| 9        | MS -> SS  | PACKET RESOURCE REQUEST                        | Received on the single block assigned in step 8. Check that PEAK_THROUGHPUT_CLASS = 5, RADIO_PRIORITY = 1, RLC_MODE = acknowledged mode                                                                                                                                                                |
| 10       | SS -> MS  | PACKET UPLINK ASSIGNMENT                       | Open-ended uplink dynamic allocation, no starting time, USF_GRANULARITY = single block. Sent on PACCH of the same PDCH assigned in step 8.                                                                                                                                                             |
| 11       | SS -> MS  | PACKET DOWNLINK DUMMY CONTROL BLOCK            | Sent on the PACCH of the PDCH assigned, the USF assigned to the MS.                                                                                                                                                                                                                                    |
| 12-1     | MS -> SS  | EGPRS UPLINK RLC DATA BLOCK                    | Received on the assigned PDTCH. Check that the coding and the TFI are correct.                                                                                                                                                                                                                         |
| 12-2     | MS -> SS  | PACKET RESOURCE REQUEST                        | Received on the PACCH of the assigned PDCH, acknowledged mode for LLC PDU in a lower radio priority.                                                                                                                                                                                                   |
| 13       | SS        |                                                | Repeat step 11 and 12-1 until PACKET RESOURCE REQUEST in 12-2, instead of a RLC data block in 12-1, is received.<br>Observe the Length indicators, and E bit of the received data headers.<br>Check that a complete LLC PDU is transmitted and the transmission of another LLC PDU is not yet started. |
| 14       | SS -> MS  | PACKET UPLINK ACK/NACK                         | Sent on the PACCH of the PDCH assigned, acknowledge all received data                                                                                                                                                                                                                                  |
| 15       | SS -> MS  | PACKET TIMESLOT RECONFIGURE                    | Sent on PACCH of the PDCH assigned in step 10, assigning a new PDCH, USF_GRANULARITY=4.                                                                                                                                                                                                                |
| 16       | SS -> MS  | PACKET DOWNLINK DUMMY CONTROL BLOCK            | Sent on the PACCH of the PDCH assigned in step 15, the USF assigned to the MS.                                                                                                                                                                                                                         |
| 17       | MS -> SS  | EGPRS UPLINK RLC DATA BLOCK                    | Received on the PDTCH assigned in step 15.                                                                                                                                                                                                                                                             |
| 18       | MS -> SS  | EGPRS UPLINK RLC DATA BLOCK                    | Received on the PDTCH assigned in step 15.                                                                                                                                                                                                                                                             |
| 19       | MS -> SS  | EGPRS UPLINK RLC DATA BLOCK                    | Received on the PDTCH assigned in step 15.                                                                                                                                                                                                                                                             |
| 20       | MS -> SS  | EGPRS UPLINK RLC DATA BLOCK                    | Received on the PDTCH assigned in step 15.                                                                                                                                                                                                                                                             |
| 21       |           | {Completion of uplink RLC data block transfer} |                                                                                                                                                                                                                                                                                                        |
| 22B      | MS        |                                                | Switch off                                                                                                                                                                                                                                                                                             |

NOTE: After the abnormal release for random access in step 7 there are two LLC PDUs waiting for sending. It is assumed in step 9 that the MS requests an uplink PDCH for the LLC PDU in a higher radio priority.

### 52.3.3.3 Dynamic Allocation / Resource reallocation / Reject

#### 52.3.3.3.1 Conformance requirements

1. On receipt of a PACKET ACCESS REJECT message, the mobile station shall stop timer T3168 if running and indicate a packet access failure to upper layers. If no downlink TBF exists, the mobile station shall return to packet idle mode.
2. If the PACKET ACCESS REJECT message contains a WAIT\_INDICATION field in a Reject structure addressed to the mobile station, the mobile station shall start timer T3172 and if the mobile station has additional RLC data blocks to transmit, it shall initiate a new TBF establishment procedure on the RACH or PRACH, but the mobile station is not allowed to make a new attempt for packet access in the same cell until timer T3172 expires, it may, however, attempt packet access in an other cell after successful cell reselection. A mobile station in EGPRS MS class A or B mode of operation may attempt to enter the dedicated mode in the same cell before timer T3172 has expired. During the time T3172 is running, the mobile station shall ignore all received PACKET PAGING REQUEST messages except paging request to trigger RR connection establishment.

#### References

3GPP TS 04.60, subclause 8.1.1.1.2.

#### 52.3.3.3.2 Test purposes

To verify that during the uplink resource reallocation:

1. The MS returns to packet idle mode when it receives PACKET ACCESS REJECT without WAIT\_INDICATION.

2. On receipt of a PACKET ACCESS REJECT with a WAIT\_INDICATION the MS waits until T3172 expires. The MS, having another RLC data blocks to transmit, initiates a new TBF establishment procedure on the PRACH.

#### 52.3.3.3.3 Method of test

##### Initial Conditions

###### System Simulator:

1 cell, default setting, BS\_PBCCH\_BLKs = 3, N201-U=500 for SAPI 3, 5, 9, 11, N201-U=270 for SAPI 7.

###### Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated:

- for the MS supporting two PDP contexts: test PDP context2 and context5 activated;
- for the MS supporting one PDP context and SMS over GPRS: test PDP context5 activated.

##### Related PICS/PIXIT Statement(s)

Support EGPRS service.

Support activation of at least one PDP context.

Support two PDP contexts.

Support SMS.

Support SMS over GPRS.

The way to initiate an uplink packet transfer.

The way to trigger transferring new user data in a different PDP context while an uplink transfer is in progress.

The way to trigger the MS sending an MO short message over GPRS.

##### Test Procedure

An uplink TBF is established and in progress. The MS is triggered to transfer data with a higher radio priority in the same RLC mode.

The MS sends PACKET RESOURCE REQUEST. SS sends PACKET ACCESS REJECT without containing WAIT\_INDICATION. The MS attempts a new random access because of the user data from the upper layer.

SS assigns a two-phase dynamic allocation. It is checked that the requested radio priority, throughput and the RLC mode in PACKET RESOURCE REQUEST are in consistence with the test PDP context 5. SS grants the sufficient resources to the MS for transmission of the RLC data blocks until the MS sends PACKET RESOURCE REQUEST. It is checked that the MS has sent only one complete LLC PDU.

SS acknowledges all received data and assigns new resources to the MS to complete the RLC data block transferring..

The test procedure is repeated once. The difference between the two executions is that in the 2<sup>nd</sup> execution, PACKET ACCESS REJECT contains WAIT\_INDICATION. The MS starts the random access after T3172 expires.

##### Maximum Duration of Test

5 minutes.

## Expected Sequence

The test sequence is executed twice for  $k = 1 \dots 2$ . The branch A in the sequence is applicable for the MS supporting two PDP contexts. The branch B is applicable for the MS supporting SMS over GPRS (SMS has the radio priority level = 2 assigned in the attach accept message) and one PDP context.

## Specific Message Contents

PACKET ACCESS REJECT message in step 8 for k=1:

| Information Element | value/ remark                       |
|---------------------|-------------------------------------|
| MESSAGE_TYPE        | 1 00001                             |
| PAGE_MODE           | Normal Paging                       |
| Reject              |                                     |
| -                   | 0 (TLLI)                            |
| - TLLI              | the same value as the TLLI received |
| -                   | 0 (no WAIT_INDICATION)              |
| -                   | 0                                   |

PACKET ACCESS REJECT message in step 8 for k=2:

| Information Element    | value/ remark                       |
|------------------------|-------------------------------------|
| MESSAGE_TYPE           | 1 00001                             |
| PAGE_MODE              | Normal Paging                       |
| Reject                 |                                     |
| -                      | 0 (TLLI)                            |
| - TLLI                 | The same value as the TLLI received |
| -                      | 1 (WAIT_INDICATION present)         |
| - WAIT_INDICATION      | 30 seconds                          |
| - WAIT_INDICATION_SIZE | 0 (unites of seconds)               |
| -                      | 0 (end of reject IE)                |

PACKET RESOURCE REQUEST message in step 9:

Same as in subclause 52.3.3.2.2, step 11.

PACKET RESOURCE REQUEST message in step 14-2

Same as in subclause 52.3.3.2.2, step 12-2.

PACKET TIMESLOT RECONFIGURE message in step 17

Same as in subclause 52.3.3.2.2, step 15.

### 52.3.4 Default message contents

The following default values of messages and the default contents of messages are defined for subclause 52.3. They, unless indicated otherwise in subclause 52.3, shall be transmitted by the system simulator and are required to be received from the MS under test.

In this clause, decimal values are normally used. However, sometimes a hexadecimal value, indicated by an "Hex", or a binary value, indicated by a "Binary" is used.

All macro definitions are referred to subclause 40.5 and test PDP contexts are referred to subclause 40.6.

The default initial conditions used in subclause 52.3 are that PBCCH is present.

EGPRS PACKET CHANNEL REQUEST message:

| Information Element | value/ remark                                                                     |
|---------------------|-----------------------------------------------------------------------------------|
| Access Type         | "One phase access request" or "Two phase access request"                          |
| Multislot class     | As declared (valid for one phase access request)                                  |
| Radio priority      | Same as in the test PDP context applied to the test, or, Priority level 3 for SMS |
| Random Reference    | Any value                                                                         |

PACKET CONTROL ACKNOWLEDGEMENT message:

| Information Element | value/ remark |
|---------------------|---------------|
| MESSAGE_TYPE        | 000001        |
| TLLI                | Any value     |
| CTRL_ACK            | Any value     |
| Spare padding       | Spare Padding |

MESSAGE\_TYPE for 11 bit: 1111 1100 1, , without TLLI.

1. For one-phase uplink assignment, the Packet Request reference is used for addressing the MS.

2. For re-assignment of an uplink TBF, the address information should be changed to UPLINK\_TFI of Global\_TFI. UPLINK\_TFI\_ASSIGNMENT is absent.
3. For assignment of an uplink TBF while a downlink TBF has been established, the address information should be changed to DOWNLINK\_TFI of Global\_TFI. UPLINK\_TFI\_ASSIGNMENT is present.

## 52.4 Measurement reports and Cell change order procedures

This clause presents tests for "Measurement Reports and Cell Change Order Procedures" which are specified in 3GPP TS 04.60 subclauses 5.6 and 8.4.

Applicability and default conditions

The clause is applicable for mobiles supporting EGPRS.

Default message contents and signalling macros are defined in the EGPRS general defaults subclause, except for those messages and macros specified at the end of this subclause.

## 52.4.1 Measurement reports

### 52.4.1.1 Network Control measurement reporting / Uplink / Normal case

#### 52.4.1.1.1 Conformance requirement

The behaviour of the mobile station is controlled by the NETWORK\_CONTROL\_ORDER parameter in a PACKET MEASUREMENT ORDER message. The reporting periods are indicated in the NC\_REPORTING\_PERIOD\_T field of the PACKET MEASUREMENT ORDER message. The mobile station shall apply to the timer T3158 the NC\_REPORTING\_PERIOD\_T when in packet transfer mode.

The procedure for NC measurement report sending shall be initiated by the mobile station at expiry of the NC measurement report interval timer T3158. At expiry of the timer T3158 the mobile station shall restart the timer T3158, perform the measurements and send the PACKET MEASUREMENT REPORT message containing the 'NC measurement report struct' on PACCH.

A mobile station in mode NC1 may receive a new indicated reporting period or change packet mode while timer T3158 is active. If the new indicated reporting period is less than the time to expiry of timer T3158, the mobile station shall immediately restart timer T3158 with the new indicated reporting period. Otherwise, the timer T3158 shall continue to run.

#### 52.4.1.1.2 Test Purpose

To verify that the MS sends the measurement report of the NC measurements according to the indicated reporting periods, when the T3158 expires.

To verify that the MS restarts the timer T3158 when it expires.

#### Reference

3GPP TS 04.60, subclauses 5.6.1 and 8.3.

#### 52.4.1.1.3 Method of test

##### Initial conditions

System Simulator:

1 cell, EGPRS supported.

Mobile Station:

MS is in Packet Idle mode and GPRS attached.

PDP context established.

##### Related PICS/PIXIT statement

Support of EGPRS.

The way to trigger the MS initiating an uplink packet transfer.

##### Foreseen final state of the MS

MS is in transfer mode.

## Test procedure

MS is brought into uplink packet transfer mode. SS sends a PACKET MEASUREMENT ORDER message. MS sends continuously data blocks and PACKET MEASUREMENT REPORT messages according to the indicated reporting period. A PACKET MEASUREMENT ORDER message is sent again with new reporting period. MS sends data blocks and PACKET MEASUREMENT REPORT messages according to the new reporting period.

## 52.4.1.2 Network Control measurement reporting / Idle mode / New cell reselection

### 52.4.1.2.1 Conformance requirement

The procedure for measurement report sending shall be initiated by the mobile station at expiry of the NC measurement report interval timer T3158. At expiry of the timer T3158 the mobile station shall restart the expired timer T3158, perform the measurements and initiate the packet access. The packet access procedure is initiated by the RR entity in the mobile station with access type 'Single block without TBF establishment' indicated in the PACKET CHANNEL REQUEST message. The radio resource is assigned to the mobile station in a PACKET UPLINK ASSIGNMENT message sent on any PAGCH on the same PCCCH on which the network has received the PACKET CHANNEL REQUEST message.

When receiving a PACKET UPLINK ASSIGNMENT message the mobile station shall send either PACKET MEASUREMENT REPORT in the allocated radio block on the assigned PDCH and immediately switch back to the PCCCH in non-DRX mode. No TBF is established and the network shall not acknowledge the reception of the PACKET MEASUREMENT REPORT.

A mobile station may reselect a new cell or may be ordered to reselect a new cell with mode NC1 or NC2 while timer T3158 is active. If time to expiry of timer T3158 is greater than the indicated reporting period for the new cell, the mobile station shall immediately restart timer T3158 with the indicated reporting period for the new cell. Otherwise the timer T3158 shall continue to run.

### 52.4.1.2.2 Test Purpose

To verify that if the MS reselects a new cell while timer T3158 is active, and the time to expiry of timer T3158 is greater than the indicated reporting period for the new cell, the MS shall immediately restart timer T3158 with the indicated reporting period for the new cell.

To verify that if the MS reselects a new cell while timer T3158 is active, and the time to expiry of timer T3158 is shorter than the indicated reporting period for the new cell, the timer T3158 shall continue to run.

### Reference

3GPP TS 04.60, subclauses 7.3 and 5.6.1.

## 52.4.1.2.3 Method of test

## Initial conditions

## System Simulator:

3 cells, EGPRS supported, PCCCH is present.

## Mobile Station:

MS is in Packet Idle mode and GPRS attached.

PDP context established.

the Ready Timer is running.

## Related PICS/PIXIT statement

Support of EGPRS.

## Foreseen final state of the MS

MS is in idle mode.

## Test procedure

SS sends PACKET MEASUREMENT ORDER message to MS. SS sends PACKET CELL CHANGE ORDER message to MS with new reporting period before the old reporting period has expired. MS initiates a packet access and sends the PACKET MEASUREMENT REPORT to SS. Another measurement report is sent before new PACKET CELL CHANGE ORDER message with new reporting period is sent to MS. Two more measurement reports are sent using correct reporting periods.

## Maximum duration of the test

-

### 52.4.1.3 Network Control measurement reporting / Downlink transfer / Normal case

#### 52.4.1.3.1 Conformance requirement

The procedure for NC measurement report sending shall be initiated by the mobile station at the expiry of the NC measurement report interval timer T3158. At expiry of the timer T3158 the mobile station shall restart the timer T3158, perform the measurements and send the PACKET MEASUREMENT REPORT message containing the 'NC measurement report struct' on PACCH.

Following a downlink TBF establishment, the PACKET MEASUREMENT REPORT message shall not be sent on the uplink PACCH associated with this TBF until two PACKET DOWNLINK ACK/NACK messages has been sent to the network.

The mobile station shall transmit an RLC/MAC control message other than a PACKET DOWNLINK ACK/NACK message at most every second time it is polled.

#### 52.4.1.3.2 Test Purpose

To verify that the MS sends the measurement report of the NC measurements according to the indicated reporting periods, when the T3158 expires.

To verify that the MS restarts the timer T3158 when it expires.

To verify that the MS sends at least two PACKET DOWNLINK ACK/NACK messages before transmitting a PACKET MEASUREMENT REPORT message upon entering transfer state.

#### Reference

3GPP TS 04.60, subclauses 8.1.2.2, 8.3 and 5.6.1.

### 52.4.1.3.3 Method of test

#### Initial conditions

##### System Simulator:

1 cell, EGPRS supported.

##### Mobile Station:

MS is in Packet Idle mode and GPRS attached.

PDP context established.

#### Related PICS/PIXIT statement

Support of EGPRS.

#### Foreseen final state of the MS

MS is in transfer mode.

#### Test procedure

MS is brought into downlink packet transfer mode. SS sends a PACKET MEASUREMENT ORDER message. SS sends data blocks and MS answers with PACKET DOWNLINK ACK/NACK. When reporting period has expired and at least two PACKET DOWNLINK ACK/NACK messages have been sent, MS sends a PACKET MEASUREMENT REPORT message. SS sends data blocks continuously and MS sends PACKET MEASUREMENT REPORT messages when reporting period has expired and at least one PACKET DOWNLINK ACK/NACK messages have been sent after the last PACKET MEASUREMENT REPORT message.

#### Maximum duration of the test

## 52.4.2 Cell change order procedures

### 52.4.2.1 Cell change order procedure / Uplink transfer

#### 52.4.2.1.1 Cell change order procedure / Uplink transfer / Normal case

##### 52.4.2.1.1.1 Conformance requirement

The cell change order procedure is started by sending a PACKET CELL CHANGE ORDER message to the mobile station on the PCCCH or PACCH. Upon receipt of the PACKET CELL CHANGE ORDER message the mobile station shall start timer T3174 and apply the cell reselection procedure defined in 3GPP TS 04.60 subclause 5.5.1.1.

When a cell reselection is made controlled by the network, the mobile station shall act upon the IMMEDIATE\_REL value which has been received in the Packet Cell Change Order: if required, the mobile station shall abort any TBF in progress by immediately ceasing to decode the downlink, ceasing to transmit on the uplink, stopping all RLC/MAC timers except for timers related to measurement reporting. The mobile station shall then switch to the identified specified new cell and shall obey the relevant RLC/MAC procedures on this new cell.

##### 52.4.2.1.1.2 Test Purpose

To verify that when the cell change order procedure is started by sending a PACKET CELL CHANGE ORDER message with the IMMEDIATE\_REL value set to 1, the MS shall abort any TBF in progress and stop transmitting.

To verify that the MS shall switch to the new cell.

#### Reference

3GPP TS 04.60, subclauses 8.4 and 5.5.1.1.

##### 52.4.2.1.1.3 Method of test

#### Initial conditions

System Simulator:

2 cells, EGPRS supported.

Mobile Station:

MS is in Packet Idle mode and GPRS attached.

PDP context established.

#### Related PICS/PIXIT statement

Support of EGPRS.

The way to trigger the MS initiating an uplink packet transfer.

Foreseen final state of the MS

MS is in transfer mode.

Test procedure

MS is brought into uplink packet transfer mode. SS sends a PACKET CELL CHANGE ORDER message. SS checks that there is no traffic on the old cell. MS switches to the new cell and re-establishes the uplink TBF.

Maximum duration of the test

#### 52.4.2.1.2 Cell change order procedure / Uplink transfer / Failure cases / T3174 expiry

##### 52.4.2.1.2.1 Conformance requirement

If timer T3174 expires before a response to the PACKET CHANNEL REQUEST message has been received from the new cell, the mobile station shall start timer T3176 and return to the old cell. The mobile station shall send a PACKET CELL CHANGE FAILURE message to the network.

If the mobile station was in uplink packet transfer mode before the cell change, the mobile station shall establish a new uplink TBF and send the PACKET CELL CHANGE FAILURE message on this TBF. The mobile station shall then resume its uplink transfer on this TBF.

##### 52.4.2.1.2.2 Test Purpose

To verify that the mobile station sends a PACKET CELL CHANGE FAILURE message to the network, if timer T3174 expires before a response from the new cell, and returns to the old cell.

## Reference

3GPP TS 04.60, subclause 8.4.1.

## 52.4.2.1.2.3 Method of test

## Initial conditions

## System Simulator:

2 cells, EGPRS supported.

## Mobile Station:

MS is in Packet Idle mode and GPRS attached.

PDP context established.

## Related PICS/PIXIT statement

Support of EGPRS.

The way to trigger the MS initiating an uplink packet transfer.

## Foreseen final state of the MS

MS is in Transfer mode.

## Test procedure

MS is brought into uplink packet transfer mode. SS sends the PACKET CELL CHANGE ORDER message to the MS. MS sends several PACKET CHANNEL REQUESTs on the new cell, but the timer T3174 expires before a response to PACKET CHANNEL REQUEST message has been received from the new cell. MS returns to the old cell, sends a PACKET CELL CHANGE FAILURE message to the SS and continues data transfer on the old cell.

## Maximum duration of the test

#### 52.4.2.1.4 Cell change order procedure / Uplink transfer / Failure cases / Contention resolution failure

##### 52.4.2.1.4.1 Conformance requirement

If the contention resolution procedure fails on the new cell, then the mobile station shall start timer T3176 and return to the old cell. The mobile station shall send a PACKET CELL CHANGE FAILURE message to the network.

If the mobile station was in uplink packet transfer before the cell change, the mobile station shall establish a new uplink TBF and send the PACKET CELL CHANGE FAILURE message on this TBF. The mobile station shall then resume its uplink transfer on this TBF.

##### 52.4.2.1.4.2 Test Purpose

To verify that the mobile station initiates a random access to the old cell, if the contention resolution procedure fails on the new cell.

#### 52.4.2.1.5 Cell change order procedure / Uplink transfer / Failure cases / REJECT from the new cell and T3176 expiry

##### 52.4.2.1.5.1 Conformance requirement

If a PACKET ACCESS REJECT message is received from the new cell, the mobile station shall start timer T3176, return to the old cell and send a PACKET CELL CHANGE FAILURE message to the network.

If the mobile station was in uplink packet transfer before the cell change, the mobile station shall establish a new uplink TBF and send the PACKET CELL CHANGE FAILURE message on this TBF. When the mobile station has sent a PACKET CELL CHANGE FAILURE message, timer T3176 shall be stopped.

If T3176 expires and the mobile station was previous in an uplink packet transfer mode on the old cell, the mobile station shall perform the abnormal release with access retry.

##### 52.4.2.1.5.2 Test Purpose

To verify that the mobile station shall perform the abnormal release with access retry, if a PACKET ACCESS REJECT message is received from the new cell and timer T3176 expires.

#### Reference

3GPP TS 04.60, subclause 8.4.1.

##### 52.4.2.1.5.3 Method of test

#### Initial conditions

System Simulator:

2 cells, EGPRS supported.

Mobile Station:

MS is in Packet Idle mode and GPRS attached.

PDP context established.

#### Related PICS/PIXIT statement

Support of EGPRS.

The way to trigger the MS initiating an uplink packet transfer.

#### Foreseen final state of the MS

MS is in idle mode.

#### Test procedure

MS is brought into uplink packet transfer mode. SS sends the PACKET CELL CHANGE ORDER message to the MS. MS sends the PACKET CHANNEL REQUEST. SS sends PACKET ACCESS REJECT message. MS performs the abnormal release with access retry.

#### Maximum duration of the test

## 52.4.2.2 Cell change order procedure / Downlink transfer

## 52.4.2.2.1 Cell change order procedure / Downlink transfer / Normal case

## 52.4.2.2.1.1 Conformance requirement

The cell change order procedure is started by sending a PACKET CELL CHANGE ORDER message to the mobile station on the PCCCH or PACCH. Upon receipt of the PACKET CELL CHANGE ORDER message the mobile station shall start timer T3174 and apply the cell reselection procedure defined in 3GPP TS 04.60 subclause 5.5.1.1.

When a cell reselection is made controlled by the network, the mobile station shall act upon the IMMEDIATE\_REL value which has been received in the Packet Cell Change Order: if required, the mobile station shall abort any TBF in progress by immediately ceasing to decode the downlink, ceasing to transmit on the uplink, stopping all RLC/MAC timers except for timers related to measurement reporting. The mobile station shall then switch to the identified specified new cell and shall obey the relevant RLC/MAC procedures on this new cell.

## 52.4.2.2.1.2 Test Purpose

To verify that the cell change order procedure is started when the MS receives a PACKET CELL CHANGE ORDER message.

To verify that the MS switches to the new cell.

To verify that the MS uses the established downlink TBF on the new cell.

#### Reference

3GPP TS 04.60, subclauses 8.4 and 5.5.1.1.

#### 52.4.2.2.1.3 Method of test

##### Initial conditions

#### 52.4.2.2.2 Cell change order procedure / Downlink transfer / Failure cases / REJECT from the new cell

##### 52.4.2.2.2.1 Conformance requirement

If a PACKET ACCESS REJECT message is received from the new cell, the mobile station shall start timer T3176, return to the old cell and send a PACKET CELL CHANGE FAILURE message to the network.

If the mobile station was in downlink packet transfer mode before the cell change, the mobile station shall initiate a random access to the old cell, with access type "single block without TBF establishment", and then transmit the PACKET CELL CHANGE FAILURE message on the single block.

##### 52.4.2.2.2.2 Test Purpose

To verify that the mobile station sends a PACKET CELL CHANGE FAILURE message to the network in the old cell, if a PACKET ACCESS REJECT message is received from the new cell.

Reference

3GPP TS 04.60, subclause 8.4.1.

##### 52.4.2.2.2.3 Method of test

Initial conditions

System Simulator:

2 cells, EGPRS supported.

Mobile Station:

## 52.4.2.3 Cell change order procedure / Simultaneous uplink and downlink transfer

## 52.4.2.3.1 Cell change order procedure / Simultaneous uplink and downlink transfer / Normal case

## 52.4.2.3.1.1 Conformance requirement

The cell change order procedure is started by sending a PACKET CELL CHANGE ORDER message to the mobile station on the PCCCH or PACCH. Upon receipt of the PACKET CELL CHANGE ORDER message the mobile station shall start timer T3174.

When a cell reselection is made controlled by the network, the mobile station shall act upon the IMMEDIATE\_REL value which has been received in the Packet Cell Change Order: if required, the mobile station shall abort any TBF in progress by immediately ceasing to decode the downlink, ceasing to transmit on the uplink, stopping all RLC/MAC timers except for timers related to measurement reporting. The mobile station shall then switch to the identified specified new cell and shall obey the relevant RLC/MAC procedures on this new cell.

When cell reselection is controlled by the network, the mobile station in packet transfer mode shall act upon the IMMEDIATE\_REL value: it may continue its operation in the old serving cell, as in mobile steered cell reselection, or it shall immediately abort its TBF if it is indicated by the IMMEDIATE\_REL value.

Under no circumstances, operations in the old cell shall be continued more than 5 s after a cell reselection has been determined.

#### 52.4.2.3.1.2 Test Purpose

To verify that when the cell change order procedure is started by sending a PACKET CELL CHANGE ORDER message, the MS shall abort any TBF in progress and stop transmitting.

To verify that the MS shall switch to the new cell.

To verify that the MS shall act upon the IMMEDIATE\_REL value.

#### Reference

3GPP TS 04.60, subclauses 5.5.1.1, 8.4 and 8.4.1

#### 52.4.2.3.1.3 Method of test

##### Initial conditions

System Simulator:

2 cells, EGPRS supported.

Mobile Station:

MS is in Packet Idle mode and GPRS attached.

PDP context established.

##### Related PICS/PIXIT statement

Support of EGPRS.

The way to trigger the MS initiating an uplink packet transfer.

##### Foreseen final state of the MS

MS is in simultaneous uplink and downlink packet transfer mode.

##### Test procedure

MS is brought into simultaneous uplink and downlink packet transfer mode. SS sends a PACKET CELL CHANGE ORDER message with IMMEDIATE\_REL value set to 1 to force the mobile to release all ongoing TBFs. MS switches to the new cell and simultaneous uplink and downlink TBF is re-established.

SS sends a PACKET CELL CHANGE ORDER message with IMMEDIATE\_REL value set to 0. The MS continues its operation in the old serving cell.

##### Maximum duration of the test

-

## Expected sequence

|------------------------------------------------------------|---------------------------------------------------------------|
| Packet Cell Change Order message content:<br>IMMEDIATE_REL | 1 (Immediate abort of operation in the old cell is required.) |

#### PACKET CELL CHANGE ORDER in Step 18:

| Information Element                                        | value/ remark                                                   |
|------------------------------------------------------------|-----------------------------------------------------------------|
| Packet Cell Change Order message content:<br>IMMEDIATE_REL | 0 (No immediate abort of operation in the old cell is required) |

### 52.4.2.3.2 Cell change order procedure / Simultaneous uplink and downlink transfer / Failure case / T3174 expiry

#### 52.4.2.3.2.1 Conformance requirement

If timer T3174 expires before a response to the PACKET CHANNEL REQUEST message has been received from the new cell, the mobile station shall start timer T3176 and return to the old cell. The mobile station shall send a PACKET CELL CHANGE FAILURE message to the network.

If the mobile station was in a simultaneous uplink and downlink packet transfer mode before the cell change, the mobile station shall establish a new uplink TBF and send the PACKET CELL CHANGE FAILURE message on this TBF. The mobile station shall then resume its uplink transfer on this TBF. When the mobile station has sent a PACKET CELL CHANGE FAILURE message, timer T3176 shall be stopped. The mobile station shall then resume its uplink transfer on this TBF.

#### 52.4.2.3.2.2 Test Purpose

To verify that the mobile station sends a PACKET CELL CHANGE FAILURE message to the network and returns to the old cell if timer T3174 expires before a response from the new cell.

#### Reference

3GPP TS 04.60, subclause 8.4.1.

#### 52.4.2.3.2.3 Method of test

#### Initial conditions

System Simulator:

2 cells, EGPRS supported.

Mobile Station:

MS is in Packet Idle mode and GPRS attached.

PDP context established.

Related PICS/PIXIT statement

Support of EGPRS.

The way to trigger the MS initiating an uplink packet transfer.

Foreseen final state of the MS

MS is in Idle mode.

Test procedure

MS is brought into simultaneous uplink and downlink packet transfer mode. SS sends the PACKET CELL CHANGE ORDER message to the MS. MS sends several PACKET CHANNEL REQUESTs to the new cell, but the timer T3174 expires before a response to PACKET CHANNEL REQUEST message has been received from the new cell. MS returns to the old cell and sends a PACKET CELL CHANGE FAILURE message to the SS.

Maximum duration of the test

-

Expected sequence

## 52.4.4 Cell Change Order Procedures without PBCCH

### 52.4.4.1 Network Controlled Cell Reselection – Packet Measurement Order Procedure

#### 52.4.4.1.1 Conformance requirement

A cell re-selection command may be sent from the network to an MS. When the MS receives the command, it shall immediately re-select the cell according to the included cell description and change the network control mode according to the command.

#### Reference:

3GPP TS 04.60 subclause 8.4.

3GPP TS 05.08 subclause 10.1.4.2.

#### 52.4.4.1.2 Test purpose

To verify that when the Network initiates the Packet Measurement Order Procedure, the MS correctly interprets the Packet Measurement Order Message and reselects to the cell given in Packet Measurement Order.

#### 52.4.4.1.3 Method of test

#### Initial conditions

| Parameter                 | Carrier1 | Carrier2 | Carrier3 |
|---------------------------|----------|----------|----------|
| RF Signal Level (dBm)     | -70      | -80      | -50      |
| GPRS_RXLEV_ACCE<br>SS_MIN | -100     | -100     | -100     |
| NETWORK_CONTROL_ORDER     | NC2      | NC2      | NC2      |
| C1                        | 30       | 20       | 50       |
| C2                        | 30       | 20       | 50       |

#### System simulator:

3 cells, EGPRS supported, PBCCH not present (Carrier 1 & 2 is active. Carrier 3 is off.)

#### Mobile Station:

MS is GPRS attached on carrier 1 (with Ready timer value unit set to '111' in the ATTACH ACCEPT message, thus the MS is always in Ready state).

#### Related PICS/PIXIT statement

Support of EGPRS.

#### Test Procedure

The SS establishes single block down link TBF and then initiates the Packet Measurement Order Procedure on carrier 1 with the Packet Measurement Order (PMO) changing NC2 to NC0. The MS shall reselect to carrier 3 and initiate channel request procedure.

## Expected Sequence

| Step | Direction | Message                      | Comments                                                                  |
|------|-----------|------------------------------|---------------------------------------------------------------------------|
| 1    | SS        |                              | Activate carrier 3                                                        |
| 2    | SS->MS    | IMMEDIATE ASSIGNMENT         | SS establishes a single block down link TBF on carrier 1.                 |
| 3    | SS->MS    | PACKET MEASUREMENT ORDER     | Sent on PACCH of carrier 1. PMO message contains Network Control Order 0  |
| 4    | MS->SS    | CHANNEL REQUEST              | Verify MS sends channel request on carrier 3 within 30 seconds of step 3. |
| 5    | SS->MS    | IMMEDIATE ASSIGNMENT REJECT. | Network sends immediate assignment reject on carrier 3.                   |

#### 52.4.4.2 Network Controlled Cell Reselection/validity of reselection parameters/MS enters standby state

##### 52.4.4.2.1 Conformance requirement

A set of measurement reporting parameters (NETWORK\_CONTROL\_ORDER and NC\_REPORTING\_PERIOD(s)) is broadcast on PBCCH. The parameters may also be sent individually to an MS on PCCCH or PACCH, in which case it overrides the broadcast parameters. The individual parameters are valid until the RESET command is sent to MS., there is a downlink signaling failure or the MS enters Standby State.

##### Reference:

3GPP TS 05.08 subclause 10.1.4.

##### 52.4.4.2.2 Test purpose

To verify that the measurement reporting parameters are valid till the MS enters the standby state.

##### 52.4.4.2.3 Method of test

##### Initial conditions

| Parameter                 | Carrier1 | Carrier2 |
|---------------------------|----------|----------|
| RF Signal Level (dBm)     | -80      | -70      |
| GPRS_RXLEV_ACCE<br>SS_MIN | -100     | -100     |
| NETWORK_CONTRO<br>L_ORDER | NC0      | NC2      |
| C1                        | 20       | 30       |
| C32                       | 20       | 30       |

##### System simulator:

2 cells, EGPRS supported, PBCCH not present (Carrier 1 is active. Carrier 2 is off).

##### Mobile Station:

MS is off.

##### Related PICS/PIXIT statement

Support of EGPRS.

## Test Procedure

The SS establishes single block down link TBF and then initiates the Packet Measurement Order Procedure on carrier 1 with the Packet Measurement Order (PMO) changing NC0 to NC2. The SS activates carrier 2 with higher RF signal strength than carrier 1. After the Ready Timer expires in the mobile, the MS shall reselect carrier 2 as NC2 is not applicable in standby mode.

## Expected Sequence

| Step | Direction | Message                  | Comments                                                                      |
|------|-----------|--------------------------|-------------------------------------------------------------------------------|
| 1    | MS        |                          | The MS is powered up or switched on and initiates an attach (see PICS).       |
| 2    | MS -> SS  | ATTACH REQUEST           |                                                                               |
| 3    | SS -> MS  | ATTACH ACCEPT            | Ready timer set to 60 seconds.                                                |
| 4    | SS->MS    | IMMEDIATE ASSIGNMENT     | SS establishes a single block down link TBF on carrier 1.                     |
| 5    | SS->MS    | PACKET MEASUREMENT ORDER | Sent on PACCH of carrier 1<br>PMO message contains<br>Network Control Order 2 |
| 6    | SS        |                          | Activate carrier 2                                                            |
| 7    | SS        |                          | Wait for 30 seconds                                                           |
| 8    | SS->MS    | PAGING REQUEST TYPE 1    | MS paged continuously on carrier 2                                            |
| 9    | SS        |                          | Verify no response from MS on carrier 2 for 25 seconds.                       |
| 10   | MS -> SS  | CHANNEL REQUEST          | Verify MS has camped on carrier 2. Sent within 80 seconds of step 3.          |

52.5.1 Void

52.5.2 Void

52.5.3 Void

52.5.4 Void

52.5.5 Downlink Transfer / Reestablishment

52.5.5.1 Downlink Transfer/ Reestablishment/ T3192 Expiry

52.5.5.1.1 Definition and applicability

This test case applies to all MSs supporting EGPRS.

52.5.5.1.2 Conformance Requirement

After the network has initiated the release of a downlink TBF and the mobile station has received all the RLC blocks, the mobile station shall send the EGPRS PACKET DOWNLINK ACK/NACK message with the Final Ack Indicator bit set to '1', start timer T3192 and continue to monitor all assigned PDCHs.

If the network receives a EGPRS PACKET DOWNLINK ACK/NACK message with the Final Ack Indicator bit set to '1' and has new data to transmit for the mobile station, the network may establish a new downlink TBF for the mobile station by sending the PACKET DOWNLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message with the Control Ack bit set to '1' on PACCH.

If the mobile station, after sending the EGPRS PACKET DOWNLINK ACK/NACK message with the Final Ack Indicator bit set to '1', receives a PACKET DOWNLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message with the Control Ack bit set to '1' while timer T3192 is running, the mobile station shall stop timer T3192, consider the previous downlink TBF released and act upon the new assignment.

When timer T3192 expires the mobile station shall stop monitoring its assigned downlink PDCHs. If the mobile station is operating in half duplex mode and received an uplink assignment during the TBF release procedure, the mobile station shall then immediately act upon the assignment. Otherwise, if there is no ongoing uplink TBF the mobile station shall enter packet idle mode. Upon entering packet idle mode, the mobile shall apply DRX mode procedures as specified in subclause 5.5.1.4.

## References

3GPP TS 04.60, subclauses 8.1.2.4, 9.3.3.5 and 11.2.6a.

### 52.5.5.1.3 Test purpose

Verify that after a downlink TBF is released, MS returns to packet idle mode when T3192 expires.

### 52.5.5.1.4 Method of test

## Initial Conditions

System Simulator:

1 cell, EGPRS supported, PCCCH present.

Mobile Station:

The MS is EGPRS capable and in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 3 activated.

## Related PICS/PIXIT Statement(s)

Support EGPRS service.

## Test Procedure

1. MS receives a PACKET DOWNLINK ASSIGNMENT message on its assigned PCCCH, containing no starting time.
2. SS transmits EGPRS downlink RLC data blocks for the downlink allocation.
3. SS transmits an EGPRS downlink RLC data block, with valid RRBP field (polling), with Final Block indicator set to 1.
4. MS responds by sending a EGPRS PACKET DOWNLINK ACK/NACK with Final Ack indicator set to 1 and starting T3192.
5. When T3192 expires, MS returns to packet idle mode.
6. SS transmits an EGPRS downlink RLC data block (using previous resources).
7. MS ignores this block, because it has returned to packet idle mode.
8. SS transmits a PACKET DOWNLINK ASSIGNMENT, followed by RLC data blocks for the downlink allocation.
9. MS responds with an EGPRS PACKET DOWNLINK ACK/NACK.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

| Step | Direction | Message                        | Comments                                                                          |
|------|-----------|--------------------------------|-----------------------------------------------------------------------------------|
| 1    | SS -> MS  | PACKET DOWNLINK ASSIGNMENT     | Triggers the MS to switch to assigned PDCH. (no starting time)                    |
| 2    | SS -> MS  | EGPRS RLC DATA BLOCKS          | Starting 3 blocks after the previous message, on assigned PDCH, addressed to MS.  |
| 3    | SS -> MS  | EGPRS RLC DATA BLOCK           | With valid RRBP field, addressed to MS, with Final Block indication set to 1.     |
| 4    | MS -> SS  | EGPRS PACKET DOWNLINK ACK/NACK | MS acknowledges the previously received RLC data blocks, with final ack set to 1. |
| 5    | SS        |                                | MS starts T3192                                                                   |
| 6    | SS        |                                | Wait T3192 * 0.7 seconds                                                          |
| 7    | SS        |                                | Repeat steps 3 and 4.                                                             |
| 8    | SS -> MS  | EGPRS RLC DATA BLOCK           | Wait T3192 * 1.2 seconds.                                                         |
| 9    | SS        |                                | On previously assigned PDCH. With valid RRBP field, addressed to MS.              |
| 10   | SS -> MS  | PACKET DOWNLINK ASSIGNMENT     | Verify no response from MS on previously assigned PDCH.                           |
| 11   | SS -> MS  | EGPRS RLC DATA BLOCK           | Triggers the MS to switch to assigned PDCH (no starting time)                     |
| 12   | MS -> SS  | EGPRS PACKET DOWNLINK ACK/NACK | With valid RRBP field, addressed to MS, on new resources assigned in step 10.     |
|      |           |                                | MS acknowledges the previously received RLC data block.                           |

## 52.5.5.2 Downlink Transfer/ Reestablishment/ Packet Downlink Assignment

### 52.5.5.2.1 Definition and applicability

This test case applies to all MSs supporting EGPRS.

### 52.5.5.2.2 Conformance Requirement

After the network has initiated the release of a downlink TBF and the mobile station has received all the RLC blocks, the mobile station shall send the EGPRS PACKET DOWNLINK ACK/NACK message with the Final Ack Indicator bit set to '1', start timer T3192 and continue to monitor all assigned PDCHs.

If the network receives a EGPRS PACKET DOWNLINK ACK/NACK message with the Final Ack Indicator bit set to '1' and has new data to transmit for the mobile station, the network may establish a new downlink TBF for the mobile station by sending the PACKET DOWNLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message with the Control Ack bit set to '1' on PACCH.

If the mobile station, after sending the EGPRS PACKET DOWNLINK ACK/NACK message with the Final Ack Indicator bit set to '1', receives a PACKET DOWNLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message with the Control Ack bit set to '1' while timer T3192 is running, the mobile station shall stop timer T3192, consider the previous downlink TBF released and act upon the new assignment.

### References

3GPP TS 04.60, subclause 8.1.2.4.

### 52.5.5.2.3 Test purpose

Verify that after a downlink TBF is released, MS acts on a PACKET DOWNLINK ASSIGNMENT message.

### 52.5.5.2.4 Method of test

#### Initial Conditions

System Simulator:

2 cells, EGPRS supported, PCCCH present.

Mobile Station:

The MS is EGPRS capable and in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 3 activated.

#### Related PICS/PIXIT Statement

Support EGPRS service.

#### Test Procedure

1. MS receives a PACKET DOWNLINK ASSIGNMENT message on its assigned PCCCH, containing no starting time.
2. SS transmits downlink RLC data blocks for the downlink allocation.
3. SS transmits a downlink RLC data block, with valid RRBP field (polling), with Final Block indicator set to 1.

4. MS responds by sending a EGPRS PACKET DOWNLINK ACK/NACK with Final Ack indicator set to 1.
5. SS transmits a PACKET DOWNLINK ASSIGNMENT, assigning a new PDCH.
6. SS transmits a downlink RLC data block on newly assigned PDCH, with valid RRBP field.
7. MS responds by sending a EGPRS PACKET DOWNLINK ACK/NACK.

#### Maximum Duration of Test

5 minutes.

#### Expected Sequence

| Step | Direction | Message                        | Comments                                                                                         |
|------|-----------|--------------------------------|--------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PACKET DOWNLINK ASSIGNMENT     | Triggers the MS to switch to assigned PDCH. (no starting time)                                   |
| 2    | SS -> MS  | EGPRS RLC DATA BLOCKS          | Starting at a minimum of 3 blocks after the previous message, on assigned PDCH, addressed to MS. |
| 3    | SS -> MS  | EGPRS RLC DATA BLOCK           | With valid RRBP field, addressed to MS, with Final Block indication set to 1.                    |
| 4    | MS -> SS  | EGPRS PACKET DOWNLINKACK/NACK  | MS acknowledges the previously received RLC data blocks, with final ACK set to 1.                |
| 5    | SS        |                                | Wait (T3192 * 0.8) seconds                                                                       |
| 6    | SS -> MS  | PACKET DOWNLINK ASSIGNMENT     | Sent on PACCH. Triggers the MS to switch to a new PDCH. (no starting time)                       |
| 7    | SS -> MS  | EGPRS RLC DATA BLOCK           | 6 blocks after step 6, on PDCH assigned in step 6. With valid RRBP field, addressed to MS.       |
| 8    | MS -> SS  | EGPRS PACKET DOWNLINK ACK/NACK | MS acknowledges the previously received RLC data blocks.                                         |

#### Specific Message Contents

### 52.5.5.3 Downlink Transfer/ Reestablishment/ Invalid Frequency Parameters IE

#### 52.5.5.3.1 Definition and applicability

This test case applies to all MSs supporting EGPRS.

#### 52.5.5.3.2 Conformance Requirement

After the network has initiated the release of a downlink TBF and the mobile station has received all the RLC blocks, the mobile station shall send the EGPRS PACKET DOWNLINK ACK/NACK message with the Final Ack Indicator bit set to '1', start timer T3192 and continue to monitor all assigned PDCHs.

If the network receives a EGPRS PACKET DOWNLINK ACK/NACK message with the Final Ack Indicator bit set to '1' and has new data to transmit for the mobile station, the network may establish a new downlink TBF for the mobile station by sending the PACKET DOWNLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message with the Control Ack bit set to '1' on PACCH.

If the mobile station, after sending the EGPRS PACKET DOWNLINK ACK/NACK message with the Final Ack Indicator bit set to '1', receives a PACKET DOWNLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message with the Control Ack bit set to '1' while timer T3192 is running, the mobile station shall stop timer T3192, consider the previous downlink TBF released and act upon the new assignment.

If a mobile station receives a PACKET DOWNLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message and detects an invalid Frequency Parameters information element in the message, it shall perform an abnormal release. If PCCCH is present in the cell the mobile station shall perform an abnormal release with system information (see subclause 8.7.3). If PCCCH is not present, the mobile station shall perform an abnormal release with random access (see subclause 8.7.2).

3GPP TS 04.60, subclauses 8.1.2.4, 8.1.2.4.1 and 5.5.1.2.1.

#### 52.5.5.3.3 Test purpose

Verify that after a downlink TBF is released, MS returns to packet idle mode if a PACKET DOWNLINK ASSIGNMENT with invalid frequency parameters IE is received.

