain all possible TFCI that could happen in a sub-test. The actual TTI of the different radio bearers and signalling radio bearers as well as the possible UE processing delays shall be taken into consideration. The restricted set of TFCIs must comply with the minimum set of TFCIs as specified in TS 25.331, clause 8.6.5.2.

## 18.2.3.1.1.2 Test purpose

Test to verify establishment and data transfer of reference radio bearer configuration for **two UL transport** channels (a **RACH** and a **USCH**) and **two DL transport** channels (**DSCH** and **FACH**) as specified in TS 34.108, clause **6.10.3.4.2.1**, for the **uplink payload of 320 bits** and downlink **10 ms TTI case**.

On the **UL**

- The **USCH** channel can carry combinations of the **Interactive/Background 64 kbps UL PS RAB**, 16.8 kbps **SHCCH** and the **3.4 kbps DCCH**. The Interactive/Background PS RAB on the USCH has a **320 bit** Payload Size.
- The **RACH** channel can carry combinations of the **signalling Radio Bearer for 16.8 kbps CCCH, DCCH, and SHCCH** excluding or including an **Interactive/Background 12.8 kbps UL PS RAB**.

On the **DL**

- The **DSCH** can carry combinations of the **Interactive/Background 256 kbps PS RAB**, the 16 kbps **SHCCH** and the 3.4 kbps **DCCH**. The Interactive/Background PS RAB on the DSCH has a 10 ms TTI.
- The **FACH** can carry combinations of the **signalling Radio Bearer for 33.6 kbps CCCH, DCCH, SCCH, BCCH** and *excluding or including* an **Interactive/Background 32 kbps PS RAB**.

To be able to test the **downlink** radio bearer on the DSCH, the UE loopback function is used on the **uplink** radio bearer on the USCH.

## 18.2.3.2.3.2 Test purpose

Test to verify establishment and data transfer of reference radio bearer configuration for **two UL transport** channels (a **RACH** and a **USCH**) and **two DL transport** channels (**DSCH** and **FACH**) as specified in TS 34.108, clause **6.10.3.4.2.2** for the downlink **20 ms TTI** case.

On the **UL**

- **The USCH** channel can carry combinations of the **Interactive/Background 64 kbps UL PS RAB, SHCCH and the DCCH**.
- **The RACH** channel can carry combinations of the signalling Radio Bearer for **CCCH, DCCH, and SHCCH** *excluding or including* an **Interactive/Background 64 kbps UL PS RAB**.

On the **DL**

- The **DSCH** can carry combinations of the **Interactive/Background 384 kbps PS RAB**, the **SHCCH** and the **DCCH**. The **Interactive/Background PS RAB** on the **DSCH** has a 10 ms TTI. The **Interactive/Background 256 kbps UL PS RAB** channel has a **337 bit** Transport Block Size (TBS).
- The **FACH** can carry combinations of the signalling Radio Bearer for **CCCH, DCCH, SCCH, BCCH** and *excluding or including* an **Interactive/Background 384 kbps PS RAB**.

To be able to test the **downlink** radio bearer on the **DSCH**, the UE loopback function is used on the **uplink** radio bearer on the **USCH**.

On the **UL**

- **The USCH** channel can carry combinations of the **Interactive/Background 64 kbps UL PS RAB, SHCCH and the DCCH**.
- **The RACH** channel can carry combinations of the signalling Radio Bearer for **CCCH, DCCH, and SHCCH excluding or including an Interactive/Background 64 kbps UL PS RAB**.

On the **DL**

- The **DSCH** can carry combinations of the Interactive/Background **2048 kbps PS RAB**, the **SHCCH** and the **DCCH**. The Interactive/Background PS RAB on the DSCH has a 10 ms TTI. The Interactive/Background **2048 kbps UL PS RAB** channel has a **337 bit** Transport Block Size (TBS).
- The **FACH** can carry combinations of the signalling Radio Bearer for **CCCH, DCCH, SCCH, BCCH** and *excluding or including an Interactive/Background 2048 kbps PS RAB*.

To be able to test the **downlink** radio bearer on the DSCH, the UE loopback function is used on the **uplink** radio bearer on the USCH.

