Copyright Notification

Intellectual Property Rights

Essential patents

IPRs essential or potentially essential to normative deliverables may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: *"Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards"*, which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (https://ipr.etsi.org/).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Trademarks

The present document may include trademarks and/or tradenames which are asserted and/or registered by their owners. ETSI claims no ownership of these except for any which are indicated as being the property of ETSI, and conveys no right to use or reproduce any trademark and/or tradename. Mention of those trademarks in the present document does not constitute an endorsement by ETSI of products, services or organizations associated with those trademarks.

Legal Notice

This Technical Specification (TS) has been produced by ETSI 3rd Generation Partnership Project (3GPP).

The present document may refer to technical specifications or reports using their 3GPP identities. These shall be interpreted as being references to the corresponding ETSI deliverables.

The cross reference between 3GPP and ETSI identities can be found under http://webapp.etsi.org/key/queryform.asp.

Modal verbs terminology

In the present document "**shall**", "**shall not**", "**should**", "**should not**", "**may**", "**need not**", "**will**", "**will not**", "**can**" and "**cannot**" are to be interpreted as described in clause 3.2 of the ETSI Drafting Rules (Verbal forms for the expression of provisions).

"**must**" and "**must not**" are **NOT** allowed in ETSI deliverables except when used in direct citation.

Contents

Foreword

This Technical Specification has been produced by the 3rd Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

x   the first digit:

1   presented to TSG for information;

2   presented to TSG for approval;

3   or greater indicates TSG approved document under change control.

Y   the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.

z   the third digit is incremented when editorial only changes have been incorporated in the document.

1 Scope

The present document specifies the coding, multiplexing and mapping to physical channels for E-UTRA.

2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.

- For a specific reference, subsequent revisions do not apply.

- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the same Release as the present document*.

3 Definitions, symbols and abbreviations

3.1 Definitions

For the purposes of the present document, the terms and definitions given in [1] and the following apply. A term defined in the present document takes precedence over the definition of the same term, if any, in [1].

BL/CE: A Bandwidth-reduced Low-complexity or Coverage Enhanced (BL/CE) UE is capable of coverage enhancement mode A support and intends to access a cell in a coverage enhancement mode or is configured in a coverage enhancement mode.

Non-BL/CE: A non-BL/CE UE is a UE that does not fulfil the conditions in the above definition of a BL/CE UE.

3.2 Symbols

For the purposes of the present document, the following symbols apply:

$N_{\text{RB}}^{\text{DL}}$	Downlink bandwidth configuration, expressed in number of resource blocks [2]
$N_{\text{RB}}^{\text{UL}}$	Uplink bandwidth configuration, expressed in number of resource blocks [2]
$N_{\text{RB}}^{\text{SL}}$	Sidelink bandwidth configuration, expressed in number of resource blocks [2]
$N_{\text{subchannel}}^{\text{SL}}$	Number of sidelink subchannels configured on the resource pool of a subcarrier [2]
$N_{\text{sc}}^{\text{RB}}$	Resource block size in the frequency domain, expressed as a number of subcarriers
$N_{\text{symb}}^{\text{PUSCH}}$	Number of SC-FDMA symbols carrying PUSCH in a subframe
$N_{\text{symb}}^{\text{PUSCH-initial}}$	Number of SC-FDMA symbols carrying PUSCH in the initial PUSCH transmission subframe
$N_{\text{symb}}^{\text{UL}}$	Number of SC-FDMA symbols in an uplink slot
$N_{\text{symb}}^{\text{SL}}$	Number of SC-FDMA symbols in a sidelink slot
N_{SRS}	Number of SC-FDMA symbols used for SRS transmission in a subframe (0 or 1).

3.3   Abbreviations

For the purposes of the present document, the following abbreviations apply:

AUL	Autonomous Uplink
AUL-DFI	AUL downlink feedback information
AUL-UCI	AUL uplink control information
BCH	Broadcast channel
CFI	Control Format Indicator
COT	Channel Occupancy Time
CP	Cyclic Prefix
CSI	Channel State Information
DCI	Downlink Control Information
DL-SCH	Downlink Shared channel
EN-DC	E-UTRA NR Dual Connectivity with MCG using E-UTRA and SCG using NR
EPDCCH	Enhanced Physical Downlink Control channel

5   Channel coding, multiplexing and interleaving

Data and control streams from/to MAC layer are encoded /decoded to offer transport and control services over the radio transmission link. Channel coding scheme is a combination of error detection, error correcting, rate matching, interleaving and transport channel or control information mapping onto/splitting from physical channels.

5.1   Generic procedures

This subclause contains coding procedures which are used for more than one transport channel or control information type.

5.1.1   CRC calculation

Denote the input bits to the CRC computation by $a_0, a_1, a_2, a_3,..., a_{A-1}$, and the parity bits by $p_0, p_1, p_2, p_3,..., p_{L-1}$. A is the size of the input sequence and L is the number of parity bits. The parity bits are generated by one of the following cyclic generator polynomials:

- $g_{CRC24A}(D) = [D^{24} + D^{23} + D^{18} + D^{17} + D^{14} + D^{11} + D^{10} + D^7 + D^6 + D^5 + D^4 + D^3 + D + 1]$ and;

- $g_{CRC24B}(D) = [D^{24} + D^{23} + D^6 + D^5 + D + 1]$ for a CRC length $L = 24$ and;

- $g_{CRC16}(D) = [D^{16} + D^{12} + D^5 + 1]$ for a CRC length $L = 16$.

- $g_{CRC8}(D) = [D^8 + D^7 + D^4 + D^3 + D + 1]$ for a CRC length of $L = 8$.

The encoding is performed in a systematic form, which means that in GF(2), the polynomial:

$$a_0 D^{A+23} + a_1 D^{A+22} +...+ a_{A-1}D^{24} + p_0 D^{23} + p_1 D^{22} +...+ p_{22}D^1 + p_{23}$$

yields a remainder equal to 0 when divided by the corresponding length-24 CRC generator polynomial, $g_{CRC24A}(D)$ or $g_{CRC24B}(D)$, the polynomial:

$$a_0 D^{A+15} + a_1 D^{A+14} +...+ a_{A-1}D^{16} + p_0 D^{15} + p_1 D^{14} +...+ p_{14}D^1 + p_{15}$$

yields a remainder equal to 0 when divided by $g_{CRC16}(D)$, and the polynomial:

$$a_0 D^{A+7} + a_1 D^{A+6} +...+ a_{A-1}D^8 + p_0 D^7 + p_1 D^6 +...+ p_6 D^1 + p_7$$

yields a remainder equal to 0 when divided by $g_{CRC8}(D)$.

The bits after CRC attachment are denoted by $b_0, b_1, b_2, b_3, ..., b_{B-1}$, where $B = A + L$. The relation between a_k and b_k is:

$b_k = a_k$ for $k = 0, 1, 2, ..., A$-1

$b_k = p_{k-A}$ for $k = A, A+1, A+2, ..., A+L$-1.

5.1.2   Code block segmentation and code block CRC attachment

The input bit sequence to the code block segmentation is denoted by $b_0, b_1, b_2, b_3, ..., b_{B-1}$, where $B > 0$. If B is larger than the maximum code block size Z, segmentation of the input bit sequence is performed and an additional CRC sequence of $L = 24$ bits is attached to each code block. The maximum code block size is:

- $Z = 6144$.

If the number of filler bits F calculated below is not 0, filler bits are added to the beginning of the first block.

> Note that if $B < 40$, filler bits are added to the beginning of the code block.

The filler bits shall be set to *<NULL>* at the input to the encoder.

Total number of code blocks C is determined by:

if $B \le Z$

$\quad L = 0$

$\quad$ Number of code blocks: $C = 1$

$\quad B' = B$

else

$\quad L = 24$

$\quad$ Number of code blocks: $C = \lceil B/(Z - L) \rceil$.

$\quad B' = B + C \cdot L$

end if

The bits output from code block segmentation, for $C \ne 0$, are denoted by $c_{r0}, c_{r1}, c_{r2}, c_{r3}, ..., c_{r(K_r-1)}$, where r is the code block number, and K_r is the number of bits for the code block number r.

> Number of bits in each code block (applicable for $C \ne 0$ only):

> First segmentation size: $K_+ = $ minimum K in table 5.1.3-3 such that $C \cdot K \ge B'$

> if $C = 1$

> $\quad$ the number of code blocks with length K_+ is $C_+ = 1$, $K_- = 0$, $C_- = 0$

> else if $C > 1$

> $\quad$ Second segmentation size: $K_- = $ maximum K in table 5.1.3-3 such that $K < K_+$

> $\quad \Delta_K = K_+ - K_-$

> $\quad\quad$ Number of segments of size K_-: $C_- = \left\lfloor \dfrac{C \cdot K_+ - B'}{\Delta_K} \right\rfloor$.

Number of segments of size K_+: $C_+ = C - C_-$.

end if

Number of filler bits: $F = C_+ \cdot K_+ + C_- \cdot K_- - B'$

for $k = 0$ to F-1   -- Insertion of filler bits

$\qquad c_{0k} = <NULL>$

end for

$k = F$

$s = 0$

for $r = 0$ to C-1

$\qquad$ if $r < C_-$

$\qquad\qquad K_r = K_-$

$\qquad$ else

$\qquad\qquad K_r = K_+$

$\qquad$ end if

$\qquad$ while $k < K_r - L$

$\qquad c_{rk} = b_s$

$\qquad k = k + 1$

$\qquad s = s + 1$

$\qquad$ end while

$\qquad$ if $C > 1$

$\qquad\qquad$ The sequence $c_{r0}, c_{r1}, c_{r2}, c_{r3}, ..., c_{r(K_r - L - 1)}$ is used to calculate the CRC parity bits $p_{r0}, p_{r1}, p_{r2}, ..., p_{r(L-1)}$ according to subclause 5.1.1 with the generator polynomial $g_{CRC24B}(D)$. For CRC calculation it is assumed that filler bits, if present, have the value 0.

$\qquad\qquad$ while $k < K_r$

$\qquad\qquad\qquad c_{rk} = p_{r(k+L-K_r)}$

$\qquad\qquad\qquad k = k + 1$

$\qquad\qquad$ end while

$\qquad$ end if

$\qquad k = 0$

end for

5.1.3   Channel coding

The bit sequence input for a given code block to channel coding is denoted by $c_0, c_1, c_2, c_3, ..., c_{K-1}$, where K is the number of bits to encode. After encoding the bits are denoted by $d_0^{(i)}, d_1^{(i)}, d_2^{(i)}, d_3^{(i)}, ..., d_{D-1}^{(i)}$, where D is the number of

encoded bits per output stream and i indexes the encoder output stream. The relation between c_k and $d_k^{(i)}$ and between K and D is dependent on the channel coding scheme.

The following channel coding schemes can be applied to TrCHs:

- tail biting convolutional coding;

- turbo coding.

Usage of coding scheme and coding rate for the different types of TrCH is shown in table 5.1.3-1. Usage of coding scheme and coding rate for the different control information types is shown in table 5.1.3-2.

The values of D in connection with each coding scheme:

- tail biting convolutional coding with rate 1/3: $D = K$;

- turbo coding with rate 1/3: $D = K + 4$.

The range for the output stream index i is 0, 1 and 2 for both coding schemes.

Table 5.1.3-1: Usage of channel coding scheme and coding rate for TrCHs

TrCH	Coding scheme	Coding rate
UL-SCH	Turbo coding	1/3
DL-SCH		
PCH		
MCH		
SL-SCH		
SL-DCH

SL-BCH		

Table 5.1.3-2: Usage of channel coding scheme and coding rate for control information

Control Information	Coding scheme	Coding rate
DCI	Tail biting convolutional coding	1/3
CFI	Block code	1/16
HI	Repetition code	1/3
UCI	Block code	variable
	Tail biting convolutional coding	1/3
SCI	Tail biting convolutional coding	1/3

5.1.3.1 Tail biting convolutional coding

A tail biting convolutional code with constraint length 7 and coding rate 1/3 is defined.

The configuration of the convolutional encoder is presented in figure 5.1.3-1.

The initial value of the shift register of the encoder shall be set to the values corresponding to the last 6 information bits in the input stream so that the initial and final states of the shift register are the same. Therefore, denoting the shift register of the encoder by $s_0, s_1, s_2, ..., s_5$, then the initial value of the shift register shall be set to

$$s_i = c_{(K-1-i)}$$
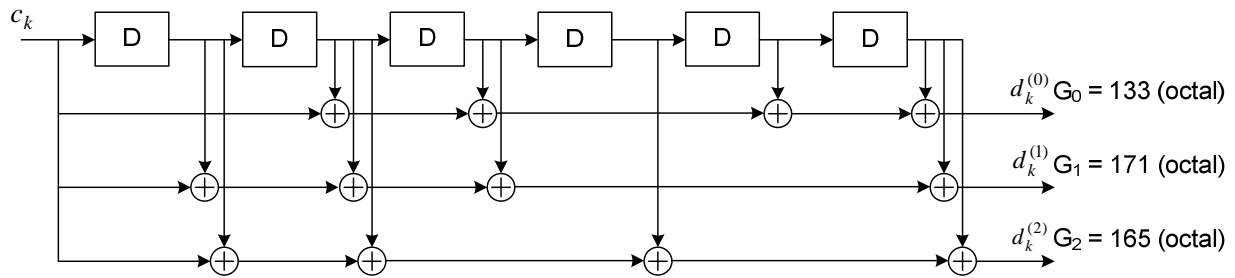

Figure 5.1.3-1: Rate 1/3 tail biting convolutional encoder

The encoder output streams $d_k^{(0)}$, $d_k^{(1)}$ and $d_k^{(2)}$ correspond to the first, second and third parity streams, respectively as shown in Figure 5.1.3-1.

5.1.3.2   Turbo coding

5.1.3.2.1   Turbo encoder

The scheme of turbo encoder is a Parallel Concatenated Convolutional Code (PCCC) with two 8-state constituent encoders and one turbo code internal interleaver. The coding rate of turbo encoder is 1/3. The structure of turbo encoder is illustrated in figure 5.1.3-2.

The transfer function of the 8-state constituent code for the PCCC is:

$$G(D) = \left[1, \frac{g_1(D)}{g_0(D)} \right],$$

where

$$g_0(D) = 1 + D^2 + D^3,$$

$$g_1(D) = 1 + D + D^3.$$

The initial value of the shift registers of the 8-state constituent encoders shall be all zeros when starting to encode the input bits.

The output from the turbo encoder is

$$d_k^{(0)} = x_k$$

$$d_k^{(1)} = z_k$$

$$d_k^{(2)} = z_k'$$

for $k = 0,1,2,...,K-1$.

If the code block to be encoded is the 0-th code block and the number of filler bits is greater than zero, i.e., $F > 0$, then the encoder shall set $c_k, = 0$, $k = 0,\ldots,(F-1)$ at its input and shall set $d_k^{(0)} =< NULL >$, $k = 0,\ldots,(F-1)$ and $d_k^{(1)} =< NULL >$, $k = 0,\ldots,(F-1)$ at its output.

The bits input to the turbo encoder are denoted by $c_0, c_1, c_2, c_3,..., c_{K-1}$, and the bits output from the first and second 8-state constituent encoders are denoted by $z_0, z_1, z_2, z_3,..., z_{K-1}$ and $z_0', z_1', z_2', z_3',..., z_{K-1}'$, respectively. The bits output from the turbo code internal interleaver are denoted by $c_0', c_1',..., c_{K-1}'$, and these bits are to be the input to the second 8-state constituent encoder.
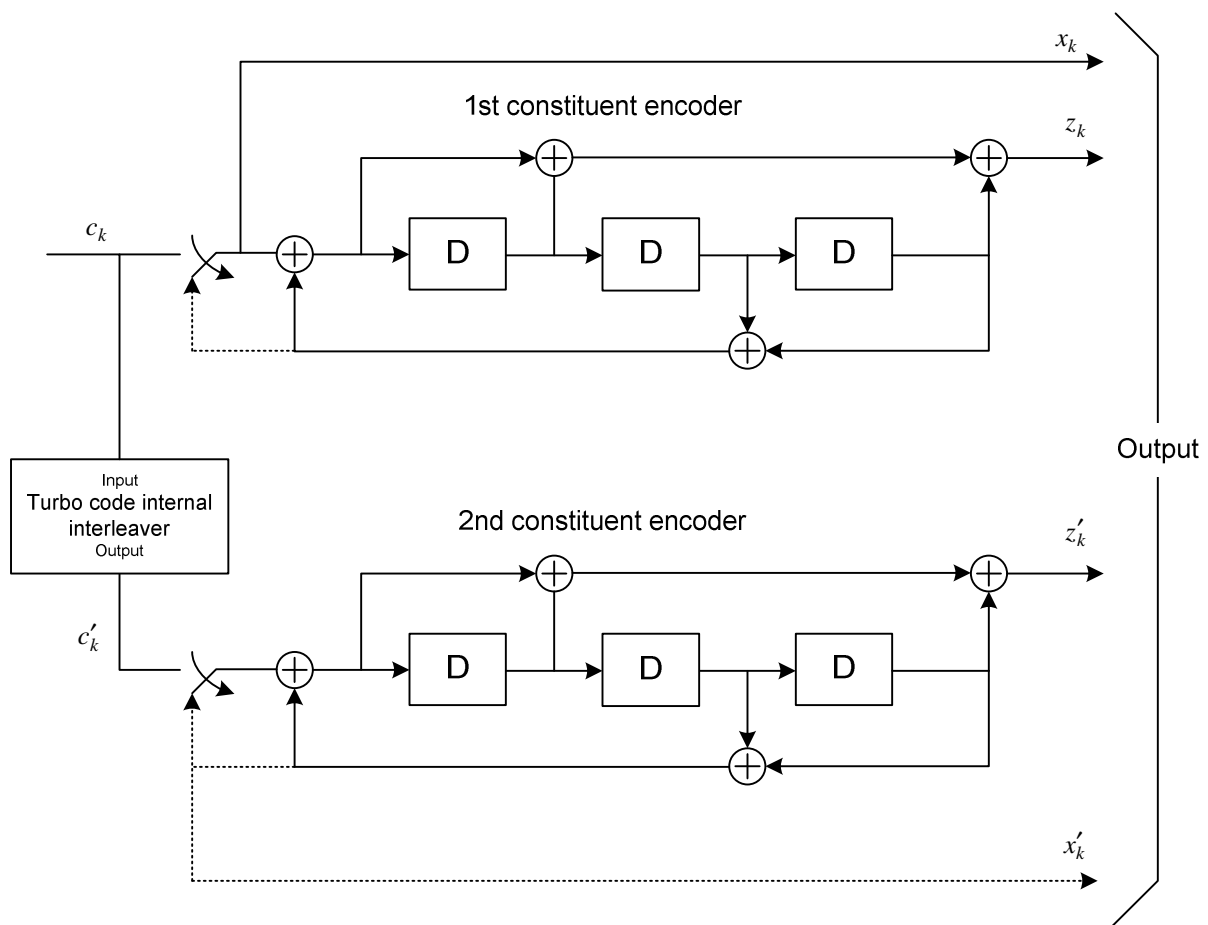

Figure 5.1.3-2: Structure of rate 1/3 turbo encoder (dotted lines apply for trellis termination only)

5.1.3.2.2   Trellis termination for turbo encoder

Trellis termination is performed by taking the tail bits from the shift register feedback after all information bits are encoded. Tail bits are padded after the encoding of information bits.

The first three tail bits shall be used to terminate the first constituent encoder (upper switch of figure 5.1.3-2 in lower position) while the second constituent encoder is disabled. The last three tail bits shall be used to terminate the second constituent encoder (lower switch of figure 5.1.3-2 in lower position) while the first constituent encoder is disabled.

The transmitted bits for trellis termination shall then be:

$$d_K^{(0)} = x_K, \; d_{K+1}^{(0)} = z_{K+1}, \; d_{K+2}^{(0)} = x_K', \; d_{K+3}^{(0)} = z_{K+1}'$$

$$d_K^{(1)} = z_K, \; d_{K+1}^{(1)} = x_{K+2}, \; d_{K+2}^{(1)} = z_K', \; d_{K+3}^{(1)} = x_{K+2}'$$

$$d_K^{(2)} = x_{K+1}, \; d_{K+1}^{(2)} = z_{K+2}, \; d_{K+2}^{(2)} = x_{K+1}', \; d_{K+3}^{(2)} = z_{K+2}'$$

5.1.3.2.3   Turbo code internal interleaver

The bits input to the turbo code internal interleaver are denoted by $c_0, c_1, ..., c_{K-1}$, where K is the number of input bits. The bits output from the turbo code internal interleaver are denoted by $c_0', c_1', ..., c_{K-1}'$.

The relationship between the input and output bits is as follows:

$$c'_i = c_{\Pi(i)}, \quad i=0, 1\ldots, (K\text{-}1)$$

where the relationship between the output index i and the input index $\Pi(i)$ satisfies the following quadratic form:

$$\Pi(i) = \left(f_1 \cdot i + f_2 \cdot i^2\right)\bmod K$$

The parameters f_1 and f_2 depend on the block size K and are summarized in Table 5.1.3-3.

Table 5.1.3-3: Turbo code internal interleaver parameters

i	K	f_1	f_2	i	K	f_1	f_2	i	K	f_1	f_2	i	K	f_1	f_2

5.1.4   Rate matching

5.1.4.1   Rate matching for turbo coded transport channels

The rate matching for turbo coded transport channels is defined per coded block and consists of interleaving the three information bit streams $d_k^{(0)}$, $d_k^{(1)}$ and $d_k^{(2)}$, followed by the collection of bits and the generation of a circular buffer as depicted in Figure 5.1.4-1. The output bits for each code block are transmitted as described in subclause 5.1.4.1.2.
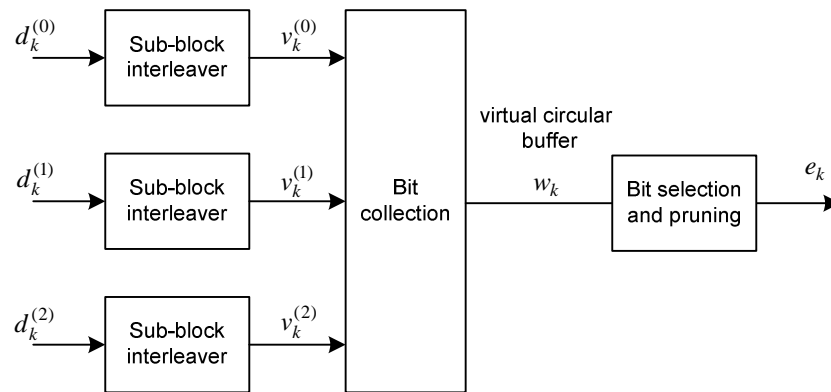

Figure 5.1.4-1. Rate matching for turbo coded transport channels

The bit stream $d_k^{(0)}$ is interleaved according to the sub-block interleaver defined in subclause 5.1.4.1.1 with an output sequence defined as $v_0^{(0)}, v_1^{(0)}, v_2^{(0)}, ..., v_{K_\Pi-1}^{(0)}$ and where K_Π is defined in subclause 5.1.4.1.1.

The bit stream $d_k^{(1)}$ is interleaved according to the sub-block interleaver defined in subclause 5.1.4.1.1 with an output sequence defined as $v_0^{(1)}, v_1^{(1)}, v_2^{(1)}, ..., v_{K_\Pi-1}^{(1)}$.

The bit stream $d_k^{(2)}$ is interleaved according to the sub-block interleaver defined in subclause 5.1.4.1.1 with an output sequence defined as $v_0^{(2)}, v_1^{(2)}, v_2^{(2)}, ..., v_{K_\Pi-1}^{(2)}$.

The sequence of bits e_k for transmission is generated according to subclause 5.1.4.1.2.

5.1.4.1.1   Sub-block interleaver

The bits input to the block interleaver are denoted by $d_0^{(i)}, d_1^{(i)}, d_2^{(i)}, ..., d_{D-1}^{(i)}$, where D is the number of bits. The output bit sequence from the block interleaver is derived as follows:

(1) Assign $C_{subblock}^{TC} = 32$ to be the number of columns of the matrix. The columns of the matrix are numbered 0, 1, 2,..., $C_{subblock}^{TC} - 1$ from left to right.

(2) Determine the number of rows of the matrix $R_{subblock}^{TC}$, by finding minimum integer $R_{subblock}^{TC}$ such that:

$$D \leq \left(R_{subblock}^{TC} \times C_{subblock}^{TC} \right)$$

The rows of rectangular matrix are numbered 0, 1, 2,..., $R_{subblock}^{TC} - 1$ from top to bottom.

(3) If $\left(R_{subblock}^{TC} \times C_{subblock}^{TC}\right) > D$, then $N_D = \left(R_{subblock}^{TC} \times C_{subblock}^{TC} - D\right)$ dummy bits are padded such that $y_k = <NULL>$

for $k = 0, 1, ..., N_D$ - 1. Then, $y_{N_D+k} = d_k^{(i)}$, $k = 0, 1, ..., D$-1, and the bit sequence y_k is written into the

$\left(R_{subblock}^{TC} \times C_{subblock}^{TC}\right)$ matrix row by row starting with bit y_0 in column 0 of row 0:

$$
\begin{bmatrix}
y_0 & y_1 & y_2 & \cdots & y_{C_{subblock}^{TC}-1} \\
y_{C_{subblock}^{TC}} & y_{C_{subblock}^{TC}+1} & y_{C_{subblock}^{TC}+2} & \cdots & y_{2C_{subblock}^{TC}-1} \\
\vdots & \vdots & \vdots & \ddots & \vdots \\
y_{(R_{subblock}^{TC}-1)\times C_{subblock}^{TC}} & y_{(R_{subblock}^{TC}-1)\times C_{subblock}^{TC}+1} & y_{(R_{subblock}^{TC}-1)\times C_{subblock}^{TC}+2} & \cdots & y_{(R_{subblock}^{TC}\times C_{subblock}^{TC}-1)}
\end{bmatrix}
$$

For $d_k^{(0)}$ and $d_k^{(1)}$:

(4) Perform the inter-column permutation for the matrix based on the pattern $\left\langle P(j) \right\rangle_{j \in \{0,1,...,C_{subblock}^{TC}-1\}}$ that is shown in

table 5.1.4-1, where P(j) is the original column position of the j-th permuted column. After permutation of the

columns, the inter-column permuted $\left(R_{subblock}^{TC} \times C_{subblock}^{TC}\right)$ matrix is equal to

$$
\begin{bmatrix}
y_{P(0)} & y_{P(1)} & y_{P(2)} & \cdots & y_{P(C_{subblock}^{TC}-1)} \\
y_{P(0)+C_{subblock}^{TC}} & y_{P(1)+C_{subblock}^{TC}} & y_{P(2)+C_{subblock}^{TC}} & \cdots & y_{P(C_{subblock}^{TC}-1)+C_{subblock}^{TC}} \\
\vdots & \vdots & \vdots & \ddots & \vdots \\
y_{P(0)+(R_{subblock}^{TC}-1)\times C_{subblock}^{TC}} & y_{P(1)+(R_{subblock}^{TC}-1)\times C_{subblock}^{TC}} & y_{P(2)+(R_{subblock}^{TC}-1)\times C_{subblock}^{TC}} & \cdots & y_{P(C_{subblock}^{TC}-1)+(R_{subblock}^{TC}-1)\times C_{subblock}^{TC}}
\end{bmatrix}
$$

(5) The output of the block interleaver is the bit sequence read out column by column from the inter-column

permuted $\left(R_{subblock}^{TC} \times C_{subblock}^{TC}\right)$ matrix. The bits after sub-block interleaving are denoted by $v_0^{(i)}, v_1^{(i)}, v_2^{(i)},...,v_{K_\Pi-1}^{(i)}$

, where $v_0^{(i)}$ corresponds to $y_{P(0)}$, $v_1^{(i)}$ to $y_{P(0)+C_{subblock}^{TC}}$ ... and $K_\Pi = \left(R_{subblock}^{TC} \times C_{subblock}^{TC}\right)$.

For $d_k^{(2)}$:

(4) The output of the sub-block interleaver is denoted by $v_0^{(2)}, v_1^{(2)}, v_2^{(2)},...,v_{K_\Pi-1}^{(2)}$, where $v_k^{(2)} = y_{\pi(k)}$ and where

$$
\pi(k) = \left(P\left(\left\lfloor \frac{k}{R_{subblock}^{TC}} \right\rfloor \right) + C_{subblock}^{TC} \times \left(k \bmod R_{subblock}^{TC} \right) + 1 \right) \bmod K_\Pi
$$

The permutation function P is defined in Table 5.1.4-1.

Table 5.1.4-1 Inter-column permutation pattern for sub-block interleaver

Number of columns $C_{subblock}^{TC}$	Inter-column permutation pattern $< P(0), P(1),..., P(C_{subblock}^{TC}-1) >$
32	< 0, 16, 8, 24, 4, 20, 12, 28, 2, 18, 10, 26, 6, 22, 14, 30, 1, 17, 9, 25, 5, 21, 13, 29, 3, 19, 11, 27, 7, 23, 15, 31 >

5.1.4.1.2 Bit collection, selection and transmission

The circular buffer of length $K_w = 3K_\Pi$ for the r-th coded block is generated as follows:

$w_k = v_k^{(0)}$ for $k = 0,..., K_\Pi - 1$

$w_{K_\Pi+2k} = v_k^{(1)}$ for $k = 0,..., K_\Pi - 1$

$$w_{K_\Pi + 2k+1} = v_k^{(2)} \text{ for } k = 0,\ldots, K_\Pi - 1$$

Denote the soft buffer size for the transport block by N_{IR} bits and the soft buffer size for the r-th code block by N_{cb} bits. The size N_{cb} is obtained as follows, where C is the number of code blocks computed in subclause 5.1.2:

- $N_{cb} = \min\left(\left\lfloor \dfrac{N_{IR}}{C} \right\rfloor, K_w\right)$ for DL-SCH and PCH transport channels

- $N_{cb} = K_w$ for UL-SCH, MCH, SL-SCH and SL-DCH transport channels

For UE category 0, for DL-SCH associated with SI-RNTI and RA-RNTI and PCH transport channel, N_{cb} is always equal to K_w.

Where N_{IR} is equal to:

$$N_{IR} = \left\lfloor \frac{\alpha \cdot N_{soft}}{K_C \cdot K_{MIMO} \cdot \min\left(M_{DL\_HARQ}, M_{limit}\right)} \right\rfloor$$

Where the coefficient α is 1 for subframe duration, 0.5 for slot duration and $\frac{1}{6}$ for subslot duration of initial PDSCH transmission. For retransmission of a transport block with slot or subslot duration, α is 1 if the transport block has initially been transmitted with subframe duration. For retransmission of a transport block with subframe duration, α is 0.5 if the transport block has initially been transmitted with slot duration, and $\frac{1}{6}$ if the transport block has initially been transmitted with subslot duration.

If the UE signals *ue-CategoryDL-v14xy* indicating UE category M2, N_{soft} is the total number of soft channel bits according to the UE category indicated by *ue-CategoryDL-v14xy*. Otherwise, if the UE signals *ue-CategoryDL-v1310* indicating UE category M1, N_{soft} is the total number of soft channel bits according to the UE category indicated by *ue-CategoryDL-v1310*. Otherwise, if the UE signals *ue-CategoryDL-v13xy*, and is configured with transmission mode 9 or transmission mode 10 and the higher layer parameter *maxLayersMIMO-r10* is configured to eightLayers, N_{soft} is the total number of soft channel bits according to the UE category indicated by *ue-CategoryDL-v13xy*. Otherwise, if the UE signals *ue-CategoryDL-r12* indicating UE category 0, or if the UE signals *ue-CategoryDL-r12* indicating UE category 14 and is configured by higher layers with *altCQI-Table-r12* for the DL cell, N_{soft} is the total number of soft channel bits according to the UE category indicated by *ue-CategoryDL-r12*. Otherwise, if the UE signals *ue-Category-v11a0,* and is configured by higher layers with *altCQI-Table-r12* or *altCQI-Table-1024QAM-r15* for the DL cell, N_{soft} is the total number of soft channel bits according to the UE category indicated by *ue-Category-v11a0*. Otherwise, if the UE signals *ue-Category-v1020*, and is configured with transmission mode 9 or transmission mode 10, or is configured with transmission mode 3 or transmission mode 4 and the higher layer parameter *maxLayersMIMO-r10* is configured to fourLayers, for the DL cell, N_{soft} is the total number of soft channel bits [4] according to the UE category indicated by *ue-Category-v1020* [6]. Otherwise, N_{soft} is the total number of soft channel bits [4] according to the UE category indicated by *ue-Category* (without suffix) [6].

If N_{soft} = 35982720 or 47431680,

K_C= 5,

elseif N_{soft} = 303562752,

K_C= 32,

elseif N_{soft} = 14616576,

if the UE is configured by higher layers with *altCQI-Table-r12*,

$K_C = 3/2$

else

$K_C = 2$

    end if.

elseif N_{soft} = 19488768,

    if the UE is configured by higher layers with *altCQI-Table-1024QAM-r15,*

        K_C = 8/5

    elseif the UE is configured by higher layers with *altCQI-Table-r12,*

        K_C = 2

    else

        K_C = 8/3

    end if.

elseif N_{soft} = 7308288 and the UE is configured by higher layers with *altCQI-Table-r12,*

    if the UE is capable of supporting no more than a maximum of two spatial layers for the DL cell in the transmission mode configured for the UE, or if the configured maximum number of layers indicated by the *maxLayersMIMO-r10* field is no more than two,

        K_C = 3

    else

        K_C = 3/2

    end if.

elseif N_{soft} = 7308288 and the UE is configured by higher layers with *altCQI-Table-1024QAM-r15,*
    if the UE is capable of supporting no more than a maximum of two spatial layers for the DL cell in the transmission mode configured for the UE, or if the configured maximum number of layers indicated by the *maxLayersMIMO-r10* field is no more than two,

        K_C = 12/5

    else

        K_C = 6/5

    end if.

elseif N_{soft} = 3654144 and the UE is capable of supporting no more than a maximum of two spatial layers for the DL cell, or if the configured maximum number of layers indicated by the *maxLayersMIMO-r10* field is no more than two,

    K_C = 2

else

    K_C = 1

End if.

For initial PDSCH transmission with subframe duration, K_{MIMO} is equal to 2 if the UE is configured to receive PDSCH transmissions based on transmission modes 3, 4, 8, 9 or 10 as defined in subclause 7.1 of [3], and is equal to 1 otherwise. For BL/CE UE K_{MIMO} is equal to 1. For initial PDSCH transmission with slot/subslot duration, K_{MIMO} is equal to 1.

M_{DL_HARQ} is the maximum number of DL HARQ processes as defined in clause 7 of [3].

M_{limit} is a constant equal to 8.

Denoting by E the rate matching output sequence length for the r-th coded block, and rv_{idx} the redundancy version number for this transmission (rv_{idx} = 0, 1, 2 or 3), the rate matching output bit sequence is e_k, $k = 0,1,..., E-1$.

Define by G the total number of bits available for the transmission of one transport block.

Set $G' = G/(N_L \cdot Q_m)$ where Q_m is equal to 1 for $\pi/2$-BPSK, 2 for QPSK, 4 for 16QAM, 6 for 64QAM, 8 for 256QAM, and 10 for 1024QAM, and where

- For transmit diversity:

  - N_L is equal to 2,

- Otherwise:

  - N_L is equal to the number of layers a transport block is mapped onto

Set $\gamma = G' \bmod C$, where C is the number of code blocks computed in subclause 5.1.2.

if $r \leq C - \gamma - 1$

$\quad$ set $E = N_L \cdot Q_m \cdot \left\lfloor G'/C \right\rfloor$

else

$\quad$ set $E = N_L \cdot Q_m \cdot \left\lceil G'/C \right\rceil$

end if

Set $k_0 = R_{subblock}^{TC} \cdot \left(2 \cdot \left\lceil \dfrac{N_{cb}}{8R_{subblock}^{TC}} \right\rceil \cdot rv_{idx} + 2 \right)$, where $R_{subblock}^{TC}$ is the number of rows defined in subclause 5.1.4.1.1.

Set $k = 0$ and $j = 0$

while $\{ k < E \}$

$\quad$ if $w_{(k_0 + j) \bmod N_{cb}} \neq < NULL >$

$\quad$ $e_k = w_{(k_0 + j) \bmod N_{cb}}$

$\quad$ $k = k + 1$

$\quad$ end if

$\quad$ $j = j + 1$

end while

5.1.4.2 Rate matching for convolutionally coded transport channels and control information

The rate matching for convolutionally coded transport channels and control information consists of interleaving the three bit streams, $d_k^{(0)}$, $d_k^{(1)}$ and $d_k^{(2)}$, followed by the collection of bits and the generation of a circular buffer as depicted in Figure 5.1.4-2. The output bits are transmitted as described in subclause 5.1.4.2.2.
Figure 5.1.4-2. Rate matching for convolutionally coded transport channels and control information

The bit stream $d_k^{(0)}$ is interleaved according to the sub-block interleaver defined in subclause 5.1.4.2.1 with an output sequence defined as $v_0^{(0)}, v_1^{(0)}, v_2^{(0)}, ..., v_{K_\Pi-1}^{(0)}$ and where K_Π is defined in subclause 5.1.4.2.1.

The bit stream $d_k^{(1)}$ is interleaved according to the sub-block interleaver defined in subclause 5.1.4.2.1 with an output sequence defined as $v_0^{(1)}, v_1^{(1)}, v_2^{(1)}, ..., v_{K_\Pi-1}^{(1)}$.

The bit stream $d_k^{(2)}$ is interleaved according to the sub-block interleaver defined in subclause 5.1.4.2.1 with an output sequence defined as $v_0^{(2)}, v_1^{(2)}, v_2^{(2)}, ..., v_{K_\Pi-1}^{(2)}$.

The sequence of bits e_k for transmission is generated according to subclause 5.1.4.2.2.

5.1.4.2.1   Sub-block interleaver

The bits input to the block interleaver are denoted by $d_0^{(i)}, d_1^{(i)}, d_2^{(i)}, ..., d_{D-1}^{(i)}$, where D is the number of bits. The output bit sequence from the block interleaver is derived as follows:

(1) Assign $C_{subblock}^{CC} = 32$ to be the number of columns of the matrix. The columns of the matrix are numbered 0, 1, 2,…, $C_{subblock}^{CC} - 1$ from left to right.

(2) Determine the number of rows of the matrix $R_{subblock}^{CC}$, by finding minimum integer $R_{subblock}^{CC}$ such that:

$$D \le \left(R_{subblock}^{CC} \times C_{subblock}^{CC} \right)$$

The rows of rectangular matrix are numbered 0, 1, 2,…, $R_{subblock}^{CC} - 1$ from top to bottom.

(3) If $\left(R_{subblock}^{CC} \times C_{subblock}^{CC} \right) > D$, then $N_D = \left(R_{subblock}^{CC} \times C_{subblock}^{CC} - D \right)$ dummy bits are padded such that $y_k = <NULL>$ for $k = 0, 1, ..., N_D$ - 1. Then, $y_{N_D+k} = d_k^{(i)}$, $k = 0, 1, ..., D$-1, and the bit sequence y_k is written into the $\left(R_{subblock}^{CC} \times C_{subblock}^{CC} \right)$ matrix row by row starting with bit y_0 in column 0 of row 0:

$$\begin{bmatrix} y_0 & y_1 & y_2 & \cdots & y_{C_{subblock}^{CC}-1} \\ y_{C_{subblock}^{CC}} & y_{C_{subblock}^{CC}+1} & y_{C_{subblock}^{CC}+2} & \cdots & y_{2C_{subblock}^{CC}-1} \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ y_{(R_{subblock}^{CC}-1)\times C_{subblock}^{CC}} & y_{(R_{subblock}^{CC}-1)\times C_{subblock}^{CC}+1} & y_{(R_{subblock}^{CC}-1)\times C_{subblock}^{CC}+2} & \cdots & y_{(R_{subblock}^{CC}\times C_{subblock}^{CC}-1)} \end{bmatrix}$$

(4) Perform the inter-column permutation for the matrix based on the pattern $\left\langle P(j) \right\rangle_{j \in \left\{0,1,...,C_{subblock}^{CC}-1\right\}}$ that is shown in table 5.1.4-2, where P(j) is the original column position of the j-th permuted column. After permutation of the columns, the inter-column permuted $\left(R_{subblock}^{CC} \times C_{subblock}^{CC} \right)$ matrix is equal to

$$
\begin{bmatrix}
y_{P(0)} & y_{P(1)} & y_{P(2)} & \cdots & y_{P(C_{subblock}^{CC}-1)} \\
y_{P(0)+C_{subblock}^{CC}} & y_{P(1)+C_{subblock}^{CC}} & y_{P(2)+C_{subblock}^{CC}} & \cdots & y_{P(C_{subblock}^{CC}-1)+C_{subblock}^{CC}} \\
\vdots & \vdots & \vdots & \ddots & \vdots \\
y_{P(0)+(R_{subblock}^{CC}-1)\times C_{subblock}^{CC}} & y_{P(1)+(R_{subblock}^{CC}-1)\times C_{subblock}^{CC}} & y_{P(2)+(R_{subblock}^{CC}-1)\times C_{subblock}^{CC}} & \cdots & y_{P(C_{subblock}^{CC}-1)+(R_{subblock}^{CC}-1)\times C_{subblock}^{CC}}
\end{bmatrix}
$$

(5) The output of the block interleaver is the bit sequence read out column by column from the inter-column permuted $\left(R_{subblock}^{CC} \times C_{subblock}^{CC} \right)$ matrix. The bits after sub-block interleaving are denoted by $v_0^{(i)}, v_1^{(i)}, v_2^{(i)}, ..., v_{K_\Pi-1}^{(i)}$, where $v_0^{(i)}$ corresponds to $y_{P(0)}$, $v_1^{(i)}$ to $y_{P(0)+C_{subblock}^{CC}}$ ... and $K_\Pi = \left(R_{subblock}^{CC} \times C_{subblock}^{CC} \right)$

Table 5.1.4-2 Inter-column permutation pattern for sub-block interleaver

Number of columns $C_{subblock}^{CC}$	Inter-column permutation pattern $< P(0), P(1),..., P(C_{subblock}^{CC}-1) >$
32	< 1, 17, 9, 25, 5, 21, 13, 29, 3, 19, 11, 27, 7, 23, 15, 31, 0, 16, 8, 24, 4, 20, 12, 28, 2, 18, 10, 26, 6, 22, 14, 30 >

This block interleaver is also used in interleaving PDCCH modulation symbols. In that case, the input bit sequence consists of PDCCH symbol quadruplets [2].

5.1.4.2.2   Bit collection, selection and transmission

The circular buffer of length $K_w = 3K_\Pi$ is generated as follows:

$w_k = v_k^{(0)}$ for $k = 0,..., K_\Pi - 1$

$w_{K_\Pi+k} = v_k^{(1)}$ for $k = 0,..., K_\Pi - 1$

$w_{2K_\Pi+k} = v_k^{(2)}$ for $k = 0,..., K_\Pi - 1$

Denoting by E the rate matching output sequence length, the rate matching output bit sequence is e_k, $k = 0,1,..., E-1$.

Set $k = 0$ and $j = 0$

while $\{k < E\}$

    if $w_{j \bmod K_w} \neq < NULL >$

       $e_k = w_{j \bmod K_w}$

       $k = k + 1$

    end if

    $j = j + 1$

end while

5.1.5   Code block concatenation

The input bit sequence for the code block concatenation block are the sequences e_{rk}, for $r = 0,...,C-1$ and $k = 0,...,E_r - 1$. The output bit sequence from the code block concatenation block is the sequence f_k for $k = 0,...,G-1$.

The code block concatenation consists of sequentially concatenating the rate matching outputs for the different code blocks. Therefore,

Set $k = 0$ and $r = 0$

while $r < C$

    Set $j = 0$

    while $j < E_r$

        $f_k = e_{rj}$

        $k = k + 1$

        $j = j + 1$

    end while

    $r = r + 1$

end while

5.2   Uplink transport channels and control information

If the UE is configured with a Master Cell Group (MCG) and Secondary Cell Group (SCG) [6], the procedures described in this clause are applied to the MCG and SCG, respectively. When the procedures are applied to a SCG, the term primary cell refers to the primary SCell (PSCell) of the SCG.

If the UE is configured with a PUCCH SCell [6], the procedures described in this clause are applied to the group of DL cells associated with the primary cell and the group of DL cells associated with the PUCCH SCell, respectively. When the procedures are applied to the group of DL cells associated with the PUCCH SCell, the term primary cell refers to the PUCCH SCell.

If the UE is configured with a LAA SCell, the procedures described in this clause are applied assuming the LAA SCell is an FDD SCell.

5.2.1   Random access channel

The sequence index for the random access channel is received from higher layers and is processed according to [2].

5.2.2   Uplink shared channel

Figure 5.2.2-1 shows the processing structure for the UL-SCH transport channel on one UL cell. If sub-PRB allocation is used, data arrives to the coding unit in the form of one transport block over a number of subframes per UL cell. Otherwise, data arrives to the coding unit in the form of a maximum of two transport blocks every transmission time interval (TTI) per UL cell. The following coding steps can be identified for each transport block of an UL cell:

-    Add CRC to the transport block

-    Code block segmentation and code block CRC attachment

-    Channel coding of data and control information

-    Rate matching

- Code block concatenation

- Multiplexing of data and control information

- Channel interleaver

The coding steps for one UL-SCH transport block are shown in the figure below. The same general processing applies for each UL-SCH transport block on each UL cell with restrictions as specified in [3].
Figure 5.2.2-1: Transport block processing for UL-SCH

5.2.2.1   Transport block CRC attachment

Error detection is provided on each UL-SCH transport block through a Cyclic Redundancy Check (CRC).

The entire transport block is used to calculate the CRC parity bits. Denote the bits in a transport block delivered to layer 1 by $a_0, a_1, a_2, a_3, ..., a_{A-1}$, and the parity bits by $p_0, p_1, p_2, p_3, ..., p_{L-1}$. A is the size of the transport block and L is the number of parity bits. The lowest order information bit a_0 is mapped to the most significant bit of the transport block as defined in subclause 6.1.1 of [5].

The parity bits are computed and attached to the UL-SCH transport block according to subclause 5.1.1 setting L to 24 bits and using the generator polynomial $g_{CRC24A}(D)$.

5.2.2.2 Code block segmentation and code block CRC attachment

The bits input to the code block segmentation are denoted by $b_0, b_1, b_2, b_3, ..., b_{B-1}$ where B is the number of bits in the transport block (including CRC).

Code block segmentation and code block CRC attachment are performed according to subclause 5.1.2.

The bits after code block segmentation are denoted by $c_{r0}, c_{r1}, c_{r2}, c_{r3}, ..., c_{r(K_r-1)}$, where r is the code block number and K_r is the number of bits for code block number r.

5.2.2.3 Channel coding of UL-SCH

Code blocks are delivered to the channel coding block. The bits in a code block are denoted by $c_{r0}, c_{r1}, c_{r2}, c_{r3}, ..., c_{r(K_r-1)}$, where r is the code block number, and K_r is the number of bits in code block number r. The total number of code blocks is denoted by C and each code block is individually turbo encoded according to subclause 5.1.3.2.

After encoding the bits are denoted by $d_{r0}^{(i)}, d_{r1}^{(i)}, d_{r2}^{(i)}, d_{r3}^{(i)}, ..., d_{r(D_r-1)}^{(i)}$, with $i = 0, 1$, and 2 and where D_r is the number of bits on the i-th coded stream for code block number r, i.e. $D_r = K_r + 4$.

5.2.2.4 Rate matching

Turbo coded blocks are delivered to the rate matching block. They are denoted by $d_{r0}^{(i)}, d_{r1}^{(i)}, d_{r2}^{(i)}, d_{r3}^{(i)}, ..., d_{r(D_r-1)}^{(i)}$, with $i = 0, 1$, and 2 , and where r is the code block number, i is the coded stream index, and D_r is the number of bits in each coded stream of code block number r. The total number of code blocks is denoted by C and each coded block is individually rate matched according to subclause 5.1.4.1.

After rate matching, the bits are denoted by $e_{r0}, e_{r1}, e_{r2}, e_{r3}, ..., e_{r(E_r-1)}$, where r is the coded block number, and where E_r is the number of rate matched bits for code block number r.

5.2.2.5 Code block concatenation

The bits input to the code block concatenation block are denoted by $e_{r0}, e_{r1}, e_{r2}, e_{r3}, ..., e_{r(E_r-1)}$ for $r = 0, ..., C-1$ and where E_r is the number of rate matched bits for the r-th code block.

Code block concatenation is performed according to subclause 5.1.5.

The bits after code block concatenation are denoted by $f_0, f_1, f_2, f_3, ..., f_{G-1}$, where G is the total number of coded bits for transmission of the given transport block over N_L transmission layers excluding the bits used for control transmission, when control information is multiplexed with the UL-SCH transmission.

5.2.2.6 Channel coding of control information

Control data arrives at the coding unit in the form of channel quality information (CQI and/or PMI), HARQ-ACK and rank indication, and CSI-RS resource indication (CRI). Different coding rates for the control information are achieved by allocating different number of coded symbols for its transmission. When control data are transmitted in the PUSCH, the channel coding for HARQ-ACK, rank indication (including RI only, joint report of RI/i1, joint report of CRI/RI, joint report of CRI/RI/i1, joint report of CRI/RI/PTI, joint report of RI/i1,p-2, and joint report of RI/PTI), CRI and channel quality information $o_0, o_1, o_2, ..., o_{O-1}$ is done independently. Parameters i1,1-1 , i1,2-1 , i1,1-2 , i1,2-2 , i1,p-2 correspond to parameters $i_{1,1}$, $i_{1,2}$, d_1, d_2, and I_p in subclause 7.2.4 of [3].

For the cases with TDD primary cell, the number of HARQ-ACK bits is determined as described in subclause 7.3 of [3].

When the UE transmits HARQ-ACK bits, rank indicator bits or CRI bits, it shall determine the number of coded modulation symbols per layer Q' for HARQ-ACK, rank indicator, or CRI bits as follows.

For the case when only one transport block is transmitted in the PUSCH conveying the HARQ-ACK bits, rank indicator bits or CRI bits:

$$Q' = \min\left(\left\lceil \frac{O \cdot M_{sc}^{PUSCH-initial} \cdot N_{symb}^{PUSCH-initial} \cdot \beta_{offset}^{PUSCH}}{\sum_{r=0}^{C-1} K_r} \right\rceil, N_{symb}^{UCI} \cdot M_{sc}^{PUSCH}\right)$$

where

- O is the number of HARQ-ACK bits, rank indicator bits or CRI bits, and

- N_{symb}^{UCI} is 4 for PUSCH with subframe duration, or for Partial PUSCH Mode 1. N_{symb}^{UCI} is 2 for PUSCH with slot duration, or for Partial PUSCH Mode 2 or 3. N_{symb}^{UCI} is 1 for PUSCH with subslot duration.

- M_{sc}^{PUSCH} is the scheduled bandwidth for PUSCH transmission in the current subframe/slot/subslot for the transport block, expressed as a number of subcarriers in [2], and

- $N_{symb}^{PUSCH-initial}$ is the number of SC-FDMA symbols per subframe/slot/subslot for initial PUSCH transmission for the same transport block, respectively, given by
  $N_{symb}^{PUSCH-initial} = \left(\tilde{N}_{symb}^{UL} - N_{SRS} - N_{start}^{PUSCH-initial} - N_{end}^{PUSCH-initial}\right)$, where

  - $\tilde{N}_{symb}^{UL} = \left(N_{symb}^{UL} - 1\right)$ for PUSCH with slot duration, or for Partial PUSCH Mode 2 or 3, or

  - $\tilde{N}_{symb}^{UL} = N_{symb}^{subslot} - N_{DMRS}$ for PUSCH with subslot duration,

    - $N_{symb}^{subslot}$ is the number of SC-FDMA symbols of the subslot as defined in subclause 4.1 of [2],

    - N_{DMRS} is the number of SC-FDMA symbols for DMRS of the subslot as defined in subclause 5.5.2.1.2 of [2]

  - otherwise $\tilde{N}_{symb}^{UL} = 2\left(N_{symb}^{UL} - 1\right)$.

- N_{SRS} is equal to 1

  - if UE configured with one UL cell is configured to send PUSCH and SRS in the same subframe/slot/subslot for initial transmission, or

  - if UE transmits PUSCH and SRS in the same subframe/slot/subslot in the same serving cell for initial transmission, or

  - if the PUSCH resource allocation for initial transmission even partially overlaps with the cell-specific SRS subframe and bandwidth configuration defined in subclause 5.5.3 of [2], and for PUSCH with slot/subslot duration if the current slot/subslot is the last slot/subslot in a subframe, or

- if the subframe/slot/subslot for initial transmission in the same serving cell is in a UE-specific type-1 SRS subframe as defined in Subclause 8.2 of [3], and for PUSCH with slot/subslot duration if the current slot/subslot is the last slot/subslot in a subframe, or

- if the subframe/slot/subslot for initial transmission in the same serving cell is in a UE-specific type-0 SRS subframe as defined in subclause 8.2 of [3] and the UE is configured with multiple TAGs, and for PUSCH with slot/subslot duration if the current slot/subslot is the last slot/subslot in a subframe.

- Otherwise N_{SRS} is equal to 0.

- $N_{\text{start}}^{PUSCH\text{-}initial}$ is equal to 1 when the UE configured for uplink transmission on a LAA SCell is indicated to transmit the PUSCH not starting from the beginning of the first symbol or the seventh symbol of the subframe for initial transmission, otherwise is equal to 0.

- $N_{\text{end}}^{PUSCH\text{-}initial}$ is equal to 1 when the UE configured for uplink transmission on a LAA SCell is indicated to transmit the PUSCH up to the second to last symbol of the subframe for initial transmission and N_{SRS} is equal to 0, otherwise is equal to 0.

- $M_{sc}^{PUSCH-initial}$, C, and K_r are obtained from the initial PDCCH or EPDCCH or MPDCCH or SPDCCH for the same transport block. If there is no initial PDCCH or EPDCCH with DCI format 0/0A/0B/4A/4B or MPDCCH with DCI format 6-0A/6-0B or SPDCCH with DCI format 7-0A/7-0B for the same transport block, $M_{sc}^{PUSCH-initial}$, C, and K_r shall be determined from:

  - the most recent semi-persistent scheduling assignment PDCCH or EPDCCH or MPDCCH or SPDCCH, when the initial PUSCH for the same transport block is semi-persistently scheduled, or,

  - the random access response grant for the same transport block, when the PUSCH is initiated by the random access response grant, or

  - the most recent AUL activation DCI as defined in [3], when the initial PUSCH for the same transport block is AUL PUSCH.

For the case when two transport blocks are transmitted in the PUSCH conveying the HARQ-ACK bits, rank indicator bits or CRI bits:

$$Q' = \max\left[\min\left(Q'_{temp}, 4 \cdot M_{sc}^{PUSCH}\right), Q'_{\min}\right] \text{ with}$$

$$Q'_{temp} = \left\lceil \frac{O \cdot M_{sc}^{PUSCH-initial(1)} \cdot N_{symb}^{PUSCH-initial(1)} \cdot M_{sc}^{PUSCH-initial(2)} \cdot N_{symb}^{PUSCH-initial(2)} \cdot \beta_{offset}^{PUSCH}}{\sum_{r=0}^{C^{(1)}-1} K_r^{(1)} \cdot M_{sc}^{PUSCH-initial(2)} \cdot N_{symb}^{PUSCH-initial(2)} + \sum_{r=0}^{C^{(2)}-1} K_r^{(2)} \cdot M_{sc}^{PUSCH-initial(1)} \cdot N_{symb}^{PUSCH-initial(1)}} \right\rceil$$

where

- O is the number of HARQ-ACK bits, rank indicator bits or CRI bits, and

- $Q'_{\min} = O$ if $O \le 2$, $Q'_{\min} = \lceil 2O/Q'_m \rceil$ if $3 \le O \le 11$ with $Q'_m = \min\left(Q_m^1, Q_m^2\right)$ where $Q_m^x, x = \{1,2\}$ is the modulation order of transport block "x", and $Q'_{\min} = \lceil 2O_1/Q'_m \rceil + \lceil 2O_2/Q'_m \rceil$ if $O > 11$ with $O_1 = \lceil O/2 \rceil$ and $O_2 = O - \lceil O/2 \rceil$.

- $M_{sc}^{PUSCH-initial(x)}, x = \{1,2\}$ are the scheduled bandwidths or bandwidths assigned by the most recent AUL activation DCI as defined in [3] for PUSCH transmission in the initial sub-frame for the first and second transport block, respectively, expressed as a number of subcarriers in [2], and

- $N_{\text{symb}}^{PUSCH\text{-}initial(x)}$, $x = \{1,2\}$ are the number of SC-FDMA symbols per subframe for initial PUSCH transmission for the first and second transport block given by

$$N_{\text{symb}}^{PUSCH\text{-}initial(x)} = \left(\tilde{N}_{\text{symb}}^{\text{UL}} - N_{\text{SRS}}^{(x)} - N_{\text{start}}^{PUSCH\text{-}initial(x)} - N_{\text{end}}^{PUSCH\text{-}initial(x)} \right), x = \{1,2\}, \text{ where}$$

- $\tilde{N}_{\text{symb}}^{\text{UL}} = \left(N_{\text{symb}}^{\text{UL}} - 1 \right)$ for Partial PUSCH Mode 2 or 3,

- otherwise $\tilde{N}_{\text{symb}}^{\text{UL}} = 2\left(N_{\text{symb}}^{\text{UL}} - 1 \right)$.

- $N_{SRS}^{(x)}, x = \{1,2\}$ is equal to 1

  - if UE configured with one UL cell is configured to send PUSCH and SRS in the same subframe for initial transmission, or

  - if UE transmits PUSCH and SRS in the same subframe in the same serving cell for initial transmission of transport block "x", or

  - if the PUSCH resource allocation for initial transmission of transport bock "x" even partially overlaps with the cell-specific SRS subframe and bandwidth configuration defined in subclause 5.5.3 of [2] , or

  - if the subframe for initial transmission of transport block "x" in the same serving cell is a UE-specific type-1 SRS subframe as defined in Subclause 8.2 of [3], or

  - if the subframe for initial transmission of transport block "x" in the same serving cell is a UE-specific type-0 SRS subframe as defined in subclause 8.2 of [3] and the UE is configured with multiple TAGs.

  - Otherwise $N_{SRS}^{(x)}, x = \{1,2\}$ is equal to 0.

- $N_{\text{start}}^{PUSCH\text{-}initial(x)}, x = \{1,2\}$ is equal to 1 when the UE configured for uplink transmission on a LAA SCell is indicated to transmit the PUSCH for the first and second transport block not starting from the beginning of the first symbol or the seventh symbol of the subframe for initial transmission, otherwise is equal to 0.

- $N_{\text{end}}^{PUSCH\text{-}initial(x)}, x = \{1,2\}$ is equal to 1 when the UE configured for uplink transmission on a LAA SCell is indicated to transmit the PUSCH for the first and second transport block up to the second to last symbol of the subframe for initial transmission and $N_{SRS}^{(x)}, x = \{1,2\}$ is equal to 0, otherwise is equal to 0.

- $M_{sc}^{PUSCH-initial(x)}, x = \{1,2\}$, $C^{(x)}, x = \{1,2\}$, and $K_r^{(x)}, x = \{1,2\}$ are obtained from the initial PDCCH or EPDCCH for the corresponding transport block, or from the most recent AUL activation DCI as defined in [3], when the initial PUSCH for the corresponding transport block is AUL PUSCH.