#### 52.5.5.3.4 Method of test

#### Initial Conditions

System Simulator:

1 cell, EGPRS supported, PCCCH present.

Mobile Station:

The MS is EGPRS capable and in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 3 activated.

#### Related PICS/PIXIT Statement(s)

Support EGPRS service.

#### Test Procedure

1. MS receives a PACKET DOWNLINK ASSIGNMENT message on its assigned PCCCH, containing no starting time.
2. SS transmits downlink RLC data blocks for the downlink allocation.
3. SS transmits a downlink RLC data block, with valid RRBP field (polling), with Final Ack indicator set to 1.
4. MS responds by sending a EGPRS PACKET DOWNLINK ACK/NACK.
5. SS transmits a PACKET DOWNLINK ASSIGNMENT, assigning a new PDCH, but with invalid frequency parameters.
6. SS transmits a downlink RLC data block on previously assigned PDCH, with valid RRBP field.
7. MS ignores the block because it has returned to packet idle mode.

#### Maximum Duration of Test

5 minutes.

#### Expected Sequence

| Step | Direction | Message                        | Comments                                                                                                                                                                                          |

## 53 Test of EGPRS Radio Link Control (RLC) Protocol

### Applicability

All test cases in this subclause are applicable for the MS supporting EGPRS service with RLC/MAC in acknowledged mode.

## Default conditions and messages

The default conditions, message contents and macros not specified in this subclause must be set as in subclause 50 for EGPRS system testing.

## Initial conditions

Unless otherwise indicated, the initial conditions for all acknowledged mode tests, as a minimum, are as follows. Other initial conditions may apply. In the event of conflict between initial conditions stated here and those stated in a test case, the test case shall take precedence.

- The MS is EGPRS attached.
- A PDP context has been activated with RLC acknowledged mode operation.

# 53.1 Acknowledged Mode

## 53.1.1 Acknowledged Mode/ Uplink TBF

### 53.1.1.1 Acknowledged Mode/ Uplink TBF/ Send State Variable V(S)

#### 53.1.1.1.1 Conformance requirements

1. The send state variable V(S), can take on the values 0 through 2 047. Each RLC data block contains a block sequence number (BSN) field that is 11 bits in length. At the time that an in-sequence RLC data block is designated for transmission, the value of BSN is set equal to the value of the send state variable.
2. V(S) shall be set to the value 0 at the beginning of each TBF in which the RLC endpoint is the transmitter.
3. The value of V(S) shall be incremented by 1 after transmission of the RLC data block with BSN = V(S).

## References

3GPP TS 04.60, subclause 9.1.1.

#### 53.1.1.1.2 Test purpose

1. To verify that the mobile station sets the V(S) to 0 at the beginning of each TBF.
2. To verify that the mobile station increases the V(S) by 1 after transmission of the RLC data block with BSN set to V(S).
3. To verify that the mobile station wraps the V(S) to 0 after 2047.

#### 53.1.1.1.3 Method of test

## Initial Conditions

System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present, BS\_CV\_MAX = 1.

Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP context2 activated.

## Related PICS/PIXIT Statement(s)

The way to initiate an uplink data transfer in EGPRS RLC acknowledged mode.

## Test Procedure

The EGPRS capable MS is made to transmit uplink RLC data blocks in EGPRS TBF RLC acknowledged mode. The EGPRS Channel Coding Command IE indicates MCS-1 in the Packet Uplink Assignment message.

The SS checks that the BSN in the received RLC data blocks obeys the following rule:

1. BSN is set to the value 0 at the beginning of each TBF in which the mobile station is the transmitter;
2. BSN is incremented by 1 in each subsequent RLC data block in the TBF;
3. BSN takes on all values in the range 0 to 2047 and then back to 0.

## Maximum Duration of Test

30 minutes.

### 53.1.1.2 Acknowledged Mode/ Uplink TBF/ Acknowledge State Variable V(A)

#### 53.1.1.2.1 Conformance requirements

1. The Acknowledge state variable V(A) contains the BSN value of the oldest RLC data block that has not been positively acknowledged by its peer. V(A) can take on the values 0 through 2047.
2. V(A) shall be set to the value 0 at the beginning of each TBF in which the RLC endpoint is the transmitter.
3. The value of V(A) shall be updated from the values received from its peer in the received block bitmap (RB) of the Packet Ack/Nack message.

#### References

3GPP TS 04.60, subclauses 9.1.2 and 9.1.8.

#### 53.1.1.2.2 Test purpose

1. To verify that the mobile station correctly decodes the RB and updates the values of V(A).

#### 53.1.1.2.3 Method of test

#### Initial Conditions

System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present, BS\_CV\_MAX = 1.

Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP context2 activated.

Related PICS/PIXIT Statement(s)

The way to initiate an uplink data transfer in EGPRS RLC acknowledged mode.

Test Procedure

The EGPRS capable MS is made to transmit uplink RLC data blocks in EGPRS TBF RLC acknowledged mode. The EGPRS Windows Size IE in the Packet Uplink Assignment message indicates the value in accordance with the number of timeslots allocated.

The MS transmits WS (window size) blocks without acknowledgement from the SS. The SS then acknowledges the first N blocks and verifies that the MS shall transmit N more RLC data blocks.

The test procedure is performed for the values of N = 10, 15 and 20.

Maximum Duration of Test

30 minutes.

### 53.1.1.3 Acknowledged Mode/ Uplink TBF/ Window Size/ Default Value

#### 53.1.1.3.1 Conformance requirements

1. In case a PACKET TIMESLOT RECONFIGURE is sent to the MS without any window size for a specific TBF, then any previous value received for the specific TBF shall be used or, if no previous value has been received for the specific TBF, default window size shall be used.

#### References

3GPP TS 04.60, subclause 9.1.9.2.

#### 53.1.1.3.2 Test purpose

1. To verify that when a PACKET TIMESLOT RECONFIGURE is sent to the MS without any window size indication, the previous value received for the specific TBF shall be used if there's any.

#### 53.1.1.3.3 Method of test

#### Initial Conditions

System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present, BS\_CV\_MAX = 1.

Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP context2 activated.

#### Related PICS/PIXIT Statement(s)

The way to initiate an uplink data transfer in EGPRS RLC acknowledged mode.

The MS class for multislot capability.

#### Test Procedure

The MS is made to establish an uplink EGPRS TBF to transmit RLC data blocks. EGPRS Window size is commanded to be WS=160.

The SS sends a PACKET UPLINK ACK/NACK message and set pre-emptive bit to be '1'.

The SS observes the BSN sequence to be 0, 1, 2, ..., WS-1, 0, ...

The SS sends a PACKET TIMESLOT RECONFIGURE message and does not include a Window Size field.

The SS verifies that the BSN sequence 0, 1, 2, ..., WS-1, 0, ... is still observed.

#### Maximum Duration of Test

30 minutes.

## Expected Sequence

## 53.1.1.4 Acknowledged Mode/ Uplink TBF/ Window Size/ Assigned Value

## 53.1.1.4.1 Conformance requirements

1. For EGPRS the window size (WS) shall be set by the network according to the number of timeslots allocated in the direction of the TBF (uplink or downlink). MS shall support the maximum window size corresponding to its multi timeslot capability.
2. The selected WS shall be indicated within PACKET UPLINK/DOWNLINK ASSIGNMENT and PACKET TIMESLOT RECONFIGURE.
3. Once a window size is selected for a given MS, it may be changed to a larger size but not to a smaller size, in order to prevent dropping data blocks from the window.

## References

3GPP TS 04.60, subclause 9.1.9.2.

#### 53.1.1.4.2 Test purpose

1. To verify that the MS correctly recognise the window size indicated in Packet Uplink Assignment messages.
2. To verify that the MS operates correctly according to the window size indicated in PACKET TIMESLOT RECONFIGURE messages.
3. To verify that the MS supports the maximum window size corresponding to its multi timeslot capability.

#### 53.1.1.4.3 Method of test

##### Initial Conditions

###### System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present, BS\_CV\_MAX = 1.

###### Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP context2 activated.

##### Related PICS/PIXIT Statement(s)

The way to initiate an uplink data transfer in EGPRS RLC acknowledged mode.

The MS class for multislot capability.

##### Test Procedure

The MS is made to transmit uplink RLC data blocks in an acknowledged mode uplink EGPRS TBF to transmit an enough number of uplink RLC data blocks. In the PACKET UPLINK ASSIGNMENT message WS is commanded to be WS1 which is half of the maximum window size WS2 corresponding to the timeslot capability of the mobile station.

The SS assigns resources for the mobile station to transmit data blocks for WS1+1 times. Each time a radio block is assigned.

The SS observe the BSN and Stall Indicator values of the uplink RLC data blocks, SS verifies that BSN go back to 0 after the block with BSN=WS-1 is transmitted. SS also verifies that SI bit is set in the retransmitted block with BSN=0,1,2,.....

The SS sends a in PACKET TIMESLOT RECONFIGURE messages and command Window Size to be the maximum window size WS2 corresponding to the timeslot capability of the mobile station.

The SS assigns resources for the mobile station to transmit data blocks for WS2-WS1+2 times. Each time a radio block is assigned.

The SS observe the BSN and Stall Indicator values of the uplink RLC data blocks, and verifies that BSN=WS1, WS1+1, ..., WS2-1 blocks are received, BSN go back to 0 after WS2-1 and SI is set for retransmitted block BSN=0.

Different possible WS values shall be applied..

##### Maximum Duration of Test

30 minutes.

## 53.1.1.5 Acknowledged mode/ Uplink TBF/ Invalid Negative Acknowledgement

## 53.1.1.5.1 Conformance requirements

1. If the mobile station is the transmitter, it shall set an instance of timer T3198 for each RLC data block sent (subclause 9.1.3 3GPP TS 04.60).
2. The timer T3198 shall have the expiry value set to BS\_CV\_MAX block periods (subclause 9.1.3, 3GPP TS 04.60).
3. The mobile station shall not modify the element in the acknowledge state array, V(B), corresponding to an RLC data block that cannot be validly negatively acknowledged (subclause 9.1.8 3GPP TS 04.60).

## References

3GPP TS 04.60, subclauses 9.1.3 and 9.1.8.

## 53.1.1.5.2 Test purpose

1. To verify the operation of the timer T3198.
2. To verify the correct response of the mobile station to an invalid negative acknowledgement.

## 53.1.1.5.3 Method of test

## Initial Conditions

## System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present, BS\_CV\_MAX = 15.

## Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP context2 activated.

## Related PICS/PIXIT Statement(s)

The way to initiate an uplink data transfer in EGPRS RLC acknowledged mode.

## Test Procedure

The EGPRS capable MS is made to transmit uplink RLC data blocks in EGPRS TBF RLC acknowledged mode.

The SS negatively acknowledges some RLC data blocks within BS\_CV\_MAX block periods.

The MS shall not retransmit the RLC data blocks that were negatively acknowledged.

## Maximum Duration of Test

30 minutes.

## Expected Sequence

### 53.1.1.6 Acknowledged Mode/ Uplink TBF/ Countdown Value

#### 53.1.1.6.1 Conformance requirements

1. The mobile station shall send the Countdown Value (CV) in each uplink RLC data block to indicate to the network the absolute BSN (BSN') of the last RLC data block that will be sent in the uplink TBF.
2. When a radio block for EGPRS data transfer consists of two RLC data blocks, the CV value of the RLC/MAC header refers to the second RLC data block.

#### References

3GPP TS 04.60, subclause 9.3.1.

#### 53.1.1.6.2 Test purpose

1. To verify that when a radio block for EGPRS data transfer consists of two RLC data blocks, the CV value is calculated based on BSN of the second RLC data block.

#### 53.1.1.6.3 Method of test

#### Initial Conditions

System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present, BS\_CV\_MAX = 15.

Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP context2 activated.

#### Related PICS/PIXIT Statement(s)

The way to initiate an uplink data transfer in EGPRS RLC acknowledged mode.

#### Test Procedure

The MS is made to transmit uplink RLC data blocks in an acknowledged mode uplink EGPRS TBF to transmit TBC uplink RLC data blocks. EGPRS Channel Coding Command is MCS-7. N is less than Window Size.

The SS assigns resources for the mobile station to transmit data blocks. Each time one radio block is assigned.

The SS observes the CV value in the uplink blocks. BSN' = Absolute BSN of the second RLC data block is calculated upon each radio block is received.

The SS verifies that when  $x = \text{round}((\text{TBS} - \text{BSN}' - 1) / \text{NTS})$  is greater than BS\_CV\_MAX, CV equals to 15, otherwise, CV=x.

MCS-8 and MCS-9 shall be applied.

#### Maximum Duration of Test

30 minutes.

## 53.1.1.7 Acknowledged Mode/ Uplink TBF/ Interpretation of Receive Block Bitmap

## 53.1.1.7.1 Conformance requirements

1. In an uplink EGPRS TBF, if a compressed Reported Bitmap is received by the mobile station, the bitmap shall first be decompressed.
2. The uncompressed bitmap shall then be treated as follows:
  - 1) Firstly, if the BOW bit is set in the Reported Bitmap, then this bitmap acknowledges all blocks between V(A) and (SSN- 2) modulo SNS, and the corresponding elements in V(B) shall be set to the value ACKED. Also a bitmap value of '0' is assumed at the bit position corresponding to (SSN-1) modulo SNS which corresponds to V(Q).
  - 2) Then, for each bit in the uncompressed bitmap whose corresponding BSN value is within the transmit window, if the bit contains the value '1', the corresponding element in V(B) indexed relative to SSN shall be set to the value ACKED. If the bit contains the value '0', the element in V(B) shall be set to the value NACKED. A bit within the uncompressed bitmap whose corresponding BSN is not within the transmit window, shall be ignored.
  - 3) If the EOW bit is set, assume a bitmap value of '0' for all RLC blocks with a BSN value higher than the last entry in the bitmap but less than V(S) (i.e.  $[V(R) - 1 < BSN < V(S)]$  modulo SNS).
  - 4) If the RLC transmitter is on the mobile station side, the bit contains the value '0' and the instance of timer T3198 corresponding to BSN is not expired (i.e. the RLC data block was recently (re)transmitted and thus can not be validly negatively acknowledged in this particular Packet Ack/Nack message), the element in V(B) shall not modified.

## References

3GPP TS 04.60, subclauses 9.1.8.2.4 and 9.1.10.

## 53.1.1.7.2 Test purpose

1. To verify that the mobile station retransmits the blocks corresponds to the '0' bits in the uncompressed bitmap when the instances of timer T3198 are expired.
2. To verify that if the BOW bit is set in the Reported Bitmap, then this bitmap acknowledges all blocks between V(A) and (SSN- 2) modulo SNS.
3. To verify a bitmap value of '0' is assumed at the bit position corresponding to (SSN-1) modulo SNS.

4. To verify if the EOW bit is set, then a bitmap value of '0' is assumed for all RLC blocks with a BSN value higher than the last entry in the bitmap but less than V(S).

#### 53.1.1.7.3 Method of test

##### Initial Conditions

###### System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present, BS\_CV\_MAX = 1.

###### Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP context2 activated.

##### Related PICS/PIXIT Statement(s)

The way to initiate an uplink data transfer in EGPRS RLC acknowledged mode.

##### Test Procedure

The MS is made to establish an uplink EGPRS TBF to transmit N RLC data blocks.

The SS assigns resources for the mobile station to transmit N1 (N1<N) data blocks.

The SS wait for BS\_CV\_MAX block periods, then sends a Packet Uplink Ack/Nack message to negatively acknowledge all the received blocks.

The SS observes the uplink packet channel. The MS shall retransmit the negatively acknowledged RLC data blocks immediately in the order of age.

The SS assigns resources for the mobile station to transmit the following blocks.

The SS wait for BS\_CV\_MAX block periods, then sends a Packet Uplink Ack/Nack message, the EGPRS Ack/Nack Description IE contains: SSN=N1+n1 (n1>0 and N1+n1<N), BOW=1, EOW=1, and the last entry in the RB correspond to the BSN=N-n2 block.

The SS assigns resources for the mobile station to transmit the following blocks.

The SS verifies that:

1. Blocks with BSN=N1, N1+1, ... , N1+n1-2 are not retransmitted.
2. Block with BSN=N1+n1-1 are retransmitted.
3. Blocks with BSN=N-n2+1 to N-1 are retransmitted.

##### Maximum Duration of Test

30 minutes.

## 53.1.1.8 Acknowledged Mode/ Uplink TBF/ Pre-emptive Transmission/ Default Mode

## 53.1.1.8.1 Conformance requirements

1. If  $[V(S) < V(A) + WS]$  modulo SNS and no RLC data blocks have a corresponding element in V(B) with the value NACKED, the RLC data block with BSN = V(S) shall be transmitted and the corresponding element in V(B) shall be set to the value PENDING\_ACK. If the transmitter is the mobile station, the pre-emptive transmission bit is set to '1' in the PACKET UPLINK ACK/NACK message and there are no further RLC data blocks available for transmission (i.e. the RLC data block with BSN= V(S) does not exist), the sending side shall transmit the oldest RLC data block whose corresponding element in V(B) has the value PENDING\_ACK, then the next oldest block whose corresponding element in V(B) has the value PENDING\_ACK, etc. If all RLC data blocks whose corresponding element in V(B) has the value PENDING\_ACK have been transmitted once, the process shall be repeated beginning with the oldest RLC data block.
2. If the transmitter is the mobile station and the pre-emptive transmission bit is set to '0' in the PACKET UPLINK ACK/NACK message the transmitter shall not transmit the oldest RLC data block whose corresponding element in V(B) has the value PENDING\_ACK (and the next continuing indefinitely). When a PACKET UPLINK ACK/NACK message is received the MS shall retransmit the RLC blocks which are set to NACKED in V(B) and new RLC data blocks as far as the transmit window (if advanced) allows.
3. The default for the mobile side is that the transmitter shall use pre-emptive transmission.

## References

3GPP TS 04.60, subclauses 9.1.3.2 and 11.2.28.

## 53.1.1.8.2 Test purpose

1. To verify that the MS shall use pre-emptive transmission as default mode before PACKET UPLINK ACK/NACK messages are received.

## 53.1.1.8.3 Method of test

## Initial Conditions

System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present, BS\_CV\_MAX = 1.

Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP context2 activated.

## Related PICS/PIXIT Statement(s)

The way to initiate an uplink data transfer in EGPRS RLC acknowledged mode.

## Test Procedure

The MS is made to establish an uplink EGPRS TBF and to transmit N RLC data blocks.

1. The SS does not send any PACKET UPLINK ACK/NACK message.
2. The SS observes the uplink packet channel.
3. The MS shall retransmit the transmitted RLC data blocks in the original order after all the N data blocks are transmitted or after the transmission window is stalled.

## Maximum Duration of Test

30 minutes.

### 53.1.1.9 Acknowledged Mode/ Uplink TBF/ Pre-emptive Transmission Bit Set to '1'

#### 53.1.1.9.1 Conformance requirements

1. If  $[V(S) < V(A) + WS]$  modulo SNS and no RLC data blocks have a corresponding element in V(B) with the value NACKED, the RLC data block with  $BSN = V(S)$  shall be transmitted and the corresponding element in V(B) shall be set to the value PENDING\_ACK.
2. If the transmitter is the mobile station, the pre-emptive transmission bit is set to '1' in the PACKET UPLINK ACK/NACK message and there are no further RLC data blocks available for transmission (i.e. the RLC data block with  $BSN = V(S)$  does not exist), the sending side shall transmit the oldest RLC data block whose corresponding element in V(B) has the value PENDING\_ACK, then the next oldest block whose corresponding element in V(B) has the value PENDING\_ACK, etc. If all RLC data blocks whose corresponding element in V(B) has the value PENDING\_ACK have been transmitted once, the process shall be repeated beginning with the oldest RLC data block.

#### References

3GPP TS 04.60, subclauses 9.1.3.2 and 11.2.28.

#### 53.1.1.9.2 Test purpose

1. To verify when pre-emptive bit is set to '1' and there are no further data to be transmitted, the MS shall transmit the PENDING\_ACK data blocks repeatedly.
2. To verify when pre-emptive bit is set to '1' and the transmission widow is stalled, the MS shall transmit the PENDING\_ACK data blocks repeatedly.

#### 53.1.1.9.3 Method of test

##### Initial Conditions

System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present,  $BS\_CV\_MAX = 1$ .

Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP context2 activated.

##### Related PICS/PIXIT Statement(s)

The way to initiate an uplink data transfer in EGPRS RLC acknowledged mode.

##### Test Procedure

The EGPRS capable MS is made to establish an acknowledged mode uplink EGPRS TBF and begin to transmit  $N_0 + N_1$  uplink RLC data blocks where  $N_0 + N_1 > WS$  (Window Size) and  $N_0 < WS$ ,  $N_1 < WS$ .

The SS sends a PACKET UPLINK ACK/NACK message with Preemptive Bit set to '1' after several RLC data blocks is received. No RLC data block is acknowledged.

The SS verifies that the BSN sequence in the uplink RLC data blocks is: 0,1,...,WS-1,0...

The SS then sends a PACKET UPLINK ACK/NACK message with Preemptive Bit set to '1' after an RLC data block is received. All blocks with  $BSN=0$  to  $N_0$  are acknowledged.

The SS verifies that the BSN sequence in the received uplink RLC data blocks is:  $N_0+1$ ,  $N_0+2$ , ...,  $N_0+N_1-1$ ,  $N_0+1$ , ...

## Maximum Duration of Test

30 minutes.

### 53.1.1.10 Acknowledged Mode/ Uplink TBF/ Pre-emptive Transmission Bit Set to '0'/ PENDING\_ACK Blocks

#### 53.1.1.10.1 Conformance requirements

1. If the transmitter is the mobile station and the pre-emptive transmission bit is set to '0' in the PACKET UPLINK ACK/NACK message the transmitter shall not transmit the oldest RLC data block whose corresponding element in V(B) has the value PENDING\_ACK (and the next continuing indefinitely). When a PACKET UPLINK ACK/NACK message is received the MS shall retransmit the RLC blocks which are set to NACKED in V(B) and new RLC data blocks as far as the transmit window (if advanced) allows.
2. However if the RLC data block is the last in the TBF it shall be retransmitted even if its state is PENDING\_ACK.

#### References

3GPP TS 04.60, subclauses 9.1.3.2 and 11.2.28.

#### 53.1.1.10.2 Test purpose

1. To verify that the MS shall not retransmit the PENDING\_ACK blocks when pre-emptive bit is set to '0' and the block is not the last block in the TBF.

2. To verify that the MS shall retransmit the PENDING\_ACK blocks when pre-emptive bit is set to '0' and the block is the last block in the TBF.

#### 53.1.1.10.3 Method of test

##### Initial Conditions

###### System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present, BS\_CV\_MAX = 1.

###### Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP context2 activated.

##### Related PICS/PIXIT Statement(s)

The way to initiate an uplink data transfer in EGPRS RLC acknowledged mode.

##### Test Procedure

The MS is made to transmit WS+2 uplink RLC data blocks in an acknowledged mode uplink EGPRS TBF. WS is the window size value.

1. The SS does not acknowledge any uplink RLC data block.
2. The SS sends a Packet Uplink Ack/Nack message with Preemptive Bit = 0, and no blocks are acknowledged.
3. The SS verifies that the stall indicator is set in the latest received RLC data block.
4. The SS checks that the transmitted blocks are not retransmitted.
5. The SS sends a PACKET UPLINK ACK/NACK message to acknowledge all the received data blocks. Pre-emptive Bit is set to '0'.
6. The SS checks that new blocks are transmitted once, and the last block with BSN=WS+1 is retransmitted repeatedly.

##### Maximum Duration of Test

30 minutes.

### 53.1.1.11 Acknowledged Mode/ Uplink TBF/ Pre-emptive Transmission Bit Set to '0'/ Negative Acknowledgement

#### 53.1.1.11.1 Conformance requirements

1. If the transmitter is the mobile station and the pre-emptive transmission bit is set to '0' in the PACKET UPLINK ACK/NACK message the transmitter shall not transmit the oldest RLC data block whose corresponding element in V(B) has the value PENDING\_ACK (and the next continuing indefinitely). When a PACKET UPLINK ACK/NACK message is received the MS shall retransmit the RLC blocks which are set to NACKED in V(B) and new RLC data blocks as far as the transmit window (if advanced) allows.
2. If the mobile station is the transmitter, it shall start an instance of timer T3198 for each RLC data block sent. The timer T3198 shall have the expiry value set to BS\_CV\_MAX block periods.
3. If a compressed reported bitmap is received, the bitmap shall first be decompressed according to Subclause 9.1.10. The uncompressed bitmap shall then be treated as follows:
4. Firstly, if the BOW bit is set in the Reported Bitmap, then this bitmap acknowledges all blocks between V(A) and (SSN- 2) modulo SNS, and the corresponding elements in V(B) shall be set to the value ACKED. Also a bitmap value of '0' is assumed at the bit position corresponding to (SSN-1) modulo SNS which corresponds to V(Q).

5. Then, for each bit in the uncompressed bitmap whose corresponding BSN value is within the transmit window, if the bit contains the value '1', the corresponding element in  $V(B)$  indexed relative to  $SSN$  shall be set to the value ACKED. If the bit contains the value '0', the element in  $V(B)$  shall be set to the value NACKED. A bit within the uncompressed bitmap whose corresponding BSN is not within the transmit window, shall be ignored. If the EOW bit is set, assume a bitmap value of '0' for all RLC blocks with a BSN value higher than the last entry in the bitmap but less than  $V(S)$  (i.e.  $[V(R) - 1 < BSN < V(S)]$  modulo  $SNS$ ). If the RLC transmitter is on the mobile station side, the bit contains the value '0' and the instance of timer T3198 corresponding to BSN is not expired (i.e., the RLC data block was recently (re)transmitted and thus can not be validly negatively acknowledged in this particular Packet Ack/Nack message), the element in  $V(B)$  shall not be modified. Similarly, if the RLC transmitter is on the network side and the RLC data block cannot be validly negatively acknowledged in this particular Packet Ack/Nack message the element in  $V(B)$  shall not be modified.

3GPP TS 04.60, subclauses 9.1.3.2, 9.1.8.2.4 and 11.2.28.

### 53.1.1.11.2 Test purpose

1. To verify that the MS shall transmit the NACKED blocks when pre-emptive bit is set to '0'.

### 53.1.1.11.3 Method of test

## Initial Conditions

System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present,  $BS\_CV\_MAX = 1$ .

Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP context2 activated.

## Related PICS/PIXIT Statement(s)

The way to initiate an uplink data transfer in EGPRS RLC acknowledged mode.

## Test Procedure

The MS is made to transmit  $N$  uplink RLC data blocks in an acknowledged mode uplink EGPRS TBF. Number  $N$  is greater than the window size.

1. The SS receives uplink RLC data blocks with  $BSN=0, 1, 2, 3, \dots, 63$ .
3. The SS wait for  $BS\_CV\_MAX$  block periods.
4. The SS transmits a PACKET UPLINK ACK/NACK message to acknowledge blocks 0,1,2, and 3 and negatively acknowledge all the other received data blocks, Pre-emptive Bit is set to '0'B in the message.
5. The SS checks that  $BSN=4$  block is retransmitted immediately.

## Maximum Duration of Test

30 minutes.

## Expected Sequence

## 53.1.1.12 Acknowledged Mode/ Uplink TBF/ Retransmission/ Split RLC Data Block

## 53.1.1.12.1 Conformance requirements

1. In RLC acknowledged mode, each RLC endpoint transmitter shall have an associated acknowledge state array (V(B)).
2. The transmitter shall transmit the oldest RLC data block whose corresponding element in V(B) indexed relative to V(A) has the value NACKED. As each RLC data block is transmitted the corresponding element in V(B) is set to the value PENDING\_ACK.
3. Depending on the modulation and coding scheme, one or two RLC data blocks are contained in one RLC/MAC block. For MCS-7, MCS-8, MCS-9 there are two RLC data blocks in one RLC/MAC block.
4. A re-segment bit is included within each PACKET UPLINK ACK/NACK, PACKET UPLINK ASSIGNMENT and PACKET TIMESLOT RECONFIGURE message. For initial transmissions of new RLC blocks the channel coding commanded is applied. The re-segment bit is used to set the ARQ mode to type I or type II (incremental redundancy) for uplink TBFs.
5. For retransmissions, setting the re-segment bit to 1 (type I ARQ) requires the mobile station to use an MCS within the same family as the initial transmission and the payload may be split.
6. If the RLC data block to be transmitted is split over two radio blocks, both radio blocks shall be transmitted
7. RLC data blocks initially transmitted with MCS4, MCS-5, MCS-6, MCS-7, MCS-8 or MCS- 9, can optionally be retransmitted with MCS-1, MCS-2 and MCS-3 respectively, using two radio blocks. In this case, the split block field in the header shall be set to indicate that the RLC data block is split, and the order of the two parts.

### 53.1.1.12.2 Test purpose

1. To verify that if the RLC data block to be transmitted is split over two radio blocks, both radio blocks shall be transmitted.
2. To verify the correct setting of the Split Block field in the block header.
3. To verify that the order of the retransmitted two parts of the data block is correct.

### 53.1.1.12.3 Method of test

#### Initial Conditions

System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present, BS\_CV\_MAX = 1.

Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP context2 activated.

#### Related PICS/PIXIT Statement(s)

The way to initiate an uplink data transfer in EGPRS RLC acknowledged mode.

#### Test Procedure

The EGPRS capable MS is made to transmit uplink RLC data blocks in EGPRS TBF RLC acknowledged mode. The EGPRS Channel Coding Command IE indicates MCS-4 in the Packet Uplink Assignment message.

After the expiry of timer T3198 the SS sends a Packet Uplink Ack/Nack message to negatively acknowledge some RLC data blocks. In the message EGPRS Channel Coding Command IE is set to MCS-1 and Re-segment IE should be set to '1'B.

The MS shall retransmit the NACKED RLC data blocks using MSC-1 in splitted radio blocks. Observe the uplink RLC data block header. Both of split blocks shall be received, the first one shall contain a SPB field equals to '10'B while the second shall be '11'B.

Other MCSs scheme should be tested in the same way.

#### Maximum Duration of Test

30 minutes

## 53.1.1.13 Acknowledged Mode/ Uplink TBF/ Calculation of BSN2

## 53.1.1.13.1 Conformance requirements

- Each RLC data block contains a block sequence number (BSN) field that is 11 bits in length. At the time that an in-sequence RLC data block is designated for transmission, the value of BSN is set equal to the value of the send state variable V(S).
- The transfer of RLC data blocks in the RLC acknowledged mode uses retransmissions of RLC data blocks. The transmitting side numbers the RLC data blocks via the block sequence number (BSN). The BSN is used for retransmission and for reassembly. The receiving side sends PACKET Ack/Nack messages in order to request retransmission of RLC data blocks.
- In case two RLC data blocks are sent within a RLC/MAC block, BSN2 is relative to BSN1, provided the difference between the second block number and the first block modulo SNS is less than Window Size (WS).
- Second block sequence number = [BSN1 + BSN2] modulo SNS.

### 53.1.1.13.2 Test purpose

1. To verify that the mobile station correctly calculate the value of BSN 2.

### 53.1.1.13.3 Method of test

#### Initial Conditions

##### System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present.

##### Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP context2 activated.

#### Related PICS/PIXIT Statement(s)

The way to initiate an uplink data transfer in EGPRS RLC acknowledged mode.

#### Test Procedure

The EGPRS capable MS is made to transmit uplink RLC data blocks in EGPRS TBF RLC acknowledged mode. The Window Size is assigned to be the maximum corresponding to the MS multislot class.

The MS is made to transmit SNS-N RLC Data Blocks, where  $N < WS$ . SS acknowledges all the data blocks. The MS sends SNS-N+1 to SNS-N+WS data blocks. SS acknowledges all but one data block and negatively acknowledges this one data block with BSN=BSN\_1.

The MS is made to transmit another one Radio Block which contains two RLC data blocks.

(MCS -8 or MCS-9) The SS verifies that the Radio block contains the retransmission of the previously negatively acknowledged RLC data Block (BSN\_1) and the new RLC data block with BSN=SNS-N+WS+1 (BSN\_2).

SS verifies that:

$$BSN1=BSN\_1;$$

$$BSN2 = [BSN\_2 - BSN\_1] \text{ modulo SNS.}$$

The test procedure is performed for various values of BSN\_1 and BSN\_2.

#### Maximum Duration of Test

30 minutes.

#### Expected Sequence

Value of N=40 is taken for this test case.

### 53.1.1.14 Acknowledged Mode/ Uplink TBF/ Verification of Coding Schemes

#### 53.1.1.14.1 Conformance requirements

1. In EGPRS TBF mode, RLC data blocks that are transmitted for the first time shall be transmitted with the MCS commanded, except if the commanded mode is MCS-5-7, in which case the data block shall be transmitted with MCS-5, or if the commanded mode is MCS-6-9, in which case the data block shall be transmitted with MCS-6.
2. A re-segment bit is included within each PACKET UPLINK ACK/NACK, PACKET UPLINK ASSIGNMENT and PACKET TIMESLOT RECONFIGURE messages.
3. For retransmissions, setting the resegment bit to '1' (type I ARQ) requires the mobile station to use an MCS within the same family as the initial transmission and the payload may be split.

#### References

3GPP TS 04.60, subclause 8.1.1.

#### 53.1.1.14.2 Test purpose

1. To verify that the mobile station uses the correct channel coding commanded by the Network for initial transmission.
2. To verify that correct channel coding command is used for retransmission.

#### 53.1.1.14.3 Method of test

##### Initial Conditions

###### System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present, BS\_CV\_MAX = 1.

###### Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP context2 activated.

##### Related PICS/PIXIT Statement(s)

The way to initiate an uplink data transfer in EGPRS RLC acknowledged mode.

##### Test Procedure

The EGPRS capable MS is made to transmit uplink RLC data blocks in EGPRS TBF RLC acknowledged mode. The EGPRS Channel Coding Command IE is commanded in the Packet Uplink Assignment message. The resegment IE is set to 1.

The SS checks that the Uplink RLC Data Blocks are transmitted by the mobile using the channel coding scheme commanded by the SS.

The SS negatively acknowledges the received data blocks. The Coding scheme to be used by the mobile is commanded in the EGPRS Channel Coding Command IE.

The SS checks that the Uplink RLC data blocks are retransmitted using the channel coding scheme commanded by the SS.

##### Maximum Duration of Test

30 minutes.

### 53.1.1.15 Acknowledged Mode/ Uplink TBF/ Recalculation of CV on MCS change

#### 53.1.1.15.1 Conformance requirements

1. The mobile station shall send the Countdown Value (CV) in each uplink RLC data block to indicate to the network the absolute BSN (BSN') of the last RLC data block that will be sent in the uplink TBF. The CV shall be calculated as follows.

$$\text{Let integer } x = \text{round} \left( \frac{\text{TBC} - \text{BSN}' - 1}{\text{NTS}} \right).$$

$$\text{Then, CV} = \begin{cases} x, & \text{if } x \leq \text{BS\_CV\_MAX} \\ 15, & \text{otherwise} \end{cases},$$

where:

- TBC = total number of RLC data blocks that will be transmitted in the TBF;
  - BSN' = absolute block sequence number of the RLC data block, with range from 0 to (TBC - 1);
  - NTS = number of timeslots assigned to the uplink TBF in the assignment message, with range 1 to 8;
  - the function round() rounds upwards to the nearest integer;
  - BS\_CV\_MAX is a parameter broadcast in the system information;
  - the division operation is non-integer and results in zero only for (TBC - BSN' - 1) = 0.
2. If the mobile station receives a change in the Channel Coding Command in a PACKET UPLINK ACK/NACK message during the countdown procedure, the mobile station shall act upon the new Channel Coding Command. The mobile station shall then recalculate the CV values for any untransmitted RLC data blocks using the new RLC data block size.

#### References

3GPP TS 04.60, subclause 9.3.1 and clause F.3.

#### 53.1.1.15.2 Test purpose

To verify that the mobile station correctly recalculates the CV values when the MCS is changed during countdown procedure.

#### 53.1.1.15.2 Method of test

#### Initial Conditions

System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present, BS\_CV\_MAX = 15.

Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP context2 activated.

#### Related PICS/PIXIT Statement(s)

The way to initiate an uplink data transfer in EGPRS RLC acknowledged mode.

#### Test Procedure

The EGPRS capable MS is made to transmit uplink RLC data blocks in EGPRS TBF RLC acknowledged mode. MCS-9 is commanded. Total number of Data Blocks is taken to be a minimum of 20 blocks.

SS acknowledges all the Data Blocks upon reception.

SS monitors the CV of the data blocks sent.

SS sends a PACKET UL ACK/NACK message acknowledging the RLC data block with CV =14 or CV = 13 and ordering a change of MCS to MCS-3.

The Mobile might send a new Data Block with MCS-9 which could have been stored in the Transmit buffer.

SS notes the BSN of the last data block, received with MCS9 as  $BSN_{2SS}$  verifies that  $CV=15$  till  $BSN=BSN_{2SS}+2*CV1-15$

where  $CV1 = CV$  in the last radio block received with MCS9

SS verifies that CV decreases progressively in further blocks.

Maximum Duration of Test

5 minutes.

## 53.1.1.16 Acknowledged Mode/ Uplink TBF/ Retransmission/ Padding in the Data Field

## 53.1.1.16.1 Conformance requirements

1. According to the link quality, an initial Modulation and Coding Scheme (MCS) is selected for an RLC block. For the retransmissions, the same or another MCS from the same family of MCSs can be selected.
2. For blocks initially transmitted with MCS-8 which are retransmitted using MCS-6 or MCS-3, padding of the first six octets in the data field shall be applied, and the CPS field shall be set to indicate that this has been done.

## References

3GPP TS 04.60, subclauses 9.3.2.1 and 10.4.8a.

#### 53.1.1.16.2 Test purpose

1. To verify the padding of the first six octets in the data field for blocks initially transmitted with MCS-8 and retransmitted using MCS-6 or MCS-3.
2. To verify that the CPS field is set to indicate padding in the retransmitted blocks.

#### 53.1.1.16.3 Method of test

##### Initial Conditions

###### System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present, BS\_CV\_MAX = 1.

###### Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP context2 activated.

##### Related PICS/PIXIT Statement(s)

The way to initiate an uplink data transfer in EGPRS RLC acknowledged mode.

##### Test Procedure

The EGPRS capable MS is made to transmit uplink RLC data blocks in EGPRS TBF RLC acknowledged mode. The EGPRS Channel Coding Command IE indicates MCS-8 in the Packet Uplink Assignment message.

After the expiry of timer T3198 the SS sends a Packet Uplink Ack/Nack message to negatively acknowledge some RLC data blocks. In the message EGPRS Channel Coding Command IE is set to MCS-6 or MCS-3 and Resegment IE should be set to '1'.

The MS shall then retransmit the NACKED RLC data blocks using MSC-6 or MCS-3. The SS verifies that the first 6 octets in the retransmitted RLC data blocks are padding octets and the CPS field in the RLC/MAC header indicates padding.

##### Maximum Duration of Test

30 minutes.

### 53.1.1.17 Acknowledged Mode/ Uplink TBF/ Retransmission/ Puncturing Scheme Cycle

#### 53.1.1.17.1 Conformance requirements

1. On initial transmission the RLC data blocks are sent with one of the initial code rates (the rate 1/3 encoded data is punctured with Puncturing Scheme (PS) 1 of the selected Modulation and Coding Scheme MCS) and if the RLC data block is required to be retransmitted it is sent with PS 2 of the selected MCS.
2. If the RLC Data Blocks are to be retransmitted, additional coded bits (i.e., the output of the rate 1/3 encoded data which is punctured with PS 2 of the prevailing MCS) shall be sent.
3. If all the code words (different punctured versions of the encoded data block) have been sent, the procedure shall start over and the first code word (which is punctured with PS 1) shall be sent followed by PS 2 etc.

- 3GPP TS 04.60, subclauses 9.3.2.1 and 10.4.8a.  
3GPP TS 05.05.  
3GPP TS 05.09.

#### 53.1.1.17.2 Test purpose

1. To verify that if the RLC data block is required to be retransmitted it is sent with PS 2 of the selected MCS for the first retransmission.
2. On subsequent retransmissions the RLC data block is transmitted with PS in a cyclic way.

#### 53.1.1.17.3 Method of test

##### Initial Conditions

System Simulator:

- 1 cell with EGPRS support, default setting, PBCCH not present, BS\_CV\_MAX = 1.

Mobile Station:

- The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP context2 activated.

## Related PICS/PIXIT Statement(s)

The way to initiate an uplink data transfer in EGPRS RLC acknowledged mode.

## Test Procedure

The MS is made to transmit uplink RLC data blocks in an acknowledged mode uplink EGPRS TBF.

The SS NACK BSN=3 block.

The Puncture Scheme of the re-transmitted RLC data blocks (BSN=3) is observed. The PS used for the retransmissions shall be PS2, then PS3, then back to PS1....

## Maximum Duration of Test

30 minutes.

## Expected Sequence

| Step              | Direction | Message                                        | Comments                                                                                                                                                                                                                                                                                                         |

Verify that Steps 1-7 and Steps 10 to 11 are repeated.Reason: Since there is no PS3 for MCS-1, MCS2, MCS-5 and MCS-6. |

53.1.1.18 EGPRS Acknowledged mode / Uplink TBF / Link Adaptation Procedure for retransmission

53.1.1.18.1 Conformance requirements

1. In EGPRS TBF mode, RLC data blocks that are transmitted for the first time shall be transmitted with the MCS commanded, except if the commanded mode is MCS-5-7, in which case the data block shall be transmitted with MCS-5, or if the commanded mode is MCS-6-9, in which case the data block shall be transmitted with MCS-6. In EGPRS TBF mode, a MS may choose an alternate MCS than the one commanded, for the initial transmission of the last RLC data blocks of the TBF under the following conditions:
  - the alternate MCS is more robust than the commanded MCS;
  - the alternate MCS has already been commanded by the network during the TBF or was available for selection by the MS during the TBF according to the MCS selection rules for retransmissions; and
  - the TBF requires no more radio blocks for initial transmission of the RLC data blocks using the alternate MCS than would be required when using the commanded MCS.

A re-segment bit is included within each PACKET UPLINK ACK/NACK, PACKET UPLINK ASSIGNMENT and PACKET TIMESLOT RECONFIGURE messages. For initial transmissions of new RLC blocks the channel coding commanded is applied. The resegment bit is used to set the ARQ mode to type I or type II (incremental redundancy) for uplink TBFs. For retransmissions, setting the resegment bit to '1' (type I ARQ) requires the mobile station to use an MCS within the same family as the initial transmission and the payload may be split (refer to table 1).

**Table 1: Choice of MCS for retransmissions with re-segmentation**

| Scheme used for initial transmission | Scheme to use for retransmissions after switching to a different MCS |                 |                 |                   |                 |                   |                 |                 |                 |                 |                 |

53.1.1.18.2 Test purpose

1. To verify that the mobile station retransmits Nacked data blocks with the MCS commanded and according to table 1 (see above).

## 53.1.1.18.3 Method of test

## Initial Conditions

System Simulator:

1 cell, default setting, , PBCCH not present, BS\_CV\_MAX = 0

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP Context2 activated.

## Related PICS/PIXIT Statement(s)

The way to initiate an acknowledged uplink transfer.

## Test Procedure

The MS is made to transmit RLC data blocks. The SS negatively acknowledges RLC data blocks and commands the MS to use a different MCS (EGPRS Channel Coding Command). The MS retransmits the negatively acknowledged RLC data blocks and uses the commanded MCS by taking into account the scheme specified in table 1 (see above).

Test Procedure is repeated for  $k = 1$  to 9 with:

- k=1: MCS-9 to be used at step 1,
- k=2: MCS-8 to be used at step 1,
- k=3: MCS-7 to be used at step 1,
- k=4: MCS-6 to be used at step 1,
- k=5: MCS-5 to be used at step 1,
- k=6: MCS-4 to be used at step 1,
- k=7: MCS-3 to be used at step 1,
- k=8: MCS-2 to be used at step 1,
- k=9: MCS-1 to be used at step 1.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

| 51   |           | { Completion of uplink RLC data block transfer} |                                                                                                                                                  |

NOTE: The MS may send one further RLC data block during waiting for retransmission of Naked data blocks to SS. This has to be taken into account for verifying the correct BSN's (see for example step 8) and for calculating the numbers of repetitions (see for example step 9).

### 53.1.1.19 EGPRS Acknowledged mode / Uplink TBF / Link Adaptation Procedure for initial transmission

#### 53.1.1.19.1 Conformance requirements

1. In EGPRS TBF mode, RLC data blocks that are transmitted for the first time shall be transmitted with the MCS commanded, except if the commanded mode is MCS-5-7, in which case the data block shall be transmitted with MCS-5, or if the commanded mode is MCS-6-9, in which case the data block shall be transmitted with MCS-6.
2. If these rules require a transmission (either original transmission or retransmission) in in a) MCS-7 or b) MCS-8 or MCS-9, but there is only one RLC block that can be transmitted in that MCS, the MS shall send that block in either MCS-5 for case a) or MCS-6 for case b).

#### 53.1.1.19.2 Test purpose

1. To verify that the mobile station transmits data blocks with the correct MCS in initial transmission.

#### 53.1.1.19.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, default setting, , PBCCH not present, BS\_CV\_MAX = 0.

Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP Context2 activated.

#### Related PICS/PIXIT Statement(s)

The way to initiate an acknowledged uplink transfer.

## Test Procedure

The MS is made to transmit RLC data blocks. The SS acknowledges RLC data blocks and verify if the MS is using the correct MCS as mentioned above.

| Execution counter<br>k | Number of octets<br>n | Commanded MCS to<br>be used in step 1 | Expected MCS to be<br>used in step 4 (see note) |

### 53.1.1.20 Acknowledged Mode/ Uplink TBF/ Retransmission/ MCS Selection without Re-segmentation

#### 53.1.1.20.1 Conformance requirements

1. If the transmitter side is the mobile station and the re-segment bit is not set, the mobile station shall use an MCS within the same family as the initial MCS without splitting the payload (refer to subclause 8.1.1 table 3, 3GPP TS 04.60) for retransmission.

#### References

3GPP TS 04.60, subclause 8.1.1.

