

ETSI TS 134 229-1 V5.0.0 (2006-06)

Technical Specification

**Universal Mobile Telecommunications System (UMTS);
Internet Protocol (IP) multimedia call control protocol
based on Session Initiation Protocol (SIP)
and Session Description Protocol (SDP);
Part 1: Protocol conformance specification
(3GPP TS 34.229-1 version 5.0.0 Release 5)**

Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: "*Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards*", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (<http://webapp.etsi.org/IPR/home.asp>).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Foreword

This Technical Specification (TS) has been produced by ETSI 3rd Generation Partnership Project (3GPP).

The present document may refer to technical specifications or reports using their 3GPP identities, UMTS identities or GSM identities. These should be interpreted as being references to the corresponding ETSI deliverables.

The cross reference between GSM, UMTS, 3GPP and ETSI identities can be found under <http://webapp.etsi.org/key/queryform.asp>.

Foreword

This Technical Specification has been produced by the 3rd Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

- x the first digit:
 - 1 presented to TSG for information;
 - 2 presented to TSG for approval;
 - 3 or greater indicates TSG approved document under change control.
- y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- z the third digit is incremented when editorial only changes have been incorporated in the document.

Introduction

The present document is the first part of a multi-part conformance specification valid for 3GPP Release 5 and later releases.

3GPP TS 34.229-1 (the present document): Internet Protocol (IP) multimedia call control protocol based on Session Initiation Protocol (SIP) and Session Description Protocol (SDP); User Equipment (UE) conformance specification; Part 1: Protocol conformance specification- current document.

3GPP TS 34.229-2 [5]: "Internet Protocol (IP) multimedia call control protocol based on Session Initiation Protocol (SIP) and Session Description Protocol (SDP); User Equipment (UE) conformance specification; Part 2: Implementation Conformance Statement (ICS) proforma specification".

3GPP TS 34.229-3 [6]: "Internet Protocol (IP) multimedia call control protocol based on Session Initiation Protocol (SIP) and Session Description Protocol (SDP); User Equipment (UE) conformance specification; Part 3: Abstract Test Suites (ATS)".

- Note 1: The ATS is written in a standard testing language, TTCN-3, as defined in ETSI ES 201 873 Parts 1 to 3 [36] [37] [38].
- Note 2: For conformance testing of the UTRAN requirements refer to 3GPP TS 34.123 Parts 1 to 3 [2] [3] [4].
- Note 3: Further information on testing can be found in ETSI ETS 300 406[9] and ISO/IEC 9646-1 [7].

For at least a minimum set of services, the prose descriptions of test cases will have a matching detailed test case implemented in TTCN-3 (and provided in 3GPP TS 34.229-3 [6]).

1 Scope

The present document specifies the protocol conformance testing for the User Equipment (UE) supporting the Internet Protocol (IP) multimedia call control protocol based on Session Initiation Protocol (SIP) and Session Description Protocol (SDP).

This is the first part of a multi-part test specification. The following information can be found in this part:

- the overall test structure;
- the test configurations;
- the conformance requirement and reference to the core specifications;
- the test purposes; and
- a brief description of the test procedure, the specific test requirements and short message exchange table.

The following information relevant to testing can be found in accompanying specifications:

- the applicability of each test case [5].

A detailed description of the expected sequence of messages can be found in the 3rd part of present test specification [6].

The Implementation Conformance Statement (ICS) pro-forma can be found in the 2nd part of the present test specification [5].

The present document is valid for UE implemented according to 3GPP Releases starting from Release 5 up to the Release indicated on the cover page of the present document.

2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document in the same Release as the present document.
 - For a Release 1999 UE, references to 3GPP documents are to version 3.x.y, when available.
 - For a Release 4 UE, references to 3GPP documents are to version 4.x.y, when available.
 - For a Release 5 UE, references to 3GPP documents are to version 5.x.y, when available.

3 Definitions, symbols and abbreviations

For the purposes of the present document, the terms and definitions given in TR 21.905 [1] and the following apply. A term defined in the present document takes precedence over the definition of the same term, if any, in TR 21.905 [1].

3.1 Definitions

For the purposes of the present document, the following additional abbreviations apply:

example: text used to clarify abstract rules by applying them literally

Floor: Floor(x) is the largest integer smaller than or equal to x.

Ceil: Ceil (x) is the smallest integer larger than or equal to x.

3.2 Symbols

For the purposes of the present document, the following additional symbols apply:

None.

3.3 Abbreviations

For the purposes of the present document, the following abbreviations apply:

AAAA	Address (IP v6)
AKA	Authentication and Key Agreement
AKAv1-MD5	Authentication and Key Agreement version 1- Message-Digest 5
DUID	DHCP Unique Identifier
FQDN	Fully Qualified Domain Name
HMAC-MD5-96	Hashing for Message Authentication Code - Message-Digest 5 – 96 (bits)
HMAC-SHA-1-96	Hashing for Message Authentication Code - Secure Hash Algorithm 1 - 96 (bits)
ICS	Implementation Conformance Statement
IN	INternet
IPsec	IP Security
IXIT	Implementation eXtra Information for Testing
MIME	Multi purpose Internet Mail Extensions
NAPTR	Naming Authority Pointer
P-CSCF	Proxy – Call Session Control Function
RTCP	Real Time Transport Control Protocol
SIGComp	SIGnalling Compression
SRV	SeRVice
SS	System Simulator

4 Overview

4.1 Test Methodology

4.1.1 Testing of optional functions and procedures

Any function or procedure which is optional, as indicated in the present document, may be subject to a conformance test if it is implemented in the UE.

A declaration by the apparatus supplier (Implementation Conformance Statement (ICS)) is used to determine whether an optional function/procedure has been implemented (see ISO/IEC 9646-7 [8] for general information about ICS).

4.2 Implicit Testing

For some 3GPP signalling and protocol features conformance is not verified explicitly in the present document. This does not imply that correct functioning of these features is not essential, but that these are implicitly tested to a sufficient degree in other tests.

4.3 Conformance Requirements

The Conformance Requirements clauses in the present document are copy/paste from the relevant core specification where skipped text have been replaced with "...". References to clauses in the Conformance Requirements section of the test body refers to clauses in the referred specification, not sections in the present document.

5 Reference Conditions

The test cases are expected to be executed through the 3GPP radio interface. Details of the radio interfaces are outside the scope of this specification. The reference environments used by tests are specified in the test.

5.1 Generic setup procedures

A set of basic generic procedures for PDP Context Activation, P-CSCF Discovery and Registration are described in Annex C. These procedures are used in numerous test cases throughout the present document.

6 PDP Context Activation

6.1 General Purpose PDP Context Establishment

Implicitly tested.

Note: This is implicitly tested as part of generic procedures.

6.2 General Purpose PDP Context Establishment (UE Requests for a Dedicated PDP Context)

6.2.1 Definition

Test to verify that the UE can establish a "General Purpose PDP context" for SIP signalling.

6.2.2 Conformance requirement

Prior to communication with the IM CN subsystem, the UE shall

- a) perform a GPRS attach procedure;
- b) establish a PDP context used for SIP signalling according to the APN and GGSN selection criteria described in 3GPP TS 23.060 and 3GPP TS 27.060. This PDP context shall remain active throughout the period the UE is connected to the IM CN subsystem, i.e. from the initial registration and at least until the deregistration. As a result, the PDP context provides the UE with information that makes the UE able to construct an IPv6 address;

The UE shall choose one of the following options when performing establishment of this PDP context:

I.

II. A general-purpose PDP context:

The UE may decide to use a general-purpose PDP Context to carry IM CN subsystem-related signaling. The UE shall indicate to the GGSN that this is a general-purpose PDP context by not setting the IM CN Subsystem Signalling Flag. The UE may carry both signalling and media on the general-purpose PDP context. The UE can also set the Signalling Indication attribute within the QoS IE.

The UE indicates the IM CN Subsystem Signalling Flag to the GGSN within the Protocol Configuration Options IE of the ACTIVATE PDP CONTEXT REQUEST message or ACTIVATE SECONDARY PDP CONTEXT REQUEST message. Upon successful signalling PDP context establishment the UE receives an indication from GGSN in the form of IM CN Subsystem Signalling Flag within the Protocol Configuration Options IE. If the flag is not received, the UE shall consider the PDP context as a general-purpose PDP context.

The encoding of the IM CN Subsystem Signalling Flag within the Protocol Configuration Options IE is described in 3GPP TS 24.008 .

Reference(s)

3GPP TS 24.229[10], clause 9.2.1

6.2.3 Test purpose

To verify that the UE sends a correctly composed Activate PDP context request by setting the IM CN Subsystem Signalling Flag to the GGSN within the Protocol Configuration Options IE.

On receiving Activate PDP Context accept with IM CN Subsystem Signalling Flag not set within the Protocol Configuration Options IE, UE shall consider the PDP context as a General Purpose PDP context for SIP signalling .

6.2.4 Method of test

Initial conditions

The UE is in GMM-state "GMM-REGISTERED, normal service" with valid P-TMSI and CKSN. UE is not registered to IMS services, has not established PDP context for IMS

Related ICS/IXIT Statement(s)

UE capable of being configured to initiate Dedicated PDP Context (Yes/No)

UE Supports IPv4 (Yes/No)

UE Supports IPv6 (Yes/No)

Test procedure

- 1) UE is configured for setting the IM CN Subsystem Signalling Flag to the GGSN within the Protocol Configuration Options IE in Activate PDP Context Request message. UE initiates an Activate PDP Context procedure.
- 2) SS Responds with an Activate PDP Context Accept message by not setting IM CN Subsystem Signalling Flag within the Protocol Configuration Options IE
- 3) UE is made to continue with Registration procedure, Annex C, step 3.

Expected sequence

Step	Direction		Message	Comment
	UE	SS		
1		→	Activate PDP Context Request	UE sends this PDU by setting the IM CN Subsystem Signalling Flag to the GGSN within the Protocol Configuration Options IE
2		←	Activate PDP Context Accept	SS Sends this response by not setting IM CN Subsystem Signalling Flag within the Protocol Configuration Options IE
3		↔	Initiate Annex C step 3	UE is made to continue with Registration procedure Annex C step 3

Specific Message Contents:

Activate PDP Context Request (step 1)

IE	Value/Remarks
Protocol Configuration options - Additional Parameters -- container 1 Identifier -- Container 1 Length	* 0002H (IM CN Subsystem Signaling Flag) 0 bytes

*Note: UE may include additional containers also. If multiple containers are present they can be in any order.

Activate PDP Context Accept (step 2)

Case 1: UE supports IPv6 / IPv6 and IPv4

IE	Value/Remarks
Protocol Configuration options - Additional Parameters -- container 1 Identifier -- Container 1 Length -- Container 1 contents -- container 2 Identifier -- Container 2 Length -- Container 2 contents	0001H (P-CSCF Address) (Included if "P-CSCF Server Address Request" is received) 16 bytes IPv6 address of SS P-CSCF Server 0003H (DNS Address) (Included if "DNS Server Address Request" is received) 16 bytes IPv6 address of SS DNS Server

Case 2: UE supports only IPv4

IE	Value/Remarks
Protocol Configuration options - Additional Parameters -- container 1 Identifier -- Container 1 Length -- Container 1 contents -- container 2 Identifier -- Container 2 Length -- Container 2 contents	0001H (P-CSCF Address) 16 bytes IPv4 address of SS P-CSCF encoded as per 3GPP TR 23.981[35] 0003H (DNS Address) (Included if "DNS Server Address Request" is received) 16 bytes IPv4 address of SS DNS server encoded as per 3GPP TR23.981[35]

6.2.5 Test requirements

- 1) In step 1, UE sets the IM CN Subsystem Signalling Flag to the GGSN within the Protocol Configuration Options IE.

- 2) After step 2, UE shall consider the PDP context as a general purpose PDP context for SIP signalling and continue with Registration procedure in Annex C.2 step 3.

6.3 Dedicated PDP Context Establishment

6.3.1 Definition

Test to verify that the UE can establish a "Dedicated PDP context" for SIP signalling.

6.3.2 Conformance requirement

A. Prior to communication with the IM CN subsystem, the UE shall:

- a) perform a GPRS attach procedure;
- b) establish a PDP context used for SIP signalling according to the APN and GGSN selection criteria described in 3GPP TS 23.060 and 3GPP TS 27.060 . This PDP context shall remain active throughout the period the UE is connected to the IM CN subsystem, i.e. from the initial registration and at least until the deregistration. As a result, the PDP context provides the UE with information that makes the UE able to construct an IPv6 address;

The UE shall choose one of the following options when performing establishment of this PDP context:

I. A dedicated PDP context for SIP signalling:

The UE shall indicate to the GGSN that this is a PDP context intended to carry IM CN subsystem-related signalling only by setting the IM CN Subsystem Signalling Flag. The UE may also use this PDP context for DNS and DHCP signalling according to the static packet filters as described in 3GPP TS 29.061 . The UE can also set the Signalling Indication attribute within the QoS IE;

II. A general-purpose PDP context:

The UE may decide to use a general-purpose PDP Context to carry IM CN subsystem-related signaling. The UE shall indicate to the GGSN that this is a general-purpose PDP context by not setting the IM CN Subsystem Signalling Flag. The UE may carry both signalling and media on the general-purpose PDP context. The UE can also set the Signalling Indication attribute within the QoS IE.

The UE indicates the IM CN Subsystem Signalling Flag to the GGSN within the Protocol Configuration Options IE of the ACTIVATE PDP CONTEXT REQUEST message or ACTIVATE SECONDARY PDP CONTEXT REQUEST message. Upon successful signalling PDP context establishment the UE receives an indication from GGSN in the form of IM CN Subsystem Signalling Flag within the Protocol Configuration Options IE. If the flag is not received, the UE shall consider the PDP context as a general-purpose PDP context.

The encoding of the IM CN Subsystem Signalling Flag within the Protocol Configuration Options IE is described in 3GPP TS 24.008 .

Reference(s)

3GPPTS 24.229[10], clause 9.2.1.

6.3.3 Test purpose

To verify that on receiving Activate PDP Context accept with IM CN Subsystem Signalling Flag included within the Protocol Configuration Options IE, UE shall consider the PDP context as a Dedicated PDP context for SIP signalling.

6.3.4 Method of test

Initial conditions

The UE is in GMM-state "GMM-REGISTERED, normal service" with valid P-TMSI and CKSN. UE is not registered to IMS services, has not established PDP context.

Related ICS/IXIT Statement(s)

UE capable of being configured to initiate Dedicated PDP Context (Yes/No)

Specific Message Contents:

Activate PDP Context Request (step 1)

IE	Value/Remarks
Protocol Configuration options - Additional Parameters -- container 1 Identifier -- Container 1 Length	* 0002H (IM CN Subsystem Signaling Flag) 0 bytes

* Note: UE may include additional containers also. If multiple containers are present they can be in any order.

Activate PDP Context Accept (step 2)

Case 1: UE supports IPv6 / IPv6 and IPv4

IE	Value/Remarks
Protocol Configuration options	
- Additional Parameters	
-- container 1 Identifier	0002H (IM CN Subsystem Signaling Flag)
-- Container 1 Length	0 bytes
-- container 2 Identifier	0001H (P-CSCF Address) (Included if "P-CSCF Server Address Request" is received)
-- Container 2 Length	16 bytes
-- Container 2 contents	IPv6 address of SS P-CSCF Server
-- container 3 Identifier	0003H (DNS Address) (Included if "DNS Server Address Request" is received)
-- Container 3 Length	16 bytes
-- Container 3 contents	IPv6 address of SS DNS Server

Case 2: UE supports only IPv4

IE	Value/Remarks
Protocol Configuration options	
- Additional Parameters	
-- container 1 Identifier	0002H (IM CN Subsystem Signaling Flag)
-- Container 1 Length	0 bytes
-- container 2 Identifier	0001H (P-CSCF Address)
-- Container 2 Length	16 bytes
-- Container 2 contents	IPv4 address of SS P-CSCF encoded as per 3GPP TR 23.981
-- container 3 Identifier	0003H (DNS Address) (Included if "DNS Server Address Request" is received)
-- Container 3 Length	16 bytes
-- Container 3 contents	IPv4 address of SS DNS server encoded as per 3GPP TR 23.981[35]

6.3.5 Test requirements

- 1) In step 1, UE sets the IM CN Subsystem Signalling Flag to the GGSN within the Protocol Configuration Options IE.
- 2) After step 2, UE shall consider the PDP context as a dedicated PDP context for SIP signalling and continue with Registration procedure in Annex C.2 step 3

7 P-CSCF Discovery

7.1 P-CSCF Discovery via PDP Context

7.1.1 Definition

Test to verify that the UE can establish a PDP context for SIP signalling and acquire P-CSCF address(es) during PDP Context Activation procedure.

7.1.2 Conformance requirement

Prior to communication with the IM CN subsystem, the UE shall:

- a) perform a GPRS attach procedure;

- b) establish a PDP context used for SIP signalling according to the APN and GGSN selection criteria described in 3GPP TS 23.060 and 3GPP TS 27.060. This PDP context shall remain active throughout the period the UE is connected to the IM CN subsystem, i.e. from the initial registration and at least until the deregistration. As a result, the PDP context provides the UE with information that makes the UE able to construct an IPv6 address;

The UE shall choose one of the following options when performing establishment of this PDP context:

I. ...

II. A general-purpose PDP context:

The UE may decide to use a general-purpose PDP Context to carry IM CN subsystem-related signaling. The UE shall indicate to the GGSN that this is a general-purpose PDP context by not setting the IM CN Subsystem Signalling Flag. The UE may carry both signalling and media on the general-purpose PDP context. The UE can also set the Signalling Indication attribute within the QoS IE.

The UE indicates the IM CN Subsystem Signalling Flag to the GGSN within the Protocol Configuration Options IE of the ACTIVATE PDP CONTEXT REQUEST message or ACTIVATE SECONDARY PDP CONTEXT REQUEST message. Upon successful signalling PDP context establishment the UE receives an indication from GGSN in the form of IM CN Subsystem Signalling Flag within the Protocol Configuration Options IE. If the flag is not received, the UE shall consider the PDP context as a general-purpose PDP context.

The encoding of the IM CN Subsystem Signalling Flag within the Protocol Configuration Options IE is described in 3GPP TS 24.008.

The UE can indicate a request for prioritised handling over the radio interface by setting the Signalling Indication attribute (see 3GPP TS 23.107 [4A]). The general QoS negotiation mechanism and the encoding of the Signalling Indication attribute within the QoS IE are described in 3GPP TS 24.008.

NOTE: A general-purpose PDP Context may carry both IM CN subsystem signaling and media, in case the media does not need to be authorized by Service Based Local Policy mechanisms defined in 3GPP TS 29.207 and the media stream is not mandated by the P-CSCF to be carried in a separate PDP Context.

- c) acquire a P-CSCF address(es).

The methods for P-CSCF discovery are:

I. ...

II. Transfer P-CSCF address(es) within the PDP context activation procedure.

The UE shall indicate the request for a P-CSCF address to the GGSN within the Protocol Configuration Options IE of the ACTIVATE PDP CONTEXT REQUEST message or ACTIVATE SECONDARY PDP CONTEXT REQUEST message.

If the GGSN provides the UE with a list of P-CSCF IPv6 addresses in the ACTIVATE PDP CONTEXT ACCEPT message or ACTIVATE SECONDARY PDP CONTEXT ACCEPT message, the UE shall assume that the list is prioritised with the first address within the Protocol Configuration Options IE as the P-CSCF address with the highest priority.

From 23.981 [35]:

The existing P-CSCF discovery mechanisms are either IPv6 specific or use Release 5 or later GPRS. For an IPv4 based IMS implementation, operators may need other mechanisms not currently defined as possible options in 3GPP IMS.

The following mechanisms need to be evaluated for P-CSCF discovery in IPv4:

- a) the address of the P-CSCF can be requested by the UE and returned by the GGSN at PDP context establishment time. An IPv4 UE would need to obtain an IPv4 address as part of this exchange.

If the PDP context established is of PDP type IPv4, then the GGSN may provide an IPv4 P-CSCF address. This does not preclude scenarios, where the GGSN returns an IPv6 P-CSCF address at IPv4 PDP context establishment, e.g. for the support of tunnelling (see subclause 5.3.4.3), or both IPv4 and IPv6 P-CSCF addresses. If the PDP type is IPv4 then it is recommended that the GGSN always return both IP versions, if it is capable, using the existing capabilities to send multiple P-CSCF addresses within the PCO IE.

According to TS 24.008, the P-CSCF address in the PCO field is an IPv6 address. Thus there are at least two possible approaches: The first approach would be to avoid any changes to or deviations from TS 24.008 and use the existing methods to transfer an IPv4 address as an IPv6 address ("IPv6 address with embedded IPv4 address", as defined in RFC 2373).

Reference(s)

3GPPTS 24.229[10], clause 9.2.1, 3GPPTR 23.981[35], clause 5.2.1

7.1.3 Test purpose

To verify that the UE sends a correctly composed Activate PDP context request message requesting for P-CSCF address(es) to the GGSN within the Protocol Configuration Options IE.

On receiving Activate PDP Context accept with IM CN Subsystem Signalling Flag not included within the Protocol Configuration Options IE and list of P-CSCF IPv6/IPv4 addresses included, UE shall consider the PDP context as a general purpose PDP context for SIP signalling and P-CSCF discovery procedure to be successful.

7.1.4 Method of test

Initial conditions

The UE is in GMM-state "GMM-REGISTERED, normal service" with valid P-TMSI and CKSN. UE is not registered to IMS services, has not established PDP context for IMS.

Related ICS/IXIT Statement(s)

UE Supports IPv4 (Yes/No)

UE Supports IPv6 (Yes/No)

UE capable of being configured to initiate P-CSCF Discovery via PCO (Yes/No)

Test procedure

- 1) UE is configured for setting request for a P-CSCF address to the GGSN within the Protocol Configuration Options IE in Activate PDP Context Request message. UE initiates an Activate PDP Context procedure.
- 2) SS responds with an Activate PDP Context Accept including list of P-CSCF IPv6 and IPv4 addresses. IPv4 addresses are encoded as per 23.981[35] clause 5.2.1
- 3) UE is made to initiate Registration procedure for IMS services.

Expected sequence

Step	Direction		Message	Comment
	UE	SS		
1		→	Activate PDP Context Request	UE sends this PDU by setting request for P-CSCF address(es) to the GGSN within the Protocol Configuration Options IE
2		←	Activate PDP Context Accept	SS Sends this response by including list of P-CSCF addresses
3		↔	Registration	UE is made to initiate Registration procedure to IMS services as defined in Annex C Generic Registration Procedure.

NOTE: The test sequence is identical for IPv4 and IPv6 except the message contents of Activate PDP Context Accept message. For a UE supporting both IPv4 and IPv6, only IPv6 option need to be executed.

Specific Message Contents:

Activate PDP Context Request (step 1)

Note: Containers can be in any order.

IE	Value/Remarks
Protocol Configuration options - Additional Parameters -- container 1 Identifier -- Container 1 Length -- container 2 Identifier -- Container 2 Length	0001H (P-CSCF Address Request); 0 bytes 0003H (DNS Server Address Request) (Optional) 0 bytes

Activate PDP Context Accept (step 2)

Case 1: UE supports IPv6 / IPv6 and IPv4

IE	Value/Remarks
Protocol Configuration options - Additional Parameters -- container 1 Identifier -- Container 1 Length -- Container 1 contents -- container 2 Identifier -- Container 2 Length -- Container 2 contents	0001H (P-CSCF Address) 16 bytes IPV6 address of SS P-CSCF Server 0003H (DNS Address) (Included if "DNS Server Address Request" is received) 16 bytes IPV6 address of SS DNS Server

Case 2: UE supports only IPv4

IE	Value/Remarks
- Additional Parameters	
Protocol Configuration options - Additional Parameters -- container 2 Identifier -- Container 2 Length -- Container 2 contents -- container 3 Identifier -- Container 3 Length -- Container 3 contents	0001H (P-CSCF Address) 16 bytes IPV4 address of SS encoded as per 3GPP TR 23.981[35] 0003H (DNS Address) (Included if "DNS Server Address Request" is received) 16 bytes IPV4 address of SS DNS server encoded as per 3GPP TR 23.981[35]

7.1.5 Test requirements

- 1) In step 1, UE requests for P-CSCF address to the GGSN within the Protocol Configuration Options IE.
- 3) After step 2, UE shall consider P-CSCF discovery procedure to be successful. and should initiate Registration for IMS services

7.2 P-CSCF Discovery via DHCP – IPv4

7.2.1 Definition

Test to verify that UE will perform P-CSCF discovery procedure via DHCP.

7.2.2 Conformance requirement

A. Prior to communication with the IM CN subsystem, the UE shall:

- a) perform a GPRS attach procedure;
- b) establish a PDP context used for SIP signalling according to the APN and GGSN selection criteria described in 3GPP TS 23.060 and 3GPP TS 27.060 . This PDP context shall remain active throughout the period the UE is connected to the IM CN subsystem, i.e. from the initial registration and at least until the deregistration. As a result, the PDP context provides the UE with information that makes the UE able to construct an IPv6 address;
...
- c) acquire a P-CSCF address(es).

The methods for P-CSCF discovery are:

- I. Employ Dynamic Host Configuration Protocol for IPv6 (DHCPv6) RFC 3315 , the DHCPv6 options for SIP servers RFC 3319 and the DHCPv6 options for Domain Name Servers (DNS) RFC 3646 after PDP context activation.

The UE shall either:

- in the DHCP query, request a list of SIP server domain names of P-CSCF(s) and the list of Domain Name Servers (DNS); or
- request a list of SIP server IPv6 addresses of P-CSCF(s).

The UE can freely select method I or II for P-CSCF discovery. In case method I is selected and several P-CSCF addresses or FQDNs are provided to the UE, the selection of P-CSCF address or FQDN shall be performed as indicated in RFC 3319 If sufficient information for P-CSCF address selection is not available, selection of the P-CSCF address by the UE is implementation specific.

If the UE is designed to use I above, but receives P-CSCF address(es) according to II, then the UE shall either ignore the received address(es), or use the address(es) in accordance with II, and not proceed with the DHCP request according to I.

The UE may request a DNS Server IPv6 address(es) via RFC 3315 or by the Protocol Configuration Options IE when activating a PDP context according to 3GPP TS 27.060 .

From 23.981[35]

- b) based on DHCP. Currently the specifications limit this to the IPv6 methods for DHCP. In order for this method to be used by an IPv4 UE, it needs to be identified how IPv4 DHCP is used to obtain the P-CSCF address. A solution that provides access independence would be that an IPv4 P-CSCF and IPv4 UE support configuration of the appropriate P-CSCF information via DHCPv4. In this solution, use of DHCP provides the UE with the fully qualified domain name of a P-CSCF and the address of a Domain Name Server (DNS) that is capable of resolving the P-CSCF name. When using DHCP/DNS procedure for P-CSCF discovery with IPv4 GPRS-access, the GGSN acts as DHCP Relay agent relaying DHCP messages between UE and the DHCP server. This is necessary to allow the UE to properly interoperate with the GGSN. This solution however requires that a UE supporting early IPv4 implementations would support DHCPv4.

Reference(s)

3GPP TS 24.229[10], clause 9.2.1

3GPP TR 23.981[35], clause 5.2.1.

7.2.3 Test purpose

To verify UE shall initiate and successfully complete a P-CSCF discovery procedure via DHCP when P-CSCF address is not provided as part of PDP Context Activation procedure.

7.2.4 Method of test

Initial conditions

The UE is in GMM-state "GMM-REGISTERED, normal service" with valid P-TMSI and CKSN. UE is not registered to IMS services. UE is not configured for using static P-CSCF address. UE has established a PDP context (No P-CSCF address information provided). If UE sets flag "DNS Server Address Request" in PCO of PDP Context Request, DNS server address list is provided in PDP Context Accept message.

Related ICS/IXIT Statement(s)

UE Supports IPv4 (Yes/No)

UE capable of being configured to initiate P-CSCF Discovery via DHCPv4 (Yes/No)

Test procedure

- 1) If UE already knows DHCP server address, it goes to step 3. Otherwise, UE sends DHCPDISCOVER message locating a server.
- 2) SS responds by DHCPOFFER message.
- 3) UE sends DHCPINFORM message requesting for P-CSCF address(es) in options field.
- 4) SS responds by DHCPACK message providing the domain names of P-CSCF address(es) and giving DNS server address.
- 5) UE initiates a DNS NAPTR query to select the transport protocol. UE's configured to use specific Transport protocol on default ports, can skip steps 5 to 8 and go directly to step 9.
- 6) SS responds with NAPTR response.
- 7) UE initiates a DNS SRV query.
- 8) SS responds with SRV response.
- 9) UE initiates a DNS A query
- 10) SS responds with DNS A response.
- 11) UE is made to initiate Registration procedure for IMS services.

Expected sequence

Step	Direction		Message	Comment
	UE	SS		
1		→	DHCPDISCOVER	Optionally sent if UE does not have DHCP server address.
2		←	DHCPOFFER	Sent if DHCP Discover message is received.
3		→	DHCPINFORM	Requesting P-CSCF Address(es)
4		←	DHCPACK	Including P-CSCF Address(es)
5		→	DNS NAPTR Query	UE configured to use specific Transport protocol on default ports, can skip steps 5 to 8 and go directly to step 9
6		←	DNS NAPTR Response	
7		→	DNS SRV Query	
8		←	DNS SRV Response	
9		→	DNS A Query	
10		←	DNS A Response	
11		↔	Registration	UE is made to initiate Registration procedure to IMS services as defined in Annex C Generic Registration Procedure.

