# Foreword

This Technical Specification has been produced by the 3rd Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

- x the first digit:
  - 1 presented to TSG for information;
  - 2 presented to TSG for approval;
  - 3 or greater indicates TSG approved document under change control.
- y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- z the third digit is incremented when editorial only changes have been incorporated in the document.

In the present document, modal verbs have the following meanings:

- shall** indicates a mandatory requirement to do something
- shall not** indicates an interdiction (prohibition) to do something

The constructions "shall" and "shall not" are confined to the context of normative provisions, and do not appear in Technical Reports.

The constructions "must" and "must not" are not used as substitutes for "shall" and "shall not". Their use is avoided insofar as possible, and they are not used in a normative context except in a direct citation from an external, referenced, non-3GPP document, or so as to maintain continuity of style when extending or modifying the provisions of such a referenced document.

- should** indicates a recommendation to do something
- should not** indicates a recommendation not to do something
- may** indicates permission to do something
- need not** indicates permission not to do something

The construction "may not" is ambiguous and is not used in normative elements. The unambiguous constructions "might not" or "shall not" are used instead, depending upon the meaning intended.

- can** indicates that something is possible
- cannot** indicates that something is impossible

The constructions "can" and "cannot" are not substitutes for "may" and "need not".

- will** indicates that something is certain or expected to happen as a result of action taken by an agency the behaviour of which is outside the scope of the present document
- will not** indicates that something is certain or expected not to happen as a result of action taken by an agency the behaviour of which is outside the scope of the present document
- might** indicates a likelihood that something will happen as a result of action taken by some agency the behaviour of which is outside the scope of the present document

**might not** indicates a likelihood that something will not happen as a result of action taken by some agency the behaviour of which is outside the scope of the present document

In addition:

**is** (or any other verb in the indicative mood) indicates a statement of fact

**is not** (or any other negative verb in the indicative mood) indicates a statement of fact

The constructions "is" and "is not" do not indicate requirements.

# 1 Scope

The present document establishes the minimum RF requirements for NR User Equipment (UE) operating on frequency Range 1.

# 2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.

For a specific reference, subsequent revisions do not apply.

For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document in the same Release as the present document.

## 3 Definitions, symbols and abbreviations

### 3.1 Definitions

For the purposes of the present document, the terms and definitions given in 3GPP TR 21.905 [1] and the following apply. A term defined in the present document takes precedence over the definition of the same term, if any, in 3GPP TR 21.905 [1].

**Aggregated Channel Bandwidth:** The RF bandwidth in which a UE transmits and receives multiple contiguously aggregated carriers.

**Carrier aggregation:** Aggregation of two or more component carriers in order to support wider transmission bandwidths.

**Carrier aggregation band:** A set of one or more operating bands across which multiple carriers are aggregated with a specific set of technical requirements.

**Carrier aggregation bandwidth class:** A class defined by the aggregated transmission bandwidth configuration and maximum number of component carriers supported by a UE.

**Carrier aggregation configuration:** A combination of CA operating band(s) and CA bandwidth class(es) supported by a UE.

**Con-current operation:** The simultaneous transmission and reception of sidelink and Uu interfaces while operation is agnostic of the service used on each interface.

**Contiguous carriers:** A set of two or more carriers configured in a spectrum block where there are no RF requirements based on co-existence for un-coordinated operation within the spectrum block.

**Contiguous resource allocation:** A resource allocation of consecutive resource blocks within one carrier or across contiguously aggregated carriers. The gap between contiguously aggregated carriers due to the nominal channel spacing is allowed.

**Contiguous spectrum:** Spectrum consisting of a contiguous block of spectrum with no sub-block gaps.

**Inter-band carrier aggregation:** Carrier aggregation of component carriers in different operating bands.

NOTE: Carriers aggregated in each band can be contiguous or non-contiguous.

**Intra-band contiguous carrier aggregation:** Contiguous carriers aggregated in the same operating band.

**Intra-band non-contiguous carrier aggregation:** Non-contiguous carriers aggregated in the same operating band.

**RedCap UE:** A UE capable of supporting RedCap [IE].

**Sub-band:** For a UE that supports shared spectrum channel access in wideband operation, a sub-band is the set of RBs within an approximately 20 MHz segment of the channel where the wideband channel is uniformly divided into an integer number of 20 MHz sub-bands. Sub-bands may be separately allocated in uplink and downlink.

**Sub-block:** This is one contiguous allocated block of spectrum for transmission and reception by the same UE. There may be multiple instances of sub-blocks within an RF bandwidth.

**Sub-block bandwidth:** The bandwidth of one sub-block.

**Sub-block gap:** A frequency gap between two consecutive sub-blocks within an RF bandwidth, where the RF requirements in the gap are based on co-existence for un-coordinated operation.

**UE transmission bandwidth configuration:** Set of resource blocks located within the UE channel bandwidth which may be used for transmitting or receiving by the UE.

**Vehicular UE:** A UE embedded in a vehicle, permanently connected to an embedded antenna system that radiates externally for NR operating bands.

NOTE: Vehicular UE does not refer to other UE form factors placed inside the vehicle.

**Wideband operation:** For a UE that supports shared spectrum channel access, wideband operation refers to operation within a channel larger than 20 MHz in which intra-cell guard bands may be configured to distinguish individual RB-sets

## 4 General

### 4.1 Relationship between minimum requirements and test requirements

The present document is a Single-RAT specification for NR UE, covering RF characteristics and minimum performance requirements. Conformance to the present specification is demonstrated by fulfilling the test requirements specified in the conformance specification 3GPP TS 38.521-1 [4].

The Minimum Requirements given in this specification make no allowance for measurement uncertainty. The test specification TS 38.521-1 [4] defines test tolerances. These test tolerances are individually calculated for each test. The test tolerances are used to relax the minimum requirements in this specification to create test requirements. For some requirements, including regulatory requirements, the test tolerance is set to zero.

The measurement results returned by the test system are compared - without any modification - against the test requirements as defined by the shared risk principle.

The shared risk principle is defined in Recommendation ITU-R M.1545 [5].

### 4.2 Applicability of minimum requirements

- In this specification the Minimum Requirements are specified as general requirements and additional requirements. Where the Requirement is specified as a general requirement, the requirement is mandated to be met in all scenarios
- For specific scenarios for which an additional requirement is specified, in addition to meeting the general requirement, the UE is mandated to meet the additional requirements.
- The spurious emissions power requirements are for the long-term average of the power. For the purpose of reducing measurement uncertainty it is acceptable to average the measured power over a period of time sufficient to reduce the uncertainty due to the statistical nature of the signal
- All the requirements for intra-band contiguous and non-contiguous CA apply under the assumption of the same slot format indicated by UL-DL-configuration-common in the PCell and SCells for NR SA.
- The requirements for Tx diversity in this release are applied for UE which indicates IE [*txDiversity-r16*].

### 4.3 Specification suffix information

Unless stated otherwise the following suffixes are used for indicating at 2<sup>nd</sup> level clause, shown in Table 4.3-1.

**Table 4.3-1: Definition of suffixes**

| Clause suffix | Variant                              |
|---------------|--------------------------------------|
| None          | Single Carrier                       |
| A             | Carrier Aggregation (CA)             |
| B             | Dual-Connectivity (DC)               |
| C             | Supplement Uplink (SUL)              |
| D             | UL MIMO                              |
| E             | V2X                                  |
| F             | Shared spectrum channel access       |
| G             | Tx Diversity (TxD)                   |
| H             | Carrier Aggregation(CA) with UL MIMO |
| I             | RedCap                               |

A terminal which supports the above features needs to meet both the general requirements and the additional requirement applicable to the additional clause (suffixes A to I) in clauses 5, 6 and 7. Where there is a difference in requirement between the general requirements and the additional clause requirements (suffixes A to I) in clauses 5, 6 and 7, the tighter requirements are applicable unless stated otherwise in the additional clause.

A terminal which supports advanced V2X services, public safety services and other commercial use cases related to NR sidelink operation shall meet all of the separate corresponding requirements in suffix E.

For a terminal that supports SUL for the band combination specified in Table 5.2C-1, the current version of the specification assumes the terminal is configured with active transmission either on UL carrier or SUL carrier at any time in one serving cell and the UE requirements for single carrier shall apply for the active UL or SUL carrier accordingly. For a terminal that supports SUL, the current version of the specification assumes the terminal is not configured with UL MIMO on SUL carrier.

For a terminal that supports public safety service using sidelink, the minimum requirements are applicable when

- The UE is associated with a serving cell on PS carrier, or
- The UE is not associated with a serving cell on the PS carrier and is provisioned with the preconfigured radio parameters for PS that are associated with known Geographical Area, or
- The UE is associated with a serving cell on a carrier different than the PS carrier, and the radio parameters for PS that are provided by the serving cell, or
- The UE is associated with a serving cell on a carrier different than the PS carrier, and has a non-serving cell selected on the PS carrier with the preconfigured radio parameters.

When the advanced-V2X or PS UE is not associated with a serving cell on the V2X or PS carrier, and the UE does not have knowledge of its geographical area, or is provisioned with preconfigured radio parameters that are not associated with any Geographical Area, V2X or PS UE' transmissions are not allowed, and the requirements in Section 6.3E.2 apply.

For a terminal that supports operation in shared spectrum, the current version of this specification assumes in the uplink sub-bands within a wideband channel shall be contiguously allocated to the UE. The uplink requirements for one or more non-transmitted sub-bands between two transmitted sub-bands does not form a part of the current version of this specification.

## 5 Operating bands and channel arrangement

### 5.1 General

The channel arrangements presented in this clause are based on the operating bands and channel bandwidths defined in the present release of specifications.

NOTE: Other operating bands and channel bandwidths may be considered in future releases.

Requirements throughout the RF specifications are in many cases defined separately for different frequency ranges (FR). The frequency ranges in which NR can operate according to this version of the specification are identified as described in Table 5.1-1.

**Table 5.1-1: Definition of frequency ranges**

| Frequency range designation | Corresponding frequency range |
|-----------------------------|-------------------------------|
| FR1                         | 410 MHz – 7125 MHz            |
| FR2                         | 24250 MHz – 52600 MHz         |

The present specification covers FR1 operating bands.

## 5.2A Operating bands for CA

### 5.2A.0 General

CA operating bands including Band n90 are defined by the corresponding CA operating bands including Band n41 with Band n90 replacing Band n41. For brevity the said CA operating bands including Band n90 are not listed in the tables below but are covered by this specification.

### 5.2A.1 Intra-band CA

NR intra-band carrier aggregation is designed to operate in the operating bands defined in Table 5.2A.1-1 and Table 5.2A.1-2, where all operating bands are within FR1.

- NOTE 3: The frequency range below 2506 MHz for Band n41 is not used in this combination.
- NOTE 4: Applicable for frequency range above 4800 MHz for Band n79 in this combination.
- NOTE 5: For UEs supporting band n77, the minimum requirements apply only when there is non-simultaneous Rx/Tx operation between n78-n79 NR carriers. This restriction applies also for these carriers when applicable NR CA configuration is part of a higher order configuration.
- NOTE 6: The PCell is allocated in the licensed band in this combination.
- NOTE 7: The minimum requirements apply only when there is non-simultaneous Rx/Tx operation between n77-n79 NR carriers. This restriction applies also for these carriers when applicable NR CA configuration is part of a higher order configuration.
- NOTE 8: Applicable when dynamic Tx switching is conducted. The DL interruption requirement is specified in clause 8.2.2.2.10 of 38.133 [13].
- NOTE 9: Only applicable for UE supporting inter-band carrier aggregation without simultaneous Rx/Tx.
- NOTE 10: The frequency range in band n77 is restricted for this band combination to 3520-3560 MHz, 3700-3800 MHz, 4000-4100 MHz.
- NOTE 11: The frequency range in band n78 is restricted for this band combination to 3520-3560 MHz and 3700-3800 MHz.
- NOTE 12: The implementation with 4 antennas is targeted for FWA form factor for this band combination.
- NOTE 13: Simultaneous Rx/Tx capability for TDD combinations does not apply for UEs supporting band n48 with an n77 implementation.
- NOTE 14: The band n48 and n77 will synchronize their uplink and downlink configurations and in commonly TDD network coordination
- NOTE 15: Simultaneous Rx/Tx capability does not apply for UEs supporting CA\_n46-n96. Same restrictions are applied when applicable NR CA configuration is part of a higher order configurations
- NOTE 16: The minimum requirements for intra-band non-contiguous CA/DC apply for CA\_n46-n96 and related higher order CA/DC configurations.
- NOTE 17: The combination is not used alone as fall back mode of other band combinations in which UL in Band 48 is not used.
- NOTE 18: The minimum requirements for inter-band CA apply when the maximum power spectral density imbalance between downlink carriers is within 6 dB. The power spectral density imbalance condition also applies for these carriers when applicable CA configuration is a subset of a higher order CA configuration.

## 5.2B Operating bands for DC

The operating bands are specified in clause 5.5B for operation with NR dual connectivity configured, where all operating bands are within FR1.

If the mandatory simultaneous Rx/Tx capability applies for a band combination, the mandatory simultaneous Rx/Tx capability also applies for the band combination when the applicable band combination is a subset of a higher order band combination.

## 5.2C Operating band combination for SUL

NR operation is designed to operate in the operating band combination defined in Table 5.2C-1, Table 5.2C-2, Table 5.2C-3 and Table 5.2C-4, where all operating bands are within FR1.

If the mandatory simultaneous Rx/Tx capability applies for a band combination, the mandatory simultaneous Rx/Tx capability also applies for the band combination when the applicable band combination is a subset of a higher order band combination.

## 5.3 UE channel bandwidth

### 5.3.1 General

The UE channel bandwidth supports a single NR RF carrier in the uplink or downlink at the UE. From a BS perspective, different UE channel bandwidths may be supported within the same spectrum for transmitting to and receiving from UEs connected to the BS. Transmission of multiple carriers to the same UE (CA) or multiple carriers to different UEs within the BS channel bandwidth can be supported.

From a UE perspective, the UE is configured with one or more BWP / carriers, each with its own UE channel bandwidth. The UE does not need to be aware of the BS channel bandwidth or how the BS allocates bandwidth to different UEs.

The placement of the UE channel bandwidth for each UE carrier is flexible but can only be completely within the BS channel bandwidth.

The relationship between the channel bandwidth, the guardband and the maximum transmission bandwidth configuration is shown in Figure 5.3.1-1.

**Figure 5.3.1-1: Definition of the channel bandwidth and the maximum transmission bandwidth configuration for one NR channel**

### 5.3.2 Maximum transmission bandwidth configuration

The maximum transmission bandwidth configuration  $N_{RB}$  for each UE channel bandwidth and subcarrier spacing is specified in Table 5.3.2-1.

**Table 5.3.2-1: Maximum transmission bandwidth configuration  $N_{RB}$**

| SCS (kHz) | 5 MHz    | 10 MHz   | 15 MHz   | 20 MHz   | 25 MHz   | 30 MHz   | 35 MHz   | 40 MHz   | 45 MHz   | 50 MHz   | 60 MHz   | 70 MHz   | 80 MHz   | 90 MHz   | 100 MHz  |

### 5.3.3 Minimum guardband and transmission bandwidth configuration

The minimum guardband for each UE channel bandwidth and SCS is specified in Table 5.3.3-1,

**Table 5.3.3-1: Minimum guardband for each UE channel bandwidth and SCS (kHz)**

| SCS (kHz) | 5 MHz | 10 MHz | 15 MHz | 20 MHz | 25 MHz | 30 MHz | 35 MHz | 40 MHz | 45 MHz | 50 MHz | 60 MHz | 70 MHz | 80 MHz | 90 MHz | 100 MHz |
|-----------|-------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|---------|
| 15        | 242.5 | 312.5  | 382.5  | 452.5  | 522.5  | 592.5  | 572.5  | 552.5  | 712.5  | 692.5  | N/A    | N/A    | N/A    | N/A    | N/A     |
| 30        | 505   | 665    | 645    | 805    | 785    | 945    | 925    | 905    | 1065   | 1045   | 825    | 965    | 925    | 885    | 845     |
| 60        | N/A   | 1010   | 990    | 1330   | 1310   | 1290   | 1630   | 1610   | 1590   | 1570   | 1530   | 1490   | 1450   | 1410   | 1370    |

NOTE: The minimum guardbands have been calculated using the following equation:  $(BW_{\text{Channel}} \times 1000 \text{ (kHz)} - N_{RB} \times SCS \times 12) / 2 - SCS/2$ , where  $N_{RB}$  are from Table 5.3.2-1.

**Figure 5.3.3-1: Void**

The number of RBs configured in any channel bandwidth shall ensure that the minimum guardband specified in this clause is met.

**Figure 5.3.3-2: UE PRB utilization**

In the case that multiple numerologies are multiplexed in the same symbol due to BS transmission of SSB, the minimum guardband on each side of the carrier is the guardband applied at the configured channel bandwidth for the numerology that is received immediately adjacent to the guard.

If multiple numerologies are multiplexed in the same symbol and the UE channel bandwidth is >50 MHz, the minimum guardband applied adjacent to 15 kHz SCS shall be the same as the minimum guardband defined for 30 kHz SCS for the same UE channel bandwidth.

**Figure 5.3.3-3 Guard band definition when transmitting multiple numerologies**

NOTE: Figure 5.3.3-3 is not intended to imply the size of any guard between the two numerologies. Inter-numerology guard band within the carrier is implementation dependent.

For a UE supporting wideband operation, the nominal intra-cell guard bands and the corresponding sizes of the RB sets separated by the said guard bands are as specified in Table 5.3.3-2 for each UE channel bandwidth and sub-carrier spacing for the downlink and uplink. The nominal intra-cell guard bands in Table 5.3.3-2 are applicable when the respective IE *intraCellGuardBandsUL-List* and *intraCellGuardBandsDL-List* [7] for the uplink and downlink are not provided, as specified in [10] clause 7.

**Table 5.3.3-2: Nominal intra-cell guard bands for wideband operation**

| SCS (kHz)  | 40 MHz             | 60 MHz                | 80 MHz                     | 100 MHz                         |
|--|--------------------|-----------------------|----------------------------|---------------------------------|
| 15   | 105-6-105<br>(216) | N/A                   | N/A                        | N/A                             |
| 30   | 50-6-50<br>(106)   | 50-6-50-6-50<br>(162) | 50-6-50-5-50-6-50<br>(217) | 50-6-50-6-49-6-50-6-50<br>(273) |
| 60   | 23-5-23<br>(51)    | 23-5-23-5-23<br>(79)  | 23-5-23-5-23-5-23<br>(107) | 23-5-23-5-23-5-23-5-23<br>(135) |
| NOTE 1: The intra-cell guard band is denoted $TBW_0-GB_0-\dots-GB_{N\_RBset-2}-TBW_{N\_RBset-1}$ for $N\_RBset > 1$ number of RB-sets with $TBW_r$ the maximum transmission bandwidth (PRB) of RB-set $r$ and $GB_r$ the guard band (PRB) above the upper edge of RB-set $r$ . The RB-set 0 is starting at the first common resource block (CRB) of the carrier as indicated by <i>offsetToCarrier</i> . The total transmission bandwidth configuration (size of resource grid) including guard bands is given in between parentheses. |                    |                       |                            |                                 |

For a UE that supports shared spectrum channel access, there are no uplink or downlink intra-cell guard bands for operation with 10 MHz and 20 MHz channel bandwidths; the maximum transmission bandwidth configurations for these channel bandwidths are in accordance with clause 5.3.2.

For each UE channel bandwidth and sub-carrier spacing given by Table 5.3.3-2, the maximum transmission bandwidth configuration of the carrier including intra-cell guard bands, if configured for the uplink and downlink by the respective IE *intraCellGuardBandsUL-List* and *intraCellGuardBandsDL-List* [7], and corresponding RB-set(s) shall be in accordance with clause 5.3.2 with a minimum inter-cell guard band of the UE channel bandwidth as specified in Table 5.3.3-1 for the uplink and downlink. Minimum requirements specified for wideband operation in Clause 6 and Clause 7 also apply for intra-cell guard bands larger than the nominal sizes in Table 5.3.3-2 as listed in Table 5.3.3-3 for each sub-carrier spacing; each guard band in order of CRB index must be larger than or equal to the corresponding nominal guard band specified in Table 5.3.3-2 for each channel bandwidth.

**Table 5.3.3-3: Applicable intra-cell guard bands for wideband operation**

| Parameter                               | Unit | SCS     |          |
|---|------|---------|----------|
|   |      | 15 kHz  | 30 kHz   |
| Intra-cell guard band (size)            | PRB  | 6,7     | 5,6,7    |
| Transmission bandwidth (size) of RB-set | PRB  | 104,105 | 49,50,51 |

If the UE is configured with zero width intra-cell guard bands for the uplink and downlink by the IE *intraCellGuardBandsUL-List* and *intraCellGuardBandsDL-List* [7] on a carrier greater than 20 MHz, the maximum transmission bandwidth configuration for the uplink and downlink shall be in accordance with clause 5.3.2 with a minimum inter-cell guard band of the UE channel bandwidth as specified in Table 5.3.3-1.

### 5.3.4 RB alignment

For each numerology, its common resource blocks are specified in Clause 4.4.4.3 in TS 38.211 [6], and the starting point of its transmission bandwidth configuration on the common resource block grid for a given channel bandwidth is indicated by an offset to "Reference point A" in the unit of the numerology. The *UE transmission bandwidth configuration* is indicated by the higher layer parameter *carrierBandwidth* [7] and will fulfil the minimum UE guardband requirement specified in Clause 5.3.3.

### 5.3.5 UE channel bandwidth per operating band

The requirements in this specification apply to the combination of channel bandwidths, SCS and operating bands shown in Table 5.3.5-1. The transmission bandwidth configuration in Table 5.3.2-1 shall be supported for each of the specified channel bandwidths. The channel bandwidths are specified for both the TX and RX path.

### 5.3.6 Asymmetric channel bandwidths

The UE channel bandwidth can be asymmetric in downlink and uplink. In asymmetric channel bandwidth operation, the narrower carrier shall be confined within the frequency range of the wider channel bandwidth.

In FDD, the confinement is defined as a maximum deviation to the Tx-Rx carrier center frequency separation (defined in table 5.4.4-1) as following:

$$\Delta F_{\text{TX-RX}} = |(\text{BW}_{\text{DL}} - \text{BW}_{\text{UL}})/2|$$

The operating bands and supported asymmetric channel bandwidth combinations are defined in table 5.3.6-1.

 NOTE 2: As indicated in TS38.306 [15], it is mandatory for UEs to support asymmetric channel BCS0 if there is an asymmetric BCS0 defined for the band.

In TDD, the operating bands and supported asymmetric channel bandwidth combinations are defined in table 5.3.6-2.

Figure 5.3A.1-2: Void

## 5.3A.2 Maximum transmission bandwidth configuration for CA

For carrier aggregation, the maximum transmission bandwidth configuration is defined per component carrier and the requirement is specified in clause 5.3.2.

## 5.3A.3 Minimum guardband and transmission bandwidth configuration for CA

For intra-band contiguous carrier aggregation, *Aggregated Channel Bandwidth* and *Guard Bands* are defined as follows, see Figure 5.3A.3-1.

**Figure 5.3A.3-1: Definition of *Aggregated Channel Bandwidth* for intra-band carrier aggregation**

The *aggregated channel bandwidth*,  $BW_{\text{Channel\_CA}}$ , is defined as

$$BW_{\text{Channel\_CA}} = F_{\text{edge,high}} - F_{\text{edge,low}} \text{ (MHz)}.$$

The lower bandwidth edge  $F_{\text{edge,low}}$  and the upper bandwidth edge  $F_{\text{edge,high}}$  of the aggregated channel bandwidth are used as frequency reference points for transmitter and receiver requirements and are defined by

$$F_{\text{edge,low}} = F_{\text{C,low}} - F_{\text{offset,low}}$$

$$F_{\text{edge,high}} = F_{\text{C,high}} + F_{\text{offset,high}}$$

The lower and upper frequency offsets depend on the transmission bandwidth configurations of the lowest and highest assigned component carrier and are defined as

$$F_{\text{offset,low}} = (N_{\text{RB,low}} * 12 + 1) * SCS_{\text{low}} / 2 + BW_{\text{GB}} \text{ (MHz)}$$

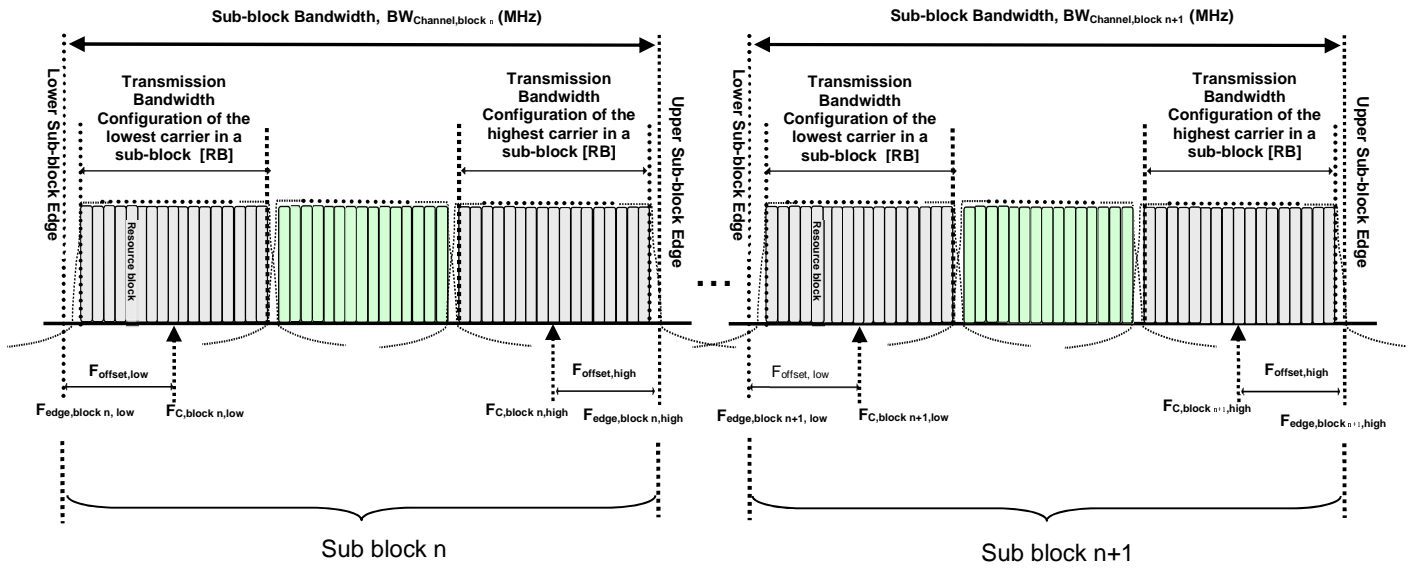

$$F_{\text{offset,high}} = (N_{\text{RB,high}} * 12 - 1) * SCS_{\text{high}} / 2 + BW_{\text{GB}} \text{ (MHz)}$$

$$BW_{\text{GB}} = \max(BW_{\text{GB,Channel}(k)})$$

$N_{\text{RB,low}}$  and  $N_{\text{RB,high}}$  are the transmission bandwidth configurations according to Table 5.3.2-1 for the lowest and highest assigned component carrier,  $SCS_{\text{low}}$  and  $SCS_{\text{high}}$  are the sub-carrier spacing for the lowest and highest assigned component carrier respectively.  $SCS_{\text{low}}$ ,  $SCS_{\text{high}}$ ,  $N_{\text{RB,low}}$ ,  $N_{\text{RB,high}}$ , and  $BW_{\text{GB,Channel}(k)}$  use the largest  $\mu$  value among the subcarrier spacing configurations supported in the operating band for both of the channel bandwidths according to Table 5.3.5-1 and  $BW_{\text{GB,Channel}(k)}$  is the minimum guard band for carrier  $k$  according to Table 5.3.3-1 for the said  $\mu$  value.

In case there is no common  $\mu$  value for both of the channel bandwidths,  $\mu=1$  is used for  $SCS_{\text{low}}$ ,  $SCS_{\text{high}}$ ,  $N_{\text{RB,low}}$ ,  $N_{\text{RB,high}}$ , and  $BW_{\text{GB,Channel}(k)}$ .

For intra-band non-contiguous carrier aggregation *Sub-block Bandwidth* and *Sub-block edges* are defined as follows, see Figure 5.3A.3-2.

**Figure 5.3A.3-2: Definition of sub-block bandwidth for intra-band non-contiguous spectrum**

The lower sub-block edge of the Sub-block Bandwidth ( $BW_{Channel,block}$ ) is defined as

$$F_{edge,block,low} = F_{C,block,low} - F_{offset,low}$$

The upper sub-block edge of the Sub-block Bandwidth is defined as

$$F_{edge,block,high} = F_{C,block,high} + F_{offset,high}$$

The Sub-block Bandwidth,  $BW_{Channel,block}$ , is defined as follows:

$$BW_{Channel,block} = F_{edge,block,high} - F_{edge,block,low} \text{ (MHz)}$$

The lower and upper frequency offsets  $F_{offset,block,low}$  and  $F_{offset,block,high}$  depend on the transmission bandwidth configurations of the lowest and highest assigned edge component carriers within a sub-block and are defined as

$$F_{offset,block,low} = (N_{RB,low} * 12 + 1) * SCS_{low} / 2 + BW_{GB} \text{ (MHz)}$$

$$F_{offset,block,high} = (N_{RB,high} * 12 - 1) * SCS_{high} / 2 + BW_{GB} \text{ (MHz)}$$

$$BW_{GB} = \max(BW_{GB,Channel(k)})$$

where  $N_{RB,low}$  and  $N_{RB,high}$  are the transmission bandwidth configurations according to Table 5.3.2-1 for the lowest and highest assigned component carrier within a sub-block, respectively.  $SCS_{low}$  and  $SCS_{high}$  are the sub-carrier spacing for the lowest and highest assigned component carrier within a sub-block, respectively.  $SCS_{low}$ ,  $SCS_{high}$ ,  $N_{RB,low}$ ,  $N_{RB,high}$ , and  $BW_{GB,Channel(k)}$  use the largest  $\mu$  value among the subcarrier spacing configurations supported in the operating band for both of the channel bandwidths according to Table 5.3.5-1 and  $BW_{GB,Channel(k)}$  is the minimum guard band for carrier  $k$  according to Table 5.3.3-1 for the said  $\mu$  value. In case there is no common  $\mu$  value for both of the channel bandwidths,  $\mu=1$  is used for  $SCS_{low}$ ,  $SCS_{high}$ ,  $N_{RB,low}$ ,  $N_{RB,high}$ , and  $BW_{GB,Channel(k)}$ .

The sub-block gap size between two consecutive sub-blocks  $W_{gap}$  is defined as

$$W_{gap} = F_{edge,block n+1,low} - F_{edge,block n,high} \text{ (MHz)}$$

### 5.3A.4 Void

### 5.3A.5 UE channel bandwidth per operating band for CA

The requirements for carrier aggregation in this specification are defined for carrier aggregation configurations.

For intra-band contiguous carrier aggregation, a carrier aggregation configuration is a single operating band supporting a carrier aggregation bandwidth class with associated bandwidth combination sets specified in clause 5.5A.1. For each carrier aggregation configuration, requirements are specified for all aggregated channel bandwidths contained in a bandwidth combination set, a UE can indicate support of several bandwidth combination sets per carrier aggregation configuration. For intra-band non-contiguous carrier aggregation, a carrier aggregation configuration is a single operating band supporting two or more sub-blocks, each supporting a carrier aggregation bandwidth class.

For intra-band non-contiguous uplink carrier aggregation, frequency separation class (Fs) specified in Table 5.3A.5-2 indicates the maximum frequency span between lower edge of lowest component carrier and upper edge of highest component carrier that UE can support per band combination in uplink in non-contiguous intra-band operation when the signalling is absent for dualPA-Architecture IE.

For inter-band carrier aggregation, a carrier aggregation configuration is a combination of operating bands, each supporting a carrier aggregation bandwidth class.

## 5.3l Channel bandwidth for RedCap

The requirements in this specification apply to the combination of channel bandwidths, SCS and operating bands shown in Table 5.3.5-1 with maximum channel bandwidth of 20MHz. The transmission bandwidth configuration in Table 5.3.2-1 shall be supported for each of the specified channel bandwidths up to 20 MHz. The channel bandwidths are specified for both the TX and RX path.

## 5.4 Channel arrangement

### 5.4.1 Channel spacing

#### 5.4.1.1 Channel spacing for adjacent NR carriers

The spacing between carriers will depend on the deployment scenario, the size of the frequency block available and the channel bandwidths. The nominal channel spacing between two adjacent NR carriers is defined as following:

- For NR operating bands with 100 kHz channel raster,

$$\text{Nominal Channel spacing} = (\text{BW}_{\text{Channel}(1)} + \text{BW}_{\text{Channel}(2)})/2$$

- For NR operating bands with 15 kHz channel raster,

$$\text{Nominal Channel spacing} = (\text{BW}_{\text{Channel}(1)} + \text{BW}_{\text{Channel}(2)})/2 + \{-5 \text{ kHz}, 0 \text{ kHz}, 5 \text{ kHz}\} \text{ for } \Delta F_{\text{Raster}} \text{ equals } 15 \text{ kHz}$$

$$\text{Nominal Channel spacing} = (\text{BW}_{\text{Channel}(1)} + \text{BW}_{\text{Channel}(2)})/2 + \{-10 \text{ kHz}, 0 \text{ kHz}, 10 \text{ kHz}\} \text{ for } \Delta F_{\text{Raster}} \text{ equals } 30 \text{ kHz}$$

where  $\text{BW}_{\text{Channel}(1)}$  and  $\text{BW}_{\text{Channel}(2)}$  are the channel bandwidths of the two respective NR carriers. The channel spacing can be adjusted depending on the channel raster to optimize performance in a particular deployment scenario.

### 5.4.2 Channel raster

#### 5.4.2.1 NR-ARFCN and channel raster

The global frequency channel raster defines a set of RF reference frequencies  $F_{\text{REF}}$ . The RF reference frequency is used in signalling to identify the position of RF channels, SS blocks and other elements.

The global frequency raster is defined for all frequencies from 0 to 100 GHz. The granularity of the global frequency raster is  $\Delta F_{\text{Global}}$ .

RF reference frequencies are designated by an NR Absolute Radio Frequency Channel Number (NR-ARFCN) in the range (0...2016666) on the global frequency raster. The relation between the NR-ARFCN and the RF reference frequency  $F_{\text{REF}}$  in MHz is given by the following equation, where  $F_{\text{REF-Offs}}$  and  $N_{\text{REF-Offs}}$  are given in table 5.4.2.1-1 and  $N_{\text{REF}}$  is the NR-ARFCN.

$$F_{\text{REF}} = F_{\text{REF-Offs}} + \Delta F_{\text{Global}} (N_{\text{REF}} - N_{\text{REF-Offs}})$$

**Table 5.4.2.1-1: NR-ARFCN parameters for the global frequency raster**

| Frequency range (MHz) | $\Delta F_{\text{Global}}$ (kHz) | $F_{\text{REF-Offs}}$ (MHz) | $N_{\text{REF-Offs}}$ | Range of $N_{\text{REF}}$ |
|-----------------------|----------------------------------|-----------------------------|-----------------------|---------------------------|
| 0 – 3000              | 5                                | 0                           | 0                     | 0 – 599999                |
| 3000 – 24250          | 15                               | 3000                        | 600000                | 600000 – 2016666          |

The channel raster defines a subset of RF reference frequencies that can be used to identify the RF channel position in the uplink and downlink. The RF reference frequency for an RF channel maps to a resource element on the carrier. For

each operating band, a subset of frequencies from the global frequency raster are applicable for that band and forms a channel raster with a granularity  $\Delta F_{\text{Raster}}$ , which may be equal to or larger than  $\Delta F_{\text{Global}}$ .

For SUL bands except n95, n97, n98 and for the uplink of all FDD bands defined in Table 5.2-1, and for TDD bands n34, n39, n48, n90, n38 and n40

$$F_{\text{REF, shift}} = F_{\text{REF}} + \Delta_{\text{shift}}, \Delta_{\text{shift}} = 0 \text{ kHz or } 7.5 \text{ kHz.}$$

where  $\Delta_{\text{shift}}$  is signalled by the network in higher layer parameter *frequencyShift7p5khz* [7]. For Band n34, n38, n39, n40, n48  $F_{\text{REF, shift}}$  is only applicable to uplink transmissions using a 15 kHz SCS.

The mapping between the channel raster and corresponding resource element is given in Clause 5.4.2.2. The applicable entries for each operating band are defined in Clause 5.4.2.3.

### 5.4.2.2 Channel raster to resource element mapping

The mapping between the RF reference frequency on the channel raster and the corresponding resource element is given in Table 5.4.2.2-1 and can be used to identify the RF channel position. The mapping depends on the total number of RBs that are allocated in the channel and applies to both UL and DL. The mapping must apply to at least one numerology supported by the UE.

**Table 5.4.2.2-1: Channel raster to resource element mapping**

|   | $N_{\text{RB}} \bmod 2 = 0$   | $N_{\text{RB}} \bmod 2 = 1$   |
|---|---|---|
| Resource element index $k$                      | 0   | 6   |
| Physical resource block number $n_{\text{PRB}}$ | $n_{\text{PRB}} = \left\lfloor \frac{N_{\text{RB}}}{2} \right\rfloor$ | $n_{\text{PRB}} = \left\lfloor \frac{N_{\text{RB}}}{2} \right\rfloor$ |

$k, n_{\text{PRB}}, N_{\text{RB}}$  are as defined in TS 38.211[6].

### 5.4.2.3 Channel raster entries for each operating band

The RF channel positions on the channel raster in each NR operating band are given through the applicable NR-ARFCN in Table 5.4.2.3-1, using the channel raster to resource element mapping in clause 5.4.2.2.

For NR operating bands with 100 kHz channel raster,  $\Delta F_{\text{Raster}} = 20 \times \Delta F_{\text{Global}}$ . In this case every 20<sup>th</sup> NR-ARFCN within the operating band are applicable for the channel raster within the operating band and the step size for the channel raster in Table 5.4.2.3-1 is given as  $\langle 20 \rangle$ .

For NR operating bands with 15 kHz channel raster below 3GHz,  $\Delta F_{\text{Raster}} = I \times \Delta F_{\text{Global}}$ , where  $I \in \{3, 6\}$ . Every  $I^{\text{th}}$  NR-ARFCN within the operating band are applicable for the channel raster within the operating band and the step size for the channel raster in Table 5.4.2.3-1 is given as  $\langle I \rangle$ .

For NR operating bands with 15 kHz channel raster above 3GHz,  $\Delta F_{\text{Raster}} = I \times \Delta F_{\text{Global}}$ , where  $I \in \{1, 2\}$ . Every  $I^{\text{th}}$  NR-ARFCN within the operating band are applicable for the channel raster within the operating band and the step size for the channel raster in table 5.4.2.3-1 is given as  $\langle I \rangle$ .

In frequency bands with two or more  $\Delta F_{\text{Raster}}$ , the higher  $\Delta F_{\text{Raster}}$ : For 15 kHz and 30 kHz channel raster applies to channels using only the SCS that is equal to or larger than the higher  $\Delta F_{\text{Raster}}$  and SSB SCS is equal to the higher  $\Delta F_{\text{Raster}}$ .

## 5.4.3 Synchronization raster

### 5.4.3.1 Synchronization raster and numbering

The synchronization raster indicates the frequency positions of the synchronization block that can be used by the UE for system acquisition when explicit signalling of the synchronization block position is not present.

A global synchronization raster is defined for all frequencies. The frequency position of the SS block is defined as  $SS_{REF}$  with corresponding number GSCN. The parameters defining the  $SS_{REF}$  and GSCN for all the frequency ranges are in Table 5.4.3.1-1.

The resource element corresponding to the SS block reference frequency  $SS_{REF}$  is given in clause 5.4.3.2. The synchronization raster and the subcarrier spacing of the synchronization block is defined separately for each band.

**Table 5.4.3.1-1: GSCN parameters for the global frequency raster**

| Frequency range  | SS Block frequency position $SS_{REF}$   | GSCN           | Range of GSCN |
|------------------|--|----------------|---------------|
| 0 – 3000 MHz     | $N * 1200\text{kHz} + M * 50\text{ kHz}$ ,<br>$N=1:2499, M \in \{1,3,5\}$ (Note 1) | $3N + (M-3)/2$ | 2 – 7498      |
| 3000 – 24250 MHz | $3000\text{ MHz} + N * 1.44\text{ MHz}$<br>$N = 0:14756$                           | $7499 + N$     | 7499 – 22255  |

NOTE 1: The default value for operating bands with which only support SCS spaced channel raster(s) is  $M=3$ .

### 5.4.3.2 Synchronization raster to synchronization block resource element mapping

The mapping between the synchronization raster and the corresponding resource element of the SS block is given in Table 5.4.3.2-1.

**Table 5.4.3.2-1: Synchronization raster to SS block resource element mapping**

|                            |     |
|----------------------------|-----|
| Resource element index $k$ | 120 |
|----------------------------|-----|

$k$  is the subcarrier number of SS/PBCH block defined in TS 38.211 clause 7.4.3.1 [6].

### 5.4.3.3 Synchronization raster entries for each operating band

The synchronization raster for each band is give in Table 5.4.3.3-1. The distance between applicable GSCN entries is given by the <Step size> indicated in Table 5.4.3.3-1.

## 5.4A Channel arrangement for CA

### 5.4A.1 Channel spacing for CA

For intra-band contiguous carrier aggregation with two or more component carriers, the nominal channel spacing between two adjacent NR component carriers is defined as the following unless stated otherwise:

For NR operating bands with a 100 kHz channel raster:

$$\text{Nominal channel spacing} = \left\lfloor \frac{BW_{Channel(1)} + BW_{Channel(2)} - 2|GB_{Channel(1)} - GB_{Channel(2)}|}{0.6} \right\rfloor 0.3 [\text{MHz}]$$

while for NR operating bands without a 100 kHz channel raster:

$$\text{Nominal channel spacing} = \left\lceil \frac{BW_{\text{Channel (1)}} + BW_{\text{Channel (2)}} - 2|GB_{\text{Channel (1)}} - GB_{\text{Channel (2)}}|}{0.015 * 2^{n+1}} \right\rceil 0.015 * 2^n \text{ [MHz]}$$

with

$$n = \mu_0$$

where  $BW_{\text{Channel(1)}}$  and  $BW_{\text{Channel(2)}}$  are the channel bandwidths of the two respective NR component carriers according to Table 5.3.2-1 with values in MHz,  $\mu_0$  is the largest  $\mu$  value among the subcarrier spacing configurations supported in the operating band for both of the channel bandwidths according to Table 5.3.5-1 and  $GB_{\text{Channel(i)}}$  is the minimum guard band for channel bandwidth  $i$  according to Table 5.3.3-1 for the said  $\mu$  value with  $\mu$  as defined in TS 38.211. In case there is no common  $\mu$  value for both of the channel bandwidths,  $\mu_0=1$  is selected and  $GB_{\text{Channel(i)}}$  is the minimum guard band for channel bandwidth  $i$  according to Table 5.3.3-1 for  $\mu=1$  with  $\mu$  as defined in TS 38.211.

The channel spacing for intra-band contiguous carrier aggregation can be adjusted to any multiple of least common multiple of channel raster and sub-carrier spacing less than the nominal channel spacing to optimize performance in a particular deployment scenario.

For intra-band non-contiguous carrier aggregation, the channel spacing between two NR component carriers in different sub-blocks shall be larger than the nominal channel spacing defined in this clause.

## 5.4A.2 Channel raster for CA

For inter-band and intra-band contiguous carrier aggregation, the channel raster requirements in clause 5.4.2 apply for each operating band.

## 5.4A.3 Synchronization raster for CA

For inter-band and intra-band contiguous carrier aggregation, the synchronization raster requirements in clause 5.4.3 apply for each operating band.

## 5.4A.4 Tx-Rx frequency separation for CA

For inter-band carrier aggregation, the Tx-Rx frequency separation requirements in clause 5.4.4 apply for each operating band.

For intra-band contiguous carrier aggregation, the same TX-RX frequency separation as specified in Table 5.4.4-1 is applied to PCC and SCC, respectively.

### 5.4E.2.1 NR-ARFCN and channel raster

For NR V2X, the NR-ARFCN and channel raster requirements in clause 5.4.2.1 apply for each operating band.

For NR V2X UE, the reference frequency can be shifted by configuration.

$$F_{\text{REF\_V2X}} = F_{\text{REF}} + \Delta_{\text{shift}} + N * 5 \text{ kHz}$$

where

$\Delta_{\text{shift}} = 0 \text{ kHz}$  or  $7.5 \text{ kHz}$  indicated in IE (*frequencyShift7p5khz*), and

$N$  can be set as one of following values  $\{-1, 0, 1\}$ , which are signalled by the network in higher layer parameters or configured by pre-configuration parameters.

### 5.4E.2.2 Channel raster to resource element mapping

For NR V2X, the channel raster to resource element mapping requirements in clause 5.4.2.2 apply for each operating band.

### 5.4E.2.3 Channel raster entries for each operating band

For NR V2X, the channel raster entries, the channel raster entries requirements in clause 5.4.2.3 apply for each operating band.

The RF channel positions on the channel raster in each NR V2X operating band are given through the applicable NR-ARFCN in Table 5.4.2.3-1, using the channel raster to resource element mapping in clause 5.4E.2.2.

For NR V2X operating band n47,  $\Delta F_{\text{Raster}} = I \times \Delta F_{\text{Global}}$ , where  $I \in \{1\}$ . Every  $I^{\text{th}}$  NR-ARFCN within the operating band are applicable for the channel raster within the operating band and the step size for the channel raster in Table 5.4.2.3-1 is given as  $\langle I \rangle$ .

## 5.4E.3 Synchronization raster for V2X

There is no synchronization raster definition for NR V2X for both licensed bands and unlicensed bands.

## 5.5A Configurations for CA

### 5.5A.0 General

The configurations for CA operating band including Band n41 also apply for the corresponding CA operating bands with Band n90 replacing Band n41 but with otherwise identical parameters. For brevity the said configuration for CA operating bands with Band n90 are not listed in the tables below but are covered by this specification. For BCS4 and BCS5 combinations with n41, the n90 equivalents also include 5 MHz.

Non-contiguous resource allocation and almost contiguous allocation are not applicable for each NR carrier of intra-band contiguous and non-contiguous CA configurations.

For a CA configuration with one or more operating band supporting asymmetric channel bandwidths as specified in sub-clause 5.3.6, requirements are defined for an asymmetric UL and DL channel bandwidth combination of a supported asymmetric channel bandwidth combination set for an operating band of the CA configuration when the said UL and DL channel bandwidths are also contained in a supported bandwidth combination set of the CA configuration.

For a higher order band combination of which CA\_n20-n28 is a subset, the frequency range in band n28 is restricted for the higher order band combination to 703-733 MHz for the UL and 758-788 MHz for the DL.

The configuration tables for CA describe Bandwidth Combination Sets. Bandwidth Combination Set 4 and 5 contain all possible defined channel bandwidths for each band in the combination. The fact that BCS4 and BCS5 contain all channel bandwidths for each band does not alter if a bandwidth is mandatory or optional for a given band. Bandwidths that are identified as optional in Table 5.3.5-1 for a given release are still optional for UEs that support BCS4 or BCS5, where the bandwidths the UE supports for each band, the maximum bandwidth and/or minimum bandwidth for the band in the band combination are indicated in the UE capabilities. Note that the minimum bandwidth is indicated only in BCS5 and BCS5 shall not be indicated together with BCS4 for a CA configuration. For inter-band CA combinations including FR1 intra-band CA and with BCS4 or BCS5, the Bandwidth Combination Sets for the FR1 intra-band CA are BCS4 or BCS5.

### 5.5A.1 Configurations for intra-band contiguous CA

Power class 3 is supported for all uplinks. Power classes other than power class 3 are supported as indicated in Table 5.5A.1-1.

NOTE 1: 5 MHz is not applicable for 30/60 kHz SCS.

NOTE 2: The aggregated bandwidth must be greater than or equal to the minimum for the bandwidth class defined in Table 5.3A.5-1, and smaller than or equal to the maximum aggregated bandwidth.

NOTE 3: Power Class 2 is allowed for this uplink combination or single uplink carrier in this downlink/uplink combination

NOTE 4: Power Class 1.5 is allowed for this uplink combination or single uplink carrier in this downlink/uplink combination

NOTE 5: Only single uplink carriers with power class other than PC3 are listed.

NOTE 1: Void.

NOTE 2: Parameter value accounts for both, the maximum frequency range of band n48 (150 MHz), and the minimum frequency gaps in between NR non-contiguous component carriers.

NOTE 3: Power Class 2 is allowed for this uplink combination or single uplink carrier in this downlink/uplink combination

NOTE 4: Power Class 1.5 is allowed for this uplink combination or single uplink carrier in this downlink/uplink combination

NOTE 5: Only single uplink carriers with power class other than PC3 are listed.

The following notes are applied to the above tables:

NOTE 1: This UE channel bandwidth is applicable only to downlink.

NOTE 2: The minimum requirements for intra-band contiguous or non-contiguous CA apply.

NOTE 3: The SCS of each channel bandwidth for NR band refers to Table 5.3.5-1.

NOTE 4: This UE channel bandwidth is optional in this release of the specification.

NOTE 5: For this bandwidth, the minimum requirements are restricted to operation when carrier is configured as an SCell part of DC or CA configuration.

NOTE 6: For this bandwidth, the minimum requirements are restricted to operation when carrier is configured as an downlink SCell part of CA configuration

NOTE 7: Limited to operation at 3450-3550 MHz and 3700–3980 MHz.

NOTE 8: Power Class 2 is allowed for this uplink combination or single uplink carrier in this downlink/uplink combination

NOTE 9: Power Class 1.5 is allowed for this uplink combination or single uplink carrier in this downlink/uplink combination

NOTE 10: Only single uplink carriers with power class other than PC3 are listed.

NOTE 11: The CA configurations are given in Table 5.5A.1-1 or Table 5.5A.2-1 in this specification

- NOTE 1: This UE channel bandwidth is applicable only to downlink
- NOTE 2: For the 20 MHz bandwidth, the minimum requirements are specified for NR UL carrier frequencies confined to either 713-723 MHz or 728-738 MHz.
- NOTE 3: The SCS of each channel bandwidth for NR band refers to Table 5.3.5-1.
- NOTE 4: The minimum requirements only apply for non-simultaneous Tx/Rx between all carriers for TDD combinations.
- NOTE 5: Simultaneous Rx/Tx capability for TDD combinations does not apply for UEs supporting band n78 with an n77 implementation.
- NOTE 6: Only single uplink carriers with power class other than PC3 are listed.
- NOTE 7: Power Class 2 is allowed for this uplink combination or single uplink carrier in this downlink/uplink combination
- NOTE 8: For this bandwidth, the minimum requirements are restricted to operation when carrier is configured as an SCell part of DC or CA configuration.
- NOTE 9: Power Class 1.5 is allowed for single uplink carrier in this downlink/uplink combination

## 5.5B Configurations for DC

For an NR DC configuration specified in 5.5B.1-1, the bandwidth combination sets for the corresponding NR CA configuration in 5.5A.3, i.e., dual uplink inter-band carrier aggregation with uplink assigned to two NR bands, are applicable to Dual Connectivity.