#### 53.1.1.20.2 Test purpose

1. To verify that if the re-segment bit is not set, the mobile station shall use an MCS within the same family as the initial MCS without splitting the payload for retransmission in accordance with subclause 8.1.1 table 3, 3GPP TS 04.60.

#### 53.1.1.20.3 Method of test

#### Initial Conditions

##### System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present, BS\_CV\_MAX = 1.

##### Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP context2 activated.

#### Related PICS/PIXIT Statement(s)

The way to initiate an uplink data transfer in EGPRS RLC acknowledged mode.

## Test Procedure

The EGPRS capable MS is made to transmit uplink RLC data blocks in EGPRS TBF RLC acknowledged mode. The EGPRS Channel Coding Command IE in the Packet Uplink Assignment message is set according to the execution counter K described as below.

After the expiry of timer T3198 the SS sends a Packet Uplink Ack/Nack message to negatively acknowledge some RLC data blocks. In the message EGPRS Channel Coding Command IE is set to a different MCS and Resegment IE should be set to '0'.

The MS shall then retransmit the negatively acknowledged RLC data blocks using the MCS specified in table 3, 3GPP TS 04.60.

Test procedure is repeated for K = 1 to 9 with:

- K=1: MCS-9 to be used at step 1,
- K=2: MCS-8 to be used at step 1,
- K=3: MCS-7 to be used at step 1,
- K=4: MCS-6 to be used at step 1,
- K=5: MCS-5 to be used at step 1,
- K=6: MCS-4 to be used at step 1,
- K=7: MCS-3 to be used at step 1,
- K=8: MCS-2 to be used at step 1,
- K=9: MCS-1 to be used at step 1.

## Maximum Duration of Test

30 minutes.

### 53.1.1.21 Acknowledged Mode/ Uplink TBF/ Initial Puncturing Scheme After MCS Switching

#### 53.1.1.21.1 Conformance requirements

1. RLC data blocks which are retransmitted using a new MCS shall at the first transmission after the MCS switch be sent with the puncturing scheme indicated in table 10, 3GPP TS 04.60 subclause 9.3.2.1.

#### References

3GPP TS 04.60, subclause 9.3.2.1.

3GPP TS 05.05.

3GPP TS 05.09.

#### 53.1.1.21.2 Test purpose

1. To verify the correct selection of initial PS scheme after MCS switch.

#### 53.1.1.21.3 Method of test

#### Initial Conditions

System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present, BS\_CV\_MAX = 1.

Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP context2 activated.

#### Related PICS/PIXIT Statement(s)

The way to initiate an uplink data transfer in EGPRS RLC acknowledged mode.

#### Test Procedure

The MS is made to transmit uplink RLC data blocks in an acknowledged mode uplink EGPRS TBF. EGPRS Coding Command is set to indicate MCS-9.

The SS sends a PACKET UPLINK ACK/NACK message and NACK all blocks received. MCS- 6 is commanded in the message. Pre-emptive Bit is set to '1'B.

The SS checks that the retransmitted blocks are received in MCS-6, PS1.

Repeat the above steps with different allowed MCS and PS combinations.

#### Maximum Duration of Test

30 minutes.

#### Expected Sequence

## 53.1.2 Acknowledged Mode/ Downlink TBF

### 53.1.2.1 Acknowledged Mode/ Downlink TBF/ Receive State Variable V(R)

#### 53.1.2.1.1 Conformance requirements

1. In RLC acknowledged mode, each RLC endpoint receiver shall have an associated receive state variable V(R). The receive state variable denotes the BSN of the next in-sequence RLC data block expected to be received.
2. The BOW bit shall be set if  $SSN = [V(Q) + 1]$  modulo SNS, the EOW bit shall be set if  $[V(R) - 1]$  modulo SNS is explicitly included in the bitmap.

#### References

3GPP TS 04.60, subclause 9.1.5.

#### 53.1.2.1.2 Test purpose

1. To verify the receive state variable, V(R) is set to the next in-sequence RLC data block expected to be received.

#### 53.1.2.1.3 Method of test

#### Initial Conditions

##### System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present, BS\_CV\_MAX = 1.

##### Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP context2 activated.

#### Related PICS/PIXIT Statement(s)

N/A

#### Test Procedure

The SS initiates the establishment of a downlink EGPRS TBF, setting window size value to the maximum possible.

The SS sends 5 EGPRS RLC data blocks with BSN = 1, 3, 5, 7, 9, and polls the MS. The MS shall send an EGPRS PACKET DOWNLINK ACK/NACK message to the SS with EOW set in the EGPRS Ack/Nack Description IE.

The SS then sends more EGPRS RLC data blocks with BSN = 11, 13, ..., and polls the MS in the last block with ES/P='01'B. The MS shall send an EGPRS PACKET DOWNLINK ACK/NACK message to the SS with EOW not set.

#### Maximum Duration of Test

30 minutes.

## Expected Sequence

## 53.1.2.2 Acknowledged Mode/ Downlink TBF/ Receive Window State Variable V(Q)

## 53.1.2.2.1 Conformance requirements

1. In RLC acknowledged mode, each RLC endpoint receiver shall have an associated receive window state variable, V(Q). The mobile station shall set V(Q) to the value 0 at the beginning of each TBF in which the RLC endpoint is the receiver.
2. The value of V(Q) shall be updated when the RLC receiver receives the RLC data block whose BSN is equal to V(Q).
3. The EGPRS Packet Ack/Nack message contains a starting sequence number (SSN) and a reported bitmap (RB). The EGPRS Packet Ack/Nack message is sent by the RLC receiver and is received by the RLC transmitter.

## References

3GPP TS 04.60, subclause 9.1.6.

## 53.1.2.2.2 Test purpose

1. To verify the correct initialisation of the receive state variable V(Q).
2. To verify that V(Q) is not updated when data blocks with BSN not equal to V(Q) are received.

## 53.1.2.2.3 Method of test

## Initial Conditions

System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present, BS\_CV\_MAX = 1.

Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP context2 activated.

## Related PICS/PIXIT Statement(s)

N/A

## Test Procedure

The SS initiates the establishment of a downlink EGPRS TBF.

The SS sends an EGPRS RLC data block with BSN = 1 to the MS and polls the MS. The SS verifies that the MS shall send an EGPRS PACKET DOWNLINK ACK/NACK message with SSN = 1.

The SS sends a sequence of EGPRS RLC data blocks with BSN = 2,3,4,5,6 in sequence and polls the MS each time with ES/P = '01'. The SS verifies that the MS shall send an EGPRS PACKET DOWNLINK ACK/NACK message to the SS each time with SSN = 1 not changed.

The SS sends an RLC data blocks with BSN = 0 and polls the MS with ES/P = '01'. The SS verifies that the MS shall send an EGPRS PACKET DOWNLINK ACK/NACK message to the SS with SSN = 8.

#### Maximum Duration of Test

30 minutes.

#### Expected Sequence

### 53.1.2.3 Acknowledged Mode/ Downlink TBF/ Window Size/ Default Value

#### 53.1.2.3.1 Conformance requirements

1. In case the MS multislot class is not indicated during packet data connection establishment (short access, access request for signalling message transfer), a default window size corresponding to the minimum window size for 1 timeslot shall be selected.
2. In case a PACKET TIMESLOT RECONFIGURE is sent to the MS without any window size for a specific TBF, then any previous value received for the specific TBF shall be used or, if no previous value has been received for the specific TBF, default window size shall be used.

#### References

3GPP TS 04.60, subclause 9.1.9.2.

#### 53.1.2.3.2 Test purpose

1. To verify that MS select the default WS value when WS is not indicated during EGPRS downlink TBF establishment.
2. To verify that MS use a correct WS value when a PACKET TIMESLOT RECONFIGURE is sent to the MS without any window size indication during a downlink TBF.

## 53.1.2.3.3 Method of test

## Initial Conditions

System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present, BS\_CV\_MAX = 1.

Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP context2 activated.

## Related PICS/PIXIT Statement(s)

N/A

## Test Procedure

The SS establishes a downlink EGPRS TBF without a WS indication in Packet Downlink Assignment message and sends two EGPRS DOWNLINK RLC DATA Blocks with BSN = N and N - 1 (N is the default WS value MS shall selected). The MS shall acknowledge the BSN=N-1 block but not the block of BSN=N.

The SS first sends a PACKET TIMESLOT RECONFIGURE message with WS = N' (a value different from N and not greater than the maximum value allowed), then a PACKET TIMESLOT RECONFIGURE message without WS indication. The SS sends two EGPRS DOWNLINK RLC DATA Blocks with BSN = N' and N'-1. The MS shall acknowledge the BSN=N'-1 block but not the BSN=N' block.

## Maximum Duration of Test

30 minutes.

## Expected Sequence

| Step | Direction | Message                        | Comments                                                                                        |

| 11   | MS -> SS  | EGPRS PACKET DOWNLINK ACK/NACK | Received on PACCH of the assigned PDTCH with the acknowledgement for the block of BSN = N' - 1. |

## 53.1.2.4 Acknowledged Mode/ Downlink TBF/ Window Size/ Assigned Value

### 53.1.2.4.1 Conformance requirements

1. For EGPRS the window size (WS) shall be set by the network according to the number of timeslots allocated in the direction of the TBF (uplink or downlink).
2. MS shall support the maximum window size corresponding to its multi timeslot capability.
3. The selected WS shall be indicated within PACKET UL/DL ASSIGNMENT and PACKET TIMESLOT RECONFIGURE.

### References

3GPP TS 04.60, subclause 9.1.9.2.

### 53.1.2.4.2 Test purpose

1. To verify that the MS correctly interprets the window size indication in PACKET DOWNLINK ASSIGNMENT.
2. To verify that the MS correctly interprets the window size indication in PACKET TIMESLOT RECONFIGURE during downlink TBF.
3. To verify that the MS supports the maximum window size corresponding to its multi timeslot capability for downlink TBF.

### 53.1.2.4.3 Method of test

#### Initial Conditions

System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present, BS\_CV\_MAX = 1.

Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP context2 activated.

#### Related PICS/PIXIT Statement(s)

N/A

#### Test Procedure

The SS initiates the establishment of a downlink EGPRS TBF, setting  $WS = N < N'$  (the maximum possible legal WS value) in the PACKET DOWNLINK ASSIGNMENT message. The SS sends a RLC data block with BSN = N and polls for acknowledgement. MS shall send a Packet Downlink Ack/Nack message acknowledging no block. The SS sends an RLC data block with BSN = N-1 and polls for acknowledgement. The MS shall send a Packet Downlink Ack/Nack message acknowledging the BSN = N - 1 block.

During the downlink TBF, The SS sends a PACKET TIMESLOT RECONFIGURE message with  $WS = N'$ . The SS sends an RLC data block with BSN = N' and polls for acknowledgement. The MS shall send a Packet Downlink Ack/Nack message without acknowledging the BSN = N' block. The SS sends a RLC data block with BSN = N'-1 and poll for acknowledgement. The MS shall send a Packet Downlink Ack/Nack message acknowledging the BSN = N'-1 block.

#### Maximum Duration of Test

30 minutes.

## Expected Sequence

| 9    | SS -> MS  | EGPRS DOWNLINK RLC DATA BLOCK  | Sent on the assigned PDTCH, with BSN = N' - 1, ES/P = '01'B RRBP = '00'B                               |
| 10   | MS -> SS  | EGPRS PACKET DOWNLINK ACK/NACK | Received on PACCH of the assigned PDTCH with the acknowledgement for the block of BSN = N' - 1.        |

## 53.1.2.5 Acknowledged Mode/ Downlink TBF/ BOW

## 53.1.2.5.1 Conformance requirements

1. For downlink TBF, the reported bitmap is sent using the EGPRS PACKET DOWNLINK ACK/NACK message corresponding to the used RB size.
2. The BOW bit shall be set if  $SSN = [V(Q) + 1]$  modulo SNS is explicitly included in the bitmap.

## References

3GPP TS 04.60, subclause 9.1.8.2.4.

## 53.1.2.5.2 Test purpose

1. To verify the BOW bit is set to '1' when  $SSN = [V(Q) + 1]$  modulo SNS is explicitly included in the bitmap.
2. To verify the BOW bit is set to '0' when  $SSN = [V(Q) + 1]$  modulo SNS is not explicitly included in the bitmap.

## 53.1.2.5.3 Method of test

## Initial Conditions

System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present, BS\_CV\_MAX = 1.

Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP context2 activated.

## Related PICS/PIXIT Statement(s)

The MS class for multislot capability.

## Test Procedure

The SS establishes an acknowledged mode downlink EGPRS TBF with the MS:

1. Set the window size to the maximum value according to the number of timeslots assigned to TBF.
2. Make the FRB length shorter than the possible RB size, set the BSN sequence for transmit like 0, 2, 4, 6, 8, ..., (max value of windows size), all with even values.
3. The SS sends those RLC data blocks with expected BSNs and polls the MS for the First Partial Bitmap in the last block.
4. Check the BOW bit of EGPRS PACKET DOWNLINK ACK/NACK should be '1' and the Report Bitmap should be a correct Report Bitmap.
5. The SS polls the MS for the Next Partial Bitmap.
6. Check the BOW bit of EGPRS PACKET DOWNLINK ACK/NACK should be '0' and the Report Bitmap should be a correct Report Bitmap.
7. The SS sends all of missed RLC data blocks to the MS.

## Maximum Duration of Test

30 minutes.

## Expected Sequence

| Step | Direction | Message                        | Comments                                                                                                         |

| 3    | MS -> SS  | EGPRS PACKET DOWNLINK ACK/NACK | The EGPRS PACKET DOWNLINK ACK/NACK include a Channel Quality Report IE,<br>The RB is an correct RB               |

### 53.1.2.8 Acknowledged Mode/ Downlink TBF/ Generation of Bitmap

#### 53.1.2.8.1 Conformance requirements

- For uplink TBFs, the reported bitmap is sent using the PACKET UPLINK ACK/NACK message corresponding to the used RB size.
- First, a Full Received Bitmap (FRB) is built from the receive state array  $V(N)$  by extracting the part between  $V(Q)$  and  $V(R)$  similar to the GPRS case: it is assigned the elements whose indices in the receive state array  $V(N)$  at the receiver range from  $[V(Q)+1]$  modulo SNS to  $[V(R)-1]$  modulo SNS. This global number of elements is less than WS. For each bit in the bitmap, the bit is assigned the value '1' if the corresponding element in  $V(N)$  indexed relative to SSN has the value RECEIVED. The bit is assigned the value '0' if the element in  $V(N)$  has the value INVALID.
- The BOW bit shall be set if  $SSN = [V(Q) + 1]$  modulo SNS, the EOW bit shall be set if  $[V(R) - 1]$  modulo SNS is explicitly included in the bitmap.
- If  $V(Q)$  equals  $V(R)$ , then SSN shall be set to the value  $SSN = [V(Q) + 1]$  modulo SNS, BOW bit shall be set to the value '1', EOW shall be set to the value '1' and the reported bitmap size shall equal 0 bits.

#### References

3GPP TS 04.60, subclause 9.1.8.2.3.

#### 53.1.2.8.2 Test purpose

- To verify that the mobile station correctly formulates the EGPRS DL Ack/Nack message when the condition of  $V(Q) = V(R)$  is met.

#### 53.1.2.8.3 Method of test

#### Initial Conditions

##### System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present, BS\_CV\_MAX = 1.

##### Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP context2 activated.

## Related PICS/PIXIT Statement(s)

The way to initiate an downlink data transfer in EGPRS RLC acknowledged mode.

## Test Procedure

The SS transmits N RLC data blocks from BSN=0 in sequence and polls the MS for acknowledgement.

The MS acknowledges all the RLC data blocks in EGPRS DL Ack/Nack.

The SS verifies that BOW and EOW bits are set and the reported bitmap size is zero.

The above procedure is performed with different values of N.

## Maximum Duration of Test

10 minutes.

## Expected Sequence

N=10 assumed for the test case.

| Step | Direction | Message                        | Comments                                                                                                                                |

## 53.1.2.9 Acknowledged Mode/ Downlink TBF/ Interpretation of BSN2

## 53.1.2.9.1 Conformance requirements

- Each RLC data block contains a block sequence number (BSN) field that is 11 bits in length. At the time that an in-sequence RLC data block is designated for transmission, the value of BSN is set equal to the value of the send state variable V(S).
- The transfer of RLC data blocks in the RLC acknowledged mode uses retransmissions of RLC data blocks. The transmitting side numbers the RLC data blocks via the block sequence number (BSN). The BSN is used for retransmission and for reassembly. The receiving side sends PACKET Ack/Nack messages in order to request retransmission of RLC data blocks.
- In case two RLC data blocks are sent within a RLC/MAC block, BSN2 is relative to BSN1, provided the difference between the second block number and the first block modulo SNS is less than Window Size (WS).
- Second block sequence number = [BSN1 + BSN2] modulo SNS.

## References

3GPP TS 04.60, subclauses 9.1.4.2, 9.3.1 and 10.4.12.

## 53.1.2.9.2 Test purpose

1. To verify that the mobile station correctly interpret the value of BSN 2.

## 53.1.2.9.3 Method of test

## Initial Conditions

## System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present, BS\_CV\_MAX = 1.

## Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP context2 activated.

## Related PICS/PIXIT Statement(s)

The way to initiate a downlink data transfer in EGPRS RLC acknowledged mode.

## Test Procedure

SS transmit an RLC radio block using MCS-8 containing two RLC data blocks with BSN1=bsn1 and BSN2=bsn2. That is block sequence number of second block is [bsn1+bsn2]modulo SNS.

SS polls the MS for acknowledgement.

SS verifies that the Received Bitmap correctly acknowledges Blocks with BSN=BSN1 and BSN=[bsn1+bsn2]modulo SNS.

Test is repeated with different combinations of bsn1 and bsn2.

## Maximum Duration of Test

10 minutes.

## Expected Sequence

## 53.1.2.10 Acknowledged Mode/ Downlink TBF/ Split RLC Data Block

## 53.1.2.10.1 Conformance requirements

1. When an RLC data block is received with BSN within the active window i.e. such that  $[V(Q) \leq BSN < V(Q) + WS]$  modulo SNS, the corresponding element in V(N) is set to the value RECEIVED (the RLC data block has passed FCS).

2. If the RLC data block is split over two radio blocks, the element shall be set to the value RECEIVED if both radio blocks have been received.
3. The element shall not be set to the value RECEIVED if any of the radio blocks has not been received.

## References

3GPP TS 04.60, subclause 9.1.7.

### 53.1.2.10.2 Test purpose

To verify that in case an RLC data block is split over two radio blocks:

1. The corresponding V(N) element shall not be marked as RECEIVED if any of the two radio blocks is not received.
2. The corresponding V(N) element shall be marked as RECEIVED if both of the radio blocks are received.

### 53.1.2.10.3 Method of test

#### Initial Conditions

System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present, BS\_CV\_MAX = 1.

Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP Context2 activated.

#### Related PICS/PIXIT Statement(s)

N/A

#### Test Procedure

The SS establishes a downlink EGPRS TBF.

The SS sends a RLC data block  $n > N$ ,  $n < WS$  using MCS-8. The SS sends the first part of a splitted RLC data block using MCS-6, with  $BSN=N$  ( $N < \text{window size}$ ),  $SPB='10'B$ , and polls for the EGPRS PACKET DOWNLINK ACK/NACK message from the MS. The MS shall respond with an EGPRS PACKET DOWNLINK ACK/NACK message indicating the block  $BSN=N$  is not received.

The SS then sends the second splitted RLC block with the same  $BSN=N$  ( $N < WS$ ),  $SPB='11'$ , and polls for the EGPRS PACKET DOWNLINK ACK/NACK message from the MS. The MS shall respond with an EGPRS PACKET DOWNLINK ACK/NACK message with the  $BSN=N$  acknowledged.

#### Maximum Duration of Test

30 minutes.

## Expected Sequence

### 53.1.2.11 Acknowledged Mode/ Downlink TBF/ First Partial Bitmap and Next Partial Bitmap

#### 53.1.2.11.1 Conformance requirements

- In EGPRS downlink TBFs, an additional poll bit is added to the S/P field in every downlink RLC block so that the network can request the following:
  - First Partial Bitmap (FPB) segment with  $SSN = (V(Q) + 1) \bmod 2048$  where SSN denotes the Starting Sequence Number.
  - Next Partial Bitmap (NPB) segment with  $SSN = (PBSN + 1) \bmod 2048$  where PBSN denotes a Partial Bitmap Sequence Number variable stored at the receiver.
- SSN is determined by the receiver as a function of S/P, V(Q) and PBSN. The FPB and NPB are specific instances of the EGPRS Ack/Nack Description Information Element within the Packet Downlink Ack/Nack message. The MS shall respond to S/P field according to table 4 in subclause 9.1.8.2.1 in 3GPP TS 04.60.
- Based on PBSN, V(Q) and the S/P field set by the network, SSN and PBSN shall be determined according to table 5 in subclause 9.1.8.2.2 in 3GPP TS 04.60.

#### References

3GPP TS 04.60, subclause 9.1.8.2.

#### 53.1.2.11.2 Test purpose

- To verify the correct generation of SSN and RB in the First Partial Bitmap.
- To verify the correct generation of SSN and RB in the Next Partial Bitmap.

## 53.1.2.11.3 Method of test

## Initial Conditions

## System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present, BS\_CV\_MAX = 1.

## Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP Context2 activated.

## Related PICS/PIXIT Statement(s)

N/A

## Test Procedure

The SS establishes a downlink EGPRS TBF setting EGPRS window size to the maximum possible value in accordance with the number of timeslots allocated.

The SS sends a series of RLC data blocks with BSN=0, 2, 4, ..., 188 and with ES/P = '00'B.

The SS sends a RLC data block with BSN=189, ES/P = '01'B and RRBp='00'B.

The MS shall respond with an EGPRS PACKET DOWNLINK ACK/NACK message.. The SS verifies that the EGPRS Ack/Nack description IE contains the correct SSN and RB in the message. The BOW bit shall be set to '1'B and since it is the FPB, EOW bit shall not be set. Verify that the SSN is 2. Note down the BSN of the last block acknowledged (PBSN).

The SS then sends another RLC data block with BSN=190, ES/P = '10'B. Verifies that the MS shall respond with an EGPRS PACKET DOWNLINK ACK/NACK message, and that the EGPRS Ack/Nack description IE contains SSN = PBSN+1.

## Maximum Duration of Test

30 minutes.

## 53.1.2.12 Acknowledged Mode/ Downlink TBF/ Decoding of Coding Schemes

### 53.1.2.12.1 Conformance requirements

1. In EGPRS TBF mode, the transfer of RLC Data Blocks in the acknowledged RLC/MAC mode can be controlled by a selective type I ARQ mechanism, or by type II hybrid ARQ (Incremental Redundancy: IR) mechanism, coupled with the numbering of the RLC Data Blocks within one Temporary Block Flow.
2. According to the link quality, an initial Modulation and Coding Scheme (MCS) is selected for an RLC block (see note). For the retransmissions, the same or another MCS from the same family of MCSs can be selected.
3. The selection of MCS is controlled by the network.
4. In EGPRS header, the Coding and Puncturing Scheme indicator field is used to indicate the kind of channel coding and puncturing used for data blocks.(see 3GPP TS 05.03)

### References

3GPP TS 04.60, subclauses 9.3.2.1 and 10.4.8.a.

### 53.1.2.12.2 Test purpose

To verify that the mobile station correctly decode RLC data blocks sent using different coding schemes (MCS-1 to MCS-9).

### 53.1.2.12.3 Method of test

#### Initial Conditions

System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present, BS\_CV\_MAX = 1.

Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP Context2 activated.

#### Related PICS/PIXIT Statement(s)

N/A

#### Test Procedure

The SS establishes a Downlink EGPRS TBF.

The SS sends a few RLC data blocks in different coding schemes and asks for an acknowledgement from the MS.

The MS shall correctly acknowledge all the received data blocks.

#### Maximum Duration of Test

10 minutes.

## 53.1.2.13 Acknowledged Mode/ Downlink TBF/ IR Operation

## 53.1.2.13.1 Conformance requirements

1. In EGPRS TBF mode, the transfer of RLC Data Blocks in the acknowledged RLC/MAC mode can be controlled by a selective type I ARQ mechanism, or by type II hybrid ARQ (Incremental Redundancy: IR) mechanism, coupled with the numbering of the RLC Data Blocks within one Temporary Block Flow.
2. In the type I ARQ mode, decoding of an RLC Data Block is solely based on the prevailing transmission (i.e. erroneous blocks are not stored). In the type II ARQ case, the receiver stores erroneous blocks and a joint decoding with new transmissions is done. If the memory for IR operation run out in the MS, the MS shall indicate this by setting the LA/IR bit in the EGPRS PACKET DOWNLINK ACK/NACK message.
3. For uplink TBFs, the network may implicitly set the type I mode by ordering the MS to use a specific MCS and setting the re-segment bit or type II mode by ordering the MS to use a specific MCS and not setting the re-segment bit.
4. Type II hybrid ARQ is mandatory in EGPRS MS receivers. Furthermore, it is mandatory for an EGPRS MS receiver to be able to perform joint decoding among blocks with different MCS's if the combination of MCS's is one of the following:
  - MCS-5 and MCS-7;
  - MCS-6 and MCS-9.
5. If the memory for IR operation runs out in the MS, the MS shall indicate this by setting the LA/ IR bit in the EGPRS PACKET DOWNLINK ACK/NACK message.

## References

3GPP TS 04.60, subclause 9.3.2.1.

## 53.1.2.13.2 Test purpose

1. To verify the mobile station supports joint decoding among blocks with MCS combination of MCS-5 and MCS-7 or MCS-6 and MCS-9.
2. To verify that if the memory for IR operation run outs in the MS, the MS shall indicate this by setting the LA/IR bit in the EGPRS PACKET DOWNLINK ACK/NACK message.

## 53.1.2.13.3 Method of test

## Initial Conditions

## System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present, BS\_CV\_MAX = 1.

## Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP context2 activated.

## Related PICS/PIXIT Statement(s)

The MS class for multislots capability

## Test Procedure

The SS establishes an acknowledge mode downlink EGPRS TBF with the MS:

1. Set the initial Modulation and Coding Scheme to MCS -5;
2. Randomly choice a RLC data block and randomly slightly corrupted it after puncturing;
3. The SS transmit those RLC data blocks to MS (the corrupted RLC data was included);
4. The SS poll for acknowledgement;
5. Randomly slightly corrupt the same RLC data block after puncturing and transmit it again with MCS-7;
6. The SS poll for acknowledgement;
7. Repeat step 5, 6 several times, the MS shall acknowledge the RLC data block after some rounds of repeat;
8. Repeat the above procedure with combination of MSC-6 and MSC-9.

The SS establishes an acknowledge mode downlink EGPRS TBF with the MS:

1. Set window size to the maximum value according to the the number of timeslots assigned to TBF;
2. Heavily corrupt all RLC date blocks before transmission;
3. The SS transmit the RLC data blocks and polls for acknowledgement;
4. Retransmit all RLC data blocks randomly heavily corrupted;
5. The SS polling for acknowledgement;
6. Repeat step 4, 5 several times, the SS shall receives the EGPRS PACKET DOWNLINK ACK/NACK from MS with the LA/IR bit in the message be set to '1'B.

## Maximum Duration of Test

30 minutes.

## Expected Sequence

## 53.1.2.14 Acknowledged Mode/ Downlink TBF/ Received Bitmap/ Compressed

## 53.1.2.14.1 Conformance requirements

1. A Full Received Bitmap (FRB) is built from the receive state array  $V(N)$  by extracting the part between  $V(Q)$  and  $V(R)$  similar to the GPRS case.
2. From the FRB, a reported bitmap (RB) shall then be generated. The FRB shall be recalculated before each RB is generated. For downlink TBFs, the network may order the MS to transmit a certain RB size through use of the S/P field. The RB may be compressed or uncompressed.
3. The Compression bit in the reported bitmap shall be set to the value '1' if a compressed bitmap is sent, otherwise it shall be set to the value '0'.
4. If the compressed reported bitmap does not cover more blocks than the uncompressed reported bitmap, the receiver shall send the uncompressed reported bitmap. Otherwise compressed RB should be used.

## References

3GPP TS 04.60, subclause 9.1.8.2.3.

## 53.1.2.14.2 Test purpose

1. To verify the Compression Bit is set to '1' when compressed RB is sent.
2. To verify that if the compressed reported bitmap covers more blocks than the uncompressed reported bitmap, and the FRB length is larger than the RB size, the receiver shall send the compressed reported bitmap.

## 53.1.2.14.3 Method of test

## Initial Conditions

## System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present, BS\_CV\_MAX = 1.

## Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP context2 activated.

## Related PICS/PIXIT Statement(s)

The MS class for multislot capability.

## Test Procedure

The SS establishes an acknowledged mode downlink EGPRS TBF with the MS:

1. Set the window size to the maximum value according to the number of timeslots assigned to TBF.
2. Make the compressed RB bitmap cover more blocks than uncompressed bitmap, and the FRB length is larger than the possible RB size, set the BSN sequence for transmit like 1, 2, 3, ... 100, WS-1.
3. The SS sends those RLC data blocks with the expected BSNs and polls the MS in the last sent RLC data block.
4. The SS verifies that the compression bit in EGPRS PACKET DOWNLINK ACK/NACK should be '1' and the RB in EGPRS PACKET DOWNLINK ACK/NACK should be a compressed bitmap.
5. The SS sends all the missed RLC data blocks to MS.

## Maximum Duration of Test

30 minutes.

## Expected Sequence

| Step | Direction | Message                        | Comments                                                                                                                |

## 53.1.2.15 Acknowledged Mode/ Downlink TBF/ Received Bitmap/ Uncompressed

## 53.1.2.15.1 Conformance requirements

1. A Full Received Bitmap (FRB) is built from the receive state array V(N) by extracting the part between V(Q) and V(R) similar to the GPRS case.
2. From the FRB, a reported bitmap (RB) shall then be generated. The FRB shall be recalculated before each RB is generated. For downlink TBFs, the network may order the MS to transmit a certain RB size through use of the S/P field. The RB may be compressed or uncompressed.
3. If the compressed reported bitmap does not cover more blocks than the uncompressed reported bitmap, the receiver shall send the uncompressed reported bitmap.

4. The Compression bit in the reported bitmap shall be set to the value '1' if a compressed bitmap is sent, otherwise it shall be set to the value '0'.
5. As an exception, if the FRB length or the range of indices from SSN to the end of FRB is less than or equal to RB size, the receiver may send the uncompressed reported bitmap without attempting compression.

#### References

3GPP TS 04.60, subclause 9.1.8.2.3.

#### 53.1.2.15.2 Test purpose

1. To verify the Compression Bit is set to '0' when uncompressed RB is sent.
2. To verify that if the compressed reported bitmap does not covers more blocks than the uncompressed reported bitmap, the receiver shall send the uncompressed reported bitmap.

#### 53.1.2.15.3 Method of test

#### Initial Conditions

##### System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present, BS\_CV\_MAX = 1.

##### Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP context2 activated.

#### Related PICS/PIXIT Statement(s)

The MS class for multislot capability.

#### Test Procedure

The SS establishes an acknowledge mode downlink EGPRS TBF with the MS:

1. Set the window size to the maximum value according to the number of timeslots assigned to TBF.
2. Make the compressed RB bitmap cover less blocks than uncompressed bitmap, and the FRB length is larger than the possible RB size, set the BSN sequence for transmit like 1,3,5,7.....(max value of windows size -1), all with odd value.
3. The SS sends those RLC data blocks with the expected BSNs and polls the MS in the last sent RLC data block.
4. The SS verifies that the compression bit in EGPRS PACKET DOWNLINK ACK/NACK should be '0' and the RB in EGPRS PACKET DOWNLINK ACK/NACK should be an uncompressed bitmap.

#### Maximum Duration of Test

30 minutes.

## Expected Sequence

| 3    | MS -> SS  | EGPRS PACKET DOWNLINK ACK/NACK | The Compression Bit of EGPRS PACKET DOWNLINK ACK/NACK is '0'B<br>The RB is an uncompressed RB                                             |

## 53.1.2.16 Acknowledged Mode/ Downlink TBF/ Received Block Bitmap/ Compressed Bitmap Starting Colour Code

## 53.1.2.16.1 Conformance requirements

1. In RB compression, no special code words are used either at the beginning of the bitmap or the end of a bitmap. A one bit indicator (i.e., Compressed Bitmap Starting Colour Code) is used to indicate whether the compressed bitmap starts with a run length of zeros or a run length of ones.

## References

3GPP TS 04.60, subclause 9.1.10.

## 53.1.2.16.2 Test purpose

1. To verify the correct coding of Compressed Bitmap Starting Colour Code bit field in Packet Downlink ACK/NACK.

## 53.1.2.16.3 Method of test

## Initial Conditions

System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present, BS\_CV\_MAX = 1.

Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP context2 activated.

## Related PICS/PIXIT Statement(s)

N/A

## Test Procedure

SS initiates the establishment of a downlink EGPRS TBF, setting window size value to WS in the ACKET DOWNLINK ASSIGNMENT message. WS should be greater than the available RP space. SS sends a sequence of RLC data blocks with BSN=0, 1, 2, 4, 5, WS-1 and polls for acknowledgement. MS shall send a Packet Downlink Ack/Nack message with COMPRESSED\_BITMAP\_STARTING\_COLOR\_CODE = 1. SS sends one RLC data block with BSN=3 and polls for acknowledgement. MS shall send a Packet Downlink Ack/Nack message with COMPRESSED\_BITMAP\_STARTING\_COLOR\_CODE=0.

## Maximum Duration of Test

30 minutes.

## Expected Sequence

### 53.1.2.17 Acknowledged Mode/ Downlink TBF/ Received Block Bitmap/ Terminating Code and Make-up Code

#### 53.1.2.17.1 Conformance requirements

1. The T.4 procedure for encoding run lengths is as follows. Runs of ones and zeros alternate, and the run lengths are represented by the code words listed in the tables below. The code words for run lengths of zeros and ones are as described in T.4 except for one minor modification: the terminating code words used for indicating run lengths of 1 zero and 3 zeros are interchanged.
2. Run lengths greater than 63 bits are encoded first by the make-up code word which is equal to or shorter than that required. This is then followed by the terminating code word representing the difference between the required run length and the run length represented by the make-up code.

#### References

3GPP TS 04.60, subclause 9.1.10.

#### 53.1.2.17.2 Test purpose

1. To verify that run lengths in the range 0-63 bits are encoded with their appropriate terminating code word.
2. To verify the correct use of make-up code word for run lengths in the range 64 and above.

#### 53.1.2.17.3 Method of test

#### Initial Conditions

System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present, BS\_CV\_MAX = 1.

Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP context2 activated.

#### Related PICS/PIXIT Statement(s)

The MS class for multislot capability.

## Test Procedure

The SS initiates the establishment of a downlink EGPRS TBF, setting window size to the largest value WS corresponding the number of timeslots assigned to TBF.

The SS sends EGPRS RLC data blocks one by one with BSN from WS-1 to 1 and polls for acknowledgement in each block. The MS shall send a Packet Downlink Ack/Nack message in responding to each block received, the terminating code word or make-up code word for run length of ones or zeros shall be correct.

## Maximum Duration of Test

30 minutes.

## Expected Sequence

## 60 Inter-system hard handover from GSM to UTRAN

Clause 60 contains test procedures to be used for executing Inter-system Handover from GSM to UTRAN tests. Table 60-1 contains a summary of the different combinations of parameters being tested, together with a reference to the appropriate generic test procedure. If a test uses a parameter which the MS under test does not support, the test shall be skipped. Test cases in this clause are applicable only to the MS supporting both UTRAN and GSM. The test USIM shall support service 27 to carry out these test cases.

Table 60-1

| From                     | To                                                                                               | State of call | Ref. subclause | Exec counter | Remark                    |

## 60.1 Inter system handover to UTRAN/From GSM/Speech/Success

### 60.1.1 Definition

### 60.1.2 Conformance requirement

The MS shall be able to receive a INTERSYSTEM TO UTRAN HANDOVER COMMAND message from GSM and perform an inter-system handover, even if no prior MS measurements have been performed on the target UTRAN cell and/or frequency.

If the MS succeeds to establish the connection to UTRAN, it shall transmit a HANDOVER TO UTRAN COMPLETE message on the uplink DCCH.

### Reference(s)

3GPP TS 25.331 subclause 8.3.6.

3GPP TS 04.18 subclause 3.4.4a.

### 60.1.3 Test purpose

To test that MS supporting both GSM and UTRAN handovers to the indicated channel in the UTRAN target cell when it is in the speech call active state in the GSM serving cell and receives a INTERSYSTEM TO UTRAN HANDOVER COMMAND.

### 60.1.4 Method of test

#### Initial conditions

##### System Simulator:

2 cells - Cell 1 is GSM, Cell 2 is UTRAN. The present document subclause 26.6.5.1 shall be referenced for the default parameters of cell 1. 3GPP TS 34.108, subclause 6.1 shall be referenced for default parameters of Cell 2.

##### MS:

CC State U10 in cell 1.

#### Related ICS/IXIT statement(s)

- MS supports both GSM and UTRAN Radio Access Technologies.
- MS supports UTRAN AMR.
- MS supports GSM FR.
- MS supports GSM AMR.
- MS supports GSM EFR.
- MS supports GSM HR.
- MS supports GSM-P, GSM-E, GSM-DCS, GSM-450, GSM-480.

#### Foreseen final state of the MS

The MS is in CC state U10 on cell 2.

## Test Procedure

The SS starts the GSM cell and UTRAN cell with cell selection conditions in favour of GSM cell, the MS selects the GSM cell for camping on. In UTRAN cell SIB16 is broadcast and contains the pre-configuration for conversational/speech/UL:12.2 DL:12.2 kbps/CS RAB + UL:3.4 DL3.4 kbps SRBS. After MS received and stored the SIB16, the SS brings the MS into the call active state (CC state U10) with FR speech call (for execution counter M = 1). The SS configures the dedicated channel corresponding to the pre-configuration in UTRAN cell, then sends INTERSYSTEM TO UTRAN HANDOVER COMMAND indicating the dedicated channel of the target cell to the MS through the GSM serving cell. After the MS receives the command it shall configure itself accordingly and switch to the dedicated channel of UTRAN cell. The SS checks whether the handover is performed by checking that the MS transmits HANDOVER TO UTRAN COMPLETE to the SS through DCCH of the UTRAN cell.

Depending on the PIXIT parameters, the above procedure is executed maximum four times, each time for different initial conditions:

- if the MS supports GSM FR, the procedure is executed for execution counter M = 1;
- if the MS supports GSM EFR, the procedure is executed for execution counter M = 2;
- if the MS supports GSM AMR, the procedure is executed for execution counter M = 3;
- if the MS supports GSM HR, the procedure is executed for execution counter M = 4.

## Expected sequence

This sequence is performed for a maximum execution counter M = 1, 2, 3, 4, depending on the PIXIT parameters.

|      | MS        | SS |                                       |                                                                                                                                                                                                                                        |
| 1    |           | SS |                                       | The SS configures GSM and UTRAN cells, MS camps on GSM cell and received SIB16 from UTRAN cell.                                                                                                                                        |
| 2    |           | MS |                                       | The SS bring the MS into GSM U10 state in cell 1 and for M = 1: the MS is in GSM FR speech call; for M = 2: the MS is in GSM EFR speech call; for M = 3: the MS is in GSM AMR speech call; for M = 4: the MS is in GSM HR speech call. |
| 3    |           | SS |                                       | The SS configures the dedicated channel with the configuration: conversational/speech/UL:12.2 DL:12.2 kbps/CS RAB + UL:3.4 DL3.4 kbps SRBs in UTRAN cell.                                                                              |
| 4    |           | ←  | INTERSYSTEM TO UTRAN HANDOVER COMMAND | Send on cell 1 (GSM cell)                                                                                                                                                                                                              |
| 5    |           | MS |                                       | The MS accepts the handover command and configures its lower layers using the parameters contained in the INTERSYSTEM TO UTRAN HANDOVER COMMAND                                                                                        |
| 6    |           | SS |                                       | The SS waits for uplink physical channel in synchronization                                                                                                                                                                            |
| 7    |           | →  | HANDOVER TO UTRAN COMPLETE            | The SS receives this message on DCCH of cell 2 (UTRAN cell). It implies that the down link physical channel has synchronised with UTRAN.                                                                                               |
| 8    |           |    |                                       | Check data transfer on UMTS Cell                                                                                                                                                                                                       |

### 60.1.5 Test requirement

After step 7 the ongoing call shall be continued on UTRAN cell.

## 60.2 Inter system handover to UTRAN/From GSM/Data/Same data rate/Success

### 60.2.1 Definition

### 60.2.2 Conformance requirement

The MS shall be able to receive a INTER SYSTEM TO UTRAN HANDOVER COMMAND message from GSM and perform an inter-system handover, even if no prior MS measurements have been performed on the target UTRAN cell and/or frequency.

If the MS succeeds to establish the connection to UTRAN, it shall transmit a HANDOVER TO UTRAN COMPLETE message on the uplink DCCH.

## Reference(s)

3GPP TS 25.331 subclause 8.3.6.

3GPP TS 04.18 subclause 3.4.4a.

## 60.2.3 Test purpose

To test that the MS handovers to the indicated UTRAN target cell and the data rate of the target channel is the same as the old channel when it is in the data call active state in the GSM serving cell and receives a INTER SYSTEM TO UTRAN HANDOVER COMMAND.

## 60.2.4 Method of test

## Initial conditions

## System Simulator:

2 cells - Cell 1 is GSM, Cell 2 is UTRAN. The present document subclause 26.6.5.1 or subclause 26.13.1.3 (for HSCSD) shall be referenced for the default parameters of cell 1 and 3GPP TS 34.108, subclause 6.1 shall be referenced for default parameters of Cell 2.

## MS:

CC State U10 in cell 1.

## Related ICS/IXIT statement(s)

- MS supports both GSM and UTRAN Radio Access Technologies.
- MS supports UTRAN Streaming/unknown/UL:14.4 DL:14,4 kbps/CS RAB + UL:3.4 DL:3,4 kbps SRBs.
- MS supports UTRAN Streaming/unknown/UL:28.8 DL:28,8 kbps/CS RAB + UL:3.4 DL:3,4 kbps SRBs.
- MS supports UTRAN Streaming/unknown/UL:57.6 DL:57,6 kbps/CS RAB + UL:3.4 DL:3,4 kbps SRBs.
- MS supports GSM 14,4 kbps data (HSCSD or full rate traffic channel for 14,4 kbit/s user data (TCH/F14.4)).
- MS supports GSM 28,8 kbps data (HSCSD or full rate traffic channel for 28,8 kbit/s user data (E-TCH/F28.8)).
- MS supports GSM 57,6 kbps data.
- MS supports GSM-P, GSM-E, GSM-DCS, GSM-450, GSM-480.

## Foreseen final state of the MS

The MS is in CC state U10 on cell 2.

## Test Procedure

The SS starts the GSM cell and the UTRAN cell, the cell selection conditions of these two cells are in favour of GSM cell. The MS selects the GSM cell for camping on. After the MS receives and stores pre-configuration information from SIB16 broadcast in the UTRAN cell, the SS brings the MS into the call active state (CC state U10) with 14.4 kbps CS data call (for execution counter M = 1). The SS configures a dedicated channel corresponding to the pre-configuration (streaming/unknown/UL:14.4 DL:14.4 kbps/CS RAB + UL:3.4 DL:3.4 kbps SRBS for M = 1) in UTRAN cell, then sends INTER SYSTEM TO UTRAN HANDOVER COMMAND indicating the dedicated channel of the target cell to the MS through the GSM serving cell. After the MS receives the command it shall configure itself accordingly and switch to the dedicated channel of the UTRAN cell. The SS checks whether the handover is performed by checking that the MS transmits HANDOVER TO UTRAN COMPLETE to the SS through DCCH of the UTRAN cell.

Depending on the PIXIT parameters, the above procedure is executed maximum three times, each time for different initial conditions:

- if the MS supports GSM 14.4 kbps CS data and UTRAN streaming/unknown/UL:14.4 DL:14.4 kbps/CS RAB + UL:3.4 DL3.4 kbps SRBs, the procedure is executed for execution counter M = 1;
- if the MS supports GSM 28.8 kbps CS data and UTRAN streaming/unknown/UL:28.8 DL:28.8 kbps/CS RAB + UL:3.4 DL3.4 kbps SRBs, the procedure is executed for execution counter M = 2;
- if the MS supports GSM 57.6 kbps CS data and UTRAN streaming/unknown/UL:57.6 DL:57.6 kbps/CS RAB + UL:3.4 DL3.4 kbps SRBs, the procedure is executed for execution counter M = 3.

#### Expected sequence

This sequence is performed for a maximum execution counter M = 1, 2, 3, depending on the PIXIT parameters.

## 60.2.5 Test requirement

After step 7 the ongoing call shall be continued on UTRAN cell.

## 60.3 Inter system handover to UTRAN/From GSM/Data/Data rate upgrading/Success

### 60.3.1 Definition

### 60.3.2 Conformance requirement

The MS shall be able to receive a INTER SYSTEM TO UTRAN HANDOVER COMMAND message from GSM and perform an inter-system handover, even if no prior MS measurements have been performed on the target UTRAN cell and/or frequency.

If the MS succeeds to establish the connection to UTRAN, it shall transmit a HANDOVER TO UTRAN COMPLETE message on the uplink DCCH.

### Reference(s)

3GPP TS 25.331 subclause 8.3.6.

3GPP TS 04.18 subclause 3.4.4a.

### 60.3.3 Test purpose

To test that the MS being in the data call active state handovers from the GSM serving cell to the indicated channel of a higher data rate in the UTRAN target cell after it receives a INTER SYSTEM TO UTRAN HANDOVER COMMAND.

### 60.3.4 Method of test

#### Initial conditions

##### System Simulator:

2 cells - Cell 1 is GSM, Cell 2 is UTRAN. The present document subclause 26.6.5.1 or subclause 26.13.1.3 (for HSCSD) shall be referenced for the default parameters of cell 1 and 3GPP TS 34.108 subclause 6.1 shall be referred for default parameters of Cell 2.

##### MS:

CC State U10 in cell 1.