NOTE 1: UL\_TFC0, UL\_TFC1, UL\_TFC5, UL\_TFC10 and UL\_TFC15 are part of the minimum set of TFCs

NOTE 2: See TS 34.109 [10] clause 5.3.2.6.2 for details regarding loopback of RLC SDUs.

DTCH: the UL RLC SDU size have been chosen such that the UE will return all data received in downlink and that the UL RLC SDU will fill up the uplink transport format set under test over one or several transmission time intervals.

See 18.2.1.3 for test procedure.

### 18.2.3.2.3.4 Test requirements

See 18.2.1.3 for definition of step 10 and step 15.

1. At step 10 the UE shall send RADIO BEARER SETUP COMPLETE.
2. At step A10i or B10b the UE shall send PUSCH CAPACITY REQUEST
3. At step 15 the UE transmitted transport format shall be

- for sub-test 1: DTCH/TF1 (1x145).
- for sub-test 2: DTCH /TF2 (3x145).
- for sub-test 3: DTCH /TF3 (7x145).
- for sub-test 4 to 10: DTCH /TF4 (10x145)

4. At step 15 the UE shall return

- for sub-test 1, 4, 5, 6, 7, 8, 9, and 10: an RLC SDU on DTCH having the same content as the DL RLC SDU sent by the SS.
- for sub-test 2: an RLC SDU on RB5 having the first 1272 bits equal to the content of the DL RLC SDU sent by the SS
- for sub-test 3: an RLC SDU on RB5 having the first 2552 bits equal to the content of the DL RLC SDU sent by the SS

18.2.3.3.3.1 Conformance requirement

See 18.2.2.4.1.

18.2.3.3.3.2 Test purpose

Test to verify establishment and data transfer of reference radio bearer configuration for **two UL transport** channels (a **RACH** and a **USCH**) and **two DL transport** channels (**DSCH** and **FACH**) as specified in TS 34.108, clause **6.10.3.4.2.3** for the downlink **20 ms TTI case**.

On the **UL**

- **The USCH** channel can carry combinations of the **Interactive/Background 64 kbps UL PS RAB, SHCCH and the DCCH**.
- **The RACH** channel can carry combinations of the signalling Radio Bearer for **CCCH, DCCH, and SHCCH excluding or including an Interactive/Background 64 kbps UL PS RAB**.

On the **DL**

- The **DSCH** can carry combinations of the Interactive/Background 2048 **kbps** PS RAB, the **SHCCH** and the **DCCH**. The Interactive/Background PS RAB on the **DSCH** has a 10 ms TTI. The Interactive/Background 2048 **kbps** UL PS RAB channel has a **337 bit** Transport Block Size (TBS).
- The **FACH** can carry combinations of the signalling Radio Bearer for **CCCH, DCCH, SCCH, BCCH** and *excluding or including an **Interactive/Background 2048 kbps** PS RAB*.

To be able to test the **downlink** radio bearer on the **DSCH**, the UE loopback function is used on the **uplink** radio bearer on the **USCH**.

18.2.3.3.4.2 Test purpose

Test to verify establishment and data transfer of reference radio bearer configuration for **two UL transport** channels (a **RACH** and a **USCH**) and **two DL transport** channels (**DSCH** and **FACH**) as specified in TS 34.108, clause **6.10.3.4.2.2** for the downlink **20 ms TTI** case.

On the **UL**

- **The USCH** channel can carry combinations of the Interactive/**Background 64 kbps UL PS RAB, SHCCH and the DCCH.**
- **The RACH** channel can carry combinations of the signalling Radio Bearer for **CCCH, DCCH, and SHCCH** *excluding or including* an Interactive/**Background 64 kbps UL PS RAB.**

On the **DL**

- The **DSCH** can carry combinations of the Interactive/Background 2048 **kbps PS RAB**, the **SHCCH** and the **DCCH**. The Interactive/Background PS RAB on the DSCH has a **20 ms TTI**. The Interactive/Background 2048 **kbps UL PS RAB** channel has a **145 bit** Transport Block Size (TBS).
- The **FACH** can carry combinations of the signalling Radio Bearer for **CCCH, DCCH, SCCH, BCCH** and *excluding or including* an **Interactive/Background 2048 kbps PS RAB.**

To be able to test the **downlink** radio bearer on the DSCH, the UE loopback function is used on the **uplink** radio bearer on the USCH.