Specific Message Contents:

DHCPDISCOVER (step 1)

Use the default message in annex B

DHCPOFFER (step 2)

Use the default message in annex B

DHCPINFORM (step 3)

Use the default message in annex B with the following exceptions

Field	Value/Remarks
Options	*
- code	53 (DHCP Message Type)
- len	1
-Type	2 (DHCP OFFER)
option-code - option-len	55 (Parameter Request List) Set to number of values requested for configuration parameters
Option code	120 (SIP Server Option) **
Option code	6(Domain Server) Optionally present

*Note 1: Other options may also be present

** Note 2: Other option codes may also be present and options can be in any order

DHCPACK (step 4)

Use the default message in annex B.2 with the following exceptions

Field	Value/Remarks
option-code - option-len -enc	120 (SIP Server option) Length of encoded server domain address +1 (for enc field) 0
Domain-address 1	SS P-CSCF server domain AddressRFC 3361[57]
option-code - option-len	6 (DNS option RFC 2132[49]) (Included only if requested in DHCP INFORM) 4
DNS Address	4 byte IPv4 address of DNS server

DNS NAPTR Query (step 5)

Field	Value/Remarks
OPCODE=	SQUERY
QNAME=	P-CSCF domain name received
QCLASS=	IN
QTYPE=	NAPTR

DNS NAPTR Response (step 6)

Field	Value/Remarks
OPCODE=	SQUERY, RESPONSE, AA
QNAME=	Same as received in NAPTR Query
QCLASS=	IN
QTYPE=	NAPTR
NAPTR Records	NAPTR Records included for each Transport protocol (TLS, TCP, UDP) supported RFC 3263[50]

DNS SRV Query (step 7)

Field	Value/Remarks
OPCODE=	SQUERY
QNAME=	Corresponding to the transport protocol selected by UE among those provided in DNS NAPTR Response
QCLASS=	IN
QTYPE=	SRV

DNS SRV Response (step 8)

Field	Value/Remarks
OPCODE=	SQUERY, RESPONSE, AA
QNAME=	Same as received in SRV Query
QCLASS=	IN
QTYPE=	NAPTR
SRV Records	SRV Resource Record included providing the SS target server FQDN RFC 3263[50].

DNS A Query (step 9)

Case 1: steps 5 to 8 executed:

Field	Value/Remarks
OPCODE=	SQUERY
QNAME=	Selected P-CSCF name among provided in step 8 based on priority and weight RFC 2728[56]
QCLASS=	IN
QTYPE=	A

Case 2: steps 5 to 8 not executed:

Field	Value/Remarks
OPCODE=	SQUERY
QNAME=	Selected P-CSCF name among addresses provided in step 4.
QCLASS=	IN
QTYPE=	A

DNS A Response (step 10)

IE	Value/Remarks
OPCODE=	SQUERY, RESPONSE, AA
QNAME=	Same as received in SRV Query
QCLASS=	IN
QTYPE=	A
A or AAAA records	Includes resolved IP address(es).

7.2.5 Test requirements

- 1) In step 3, UE shall initiate a P-CSCF discovery employing DHCP.
- 2) After step 4, UE shall initiate a DNS query for domain address to IPv4 address translation.
- 3) After step 10, UE should have resolved P-CSCF IPv4 address and should initiate Registration procedure to IMS services.

7.3 P-CSCF Discovery via DHCP – IPv4 (UE Requests P-CSCF discovery via PCO)

7.3.1 Definition

Test to verify that on not receiving P-CSCF Address(es) in PCO, UE will perform P-CSCF discovery procedure employing DHCP.

7.3.2 Conformance requirement

Prior to communication with the IM CN subsystem, the UE shall:

- a) perform a GPRS attach procedure;
- b) establish a PDP context used for SIP signalling according to the APN and GGSN selection criteria described in 3GPP TS 23.060 and 3GPP TS 27.060. This PDP context shall remain active throughout the period the UE is connected to the IM CN subsystem, i.e. from the initial registration and at least until the deregistration. As a result, the PDP context provides the UE with information that makes the UE able to construct an IPv6 address;

...

- c) acquire a P-CSCF address(es).

The methods for P-CSCF discovery are:

- I. Employ Dynamic Host Configuration Protocol for IPv6 (DHCPv6) RFC 3315 , the DHCPv6 options for SIP servers RFC 3319 and the DHCPv6 options for Domain Name Servers (DNS) RFC 3646 after PDP context activation.

The UE shall either:

- in the DHCP query, request a list of SIP server domain names of P-CSCF(s) and the list of Domain Name Servers (DNS); or
- request a list of SIP server IPv6 addresses of P-CSCF(s).

- II. Transfer P-CSCF address(es) within the PDP context activation procedure.

The UE shall indicate the request for a P-CSCF address to the GGSN within the Protocol Configuration Options IE of the ACTIVATE PDP CONTEXT REQUEST message or ACTIVATE SECONDARY PDP CONTEXT REQUEST message.

If the GGSN provides the UE with a list of P-CSCF IPv6 addresses in the ACTIVATE PDP CONTEXT ACCEPT message or ACTIVATE SECONDARY PDP CONTEXT ACCEPT message, the UE shall assume that the list is prioritised with the first address within the Protocol Configuration Options IE as the P-CSCF address with the highest priority.

The UE can freely select method I or II for P-CSCF discovery. In case method I is selected and several P-CSCF addresses are provided to the UE, the selection of P-CSCF address or FQDNs shall be performed as indicated in RFC 3319 . If sufficient information for P-CSCF address selection is not available, selection of the P-CSCF address by the UE is implementation specific.

If the UE is designed to use I above, but receives P-CSCF address(es) according to II, then the UE shall either ignore the received address(es), or use the address(es) in accordance with II, and not proceed with the DHCP request according to I.

The UE may request a DNS Server IPv6 address(es) via RFC 3315 or by the Protocol Configuration Options IE when activating a PDP context according to 3GPP TS 27.060 .

From 23.981[35]

- b) based on DHCP. Currently the specifications limit this to the IPv6 methods for DHCP. In order for this method to be used by an IPv4 UE, it needs to be identified how IPv4 DHCP is used to obtain the P-CSCF address. A solution that provides access independence would be that an IPv4 P-CSCF and IPv4 UE support configuration of the appropriate P-CSCF information via DHCPv4. In this solution, use of DHCP provides the UE with the fully qualified domain name of a P-CSCF and the address of a Domain Name Server (DNS) that is capable of resolving the P-CSCF name. When using DHCP/DNS procedure for P-CSCF discovery with IPv4 GPRS-access, the GGSN acts as DHCP Relay agent relaying DHCP messages between UE and the DHCP server. This is necessary to allow the UE to properly interoperate with the GGSN. This solution however requires that a UE supporting early IPv4 implementations would support DHCPv4.

Reference(s)

3GPP TS 24.229[10], clause 9.2.1

3GPP TR 23.981[35], clause 5.2.1.

7.3.3 Test purpose

To verify that the UE sends a correctly composed Activate PDP context request message requesting for P-CSCF address(es) to the GGSN within the Protocol Configuration Options IE.

On receiving Activate PDP Context accept not including P-CSCF address(es) in PCO, UE will initiate a P-CSCF discovery procedure employing DHCP/DNS.

7.3.4 Method of test

Initial conditions

The UE is in GMM-state "GMM-REGISTERED, normal service" with valid P-TMSI and CKSN. UE is not registered to IMS services, has not established PDP context. UE is not configured for using static P-CSCF address.

Related ICS/IXIT Statement(s)

UE Supports IPv4 (Yes/No)

UE capable of being configured to initiate P-CSCF Discovery via PCO (Yes/No)

UE supports P-CSCF Discovery via PCO and DHCPv4(Yes/No)Test procedure

- 1) UE is configured for requesting P-CSCF address(es) in Protocol Configuration Options IE in Activate PDP Context Request message. UE initiates an Activate PDP Context procedure.
- 2) SS Responds with an Activate PDP Context Accept message by not including P-CSCF Address(es). If a UE already knows DHCP server address, it goes to step 5. If UE sets flag "DNS Server Address Request" in PCO of PDP Context Request, DNS server address list is provided in PDP context Accept message.
- 3) If UE already knows DHCP server address, it goes to step 5. Otherwise, UE sends DHCPDISCOVER message locating a server.
- 4) SS responds by DHCPOFFER message.
- 5) UE sends DHCPINFORM message requesting for P-CSCF address(es) in options field.
- 6) SS responds by DHCPACK message providing the domain names of P-CSCF address(es) and giving a DNS server address.
- 7) UE initiates a DNS NAPTR query to select the transport protocol. UE's configured to use specific Transport protocol on default ports, can skip steps 7 to 10 and go directly to step 11.
- 8) SS responds with NAPTR response.
- 9) UE initiates a DNS SRV query.
- 10) SS responds with SRV response.
- 11) UE initiates a DNS A or query
- 12) SS responds with DNS A or response

Expected sequence

Step	Direction		Message	Comment
	UE	SS		
1		→	Activate PDP Context Request	UE sends this PDU by setting request for P-CSCF address(es) to the GGSN within the Protocol Configuration Options IE
2		←	Activate PDP Context Accept	SS Sends this response by not including P-CSCF address(es).). If UE sets flag "DNS Server Address Request" in PCO of PDP Context Request, DNS server address list is provided in PDP context Accept message .IF UE knows DHCP server address, it goes to step 5.
3		→	DHCPDISCOVER	Optionally sent if UE does not have DHCP server address.
4		←	DHCPOFFER	Sent if DHCP Discover message is received.
5		→	DHCPINFORM	Requesting P-CSCF Address(es)
6		←	DHCPACK	Including P-CSCF Address(es)
7		→	DNS NAPTR Query	UE"s configured to use specific Transport protocol on default ports, can skip steps 7 to 10 and go directly to step 11
8		←	DNS NAPTR Response	
9		→	DNS SRV Query	
10		←	DNS SRV Response	
11		→	DNS A or AAAA Query	
12		←	DNS A or AAAA Response	
13		↔	Registration	UE is made to initiate Registration procedure to IMS services as defined in Annex C Generic Registration Procedure.

- len	1
-Type	2 (DHCP OFFER)
option-code	55 (Parameter Request List)
- option-len	Set to number of values requested for configuration parameters
Option code	120 (SIP Server Option) **
Option code	6(Domain Server) Optionally present

*Note 1: Other options may also be present.

** Note 2:Other option codes may also be present and options can be in any order.

DHCPACK (step 6)

Use the default message in annex B with the following exceptions:

Field	Value/Remarks
option-code	120 (SIP Server option)
- option-len	Length of encoded server domain address +1 (for enc field)
-enc	0
Domain-address 1	SS P-CSCF server domain AddressRFC 3361[57]
option-code	6 (DNS option RFC 2132[49]) (Included only if requested in DHCP INFORM)
- option-len	4
DNS Address	4 byte IPv4 address of DNS server

DNS NAPTR Query (step 7)

Field	Value/Remarks
OPCODE=	SQUERY
QNAME=	P-CSCF domain name received
QCLASS=	IN
QTYPE=	NAPTR

DNS NAPTR Response (step 8)

Field	Value/Remarks
OPCODE=	SQUERY, RESPONSE, AA
QNAME=	Same as received in NAPTR Query
QCLASS=	IN
QTYPE=	NAPTR
NAPTR Records	NAPTR Records included for each Transport protocol (TLS, TCP, UDP) supported RFC 3263[50]

DNS SRV Query (step 9)

Field	Value/Remarks
OPCODE=	SQUERY
QNAME=	Corresponding to the transport protocol selected by UE among those provided in DNS NAPTR Response
QCLASS=	IN
QTYPE=	SRV

DNS SRV Response (step 10)

Field	Value/Remarks
OPCODE=	SQUERY, RESPONSE, AA
QNAME=	Same as received in SRV Query
QCLASS=	IN
QTYPE=	NAPTR
SRV Records	SRV Resource Record included providing the SS target server FQDN RFC 3263[50].

DNS A Query (step 11)

Case 1: steps 7 to 10 executed:

Field	Value/Remarks
OPCODE=	SQUERY
QNAME=	Selected P-CSCF name among provided in step 8 based on priority and weight RFC 2728[56]
QCLASS=	IN
QTYPE=	A

Case 2: steps 7 to 10 not executed:

Field	Value/Remarks
OPCODE=	SQUERY
QNAME=	Selected P-CSCF name among addresses provided in step 6.
QCLASS=	IN
QTYPE=	A

DNS A Response (step 12)

Field	Value/Remarks
OPCODE=	SQUERY, RESPONSE, AA
QNAME=	Same as received in SRV Query
QCLASS=	IN
QTYPE=	A
A records	Includes resolved IP address(es).

7.3.5 Test requirements

- 1) In step 1, UE sets the IM CN Subsystem Signalling Flag to the GGSN within the Protocol Configuration Options IE.
- 2) After step 2, UE shall initiate a P-CSCF discovery employing DHCP.
- 3) In step 3, if UE has no knowledge of DHCP server address sends Discover message.
- 4) In step 5, UE shall send DHCPRequest message, including options filed with option code 120.
- 5) After step 6, UE shall initiate DNS query.
- 6) After step 12, UE should have resolved P-CSCF IPv4 address and should initiate Registration procedure to IMS services.

7.4 P-CSCF Discovery by DHCP - IPv6

7.4.1 Definition

Test to verify that UE will perform P-CSCF discovery procedure employing DHCP.

7.4.2 Conformance requirement

Prior to communication with the IM CN subsystem, the UE shall:

- a) perform a GPRS attach procedure;
- b) establish a PDP context used for SIP signalling according to the APN and GGSN selection criteria described in 3GPP TS 23.060 and 3GPP TS 27.060. This PDP context shall remain active throughout the period the UE is connected to the IM CN subsystem, i.e. from the initial registration and at least until the deregistration. As a result, the PDP context provides the UE with information that makes the UE able to construct an IPv6 address;
...
- c) acquire a P-CSCF address(es).

The methods for P-CSCF discovery are:

- I. Employ Dynamic Host Configuration Protocol for IPv6 (DHCPv6) RFC 3315, the DHCPv6 options for SIP servers RFC 3319 and the DHCPv6 options for Domain Name Servers (DNS) RFC 3646 after PDP context activation.

The UE shall either:

- in the DHCP query, request a list of SIP server domain names of P-CSCF(s) and the list of Domain Name Servers (DNS); or
- request a list of SIP server IPv6 addresses of P-CSCF(s).

- II. Transfer P-CSCF address(es) within the PDP context activation procedure.

The UE shall indicate the request for a P-CSCF address to the GGSN within the Protocol Configuration Options IE of the ACTIVATE PDP CONTEXT REQUEST message or ACTIVATE SECONDARY PDP CONTEXT REQUEST message.

If the GGSN provides the UE with a list of P-CSCF IPv6 addresses in the ACTIVATE PDP CONTEXT ACCEPT message or ACTIVATE SECONDARY PDP CONTEXT ACCEPT message, the UE shall assume that the list is prioritised with the first address within the Protocol Configuration Options IE as the P-CSCF address with the highest priority.

The UE can freely select method I or II for P-CSCF discovery. In case method I is selected and several P-CSCF addresses or FQDNs are provided to the UE, the selection of P-CSCF address or FQDN shall be performed as indicated in RFC 3319. If sufficient information for P-CSCF address selection is not available, selection of the P-CSCF address by the UE is implementation specific.

If the UE is designed to use I above, but receives P-CSCF address(es) according to II, then the UE shall either ignore the received address(es), or use the address(es) in accordance with II, and not proceed with the DHCP request according to I.

The UE may request a DNS Server IPv6 address(es) via RFC 3315 and RFC 3646 or by the Protocol Configuration Options IE when activating a PDP context according to 3GPP TS 27.060 .

Reference(s)

3G TS 24.229[10], clause 9.2.1

7.4.3 Test purpose

UE will initiate P-CSCF discovery procedure employing DHCP.

7.4.4 Method of test

Initial conditions

The UE is in GMM-state "GMM-REGISTERED, normal service" with valid P-TMSI and CKSN. UE is not registered to IMS services. UE has established a PDP context. UE has not received P-CSCF address(es) during PDP context establishment. If UE sets flag "DNS Server Address Request" in PCO of PDP Context Request, DNS server address list is provided in PDP Context Accept message.

Related ICS/IXIT Statement(s)

UE Supports IPv6 (Yes/No)

UE capable of being configured to initiate P-CSCF Discovery via DHCPv6 (Yes/No)

Test procedure

1. UE sends DHCP SOLICIT message locating a server.
2. SS responds with DHCP ADVERTISE message. If UE requested for domain names or both domain names and IP address(es), SS will include P-CSCF server domain names. If UE requested for IP address only, SS includes IP address(es) of P-CSCF servers. If UE Requested for DNS Server Address, it is provided. If P-CSCF IP addresses are included go to step 11, else go to step 5
3. UE sends DHCP Query requesting either IP address(es) of P-CSCF server(s) or domain names of P-CSCF server(s) and DNS Server.
4. SS responds by DHCP Reply message. If UE requested for domain names or both domain names and IP address(es), SS will include P-CSCF server domain names. If UE requested for IP address only, SS includes IP address(es) of P-CSCF servers. If UE Requested for DNS Server Address, it is provided. If P-CSCF IP addresses are included go to step 11.
5. UE initiates a DNS NAPTR query to select the transport protocol. UE's configured to use specific Transport protocol on default ports, can skip steps 5 to 8 and go directly to step 11.
6. SS responds with NAPTR response.
7. UE initiates a DNS SRV query.
8. SS responds with SRV response.
9. UE initiates a DNS AAAA query
10. SS responds with DNS AAAA response.
11. UE is made to initiate Registration procedure for IMS services.

Expected sequence

Step	Direction		Message	Comment
	UE	SS		
1		→	DHCP SOLICIT	
2		←	DHCP ADVERTISE	Sent if DHCP Solicit message is received. Including P-CSCF Address(es). If P-CSCF IP addresses are included go to step 11, else go to step 5
3		→	DHCP Information-Request	Requesting P-CSCF Address(es)*
4		←	DHCP Reply	Including P-CSCF Address(es). If P-CSCF IP addresses are included go to step 11.
5		→	DNS NAPTR Query	UE"s configured to use specific Transport protocol on default ports, can skip steps 5 to 8 and go directly to step 9
6		←	DNS NAPTR Response	
7		→	DNS SRV Query	
8		←	DNS SRV Response	
9		→	DNS AAAA Query	
10		←	DNS AAAA Response	
11		↔	Registration	UE is made to initiate Registration procedure to IMS services as defined in Annex A.2 Generic Registration Procedure.

* Note: UE may request all options in one Information Request or send multiple Information Requests. If UE opts for multiple Information Request transmissions, SS transmits accordingly multiple Reply messages including corresponding requested options.

Specific Message Contents:

Step 1: DHCP SOLICIT*

Use the default message in annex B.1 with the following exceptions

Options	Value/Remarks
option-code	OPTION_ORO (6)
- option-len	2 times number of requested options
-requested-option-code-1	OPTION_SIP_SERVER_D (21) OR OPTION_SIP_SERVER_A (22)
- requested-option-code-2	OPTION_DNS_SERVERS (23)
- requested-option-code-3	OPTION_DOMAIN_LIST (24)

*Note: Options can be optionally present and option codes can be in any order

**Note: Numerical value, "(n)", provided in brackets in Column Value/Remarks is the 'octal' value for this option.

Step 2: DHCP ADVERTISE

Use the default message in annex B.1 with the following exceptions

Note: Options are included only if corresponding Requests are received.

Case 1: OPTION_SIP_SERVER_D (21)) or both (OPTION_SIP_SERVER_D (21) and OPTION_SIP_SERVER_A (22)) and OPTION_DOMAIN_LIST(24) or OPTION_DNS_SERVERS (23) received in step 1

Options	Value/Remarks
option-code	OPTION_SIP_SERVER_D (21)
- option-len	Length of encoded domain address RFC 3319[51]
Domain-address 1	SS P-CSCF server domain address RFC 3319[51]
option-code	OPTION_DNS_SERVERS (23)
- option-len	Length of encoded DNS server address RFC 3646[48]
Domain-address 1	SS DNS server IPv6 address RFC 3646[48]
option-code	OPTION_DOMAIN_LIST (24)
- option-len	Length of Domain search list
searchlist	List of Domain Names encoded as per RFC 1035[52]

*Note: Numerical value, "(n)", provided in brackets in Column Value/Remarks is the 'octal' value for this option.

Case 2: OPTION_SIP_SERVER_A (22) received in step 1

Options	Value/Remarks
option-code	OPTION_SIP_SERVER_A (22)
- option-len	128
Domain-address 1	IPv6 address of SS P-CSCF Server
option-code	OPTION_DNS_SERVERS (23)
- option-len	Length of encoded DNS server address RFC 3646[48]
Domain-address 1	SS DNS server IPv6 address RFC 3646[48]
option-code	OPTION_DOMAIN_LIST (24)
- option-len	Length of Domain search list
searchlist	List of Domain Names encoded as per RFC 1035[52]

*Note: Numerical value, "(n)", provided in brackets in Column Value/Remarks is the 'octal' value for this option.

Step 3: DHCP Information-Request

Use the default message in annex B.1 with the following exceptions

Options	Value/Remarks
option-code	OPTION_ORO (6)
- option-len	2 * number of requested options
- requested-option-code-1	OPTION_SIP_SERVER_D (21) OR OPTION_SIP_SERVER_A (22)
- requested-option-code-2	OPTION_DNS_SERVERS (23)(Optional)
- requested-option-code-3	OPTION_DOMAIN_LIST (24) (Optional)

Note: All options can be either received in one message or multiple messages. If more than one option codes present they can be in any order.

**Note: Numerical value, "(n)", provided in brackets in Column Value/Remarks is the 'octal' value for this option.

Step 4: DHCP Reply

Use the default message in annex B.1 with the following exceptions

Note: Options are included only if corresponding Requests are received.

Case 1: OPTION_SIP_SERVER_D (21)) or both (OPTION_SIP_SERVER_D (21) and OPTION_SIP_SERVER_A (22)) and OPTION_DOMAIN_LIST(24) or OPTION_DNS_SERVERS (23) received in step 3

Options	Value/Remarks
option-code	OPTION_SIP_SERVER_D (21)
- option-len	Length of encoded domain address RFC 3319[51]
Domain-address 1	SS P-CSCF server domain Address RFC 3319[51]
option-code	OPTION_DNS_SERVERS (23)
- option-len	Length of encoded DNS server address RFC 3646[48]
Domain-address 1	SS DNS server IPv6 address RFC 3646[48]
option-code	OPTION_DOMAIN_LIST (24)
- option-len	Length of Domain search list
searchlist	List of Domain Names encoded as per RFC 1035[52]

*Note: Numerical value, "(n)", provided in brackets in Column Value/Remarks is the 'octal' value for this option.

Case 2: OPTION_SIP_SERVER_A (22) received in step 3

Options	Value/Remarks
option-code	OPTION_SIP_SERVER_A (22)
- option-len	128
Domain-address 1	IPv6 address of SS P-CSCF Server
option-code	OPTION_DNS_SERVERS (23)
- option-len	Length of encoded DNS server address RFC 3646[48]
Domain-address 1	SS DNS server IPv6 address RFC 3646[48]
option-code	OPTION_DOMAIN_LIST (24)
- option-len	Length of Domain search list
searchlist	List of Domain Names encoded as per RFC 1035 [52]

*Note: Numerical value, "(n)", provided in brackets in Column Value/Remarks is the 'octal' value for this option.

Step 5: DNS NAPTR Query

Field	Value/Remarks
OPCODE=	SQUERY
QNAME=	P-CSCF domain name received
QCLASS=	IN
QTYPE=	NAPTR

Step 6: DNS NAPTR Response

Field	Value/Remarks
OPCODE=	SQUERY, RESPONSE, AA
QNAME=	Same as received in NAPTR Query
QCLASS=	IN
QTYPE=	NAPTR
NAPTR Records	NAPTR Records included for each Transport protocol (TLS, TCP, UDP) supported RFC 3263[50]

Step 7: DNS SRV Query

Field	Value/Remarks
OPCODE=	SQUERY
QNAME=	Corresponding to the transport protocol selected by UE among those provided in DNS NAPTR Response
QCLASS=	IN
QTYPE=	SRV

Step 8: DNS SRV Response

Field	Value/Remarks
OPCODE=	SQUERY, RESPONSE, AA
QNAME=	Same as received in SRV Query
QCLASS=	IN
QTYPE=	NAPTR
SRV Records	SRV Resource Record included providing the SS target server FQDN RFC 3263[50].

Step 9: DNS AAAA Query

Case 1: steps 5 to 8 executed:

Field	Value/Remarks
OPCODE=	SQUERY
QNAME=	Selected P-CSCF name among provided in step 8 based on priority and weight RFC 2728[56]
QCLASS=	IN
QTYPE=	AAAA

Case 2: steps 5 to 8 not executed:

Field	Value/Remarks
OPCODE=	SQUERY
QNAME=	Selected P-CSCF name among addresses provided in step 2 or 4.
QCLASS=	IN
QTYPE=	AAAA

Step 10: DNS AAAA Response

Field	Value/Remarks
OPCODE=	SQUERY, RESPONSE, AA
QNAME=	Same as received in AAAA Query
QCLASS=	IN
QTYPE=	AAAA
AAAA records	Includes resolved IP address(es).

7.4.5 Test requirements

1. In step 1, UE shall initiate a P-CSCF discovery employing DHCP.
2. After step 2 and 4, if P-CSCF IPv6 address is received UE will consider P-CSCF discovery procedure successful, else will initiate a DNS query for domain address to IPv6 address translation.
3. After step 10, UE will consider P-CSCF discovery procedure to be successful and should initiate Registration procedure to IMS services.

7.5 P-CSCF Discovery by DHCP-IPv6 (UE Requests P-CSCF discovery by PCO)

7.5.1 Definition

Test to verify that on not receiving P-CSCF Address(es) in PCO, will perform P-CSCF discovery procedure employing DHCP.

7.5.2 Conformance requirement

Prior to communication with the IM CN subsystem, the UE shall:

- a) perform a GPRS attach procedure;
- b) establish a PDP context used for SIP signalling according to the APN and GGSN selection criteria described in 3GPP TS 23.060 and 3GPP TS 27.060. This PDP context shall remain active throughout the period the UE is connected to the IM CN subsystem, i.e. from the initial registration and at least until the deregistration. As a result, the PDP context provides the UE with information that makes the UE able to construct an IPv6 address;

...

- c) acquire a P-CSCF address(es).

The methods for P-CSCF discovery are:

- I. Employ Dynamic Host Configuration Protocol for IPv6 (DHCPv6) RFC 3315 , the DHCPv6 options for SIP servers RFC 3319 and the DHCPv6 options for Domain Name Servers (DNS) RFC 3646 after PDP context activation.

The UE shall either:

- in the DHCP query, request a list of SIP server domain names of P-CSCF(s) and the list of Domain Name Servers (DNS); or
- request a list of SIP server IPv6 addresses of P-CSCF(s).

- II. Transfer P-CSCF address(es) within the PDP context activation procedure.

The UE shall indicate the request for a P-CSCF address to the GGSN within the Protocol Configuration Options IE of the ACTIVATE PDP CONTEXT REQUEST message or ACTIVATE SECONDARY PDP CONTEXT REQUEST message.

If the GGSN provides the UE with a list of P-CSCF IPv6 addresses in the ACTIVATE PDP CONTEXT ACCEPT message or ACTIVATE SECONDARY PDP CONTEXT ACCEPT message, the UE shall assume that the list is prioritised with the first address within the Protocol Configuration Options IE as the P-CSCF address with the highest priority.

The UE can freely select method I or II for P-CSCF discovery. In case method I is selected and several P-CSCF addresses or FQDNs are provided to the UE, the selection of P-CSCF address or FQDN shall be performed as indicated in RFC 3319 [41]. If sufficient information for P-CSCF address selection is not available, selection of the P-CSCF address by the UE is implementation specific.

If the UE is designed to use I above, but receives P-CSCF address(es) according to II, then the UE shall either ignore the received address(es), or use the address(es) in accordance with II, and not proceed with the DHCP request according to I.

The UE may request a DNS Server IPv6 address(es) via RFC 3315 and RFC 3646 or by the Protocol Configuration Options IE when activating a PDP context according to 3GPP TS 27.060.

Reference(s)

3G TS 24.229[10], clause 9.2.1

7.5.3 Test purpose

To verify that the UE sends a correctly composed Activate PDP context requesting for P-CSCF address(es) to the GGSN within the Protocol Configuration Options IE.

On receiving Activate PDP Context accept not including P-CSCF address(es) in PCO IE, will initiate a P-CSCF discovery procedure employing DHCP.

7.5.4 Method of test

Initial conditions

The UE is in GMM-state "GMM-REGISTERED, normal service" with valid P-TMSI and CKSN. UE is not registered to IMS services, has not established PDP context.

Related ICS/IXIT Statement(s)

UE Supports IPv6 (Yes/No)

UE capable of being configured to initiate P-CSCF Discovery via PCO (Yes/No)

UE supports P-CSCF Discovery via PCO and DHCPv6(Yes/No)

Test procedure

1. UE is configured for requesting P-CSCF address(es) in Protocol Configuration Options IE in Activate PDP Context Request message. UE initiates an Activate PDP Context procedure.
2. SS Responds with an Activate PDP Context Accept message by not including P-CSCF address(es). If UE sets flag "DNS Server Address Request" in PCO of PDP Context Request, DNS server address list is provided in PDP Context Accept message.
3. UE sends Solicit message locating a server.
4. SS responds by Advertise message. If UE requested for domain names or both domain names and IP address(es), SS will include P-CSCF server domain names. If UE requested for IP address only, SS includes IP address(es) of

P-CSCF servers. If UE Requested for DNS Server Address, it is provided. If P-CSCF IP addresses are included go to step 13 else go to step 7.