For HARQ-ACK, $Q_{ACK} = Q_m \cdot Q'$ and $\beta_{offset}^{PUSCH} = \beta_{offset}^{HARQ-ACK}$, where Q_m is the modulation order of a given transport block. For UEs configured with no more than five DL cells, $\beta_{offset}^{HARQ-ACK}$ shall be determined according to [3] depending on the number of transmission codewords for the corresponding PUSCH, the duration for the corresponding PUSCH (subslot/slot/subframe), and the beta offset indicator in SPDCCH with DCI format 7-0A/7-0B when the duration for the corresponding PUSCH is subslot. For UEs configured with more than five DL cells, $\beta_{offset}^{HARQ-ACK}$ shall be determined according to [3] depending on the number of transmission codewords for the corresponding PUSCH, the number of HARQ-ACK feedback bits, the duration for the corresponding PUSCH (subslot/slot/subframe), and the beta offset indicator in SPDCCH with DCI format 7-0A/7-0B when the duration for the corresponding PUSCH is subslot.

For rank indication or CRI, $Q_{RI} = Q_m \cdot Q'$, $Q_{CRI} = Q_m \cdot Q'$ and $\beta_{offset}^{PUSCH} = \beta_{offset}^{RI}$, where Q_m is the modulation order of a given transport block, and β_{offset}^{RI} shall be determined according to [3] depending on the number of transmission codewords for the corresponding PUSCH, the duration for the corresponding PUSCH, the beta offset indicator in SPDCCH with DCI format 7-0A/7-0B when the duration for the corresponding PUSCH is subslot, and on the uplink power control subframe set for the corresponding PUSCH when two uplink power control subframe sets are configured by higher layers for the cell.

For HARQ-ACK

- Each positive acknowledgement (ACK) is encoded as a binary '1' and each negative acknowledgement (NACK) is encoded as a binary '0'

- If HARQ-ACK feedback consists of 1-bit of information, i.e., $[o_0^{ACK}]$, it is first encoded according to Table 5.2.2.6-1.

- If HARQ-ACK feedback consists of 2-bits of information, i.e., $[o_0^{ACK} \ o_1^{ACK}]$ with o_0^{ACK} corresponding to HARQ-ACK bit for codeword 0 and o_1^{ACK} corresponding to that for codeword 1, or if HARQ-ACK feedback consists of 2-bits of information as a result of the aggregation of HARQ-ACK bits corresponding to two DL cells with which the UE is configured by higher layers, or if HARQ-ACK feedback consists of 2-bits of information corresponding to two subframes for TDD, it is first encoded according to Table 5.2.2.6-2 where $o_2^{ACK} = (o_0^{ACK} + o_1^{ACK}) \bmod 2$.

Table 5.2.2.6-1: Encoding of 1-bit HARQ-ACK

Q_m	Encoded HARQ-ACK
2	$[o_0^{ACK} \ y]$
4	$[o_0^{ACK} \ y \ x \ x]$
6	$[o_0^{ACK} \ y \ x \ x \ x \ x]$
8	$[o_0^{ACK} \ y \ x \ x \ x \ x \ x \ x]$

Table 5.2.2.6-2: Encoding of 2-bit HARQ-ACK

Q_m	Encoded HARQ-ACK
2	$[o_0^{ACK} \ o_1^{ACK} \ o_2^{ACK} \ o_0^{ACK} \ o_1^{ACK} \ o_2^{ACK}]$
4	$[o_0^{ACK} \ o_1^{ACK} \ x \ x \ o_2^{ACK} \ o_0^{ACK} \ x \ x \ o_1^{ACK} \ o_2^{ACK} \ x \ x]$
6	$[o_0^{ACK} \ o_1^{ACK} \ x \ x \ x \ x \ o_2^{ACK} \ o_0^{ACK} \ x \ x \ x \ x \ o_1^{ACK} \ o_2^{ACK} \ x \ x \ x \ x]$
8	$[o_0^{ACK} \ o_1^{ACK} \ x \ x \ x \ x \ x \ x \ o_2^{ACK} \ o_0^{ACK} \ x \ x \ x \ x \ x \ x \ o_1^{ACK} \ o_2^{ACK} \ x \ x \ x \ x \ x \ x]$

- If HARQ-ACK feedback consists of $3 \leq O^{ACK} \leq 11$ bits of information as a result of the aggregation of HARQ-ACK bits corresponding to one or more DL cells with which the UE is configured by higher layers, i.e., $o_0^{ACK} \ o_1^{ACK},...,o_{O^{ACK}-1}^{ACK}$, then a coded bit sequence $\tilde{q}_0^{ACK} \ \tilde{q}_1^{ACK},...,\tilde{q}_{31}^{ACK}$ is obtained by using the bit sequence $o_0^{ACK} \ o_1^{ACK},...,o_{O^{ACK}-1}^{ACK}$ as the input to the channel coding block described in subclause 5.2.2.6.4. In turn, the bit sequence $q_0^{ACK}, q_1^{ACK}, q_2^{ACK},...,q_{Q_{ACK}-1}^{ACK}$ is obtained by the circular repetition of the bit sequence $\tilde{q}_0^{ACK} \ \tilde{q}_1^{ACK},...,\tilde{q}_{31}^{ACK}$ so that the total bit sequence length is equal to Q_{ACK}.

- If HARQ-ACK feedback consists of $11 < O^{ACK} \leq 22$ bits of information as a result of the aggregation of HARQ-ACK bits corresponding to one or more DL cells with which the UE is configured by higher layers, i.e., $o_0^{ACK} \ o_1^{ACK},...,o_{O^{ACK}-1}^{ACK}$, then the coded bit sequence $q_0^{ACK}, q_1^{ACK}, q_2^{ACK},...,q_{Q_{ACK}-1}^{ACK}$ is obtained by using the bit sequence $o_0^{ACK} \ o_1^{ACK},...,o_{O^{ACK}-1}^{ACK}$ as the input to the channel coding block described in subclause 5.2.2.6.5.

- If HARQ-ACK feedback consists of $O^{ACK} > 22$ bits of information as a result of the aggregation of HARQ-ACK bits corresponding to one or more DL cells with which the UE is configured by higher layers, the coded bit sequence is denoted by $q_0^{ACK}, q_1^{ACK}, q_2^{ACK},...,q_{Q_{ACK}-1}^{ACK}$. The CRC attachment, channel coding and rate matching

of the HARQ-ACK bits are performed according to subclauses 5.1.1 setting L to 8 bits, 5.1.3.1 and 5.1.4.2, respectively. The input bit sequence to the CRC attachment operation is $o_0^{ACK} \, o_1^{ACK} ,..., o_{O^{ACK}-1}^{ACK}$. The output bit sequence of the CRC attachment operation is the input bit sequence to the channel coding operation. The output bit sequence of the channel coding operation is the input bit sequence to the rate matching operation.

The "x" and "y" in Table 5.2.2.6-1 and 5.2.2.6-2 are placeholders for [2] to scramble the HARQ-ACK bits in a way that maximizes the Euclidean distance of the modulation symbols carrying HARQ-ACK information.

For FDD or TDD HARQ-ACK multiplexing or the aggregation of more than one DL cell including at least one cell using FDD and at least one cell using TDD when HARQ-ACK consists of one or two bits of information, the bit sequence $q_0^{ACK}, q_1^{ACK}, q_2^{ACK} ,..., q_{Q_{ACK}-1}^{ACK}$ is obtained by concatenation of multiple encoded HARQ-ACK blocks where Q_{ACK} is the total number of coded bits for all the encoded HARQ-ACK blocks. The last concatenation of the encoded HARQ-ACK block may be partial so that the total bit sequence length is equal to Q_{ACK}.

For UEs configured by higher layers with *dl-STTI-Length*, if *codebooksizeDeterminationSTTI-rel15* is configured as *dai*, the bit sequence $\tilde{o}_0^{sACK} \tilde{o}_1^{sACK} ,..., \tilde{o}_{O^{sACK}-1}^{sACK}$ corresponding to PDSCH with slot/subslot duration is determined according to the Downlink Assignment Index (DAI) as in Table 5.3.3.1.2-2 and as defined in [3]; otherwise, the bit sequence $\tilde{o}_0^{sACK} \tilde{o}_1^{sACK} ,..., \tilde{o}_{O^{sACK}-1}^{sACK}$ is determined as below.

For FDD with at least one cell configured with higher layer parameter *dl-STTI-Length* or for the aggregation of more than one DL cell including a primary cell using FDD and at least one secondary cell using TDD and at least one DL cell configured with higher layer parameter *dl-STTI-Length*, define the bit sequence $\tilde{o}_0^{sACK} \tilde{o}_1^{sACK} ,..., \tilde{o}_{O^{sACK}-1}^{sACK}$ corresponding to PDSCH with slot/subslot duration as the result of the concatenation of HARQ-ACK bits for one or multiple DL cells configured with higher layer parameter *dl-STTI-Length*, N_{cells}^{sDL} as the number of cells configured with *dl-STTI-Length* for the UE and B_c^{sDL} as the number of slot(s) or subslot(s) for which the UE needs to feed back HARQ-ACK bits in UL slot or subslot n for the c-th serving cell. For a cell using FDD and configured with *dl-STTI-Length=subslot* and *ul-STTI-Length=subslot*, or for a cell using FDD and configured with *dl-STTI-Length=slot* and *ul-STTI-Length=slot*, $B_c^{sDL} = 1$. For a cell using FDD and configured with *dl-STTI-Length=subslot* and *ul-STTI-Length=slot*, $B_c^{sDL} = 3$.

For a cell using TDD, $B_c^{sDL} = 1$ if slot n-4 in the cell is in a DL subframe, or slot n-4 is the first slot in a special subframe with special subframe cofigurations 1/2/3/4/6/7/8/9/10 and normal downlink CP, or slot n-4 is the second slot in a special subframe with special subframe cofigurations 3/4/8 and normal downlink CP, and $B_c^{sDL} = 0$ otherwise.

The bit sequence $\tilde{o}_0^{sACK} \tilde{o}_1^{sACK} ,..., \tilde{o}_{o^{sACK}-1}^{sACK}$ is performed according to the following pseudo-code:

Set $c = 0$ – cell index: lower indices correspond to lower RRC indices of corresponding cell configured with *dl-STTI-Length*

Set $j = 0$ – HARQ-ACK bit index

while $c < N_{cells}^{sDL}$

   set $l = 0$;

   while $l < B_c^{sDL}$

      $\tilde{o}_j^{sACK} =$ HARQ-ACK bit of this cell

      $j = j + 1$

      $l = l + 1$

   end while

   $c = c + 1$

end while

For FDD with at least one cell configured with higher layer parameter *dl-STTI-Length* or for the aggregation of more than one DL cell including a primary cell using FDD and at least one secondary cell using TDD and at least one DL cell configured with higher layer parameter *dl-STTI-Length*, define the bit sequence $\tilde{o}_0^{LACK} \tilde{o}_1^{LACK}, ..., \tilde{o}_{O^{LACK}-1}^{LACK}$ corresponding to PDSCH with subframe duration as the result of the concatenation of HARQ-ACK bits for one or multiple DL cells. The bit sequence $\tilde{o}_0^{LACK} \tilde{o}_1^{LACK}, ..., \tilde{o}_{O^{LACK}-1}^{LACK}$ is determined as below for bit sequence $\tilde{o}_0^{ACK} \tilde{o}_1^{ACK}, ..., \tilde{o}_{O^{ACK}-1}^{ACK}$ and spatial bundling is performed if the HARQ-ACK is to be transmitted on subslot PUSCH or if the HARQ-ACK is to be transmitted on slot PUSCH and spatial bundling is configured.

For UEs configured by higher layers with *codebooksizeDetermination-r13 = dai*, the bit sequence $\tilde{o}_0^{ACK} \tilde{o}_1^{ACK}, ..., \tilde{o}_{O^{ACK}-1}^{ACK}$ corresponding to PDSCH with subframe duration is determined according to the Downlink Assignment Index (DAI) as in Table 5.3.3.1.2-2 and as defined in [3]. Otherwise, the bit sequence $\tilde{o}_0^{ACK} \tilde{o}_1^{ACK}, ..., \tilde{o}_{O^{ACK}-1}^{ACK}$ is determined as below.

For FDD when the UE is not configured with EN-DC/NE-DC and higher layer parameter *subframeAssignment-r15*, when HARQ ACK consists of 2 or more bits of information as a result of the aggregation of more than one DL cell, the bit sequence $\tilde{o}_0^{ACK} \tilde{o}_1^{ACK}, ..., \tilde{o}_{O^{ACK}-1}^{ACK}$ corresponding to PDSCH with subframe duration is the result of the concatenation of HARQ-ACK bits for the multiple DL cells according to the following pseudo-code:

Set $c = 0$ – cell index: lower indices correspond to lower RRC indices of corresponding cell

Set $j = 0$ – HARQ-ACK bit index

Set N_{cells}^{DL} to the number of cells configured by higher layers for the UE

while $c < N_{cells}^{DL}$

    if transmission mode configured in cell $c \in \{1,2,5,6,7\}$ – 1 bit HARQ-ACK feedback for this cell

        $\tilde{o}_j^{ACK} =$ HARQ-ACK bit of this cell

        $j = j + 1$

    else

        if the PUSCH is with subframe or slot duration and the UE is not configured with spatial bundling on PUSCH by higher layers

            $\tilde{o}_j^{ACK} =$ HARQ-ACK bit corresponding to the first codeword of this cell

            $j = j + 1$

            $\tilde{o}_j^{ACK} =$ HARQ-ACK bit corresponding to the second codeword of this cell

            $j = j + 1$

        else

            $\tilde{o}_j^{ACK} =$ binary AND operation of the HARQ-ACK bits corresponding to the first and second codewords of this cell

            $j = j + 1$

        end if

end if

$c = c + 1$

end while

For the aggregation of more than one DL cell including a primary cell using FDD and at least one secondary cell using TDD when the UE is not configured with EN-DC/NE-DC and higher layer parameter *subframeAssignment-r15*, the bit sequence $\tilde{o}_0^{ACK}$ $\tilde{o}_1^{ACK}$,..., $\tilde{o}_{O^{ACK}-1}^{ACK}$ is the result of the concatenation of HARQ-ACK bits for one or multiple DL cells.

Define N_{cells}^{DL} as the number of cells configured by higher layers for the UE and B_c^{DL} as the number of subframes for which the UE needs to feed back HARQ-ACK bits in UL subframe n for the *c*-th serving cell. For a cell using TDD, the subframes are determined by the DL-reference UL/DL configuration if the UE is configured with higher layer parameter *eimta-HARQ-ReferenceConfig*, and determined by the UL/DL configuration otherwise. For a cell using TDD, $B_c^{DL} = 1$ if subframe n-4 in the cell, or subframe n-3 in the cell if higher layer parameter *shortProcessingTime* is configured for the cell, is a DL subframe or a special subframe with special subframe configurations 1/2/3/4/6/7/8/9/10 and normal downlink CP or a special subframe with special subframe configurations 1/2/3/5/6/7 and extended downlink CP, and $B_c^{DL} = 0$ otherwise. For a cell using FDD, $B_c^{DL} = 1$.

The bit sequence $\tilde{o}_0^{ACK}$ $\tilde{o}_1^{ACK}$,..., $\tilde{o}_{O^{ACK}-1}^{ACK}$ is performed according to the following pseudo-code:

Set $c = 0$ – cell index: lower indices correspond to lower RRC indices of corresponding cell

Set $j = 0$ – HARQ-ACK bit index

while $c < N_{cells}^{DL}$

  if $B_c^{DL} = 1$

    if transmission mode configured in cell $c \in \{1,2,5,6,7\}$ – 1 bit HARQ-ACK feedback for this cell

      $\tilde{o}_j^{ACK} =$ HARQ-ACK bit of this cell

      $j = j + 1$

    else

      if the PUSCH is with subframe or slot duration and the UE is not configured with spatial bundling on PUSCH by higher layers

      $\tilde{o}_j^{ACK} =$ HARQ-ACK bit corresponding to the first codeword of this cell

      $j = j + 1$

      $\tilde{o}_j^{ACK} =$ HARQ-ACK bit corresponding to the second codeword of this cell

      $j = j + 1$

      else

      $\tilde{o}_j^{ACK} =$ binary AND operation of the HARQ-ACK bits corresponding to the first and second codewords of this cell

      $j = j + 1$

      end if

    end if

  end if

$c = c + 1$

end while

For the cases with TDD primary cell or EN-DC/NE-DC with FDD primary cell and higher layer parameter *subframeAssignment-r15* configured, when HARQ-ACK is for the aggregation of one or more DL cells and the UE is configured with PUCCH format 3, PUCCH format 4 or PUCCH format 5 [3], the bit sequence $\tilde{o}_0^{ACK}\ \tilde{o}_1^{ACK}, ..., \tilde{o}_{O^{ACK}-1}^{ACK}$ is the result of the concatenation of HARQ-ACK bits for the one or more DL cells configured by higher layers and the multiple subframes as defined in [3].

Define N_{cells}^{DL} as the number of cells configured by higher layers for the UE and B_c^{DL} as the number of subframes for which the UE needs to feed back HARQ-ACK bits as defined in Subclause 7.3 of [3].

The number of HARQ-ACK bits for the UE to convey if it is configured with PUCCH format 3, PUCCH format 4 or PUCCH format 5 is computed as follows:

Set $k = 0$ – counter of HARQ-ACK bits

Set c=0 – cell index: lower indices correspond to lower RRC indices of corresponding cell

while c < N_{cells}^{DL}

    set $l = 0$;

    while $l < B_c^{DL}$

        if transmission mode configured in cell $c \in \{1,2,5,6,7\}$ -- 1 bit HARQ-ACK feedback for this cell

            $k = k + 1$

        else

            $k = k + 2$

        end if

        $l = l+1$

    end while

    $c = c + 1$

end while

When PUCCH format 3 is configured, if $k \le 20$ when TDD is used in all the configured serving cell(s) of the UE, or if $k \le 21$ when FDD is used in at least one of the configured serving cells with TDD primary cell, or if $k \le 21$ when the UE is configured with EN-DC/NE-DC with FDD primary cell and higher layer parameter *subframeAssignment-r15*; or when PUCCH format 4 or PUCCH format 5 is configured and when the UE is not configured with spatial bundling on PUSCH by higher layers, the multiplexing of HARQ-ACK bits is performed according to the following pseudo-code:

Set $c = 0$ – cell index: lower indices correspond to lower RRC indices of corresponding cell

Set $j = 0$ – HARQ-ACK bit index

while c < N_{cells}^{DL}

    set $l = 0$;

    while $l < B_c^{DL}$

        if transmission mode configured in cell $c \in \{1,2,5,6,7\}$ -- 1 bit HARQ-ACK feedback for this cell

$$\tilde{o}_j^{ACK} = o_{c,l}^{ACK} \text{ HARQ-ACK bit of this cell as defined in Subclause 7.3 of [3]}$$

$$j = j + 1$$

else

$$[\tilde{o}_j^{ACK}, \tilde{o}_{j+1}^{ACK}] = [o_{c,2l}^{ACK}, o_{c,2l+1}^{ACK}] \text{ HARQ-ACK bits of this cell as defined in Subclause 7.3 of [3]}$$

$$j = j + 2$$

end if

$$l = l+1$$

end while

$$c = c + 1$$

end while

When PUCCH format 3 is configured, if $k > 20$ when TDD is used in all the configured serving cell(s) of the UE, or if $k > 21$ when FDD is used in at least one of the configured serving cells with TDD primary cell, or if $k > 21$ when the UE is configured with EN-DC/NE-DC with FDD primary cell and higher layer parameter *subframeAssignment-r15*, spatial bundling is applied to all subframes in all cells; or when PUCCH format 4 or PUCCH format 5 is configured and when the UE is configured with spatial bundling on PUSCH by higher layers; or when the PUSCH is subslot duration, the multiplexing of HARQ-ACK bits is performed according to the following pseudo-code:

Set $c = 0$ – cell index: lower indices correspond to lower RRC indices of corresponding cell

Set $j = 0$ – HARQ-ACK bit index

while c < N_{cells}^{DL}

set $l = 0$;

while $l < B_c^{DL}$

if transmission mode configured in cell $c \in \{1,2,5,6,7\}$ – 1 bit HARQ-ACK feedback for this cell

$$\tilde{o}_j^{ACK} = o_{c,l}^{ACK} \text{ HARQ-ACK bit of this cell as defined in Subclause 7.3 of [3]}$$

$$j = j + 1$$

else

$$\tilde{o}_j^{ACK} = o_{c,l}^{ACK} \text{ binary AND operation of the HARQ-ACK bits corresponding to the first and second}$$
codewords of this cell as defined in Subclause 7.3 of [3]

$$j = j + 1$$

end if

$$l = l+1$$

end while

$$c = c + 1$$

end while

For FDD with at least one cell configured with higher layer parameter *dl-STTI-Length* or for the aggregation of more than one DL cell including a primary cell using FDD and at least one secondary cell using TDD and at least one DL cell

configured with higher layer parameter *dl-STTI-Length*, bit sequence $\tilde{o}_0^{ACK}\ \tilde{o}_1^{ACK},...,\tilde{o}_{O^{ACK}-1}^{ACK}$ is obtained by

concatenation of the bit sequence $\tilde{o}_0^{sACK}\tilde{o}_1^{sACK},...,\tilde{o}_{O^{sACK}-1}^{sACK}$ and $\tilde{o}_0^{LACK}\tilde{o}_1^{LACK},...,\tilde{o}_{O^{LACK}-1}^{LACK}$, where $O^{ACK}=O^{sACK}+O^{LACK}$

in the cases defined in subclause 7.3 of [3]. In all other cases, the sequence of bits $\tilde{o}_0^{ACK}\ \tilde{o}_1^{ACK},...,\tilde{o}_{O^{ACK}-1}^{ACK}$ is given by

$\tilde{o}_0^{sACK}\tilde{o}_1^{sACK},...,\tilde{o}_{O^{sACK}-1}^{sACK}$. For the cases with TDD primary cell with at least one cell configured with higher layer

parameter *dl-STTI-Length*, the bit sequence $\tilde{o}_0^{ACK}\ \tilde{o}_1^{ACK},...,\tilde{o}_{O^{ACK}-1}^{ACK}$ is as defined in [3].

For $o^{ACK}\leq 11$ or $o^{ACK}>22$, the bit sequence $o_0^{ACK}\ o_1^{ACK},...,o_{O^{ACK}-1}^{ACK}$ is obtained by setting $o_i^{ACK}=\tilde{o}_i^{ACK}$.

For $11<o^{ACK}\leq 22$, the bit sequence $o_0^{ACK}\ o_1^{ACK},...,o_{O^{ACK}-1}^{ACK}$ is obtained by setting $o_{i/2}^{ACK}=\tilde{o}_i^{ACK}$ if i is even and

$o_{\lceil O^{ACK}/2\rceil+(i-1)/2}^{ACK}=\tilde{o}_i^{ACK}$ if i is odd.

For the cases with TDD primary cell when HARQ-ACK is for the aggregation of two DL cells and the UE is configured with PUCCH format 1b with channel selection, the bit sequence $o_0^{ACK}\ o_1^{ACK},...,o_{O^{ACK}-1}^{ACK}$ is obtained as described in subclause 7.3 of [3].

For TDD HARQ-ACK bundling, a bit sequence $\tilde{q}_0^{ACK},\tilde{q}_1^{ACK},\tilde{q}_2^{ACK},...,\tilde{q}_{Q_{ACK}-1}^{ACK}$ is obtained by concatenation of multiple encoded HARQ-ACK blocks where Q_{ACK} is the total number of coded bits for all the encoded HARQ-ACK blocks. The last concatenation of the encoded HARQ-ACK block may be partial so that the total bit sequence length is equal to Q_{ACK}. A scrambling sequence $\left[w_0^{ACK}\ w_1^{ACK}\ w_2^{ACK}\ w_3^{ACK}\right]$ is then selected from Table 5.2.2.6-A with index $i=(N_{bundled}-1)\bmod 4$, where $N_{bundled}$ is determined as described in subclause 7.3 of [3]. The bit sequence $q_0^{ACK},q_1^{ACK},q_2^{ACK},...,q_{Q_{ACK}-1}^{ACK}$ is then generated by setting $m=1$ if HARQ-ACK consists of 1-bit and $m=3$ if HARQ-ACK consists of 2-bits and then scrambling $\tilde{q}_0^{ACK},\tilde{q}_1^{ACK},\tilde{q}_2^{ACK},...,\tilde{q}_{Q_{ACK}-1}^{ACK}$ as follows

Set *i, k* to 0

while $i<Q_{ACK}$

  if $\tilde{q}_i^{ACK}=y$ // place-holder repetition bit

    $q_i^{ACK}=\left(\tilde{q}_{i-1}^{ACK}+w_{\lfloor k/m\rfloor}^{ACK}\right)\bmod 2$

    $k=(k+1)\bmod 4m$

  else

    if $\tilde{q}_i^{ACK}=x$ // a place-holder bit

      $q_i^{ACK}=\tilde{q}_i^{ACK}$

    else // coded bit

      $q_i^{ACK}=\left(\tilde{q}_i^{ACK}+w_{\lfloor k/m\rfloor}^{ACK}\right)\bmod 2$

      $k=(k+1)\bmod 4m$

    end if

  $i=i+1$

end while

Table 5.2.2.6-A: Scrambling sequence selection for TDD HARQ-ACK bundling

i	$\left[w_0^{ACK} \; w_1^{ACK} \; w_2^{ACK} \; w_3^{ACK} \right]$
0	[1 1 1 1]
1	[1 0 1 0]
2	[1 1 0 0]
3	[1 0 0 1]

When HARQ-ACK information is to be multiplexed with UL-SCH at a given PUSCH, the HARQ-ACK information is multiplexed in all layers of all transport blocks of that PUSCH, For a given transport block, the vector sequence output of the channel coding for HARQ-ACK information is denoted by $q_0^{ACK}, q_1^{ACK}, ..., q_{Q'_{ACK}-1}^{ACK}$, where q_i^{ACK},

$i = 0,...,Q'_{ACK} - 1$ are column vectors of length $(Q_m \cdot N_L)$ and where $Q'_{ACK} = Q_{ACK} / Q_m$ is obtained as follows:

Set i, k to 0

while $i < Q_{ACK}$

$\quad \hat{\underline{q}}_k^{ACK} = [q_i^{ACK} \; ... q_{i+Q_m-1}^{ACK}]$ -- temporary row vector

$\quad \underline{q}_k^{ACK} = [\overbrace{\hat{\underline{q}}_k^{ACK} \; \cdots \; \hat{\underline{q}}_k^{ACK}}^{N_L}]^T$ -- replicating the row vector $\hat{\underline{q}}_k^{ACK}$ N_L times and transposing into a column vector

$\quad i = i + Q_m$

$\quad k = k + 1$

end while

where N_L is the number of layers onto which the UL-SCH transport block is mapped.

For rank indication (RI) (RI only, joint report of RI and i1, joint report of CRI and RI, joint report of CRI, RI and i1, joint report of CRI, RI, and PTI, joint report of RI and i1,p-2, and joint report of RI and PTI) or CRI

- The corresponding bit widths for CRI feedback for PDSCH transmissions are given by Tables 5.2.2.6.1-2A, 5.2.2.6.1-2C, 5.2.2.6.1-2G, 5.2.2.6.2-3A, 5.2.2.6.2-3C, 5.2.2.6.2-3G, 5.2.2.6.3-3A, 5.2.2.6.3-3C, 5.2.2.6.3-3G, 5.2.3.3.1-3E, 5.2.3.3.1-3H, 5.2.3.3.2-4E, and 5.2.3.3.2-4H.

- The corresponding bit widths for RI feedback for PDSCH transmissions are given by Tables 5.2.2.6.1-2, 5.2.2.6.1-2B, 5.2.2.6.1-2D, 5.2.2.6.1-2E, 5.2.2.6.1-2F, 5.2.2.6.2-3, 5.2.2.6.2-3B, 5.2.2.6.2-3D, 5.2.2.6.2-3E, 5.2.2.6.2-3F, 5.2.2.6.3-3, 5.2.2.6.3-3B, 5.2.2.6.3-3D, 5.2.2.6.3-3E, 5.2.2.6.3-3F, 5.2.3.3.1-3, 5.2.3.3.1-3A, 5.2.3.3.1-3B, 5.2.3.3.1-3B-1, 5.2.3.3.1-3C, 5.2.3.3.1-3D, 5.2.3.3.1-3F, 5.2.3.3.1-3G, 5.2.3.3.1-3I, 5.2.3.3.1-3J, 5.2.3.3.1-5, 5.2.3.3.2-4, 5.2.3.3.2-4A, 5.2.3.3.2-4B, 5.2.3.3.2-4C, 5.2.3.3.2-4D, 5.2.3.3.2-4F, 5.2.3.3.2-4G and 5.2.3.3.2-4I which are determined assuming the maximum number of layers as follows:

  - If the *maxLayersMIMO-r10* is configured for the DL cell, the maximum number of layers for subframe operation is determined according to *maxLayersMIMO-r10* for the DL cell.

  - If the UE is configured with *ShortTTI* and if the higher layer parameter *maxLayersMIMO-sTTI-r15* is configured for the DL cell, the maximum number of layers for slot/subslot operation is determined according to *maxLayersMIMO-sTTI-r15* for the DL cell.

  - Else,

    - If the UE is configured with transmission mode 9, and the *supportedMIMO-CapabilityDL-r10* field is included in the *UE-EUTRA-Capability*, the maximum number of layers is determined according to the minimum of the configured number of CSI-RS ports and the maximum of the reported UE downlink MIMO capabilities for the same band in the corresponding band combination.

- If the UE is configured with transmission mode 9, and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K>1, and RI and CRI are transmitted in the same reporting instance, and the *supportedMIMO-CapabilityDL-r10* field is included in the *UE-EUTRA-Capability*, the maximum number of layers is determined according to the minimum of the maximum of number of antenna port of the configured CSI-RS resources and the maximum of the reported UE downlink MIMO capabilities for the same band in the corresponding band combination.

- If the UE is configured with transmission mode 9, and the *supportedMIMO-CapabilityDL-r10* field is not included in the *UE-EUTRA-Capability*, the maximum number of layers is determined according to the minimum of the configured number of CSI-RS ports and *ue-Category* (without suffix).

- If the UE is configured with transmission mode 9, and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K>1, and RI and CRI are transmitted in the same reporting instance, and the *supportedMIMO-CapabilityDL-r10* field is not included in the *UE-EUTRA-Capability*, the maximum number of layers is determined according to the minimum of the maximum of number of antenna port of the configured CSI-RS resources and *ue-Category* (without suffix).

- If the UE is configured with transmission mode 9, and higher layer parameter *semiOpenLoop*, and the *supportedMIMO-CapabilityDL-r10* field is included in the *UE-EUTRA-Capability*, the maximum number of layers is determined according to the minimum of 2 and the maximum of the reported UE downlink MIMO capabilities for the same band in the corresponding band combination.

- If the UE is configured with transmission mode 9, and higher layer parameter *semiOpenLoop*, and the *supportedMIMO-CapabilityDL-r10* field is not included in the *UE-EUTRA-Capability*, the maximum number of layers is determined according to the minimum of 2 and *ue-Category* (without suffix).

- If the UE is configured with transmission mode 9, and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K>1 with *activatedResources*>1, and RI and CRI are transmitted in the same reporting instance, and the *supportedMIMO-CapabilityDL-r10* field is included in the *UE-EUTRA-Capability*, the maximum number of layers is determined according to the minimum of the maximum of number of antenna ports of the activated CSI-RS resources and the maximum of the reported UE downlink MIMO capabilities for the same band in the corresponding band combination.

- If the UE is configured with transmission mode 9, and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K>1 with *activatedResources*>1, and RI and CRI are transmitted in the same reporting instance, and the *supportedMIMO-CapabilityDL-r10* field is not included in the *UE-EUTRA-Capability*, the maximum number of layers is determined according to the minimum of the maximum of number of antenna ports of the activated CSI-RS resources and *ue-Category* (without suffix).

- If the UE is configured with transmission mode 9, and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with *activatedResources*=1 or *numberActivatedAperiodicCSI-RS-Resources*>0, and the *supportedMIMO-CapabilityDL-r10* field is included in the *UE-EUTRA-Capability*, the maximum number of layers is determined according to the minimum of the number of antenna port of the activated or selected CSI-RS resource and the maximum of the reported UE downlink MIMO capabilities for the same band in the corresponding band combination.

- If the UE is configured with transmission mode 9, and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with *activatedResources*=1 or *numberActivatedAperiodicCSI-RS-Resources*>0, and the *supportedMIMO-CapabilityDL-r10* field is not included in the *UE-EUTRA-Capability*, the maximum number of layers is determined according to the minimum of the number of antenna ports of the activated or selected CSI-RS resource and *ue-Category* (without suffix).

- If the UE is configured with transmission mode 9 and higher layer parameter *eMIMO-Type* and *eMIMO-Type2*, and the *supportedMIMO-CapabilityDL-r10* field is included in the *UE-EUTRA-Capability*, the maximum number of layers is determined according to the minimum of the configured number of CSI-RS ports of *eMIMO-Type2* and the maximum of the reported UE downlink MIMO capabilities for the same band in the corresponding band combination.

- If the UE is configured with transmission mode 9 and higher layer parameter *eMIMO-Type* and *eMIMO-Type2*, and the *supportedMIMO-CapabilityDL-r10* field is not included in the *UE-EUTRA-Capability*, the maximum number of layers is determined according to the minimum of the configured number of CSI-RS ports of *eMIMO-Type2* and *ue-Category* (without suffix).

- If the UE is configured with transmission mode 10, and the *supportedMIMO-CapabilityDL-r10* field is included in the *UE-EUTRA-Capability*, the maximum number of layers for each CSI process is determined according to the minimum of the configured number of CSI-RS ports for that CSI process and the maximum of the reported UE downlink MIMO capabilities for the same band in the corresponding band combination.

- If the UE is configured with transmission mode 10, and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K>1, and RI and CRI are transmitted in the same reporting instance, and the *supportedMIMO-CapabilityDL-r10* field is included in the *UE-EUTRA-Capability*, the maximum number of layers for each CSI process is determined according to the minimum of the maximum of number of antenna port of the configured CSI-RS resources in that CSI process and the maximum of the reported UE downlink MIMO capabilities for the same band in the corresponding band combination.

- If the UE is configured with transmission mode 10, and the *supportedMIMO-CapabilityDL-r10* field is not included in the *UE-EUTRA-Capability*, the maximum number of layers for each CSI process is determined according to the minimum of the configured number of CSI-RS ports for that CSI process and *ue-Category* (without suffix).

- If the UE is configured with transmission mode 10, and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K>1, and RI and CRI are transmitted in the same reporting instance, and the *supportedMIMO-CapabilityDL-r10* field is not included in the *UE-EUTRA-Capability*, the maximum number of layers for each CSI process is determined according to the minimum of the maximum of number of antenna port of the configured CSI-RS resources in that CSI process and *ue-Category* (without suffix).

- If the UE is configured with transmission mode 10, and higher layer parameter *semiOpenLoop*, and the *supportedMIMO-CapabilityDL-r10* field is included in the *UE-EUTRA-Capability*, the maximum number of layers for each CSI process is determined according to the minimum of 2 and the maximum of the reported UE downlink MIMO capabilities for the same band in the corresponding band combination.

- If the UE is configured with transmission mode 10, and higher layer parameter *semiOpenLoop*, and the *supportedMIMO-CapabilityDL-r10* field is not included in the *UE-EUTRA-Capability*, the maximum number of layers for each CSI process is determined according to the minimum of 2 and *ue-Category* (without suffix).

- If the UE is configured with transmission mode 10, and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K>1 with *activatedResources*>1, and RI and CRI are transmitted in the same reporting instance, and the *supportedMIMO-CapabilityDL-r10* field is included in the *UE-EUTRA-Capability*, the maximum number of layers for each CSI process is determined according to the minimum of the maximum of number of antenna ports of the activated CSI-RS resources in that CSI process and the maximum of the reported UE downlink MIMO capabilities for the same band in the corresponding band combination.

- If the UE is configured with transmission mode 10, and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K>1 with *activatedResources*>1, and RI and CRI are transmitted in the same reporting instance, and the *supportedMIMO-CapabilityDL-r10* field is not included in the *UE-EUTRA-Capability*, the maximum number of layers for each CSI process is determined according to the minimum of the maximum of number of antenna port of the activated CSI-RS resources in that CSI process and *ue-Category* (without suffix).

- If the UE is configured with transmission mode 10, and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with *activatedResources*=1 or *numberActivatedAperiodicCSI-RS-Resources*>0, and the *supportedMIMO-CapabilityDL-r10* field is included in the *UE-EUTRA-Capability*, the maximum number of layers for each CSI process is determined according to the minimum of the number of antenna ports of the activated or selected CSI-RS resource in that CSI process and the maximum of the reported UE downlink MIMO capabilities for the same band in the corresponding band combination.

- If the UE is configured with transmission mode 10, and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with *activatedResources*=1 or *numberActivatedAperiodicCSI-RS-Resources*>0, and the *supportedMIMO-CapabilityDL-r10* field is not included in the *UE-EUTRA-Capability*, the maximum number of layers for each CSI process is determined according to the minimum

of the number of antenna port of the activated or selected CSI-RS resource in that CSI process and *ue-Category* (without suffix).

- If the UE is configured with transmission mode 10 and higher layer parameter *eMIMO-Type* and *eMIMO-Type2*, and the *supportedMIMO-CapabilityDL-r10* field is included in the *UE-EUTRA-Capability*, the maximum number of layers for each CSI process is determined according to the minimum of the configured number of CSI-RS ports of *eMIMO-Type2* for that CSI process and the maximum of the reported UE downlink MIMO capabilities for the same band in the corresponding band combination.

- If the UE is configured with transmission mode 10 and higher layer parameter *eMIMO-Type* and *eMIMO-Type2*, and the *supportedMIMO-CapabilityDL-r10* field is not included in the *UE-EUTRA-Capability*, the maximum number of layers for each CSI process is determined according to the minimum of the configured number of CSI-RS ports of *eMIMO-Type2* for that CSI process and *ue-Category* (without suffix)

- Otherwise the maximum number of layers is determined according to the minimum of the number of PBCH antenna ports and *ue-Category* (without suffix).

- If RI feedback consists of 1-bit of information, i.e., $[o_0^{RI}]$, it is first encoded according to Table 5.2.2.6-3. The $[o_0^{RI}]$ to RI mapping is given by Table 5.2.2.6-5.

- If RI feedback consists of 2-bits of information, i.e., $[o_0^{RI} \ o_1^{RI}]$ with o_0^{RI} corresponding to MSB of 2-bit input and o_1^{RI} corresponding to LSB, it is first encoded according to Table 5.2.2.6-4 where $o_2^{RI} = (o_0^{RI} + o_1^{RI}) \bmod 2$. The $[o_0^{RI} \ o_1^{RI}]$ to RI mapping is given by Table 5.2.2.6-6A if the UE is configured with higher layer parameter *feCoMP-CSI-Enabled*, otherwise given by Table 5.2.2.6-6.

Table 5.2.2.6-3: Encoding of 1-bit RI

Q_m	Encoded RI
2	$[o_0^{RI} \ y]$
4	$[o_0^{RI} \ y \ x \ x]$
6	$[o_0^{RI} \ y \ x \ x \ x \ x]$
8	$[o_0^{RI} \ y \ x \ x \ x \ x \ x \ x]$

- If RI feedback for a given DL cell consists of 3-bits of information, i.e., $[o_0^{RI}\ o_1^{RI}\ o_2^{RI}]$ with o_0^{RI} corresponding to MSB of 3-bit input and o_2^{RI} corresponding to LSB. The $[o_0^{RI}\ o_1^{RI}\ o_2^{RI}]$ to RI mapping is given by Table 5.2.2.6-7.

- If RI feedback for a given DL cell consists of 4-bits of information when the UE is configured with higher layer parameter *feCoMP-CSI-Enabled*, i.e., $[o_0^{RI} \; o_1^{RI} \; o_2^{RI} \; o_3^{RI}]$ with o_0^{RI} corresponding to MSB of 4-bit input and o_3^{RI} corresponding to LSB, the $[o_0^{RI} \; o_1^{RI} \; o_2^{RI} \; o_3^{RI}]$ to RI mapping is given by Table 5.2.2.6-8.

- If RI feedback consists of $3 \le O^{RI} \le 11$ bits of information, i.e., $[o_0^{RI} \; o_1^{RI} ,...,o_{O^{RI}-1}^{RI}]$, then a coded bit sequence $[\tilde{q}_0^{RI} \; \tilde{q}_1^{RI} ,...,\tilde{q}_{31}^{RI}]$ is obtained by using the bit sequence $[o_0^{RI} \; o_1^{RI} ,...,o_{O^{RI}-1}^{RI}]$ as the input to the channel coding block described in subclause 5.2.2.6.4.

- If RI feedback consists of $11 < O^{RI} \le 22$ bits of information as a result of the aggregation of RI bits corresponding to multiple DL cells or multiple CSI processes, i.e., $[o_0^{RI} \; o_1^{RI} ,...,o_{O^{RI}-1}^{RI}]$, then the coded bit sequence $q_0^{RI}, q_1^{RI}, q_2^{RI} ,...,q_{Q_{RI}-1}^{RI}$ is obtained by using the bit sequence $[o_0^{RI} \; o_1^{RI} ,...,o_{O^{RI}-1}^{RI}]$ as the input to the channel coding block described in subclause 5.2.2.6.5.

- If RI feedback consists of $O^{RI} > 22$ bits of information as a result of the aggregation of RI bits corresponding to multiple DL cells or multiple CSI processes, i.e., $[o_0^{RI} \; o_1^{RI} ,...,o_{O^{RI}-1}^{RI}]$, then the coded bit sequence is denoted by $q_0^{RI}, q_1^{RI}, q_2^{RI} ,...,q_{Q_{RI}-1}^{RI}$. The CRC attachment, channel coding and rate matching of the HARQ-ACK bits are performed according to subclauses 5.1.1 setting *L* to 8 bits, 5.1.3.1 and 5.1.4.2, respectively. The input bit sequence to the CRC attachment operation is $[o_0^{RI} \; o_1^{RI} ,...,o_{O^{RI}-1}^{RI}]$. The output bit sequence of the CRC attachment operation is the input bit sequence to the channel coding operation. The output bit sequence of the channel coding operation is the input bit sequence to the rate matching operation.

- A UE capable of supporting only up to 5 serving cells is not expected to support CRI/RI payload larger than 22 bits.

The "x" and "y" in Table 5.2.2.6-3 and 5.2.2.6-4 are placeholders for [2] to scramble the RI bits in a way that maximizes the Euclidean distance of the modulation symbols carrying rank information.

For the case where RI feedback for more than one DL cell is to be reported, the RI report for each DL cell is concatenated prior to coding in increasing order of cell index.

For the case where RI feedback for more than one CSI process is to be reported, the RI reports are concatenated prior to coding first in increasing order of CSI process index for each DL cell and then in increasing order of cell index.

For the case where RI feedback consists of one or two bits of information the bit sequence $q_0^{RI}, q_1^{RI}, q_2^{RI} ,...,q_{Q_{RI}-1}^{RI}$ is obtained by concatenation of multiple encoded RI blocks where Q_{RI} is the total number of coded bits for all the encoded RI blocks. The last concatenation of the encoded RI block may be partial so that the total bit sequence length is equal to Q_{RI}.

For the case where RI feedback consists of $3 \le O^{RI} \le 11$ bits of information, the bit sequence $q_0^{RI}, q_1^{RI}, q_2^{RI} ,...,q_{Q_{RI}-1}^{RI}$ is obtained by the circular repetition of the bit sequence $\tilde{q}_0^{RI} \; \tilde{q}_1^{RI} ,...,\tilde{q}_{31}^{RI}$ so that the total bit sequence length is equal to Q_{RI}.

For the case where CRI feedback is to be reported, the same procedures for RI are applied for CRI. When rank information is to be multiplexed with UL-SCH at a given PUSCH, the rank information is multiplexed in all layers of all transport blocks of that PUSCH. For a given transport block, the vector sequence output of the channel coding for rank information is denoted by $\underline{q}_0^{RI}, \underline{q}_1^{RI} ,...,\underline{q}_{Q'_{RI}-1}^{RI}$, where $\underline{q}_i^{RI}$, $i = 0,...,Q'_{RI} - 1$ are column vectors of length $(Q_m \cdot N_L)$ and where $Q'_{RI} = Q_{RI} / Q_m$. The vector sequence is obtained as follows:

Set *i, j, k* to 0

while $i < Q_{RI}$

$\hat{\underline{q}}_k^{RI} = [q_i^{RI} \ldots q_{i+Q_m-1}^{RI}]$ -- temporary row vector

$\underline{q}_k^{RI} = [\overbrace{\hat{\underline{q}}_k^{RI} \cdots \hat{\underline{q}}_k^{RI}}^{N_L}]^T$ -- replicating the row vector $\hat{\underline{q}}_k^{RI}$ N_L times and transposing into a column vector

$i = i + Q_m$

$k = k + 1$

end while

where N_L is the number of layers onto which the UL-SCH transport block is mapped.

The same processing procedures for RI and RI multiplexing with UL-SCH at a given PUSCH are applied for CRI, using CRI instead of RI in the equations.

For channel quality control information (CQI and/or PMI denoted as CQI/PMI);

When the UE transmits channel quality control information bits, it shall determine the number of modulation coded symbols per layer Q' for channel quality information as

$$Q' = \min\left(\left\lceil \frac{(O+L) \cdot M_{sc}^{PUSCH-initial(x)} \cdot N_{symb}^{PUSCH-initial(x)} \cdot \beta_{offset}^{PUSCH}}{\sum_{r=0}^{C^{(x)}-1} K_r^{(x)}} \right\rceil, M_{sc}^{PUSCH} \cdot N_{symb}^{PUSCH} - \frac{Q_{RI}^{(x)}}{Q_m^{(x)}} \right)$$

where

- O is the number of CQI/PMI bits, and

- L is the number of CRC bits given by $L = \begin{cases} 0 & O \leq 11 \\ 8 & \text{otherwise} \end{cases}$, and

- $Q_{CQI} = Q_m^{(x)} \cdot Q'$ and $\beta_{offset}^{PUSCH} = \beta_{offset}^{CQI}$, where β_{offset}^{CQI} shall be determined according to [3] depending on the number of transmission codewords for the corresponding PUSCH, the duration of the corresponding PUSCH, and on the uplink power control subframe set for the corresponding PUSCH when two uplink power control subframe sets are configured by higher layers for the cell.

- If neither RI nor CRI is not transmitted then $Q_{RI}^{(x)} = 0$.

The variable "x" in $K_r^{(x)}$ represents the transport block index corresponding to the highest I_{MCS} value indicated by the initial UL grant. In case the two transport blocks have the same I_{MCS} value in the corresponding initial UL grant, "$x = 1$", which corresponds to the first transport block. $M_{sc}^{PUSCH-initial(x)}$, $C^{(x)}$, and $K_r^{(x)}$ are obtained from the initial PDCCH or EPDCCH or MPDCCH or SPDCCH for the same transport block. If there is no initial PDCCH or EPDCCH with DCI format 0/0A/0B/4A/4B or MPDCCH with DCI format 6-0A/6-0B or SPDCCH with DCI format 7-0A/7-0B for the same transport block, $M_{sc}^{PUSCH-initial(x)}$, $C^{(x)}$, and $K_r^{(x)}$ shall be determined from:

- the most recent semi-persistent scheduling assignment PDCCH or EPDCCH or MPDCCH or SPDCCH, when the initial PUSCH for the same transport block is semi-persistently scheduled, or,

- the random access response grant for the same transport block, when the PUSCH is initiated by the random access response grant, or

- the most recent AUL activation DCI as defined in [3], when the initial PUSCH for the same transport block is AUL PUSCH.

$N_{symb}^{PUSCH-initial(x)}$ is the number of SC-FDMA symbols per subframe/slot/subslot for initial PUSCH transmission for the same transport block.

For UL-SCH data information $G = N_L^{(x)} \cdot \left(N_{symb}^{PUSCH} \cdot M_{sc}^{PUSCH} \cdot Q_m^{(x)} - Q_{CQI} - Q_{RI}^{(x)} \right)$, where

- $N_L^{(x)}$ is the number of layers the corresponding UL-SCH transport block is mapped onto, and

- M_{sc}^{PUSCH} is the scheduled bandwidth for PUSCH transmission in the current subframe/slot/subslot for the transport block, and

- N_{symb}^{PUSCH} is the number of SC-FDMA symbols in the current PUSCH transmission subframe/slot/subslot given by $N_{symb}^{PUSCH} = \left(\tilde{N}_{symb}^{UL} - N_{SRS} - N_{start}^{PUSCH} - N_{end}^{PUSCH} \right)$, where

  - $\tilde{N}_{symb}^{UL} = \left(N_{symb}^{UL} - 1 \right)$ for PUSCH with slot duration, or for Partial PUSCH Mode 2 or 3, or

  - $\tilde{N}_{symb}^{UL} = N_{symb}^{subslot} - N_{DMRS}$ for PUSCH with subslot duration,

    - $N_{symb}^{subslot}$ is the number of SC-FDMA symbols of the subslot as defined in subclause 4.1 of [2],

    - N_{DMRS} is the number of SC-FDMA symbols for DMRS of the subslot as defined in subclause 5.5.2.1.2 of [2]

  - otherwise $\tilde{N}_{symb}^{UL} = 2\left(N_{symb}^{UL} - 1 \right)$.

- N_{SRS} is equal to 1 for non-BL/CE UEs and BL/CE UEs in CEModeA

  - if UE configured with one UL cell is configured to send PUSCH and SRS in the same subframe for the current subframe/slot/subslot, or

  - if UE transmits PUSCH and SRS in the same subframe/slot/subslot for the current subframe in the same serving cell, or

  - if the PUSCH resource allocation for the current subframe even partially overlaps with the cell-specific SRS subframe and bandwidth configuration defined in subclause 5.5.3 of [2], and for PUSCH with slot/subslot duration if the current slot/subslot is the last slot/subslot in a subframe, or

  - if the current subframe/slot/subslot in the same serving cell is a UE-specific type-1 SRS subframe as defined in Subclause 8.2 of [3], and for PUSCH with slot/subslot duration if the current slot/subslot is the last slot/subslot in a subframe, or

  - if the current subframe/slot/subslot in the same serving cell is a UE-specific type-0 SRS subframe as defined in subclause 8.2 of [3] and the UE is configured with multiple TAGs, and for PUSCH with slot/subslot duration if the current slot/subslot is the last slot/subslot in a subframe.

  - Otherwise N_{SRS} is equal to 0.

- N_{start}^{PUSCH} is equal to 1 when the UE configured for uplink transmission on a LAA SCell is indicated to transmit the PUSCH not starting from the beginning of the first symbol or the seventh symbol of the current subframe, otherwise is equal to 0.

- N_{end}^{PUSCH} is equal to 1 when the UE configured for uplink transmission on a LAA SCell is indicated to transmit the PUSCH up to the second to last symbol of the current subframe and N_{SRS} is equal to 0, otherwise is equal to 0.

In case of CQI/PMI report for more than one DL cell, $o_0, o_1, o_2, ..., o_{O-1}$ is the result of concatenating the CQI/PMI report for each DL cell in increasing order of cell index. For the case where CQI/PMI feedback for more than one CSI process is to be reported, $o_0, o_1, o_2, ..., o_{O-1}$ is the result of concatenating the CQI/PMI reports in increasing order of CSI process index for each DL cell and then in increasing order of cell index.

- If the payload size is less than or equal to 11 bits, the channel coding of the channel quality information is performed according to subclause 5.2.2.6.4 with input sequence $o_0, o_1, o_2, ..., o_{O-1}$.

- For payload sizes greater than 11 bits, the CRC attachment, channel coding and rate matching of the channel quality information is performed according to subclauses 5.1.1, 5.1.3.1 and 5.1.4.2, respectively. The input bit sequence to the CRC attachment operation is $o_0, o_1, o_2, ..., o_{O-1}$. The output bit sequence of the CRC attachment operation is the input bit sequence to the channel coding operation. The output bit sequence of the channel coding operation is the input bit sequence to the rate matching operation.

The output sequence for the channel coding of channel quality information is denoted by $q_0, q_1, q_2, q_3, ..., q_{N_L \cdot Q_{CQI}-1}$, where N_L is the number of layers the corresponding UL-SCH transport block is mapped onto.

5.2.2.6.1 Channel quality information formats for wideband CQI reports

If the parameter *CQI-ReportModeAperiodic* is configured to the value of *rm12* by higher layers [6], the fields and the corresponding bit widths for channel quality information and rank indication feedback are described as below.

Table 5.2.2.6.1-1, Table 5.2.2.6.1-1A and Table 5.2.2.6.1-1B show the fields and the corresponding bit widths for the channel quality information feedback for wideband reports for PDSCH transmissions associated with transmission mode 4, transmission mode 6, transmission mode 8 configured with PMI/RI reporting, transmission mode 9 configured with PMI/RI reporting with 2/4/8 antenna ports except with *advancedCodebookEnabled=TRUE*, transmission mode 10 configured with PMI/RI reporting with 2/4/8 antenna ports except with *advancedCodebookEnabled=TRUE*, transmission mode 9/10 configured with PMI/RI reporting with 2/4/8 antenna ports and higher layer parameter *eMIMO-Type*, *eMIMO-Type* is set to 'CLASS B' for a CSI process with K>1 except with *feCoMP-CSI-Enabled=true*, and K=1 except with *alternativeCodebookEnabledCLASSB_K1=TRUE*, and transmission mode 9/10 configured with higher layer parameter *eMIMO-Type* and *eMIMO-Type2*, and *eMIMO-Type2* configured with PMI/RI reporting with 2/4/8 antenna ports except with *alternativeCodebookEnabledCLASSB_K1=TRUE*. The number of configured CSI-RS resources in a CSI process K is defined in [3] and *alternativeCodebookEnabledCLASSB_K1* is configured by higher layers [6].

Table 5.2.2.6.1-1-1 and Table 5.2.2.6.1-1A-1 show the fields and the corresponding bit widths for the channel quality information feedback for wideband reports for PDSCH transmissions associated with transmission mode 10 configured with PMI/RI reporting and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with 2/4/8 antenna ports with K>1 and higher layer parameter *feCoMP-CSI-Enabled=true* except with *alternativeCodeBookEnabledFor4TX-r12=TRUE*. The number of configured CSI-RS resources in a CSI process K is defined in [3].

Table 5.2.2.6.1-1B-1 and Table 5.2.2.6.1-1B-2 show the fields and the corresponding bit widths for the channel quality information feedback for wideband reports for PDSCH transmissions associated with transmission mode 9/10 configured with PMI/RI reporting with 4/8 antenna ports and higher layer parameter *advancedCodebookEnabled=TRUE*.

Table 5.2.2.6.1-1B-3 shows the fields and the corresponding bit widths for the channel quality information feedback for wideband reports for PDSCH transmissions associated with transmission mode 10 configured with PMI/RI reporting and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with 4 antenna ports with K>1, and higher layer parameter *feCoMP-CSI-Enabled=true* with *alternativeCodeBookEnabledFor4TX-r12=TRUE*. The number of configured CSI-RS resources in a CSI process K is defined in [3].For Table 5.2.2.6.1-1-1, Table 5.2.2.6.1-1A-1 and Table 5.2.2.6.1-1B-3, in the case of CRI=2, the rank value corresponds to RI0 for codeword 0 and RI1 for codeword 1.

Table 5.2.2.6.1-1C and Table 5.2.2.6.1-1D show the fields and the corresponding bit widths for the channel quality information feedback for wideband reports for PDSCH transmissions associated with transmission mode 9/10 configured with PMI/RI reporting with 8/12/16/20/24/28/32 antenna ports and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS A' except with *advancedCodebookEnabled=TRUE*.

Table 5.2.2.6.1-1D-1 and Table 5.2.2.6.1-1D-2 show the fields and corresponding bit widths for the channel quality information feedback for wideband reports for PDSCH transmissions associated with transmission mode 9/10

configured with PMI/RI reporting with 8/12/16/20/24/28/32 antenna ports and higher layer parameters *advancedCodebookEnabled* and *eMIMO-Type,* and *eMIMO-Type* is set to 'CLASS A' and *advancedCodebookEnabled=TRUE*.

Table 5.2.2.6.1-1E shows the fields and corresponding bit widths for the channel quality information feedback for wideband reports for PDSCH transmissions associated with transmission mode 9/10 configured with PMI/RI reporting with 2/4/8 antenna ports and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K=1 and higher layer parameter *alternativeCodebookEnabledCLASSB_K1=TRUE* configured, and transmission mode 9/10 configured with higher layer parameter *eMIMO-Type* and *eMIMO-Type*2, and *eMIMO-Type*2 configured with PMI/RI reporting with 2/4/8 antenna ports and higher layer parameter *alternativeCodebookEnabledCLASSB_K1=TRUE*.

For Table 5.2.2.6.1-1, Table 5.2.2.6.1-1-1, Table 5.2.2.6.1-1A, Table 5.2.2.6.1-1A-1, Table 5.2.2.6.1-1B, Table 5.2.2.6.1-1B-1, Table 5.2.2.6.1-1B-2, Table 5.2.2.6.1-1B-3, Table 5.2.2.6.1-1C, Table 5.2.2.6.1-D, Table 5.2.2.6.1-1D-1, Table 5.2.2.6.1-1D-2 and Table 5.2.2.6.1-1E, N is defined in subclause 7.2 of [3]. For Table 5.2.2.6.1-1B-1, Table 5.2.2.6.1-1B-2, Table 5.2.2.6.1-1C, Table 5.2.2.6.1-D, Table 5.2.2.6.1-1D-1 and Table 5.2.2.6.1-1D-2, the codebook configuration (N_1, N_2, O_1, O_2) is defined in [3], and *CodebookConfig* is configured by higher layers [6]. The parameters (S_1, S_2) in rank 3 and 4 are defined as $(S_1, S_2) = (1, 1)$ for *CodebookConfig*=1, $(S_1, S_2) = \left(\dfrac{O_1}{2}, \dfrac{O_2}{2} \right)$ for *CodebookConfig*=2, $(S_1, S_2) = \left(O_1, \dfrac{O_2}{2} \right)$ for *CodebookConfig*=3, $(S_1, S_2) = \left(O_1, \dfrac{O_2}{4} \right)$ for *CodebookConfig*=4. The parameters (S_1, S_2) in rank 5 to 8 are defined as $(S_1, S_2) = (1, 1)$ for *CodebookConfig*=1, $(S_1, S_2) = \left(\dfrac{O_1}{4}, \dfrac{O_2}{4} \right)$ for *CodebookConfig*=2/3/4. The parameters (L_1, L_2) are defined as $L_1 = \min\{4, N_1\}$ and $L_2 = 2$ for $N_1 \geq N_2$ and $N_2 \neq 1$, $L_1 = 2$ and $L_2 = \min\{4, N_2\}$ for $N_1 < N_2$ and $N_1 \neq 1$, and $L_1 = \min\{8, N_1\}$ and $L_2 = 1$ for $N_2 = 1$.

Table 5.2.2.6.1-1: Fields for channel quality information feedback for wideband CQI and subband PMI reports (transmission mode 4, transmission mode 6, transmission mode 8 configured with PMI/RI reporting except with *alternativeCodeBookEnabledFor4TX-r12=TRUE*, transmission mode 9 configured with PMI/RI reporting with 2/4 antenna ports except with *alternativeCodeBookEnabledFor4TX-r12=TRUE* or *advancedCodebookEnabled=TRUE*, transmission mode 10 configured with PMI/RI reporting with 2/4 antenna ports except with *alternativeCodeBookEnabledFor4TX-r12=TRUE* or *advancedCodebookEnabled=TRUE,* and transmission mode 9/10 configured with PMI/RI reporting and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with 2/4 antenna ports with K>1 except with *feCoMP-CSI-Enabled=true*, and K=1 except with *alternativeCodebookEnabledCLASSB_K1=TRUE*, except with *alternativeCodeBookEnabledFor4TX-r12=TRUE*, and transmission mode 9/10 configured with higher layer parameter *eMIMO-Type* and *eMIMO-Type*2, and *eMIMO-Type*2 configured with PMI/RI reporting with 2/4 antenna ports except with *alternativeCodeBookEnabledCLASSB_K1=TRUE* or *alternativeCodeBookEnabledFor4TX-r12=TRUE*)

Field	Bit width

If the parameter *CQI-ReportModeAperiodic* is configured to the value of *rm10-v13xy* by higher layers [6], the fields and the corresponding bit widths for channel quality information and rank indication feedback are described as below.