18.2.3.4.1.2 Test purpose

Test to verify establishment and data transfer of reference radio bearer configuration for **two UL transport** channels (a **RACH** and a **USCH**) and **two DL transport** channels (**DSCH** and **FACH**) as specified in TS 34.108, clause **6.10.3.4.2.4** for the downlink **10 ms TTI case**.

On the **UL**

- **The USCH** channel can carry combinations of the Interactive/**Background 384 kbps UL PS RAB, SHCCH and the DCCH**.
- **The RACH** channel can carry combinations of the signalling Radio Bearer for **CCCH, DCCH, and SHCCH excluding or including** an Interactive/**Background 384 kbps UL PS RAB**.

On the **DL**

- **The DSCH** can carry combinations of the Interactive/**Background 2048 kbps PS RAB**, the SHCCH and the DCCH. The Interactive/Background PS RAB on the DSCH has a 10 ms TTI. The Interactive/Background **384 kbps UL PS RAB** channel has a **337 bit** Transport Block Size (TBS).
- The **FACH** can carry combinations of the signalling Radio Bearer for CCCH, DCCH, SCCH, BCCH and *excluding or including* an **Interactive/Background 384 kbps PS RAB**.

To be able to test the **downlink** radio bearer on the DSCH, the UE loopback function is used on the **uplink** radio bearer on the USCH.

## 18.2.3.4.2.2 Test purpose

Test to verify establishment and data transfer of reference radio bearer configuration for **two UL transport** channels (a **RACH** and a **USCH**) and **two DL transport** channels (**DSCH** and **FACH**) as specified in TS 34.108, clause **6.10.3.4.2.4** for the downlink **10 ms TTI case**.

On the **UL**

- **The USCH** channel can carry combinations of the Interactive/**Background 384 kbps UL PS RAB, SHCCH and the DCCH**.
- **The RACH** channel can carry combinations of the signalling Radio Bearer for **CCCH, DCCH, and SHCCH** *excluding or including* an Interactive/**Background 384 kbps UL PS RAB**.

On the **DL**

- **The DSCH** can carry combinations of the Interactive/**Background 2048 kbps PS RAB**, the SHCCH and the DCCH. The Interactive/Background PS RAB on the DSCH has a 10 ms TTI. The Interactive/Background **384 kbps UL PS RAB** channel has a **145 bit** Transport Block Size (TBS).
- The **FACH** can carry combinations of the signalling Radio Bearer for CCCH, DCCH, SCCH, BCCH and *excluding or including* an **Interactive/Background 384 kbps PS RAB**.

To be able to test the **downlink** radio bearer on the DSCH, the UE loopback function is used on the **uplink** radio bearer on the USCH.

## 18.2.3.4.3.2 Test purpose

Test to verify establishment and data transfer of reference radio bearer configuration for **two UL transport** channels (a **RACH** and a **USCH**) and **two DL transport** channels (**DSCH** and **FACH**) as specified in TS 34.108, clause **6.10.3.4.2.4** for the downlink **20 ms TTI** case.

On the **UL**

- **The USCH** channel can carry combinations of the Interactive/**Background 384 kbps UL PS RAB, SHCCH and the DCCH.**
- **The RACH** channel can carry combinations of the signalling Radio Bearer for **CCCH, DCCH, and SHCCH** *excluding or including* an Interactive/**Background 384 kbps UL PS RAB.**

On the **DL**

- **The DSCH** can carry combinations of the Interactive/**Background 2048 kbps PS RAB,** the SHCCH and the DCCH. The Interactive/Background PS RAB on the DSCH has a 10 ms TTI. The Interactive/Background **384 kbps UL PS RAB** channel has a **337 bit** Transport Block Size (TBS).
- The **FACH** can carry combinations of the signalling Radio Bearer for CCCH, DCCH, SCCH, BCCH and *excluding or including* an **Interactive/Background 384 kbps PS RAB.**

To be able to test the **downlink** radio bearer on the DSCH, the UE loopback function is used on the **uplink** radio bearer on the USCH.