#### Related ICS/IXIT statement(s)

- MS supports both GSM and UTRAN Radio Access Technologies.
- MS supports UTRAN Streaming/unknown/UL:28.8 DL:28.8 kbps/CS RAB + UL:3.4 DL:3.4 kbps SRBs.
- MS supports UTRAN Streaming/unknown/UL:57.6 DL:57.6 kbps/CS RAB + UL:3.4 DL:3.4 kbps SRBs.
- MS supports GSM 14.4 kbps data (HSCSD or full rate traffic channel for 14.4 kbit/s user data (TCH/F14.4)).
- MS supports GSM 28.8 kbps data (HSCSD or full rate traffic channel for 28.8 kbit/s user data (E-TCH/F28.8)).
- MS supports GSM-P, GSM-E, GSM-DCS, GSM-450, GSM-480.

#### Foreseen final state of the MS

The MS is in CC state U10 on cell 2.

## Test Procedure

The SS starts the GSM cell and the UTRAN cell with cell selection conditions in favour of GSM cell. In UTRAN cell SIB16 is broadcast. The MS selects the GSM cell and received the pre-configuration information from SIB16. Then the SS brings the MS into the call active state (CC state U10) with 14.4 kbps CS data call (for execution counter M = 1). The SS configures a dedicated channel corresponding to the pre-configuration (streaming/unknown/UL:28.8 DL:28.8 kbps/CS RAB + UL:3.4 DL3.4 kbps SRBS for M = 1), then sends INTER SYSTEM TO UTRAN HANDOVER COMMAND indicating the dedicated channel of the target cell to the MS through the GSM serving cell. After the MS receives the command it shall configure itself accordingly and switch to the new channel of the UTRAN cell. The SS checks whether the handover is performed by checking that the MS transmits HANDOVER TO UTRAN COMPLETE to the SS through DCCH of the UTRAN cell.

Depending on the PIXIT parameters, the above procedure is executed maximum three times, each time for different conditions:

- if the MS supports GSM 14.4 kbps CS data and UTRAN streaming/unknown/UL:28.8 DL:28.8 kbps/CS RAB + UL:3.4 DL3.4 kbps SRBs, the procedure is executed for execution counter M = 1;
- if the MS supports GSM 14.4 kbps CS data and UTRAN streaming/unknown/UL:57.6 DL:57.6 kbps/CS RAB + UL:3.4 DL3.4 kbps SRBs, the procedure is executed for execution counter M = 2;
- if the MS supports GSM 28.8 kbps CS data and UTRAN streaming/unknown/UL:57.6 DL:57.6 kbps/CS RAB + UL:3.4 DL3.4 kbps SRBs, the procedure is executed for execution counter M = 3.

## Expected sequence

This sequence is performed for a maximum execution counter M = 1, 2, 3, depending on the PIXIT parameters.

60.3.5 Test requirement

After step 7 the ongoing call shall be continued on UTRAN cell.

## 60.4 Inter system handover to UTRAN/From GSM/Speech/Establishment/Success

60.4.1 Definition

60.4.2 Conformance requirement

The MS shall be able to receive a INTER SYSTEM TO UTRAN HANDOVER COMMAND message from GSM and perform an inter-system handover, even if no prior MS measurements have been performed on the target UTRAN cell and/or frequency.

If the MS succeeds to establish the connection to UTRAN, it shall transmit a HANDOVER TO UTRAN COMPLETE message on the uplink DCCH.

Reference(s)

3GPP TS 25.331 subclause 8.3.6.

3GPP TS 04.18 subclause 3.4.4a.

60.4.3 Test purpose

To test that the MS supporting both GSM and UTRAN handovers from the GSM serving cell to the indicated channel in UTRAN target cell when the MS is in the call establishment phase and receives a INTER SYSTEM TO UTRAN HANDOVER COMMAND.

60.4.4 Method of test

Initial conditions

System Simulator:

2 cells - Cell 1 is GSM, Cell 2 is UTRAN. The present document subclause 26.6.5.1 shall be referenced for the default parameters of cell 1 and 3GPP TS 34.108, subclause 6.2 shall be referred to default parameters of Cell 2.

MS:

CC State U1 in cell 1.

## Related ICS/IXIT statement(s)

- MS supports both GSM and UTRAN Radio Access Technologies.
- MS supports UTRAN AMR.
- MS supports GSM FR.
- MS supports GSM-P, GSM-E, GSM-DCS, GSM-450, GSM-480.

## Foreseen final state of the MS

The MS is in CC state U1 on cell 2.

## Test Procedure

The SS starts GSM cell and UTRAN cell with the cell selection conditions in favour of GSM cell. The MS selects the GSM cell. After the MS camps on the GSM cell and received SIB16 broadcast in the UTRAN cell, the MS is triggered to make an MO speech call. After the SS received SETUP message it configures a dedicated channel corresponding to the predefined configuration (conversational/speech/UL:12.2 DL:12.2 kbps/CS RAB + UL:3.4 DL3.4 kbps SRBS) described by SIB16, then the SS sends INTER SYSTEM TO UTRAN HANDOVER COMMAND indicating the dedicated channel to the MS through the GSM serving cell. After the MS receives the command and it shall configure itself accordingly and switch to the new channel of UTRAN cell. The SS checks whether the handover is performed by checking that the MS transmits HANDOVER TO UTRAN COMPLETE to the SS through DCCH of the UTRAN cell.

## Specific message contents

Same as the default message contents in subclause 60.1 for M = 1.

## 60.4.5 Test requirement

After step 11 the ongoing call shall be continued on UTRAN cell.

## 60.5 Inter system handover to UTRAN/From GSM/Speech/Blind HO/Success

### 60.5.1 Definition

### 60.5.2 Conformance requirement

The MS shall be able to receive a INTER SYSTEM TO UTRAN HANDOVER COMMAND message from GSM and perform an inter-system handover, even if no prior MS measurements have been performed on the target UTRAN cell and/or frequency.

If the MS succeeds to establish the connection to UTRAN, it shall transmit a HANDOVER TO UTRAN COMPLETE message on the uplink DCCH.

### Reference(s)

3GPP TS 25.331 subclause 8.3.6.

3GPP TS 04.18 subclause 3.4.4a.

### 60.5.3 Test purpose

To test that the MS handovers from the GSM serving cell to the indicated channel of UTRAN target cell when it is in the speech call active state without any knowledge of the target system (blind handover) and receives a INTER SYSTEM TO UTRAN HANDOVER COMMAND.

### 60.5.4 Method of test

#### Initial conditions

##### System Simulator:

2 cells - Cell 1 is GSM, Cell 2 is UTRAN. The present document subclause 26.6.5.1 shall be referenced for the default parameters of cell 1 and 3GPP TS 34.108 subclause 6.1 shall be referred to for default parameters of Cell 2.

##### MS:

CC State U10 in cell 1.

#### Related ICS/IXIT statement(s)

- MS supports both GSM and UTRAN Radio Access Technologies.
- MS supports UTRAN AMR.
- MS supports GSM FR.
- MS supports GSM-P.
- GSM-E, GSM-DCS, GSM-450, GSM-480.

#### Foreseen final state of the MS

The MS is in CC state U10 on cell 2.

## Test Procedure

The SS starts the GSM cell and the UTRAN cell with cell selection conditions in favour of GSM cell, SIB16 is not broadcast in the UTRAN cell and the MS has no any predefined configuration stored. The MS selects the GSM cell. Then the SS brings the MS into the call active state (CC state U10) with FR speech. The SS configures a dedicated channel (conversational/speech/UL:12.2 DL:12.2 kbps/CS RAB + UL:3.4 DL3.4 kbps SRBS), then sends INTER SYSTEM TO UTRAN HANDOVER COMMAND indicating the dedicated channel of the target cell to the MS through the GSM serving cell. After the MS receives the command it shall configure itself accordingly and switch to the dedicated channel of UTRAN cell. The SS checks whether the handover is performed by checking that the MS transmits HANDOVER TO UTRAN COMPLETE to the SS through DCCH of the UTRAN cell.

## Expected sequence

### 60.5.5 Test requirement

At step 6 the HANDOVER TO UTRAN COMPLETE shall be received on UTRAN cell.

## 60.6 Inter system handover to UTRAN/From GSM/Speech/Failure

### 60.6.1 Definition

### 60.6.2 Conformance requirement

The MS shall be able to receive a INTER SYSTEM TO UTRAN HANDOVER COMMAND message from GSM and perform an inter-system handover, even if no prior MS measurements have been performed on the target UTRAN cell and/or frequency.

If the MS can not establish the connection to UTRAN, it shall reactivate the old channel and transmit a HANOVER FAILURE message on the old channel.

#### Reference(s)

3GPP TS 25.331 subclause 8.3.6.

3GPP TS 04.18 subclause 3.4.4a.

#### 60.6.3 Test purpose

To test that the MS reactivates the old channel and transmits HANOVER FAILURE message to the network on the old channel in the GSM cell when it received INTER SYSTEM TO UTRAN HANOVER COMMAND and the handover to UTRAN failed.

#### 60.6.4 Method of test

##### Initial conditions

System Simulator:

2 cells - Cell 1 is GSM, Cell 2 is UTRAN. The present document subclause 26.6.5.1 shall be referenced for the default parameters of cell 1 and 3GPP TS 34.108, subclause 6.1 will be referred to for the default parameters of Cell 2.

MS:

CC State U10 in cell 1.

##### Related ICS/IXIT statement(s)

- MS supports both GSM and UTRAN Radio Access Technologies.
- MS supports UTRAN AMR.
- MS supports GSM FR.
- MS supports GSM-P, GSM-E, GSM-DCS, GSM-450, GSM-480.

##### Foreseen final state of the MS

The MS is in CC state U10 on cell 1.

## Test Procedure

The SS starts the GSM cell and the UTRAN cell with cell selection conditions in favour of GSM cell. SIB16 is broadcast in UTRAN cell. The MS selects the GSM cell, and received the SIB16. Then the SS brings the MS into the call active state (CC state U10) with FR speech call. The SS does not configure the dedicated channel corresponding to the predefined configuration described in SIB16 (conversational/speech/UL:12.2 DL:12.2 kbps/CS RAB + UL:3.4 DL3.4 kbps SRBS), then sends INTER SYSTEM TO UTRAN HANDOVER COMMAND indicating the dedicated channel of the target cell to the MS through the GSM serving cell. The MS will not be able to establish the connection to UTRAN. The SS checks that the handover is failed by checking that the MS returns to the old channel and transmits HANDOVER FAILURE to the SS through the old channel.

## Specific message contents

Same as the specific message contents in subclause 60.1 for M = 1.

### 60.6.5 Test requirement

At step 7 the HANDOVER FAILURE shall be received on GSM cell.

## 60.7 Inter system handover to UTRAN/From GSM/Failure/Cause: Frequency not implemented

### 60.7.1 Definition

### 60.7.2 Conformance requirement

The MS shall be able to receive a HANDOVER TO UTRAN COMMAND message from GSM and perform an inter-system handover, even if no prior MS measurements have been performed on the target UTRAN cell and/or frequency.

The HANDOVER TO UTRAN COMMAND message instructs the mobile station to use frequency that it is not capable of, and then the MS shall return a HANDOVER FAILURE message with cause "frequency not implemented" (Reference 3GPP TS 04.18 subclause 3.4.4a.3).

## Reference(s)

3GPP TS 25.331 subclause 8.3.6.

3GPP TS 04.18 subclause 3.4.4a.

### 60.7.3 Test purpose

To test that the MS reactivates the old channel and transmits HANOVER FAILURE message to the network on the old channel in the GSM cell when it received HANOVER TO UTRAN COMMAND and the handover to UTRAN failed because of frequency not implemented.

### 60.7.4 Method of test

#### Initial conditions

##### System Simulator:

2 cells - Cell 1 is GSM, Cell 2 is UTRAN. TS 51.010-1 subclause 26.6.5.1 shall be referenced for the default parameters of cell 1.

##### MS:

CC State U10 in cell 1.

#### Related PICS/PIXIT statement(s)

- MS supports both GSM and UTRAN Radio Access Technologies.
- MS supports UTRAN AMR.
- MS supports GSM FR.
- MS supports GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900.

#### Foreseen final state of the MS

The MS is in CC state U10 on cell 1.

#### Test Procedure:

The SS starts the GSM cell and UTRAN cell with the cell selection condition in favour of GSM cell. SIB16 is broadcast in UTRAN cell. The MS selects the GSM cell, and receives the SIB16.

SS brings the MS into the call active state (CC state U10) with FR speech call. The SS configures the dedicated channel corresponding to the predefined configuration described in SIB16 (conversational/speech/uplink: 12.2 DL: 12.2 kbps/CS RAB + uplink: 3.4 DL3.4 kbps SRBS), then sends HANOVER TO UTRAN COMMAND indicating the dedicated channel of the target cell to the MS through the GSM serving cell. The HANOVER TO UTRAN COMMAND message instructs the mobile station to use frequency that it is not capable of, and then the MS shall return a HANOVER FAILURE message with cause "frequency not implemented" (Reference 3GPP TS 04.18 subclause 3.4.4a.3).

Later, SS checks that the handover is failed by checking that the MS returns to the old channel and transmits HANOVER FAILURE to the SS through the old channel.

Expected sequence

| 7    |           | →  | HANDOVER FAILURE          | The SS receives this message on DCCH of cell 1 (old channel in GSM cell) with RR Cause "frequency not implemented".                                                    |

Specific message contents

Same as the specific message contents in subclause 60.1 for M = 1

60.7.5 Test requirement

At step 7 the HANDOVER FAILURE shall be received on GSM cell.

## 60.8 Inter system handover to UTRAN/From GSM/Failure/Cause: UTRAN preconfiguration unknown

60.8.1 Definition

60.8.2 Conformance requirement

The MS shall be able to receive a HANDOVER TO UTRAN COMMAND message from GSM and perform an inter-system handover, even if no prior MS measurements have been performed on the target UTRAN cell and/or frequency. The HANDOVER TO UTRAN COMMAND message instructs the mobile station to use preconfiguration that the mobile station has not read or instruct to use default reconfiguration not implemented by MS, then the MS shall return a HANDOVER FAILURE message with cause "UTRAN preconfiguration unknown" (3GPP TS 04.18 subclause 3.4.4a.3).

Reference(s)

3GPP TS 25.331 subclause 8.3.6.

3GPP TS 04.18 subclause 3.4.4a.

60.8.3 Test purpose

To test that the MS reactivates the old channel and transmits HANDOVER FAILURE message to the network on the old channel in the GSM cell when it receives HANDOVER TO UTRAN COMMAND and the handover to UTRAN failed because of UTRAN preconfiguration unknow.

## 60.8.4 Method of test

## Initial conditions

System Simulator:

2 cells - Cell 1 is GSM, Cell 2 is UTRAN. TS 51.010-1 section 26.6.5.1 shall be referenced for the default parameters of cell 1.

MS:

CC State U10 in cell.

## Related PICS/PIXIT statement(s)

- MS supports both GSM and UTRAN Radio Access Technologies.
- MS supports UTRAN AMR.
- MS supports GSM FR.
- MS supports GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900.

## Foreseen final state of the MS

The MS is in CC state U10 on cell 1.

## Test Procedure:

The SS starts the GSM cell and UTRAN cell with the cell selection condition in favour of GSM cell, SIB16 is not broadcast in UTRAN cell and MS has no predefined configuration stored.

The MS selects the GSM cell. SS brings the MS into the call active state (CC state U10) with FR speech call. The SS configures a dedicated channel (conversational/speech/uplink: 12.2 DL: 12.2 kbps/CS RAB + uplink: 3.4 DL:3.4 kbps SRBS), and then sends HANOVER TO UTRAN COMMAND without indicating the dedicated channel of the target cell to the MS through the GSM serving cell. The HANOVER TO UTRAN COMMAND message instructs the mobile station to use preconfiguration that the mobile station has not read or instructed to use default reconfiguration not implemented by MS, then the MS shall return a HANOVER FAILURE message with cause "UTRAN preconfiguration unknown " (Reference 3GPP TS 04.18 subsubclause 3.4.4a.3). Later, SS checks that the handover is failed by checking that the MS returns to the old channel and transmits HANOVER FAILURE to the SS through the old channel.

#### 60.8.5 Test requirement

At step 7 the HANDOVER FAILURE shall be received on GSM cell.

## 60.9 Inter system handover to UTRAN/From GSM/Failure/Cause: Protocol Error

#### 60.9.1 Definition

#### 60.9.2 Conformance requirement

The MS shall be able to receive a HANDOVER TO UTRAN COMMAND message from GSM and perform an inter-system handover, even if no prior MS measurements have been performed on the target UTRAN cell and/or frequency. The HANDOVER TO UTRAN COMMAND message, which contains a protocol error causing the variable PROTOCOL\_ERROR\_REJECT to be set TRUE according to subclause 9 of 3GPP TS 25.331.

#### Reference(s)

3GPP TS 25.331 subsubclause 8.3.6.

3GPP TS 04.18 subclause 3.4.4a.

#### 60.9.3 Test purpose

To test that the MS reactivates the old channel and transmits RR Status message to the network on the old channel in the GSM cell when it receives HANDOVER TO UTRAN COMMAND and the handover to UTRAN failed because of protocol error.

#### 60.9.4 Method of test

#### Initial conditions

System Simulator:

2 cells - Cell 1 is GSM, Cell 2 is UTRAN. TS 51.010-1 section 26.6.5.1 shall be referenced for the default parameters of cell 1.

MS:

CC State U10 in cell 1.

#### Related PICS/PIXIT statement(s)

- MS supports both GSM and UTRAN Radio Access Technologies.
- MS supports UTRAN AMR.
- MS supports GSM FR.
- MS supports GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900.

Foreseen final state of the MS

The MS is in CC state U10 on cell 1.

Test Procedure:

The SS starts the GSM cell and UTRAN cell with the cell selection condition in favor of GSM cell. SIB16 is broadcast in UTRAN cell. The MS selects the GSM cell, and receives the SIB16. SS brings the MS into the call active state (CC state U10) with FR speech call. The SS configures the dedicated channel corresponding to the predefined configuration described in SIB16 (conversational/speech/uplink: 12.2 DL: 12.2 kbps/CS RAB + uplink: 3.4 DL3.4 kbps SRBS), then sends HANOVER TO UTRAN COMMAND indicating the dedicated channel of the target cell to the MS through the GSM serving cell.

The HANOVER TO UTRAN COMMAND message, which contains a protocol error causing the variable `PROTOCOL_ERROR_REJECT` to be set TRUE according to subclause 9, then the MS shall perform procedure specific error handling as follows:

- resume the connection used before the handover to the source radio access system;
- indicate a failure to the source radio access system, using "protocol error" as cause for the failure;
- transmit an RR STATUS message to the other radio access system, and include the IE "Protocol error information" with contents set to the value of the variable `PROTOCOL_ERROR_INFORMATION`.

Expected sequence

| Step | Direction |    | Message                  | Comments                                                                                                                                                      |
|------|-----------|----|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
|      | MS        | SS |                          |                                                                                                                                                               |
| 1    | SS        |    |                          | The SS starts GSM and UTRAN cells; SIB16 is broadcast in the UTRAN cell. The MS camps on GSM cell and received SIB16.                                         |
| 2    | MS        |    |                          | The SS bring the MS into GSM U10 state in cell 1                                                                                                              |
| 3    | SS        |    |                          | The SS configures dedicated channel with the configuration: conversational/speech/uplink:12.2 DL:12.2 kbps/CS RAB + uplink:3.4 DL3.4 kbps SRBs in UTRAN cell. |
| 4    | ←         |    | HANOVER TO UTRAN COMMAND | Handover message is sent on cell 1 (GSM cell) with missing mandatory IE.                                                                                      |
| 5    | →         |    | RR STATUS                | The SS receives this message on DCCH of cell 1 (old channel in GSM cell) with RR cause "protocol error".                                                      |

Specific message contents

Same as the specific message contents in subsubclause 60.1 for M = 1.

60.9.5 Test requirement

At step 5 the RR STATUS shall be received on GSM cell.

61-69 Void

70 Location Services

This subclause contains test cases for Location Services (LCS).

## 70.1 Default conditions

### 70.1.1 Default conditions during LCS tests

During tests in subclause 70, default conditions from subclause 26 shall apply, if not otherwise stated within the test descriptions, with the following exception.

#### SYSTEM INFORMATION TYPE 3:

as default except:

| Information Element                                   | value/remark                        |
|-------------------------------------------------------|-------------------------------------|
| SI 3 rest octets<br>- Early Classmark Sending Control | 1 (perform early classmark sending) |

During A-GPS tests in subclause 70, the default conditions of the test setup shall, at a minimum, generate satellite signals that are of a sufficient number and strength to ensure that the MS can respond to a positioning request with a valid measurement response. Only the minimum assistance data necessary to ensure a valid MS response shall be provided within a positioning request. Any assistance data provided during these tests shall be consistent with the satellite signals generated during these tests.

## 70.2 Network Induced Location Request

The test cases in this subclause focus on Network Induced Location requests. Although normally associated with Emergency Calls, it is possible for an MS to receive a NI-LR at any time during idle or dedicated mode by a PLMN operator LCS client.

### 70.2.1 LCS Network Induced Emergency Call on an SDCCH / idle, no IMSI

This test case applies to all MSs supporting MS-Assisted E-OTD Location Service capabilities.

#### 70.2.1.1 Conformance requirement

1. With the MS in the "idle, updated" state, the user shall initiate an emergency after the number 112 (for GSM 900 and 1800 MS), or 911 (for PCS 1 900 MS in the USA), or 08 (for PCS 1 900 MS in Mexico) has been entered by the user. The MS shall send a CHANNEL REQUEST message with correct establishment cause ("emergency call").
2. After assignment of a dedicated channel the first layer message sent by the MS on the assigned dedicated channel shall be a CM SERVICE REQUEST message specifying the correct IMEI and a non-available CKSN, with CM Service Type "emergency call establishment". The ES\_IND bit in the Mobile Station Classmark 2 information element shall be set to "Controlled Early Classmark Sending is implemented".
3. After sending the CM SERVICE REQUEST message the MS shall send a CLASSMARK CHANGE message. The "Mobile Station Classmark 3" information element shall correctly specify the positioning methods supported by the MS.
4. After the CM SERVICE ACCEPT message is received from the network, the MS shall send an EMERGENCY SETUP message.
5. On receiving the RRLP MEASURE POSITION REQUEST message the MS will perform position measurements and respond with an RRLP MEASURE POSITION RESPONSE message.
6. After receipt of a CONNECT ACKNOWLEDGE message during correct establishment of the emergency call the MS shall indicate that the TCH is through connected in both directions.

#### 70.2.1.2 Test Purpose

To verify when an emergency call is initiated by an MS which does not have a SIM fitted, the network instigates the LCS positioning procedure by sending RRLP (Measure Position Request) message and the mobile responds with RRLP (Measure Position Response) containing E-OTD measurement values.

#### 70.2.1.3 Method of Test

##### Initial Conditions

###### System Simulator:

**Neighbor Cells:** at least 3 neighbor cells are used with a minimum configuration of a BCCH. This is to allow the MS to perform the required timing measurements.

###### Mobile Station:

The MS is in MM-state "idle, no IMSI", no SIM inserted.

##### Related PICS/PIXIT Statements

- Support MS assisted E-OTD.

##### Test Procedure

An Emergency Call is initiated with the MS, with no SIM inserted in the MS.

Directly after sending EMERGENCY SETUP the MS receives a RR APPLICATION INFORMATION message containing an RRLP Measure Position Request.

The MS then performs positioning measurements and responds with a RR APPLICATION INFORMATION message containing a RRLP Measure Position Response.

The emergency call is then established as normal with late assignment. Having reached the active state, the call is cleared by the SS.

##### Maximum duration of the test

3 minutes.

## Expected Test Sequence

| Step | Direction | Message                    | Comments                                                                                                                                                                                                               |

## 70.2.2 Positioning / RR / Classmark Interrogation tests

## 70.2.2.1 Conformance requirement

If the MS supports MS-assisted or MS based positioning method, the MS will provide the BSC and MSC with the positioning method(s) it supports via controlled early Classmark sending.

The clause is applicable for MS assisted positioning LCS E-OTD location method. The tests shall be executed on the SDCCH radio channel type.

3GPP TS TS 24.008 subclauses 10.5.1.5, 10.5.1.6 and 10.5.1.7.

## 70.2.2.2 Test Purpose

To verify that if the network requests the MS to supply all its Classmark information, this information is sent on the SDCCH to the network.

NOTE: No positioning procedure is performed and no TCH involved.

### 70.2.2.3 Method of Test

#### Initial Conditions

Simulator (SS):

1 cell, default parameters.

Mobile Station:

"idle, updated", channel released mode with TMSI allocated.

#### Related PICS/PIXIT statement

- Support of MS-Assisted E-OTD LCS.

#### Test Procedure

The MS is switched off. The SS then sets the IMSI attach-detach flag in the SYSTEM INFORMATION messages so that the MS shall perform a location update when switched on.

The MS is switched on (or its power is re-applied). The MS then initiates a location update attempt. After the successful completion of the location update procedure (with TMSI reallocation) the SS transmits a CLASSMARK ENQUIRY message.

The MS shall be ready to transmit the CLASSMARK CHANGE message before 300 ms after the end of the CLASSMARK ENQUIRY message. Then the channel is released.

#### Maximum duration of the test

1 minute.

Expected Sequence:

| Step | Direction | Message                       | Comments                                                                                                                                                                                                                                                                                                                                                                                                    |

## 70.2.3 Network Induced Location Request Emergency Call on an SDCCH

For Mobiles supporting speech, emergency call establishment will be initiated by the MS whether location updating has been successful or not and whether a SIM is inserted into the MS or not.

A Network Induced Location Request could occur at any point during emergency call setup (Ref 3GPP TS 03.71 subclause 7.6.4.1). This could occur during an emergency setup before connection to a traffic channel.

The tests of this section are only applicable to an MS supporting MS-Assisted E-OTD positioning.

### 70.2.3.1 Conformance requirements:

The following requirements apply for this test:

1. With the MS in the "idle, updated" state, the user shall initiate an emergency after the number 112 (for GSM 900 and 1800 MS), or 911 (for PCS 1 900 MS in the USA), or 08 (for PCS 1 900 MS in Mexico) has been entered by the user. The MS shall send a CHANNEL REQUEST message with correct establishment cause ("emergency call").
2. After assignment of a dedicated channel, the MS shall send a CM SERVICE REQUEST message specifying the correct CKSN and TMSI with CM Service Type "emergency call establishment". The ES\_IND bit in the Mobile Station Classmark 2 information element shall be set to "Controlled Early Classmark Sending is implemented".
3. After sending the CM SERVICE REQUEST message the MS shall send a CLASSMARK CHANGE message. The "Mobile Station Classmark 3" information element shall correctly specify the positioning methods supported by the MS.
4. After cipher mode setting acceptance by the network, the MS shall send an EMERGENCY SETUP message.
5. On receiving the RRLP Measure Position Request message the MS will perform position measurements and respond with an RRLP Measure Position Response message.
6. After receipt of a CONNECT ACKNOWLEDGE message during correct establishment of the emergency call the MS shall indicate that the TCH is through connected in both directions.

### 70.2.3.3 Test Purpose

To verify when an emergency call is initiated by the MS, the network instigates the LCS positioning procedure by sending RRLP (Measure Position Request) message and the mobile responds with RRLP (Measure Position Response) containing E-OTD measurement values.

### Related PICS/PIXIT Statements

- Support MS Assisted E-OTD.

### 70.2.3.4 Method of Test

#### Initial Conditions:

System Simulator:

**Neighbor Cells:** at least 3 neighbor cells are used with a minimum configuration of a BCCH. This is to allow the MS to perform the required timing measurements.

Mobile Station:

The MS is in MM-state "idle, updated" with valued TMSI and CKSN.

Test Procedure:

An Emergency Call is initiated with the MS. SIM card is included in the MS.

Directly after sending EMERGENCY SETUP the MS receives a RR APPLICATION INFORMATION message containing an RRLP Measure Position Request.

The MS then performs positioning measurements and responds with a RR APPLICATION INFORMATION message containing a RRLP Measure Position Response.

The emergency call is then established as normal with late assignment. Having reached the active state, the call is cleared by the SS.

Maximum duration of the test:

3 minutes.

Expected Sequence

| Step | Direction | Message                    | Comments                                                                                                                                                                   |

## 70.2.4 Emergency Call NI-LR while Voice is Through Connected

A Network Induced Location Request could occur at any point during emergency call setup (Ref 3GPP TS 03.71 subclause 7.6.4.1). In this case the voice call is established before the MS receives the location request.

The tests of this clause are only applicable to an MS supporting speech and MS Assisted E-OTD positioning.

### 70.2.4.1 Conformance requirements:

The following requirements apply for this test:

1. With the MS in the "idle, updated" state, the user shall initiate an emergency call after the number 112 (GSM 900 and 1800 MSs), or 911 (for PCS 1 900 in the USA), or 08 (for PCS 1 900 in Mexico) has been entered by the user. The MS shall end a CHANNEL REQUEST message with correct establishment cause ("emergency call").
2. After assignment of a dedicated channel, the MS shall send a CM SERVICE REQUEST message specifying the correct CKSN and TMSI with CM Service Type "emergency call establishment". The ES\_IND bit in the Mobile Station Classmark 2 information element shall be set to "Controlled Early Classmark Sending is implemented".
3. After sending the CM SERVICE REQUEST message the MS shall send a CLASSMARK CHANGE message. The "Mobile Station Classmark 3" information element shall correctly specify the positioning methods supported by the MS.
4. After cipher mode setting acceptance by the network, the MS shall send an EMERGENCY SETUP message.
5. After receipt of a CONNECT ACKNOWLEDGE message during correct establishment of the emergency call, the MS shall indicate that the TCH is through connected in both directions.

6. On receiving the RRLP Measure Position Request message the MS will perform position measurements and respond with an RRLP Measure Position Response message.

#### Test References

For conformance requirement stated above:

3GPP TS 04.08 / 44.018 subclauses 3.3.1.1 and 9.1.11.

3GPP TS 04.08 / 24.008 subclauses 5.2.1, 4.5.1.5, 5.1.3, 9.2.9, 10.5.1.6, and 10.5.1.7.

3GPP TS 02.30 clause 4.

3GPP TS 04.31 Appendix A subclause 2.2.1.

#### 70.2.4.2 Test Purpose

To verify when a network instigates the LCS positioning procedure by sending RRLP (Measure Position Request) message, after a traffic channel has been established during an emergency call, the mobile responds with RRLP (Measure Position Response) containing E-OTD measurement values.

#### Related PICS/PIXIT Statements

- Support MS Assisted E-OTD.

#### 70.2.4.3 Method of Test

#### Initial Conditions

System Simulator:

**Serving cell:** Default parameters, in SYSTEM INFORMATION TYPE 3 (SI3 Rest Octet) the early classmark sending control is implemented in the SS.

**Neighbor Cells:** at least 2 neighbor cells are used with a minimum configuration of a BCCH. This is to allow the MS to perform the required timing measurements.

Mobile Station:

The MS is in MM-state "idle, updated" with valued TMSI and CKSN.

#### Test Procedure:

An Emergency Call is initiated by the MS. SIM card is present in the MS.

The emergency call is established with a late assignment.

After receiving the CONNECT ACKNOWLEDGE message from the MS, the SS sends an RR APPLICATION INFORMATION message containing an RRLP Measure Position Request on the FACCH.

The MS then performs positioning measurements and responds with a RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

The call is then cleared by the SS.

Maximum duration of the test:

1 minutes.

| UseMultipleSets     | Enumerated     | oneSet       |

## 70.3 Mobile Originating Location Request

The test cases in this subclause focus on Mobile Originating Location Request. A MO\_LR could occur by a MS to request the network to start location procedure, which is used for either its own location, location assistance data or deciphering keys for broadcast assistance data message.

### 70.3.1 MO\_LR Basic Self Location Request

Basic Self Location Request is only applicable for requesting its own location by using MS Assisted E-OTD positioning..

#### 70.3.1.1 MO\_LR Basic Self Location Request In Idle Mode (Normal Case)

##### 70.3.1.1.1 Conformance requirements:

The MS sends a DTAP LCS MO-LR invoke to the VMSC. If the MS is requesting its own location or that its own location be sent to another LCS client, this message carries LCS QoS information (e.g. accuracy, response time).

The MS invokes a MO-LR by sending a REGISTER message to the network containing a LCS-MOLR invoke component with MO\_LR TYPE set to LocationEstimate, LCS QoS value and other optional field if it is needed.

The MS shall terminate the dialogue by sending a RELEASE COMPLETE message.

#### Test References

3GPP TS 03.71, subclause 7.6.6.

3GPP TS 04.30 subclause 5.1.1.

3GPP TS 04.80 subclauses 2.4, 2.5 and 4.

##### 70.3.1.1.2 Test Purpose

Verifies that a MS sends a correct LCS-MOLR Invoke message with the component MO\_LR TYPE set to LocationEstimate and LCS\_QoS value on the initiation of MOLR. On receipt of a RRLP Measure position request from SS to start the measurement, MS shall send back RRLP Measure Position Response to SS after finishing the measurement.

##### 70.3.1.1.3 Method of Test

#### Initial Conditions

System Simulator:

**Serving cell:** Default parameters, in SYSTEM INFORMATION TYPE 3 (SI3 Rest Octet) the early classmark sending control is implemented in the SS.

**Neighbor Cells:** at least 2 neighbor cells are used with a minimum configuration of a BCCH. This is to allow the MS to perform the required timing measurements.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

#### Related PICS/PIXIT Statements

Support MS Assisted E-OTD

#### Test Procedure:

A MOLR procedure as call independent supplementary services is initiated from the MS. The MS performs control early classmark sending to provide LCS positioning method capability. After sending the CIPHERING MODE COMPLETE message the MS sends a REGISTER message with Facility IE containing a component set to LCS-MOLR Invoke. The SS sends RRLP Request to start the measurement. Once the measurement is done, RRLP response is sent back to SS with the measurement data. The SS returns location estimate to MS through LCS-MOLR Return Result. The MS terminates the dialogue by sending RELEASE COMPLETE message.

Maximum duration of the test:

3 minutes.

#### Expected Sequence

| Step | Direction | Message                    | Comments                                                                                                                                                 |
|------|-----------|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                            | Initiate MOLR Procedure (Basic Self Location Request)                                                                                                    |

## 70.3.1.2 MO\_LR Basic Self Location Request In Dedicated Mode (Normal case)

## 70.3.1.2.1 Conformance Requirement:

The MS sends a DTAP LCS MO-LR invoke to the VMSC. If the MS is requesting its own location or that its own location be sent to another LCS client, this message carries LCS QoS information (e.g. accuracy, response time).

The MS invokes a MO-LR by sending a REGISTER message to the network containing a LCS-MOLR invoke component with MO\_LR TYPE set to LocationEstimate, LCS QoS value and other optional field if it is needed.

The MS shall terminate the dialogue by sending a RELEASE COMPLETE message.

3GPP TS 04.30 subclause 5.1.1

3GPP TS 04.80 subclauses 2.4, 2.5 & 4

### 70.3.1.2.2 Test Purpose

Verifies that a MS sends a correct LCS-MOLR Invoke message on already established speech call related SACCH with the component MO\_LR TYPE sets to LocationEstimate and LCS\_QoS value on the initiation of MO\_LR. On receipt of a RRLP Measure position request from SS to start the measurement, MS shall send back RRLP Measure Position Response to SS after finishing the measurement.

### 70.3.1.2.3 Method of Test

Initial Conditions:

System Simulator:

**Serving Cell:** Default parameters, in SYSTEM INFORMATION 3 ( SI 3 Rest Octet ) the early classmark sending control is implemented in the SS.

**Neighbor Cells:** at least 2 neighbor cells are used with a minimum configuration of a BCCH. This is to allow the MS to perform the required timing measurements.

Mobile Station:

The MS has valid TMSI and CKSN.

The MS is brought into the state U10 by using table 26.8.1.2/3.

Related PICS/PIXIT Statements

Support MS Assisted E-OTD

Test Procedure:

A MOLR procedure as call independent supplementary services is initiated from the MS on the existing SACCH channel. After received CM SERVICE ACCEPT message, MS sends a REGISTER message with Facility IE containing a component set to a LCS-MOLR Invoke. The SS sends RRLP Request to start the measurement. Once the measurement is done, RRLP Response is sent back to SS with the measurement data. The SS returns location estimate to MS through LCS-MOLR Return Result. The MS terminates the dialogue by sending RELEASE COMPLETE message.

Maximum duration of the test:

3 minutes.

### 70.3.2 MO\_LR Transfer to 3<sup>rd</sup> Party

Transfer to 3<sup>rd</sup> Party is only applicable for requesting to transfer its own location to another LCS client by using MS Assisted E-OTD Positioning.

#### 70.3.2.1 Conformance requirements:

The MS sends a DTAP LCS MO-LR invoke to the VMSC. If the MS is requesting its own location or that its own location be sent to another LCS client, this message carries LCS QoS information (e.g. accuracy, response time). If the MS is requesting that its location be sent to another LCS client, the message shall include the identity of the LCS client and may include the address of the GMLC through which the LCS client should be accessed

The MS invokes a MO-LR by sending a REGISTER message to the network containing a LCS-MOLR invoke component with MO\_LR TYPE set to LocationEstimate, LCS QoS value, LCS-ClientExternalID and MLC\_Number if it is available.

#### Test References

- 3GPP TS 03.71, subclause 7.6.6,
- 3GPP TS 04.030 subclause 5.1.1,
- 3GPP TS 04.80 subclauses 2.4, 2.5 & 4

#### 70.3.2.2 Test Purpose

Verifies that a MS sends a correct LCS-MOLR Invoke message with the component MO\_LR TYPE set to LocationEstimate, LCS\_QoS value, LCS-ClientExternalID and MLC\_Number (if available) on the initiation of MOLR. On receipt of a RRLP Measure position request from SS to start the measurement, MS shall send back RRLP Measure Position Response to SS after finishing the measurement.

#### 70.3.2.3 Method of Test

##### Initial Conditions

System Simulator:

**Serving cell:** Default parameters, in SYSTEM INFORMATION TYPE 3 (SI3 Rest Octet) the early classmark sending control is implemented in the SS.

**Neighbor Cells:** at least 2 neighbor cells are used with a minimum configuration of a BCCH. This is to allow the MS to perform the required timing measurements.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

##### Related PICS/PIXIT Statements

- Support MS Assisted E-OTD.

##### Test Procedure:

A MOLR procedure as call independent supplementary services is initiated from the MS. The MS performs control early classmark sending to provide LCS positioning method capability. After sending the CIPHERING MODE COMPLETE message the MS sends a REGISTER message with Facility IE containing a component set to a LCS-MOLR Invoke. The SS sends RRLP Request to start the measurement. Once the measurement is done, RRLP response is sent back to SS with the measurement data. The SS may then transfer the location information to the internal or external LCS client.

##### Maximum duration of the test:

3 minutes.

## 70.4 Mobile Terminated Location Request

The test cases in this subclause focus on Mobile Terminated Location Request. A MT-LR occurs when an external LCS client requests the position of an MS by sending the SS REGISTER message. This may be sent to request verification for a particular MT-LR or simply to notify the user about an MT-LR that has already been authorized.

### 70.4.1 MT-LR Location Notification

Location notification takes place to inform the MS user that a particular LCS client is requesting their position without seeking the users permission.

#### 70.4.1.1 Conformance requirements:

The following requirements apply for this test:

1. On receipt of a REGISTER message containing the LCS Notification Invoke component with notificationType set to notifyLocationAllowed. The MS shall notify the MS user of the location request using the method defined in the manufacturers specification.
2. The MS shall terminate the dialogue by sending a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionGranted.

#### Test References

3GPP TS 03.71, subclause 7.6.1,

3GPP TS 04.30, subclause 4.1.1,

3GPP TS 04.80, subclauses 2.4 and 2.5.

## 70.4.1.2 Test Purpose

Verifies that when the MS receives a REGISTER message, containing a LCS Location Notification Invoke component set to notifyLocationAllowed, the MS displays information about the LCS client correctly (as defined by the individual manufacturer) and sends a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionGranted.

## Related PICS/PIXIT Statements

- Support MS Assisted E-OTD.

## 70.4.1.3 Method of Test

## Initial Conditions

## System Simulator:

**Serving cell:** Default parameters, in SYSTEM INFORMATION TYPE 3 (SI3 Rest Octet) the early classmark sending control is implemented in the SS.

## Mobile Station:

The MS is in MM-state "idle, updated" with valued TMSI and CKSN.

## Test Procedure:

The MS is paged with a PAGING REQUEST TYPE 1 message. After sending the CIPHERING MODE COMPLETE message the MS receives an SS REGISTER message containing a Facility IE containing a DTAP LCS Location Notification Invoke message set to notifyLocationAllowed. The LCS Client Name contained in the USSD text string of the lcs-LocationNotification shall be displayed as defined by the Manufacturer. The MS then responds with a RELEASE COMPLETE message containing a LocationNotification return to terminate the dialogue.

## Maximum duration of the test:

1 minute.

## Expected Sequence

| Step | Direction | Message                | Comments                                                                                                                                                                                                                                 |

## 70.4.2 MT-LR Privacy Options

Privacy options are used in conjunction with the MS subscription profile on the VLR. They give the MS user the option to grant or withhold permission for individual location requests as they occur.

### 70.4.2.1 MT-LR Privacy Options/ Verification – Location Allowed If No Response

The case occurs when the target MS subscription profile on the VLR is set to location allowed if no response is sent. This is the default option if the VMSC does not receive verification from the target MS within a predetermined time.

#### 70.4.2.1.1 Conformance requirements

The following requirements apply for this test:

1. On receipt of a REGISTER message containing the LCS Notification Invoke component with notificationType set to notifyAndVerify-LocationAllowedIfNoResponse. The MS a) notifies the user of the request and b) indicates the default is location allowed if no response is received within a predetermined period, while c) providing the opportunity to accept or deny the request by the method defined in the manufacturer's specification.

2.

#### Option 1:

The user accepts the location request using the method specified by the manufacturer.  
The MS shall terminate the dialogue by sending a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionGranted.

#### Option 2:

The user denies the location request using the method defined by the manufacturer.  
The MS shall terminate the dialogue by sending a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionDenied.

#### Option 3:

The user takes no action and the verification process times-out.  
The MS shall terminate the dialogue by sending a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionGranted.

## Test References

For conformance requirement 1:

3GPP TS 03.71, subclause 7.6.1.

3GPP TS 24.030 subclause 4.1.1.

3GPP TS 24.080 subclause 2.4.

For conformance requirement 2:

3GPP TS 03.71, subclause 7.6.1.

3GPP TS 24.030 subclause 4.1.1.

3GPP TS 24.080 subclause 2.5.

#### 70.4.2.1.2 Test Purpose

Verifies that when the MS receives a REGISTER message, containing a LCS Location Notification Invoke component set to notifyAndVerify-LocationAllowedIfNoResponse, the MS displays information about the LCS client correctly and indicates that the default response is location allowed if no response is sent. Gives the user the option to accept or reject the request and sends a RELEASE COMPLETE message containing a LocationNotification return result with the verificationResponse set to permissionDenied or permissionGranted as appropriate.

- Support MS Assisted E-OTD.

#### 70.4.2.1.3 Method of Test

##### Initial Conditions

System Simulator:

**Serving cell:** Default parameters, in SYSTEM INFORMATION TYPE 3 (SI3 Rest Octet) the early classmark sending control is implemented in the SS.

Mobile Station:

The MS is in MM-state "idle, updated" with valued TMSI and CKSN.

##### Test Procedure:

The MS is paged with a PAGING REQUEST TYPE 1 message. After sending the CIPHERING MODE COMPLETE message the MS receives an SS REGISTER message with a Facility IE containing a LCS Location Notification Invoke set to notifyAndVerify-LocationAllowedIfNoResponse. The LCS Client Name contained in the USSD text string of the lcs-LocationNotification shall be displayed with the option to accept or deny the request, as defined by the Manufacturer. The MS also indicates that location will be allowed if a response is not received within a predetermined time.

##### Option 1:

The user then accepts the location request by the method defined by the manufacturer. The MS responds with a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionGranted.

##### Option 2:

The user then denies the location request by the method defined by the manufacturer. The MS responds with a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionDenied.

##### Option 3:

The user ignores the location request by taking no action, allowing the verification process timer to time-out. The MS responds with a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionGranted.

##### Maximum duration of the test:

1 minute.

## 70.4.2.2 MT-LR Privacy Options/ Verification – Location Not Allowed If No Response

This case occurs when the target MS subscription profile on the VLR is set to location not allowed if no response is sent. This is the default option if the VMSC does not receive verification from the target MS within a predetermined time.

#### 70.4.2.2.1 Conformance requirements:

The following requirements apply for this test:

1. On receipt of a REGISTER message containing the LCS Notification Invoke component with notificationType set to notifyAndVerify-LocationAllowedIfNoResponse. The MS a) notifies the user of the request and b) indicates that the default is location not allowed if no response is received within a predetermined period, while c) providing the opportunity to accept or deny the request by the method defined in the manufacturer's specification.

2.

##### Option 1:

The user accepts the location request using the method specified by the manufacturer.  
The MS shall terminate the dialogue by sending a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionGranted.

##### Option 2:

The user denies the location request using the method defined by the manufacturer.  
The MS shall terminate the dialogue by sending a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionDenied.

##### Option 3:

The user takes no action and the verification process times-out.  
The MS shall terminate the dialogue by sending a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionDenied.

#### Test References

For conformance requirement 1:

- 3GPP TS 03.71, subclause 7.6.1.
- 3GPP TS 24.030 subclause 4.1.1.
- 3GPP TS 24.080 subclause 2.4.

For conformance requirement 2:

- 3GPP TS 03.71, subclause 7.6.1.
- 3GPP TS 24.030 subclause 4.1.1.
- 3GPP TS 24.080 subclause 2.5.

#### 70.4.2.2.2 Test Purpose

Verifies that when the MS receives a REGISTER message, containing a LCS Location Notification Invoke component set to notifyAndVerify-LocationNotAllowedIfNoResponse, the MS displays information about the LCS client correctly and indicates that the default response is location not allowed if no response is sent. Gives the user the option to accept or reject the request and sends a RELEASE COMPLETE message containing a LocationNotification return result with the verificationResponse set to permissionDenied or permissionGranted as appropriate.