## 5.5C Configurations for SUL

The configuration tables for SUL describe Bandwidth Combination Sets. Bandwidth Combination Set 4 and 5 contains all possible defined channel bandwidths for each band in the combination. The fact that BCS4 and BCS5 contains all channel bandwidths for each band does not alter if a bandwidth is mandatory or optional for a given band. Bandwidths that are identified as optional in Table 5.3.5-1 for a given release are still optional for UEs that support BCS4 or BCS5. , where the bandwidths the UE supports for each band, the maximum bandwidth and/or minimum bandwidth for the band in the band combination are indicated in the UE capabilities. Note that the minimum bandwidth is indicated only in BCS5 and BCS5 shall not be indicated together with BCS4 for a SUL configuration. For SUL band combinations including FR1 intra-band CA and with BCS4 or BCS5, the Bandwidth Combination Sets for the FR1 intra-band CA are BCS4 or BCS5.

## 6 Transmitter characteristics

### 6.1 General

Unless otherwise stated, the transmitter characteristics are specified at the antenna connector of the UE with a single or multiple transmit antenna(s). For UE with integral antenna only, a reference antenna with a gain of 0 dBi is assumed.

Transmitter requirements for UL MIMO operation apply when the UE transmits on 2 ports on the same CDM group. The UE may use higher MPR values outside this limitation.

The applicability of transmitter requirements for Band n90 is in accordance with that for Band n41; a UE supporting Band n90 shall meet the minimum requirements for Band n41.

#### 6.1A General

The minimum requirements for band combinations including Band n41 also apply for the corresponding band combinations with Band n90 replacing Band n41 but with otherwise identical parameters. For brevity the said band combinations with Band n90 are not listed in the tables below but are covered by this specification.

#### 6.1F General

For wideband operations, the minimum requirements for the transmitter characteristics are specified for transmissions on one scheduled RB set or  $\geq 1$  scheduled contiguous RB set(s) within the UE channel. The requirements apply with configured UL intra-cell guard bands of non-zero size according to Table 5.3.3-2, with the union of the scheduled RB sets and the intra-cell guard bands b.

### 6.2 Transmitter power

#### 6.2.1 UE maximum output power

The following UE Power Classes define the maximum output power for any transmission bandwidth within the channel bandwidth of NR carrier unless otherwise stated. The period of measurement shall be at least one sub frame (1ms).

Table 6.2.1-1: UE Power Class

| NR band | Class 1 (dBm)   | Tolerance (dB) | Class 1.5 (dBm) | Tolerance (dB)     | Class 2 (dBm) | Tolerance (dB)     | Class 3 (dBm) | Tolerance (dB)     |

NOTE 1: P<sub>PowerClass</sub> is the maximum UE power specified without taking into account the tolerance

NOTE 2: Power class 3 is default power class unless otherwise stated

NOTE 3: Refers to the transmission bandwidths confined within F<sub>UL\_low</sub> and F<sub>UL\_low</sub> + 4 MHz or F<sub>UL\_high</sub> – 4 MHz and F<sub>UL\_high</sub>, the maximum output power requirement is relaxed by reducing the lower tolerance limit by 1.5 dB.

NOTE 4: The maximum output power requirement is relaxed by reducing the lower tolerance limit by 0.3 dB

NOTE 5: Achieved via dual Tx

NOTE 6: Generally, PC1 UE is not targeted for smartphone form factor. The UE power class 1 requirements for Band n14 are applicable for public safety scenario only.

If a UE supports a different power class than the default UE power class for the band and the supported power class enables the higher maximum output power than that of the default power class:

- if the field of UE capability *maxUplinkDutyCycle-PC2-FRI* is absent and the field of UE capability *maxUplinkDutyCycle-PC1dot5-MPE-FRI* is absent and the percentage of uplink symbols transmitted in a certain evaluation period is larger than 50% (The exact evaluation period is no less than one radio frame); or
- if the field of UE capability *maxUplinkDutyCycle-PC2-FRI* is not absent and the percentage of uplink symbols transmitted in a certain evaluation period is larger than *maxUplinkDutyCycle-PC2-FRI* as defined in TS 38.306 (The exact evaluation period is no less than one radio frame); or
- if the field of UE capability *maxUplinkDutyCycle-PC1dot5-MPE-FRI* is not absent and half the percentage of uplink symbols transmitted in a certain evaluation period is larger than *maxUplinkDutyCycle-PC1dot5-MPE-FRI* as defined in TS 38.306 (The exact evaluation period is no less than one radio frame); or
- if the IE P-Max as defined in TS 38.331 [7] is provided and set to the maximum output power of the default power class or lower;
- shall apply all requirements for the default power class to the supported power class and set the configured transmitted power as specified in clause 6.2.4;
- else if the UE does not support a power class with higher maximum output power than PC2; or
- if the field of UE capability *maxUplinkDutyCycle-PC2-FRI* is absent and the field of UE capability *maxUplinkDutyCycle-PC1dot5-MPE-FRI* is absent and the percentage of uplink symbols transmitted in a certain evaluation period is larger than 25% (The exact evaluation period is no less than one radio frame); or
- if the field of UE capability *maxUplinkDutyCycle-PC2-FRI* is not absent and the percentage of uplink symbols transmitted in a certain evaluation period is larger than  $0.5 * \text{maxUplinkDutyCycle-PC2-FRI}$  (The exact evaluation period is no less than one radio frame); or
- if the field of UE capability *maxUplinkDutyCycle-PC1dot5-MPE-FRI* is not absent and the percentage of uplink symbols transmitted in a certain evaluation period is larger than *maxUplinkDutyCycle-PC1dot5-MPE-FRI* as defined in TS 38.306 (The exact evaluation period is no less than one radio frame); or
- if the IE P-Max as defined in TS 38.331 [7] is provided and set to the maximum output power of the power class 2 or lower;
- shall apply all requirements for power class 2 to the supported power class and set the configured transmitted power as specified in clause 6.2.4;
- else shall apply all requirements for the supported power class and set the configured transmitted power as specified in clause 6.2.4.

## 6.2.11 Maximum output power for RedCap UE

For Redcap UE, the requirements for power class 3 specified in clause 6.2.1 apply.

## 6.2.2 UE maximum output power reduction

UE is allowed to reduce the maximum output power due to higher order modulations and transmit bandwidth configurations. For UE power class 2 and 3 and UE power class 1, the allowed maximum power reduction (MPR) is defined in Table 6.2.2-2, Table 6.2.2-1 and Table 6.2.2-5, respectively for channel bandwidths  $\leq 100$  MHz. For UE power class 1.5, the allowed maximum power reduction (MPR) is defined in Table 6.2D.2-2 and Table 6.2D.2-3 in accordance with the indicated *modifiedMPR-Behavior* specified in Table L.1-1 for channel bandwidths  $\leq 100$  MHz

If the relative channel bandwidth  $\leq 4\%$  for TDD bands or  $\leq 3\%$  for FDD band, the  $\Delta\text{MPR}$  is set to zero.

If the relative channel bandwidth > 4% for TDD bands or > 3% for FDD bands, the  $\Delta$ MPR is defined in Table 6.2.2-3.

Where relative channel bandwidth =  $2 \cdot BW_{\text{Channel}} / (F_{\text{UL\_low}} + F_{\text{UL\_high}})$

The allowed MPR for SRS, PUCCH formats 0, 1, 3 and 4, and PRACH shall be as specified for QPSK modulated DFT-s-OFDM of equivalent RB allocation. The allowed MPR for PUCCH format 2 shall be as specified for QPSK modulated CP-OFDM of equivalent RB allocation.

Where the following parameters are defined to specify valid RB allocation ranges for Outer and Inner RB allocations:

$N_{RB}$  is the maximum number of RBs for a given Channel bandwidth and sub-carrier spacing defined in Table 5.3.2-1.

$$RB_{Start,Low} = \max(1, \text{floor}(L_{CRB}/2))$$

where  $\max()$  indicates the largest value of all arguments and  $\text{floor}(x)$  is the greatest integer less than or equal to  $x$ .

$$RB_{Start,High} = N_{RB} - RB_{Start,Low} - L_{CRB}$$

The RB allocation is an Inner RB allocation if the following conditions are met

$$RB_{Start,Low} \leq RB_{Start} \leq RB_{Start,High}, \text{ and}$$

$$L_{CRB} \leq \text{ceil}(N_{RB}/2)$$

where  $\text{ceil}(x)$  is the smallest integer greater than or equal to  $x$ .

An Edge RB allocation is the one for which the RB(s) is (are) allocated at the lowermost or uppermost edge of the channel  $L_{CRB} \leq 2$  RBs.

The RB allocation is an Outer RB allocation for all other allocations which are not an Inner RB allocation or Edge RB allocation.

If CP-OFDM allocation satisfies following conditions, it is considered as almost contiguous allocation

$$N_{RB\_gap} / (N_{RB\_alloc} + N_{RB\_gap}) \leq 0.25$$

and  $N_{RB\_alloc} + N_{RB\_gap}$  is larger than 106, 51 or 24 RBs for 15 kHz, 30 kHz or 60 kHz SCS respectively where  $N_{RB\_gap}$  is the total number of unallocated RBs between allocated RBs and  $N_{RB\_alloc}$  is the total number of allocated RBs. The size and location of allocated and unallocated RBs are restricted by RBG parameters specified in clause 6.1.2.2 of TS 38.214 [10]. For these almost contiguous signals in power class 2 and 3, the allowed maximum power reduction defined in Table 6.2.2-2 and Table 6.2.2-1 are increased by

$$\text{CEIL}\{ 10 \log_{10}(1 + N_{RB\_gap} / N_{RB\_alloc}), 0.5 \} \text{ dB},$$

where  $\text{CEIL}\{x, 0.5\}$  means  $x$  rounding upwards to closest 0.5dB. The parameters of  $RB_{Start,Low}$  and  $RB_{Start,High}$  to specify valid RB allocation ranges for Outer and Inner RB allocations are defined as following:

$$RB_{Start,Low} = \max(1, \text{floor}((N_{RB\_alloc} + N_{RB\_gap})/2))$$

$$RB_{Start,High} = N_{RB} - RB_{Start,Low} - N_{RB\_alloc} - N_{RB\_gap}$$

For the UE maximum output power modified by MPR, the power limits specified in clause 6.2.4 apply.

## 6.2.3 UE additional maximum output power reduction

### 6.2.3.1 General

Additional emission requirements can be signalled by the network. Each additional emission requirement is associated with a unique network signalling (NS) value indicated in RRC signalling by an NR frequency band number of the applicable operating band and an associated value in the field *additionalSpectrumEmission*. Throughout this specification, the notion of indication or signalling of an NS value refers to the corresponding indication of an NR frequency band number of the applicable operating band, the IE field *freqBandIndicatorNR* and an associated value of *additionalSpectrumEmission* in the relevant RRC information elements [7].

To meet the additional requirements, additional maximum power reduction (A-MPR) is allowed for the maximum output power as specified in Table 6.2.1-1. Unless stated otherwise, the total reduction to UE maximum output power is  $\max(\text{MPR}, \text{A-MPR})$  where MPR is defined in clause 6.2.2. Outer and inner allocation notation used in clause 6.2.3 is defined in clause 6.2.2. Unless stated otherwise, Edge RB allocations get the same AMPR as Outer RB allocations. In absence of modulation and waveform types the A-MPR applies to all modulation and waveform types.

Table 6.2.3.1-1 specifies the additional requirements with their associated network signalling values and the allowed A-MPR and applicable operating band(s) for each NS value. In case of a power class 3 UE, when IE *powerBoostPi2BPSK* is set to 1, power class 2 A-MPR values apply. The mapping of NR frequency band numbers and values of the *additionalSpectrumEmission* to network signalling labels is specified in Table 6.2.3.1-1A.

For almost contiguous allocations in CP-OFDM waveforms in power class 3, the allowed A-MPR defined in clause 6.2.3 is increased by  $\text{CEIL}\{10 \log_{10}(1 + N_{\text{RB\_gap}}/N_{\text{RB\_alloc}}), 0.5\}$  dB, where  $\text{CEIL}\{x, 0.5\}$  means  $x$  rounding upwards to closest 0.5dB,  $N_{\text{RB\_gap}}$  is the total number of unallocated RBs between allocated RBs and  $N_{\text{RB\_alloc}}$  is the total number of allocated RBs, and the parameter  $L_{\text{CRB}}$  is replaced by  $N_{\text{RB\_alloc}} + N_{\text{RB\_gap}}$  in specifying the RB allocation regions.

Unless otherwise specified, pi/2 BPSK in following A-MPR tables refers to both variants of pi/2 BPSK referenced in 6.2.2 tables 6.2.2-1.

### 6.2.3.2 A-MPR for NS\_04

For NS\_04, A-MPR is not added to MPR. Also, when NS\_04 is signalled, MPR shall be set to zero in the  $P_{\text{CMAX}}$  equations to avoid double counting MPR.

Allowed maximum power reduction is defined as  $A\text{-MPR} = \max(\text{MPR}, A\text{-MPR}')$ ,

Note that  $A\text{-MPR}' = 0$  dB means only MPR is applied,

where  $A\text{-MPR}'$  is defined as

```

if  $R_{\text{Bstart}} \leq f_{\text{start,max,IMD3}} / (12 \cdot \text{SCS})$  and  $L_{\text{CRB}} \leq AW_{\text{max,IMD3}} / (12 \cdot \text{SCS})$  and  $F_{\text{C}} - BW_{\text{channel}}/2 < F_{\text{UL,low}} + \text{offset}_{\text{IMD3}}$ ,
then
    the A-MPR' is defined according to Table 6.2.3.2-2 PC3_A2 relative to 23 dBm for power class 3,
    PC2_A4 relative to 26 dBm for power class 2, and PC1.5_A6 relative to 29 dBm for power class 1.5,
    else,
if  $R_{\text{Bstart}} \leq L_{\text{CRB}}/2 + \Delta_{\text{start}} / (12 \cdot \text{SCS})$  and  $L_{\text{CRB}} \leq AW_{\text{max,regrowth}} / (12 \cdot \text{SCS})$  and  $F_{\text{C}} - BW_{\text{channel}}/2 < F_{\text{UL,low}} + \text{offset}_{\text{regrowth}}$ ,
then
    the A-MPR' is defined according to Table 6.2.3.2-2 PC3_A1 relative to 23 dBm for power class 3,
    PC2_A3 relative to 26 dBm for power class 2, , and PC1.5_A5 relative to 29 dBm for power class 1.5,
    else
    A-MPR' = 0 dB and apply MPR.

```

With the parameters defined in Table 6.2.3.2-1.

| 20                      | RB <sub>start</sub>    | 0 – 15           |
|                         | L <sub>CRB</sub> (RBs) | 1 – 20           |
|                         | A (dB)                 | ≤ 6 <sup>6</sup> |

NOTE 1: RB<sub>start</sub> indicates the lowest RB index of transmitted resource blocks  
 NOTE 2: L<sub>CRB</sub> is the length of a contiguous resource block allocation  
 NOTE 3: For intra-subframe frequency hopping which intersects Region A, notes 1 and 2 apply on a per slot basis. For intra-slot or intra-subslot frequency hopping which intersects Region A, notes 1 and 2 apply on a T<sub>no\_hopping</sub> basis.  
 NOTE 4: For intra-subframe frequency hopping which intersect Region A, the larger A-MPR value may be applied for both slots in the subframe. For intra-slot frequency hopping which intersects Region A, the larger A-MPR value may be applied for the slot. For intra-subslot frequency hopping which intersects Region A, the larger A-MPR value may be applied for the subslot.  
 NOTE 5: The A-MPR for DFT-s-OFDM is the total backoff and is obtained by taking the maximum value of MPR + A-MPR specified in Table 6.2.3-1 and Table 6.2.4-1 in TS 36.101 and A value specified in Table 6.2.3.3-1.  
 NOTE 6: The A-MPR for CP-OFDM is the total backoff and is obtained by adding the A value in Table 6.2.3.3-1 to the corresponding MPR specified in Table 6.2.2-1.