Table 5.2.2.6.1-1F shows the fields and the corresponding bit width for the channel quality information feedback for higher layer configured report for PDSCH transmissions associated with transmission mode 1, transmission mode 2, transmission mode 3, transmission mode 7, transmission mode 8 configured without PMI/RI reporting, transmission mode 9 configured without PMI/RI reporting or configured with 1 antenna port, and transmission mode 10 configured without PMI/RI reporting or configured with 1 antenna port except with *feCoMP-CSI-Enabled=true*.

Table 5.2.2.6.1-1F-1 shows the fields and the corresponding bit width for the channel quality information feedback for higher layer configured report for PDSCH transmissions associated with transmission mode 10 configured without PMI/RI reporting or configured with 1 antenna port and higher layer parameter *feCoMP-CSI-Enabled=true*.

Table 5.2.2.6.1-1G shows the fields and the corresponding bit width for the channel quality information feedback for higher layer configured report for PDSCH transmissions associated with transmission mode 9/10 configured without PMI reporting and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with 2/4/8 antenna ports except with *feCoMP-CSI-Enabled=true*, and transmission mode 9/10 configured with higher layer parameter *eMIMO-Type* and *eMIMO-Type2*, and *eMIMO-Type*2 is set to 'CLASS B' with 2/4/8 antenna ports without PMI reporting.

Table 5.2.2.6.1-1G-1 shows the fields and the corresponding bit width for the channel quality information feedback for higher layer configured report for PDSCH transmissions associated with transmission mode 10 configured without PMI reporting and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with 2/4/8 antenna ports and higher layer parameter *feCoMP-CSI-Enabled=true*.

For Table 5.2.2.6.1-1F-1 and Table 5.2.2.6.1-1G-1, in the case of CRI=2, the rank value corresponds to RI0 for codeword 0 and RI1 for codeword 1.

Table 5.2.2.6.1-1F: Fields for channel quality information feedback for wideband CQI reports (transmission mode 1, transmission mode 2, transmission mode 3, transmission mode 7, transmission mode 8 configured without PMI/RI reporting, transmission mode 9 configured without PMI/RI reporting or configured with 1 antenna port, and transmission mode 10 configured without PMI/RI reporting or configured with 1 antenna port except with *feCoMP-CSI-Enabled=true*)

If the parameter *CQI-ReportModeAperiodic* is configured to the value of *rm11-v13xx* by higher layers [6], the fields and the corresponding bit widths for channel quality information and rank indication feedback are described as below.

Table 5.2.2.6.1-1H, Table 5.2.2.6.1-1I and Table 5.2.2.6.1-1J show the fields and the corresponding bit widths for the channel quality information feedback for higher layer configured report for PDSCH transmissions associated with transmission mode 4, transmission mode 5, transmission mode 6, transmission mode 8 configured with PMI/RI reporting, transmission mode 9 configured with PMI/RI reporting with 2/4/8 antenna ports, transmission mode 10 configured with PMI/RI reporting with 2/4/8 antenna ports, transmission mode 9/10 configured with PMI/RI reporting with 2/4/8 antenna ports and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K>1 except with *feCoMP-CSI-Enabled=true*, and K=1 except with *alternativeCodebookEnabledCLASSB_K1=TRUE*, and transmission mode 9/10 configured with higher layer parameter *eMIMO-Type* and *eMIMO-Type*2, and *eMIMO-Type*2 configured with PMI/RI reporting with 2/4/8 antenna ports except with *alternativeCodebookEnabledCLASSB_K1=TRUE*. The number of configured CSI-RS resources in a CSI process K is defined in [3] and *alternativeCodebookEnabledCLASSB_K1* is configured by higher layers [6].

Table 5.2.2.6.1-1H-1, Table 5.2.2.6.1-1I-1 show the fields and the corresponding bit width for the channel quality information feedback for higher layer configured report for PDSCH transmissions associated with transmission mode 10 configured with PMI/RI reporting with 2/4/8 antenna ports and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K>1 and higher layer parameter *feCoMP-CSI-Enabled=true*, except with *alternativeCodeBookEnabledFor4TX-r12=TRUE*. The number of configured CSI-RS resources in a CSI process K is defined in [3].

Table 5.2.2.6.1-1J-1 and Table 5.2.2.6.1-1J-2 show the fields and the corresponding bit widths for the channel quality information feedback for higher layer configured report for PDSCH transmissions associated with transmission mode 9/10 configured with PMI/RI reporting with 8/12/16/20/24/28/32 antenna ports and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS A'.

Table 5.2.2.6.1-1J-3 shows the fields and the corresponding bit widths for the channel quality information feedback for higher layer configured report for PDSCH transmissions associated with transmission mode 9/10 configured with PMI/RI reporting with 2/4/8 antenna ports and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K=1 and *alternativeCodebookEnabledCLASSB_K1=TRUE*, and transmission mode 9/10 configured with higher layer parameter *eMIMO-Type* and *eMIMO-Type*2, and *eMIMO-Type*2 configured with PMI/RI reporting with 2/4/8 antenna ports and higher layer parameter *alternativeCodebookEnabledCLASSB_K1=TRUE*.

Table 5.2.2.6.1-1J-4 shows the fields and the corresponding bit width for the channel quality information feedback for higher layer configured report for PDSCH transmissions associated with transmission mode 10 configured with PMI/RI reporting with 4 antenna ports and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K>1 and higher layer parameter *feCoMP-CSI-Enabled=true* with *alternativeCodeBookEnabledFor4TX-r12=TRUE*. The number of configured CSI-RS resources in a CSI process K is defined in [3].

For Table 5.2.2.6.1-1H-1, Table 5.2.2.6.1-1I-1 and Table 5.2.2.6.1-1J-4, in the case of CRI=2, the rank value corresponds to RI0 for codeword 0 and RI1 for codeword 1.

Table 5.2.2.6.1-1K-1 and Table Table 5.2.2.6.1-1K-2 show the fields and the corresponding bit widths for channel quality information feedback for higher layer configured report for PDSCH transmission associated with transmission mode 9/10 configured with higher layer parameters *semiOpenLoop* and *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with 2/4/8 antenna ports except with *alternativeCodebookEnabledCLASSB_K1=TRUE*.

Table 5.2.2.6.1-1K-3 and Table 5.2.2.6.1-1K-4 show the fields and the corresponding bit widths for channel quality information feedback for higher layer configured report for PDSCH transmission associated with transmission mode

9/10 configured with higher layer parameters *semiOpenLoop* and *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS A' with codebook configuration (N_1, N_2, O_1, O_2).

For Table 5.2.2.6.1-1H, Table 5.2.2.6.1-1I, Table 5.2.2.6.1-1J, Table 5.2.2.6.1-1J-1, Table 5.2.2.6.1-1J-2 and Table 5.2.2.6.1-1J-3, *N* is defined in subclause 7.2 of [3]. For Table 5.2.2.6.1-1J-1, Table 5.2.2.6.1-1J-2, Table 5.2.2.6.1-1K-3, Table 5.2.2.6.1-1K-4 and Table 5.2.2.6.1-1K-5, the codebook configuration $\left(N_1, N_2, O_1, O_2\right)$ is defined in [3], and *CodebookConfig* is configured by higher layers [6]. The parameters $\left(S_1, S_2\right)$ in rank 1 and rank 2 are defined as $\left(S_1, S_2\right) = \left(1, 1\right)$ for *CodebookConfig*=1 and $\left(S_1, S_2\right) = \left(2, 2\right)$ for *CodebookConfig* =2, 3 and 4. The parameters $\left(S_1, S_2\right)$ in rank 3 and 4 are defined as $\left(S_1, S_2\right) = \left(1, 1\right)$ for *CodebookConfig*=1, $\left(S_1, S_2\right) = \left(\dfrac{O_1}{2}, \dfrac{O_2}{2}\right)$ for *CodebookConfig*=2, $\left(S_1, S_2\right) = \left(O_1, \dfrac{O_2}{2}\right)$ for *CodebookConfig*=3, $\left(S_1, S_2\right) = \left(O_1, \dfrac{O_2}{4}\right)$ for *CodebookConfig*=4. The parameters $\left(S_1, S_2\right)$ in rank 5 to 8 are defined as $\left(S_1, S_2\right) = \left(1, 1\right)$ for *CodebookConfig*=1, $\left(S_1, S_2\right) = \left(\dfrac{O_1}{4}, \dfrac{O_2}{4}\right)$ for *CodebookConfig*=2/3/4.

Table 5.2.2.6.1-1H: Fields for channel quality information feedback for wideband CQI reports (transmission mode 4, transmission mode 5, transmission mode 6, transmission mode 8 configured with PMI/RI reporting except with *alternativeCodeBookEnabledFor4TX-r12=TRUE*, transmission mode 9 configured with PMI/RI reporting with 2/4 antenna ports except with *alternativeCodeBookEnabledFor4TX-r12=TRUE*, transmission mode 10 configured with PMI/RI reporting with 2/4 antenna ports except with *alternativeCodeBookEnabledFor4TX-r12=TRUE*, transmission mode 9/10 configured with PMI/RI reporting with 2/4 antenna ports and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K>1 except with *feCoMP-CSI-Enabled=true*, and K=1 except with *alternativeCodebookEnabledCLASSB_K1=TRUE*, except with *alternativeCodeBookEnabledFor4TX-r12=TRUE*, and transmission mode 9/10 configured with higher layer parameter *eMIMO-Type* and *eMIMO-Type*2, and *eMIMO-Type*2 configured with PMI/RI reporting with 2/4 antenna ports except with *alternativeCodebookEnabledCLASSB_K1=TRUE* or *alternativeCodeBookEnabledFor4TX-r12=TRUE*)

Table 5.2.2.6.1-2 shows the fields and the corresponding bit width for the rank indication feedback for wideband CQI reports for PDSCH transmissions associated with transmission mode 3, transmission mode 4, transmission mode 8 configured with PMI/RI reporting, transmission mode 9 configured with PMI/RI reporting with 2/4/8 antenna ports, transmission mode 10 configured with PMI/RI reporting with 2/4/8 antenna ports, transmission mode 9/10 configured with PMI/RI reporting with 2/4/8 antenna ports and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K=1, transmission mode 9/10 configured with PMI/RI reporting and higher layer parameter *csi-RS-NZP-mode* set to 'multi-shot' with *activatedResources*=1 and more than one port for the activated CSI-RS resource, transmission mode 9/10 configured with PMI/RI reporting and higher layer parameter *csi-RS-ConfigNZP-ApList*, and the higher layer parameter *csi-RS-NZP-mode* is set to 'aperiodic' and more than one port for the activated CSI-RS resource, transmission mode 9/10 configured with higher layer parameter *eMIMO-Type* and *eMIMO-Type2*, and *eMIMO-Type*2 configured with PMI/RI reporting with 2/4/8 antenna ports, and rank indication is associated with *eMIMO-Type*2, transmission mode 9/10 configured with PMI/RI reporting with 8/12/16/20/24/28/32 antenna ports and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS A', and transmission mode 9/10 configured without PMI reporting and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K=1 with 2/4/8 antenna ports, transmission mode 9/10 configured without PMI reporting and higher layer parameter *csi-RS-NZP-mode* set to 'multi-shot' and with *activatedResources*=1 and more than one port for the activated CSI-RS resource, transmission mode 9/10 configured with PMI/RI reporting and higher layer parameter *csi-RS-ConfigNZP-ApList* and the higher layer parameter *csi-RS-NZP-mode* is set to 'aperiodic' and more than one port for the activated CSI-RS resource, and transmission mode 9/10 configured with higher layer parameter *eMIMO-Type* and *eMIMO-Type2*, and *eMIMO-Type*2 configured without PMI reporting with 2/4/8 antenna ports, and rank indication is associated with *eMIMO-Type*2.

Table 5.2.2.6.1-2A shows the fields and the corresponding bit width for the CRI feedback for wideband CQI reports for PDSCH transmissions associated with transmission mode 9/10 configured with PMI/RI reporting for Class B CSI reporting with K>1 CSI-RS resources except with *feCoMP-CSI-Enabled=true* and one port per CSI-RS resource except with higher layer parameter *csi-RS-NZP-mode* configured, and transmission mode 9/10 configured with higher layer parameter *eMIMO-Type* and *eMIMO-Type2*, and *eMIMO-Type* is set to 'CLASS B' with K>1, where CRI is associated with the *eMIMO-Type*.

Table 5.2.2.6.1-2B shows the fields and the corresponding bit width for the joint CRI and RI feedback for wideband CQI reports for PDSCH transmissions associated with transmission mode 9/10 configured without PMI reporting and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K>1 except with *feCoMP-CSI-Enabled=true*, and except with higher layer parameter *csi-RS-NZP-mode* configured, and transmission mode 9/10 configured with PMI/RI reporting and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K>1 CSI-RS resources except with *feCoMP-CSI-Enabled=true* and more than one port for at least one CSI-RS resource except with higher layer parameter *csi-RS-NZP-mode* configured.

Table 5.2.2.6.1-2C shows the fields and the corresponding bit width for the CRI feedback for wideband CQI reports for PDSCH transmissions associated with transmission mode 9/10 configured with PMI/RI reporting and the higher layer parameter *csi-RS-NZP-mode* is set to 'multi-shot' with *activatedResources*>1 and one port per activated CSI-RS resource except with *feCoMP-CSI-Enabled=true*. N is the value of higher layer parameter *activatedResources*.

Table 5.2.2.6.1-2D shows the fields and the corresponding bit width for the joint CRI and RI feedback for wideband CQI reports for PDSCH transmissions associated with transmission mode 9/10 configured without PMI reporting and higher layer parameter *csi-RS-NZP-mode* is set to 'multi-shot' with *activatedResources*>1 and more than one port for at least one activated CSI-RS resource except with *feCoMP-CSI-Enabled=true*, and transmission mode 9/10 configured with PMI/RI reporting and the higher layer parameter *csi-RS-NZP-mode*is set to 'multi-shot' with *activatedResources*>1 and more than one port for at least one activated CSI-RS resource except with *feCoMP-CSI-Enabled=true*. N is the value of higher layer parameter *activatedResources*.

Table 5.2.2.6.1-2E shows the fields and the corresponding bit width for the rank indication feedback for wideband CQI reports for PDSCH transmissions associated with transmission mode 9/10 configured with higher layer parameter *eMIMO-Type* and *eMIMO-Type*2, and *eMIMO-Type* is set to 'CLASS A' and *eMIMO-Type*2 is set to 'CLASS B', where rank indication is associated with the *eMIMO-Type*.

Table 5.2.2.6.1-2F shows the fields and the corresponding bit width for the joint CRI and RI feedback for wideband CQI reports for PDSCH transmissions associated with transmission mode 10 configured without PMI reporting and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K>1 and higher layer parameter *feCoMP-CSI-Enabled=true* except with higher layer parameter *csi-RS-NZP-mode* configured, transmission mode 10 configured with PMI/RI reporting and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K>1 CSI-RS resources and more than one port for at least one CSI-RS resource and higher layer parameter *feCoMP-CSI-Enabled=true*, transmission mode 10 configured without PMI reporting and higher layer parameter *csi-RS-NZP-mode* is set to 'multi-shot' with *activatedResources*>1 and more than one port for at least one activated CSI-RS resource and higher layer parameter *feCoMP-CSI-Enabled=true*, and transmission mode 10 configured with PMI/RI reporting and higher layer parameter *csi-RS-NZP-mode* is set to 'multi-shot' with *activatedResources*>1 and more than one port for at least one activated CSI-RS resource and higher layer parameter *feCoMP-CSI-Enabled=true*. In the case of CRI=2, Rank indication in Table 5.2.2.6.1-2F corresponds to {RI0, RI1}, where RI0 is the rank indication for codeword 0 and RI1 is the rank indication for codeword 1.

Table 5.2.2.6.1-2G shows the fields and the corresponding bit width for the CRI feedback for wideband CQI reports for PDSCH transmissions associated with transmission mode 10 configured with PMI/RI reporting and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K>1 CSI-RS resources and one port for each CSI-RS resource and higher layer parameter *feCoMP-CSI-Enabled=true*, and transmission mode 10 configured with PMI/RI reporting and higher layer parameter *csi-RS-NZP-mode* is set to 'multi-shot' with *activatedResources*>1 and one port per activated CSI-RS resource and higher layer parameter *feCoMP-CSI-Enabled=true*.

Table 5.2.2.6.1-2: Fields for rank indication feedback for wideband CQI reports (transmission mode 3, transmission mode 4, transmission mode 8 configured with PMI/RI reporting, transmission mode 9 configured with PMI/RI reporting with 2/4/8 antenna ports, transmission mode 10 configured with PMI/RI reporting with 2/4/8 antenna ports, transmission mode 9/10 configured with PMI/RI or without PMI reporting with 2/4/8 antenna ports and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K=1, transmission mode 9/10 configured with PMI/RI or without PMI reporting and higher layer parameter *csi-RS-NZP-mode* is set to 'multi-shot' with *activatedResources*=1 and more than one port for the activated CSI-RS resource, transmission mode 9/10 configured with PMI/RI reporting and higher layer parameter *csi-RS-ConfigNZP-ApList* and the higher layer parameter *csi-RS-NZP-mode* is set to 'aperiodic' and more than one port for the activated CSI-RS resource, transmission mode 9/10 and higher layer parameter *eMIMO-Type* and *eMIMO-Type*2, and *eMIMO-Type*2 configured with PMI/RI or without PMI reporting with 2/4/8 antenna ports and rank indication is associated with *eMIMO-Type*2, and transmission mode 9/10 configured with PMI/RI reporting with 8/12/16/20/24/28/32 antenna ports and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS A')

Field	Bit width

The channel quality bits in Table 5.2.2.6.1-1, Table 5.2.2.6.1-1-1, Table 5.2.2.6.1-1A, Table 5.2.2.6.1-1A-1, Table 5.2.2.6.1-1B, Table 5.2.2.6.1-1B-1, Table 5.2.2.6.1-1B-2, Table 5.2.2.6.1-1B-3, Table 5.2.2.6.1-1C, Table 5.2.2.6.1-1D, Table 5.2.2.6.1-1D-1, Table 5.2.2.6.1-1D-2, Table 5.2.2.6.1-1E, Table 5.2.2.6.1-1F, Table 5.2.2.6.1-1F-1, Table 5.2.2.6.1-1G, Table 5.2.2.6.1-1G-1, Table 5.2.2.6.1-1H, Table 5.2.2.6.1-1H-1, Table 5.2.2.6.1-1I, Table 5.2.2.6.1-1I-1,

Table 5.2.2.6.1-1J, Table 5.2.2.6.1-1J-1, Table 5.2.2.6.1-1J-2, Table 5.2.2.6.1-1J-3, Table 5.2.2.6.1-1J-4, Table 5.2.2.6.1-1K-1, Table 5.2.2.6.1-1K-2, Table 5.2.2.6.1-1K-3, Table 5.2.2.6.1-1K-4, Table 5.2.2.6.1-2B, and Table 5.2.2.6.1-2D, form the bit sequence $o_0, o_1, o_2, ..., o_{O-1}$ with o_0 corresponding to the first bit of the first field in the table, o_1 corresponding to the second bit of the first field in the table, and o_{O-1} corresponding to the last bit in the last field in the table. The field of PMI shall be in the increasing order of the subband index [3]. The first bit of each field corresponds to MSB and the last bit LSB. The RI bits sequence in Table 5.2.2.6.1-2, Table 5.2.2.6.1-2B, Table 5.2.2.6.1-2D, Table 5.2.2.6.1-2E, Table 5.2.2.6.1-2F and the CRI sequence in Table 5.2.2.6.1-2A, Table 5.2.2.6.1-2C, Table 5.2.2.6.1-2G are encoded according to subclause 5.2.2.6.

For transmission mode 9/10 configured with Class B CSI reporting and K>1 except with *feCoMP-CSI-Enabled=true*, the number of antenna port in Table 5.2.2.6.1-2B (or Table 5.2.2.6.1-2F with *feCoMP-CSI-Enabled=true*) refers to the maximum number of antenna ports of K CSI-RS resources configured for the CSI-process for the UE.

For transmission mode 9/10 configured with Class B CSI reporting and K>1 except with *feCoMP-CSI-Enabled=true* and with *activatedResources*>1, the number of antenna port in Table 5.2.2.6.1-2D refers to the maximum number of antenna ports of N CSI-RS resources activated for the CSI-process for the UE. N is the value of higher layer parameter *activatedResources*.

For a UE configured with the higher layer parameter *shortTTI*, the entries associated with codeword 1 in Table 5.2.2.6.1-1, Table 5.2.2.6.1-1A, Table 5.2.2.6.1-1B, Table 5.2.2.6.1-1B-1, Table 5.2.2.6.1-1B-2, Table 5.2.2.6.1-1C, Table 5.2.2.6.1-1D, Table 5.2.2.6.1-1D-1, Table 5.2.2.6.1-1D-2, Table 5.2.2.6.1-1E, Table 5.2.2.6.1-1G, Table 5.2.2.6.1-1H, Table 5.2.2.6.1-1I, Table 5.2.2.6.1-1J, Table 5.2.2.6.1-1J-1, Table 5.2.2.6.1-1J-2, Table 5.2.2.6.1-1J-3, Table 5.2.2.6.1-1K-1, Table 5.2.2.6.1-1K-2, Table 5.2.2.6.1-1K-3 and Table 5.2.2.6.1-1K-4 are not applicable.

5.2.2.6.2 Channel quality information formats for higher layer configured subband CQI reports

Table 5.2.2.6.2-1 shows the fields and the corresponding bit width for the channel quality information feedback for higher layer configured report for PDSCH transmissions associated with transmission mode 1, transmission mode 2, transmission mode 3, transmission mode 7, transmission mode 8 configured without PMI/RI reporting, transmission mode 9 configured without PMI/RI reporting or configured with 1 antenna port, and transmission mode 10 configured without PMI/RI reporting or configured with 1 antenna port except with *feCoMP-CSI-Enabled=true*. N in Table 5.2.2.6.2-1 is defined in subclause 7.2 of [3].

Table 5.2.2.6.2-1A shows the fields and the corresponding bit width for the channel quality information feedback for higher layer configured report for PDSCH transmissions associated with transmission mode 9/10 configured without PMI reporting and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with 2/4/8 antenna ports except with *feCoMP-CSI-Enabled=true*, transmission mode 9/10 configured with higher layer parameter *eMIMO-Type* and *eMIMO-Type2*, and *eMIMO-Type2* is set to 'CLASS B' without PMI reporting with 2/4/8 antenna ports, and transmission mode 9/10 configured with PMI/RI reporting and higher layer parameters *semiOpenLoop* and *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with 2/4 antenna ports except with *alternativeCodebookEnabledCLASSB_K1=TRUE* or *alternativeCodeBookEnabledFor4TX-r12=TRUE*.

Table 5.2.2.6.2-1B shows the fields and the corresponding bit width for the channel quality information feedback for higher layer configured report for PDSCH transmissions associated with transmission mode 10 configured without PMI/RI reporting or configured with 1 antenna port and higher layer parameter *feCoMP-CSI-Enabled=true*. The number of configured CSI-RS resources in a CSI process K is defined in [3]. N in Table 5.2.2.6.2-1B is defined in subclause 7.2 of [3].

Table 5.2.2.6.2-1B-1 shows the fields and the corresponding bit width for the channel quality information feedback for higher layer configured report for PDSCH transmissions associated with transmission mode 10 configured without PMI reporting and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with 2/4/8 antenna ports and higher layer parameter *feCoMP-CSI-Enabled=true*. The number of configured CSI-RS resources in a CSI process K is defined in [3]. N in Table 5.2.2.6.2-1B-1 is defined in subclause 7.2 of [3].

For Table 5.2.2.6.2-1B and Table 5.2.2.6.2-1B-1, in the case of CRI=2, the rank value corresponds to RI0 for codeword 0 and RI1 for codeword 1.

Table 5.2.2.6.2-1: Fields for channel quality information feedback for higher layer configured subband CQI reports (transmission mode 1, transmission mode 2, transmission mode 3, transmission mode 7, transmission mode 8 configured without PMI/RI reporting, transmission mode 9 configured without PMI/RI reporting or configured with 1 antenna port, and transmission mode 10 configured without PMI/RI reporting or configured with 1 antenna port except with *feCoMP-CSI-Enabled=true*)

Field	Bit width
Wide-band CQI codeword	4

Subband differential CQI codeword 1	$2N$	$2N$

Table 5.2.2.6.2-2, Table 5.2.2.6.2-2A and Table 5.2.2.6.2-2B show the fields and the corresponding bit widths for the channel quality information feedback for higher layer configured report for PDSCH transmissions associated with transmission mode 4, transmission mode 5, transmission mode 6, transmission mode 8 configured with PMI/RI reporting, transmission mode 9 configured with PMI/RI reporting with 2/4/8 antenna ports except with *advancedCodebookEnabled=TRUE*, transmission mode 10 configured with PMI/RI reporting with 2/4/8 antenna ports except with *advancedCodebookEnabled=TRUE*, transmission mode 9/10 configured with PMI/RI reporting with 2/4/8 antenna ports and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K>1 except with *feCoMP-CSI-Enabled=true*, and K=1 except with *alternativeCodebookEnabledCLASSB_K1=TRUE*, and transmission mode 9/10 configured with higher layer parameter *eMIMO-Type* and *eMIMO-Type*2, and *eMIMO-Type*2 configured with PMI/RI reporting with 2/4/8 antenna ports except with *alternativeCodebookEnabledCLASSB_K1=TRUE*. The number of configured CSI-RS resources in a CSI process K is defined in [3] and *alternativeCodebookEnabledCLASSB_K1* is configured by higher layers [6].

Table 5.2.2.6.2-2-1 and Table 5.2.2.6.2-2A-1 show the fields and the corresponding bit widths for the channel quality information feedback for higher layer configured report for PDSCH transmissions associated with transmission mode 10 configured with PMI/RI reporting with 2/4/8 antenna ports and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K>1 and higher layer parameter *feCoMP-CSI-Enabled=true*, except with *alternativeCodeBookEnabledFor4TX-r12=TRUE*. The number of configured CSI-RS resources in a CSI process K is defined in [3].

Table 5.2.2.6.2-2B-1 and Table 5.2.2.6.2-2B-2 show the fields and the corresponding bit widths for the channel quality information feedback for higher layer configured report for PDSCH transmissions associated with transmission mode 9/10 configured with PMI/RI reporting with 8/12/16/20/24/28/32 antenna ports and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS A' except with *advancedCodebookEnabled=TRUE*.

Table5.2.2.6.2-2B-3 shows the fields and the corresponding bit widths for the channel quality information feedback for higher layer configured report for PDSCH transmissions associated with transmission mode 9/10 configured with PMI/RI reporting with 2/4/8 antenna ports and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K=1 and *alternativeCodebookEnabledCLASSB_K1=TRUE*, and transmission mode 9/10 configured with higher layer parameter *eMIMO-Type* and *eMIMO-Type*2, and *eMIMO-Type*2 configured with PMI/RI reporting with 2/4/8 antenna ports and higher layer parameter *alternativeCodebookEnabledCLASSB_K1=TRUE*.

Table5.2.2.6.2-2B-4 shows the fields and the corresponding bit widths for the channel quality information feedback for higher layer configured report for PDSCH transmissions associated with transmission mode 9/10 configured with PMI/RI reporting with 4/8 antenna ports and higher layer parameters *semiOpenLoop* and *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' without *alternativeCodebookEnabledCLASSB_K1=TRUE*, with *alternativeCodebookEnabledCLASSB_K1=TRUE*.

Table5.2.2.6.2-2B-5 and Table5.2.2.6.2-2B-6 show the fields and the corresponding bit widths for the channel quality information feedback for higher layer configured report for PDSCH transmissions associated with transmission mode 9/10 configured with PMI/RI reporting and higher layer parameters *semiOpenLoop* and *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS A' with 8/12/16/20/24/28/32 antenna ports.

Table 5.2.2.6.2-2B-7 and Table 5.2.2.6.2-2B-8 show the fields and the corresponding bit widths for the channel quality information feedback for higher layer configured report for PDSCH transmissions associated with transmission mode 9/10 configured with PMI/RI reporting with 4/8 antenna ports and higher layer parameter *advancedCodebookEnabled=TRUE*.

Table 5.2.2.6.2-2B-9 and Table 5.2.2.6.2-2B-10 show the fields and the corresponding bit widths for the channel quality information feedback for higher layer configured report for PDSCH transmissions associated with transmission mode 9/10 configured with PMI/RI reporting with 8/12/16 /20/24/28/32 antenna ports and higher layer parameters *advancedCodebookEnabled* and *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS A' and *advancedCodebookEnabled =TRUE*.

Table 5.2.2.6.2-2B-11 shows the fields and the corresponding bit widths for the channel quality information feedback for higher layer configured report for PDSCH transmissions associated with transmission mode 10 configured with PMI/RI reporting with 4 antenna ports and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K>1 and higher layer parameter *feCoMP-CSI-Enabled=true*, with *alternativeCodeBookEnabledFor4TX-r12=TRUE*. The number of configured CSI-RS resources in a CSI process K is defined in [3].

For Table 5.2.2.6.2-2-1, Table 5.2.2.6.2-2A-1 and Table 5.2.2.6.2-2B-11, in the case of CRI=2, the rank value corresponds to RI0 for codeword 0 and RI1 for codeword 1.

For Table 5.2.2.6.2-2, Table 5.2.2.6.2-2-1, Table 5.2.2.6.2-2A, Table 5.2.2.6.2-2A-1, Table 5.2.2.6.2-2B, Table 5.2.2.6.2-2B-1, Table 5.2.2.6.2-2B-2, Table 5.2.2.6.2-2B-3, Table 5.2.2.6.2-2B-4, Table 5.2.2.6.2-2B-5, Table 5.2.2.6.2-2B-6, Table 5.2.2.6.2-2B-7, Table 5.2.2.6.2-2B-8, Table 5.2.2.6.2-2B-9, Table 5.2.2.6.2-2B-10 and Table 5.2.2.6.2-2B-11, N is defined in subclause 7.2 of [3]. For Table 5.2.2.6.2-2B-1, Table 5.2.2.6.2-2B-2, Table 5.2.2.6.2-2B-5, Table 5.2.2.6.2-2B-6, Table5.2.2.6.2-2B-8, Table 5.2.2.6.2-2B-9 and Table 5.2.2.6.2-2B-10, the codebook configuration (N_1, N_2, O_1, O_2) is defined in [3], and *CodebookConfig* is configured by higher layers [6]. The parameters (S_1, S_2)

in rank 3 and 4 are defined as $(S_1, S_2) = (1, 1)$ for *CodebookConfig*=1, $(S_1, S_2) = \left(\dfrac{O_1}{2}, \dfrac{O_2}{2} \right)$ for

CodebookConfig=2, $(S_1, S_2) = \left(O_1, \dfrac{O_2}{2} \right)$ for *CodebookConfig*=3, $(S_1, S_2) = \left(O_1, \dfrac{O_2}{4} \right)$ for *CodebookConfig*=4.

The parameters (S_1, S_2) in rank 5 to 8 are defined as $(S_1, S_2) = (1, 1)$ for *CodebookConfig*=1,

$(S_1, S_2) = \left(\dfrac{O_1}{4}, \dfrac{O_2}{4} \right)$ for *CodebookConfig*=2/3/4. The parameters (L_1, L_2) are defined as $L_1 = \min\{4, N_1\}$ and

$L_2 = 2$ for $N_1 \geq N_2$ and $N_2 \neq 1$, $L_1 = 2$ and $L_2 = \min\{4, N_2\}$ for $N_1 < N_2$ and $N_1 \neq 1$, $L_1 = \min\{8, N_1\}$ and $L_2 = 1$ for $N_2 = 1$.

Table 5.2.2.6.2-2: Fields for channel quality information feedback for higher layer configured subband CQI reports (transmission mode 4, transmission mode 5, transmission mode 6, transmission mode 8 configured with PMI/RI reporting except with *alternativeCodeBookEnabledFor4TX-r12=TRUE*, transmission mode 9 configured with PMI/RI reporting with 2/4 antenna ports except with *alternativeCodeBookEnabledFor4TX-r12=TRUE* or *advancedCodebookEnabled=TRUE*, transmission mode 10 configured with PMI/RI reporting with 2/4 antenna ports except with *alternativeCodeBookEnabledFor4TX-r12=TRUE* or *advancedCodebookEnabled=TRUE*, transmission mode 9/10 configured with PMI/RI reporting with 2/4 antenna ports and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K>1 except with *feCoMP-CSI-Enabled=true*, and K=1 except with *alternativeCodebookEnabledCLASSB_K1=TRUE*, except with *alternativeCodeBookEnabledFor4TX-r12=TRUE*, and transmission mode 9/10 configured with higher layer parameter *eMIMO-Type* and *eMIMO-Type*2, and *eMIMO-Type*2 configured with PMI/RI reporting with 2/4 antenna ports except with *alternativeCodebookEnabledCLASSB_K1=TRUE* or *alternativeCodeBookEnabledFor4TX-r12=TRUE*)

Table 5.2.2.6.2-2C, Table 5.2.2.6.2-2D and Table 5.2.2.6.2-2E show the fields and the corresponding bit widths for the channel quality information feedback for higher layer configured report for PDSCH transmissions associated with transmission mode 4, transmission mode 6, transmission mode 8 configured with subband PMI/RI reporting, transmission mode 9 configured with subband PMI/RI reporting with 2/4/8 antenna ports except with *advancedCodebookEnabled=TRUE*, transmission mode 10 configured with subband PMI/RI reporting with 2/4/8 antenna ports except with *advancedCodebookEnabled=TRUE*, transmission mode 9/10 configured with subband PMI/RI reporting with 2/4/8 antenna ports and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K>1 except with *feCoMP-CSI-Enabled=true* and K=1 except with *alternativeCodebookEnabledCLASSB_K1=TRUE*, and transmission mode 9/10 configured with higher layer parameter *eMIMO-Type* and *eMIMO-Type2*, and *eMIMO-Type2* configured with subband PMI/RI reporting with 2/4/8 antenna ports except with *alternativeCodebookEnabledCLASSB_K1=TRUE*. The number of configured CSI-RS resources in a CSI process K is defined in [3] and *alternativeCodebookEnabledCLASSB_K1* is configured by higher layers [6].

Table 5.2.2.6.2-2C-1 and Table 5.2.2.6.2-2D-1 show the fields and the corresponding bit widths for the channel quality information feedback for higher layer configured report for PDSCH transmissions associated with transmission mode 10 configured with subband PMI/RI reporting with 2/4/8 antenna ports and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K>1 and higher layer parameter *feCoMP-CSI-Enabled=true*, except with *alternativeCodeBookEnabledFor4TX-r12=TRUE*. The number of configured CSI-RS resources in a CSI process K is defined in [3].

Table 5.2.2.6.2-2E-1 and Table 5.2.2.6.2-2E-2 show the fields and the corresponding bit widths for the channel quality information feedback for higher layer configured report for PDSCH transmissions associated with transmission mode 9/10 configured with subband PMI/RI reporting with 8/12/16/20/24/28/32 antenna ports and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS A' except with *advancedCodebookEnabled=TRUE*.

Table5.2.2.6.2-2E-3 shows the fields and the corresponding bit widths for the channel quality information feedback for higher layer configured report for PDSCH transmissions associated with transmission mode 9/10 configured with subband PMI/RI reporting with 2/4/8 antenna ports and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K=1 and *alternativeCodebookEnabledCLASSB_K1=TRUE*, and transmission mode 9/10 configured with higher layer parameter *eMIMO-Type* and *eMIMO-Type*2, and *eMIMO-Type*2 configured with subband PMI/RI reporting with 2/4/8 antenna ports and higher layer parameter *alternativeCodebookEnabledCLASSB_K1=TRUE*.

Table 5.2.2.6.2-2E-4 and Table 5.2.2.6.2-2E-5 show the fields and the corresponding bit widths for the channel quality information feedback for higher layer configured report for PDSCH transmissions associated with transmission mode 9/10 configured with PMI/RI reporting with 4/8 antenna ports and higher layer parameter *advancedCodebookEnabled=TRUE*.

Table 5.2.2.6.2-2E-6 and Table 5.2.2.6.2-2E-7 show the fields and the corresponding bit widths for the channel quality information feedback for higher layer configured report for PDSCH transmissions associated with transmission mode 9/10 configured with subband PMI/RI reporting with 8/12/16/20/24/28/32 antenna ports and higher layer parameters *advancedCodebookEnabled* and *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS A' and *advancedCodebookEnabled=TRUE*.

Table 5.2.2.6.2-2E-9 shows the fields and the corresponding bit widths for the channel quality information feedback for higher layer configured report for PDSCH transmissions associated with transmission mode 10 configured with subband PMI/RI reporting with 4 antenna ports and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K>1and higher layer parameter *feCoMP-CSI-Enabled=true*, with *alternativeCodeBookEnabledFor4TX-r12=TRUE*. The number of configured CSI-RS resources in a CSI process K is defined in [3].

For Table 5.2.2.6.2-2C-1, Table 5.2.2.6.2-2D-1 and Table 5.2.2.6.2-2E-9, in the case of CRI=2, the rank value corresponds to RI0 for codeword 0 and RI1 for codeword 1.

For Table 5.2.2.6.2-2C, Table 5.2.2.6.2-2C-1, Table 5.2.2.6.2-2D, Table 5.2.2.6.2-2D-1, Table 5.2.2.6.2-2E, Table 5.2.2.6.2-2E-1, Table 5.2.2.6.2-2E-2, Table 5.2.2.6.2-2E-3, Table 5.2.2.6.2-2E-4, Table 5.2.2.6.2-2E-5, Table 5.2.2.6.2-2E-6, Table 5.2.2.6.2-2E-7 and Table 5.2.2.6.2-2E-9, N is defined in subclause 7.2 of [3]. For Table 5.2.2.6.2-2E-1, Table 5.2.2.6.2-2E-2, Table 5.2.2.6.2-2E-5, Table 5.2.2.6.2-2E-6, Table 5.2.2.6.2-2E-7 and Table 5.2.2.6.2-2E-8, the codebook configuration $\left(N_1, N_2, O_1, O_2 \right)$ is defined in [3], and *CodebookConfig* is configured by higher layers [6]. The parameters $\left(S_1, S_2 \right)$ in rank 1 and rank 2 are defined as $\left(S_1, S_2 \right) = \left(1, 1 \right)$ for *CodebookConfig*=1 and $\left(S_1, S_2 \right) = \left(2, 2 \right)$ for *CodebookConfig* =2, 3 and 4. The parameters $\left(S_1, S_2 \right)$ in rank 3 and 4 are defined as $\left(S_1, S_2 \right) = \left(1, 1 \right)$ for *CodebookConfig*=1, $\left(S_1, S_2 \right) = \left(\dfrac{O_1}{2}, \dfrac{O_2}{2} \right)$ for *CodebookConfig*=2, $\left(S_1, S_2 \right) = \left(O_1, \dfrac{O_2}{2} \right)$ for *CodebookConfig*=3, $\left(S_1, S_2 \right) = \left(O_1, \dfrac{O_2}{4} \right)$ for *CodebookConfig*=4. The parameters $\left(S_1, S_2 \right)$ in rank 5 to 8 are defined as $\left(S_1, S_2 \right) = \left(1, 1 \right)$ for *CodebookConfig*=1, $\left(S_1, S_2 \right) = \left(\dfrac{O_1}{4}, \dfrac{O_2}{4} \right)$ for *CodebookConfig*=2/3/4. The parameters $\left(L_1, L_2 \right)$ are defined as $L_1 = \min\{4, N_1\}$ and $L_2 = 2$ for $N_1 \geq N_2$ and $N_2 \neq 1$, $L_1 = 2$ and $L_2 = \min\{4, N_2\}$ for $N_1 < N_2$ and $N_1 \neq 1$, $L_1 = \min\{8, N_1\}$ and $L_2 = 1$ for $N_2 = 1$.

Table 5.2.2.6.2-3 shows the fields and the corresponding bit width for the rank indication feedback for higher layer configured subband CQI reports for PDSCH transmissions associated with transmission mode 3, transmission mode 4, transmission mode 8 configured with PMI/RI reporting, transmission mode 9 configured with PMI/RI reporting with 2/4/8 antenna ports, transmission mode 10 configured with PMI/RI reporting with 2/4/8 antenna ports, and transmission mode 9/10 configured with PMI/RI reporting with 2/4/8 antenna ports and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K=1, transmission mode 9/10 configured with PMI/RI reporting and higher layer parameter *csi-RS-NZP-mode* is set to 'multi-shot' with *activatedResources*=1 and more than one port for the activated CSI-RS resource, transmission mode 9/10 configured with PMI/RI reporting and higher layer parameter *csi-RS-ConfigNZP-ApList* and the higher layer parameter *csi-RS-NZP-mode* is set to 'aperiodic' and more than one port for the activated CSI-RS resource, transmission mode 9/10 configured with higher layer parameter *eMIMO-Type* and *eMIMO-Type*2, and *eMIMO-Type*2 configured with PMI/RI reporting with 2/4/8 antenna ports and rank indication is associated with *eMIMO-Type*2, transmission mode 9/10 configured with PMI/RI reporting with 8/12/16/20/24/28/32 antenna ports and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS A', and transmission mode 9/10 configured without PMI reporting and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K=1 with 2/4/8 antenna ports, transmission mode 9/10 configured without PMI reporting and higher layer parameter *csi-RS-NZP-mode* is set to 'multi-shot' with *activatedResources*=1 and more than one port for the activated CSI-RS resource, transmission mode 9/10 configured with PMI/RI reporting and higher layer parameter *csi-RS-ConfigNZP-ApList* and the higher layer parameter *csi-RS-NZP-mode* is set to 'aperiodic' and more than one port for the activated CSI-RS resource, and transmission mode 9/10 configured with higher layer parameter *eMIMO-Type* and *eMIMO-*

*Type*2, and *eMIMO-Type*2 configured without PMI reporting with 2/4/8 antenna ports and rank indication is associated with *eMIMO-Type*2.

Table 5.2.2.6.2-3A shows the fields and the corresponding bit width for the CSI-RS resource indication feedback for higher layer configured subband CQI reports for PDSCH transmissions associated with transmission mode 9/10 configured with 1 antenna port for each CSI-RS resource except with *feCoMP-CSI-Enabled=true* and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K>1 except with higher layer parameter *csi-RS-NZP-mode* configured, and transmission mode 9/10 configured with higher layer parameter *eMIMO-Type* and *eMIMO-Type*2, and *eMIMO-Type* is set to 'CLASS B' with K>1, where CRI is associated with the *eMIMO-Type*.

Table 5.2.2.6.2-3B shows the fields and the corresponding bit width for the joint CRI and RI feedback for higher layer configured subband CQI reports for PDSCH transmissions associated with transmission mode 9/10 configured without PMI reporting and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K>1 except with *feCoMP-CSI-Enabled=true*, and except with higher layer parameter *csi-RS-NZP-mode* configured, transmission mode 9/10 configured with PMI/RI reporting and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K>1 except with *feCoMP-CSI-Enabled=true* and 2/4/8 antenna ports except with higher layer parameter *csi-RS-NZP-mode* configured.

Table 5.2.2.6.2-3C shows the fields and the corresponding bit width for the CSI-RS resource indication feedback for higher layer configured subband CQI reports for PDSCH transmissions associated with transmission mode 9/10 configured with higher layer parameter *csi-RS-NZP-mode* set to 'multi-shot' and with *activatedResources*, and 1 antenna port per activated CSI-RS resource except with *feCoMP-CSI-Enabled=true*. N is the value of higher layer parameter *activatedResources*.

 Table 5.2.2.6.2-3D shows the fields and the corresponding bit width for the joint CRI and RI feedback for higher layer configured subband CQI reports for PDSCH transmissions associated with transmission mode 9/10 configured without PMI reporting and higher layer parameter *csi-RS-NZP-mode* is set to 'multi-shot' and with *activatedResources*>1 and more than one port for at least one activated CSI-RS resource except with *feCoMP-CSI-Enabled=true*, and transmission mode 9/10 configured with PMI/RI reporting and higher layer parameter *csi-RS-NZP-mode* is set to 'multi-shot' and with *activatedResources*>1 and more than one port for at least one activated CSI-RS resource except with *feCoMP-CSI-Enabled=true*. N is the value of higher layer parameter *activatedResources*.

Table 5.2.2.6.2-3E shows the fields and the corresponding bit width for the rank indication feedback for higher layer configured subband CQI reports for PDSCH transmissions associated with transmission mode 9/10 configured with higher layer parameter *eMIMO-Type* and *eMIMO-Type2*, and *eMIMO-Type* is set to 'CLASS A' with 8/12/16/20/24/28/32 antenna ports and *eMIMO-Type2* is set to 'CLASS B', where rank indication is associated with the *eMIMO-Type*.

Table 5.2.2.6.2-3F shows the fields and the corresponding bit width for the joint CRI and RI feedback for higher layer configured subband CQI reports for PDSCH transmissions associated with transmission mode 10 configured without PMI reporting and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K>1 and higher layer parameter *feCoMP-CSI-Enabled=true* except with higher layer parameter *csi-RS-NZP-mode* configured, transmission mode 10 configured with PMI/RI reporting and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K>1 CSI-RS resources and more than one port for at least one CSI-RS resource and higher layer parameter *feCoMP-CSI-Enabled=true*, transmission mode 10 configured without PMI reporting and higher layer parameter *csi-RS-NZP-mode* is set to 'multi-shot' and with *activatedResources*>1 and more than one port for at least one activated CSI-RS resource and higher layer parameter *feCoMP-CSI-Enabled=true*, and transmission mode 10 configured with PMI/RI reporting and higher layer parameter *csi-RS-NZP-mode* is set to 'multi-shot' and with *activatedResources*>1 and more than one port for at least one activated CSI-RS resource and higher layer parameter *feCoMP-CSI-Enabled=true*. In the case of CRI=2, Rank indication in Table 5.2.2.6.2-3F corresponds to {RI0, RI1}, where RI0 is the rank indication for codeword 0 and RI1 is the rank indication for codeword 1.

Table 5.2.2.6.2-3G shows the fields and the corresponding bit width for the CRI feedback for higher layer configured subband CQI reports for PDSCH transmissions associated with transmission mode 10 configured with PMI/RI reporting and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K>1 CSI-RS resources and one port for each CSI-RS resource and higher layer parameter *feCoMP-CSI-Enabled=true*, and transmission mode 10 configured with higher layer parameter *csi-RS-NZP-mode* set to 'multi-shot' and with *activatedResources*>1, and 1 antenna port per activated CSI-RS resource and higher layer parameter *feCoMP-CSI-Enabled=true*.

Table 5.2.2.6.2-3: Fields for rank indication feedback for higher layer configured subband CQI reports (transmission mode 3, transmission mode 4, transmission mode 8 configured with PMI/RI reporting, transmission mode 9 configured with PMI/RI reporting with 2/4/8 antenna ports, transmission mode 10 configured with PMI/RI reporting with 2/4/8 antenna ports, transmission mode 9/10 configured with PMI/RI or without PMI reporting with 2/4/8 antenna ports and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K=1, transmission mode 9/10 configured with PMI/RI or without PMI reporting and higher layer parameter *csi-RS-NZP-mode* is set to 'multi-shot' with *activatedResources* =1 and more than one port for the activated CSI-RS resource, transmission mode 9/10 configured with PMI/RI reporting and higher layer parameter *csi-RS-ConfigNZP-ApList* and the higher layer parameter *csi-RS-NZP-mode* is set to 'aperiodic' and more than one port for the activated CSI-RS resource, transmission mode 9/10 configured with higher layer parameter *eMIMO-Type* and *eMIMO-Type*2, and *eMIMO-Type*2 configured with PMI/RI or without PMI reporting with 2/4/8 antenna ports and rank indication is associated with *eMIMO-Type*2, and transmission mode 9/10 configured with PMI/RI reporting with 8/12/16/20/24/28/32 antenna ports and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS A')

Field	Bit width

CRI	2

The channel quality bits in Table 5.2.2.6.2-1, Table 5.2.2.6.2-1B, Table 5.2.2.6.2-1B-1, Table 5.2.2.6.2-2, Table 5.2.2.6.2-2-1, Table 5.2.2.6.2-2A, Table 5.2.2.6.2-2A-1, Table 5.2.2.6.2-2B, Table 5.2.2.6.2-2C, Table 5.2.2.6.2-2C-1, Table 5.2.2.6.2-2D, Table 5.2.2.6.2-2D-1, Table 5.2.2.6.2-2E, Table 5.2.2.6.2-2B-1, Table 5.2.2.6.2-2B-2, Table 5.2.2.6.2-2B-3, Table 5.2.2.6.2-2B-4, Table 5.2.2.6.2-2B-5, Table 5.2.2.6.2-2B-6, Table 5.2.2.6.2-2B-7, Table 5.2.2.6.2-2B-8, Table 5.2.2.6.2-2B-9, Table 5.2.2.6.2-2B-10, Table 5.2.2.6.2-2B-11, Table 5.2.2.6.2-2E-1, Table 5.2.2.6.2-2E-2, Table 5.2.2.6.2-2E-3, Table 5.2.2.6.2-2E-4, Table 5.2.2.6.2-2E-5, Table 5.2.2.6.2-2E-6, Table 5.2.2.6.2-2E-7, Table 5.2.2.6.2-2E-9, Table 5.2.2.6.2-3B, and Table 5.2.2.6.2-3D form the bit sequence $o_0, o_1, o_2, ..., o_{O-1}$ with o_0 corresponding to the first bit of the first field in each of the tables, o_1 corresponding to the second bit of the first field in each of the tables, and o_{O-1} corresponding to the last bit in the last field in each of the tables. The field of the PMI and subband differential CQI shall be in the increasing order of the subband index [3]. The first bit of each field corresponds to MSB and the last bit LSB. The RI bits sequence in Tables 5.2.2.6.2-3, 5.2.2.6.2-3B, 5.2.2.6.2-3D, 5.2.2.6.2-3E, 5.2.2.6.2-3F and the CRI sequence in Tables 5.2.2.6.2-3A, 5.2.2.6.2-3C and 5.2.2.6.2-3G are encoded according to subclause 5.2.2.6.

For transmission mode 9/10 configured with Class B CSI reporting and K>1 except with *feCoMP-CSI-Enabled=true*, the number of antenna port in Table 5.2.2.6.2-3B (or Table 5.2.2.6.2-3F with *feCoMP-CSI-Enabled=true*) refers to the maximum number of antenna ports of K CSI-RS resources configured for the CSI-process for the UE.

For transmission mode 9/10 configured with Class B CSI reporting and K>1 except with *feCoMP-CSI-Enabled=true* and with *activatedResources*>1, the number of antenna port in Table 5.2.2.6.2-3D refers to the maximum number of antenna ports of N CSI-RS resources activated for the CSI-process for the UE. *N* is the value of higher layer parameter *activatedResources*.

For a UE configured with the higher layer parameter *shortTTI*, the entries associated with codeword 1 in Table 5.2.2.6.2-1A, Table 5.2.2.6.2-2, Table 5.2.2.6.2-2A, Table 5.2.2.6.2-2B, Table 5.2.26.2-2B1, Table 5.2.26.2-2B2, Table 5.2.26.2-2B3, Table 5.2.26.2-2B4, Table 5.2.26.2-2B5, Table 5.2.26.2-2B6, Table 5.2.26.2-2B7, Table 5.2.26.2-2B8, Table 5.2.26.2-2B9, Table 5.2.26.2-2B10, Table 5.2.2.6.2-2C, Table 5.2.2.6.2-2D, Table 5.2.2.6.2-2E, Table 5.2.2.6.2-2E-1, Table 5.2.2.6.2-2E-2, Table 5.2.2.6.2-2E-3, Table 5.2.2.6.2-2E-4, Table 5.2.2.6.2-2E-5, Table 5.2.2.6.2-2E-6, Table 5.2.2.6.2-2E-7 and Table 5.2.2.6.2-2E-8 are not applicable.

5.2.2.6.3 Channel quality information formats for UE selected subband CQI reports

Table 5.2.2.6.3-1 shows the fields and the corresponding bit widths for the channel quality information feedback for UE selected subband CQI for PDSCH transmissions associated with transmission mode 1, transmission mode 2, transmission mode 3, transmission mode 7, transmission mode 8 configured without PMI/RI reporting, transmission mode 9 configured without PMI/RI reporting or configured with 1 antenna port, transmission mode 10 configured without PMI/RI reporting or configured with 1 antenna port except with *feCoMP-CSI-Enabled=true*, and transmission mode 6 for BL/CE UEs. *L* in Table 5.2.2.6.3-1 is defined in subclause 7.2 of [3].

Table 5.2.2.6.3-1A shows the fields and the corresponding bit widths for the channel quality information feedback for UE selected subband CQI for PDSCH transmissions associated with transmission mode 9/10 configured without PMI reporting and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with 2/4/8 antenna ports except with *feCoMP-CSI-Enabled=true*, transmission mode 9/10 configured with higher layer parameter *eMIMO-Type* and *eMIMO-Type*2, and *eMIMO-Type*2 configured without PMI reporting with 2/4/8 antenna ports.

Table 5.2.2.6.3-1B show the fields and the corresponding bit widths for the channel quality information feedback for UE selected subband CQI for PDSCH transmissions associated with transmission mode 10 configured without PMI/RI reporting or configured with 1 antenna port and higher layer parameter *feCoMP-CSI-Enabled=true*.

Table 5.2.2.6.3-1B-1 show the fields and the corresponding bit widths for the channel quality information feedback for UE selected subband CQI for PDSCH transmissions associated with transmission mode 10 configured without PMI reporting and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with 2/4/8 antenna ports and higher layer parameter *feCoMP-CSI-Enabled=true*.

For Table 5.2.2.6.3-1B and Table 5.2.2.6.3-1B-1, in the case of CRI=2, the rank value corresponds to RI0 for codeword 0 and RI1 for codeword 1.

Table 5.2.2.6.3-1: Fields for channel quality information feedback for UE selected subband CQI reports (transmission mode 1, transmission mode 2, transmission mode 3, transmission mode 7, transmission mode 8 configured without PMI/RI reporting, transmission mode 9 configured without PMI/RI reporting or configured with 1 antenna port, transmission mode 10 configured without PMI/RI reporting or configured with 1 antenna port except with *feCoMP-CSI-Enabled=true*, and transmission mode 6 for BL/CE UEs)

Table 5.2.2.6.3-2, Table 5.2.2.6.3-2A and Table 5.2.2.6.3-2B show the fields and the corresponding bit widths for the channel quality information feedback for UE selected subband CQI for PDSCH transmissions associated with transmission mode 4, transmission mode 6, transmission mode 8 configured with PMI/RI reporting, transmission mode 9 configured with PMI/RI reporting with 2/4/8 antenna port except with *advancedCodebookEnabled=TRUE*, transmission mode 10 configured with PMI/RI reporting with 2/4/8 antenna ports except with *advancedCodebookEnabled=TRUE*, and transmission mode 9/10 configured with PMI/RI reporting with 2/4/8 antenna ports and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K>1 except with *feCoMP-CSI-Enabled=true* and K=1 except with *alternativeCodebookEnabledCLASSB_K1=TRUE*, and transmission mode 9/10 configured with higher layer parameter *eMIMO-Type* and *eMIMO-Type*2, and *eMIMO-Type*2 configured with PMI/RI reporting with 2/4/8 antenna ports except with *alternativeCodebookEnabledCLASSB_K1=TRUE*, where the number of configured CSI-RS resources in a CSI process K is defined in [3] and *alternativeCodebookEnabledCLASSB_K1* is configured by higher layers [6].

Table 5.2.2.6.3-2-1 and Table 5.2.2.6.3-2A-1 show the fields and the corresponding bit widths for the channel quality information feedback for UE selected subband CQI for PDSCH transmissions associated with transmission mode 10 configured with PMI/RI reporting with 2/4/8 antenna ports and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K>1, and higher layer parameter *feCoMP-CSI-Enabled=true*, except with *alternativeCodeBookEnabledFor4TX-r12=TRUE*. The number of configured CSI-RS resources in a CSI process K is defined in [3].

Table 5.2.2.6.3-2B-1 shows the fields and the corresponding bit widths for the channel quality information feedback for UE selected subband CQI for PDSCH transmissions associated with transmission mode 10 configured with PMI/RI reporting with 4 antenna ports and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K>1, and higher layer parameter *feCoMP-CSI-Enabled=true*, with *alternativeCodeBookEnabledFor4TX-r12=TRUE*. The number of configured CSI-RS resources in a CSI process K is defined in [3].

For Table 5.2.2.6.3-2-1, Table 5.2.2.6.3-2A-1 and Table 5.2.2.6.3-2B-1, in the case of CRI=2, the rank value corresponds to RI0 for codeword 0 and RI1 for codeword 1.

Table 5.2.2.6.3-2C and Table 5.2.2.6.3-2D show the fields and the corresponding bit widths for the channel quality information feedback for UE selected subband CQI for PDSCH transmissions associated with transmission mode 9/10 configured with PMI/RI reporting with 8/12/16/20/24/28/32 antenna ports and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS A' except with *advancedCodebookEnabled=TRUE*.

Table 5.2.2.6.3-2E shows the fields and the corresponding bit widths for the channel quality information feedback for UE selected subband CQI for PDSCH transmissions associated with transmission mode 9/10 configured with PMI/RI reporting with 2/4/8 antenna ports and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K=1 and *alternativeCodebookEnabledCLASSB_K1=TRUE*, and transmission mode 9/10 configured with higher layer parameter *eMIMO-Type* and *eMIMO-Type*2, and *eMIMO-Type*2 configured with PMI/RI reporting with 2/4/8 antenna ports with *alternativeCodebookEnabledCLASSB_K1=TRUE*.

Table 5.2.2.6.3-2F and Table 5.2.2.6.3-2G show the fields and the corresponding bit widths for the channel quality information feedback for UE selected subband CQI for PDSCH transmissions associated with transmission mode 9/10 configured with PMI/RI reporting with 4/8 antenna ports and higher layer parameter *advancedCodebookEnabled=TRUE*.

Table 5.2.2.6.3-2H and Table 5.2.2.6.3-2I show the fields and the corresponding bit widths for the channel quality information feedback for UE selected subband CQI for PDSCH transmissions associated with transmission mode 9/10 configured with PMI/RI reporting with 8/12/16/20/24/28/32 antenna ports and higher layer parameters *advancedCodebookEnabled* and *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS A' and *advancedCodebookEnabled=TRUE*.

For Table 5.2.2.6.3-2, Table 5.2.2.6.3-2-1, Table 5.2.2.6.3-2A, Table 5.2.2.6.3-2A-1, Table 5.2.2.6.3-2B, Table 5.2.2.6.3-2B-1, Table 5.2.2.6.3-2C, Table 5.2.2.6.3-2D, Table 5.2.2.6.3-2E, Table 5.2.2.6.3-2F, Table 5.2.2.6.3-2G, Table 5.2.2.6.3-2H and Table 5.2.2.6.3-2I, L is defined in subclause 7.2 of [3]. For Table 5.2.2.6.3-2C, Table 5.2.2.6.3-2D, Table 5.2.2.6.3-2G, Table 5.2.2.6.3-2H, Table 5.2.2.6.3-2I and Table 5.2.2.6.3-2J, the codebook configuration (N_1, N_2, O_1, O_2) is defined in [3], and *CodebookConfig* is configured by higher layers [6]. The parameters (S_1, S_2) in rank 1 and rank 2 are defined as $(S_1, S_2) = (1, 1)$ for *CodebookConfig*=1 and $(S_1, S_2) = (2, 2)$ for *CodebookConfig* =2, 3 and 4. The parameters (S_1, S_2) in rank 3 and 4 are defined as $(S_1, S_2) = (1, 1)$ for *CodebookConfig*=1, $(S_1, S_2) = \left(\dfrac{O_1}{2}, \dfrac{O_2}{2}\right)$ for *CodebookConfig*=2, $(S_1, S_2) = \left(O_1, \dfrac{O_2}{2}\right)$ for *CodebookConfig*=3,

$$(S_1, S_2) = \left(O_1, \frac{O_2}{4} \right) \text{ for } CodebookConfig=4. \text{ The parameters } (S_1, S_2) \text{ in rank 5 to 8 are defined as}$$

$$(S_1, S_2) = (1,1) \text{ for } CodebookConfig=1, \; (S_1, S_2) = \left(\frac{O_1}{4}, \frac{O_2}{4} \right) \text{ for } CodebookConfig=2/3/4. \text{ The parameters}$$

(L_1, L_2) are defined as $L_1 = \min\{4, N_1\}$ and $L_2 = 2$ for $N_1 \geq N_2$ and $N_2 \neq 1$, $L_1 = 2$ and $L_2 = \min\{4, N_2\}$ for $N_1 < N_2$ and $N_1 \neq 1$, $L_1 = \min\{8, N_1\}$ and $L_2 = 1$ for $N_2 = 1$.

