## 26.6.7 Test of the channel mode modify procedure

The channel mode modify procedure allows the network to request the MS to change the channel mode for one channel. If the mobile station does not correctly respond to the CHANNEL MODE MODIFY message (with a positive acknowledgement if the new channel mode is supported, with a negative acknowledgement if the new channel mode is not supported), the network may try to repeat the procedure, release the connection, or continue to wait for the acknowledgement (the maximum time resulting from layer two re-transmissions and MS reaction time being around 5 s).

### 26.6.7.1 Test of the channel mode modify procedure / full rate

This test is only applicable to an MS supporting TCH/F.

#### 26.6.7.1.1 Conformance requirement

When the MS has received the CHANNEL MODE MODIFY message, the mobile station changes the mode for the indicated channel and then replies by a CHANNEL MODE MODIFY ACKNOWLEDGE message indicating the new channel mode.

If the mobile station does not support the indicated mode, it shall retain the old mode and return the associated channel mode information in the CHANNEL MODE MODIFY ACKNOWLEDGE message.

3GPP TS 04.08 / 3GPP TS 44.018, subclauses 3.4.6.1.2 and 3.4.6.1.3

#### 26.6.7.1.2 Test purpose

To verify that the MS, in an RR connected state, acknowledges a CHANNEL MODE MODIFY message by sending a CHANNEL MODE MODIFY ACKNOWLEDGEMENT message specifying and switching to the correct mode.

- the new mode if that mode is supported.
- the old mode if the new mode is not supported.

This shall be verified for the channel modes

- signalling only.
- speech full rate version 1.
- data 9,6 Kb/s.
- data 4,8 Kb/s full rate.
- data 2,4 Kb/s full rate.

#### 26.6.7.1.3 Method of test

##### Initial Conditions

System Simulator:

1 cells, default parameters.

Mobile Station:

The MS is "idle updated", with TMSI allocated.

##### Related PICS/PIXIT Statements

- Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).
- The MS supports TCH/F (Y/N).
- Bearer Capabilities supported by the MS.
- Channel modes supported by the MS:
  - \* MS supports speech full rate version 1 (p1 = Y/N);
  - \* MS supports data 9,6 Kb/s (p2 = Y/N);
  - \* MS supports data 4,8 Kb/s full rate (p3 = Y/N);
  - \* MS supports data 2,4 Kb/s full rate (p4 = Y/N).

##### Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

##### Test procedure

A Mobile Terminated call is initiated, however following the Channel Request received from the Mobile Station, the SS sends an Immediate Assignment to the MS commanding it to go to a TCH/F. This sets the Channel Mode automatically to "Signalling Only".

The SS then sends a series of CHANNEL MODE MODIFY messages to the MS. Each time it is checked that the MS responds with a CHANNEL MODE MODIFY ACKNOWLEDGE message specifying:

- the channel mode that has been specified in the CHANNEL MODE MODIFY message, if the MS supports that mode (this mode then becomes the "channel mode in use");
- the channel mode that was in use when the CHANNEL MODE MODIFY message has been received, if the MS does not support the channel mode specified in the CHANNEL MODE MODIFY message.

##### Maximum Duration of Test

30 s.

26.6.7.2 Test of the channel mode modify procedure / half rate

This test is only applicable to an MS supporting TCH/H.

26.6.7.2.1 Conformance requirement

When the MS has received the CHANNEL MODE MODIFY message, the mobile station changes the mode for the indicated channel and then replies by a CHANNEL MODE MODIFY ACKNOWLEDGE message indicating the new channel mode.

If the mobile station does not support the indicated mode, it shall retain the old mode and return the associated channel mode information in the CHANNEL MODE MODIFY ACKNOWLEDGE message.

## References

3GPP TS 04.08 / 3GPP TS 44.018, subclauses 3.4.6.1.2 and 3.4.6.1.3.

### 26.6.7.2.2 Test purpose

To verify that the MS, in an RR connected state, acknowledges a CHANNEL MODE MODIFY message by sending a CHANNEL MODE MODIFY ACKNOWLEDGEMENT message specifying and switches to the correct mode:

- the new mode if that mode is supported;
- the old mode if the new mode is not supported.

This shall be verified for the channel modes:

- signalling only;
- speech half rate version 1;
- data 4,8 Kb/s half rate;
- data 2,4 Kb/s half rate.

### 26.6.7.2.3 Method of test

#### Initial Conditions

System Simulator:

1 cells, default parameters.

Mobile Station:

The MS is "idle updated", with TMSI allocated.

#### Related PICS/PIXIT Statements

- Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).
- The MS supports TCH/H (Y/N).
- Bearer Capabilities supported by the MS.
- Channel modes supported by the MS:
  - \* MS supports speech half rate version 1 (q1 = Y/N);
  - \* MS supports data 4,8 Kb/s half rate (q2 = Y/N);
  - \* MS supports data 2,4 Kb/s half rate (q3 = Y/N).

#### Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

#### Test procedure

A Mobile Terminated call is initiated, however following the Channel Request received from the Mobile Station, the SS sends an Immediate Assignment to the MS commanding it to go to a TCH/H. This sets the Channel Mode automatically to "Signalling Only".

The SS then sends a series of CHANNEL MODE MODIFY messages to the MS. Each time it is checked that the MS responds with a CHANNEL MODE MODIFY ACKNOWLEDGE message specifying:

- the channel mode that has been specified in the CHANNEL MODE MODIFY message, if the MS supports that mode (this mode then becomes the "channel mode in use");
- the channel mode that was in use when the CHANNEL MODE MODIFY message has been received, if the MS does not support the channel mode specified in the CHANNEL MODE MODIFY message.

#### Maximum Duration of Test

30 s.