DTCH: the UL RLC SDU size have been chosen such that the UE will return all data received in downlink and that the UL RLC SDU will fill up the uplink transport format set under test over one or several transmission time intervals.						

#### 18.2.3.4.3.4 Test requirements

See 18.1.1.3 for definition of step 10 and step 15.

1. At step 10 the UE shall send RADIO BEARER SETUP COMPLETE.
2. At step A10i or B10b the UE shall send PUSCH CAPACITY REQUEST.
3. At step 15 the UE transmitted transport format shall be
  - for sub-test 1: DTCH/TF1 (1x128).
  - for sub-test 2: DTCH/TF2 (5x128).
  - for sub-test 3: DTCH/TF3 (10x128).

18.2.4.1.1.1 Conformance requirement

See 18.2.2.4.1

18.2.4.1.1.2 Test purpose

Test to verify establishment and data transfer of reference radio bearer configuration for **three UL transport** channels (**USCH, RACH, and DCH**) and **three DL transport** channels (**DSCH, FACH, and DCH**) as specified in TS 34.108, clause **6.10.3.4.3.1**. Test is designed for the downlink shared channel (**DSCH**) **10 ms TTI case and 320 bit payload for the Interactive/Background PS RAB**.

On the **UL**

- The **USCH** channel can carry combinations of the **Interactive/Background 64 kbps UL PS RAB** and 16.8 kbps **SHCCH**. The **Interactive/Background 64 kbps PS RAB on the USCH has a 320 bit payload and 20 ms TTI**.
- The **RACH** channel can carry combinations of the 16.8 kbps signalling Radio Bearers for **CCCH and SHCCH**.
- The **DCH** channel can carry combinations of the **12.2 kbps Conversational/Speech/CS** and the **3.4 kbps DCCH**.

On the **DL**

- The **DSCH** can carry combinations of the **Interactive/Background 256 kbps PS RAB** and the 16.8 kbps **SHCCH**. The **Interactive/Background 256 kbps PS RAB on the DSCH has a 320 bit payload and 10 ms TTI**.
- The **FACH** can carry combinations of the signalling 33.6 kbps Radio Bearer for **CCCH, BCCH and SCCH**.

- The **DCH** channel can carry combinations of the **12.2 kbps Conversational/Speech/CS** and the **3.4 kbps DCCH**

To be able to test the **downlink** radio bearer on the DSCH and the DCH, the UE loopback function is used on the **uplink** radio bearer on the USCH.

See 18.2.2.4.1

18.2.4.1.2.2 Test purpose

Test to verify establishment and data transfer of reference radio bearer configuration for **three UL transport channels (USCH, RACH, and DCH)** and **three DL transport channels (DSCH, FACH, and DCH)** as specified in TS 34.108, clause **6.10.3.4.3.1**. Test is designed for the downlink shared channel (DSCH) **10 ms TTI case and 145 bit payload for the Interactive/Background PS RAB**.

On the UL

- The **USCH** channel can carry combinations of the **Interactive/Background 64 kbps UL PS RAB** and **16.8 kbps SHCCH**. The **Interactive/Background 64 kbps PS RAB on the USCH has a 145 bit payload and 20 ms TTI**.
- The **RACH** channel can carry combinations of the **16.8 kbps signalling Radio Bearers for CCCH and SHCCH**.
- The **DCH** channel can carry combinations of the **12.2 kbps Conversational/Speech/CS** and the **3.4 kbps DCCH**.

On the DL

- The **DSCH** can carry combinations of the **Interactive/Background 256 kbps PS RAB** and the **16.8 kbps SHCCH**. The **Interactive/Background 256 kbps PS RAB on the DSCH has a 320 bit payload and 10 ms TTI**. (TBS).
- The **FACH** can carry combinations of the signalling **33.6 kbps Radio Bearer for CCCH, BCCH and SCCH**.