## 70.5 Void

## 70.6 E-OTD Timing Measurement Accuracy

## Scope of Tests

This test procedure plan is intended verify the operation of Enhanced Observed Timing Difference (E-OTD) measurement functionality from an E-OTD capable GSM Mobile Station (MS).

The scope of this test plan is limited to verification of the MS physical layer against 3GPP TS 05.05, Release 1999, version 8.7.1, annex I. Specifically, this includes validation of MS observed timing measurement accuracy only.

The recommended measurement test environment is shown in the present document annex 6.

## 70.6.1 E-OTD Accuracy, Sensitivity Performance Tests using GMSK Signals

## 70.6.1.1 Definition and applicability

Enhanced Observed Timing Difference is a mechanism intended to provide location information from an MS within a GSM network. E-OTD measures the burst timing alignment between the serving cell for the MS and a minimum of two neighbor cells. The observed timing difference, along with the BSIC or Cell ID of each neighbor cell that can be

received and measured by the MS, is reported to the network. Using this information, an E-OTD capable network can calculate the location of the MS using triangulation techniques.

Although an E-OTD capable MS must receive a minimum of two neighbors in order to provide the network with useable data for E-OTD positioning, only one neighbor is required for the timing measurement tests described in this procedure.

#### 70.6.1.2 Conformance requirement

The  $RMS_{90}$  measurement error of an E-OTD capable MS receiving a neighbor shall not exceed 100 nanoseconds and 300 nanoseconds at a minimum neighbor carrier signal strength relative to relative sensitivity levels of 12 dB and -8 dB respectively, as specified in 3GPP TS 05.05, annex I, subclause I.2.1, table I.2.1

#### 70.6.1.3 Test purpose

E-OTD measurement accuracy is heavily influenced by the type of RF environment available to the MS at the time a Measure Position Request is received from the network. Nearby neighbor stations that provide a relatively high C/N to the MS receiver should result in greater measurement accuracy than those further away with a low C/N.

The purpose of this test case is to verify that an E-OTD capable MS can provide an observed timing difference (OTD) measurement of sufficient accuracy when measuring against a GMSK neighbor. During this test, there shall be no co-, adjacent-, or alternate-channel interference.

#### Related PICS/PIXIT Statement

- Support MS Assisted/Unassisted E-OTD.

#### 70.6.1.4 Method of Test

##### Initial Configuration

Neighbor Cell: One neighbor cells with a minimum configuration of a BCCH in order to allow the MS to perform the required measurements. The neighbor BCCH shall be included in the serving BCCH System Information Neighbor List.

Assistance Data: The assistance data listed in Table 70.6.1-1 and Table 70.6.1-2 shall be provided by the serving base station simulator. Without assistance data, successful validation of the MS physical layer may be impossible due to limitations imposed by the device's upper protocol layers.

| Relative East               | None                         | Not Applicable                                                                                                                               |

#### 70.6.1.5 Test procedure

- a) Configure serving base station simulator to transmit GMSK dummy bursts in time slots 1 through 7.
- b) Establish RF connectivity between the E-OTD compatible MS and its serving base station simulator, verify RSSI of -80 dB.
- c) Disable the interfering signal generator.
- d) Configure the neighbor base station simulator such that its power (as measured at the antenna terminal of the E-OTD MS under test) is -90 dBm, and that it is transmitting GMSK dummy bursts in time slots 1 through 7.
- e) The serving base station SS initiates a Measure Position Request RRLP message. Begin logging E-OTD Measure Position Response RRLP message from the MS under test. The Measure Position Request is repeated a minimum of 250 times at 5 s intervals and the response RRLP messages are logged.
- f) The SS calculates each trial's error relative to the known RTD, sort the data in ascending order, develop the 90 % subset M and calculate the RMS<sub>90</sub> error.
- g) Disable the interfering signal generator.
- h) Configure the neighbor base station simulator such that its power (as measured at the antenna terminal of the E-OTD MS under test) is -110 dBm, and that it is transmitting GMSK dummy bursts in time slots 1 through 7.
- i) The serving base station SS initiates a Measure Position Request RRLP message. Begin logging E-OTD Measure Position Response RRLP message from the MS under test. The Measure Position Request is repeated a minimum of 250 times at 5 second intervals and the response RRLP messages are logged.
- j) After transmitting 250 Measure Position Request RRLP messages to the MS under test, calculate each trial's error relative to the known RTD, sort the data in ascending order, develop the 90 % subset M and calculate the RMS<sub>90</sub> error.

#### 70.6.1.6 Test Requirements

Verify that the RMS<sub>90</sub> error calculated for each procedure in 70.6.1.5 is within the test conformance requirements listed in Table 70.6.1-3

**Table 70.6.1-3, Test Conformance Requirements**

| Procedure | RMS <sub>90</sub> error, 3GPP TS 05.05, Annex I, Minimum Performance Requirement | RMS <sub>90</sub> error, 3GPP TS 51.010, 70.6.1, Test Conformance Requirement |
|-----------|----------------------------------------------------------------------------------|-------------------------------------------------------------------------------|
| Step f    | ≤ 100 nanoseconds                                                                | ≤110 nanoseconds                                                              |
| Step j    | ≤ 300 nanoseconds                                                                | ≤310 nanoseconds                                                              |

## 70.6.2 E-OTD Accuracy, Interference Performance Tests

### 70.6.2.1 Definition and applicability

Enhanced Observed Timing Difference is a mechanism intended to provide location information from an MS within a GSM network. E-OTD measures the burst timing alignment between the serving cell for the MS and a minimum of two neighbor cells. The observed timing difference, along with the BSIC or Cell ID of each neighbor cell that can be received and measured by the MS, is reported to the network. Using this information, an E-OTD capable network can calculate the location of the MS using triangulation techniques.

Although an E-OTD capable MS must receive a minimum of two neighbors in order to provide the network with useable data for E-OTD positioning, only one neighbor is required for the timing measurement tests described in this procedure.

The requirements of this test apply to all types of MS that are capable of supporting E-OTD.

### 70.6.2.2 Conformance requirement

The RMS<sub>90</sub> measurement error of an E-OTD capable MS receiving a neighbor with a co-channel interference ratio of 0 dB shall not exceed 300 nanoseconds, 10dB not exceeding 100 nanoseconds, adjacent channel interference ratio of –18dB not exceeding 500 nanoseconds, –8 dB not exceeding 200 nanoseconds, as well as an adjacent channel (400 kHz ) interference ratio of –41dB not exceeding 100 nanoseconds, as specified in 3GPP TS 05.05, Release 99, Annex I, Section I.2.1, Table I.2.2

### 70.6.2.3 Test purpose

E-OTD measurement accuracy is heavily influenced by the type of RF environment available to the MS at the time a Measure Position Request is received from the network. As the C/I ratio due to neighbor cell co-channel interference is reduced, E-OTD measurement accuracy may be reduced as well.

The purpose of this test case is to verify that an E-OTD capable MS can provide an observed timing difference (OTD) measurement of sufficient accuracy when measuring against a GMSK neighbor in the presence of a channel interference with a 0 dB, 10dB, -18dB, -8dB, and –41dB C/I.

Related PICS/PIXIT Statement:

- Support MS Assisted/Unassisted E-OTD

### 70.6.2.4 Method of Test

Initial Configuration

**Neighbor Cells:** at least two neighbor cells with a minimum configuration of a BCCH in order to allow the mobile to perform the required accuracy measurements. The neighbor BCCH shall be included in the serving BCCH System Information Neighbor List.

### 70.6.2.5 Test procedure

Co-Channel test procedure at 0dB C/I:

- a) Configure serving base station simulator to transmit GMSK dummy bursts in time slots 1 through 7
- b) Establish RF connectivity between the E-OTD compatible MS and its serving base station simulator, verify RSSI of -80 dBm

- c) Enable the interfering signal generator on the frequency of the neighbor cell at a power (at the antenna connection of the EOTD-capable MS) of -80 dBm
- d) Configure the neighbor base station simulator such that its power (as measured at the antenna terminal of the E-OTD MS under test) is -80 dBm, and that it is transmitting GMSK dummy bursts in time slots 1 through 7.
- e) The SS initiates a Measure Position Request RRLP messages and begins logging E-OTD Response messages from the MS under test. The Measure Position Request message is repeated 250 times at 5-second intervals and the response RRLP messages are recorded.
- f) After transmitting 250 Measure Position Request RRLP messages to the MS under test, calculate each trial's error relative to the known RTD, sort the data in ascending order, develop the 90% subset M and calculate the RMS<sub>90</sub> error.

Co-Channel test procedure at 10dB C/I:

- g) Establish RF connectivity between the E-OTD compatible MS and its serving base station simulator, verify RSSI of -80 dBm
- h) Enable the interfering signal generator on the frequency of the neighbor cell at a power (at the antenna connection of the EOTD-capable MS) of -90 dBm
- i) Configure the neighbor base station simulator such that its power (as measured at the antenna terminal of the E-OTD MS under test) is -80 dBm, and that it is transmitting GMSK dummy bursts in time slots 1 through 7.
- j) The SS initiates a Measure Position Request RRLP messages and begins logging E-OTD Response messages from the MS under test. The Measure Position Request message is repeated 250 times at 5-second intervals and the response RRLP messages are recorded.
- k) Repeat Step f) and calculate the results.

Adjacent channel test procedure at -18dB C/I:

- l) Establish RF connectivity between the E-OTD compatible MS and its serving base station simulator, verify RSSI of -70 dBm
- m) Enable the interfering signal generator on either of the channels adjacent to the frequency of the neighbor cell at a power (at the antenna connection of the EOTD-capable MS) of -62 dBm. The RF channel used by the interfering signal generator during this test must not be the same as that used by the serving base station simulator.
- n) Configure the neighbor base station simulator such that its power (as measured at the antenna terminal of the E-OTD MS under test) is -80 dBm, and that it is transmitting GMSK dummy bursts in time slots 1 through 7.
- o) The SS initiates a Measure Position Request RRLP messages and begins logging E-OTD Response messages from the MS under test. The Measure Position Request message is repeated 250 times at 5-second intervals and the response RRLP messages are recorded.
- p) Repeat Step f) and calculate the results.

Adjacent channel test procedure at - 8dB C/I:

- q) Establish RF connectivity between the E-OTD compatible MS and its serving base station simulator, verify RSSI of -70 dBm
- r) Enable the interfering signal generator on either of the channels adjacent to the frequency of the neighbor cell at a power (at the antenna connection of the EOTD-capable MS) of -72 dBm. The RF channel used by the interfering signal generator during this test must not be the same as that used by the serving base station simulator.
- s) Configure the neighbor base station simulator such that its power (as measured at the antenna terminal of the E-OTD MS under test) is -80 dBm, and that it is transmitting GMSK dummy bursts in time slots 1 through 7.
- t) The SS initiates a Measure Position Request RRLP messages and begins logging E-OTD Response messages from the MS under test. The Measure Position Request message is repeated 250 times at 5-second intervals and the response RRLP messages are recorded.

- u) Repeat Step f) and calculate the results.

Adjacent channel (400kHz) test procedure at -41dB C/I:

- v) Establish RF connectivity between the E-OTD compatible MS and its serving base station simulator, verify RSSI of -70 dBm
- w) Enable the interfering signal generator on either of the channels alternate (400 kHz offset) to the frequency of the neighbor cell at a power (at the antenna connection of the EOTD-capable MS) of -39 dBm. The RF channel used by the interfering signal generator during this test must not be the same as that used by the serving base station simulator.
- x) Configure the neighbor base station simulator such that its power (as measured at the antenna terminal of the E-OTD MS under test) is -80 dBm, and that it is transmitting GMSK dummy bursts in time slots 1 through 7.
- y) The SS initiates a Measure Position Request RRLP messages and begins logging E-OTD Response messages from the MS under test. The Measure Position Request message is repeated 250 times at 5-second intervals and the response RRLP messages are recorded.
- z) Repeat Step f) and calculate the results.

### 70.6.2.6 Test Requirements

Verify that the  $RMS_{90}$  error calculated for each procedure in 70.6.2.5 is within the test conformance requirements listed in Table 70.6.2-1.

**Table 70.6.2-1, Test Conformance Requirements**

| Procedure | $RMS_{90}$ error, 3GPP TS 05.05, Annex I, Minimum Performance Requirement | $RMS_{90}$ error, 3GPP TS 51.010, 70.6.2, Test Conformance Requirement |
|-----------|---------------------------------------------------------------------------|------------------------------------------------------------------------|
| Step f    | $\leq 300$ nanoseconds                                                    | $\leq 310$ nanoseconds                                                 |
| Step k    | $\leq 100$ nanoseconds                                                    | $\leq 110$ nanoseconds                                                 |
| Step p    | $\leq 500$ nanoseconds                                                    | $\leq 510$ nanoseconds                                                 |
| Step u    | $\leq 200$ nanoseconds                                                    | $\leq 210$ nanoseconds                                                 |
| Step z    | $\leq 100$ nanoseconds                                                    | $\leq 110$ nanoseconds                                                 |

## 70.6.3 E-OTD Accuracy, Multipath Performance Test using GMSK Modulated Signals.

### 70.6.3.1 Definition and applicability

Enhanced Observed Timing Difference is a mechanism intended to provide location information from an MS within a GSM network. E-OTD measures the burst timing alignment between the serving cell for the MS and a minimum of two neighbor cells. The observed timing difference, along with the BSIC or Cell ID of each neighbor cell that can be received and measured by the MS, is reported to the network. Using this information, an E-OTD capable network can calculate the location of the MS using triangulation techniques.

Although an E-OTD capable MS must receive a minimum of two neighbors in order to provide the network with useable data for E-OTD positioning, only one neighbor is required for the timing measurement tests described in this procedure.

The requirements of this test apply to all types of MS that are capable of supporting E-OTD.

### 70.6.3.2 Conformance requirement

The  $RMS_{90}$  measurement error of an E-OTD capable MS receiving a TU3 Rayleigh-faded neighbor shall not exceed 1.5 microseconds, as specified in 3GPP TS 05.05, Release 99, Version 8.7.1, Annex I, Clause I.2.3, Table I.2.3

### 70.6.3.3 Test purpose

E-OTD measurement accuracy is heavily influenced by the type of RF environment available to the MS at the time a Measure Position Request is received from the network. Rayleigh fading to the neighbor cell will reduce E-OTD measurement accuracy.

The purpose of this test case is to verify that an E-OTD capable MS can provide an observed timing difference (OTD) measurement of sufficient accuracy when measuring against a TU3 Rayleigh fading GMSK distant neighbor. During this test, there shall be no co-, adjacent-, or alternate-channel interference.

### 70.6.3.4 Method of Test

#### Initial Configuration

Neighbor Cell: at least one neighbor cell with a minimum configuration of a BCCH in order to allow the mobile to perform the required accuracy measurements. The neighbor BCCH shall be included in the serving BCCH System Information Neighbor List.

Assistance Data: The assistance data listed in Table 70.6.3-1 and Table 70.6.3-2 shall be provided by the serving base station simulator. Without assistance data, successful validation of the MS physical layer may be impossible due to limitations imposed by the device's upper protocol layers.

**Table 70.6.3-2: RRLP Measure Position Request Field Values, E-OTD Reference BTS for Assistance Data Element**

| Field Name       | Value                        | Comments                                                                                                             |
|------------------|------------------------------|----------------------------------------------------------------------------------------------------------------------|
| BCCH Carrier     | Range 0-1023                 | ARFCN of Serving BCCH                                                                                                |
| BSIC             | Range 0 to 65                | BSIC of Serving BCCH                                                                                                 |
| Time Slot Scheme | Either 0 or 1, as applicable | 0=All time slots 156.25 bits long<br>1=Time slots 0 and 4 are 157 bits long, all other time slots are 156 bits long. |
| BTS Position     | None                         | Not applicable for timing accuracy measurements                                                                      |

**Table 70.6.3-2: RRLP Measure Position Request Field Values, E-OTD Measurement Assistance Data for System Information List Element**

| Field Name                  | Value                        | Comments                                                                                                                                     |

| Expected OTD                | None                         | Not Applicable                                                                                                                               |
| Uncertainty of Expected OTD | None                         | Not Applicable                                                                                                                               |
| Fine RTD                    | None                         | Not Applicable                                                                                                                               |
| Relative North              | None                         | Not Applicable                                                                                                                               |
| Relative East               | None                         | Not Applicable                                                                                                                               |

### 70.6.3.5 Test procedure

- a) Configure serving base station simulator to transmit GMSK dummy bursts in time slots 1 through 7
- b) Establish RF connectivity between the E-OTD compatible MS and its serving base station simulator, verify RSSI of -80 dBm
- c) Disable the interfering signal generator
- d) Configure the neighbor base station simulator such that its power (as measured at the antenna terminal of the EOTD MS under test) is -110 dBm with Rayleigh fading disabled. The neighbor shall be transmitting GMSK dummy bursts in time slots 1 through 7
- e) Configure the fading simulator for Rayleigh fading corresponding to a velocity of 3 kph, with a 12-tap delay and amplitude spread in accordance with 3GPP TS 05.05, Release 99, Rev. 8.7.1, Annex C, Section C.3.3.
- f) With the carrier from the serving base station simulator disabled, enable TU3 Rayleigh fading on the neighbor cell, and verify an average RSSI (at the antenna connection of the MS) of -110 dBm
- g) Re-enable the serving base station simulator carrier, verify an RSSI (at the antenna connection of the MS) of -80 dBm
- h) The SS initiates a Measure Position Request RRLP messages and begins logging E-OTD Response messages from the MS under test. The Measure Position Request message is repeated 250 times at 5-second intervals and the response RRLP messages are recorded.
- i) After transmitting 250 Measure Position Request RRLP messages to the MS under test, calculate each trial's error relative to the known RTD, sort the data in ascending order, develop the 90% subset M and calculate the RMS<sub>90</sub> error.

### 70.6.3.6 Test Requirements

Verify that the RMS<sub>90</sub> error calculated in Step i) is < 1.5 microseconds

## 70.6.4 E-OTD Accuracy, Interference Performance Tests, 8PSK BCCH

### 70.6.4.1 Definition and applicability

Enhanced Observed Timing Difference is a mechanism intended to provide location information from an MS within a GSM network. E-OTD measures the burst timing alignment between the serving cell for the MS and a minimum of two neighbor cells. The observed timing difference, along with the BSIC or Cell ID of each neighbor cell that can be received and measured by the MS, is reported to the network. Using this information, an E-OTD capable network can calculate the location of the MS using triangulation techniques.

Although an E-OTD capable MS must receive a minimum of two neighbors in order to provide the network with useable data for E-OTD positioning, only one neighbor is required for the timing measurement tests described in this procedure.

The requirements of this test apply to all types of MS that are capable of supporting E-OTD.

### 70.6.2.2 Conformance requirement

The RMS<sub>90</sub> measurement error of an E-OTD capable MS receiving an 8PSK neighbor with a co-channel interference ratio of 0 dB shall not exceed 300 nanoseconds, 10dB not exceeding 300 nanoseconds, adjacent channel interference ratio of -18dB not exceeding 500 nanoseconds, -8 dB not exceeding 200 nanoseconds, as well as an adjacent channel (400 kHz ) interference ratio of -41dB not exceeding 100 nanoseconds, as specified in 3GPP TS 05.05, Release 99, Annex I, Section I.2.1, Table I.2.2

### 70.6.2.3 Test purpose

E-OTD measurement accuracy is heavily influenced by the type of RF environment available to the MS at the time a Measure Position Request is received from the network. As the C/I ratio due to neighbor cell co-channel interference is reduced, E-OTD measurement accuracy may be reduced as well.

The purpose of this test case is to verify that an E-OTD capable MS can provide an observed timing difference (OTD) measurement of sufficient accuracy when measuring against a neighbor modulated with 8PSK in time slots 1-7, in the presence of a channel interference with a 0 dB, 10dB, -18dB, -8dB, and -41dB C/I.

Related PICS/PIXIT Statement:

- Support MS Assisted/Unassisted E-OTD

### 70.6.4.4 Method of Test

#### Initial Configuration

Neighbor Cells: at least one neighbor cell with a minimum configuration of a BCCH in order to allow the mobile to perform the required accuracy measurements. The neighbor BCCH shall be included in the serving BCCH System Information Neighbor List.

### 70.6.4.5 Test procedure

Co-Channel 8PSK test procedure at 0dB C/I:

- a) Configure serving base station simulator to transmit in time slots 1 through 7
- b) Establish RF connectivity between the E-OTD compatible MS and its serving base station simulator, verify RSSI of -80 dBm
- c) Enable the interfering signal generator on the frequency of the neighbor cell at a power (at the antenna connection of the EOTD-capable MS) of -80 dBm
- d) Configure the neighbor base station simulator such that its power (as measured at the antenna terminal of the E-OTD MS under test) is -80 dBm, and that it is transmitting 8PSK bursts modulated with pseudo-random data in time slots 1 through 7.
- e) The SS initiates a Measure Position Request RRLP messages and begins logging E-OTD Response messages from the MS under test. The Measure Position Request message is repeated 250 times at 5-second intervals and the response RRLP messages are recorded.
- f) After transmitting 250 Measure Position Request RRLP messages to the MS under test, calculate each trial's error relative to the known RTD, sort the data in ascending order, develop the 90% subset M and calculate the  $RMS_{90}$  error.

Co-Channel 8PSK test procedure at 10dB C/I:

- g) Establish RF connectivity between the E-OTD compatible MS and its serving base station simulator, verify RSSI of -80 dBm
- h) Enable the interfering signal generator on the frequency of the neighbor cell at a power (at the antenna connection of the EOTD-capable MS) of -90 dBm
- i) Configure the neighbor base station simulator such that its power (as measured at the antenna terminal of the E-OTD MS under test) is -80 dBm, and that it is transmitting 8PSK bursts modulated with pseudo-random data in time slots 1 through 7.
- j) The SS initiates a Measure Position Request RRLP messages and begins logging E-OTD Response messages from the MS under test. The Measure Position Request message is repeated 250 times at 5-second intervals and the response RRLP messages are recorded.
- k) Repeat Step f) and calculate the results.

Adjacent channel 8PSK test procedure at -18dB C/I:

- l) Establish RF connectivity between the E-OTD compatible MS and its serving base station simulator, verify RSSI of -70 dBm
- m) Enable the interfering signal generator on either of the channels adjacent to the frequency of the neighbor cell at a power (at the antenna connection of the EOTD-capable MS) of -62 dBm. The RF channel used by the interfering signal generator during this test must not be the same as that used by the serving base station simulator.
- n) Configure the neighbor base station simulator such that its power (as measured at the antenna terminal of the E-OTD MS under test) is -80 dBm, and that it is transmitting 8PSK bursts modulated with pseudo-random data in time slots 1 through 7.
- o) The SS initiates a Measure Position Request RRLP messages and begins logging E-OTD Response messages from the MS under test. The Measure Position Request message is repeated 250 times at 5-second intervals and the response RRLP messages are recorded.
- p) Repeat Step f) and calculate the results.

Adjacent channel 8PSK test procedure at - 8dB C/I:

- q) Establish RF connectivity between the E-OTD compatible MS and its serving base station simulator, verify RSSI of -70 dBm
- r) Enable the interfering signal generator on either of the channels adjacent to the frequency of the neighbor cell at a power (at the antenna connection of the EOTD-capable MS) of -72 dBm. The RF channel used by the interfering signal generator during this test must not be the same as that used by the serving base station simulator.
- s) Configure the neighbor base station simulator such that its power (as measured at the antenna terminal of the E-OTD MS under test) is -80 dBm, and that it is transmitting 8PSK bursts modulated with pseudo-random data in time slots 1 through 7.
- t) The SS initiates a Measure Position Request RRLP messages and begins logging E-OTD Response messages from the MS under test. The Measure Position Request message is repeated 250 times at 5-second intervals and the response RRLP messages are recorded.
- u) Repeat Step f) and calculate the results.

Adjacent channel (400kHz) 8PSK test procedure at -41dB C/I:

- v) Establish RF connectivity between the E-OTD compatible MS and its serving base station simulator, verify RSSI of -70 dBm
- w) Enable the interfering signal generator on either of the channels alternate (400 kHz offset) to the frequency of the neighbor cell at a power (at the antenna connection of the EOTD-capable MS) of -39 dBm. The RF channel used by the interfering signal generator during this test must not be the same as that used by the serving base station simulator.
- x) Configure the neighbor base station simulator such that its power (as measured at the antenna terminal of the E-OTD MS under test) is -80 dBm, and that it is transmitting 8PSK bursts modulated with pseudo-random data in time slots 1 through 7.
- y) The SS initiates a Measure Position Request RRLP messages and begins logging E-OTD Response messages from the MS under test. The Measure Position Request message is repeated 250 times at 5-second intervals and the response RRLP messages are recorded.
- z) Repeat Step f) and calculate the results.

#### 70.6.4.6 Test Requirements

Verify that the RMS<sub>90</sub> error calculated for each procedure in 70.6.4.5 is within the test conformance requirements listed in Table 70.6.4-1

**Table 70.6.4-1, Test Conformance Requirements**

| Procedure | RMS <sub>90</sub> error, 3GPP TS 05.05, Annex I, Minimum Performance Requirement | RMS <sub>90</sub> error, 3GPP TS 51.010, 70.6.4, Test Conformance Requirement |
|-----------|----------------------------------------------------------------------------------|-------------------------------------------------------------------------------|
| Step f    | ≤ 300 nanoseconds                                                                | ≤310 nanoseconds                                                              |
| Step k    | ≤ 100 nanoseconds                                                                | ≤110 nanoseconds                                                              |
| Step p    | ≤ 500 nanoseconds                                                                | ≤510 nanoseconds                                                              |
| Step u    | ≤ 200 nanoseconds                                                                | ≤210 nanoseconds                                                              |
| Step z    | ≤ 100 nanoseconds                                                                | ≤110 nanoseconds                                                              |

## 70.6.5 E-OTD Accuracy, Multipath Performance Test, 8PSK BCCH

### 70.6.5.1 Definition and applicability

Enhanced Observed Timing Difference is a mechanism intended to provide location information from an MS within a GSM network. E-OTD measures the burst timing alignment between the serving cell for the MS and a minimum of two neighbor cells. The observed timing difference, along with the BSIC or Cell ID of each neighbor cell that can be received and measured by the MS, is reported to the network. Using this information, an E-OTD capable network can calculate the location of the MS using triangulation techniques.

Although an E-OTD capable MS must receive a minimum of two neighbors in order to provide the network with useable data for E-OTD positioning, only one neighbor is required for the timing measurement tests described in this procedure.

The requirements of this test apply to all types of MS that are capable of supporting E-OTD.

### 70.6.5.2 Conformance requirement

The RMS<sub>90</sub> measurement error of an E-OTD capable MS receiving a TU3 Rayleigh-faded 8PSK-modulated neighbor shall not exceed 1.5 microseconds, as specified in 3GPP TS 05.05, Release 99, Annex I, Clause I.2.3, Table I.2.3

### 70.6.5.3 Test purpose

E-OTD measurement accuracy is heavily influenced by the type of RF environment available to the MS at the time a Measure Position Request is received from the network. Rayleigh fading to the neighbor cell will reduce E-OTD measurement accuracy.

The purpose of this test case is to verify that an E-OTD capable MS can provide an observed timing difference (OTD) measurement of sufficient accuracy when measuring against a TU3 Rayleigh fading distant neighbor modulated with 8PSK in time slots 1-7. During this test, there shall be no co-, adjacent-, or alternate-channel interference.

### 70.6.5.4 Method of Test

#### Initial Configuration

Neighbor Cells: At least one neighbor cell with a minimum configuration of a BCCH in order to allow the mobile to perform the required accuracy measurements. The neighbor BCCH shall be included in the serving BCCH System Information Neighbor List.

Assistance Data: The assistance data listed in Table 70.6.5-1 and Table 70.6.5-2 shall be provided by the serving base station simulator. Without assistance data, successful validation of the MS physical layer may be impossible due to limitations imposed by the device's upper protocol layers.

**Table 70.6.5-3: RRLP Measure Position Request Field Values, E-OTD Reference BTS for Assistance Data Element**

| Field Name       | Value                        | Comments                                                                                                             |
|------------------|------------------------------|----------------------------------------------------------------------------------------------------------------------|
| BCCH Carrier     | Range 0-1023                 | ARFCN of Serving BCCH                                                                                                |
| BSIC             | Range 0 to 65                | BSIC of Serving BCCH                                                                                                 |
| Time Slot Scheme | Either 0 or 1, as applicable | 0=All time slots 156.25 bits long<br>1=Time slots 0 and 4 are 157 bits long, all other time slots are 156 bits long. |
| BTS Position     | None                         | Not applicable for timing accuracy measurements                                                                      |

| Relative East               | None                         | Not Applicable                                                                                                                               |

### 70.6.5.5 Test procedure

- a) Configure serving base station simulator to transmit 8PSK bursts modulated with pseudo-random data in time slots 1 through 7
- b) Establish RF connectivity between the E-OTD compatible MS and its serving base station simulator, verify RSSI of -80 dBm
- c) Disable the interfering signal generator
- d) Configure the neighbor base station simulator such that its power (as measured at the antenna terminal of the EOTD MS under test) is -110 dBm with Rayleigh fading disabled. The neighbor shall be transmitting 8PSK bursts modulated with pseudo-random data in time slots 1 through 7
- e) Configure the fading simulator for Rayleigh fading corresponding to a velocity of 3 kph, with a 12-tap delay and amplitude spread in accordance with 3GPP TS 05.05, Release 99, Rev. 8.7.1, Annex C, Section C.3.3.
- f) With the carrier from the serving base station simulator disabled, enable TU3 Rayleigh fading on the neighbor cell, and verify an average RSSI (at the antenna connection of the MS) of -110 dBm
- g) Re-enable the serving base station simulator carrier, verify an RSSI (at the antenna connection of the MS) of -80 dBm
- h) The SS initiates a Measure Position Request RRLP messages and begins logging E-OTD Response messages from the MS under test. The Measure Position Request message is repeated 250 times at 5-second intervals and the response RRLP messages are recorded.
- i) After transmitting 250 Measure Position Request RRLP messages to the MS under test, calculate each trial's error relative to the known RTD, sort the data in ascending order, develop the 90% subset M and calculate the RMS<sub>90</sub> error.

### 70.6.5.6 Test Requirements

Verify that the RMS<sub>90</sub> error calculated in Step i) is < 1.5 microseconds

## 70.6.6 E-OTD Accuracy, Sensitivity Performance Tests for 8PSK Modulated signals

### 70.6.6.1 Definition and applicability

Enhanced Observed Timing Difference is a mechanism intended to provide location information from an MS within a GSM network. E-OTD measures the burst timing alignment between the serving cell for the MS and a minimum of two neighbor cells. The observed timing difference, along with the BSIC or Cell ID of each neighbor cell that can be received and measured by the MS, is reported to the network. Using this information, an E-OTD capable network can calculate the location of the MS using triangulation techniques.

Although an E-OTD capable MS must receive a minimum of two neighbors in order to provide the network with useable data for E-OTD positioning, only one neighbor is required for the timing measurement tests described in this procedure.

### 70.6.6.2 Conformance requirement

The  $RMS_{90}$  measurement error of an E-OTD capable MS receiving a neighbor shall not exceed 100 nanoseconds and 300 nanoseconds at a minimum neighbor carrier signal strength relative to relative sensitivity levels of 12 dB and -8 dB respectively, as specified in 3GPP TS 05.05, annex I, subclause I.2.1, table I.2.1

### 70.6.6.3 Test purpose

E-OTD measurement accuracy is heavily influenced by the type of RF environment available to the MS at the time a Measure Position Request is received from the network. Nearby neighbor stations that provide a relatively high C/N to the MS receiver should result in greater measurement accuracy than those further away with a low C/N.

The purpose of this test case is to verify that an E-OTD capable MS can provide an observed timing difference (OTD) measurement of sufficient accuracy when measuring against an 8PSK neighbor. During this test, there shall be no co-, adjacent-, or alternate-channel interference.

#### Related PICS/PIXIT Statement

- Support MS Assisted/Unassisted E-OTD.

### 70.6.6.4 Method of Test

#### Initial Configuration

Neighbor Cell: One-neighbor cells with a minimum configuration of a BCCH in order to allow the MS to perform the required measurements. The neighbor BCCH shall be included in the serving BCCH System Information Neighbor List.

Assistance Data: The assistance data listed in Table 70.6.6-1 and Table 70.6.6-2 shall be provided by the serving base station simulator. Without assistance data, successful validation of the MS physical layer may be impossible due to limitations imposed by the device's upper protocol layers.

#### 70.6.6.5 Test procedure

- a) Configure serving base station simulator to transmit 8PSK bursts in time slots 1 through 7.
- b) Establish RF connectivity between the E-OTD compatible MS and its serving base station simulator, verify RSSI of -80 dBm.
- c) Disable the interfering signal generator.
- d) Configure the neighbor base station simulator such that its power (as measured at the antenna terminal of the E-OTD MS under test) is -90 dBm, and that it is transmitting 8PSK bursts in time slots 1-7.
- e) The serving base station SS initiates a Measure Position Request RRLP message. Begin logging E-OTD Measure Position Response RRLP messages from the MS under test. The Measure Position Request is repeated a minimum of 250 times at 5-second intervals and the response RRLP messages are logged.
- f) The SS calculates each trial's error relative to the known RTD, sort the data in ascending order, develop the 90 % subset M and calculate the RMS<sub>90</sub> error.
- g) Disable the interfering signal generator.
- h) Configure the neighbor base station simulator such that its power (as measured at the antenna terminal of the E-OTD MS under test) is -110 dBm, and that it is transmitting 8PSK bursts in time slots 1-7.
- i) The serving base station SS initiates a Measure Position Request RRLP message. Begin logging E-OTD Measure Position Response RRLP messages from the MS under test. The Measure Position Request is repeated a minimum of 250 times at 5 s intervals and the response RRLP messages are logged.
- j) After transmitting 250 Measure Position Request RRLP messages to the MS under test, calculate each trial's error relative to the known RTD, sort the data in ascending order, develop the 90 % subset M and calculate the RMS<sub>90</sub> error.

#### 70.6.6.6 Test Requirements

Verify that the RMS<sub>90</sub> error calculated for each procedure in 70.6.6.5 is within the test conformance requirements listed in Table 70.6.6-3

**Table 70.6.6-3, Test Conformance Requirements**

| Procedure | RMS <sub>90</sub> error, 3GPP TS 05.05, Annex I, Minimum Performance Requirement | RMS <sub>90</sub> error, 3GPP TS 51.010, 70.6.6, Test Conformance Requirement |
|-----------|----------------------------------------------------------------------------------|-------------------------------------------------------------------------------|
| Step f    | ≤ 100 nanoseconds                                                                | ≤110 nanoseconds                                                              |
| Step j    | ≤ 300 nanoseconds                                                                | ≤310 nanoseconds                                                              |

## 70.7 Assisted GPS Network Induced Tests

### 70.7.1 LCS Network Induced Emergency Call on an SDCCH / idle, no IMSI State

#### 70.7.1.1 LCS Network Induced Emergency Call on an SDCCH / idle, no IMSI for mobiles supporting MS-Based GPS

This test case applies to all MSs supporting MS-Based GPS Location Service capabilities.

##### 70.7.1.1.1 Conformance requirements

1. With the MS (no SIM inserted) in the "idle, no IMSI" state, the user shall initiate an emergency call by dialling the number 112 (for GSM 900 and 1 800 MSs), or 911 (for PCS 1 900 MS in the USA 1 900 MS), or 08 (for PCS MS in Mexico). The MS shall send a CHANNEL REQUEST message with correct establishment cause ("emergency call").
2. The network allocates a dedicated channel to the mobile station by sending an IMMEDIATE ASSIGNMENT message. When a user requests an emergency call establishment the mobile station will send a CM SERVICE REQUEST message to the network with a CM service type information element indicating emergency call establishment and the correct CKSN and TMSI. A mobile station which implements the "LCS" option shall also implement the "Controlled Early Classmark Sending" option. A mobile station which implements the "Controlled Early Classmark Sending" option shall indicate it in the classmark (ES IND bit).
3. After sending the CM SERVICE REQUEST message the MS shall send a CLASSMARK CHANGE message. The "Mobile Station Classmark 3" information element shall correctly specify the positioning methods supported by the MS.
4. After the CM SERVICE ACCEPT message is received from the network, the MS shall send an EMERGENCY SETUP message.
5. On receiving the RRLP MEASURE POSITION REQUEST message the MS tries to perform the requested location measurements, and calculates its own position. It sends the results in the RRLP MEASURE POSITION RESPONSE message.
6. After receipt of a CONNECT ACKNOWLEDGE message during correct establishment of the emergency call the MS shall indicate that the TCH is through connected in both directions.

#### 70.7.1.1.2 Purpose

To verify when an emergency call is initiated by an MS that does not have a SIM fitted, the network instigates the LCS positioning procedure by sending RRLP (Measure Position Request) message and the mobile responds with RRLP (Measure Position Response) containing MS location.

#### 70.7.1.1.3 Method of Test

##### Initial Conditions

System Simulator (SS):

Serving Cell: default conditions.

Satellites: at least 3 GPS satellite signals are used.

Mobile Station (MS):

The MS is in MM-state "idle, no IMSI", no SIM inserted.

SIM:

No SIM.

##### Related PICS/PIXIT Statements

- Support A-GPS LCS for MS-Based GPS.

##### Test Procedure

An Emergency Call is initiated by the MS, with no SIM inserted in the MS.

Directly after sending EMERGENCY SETUP the MS receives a RR APPLICATION INFORMATION message containing an RRLP Measure Position Request.

The MS then performs positioning measurements, calculates MS location estimate, and responds with a RR APPLICATION INFORMATION message containing MS location in a RRLP Measure Position Response.

The emergency call is then established as normal with late assignment. Having reached the active state, the call is cleared by the SS.

##### Maximum duration of the test

1 minute.

## Expected Sequence

| Step | Direction | Message                    | Comments                                                                                                                                                                                                                                                                                                         |

### 70.7.1.2 LCS Network Induced Emergency Call on an SDCCH / idle, no IMSI for mobiles supporting MS-Assisted GPS

This test case applies to all MSs supporting MS-Assisted GPS Location Service capabilities.

#### 70.7.1.2.1 Conformance requirements

1. With the MS (no SIM inserted) in the "idle, no IMSI" state, the user shall initiate an emergency call by dialling the number 112 (for GSM 900 and 1 800 MSs), or 911 (for PCS 1 900 MS in the USA 1 900 MS), or 08 (for PCS MS in Mexico). The MS shall send a CHANNEL REQUEST message with correct establishment cause ("emergency call").
2. The network allocates a dedicated channel to the mobile station by sending an IMMEDIATE ASSIGNMENT message. When a user requests an emergency call establishment the mobile station will send a CM SERVICE REQUEST message to the network with a CM service type information element indicating emergency call establishment and the correct CKSN and TMSI. A mobile station which implements the "LCS" option shall also implement the "Controlled Early Classmark Sending" option. A mobile station which implements the "Controlled Early Classmark Sending" option shall indicate it in the classmark (ES IND bit).
3. After sending the CM SERVICE REQUEST message the MS shall send a CLASSMARK CHANGE message. The "Mobile Station Classmark 3" information element shall correctly specify the positioning methods supported by the MS.
4. After the CM SERVICE ACCEPT message is received from the network, the MS shall send an EMERGENCY SETUP message.
5. On receiving the RRLP MEASURE POSITION REQUEST message the MS tries to perform the requested location measurements. It sends the results in the RRLP MEASURE POSITION RESPONSE message.
6. After receipt of a CONNECT ACKNOWLEDGE message during correct establishment of the emergency call the MS shall indicate that the TCH is through connected in both directions.

### 70.7.1.2.2 Test Purpose

To verify when an emergency call is initiated by an MS that does not have a SIM fitted, the network instigates the LCS positioning procedure by sending RRLP (Measure Position Request) message and the mobile responds with RRLP (Measure Position Response) containing A-GPS measurement values.

### 70.7.1.2.3 Method of Test

#### Initial Conditions

System Simulator (SS):

Serving Cell: default parameters.

Satellites: at least 3 GPS satellite signals are used.

Mobile Station (MS):

The MS is in MM-state "idle, no IMSI", no SIM inserted.

SIM:

No SIM.

#### Related PICS/PIXIT Statements

- Support A-GPS LCS for MS-Assisted GPS.

#### Test Procedure

An Emergency Call is initiated by the MS, with no SIM inserted in the MS.

Directly after sending EMERGENCY SETUP the MS receives a RR APPLICATION INFORMATION message containing an RRLP Measure Position Request.

The MS then performs positioning measurements and responds with a RR APPLICATION INFORMATION message containing a RRLP Measure Position Response.

The emergency call is then established as normal with late assignment. Having reached the active state, the call is cleared by the SS.

#### Maximum duration of the test

1 minute.

The setting for positioning specifies Positioning Method capability and Positioning Method Support. In the position method support( 5 bit field), Bit 3 is set to 1 (MS-Assisted GPS) |

## 70.7.2 Positioning/ RR/ Classmark Interrogation tests

## 70.7.2.1 Positioning/ RR/ Classmark Interrogation test for mobile supporting MS-Based GPS

This subclause is applicable for MS-Based GPS cases of the A-GPS LCS method.

## 70.7.2.1.1 Conformance requirement

If the MS supports MS-Based positioning method, the MS shall provide the BSC and MSC with the positioning method(s) it supports via controlled early Classmark sending.

## References

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.3.1.1.4.1.

## 70.7.2.1.2 Test Purpose

To verify that the MS supplies MS Positioning Method Capability and Positioning Method(s) support, 5 bit field by early classmark sending procedure on SDCCH. Note: no positioning procedure is performed and no TCH is involved.

## 70.7.2.1.3 Method of Test

## Initial Conditions

System Simulator (SS):

Serving Cell: ATT bit set to 1, Early classmark sending control set to on.

Mobile Station (MS):

Switched off.

Related PICS/PIXIT statement

- Support A-GPS LCS for MS-Based GPS LCS.

Test Procedure

The MS is switched on. The MS shall initiate location update procedure. After the LOCATION\_UPDATING\_REQUEST message the MS shall transmit CLASSMARK\_CHANGE message including MS Positioning Method Capability and Positioning Method(s) support elements.

Maximum duration of the test

1 minute.

Expected Sequence

| Step | Direction | Message                    | Comments                                                                                                                                                                                                                                                                                                                         |

### 70.7.2.2 Positioning/ RR/ Classmark Interrogation test for mobile supporting MS-Assisted GPS

This subclause is applicable for MS-Assisted GPS LCS method.

#### 70.7.2.2.1 Conformance requirement

If the MS supports MS-Assisted positioning method, the MS shall provide the BSC and MSC with the positioning method(s) it supports via controlled early Classmark sending.

#### 70.7.2.2.2 Test Purpose

To verify that the MS supplies MS Positioning Method Capability and Positioning Method(s) support, 5 bit field by early classmark sending procedure on SDCCH.

NOTE: No positioning procedure is performed and no TCH is involved.

## 70.7.2.2.3 Method of Test

## Initial Conditions

System Simulator (SS):

1 cell, ATT bit set to 1.

Mobile Station (MS):

Switched off.

## Related PICS/PIXIT statement

- Support A-GPS LCS for MS-Assisted GPS LCS.

## Test Procedure

The MS is switched on. The MS shall initiate location update procedure. After the LOCATION\_UPDATING\_REQUEST message the MS shall transmit CLASSMARK\_CHANGE message including MS Positioning Method Capability and Positioning Method(s) support elements.

## Maximum duration of the test

1 minute.

## Expected Sequence

## 70.7.3 Network Induced Location Request Emergency Call on an SDCCH

For Mobiles supporting speech, emergency call establishment will be initiated by the MS whether location updating has been successful or not and whether a SIM is inserted into the MS or not.

A Network Induced Location Request could occur at any point during emergency call setup (Ref 3GPP TS 03.71 subclause 7.6.4.1). This could occur during an emergency setup before connection to a traffic channel.

## 70.7.3.1 Network Induced Location Request Emergency Call on an SDCCH for mobiles supporting MS-Based GPS

The tests of this section are only applicable to an MS supporting speech and MS-Based GPS positioning.

#### 70.7.3.1.1 Conformance requirements

1. With the MS in the "idle, updated" state, the user shall initiate an emergency after the number 112 (for GSM 900 and 1 800 MS), or 911 (for PCS 1 900 MS in the USA), or 08 (for PCS 1 900 MS in Mexico) has been entered by the user. The MS shall send a CHANNEL REQUEST message with correct establishment cause ("emergency call").
2. The network allocates a dedicated channel to the mobile station by sending an IMMEDIATE ASSIGNMENT message. When a user requests an emergency call establishment the mobile station will send a CM SERVICE REQUEST message to the network with a CM service type information element indicating emergency call establishment and the correct CKSN and TMSI. A mobile station which implements the "LCS" option shall also implement the "Controlled Early Classmark Sending" option. A mobile station which implements the "Controlled Early Classmark Sending" option shall indicate it in the classmark (ES IND bit).
3. After sending the CM SERVICE REQUEST message the MS shall send a CLASSMARK CHANGE message. The "Mobile Station Classmark 3" information element shall correctly specify the positioning methods supported by the MS.
4. After cipher mode setting acceptance by the network, the MS shall send an EMERGENCY SETUP message.
5. On receiving the RRLP MEASURE POSITION REQUEST message the MS tries to perform the requested location measurements, and calculates its own position. It sends the results in the RRLP MEASURE POSITION RESPONSE message.
6. After receipt of a CONNECT ACKNOWLEDGE message during correct establishment of the emergency call the MS shall indicate that the TCH is through connected in both directions.

#### 70.7.3.1.2 Test Purpose

To verify when an emergency call is initiated by the MS, the network instigates the LCS positioning procedure by sending RRLP (Measure Position Request) message and the mobile responds with RRLP (Measure Position Response) containing MS location estimate.

#### 70.7.3.1.3 Method of Test

##### Initial Conditions

System Simulator (SS):

Serving Cell: default parameters.

Satellites: at least 3 GPS satellite signals are used.

Mobile Station (MS):

The MS is in MM-state "idle, updated" with valued TMSI and CKSN.

##### Related PICS/PIXIT Statements

- Support A-GPS LCS for MS Based GPS.

## Test Procedure

An Emergency Call is initiated with the MS. SIM card is included in the MS.