For 5 MHz channel centered on frequencies ( $F_c$ ) = 1630.0, 1630.3 MHz, A-MPR is defined as

```

if  $RB_{start} \leq \text{ceil}\{3/SCS/15 \text{ kHz}\}$  and  $L_{CRB} \leq \text{ceil}\{17/SCS/15 \text{ kHz}\}$ ,
then
  the A-MPR = 14 dB for SCS = 15 kHz and AMPR = 8 dB for SCS  $\geq$  30 kHz,

then
  the A-MPR = 12 dB for SCS = 15 kHz and AMPR = 8 dB for SCS  $\geq$  30 kHz,
else,
if  $RB_{start} < \text{ceil}\{9/(SCS/15 \text{ kHz})\}$ , and  $L_{CRB} > \text{ceil}\{8/(SCS/15 \text{ kHz})\}$ ,

then
    the A-MPR = 3 dB,
else,
if RB_start >= floor{35/(SCS/15 kHz)} and L_CRB <= ceil{7/(SCS/15 kHz)},
then
    the A-MPR = 4 dB,
else,
if RB_start >= floor{35/(SCS/15 kHz)} and L_CRB > ceil{7/(SCS/15 kHz)},

## 6.2.4 Configured transmitted power

The UE is allowed to set its configured maximum output power  $P_{\text{CMAX},f,c}$  for carrier  $f$  of serving cell  $c$  in each slot. The configured maximum output power  $P_{\text{CMAX},f,c}$  is set within the following bounds:

$$P_{\text{CMAX},L,f,c} \leq P_{\text{CMAX},f,c} \leq P_{\text{CMAX},H,f,c} \text{ with}$$

$$P_{\text{CMAX},L,f,c} = \text{MIN} \{ P_{\text{EMAX},c} - \Delta T_{C,c}, (P_{\text{PowerClass}} - \Delta P_{\text{PowerClass}}) - \text{MAX}(\text{MAX}(\text{MPR}_c + \Delta \text{MPR}_c, \text{A-MPR}_c) + \Delta T_{\text{IB},c} + \Delta T_{C,c} + \Delta T_{\text{RxsRS}}, P\text{-MPR}_c) \}$$

$$P_{\text{CMAX},H,f,c} = \text{MIN} \{ P_{\text{EMAX},c}, P_{\text{PowerClass}} - \Delta P_{\text{PowerClass}} \}$$

where

$P_{\text{EMAX},c}$  is the value given by either the *p-Max* IE or the field *additionalPmax* of the *NR-NS-PmaxList IE*, whichever is applicable according to TS 38.331[7];

$P_{\text{PowerClass}}$  is the maximum UE power specified in Table 6.2.1-1 without taking into account the tolerance specified in the Table 6.2.1-1;

When the IE *powerBoostPi2BPSK* is set to 1,  $P_{\text{EMAX},c}$  is increased by +3 dB for a power class 3 capable UE operating in TDD bands n40, n41, n77, n78, and n79 with  $\text{PI}/2$  BPSK modulation and UE indicates support for UE capability *powerBoosting-pi2BPSK* and 40% or less symbols in certain evaluation period are used for UL transmission when  $P_{\text{EMAX},c} \geq 20$  dBm (The exact evaluation period is no less than one radio frame).

When the IE *powerBoostPi2BPSK* is set to 1,  $\Delta P_{\text{PowerClass}} = -3$  dB for a power class 3 capable UE operating in TDD bands n40, n41, n77, n78, and n79 with  $\text{PI}/2$  BPSK modulation and UE indicates support for UE capability *powerBoosting-pi2BPSK* and 40% or less slots in radio frame are used for UL transmission.

$\Delta P_{\text{PowerClass}} =$

- 3 dB for a power class 2 capable UE or 6 dB for a power class 1.5 UE when P-max of 23 dBm or lower is indicated; or when the field of UE capability *maxUplinkDutyCycle-PC2-FR1* is absent and the field of UE capability *maxUplinkDutyCycle-PC1dot5-MPE-FR1* is absent and the percentage of uplink symbols transmitted in a certain evaluation period is larger than 50%; or when the field of UE capability *maxUplinkDutyCycle-PC2-FR1* is not absent and the percentage of uplink symbols transmitted in a certain evaluation period is larger than *maxUplinkDutyCycle-PC2-FR1* as defined in TS 38.306 (The exact evaluation period is no less than one radio frame); or when the field of UE capability *maxUplinkDutyCycle-PC1dot5-MPE-FR1* is not absent and half the percentage of uplink symbols transmitted in a certain evaluation period is larger than *maxUplinkDutyCycle-PC1dot5-MPE-FR1* as defined in TS 38.306 (The exact evaluation period is no less than one radio frame).
- 3 dB for a power class 1.5 capable UE when P-max of between 23 dBm and 26 dB is indicated; or when the field of UE capability *maxUplinkDutyCycle-PC2-FR1* is absent and the field of UE capability *maxUplinkDutyCycle-PC1dot5-MPE-FR1* is absent and the percentage of uplink symbols transmitted in a certain evaluation period is between 25% and 50%; or when the field of UE capability *maxUplinkDutyCycle-PC2-FR1* is not absent and the percentage of uplink symbols transmitted in a certain evaluation period is between *maxUplinkDutyCycle-PC2-FR1* and *maxUplinkDutyCycle-PC2-FR1/2* as defined in TS 38.306 (The

exact evaluation period is no less than one radio frame); or when the field of UE capability *maxUplinkDutyCycle-PC1dot5-MPE-FR1* is not absent and the percentage of uplink symbols transmitted in a certain evaluation period is larger than *maxUplinkDutyCycle-PC1dot5-MPE-FR1* as defined in TS 38.306 (The exact evaluation period is no less than one radio frame).

- 3dB when the UE is configured with SUL configurations and the requirements of default power class are applied as specified in sub-clause 6.2C.1 on the band where UE indicates power class 2;
- 3dB is applied during SRS transmission occasions with usage in SRS-ResourceSet set as 'antennaSwitching' with configured SRS resources in each SRS resource set(s) consisting of one SRS port when PC2 capable UE with txDiversity-r16 capability or PC1.5 capable UE further indicates SRS-TxSwitch capability 't1r2' or 't1r4' or 't1r1-t1r2' or 't1r1-t1r2-t1r4';
- 0 dB otherwise;

$\Delta T_{IB,c}$  is the additional tolerance for serving cell c as specified in clause 6.2A.4.2 for NR CA, clause 6.2C.2 for SUL, or TS 38.101-3 clause 6.2B.4.2 for EN-DC;  $\Delta T_{IB,c} = 0$  dB otherwise; In case the UE supports more than one of band combinations for V2X operating bands for concurrent operation, CA, SUL or DC, and an operating band belongs to more than one band combinations then

- a) When the operating band frequency range is  $\leq 1$  GHz, the applicable additional  $\Delta T_{IB,c}$  shall be the average value for all band combinations defined in clause 6.2A.4.2, 6.2C.2 in this specification and 6.2B.4.2 in TS 38.101-3 [3], truncated to one decimal place that apply for that operating band among the supported band combinations. In case there is a harmonic relation between low band UL and high band DL, then the maximum  $\Delta T_{IB,c}$  among the different supported band combinations involving such band shall be applied
- b) When the operating band frequency range is  $> 1$  GHz, the applicable additional  $\Delta T_{IB,c}$  shall be the maximum value for all band combinations defined in clause 6.2A.4.2, 6.2C.2 in this specification and 6.2B.4.2 in TS 38.101-3 [3] for the applicable operating bands.

$\Delta T_{C,c} = 1.5$ dB when NOTE 3 in Table 6.2.1-1 in 38.101-1 applies for a serving cell c, otherwise  $\Delta T_{C,c} = 0$  dB ;

$MPR_c$  and  $A-MPR_c$  for serving cell c are specified in clause 6.2.2 and clause 6.2.3, respectively;

$\Delta MPR_c$  for serving cell c is specified in clause 6.2.2.

$\Delta T_{RxsRS}$  is applied during SRS transmission occasions with *usage* in *SRS-ResourceSet* set as 'antennaSwitching' when

- a) UE transmits SRS on the second SRS resource in every configured SRS resource set when the *SRS-TxSwitch* capability is indicated as 't1r2' or 't1r1-t1r2'
- b) UE transmits SRS on the second, third and fourth SRS resources of the total 4 SRS resources from all configured SRS resource set(s) consisting of one SRS port when the *SRS-TxSwitch* capability is indicated as 't1r4' or, 't1r4-t2r4' or 't1r1-t1r2-t1r4' or, 't1r1-t1r2-t2r2-t1r4-t2r4'
- c) UE transmits SRS from the second SRS port pair on the second SRS resource in every configured SRS resource set consisting of two SRS ports when the *SRS-TxSwitch* capability is indicated as 't2r4' or 't1r4-t2r4', or 't1r1-t1r2-t2r2-t2r4' or 't1r1-t1r2-t2r2-t1r4-t2r4', or
- d) UE transmits SRS to a DL-only carrier

The value of  $\Delta T_{RxsRS}$  is 4.5dB for bands whose  $F_{UL\_high}$  is higher than the  $F_{UL\_low}$  of n79 and 3 dB for bands whose  $F_{UL\_high}$  is lower than the  $F_{UL\_low}$  of n79 when the device is capable of power class 3 or power class 5 or power class 1.5 in the band, or when the device is capable of power class 2 in the band and  $\Delta P_{PowerClass} = 3$  dB, or when UE indicating *txDiversity-r16*.

The value of  $\Delta T_{RxsRS}$  is 7.5dB for bands whose  $F_{UL\_high}$  is higher than the  $F_{UL\_low}$  of n79 and 6 dB for bands whose  $F_{UL\_high}$  is lower than the  $F_{UL\_low}$  of n79 during SRS transmission occasions with configured SRS resources consisting of one SRS port when the device is capable of power class 2 in the band and  $\Delta P_{PowerClass} = 0$  dB and not indicating *txDiversity-r16*.

For other SRS transmissions  $\Delta T_{RxsRS}$  is zero;

$P-MPR_c$  is the power management maximum power reduction for

- a) ensuring compliance with applicable electromagnetic energy absorption requirements and addressing unwanted emissions / self desense requirements in case of simultaneous transmissions on multiple RAT(s) for scenarios not in scope of 3GPP RAN specifications;
- b) ensuring compliance with applicable electromagnetic energy absorption requirements in case of proximity detection is used to address such requirements that require a lower maximum output power.

The UE shall apply  $P\text{-MPR}_c$  for serving cell  $c$  only for the above cases. For UE conducted conformance testing  $P\text{-MPR}_c$  shall be 0 dB

NOTE 1:  $P\text{-MPR}_c$  was introduced in the  $P_{\text{CMAX},f,c}$  equation such that the UE can report to the gNB the available maximum output transmit power. This information can be used by the gNB for scheduling decisions.

NOTE 2:  $P\text{-MPR}_c$  may impact the maximum uplink performance for the selected UL transmission path.

$T_{\text{REF}}$  and  $T_{\text{eval}}$  are specified in Table 6.2.4-1. For each  $T_{\text{REF}}$ , the  $P_{\text{CMAX},L,c}$  for serving cell  $c$  are evaluated per  $T_{\text{eval}}$  and given by the minimum value taken over the transmission(s) within the  $T_{\text{eval}}$ ; the minimum  $P_{\text{CMAX},L,f,c}$  over one or more  $T_{\text{eval}}$  is then applied for the entire  $T_{\text{REF}}$

**Table 6.2.4-1: Evaluation and reference periods for P<sub>cm</sub>**

| $T_{\text{REF}}$        | $T_{\text{eval}}$       | $T_{\text{eval}}$ with frequency hopping                             |
|-------------------------|-------------------------|--|
| Physical channel length | Physical channel length | $\text{Min}(T_{\text{no\_hopping}}, \text{Physical Channel Length})$ |

The measured configured maximum output power  $P_{\text{UMAX},f,c}$  shall be within the following bounds:

$$P_{\text{CMAX},L,f,c} - \text{MAX}\{T_{L,c}, T(P_{\text{CMAX},L,f,c})\} \leq P_{\text{UMAX},f,c} \leq P_{\text{CMAX},H,f,c} + T(P_{\text{CMAX},H,f,c}).$$

where the tolerance  $T(P_{\text{CMAX},f,c})$  for applicable values of  $P_{\text{CMAX},f,c}$  is specified in Table 6.2.4-1. The tolerance  $T_{L,c}$  is the absolute value of the lower tolerance for the applicable operating band as specified in Table 6.2.1-1.

NOTE 1: If all transmitted resource blocks over all component carriers are confined within  $F_{UL\_low}$  and  $F_{UL\_low} + 4$  MHz or/and  $F_{UL\_high} - 4$  MHz and  $F_{UL\_high}$ , the maximum output power requirement is relaxed by reducing the lower tolerance limit by 1.5 dB

NOTE 2:  $P_{PowerClass}$  is the maximum UE power specified without taking into account the tolerance

NOTE 3: For intra-band contiguous carrier aggregation the maximum power requirement shall apply to the total transmitted power over all component carriers (per UE).

### 6.2A.1.2 UE maximum output power for Intra-band non-contiguous CA

For intra-band non-contiguous carrier aggregation with one uplink carrier on the PCC, the requirements in clause 6.2.1 apply for power class 3 and other power classes if indicated in clause 5.5A.2. For intra-band non-contiguous carrier aggregation with two uplink carriers the maximum output power is specified in Table 6.2A.1.2-1.

NOTE 1: For transmission bandwidths confined within  $F_{UL\_low}$  and  $F_{UL\_low} + 4$  MHz or  $F_{UL\_high} - 4$  MHz and  $F_{UL\_high}$ , the maximum output power requirement is relaxed by reducing the lower tolerance limit by 1.5 dB

NOTE 3: For intra-band non-contiguous carrier aggregation the maximum power requirement shall apply to the total transmitted power over all component carriers (per UE).

### 6.2A.1.3 UE maximum output power for Inter-band CA

For inter-band downlink carrier aggregation with one uplink carrier assigned to one NR band, the transmitter power requirements in Table 6.2.1-1 apply for power class 3 and other power classes if indicated in clause 5.5A.3.

For inter-band carrier aggregation with two uplink contiguous carrier assigned to one NR band, the transmitter power requirements specified in subclause 6.2A.1.1 apply.

For inter-band carrier aggregation with two uplink non-contiguous carrier assigned to one NR band, the transmitter power requirements specified in subclause 6.2A.1.2 apply. For inter-band uplink carrier aggregation with uplink assigned to two NR bands, UE maximum output power shall be measured over all component carriers from different bands. If each band has separate antenna connectors, maximum output power is defined as the sum of maximum output power from each UE antenna connector. The period of measurement shall be at least one sub frame (1 ms). The maximum output power is specified in Table 6.2A.1.3-1.

NOTE 1: Void

NOTE 2: An uplink CA configuration in which at least one of the bands has NOTE 3 in Table 6.2.1-1 is allowed to reduce the lower tolerance limit by 1.5 dB when the transmission bandwidths of at least one of the bands is confined within  $F_{UL\_low}$  and  $F_{UL\_low} + 4$  MHz or  $F_{UL\_high} - 4$  MHz and  $F_{UL\_high}$ .

NOTE 3:  $P_{PowerClass}$  is the maximum UE power specified without taking into account the tolerance

NOTE 4: For inter-band carrier aggregation the maximum power requirement should apply to the total transmitted power over all component carriers (per UE).

NOTE 5: Power class 3 is the default power class unless otherwise stated.

NOTE 6: The UE supports PC3 within NR FDD band, and supports either PC3 or PC2 within NR TDD band.

NOTE 7: The UE that supports PC3 within an NR TDD or FDD band and supports PC2 within a second NR TDD band may signal a [HigherPowerLimitCADC] capability whereby the maximum output power indicated in the table may be exceeded in accordance with sub-clause 6.2A.4.1.3. The power classes referenced are according to the reported [powerClassPerBand] if indicated or ue-PowerClass otherwise.

If a UE supports a different power class than the default UE power class for the band combination listed in Table 6.2A.1.3-1 and the supported power class enables the higher maximum output power than that of the default power class:

- if the field of UE capability *maxUplinkDutyCycle-interBandCA-PC2* is not absent and the average percentage of uplink symbols transmitted in a certain evaluation period is larger than *maxUplinkDutyCycle-interBandCA-PC2* as defined in TS 38.331 (The exact evaluation period is no less than one radio frame); or
- if the IE *P-Max* as defined in TS 38.331 [7] is provided and set to the maximum output power of the default power class or lower;
  - shall apply all requirements for the default power class to the supported power class and set the configured transmitted power as specified in clause 6.2A.4;
- else;
  - shall apply all requirements for the supported power class and set the configured transmitted power as specified in clause 6.2A.4 (regardless of the average percentage of uplink symbols if the field of UE capability *maxUplinkDutyCycle-interBandCA-PC2* is absent).

The average percentage of uplink symbols is defined as  $50\% \times (Duty_{NR,x} / maxDuty_{NR,x} + Duty_{NR,y} / maxDuty_{NR,y})$ .  $Duty_{NR,x}$ ,  $Duty_{NR,y}$  represent the actual percentage of uplink symbols transmitted in the same evaluation period (The exact evaluation period is no less than one radio frame) for NR Band x, NR Band y respectively;  $maxDuty_{NR,x}$ ,  $maxDuty_{NR,y}$  represent the field of UE capability *maxUplinkDutyCycle-PC2-FR1* per band as defined in TS 38.331. For NR Band x or NR Band y,

- if power class of one or both of the bands within the band combination is power class 2 and the corresponding UE capability *maxUplinkDutyCycle-PC2-FR1* is absent;
  - the corresponding  $maxDuty_{NR,x}$  or  $maxDuty_{NR,y}$  is equal to 50%;
- else if the band is configured with power class 3;
  - the corresponding  $maxDuty_{NR,x}$  or  $maxDuty_{NR,y}$  is equal to 100%.

## 6.2A.2 UE maximum output power reduction for CA

## 6.2A.2.1 UE maximum output power reduction for Intra-band contiguous CA

For intra-band contiguous carrier aggregation the allowed Maximum Power Reduction (MPR) for the maximum output power in Table 6.2A.1.1-1 with non-contiguous RB allocation is specified in Table 6.2A.2.1-2 for UE power class 3 CA bandwidth classes B and C. The MPR with non-contiguous RB allocation is specified in Table 6.2A.2.1-3 for power class 2 CA bandwidth classes B and C when the signalling is absent for *dualPA-Architecture* IE, and for power class 2 CA bandwidth class C when the signalling is indicated for *dualPA-Architecture* IE. The MPR with non-contiguous RB allocation is specified in Table 6.2A.2.1-4 for power class 2 CA bandwidth classes B and C with TxD supported.

In case the modulation format is different on different component carriers then the MPR is determined by the rules applied to higher order of those modulations.

Unless otherwise specified, pi/2 BPSK in following A-MPR tables refers to both variants of pi/2 BPSK referenced in 6.2.2 tables 6.2.2-1.

NOTE 1: When 1 RB or 2 RB are allocated at the lower edge of lowest CC or upper edge of upper CC, MPR for outer is 5.5 dB.  
NOTE 2: UE indicating TxD supported

For CA bandwidth class B and bandwidth class C with contiguous RB allocation, the following parameters are defined to specify valid RB allocation ranges for Inner and Outer RB allocations:

An RB allocation is contiguous if  $L_{CRB1} = 0$  or  $L_{CRB2} = 0$  or ( $L_{CRB1} \neq 0$  and  $L_{CRB2} \neq 0$  and  $RB_{Start1} + L_{CRB1} = N_{RB1}$  and  $RB_{Start2} = 0$ ), where  $RB_{Start1}$ ,  $L_{CRB1}$ , and  $N_{RB1}$  are for CC1,  $RB_{Start2}$ ,  $L_{CRB2}$ , and  $N_{RB2}$  are for CC2, CC1 is the component carrier with lower frequency.

In contiguous CA, a contiguous allocation is an inner allocation if

$$RB_{Start,Low} \leq RB_{Start,CA} \leq RB_{Start,High}, \text{ and } N_{RB,alloc} \leq \text{ceil}(N_{RB,agg}/2),$$

where

$$RB_{Start,Low} = \max(1, \text{floor}(N_{RB,alloc}/2))$$

$$RB_{Start,High} = N_{RB,agg} - RB_{Start,Low} - N_{RB,alloc},$$

with

$$N_{RB,alloc} = L_{CRB1} \cdot 2^{\mu_1} + L_{CRB2} \cdot 2^{\mu_2}$$

$$N_{RB,alloc} = (N_{RB1} - RB_{Start1}) \cdot 2^{\mu_1} + (RB_{Start2} + L_{CRB2}) \cdot 2^{\mu_2},$$

$$N_{RB,agg} = N_{RB1} \cdot 2^{\mu_1} + N_{RB2} \cdot 2^{\mu_2}.$$

$$\text{If } L_{CRB1} = 0, RB_{Start,CA} = N_{RB1} \cdot 2^{\mu_1} + RB_{Start2} \cdot 2^{\mu_2},$$

$$\text{if } L_{CRB1} > 0, RB_{Start,CA} = RB_{Start1} \cdot 2^{\mu_1}.$$

A contiguous allocation that is not an Inner contiguous allocation is an Outer contiguous allocation.

For intra-band contiguous carrier aggregation the allowed Maximum Power Reduction (MPR) for the maximum output power in Table 6.2A.1.1-1 with non-contiguous RB allocation is specified in Table 6.2A.2.1-2 for UE power class 3 CA bandwidth classes B and C. The MPR with non-contiguous RB allocation is specified in Table 6.2A.2.1-3 for power class 2 CA bandwidth classes B and C when the signalling is absent for *dualPA-Architecture* IE, and for power class 2 CA bandwidth class C when the signalling is indicated for *dualPA-Architecture* IE. The MPR with non-contiguous RB allocation is specified in Table 6.2A.2.1-4 for power class 2 CA bandwidth classes B and C with TxD supported.

NOTE 4: UE indicating TxD supported

For CA bandwidth classes B and C with non-contiguous RB allocation, the following parameters are defined to specify valid RB allocation ranges for Inner, Outer1 and Outer2 RB allocations:

Non-Contiguous RB allocation is defined as  $RB_{Start1} + L_{CRB1} < N_{RB1}$ , or  $RB_{Start2} > 0$ , when both uplink CCs are activated and allocated with RB(s), where  $RB_{Start1}$ ,  $L_{CRB1}$ , and  $N_{RB1}$  are for CC1,  $RB_{Start2}$ ,  $L_{CRB2}$ , and  $N_{RB2}$  are for CC2, CC1 is the component carrier with lower frequency.

In contiguous CA, a non-contiguous RB allocation is a non-contiguous Inner RB allocation if the following conditions are met:

$$RB_{Start,Low} \leq RB_{Start,CA} \leq RB_{Start,High} \text{ and } N_{RB\_alloc} \leq \text{ceil}((BW_{Channel\_CA} / 3 - BW_{gap}) / 0.18\text{MHz}),$$

where

$$N_{RB\_alloc} = (N_{RB1} - RB_{Start1}) \cdot 2^{\mu_1} + (RB_{Start2} + L_{CRB2}) \cdot 2^{\mu_2}, RB_{Start,CA} = RB_{Start1} \cdot 2^{\mu_1}$$

$$RB_{Start,Low} = \max(1, \text{floor}(N_{RB\_alloc} + (BW_{gap} - BW_{GB,low}) / 0.18\text{MHz}))$$

$$RB_{Start,High} = \text{floor}((BW_{Channel\_CA} - 2 \cdot BW_{gap} - BW_{GB,low}) / 0.18\text{MHz} - 2 \cdot N_{RB\_alloc})$$

$$BW_{GB,low} = F_{offset,low} - (N_{RB1} \cdot 12 + 1) \cdot SCS_1 / 2$$

$BW_{gap}$  is the bandwidth of the gap between  $N_{RB1}$  and  $N_{RB2}$  possible allocations of CC1 and CC2 respectively.

In contiguous CA, a non-contiguous RB allocation is a non-contiguous outer 1 RB allocation if the following conditions are met:

$$RB_{Start,Low} \leq RB_{Start,CA} \leq RB_{Start,High} \text{ and } N_{RB\_alloc} \leq \text{ceil}((3 \cdot BW_{Channel\_CA} / 5 - BW_{gap}) / 0.18\text{MHz})$$

where

$$RB_{Start,Low} = \max(1, 2 \cdot N_{RB\_alloc} - \text{floor}((BW_{Channel\_CA} - 2 \cdot BW_{gap} + BW_{GB,low}) / 0.18\text{MHz})),$$

$$RB_{Start,High} = \text{floor}((2 \cdot BW_{Channel\_CA} - 3 \cdot BW_{gap} - BW_{GB,low}) / 0.18\text{MHz} - 3 \cdot N_{RB\_alloc})$$

$N_{RB\_alloc}$ ,  $RB_{Start,CA}$ ,  $BW_{gap}$  and  $BW_{GB,low}$  are as defined for the Inner region.

In contiguous CA, a non-contiguous allocation is an Outer 2 allocation if it is neither a non-contiguous Inner allocation nor an Outer 1 allocation.

## 6.2A.2.2 UE maximum output power reduction for Intra-band non-contiguous CA

### 6.2A.2.2.0 General

For intra-band non-contiguous CA, the allowed Maximum Power Reduction (MPR) for the maximum output power is specified into 2 types: MPR to meet -30dBm/MHz and -13dBm/MHz. The UE determines the MPR type as follows:

For UE indicating *dualPA-Architecture* supported

If OR ( $L_{CRB1} = 0$ ,  $L_{CRB2} = 0$ )

MPR defined in Table 6.2.2-1 and Table 6.2.2-2 for PC3 and PC2 UE respectively

Else If AND(  $F_{IM3,low\_block,low} > SEM_{-13,low}$ ,  $F_{IM3,high\_block,high} < SEM_{-13,high}$  )

MPR defined in Clause 6.2A.2.2.2.1 and Clause 6.2A.2.2.2.2 for PC3 and PC2 UE respectively.

Else

MPR defined in Clause 6.2A.2.2.1.1 and Clause 6.2A.2.2.1.2 for PC3 and PC2 UE respectively.

For UE without indicating *dualPA-Architecture* supported

If OR(  $L_{CRB1} = 0$ ,  $L_{CRB2} = 0$  )

For PC3 UE, MPR defined in Table 6.2.2-1, except for  $B < 9$  MHz where 5.5 dB MPR is used;

For PC2 UE without indicating *TxD*, MPR defined in Table 6.2.2-2 is used, except for  $B < 11.52$  MHz where 6.5 dB is used;

For PC2 UE indicating *TxD*, MPR defined in Table 6.2D.2-1 is used, except for  $B < 11.52$  MHz where the maximum value between 6.5 dB and MPR defined in Table 6.2D.2-1 is used.

Else If AND(  $F_{IM3,low\_block,low} > SEM_{-13,low}$ ,  $F_{IM3,high\_block,high} < SEM_{-13,high}$  )

MPR defined in Clause 6.2A.2.2.2.3 and Clause 6.2A.2.2.2.4 for PC3 and PC2 UE respectively.

Else

MPR defined in Clause 6.2A.2.2.1.3 and Clause 6.2A.2.2.1.4 for PC3 and PC2 UE respectively.

where

- $L_{CRB1}$  is for CC1 which is the component carrier with lower frequency
- $L_{CRB2}$  is for CC2 which is the component carrier with higher frequency
- $B = (L_{CRB1} * 12 * SCS_1 + L_{CRB2} * 12 * SCS_2) / 1,000,000$
- $F_{IM3,high\_block,high} = (2 * F_{high\_alloc,high\_edge}) - F_{low\_alloc,low\_edge}$
- $F_{IM3,low\_block,low} = (2 * F_{low\_alloc,low\_edge}) - F_{high\_alloc,high\_edge}$
- $F_{low\_alloc,low\_edge}$  is the lowermost frequency of the lower transmission bandwidth allocation.
- $F_{low\_alloc,high\_edge}$  is the uppermost frequency of the lower transmission bandwidth allocation.
- $F_{high\_alloc,low\_edge}$  is the lowermost frequency of the upper transmission bandwidth allocation.
- $F_{high\_alloc,high\_edge}$  is the uppermost frequency of the upper transmission bandwidth allocation.
- $SEM_{-13,low}$  = Threshold frequency where lower spectral emission mask below the lower channel drops from -13 dBm / MHz to -25 dBm / MHz, as specified in Clause 6.5A.2.2.2.
- $SEM_{-13,high}$  = Threshold frequency where upper spectral emission mask above the upper channel drops from -13 dBm / MHz to -25 dBm / MHz, as specified in Clause 6.5A.2.2.2.

MPRs in section 6.2A.2.2.1.3, 6.2A.2.2.1.4, 6.2A.2.2.2.3 and 6.2A.2.2.2.4 are applicable only when the Gap between the component carriers is  $\leq$  to the aggregated bandwidth and when UE declares *intraBandFreqSeparationUL-v1620* value  $\leq$  200 MHz.

The definition of the gap is between the component carriers in a spectrum that is not part of any configured component carrier that is located in between the lowest edge of the component carrier with higher center frequency and the highest edge of the component carrier with center frequency that is located lower in frequency.

#### 6.2A.2.3 UE maximum output power reduction for Inter-band CA

For inter-band carrier aggregation with one uplink carrier assigned to one NR band, the requirements in subclause 6.2.2 apply.

For inter-band carrier aggregation with two uplink contiguous carrier assigned to one NR band, the maximum output power reduction requirements for intra-band contiguous carrier aggregation in subclause 6.2A.2.1 apply for that band.

For inter-band carrier aggregation with two uplink non-contiguous carrier assigned to one NR band, the maximum output power reduction requirements for intra-band non-contiguous carrier aggregation in subclause 6.2A.2.2 apply for that band.

For inter-band carrier aggregation with uplink assigned to two NR bands, the requirements in clause 6.2.2 apply for each uplink component carrier.

For combinations of intra-band and inter-band carrier aggregation with three uplink component carriers (up to two contiguously aggregated carriers per operating band), the maximum output power reduction requirements specified in subclause 6.2.2 apply for the NR band supporting one component carrier, and for the NR band supporting two contiguous component carriers the requirements specified in subclause 6.2A.2.1 apply.

### 6.2A.3 UE additional maximum output power reduction for CA

#### 6.2A.3.1.1 UE additional maximum output power reduction for Intra-band contiguous CA

Additional emission requirements can be signalled by the network. Each additional emission requirement is associated with a unique network signalling (NS) value indicated in RRC signalling by an NR frequency band number of the applicable operating band and an associated value in the field *additionalSpectrumEmission*. Throughout this specification, the notion of indication or signalling of an NS value refers to the corresponding indication of an NR frequency band number of the applicable operating band, the IE field *freqBandIndicatorNR* and an associated value of

*additionalSpectrumEmission* in the relevant RRC information elements [7]. Relation between NR CA band and NR frequency band is specified in Table 5.2A.1-1.

To meet the additional requirements, additional maximum power reduction (A-MPR) is allowed for the maximum output power as specified in Table 6.2A.1.5-1. Unless stated otherwise, the total reduction to UE maximum output power is  $\max(\text{MPR}, \text{A-MPR})$  where MPR is defined in clause 6.2A.2.4. In absence of modulation and waveform types the A-MPR applies to all modulation and waveform types.

Table 6.2A.3.1.1-1 specifies the additional requirements with their associated network signalling values and the allowed A-MPR and applicable CA band(s) for each CA\_NS value. The mapping of NR CA band numbers and values of the *additionalSpectrumEmission* to network signalling labels is specified in Table 6.2.3.1.1-2.

- $\text{AMPR}_{\text{cc}}$  is defined as the PC3\_A2 AMPR in table 6.2.3.2-2.

### 6.2A.3.1.1.1.2 Non-contiguous allocations

For intra-band contiguous CA\_n41B and CA\_n41C and it receives IE CA\_NS\_04, the UE determines the allowed Additional Maximum Power Reduction (AMPR) for the maximum output power as specified in this clause. The AMPR is specified by  $AMPR_{IM3}$  to meet -25dBm/MHz when IM3 falls in -25dBm/MHz region of Table 6.5A.2.3.1-1 or Table 6.5A.3.3.1-1. And uses MPR for all other cases.

The UE determines the AMPR type as follows:

For all waveform types, modulations and SCS when  $F_{edge, low} - BW_{Channel\_CA} \geq 2490.5$  MHz,

if allocation is an inner or outer 1 allocation as defined in Table 6.2A.2.4-2 then A-MPR = MPR

if allocation is an outer 2 allocation as defined in Table 6.2A.2.4-2 then A-MPR = MPR-1dB

For all waveform types, modulations and SCS when  $F_{edge, low} - BW_{Channel\_CA} < 2490.5$  MHz

If  $AND( MIN(F_{IM3,low\_block,high}, SEM_{-13,low}) < F_{filter,low}, MAX( SEM_{-13,high}, F_{IM3,high\_block,low} ) > F_{filter,high} )$

if RB allocation is an inner or outer 1 allocation as defined in Table 6.2A.2.4-1 then A-MPR = MPR

if RB allocation is an outer 2 allocation as defined in Table 6.2A.2.4-2 then A-MPR = MPR-1dB

Else

A-MPR = A-MPR<sub>IM3</sub> defined in Clause 6.2A.3.1.2.2.1

where

- MPR is the MPR as defined in Table 6.2A.2.4-2 for the respective CA bandwidth class
- $F_{IM3,low\_block,high} = (2 * F_{low\_alloc,high\_edge}) - F_{high\_alloc,low\_edge}$

- $F_{low\_alloc,low\_edge}$  is the lowermost frequency of lower transmission bandwidth allocation.
- $F_{low\_alloc,high\_edge}$  is the uppermost frequency of lower transmission bandwidth allocation.
- $F_{high\_alloc,low\_edge}$  is the lowermost frequency of upper transmission bandwidth allocation.
- $F_{high\_alloc,high\_edge}$  is the uppermost frequency of upper transmission bandwidth allocation.
- $F_{filter,low} = 2480$  MHz
- $F_{filter,high} = 2745$  MHz
- $SEM_{-13,high}$  = Threshold frequency where upper spectral emission mask for upper channel drops from -13 dBm / 1MHz to -25 dBm / 1MHz, as specified in Clause 6.5A.2.3.1.1
- $SEM_{-13,low}$  = Threshold frequency where lower spectral emission mask below the lower channel drops from -13 dBm / MHz to -25 dBm / MHz, as specified in Clause 6.5A.2.3.1.1

6.2A.3.1.2 UE additional maximum output power reduction for Intra-band non-contiguous CA

6.2A.3.1.2.0 General

Table 6.2A.3.1.2-1 specifies the additional requirements with their associated network signalling values and the allowed A-MPR and applicable CA band(s) for each CA\_NC\_NS value. The mapping of NR CA band numbers and values of the *additionalSpectrumEmission* to network signalling labels is specified in Table 6.2A.3.1.2-2.

6.2A.3.1.2.1 AMPR for CA\_NC\_NS\_04 (CA\_n41(2A))

For intra-band non-contiguous CA\_n41(2A) and it receives IE CA\_NC\_NS\_04 for UE indicating *dualPA-Architecture* supported for PC3 and PC2 operation, the UE determines the allowed Additional Maximum Power Reduction (AMPR) for the maximum output power as specified in this clause. The AMPR is specified into 2 types: AMPR to meet -25dBm/MHz and -13dBm/MHz. The A-MPR defined in this clause is used instead of MPR defined in 6.2A.2.2, not additively, so CA MPR=0 when CA\_NC\_NS\_04 is signaled.

The UE determines the AMPR type as follows:

If  $\text{AND}(\text{MIN}(F_{\text{IM3,low\_block,high}}, \text{SEM}_{13,\text{low}}) < F_{\text{filter,low}}, \text{MAX}(\text{SEM}_{13,\text{high}}, F_{\text{IM3,high\_block,low}}) > F_{\text{filter,high}})$

A-MPR<sub>IM3</sub> defined in Clause 6.2A.3.2.1.2

Else

A-MPR<sub>IM3</sub> defined in Clause 6.2A.3.2.1.1

where

- L<sub>CRB1</sub> is for CC1 which is the component carrier with lower frequency
- L<sub>CRB2</sub> is for CC2 which is the component carrier with higher frequency
- $B = (\text{L}_{\text{CRB1}} * 12 * \text{SCS}_1 + \text{L}_{\text{CRB2}} * 12 * \text{SCS}_2) / 1,000,000$
- $F_{\text{IM3,low\_block,high}} = (2 * F_{\text{low\_alloc,high\_edge}}) - F_{\text{high\_alloc,low\_edge}}$
- $F_{\text{IM3,high\_block,low}} = (2 * F_{\text{high\_alloc,low\_edge}}) - F_{\text{low\_alloc,high\_edge}}$
- F<sub>low\_alloc,low\_edge</sub> is the lowermost frequency of lower transmission bandwidth allocation.
- F<sub>low\_alloc,high\_edge</sub> is the uppermost frequency of lower transmission bandwidth allocation.
- F<sub>high\_alloc,low\_edge</sub> is the lowermost frequency of upper transmission bandwidth allocation.
- F<sub>high\_alloc,high\_edge</sub> is the uppermost frequency of upper transmission bandwidth allocation.
- F<sub>filter,low</sub> = -2480 MHz-
- F<sub>filter,high</sub> = -2745 MHz-
- SEM<sub>13,high</sub> = Threshold frequency where upper spectral emission mask for upper channel drops from -13 dBm / 1MHz to -25 dBm / 1MHz, as specified in Clause 6.5A.2.3.2.
- SEM<sub>13,low</sub> = Threshold frequency where lower spectral emission mask below the lower channel drops from -13 dBm / MHz to -25 dBm / MHz, as specified in Clause 6.5A.2.3.2.

#### 6.2A.3.1.2.1.1 AMPR<sub>IM3</sub> to meet -25dBm/MHz for PC3

AMPR in this clause is for intra-band non-contiguous CA\_n41(2A) power class 3 for UEs indicating IE *dualPA-Architecture* supported. The allowed maximum output power reduction is defined as:

$AMPR$  in this clause is for intra-band non-contiguous CA\_n41(2A) power class 2 for UEs indicating IE *dualPA-Architecture* supported. The allowed maximum output power reduction is defined as:

$$AMPR_{IM3}=M_A$$

$$M_A = \begin{array}{ll} 9 & ; \quad 0 \leq B < 0.54 \\ 8 & ; \quad 0.54 \leq B < 1.08 \\ 7 & ; \quad 1.08 \leq B < 2.16 \\ 6.5 & ; \quad 2.16 \leq B < 3.24 \\ 6 & ; \quad 3.24 \leq B < 5.4 \\ 5.5 & ; \quad 5.4 \leq B \leq 10.8 \end{array}$$

Where:

### 6.2A.3.1.3 UE additional maximum output power reduction for Inter-band CA

Unless otherwise stated, for inter-band carrier aggregation with one uplink carrier assigned to one NR band, the requirements in subclause 6.2.3 apply.

Unless otherwise stated, for inter-band carrier aggregation with two uplink contiguous carrier assigned to one NR band, the additional maximum output power reduction requirements for intra-band contiguous carrier aggregation in subclause 6.2A.3.1.1 apply for that band, for inter-band carrier aggregation with two uplink non-contiguous carrier assigned to one NR band, the additional maximum output power reduction requirements for intra-band contiguous carrier aggregation in subclause 6.2A.3.1.2 apply for that band.

For combinations of intra-band and inter-band carrier aggregation with three uplink component carriers (up to two contiguously aggregated carriers per operating band), the additional maximum output power reduction requirements specified in subclause 6.2.3 apply for the NR band supporting one component carrier, and for the NR band supporting two contiguous component carriers the requirements specified in subclause 6.2A.3.1.1 apply.

Unless specified in Table 6.2A.3.1.3-1, for inter-band carrier aggregation with uplink assigned to two NR bands, the requirements in clause 6.2.3 apply only to the indicated carrier. The requirements in Table 6.2A.3.1.3-1 are specified in terms of an additional spectrum emission requirement with their associated network signalling values and the allowed A-MPR. Unless otherwise stated, the combined requirements and allowed A-MPR are applicable on both bands when both component carriers are active. Additional spurious emission requirements are signalled by the network to indicate that the UE shall meet the additional requirement for a specific deployment scenario as part of the cell handover/broadcast message.

To meet the additional requirements, additional maximum power reduction (A-MPR) is allowed for the maximum output power as specified in Table 6.2.1-1. Unless stated otherwise, the total reduction to UE maximum output power is  $\max(\text{MPR}, \text{A-MPR})$  where MPR is defined in clause 6.2.2. In case of a power class 3 UE, when IE powerBoostPi2BPSK is set to 1, power class 2 A-MPR values apply.

For almost contiguous allocations in CP-OFDM waveforms in power class 3, the allowed A-MPR defined in clause 6.2.3 is increased by  $\text{CEIL}\{ 10 \log_{10}(1 + \text{NRB}_{\text{gap}} / \text{NRB}_{\text{alloc}}), 0.5 \}$  dB, where  $\text{NRB}_{\text{gap}}$  is the total number of unallocated RBs between allocated RBs and  $\text{NRB}_{\text{alloc}}$  is the total number of allocated RBs, and the parameter LCRB is replaced by  $\text{NRB}_{\text{alloc}} + \text{NRB}_{\text{gap}}$  in specifying the RB allocation regions.

Unless otherwise specified, pi/2 BPSK in following A-MPR tables refers to both variants of pi/2 BPSK referenced in 6.2.2 tables 6.2.2-1.

The emission requirements specified in Table 6.2A.3.1.3-1 also apply for the frequency ranges that are less than  $F_{\text{OoB}}$  (MHz) in Table 6.5.3.1-1 from the edge of the channel bandwidth.

## 6.2A.4 Configured output power for CA

### 6.2A.4.1 Configured transmitted power level

#### 6.2A.4.1.1 Configured transmitted power for Intra-band contiguous CA

For uplink carrier aggregation the UE is allowed to set its configured maximum output power  $P_{\text{CMAX},c}$  for serving cell  $c$  and its total configured maximum output power  $P_{\text{CMAX}}$ .

The configured maximum output power  $P_{\text{CMAX},c}$  on serving cell  $c$  shall be set as specified in clause 6.2.4, but with  $\text{MPR}_c = \text{MPR}$  and  $\text{A-MPR}_c = \text{A-MPR}$  with  $\text{MPR}$  and  $\text{A-MPR}$  as determined by subclause 6.2A.2 and 6.2A.3, respectively. For PH reporting the following exception applies: if the UE is configured with multiple uplink serving cells, the power  $P_{\text{CMAX},c}$  used for the purpose of PH reporting on first serving cell  $c = c_1$  does not consider for computation of the PH report transmissions on a second serving cell  $c_2$  as exempted in subclause 7.7.1 in [8]. There is one power management term for the UE, denoted P-MPR, and  $\text{P-MPR}_c = \text{P-MPR}$ .

The total configured maximum output power  $P_{\text{CMAX}}$  shall be set within the following bounds:

$$P_{\text{CMAX}_L} \leq P_{\text{CMAX}} \leq P_{\text{CMAX}_H}$$

For uplink intra-band contiguous carrier aggregation when same slot pattern is used in all aggregated serving cells,

$$P_{\text{CMAX}_L} = \text{MIN}\{10 \log_{10} \sum p_{\text{EMAX},c} - \Delta T_C, P_{\text{EMAX},CA}, (P_{\text{PowerClass},CA} - \Delta P_{\text{PowerClass},CA}) - \text{MAX}(\text{MAX}(\text{MPR}, \text{A-MPR}) + \Delta T_{\text{IB},c} + \Delta T_C + \Delta T_{\text{RxsRS}}, \text{P-MPR}_c) \}$$

$$P_{\text{CMAX}_H} = \text{MIN}\{10 \log_{10} \sum p_{\text{EMAX},c}, P_{\text{EMAX},CA}, P_{\text{PowerClass},CA} - \Delta P_{\text{PowerClass},CA} \}$$

where

- $p_{\text{EMAX},c}$  is the linear value of  $P_{\text{EMAX},c}$  which is given by IE *P-Max* for serving cell  $c$  in [7];
- $P_{\text{PowerClass},CA}$  is the maximum UE power specified in Table 6.2A.1.1-1 without taking into account the tolerance;
- $\text{MPR}$  and  $\text{A-MPR}$  are specified in clause 6.2A.2 and 6.2A.3, respectively;
- $\Delta P_{\text{PowerClass},CA} = 3$  dB for a power class 2 capable UE when  $10 \log_{10} \sum p_{\text{EMAX},c}$  of 23 dBm or lower is indicated; or when  $P_{\text{EMAX},CA}$  of 23dBm or lower is indicated; or when the field of UE capability *maxUplinkDutyCycle-PC2-FRI* is absent and the percentage of total uplink symbols transmitted on all UL CCs in a certain evaluation period is larger than 50%; or when the field of UE capability *maxUplinkDutyCycle-PC2-FRI* is not absent and the percentage of total uplink symbols transmitted in a certain evaluation period is larger than *maxUplinkDutyCycle-PC2-FRI* as defined in TS 38.331 (The exact evaluation period is no less than one radio frame); otherwise  $\Delta P_{\text{PowerClass},CA} = 0$  dB;

- $\Delta T_{IB,c}$  is the additional tolerance for serving cell  $c$  as specified in clause 6.2A.4.2 for NR CA, clause 6.2C.2 for SUL, or TS 38.101-3 clause 6.2B.4.2 for EN-DC; In case the UE supports more than one of band combinations for CA, SUL or DC, and an operating band belongs to more than one band combinations then
  - a) When the operating band frequency range is  $\leq 1$  GHz, the applicable additional  $\Delta T_{IB,c}$  shall be the average value for all band combinations defined in clause 6.2A.4.2, 6.2C.2 in this specification and 6.2B.4.2 in TS 38.101-3 [3], truncated to one decimal place that apply for that operating band among the supported band combinations. In case there is a harmonic relation between low band UL and high band DL, then the maximum  $\Delta T_{IB,c}$  among the different supported band combinations involving such band shall be applied
  - b) When the operating band frequency range is  $> 1$  GHz, the applicable additional  $\Delta T_{IB,c}$  shall be the maximum value for all band combinations defined in clause 6.2A.4.2, 6.2C.2 in this specification and 6.2B.4.2 in TS 38.101-3 [3] for the applicable operating bands.
- P-MPR is the power management term for the UE;
- $\Delta T_C$  is the highest value  $\Delta T_{C,c}$  among all serving cells  $c$ ;
- $\Delta T_{RxsRS}$  is the highest value among all serving cells  $c$ ;
- $P_{EMAX,CA}$  is the value indicated by  $p$ -NR-FRI or by  $p$ -UE-FRI whichever is the smallest if both are present.

For uplink intra-band contiguous carrier aggregation, when at least one different numerology/slot pattern is used in aggregated cells, the UE is allowed to set its configured maximum output power  $P_{CMAX,c(i),i}$  for serving cell  $c(i)$  of slot numerology type  $i$ , and its total configured maximum output power  $P_{CMAX}$ .

The configured maximum output power  $P_{CMAX,c(i),i}(p)$  in slot  $p$  of serving cell  $c(i)$  on slot numerology type  $i$  shall be set within the following bounds:

$$P_{CMAX\_L,f,c(i),i}(p) \leq P_{CMAX,f,c(i),i}(p) \leq P_{CMAX\_H,f,c(i),i}(p)$$

where  $P_{CMAX\_L,f,c(i),i}(p)$  and  $P_{CMAX\_H,f,c(i),i}(p)$  are the limits for a serving cell  $c(i)$  of slot numerology type  $i$  as specified in clause 6.2.4.

The total UE configured maximum output power  $P_{CMAX}(p,q)$  in a slot  $p$  of slot numerology or symbol pattern  $i$ , and a slot  $q$  of slot numerology or symbol pattern  $j$  that overlap in time shall be set within the following bounds unless stated otherwise:

$$P_{CMAX\_L}(p,q) \leq P_{CMAX}(p,q) \leq P_{CMAX\_H}(p,q)$$

When slots  $p$  and  $q$  have different transmissions lengths and belong to different cells on different or same bands:

$$P_{CMAX\_L}(p,q) = \text{MIN} \{ 10 \log_{10} [p_{CMAX\_L,f,c(i),i}(p) + p_{CMAX\_L,f,c(i),j}(q)], P_{PowerClass,CA}, P_{EMAX,CA} \}$$

$$P_{CMAX\_H}(p,q) = \text{MIN} \{ 10 \log_{10} [p_{CMAX\_H,f,c(i),i}(p) + p_{CMAX\_H,f,c(i),j}(q)], P_{PowerClass,CA}, P_{EMAX,CA} \}$$

where  $p_{CMAX\_L,f,c(i),i}$  and  $p_{CMAX\_H,f,c(i),i}$  are the respective limits  $P_{CMAX\_L,f,c(i),i}$  and  $P_{CMAX\_H,f,c(i),i}$  expressed in linear scale.

$T_{REF}$  and  $T_{eval}$  are specified in Table 6.2A.4.1.1-0 when same and different slot patterns are used in aggregated carriers. For each  $T_{REF}$ , the  $P_{CMAX\_L}$  is evaluated per  $T_{eval}$  and given by the minimum value taken over the transmission(s) within the  $T_{eval}$ ; the minimum  $P_{CMAX\_L}$  over the one or more  $T_{eval}$  is then applied for the entire  $T_{REF}$ . The lesser of  $P_{PowerClass,CA}$  and  $P_{EMAX,CA}$  shall not be exceeded by the UE during any period of time.

**Table 6.2A.4.1.1-0:  $P_{CMAX}$  evaluation window for different slot and channel durations**

| $T_{REF}$   | $T_{eval}$              | $T_{eval}$ with frequency hopping                 |

If the UE is configured with multiple TAGs and transmissions of the UE on slot  $i$  for any serving cell in one TAG overlap some portion of the first symbol of the transmission on slot  $i + 1$  for a different serving cell in another TAG, the UE minimum of  $P_{\text{CMAX\_L}}$  for slots  $i$  and  $i + 1$  applies for any overlapping portion of slots  $i$  and  $i + 1$ . The lesser of  $P_{\text{PowerClass,CA}}$  and  $P_{\text{EMAX,CA}}$  shall not be exceeded by the UE during any period of time.

The measured maximum output power  $P_{\text{UMAX}}$  over all serving cells with same slot pattern shall be within the following range:

$$P_{\text{CMAX\_L}} - \text{MAX}\{T_{\text{L}}, T_{\text{LOW}}(P_{\text{CMAX\_L}})\} \leq P_{\text{UMAX}} \leq P_{\text{CMAX\_H}} + T_{\text{HIGH}}(P_{\text{CMAX\_H}})$$

$$P_{\text{UMAX}} = 10 \log_{10} \sum p_{\text{UMAX},c}$$

where  $p_{\text{UMAX},c}$  denotes the measured maximum output power for serving cell  $c$  expressed in linear scale. The tolerances  $T_{\text{LOW}}(P_{\text{CMAX}})$  and  $T_{\text{HIGH}}(P_{\text{CMAX}})$  for applicable values of  $P_{\text{CMAX}}$  are specified in Table 6.2A.4.1.1-1. The tolerance  $T_{\text{L}}$  is the absolute value of the lower tolerance for applicable NR CA configuration as specified in Table 6.2A.1.1-1 for intra-band carrier aggregation.

The measured maximum output power  $P_{\text{UMAX}}$  over all serving cells, when at least one slot has a different transmission numerology or slot pattern, shall be within the following range:

$$P'_{\text{CMAX\_L}} - \text{MAX}\{T_{\text{L}}, T_{\text{LOW}}(P'_{\text{CMAX\_L}})\} \leq P'_{\text{UMAX}} \leq P'_{\text{CMAX\_H}} + T_{\text{HIGH}}(P'_{\text{CMAX\_H}})$$

$$P'_{\text{UMAX}} = 10 \log_{10} \sum p'_{\text{UMAX},c}$$

where  $p'_{\text{UMAX},c}$  denotes the average measured maximum output power for serving cell  $c$  expressed in linear scale over  $T_{\text{REF}}$ . The tolerances  $T_{\text{LOW}}(P'_{\text{CMAX}})$  and  $T_{\text{HIGH}}(P'_{\text{CMAX}})$  for applicable values of  $P'_{\text{CMAX}}$  are specified in Table 6.2A.4.1.1-1 for intra-band carrier aggregation. The tolerance  $T_{\text{L}}$  is the absolute value of the lower tolerance for applicable NR CA configuration as specified in Table 6.2A.1.1-1 for inter-band carrier aggregation.

where:

$$P'_{\text{CMAX\_L}} = \text{MIN}\{ \text{MIN}\{10 \log_{10} \sum (p_{\text{CMAX\_L},f,c(i),i}), P_{\text{PowerClass,CA}}\} \text{ over all overlapping slots in } T_{\text{REF}}\}$$

### 6.2A.4.1.3 Configured transmitted power for Inter-band CA

For uplink carrier aggregation the UE is allowed to set its configured maximum output power  $P_{\text{CMAX},c}$  for serving cell  $c$  and its total configured maximum output power  $P_{\text{CMAX}}$ .

The configured maximum output power  $P_{\text{CMAX},c}$  on serving cell  $c$  shall be set as specified in clause 6.2.4, except that the UE power class for serving cell  $c$  on the specific operating band shall be determined by the [powerClassPerBand] IE [TS 38.331] as indicated for the band combination if signalled.

For uplink inter-band carrier aggregation,  $\text{MPR}_c$  and  $\text{A-MPR}_c$  apply per serving cell  $c$  and are specified in clause 6.2.2 and clause 6.2.3, respectively.  $\text{P-MPR}_c$  accounts for power management for serving cell  $c$ .  $P_{\text{CMAX},c}$  is calculated under the assumption that the transmit power is increased independently on all component carriers.

The total configured maximum output power  $P_{\text{CMAX}}$  shall be set within the following bounds:

$$P_{\text{CMAX}_L} \leq P_{\text{CMAX}} \leq P_{\text{CMAX}_H}$$

For uplink inter-band carrier aggregation with one serving cell  $c$  per operating band when same slot symbol pattern is used in all aggregated serving cells,

$$P_{\text{CMAX}_L} = \text{MIN} \left\{ 10 \log_{10} \sum \text{MIN} \left[ \frac{P_{\text{EMAX},c}}{\Delta t_{C,c}}, \frac{p_{\text{PowerClass},c}}{\text{MAX}(\text{mpr}_c \cdot \Delta \text{mpr}_c, \text{a-mpr}_c) \cdot \Delta t_{C,c} \cdot \Delta t_{\text{IB},c} \cdot \Delta t_{\text{RxsRS},c}}, \frac{p_{\text{PowerClass},c}}{\text{pmpr}_c} \right], P_{\text{EMAX},\text{CA}}, P_{\text{PowerClass},\text{CA}} - \Delta P_{\text{PowerClass},\text{CA}} \right\}$$

$$P_{\text{CMAX}_H} = \text{MIN} \left\{ 10 \log_{10} \sum p_{\text{EMAX},c}, P_{\text{EMAX},\text{CA}}, P_{\text{PowerClass},\text{CA}} - \Delta P_{\text{PowerClass},\text{CA}} \right\}$$

where

- $p_{\text{EMAX},c}$  is the linear value of  $P_{\text{EMAX},c}$  which is given by IE *P-Max* for serving cell  $c$  in [7];
- $P_{\text{PowerClass},\text{CA}}$  is the maximum UE power specified in Table 6.2A.1.3-1 without taking into account the tolerance specified in the Table 6.2A.1.3-1; If the UE indicates [HigherPowerLimitCADC] for an eligible CA configuration as specified in Table 6.2A.1.3-1 and  $\Delta P_{\text{PowerClass},\text{CA}} = 0$ ,  $P_{\text{PowerClass},\text{CA}}$  is replaced by  $10 \log_{10} \sum p_{\text{PowerClass},c}$ .
- $p_{\text{PowerClass},c}$  is the linear value of the maximum UE power for serving cell  $c$  specified in Table 6.2.1-1 according to [powerClassPerBand] if indicated or ue-PowerClass otherwise without taking into account the tolerance;
- $\Delta P_{\text{PowerClass},\text{CA}} = 3$  dB for a power class 2 capable UE when the requirements of default power class are applied as specified in sub-clause 6.2.A.1.3; otherwise  $\Delta P_{\text{PowerClass},\text{CA}} = 0$  dB;
- $\text{mpr}_c$  and  $\text{a-mpr}_c$  are the linear values of  $\text{MPR}_c$  and  $\text{A-MPR}_c$  as specified in clause 6.2.2 and clause 6.2.3, respectively;
- $\Delta \text{mpr}_c$  is the linear value of  $\Delta \text{MPR}_c$  as specified in clause 6.2.2;
- $\text{pmp}_c$  is the linear value of  $\text{P-MPR}_c$ ;
- $\Delta t_{\text{RxsRS},c}$  is the linear value of  $\Delta T_{\text{RxsRS},c}$ ;
- $\Delta t_{C,c}$  is the linear value of  $\Delta T_{C,c}$ .  $\Delta t_{C,c} = 1.41$  when NOTE 2 in Table 6.2A.1.3-1 applies for a serving cell  $c$ , otherwise  $\Delta t_{C,c} = 1$ ;
- $\Delta t_{\text{IB},c}$  is the linear value of the inter-band relaxation term  $\Delta T_{\text{IB},c}$  of the serving cell  $c$  as specified in clause 6.2A.4.2 for NR CA, clause 6.2C.2 for SUL, or TS 38.101-3 clause 6.2B.4.2 for EN-DC; otherwise  $\Delta t_{\text{IB},c} = 1$ ; In case the UE supports more than one of band combinations for CA, SUL or DC, and an operating band belongs to more than one band combinations then
  - a) When the operating band frequency range is  $\leq 1$  GHz, the applicable additional  $\Delta T_{\text{IB},c}$  shall be the average value for all band combinations defined in clause 6.2A.4.2, 6.2C.2 in this specification and 6.2B.4.2 in TS 38.101-3 [3], truncated to one decimal place that apply for that operating band among the supported band combinations. In case there is a harmonic relation between low band UL and high band DL, then the maximum  $\Delta T_{\text{IB},c}$  among the different supported band combinations involving such band shall be applied
  - b) When the operating band frequency range is  $> 1$  GHz, the applicable additional  $\Delta T_{\text{IB},c}$  shall be the maximum value for all band combinations defined in clause 6.2A.4.2, 6.2C.2 in this specification and 6.2B.4.2 in TS 38.101-3 [3] for the applicable operating bands.

- $P_{EMAX,CA}$  is the value indicated by  $p$ -NR-FRI or by  $p$ -UE-FRI whichever is the smallest if both are present. For uplink inter-band carrier aggregation with one serving cell  $c$  per operating band when at least one different numerology/slot pattern is used in aggregated cells, the UE is allowed to set its configured maximum output power  $P_{CMAX,c(i),i}$  for serving cell  $c(i)$  of slot numerology type  $i$ , and its total configured maximum output power  $P_{CMAX}$ .

$$P_{CMAX\_L,f,c(i),i}(p) \leq P_{CMAX,f,c(i),i}(p) \leq P_{CMAX\_H,f,c(i),i}(p)$$

where  $P_{CMAX\_L,f,c(i),i}(p)$  and  $P_{CMAX\_H,f,c(i),i}(p)$  are the limits for a serving cell  $c(i)$  of slot numerology type  $i$  as specified in clause 6.2.4, except that the UE power class for the serving cell  $c(i)$  on the specific operating band shall be determined by the [powerClassPerBand] IE [TS 38.331] as indicated for the band combination if signalled.

The total UE configured maximum output power  $P_{CMAX}(p,q)$  in a slot  $p$  of slot numerology or symbol pattern  $i$ , and a slot  $q$  of slot numerology or symbol pattern  $j$  that overlap in time shall be set within the following bounds unless stated otherwise:

$$P_{CMAX\_L}(p,q) \leq P_{CMAX}(p,q) \leq P_{CMAX\_H}(p,q)$$

When slots  $p$  and  $q$  have different transmissions lengths and belong to different cells on different bands:

$$P_{CMAX\_L}(p,q) = \text{MIN} \{ 10 \log_{10} [p_{CMAX\_L,f,c(i),i}(p) + p_{CMAX\_L,f,c(i),j}(q)], P_{PowerClass,CA}, P_{EMAX,CA} \}$$

For the case when  $p$  and  $q$  belong to the same band and  $k$  belongs to a different band, but  $p$ ,  $q$  and  $k$  are of the same numerology and slot patterns.

$$P_{CMAX\_L} = \text{MIN} \{ 10 \log_{10} \sum (p_{CMAX\_L, B_i}), P_{EMAX,CA}, P_{PowerClass,CA} \}$$

$$P_{CMAX\_H} = \text{MIN} \{ 10 \log_{10} \sum p_{EMAX,c}, P_{EMAX,CA}, P_{PowerClass,CA} \}$$

NOTE 1: The requirements only apply when the sub-frame and Tx-Rx timings are synchronized between the component carriers. In the absence of synchronization, the requirements are not within scope of these specifications.

NOTE 2: Only applicable for UE supporting inter-band carrier aggregation with uplink in one NR band and without simultaneous Rx/Tx.

NOTE 3: Applicable for UE supporting inter-band carrier aggregation without simultaneous Rx/Tx.

NOTE 4: The requirement is applied for UE transmitting on the frequency range of 2515-2690 MHz.

NOTE 5: The requirement is applied for UE transmitting on the frequency range of 2496-2515 MHz.

NOTE 6: The requirement is applied for UE transmitting on the frequency range of 2545-2690 MHz.

NOTE 7: The requirement is applied for UE transmitting on the frequency range of 2496-2545 MHz.

NOTE 8: The requirements only apply for UE supporting inter-band carrier aggregation with simultaneous Rx/Tx capability, and NR UL carrier frequencies are confined to 3700 MHz-3800MHz for n78 and 4400 MHz-4500MHz for n79. Simultaneous Rx/Tx capability does not apply for UEs supporting band n78 with a n77 implementation.

## 6.2B Transmitter power for NR-DC

## 6.2B.0 General

The requirements apply for inter-band NR-DC with one uplink serving cell configured per CG.