- The **DCH** channel can carry combinations of the **12.2 kbps Conversational/Speech/CS** and the **3.4 kbps DCCH**

To be able to test the **downlink** radio bearer on the DSCH and the DCH, the UE loopback function is used on the **uplink** radio bearer on the USCH.

See 18.2.2.4.1

18.2.4.1.3.2 Test purpose

Test to verify establishment and data transfer of reference radio bearer configuration for **three UL transport channels (USCH, RACH, and DCH)** and **three DL transport channels (DSCH, FACH, and DCH)** as specified in TS 34.108, clause **6.10.3.4.3.1**. Test is designed for the downlink shared channel (DSCH) **20 ms TTI case and 320 bit payload for the Interactive/Background PS RAB**.

On the UL

- The **USCH** channel can carry combinations of the **Interactive/Background 64 kbps UL PS RAB** and **16.8 kbps SHCCH**. The **Interactive/Background 64 kbps PS RAB on the USCH has a 320 bit payload and 20 ms TTI**.

- The **RACH** channel can carry combinations of the 16.8 kbps signalling Radio Bearers for **CCCH and SHCCH**.
- The **DCH** channel can carry combinations of the **12.2 kbps Conversational/Speech/CS** and the **3.4 kbps DCCH**.

On the **DL**

- The **DSCH** can carry combinations of the Interactive/**Background 256 kbps** PS RAB and the 16.8 kbps SHCCH. The **Interactive/Background 256 kbps PS RAB on the DSCH has a 320 bit payload and 20 ms TTI**.
- The FACH can carry combinations of the signalling 33.6 kbps Radio Bearer for **CCCH, BCCH and SCCH**.
- The **DCH** channel can carry combinations of the **12.2 kbps Conversational/Speech/CS** and the **3.4 kbps DCCH**

To be able to test the **downlink** radio bearer on the DSCH and the DCH, the UE loopback function is used on the **uplink** radio bearer on the USCH.

18.2.4.1.4.1 Conformance requirement

See 18.2.2.4.1

18.2.4.1.4.2 Test purpose

Test to verify establishment and data transfer of reference radio bearer configuration for **three UL transport channels (USCH , RACH , and DCH)** and **three DL transport channels (DSCH , FACH, and DCH)** as specified in TS 34.108, clause **6.10.3.4.3.1**. Test is designed for the downlink shared channel (DSCH) **20 ms TTI case and 145 bit payload for the Interactive/Background PS RAB**.

On the UL

- The **USCH** channel can carry combinations of the **Interactive/Background 64 kbps UL PS RAB** and 16.8 kbps **SHCCH**. The **Interactive/Background 64 kbps PS RAB on the USCH has a 145 bit payload and 20 ms TTI**.
- The **RACH** channel can carry combinations of the 16.8 kbps signalling Radio Bearers for **CCCH and SHCCH**.
- The **DCH** channel can carry combinations of the **12.2 kbps Conversational/Speech/CS** and the **3.4 kbps DCCH**.

On the DL

- The **DSCH** can carry combinations of the **Interactive/Background 256 kbps PS RAB** and the 16.8 kbps **SHCCH**. The **Interactive/Background 256 kbps PS RAB on the DSCH has a 320 bit payload and 20 ms TTI**. (TBS).
- The **FACH** can carry combinations of the signalling 33.6 kbps Radio Bearer for **CCCH, BCCH and SCCH**.
- The **DCH** channel can carry combinations of the **12.2 kbps Conversational/Speech/CS** and the **3.4 kbps DCCH**

To be able to test the **downlink** radio bearer on the DSCH and the DCH, the UE loopback function is used on the **uplink** radio bearer on the USCH.