5. UE sends DHCP Information-Request Query requesting either IP address(es) of P-CSCF server(s) or domain names of P-CSCF server(s) and DNS Server.
6. SS responds by DHCP Reply message. . If UE requested for domain names or both domain names and IP address(es), SS will include P-CSCF server domain names. If UE requested for IP address only, SS includes IP address(es) of P-CSCF servers. If UE Requested for DNS Server Address, it is provided. If P-CSCF IP addresses are included go to step 13.
7. UE initiates a DNS NAPTR query to select the transport protocol. UE"s configured to use specific Transport protocol on default ports, can skip steps 7 to 10 and go directly to step 11.
8. SS responds with NAPTR response.
9. UE initiates a DNS SRV query.
10. SS responds with SRV response.
11. UE initiates a DNS AAAA query
12. SS responds with DNS AAAA response
13. UE is made to initiate Registration procedure for IMS services.

Expected sequence

Step	Direction		Message	Comment
	UE	SS		
1		→	Activate PDP Context Request	UE sends this PDU by setting request for P-CSCF address(es) to the GGSN within the Protocol Configuration Options IE
2		←	Activate PDP Context Accept	SS Sends this response by not including P-CSCF address(es). If UE sets flag "DNS Server Address Request" in PCO of PDP Context Request, DNS server address list is provided.
3		→	DHCP SOLICIT	.
4		→	DHCP ADVERTISE	Sent if DHCP Solicit message is received. Including P-CSCF Address(es). If P-CSCF IP addresses are included go to step 13 else go to step 7

12		←	DNS AAAA Response	
13		↔	Registration	UE is made to initiate Registration procedure to IMS services as defined in Annex A.2 Generic Registration Procedure.

* Note: UE may request all options in one Information Request or send multiple Information Requests. If UE opts for multiple Information Request transmissions, SS transmits accordingly multiple Reply messages including corresponding requested options.

Specific Message Contents:

Step 1: Activate PDP Context Request

Options	Value/Remarks
Protocol Configuration options	
- Additional Parameters	
-- container 1 Identifier	0001H (P-CSCF Address Request)
-- Container 1 Length	0 bytes
-- container 2 Identifier	0003H (DNS Server Address Request) (Optionally present)
-- Container 2 Length	0 bytes

Step 2: Activate PDP Context Accept

Options	Value/Remarks
Protocol Configuration options	(Included if "DNS Server Address Request" is received)
- Additional Parameters	
-- container 1 Identifier	0003H (DNS Address)
-- Container 1 Length	16 bytes
-- Container 1 contents	IPV6 address of SS DNS Server

Step 3: DHCP SOLICIT*

Use the default message in annex B.1 with the following exceptions

Options	Value/Remarks
option-code	OPTION_ORO (6)
- option-len	2 times number of requested options
- requested-option-code-1	OPTION_SIP_SERVER_D (21) OR OPTION_SIP_SERVER_A (22)
- requested-option-code-2	OPTION_DNS_SERVERS (23)
- requested-option-code-3	OPTION_DOMAIN_LIST (24)

*Note: Options can be optionally present and option codes can be in any order

**Note: Numerical value, "(n)", provided in brackets in Column Value/Remarks is the 'octal' value for this option.

Step 4: DHCP ADVERTISE

Use the default message in annex B.1 with the following exceptions

Note: Options are included only if corresponding Requests are received.

Case 1: OPTION_SIP_SERVER_D (21) or both (OPTION_SIP_SERVER_D (21) and OPTION_SIP_SERVER_A (22)) and OPTION_DOMAIN_LIST(24) or OPTION_DNS_SERVERS (23) received in step 3

Options	Value/Remarks
option-code	OPTION_SIP_SERVER_D (21)
- option-len	Length of encoded domain address RFC 3319[51]
Domain-address 1	SS P-CSCF server domain Address RFC 3319[51]
option-code	OPTION_DNS_SERVERS (23)
- option-len	Length of encoded DNS server address RFC 3646[48]
Domain-address 1	SS DNS server IPv6 address RFC 3646[48]
option-code	OPTION_DOMAIN_LIST (24)
- option-len	Length of Domain search list
searchlist	List of Domain Names encoded as per RFC 1035[52]

*Note: Numerical value, "(n)", provided in brackets in Column Value/Remarks is the 'octal' value for this option.

Case 2: OPTION_SIP_SERVER_A (22) received in step 3

Options	Value/Remarks
option-code	OPTION_SIP_SERVER_A (22)
- option-len	128
Domain-address 1	IPv6 address of SS P-CSCF Server
option-code	OPTION_DNS_SERVERS (23)
- option-len	Length of encoded DNS server address RFC 3646[48]
Domain-address 1	SS DNS server IPv6 address RFC 3646[48]
option-code	OPTION_DOMAIN_LIST (24)
- option-len	Length of Domain search list
searchlist	List of Domain Names encoded as per RFC 1035 [52]

*Note: Numerical value, "(n)", provided in brackets in Column Value/Remarks is the 'octal' value for this option.

Step 5: DHCP Information-Request

Use the default message in annex B.1 with the following exceptions

Options	Value/Remarks
option-code	OPTION_ORO (6)
- option-len	2 * number of requested options
-requested-option-code-1	OPTION_SIP_SERVER_D (21) OR OPTION_SIP_SERVER_A (22)
- requested-option-code-2	OPTION_DNS_SERVERS (23)(Optional)
- requested-option-code-3	OPTION_DOMAIN_LIST (24) (Optional)

Note: All options can be either received in one message or multiple messages. If more than one option codes present they can be in any order.

**Note: Numerical value, "(n)", provided in brackets in Column Value/Remarks is the 'octal' value for this option.

Step 6: DHCP Reply

Use the default message in annex B.1 with the following exceptions

Note: Options are included only if corresponding Requests are received.

Case 1: OPTION_SIP_SERVER_D (21) or both (OPTION_SIP_SERVER_D (21) and OPTION_SIP_SERVER_A (22)) and OPTION_DOMAIN_LIST(24) or OPTION_DNS_SERVERS (23) received in step 5

Options	Value/Remarks
option-code	OPTION_SIP_SERVER_D (21)
- option-len	Length of encoded domain address RFC 3319[51]
Domain-address 1	SS P-CSCF server domain Address RFC 3319[51]
option-code	OPTION_DNS_SERVERS (23)
- option-len	Length of encoded DNS server address RFC 3646[48]
Domain-address 1	SS DNS server IPv6 address RFC 3646[48]
option-code	OPTION_DOMAIN_LIST (24)
- option-len	Length of Domain search list
searchlist	List of Domain Names encoded as per RFC 1035[52]

*Note: Numerical value, "(n)", provided in brackets in Column Value/Remarks is the 'octal' value for this option.

Case 2: OPTION_SIP_SERVER_A (22) received in step 5

Options	Value/Remarks
option-code	OPTION_SIP_SERVER_A (22)
- option-len	128
Domain-address 1	IPv6 address of SS P-CSCF Server
option-code	OPTION_DNS_SERVERS (23)
- option-len	Length of encoded DNS server address RFC 3646[48]
Domain-address 1	SS DNS server IPv6 address RFC 3646[48]
option-code	OPTION_DOMAIN_LIST (24)
- option-len	Length of Domain search list
searchlist	List of Domain Names encoded as per RFC 1035 [52]

*Note: Numerical value, "(n)", provided in brackets in Column Value/Remarks is the 'octal' value for this option.

Step 7: DNS NAPTR Query

Field	Value/Remarks
OPCODE=	SQUERY
QNAME=	P-CSCF domain name received
QCLASS=	IN
QTYPE=	NAPTR

Step 8: DNS NAPTR Response

Field	Value/Remarks
OPCODE=	SQUERY, RESPONSE, AA
QNAME=	Same as received in NAPTR Query
QCLASS=	IN
QTYPE=	NAPTR
NAPTR Records	NAPTR Records included for each Transport protocol (TLS, TCP, UDP) supported RFC 3263[50]

Step 9: DNS SRV Query

Field	Value/Remarks
OPCODE=	SQUERY
QNAME=	Corresponding to the transport protocol selected by UE among those provided in DNS NAPTR Response
QCLASS=	IN
QTYPE=	SRV

Step 10: DNS SRV Response

Field	Value/Remarks
OPCODE=	SQUERY, RESPONSE, AA
QNAME=	Same as received in SRV Query
QCLASS=	IN
QTYPE=	NAPTR
SRV Records	SRV Resource Record included providing the SS target server FQDN RFC 3263[50].

Step 11: DNS AAAA Query

Case 1: steps 7 to 10 executed:

Field	Value/Remarks
OPCODE=	SQUERY
QNAME=	Selected P-CSCF name among provided in step 10 based on priority and weight RFC 2728[56]
QCLASS=	IN
QTYPE=	AAAA

Case 2: steps 7 to 10 not executed:

Field	Value/Remarks
OPCODE=	SQUERY
QNAME=	Selected P-CSCF name among addresses provided in step 4 or 6.
QCLASS=	IN
QTYPE=	AAAA

Step 12: DNS AAAA Response

Field	Value/Remarks
OPCODE=	SQUERY, RESPONSE, AA
QNAME=	Same as received in AAAA Query
QCLASS=	IN
QTYPE=	AAAA
AAAA records	Includes resolved IP address(es).

7.5.5 Test requirements

1. In step 1, UE sets the IM CN Subsystem Signalling Flag to the GGSN within the Protocol Configuration Options IE.
2. After step 2, UE shall initiate a P-CSCF discovery employing DHCP.
3. After step 6, if P-CSCF IPv6 address is received UE will consider P-CSCF discovery procedure successful, else will initiate a DNS query for domain address to IPv6 address translation.
4. After step 12, UE will consider P-CSCF discovery procedure to be successful and should initiate Registration procedure to IMS services.

7.6 P-CSCF Discovery by DHCP – IPv6 (UE does not Request P-CSCF discovery by PCO, SS includes P-CSCF Address(es) in PCO)

7.6.1 Definition

Test to verify that on not receiving P-CSCF Address(es) in PCO, will perform P-CSCF discovery procedure employing DHCP.

7.6.2 Conformance requirement

Prior to communication with the IM CN subsystem, the UE shall:

- a) perform a GPRS attach procedure;
- b) establish a PDP context used for SIP signalling according to the APN and GGSN selection criteria described in 3GPP TS 23.060 and 3GPP TS 27.060. This PDP context shall remain active throughout the period the UE is connected to the IM CN subsystem, i.e. from the initial registration and at least until the deregistration. As a result, the PDP context provides the UE with information that makes the UE able to construct an IPv6 address;
- ...
- c) acquire a P-CSCF address(es).

The methods for P-CSCF discovery are:

- I. Employ Dynamic Host Configuration Protocol for IPv6 (DHCPv6) RFC 3315, the DHCPv6 options for SIP servers RFC 3319 and the DHCPv6 options for Domain Name Servers (DNS) RFC 3646 after PDP context activation.

The UE shall either:

- in the DHCP query, request a list of SIP server domain names of P-CSCF(s) and the list of Domain Name Servers (DNS); or
- request a list of SIP server IPv6 addresses of P-CSCF(s).

II. Transfer P-CSCF address(es) within the PDP context activation procedure.

The UE shall indicate the request for a P-CSCF address to the GGSN within the Protocol Configuration Options IE of the ACTIVATE PDP CONTEXT REQUEST message or ACTIVATE SECONDARY PDP CONTEXT REQUEST message.

If the GGSN provides the UE with a list of P-CSCF IPv6 addresses in the ACTIVATE PDP CONTEXT ACCEPT message or ACTIVATE SECONDARY PDP CONTEXT ACCEPT message, the UE shall assume that the list is prioritised with the first address within the Protocol Configuration Options IE as the P-CSCF address with the highest priority.

The UE can freely select method I or II for P-CSCF discovery. In case method I is selected and several P-CSCF addresses or FQDNs are provided to the UE, the selection of P-CSCF address or FQDN shall be performed as indicated in RFC 3319 [41]. If sufficient information for P-CSCF address selection is not available, selection of the P-CSCF address by the UE is implementation specific.

If the UE is designed to use I above, but receives P-CSCF address(es) according to II, then the UE shall either ignore the received address(es), or use the address(es) in accordance with II, and not proceed with the DHCP request according to I.

The UE may request a DNS Server IPv6 address(es) via RFC 3315 and RFC 3646 or by the Protocol Configuration Options IE when activating a PDP context according to 3GPP TS 27.060.

Reference(s)

3G TS 24.229[10], clause 9.2.1

7.6.3 Test purpose

To verify that a UE, which has not requested for P-CSCF address in PDP context activate message, receives P-CSCF address, may accept the P-CSCF address or ignore it and hence initiate P-CSCF discovery by DHCP.

7.6.4 Method of test

Initial conditions

The UE is in GMM-state "GMM-REGISTERED, normal service" with valid P-TMSI and CKSN. UE is not registered to IMS services, has not established PDP context.

Related ICS/IXIT Statement(s)

UE Supports IPv6 (Yes/No)

UE capable of being configured to initiate P-CSCF Discovery via DHCPv6 (Yes/No)

UE supports P-CSCF Discovery via PCO and DHCPv6(Yes/No)

Test procedure

1. UE is configured for not requesting P-CSCF addresses in PCO.
2. SS Responds with an Activate PDP Context Accept message by including P-CSCF Address(es). UE can either assume P-CSCF procedure to be complete or neglect the P-CSCF address(es) in PDP context Accept. Test Ends if UE assumes P-CSCF procedure to be complete.
3. UE sends Solicit message locating a server.
4. SS responds by Advertise message. . If UE requested for domain names or both domain names and IP address(es), SS will include P-CSCF server domain names. If UE requested for IP address only, SS includes IP address(es) of P-CSCF servers. If UE Requested for DNS Server Address, it is provided. If P-CSCF IP addresses are included go to step 13, else go to step 7.

5. UE sends DHCP Information-Request Query requesting either IP address(es) of P-CSCF server(s) or domain names of P-CSCF server(s) and DNS Server.
6. SS responds by DHCP Reply message. If UE requested for domain names or both domain names and IP address(es), SS will include P-CSCF server domain names. If UE requested for IP address only, SS includes IP address(es) of P-CSCF servers. If UE Requested for DNS Server Address, it is provided. If P-CSCF IP addresses are included go to step 13.
7. UE initiates a DNS NAPTR query to select the transport protocol. UE"s configured to use specific Transport protocol on default ports, can skip steps 7 to 10 and go directly to step 11.
8. SS responds with NAPTR response.
9. UE initiates a DNS SRV query.
10. SS responds with SRV response.
11. UE initiates a DNS AAAA query
12. SS responds with DNS AAAA response.
13. UE is made to initiate Registration procedure for IMS services.

Expected sequence

Step	Direction		Message	Comment
	UE	SS		
1		→	Activate PDP Context Request	UE sends this PDU not requesting for P-CSCF address(es)
2		←	Activate PDP Context Accept	SS Sends this response including P-CSCF Address(es). UE shall either ignore the received address, or use the address. If UE uses address, go to step 13.
3		→	DHCP SOLICIT	.
4		←	DHCP ADVERTISE	Sent if DHCP Solicit message is received. Including P-CSCF Address(es). If P-CSCF IP addresses are included go to step 13, else go to step 7
5		→	DHCP Information-Request	Requesting P-CSCF Address(es)*
6		←	DHCP Reply	Including P-CSCF Address(es). If P-CSCF IP addresses are included go to step 13.
7		→	DNS NAPTR Query	UE"s configured to use specific Transport protocol on default ports, can skip steps 7 to 10 and go directly to step 11
8		←	DNS NAPTR Response	
9		→	DNS SRV Query	
10		←	DNS SRV Response	
11		→	DNS AAAA Query	
12		←	DNS AAAA Response	
13		←→	Registration	UE is made to initiate Registration procedure to IMS services as defined in Annex A.2 Generic Registration Procedure.

* Note: UE may request all options in one Information Request or send multiple Information Requests. If UE opts for multiple Information Request transmissions, SS transmits accordingly multiple Reply messages including corresponding requested options.

Specific Message Contents:

Step 2: Activate PDP Context Accept

Options	Value/Remarks
Protocol Configuration options	
- Additional Parameters	
-- container 1 Identifier	0001H (P-CSCF Address)
-- Container 1 Length	16 bytes
-- Container 1 contents	IPV6 address of SS
-- container 2 Identifier	0003H (DNS Address)
-- Container 2 Length	16 bytes
-- Container 2 contents	IPV6 address of SS DNS Server

Step 3: DHCP SOLICIT*

Use the default message in annex B.1 with the following exceptions

Options	Value/Remarks
option-code	OPTION_ORO (6)
- option-len	2 times number of requested options
-requested-option-code-1	OPTION_SIP_SERVER_D (21) OR OPTION_SIP_SERVER_A (22)
- requested-option-code-2	OPTION_DNS_SERVERS (23)
- requested-option-code-3	OPTION_DOMAIN_LIST (24)

*Note: Options can be optionally present and option codes can be in any order

**Note: Numerical value, "(n)", provided in brackets in Column Value/Remarks is the 'octal' value for this option.

Step 4: DHCP ADVERTISE

Use the default message in annex B.1 with the following exceptions

Note: Options are included only if corresponding Requests are received.

Case 1: OPTION_SIP_SERVER_D (21)) or both (OPTION_SIP_SERVER_D (21) and
OPTION_SIP_SERVER_A (22)) and OPTION_DOMAIN_LIST(24) or
OPTION_DNS_SERVERS (23) received in step 3

Options	Value/Remarks
option-code	OPTION_SIP_SERVER_D (21)
- option-len	Length of encoded domain address RFC 3319[51]
Domain-address 1	SS P-CSCF server domain Address RFC 3319[51]
option-code	OPTION_DNS_SERVERS (23)
- option-len	Length of encoded DNS server address RFC 3646[48]
Domain-address 1	SS DNS server IPv6 address RFC 3646[48]
option-code	OPTION_DOMAIN_LIST (24)
- option-len	Length of Domain search list
searchlist	List of Domain Names encoded as per RFC 1035 [52]

*Note: Numerical value, "(n)", provided in brackets in Column Value/Remarks is the 'octal' value for this option.

Case 2: OPTION_SIP_SERVER_A (22) received in step 3

Options	Value/Remarks
option-code	OPTION_SIP_SERVER_A (22)
- option-len	128
Domain-address 1	IPv6 address of SS P-CSCF Server
option-code	OPTION_DNS_SERVERS (23)
- option-len	Length of encoded DNS server address RFC 3646[48]
Domain-address 1	SS DNS server IPv6 address RFC 3646[48]
option-code	OPTION_DOMAIN_LIST (24)
- option-len	Length of Domain search list
searchlist	List of Domain Names encoded as per RFC 1035 [52]

*Note: Numerical value, "(n)", provided in brackets in Column Value/Remarks is the 'octal' value for this option.

Step 5: DHCP Information-Request

Use the default message in annex B.1 with the following exceptions

Options	Value/Remarks
option-code	OPTION_ORO (6)
- option-len	2 * number of requested options
-requested-option-code-1	OPTION_SIP_SERVER_D (21) OR OPTION_SIP_SERVER_A (22)
- requested-option-code-2	OPTION_DNS_SERVERS (23)(Optional)
- requested-option-code-3	OPTION_DOMAIN_LIST (24) (Optional)

Note: All options can be either received in one message or multiple messages. If more than one option codes present they can be in any order.

*Note: Numerical value, "(n)", provided in brackets in Column Value/Remarks is the 'octal' value for this option.

Step 6: DHCP Reply

Use the default message in annex B.1 with the following exceptions

Note: Options are included only if corresponding Requests are received.

Case 1: OPTION_SIP_SERVER_D (21)) or both (OPTION_SIP_SERVER_D (21) and OPTION_SIP_SERVER_A (22)) and OPTION_DOMAIN_LIST(24) or OPTION_DNS_SERVERS (23) received in step 5

Options	Value/Remarks
option-code	OPTION_SIP_SERVER_D (21)
- option-len	Length of encoded domain address RFC 3319[51]
Domain-address 1	SS P-CSCF server domain Address RFC 3319[51]
option-code	OPTION_DNS_SERVERS (23)
- option-len	Length of encoded DNS server address RFC 3646[48]
Domain-address 1	SS DNS server IPv6 address RFC 3646[48]
option-code	OPTION_DOMAIN_LIST (24)
- option-len	Length of Domain search list
searchlist	List of Domain Names encoded as per RFC 1035 [52]

*Note: Numerical value, "(n)", provided in brackets in Column Value/Remarks is the 'octal' value for this option.

Case 2: OPTION_SIP_SERVER_A (22) received in step 5

Options	Value/Remarks
option-code	OPTION_SIP_SERVER_A (22)
- option-len	128
Domain-address 1	IPv6 address of SS P-CSCF Server
option-code	OPTION_DNS_SERVERS (23)
- option-len	Length of encoded DNS server address RFC 3646[48]
Domain-address 1	SS DNS server IPv6 address RFC 3646[48]
option-code	OPTION_DOMAIN_LIST (24)
- option-len	Length of Domain search list
searchlist	List of Domain Names encoded as per RFC 1035 [52]

*Note: Numerical value, "(n)", provided in brackets in Column Value/Remarks is the 'octal' value for this option.

Step 7: DNS NAPTR Query

Field	Value/Remarks
OPCODE=	SQUERY
QNAME=	P-CSCF domain name received
QCLASS=	IN
QTYPE=	NAPTR

Step 8: DNS NAPTR Response

Field	Value/Remarks
OPCODE=	SQUERY, RESPONSE, AA
QNAME=	Same as received in NAPTR Query
QCLASS=	IN
QTYPE=	NAPTR
NAPTR Records	NAPTR Records included for each Transport protocol (TLS, TCP, UDP) supported RFC 3263[50]

Step 9: DNS SRV Query

Field	Value/Remarks
OPCODE=	SQUERY
QNAME=	Corresponding to the transport protocol selected by UE among those provided in DNS NAPTR Response
QCLASS=	IN
QTYPE=	SRV

Step 10: DNS SRV Response

Field	Value/Remarks
OPCODE=	SQUERY, RESPONSE, AA
QNAME=	Same as received in SRV Query
QCLASS=	IN
QTYPE=	NAPTR
SRV Records	SRV Resource Record included providing the SS target server FQDN RFC 3263[50].

Step 11: DNS AAAA Query

Case 1: steps 7 to 10 executed:

Field	Value/Remarks
OPCODE=	SQUERY
QNAME=	Selected P-CSCF name among provided in step 10 based on priority and weight RFC 2728[56]
QCLASS=	IN
QTYPE=	AAAA

Case 2: steps 7 to 10 not executed:

Field	Value/Remarks
OPCODE=	SQUERY
QNAME=	Selected P-CSCF name among addresses provided in step 4 or 6.
QCLASS=	IN
QTYPE=	AAAA

Step 12: DNS AAAA Response

Field	Value/Remarks
OPCODE=	SQUERY, RESPONSE, AA
QNAME=	Same as received in AAAA Query
QCLASS=	IN
QTYPE=	AAAA
AAAA records	Includes resolved IP address(es).

7.6.5 Test requirements

1. In step 1, UE sends PDP Context Request message.
2. After step 2, UE shall either ignore the received address, or use the address received.
3. If UE ignores P-CSCF address in step 2, will send DHCP query in step 3
4. After step 4 and 6, if P-CSCF IPv6 address is received UE will consider P-CSCF discovery procedure successful, else will initiate DNS query for domain address to IPv6 address translation.
- 5) After step 12, UE will consider P-CSCF discovery procedure to be successful and should initiate Registration procedure to IMS services.

8 Registration

8.1 Initial registration

8.1.1 Definition and applicability

Test to verify that the UE can correctly register to IMS services when equipped with UICC that contains either both ISIM and USIM applications or only USIM application but not ISIM. The process consists of sending initial registration to S-CSCF via the P-CSCF discovered, authenticating the user and finally subscribing the registration event package for the registered default public user identity.

8.1.2 Conformance requirement

If there is an ISIM and a USIM application on a UICC, then the ISIM application shall always be used for IMS authentication, as described in 3GPP TS 33.203.

In case the UE is loaded with a UICC that contains the ISIM application, it will be preconfigured with all the necessary parameters to initiate the registration to the IM CN subsystem. These parameters include:

- the private user identity;
- one or more public user identities; and
- the home network domain name used to address the SIP REGISTER request

In case the UE is loaded with a UICC that does not contain the ISIM application, the UE shall:

- generate a private user identity;
- generate a temporary public user identity; and
- generate a home network domain name to address the SIP REGISTER request to.

All these three parameters are derived from the IMSI parameter in the USIM, according to the procedures described in 3GPP TS 23.003. If the UICC does not contain the ISIM application, the UE shall derive new values every time the UICC is changed, and shall discard existing values if the UICC is removed.

The temporary public user identity is only used in REGISTER requests, i.e. initial registration, re-registration, mobile-initiated deregistration. After a successful registration, the UE will get the associated public user identities, and the UE may use any of them in subsequent non-REGISTER requests.

The UE shall not reveal to the user the temporary public user identity if the temporary public user identity is barred. The temporary public user identity is not barred if received by the UE in the P-Associated-URI header.

The UE can register a public user identity at any time that a valid PDP context exists. However, the UE shall only initiate a new registration procedure when it has received a final response from the registrar for the ongoing registration, or the previous REGISTER request has timed out.

The UE shall send only the initial REGISTER requests to the port advertised to the UE during the P-CSCF discovery procedure. If the UE does not receive any specific port information during the P-CSCF discovery procedure, the UE shall send the initial REGISTER request to the SIP default port values as specified in RFC 3261.

A REGISTER request may be protected using a security association, see 3GPP TS 33.203, established as a result of an earlier registration.

The UE shall extract or derive from the UICC a public user identity, the private user identity, and the domain name to be used in the Request-URI in the registration, according to the procedures described in 3GPP TS 24.229 subclause 5.1.1.1A. A public user identity may be input by the end user.

On sending a REGISTER request, the UE shall populate the header fields as follows:

- a) the Authorization header, with:
 - the username directive, set to the value of the private user identity;
 - the realm directive, set to the domain name of the home network;
 - the uri directive, set to the SIP URI of the domain name of the home network;
 - the nonce directive, set to an empty value; and
 - the response directive, set to an empty value.
- b) the From header set to the SIP URI that contains the public user identity to be registered;
- c) the To header set to the SIP URI that contains the public user identity to be registered;
- d) the Contact header set to include SIP URI(s) containing the IP address of the UE in the hostport parameter or FQDN. If the REGISTER request is protected by a security association, the UE shall also include the protected server port value in the hostport parameter;
- e) the Via header containing the IP address or FQDN of the UE in the sent-by field. If the REGISTER request is protected by a security association, the UE shall also include the protected server port value in the sent-by field.

NOTE 1: If the UE specifies its FQDN in the host parameter in the Contact header and in the sent-by field in the Via header, then it has to ensure that the given FQDN will resolve (e.g., by reverse DNS lookup) to the IP address that is bound to the security association.

NOTE 2: The UE associates two ports, a protected client port and a protected server port, with each pair of security association. For details on the selection of the protected port value see 3GPP TS 33.203.

- f) the Expires header, or the expires parameter within the Contact header, set to the value of 600 000 seconds as the value desired for the duration of the registration;

NOTE 3: The registrar (S-CSCF) might decrease the duration of the registration in accordance with network policy. Registration attempts with a registration period of less than a predefined minimum value defined in the registrar will be rejected with a 423 (Interval Too Brief) response.

- g) a Request-URI set to the SIP URI of the domain name of the home network;

- h) the Security-Client header field set to specify the security mechanism the UE supports, the IPsec layer algorithms the UE supports and the parameters needed for the security association setup. The UE shall support the setup of two pairs of security associations as defined in 3GPP TS 33.203. The syntax of the parameters needed for the security association setup is specified in Annex H of 3GPP TS 33.203. The UE shall support the "ipsec-3gpp" security mechanism, as specified in RFC 3329. The UE shall support the HMAC-MD5-96 (RFC 2403) and HMAC-SHA-1-96 (RFC 2404) IPsec layer algorithms, and shall announce support for them according to the procedures defined in RFC 3329;
- i) the Supported header containing the option tag "path"; and
- j) if a security association exists, a P-Access-Network-Info header that contains information concerning the access network technology and, if applicable, the cell ID.

When a 401 (Unauthorized) response to a REGISTER is received the UE shall behave as described in 3GPP TS 24.229 subclause 5.1.1.5.1.

Authentication is achieved via the registration and re-registration procedures. When the network requires authentication or re-authentication of the UE, the UE will receive a 401 (Unauthorized) response to the REGISTER request.

On receiving a 401 (Unauthorized) response to the REGISTER request, the UE shall:

- 1) extract the RAND and AUTN parameters;
- 2) check the validity of a received authentication challenge, as described in 3GPP TS 33.203 i.e. the locally calculated XMAC must match the MAC parameter derived from the AUTN part of the challenge; and the SQN parameter derived from the AUTN part of the challenge must be within the correct range; and
- 3) check the existence of the Security-Server header as described in RFC 3329. If the header is not present or it does not contain the parameters required for the setup of the set of security associations (see annex H of 3GPP TS 33.203), the UE shall abandon the authentication procedure and send a new REGISTER request with a new Call-ID.