Table 5.2.2.6.3-3 shows the fields and the corresponding bit widths for the rank indication feedback for UE selected subband CQI reports for PDSCH transmissions associated with transmission mode 3, transmission mode 4, transmission mode 8 configured with PMI/RI reporting, transmission mode 9 configured with PMI/RI reporting with 2/4/8 antenna ports, transmission mode 10 configured with PMI/RI reporting with 2/4/8 antenna ports, transmission mode 9/10 configured with PMI/RI reporting with 2/4/8 antenna ports and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K=1, transmission mode 9/10 configured with PMI/RI reporting and higher layer parameter *csi-RS-NZP-mode* set to 'multi-shot' and with *activatedResources*=1 and more than one port for the activated CSI-RS resource, transmission mode 9/10 configured with PMI/RI reporting and higher layer parameter *csi-RS-ConfigNZP-ApList* and the higher layer parameter *csi-RS-NZP-mode* is set to 'aperiodic' and more than one port for the activated CSI-RS resource, transmission mode 9/10 configured with higher layer parameter *eMIMO-Type* and *eMIMO-Type*2, and *eMIMO-Type*2 configured with PMI/RI reporting with 2/4/8 antenna ports and rank indication is associated with *eMIMO-Type*2, transmission mode 9/10 configured with PMI/RI reporting with 8/12/16/20/24/28/32 antenna ports and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS A', and transmission mode 9/10 configured without PMI reporting and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with with 2/4/8 antenna ports, transmission mode 9/10 configured without PMI reporting and higher layer parameter *csi-RS-NZP-mode* set to 'multi-shot' and with *activatedResources*=1 and more than one port for the activated CSI-RS resource, transmission mode 9/10 configured with PMI/RI reporting and higher layer parameter *csi-RS-ConfigNZP-ApList* and the higher layer parameter *csi-RS-NZP-mode* is set to 'aperiodic' and more than one port for the activated CSI-RS resource,

and transmission mode 9/10 configured with higher layer parameter *eMIMO-Type* and *eMIMO-Type*2, and *eMIMO-Type*2 configured without PMI reporting with 2/4/8 antenna ports and rank indication is associated with *eMIMO-Type*2.

Table 5.2.2.6.3-3A shows the fields and the corresponding bit widths for the CSI-RS resource indication feedback for UE selected subband CQI reports for PDSCH transmissions associated with transmission mode 9/10 configured with 1 antenna port for each CSI-RS resource except with *feCoMP-CSI-Enabled=true* and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K>1 except with higher layer parameter *csi-RS-NZP-mode* configured, and transmission mode 9/10 configured with higher layer parameter *eMIMO-Type* and *eMIMO-Type*2, and *eMIMO-Type* is set to 'CLASS B' with K>1, where CRI is assocated with the *eMIMO-Type*.

Table 5.2.2.6.3-3B shows the fields and the corresponding bit widths for the joint CRI and RI feedback for UE selected subband CQI report for PDSCH transmissions associated with transmission mode 9/10 configured without PMI reporting and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K>1 except with *feCoMP-CSI-Enabled=true*, and except with higher layer parameter *csi-RS-NZP-mode* configured, transmission mode 9/10 configured with PMI/RI reporting and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K>1 except with *feCoMP-CSI-Enabled=true* and 2/4/8 antenna ports except with higher layer parameter *csi-RS-NZP-mode* configured.

Table 5.2.2.6.3-3C shows the fields and the corresponding bit widths for the CSI-RS resource indication feedback for UE selected subband CQI reports for PDSCH transmissions associated with transmission mode 9/10 configured with higher layer parameter *csi-RS-NZP-mode* set to 'multi-shot' and with *activatedResources*>1 and with 1 antenna port per activated CSI-RS resource except with *feCoMP-CSI-Enabled=true* . N is the value of higher layer parameter *activatedResources*.

Table 5.2.2.6.3-3D shows the fields and the corresponding bit widths for the joint CRI and RI feedback for UE selected subband CQI report for PDSCH transmissions associated with transmission mode 9/10 configured without PMI reporting and higher layer parameter *csi-RS-NZP-mode* is set to 'multi-shot' and with *activatedResources*>1 and more than one port for at least one activated CSI-RS resource except with *feCoMP-CSI-Enabled=true*, and transmission mode 9/10 configured with PMI/RI reporting and higher layer parameter *csi-RS-NZP-mode* is set to 'multi-shot' and with *activatedResources*>1 and more than one port for at least one activated CSI-RS resource except with *feCoMP-CSI-Enabled=true* . N is the value of higher layer parameter *activatedResources*.

Table 5.2.2.6.3-3E shows the fields and the corresponding bit width for the rank indication feedback for UE selected subband CQI reports for PDSCH transmissions associated with transmission mode 9/10 configured with higher layer parameter *eMIMO-Type* and *eMIMO-Type*2, and *eMIMO-Type* is set to 'CLASS A' with8/12/16/20/24/28/32 antenna ports and *eMIMO-Type2* is set to 'CLASS B', where rank indication is associated with the *eMIMO-Type*.

Table 5.2.2.6.3-3F shows the fields and the corresponding bit width for the joint CRI and RI feedback for UE selected subband CQI reports for PDSCH transmissions associated with transmission mode 10 configured without PMI reporting and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K>1 and higher layer parameter *feCoMP-CSI-Enabled=true* except with higher layer parameter *csi-RS-NZP-mode* configured, transmission mode 10 configured with PMI/RI reporting and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K>1 CSI-RS resources and more than one port for at least one CSI-RS resource and higher layer parameter *feCoMP-CSI-Enabled=true*, transmission mode 10 configured without PMI reporting and higher layer parameter *csi-RS-NZP-mode* is set to 'multi-shot' and with *activatedResources*>1 and more than one port for at least one activated CSI-RS resource and higher layer parameter *feCoMP-CSI-Enabled=true*, and transmission mode 10 configured with PMI/RI reporting and higher layer parameter *csi-RS-NZP-mode* is set to 'multi-shot' and with *activatedResources*>1 and more than one port for at least one activated CSI-RS resource and higher layer parameter *feCoMP-CSI-Enabled=true*. In the case of CRI=2, Rank indication in Table 5.2.2.6.1-2F corresponds to {RI0, RI1}, where RI0 is the rank indication for codeword 0 and RI1 is the rank indication for codeword 1.

Table 5.2.2.6.3-3G shows the fields and the corresponding bit width for the CRI feedback for UE selected subband CQI reports for PDSCH transmissions associated with transmission mode 10 configured with PMI/RI reporting and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K>1 CSI-RS resources and one port for each CSI-RS resource and higher layer parameter *feCoMP-CSI-Enabled=true*, and transmission mode 10 configured with higher layer parameter *csi-RS-NZP-mode* set to 'multi-shot' and with *activatedResources*>1, and 1 antenna port per activated CSI-RS resource and higher layer parameter *feCoMP-CSI-Enabled=true*.

Table 5.2.2.6.3-3: Fields for rank indication feedback for UE selected subband CQI reports (transmission mode 3, transmission mode 4, transmission mode 8 configured with PMI/RI reporting, transmission mode 9 configured with PMI/RI reporting with 2/4/8 antenna ports and transmission mode 10 configured with PMI/RI reporting with 2/4/8 antenna ports, transmission mode 9/10 configured with PMI/RI or without PMI reporting with 2/4/8 antenna ports and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with K=1, transmission mode 9/10 configured with PMI/RI or without PMI reporting and higher layer parameter *csi-RS-NZP-mode* is set to 'multi-shot' with *activatedResources=1* and more than one port for the activated CSI-RS resource, transmission mode 9/10 configured with PMI/RI reporting and higher layer parameter *csi-RS-ConfigNZP-ApList* and the higher layer parameter *csi-RS-NZP-mode* is set to 'aperiodic' and more than one port for the activated CSI-RS resource, transmission mode 9/10 configured with higher layer parameter *eMIMO-Type* and *eMIMO-Type*2, and *eMIMO-Type*2 configured with PMI/RI or without PMI reporting with 2/4/8 antenna ports and rank indication is associated with *eMIMO-Type*2, and transmission mode 9/10 configured with PMI/RI reporting with 8/12/16/20/24/28/32 antenna ports and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS A')

The channel quality bits in Table 5.2.2.6.3-1, Table 5.2.2.6.3-1B, Table 5.2.2.6.3-1B-1, Table 5.2.2.6.3-2, Table 5.2.2.6.3-2-1, Table 5.2.2.6.3-2A, Table 5.2.2.6.3-2A-1, Table 5.2.2.6.3-2B, Table 5.2.2.6.3-2B-1, Table 5.2.2.6.3-2C, Table 5.2.2.6.3-2D, Table 5.2.2.6.3-2E, Table 5.2.2.6.3-2F, Table 5.2.2.6.3-2G, Table 5.2.2.6.3-2H, Table 5.2.2.6.3-2I, Table 5.2.2.6.3-3B, and Table 5.2.2.6.3-3D form the bit sequence $o_0, o_1, o_2, ..., o_{O-1}$ with o_0 corresponding to the first bit of the first field in each of the tables, o_1 corresponding to the second bit of the first field in each of the tables, and o_{O-1} corresponding to the last bit in the last field in each of the tables. The field of PMI shall start with the wideband PMI followed by the PMI for the M selected subbands. The first bit of each field corresponds to MSB and the last bit LSB. The RI bits sequence in Table 5.2.2.6.3-3, Table 5.2.2.6.3-3B, Table 5.2.2.6.3-3D, Table 5.2.2.6.3-3E, Table 5.2.2.6.3-3F, and the CRI sequence in Table 5.2.2.6.3-3A, Table 5.2.2.6.3-3C and Table 5.2.2.6.3-3G are encoded according to subclause 5.2.2.6.

For transmission mode 9/10 configured with Class B CSI reporting and K>1, the number of antenna port in Table 5.2.2.6.3-3B (or Table 5.2.2.6.3-3F with *feCoMP-CSI-Enabled=true*) refers to the maximum number of antenna ports of K CSI-RS resources configured for the CSI-process for the UE.

For transmission mode 9/10 configured with Class B CSI reporting and K>1 except with *feCoMP-CSI-Enabled=true* and with *activatedResources>1*, the number of antenna port in Table 5.2.2.6.3-3D refers to the maximum number of antenna ports of N CSI-RS resources activated for the CSI-process for the UE. N is the value of higher layer parameter *activatedResources*.

For a UE configured with the higher layer parameter *shortTTI*, the entries associated with codeword 1 in Table 5.2.2.6.3-1A, Table 5.2.2.6.3-2, Table 5.2.2.6.3-2A, Table 5.2.2.6.3-2B, Table 5.2.2.6.3-2C, Table 5.2.2.6.3-2D, Table 5.2.2.6.3-2E, Table 5.2.2.6.3-2F, Table 5.2.2.6.3-2G, Table 5.2.2.6.3-2H and Table 5.2.2.6.3-2I are not applicable.

5.2.2.6.4 Channel coding for CQI/PMI information in PUSCH

The channel quality bits input to the channel coding block are denoted by $o_0, o_1, o_2, o_3, ..., o_{O-1}$ where O is the number of bits. The number of channel quality bits depends on the transmission format. When PUCCH-based reporting format is used, the number of CQI/PMI bits is defined in subclause 5.2.3.3.1 for wideband reports and in subclause 5.2.3.3.2 for UE selected subbands reports. When PUSCH-based reporting format is used, the number of CQI/PMI bits is defined in subclause 5.2.2.6.1 for wideband reports, in subclause 5.2.2.6.2 for higher layer configured subbands reports and in subclause 5.2.2.6.3 for UE selected subbands reports.

The channel quality information is first coded using a (32, O) block code. The code words of the (32, O) block code are a linear combination of the 11 basis sequences denoted $M_{i,n}$ and defined in Table 5.2.2.6.4-1.

Table 5.2.2.6.4-1: Basis sequences for (32, *O*) code

i	$M_{i,0}$	$M_{i,1}$	$M_{i,2}$	$M_{i,3}$	$M_{i,4}$	$M_{i,5}$	$M_{i,6}$	$M_{i,7}$	$M_{i,8}$	$M_{i,9}$	$M_{i,10}$
0	1	1	0	0	0	0	0	0	0	0	1
1	1	1	1	0	0	0	0	0	0	1	1
2	1	0	0	1	0	0	1	0	1	1	1

17	1	0	0	1	1	1	0	0	1	0	0
18	1	1	0	1	1	1	1	1	0	0	0
19	1	0	0	0	0	1	1	0	0	0	0
20	1	0	1	0	0	0	1	0	0	0	1
21	1	1	0	1	0	0	0	0	0	1	1
22	1	0	0	0	1	0	0	1	1	0	1
23	1	1	1	0	1	0	0	0	1	1	1
24	1	1	1	1	1	0	1	1	1	1	0
25	1	1	0	0	0	1	1	1	0	0	1
26	1	0	1	1	0	1	0	0	1	1	0
27	1	1	1	1	0	1	0	1	1	1	0
28	1	0	1	0	1	1	1	0	1	0	0
29	1	0	1	1	1	1	1	1	1	0	0
30	1	1	1	1	1	1	1	1	1	1	1
31	1	0	0	0	0	0	0	0	0	0	0

The encoded CQI/PMI block is denoted by $b_0, b_1, b_2, b_3, ..., b_{B-1}$ where $B = 32$ and

$$b_i = \sum_{n=0}^{O-1} \left(o_n \cdot M_{i,n} \right) \bmod 2 \quad \text{where } i = 0, 1, 2, \ldots, B\text{-1}.$$

The output bit sequence $q_0, q_1, q_2, q_3, ..., q_{N_L \cdot Q_{CQI}-1}$ is obtained by circular repetition of the encoded CQI/PMI block as follows

$q_i = b_{(i \bmod B)}$ where $i = 0, 1, 2, \ldots, N_L \cdot Q_{CQI}$-1, where N_L is the number of layers the corresponding UL-SCH transport block is mapped onto.

5.2.2.6.5   Channel coding for more than 11 bits of HARQ-ACK information

The HARQ-ACK bits input to the channel coding block are denoted by $o_0^{ACK} \, o_1^{ACK}, ..., o_{O^{ACK}-1}^{ACK}$ where $11 < O^{ACK} \le 22$ is the number of bits.

The sequences of bits $o_0^{ACK}, o_1^{ACK}, o_2^{ACK}, ..., o_{\left\lceil O^{ACK}/2 \right\rceil -1}^{ACK}$ and $o_{\left\lceil O^{ACK}/2 \right\rceil}^{ACK}, o_{\left\lceil O^{ACK}/2 \right\rceil +1}^{ACK}, o_{\left\lceil O^{ACK}/2 \right\rceil +2}^{ACK}, ..., o_{O^{ACK}-1}^{ACK}$ are encoded as follows

$$\tilde{q}_i = \sum_{n=0}^{\left\lceil O^{ACK}/2 \right\rceil - 1} \left(o_n^{ACK} \cdot M_{i,n} \right) \bmod 2$$

and

$$\tilde{\tilde{q}}_i = \sum_{n=0}^{O^{ACK} - \left\lceil O^{ACK}/2 \right\rceil - 1} \left(o_{\left\lceil O^{ACK}/2 \right\rceil + n}^{ACK} \cdot M_{i,n} \right) \bmod 2$$

where $i = 0, 1, 2, \ldots, 31$ and the basis sequences $M_{i,n}$ are defined in Table 5.2.2.6.4-1.

The output bit sequence $q_0^{ACK}, q_1^{ACK}, q_2^{ACK}, \ldots, q_{Q_{ACK}-1}^{ACK}$ is obtained by the concatenation and circular repetition of the bit sequences $\tilde{q}_0, \tilde{q}_1, \tilde{q}_2, \ldots, \tilde{q}_{31}$ and $\tilde{\tilde{q}}_0, \tilde{\tilde{q}}_1, \tilde{\tilde{q}}_2, \ldots, \tilde{\tilde{q}}_{31}$ as follows:

Set $i = 0$

while $i < \left\lceil Q'/2 \right\rceil \cdot Q_m$

$\qquad q_i^{ACK} = \tilde{q}_{i \bmod 32}$

$\qquad i = i + 1$

end while

Set $i = 0$

while $i < \left(Q' - \left\lceil Q'/2 \right\rceil \right) \cdot Q_m$

$\qquad q_{\left\lceil Q'/2 \right\rceil \cdot Q_m + i}^{ACK} = \tilde{\tilde{q}}_{i \bmod 32}$

$\qquad i = i + 1$

end while

5.2.2.6A   Channel coding of AUL-UCI

Control data arrives at the coding unit in the form of AUL uplink control information (AUL-UCI), $o_0^{AUL-UCI}, o_1^{AUL-UCI}, o_2^{AUL-UCI}, \ldots, o_{O-1}^{AUL-UCI}$, and is transmitted on AUL PUSCH as defined in [3].

When the UE transmits AUL-UCI bits in the AUL PUSCH, it shall determine the number of modulation coded symbols per layer Q' for AUL-UCI as

$$Q' = \min \left(\left\lceil \frac{(O + L) \cdot M_{sc}^{PUSCH-initial(x)} \cdot N_{symb}^{PUSCH-initial(x)} \cdot \beta_{offset}^{PUSCH}}{\sum_{r=0}^{C^{(x)}-1} K_r^{(x)}} \right\rceil, M_{sc}^{PUSCH} \cdot N_{symb}^{PUSCH} \right)$$

where

-   O is the number of AUL-UCI bits, and

-   L is the number of CRC bits given by $L = 16$, and

- $Q_{AUL-UCI} = Q_m^{(x)} \cdot Q'$ and $\beta_{offset}^{PUSCH} = \beta_{offset}^{AUL-UCI}$, where $\beta_{offset}^{AUL-UCI}$ shall be determined according to [3] depending on the number of transmission codewords for the corresponding AUL PUSCH, and where $Q_m^{(x)}$ is the modulation order of transport block "x".

- M_{sc}^{PUSCH} is the bandwidth assigned in the most recent AUL activation DCI as defined in [3] for PUSCH transmission for the transport block.

- $M_{sc}^{PUSCH-initial(x)}$, $N_{symb}^{PUSCH-initial(x)}$, and N_{symb}^{PUSCH} are defined in 5.2.2.6.

The variable "x" in $K_r^{(x)}$ represents the transport block index corresponding to the highest I_{MCS} value indicated by the most recent AUL activation DCI. In case the two transport blocks have the same I_{MCS} value in the corresponding AUL activation DCI, "x =1", which corresponds to the first transport block. $M_{sc}^{PUSCH-initial(x)}$, $C^{(x)}$, and $K_r^{(x)}$ are obtained from the most recent AUL activation DCI as defined in [3] for the same transport block.

For UL-SCH data information transmitted on the AUL PUSCH, $G = N_L^{(x)} \cdot \left(N_{symb}^{PUSCH} \cdot M_{sc}^{PUSCH} \cdot Q_m^{(x)} - Q_{AUL-UCI} \right)$, where $N_L^{(x)}$ is the number of layers the corresponding UL-SCH transport block is mapped onto.

Table 5.2.2.6A-1 shows the fields and the corresponding bit widths for the AUL-UCI that is transmitted on the AUL PUSCH configured for 1 transport block and 2 transport blocks, respectively.

Table 5.2.2.6A-1: Fields for AUL-UCI

Field	Bit width	
	1 transport block	**2 transport blocks**
AUL C-RNTI	16	16
HARQ process number	4	4
Redundancy version	2	2
New data indicator	1	2
PUSCH starting symbol	1	1
PUSCH ending symbol	1	1
Channel Occupancy Time (COT) sharing indication	1	1

The CRC attachment, channel coding and rate matching of the AUL-UCI is performed according to subclauses 5.1.1, 5.1.3.1 and 5.1.4.2, respectively. The input bit sequence to the CRC attachment operation is $o_0^{AUL-UCI}, o_1^{AUL-UCI}, o_2^{AUL-UCI}, ..., o_{O-1}^{AUL-UCI}$, which is obtained by concatenating the fields as given in Table 5.2.2.6A-1. The output bit sequence of the CRC attachment operation is the input bit sequence to the channel coding operation. The output bit sequence of the channel coding operation is the input bit sequence to the rate matching operation.

The output sequence for the channel coding of AUL-UCI is denoted by $q_0^{AUL-UCI}, q_1^{AUL-UCI}, q_2^{AUL-UCI}, q_3^{AUL-UCI}, ..., q_{N_L \cdot Q_{AUL-UCI}-1}^{AUL-UCI}$, where N_L is the number of layers the corresponding UL-SCH transport block is mapped onto.

5.2.2.7   Data and control multiplexing

The control and data multiplexing is performed such that HARQ-ACK information is present on both slots and is mapped to resources around the demodulation reference signals. In addition, the multiplexing ensures that control and data information are mapped to different modulation symbols.

The inputs to the data and control multiplexing are the coded bits of the control information denoted by $q_0, q_1, q_2, q_3, ..., q_{N_L \cdot Q_{CQI}-1}$ and the coded bits of the UL-SCH denoted by $f_0, f_1, f_2, f_3, ..., f_{G-1}$. The output of the data and control multiplexing operation is denoted by $\underline{g}_0, \underline{g}_1, \underline{g}_2, \underline{g}_3, ..., \underline{g}_{H'-1}$, where $H = (G + N_L \cdot Q_{CQI})$ and

$H' = H/(N_L \cdot Q_m)$, and where $\underline{g}_i$, $i = 0,..., H'-1$ are column vectors of length $(Q_m \cdot N_L)$. H is the total number of coded bits allocated for UL-SCH data and CQI/PMI information across the N_L transmission layers of the transport block.

In case where more than one UL-SCH transport block are transmitted in a subframe of an UL cell, the CQI/PMI information is multiplexed with data only on the UL-SCH transport block with highest I_{MCS} value on the initial grant or for the initial PUSCH. In case the two transport blocks have the same I_{MCS} value in the corresponding initial UL grant or for the initial PUSCH, the CQI/PMI information is multiplexed with data only on the first transport block. For that UL-SCH transport block or in the case of single transport block transmission, and assuming that N_L is the number of layers onto which the UL-SCH transport block is mapped, the control information and the data shall be multiplexed as follows:

Set i, j, k to 0

while $j < N_L.Q_{CQI}$ -- first place the control information

$$\underline{g}_k = [q_j \, ... q_{j+N_L \cdot Q_m -1}]^T$$

$$j = j + N_L \cdot Q_m$$

$$k = k + 1$$

end while

while $i < G$ -- then place the data

$$\underline{g}_k = [f_i \, ... f_{i+Q_m \cdot N_L -1}]^T$$

$$i = i + Q_m \cdot N_L$$

$$k = k + 1$$

end while

5.2.2.7A   Data and control multiplexing for Partial PUSCH Mode 1

If the control information is channel quality information and the control information is transmitted on the Partial PUSCH Mode 1, the UL-SCH data information and control information are multiplexed such that the CQI/PMI information is present only on the second slot of the subframe.

The inputs to the data and control multiplexing are the coded bits of the control information denoted by $q_0, q_1, q_2, q_3, ..., q_{N_L \cdot Q_{CQI} -1}$ and the coded bits of the UL-SCH denoted by $f_0, f_1, f_2, f_3, ..., f_{G-1}$. The output for UL-SCH data information is denoted by $\underline{g}_0, \underline{g}_1, \underline{g}_2, \underline{g}_3, ..., \underline{g}_{H'-1}$, where $H = G$ and $H' = H/(N_L \cdot Q_m)$, and where $\underline{g}_i$, $i = 0,..., H'-1$ are column vectors of length $(Q_m \cdot N_L)$. The output for channel quality information is denoted by $\underline{q}_0, \underline{q}_1, ..., \underline{q}_{Q'_{CQI} -1}$, where $\underline{q}_i$, $i = 0,..., Q'_{CQI} -1$ are column vectors of length $(Q_m \cdot N_L)$ and where $Q'_{CQI} = Q_{CQI}/Q_m$.

For a UL-SCH transport block, and assuming that N_L is the number of layers onto which the UL-SCH transport block is mapped, the output for UL-SCH data information is obtained as follows:

Set i, k to 0

while $i < G$

$$\underline{g}_k = [f_i \, ... f_{i+Q_m \cdot N_L -1}]^T$$

$$i = i + Q_m \cdot N_L$$

$$k = k + 1$$

end while

In case where more than one UL-SCH transport block are transmitted in a subframe of an UL cell, the CQI/PMI information is multiplexed with data only on the UL-SCH transport block with highest I_{MCS} value for the initial PUSCH. In case the two transport blocks have the same I_{MCS} value for the initial PUSCH, the CQI/PMI information is multiplexed with data only on the first transport block. For that UL-SCH transport block or in the case of single transport block transmission, and assuming that N_L is the number of layers onto which the UL-SCH transport block is mapped, the output for the CQI/PMI information is obtained as follows:

Set i, k to 0

while $i < N_L.Q_{CQI}$

$$\underline{q}_k = [q_i \; ...q_{i+N_L \cdot Q_m -1}]^T$$

$$i = i + N_L \cdot Q_m$$

$$k = k + 1$$

end while

5.2.2.7B   Data and control multiplexing for AUL PUSCH

If the control information is AUL-UCI and the control information is transmitted on the AUL PUSCH, the UL-SCH data information and control information are multiplexed such that the AUL-UCI is mapped from symbol 1 to symbol 12 of the subframe.

The inputs to the data and control multiplexing are the coded bits of the control information denoted by $q_0^{AUL-UCI}, q_1^{AUL-UCI}, q_2^{AUL-UCI}, q_3^{AUL-UCI}, ..., q_{N_L \cdot Q_{AUL-UCI} -1}^{AUL-UCI}$ and the coded bits of the UL-SCH denoted by $f_0, f_1, f_2, f_3, ..., f_{G-1}$. The output for UL-SCH data information is denoted by $\underline{g}_0, \underline{g}_1, \underline{g}_2, \underline{g}_3, ..., \underline{g}_{H'-1}$, where $H = G$ and $H' = H/(N_L \cdot Q_m)$, and where $\underline{g}_i$, $i = 0, ..., H'-1$ are column vectors of length $(Q_m \cdot N_L)$. The output for AUL-UCI is denoted by $\underline{q}_0^{AUL-UCI}, \underline{q}_1^{AUL-UCI}, ..., \underline{q}_{Q'_{AUL-UCI}-1}^{AUL-UCI}$, where $\underline{q}_i^{AUL-UCI}$, $i = 0, ..., Q'_{AUL-UCI}-1$ are column vectors of length $(Q_m \cdot N_L)$ and where $Q'_{AUL-UCI} = Q_{AUL-UCI} / Q_m$.

For a UL-SCH transport block, and assuming that N_L is the number of layers onto which the UL-SCH transport block is mapped, the output for UL-SCH data information is obtained as follows:

Set i, k to 0

while $i < G$

$$\underline{g}_k = [f_i \; ... f_{i+Q_m \cdot N_L -1}]^T$$

$$i = i + Q_m \cdot N_L$$

$$k = k + 1$$

end while

In case where more than one UL-SCH transport block are transmitted in a subframe of an UL cell, the AUL-UCI is multiplexed with data only on the UL-SCH transport block with highest I_{MCS} value indicated by the AUL activation DCI. In case the two transport blocks have the same I_{MCS} value in the corresponding AUL activation DCI, the AUL-UCI is multiplexed with data only on the first transport block. For that UL-SCH transport block or in the case of single

transport block transmission, and assuming that N_L is the number of layers onto which the UL-SCH transport block is mapped, the output for the AUL-UCI is obtained as follows:

Set i, k to 0

while $i < N_L \cdot Q_{AUL-UCI}$

$$\underline{q}_k^{AUL-UCI} = [q_i^{AUL-UCI} \dots q_{i+N_L \cdot Q_m - 1}^{AUL-UCI}]^T$$

$$i = i + N_L \cdot Q_m$$

$$k = k + 1$$

end while

5.2.2.8   Channel interleaver

The channel interleaver described in this subclause in conjunction with the resource element mapping for PUSCH in [2] implements a time-first mapping of modulation symbols onto the transmit waveform while ensuring that

- if the PUSCH is Partial PUSCH Mode 1, the CQI/PMI and RI information are present only on the second slot of the subframe regardless of the number of actually transmitted slot(s) for the subframe based on the result of the channel access procedure in 4.2.1 defined in [8];

- if the PUSCH is Partial PUSCH Mode 2 or 3, the CQI/PMI and RI information are present only on the scheduled slot of the subframe;

- if the PUSCH is AUL PUSCH, the AUL-UCI is mapped from symbol 1 to symbol 12 of the subframe;

- otherwise, the HARQ-ACK and RI information are present on both slots in the subframe for PUSCH with subframe duration. HARQ-ACK information is mapped to resources around the uplink demodulation reference signals while RI information is mapped to resources around those used by HARQ-ACK.

The input to the channel interleaver are denoted by

- $\underline{g}_0, \underline{g}_1, \underline{g}_2, \dots, \underline{g}_{H'-1}$, $\underline{q}_0^{RI}, \underline{q}_1^{RI}, \underline{q}_2^{RI}, \dots, \underline{q}_{Q'_{RI}-1}^{RI}$, and $\underline{q}_0, \underline{q}_1, \dots, \underline{q}_{Q'_{CQI}-1}$, if the PUSCH is Partial PUSCH Mode 1;

- $\underline{g}_0, \underline{g}_1, \underline{g}_2, \dots, \underline{g}_{H'-1}$, and $\underline{q}_0^{AUL-UCI}, \underline{q}_1^{AUL-UCI}, \dots, \underline{q}_{Q'_{AUL-UCI}-1}^{AUL-UCI}$, if the PUSCH is AUL PUSCH;

- otherwise $\underline{g}_0, \underline{g}_1, \underline{g}_2, \dots, \underline{g}_{H'-1}$, $\underline{q}_0^{RI}, \underline{q}_1^{RI}, \underline{q}_2^{RI}, \dots, \underline{q}_{Q'_{RI}-1}^{RI}$ and $\underline{q}_0^{ACK}, \underline{q}_1^{ACK}, \underline{q}_2^{ACK}, \dots, \underline{q}_{Q'_{ACK}-1}^{ACK}$.

In case where more than one UL-SCH transport block are transmitted in a subframe of an UL cell, the HARQ-ACK and RI information are multiplexed with data on both UL-SCH transport blocks.

The number of modulation symbols per layer in the subframe is given by

- $H'_{total} = H' + Q'_{CQI} + Q'_{RI}$ if the PUSCH for the subframe is Partial PUSCH Mode 1and the CQI/PMI is multiplexed with data on this UL-SCH transport block,

- $H'_{total} = H' + Q'_{AUL-UCI}$ if the PUSCH for the subframe is AUL PUSCH and the AUL-UCI is multiplexed with data on this UL-SCH transport block, and

- $H'_{total} = H' + Q'_{RI}$ otherwise.

In the case sub-PRB allocation is used, $H' = H'_s$ is the number of modulation symbols in a BL/CE subframe s of the S subframes allocated to a UL-SCH transport block, $s = 0, 1, 2, \dots, S$-1 [3]. The output bit sequence from the channel interleaver is derived as follows:

(1) Assign $C_{mux} = N_{symb}^{PUSCH}$ to be the number of columns of the matrix. The columns of the matrix are numbered 0, 1, 2,…, $C_{mux} - 1$ from left to right. N_{symb}^{PUSCH} is determined according to subclause 5.2.2.6, or by higher layer parameter symPUSCH-UpPts for PUSCH transmission in UpPTS.

(2) The number of rows of the matrix is $R_{mux} = (H'_{total} \cdot Q_m \cdot N_L) / C_{mux}$ and we define $R'_{mux} = R_{mux} / (Q_m \cdot N_L)$.

The rows of the rectangular matrix are numbered 0, 1, 2,…, $R_{mux} - 1$ from top to bottom.

(3) If rank information is transmitted in this subframe/slot/subslot, the vector sequence $\underline{q}_0^{RI}, \underline{q}_1^{RI}, \underline{q}_2^{RI}, ..., \underline{q}_{Q'_{RI}-1}^{RI}$ is written onto the columns depending on PUSCH duration and DMRS pattern for PUSCH with subslot duration and by sets of $(Q_m \cdot N_L)$ rows starting from the last row and moving upwards according to the following pseudo-code.

Set i, j to 0.

Set r to $R'_{mux} - 1$

while $i < Q'_{RI}$

    if the PUSCH is Partial PUSCH Mode 1

        $c_{RI} = \text{Column Set}(j+2)$

    else

        $c_{RI} = \text{ColumnSet}(j)$

    end if

    $\underline{y}_{r \times C_{mux} + c_{RI}} = \underline{q}_i^{RI}$

    $i = i + 1$

    if the duration of the PUSCH is subframe

        $r = R'_{mux} - 1 - \lfloor i/4 \rfloor$

        $j = (j+3) \bmod 4$

    else if the duration of the PUSCH is slot, or if the PUSCH is Partial PUSCH Mode 1, 2 or 3

        $r = R'_{mux} - 1 - \lfloor i/2 \rfloor$

        $j = (j+1) \bmod 2$

    else if the duration of the PUSCH is subslot

        $r = R'_{mux} - 1 - i$

    end if

end while

Where ColumnSet is given

    -   in Table 5.2.2.8-1A if the PUSCH is scheduled by DCI format 0A/0B/4A/4B and

        -   indexed left to right from 0 to 1 if the PUSCH is Partial PUSCH Mode 1, 2, or 3;

        -   indexed left to right from 0 to 3 otherwise;

- otherwise,

  - in Table 5.2.2.8-1 indexed left to right from 0 to 3 for PUSCH with subframe duration,

  - in Table 5.2.2.8-1 indexed left to right from 0 to 1 for PUSCH with slot duration,

  - as {1} if DMRS pattern field of corresponding uplink DCI formats is '00' for subslot#0, '10' for subslot#1, '01' for subslot#2, '10' for subslot#4, '00' for subslot#5 in case N_{SRS} is equal to 0, or '01' for subslot#5, and as {0} otherwise, for PUSCH with subslot duration.

  - as {1} for subslot #0 and subslot #5 in case N_{SRS} is equal to 0, and as {0} otherwise, for semi-persistently scheduled PUSCH with subslot duration.

(3a)   If CQI/PMI information is transmitted in this subframe with Partial PUSCH mode 1, the vector sequence $\underline{q}_0, \underline{q}_1, ..., \underline{q}_{Q'_{CQI}-1}$ is written onto the $(R_{mux} \times C_{mux})$ matrix by sets of $(Q_m \cdot N_L)$ rows from the column with $\underline{y}_{\lfloor C_{mux}/2 \rfloor}$ to the column with $\underline{y}_{C_{mux}-1}$ and rows 0 to $(Q_m \cdot N_L - 1)$ and skipping the matrix entries that are already occupied:

$$\begin{bmatrix} \underline{y}_0 & \underline{y}_1 & \underline{y}_2 & \mathrm{L} & \underline{y}_{C_{mux}-1} \\ \underline{y}_{C_{mux}} & \underline{y}_{C_{mux}+1} & \underline{y}_{C_{mux}+2} & \mathrm{L} & \underline{y}_{2C_{mux}-1} \\ \mathrm{M} & \mathrm{M} & \mathrm{M} & \mathrm{O} & \mathrm{M} \end{bmatrix}$$

The pseudocode is as follows:

Set i, k to 0.

  while k < Q'_{CQI} ,

    if $\underline{y}_i$ is not assigned to RI symbols in step (3) and $i \bmod C_{mux} \geq \lfloor C_{mux}/2 \rfloor$

      $\underline{y}_i = \underline{q}_k$

      k = k + 1

    end if

    i = i+1

  end while

(3b) If AUL-UCI is transmitted in this subframe, the vector sequence $\underline{q}_0^{AUL-UCI}, \underline{q}_1^{AUL-UCI}, ..., \underline{q}_{Q'_{AUL-UCI}-1}^{AUL-UCI}$ is written onto the $(R_{mux} \times C_{mux})$ matrix by sets of $(Q_m \cdot N_L)$ rows from the column with $\underline{y}_1$ to the column with $\underline{y}_{C_{mux}-2}$ and rows 0 to $(Q_m \cdot N_L - 1)$:

$$\begin{bmatrix} \underline{y}_0 & \underline{y}_1 & \underline{y}_2 & \mathrm{L} & \underline{y}_{C_{mux}-1} \\ \underline{y}_{C_{mux}} & \underline{y}_{C_{mux}+1} & \underline{y}_{C_{mux}+2} & \mathrm{L} & \underline{y}_{2C_{mux}-1} \\ \mathrm{M} & \mathrm{M} & \mathrm{M} & \mathrm{O} & \mathrm{M} \end{bmatrix}$$

The pseudocode is as follows:

Set i, k to 0.

  while k < $Q'_{AUL-UCI}$,

if $i \bmod C_{mux} \geq 1$ and $i \bmod C_{mux} \leq C_{mux} - 2$

$$\underline{y}_i = \underline{q}_k^{AUL-UCI}$$

k = k + 1

end if

i = i+1

end while

(4) Write the input vector sequence, for $k = 0, 1,\ldots, H'-1$, into the $\left(R_{mux} \times C_{mux}\right)$ matrix by sets of $\left(Q_m \cdot N_L\right)$ rows starting with the vector $\underline{y}_0$ in column 0 and rows 0 to $\left(Q_m \cdot N_L - 1\right)$ and skipping the matrix entries that are already occupied:

$$\begin{bmatrix} \underline{y}_0 & \underline{y}_1 & \underline{y}_2 & \cdots & \underline{y}_{C_{mux}-1} \\ \underline{y}_{C_{mux}} & \underline{y}_{C_{mux}+1} & \underline{y}_{C_{mux}+2} & \cdots & \underline{y}_{2C_{mux}-1} \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ \underline{y}_{(R'_{mux}-1)\times C_{mux}} & \underline{y}_{(R'_{mux}-1)\times C_{mux}+1} & \underline{y}_{(R'_{mux}-1)\times C_{mux}+2} & \cdots & \underline{y}_{(R'_{mux}\times C_{mux}-1)} \end{bmatrix}$$

The pseudocode is as follows:

Set i, k to 0.

while $k < H'$,

if $\underline{y}_i$ is not assigned to RI symbols, or CQI/PMI symbols in step (3a), or AUL-UCI symbols in step (3b)

$$\underline{y}_i = \underline{g}_k$$

k = k + 1

end if

i = i+1

end while

(5) If HARQ-ACK information is transmitted in this subframe/slot/subslot, the vector sequence $\underline{q}_0^{ACK}, \underline{q}_1^{ACK}, \underline{q}_2^{ACK}, \ldots, \underline{q}_{Q'_{ACK}-1}^{ACK}$ is written onto the columns depending on PUSCH duration and DMRS pattern for PUSCH with subslot duration, and by sets of $\left(Q_m \cdot N_L\right)$ rows starting from the last row and moving upwards according to the following pseudo-code. Note that this operation overwrites some of the channel interleaver entries obtained in step (4).

Set i, j to 0.

Set r to $R'_{mux} - 1 - Q'_{RI}$ if $N_{symb}^{PUSCH} = 1$ and $R'_{mux} - Q'_{RI} \geq Q'_{ACK}$ for PUSCH with subslot duration, $Q'_{ACK} - 1$ if $N_{symb}^{PUSCH} = 1$ and $R'_{mux} - Q'_{RI} < Q'_{ACK}$ for PUSCH with subslot duration, and $R'_{mux} - 1$ otherwise

while $i < Q'_{ACK}$

$c_{ACK} = \text{ColumnSet}(j)$

$$\underline{y}_{r \times C_{mux} + c_{ACK}} = \underline{q}_i^{ACK}$$

$i = i+1$

if the duration of the PUSCH is subframe

$$r = R'_{mux} - 1 - \lfloor i/4 \rfloor$$

$$j = (j+3) \bmod 4$$

else if the duration of the PUSCH is slot

$$r = R'_{mux} - 1 - \lfloor i/2 \rfloor$$

$$j = (j+1) \bmod 2$$

else if the duration of the PUSCH is subslot, $R'_{mux} - Q'_{RI} \geq Q'_{ACK}$ and $N^{PUSCH}_{symb} = 1$

$$r = R'_{mux} - 1 - i - Q'_{RI}$$

else if the duration of the PUSCH is subslot, $R'_{mux} - Q'_{RI} < Q'_{ACK}$ and $N^{PUSCH}_{symb} = 1$

$$r = Q'_{ACK} - 1 - i$$

else if the duration of the PUSCH is subslot and $N^{PUSCH}_{symb} = 2$ or $N^{PUSCH}_{symb} = 3$

$$r = R'_{mux} - 1 - i$$

end if

end while

Where ColumnSet is given

- in Table 5.2.2.8-2 indexed left to right from 0 to 3 for PUSCH with subframe duration,

- in Table 5.2.2.8-2 indexed left to right from 0 to 1 for PUSCH with slot duration,

- as {1} if DMRS pattern field of corresponding uplink DCI formats is '01' for subslot#0, '11' for subslot#1, '10' for subslot#3, or '11' for subslot#4, and as {0} otherwise, for PUSCH with subslot duration.

- as {1} for subslot #1 and subslot #3 if the higher layer parameter *semiPersistSchedIntervalUL* is set to 1 subslot and MSB of DMRS pattern field of corresponding uplink DCI formats is '1', and as {0} otherwise, for semi-persistently scheduled PUSCH with subslot duration.

(6) The output of the block interleaver is the bit sequence read out column by column from the $(R_{mux} \times C_{mux})$ matrix. The bits after channel interleaving are denoted by $h_0, h_1, h_2, ..., h_{H+N_L \cdot Q_{RI}-1}$, where N_L is the number of layers the corresponding UL-SCH transport block is mapped onto.

The same channel interleaver procedures for RI are applied for CRI, using CRI instead of RI in the equations.

5.2.3 Uplink control information on PUCCH

Data arrives to the coding unit in the form of indicators for measurement indication, scheduling request and HARQ acknowledgement.

Three forms of channel coding are used as shown in Figure 5.2.3-1,

- one for HARQ-ACK and for combination of HARQ-ACK and periodic CSI transmitted on PUCCH format 3, including the cases with scheduling request,

- another for the channel quality information CQI/PMI transmitted on PUCCH format 2,

- and another for combination of CQI/PMI and HARQ-ACK transmitted on PUCCH format 2/2a/2b.

A fourth form of channel coding is used as shown in Figure 5.2.3-2, for HARQ-ACK and for combination of HARQ-ACK and periodic CSI transmitted on PUCCH format 4 or PUCCH format 5 including the cases with scheduling request, or for periodic CSI transmitted on PUCCH format 4 or PUCCH format 5 including the cases with scheduling request.

5.2.3.1 Channel coding for UCI HARQ-ACK on PUCCH

The HARQ-ACK bits are received from higher layers for each subframe of each cell. Each positive acknowledgement (ACK) is encoded as a binary '1' and each negative acknowledgement (NACK) is encoded as a binary '0'. For UEs configured with no more than five DL cells, or for UEs configured by higher layers with *codebooksizeDetermination-r13 = cc*, and for the case where PUCCH format 3, PUCCH format 4 or PUCCH format 5 [2] is configured by higher layers and is used for transmission of the HARQ-ACK feedback information, the HARQ-ACK feedback consists of the concatenation of HARQ-ACK bits for each of the serving cells. For UEs configured by higher layers with *codebooksizeDetermination-r13 = dai*, the HARQ-ACK feedback consists of the HARQ-ACK bits for the serving cells depending on the Downlink Assignment Index (DAI) as in Table 5.3.3.1.2-2 and as defined in [3]. For cells configured with transmission modes 1, 2, 5, 6 or 7 [3], i.e., single codeword transmission modes, 1 bit of HARQ-ACK information, a_k, is used for that cell. For cells configured with other transmission modes, 2 bits of HARQ-ACK information are used for those cells, i.e., a_k, a_{k+1} with a_k corresponding to HARQ-ACK bit for codeword 0 and a_{k+1} corresponding to that for codeword 1.

Define O^{ACK} as the number of HARQ-ACK feedback bits and $N_{A/N}^{\text{PUCCH format 3}}$ as the number of HARQ-ACK feedback bits including the possible concurrent transmission of scheduling request and/or periodic CSI when PUCCH format 3 is used for transmission of HARQ-ACK feedback (subclause 10.1 in [3]), and $N_{A/N}^{\text{PUCCH format 4}}$ as the number of HARQ-ACK feedback bits including the possible concurrent transmission of scheduling request and/or periodic CSI when PUCCH format 4 is used for transmission of HARQ-ACK feedback (subclause 10.1 in [3]), and $N_{A/N}^{\text{PUCCH format 5}}$ as the number of HARQ-ACK feedback bits including the possible concurrent transmission of scheduling request and/or periodic CSI when PUCCH format 5 is used for transmission of HARQ-ACK feedback (subclause 10.1 in [3]).

For UEs configured by higher layers with *codebooksizeDetermination-r13 = dai*, the bit sequence $\tilde{o}_0^{ACK}, \tilde{o}_1^{ACK}, ..., \tilde{o}_{O^{ACK}-1}^{ACK}$ is determined according to the Downlink Assignment Index (DAI) as in Table 5.3.3.1.2-2 and as defined in [3]. Otherwise, the bit sequence $\tilde{o}_0^{ACK}, \tilde{o}_1^{ACK}, ..., \tilde{o}_{O^{ACK}-1}^{ACK}$ is determined as below.

For FDD when the UE is not configured with EN-DC/NE-DC and higher layer parameter *subframeAssignment-r15*, the sequence of bits $\tilde{o}_0^{ACK}, \tilde{o}_1^{ACK}, ..., \tilde{o}_{O^{ACK}-1}^{ACK}$ is the result of the concatenation of HARQ-ACK bits for different cells according to the following pseudo-code:

Set $c = 0$ – cell index: lower indices correspond to lower RRC indices of corresponding cell

Set $j = 0$ – HARQ-ACK bit index

Set N_{cells}^{DL} to the number of cells configured by higher layers for the UE

while $c < N_{cells}^{DL}$

    if transmission mode configured in cell $c \in \{1,2,5,6,7\}$ -- 1 bit HARQ-ACK feedback for this cell

        $\tilde{o}_j^{ACK} =$ HARQ-ACK bit of this cell

        $j = j + 1$

    else

        if the UE is configured with spatial bundling on PUCCH by higher layers and if the UE is configured with PUCCH format 4 or PUCCH format 5 or PUCCH format 3 with more than 5 serving cells or if HARQ-ACK is to be transmitted on subslot SPUCCH as described in subclause 5.2.3.1A

            $\tilde{o}_j^{ACK} =$ binary AND operation of the HARQ-ACK bits corresponding to the first and second codewords of this cell

            $j = j + 1$

        else

            $\tilde{o}_j^{ACK} =$ HARQ-ACK bit corresponding to the first codeword of this cell

            $j = j + 1$

            $\tilde{o}_j^{ACK} =$ HARQ-ACK bit corresponding to the second codeword of this cell

            $j = j + 1$

        end if

    end if

    $c = c + 1$

end while

For the aggregation of more than one DL cell including a primary cell using FDD and at least one secondary cell using TDD when the UE is not configured with EN-DC/NE-DC and higher layer parameter *subframeAssignment-r15*, the sequence of bits $\tilde{o}_0^{ACK}, \tilde{o}_1^{ACK}, ..., \tilde{o}_{O^{ACK}-1}^{ACK}$ is the result of the concatenation of HARQ-ACK bits for different cells.

Define N_{cells}^{DL} as the number of cells configured by higher layers for the UE and B_c^{DL} as the number of subframes for which the UE needs to feed back HARQ-ACK bits in UL subframe n for the c-th serving cell. For a cell using TDD, the subframes are determined by the DL-reference UL/DL configuration if the UE is configured with higher layer parameter *eimta-HARQ-ReferenceConfig*, and determined by the UL/DL configuration otherwise. For a cell using TDD, $B_c^{DL} = 1$ if subframe n-4 in the cell, or subframe n-3 in the cell if higher layer parameter *shortProcessingTime* is configured for the cell, is a DL subframe or a special subframe with special subframe configurations 1/2/3/4/6/7/8/9/10 and normal downlink CP or a special subframe with special subframe configurations 1/2/3/5/6/7 and extended downlink CP, and $B_c^{DL} = 0$ otherwise. For a cell using FDD, $B_c^{DL} = 1$.

The sequence of bits $\tilde{o}_0^{ACK}, \tilde{o}_1^{ACK}, ..., \tilde{o}_{O^{ACK}-1}^{ACK}$ is performed according to the following pseudo-code:

Set $c = 0$ – cell index: lower indices correspond to lower RRC indices of corresponding cell

Set $j = 0$ – HARQ-ACK bit index

while $c < N_{cells}^{DL}$

if $B_c^{DL} = 1$

if transmission mode configured in cell $c \in \{1,2,5,6,7\}$ -- 1 bit HARQ-ACK feedback for this cell

$\tilde{o}_j^{ACK}$ = HARQ-ACK bit of this cell

$j = j + 1$

else

if the UE is configured with spatial bundling on PUCCH by higher layers and if the UE is configured with PUCCH format 4 or PUCCH format 5 or PUCCH format 3 with more than 5 serving cells or if HARQ-ACK is to be transmitted on subslot SPUCCH as described in subclause 5.2.3.1A

$\tilde{o}_j^{ACK}$ = binary AND operation of the HARQ-ACK bits corresponding to the first and second codewords of this cell

$j = j + 1$

else

$\tilde{o}_j^{ACK}$ = HARQ-ACK bit corresponding to the first codeword of this cell

$j = j + 1$

$\tilde{o}_j^{ACK}$ = HARQ-ACK bit corresponding to the second codeword of this cell

$j = j + 1$

end if

end if

$c = c + 1$

end while

For the cases with TDD primary cell or EN-DC/NE-DC with FDD primary cell and higher layer parameter *subframeAssignment-r15* configured, the sequence of bits $\tilde{o}_0^{ACK}, \tilde{o}_1^{ACK}, ..., \tilde{o}_{O^{ACK}-1}^{ACK}$ is obtained from the HARQ-ACK bits for different cells and different subframes.

Define N_{cells}^{DL} as the number of cells configured by higher layers for the UE and B_c^{DL} as the number of subframes for which the UE needs to feed back HARQ-ACK bits in cell *c* as defined in Subclause 7.3 of [3].

The number of HARQ-ACK bits *k* and the number of HARQ-ACK bits after spatial bundling k_b are computed as follows:

Set $k = 0$ – counter of HARQ-ACK bits

Set $k_b = 0$ – counter of HARQ-ACK bits after spatial bundling

Set $c = 0$ – cell index: lower indices correspond to lower RRC indices of corresponding cell

while c $< N_{cells}^{DL}$

set $l = 0$;

while $l < B_c^{DL}$

if transmission mode configured in cell $c \in \{1,2,5,6,7\}$ -- 1 bit HARQ-ACK feedback for this cell

$$k = k + 1$$

$$k_b = k_b + 1$$

else

$$k = k + 2$$

$$k_b = k_b + 1$$

end if

$$l = l+1$$

end while

$$c = c + 1$$

end while

In case the transmission of HARQ-ACK feedback using PUCCH format 3, PUCCH format 4 or PUCCH format 5 coincides with a sub-frame configured to the UE by higher layers for transmission of scheduling request, the number of scheduling request bit O^{SR} is 1; otherwise $O^{SR}=0$.

In case the transmission of HARQ-ACK feedback using PUCCH format 3, PUCCH format 4 or PUCCH format 5 coincides with a sub-frame configured to the UE by higher layers for transmission of periodic CSI, O^{CSI} is the number of periodic CSI bit(s) for the CSI report as defined in subclause 7.2.2 [3]; otherwise $O^{CSI}=0$.

For PUCCH format 3, the number of HARQ-ACK feedback bits O^{ACK} is computed as follows:

If the UE is configured with more than 5 serving cells and spatial bundling on PUCCH is configured, then:

- $O^{ACK} = k_b$,

else, set $k_{max} = 20$ when TDD is used in all the configured serving cell(s) of the UE and $k_{max} = 21$ when FDD is used in at least one of the configured serving cells with TDD primary cell and $k_{max} = 21$ when the UE is configured with EN-DC/NE-DC with FDD primary cell and higher layer parameter *subframeAssignment-r15*.

If $k \leq k_{max}$ and $O^{CSI} = 0$, or if $k + O^{CSI} + O^{SR} \leq 22$ and $O^{CSI} > 0$, or if $k_b + O^{CSI} + O^{SR} > 22$ and $k \leq k_{max}$, then

- $O^{ACK} = k$

else,

- $O^{ACK} = k_b$.

For PUCCH format 4 or PUCCH format 5, $O^{ACK} = k$ if the UE is not configured with spatial bundling on PUCCH by higher layers; otherwise $O^{ACK} = k_b$.

If $O^{ACK} = k$ and the HARQ-ACK is to be transmitted on slot SPUCCH or PUCCH, the multiplexing of HARQ-ACK bits is performed according to the following pseudo-code:

Set $c = 0$ – cell index: lower indices correspond to lower RRC indices of corresponding cell

Set $j = 0$ – HARQ-ACK bit index

while c < N_{cells}^{DL}

set $l = 0$;

while $l < B_c^{DL}$

    if transmission mode configured in cell $c \in \{1,2,5,6,7\}$ -- 1 bit HARQ-ACK feedback for this cell

        $\tilde{o}_j^{ACK} = o_{c,l}^{ACK}$ HARQ-ACK bit of this cell as defined in Subclause 7.3 of [3]

        $j = j + 1$

    else

        $[\tilde{o}_j^{ACK}, \tilde{o}_{j+1}^{ACK}] = [o_{c,2l}^{ACK}, o_{c,2l+1}^{ACK}]$ HARQ-ACK bit of this cell as defined in Subclause 7.3 of [3]

        $j = j + 2$

    end if

    $l = l+1$

  end while

  $c = c + 1$

end while

If $O^{ACK} = k_b$ or if HARQ-ACK is to be transmitted on subslot SPUCCH as described in subclause 5.2.3.1A, spatial bundling is applied to all subframes in all cells and the multiplexing of HARQ-ACK bits is performed according to the following pseudo-code

Set $c = 0$ – cell index: lower indices correspond to lower RRC indices of corresponding cell

Set $j = 0$ – HARQ-ACK bit index

while c $< N_{cells}^{DL}$

  set $l = 0$;

  while $l < B_c^{DL}$

    if transmission mode configured in cell $c \in \{1,2,5,6,7\}$ – 1 bit HARQ-ACK feedback for this cell

        $\tilde{o}_j^{ACK} = o_{c,l}^{ACK}$ HARQ-ACK bit of this cell as defined in Subclause 7.3 of [3]

        $j = j + 1$

    else

        $\tilde{o}_j^{ACK} = o_{c,l}^{ACK}$ binary AND operation of the HARQ-ACK bits corresponding to the first and second codewords of this cell as defined in Subclause 7.3 of [3]

        $j = j + 1$

    end if

    $l = l+1$

  end while

  $c = c + 1$

end while

In case the transmission of HARQ-ACK feedback using PUCCH format 3, PUCCH format 4 or PUCCH format 5 [2] coincides with a sub-frame configured to the UE by higher layers for transmission of scheduling request, the scheduling request bit (1 = positive SR; 0 = negative SR) is appended at the end of the sequence of concatenated HARQ-ACK bits.

In case the transmission of HARQ-ACK feedback using PUCCH format 3, PUCCH format 4 or PUCCH format 5 [2] coincides with a sub-frame configured to the UE by higher layers for transmission of periodic CSI, and periodic CSI is not dropped as defined in subclause 7.3.2 and subclause 10.1.1 of [3], the periodic CSI bits for the CSI report as defined in subclause 7.2.2 [3] are appended at the end of the sequence of concatenated HARQ-ACK bits and scheduling request bit (if any), where in case of CSI report for more than one DL cell, the CSI report for each DL cell is appended in increasing order of cell index. As with the transmission of the scheduling request, the procedure above is used with $N_{A/N}^{\text{PUCCH format 3}}$, $N_{A/N}^{\text{PUCCH format 4}}$ or $N_{A/N}^{\text{PUCCH format 5}}$ including the number of periodic CSI bits and scheduling request bit (if any).

For $N_{A/N}^{\text{PUCCH format 3}} \leq 11$, the bit sequence $a_0, a_1, a_2, ..., a_{N_{A/N}^{\text{PUCCH format 3}}-1}$ is obtained by setting $a_i = \tilde{o}_i^{ACK}$.

For $11 < N_{A/N}^{\text{PUCCH format 3}} \leq 22$, the bit sequence $a_0, a_1, a_2, ..., a_{N_{A/N}^{\text{PUCCH format 3}}-1}$ is obtained by setting $a_{i/2} = \tilde{o}_i^{ACK}$ if i is even and $a_{\lceil N_{A/N}^{PUCCH format 3}/2 \rceil + (i-1)/2} = \tilde{o}_i^{ACK}$ if i is odd.

For $N_{A/N}^{\text{PUCCH format 3}} \leq 11$, the sequence of bits $a_0, a_1, a_2, ..., a_{N_{A/N}^{\text{PUCCH format 3}}-1}$ is encoded as follows

$$\tilde{b}_i = \sum_{n=0}^{N_{A/N}^{\text{PUCCH format 3}}-1} (a_n \cdot M_{i,n}) \bmod 2$$

where $i = 0, 1, 2, ..., 31$ and the basis sequences $M_{i,n}$ are defined in Table 5.2.2.6.4-1.

The output bit sequence $b_0, b_1, b_2, ..., b_{B-1}$ is obtained by circular repetition of the sequence $\tilde{b}_0, \tilde{b}_1, \tilde{b}_2, ..., \tilde{b}_{31}$

$$b_i = \tilde{b}_{(i \bmod 32)}$$

where $i = 0, 1, 2, ..., B\text{-}1$ and where $B = 4 \cdot N_{\text{sc}}^{\text{RB}}$.

For $11 < N_{A/N}^{\text{PUCCH format 3}} \leq 22$, the sequences of bits $a_0, a_1, a_2, ..., a_{\lceil N_{A/N}^{PUCCH format 3}/2 \rceil - 1}$ and $a_{\lceil N_{A/N}^{\text{PUCCH format 3}}/2 \rceil}, a_{\lceil N_{A/N}^{\text{PUCCH format 3}}/2 \rceil + 1}, a_{\lceil N_{A/N}^{\text{PUCCH format 3}}/2 \rceil + 2}, ..., a_{N_{A/N}^{\text{PUCCH format 3}}-1}$ are encoded as follows

$$\tilde{b}_i = \sum_{n=0}^{\lceil N_{A/N}^{\text{PUCCH format 3}}/2 \rceil - 1} (a_n \cdot M_{i,n}) \bmod 2$$

and

$$\tilde{\tilde{b}}_i = \sum_{n=0}^{N_{A/N}^{\text{PUCCH format 3}} - \lceil N_{A/N}^{\text{PUCCH format 3}}/2 \rceil - 1} \left(a_{\lceil N_{A/N}^{\text{PUCCH format 3}}/2 \rceil + n} \cdot M_{i,n} \right) \bmod 2$$

where $i = 0, 1, 2, ..., 23$ and the basis sequences $M_{i,n}$ are defined in Table 5.2.2.6.4-1.