Directly after sending EMERGENCY SETUP the MS receives a RR APPLICATION INFORMATION message containing an RRLP Measure Position Request.

The MS then performs positioning measurements, calculates MS location estimate, and responds with a RR APPLICATION INFORMATION message containing MS location in a RRLP Measure Position Response.

The emergency call is then established as normal with late assignment. Having reached the active state, the call is cleared by the SS.

## Maximum duration of the test

1 minute.

## Expected Sequence

| LocationInfo        | SEQUENCE       | Minimum set of location information parameters is tbd. Any value of those parameters is acceptable. |
| LocationError       | SEQUENCE       | Any error value is acceptable.                                                                      |

### 70.7.3.2 Network Induced Location Request Emergency Call on an SDCCH for mobiles supporting MS-Assisted GPS

The tests of this section are only applicable to an MS supporting speech and MS-Assisted GPS positioning.

#### 70.7.3.2.1 Conformance requirements

1. With the MS in the "idle, updated" state, the user shall initiate an emergency after the number 112 (for GSM 900 and 1 800 MS), or 911 (for PCS 1 900 MS in the USA), or 08 (for PCS 1 900 MS in Mexico) has been entered by the user. The MS shall send a CHANNEL REQUEST message with correct establishment cause ("emergency call").

2. The network allocates a dedicated channel to the mobile station by sending an IMMEDIATE ASSIGNMENT message. When a user requests an emergency call establishment the mobile station will send a CM SERVICE REQUEST message to the network with a CM service type information element indicating emergency call establishment and the correct CKSN and TMSI. A mobile station which implements the "LCS" option shall also implement the "Controlled Early Classmark Sending" option. A mobile station which implements the "Controlled Early Classmark Sending" option shall indicate it in the classmark (ES IND bit).
3. After sending the CM SERVICE REQUEST message the MS shall send a CLASSMARK CHANGE message. The "Mobile Station Classmark 3" information element shall correctly specify the positioning methods supported by the MS.
4. After cipher mode setting acceptance by the network, the MS shall send an EMERGENCY SETUP message.
5. On receiving the RRLP MEASURE POSITION REQUEST message the MS tries to perform the requested location measurements. It sends the results in the RRLP MEASURE POSITION RESPONSE message.
6. After receipt of a CONNECT ACKNOWLEDGE message during correct establishment of the emergency call the MS shall indicate that the TCH is through connected in both directions.

### 70.7.3.2.2 Test Purpose

To verify when an emergency call is initiated by the MS, the network instigates the LCS positioning procedure by sending RRLP (Measure Position Request) message and the mobile responds with RRLP (Measure Position Response) containing A-GPS measurement values.

### 70.7.3.2.3 Method of Test

#### Initial Conditions

System Simulator (SS):

Serving Cell: default parameters.

Satellites: at least 3 GPS satellite signals.

Mobile Station (MS):

The MS is in MM-state "idle, updated" with valued TMSI and CKSN.

SIM:

Normal SIM.

#### Related PICS/PIXIT Statements

- Support A-GPS LCS for MS Assisted GPS.

#### Test Procedure

An Emergency Call is initiated with the MS. SIM card is included in the MS.

Directly after sending EMERGENCY SETUP the MS receives a RR APPLICATION INFORMATION message containing an RRLP Measure Position Request.

The MS then performs positioning measurements, and responds with a RR APPLICATION INFORMATION message containing a RRLP Measure Position Response.

The emergency call is then established as normal with late assignment. Having reached the active state, the call is cleared by the SS.

Maximum duration of the test

1 minute.

Expected Sequence

| Step | Direction | Message                    | Comments                                                                                                                                                                                                                                                                                                            |

## 70.7.4 Network Induced Location Request Emergency Call on TCH Radio Channel

### 70.7.4.1 Network Induced Location Request Emergency Call on TCH Radio Channel for Mobiles Supporting MS-Based GPS

The tests of this section are only applicable to an MS supporting speech and MS-Based GPS positioning.

#### 70.7.4.1.1 Conformance requirements

1. With the MS in the "idle, updated" state, the user shall initiate an emergency after the number 112 (for GSM900 and 1800 MS), or 911 (for PCS 1900 MS in the USA), or 08 (for PCS 1900 MS in Mexico) has been entered by

the user. The MS shall send a CHANNEL REQUEST message with correct establishment cause ("emergency call").

2. When a user requests an emergency call establishment the mobile station will send a CM SERVICE REQUEST message to the network with a CM service type information element indicating emergency call establishment and the correct CKSN and TMSI. A mobile station which implements the "LCS" option shall also implement the "Controlled Early Classmark Sending" option. A mobile station which implements the "Controlled Early Classmark Sending" option shall indicate it in the classmark (ES IND bit).
3. After sending the CM SERVICE REQUEST message the MS shall send a CLASSMARK CHANGE message. The "Mobile Station Classmark 3" information element shall correctly specify the positioning methods supported by the MS.
4. After cipher mode setting acceptance by the network, the MS shall send an EMERGENCY SETUP message.
5. After receipt of a CONNECT ACKNOWLEDGE message during correct establishment of the emergency call the MS shall indicate that the TCH is through connected in both directions.
6. On receiving the MEASURE POSITION REQUEST message the MS tries to perform the requested location measurements, and calculates its own position. It sends the results in the RRLP MEASURE POSITION RESPONSE message.

### 70.7.4.1.2 Test Purpose

To verify when a network instigates the LCS positioning procedure by sending RRLP (Measure Position Request) message, after a traffic channel has been established during an emergency call, the mobile responds with RRLP (Measure Position Response) containing MS location estimate.

### 70.7.4.1.3 Method of Test

#### Initial Conditions

System Simulator (SS):

Serving Cell: default parameters.

Satellites: at least 3 GPS satellite signals.

Mobile Station (MS):

The MS is in MM-state "idle, updated" with valued TMSI and CKSN.

SIM:

Normal SIM

#### Related PICS/PIXIT Statements

Support A-GPS LCS for MS Based GPS.

#### Test Procedure

An Emergency Call is initiated with the MS. SIM card is included in the MS.

The emergency call is established with a late assignment.

After receiving the CONNECT ACKNOWLEDGE message from the MS, the SS sends an RR APPLICATION INFORMATION message containing an RRLP Measure Position Request on FACCH.

The MS then performs positioning measurements, and responds with a RR APPLICATION INFORMATION message containing a RRLP Measure Position Response.

The call is cleared by the SS.

Maximum duration of the test

1 minute.

### 70.7.4.2 Network Induced Location Request Emergency Call on TCH Radio Channel for mobiles supporting MS-Assisted GPS

The tests of this section are only applicable to an MS supporting speech and MS-Assisted GPS positioning.

#### 70.7.4.2.1 Conformance requirements

1. With the MS in the "idle, updated" state, the user shall initiate an emergency after the number 112 (for GSM900 and 1800 MS), or 911 (for PCS 1900 MS in the USA), or 08 (for PCS 1900 MS in Mexico) has been entered by the user. The MS shall send a CHANNEL REQUEST message with correct establishment cause ("emergency call").
2. When a user requests an emergency call establishment the mobile station will send a CM SERVICE REQUEST message to the network with a CM service type information element indicating emergency call establishment and the correct CKSN and TMSI. A mobile station which implements the "LCS" option shall also implement the "Controlled Early Classmark Sending" option. A mobile station which implements the "Controlled Early Classmark Sending" option shall indicate it in the classmark (ES IND bit).
3. After sending the CM SERVICE REQUEST message the MS shall send a CLASSMARK CHANGE message. The "Mobile Station Classmark 3" information element shall correctly specify the positioning methods supported by the MS.
4. After cipher mode setting acceptance by the network, the MS shall send an EMERGENCY SETUP message.
5. After receipt of a CONNECT ACKNOWLEDGE message during establishment of the emergency call the MS shall indicate that the TCH is through connected in both directions.
6. On receiving the RRLP MEASURE POSITION REQUEST the MS tries to perform the requested location measurements. It sends the results in the MEASURE POSITION RESPONSE message.

### 70.7.4.2.2 Test Purpose

To verify when a network instigates the LCS positioning procedure by sending RRLP (Measure Position Request) message, after a traffic channel has been established during an emergency call, the mobile responds with RRLP (Measure Position Response) containing A-GPS measurement values.

### 70.7.4.2.3 Method of Test

#### Initial Conditions

System Simulator (SS):

Serving Cell: default parameters

Satellites: at least 3 GPS satellite signals.

Mobile Station (MS):

The MS is in MM-state "idle, updated" with valued TMSI and CKSN.

#### Related PICS/PIXIT Statements

Support A-GPS LCS for MS Assisted GPS

#### Test Procedure

An Emergency Call is initiated with the MS. SIM card is included in the MS.

The emergency call is established with a late assignment.

After receiving the CONNECT ACKNOWLEDGE message from the MS, the SS sends an RR APPLICATION INFORMATION message containing an RRLP Measure Position Request on FACCH.

The MS then performs positioning measurements, and responds with a RR APPLICATION INFORMATION message containing a RRLP Measure Position Response.

The call is cleared by the SS.

#### Maximum duration of the test

1 minute.

## 70.8 Assisted GPS Mobile Originated Tests

### 70.8.1 Basic Self Location

The tests of this section are only applicable to an MS supporting MS-Assisted GPS positioning in idle mode.

#### 70.8.1.1 Conformance requirements

- 1) The MS sends CM SERVICE REQUEST to network for call independent supplementary service.
- 2) The MS invokes self-location request by sending REGISTER message containing Facility IE LCS MO-LR.
- 3) The MS needs to interact with the network for each separate location request.
- 4) On receiving an RRLP MEASURE POSITION REQUEST message the MS tries to perform the requested location measurements. It sends the results in an RRLP MEASURE POSITION RESPONSE message.
- 5) The network returns an LCS result to the MS carrying location estimate requested by the MS in FACILITY message.
- 6) The MS shall terminate the dialogue by sending a RELEASE COMPLETE message.

#### References

3GPP TS 04.80 clauses 2, 3, and 4.

3GPP TS 04.31 clauses 2, 3, 4 and 5.

3GPP TS 04.30 subclause 5.1.1.

#### 70.8.1.2 Test Purpose

To verify that the MS invokes a self-location request by sending the network a REGISTER message containing the Facility IE LCS MO-LR. When the MS receives a FACILITY message containing a Facility IE MO-LR LCS result carrying the requested location estimate, it clears the transaction by sending a RELEASE COMPLETE message.

#### 70.8.1.3 Method of Test

##### Initial Conditions

System Simulator (SS):

Serving Cell: default parameters

Satellites: at least 3 GPS satellite signals.

Mobile Station (MS):

The MS is in MM-state "idle, updated" with valued TMSI and CSKN.

## Related PICS/PIXIT Statements

Support A-GPS LCS for MS Assisted GPS

## Test Procedure

The MS invokes call independent supplementary service through a CM SERVICE REQUEST. The network initiates authentication and ciphering. Then the MS invokes an MO-LR request. The network responds with a FACILITY message containing an MO-LR result. When MS receives FACILITY message, it clears the transaction by sending a RELEASE COMPLETE message.

## Maximum duration of the test

1 minute.

## Expected Sequence

## 70.9 Assisted GPS Mobile Terminated Tests

### 70.9.1 MT-LR Location Notification

#### 70.9.1.1 MT-LR Location Notification for Mobiles Supporting MS-Based GPS

The tests of this section are only applicable to an MS supporting MS-Based GPS positioning.

##### 70.9.1.1.1 Conformance requirements

1. The network invokes a location notification procedure by sending a REGISTER message containing a LCS-LocationNotification invoke component to the MS with notificationType set to notifyLocationAllowed. The MS shall notify the MS user of the location request.
2. The MS shall terminate the dialogue by sending a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionGranted.

##### References

- 3GPP TS 03.71 subclause 7.6.1.
- 3GPP TS 04.30 subclause 4.1.1.
- 3GPP TS 04.80 subclauses 2.4 and 2.5.

##### 70.9.1.1.2 Test Purpose

To verify that when the MS receives a REGISTER message, containing a LCS Location Notification Invoke component set to NotifyLocationAllowed, the MS displays information about the LCS client correctly and sends a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionGranted.

##### 70.9.1.2.3 Method of Test

##### Initial Conditions

System Simulator (SS):

- Serving Cell: default parameters
- Satellites: at least 3 GPS satellite signals.

Mobile Station (MS):

- The MS is in MM-state "idle, updated" with valued TMSI and CKSN.

##### Related PICS/PIXIT Statements

Support A-GPS LCS for MS Based GPS

##### Test Procedure

The MS is paged with a PAGING REQUEST TYPE 1 message. After sending the CIPHERING MODE COMPLETE message the MS receives an SS REGISTER message containing a Facility IE containing a DTAP LCS Location Notification Invoke message set to notifyLocationAllowed. The LCS Client Name contained in the USSD text string of the lcs-LocationNotification shall be displayed. The MS then responds with a RELEASE COMPLETE message containing a LocationNotification return to terminate the dialogue.

##### Maximum duration of the test

1 minute.

## 70.9.1.2 MT-LR Location Notification for Mobiles Supporting MS-Assisted GPS

The tests of this section are only applicable to an MS supporting MS-Assisted GPS positioning.

## 70.9.1.2.1 Conformance requirements

1. The network invokes a location notification procedure by sending a REGISTER message containing a LCS-LocationNotification invoke component to the MS with notificationType set to notifyLocationAllowed. The MS shall notify the MS user of the location request.
2. The MS shall terminate the dialogue by sending a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionGranted.

## References

3GPP TS 03.71 subclause 7.6.1.

3GPP TS 04.30 subclause 4.1.1.

3GPP TS 04.80 subclauses 2.4 and 2.5.

## 70.9.1.2.2 Test Purpose

To verify that when the MS receives a REGISTER message, containing a LCS Location Notification Invoke component set to NotifyLocationAllowed, the MS displays information about the LCS client correctly and sends a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionGranted.

## 70.9.1.2.3 Method of Test

## Initial Conditions

## System Simulator (SS):

Serving Cell: default parameters

Satellites: at least 3 GPS satellite signals.

## Mobile Station (MS):

The MS is in MM-state "idle, updated" with valued TMSI and CKSN.

## Related PICS/PIXIT Statements

Support A-GPS LCS for MS Assisted GPS.

## Test Procedure

The MS is paged with a PAGING REQUEST TYPE 1 message. After sending the CIPHERING MODE COMPLETE message the MS receives an SS REGISTER message containing a Facility IE containing a DTAP LCS Location Notification Invoke message set to notifyLocationAllowed. The LCS Client Name contained in the USSD text string of

the lcs-LocationNotification shall be displayed. The MS then responds with a RELEASE COMPLETE message containing a LocationNotification return to terminate the dialogue.

Maximum duration of the test

1 minute.

## 70.9.2 MT-LR Privacy Options/Verification – Location Allowed If No Response

### 70.9.2.1 MT-LR Privacy Options/Verification– Location Allowed If No Response for mobiles supporting MS-Based GPS

The tests of this section are only applicable to an MS supporting MS-Based GPS positioning.

#### 70.9.2.1.1 Conformance requirements

1. On receipt of a REGISTER message containing the LCS Notification Invoke component with notificationType set to notifyAndVerify-LocationAllowedIfNoResponse. The MS: a) notifies the user of the request, b) indicates the default is location allowed if no response is received within a predetermined period, and c) providing the opportunity to accept or deny the request if allowed by subscription or if barred by subscription.
- 2.

Option 1: The user accepts the location request. The MS shall terminate the dialogue by sending a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionGranted.

Option 2: The user denies the location request.

The MS shall terminate the dialogue by sending a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionDenied.

Option 3: The user takes no action and the verification process times-out.

The MS shall terminate the dialogue by sending a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionGranted if allowed by subscription.

#### References

3GPP TS 03.71 subclause 7.6.1.

3GPP TS 04.30 subclause 4.1.1.

3GPP TS 04.80 subclauses 2.4 and 2.5.

### 70.9.2.1.2 Test Purpose

To verify that the MS receives a REGISTER message, containing a LCS Location Notification Invoke component set to notifyAndVerify-LocationAllowedIfNoResponse, the MS displays information about the LCS client correctly and indicates that the default response is location allowed if no response is sent. Gives the user the option to accept or reject the request and sends a RELEASE COMPLETE message containing a LocationNotification return result with the verificationResponse set to permissionDenied or permissionGranted as appropriate.

### 70.9.2.1.3 Method of Test

#### Initial Conditions

##### System Simulator (SS):

Serving Cell: default parameters.

Satellites: at least 3 GPS satellite signals.

##### Mobile Station (MS):

The MS is in MM-state "idle, updated" with valued TMSI and CKSN.

##### SIM:

SIM has location permission allowed if user does not reply to location privacy request.

#### Related PICS/PIXIT Statements

Support A-GPS LCS for MS Based GPS

#### Test Procedure

The MS is paged with a PAGING REQUEST TYPE 1 message. After sending the CIPHERING MODE COMPLETE message the MS receives an SS REGISTER message with a Facility IE containing a LCS Location Notification Invoke set to notifyAndVerify-LocationAllowedIfNoResponse. The LCS Client Name contained in the USSD text string of the lcs-LocationNotification shall be displayed with the option to accept or deny the request, if allowed by subscription if or barred by subscription respectively. The MS also indicates that location will be allowed if a response is not received within a predetermined time.

##### Option 1:

The user then accepts the location request. The MS responds with a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionGranted.

##### Option 2:

The user then denies the location request. The MS responds with a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionDenied.

##### Option 3:

The user ignores the location request by taking no action, allowing the verification process timer to time-out. The MS responds with a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionGranted.

#### Maximum duration of the test

1 minute.

## Expected Sequence

The test sequence is repeated for  $k = 1 \dots 3$ .

## 70.9.2.2 MT-LR Privacy Options/Verification– Location Allowed If No Response for Mobiles Supporting MS-Assisted GPS

The tests of this section are only applicable to an MS supporting MS-Assisted GPS positioning.

#### 70.9.2.2.1 Conformance requirements

1. On receipt of a REGISTER message containing the LCS Notification Invoke component with notificationType set to notifyAndVerify-LocationAllowedIfNoResponse. The MS: a) notifies the user of the request, b) indicates the default is location allowed if no response is received within a predetermined period, and c) providing the opportunity to accept or deny the request if allowed by subscription or if barred by subscription.

2.

Option 1: The user accepts the location request. The MS shall terminate the dialogue by sending a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionGranted.

Option 2: The user denies the location request.

The MS shall terminate the dialogue by sending a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionDenied.

Option 3: The user takes no action and the verification process times-out.

The MS shall terminate the dialogue by sending a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionGranted if allowed by subscription.

#### References

3GPP TS 03.71 subclause 7.6.1.

3GPP TS 04.30 subclause 4.1.1.

3GPP TS 04.80 subclauses 2.4 and 2.5.

#### 70.9.2.2.2 Test Purpose

To verify that the MS receives a REGISTER message, containing a LCS Location Notification Invoke component set to notifyAndVerify-LocationAllowedIfNoResponse, the MS displays information about the LCS client correctly and indicates that the default response is location allowed if no response is sent. Gives the user the option to accept or reject the request and sends a RELEASE COMPLETE message containing a LocationNotification return result with the verificationResponse set to permissionDenied or permissionGranted as appropriate.

#### 70.9.2.2.3 Method of Test

##### Initial Conditions

System Simulator (SS):

Serving Cell: default parameters

Satellites: at least 3 GPS satellite signals

Mobile Station (MS):

The MS is in MM-state "idle, updated" with valued TMSI and CKSN.

SIM:

SIM has location permission allowed if user does not reply to location privacy request.

##### Related PICS/PIXIT Statements

Support A-GPS LCS for MS Assisted GPS

##### Test Procedure

The MS is paged with a PAGING REQUEST TYPE 1 message. After sending the CIPHERING MODE COMPLETE message the MS receives an SS REGISTER message with a Facility IE containing a LCS Location Notification Invoke

set to notifyAndVerify-LocationAllowedIfNoResponse. The LCS Client Name contained in the USSD text string of the lcs-LocationNotification shall be displayed with the option to accept or deny the request, if allowed by subscription or if barred by subscription . The MS also indicates that location will be allowed if a response is not received within a predetermined time.

Option 1:

The user then accepts the location request. The MS responds with a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionGranted.

Option 2:

The user then denies the location request. The MS responds with a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionDenied.

Option 3:

The user ignores the location request by taking no action, allowing the verification process timer to time-out. The MS responds with a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionGranted if allowed by subscription.

Maximum duration of the test

1 minute.

## Expected Sequence

The test sequence is repeated for  $k = 1 \dots 3$ .

## 70.9.3 MT-LR Privacy Options/Verification – Location Not Allowed If No Response

### 70.9.3.1 MT-LR Privacy Options/Verification– Location Not Allowed If No Response for Mobiles Supporting MS-Based GPS

The tests of this section are only applicable to an MS supporting MS-Based GPS positioning.

#### 70.9.3.1.1 Conformance requirements

1. On receipt of a REGISTER message containing the LCS Notification Invoke component with notificationType set to notifyAndVerify-LocationAllowedIfNoResponse, the MS: a) notifies the user of the request, b) indicates the default is location not allowed if no response is received within a predetermined period, and c) providing the opportunity to accept or deny the request if allowed by subscription or if barred by subscription.

2.

Option 1: The user accepts the location request. The MS shall terminate the dialogue by sending a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionGranted.

Option 2: The user denies the location request.

The MS shall terminate the dialogue by sending a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionDenied.

Option 3: The user takes no action and the verification process times-out.

The MS shall terminate the dialogue by sending a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionDenied if barred by subscription.

#### References

3GPP TS 03.71 subclause 7.6.1.

3GPP TS 04.30 subclause 4.1.1.

3GPP TS 04.80 subclauses 2.4 and 2.5.

#### 70.9.3.1.2 Test Purpose

To verify that if the MS receives a REGISTER message, containing a LCS Location Notification Invoke component set to notifyAndVerify-LocationNotAllowedIfNoResponse, then the MS displays information about the LCS client correctly and indicates that the default response is location allowed if no response is sent. Gives the user the option to accept or reject the request and sends a RELEASE COMPLETE message containing a LocationNotification return result with the verificationResponse set to permissionDenied or permissionGranted as appropriate.

#### 70.9.3.1.3 Method of Test

##### Initial Conditions

System Simulator (SS):

Serving Cell: default parameters

Satellites: at least 3 GPS satellite signals

Mobile Station (MS):

The MS is in MM-state “idle, updated” with valued TMSI and CKSN.

SIM:

SIM has location permission barred if user does not reply to location privacy request.

Support A-GPS LCS for MS Based GPS

## Test Procedure

The MS is paged with a PAGING REQUEST TYPE 1 message. After sending the CIPHERING MODE COMPLETE message the MS receives an SS REGISTER message with a Facility IE containing a LCS Location Notification Invoke set to notifyAndVerify-LocationNotAllowedIfNoResponse. The LCS Client Name contained in the USSD text string of the lcs-LocationNotification shall be displayed with the option to accept or deny the request, if allowed by subscription or if barred by subscription respectively. The MS also indicates that location will be allowed if a response is not received within a predetermined time.

### Option 1:

The user then accepts the location request. The MS responds with a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionGranted.

### Option 2:

The user then denies the location request. The MS responds with a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionDenied.

### Option 3:

The user ignores the location request by taking no action, allowing the verification process timer to time-out. The MS responds with a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionDenied if barred by subscription.

## Maximum duration of the test

1 minute.

## Expected Sequence

The test sequence is repeated for  $k = 1 \dots 3$ .

## 70.9.3.2 MT-LR Privacy Options/Verification– Location Not Allowed If No Response for mobiles supporting MS-Assisted GPS

The tests of this section are only applicable to an MS supporting MS-Assisted GPS positioning.

### 70.9.3.2.1 Conformance requirements

1. On receipt of a REGISTER message containing the LCS Notification Invoke component with notificationType set to notifyAndVerify-LocationAllowedIfNoResponse. The MS: a) notifies the user of the request, b) indicates the default is location not allowed if no response is received within a predetermined period, and c) providing the opportunity to accept or deny the request if allowed by subscription or if barred by subscription respectively.

2.

Option 1: The user accepts the location request. The MS shall terminate the dialogue by sending a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionGranted.

Option 2: The user denies the location request.

The MS shall terminate the dialogue by sending a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionDenied.

Option 3: The user takes no action and the verification process times-out.

The MS shall terminate the dialogue by sending a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionDenied if barred by subscription.

### References

3GPP TS 03.71 subclause 7.6.1.

3GPP TS 04.30 subclause 4.1.1.

3GPP TS 04.80 subclauses 2.4 and 2.5.

### 70.9.3.2.2 Test Purpose

To verify that the MS receives a REGISTER message, containing a LCS Location Notification Invoke component set to notifyAndVerify-LocationNotAllowedIfNoResponse, the MS displays information about the LCS client correctly and indicates that the default response is location allowed if no response is sent. Gives the user the option to accept or reject the request and sends a RELEASE COMPLETE message containing a LocationNotification return result with the verificationResponse set to permissionDenied or permissionGranted as appropriate.

### 70.9.3.2.3 Method of Test

#### Initial Conditions

System Simulator (SS):

Serving Cell: default parameters

Satellites: at least 3 GPS satellite signals

Mobile Station (MS):

The MS is in MM-state "idle, updated" with valued TMSI and CKSN.

SIM:

SIM has location permission barred if user does not reply to location privacy request.

#### Related PICS/PIXIT Statements

Support A-GPS LCS for MS Assisted GPS

#### Test Procedure

The MS is paged with a PAGING REQUEST TYPE 1 message. After sending the CIPHERING MODE COMPLETE message the MS receives an SS REGISTER message with a Facility IE containing a LCS Location Notification Invoke

set to notifyAndVerify-LocationNotAllowedIfNoResponse. The LCS Client Name contained in the USSD text string of the lcs-LocationNotification shall be displayed with the option to accept or deny the request, if allowed by subscription or if barred by subscription respectively. The MS also indicates that location will be allowed if a response is not received within a predetermined time.

Option 1:

The user then accepts the location request. The MS responds with a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionGranted.

Option 2:

The user then denies the location request. The MS responds with a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionDenied.

Option 3:

The user ignores the location request by taking no action, allowing the verification process timer to time-out. The MS responds with a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionDenied if barred by subscription.

Maximum duration of the test

1 minute.

## Expected Sequence

The test sequence is repeated for  $k = 1 \dots 3$ .

## Annex 1 (normative): Reference test methods

### A1.1 General Conditions (GC)

#### A1.1.1 Outdoor test site and general arrangements for measurements involving the use of radiated fields (GC4)

The outdoor test site shall be on a reasonably level surface or ground. At one point on the site a ground plane of at least 5 m diameter shall be provided. In the middle of this ground plane a non-conducting support capable of rotation through 360 degrees in the horizontal plane shall be used to support the test sample at 1,5 m above the ground plane.

The test site shall be large enough to allow the erection of a measuring or transmitting antenna at a distance of half a wavelength or at least 3 m whichever is the greater. Sufficient precautions shall be taken to ensure that reflections from extraneous objects adjacent to the site and ground reflections do not degrade the measurement results.

The test antenna is used to detect the radiation from both the test sample and the substitution antenna, when the site is used for radiation measurements. Where necessary the substitution antenna is used as a transmitting antenna, when the site is used for the measurement of receiver characteristics. This antenna is mounted on a support such as to allow the antenna to be used in either the horizontal or vertical polarization and for the height of its centre above ground to be varied over the range 1 m to 4 m. Preferably test antennas with pronounced directivity should be used. The size of the test antenna along the measurement axis shall not exceed 20 % of the measuring distance.

For radiation measurements the test antenna is connected to a test receiver capable of being tuned to any frequency under investigation and of measuring accurately the relative levels of signals at its input. When necessary (for receiver measurements) the test receiver is replaced by a signal source.

The substitution antenna shall be a half wave dipole, resonant at the frequency under consideration, or a shortened dipole, or (in the range 1 GHz to 4 GHz) a horn radiator. Antennas other than a half wave dipole shall have been calibrated to the half wave dipole. The centre of this antenna shall coincide with the reference point of the test sample it has replaced. This reference point shall be the volume centre of the sample when its antenna is mounted inside the cabinet, or the point where an external antenna is connected to the cabinet. The distance between the lower extremity of the dipole and the ground shall be at least 30 cm.

The substitution antenna shall be connected to a calibrated signal generator when the site is used for radiation measurements and to a calibrated measuring receiver when the site is used for measurements of receiver characteristics. The signal generator and the receiver shall be operating at the frequencies under investigation and shall be connected to the antenna through suitable matching and balancing network.

#### A1.1.2 Anechoic shielded chamber (GC5)

As an alternative to the above mentioned outdoor test site an indoor test site, being a well shielded anechoic chamber simulating free space environment may be used. If such a chamber is used, this shall be recorded in the test report.

NOTE: The anechoic shielded chamber is the preferred test site for testing to the present document.

The measurement site may be an electrically shielded anechoic chamber being 10 m long, 5 m broad and 5 m high. Walls and ceiling should be coated with RF absorbers of 1 m height. The ground should be covered with absorbing material 1 m thick able to carry test equipment and operators. A measuring distance of 3 m to 5 m in the long middle axis of the chamber can be used for measurements up to at least 10 GHz.

The test antenna, test receiver, substitution antenna and calibrated signal generator are used in a way similar to that of the outdoor test site method with the exception that, because the floor absorbers reject floor reflections, the antenna height need not be changed and shall be at the same height as the test sample. In the range between 30 MHz and 100 MHz some additional calibration may be necessary.

### A1.1.3 Temporary antenna connector (GC7)

If the MS to be tested does not normally have a permanent external 50  $\Omega$  connector then for test purposes only it may be modified to fit a temporary 50  $\Omega$  antenna connector.

The permanent integral antenna shall be used for measurement of:

- Transmitter effective radiated power (subclause 13.3).
- Radiated spurious emissions (clause 12).

For tests in the relevant MS Receive band:

- The temporary antenna coupling factor is determined using the procedure defined in annex 1, subclause 1.1.5. When using the temporary antenna connector, the temporary antenna coupling factor needs to be taken into consideration when determining a stimulus or measured level in the receive band.

For tests in the relevant MS Transmit band:

- The temporary antenna coupling factor is determined using the procedure defined in subclause 13.3.4.2. When using the temporary antenna connector, the temporary antenna coupling factor needs to be taken into consideration when determining a stimulus or measured level in the transmit band.

For frequencies outside the above mentioned relevant bands the temporary antenna coupling factor is assumed to be 0 dB.

NOTE 1: The uncertainty in the determined value of the temporary antenna coupling factor is directly related to the uncertainty of the field strength value measured in subclause 13.3.4.2 step n) and annex 1, subclause 1.1.5.2 (approximately  $\pm 3$  dB). By mutual agreement, between the MS manufacturer and the testing authority, a value of 0 dB for the temporary antenna coupling factor could be used.

NOTE 2: The accommodation of the uncertainty in the temporary antenna coupling factor in the relevant MS receive band for the tests in clause 14 is for further study.

NOTE 3: The uncertainty in the temporary antenna coupling factor in the relevant MS transmit band can be accommodated with appropriate adjustment of the measured levels by the uncertainty.

Testing must be performed in the following order to ensure that all the free field measurements are performed before the MS is modified.

- Subclause 12.1.2.
- Annex 1, subclauses 1.1.5.1 and 1.1.5.2.
- Subclause 13.3.4.2 (during this step the MS is modified).
- Annex 1, subclause 1.1.5.3.
- All remaining tests of clauses 12, 13, 14, 15, 16, 17, 18, 19, 20, 21 and 22.

### A1.1.4 Temporary antenna connector characteristics

The method of connection of the temporary connector shall allow secure and repeatable connections to be made to the device under test.

The antenna connector shall present a nominal 50  $\Omega$  impedance over the GSM receive and transmit frequency ranges. The maximum loss within the frequency range 100 kHz to 12,75 GHz shall be less than 1 dB.

The connection circuitry shall be maximally broadband and shall contain no non-linear or active devices.

The characteristics of the connector shall not be significantly affected by temperatures in the range -25° to +60° Celsius.

## A1.1.5 Calibration of the temporary antenna connector

For equipments fitted with an integral antenna and not provided with a permanent means for connection to an external antenna a calibration procedure is required to allow subsequent measurements to be performed on the temporary antenna connector.

Once calibrated this temporary antenna connector enables all receiver test procedures to be identical for equipments with an integral antenna and for equipments with an antenna connector.

The calibration procedure shall be carried out at three frequencies, namely an ARFCN in the low mid and high ARFCN ranges. The procedure consists of three distinct stages as follows:

- 1) Establish the MS antenna radiation pattern for the three selected frequencies.
- 2) Calibrate the test range (or anechoic shielded chamber) for the conditions needed in 1).
- 3) Determine the temporary antenna connector coupling factor.

### A1.1.5.1 Antenna radiation pattern

- a) The MS shall be in the anechoic shielded chamber, or on an outdoor test site, on an isolated support in a vertical position at an orientation specified by the manufacturer. This position is the 0° position.  
  
A test antenna, connected to the SS shall be in the anechoic shielded chamber, or on the outdoor test site, at a distance of at least 3 m from the MS.
- b) A call shall be originated by the SS to the MS on a frequency in the low ARFCN range. The MS shall be made to answer the call. The SS shall command the MS to maximum transmit power.
- c) The SS shall, using estimated parameters for the outdoor test site or anechoic shielded chamber, set its output level "E" [see figure A1-1 to give an MS receiver input level of approximately 32 dB $\mu$ V<sub>emf</sub>. This corresponds to a field strength of 55,5 dB $\mu$ V/m at the MS position. The signal shall be the Standard Test Signal C1.

NOTE 1: The absolute value of the received signal level is not critical. The value suggested however will ensure that the MS receiver is operating essentially error free, yet is low enough to avoid any non linear effects in the receiver.

- d) The SS shall use the RXLEV message from the MS to determine a measure of the received field strength. The procedure detailed in the flow chart of figure A1-1 shall now be followed.

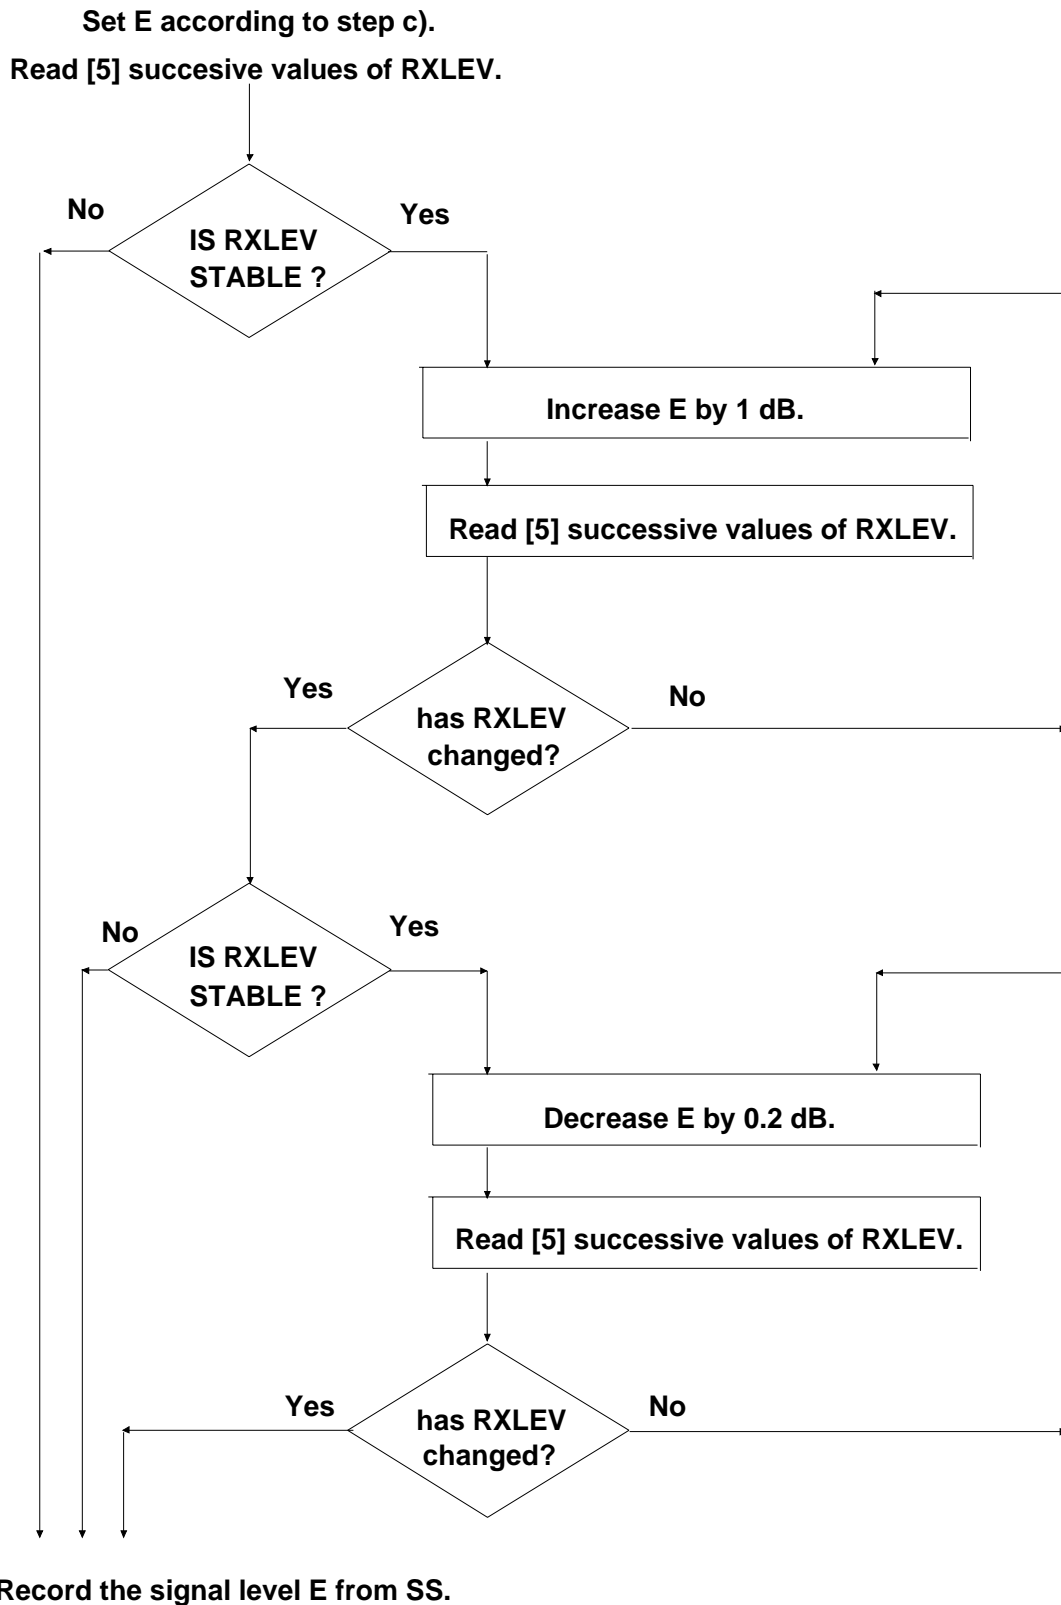

Figure A1-1

The signal level from the SS that just results in the transition from  $RXLEV_a$  to  $RXLEV_b$  shall be recorded as  $E_i$ .

NOTE 2: The actual values of  $RXLEV_a$  and  $RXLEV_b$  will need to be recorded, because this transition will be used as the reference point for all further stages of the calibration procedure.

e) Step d) shall be repeated after the MS has been rotated by  $n \times 45^\circ$  in the horizontal plane. Ensuring that the same RXLEV transition is used, the signal levels from the SS shall be recorded as  $E_{in}$ .

- f) Calculate the effective mean signal level from the RMS value of the eight signal levels obtained in d) and e) above by using the following formula:

$$E_1 = \left[ \frac{8}{\sum_{n=0}^{n=7} \frac{1}{E_{in}}} \right]^{1/2}$$

- g) Repeat steps b) to f), except in step b) use an ARFCN in the mid ARFCN range to obtain a mean signal level  $E_2$ . Ensure the same RXLEV transition is used.
- h) Repeat steps b) to f), except in step b) use an ARFCN in the high ARFCN range to obtain a mean signal level  $E_3$ .

Ensure the same RXLEV transition is used.

### A1.1.5.2 Test range calibration

The objective of this step is to determine the actual field strength at the MS corresponding to the three signal levels  $E_1$ ,  $E_2$  and  $E_3$  established in annex 1, subclause 1.1.5.1. The following procedure shall be used:

- a) Replace the MS by a calibrated reception antenna connected to a measuring receiver.
- b) For each frequency used in annex 1, subclause 1.1.5.1 measure the field strength  $E_{fr}$  corresponding to the respective signal levels  $E_r$  determined in steps f), g) and h) of annex 1, subclause 1.1.5.1 record these values as  $E_{f1}$ ,  $E_{f2}$ ,  $E_{f3}$ .

### A1.1.5.3 Temporary antenna connector coupling factor

The coupling factor of the temporary antenna connector is the relationship expressed in dB, between the output signal of the SS and the effective receiver input signal for the MS.

The test sample MS is modified to fit a temporary antenna connector in accordance with annex 1, subclause 1.1.3. Or alternatively a second MS shall be provided, fitted with such a temporary antenna connector.

- NOTE: If only one MS is supplied for testing, the tests of radiated spurious emissions (transmit and receive) and receiver sensitivity shall be performed before the MS is modified to accept a temporary antenna connector.

The calibration procedure shall be as follows:

- a) The MS temporary connector is connected to the output of the SS.
- b) A call shall be originated by the SS to the MS using a frequency in the low ARFCN range. The MS shall be made to answer the call. The SS shall command the MS to maximum transmit power, non hopping encrypted mode.
- c) The SS shall, using the procedures of annex 1, subclause 1.1.5.1, adjust its output signal level to determine the RXLEV<sub>a</sub> to RXLEV<sub>b</sub> transition. This signal level shall be recorded as  $E_{c1}$ .
- d) Repeat steps b) and c) for frequencies in the mid ARFCN range and the high ARFCN range. Record the RXLEV transitions as  $E_{c2}$  and  $E_{c3}$  respectively.
- e) The temporary antenna connector coupling factor F is then calculated from:

$$F_n = 20 \log_{10} \left[ \frac{E_{cn}}{E_{fn} * K_n} \right]$$

where  $K_n$  = conversion factor of an isotropic antenna expressed as  $\mu V$  at the frequency  $\mu V/m$  corresponding to the ARFCN used.

- f) The mean antenna coupling factor  $F_m$  to be used for measurements requiring hopping shall be calculated from the RMS value of all parameters in e) as follows:

$$E_{cm} = \left[ \frac{3}{1/E_{c1} + 1/E_{c2} + 1/E_{c3}} \right]^{1/2}$$

$$E_{fm} = \left[ \frac{3}{1/E_{f1} + 1/E_{f2} + 1/E_{f3}} \right]^{1/2}$$

$$k_m = \left[ \frac{k_1 + k_2 + k_3}{3} \right]^{1/2}$$

$$F_m = 20 \log_{10} \left[ \frac{E_{cm}}{E_{fm} + k_m} \right]$$

- g) In all tests in which a MS with integral antenna is the unit under test, the signal level at the temporary antenna connector is determined from:

$$- E_{in} = E_{req} + F;$$

where:

- $E_{in}$  = signal level at coupling device (dB $\mu$ Vemf);
- $E_{req}$  = signal level required by the test (dB $\mu$ Vemf);
- $F$  = coupling factor at the respective ARFCN (dB).

This is indicated in the test procedures as  $E_{req}$ , dB $\mu$ Vemf( ), where the empty parenthesis is to be read as  $E_{in}$ .

For frequencies not in the receive band or the transmit band, 0dBi antenna gain shall be assumed.]

## A1.2 Normal and extreme Test Conditions (TC)

### A1.2.1 Power sources and ambient temperatures (TC2)

During type approval tests the power source of the equipment shall be replaced by a test power source, capable of producing normal and extreme test voltages as specified in subclauses 1.2.2 and 1.2.3. The internal impedance of the test power source shall be low enough for its effect on the test results to be negligible. For the purpose of tests, the voltage of the power source shall be measured at the input terminals of the equipment. If the equipment is provided with a permanently connected power cable, the test voltage shall be that measured at the point of connection of the power cable to the equipment. In equipment with incorporated batteries the test power source shall be applied as close to the battery terminals as practicable.

During tests the power source voltages shall be maintained within a tolerance of  $\pm 3$  % relative to the voltage at the beginning of each test.

### A1.2.2 Normal test conditions (TC2.1)

The normal temperature and humidity conditions for tests shall be any convenient combination of temperature and humidity within the following ranges:

- Temperature: +15°C to +35°C (degrees Celsius).
- Relative humidity: 20 % to 75 %.

NOTE: When it is impracticable to carry out the tests under the conditions stated above, the actual temperature and relative humidity during the tests shall be recorded in the test report.

The normal test voltage for equipment to be connected to the mains shall be the nominal mains voltage. For the purpose of these specifications, the nominal voltage shall be the declared voltage or any of the declared voltages for which the equipment was designed. The frequency of the test power source corresponding to the mains shall be within 1 Hz of the nominal mains frequency.

When the radio equipment is intended for operation from the usual types of regulated lead-acid battery power source of vehicles, the normal test voltage shall be 1,1 times the nominal voltage of the battery (6 volts, 12 volts etc.).

For operation from other power sources or types of battery (primary or secondary) the normal test voltage shall be that declared by the equipment manufacturer.

### A1.2.3 Extreme test conditions (TC2.2)

For tests under extreme test conditions the 4 combinations of extreme voltages and extreme temperatures in table A1.1 shall be applied.

**Table A1.1**

|             | 1    | 2    | 3    | 4   |
|-------------|------|------|------|-----|
| Temperature | High | High | Low  | Low |
| Voltage     | High | Low  | High | Low |

For tests at extreme ambient temperatures measurements shall be made at the temperatures given in table A1.2, following the testing procedures given in IEC publications 68-2-1 and 68-2-2 for the low and high temperature tests.