## 6.2B.1 UE maximum output power for NR-DC

For inter-band NR-DC with one uplink carrier assigned per NR band, the transmitter power requirements in clause 6.2 apply per band.

For inter-band NR-DC with one uplink assigned per band, the UE maximum output power shall be measured over all component carriers from different bands. If each band has separate antenna connectors, the maximum output power is defined as the sum of maximum output power from each UE antenna connector. The period of measurement shall be at least one sub frame (1 ms). The maximum output power is specified in Table 6.2B.1.3-1.

NOTE 1: An uplink DC configuration in which at least one of the bands has NOTE 3 in Table 6.2.1-1 is allowed to reduce the lower tolerance limit by 1.5 dB when the transmission bandwidths of at least one of the bands is confined within  $F_{UL\_low}$  and  $F_{UL\_low} + 4$  MHz or  $F_{UL\_high} - 4$  MHz and  $F_{UL\_high}$ .

NOTE 2:  $P_{PowerClass}$  is the maximum UE power specified without account of the tolerance

NOTE 3: The maximum power requirement applies to the total transmitted power over both the MCG and SCG.

NOTE 4: Power class 3 is the default power class unless otherwise stated.

## 6.2B.2 UE maximum output power reduction for NR-DC

For inter-band NR-DC with one uplink assigned per band, the requirements in clause 6.2.2 or 6.2F.2 when the uplink belongs to a spectrum sharing defined band apply for each uplink component carrier.

When inter-band NR-DC is configured with intra-band contiguous carrier aggregation in one of the cell groups or both, the requirements in clause 6.2A.2 apply for each cell group configured with uplink contiguous carrier aggregation.

## 6.2B.3 UE additional maximum output power reduction for NR-DC

For inter-band NR-DC with one uplink assigned per band, the requirements in clause 6.2.3 apply for each uplink component carrier.

For inter-band NR-DC with one uplink assigned per band, the requirements in clause 6.2.3 or 6.2F.3 when the uplink belongs to a spectrum sharing defined band apply for each uplink component carrier.

For inter-band NR-DC where the corresponding inter-band CA configuration is specified in Table 6.2A.3.1.3-1, the combined requirements and allowed A-MPR are applicable on both bands when both component carriers are active.

When inter-band NR-DC is configured with intra-band contiguous carrier aggregation in one of the cell groups or both, the requirements in clause 6.2A.3 or 6.2F.3A for shared spectrum defined bands, are applicable for each cell group configured with uplink contiguous carrier aggregation.

## 6.2B.4 Configured output power for NR-DC

### 6.2B.4.1 Configured transmitted power level for NR-DC

The UE is allowed to set its configured maximum output power  $P_{\text{CMAX},f,c,\text{MCG}}$  and  $P_{\text{CMAX},f,c,\text{SCG}}$  for the respective MCG and SCG and its total configured maximum output power for NR-DC operation  $P_{\text{Total}}^{\text{NR-DC}} = 10 \log_{10}(\hat{P}_{\text{Total}}^{\text{NR-DC}})$  with  $\hat{P}_{\text{Total}}^{\text{NR-DC}}$  as specified in clause 7.6.2 of [8]. The UE is configured with an inter-CG power sharing mode by *NR-DC-PC-mode*. The requirements apply for one uplink serving cell configured per CG and for asynchronous and synchronous NR-DC if not otherwise stated.

Unless otherwise stated, the configured maximum output power  $P_{\text{CMAX},f,c,\text{MCG}}(q)$  in physical-channel  $q$  for carrier  $f$  of serving cell  $c$  shall be set within the bounds if contained in the MCG,

$$P_{\text{CMAX},L,f,c,\text{MCG}}(q) \leq P_{\text{CMAX},f,c,\text{MCG}}(q) \leq P_{\text{CMAX},H,f,c,\text{MCG}}(q)$$

and the corresponding  $P_{\text{CMAX},L,f,c,\text{SCG}}(q)$  for a serving cell contained in the SCG,

$$P_{\text{CMAX},L,f,c,\text{SCG}}(q) \leq P_{\text{CMAX},f,c,\text{SCG}}(q) \leq P_{\text{CMAX},H,f,c,\text{SCG}}(q)$$

where  $P_{\text{CMAX},L,f,c,\text{MCG}}$ ,  $P_{\text{CMAX},H,f,c,\text{MCG}}$ ,  $P_{\text{CMAX},L,f,c,\text{SCG}}$  and  $P_{\text{CMAX},H,f,c,\text{SCG}}$  are the limits for a serving cell  $c$  as specified in clause 6.2.4 modified as follows:

$$P_{\text{CMAX},L,f,c,\text{MCG}} = \text{MIN}\{\text{MIN}(P_{\text{EMAX},c}, P_{\text{EMAX},\text{NR-DC}}, P_{\text{NR}}) - \Delta T_{C,c}, (P_{\text{PowerClass}} - \Delta P_{\text{PowerClass}}) - \text{MAX}(\text{MAX}(\text{MPR}_c + \Delta \text{MPR}_c, \text{A-MPR}_c) + \Delta T_{\text{IB},c} + \Delta T_{C,c} + \Delta T_{\text{RxsRSRS}}, P\text{-MPR}_c)\}$$

$$P_{\text{CMAX},H,f,c,\text{MCG}} = \text{MIN}\{P_{\text{EMAX},c}, P_{\text{EMAX},\text{NR-DC}}, P_{\text{NR}}, P_{\text{PowerClass}} - \Delta P_{\text{PowerClass}}\}$$

for the MCG and

$$P_{\text{CMAX},L,f,c,\text{SCG}} = \text{MIN}\{\text{MIN}(P_{\text{EMAX},c}, P_{\text{EMAX},\text{NR-DC}}, P_{\text{NR}}) - \Delta T_{C,c}, (P_{\text{PowerClass}} - \Delta P_{\text{PowerClass}}) - \text{MAX}(\text{MAX}(\text{MPR}_c + \Delta \text{MPR}_c, \text{A-MPR}_c) + \Delta T_{\text{IB},c} + \Delta T_{C,c} + \Delta T_{\text{RxsRSRS}}, P\text{-MPR}_c)\}$$

$$P_{\text{CMAX},H,f,c,\text{SCG}} = \text{MIN}\{P_{\text{EMAX},c}, P_{\text{EMAX},\text{NR-DC}}, P_{\text{NR}}, P_{\text{PowerClass}} - \Delta P_{\text{PowerClass}}\}$$

for the SCG, where

- $P_{\text{EMAX},\text{NR-DC}}$  is the value given by the field *p-UE-FRI* of the *PhysicalCellGroupConfig* IE for the MCG as defined in [7];
- $P_{\text{NR}}$  is the value given by the field *p-NR-FRI* of the *PhysicalCellGroupConfig* IE as defined in [7];
- $P_{\text{PowerClass}}$  is the maximum UE power specified in Table 6.2B.1.3-1 without taking into account the tolerance specified in the Table 6.2B.1.3-1;
- $\Delta T_{\text{IB},c}$  is the additional tolerance for serving cell  $c$  as specified in clause 6.2B.4.2 for NR-DC;  $\Delta T_{\text{IB},c} = 0$  dB otherwise;
- $\Delta T_{C,c} = 1.5$  dB when NOTE 2 in Table 6.2B.1.3-1 applies for a serving cell  $c$ , otherwise  $\Delta T_{C,c} = 0$  dB ;
- $\Delta \text{MPR}_c$  for serving cell  $c$  is specified in clause 6.2.2.
- $\Delta P_{\text{PowerClass}} = 0$  dB for a power class 3 capable UE.

When MSG or SCG are configured with intra-band contiguous carrier aggregation, then intra-band carrier aggregation  $P_{\text{CMAX},\text{CA},\text{MCG}}(q)$  and/or  $P_{\text{CMAX},\text{CA},\text{SCG}}(q)$  in physical-channel  $q$  shall be set within the bounds:

$$P_{\text{CMAX\_L,CA,MCG}}(q) \leq P_{\text{CMAX,CA,MCG}}(q) \leq P_{\text{CMAX\_H,CA,MCG}}(q)$$

for MSG, and/or

$$P_{\text{CMAX\_L,CA,SCG}}(q) \leq P_{\text{CMAX,CA,SCG}}(q) \leq P_{\text{CMAX\_H,CA,SCG}}(q)$$

for SCG, where  $P_{\text{CMAX\_L,CA,MCG}}$ ,  $P_{\text{CMAX\_H,CA,MCG}}$ ,  $P_{\text{CMAX,CA,SCG}}$  and  $P_{\text{CMAX\_H,CA,SCG}}$  are the limits for a carrier aggregation uplink as specified in clause 6.2A.4.1.1 modified as follows:

$$P_{\text{CMAX\_L,CA,MCG}} = \text{MIN}\{10 \log_{10} \sum p_{\text{EMAX,c}} - \Delta T_{\text{C}}, P_{\text{EMAX,CA}}, P_{\text{EMAX,NR-DC}}, P_{\text{NR,MCG}}, (P_{\text{PowerClass}} - \Delta P_{\text{PowerClass}}) - \text{MAX}(\text{MAX}(\text{MPR}, \text{A-MPR}) + \Delta T_{\text{IB,c}} + \Delta T_{\text{C}} + \Delta T_{\text{RxsRS}}, P\text{-MPR}_c) \}$$

$$P_{\text{CMAX\_H,CA,MCG}} = \text{MIN}\{10 \log_{10} \sum p_{\text{EMAX,c}}, P_{\text{EMAX,CA}}, P_{\text{EMAX,NR-DC}}, P_{\text{NR,MCG}}, P_{\text{PowerClass}} - \Delta P_{\text{PowerClass}} \}$$

for the MCG, and

$$P_{\text{CMAX\_L,CA,SCG}} = \text{MIN}\{10 \log_{10} \sum p_{\text{EMAX,c}} - \Delta T_{\text{C}}, P_{\text{EMAX,CA}}, P_{\text{EMAX,NR-DC}}, P_{\text{NR,SCG}}, (P_{\text{PowerClass}} - \Delta P_{\text{PowerClass}}) - \text{MAX}(\text{MAX}(\text{MPR}, \text{A-MPR}) + \Delta T_{\text{IB,c}} + \Delta T_{\text{C}} + \Delta T_{\text{RxsRS}}, P\text{-MPR}_c) \}$$

$$P_{\text{CMAX\_H,CA,SCG}} = \text{MIN}\{10 \log_{10} \sum p_{\text{EMAX,c}}, P_{\text{EMAX,CA}}, P_{\text{EMAX,NR-DC}}, P_{\text{NR,SCG}}, P_{\text{PowerClass}} - \Delta P_{\text{PowerClass}} \}$$

for SCG.

For a UE provided with *NR-DC-PC-mode = Semi-static-mode1*,

$$P_{\text{Total}}^{\text{NR-DC}} = \text{MIN}\{P_{\text{EMAX, NR-DC}}, P_{\text{PowerClass}}\} + 0.3 \text{ dB}$$

with  $P_{\text{PowerClass}}$  set to power class 3 in case the UE indicates a higher power class in any CG. The UE determines the maximum transmission power for the MCG and the SCG using the respective configured maximum power  $P_{\text{CMAX,f,c,MCG}}$  and  $P_{\text{CMAX,f,c,SCG}}$  for a single serving cell per band or  $P_{\text{CMAX,CA,MCG}}$  and/or  $P_{\text{CMAX,CA,SCG}}$  when it is configured with contiguous intra-band carrier aggregation in one or both cell groups.

If for synchronous NR-DC operation a UE is provided *NR-DC-PC-mode = Semi-static-mode2*, the  $P_{\text{Total}}^{\text{NR-DC}}$  is determined as above and

- if at least one symbol of slot  $i_1$  of the MCG/SCG is indicated as uplink or flexible to a UE by *tdd-UL-DL-ConfigurationCommon* and *tdd-UL-DL-ConfigurationDedicated*, if provided, overlaps with a symbol for any ongoing transmission overlapping with slot  $i_2$  of the SCG/MCG, the UE determines a maximum power for the transmission on the SCG/MCG overlapping with slot  $i_2$  using the configured maximum power  $P_{\text{CMAX,f,c,SCG}}$  or  $P_{\text{CMAX,f,c,MCG}}$  or  $P_{\text{CMAX,CA,MCG}}$  and/or  $P_{\text{CMAX,CA,SCG}}$  when it is configured with intra-band contiguous carrier aggregation in one or both cell groups for the SCG or MCG, respectively,
- otherwise (i.e. an ongoing transmission overlapping with slot  $i_2$  of the SCG/MCG overlaps with only semi-static downlink symbols within slot  $i_1$  of the MCG/SCG), the UE determines a maximum power for the transmission on MCG or the SCG overlapping with slot  $i_2$  using the configured maximum power as specified in clause 6.2.4 or the modified 6.2A.4.1.1 as described in this clause.

If a UE indicates a capability for dynamic power sharing between the MCG and the SCG and is provided with *NR-DC-PC-mode = Dynamic*,

$$P_{\text{Total}}^{\text{NR-DC}} = \text{MIN}\{P_{\text{EMAX, NR-DC}}, P_{\text{PowerClass}}\}$$

with  $P_{\text{PowerClass}}$  set to power class 3 in case the UE indicates a higher power class in any CG. The UE determines the maximum transmission power for the MCG and the SCG using the respective configured maximum power  $P_{\text{CMAX,f,c,MCG}}$  and  $P_{\text{CMAX,f,c,SCG}}$  or  $P_{\text{CMAX,CA,MCG}}$  and/or  $P_{\text{CMAX,CA,SCG}}$  or a combination of  $P_{\text{CMAX,f,c,MCG}}$  or  $P_{\text{CMAX,f,c,SCG}}$  and  $P_{\text{CMAX,CA,MCG}}$  or  $P_{\text{CMAX,CA,SCG}}$  when it is configured with intra-band contiguous carrier aggregation in one or both cell groups except

- if UE transmission(s) in slot  $i_1$  of the MCG or in slot  $i_2$  of the SCG do not overlap in time with any UE transmission(s) on the SCG or the MCG, respectively, the UE determines a maximum transmission power in slot  $i_1$  of the MCG or in slot  $i_2$  of the SCG using the configured maximum power as specified in clause 6.2.4 or the modified 6.2A.4.1.1 as described in this clause for the uplink contiguous carrier aggregation configured cell group.

If a UE indicates a capability to determine a total transmission power on the SCG at a first symbol of a transmission occasion on the SCG by determining transmissions on the MCG as specified in clause 7.6.2 of [8], and is provided with  $NR\text{-}DC\text{-}PC\text{-}mode = Dynamic$ ,

$$P_{Total}^{NR\text{-}DC} = \text{MIN}\{P_{EMAX, NR\text{-}DC}, P_{PowerClass}\}$$

with  $P_{PowerClass}$  set to power class 3 in case the UE indicates a higher power class in any CG. The UE determines the maximum transmission power for the MCG and the SCG using the respective configured maximum power  $P_{CMAX, f, c, MCG}$  and  $P_{CMAX, f, c, SCG}$  or  $P_{CMAX, CA, MCG}$  and/or  $P_{CMAX, CA, SCG}$  or a combination of  $P_{CMAX, f, c, MCG}$  or  $P_{CMAX, f, c, SCG}$  and  $P_{CMAX, CA, MCG}$  or  $P_{CMAX, CA, SCG}$  when it is configured with intra-band contiguous carrier aggregation in one or both cell groups.

The measured total maximum output power  $P_{UMAX}$  over both CGs measured over the transmission reference time duration is

$$P_{UMAX} = 10 \log_{10} (p_{UMAX, MCG} + p_{UMAX, SCG}),$$

where  $p_{UMAX, MCG}$  and  $p_{UMAX, SCG}$  denote the measured output power of serving cells contained in the respective MSG and SCG expressed in linear scale.

The measured total configured maximum output power  $P_{UMAX}$  shall be within the following bounds:

$$P_{CMAX, L} - T_{LOW} (P_{CMAX, L}) \leq P_{UMAX} \leq P_{CMAX, H} + T_{HIGH} (P_{CMAX, H})$$

with the tolerances  $T_{LOW}(P_{CMAX, H})$  and  $T_{HIGH}(P_{CMAX, H})$  for applicable values of  $P_{CMAX}$  specified in Table 6.2B.4.1.3-2.

When a subframe  $p$  on the MSG overlap with a physical-channel  $q$  on the SCG, then for  $P_{UMAX}$  evaluation, the subframe  $p$  on the MCG is taken as reference period  $T_{REF}$  and always considered as the reference measurement duration and the following rules are applicable.

$T_{REF}$  and  $T_{eval}$  are specified in Table 6.2B.4.1.3-1 when same or different subframe and physical-channel durations are used on the carriers. The  $P_{PowerClass}$  shall not be exceeded by the UE during any evaluation period of time.

**Table 6.2B.4.1.3-1:  $P_{CMAX}$  evaluation window**

| Transmission duration                                    | $T_{REF}$    | $T_{eval}$  |
|--|--------------|---|
| Different transmission duration in different CG carriers | MCG subframe | $\text{MIN}(T_{no\_hopping}, \text{Physical Channel Length})$ |

For each  $T_{REF}$ , the  $P_{CMAX, H}$  is evaluated per  $T_{eval}$  and given by the maximum value over the transmission(s) within the  $T_{eval}$  as follows:

$$P_{CMAX, H} = \text{MAX}\{P_{CMAX, NR\text{-}DC, H}(p, q), P_{CMAX, NR\text{-}DC, H}(p, q+1), \dots, P_{CMAX, NR\text{-}DC, H}(p, q+n)\}$$

where  $P_{CMAX, NR\text{-}DC, H}$  entries are the applicable upper limits for each overlapping scheduling unit pairs  $(p, q)$ ,  $(p, q+1)$ , up to  $(p, q+n)$  for each applicable  $T_{eval}$  duration, where  $q+n$  is the last physical-channel on the SCG overlapping with subframe  $p$  on the MCG, while  $P_{CMAX, L}$  is computed as follows:

$$P_{CMAX, L} = \text{MIN}\{P_{CMAX, NR\text{-}DC, L}(p, q), P_{CMAX, NR\text{-}DC, L}(p, q+1), \dots, P_{CMAX, NR\text{-}DC, L}(p, q+n)\}$$

where  $P_{CMAX, NR\text{-}DC, L}$  entries are the applicable lower limits for each overlapping scheduling unit pairs  $(p, q)$ ,  $(p, q+1)$  up to  $(p, q+n)$  for each applicable  $T_{eval}$  duration, where  $q+n$  is the last physical-channel on the SCG overlapping with subframe  $p$  on the MCG.

For a UE provided with  $NR\text{-}DC\text{-}PC\text{-}mode = Semi\text{-}static\text{-}mode1$  and configured with  $p_{NR, MCG} + p_{NR, SCG} \leq \hat{P}_{Total}^{NR\text{-}DC}$  with  $p_{NR, MCG}$  and  $p_{NR, SCG}$  the values of the  $P_{NR}$  for the respective MCG and SCG expressed in linear scale

$$P_{CMAX, NR\text{-}DC, L}(p, q) = 10 \log_{10} [p_{CMAX, L, MCG}(p) + p_{CMAX, L, SCG}(q)]$$

$$P_{CMAX, NR\text{-}DC, H}(p, q) = 10 \log_{10} [p_{CMAX, H, MCG}(p) + p_{CMAX, H, SCG}(q)]$$

## 6.2B.4.2 $\Delta T_{\text{IB,c}}$ for NR-DC

For inter-band NR-DC with one uplink carrier assigned per NR band, the  $\Delta T_{\text{IB,c}}$  for the corresponding inter-band CA configuration as specified in clause 6.2A.4.2 applies.

## 6.2C Transmitter power for SUL

### 6.2C.1 Configured transmitted power for SUL

When a UE is configured with both NR UL and NR SUL carriers in a serving cell with active transmission either on the UL carrier(s) or SUL carrier, the configured transmit power requirements specified in clause 6.2.4 and 6.2A.4 are applicable for the UL carrier(s) and the SUL carrier, respectively.

If a UE supports a different power class than the default UE power class for NR UL band of SUL combination and the supported power class enables the higher maximum output power for SUL combination than that of the default power class:

- if the field of UE capability *maxUplinkDutyCycle-SULcombination-PC2* is not absent and the average percentage of uplink symbols transmitted in a certain evaluation period is larger than the maximum percentage of uplink symbols that the UE indicates by *maxUplinkDutyCycle-SULcombination-PC2* as defined in TS 38.331 (The exact evaluation period is no less than one radio frame); or
- if the IE P-Max as defined in TS 38.331 [7] is provided and set to the maximum output power of the default power class or lower;
  - shall apply all requirements for the default power class to the supported power class and set the configured transmitted power as specified in clause 6.2.4;
- else;
  - shall apply all requirements for the supported power class and set the configured transmitted power as specified in clause 6.2.4 (regardless of the average percentage of uplink symbols if the field of UE capability *maxUplinkDutyCycle-interBandCA-PC2* is absent).

The average percentage of uplink symbols is defined as  $50\% \times (\text{Duty}_{\text{NR,x}} / \text{maxDuty}_{\text{NR,x}} + \text{Duty}_{\text{NR,y}} / \text{maxDuty}_{\text{NR,y}})$ .  $\text{Duty}_{\text{NR,x}}$ ,  $\text{Duty}_{\text{NR,y}}$  represent the actual percentage of uplink symbols transmitted in the same evaluation period (The exact evaluation period is no less than one radio frame) for NR Band x, NR Band y respectively  $\text{maxDuty}_{\text{NR,x}}$ ,  $\text{maxDuty}_{\text{NR,y}}$  represent the field of UE capability *maxUplinkDutyCycle-PC2-FR1* per band as defined in TS 38.331. For NR Band x or NR Band y,

- if power class of one or both of the bands within the band combination is power class 2 and the corresponding UE capability *maxUplinkDutyCycle-PC2-FR1* is absent;
  - the corresponding  $\text{maxDuty}_{\text{NR,x}}$  or  $\text{maxDuty}_{\text{NR,y}}$  is equal to 50%;
- else if the band is configured with power class 3;

- the corresponding maxDutyNR,x or maxDutyNR,y is equal to 100%.

## 6.2C.2 $\Delta T_{IB,c}$

For the UE which supports SUL band combination,  $\Delta T_{IB,c}$  in Tables below applies. Unless otherwise stated,  $\Delta T_{IB,c}$  is set to zero.

## 6.2D Transmitter power for UL MIMO

### 6.2D.1 UE maximum output power for UL MIMO

For UE with two transmit antenna connectors in closed-loop spatial multiplexing scheme, the maximum output power for any transmission bandwidth within the channel bandwidth is specified in Table 6.2D.1-1. The requirements shall be met with the UL MIMO configurations specified in Table 6.2D.1-2. For UE supporting UL MIMO, the maximum output power is defined as the sum of the maximum output power from both UE antenna connectors. The period of measurement shall be at least one sub frame (1 ms).

The requirements shall be met with the UL MIMO configurations of using 2-layer UL MIMO transmission with

codebook of  $\frac{1}{\sqrt{2}} \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$ . DCI Format for UE configured in PUSCH transmission mode for uplink single-user MIMO shall be used.

NOTE 1: The UE is configured with one SRS resource with the parameter *nrofSRS-Ports* set to 2.

For UE support uplink full power transmission (ULFPTx) for UL MIMO, the maximum output power requirements specified in Table 6.2D.1-1 shall be met with the PUSCH configurations specified in Table 6.2D.1-3, based upon UE's support of uplink full power transmission mode.

NOTE 1: The UE is configured with one SRS resource with the parameter *nrofSRS-Ports* set to 2.  
NOTE 2: TPMI index selected shall be based upon the full power TPMI reported by the UE [8, TS 38.213].  
NOTE 3: For PUSCH configured with ULFPTxModes set to Mode-1, all the transmitter requirement for CP-OFDM based modulation is not needed to be verified if the requirement for UL MIMO has been validated.

If the UE is scheduled for single antenna-port PUSCH transmission by DCI format 0\_0 or by DCI format 0\_1 for single antenna port codebook based transmission, the requirements in clause 6.2 apply for at least one antenna connector for the power class as indicated by the *ue-PowerClass* field in capability signalling with the following exception: for UEs indicating *txDiversity-r16*, the requirements in clause 6.2G for the power class indicated by the *ue-PowerClass*.

A UE indicating the feature *ul-FullPwrMode-r16* or *ul-FullPwrMode2-TPMIGroup-r16* for a band shall meet the requirement in clause 6.2 for at least one antenna connector when scheduled for single antenna-port transmission by DCI format 0\_0 or by DCI format 0\_1 for codebook-based transmission on a single antenna port.

## 6.2D.2 UE maximum output power reduction for UL MIMO

For UE with two transmit antenna connectors in closed-loop spatial multiplexing scheme, the allowed Maximum Power Reduction (MPR) for the maximum output power in Table 6.2D.1-1 is specified in Table 6.2.2-1 for PC3, Table 6.2D.2-1 for 2Tx PC2, Table 6.2D.2-2 and Table 6.2D.2-3 for PC1.5 respectively. For UE power class 1.5, the allowed maximum power reduction (MPR) defined in Table 6.2D.2-3 is in accordance with the indicated *modifiedMPR-Behavior* specified in Table L.1-1 for channel bandwidths  $\leq 100$  MHz. The requirements shall be met with UL MIMO configurations defined in Table 6.2D.1-2. For UE supporting UL MIMO, the maximum output power is defined as the sum of the maximum output power from both UE antenna connectors.

For UE support uplink full power transmission (ULFPTx) for UL MIMO except the feature *ul-FullPwrMode-r16* or *ul-FullPwrMode2-TPMIGroup-r16*, the allowed MPR for the maximum output power in Table 6.2D.1-1 is specified in Table 6.2.2-1 for PC3, Table 6.2D.2-1 when *TxD* is indicated and Table 6.2.2-2 when *TxD* is not indicated for PC2, Table 6.2D.2-2 and Table 6.2D.2-3 for PC1.5 respectively, and the requirements shall be met with the PUSCH configurations specified in Table 6.2D.1-3, based upon UE's support of uplink full power transmission mode. A UE indicating the feature *ul-FullPwrMode-r16* or *ul-FullPwrMode2-TPMIGroup-r16* for a band shall meet the maximum output power requirement with MPR according to clause 6.2.2.

The same MPR requirements shall be applicable to UE with 1-layer UL MIMO transmission (either with or without

ULPFTx) as with the UL MIMO configurations of using 2-layer UL MIMO transmission with codebook of  $\frac{1}{\sqrt{2}} \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$ .

For the UE maximum output power modified by MPR, the power limits specified in clause 6.2D.4 apply.

If UE is scheduled for single antenna-port PUSCH transmission by DCI format 0\_0 or by DCI format 0\_1 for single antenna port codebook based transmission, the corresponding requirements in clause 6.2D.1 apply for the power class as indicated by the *ue-PowerClass* field in capability signaling. A UE indicating the feature *ul-FullPwrMode-r16* or *ul-FullPwrMode2-TPMIGroup-r16* for a band shall meet the requirement in clause 6.2 with MPR according to clause 6.2.2 for at least one antenna connector when scheduled for single antenna-port transmission by DCI format 0\_0 or by DCI format 0\_1 for codebook-based transmission on a single antenna port.

### 6.2D.3 UE additional maximum output power reduction for UL MIMO

For UE with two transmit antenna connectors in closed-loop spatial multiplexing scheme, the A-MPR values specified in clause 6.2.3 shall apply to the maximum output power specified in Table 6.2D.1-1. The requirements shall be met with the UL MIMO configurations specified in Table 6.2D.1-2. For UE supporting UL MIMO, the maximum output power is defined as the sum of the maximum output power from both UE antenna connector. Unless stated otherwise, an A-MPR of 0 dB shall be used.

For UE support uplink full power transmission (ULFPTx) for UL MIMO, the A-MPR values specified in clause 6.2.3 shall apply to the maximum output power specified in Table 6.2D.1-1. The requirements shall be met with the PUSCH configurations specified in Table 6.2D.1-3, based upon UE's support of uplink full power transmission mode.

For the UE maximum output power modified by A-MPR, the power limits specified in clause 6.2D.4 apply.

If the UE is scheduled for single antenna-port PUSCH transmission by DCI format 0\_0 or by DCI format 0\_1 for single antenna port codebook-based transmission, the corresponding requirements in clause 6.2D.1 apply for the power class as indicated by the *ue-PowerClass* field in capability signaling. A UE indicating the feature *ul-FullPwrMode-r16* or *ul-FullPwrMode2-TPMIGroup-r16* for a band shall meet the requirement in clause 6.2 for at least one connector with A-MPR according to clause 6.2.3 when scheduled for single antenna-port transmission by DCI format 0\_0 or by DCI format 0\_1 for codebook-based transmission on a single antenna port.

## 6.2D.4 Configured transmitted power for UL MIMO

For UE supporting UL MIMO, the transmitted power is configured per each UE.

The definitions of configured maximum output power  $P_{\text{CMAX},c}$ , the lower bound  $P_{\text{CMAX}_L,c}$ , and the higher bound  $P_{\text{CMAX}_H,c}$  specified in clause 6.2.4 shall apply to UE supporting UL MIMO, where

- $P_{\text{PowerClass}}$ ,  $\Delta P_{\text{PowerClass}}$  and  $\Delta T_{C,c}$  are specified in clause 6.2.4 unless otherwise stated;
- $\text{MPR}_c$  is specified in clause 6.2D.2;
- $\text{A-MPR}_c$  is specified in clause 6.2D.3.

The measured configured maximum output power  $P_{\text{UMAX},c}$  for serving cell  $c$  shall be within the following bounds:

$$P_{\text{CMAX}_L,c} - \text{MAX}\{T_L, T_{\text{LOW}}(P_{\text{CMAX}_L,c})\} \leq P_{\text{UMAX},c} \leq P_{\text{CMAX}_H,c} + T_{\text{HIGH}}(P_{\text{CMAX}_H,c})$$

where  $T_{\text{LOW}}(P_{\text{CMAX}_L,c})$  and  $T_{\text{HIGH}}(P_{\text{CMAX}_H,c})$  are defined as the tolerance and applies to  $P_{\text{CMAX}_L,c}$  and  $P_{\text{CMAX}_H,c}$  separately, while  $T_L$  is the absolute value of the lower tolerance in Table 6.2D.1-1 for the applicable operating band.

For UE with two transmit antenna connectors in closed-loop spatial multiplexing scheme, the tolerance is specified in Table 6.2D.4-1. The requirements shall be met with UL MIMO configurations specified in Table 6.2D.1-2.

For UE support uplink full power transmission (ULFPTx) for UL MIMO, the tolerance is specified in Table 6.2D.4-1. The requirements shall be met with the PUSCH configurations specified in Table 6.2D.1-3, based upon UE's support of uplink full power transmission mode.

| $P_{\text{CMAX},c}$<br>(dBm)      | Tolerance<br>$T_{\text{LOW}}(P_{\text{CMAX}_L,c})$ (dB) | Tolerance<br>$T_{\text{HIGH}}(P_{\text{CMAX}_H,c})$ (dB) |
|-----------------------------------|---|--|
| $P_{\text{CMAX},c} = 26$          | 3.0   | 2.0  |

| $22 \leq P_{\text{CMAX},c} < 23$  | 5.0   | 2.0  |
| $21 \leq P_{\text{CMAX},c} < 22$  | 5.0   | 3.0  |
| $20 \leq P_{\text{CMAX},c} < 21$  | 6.0   | 4.0  |
| $16 \leq P_{\text{CMAX},c} < 20$  | 5.0   |  |
| $11 \leq P_{\text{CMAX},c} < 16$  | 6.0   |  |
| $-40 \leq P_{\text{CMAX},c} < 11$ | 7.0   |  |

If the UE is scheduled for single antenna-port PUSCH transmission by DCI format 0\_0 or by DCI format 0\_1 for single antenna port codebook-based transmission, the corresponding requirements in clause 6.2D.1 apply for the power class as indicated by the *ue-PowerClass* field in capability signaling.

For the inter-band con-current NR V2X operation, the allowed maximum power reduction (MPR) for the maximum output power shall be applied per each component carrier. The MPR requirements in clause 6.2.2 apply for NR Uu operation in licensed band, and the MPR requirements in clause 6.2E.2 apply for NR sidelink operation in licensed band or Band n47.

For the intra-band con-current NR V2X operation with contiguous RB allocation, the allowed maximum power reduction (MPR) for NR V2X physical channels PSCCH and PSSCH shall be as specified in Table 6.2E.2.3-1 for Power class 3 V2X con-current UE.

**Table 6.2E.2.3-1: MPR for contiguous RB allocation for power class 3 NR V2X con-current UE**

| Higher Modulation order between Sidelink and Uplink |        | MPR for bandwidth class B(dB) |                     |
|---|--------|-------------------------------|---------------------|
|   |        | Inner RB allocation           | Outer RB allocation |
| CP-OFDM   | QPSK   | ≤ 2.5                         | ≤ 4.5               |
|   | 16QAM  | ≤ 2.5                         | ≤ 4.5               |
|   | 64QAM  | ≤ 4.5                         | ≤ 5.0               |
|   | 256QAM | ≤ 6.0                         | ≤ 6.0               |

For bandwidth class B with contiguous RB allocation, the following parameters are defined to specify valid RB allocation ranges for Inner and Outer RB allocations:

An RB allocation is contiguous if  $L_{CRB1} = 0$  or  $L_{CRB2} = 0$  or ( $L_{CRB1} \neq 0$  and  $L_{CRB2} \neq 0$  and  $RB_{Start1} + L_{CRB1} = N_{RB1}$  and  $RB_{Start2} = 0$ ), where  $RB_{Start1}$ ,  $L_{CRB1}$ , and  $N_{RB1}$  are for SL CC1,  $RB_{Start2}$ ,  $L_{CRB2}$ , and  $N_{RB2}$  are for UL CC2. SL CC1 is the component carrier with lower frequency.

In contiguous NR V2X intra-band con-current operation, a contiguous allocation is an inner allocation if

$$RB_{Start,Low} \leq RB_{Start\_SL\&UL} \leq RB_{Start,High}, \text{ and } N_{RB\_alloc} \leq \text{ceil}(N_{RB,agg}/2),$$

where

$$RB_{Start,Low} = \max(1, \text{floor}(N_{RB\_alloc}/2))$$

$$RB_{Start,High} = N_{RB,agg} - RB_{Start,Low} - N_{RB,alloc},$$

with

$$N_{RB\_alloc} = L_{CRB1} \cdot 2^{\mu_1} + L_{CRB2} \cdot 2^{\mu_2}$$

$$N_{RB\_alloc} = (N_{RB1} - RB_{Start1}) \cdot 2^{\mu_1} + (RB_{Start2} + L_{CRB2}) \cdot 2^{\mu_2},$$

$$N_{RB,agg} = N_{RB1} \cdot 2^{\mu_1} + N_{RB2} \cdot 2^{\mu_2}.$$

$$\text{If } L_{CRB1} = 0, RB_{Start\_SL\&UL} = N_{RB1} \cdot 2^{\mu_1} + RB_{Start2} \cdot 2^{\mu_2},$$

$$\text{if } L_{CRB1} > 0, RB_{Start\_SL\&UL} = RB_{Start1} \cdot 2^{\mu_1}.$$

Where,  $\mu_1$  and  $\mu_2$  is 0, 1 and 2 for SCS of 15kHz, 30kHz and 60kHz respectively.

A contiguous allocation that is not an Inner contiguous allocation is an Outer contiguous allocation.

For the intra-band con-current NR V2X operation with non-contiguous RB allocation, the allowed maximum power reduction (MPR) for NR V2X physical channels PSCCH and PSSCH shall be as specified in Table 6.2E.2.3-2 for Power class 3 V2X con-current UE.

**Table 6.2E.2.3-2: MPR for non-contiguous RB allocation for power class 3 NR V2X con-current UE**

| Higher Modulation order between Sidelink and Uplink |        | MPR for bandwidth class B(dB) |                      |                      |
|---|--------|-------------------------------|----------------------|----------------------|
|   |        | Inner RB allocation           | Outer1 RB allocation | Outer2 RB allocation |
| CP-OFDM   | QPSK   | ≤ 2.5                         | ≤ 4.0                | ≤ 4.5                |
|   | 16QAM  | ≤ 2.5                         | ≤ 4.0                | ≤ 4.5                |
|   | 64QAM  | ≤ 4.5                         | ≤ 4.5                | ≤ 5.0                |
|   | 256QAM | ≤ 6.0                         | ≤ 6.0                | ≤ 6.0                |

For bandwidth classes B with non-contiguous RB allocation, the following parameters are defined to specify valid RB allocation ranges for Inner, Outer1 and Outer2 RB allocations:

Non-Contiguous RB allocation is defined as  $RB_{Start1} + L_{CRB1} < N_{RB1}$ , or  $RB_{Start2} > 0$ , when both SL CC and UL CC are activated and allocated with RB(s), where  $RB_{Start1}$ ,  $L_{CRB1}$ , and  $N_{RB1}$  are for SL CC1,  $RB_{Start2}$ ,  $L_{CRB2}$ , and  $N_{RB2}$  are for UL CC2. SL CC1 is the component carrier with lower frequency.

In contiguous NR V2X intra-band con-current operation, a non-contiguous RB allocation is a non-contiguous Inner RB allocation if the following conditions are met:

$$RB_{Start,Low} \leq RB_{Start,CA} \leq RB_{Start,High} \text{ and } N_{RB\_alloc} \leq \text{ceil}((BW_{Channel\_SL\&UL} / 3 - BW_{gap}) / 0.18\text{MHz}),$$

where

$$N_{RB\_alloc} = (N_{RB1} - RB_{Start1}) \cdot 2^{\mu_1} + (RB_{Start2} + L_{CRB2}) \cdot 2^{\mu_2}, RB_{Start\_SL\&UL} = RB_{Start1} \cdot 2^{\mu_1}$$

$$RB_{Start,Low} = \max(1, \text{floor}(N_{RB\_alloc} + (BW_{gap} - BW_{GB,low}) / 0.18\text{MHz}))$$

$$RB_{Start,High} = \text{floor}((BW_{Channel\_SL\&UL} - 2 \cdot BW_{gap} - BW_{GB,low}) / 0.18\text{MHz} - 2 \cdot N_{RB\_alloc})$$

$$BW_{GB,low} = F_{offset,low} - (N_{RB1} \cdot 12 + 1) \cdot SCS_1 / 2$$

$BW_{gap}$  is the bandwidth of the gap between  $N_{RB1}$  and  $N_{RB2}$  possible allocations of SL CC1 and UL CC2 respectively.

In contiguous NR V2X intra-band con-current operation, a non-contiguous RB allocation is a non-contiguous outer 1 RB allocation if the following conditions are met:

$$RB_{Start,Low} \leq RB_{Start\_SL\&UL} \leq RB_{Start,High} \text{ and } N_{RB\_alloc} \leq \text{ceil}((3 BW_{Channel\_SL\&UL} / 5 - BW_{gap}) / 0.18\text{MHz})$$

where

$$RB_{Start,Low} = \max(1, 2 \cdot N_{RB\_alloc} - \text{floor}((BW_{Channel\_SL\&UL} - 2 \cdot BW_{gap} + BW_{GB,low}) / 0.18\text{MHz})),$$

$$RB_{Start,High} = \text{floor}((2 \cdot BW_{Channel\_SL\&UL} - 3 \cdot BW_{gap} - BW_{GB,low}) / 0.18\text{MHz} - 3 \cdot N_{RB\_alloc})$$

$N_{RB\_alloc}$ ,  $RB_{Start\_SL\&UL}$ ,  $BW_{gap}$  and  $BW_{GB,low}$  are as defined for the Inner region.

In contiguous NR V2X intra-band con-current operation, a non-contiguous allocation is an Outer 2 allocation if it is neither a non-contiguous Inner allocation nor an Outer 1 allocation.

For PSFCH with single RB transmission for PC3 NR V2X intra-band con-current UE, the required MPR is specified in clause 6.2E.2.2 shall be applied.

For the allowed MPR for S-SSB transmission for PC3 NR V2X intra-band con-current UE, the required MPR is specified in clause 6.2E.2.2 shall be applied.

For the intra-band con-current NR V2X operation with contiguous RB allocation in contiguous carrier, the allowed maximum power reduction (MPR) for NR V2X physical channels PSCCH and PSSCH shall be as specified in Table 6.2E.2.3-3 for Power class 2 V2X con-current UE.

#### 6.2E.2.4 MPR for Power class 1 UE in n14

For NR Public Safety (PS) UE with contiguous allocation of PSCCH and PSSCH simultaneous transmission, the allowed NR PS UE maximum output power reduction for power class 1 UE shall be met the NR V2X MPR values specified in clause 6.2E.2.2.

### 6.2E.3 UE additional maximum output power reduction for V2X

#### 6.2E.3.1 General

For the applied maximum output power reduction is obtained by taking the maximum value of MPR requirements specified in clause 6.2E.2 and A-MPR requirements specified in current clause.

Additional emission requirements can be indicated by the network or pre-configured radio parameters. Each additional emission requirement is associated with a unique network signalling (NS) value indicated in RRC signalling by an NR frequency band number of the applicable operating band and an associated value in the field [*additionalSpectrumEmission*]. Throughout this specification, the notion of indication or signalling of an NS value refers to the corresponding indication of an NR V2X frequency band number of the applicable operating band, the IE field [*freqBandIndicatorNR*] and an associated value of [*additionalSpectrumEmission*] in the relevant RRC information elements [7].

To meet the additional requirements, additional maximum power reduction (A-MPR) is allowed for the maximum output power as specified in Table 6.2.1-1. Outer and inner allocation notation used in clause 6.2E.3 is defined in clause 6.2E.2. In absence of modulation and waveform types the A-MPR applies to all modulation and waveform types.

| NOTE 1: [additionalSpectrumEmission] corresponds to an information element of the same name defined in clause 6.3.2 of TS 38.331 [7].               |                                     |       |       |   |   |   |   |   |
| NOTE 2: For the NR PS UE in n14, same A-MPR shall be applied for PC1 PS UE since PC1 PS UE for Band n14 is not targeted for smartphone form factor. |                                     |       |       |   |   |   |   |   |

For UE with two transmit antenna connectors, the A-MPR values specified in clause 6.2E.3.2 and 6.2E.3.3 shall apply to the maximum output power specified in Table 6.2E.1.1-1. The requirements shall be met with the SL MIMO configurations specified in Table 6.2D.1-2. For UE supporting SL MIMO, the maximum output power is defined as the sum of the maximum output power from each UE antenna connector. Unless stated otherwise, an A-MPR of 0 dB shall be used.

For the UE maximum output power modified by A-MPR, the power limits specified in clause 6.2E.4 apply.

### 6.2E.3.2 A-MPR for V2X UE by NS\_33

When NS\_33 is indicated by the network or pre-configured radio parameters for NR V2X UE, the additional maximum output power reduction specified as

$$A\text{-MPR} = \text{CEIL} \{M_A, 0.5\}$$

Where  $M_A$  is defined as follows

$$M_A = A\text{-MPR}_{\text{Base}} + G_{\text{post connector}} * A\text{-MPR}_{\text{Step}}$$

$\text{CEIL}\{M_A, 0.5\}$  means rounding upwards to closest 0.5dB.

$A\text{-MPR}_{\text{Base}}$  and  $A\text{-MPR}_{\text{Step}}$  are specified in Tables 6.2E.3.2-1, 6.2E.3.2-2 is allowed when network signalling value is provided.  $A\text{-MPR}_{\text{Base}}$  is the default A-MPR value when no  $G_{\text{post connector}}$  is declared. The supported post antenna connector gain  $G_{\text{post connector}}$  is declared by the UE following the principle described in annex I in [11]. The  $A\text{-MPR}_{\text{Step}}$  is the increase in A-MPR allowance to allow UE to meet tighter conducted A-SE and A-SEM requirements with higher value of declared  $G_{\text{post connector}}$ .

For the contiguous PSSCH and PSCCH transmission when NS\_33 is indicated by the network or pre-configured radio parameters for NR V2X UE, the NR UE allow the follow A-MPR requirements specified in Table 6.2E.3.2-1 and 6.2E.3.2-2 for power class 3. And A-MPR requirements specified in Table 6.2E.3.2-2a and 6.2E.3.2-2b for power class 2 are allowed for NR V2X UE.

#### 6.2E.3.4 A-MPR for V2X con-current operation

For the inter-band con-current NR V2X operation, the allowed additional maximum power reduction (A-MPR) for the maximum output power shall be applied per each component carrier. The A-MPR requirements in clause 6.2.3 apply for NR Uu operation in licensed band, and the A-MPR requirements in clause 6.2E.3.2 and 6.2E.3.3 apply for NR sidelink operation in Band n47.

For the intra-band con-current NR V2X operation, the A-MPR requirements in [6.2E.3.4] apply for NR Uu and SL con-current operation in the licensed band.

## 6.2E.4 Configured transmitted power for V2X

### 6.2E.4.1 General

The NR V2X UE is allowed to set its configured maximum output power  $P_{\text{CMAX},f,c}$  for carrier  $f$  of serving cell  $c$  in each slot. The configured maximum output power  $P_{\text{CMAX},f,c}$  is set within the following bounds:

$$P_{\text{CMAX}_L,f,c} \leq P_{\text{CMAX},f,c} \leq P_{\text{CMAX}_H,f,c} \text{ with}$$

$$P_{\text{CMAX}_L,f,c} = \text{MIN} \{ P_{\text{EMAX},c}, P_{\text{PowerClass}, \text{V2X}} - \text{MAX}(\text{MAX}(\text{MPR}_c, \text{A-MPR}_c) + \Delta T_{\text{IB},c}, \text{P-MPR}_c), P_{\text{Regulatory},c} \}$$

$$P_{\text{CMAX}_H,f,c} = \text{MIN} \{ P_{\text{EMAX},c}, P_{\text{PowerClass}}, P_{\text{Regulatory}} \}$$

where

- $P_{\text{CMAX},f,c}$  is configured for PSSCH\PSCCH, S-SSB and PSFCH, respectively;
- For the total transmitted power  $P_{\text{CMAX},\text{PSSCH}/\text{PSCCH}}$ ,  $P_{\text{EMAX},c}$  is the value given by *IEsl-maxTxPower*, defined by TS 38.331, when the UE is not associated with a serving cell on the NR V2X carrier .
- $P_{\text{PowerClass}, \text{V2X}}$  is the maximum UE power specified in Table 6.2E.1.1-1 without taking into account the tolerance specified in the Table 6.2E.1.1-1;
- $\text{MPR}_c$  and  $\text{A-MPR}_c$  for serving cell  $c$  are specified in clause 6.2E.2 and clause 6.2E.3 for PSSCH\PSCCH, S-SSB and PSFCH, respectively;
- $\Delta T_{\text{IB},c}$ , and  $\text{P-MPR}_c$  are specified in clause 6.2.4
- $P_{\text{Regulatory},c} = 10 - G_{\text{post connector}}$  dBm the V2X UE is within the protected zone [12] of CEN DSRC tolling system and operating in Band n47;  $P_{\text{Regulatory},c} = 33 - G_{\text{post connector}}$  dBm otherwise.

The maximum output power  $P_{\text{CMAX},\text{PSSCH}}$  and  $P_{\text{CMAX},\text{PSCCH}}$  are derived from  $P_{\text{CMAX},c}$  based on 0dB PSD offset between PSSCH and PSCCH.

For the measured configured maximum output power  $P_{\text{UMAX},c}$  for NR V2X sidelink transmissions non-concurrent with NR uplink transmissions, the same requirement as in clause 6.2.4 shall be applied.

For NR V2X UE supporting SL MIMO, the transmitted power is configured per each UE.

For NR V2X UE with two transmit antenna connectors, the tolerance is specified in Table 6.2E.4.1-1. The requirements shall be met with SL MIMO configurations specified in Table 6.2D.1-2.

If the UE transmits on two antenna connectors at the same time, the tolerance is specified in Table 6.2E.4.1-1.

**Table 6.2E.4.1-1:  $P_{\text{CMAX},c}$  tolerance schemes for MIMO**

### 6.2E.4.2 Configured transmitted power for inter-band V2X con-current operation

When a UE is configured for simultaneous NR V2X sidelink and NR uplink transmissions for inter-band con-current operation, the UE is allowed to set its configured maximum output power  $P_{\text{CMAX},c,\text{NR}}$  and  $P_{\text{CMAX},c,\text{V2X}}$  for the configured NR uplink carrier and the configured NR V2X carrier, respectively, and its total configured maximum output power  $P_{\text{CMAX},c}$ .

The configured maximum output power  $P_{\text{CMAX},c,\text{NR}}(p)$  in slot  $p$  for the configured NR uplink carrier shall be set within the bounds:

$$P_{\text{CMAX},L,c,\text{NR}}(p) \leq P_{\text{CMAX},c,\text{NR}}(p) \leq P_{\text{CMAX},H,c,\text{NR}}(p)$$

where  $P_{\text{CMAX},L,c,\text{NR}}$  and  $P_{\text{CMAX},H,c,\text{NR}}$  are the limit as specified in clause 6.2E.4.1.

The configured maximum output power  $P_{\text{CMAX},c,\text{V2X}}(q)$  in slot  $q$  for the configured NR V2X carrier shall be set within the bounds:

$$P_{\text{CMAX},c,\text{V2X}}(q) \leq P_{\text{CMAX},H,c,\text{V2X}}(q)$$

where  $P_{\text{CMAX},H,c,\text{V2X}}$  is the limit as specified in clause 6.2E.4.

The total UE configured maximum output power  $P_{\text{CMAX}}(p,q)$  in a slot  $p$  of NR uplink carrier and a slot  $q$  of NR V2X sidelink that overlap in time shall be set within the following bounds for synchronous and asynchronous operation unless stated otherwise:

$$P_{\text{CMAX},L}(p,q) \leq P_{\text{CMAX}}(p,q) \leq P_{\text{CMAX},H}(p,q)$$

with

$$P_{\text{CMAX},L}(p,q) = P_{\text{CMAX},L,c,\text{NR}}(p)$$

$$P_{\text{CMAX},H}(p,q) = 10 \log_{10} [p_{\text{CMAX},H,c,\text{NR}}(p) + p_{\text{CMAX},H,c,\text{V2X}}(q)]$$

where  $p_{\text{CMAX},H,c,\text{V2X}}$  and  $p_{\text{CMAX},H,c,\text{NR}}$  are the limits  $P_{\text{CMAX},H,c,\text{V2X}}(q)$  and  $P_{\text{CMAX},H,c,\text{NR}}(p)$  expressed in linear scale.

The measured total maximum output power  $P_{\text{UMAX}}$  over both the NR uplink and NR V2X carriers is

$$P_{\text{UMAX}} = 10 \log_{10} [p_{\text{UMAX},c,\text{NR}} + p_{\text{UMAX},c,\text{V2X}}],$$

where  $p_{\text{UMAX},c,\text{NR}}$  denotes the measured output power of serving cell  $c$  for the configured NR uplink carrier, and  $p_{\text{UMAX},c,\text{V2X}}$  denotes the measured output power for the configured NR V2X carrier expressed in linear scale.

When a UE is configured for synchronous V2X sidelink and uplink transmissions,

$$P_{\text{CMAX},L}(p,q) - T_{\text{LOW}}(P_{\text{CMAX},L}(p,q)) \leq P_{\text{UMAX}} \leq P_{\text{CMAX},H}(p,q) + T_{\text{HIGH}}(P_{\text{CMAX},H}(p,q))$$

where  $P_{\text{CMAX},L}(p,q)$  and  $P_{\text{CMAX},H}(p,q)$  are the limits for the pair  $(p,q)$  and with the tolerances  $T_{\text{LOW}}(P_{\text{CMAX}})$  and  $T_{\text{HIGH}}(P_{\text{CMAX}})$  for applicable values of  $P_{\text{CMAX}}$  specified in Table 6.2E.4.1-1..  $P_{\text{CMAX},L}$  may be modified for any overlapping portion of slots  $(p,q)$  and  $(p+1, q+1)$ .

### 6.2E.4.3 Configured transmitted power for intra-band V2X con-current operation

For intra-band con-current operation, if transmission of Uu and SL does not overlap in time, the configured output power  $P_{\text{CMAX},c}$  specified in clause 6.2E.4.1 and 6.2.4 apply for SL and Uu transmission respectively; otherwise, if transmission of Uu and SL overlap in time, the configured maximum output power  $P_{\text{CMAX},c}$  on serving cell  $c$  for SL and Uu shall be set as specified in clause 6.2E.4.1 and in clause 6.2.4, but with  $\text{MPR}_c = \text{MPR}$  and  $\text{A-MPR}_c = \text{A-MPR}$  with MPR and A-MPR as determined by subclause 6.2E.2.3 for both PC3 and PC2 and subclause 6.2E.3.4, respectively. There is one power management term for the UE, denoted P-MPR, and  $\text{P-MPR}_c = \text{P-MPR}$ .

The total configured maximum output power  $P_{\text{CMAX}}$  shall be set within the following bounds:

$$P_{\text{CMAX},L} \leq P_{\text{CMAX}} \leq P_{\text{CMAX},H}$$

For intra-band concurrent operation when same slot pattern is used in all aggregated serving cells,

$$P_{\text{CMAX},L} = \text{MIN}\{10 \log_{10} \sum p_{\text{EMAX},c} - \Delta T_C, P_{\text{PowerClass,con-current}} - \text{MAX}(\text{MAX}(\text{MPR}, \text{A-MPR}) + \Delta T_{\text{IB},c} + \Delta T_C, \text{P-MPR})\}$$

$$P_{\text{CMAX},H} = \text{MIN}\{10 \log_{10} \sum p_{\text{EMAX},c}, P_{\text{PowerClass,co-current}}\}$$

where

- $p_{\text{EMAX},c}$  is the linear value of  $P_{\text{EMAX},c}$  which is given by IE *P-Max* for Uu serving cell  $c$  or by and [*sl-MaxTransPower*] for SL defined in [7];

- $P_{\text{PowerClass,con-current}}$  is the maximum UE power specified in Table [6.2E.1.2-2] without taking into account the tolerance;
- MPR and A-MPR are specified in clause 6.2E.2 and 6.2E.3, respectively;
- $\Delta T_{\text{IB},c}$  is the additional tolerance for serving cell  $c$  as specified in clause [6.2E.4.3]
- P-MPR is the power management term for the UE;
- $\Delta T_{\text{C}}$  is the highest value  $\Delta T_{\text{C},c}$  among all serving cells  $c$ ;

For intra-band concurrent operation, when at least one different numerology/slot pattern is used in aggregated cells, the UE is allowed to set its configured maximum output power  $P_{\text{CMAX},c(i),i}$  for serving cell  $c(i)$  of slot numerology type  $i$ , and its total configured maximum output power  $P_{\text{CMAX}}$ .

The configured maximum output power  $P_{\text{CMAX},c(i),i}(p)$  in slot  $p$  of serving cell  $c(i)$  on slot numerology type  $i$  shall be set within the following bounds:

$$P_{\text{CMAX}_L,f,c(i),i}(p) \leq P_{\text{CMAX},f,c(i),i}(p) \leq P_{\text{CMAX}_H,f,c(i),i}(p)$$

where  $P_{\text{CMAX}_L,f,c(i),i}(p)$  and  $P_{\text{CMAX}_H,f,c(i),i}(p)$  are the limits for a serving cell  $c(i)$  of slot numerology type  $i$  as specified in clause 6.2.4.

The total UE configured maximum output power  $P_{\text{CMAX}}(p,q)$  in a slot  $p$  of slot numerology or symbol pattern  $i$ , and a slot  $q$  of slot numerology or symbol pattern  $j$  that overlap in time shall be set within the following bounds unless stated otherwise:

$$P_{\text{CMAX}_L}(p,q) \leq P_{\text{CMAX}}(p,q) \leq P_{\text{CMAX}_H}(p,q)$$

When slots  $p$  and  $q$  have different transmissions lengths and belong to different cells on same band for intra-band operation:

$$P_{\text{CMAX}_L}(p,q) = \text{MIN} \{ 10 \log_{10} [p_{\text{CMAX}_L,f,c(i),Uu,i}(p) + p_{\text{CMAX}_L,f,c(i),V2X,j}(q)], P_{\text{PowerClass,con-current}} \}$$

$$P_{\text{CMAX}_H}(p,q) = \text{MIN} \{ 10 \log_{10} [p_{\text{CMAX}_H,f,c(i),Uu,i}(p) + p_{\text{CMAX}_H,f,c(i),V2X,j}(q)], P_{\text{PowerClass,con-current}} \}$$

where  $p_{\text{CMAX}_L,f,c(i),Uu,i}$  and  $p_{\text{CMAX}_H,f,c(i),Uu,i}$  are the respective limits  $P_{\text{CMAX}_L,f,c(i),Uu,i}$  and  $P_{\text{CMAX}_H,f,c(i),Uu,i}$  expressed in linear scale.

$T_{\text{REF}}$  and  $T_{\text{eval}}$  are specified in Table 6.2E.4.3-1 when same and different slot patterns are used in aggregated carriers. For each  $T_{\text{REF}}$ , the  $P_{\text{CMAX}_L}$  is evaluated per  $T_{\text{eval}}$  and given by the minimum value taken over the transmission(s) within the  $T_{\text{eval}}$ ; the minimum  $P_{\text{CMAX}_L}$  over the one or more  $T_{\text{eval}}$  is then applied for the entire  $T_{\text{REF}}$ . The lesser of  $P_{\text{PowerClass,Concurrent}}$  and  $P_{\text{EMAX,Concurrent}}$  shall not be exceeded by the UE during any period of time.

**Table 6.2E.4.3-1:  $P_{\text{CMAX}}$  evaluation window for different slot and channel durations**

| $T_{\text{REF}}$  | $T_{\text{eval}}$       | $T_{\text{eval}}$ with frequency hopping                 |
|---|-------------------------|--|

The measured maximum output power  $P_{\text{UMAX}}$  over all serving cells with same slot pattern shall be within the following range:

$$P_{\text{CMAX}_L} - \text{MAX}\{T_L, T_{\text{LOW}}(P_{\text{CMAX}_L})\} \leq P_{\text{UMAX}} \leq P_{\text{CMAX}_H} + T_{\text{HIGH}}(P_{\text{CMAX}_H})$$

$$P_{\text{UMAX}} = 10 \log_{10} \sum P_{\text{UMAX},c}$$

where  $p_{\text{UMAX},c}$  denotes the measured maximum output power for serving cell  $c$  expressed in linear scale. The tolerances  $T_{\text{LOW}}(P_{\text{CMAX}})$  and  $T_{\text{HIGH}}(P_{\text{CMAX}})$  for applicable values of  $P_{\text{CMAX}}$  are specified in Table 6.2E.4.3-2. The tolerance  $T_L$  is the absolute value of the lower tolerance for applicable NRV2X concurrent operation configuration as specified in Table 6.2A.1.3-1-2 for inter-band NR V2X concurrent operation.

The measured maximum output power  $P_{\text{UMAX}}$  over all serving cells, when at least one slot has a different transmission numerology or slot pattern, shall be within the following range:

$$P'_{\text{CMAX}_L} - \text{MAX}\{T_L, T_{\text{LOW}}(P'_{\text{CMAX}_L})\} \leq P'_{\text{UMAX}} \leq P'_{\text{CMAX}_H} + T_{\text{HIGH}}(P'_{\text{CMAX}_H})$$

$$P'_{\text{UMAX}} = 10 \log_{10} \sum p'_{\text{UMAX},c}$$

where  $p'_{\text{UMAX},c}$  denotes the average measured maximum output power for serving cell  $c$  expressed in linear scale over  $T_{\text{REF}}$ . The tolerances  $T_{\text{LOW}}(P'_{\text{CMAX}})$  and  $T_{\text{HIGH}}(P'_{\text{CMAX}})$  for applicable values of  $P'_{\text{CMAX}}$  are specified in Table 6.2E.4.3-2 for intra-band carrier aggregation. The tolerance  $T_L$  is the absolute value of the lower tolerance for applicable NR V2X concurrent operation configuration as specified in Table 6.2E.1.2-1 for inter-band carrier aggregation.

where:

$$P'_{\text{CMAX}_L} = \text{MIN}\{ \text{MIN}\{10 \log_{10} \sum (p_{\text{CMAX}_L,f,c(i),i}), P_{\text{PowerClass,concurrent}}\} \text{ over all overlapping slots in } T_{\text{REF}}\}$$

$$P'_{\text{CMAX}_H} = \text{MAX}\{ \text{MIN}\{10 \log_{10} \sum p_{\text{EMAX},c}, P_{\text{PowerClass,concurrent}}\} \text{ over all overlapping slots in } T_{\text{REF}}\}$$

A UE supporting sidelink operation can be configured by higher layers with one or more sidelink resource pools. A sidelink resource pool can be associated with either sidelink resource allocation mode 1 or sidelink resource allocation mode 2.

For sidelink resource allocation in either mode 1 or mode 2, if UE is in RRC\_CONNECTED state, and the preparation procedure time for transmission of sidelink physical channel is available before  $T_{\text{proc},2}$  of PUSCH preparation procedure time, for transmission of Uu and SL not overlap in time, the configured output power  $P_{\text{CMAX},c}$  specified in clause 6.2E.4.1 and in clause 6.2.4 apply for SL and Uu transmission respectively, otherwise, the configured maximum output power  $P_{\text{CMAX}}$  specified in this clause shall apply.

For sidelink resource allocation mode 2, if UE is in RRC\_IDLE state, sidelink transmission is based on pre-configured sidelink resource pool, the UE configured output power is determined by sidelink only, where the configured output power specified in clause 6.2E.4.1 apply.

For sidelink resource allocation mode 2, if UE is in RRC\_INACTIVE state, and Uu does not support SDT, the configured output power specified in clause 6.2E.4.1 apply, otherwise, the configured maximum output power  $P_{\text{CMAX}}$  in this clause shall apply.

## 6.2F Transmitter power for shared spectrum channel access

The UE operating shall meet the following additional requirements for maximum mean transmission power density specified in Table 6.2F.1-2 when NS is signaled and when transmission overlaps with any portion of the specified frequency range. In case transmission overlaps multiple frequency ranges, the lowest power density requirement applies.

## 6.2F.1A UE maximum output power for CA

### 6.2F.1A.1 UE maximum output power for inter-band CA

For inter-band carrier aggregation with one uplink carrier assigned to one NR band, the transmitter power requirements in clause 6.2 apply.

For inter-band carrier aggregation with uplink assigned to two NR bands and including one of the bands listed in Table 6.2F.1-1, UE maximum output power shall be measured over all component carriers from different bands. If each band has separate antenna connectors, maximum output power is defined as the sum of maximum output power from each

UE antenna connector. The period of measurement shall be at least one sub frame (1 ms). The maximum output power is specified in Table 6.2A.1.3-1.

**Table 6.2F.1A.1-1 void**

## 6.2F.1D UE maximum output power for UL MIMO

For UE with two transmit antenna connectors in closed-loop spatial multiplexing scheme, the maximum output power for any transmission bandwidth within the channel bandwidth is specified in Table 6.2F.1D-1. The requirements shall be met with the UL MIMO configurations specified in Table 6.2D.1-2. For UE supporting UL MIMO, the maximum output power is defined as the sum of the maximum output power from both UE antenna connectors. The period of measurement shall be at least one sub frame (1 ms).

The requirements shall be met with the UL MIMO configurations of using 2-layer UL MIMO transmission with

codebook of  $\frac{1}{\sqrt{2}} \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$ . DCI Format for UE configured in PUSCH transmission mode for uplink single-user MIMO shall be used.