See 18.2.2.4.1

18.2.4.2.1.2 Test purpose

Test to verify establishment and data transfer of reference radio bearer configuration for **three UL transport** channels (**USCH, RACH, and DCH**) and **three DL transport** channels (**DSCH, FACH, and DCH**) as specified in TS 34.108, clause 6.10.3.4.3.2. Test is designed for the downlink shared channel (**DSCH**) **10 ms TTI case and 320 bit payload for the Interactive/Background PS RAB.**

On the **UL**

- The **USCH** channel can carry combinations of the **Interactive/Background 64 kbps UL PS RAB** and **16.8 kbps SHCCH**. The **Interactive/Background 64 kbps PS RAB on the USCH has a 320 bit payload and 20 ms TTI.**
- The **RACH** channel can carry combinations of the **16.8 kbps signalling Radio Bearers for CCCH and SHCCH.**
- The **DCH** channel can carry combinations of the **12.2 kbps Conversational/Speech/CS** and the **3.4 kbps DCCH.**

On the **DL**

- The **DSCH** can carry combinations of the **Interactive/Background 256 kbps PS RAB** and the **16.8 kbps SHCCH**. The **Interactive/Background 256 kbps PS RAB on the DSCH has a 320 bit payload and 10 ms TTI.**
- The **FACH** can carry combinations of the signalling **33.6 kbps Radio Bearer for CCCH, BCCH and SCCH.**
- The **DCH** channel can carry combinations of the **12.2 kbps Conversational/Speech/CS** and the **3.4 kbps DCCH**

To be able to test the **downlink** radio bearer on the DSCH and the DCH, the UE loopback function is used on the **uplink** radio bearer on the USCH.

34.108, clause **6.10.3.4.3.2**. Test is designed for the downlink shared channel (DSCH) **10 ms TTI case and 320 bit payload for the Interactive/Background PS RAB**.

On the UL

- The **USCH** channel can carry combinations of the **Interactive/Background 64 kbps UL PS RAB** and **16.8 kbps SHCCH**. The **Interactive/Background 64 kbps PS RAB on the USCH** has a **145 bit payload and 20 ms TTI**.
- The **RACH** channel can carry combinations of the **16.8 kbps signalling Radio Bearers for CCCH and SHCCH**.
- The **DCH** channel can carry combinations of the **12.2 kbps Conversational/Speech/CS** and the **3.4 kbps DCCH**.

On the DL

- The **DSCH** can carry combinations of the **Interactive/Background 256 kbps PS RAB** and the **16.8 kbps SHCCH**. The **Interactive/Background 384 kbps PS RAB on the DSCH** has a **320 bit payload and 10 ms TTI**. (TBS).
- The **FACH** can carry combinations of the signalling **33.6 kbps Radio Bearer for CCCH, BCCH, and SCCH**.
- The **DCH** channel can carry combinations of the **12.2 kbps Conversational/Speech/CS** and the **3.4 kbps DCCH**.

To be able to test the **downlink** radio bearer on the DSCH and the DCH, the UE loopback function is used on the **uplink** radio bearer on the USCH.

See 18.2.2.4.1

18.2.4.2.4.2 Test purpose

Test to verify establishment and data transfer of reference radio bearer configuration for **three UL transport channels (USCH, RACH, and DCH)** and **three DL transport channels (DSCH, FACH, and DCH)** as specified in TS 34.108, clause **6.10.3.4.3.2**. Test is designed for the downlink shared channel (DSCH) **20 ms TTI case and 320 bit payload for the Interactive/Background PS RAB**.

On the **UL**

- The **USCH** channel can carry combinations of the **Interactive/Background 64 kbps UL PS RAB** and **16.8 kbps SHCCH**. The **Interactive/Background 64 kbps PS RAB on the USCH** has a **145 bit payload and 20 ms TTI**.
- The **RACH** channel can carry combinations of the **16.8 kbps signalling Radio Bearers for CCCH and SHCCH**.
- The **DCH** channel can carry combinations of the **12.2 kbps Conversational/Speech/CS** and the **3.4 kbps DCCH**.

On the **DL**

- The **DSCH** can carry combinations of the **Interactive/Background 384 kbps PS RAB** and the **16.8 kbps SHCCH**. The **Interactive/Background 384 kbps PS RAB on the DSCH** has a **320 bit payload and 20 ms TTI**. (TBS).
- The **FACH** can carry combinations of the signalling **33.6 kbps Radio Bearer for CCCH, BCCH and SCCH**.
- The **DCH** channel can carry combinations of the **12.2 kbps Conversational/Speech/CS** and the **3.4 kbps DCCH**.