The output bit sequence $b_0, b_1, b_2, ..., b_{B-1}$ where $B = 4 \cdot N_{\text{sc}}^{\text{RB}}$ is obtained by the alternate concatenation of the bit sequences $\tilde{b}_0, \tilde{b}_1, \tilde{b}_2, ..., \tilde{b}_{23}$ and $\tilde{\tilde{b}}_0, \tilde{\tilde{b}}_1, \tilde{\tilde{b}}_2, ..., \tilde{\tilde{b}}_{23}$ as follows

Set $i, j = 0$

while $i < 4 \cdot N_{sc}^{RB}$

$b_i = \tilde{b}_j$, $b_{i+1} = \tilde{b}_{j+1}$

$b_{i+2} = \tilde{\tilde{b}}_j$, $b_{i+3} = \tilde{\tilde{b}}_{j+1}$

$i = i + 4$

$j = j + 2$

end while

For $N_{A/N}^{\text{PUCCH format 4}} > 22$, the bit sequence $a_0, a_1, a_2, ..., a_{N_{A/N}^{\text{PUCCH format 4}}-1}$ is obtained by setting $a_i = \tilde{o}_i^{ACK}$, and the output bit sequence after the rate matching is denoted by $e_0, e_1, e_2, ..., e_{E-1}$, where $E = Q_m \cdot M_{RB}^{PUCCH4} \cdot N_{symb}^{PUSCH} \cdot N_{sc}^{RB}$, Q_m is the modulation order of the PUCCH format 4, N_{symb}^{PUSCH} is determined according to subclause 5.2.4.1, and M_{RB}^{PUCCH4} represents the bandwidth of the PUCCH format 4 in terms of resource blocks [2]. The CRC attachment, channel coding and rate matching are performed according to subclauses 5.1.1 by setting L to 8 bits, 5.1.3.1 and 5.1.4.2, respectively. The input bit sequence to the CRC attachment operation is $a_0, a_1, a_2, ..., a_{N_{A/N}^{\text{PUCCH format 4}}-1}$. The output bit sequence of the CRC attachment operation is the input bit sequence to the channel coding operation. The output bit sequence of the channel coding operation is the input bit sequence to the rate matching operation.

For $N_{A/N}^{\text{PUCCH format 5}} > 22$, the bit sequence $a_0, a_1, a_2, ..., a_{N_{A/N}^{\text{PUCCH format 5}}-1}$ is obtained by setting $a_i = \tilde{o}_i^{ACK}$, and the output bit sequence after the rate matching is denoted by $e_0, e_1, e_2, ..., e_{E-1}$, where $E = Q_m \cdot N_{symb}^{PUSCH} \cdot N_{sc}^{RB} / 2$, Q_m is the modulation order of the PUCCH format 5 and N_{symb}^{PUSCH} is determined according to subclause 5.2.4.1. The CRC attachment, channel coding and rate matching are performed according to subclauses 5.1.1 by setting L to 8 bits, 5.1.3.1 and 5.1.4.2, respectively. The input bit sequence to the CRC attachment operation is $a_0, a_1, a_2, ..., a_{N_{A/N}^{\text{PUCCH format 5}}-1}$. The output bit sequence of the CRC attachment operation is the input bit sequence to the channel coding operation. The output bit sequence of the channel coding operation is the input bit sequence to the rate matching operation.

When PUCCH format 3, PUCCH format 4 or PUCCH format 5 is not used for transmission of HARQ-ACK feedback, the HARQ-ACK bits are processed for transmission according to subclause 10.1 in [3].

5.2.3.1A Channel coding for UCI HARQ-ACK on SPUCCH

The HARQ-ACK bits are received from higher layers for each subframe of each cell and for each slot or subslot of each cell if higher layer parameter *dl-STTI-Length* is configured for the cell. Each positive acknowledgement (ACK) is encoded as a binary '1' and each negative acknowledgement (NACK) is encoded as a binary '0'. For UEs configured with more than one DL cell and no more than five DL cells, or for UEs configured by higher layers with *codebooksizeDeterminationSTTI-rel15 = cc*, the HARQ-ACK feedback consists of the concatenation of HARQ-ACK bits for each of the serving cells. For UEs configured by higher layers with *codebooksizeDeterminationSTTI-rel15 = dai*, the HARQ-ACK feedback consists of the HARQ-ACK bits for the serving cells depending on the Downlink Assignment Index (DAI) as in Table 5.3.3.1.2-2 and as defined in [3]. For a cell configured with higher layer parameter *dl-STTI-Length*, 1 bit of HARQ-ACK information, a_k, is used for that cell.

Define O^{ACK} as the number of HARQ-ACK feedback bits and $N_{A/N}^{\text{SPUCCH format 3}}$ as the number of HARQ-ACK feedback bits including the possible concurrent transmission of scheduling request when SPUCCH format 3 is used for transmission of HARQ-ACK feedback (subclause 10.1 in [3]), and $N_{A/N}^{\text{SPUCCH format 4}}$ as the number of HARQ-ACK feedback bits including the possible concurrent transmission of scheduling request when SPUCCH format 4 is used for transmission of HARQ-ACK feedback (subclause 10.1 in [3]).

For UEs configured by higher layers with *codebooksizeDeterminationSTTI-rel15 = dai*, the bit sequence $\tilde{o}_0^{sACK} \tilde{o}_1^{sACK}, ..., \tilde{o}_{O^{sACK}-1}^{sACK}$ is determined according to the Downlink Assignment Index (DAI) as in Table 5.3.3.1.2-2 and as defined in [3]. Otherwise, the bit sequence $\tilde{o}_0^{sACK} \tilde{o}_1^{sACK}, ..., \tilde{o}_{O^{sACK}-1}^{sACK}$ is determined as below.

For FDD with at least one cell configured with higher layer parameter *dl-STTI-Length* or for the aggregation of more than one DL cell including a primary cell using FDD and at least one secondary cell using TDD and at least one DL cell configured with higher layer parameter *dl-STTI-Length*, define the bit sequence $\tilde{o}_0^{sACK}\tilde{o}_1^{sACK},...,\tilde{o}_{O^{sACK}-1}^{sACK}$ corresponding to PDSCH with slot/subslot duration as the result of the concatenation of HARQ-ACK bits for one or multiple DL cells configured with higher layer parameter *dl-STTI-Length*, N_{cells}^{sDL} as the number of cells configured with *dl-STTI-Length* for the UE and B_c^{sDL} as the number of slot(s) or subslot(s) for which the UE needs to feed back HARQ-ACK bits in UL slot or subslot *n* for the *c*-th serving cell. For a cell using FDD and configured with *dl-STTI-Length*=subslot and *ul-STTI-Length*=subslot, or for a cell using FDD and configured with *dl-STTI-Length*=slot and *ul-STTI-Length*=slot, $B_c^{sDL}=1$. For a cell using FDD and configured with *dl-STTI-Length*=subslot and *ul-STTI-Length*=slot, $B_c^{sDL}=3$. For a cell using TDD, $B_c^{sDL}=1$ if slot n-4 in the cell is in a DL subframe, or slot n-4 is the first slot in a special subframe with special subframe configurations 1/2/3/4/6/7/8/9/10 and normal downlink CP, or slot n-4 is the second slot in a special subframe with special subframe configurations 3/4/8 and normal downlink CP, and $B_c^{sDL}=0$ otherwise.

The bit sequence $\tilde{o}_0^{sACK}\tilde{o}_1^{sACK},...,\tilde{o}_{O^{sACK}-1}^{sACK}$ is performed according to the following pseudo-code:

Set *c* = 0 – cell index: lower indices correspond to lower RRC indices of corresponding cell configured with *dl-STTI-Length*

Set *j* = 0 – HARQ-ACK bit index

while $c < N_{cells}^{sDL}$

    set *l* = 0;

    while $l < B_c^{sDL}$

        $\tilde{o}_j^{sACK} =$ HARQ-ACK bit of this cell

        j = *j* + 1

        l=*l*+*1*

    end while

    c = *c* + 1

end while

For FDD with at least one cell configured with higher layer parameter *dl-STTI-Length* or for the aggregation of more than one DL cell including a primary cell using FDD and at least one secondary cell using TDD and at least one DL cell configured with higher layer parameter *dl-STTI-Length*, define the bit sequence $\tilde{o}_0^{LACK}\tilde{o}_1^{LACK},...,\tilde{o}_{O^{LACK}-1}^{LACK}$ as the result of the concatenation of HARQ-ACK bits corresponding to PDSCH with subframe duration for one or multiple DL cells. The bit sequence $\tilde{o}_0^{LACK}\tilde{o}_1^{LACK},...,\tilde{o}_{O^{LACK}-1}^{LACK}$ is determined as for bit sequence $\tilde{o}_0^{ACK}\ \tilde{o}_1^{ACK},...,\ \tilde{o}_{O^{ACK}-1}^{ACK}$ in subclause 5.2.3.1 and spatial bundling is performed if the HARQ-ACK is to be transmitted on subslot SPUCCH or if the HARQ-ACK is to be transmitted on slot SPUCCH and spatial bundling is configured. For FDD with at least one cell configured with higher layer parameter *dl-STTI-Length* or for the aggregation of more than one DL cell including a primary cell using FDD and at least one secondary cell using TDD and at least one DL cell configured with higher layer parameter *dl-STTI-Length,* the sequence of bits $\tilde{o}_0^{ACK},\ \tilde{o}_1^{ACK},...,\tilde{o}_{O^{ACK}-1}^{ACK}$ is the result of the concatenation of HARQ-ACK bits for different cells and is obtained by concatenation of the bit sequence $\tilde{o}_0^{sACK}\tilde{o}_1^{sACK},...,\tilde{o}_{O^{sACK}-1}^{sACK}$ and $\tilde{o}_0^{LACK}\tilde{o}_1^{LACK},...,\tilde{o}_{O^{LACK}-1}^{LACK}$ in the cases defined in subclause 7.3 of [3]. In all other cases, the sequence of bits $\tilde{o}_0^{ACK},\ \tilde{o}_1^{ACK},...,\tilde{o}_{O^{ACK}-1}^{ACK}$ is given by $\tilde{o}_0^{sACK}\tilde{o}_1^{sACK},...,\tilde{o}_{O^{sACK}-1}^{sACK}$.

In case the transmission of HARQ-ACK feedback using SPUCCH format 3 or SPUCCH format 4 coincides with a slot/subslot configured to the UE by higher layers for transmission of scheduling request, the number of scheduling request bits O^{SR} is 1; otherwise $O^{SR}=0$, and the scheduling request bit (1 = positive SR; 0 = negative SR) is appended at the end of the sequence of concatenated HARQ-ACK bits.

For $N_{A/N}^{\text{SPUCCH format 3}} \leq 11$, the bit sequence $a_0, a_1, a_2, ..., a_{N_{A/N}^{\text{SPUCCH format 3}}-1}$ is obtained by setting $a_i = \tilde{o}_i^{ACK}$ and is encoded as follows

$$b_i = \sum_{n=0}^{N_{A/N}^{\text{SPUCCHformat3}}-1} \left(a_n \cdot M_{i,n} \right) \bmod 2$$

where $i = 0, 1, 2, ..., B-1$ and $B = 2 \cdot N_{sc}^{RB}$, the basis sequences $M_{i,n}$ are defined in Table 5.2.2.6.4-1.

For SPUCCH format 4, the output sequence is of length E, where $E = Q_m \cdot M_{RB}^{\text{SPUCCH format 4}} \cdot N_{\text{symb}}^{\text{SPUCCH format 4}} \cdot N_{sc}^{RB}$, Q_m is the modulation order of the SPUCCH format 4, $N_{\text{symb}}^{\text{SPUCCH format 4}}$ is equal to $N_{\text{symb}}^{\text{SPUSCH}} - 1$ for slot SPUCCH format 4 and equal to $N_{\text{symb}}^{\text{SPUSCH}}$ for subslot SPUCCH format 4, $N_{\text{symb}}^{\text{SPUSCH}}$ is determined according to subclause 5.2.4.1, and $M_{RB}^{\text{SPUCCH format 4}}$ represents the bandwidth of the SPUCCH format 4 in terms of resource blocks [2].

For $N_{A/N}^{\text{SPUCCH format 4}} \leq 11$, the bit sequence $a_0, a_1, a_2, ..., a_{N_{A/N}^{\text{SPUCCH format 4}}-1}$ is obtained by setting $a_i = \tilde{o}_i^{ACK}$ and is encoded as follows

$$\tilde{b}_i = \sum_{n=0}^{N_{A/N}^{\text{SPUCCHformat4}}-1} \left(a_n \cdot M_{i,n} \right) \bmod 2$$

where $i = 0, 1, 2, ..., 31$ and the basis sequences $M_{i,n}$ are defined in Table 5.2.2.6.4-1.

The output bit sequence $b_0, b_1, b_2, ..., b_{E-1}$ is obtained by circular repetition of the sequence $\tilde{b}_0, \tilde{b}_1, \tilde{b}_2, ..., \tilde{b}_{31}$

$$b_i = \tilde{b}_{(i \bmod 32)},$$

where $i = 0, 1, 2, ..., E-1$.

For $11 < N_{A/N}^{\text{SPUCCH format 4}} \leq 22$, the bit sequence $a_0, a_1, a_2, ..., a_{N_{A/N}^{\text{SPUCCH format 4}}-1}$ is obtained by setting $a_{i/2} = \tilde{o}_i^{ACK}$ if i is even and $a_{\lceil N_{A/N}^{\text{SPUCCHformat4}}/2 \rceil + (i-1)/2} = \tilde{o}_i^{ACK}$ if i is odd. The sequences of bits $a_0, a_1, a_2, ..., a_{\lceil N_{A/N}^{\text{SPUCCHformat4}}/2 \rceil - 1}$ and $a_{\lceil N_{A/N}^{\text{SPUCCHformat4}}/2 \rceil}, a_{\lceil N_{A/N}^{\text{SPUCCHformat4}}/2 \rceil + 1}, a_{\lceil N_{A/N}^{\text{SPUCCHformat4}}/2 \rceil + 2}, ..., a_{N_{A/N}^{\text{SPUCCHformat4}}-1}$ are encoded as follows

$$\tilde{b}_i = \sum_{n=0}^{\lceil N_{A/N}^{\text{SPUCCH format4}}/2 \rceil - 1} \left(a_n \cdot M_{i,n} \right) \bmod 2$$

and

$$\tilde{\tilde{b}}_i = \sum_{n=0}^{N_{A/N}^{\text{SPUCCH format4}} - \lceil N_{A/N}^{\text{SPUCCH format4}}/2 \rceil - 1} \left(a_{\lceil N_{A/N}^{\text{SPUCCH format4}}/2 \rceil + n} \cdot M_{i,n} \right) \bmod 2$$

where $i = 0, 1, 2, ..., 31$ and the basis sequences $M_{i,n}$ are defined in Table 5.2.2.6.4-1.

The output bit sequence $b_0, b_1, b_2, ..., b_{E-1}$ is obtained by the concatenation and circular repetition of the bit sequences $\tilde{b}_0, \tilde{b}_1, \tilde{b}_2, ..., \tilde{b}_{31}$ and $\tilde{\tilde{b}}_0, \tilde{\tilde{b}}_1, \tilde{\tilde{b}}_2, ..., \tilde{\tilde{b}}_{31}$ as follows

Set $i = 0$

while $i < \lceil E/2 \rceil$

$$b_i = \tilde{b}_{i \bmod 32}$$

$$i = i + 1$$

end while

while $i < E - \lceil E/2 \rceil$

$$b_{\lceil E/2 \rceil + i} = \tilde{\tilde{b}}_{i \bmod 32}$$

$$i = i + 1$$

end while

For $N_{A/N}^{\text{SPUCCH format 4}} \geq 22$, the output bit sequence after the rate matching is denoted by $e_0, e_1, e_2, ..., e_{E-1}$. The CRC attachment, channel coding and rate matching are performed according to subclauses 5.1.1 by setting L to 8 bits, 5.1.3.1 and 5.1.4.2, respectively. The input bit sequence to the CRC attachment operation is $a_0, a_1, a_2, ..., a_{N_{A/N}^{\text{SPUCCHformat4}} - 1}$. The output bit sequence of the CRC attachment operation is the input bit sequence to the channel coding operation. The output bit sequence of the channel coding operation is the input bit sequence to the rate matching operation.

When SPUCCH format 3 or SPUCCH format 4 is not used for transmission of HARQ-ACK feedback, the HARQ-ACK bits are processed for transmission according to subclause 10.1 in [3].

5.2.3.2 Channel coding for UCI scheduling request

The scheduling request indication is received from higher layers and is processed according to [2].

5.2.3.3 Channel coding for UCI channel quality information

The channel quality and possible concurrent scheduling request bits input to the channel coding block are denoted by $a_0, a_1, a_2, a_3, ..., a_{A-1}$ where A is the number of bits, and where the scheduling request bit (if present) is prepended to the sequence of channel quality bits. The number of channel quality bits depends on the transmission format as indicated in subclause 5.2.3.3.1 for wideband reports and in subclause 5.2.3.3.2 for UE-selected subbands reports.

For PUCCH format 2, the channel quality information is coded using a (20, A) code. The code words of the (20, A) code are a linear combination of the 13 basis sequences denoted M$_{i,n}$ and defined in Table 5.2.3.3-1.

Table 5.2.3.3-1: Basis sequences for (20, *A*) code

i	$M_{i,0}$	$M_{i,1}$	$M_{i,2}$	$M_{i,3}$	$M_{i,4}$	$M_{i,5}$	$M_{i,6}$	$M_{i,7}$	$M_{i,8}$	$M_{i,9}$	$M_{i,10}$	$M_{i,11}$	$M_{i,12}$
0	1	1	0	0	0	0	0	0	0	0	1	1	0

14	1	0	0	0	1	1	0	1	0	0	1	0	1
15	1	1	0	0	1	1	1	1	0	1	1	0	1
16	1	1	1	0	1	1	1	0	0	1	0	1	1
17	1	0	0	1	1	1	0	0	1	0	0	1	1
18	1	1	0	1	1	1	1	1	0	0	0	0	0
19	1	0	0	0	0	1	1	0	0	0	0	0	0

After encoding the bits are denoted by $b_0, b_1, b_2, b_3, ..., b_{B-1}$ where $B = 20$ and with

$$b_i = \sum_{n=0}^{A-1} (a_n \cdot M_{i,n}) \bmod 2 \text{ where } i = 0, 1, 2, …, B\text{-}1.$$

For PUCCH format 4, the output bit sequence after the rate matching is denoted by $e_0, e_1, e_2, ..., e_{E-1}$, where $E = Q_m \cdot M_{RB}^{PUCCH4} \cdot N_{symb}^{PUSCH} \cdot N_{sc}^{RB}$, Q_m is the modulation order of the PUCCH format 4, N_{symb}^{PUSCH} is determined according to subclause 5.2.4.1, and M_{RB}^{PUCCH4} represents the bandwidth of the PUCCH format 4 in terms of resource blocks [2]. The CRC attachment, channel coding and rate matching are performed according to subclauses 5.1.1 by setting *L* to 8 bits, 5.1.3.1 and 5.1.4.2, respectively. The input bit sequence to the CRC attachment operation is $a_0, a_1, a_2, ..., a_{A-1}$. The output bit sequence of the CRC attachment operation is the input bit sequence to the channel coding operation. The output bit sequence of the channel coding operation is the input bit sequence to the rate matching operation.

For PUCCH format 5, the output bit sequence after the rate matching is denoted by $e_0, e_1, e_2, ..., e_{E-1}$, where $E = Q_m \cdot N_{symb}^{PUSCH} \cdot N_{sc}^{RB} / 2$, Q_m is the modulation order of the PUCCH format 5 and N_{symb}^{PUSCH} is determined according to subclause 5.2.4.1. The CRC attachment, channel coding and rate matching are performed according to subclauses 5.1.1 by setting *L* to 8 bits, 5.1.3.1 and 5.1.4.2, respectively. The input bit sequence to the CRC attachment operation is $a_0, a_1, a_2, ..., a_{A-1}$. The output bit sequence of the CRC attachment operation is the input bit sequence to the channel coding operation. The output bit sequence of the channel coding operation is the input bit sequence to the rate matching operation.

5.2.3.3.1 Channel quality information formats for wideband reports

Table 5.2.3.3.1-1 shows the fields and the corresponding bit widths for the channel quality information feedback for wideband reports for PDSCH transmissions associated with a transmission mode 1, transmission mode 2, transmission mode 3, transmission mode 7, transmission mode 8 configured without PMI/RI reporting, transmission mode 9 configured without PMI/RI reporting or configured with 1 antenna port, transmission mode 10 configured without PMI/RI reporting or configured with 1 antenna port, transmission mode 9/10 configured without PMI with higher layer

parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B', and transmission mode 9/10 configured with higher layer parameter *eMIMO-Type* and *eMIMO-Type2,* and *eMIMO-Type2* configured without PMI.

Table 5.2.3.3.1-1A shows the fields and the corresponding bit widths for the channel quality information feedback for wideband reports for PDSCH transmissions associated with transmission mode 9/10 configured without PMI reporting and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with 2/4/8 antenna ports, transmission mode 9/10 configured with higher layer parameter *eMIMO-Type* and *eMIMO-Type*2, and *eMIMO-Type*2 configured without PMI reporting with 2/4/8 antenna ports, and transmission mode 9/10 configured with PMI/RI reporting and higher layer parameters *semiOpenLoop* and *eMIMO-Type*.

Table 5.2.3.3.1-1: UCI fields for channel quality information feedback for wideband CQI reports (transmission mode 1, transmission mode 2, transmission mode 3, transmission mode 7, transmission mode 8 configured without PMI/RI reporting, transmission mode 9 configured without PMI/RI reporting or configured with 1 antenna port, transmission mode 10 configured without PMI/RI reporting or configured with 1 antenna port, and transmission mode 9/10 configured without PMI with higher layer parameter *eMIMO-Type,* and *eMIMO-Type* is set to 'CLASS B', and transmission mode 9/10 configured with higher layer parameter *eMIMO-Type* and *eMIMO-Type2,* and *eMIMO-Type2* configured without PMI)

RI	0	1	

The channel quality bits in Table 5.2.3.3.1-1 through Table 5.2.3.3.1-4C form the bit sequence $a_0, a_1, a_2, a_3, ..., a_{A-1}$ with a_0 corresponding to the first bit of the first field in each of the tables, a_1 corresponding to the second bit of the first field in each of the tables, and a_{A-1} corresponding to the last bit in the last field in each of the tables. The first bit of each field corresponds to MSB and the last bit LSB. The RI feedback for one bit is mapped according to Table 5.2.2.6-5 with o_0^{RI} replaced by a_0. The RI feedback for two bits is mapped according to Table 5.2.2.6-6 with o_0^{RI}, o_1^{RI} replaced by a_0, a_1. The RI feedback for three bits is mapped according to Table 5.2.2.6-7 with o_0^{RI}, o_1^{RI}, o_2^{RI} replaced by a_0, a_1, a_2. The same procedures for RI mapping are applied to CRI, replacing RI with CRI. The mapping for the jointly coded RI and i1 is provided in Table 7.2.2-1E of [3].

When multiplexed with UL-SCH, the channel coding and multiplexing for the transmission configurations in Table 5.2.3.3.1-3, Table 5.2.3.3.1-3A, Table 5.2.3.3.1-3B, Table 5.2.3.3.1-3B-1, Table 5.2.3.3.1-3C, Table 5.2.3.3.1-3D, Table 5.2.3.3.1-3F, Tables 5.2.3.3.1-3G, 5.2.3.3.1-3I, 5.2.3.3.1-3J and Table 5.2.3.3.1-4D is performed assuming RI transmission in subclause 5.2.2.6. All other transmission configurations in this subclause are coded and multiplexed assuming CQI/PMI transmission in subclause 5.2.2.6.

For transmission mode 9/10 configured with Class B CSI reporting and K>1, the number of antenna port in Table 5.2.3.3.1-3C, 5.2.3.3.1-3D refers to the maximum number of antenna ports of K CSI-RS resources configured for the CSI-process for the UE.

For transmission mode 9/10 configured with Class B CSI reporting and K>1 and with *numberActivatedCSI-RS-Resource*>1, the number of antenna port in Table 5.2.3.3.1-3F, 5.2.3.3.1-3G refers to the maximum number of antenna ports of N CSI-RS resources activated for the CSI-process for the UE.

### 5.2.3.3.2	Channel quality information formats for UE-selected sub-band reports

Table 5.2.3.3.2-1 shows the fields and the corresponding bit widths for the sub-band channel quality information feedback for UE-selected sub-band reports for PDSCH transmissions associated with transmission mode 1, transmission mode 2, transmission mode 3, transmission mode 7, transmission mode 8 configured without PMI/RI reporting, transmission mode 9 configured without PMI/RI reporting or configured with 1 antenna port, transmission mode 10 configured without PMI/RI reporting or configured with 1 antenna port, and transmission mode 9/10 configured with higher layer parameter *eMIMO-Type* and *eMIMO-Type2*, and *eMIMO-Type2* is set to 'CLASS B' configured without PMI/RI reporting or configured with 1 antenna port.

Table 5.2.3.3.2-1A shows the fields and the corresponding bit widths for the sub-band channel quality information feedback for UE-selected sub-band reports for PDSCH transmissions associated with transmission mode 9/10 configured without PMI reporting and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with 2/4/8 antenna ports, and transmission mode 9/10 configured with higher layer parameter *eMIMO-Type* and *eMIMO-Type2*, and *eMIMO-Type2* is set to 'CLASS B' configured without PMI reporting with 2/4/8 antenna ports.

Table 5.2.3.3.2-1: UCI fields for channel quality information feedback for UE-selected sub-band CQI reports (transmission mode 1, transmission mode 2, transmission mode 3, transmission mode 7, transmission mode 8 configured without PMI/RI reporting, transmission mode 9 configured without PMI/RI reporting or configured with 1 antenna port, transmission mode 10 configured without PMI/RI reporting or configured with 1 antenna port, transmission mode 9/10 configured without PMI/RI with higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B', and transmission mode 9/10 configured with higher layer parameter *eMIMO-Type* and *eMIMO-Type2*, and *eMIMO-Type2* is set to 'CLASS B' configured without PMI/RI reporting or configured with 1 antenna port)

Field	Bit width
Sub-band CQI	4
Sub-band label	1 or 2

Table 5.2.3.3.2-1A: UCI fields for channel quality information feedback for UE-selected subband CQI reports (transmission mode 9/10 configured without PMI reporting and higher layer parameter *eMIMO-Type*, and *eMIMO-Type* is set to 'CLASS B' with 2/4/8 antenna ports, and transmission mode 9/10 configured with higher layer parameter *eMIMO-Type* and *eMIMO-Type2*, and *eMIMO-Type2* is set to 'CLASS B' configured without PMI reporting with 2/4/8 antenna ports)

Field	Bit width	
	Rank = 1	Rank > 1
Wide-band CQI	4	4

Table 5.2.3.3.1-4I shows the fields and the corresponding bit widths for the joint transmission of rank indication and i1 for UE-selected sub-band reports for PDSCH transmissions associated with transmission mode 9/10 configured with higher layer parameter *eMIMO-Type* and *eMIMO-Type2*, and *eMIMO-Type* is set to 'CLASS A' with 8/12/16/20/24/28/32 antenna ports and *eMIMO-Type2* is set to 'CLASS B', where rank indication and i1 are associated with Class A. The parameters (S_1, S_2) in rank 1 and rank 2 are defined as $(S_1, S_2) = (1, 1)$ for *CodebookConfig*=1 and $(S_1, S_2) = (2, 2)$ for *CodebookConfig* =2, 3 and 4. The parameters (S_1, S_2) in rank 3 and 4 are defined as

$(S_1, S_2) = (1, 1)$ for *CodebookConfig*=1, $(S_1, S_2) = \left(\dfrac{O_1}{2}, \dfrac{O_2}{2} \right)$ for *CodebookConfig*=2, $(S_1, S_2) = \left(O_1, \dfrac{O_2}{2} \right)$ for

CodebookConfig=3, $(S_1, S_2) = \left(O_1, \dfrac{O_2}{4} \right)$ for *CodebookConfig*=4.

Table 5.2.3.3.2-4I: UCI fields for channel quality information feedback for report of i1 and rank indication feedback (transmission mode 9/10 configured with higher layer parameter *eMIMO-Type* and *eMIMO-Type2,* and *eMIMO-Type* is set to 'CLASS A' with codebook configuration (N_1, N_2, O_1, O_2), where i1 and rank indication are associated with Class A)

Field	Bit width		
	Max 1 or 2 layers	Max 4 or 8 layers	
	Rank = 1	Rank = 1	Rank =3
Wideband first PMI i1,1	$\lceil \log_2(N_1 O_1 / S_1) \rceil$	$\lceil \log_2(N_1 O_1 / S_1) \rceil$	$\left\lceil \log_2\left(\frac{N_1 O_1}{S_1} \times \left(2 + \left\lfloor \frac{9 - N_2}{8} \right\rfloor \right) \right) \right\rceil$
Wideband first PMI i1,2	$\lceil \log_2(N_2 O_2 / S_2) \rceil$	$\lceil \log_2(N_2 O_2 / S_2) \rceil$	$\lceil \log_2(N_2 O_2 / S_2) \rceil$
RI	0	1	

The channel quality bits in Table 5.2.3.3.2-1 through Table 5.2.3.3.2-3C-1 form the bit sequence $a_0, a_1, a_2, a_3, ..., a_{A-1}$ with a_0 corresponding to the first bit of the first field in each of the tables, a_1 corresponding to the second bit of the first field in each of the tables, and a_{A-1} corresponding to the last bit in the last field in each of the tables. The first bit of each field corresponds to MSB and the last bit LSB. The RI feedback for one bit is mapped according to Table 5.2.2.6-5 with o_0^{RI} replaced by a_0. The RI feedback for two bits is mapped according to Table 5.2.2.6-6 with o_0^{RI}, o_1^{RI} replaced by a_0, a_1. The RI feedback for three bits is mapped according to Table 5.2.2.6-7 with o_0^{RI}, o_1^{RI}, o_2^{RI} replaced by a_0, a_1, a_2. The same procedures for RI mapping are applied to CRI, replacing RI with CRI.

When multiplexed with UL-SCH, the channel coding and multiplexing for the transmission configurations in Table 5.2.3.3.2-4, Table 5.2.3.3.2-4A, Table 5.2.3.3.2-4B, Table 5.2.3.3.2-4C, Table 5.2.3.3.2-4D, Table 5.2.3.3.2-4F, Table 5.2.3.3.2-4G and Table 5.2.3.3.2-4I is performed assuming RI transmission in subclause 5.2.2.6. All other transmission configurations in this subclause are coded and multiplexed assuming CQI/PMI transmission in subclause 5.2.2.6.

For transmission mode 9/10 configured with Class B CSI reporting and K>1, the number of antenna port in Table 5.2.3.3.2-4C, 5.2.3.3.2-4D refers to the maximum number of antenna ports of K CSI-RS resources configured for the CSI-process for the UE.

For transmission mode 9/10 configured with Class B CSI reporting and K>1, and with *activatedResources*>1, the number of antenna ports in Table 5.2.3.3.2-4F and Table 5.2.3.3.2-4G refers to the maximum number of antenna ports of N CSI-RS resources activated for the CSI-process for the UE.

5.2.3.4 Channel coding for UCI channel quality information and HARQ-ACK

This subclause defines the channel coding scheme for the simultaneous transmission of channel quality information and HARQ-ACK information in a subframe.

When normal CP is used for uplink transmission, the channel quality information is coded according to subclause 5.2.3.3 with input bit sequence $a'_0, a'_1, a'_2, a'_3, ..., a'_{A-1}$ and output bit sequence $b'_0, b'_1, b'_2, b'_3, ..., b'_{B'-1}$, where $B' = 20$. The HARQ-ACK bits are denoted by a''_0 in case one HARQ-ACK bit or a''_0, a''_1 in case two HARQ-ACK bits are reported per subframe. Each positive acknowledgement (ACK) is encoded as a binary '1' and each negative acknowledgement (NACK) is encoded as a binary '0'.

The output of this channel coding block for normal CP is denoted by $b_0, b_1, b_2, b_3, ..., b_{B-1}$, where

$$b_i = b'_i, i = 0, ..., B' - 1$$

In case one HARQ-ACK bit is reported per subframe:

$$b_{B'} = a''_0 \text{ and } B = (B' + 1)$$

In case two HARQ-ACK bits are reported per subframe:

$$b_{B'} = a''_0, b_{B'+1} = a''_1 \text{ and } B = (B' + 2)$$

When extended CP is used for uplink transmission, the channel quality information and the HARQ-ACK bits are jointly coded. The HARQ-ACK bits are denoted by a_0'' in case one HARQ-ACK bit or $[a_0'', a_1'']$ in case two HARQ-ACK bits are reported per subframe.

The channel quality information denoted by $a_0', a_1', a_2', a_3', ..., a_{A'-1}'$ is multiplexed with the HARQ-ACK bits to yield the sequence $a_0, a_1, a_2, a_3, ..., a_{A-1}$ as follows

$$a_i = a_i', i = 0, ..., A'-1$$

and

$a_{A'} = a_0''$ and $A = (A'+1)$ in case one HARQ-ACK bit is reported per subframe, or

$a_{A'} = a_0''$, $a_{(A'+1)} = a_1''$ and $A = (A'+2)$ in case two HARQ-ACK bits are reported per subframe.

The sequence $a_0, a_1, a_2, a_3, ..., a_{A-1}$ is encoded according to subclause 5.2.3.3 to yield the output bit sequence $b_0, b_1, b_2, b_3, ..., b_{B-1}$ where $B = 20$.

5.2.4 Uplink control information on PUSCH without UL-SCH data

When control data are sent via PUSCH without UL-SCH data, the following coding steps can be identified:

- Channel coding of control information

- Control information mapping

- Channel interleaver

5.2.4.1 Channel coding of control information

Control data arrives at the coding unit in the form of channel quality information (CQI and/or PMI), HARQ-ACK and rank indication. Different coding rates for the control information are achieved by allocating different number of coded symbols for its transmission. When the UE transmits HARQ-ACK bits or rank indicator bits, it shall determine the number of coded symbols Q' for HARQ-ACK or rank indicator as

$$Q' = \min\left(\left\lceil \frac{O \cdot M_{sc}^{PUSCH} \cdot N_{symb}^{PUSCH} \cdot \beta_{offset}^{PUSCH}}{O_{CQI-MIN}} \right\rceil, N_{symb}^{UCI} \cdot M_{sc}^{PUSCH}\right)$$

where

- O is the number of HARQ-ACK bits as defined in subclause 5.2.2.6, or rank indicator bits,

- $O_{CQI-MIN}$ is the number of CQI bits including CRC bits assuming rank equals to 1 for all serving cells for which an aperiodic CSI report is triggered [3],

- N_{symb}^{UCI} is 4 for PUSCH with subframe duration, N_{symb}^{UCI} is 2 for PUSCH with slot duration, or for Partial PUSCH Mode 2 or 3. N_{symb}^{UCI} is 1 for PUSCH with subslot duration,

- M_{sc}^{PUSCH} is the scheduled bandwidth for PUSCH transmission in the current subframe/slot/subslot expressed as a number of subcarriers in [2], and

- N_{symb}^{PUSCH} is the number of SC-FDMA symbols in the current PUSCH transmission subframe/slot/subslot given by $N_{symb}^{PUSCH} = \left(\tilde{N}_{symb}^{UL} - N_{SRS} - N_{start}^{PUSCH} - N_{end}^{PUSCH}\right)$, where

  - $\tilde{N}_{symb}^{UL} = \left(N_{symb}^{UL} - 1\right)$ for PUSCH with slot duration, or for Partial PUSCH Mode 2 or 3, or

- $\tilde{N}_{\text{symb}}^{\text{UL}} = N_{\text{symb}}^{subslot} - N_{DMRS}$ for PUSCH with subslot duration,

  - $N_{\text{symb}}^{subslot}$ is the number of SC-FDMA symbols of the subslot as defined in subclause 4.1 of [2],

  - N_{DMRS} is the number of SC-FDMA symbols for DMRS of the subslot as defined in subclause 5.5.2.1.2 of [2]

- otherwise $\tilde{N}_{\text{symb}}^{\text{UL}} = 2\left(N_{\text{symb}}^{\text{UL}} - 1\right)$.

- N_{SRS} is equal to 1

  - if UE is configured to send PUSCH and SRS in the same subframe/slot/subslot for the current subframe, or

  - if the PUSCH resource allocation for the current subframe/slot/subslot even partially overlaps with the cell-specific SRS subframe and bandwidth configuration defined in subclause 5.5.3 of [2], and for PUSCH with slot/subslot duration if the current slot/subslot is the last slot/subslot in a subframe, or

  - if the current subframe/slot/subslot is within a UE-specific type-1 SRS subframe as defined in Subclause 8.2 of [3], and for PUSCH with slot/subslot duration if the current slot/subslot is the last slot/subslot in a subframe, or

  - if the current subframe/slot/subslot is within a UE-specific type-0 SRS subframe as defined in subclause 8.2 of [3] and the UE is configured with multiple TAGs, and for PUSCH with slot/subslot duration if the current slot/subslot is the last slot/subslot in a subframe.

  - Otherwise N_{SRS} is equal to 0.

- N_{start}^{PUSCH} is equal to 1 when the UE configured for uplink transmission on a LAA SCell is indicated to transmit the PUSCH not starting from the beginning of the first symbol or the seventh symbol of the current subframe, otherwise is equal to 0.

- N_{end}^{PUSCH} is equal to 1 when the UE configured for uplink transmission on a LAA SCell is indicated to transmit the PUSCH up to the second to last symbol of the current subframe and N_{SRS} is equal to 0, otherwise is equal to 0.

For HARQ-ACK information $Q_{ACK} = Q_m \cdot Q'$ and [$\beta_{offset}^{PUSCH} = \beta_{offset}^{HARQ-ACK} \big/ \beta_{offset}^{CQI}$]. For UEs configured with no more than five DL cells, $\beta_{offset}^{HARQ-ACK}$ shall be determined according to [3] depending on the duration for the corresponding PUSCH (subframe/slot/subslot), and the beta offset indicator in PDCCH/SPDCCH with DCI format 7-0A/7-0B when the duration for the corresponding PUSCH is subslot. For UEs configured with more than five DL cells, $\beta_{offset}^{HARQ-ACK}$ shall be determined according to [3] depending on the number of HARQ-ACK feedback bits, the duration for the corresponding PUSCH (subframe/slot/subslot), and the beta offset indicator in PDCCH/SPDCCH with DCI format 7-0A/7-0B when the duration for the corresponding PUSCH is subslot.

For rank indication or CRI, $Q_{RI} = Q_m \cdot Q'$, $Q_{CRI} = Q_m \cdot Q'$ and [$\beta_{offset}^{PUSCH} = \beta_{offset}^{RI} \big/ \beta_{offset}^{CQI}$], where β_{offset}^{RI} shall be determined according to [3] depending on the duration for the corresponding PUSCH (subframe/slot/subslot), and the beta offset indicator in PDCCH/SPDCCH with DCI format 7-0A/7-0B when the duration for the corresponding PUSCH is subslot.

For CQI and/or PMI information $Q_{CQI} = N_{symb}^{PUSCH} \cdot M_{sc}^{PUSCH} \cdot Q_m - Q_{RI}$.

The channel coding and rate matching of the control data is performed according to subclause 5.2.2.6. The coded output sequence for channel quality information is denoted by $q_0, q_1, q_2, q_3, ..., q_{Q_{CQI}-1}$, the coded vector sequence output for

HARQ-ACK is denoted by $\underline{q}_0^{ACK}, \underline{q}_1^{ACK}, \underline{q}_2^{ACK}, ..., \underline{q}_{Q'_{ACK}-1}^{ACK}$ and the coded vector sequence output for rank indication or CRI, is denoted by $\underline{q}_0^{RI}, \underline{q}_1^{RI}, \underline{q}_2^{RI}, ..., \underline{q}_{Q'_{RI}-1}^{RI}$.

5.2.4.2 Control information mapping

The input are the coded bits of the channel quality information denoted by $q_0, q_1, q_2, q_3, ..., q_{Q_{CQI}-1}$. The output is denoted by $\underline{g}_0, \underline{g}_1, \underline{g}_2, \underline{g}_3, ..., \underline{g}_{H'-1}$, where $H = Q_{CQI}$ and $H' = H / Q_m$, and where $\underline{g}_i$, $i = 0,..., H'-1$ are column vectors of length Q_m. H is the total number of coded bits allocated for CQI/PMI information.

The control information shall be mapped as follows:

Set j, k to 0

while $j < Q_{CQI}$

$\quad \underline{g}_k = [q_j \ldots q_{j+Q_m-1}]^T$

$\quad j = j + Q_m$

$\quad k = k + 1$

end while

5.2.4.3 Channel interleaver

The vector sequences $\underline{g}_0, \underline{g}_1, \underline{g}_2, ..., \underline{g}_{H'-1}$, $\underline{q}_0^{RI}, \underline{q}_1^{RI}, \underline{q}_2^{RI}, ..., \underline{q}_{Q'_{RI}-1}^{RI}$ and $\underline{q}_0^{ACK}, \underline{q}_1^{ACK}, \underline{q}_2^{ACK}, ..., \underline{q}_{Q'_{ACK}-1}^{ACK}$ are channel interleaved according subclause 5.2.2.8. The bits after channel interleaving are denoted by $h_0, h_1, h_2, ..., h_{H+Q_{RI}-1}$.

5.3 Downlink transport channels and control information

If the UE is configured with a Master Cell Group (MCG) and Secondary Cell Group (SCG) [6], the procedures described in this clause are applied to the MCG and SCG, respectively. When the procedures are applied to a SCG, the term primary cell refers to the primary SCell (PSCell) of the SCG.

If the UE is configured with a PUCCH SCell [6], the procedures described in this clause are applied to the group of DL cells associated with the primary cell and the group of DL cells associated with the PUCCH SCell, respectively. When the procedures are applied to the group of DL cells associated with the PUCCH SCell, the term primary cell refers to the PUCCH SCell.

If the UE is configured with a LAA SCell, the procedures described in this clause are applied assuming the LAA SCell is an FDD SCell.

5.3.1 Broadcast channel

Figure 5.3.1-1 shows the processing structure for the BCH transport channel. Data arrives to the coding unit in the form of a maximum of one transport block every transmission time interval (TTI) of 40ms, or 160ms for a MBMS-dedicated cell. The following coding steps can be identified:

- Add CRC to the transport block

- Channel coding

- Rate matching

The coding steps for BCH transport channel are shown in the figure below.
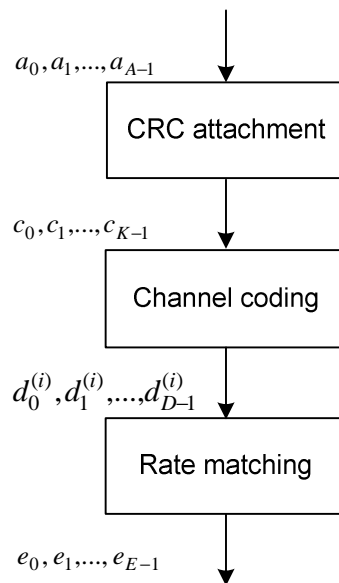

Figure 5.3.1-1: Transport channel processing for BCH

5.3.1.1 Transport block CRC attachment

Error detection is provided on BCH transport blocks through a Cyclic Redundancy Check (CRC).

The entire transport block is used to calculate the CRC parity bits. Denote the bits in a transport block delivered to layer 1 by $a_0, a_1, a_2, a_3, ..., a_{A-1}$, and the parity bits by $p_0, p_1, p_2, p_3, ..., p_{L-1}$. A is the size of the transport block and set to 24 bits and L is the number of parity bits. The lowest order information bit a_0 is mapped to the most significant bit of the transport block as defined in subclause 6.1.1 of [5].

The parity bits are computed and attached to the BCH transport block according to subclause 5.1.1 setting L to 16 bits. After the attachment, the CRC bits are scrambled according to the eNodeB transmit antenna configuration with the sequence $x_{ant,0}, x_{ant,1}, ..., x_{ant,15}$ as indicated in Table 5.3.1.1-1 to form the sequence of bits $c_0, c_1, c_2, c_3, ..., c_{K-1}$ where

$$c_k = a_k \quad \text{for } k = 0, 1, 2, ..., A\text{-}1$$

$$c_k = \left(p_{k-A} + x_{ant,k-A}\right) \bmod 2 \quad \text{for } k = A, A+1, A+2, ..., A+15.$$

Table 5.3.1.1-1: CRC mask for PBCH

Number of transmit antenna ports at eNodeB	PBCH CRC mask $< x_{ant,0}, x_{ant,1}, ..., x_{ant,15} >$
1	<0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0>
2	<1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1>
4	<0, 1, 0, 1, 0, 1, 0, 1, 0, 1, 0, 1, 0, 1, 0, 1>

5.3.1.2 Channel coding

Information bits are delivered to the channel coding block. They are denoted by $c_0, c_1, c_2, c_3, ..., c_{K-1}$, where K is the number of bits, and they are tail biting convolutionally encoded according to subclause 5.1.3.1.

After encoding the bits are denoted by $d_0^{(i)}, d_1^{(i)}, d_2^{(i)}, d_3^{(i)}, ..., d_{D-1}^{(i)}$, with $i = 0, 1,$ and 2, and where D is the number of bits on the i-th coded stream, i.e., $D = K$.

5.3.1.3 Rate matching

A tail biting convolutionally coded block is delivered to the rate matching block. This block of coded bits is denoted by $d_0^{(i)}, d_1^{(i)}, d_2^{(i)}, d_3^{(i)}, ..., d_{D-1}^{(i)}$, with $i = 0,1$, and 2, and where i is the coded stream index and D is the number of bits in each coded stream. This coded block is rate matched according to subclause 5.1.4.2.

After rate matching, the bits are denoted by $e_0, e_1, e_2, e_3, ..., e_{E-1}$, where E is the number of rate matched bits as defined in subclause 6.6.1 of [2].

5.3.2 Downlink shared channel, Paging channel and Multicast channel

Figure 5.3.2-1 shows the processing structure for each transport block for the DL-SCH, PCH and MCH transport channels. Data arrives to the coding unit in the form of a maximum of two transport blocks every transmission time interval (TTI) per DL cell. The following coding steps can be identified for each transport block of a DL cell:

- Add CRC to the transport block

- Code block segmentation and code block CRC attachment

- Channel coding

- Rate matching

- Code block concatenation

The coding steps for PCH and MCH transport channels, and for one transport block of DL-SCH are shown in the figure below. The same processing applies for each transport block on each DL cell.
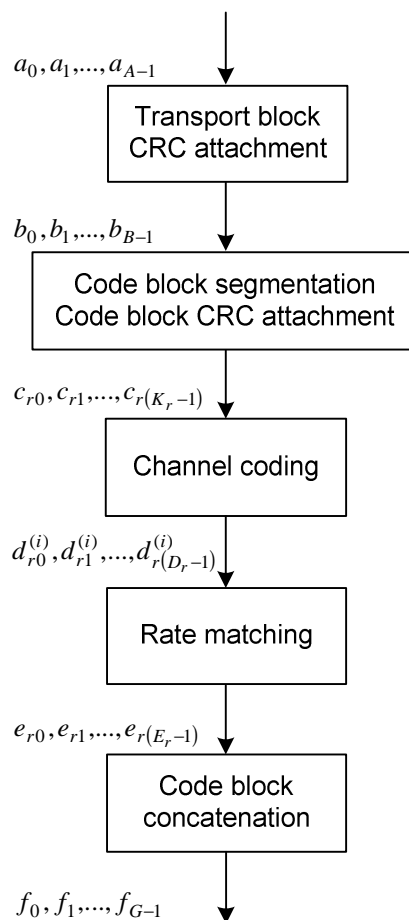

Figure 5.3.2-1: Transport block processing for DL-SCH, PCH and MCH

5.3.2.1 Transport block CRC attachment

Error detection is provided on transport blocks through a Cyclic Redundancy Check (CRC).

The entire transport block is used to calculate the CRC parity bits. Denote the bits in a transport block delivered to layer 1 by $a_0, a_1, a_2, a_3, ..., a_{A-1}$, and the parity bits by $p_0, p_1, p_2, p_3, ..., p_{L-1}$. A is the size of the transport block and L is the number of parity bits. The lowest order information bit a_0 is mapped to the most significant bit of the transport block as defined in subclause 6.1.1 of [5].

The parity bits are computed and attached to the transport block according to subclause 5.1.1 setting L to 24 bits and using the generator polynomial $g_{CRC24A}(D)$.

5.3.2.2 Code block segmentation and code block CRC attachment

The bits input to the code block segmentation are denoted by $b_0, b_1, b_2, b_3, ..., b_{B-1}$ where B is the number of bits in the transport block (including CRC).

Code block segmentation and code block CRC attachment are performed according to subclause 5.1.2.

The bits after code block segmentation are denoted by $c_{r0}, c_{r1}, c_{r2}, c_{r3}, ..., c_{r(K_r-1)}$, where r is the code block number and K_r is the number of bits for code block number r.

5.3.2.3 Channel coding

Code blocks are delivered to the channel coding block. They are denoted by $c_{r0}, c_{r1}, c_{r2}, c_{r3}, ..., c_{r(K_r-1)}$, where r is the code block number, and K_r is the number of bits in code block number r. The total number of code blocks is denoted by C and each code block is individually turbo encoded according to subclause 5.1.3.2.

After encoding the bits are denoted by $d_{r0}^{(i)}, d_{r1}^{(i)}, d_{r2}^{(i)}, d_{r3}^{(i)}, ..., d_{r(D_r-1)}^{(i)}$, with $i = 0, 1,$ and 2, and where D_r is the number of bits on the i-th coded stream for code block number r, i.e. $D_r = K_r + 4$.

5.3.2.4 Rate matching

Turbo coded blocks are delivered to the rate matching block. They are denoted by $d_{r0}^{(i)}, d_{r1}^{(i)}, d_{r2}^{(i)}, d_{r3}^{(i)}, ..., d_{r(D_r-1)}^{(i)}$, with $i = 0, 1,$ and 2, and where r is the code block number, i is the coded stream index, and D_r is the number of bits in each coded stream of code block number r. The total number of code blocks is denoted by C and each coded block is individually rate matched according to subclause 5.1.4.1.

After rate matching, the bits are denoted by $e_{r0}, e_{r1}, e_{r2}, e_{r3}, ..., e_{r(E_r-1)}$, where r is the coded block number, and where E_r is the number of rate matched bits for code block number r.

5.3.2.5 Code block concatenation

The bits input to the code block concatenation block are denoted by $e_{r0}, e_{r1}, e_{r2}, e_{r3}, ..., e_{r(E_r-1)}$ for $r = 0, ..., C-1$ and where E_r is the number of rate matched bits for the r-th code block.

Code block concatenation is performed according to subclause 5.1.5.

The bits after code block concatenation are denoted by $f_0, f_1, f_2, f_3, ..., f_{G-1}$, where G is the total number of coded bits for transmission. This sequence of coded bits corresponding to one transport block after code block concatenation is referred to as one codeword in subclause 6.3.1 of [2]. In case of multiple transport blocks per TTI, the transport block to codeword mapping is specified according to subclause 5.3.3.1.5, 5.3.3.1.5A or 5.3.3.1.5B, depending on the DCI Format.

5.3.3 Downlink control information

A DCI transports downlink, uplink or sidelink scheduling information, requests for aperiodic CQI reports, LAA common information, notifications of MCCH change [6] or uplink power control commands for one cell and one RNTI. The RNTI is implicitly encoded in the CRC.

Figure 5.3.3-1 shows the processing structure for one DCI. The following coding steps can be identified:

- Information element multiplexing

- CRC attachment

- Channel coding

- Rate matching

The coding steps for DCI are shown in the figure below.

$a_0, a_1, ..., a_{A-1}$

CRC attachment

$c_0, c_1, ..., c_{K-1}$

Channel coding

$d_0^{(i)}, d_1^{(i)}, ..., d_{D-1}^{(i)}$

Rate matching

$e_0, e_1, ..., e_{E-1}$
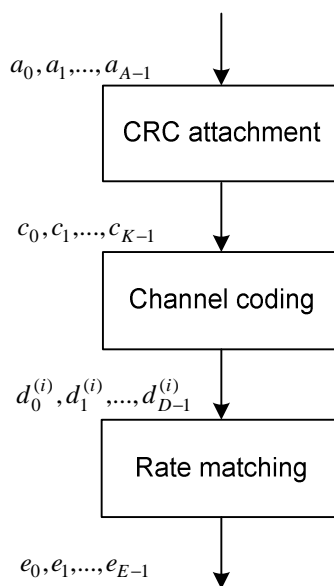

Figure 5.3.3-1: Processing for one DCI

5.3.3.1 DCI formats

The fields defined in the DCI formats below are mapped to the information bits a_0 to a_{A-1} as follows.

Each field is mapped in the order in which it appears in the description, including the zero-padding bit(s), if any, with the first field mapped to the lowest order information bit a_0 and each successive field mapped to higher order information bits. The most significant bit of each field is mapped to the lowest order information bit for that field, e.g. the most significant bit of the first field is mapped to a_0.

5.3.3.1.1 Format 0

DCI format 0 is used for the scheduling of PUSCH in one UL cell.

The following information is transmitted by means of the DCI format 0:

- Carrier indicator – 0 or 3 bits. This field is present according to the definitions in [3].

- Flag for format0/format1A differentiation – 1 bit, where value 0 indicates format 0 and value 1 indicates format 1A

- Frequency hopping flag – 1 bit as defined in subclause 8.4 of [3]. This field is used as the MSB of the corresponding resource allocation field for resource allocation type 1.

- Resource block assignment and hopping resource allocation – $\left\lceil \log_2(N_{RB}^{UL}(N_{RB}^{UL}+1)/2) \right\rceil$ bits

  - For PUSCH hopping (resource allocation type 0 only):

    - N_{UL_hop} MSB bits are used to obtain the value of $\tilde{n}_{PRB}(i)$ as indicated in subclause 8.4 of [3]

    - $\left(\left\lceil \log_2(N_{RB}^{UL}(N_{RB}^{UL}+1)/2) \right\rceil - N_{UL\_hop} \right)$ bits provide the resource allocation of the first slot in the UL subframe

  - For non-hopping PUSCH with resource allocation type 0:

    - $\left(\left\lceil \log_2(N_{RB}^{UL}(N_{RB}^{UL}+1)/2) \right\rceil \right)$ bits provide the resource allocation in the UL subframe as defined in subclause 8.1.1 of [3]

  - For non-hopping PUSCH with resource allocation type 1:

    - The concatenation of the frequency hopping flag field and the resource block assignment and hopping resource allocation field provides the resource allocation field in the UL subframe as defined in subclause 8.1.2 of [3]

- Modulation and coding scheme and redundancy version – 5 bits as defined in subclause 8.6 of [3]

- New data indicator – 1 bit

- HARQ process number – 4 bits if higher layer parameter *ul-STTI-Length* is configured for the cell, otherwise 3 bits (this field is present when higher layer parameter *shortProcessingTime* is configured for the cell and the corresponding DCI is mapped onto the UE specific search space given by the C-RNTI as defined in [3])

- Redundancy version – 2 bits (this field is present when higher layer parameter *shortProcessingTime* is configured for the cell and the corresponding DCI is mapped onto the UE specific search space given by the C-RNTI as defined in [3])

- TPC command for scheduled PUSCH – 2 bits as defined in subclause 5.1.1.1 of [3]

- Cyclic shift for DM RS and OCC index and IFDMA configuration – 3 bits as defined in subclause 5.5.2.1.1 of [2] (this field is not present when the format 0 CRC is scrambled by UL-SPS-V-RNTI)

- UL SPS configuration index – 3 bits as defined in subclause 9.2.1 of [3]. (this field is present when the format 0 CRC is scrambled by UL-SPS-V-RNTI)

- UL index – 2 bits as defined in subclauses 5.1.1.1, 7.2.1, 8 and 8.4 of [3] (this field is present only for TDD operation with uplink-downlink configuration 0, or TDD operation with uplink-downlink configuration 6 and special subframe configuration 10 when the higher layer parameter *symPUSCH-UpPts* or *shortProcessingTime* is configured for the cell and the corresponding DCI is mapped onto the UE specific search space given by the C-RNTI as defined in [3])

- Downlink Assignment Index (DAI) – 2 bits as defined in subclause 7.3 of [3] (this field is present only for the following cases: 1) TDD primary cell and either TDD operation with uplink-downlink configurations 1-6 or FDD operation; or 2) EN-DC/NE-DC with FDD primary cell and higher layer parameter *subframeAssignment-r15* configured and the corresponding DCI is mapped onto the UE specific search space given by the C-RNTI as defined in [3])

- CSI request – 1, 2, 3, 4 or 5 bits as defined in subclause 7.2.1 of [3].

  If UEs are not configured with CSI-RS-ConfigNZPAperiodic or if UEs are configured with CSI-RS-ConfigNZPAperiodic and numberActivatedAperiodicCSI-RS-Resources=1 for each CSI process,

  the 2-bit field applies to UEs configured with no more than five DL cells and to

  - UEs that are configured with more than one DL cell and when the corresponding DCI format is mapped onto the UE specific search space given by the C-RNTI as defined in [3];

- UEs that are configured by higher layers with more than one CSI process and when the corresponding DCI format is mapped onto the UE specific search space given by the C-RNTI as defined in [3];

- UEs that are configured with two CSI measurement sets by higher layers with the parameter *csi-MeasSubframeSet,* and when the corresponding DCI format is mapped onto the UE specific search space given by the C-RNTI as defined in [3];

the 3-bit field applies to UEs that are configured with more than five DL cells and when the corresponding DCI format is mapped onto the UE specific search space given by the C-RNTI as defined in [3];

otherwise the 1-bit field applies

If UEs are configured with CSI-RS-ConfigNZPAperiodic and numberActivatedAperiodicCSI-RS-Resources>1 for at least one CSI process,

the 4-bit field applies to UEs configured with no more than five DL cells and to

- UEs that are configured with more than one DL cell and when the corresponding DCI format is mapped onto the UE specific search space given by the C-RNTI as defined in [3];

- UEs that are configured by higher layers with more than one CSI process and when the corresponding DCI format is mapped onto the UE specific search space given by the C-RNTI as defined in [3];

- UEs that are configured with two CSI measurement sets by higher layers with the parameter *csi-MeasSubframeSet,* and when the corresponding DCI format is mapped onto the UE specific search space given by the C-RNTI as defined in [3];

the 5-bit field applies to UEs that are configured with more than five DL cells and when the corresponding DCI format is mapped onto the UE specific search space given by the C-RNTI as defined in [3];

otherwise the 3-bit field applies.

- SRS request – 0 or 1 bit. This field can only be present in DCI formats scheduling PUSCH which are mapped onto the UE specific search space given by the C-RNTI as defined in [3]. The interpretation of this field is provided in subclause 8.2 of [3]

- Resource allocation type – 1 bit. This field is only present if $N_{\mathrm{RB}}^{\mathrm{UL}} \leq N_{\mathrm{RB}}^{\mathrm{DL}}$. The interpretation of this field is provided in subclause 8.1 of [3]

- Cyclic Shift Field mapping table for DMRS – 1 bit as defined in subclause 5.5.2.1.1 of [2]. The 1-bit field applies to UEs that are configured with higher layer parameter *UL-DMRS-IFDMA*, and when the corresponding DCI format is mapped onto the UE-specific search space given by the C-RNTI as defined in [3]. When the format 0 CRC is scrambled by SPS C-RNTI, this field is set to zero.

If the number of information bits in format 0 mapped onto a given search space is less than the payload size of format 1A for scheduling the same serving cell and mapped onto the same search space (including any padding bits appended to format 1A), zeros shall be appended to format 0 until the payload size equals that of format 1A.

5.3.3.1.1A   Format 0A

DCI format 0A is used for the scheduling of PUSCH in a LAA SCell, or activating/releasing AUL transmission as defined in [3], or indicating AUL downlink feedback information (AUL-DFI) to a UE that is activated with AUL transmission.

The following information is transmitted by means of the DCI format 0A:

- Carrier indicator – 0 or 3 bits. This field is present according to the definitions in [3].