For tests at the high temperature, after thermal balance has been achieved, the MS is switched on in the transmit condition (non DTX) for a period of one minute followed by 4 minutes in the idle mode (non DRX) after which the MS shall meet the specified requirements.

For tests at the low temperature, after thermal balance has been achieved, the MS is switched to the idle mode (non DRX) for a period of one minute after which the MS shall meet the specified requirements.

**Table A1.2**

|                       | Temperature (degrees Celsius) |      |
|-----------------------|-------------------------------|------|
|                       | Low                           | High |
| Handheld              | -10                           | +55  |
| Vehicular or Portable | -20                           | +55  |

For tests at extreme voltages measurements shall be made at the lower and higher extreme voltages as declared by the MS manufacturer. For MS that can be operated from one or more of the power sources listed below, the lower extreme voltage shall not be higher, and the higher extreme voltage shall not be lower than that specified in table A1.3.

**Table A1.3**

|                                | Voltage (relative to nominal) |                |              |
|--------------------------------|-------------------------------|----------------|--------------|
|                                | Lower extreme                 | Higher extreme | Normal cond. |
| Power source:<br>AC mains      | 0,9                           | 1,1            | 1,0          |
| Regulated lead<br>acid battery | 0,9                           | 1,3            | 1,1          |
| Non regulated<br>batteries:    |                               |                |              |
| Leclanché/<br>lithium          | 0,85                          | 1,0            | 1,0          |
| mercury/<br>nickel cadmium     | 0,9                           | 1,0            | 1,0          |

### A1.2.4 Vibration requirements (TC4)

When the MS is to be tested under vibration, then random vibration is used, where the acceleration spectral densities (ASD) and the frequency ranges of 3GPP TS 05.05 [subclause D.2.3] apply. These are given in table A1.4.

**Table A1.4**

| frequency in Hz | ASD in $\text{m}^2/\text{s}^3$           |
|-----------------|------------------------------------------|
| 5- 20           | 0,96                                     |
| 20 - 500        | 0,96 at 20 Hz, thereafter -3 dB / octave |

The test shall be performed as described in IEC publication 68-2-36.

## Annex 2: Not used

Text deleted.

---

## Annex 3: Protocol implementation information

### General

The list of PICS and PIXIT gives all the information needed to perform the tests described in 3GPP TS 11.10.

---

## A3.1 Protocol Implementation Conformance Statement (PICS)

For the points listed the manufacturer has the choice between different solutions in implementation. The manufacturer has to describe his choice if there is any consequence for the tests.

### A3.1.1 LAPDm protocol (3GPP TS 04.05 and 04.06)

#### A3.1.1.1 Simplified protocol - 3GPP TS 04.06 clause 6

Statement about the choice made by the manufacturer.

#### A3.1.1.2 Management of SAPI = 3 - 3GPP TS 04.11 subclause 2.3

Statement about the handling of SAPI = 3 on the data link layer chosen by the manufacturer.

### A3.1.2 Mobility management

#### A3.1.2.1 IMSI detach initiation by the MS - 3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.3.4.1

During a location updating, if an IMSI detach has to be performed (SIM or power off), the IMSI detach can be delayed until the location updating is finished, or can be omitted.

#### A3.1.2.2 IMSI detach completion by the MS - 3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.3.4.3

The MS should delay the local release of the channel to allow a normal release from the network after a detach by power off command, if possible.

If not possible the RR sub-layer on the MS side should be aborted without waiting for something from the network.

#### A3.1.2.3 MM specific procedures - 3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.4 and 4.5.1.1

During the lifetime of an MM specific procedure, if an MM connection establishment is required by a CM-entity, this request will either be rejected or delayed until the running MM specific procedure is terminated and, provided that the network has not sent a "follow-on proceed" indication, the RR connection is released.

If the LOCATION UPDATING REQUEST message has not been sent, the mobile station may include a "follow-on request" indicator in the message. The mobile station shall then delay the request until the MM specific procedure is completed, when it may be given the opportunity by the network to use the RR connection.

### A3.1.2.4 Receiving an MM STATUS message - 3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.6

If the MM-entity of the Mobile Station receives a MM-STATUS message no state transition and no specific action shall be taken as seen from the radio interface, i.e. local actions are possible.

## A3.1.3 Call control

### A3.1.3.1 Status enquiry procedures - 3GPP TS 04.08 / 3GPP TS 24.008 subclause 5.5.3.1

The MS may send a STATUS ENQUIRY and take the appropriate actions based on the answer (STATUS) of the network.

### A3.1.3.2 Receiving a STATUS message by a CC entity - 3GPP TS 04.08 / 3GPP TS 24.008 subclause 5.5.3.2

The determination of which CC states are incompatible between the MS and the network is left as an implementation decision except in some particular cases.

### A3.1.3.3 Called side compatibility checking - 3GPP TS 04.08 / 3GPP TS 24.008 clause B.3

Compatibility checking can be performed in various ways from the viewpoint of execution order and information to be checked, e.g. first DDI number, sub-address and then compatibility or vice versa.

### A3.1.3.4 Disconnect on incoming call

The mobile equipment may or may not offer the possibility to disconnect an incoming call:

- a) after having confirmed an incoming call, but before alerting;
- b) after alerting, but before connecting.

3GPP TS 02.30 (subclause 5.2.3) allows the combination of SEND and END function in one key.

## A3.1.4 Layer 1

### A3.1.4.1 Optional storage of BCCH carrier information - 3GPP TS 05.08 subclause 6.3

The MS may include optional storage of BCCH carrier information. For instance, the MS may store the BCCH carriers in use by the PLMN accessed when it was last active in the GSM network, or it may store BCCH carriers for more than one PLMN.

### A3.1.5 Autocalling - (ref.: 3GPP TS 02.07, annex 1)

Cause number 27 implemented in:

- category 2 (preferred);
- category 3.

## A3.1.6 Transient states

The following call control states may be transient in the mobile station:

State U6

State U6 may be transient if the mobile station is not configured to support explicit refusal of an incoming call by the (human or non-human) user (e.g. via a terminal interface) before call confirmation.

If U6 is transient, there is an internal transition:

CALL CONFIRMED

U6 -----> U9

or an internal transition:

RELEASE COMPLETE

U6 ----- > U0.

State U7:

State U7 is transient if the implementation allows for automatic connect after an implementation specific time T.

If U7 is transient, there is an internal transition:

after T, CONNECT

U7 ----- > U8.

State U9:

State U9 is not transient if:

- the implementation does not support immediate connect;
- an appropriate TCH is not yet assigned;
- the signalling element has not been present in the SETUP.

If the implementation supports immediate connect, there is an internal transition:

CONNECT

U9 ----- > U8.

If the appropriate TCH is available or the signalling element was present in SETUP, there is an internal transition:

ALERTING

U9 ----- > U7.

State U12:

U12 is a stable state, if an appropriate speech traffic channel is connected and progress indicator #8 was present in the DISCONNECT message. Otherwise U12 is transient, and there is an internal transition:

---

## A3.2 Protocol Implementation Extra Information for Testing (PIXIT)

### A3.2.0 Introduction

Some of the features listed below are mandatory, others are not ; but in any case for each feature implemented the manufacturer must provide information to enable regulatory testing to be conducted.

### A3.2.1 Basic characteristics

#### A3.2.1.1 Type of antenna

- Integrated without a connector.
- Position for normal use (if integrated without a connector).
- With a connector allowing the connection of an external antenna.
- If with a connector, declare in band impedance.

#### A3.2.1.2 Power supply

- Type of battery (if any).
- Type of power supply.
- Nominal voltage(s).
- End-point voltage(s) of battery(s) (if any).
- Details of MS shut-down voltage.

#### A3.2.1.3 Power class of the MS

- Different class declared.
- Class mark change: description of the means to change the RF power capabilities.

#### A3.2.1.4 Channel modes supported

- Speech full rate.
- Speech half rate.
- Data 14.5 kbit/s T/NT.
- Data 12 kbit/s full rate T/NT.
- Data 6 kbit/s full rate T/NT.
- Data 6 kbit/s half rate T/NT.
- Data 3,6 kbit/s full rate T.
- Data 3,6 kbit/s half rate T.

### A3.2.1.5 Teleservices supported

- 11) Telephony.
- 12) Emergency calls.
- 21) Short message MT/PP.
- 22) Short message MO/PP.
- 23) Short message transmission cell broadcast.
- 61) Alternate speech and facsimile group 3 T/NT.
- 62) Automatic facsimile group 3 T/NT.

### A3.2.1.6 Supplementary services supported

- Call forwarding.
- Call restriction.
- Handling of undefined GSM Supplementary Services.

### A3.2.1.7 Bearer services supported

- |     |                                                                                                                                           |                                 |
|-----|-------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------|
| 20) | Asynchronous General Bearer Service                                                                                                       | see 3GPP TS 02.02 subclause 3.1 |
| 21) | Data circuit Duplex asynchronous                                                                                                          | 300 bit/s T/NT                  |
| 22) | Data circuit Duplex asynchronous                                                                                                          | 1 200 bit/s T/NT                |
| 23) | Data circuit Duplex asynchronous                                                                                                          | 1 200/75 bit/s T/NT             |
| 24) | Data circuit Duplex asynchronous                                                                                                          | 2 400 bit/s T/NT                |
| 25) | Data circuit Duplex asynchronous                                                                                                          | 4 800 bit/s T/NT                |
| 26) | Data circuit Duplex asynchronous                                                                                                          | 9 600 bit/s T/NT                |
| 30) | Synchronous General Bearer Service                                                                                                        | see 3GPP TS 02.02 subclause 3.1 |
| 31) | Data circuit Duplex synchronous                                                                                                           | 1 200 bit/s T                   |
| 32) | Data circuit Duplex synchronous                                                                                                           | 2 400 bit/s T/NT                |
| 33) | Data circuit Duplex synchronous                                                                                                           | 4 800 bit/s T/NT                |
| 34) | Data circuit Duplex synchronous                                                                                                           | 9 600 bit/s T/NT                |
| 40) | General PAD Access Bearer Service                                                                                                         | see 3GPP TS 02.02 subclause 3.1 |
| 41) | PAD Access circuit asynchronous                                                                                                           | 300 bit/s T/NT                  |
| 42) | PAD Access circuit asynchronous                                                                                                           | 1 200 bit/s T/NT                |
| 43) | PAD Access circuit asynchronous                                                                                                           | 1 200/75 bit/s T/NT             |
| 44) | PAD Access circuit asynchronous                                                                                                           | 2 400 bit/s T/NT                |
| 45) | PAD Access circuit asynchronous                                                                                                           | 4 800 bit/s T/NT                |
| 46) | PAD Access circuit asynchronous                                                                                                           | 9 600 bit/s T/NT                |
| 50) | General Packet Access Bearer Service                                                                                                      | see 3GPP TS 02.02 subclause 3.1 |
| 51) | Data Packet Duplex synchronous                                                                                                            | 2 400 bit/s NT                  |
| 52) | Data Packet Duplex synchronous                                                                                                            | 4 800 bit/s NT                  |
| 53) | Data Packet Duplex synchronous                                                                                                            | 9 600 bit/s NT                  |
| 61) | Alternate Speech/Data<br>(here Data offers the same service<br>as bearer services 21-34 with "3,1kHz" information transfer capability)    |                                 |
| 81) | Speech followed by Data<br>(here Data offers the same service<br>as bearer services 21-34 with "3,1kHz" information transfer capability). |                                 |

### A3.2.1.8 SIM removal

- Removal of the SIM is possible without disconnection of the power supply (Y/N).

### A3.2.1.9 Classmark

The coding of Mobile station classmark 1, 2, and 3 and the fact whether and under which conditions the classmark 3 information element is included in a CLASSMARK CHANGE message, has to be declared by the manufacturer. The declaration has to fulfil the following requirements:

- Mobile station classmark 1: Bits 4, 5 and 8 of the first (and only) octet of the value part of the information element shall be coded as "0". The "Revision level" and "RF power capability" field shall specify the value that is correct for the MS.
- Mobile station classmark 2: Bits 4, 5 and 8 of the first octet, bits 2, 3 and 8 of the second octet, bits 3 to 7 of the third octet of the value part of the information element shall be coded as "0". The "Revision level" field, "RF power capability" field, "PS capability" field, "SS Screening indicator" field, "SM capability" field, "Frequency capability" field, "Classmark 3" field, "A5/2 algorithm supported" field, and "A5/3 algorithm supported" field shall specify the value that is correct for the MS.
- Mobile station classmark 3: Bits 5 to 8 of the first octet of the value part of the information element shall be coded as "0". If the value part contains more octets, they shall be coded as "0000 0000". The "A5/4 algorithm supported" field, "A5/5 algorithm supported" field "A5/6 algorithm supported" field, and "A5/7 algorithm supported" field shall specify the value that is correct for the MS (that is, they shall be set to "0").

NOTE: The requirements to the classmark may be subject to changes. That is why test cases are expected to verify the manufacturer's declaration, whereas the correctness of the manufacturer's declaration is to be verified "off line".

### A3.2.1.10 Type of SIM/ME interface (ref. 3GPP TS 11.11 and 3GPP TS 11.12)

- 5V SIM/ME interface (5V only ME).
- 3V SIM/ME interface (3V only ME).
- 5V/3V SIM/ME interface (3V technology ME).

### A3.2.1.11 Multislot class

- Multislot class as defined in clause B.1 of 3GPP TS 05.02.

## A3.2.2 Man machine interface

### A3.2.2.1 Mobile station features

- Description of manual entry and display of a called number.
- Description of the basic way to send a call manually.
- Description of the basic way to take a call manually.
- Description of the basic way to end a call manually.
- Description of the basic way to send an emergency call manually.
- Description of the basic way to send DTMF manually.
- Description of the manual PLMN selector.
- Description of the automatic PLMN selector.

- Description of the indication of the country.
- Description of the indication of the available PLMN.
- Description of the indication of the automatic registration to a PLMN.
- Description of the service indicator.
- Description of the management of the SIM by the user:
  - keying PIN and changing PIN;
  - indication of acceptance or rejection of keyed PIN;
  - indication of blocked SIM;
  - indication of successful unblocking of the SIM;
  - storing an abbreviated number;
  - displaying an abbreviated number.
- Description of the selection of the hands free.
- Description of the volume control.
- Description of local barring of outgoing calls.
- Description of prevention of unauthorized calls.
- Description of the auto calling management:
  - selection of the auto calling;
  - indication that the call failed and a re-try is attempted;
  - indication that the call finally failed;
  - number of B-party numbers that can be stored in the list of blacklisted numbers.
- Description of the way in which the MS generates an MS originated NOTIFY, if possible. This feature may or may not be supported by the MS.
- Description of the way the MS indicates the identity of the current LSA to the human user (only applicable if the SoLSA MS has an interface to the human user).
- Description of the way the MS indicates the change of the current LSA to the human user (only applicable if the SoLSA MS has an interface to the human user).

NOTE: All the above description could be extracted from the user's manual.

### A3.2.2.2 Short message service

- Description of the basic procedures to send a mobile originated short message.
- Description of the basic procedures to display a mobile terminated short message.
- Description of the basic procedures to display a cell broadcasted short message.
- The value of the timer TC1M.
- Whether SMS messages are stored in the SIM and/or the ME.
- Maximum length (characters) of a mobile originated short message.

### A3.2.2.3 Supplementary services

#### A3.2.2.3.1 Call forwarding

- Description of the user's commands and of the display of the answers from the network for:
  - registration;
  - erasure;
  - activation;
  - deactivation;
  - interrogation;
  - specific data request.
- Description of the display of:
  - notification of an incoming call to the "served" mobile or the "forwarded to" mobile;
  - notification during out-going call;
  - information to the calling mobile.

#### A3.2.2.3.2 Call restriction

- Description of the user's commands and the display of the answers from the network for:
  - registration;
  - change of the password;
  - activation;
  - deactivation;
  - interrogation.
- Description of the display of the indication of call barring.

#### A3.2.2.3.3 Handling of (undefined) GSM supplementary services

- Description of the user's commands and the display of the answer from the network.
- Identification of the short strings defining MS manufacturer defined procedure in idle mode (1 or 2 characters defined in the 3GPP TS 03.38 default alphabet followed by "SEND").

## A3.2.3 Electrical Man Machine Interface (EMMI)

### A3.2.3.1 Methods supported for activation/deactivation of EMMI

- All possibilities specified in 3GPP TS 11.10, subclause 36.2.2.
- All possibilities specified in 3GPP TS 11.10, subclause 36.2.2, except activation by inserting a test SIM (when the ME is already switched on).
- Activation/deactivation only via layer 3 messages on the radio interface according to 3GPP TS 11.10, subclause 36.2.2.

### A3.2.3.2 Transmission rate supported by the ME on the EMMI

#### A3.2.3.3 Layer 3 messages supported on the EMMI

- Layer 3 messages as specified in 3GPP TS 11.10, subclause 36.3.5.3.2, except: (followed by the list of messages not supported).
- others than defined in 3GPP TS 11.10 subclause 36.3.5.3.1 table 9.

#### A3.2.3.4 Keystroke sequence messages

Non standard keystroke sequences to be used on the EMMI (in line with 3GPP TS 11.10, subclause 36.3.5.3.2):

- related to tests of the mobile station features (3GPP TS 11.10, clause 33);
- related to testing of the ME/SIM interface (3GPP TS 11.10, clause 27);
- related to tests of autocalling restrictions (3GPP TS 11.10, clause 28);
- related to tests of supplementary services (3GPP TS 11.10, clause 31);
- related to tests of data services (3GPP TS 11.10, clause 29);
- related to tests of short message service (3GPP TS 11.10, clause 34);
- related to other tests.

#### A3.2.3.5 Internal malfunction detected messages

List of the error indicators provided.

### A3.2.4 Digital Audio Interface (DAI)

Description of the speech data routing:

- via the control lines; or
- via the test interface message.

### A3.2.5 Characteristics related to bearer services or teleservices

#### A3.2.5.1 Access interface

Description of the access interface to connect the DTE (e.g. V series (V.24, V.28), X series, two wire analogue interface for use with fax group 3, I.420 (S-reference point).

In case of a proprietary interface to a DTE (non standard), description of this interface (hardware and software).

In case of a non standard connector provide a mechanical adapter.

### A3.2.5.2 Configuration of the MT

Description of the configuration information to be selected in the MT to connect a terminal equipment to the mobile termination.

Description of the (different) configuration(s) of the MT for each bearer service and each teleservice supported, with the range or value for the parameters and the configuration procedure.

For the purpose of test of MOC, the manufacturer shall describe precisely how it is possible to put the MT in the different configurations to generate the capability information of the Mobile according to subclause 3.2.5.3, and described as supported by the MS.

For the purpose of test of MTC, the manufacturer shall describe how to verify the correct selection by the MT of the required function with regard to the capability information as described below, especially using the messages at the Um interface if there is no R or S interface available (case MTO). The description shall be made for every combination of the parameter value valid for the MT.

### A3.2.5.3 Capability information

Description of the capability information, related to supported bearer services:

- bearer capabilities;
- higher layer capabilities;
- lower layer capabilities.

The manufacturer shall describe for every capability the associated terminal functions and their characteristics.

### A3.2.5.4 Subaddress or DDI number

Subaddress or a DDI number of the MT.

Procedure to allocate or change DDI number or subaddress, if possible.

### A3.2.5.5 User to user signalling

Description of the function and the user's access to it.

### A3.2.5.6 Data call set-up and data call clearing

For each implemented transparent and non-transparent data service:

- Description of the data call establishment mechanism:
  - Terminal initiated (CT108) (if possible);
  - MT (MMI/EMMI) initiated;
  - Description of DCE provided information (MT to TE), if any;
  - Declaration of optimal function and procedure, services supported by the MT.
- Description of the data call clearing mechanism:
  - Terminal initiated (CT109) (if possible);
  - MT (MMI/EMMI) initiated;
  - Description of DCE provided information (MT to TE) related to a mobile or network initiated call clearing, if any.

### A3.2.5.7 Characteristics of non-transparent data services

Description of Radio Link Protocol (RLP) features supported.

Description of supported RLP parameters and how to modify these values (if possible):

<iws> IWF to MS window size

<mws> MS to IWF window size

<T1> acknowledgement timer T1

<N2> retransmission attempts N2

Ability to configure the MS to use non-default RLP parameters.

Description of flow control mechanism:

- INBAND (XON/XOFF);
- OUTBAND COPnoFICt (CT105 and CT106).

### A3.2.5.8 Possible ways of setting-up a call from either an external interface or internally

Describe in detail all possible ways a call can be initiated from the MS or a connected terminal.

### A3.2.5.9 Application layer causing automatic call termination

State whether the call termination facility can be disabled and if so, describe in detail how.

### A3.2.5.10 Call re-establishment for MS not supporting speech

Applicability of call re-establishment.

## A3.2.6 International mobile station equipment identity

IMEI of the MS.

## A3.2.7 Receiver intermediate frequencies

$F_0$  - Local Oscillator frequency applied to first receiver mixer.

$IF_1 \dots IF_n$  - intermediate frequencies.

## A3.2.8 Artificial ear

The manufacturer shall declare which type of artificial ear (type 1 or type 3.2 or type 3.4) is used for teleservices speech testing.

The following illustrate the results of both artificial ears when specified for acoustic receiving measurement.

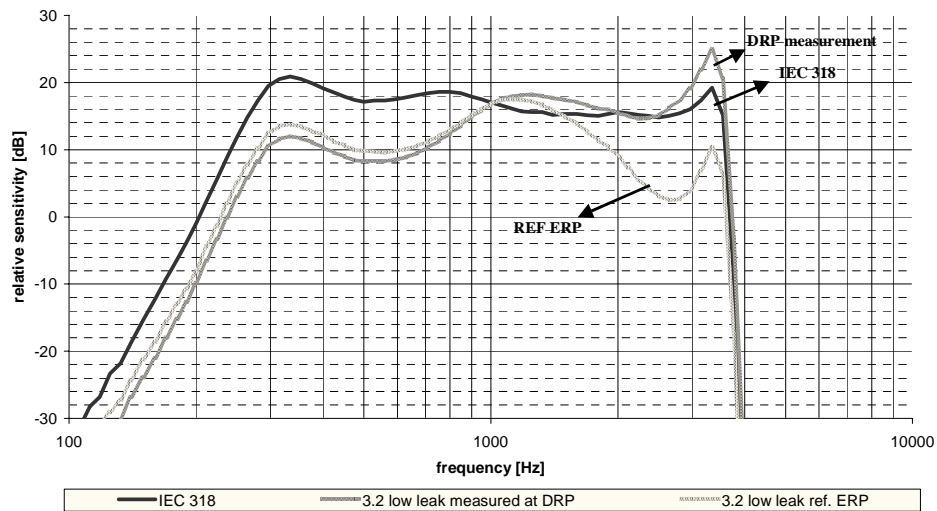

Type 3.2 results are currently referred to ERP (as specified), but measured at DRP. When introducing DRP to ERP correction, a special frequency response is used which is obtained with the artificial ear in a free sound field. The overall result actually differs substantially from the transfer function under the IEC 318 test conditions. Referring the results to DRP instead avoids misleading interpretations.

Receiving frequency response, sample mobile 1

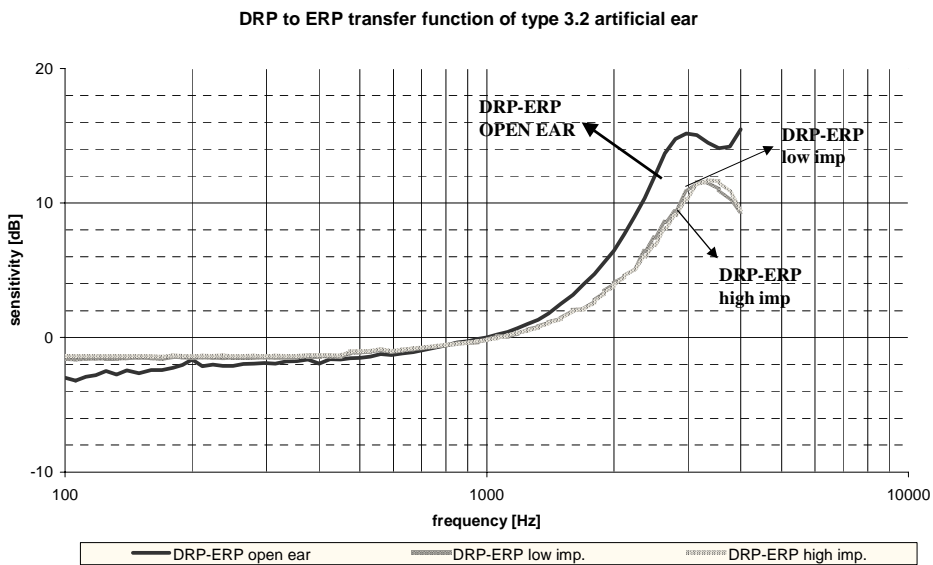

This slide as well as the following two shows results of three measurement and evaluation methods per each mobile sample. The blue curve is as measured sealed to IEC 318 closed coupler. The green curve is as measured with type 3.2 low leak coupler at DRP. The red curve shows the same measurement data corrected to ERP using the correction function provided by the manufacturer.

Receiving frequency response, sample mobile 2

Below 1 KHz both type 3.2 curves are similar. The level decreases from IEC 318 to the type 3.2 results is due to the leak. At high frequencies the measured type 3.2 curve without DRP to ERP correction (green) clearly illustrates better compatibility towards IEC 318 results than the curve referred to ERP (red).

The three curves show the DRP to ERP transfer function for different source conditions. The blue line is obtained mounted in a baffle. The other two functions are measured with a probe microphone at ERP on two mobiles with different acoustic source impedance.

Measured SPL closed ear with low acoustic impedance source (example)

Contrary to the first three slides, the type 3.2 low leak response at ERP here is not calculated, but measured with a probe microphone. The relationship between the three curves is the same as in each of the first three slides.

The difference between the results of type 3.2 low leak artificial ear referred to DRP and ERP respectively is due to the acoustic input impedance of the artificial ear. The high acoustic impedance at DRP is transferred to a relatively low impedance at ERP for high frequencies according to the quarter wavelength distance between both points. This means that acoustic energy at ERP is more in terms of sound velocity, which is not measured with the used pressure microphone. The human ear is known to have its highest sensitivity around 5 KHz. Type 3.2 low leak measurement referred to ERP has particularly low sensitivity at this frequency. In order to account for compatibility between IEC 318 results and type 3.2 low leak results as well as for the sensitivity of the human ear, it is up to the choice of the terminal manufacturer, whether acoustic test results from the type 3.2 low leak artificial ear should be referred to ERP or to DRP.

---

## Annex 4: Test SIM Parameters

### A4.1 Introduction

This clause defines default parameters for programming the elementary files of the test SIM. The requirements of this annex do not apply to the SIM/ME tests of clause 27.

#### A4.1.1 Definitions

"Test SIM card":

A SIM card supporting the test algorithm for authentication, programmed with the parameters defined in this subclause. The electrical, mechanical and environmental requirements of the test SIM card are specified in 3GPP TS 11.11.

"Test SIM":

Either a test SIM card or the SIM simulator programmed with the parameters defined in this subclause.

#### A4.1.2 Definition of the test algorithm for authentication

The following procedure employs bit wise modulo 2 addition ("XOR").

The following convention applies:

In all data transfer the most significant byte is the first byte to be sent; data is represented so that the left most bit is the most significant bit of the most significant byte.

Step 1:

XOR to the challenge RAND, a predefined number  $K_i$ , having the same bit length (128 bits) as RAND. The result RES1 of this is

$$RES1 = RAND \text{ XOR } K_i$$

Step 2:

The most significant 32 bits of RES1 form SRES. The next 64 bits of RES1 form Kc. The remaining 32 bits are not used.

---

### A4.2 Default Parameters for the test SIM

Ki:

The authentication key "Ki" will be chosen by the test house and will be non zero. The "Ki" value used by the SS will align with this value.

PIN Disabling

The PIN enabled / disabled flag will be set to "PIN Disabled". This ensures that when the Test SIM is inserted into a MS the user will not be prompted for PIN entry. This requires a specific card capability defined by the SIM service table (see subclause 2.9).

## A4.3 Default settings for the Elementary Files (EFs)

The format and coding of elementary files of the SIM are defined in 3GPP TS 11.11. The following subclauses define the default parameters to be programmed into each elementary file. Some files may be updated by the MS based on information received from the SS. These are identified in the following subclauses.

### A4.3.1 EF<sub>ICCID</sub> (ICC Identification)

The programming of this EF is a test house option.

### A4.3.2 EF<sub>LP</sub> (Language preference)

The programming of this EF is a test house option.

### A4.3.3 EF<sub>IMSI</sub> (IMSI)

The IMSI value will be chosen by the test house. The IMSI used by the SS will align this value.

File size: 9 bytes  
 Default values: Byte 1 (DEC): 8  
 Bytes 2-9 (HEX): 09 10 10 \* \* \* \* \* for GSM 400, GSM 900 and DCS 1 800  
 Bytes 2-9 (HEX): 09 10 10 \*1 \* \* \* \* \* for GSM 700, GSM 850 and GSM 1 900

"\*" indicates any number between 0 and 9 subject to the restriction that IMSI mod 1000 (i.e. bytes 7, 8 and 9) lies in one of the following ranges:

- 063-125, 189-251, 315-377, 441-503, 567-629, 693-755, 819-881 or 945-999.

NOTE: This ensures that the MS can listen to the second CCCH when more than one basic physical channel is configured for the CCCH. This is necessary for the test of "paging re-organization".

### A4.3.4 EF<sub>Kc</sub> (Cipherring key Kc)

File size: 9 Bytes  
 Default values (HEX): Bytes 1-8: Align with Kc used by SS  
 Byte 9: 07

Byte 9 is set to 07 to indicate that there is no key available at the start of a test.

The bytes within this elementary file may be updated by the MS as a result of a successful authentication attempt.

### A4.3.5 EF<sub>PLMNsel</sub> (PLMN selector)

GSM 400, GSM 900 and DCS 1 800 begin

File size: 102 bytes  
 Default values (HEX): Bytes 1-3: 32 F4 10 (MCC, MNC) - Translates to 234, 01  
 Bytes 4-6: 32 F4 20 (MCC, MNC)  
 Bytes 7-9: 32 F4 30 (MCC, MNC)  
 ....  
 ....  
 ....  
 Bytes 94-96: 32 F4 23 (MCC, MNC)  
 Bytes 97-99: 32 F4 33 (MCC, MNC)  
 Bytes 100-102: 32 F4 43 (MCC, MNC)

GSM 400, GSM 900 and DCS 1 800 end

GSM 700, GSM 850 and PCS 1900 begin

File size: 102 bytes  
 Default values (HEX): Bytes 1-3: 32 24 10 (MCC, MNC) - Translates to 234, 012  
 Bytes 4-6: 32 34 20 (MCC, MNC)  
 Bytes 7-9: 32 44 30 (MCC, MNC)  
 ....  
 ....  
 ....  
 Bytes 94-96: 32 34 23 (MCC, MNC)  
 Bytes 97-99: 32 44 33 (MCC, MNC)  
 Bytes 100-102: 32 54 43 (MCC, MNC)

GSM 700, GSM 850 and PCS 1900 end

34 PLMNs are shown coded above since this is the largest number required for a test - see subclause 27.9.4.1. It is necessary to take this into account since the SIM cards must be dimensioned to cope with this number of records.

### A4.3.6 EF<sub>HPLMN</sub> (HPLMN search period)

File size: 1 byte  
 Default value (HEX): 00 (no HPLMN search attempts)

### A4.3.7 EF<sub>ACMmax</sub> (ACM maximum value)

File size: 3 bytes  
 Default: Byte 1: 00  
 Byte 2: 00  
 Byte 3: 00

The above translates to: "Not valid".

### A4.3.8 EF<sub>SST</sub> (SIM service table)

Services will be allocated and activated as follows:

| Service                                                                        | Allocated | Activated |
|--------------------------------------------------------------------------------|-----------|-----------|
| No. 1: CHV1 disable function                                                   | Yes       | Yes       |
| No. 2: Abbreviated Dialling numbers (ADN)                                      | Yes       | Yes       |
| No. 3: Fixed dialling numbers (FDN)                                            | Yes       | Optional  |
| No. 4: Short Message Storage (SMS)                                             | Yes       | Yes       |
| No. 5: Advice of Charge (AoC)                                                  | Yes       | Yes       |
| No. 6: Capability Configuration Parameters (CCP)                               | Yes       | Yes       |
| No. 7: PLMN Selector                                                           | Yes       | Yes       |
| No. 8: Reserved for future use                                                 | No        | No        |
| No. 9: MSISDN                                                                  | Optional  | Optional  |
| No. 10: Extension 1                                                            | Yes       | Optional  |
| No. 11: Extension 2                                                            | Yes       | Optional  |
| No. 12: SMS Parameters                                                         | Yes       | Yes       |
| No. 13: Last Dialed Number (LND)                                               | Yes       | Yes       |
| No. 14: Cell Broadcast Message Identifier                                      | Yes       | Yes       |
| No. 15: Group identifier Level 1                                               | Yes       | Optional  |
| No. 16: Group identifier Level 2                                               | Yes       | Optional  |
| No. 21: VGCS Group Identifier List (EF <sub>VGCS</sub> , EF <sub>VGCSs</sub> ) | Yes       | Yes       |
| No. 22: VBS Group Identifier List (EF <sub>VBS</sub> , EF <sub>VBSs</sub> )    | Yes       | Yes       |
| No. 23: eMLPP service                                                          | Yes       | Yes       |
| No. 24: Automatic answer for eMLPP                                             | Yes       | Yes       |

| Service                                                   | Allocated | Activated |
|-----------------------------------------------------------|-----------|-----------|
| No. 25: Data download via SMS-CB                          | Optional  | Optional  |
| No. 26: Data download via SMS-PP                          | Optional  | Optional  |
| No. 27: Menu selection                                    | Optional  | Optional  |
| No. 28: Call control                                      | Optional  | Optional  |
| No. 29: Proactive SIM                                     | Optional  | Optional  |
| No. 30: Cell Broadcast Message Identifier Ranges          | Optional  | Optional  |
| No. 31: Barred Dialling Numbers (BDN)                     | Optional  | Optional  |
| No. 32: Extension4                                        | Optional  | Optional  |
| No. 33: De-personalization Control Keys                   | Optional  | Optional  |
| No. 34: Co-operative Network List                         | Optional  | Optional  |
| No. 35: Short Message Status Reports                      | Optional  | Optional  |
| No. 36: Network's indication of alerting in the MS        | Optional  | Optional  |
| No. 37: Mobile Originated Short Message control by SIM    | Optional  | Optional  |
| No. 38: GPRS                                              | Optional  | NOTE      |
| NOTE: For GPRS tests the GPRS service shall be activated. |           |           |

### A4.3.9 EF<sub>ACM</sub> (Accumulated call meter)

File size: 3 bytes  
 Default: Byte 1: 00  
 Byte 2: 00  
 Byte 3: 00

The above translates to: "Not yet implemented".

### A4.3.10 EF<sub>PUCT</sub> (Price per unit and currency table)

File size: 5 bytes  
 Default: Byte 1-3: FF  
 Byte 4-5: 00

### A4.3.11 EF<sub>CBMI</sub> (Cell broadcast Message Identifier Selection)

The programming of this EF is a test house option.

The file size is 2n bytes, where n is the number of Cell broadcast message identifier records - each record defining a type of Cell Broadcast message which may be accessed by the MS. Care should be taken when dimensioning the SIM to take into account the number of Cell Broadcast message identifier records required.

### A4.3.12 EF<sub>BCCH</sub> (Broadcast control channels)

File size: 16 Bytes  
 Default values (BIN): Bytes 1-2: 11111111 11111111  
 Bytes 3-4: 11111111 11111111  
 Bytes 5-6: 11111111 11111111  
 Bytes 7-8: 11111111 11111111  
 Bytes 9-10: 11111111 11111111  
 Bytes 11-12: 11111111 11111111  
 Bytes 13-14: 11111111 11111111  
 Bytes 15-16: 11111111 11111111

This field may be updated dependent on the MS implementation.

### A4.3.13 EF<sub>ACC</sub> (Access control class)

File size: 2 Bytes  
 Default values (BIN): Byte 1: 00000000  
 Byte 2: \*\*\*\*\*

The test house may set any single bit of byte 2 to "1". All remaining bits of byte 2 will be set to "0". This determines the access control class of the SIM.

### A4.3.14 EF<sub>FPLMN</sub> (Forbidden PLMNs)

Length: 12 Bytes  
 Format (HEX): Bytes 1-3: FF FF FF  
 Bytes 4-6: FF FF FF  
 Bytes 7-9: FF FF FF  
 Bytes 10-12: FF FF FF

This coding corresponds to an empty "forbidden PLMN list". The bytes within this file may be updated if a LOCATION UPDATE REJECT message is received by the MS with cause, "PLMN not allowed".

### A4.3.15 EF<sub>LOCI</sub> (Location information)

GSM 400, GSM 900 and DCS 1 800 begin

File size: 11 Bytes  
 Default values: Bytes 1-4 (HEX): FF FF FF FF (TMSI)  
 Bytes 5-9 (HEX): 42 F6 18 FF FE (LAI)  
 Byte 10 (HEX): FF (Periodic LU Time = "the timer is not running")  
 Byte 11 (BIN): 00000001 (Location Update Status = "not updated")

Bytes 5-9: LAI-MCC = 246 (bytes 5-6) and LAI-MNC = 81 (byte 7) are frequently used in clause 27. The LAC (bytes 8-9) is set to "FF FE" since this, in conjunction with byte 11 setting of "01", is used to ensure that the MS performs a location update at the beginning of a test.

Bytes in this file (e.g. TMSI in bytes 1-4) may be updated as a result of a location update attempt by the MS.

GSM 400, GSM 900 and DCS 1 800 end

GSM 700, GSM 850 and PCS 1900 begin

File size: 11 Bytes  
 Default values: Bytes 1-4 (HEX): FF FF FF FF (TMSI)  
 Bytes 5-9 (HEX): 42 36 18 FF FE (LAI)  
 Byte 10 (HEX): FF (Periodic LU Time = "the timer is not running")  
 Byte 11 (BIN): 00000001 (Location Update Status = "not updated")

Bytes 5-9: LAI-MCC = 246 (bytes 5-6) and LAI-MNC = 813 (bytes 6-7) are frequently used in clause 27. The LAC (bytes 8-9) is set to "FF FE" since this, in conjunction with byte 11 setting of "01", is used to ensure that the MS performs a location update at the beginning of a test.

Bytes in this file (e.g. TMSI in bytes 1-4) may be updated as a result of a location update attempt by the MS.

GSM 700, GSM 850 and PCS 1900 end

### A4.3.16 EF<sub>AD</sub> (Administrative data)

File size: 3 bytes  
 Default values Byte 1: 10000000 - (type approval operations)  
 Byte 2: 11111111  
 Byte 3: 11111111

### A4.3.17 EF<sub>Phase</sub> (Phase identification)

File size: 1 byte  
 Default value (HEX): 02 Phase 2

### A4.3.18 EF<sub>ADN</sub> (Abbreviated dialling numbers)

The programming of this EF is a test house option. It should be noted that sufficient space should be provided on the SIM card for 101 records - see subclause 27.15.4.1.

### A4.3.19 EF<sub>FNDN</sub> (Fixed dialling numbers)

Optional.

### A4.3.20 EF<sub>SMS</sub> (Short messages)

|          |             |               |                                     |
|----------|-------------|---------------|-------------------------------------|
| Default: | Records 1-5 | Byte 1:       | 00                                  |
|          |             | Byte 2:       | FF                                  |
|          |             | Bytes 3-14:   | FF FF FF FF FF FF FF FF FF FF FF FF |
|          |             | Bytes 15-26:  | FF FF FF FF FF FF FF FF FF FF FF FF |
|          |             | Byte 27:      | FF                                  |
|          |             | Byte 28:      | FF                                  |
|          |             | Bytes 29-35:  | FF FF FF FF FF FF FF                |
|          |             | Byte 36:      | FF                                  |
|          |             | Bytes 37-176: | All Bytes set to FF                 |

### A4.3.21 EF<sub>CCP</sub> (Capability configuration parameters)

File size: 14 bytes  
 Default values Byte 1: 04  
 Byte 2: 01  
 Byte 3: A0  
 Bytes 4-14: FF

The above translates to: "Full rate, GSM Standardized coding, circuit mode and speech".

### A4.3.22 EF<sub>MSISDN</sub> (MSISDN)

Optional.

### A4.3.23 EF<sub>SMSP</sub> (Short message service parameters)

The programming of this EF is a test house option.

Each record size is 28+Y bytes, where Y is the number of bytes in the Alpha Identifier. Care should be taken when dimensioning the SIM to take into account the number of Short message service parameter records required.

### A4.3.24 EF<sub>SMSS</sub> (SMS status)

File size: 2 bytes  
 Byte 1: 00  
 Byte 2 (BIN): 11111111

The above translates to:

- (a) Last Mobile Originated Short Message had a TP Message Reference parameter of "00".
- (b) SMS Memory Capacity Exceeded, Notification Flag unset: memory capacity available.

### A4.3.25 EF<sub>EXT1</sub> (Extension 1)

Optional.

### A4.3.26 EF<sub>EXT2</sub> (Extension 2)

Optional.

### A4.3.27 EF<sub>VGCS</sub> (Voice Group Call Service)

This EF contains a list of the default VGCS group identifiers.

File size: Bytes 200

Default values:

| Bytes | Group ID | Value   | BCD encoding in the SIM card |
|-------|----------|---------|------------------------------|
| 1-4   | 1        | 12      | 21 FF FF FF                  |
| 5-8   | 2        | 123     | 21 F3 FF FF                  |
| 9-12  | 3        | 1234    | 21 43 FF FF                  |
| 13-16 | 4        | 12348   | 21 43 F8 FF                  |
| 17-20 | 5        | 123491  | 21 43 19 FF                  |
| 21-24 | 6        | 1235029 | 21 53 20 F9                  |
| 25-28 | 7        | 12351   | 21 53 F1 FF                  |
| 29-32 | 8        | 12352   | 21 53 F2 FF                  |
| 33-36 | 9        | 12353   | 21 53 F3 FF                  |
| 37-40 | 10       | 12354   | 21 53 F4 FF                  |
| 41-44 | 11       | 12355   | 21 53 F5 FF                  |
| 45-48 | 12       | 12356   | 21 53 F6 FF                  |
| 49-52 | 13       | 12357   | 21 53 F7 FF                  |
| 53-56 | 14       | 12358   | 21 53 F8 FF                  |
| 57-60 | 15       | 12359   | 21 53 F9 FF                  |
| 61-64 | 16       | 20000   | 02 00 F0 FF                  |
| 65-68 | 17       | 20001   | 02 00 F1 FF                  |
| 69-72 | 18       | 20002   | 02 00 F2 FF                  |

### A4.3.28EF<sub>VGCS</sub> (Voice Group Call Service Status)

This EF contains the default activation of the VGCS group identifiers. The following list of group ID are activated: 1, 4, 20, 30, 50.

File size: Bytes 7  
 Default values (HEX): Bytes 1-7: '09 00 08 20 00 00 FE'

### A4.3.29EF<sub>VBS</sub> (Voice Broadcast Service)

This EF contains a list of the default VBS group identifiers.

File size: Bytes 200

Default values:

| Bytes | Group ID | Value   | BCD encoding in the SIM card |
|-------|----------|---------|------------------------------|
| 1-4   | 1        | 12      | 21 FF FF FF                  |
| 5-8   | 2        | 123     | 21 F3 FF FF                  |
| 9-12  | 3        | 1234    | 21 43 FF FF                  |
| 13-16 | 4        | 12348   | 21 43 F8 FF                  |
| 17-20 | 5        | 123491  | 21 43 19 FF                  |
| 21-24 | 6        | 1235029 | 21 53 20 F9                  |
| 25-28 | 7        | 12351   | 21 53 F1 FF                  |
| 29-32 | 8        | 12352   | 21 53 F2 FF                  |
| 33-36 | 9        | 12353   | 21 53 F3 FF                  |
| 37-40 | 10       | 12354   | 21 53 F4 FF                  |
| 41-44 | 11       | 12355   | 21 53 F5 FF                  |
| 45-48 | 12       | 12356   | 21 53 F6 FF                  |
| 49-52 | 13       | 12357   | 21 53 F7 FF                  |
| 53-56 | 14       | 12358   | 21 53 F8 FF                  |
| 57-60 | 15       | 12359   | 21 53 F9 FF                  |
| 61-64 | 16       | 20000   | 02 00 F0 FF                  |

| Bytes   | Group ID | Value   | BCD encoding in the SIM card |
|---------|----------|---------|------------------------------|
| 65-68   | 17       | 20001   | 02 00 F1 FF                  |
| 69-72   | 18       | 20002   | 02 00 F2 FF                  |
| 73-76   | 19       | 20003   | 02 00 F3 FF                  |
| 77-80   | 20       | 20004   | 02 00 F4 FF                  |
| 81-84   | 21       | 20005   | 02 00 F5 FF                  |
| 85-88   | 22       | 20006   | 02 00 F6 FF                  |
| 89-92   | 23       | 20007   | 02 00 F7 FF                  |
| 93-96   | 24       | 20008   | 02 00 F8 FF                  |
| 97-100  | 25       | 20009   | 02 00 F9 FF                  |
| 101-104 | 26       | 20010   | 02 10 F0 FF                  |
| 105-108 | 27       | 66660   | 66 66 F0 FF                  |
| 109-112 | 28       | 66661   | 66 66 F1 FF                  |
| 113-116 | 29       | 66662   | 66 66 F2 FF                  |
| 117-120 | 30       | 666638  | 66 66 83 FF                  |
| 121-124 | 31       | 66664   | 66 66 F4 FF                  |
| 125-128 | 32       | 66665   | 66 66 F5 FF                  |
| 129-132 | 33       | 66666   | 66 66 F6 FF                  |
| 133-136 | 34       | 66667   | 66 66 F7 FF                  |
| 137-140 | 35       | 66668   | 66 66 F8 FF                  |
| 141-144 | 36       | 66669   | 66 66 F9 FF                  |
| 145-148 | 37       | 66670   | 66 76 F0 FF                  |
| 149-152 | 38       | 80120   | 08 21 F0 FF                  |
| 153-156 | 39       | 80121   | 08 21 F1 FF                  |
| 157-160 | 40       | 80122   | 08 21 F2 FF                  |
| 161-164 | 41       | 80123   | 08 21 F3 FF                  |
| 165-168 | 42       | 80124   | 08 21 F4 FF                  |
| 169-172 | 43       | 80125   | 08 21 F5 FF                  |
| 173-176 | 44       | 80126   | 08 21 F6 FF                  |
| 177-180 | 45       | 80127   | 08 21 F7 FF                  |
| 181-184 | 46       | 80128   | 08 21 F8 FF                  |
| 185-188 | 47       | 80129   | 08 21 F9 FF                  |
| 189-192 | 48       | 80130   | 08 31 F0 FF                  |
| 193-196 | 49       | 99999   | 99 99 F9 FF                  |
| 197-200 | 50       | 1111119 | 11 11 11 F9                  |

### A4.3.30 EF<sub>VBSS</sub> (Voice Broadcast Service Status)

This EF contains the default activation of the VBS group identifiers. The following list of group ID are activated: 1, 4, 20, 30, 50.