In the case that the 401 (Unauthorized) response to the REGISTER request is deemed to be valid the UE shall:

- 1) calculate the RES parameter and derive the keys CK and IK from RAND as described in 3GPP TS 33.203;
- 2) set up a temporary set of security associations based on the static list and parameters it received in the 401 (Unauthorized) response and its capabilities sent in the Security-Client header in the REGISTER request. The UE sets up the temporary set of security associations using the most preferred mechanism and algorithm returned by the P-CSCF and supported by the UE and using IK as the shared key. The UE shall use the parameters received in the Security-Server header to setup the temporary set of security associations. The UE shall set a temporary SIP level lifetime for the temporary set of security associations to the value of reg-await-auth timer; and
- 3) send another REGISTER request using the temporary set of security associations to protect the message. The header fields are populated as defined for the initial request, with the addition that the UE shall include an Authorization header containing the private user identity and the authentication challenge response calculated by the UE using RES and other parameters, as described in RFC 3310. The UE shall also insert the Security-Client header that is identical to the Security-Client header that was included in the previous REGISTER request (i.e. the REGISTER request that was challenged with the received 401 (Unauthorized) response). The UE shall also insert the Security-Verify header into the request, by mirroring in it the content of the Security-Server header received in the 401 (Unauthorized) response. The UE shall set the Call-ID of the integrity protected REGISTER request which carries the authentication challenge response to the same value as the Call-ID of the 401 (Unauthorized) response which carried the challenge.

On receiving the 200 (OK) response for the integrity protected REGISTER request, the UE shall:

- change the temporary set of security associations to a newly established set of security associations, i.e. set its SIP level lifetime to the longest of either the previously existing set of security associations SIP level lifetime, or the lifetime of the just completed registration plus 30 seconds; and
- use the newly established set of security associations for further messages sent towards the P-CSCF as appropriate.

NOTE: In this case, the UE will send requests towards the P-CSCF over the newly established set of security associations. Responses towards the P-CSCF that are sent via UDP will be sent over the newly established set of security associations. Responses towards the P-CSCF that are sent via TCP will be sent over the same set of security associations that the related request was received on.

When the first request or response protected with the newly established set of security associations is received from the P-CSCF, the UE shall delete the old set of security associations and related keys it may have with the P-CSCF after all SIP transactions that use the old set of security associations are completed.

On receiving the 200 (OK) response to the REGISTER request, the UE shall:

- a) store the expiration time of the registration for the public user identities found in the To header value;
- b) store the list of URIs contained in the P-Associated-URI header value. This list contains the URIs that are associated to the registered public user identity;
- c) store as the default public user identity the first URI on the list of URIs present in the P-Associated-URI header;
- d) treat the identity under registration as a barred public user identity, if it is not included in the P-Associated-URI header;
- e) store the list of Service-Route headers contained in the Service-Route header, in order to build a proper preloaded Route header value for new dialogs; and
- f) set the security association lifetime to the longest of either the previously existing security association lifetime (if available), or the lifetime of the just completed registration plus 30 seconds.

Upon receipt of a 2xx response to the initial registration, the UE shall subscribe to the reg event package for the public user identity registered at the users registrar (S-CSCF) as described in RFC 3680.

The UE shall use the default public user identity for subscription to the registration-state event package, if the public user identity that was used for initial registration is a barred public user identity. The UE may use either the default public user identity or the public user identity used for initial registration for the subscription to the registration-state event package, if the initial public user identity that was used for initial registration is not barred.

On sending a SUBSCRIBE request, the UE shall populate the header fields as follows:

- a) a Request URI set to the resource to which the UE wants to be subscribed to, i.e. to a SIP URI that contains the public user identity used for subscription;
- b) a From header set to a SIP URI that contains the public user identity used for subscription;
- c) a To header set to a SIP URI that contains the public user identity used for subscription;
- d) an Event header set to the "reg" event package;
- e) an Expires header set to 600 000 seconds as the value desired for the duration of the subscription; and
- f) a P-Access-Network-Info header that contains information concerning the access network technology and, if applicable, the cell ID.

The procedures of this subclause are general to all requests and responses, except those for the REGISTER method.

When the UE sends any request, the UE shall:

- include the protected server port in the Via header entry relating to the UE; and
- include the protected server port in any Contact header that is otherwise included.

....

The UE shall insert a P-Access-Network-Info header into any request for a dialog, any subsequent request (except ACK requests and CANCEL requests) or response (except CANCEL responses) within a dialog or any request for a standalone method. This header shall contain information concerning the access network technology and, if applicable, the cell ID.

The UE shall build a proper preloaded Route header value for all new dialogs and standalone transactions. The UE shall build a list of Route header values made out of, in this order, the P-CSCF URI (containing the IP address or the FQDN learnt through the P-CSCF discovery procedures, and the protected port learnt during the registration procedure), and the values received in the Service-Route header saved from the 200 (OK) response to the last registration or re-registration.

Upon receipt of a 2xx response to the SUBSCRIBE request, the UE shall store the information for the established dialog and the expiration time as indicated in the Expires header of the received response.

Upon receipt of a NOTIFY request on the dialog which was generated during subscription to the reg event package the UE shall perform the following actions:

- if a state attribute "active", i.e. registered is received for one or more public user identities, the UE shall store the indicated public user identities as registered;
- if a state attribute "terminated", i.e. deregistered is received for one or more public user identities, the UE shall store the indicated public user identities as deregistered.

NOTE: There may be public user identities which are automatically registered within the registrar (S-CSCF) of the user upon registration of one public user identity. Usually these automatically or implicitly registered public user identities belong to the same service profile of the user and they might not be available within the UE. The implicitly registered public user identities may also belong to different service profiles. The here-described procedures provide a different mechanism (to the 200 (OK) response to the REGISTER request) to inform the UE about these automatically registered public user identities.

Reference(s)

3GPPTS 24.229[10], clauses 5.1.1.1A, 5.1.1.2, 5.1.1.3, 5.1.1.5.1, 5.1.2.1 and 5.1.2A.1

8.1.3 Test purpose

- 1) To verify that UE correctly derives a private user identity, a temporary public user identity and a home network domain name from the IMSI parameter in the USIM, according to the procedures described in 3GPP TS 23.003 [32] clause 13 or alternatively uses the values retrieved from ISIM; and
- 2) To verify that the UE sends a correctly composed initial REGISTER request to S-CSCF via the discovered P-CSCF, according to 3GPP TS 24.229 [10] clause 5.1.1.2; and
- 3) To verify that after receiving a valid 401 (Unauthorized) response from S-CSCF for the initial REGISTER sent, the UE correctly authenticates itself by sending another REGISTER request with correctly composed Authorization header using AKAv1-MD5 algorithm (as described in RFC 3310 [17]); and
- 4) To verify that the UE announces to support the "ipsec-3gpp" security mechanism together with HMAC-MD5-96 (RFC 2403 [28]) and HMAC-SHA-1-96 (RFC 2404 [29]) IPsec layer algorithms according to the procedures defined in RFC 3329 [21]; and
- 5) To verify that the UE supports both the HMAC-MD5-96 (RFC 2403 [28]) and HMAC-SHA-1-96 (RFC 2404 [29]) IPsec layer algorithms for integrity protection and uses the one that is preferred by the P-CSCF according to the procedures defined in RFC 3329 [21]; and
- 6) To verify that the UE sets up two pairs of security associations as defined in 3GPP TS 33.203 [14] clause 7 and uses those for sending the REGISTER request to authenticate itself and for sending any other subsequent request; and
- 7) To verify that after receiving a valid 200 OK response from S-CSCF for the REGISTER sent for authentication, the UE stores the default public user identity and information about barred user identities; and
- 8) To verify that after receiving a valid 200 OK response from S-CSCF for the REGISTER sent for authentication, the UE subscribes to the reg event package for the public user identity registered at the users registrar (S-CSCF) as described in RFC 3680 [22]; and
- 9) To verify that the UE uses the default public user identify for subscription to the registration-state event package, when the public user identity that was used for initial registration is a barred public user identity; and

- 10) To verify that the UE uses the stored service route for routing the SUBSCRIBE sent; and
- 11) To verify that after receiving a valid 200 OK response from S-CSCF to the SUBSCRIBE sent for registration event package, the UE maintains the generated dialog; and
- 12) To verify that after receiving a valid NOTIFY for the registration event package, the UE will update and store the registration state of the indicated public user identities accordingly (as specified in RFC 3680 [22] clause 5); and
- 13) To verify that the UE responds the received valid NOTIFY with 200 OK.

8.1.4 Method of test

Initial conditions

UE contains either ISIM and USIM applications or only USIM application on UICC. UE is not registered to IMS services, but has an active PDP context and has discovered the SS as P-CSCF by executing the generic test procedure in Annex C.2 up to step 3.

SS is configured with the IMSI within the USIM application, the home domain name, public and private user identities together with the shared secret key of IMS AKA algorithm, related to the IMS private user identity (IMPI) that is configured on the UICC card equipped into the UE. SS is listening to SIP default port 5060 for both UDP and TCP protocols. SS is able to perform AKAv1-MD5 authentication algorithm for that IMPI, according to 3GPP TS 33.203 [14] clause 6.1 and RFC 3310 [17].

Related ICS/IXIT Statement(s)

-

Test procedure

- 1) IMS registration is initiated on the UE. SS waits the UE to send an initial REGISTER request.
- 2) SS responds to the initial REGISTER request with a valid 401 Unauthorized response, headers populated according to the 401 response common message definition.
- 3) SS waits for the UE to set up a temporary set of security associations and send another REGISTER request, over those security associations.
- 4) SS responds to the second REGISTER request with valid 200 OK response, sent over the same temporary set of security associations that the UE used for sending the REGISTER request. SS shall populate the headers of the 200 OK response according to the 200 response for REGISTER common message definition.
- 5) SS waits for the UE to send a SUBSCRIBE request over the newly established security associations.
- 6) SS responds to the SUBSCRIBE request with a valid 200 OK response, headers populated according to the 200 response for SUBSCRIBE common message definition.
- 7) SS sends UE a NOTIFY request for the subscribed registration event package. In the request the Request URI, headers and the request body shall be populated according to the NOTIFY common message definition.
- 8) SS waits for the UE to respond the NOTIFY with 200 OK response.

NOTE: This test case shall be run twice in order to test that the UE correctly supports both HMAC-MD5-96 and HMAC-SHA-1-96 algorithms. For each test round the name of the corresponding algorithm shall be configured into px_IpSecAlgorithm PIXIT.

Expected sequence

Step	Direction		Message	Comment
	UE	SS		
1		→	REGISTER	UE sends initial registration for IMS services.
2		←	401 Unauthorized	The SS responds with a valid AKAv1-MD5 authentication challenge and security mechanisms supported by the network.
3		→	REGISTER	UE completes the security negotiation procedures, sets up a temporary set of SAs and uses those for sending another REGISTER with AKAv1-MD5 credentials.
4		←	200 OK	The SS responds with 200 OK.
5		→	SUBSCRIBE	UE subscribes to its registration event package.
6		←	200 OK	The SS responds SUBSCRIBE with 200 OK
7		←	NOTIFY	The SS sends initial NOTIFY for registration event package, containing full registration state information for the registered public user identity in the XML body
8		→	200 OK	The UE responds the NOTIFY with 200 OK

Specific Message Contents

REGISTER (Step 1)

Use the default message 'REGISTER' in annex A.1.1 with condition A1 "Initial unprotected REGISTER"

401 Unauthorized for REGISTER (Step 2)

Use the default message '401 Unauthorized for REGISTER' in annex A.1.2

REGISTER (Step 3)

Use the default message 'REGISTER' in annex A.1.1 with condition A2 "Subsequent REGISTER sent over security associations"

200 OK for REGISTER (Step 4)

Use the default message '200 OK for REGISTER' in annex A.1.3

SUBSCRIBE (Step 5)

Use the default message 'SUBSCRIBE for reg-event package' in annex A.1.4

200 OK for SUBSCRIBE (Step 6)

Use the default message '200 OK for SUBSCRIBE' in annex A.1.5

NOTIFY (Step 7)

Use the default message 'NOTIFY for reg-event package' in annex A.1.6

200 OK for NOTIFY (Step 8)

Use the default message '200 OK for other requests than REGISTER or SUBSCRIBE' in annex A.3.1

8.1.5 Test requirements

Step 3: SS shall check that in accordance to the 3GPP TS 24.229 [10] clause 5.1.1.5 the UE sends another REGISTER request as follows:

- a) the UE sets up the temporary set of security associations between the ports announced in Security-Client header (UE) in the REGISTER request and Security-Server header (SS) in the 401 Unauthorized response; and
- b) the UE uses the most preferred mechanism and algorithm returned by the SS and supported by the UE for the temporary set of security associations; and
- c) the UE uses IK derived from RAND as the shared key for integrity protection for the temporary set of security associations; and
- d) the UE sends the second REGISTER over the temporary set of security associations; and

Step 5: SS shall check that, in accordance to the 3GPP TS 24.229 [10] clause 5.1.1.3, the UE sends a SUBSCRIBE request for registration event package over the newly established set of security associations.

NOTE: If the UE specifies its FQDN in the host parameter in the Contact header and in the sent-by field in the Via header (within any of the request sent by the UE), then SS has to ensure that the given FQDN will resolve (e.g., by reverse DNS lookup) to the IP address that is bound to the security association (or to the unprotected port in the initial REGISTER).

8.2 User Initiated Re-Registration

8.2.1 Definition

Test to verify that the UE can re-register a previously registered public user identity at any time. This process is described in 3GPPTS 24.229 [10], clause 5.1.1.4

8.2.2 Conformance requirement

Unless either the user or the application within the UE has determined that a continued registration is not required the UE shall reregister the public user identity either 600 seconds before the expiration time if the initial registration was for greater than 1200 seconds, or when half of the time has expired if the initial registration was for 1200 seconds or less.

The UE shall protect the REGISTER request using a security association, see 3GPP TS 33.203, established as a result of an earlier registration, if IK is available.

The UE shall extract or derive from the UICC a public user identity, the private user identity, and the domain name to be used in the Request-URI in the registration, according to the procedures described in subclause 5.1.1.1A.

On sending a REGISTER request that does not contain a challenge response, the UE shall populate the header fields as follows:

- a) an Authorization header, with with:
 - the username directive set to the value of the private user identity;
 - the realm directive, set to the domain name of the home network;
 - the uri directive, set to the SIP URI of the domain name of the home network;
 - the nonce directive, set to last received nonce value; and
 - the response directive, set to the last calculated response;
- b) a From header set to the SIP URI that contains the public user identity to be registered;
- c) a To header set to the SIP URI that contains the public user identity to be registered;
- d) a Contact header set to include SIP URI(s) that contain(s) in the hostport parameter the IP address of the UE or FQDN and protected server port value bound to the security association;
- e) a Via header containing the IP address or FQDN of the UE in the sent-by field and the protected server port value bound to the security association;

NOTE 1: If the UE specifies its FQDN in the host parameter in the Contact header and in the sent-by field in the Via header, then it has to ensure that the given FQDN will resolve (e.g., by reverse DNS lookup) to the IP address that is bound to the security association.

NOTE 2: The UE associates two ports, a protected client port and a protected server port, with each pair of security associations. For details on the selection of the protected port value see 3GPP TS 33.203.

f) an Expires header, or an expires parameter within the Contact header, set to 600 000 seconds as the value desired for the duration of the registration;

NOTE 3: The registrar (S-CSCF) might decrease the duration of the registration in accordance with network policy. Registration attempts with a registration period of less than a predefined minimum value defined in the registrar will be rejected with a 423 (Interval Too Brief) response.

g) a Request-URI set to the SIP URI of the domain name of the home network;

h) a Security-Client header field, set to specify the security mechanism it supports, the IPsec layer algorithms it supports and the new parameter values needed for the setup of two new pairs of security associations. For further details see 3GPP TS 33.203 and RFC 3329;

i) a Security-Verify header that contains the content of the Security-Server header received in the 401 (Unauthorized) response of the last successful authentication;

j) the Supported header containing the option tag "path"; and

k) the P-Access-Network-Info header that contains information concerning the access network technology and, if applicable, the cell ID (see subclause 7.2A.4).

On receiving the 200 (OK) response to the REGISTER request, the UE shall:

a) store the new expiration time of the registration for this public user identity found in the To header value;

b) store the list of URIs contained in the P-Associated-URI header value. This list contains the URIs that are associated to the registered public user identity;

c) store the list of Service-Route headers contained in the Service-Route header, in order to build a proper preloaded Route header value for new dialogs; and

d) set the security association lifetime to the longest of either the previously existing security association lifetime, or the lifetime of the just completed registration plus 30 seconds.

When a 401 (Unauthorized) response to a REGISTER is received the UE shall behave as described in subclause 5.1.1.5.1. On receiving a 423 (Interval Too Brief) response to the REGISTER request, the UE shall:

- send another REGISTER request populating the Expires header or the expires parameter with an expiration timer of at least the value received in the Min-Expires header of the 423 (Interval Too Brief) response.

NOTE: There may be public user identities which are automatically registered within the registrar (S-CSCF) of the user upon registration of one public user identity. Usually these automatically or implicitly registered public user identities belong to the same service profile of the user and they might not be available within the UE. The implicitly registered public user identities may also belong to different service profiles. The here-described procedures provide a different mechanism (to the 200 (OK) response to the REGISTER request) to inform the UE about these automatically registered public user identities.

Reference(s)

3GPP TS 24.229[10], clauses 5.1.1.4

8.2.3 Test purpose

1) To verify that the UE can re-register a previously registered public user identity at either 600 seconds before the expiration time if the initial registration was for greater than 1200 seconds, or when half of the time has expired if the initial registration was for 1200 seconds or less; and

- 2) Extract or derive from the UICC a public user identity, the private user identity, and the domain name to be used in the Request-URI in the registration; and
- 3) To verify that the UE populates the header field in the REGISTER request with From, To, Via, Contact, Authorization, Expires, Security-Client, Security-verify, Supported, and P-Access-Network-Info headers; and
- 4) Upon receiving 200 OK for REGISTER, the UE shall store the new expiration time of the registration for this public user identity, the list of URIs contained in the P-Associated-URI header value and use these values in the next re-register request.

8.2.4 Method of test

Initial conditions

UE contains either ISIM and USIM applications or only USIM application on UICC. UE is not registered to IMS services, but has an active PDP context and has discovered the SS as P-CSCF by executing the generic test procedure in Annex C.2 up to step 3.

SS is configured with the shared secret key of IMS AKA algorithm, related to the IMS private user identity (IMPI) configured on the UICC card equipped into the UE. SS is able to perform AKAv1-MD5 authentication algorithm for that IMPI, according to 3GPP TS 33.203 [14] clause 6.1 and RFC 3310 [17].

Related ICS/IXIT Statement(s)

-

Test procedure

- 1-8) The same procedure as in subclause 8.1.4 are used with the exception that the SS sets the expiration time to 120 seconds in Step 4.
- 9) Before half of the time has expired from the initial registration SS receives re-register message request with the From, To, Via, Contact, Authorization, Expires, Security-Client, Security-verify, Supported, and P-Access-Network-Info header fields.
- 10) SS responds to the REGISTER request with valid 200 OK response with the list of URIs contained in the P-Associated-URI header value, the new expiration time (1200 seconds) of the registration for this public user identity,.
- 11) SS waits for the REGISTER request and verifies it is received at least 600 seconds before the expected expiration time.
- 12) SS responds to the REGISTER request with valid 200 OK response with the list of URIs contained in the P-Associated-URI header value, the new expiration time (1800 seconds) of the registration for this public user identity.
- 13) SS waits for the REGISTER request and verifies it is received at least 600 seconds before the expected expiration time.
- 14) SS responds to the REGISTER request with valid 200 OK response. SS shall populate the headers of the 200 OK response according to the 200 response for REGISTER common message definition.

Expected sequence

Step	Direction		Message	Comment
	UE	SS		
1-8			Messages in Initial Registration Test case (subclause 8.1.4)	The same messages as in subclause 8.1.4 are used with the exception that in Step 4, the SS responds with 200 OK indicating 120 seconds expiration time.
9		→	REGISTER	The SS receives REGISTER from the UE 60 seconds before the expiration time set in the initial registration request.
106		←	200 OK	The SS responds with 200 OK indicating 1200 seconds expiration time.
11		→	REGISTER	The SS receives REGISTER from the UE 600 seconds before the expiration time set in step 6.
128		←	200 OK	The SS responds with 200 OK indicating 1800 seconds expiration time.
13		→	REGISTER	The SS receives REGISTER from the UE 600 seconds before the expiration time set in step 8
14		←	200 OK	The SS responds with 200 OK indicating the default expiration time.

Specific Message Contents

Messages in Step 1-8

Messages in Step 1-8 are the same as those specified in subclause 8.1.4 with the following exception for the 200 OK for REGISTER in Step 4:

Use the default message 'REGISTER' in annex A.1.1 with condition A1 "Subsequent REGISTER sent over security associations" and with the following exceptions:

Header/param	Value/remark
Contact expires	120

REGISTER (Step 9)

Use the default message 'REGISTER' in annex A.1.1 with condition A2 "Subsequent REGISTER sent over security associations" and with the following exceptions:

Header/param	Value/remark
Security-Client	
spi-c	new SPI number of the inbound SA at the protected client port
spi-s	new SPI number of the inbound SA at the protected server port
port-c	new protected client port needed for the setup of new pairs of security associations
port-s	Same value as in the previous REGISTERs

200 OK for REGISTER (Step 10)

Use the default message '200 OK for REGISTER' in annex A.1.3 with the following exceptions:

Header/param	Value/remark
Contact expires	1200

REGISTER (Step 11)

Use the default message 'REGISTER' in annex A.1.1 with condition A2 "Subsequent REGISTER sent over security associations" and with the following exceptions:

Header/param	Value/remark
Security-Client	
spi-c	new SPI number of the inbound SA at the protected client port, may or may not be the same as in step 1
spi-s	new SPI number of the inbound SA at the protected server port, may or may not be the same as in step 1
port-c	new protected client port needed for the setup of new pairs of security associations, may or may not be the same as in step 1
port-s	Same value as in the previous REGISTERs

200 OK for REGISTER (Step 12)

Use the default message '200 OK for REGISTER' in annex A.1.3 with the following exceptions:

Header/param	Value/remark
Contact	
expires	1800

REGISTER (Step 13)

Use the default message 'REGISTER' in annex A.1.1 with condition A2 "Subsequent REGISTER sent over security associations" and with the following exceptions:

Header/param	Value/remark
Security-Client	
spi-c	new SPI number of the inbound SA at the protected client port, may or may not be the same as in step 1 and 3
spi-s	new SPI number of the inbound SA at the protected server port, may or may not be the same as in step 1 and 3
port-c	new protected client port needed for the setup of new pairs of security associations, may or may not be the same as in step 1 or 3
port-s	Same value as in the previous REGISTERs

200 OK for REGISTER (Step 14)

Use the default message '200 OK for REGISTER' in annex A.1.3.

8.2.5 Test requirements

1. The UE shall in step 9 send the REGISTER request within 60 seconds from the time instant that it receives 200 OK in step 4 from the SS.
2. The UE shall in step 11 send the REGISTER request within 600 seconds from the time instant that it receives 200 OK from the SS in step 10.
3. The UE shall in step 13 send the REGISTER request within 1200 seconds from the time instant that it receives 200 OK from the SS in step 12.

8.3 Mobile Initiated Deregistration

8.3.1 Definition and applicability

Test to verify that the UE can perform a correct de-registration procedure. This process is described in 3GPPTS 24.229 [10], clause 5.1.1.6

8.3.2 Conformance requirement

The UE can deregister a previously registered public user identity at any time.

The UE shall integrity protect the REGISTER request using a security association, see 3GPP TS 33.203, established as a result of an earlier registration, if one is available.

The UE shall extract or derive from the UICC a public user identity, the private user identity, and the domain name to be used in the Request-URI in the registration, according to the procedures described in subclause 5.1.1.1A.

Prior to sending a REGISTER request for deregistration, the UE shall release all dialogs related to the public user identity that is going to be deregistered or to one of the implicitly registered public user identities.

On sending a REGISTER request, the UE shall populate the header fields as follows:

- a) the Authorization header, with;
 - the username directive, set to the value of the private user identity;
 - the realm directive, set to the domain name of the home network;
 - the uri directive, set to the SIP URI of the domain name of the home network;
 - the nonce directive, set to last received nonce value; and
 - the response directive, set to the last calculated response value;
- b) the From header set to the SIP URI that contains the public user identity to be deregistered;
- c) the To header set to the SIP URI that contains the public user identity to be deregistered;
- d) the Contact header set to either the value of "*" or SIP URI(s) that contain(s) in the hostport parameter the IP address of the UE or FQDN and the protected server port value bound to the security association;
- e) a Via header containing the IP address or FQDN of the UE in the sent-by field and the protected server port value bound to the security association;

NOTE 1: If the UE specifies its FQDN in the host parameter in the Contact header and in the sent-by field in the Via header, then it has to ensure that the given FQDN will resolve (e.g., by reverse DNS lookup) to the IP address that is bound to the security association.

- f) the Expires header, or the expires parameter of the Contact header, set to the value of zero, appropriate to the deregistration requirements of the user;
- g) a Request-URI set to the SIP URI of the domain name of the home network; and
- h) a P-Access-Network-Info header that contains information concerning the access network technology and, if applicable, the cell ID (see subclause 7.2A.4).

On receiving the 200 (OK) response to the REGISTER request, the UE shall remove all registration details relating to this public user identity.

If there are no more public user identities registered, the UE shall delete the security associations and related keys it may have towards the P-CSCF.

If all public user identities are deregistered and the security association is removed, then the UE shall consider subscription to the reg event package cancelled (i.e. as if the UE had sent a SUBSCRIBE request with an Expires header containing a value of zero).

NOTE: When the UE has received the 200 (OK) response for the REGISTER request of the only public user identity currently registered with its associated set of implicitly registered public user identities (i.e. no other is registered), the UE removes the security association established between the P-CSCF and the UE. Therefore further SIP signalling (e.g. the NOTIFY request containing the deregistration event) will not reach the UE.

Reference(s)

3GPPTS 24.229[10], clause 5.1.1.6

8.3.3 Test purpose

- 1) To verify that the UE sends a correctly composed initial REGISTER request with an Expires header or expires parameter set to 0 to S-CSCF via the discovered P-CSCF, according to 3GPP TS 24.229 [10] clause 5.1.1.6.

8.3.4 Method of test

Initial conditions

UE contains either ISIM and USIM applications or only USIM application on UICC. UE is registered to IMS services by performing the generic registration test procedure in Annex C up to the last step.

SS is configured with the IMSI within the USIM application, the home domain name, public and private user identities together with the shared secret key of IMS AKA algorithm, related to the IMS private user identity (IMPI) that is configured on the UICC card equipped into the UE. SS is listening to SIP default port 5060 for both UDP and TCP protocols. SS is able to perform AKAv1-MD5 authentication algorithm for that IMPI, according to 3GPP TS 33.203[14] clause 6.1 and RFC 3310 [17].

Related ICS/IXIT Statement(s)

Method of triggering the UE to deregister from IMS services Yes/No

Test procedure

- 1) The UE is triggered by MMI to initiate a deregistration procedure
- 2) IMS deregistration is initiated on the UE. SS waits the UE to send a REGISTER request, in accordance to 3GPP TS 24.229 [10], clause 5.1.1.6

Expected sequence

Step	Direction		Message	Comment
	UE	SS		
1	→		REGISTER	UE sends deregistration for IMS services. (Register request with Expires header set to 0).
2	←		200 OK	The SS responds REGISTER with 200 OK

Specific message contents

REGISTER (step 1)

SS shall check that in accordance to the 3GPP TS 24.229 [10] clause 5.1.1.6 the UE sends an initial REGISTER request where the Request-URI and the headers have been correctly populated according to the REGISTER common message definition in annex A.1.1condition A2 with the following exception:

Header/param	Value/remark
Contact	
addr-spec	SIP URI with IP address or FQDN and protected server port of UE or *
expires	0 (if present, see Rule)
Expires	(if present, see Rule)
delta-seconds	0

Rule: if the addr-spec parameter of **Contact** header is *, expires parameter must not be present and **Expires** header is mandatory, if the addr-spec parameter of **Contact** header is not *, expires parameter is mandatory and **Expires** header must not be present.

8.3.5 Test Requirements

SS shall check in step 1 that the de-register request sent by the UE have the headers correctly populated as per the default message 'REGISTER' in annex A.1.1condition A2, except for the headers described in 8.3.4.

8.4 Invalid behaviour- 423 Interval too brief

8.4.1 Definition and applicability

Test to verify that the UE another REGISTER request using a correct expiration timer when a registration attempt was rejected with a 423 (Interval Too Brief) response.

8.4.2 Conformance requirement

On receiving a 423 (Interval Too Brief) too brief response to the REGISTER request, the UE shall:

- send another REGISTER request populating the Expires header or the expires parameter with an expiration timer of at least the value received in the Min-Expires header of the 423 (Interval Too Brief) response.

Reference(s)

3G TS 24.229[10], clause 5.1.1.2

8.4.3 Test purpose

To verify that after receiving a valid 423 (Interval Too Brief) response to the REGISTER request, the UE sends another REGISTER request populating the Expires header or the expires parameter in the Contact header with an expiration timer of at least the value received in the Min-Expires header of the 423 (Interval Too Brief) response.

8.4.4 Method of test

Initial conditions

UE contains either ISIM and USIM applications or only USIM application on UICC. UE is not registered to IMS services, but has an active PDP context and has discovered the SS as P-CSCF by executing the generic test procedure in Annex C.2 up to step 3.