If the format 0A DCI is scrambled by C-RNTI

- Flag for format0A/format1A differentiation – 1 bit, where value 0 indicates format 0A and value 1 indicates format 1A;

Else

- Flag for AUL differentiation – 1 bit, where value 0 indicates activating/releasing AUL transmission and value 1 indicates AUL-DFI.

If the format 0A is used for the scheduling of PUSCH in a LAA SCell or activating/releasing AUL transmission for a UE, all the remaining fields are set as follows:

- PUSCH trigger A – 1 bit, where value 0 indicates non-triggered scheduling and value 1 indicates triggered scheduling as defined in subclause 8.0 of [3].

- Timing offset – 4 bits as defined in subclause 8.0 of [3].

  - When the PUSCH trigger A is set to 0,

    - The field indicates the absolute timing offset for the PUSCH transmission.

  - Otherwise,

    - The first two bits of the field indicate the timing offset, relative to the UL offset l as defined in clause 13A of [3], for the PUSCH transmission.

    - The last two bits of the field indicate the time window within which the scheduling of PUSCH via triggered scheduling is valid.

- Resource block assignment – 5 or 6 bits provide the resource allocation in the UL subframe as defined in subclause 8.1.4 of [3]

- Modulation and coding scheme – 5 bits as defined in subclause 8.6 of [3]

- HARQ process number – 4 bits.

- New data indicator – 1 bit

- Redundancy version – 2 bits as defined in subclause 8.6.1 of [3]

- TPC command for scheduled PUSCH – 2 bits as defined in subclause 5.1.1.1 of [3]

- Cyclic shift for DM RS and OCC index – 3 bits as defined in subclause 5.5.2.1.1 of [2]

- CSI request – 1, 2 or 3 bits as defined in subclause 7.2.1 of [3]. The 2-bit field applies to UEs configured with no more than five DL cells and to

  - UEs that are configured with more than one DL cell and when the corresponding DCI format is mapped onto the UE specific search space given by the C-RNTI as defined in [3];

  - UEs that are configured by higher layers with more than one CSI process and when the corresponding DCI format is mapped onto the UE specific search space given by the C-RNTI as defined in [3];

  - UEs that are configured with two CSI measurement sets by higher layers with the parameter *csi-MeasSubframeSet,* and when the corresponding DCI format is mapped onto the UE specific search space given by the C-RNTI as defined in [3];

  the 3-bit field applies to UEs that are configured with more than five DL cells and when the corresponding DCI format is mapped onto the UE specific search space given by the C-RNTI as defined in [3];

  otherwise the 1-bit field applies

- SRS request – 1 bit. The interpretation of this field is provided in subclause 8.2 of [3]

- Partial PUSCH Mode – 2 bits as specified in Table 5.3.3.1.1A-3. This field is only present when at least one of *laa-PUSCH-Mode1*, *laa-PUSCH-Mode2*, and *laa-PUSCH-Mode3* is configured. The UE is not expected to be indicated with a partial PUSCH mode that is not configured by RRC.

- PUSCH starting position – 2 bits

  - as specified in Table 5.3.3.1.1A-2 if the 'Partial PUSCH Mode' field indicates Partial PUSCH Mode 2;

  - as specified in Table 5.3.3.1.1A-1 otherwise.

- - PUSCH ending symbol – 1 bit, where

    - if the 'Partial PUSCH Mode' field indicates Partial PUSCH Mode 3, value 0 indicates symbol 6 of the subframe, and value 1 indicates symbol 3 of the subframe.

    - otherwise value 0 indicates the last symbol of the subframe and value 1 indicates the second to last symbol of the subframe.

- - Channel Access type – 1 bit as defined in subclause 4.2 of [8]

- - Channel Access Priority Class – 2 bits as defined in subclause 4.2 of [8]

If the format 0A is used for indicating AUL-DFI to a UE that is activated with AUL transmission, all the remaining fields are set as follows:

- - HARQ-ACK bitmap – 16 bits, where the order of the bitmap to HARQ process index mapping is such that HARQ process indices are mapped in ascending order from MSB to LSB of the bitmap. For each bit of the bitmap, value 1 indicates ACK, and value 0 indicates NACK.

- - TPC command – 2 bits as defined in subclause 5.1.1.1 of [3].

- - All the remaining bits in format 0A are set to zero.

If the number of information bits in format 0A mapped onto a given search space is less than the payload size of format 1A for scheduling the same serving cell and mapped onto the same search space (including any padding bits appended to format 1A), zeros shall be appended to format 0A until the payload size equals that of format 1A.

Table 5.3.3.1.1A-1: PUSCH starting position

Value	PUSCH starting position
00	symbol 0
01	25µs in symbol 0
10	(25+TA) µs in symbol 0
11	symbol 1

Table 5.3.3.1.1A-2: PUSCH starting position in the second slot

Value	PUSCH starting position
00	symbol 7
01	25µs in symbol 7
10	(25+TA) µs in symbol 7
11	symbol 8

Table 5.3.3.1.1A-3: Partial PUSCH Mode

Value	Partial PUSCH Mode	Starting position	Ending symbol
00	Partial PUSCH Mode 0	Indicated by 'PUSCH starting position' according to Table 5.3.3.1.1A-1	The last symbol of the subframe or the second to last symbol of the subframe
01	Partial PUSCH Mode 1	Indicated by 'PUSCH starting position' or at symbol 7, based on the result of the channel access procedure in 4.2.1 defined in [8]	The last symbol of the subframe or the second to last symbol of the subframe
10	Partial PUSCH Mode 2	Indicated by 'PUSCH starting position' according to Table 5.3.3.1.1A-2	The last symbol of the subframe or the second to last symbol of the subframe
11	Partial PUSCH Mode 3	Indicated by 'PUSCH starting position' according to Table 5.3.3.1.1A-1	Symbol 3 of the subframe or symbol 6 of the subframe

5.3.3.1.1B   Format 0B

DCI format 0B is used for the scheduling of PUSCH in each of multiple subframes in a LAA SCell.

The following information is transmitted by means of the DCI format 0B:

- Carrier indicator – 0 or 3 bits. This field is present according to the definitions in [3].

- PUSCH trigger A – 1 bit, where value 0 indicates non-triggered scheduling and value 1 indicates triggered scheduling as defined in subclause 8.0 of [3].

- Timing offset – 4 bits as defined in subclause 8.0 of [3].

    - When the PUSCH trigger A is set to 0,

        - The field indicates the absolute timing offset for the PUSCH transmission.

    - Otherwise,

        - The first two bits of the field indicate the timing offset, relative to the UL offset l as described in clause 13A of [3], for the PUSCH transmission.

        - The last two bits of the field indicate the time window within which the scheduling of PUSCH via triggered scheduling is valid.

- Number of scheduled subframes – 1 or 2 bits. The 1-bit field applies when *maxNumberOfSchedSubframes-Format0B-r14* is configured by higher layers to two, otherwise the 2-bit field applies.

- Resource block assignment – 5 or 6 bits provide the resource allocation in the UL subframe as defined in subclause 8.1.4 of [3].

- Modulation and coding scheme – 5 bits as defined in subclause 8.6 of [3].

- HARQ process number - 4 bits. The 4-bit applies to the first scheduled subframe, and the HARQ process numbers for other scheduled subframes are defined in subclause 8.0 of [3].

- New data indicator – *maxNumberOfSchedSubframes-Format0B-r14* bits. Each scheduled PUSCH corresponds to 1 bit.

- Redundancy version – *maxNumberOfSchedSubframes-Format0B-r14* bits. Each scheduled PUSCH corresponds to 1 bit as defined in subclause 8.6.1 of [3].

- TPC command for scheduled PUSCH – 2 bits as defined in subclause 5.1.1.1 of [3].

- Cyclic shift for DM RS and OCC index – 3 bits as defined in subclause 5.5.2.1.1 of [2].

- CSI request – 1, 2 or 3 bits as defined in subclause 7.2.1 of [3]. The 2-bit field applies to UEs configured with no more than five DL cells and to

    - UEs that are configured with more than one DL cell and when the corresponding DCI format is mapped onto the UE specific search space given by the C-RNTI as defined in [3];

    - UEs that are configured by higher layers with more than one CSI process and when the corresponding DCI format is mapped onto the UE specific search space given by the C-RNTI as defined in [3];

    - UEs that are configured with two CSI measurement sets by higher layers with the parameter *csi-MeasSubframeSet,* and when the corresponding DCI format is mapped onto the UE specific search space given by the C-RNTI as defined in [3];

    the 3-bit field applies to UEs that are configured with more than five DL cells and when the corresponding DCI format is mapped onto the UE specific search space given by the C-RNTI as defined in [3];

    otherwise the 1-bit field applies.

- SRS request – 2 bits. The interpretation of this field is provided in subclause 8.2 of [3].

- Partial PUSCH Mode 1 – 1 bit only present if *laa-PUSCH-Mode1* is configured by higher layer, and applicable to each of the scheduled subframe(s), except for the first scheduled subframe in case the 'Partial PUSCH Mode 2' field is value 1 and the last scheduled subframe in case the 'Partial PUSCH Mode 3' field is value 1, where

    - value 0 indicates the starting position of the PUSCH is determined following Partial PUSCH Mode 0 as defined in Table 5.3.3.1.1A-3;

- value 1 indicates the starting position of the PUSCH of the first transmitted subframe is determined following Partial PUSCH Mode 1 as defined in Table 5.3.3.1.1A-3.

- Partial PUSCH Mode 2 – 1 bit. This field is only present if *laa-PUSCH-Mode2* is configured by higher layer, and applicable to only the first scheduled subframe.

- Partial PUSCH Mode 3 – 1 bit. This field is only present if *laa-PUSCH-Mode3* is configured by higher layer, and applicable to only the last scheduled subframe.

- PUSCH starting position – 2 bits

  - as specified in Table 5.3.3.1.1A-2 applicable to only the first scheduled subframe, if the 'Partial PUSCH Mode 2' field is value 1;

  - as specified in Table 5.3.3.1.1A-1 applicable to only the first scheduled subframe otherwise.

- PUSCH ending symbol – 1 bit, where

  - if the 'Partial PUSCH Mode 3' field is value 1, value 0 indicates symbol 6 of the last scheduled subframe, and value 1 indicates symbol 3 of the last scheduled subframe;

  - otherwise value 0 indicates the last symbol of the last scheduled subframe and value 1 indicates the second to last symbol of the last scheduled subframe.

- Channel Access type – 1 bit as defined in subclause 4.2 of [8].

- Channel Access Priority Class – 2 bits as defined in subclause 4.2 of [8].

If the number of information bits in format 0B is equal to the payload size for DCI format 1, 2, 2A, 2B, 2C or 2D associated with the configured DL transmission mode in the same serving cell, one zero bit shall be appended to format 0B.

5.3.3.1.1C   Format 0C

DCI format 0C is used for the scheduling of PUSCH in one UL cell.

The following information is transmitted by means of the DCI format 0C:

- Flag for format 0C/format1A differentiation – 1 bit, where value 0 indicates format 0C and value 1 indicates format 1A

- Resource allocation type – 1 bit. This field is only present if $N_{RB}^{UL} \leq N_{RB}^{DL}$. The interpretation of this field is provided in subclause 8.1 of [3]

- Frequency hopping flag – 1 bit as defined in subclause 5.3.4 of [2]. This field is used as the MSB of the corresponding resource allocation field for resource allocation type 1.

- Resource block assignment – $\left\lceil \log_2 (N_{RB}^{UL} (N_{RB}^{UL} + 1) / 2) \right\rceil$ bits

  - For PUSCH with resource allocation type 0:

    - $\left\lceil \log_2 (N_{RB}^{UL} (N_{RB}^{UL} + 1) / 2) \right\rceil$ bits provide the resource allocation in the UL subframe as defined in subclause 8.1.1 of [3]

  - For non-hopping PUSCH with resource allocation type 1:

    - The concatenation of the frequency hopping flag field and the resource block assignment field provides the resource allocation field in the UL subframe as defined in subclause 8.1.2 of [3]

- Modulation and coding scheme – 5 bits as defined in subclause 8.6 of [3]

- Repetition number – 3 bits as defined in subclause 8.0 of [3]

- HARQ process number – 3 bits

- New data indicator – 1 bit

- Redundancy version – 2 bits

- TPC command for scheduled PUSCH – 2 bits as defined in subclause 5.1.1.1 of [3]

- Cyclic shift for DM RS and OCC index – 3 bits as defined in subclause 5.5.2.1.1 of [2]

- UL index – 2 bits as defined in subclauses 5.1.1.1, 7.2.1, 8 and 8.4 of [3] (this field is present only for TDD operation with uplink-downlink configuration 0, or TDD operation with uplink-downlink configuration 6 and special subframe configuration 10 when the higher layer parameter *symPUSCH-UpPts* is configured)

- Downlink Assignment Index (DAI) – 2 bits as defined in subclause 7.3 of [3] (This field is present only for the following cases: 1) TDD primary cell and either TDD operation with uplink-downlink configurations 1-6 or FDD operation; or 2) EN-DC/NE-DC with FDD primary cell and higher layer parameter *subframeAssignment-r15* configured)

- CSI request – 1, 2 or 3 bits as defined in subclause 7.2.1 of [3]. The 2-bit field applies to UEs configured with no more than five DL cells and to

    - UEs that are configured with more than one DL cell and when the corresponding DCI format is mapped onto the UE specific search space given by the C-RNTI as defined in [3];

    - UEs that are configured by higher layers with more than one CSI process and when the corresponding DCI format is mapped onto the UE specific search space given by the C-RNTI as defined in [3];

    - UEs that are configured with two CSI measurement sets by higher layers with the parameter *csi-MeasSubframeSet,* and when the corresponding DCI format is mapped onto the UE specific search space given by the C-RNTI as defined in [3];

the 3-bit field applies to UEs that are configured with more than five DL cells and when the corresponding DCI format is mapped onto the UE specific search space given by the C-RNTI as defined in [3];

otherwise the 1-bit field applies

- SRS request –1 bit. The interpretation of this field is provided in subclause 8.2 of [3]

- Modulation order override – 1 bit as defined in subclause 8.6.1 of [3]

- Precoding information: number of bits as specified in Table 5.3.3.1.8-1. This field is present only if the higher layer parameter *transmissionModeUL* is configured to be transmission mode 2. Bit field as shown in Table 5.3.3.1.8-2 and Table 5.3.3.1.8-3, where only codeword 0 is enabled and the indexes corresponding to 1 layer are used. Note that TPMI for 2 antenna ports indicates which codebook index is to be used in Table 5.3.3A.2-1 of [2], and TPMI for 4 antenna ports indicates which codebook index is to be used in Table 5.3.3A.2-2, Table 5.3.3A.2-3, Table 5.3.3A.2-4 and Table 5.3.3A.2-5 of [2]. The transport block is mapped to codeword 0.

If the number of information bits in format 0C mapped onto a given search space is less than the payload size of format 1A for scheduling the same serving cell and mapped onto the same search space (including any padding bits appended to format 1A), zeros shall be appended to format 0C until the payload size equals that of format 1A.

5.3.3.1.2 Format 1

DCI format 1 is used for the scheduling of one PDSCH codeword in one cell.

The following information is transmitted by means of the DCI format 1:

- Carrier indicator – 0 or 3 bits. This field is present according to the definitions in [3].

- Resource allocation header (resource allocation type 0 / type 1) – 1 bit as defined in subclause 7.1.6 of [3]

    If downlink bandwidth is less than or equal to 10 PRBs, there is no resource allocation header and resource allocation type 0 is assumed.

- Resource block assignment:

    - For resource allocation type 0 as defined in subclause 7.1.6.1 of [3]:

- $\left\lceil N_{\mathrm{RB}}^{\mathrm{DL}} / P \right\rceil$ bits provide the resource allocation

  - For resource allocation type 1 as defined in subclause 7.1.6.2 of [3]:

    - $\left\lceil \log_2(P) \right\rceil$ bits of this field are used as a header specific to this resource allocation type to indicate the selected resource blocks subset

    - 1 bit indicates a shift of the resource allocation span

    - $\left(\left\lceil N_{\mathrm{RB}}^{\mathrm{DL}} / P \right\rceil - \left\lceil \log_2(P) \right\rceil - 1 \right)$ bits provide the resource allocation

  where the value of P depends on the number of DL resource blocks as indicated in subclause 7.1.6.1 of [3]

- Modulation and coding scheme – 5 bits if higher layer parameter *altMCS-Table* is not configured, 6 bits otherwise, as defined in subclause 7.1.7 of [3]

- HARQ process number – 4 bits if higher layer parameter *dl-STTI-Length* is configured for the cell, otherwise 3 bits (for cases with FDD primary cell not configured with EN-DC/NE-DC and higher layer parameter *subframeAssignment-r15*), 4 bits (for cases with TDD primary cell, or for cases with EN-DC/NE-DC with FDD primary cell and higher layer parameter *subframeAssignment-r15* configured)

- New data indicator – 1 bit

- Redundancy version – 2 bits

- TPC command for PUCCH – 2 bits as defined in subclause 5.1.2.1 of [3]

- Downlink Assignment Index – number of bits as specified in Table 5.3.3.1.2-2.

- HARQ-ACK resource offset (this field is present when this format is carried by EPDCCH. This field is not present when this format is carried by PDCCH) – 2 bits as defined in subclause 10.1 of [3]. The 2 bits are set to 0 when this format is carried by EPDCCH on a secondary cell, or when this format is carried by EPDCCH on the primary cell scheduling PDSCH on a secondary cell and the UE is configured with PUCCH format 3 for HARQ-ACK feedback.

- MUST interference presence and power ratio – 0 or 2 bits as defined in subclause 6.3.3 of [2]. This field is present only when the UE is configured for MUST-near operation and the number of antenna ports for CRS transmission in the serving cell is 2.

- Aperiodic zero-power CSI-RS resource indicator for PDSCH RE Mapping – 2 bits as defined in subclauses 7.1.9 and 7.2.7 of [3]. This field is present only when the UE is configured with *csi-RS-ConfigZP-ApList*.

If the UE is not configured to decode PDCCH or EPDCCH with CRC scrambled by the C-RNTI and the number of information bits in format 1 is equal to that for format 0/1A, one bit of value zero shall be appended to format 1.

If the UE is configured to decode PDCCH or EPDCCH with CRC scrambled by the C-RNTI and the number of information bits in format 1 is equal to that for format 0/1A for scheduling the same serving cell and mapped onto the UE specific search space given by the C-RNTI as defined in [3], one bit of value zero shall be appended to format 1.

If the number of information bits in format 1 carried by PDCCH belongs to one of the sizes in Table 5.3.3.1.2-1, one or more zero bit(s) shall be appended to format 1 until the payload size of format 1 does not belong to one of the sizes in Table 5.3.3.1.2-1 and is not equal to that of format 0/1A mapped onto the same search space.

Table 5.3.3.1.2-1: Ambiguous Sizes of Information Bits

{12, 14, 16 ,20, 24, 26, 32, 40, 44, 56}

Table 5.3.3.1.2-2: Number of bits for Downlink Assignment Index

Number of bits	
4	For UEs configured by higher layers with *codebooksizeDetermination-r13 = dai* and when a DCI format 1/1A/1B/1D/2/2A/2B/2C/2D/6-1A scheduling PDSCH is mapped onto the UE specific search space given by the C-RNTI as defined in [3], or UEs configured by higher layers with *codebooksizeDeterminationSTTI = dai* and when a DCI format 7-1A/7-1B/7-1C/7-1D/7-1E/7-1F/7-1G scheduling PDSCH is mapped onto the UE specific search space given by the C-RNTI as defined in [3], the 4-bit DAI consists of a 2-bit counter DAI and a 2-bit total DAI. - Counter DAI – 2 bits as defined in subclause 7.3 of [3] - Total DAI – 2 bits as defined in subclause 7.3 of [3]
2	For UEs not configured with *codebooksizeDetermination-r13 = dai* and *codebooksizeDeterminationSTTI-r15=dai*, or for UEs configured by higher layers with *codebooksizeDetermination-r13 = dai* and when a DCI format scheduling PDSCH is not mapped onto the UE specific search space given by the C-RNTI as defined in [3], this field is present for FDD or TDD operation, for cases with TDD primary cell. If the UL/DL configuration of all TDD serving cells is same and the UE is not configured to decode PDCCH with CRC scrambled by *eimta-RNTI*, then this field only applies to serving cell with UL/DL configuration 1-6. If at least two TDD serving cells have different UL/DL configurations or the UE is configured to decode PDCCH with CRC scrambled by *eimta-RNTI*, then this field applies to a serving cell with DL-reference UL/DL configuration 1-6 as defined in subclause 10.2 of [3]. For UEs configured with EN-DC/NE-DC with FDD primary cell and higher layer parameter *subframeAssignment-r15* and a DCI format scheduling PDSCH is mapped onto the UE specific search space given by the C-RNTI as defined in [3], this field is present.
0	For UEs not configured with *codebooksizeDetermination-r13 = dai* and *codebooksizeDeterminationSTTI-r15=dai* and not configured with EN-DC/NE-DC and higher layer parameter *subframeAssignment-r15*, or for UEs configured by higher layers with *codebooksizeDetermination-r13 = dai* and when a DCI format scheduling PDSCH is not mapped onto the UE specific search space given by the C-RNTI as defined in [3], this field is not present for FDD or TDD operation, for cases with FDD primary cell. For UEs configured with EN-DC/NE-DC with FDD primary cell and higher layer parameter *subframeAssignment-r15* and a DCI format scheduling PDSCH is not mapped onto the UE specific search space given by the C-RNTI as defined in [3], this field is not present.

5.3.3.1.3 Format 1A

DCI format 1A is used for the compact scheduling of one PDSCH codeword in one cell and random access procedure initiated by a PDCCH order. The DCI corresponding to a PDCCH order can be carried by PDCCH or EPDCCH.

The following information is transmitted by means of the DCI format 1A:

- Carrier indicator – 0 or 3 bits. This field is present according to the definitions in [3].

- Flag for format0/format1A differentiation or flag for format0A/format1A differentiation – 1 bit, where value 0 indicates format 0 or format 0A and value 1 indicates format 1A

Format 1A is used for random access procedure initiated by a PDCCH order only if format 1A CRC is scrambled with C-RNTI and all the remaining fields are set as follows:

  - Localized/Distributed VRB assignment flag – 1 bit is set to '0'

  - Resource block assignment – $\left\lceil \log_2 (N_{RB}^{DL}(N_{RB}^{DL}+1)/2) \right\rceil$ bits, where all bits shall be set to 1

  - Preamble Index – 6 bits

  - PRACH Mask Index – 4 bits, [5]

  - All the remaining bits in format 1A for compact scheduling assignment of one PDSCH codeword are set to zero

Otherwise,

- Localized/Distributed VRB assignment flag – 1 bit as defined in 7.1.6.3 of [3]

- Resource block assignment – $\left\lceil \log_2(N_{RB}^{DL}(N_{RB}^{DL}+1)/2) \right\rceil$ bits as defined in subclause 7.1.6.3 of [3]:

  - For localized VRB:

    $\left\lceil \log_2(N_{RB}^{DL}(N_{RB}^{DL}+1)/2) \right\rceil$ bits provide the resource allocation

  - For distributed VRB:

    - If $N_{RB}^{DL} < 50$ or if the format 1A CRC is scrambled by RA-RNTI, P-RNTI, SI-RNTI, SC-RNTI or G-RNTI:

      - $\left\lceil \log_2(N_{RB}^{DL}(N_{RB}^{DL}+1)/2) \right\rceil$ bits provide the resource allocation

    - Else

      - 1 bit, the MSB indicates the gap value, where value 0 indicates $N_{gap} = N_{gap,1}$ and value 1 indicates $N_{gap} = N_{gap,2}$

      - $(\left\lceil \log_2(N_{RB}^{DL}(N_{RB}^{DL}+1)/2) \right\rceil - 1)$ bits provide the resource allocation,

  where N_{gap} is defined in [2].

- Modulation and coding scheme – 5bits as defined in subclause 7.1.7 of [3]. The MSB is set to 0 when the UE is configured with *blindSubframePDSCH-Repetitions* set to TRUE and the corresponding DCI is mapped onto the UE specific search space given by the C-RNTI as defined in [3] and the repetition number is greater than 1 and the higher layer parameter *mcs-restrictionSubframePDSCH-Repetitions* is configured to 1.

- HARQ process number – 4 bits if higher layer parameter *dl-STTI-Length* is configured for the cell and the corresponding DCI is mapped onto the UE specific search space given by the C-RNTI as defined in [3], otherwise 3 bits (for cases with FDD primary cell not configured with EN-DC/NE-DC and higher layer parameter *subframeAssignment-r15*, or for cases with EN-DC/NE-DC with FDD primary cell and higher layer parameter *subframeAssignment-r15* configured and the corresponding DCI is not mapped onto the UE specific search space given by the C-RNTI as defined in [3]), 4 bits (for cases with TDD primary cell, or for cases with EN-DC/NE-DC with FDD primary cell and higher layer parameter *subframeAssignment-r15* configured and the corresponding DCI is mapped onto the UE specific search space given by the C-RNTI as defined in [3])

- New data indicator – 1 bit

  - If the format 1A CRC is scrambled by RA-RNTI, P-RNTI, SI-RNTI, SC-RNTI or G-RNTI:

    - If $N_{RB}^{DL} \geq 50$ and Localized/Distributed VRB assignment flag is set to 1

      - the new data indicator bit indicates the gap value, where value 0 indicates $N_{gap} = N_{gap,1}$ and value 1 indicates $N_{gap} = N_{gap,2}$.

- Else the new data indicator bit is reserved.

- Else

- The new data indicator bit as defined in [5]

- Redundancy version – 2 bits

- TPC command for PUCCH – 2 bits as defined in subclause 5.1.2.1 of [3]

  - If the format 1A CRC is scrambled by RA-RNTI, P-RNTI, or SI-RNTI:

  - The most significant bit of the TPC command is reserved.

  - The least significant bit of the TPC command indicates column N_{PRB}^{1A} of the TBS table defined of [3].

- If least significant bit is 0 then $N_{\text{PRB}}^{1A} = 2$ else $N_{\text{PRB}}^{1A} = 3$.

  - Else

  - The two bits including the most significant bit indicates the TPC command

- Downlink Assignment Index – number of bits as specified in Table 5.3.3.1.2-2.

- SRS request – 0 or 1 bit. This field can only be present in DCI formats scheduling PDSCH which are mapped onto the UE specific search space given by the C-RNTI as defined in [3]. The interpretation of this field is provided in subclause 8.2 of [3]. This field is not present when the DCI is used for scheduling PDSCH in a LAA SCell.

- HARQ-ACK resource offset (this field is present when this format is carried by EPDCCH. This field is not present when this format is carried by PDCCH) – 2 bits as defined in subclause 10.1 of [3]. The 2 bits are set to 0 when this format is carried by EPDCCH on a secondary cell, or when this format is carried by EPDCCH on the primary cell scheduling PDSCH on a secondary cell and the UE is configured with PUCCH format 3 for HARQ-ACK feedback.

- SRS timing offset – 3 bits as defined in [3]. This field is present only when the DCI format is used for scheduling PDSCH in a LAA SCell and the UE is configured with uplink transmission on the LAA Scell.

- Repetition number – 2 bits as defined in Table 5.3.3.1.17-1, where the number of transmissions for PDSCH is given by higher layer parameter *maxNumber-SubframePDSCH-Repetitions* for the value of '11'. This field is present only when the UE is configured with higher layer parameter *blindSubframePDSCH-Repetitions* set to TRUE and the corresponding DCI is mapped onto the UE specific search space given by the C-RNTI as defined in [3].

If the UE is not configured to decode PDCCH or EPDCCH with CRC scrambled by the C-RNTI, and the number of information bits in format 1A is less than that of format 0, zeros shall be appended to format 1A until the payload size equals that of format 0.

If the UE is configured to decode PDCCH or EPDCCH with CRC scrambled by the C-RNTI and the number of information bits in format 1A mapped onto a given search space is less than that of format 0 for scheduling the same serving cell and mapped onto the same search space, zeros shall be appended to format 1A until the payload size equals that of format 0, except when format 1A assigns downlink resource on a secondary cell without an uplink configuration associated with the secondary cell.

If the UE is configured to decode PDCCH or EPDCCH with CRC scrambled by the C-RNTI and the number of information bits in format 1A mapped onto a given search space is less than that of format 0A for scheduling the same serving cell and mapped onto the same search space, zeros shall be appended to format 1A until the payload size equals that of format 0A, except when format 1A assigns downlink resource on a secondary cell without an uplink configuration associated with the secondary cell.

If the UE is configured to decode PDCCH or EPDCCH with CRC scrambled by the C-RNTI and the number of information bits in format 1A mapped onto a given search space is less than that of format 0C for scheduling the same serving cell and mapped onto the same search space, zeros shall be appended to format 1A until the payload size equals that of format 0C, except when format 1A assigns downlink resource on a secondary cell without an uplink configuration associated with the secondary cell.

If the number of information bits in format 1A carried by PDCCH belongs to one of the sizes in Table 5.3.3.1.2-1, one zero bit shall be appended to format 1A.

When the format 1A CRC is scrambled with a RA-RNTI, P-RNTI, SI-RNTI, SC-RNTI or G-RNTI then the following fields among the fields above are reserved:

  - HARQ process number

  - Downlink Assignment Index (used for cases with TDD primary cell and either FDD operation or TDD operation, and is not present for cases with FDD primary cell and either FDD operation or TDD operation)

5.3.3.1.3A   Format 1B

DCI format 1B is used for the compact scheduling of one PDSCH codeword in one cell with precoding information.

The following information is transmitted by means of the DCI format 1B:

- Carrier indicator – 0 or 3 bits. The field is present according to the definitions in [3].

- Localized/Distributed VRB assignment flag – 1 bit as defined in subclause 7.1.6.3 of [3]

- Resource block assignment – $\left\lceil \log_2(N_{RB}^{DL}(N_{RB}^{DL}+1)/2) \right\rceil$ bits as defined in subclause 7.1.6.3 of [3]

    - For localized VRB:

    $\left\lceil \log_2(N_{RB}^{DL}(N_{RB}^{DL}+1)/2) \right\rceil$ bits provide the resource allocation

    - For distributed VRB:

      - For $N_{RB}^{DL} < 50$

        - $\left\lceil \log_2(N_{RB}^{DL}(N_{RB}^{DL}+1)/2) \right\rceil$ bits provide the resource allocation

      - For $N_{RB}^{DL} \geq 50$

        - 1 bit, the MSB indicates the gap value, where value 0 indicates $N_{gap} = N_{gap,1}$ and value 1 indicates $N_{gap} = N_{gap,2}$

        - $(\left\lceil \log_2(N_{RB}^{DL}(N_{RB}^{DL}+1)/2) \right\rceil - 1)$ bits provide the resource allocation

- Modulation and coding scheme – 5 bits if higher layer parameter *altMCS-Table* is not configured, 6 bits otherwise, as defined in subclause 7.1.7 of [3]

- HARQ process number – 4 bits if higher layer parameter *dl-STTI-Length* is configured for the cell, otherwise 3 bits (for cases with FDD primary cell not configured with EN-DC/NE-DC and higher layer parameter *subframeAssignment-r15*), 4 bits (for cases with TDD primary cell, or for cases with EN-DC/NE-DC with FDD primary cell and higher layer parameter *subframeAssignment-r15* configured)

- New data indicator – 1 bit

- Redundancy version – 2 bits

- TPC command for PUCCH – 2 bits as defined in subclause 5.1.2.1 of [3]

- Downlink Assignment Index – number of bits as specified in Table 5.3.3.1.2-2.

- TPMI information for precoding – number of bits as specified in Table 5.3.3.1.3A-1

    TPMI information indicates which codebook index is used in Table 6.3.4.2.3-1 or Table 6.3.4.2.3-2 of [2] corresponding to the single-layer transmission.

- PMI confirmation for precoding – 1 bit as specified in Table 5.3.3.1.3A-2

- HARQ-ACK resource offset (this field is present when this format is carried by EPDCCH. This field is not present when this format is carried by PDCCH) – 2 bits as defined in subclause 10.1 of [3]. The 2 bits are set to 0 when this format is carried by EPDCCH on a secondary cell, or when this format is carried by EPDCCH on the primary cell scheduling PDSCH on a secondary cell and the UE is configured with PUCCH format 3 for HARQ-ACK feedback.

- Aperiodic zero-power CSI-RS resource indicator for PDSCH RE Mapping – 2 bits as defined in subclauses 7.1.9 and 7.2.7 of [3]. This field is present only when the UE is configured with *csi-RS-ConfigZP-ApList*.

If PMI confirmation indicates that the eNodeB has applied precoding according to PMI(s) reported by the UE, the precoding for the corresponding RB(s) in subframe *n* is according to the latest PMI(s) in an aperiodic CSI reported on or before subframe *n*-4.

Table 5.3.3.1.3A-1: Number of bits for TPMI information

Number of antenna ports at eNodeB	Number of bits
2	2
4	4

Table 5.3.3.1.3A-2: Content of PMI confirmation

Bit field mapped to index	Message
0	Precoding according to the indicated TPMI in the TPMI information field
1	Precoding using the precoder(s) according to PMI(s) indicated in the latest aperiodic CSI report. For aperiodic CSI mode 2-2: - Precoding of scheduled resource blocks belonging to the reported preferred M subband(s), use precoder(s) according to the preferred M subband PMI(s) indicated in the latest aperiodic CSI report; - Precoding of scheduled resource blocks not belonging to the reported preferred M subband(s), precoding using a precoder according to the wideband PMI indicated in the latest aperiodic CSI report.

If the number of information bits in format 1B is equal to that for format 0/1A for scheduling the same serving cell and mapped onto the UE specific search space given by the C-RNTI as defined in [3], one bit of value zero shall be appended to format 1B.

If the number of information bits in format 1B carried by PDCCH belongs to one of the sizes in Table 5.3.3.1.2-1, one or more zero bit(s) shall be appended to format 1B until the payload size of format 1B does not belong to one of the sizes in Table 5.3.3.1.2-1 and is not equal to that of format 0/1A mapped onto the same search space.

5.3.3.1.4   Format 1C

DCI format 1C is used for very compact scheduling of one PDSCH codeword, notifying MCCH change [6], notifying SC-MCCH change and direct indication [6] , reconfiguring TDD, and LAA common information.

The following information is transmitted by means of the DCI format 1C:

If the format 1C is used for very compact scheduling of one PDSCH codeword

- 1 bit indicates the gap value, where value 0 indicates $N_{\text{gap}} = N_{\text{gap},1}$ and value 1 indicates $N_{\text{gap}} = N_{\text{gap},2}$

- For $N_{\text{RB}}^{\text{DL}} < 50$, there is no bit for gap indication

- Resource block assignment – $\left\lceil \log_2 \left(\left\lfloor N_{\text{VRB,gap1}}^{\text{DL}} / N_{\text{RB}}^{\text{step}} \right\rfloor \cdot \left(\left\lfloor N_{\text{VRB,gap1}}^{\text{DL}} / N_{\text{RB}}^{\text{step}} \right\rfloor + 1 \right) / 2 \right) \right\rceil$ bits as defined in 7.1.6.3 of [3] where $N_{\text{VRB,gap1}}^{\text{DL}}$ is defined in [2] and $N_{\text{RB}}^{\text{step}}$ is defined in [3]

- Modulation and coding scheme – 5 bits as defined in subclause 7.1.7 of [3]

Else if the format 1C is used for notifying MCCH change and direct indication

- Information for MCCH change notification – 8 bits as defined in subclause 5.8.1.3 of [6]

- Direct Indication information – 2 bits provide direct indication of system information update and other fields, as defined in subclause 6.6a [6]. This field is only present for MBMS-dedicated cell or feMBMS/Unicast-mixed cell with $N_{\text{RB}}^{\text{DL}} \geq 15$.

- Reserved information bits are added until the size is equal to that of format 1C used for very compact scheduling of one PDSCH codeword

Else if the format 1C is used for notifying SC-MCCH change

- Information for SC-MCCH change notification – 8 bits as defined in subclause 5.8a.1.3 of [6]

- Reserved information bits are added until the size is equal to that of format 1C used for very compact scheduling of one PDSCH codeword

Else if the format 1C is used for reconfiguring TDD

- UL/DL configuration indication:

    UL/DL configuration number 1, UL/DL configuration number 2,…, UL/DL configuration number I

    Where each UL/DL configuration is 3 bits, $I = \left\lfloor \dfrac{L_{\text{format 1c}}}{3} \right\rfloor$, $L_{\text{format 1c}}$ is equal to the payload size of format 1C used for very compact scheduling of one PDSCH codeword. The parameter *eimta-UL-DL-ConfigIndex* provided by higher layers determines the index to the UL/DL configuration indication for a serving cell.

- Zeros are added until the size is equal to that of format 1C used for very compact scheduling of one PDSCH codeword

Else

- Subframe configuration for LAA – 4 bits as defined in clause 13A of [3]

- UL duration and offset – 5 bits as defined in clause 13A of [3]. The field only applies to a UE configured with uplink transmission on a LAA SCell

- PUSCH trigger B – 1 bit as defined in subclause 8.0 of [3]. The field only applies to a UE configured with uplink transmission on a LAA SCell

- COT sharing indication for AUL – 1 bit as defined in 4.2.1 of [8]. The field only applies to a UE configured with uplink transmission on a LAA SCell

- Reserved information bits are added until the size is equal to that of format 1C used for very compact scheduling of one PDSCH codeword

5.3.3.1.4A   Format 1D

DCI format 1D is used for the compact scheduling of one PDSCH codeword in one cell with precoding and power offset information.

The following information is transmitted by means of the DCI format 1D:

- Carrier indicator – 0 or 3 bits. The field is present according to the definitions in [3].

- Localized/Distributed VRB assignment flag – 1 bit as defined in subclause 7.1.6.3 of [3]

- Resource block assignment – $\left\lceil \log_2 (N_{\text{RB}}^{\text{DL}} (N_{\text{RB}}^{\text{DL}} + 1)/2) \right\rceil$ bits as defined in subclause 7.1.6.3 of [3]:

    - For localized VRB:

        $\left\lceil \log_2 (N_{\text{RB}}^{\text{DL}} (N_{\text{RB}}^{\text{DL}} + 1)/2) \right\rceil$ bits provide the resource allocation

    - For distributed VRB:

        - For $N_{\text{RB}}^{\text{DL}} < 50$

            - $\left\lceil \log_2 (N_{\text{RB}}^{\text{DL}} (N_{\text{RB}}^{\text{DL}} + 1)/2) \right\rceil$ bits provide the resource allocation

- For $N_{RB}^{DL} \geq 50$

  - 1 bit, the MSB indicates the gap value, where value 0 indicates $N_{gap} = N_{gap,1}$ and value 1 indicates $N_{gap} = N_{gap,2}$

  - $(\lceil \log_2(N_{RB}^{DL}(N_{RB}^{DL}+1)/2)\rceil - 1)$ bits provide the resource allocation

- Modulation and coding scheme – 5 bits if higher layer parameter *altMCS-Table* is not configured, 6 bits otherwise, as defined in subclause 7.1.7 of [3]

- HARQ process number – 4 bits if higher layer parameter *dl-STTI-Length* is configured for the cell, otherwise 3 bits (for cases with FDD primary cell not configured with EN-DC/NE-DC and higher layer parameter *subframeAssignment-r15*), 4 bits (for cases with TDD primary cell, or for cases with EN-DC/NE-DC with FDD primary cell and higher layer parameter *subframeAssignment-r15* configured)

- New data indicator – 1 bit

- Redundancy version – 2 bits

- TPC command for PUCCH – 2 bits as defined in subclause 5.1.2.1 of [3]

- Downlink Assignment Index – number of bits as specified in Table 5.3.3.1.2-2.

- TPMI information for precoding – number of bits as specified in Table 5.3.3.1.4A-1

  TPMI information indicates which codebook index is used in Table 6.3.4.2.3-1 or Table 6.3.4.2.3-2 of [2] corresponding to the single-layer transmission.

- Downlink power offset – 1 bit as defined in subclause 7.1.5 of [3]

- HARQ-ACK resource offset (this field is present when this format is carried by EPDCCH. This field is not present when this format is carried by PDCCH) – 2 bits as defined in subclause 10.1 of [3]. The 2 bits are set to 0 when this format is carried by EPDCCH on a secondary cell, or when this format is carried by EPDCCH on the primary cell scheduling PDSCH on a secondary cell and the UE is configured with PUCCH format 3 for HARQ-ACK feedback.

- Aperiodic zero-power CSI-RS resource indicator for PDSCH RE Mapping – 2 bits as defined in subclauses 7.1.9 and 7.2.7 of [3]. This field is present only when the UE is configured with *csi-RS-ConfigZP-ApList*.

Table 5.3.3.1.4A-1: Number of bits for TPMI information

Number of antenna ports at eNodeB	Number of bits
2	2
4	4

If the number of information bits in format 1D is equal to that for format 0/1A for scheduling the same serving cell and mapped onto the UE specific search space given by the C-RNTI as defined in [3], one bit of value zero shall be appended to format 1D.

If the number of information bits in format 1D carried by PDCCH belongs to one of the sizes in Table 5.3.3.1.2-1, one or more zero bit(s) shall be appended to format 1D until the payload size of format 1D does not belong to one of the sizes in Table 5.3.3.1.2-1 and is not equal to that of format 0/1A mapped onto the same search space.

5.3.3.1.5   Format 2

The following information is transmitted by means of the DCI format 2:

- Carrier indicator – 0 or 3 bits. The field is present according to the definitions in [3].

- Resource allocation header (resource allocation type 0 / type 1) – 1 bit as defined in subclause 7.1.6 of [3]

If downlink bandwidth is less than or equal to 10 PRBs, there is no resource allocation header and resource allocation type 0 is assumed.

- Resource block assignment:

    - For resource allocation type 0 defined in subclause 7.1.6.1 of [3]:

        - $\left\lceil N_{RB}^{DL} / P \right\rceil$ bits provide the resource allocation

    - For resource allocation type 1 as defined in subclause 7.1.6.2 of [3]:

        - $\left\lceil \log_2(P) \right\rceil$ bits of this field are used as a header specific to this resource allocation type to indicate the selected resource blocks subset

        - 1 bit indicates a shift of the resource allocation span

        - $\left(\left\lceil N_{RB}^{DL} / P \right\rceil - \left\lceil \log_2(P) \right\rceil - 1 \right)$ bits provide the resource allocation

where the value of P depends on the number of DL resource blocks as indicated in subclause 7.1.6.1 of [3]

- TPC command for PUCCH – 2 bits as defined in subclause 5.1.2.1 of [3]

- Downlink Assignment Index – number of bits as specified in Table 5.3.3.1.2-2.

- HARQ process number - 4 bits if higher layer parameter *dl-STTI-Length* is configured for the cell, otherwise 3 bits (for cases with FDD primary cell not configured with EN-DC/NE-DC and higher layer parameter *subframeAssignment-r15*), 4 bits (for cases with TDD primary cell, or for cases with EN-DC/NE-DC with FDD primary cell and higher layer parameter *subframeAssignment-r15* configured)

- Transport block to codeword swap flag – 1 bit

In addition, for transport block 1:

- Modulation and coding scheme – 5 bits if higher layer parameter *altMCS-Table* is not configured, 6 bits otherwise, as defined in subclause 7.1.7 of [3]

- New data indicator – 1 bit

- Redundancy version – 2 bits

- MUST interference presence and power ratio – 0 or 2 bits as defined in subclause 6.3.3 of [2]. This field is present only when the UE is configured for MUST-near operation and the number of antenna ports for CRS transmission in the serving cell is 2

In addition, for transport block 2:

- Modulation and coding scheme – 5 bits if higher layer parameter *altMCS-Table* is not configured, 6 bits otherwise, as defined in subclause 7.1.7 of [3]

- New data indicator – 1 bit

- Redundancy version – 2 bits

- MUST interference presence and power ratio – 0 or 2 bits as defined in subclause 6.3.3 of [2]. This field is present only when the UE is configured for MUST-near operation and the number of antenna ports for CRS transmission in the serving cell is 2

Precoding information – number of bits as specified in Table 5.3.3.1.5-3

- HARQ-ACK resource offset (this field is present when this format is carried by EPDCCH. This field is not present when this format is carried by PDCCH) – 2 bits as defined in subclause 10.1 of [3]. The 2 bits are set to 0 when this format is carried by EPDCCH on a secondary cell, or when this format is carried by EPDCCH on the primary cell scheduling PDSCH on a secondary cell and the UE is configured with PUCCH format 3 for HARQ-ACK feedback.

- Aperiodic zero-power CSI-RS resource indicator for PDSCH RE Mapping – 2 bits as defined in subclauses 7.1.9 and 7.2.7 of [3]. This field is present only when the UE is configured with *csi-RS-ConfigZP-ApList*.

If both transport blocks are enabled, the transport block to codeword mapping is specified according to Table 5.3.3.1.5-1.

In case one of the transport blocks is disabled as specified in subclause 7.1.7.2 of [3], the transport block to codeword swap flag is reserved and the transport block to codeword mapping is specified according to Table 5.3.3.1.5-2.

Table 5.3.3.1.5-1: Transport block to codeword mapping (two transport blocks enabled)

transport block to codeword swap flag value	codeword 0 (enabled)	codeword 1 (enabled)
0	transport block 1	transport block 2
1	transport block 2	transport block 1

Table 5.3.3.1.5-2: Transport block to codeword mapping (one transport block enabled)

transport block 1	transport block 2	codeword 0 (enabled)	codeword 1 (disabled)
enabled	disabled	transport block 1	-
disabled	enabled	transport block 2	-

The interpretation of the precoding information field depends on the number of enabled codewords according to Table 5.3.3.1.5-4 and Table 5.3.3.1.5-5. Note that TPMI indicates which codebook index is used in Table 6.3.4.2.3-1 or Table 6.3.4.2.3-2 of [2]. For a single enabled codeword, indices 18 to 34 inclusive in Table 5.3.3.1.5-5 are only supported for retransmission of the corresponding transport block if that transport block has previously been transmitted using two layers with closed-loop spatial multiplexing.

If the number of information bits in format 2 carried by PDCCH belongs to one of the sizes in Table 5.3.3.1.2-1, one zero bit shall be appended to format 2.

Some entries in Table 5.3.3.1.5-4 and Table 5.3.3.1.5-5 are used for indicating that the eNodeB has applied precoding according to PMI(s) reported by the UE. In these cases the precoding for the corresponding RB(s) in subframe *n* is according to the latest PMI(s) in an aperiodic CSI reported on or before subframe *n*-4. For aperiodic CSI mode 2-2: Precoding of scheduled resource blocks belonging to the reported preferred M subband(s) use precoder(s) according to the preferred M subband PMI indicated by the latest aperiodic CSI report; Precoding of scheduled resource blocks not belonging to the reported preferred M subband(s) use a precoder according to the wideband PMI indicated by the latest aperiodic CSI report.

5.3.3.1.5A Format 2A

The following information is transmitted by means of the DCI format 2A:

- Carrier indicator – 0 or 3 bits. The field is present according to the definitions in [3].

- Resource allocation header (resource allocation type 0 / type 1) – 1 bit as defined in subclause 7.1.6 of [3]

If downlink bandwidth is less than or equal to 10 PRBs, there is no resource allocation header and resource allocation type 0 is assumed.

- Resource block assignment:

    - For resource allocation type 0 as defined in subclause 7.1.6.1 of [3]

        - $\left\lceil N_{RB}^{DL} / P \right\rceil$ bits provide the resource allocation

    - For resource allocation type 1 as defined in subclause 7.1.6.2 of [3]

        - $\left\lceil \log_2(P) \right\rceil$ bits of this field are used as a header specific to this resource allocation type to indicate the selected resource blocks subset

        - 1 bit indicates a shift of the resource allocation span

        - $\left(\left\lceil N_{RB}^{DL} / P \right\rceil - \left\lceil \log_2(P) \right\rceil - 1 \right)$ bits provide the resource allocation

where the value of P depends on the number of DL resource blocks as indicated in subclause 7.1.6.1 of [3]

- TPC command for PUCCH – 2 bits as defined in subclause 5.1.2.1 of [3]

- Downlink Assignment Index – number of bits as specified in Table 5.3.3.1.2-2.

- HARQ process number - 4 bits if higher layer parameter *dl-STTI-Length* is configured for the cell, otherwise 3 bits (for cases with FDD primary cell not configured with EN-DC/NE-DC and higher layer parameter *subframeAssignment-r15*), 4 bits (for cases with TDD primary cell, or for cases with EN-DC/NE-DC with FDD primary cell and higher layer parameter *subframeAssignment-r15* configured)

- Transport block to codeword swap flag – 1 bit

In addition, for transport block 1:

    - Modulation and coding scheme – 5 bits if higher layer parameter *altMCS-Table* is not configured, 6 bits otherwise, as defined in subclause 7.1.7 of [3]

    - New data indicator – 1 bit

    - Redundancy version – 2 bits

In addition, for transport block 2:

    - Modulation and coding scheme – 5 bits if higher layer parameter *altMCS-Table* is not configured, 6 bits otherwise, as defined in subclause 7.1.7 of [3]

    - New data indicator – 1 bit

    - Redundancy version – 2 bits

- Precoding information – number of bits as specified in Table 5.3.3.1.5A-1

- HARQ-ACK resource offset (this field is present when this format is carried by EPDCCH. This field is not present when this format is carried by PDCCH) – 2 bits as defined in subclause 10.1 of [3]. The 2 bits are set to 0 when this format is carried by EPDCCH on a secondary cell, or when this format is carried by EPDCCH on the primary cell scheduling PDSCH on a secondary cell and the UE is configured with PUCCH format 3 for HARQ-ACK feedback. - MUST interference presence and power ratio – 0 or 2 bits as defined in subclause 6.3.3 of [2]. This field is present only when the UE is configured for MUST-near operation and the number of antenna ports for CRS transmission in the serving cell is 2.

- Aperiodic zero-power CSI-RS resource indicator for PDSCH RE Mapping – 2 bits as defined in subclauses 7.1.9 and 7.2.7 of [3]. This field is present only when the UE is configured with *csi-RS-ConfigZP-ApList*.

If both transport blocks are enabled, the transport block to codeword mapping is specified according to Table 5.3.3.1.5-1.

In case one of the transport blocks is disabled, the transport block to codeword swap flag is reserved and the transport block to codeword mapping is specified according to Table 5.3.3.1.5-2.

The precoding information field is defined according to Table 5.3.3.1.5A-2. For a single enabled codeword, index 1 in Table 5.3.3.1.5A-2 is only supported for retransmission of the corresponding transport block if that transport block has previously been transmitted using two layers with large delay CDD.

For transmission with 2 antenna ports, the precoding information field is not present. The number of transmission layers is equal to 2 if both codewords are enabled; transmit diversity is used if codeword 0 is enabled while codeword 1 is disabled.

If the number of information bits in format 2A carried by PDCCH belongs to one of the sizes in Table 5.3.3.1.2-1, one zero bit shall be appended to format 2A.

Table 5.3.3.1.5A-1: Number of bits for precoding information

Number of antenna ports at eNodeB	Number of bits for precoding information
2	0
4	2

Table 5.3.3.1.5A-2: Content of precoding information field for 4 antenna ports

One codeword: Codeword 0 enabled, Codeword 1 disabled		Two codewords: Codeword 0 enabled, Codeword 1 enabled	
Bit field mapped to index	Message	Bit field mapped to index	Message
0	4 layers: Transmit diversity	0	2 layers: precoder cycling with large delay CDD
1	2 layers: precoder cycling with large delay CDD	1	3 layers: precoder cycling with large delay CDD
2	reserved	2	4 layers: precoder cycling with large delay CDD
3	reserved	3	reserved

5.3.3.1.5B Format 2B

The following information is transmitted by means of the DCI format 2B:

- Carrier indicator – 0 or 3 bits. The field is present according to the definitions in [3].

- Resource allocation header (resource allocation type 0 / type 1) – 1 bit as defined in subclause 7.1.6 of [3]

    If downlink bandwidth is less than or equal to 10 PRBs, there is no resource allocation header and resource allocation type 0 is assumed.

- Resource block assignment:

    - For resource allocation type 0 as defined in subclause 7.1.6.1 of [3]

        - $\left\lceil N_{RB}^{DL} / P \right\rceil$ bits provide the resource allocation

    - For resource allocation type 1 as defined in subclause 7.1.6.2 of [3]

        - $\left\lceil \log_2(P) \right\rceil$ bits of this field are used as a header specific to this resource allocation type to indicate the selected resource blocks subset

        - 1 bit indicates a shift of the resource allocation span

- $\left(\left\lceil N_{RB}^{DL}/P \right\rceil - \left\lceil \log_2(P) \right\rceil - 1\right)$ bits provide the resource allocation

where the value of P depends on the number of DL resource blocks as indicated in subclause [7.1.6.1] of [3]

- TPC command for PUCCH – 2 bits as defined in subclause 5.1.2.1 of [3]

- Downlink Assignment Index – number of bits as specified in Table 5.3.3.1.2-2.

- HARQ process number - 4 bits if higher layer parameter *dl-STTI-Length* is configured for the cell, otherwise 3 bits (for cases with FDD primary cell not configured with EN-DC/NE-DC and higher layer parameter *subframeAssignment-r15*), 4 bits (for cases with TDD primary cell, or for cases with EN-DC/NE-DC with FDD primary cell and higher layer parameter *subframeAssignment-r15* configured)

- Scrambling identity– 1 bit as defined in subclause 6.10.3.1 of [2]

- SRS request – [0-1] bit. This field can only be present for TDD operation and if present is defined in subclause 8.2 of [3]

In addition, for transport block 1:

- Modulation and coding scheme – 5 bits if higher layer parameter *altMCS-Table* is not configured, 6 bits otherwise, as defined in subclause 7.1.7 of [3]

- New data indicator – 1 bit

- Redundancy version – 2 bits

In addition, for transport block 2:

- Modulation and coding scheme – 5 bits if higher layer parameter *altMCS-Table* is not configured, 6 bits otherwise, as defined in subclause 7.1.7 of [3]

- New data indicator – 1 bit

- Redundancy version – 2 bits

- HARQ-ACK resource offset (this field is present when this format is carried by EPDCCH. This field is not present when this format is carried by PDCCH) – 2 bits as defined in subclause 10.1 of [3]. The 2 bits are set to 0 when this format is carried by EPDCCH on a secondary cell, or when this format is carried by EPDCCH on the primary cell scheduling PDSCH on a secondary cell and the UE is configured with PUCCH format 3 for HARQ-ACK feedback.

- MUST interference presence and modulation (This field is present only when the UE is configured for MUST operation) – 0 or 2 bits. The field is defined in Table 5.3.3.1.5C-3, where the interfering antenna port is in {7,8} excluding the antenna port for transmission. The interfering antenna port has the same scrambling identity as indicated in the "Scrambling identity" field.

- SRS timing offset – 3 bits as defined in [3]. This field is present only when the DCI format is used for scheduling PDSCH in a LAA SCell and the UE is configured with uplink transmission on the LAA SCell.

- Aperiodic zero-power CSI-RS resource indicator for PDSCH RE Mapping – 2 bits as defined in subclauses 7.1.9 and 7.2.7 of [3]. This field is present only when the UE is configured with *csi-RS-ConfigZP-ApList*.

If both transport blocks are enabled, the number of layers equals two; transport block 1 is mapped to codeword 0; and transport block 2 is mapped to codeword 1. Antenna ports 7 and 8 are used for spatial multiplexing.

In case one of the transport blocks is disabled, the number of layers equals one; the transport block to codeword mapping is specified according to Table 5.3.3.1.5-2; and the antenna port for single-antenna port transmission is according to Table 5.3.3.1.5B-1.

Table 5.3.3.1.5B-1: Antenna port for single-antenna port transmission (one transport block disabled)

New data indicator of the disabled transport block	Antenna port
0	7
1	8

If the number of information bits in format 2B carried by PDCCH belongs to one of the sizes in Table 5.3.3.1.2-1, one zero bit shall be appended to format 2B.

5.3.3.1.5C   Format 2C

The following information is transmitted by means of the DCI format 2C:

- Carrier indicator – 0 or 3 bits. The field is present according to the definitions in [3].

- Resource allocation header (resource allocation type 0 / type 1) – 1 bit as defined in subclause 7.1.6 of [3]

    If downlink bandwidth is less than or equal to 10 PRBs, there is no resource allocation header and resource allocation type 0 is assumed.

- Resource block assignment:

    - For resource allocation type 0 as defined in subclause 7.1.6.1 of [3]

        - $\left\lceil N_{RB}^{DL} / P \right\rceil$ bits provide the resource allocation

    - For resource allocation type 1 as defined in subclause 7.1.6.2 of [3]

        - $\left\lceil \log_2(P) \right\rceil$ bits of this field are used as a header specific to this resource allocation type to indicate the selected resource blocks subset

        - 1 bit indicates a shift of the resource allocation span

        - $\left(\left\lceil N_{RB}^{DL} / P \right\rceil - \left\lceil \log_2(P) \right\rceil - 1 \right)$ bits provide the resource allocation

    where the value of P depends on the number of DL resource blocks as indicated in subclause [7.1.6.1] of [3]

- TPC command for PUCCH – 2 bits as defined in subclause 5.1.2.1 of [3]

- Downlink Assignment Index – number of bits as specified in Table 5.3.3.1.2-2.

- HARQ process number - 4 bits if higher layer parameter *dl-STTI-Length* is configured for the cell, otherwise 3 bits (for cases with FDD primary cell not configured with EN-DC/NE-DC and higher layer parameter *subframeAssignment-r15*), 4 bits (for cases with TDD primary cell, or for cases with EN-DC/NE-DC with FDD primary cell and higher layer parameter *subframeAssignment-r15* configured)

- Antenna port(s), scrambling identity and number of layers – 3 bits as specified in Table 5.3.3.1.5C-1 where n_{SCID} is the scrambling identity for antenna ports 7 and 8 defined in subclause 6.10.3.1 of [2], or 4 bits as specified in Table 5.3.3.1.5C-2 where n_{SCID} is the scrambling identity for antenna ports 7, 8, 11 and 13 defined in subclause 6.10.3.1 of [2] when higher layer parameter *dmrs-tableAlt* is set to 1, or 1 bit as specified in Table 5.3.3.1.5C-6 where n_{SCID} is the scrambling identity for antenna ports 7 and 8 defined in subclause 6.10.3.1 of [2] when higher layer parameter *semiOpenLoop* is configured.

- SRS request – [0-1] bit. This field can only be present for TDD operation and if present is defined in subclause 8.2 of [3]

In addition, for transport block 1:

    - Modulation and coding scheme – 5 bits if higher layer parameter *altMCS-Table* is not configured, 6 bits otherwise, as defined in subclause 7.1.7 of [3]

    - New data indicator – 1 bit

    - Redundancy version – 2 bits

In addition, for transport block 2:

    - Modulation and coding scheme – 5 bits if higher layer parameter *altMCS-Table* is not configured, 6 bits otherwise, as defined in subclause 7.1.7 of [3]

- New data indicator – 1 bit

- Redundancy version – 2 bits

- HARQ-ACK resource offset (this field is present when this format is carried by EPDCCH. This field is not present when this format is carried by PDCCH) – 2 bits as defined in subclause 10.1 of [3]. The 2 bits are set to 0 when this format is carried by EPDCCH on a secondary cell, or when this format is carried by EPDCCH on the primary cell scheduling PDSCH on a secondary cell and the UE is configured with PUCCH format 3 for HARQ-ACK feedback.

- MUST interference presence, antenna port, and modulation (this field is only present when the UE is configured for MUST operation) – 2 bits when higher layer parameter *dmrs-tableAlt* is not configured or is set to 0, 4 bits when higher layer parameter *k-max* is set to 1 and *dmrs-tableAlt* =1, or 6 bits when *k-max* is set to 3 and *dmrs-tableAlt* =1. For the 2 and 6 bit fields, two bits are defined for each interfering antenna port in Table 5.3.3.1.5C-3, where a single interfering antenna port is in {7,8} excluding the antenna port for transmission, and multiple interfering antenna ports are in {7,8,11,13} excluding the antenna ports for transmission. For the 6 bit field, the two or four LSB are reserved in the case of two or one interfering antenna port, respectively. Each pair of the used bits in 6 bit field from MSB to LSB is associated with one interfering antenna port in increasing order of port index. For the 4 bit field, two MSB are defined for interference presence and antenna port in Table 5.3.3.1.5C-4 where the single interfering antenna port is one of {7,8,11,13} excluding the antenna port for transmission, and two LSB are defined for interference modulation in 5.3.3.1.5C-5. The interfering antenna port(s) have the same scrambling identity and OCC length as indicated in the "Antenna port(s), scrambling identity and number of layers" field.