For UE supporting uplink full power transmission (ULFPTx) for UL MIMO, the maximum output power requirements specified in Table 6.2F.1D-1 shall be met with the PUSCH configurations specified in Table 6.2D.1-3, based upon UE's support of uplink full power transmission mode.

## 6.2F.2 UE maximum output power reduction

## 6.2F.2D UE maximum output power reduction for UL MIMO

For UE with two transmit antenna connectors in closed-loop spatial multiplexing scheme, the allowed Maximum Power Reduction (MPR) for the maximum output power in Table 6.2F.1D-1 is specified in Table 6.2F.2-1. The requirements shall be met with UL MIMO configurations defined in Table 6.2D.1-2. For UE supporting UL MIMO, the maximum output power is defined as the sum of the maximum output power from both UE antenna connectors.

For UE supporting uplink full power transmission (ULFPTx) for UL MIMO, the allowed MPR for the maximum output power in Table 6.2F.1D-1 is specified in Table 6.2F.2-1 for power class 5, and the requirements shall be met with the PUSCH configurations specified in Table 6.2D.1-3, based upon UE's support of uplink full power transmission mode.

The same MPR requirements shall be applicable to UE with 1-layer UL MIMO transmission (either with or without

ULFPTx) as with the UL MIMO configurations of using 2-layer UL MIMO transmission with codebook of  $\frac{1}{\sqrt{2}} \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$ .

For the UE maximum output power modified by MPR, the power limits specified in clause 6.2D.4 apply.

If UE is scheduled for single antenna-port PUSCH transmission by DCI format 0\_0 or by DCI format 0\_1 for single antenna port codebook based transmission, the requirements in clause 6.2F.2 apply for the power class as indicated by the *ue-PowerClass* field in capability signaling.

## 6.2F.3 UE additional maximum output power reduction

### 6.2F.3.1 General

Additional emission requirements can be signalled by the network. Each additional emission requirement is associated with a unique network signalling (NS) value indicated in RRC signalling by an NR frequency band number of the applicable operating band and an associated value in the field *additionalSpectrumEmission*. Throughout this specification, the notion of indication or signalling of an NS value refers to the corresponding indication of an NR frequency band number of the applicable operating band, the IE field *freqBandIndicatorNR* and an associated value of *additionalSpectrumEmission* in the relevant RRC information elements [7].

To meet the additional requirements, additional maximum power reduction (A-MPR) is allowed for the maximum output power as specified in Table 6.2F.1-1. Unless stated otherwise, the total reduction to UE maximum output power is  $\max(\text{MPR}, \text{A-MPR})$  where MPR is defined in clause 6.2F.2.

Table 6.2F.3.1-1 specifies the additional requirements with their associated network signalling values and the allowed A-MPR and applicable operating band(s) for each NS value. The mapping of NR frequency band numbers and values of the *additionalSpectrumEmission* to network signalling labels is specified in Table 6.2F.3.1-1A.

NOTE 1: Full allocation A-MPR applies when all RB's in a 20 MHz channel or all RB's in all sub-bands for wideband operation are fully allocated and all sub-bands are transmitted. When not all sub-bands within the channel are transmitted, the A-MPR associated with the channel bandwidth according to the bandwidth of the contiguously transmitted sub-bands and according to the allocation type applies.

## 6.2F.3A UE additional maximum output power reduction for CA

### 6.2F.3A.1 UE additional maximum output power reduction for inter-band CA

For inter-band carrier aggregation with uplink assigned to two bands, the requirements in clause 6.2.3 apply for the NR uplink carrier and clause 6.2F.3 for the carrier operating with shared spectrum access.

## 6.2F.3D UE additional maximum output power reduction for UL MIMO

For UE with two transmit antenna connectors in closed-loop spatial multiplexing scheme, the A-MPR values specified in clause 6.2F.3 shall apply to the maximum output power specified in Table 6.2F.1D-1. The requirements shall be met with the UL MIMO configurations specified in Table 6.2D.1-2. For UE supporting UL MIMO, the maximum output power is defined as the sum of the maximum output power from both UE antenna connector.

For UE supporting uplink full power transmission (ULFPTx) for UL MIMO, the A-MPR values specified in clause 6.2F.3 shall apply to the maximum output power specified in Table 6.2F.1D-1. The requirements shall be met with the PUSCH configurations specified in Table 6.2D.1-3, based upon UE's support of uplink full power transmission mode.

For the UE maximum output power modified by A-MPR, the power limits specified in clause 6.2D.4 apply.

If UE is scheduled for single antenna-port PUSCH transmission by DCI format 0\_0 or by DCI format 0\_1 for single antenna port codebook based transmission, the requirements in clause 6.2.4 apply for the power class as indicated by the *ue-PowerClass* field in capability signaling.

## 6.2F.4 Configured transmitted power

The requirements for configured maximum output power in clause 6.2.4 apply.

### 6.2F.4D Configured transmitted power UL MIMO

For UE supporting UL MIMO, the transmitted power is configured per each UE.

The definitions of configured maximum output power  $P_{\text{CMAX},c}$ , the lower bound  $P_{\text{CMAX}_{L,c}}$ , and the higher bound  $P_{\text{CMAX}_{H,c}}$  specified in clause 6.2.4 shall apply to UE supporting UL MIMO, where

- $P_{\text{PowerClass}}$ ,  $\Delta P_{\text{PowerClass}}$  and  $\Delta T_{C,c}$  are specified in clause 6.2.4 unless otherwise stated;
- $\text{MPR}_c$  is specified in clause 6.2F.2D;
- $\text{A-MPR}_c$  is specified in clause 6.2F.3.

The measured configured maximum output power  $P_{\text{UMAX},c}$  for serving cell  $c$  shall be within the following bounds:

$$P_{\text{CMAX}_{L,c}} - \text{MAX}\{T_L, T_{\text{LOW}}(P_{\text{CMAX}_{L,c}})\} \leq P_{\text{UMAX},c} \leq P_{\text{CMAX}_{H,c}} + T_{\text{HIGH}}(P_{\text{CMAX}_{H,c}})$$

where  $T_{\text{LOW}}(P_{\text{CMAX}_{L,c}})$  and  $T_{\text{HIGH}}(P_{\text{CMAX}_{H,c}})$  are defined as the tolerance and applies to  $P_{\text{CMAX}_{L,c}}$  and  $P_{\text{CMAX}_{H,c}}$  separately, while  $T_L$  is the absolute value of the lower tolerance in Table 6.2D.1-1 for the applicable operating band.

For UE with two transmit antenna connectors in closed-loop spatial multiplexing scheme, the tolerance is specified in Table 6.2D.4-1. The requirements shall be met with UL MIMO configurations specified in Table 6.2D.1-2.

For UE supporting uplink full power transmission (ULFPTx) for UL MIMO, the tolerance is specified in Table 6.2D.4-1. The requirements shall be met with the PUSCH configurations specified in Table 6.2D.1-3, based upon UE's support of uplink full power transmission mode.

## 6.3.2 Transmit OFF power

Transmit OFF power is defined as the mean power in the channel bandwidth when the transmitter is OFF. The transmitter is considered OFF when the UE is not allowed to transmit on any of its ports..

## 6.3.3 Transmit ON/OFF time mask

### 6.3.3.1 General

The transmit power time mask defines the transient period(s) allowed

- between transmit OFF power as defined in clause 6.3.2 and transmit ON power symbols (transmit ON/OFF)
- between continuous ON-power transmissions with power change or RB hopping is applied. When a UE signals the transient period capability, the transient period value ( $tp$ ) can be 2, 4, or 7 $\mu$ s. If no capability is signalled, the default transient period value of 10 $\mu$ s applies.

In case of RB hopping, and in following figures where  $tp_{start}$  is specified, the transient period is shared symmetrically when the transient period is 10 $\mu$ s. If the UE signals a transient period ( $tp$ ) of 2, 4 or 7 $\mu$ s, the transient period start position is given by  $tp_{start}$  in Table 6.3.3.1-1.

Table 6.3.3.1-1  $tp_{start}$  values

| $tp$<br>( $\mu s$ )  | $tp_{start}$ ( $\mu s$ ) |
|--|--------------------------|
| 2  | -0.5                     |
| 4  | -1                       |
| 7  | -2.7                     |
| NOTE 1: Negative values mean that the transient period starts before the symbol boundary |                          |

Unless otherwise stated the requirements in clause 6.5 apply also in transient periods.

In the following clauses, following definitions apply:

- A slot or long subslot transmission is a transmission with more than 2 symbols.
- A short subslot transmission is a transmission with 1 or 2 symbols.

### 6.3.3.2 General ON/OFF time mask

The general ON/OFF time mask defines the observation period between transmit OFF and ON power and between transmit ON and OFF power for each SCS. ON/OFF scenarios include: contiguous, and non-contiguous transmission, etc

The OFF power measurement period is defined in a duration of at least one slot excluding any transient periods. The ON power is defined as the mean power over one slot excluding any transient period.

### 6.3.3.3 Transmit power time mask for slot and short or long subslot boundaries

The above transient period applies to all the transmit CCs in CA with the CC sounding SRS. UE RF requirements do not apply during this transient period.

### 6.3.3.7 PUSCH-PUCCH and PUSCH-SRS time masks

The PUCCH/PUSCH/SRS time mask defines the observation period between sounding reference symbol (SRS) and an adjacent PUSCH/PUCCH symbol and subsequent UL transmissions. The time masks apply for all types of frame structures and their allowed PUCCH/PUSCH/SRS transmissions unless otherwise stated.

**Figure 6.3.3.7-1: PUCCH/PUSCH/SRS time mask when there is a transmission before or after or both before and after SRS, when sounded on the same antenna (Ant 'x')**

**Figure 6.3.3.7-2: PUCCH/PUSCH/SRS time mask when there is a transmission before or after or both before and after SRS, when sounded on a different antenna (Ant 'x' and Ant 'y' are different antenna ports)**

**Figure 6.3.3.7-3: Consecutive long subslot transmission and long subslot transmission time mask**

This transient period of 15 μsec applies before and after SRS transmission to all the transmit CCs in CA with the CC sounding SRS. UE RF requirements do not apply during this transient period.

When there is no transmission preceding SRS transmission or succeeding SRS transmission, then the same time mask applies as shown in Figure 6.3.3.7-1.

### 6.3.4 Power control

#### 6.3.4.1 General

The requirements on power control accuracy apply under normal conditions.

#### 6.3.4.2 Absolute power tolerance

The absolute power tolerance is the ability of the UE transmitter to set its initial output power to a specific value for the first sub-frame (1 ms) at the start of a contiguous transmission or non-contiguous transmission with a transmission gap larger than 20 ms. The tolerance includes the channel estimation error.

The minimum requirement specified in Table 6.3.4.2-1 apply in the power range bounded by the minimum output power as specified in clause 6.3.1 and the maximum output power as specified in clause 6.2.1.

**Table 6.3.4.2-1: Absolute power tolerance**

| Conditions | Tolerance |
|------------|-----------|
| Normal     | ± 9.0 dB  |

#### 6.3.4.3 Relative power tolerance

The relative power tolerance is the ability of the UE transmitter to set its output power in a target sub-frame (1 ms) relatively to the power of the most recently transmitted reference sub-frame (1 ms) if the transmission gap between these sub-frames is less than or equal to 20 ms.

The minimum requirements specified in Table 6.3.4.3-1 apply when the power of the target and reference sub-frames are within the power range bounded by the minimum output power as defined in clause 6.3.1 and the measured P<sub>UMAX</sub> as defined in clause 6.2.1.

To account for RF Power amplifier mode changes, 2 exceptions are allowed for each of two test patterns. The test patterns are a monotonically increasing power sweep and a monotonically decreasing power sweep over a range bounded by the requirements of minimum power and maximum power specified in clauses 6.3.1 and 6.2.1, respectively. For those exceptions, the power tolerance limit is a maximum of ± 6.0 dB in Table 6.3.4.3-1.

Table 6.3.4.3-1: Relative power tolerance

| Power step $\Delta P$<br>(Up or down)<br>(dB)  | All combinations<br>of PUSCH and<br>PUCCH<br>transitions (dB) | All combinations of<br>PUSCH/PUCCH and<br>SRS transitions<br>between sub-<br>frames (dB) | PRACH (dB) |
|--|---|--|------------|
| $\Delta P < 2$   | $\pm 2.0$ (NOTE)  | $\pm 2.5$  | $\pm 2.0$  |
| $2 \leq \Delta P < 3$  | $\pm 2.5$   | $\pm 3.5$  | $\pm 2.5$  |
| $3 \leq \Delta P < 4$  | $\pm 3.0$   | $\pm 4.5$  | $\pm 3.0$  |
| $4 \leq \Delta P < 10$   | $\pm 3.5$   | $\pm 5.5$  | $\pm 3.5$  |
| $10 \leq \Delta P < 15$  | $\pm 4.0$   | $\pm 7.0$  | $\pm 4.0$  |
| $15 \leq \Delta P$   | $\pm 5.0$   | $\pm 8.0$  | $\pm 5.0$  |
| NOTE: For PUSCH to PUSCH transitions with the allocated resource blocks fixed in frequency and no transmission gaps other than those generated by downlink subframes, DwPTS fields or Guard Periods: for a power step $\Delta P \leq 1$ dB, the relative power tolerance for transmission is $\pm 0.7$ dB. |   |  |            |

#### 6.3.4.4 Aggregate power tolerance

The aggregate power control tolerance is the ability of the UE transmitter to maintain its power in a sub-frame (1 ms) during non-contiguous transmissions within 21 ms in response to 0 dB commands with respect to the first UE transmission and all other power control parameters as specified in TS 38.213 [8] kept constant.

The minimum requirement specified in Table 6.3.4.4-1 apply in the power range bounded by the minimum output power as specified in clause 6.3.1 and the maximum output power as specified in clause 6.2.2.

Table 6.3.4.4-1: Aggregate power tolerance

| TPC command | UL channel | Aggregate power tolerance within 21 ms |
|-------------|------------|--|
| 0 dB        | PUCCH      | $\pm 2.5$ dB                           |

## 6.4 Transmit signal quality

### 6.4.1 Frequency error

The UE basic measurement interval of modulated carrier frequency is 1 UL slot. The mean value of basic measurements of UE modulated carrier frequency shall be accurate to within  $\pm 0.1$  PPM observed over a period of 1 ms of cumulated measurement intervals compared to the carrier frequency received from the NR Node B.

### 6.4.2 Transmit modulation quality

Transmit modulation quality defines the modulation quality for expected in-channel RF transmissions from the UE. The transmit modulation quality is specified in terms of:

- Error Vector Magnitude (EVM) for the allocated resource blocks (RBs)
- EVM equalizer spectrum flatness derived from the equalizer coefficients generated by the EVM measurement process
- Carrier leakage
- In-band emissions for the non-allocated RB

All the parameters defined in clause 6.4.2 are defined using the measurement methodology specified in Annex F.

In case the parameter 3300 or 3301 is reported from UE via the parameter *txDirectCurrentLocation* in *UplinkTxDirectCurrentList* IE (as defined in TS 38.331 [7]), carrier leakage measurement requirement in clause 6.4.2.2 and 6.4.2.3 shall be waived, and the RF correction with regard to the carrier leakage and IQ image shall be omitted during the calculation of transmit modulation quality.

#### 6.4.2.1 Error Vector Magnitude

The Error Vector Magnitude is a measure of the difference between the reference waveform and the measured waveform. This difference is called the error vector. Before calculating the EVM the measured waveform is corrected by the sample timing offset and RF frequency offset. Then the carrier leakage shall be removed from the measured waveform before calculating the EVM.

The measured waveform is further equalised using the channel estimates subjected to the EVM equaliser spectrum flatness requirement specified in clause 6.4.2.4. For DFT-s-OFDM waveforms, the EVM result is defined after the front-end FFT and IDFT as the square root of the ratio of the mean error vector power to the mean reference power expressed as a %. For CP-OFDM waveforms, the EVM result is defined after the front-end FFT as the square root of the ratio of the mean error vector power to the mean reference power expressed as a %.

The basic EVM measurement interval in the time domain is one preamble sequence for the PRACH and one slot for PUCCH and PUSCH in the time domain. The EVM measurement interval is reduced by any symbols that contains an allowable power transient in the measurement interval, as defined in clause 6.3.3.

The RMS average of the basic EVM measurements over 10 subframes for the average EVM case, and over 60 subframes for the reference signal EVM case, for the different modulation schemes shall not exceed the values specified in Table 6.4.2.1-1 for the parameters defined in Table 6.4.2.1-2. For EVM evaluation purposes, all 13 PRACH preamble formats and all 5 PUCCH formats are considered to have the same EVM requirement as QPSK modulated..

**Table 6.4.2.1-1: Requirements for Error Vector Magnitude**

| Parameter | Unit | Average EVM Level |
|-----------|------|-------------------|
| Pi/2-BPSK | %    | 30                |
| QPSK      | %    | 17.5              |
| 16 QAM    | %    | 12.5              |

**Table 6.4.2.1-2: Parameters for Error Vector Magnitude**

| Parameter                   | Unit | Level                   |

### 6.4.2.1a Error Vector Magnitude including symbols with transient period

In 6.4.2.1, EVM has been defined by excluding the symbols which have a transient period. In this section, measurement interval is defined for the symbols with a transient period to include these symbols in the RMS average EVM computation when the UE reports a transient period capability other than the default. Before calculating the EVM, the measured waveform is corrected for sample timing offset and RF frequency offset. Then the carrier leakage shall be removed from the measured waveform before calculating the EVM. The symbols with transient period should not be used for equalization. Only CP-OFDM waveform is used for conformance testing.

In the case of PUSCH or PUCCH transmissions when the mean power, modulation or RB allocation across slot or subslot boundaries is expected to change the EVM result over the symbols where the transient occurs is calculated according to Table 6.4.2.1a-1.

**Table 6.4.2.1a-1: EVM definition for reported transient period**

| Reported transient capability (us) | EVM definition  | $tp_{start}$ (μs) | SCS <sup>4</sup>            |
|------------------------------------|---|-------------------|-----------------------------|
| 2                                  | $EVM_{after} = \max(\overline{EVM_{l,tp}}, \overline{EVM_h})$<br>$EVM_{before} = \max(\overline{EVM_l}, \overline{EVM_{h,tp}})$ | -0.5              | 15kHz or 30kHz <sup>5</sup> |

NOTE 1:  $\overline{EVM_l}$ ,  $\overline{EVM_h}$ ,  $\overline{EVM_{l,tp}}$ , and  $\overline{EVM_{h,tp}}$  are defined in Annex F  
NOTE 2:  $EVM_{after}$  is the EVM for a symbol right after a transition;  $EVM_{before}$  is the EVM for a symbol right before a transition  
NOTE 3:  $tp_{start}$  denotes the start position of the EVM exclusion window as shown in Annex F.4  
NOTE 4: SCS denotes the SCS that can be used in the conformance test  
NOTE 5: 30kHz shall be used in the conformance test unless the UE signals in *supportedSubCarrierSpacingUL* in *FeatureSetPerCC* that it only supports 15kHz in the corresponding band

The RMS average of the basic EVM measurements over 108 subframes for the symbols where the transient occurs for the different modulation schemes shall not exceed the values specified in Table 6.4.2.1a-2 for the parameters defined in Table 6.4.2.1a-3. This requirement can be verified with 64 QAM and 256 QAM modulation.

**Table 6.4.2.1a-2: Requirements for Error Vector Magnitude**

| Parameter | Unit | Average EVM Level |
|-----------|------|-------------------|
| 64 QAM    | %    | 10                |

### 6.4.2.2 Carrier leakage

Carrier leakage is an additive sinusoid waveform whose frequency is the same as the modulated waveform carrier frequency. The measurement interval is one slot in the time domain.

In the case that uplink sharing, the carrier leakage may have 7.5 kHz shift with the carrier frequency.

The relative carrier leakage power is a power ratio of the additive sinusoid waveform and the modulated waveform. The relative carrier leakage power shall not exceed the values specified in Table 6.4.2.2-1.

| Parameter  | Relative Limit (dBc) |
|--|----------------------|

### 6.4.2.3 In-band emissions

The in-band emission is defined as the average emission across 12 sub-carriers and as a function of the RB offset from the edge of the allocated UL transmission bandwidth. The in-band emission is measured as the ratio of the UE output power in a non-allocated RB to the UE output power in an allocated RB.

The basic in-band emissions measurement interval is defined over one slot in the time domain; however, the minimum requirement applies when the in-band emission measurement is averaged over 10 sub-frames. When the PUSCH or PUCCH transmission slot is shortened due to multiplexing with SRS, the in-band emissions measurement interval is reduced by one or more symbols, accordingly.

The average of the basic in-band emission measurement over 10 sub-frames shall not exceed the values specified in Table 6.4.2.3-1.

#### 6.4.2.4 EVM equalizer spectrum flatness

The zero-forcing equalizer correction applied in the EVM measurement process (as described in Annex F) must meet a spectral flatness requirement for the EVM measurement to be valid. The EVM equalizer spectrum flatness is defined in terms of the maximum peak-to-peak ripple of the equalizer coefficients (dB) across the allocated uplink block. The basic measurement interval is the same as for EVM.

The peak-to-peak variation of the EVM equalizer coefficients contained within the frequency range of the uplink allocation shall not exceed the maximum ripple specified in Table 6.4.2.4-1 for normal conditions. For uplink allocations contained within both Range 1 and Range 2, the coefficients evaluated within each of these frequency ranges shall meet the corresponding ripple requirement and the following additional requirement: the relative difference between the maximum coefficient in Range 1 and the minimum coefficient in Range 2 must not be larger than 5 dB, and the relative difference between the maximum coefficient in Range 2 and the minimum coefficient in Range 1 must not be larger than 7 dB (see Figure 6.4.2.4-1).

The EVM equalizer spectral flatness shall not exceed the values specified in Table 6.4.2.4-2 for extreme conditions. For uplink allocations contained within both Range 1 and Range 2, the coefficients evaluated within each of these frequency ranges shall meet the corresponding ripple requirement and the following additional requirement: the relative difference between the maximum coefficient in Range 1 and the minimum coefficient in Range 2 must not be larger than 6 dB,

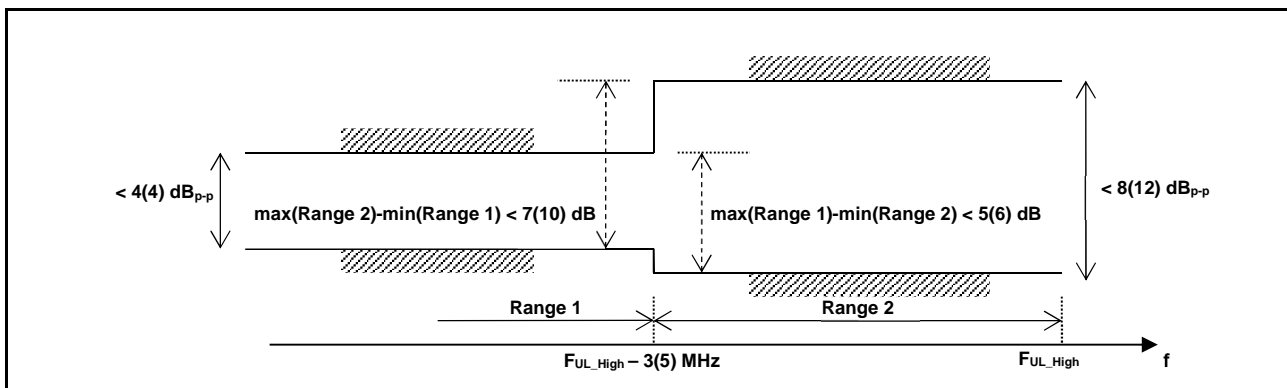

and the relative difference between the maximum coefficient in Range 2 and the minimum coefficient in Range 1 must not be larger than 10 dB (see Figure 6.4.2.4-1).

6.4.2.4.1 Requirements for Pi/2 BPSK modulation

These requirements apply if the IE *powerBoostPi2BPSK* is set to 1 for power class 3 capable UE operating in TDD bands n40, n41, n77, n78 and n79 with Pi/2 BPSK modulation and UE indicates support for UE capability *powerBoosting-pi2BPSK* and 40 % or less slots in radio frame are used for UL transmission. These requirements also apply if the IE *dmrs-UplinkTransformPrecoding-r16* is configured and UE indicates support for UE capability *lowPAPR-DMRS-PUSCHwithPrecoding-r16*. Otherwise the requirements for EVM equalizer spectrum flatness defined in clause 6.4.2.4 apply

The EVM equalizer coefficients across the allocated uplink block shall be modified to fit inside the mask specified in Table 6.4.2.4.1-1 for normal conditions, prior to the calculation of EVM. The limiting mask shall be placed to minimize the change in equalizer coefficients in a sum of squares sense.

**Figure 6.4.2.4.1-1: The limits for EVM equalizer spectral flatness with the maximum allowed variation.**

For Pi/2 BPSK modulation the UE shall be allowed to employ spectral shaping and the shaping filter shall be restricted so that the impulse response of the shaping filter itself shall meet

$$|\tilde{a}_i(t,0)| \geq |\tilde{a}_i(t,\tau)| \quad \forall \tau \neq 0$$

$$20\log_{10} |\tilde{a}_i(t,\tau)| < -15 \text{ dB} \quad 1 < \tau < M - 1,$$

where  $|\tilde{a}_i(t,\tau)| = IDFT\{ |\tilde{a}_i(t,f)| e^{j\varphi(t,f)} \}$ ,  $f$  is the frequency of the  $M$  allocated subcarriers,  $\tilde{a}_i(t,f)$  and  $\varphi(t,f)$  are the amplitude and phase response.

0 dB reference is defined as  $20\log_{10} |\tilde{a}_i(t,0)|$ .

### 6.4.2.5 Phase continuity requirements for DMRS bundling

For bands that UE indicates the support of DMRS bundling, the maximum allowable difference between the measured phase value in any slot  $p-1$  and slot  $p$ , or slot 0 and any slot  $p$  for each antenna connector shall satisfy the requirements as listed in Table 6.4.2.5-1 for the measurement conditions defined in Table 6.4.2.5-2, within a measurement time window limited by the UE capability of maximum duration for DMRS bundling [*maxDMRS-BundlingDuration*], and defined for each frequency band separately. The phase value for each slot is measured as shown in Annex F.9. These requirements apply to PUCCH and PUSCH transmissions with DFT-s-OFDM and CP-OFDM waveforms.

**Table 6.4.2.5-1: Maximum allowable phase difference for DMRS bundling**

| UL channel   | Modulation order         | Phase difference between any slot $p-1$ and slot $p$ (NOTE 2) | Phase difference between slot $0$ and any slot $p$ (NOTE 3) |

| PUSCH  | $\pi/2$ BPSK, QPSK       | [25] degrees  | [30] degrees  |
| PUCCH  | $\pi/2$ BPSK, BPSK, QPSK |   |   |
| NOTE 1: The UE capability of the length of maximum duration refers to the maximum time duration during which UE is able to meet the phase continuity requirements, assuming no phase consistency violating events defined in TS 38.214 in between. |                          |   |   |
| NOTE 2: This requirement applies for FDD and TDD bands, for supported DMRS bundling configurations $\leq 8$ slots.   |                          |   |   |
| NOTE 3: This requirement applies only for FDD bands, for supported DMRS bundling configurations of 16 slots.   |                          |   |   |

The above requirements are applicable when all the following conditions are met within the measurement time window:

- RB allocation in terms of length and frequency position does not change, and intra-slot and inter-slot frequency hopping is not activated.
- Modulation order does not change.
- No network commanded TA takes effect.
- The TPMI precoder does not change.
- There is no change in UE transmission power level, and no change in the level of P-MPR applied by the UE.
- UE is not scheduled with uplink transmission of other physical channel/signal in-between the PUSCH or PUCCH transmissions.
- For TDD, no downlink slot(s) or downlink symbol(s) or flexible symbol(s) with/without DL monitoring occasion configured in-between the PUSCH or PUCCH transmissions.

## 6.4A Transmit signal quality for CA

### 6.4A.1 Frequency error for CA

#### 6.4A.1.1 Frequency error for intra-band contiguous CA

For intra-band contiguous carrier aggregation the UE modulated carrier frequencies per band shall be accurate to within  $\pm 0.1$  PPM observed over a period of one timeslot compared to the carrier frequency of primary component carrier received in the corresponding band

### 6.4A.1.2 Frequency error for intra-band non-contiguous CA

For intra-band non-contiguous carrier aggregation the requirements in Section 6.4.1 applies per component carrier.

### 6.4A.1.3 Frequency error for inter-band CA

For inter-band carrier aggregation with one uplink carrier assigned to one NR band, the frequency error requirements in subclause 6.4.1 apply.

For inter-band carrier aggregation with two uplink non-contiguous carrier assigned to one NR band, the frequency error requirements in subclause 6.4A.1.2 apply for those carriers.

For inter-band carrier aggregation with uplink assigned to two NR bands, the frequency error requirements defined in clause 6.4.1 shall apply on each component carrier with all component carriers active.

For combinations of intra-band and inter-band carrier aggregation with three uplink component carriers (up to two contiguously aggregated carriers per operating band), the frequency error requirements specified in subclause 6.4.1 apply for the NR band supporting one component carrier, and for the NR band supporting two contiguous component carriers the requirements specified in subclause 6.4A.1.1 apply.

### 6.4A.1.4 Void

## 6.4A.2 Transmit modulation quality for CA

### 6.4A.2.1 Transmit modulation quality for intra-band contiguous CA

#### 6.4A.2.1.0 General

For intra-band contiguous carrier aggregation, the requirements in clauses 6.4A.2.1.1, 6.4A.2.1.2 applies.

The requirements in this clause apply with PCC and SCC in the UL configured and activated: PCC with PRB allocation and SCC without PRB allocation and without CSI reporting and SRS configured.

In case the parameter 3300 or 3301 is reported from UE via *txDirectCurrentLocation-r16* or *txDirectCurrentLocation* (as defined in TS 38.331 [7]) or UE does not indicate the DC location parameters, carrier leakage measurement requirement in clause 6.4A.2.4.2 shall be waived, and the RF correction with regard to the carrier leakage and IQ image shall be omitted during the calculation of transmit modulation quality.

#### 6.4A.2.1.1 Error Vector Magnitude

For the intra-band contiguous carrier aggregation, the Error Vector Magnitude requirement should be defined for each component carrier. Requirements only apply with PRB allocation in one of the component carriers. Similar transmitter impairment removal procedures are applied for CA waveform before EVM calculation as is specified for non-CA waveform in sub-clause 6.4.2.1.

When a single component carrier is configured Table 6.4.2.1-1 apply.

The EVM requirements are according to Table 6.4A.2.1.1-1 if CA is configured in uplink with the parameters defined in Table 6.4.2.1-2.

**Table 6.4A.2.1.1-1: Minimum requirements for Error Vector Magnitude**

| Parameter | Unit | Average EVM Level per CC |
|-----------|------|--------------------------|
| Pi/2-BPSK | %    | 30                       |
| QPSK      | %    | 17.5                     |

| 256 QAM   | %    | 3.5                      |

#### 6.4A.2.1.2 In-band emissions

For intra-band contiguous carrier aggregation, the requirements in Table 6.4A.2.1.2-1 and 6.4A.2.1.2-2 apply within the aggregated transmission bandwidth configuration with both component carrier (s) active and one single contiguous PRB allocation of bandwidth  $L_{CRB}$  at the edge of the aggregated transmission bandwidth configuration.

The inband emission is defined as the interference falling into the non allocated resource blocks for all component carriers. The measurement method for the inband emissions in the component carrier with PRB allocation is specified in annex F.3. For a non allocated component carrier a spectral measurement is specified.

### 6.4A.2.1.3 Carrier leakage

Carrier leakage is an additive sinusoid waveform that is confined within the aggregated transmission bandwidth configuration. For intra-band contiguous CA, the carrier leakage requirement is defined with applicable frequencies dependent on parameter *txDirectCurrentLocation-r16* or *txDirectCurrentLocation* (as defined in TS 38.331 [7]). For only one uplink carrier is activated, the applicable LO leakage frequency follow definition in clause 6.4.2. The measurement interval is one slot in the time domain.

The relative carrier leakage power is a power ratio of the additive sinusoid waveform and the modulated waveform. The relative carrier leakage power shall not exceed the values specified in Table 6.4A.2.4.3-1. Carrier leakage frequencies are those that are enclosed either in the RB containing the carrier leakage frequency, or in the two RBs immediately adjacent to the carrier leakage frequency but excluding any allocated RB.

**Table 6.4A.2.1.3-1: Minimum requirements for Relative Carrier Leakage Power**

| Parameters                       | Relative Limit (dBc) |

The requirements in this clause apply with PCC and SCC in the UL configured and activated: PCC with PRB allocation and SCC without PRB allocation and without CSI reporting and SRS configured.

In case the parameter 3300 or 3301 is reported from UE via *txDirectCurrentLocation-r16* or *txDirectCurrentLocation* (as defined in TS 38.331 [7]), or UE does not indicate the DC location parameters, carrier leakage measurement requirement in subclause 6.4A.2.2.2 shall be waived, and the RF correction with regard to the carrier leakage and IQ image shall be omitted during the calculation of transmit modulation quality.

#### 6.4A.2.2.1 Error Vector Magnitude

For the intra-band non-contiguous carrier aggregation, the Error Vector Magnitude requirement should be defined for each component carrier. Requirements only apply with PRB allocation in one of the component carriers. Similar transmitter impairment removal procedures are applied for CA waveform before EVM calculation as is specified for non-CA waveform in sub-section 6.4.2.1.

When a single component carrier is configured Table 6.4.2.1-1 apply.

The EVM requirements are according to Table 6.4A.2.2.1-1 if CA is configured in uplink with the parameters defined in Table 6.4.2.1-2.

**Table 6.4A.2.2.1-1: Minimum requirements for Error Vector Magnitude**

| QPSK      | %    | 17.5                     |
| 16 QAM    | %    | 12.5                     |
| 64 QAM    | %    | 8                        |

### 6.4A.2.2.2 In-band emissions

For intra-band non-contiguous carrier aggregation the requirements for in-band emissions are defined for each component carrier. Requirements defined in clause 6.4A.2.1.2 only apply with PRB allocation in one of the component carriers.

When signalling for dualPA-Architecture IE is absent, carrier leakage or I/Q image may land inside the gap spectrum between 2 UL CCs.

For intra-band non-contiguous CA, the IQ image requirement is defined with the applicable frequencies based on symmetry with respect to the carrier leakage frequency, but excluding any allocated RBs.

### 6.4A.2.2.3 Carrier leakage

For intra-band non-contiguous CA, if UE indicates *uplinkTxDC-TwoCarrierReport-r16*, the carrier leakage requirement is defined with applicable frequencies dependent on parameter *txDirectCurrentLocation-r16* in *UplinkTxDirectCurrentTwoCarrierList* IE indicated in activated uplink carrier(s), otherwise, the carrier leakage requirement is defined with applicable frequencies dependent on parameter *txDirectCurrentLocation* in *UplinkTxDirectCurrent* IE. The relative carrier leakage power is a power ratio of the additive sinusoid waveform and the modulated waveform. The relative carrier leakage power shall not exceed the values specified in Table 6.4A.2.4.3-1. Carrier leakage frequencies are those that are enclosed either in the RB containing the carrier leakage frequency, or in the two RBs immediately adjacent to the carrier leakage frequency but excluding any allocated RB.

### 6.4A.2.3 Transmit modulation quality for inter-band CA

For inter-band carrier aggregation with one uplink carrier assigned to one NR band, the transmit modulation quality requirements in subclause 6.4.2 apply including phase continuity requirements for DMRS bundling [IE name].

For inter-band carrier aggregation with two uplink non-contiguous carrier assigned to one NR band, the transmit modulation quality requirements in subclause 6.4A.2.2 apply for those carriers.

For inter-band carrier aggregation with uplink assigned to two NR bands, the transmit modulation quality requirements shall apply on each component carrier as defined in clause 6.4.2 with all component carriers active: PCC with PRB allocation and SCC without PRB allocation and without CSI reporting and SRS configured. For DMRS bundling [IE name], requirements for phase continuity in clause 6.4.2.5 apply for PCC when SCC has no UL allocation for the duration of the bundle on PCC.

For combinations of intra-band and inter-band carrier aggregation with three uplink component carriers (up to two contiguously aggregated carriers per operating band), the transmit modulation quality requirements specified in subclause 6.4.2 apply for the NR band supporting one component carrier, and for the NR band supporting two contiguous component carriers the requirements specified in subclause 6.4A.2.1 apply.

The requirements in Table 6.4D.4-1 apply when the UL transmission power at each antenna connector is larger than 0 dBm for SRS transmission and for the duration of time window.

**Table 6.4D.4-1: Maximum allowable difference of relative phase and power errors in a given slot compared to those measured at last SRS transmitted**

The basic in-band emissions measurement interval is defined over one slot in the time domain; however, the minimum requirement applies when the in-band emission measurement is averaged over 10 sub-frames. When the PUSCH or PUCCH transmission slot is shortened, the in-band emissions measurement interval is reduced by one or more symbols, accordingly. The requirement applies for power class 5 UE for 20 MHz channel bandwidth and 15 kHz SCS,

Instead of the general requirement in clause 6.4.2.3, the average of the basic in-band emission measurement over 10 sub-frames shall not exceed the values specified in Table 6.4F.2.3-1.

## 6.5 Output RF spectrum emissions

### 6.5.1 Occupied bandwidth

Occupied bandwidth is defined as the bandwidth containing 99 % of the total integrated mean power of the transmitted spectrum on the assigned channel. The occupied bandwidth for all transmission bandwidth configurations (Resources Blocks) shall be less than the channel bandwidth specified in Table 6.5.1-1.

**Table 6.5.1-1: Occupied channel bandwidth**

|                                  | NR channel bandwidth (MHz)                                 |
|----------------------------------|--|
|                                  | 5, 10, 15, 20, 25, 30, 35, 40, 45, 50, 60, 70, 80, 90, 100 |
| Occupied channel bandwidth (MHz) | Same as NR channel bandwidth                               |

### 6.5.2 Out of band emission

#### 6.5.2.1 General

The Out of band emissions are unwanted emissions immediately outside the assigned channel bandwidth resulting from the modulation process and non-linearity in the transmitter but excluding spurious emissions. This out of band emission limit is specified in terms of a spectrum emission mask and an adjacent channel leakage power ratio.

To improve measurement accuracy, sensitivity and efficiency, the resolution bandwidth may be smaller than the measurement bandwidth. When the resolution bandwidth is smaller than the measurement bandwidth, the result should be integrated over the measurement bandwidth in order to obtain the equivalent noise bandwidth of the measurement bandwidth.

#### 6.5.2.2 Spectrum emission mask

The spectrum emission mask of the UE applies to frequencies ( $\Delta f_{\text{OoB}}$ ) starting from the  $\pm$  edge of the assigned NR channel bandwidth. For frequencies offset greater than  $\Delta f_{\text{OoB}}$ , the spurious requirements in clause 6.5.3 are applicable.

**NOTE:** For measurement conditions at the edge of each frequency range, the lowest frequency of the measurement position in each frequency range should be set at the lowest boundary of the frequency range plus  $\text{MBW}/2$ . The highest frequency of the measurement position in each frequency range should be set at the highest boundary of the frequency range minus  $\text{MBW}/2$ . MBW denotes the measurement bandwidth defined for the protected band.

The power of any UE emission shall not exceed the levels specified in Table 6.5.2.2-1 for the specified channel bandwidth.

**Table 6.5.2.2-1: General NR spectrum emission mask**

NOTE 1: The measurement bandwidth shall be 1 MHz

NOTE: As a general rule, the resolution bandwidth of the measuring equipment should be equal to the measurement bandwidth. However, to improve measurement accuracy, sensitivity and efficiency, the resolution bandwidth may be smaller than the measurement bandwidth. When the resolution bandwidth is smaller than the measurement bandwidth, the result should be integrated over the measurement bandwidth in order to obtain the equivalent noise bandwidth of the measurement bandwidth.

#### 6.5.2.3.2 Requirements for network signalling value "NS\_04"

Additional spectrum emission requirements are signalled by the network to indicate that the UE shall meet an additional requirement for a specific deployment scenario as part of the cell handover/broadcast message.

The n41 SEM transition point from -13 dBm/MHz to -25 dBm/MHz is based on the emission bandwidth. The emission bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power. Since the 26-dB emission bandwidth is implementation dependent, the maximum transmission bandwidths in MHz ( $N_{\text{RB}} * \text{SCS} * 12 / 1,000,000$ ) is used for the SEM.

NOTE: As a general rule, the resolution bandwidth of the measuring equipment should be equal to the measurement bandwidth. However, to improve measurement accuracy, sensitivity and efficiency, the resolution bandwidth may be smaller than the measurement bandwidth. When the resolution bandwidth is smaller than the measurement bandwidth, the result should be integrated over the measurement bandwidth in order to obtain the equivalent noise bandwidth of the measurement bandwidth.

### 6.5.2.4 Adjacent channel leakage ratio

Adjacent Channel Leakage power Ratio (ACLR) is the ratio of the filtered mean power centred on the assigned channel frequency to the filtered mean power centred on an adjacent channel frequency.

To improve measurement accuracy, sensitivity and efficiency, the resolution bandwidth may be smaller than the measurement bandwidth. When the resolution bandwidth is smaller than the measurement bandwidth, the result should be integrated over the measurement bandwidth in order to obtain the equivalent noise bandwidth of the measurement bandwidth.

#### 6.5.2.4.1 NR ACLR

NR Adjacent Channel Leakage power Ratio ( $\text{NR}_{\text{ACLR}}$ ) is the ratio of the filtered mean power centred on the assigned NR channel frequency to the filtered mean power centred on an adjacent NR channel frequency at nominal channel spacing.

The assigned NR channel power and adjacent NR channel power are measured with rectangular filters with measurement bandwidths specified in Table 6.5.2.4.1-1.

If the measured adjacent channel power is greater than  $-50$  dBm then the  $\text{NR}_{\text{ACLR}}$  shall be higher than the value specified in Table 6.5.2.4.1-2.

### 6.5.2.4.2 UTRA ACLR

UTRA adjacent channel leakage power ratio ( $UTRA_{ACLR}$ ) is the ratio of the filtered mean power centred on the assigned NR channel frequency to the filtered mean power centred on an adjacent(s) UTRA channel frequency.

$UTRA_{ACLR}$  is specified for the first adjacent UTRA channel ( $UTRA_{ACLR1}$ ) which center frequency is  $\pm 2.5$  MHz from NR channel edge and for the 2<sup>nd</sup> adjacent UTRA channel ( $UTRA_{ACLR2}$ ) which center frequency is  $\pm 7.5$  MHz from NR channel edge.

The UTRA channel power is measured with a RRC filter with roll-off factor  $\alpha = 0.22$  and bandwidth of 3.84 MHz. The assigned NR channel power is measured with a rectangular filter with measurement bandwidth specified in Table 6.5.2.4.1-1.

If the measured adjacent channel power is greater than  $-50$  dBm then the  $UTRA_{ACLR1}$  and  $UTRA_{ACLR2}$  shall be higher than the value specified in Table 6.5.2.4.2-1.

$UTRA_{ACLR}$  is not applicable to the power class 3 UE operating in Band n12, n14, n17, and n30.

$UTRA_{ACLR}$  is not applicable to the power class 1 UE operating in Band n14.

**Table 6.5.2.4.2-1: UTRA ACLR requirement**

|                                  | Power class 3 |

| <b><math>UTRA_{ACLR1}</math></b> | 33 dB         |
| <b><math>UTRA_{ACLR2}</math></b> | 36 dB         |

UTRA ACLR requirement is applicable when signalled by the network with network signalling value indicated by the field *additionalSpectrumEmission*.

## 6.5.3 Spurious emissions

Spurious emissions are emissions which are caused by unwanted transmitter effects such as harmonics emission, parasitic emissions, intermodulation products and frequency conversion products, but exclude out of band emissions unless otherwise stated. The spurious emission limits are specified in terms of general requirements in line with SM.329 [9] and NR operating band requirement to address UE co-existence.

To improve measurement accuracy, sensitivity and efficiency, the resolution bandwidth may be smaller than the measurement bandwidth. When the resolution bandwidth is smaller than the measurement bandwidth, the result should be integrated over the measurement bandwidth in order to obtain the equivalent noise bandwidth of the measurement bandwidth.

NOTE: For measurement conditions at the edge of each frequency range, the lowest frequency of the measurement position in each frequency range should be set at the lowest boundary of the frequency range plus  $MBW/2$ . The highest frequency of the measurement position in each frequency range should be set at the highest boundary of the frequency range minus  $MBW/2$ . MBW denotes the measurement bandwidth defined for the protected band.

### 6.5.3.1 General spurious emissions

Unless otherwise stated, the spurious emission limits apply for the frequency ranges that are more than  $F_{OOB}$  (MHz) in Table 6.5.3.1-1 from the edge of the channel bandwidth. The spurious emission limits in Table 6.5.3.1-2 apply for all transmitter band configurations ( $N_{RB}$ ) and channel bandwidths.

- NOTE 1:  $F_{DL\_low}$  and  $F_{DL\_high}$  refer to each frequency band specified in Table 5.2-1 in TS 38.101-1 or Table 5.5-1 in TS 36.101
- NOTE 2: As exceptions, measurements with a level up to the applicable requirements defined in Table 6.5.3.1-2 are permitted for each assigned NR carrier used in the measurement due to 2nd, 3rd, 4th or 5th harmonic spurious emissions. Due to spreading of the harmonic emission the exception is also allowed for the first 1 MHz frequency range immediately outside the harmonic emission on both sides of the harmonic emission. This results in an overall exception interval centred at the harmonic emission of  $(2 \text{ MHz} + N \times L_{CRB} \times RB_{size} \text{ kHz})$ , where N is 2, 3, 4, 5 for the 2nd, 3rd, 4th or 5th harmonic respectively. The exception is allowed if the measurement bandwidth (MBW) totally or partially overlaps the overall exception interval.
- NOTE 3: 15 kHz SCS is assumed when RB is mentioned in the note when channel bandwidth is less than or equal to 50 MHz, lowest SCS is assumed when channel bandwidth is larger than 50 MHz. The transmission bandwidth in terms of RB position and range is not limited to 15 kHz SCS and shall scale with SCS accordingly.
- NOTE 4: Void
- NOTE 5: For non-synchronised TDD operation to meet these requirements some restriction will be needed for either the operating band or protected band
- NOTE 6: N/A
- NOTE 7: Void
- NOTE 8: Applicable when co-existence with PHS system operating in 1884.5 - 1915.7 MHz.
- NOTE 9: Void
- NOTE 10: Void
- NOTE 11: Void
- NOTE 12: The emissions measurement shall be sufficiently power averaged to ensure a standard deviation < 0.5 dB
- NOTE 13: Void
- NOTE 14: Void
- NOTE 15: These requirements also apply for the frequency ranges that are less than  $F_{OOB}$  (MHz) in Table 6.5.3.1-1 from the edge of the channel bandwidth.
- NOTE 16: Void
- NOTE 17: Void
- NOTE 18: Void
- NOTE 19: Applicable when the assigned NR carrier is confined within 718 MHz and 748 MHz and when the channel bandwidth used is 5 or 10 MHz.
- NOTE 20: Void
- NOTE 21: This requirement is applicable for any channel bandwidths up to 20MHz within the range 2500 - 2570 MHz with the following restriction: for carriers of 15 MHz bandwidth when carrier centre frequency is within the range 2560.5 - 2562.5 MHz and for carriers of 20 MHz bandwidth when carrier centre frequency is within the range 2552 - 2560 MHz the requirement is applicable only for an uplink transmission bandwidth less than or equal to 54 RB.
- NOTE 22: This requirement is applicable for power class 3 UE for any channel bandwidths up to 20 MHz. For channel bandwidth within the range 2570 - 2615 MHz with the following restriction: for carriers of 15 MHz bandwidth when the carrier centre frequency is within the range 2605.5 - 2607.5 MHz and for carriers of 20 MHz bandwidth when the carrier centre frequency is within the range 2597 - 2605 MHz the requirement is applicable only for an uplink transmission bandwidth less than or equal to 54 RB. For carriers overlapping the frequency range 2615 - 2620 MHz the requirement applies with the maximum output power configured to +19 dBm in the IE P-Max.
- NOTE 23: Void
- NOTE 24: As exceptions, measurements with a level up to the applicable requirement of -38 dBm/MHz is permitted for each assigned NR carrier used in the measurement due to 2nd harmonic spurious emissions. An exception is allowed if there is at least one individual RB within the transmission bandwidth (see Figure 5.3.1-1) for which the 2nd harmonic totally or partially overlaps the measurement bandwidth (MBW).
- NOTE 25: As exceptions, measurements with a level up to the applicable requirement of -36 dBm/MHz is permitted for each assigned NR carrier used in the measurement due to 3rd harmonic spurious emissions. An exception is allowed if there is at least one individual RB within the transmission bandwidth (see Figure 5.3.1-1) for which the 3rd harmonic totally or partially overlaps the measurement bandwidth (MBW).
- NOTE 26: For these adjacent bands, the emission limit could imply risk of harmful interference to UE(s) operating in the protected operating band.
- NOTE 27: This requirement is applicable for channel bandwidths up to 20 MHz within the range 1920 - 1980 MHz with the following restriction: for carriers of 15 MHz bandwidth when the carrier centre frequency is within the range 1927.5 - 1929.5 MHz and for carriers of 20 MHz bandwidth when the carrier centre frequency is within the range 1930 - 1938 MHz the requirement is applicable only for an uplink transmission bandwidth less than or equal to 54 RB.

## 6.5.4 Transmit intermodulation

The transmit intermodulation performance is a measure of the capability of the transmitter to inhibit the generation of signals in its non linear elements caused by presence of the wanted signal and an interfering signal reaching the transmitter via the antenna.

UE transmit intermodulation is defined by the ratio of the mean power of the wanted signal to the mean power of the intermodulation product when an interfering CW signal is added at a level below the wanted signal at each transmitter antenna port with the other antenna port(s) if any terminated. Both the wanted signal power and the intermodulation product power are measured through NR rectangular filter with measurement bandwidth shown in Table 6.5.4-1.

The requirement of transmit intermodulation is specified in Table 6.5.4-1.

Table 6.5.4-1: Transmit Intermodulation

| Wanted signal channel bandwidth                          | $BW_{\text{Channel}}$   |   |

## 6.5A Output RF spectrum emissions for CA

For inter-band carrier aggregation with one uplink carrier assigned to one NR band, the output RF spectrum emissions requirements in clause 6.5 apply.

## 6.5A.1 Occupied bandwidth for CA

### 6.5A.1.1 Void

#### 6.5A.1.1a Occupied bandwidth for Intra-band contiguous CA

For intra-band contiguous carrier aggregation the occupied bandwidth is a measure of the bandwidth containing 99 % of the total integrated power of the transmitted spectrum. The occupied bandwidth shall be less than the aggregated channel bandwidth defined in clause 5.3A.3.

#### 6.5A.1.2 Occupied bandwidth for Intra-band non-contiguous CA

For intra-band non-contiguous carrier aggregation, the OBW requirement is met when the ratio of the transmitted power in all sub-blocks of the uplink CA configuration to the total integrated power of the transmitted spectrum is greater than 99%.

#### 6.5A.1.3 Occupied bandwidth for Inter-band CA

For inter-band carrier aggregation with two contiguous carriers assigned to one NR band, the occupied bandwidth requirements in subclause 6.5A.1.1a apply for that band.

For inter-band carrier aggregation with uplink assigned to two NR bands, the occupied bandwidth is defined per component carrier. Occupied bandwidth is the bandwidth containing 99 % of the total integrated mean power of the transmitted spectrum on assigned channel bandwidth on the component carrier. The occupied bandwidth shall be less than the channel bandwidth specified in Table 6.5.1-1.

## 6.5A.2 Out of band emission for CA

### 6.5A.2.1 General

This clause contains requirements for out of band emissions for UE configured of carrier aggregation.

#### 6.5A.2.2 Spectrum emission mask

##### 6.5A.2.2.1 Spectrum emission mask for intra-band contiguous CA

For intra-band contiguous carrier aggregation the spectrum emission mask of the UE applies to frequencies ( $\Delta f_{\text{OOB}}$ ) starting from the  $\pm$  edge of the aggregated channel bandwidth. For intra-band contiguous carrier aggregation, the power of any UE emission shall not exceed the levels specified in Table 6.5A.2.2.1-1 for the specified channel bandwidth.

For power class 2 intra-band contiguous carrier aggregation, the spectrum emission mask is measured as the sum from both UE transmit antenna connectors when UE indicates support for *dualPA-Architecture* IE.

**Table 6.5A.2.2.1-1: General NR CA spectrum emission mask**

| $\Delta f_{\text{OOB}}$<br>(MHz)                                 | Spectrum emission limit(dBm) | MBW(MHz)  |
|--|------------------------------|---|
| $\pm 0 - 1$  | -13                          | $\text{Min}(0.01 * BW_{\text{channel\_CA}}, 0.4)$ |
| $\pm 1 - 5$  | -10                          | 1MHz  |