SS is configured with the IMSI within the USIM application, the home domain name, public and private user identities together with the shared secret key of IMS AKA algorithm, related to the IMS private user identity (IMPI) that is configured on the UICC card equipped into the UE. SS is listening to SIP default port 5060 for both UDP and TCP protocols.

Related ICS/IXIT Statement(s)

<To be added>

Test procedure

- 1 IMS registration is initiated on the UE. SS waits for the UE to send an initial REGISTER request.
- 2 SS responds to the initial REGISTER request with a 423 (Interval Too Brief) response because the expiration time of the resource refreshed by the request is too short.
- 3 SS waits for the UE to send another REGISTER request populating the Expires header or the expires parameter in the Contact header with an expiration timer of at least the value received in the Min-Expires header of the 423 (Interval Too Brief) response.

Expected sequence

Step	Direction		Message	Comment
	UE	SS		
1		→	REGISTER	UE sends initial registration for IMS services.
2		←	423 Interval Too Brief	The SS responds with a 423 (Interval Too Brief) too brief response to the REGISTER request with T value in Min-Expires header
3		→	REGISTER	UE sends a new REGISTER request with expires parameter value set to Tmod (equal or greater to T value in Min-Expires header of 423 Interval Too Brief)

Specific Message Contents

REGISTER (Step 1)

Use the default message 'REGISTER' in annex A.1.1 with condition A1 'Initial unprotected REGISTER'.

423 Interval Too Brief for REGISTER (Step 2)

Use the default message '423 Interval Too Brief for REGISTER' in annex A.1.7 with the following exception:

Header/param	Value/remark
Min-Expires	
delta-seconds	800000 (referred to as T in the test procedure and test requirement)

REGISTER (Step 3)

Use the default message 'REGISTER' in annex A.1.1 with condition A2 "Subsequent REGISTER sent over security associations" with the following exception:

Header/param	Value/remark
Contact	
expires	800000 (referred to as Tmod in the expected sequence)

8.4.5 Test requirements

Step 3: The UE shall send another REGISTER request populating the Expires header or the expires parameter in the Contact header with an expiration timer of at least the value received in the Min-Expires header of the 423 (Interval Too Brief) response.

9 Authentication

9.1 Invalid Behaviour – MAC Parameter Invalid

9.1.1 Definition

To test that the UE when receiving an invalid 401 (Unauthorized) response to its initial REGISTER request behaves correctly. This procedure is described in 24.229 [10] clause 5.1.1.5.

9.1.2 Conformance requirement

Whenever the 200 (OK) response is not received before the temporary SIP level lifetime of the temporary set of security associations expires or a 403 (Forbidden) response is received, the UE shall consider the registration to have failed. The UE shall delete the temporary set of security associations it was trying to establish, and use the old set of security associations. The UE should send an unprotected REGISTER message according to the procedure specified in subclause 5.1.1.2 if the UE considers the old set of security associations to be no longer active at the P-CSCF.

...

When the network requires authentication of the UE, the UE will receive a 401 (Unauthorized) response to the REGISTER request.

On receiving a 401 (Unauthorized) response to the REGISTER request, the UE shall:

- 1) extract the RAND and AUTN parameters;
- 2) check the validity of a received authentication challenge, as described in 3GPP TS 33.203 i.e. the locally calculated XMAC must match the MAC parameter derived from the AUTN part of the challenge; and the SQN parameter derived from the AUTN part of the challenge must be within the correct range; and

...

If, in a 401 (Unauthorized) response, either the MAC or SQN is incorrect the UE shall respond with a further REGISTER indicating to the S-CSCF that the challenge has been deemed invalid as follows:

- in the case where the UE deems the MAC parameter to be invalid the subsequent REGISTER request shall contain noAUTS directive and an empty response directive, i.e. no authentication challenge response;
- in the case where the UE deems the SQN to be out of range, the subsequent REGISTER request shall contain the AUTS directive (see 3GPP TS 33.102).

NOTE: In the case of the SQN being out of range, a response directive can be included by the UE, based on the procedures described in RFC 3310. Whenever the UE detects any of the above cases, the UE shall:

- send the REGISTER request using an existing set of security associations, if available (see 3GPP TS 33.203);
- populate a new Security-Client header within the REGISTER request, set to specify the security mechanism it supports, the IPsec layer algorithms it supports and the parameters needed for the new security association setup; and
- not create a temporary set of security associations.

A UE shall only respond to two consecutive invalid challenges. The UE may attempt to register with the network again after an implementation specific time.

Reference(s)

3GPPTS 24.229[10], clauses 5.1.1.5

9.1.3 Test purpose

- 1) To verify that after receiving a 401 (Unauthorized) response from S-CSCF for the initial REGISTER sent, the UE checks the validity of the received authentication challenge, as described in 3GPP TS 33.203 [14] i.e. the locally calculated XMAC must match the MAC parameter derived from the AUTN part of the challenge
- 2) If, the value of MAC derived from the AUTN part of the 401 (Unauthorized) received by the UE does not match the value of locally calculated XMAC:
 - the UE responds with a further REGISTER indicating to the S-CSCF that the challenge has been deemed invalid and:
 - this subsequent REGISTER request contains no AUTS directive and an empty response directive, i.e. no authentication challenge response- populates a new Security-Client header within the REGISTER request, set to specify the security mechanism it supports, the IPsec layer algorithms it supports and the parameters needed for the new security association setup; and
 - does not create a temporary set of security associations.

9.1.4 Method of test

Initial conditions

UE contains either ISIM and USIM applications or only USIM application on UICC. UE is not registered to IMS services, but has an active PDP context and has discovered the SS as P-CSCF by executing the generic test procedure in Annex C.2 up to step 3.

SS is configured with the shared secret key of IMS AKA algorithm, related to the IMS private user identity (IMPI) configured on the UICC card equipped into the UE. SS is able to perform AKAv1-MD5 authentication algorithm for that IMPI, according to 3GPP TS 33.203 [14] clause 6.1 and RFC 3310 [17]. SS is listening to SIP default port 5060 for both UDP and TCP protocols.

Related ICS/IXIT Statement(s)

<To be added>

Test procedure

- 1) IMS registration is initiated on the UE. SS waits for the UE to send an initial REGISTER request, in accordance to 3GPP TS 24.229 [10], clause 5.1.1.2
- 2) SS responds to the initial REGISTER request with an invalid 401 Unauthorized response, headers populated as follows:
 - a) To, From, Via, CSeq, Call-ID and Content-Length headers according to RFC 3261 [15] clauses 8.2.6.2 and 20.14; and
 - b) WWW-Authentication header with AKAv1-MD5 authentication challenge according to in 3GPP TS 24.229 [10], clause 5.4.1.2.1 and RFC 3310 [17] clause 3; except that the MAC value in AUTN should be incorrect and the CK and IK values are not included
 - c) Security-Server header according to 3GPP TS 24.229 [10], clause 5.2.2 and RFC 3329 [21] clause 2.
- 3) SS waits for the UE to send a second Registration message indicating that the received 401 (Unauthorized) message was invalid
- 4) SS sends an invalid 401 (UNAUTHORIZED) message, same as in step b)

- 5) SS waits for the UE to send a second Registration message indicating that the received 401 (Unauthorized) message was invalid

Note: From this point onward the SS shall ignore any Registration message sent by the UE.

- 6) SS sends a 403 (Forbidden) message to the UE (to get the UE in a stable state at the end of the test case).

Expected sequence

Step	Direction		Message	Comment
	UE	SS		
1		→	REGISTER	UE sends initial registration for IMS services.
2		←	401 Unauthorized	The SS responds with an invalid AKAv1-MD5 authentication challenge with an invalid MAC value.
3		→	REGISTER	REGISTER request: - - contains no AUTS directive and an empty response directive, i.e. no authentication challenge response - UE populates a new Security-Client header set to specify the security mechanism it supports, the IPsec layer algorithms it supports and the parameters needed for the new security association setup
4		←	401 Unauthorized	The SS responds with an invalid AKAv1-MD5 authentication challenge with an invalid MAC value.
5		→	REGISTER	REGISTER request: - contains no AUTS directive and an empty response directive, i.e. no authentication challenge response - UE populates a new Security-Client header set to specify the security mechanism it supports, the IPsec layer algorithms it supports and the parameters needed for the new security association setup
				Note: From this point onward the SS shall ignore any Registration message sent by the UE.
6		←	403 Forbidden	The SS sends this message to get the UE in a stable state.

Specific message contents

401 UNAUTHORIZED (Steps 2 and 4)

Use the default message '401 Unauthorized for REGISTER' in annex A.1.2 with the following modification:

Header/param	Value/remark
WWW-Authenticate nonce	Base 64 encoding of RAND and AUTN, incorrect MAC value is used to generate

REGISTER (Step 1)

Use the default message 'REGISTER' in annex A.1.1 with condition A1

REGISTER (Steps 3 and 5)

Use the default message 'REGISTER' in annex A.1.1 with condition A1 with the following exceptions:

Header/param	Value/remark
CSeq value	The value sent in the previous REGISTER message + 1 (incremented)
Call-ID Call-ID	The same value as in REGISTER in Step 1
Security-Verify	Header must not appear in the request
Authorization response auth-param nonce-count	It should be present but empty If present it should not contain the auts='<base 64 encoded value>' directive value or presence of the parameter not to be checked

403 FORBIDDEN (Step 6)

Header/param	Value/remark	Rel	Reference
Status-Line SIP-Version Status-Code Reason-Phrase	<i>SIP/2.0</i> <i>403</i> <i>Forbidden</i>		RFC 3261 [15]
Via via-param	same value as received in the previous REGISTER message		RFC 3261 [15]
To addr-spec tag	same value as received in the previous REGISTER message px_ToTagRegister		RFC 3261 [15]
From addr-spec	same value as received in the previous REGISTER message		RFC 3261 [15]
Call-ID value	same value as received in the previous REGISTER message		RFC 3261 [15]
CSeq value	same value as received in the previous REGISTER message		RFC 3261 [15]
Content-length value	0		RFC 3261 [15] RFC 3261 [15]

Editor's note: This table has got a special format with 2 extra columns as this message is supposed to be moved to the default messages from the next meeting.

9.1.5 Test requirements

SS shall check in step 3 and 5 that in accordance to the 3GPP TS 24.229 [10] clause 5.1.1.5

- the UE responds with a further REGISTER indicating to the S-CSCF that the challenge has been deemed invalid and:
- sends the REGISTER request using no security associations; and
- the REGISTER request contains no AUTS directive and an empty response directive, i.e. no authentication challenge; and

- populates a new Security-Client header within the REGISTER request, set to specify the security mechanism it supports, the IPsec layer algorithms it supports and the parameters needed for the new security association setup; and
- does not create a temporary set of security associations.

9.2 Invalid Behaviour – SQN out of range

9.2.1 Definition

To test that the UE when receiving an invalid 401 (Unauthorized) response to its initial REGISTER request behaves correctly. This procedure is described in 24.229 [10] clause 5.1.1.5.

To test after a failed authentication attempt that the UE when receiving a valid 401 (Unauthorized) response to its initial REGISTER request behaves correctly. This procedure is described in 24.229 [10] clause 5.1.1.5.

9.2.2 Conformance requirement

When the network requires authentication of the UE, the UE will receive a 401 (Unauthorized) response to the REGISTER request.

On sending a REGISTER request, the UE shall populate the header fields as follows:

- a) the Authorization header, with the username field, set to the value of the private user identity;
- b) the From header set to the SIP URI that contains the public user identity to be registered;
- c) the To header set to the SIP URI that contains the public user identity to be registered;
- d) the Contact header set to include SIP URI(s) containing the IP address of the UE in the hostport parameter or FQDN. If the REGISTER request is protected by a security association, the UE shall also include the protected server port value in the hostport parameter;
- e) the Via header containing the IP address or FQDN of the UE in the sent-by field. If the REGISTER request is protected by a security association, the UE shall also include the protected server port value in the sent-by field.

NOTE 1: If the UE specifies its FQDN in the host parameter in the Contact header and in the sent-by field in the Via header, then it has to ensure that the given FQDN will resolve (e.g., by reverse DNS lookup) to the IP address that is bound to the security association.

NOTE 2: The UE associates two ports, a protected client port and a protected server port, with each pair of security association. For details on the selection of the protected port value see 3GPP TS 33.203.

- f) the Expires header, or the expires parameter within the Contact header, set to the value of 600 000 seconds as the value desired for the duration of the registration;

NOTE 3: The registrar (S-CSCF) might decrease the duration of the registration in accordance with network policy. Registration attempts with a registration period of less than a predefined minimum value defined in the registrar will be rejected with a 423 (Interval Too Brief) response.

- g) a Request-URI set to the SIP URI of the domain name of the home network;
- h) the Security-Client header field set to specify the security mechanism the UE supports, the IPsec layer algorithms the UE supports and the parameters needed for the security association setup. The UE shall support the setup of two pairs of security associations as defined in 3GPP TS 33.203 . The syntax of the parameters needed for the security association setup is specified in Annex H of 3GPP TS 33.203. The UE shall support the "ipsec-3gpp" security mechanism, as specified in RFC 3329. The UE shall support the HMAC-MD5-96 (RFC 2403) and HMAC-SHA-1-96 (RFC 2404) IPsec layer algorithms, and shall announce support for them according to the procedures defined in RFC 3329;
- i) the Supported header containing the option tag "path"; and

- j) if a security association exists, a P-Access-Network-Info header that contains information concerning the access network technology and, if applicable, the cell ID (see subclause 7.2A.4).

...

On receiving a 401 (Unauthorized) response to the REGISTER request, the UE shall:

- 1) extract the RAND and AUTN parameters;
- 2) check the validity of a received authentication challenge, as described in 3GPP TS 33.203 i.e. the locally calculated XMAC must match the MAC parameter derived from the AUTN part of the challenge; and the SQN parameter derived from the AUTN part of the challenge must be within the correct range; and
- 3) check the existence of the Security-Server header as described in RFC 3329. If the header is not present or it does not contain the parameters required for the setup of the set of security associations (see annex H of 3GPP TS 33.203), the UE shall abandon the authentication procedure and send a new REGISTER request with a new Call-ID.

In the case that the 401 (Unauthorized) response to the REGISTER request is deemed to be valid the UE shall:

- 1) calculate the RES parameter and derive the keys CK and IK from RAND as described in 3GPP TS 33.203;
- 2) set up a temporary set of security associations based on the static list and parameters it received in the 401 (Unauthorized) response and its capabilities sent in the Security-Client header in the REGISTER request. The UE sets up the temporary set of security associations using the most preferred mechanism and algorithm returned by the P-CSCF and supported by the UE and using IK as the shared key. The UE shall use the parameters received in the Security-Server header to setup the temporary set of security associations. The UE shall set a temporary SIP level lifetime for the temporary set of security associations to the value of reg-await-auth timer; and
- 3) send another REGISTER request using the temporary set of security associations to protect the message. The header fields are populated as defined for the initial request, with the addition that the UE shall include an Authorization header containing the private user identity and the authentication challenge response calculated by the UE using RES and other parameters, as described in RFC 3310. The UE shall also insert the Security-Client header that is identical to the Security-Client header that was included in the previous REGISTER request (i.e. the REGISTER request that was challenged with the received 401 (Unauthorized) response). The UE shall also insert the Security-Verify header into the request, by mirroring in it the content of the Security-Server header received in the 401 (Unauthorized) response. The UE shall set the Call-ID of the integrity protected REGISTER request which carries the authentication challenge response to the same value as the Call-ID of the 401 (Unauthorized) response which carried the challenge.

...

If, in a 401 (Unauthorized) response, either the MAC or SQN is incorrect the UE shall respond with a further REGISTER indicating to the S-CSCF that the challenge has been deemed invalid as follows:

- in the case where the UE deems the MAC parameter to be invalid the subsequent REGISTER request shall contain no AUTS directive and an empty response directive, i.e. no authentication challenge response;
- in the case where the UE deems the SQN to be out of range, the subsequent REGISTER request shall contain the AUTS directive (see 3GPP TS 33.102).

NOTE: In the case of the SQN being out of range, a response directive can be included by the UE, based on the procedures described in RFC 3310.

Whenever the UE detects any of the above cases, the UE shall:

- send the REGISTER request using an existing set of security associations, if available (see 3GPP TS 33.203);
- populate a new Security-Client header within the REGISTER request, set to specify the security mechanism it supports, the IPsec layer algorithms it supports and the parameters needed for the new security association setup; and
- not create a temporary set of security associations.

A UE shall only respond to two consecutive invalid challenges. The UE may attempt to register with the network again after an implementation specific time.

Reference(s)

3GPPTS 24.229[10], clauses 5.1.1.2 and 5.1.1.5

9.2.3 Test purpose

- 1) To verify that after receiving a 401 (Unauthorized) response for the initial REGISTER sent, the UE checks that the SQN parameter derived from the AUTN part of the authentication challenge is within the correct range
- 2) If, the value of SQN derived from the AUTN part of the 401 (Unauthorized) received by the UE is out of range the UE reacts correctly:
- 3) To verify after a failed authentication attempt if the UE on receives a valid 401 (Unauthorized) message from the network in response to the Register request sent, the UE is able to perform the authentication and registration successfully:

9.2.4 Method of test

Initial conditions

UE contains either ISIM and USIM applications or only USIM application on UICC. UE is not registered to IMS services, but has an active PDP context and has discovered the SS as P-CSCF by executing the generic test procedure in Annex C.2 up to step 3.

SS is configured with the shared secret key of IMS AKA algorithm, related to the IMS private user identity (IMPI) configured on the UICC card equipped into the UE. SS is able to perform AKAv1-MD5 authentication algorithm for that IMPI, according to 3GPP TS 33.203 [14] clause 6.1 and RFC 3310 [17]. SS is listening to SIP default port 5060 for both UDP and TCP protocols.

Related ICS/IXIT Statement(s)

<To be added>

Test procedure

- 1) IMS registration is initiated on the UE. SS waits for the UE to send an initial REGISTER request, in accordance to 3GPP TS 24.229 [10], clause 5.1.1.2
- 2) SS responds to the initial REGISTER request with an invalid 401 Unauthorized response, headers populated as follows:
 - a) To, From, Via, CSeq, Call-ID and Content-Length headers according to RFC 3261 [15] clauses 8.2.6.2 and 20.14; and
 - b) WWW-Authentication header with AKAv1-MD5 authentication challenge according to in 3GPP TS 24.229 [10], clause 5.4.1.2.1 and RFC 3310 [17] clause 3; except that the SQN value in AUTN should be out of range and the CK and IK values are not included
 - c) Security-Server header according to 3GPP TS 24.229 [10], clause 5.2.2 and RFC 3329 [21] clause 2.
- 3) SS waits for the UE to send a second Registration message indicating that the received 401 (Unauthorized) message was invalid
- 4) SS sends a valid 401 (Unauthorized) message to the UE
- 5) SS waits for the UE to send a Registration request using the temporary set of security associations to protect the message. The Registration request shall contain the valid answer to the authentication challenge in 401 (Unauthorized) sent in the previous step

- 6.) SS responds to the second REGISTER request with valid 200 OK response, sent over the same temporary set of security associations that the UE used for sending the REGISTER request. SS shall populate the headers of the 200 OK response according to the 200 response for REGISTER common message definition.

Expected sequence

Step	Direction		Message	Comment
	UE	SS		
1	→		REGISTER	UE sends initial registration for IMS services.
2	←		401 Unauthorized	The SS responds with an invalid AKAv1-MD5 authentication challenge with SQN out of range.
3	→		REGISTER	REGISTER request: - contains AUTS directive - UE populates a new Security-Client header set to specify the security mechanism it supports, the IPsec layer algorithms it supports and the parameters needed for the new security association setup
4	←		401 Unauthorized	This is a valid 401 (Unauthorized) message
5	→		REGISTER	Message is sent using the temporary set of security associations to protect the message Contains the valid answer to the authentication challenge sent in the 401 (Unauthorized) message
6	←		200 OK	The SS responds with 200 OK.

Specific message contents

REGISTER (Step 1)

Use the default message 'REGISTER' in annex A.1.1 with condition A1.

401 UNAUTHORIZED (Step 2)

Use the default message '401 Unauthorized for REGISTER' in annex A.1.2 with the following modification:

Header/param	Value/remark
WWW-Authenticate nonce	Base 64 encoding of RAND and AUTN, Generated with SQN out of range

REGISTER (Step 3)

Use the default message 'REGISTER' in annex A.1.1 with condition A1 with the following exceptions:

Header/param	Value/remark
CSeq value	The value sent in the previous REGISTER message + 1 (incremented)
Call-ID Call-ID	The same value as in REGISTER in Step 1
Authorization nonce opaque response auth-param nonce-count	Same value as the opaque value in the previous 401 UNAUTHORIZED message Same value as the opaque value in the previous 401 UNAUTHORIZED message parameter must exist, but value not to be checked auts= LDQUOT auts-value RDQUOT, auts-value not to be checked value or presence of the parameter not to be checked

REGISTER (Step 5)

Use the default message 'REGISTER' in annex A.1.1 with option A2 with the following exceptions:

Header/param	Value/remark
CSeq value	The value sent in the previous REGISTER message + 1 (incremented)
Call-ID Call-ID	The same value as in REGISTER in Step 1

Note: This message should be sent using the temporary set of security associations to protect the message.

9.2.5 Test requirements

SS shall check in step 3 that in accordance to the 3GPP TS 24.229 [10] clause 5.1.1.5

- the UE responds with a further REGISTER indicating to the S-CSCF that the challenge has been deemed invalid and:
- sends the REGISTER request using no security associations; and
- the REGISTER request contains AUTS directive; and
- populates a new Security-Client header within the REGISTER request, set to specify the security mechanism it supports, the IPsec layer algorithms it supports and the parameters needed for the new security association setup; and
- does not create a temporary set of security associations.

SS shall check that in step 5 the UE:

- Sends the Registration request using the temporary set of security associations to protect the message
- The header fields are populated as defined for the initial request, with the addition that the UE shall include an Authorization header containing the private user identity and the authentication challenge response calculated by the UE using RES and other parameters, as described in RFC 3310 [17]
- inserts the Security-Client header into the request that is identical to the Security-Client header that was included in the previous REGISTER request(the message sent in step 3)
- inserts the Security-Verify header into the request, by mirroring in it the content of the Security-Server header received in the 401 (Unauthorized) response
- sets the Call-ID of the integrity protected REGISTER request which carries the authentication challenge response to the same value as the Call-ID of the 401 (Unauthorized) response which carried the challenge(the message sent in step 4)

10 Subscription

10.1 Invalid Behaviour – 503 Service Unavailable

10.1.1 Definition and applicability

Test to verify that when the UE receives a 503 (Service Unavailable) response to a SUBSCRIBE request containing a Retry-After header, then the UE shall not automatically reattempt the request until after the period indicated by the Retry-After header contents. This can happen when the server is temporarily unable to process the request due to a temporary overloading or maintenance of the server.

10.1.2 Conformance requirement

If the UE receives a 503 (Service Unavailable) response to an initial SUBSCRIBE request containing a Retry-After header, then the UE shall not automatically reattempt the request until after the period indicated by the Retry-After header contents.

Reference(s)

3G TS 24.229[10], clause 5.1.2.2

10.1.3 Test purpose

To verify that after receiving a 503 (Service Unavailable) response to a SUBSCRIBE request, containing a Retry-After header, the UE shall not automatically reattempt the request until after the period indicated by the Retry-After header contents. This can happen when the server is temporarily unable to process the request due to a temporary overloading or maintenance of the server.

10.1.4 Method of test

Initial conditions

UE contains either ISIM or USIM application or only one USIM application on UICC. UE has an active PDP context, discovered the SS as P-CSCF and registered to IMS services by executing the generic test procedure in Annex C.2 up to step 7.

SS is configured with the shared secret key of IMS AKA algorithm, related to the IMS private user identity (IMPI) configured on the UICC card equipped into the UE. SS has performed AKA_{v1}-MD5 authentication with the UE and accepted the registration.

<To be added>

Test procedure

- 1) The UE sends a SUBSCRIBE request over the established security associations.
- 2) The SS responds to the SUBSCRIBE request with a 503 (Service Unavailable) response with the Retry-After header with period set to T, indicating how long the service is expected to be unavailable to the requesting client.
- 3) The SS waits for the period of time T defined in the Retry-After header, to check that the UE does not try to SUBSCRIBE for the registration event during this period..
- 4) The UE sends a new SUBSCRIBE request and the SS responds with a valid 200 OK response.

Expected sequence

Step	Direction		Message	Comment
	UE	SS		
1	→		SUBSCRIBE	UE subscribes to its registration event package.
2		←	503 Service Unavailable	The SS responds with 503 response containing a Retry-After header with period set to T
3				SS waits for Time T to check that the UE does not re-attempt the request .
4	→		SUBSCRIBE	UE reattempts to subscribe to its registration event package.
5		←	200 OK	SS responds to SUBSCRIBE with 200 OK

Specific Message Contents

SUBSCRIBE (Step 1)

Use the default message 'SUBSCRIBE for reg-event package' in annex A.1.4 .

503 Service Unavailable response (Step 2)

Header/param	Value/remark
Retry-after	
period	60 (referred to as T in the test procedure and test requirement)
duration	Not present
comment	Not present

SUBSCRIBE (Step 4)

Use the default message 'SUBSCRIBE for reg-event package' in annex A.1.4 with the following exception:

Header/param	Value/remark
Call-ID	
callid	value different from the previous SUBSCRIBE request

200 OK for SUBSCRIBE (Step 5)

Use the default message '200 OK for SUBSCRIBE' in annex A.1.5 .

10.1.5 Test requirements

Step 3: The UE shall not automatically reattempt the request during the period duration T.

Step 4: The UE reattempts to send a SUBSCRIBE request for registration event package.

11 Notification

11.1 Network-initiated deregistration

11.1.1 Definition and applicability

Test to verify that the UE can correctly process the network initiated deregistration request.

11.1.2 Conformance requirement

Upon receipt of a NOTIFY request on the dialog which was generated during subscription to the reg event package as described in subclause 5.1.1.3, including one or more <registration> element(s) with the state attribute set to "terminated" and the event attribute set to "rejected" or "deactivated", the UE shall remove all registration details relating to these public user identities. In case of a "deactivated" event attribute, the UE shall start the initial registration procedure as described in subclause 5.1.1.2. In case of a "rejected" event attribute, the UE shall release all dialogs related to those public user identities.

Upon receipt of a NOTIFY request with all <registration> element(s) having their state attribute set to "terminated" (i.e. all public user identities are deregistered) and the Subscription-State header contains the value of "terminated", the UE

shall delete the security associations towards the P-CSCF after the server transaction (as defined in RFC 3261) pertaining to the NOTIFY request terminates.

NOTE 1: Deleting a security association is an internal procedure of the UE and does not involve any SIP procedures.

NOTE 2: If the security association towards the P-CSCF is removed, then the UE considers the subscription to the reg event package terminated (i.e. as if the UE had sent a SUBSCRIBE request with an Expires header containing a value of zero, or a NOTIFY request was received with Subscription-State header containing the value of "terminated").

NOTE 3: When the P-CSCF has removed the security association established between the P-CSCF and the UE, further SIP signalling (e.g. the NOTIFY containing the deregistration event) will not reach the UE.

Reference(s)

3GPP TS 24.229[10], clauses 5.1.1.7

11.1.3 Test purpose

To verify that UE will not try registration after getting a NOTIFY with all <registration> element(s) set to "terminated" and "rejected".

11.1.4 Method of test

Initial conditions

UE contains either ISIM and USIM applications or only USIM application on UICC. UE has activated a PDP context, discovered P-CSCF and registered to IMS services by executing the generic test procedure in Annex C.2 up to the last step..

SS is configured with the IMSI within the USIM application, the home domain name, public and private user identities together with the shared secret key of IMS AKA algorithm, related to the IMS private user identity (IMPI) that is configured on the UICC card equipped into the UE. SS is able to perform AKAv1-MD5 authentication algorithm for that IMPI, according to 3GPP TS 33.203 [14] clause 6.1 and RFC 3310 [17].

Related ICS/IXIT Statement(s)

-

Test procedure

- 1) SS sends UE a NOTIFY request for the subscribed registration event package, indicating that registration for all the previously registered user identities has been terminated and that new registration shall not be performed. Request is sent over the existing security associations between SS and UE.
- 2) SS waits for the UE to respond the NOTIFY with 200 OK response.

Expected sequence

Step	Direction		Message	Comment
	UE	SS		
1		←	NOTIFY	The SS sends a NOTIFY for registration event package, containing full registration state information, with all previously registered public user identities "terminated" and "rejected"
2		→	200 OK	The UE responds the NOTIFY with 200 OK

Specific Message Contents

NOTIFY (Step 1)

Use the default message 'NOTIFY for reg-event package' in annex A.1.6 with the following exceptions:

Header/param	Value/remark
CSeq value	2
Subscription-State substate-value expires	<i>terminated</i> 0
Message-body	<pre><?xml version='1.0?'> <reginfo xmlns='urn:ietf:params:xml:ns:reginfo' version='1' state='full'> <registration aor='px_PublicUserIdentity' id='a100' state='terminated'> <contact id='980' state='terminated' event='rejected'> <uri>same value as in Contact header of REGISTER request</uri> </contact> </registration> <registration aor='px_AssociatedTelUri' id='a101' state='terminated'> <contact id='981' state='terminated' event='rejected'> <uri>same value as in Contact header of REGISTER request</uri> </contact> </registration> </reginfo></pre>

200 OK for NOTIFY (Step 2)

Use the default message '200 OK for other requests than REGISTER or SUBSCRIBE' in annex A.3.1

11.1.5 Test requirements

Step 2: SS shall check that the UE sends the 200 OK response over the existing set of security associations.