- SRS timing offset – 3 bits as defined in [3]. This field is present only when the DCI format is used for scheduling PDSCH in a LAA SCell and the UE is configured with uplink transmission on the LAA SCell.

- Aperiodic zero-power CSI-RS resource indicator for PDSCH RE Mapping – 2 bits as defined in subclauses 7.1.9 and 7.2.7 of [3]. This field is present only when the UE is configured with *csi-RS-ConfigZP-ApList*.

If both transport blocks are enabled; transport block 1 is mapped to codeword 0; and transport block 2 is mapped to codeword 1. When higher layer parameter *semiOpenLoop* is configured, antenna ports 7 and 8 are used for spatial multiplexing.

In case one of the transport blocks is disabled; the transport block to codeword mapping is specified according to Table 5.3.3.1.5-2. For the single enabled codeword, Value = 4, 5, 6 in Table 5.3.3.1.5C-1 or Value = 12, 13,14 in Table 5.3.3.1.5C-2 are only supported for retransmission of the corresponding transport block if that transport block has previously been transmitted using two, three or four layers, respectively. When higher layer parameter *semiOpenLoop* is configured, antenna ports 7 and 8 are used for transmit diversity.

If the number of information bits in format 2C carried by PDCCH belongs to one of the sizes in Table 5.3.3.1.2-1, one zero bit shall be appended to format 2C.

Table 5.3.3.1.5C-1: Antenna port(s), scrambling identity and number of layers indication

One Codeword: Codeword 0 enabled, Codeword 1 disabled		Two Codewords: Codeword 0 enabled, Codeword 1 enabled	
Value	**Message**	**Value**	**Message**
0	1 layer, port 7, n_{SCID}=0	0	2 layers, ports 7-8, n_{SCID}=0

5.3.3.1.5D   Format 2D

The following information is transmitted by means of the DCI format 2D:

- Carrier indicator – 0 or 3 bits. The field is present according to the definitions in [3].

- Resource allocation header (resource allocation type 0 / type 1) – 1 bit as defined in subclause 7.1.6 of [3]

  If downlink bandwidth is less than or equal to 10 PRBs, there is no resource allocation header and resource allocation type 0 is assumed.

- Resource block assignment:

  - For resource allocation type 0 as defined in subclause 7.1.6.1 of [3]

    - $\left\lceil N_{RB}^{DL} / P \right\rceil$ bits provide the resource allocation

  - For resource allocation type 1 as defined in subclause 7.1.6.2 of [3]

    - $\left\lceil \log_2(P) \right\rceil$ bits of this field are used as a header specific to this resource allocation type to indicate the selected resource blocks subset

    - 1 bit indicates a shift of the resource allocation span

    - $\left(\left\lceil N_{RB}^{DL} / P \right\rceil - \left\lceil \log_2(P) \right\rceil - 1 \right)$ bits provide the resource allocation

where the value of P depends on the number of DL resource blocks as indicated in subclause [7.1.6.1] of [3]

- TPC command for PUCCH – 2 bits as defined in subclause 5.1.2.1 of [3]

- Downlink Assignment Index – number of bits as specified in Table 5.3.3.1.2-2.

- HARQ process number - 4 bits if higher layer parameter *dl-STTI-Length* is configured for the cell, otherwise 3 bits (for cases with FDD primary cell not configured with EN-DC/NE-DC and higher layer parameter *subframeAssignment-r15*), 4 bits (for cases with TDD primary cell, or for cases with EN-DC/NE-DC with FDD primary cell and higher layer parameter *subframeAssignment-r15* configured)

- Antenna port(s), scrambling identity and number of layers – 3 bits as specified in Table 5.3.3.1.5C-1 (or Table 5.3.3.1.5D-1 for two codewords when higher layer parameter *qcl-Operation* is set to 'typeC') where n_{SCID} is the scrambling identity for antenna ports 7 and 8 defined in subclause 6.10.3.1 of [2], or 4 bits as specified in Table 5.3.3.1.5C-2 (or Table 5.3.3.1.5D-2 for two codewords when higher layer parameter *qcl-Operation* is set to 'typeC') where n_{SCID} is the scrambling identity for antenna ports 7, 8, 11 and 13 defined in subclause 6.10.3.1 of [2] when higher layer parameter *dmrs-tableAlt* is set to 1, or 1 bit as specified in Table 5.3.3.1.5C-6 where n_{SCID} is the scrambling identity for antenna ports 7 and 8 defined in subclause 6.10.3.1 of [2] when higher layer parameter *semiOpenLoop* is configured.

- SRS request – [0-1] bit. This field can only be present for TDD operation and if present is defined in subclause 8.2 of [3]

In addition, for transport block 1:

  - Modulation and coding scheme – 5 bits if higher layer parameter *altMCS-Table* is not configured, 6 bits otherwise, as defined in subclause 7.1.7 of [3]

  - New data indicator – 1 bit

  - Redundancy version – 2 bits

In addition, for transport block 2:

  - Modulation and coding scheme – 5 bits if higher layer parameter *altMCS-Table* is not configured, 6 bits otherwise, as defined in subclause 7.1.7 of [3]

  - New data indicator – 1 bit

- Redundancy version – 2 bits

- PDSCH RE Mapping and Quasi-Co-Location Indicator – 2 bits as defined in subclauses 7.1.9 and 7.1.10 of [3]

- HARQ-ACK resource offset (this field is present when this format is carried by EPDCCH. This field is not present when this format is carried by PDCCH) – 2 bits as defined in subclause 10.1 of [3]. The 2 bits are set to 0 when this format is carried by EPDCCH on a secondary cell, or when this format is carried by EPDCCH on the primary cell scheduling PDSCH on a secondary cell and the UE is configured with PUCCH format 3 for HARQ-ACK feedback.

- MUST interference presence, antenna port, and modulation (this field is only present when the UE is configured for MUST operation) – 2 bits when higher layer parameter *dmrs-tableAlt* is not configured or is set to 0, 4 bits when higher layer parameter *k-max* is set to 1 and *dmrs-tableAlt* =1, 6 bits when *k-max* is set to 3 and *dmrs-tableAlt* =1. For the 2 and 6 bit fields, two bits are defined for each interfering antenna port in Table 5.3.3.1.5C-3, where a single interfering antenna port is in {7,8} excluding the antenna port for transmission, and multiple interfering antenna ports are in {7,8,11,13} excluding the antenna ports for transmission. For the 6 bit field, the two or four LSB are reserved in the case of two or one interfering antenna port, respectively. Each pair of the used bits in 6 bit field from MSB to LSB is associated with one interfering antenna port in increasing order of port index. For the 4 bit field, two MSB are defined for interference presence and antenna port in Table 5.3.3.1.5C-4 where the single interfering antenna port is one of {7,8,11,13} excluding the antenna port for transmission, and two LSB are defined for interference modulation in 5.3.3.1.5C-5. The interfering antenna port(s) have the same scrambling identity and OCC length as indicated in the "Antenna port(s), scrambling identity and number of layers" field.

- SRS timing offset – 3 bits as defined in [3]. This field is present only when the DCI format is used for scheduling PDSCH in a LAA SCell and the UE is configured with uplink transmission on the LAA SCell.

- Aperiodic zero-power CSI-RS resource indicator for PDSCH RE Mapping – 2 bits as defined in subclauses 7.1.9 and 7.2.7 of [3]. This field is present only when the UE is configured with *csi-RS-ConfigZP-ApList*.

If both transport blocks are enabled; transport block 1 is mapped to codeword 0; and transport block 2 is mapped to codeword 1. When higher layer parameter *semiOpenLoop* is configured, antenna ports 7 and 8 are used for spatial multiplexing.

In case one of the transport blocks is disabled; the transport block to codeword mapping is specified according to Table 5.3.3.1.5-2. For the single enabled codeword, Value = 4, 5, 6 in Table 5.3.3.1.5C-1 or Value = 12, 13,14 in Table 5.3.3.1.5C-2 are only supported for retransmission of the corresponding transport block if that transport block has previously been transmitted using two, three or four layers, respectively. When higher layer parameter *semiOpenLoop* is configured, antenna ports 7 and 8 are used for transmit diversity.

If the number of information bits in format 2D carried by PDCCH belongs to one of the sizes in Table 5.3.3.1.2-1, one zero bit shall be appended to format 2D.

Table 5.3.3.1.5D-1: Antenna port(s), scrambling identity and number of layers indication

Two Codewords	
Value	Message
0	2 layers, ports 7-8, n_{SCID}=0
1	2 layers, ports 7-8, n_{SCID}=1
2	3 layers, ports 7,9,10
3	4 layers, ports 7-10
4	5 layers, ports 7,8,9,10,12
5	6 layers, ports 7,8,11,9,10,12
6	7 layers, ports 7,8,11,9,10,12,14
7	8 layers, ports 7,8,11,13,9,10,12,14

5.3.3.1.6 Format 3

DCI format 3 is used for the transmission of TPC commands for PUCCH, SPUCCH corresponding to semi-persistently scheduled PDSCH with slot/subslot duration, semi-persistently scheduled PUSCH with slot/subslot duration, and PUSCH with subframe durationw ith 2-bit power adjustments.

The following information is transmitted by means of the DCI format 3:

- TPC command number 1, TPC command number 2,…, TPC command number N

where $N = \left\lfloor \dfrac{L_{\text{format 0}}}{2} \right\rfloor$, and where $L_{\text{format 0}}$ is equal to the payload size of format 0 before CRC attachment when format 0 is mapped onto the common search space, including any padding bits appended to format 0. The parameter *tpc-Index* or *tpc-Index-PUCCH-SCell-r13* provided by higher layers determines the index to the TPC command for a given UE.

If $\left\lfloor \dfrac{L_{\text{format 0}}}{2} \right\rfloor < \dfrac{L_{\text{format 0}}}{2}$, a bit of value zero shall be appended to format 3.

For BL/CE UE, $L_{\text{format 0}}$ and format 0 are replaced by $L_{\text{format 6-0A}}$ and format 6-0A, respectively, in the description above.

5.3.3.1.7   Format 3A

DCI format 3A is used for the transmission of TPC commands for PUCCH, SPUCCH corresponding to semi-persistently scheduled PDSCH with slot/subslot duration, semi-persistently scheduled PUSCH with slot/subslot duration, and PUSCH with subframe duration with single bit power adjustments.

The following information is transmitted by means of the DCI format 3A:

- TPC command number 1, TPC command number 2,…, TPC command number M

where $M = L_{\text{format 0}}$, and where $L_{\text{format 0}}$ is equal to the payload size of format 0 before CRC attachment when format 0 is mapped onto the common search space, including any padding bits appended to format 0. The parameter *tpc-Index* or *tpc-Index-PUCCH-SCell-r13* provided by higher layers determines the index to the TPC command for a given UE.

For BL/CE UE, $L_{\text{format 0}}$ and format 0 are replaced by $L_{\text{format 6-0A}}$ and format 6-0A, respectively, in the description above.

5.3.3.1.7A   Format 3B

DCI format 3B is used for the transmission of a group of TPC commands for SRS transmissions by one or more UEs. Along with a TPC command, a SRS request may also be transmitted.

The following information is transmitted by means of the DCI format 3B:

- block number 1, block number 2, …, block number B

  where the starting position of a block is determined by the parameter *startingBitOfFormat3B* provided by higher layers for the UE configured with the block.

If a UE has more than 5 TDD SCells configured without PUCCH and without PUSCH, one block is configured for the UE by higher layers, with the following fields defined for the block:

- SRS request – 0 or 2 bits. This field is present, and if present interpreted, according to the definition in Subclause 8.2 of [3].

- TPC command number 1, TPC command number 2, …, TPC command number n

  The n TPC command fields correspond to a set of n TDD SCells without PUCCH and without PUSCH, with the set indicated by the SRS request field or determined by higher layers if there is no SRS request field present. A TPC command field has 1 bit if the parameter *fieldTypeFormat3B* provided by higher layers has a value of 1 or 3, and 2 bits if the parameter *fieldTypeFormat3B* has a value of 2 or 4.

If a UE has up to 5 TDD SCells configured without PUCCH and without PUSCH, one or more blocks each corresponding to an SCell are configured by higher layers, with the following fields defined for each block:

- SRS request - 0, 1, or 2 bits, where the number of bits is determined in Subclause 8.2 of [3].

- TPC command - 1 or 2 bits, where the number of bits is 1 if the parameter *fieldTypeFormat3B* provided by higher layers has a value of 1 or 3, and 2 if the parameter *fieldTypeFormat3B* has a value of 2 or 4.

The size of format 3B is equal to $L_{\text{format }0}$, and where $L_{\text{format }0}$ is equal to the payload size of format 0 before CRC attachment when format 0 is mapped onto the common search space, including any padding bits appended to format 0.

5.3.3.1.8 Format 4

DCI format 4 is used for the scheduling of PUSCH in one UL cell with multi-antenna port transmission mode,

The following information is transmitted by means of the DCI format 4:

- Carrier indicator – 0 or 3 bits. The field is present according to the definitions in [3].

- Resource block assignment - $\max\left(\left\lceil \log_2(N_{\text{RB}}^{\text{UL}}(N_{\text{RB}}^{\text{UL}}+1)/2) \right\rceil, \left\lceil \log_2\left(\binom{\lceil N_{RB}^{UL}/P+1 \rceil}{4} \right) \right\rceil \right)$ bits, where P is the

  UL RBG size as defined in subclause 8.1.2 of [3]

- For resource allocation type 0:

  - The $\left(\left\lceil \log_2(N_{\text{RB}}^{\text{UL}}(N_{\text{RB}}^{\text{UL}}+1)/2) \right\rceil \right)$ LSBs provide the resource allocation in the UL subframe as defined in subclause 8.1.1 of [3]

- For resource allocation type 1:

  - The $\left\lceil \log_2\left(\binom{\lceil N_{RB}^{UL}/P+1 \rceil}{4} \right) \right\rceil$ LSBs provide the resource allocation in the UL subframe as defined in subclause 8.1.2 of [3]

- TPC command for scheduled PUSCH – 2 bits as defined in subclause 5.1.1.1 of [3]

- Cyclic shift for DM RS and OCC index and IFDMA configuration – 3 bits as defined in subclause 5.5.2.1.1 of [2]

- UL index – 2 bits as defined in subclauses 5.1.1.1, 7.2.1, 8 and 8.4 of [3] (this field is present only for TDD operation with uplink-downlink configuration 0, or TDD operation with uplink-downlink configuration 6 and special subframe configuration 10 when the higher layer parameter *symPUSCH-UpPts* or *shortProcessingTime* is configured for the cell)

- Downlink Assignment Index (DAI) – 2 bits as defined in subclause 7.3 of [3] (this field is present only for the following cases: 1) TDD primary cell and either TDD operation with uplink-downlink configurations 1-6 or FDD operation; or 2) EN-DC/NE-DC with FDD primary cell and higher layer parameter *subframeAssignment-r15* configured)

- CSI request – 1, 2, 3, 4 or 5 bits as defined in subclause 7.2.1 of [3].

  If UEs are not configured with CSI-RS-ConfigNZPAperiodic or if UEs are configured with CSI-RS-ConfigNZPAperiodic and numberActivatedAperiodicCSI-RS-Resources=1 for each CSI process,

    the 2-bit field applies to UEs configured with no more than five DL cells and to

    - UEs that are configured with more than one DL cell;

    - UEs that are configured by higher layers with more than one CSI process;

    - UEs that are configured with two CSI measurement sets by higher layers with the parameter *csi-MeasSubframeSet*;

    the 3-bit field applies to UEs that are configured with more than five DL cells;

    otherwise the 1-bit field applies

If UEs are configured with CSI-RS-ConfigNZPAperiodic and numberActivatedAperiodicCSI-RS-Resources>1 for at least one CSI process,

the 4-bit field applies to UEs configured with no more than five DL cells and to

- UEs that are configured with more than one DL cell;

- UEs that are configured by higher layers with more than one CSI process;

- UEs that are configured with two CSI measurement sets by higher layers with the parameter *csi-MeasSubframeSet*;

the 5-bit field applies to UEs that are configured with more than five DL cells;

otherwise the 3-bit field applies.

- SRS request – 2 bits as defined in subclause 8.2 of [3]

- Resource allocation type – 1 bit as defined in subclause 8.1 of [3]

- Cyclic Shift Field mapping table for DMRS – 1 bit as defined in subclause 5.5.2.1.1 of [2]. The 1-bit field applies to UEs that are configured with higher layer parameter *UL-DMRS-IFDMA*.

- HARQ process number – 4 bits if higher layer parameter *ul-STTI-Length* is configured for the cell, otherwise 3 bits (this field is present when higher layer parameter *shortProcessingTime* is configured for the cell)

- Redundancy version – 2 bits (this field is present when higher layer parameter *shortProcessingTime* is configured for the cell)

In addition, for transport block 1:

- Modulation and coding scheme and redundancy version – 5 bits as defined in subclause 8.6 of [3]

- New data indicator – 1 bit

In addition, for transport block 2:

- Modulation and coding scheme and redundancy version – 5 bits as defined in subclause 8.6 of [3]

- New data indicator – 1 bit

Precoding information and number of layers: number of bits as specified in Table 5.3.3.1.8-1. Bit field as shown in Table 5.3.3.1.8-2 and Table 5.3.3.1.8- 3. Note that TPMI for 2 antenna ports indicates which codebook index is to be used in Table 5.3.3A.2-1 of [2], and TPMI for 4 antenna ports indicates which codebook index is to be used in Table 5.3.3A.2-2, Table 5.3.3A.2-3, Table 5.3.3A.2-4 and Table 5.3.3A.2-5 of [2]. If both transport blocks are enabled, transport block 1 is mapped to codeword 0; and transport block 2 is mapped to codeword 1. In case one of the transport blocks is disabled, the transport block to codeword mapping is specified according to Table 5.3.3.1.5-2. For a single enabled codeword, indices 24 to 39 in Table 5.3.3.1.8-3 are only supported for retransmission of the corresponding transport block if that transport block has previously been transmitted using two layers.

Table 5.3.3.1.8-1: Number of bits for precoding information

Number of antenna ports at UE	Number of bits for precoding information
2	3
4	6

Table 5.3.3.1.8-2: Content of precoding information field for 2 antenna ports

		29 - 63	Reserved

If the number of information bits in format 4 is equal to the payload size for DCI format 1, 2, 2A, 2B, 2C or 2D associated with the configured DL transmission mode in the same serving cell, one zero bit shall be appended to format 4.

5.3.3.1.8A   Format 4A

DCI format 4 is used for the scheduling of PUSCH in a LAA SCell with multi-antenna port transmission mode, or activating/releasing AUL transmission for a UE with multi-antenna port transmission mode, or indicating AUL-DFI to a UE that is activated with AUL transmission with multi-antenna port transmission mode.

The following information is transmitted by means of the DCI format 4A:

- Carrier indicator – 0 or 3 bits. The field is present according to the definitions in [3].

If the format 4A DCI is scrambled by C-RNTI

- PUSCH trigger A – 1 bit, where value 0 indicates non-triggered scheduling and value 1 indicates triggered scheduling as defined in subclause 8.0 of [3];

Else

- Flag for AUL differentiation – 1 bit, where value 0 indicates activating/releasing AUL transmission and value 1 indicates AUL-DFI.

If the format 4A is used for the scheduling of PUSCH in a LAA SCell or activating/releasing AUL transmission for a UE, all the remaining fields are set as follows:

- Timing offset – 4 bits as defined in subclause 8.0 of [3].

    - When the PUSCH trigger A is set to 0,

- The field indicates the absolute timing offset for the PUSCH transmission.

  - Otherwise,

    - The first two bits of the field indicate the timing offset, relative to the UL offset *l* as defined in clause 13A of [3], for the PUSCH transmission.

    - The last two bits of the field indicate the time window within which the scheduling of PUSCH via triggered scheduling is valid.

- Resource block assignment – 5 or 6 bits provide the resource allocation in the UL subframe as defined in subclause 8.1.4 of [3].

- HARQ process number – 4 bits.

- Redundancy version – 2 bits as defined in subclause 8.6.1 of [3] which is common for both transport blocks.

- TPC command for scheduled PUSCH – 2 bits as defined in subclause 5.1.1.1 of [3]

- Cyclic shift for DM RS and OCC index – 3 bits as defined in subclause 5.5.2.1.1 of [2]

- CSI request – 1, 2 or 3 bits as defined in subclause 7.2.1 of [3]. The 2-bit field applies to UEs configured with no more than five DL cells and to

  - UEs that are configured with more than one DL cell;

  - UEs that are configured by higher layers with more than one CSI process;

  - UEs that are configured with two CSI measurement sets by higher layers with the parameter *csi-MeasSubframeSet*;

  the 3-bit field applies to UEs that are configured with more than five DL cells;

  otherwise the 1-bit field applies.

- SRS request – 2 bits as defined in subclause 8.2 of [3].

- Partial PUSCH Mode – 2 bits as specified in Table 5.3.3.1.1A-3. This field is only present when at least one of *laa-PUSCH-Mode1*, *laa-PUSCH-Mode2*, and *laa-PUSCH-Mode3* is configured. The UE is not expected to be indicated with a partial PUSCH mode that is not configured by RRC.

- PUSCH starting position – 2 bits

  - as specified in Table 5.3.3.1.1A-2 if the 'Partial PUSCH Mode' field indicates Partial PUSCH Mode 2;

  - as specified in Table 5.3.3.1.1A-1 otherwise.

- PUSCH ending symbol – 1 bit, where

  - if the 'Partial PUSCH Mode' field indicates Partial PUSCH Mode 3, value 0 indicates symbol 6 of the subframe, and value 1 indicates symbol 3 of the subframe.

  - otherwise value 0 indicates the last symbol of the subframe and value 1 indicates the second to last symbol of the subframe.

- Channel Access type – 1 bit as defined in subclause 4.2 of [8].

- Channel Access Priority Class – 2 bits as defined in subclause 4.2 of [8].

In addition, for transport block 1:

- Modulation and coding scheme and redundancy version – 5 bits as defined in subclause 8.6 of [3].

- New data indicator – 1 bit.

In addition, for transport block 2:

- Modulation and coding scheme and redundancy version – 5 bits as defined in subclause 8.6 of [3].

- New data indicator – 1 bit.

Precoding information and number of layers: number of bits as specified in Table 5.3.3.1.8-1. Bit field as shown in Table 5.3.3.1.8-2 and Table 5.3.3.1.8- 3. Note that TPMI for 2 antenna ports indicates which codebook index is to be used in Table 5.3.3A.2-1 of [2], and TPMI for 4 antenna ports indicates which codebook index is to be used in Table 5.3.3A.2-2, Table 5.3.3A.2-3, Table 5.3.3A.2-4 and Table 5.3.3A.2-5 of [2]. If both transport blocks are enabled, transport block 1 is mapped to codeword 0; and transport block 2 is mapped to codeword 1. In case one of the transport blocks is disabled, the transport block to codeword mapping is specified according to Table 5.3.3.1.5-2. For a single enabled codeword, indices 24 to 39 in Table 5.3.3.1.8-3 are only supported for retransmission of the corresponding transport block if that transport block has previously been transmitted using two layers.

If the format 4A is used for indicating AUL-DFI to a UE that is activated with AUL transmission, all the remaining fields are set as follows:

- HARQ-ACK bitmap – 32 bits, where the order of the bitmap to HARQ process index mapping is such that HARQ process indices are mapped in ascending order from MSB to LSB of the bitmap. For each bit of the bitmap, value 1 indicates ACK, and value 0 indicates NACK.

- TPC command – 2 bits as defined in subclause 5.1.1.1 of [3].

- Precoding information: number of bits as specified in Table 5.3.3.1.8-1. Bit field as shown in Table 5.3.3.1.8-2 and Table 5.3.3.1.8- 3. Note that TPMI for 2 antenna ports indicates which codebook index is to be used in Table 5.3.3A.2-1 of [2], and TPMI for 4 antenna ports indicates which codebook index is to be used in Table 5.3.3A.2-2, Table 5.3.3A.2-3, Table 5.3.3A.2-4 and Table 5.3.3A.2-5 of [2]. If both transport blocks are enabled, transport block 1 is mapped to codeword 0; and transport block 2 is mapped to codeword 1. In case one of the transport blocks is disabled, the transport block to codeword mapping is specified according to Table 5.3.3.1.5-2. For a single enabled codeword, indices 24 to 39 in Table 5.3.3.1.8-3 are only supported for retransmission of the corresponding transport block if that transport block has previously been transmitted using two layers.

- All the remaining bits in format 4A are set to zero.

If the number of information bits in format 4A is equal to the payload size for DCI format 1, 2, 2A, 2B, 2C or 2D associated with the configured DL transmission mode in the same serving cell, one zero bit shall be appended to format 4A.

5.3.3.1.8B   Format 4B

DCI format 4B is used for the scheduling of PUSCH with multi-antenna port transmission mode in each of multiple subframes in a LAA SCell.

The following information is transmitted by means of the DCI format 4B:

- Carrier indicator – 0 or 3 bits. The field is present according to the definitions in [3].

- PUSCH trigger A – 1 bit, where value 0 indicates non-triggered scheduling and value 1 indicates triggered scheduling as defined in subclause 8.0 of [3].

- Timing offset – 4 bits as defined in subclause 8.0 of [3].

    - When the PUSCH trigger A is set to 0,

        - The field indicates the absolute timing offset for the PUSCH transmission.

    - Otherwise,

        - The first two bits of the field indicate the timing offset, relative to the UL offset l as defined in clause 13A of [3], for the PUSCH transmission.

        - The last two bits of the field indicate the time window within which the scheduling of PUSCH via triggered scheduling is valid.

- Number of scheduled subframes – 1 or 2 bits. The 1-bit field applies when *maxNumberOfSchedSubframes-Format4B-r14* is configured by higher layers to two, otherwise the 2-bit field applies.

- Resource block assignment – 5 or 6 bits provide the resource allocation in the UL subframe as defined in subclause 8.1.4 of [3].

- HARQ process number – 4 bits. The 4-bit applies to the first scheduled subframe, and the HARQ process numbers for other scheduled subframes are defined in subclause 8.0 of [3].

- Redundancy version – *maxNumberOfSchedSubframes-Format4B-r14* bits. Each scheduled PUSCH corresponds to 1 bit as defined in subclause 8.6.1 of [3]. Redundancy version is common for both transport blocks.

- TPC command for scheduled PUSCH – 2 bits as defined in subclause 5.1.1.1 of [3].

- Cyclic shift for DM RS and OCC index – 3 bits as defined in subclause 5.5.2.1.1 of [2].

- CSI request – 1, 2 or 3 bits as defined in subclause 7.2.1 of [3]. The 2-bit field applies to UEs configured with no more than five DL cells and to

    - UEs that are configured with more than one DL cell;

    - UEs that are configured by higher layers with more than one CSI process;

    - UEs that are configured with two CSI measurement sets by higher layers with the parameter *csi-MeasSubframeSet*;

    the 3-bit field applies to UEs that are configured with more than five DL cells;

    otherwise the 1-bit field applies.

- SRS request – 2 bits as defined in subclause 8.2 of [3].

- Partial PUSCH Mode 1 – 1 bit only present if *laa-PUSCH-Mode1* is configured by higher layer, and applicable to each of the scheduled subframe(s), except for the first scheduled subframe in case the 'Partial PUSCH Mode 2' field is value 1 and the last scheduled subframe in case the 'Partial PUSCH Mode 3' field is value 1, where

    - value 0 indicates the starting position of the PUSCH is determined following Partial PUSCH Mode 0 as defined in Table 5.3.3.1.1A-3;

    - value 1 indicates the starting position of the PUSCH of the first transmitted subframe is determined following Partial PUSCH Mode 1 as defined in Table 5.3.3.1.1A-3.

- Partial PUSCH Mode 2 – 1 bit. This field is only present if *laa-PUSCH-Mode2* is configured by higher layer, and applicable to only the first scheduled subframe.

- Partial PUSCH Mode 3 – 1 bit. This field is only present if *laa-PUSCH-Mode3* is configured by higher layer, and applicable to only the last scheduled subframe.

- PUSCH starting position – 2 bits

    - as specified in Table 5.3.3.1.1A-2 applicable to only the first scheduled subframe, if the 'Partial PUSCH Mode 2' field is value 1;

    - as specified in Table 5.3.3.1.1A-1 applicable to only the first scheduled subframe otherwise.

- PUSCH ending symbol – 1 bit, where

    - if the 'Partial PUSCH Mode 3' is value 1, value 0 indicates symbol 6 of the last scheduled subframe, and value 1 indicates symbol 3 of the last scheduled subframe;

    - otherwise value 0 indicates the last symbol of the last scheduled subframe and value 1 indicates the second to last symbol of the last scheduled subframe.

- Channel Access type – 1 bit as defined in subclause 4.2 of [8].

- Channel Access Priority Class – 2 bits as defined in subclause 4.2 of [8].

In addition, for transport block 1:

- Modulation and coding scheme and redundancy version – 5 bits as defined in subclause 8.6 of [3].

- New data indicator – *maxNumberOfSchedSubframes-Format4B-r14* bits. Each scheduled PUSCH corresponds to 1 bit.

In addition, for transport block 2:

- Modulation and coding scheme and redundancy version – 5 bits as defined in subclause 8.6 of [3].

- New data indicator – *maxNumberOfSchedSubframes-Format4B-r14* bits. Each scheduled PUSCH corresponds to 1 bit.

Precoding information and number of layers: number of bits as specified in Table 5.3.3.1.8-1. Bit field as shown in Table 5.3.3.1.8-2 and Table 5.3.3.1.8- 3. Note that TPMI for 2 antenna ports indicates which codebook index is to be used in Table 5.3.3A.2-1 of [2], and TPMI for 4 antenna ports indicates which codebook index is to be used in Table 5.3.3A.2-2, Table 5.3.3A.2-3, Table 5.3.3A.2-4 and Table 5.3.3A.2-5 of [2]. If both transport blocks are enabled, transport block 1 is mapped to codeword 0; and transport block 2 is mapped to codeword 1. In case one of the transport blocks is disabled, the transport block to codeword mapping is specified according to Table 5.3.3.1.5-2. For a single enabled codeword, indices 24 to 39 in Table 5.3.3.1.8-3 are only supported for retransmission of the corresponding transport block if that transport block has previously been transmitted using two layers.

If the number of information bits in format 4B is equal to the payload size for DCI format 1, 2, 2A, 2B, 2C or 2D associated with the configured DL transmission mode in the same serving cell, one zero bit shall be appended to format 4B.

5.3.3.1.9   Format 5

DCI format 5 is used for the scheduling of PSCCH, and also contains several SCI format 0 fields used for the scheduling of PSSCH.

The following information is transmitted by means of the DCI format 5:

- Resource for PSCCH – 6 bits as defined in subclause 14.2.1 of [3]

-TPC command for PSCCH and PSSCH – 1 bit as defined in subclauses 14.2.1 and 14.1.1 of [3]

- SCI format 0 fields according to 5.4.3.1.1:

    - Frequency hopping flag

    - Resource block assignment and hopping resource allocation

    - Time resource pattern

If the number of information bits in format 5 mapped onto a given search space is less than the payload size of format 0 for scheduling the same serving cell, zeros shall be appended to format 5 until the payload size equals that of format 0 including any padding bits appended to format 0.

5.3.3.1.9A   Format 5A

DCI format 5A is used for the scheduling of PSCCH, and also contains several SCI format 1 fields used for the scheduling of PSSCH.

The following information is transmitted by means of the DCI format 5A:

- Carrier indicator –3 bits. This field is present according to the definitions in [3].

- Lowest index of the subchannel allocation to the initial transmission - $\left\lceil \log_2(N_{\text{subchannel}}^{\text{SL}}) \right\rceil$ bits as defined in subclause 14.1.1.4C of [3].

- SCI format 1 fields according to 5.4.3.1.2:

    - Frequency resource location of initial transmission and retransmission.

    - Time gap between initial transmission and retransmission.

- SL index – 2 bits as defined in subclause 14.2.1 of [3] (this field is present only for cases with TDD operation with uplink-downlink configuration 0-6).

When the format 5A CRC is scrambled with SL-SPS-V-RNTI, the following fields are present:

- SL SPS configuration index – 3 bits as defined in subclause 14.2.1 of [3].

- Activation/release indication – 1 bit as defined in subclause 14.2.1 of [3].

If the number of information bits in format 5A mapped onto a given search space is less than the payload size of format 0 mapped onto the same search space, zeros shall be appended to format 5A until the payload size equals that of format 0 including any padding bits appended to format 0.

If the format 5A CRC is scrambled by SL-V-RNTI and if the number of information bits in format 5A mapped onto a given search space is less than the payload size of format 5A with CRC scrambled by SL-SPS-V-RNTI mapped onto the same search space and format 0 is not defined on the same search space, zeros shall be appended to format 5A until the payload size equals that of format 5A with CRC scrambled by SL-SPS-V-RNTI.

5.3.3.1.10   Format 6-0A

DCI format 6-0A is used for the scheduling of PUSCH in one UL cell, and for the indication of ACK feedback.

The following information is transmitted by means of the DCI format 6-0A:

- Flag format 6-0A/format 6-1A differentiation – 1 bit, where value 0 indicates format 6-0A and value 1 indicates format 6-1A

- Frequency hopping flag – 1 bit, where value 0 indicates frequency hopping is not enabled and value 1 indicates frequency hopping is enabled as defined in subclause 5.3.4 of [2]

- Number of resource units – 2 bits, where value '00' indicates the format 6-0A DCI uses PRB resource allocation, otherwise the DCI format 6-0A uses sub-PRB resource allocation as defined in subclause 8.1.6 of [3]. This field is present when *ce-PUSCH-SubPRB-Config* is configured by higher layers and the DCI is mapped onto the UE-specific search space given by C-RNTI as defined in [3]

- Resource block assignment –

  - If the format 6-0A DCI uses sub-PRB resource allocation:

    - $\left\lceil \log_2 \left\lfloor \dfrac{N_{RB}^{UL}}{6} \right\rfloor \right\rceil + 6$ bits for PUSCH as defined in [3]

    - $\left\lceil \log_2 \left\lfloor \dfrac{N_{RB}^{UL}}{6} \right\rfloor \right\rceil$ MSB bits provide the narrowband index as defined in subclause 5.2.4 of [2]

      - 6 bits provide the resource allocation within the indicated narrowband using UL resource allocation type 5 as defined in subclause 8.1.6 of [3]

  - Else if flexible starting PRB for PUSCH resource allocation is enabled by higher layers with N_{RB}^{UL} equal to N_{RB}^{DL}, $\left\lceil \log_2 (6 N_{RB}^{UL}) \right\rceil$ bits for FDD PUSCH and $\left\lceil \log_2 (5 N_{RB}^{UL}) \right\rceil$ bits for TDD PUSCH provide the resource allocation using UL resource allocation type 0 as defined in subclause 8.1.1 of [3]

  - Otherwise, $\left\lceil \log_2 \left\lfloor \dfrac{N_{RB}^{UL}}{6} \right\rfloor \right\rceil + 5$ bits for PUSCH as defined in [3]:

    - If the 5 LSB bits indicate a value not larger than 20

      - $\left\lceil \log_2 \left\lfloor \dfrac{N_{RB}^{UL}}{6} \right\rfloor \right\rceil$ MSB bits provide the narrowband index as defined in subclause 5.2.4 of [2]

- 5 bits provide the resource allocation using UL resource allocation type 0 within the indicated narrowband

- Otherwise,

- $\left\lceil \log_2 \left\lfloor \dfrac{N_{RB}^{UL}}{6} \right\rfloor \right\rceil + 5$ bits provide the resource allocation using UL resource allocation type 4 as defined in subclause 8.1.5 of[3]

- Modulation and coding scheme – 3 or 4 bits as defined in subclause 8.6 of [3] . The 3-bit field applies when the format 6-0A DCI uses sub-PRB resource allocation, otherwise the 4-bit field applies.

- Repetition number – 2 or 3 bits as defined in subclause 8.0 of [3]. The 3-bit field applies when *ce-pdsch-puschEnhancement-config* is configured by higher layers, otherwise the 2-bit field applies.

- HARQ process number – 3 bits

- New data indicator – 1 bit

- Redundancy version – 2 bits

- TPC command for scheduled PUSCH – 2 bits as defined in subclause 5.1.1.1 of [3]

- UL index – 2 bits as defined in subclauses 5.1.1.1, 7.2.1, 8 and 8.4 of [3] (this field is present only for TDD operation with uplink-downlink configuration 0)

- Downlink Assignment Index (DAI) – 2 bits as defined in subclause 7.3 of [3] (This field is present only for cases with TDD primary cell and either TDD operation with uplink-downlink configurations 1-6 or FDD operation. This field is reserved when the configured maximum repetition number is larger than 1 for MPDCCH, or when the higher layer parameter *csi-NumRepetitionCE-r13* indicates more than one subframe)

- CSI request – 1 bit as defined in subclause 7.2.1 of [3]. This field is reserved if the format 6-0A DCI uses sub-PRB resource allocation.

- SRS request –1 bit. The interpretation of this field is provided in subclause 8.2 of [3]

- DCI subframe repetition number – 2 bits as defined in subclause 9.1.5 of [3]

- Modulation order override – 1 bit as defined in subclause 8.6.1 of [3]. This field is only present when *ce-pdsch-puschEnhancement-config* is configured by higher layers

If the Resource block assignment in format 6-0A is set to all ones, format 6-0A is used for the indication of ACK feedback, and all the remaining bits except Flag format 6-0A/format 6-1A differentiation and DCI subframe repetition number are set to zero.

If the number of information bits in format 6-0A mapped onto a given search space is less than the payload size of format 6-1A for scheduling the same serving cell and mapped onto the same search space (including any padding bits appended to format 6-1A), zeros shall be appended to format 6-0A until the payload size equals that of format 6-1A.

5.3.3.1.11 Format 6-0B

DCI format 6-0B is used for the scheduling of PUSCH in one UL cell, and for the indication of ACK feedback.

The following information is transmitted by means of the DCI format 6-0B:

- Flag for format 6-0B/format 6-1B differentiation – 1 bit, where value 0 indicates format 6-0B and value 1 indicates format 6-1B

- Flag for sub-PRB resource allocation – 1 bit, where value 1 indicates the format 6-0B DCI uses sub-PRB resource allocation and value 0 indicates the format 6-0B DCI does not use sub-PRB resource allocation. This field is present when *ce-PUSCH-SubPRB-Config* is configured by higher layers and the DCI is mapped onto the UE-specific search space given by C-RNTI as defined in [3].

- Resource block assignment –

- If the flag for sub-PRB resource allocation is set to 1:

  - $\left\lceil \log_2 \left\lfloor \dfrac{N_{RB}^{UL}}{6} \right\rfloor \right\rceil$ +4 bits for PUSCH as defined in [3]

    - $\left\lceil \log_2 \left\lfloor \dfrac{N_{RB}^{UL}}{6} \right\rfloor \right\rceil$ MSB bits provide the narrowband index as defined in subclause 5.2.4 of [2]

      - 4 bits provide the resource allocation within the indicated narrowband using UL resource allocation type 5 as defined in subclause 8.1.6 of [3]

  - Otherwise, $\left\lceil \log_2 \left\lfloor \dfrac{N_{RB}^{UL}}{6} \right\rfloor \right\rceil$ +3 bits for PUSCH as defined in [3]:

    - $\left\lceil \log_2 \left\lfloor \dfrac{N_{RB}^{UL}}{6} \right\rfloor \right\rceil$ MSB bits provide the narrowband index as defined in subclause 5.2.4 of [2]

      - 3 bits provide the resource allocation within the indicated narrowband as specified in subclause 8.1.3 of [3]

- Modulation and coding scheme – 3 or 4 bits as defined in subclause 8.6 of [3]. The 3-bit field applies when the flag for sub-PRB resource allocation is present and set to 1, otherwise the 4-bit field applies.

- Number of resource units – 1 bit as defined in subclause 8.1.6 of [3]. This field is present when the flag for sub-PRB resource allocation is present and is reserved when the flag for sub-PRB resource allocation is set to 0.

- Repetition number – 3 bits as defined in subclause 8.0 of [3]

- HARQ process number – 1 bit

- New data indicator – 1 bit

- DCI subframe repetition number – 2 bits as defined in subclause 9.1.5 of [3]

If the Modulation and coding scheme in format 6-0B is 4 bits and set to all ones, format 6-0B is used for the indication of ACK feedback, and all the remaining bits except Flag for format 6-0B/format 6-1B differentiation and DCI subframe repetition number are set to zero.

If the number of information bits in format 6-0B mapped onto a given search space is less than the payload size of format 6-1B for scheduling the same serving cell and mapped onto the same search space (including any padding bits appended to format 6-1B), zeros shall be appended to format 6-0B until the payload size equals that of format 6-1B.

5.3.3.1.12 Format 6-1A

DCI format 6-1A is used for the compact scheduling of one PDSCH codeword in one cell, random access procedure initiated by a PDCCH order, and notifying SC-MCCH change. The DCI corresponding to a PDCCH order can be carried by MPDCCH.

The following information is transmitted by means of the DCI format 6-1A:

- Flag format 6-0A/format 6-1A differentiation – 1 bit, where value 0 indicates format 6-0A and value 1 indicates format 6-1A

  Format 6-1A is used for random access procedure initiated by a PDCCH order only if format 6-1A CRC is scrambled with C-RNTI and all the remaining fields are set as follows:

  - Resource block assignment – $\left\lceil \log_2 \left\lfloor \dfrac{N_{RB}^{DL}}{6} \right\rfloor \right\rceil$ +5 bits, where all bits shall be set to 1

  - Preamble Index – 6 bits

- PRACH Mask Index – 4 bits, [5]

- Starting CE level – 2 bits provide the PRACH starting CE level as defined in [5]

- All the remaining bits in format 6-1A for compact scheduling assignment of one PDSCH codeword are set to zero

Otherwise,

- Frequency hopping flag – 1 bit, where value 0 indicates frequency hopping is not enabled and value 1 indicates frequency hopping is enabled as defined in subclause 6.4.1 of [2]. If the UE is configured with 64QAM for PDSCH and the repetition number field indicates no PDSCH repetition, this field is the MSB bit of the extended Modulation and coding scheme field, as specified in Table 7.1.7.1-1 of [3].

- Resource block assignment flag – 1 bit. This field is only present when the higher layer parameter *ce-pdsch-maxBandwidth-config* is configured and set to 20 MHz and the DCI is mapped onto the UE-specific search space given by the C-RNTI as defined in [3].

- Resource block assignment –

    - If *ce-pdsch-maxBandwidth-config* is set to 5 MHz or *mpdcch-PDSCH-MaxBandwidth-SC-MTCH* is set to 24 PRBs or the resource block assignment flag is set to 1, and the DCI is mapped onto the UE-specific search space given by the C-RNTI as defined in [3],

        - If $N_{RB}^{DL} > 25$, $\left\lceil \log_2 \left\lfloor \dfrac{N_{RB}^{DL}}{6} \right\rfloor \right\rceil + 8$ bits for PDSCH as defined in [3]:

            - $\left\lceil \log_2 \left\lfloor \dfrac{N_{RB}^{DL}}{6} \right\rfloor \right\rceil$ MSB bits provide the starting narrowband index as defined in subclause 6.2.7 of [2]

            - 3 bit bitmap provides additional allocated narrowbands among the three narrowbands following the starting narrowband. The order of the bitmap to narrowband index mapping is such that the first narrowband after the starting narrowband to the third narrowband after the starting narrowband are mapped to MSB to LSB of the bitmap.

            - 5 bits provide the same resource allocation using DL resource allocation type 2 within each of the allocated narrowbands.

        - Else if $6 < N_{RB}^{DL} \leq 25$, $\left\lfloor \dfrac{N_{RB}^{DL}}{6} \right\rfloor + 5$ bits for PDSCH as defined below:

            - $\left\lfloor \dfrac{N_{RB}^{DL}}{6} \right\rfloor$ MSB bits provide a bitmap of allocated narrowbands. The order of the bitmap to narrowband index mapping is such that narrowband index 0 to $\left\lfloor \dfrac{N_{RB}^{DL}}{6} \right\rfloor - 1$ are mapped to MSB to LSB of the bitmap.

            - 5 bits provide the same resource allocation using DL resource allocation type 2 within each of the allocated narrowbands

        - Otherwise, 5 bits for PDSCH as defined below:

            - 5 bits provide resource allocation using DL resource allocation type 2

    - Else if the resource block assignment flag is set to 0:

- $\left\lfloor \dfrac{N_{RB}^{DL}}{S} \right\rfloor$ bits provide the RBG bitmap as defined in subclause 7.1.6.1 of [3], where $S = 9$ if

$N_{RB}^{DL} > 75$ and $S = 6$ otherwise

- Reserved information bits are added until the size is equal to the size of the resource block assignment with resource block assignment flag is set to 1

- Otherwise, $\left\lceil \log_2 \left\lfloor \dfrac{N_{RB}^{DL}}{6} \right\rfloor \right\rceil + 5$ bits for PDSCH as defined in [3]:

- $\left\lceil \log_2 \left\lfloor \dfrac{N_{RB}^{DL}}{6} \right\rfloor \right\rceil$ MSB bits provide the narrowband index as defined in subclause 6.2.7 of [2]

- 5 bits provide the resource allocation using DL resource allocation type 2 within the indicated narrowband

- Modulation and coding scheme – 4 bits as defined in subclause 7.1.7 of [3]

- Repetition number – 2 bits as defined in subclause 7.1.11 of [3]

- HARQ process number – 3 bits (for cases with FDD primary cell), 4 bits (for cases with TDD primary cell, or for cases with FDD primary cell when *ce-pdsch-tenProcesses-config* is configured by higher layers and the DCI is mapped onto the UE-specific search space given by the C-RNTI as defined in [3]). This field is not present when the format 6-1A CRC is scrambled with G-RNTI.

- New data indicator – 1 bit. This field is not present when the format 6-1A CRC is scrambled with G-RNTI.

- Redundancy version – 2 bits

- TPC command for PUCCH – 2 bits as defined in subclause 5.1.2.1 of [3] . This field is not present when the format 6-1A CRC is scrambled with G-RNTI.

    - If the format 6-1A CRC is scrambled by RA-RNTI:

        - The most significant bit of the TPC command is reserved.

        - The least significant bit of the TPC command indicates column N_{PRB}^{1A} of the TBS table defined of [3].

        - If least significant bit is 0 then $N_{PRB}^{1A} = 2$ else $N_{PRB}^{1A} = 3$.

    - Else

        - The two bits including the most significant bit indicate the TPC command

- Downlink Assignment Index – number of bits as specified in Table 5.3.3.1.2-2. This field is reserved when the configured maximum repetition number is larger than 1 for MPDCCH, and not present when the format 6-1A CRC is scrambled with G-RNTI, or when the higher layer parameter *csi-NumRepetitionCE-r13* indicates more than one subframe.

- Antenna port(s) and scrambling identity – 2 bits indicating the values 0 to 3, as specified in Table 5.3.3.1.5C-1. This field is present only if PDSCH transmission is configured with TM9 for DCI formats scheduling PDSCH which are mapped onto the UE specific search space given by the C-RNTI as defined in [3].

- SRS request –1 bit. The interpretation of this field is provided in subclause 8.2 of [3]

- TPMI information for precoding – number of bits as specified in Table 5.3.3.1.3A-1.

    - TPMI information indicates which codebook index is used in Table 6.3.4.2.3-1 or Table 6.3.4.2.3-2 of [2] corresponding to the single-layer transmission. This field is present only if PDSCH transmission is

configured with TM6 for DCI formats scheduling PDSCH which are mapped onto the UE specific search space given by the C-RNTI as defined in [3].

- PMI confirmation for precoding – 1 bit as specified in Table 5.3.3.1.3A-2. This field is present only if PDSCH transmission is configured with TM6 for DCI formats scheduling PDSCH which are mapped onto the UE specific search space given by the C-RNTI as defined in [3].

- HARQ-ACK resource offset – 0 or 2 bits as defined in subclause 10.1 of [3] (this field is 0 bits if Information for SC-MCCH change notification is present)

- Information for SC-MCCH change notification – 2 bits as defined in subclause 5.8a of [6] (this field is present if the format 6-1A CRC is scrambled with G-RNTI)

- DCI subframe repetition number – 0 or 2 bits as defined in subclause 9.1.5 of [3] (this field is 0 bits if Transport blocks in a bundle is present)

- Transport blocks in a bundle – 0 or 2 bits as defined in subclause 7.3.1 of [3] (this field is 2 bits when DCI Field "HARQ-ACK bundling flag" is set to 1, and the DCI is mapped onto the UE-specific search space given by the C-RNTI as defined in [3]. Otherwise this field is 0 bits)

- HARQ-ACK bundling flag – 1 bit, where value 0 indicates HARQ-ACK bundling is not enabled and value 1 indicates HARQ-ACK bundling is enabled as defined in subclause 7.3 of [3]. This field is only present when the higher layer parameter *ce-HarqAckBundling-config* is configured and the DCI is mapped onto the UE-specific search space given by the C-RNTI as defined in [3].

- HARQ-ACK delay – 3 bits as defined in 7.3 of [3]. This field is only present when the higher layer parameter *ce-schedulingEnhancement-config* or *ce-HarqAckBundling-config* is configured and the DCI is mapped onto the UE-specific search space given by the C-RNTI as defined in [3].

When the format 6-1A CRC is scrambled with a RA-RNTI, then the following fields among the fields above are reserved:

- HARQ process number

- New data indicator

- Downlink Assignment Index

- HARQ-ACK resource offset

If the UE is not configured to decode MPDCCH with CRC scrambled by the C-RNTI and the format 6-1A CRC is not scrambled with a G-RNTI, and the number of information bits in format 6-1A is less than that of format 6-0A, zeros shall be appended to format 6-1A until the payload size equals that of format 6-0A.

If the UE is configured to decode MPDCCH with CRC scrambled by the C-RNTI and the format 6-1A CRC is not scrambled with a G-RNTI, and the number of information bits in format 6-1A mapped onto a given search space is less than that of format 6-0A for scheduling the same serving cell and mapped onto the same search space, zeros shall be appended to format 6-1A until the payload size equals that of format 6-0A.

5.3.3.1.13   Format 6-1B

DCI format 6-1B is used for the scheduling of one PDSCH codeword in one cell and notifying SC-MCCH change.

The following information is transmitted by means of the DCI format 6-1B:

- Flag for format 6-0B/format 6-1B differentiation – 1 bit, where value 0 indicates format 6-0B and value 1 indicates format 6-1B

Format 6-1B is used for random access procedure initiated by a PDCCH order only if format 6-1B CRC is scrambled with C-RNTI and all the remaining fields are set as follows:

- Reserved bits – $\left\lceil \log_2 \left\lfloor \frac{N_{\mathrm{RB}}^{\mathrm{DL}}}{6} \right\rfloor \right\rceil + 2$ bits, where all bits shall be set to 1

- Preamble Index – 6 bits

- PRACH Mask Index – 4 bits [5]

- Starting CE level – 2 bits provide the PRACH starting CE level as defined in [5]

- All the remaining bits in format 6-1B for compact scheduling assignment of one PDSCH codeword are set to zero

Otherwise,

- Modulation and coding scheme – 4 bits as defined in subclause 7.1.7 of [3]

- Resource block assignment –

  - If *ce-pdsch-maxBandwidth-config* is set to 5 MHz or *mpdcch-PDSCH-MaxBandwidth-SC-MTCH* is set to 24 PRBs,

    - If $N_{RB}^{DL} > 25$, $\left\lceil \log_2 \left\lfloor \dfrac{N_{RB}^{DL}}{24} \right\rfloor \right\rceil + 4$ bits for PDSCH as defined in [3]:

      - $\left\lceil \log_2 \left\lfloor \dfrac{N_{RB}^{DL}}{24} \right\rfloor \right\rceil$ MSB bits provide the wideband index as defined in subclause 6.2.7 of [2]

        - 4 bits provide a narrowband bitmap for resource allocation within the indicated wideband

    - Otherwise, $\left\lfloor \dfrac{N_{RB}^{DL}}{6} \right\rfloor$ bits for PDSCH as defined below:

      - if $\left\lfloor \dfrac{N_{RB}^{DL}}{6} \right\rfloor = 1$, 1 bit provides the resource allocation within the narrowband, where value 0 indicates RBs with PRB index {0, 1, 2, 3} and value 1 indicates that all 6 PRBs are used.

        - Otherwise, $\left\lfloor \dfrac{N_{RB}^{DL}}{6} \right\rfloor$ bits provide allocated narrowbands

  - Else if *ce-pdsch-maxBandwidth-config* is set to 20 MHz,

    - If $N_{RB}^{DL} \geq 50$, $\left\lceil \log_2 \left\lfloor \dfrac{N_{RB}^{DL}}{24} \right\rfloor \right\rceil + 5$ bits for PDSCH as defined in [3]:

      - $\left\lceil \log_2 \left\lfloor \dfrac{N_{RB}^{DL}}{24} \right\rfloor \right\rceil + 1$ bits provide a wideband combination index as defined in subclause 7.1.6 of [3]

        - 4 bits provide a narrowband bitmap for resource allocation within each indicated wideband

    - Otherwise, $\left\lfloor \dfrac{N_{RB}^{DL}}{6} \right\rfloor$ bits for PDSCH as defined in [3]:

      - If $\left\lfloor \dfrac{N_{RB}^{DL}}{6} \right\rfloor = 1$, 1 bit provides the resource allocation within the narrowband, where value 0 indicates RBs with PRB index {0, 1, 2, 3} and value 1 indicates that all 6 PRBs are used.

- Otherwise, $\left\lfloor \dfrac{N_{\mathrm{RB}}^{\mathrm{DL}}}{6} \right\rfloor$ bits provide a narrowband bitmap for resource allocation

- Otherwise, $\left\lceil \log_2 \left\lfloor \dfrac{N_{\mathrm{RB}}^{\mathrm{DL}}}{6} \right\rfloor \right\rceil + 1$ bits for PDSCH as defined in [3]:

  - $\left\lceil \log_2 \left\lfloor \dfrac{N_{\mathrm{RB}}^{\mathrm{DL}}}{6} \right\rfloor \right\rceil$ MSB bits provide the narrowband index as defined in subclause 6.2.7 of [2]

    - 1 bit provides the resource allocation within the indicated narrowband, where value 0 indicates RBs with PRB index {0, 1, 2, 3} and value 1 indicates that all 6 PRBs are used.

- Repetition number – 3 bits as defined in subclause 7.1.11 of [3]

- HARQ process number – 1 bit. This field is not present when the format 6-1B CRC is scrambled with G-RNTI.

- New data indicator – 1 bit. This field is not present when the format 6-1B CRC is scrambled with G-RNTI.

- HARQ-ACK resource offset – 0 or 2 bits as defined in subclause 10.1 of [3] (this field is 0 bits if Information for SC-MCCH change notification is present)

- Information for SC-MCCH change notification – 2 bits as defined in subclause 5.8a of [6] (this field is present if the format 6-1B CRC is scrambled with G-RNTI)

- DCI subframe repetition number –2 bits as defined in subclause 9.1.5 of [3]

When the format 6-1B CRC is scrambled with a RA-RNTI then the following fields among the fields above are reserved:

- HARQ process number

- New data indicator

- HARQ-ACK resource offset

If the UE is not configured to decode MPDCCH with CRC scrambled by the C-RNTI and the format 6-1B CRC is not scrambled with a G-RNTI, and the number of information bits in format 6-1B is less than that of format 6-0B, zeros shall be appended to format 6-1B until the payload size equals that of format 6-0B.

If the UE is configured to decode MPDCCH with CRC scrambled by the C-RNTI and the format 6-1B CRC is not scrambled with a G-RNTI, and the number of information bits in format 6-1B mapped onto a given search space is less than that of format 6-0B for scheduling the same serving cell and mapped onto the same search space, zeros shall be appended to format 6-1B until the payload size equals that of format 6-0B.

5.3.3.1.14 Format 6-2

DCI format 6-2 is used for paging, direct indication, scheduling of one PDSCH codeword carrying SC-MCCH in one cell, and notifying SC-MCCH change.

The following information is transmitted by means of the DCI format 6-2:

- If the format 6-2 CRC is scrambled by P-RNTI:

  - Flag for paging/direct indication differentiation – 1 bit, with value 0 for direct indication and value 1 for paging

- Else if the format 6-2 CRC is scrambled by a SC-RNTI:

  - Information for SC-MCCH change notification – 1 bit as defined in subclause 5.8a of [6]

- If the format 6-2 CRC is scrambled by P-RNTI and Flag=0:

- Direct Indication information – 8 bits provide direct indication of system information update and other fields, as defined in [6]

- Reserved information bits are added until the size is equal to that of format 6-2 with Flag=1

- If the format 6-2 CRC is scrambled by P-RNTI and Flag=1, or if the format 6-2 CRC is scrambled by SC-RNTI:

  - Resource block assignment – $\left\lceil \log_2 \left\lfloor \frac{N_{RB}^{DL}}{6} \right\rfloor \right\rceil$ bits for the narrowband index as defined in subclause 7.1.6 of [3]

  - Modulation and coding scheme – 3 bits as defined in subclause 7.1.7 of [3]

  - Repetition number – 3 bits as defined in subclause 7.1.11 of [3]

  - DCI subframe repetition number – 2 bits as defined in subclause 9.1.5 of [3]

5.3.3.1.15   Format 7-0A

DCI format 7-0A is used for the scheduling of PUSCH with slot or subslot duration in one UL cell.

The following information is transmitted by means of the DCI format 7-0A:

- Flag for UL/DL differentiation – 1 bit, where value 0 indicates format 7-0A and value 1 indicates format 7-1A/B/C/D/E/F/G depending on the configured downlink transmission mode

- Resource block assignment – $(\lceil \log_2(\lceil N_{RB}^{UL}/P\rceil(\lceil N_{RB}^{UL}/P\rceil + 1)/2)\rceil)$ bits provide the resource allocation in the UL slot or subslot as defined in subclause 8.1.1 of [3], where $P = 4$ if $N_{RB}^{UL} > 15$, and $P = 1$ otherwise.

- Modulation and coding scheme – 5 bits as defined in subclause 8.6 of [3]

- HARQ process number – 4 bits

- New data indicator – 1 bit

- Redundancy version – 2 bits

- TPC command for scheduled PUSCH – 2 bits as defined in subclause 5.1.1.1 of [3]

- DMRS pattern – 2 bits as defined in subclause 5.5.2.1.2 in [2] (The field is present only for PUSCH with subslot duration)

- Cyclic shift for DMRS and IFDMA configuration – 1 bit as defined in subclause 5.5.2.1.1 of [2]

- UL index – 2 bits as defined in subclauses 5.1.1.1, 7.2.1, 8 and 8.4 of [3] (this field is present only for TDD operation with uplink-downlink configuration 0, or TDD operation with uplink-downlink configuration 6 and special subframe configuration 0, 5, 9 or 10)

- Downlink Assignment Index (DAI) – 2 bits as defined in subclause 7.3 of [3] (this field is present only for cases with TDD primary cell and either TDD operation with uplink-downlink configurations 1-6 or FDD operation)

- CSI request – 1, 2 or 3 bits as defined in subclause 7.2.1 of [3]:

  The 2-bit field applies to UEs configured with no more than five DL cells and to

    - UEs that are configured with more than one DL cell;

    - UEs that are configured by higher layers with more than one CSI process;

    - UEs that are configured with two CSI measurement sets by higher layers with the parameter *csi-MeasSubframeSet*;

  the 3-bit field applies to UEs that are configured with more than five DL cells;

  otherwise the 1-bit field applies

- SRS request – 0 or 1 bit as defined in subclause 8.2 of [3] (this field is present only for TDD operation, if the UE has indicated the capability *srs-DCI7-Triggering-FS2-r15* and the UE is configured with higher layer parameter *srs-DCI7-TriggeringConfig-r15*)

- Beta offet indicator – 1 bit as defined in subclause 8.6.3 of [3] (this field is present only if UE is configured with *ul-STTI-Length*=subslot).