| $\pm 5 - BW_{\text{channel\_CA}}$                                | -13                          | 1MHz  |
| $\pm BW_{\text{channel\_CA}} -$<br>$BW_{\text{channel\_CA}} + 5$ | -25                          | 1MHz  |

### 6.5A.2.2.2 Spectrum emission mask for intra-band non-contiguous CA

For intra-band non-contiguous carrier aggregation the spectrum emission mask requirement is defined as a composite spectrum emissions mask. Composite spectrum emission mask applies to frequencies up to  $\Delta f_{OOB}$  starting from the edges of the sub-blocks. Composite spectrum emission mask is defined as follows

- a) Composite spectrum emission mask is a combination of individual sub-block spectrum emissions masks
- b) In case the sub-block consist of one component carrier the sub-block general spectrum emission mask is defined in subclause 6.5.2.1
- c) If for some frequency sub-block spectrum emission masks overlap then spectrum emission mask allowing higher power spectral density applies for that frequency
- d) If for some frequency a sub-block spectrum emission mask overlaps with the sub-block bandwidth of another sub-block, then the emission mask does not apply for that frequency.

### 6.5A.2.2.3 Spectrum emission mask for Inter-band CA

For inter-band carrier aggregation with two contiguous carriers assigned to one NR band, the spectrum emission mask requirements in subclause 6.5A.2.2.1 apply for that band.

For inter-band carrier aggregation with two uplink non-contiguous carrier assigned to one NR band, the spectrum emission mask requirements in subclause 6.5A.2.2.2 apply for that band.

For inter-band carrier aggregation with uplink assigned to two NR bands, the spectrum emission mask of the UE is defined per component carrier while both component carriers are active and the requirements are specified in clauses 6.5.2.1 and 6.5.2.2. If for some frequency spectrum emission masks of component carriers overlap then spectrum emission mask allowing higher power spectral density applies for that frequency. If for some frequency a component carrier spectrum emission mask overlaps with the channel bandwidth of another component carrier, then the emission mask does not apply for that frequency.

For combinations of intra-band and inter-band carrier aggregation with three uplink component carriers (up to two contiguously aggregated carriers per operating band), the spectrum emission mask of the UE is defined per NR band while all component carriers are active. For the NR band supporting one component carrier the requirements in subclauses 6.5.2.1 and 6.5.2.2 apply. For the NR band supporting two contiguous component carriers the requirements specified in subclause 6.5A.2.2.1 apply. If for some frequency spectrum emission masks of single component carrier and two contiguous component carriers overlap then spectrum emission mask allowing higher power spectral density applies for that frequency. If for some frequency spectrum emission masks of single component carrier or two contiguous component carriers overlap then the emission mask does not apply for that frequency.

NOTE 1: X is the aggregated channel bandwidth  
NOTE 2: The requirements apply only at the frequency range from 3540 MHz to 3710 MHz.

NOTE: As a general rule, the resolution bandwidth of the measuring equipment should be equal to the measurement bandwidth. However, to improve measurement accuracy, sensitivity and efficiency, the resolution bandwidth may be smaller than the measurement bandwidth. When the resolution bandwidth is smaller than the measurement bandwidth, the result should be integrated over the measurement bandwidth in order to obtain the equivalent noise bandwidth of the measurement bandwidth.

## 6.5A.2.4.1 NR ACLR

## 6.5A.2.4.1.1 NR ACLR for intra-band contiguous CA

For intra-band contiguous carrier aggregation the carrier aggregation the Adjacent Channel Leakage power Ratio is the ratio of the filtered mean power centred on the aggregated channel bandwidth to the filtered mean power centred on an adjacent aggregated channel bandwidth at nominal channel spacing. The assigned aggregated channel bandwidth power and adjacent aggregated channel bandwidth power are measured with rectangular filters with measurement bandwidths specified in Table 6.5A.2.4.1.1-1 and 6.5A.2.4.1.1-2. If the measured adjacent channel power is greater than  $-50\text{dBm}$  then the NR<sub>ACLR</sub> shall be higher than the value specified in Table 6.5A.2.4.1.1-1 and 6.5A.2.4.1.1-2.

#### 6.5A.2.4.1.2 NR ACLR for intra-band non-contiguous CA

For intra-band non-contiguous carrier aggregation, CA Adjacent Channel Leakage power Ratio( $CA_{ACLR}$ ) is the ratio of the sum of the filtered mean power centred on each assigned channel frequency to the filtered mean power centred on an adjacent NR channel frequency at nominal channel spacing. In case the gap bandwidth  $W_{gap}$  between 2 uplink CCs is smaller than maximum of the 2 uplink channel bandwidths then no  $CA_{ACLR}$  requirement is set for the gap. Each assigned NR channel power and adjacent NR channel power are measured with rectangular filters with measurement bandwidths specified in Table 6.5.2.4.1-1. If the measured adjacent channel power is greater than  $-50\text{dBm}$  then the ACLR shall be higher than the value specified in Table 6.5A.2.4.1.2-1.

**Table 6.5A.2.4.1.2-1: General requirements for intra-band non-contiguous CA ACLR**

|  | ACLR / Measurement bandwidth              |

| NOTE 1: $MBW_{ACLR}$ is the single-channel ACLR measurement bandwidths specified in 6.5.2.4.1. |   |

#### 6.5A.2.4.1.3 NR ACLR for Inter-band CA

For inter-band carrier aggregation with two contiguous carriers assigned to one NR band, the NR Adjacent Channel Leakage power Ratio (NRACLR) requirements in subclause 6.5A.2.4.1.1 apply for that band. For inter-band carrier aggregation with two uplink non-contiguous carrier assigned to one NR band, the NR Adjacent Channel Leakage power Ratio (NRACLR) requirements in subclause 6.5A.2.4.1.2 apply for that band.

For inter-band carrier aggregation with uplink assigned to two NR bands, the NR Adjacent Channel Leakage power Ratio (NRACLR) is defined per component carrier while both component carriers are active and the requirement is specified in clause 6.5.2.4.1.

For combinations of intra-band and inter-band carrier aggregation with three uplink component carriers (up to two contiguously aggregated carriers per operating band), the NR ACLR is defined as follows. For the NR band supporting one component carrier, the NR ACLR is the ratio of the filtered mean power centred on the assigned channel bandwidth of the component carrier to the filtered mean power centred on an adjacent channel frequency and the requirements in subclause 6.5.2.4.1 apply. For the NR band supporting two contiguous component carriers the NR ACLR is the ratio of the filtered mean power centred on the aggregated channel bandwidth to the filtered mean power centred on an adjacent(s) aggregated channel bandwidth at nominal channel spacing and the requirements of CA ACLR specified in subclause 6.5A.2.4.1 apply.

6.5A.2.4.2.1          Void

6.5A.2.4.2.2          Void

6.5A.2.4.2.3          UTRA ACLR for Inter-band CA

For inter-band carrier aggregation with uplink assigned to two NR bands, the UTRA Adjacent Channel Leakage power Ratio (UTRAACLR) is defined per component carrier while both component carrier are active and the requirement is specified in clause 6.5.2.4.2.

## 6.5A.3 Spurious emission for CA

### 6.5A.3.1 General spurious emissions

For inter-band carrier aggregation with uplink assigned to two NR bands, the spurious emission requirement Table 6.5.3.1-2 apply for the frequency ranges that are more than  $F_{OOB}$  as defined in Table 6.5.3.1-1 away from edges of the assigned channel bandwidth on a component carrier. If for some frequency a spurious emission requirement of individual component carrier overlaps with the spectrum emission mask or channel bandwidth of another component carrier then it does not apply.

NOTE: For inter-band carrier aggregation with uplink assigned to two NR bands the requirements in Table 6.5.3.1-2 could be verified by measuring spurious emissions at the specific frequencies where second and third order intermodulation products generated by the two transmitted carriers can occur; in that case, the requirements for remaining applicable frequencies in Table 6.5.3.1-2 would be considered to be verified by the measurements verifying the one uplink inter-band CA spurious emission requirement.

For intra-band contiguous carrier aggregation the spurious emission limits apply for the frequency ranges that are more than  $F_{OOB}$  (MHz) in Table 6.5A.3.1-1 from the edge of the aggregated channel bandwidth. For frequencies  $\Delta f_{OOB}$  greater than  $F_{OOB}$  as specified in Table 6.5A.3.1-1 the spurious emission requirements in Table 6.5.3.1-2 are applicable. For power class 2 intra-band contiguous carrier aggregation, the spurious emissions is measured as the sum from both UE transmit antenna connectors when UE indicates support for *dualPA-Architecture* IE.

**Table 6.5A.3.1-1: Boundary between out of band and spurious emission domain for intra-band contiguous carrier aggregation**

| Aggregated Channel bandwidth | OOB boundary $F_{OOB}$ (MHz) |
|------------------------------|------------------------------|
| $BW_{Channel\_CA}$           | $BW_{Channel\_CA} + 5$       |

For intra-band non-contiguous carrier aggregation transmission the spurious emission requirement is defined as a composite spurious emission requirement. Composite spurious emission requirement applies to frequency ranges that

are more than FOOB away from the edges of each carrier in the gap and out of the gap. Composite spurious emission requirement is defined as follows

- a) Composite spurious emission requirement is a combination of individual sub-block spurious emission requirements
- b) In case the sub-block consist of one component carrier the sub-block spurious emission requirement and FOOB are defined in subclause 6.5.3.1
- c) If for some frequency an individual sub-block spurious emission requirement overlaps with the general spectrum emission mask or the sub-block bandwidth of another sub-block then it does not apply

For combinations of intra-band and inter-band carrier aggregation with three uplink component carriers (up to two contiguously aggregated carriers per operating band), the spurious emission requirement is defined as follows. For the NR band supporting one component carrier the requirements in Table 6.5.3.1-2 apply for frequency ranges that are more than FOOB (MHz) from the edges of assigned channel bandwidth as defined in Table 6.5.3.1-1. For the NR band supporting two contiguous component carriers the requirements in Table 6.5.3.1-2 apply for frequency ranges that are more than FOOB (MHz) from the edges of assigned aggregated channel bandwidth as defined in Table 6.5A.3.1-1. If for some frequency a spurious emission requirement of a single component carrier or two contiguous component carriers overlap with the spurious emission requirement or channel bandwidth of another component carrier or two contiguously aggregated carriers then it does not apply.

## 6.5A.3.2 Spurious emissions for UE co-existence

### 6.5A.3.2.1 Spurious emissions for UE co-existence for intra-band contiguous CA

This clause specifies the requirements for the specified intra-band contiguous carrier aggregation configurations for coexistence with protected bands, the requirements in Table 6.5A.3.2.1-1 apply. For power class 2 intra-band contiguous carrier aggregation, the spurious emissions is measured as the sum from both UE transmit antenna connectors when UE indicates support for *dualPA-Architecture* IE.

**NOTE:** For measurement conditions at the edge of each frequency range, the lowest frequency of the measurement position in each frequency range should be set at the lowest boundary of the frequency range plus MBW/2. The highest frequency of the measurement position in each frequency range should be set at the highest boundary of the frequency range minus MBW/2. MBW denotes the measurement bandwidth defined for the protected band.

This results in an overall exception interval centred at the harmonic emission of (2 MHz + N x L <sub>CRB</sub> x R <sub>Bsize</sub> kHz), where N is 2, 3, 4, 5 for the 2nd, 3rd, 4th or 5th harmonic respectively. The exception is allowed if the measurement bandwidth (MBW) totally or partially overlaps the overall exception interval. |  |                       |   |                      |                     |           |      |

### 6.5A.3.2.2 Spurious emissions for UE co-existence for intra-band non-contiguous CA

This clause specifies the requirements for the specified intra-band non-contiguous carrier aggregation configurations for coexistence with protected bands, the requirements in Table 6.5A.3.2.2-1 apply.

NOTE: For measurement conditions at the edge of each frequency range, the lowest frequency of the measurement position in each frequency range should be set at the lowest boundary of the frequency range plus MBW/2. The highest frequency of the measurement position in each frequency range should be set at the highest boundary of the frequency range minus MBW/2. MBW denotes the measurement bandwidth defined for the protected band.

| <p>NOTE 1: As exceptions, measurements with a level up to the applicable requirements defined in Table 6.5.3.1-2 are permitted for each assigned NR carrier used in the measurement due to 2nd, 3rd, 4th or 5th harmonic spurious emissions. Due to spreading of the harmonic emission the exception is also allowed for the first 1 MHz frequency range immediately outside the harmonic emission on both sides of the harmonic emission. This results in an overall exception interval centred at the harmonic emission of <math>(2 \text{ MHz} + N \times L_{\text{CRB}} \times R_{\text{Bsize}} \text{ kHz})</math>, where N is 2, 3, 4, 5 for the 2nd, 3rd, 4th or 5th harmonic respectively. The exception is allowed if the measurement bandwidth (MBW) totally or partially overlaps the overall exception interval.</p> <p>NOTE 2: This requirement applies when the NR carrier is confined within 2545 – 2575 MHz or 2595 – 2645 MHz and the channel bandwidth is 10 or 20 MHz</p> |   |                       |   |                      |                     |           |      |

### 6.5A.3.2.3 Spurious emissions for UE co-existence for Inter-band CA

For inter-band carrier aggregation with two contiguous carriers assigned to one NR band, the requirements in subclause 6.5A.3.2.1 apply for that band.

For inter-band carrier aggregation with two uplink non-contiguous carrier assigned to one NR band, the spurious emissions for UE co-existence requirements in subclause 6.5A.3.2.2 apply for that band.

For inter-band carrier aggregation with the uplink assigned to two NR bands, the requirements in Table 6.5A.3.2.3-1 apply on each component carrier with all component carriers are active.

NOTE: For inter-band carrier aggregation with uplink assigned to two NR bands the requirements in Table 6.5A.3.2.3-1 could be verified by measuring spurious emissions at the specific frequencies where second and third order intermodulation products generated by the two transmitted carriers can occur; in that case, the requirements for remaining applicable frequencies in Table 6.5A.3.2.3-1 would be considered to be verified by the measurements verifying the one uplink inter-band CA UE to UE co-existence requirements.

- NOTE 1:  $F_{DL\_low}$  and  $F_{DL\_high}$  refer to each frequency band specified in Table 5.2-1 in TS 38.101-1 or Table 5.5-1 in TS 36.101
- NOTE 2: As exceptions, measurements with a level up to the applicable requirements defined in Table 6.5.3.1-2 are permitted for each assigned NR carrier used in the measurement due to 2nd, 3rd, 4th or 5th harmonic spurious emissions. Due to spreading of the harmonic emission the exception is also allowed for the first 1 MHz frequency range immediately outside the harmonic emission on both sides of the harmonic emission. This results in an overall exception interval centred at the harmonic emission of  $(2 \text{ MHz} + N \times L_{CRB} \times 180\text{kHz})$ , where N is 2, 3, 4, 5 for the 2nd, 3rd, 4th or 5th harmonic respectively. The exception is allowed if the measurement bandwidth (MBW) totally or partially overlaps the overall exception interval.
- NOTE 3: Applicable when co-existence with PHS system operating in 1884.5 -1915.7 MHz
- NOTE 4: These requirements also apply for the frequency ranges that are less than  $F_{OoB}$  (MHz) in Table 6.5.3.1-1 from the edge of the channel bandwidth.
- NOTE 5: Void.
- NOTE 6: This requirement is applicable for any channel bandwidths within the range 1920 – 1980 MHz with the following restriction: for carriers of 15 MHz bandwidth when carrier centre frequency is within the range 1927.5 - 1929.5 MHz and for carriers of 20 MHz bandwidth when carrier centre frequency is within the range 1930 – 1938 MHz the requirement is applicable only for an uplink transmission bandwidth less than or equal to 54 RB.
- NOTE 7: For these adjacent bands, the emission limit could imply risk of harmful interference to UE(s) operating in the protected operating band.
- NOTE 8: This requirement is only applicable for carriers with bandwidth confined within 1885-1920 MHz (requirement for carriers with at least 1RB confined within 1880 - 1885 MHz is not specified). This requirement applies for an uplink transmission bandwidth less than or equal to 54 RB for carriers of 15 MHz bandwidth when carrier center frequency is within the range 1892.5 - 1894.5 MHz and for carriers of 20 MHz bandwidth when carrier center frequency is within the range 1895 - 1903 MHz.
- NOTE 9: Void.
- NOTE 10: Void.
- NOTE 11: Applicable when the assigned NR carrier is confined within 718 MHz and 748 MHz and when the channel bandwidth used is 5 or 10 MHz.
- NOTE 12: As exceptions, measurements with a level up to the applicable requirement of -38 dBm/MHz is permitted for each assigned NR carrier used in the measurement due to 2<sup>nd</sup> harmonic spurious emissions. An exception is allowed if there is at least one individual RB within the transmission bandwidth (see Figure 5.3.1-1) for which the 2<sup>nd</sup> harmonic totally or partially overlaps the measurement bandwidth (MBW).
- NOTE 13: This requirement is applicable for 5 and 10 MHz NR channel bandwidth allocated within 718 - 728 MHz. For carriers of 10 MHz bandwidth, this requirement applies for an uplink transmission bandwidth less than or equal to 30 RB with  $RB_{start} > 1$  and  $RB_{start} < 48$ .
- NOTE 14: This requirement is applicable in the case of a 10 MHz NR carrier confined within 703 MHz and 733 MHz, otherwise the requirement of -25 dBm with a measurement bandwidth of 8 MHz applies.
- NOTE 15: As exceptions, measurements with a level up to the applicable requirement of -36 dBm/MHz is permitted for each assigned E-UTRA carrier used in the measurement due to 3rd harmonic spurious emissions. An exception is allowed if there is at least one individual RB within the transmission bandwidth (see Figure 5.6-1) for which the 3rd harmonic totally or partially overlaps the measurement bandwidth (MBW).
- NOTE 17: Void.
- NOTE 18: This requirement is applicable for any channel bandwidths within the range 2500 – 2570 MHz with the following restriction: for carriers of 15 MHz bandwidth when carrier centre frequency is within the range 2560.5 - 2562.5 MHz and for carriers of 20 MHz bandwidth when carrier centre frequency is within the range 2552 – 2560 MHz the requirement is applicable only for an uplink transmission bandwidth less than or equal to 54 RB.
- NOTE 19: This requirement is applicable for power class 3 UE for any channel bandwidths within the range 2570 - 2615 MHz with the following restriction: for carriers of 15 MHz bandwidth when carrier centre frequency is within the range 2605.5 - 2607.5 MHz and for carriers of 20 MHz bandwidth when carrier centre frequency is within the range 2597 - 2605 MHz the requirement is applicable only for an uplink transmission bandwidth less than or equal to 54 RB. For power class 2 or 3 UE for carriers with channel bandwidth overlapping the frequency range 2615 - 2620 MHz the requirement applies with the maximum output power configured to +19 dBm in the IE P-Max.
- NOTE 20: Applicable for cases and when the lower edge of the assigned NR UL channel bandwidth frequency is greater than or equal to 1427 MHz + the channel BW assigned for 5 and 10 MHz bandwidth, and when the lower edge of the assigned NR UL channel bandwidth frequency is greater than or equal to 1440 MHz for 15 and 20 MHz bandwidth.
- NOTE 21: Applicable for 5 MHz bandwidth, and when the upper edge of the assigned NR UL channel bandwidth frequency is less than or equal to 1467 MHz assigned for 10 MHz bandwidth, and when the upper edge of the assigned NR UL channel bandwidth frequency is less than or equal to 1463.8 MHz for 15 MHz bandwidth, and when the upper edge of the assigned NR UL channel bandwidth.
- NOTE 22: As exceptions, for 90 and 100 MHz channel bandwidth, -40 dBm/MHz is applicable in the frequency range of 2496 – 2505 MHz.

NOTE 23: For these adjacent bands, the emission limit could imply risk of harmful interference to UE(s) operating in the protected operating band if the measurement bandwidth (MBW) totally or partially overlaps the overall exception interval.

NOTE: To simplify Table 6.5A.3.2.3-1, E-UTRA band numbers are listed for bands which are specified only for E-UTRA operation or both E-UTRA and NR operation. NR band numbers are listed for bands which are specified only for NR operation.

**Table 6.5E.2.3.1-1: Additional spectrum mask requirements for 10MHz channel bandwidth**

| Spectrum emission limit (dBm EIRP)/ Channel bandwidth |  |                          |
|---|--|--------------------------|
| $\Delta f_{\text{OOB}}$<br>(MHz)                      | 10 MHz   | Measurement<br>bandwidth |
| $\pm 0-0.5$   | $[-13 - 12 \left( \frac{ \Delta f_{\text{OOB}} }{\text{MHz}} \right)]$                 | 100 kHz                  |
| $\pm 0.5-5$   | $[-19 - \frac{16}{9} \left( \frac{ \Delta f_{\text{OOB}} }{\text{MHz}} - 0.5 \right)]$ | 100 kHz                  |
| $\pm 5-10$  | $[-27 - 2 \left( \frac{ \Delta f_{\text{OOB}} }{\text{MHz}} - 5.0 \right)]$            | 100 kHz                  |

NOTE 1: As a general rule, the resolution bandwidth of the measuring equipment should be equal to the measurement bandwidth. However, to improve measurement accuracy, sensitivity and efficiency, the resolution bandwidth may be smaller than the measurement bandwidth. When the resolution bandwidth is smaller than the measurement bandwidth, the result should be integrated over the measurement bandwidth in order to obtain the equivalent noise bandwidth of the measurement bandwidth.

NOTE 2: Additional SEM for NR V2X overrides any other requirements in frequency range 5855-5950MHz.

| $\pm 20-40$                   | -43                  | 100kHz                |

When UE is configured for NR V2X sidelink transmissions non-concurrent with NR uplink transmissions for NR V2X operating bands specified in Table 5.2E.1-1, the general spurious emission requirements in clause 6.5.3.1 shall apply for NR V2X sidelink transmission.

For NR V2X UE with two transmit antenna connectors, the requirements specified for single carrier shall apply to each transmit antenna connector. The requirements shall be met with the SL MIMO configurations described in clause 6.2D.1.

### 6.5E.3.2 Spurious emissions for UE co-existence

When UE is configured for NR V2X sidelink transmissions non-concurrent with NR uplink transmissions for NR V2X operating bands specified in Table 5.2E.1-1, the requirements in clause 6.5.3.2 shall apply for NR V2X sidelink transmission.

For NR V2X UE with two transmit antenna connectors, the requirements specified for single carrier shall apply to each transmit antenna connector. The requirements shall be met with the SL MIMO configurations described in clause 6.2D.1.

### 6.5E.3.3 Spurious emissions for UE co-existence for V2X con-current operation

For the inter-band con-current NR V2X operation, the UE-coexistence requirements in Table 6.5E.3.3-1 apply for the corresponding inter-band con-current operation with transmission assigned to both uplink in licensed band and sidelink in Band n47.

NOTE 1: As exceptions, measurements with a level up to the applicable requirements defined in Table 6.6.3.1-2 are permitted for each assigned E-UTRA carrier used in the measurement due to 2<sup>nd</sup>, 3<sup>rd</sup>, 4<sup>th</sup> or 5<sup>th</sup> harmonic spurious emissions. In case the exceptions are allowed due to spreading of the harmonic emission the exception is also allowed for the first 1 MHz frequency range immediately outside the harmonic emission on both sides of the harmonic emission. This results in an overall exception interval centred at the harmonic emission of (2MHz + N x L<sub>CRB</sub> x 180kHz), where N is 2, 3 or 4 for the 2<sup>nd</sup>, 3<sup>rd</sup> or 4<sup>th</sup> harmonic respectively. The exception is allowed if the measurement bandwidth (MBW) totally or partially overlaps the overall exception interval.

NOTE 2: These requirements also apply for the frequency ranges that are less than F<sub>OOB</sub> (MHz) in Table 6.6.3.1-1 and Table 6.6.3.1A-1 from the edge of the aggregated channel bandwidth.

NOTE 3: Applicable when NS\_33 is configured by the pre-configured radio parameters for power class 3 V2X UE.

NOTE 4: In the frequency range x-5950MHz, SE requirement of -30dBm/MHz should be applied; where x = max (5925, f<sub>c</sub> + 15), where f<sub>c</sub> is the channel centre frequency.

For the intra-band NR V2X transmission where  $U_u$  and  $S_L$  overlap in time, the UE-coexistence requirements in Table 6.5A.3.2.1-1 apply for the corresponding intra-band concurrent operation for the both uplink and sidelink transmission in licensed band.

### 6.5E.4 Transmit intermodulation

#### 6.5E.4.1 General

When UE is configured for NR V2X sidelink transmissions non-concurrent with NR uplink transmissions for NR V2X operating bands specified in Table 5.2E.1-1, the requirements in clause 6.5.4 apply for NR V2X sidelink transmission.

For NR V2X UE with two transmit antenna connectors, the requirements specified for single carrier shall apply to each transmit antenna connector. The requirements shall be met with the SL MIMO configurations described in clause 6.2D.1.

#### 6.5E.4.2 Transmit intermodulation for V2X concurrent operation

For the inter-band concurrent NR V2X operation, the requirements specified in clause 6.5.4 shall apply for the uplink in licensed band and the requirements specified in clause 6.5E.4.1 shall apply for the sidelink in licensed band or Band n47.

For the intra-band NR V2X operation where  $U_u$  and  $S_L$  transmission overlaps in time, the requirements specified in clause 6.5A.4 shall apply for both uplink and sidelink in licensed band

## 6.5F Output RF spectrum emissions

### 6.5F.1 Occupied bandwidth

The requirements for occupied bandwidth in clause 6.5.1 apply for the specified NR-U channel bandwidths in Table 5.3.5-1.

### 6.5F.2 Out of band emission

#### 6.5F.2.1 General

The Out of band emissions are unwanted emissions immediately outside the assigned channel bandwidth resulting from the modulation process and non-linearity in the transmitter but excluding spurious emissions. This out of band emission limit is specified in terms of a spectrum emission mask and an adjacent channel leakage power ratio.

To improve measurement accuracy, sensitivity and efficiency, the resolution bandwidth may be smaller than the measurement bandwidth. When the resolution bandwidth is smaller than the measurement bandwidth, the result should be integrated over the measurement bandwidth in order to obtain the equivalent noise bandwidth of the measurement bandwidth.

#### 6.5F.2.2 Spectrum emission mask for operation with shared spectrum channel access

Instead of the general spectrum emission mask requirement in clause 6.5.2.2, when operating with shared spectrum channel access the relative power of any UE emission shall not exceed the levels specified in Table 6.5F.2.2-1 for the specified channel bandwidth or -30 dBm/MHz whichever is the greatest. The spectrum emission mask for operation with shared spectrum channel access is defined relative to the maximum power density in a 1 MHz measurement bandwidth within the channel bandwidth.

The spectrum emission mask for operation with shared spectrum channel access applies to frequencies ( $\Delta f_{OOB}$ ) starting from the  $\pm$  edge of the assigned channel bandwidth. For frequencies offset greater than  $\Delta f_{OOB}$ , the spurious requirements in clause 6.5.3 are applicable.

**Table 6.5F.2.2-1: Spectrum emission mask for operation with shared spectrum channel access**

| Spectrum emission limit (dBr) / Channel bandwidth  |  |                                |
|--|--|--------------------------------|
| $\Delta f_{OOB}$<br>(MHz)  | 10, 20, 40, 60, 80, 100 MHz  | Measurement bandwidth<br>(MBW) |
| $\pm 0-1$  | $-20  \Delta f_{OOB} $   | $[100\text{kHz}]^3$            |
| $\pm 1-(BW_{\text{Channel}} / 2)$  | $-20 - (8 / A)  \Delta f_{OOB} - 1 $ where $A = (BW_{\text{Channel}} / 2) - 1$ | 1 MHz                          |
| $\pm (BW_{\text{Channel}} / 2) - BW_{\text{Channel}}$  | $-16 - (6 / BW_{\text{Channel}})  \Delta f_{OOB} $                             |                                |
| $< - BW_{\text{Channel}}$ or $> BW_{\text{Channel}}$   | -40  |                                |
| NOTE 1: Void<br>NOTE 2: Void<br>NOTE 3: The measured value shall be scaled by a factor equal to the ratio of the reference bandwidth (1 MHz) to the measurement bandwidth before the emission limit (dBr) is applied.<br>NOTE 4: The carrier leakage exceptions from Table 6.4F.2.3-1 apply and carrier leakage contribution shall be removed prior to setting the 0dBr level of the mask, the reported carrier frequency location in <i>txDirectCurrentLocation</i> field of the <i>UplinkTxDirectCurrentBWP</i> can be used to cancel the carrier leakage contribution. If <i>txDirectCurrentLocation</i> is not available or is reported with value 3300 or 3301, a carrier frequency location at the center of the channel shall be assumed. |  |                                |

For measurement conditions at the edge of each frequency range, the lowest frequency of the measurement position in each frequency range should be set at the lowest boundary of the frequency range plus MBW/2. The highest frequency of the measurement position in each frequency range should be set at the highest boundary of the frequency range minus MBW/2.

### 6.5F.2.2.1 Spectrum emission mask for non-transmitted channels

In the case of non-transmitted 20 MHz channel(s) on the edges of an assigned channel bandwidth the spectrum emission mask for operation with shared spectrum channel access, specified in Table 6.5F.2.2-1, is applied by using the total bandwidth of the remaining transmitted channels. The spectrum emission mask for non-transmitted channels is floored at -28dB.

The relative power of any UE emission shall not exceed the most stringent levels given by the spectrum emission mask for operation with shared spectrum channel access with full channel bandwidth and the spectrum emission mask for non-transmitted channels with the channel bandwidth of the transmitted channels in the case of non-transmitted channels at the edge of an assigned channel bandwidth.

An exception to the spectrum emission mask for non-transmitted channels allows a single [2] MHz bandwidth to extend to [-28] dBc relative to total transmit power, or [-20] dBm, whichever is the greatest.

### 6.5F.2.3 Additional spectrum emission mask

There are no additional spectrum emission mask requirements in this version of the specification.

### 6.5F.2.4 Adjacent channel leakage ratio

Adjacent Channel Leakage power Ratio (ACLR) is the ratio of the filtered mean power centred on the assigned channel frequency to the filtered mean power centred on an adjacent channel frequency.

To improve measurement accuracy, sensitivity and efficiency, the resolution bandwidth may be smaller than the measurement bandwidth. When the resolution bandwidth is smaller than the measurement bandwidth, the result should be integrated over the measurement bandwidth in order to obtain the equivalent noise bandwidth of the measurement bandwidth.

#### 6.5F.2.4.1 Shared spectrum channel access ACLR

The Adjacent Channel Leakage power Ratio is the ratio of the filtered mean power centred on the assigned channel frequency to the filtered mean power centred on an adjacent channel frequency at nominal channel spacing. The assigned channel power and adjacent channel power are measured with rectangular filters with measurement bandwidths specified in Table 6.5.2.4.1-1.

Instead of the general ACLR requirement in clause 6.5.2.4, if the measured adjacent channel power is greater than -47 dBm then the ACLR shall be higher than the value specified in Table 6.5F.2.4.1-1.

**Table 6.5F.2.4.1-1: Shared spectrum channel access ACLR requirement**

|      | Power class 5 |
|------|---------------|
| ACLR | 27 dB         |

#### 6.5F.2.4.2 Additional requirement for network signaled value "NS\_29"

When "NS\_29" is indicated in the cell, the UE emission shall meet the additional requirements specified in Table 6.5F.2.4.2-1 for shared spectrum channels assigned within 5150 – 5350 MHz and 5470 – 5730 MHz.

**Table 6.5F.2.4.2-1: ACLR2 requirement for "NS\_29"**

| Power class 5                                  | 20 MHz    | 40 MHz    | 60, 80 MHz |
|--|-----------|-----------|------------|
| ACLR2  | 40 dB     | 40 dB     | N/A        |
| Measurement bandwidth                          | 20 MHz    | 40 MHz    | N/A        |
| Adjacent channel center frequency offset (MHz) | +40 / -40 | +80 / -80 | N/A        |

### 6.5F.3 Spurious emissions

Spurious emissions are emissions which are caused by unwanted transmitter effects such as harmonics emission, parasitic emissions, intermodulation products and frequency conversion products, but exclude out of band emissions

unless otherwise stated. The spurious emission limits are specified in terms of general requirements in line with SM.329 [9] and NR operating band requirement to address UE co-existence.

To improve measurement accuracy, sensitivity and efficiency, the resolution bandwidth may be smaller than the measurement bandwidth. When the resolution bandwidth is smaller than the measurement bandwidth, the result should be integrated over the measurement bandwidth in order to obtain the equivalent noise bandwidth of the measurement bandwidth.

**NOTE:** For measurement conditions at the edge of each frequency range, the lowest frequency of the measurement position in each frequency range should be set at the lowest boundary of the frequency range plus MBW/2. The highest frequency of the measurement position in each frequency range should be set at the highest boundary of the frequency range minus MBW/2. MBW denotes the measurement bandwidth defined for the protected band.

### 6.5F.3.1 General spurious emissions

The requirements for general spurious emission requirements in clause 6.5.3.1 apply.

### 6.5F.3.2 Spurious emissions for UE co-existence

Spurious emissions requirements for UE coexistence are not applicable to bands restricted to stand-alone operation with shared spectrum channel access as identified in Table 5.2-1.

### 6.5F.3.3 Additional spurious emissions

These requirements are specified in terms of an additional spectrum emission requirement. Additional spurious emission requirements are signalled by the network to indicate that the UE shall meet an additional requirement for a specific deployment scenario as part of the cell handover/broadcast message.

#### 6.5F.3.3.1 Requirement for network signalling value "NS\_28"

### 6.5F.4 Transmit intermodulation

The requirements for transmit intermodulation in clause 6.5F.4 apply.

## 6.5G Output RF spectrum emissions for Tx Diversity

### 6.5G.1 Occupied bandwidth for Tx Diversity

For UE supporting Tx diversity, the requirements for occupied bandwidth apply to the transmitted spectrum as measured as the sum of the power from all UE transmit antenna connectors. The occupied bandwidth is defined as the bandwidth containing 99 % of the total integrated mean power of the transmitted spectrum on the assigned channel at each transmit antenna connector.

### 6.5G.2 Out of band emission for Tx Diversity

For UE supporting Tx diversity, the requirements for Out of band emissions resulting from the modulation process and non-linearity in the transmitters apply to the sum of the emissions from all UE transmit antenna connectors.

If UE indicates IE [*txDiversity-r16*], Adjacent Channel Leakage power Ratio (ACLR) is defined as the ratio of sum of the filtered mean power at each antenna connector centred on the assigned channel frequency to sum of the filtered mean power at each antenna connector centred on an adjacent channel frequency.

### 6.5G.3 Spurious emission for Tx Diversity

For UE supporting Tx diversity, the requirements for Spurious emissions which are caused by unwanted transmitter effects such as harmonics emission, parasitic emissions, intermodulation products and frequency conversion products apply to the sum of the emissions from all UE transmit antenna connectors.

### 6.5G.4 Transmit intermodulation for Tx Diversity

For UE supporting Tx diversity, the transmit intermodulation requirements are specified at each transmit antenna connector and the wanted signal is defined as the sum of output power from all UE transmit antenna connectors.

The requirements shall be met with the UL MIMO configurations described in clause 6.2H.1.1.

If UE is scheduled for single antenna-port PUSCH transmission by DCI format 0\_0 or by DCI format 0\_1 for single antenna port codebook based transmission, the requirements in clause 6.5A.4 apply.

## 6.6 Void

### 6.6E Time alignment error

For V2X UE(s) with two transmit antenna connectors in SL MIMO, this requirement applies to slot timing differences between transmissions on two transmit antenna connectors. The Time Alignment Error (TAE) shall not exceed 260 ns.

## 7 Receiver characteristics

### 7.1 General

Unless otherwise stated the receiver characteristics are specified at the antenna connector(s) of the UE. For UE(s) with an integral antenna only, a reference antenna(s) with a gain of 0 dBi is assumed for each antenna port(s). UE with an integral antenna(s) may be taken into account by converting these power levels into field strength requirements, assuming a 0 dBi gain antenna. For UEs with more than one receiver antenna connector, identical interfering signals shall be applied to each receiver antenna port if more than one of these is used (diversity).

The levels of the test signal applied to each of the antenna connectors shall be as defined in the respective clauses below.

The applicability of receiver requirements for Band n90 is in accordance with that for Band n41; a UE supporting Band n90 shall meet the minimum requirements for Band n41.

With the exception of clause 7.3, the requirements shall be verified with the network signalling value NS\_01 configured (Table 6.2.3-1).

All the parameters in clause 7 are defined using the UL reference measurement channels specified in Annex A.2.2, the DL reference measurement channels specified in Annex A.3.2 and using the set-up specified in Annex C.3.1.

The minimum requirements specified in clauses 7.5, 7.6, 7.7 and 7.8 for NR band n48 refer to the minimum requirements for NR bands < 2.7 GHz.

For the additional requirements for intra-band non-contiguous carrier aggregation of two or more sub-blocks, an in-gap test refers to the case when the interfering signal is located at a negative offset with respect to the assigned lowest channel frequency of the highest sub-block and located at a positive offset with respect to the assigned highest channel frequency of the lowest sub-block.

For the additional requirements for intra-band non-contiguous carrier aggregation of two or more sub-blocks, an out-of-gap test refers to the case when the interfering signal(s) is (are) located at a positive offset with respect to the assigned channel frequency of the highest carrier frequency, or located at a negative offset with respect to the assigned channel frequency of the lowest carrier frequency.

For the additional requirements for intra-band non-contiguous carrier aggregation of two or more sub-blocks with channel bandwidth larger than or equal to 5 MHz, the existing adjacent channel selectivity requirements, in-band blocking requirements (for each case), and narrow band blocking requirements apply for in-gap tests only if the corresponding interferer frequency offsets with respect to the two measured carriers satisfy the following condition in relation to the sub-block gap size  $W_{\text{gap}}$  for at least one of these carriers  $j = 1, 2$ , so that the interferer frequency position does not change the nature of the core requirement tested:

$$W_{\text{gap}} \geq 2 \cdot |F_{\text{Interferer (offset)}_j} - BW_{\text{Channel}(j)}|$$

where  $F_{\text{Interferer (offset)}_j}$  for a sub-block with a single component carrier is the interferer frequency offset with respect to carrier  $j$  as specified in clause 7.5, clause 7.6.2 and clause 7.6.4 for the respective requirement and  $BW_{\text{Channel}(j)}$  the channel bandwidth of carrier  $j$ .  $F_{\text{Interferer (offset)}_j}$  for a sub-block with two or more contiguous component carriers is the interference frequency offset with respect to the carrier adjacent to the gap is specified in clause 7.5A, 7.6A.2 and 7.6A.3. The interferer frequency offsets for adjacent channel selectivity, each in-band blocking case and narrow-band blocking shall be tested separately with a single in-gap interferer at a time.

For the additional requirements for operation with shared spectrum channel access, the receiver requirements apply under the assumption that all 20 MHz sub-bands and all RB's of each sub-band within the downlink channel are allocated with intra-cell guard bands configured to zero.

#### 7.1A General

The minimum requirements for band combinations including Band n41 also apply for the corresponding band combinations with Band n90 replacing Band n41 but with otherwise identical parameters. For brevity the said band combinations with Band n90 are not listed in the tables below but are covered by this specification.

The minimum requirements specified in clauses 7.5A, 7.6A, 7.7A and 7.8A for NR band n48 refer to the minimum requirements for NR bands < 2.7 GHz.

## 7.1F General

For wideband operations, the minimum requirements for the receiver characteristics are specified when zero width intra-cell guardbands are configured and with all RB set(s) within the channel scheduled and with all RB sets available for DL transmissions according to the channel access procedures in [14].

## 7.1I General

For a Redcap UE the requirements in Section 7 shall be verified with the channel bandwidth up to 20MHz and REFSSENS specified in clause 7.3I.

## 7.2 Diversity characteristics

The UE is required to be equipped with a minimum of two Rx antenna ports in all operating bands except for the bands n7, n38, n41, n48, n77, n78, n79 where the UE is required to be equipped with a minimum of four Rx antenna ports. This requirement applies when the band is used as a standalone band or as part of a band combination.

For the single carrier REFSSENS requirements in Clause 7, the UE shall be verified with two Rx antenna ports in all supported frequency bands, additional requirements for four Rx ports shall be verified in operating bands where the UE is equipped with four Rx antenna ports.

For Rx requirements other than single carrier REFSSENS in Clause 7, the UE shall be verified with four Rx antenna ports and skip two Rx antenna ports requirements in operating bands where the UE is equipped with four Rx antenna ports, otherwise, the UE shall be verified with two Rx antenna ports.

The above rules apply for all clauses with the exception of clause 7.9.

A Redcap UE is required to be equipped with a minimum of single Rx antenna port and maximum of two Rx antenna ports. Clause 7 requirements for four Rx antenna ports do not apply to a RedCap UE.

## 7.3 Reference sensitivity

### 7.3.1 General

The reference sensitivity power level REFSSENS is the minimum mean power applied to each one of the UE antenna ports for all UE categories, at which the throughput shall meet or exceed the requirements for the specified reference measurement channel.

In later clauses of Clause 7 where the value of REFSSENS is used as a reference to set the corresponding requirement:

in all bands, the UE shall be verified against those requirements by applying the REFSSENS value in Table 7.3.2-1a, Table 7.3.2-1b and Table 7.3.2-1c or Table 7.3.2-1d with 2 Rx antenna ports tested;

for bands where the UE is required to be equipped with 4 Rx antenna ports, the UE shall additionally be verified against those requirements by applying the resulting REFSSENS value derived from the requirement in Table 7.3.2-2 with 4 Rx antenna ports tested.

### 7.3.2 Reference sensitivity power level

The throughput shall be  $\geq 95$  % of the maximum throughput of the reference measurement channels as specified in Annexes A.2.2.2, A3.2 and A.3.3 (with one sided dynamic OCNG Pattern OP.1 FDD/TDD for the DL-signal as described in Annex A.5.1.1/A.5.2.1) with parameters specified in Table 7.3.2-1a, Table 7.3.2-1b, Table 7.3.2-1c, Table 7.3.2-1d and Table 7.3.2-2.

NOTE 1: Four Rx antenna ports shall be the baseline for this operating band except for two Rx vehicular UE. Four Rx antenna ports for RedCap UE is not supported for this operating band.  
 NOTE 2: The transmitter shall be set to P<sub>UMAX</sub> as defined in clause 6.2.4.  
 NOTE 3: Void  
 NOTE 4: The requirement is modified by -0.5 dB when the assigned UE channel bandwidth is confined within 3300 - 3800 MHz.  
 NOTE 5: For these bandwidths, the minimum requirements are restricted to operation when carrier is configured as a downlink carrier part of CA configuration.  
 NOTE 6: Void  
 NOTE 7: For SDL bands, the reference sensitivity requirements shall be verified by inter-band CA combinations with SDL band, which are supported by UE.  
 NOTE 8: The REFSSENS value is rounded to the nearest number down to one decimal point. "N<sub>RB</sub>" in REFSSENS formula is the maximum transmission bandwidth configuration as defined in Table 5.3.2-1.  
 NOTE 9: 5 MHz only applies to n90, not n41

For power class 2 UEs, certain degradation of the reference sensitivity in Table 7.3.2-1a is allowed. The maximum amount of degradation is specified in Table 7.3.2-1c, and in Table 7.3.2-1d for a UE that indicates *txDiversity-r16* [15].

For UE(s) equipped with 4 Rx antenna ports, reference sensitivity for 2Rx antenna ports in Table 7.3.2-1a and in Table 7.3.2-1b shall be modified by the amount given in ΔR<sub>IB,4R</sub> in Table 7.3.2-2 for the applicable operating bands.

### 7.3.3 $\Delta R_{IB,c}$

For a UE supporting CA, SUL or DC band combination, the minimum requirement for reference sensitivity in Table 7.3.2-1a and Table 7.3.2-1b shall be increased by the amount given by  $\Delta R_{IB,c}$  defined in clause 7.3A, 7.3B, 7.3C in this specification and 7.3A, 7.3B in TS 38.101-3 [3] for the applicable operating bands.

In case the UE supports more than one of band combinations for CA, SUL or DC, and an operating band belongs to more than one band combinations then

- When the operating band frequency range is  $\leq 1$  GHz, the applicable additional  $\Delta R_{IB,c}$  shall be the average value for all band combinations defined in clause 7.3A, 7.3B, 7.3C in this specification and 7.3A, 7.3B in TS 38.101-3 [3], truncated to one decimal place that apply for that operating band among the supported band combinations. In case there is a harmonic relation between low band UL and high band DL, then the maximum  $\Delta R_{IB,c}$  among the different supported band combinations involving such band shall be applied
- When the operating band frequency range is  $> 1$  GHz, the applicable additional  $\Delta R_{IB,c}$  shall be the maximum value for all band combinations defined in clause 7.3A, 7.3B, 7.3C in this specification and 7.3A, 7.3B in TS 38.101-3 [3] for the applicable operating bands.

## 7.3A Reference sensitivity for CA

### 7.3A.1 General

The reference sensitivity power level REFSENS is the minimum mean power applied to each one of the UE antenna ports for all UE categories, at which the throughput shall meet or exceed the requirements for the specified reference measurement channel.

### 7.3A.2 Reference sensitivity power level for CA

#### 7.3A.2.1 Reference sensitivity power level for Intra-band contiguous CA

For intra-band contiguous carrier aggregation, the throughput of each component carrier shall be  $\geq 95$  % of the maximum throughput of the reference measurement channels as specified in Annexes A.2.2.2, A.3.2, and A.3.3 (with one sided dynamic OCN Pattern OP.1 FDD/TDD for the DL-signal as described in Annex A.5.1.1/A.5.2.1) with parameters specified in Table 7.3.2-1a, Table 7.3.2-1b, Table 7.3.2-2, and Table 7.3.2-3.

For UE(s) supporting one uplink carrier, the uplink configuration of the PCC shall be in accordance with Table 7.3.2-3 and the downlink PCC carrier center frequency shall be configured closer to uplink operating band than any of the downlink SCC center frequency.

For aggregation of two or more downlink FDD carriers with two uplink carriers, the reference sensitivity is defined only for the specific uplink and downlink test points which are specified in Table 7.3A.2.1-1 and the reference sensitivity power level increased by  $\Delta R_{IBC}$ . The requirements apply with all downlink carriers active. Unless given by Table 7.3.2-4, the reference sensitivity requirements shall be verified with the network signaling value NS\_01 (Table 6.2.3.1-1) configured.

**Table 7.3A.2.1-1: Intra-band contiguous CA uplink configuration for reference sensitivity**

| CA configuration | SCS (PCC/SCC) (kHz) | Aggregated channel bandwidth (PCC+SCC) | UL PCC allocation ( $L_{CRB}$ ) | UL SCC allocation ( $L_{CRB}$ ) | PCC $\Delta R_{IBC}$ (dB) | SCC $\Delta R_{IBC}$ (dB) | Duplex mode |
|------------------|---------------------|--|---------------------------------|---------------------------------|---------------------------|---------------------------|-------------|
| CA_n5B           | 15/15               | 10MHz + 10MHz                          | 10 ( $RB_{start} = 0$ )         | 10 ( $RB_{start} = 42$ )        | 30.8                      | 26.1                      | FDD         |
| CA_n7B           | 15/15               | 10MHz + 40MHz                          | 9 ( $RB_{start} = 26$ )         | 36 ( $RB_{start} = 180$ )       | 34                        | 25                        | FDD         |

NOTE 1: All combinations of channel bandwidths defined in Table 5.5A.1-1.

NOTE 2: The carrier centre frequency of SCC in the UL operating band is configured closer to the DL operating band.

NOTE 3: The transmitted power over both PCC and SCC shall be set to  $P_{UMAX}$  as defined in subclause 6.2A.4.

NOTE 4: The PCC allocation is same as Transmission bandwidth configuration  $N_{RB}$  as defined in Table 5.3.2-1.

### 7.3A.2.2 Reference sensitivity power level for Intra-band non-contiguous CA

For intra-band non-contiguous carrier aggregation with one uplink carrier and two or more downlink sub-blocks, throughput of each downlink component carrier shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annexes A.2.2 and A.3.2 (with one sided dynamic OCNG Pattern OP.1 FDD/TDD for the DL-signal as described in Annex A.5.1.1/A.5.2.1) and parameters specified in Table 7.3.2-1a, Table 7.3.2-1b, Table 7.3.2-2, and Table 7.3A.2.2-1 with the reference sensitivity power level increased by  $\Delta R_{IBC}$  given in Table 7.3A.2.2-1 for the SCC(s).

For aggregation of two or more downlink FDD carriers with one uplink carrier the reference sensitivity is defined only for the specific uplink and downlink test points which are specified in Table 7.3A.2.2-1. The requirements apply with all downlink carriers active. Unless given by Table 7.3.2-4, the reference sensitivity requirements shall be verified with the network signaling value NS\_01 (Table 6.2.3.1-1) configured.

NOTE 1: All combinations of channel bandwidths defined in Table 5.5A.2-1.  
NOTE 2: All applicable sub-block gap sizes.  
NOTE 3: The PCC allocation is same as Transmission bandwidth configuration  $N_{\text{RB}}$  as defined in Table 5.3.2-1.  
NOTE 4: The carrier center frequency of PCC in the DL operating band is configured closer to the UL operating band.  
NOTE 5: Refers to the UL resource blocks shall be located as close as possible to the downlink operating band but confined within the transmission.  
NOTE 6:  $W_{\text{gap}}$  is the sub-block gap between the two sub-blocks.  
NOTE 7: The carrier centre frequency of SCC in the DL operating band is configured closer to the UL operating band.  
NOTE 8: For operation with three or more non-contiguous component carriers,  $\Delta R_{\text{IBNC}}$  applies to all secondary component carriers.

### 7.3A.2.3 Reference sensitivity power level for Inter-band CA

For inter-band carrier aggregation with one component carrier per operating band and the uplink assigned to one NR band the throughput shall be  $\geq 95$  % of the maximum throughput of the reference measurement channels as specified in Annexes A.2.2.2, A.3.2, and A.3.3 (with one sided dynamic OCNG Pattern OP.1 FDD/TDD for the DL-signal as described in Annex A.5.1.1/A.5.2.1 with parameters specified in Table 7.3.2-1a, Table 7.3.2-1b, Table 7.3.2-2 and Table 7.3.2-3 modified in accordance with clause 7.3A.3.2. The reference sensitivity is defined to be met with all downlink component carriers active and one of the uplink carriers active. Exceptions to reference sensitivity are allowed in accordance with clause 7.3A.4, 7.3A.5 and 7.3A.6.

For the combination of intra-band and inter-band carrier aggregation, the intra-band CA relaxation,  $\Delta R_{\text{IBC}}$  and  $\Delta R_{\text{IBNC}}$ , are also applied according to the clause 7.3A.2.1 and 7.3A.2.2.