SS shall check that terminal does not try to send a REGISTER message after sending 200 OK. Waiting period of one minute is sufficient.

11.2 Network initiated re-authentication

11.2.1 Definition and applicability

Test to verify that the UE can correctly process the network initiated re-authentication request and re-authenticate the user before the registration expires, in accordance to 3GPP TS 24.229 [10], clause 5.1.1.5.2.

11.2.2 Conformance requirement

At any time, the UE can receive a NOTIFY request carrying information related to the reg event package (as described in subclause 5.1.1.3). If:

- the state attribute in any of the <registration> elements is set to "active";
- the value of the <uri> sub-element inside the <contact> sub-element is set to the Contact address that the UE registered; and
- the event attribute of that <contact> sub-element(s) is set to "shortened";

the UE shall:

- 1) use the expiry attribute within the <contact> element to adjust the expiration time for that public user identity; and

- 2) start the re-authentication procedures at the appropriate time (as a result of the S-CSCF procedure described in subclause 5.4.1.6) by initiating a reregistration as described in subclause 5.1.1.4.

Reference(s)

3GPPTS 24.229[10], clause 5.1.1.5.2

11.2.3 Test purpose

- 1) To verify that UE adjusts the expiration time for a public user identity as indicated within the received NOTIFY related to reg event package; and
- 2) To verify that the UE will start the re-authentication procedures at the appropriate time before the registration expires.

11.2.4 Method of test

Initial conditions

UE contains either ISIM and USIM applications or only USIM application on UICC. UE has activated a PDP context, discovered P-CSCF and registered to IMS services by executing the generic test procedure in Annex C.2 up to the last step.. The expiration time for the registration (as controlled by px_RegisterExpiration) must be at least 600 seconds. Security associations have been set up between UE and the SS.

SS is configured with the IMSI within the USIM application, the home domain name, public and private user identities together with the shared secret key of IMS AKA algorithm, related to the IMS private user identity (IMPI) that is configured on the UICC card equipped into the UE. SS is able to perform AKAv1-MD5 authentication algorithm for that IMPI, according to 3GPP TS 33.203 [14] clause 6.1 and RFC 3310 [17].

Related ICS/IXIT Statement(s)

-

Test procedure

- 1) SS sends UE a NOTIFY request for the subscribed registration event package, indicating the shortened expiration time as 60 seconds. Request is sent over the existing security associations between SS and UE.
- 2) SS waits for the UE to respond the NOTIFY with 200 OK response.
- 3) SS waits for the UE send a REGISTER request 30 seconds before the expected new expiration time.
- 4) SS responds to the REGISTER request with a valid 401 Unauthorized response, headers populated according to the 401 response common message definition.
- 5) SS waits for the UE to set up a new set of security associations and send another REGISTER request, over those security associations.
- 6) SS responds to the REGISTER request with valid 200 OK response sent over the newly set up security associations

Expected sequence

Step	Direction		Message	Comment
	UE	SS		
1		←	NOTIFY	The SS sends a NOTIFY for registration event package, containing partial registration state information, indicating shortened expiration time (60 seconds) for the registered public user identity in the XML body
2		→	200 OK	The UE responds the NOTIFY with 200 OK
3		→	REGISTER	UE re-registers the user 30 seconds before the expected expiration
4		←	401 Unauthorized	The SS responds with a valid AKAv1-MD5 authentication challenge and security mechanisms supported by the network
5		→	REGISTER	UE completes the security negotiation procedures, sets up a new temporary set of SAs and uses those for sending another REGISTER with AKAv1-MD5 credentials.
6		←	200 OK	The SS responds with 200 OK to complete the re-authentication..

Specific Message Contents

NOTIFY (Step 1)

Use the default message 'NOTIFY for reg-event package' in annex A.1.6 with the following exceptions:

Header/param	Value/remark
CSeq	
value	2
Message-body	<pre><?xml version='1.0?'> <reginfo xmlns='urn:ietf:params:xml:ns:reginfo' version='1' state='partial'> <registration aor='px_PublicUserIdentity' id='a100' state='active'> <contact id='980' state='active' event='shortened' expires="60"> <uri>same value as in Contact header of REGISTER request</uri> </contact> </registration> </reginfo></pre>

200 OK for NOTIFY (Step 2)

Use the default message '200 OK for other requests than REGISTER or SUBSCRIBE' in annex A.3.1

REGISTER (Step 3)

Use the default message 'REGISTER' in annex A.1.1 condition A2 with the following exceptions:

Header/param	Value/remark
CSeq	
value	sequence number incremented by one compared to the previous REGISTER
Security-Client	
spi-c	new SPI number of the inbound SA at the protected client port
spi-s	new SPI number of the inbound SA at the protected server port
port-c	new protected client port needed for the setup of new pairs of security associations
port-s	Same value as in the previous REGISTER

401 Unauthorized for REGISTER (Step 4)

Use the default message '401 Unauthorized for REGISTER' in annex A.1.2 with the following exceptions:

Header/param	Value/remark
Security-Server	
spi-c	new SPI number of the inbound SA at the protected client port
spi-s	new SPI number of the inbound SA at the protected server port
port-c	new protected client port needed for the setup of new pairs of security associations
port-s	Same value as in the previous Security-Server headers
WWW-Authenticate	
nonce	Base 64 encoding of a new RAND and AUTN

REGISTER (Step 5)

Use the default message 'REGISTER' in annex A.1.1 with condition A2 and the following exceptions:

Header/param	Value/remark
CSeq	
value	sequence number incremented by one compared to the previous REGISTER request

200 OK for REGISTER (Step 6)

Use the default message '200 OK for REGISTER' in annex A.1.3

11.2.5 Test requirements

Step 2: SS shall check that the UE sends the 200 OK response over the existing set of security associations.

Step 3: SS shall check that in accordance to the 3GPP TS 24.229 [10] clause 5.1.1.4 the UE sends a REGISTER request over the existing set of security associations.

12 Call Control

12.1 MO Call Successful

12.1.1 Definition and applicability

Test to verify that the UE correctly performs IMS mobile originated call setup and release. This process is described in 3GPPTS 24.229 [10], clauses 5.1.3 and 6.1.

12.1.2 Conformance requirement

- . When the UE sends any request, the UE shall:
 - include the protected server port in the Via header entry relating to the UE; and
 - include the protected server port in any Contact header that is otherwise included.

....

The UE shall insert a P-Access-Network-Info header into any request for a dialog, any subsequent request (except ACK requests and CANCEL requests) or response (except CANCEL responses) within a dialog or any request for a standalone method. This header shall contain information concerning the access network technology and, if applicable, the cell ID (see subclause 7.2A.4 of TS 24.229).

The UE shall build a proper preloaded Route header value for all new dialogs and standalone transactions. The UE shall build a list of Route header values made out of, in this order, the P-CSCF URI (containing the IP address or the FQDN learnt through the P-CSCF discovery procedures, and the protected port learnt during the registration procedure), and the values received in the Service-Route header saved from the 200 (OK) response to the last registration or re-registration.

Upon generating an initial INVITE request, the UE shall:

- indicate the support for reliable provisional responses and specify it using the Supported header mechanism;
- indicate the requirement of precondition and specify it using the Require header mechanism.

....

When a final answer is received for one of the early dialogues, the UE proceeds to set up the SIP session.

Usage of SDP by the UE:

- 1) In order to authorize the media streams, the P-CSCF and S-CSCF have to be able to inspect the SDP payloads. Hence, the UE shall not encrypt the SDP payloads.
- 2) An INVITE request generated by a UE shall contain SDP payload. The SDP payload shall reflect the calling user's terminal capabilities and user preferences for the session. The UE shall order the SDP payload with the most preferred codec listed first. In addition, the calling user shall indicate the desired QoS for the session, using the segmented status type. In an initial INVITE request the UE shall indicate that it mandates local QoS and that this precondition is not yet satisfied, i.e. the UE shall include the following preconditions:

a=des: qos mandatory local sendrecv

a=curr: qos local none

- 3) Providing that the INVITE request received by the UE contains an SDP offer including one or more "m=" media descriptions, the first 183 (Session Progress) provisional response that the UE sends, shall contain the answer for the SDP received in the INVITE. The said SDP answer shall reflect the called user's terminal capabilities and user preferences.

- 4) When the UE sends a 183 (Session Progress) response with SDP payload including one or more "m=" media descriptions, it shall request confirmation for the result of the resource reservation at the originating end point.
- 5) During session establishment procedure, SIP messages shall only contain SDP payload if that is intended to modify the session description.
- 6) For "video" and "audio" media types that utilize the RTP/RTCP, the UE shall specify the proposed bandwidth for each media stream utilizing the "b=" media descriptor and the "AS" bandwidth modifier in the SDP.

If the media line in the SDP indicates the usage of RTP/RTCP, in addition to the "AS" bandwidth modifier in the media-level "b=" line, the UE shall include two media-level "b=" lines, one with the "RS" bandwidth modifier and the other with the "RR" bandwidth modifier as described in RFC 3556 to specify the required bandwidth allocation for RTCP.

For other media streams the "b=" media descriptor may be included. The value or absence of the "b=" parameter will affect the assigned QoS which is defined in 3GPP TS 29.208.

NOTE 1: In a two-party session where both participants are active, the RTCP receiver reports are not sent, therefore, the RR bandwidth modifier will typically get the value of zero.

- 7) The UE shall include the MIME subtype "telephone-event" in the "m=" media descriptor in the SDP for audio media flows that support both audio codec and DTMF payloads in RTP packets as described in RFC 2833.

Reference(s)

3GPPTS 24.229[10], clauses 5.1.2A.1, 5.1.3 and 6.1

12.1.3 Test purpose

- 1) To verify that when initiating MO call the UE performs correct exchange of SIP protocol signalling messages for setting up the session; and
- 2) To verify that within SIP signalling the UE performs the correct exchange of SDP messages for negotiating media and indicating preconditions for resource reservation (as described by 3GPP TS 24.229 [10], clause 6.1).
- 3) To verify that the UE is able to release the call.

12.1.4 Method of test

Initial conditions

UE contains either ISIM and USIM applications or only USIM application on UICC. UE has activated a PDP context, discovered P-CSCF and registered to IMS services, by executing the generic test procedure in Annex C.2 up to the last step.

SS is configured with the shared secret key of IMS AKA algorithm, related to the IMS private user identity (IMPI) configured on the UICC card equipped into the UE. SS has performed AKAv1-MD5 authentication with the UE and accepted the registration.

Related ICS/IXIT Statement(s)

- | | |
|----------------------------------|----------|
| Support for initiating a session | (Yes/No) |
| Support for use of preconditions | (Yes/No) |

Test procedure

- 1) MO call is initiated on the UE. SS waits the UE to send an INVITE request with first SDP offer, over the security associations set up during registration, in accordance to 3GPP TS 24.229 [10], clause 5.1.3

- 2) SS responds to the INVITE request with a 100 Trying response.
 - 3) SS responds to the INVITE request with a 183 Session in Progress response
- NOTE: SS is not expected to take care of the media, so the IP address and port could be assigned so that the SS is listening to it, but may discard the RTP packets received.
- 4) SS waits for the UE to send a PRACK request possibly containing the second SDP offer.
 - 5) SS responds to the PRACK request with valid 200 OK response.
 - 6) SS waits for the UE to optionally send a UPDATE request containing the final SDP offer. UE will not send the UPDATE request if PRACK request of step 4 already contained the final offer with preconditions met.
 - 7) SS responds to the UPDATE request (if UE sent one) with valid 200 OK response.
 - 8) SS responds to the INVITE request with 180 Ringing response.
 - 9) SS waits for the UE to send a PRACK request.
 - 10) SS responds to the PRACK request with valid 200 OK response.
 11. SS responds to the INVITE request with valid 200 OK response.
 - 12) SS waits for the UE to send an ACK to acknowledge receipt of the 200 OK for INVITE.
 - 13) Call is released on the UE. SS waits the UE to send a BYE request.
 - 14) SS responds to the BYE request with valid 200 OK response.

Expected sequence

Step	Direction		Message	Comment
	UE	SS		
1	→		INVITE	UE sends INVITE with the first SDP offer indicating all desired medias and codecs the UE supports
2	←		100 Trying	The SS responds with a 100 Trying provisional response
3	←		183 Session in Progress	The SS responds with an SDP answer indicating the medias and codecs acceptable for SS
4	→		PRACK	UE acknowledges the receipt of 183 response with PRACK and offers second SDP that indicates one agreed codec per media and possibly indicates preconditions as met after having reserved the resources with GPRS
5	←		200 OK	The SS responds PRACK with 200 OK and answers the second SDP with mirroring its contents and indicates having reserved the resources if UE has also done so.
6	→		UPDATE	Optional step: UE sends an UPDATE after having reserved the resources with GPRS procedures for PDP context used for the media
7	←		200 OK	Optional step : The SS responds UPDATE with 200 OK and indicates having reserved the resourced for the virtual remote UE
8	←		180 Ringing	The SS responds INVITE with 180 Ringing to indicate that the virtual remote UE has started ringing
9	→		PRACK	UE acknowledges the receipt of 180 response by sending PRACK
10	←		200 OK	The SS responds PRACK with 200 OK
11	←		200 OK	The SS responds INVITE with 200 OK to indicate that the virtual remote UE had answered the call
12	→		ACK	The UE acknowledges the receipt of 200 OK for INVITE
13	→		BYE	The UE releases the call with BYE
14	←		200 OK	The SS sends 200 OK for BYE

Specific Message Contents

INVITE (Step 1)

Use the default message 'INVITE for MO call setup' in annex A.2.1 For the contents of SDP body see test requirement details.

100 Trying for INVITE (Step 2)

Use the default message '100 Trying for INVITE' in annex A.2.2

183 Session in Progress for INVITE (Step 3)

Use the default message '183 Session in Progress for INVITE' in annex A.2.3

PRACK (Step 4)

Use the default message 'PRACK' in annex A.2.4

200 OK for PRACK (Step 5)

Use the default message "200 OK for other requests than REGISTER or SUBSCRIBE" in annex A.3.1 with the following exceptions:

Header/param	Value/remark
Content-Type media-type	header shall be present only if there is SDP in message-body <i>application/sdp</i>
Content-Length value	length of message-body
Message-body	<p>SDP body of the 200 response copied from the received PRACK, if it contained one but otherwise omitted. The copied SDP body must be modified as follows for the 200 OK response:</p> <ul style="list-style-type: none"> - IP address on "o=" and "c=" lines and transport port on "m=" lines changed to indicate to which IP address and port the UE should start sending the media; and <ul style="list-style-type: none"> optional "a=sendonly" line inverted to "a=recvonly" and vice versa; and - the "a=" lines describing the current and desired state of the preconditions, as described in RFC 3312 [31], updated as follows: <ul style="list-style-type: none"> a=curr:qos local [direction-tag] (1) a=curr:qos remote [direction-tag] (2) a=des:qos mandatory local [direction-tag] (3) a=des:qos mandatory remote [direction-tag] (3) a=conf:qos remote [direction-tag] (4) <p>1) The value of direction-tag in a=curr qos local line of 200 must be the inverse of that in the a=curr:qos local line of PRACK. If the PRACK contained the direction-tag as "recv" the 200 must have it as "send" and vice versa. The values "none" and "sendrecv" will be kept as is.</p> <p>2) The value of direction-tag in a=curr qos remote line of 200 must be the inverse from the a=curr:qos local line of PRACK.</p> <p>3) The value of direction-tags in a=des lines of 200 must be the inverse from those of PRACK (both a= lines for local and remote). If the PRACK contained the direction-tag as "recv" the 200 must have it as "send" and vice versa. The value "sendrecv" will be kept as is.</p> <p>4) The value of direction-tag for the optional line conf:qos remote shall be the same as for des: qos mandatory remote. This line is only included if a=curr:qos remote is still "none".</p>

UPDATE (Step 6) optional step used when PRACK contained a=curr:qos local none

Use the default message 'UPDATE' in annex A.2.5

200 OK for UPDATE (Step 7) - optional step used when UE sent UPDATE

Use the default message '200 OK for other requests than REGISTER or SUBSCRIBE' in annex A.3.1 with the following exceptions:

Header/param	Value/remark
Content-Type media-type	<i>application/sdp</i>
Content-Length value	length of message-body
Message-body	<p>SDP body of the 200 response copied from the received UPDATE but modified as follows:</p> <ul style="list-style-type: none"> - IP address on "o=" and "c=" lines and transport port on "m=" lines changed to indicate to which IP address and port the UE should start sending the media; and <ul style="list-style-type: none"> optional "a=sendonly" line inverted to "a=recvonly" and vice versa; and - the "a=" lines describing the current and desired state of the preconditions, as described in RFC 3312 [31], updated as follows: <ul style="list-style-type: none"> a=curr:qos local [direction-tag] (1) a=curr:qos remote [direction-tag] (2) a=des:qos mandatory local [direction-tag] (3) a=des:qos mandatory remote [direction-tag] (3) <p>1) The value of direction-tag in a=curr qos local line of 200 must be the inverse of that in the a=curr:qos local line of UPDATE. If the UPDATE contained the direction-tag as "recv" the 200 must have it as "send" and vice versa. The value "sendrecv" will be kept as is.</p> <p>2) The value of direction-tag in a=curr qos remote line of 200 must be the inverse from the a=curr:qos local line of UPDATE.</p> <p>3) The value of direction-tags in a=des lines of 200 must be the inverse from those of UPDATE (both a= lines for local and remote). If the UPDATE contained the direction-tag as "recv" the 200 must have it as "send" and vice versa. The value "sendrecv" will be kept as is.</p>

180 Ringing for INVITE (Step 8)

Use the default message '180 Ringing for INVITE' in annex A.2.6

PRACK (Step 9)

Use the default message 'PRACK' in annex A.2.4

200 OK for PRACK (Step 10)

Use the default message '200 OK for other requests than REGISTER or SUBSCRIBE' in annex A.3.1.

200 OK for INVITE (Step 11)

Use the default message '200 OK for other requests than REGISTER or SUBSCRIBE' in annex A.3.1 with the following exceptions:

Header/param	Value/remark
Record-Route rec-route	Same value as in the 180 response
Contact addr-spec	Same value as in the 180 response

ACK (Step 12)

Use the default message 'ACK' in annex A.2.7

BYE (Step 13)

Use the default message 'BYE' in annex A.2.8

200 OK for BYE (Step 14)

Use the default message '200 OK for other requests than REGISTER or SUBSCRIBE' in annex A.3.1.

12.1.5 Test requirements

SS must check that the UE sends all the requests over the security associations set up during registration, in accordance to 3GPP TS 24.229 [10], clause 5.1.1.5.1.

Step 1: the UE shall send an INVITE message with correct content. The UE shall include the following lines in the SDP body:

- All mandatory SDP lines, as specified in SDP grammar in RFC 2327 [27] appendix A, including:
 - "o=" line indicating e.g. the session identifier and the IP address of the UE;
 - "c=" line indicating the IP address of the UE for receiving the media flow;
- Media description lines for the media proposed by UE for the MO call. For each type of offered media the following lines must exist within the SDP:
 - "m=" line describing the media type, transport port and protocol used for media and media format;
 - "b=" line proposing the application specific maximum bandwidth ("AS" modifier) for the media , however this line may be missing if the SDP contains "a=sendonly" line, according to RFC 3264 [30];
 - optionally two "b=" lines proposing the bandwidth allocations for RTCP (for "RS" and "RR" modifiers), if the media line in the SDP indicates the usage of RTP/RTCP, as described in RFC 3556;
 - extra "a=" line for rtpmap attribute per each dynamic payload type given in the "m=" line;

- If the UE supports DTMF payloads in RTP packets for audio type of media, then one of the "a=" lines shall indicate "telephone-event" MIME subtype;
- Any of the "a=" line for rtpmap attribute may be followed by extra "a=" line for fmtp attribute to convey parameters specific to a particular format;
- four "a=" lines describing the current and desired state of the preconditions, as described in RFC 3312 [31].
At this stage of the call setup the lines shall be as follows:
a=curr:qos local none
a=curr:qos remote none
a=des:qos mandatory local [send, recv or sendrecv]
a=des:qos [none optional or mandatory] remote [send, recv or sendrecv]
The direction tag for remote shall be the same as for local

...

Step 4: the UE shall send a PRACK request with the correct content. The UE may include a SDP body in the PRACK request if SDP body of INVITE offered multiple codecs per media. In that case the following lines shall be included in the SDP body of PRACK:

- All mandatory SDP lines, like in INVITE request except the version number in the 'o' line incremented by one; and
- All media description lines as in the INVITE and the order of those lines preserved. The permitted changes to the media description lines and media dependent attribute lines are as described in RFC 3264 [30] and include e.g. the following:
 - New media lines (if any) shall be added after the media lines introduced within the INVITE.
 - Media lines dropped in the offer/answer negotiation indicated by port number changed as zero. Any attribute lines related to dropped media may have been removed.
 - Address, port or transport, media types, formats or attributes of original media lines may have been modified.
 - Optional new "a=" lines may be introduced that the SS shall ignore - The "a=" lines for preconditions in the PRACK shall be like for INVITE in step 1 but with the following exceptions:
 - in attribute line a=curr:qos local the direction-tag may have either the value "none" or the same value that the direction-tag has in the attribute line a=des:qos mandatory local. The latter case indicates that the UE has already met its local preconditions.
 - in attribute line a=des:qos [strength-tag] remote [direction-tag] the strength-tag must be "mandatory" (according to what SS answered in 183 response)

...

Step 6: the UE may conditionally send an UPDATE request with the correct content. The UE shall include the following lines in the SDP body:

- All mandatory SDP lines, like in INVITE request except the version number in the 'o' line incremented by two; and
- All media description lines as in the INVITE and the order of those lines preserved. The permitted changes to the media description lines and media dependent attribute lines are as described in RFC 3264 [30]
- Optional new "a=" lines may be introduced that the SS shall ignore
- The "a=" lines for preconditions in the UPDATE shall be like for INVITE in step 1 but with the following exceptions:
 - in attribute line a=curr:qos local the direction-tag must have the same value that the direction-tag has in the attribute line a=des:qos mandatory local, to indicate that the UE has met its local preconditions.
 - in attribute line a=des:qos [strength-tag] remote [direction-tag] the strength-tag must be "mandatory" (according to what SS answered in 183 response)

...

Step 9: the UE shall send a PRACK request with the correct content, according to common message definitions.

...

Step 12: the UE shall send an ACK request with the correct content, according to common message definitions.

Step 13: the UE shall send a BYE request with the correct content, according to common message definitions.

12.2 MO Call – 503 Service Unavailable

12.2.1 Definition

When a server is temporarily unable to process an INVITE request due to a temporary overloading or maintenance of the server sends a 503 Service Unavailable response. The server may indicate when the service will be available again in a Retry-After header field. This process is described in 3GPP TS 24.229 [10], clause 5.1.3.1.

12.2.2 Conformance requirement

If the UA receives a 503 (Service Unavailable) response to an initial INVITE request containing a Retry-After header, then the UE shall not automatically reattempt the request until after the period indicated by the Retry-After header contents.

Reference(s)

3GPPTS 24.229[10], clause 5.1.3.1

12.2.3 Test purpose

To verify that when the UE receives a 503 (Service Unavailable) response to an initial INVITE request containing a Retry-After header, then the UE shall not automatically reattempt the request until after the period indicated by the Retry-After header contents.

12.2.4 Method of test

Initial conditions

UE contains either ISIM and USIM applications or only USIM application on UICC. UE has activated a PDP context, discovered P-CSCF and registered to IMS services, by executing the generic test procedure in Annex C.2 up to the last step.

SS is configured with the shared secret key of IMS AKA algorithm, related to the IMS private user identity (IMPI) configured on the UICC card equipped into the UE. SS has performed AKAv1-MD5 authentication with the UE and accepted the registration.

Related ICS/IXIT Statement(s)

-

Test procedure

For value of T see specific message content for 503 (Service Unavailable) message.

- 1) MO call is initiated on the UE. SS waits for the UE to send an INVITE request with first SDP offer, over the security associations set up during registration, in accordance to 3GPP TS 24.229 [10], clause 5.1.3
- 2) The SS responds with a provisional 100 (Trying) response to the INVITE request followed by a 503 (Service Unavailable) response with the Retry-After header set to T.

- 3) The SS waits for the UE to send an ACK to acknowledge the reception of the 503 (Service Unavailable) response.
- 4) SS waits for a duration of time T and checks that the UE does not reattempt sending the INVITE request. After the time T the UE may reattempt sending the INVITE request.
- 5) The UE may reattempt sending the INVITE request after time T.

Expected sequence

Step	Direction		Message	Comment
	UE	SS		
1		→	INVITE	The UE sends an INVITE request with the first SDP offer indicating all desired medias and codecs the UE supports
2a		←	100 Trying	The SS responds with a 100 Trying provisional response
2b		←	503 Service Unavailable	Including Retry-After header with period set to T
3		→	ACK	The UE acknowledges the reception of the 503 (Service Unavailable) response
4				The SS waits for a duration of time T and checks that the UE does not re-send the INVITE request
5		→	INVITE	Optional

Specific Message Contents

INVITE (Step 1)

Use the default message 'INVITE for MO call setup' in annex A.

100 Trying (Step 2a)

Use the default message '100 Trying for MO INVITE' in annex A.

503 Service Unavailable (Step 2b)

Header	Value/remark
Retry-After period	60secs (referred to as T in the test procedure and test requirement)
duration	Not present
comment	Not present

ACK (Step 3)

Use the default message 'ACK' in annex A.

INVITE (Step 4)

Use the default message 'INVITE for MO call setup' in annex A.

12.2.5 Test requirements

At step 4 the UE shall not reattempt the INVITE request before time T from the time the SS receives the ACK from the UE in step 2b.

12.3 MO Call – 488 Not Acceptable Here

12.3.1 Definition

When a UA has been contacted successfully but some aspects of the session description such as the requested media, bandwidth, or addressing style were not acceptable then the UA may send a 488 (Not Acceptable Here) response. A message body containing a description of media capabilities may be present in the response. This process is described in 3GPP TS 24.229 [10], clauses 5.1.3.1 and 6.1.

12.3.2 Conformance requirement

If the UE receives a 488 (Not Acceptable Here) response to an initial INVITE request, the UE should send a new INVITE request containing SDP according to the procedures defined in subclause 6.1 of 24.229.

....

Usage of SDP by the UE:

....

10. If the UE builds SDP for an INVITE request generated after receiving a 488 (Not Acceptable Here) response, as described in subclause 5.1.3.1 of 24.229, the UE shall include SDP payload containing a subset of the allowed media types, codecs and other parameters from the SDP payload of all 488 (Not Acceptable Here) responses related to the same session establishment attempt (i.e. a set of INVITE requests used for the same session establishment). The UE shall order the codecs in the SDP payload according to the order of the codecs in the SDP payload of the 488 (Not Acceptable Here) response.

NOTE 2: The UE may be attempting a session establishment through multiple networks with different policies and potentially may need to send multiple INVITE requests and receive multiple 488 (Not Acceptable Here) responses from different CSCF nodes. The UE therefore takes into account the SDP contents of all the 488 (Not Acceptable Here) responses received related to the same session establishment when building a new INVITE request.

Reference(s)

3GPP TS 24.229[10], clauses 5.1.3.1 and 6.1

12.3.3 Test purpose

- 1) To verify that the UE includes SDP payload containing a subset of the allowed media types, codecs and other parameters from the SDP payload of the 488 (Not Acceptable Here) response.
- 2) To verify that the UE orders the codecs in the SDP payload according to the order of the codecs in the SDP payload of the 488 (Not Acceptable Here) response.

12.3.4 Method of test

Initial conditions

UE contains either ISIM and USIM applications or only USIM application on UICC. UE has activated a PDP context, discovered P-CSCF and registered to IMS services, by executing the generic test procedure in Annex C.2 up to the last step

SS is configured with the shared secret key of IMS AKA algorithm, related to the IMS private user identity (IMPI) configured on the UICC card equipped into the UE. SS has performed AKAv1-MD5 authentication with the UE and accepted the registration.

Related ICS/IXIT Statement(s)

[UE supports sending of new INVITE request upon receiving a 488 (Not Acceptable Here) response]

UEs supporting more than one media

Test procedure

- 1) MO call is initiated on the UE. SS waits for the UE to send an INVITE request with first SDP offer, over the security associations set up during registration, in accordance to 3GPP TS 24.229 [10], clause 5.1.3
- 2) The SS responds with a provisional 100 (Trying) response to the INVITE request followed by a 488 (Not Acceptable Here) response. The SS includes a SDP payload [TBD].
- 3) The SS waits for the UE to send an ACK to acknowledge the reception of the 488 (Not Acceptable Here) response.
- 4) SS wait for the UE to send a new INVITE request. The SS checks that the SDP payload of the new INVITE request includes a subset of the allowed media types, codecs and other parameters from the SDP payload of the 488 (Not Acceptable Here) response in step 2.

Expected sequence

Step	Direction		Message	Comment
	UE	SS		
1		→	INVITE	The UE sends an INVITE request with the first SDP offer indicating all desired medias and codecs the UE supports
2a		←	100 Trying	The SS responds with a 100 Trying provisional response
2b		←	488 Not Acceptable Here	The SS includes a SDP payload being a subset of the offer in the first SDP offer in step 1.
3		→	ACK	The UE acknowledges the reception of the 488 (Not Acceptable Here) response
4		→	INVITE	The UE sends a new INVITE request.

Specific Message Contents

INVITE (Step 1)

Use the default message 'INVITE for MO call setup' in annex A.