- Cyclic Shift Field mapping table for DMRS – 1 bit as defined in subclause 5.5.2.1.1 of [2].

If the number of information bits in format 7-0A mapped onto a given search space is less than the payload size of format 7-1A/B/C/D/E/F/G depending on the configured downlink transmission mode for scheduling the same serving cell and mapped onto the same search space (including any padding bits appended to format 7-1A/B/C/D/E/F/G), zeros shall be appended to format 7-0A until the payload size equals that of format 7-1A/B/C/D/E/F/G.

If the number of information bits in format 7-0A carried by PDCCH is equal to the payload size of a configured format 0/0C/1/1A/1B/1D/2/2A/2B/2C/2D/4 mapped onto the UE specific search space given by C-RNTI or SPS C-RNTI as defined in [3] (including any padding bits appended to format 0/0C/1/1A/1B/1D/2/2A/2B/2C/2D/4), one or more zero bit(s) shall be appended to format 7-0A until the payload size is not equal to that of a configured format 0/0C/1/1A/1B/1D/2/2A/2B/2C/2D/4.

5.3.3.1.16 Format 7-0B

DCI format 7-0B is used for the scheduling of PUSCH with slot or subslot duration in one UL cell with multi-antenna port transmission mode.

The following information is transmitted by means of the DCI format 7-0B:

- Flag for UL/DL differentiation – 1 bit, where value 0 indicates format 7-0B and value 1 indicates format 7-1A/B/C/D/E/F/G depending on the configured downlink transmission mode

- Resource block assignment – ($\lceil \log_2(\lceil N_{RB}^{UL}/P \rceil (\lceil N_{RB}^{UL}/P \rceil + 1)/2) \rceil$) bits provide the resource allocation in the UL slot or subslot as defined in subclause 8.1.1 of [3], where $P = 4$ if $N_{RB}^{UL} > 15$, and $P = 1$ otherwise.

- Modulation and coding scheme – 5 bits as defined in subclause 8.6 of [3]

- HARQ process number – 4 bits

- New data indicator – 1 bit

- Redundancy version – 2 bits

- TPC command for scheduled PUSCH – 2 bits as defined in subclause 5.1.1.1 of [3]

- DMRS pattern – 2 bits as defined in subclause 5.5.2.1.2 in [2] (The field is present only for PUSCH with subslot duration)

- Cyclic shift for DMRS and IFDMA configuration – 1 bit as defined in subclause 5.5.2.1.1 of [2]

- UL index – 2 bits as defined in subclauses 5.1.1.1, 7.2.1, 8 and 8.4 of [3] (this field is present only for TDD operation with uplink-downlink configuration 0, or TDD operation with uplink-downlink configuration 6 and special subframe configuration 0, 5, 9 or 10)

- Downlink Assignment Index (DAI) – 2 bits as defined in subclause 7.3 of [3] (this field is present only for cases with TDD primary cell and either TDD operation with uplink-downlink configurations 1-6 or FDD operation)

- CSI request – 1, 2 or 3 bits as defined in subclause 7.2.1 of [3]:

  The 2-bit field applies to UEs configured with no more than five DL cells and to

    - UEs that are configured with more than one DL cell;

    - UEs that are configured by higher layers with more than one CSI process;

    - UEs that are configured with two CSI measurement sets by higher layers with the parameter *csi-MeasSubframeSet*;

the 3-bit field applies to UEs that are configured with more than five DL cells;

otherwise the 1-bit field applies

-   SRS request – 2 bits as defined in subclause 8.2 of [3] (this field is present only for TDD operation, if the UE has indicated the capability *srs-DCI7-Triggering-FS2-r15* and the UE is configured with higher layer parameter *srs-DCI7-TriggeringConfig-r15*)

-   Beta offet indicator – 1 bit as defined in subclause 8.6.3 of [3] (this field is present only if UE is configured with *ul-STTI-Length*=subslot).

-   Cyclic Shift Field mapping table for DMRS – 1 bit as defined in subclause 5.5.2.1.1 of [2].

-   Precoding information and number of layers: number of bits as specified in Table 5.3.3.1.8-1. Bit field are shown in Table 5.3.3.1.16-1 and Table 5.3.3.1.16- 2. Note that TPMI for 2 antenna ports indicates which codebook index is to be used in Table 5.3.3A.2-1 of [2], and TPMI for 4 antenna ports indicates which codebook index is to be used in Table 5.3.3A.2-2, Table 5.3.3A.2-3, Table 5.3.3A.2-4 and Table 5.3.3A.2-5 of [2].

Table 5.3.3.1.16-1: Content of precoding information field for 2 antenna ports

Bit field mapped to index	Message
0	1 layer: TPMI=0
1	1 layer: TPMI=1
2	1 layer: TPMI=2
…	…
5	1 layer: TPMI=5
6	2 layers: TPMI=0
7	reserved

Table 5.3.3.1.16-2: Content of precoding information field for 4 antenna ports

39	2 layers: TPMI=15
40	3 layers: TPMI=0
41	3 layers: TPMI=1
…	…
51	3 layers: TPMI=11
52	4 layers: TPMI=0
53-63	reserved

If the number of information bits in format 7-0B mapped onto a given search space is less than the payload size of format 7-1A/B/C/D/E/F/G depending on the configured downlink transmission mode for scheduling the same serving cell and mapped onto the same search space (including any padding bits appended to format 7-1A/B/C/D/E/F/G), zeros shall be appended to format 7-0B until the payload size equals that of format 7-1A/B/C/D/E/F/G.

If the number of information bits in format 7-0B carried by PDCCH is equal to the payload size of a configured format 0/0C/1/1A/1B/1D/2/2A/2B/2C/2D/4 mapped onto the UE specific search space given by C-RNTI or SPS C-RNTI as defined in [3] (including any padding bits appended to format 0/0C/1/1A/1B/1D/2/2A/2B/2C/2D/4), one or more zero bit(s) shall be appended to format 7-0B until the payload size is not equal to that of a configured format 0/0C/1/1A/1B/1D/2/2A/2B/2C/2D/4.

5.3.3.1.17   Format 7-1A

DCI format 7-1A is used for the scheduling of one PDSCH codeword with slot or subslot duration in one cell.

The following information is transmitted by means of the DCI format 7-1A:

- Flag for DL/UL differentiation – 1 bit, where value 0 indicates format 7-0A/B depending on the configured uplink transmission mode and value 1 indicates the DL DCI format

- For resource allocation type 0 as defined in subclause 7.1.6.1 of [3]:

    - $\left\lfloor N_{\mathrm{RB}}^{\mathrm{DL}} / P \right\rfloor$ bits provide the resource allocation

    where the value of P depends on the number of DL resource blocks as indicated in subclause 7.1.6.1 of [3]

- For resource allocation type 2 as defined in subclause 7.1.6.3 of [3]:

    - $\left\lceil \log_2 \left(\left\lfloor N_{\mathrm{RB}}^{\mathrm{DL}} / N_{\mathrm{RB}}^{\mathrm{step}} \right\rfloor \left(\left\lfloor N_{\mathrm{RB}}^{\mathrm{DL}} / N_{\mathrm{RB}}^{\mathrm{step}} \right\rfloor + 1 \right) / 2 \right) \right\rceil$ bits provide the resource allocation

    - one additional bit if $N_{\mathrm{RB}}^{\mathrm{DL}} = 25$

    where $N_{\mathrm{RB}}^{\mathrm{step}}$ is defined in subclause 7.1.6.3 of [3]

- Modulation and coding scheme – 5 bits as defined in subclause 7.1.7 of [3]. The MSB is set to 0 when the UE is configured with *blindSlotSubslotPDSCH-Repetitions* set to TRUE and the repetition number is greater than 1 and the higher layer parameter *mcs-restrictionSlotSubslotPDSCH-Repetitions* is configured to 1.

- HARQ process number – 4 bits

- New data indicator – 1 bit

- Redundancy version – 2 bits

- TPC command for slot-SPUCCH or subslot-SPUCCH – 2 bits as defined in subclause 5.1.2.1 of [3]

- Downlink Assignment Index – number of bits as specified in Table 5.3.3.1.2-2

- Used/Unused SPDCCH resource indication – 2 bits (This field is present if the DCI is mapped to SPDCCH and L1-based reuse indication is configured by higher layers)

- SPUCCH resource indication – 2 bit as defined in subclause 10.1.2 of [3].

- Repetition number – 2 bits as defined in Table 5.3.3.1.17-1, where the number of transmissions for PDSCH is given by higher layer parameter *maxNumber-SlotSubslotPDSCH-Repetitions* for the value of '11'. This field is present only when the UE is configured with higher layer parameter *blindSlotSubslotPDSCH-Repetitions* set to TRUE.

Table 5.3.3.1.17-1: Content of repetition number field

Bit field	Number of transmissions for PDSCH
00	1
01	2
10	3
11	as configured by higher layers

If the UE is configured to decode SPDCCH CRC scrambled by the C-RNTI and the number of information bits in format 7-1A mapped onto a given search space is less than that of format 7-0A/B depending on the configured uplink transmission mode for scheduling the same serving cell and mapped onto the same search space, zeros shall be appended to format 7-1A until the payload size equals that of format 7-0A/B, except when format 7-1A assigns downlink resource on a secondary cell without an uplink configuration associated with the secondary cell.

If the number of information bits in format 7-1A carried by PDCCH is equal to the payload size of a configured format 0/0C/1/1A/1B/1D/2/2A/2B/2C/2D/4 mapped onto the UE specific search space given by C-RNTI or SPS C-RNTI as

3GPP TS 36.212 version 15.8.0 Release 15

defined in [3] (including any padding bits appended to format 0/0C/1/1A/1B/1D/2/2A/2B/2C/2D/4), one or more zero bit(s) shall be appended to format 7-1A until the payload size is not equal to that of a configured format 0/0C/1/1A/1B/1D/2/2A/2B/2C/2D/4.

5.3.3.1.18   Format 7-1B

DCI format 7-1B is used for the scheduling of one PDSCH codeword with slot or subslot duration in one cell.

The following information is transmitted by means of the DCI format 7-1B:

- The fields of format 7-1A

- Precoding information –1 bit for transmission with 2 antenna ports and 2 bits for transmission with 4 antenna ports.

For transmission with 4 antenna ports, the precoding information field is defined according to Table 5.3.3.1.18-1. For transmission with 2 antenna ports, the number of transmission layers is equal to 2 if precoding information is 1; transmit diversity is used if precoding information is 0.

Table 5.3.3.1.18-1: Content of precoding information field for 4 antenna ports

Bit field mapped to index	Message
0	4 layers: Transmit diversity
1	2 layers: precoder cycling with large delay CDD
2	3 layers: precoder cycling with large delay CDD
3	4 layers: precoder cycling with large delay CDD

If the UE is configured to decode SPDCCH CRC scrambled by the C-RNTI and the number of information bits in format 7-1B mapped onto a given search space is less than that of format 7-0A/B depending on the configured uplink transmission mode for scheduling the same serving cell and mapped onto the same search space, zeros shall be appended to format 7-1B until the payload size equals that of format 7-0A/B, except when format 7-1B assigns downlink resource on a secondary cell without an uplink configuration associated with the secondary cell.

If the number of information bits in format 7-1B carried by PDCCH is equal to the payload size of a configured format 0/0C/1/1A/1B/1D/2/2A/2B/2C/2D/4 mapped onto the UE specific search space given by C-RNTI or SPS C-RNTI as defined in [3] (including any padding bits appended to format 0/0C/1/1A/1B/1D/2/2A/2B/2C/2D/4), one or more zero bit(s) shall be appended to format 7-1B until the payload size is not equal to that of a configured format 0/0C/1/1A/1B/1D/2/2A/2B/2C/2D/4.

5.3.3.1.19   Format 7-1C

DCI format 7-1C is used for the scheduling of one PDSCH codeword with slot or subslot duration in one cell.

The following information is transmitted by means of the DCI format 7-1C:

- The fields of format 7-1A

- Precoding information – 4 bits for 2 antenna ports and 6 bits for 4 antenna ports.

The precoding information field is defined in Table 5.3.3.1.19-1 and Table 5.3.3.1.19-2. Note that TPMI indicates which codebook index is used in Table 6.3.4.2.3-1 or Table 6.3.4.2.3-2 of [2].

Some entries in Table 5.3.3.1.5-4 and Table 5.3.3.1.5-5 are used for indicating that the eNodeB has applied precoding according to PMI(s) reported by the UE. In these cases the precoding for the corresponding RB(s) in slot/subslot n is according to the latest PMI(s) in an aperiodic CSI reported on or before slot n-4 if higher layer parameter *ul-STTI-*

Length is configured as slot, or subslot *n-k* if higher layer parameter *ul-STTI-Length* is configured as subslot, where *k* is the minimum processing timing configured in higher layer parameter *min-proc-TimelineSubslot*. For aperiodic CSI mode 2-2: Precoding of scheduled resource blocks belonging to the reported preferred M subband(s) use precoder(s) according to the preferred M subband PMI indicated by the latest aperiodic CSI report; Precoding of scheduled resource blocks not belonging to the reported preferred M subband(s) use a precoder according to the wideband PMI indicated by the latest aperiodic CSI report.

Table 5.3.3.1.19-1: Content of precoding information field for 2 antenna ports

Bit field mapped to index	Message
0	2 layers: Transmit diversity
1	1 layer: Precoding corresponding to precoding vector $\begin{bmatrix}1 & 1\end{bmatrix}^T/\sqrt{2}$
2	1 layer: Precoding corresponding to precoder vector $\begin{bmatrix}1 & -1\end{bmatrix}^T/\sqrt{2}$
3	1 layer: Precoding corresponding to precoder vector $\begin{bmatrix}1 & j\end{bmatrix}^T/\sqrt{2}$
4	1 layer: Precoding corresponding to precoder vector $\begin{bmatrix}1 & -j\end{bmatrix}^T/\sqrt{2}$
5	1 layer: Precoding according to the latest PMI report on PUSCH, using the precoder(s) indicated by the reported PMI(s), if RI=2 was reported, using 1st column multiplied by $\sqrt{2}$ of all precoders implied by the reported PMI(s)
6	1 layer: Precoding according to the latest PMI report on PUSCH, using the precoder(s) indicated by the reported PMI(s), if RI=2 was reported, using 2nd column multiplied by $\sqrt{2}$ of all precoders implied by the reported PMI(s)
7	2 layers: Precoding corresponding to precoder matrix $\frac{1}{2}\begin{bmatrix}1 & 1\\1 & -1\end{bmatrix}$
8	2 layers: Precoding corresponding to precoder matrix $\frac{1}{2}\begin{bmatrix}1 & 1\\j & -j\end{bmatrix}$
9	2 layers: Precoding according to the latest PMI report on PUSCH, using the precoder(s) indicated by the reported PMI(s)
10~15	reserved

If the UE is configured to decode SPDCCH CRC scrambled by the C-RNTI and the number of information bits in format 7-1C mapped onto a given search space is less than that of format 7-0A/B depending on the configured uplink transmission mode for scheduling the same serving cell and mapped onto the same search space, zeros shall be appended to format 7-1C until the payload size equals that of format 7-0A/B, except when format 7-1C assigns downlink resource on a secondary cell without an uplink configuration associated with the secondary cell.

If the number of information bits in format 7-1C carried by PDCCH is equal to the payload size of a configured format 0/0C/1/1A/1B/1D/2/2A/2B/2C/2D/4 mapped onto the UE specific search space given by C-RNTI or SPS C-RNTI as defined in [3] (including any padding bits appended to format 0/0C/1/1A/1B/1D/2/2A/2B/2C/2D/4), one or more zero bit(s) shall be appended to format 7-1C until the payload size is not equal to that of a configured format 0/0C/1/1A/1B/1D/2/2A/2B/2C/2D/4.

5.3.3.1.20 Format 7-1D

DCI format 7-1D is used for the scheduling of one PDSCH codeword with slot or subslot duration in one cell.

The following information is transmitted by means of the DCI format 7-1C:

- The fields of format 7-1A

- Precoding information – number of bits as the value specified in Table 5.3.3.1.3A-1 plus one

The precoding information field is defined in Table 5.3.3.1.20-1 and Table 5.3.3.1.20-2.

Table 5.3.3.1.20-1: Content of precoding information field for 2 antenna ports

Bit field mapped to index	Message
0	2 layers: Transmit diversity
1	1 layer: Precoding corresponding to precoding vector $\begin{bmatrix} 1 & 1 \end{bmatrix}^T / \sqrt{2}$
2	1 layer: Precoding corresponding to precoder vector $\begin{bmatrix} 1 & -1 \end{bmatrix}^T / \sqrt{2}$
3	1 layer: Precoding corresponding to precoder vector $\begin{bmatrix} 1 & j \end{bmatrix}^T / \sqrt{2}$
4	1 layer: Precoding corresponding to precoder vector $\begin{bmatrix} 1 & -j \end{bmatrix}^T / \sqrt{2}$
5	1 layer: Precoding according to the latest PMI report on PUSCH, using the precoder(s) indicated by the reported PMI(s)
6~8	reserved

Bit field mapped to index	Message
0	4 layers: Transmit diversity
1	1 layer: TPMI=0
2	1 layer: TPMI=1
⋮	⋮
16	1 layer: TPMI=15
17	1 layer: Precoding according to the latest PMI report on PUSCH using the precoder(s) indicated by the reported PMI(s)
18~31	reserved

If the UE is configured to decode SPDCCH CRC scrambled by the C-RNTI and the number of information bits in format 7-1D mapped onto a given search space is less than that of format 7-0A/B depending on the configured uplink transmission mode for scheduling the same serving cell and mapped onto the same search space, zeros shall be

appended to format 7-1D until the payload size equals that of format 7-0A/B, except when format 7-1D assigns downlink resource on a secondary cell without an uplink configuration associated with the secondary cell.

If the number of information bits in format 7-1D carried by PDCCH is equal to the payload size of a configured format 0/0C/1/1A/1B/1D/2/2A/2B/2C/2D/4 mapped onto the UE specific search space given by C-RNTI or SPS C-RNTI as defined in [3] (including any padding bits appended to format 0/0C/1/1A/1B/1D/2/2A/2B/2C/2D/4), one or more zero bit(s) shall be appended to format 7-1D until the payload size is not equal to that of a configured format 0/0C/1/1A/1B/1D/2/2A/2B/2C/2D/4.

5.3.3.1.21 Format 7-1E

DCI format 7-1E is used for the scheduling of one PDSCH codeword with slot or subslot duration in one cell.

The following information is transmitted by means of the DCI format 7-1E:

- The fields of format 7-1A

- SRS request – 0 or 1 bit as defined in subclause 8.2 of [3] (this field is present only for TDD operation, if the UE has indicated the capability *srs-DCI7-Triggering-FS2-r15* and the UE is configured with higher layer parameter *srs-DCI7-TriggeringConfig-r15*)

- Scrambling identity– 1 bit as defined in subclause 6.10.3.1 of [2]

- Precoding information – 2 bits as specified in Table 5.3.3.1.21-1.

Table 5.3.3.1.21-1: Content of precoding information field

Bit field mapped to index	Message
0	2 layers: transmit diversity antenna ports 7, 8
1	1 layer: antenna port 7
2	1 layer: antenna port 8
3	2 layers: antenna ports 7, 8

If the UE is configured to decode SPDCCH CRC scrambled by the C-RNTI and the number of information bits in format 7-1E mapped onto a given search space is less than that of format 7-0A/B depending on the configured uplink transmission mode for scheduling the same serving cell and mapped onto the same search space, zeros shall be appended to format 7-1E until the payload size equals that of format 7-0A/B, except when format 7-1E assigns downlink resource on a secondary cell without an uplink configuration associated with the secondary cell.

If the number of information bits in format 7-1E carried by PDCCH is equal to the payload size of a configured format 0/0C/1/1A/1B/1D/2/2A/2B/2C/2D/4 mapped onto the UE specific search space given by C-RNTI or SPS C-RNTI as defined in [3] (including any padding bits appended to format 0/0C/1/1A/1B/1D/2/2A/2B/2C/2D/4), one or more zero bit(s) shall be appended to format 7-1E until the payload size is not equal to that of a configured format 0/0C/1/1A/1B/1D/2/2A/2B/2C/2D/4.

5.3.3.1.22 Format 7-1F

DCI format 7-1F is used for the scheduling of one PDSCH codeword with slot or subslot duration in one cell.

The following information is transmitted by means of the DCI format 7-1F:

- The fields of format 7-1A

- SRS request – 0 or 1 bit as defined in subclause 8.2 of [3] (this field is present only for TDD operation, if the UE has indicated the capability *srs-DCI7-Triggering-FS2-r15* and the UE is configured with higher layer parameter *srs-DCI7-TriggeringConfig-r15*)

- DMRS position indicator – 1 bit, where the value 0 indicates the presence of DMRS and the value 1 indicates the absence of DMRS. (The field is present only if UE is configured with *dl-STTI-Length=subslot*). This field is set to 0 when the UE is configured with higher layer parameter *blindSlotSubslotPDSCH-Repetitions* set to TRUE and the repetition number is greater than 1.

- Antenna port(s), scrambling identity and number of layers – 3 bits as specified in Table 5.3.3.1.22-2 if the UE is higher layer configured with *slotSubslotPDSCH-TXDiv-2layer-TM9/10*, Table 5.3.3.1.22-3 if the UE is higher layer configured with *slotSubslotPDSCH-TXDiv-4layer-TM9/10,* or Table 5.3.3.1.22-1 otherwise, where n_{SCID} is the scrambling identity for antenna ports 7 and 8 defined in subclause 6.10.3.1 of [2], or 1 bit as specified in Table 5.3.3.1.5C-6 where n_{SCID} is the scrambling identity for antenna ports 7 and 8 defined in subclause 6.10.3.1 of [2] when higher layer parameter *semiOpenLoop-STTI* is configured.

When higher layer parameter *semiOpenLoop-STTI* is configured, antenna ports 7 and 8 are used for transmit diversity.

Table 5.3.3.1.22-1: Antenna port(s), scrambling identity and number of layers indication

Value	Message
0	1 layer, port 7, n_{SCID}=0
1	1 layer, port 7, n_{SCID}=1
2	1 layer, port 8, n_{SCID}=0
3	1 layer, port 8, n_{SCID}=1
4	2 layers, ports 7-8, n_{SCID}=0
5	2 layers, ports 7-8, n_{SCID}=1
6	3 layers, ports 7-9
7	4 layers, ports 7-10

Table 5.3.3.1.22-2: Antenna port(s), scrambling identity and number of layers indication if the UE is configured with *slotSubslotPDSCH-TXDiv-2layer-TM9/10*

Value	Message
0	1 layer, port 7, n_{SCID}=0
1	1 layer, port 7, n_{SCID}=1
2	1 layer, port 8, n_{SCID}=0
3	1 layer, port 8, n_{SCID}=1
4	2 layers, ports 7-8, n_{SCID}=0
5	2 layers, ports 7-8, n_{SCID}=1
6	2 layers, transmit diversity ports 7-8, n_{SCID}=0
7	2 layers, transmit diversity ports 7-8, n_{SCID}=1

Table 5.3.3.1.22-3: Antenna port(s), scrambling identity and number of layers indication if the UE is configured with *slotSubslotPDSCH-TXDiv-4layer-TM9/10*

Value	Message
0	1 layer, port 7, n_{SCID}=0
1	1 layer, port 7, n_{SCID}=1
2	1 layer, port 8, n_{SCID}=0
3	1 layer, port 8, n_{SCID}=1
4	2 layers, ports 7-8, n_{SCID}=0
5	2 layers, transmit diversity ports 7-8, n_{SCID}=0
6	3 layers, ports 7-9
7	4 layers, ports 7-10

If the UE is configured to decode SPDCCH CRC scrambled by the C-RNTI and the number of information bits in format 7-1F mapped onto a given search space is less than that of format 7-0A/B depending on the configured uplink transmission mode for scheduling the same serving cell and mapped onto the same search space, zeros shall be appended to format 7-1F until the payload size equals that of format 7-0A/B, except when format 7-1F assigns downlink resource on a secondary cell without an uplink configuration associated with the secondary cell.

If the number of information bits in format 7-1F carried by PDCCH is equal to the payload size of a configured format 0/0C/1/1A/1B/1D/2/2A/2B/2C/2D/4 mapped onto the UE specific search space given by C-RNTI or SPS C-RNTI as defined in [3] (including any padding bits appended to format 0/0C/1/1A/1B/1D/2/2A/2B/2C/2D/4), one or more zero bit(s) shall be appended to format 7-1F until the payload size is not equal to that of a configured format 0/0C/1/1A/1B/1D/2/2A/2B/2C/2D/4.

5.3.3.1.23   Format 7-1G

DCI format 7-1G is used for the scheduling of one PDSCH codeword with slot or subslot duration in one cell.

The following information is transmitted by means of the DCI format 7-1G:

- The fields of format 7-1A

- SRS request – 0 or 1 bit as defined in subclause 8.2 of [3] (this field is present only for TDD operation, if the UE has indicated the capability *srs-DCI7-Triggering-FS2-r15* and the UE is configured with higher layer parameter *srs-DCI7-TriggeringConfig-r15*)

- DMRS position indicator – 1 bit, where the value 0 indicates the presence of DMRS and the value 1 indicates the absence of DMRS. (The field is present only if UE is configured with *dl-STTI-Length=subslot*). This field is set to 0 when the UE is configured with higher layer parameter *blindSlotSubslotPDSCH-Repetitions* set to TRUE and the repetition number is greater than 1.

- Antenna port(s), scrambling identity and number of layers – 3 bits as specified in Table 5.3.3.1.22-2 if the UE is higher layer configured with *slotSubslotPDSCH-TXDiv-2layer-TM9/10*, Table 5.3.3.1.22-3 if the UE is higher layer configured with *slotSubslotPDSCH-TXDiv-4layer-TM9/10,* or Table 5.3.3.1.22-1 otherwise, where n_{SCID} is the scrambling identity for antenna ports 7 and 8 defined in subclause 6.10.3.1 of [2], or 1 bit as specified in Table 5.3.3.1.5C-6 where n_{SCID} is the scrambling identity for antenna ports 7 and 8 defined in subclause 6.10.3.1 of [2] when higher layer parameter *semiOpenLoop-STTI* is configured.

- PDSCH RE Mapping and Quasi-Co-Location Indicator – 2 bits as defined in subclauses 7.1.9 and 7.1.10 of [3]

When higher layer parameter *semiOpenLoop-STTI* is configured, antenna ports 7 and 8 are used for transmit diversity.

If the UE is configured to decode SPDCCH CRC scrambled by the C-RNTI and the number of information bits in format 7-1G mapped onto a given search space is less than that of format 7-0A/B depending on the configured uplink transmission mode for scheduling the same serving cell and mapped onto the same search space, zeros shall be appended to format 7-1G until the payload size equals that of format 7-0A/B, except when format 7-1G assigns downlink resource on a secondary cell without an uplink configuration associated with the secondary cell.

If the number of information bits in format 7-1G carried by PDCCH is equal to the payload size of a configured format 0/0C/1/1A/1B/1D/2/2A/2B/2C/2D/4 mapped onto the UE specific search space given by C-RNTI or SPS C-RNTI as defined in [3] (including any padding bits appended to format 0/0C/1/1A/1B/1D/2/2A/2B/2C/2D/4), one or more zero bit(s) shall be appended to format 7-1G until the payload size is not equal to that of a configured format 0/0C/1/1A/1B/1D/2/2A/2B/2C/2D/4.

5.3.3.2   CRC attachment

Error detection is provided on DCI transmissions through a Cyclic Redundancy Check (CRC).

The entire payload is used to calculate the CRC parity bits. Denote the bits of the payload by $a_0, a_1, a_2, a_3, ..., a_{A-1}$, and the parity bits by $p_0, p_1, p_2, p_3, ..., p_{L-1}$. A is the payload size and L is the number of parity bits.

The parity bits are computed and attached according to subclause 5.1.1 setting L to 16 bits, resulting in the sequence $b_0, b_1, b_2, b_3, ..., b_{B-1}$, where $B = A + L$.

In the case where closed-loop UE transmit antenna selection is not configured or applicable, after attachment, the CRC parity bits are scrambled with the corresponding RNTI $x_{rnti,0}, x_{rnti,1}, ..., x_{rnti,15}$, where $x_{rnti,0}$ corresponds to the MSB of the RNTI, to form the sequence of bits $c_0, c_1, c_2, c_3, ..., c_{B-1}$. The relation between c_k and b_k is:

$c_k = b_k$ for $k = 0, 1, 2, ..., A$-1

$c_k = (b_k + x_{rnti,k-A}) \mod 2$ for $k = A, A+1, A+2, ..., A+15$.

In the case where closed-loop UE transmit antenna selection is configured and applicable, after attachment, the CRC parity bits with DCI format 0 or DCI format 6-0A are scrambled with the antenna selection mask $x_{AS,0}, x_{AS,1}, ..., x_{AS,15}$ as

indicated in Table 5.3.3.2-1 and the corresponding RNTI $x_{rnti,0}, x_{rnti,1}, ..., x_{rnti,15}$ to form the sequence of bits $c_0, c_1, c_2, c_3, ..., c_{B-1}$. The relation between c_k and b_k is:

$$c_k = b_k \quad \text{for } k = 0, 1, 2, ..., A\text{-}1$$

$$c_k = (b_k + x_{rnti,k-A} + x_{AS,k-A}) \bmod 2 \quad \text{for } k = A, A+1, A+2, ..., A+15.$$

Table 5.3.3.2-1: UE transmit antenna selection mask

UE transmit antenna selection	Antenna selection mask $< x_{AS,0}, x_{AS,1}, ..., x_{AS,15} >$
UE port 0	<0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0>
UE port 1	<0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 1>

5.3.3.3 Channel coding

Information bits are delivered to the channel coding block. They are denoted by $c_0, c_1, c_2, c_3, ..., c_{K-1}$, where K is the number of bits, and they are tail biting convolutionally encoded according to subclause 5.1.3.1.

After encoding the bits are denoted by $d_0^{(i)}, d_1^{(i)}, d_2^{(i)}, d_3^{(i)}, ..., d_{D-1}^{(i)}$, with $i = 0, 1,$ and 2, and where D is the number of bits on the i-th coded stream, i.e., $D = K$.

5.3.3.4 Rate matching

A tail biting convolutionally coded block is delivered to the rate matching block. This block of coded bits is denoted by $d_0^{(i)}, d_1^{(i)}, d_2^{(i)}, d_3^{(i)}, ..., d_{D-1}^{(i)}$, with $i = 0, 1,$ and 2, and where i is the coded stream index and D is the number of bits in each coded stream. This coded block is rate matched according to subclause 5.1.4.2.

After rate matching, the bits are denoted by $e_0, e_1, e_2, e_3, ..., e_{E-1}$, where E is the number of rate matched bits.

5.3.4 Control format indicator

Data arrives each subframe to the coding unit in the form of an indicator for the time span, in units of OFDM symbols, of the DCI carried by PDCCH in that subframe of the corresponding DL cell. The CFI takes values CFI = 1, 2 or 3. For system bandwidths $N_{RB}^{DL} > 10$, the span of the DCI carried by PDCCH in units of OFDM symbols, 1, 2 or 3, is given by the CFI. For system bandwidths $N_{RB}^{DL} \leq 10$, the span of the DCI carried by PDCCH in units of OFDM symbols, 2, 3 or 4, is given by CFI+1.
The coding flow is shown in Figure 5.3.4-1.

Figure 5.3.4-1 Coding for CFI

5.3.4.1 Channel coding

The control format indicator is coded according to Table 5.3.4-1.

Table 5.3.4-1: CFI code words

CFI	CFI code word < b_0, b_1, ..., b_{31} >
1	<0,1,1,0,1,1,0,1,1,0,1,1,0,1,1,0,1,1,0,1,1,0,1,1,0,1,1,0,1,1,0,1>
2	<1,0,1,1,0,1,1,0,1,1,0,1,1,0,1,1,0,1,1,0,1,1,0,1,1,0,1,1,0,1,1,0>
3	<1,1,0,1,1,0,1,1,0,1,1,0,1,1,0,1,1,0,1,1,0,1,1,0,1,1,0,1,1,0,1,1>
4 (Reserved)	<0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0>

5.3.5   HARQ indicator (HI)

Data arrives to the coding unit in the form of indicators for HARQ acknowledgement for one transport block.

The coding flow is shown in Figure 5.3.5-1.

Figure 5.3.5-1 Coding for HI

5.3.5.1   Channel coding

The HI is coded according to Table 5.3.5-1, where for a positive acknowledgement HI = 1 and for a negative acknowledgement HI = 0.

Table 5.3.5-1: HI code words

HI	HI code word < b_0, b_1, b_2 >
0	< 0,0,0 >
1	< 1,1,1 >

5.4   Sidelink transport channels and control information

5.4.1   Sidelink broadcast channel

Figure 5.4.1-1 shows the processing structure for the SL-BCH transport channel. Data arrives to the coding unit in the form of a maximum of one transport block. The following coding steps can be identified:

- Add CRC to the transport block

- Channel coding

- Rate matching

The coding steps for SL-BCH transport channel are shown in the figure below. In addition, after rate matching PUSCH interleaving is applied according to subclauses 5.2.2.7 and 5.2.2.8 without any control information in order to apply a

time-first rather than frequency-first mapping, where $C_{mux} = 2 \cdot \left(N_{\text{symb}}^{\text{SL}} - 3\right)$ and the sequence of bits f is equal to e. For SL-BCH configured by higher layers for V2X sidelink, $C_{mux} = 2 \cdot \left(N_{\text{symb}}^{\text{SL}} - 2\right) - 3$ is used.

$$a_0, a_1, ..., a_{A-1}$$

$$c_0, c_1, ..., c_{K-1}$$

$$\boxed{\text{Channel coding}}$$

$$d_0^{(i)}, d_1^{(i)}, ..., d_{D-1}^{(i)}$$

$$\boxed{\text{Rate matching}}$$
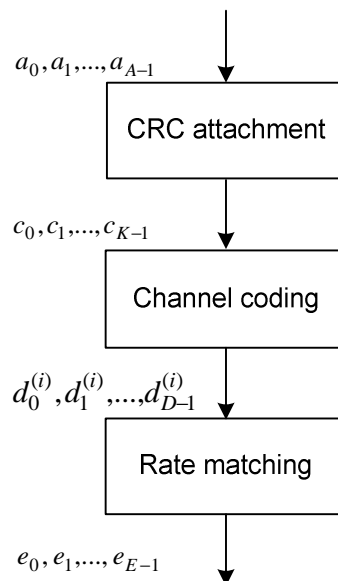

$$e_0, e_1, ..., e_{E-1}$$

Figure 5.4.1-1: Transport channel processing for SL-BCH

5.4.1.1 Transport block CRC attachment

Error detection is provided on transport blocks through a Cyclic Redundancy Check (CRC).

The entire transport block is used to calculate the CRC parity bits. Denote the bits in a transport block delivered to layer 1 by $a_0, a_1, a_2, a_3, ..., a_{A-1}$, and the parity bits by $p_0, p_1, p_2, p_3, ..., p_{L-1}$. A is the size of the transport block and L is the number of parity bits. The lowest order information bit a_0 is mapped to the most significant bit of the transport block as defined in subclause 6.1.1 of [5].

The parity bits are computed and attached according to subclause 5.1.1 setting L to 16 bits, resulting in the sequence of bits $c_0, c_1, c_2, c_3, ..., c_{K-1}$ where $c_k = b_k$ for $k = 0, 1, 2, ..., K$-1 and $K=A+L$.

5.4.1.2 Channel coding

Information bits are delivered to the channel coding block. They are denoted by $c_0, c_1, c_2, c_3, ..., c_{K-1}$, where K is the number of bits, and they are tail biting convolutionally encoded according to subclause 5.1.3.1.

After encoding the bits are denoted by $d_0^{(i)}, d_1^{(i)}, d_2^{(i)}, d_3^{(i)}, ..., d_{D-1}^{(i)}$, with $i = 0,1,$ and 2, and where D is the number of bits on the i-th coded stream, i.e., $D = K$.

5.4.1.3 Rate matching

A tail biting convolutionally coded block is delivered to the rate matching block. This block of coded bits is denoted by $d_0^{(i)}, d_1^{(i)}, d_2^{(i)}, d_3^{(i)}, ..., d_{D-1}^{(i)}$, with $i = 0,1,$ and 2, and where i is the coded stream index and D is the number of bits in each coded stream. This coded block is rate matched according to subclause 5.1.4.2.

After rate matching, the bits are denoted by $e_0, e_1, e_2, e_3, ..., e_{E-1}$, where E is the number of rate matched bits as defined in subclause 9.6.1 of [2].

5.4.2 Sidelink shared channel

The processing of the sidelink shared channel follows the downlink shared channel according to subclause 5.3.2, with the following differences:

- Data arrives to the coding unit in the form of a maximum of one transport block every transmission time interval (TTI)

- In the step of code block concatenation, the sequence of coded bits corresponding to one transport block after code block concatenation is referred to as one codeword in subclause 9.3.1 of [2].

- PUSCH interleaving is applied according to subclauses 5.2.2.7 and 5.2.2.8 without any control information in order to apply a time-first rather than frequency-first mapping, where $C_{mux} = 2 \cdot \left(N_{symb}^{SL} - 1 \right)$. For SL-SCH configured by higher layers for V2X sidelink, $C_{mux} = 2 \cdot \left(N_{symb}^{SL} - 2 \right) - 1$ is used if the transmission format field of SCI format 1 is present and set to 1, otherwise $C_{mux} = 2 \cdot \left(N_{symb}^{SL} - 2 \right)$.

5.4.3 Sidelink control information

An SCI transports sidelink scheduling information.

The processing for one SCI follows the downlink control information according to subclause 5.3.3, with the following differences:

- In the step of CRC attachment, no scrambling is performed.

- PUSCH interleaving is applied according to subclauses 5.2.2.7 and 5.2.2.8 without any control information in order to apply a time-first rather than frequency-first mapping, where $C_{mux} = 2 \cdot \left(N_{symb}^{SL} - 1 \right)$ and the sequence of bits f is equal to e. For SCI format 1, $C_{mux} = 2 \cdot \left(N_{symb}^{SL} - 2 \right)$.

5.4.3.1 SCI formats

The fields defined in the SCI formats below are mapped to the information bits a_0 to a_{A-1} as follows.

Each field is mapped in the order in which it appears in the description, with the first field mapped to the lowest order information bit a_0 and each successive field mapped to higher order information bits. The most significant bit of each field is mapped to the lowest order information bit for that field, e.g. the most significant bit of the first field is mapped to a_0.

5.4.3.1.1 SCI format 0

SCI format 0 is used for the scheduling of PSSCH.

The following information is transmitted by means of the SCI format 0:

- Frequency hopping flag – 1 bit as defined in subclause 14.1.1 of [3].

- Resource block assignment and hopping resource allocation – $\left\lceil \log_2(N_{RB}^{SL}(N_{RB}^{SL}+1)/2) \right\rceil$ bits

  - For PSSCH hopping:

    - N_{SL_hop} MSB bits are used to obtain the value of $\tilde{n}_{PRB}(i)$ as indicated in subclause 8.4 of [3]

    - $\left(\left\lceil \log_2(N_{RB}^{SL}(N_{RB}^{SL}+1)/2) \right\rceil - N_{SL\_hop} \right)$ bits provide the resource allocation in the subframe

  - For non-hopping PSSCH:

    - $\left(\left\lceil \log_2(N_{RB}^{SL}(N_{RB}^{SL}+1)/2) \right\rceil \right)$ bits provide the resource allocation in the subframe as defined in subclause 8.1.1 of [3]

- Time resource pattern – 7 bits as defined in subclause 14.1.1 of [3].

- Modulation and coding scheme – 5 bits as defined in subclause 14.1.1 of [3]

- Timing advance indication – 11 bits as defined in subclause 14.2.1 of [3]

- Group destination ID – 8 bits as defined by higher layers

5.4.3.1.2 SCI format 1

SCI format 1 is used for the scheduling of PSSCH.

The following information is transmitted by means of the SCI format 1:

- Priority - 3 bits as defined in subclause 4.4.5.1 of [7].

- Resource reservation – 4 bits as defined in subclause 14.2.1 of [3].

- Frequency resource location of initial transmission and retransmission – $\left\lceil \log_2 (N_{\mathrm{subchannel}}^{\mathrm{SL}} (N_{\mathrm{subchannel}}^{\mathrm{SL}} + 1)/2) \right\rceil$ bits as defined in subclause 14.1.1.4C of [3].

- Time gap between initial transmission and retransmission - 4 bits as defined in subclause 14.1.1.4C of [3].

- Modulation and coding scheme – 5 bits as defined in subclause 14.2.1 of [3].

- Retransmission index – 1 bit as defined in subclause 14.2.1 of [3].

- Transmission format– 1 bit, where value 1 indicates a transmission format including rate-matching and TBS scaling, and value 0 indicates a transmission format including puncturing and no TBS-scaling. This field is only present if the transport mechanism selected by higher layers indicates the support of rate matching and TBS scaling.

- Reserved information bits are added until the size of SCI format 1 is equal to 32 bits. The reserved bits are set to zero.

5.4.4 Sidelink discovery channel

The processing of the sidelink discovery channel follows the downlink shared channel according to subclause 5.3.2, with the following differences:

- Data arrives to the coding unit in the form of a maximum of one transport block every transmission time interval (TTI).

- In the step of code block concatenation, the sequence of coded bits corresponding to one transport block after code block concatenation is referred to as one codeword in subclause 9.5.1 of [2].

- PUSCH interleaving is applied according to subclauses 5.2.2.7 and 5.2.2.8 without any control information in order to apply a time-first rather than frequency-first mapping, where $C_{mux} = 2 \cdot \left(N_{\mathrm{symb}}^{\mathrm{SL}} - 1 \right)$.

6 Narrowband IoT

6.1 Mapping to physical channels

For Narrowband IoT, transport channels are mapped onto narrowband physical channels, the channel coding, multiplexing, and interleaving of which are specified in subclauses 6.3 and 6.4 for the uplink and downlink, respectively. Table 6.1-1 specifies the mapping of the uplink transport channels to their corresponding physical channels. Table 6.1-2 specifies the mapping of the downlink transport channels to their corresponding physical channels. Table 6.1-3 specifies the mapping of control channel information to its corresponding physical channel.

DCI	NPDCCH

6.2 Generic procedures

The generic procedures for channel coding, multiplexing and interleaving are as in subclause 5.1 unless otherwise noted in subclause 6.

Usage of coding scheme and coding rate for the different types of TrCH is shown in table 6.2-1. Usage of coding scheme and coding rate for the different control information types is shown in table 6.2-2.

Table 6.2-1: Usage of channel coding scheme and coding rate for TrCHs

6.3 Uplink transport channels and control information

6.3.1 Random access channel

The sequence for the random access channel is processed according to [2].

6.3.2 Uplink shared channel

Figure 6.3.2-1 shows the processing structure for the UL-SCH transport channel. Data arrives to the coding unit in the form of a maximum of one transport block over a number of resource units per UL cell. The number of resource units is scheduled according to [3]. The following coding steps can be identified:

- CRC attachment

- Channel coding

- Rate matching

Figure 6.3.2-1: Transport block processing for UL-SCH

The CRC attachment, channel coding, and rate matching are performed according to subclauses 5.2.2.1, 5.2.2.3, and 5.2.2.4, respectively, with the following differences:

- In subclause 5.1.4.1.2 in the calculation of G', Q_m is 1 for $\pi/2$-BPSK and 2 for $\pi/4$-QPSK, and $rv_{idx} = 0$ or 2.

In addition, after rate matching interleaving is applied per resource unit according to subclauses 5.2.2.7 and 5.2.2.8 without any control information in order to apply a time-first rather than frequency-first mapping, where the input sequence to 5.2.2.7 is the portion of e for a resource unit instead of f, and where $C_{mux} = \left(N_{symb}^{UL} - 1\right)N_{slots}^{UL}$ is the number of SC-FDMA symbols for NPUSCH in a UL resource unit as given in subclause 10.1.2.3 of [2].

6.3.3 Uplink control information on NPUSCH without UL-SCH data

When control data is sent via NPUSCH without UL-SCH data and arrives to the coding unit in the form of an indicator for HARQ acknowledgement for one transport block, the coding flow is as shown in Figure 6.3.3-1.

Figure 6.3.3-1: Coding for HARQ-ACK

The one bit information of HARQ-ACK o_0^{ACK} is coded according to Table 6.3.3-1, where for a positive acknowledgement $o_0^{ACK} = 1$ and for a negative acknowledgement $o_0^{ACK} = 0$.

Table 6.3.3-1: HARQ-ACK code words

HARQ-ACK $< o_0^{ACK} >$	HARQ-ACK code word $< b_0, b_1, b_2,...,b_{15} >$
0	<0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0>
1	<1,1,1,1,1,1,1,1,1,1,1,1,1,1,1,1>

6.3.4 Scheduling request

The scheduling request indication is received from higher layers and is processed according to [2] and [3].

6.4 Downlink transport channels and control information

6.4.1 Broadcast channel

The processing structure for the BCH transport channel is according to Subclause 5.3.1, with the following differences:

- The transmission time interval (TTI) is 640ms

- The size of the BCH transport block is set to 34 bits

- The CRC mask for NPBCH is selected according to 1 or 2 transmit antenna ports at eNodeB according to Table 5.3.1.1-1, where the transmit antenna ports are defined in subclause 10.2.6 of [2]

- The number of rate matched bits is defined in subclause 10.2.4.1 of [2].

6.4.2 Downlink shared channel and Paging channel

Figure 6.4.2-1 shows the processing structure for each transport block for the DL-SCH and PCH transport channels. Data arrives to the coding unit in the form of a maximum of one transport blocks over a number of resource units per DL cell. The following coding steps can be identified for each transport block of a DL cell:

- CRC attachment
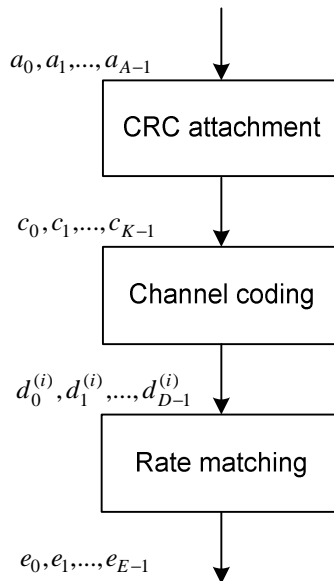

- Channel coding

- Rate matching

Figure 6.4.2-1: Transport block processing for DL-SCH and PCH

The CRC attachment, channel coding, and rate matching is performed according to subclauses 5.1.1, 5.1.3.1 and 5.1.4.2, respectively. For the CRC attachment, the parity bits are computed and attached according to subclause 5.1.1 setting L to 24 bits and using the generator polynomial $g_{CRC24A}(D)$, resulting in the sequence of bits $c_0, c_1, c_2, c_3, ..., c_{K-1}$ where $c_k = b_k$ for $k = 0, 1, 2, ..., K$-1 and $K = A + L$.

6.4.3   Downlink control information

A DCI transports downlink or uplink scheduling information for one cell and one RNTI. The RNTI is implicitly encoded in the CRC. The processing structure for one DCI is according to Subclause 5.3.3.

6.4.3.1   DCI Format N0

DCI format N0 is used for the scheduling of NPUSCH in one UL cell.

The following information is transmitted by means of the DCI format N0:

- Flag for format N0/format N1 differentiation – 1 bit, where value 0 indicates format N0 and value 1 indicates format N1

- Subcarrier indication – 6 bits as defined in subclause 16.5.1.1 of [3]

- Resource assignment – 3 bits as defined in subclause 16.5.1.1 of [3]

- Scheduling delay – 2 bits as defined in subclause 16.5.1 of [3]

- Modulation and coding scheme – 4 bits as defined in subclause 16.5.1.2 of [3]

- Redundancy version – 1 bit as defined in subclause 16.5.1.2 of [3]

- Repetition number – 3 bits as defined in subclause 16.5.1.1 of [3]

- New data indicator – 1 bit

- DCI subframe repetition number – 2 bits as defined in subclause 16.6 in [3]

- HARQ process number – 1 bit. This field can only be present if 2 HARQ processes are configured and the corresponding DCI format is mapped onto the UE specific search space given by the C-RNTI as defined in [3].

6.4.3.2   DCI Format N1

DCI format N1 is used for the scheduling of one NPDSCH codeword in one cell, random access procedure initiated by a NPDCCH order, and notifying SC-MCCH change. The DCI corresponding to a NPDCCH order is carried by NPDCCH.

The following information is transmitted by means of the DCI format N1:

- If the format N1 CRC is scrambled by C-RNTI or RA-RNTI:

    - Flag for format N0/format N1 differentiation – 1 bit, where value 0 indicates format N0 and value 1 indicates format N1

    - NPDCCH order indicator – 1 bit

- Else if the format N1 CRC is scrambled by a G-RNTI:

    - Information for SC-MCCH change notification – 2 bits as defined in subclause 5.8a of [6]

Format N1 is used for random access procedure initiated by a NPDCCH order only if NPDCCH order indicator is set to '1', format N1 CRC is scrambled with C-RNTI, and all the remaining fields are set as follows:

- Preamble format indicator – 1 bit, where value 0 indicates preamble format 0/1 and value 1 indicates preamble format 2. This field is only present if *SystemInformationBlockType2-NB* or *SystemInformationBlockType23-NB* is configured and the UE indicates the *nprach-Format2* capability.

- Starting number of NPRACH repetitions – 2 bits as defined in subclause 16.3.2 of [3]

- Subcarrier indication of NPRACH – 6 or 8 bits, this field is 8 bits only if Preamble format indicator is present and set to 1, as defined in subclause 16.3.2 of [3]

- Carrier indication of NPRACH – 4 bits as defined in subclause 16.3.2 of [3]. This field is only present if *ul-ConfigList* is configured and the UE indicates the *multiCarrier-NPRACH* capability.

- All the remaining bits in format N1 are set to one

Otherwise,

- Scheduling delay – 3 bits as defined in subclause 16.4.1 of [3]

- Resource assignment – 3 bits as defined in subclause 16.4.1.3 of [3]

- Modulation and coding scheme – 4 bits as defined in subclause 16.4.1.5 of [3]

- Repetition number – 4 bits as defined in subclause 16.4.1.3 of [3]

- New data indicator – 1 bit

- HARQ-ACK resource – 4 bits as defined in subclause 16.4.2 of [3].

- DCI subframe repetition number – 2 bits as defined in subclause 16.6 in [3]

- HARQ process number – 1 bit. This field can only be present if 2 HARQ processes are configured and the corresponding DCI format is mapped onto the UE specific search space given by the C-RNTI as defined in [3].

When the format N1 CRC is scrambled with a RA-RNTI or a G-RNTI, then the following fields among the fields above are reserved for RA-RNTI and not present for G-RNTI:

- New data indicator

- HARQ-ACK resource

If the number of information bits in format N1 is less than that of format N0 and the format N1 CRC is not scrambled by G-RNTI, zeros shall be appended to format N1 until the payload size equals that of format N0.

6.4.3.3   DCI Format N2

DCI format N2 is used for paging, direct indication, scheduling of one NPDSCH codeword carrying SC-MCCH in one cell, and notifying SC-MCCH change.

The following information is transmitted by means of the DCI format N2:

- If the format N2 CRC is scrambled by P-RNTI:

    - Flag for paging/direct indication differentiation – 1 bit, with value 0 for direct indication and value 1 for paging

- Else if the format N2 CRC is scrambled by a SC-RNTI:

    - Information for SC-MCCH change notification – 1 bit as defined in subclause 5.8a of [6]

- If the format N2 CRC is scrambled by P-RNTI and Flag=0:

    - Direct Indication information – 8 bits provide direct indication of system information update and other fields, as defined in [6]

    - Reserved information bits are added until the size is equal to that of format N2 with Flag=1

- If the format N2 CRC is scrambled by P-RNTI and Flag=1, or if the format N2 CRC is scrambled by SC-RNTI:

    - Resource assignment – 3 bits as defined in subclause 16.4.1.3 of [3]

    - Modulation and coding scheme – 4 bits as defined in subclause 16.4.1.5 of [3]

    - Repetition number – 4 bits as defined in subclause 16.4.1.3 of [3]

    - DCI subframe repetition number – 3 bits as defined in subclause 16.6 of [3]

Annex A (informative):
Change history

Change history								
Date	**TSG #**	**TSG Doc.**	**CR**	**Rev**	**Subject/Comment**		**Old**	**New**
2006-09					Skeleton			0.0.0
2006-10					Updated skeleton		0.0.0	0.0.1
2006-10					Endorsed skeleton		0.0.1	0.1.0
2006-11					Added TC. Added Broadcast, Paging and MBMS transport channels in Table 4.2-1.		0.1.0	0.1.1
2006-11					Endorsed v 0.2.0		0.1.1	0.2.0
2006-12					Added CC. Added type of coding for each transport channel or control information.		0.2.0	0.2.1
2007-01					Editor's version		0.2.1	0.2.2
2007-01					Endorsed v 0.3.0		0.2.2	0.3.0
2007-02					Added QPP turbo Interleaver description.		0.3.0	0.3.1
2007-02					Editor's version		0.3.1	0.3.2
2007-02					Endorsed v 0.4.0		0.3.2	0.4.0
2007-02					Added CRC details for PDSCH, PDCCH and PUSCH. Added QPP turbo-interleaver parameters. Set Z to 6144. Added details on code block segmentation.		0.4.0	0.4.1
2007-02					Editor's version		0.4.1	0.4.2

2017-06	RAN#76	RP-171204	0260	-	F	Clarification of resource allocation for PDSCH with maximum 5 MHz channel bandwidth in CE mode A	14.3.0

2017-06	RAN#76	RP-171204	0263	-	F	Corrections on total number of soft channel bits for UE Cat M1 and M2 in 36.212	14.3.0
2017-09	RAN#77	RP-171646	0264	3	F	Correction on NB-IoT DCI format N1 in 36.212	14.4.0
2017-09	RAN#77	RP-171647	0265	-	F	CR on UE assumption on co-scheduled DMRS ports for MUST in 36.212	14.4.0
2017-12	RAN#78	RP-172686	0266	1	F	Correction to multi-carrier NPRACH IE name in PDCCH order DCI format N1	14.5.0
2017-12	RAN#78	RP-172678	0270	-	A	Clarification for DAI for eCA	14.5.0
2017-12	RAN#78	RP-172685	0271	-	F	Correction of section references for feMTC	14.5.0
2017-12	RAN#78	RP-172692	0272	-	F	Correction of section reference for eVoLTE	14.5.0
2017-12	RAN#78	RP-172682	0273	-	F	Correction on deriving number of available symbols for PUSCH	14.5.0
2017-12	RAN#78	RP-172690	0276	-	A	Correction on number of SRS symbol for UCI multiplexing	14.5.0
2017-12	RAN#78	RP-172686	0277	-	F	Clarification on 2 HARQ process applicability to UE-specific search space	14.5.0
2017-12	RAN#78	RP-172693	0278	-	B	Introduction of shortened processing time and shortened TTI into 36.212	15.0.0
2018-01						MCC to correct missing 5G logo on spec cover sheet	15.0.1
2018-03	RAN#79	RP-180195	0268	1	B	Introduction of FeCoMP into 36.212	15.1.0
2018-03	RAN#79	RP-180201	0279	1	B	Introduction of EN-DC into 36.212	15.1.0
2018-06	RAN#80	RP-181170	0280	2	F	Corrections on shortened processing time and shortened TTI in 36.212	15.2.0
2018-06	RAN#80	RP-181162	0283	-	A	Ordering of P-CSI plus SR in eCA	15.2.0
2018-06	RAN#80	RP-181173	0284	1	B	Introduction of high capacity stationary wireless link and 1024QAM into 36.212	15.2.0
2018-06	RAN#80	RP-181166	0285	-	F	Clarification on CRC attachment for DL-SCH and PCH transport channels in NB-IoT	15.2.0
2018-06	RAN#80	RP-181165	0286	-	A	Correction on TPC field in DCI format 6-1A	15.2.0
2018-06	RAN#80	RP-181165	0288	-	A	Fallback DCI for eMTC	15.2.0
2018-06	RAN#80	RP-181180	0290	2	B	Introduction of FeLAA into 36.212	15.2.0
2018-06	RAN#80	RP-181182	0291	-	F	Introduce definition of non-BL/CE in Definitions section	15.2.0
2018-06	RAN#80	RP-181174	0292	-	B	Introduction of even further enhanced MTC for LTE in 36.212	15.2.0
2018-06	RAN#80	RP-181166	0293	-	B	Introduction of further enhancements to NB-IoT in 36.212	15.2.0
2018-06	RAN#80	RP-181176	0294	-	B	Introduction of V2X Phase 2 based on LTE	15.2.0
2018-06	RAN#80	RP-181177	0295	-	B	Introduction of HRLLC into 36.212	15.2.0
2018-06	RAN#80	RP-181182	0296	-	B	Introduction of modulation enhancements	15.2.0
2018-07						MCC correction to remove duplication of DMRS position indicator statement for format 7-1F (subclause 5.3.3.1.22) and format 7-1G (subclause 5.3.3.1.23).	15.2.1
2018-09	RAN#81	RP-181795	0297	1	F	Correction on the interpretation of HARQ-ACK bitmap for FeLAA in 36.212	15.3.0
2018-09	RAN#81	RP-181782	0299	-	A	Correction on DCI for HARQ-ACK bundling	15.3.0
2018-09	RAN#81	RP-181795	0300	-	F	Correction on the partial PUSCH mode field for FeLAA in 36.212	15.3.0
2018-09	RAN#81	RP-181790	0301	-	F	Correction of RRC parameter name for 1024QAM rate matching	15.3.0
2018-09	RAN#81	RP-181799	0303	-	A	Corrections to modulation signalling in MUST	15.3.0
2018-09	RAN#81	RP-181787	0304	-	F	Corrections on shortened processing time and shortened TTI in 36.212	15.3.0
2018-09	RAN#81	RP-181791	0305	-	F	Corrections to Even further enhanced MTC for LTE	15.3.0
2018-09	RAN#81	RP-181783	0306	-	F	Corrections to Further Enhancements of NB-IoT	15.3.0
2018-09	RAN#81	RP-181793	0307	-	D	Corrections on HRLLC in 36.212	15.3.0
2018-12	RAN#82	RP-182518	0308	-	A	Correction on aperiodic CSI-RS in 36.212	15.4.0
2018-12	RAN#82	RP-182524	0310	-	F	Corrections to Even further enhanced MTC for LTE	15.4.0
2019-03	RAN#83	RP-190440	0311	-	F	Correction on rate matching for 1024QAM	15.5.0
2019-03	RAN#83	RP-190446	0312	-	F	Introduction of SUO Case 1 for NE-DC as Rel-15 late drop	15.5.0
2019-03	RAN#83	RP-190435	0313	-	F	Correction on NPRACH format 2 configuration presence	15.5.0
2019-03	RAN#83	RP-190445	0315	-	A	Correction for DCI 0C and special subframe configuration 10	15.5.0
2019-06	RAN#84	RP-191270	0316	-	F	Indentation Correction for DCI Format 6-0B in LTE-MTC	15.6.0
2019-06	RAN#84	RP-191276	0319	-	A	Clarification on the bitwidth of report type 1a for FD-MIMO Class A	15.6.0
2019-06	RAN#84	RP-191275	0322	-	A	Spatial bundling for PUCCH format 3 with more than 5 CC	15.6.0
2019-09	RAN#85	RP-191946	0323	-	F	CR on Correction of a reference to 'COT sharing indication for AUL'	15.7.0
2019-09	RAN#85	RP-191945	0324	1	F	Correction on higher layer parameter configuring short TTI length in 36.212	15.7.0
2019-12	RAN#86	RP-192631	0327	-	A	Correction on DCI format N0	15.8.0