File size: Bytes 7  
 Default values (HEX): Bytes 1-7: '09 00 08 20 00 00 FE'

### A4.3.31 EF<sub>eMLPP</sub> (enhanced Multi Level Pre-emption and Priority)

This EF contains default information about priority levels and fast call set-up conditions for the enhanced Multi Level Pre-emption and Priority service.

Length: 2 Bytes  
 Format (HEX): Byte 1 (Priority levels): '74'  
 Byte 2 (Fast call set-up conditions): '04'

The coding corresponds to available priority levels 2, 3, 4 and 0. For fast call setup, the coding corresponds to available priority level 0.

### A4.3.32 EF<sub>AAeM</sub> (Automatic Answer for eMLPP Service)

This EF contains the default priority levels (of the Multi Level Pre-emption and Priority service) for which the mobile station shall answer automatically to incoming calls.

Length: 1 Byte  
 Format (HEX): Byte 1: '0F'

The coding corresponds to the default capability of the MS to answer automatically to incoming calls that have a priority level higher than 2.

### A4.3.33 EF<sub>KcGPRS</sub> (GPRS Ciphering key KcGPRS)

Mandatory if GPRS shall be tested else optional.

File size: 9 bytes  
 Default values (HEX): Bytes 1-8: Align with KcGPRS used by SS  
 Byte 9: 07

Byte 9 is set to 07 to indicate that there is no key available at the start of a test unless other conditions follow from the definition of the initial conditions of the mobile.

The bytes within this elementary file may be updated by the MS as a result of a successful authentication attempt.

### A4.3.34 EF<sub>LOCIGPRS</sub> (GPRS location information)

Mandatory if GPRS shall be tested else optional.

File size: 14 bytes  
 Default values: Bytes 1-4 (HEX): FF FF FF FF (P-TMSI)  
 Bytes 5-7 (HEX): FF FF FF (P-TMSI signature value)  
 Bytes 8-13 (HEX): FF FF FF FF FF FF (RAI)  
 Byte 14 (BIN): 00000001 (Routing Area Update Status = "not updated")

Bytes in this file (e.g. P-TMSI in bytes 1-4) may be updated as a result of a routing area update attempt by the MS.

---

## Annex 5: Test equipment

### A5.1 Introduction

#### A5.1.1 General

The test equipment is either an equipment or assembly of equipments which enables the tests described in the present document to be conducted.

This annex describes requirements for the test equipment which cannot be derived from and which are assumed in, the conformance test descriptions described in the present document.

Specifically stimulus setting and measurement uncertainties are defined.

#### A5.1.2 Test equipment terms

The term "System Simulator" (SS) is used to describe the complete suite of test equipment required to perform the tests in the present document when interacting with the following MS interfaces:

- Antenna (Connector or radiated);
- Acoustic;
- Data Port(s);
- Power supply;
- DAI.

NOTE: To perform a sub-set of tests, the SS may be simplified accordingly.

The term "SIM simulator" is used to describe the test equipment required to interact with the SIM/ME interface.

A "test SIM" has the physical characteristics of a standard SIM card, (see 3GPP TS 11.11) with specific parameters defined in annex 3.

#### A5.1.3 Confidence level

All uncertainty values stated in this annex are quoted for a Confidence Level of 95 %.

---

## A5.2 Standard test signals

The Cx signals represent the wanted signals and the Ix signals represent the unwanted signals.

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Signal C0 | Unmodulated continuous carrier.                                                                                                                                                                                                                                                                                                                                                                                                      |
| Signal C1 | A standard GSM signal with GMSK modulation derived by applying a data reversals signal to the input of a channel coder. The channel coder will depend on the test and the cipher mode shall be selectable by the test method. When using this signal in the non hopping mode, the unused seven time slots shall also contain dummy bursts, with power levels variable with respect to the used timeslot, see also subclause 2.3.1.3. |
| Signal I0 | Unmodulated continuous carrier.                                                                                                                                                                                                                                                                                                                                                                                                      |
| Signal I1 | A GMSK modulated carrier following the structure of the GSM signals, but with all modulating bits (including the midamble period) derived directly from a random or pseudo random data stream.                                                                                                                                                                                                                                       |
| Signal I2 | A standard GMSK modulated signal with valid midamble, different from C1. The data bits (including bits 58 and 59) shall be derived from a random or pseudo random data stream.                                                                                                                                                                                                                                                       |

---

## A5.3 SS functional requirements

### A5.3.1 Level setting range

It is assumed that the SS is capable of setting stimulus levels, at the MS interface, to those required in the test specification extended by the measurement uncertainty defined in this annex.

NOTE: This ensures that the SS is able adequately to stimulate the MS performance at and just beyond the limit requirement under all conditions.

### A5.3.2 Level Measurement / operation range

It is assumed that the SS is capable of performing measurements, within the uncertainty defined in this annex, over a level range, at the MS interface, as required in the test specification extended by the SS measurement uncertainty defined in this annex and extended by a further 3dB on the MS conformity requirement.

NOTE: This ensures that the SS is able adequately to measure the MS performance at and just beyond the limit requirement under all conditions.

### A5.3.3 MS power supply interface

Test DC power supply for MS:

|                             |                                  |
|-----------------------------|----------------------------------|
| Voltage setting uncertainty | < 1 %.                           |
| Ripple                      | < 10 mV RMS, 50 mV peak to peak. |

Test AC power supply for MS:

|                              |        |
|------------------------------|--------|
| Voltage setting uncertainty: | < 1 %. |
|------------------------------|--------|

## A5.3.4 MS antenna interface

The SS is assumed to offer a nominal 50 ohm impedance to the MS.

|      |                      |         |          |             |
|------|----------------------|---------|----------|-------------|
|      | GSM/DCS/PCS<br>bands | < 4 GHz | < 10 GHz | < 12,75 GHz |
| VSWR | ≤ 1,3                | ≤ 2,0   | ≤ 3,0    | ≤ 3,5       |

### A5.3.4.1 Uplink receiver error

The SS receiver should be capable of performing the tests as specified in 3GPP TS 11.10 without the addition of bit errors in excess of 1 in 10E7 due to the receiver performance when operated with a MS which meets the transmitter requirements of 3GPP TS 05.05. This requirement shall apply for GMSK and 8PSK modulation.

NOTE: This requirement is based on a minimum BER measurement of 1 in 10E5.

### A5.3.4.2 Power and Power versus time measurements

Measurement uncertainty of transmitter output power for GMSK and 8PSK signals: ±1 dB.

In the case of 8PSK, provision is made for power measurement by averaging over multiple bursts or by using an estimation method, see 3GPP TS 05.05, clause 4. The estimation method may be based on measurements of one or more bursts, or part of a burst.

If 8PSK power is measured by averaging over multiple bursts, allowance must be made for variations in burst power as a function of the data. This allowance must be included within the ±1 dB measurement limit. The allowance is related to the number of bursts taken in the average and shall be defined as follows:

$$\text{Allowance for burst power variation} = 2\sigma/\text{SQRT}(N)$$

Where:  $\sigma$  = the standard deviation of burst power variation for random data (0,2 dB).

(two standard deviations yield a 95 % confidence interval).

N = number of averages.

EXAMPLE: An average is calculated from 4 bursts. The allowance for burst power variation is 0,2 dB. The accuracy for the power meter should then be better than ±0,8 dB.

If 8PSK power is measured using an estimation method, it shall be demonstrated, using the method described below, that the accuracy of the estimation technique is also ±1 dB.

A test signal is established consisting of properly formatted bursts with midambles and random data in the payload. The long-term average power of this signal is determined by measuring the power over 200 bursts and taking the average ( $P_{\text{avg}}$ ). The measurement uncertainty of the equipment used to determine the long-term average shall be noted ( $\Delta P$ ).

The same test signal is then measured using the estimation technique. The difference between the estimated value of long-term average power and the measured long-term average power is noted ( $P_{\text{est}}$ ). The following inequality shall hold:

$$|\Delta P| + |(P_{\text{avg}} - P_{\text{est}})| \leq 1 \text{ dB}$$

For GMSK, measurement uncertainty of power level (relative to peak transmitter carrier power):

| Power level      | Measurement uncertainty |
|------------------|-------------------------|
| +6 dB to -7 dB   | ±0,25 dB                |
| -7 dB to -20 dB  | ±1,0 dB                 |
| -20 dB to -32 dB | ±2,0 dB                 |
| -32 dB to -45 dB | ±5,0 dB                 |
| -45 dB to -71 dB | ±1,0 dB                 |
| < -71 dB         | ±2,0 dB                 |

For 8PSK, measurement uncertainty of power level (relative to output power):

| Power level      | Measurement uncertainty |
|------------------|-------------------------|
| +6 dB to -7 dB   | $\pm 0,25$ dB           |
| -7 dB to -16 dB  | $\pm 1,0$ dB            |
| -16 dB to -32 dB | $\pm 2,0$ dB            |
| -32 dB to -45 dB | $\pm 5,0$ dB            |
| -45 dB to -71 dB | $\pm 1,0$ dB            |
| < -71 dB         | $\pm 2,0$ dB            |

NOTE: Due to the method of measurement (downconversion to I/Q baseband / filtering / A/D conversion / postprocessing) several uncertainties occur. The sources are:

- a) absolute level uncertainty;
- b) filter ripple,  
I/Q gain imbalance,  
I/Q imperfect quadrature;
- c) A/D conversion (resolution),  
I/Q offset.

Items under b) and c) affect the individual samples and can be observed as a "ripple" in the horizontal part of the power time mask.

Items under b) are uncertainties which are proportional to the signal measured.

Items under c) are constant amounts of uncertainty, independent of the signal measured.

The item a) moves the entire power time template up or down.

The uncertainties b) and c) are added to the measured signal as an uncorrelated interferer.

The above mentioned absolute measurement uncertainty refers to a). The table covers uncertainties b) and c).

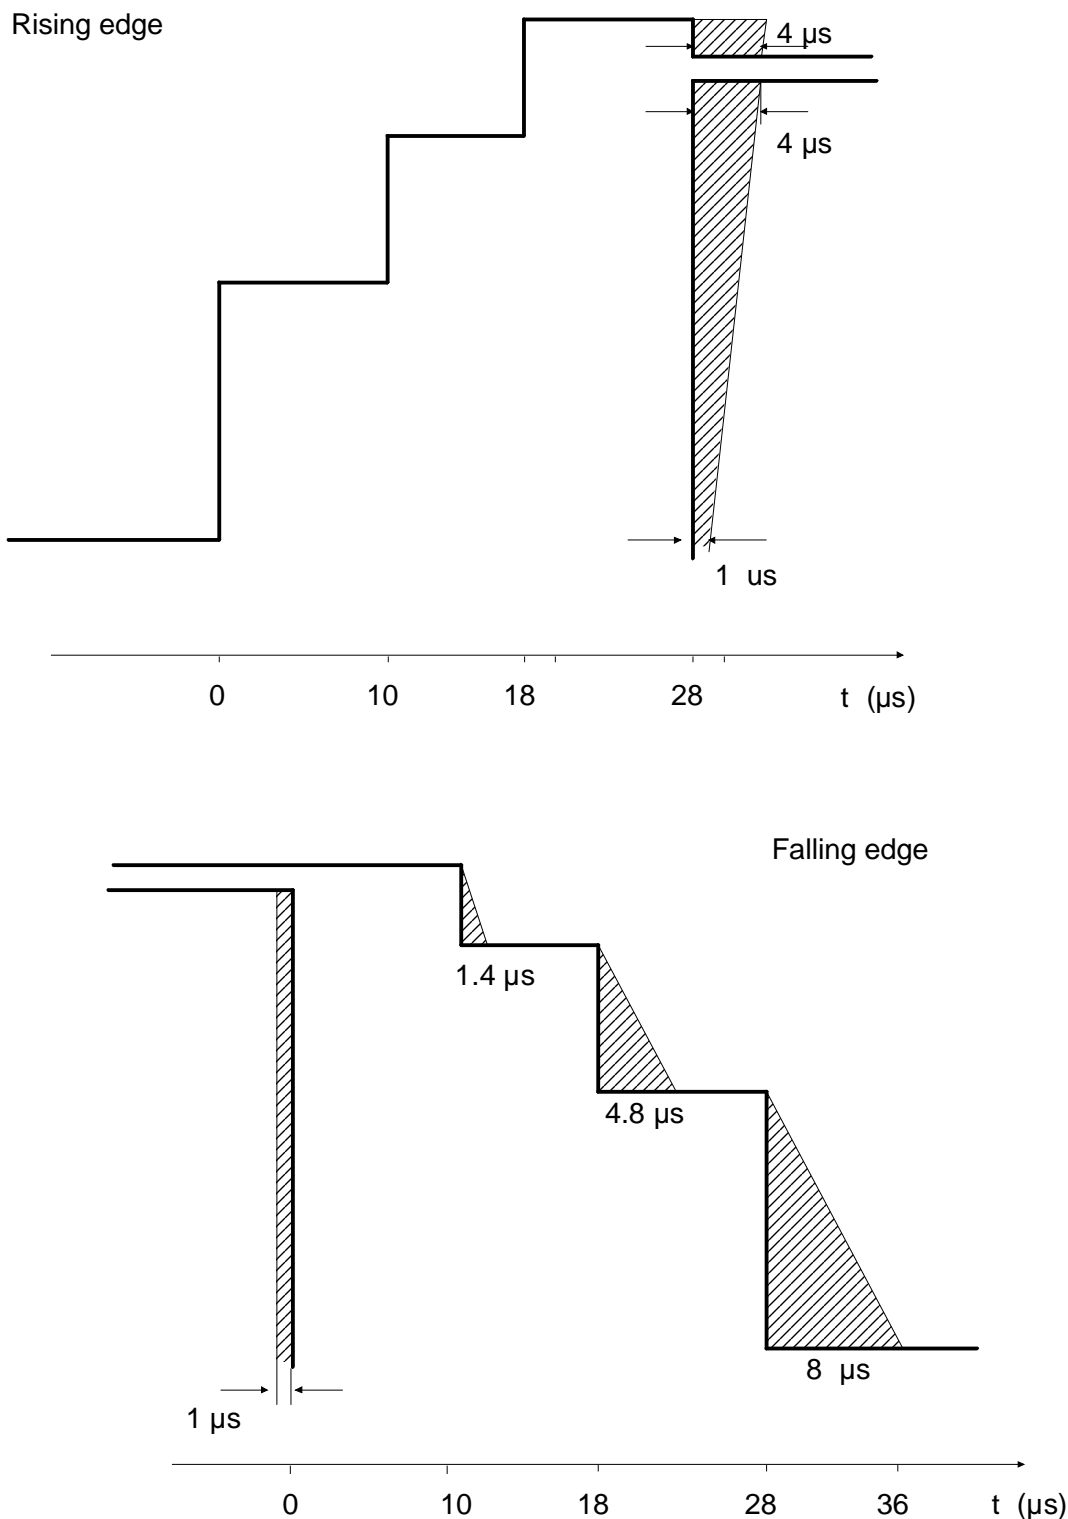

#### Uncertainty of time measurement

The relative timing uncertainty of the transition point:

- symbol 13 to 14 in the midamble (normal burst);
- end of the sync sequence (access burst);

is  $\pm 1/8$  symbol.

Timing uncertainty of the measurement samples in the vertical part of the power time mask are displayed as marked fields in the figure A5.3-1.

**Figure A5.3-1: Time Measurement Uncertainty for the Power Time Mask**

NOTE: With a real method of measurement one has to reckon on systematic measurement uncertainties in the vertical part of the power time template (figures 13-2 & 13-3). The reason for this is that the measurement is conducted through a filter which has to fulfil different requirements simultaneously, requirements in the frequency domain and in the time domain as well. The time behaviour of the filter causes the above mentioned measurement uncertainty. It occurs clearly when measuring the falling edge of the power burst. The measurement uncertainty, which in principle delays the actual performance, depends on the filter characteristics and on the signal shape. At favourable signal shapes the uncertainty is negligible, however, at unfavourable signal shapes it consumes the marked area in figure A5.3-1 (falling edge).

## A5.3.4.5 Modulation accuracy and frequency error measurements

### GMSK modulation

Ref.: Subclauses 13.1 and 13.2 for definitions and methods of measurement.

Phase measurement uncertainty:

$\pm 1$  degree RMS;

$\pm 4$  degrees for individual phase measurement samples.

The phase measurement uncertainties above apply during the useful bits.

Frequency measurement uncertainty:  $\pm 5$  Hz.

### 8PSK modulation

Ref.: Subclause 13.17.1 for definitions and methods of measurement.

EVM measurement uncertainty:

$+(0,75 - 0,025\text{RMS\_EVM}), -(0,75 + 0,025\text{RMS\_EVM})$  % RMS;

4% for individual EVM measurement samples.

NOTE 1: The value of the RMS EVM specification is a function of the value of RMS\_EVM being measured. The asymmetric specification results from the RMS EVM minimisation method used for parameter estimation (see 3GPP TS 05.05, annex G). This method of measurement for RMS EVM always produces a result that is lower than the actual value of RMS EVM.

NOTE 2: The value for individual EVM samples assumes a Rayleigh distribution of measurement errors. It represents the maximum 95<sup>th</sup> percentile value test equipment should return when measuring a signal without error.

NOTE 3: If the test equipment demodulates the transmitted signal to derive the reference signal for the EVM measurement, the symbol error rate of the demodulation process must be less than  $4.4 \times 10^{-4}$  for 95% confidence that no detection errors occur in a burst.

Origin Offset uncertainty (for a single burst)  $< \pm 1,5$  dB for origin offset  $\geq -35$ dBc.

Frequency measurement uncertainty  $< \pm 20$  Hz.

## A5.3.4.6 RF delay measurements relative to nominal times

Range -140 to +140 symbol periods.

Resolution 1/4 symbol period.

Uncertainty  $\pm 1/8$  symbol period.

## A5.3.4.7 The wanted signal or traffic channel of serving cell

The Wanted signal is used in most of the specified RF measurements. The traffic channel of the serving cell is used in most of the signalling tests.

FREQUENCY:

GMSK

Uncertainty:  $< \pm 5 \times 10^{-9}$ .

8PSK

Uncertainty:  $< \pm 20 \times 10^{-9}$ .

MODULATION (see 3GPP TS 05.04):

GMSK

Phase uncertainty: <  $\pm 1$  degree RMS; and  
<  $\pm 4$  degrees peak (as defined in 3GPP TS 05.05).

8PSK

EVM uncertainty < 4 % RMS.  
Origin offset suppression < -35 dBc.

LEVEL:

Uncertainty: <  $\pm 1$  dB in subclause 13, 14 except;  
<  $\pm 3$  dB for test 14.2 radiated;  
<  $\pm 1,2$  dB for test 14.6;  
<  $\pm 2,5$  dB for all other tests.

Settling time: < 10  $\mu$ s.

DYNAMIC LEVEL SETTING:

The SS shall be able to switch from any power level to any other power level within the range of 30 dB on a timeslot per timeslot basis. This dynamic switching requirement only applicable for a single channel for a limited number of tests.

SPURIOUS:

inchannel:

Covered by phase error.

outchannel:

Noise Power, 1 Hz bandwidth:

< -100 dBc for > 100 kHz carrier offset;  
< -110 dBc for > 300 kHz carrier offset;  
< -121 dBc for > 1 500 kHz carrier offset.

Non harmonics:

< -55 dBc for > 100 kHz carrier offset;  
< -68 dBc for > 1 500 kHz carrier offset.

FREQUENCY HOPPING:

The signal shall be capable of hopping according to the criteria of 3GPP TS 05.02. The timing of the frequency change shall be such that frequency transitions do not occur during the active timeslot of the MS.

### A5.3.4.8 The first interfering signal or traffic channel of the first adjacent cell

The First interfering signal is used in measurements of co-channel rejection, adjacent channel rejection and intermodulation rejection. The Traffic channel of the first adjacent cell is used in handover tests.

#### FREQUENCY:

Uncertainty:

<  $\pm 5 \cdot 10^{-9}$

#### PHASE:

Uncertainty:

<  $\pm 1$  degree RMS; and

<  $\pm 4$  degrees peak (as defined in 3GPP TS 05.05).

#### LEVEL:

Uncertainty:

<  $\pm 1$  dB relative to the wanted signal for test 13.2 and 14.5;

<  $\pm 0,3$  dB relative to the wanted signal for test 14.;

<  $\pm 1$  dB for test 14.6;

<  $\pm 2,5$  dB for all other tests.

#### MODULATION:

GMSK (as specified in 3GPP TS 05.04)

The total relative single sideband power (noise + harmonics) in the frequency range 1,5 MHz to 1,7 MHz offset from the nominal carrier frequency shall be less than -72 dBc.

#### SPURIOUS:

Inchannel:

Covered by phase error.

Outchannel:

Noise Power, 1 Hz bandwidth:

< -100 dBc for > 100kHz carrier offset;

< -110 dBc for > 300kHz carrier offset;

< -127 dBc for > 1 500kHz carrier offset.

non harmonics:

< -55 dBc for > 100 kHz carrier offset;

< -68 dBc for > 1 500 kHz carrier offset.

#### FREQUENCY HOPPING:

The signal shall be capable of hopping according to the criteria of 3GPP TS 05.02. The timing of the frequency change shall be such that frequency transitions do not occur during the active timeslot of the MS.

### A5.3.4.9 The second interfering signal

The second interfering signal is used in the measurements of intermodulation rejection and blocking.

**FREQUENCY:**

Uncertainty:

$< \pm 5 \cdot 10^{-9}$ .

**LEVEL:**

Uncertainty:

$< \pm 1$  dB for test 14.6;

$< \pm 1,5$  dB relative to the wanted signal for all other tests.

**MODULATION:**

Unmodulated.

**SPURIOUS:**

Inchannel:

No requirements.

Outchannel:

Noise Power, 1 Hz bandwidth:

$< -135$  dBc for  $> 500$  kHz carrier offset;

$< -140$  dBc for  $> 700$  kHz carrier offset;

$< -150$  dBc for  $> 1\ 500$  kHz carrier offset.

Non harmonics:

$< -79$  dBc for  $> 500$  kHz carrier offset;

$< -84$  dBc for  $> 700$  kHz carrier offset;

$< -94$  dBc for  $> 1\ 500$  kHz carrier offset.

Harmonically related spuri:

$< -40$  dBc.

### A5.3.4.10 BCCH carriers of serving and adjacent cells

The BCCH of the serving cell is used for synchronizing the MS and to send network information to the MS under test. The BCCH signals of the adjacent cells are used in the handover tests. The MS measures the RF-levels of the BCCHs of adjacent cells.

**FREQUENCY:**

Uncertainty:

$< \pm 5 \cdot 10^{-9}$ .

**PHASE:**

## Uncertainty:

< ±1 degree RMS; and

< ±4 degrees peak(as defined in 3GPP TS 05.05).

**LEVEL:**

## Uncertainty:

< 1 dB for test 13.2 and 20;

< 2,5 dB for all other tests;

< 0,6 dB relative to each other and to TCH for test 21 over the range 65 dBmicroVoltemf to 3 dBmicroVoltemf;

< 1,2 dB relative to each other and to TCH for test 26.3.

**MODULATION:**

GMSK (as specified in 3GPP TS 05.04).

**SPURIOUS:**

## Inchannel:

Covered by phase error.

## Outchannel:

## Noise Power, 1Hz bandwidth:

< -100 dBc for > 100 kHz carrier offset;

< -125 dBc for > 1 500 kHz carrier offset.

## Non harmonics:

< -55 dBc for > 100 kHz carrier offset;

< -72 dBc for > 1 500 kHz carrier offset.

### A5.3.4.11 The wide frequency range signal

The wide frequency range signal is used in the measurements of spurious response.

**FREQUENCY**

## Uncertainty:

< ± 5\*10E-9.

**LEVEL**

## Uncertainty:

< ±1,5 dB relative to the wanted signal for test 14.7;

< ±1 dB error of substituted "wanted signal".

**MODULATION:**

Unmodulated.

SPURIOUS in the MS receiving range:

Non harmonics:

< -94 dBc.

Harmonically related spuri:

< -40 dBc.

Noise:

< -4 dBuVemf equivalent at the MS receiver input when measured in a 200 kHz bandwidth.

### A5.3.4.12 The multipath fading function

The multipath fading function simulates the fading effects of a broadband radio channel in mobile radio communication.

The propagation conditions are specified in 3GPP TS 05.05, annex 3.

The multipath fading function shall be performed only within a 5 MHz bandwidth during one test case.

## A5.3.5 MS audio interface and DAI

### A5.3.5.1 General uncertainties

Unless otherwise specified, the following uncertainties apply to the audio interface:

Signal level measurement uncertainty:  $\pm 0,2$  dB;

Sound pressure measurement uncertainty:  $\pm 0,6$  dB;

Frequency Measurement uncertainty:  $\pm 0,1$  %.

Stimulus frequency setting uncertainty:

Frequency settings are taken from ISO 3, R10 series or R40 series or from table 2 of Rec. ITU-T Recommendation P.79. A departure from the nominal frequencies of  $\pm 5$  % below 240 Hz and  $\pm 2$  % at 240 Hz and above is accepted.

In the case of 4 kHz the departure is restricted to -2 %.

### A5.3.5.2 Analogue single test tone

Total distortion:

< 0,5 %.

### A5.3.5.3 Delay measurement between Um and DAI

The delay measurement between the Um interface of the MS and its DAI in both directions is described in subclause 32.5.

Uncertainty:

<  $\pm 0,1$  ms.

---

## A5.4 SIM simulator functional requirements

### A5.4.1 General

The SIM simulator shall implement the functions of a SIM as described in 3GPP TS 02.17 and 3GPP TS 11.11.

The Test Algorithm for authentication incorporated in the SIM Simulator shall operate as described in annex 3.

### A5.4.2 Contacts C1, C2, C6, C7

#### A5.4.2.1 Default measurement / setting uncertainties

Unless stated otherwise below, the following uncertainties apply:

Voltage measurement uncertainty:  $< \pm 50$  mV;

Voltage setting uncertainty:  $< \pm 20$  mV;

Time measurement uncertainty:  $< \pm 100$  ns.

#### A5.4.2.2 Contact C1

Continuous Spikes:

Voltage measurement uncertainty:

$< \pm 100$  mV.

Current Load Amplitude:

0 mA - 20 mA

Adjustable Step Size:

1 mA.

Uncertainty

$< \pm 1$  mA.

Additional Current Offset:

0 mA - 5 mA.

Adjustable Step Size:

1 mA.

Uncertainty:

$< \pm 1$  mA.

Pulse Width:

100 ns - 500 ns.

Adjustable Step Size:

50 ns.

Uncertainty:

$< \pm 25$  ns.

Rise and Fall Time:

$\leq 50$  ns.

Pause Width:

100 ns - 500 ns.

Adjustable Step Size:

50 ns.

Uncertainty:

$< \pm 25$  ns.

Random Spikes:

Voltage measurement uncertainty:

$< \pm 100$  mV.

Current Load Amplitude:

50 mA - 200 mA.

Adjustable Step Size:

1 mA.

Uncertainty:

$< \pm 1$  mA.

Additional Current Offset:

0 mA - 5 mA.

Adjustable Step Size:

1 mA.

Uncertainty:

$< \pm 0,1$  mA.

Pulse Width:

100 ns - 500 ns.

Adjustable Step Size:

50 ns.

Uncertainty:

$< \pm 25$  ns.

Rise and Fall Time:

$\leq 50$  ns.

Pause Width:

0,1 ms - 500 ms, randomly varied.

Adjustable Step Size:

0,1 ms.

Uncertainty:

<  $\pm 0,1$  ms.

### A5.4.2.3 Contact C7

The Elementary Time Unit (etu) used in the subclauses below refer to the nominal bit duration on the I/O line, as defined in ISO 7816-3.

Rise & fall Time setting uncertainty: <  $\pm 100$  ns.

Jitter measurement uncertainty: <  $\pm 5 \cdot 10^{-3}$  etu.

Jitter setting uncertainty: <  $\pm 5 \cdot 10^{-3}$  etu.

### A5.4.3 Contact C3

Frequency measurement uncertainty: <  $\pm 0,5$  %.

Voltage Measurement uncertainty: <  $\pm 50$  mV.

Rise & fall time measurement uncertainty: <  $\pm 5$  ns.

Duty cycle measurement uncertainty: <  $\pm 2,5$  %.

### A5.4.4 Definition of timing

It shall be possible to define all timings relative to the clock. The SIM simulator shall be able to calculate and to use the absolute values automatically, even if the ME changes the frequency during the communication.

---

## Annex 6 (informative): E-OTD Accuracy Measurement Test Environment

### A6.1 Recommended Timing Accuracy Test Environment (Unassisted)

3GPP TS 05.05, annex I calls for a best-case MS measurement observed timing difference (OTD) accuracy of 100 nanoseconds. This level of measurement accuracy implies that:

1. The time delay and phase shift of all components in the test environment must be taken into account.
2. The laboratory equipment utilized to measure the burst alignment of the two base station simulators must support a time resolution of at least 10 nanoseconds.
3. All base station simulators, active RF channel simulators, and time measurement equipment must be phase-locked to a common reference clock.
4. All base station simulators used for this test must be frame synchronized.

Figure A6-1 represents a recommended configuration for the unassisted measurement of E-OTD accuracy. If this test environment is utilized, the effects of differing cable lengths, channel simulator processing delays, etc., must be compensated for in order to establish the RTD between bursts from the base station simulators.

The "unassisted" test environment should require a relatively short time ( $< 3\ 000$  s) for the test environment to obtain  $N$  measurements for the purpose of calculating the  $\text{RMS}_{90}$  timing error of the MS. In many cases, the predominant component leading to uncertainty in RTD between the two base station simulators during the measurement period will be phase jitter, which should follow a Gaussian distribution. The standard deviation of this distribution must be kept within a range that allows the test laboratory to confirm that this uncertainty component does not significantly affect the results of the OTD measurements made and reported by the MS. Test labs and base station simulator manufacturers are expected to quantify and document the test environment's RTD. Test labs and base station simulator manufacturers are also expected to have some means of verifying the standard deviation of the test environment's RTD (including phase jitter introduced by the RF channel simulators), declaring that this uncertainty will be negligible relative to the 100 nanosecond  $\text{RMS}_{90}$  best-case requirements of 3GPP TS 05.05 (V8.7.1), Release 99, annex I.

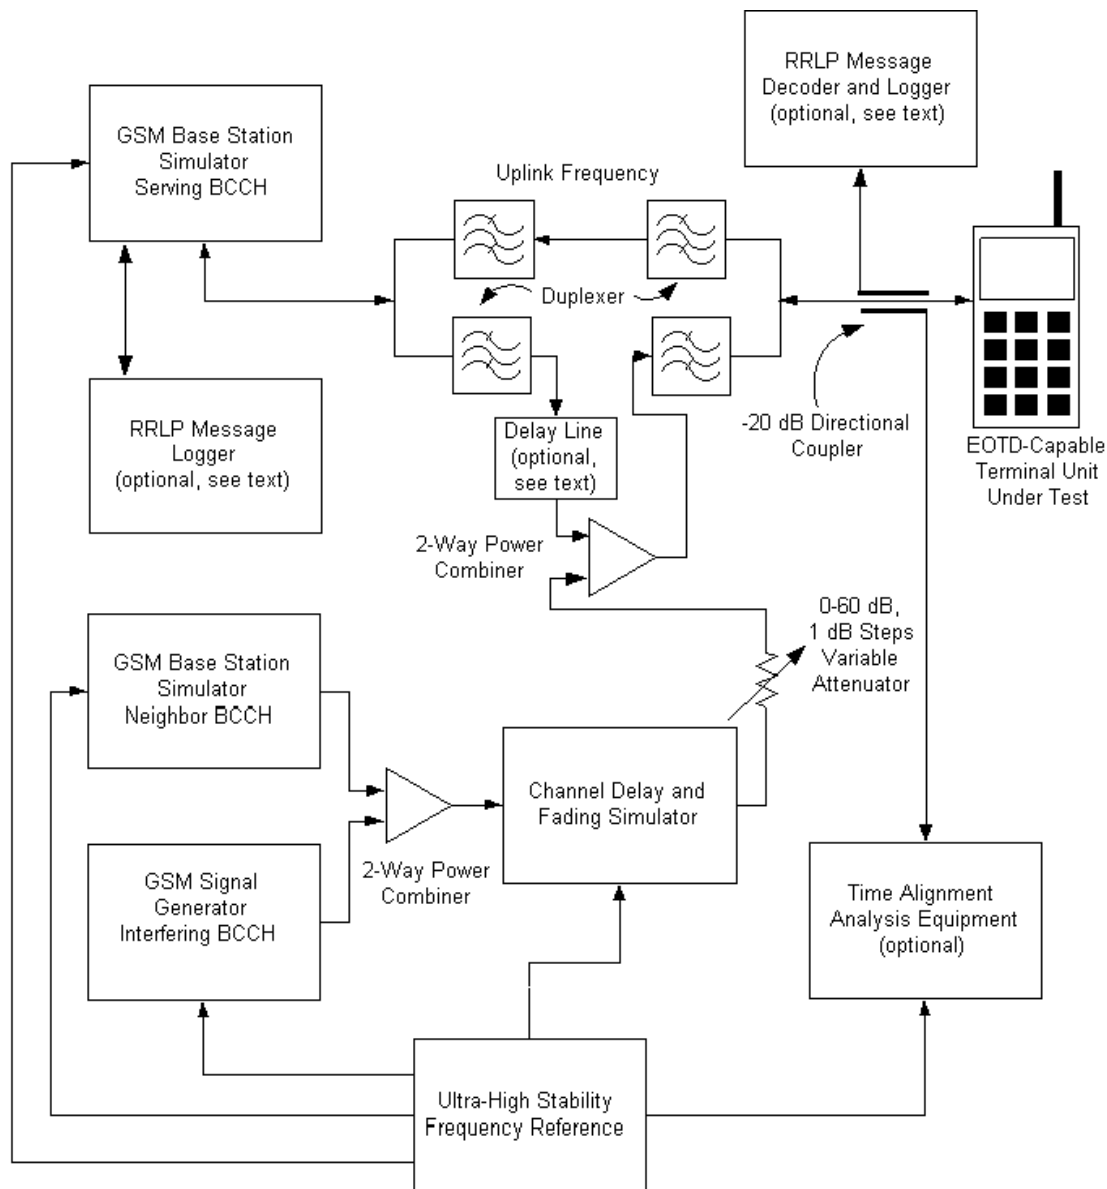

Figure A6-1: "Unassisted" E-OTD Test Environment

## A6.2 Recommended Timing Accuracy Test Environment (Assisted)

In some laboratory environments, test equipment may not be available to measure and/or maintain the base station simulator burst time alignment to the accuracy required by the "unassisted" test environment described earlier. In such cases, a test configuration of the type shown in figure A6-2 may be employed for E-OTD performance validation. In this configuration, an LMU of known accuracy is used to measure the real timing difference (RTD) between the serving and neighbor base station simulators.

The "assisted" test environment should require a relatively short time (< 3 000 s) for the test environment to obtain  $N$  measurements for the purpose of calculating the  $RMS_{90}$  timing error of the MS. In many cases, the predominant component leading to uncertainty in RTD between the two base station simulators during the measurement period will be phase jitter, which should follow a Gaussian distribution. The timing offset or RTD between the two base station simulators is reported by the LMU. Even if an RTD measurement from the LMU is made in synchronism with an OTD measurement from the MS, some means of verification must be available to assure that the standard deviation of the RTD is kept within a range that allows the laboratory to confirm that this uncertainty does not significantly affect the results of the OTD reported by the MS. Test labs and LMU manufacturers are expected to have some means of verifying the standard deviation of the RTD reported for the test environment (including phase jitter introduced by the RF channel simulator), and declaring that this uncertainty component will be negligible relative to the 100 nanosecond  $RMS_{90}$  best-case requirements of 3GPP TS 05.05 (V8.7.1), Release 99, annex I.

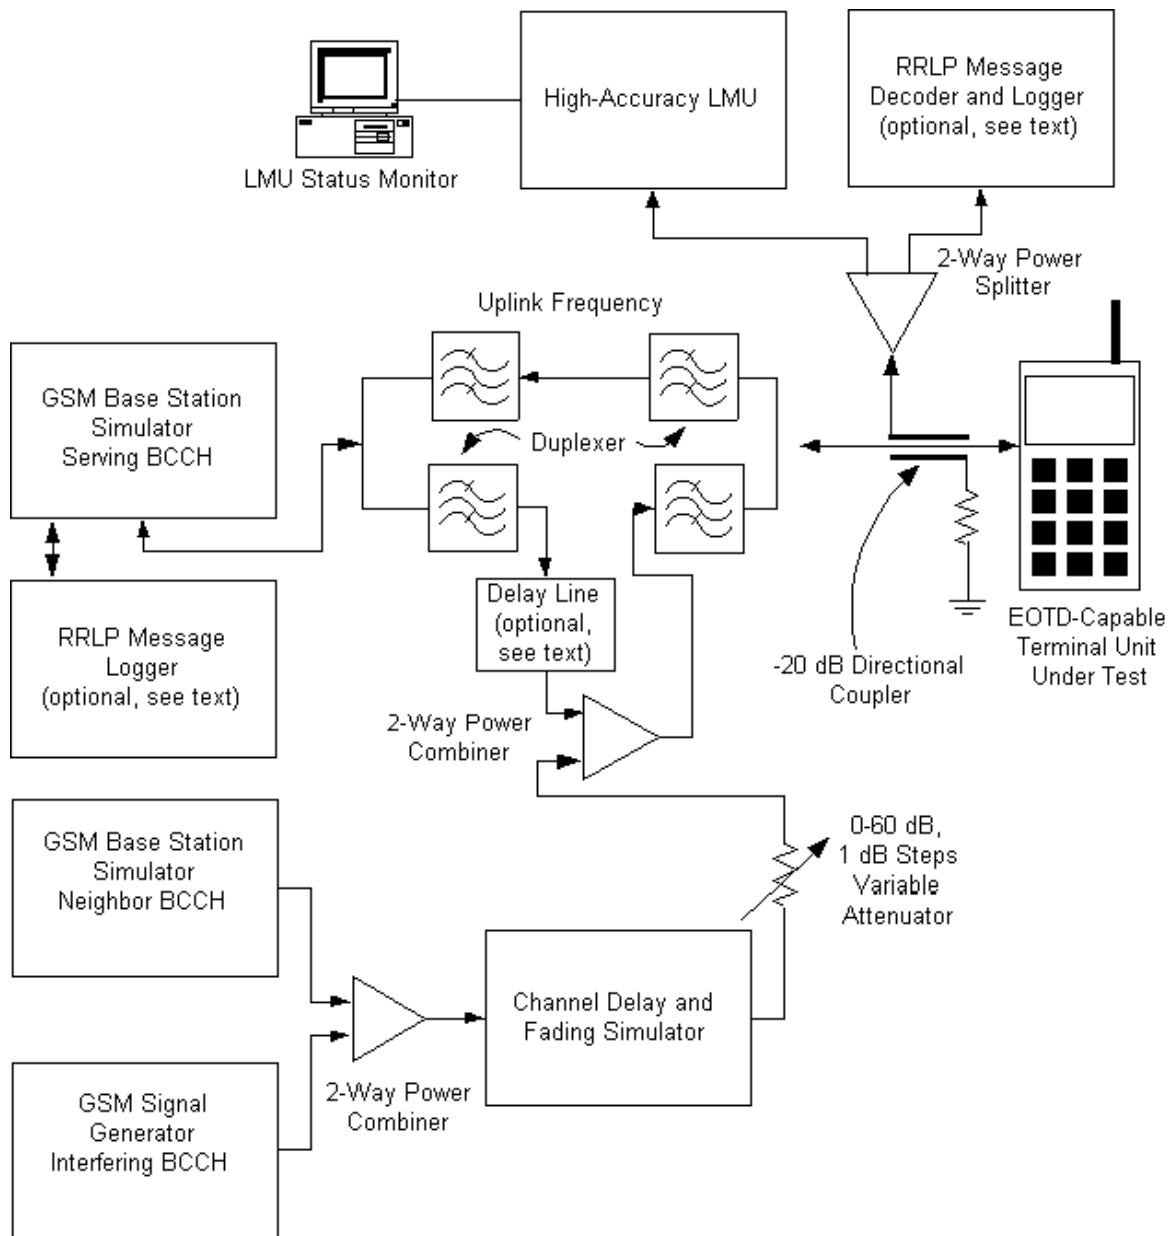

Figure A6-2: "Assisted" E-OTD Test Environment

**Delay Line**

Almost all active RF channel fading simulators introduce some intrinsic propagation delay, even when set to an RF channel delay of zero. In some cases, this delay may be too great to compensate for using a passive delay as shown in figure A6-1 and figure A6-2. In such cases, the intrinsic delay of the channel simulator shall be included in the calculation of RTD for the test environment. Any phase jitter contribution from the RF channel fading simulator must be taken into account when evaluating the standard deviation of the test environment's RTD.

### Simulated Geometric Time Difference

Once the RTD of the test environment is known, any additional time delay added to the fading simulator RF path will simulate the effect of distance between the MS and its neighbor cell. 3GPP TS 05.05 (V8.7.1), Release 99, annex I does not specify a value for geometric time delay, in part because the MS could be equidistant from the three base stations required for E-OTD calculation in a real network. Also, in an actual network, the geometric delay an MS must contend with can vary from 0  $\mu$ sec to over 50  $\mu$ sec, however, the 3GPP TS 05.05, annex I specification is only concerned with measurement error. Consequently, the test procedures described in this subclause require that no additional time delay will be added to simulate a geometric time difference.

### Neighbor Lists

The serving base station simulator must be configured to include the neighbor base station simulator in its BA list. During interference tests, the interfering signal generator shall not be included in the serving base station simulator's BA list.

### Interfering BCCH Signal Generator

The interfering BCCH signal generator shall provide a continuous GMSK signal, modulated with a pseudo-random bit sequence. This signal generator shall not be frame-synchronized with the serving or neighbor base station simulators.

### RRLP Measure Position Request

The RRLP Measure Position Request sent from the serving base station simulator shall include the field values listed in table A6-1.

**Table A6-1: RRLP Measure Position Request Field Values, Positioning Instructions Data Element**

| Field Name                     | Value | Comments                    |
|--------------------------------|-------|-----------------------------|
| Method Type                    | 0     | Value="MS assisted"         |
| Positioning Methods            | 0     | Value="E-OTD"               |
| Response Time                  | 1     | Value=2 seconds             |
| Accuracy                       | NA    | This field is optional      |
| Multiple Sets                  | 0     | Value=Multiple sets allowed |
| Environmental Characterisation | NA    | This field is optional      |

The following Measure Position Request components will be used when relevant to the test:

- E-OTD Reference BTS of Assistance Data;
- E-OTD Measurement Assistance Data for System Information List Element;

These two assistance data elements are necessary in the Measure Position Request to facilitate the execution of certain physical-layer E-OTD tests. For example, 3GPP TS 05.05, Annex I requires that in some instances, an E-OTD capable MS must support a specified timing measurement accuracy when the neighbor BCCH is below the device's reference sensitivity. Without assistance data, it may be impossible to execute the necessary physical layer validation tests because the MS upper protocol layers would be incapable of decoding the BSIC of the neighbor BCCH.

### MS Mode During Measurement

The MS under test shall make the requested measurements while in the dedicated mode on a TCH.

### Automation of E-OTD Measurements

If at all possible, the laboratory environment used to verify E-OTD accuracy should be capable of supporting automated measurements. A minimum of 250 trials shall be utilized.

### Terminal Unit RRLP Message Monitoring

The test lab shall have some means of logging the Measure Position Response message transmitted by the MS. This can be accomplished utilizing a suitable  $U_m$  interface analyzer monitoring the MS RRLP messages on the uplink, or through a base station simulator capable of reading and logging RRLP messaging. The device used to capture the received RRLP messages should be capable of logging the MS observed time difference measurement to a flat ASCII file, with each of the reported OTD values in decimal.

### E-OTD Measurement With 8PSK Modulated Bursts

3GPP TS 05.05 (V8.7.1) Release 99, annex I requires that an E-OTD-capable MS must support E-OTD measurements when the serving and the neighbor base stations are transmitting 8PSK modulated bursts. This test plan verifies that the timing error of an E-OTD-capable MS is maintained regardless of whether the serving and neighbor base station simulators are transmitting either GMSK or 8PSK in time slots 1 through 7.

### Accuracy Calculation

In order to minimize the effects of "outlying" data points, the timing difference measurement accuracy of an E-OTD MS shall be calculated as an RMS value of 90% of the measurement trials with the least error. For example, if N=250 measurement trials, the trial error results  $x_1$  through  $x_{250}$  shall be sorted in ascending order of error. A subset M that includes 90 % of the trials in set N (M=225 trials in this example) shall be established. In this example, the subset M will include the 225 trial results with the least error from set N. The RMS error is then calculated from the data points in subset M according to Equation A6-1 below:

#### (Equation A6-1) RMS<sub>90</sub> Calculation

$$\text{Error}_{\text{RMS}} = \sqrt{\left( \frac{\sum_{i=1}^M x_i^2}{M} \right)}$$

## Annex B (informative): Change history