100 Trying (Step 2a)

Use the default message '100 Trying for MO INVITE' in annex A.

488 Not Acceptable Here (Step 2b)

Header	Value/remark
SDP	[FFS]

ACK (Step 3)

Use the default message 'ACK' in annex A.

INVITE (Step 4)

Use the default message 'INVITE for MO call setup' in annex A. For the contents of SDP body see test requirement details.

12.3.5 Test requirements

- 1) At step 4 the SDP payload in the INVITE request shall include a SDP payload containing a subset of the allowed media types, codecs and other parameters from the SDP payload of the 488 (Not Acceptable Here) response in step 2b.
- 2) At step 4 the codecs in the SDP payload in the INVITE request shall be in the same order as in the SDP payload of the 488 (Not Acceptable Here) response.

12.4 Call initiation – Mobile termination

12.4.1 Definition

Test to verify that the UE can correctly receive a call initiation request and generate the correct response. This process is described in 3GPP TS 24.229 [10], clause 5.1.4.1

12.4.2 Conformance requirement

When the UE sends any response, the UE shall:

- include the protected server port in any Contact header that is otherwise included.

The UE shall discard any SIP request that is not integrity protected and is received from the P-CSCF outside of the registration and authentication procedures.

The UE can indicate privacy of the P-Asserted-Identity that will be generated by the P-CSCF in accordance with RFC 3323 and the additional requirements contained within RFC 3325 .

The UE shall insert a P-Access-Network-Info header into any response to a request for a dialog, any subsequent request (except CANCEL requests) or response (except CANCEL responses) within a dialog or any response to a standalone method. This header shall contain information concerning the access network technology and, if applicable, the cell ID

.

Upon receiving an initial INVITE request without containing either Supported: precondition or Require: precondition header values, the UE shall generate a 421 (Extension Required) response indicating the required extension in the Require header field.

Upon generating the first response to the initial INVITE request, the UE shall indicate the requirement for reliable provisional responses and specify it using the Require header mechanism. The UE shall send the 200 (OK) response to the initial INVITE request only after the local resource reservation has been completed.

.

In order to authorize the media streams, the P-CSCF and S-CSCF have to be able to inspect the SDP payloads. Hence, the UE shall not encrypt the SDP payloads.

An INVITE request generated by a UE shall contain SDP payload. The SDP payload shall reflect the calling user's terminal capabilities and user preferences for the session. The UE shall order the SDP payload with the most preferred codec listed first. In addition, the calling user shall indicate the desired QoS for the session, using the segmented status

type. In an initial INVITE request the UE shall indicate that it mandates local QoS and that this precondition is not yet satisfied, i.e. the UE shall include the following preconditions:

a=des: qos mandatory local sendrecv

a=curr: qos local none

Providing that the INVITE request received by the UE contains an SDP offer including one or more "m=" media descriptions, the first 183 (Session Progress) provisional response that the UE sends, shall contain the answer for the SDP received in the INVITE. The said SDP answer shall reflect the called user's terminal capabilities and user preferences.

When the UE sends a 183 (Session Progress) response with SDP payload including one or more "m=" media descriptions, it shall request confirmation for the result of the resource reservation at the originating end point.

During session establishment procedure, SIP messages shall only contain SDP payload if that is intended to modify the session description.

For "video" and "audio" media types that utilize the RTP/RTCP, the UE shall specify the proposed bandwidth for each media stream utilizing the "b=" media descriptor and the "AS" bandwidth modifier in the SDP.

If the media line in the SDP indicates the usage of RTP/RTCP, in addition to the "AS" bandwidth modifier in the media-level "b=" line, the UE shall include two media-level "b=" lines, one with the "RS" bandwidth modifier and the other with the "RR" bandwidth modifier as described in RFC 3556 to specify the required bandwidth allocation for RTCP.

For other media streams the "b=" media descriptor may be included. The value or absence of the "b=" parameter will affect the assigned QoS which is defined in 3GPP TS 29.208.

The UE shall include the MIME subtype "telephone-event" in the "m=" media descriptor in the SDP for audio media flows that support both audio codec and DTMF payloads in RTP packets as described in RFC 2833.

The UE shall inspect the SDP contained in any SIP request or response, looking for possible indications of grouping of media streams according to RFC 3524 and perform the action outlined in subclause 9.2.5.

Reference(s)

3GPPTS 24.229[10], clauses 5.1.2A.2, 5.1.4.1, 6.1

12.4.3 Test purpose

- 1) To verify that after receiving a valid INVITE for call initiation, the UE correctly generates and sends the first 183 Session Progress response; and
- 2) To verify that the UE includes the proper SDP answer to the SDP offer in the INVITE; and
- 3) To verify that the UE inserts a P-Access-Network-Info header into any response to a request for a dialog, any subsequent request (except CANCEL requests) or response (except CANCEL responses) within a dialog or any response to a standalone method. This header shall contain information concerning the access network technology and, if applicable, the cell ID; and
- 4) To verify that the UE includes the protected server port in any Contact header; and
- 5) To verify that the UE does not encrypt the SDP payload; and
- 6) To verify that the UE supports and handles the precondition extension properly
- 7) To verify that the UE can release the call on receiving BYE from the SS

12.4.4 Method of test

Initial conditions

UE contains either ISIM and USIM applications or only USIM application on UICC. UE has activated a PDP context, discovered P-CSCF and registered to IMS services, by executing the generic test procedure in Annex C.2 up to the last step.

SS is configured with the shared secret key of IMS AKA algorithm, related to the IMS private user identity (IMPI) configured on the UICC card equipped into the UE. SS has performed AKAv1-MD5 authentication with the UE and accepted the registration.

Related ICS/IXIT Statement(s)

<The SS is preconfigured to generate SDP offers that are compatible with the UE's capabilities.>

Test procedure

- 1) SS sends an INVITE request to the UE.
- 2) SS may receive 100 Trying from the UE.
- 3) SS expects and receives 183 Session Progress from the UE.
- 4) SS sends PRACK to the UE to acknowledge the 183 Session Progress.
- 5) SS expects and receives 200OK for PRACK from the UE.
- 6) SS sends UPDATE to the UE, with SDP indicating that precondition is met on the server side.
- 7) SS expects and receives 200OK for UPDATE from the UE, with proper SDP as answer.
- 8) SS expects and receives 180 Ringing from the UE.
- 9) SS sends PRACK to the UE to acknowledge the 180 Ringing.
- 10) SS expects and receives 200OK for PRACK from the UE.
- 11) SS expects and receives 200OK for INVITE from the UE.
- 12) SS sends ACK to the UE.
- 13) SS sends BYE to the UE.
- 14) SS expects and receives 200OK for BYE from the UE.

Expected sequence

Step	Direction		Message	Comment
	UE	SS		
1		←	INVITE	SS sends INVITE with the first SDP offer.
2		→	100 Trying	(Optional) The UE responds with a 100 Trying provisional response
3		→	183 Session Progress	The UE sends 183 response reliably with the SDP answer to the offer in INVITE
4		←	PRACK	SS acknowledges the receipt of 183 from the UE. No SDP offer is included here.
5		→	200OK	The UE responds to PRACK with 200OK.
6		←	UPDATE	SS sends an UPDATE with a second SDP offer after having reserved the resources.
7		→	200OK	The UE acknowledges the UPDATE with 200OK and includes SDP answer to acknowledge its current precondition status.
8		→	180 Ringing	The UE responds to INVITE with 180 Ringing after its resource is ready.
9		←	PRACK	The SS acknowledges the 180 response with PRACK.
10		→	200OK	The UE acknowledges the PRACK with 200OK.
11		→	200OK	The UE responds to INVITE with 200 OK final response after the user answers the call.
12		←	ACK	The SS acknowledges the receipt of 200OK for INVITE.
13		←	BYE	The SS sends BYE to release the call.
14		→	200OK	The UE sends 200OK for the BYE request and ends the call.

Specific Message Content

INVITE (Step 1)

Same as the default message in subclause A.2.9 with the following exceptions:

Headers to be included	Value/Remark
SDP	<p>The SDP contains all mandatory SDP lines, as specified in SDP grammar in RFC 2327[27], including:</p> <ul style="list-style-type: none"> - 'v= 0' - "o=" line indicating e.g. the session identifier and the IP address of the SS; - 's=IMS conformance test' - 't=0 0' - "c=" line indicating the IP address of the SS for receiving the media flow; <p>The SDP includes one or more media description lines based on preconfigured information so that the SDP is compatible with the UE's capabilities.</p> <p>For each type of offered media the following lines must exist within the SDP:</p> <ul style="list-style-type: none"> - "m=" line describing the media type, transport port and protocol used for media and media format; - "b=" line proposing the application specific maximum bandwidth ("AS" modifier) for the media; - two "b=" lines proposing the bandwidth allocations for RTCP (for "RS" and "RR" modifiers), if the media line in the SDP indicates the usage of RTP/RTCP, as described in RFC 3556[53]; - extra "a=" line for rtpmap attribute per each dynamic payload type given in the "m=" line. - Any of the "a=" line for rtpmap attribute may be followed by extra "a=" line for fntp attribute to convey parameters specific to a particular format; <p>For each offered media, the precondition shall be set as follows: a=curr:qos local none a=curr:qos remote none a=des:qos mandatory local [direction-tag] (note 1) a=des:qos mandatory remote [direction-tag] (note 2) note 1: The value of direction-tag may be sendrecv, send, or recv. It is preconfigured based on the UE's capability. note 2: The value of direction-tag may be sendrecv, send, or recv.</p>

100 Trying (Step 2)

Shall be formatted same as the default message in subclause A2.2.

183 Session Progress (Step 3)

Same as the default message in subclause A.2.3 with the following exceptions:

Headers to be included	Value/Remark
Status-Line Reason-Phrase	Not checked
SDP	<p>Properly generated SDP answer to the SDP offer contained in the INVITE.</p> <p>For each media, the precondition attribute lines are set as follows: a=curr:qos local [direction-tag] (note 1) a=curr:qos remote none a=des:qos mandatory local [direction-tag] (note 2) a=des:qos mandatory remote [direction-tag] (note 3) a=conf:qos remote [direction-tag] (note 4)</p> <p>note 1: The current qos status for local may be either none or the inverse of the desired remote value in Step 1 depending on whether the UE"s precondition status has been met. note 2: The inverse of the desired remote value in Step 1. note 3: The inverse of the desired local value in Step 1. note 4: The inverse of the desired local value in Step 1.</p>

PRACK (step 4)

Shall be formatted as the default message in subclause A.2.4, but without 'Route' and 'P-Access-Network-Info' headers. No content body is included in the PRACK.

200 OK (Step 5)

Shall be formatted as the default message in subclause A.3.1 with following exceptions:

Headers to be included	Value/Remark
P-Access-Network-Info	same value as in 183 message

UPDATE (step 6)

Shall be the same as the default message in subclause A.2.5, but without including 'Route', 'Proxy-Require', 'Security-Verify', and 'P-Access-Network-Info' headers and with the following exceptions:

Headers to be included	Value/Remark
SDP	<p>Same SDP offer as in INVITE with version number in the 'o' line incremented by one.</p> <p>For each media, the precondition attributes are set as follows: a=curr:qos local local [direction-tag] (note 1) a=curr:qos remote local [direction-tag] (note 2) a=des:qos mandatory local local [direction-tag] (note 3) a=des:qos mandatory remote local [direction-tag] (note 4)</p> <p>note 1: The same value as the desired local value in Step 1. note 2: The inverse of the current local value in Step 3. note 3: The same value as the desired local value in Step 1. note 4: The same value as the desired remote value in Step 1.</p>
Require	Option tag 'sec-agree' is not included

200 OK (step 7)

Shall be the same as the default message '200 OK' in subclause A.3.1 with the following exceptions:

Headers to be included	Value/Remark
SDP	Same SDP answer as in 183 with version number in the 'o' line incremented by one. For each media, the precondition attributes are set as follows: a=curr:qos local [direction-tag] (note 1) a=curr:qos remote [direction-tag] (note 2) a=des:qos mandatory local [direction-tag] (note 3) a=des:qos mandatory remote [direction-tag] (note 4) note 1: The current qos status for local may be either none or the same as the desired local value in Step 3 depending on whether the UE's precondition status has been met. note 2: The same value as the desired remote value in Step 3. note 3: The same value as the desired local value in Step 3. note 4: The same value as the desired remote value in Step 3.
P-Access-Network-Info	same value as in 183 message
Content-Type	application/SDP

180 Ringing (step 8)

Shall be formatted as the default message in subclause A.2.6 without the 'Record-Route' header and with the following exceptions:

Headers to be included	Value/Remark
Status-Line Reason-Phrase	Not checked
P-Access-Network-Info	same value as in 183 message
RSeq response-num	the value in 183 incremented by one

PRACK (step 9)

Shall be formatted as the default message in subclause A.2.4, but without 'Route' and 'P-Access-Network-Info' headers. No content body is included in the PRACK.

200 OK (step 10)

Shall be formatted as the default message '200 OK' in subclause A.3.1 with following exceptions:

Headers to be included	Value/Remark
P-Access-Network-Info	same value as in 183 message

200 OK (step 11)

Shall be formatted as the default message '200 OK' in subclause A.3.1 with following exceptions:

Headers to be included	Value/Remark
P-Access-Network-Info	same value as in 183 message
Record-Route	same value as in INVITE message

ACK (step 12)

Shall be formatted the same as the default message in subclause A.2.7 without the 'Route' header.

BYE (step 13)

Shall be formatted the same as the default message in subclause A.2.8 without 'Require', 'Proxy-Require', 'Route', 'Security-Verify', and 'P-Access-Network-Info' headers.

200 OK (step 14)

Shall be formatted the same as the default message in subclause A.3.1 with following exceptions:

Headers to be included	Value/Remark
P-Access-Network-Info	same value as in 183 message

12.4.5 Test requirements

The UE shall send requests and responses described in subclause 12.4. over the security association established during the registration/authentication process. The UE shall also include the P-Access-Network-Info header in these messages. If the UE includes Contact header in the request or response, it shall include the protected server port in the Contact header. In addition, if there is SDP content in the SIP message body, the UE shall not encrypt the SDP content.

In step 2, if 100 Trying is sent, the UE shall populate the headers as defined in subclause 12.4.4.

In step 3, the UE shall populate the headers as defined in subclause 12.4.4, and:

- 1) The UE shall include the answer for the SDP offer in the INVITE. The SDP answer indicates that the UE supports the media type and MIME type offered by the SS.
- 2) The UE shall request confirmation for the result of the resource reservation at the originating end point. The precondition related SDP lines are verified as described in subclause 12.4.4.

In step 5, the UE shall populate the headers as defined in subclause 12.4.4.

In step 7, the UE shall populate the headers as defined in subclause 12.4.4 and

- the UE indicates in the SDP answer the precondition status on both ends as described in subclause 12.4.4.

In step 8, the UE shall populate the headers as defined in subclause 12.4.4.

In step 10, the UE shall populate the headers as defined in subclause 12.4.4.

In step 11, the UE shall populate the headers as defined in subclause 12.4.4.

In step 14, the UE shall populate the headers as defined in subclause 12.4.4.

The SS shall check in step 8) that in accordance to the 3GPP TS 24.229[10], the headers covered in the specific message

13 Signalling Compression (SIGComp)

13.1 SigComp in the Initial registration

13.1.1 Definition and applicability

Test to verify that the UE can correctly register to IMS services when the P-CSCF supports and uses SigComp. The process consists of sending initial registration by the UE to S-CSCF via the P-CSCF with SIP Compression enabled and support of SIP Compression indicated by 'comp=sigcomp'.

13.1.2 Conformance requirement

The UE shall support SigComp as specified in RFC 3320. When using SigComp the UE shall send compressed SIP messages in accordance with RFC 3486.

...

The UE shall support the SIP dictionary specified in RFC 3485. If compression is enabled, the UE shall use the dictionary to compress the first message.

...

The UE shall decompress the compressed requests and responses received from the P-CSCF according to subclause 8.1.1.

Reference(s)

3GPPTS 24.229 [10], clauses 8.1.1, 8.1.2, and 8.1.3.

13.1.3 Test purpose

- 1) To verify that the UE sends a initial REGISTER request, which announces to support SIP Compression 'comp=sigcomp', to S-CSCF via the discovered P-CSCF, according to 3GPP TS 24.229 [10] clause 8.1.1; and
- 2) To verify that the UE sends a compressed initial REGISTER request to S-CSCF via the discovered P-CSCF, according to 3GPP TS 24.229 [10] clause 8.1.1 if the UE is capable to compress the first REGISTER message; and
- 3) To verify that after receiving a valid 401 (Unauthorized) response from S-CSCF for the initial REGISTER sent, the UE sends a compressed initial REGISTER request, which announces to support SIP Compression 'comp=sigcomp', to S-CSCF via the discovered P-CSCF, according to 3GPP TS 24.229 [10] clause 8.1.1 if the UE is capable to compress upon receiving the first compressed message; and
- 4) To verify that after receiving a valid NOTIFY request from S-CSCF, which announces to support SIP Compression 'comp=sigcomp' parameter in the Via header the UE sends a compressed 200 OK response; and
- 5) To verify that the UE sends the compressed initial REGISTER in accordance with SIP dictionary specified in RFC 3485 [25] if the UE is capable to compress the first REGISTER message; and
- 6) To verify that the UE sends the compressed second REGISTER in accordance with SIP dictionary specified in RFC 3485 [25] if the UE is capable to compress upon receiving the first compressed message; and 7) To verify that the UE sends the compressed 200 OK response to NOTIFY in accordance with SIP dictionary specified in RFC 3485 [25] in the case the UE is not capable to compress the first REGISTER message or is not capable to compress upon receiving the first compressed message; and
- 7) To verify that UE decompress all the SIP messages sent by the SS in accordance 3GPP TS 24.229 [10] clause 8.1.1.

13.1.4 Method of test

Initial conditions

UE contains either ISIM and USIM applications or only USIM application on UICC. UE is not registered to IMS services, but has an active PDP context and has discovered the SS as P-CSCF by executing the generic test procedure in Annex C.2 up to step 3. SS is configured with the IMSI within the USIM application, the home domain name, public and private user identities together with the shared secret key of IMS AKA algorithm, related to the IMS private user identity (IMPI) that is configured on the UICC card equipped into the UE. SS is listening to SIP default port 5060 for both UDP and TCP protocols. SS is able to perform AKAv1-MD5 authentication algorithm for that IMPI, according to 3GPP TS 33.203 [14] clause 6.1 and RFC 3310 [17].

Related ICS/IXIT Statement(s)

UE compresses the initial REGISTER message (Yes/No)

UE compresses upon receiving the first compressed message (Yes/No)

Test procedure

- 1) IMS registration is initiated on the UE. SS waits the UE to send an uncompressed initial REGISTER request (or compressed in the case the 'UE compresses the initial REGISTER message') with SIP Compression announcement 'comp=sigcomp'.
- 2) SS responds to the initial REGISTER request with a compressed valid 401 Unauthorized response, headers populated according to the 401 response common message definition.
- 3) SS waits for the UE to set up a temporary set of security associations and send another uncompressed REGISTER request over those security associations (or compressed in the case: 'UE compresses the initial REGISTER message' or 'UE compress upon receiving the first compressed message'), with SIP Compression announcement 'comp=sigcomp'.
- 4) SS responds to the second REGISTER request with valid compressed 200 OK response, sent over the same temporary set of security associations that the UE used for sending the REGISTER request. SS shall populate the headers of the 200 OK response according to the 200 response for REGISTER common message definition.
- 5) SS waits for the UE to send an uncompressed SUBSCRIBE request (or compressed in the case 'UE compress upon receiving the first compressed message') with SIP Compression announcement 'comp=sigcomp'.
- 6) SS responds to the SUBSCRIBE request with a valid compressed 200 OK response, headers populated according to the 200 response for SUBSCRIBE common message definition with the SIP Compression announcement 'comp=sigcomp' in the record-route header.
- 7) SS sends UE a compressed NOTIFY request for the subscribed registration event package. In the request the Request URI, headers and the request body shall be populated according to the NOTIFY common message definition.
- 8) SS waits for the UE to respond the NOTIFY with compressed 200 OK response.

Expected sequence

Step	Direction		Message	Comment
	UE	SS		
1		→	REGISTER	UE sends initial registration for IMS services with comp=sigcomp in the Via and Contact headers. The message is uncompressed.
1a				Optional The message is compressed, according to the capability 'UE compress the initial REGISTER message', using SigComp.
2		←	401 Unauthorized	The SS responds with an authentication challenge compressed message.
3		→	REGISTER	UE completes the security negotiation procedures sending another REGISTER. The message is uncompressed.
3a				Optional The message is compressed, according to the capability 'UE compress the initial REGISTER message' or 'UE compress upon receiving compressed message', using SigComp.
4		←	200 OK	The SS responds with 200 OK compressed message.
5		→	SUBSCRIBE	UE subscribes to its registration event package. The message is uncompressed with sigcomp.
5a				Optional The message is compressed, according to the capability 'UE compress the initial REGISTER message' or 'UE compress upon receiving compressed message', using SigComp.
6		←	200 OK	The SS responds SUBSCRIBE with 200 OK compressed message.
7		←	NOTIFY	The SS sends initial NOTIFY for registration event package. The message is compressed.
8		→	200 OK	The UE responds the NOTIFY with 200 OK compressed message

Specific Message Contents

REGISTER (Step 1)

Use the default message 'REGISTER' in annex A.1.1, condition A1 "Initial unprotected REGISTER", with the following exceptions:

Header/param	Value/remark
Via	
via-compression	comp=sigcomp
Contact	
compression-param	comp=sigcomp

401 Unauthorized for REGISTER (Step 2)

Use the default message '401 Unauthorized for REGISTER' in annex A.1.2.

REGISTER (Step 3)

Use the default message 'REGISTER' in annex A.1.1, condition A2 "Subsequent REGISTER sent over security associations", with the following exceptions:

Header/param	Value/remark
Via via-compression	comp=sigcomp
Contact compression-param	comp=sigcomp

200 OK for REGISTER (Step 4)

Use the default message '200 OK for REGISTER' in annex A.1.3.

SUBSCRIBE (Step 5)

Use the default message 'SUBSCRIBE for reg-event package' in annex A.1.4 with the following exceptions:

Header/param	Value/remark
Via via-compression	comp=sigcomp
Contact compression-param	comp=sigcomp

200 OK for SUBSCRIBE (Step 6)

Use the default message '200 OK for SUBSCRIBE' in annex A.1.5 with the following exceptions:

Header/param	Value/remark
Record-Route compression-param	comp=sigcomp

NOTIFY (Step 7)

Use the default message 'NOTIFY for reg-event package' in annex A.1.6. with the following exceptions:

Header/param	Value/remark
Via via-param1: via-compression	comp=sigcomp

200 OK for NOTIFY (Step 8)

Use the default message '200 OK for other requests than REGISTER or SUBSCRIBE' in annex A.3.1.

13.1.5 Test requirements

Step 1: SS shall check that in accordance to the 3GPP TS 24.229 [10] clause 8.1.1 the UE sends initial REGISTER request as follows:

- a) the Via header contains the SIP Compression announcement 'comp=sigcomp'; and
- b) the Contact header contains the SIP Compression announcement 'comp=sigcomp'; and
- c) the message is sent compressed according to RFC 3320 [24] in case the 'UE compresses the initial REGISTER message'; and
- d) the compression support SIP dictionary specified in RFC 3485 [25]; and

Step 3: SS shall check that in accordance to the 3GPP TS 24.229 [10] clause 8.1.1 the UE sends second REGISTER request as follows:

- a) the Via header contains the SIP Compression announcement 'comp=sigcomp'; and
- b) the Contact header contains the SIP Compression announcement 'comp=sigcomp'; and
- c) the message is sent compressed according to RFC 3320 [24] in case the 'UE compresses the initial REGISTER message' or 'UE compress upon receiving the first compressed message'; and

Step 5: SS shall check that, in accordance to the 3GPP TS 24.229 [10] clause 8.1.1, the UE sends a SUBSCRIBE request as follows:

- a) the Via header contains the SIP Compression announcement 'comp=sigcomp'; and
- b) the Contact header contains the SIP Compression announcement 'comp=sigcomp'; and
- c) the message is sent compressed according to RFC 3320 [24] in case the 'UE compresses the initial REGISTER message' or 'UE compress upon receiving the first compressed message'; and

Step 8: SS shall check that, in accordance to the 3GPP TS 24.229 [10] clause 8.1.1, the UE sends a 200 OK for NOTIFY response as follows:

- a) the Via header contains the SIP Compression announcement 'comp=sigcomp'; and
- b) the message is sent compressed according to RFC 3320 [24].

14 Emergency Service

14.1 Emergency Call Initiation – Using CS domain

14.1.1 Definition and applicability

Test to verify that the UE correctly requests an emergency service on the CS domain. This process is described in 3GPP TS 24.229 [10], clauses 5.1.6.

14.1.2 Conformance requirement

If the UE does recognise the emergency call MMI(s) (i.e. the dialled number is stored in USIM/ME), then the UE shall use the CS CN domain to attempt to establish the emergency call.

A UE shall not attempt to establish an emergency session via the IM CN Subsystem when the UE can detect that the number dialled is an emergency number. The UE shall use the CS domain as described in 3GPP TS 24.008.

As a consequence of this, a UE operating in MS operation mode C cannot perform emergency calls.

Reference(s)

3GPP TS 24.229[10], clauses 5.16; 3GPP TS 22.101[39], clause 10.4

14.1.3 Test purpose

To verify that when calling an emergency number the UE attempts an emergency call setup according to the procedures described in 3GPP TS 24.008 [12]

14.1.4 Method of test

Initial conditions

UE contains ISIM and USIM applications or only USIM application on UICC. UE has activated a PDP context, discovered P-CSCF and registered to IMS services, by executing the generic test procedure in Annex C.2 up to the last step.

SS is configured with the shared secret key of IMS AKA algorithm, related to the IMS private user identity (IMPI) configured on the UICC card equipped into the UE. SS has performed AKAv1-MD5 authentication with the UE and accepted the registration.

Related ICS/IXIT Statement(s)

UE supports Emergency speech call (Yes/No)

Test procedure

- 1) MO call is initiated on the UE by dialling emergency number, e.g. 112.
- 2) SS waits for an emergency call setup according to the procedures described in 3GPP TS 24.008 [12].
- 3) Having reached the active state, the call is cleared by the SS.

Expected sequence

Step	Direction		Message	Comment
	UE	SS		
1				MO call is initiated on the UE by dialling emergency number, e.g. 112. The dialled number shall be one programmed in test USIM EF _{ECC} (Emergency Call Codes), ref. 34.108 [40] clause 8.3.2.21.
2				SS waits for an emergency call setup according to the procedures described in 3GPP TS 24.008[12]
3				Having reached the active state, the call is cleared by the SS

Specific Message Contents

None

14.1.5 Test requirements

Step 2, 3: SS must check that the emergency call on the CS domain is successfully established according to the procedures described in 3GPP TS 24.008 [12].

14.2 Emergency Call Initiation – 380 Alternative Service

14.2.1 Definition and applicability

Test to verify that the UE correctly requests an emergency service on CS domain if the UE has received a 380 (Alternative Service) response to an INVITE request. This process is described in 3GPP TS 24.229 [10], clauses 5.1.6.

14.2.2 Conformance requirement

If the UE does not recognise the emergency call MMI(s) (i.e. the dialled number is not stored in USIM/ME) but the serving network recognises the dialled number as an emergency call number used in the country then the IM CN subsystem shall inform the UE to use a CS CN domain for emergency services.

In the event the UE receives a 380 (Alternative Service) response to an INVITE request the response containing a XML body that includes an <alternative service> element with the <type> child element set to "emergency", the UE shall automatically:

- send an ACK request to the P-CSCF as per normal SIP procedures;
- attempt an emergency call setup according to the procedures described in 3GPP TS 24.008.

The UE may also provide an indication to the user based on the text string contained in the <reason> element.

As a consequence of this, a UE operating in MS operation mode C cannot perform emergency calls.

Reference(s)

3GPP TS 24.229[10], clauses 5.16; 3GPP TS 22.101[39], clause 10.4

14.2.3 Test purpose

To verify that if the UE is not able to detect that an emergency number has been dialled:

- in the event the UE receives a 380 (Alternative Service) response to an INVITE request the response containing a XML body that includes an <alternative service> element with the <type> child element set to "emergency", the UE:
 - send an ACK request to the P-CSCF as per normal SIP procedures;
 - attempt an emergency call setup according to the procedures described in 3GPP TS 24.008 [12].

14.2.4 Method of test

Initial conditions

UE contains ISIM and USIM applications or only USIM application on UICC. UE has activated a PDP context, discovered P-CSCF and registered to IMS services, by executing the generic test procedure in Annex C.2 up to the last step.

SS is configured with the shared secret key of IMS AKA algorithm, related to the IMS private user identity (IMPI) configured on the UICC card equipped into the UE. SS has performed AKAv1-MD5 authentication with the UE and accepted the registration.

Related ICS/IXIT Statement(s)

- UE supports Emergency speech call (Yes/No)
- UE capable of initiating a bidirectional voice session over IMS (Yes/No)
- UE capable of using Tel URI for setting up a voice session (Yes/No)

Test procedure

- 1) MO call is initiated on the UE by dialling a non emergency number.
- 2) SS waits the UE to send an INVITE request with Request-URI that matches the non emergency number dialled.
- 3) SS responds to the INVITE request with a 380 Alternative Service.

- 4) SS waits for the UE to send an ACK to acknowledge receipt of the 380 Alternative Service.
- 5) SS waits for an emergency call setup according to the procedures described in 3GPP TS 24.008 [12].
- 6) Having reached the active state, the call is cleared by the SS.