To be able to test the **downlink** radio bearer on the DSCH and the DCH, the UE loopback function is used on the **uplink** radio bearer on the USCH.

18.2.4.3.1.1 Conformance requirement

See 18.2.2.4.1

18.2.4.3.1.2 Test purpose

Test to verify establishment and data transfer of reference radio bearer configuration for **three UL transport channels (USCH, RACH, and DCH)** and **three DL transport channels (DSCH, FACH, and DCH)** as specified in TS 34.108, clause **6.10.3.4.3.3**. Test is designed for the downlink shared channel (DSCH) **10 ms TTI case and 640 bit payload for the Interactive/Background PS RAB**.

On the UL

- The **USCH** channel can carry combinations of the **Interactive/Background 64 kbps UL PS RAB** and 16.8 kbps **SHCCH**. The **Interactive/Background 64 kbps PS RAB on the USCH** has a **320 bit payload and 20 ms TTI**.
- The **RACH** channel can carry combinations of the 16.8 kbps signalling Radio Bearers for **CCCH and SHCCH**.
- The **DCH** channel can carry combinations of the **12.2 kbps Conversational/Speech/CS** and the **3.4 kbps DCCH**.

On the **DL**

- The **DSCH** can carry combinations of the **Interactive/Background 2048 kbps PS RAB** and the 16.8 kbps **SHCCH**. The **Interactive/Background 2048 kbps PS RAB on the DSCH** has a **640 bit payload and 10 ms TTI**.
- The **FACH** can carry combinations of the signalling 33.6 kbps Radio Bearer for **CCCH, BCCH and SCCH**.
- The **DCH** channel can carry combinations of the **12.2 kbps Conversational/Speech/CS** and the **3.4 kbps DCCH**

To be able to test the **downlink** radio bearer on the DSCH and the DCH, the UE loopback function is used on the **uplink** radio bearer on the USCH.

18.2.4.3.2.1 Conformance requirement

See 18.2.2.4.1

18.2.4.3.2.2 Test purpose

Test to verify establishment and data transfer of reference radio bearer configuration for **three UL transport channels (USCH, RACH, and DCH)** and **three DL transport channels (DSCH, FACH, and DCH)** as specified in TS 34.108, clause **6.10.3.4.3.3**. Test is designed for the downlink shared channel (DSCH) **10 ms TTI case and 640 bit payload for the Interactive/Background PS RAB**.

On the UL

- The **USCH** channel can carry combinations of the **Interactive/Background 64 kbps UL PS RAB** and 16.8 kbps **SHCCH**. The **Interactive/Background 64 kbps PS RAB on the USCH has a 145 bit payload and 20 ms TTI**.
- The **RACH** channel can carry combinations of the 16.8 kbps signalling Radio Bearers for **CCCH and SHCCH**.
- The **DCH** channel can carry combinations of the **12.2 kbps Conversational/Speech/CS** and the **3.4 kbps DCCH**.

On the DL

- The **DSCH** can carry combinations of the Interactive/Background 2048 kbps PS RAB and the 16.8 kbps SHCCH. The Interactive/Background 2048 kbps PS RAB on the DSCH has a 640 bit payload and 10 ms TTI (TBS).
- The **FACH** can carry combinations of the signalling 33.6 kbps Radio Bearer for **CCCH, BCCH and SCCH**.
- The **DCH** channel can carry combinations of the 12.2 kbps Conversational/Speech/CS and the 3.4 kbps DCCH

To be able to test the **downlink** radio bearer on the DSCH and the DCH, the UE loopback function is used on the **uplink** radio bearer on the USCH.

See 18.2.2.4.1

18.2.4.3.3.2 Test purpose

Test to verify establishment and data transfer of reference radio bearer configuration for **three UL transport channels (USCH, RACH, and DCH)** and **three DL transport channels (DSCH, FACH, and DCH)** as specified in TS 34.108, clause **6.10.3.4.3.3**. Test is designed for the downlink shared channel (DSCH) **20 ms TTI case and 640 bit payload for the Interactive/Background PS RAB**.