### 7.3A.2.4 Void

### 7.3A.3 $\Delta R_{IB,c}$ for CA

#### 7.3A.3.1 General

For a UE supporting a CA configuration, the  $\Delta R_{IB,c}$  applies for both SC and CA operation.

#### 7.3A.3.2 $\Delta R_{IB,c}$ for Inter-band CA

For the UE which supports inter-band carrier aggregation, the minimum requirement for reference sensitivity in clause 7.3A.2 shall be increased by the amount given by  $\Delta R_{IB,c}$  defined in clause 7.3A.3.2 for the applicable operating bands. Unless otherwise stated,  $\Delta R_{IB,c}$  is set to zero.

In case the UE supports more than one of band combinations for CA, SUL or DC, and an operating band belongs to more than one band combinations then

- When the operating band frequency range is  $\leq 1$  GHz, the applicable additional  $\Delta R_{IB,c}$  shall be the average value for all band combinations defined in clause 7.3A, 7.3B, 7.3C in this specification and 7.3A, 7.3B in TS 38.101-3 [3], truncated to one decimal place that apply for that operating band among the supported band combinations. In case there is a harmonic relation between low band UL and high band DL, then the maximum  $\Delta R_{IB,c}$  among the different supported band combinations involving such band shall be applied
- When the operating band frequency range is  $> 1$  GHz, the applicable additional  $\Delta R_{IB,c}$  shall be the maximum value for all band combinations defined in clause 7.3A, 7.3B, 7.3C in this specification and 7.3A, 7.3B in TS 38.101-3 [3] for the applicable operating bands.

| NOTE 1: The requirements only apply when the sub-frame and Tx-Rx timings are synchronized between the component carriers. In the absence of synchronization, the requirements are not within scope of these specifications. |     |                  |
| NOTE 2: Only applicable for UE supporting inter-band carrier aggregation with uplink in one NR band and without simultaneous Rx/Tx.   |     |                  |
| NOTE 3: Applicable for UE supporting inter-band carrier aggregation without simultaneous Rx/Tx.   |     |                  |
| NOTE 4: The requirement is applied for UE transmitting on the frequency range of 2515 – 2690 MHz.   |     |                  |
| NOTE 5: The requirement is applied for UE transmitting on the frequency range of 2496 – 2515 MHz.   |     |                  |
| NOTE 6: The requirement is applied for UE transmitting on the frequency range of 2545-2690 MHz.   |     |                  |

## 7.3A.4 Reference sensitivity exceptions due to UL harmonic interference for CA

Sensitivity degradation is allowed for different combinations of UL configurations and DL channel bandwidths if a band in frequency range 1 is impacted by UL harmonic interference from another band which belongs to NR band in frequency range 1 of the same downlink CA configuration. Reference sensitivity exceptions and uplink/downlink configurations due to UL harmonic from a PC3 aggressor NR UL band for either single band uplink or PC3 or PC2 CA are specified in Table 7.3A.4-1. For these exceptions, only the listed test points in Table 7.3A.4-1 are needed to be tested.

- NOTE 1: These requirements apply when there is at least one individual RE within the uplink transmission bandwidth of the aggressor (lower) band for which the 2<sup>nd</sup> / 3<sup>rd</sup> / 4<sup>th</sup> / 5<sup>th</sup> transmitter harmonic is within the downlink transmission bandwidth of a victim (higher) band.
- NOTE 2: The requirements should be verified for UL NR ARFCN of the aggressor (lower) band (superscript LB) such that  $f_{UL}^{LB} = \lfloor f_{DL}^{HB} / 0.2 \rfloor \cdot 0.1$  in MHz and  $F_{UL\_low}^{LB} + BW_{Channel}^{LB} / 2 \leq f_{UL}^{LB} \leq F_{UL\_high}^{LB} - BW_{Channel}^{LB} / 2$  with carrier frequency in the victim (higher) band in MHz and the channel bandwidth configured in the lower band.
- NOTE 3: The requirements should be verified for UL NR ARFCN of the aggressor (lower) band (superscript LB) such that  $f_{UL}^{LB} = \lfloor f_{DL}^{HB} / 0.3 \rfloor \cdot 0.1$  in MHz and  $F_{UL\_low}^{LB} + BW_{Channel}^{LB} / 2 \leq f_{UL}^{LB} \leq F_{UL\_high}^{LB} - BW_{Channel}^{LB} / 2$  with the carrier frequency in the victim (higher) band in MHz and the channel bandwidth configured in the low band.
- NOTE 4: The requirements should be verified for UL EARFCN of the aggressor (lower) band (superscript LB) such that  $f_{UL}^{LB} = \lfloor f_{DL}^{HB} / 0.4 \rfloor \cdot 0.1$  in MHz and  $F_{UL\_low}^{LB} + BW_{Channel}^{LB} / 2 \leq f_{UL}^{LB} \leq F_{UL\_high}^{LB} - BW_{Channel}^{LB} / 2$  with  $f_{DL}^{HB}$  carrier frequency in the victim (higher) band in MHz and  $BW_{Channel}^{LB}$  the channel bandwidth configured in the lower band.
- NOTE 5: The requirements should be verified for UL NR-ARFCN of the aggressor (lower) band (superscript LB) such that  $f_{UL}^{LB} = \lfloor f_{DL}^{HB} / 0.5 \rfloor \cdot 0.1$  in MHz and  $F_{UL\_low}^{LB} + BW_{Channel}^{LB} / 2 \leq f_{UL}^{LB} \leq F_{UL\_high}^{LB} - BW_{Channel}^{LB} / 2$  with  $f_{DL}^{HB}$  carrier frequency in the victim (higher) band in MHz and  $BW_{Channel}^{LB}$  the channel bandwidth configured in the lower band.
- NOTE 6: The requirements are only applicable to channel bandwidths no larger than 20 MHz and with a carrier frequency at  $\pm (20 + BW_{Channel}^{HB} / 2)$  MHz offset from  $2 f_{UL}^{LB}$  in the victim (higher) band with  $F_{UL\_low}^{LB} + BW_{Channel}^{LB} / 2 \leq f_{UL}^{LB} \leq F_{UL\_high}^{LB} - BW_{Channel}^{LB} / 2$ , where  $BW_{Channel}^{LB}$  and  $BW_{Channel}^{HB}$  are the channel bandwidths configured in the aggressor (lower) and victim (higher) bands in MHz, respectively.
- NOTE 7: For these bandwidths, the minimum requirements are restricted to operation when carrier is configured as a downlink carrier part of CA configuration.
- NOTE 8: For a UE which supports this band combination only when the Band n77 frequency range restriction defined in NOTE 12 of Table 5.2-1 applies, the MSD test point(s) cannot be verified for the band combination and the test point(s) can be skipped.
- NOTE 9: These requirements apply when the lower edge frequency of the 10 MHz, 15 MHz, or 20 MHz uplink channel in Band 71 is located at or below 668 MHz and the downlink channel in Band n25 is located with its upper edge at 1995 MHz.
- NOTE 10: These requirements apply when the lower edge frequency of the 10 MHz, 15 MHz, or 20 MHz uplink channel in Band 71 is located at or below 668 MHz and the downlink channel in Band n25 is located with its upper edge at 1995 MHz.
- NOTE 11: These requirements apply when the lower edge frequency of the uplink channel in Band n71 is located at or below 668 MHz and the downlink channel in Band n25 is located with its upper edge at 1990 MHz.
- NOTE 12: In the USA, n77 band is restricted to 3450 – 3550 MHz and 3700 – 3980 MHz. There is no UL harmonic due to n24 UL in downlink for n77 operating in 3450 – 3550 MHz and 3700 – 3980 MHz.

NOTE 1: Even though UL harmonic does not fall directly into NR-U band the exclusion region still applies.

NOTE 2: The center of the exclusion region is obtained by multiplying the UL channel center frequency by the harmonic order.

**Table 7.3A.4-3a: Void**

Sensitivity degradation is allowed for different combinations of UL configurations and DL channel bandwidths if a band is impacted by receiver harmonic mixing due to another band part which belongs to PC3 NR band or PC2 NR band of the same CA configuration. Reference sensitivity exceptions and uplink/downlink configurations due to harmonic mixing from a PC3 aggressor NR UL band for either PC3 or PC2 CA are specified in Table 7.3A.4-4 and

from a PC2 aggressor NR UL band for PC2 CA are specified in Table 7.3A.4-4a. For these exceptions, only the listed test points in Table 7.3A.4-4, Table 7.3A.4-4a and Table 7.3A.4-4b are needed to be tested.

NOTE 1: The requirements should be verified for UL NR-ARFCN of the aggressor (lower) band (superscript LB) such that  $f_{UL}^{LB} = \lfloor f_{DL}^{HB} / 0.15 \rfloor \cdot 0.1$  in MHz and  $F_{UL\_low}^{LB} + BW_{Channel}^{LB} / 2 \leq f_{UL}^{LB} \leq F_{UL\_high}^{LB} - BW_{Channel}^{LB} / 2$  with  $f_{DL}^{HB}$  carrier frequency in the victim (higher) band in MHz and  $BW_{Channel}^{LB}$  the channel bandwidth configured in the lower band.

NOTE 2: The requirements should be verified for UL NR-ARFCN of the aggressor (high) band (superscript HB) such that  $f_{UL}^{LB} = \lfloor 15 * f_{DL}^{HB} \rfloor \cdot 0.1$  in MHz and  $F_{UL\_low}^{HB} + BW_{Channel}^{HB} / 2 \leq f_{UL}^{HB} \leq F_{UL\_high}^{HB} - BW_{Channel}^{HB} / 2$  with  $f_{DL}^{LB}$  carrier frequency in the victim (lower) band in MHz and  $BW_{Channel}^{HB}$  the channel bandwidth configured in the higher band.

NOTE 3: These requirements apply when there is at least one individual RE within the downlink transmission bandwidth of the victim (lower) band for which the 3<sup>rd</sup> harmonic is within the uplink transmission bandwidth or the uplink adjacent channel's transmission bandwidth of an aggressor (higher) band.

NOTE 4: The requirements should be verified for UL NR-ARFCN of the aggressor (higher) band (superscript HB) such that  $f_{DL}^{LB} = \lfloor f_{UL}^{HB} / 0.3 \rfloor \cdot 0.1$  in MHz and  $F_{UL\_low}^{LB} + BW_{Channel}^{LB} / 2 \leq f_{UL}^{LB} \leq F_{UL\_high}^{LB} - BW_{Channel}^{LB} / 2$  with  $f_{DL}^{LB}$  the carrier frequency in the victim (lower) band and  $BW_{Channel}^{HB}$  the channel bandwidth configured in the higher band.

NOTE 5: The requirements should be verified for DL EARFCN of the victim (lower) band (superscript LB) such that  $f_{DL}^{LB} = \lfloor f_{UL}^{HB} / 0.5 \rfloor \cdot 0.1$  with  $f_{DL}^{LB}$  the DL carrier frequency in the lower band and  $f_{UL}^{HB}$  the UL carrier frequency in the higher band, both in MHz.

NOTE 6: For a UE which supports this band combination only when the Band n77 frequency range restriction defined in NOTE 12 of Table 5.2-1 applies, the MSD test point(s) cannot be verified for the band combination and the test point(s) can be skipped.

NOTE 1: The requirements should be verified for DL EARFCN of the victim (lower) band (superscript LB) such that  $f_{DL}^{LB} = \lfloor f_{UL}^{HB} / 0.5 \rfloor \cdot 0.1$  with  $f_{DL}^{LB}$  the DL carrier frequency in the lower band and  $f_{UL}^{HB}$  the UL carrier frequency in the higher band, both in MHz.

NOTE 2: For a UE which supports this band combination only when the Band n77 frequency range restriction defined in NOTE 12 of Table 5.2-1 from TS 38.101-1 applies, the MSD test point(s) cannot be verified for the band combination and the test point(s) can be skipped.

NOTE 3: The requirements should be verified for UL NR-ARFCN of the aggressor (high) band (superscript HB) such that  $f_{UL}^{LB} = \lfloor 15 * f_{DL}^{HB} \rfloor \cdot 0.1$  in MHz and  $f_{UL\_low}^{HB} + BW_{Channel}^{HB} / 2 \leq f_{UL}^{HB} \leq f_{UL\_high}^{HB} - BW_{Channel}^{HB} / 2$  with  $f_{DL}^{LB}$  carrier frequency in the victim (lower) band in MHz and  $BW_{Channel}^{LB}$  the channel bandwidth configured in the higher band.

### 7.3A.5 Reference sensitivity exceptions due to intermodulation interference due to 2UL CA

For inter-band carrier aggregation with uplink assigned to two NR bands given in Table 7.3A.5-1, Table 7.3A.5-1a, Table 7.3A.5-2 and Table 7.3A.5-2a the reference sensitivity is defined only for the specific uplink and downlink test points specified in Table 7.3A.5-1, Table 7.3A.5-1a, Table 7.3A.5-2 and Table 7.3A.5-2a. For these test points the reference sensitivity requirement specified in Table 7.3.2-1a, Table 7.3.2-1b and Table 7.3.2-2 are relaxed by the amount of the corresponding parameter MSD given in Table 7.3A.5-1, Table 7.3A.5-1a, Table 7.3A.5-2 and Table 7.3A.5-2a.

- NOTE 1: Both of the transmitters shall be set  $\min(+20 \text{ dBm}, P_{\text{CMAX\_L,f,c}})$  as defined in clause 6.2A.4
- NOTE 2:  $R_{\text{BSTART}} = 0$ , 15 kHz SCS is assumed.
- NOTE 3: No requirements apply when there is at least one individual RE within the intermodulation generated by the dual uplink is within the downlink transmission bandwidth of the FDD band. The reference sensitivity should only be verified when this is not the case (the requirements specified in clause 7.3 apply).
- NOTE 4: This band is subject to IMD5 also which MSD is not specified.
- NOTE 5: Applicable only if operation with 4 antenna ports is supported in the band with carrier aggregation configured.
- NOTE 6: Considering the spectrum holdings of the operator for CA\_n77(2A) (when one uplink sub block is assigned within 3300-3400MHz, the other uplink sub block is not assigned within 4000-4200MHz or vice versa), no IMD5 result will fall in Rx frequency range of band n3. Therefore, no MSD requirement apply for this CA configuration when two uplink sub blocks are assigned within CA\_77(2A).
- NOTE 7: In current release the maximum separation bandwidth class is 600MHz, therefore, no IMD2 MSD requirement apply for this CA configuration when two uplink sub blocks are assigned within CA\_77(2A).
- NOTE8: There is no IMD4/5 products in band n18 downlink for n77 operating in 3520 – 3560 MHz, 3700 – 3800MHz and 4000 - 4100MHz frequency range.
- NOTE 9: There is no IMD4 product in band n18 downlink for n78 operating in 3520 – 3560MHz and 3700-3800MHz frequency range.
- NOTE 10: There is no IMD4 product in band n24 downlink for n77 operating in 3450 – 3980 MHz and n24 uplink restricted to between 1627.5 – 1637.5 MHz and between 1646.5 – 1656.5 MHz.
- NOTE 11: This band is subject to IMD5 also which MSD is not specified..
- NOTE 12: This band supports intra-band non-contiguous uplink configuration.
- NOTE 13: For a UE which supports this band combination only when the Band n77 frequency range restriction defined in NOTE 12 of Table 5.2-1 applies, the MSD test point(s) cannot be verified for the band combination and the test point(s) can be skipped.

NOTE 1: Both of the transmitters shall be set min(+23 dBm,  $P_{\text{CMAX,L,f,c}}$ ) as defined in clause 6.2A.4  
NOTE 2:  $RB_{\text{START}} = 0$ , 15 kHz SCS is assumed.  
NOTE 3: No requirements apply when there is at least one individual RE within the intermodulation generated by the dual uplink is within the downlink transmission bandwidth of the FDD band. The reference sensitivity should only be verified when this is not the case (the requirements specified in clause 7.3 apply).  
NOTE 4: This band is subject to IMD5 also which MSD is not specified.  
NOTE 5: Applicable only if operation with 4 antenna ports is supported in the band with carrier aggregation configured.  
NOTE 6: For a UE which supports this band combination only when the Band n77 frequency range restriction defined in NOTE 12 of Table 5.2-1 applies, the MSD test point(s) cannot be verified for the band combination and the test point(s) can be skipped.

- NOTE 2: This band is subject to IMD4 also which MSD is not specified.
- NOTE 3: The requirements only apply for UEs supporting inter-band carrier aggregation with simultaneous Rx/Tx capability. Simultaneous Rx/Tx capability does not apply for UEs supporting band n78 with a n77 implementation.
- NOTE 4: This band is subject to IMD3 also which MSD is not specified.
- NOTE 5: For a UE which supports this band combination only when the Band n77 frequency range restriction defined in NOTE 12 of Table 5.2-1 applies, the MSD test point(s) cannot be verified for the band combination and the test point(s) can be skipped.
- NOTE 6: This band is subjected to 2<sup>nd</sup> order IMD but is not expected for the operating frequency range of n77 within USA (3450 – 3550 MHz, 3700 – 3980 MHz).
- NOTE 7: The MSD test points cannot be verified for the band combination in US due to the Band n77 frequency range restriction.
- NOTE 8: Both of the transmitters shall be set  $\min(+20 \text{ dBm}, P_{\text{CMAX\_L,f,c}})$  as defined in clause 6.2A.4

NOTE 1: This band is subject to IMD5 also which MSD is not specified.

NOTE 2: This band is subject to IMD4 also which MSD is not specified.

NOTE 3: The requirements only apply for UEs supporting inter-band carrier aggregation with simultaneous Rx/Tx capability. Simultaneous Rx/Tx capability does not apply for UEs supporting band n78 with a n77 implementation.

NOTE 4: This band is subject to IMD3 also which MSD is not specified.

NOTE 5: For a UE which supports this band combination only when the Band n77 frequency range restriction defined in NOTE 12 of Table 5.2-1 applies, the MSD test point(s) cannot be verified for the band combination and the test point(s) can be skipped.

NOTE 6: Both of the transmitters shall be set min(+23 dBm,  $P_{\text{CMAX,L,f,c}}$ ) as defined in clause 6.2A.4

## 7.3A.6 Reference sensitivity exceptions due to cross band isolation for CA

Sensitivity degradation is allowed for a band if it is impacted by UL of another band part which belongs to NR band of the same NR CA configuration due to cross band isolation issues. Thereference sensitivity degradation for the victim band due to cross band isolation is specified only for the specific uplink and downlink test points specified in Table 7.3A.6-1 for either PC3 and PC2 NR CA from a PC3 aggressor NR UL band, and for PC2 NR CA, in Table 7.3A.6-1a from a PC2 aggressor NR UL band, and in Table 7.3A.6-1b from a PC1.5 aggressor NR single band uplink

NOTE 1: Applicable only when harmonic mixing MSD for this combination is not applied.  
NOTE 2: Void  
NOTE 3: The requirements only apply for UEs supporting inter-band carrier aggregation with simultaneous Rx/Tx capability. Simultaneous Rx/Tx capability does not apply for UEs supporting band n78 with a n77 implementation.  
NOTE 4: Void  
NOTE 5: The MSD exceptions are applicable to the case that interference of UL band 3<sup>rd</sup> order IMD product falls into the affected DL channels.

## 7.3B Reference sensitivity for NR-DC

For inter-band NR-DC configurations, the reference sensitivity for the corresponding inter-band CA configuration as specified in clause 7.3A applies.

## 7.3C Reference sensitivity for SUL

### 7.3C.1 General

The reference sensitivity power level REFSENS is the minimum mean power applied to each one of the UE antenna ports for all UE categories, at which the throughput shall meet or exceed the requirements for the specified reference measurement channel.

### 7.3C.2 Reference sensitivity power level for SUL

For SUL operation, the reference receive sensitivity (REFSENS) requirement for downlink bands specified in Table 7.3.2-1a, Table 7.3.2-1b and Table 7.3.2-2 shall be met for an uplink transmission bandwidth less than or equal to that specified in Table 7.3.2-3 or supplementary uplink transmission bandwidth less than or equal to that specified in Table 7.3C.2-1 with reference measurement channels as specified in Annexes A.2.2.2, A.3.2, and A.3.3 (with one sided dynamic OCNG Pattern OP.1 FDD/TDD for the DL-signal as described in Annex A.5.1.1/A.5.2.1), unless sensitivity degradation is allowed in this clause of this specification. These exceptions also apply to any higher order CA or DC combination containing one of the exception combinations in this clause as subset.

For SUL operation with downlink CA, the reference receive sensitivity (REFSENS) requirement for downlink bands specified in clause 7.3A.2 shall be met for an uplink transmission bandwidth less than or equal to that specified in Table 7.3.2-3 or supplementary uplink transmission bandwidth less than or equal to that specified in Table 7.3C.2-1 with reference measurement channels as specified in Annexes A.2.2.2, A.3.2, and A.3.3 (with one sided dynamic OCNG Pattern OP.1 FDD/TDD for the DL-signal as described in Annex A.5.1.1/A.5.2.1), unless sensitivity degradation is allowed in this clause of this specification. These exceptions also apply to any higher order CA or DC combination containing one of the exception combinations in this clause as subset.

NOTE 1: The Tx-Rx carrier center frequency separation between SUL band and DL band is the same as the Tx-Rx carrier center frequency separation of DL band specified in table 5.4.4-1 from TS 38.101-1. The channel bandwidth of SUL band is the same as DL band. This restriction of REFSENS configurations applies also for these carriers when applicable SUL configuration is part of a higher order configuration.

For the UE that supports any of the SUL operation given in Table 7.3C.2-2, exceptions to the requirements specified in Table 7.3.2-1a and Table 7.3.2-1b are allowed for different combinations of UL configurations and DL channel bandwidths when the uplink is active in a lower frequency band and is within a specified frequency range such that transmitter harmonics fall within the downlink transmission bandwidth assigned in a higher band as noted in Table 7.3C.2-2. For these exceptions, only the listed test points in Table 7.3C.2-2 are needed to be tested.

NOTE 1: These requirements apply when there is at least one individual RE within the uplink transmission bandwidth of the aggressor (lower) band for which the 2<sup>nd</sup> / 3<sup>rd</sup> / 4<sup>th</sup> / 5<sup>th</sup> transmitter harmonic is within the downlink transmission bandwidth of a victim (higher) band.

NOTE 2: The requirements should be verified for UL NR ARFCN of the aggressor (lower) band (superscript LB) such that  $f_{UL}^{LB} = \lfloor f_{DL}^{HB} / 0.2 \rfloor \cdot 0.1$  in MHz and  $F_{UL\_low}^{LB} + BW_{Channel}^{LB} / 2 \leq f_{UL}^{LB} \leq F_{UL\_high}^{LB} - BW_{Channel}^{LB} / 2$  with carrier frequency in the victim (higher) band in MHz and the channel bandwidth configured in the lower band.

NOTE 3: The requirements should be verified for UL NR ARFCN of the aggressor (lower) band (superscript LB) such that  $f_{UL}^{LB} = \lfloor f_{DL}^{HB} / 0.3 \rfloor \cdot 0.1$  in MHz and  $F_{UL\_low}^{LB} + BW_{Channel}^{LB} / 2 \leq f_{UL}^{LB} \leq F_{UL\_high}^{LB} - BW_{Channel}^{LB} / 2$  with the carrier frequency in the victim (higher) band in MHz and the channel bandwidth configured in the low band.

NOTE 4: The requirements should be verified for UL EARFCN of the aggressor (lower) band (superscript LB) such that  $f_{UL}^{LB} = \lfloor f_{DL}^{HB} / 0.4 \rfloor \cdot 0.1$  in MHz and  $F_{UL\_low}^{LB} + BW_{Channel}^{LB} / 2 \leq f_{UL}^{LB} \leq F_{UL\_high}^{LB} - BW_{Channel}^{LB} / 2$  with  $f_{DL}^{HB}$  carrier frequency in the victim (higher) band in MHz and  $BW_{Channel}^{LB}$  the channel bandwidth configured in the lower band.

NOTE 5: The requirements should be verified for UL NR-ARFCN of the aggressor (lower) band (superscript LB) such that  $f_{UL}^{LB} = \lfloor f_{DL}^{HB} / 0.5 \rfloor \cdot 0.1$  in MHz and  $F_{UL\_low}^{LB} + BW_{Channel}^{LB} / 2 \leq f_{UL}^{LB} \leq F_{UL\_high}^{LB} - BW_{Channel}^{LB} / 2$  with  $f_{DL}^{HB}$  carrier frequency in the victim (higher) band in MHz and  $BW_{Channel}^{LB}$  the channel bandwidth configured in the lower band.

NOTE 6: The requirements are only applicable to channel bandwidths no larger than 20 MHz and with a carrier frequency at  $\pm (20 + BW_{Channel}^{HB} / 2)$  MHz offset from  $2 f_{UL}^{LB}$  in the victim (higher) band with  $F_{UL\_low}^{LB} + BW_{Channel}^{LB} / 2 \leq f_{UL}^{LB} \leq F_{UL\_high}^{LB} - BW_{Channel}^{LB} / 2$ , where  $BW_{Channel}^{LB}$  and  $BW_{Channel}^{HB}$  are the channel bandwidths configured in the aggressor (lower) and victim (higher) bands in MHz, respectively.

For the UE that supports any of the SUL operation given in Table 7.3C.2-4, reference sensitivity degradation is allowed for different combinations of UL configurations and DL channel bandwidths when a DL band is impacted by UL band due to cross band isolation issues. For these exceptions, only the listed test points in Table 7.3C.2-4 are needed to be tested.

Table 7.3C.2-5: Void

### 7.3C.3 $\Delta R_{IB,c}$ for SUL

#### 7.3C.3.1 General

For a UE supporting a SUL configuration, the  $\Delta R_{IB,c}$  applies for both SC and SUL operation.

#### 7.3C.3.2 SUL band combination

For the UE which supports SUL band combination, the minimum requirement for reference sensitivity in clause 7.3C.2 shall be increased by the amount given in  $\Delta R_{IB,c}$  defined in clause 7.3C.3.2 for the applicable operating bands. Unless otherwise stated,  $\Delta R_{IB,c}$  is set to zero.

In case the UE supports more than one of band combinations for CA, SUL or DC, and an operating band belongs to more than one band combinations then

- When the operating band frequency range is  $\leq 1$  GHz, the applicable additional  $\Delta R_{IB,c}$  shall be the average value for all band combinations defined in clause 7.3A, 7.3B, 7.3C in this specification and 7.3A, 7.3B in TS 38.101-3 [3], truncated to one decimal place that apply for that operating band among the supported band combinations. In case there is a harmonic relation between low band UL and high band DL, then the maximum  $\Delta R_{IB,c}$  among the different supported band combinations involving such band shall be applied

## 7.3D Reference sensitivity for UL MIMO

For UE with two transmitter antenna connectors in closed-loop spatial multiplexing scheme, the minimum requirements specified in clause 7.3 shall be met with the UL MIMO configurations described in clause 6.2D.1 and the reference measurement channels as specified in Annex A.2.2 for CP-OFDM waveforms shall apply. For UL MIMO, the parameter  $P_{UMAX}$  is the total transmitter power over the two transmits power over the two transmit antenna connectors.

## 7.3E Reference sensitivity for V2X

### 7.3E.1 General

### 7.3E.2 Minimum requirements

When UE is configured for NR V2X reception non-concurrent with NR uplink transmissions for NR V2X operating bands specified in Table 5.2E.1-1, the throughput shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annexes A.7.2 with parameters specified in Table 7.3E.2-1.

### 7.3E.3 Reference sensitivity power level for V2X con-current operation

When UE is configured for NR V2X reception on V2X carrier con-current with NR uplink and downlink, NR V2X sidelink throughput for the carrier shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annexes A.7.2 with parameters specified in Table 7.3E.2-1 and 7.3E.2-2. Also the NR downlink throughput shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annexes A.3 with parameters specified in table 7.3.2-1a, 7.3.2-1b, 7.3.2-2 and 7.3.2-3. The reference sensitivity is defined to be met with all downlink component carriers active. The REFSENS of Uu downlink and PC5 sidelink will be tested at the same time. Exceptions to reference sensitivity with different transmission and reception configurations are allowed for the combinations of aggressor and victim bands specified in table 7.3E.3-3 and 7.3E.3-4. The limited test configurations are specified in table 7.3E.3-3 and 7.3E.3-4 to verify MSD requirements.

For the intra-band con-current NR V2X operation, the reference sensitivity power level shall be applied per carrier. The requirements in clause 7.3.2 shall be applied for NR downlink carrier and the requirements in clause 7.3E.2 shall be applied for NR sidelink carrier. NR V2X sidelink throughput for the carrier shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annexes A.7.2. Also the NR downlink throughput shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annexes A.3.2 in TS38.101-1.

## 7.3F Reference sensitivity for shared spectrum channel access

### 7.3F.1 General

The reference sensitivity power level REFSENS is the minimum mean power applied to each one of the UE antenna ports, at which the throughput shall meet or exceed the requirements for the specified reference measurement channel.

In later clauses of Clause 7 where the value of REFSENS is used as a reference to set the corresponding requirement, the UE shall be verified against those requirements by applying the REFSENS value in Table 7.3G.2-1 with 2 Rx antenna ports tested.

### 7.3F.2 Reference sensitivity power level

The throughput shall be  $\geq 95$  % of the maximum throughput of the reference measurement channels as specified in Annexes A.2.2.2, A3.2 and A.3.3 (with one sided dynamic OCNG Pattern OP.1 FDD/TDD for the DL-signal as described in Annex A.5.1.1/A.5.2.1) with parameters specified in Table 7.3F.2-1, Table 7.3F.2-2, and Table 7.3F.2-3.

NOTE 1: The REFSENS value is rounded to the nearest number down to one decimal point. "NRB" in REFSENS formula is the maximum transmission bandwidth configuration as defined in Table 5.3.2-1.

For UE(s) equipped with 4 Rx antenna ports, reference sensitivity for 2Rx antenna ports in Table 7.3F.2-1 shall be modified by the amount given in  $\Delta R_{IB,4R}$  in Table 7.3F.2-2 for the applicable operating bands.

Unless given by Table 7.3F.2-4, the minimum requirements specified in Tables 7.3F.2-1 and 7.3F.2-2 shall be verified with the network signalling value NS\_01 (Table 6.2F.3.1-1) configured.

**Table 7.3F.2-4: Network signaling value for reference sensitivity**

| Operating band | Network Signalling value |
|----------------|--------------------------|
| n46            | NS_01                    |
| n96            | NS_53                    |
| n102           | NS_01                    |

### 7.3F.3 $\Delta R_{IB,c}$

For a UE supporting CA or DC band combination, the minimum requirement for reference sensitivity in Table 7.3F.2-1 shall be increased by the amount given by  $\Delta R_{IB,c}$  defined in Table 7.3F.3-1. Unless otherwise stated,  $\Delta R_{IB,c}$  is set to zero.

**Table 7.3F.3-1:  $\Delta R_{IB,c}$  due to CA (two bands)**

| Inter-band CA combination | Operating Band | $\Delta R_{IB,c}$ (dB) |
|---------------------------|----------------|------------------------|
| CA_n46-n48                | n46            | 0                      |
|                           | n48            | 0.5                    |

In case the UE supports more than one of band combinations for CA or DC, and an operating band belongs to more than one band combinations then the applicable additional  $\Delta R_{IB,c}$  shall be the maximum value for all band combinations defined in clause 7.3A and 7.3F.3 in this specification and 7.3A, 7.3B in TS 38.101-3 [3] for the applicable operating bands.

### 7.3F.4 Intra-band contiguous shared spectrum channel access CA

For intra-band contiguous carrier aggregation, the throughput of each component carrier shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annexes A.2.2.2, A.3.2, and A.3.3 (with one sided dynamic OCNG Pattern OP.1 FDD/TDD for the DL-signal as described in Annex A.5.1.1/A.5.2.1) with parameters specified in Table 7.3F.2-1, Table 7.3F.2-2, and Table 7.3F.2-3.

## 7.3G Reference sensitivity for Tx Diversity

For UE supporting Tx diversity, the minimum requirements specified in Table 7.3.2-1b and Table 7.3.2-1d shall be met with Tx diversity configuration described in clause 6.2G.1. For Tx diversity, the parameter  $P_{UMAX}$  is defined in clause 6.2G.4 with the sum of the output power from both UE antenna connectors.

### 7.3G.5 Inter-band CA with shared spectrum channel access

For inter-band carrier aggregation with one component carrier per operating band and the uplink assigned to one NR band the throughput of the NR carrier shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annexes A.2.2.2, A.3.2, and A.3.3 (with one sided dynamic OCNG Pattern OP.1 FDD/TDD for the DL-signal as described in Annex A.5.1.1/A.5.2.1) with parameters specified in Table 7.3.2-1a, Table 7.3.2-1b, Table 7.3.2-2 and Table 7.3.2-3 modified in accordance with clause 7.3F.3. The throughput of the NR-U carrier shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annexes A.2.2.2, A.3.2, and A.3.3 (with one sided dynamic OCNG Pattern OP.1 FDD/TDD for the DL-signal as described in Annex A.5.1.1/A.5.2.1) with parameters specified in Table 7.3F.2-1, Table 7.3F.2-2, and Table 7.3F.2-3 modified in accordance with clause 7.3F.3. The reference sensitivity is defined to be met with all downlink component carriers active and the PCell uplink carrier active. Exceptions to reference sensitivity are allowed in accordance with clause 7.3F.5.1 and clause 7.3F.5.2.

#### 7.3G.5.1 Reference sensitivity exceptions due to UL harmonic interference

The reference sensitivity for the shared access band does not apply when there is at least one individual RE within the shared access downlink transmission bandwidth which falls into the reference sensitivity exclusion region as specified in Table 7.3G.5.1-1.

**Table 7.3G.5.1-1: NR-U reference sensitivity measurement exclusion region in MHz.**

| NR Band / Harmonic order / Channel BW in UL |                |        |        |        |        |        |
|---|----------------|--------|--------|--------|--------|--------|
| Band  | Harmonic order | 5MHz   | 10MHz  | 15MHz  | 20 MHz | 40MHz  |
| n25   | 3              | +/- 15 | +/- 23 | +/- 35 | +/- 45 | +/- 90 |
| n66   | 3              | +/- 15 | +/- 23 | +/- 35 | +/- 45 | +/- 90 |

NOTE 1: Even though UL harmonic does not fall directly into NR-U band the exclusion region still applies.  
NOTE 2: The center of the exclusion region is obtained by multiplying the UL channel center frequency by the harmonic order.

#### 7.3G.5.2 Reference sensitivity exceptions due to receiver harmonic mixing

Sensitivity degradation is allowed for a band if it is impacted by receiver harmonic mixing due to another band part of the same CA configuration. Reference sensitivity exceptions are specified in Table 7.3G.5.2-1 with uplink configuration specified in Table 7.3G.5.2-2

**Table 7.3G.5.2-1: Reference sensitivity exceptions due to harmonic mixing for CA in NR FR1**

NOTE 1: The requirements should be verified for UL NR-ARFCN of the aggressor (high) band (superscript HB) such that  $f_{UL}^{LB} = \lfloor 15 * f_{DL}^{HB} \rfloor \cdot 0.1$  in MHz and  $f_{UL\_low}^{HB} + BW_{Channel}^{HB} / 2 \leq f_{UL}^{HB} \leq f_{UL\_high}^{HB} - BW_{Channel}^{HB} / 2$  with  $f_{DL}^{LB}$  carrier frequency in the victim (lower) band in MHz and  $BW_{Channel}^{LB}$  the channel bandwidth configured in the higher band.

**7.3G.5.3 Reference sensitivity exceptions due to cross band isolation**

For unsynchronized operation, Rx de-sensing in one band will be caused by another band due to lack of isolation in the band filters. Reference sensitivity exceptions for cross band are specified in Table 7.3G.5.3-1 with uplink configuration specified in Table 7.3G.5.3-2-2.

## 7.3I Reference sensitivity for RedCap

### 7.3I.1 General

The reference sensitivity power level REFSENS is the minimum mean power applied to each one of the UE antenna ports for all UE categories, at which the throughput shall meet or exceed the requirements for the specified reference measurement channel.

### 7.3I.2 Reference sensitivity power level

For a RedCap UE equipped with 2 Rx antenna ports, the throughput shall be  $\geq 95$  % of the maximum throughput of the reference measurement channels as specified in Annexes A.2.2.2, A3.2 and A.3.3 (with one sided dynamic OCNG Pattern OP.1 FDD/TDD for the DL-signal as described in Annex A.5.1.1/A.5.2.1) with parameters specified in Table 7.3.2-1a and Table 7.3.2-1b for the applicable operating bands. The reference sensitivity (REFSENS) requirement specified for a RedCap UE equipped with 2 Rx antenna ports shall be met with uplink transmission bandwidth less than or equal to that specified in Table 7.3.2-3 and, for FDD bands, with the Tx-Rx separation as defined in clause 5.4.4 for the applicable band and UE channel bandwidth.

For a RedCap UE equipped with 1 Rx antenna ports, reference sensitivity for 2Rx antenna ports in Table 7.3.2-1a and in Table 7.3.2-1b shall be modified by the amount given in  $\Delta R_{1R}$  in Table 7.3I.2-1 for the applicable operating bands. The reference sensitivity (REFSENS) requirement specified for a RedCap UE equipped with 1 Rx antenna ports shall be met with uplink transmission bandwidth less than or equal to that specified in Table 7.3.2-3 and, for FDD bands, with the Tx-Rx separation as defined in clause 5.4.4 for the applicable band and UE channel bandwidth.

**Table 7.3I.2-1: Single antenna port reference sensitivity allowance  $\Delta R_{1R}$**

| Operating band | Channel bandwidth (MHz) | $\Delta R_{1R}$ (dB) |
|----------------|-------------------------|----------------------|
| TDD band       | 5, 10, 15, 20           | 2,5                  |

| FDD band       | 10, 15, 20              | 3                    |

For a RedCap UE equipped with 2 Rx antenna ports operating in HD-FDD mode, reference sensitivity for 2Rx antenna ports in Table 7.3I.2-2 shall be met with uplink transmission bandwidth less than or equal to that specified in Table 7.3I.2-5.

## 7.4 Maximum input level

Maximum input level is defined as the maximum mean power received at the UE antenna port, at which the specified relative throughput shall meet or exceed the minimum requirements for the specified reference measurement channel. The throughput shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annexes A.3.2 and A.3.3 (with one sided dynamic OCNG Pattern OP.1 FDD/TDD as described in Annex A.5.1.1/A.5.2.1) with parameters specified in Table 7.4-1.

### 7.4A Maximum input level for CA

#### 7.4A.1 Maximum input level for Intra-band contiguous CA

For intra-band contiguous carrier aggregation maximum input level is defined as the maximum mean power received at the UE antenna port, over the Transmission bandwidth configuration of each CC.

The throughput shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annexes A.3.2 and A.3.3 (with one sided dynamic OCNG Pattern OP.1 FDD/TDD as described in Annex A.5.1.1/A.5.2.1) with parameters specified in Table 7.4A.1-1 for each component carrier.

**Table 7.4A.1-1: Maximum input level for Intra-band contiguous CA**

| Rx Parameter   | Units | NR CA Bandwidth Class  |             |             |  |
|--|-------|--|-------------|-------------|--|
|  |       | B  | C           | D           |  |
| Power in largest transmission bandwidth configuration CC, $P_{\text{largest BW}}$  | dBm   | $-23^2$  | $-23^2$     | $-25^2$     |  |
|  |       | $-25^{3,4}$  | $-25^{3,4}$ | $-27^{3,4}$ |  |
| Power in each other CC   | dBm   | $P_{\text{largest BW}} + 10 \cdot \log\{(N_{\text{RB,c}} \cdot \text{SCS}_c) / (N_{\text{RB, largest BW}} \cdot \text{SCS}_{\text{largest BW}})\}$ |             |             |  |
| NOTE 1: The transmitter shall be set to 4 dB below $P_{\text{CMAX\_L,f,c}}$ at the minimum uplink configuration specified in Table 7.3.2-3 with $P_{\text{CMAX\_L,f,c}}$ as defined in clause 6.2.4. |       |  |             |             |  |
| NOTE 2: Reference measurement channel is A.3.2.3 or A.3.3.3 for 64 QAM.  |       |  |             |             |  |
| NOTE 3: Reference measurement channel is A.3.2.4 or A.3.3.4 for 256 QAM.   |       |  |             |             |  |
| NOTE 4: Reference measurement channel is A.3.2.x for 1024 QAM.   |       |  |             |             |  |

#### 7.4A.2 Maximum input level for Intra-band non-contiguous CA

For intra-band non-contiguous carrier aggregation with one uplink carrier and two or more downlink sub-blocks, each larger than or equal to 5 MHz, the maximum input level requirements are defined with the uplink configuration in accordance with 7.3A.2.2-1. For this uplink configuration, the UE shall meet the requirements for each sub-block as specified in Table 7.4-1 and Table 7.4A.1-1 for one component carrier and two component carriers per sub-block, respectively. The throughput of each downlink component carrier shall be  $\geq 95\%$  of the maximum throughput of the

specified reference measurement channel as specified in Annex A.3.2 and A.3.3 (with one sided dynamic OCNG Pattern OP.1 FDD/TDD as described in Annex A.5.1.1 and A.5.2.1). The requirements apply with all downlink carriers active.

### 7.4A.3 Maximum input level for Inter-band CA

For inter-band carrier aggregation with one component carrier per operating band and the uplink assigned to one NR band, the maximum input level is defined with the uplink active on the band(s) other than the band whose downlink is being tested. For NR CA configurations including an operating band without uplink band or an operating band with an unpaired DL part (as noted in Table 5.2-1), the requirements for all downlinks shall be met with the single uplink carrier active in each band capable of UL operation. The UE shall meet the requirements specified in clause 7.4 for each component carrier while all downlink carriers are active.

The throughput shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annexes A.3.2 and A.3.3 (with one sided dynamic OCNG Pattern OP.1 FDD/TDD as described in Annex A.5.1.1/A.5.2.1) for each component carrier.

### 7.4B Maximum input level for NR-DC

For inter-band NR-DC configurations, the maximum input level for the corresponding inter-band CA configuration as specified in clause 7.4A applies.

### 7.4D Maximum input level for UL MIMO

For UE with two transmitter antenna connectors in closed-loop spatial multiplexing, the minimum requirements specified in clause 7.4 shall be met with the UL MIMO configurations described in clause 6.2D.1. For UL MIMO, the parameter  $P_{\text{CMAX,L}}$  is defined as the total transmitter power over the two transmit antenna connectors.

### 7.4E Maximum input level for V2X

#### 7.4E.1 General

Maximum input level is defined as the maximum mean power received at the UE antenna port, at which the specified relative throughput shall meet or exceed the minimum requirements for the specified reference measurement channel. When UE is configured for NR V2X reception non-concurrent with NR uplink transmissions for NR V2X operating bands specified in Table 5.2E.1-1, the throughput shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annexes A.7.3 and A.7.4 with parameters specified in Table 7.4E.1-1.

**Table 7.4E.1-1: Maximum input level of NR V2X**

#### 7.4E.2 Maximum input level for V2X con-current operation

For the inter-band con-current NR V2X operation, the requirements specified in clause 7.4E.1 shall apply for the NR sidelink reception in the operating Bands in Table 5.2E.1-1 and the requirements specified in clause 7.4 shall apply for the NR downlink reception in licensed band while all downlink carriers are active.

## 7.5 Adjacent channel selectivity

Adjacent channel selectivity (ACS) is a measure of a receiver's ability to receive an NR signal at its assigned channel frequency in the presence of an adjacent channel signal at a given frequency offset from the centre frequency of the assigned channel. ACS is the ratio of the receive filter attenuation on the assigned channel frequency to the receive filter attenuation on the adjacent channel(s).

The UE shall fulfil the minimum requirements specified in Table 7.5-1 for NR bands with  $F_{DL\_high} < 2700$  MHz and  $F_{UL\_high} < 2700$  MHz and the minimum requirements specified in Table 7.5-2 for NR bands with  $F_{DL\_low} \geq 3300$  MHz and  $F_{UL\_low} \geq 3300$  MHz. These requirements apply for all values of an adjacent channel interferer up to -25 dBm and for any SCS specified for the channel bandwidth of the wanted signal. However, it is not possible to directly measure the ACS; instead the lower and upper range of test parameters are chosen as in Table 7.5-3 and Table 7.5-4 for verification of the requirements specified in Table 7.5-1, and as in Table 7.5-5 and Table 7.5-6 for verification of the requirements specified in Table 7.5-2. For these test parameters, the throughput shall be  $\geq 95$  % of the maximum throughput of the reference measurement channels as specified in Annexes A.2.2, A.3.2, and A.3.3 (with one sided dynamic OCNG Pattern OP.1 FDD/TDD for the DL-signal as described in Annex A.5.1.1/A.5.2.1). For operating bands with an unpaired DL part (as noted in Table 5.2-1), the requirements only apply for carriers assigned in the paired part.

## 7.5A Adjacent channel selectivity for CA

### 7.5A.1 Adjacent channel selectivity for Intra-band contiguous CA

For intra-band contiguous carrier aggregation the downlink SCC(s) shall be configured at nominal channel spacing to the PCC. The UE shall fulfil the minimum requirement specified in Table 7.5A.1-1 and 7.5A.1-1a for an adjacent channel interferer on either side of the aggregated downlink signal at a specified frequency offset and for an interferer power up to -25 dBm.

The throughput of each carrier shall be  $\geq 95$  % of the maximum throughput of the reference measurement channels as specified in Annexes A.2.2, A.3.2, and A.3.3 (with one sided dynamic OCNG Pattern OP.1 FDD/TDD for the DL-signal as described in Annex A.5.1.1/A.5.2.1) with parameters specified in Tables 7.5A.1-2, 7.5A.1-2a, 7.5A.1-3 and 7.5A.1-3a.

NOTE 2: The absolute value of the interferer offset  $F_{Interferer}$  (offset) shall be further adjusted to  $(\lceil F_{Interferer} / SCS \rceil + 0.5) SCS$  MHz with SCS the sub-carrier spacing of the carrier closest to the interferer in MHz. The interferer is an NR signal with 15 kHz SCS.

NOTE 3: The interferer consists of the RMC specified in Annexes A.3.2.2 and A.3.3.2 with one sided dynamic OCNG Pattern OP.1 FDD/TDD for the DL-signal as described in Annex A.5.1.1/A.5.2.1.

## 7.5A.2 Adjacent channel selectivity Intra-band non-contiguous CA

For intra-band non-contiguous carrier aggregation with  $F_{DL\_low} < 2700$  MHz and  $F_{UL\_low} < 2700$  MHz with one uplink carrier and two or more downlink sub-blocks, each larger than or equal to 5 MHz, the adjacent channel selectivity requirements are defined with the uplink configuration in accordance with Table 7.3A.2.2-1. For this uplink configuration, the UE shall meet the requirements for each sub-block as specified in clauses 7.5 and 7.5A.1 for one component carrier and two component carriers per sub-block, respectively. The UE shall fulfil the minimum requirements all values of a single adjacent channel interferer in-gap and out-of-gap up to a  $-25$  dBm interferer power while all downlink carriers are active. For the lower range of test parameters (Case 1), the interferer power  $P_{Interferer}$  shall be set to the maximum of the levels given by the carriers of the respective sub-blocks as specified in Table 7.5-3 and Table 7.5A.1-2a for one component carrier and two component carriers per sub-block, respectively. The wanted signal power levels for the carriers of each sub-block shall then be adjusted relative to  $P_{Interferer}$  in accordance with the ACS requirement for each sub-block (Table 7.5-1 and Table 7.5A.1-1a). For the upper range of test parameters (Case 2) for which the interferer power  $P_{Interferer}$  is  $-25$  dBm (Table 7.5-4 and Table 7.5A.1-3a) the wanted signal power levels for the carriers of each sub-block shall be adjusted relative to  $P_{Interferer}$  like for Case 1.

For intra-band non-contiguous carrier aggregation with  $F_{DL\_low} \geq 3300$  MHz and  $F_{UL\_low} \geq 3300$  MHz with one uplink carrier and two or more downlink sub-blocks, each larger than or equal to 5 MHz, the adjacent channel selectivity requirements are defined with the uplink configuration in accordance with Table 7.3A.2.2-1. For this uplink configuration, the UE shall meet the requirements for each sub-block as specified in clauses 7.5 and 7.5A.1 for one

component carrier and two component carriers per sub-block, respectively. The UE shall fulfil the minimum requirements all values of a single adjacent channel interferer in-gap and out-of-gap up to a  $-25$  dBm interferer power while all downlink carriers are active. For the lower range of test parameters (Case 1), the interferer power  $P_{\text{interferer}}$  shall be set to the maximum of the levels given by the carriers of the respective sub-blocks as specified in Table 7.5-5 and Table 7.5A.1-2 for one component carrier and two component carriers per sub-block, respectively. The wanted signal power levels for the carriers of each sub-block shall then be adjusted relative to  $P_{\text{interferer}}$  in accordance with the ACS requirement for each sub-block (Table 7.5-2 and Table 7.5A.1-1). For the upper range of test parameters (Case 2) for which the interferer power  $P_{\text{interferer}}$  is  $-25$  dBm (Table 7.5-6 and Table 7.5A.1-3) the wanted signal power levels for the carriers of each sub-block shall be adjusted relative to  $P_{\text{interferer}}$  like for Case 1.

The throughput of each carrier shall be  $\geq 95$  % of the maximum throughput of the reference measurement channels as specified in Annexes A.2.2, A.3.2, and A.3.3 (with one sided dynamic OCNG Pattern OP.1 FDD/TDD for the DL-signal as described in Annex A.5.1.1/A.5.2.1).

### 7.5A.3 Adjacent channel selectivity Inter-band CA

For inter-band carrier aggregation with one component carrier per operating band and the uplink assigned to one NR band, the adjacent channel requirements are defined with the uplink active on the band(s) other than the band whose downlink is being tested. For NR CA configurations including an operating band without uplink operation or an operating band with an unpaired DL part (as noted in Table 5.2-1), the requirements for all downlinks shall be met with the single uplink carrier active in each band capable of UL operation. The UE shall meet the requirements specified in clause 7.5 for each component carrier while all downlink carriers are active.

The throughput of each carrier shall be  $\geq 95$  % of the maximum throughput of the reference measurement channels as specified in Annexes A.2.2, A.3.2, and A.3.3 (with one sided dynamic OCNG Pattern OP.1 FDD/TDD for the DL-signal as described in Annex A.5.1.1/A.5.2.1).

### 7.5B Adjacent channel selectivity for NR-DC

For inter-band NR-DC configurations, the adjacent channel selectivity for the corresponding inter-band CA configuration as specified in clause 7.5A applies.

### 7.5D Adjacent channel selectivity for UL MIMO

For UE(s) with two transmitter antenna connectors in closed-loop spatial multiplexing scheme, the minimum requirements specified in clause 7.5 shall be met with the UL MIMO configurations described in clause 6.2D.1. For UL MIMO, the parameter  $P_{\text{CMAX}_L}$  is defined as the total transmitter power over the two transmit antenna connectors.

### 7.5E Adjacent channel selectivity for V2X

#### 7.5E.1 General

Adjacent channel selectivity (ACS) is a measure of a receiver's ability to receive an NR signal at its assigned channel frequency in the presence of an adjacent channel signal at a given frequency offset from the centre frequency of the assigned channel. ACS is the ratio of the receive filter attenuation on the assigned channel frequency to the receive filter attenuation on the adjacent channel(s).

The UE shall fulfil the minimum requirements specified in Table 7.5E.1-1 for NR V2X UE. These requirements apply for all values of an adjacent channel interferer up to  $-25$  dBm and for any SCS specified for the channel bandwidth of the wanted signal. However, it is not possible to directly measure the ACS; instead the lower and upper range of test parameters are chosen as in Table 7.5E.1-2 and Table 7.5E.1-3 for verification of the requirements specified in Table 7.5E.1-1. For these test parameters, when UE is configured for NR V2X reception non-concurrent with NR uplink transmissions for NR V2X operating bands specified in Table 5.2E.1-1, the throughput shall be  $\geq 95$  % of the maximum throughput of the reference measurement channels as specified in Annexes A.7.2.

In licensed band, the minimum requirements shall reuse the same ACS values with NR UE.

## 7.5E.2 Adjacent channel selectivity for V2X con-current operation

For the inter-band con-current NR V2X operation, the requirements specified in clause 7.5E.1 shall apply for the NR sidelink reception in the operating Bands in Table 5.2E.1-1 and the requirements specified in clause 7.5 shall apply for the NR downlink reception in licensed band while all downlink carriers are active.

## 7.5F Adjacent channel selectivity

### 7.5F.1 General

Adjacent channel selectivity (ACS) is a measure of a receiver's ability to receive an NR signal at its assigned channel frequency in the presence of an adjacent channel signal at a given frequency offset from the centre frequency of the assigned channel. ACS is the ratio of the receive filter attenuation on the assigned channel frequency to the receive filter attenuation on the adjacent channel(s).

Instead of the general ACS requirements specified in clause 7.5, the UE shall fulfil the minimum requirements specified in Table 7.5F.1-1. These requirements apply for any SCS specified for the channel bandwidth of the wanted signal. For the test parameters specified in Table 7.5F.1-2, the throughput shall be  $\geq 95$  % of the maximum throughput of the reference measurement channels as specified in Annexes A.2.2, A.3.2, and A.3.3 (with one sided dynamic OCNG Pattern OP.1 FDD/TDD for the DL-signal as described in Annex A.5.1.1/A.5.2.1).

**Table 7.5F.1-1: ACS for shared spectrum channel access bands**

| RX parameter   | Units | Channel bandwidth                          |

## 7.5F.2 Intra-band contiguous shared spectrum channel access CA

ACS for intra-band contiguous shared access CA requirements are specified in Table 7.5F.2-1. These requirements apply for any SCS specified for the channel bandwidth of the wanted signal. For the test parameters specified in Table 7.5F.2-2, the throughput of each carrier shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annexes A.2.2, A.3.2, and A.3.3 (with one sided dynamic OCNG Pattern OP.1 FDD/TDD for the DL-signal as described in Annex A.5.1.1/A.5.2.1).

## 7.6 Blocking characteristics

### 7.6.1 General

The blocking characteristic is a measure of the receiver's ability to receive a wanted signal at its assigned channel frequency in the presence of an unwanted interferer on frequencies other than those of the spurious response or the adjacent channels, without this unwanted input signal causing a degradation of the performance of the receiver beyond a specified limit. The blocking performance shall apply at all frequencies except those at which a spurious response occurs.

For shared spectrum channel access and band combinations with operating bands intended for shared spectrum channel access, the blocking characteristics is specified in clause 7.6F.