Expected sequence

Step	Direction		Message	Comment
	UE	SS		
1				MO call is initiated on the UE by dialling a 'non emergency' number. The dialled number shall not be one programmed in test USIM field EF _{ECC} (Emergency Call Codes), ref. 34.108[40] clause 8.3.2.21.
2		→	INVITE	UE sends INVITE. Request-URI of the INVITE request matches with the 'non emergency' number dialled.
3		←	380 Alternative Service	The SS responds with a 380 Alternative Service
4		→	ACK	The UE acknowledges the receipt of 200 OK for INVITE and starts the emergency call in CS domain
5				SS waits for an emergency call setup according to the procedures described in 3GPP TS 24.008[12]
6				Having reached the active state, the call is cleared by the SS

Specific Message Contents

380 Alternative Service (Step 3)

Header/param	Value/remark	Rel	Reference
Status-Line			RFC 3261 [15]
SIP-Version	SIP/2.0		
Status-Code	380		
Reason-Phrase	Alternative Service		
XML Message body			
<alternative service>			
<type>	Emergency		

Editor's note: This table has got a special format with 2 extra columns as this message is supposed to be moved to the default messages from the next meeting.

14.2.5 Test requirements

SS must check that the UE sends all the requests over the security associations set up during registration, in accordance to 3GPP TS 24.229 [10], clause 5.1.1.5.1. Step 2: the UE shall send an INVITE message with correct content.

Step 2: the UE sends an INVITE message with correct content.

Step 4: the UE shall send an ACK.

Step 5, 6: SS must check that the emergency call on the CS domain is successfully established according to the procedures described in 3GPP TS 24.008 [12].

Annex A (normative): Default Messages

For all the message definitions below, the acceptable order and syntax of headers and fields within these headers must be according to IETF RFCs where those headers have been defined. Typically the order of headers is not significant, but there are well defined exceptions (like Via, Route and Record-Route headers) where the order is important.

The contents of the messages described in the present Annex is not complete - only the fields and headers required to be checked or generated by SS are listed here. The messages sent by the UE may contain additional parameters, fields and headers which are not checked and must thus be ignored by SS.

Values prefixed with px_ will be implemented in the TTCN with a PIXIT.

Values shown in *italics* shall be used in the messages as such.

A.1 Default messages for IMS Registration

A.1.1 REGISTER

Header/param	Cond	Value/remark	Rel	Reference
Request-Line Method Request-URI SIP-Version	A1, A2	<i>REGISTER</i> px_HomeDomainName (when using ISIM) or home domain name derived from px_IMSI (when using USIM) <i>SIP/2.0</i>		RFC 3261 [15]

A.2 Default messages for Call Setup

A.2.1 INVITE for MO Call Setup

Header/param	Value/remark	Rel	Reference
Request-Line			RFC 3261 [15]
Method	<i>INVITE</i>		
Request-URI	px_CalleeUri		
SIP-Version	<i>SIP/2.0</i>		
Via			RFC 3261 [15]
sent-protocol	<i>SIP/2.0/UDP</i> (when using UDP) or <i>SIP/2.0/TCP</i> (when using TCP)		
sent-by	IP address or FQDN and protected server port of the UE		
via-branch	value starting with " <i>z9hG4bk</i> "		
Route	order of the parameters in this header must be like in this table		RFC 3261 [15]
route-param	< <i>sip.px_pcscf:px_SSProtectedServerPort;/r</i> >, < <i>sip.px_scscf;/r</i> >		
From			RFC 3261 [15]
addr-spec	any SIP URI except public user identity derived from px_IMSI		
tag	must be present, value not checked		
To			RFC 3261 [15]
addr-spec	px_CalleeUri		
tag	not present		
Call-ID			RFC 3261 [15]
callid	value different to that received in REGISTER message		
CSeq			RFC 3261 [15]
value	must be present, value not checked		
method	<i>INVITE</i>		
Supported			RFC 3261 [15]
option-tag	<i>100rel</i>		
Require			RFC 3261 [15] RFC 3312 [31] RFC 3329 [21]
option-tag	<i>precondition, sec-agree</i>		
Proxy-Require			RFC 3261 [15] RFC 3329 [21]
option-tag	<i>sec-agree</i>		
Security-Verify			RFC 3329 [21]
sec-mechanism	same value as SecurityServer header sent by SS		
Contact			RFC 3261 [15]
addr-spec	SIP URI with IP address or FQDN and protected server port of UE		
Content-Type			RFC 3261 [15]
media-type	<i>application/sdp</i>		
Max-Forwards			RFC 3261 [15]
value	non-zero value		
P-Access-Network-Info			RFC 3455 [18]
access-net-spec	access network technology and, if applicable, the cell ID		
Content-Length			RFC 3261 [15]
value	length of message-body		

A.2.2 100 Trying for INVITE

Header/param	Value/remark	Rel	Reference
Status-Line SIP-Version Status-Code Reason-Phrase	<i>SIP/2.0</i> <i>100</i> <i>Trying</i>		RFC 3261 [15]
Via via-param	same value as received in INVITE message		RFC 3261 [15]
From addr-spec tag	same value as received in INVITE message same value as received in INVITE message		RFC 3261 [15]
To addr-spec tag	same value as received in INVITE message not present		RFC 3261 [15]
Call-ID callid	same value as received in INVITE message		RFC 3261 [15]
CSeq value	same value as received in INVITE message		RFC 3261 [15]
Content-Length value	0		RFC 3261 [15]

A.2.3 183 Session in Progress for INVITE

Header/param	Cond	Value/remark	Rel	Reference
Status-Line SIP-Version Status-Code Reason-Phrase	A3,A4	<i>SIP/2.0</i> <i>183</i> <i>Session in Progress</i>		RFC 3261 [15]
Record-Route rec-route	A3,A4	order of the parameters in this header must be like in this table < <i>sip:pcscf.other.com;lr</i> >, < <i>sip:scscf.other.com;lr</i> >, < <i>sip:orig@px_scscf;lr</i> >, < <i>sip.px_pcscf:px_SSProtectedServerPort;lr</i> >		RFC 3261 [15]
Via via-param	A3,A4	same value as received in INVITE message		RFC 3261 [15]
Require option-tag	A3,A4	<i>100rel</i>		RFC 3261 [15]
From addr-spec tag	A3,A4	same value as received in INVITE message same value as received in INVITE message		RFC 3261 [15]
To addr-spec tag	A3,A4	same value as received in INVITE message <i>px_InviteToTag</i>		RFC 3261 [15]
Contact addr-spec addr-spec	A3,A4 A3 A4	<i>px_CalleeContactUri</i> SIP URI with IP address or FQDN and protected server port of UE		RFC 3261 [15]
Rseq response-num	A3,A4	<i>px_RSeqNumFor183</i>		RFC 3262 [33]
Call-ID callid	A3,A4	same value as received in INVITE message		RFC 3261 [15]
CSeq value	A3,A4	same value as received in INVITE message		RFC 3261 [15]
Allow method	A3,A4	<i>UPDATE</i>		RFC 3261 [15]
Content-Type media-type	A3,A4	<i>application/sdp</i>		RFC 3261 [15]
Content-Length value	A3,A4	length of message-body		RFC 3261 [15]

Header/param	Cond	Value/remark	Rel	Reference
Message-body	A3,A4	<p>SDP body of the 183 response copied from the received INVITE but modified as follows:</p> <ul style="list-style-type: none"> - IP address on "o=" and "c=" lines and transport port on "m=" lines changed to indicate to which IP address and port the UE should start sending the media; and - optional "a=sendonly" line inverted to "a=recvonly" and vice versa - the "a=" lines describing the current and desired state of the preconditions, updated as follows: <pre> a=curr:qos local none a=curr:qos remote none a=des:qos mandatory local [direction-tag] (*) a=des:qos mandatory remote [direction-tag] (*) a=conf:qos remote [direction-tag] (** </pre> <p>*) The value of direction-tags in 183 must be the inverse from those of INVITE (both a= lines for local and remote). If the INVITE contained the direction-tag as "recv" the 183 must have it as "send" and vice versa. The value "sendrecv" will be kept as is. The value for direction tag of remote must be the same as for local..</p> <p>***) The value of direction-tag for conf:qos remote shall be the same as for des: qos mandatory remote.</p>		<p>RFC 2327 [27] RFC 3264 [30] RFC 3312 [31]</p>

Condition	Explanation
A3	MO call setup
A4	MT call setup

A.2.4 PRACK

Header/param	Value/remark	Rel	Reference
Request-Line Method Request-URI SIP-Version	<i>PRACK</i> <i>same value as in Contact header of 183 response</i> <i>SIP/2.0</i>		RFC 3261 [15]
Via sent-protocol sent-by via-branch	<i>SIP/2.0/UDP</i> (when using UDP) or <i>SIP/2.0/TCP</i> (when using TCP) <i>same value as in INVITE message</i> value starting with "z9hG4bk"		RFC 3261 [15]
Route route-param	URIs of the Record-Route header of 183 response in reverse order		RFC 3261 [15]
From addr-spec tag	same value as received in INVITE message same value as received in INVITE message		RFC 3261 [15]
To addr-spec tag	same value as received in INVITE message same value as in the corresponding reliable response		RFC 3261 [15]
Call-ID callid	same value as received in INVITE message		RFC 3261 [15]
CSeq value method	value as in reliable response incremented by one <i>PRACK</i>		RFC 3261 [15]
Require option-tag	<i>precondition</i>		RFC 3261 [15] RFC 3329 [21]
Max-Forwards value	non-zero value		RFC 3261 [15]
RAck response-num cseq-num method	same value as in RSeq header of the reliable response same value as in CSeq of reliable response same value as in CSeq of reliable response		RFC 3262 [33]
P-Access-Network-Info access-net-spec	access network technology and, if applicable, the cell ID		RFC 3455 [18]
Content-Type media-type	header shall be present only if there is SDP in message-body <i>application/sdp</i>		RFC 3261 [15]
Content-Length value	length of message-body		RFC 3261 [15]
Message-body	Optional SDP body. If included then the contents of the SDP shall be checked as described in the Test requirements section of the test case.		RFC 2327 [27] RFC 3264 [30] RFC 3312 [31]

A.2.5 UPDATE

Header/param	Value/remark	Rel	Reference
Request-Line Method Request-URI SIP-Version	<i>UPDATE</i> <i>same value as in PRACK message</i> <i>SIP/2.0</i>		RFC 3261 [15]
Via sent-protocol sent-by via-branch	<i>SIP/2.0/UDP</i> (when using UDP) or <i>SIP/2.0/TCP</i> (when using TCP) <i>same value as in INVITE message</i> value starting with "z9hG4bk"		RFC 3261 [15]
Route route-param	URIs of the Record-Route header of 183 response in reverse order		RFC 3261 [15]
From addr-spec tag	same value as received in INVITE message same value as received in INVITE message		RFC 3261 [15]
To addr-spec tag	same value as received in INVITE message same value as in 183 message		RFC 3261 [15]
Call-ID callid	same value as received in INVITE message		RFC 3261 [15]
CSeq value method	value of received in INVITE incremented by two <i>UPDATE</i>		RFC 3261 [15]
Require option-tag	<i>precondition, sec-agree</i>		RFC 3261 [15] RFC 3329 [21]
Proxy-Require option-tag	<i>sec-agree</i>		RFC 3261 [15] RFC 3329 [21]
Max-Forwards value	non-zero value		RFC 3261 [15]
Security-Verify sec-mechanism	same value as SecurityServer header sent by SS		RFC 3329 [21]
P-Access-Network-Info access-net-spec	access network technology and, if applicable, the cell ID		RFC 3455 [18]
Content-Type media-type	<i>application/sdp</i>		RFC 3261 [15]
Content-Length value	length of message-body		RFC 3261 [15]
Message-body	Contents of the SDP body shall be checked as described in the Test requirements section of the test case.		RFC 2327 [27] RFC 3264 [30] RFC 3312 [31]

A.2.6 180 Ringing for INVITE

Header/param	Value/remark	Rel	Reference
Status-Line SIP-Version Status-Code Reason-Phrase	<i>SIP/2.0</i> <i>180</i> <i>Ringing</i>		RFC 3261 [15]
Record-Route rec-route	same value as in the 183 response		RFC 3261 [15]
Via via-param	same value as in the 183 response		RFC 3261 [15]
Require option-tag	<i>100rel</i>		RFC 3261 [15]
From addr-spec tag	same value as in the 183 response same value as in the 183 response		RFC 3261 [15]
To addr-spec tag	same value as in the 183 response same value as in the 183 response		RFC 3261 [15]
Contact addr-spec	same value as in the 183 response		RFC 3261 [15]
Rseq response-num	px_RSeqNumFor183 incremented by one		RFC 3262 [33]
Call-ID callid	same value as in the 183 response		RFC 3261 [15]
CSeq value	same value as in the 183 response		RFC 3261 [15]
Content-Length value	0		RFC 3261 [15]

A.2.7 ACK

Header/param	Value/remark	Rel	Reference
Request-Line Method Request-URI SIP-Version	<i>ACK</i> <i>same value as in PRACK message</i> <i>SIP/2.0</i>		RFC 3261 [15]
Via via-param	same value as received in INVITE message		RFC 3261 [15]
Route route-param	URIs of the Record-Route header of 183 response in reverse order		RFC 3261 [15]
From addr-spec tag	same value as received in INVITE message same value as received in INVITE message		RFC 3261 [15]
To addr-spec tag	same value as received in INVITE message same value as received in 183 message		RFC 3261 [15]
Call-ID callid	same value as received in INVITE message		RFC 3261 [15]
CSeq value method	same value as received in INVITE message <i>ACK</i>		RFC 3261 [15]
Max-Forwards value	non-zero value		RFC 3261 [15]
P-Access-Network-Info	must not be present		RFC 3455 [18]
Content-Length value	0		RFC 3261 [15]

A.2.8 BYE

Header/param	Value/remark	Rel	Reference
Request-Line Method Request-URI SIP-Version	<i>BYE</i> <i>same value as in PRACK message</i> <i>SIP/2.0</i>		RFC 3261 [15]
Via sent-protocol sent-by via-branch	<i>SIP/2.0/UDP</i> (when using UDP) or <i>SIP/2.0/TCP</i> (when using TCP) <i>same value as in INVITE message</i> value starting with "z9hG4bk"		RFC 3261 [15]
Route route-param	URIs of the Record-Route header of 183 response in reverse order		RFC 3261 [15]
From addr-spec tag	same value as received in INVITE message same value as received in INVITE message		RFC 3261 [15]
To addr-spec tag	same value as received in INVITE message same value as in the 183 message		RFC 3261 [15]
Call-ID callid	same value as received in INVITE message		RFC 3261 [15]
CSeq value method	must be present, not checked <i>BYE</i>		RFC 3261 [15]
Require option-tag	<i>sec-agree</i>		RFC 3261 [15] RFC 3329 [21]
Proxy-Require option-tag	<i>sec-agree</i>		RFC 3261 [15] RFC 3329 [21]
Max-Forwards value	non-zero value		RFC 3261 [15]
Security-Verify sec-mechanism	same value as SecurityServer header sent by SS		RFC 3329 [21]
P-Access-Network-Info access-net-spec	access network technology and, if applicable, the cell ID		RFC 3455 [18]
Content-Length value	length of message body		RFC 3261 [15]

A.2.9 INVITE for MT Call

Header/param	Value/remark	Rel	Reference
Request-Line			RFC 3261[15]
Method	<i>INVITE</i>		
Request-URI	UE"s registered contact address in SIP URI form		
SIP-Version	<i>SIP/2.0</i>		
Via			RFC 3261[15]
sent-protocol	<i>SIP/2.0/UDP</i> (when using UDP) or <i>SIP/2.0/TCP</i> (when using TCP)		
sent-by	IP address or FQDN and protected server port of the SS		
Via-branch	value starting with " <i>z9hG4bk</i> "		
Via			RFC 3261[15]
via-parm	<i>SIP/2.0/UDP scscf1.3gpp.org;branch=z9hG4bK1234567890,</i> <i>SIP/2.0/UDP scscf2.3gpp.org;branch=z9hG4bK2345678901,</i> <i>SIP/2.0/UDP pcscf2.3gpp.org;branch=z9hG4bK3456789012</i>		
Record-Route			RFC 3261[15]
rec-route	SIP URI with FQDN or IP address and protected server port of the SS		
Record-Route			RFC 3261[15]
rec-route	<i><sip:term@scscf1.3gpp.org;lr>, <sip:orig@scscf2.3gpp.org;lr>,
<sip:pcscf2.3gpp.org;lr></i>		
From			RFC 3261[15]
addr-spec	an SIP URI representing the calling UE		
Tag	must be present, value not checked		
To			RFC 3261[15]
addr-spec	SIP or TEL URI of the UE		
Tag	not present		
Call-ID			RFC 3261[15]
callid	a random text string generated by the SS		
CSeq			RFC 3261[15]
value	must be present, value not checked		
method	<i>INVITE</i>		
Supported			RFC 3261[15]
option-tag	<i>100rel</i>		
Require			RFC 3261[15]
option-tag	<i>Precondition</i>		
P-Called-Party-ID	One of the UE"s registered, non-barred public ID		RFC 3455[18]
Contact			RFC 3261[15]
addr-spec	SIP URI with IP address or FQDN and protected server port of the calling UE		
Content-Type			RFC 3261[15]
media-type	<i>application/sdp</i>		
Max-Forwards			RFC 3261[15]
value	non-zero value		
Content-Length			RFC 3261[15]
value	length of message-body		

A.3 Generic Common Messages

A.3.1 200 OK for other requests than REGISTER or SUBSCRIBE

Header/param	Value/remark	Rel	Reference
Status-Line SIP-Version Status-Code Reason-Phrase	<i>SIP/2.0</i> <i>200</i> <i>OK</i>		RFC 3261 [15]
Via via-param	same value as received in request		RFC 3261 [15]
From addr-spec tag	same value as received in request same value as received in request		RFC 3261 [15]
To addr-spec tag	same value as received in request same value as received in request or <i>px_InviteToTag</i> added if missing from request		RFC 3261 [15]
Call-ID callid	same value as received in request		RFC 3261 [15]
CSeq value	same value as received in request		RFC 3261 [15]
Content-Length value	0		RFC 3261 [15]

Annex B (normative): Default DHCP messages

For all the message definitions below, the acceptable order and syntax of headers and fields within these headers must be according to IETF RFCs where those headers have been defined. Typically the order of headers is not significant, but there are well defined exceptions where the order is important.

For IPv6 DHCP messages refer to RFC 3315[23]

For IPv4 DHCP messages refer to RFC 2131[55].

The contents of the messages described in the present Annex is not complete - only the fields and headers required to be checked or generated by SS are listed here. The messages sent by the UE may contain additional parameters, fields and headers which are not checked and must thus be ignored by SS.

B.1 Default DHCP messages (IPv6)

B.1.1 DHCP INFORMATION-REQUEST

Options	Value/Remarks
msg-type	INFORMATION-REQUEST (11)
transaction-id	Check If Present Note the Value to be included in Reply Message
option-code	OPTION_CLIENTID (1)
- option-len	Length of the DUID of Client
- DUID	Set to DUID of Cleint

*Note: Numerical value, "(n)", provided in brackets in Column Value/Remarks is the 'octal' value for this option.

B.1.2 DHCP REPLY

Options	Value/Remarks
msg-type	REPLY (7)
transaction-id	Set the same value as received in the corresponding Uplink Information Request message
option-code	OPTION_CLIENTID (1)
- option-len	Length of the DUID of client
- DUID	Set to DUID of Cleint
option-code	OPTION_SERVERID 21)
- option-len	Length of the DUID of Server
- DUID	Set to DUID of Server

*Note: Numerical value, "(n)", provided in brackets in Column Value/Remarks is the 'octal' value for this option.

B.1.3 DHCP SOLICIT

Options	Value/Remarks
msg-type	SOLICIT (1)
transaction-id	Check If Present Note the Value to be included in Reply Message
option-code - option-len - DUID	OPTION_CLIENTID (1) Length of the DUID of Client Set to DUID of Client
option-code - option-len - requested-option-code	OPTION_ORO (6) Check Specific message contents in test case Check Specific message contents in test case

*Note: Numerical value, "(n)", provided in brackets in Column Value/Remarks is the 'octal' value for this option.

B.1.4 DHCP ADEVERTISE

Options	Value/Remarks
msg-type	ADVERTISE (2)
transaction-id	Set the same value as received in the corresponding Uplink solicit message
option-code - option-len - DUID	OPTION_CLIENTID (1) Length of the DUID of client Set to DUID of Client
option-code - option-len - DUID	OPTION_SERVERID (21) Length of the DUID of Server Set to DUID of Server

*Note: Numerical value, "(n)", provided in brackets in Column Value/Remarks is the 'octal' value for this option.

B.2 Default DHCP messages (IPv4)

B.2.1 DHCP DISCOVER

Fields	Value/Remarks
op	1 (BOOTREQUEST)
htype	Check if valid value is included
hlen	Check if valid value is included
hops	0
xid	Check For Presence Note the Value to be included in Offer Message
secs	Any Value
flags	Check For Presence Note the Value to be included in Offer Message
ciaddr	0
yiaddr	0
siaddr	0
giaddr	0
chaddr	FFS
sname	Options if indicated in sname/file else not used
file	Options if indicated in sname/file else not used
options	*
- code	53 (DHCP Message Type)
- len	1
- Type	1 (DHCP DISCOVER)

* Note: Additional options may be present

B.2.2 DHCP OFFER

Fields	Value/Remarks
op	2 (BOOTREPLY)
htype	Set to SS Hardware Type
hlen	Set to SS Hardware Address Len
hops	0
xid	Set to same value as received in corresponding DISCOVER message
secs	0
flags	Set to same value as received in corresponding DISCOVER message
ciaddr	0
yiaddr	IP address of Mobile
siaddr	Set to IP address of next Boot Strap server
giaddr	Set to same value as received in corresponding DISCOVER message
chaddr	Set to same value as received in corresponding DISCOVER message
sname	Set to Server Host name
file	Set to Client Boot File Name
options	*
- code	53 (DHCP Message Type)
- len	1
- Type	2 (DHCP OFFER)

* Note: Additional options included in response to options requested by UE and supported by SS

B.2.3 DHCP INFORM

Fields	Value/Remarks
op	1 (BOOTREQUEST)
htype	Check if valid value is included
hlen	Check if valid value is included
hops	0
xid	Check For Presence Note the Value to be included in Offer Message
secs	Any Value
flags	Check For Presence Note the Value to be included in Offer Message
ciaddr	Set to UE"s Network address
yiaddr	0
siaddr	0
giaddr	0
chaddr	FFS
sname	Options if indicated in sname/file else not used
file	Options if indicated in sname/file else not used
options	*
- code	53 (DHCP Message Type)
- len	1
- Type	8 (DHCP INFORM)

* Note: Additional options may be present

B.2.4 DHCP ACK

Fields	Value/Remarks
op	2 (BOOTREPLY)
htype	Set to SS Hardware Type
hlen	Set to SS Hardware Address Len
hops	0
xid	Set to same value as received in corresponding INFORM message
secs	0
flags	Set to same value as received in corresponding INFORM message
ciaddr	0
yiaddr	IP address of Mobile
siaddr	Set to IP address of next Boot Strap server
giaddr	Set to same value as received in corresponding INFORM message
chaddr	Set to same value as received in corresponding INFORM message
sname	Set to Server Host name
file	Set to Client Boot File Name
options	*
- code	53 (DHCP Message Type)
- len	1
- Type	5 (DHCP ACK)

* Note: Additional options included in response to options requested by UE

Annex C (normative): Generic Test Procedure

This Annex contains information about generic test procedures.

C.1 Introduction

This annex specifies the general test procedure required to get the UE to activate PDP context, discover P-CSCF and register to IMS services. Since 3GPP TS 24.229[10] specifies two options for both PDP context activation and P-CSCF discovery, the UE specific general test procedure depends on the option selected by the UE.

C.2 Generic Registration Test Procedure

The generic test procedure:

- 1 The UE sends an Activate PDP Context Request message. In the Protocol Configuration Options IE the IM CN Subsystem Signalling Flag may be set or not set, a request for P-CSCF Address or a request for DNS Server Address may be included or not.
- 2 The SS responds with an Activate PDP Context Accept message. In the Protocol Configuration Options IE the IM CN Subsystem Signalling Flag shall not be set, a list of P-CSCF addresses or DNS Server addresses shall only be included if a corresponding request was included in step 1.
- 3 Optional P-CSCF address discovery using the DHCP procedure according to Annex C.3 for IPv6 or Annex C.4 for IPv4.
- 4 The UE initiates IMS registration. SS waits for the UE to send an initial REGISTER request.
- 5 The SS responds to the initial REGISTER request with a valid 401 Unauthorized response.
- 6 The SS waits for the UE to set up a temporary set of security associations and to send another REGISTER request, over those security associations.
- 7 The SS responds to the second REGISTER request with valid 200 OK response, sent over the same temporary set of security associations that the UE used for sending the REGISTER request.
- 8 The SS waits for the UE to send a SUBSCRIBE request over the newly established security associations.
- 9 The SS responds to the SUBSCRIBE request with a valid 200 OK response.
- 10 The SS sends a valid NOTIFY request for the subscribed registration event package.
- 11 The SS waits for the UE to respond to the NOTIFY with a 200 OK response.

Expected sequence

Step	Direction		Message	Comment
	UE	SS		
1		→	Activate PDP Context Request	In the Protocol Configuration Options IE the IM CN Subsystem Signalling Flag may be set or not set, a request for P-CSCF Address or a request for DNS Server Address may be included or not.
2		←	Activate PDP Context Accept	In the Protocol Configuration Options IE the IM CN Subsystem Signalling Flag shall not be set, a list of P-CSCF IP addresses or DNS Server addresses shall only be included if a corresponding request was included in step 1.
3				Optional P-CSCF address discovery using the DHCP procedure according to Annex C.3 for IPv6 or Annex C.4 for IPv4.
4		→	REGISTER	The UE sends initial registration for IMS services.
5		←	401 Unauthorized	The SS responds with a valid AKAv1-MD5 authentication challenge and security mechanisms supported by the network.
6		→	REGISTER	The UE completes the security negotiation procedures, sets up a temporary set of SAs and uses those for sending another REGISTER with AKAv1-MD5 credentials.
7		←	200 OK	The SS responds with 200 OK.
8		→	SUBSCRIBE	The UE subscribes to its registration event package.
9		←	200 OK	The SS responds with 200 OK.
10		←	NOTIFY	The SS sends initial NOTIFY for registration event package, containing full registration state information for the registered public user identity in the XML body
11		→	200 OK	The UE responds with 200 OK.

NOTE: The default message contents in annex A are used.

C.3 Generic DHCP test procedure for IPv6

The generic test procedure (according to RFC 3315[23]

- 1 The UE sends a DHCP SOLICIT message requesting to resolve P-CSCF Domain Name(s).
- 2 The SS responds with a DHCP ADVERTISE message containing the IP address of the SS as P-CSCF address, if the UE requested the SIP Servers option within the DHCP SOLICIT message.
- 3 The UE may send a DHCP INFORMATION-REQUEST message .
- 4 The SS responds with a DHCP REPLY message containing the IP address of the SS as P-CSCF address.

Expected sequence

Step	Direction		Message	Comment
	UE	SS		
1	→		DHCP SOLICIT	Requesting to locate a DHCP server
2		←	DHCP ADVERTISE	
3	→		DHCP INFORMATION-REQUEST	Optional message.
4		←	DHCP REPLY	Sent if DHCP INFORMATION-REQUEST is received.

NOTE: The default message contents in annex B are used.

C.4 Generic DHCP test procedure for IPv4

The generic test procedure (according to RFC 2131[55]):

- 1 If the UE already knows a DHCP server address, it goes to step 3. Otherwise, the UE sends a DHCP DISCOVER message locating a server.
- 2 The SS responds with a DHCP OFFER message.
- 3 The UE sends a DHCP INFORM message requesting P-CSCF address(es) in the options field.
- 4 The SS responds with a DHCP ACK message providing the IP address of the SS as P-CSCF address.

Expected sequence

Step	Direction		Message	Comment
	UE	SS		
1	→		DHCP DISCOVER	Optionally sent if UE does not have DHCP server address.
2		←	DHCP OFFER	Sent if DHCP Discover message is received.
3	→		DHCP INFORM	Requesting P-CSCF Address(es).
4		←	DHCP ACK	Including P-CSCF IP Address.

NOTE: The default message contents in annex B are used.

Annex D (Informative): Example values for certain IXIT parameters

This table contains syntactically correct example values for a number of headers and parameters that may be used as such by SS when sending downlink messages and checking that the uplink messages would contain the same values. These values will be defined as IXIT.

IMS registration parameters from ISIM application

px_HomeDomainName sip:3gpp.org
px_PublicUserIdentity sip:localuser@3gpp.org
px_PrivateUserIdentity privateuser@3gpp.org

IMS registration parameters derived from IMSI when using USIM application TS 23.003 [32]

px_IMSI 12345611223344
home domain name sip:ims.mnc123.mcc456.3gppnetwork.org
public user identity sip:12345611223344@ims.mnc123.mcc456.3gppnetwork.org
private user identity 12345611223344@ims.mnc123.mcc456.3gppnetwork.org

CSCF domain names

px_pcscf pcscf.3gpp.org (FDQN that resolves to the IP address of SS)
px_scscf scscf.3gpp.org (FDQN that does not resolve to the IP address of SS)

Annex E (informative): Change history