On the UL

- The **USCH** channel can carry combinations of the **Interactive/Background 64 kbps UL PS RAB** and 16.8 kbps **SHCCH**. The **Interactive/Background 64 kbps UL PS RAB** channel has a **337 bit** Transport Block Size (TBS).
- The **RACH** channel can carry combinations of the 16.8 kbps signalling Radio Bearers for **CCCH and SHCCH**.
- The **DCH** channel can carry combinations of the **12.2 kbps Conversational/Speech/CS** and the **3.4 kbps DCCH**.

On the DL

- The **DSCH** can carry combinations of the **Interactive/Background 2048 kbps PS RAB** and the 16.8 kbps **SHCCH**. The **Interactive/Background PS RAB on the DSCH has a 20 ms TTI**. The **Interactive/Background 2048 kbps DL PS RAB** channel has a **657 bit** Transport Block Size (TBS).
- The **FACH** can carry combinations of the signalling 33.6 kbps Radio Bearer for **CCCH, BCCH and SCCH**.

- The **DCH** channel can carry combinations of the **12.2 kbps Conversational/Speech/CS** and the **3.4 kbps DCCH**

To be able to test the **downlink** radio bearer on the DSCH and the DCH, the UE loopback function is used on the **uplink** radio bearer on the USCH.

18.2.4.3.3.1 Conformance requirement

See 18.2.2.4.1

18.2.4.3.3.2 Test purpose

Test to verify establishment and data transfer of reference radio bearer configuration for **three UL transport channels (USCH, RACH, and DCH)** and **three DL transport channels (DSCH, FACH, and DCH)** as specified in TS 34.108, clause **6.10.3.4.3.3**. Test is designed for the downlink shared channel (**DSCH**) **20 ms TTI case and 640 bit payload for the Interactive/Background PS RAB**.

On the UL

- The **USCH** channel can carry combinations of the **Interactive/Background 64 kbps UL PS RAB** and 16.8 kbps **SHCCH**. The **Interactive/Background 64 kbps PS RAB on the USCH has a 145 bit payload and 20 ms TTI**.
- The **RACH** channel can carry combinations of the 16.8 kbps signalling Radio Bearers for **CCCH and SHCCH**.

- The **DCH** channel can carry combinations of the **12.2 kbps Conversational/Speech/CS** and the **3.4 kbps DCCH**.

On the **DL**

- The **DSCH** can carry combinations of the **Interactive/Background 2048 kbps PS RAB** and the 16.8 kbps SHCCH. The **Interactive/Background PS RAB on the DSCH has a 20 ms TTI**. The **Interactive/Background 2048 kbps PS RAB on the DSCH has a 640 bit payload and 20 ms TTI**. (TBS).
- The **FACH** can carry combinations of the signalling 33.6 kbps Radio Bearer for **CCCH**, **BCCH** and **SCCH**.
- The **DCH** channel can carry combinations of the **12.2 kbps Conversational/Speech/CS** and the **3.4 kbps DCCH**

To be able to test the **downlink** radio bearer on the DSCH and the DCH, the UE loopback function is used on the **uplink** radio bearer on the USCH.

## Annex D (normative): Generic procedure to use before and following inter-RAT handover/cell change order signalling test cases

Please note that the following procedures are applicable the default NMO in GERAN (NMO1) and UTRAN (NMO1).

### D.1 Preamble for UTRAN to GERAN test cases

Before running inter-RAT test cases, radio conditions should be such that the mobile has to select the cell of the intended original RAT. The following steps should be used before running UTRAN to GERAN test cases.

1. GERAN cell is powered OFF. The default radio conditions for a suitable UTRAN cell (in a single cell environment) are used, as defined in 34.108 clause 6.1.5. This step is performed while the UE is still switched OFF.
2. UE is switched ON and performs registration and attach
3. The GSM cell is powered ON with an RF level such that the cell is suitable, using the RF conditions defined in 34.108 clause 6.1.7 for the suitable neighbor cell, so that the UE will not re-select the GSM cell.

### D.2 Postamble to be used following for inter-RAT handover / cell change order test cases

The following procedure is used after inter-RAT handover or cell change order test cases (UTRAN to GERAN) in case the test needs to be performed multiple times in a loop.