### 7.6.2 In-band blocking

For NR bands with  $F_{DL\_high} < 2700$  MHz and  $F_{UL\_high} < 2700$  MHz in-band blocking (IBB) is defined for an unwanted interfering signal falling into the UE receive band or into the first 15 MHz below or above the UE receive band. The throughput of the wanted signal shall be  $\geq 95$  % of the maximum throughput of the reference measurement channels as specified in Annexes A.2.2, A.3.2 and A.3.3 (with one sided dynamic OCNG Pattern OP.1 FDD/TDD for the DL-signal as described in Annex A.5.1.1/A.5.2.1) with parameters specified in Table 7.6.2-1 and Table 7.6.2-2. The relative throughput requirement shall be met for any SCS specified for the channel bandwidth of the wanted signal. For operating bands with an unpaired DL part (as noted in Table 5.2-1), the requirements only apply for carriers assigned in the paired part.

### 7.6.3 Out-of-band blocking

For NR bands with  $F_{DL\_high} < 2700$  MHz and  $F_{UL\_high} < 2700$  MHz out-of-band band blocking is defined for an unwanted CW interfering signal falling outside a frequency range 15 MHz below or above the UE receive band. The throughput of the wanted signal shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annexes A.2.2, A.3.2 and A.3.3 (with one sided dynamic OCNG Pattern OP.1 FDD/TDD for the DL-signal as described in Annex A.5.1.1/A.5.2.1) with parameters specified in Table 7.6.3-1 and Table 7.6.3-2. The relative throughput requirement shall be met for any SCS specified for the channel bandwidth of the wanted signal. For operating bands with an unpaired DL part (as noted in Table 5.2-1), the requirements only apply for carriers assigned in the paired part.

bandwidth configuration,  $BW_{Channel}$  the bandwidth of the frequency channel in MHz and  $n = 1, 2, 3$  for SCS = 15, 30, 60 kHz, respectively. For these exceptions, the requirements in clause 7.7 apply.

## 7.6.4 Narrow band blocking

This requirement is measure of a receiver's ability to receive a NR signal at its assigned channel frequency in the presence of an unwanted narrow band CW interferer at a frequency, which is less than the nominal channel spacing.

The relative throughput shall be  $\geq 95$  % of the maximum throughput of the reference measurement channels as specified in Annexes A.2.2, A.3.2 and A.3.3 (with one sided dynamic OCNG Pattern OP.1 FDD/TDD for the DL-signal

as described in Annex A.5.1.1/A.5.2.1) with parameters specified in Table 7.6.4-1. For operating bands with an unpaired DL part (as noted in Table 5.2-1), the requirements only apply for carriers assigned in the paired part.

### 7.6A.2.2 In-band blocking for Intra-band non-contiguous CA

For intra-band non-contiguous carrier aggregation with one uplink carrier and two or more downlink sub-blocks, each larger than or equal to 5 MHz, the in-band blocking requirements are defined with the uplink configuration in accordance with Table 7.3A.2.2-1. For this uplink configuration, the UE shall meet the requirements for each sub-block as specified in clause 7.6.2 and 7.6A.2.1 for one component carrier and two component carriers per sub-block, respectively. The requirements apply for in-gap and out-of-gap interferers while all downlink carriers are active.

The throughput of each carrier shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annexes A.2.2, A.3.2, and A.3.3 (with one sided dynamic OCNG Pattern OP.1 FDD/TDD for the DL-signal as described in Annex A.5.1.1/A.5.2.1).

### 7.6A.2.3 In-band blocking for Inter-band CA

For inter-band carrier aggregation with one component carrier per operating band and the uplink assigned to one NR band, the in-band blocking requirements are defined with the uplink active on the band(s) other than the band whose downlink is being tested. The UE shall meet the requirements specified in clause 7.6.2 for each component carrier while all downlink carriers are active.

For the UE which supports inter-band CA configuration in Table 7.3A.3.2,  $P_{\text{interferer}}$  power defined in Table 7.6.2-2 and 7.6.2-4 is increased by the amount given by  $\Delta R_{\text{IB,c}}$  in Table 7.3A.3.2.

For E-UTRA CA configurations including an operating band without uplink operation or an operating band with an unpaired DL part (as noted in Table 5.2-1), the requirements for all downlinks shall be met with the single uplink carrier active in each band capable of UL operation. The requirements for the component carrier configured in the operating band without uplink operation are specified in Table 7.6A.2.3-1.

**Table 7.6A.3-2a: Void**

For interferer frequencies across ranges 1, 2 and 3 in Table 7.6A.3-2, a maximum of

$$\lfloor \max \{24, 6 \cdot \lceil n \cdot N_{RB} / 6 \rceil \} / \min \{ \lfloor n \cdot N_{RB} / 10 \rfloor, 5 \} \rfloor$$

exceptions are allowed for spurious response frequencies in each assigned frequency channel when measured using a step size of  $\min \{ BW_{channel} / 2, 5 \}$  MHz with  $N_{RB}$  the number of resource blocks in the downlink transmission bandwidth configuration,  $BW_{channel}$  is the bandwidth of the frequency channel in MHz and  $n = 1, 2, 3$  for SCS = 15, 30, 60 kHz, respectively. For these exceptions, the requirements in subclause 7.7A.1 apply.

### 7.6A.3.2 Out-of-band blocking for Intra-band non-contiguous CA

For intra-band non-contiguous carrier aggregation with one uplink carrier and two or more downlink sub-blocks, the out-of-band blocking requirements are defined with the uplink configuration in accordance with table 7.3A.2.2-1. For this uplink configuration, the UE shall meet the requirements for each sub-block as specified in clauses 7.6.3 and 7.6A.3.1 for one component carrier and two component carriers per sub-block, respectively. The requirements apply with all downlink carriers active.

The throughput of each carrier shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annexes A.2.2, A.3.2, and A.3.3 (with one sided dynamic OCNG Pattern OP.1 FDD/TDD for the DL-signal as described in Annex A.5.1.1/A.5.2.1).

### 7.6A.3.3 Out-of-band blocking for Inter-band CA

For inter-band carrier aggregation with one component carrier per operating band and the uplink assigned to one NR band, the out-of-band blocking requirements are defined with the uplink active on the band(s) other than the band whose downlink is being tested. For NR CA configurations including an operating band without uplink band or an operating band with an unpaired DL part (as noted in Table 5.2-1), the requirements for all downlinks shall be met with the single uplink carrier active in each band capable of UL operation. The UE shall meet the requirements specified in clause 7.6.3 for each component carrier while all downlink carriers are active.

For inter-band carrier aggregation with component carriers in operating bands  $< 2.7\text{GHz}$  including n48, and for  $F_{DL\_Low(j)} - 15 \text{ MHz} \leq f \leq F_{DL\_High(j)} + 15 \text{ MHz}$ , the appropriate adjacent channel selectivity and in-band blocking requirements in the respective clauses 7.5 and 7.6.2 shall be applied for carrier  $j$ . For inter-band carrier aggregation with component carriers in operating bands  $> 2.7\text{GHz}$  excluding n48, and for  $F_{DL\_Low(j)} - 3 \cdot BW_{channel} \leq f \leq F_{DL\_High(j)} + 3 \cdot BW_{channel}$ , the appropriate adjacent channel selectivity and in-band blocking requirements in the respective clauses 7.5 and 7.6.2 shall be applied for carrier  $j$ .  $F_{DL\_Low(j)}$  and  $F_{DL\_High(j)}$  denote the respective lower and upper frequency limits of the operating band containing carrier  $j$ ,  $j = 1, \dots, X$ , with carriers numbered in increasing order of carrier frequency and  $X$  the number of component carriers in the band combination.  $BW_{channel}$  denotes the channel bandwidth of the wanted signal component carrier  $j$ . If CW interferer falls in a gap between  $F_{DL\_High(j)}$  and  $F_{DL\_Low(j+1)}$  where the corresponding OOB ranges 1 and 2 overlap, then the lower level interferer limit of the overlapping OOB ranges applies.

For inter-band carrier aggregation with uplink assigned to two NR bands, the out-of-band blocking requirements specified in clause 7.6.3 shall be met with the transmitter power for the uplink set to 7 dB below  $P_{CMAX\_L,f,c}$  for each serving cell  $c$ .

For inter-band CA combination listed in Table 7.6A.3.3-1, exceptions to the requirement specified in Table 7.6A.3.3-2 are allowed when the second order intermodulation product of the lower frequency band UL carrier and the CW interfering signal fully or partially overlaps with the higher frequency band DL carrier. Unless otherwise stated, the exceptions apply to any power classes for the listed inter-band CA combinations.

For UE(s) supporting one uplink, the uplink configuration of the PCC shall be in accordance with Table 7.3.2-3. The UE shall fulfil the minimum requirement in presence of an interfering signal specified in Table 7.6A.4.1-1 being on either side of the aggregated signal. The throughput of each carrier shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annexes A.2.2, A.3.2 and A.3.3 (with one sided dynamic OCNG Pattern OP.1 FDD/TDD for the DL-signal as described in Annex A.5.1.1/A.5.2.1) with parameters specified in Table 7.6A.4.1-1.

### 7.6A.4.2 Narrow band blocking for Intra-band non-contiguous CA

For intra-band non-contiguous carrier aggregation with  $F_{DL\_low} < 2700$  MHz and  $F_{UL\_low} < 2700$  MHz with one uplink carrier and two or more downlink sub-blocks, the narrow band blocking requirements are defined with the uplink configuration in accordance with Table 7.3A.2.2-1. For this uplink configuration, the UE shall meet the requirements for each sub-block as specified in clauses 7.6.4 and 7.6A.4.1 for one component carrier and two component carriers per sub-block, respectively. The requirements apply for in-gap and out-of-gap interferers while all downlink carriers are active.

The throughput of each carrier shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annexes A.2.2, A.3.2, and A.3.3 (with one sided dynamic OCNG Pattern OP.1 FDD/TDD for the DL-signal as described in Annex A.5.1.1/A.5.2.1).

### 7.6A.4.3 Narrow band blocking for Inter-band CA

For inter-band carrier aggregation with one component carrier per operating band and the uplink assigned to one NR band, the narrow band blocking requirements are defined with the uplink active on the band(s) other than the band whose downlink is being tested. For NR CA configurations including an operating band without uplink band or an operating band with an unpaired DL part (as noted in Table 5.2-1), the requirements for all downlinks shall be met with the single uplink carrier active in each band capable of UL operation. The UE shall meet the requirements specified in clause 7.6.4 for each component carrier while all downlink carriers are active.

For the UE which supports inter-band CA configuration in Table 7.3A.3.2.1-1,  $P_{UW}$  power defined in Table 7.6.4-1 is increased by the amount given by  $\Delta R_{IB,c}$  in Table 7.3A.3.2.1-1.

The throughput of each carrier shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annexes A.2.2, A.3.2, and A.3.3 (with one sided dynamic OCNG Pattern OP.1 FDD/TDD for the DL-signal as described in Annex A.5.1.1/A.5.2.1).

### 7.6E.3.2 Out-of-band blocking for V2X con-current operation

For the inter-band con-current NR V2X operation, the requirements specified in clause 7.6E.3.1 shall apply for the NR sidelink reception in Band n47 and the requirements specified in clause 7.6.3 shall apply for the NR downlink reception in licensed band while all downlink carriers are active.

## 7.6F Blocking characteristics

### 7.6F.1 General

The blocking characteristic is a measure of the receiver's ability to receive a wanted signal at its assigned channel frequency in the presence of an unwanted interferer on frequencies other than those of the spurious response or the adjacent channels, without this unwanted input signal causing a degradation of the performance of the receiver beyond a specified limit. The blocking performance shall apply at all frequencies except those at which a spurious response occurs.

### 7.6F.2 In-band blocking

#### 7.6F.2.1 General

In-band blocking (IBB) is defined for an unwanted interfering signal falling into the UE receive band or into the first 60 MHz below or above the UE receive band. The throughput of the wanted signal shall be  $\geq 95$  % of the maximum throughput of the reference measurement channels as specified in Annexes A.2.2, A.3.2 and A.3.3 (with one sided dynamic OCNG Pattern OP.1 FDD/TDD for the DL-signal as described in Annex A.5.1.1/A.5.2.1) with parameters specified in Table 7.6F.2.1-1 and Table 7.6F.2.1-2. The relative throughput requirement shall be met for any SCS specified for the channel bandwidth of the wanted signal.

## 7.7 Spurious response

Spurious response is a measure of the ability of the receiver to receive a wanted signal on its assigned channel frequency without exceeding a given degradation due to the presence of an unwanted CW interfering signal at any other frequency for which a response is obtained, i.e. for which the out-of-band blocking limit as specified in clause 7.6.3 is not met.

The throughput shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annexes A.2.2, A.3.2 and A.3.3 (with one sided dynamic OCNG Pattern OP.1 FDD/TDD for the DL-signal as described in Annex A.5.1.1/A.5.2.1) with parameters for the wanted signal as specified in Table 7.7-1 for NR bands with  $F_{\text{DL\_high}} < 2700$  MHz and  $F_{\text{UL\_high}} < 2700$  MHz and in Table 7.7-1a for NR bands with  $F_{\text{DL\_high}} \geq 3300$  MHz and  $F_{\text{UL\_high}} \geq 3300$  MHz and for the interferer as specified in Table 7.7-2. The relative throughput requirement shall be met for any SCS specified for the channel bandwidth of the wanted signal. For operating bands with an unpaired DL part (as noted in Table 5.2-1), the requirements only apply for carriers assigned in the paired part.

### 7.7A.2 Spurious response for Intra-band non-contiguous CA

For intra-band non-contiguous carrier aggregation with one uplink carrier and two or more downlink sub-blocks, the spurious response requirements are defined with the uplink configuration in accordance with Table 7.3A.2.2-1. For this uplink configuration, the UE shall meet the requirements for each sub-block as specified in clauses 7.7 and 7.7A.1 for one component carrier and two component carriers per sub-block, respectively. The requirements apply with all downlink carriers active.

The throughput of each carrier shall be  $\geq 95$  % of the maximum throughput of the reference measurement channels as specified in Annexes A.2.2, A.3.2, and A.3.3 (with one sided dynamic OCNG Pattern OP.1 FDD/TDD for the DL-signal as described in Annex A.5.1.1/A.5.2.1).

### 7.7A.3 Spurious response for Inter-band CA

For inter-band carrier aggregation with one component carrier per operating band and the uplink assigned to one NR band, the spurious response are defined with the uplink active on the band(s) other than the band whose downlink is being tested. The UE shall meet the requirements specified in clause 7.7 for each component carrier while all downlink carriers are active.

For the UE which supports inter-band CA configuration in Table 7.3A.3.2.1-1,  $P_{\text{interferer}}$  power defined in Table 7.7-2 is increased by the amount given by  $\Delta R_{\text{IB,c}}$  in Table 7.3A.3.2.1-1.

The throughput of each carrier shall be  $\geq 95$  % of the maximum throughput of the reference measurement channels as specified in Annexes A.2.2, A.3.2, and A.3.3 (with one sided dynamic OCNG Pattern OP.1 FDD/TDD for the DL-signal as described in Annex A.5.1.1/A.5.2.1).

## 7.7B Spurious response for NR-DC

For inter-band NR-DC configurations, the spurious response for the corresponding inter-band CA configuration as specified in clause 7.7A applies.

## 7.7D Spurious response for UL MIMO

For UE with two transmitter antenna connectors in closed-loop spatial multiplexing scheme, the minimum requirements specified in clause 7.7 shall be met with the UL MIMO configurations described in clause 6.2D.1. For UL MIMO, the parameter  $P_{\text{CMAX}_L}$  is defined as the total transmitter power over the two transmit antenna connectors.

## 7.7E Spurious response for V2X

### 7.7E.1 General

Spurious response is a measure of the receiver's ability to receive a wanted signal on its assigned channel frequency without exceeding a given degradation due to the presence of an unwanted CW interfering signal at any other frequency for which a response is obtained, i.e. for which the out-of-band blocking limit as specified in clause 7.6E.3.1 is not met.

When UE is configured for NR V2X reception non-concurrent with NR uplink transmissions for NR V2X operating bands specified in Table 5.2E.1-1, the throughput shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annexes A.7.2 with parameters for the wanted signal as specified in Table 7.7E.1-1 and Table 7.7E.1-2 for NR V2X bands. The relative throughput requirement shall be met for any SCS specified for the channel bandwidth of the wanted signal.

## 7.8 Intermodulation characteristics

### 7.8.1 General

Intermodulation response rejection is a measure of the capability of the receiver to receive a wanted signal on its assigned channel frequency in the presence of two or more interfering signals which have a specific frequency relationship to the wanted signal

### 7.8.2 Wide band Intermodulation

The wide band intermodulation requirement is defined using a CW carrier and modulated NR signal as interferer 1 and interferer 2 respectively.

The throughput shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annexes A.2.2, A.3.2 and A.3.3 (with one sided dynamic OCNNG Pattern OP.1 FDD/TDD for the DL-signal as

described in Annex A.5.1.1/A.5.2.1) with parameters specified in Table 7.8.2-1 for NR bands with  $F_{DL\_high} < 2700$  MHz and  $F_{UL\_high} < 2700$  MHz and Table 7.8.2-2 for NR bands with  $F_{DL\_low} \geq 3300$  MHz and  $F_{UL\_low} \geq 3300$  MHz. The relative throughput requirement shall be met for any SCS specified for the channel bandwidth of the wanted signal. For operating bands with an unpaired DL part (as noted in Table 5.2-1), the requirements only apply for carriers assigned in the paired part.

### 7.8A.2.2 Wide band intermodulation for Intra-band non-contiguous CA

For intra-band non-contiguous carrier aggregation with one uplink carrier and two or more downlink sub-blocks, the wide band intermodulation requirements are defined with the uplink configuration in accordance with Table 7.3A.2.2-1. For this uplink configuration, the UE shall meet the requirements for each sub-block as specified in clause 7.8.2 and 7.8A.2.1 for one component carrier and two component carriers per sub-block, respectively. The requirements apply for out-of-gap interferers while all downlink carriers are active.

The throughput of each carrier shall be  $\geq 95$  % of the maximum throughput of the reference measurement channels as specified in Annexes A.2.2, A.3.2, and A.3.3 (with one sided dynamic OCNG Pattern OP.1 FDD/TDD for the DL-signal as described in Annex A.5.1.1/A.5.2.1).

### 7.8A.2.3 Wide band intermodulation for Inter-band CA

For inter-band carrier aggregation with one component carrier per operating band and the uplink assigned to one NR band, the wide band intermodulation requirements are defined with the uplink active on the band(s) other than the band whose downlink is being tested. The UE shall meet the requirements specified in clause 7.8 for each component carrier while all downlink carriers are active.

For the UE which supports inter-band CA configuration in Table 7.3A.3.2.1-1,  $P_{interferer}$  power defined in Table 7.8.2-1 and 7.8.2-2 is increased by the amount given by  $\Delta R_{IB,c}$  in Table 7.3A.3.2.1-1.

The throughput of each carrier shall be  $\geq 95$  % of the maximum throughput of the reference measurement channels as specified in Annexes A.2.2, A.3.2, and A.3.3 (with one sided dynamic OCNG Pattern OP.1 FDD/TDD for the DL-signal as described in Annex A.5.1.1/A.5.2.1).

## 7.8B Intermodulation characteristics for NR-DC

For inter-band NR-DC configurations, the intermodulation characteristics for the corresponding inter-band CA configuration as specified in clause 7.8A applies.

## 7.8D Intermodulation characteristics for UL MIMO

For UE(s) with two transmitter antenna connectors in closed-loop spatial multiplexing scheme, the minimum requirements in clause 7.8 shall be met with the UL MIMO configurations described in clause 6.2D.1. For UL MIMO, the parameter  $P_{\text{CMAX}_L}$  is defined as the total transmitter power over the two transmit antenna connectors.

## 7.8E Intermodulation characteristics for V2X

### 7.8E.1 General

Intermodulation response rejection is a measure of the capability of the receiver to receive a wanted signal on its assigned channel frequency in the presence of two or more interfering signals which have a specific frequency relationship to the wanted signal.

### 7.8E.2 Wide band Intermodulation

#### 7.8E.2.1 General

The wide band intermodulation requirement is defined using modulated NR carrier and a CW signal as interferer 1 and interferer 2 respectively. When UE is configured for NR V2X reception non-concurrent with NR uplink transmissions for NR V2X operating bands specified in Table 5.2E.1-1, the throughput shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annexes A.7.2 with parameters specified in Table 7.8E.2-1 for NR V2X bands. The relative throughput requirement shall be met for any SCS specified for the channel bandwidth of the wanted signal.

### 7.8E.2.2 Wide band Intermodulation for V2X con-current operation

For the inter-band con-current NR V2X operation, the requirements specified in clause 7.8E.2.1 shall apply for the NR sidelink reception in the operating Bands in Table 5.2E.1-1 and the requirements specified in clause 7.8 shall apply for the NR downlink reception in licensed band while all downlink carriers are active.

## 7.8F Intermodulation characteristics for shared spectrum channel access

### 7.8F.1 General

Intermodulation response rejection is a measure of the capability of the receiver to receive a wanted signal on its assigned channel frequency in the presence of two or more interfering signals which have a specific frequency relationship to the wanted signal

### 7.8F.2 Wide band Intermodulation

The wide band intermodulation requirement is defined using a CW carrier and modulated NR signal as interferer 1 and interferer 2 respectively.

Instead of the general wideband intermodulation requirements specified in clause 7.8.2, the throughput shall be  $\geq 95\%$  of the maximum throughput of the reference measurement channels as specified in Annexes A.2.2, A.3.2 and A.3.3 (with one sided dynamic OCNG Pattern OP.1 FDD/TDD for the DL-signal as described in Annex A.5.1.1/A.5.2.1) with parameters specified in Table 7.8F.2-1. The relative throughput requirement shall be met for any SCS specified for the channel bandwidth of the wanted signal.

| NOTE 2: Reference measurement channel is specified in Annexes A.2.2, A.3.2, and A.3.3 (with one sided dynamic OCNG Pattern OP.1 FDD/TDD for the DL-signal as described in Annex A.5.1.1/A.5.2.1).   |       |  |

| NOTE 4: The $F_{\text{interferer 1}}$ (offset) is the frequency separation of the center frequency of the carrier closest to the interferer and the center frequency of the CW interferer and $F_{\text{interferer 2}}$ (offset) is the frequency separation of the center frequency of the carrier closest to the interferer and the center frequency of the modulated interferer. |       |  |

## 7.9 Spurious emissions

The spurious emissions power is the power of emissions generated or amplified in a receiver that appear at the UE antenna connector.

The power of any narrow band CW spurious emission shall not exceed the maximum level specified in Table 7.9-1

7.9A.2 Void

### 7.9A.3 Spurious emissions for Inter-band CA

For inter-band carrier aggregation including an operating band without uplink band, the UE shall meet the Rx spurious emissions requirements specified in clause 7.9 for each component carrier while all downlink carriers are active.

# Annex A (normative): Measurement channels

---

## A.1 General

The throughput values defined in the measurement channels specified in Annex A, are calculated and are valid per datastream (codeword). For multi-stream (more than one codeword) transmissions, the throughput referenced in the minimum requirements is the sum of throughputs of all datastreams (codewords).

The UE category entry in the definition of the reference measurement channel in Annex A is only informative and reveals the UE categories, which can support the corresponding measurement channel. Whether the measurement channel is used for testing a certain UE category or not is specified in the individual minimum requirements.

---

## A.2 UL reference measurement channels

### A.2.1 General

The measurement channels in the following clauses are defined to derive the requirements in clause 6 (Transmitter Characteristics) and clause 7 (Receiver Characteristics). The measurement channels represent example configurations of physical channels for different data rates.

The measurement channels in the following clauses are applicable to both FDD and TDD.

The active uplink slots for TDD configurations are specified in table A.2.1-1. TDD slot patterns defined for reference sensitivity tests will be used for TDD UL RMCs.

**Table A.2.1-1: TDD active uplink slots**

NOTE 1: PUSCH mapping Type-A and single-symbol DM-RS configuration Type-1 with 2 additional DM-RS symbols, such that the DM-RS positions are set to symbols 2, 7, 11. DMRS is [TDM'ed] with PUSCH data. DM-RS symbols are not counted.

NOTE 2: MCS Index is based on MCS table 6.1.4.1-1 defined in TS 38.214 [10].

NOTE 3: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit)

NOTE 4: The RMCs apply to all channel bandwidth where L<sub>CRB</sub> ≤ N<sub>RB</sub>.

NOTE 1: PUSCH mapping Type-A and single-symbol DM-RS configuration Type-1 with 2 additional DM-RS symbols, such that the DM-RS positions are set to symbols 2, 7, 11. DMRS is [TDM'ed] with PUSCH data. DM-RS symbols are not counted.

NOTE 2: MCS Index is based on MCS table 6.1.4.1-1 defined in TS 38.214 [10].

NOTE 3: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit)

NOTE 4: The RMCs apply to all channel bandwidth where L<sub>CRB</sub> ≤ N<sub>RB</sub>.

NOTE 1: PUSCH mapping Type-A and single-symbol DM-RS configuration Type-1 with 2 additional DM-RS symbols, such that the DM-RS positions are set to symbols 2, 7, 11. DM-RS is [TDM'ed] with PUSCH data. DM-RS symbols are not counted.

NOTE 2: MCS Index is based on MCS table 6.1.4.1-1 defined in TS 38.214 [10].

NOTE 3: If more than one Code Block is present, an additional CRC sequence of  $L = 24$  Bits is attached to each Code Block (otherwise  $L = 0$  Bit)

NOTE 4: The RMCs apply to all channel bandwidth where  $L_{CRB} \leq N_{RB}$ .

NOTE 1: PUSCH mapping Type-A and single-symbol DM-RS configuration Type-1 with 2 additional DM-RS symbols, such that the DM-RS positions are set to symbols 2, 7, 11. DMRS is [TDM'ed] with PUSCH data. DM-RS symbols are not counted.

NOTE 2: MCS Index is based on MCS table 6.1.4.1-1 defined in TS 38.214 [10].

NOTE 3: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit)

NOTE 4: The RMCs apply to all channel bandwidth where  $L_{CRB} \leq N_{RB}$ .

NOTE 1: PUSCH mapping Type-A and single-symbol DM-RS configuration Type-1 with 2 additional DM-RS symbols, such that the DM-RS positions are set to symbols 2, 7, 11. DMRS is [TDM'ed] with PUSCH data. DM-RS symbols are not counted.

NOTE 2: MCS Index is based on MCS table 5.1.3.1-2 defined in TS 38.214 [10].

NOTE 3: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit)

NOTE 4: The RMCs apply to all channel bandwidth where L<sub>CRB</sub> ≤ N<sub>RB</sub>.

NOTE 1: PUSCH mapping Type-A and single-symbol DM-RS configuration Type-1 with 2 additional DM-RS symbols, such that the DM-RS positions are set to symbols 2, 7, 11. DMRS is [TDM'ed] with PUSCH data. DM-RS symbols are not counted.

NOTE 2: MCS Index is based on MCS table 5.1.3.1-1 defined in TS 38.214 [10].

NOTE 3: If more than one Code Block is present, an additional CRC sequence of  $L = 24$  Bits is attached to each Code Block (otherwise  $L = 0$  Bit)

NOTE 4: The RMCs apply to all channel bandwidth where  $L_{CRB} \leq N_{RB}$ .

NOTE 1: PUSCH mapping Type-A and single-symbol DM-RS configuration Type-1 with 2 additional DM-RS symbols, such that the DM-RS positions are set to symbols 2, 7, 11. DMRS is [TDM'ed] with PUSCH data. DM-RS symbols are not counted.

NOTE 2: MCS Index is based on MCS table 5.1.3.1-1 defined in TS 38.214 [10].

NOTE 3: If more than one Code Block is present, an additional CRC sequence of  $L = 24$  Bits is attached to each Code Block (otherwise  $L = 0$  Bit)

NOTE 4: The RMCs apply to all channel bandwidth where  $L_{CRB} \leq N_{RB}$ .

NOTE 1: PUSCH mapping Type-A and single-symbol DM-RS configuration Type-1 with 2 additional DM-RS symbols, such that the DM-RS positions are set to symbols 2, 7, 11. DMRS is [TDM'ed] with PUSCH data. DM-RS symbols are not counted.

NOTE 2: MCS Index is based on MCS table 5.1.3.1-1 defined in TS 38.214 [10].

NOTE 3: If more than one Code Block is present, an additional CRC sequence of  $L = 24$  Bits is attached to each Code Block (otherwise  $L = 0$  Bit)

NOTE 4: The RMCs apply to all channel bandwidth where  $L_{CRB} \leq N_{RB}$ .

NOTE 1: PUSCH mapping Type-A and single-symbol DM-RS configuration Type-1 with 2 additional DM-RS symbols, such that the DM-RS positions are set to symbols 2, 7, 11. DMRS is [TDM'ed] with PUSCH data. DM-RS symbols are not counted.

NOTE 2: MCS Index is based on MCS table 5.1.3.1-2 defined in TS 38.214 [10].

NOTE 3: If more than one Code Block is present, an additional CRC sequence of  $L = 24$  Bits is attached to each Code Block (otherwise  $L = 0$  Bit)

NOTE 4: The RMCs apply to all channel bandwidth where  $L_{CRB} \leq N_{RB}$ .

More than one Code Block is present, an additional CRC sequence of  $L = 24$  Bits is attached to each Code Block (otherwise  $L = 0$  Bit).

The PBCH block is transmitted in slot #0 of each frame

where  $i$  is slot index per frame

## A.6 Void

## A.7 V2X reference measurement channels

### A.7.1 General

The algorithm for determining the payload size  $A$  is as follows; given a desired coding rate  $R$  and radio block allocation  $NRB$

1. Calculate the RE number of 2nd stage SCI  $Q\_SCI2^A$  that can be transmitted in a given sub-frame, where in order to make sure that the code-rate of 2-A is approximate to SCI 1-A, a beta offset is selected based on MCS, and vacant resource elements  $\gamma$  value is determined based on  $NRB$  and DMRS frequency density.
2. Transport Block Size is determined according to clause 8.1.3.2 of TS 38.214 [13] based on Table A.7.1-1.
3. Calculate Binary Channel Bits per Slot for PSSCH as below

Binary Channel Bits per Slot =  $(NRB * \text{Subcarriers per resource block} * \text{CP-OFDM symbols per slot} - \text{DMRS resource REs} - \text{PSCCH resource Res} - Q\_SCI2^A) * Q_m$

Where  $Q_m$  is the modulation order corresponding to MCS.

In Table A.7.1-1 Common reference channel parameters are listed the Sidelink reference measurement channels specified in annexes A.7.2 to A.7.6.

## Annex D (normative): Characteristics of the interfering signal

### D.1 General

Some RF performance requirements for the NR UE receiver are defined with interfering signals present in addition to the wanted signal.

For NR bands with  $F_{DL\_high} < 2700$  MHz and  $F_{UL\_high} < 2700$  MHz, a modulated 5 MHz full bandwidth NR down link signal, and in some cases an additional CW signal, are used as interfering signal. For intra-band contiguous CA bandwidth class B and C, a modulated 5 MHz NR downlink signal is used. And for some cases an additional CW signal is used.

For NR bands with  $F_{DL\_low} \geq 3300$  MHz and  $F_{UL\_low} \geq 3300$  MHz, a modulated NR downlink signal which equals to channel bandwidth of the wanted signal for single carrier and inter-band CA cases is used as interfering signal. For intra-band contiguous CA bandwidth Class C, a modulated NR downlink signal which equals to the aggregated channel bandwidth of the wanted signal is used. For intra-band contiguous CA bandwidth class D and E cases, a modulated 50 MHz NR downlink signal is used. And for some cases an additional CW signal is used.

# Annex E (normative): Environmental conditions

## E.1 General

This normative annex specifies the environmental requirements of the UE. Within these limits the requirements of the present documents shall be fulfilled.

## E.2 Environmental

The requirements in this clause apply to all types of UE(s).

### E.2.1 Temperature

The UE shall fulfil all the requirements in the full temperature range of:

**Table E.2.1-1: Temperature conditions**

|                |   |
|----------------|---|
| +15°C to +35°C | For normal conditions (with relative humidity of 25 % to 75 %)  |
| -10°C to +55°C | For extreme conditions (see IEC publications 68-2-1 and 68-2-2) |

Outside this temperature range the UE, if powered on, shall not make ineffective use of the radio frequency spectrum. In no case shall the UE exceed the transmitted levels as defined in clause 6.2 for extreme operation.

### E.2.2 Voltage

The UE shall fulfil all the requirements in the full voltage range, i.e. the voltage range between the extreme voltages.

The manufacturer shall declare the lower and higher extreme voltages and the approximate shutdown voltage. For the equipment that can be operated from one or more of the power sources listed below, the lower extreme voltage shall not be higher, and the higher extreme voltage shall not be lower than that specified below.

**Table E.2.2-1: Voltage conditions**

| Power source                | Lower extreme voltage | Higher extreme voltage | Normal conditions voltage |
|-----------------------------|-----------------------|------------------------|---------------------------|
| AC mains                    | 0,9 * nominal         | 1,1 * nominal          | nominal                   |
| Regulated lead acid battery | 0,9 * nominal         | 1,3 * nominal          | 1,1 * nominal             |

Outside this voltage range the UE if powered on, shall not make ineffective use of the radio frequency spectrum. In no case shall the UE exceed the transmitted levels as defined in clause 6.2 for extreme operation. In particular, the UE shall inhibit all RF transmissions when the power supply voltage is below the manufacturer declared shutdown voltage.

## E.2.3 Vibration

Outside the specified frequency range the UE, if powered on, shall not make ineffective use of the radio frequency spectrum. In no case shall the UE exceed the transmitted levels as defined in TS 38.101-1 for extreme operation.

## Annex F (normative): Transmit modulation

### F.0 General

While measuring the transmit modulation quality of carriers, an existence of the carrier leakage needs to be taken into account indicated by the parameter *txDirectCurrentLocation* in *UplinkTxDirectCurrent* IE.

### F.1 Measurement Point

Figure F.1-1 shows the measurement point for the unwanted emission falling into non-allocated RB(s) and the EVM for the allocated RB(s).

Figure F.1-1: EVM measurement points

### F.2 Basic Error Vector Magnitude measurement

The EVM is the difference between the ideal waveform and the measured waveform for the allocated RB(s)

$$EVM = \sqrt{\frac{\sum_{v \in T_m} |z'(v) - i(v)|^2}{|T_m| \cdot P_0}},$$

where

$T_m$  is a set of  $|T_m|$  modulation symbols with the considered modulation scheme being active within the measurement period,

$z'(v)$  are the samples of the signal evaluated for the EVM,

$i(v)$  is the ideal signal reconstructed by the measurement equipment, and

$P_0$  is the average power of the ideal signal. For normalized modulation symbols  $P_0$  is equal to 1.

The basic EVM measurement interval is defined over one slot in the time domain for PUCCH and PUSCH and over one preamble sequence for the PRACH.

## F.3 Basic in-band emissions measurement

The in-band emissions are a measure of the interference falling into the non-allocated resources blocks. The in-band emission requirement is evaluated for PUCCH and PUSCH transmissions. The in-band emission requirement is not evaluated for PRACH transmissions.

The in-band emissions are measured as follows

$$Emissions_{absolute}(\Delta_{RB}) = \begin{cases} \frac{1}{|T_s|} \sum_{t \in T_s} \sum_{f_l + (12 \cdot \Delta_{RB} + 11) \cdot \Delta f}^{\min(f_{\min}, f_l + 12 \cdot \Delta_{RB} \cdot \Delta f)} |Y(t, f)|^2, \Delta_{RB} < 0 \\ \frac{1}{|T_s|} \sum_{t \in T_s} \sum_{f_h + (12 \cdot \Delta_{RB} - 11) \cdot \Delta f}^{\max(f_{\max}, f_h + 12 \cdot \Delta_{RB} \cdot \Delta f)} |Y(t, f)|^2, \Delta_{RB} > 0 \end{cases},$$

where

$T_s$  is a set of  $|T_s|$  OFDM symbols with the considered modulation scheme being active within the measurement period,

$\Delta_{RB}$  is the starting frequency offset between the allocated RB and the measured non-allocated RB (e.g.  $\Delta_{RB} = 1$  or  $\Delta_{RB} = -1$  for the first adjacent RB),

$f_{\min}$  (resp.  $f_{\max}$ ) is the lower (resp. upper) edge of the UL UE channel bandwidth,

$f_l$  and  $f_h$  are the lower and upper edge of the allocated BW, and

$Y(t, f)$  is the frequency domain signal evaluated for in-band emissions as defined in the clause (ii)

The relative in-band emissions are, given by

$$Emissions_{relative}(\Delta_{RB}) = \frac{Emissions_{absolute}(\Delta_{RB})}{\frac{1}{|T_s|} \cdot N_{RB} \sum_{t \in T_s} \sum_{f_l}^{f_l + (12 \cdot N_{RB} - 1) \cdot \Delta f} |Y(t, f)|^2}$$

where

$N_{RB}$  is the number of allocated RBs

The basic in-band emissions measurement interval is defined over one slot in the time domain. When the PUSCH or PUCCH transmission slot is shortened due to multiplexing with SRS, the in-band emissions measurement interval is reduced by one OFDM symbol, accordingly.

In the evaluation of in-band emissions, the timing is set according to  $\tilde{\Delta f} = \tilde{\Delta C}$ , where sample time offsets  $\tilde{\Delta f}$  and  $\tilde{\Delta C}$  are defined in clause F.4.

## F.4 Modified signal under test

Implicit in the definition of EVM is an assumption that the receiver is able to compensate a number of transmitter impairments.

The DFT-s-OFDM modulated signals or PRACH signal under test is modified and, in the case of DFT-s-OFDM modulated signals, decoded according to:

$$Z'(t, f) = IDFT \left\{ \frac{FFT \left\{ z(v - \Delta\tilde{t}) \cdot e^{-j2\pi\Delta\tilde{f}v} \right\} e^{j2\pi f \Delta\tilde{t}}}{\tilde{a}(t, f) \cdot e^{j\tilde{\varphi}(t, f)}} \right\}$$

where

$z(v)$  is the time domain samples of the signal under test.

The CP-OFDM modulated signals or PUSCH demodulation reference signal or PUCCH data signal under test is equalised and, in the case of CP-OFDM modulated signals decoded according to:

$$Z'(t, f) = \frac{FFT \left\{ z(v - \Delta\tilde{t}) \cdot e^{-j2\pi\Delta\tilde{f}v} \right\} e^{j2\pi f \Delta\tilde{t}}}{\tilde{a}(t, f) \cdot e^{j\tilde{\varphi}(t, f)}}$$

where

$z(v)$  is the time domain samples of the signal under test.

To minimize the error, the signal under test should be modified with respect to a set of parameters following the procedure explained below.

Notation:

$\Delta\tilde{t}$  is the sample timing difference between the FFT processing window in relation to nominal timing of the ideal signal.

$\Delta\tilde{f}$  is the RF frequency offset.

$\tilde{\varphi}(t, f)$  is the phase response of the TX chain.

$\tilde{a}(t, f)$  is the amplitude response of the TX chain.

In the following  $\Delta\tilde{c}$  represents the middle sample of the EVM window of length  $w$  (defined in the next clauses) or the last sample of the first window half if  $w$  is even.

The EVM analyser shall

- detect the start of each slot and estimate  $\Delta\tilde{t}$  and  $\Delta\tilde{f}$ ,
- determine  $\Delta\tilde{c}$  so that the EVM window of length  $w$  is centred
  - on the time interval determined by the measured cyclic prefix minus  $16\kappa$  samples of the considered OFDM symbol for symbol  $l$  for subcarrier spacing configuration  $\mu$  in a subframe, with  $l = 0$  or  $l = 7 \cdot 2^\mu$  for normal CP, i.e. the first  $16\kappa$  samples of the CP should not be taken into account for this step. In the determination of the number of excluded samples, a sampling rate of  $1/T_c$  is assumed. If a different sampling rate is used, the number of excluded samples is scaled linearly.
  - on the measured cyclic prefix of the considered OFDM symbol for all other symbols for normal CP and for symbol 0 to 11 for extended CP.
  - on the measured preamble cyclic prefix for the PRACH

To determine the other parameters a sample timing offset equal to  $\Delta\tilde{c}$  is corrected from the signal under test. The EVM analyser shall then

- correct the RF frequency offset  $\hat{\Delta f}$  for each time slot, and
- apply an FFT of appropriate size. The chosen FFT size shall ensure that in the case of an ideal signal under test, there is no measured inter-subcarrier interference.

The carrier leakage shall be removed from the evaluated signal before calculating the EVM and the in-band emissions; however, the removed relative carrier leakage power also has to satisfy the applicable requirement.

At this stage the allocated RBs shall be separated from the non-allocated RBs. In the case of PUCCH and PUSCH EVM, the signal on the non-allocated RB(s),  $y(t, f)$ , is used to evaluate the in-band emissions.

Moreover, the following procedure applies only to the signal on the allocated RB(s).

- In the case of PUCCH and PUSCH, the UL EVM analyzer shall estimate the TX chain equalizer coefficients  $\tilde{a}(t, f)$  and  $\tilde{\varphi}(t, f)$  used by the ZF equalizer for all subcarriers by time averaging at each signal subcarrier of the amplitude and phase of the reference and data symbols. The time-averaging length is 1 slot. This process creates an average amplitude and phase for each signal subcarrier used by the ZF equalizer. The knowledge of data modulation symbols may be required in this step because the determination of symbols by demodulation is not reliable before signal equalization.
- In the case of PRACH, the UL EVM analyzer shall estimate the TX chain coefficients  $\tilde{a}(t)$  and  $\tilde{\varphi}(t)$  used for phase and amplitude correction and are selected so as to minimize the resulting EVM. The TX chain coefficients are not dependent on frequency, i.e.  $\tilde{a}(t, f) = \tilde{a}(t)$  and  $\tilde{\varphi}(t, f) = \tilde{\varphi}(t)$ . The TX chain coefficient are chosen independently for each preamble transmission and for each  $\Delta\tilde{f}$ .

At this stage estimates of  $\hat{\Delta f}$ ,  $\tilde{a}(t, f)$ ,  $\tilde{\varphi}(t, f)$  and  $\Delta\tilde{f}$  are available.  $\Delta\tilde{f}$  is one of the extremities of the window  $W$ ,

i.e.  $\Delta\tilde{f}$  can be  $\Delta\tilde{c} + \alpha - \left\lfloor \frac{W}{2} \right\rfloor$  or  $\Delta\tilde{c} + \left\lfloor \frac{W}{2} \right\rfloor$ , where  $\alpha = 0$  if  $W$  is odd and  $\alpha = 1$  if  $W$  is even. The EVM analyser shall then

- calculate  $\text{EVM}_l$  with  $\Delta\tilde{f}$  set to  $\Delta\tilde{c} + \alpha - \left\lfloor \frac{W}{2} \right\rfloor$ ,
- calculate  $\text{EVM}_h$  with  $\Delta\tilde{f}$  set to  $\Delta\tilde{c} + \left\lfloor \frac{W}{2} \right\rfloor$ .

For the EVM calculation on the symbols with a transient period when the UE signals a transient period capability (tp) of 2, 4 or 7usec,  $\Delta\tilde{t}$  is given below.

- calculate  $\text{EVM}_{l\_tp}$  with  $\Delta\tilde{t}$  set to  $\left\lfloor \frac{tp+tp_{start}}{T_c} \right\rfloor + 1$ , where  $1/T_c$  is the sampling rate
- calculate  $\text{EVM}_{h\_tp}$  with  $\Delta\tilde{t}$  set to  $\left\lfloor \frac{CP+tp_{start}}{T_c} \right\rfloor - 1$ , where  $1/T_c$  is the sampling rate and the CP is the cyclic prefix of the symbol on which EVM is calculated (e.g. long CP for the first symbol of the slot) in seconds

A pictorial representation of the EVM measurement windows is given in Figure F.4-1.

Figure F.4-1 EVM measruement window

## F.5 Window length

### F.5.1 Timing offset

As a result of using a cyclic prefix, there is a range of  $\Delta\tilde{f}$ , which, at least in the case of perfect Tx signal quality, would give close to minimum error vector magnitude. As a first order approximation, that range should be equal to the length of the cyclic prefix. Any time domain windowing or FIR pulse shaping applied by the transmitter reduces the  $\Delta\tilde{f}$  range within which the error vector is close to its minimum.

### F.5.2 Window length

The window length  $W$  affects the measured EVM and is expressed as a function of the configured cyclic prefix length. In the case where equalization is present, as with frequency domain EVM computation, the effect of FIR is reduced. This is because the equalization can correct most of the linear distortion introduced by the FIR. However, the time domain windowing effect can't be removed.

### F.5.3 Window length for normal CP

Table F.5.3-1, F.5.3-2, F.5.3-3 below specify the EVM window length ( $W$ ) for normal CP.

## F.6 Averaged EVM

The general EVM is averaged over basic EVM measurements for  $n$  slots in the time domain.

$$\overline{EVM} = \sqrt{\frac{1}{n} \sum_{i=1}^n EVM_i^2},$$

where  $n$  is

$$n = \begin{cases} 10, & \text{for 15 kHz SCS} \\ 20, & \text{for 30 kHz SCS} \\ 40, & \text{for 60 kHz SCS} \end{cases}$$

for PUCCH, PUSCH.

The EVM requirements shall be tested against the maximum of the RMS average at the window  $W$  extremities of the EVM measurements:

Thus  $\overline{EVM}_l$  is calculated using  $\Delta \tilde{\tau} = \Delta \tilde{\tau}_l$  in the expressions above and  $\overline{EVM}_h$  is calculated using  $\Delta \tilde{\tau} = \Delta \tilde{\tau}_h$ .

Thus we get:

$$EVM = \max(\overline{EVM}_l, \overline{EVM}_h)$$

The calculation of the EVM for the demodulation reference signal,  $EVM_{DMRS}$ , follows the same procedure as calculating the general EVM, with the exception that the modulation symbol set  $T_m$  defined in clause F.2 is restricted to symbols containing uplink demodulation reference signals.

The basic  $EVM_{DMRS}$  measurements are first averaged over  $n$  slots in the time domain to obtain an intermediate average  $\overline{EVM}_{DMRS}$ .

$$\overline{EVM}_{DMRS} = \sqrt{\frac{1}{n} \sum_{i=1}^n EVM_{DMRS,i}^2}$$

In the determination of each  $EVM_{DMRS,i}$ , the timing is set to  $\Delta \tilde{\tau} = \Delta \tilde{\tau}_l$  if  $\overline{EVM}_l > \overline{EVM}_h$ , and it is set to  $\Delta \tilde{\tau} = \Delta \tilde{\tau}_h$  otherwise, where  $\overline{EVM}_l$  and  $\overline{EVM}_h$  are the general average EVM values calculated in the same  $n$  slots over which the intermediate average  $\overline{EVM}_{DMRS}$  is calculated. Note that in some cases, the general average EVM may be calculated only for the purpose of timing selection for the demodulation reference signal EVM.

Then the results are further averaged to get the EVM for the demodulation reference signal,  $EVM_{DMRS}$ ,

$$EVM_{DMRS} = \sqrt{\frac{1}{6} \sum_{j=1}^6 \overline{EVM}_{DMRS,j}^2}$$

The PRACH EVM,  $EVM_{PRACH}$ , is averaged over 2 preamble sequence measurements for long preamble formats as defined in table 6.3.3.1-1 in [6] and averaged over 10 preamble sequence measurements for short preamble formats as defined in table 6.3.3.1-2 in [6].

The EVM requirements shall be tested against the maximum of the RMS average at the window  $W$  extremities of the EVM measurements:

Thus  $\overline{EVM}_{PRACH,l}$  is calculated using  $\Delta \tilde{\tau} = \Delta \tilde{\tau}_l$  and  $\overline{EVM}_{PRACH,h}$  is calculated using  $\Delta \tilde{\tau} = \Delta \tilde{\tau}_h$ .

Thus we get:

$$EVM_{PRACH} = \max(\overline{EVM}_{PRACH}, \overline{EVM}_{PRACH})$$

## F.7 Spectrum Flatness

The data shall be taken from FFT coded data symbols and the demodulation reference symbols of the allocated resource block.

## F.8 EVM measurement for dual Tx

For UE with dual transmission antennas, if UE indicates IE [txDiversity-r16], EVM is measured at each antenna connector to get  $EVM_1$  and  $EVM_2$ , and the total EVM is calculated by values of  $EVM_1$  and  $EVM_2$  with weighting factor of linear power at each antenna connector.

$$EVM = \frac{P_1 * EVM_1 + P_2 * EVM_2}{P_1 + P_2}$$

where  $P_1$  and  $P_2$  denote the linear power measured at each antenna connector respectively.

## F.9 Phase offset measurement for DMRS bundling

### F.9.1 Measurement point

The measurement point for phase offset measurement is defined in Figure F.9.1-1.

Figure F.9.1-1: Measurement point for phase offset for DMRS bundling

### F.9.2 Symbols used

Phase offset is determined based on DMRS REs (3 DMRS symbols per slot) with the option to use data symbols.

### F.9.3 Modified test signal

[editor notes: updates based on LS reply from RAN5]

**F.9.4 phase offset measurement** The phase offset measurement is based on the phase response of the Tx chain  $\tilde{\varphi}(t, f)$  as derived based on Annex F.4.

The phase difference  $\Delta\tilde{\varphi}(f)$  for each subcarrier between a reference timeslot  $t_{\text{ref}}$  and the measurement timeslot  $t_m$  is then calculated as defined below:

$$\Delta\tilde{\varphi}(f) = \tilde{\varphi}(t_m, f) - \tilde{\varphi}(t_{\text{ref}}, f)$$

The phase offset between the reference and measurement timeslots are then calculated as the maximum over the results for all subcarriers as shown below:

$$PhaseOffset = \max_f(\Delta\tilde{\varphi}(f))$$

# Annex G (normative): Difference of relative phase and power errors

## G.0 General

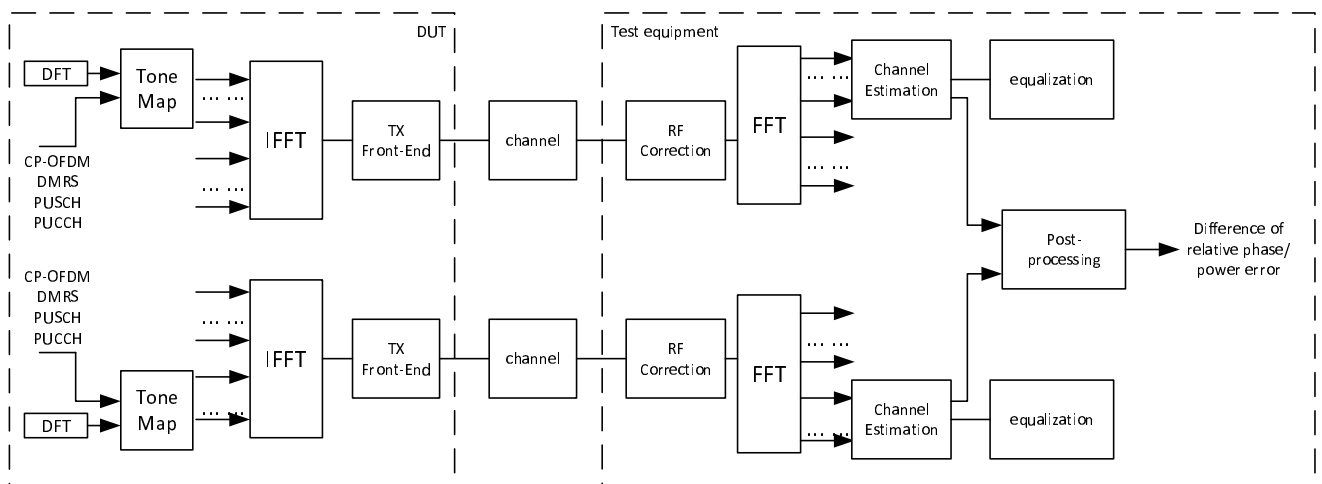

This annex gives further information needed for understanding and implementing 6.4D.4. The following terms should be understood as follows:

Relative phase error: refers to the phase difference between signals at different antenna connectors, which should be ideally 0. It should be understood as for a slot i.e. (slot) relative phase. It is calculated based on DMRS symbols of that slot or on SRS symbols.

Difference of relative phase error: refers to the difference between the relative phase error determined per slot and the relative phase error determined based on the SRS transmitted.

## G.1 Measurement Point

Figure G.1-1 shows the measurement point for the difference of relative phase and power errors.

**Figure G.1-1 - Measurement point for difference of relative phase/power error for UL coherent MIMO**

## G.2 Relative Phase Error Measurement

Here are listed the different aspects that may lead to different interpretations.

### G.2.1 Symbols used

Phase error is determined based on DMRS REs (3 DMRS symbols per slot).

## G.2.2 CFO (carrier frequency offset) correction

The TE performs a CFO correction on a slot-by-slot basis using a common frequency correction at the two uplink antenna connectors.

## G.2.3 Steps of the measurement method

Below are detailed the steps necessary to obtain the maximum difference of relative phase error during the 20ms time window.

- 1 Determination for each subcarrier and at each antenna, the SRS relative phase error based on the last SRS transmitted on Ant1 and Ant2, that relative phase error serves as a reference for the calculation of the difference of relative phase error for each slot inside the 20 ms time window.

The output is the “SRS relative phase error” vector for the last SRS transmitted:  $[1 \times \textit{number\_of\_subcarriers}]$ .

- 2 Calculation for the last SRS transmitted, for each RB of the SRS relative phase errors based on the arithmetic mean of the subcarrier SRS relative phase errors determined in previous step.

The output is the “SRS relative phase error” vector for the last SRS transmitted:  $[1 \times \textit{number\_of\_RBs}]$ .

- 3 CFO correction on slot-by-slot basis using a common frequency correction for both antenna outputs.

- 4 Determination for each subcarrier and at each antenna, the phase over the slot being analyzed. The phase is extracted from the channel estimate derived from the 3 DMRS symbols of the slot using the LSE technique.

The output is one vector of dimension  $[1 \times \textit{number\_of\_subcarriers}]$  for each antenna.

- 5 Calculation for a slot for each subcarrier of the relative phase error (difference between the vectors determined in the previous step).

The output is subcarrier relative phase errors of a slot:  $[1 \times \textit{number\_of\_subcarriers}]$ .

- 6 Calculation for a slot, for each RB of the relative phase errors based on the arithmetic mean of the subcarrier relative phase errors determined in previous step.

The output is a “slot relative phase error” vector for a slot:  $[1 \times \textit{number\_of\_RBs}]$ .

- 7 Calculation for a slot of the difference of relative phase errors based on the “SRS relative phase error” (reference) determined in step 2 and the “slot relative phase error” determined in previous step.

The output is a “difference of relative phase error” vector for a slot:  $[1 \times \textit{number\_of\_RBs}]$ .

- 8 Calculation for a slot of the arithmetic mean value of the “difference of relative phase error” vector determined in previous step, this value corresponds to an RB.

The output is a “difference of relative phase error” value for a slot:  $[1 \times 1]$ .

- 9 Perform for each slot of the 20ms time window, steps 3 to 8.

The output is a “difference of relative phase error” vector:  $[1 \times \textit{number\_of\_slots}]$ .

- 10 Calculation of the maximum value of the “difference of relative phase error”.

The output is the “difference of relative phase error” that should be verified as complying with the 40° maximum allowable difference of relative phase error requirement:  $[1 \times 1]$ .

## Annex L (normative): ModifiedMPR-Behavior

### L.1 Indication of modified MPR behavior

This annex contains the definitions of the bits in the field *modifiedMPR-Behavior* indicated per supported NR band in the IE *RF-Parameters* [7] by a UE supporting an MPR or A-MPR modified in a given version of this specification. A modified MPR or A-MPR behaviour can apply to a supported NR band in stand-alone operation (including CA and NN-DC operation) or in non-standalone operation with the said NR band as part of an EN-DC or NE-DC band combination.

NOTE 1: In the present release, the *modifiedMPR-Behavior* is indicated [7] by an 8-bit bitmap per supported NR band.