## 26.6.8 Test of ciphering mode setting

The Ciphering Mode Setting Procedure can be used by the network to trigger the start and stop of stream ciphering.

The SS shall start and synchronize ciphering and deciphering according to 3GPP TS 03.20. The bitstream shall be generated by algorithm A5 (A5/1 or A5/2 as defined by the test case) using the encryption key Kc.

### 26.6.8.1 Ciphering mode / start ciphering

#### 26.6.8.1.1 Conformance requirements

1. When the MS receives the CIPHERING MODE COMMAND message with Ciphering Mode Setting information element set to "start ciphering", the MS starts ciphering and deciphering with the algorithm indicated by the "algorithm identifier" field:
  - the MS responds with a CIPHERING MODE COMPLETE message in ciphered mode;
  - the ciphering uses the cipher key determined during the authentication procedure.
2. The MS responds to the AUTHENTICATION REQUEST message with an AUTHENTICATION RESPONSE message and continues to use the ciphering key obtained from the previous authentication procedure.

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.4.7.

#### 26.6.8.1.2 Test purpose

To verify that the MS starts ciphering when it receives a CIPHERING MODE COMMAND message with Cipher Mode Setting = "Start Ciphering". To verify that it continues to use the old cipher key after it receives an AUTHENTICATION REQUEST whilst in ciphered mode.

#### 26.6.8.1.3 Method of test

##### Initial Conditions

System Simulator:

1 cells, Radio\_Link\_Timeout set to 64.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

##### Related PICS/PIXIT Statements

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

Support for state U10 of the Call Control protocol.

Supported encryption algorithms: A5/1 and/or A5/2.

##### Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

## Test Procedure

The MS is made to originate a call. It shall send at least one CHANNEL REQUEST message. The SS sends an IMMEDIATE ASSIGNMENT and the MS shall answer with a CM SERVICE REQUEST. The SS sends an AUTHENTICATION REQUEST and the MS shall answer with AUTHENTICATION RESPONSE. Then the SS sends a CIPHERING MODE COMMAND, ordering the MS to start ciphering with an algorithm supported by the MS. After transmission of this command the SS starts deciphering. The MS shall respond with a CIPHERING MODE COMPLETE message in ciphered mode using the cipher key determined during the authentication procedure, and continue to establish the call with a SETUP message. After reception of the CIPHERING MODE COMPLETE the SS starts enciphering.

The SS then sends another AUTHENTICATION REQUEST and the MS shall respond with an AUTHENTICATION RESPONSE. The MS shall continue to use the old cipher key.

Finally the SS sends a CHANNEL RELEASE to end the test.

## Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

## Expected Sequence

This sequence is performed for execution counter, K=1, 2.

| Step | Direction | Message                 | Comments                                                                                                                                                                                                 |

## 26.6.8.2 Ciphering mode / no ciphering

### 26.6.8.2.1 Conformance requirements

When the MS receives a CIPHERING MODE COMMAND message with Ciphering Mode Setting information element set to "no ciphering" the MS shall respond in non ciphered mode with a CIPHERING MODE COMPLETE message.

When the CIPHERING MODE COMMAND with Ciphering Mode Setting information element set to "no ciphering" is received as a response to a CM SERVICE REQUEST, the MS shall continue the establishment of the CM service.

## References

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.4.7.

## 26.6.8.2.2 Test purpose

To verify that the MS does not start ciphering when it receives a CIPHERING MODE COMMAND message with Cipher Mode Setting = "No Ciphering".

## 26.6.8.2.3 Method of test

## Initial Conditions

System Simulator:

1 cells, Radio\_Link\_Timeout set to 64.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

## Related PICS/PIXIT Statements

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

Support for state U10 of the Call Control protocol.

## Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

## Test Procedure

The MS is made to originate a call. It shall send at least one CHANNEL REQUEST message. The SS sends an IMMEDIATE ASSIGNMENT and the MS shall answer with a CM SERVICE REQUEST. The SS sends an AUTHENTICATION REQUEST and the MS shall answer with an AUTHENTICATION RESPONSE. Then the SS sends a CIPHERING MODE COMMAND, ordering the MS not to start ciphering. The MS shall respond with a CIPHERING MODE COMPLETE message in non-ciphered mode and continue to establish the call with a SETUP message.

Finally the SS sends a CHANNEL RELEASE to end the test.

## Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

## Expected Sequence

| Step | Direction | Message                 | Comments                                                            |

### 26.6.8.3 Cipherng mode / old cipher key

#### 26.6.8.3.1 Conformance requirements

When the MS receives the CIPHERING MODE COMMAND message with Cipherng Mode Setting information element set to "start cipherng", the MS starts cipherng and deciphering with the algorithm indicated by the "algorithm identifier" field. Also;

- the MS responds with a CIPHERING MODE COMPLETE message in the correct ciphered mode;
- the cipherng shall use the previously stored cipher key;
- in the case of a mobile originating speech call, the MS shall send a SETUP message after the completion of the cipherng procedure.

#### References

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.4.7.

#### 26.6.8.3.2 Test purpose

To verify that the MS uses the stored cipher key when it receives a CIPHERING MODE COMMAND without a preceding authentication procedure.

#### 26.6.8.3.3 Method of test

##### Initial Conditions

System Simulator:

1 cells, Radio\_Link\_Timeout = 64.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated and a known cipher key stored.

##### Related PICS/PIXIT Statements

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

Support for state U10 of the Call Control protocol.

Supported encryption algorithms: A5/1 and/or A5/2.

##### Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

##### Test Procedure

The MS is made to originate a call. It shall send at least one CHANNEL REQUEST message. The SS sends an IMMEDIATE ASSIGNMENT and the MS shall answer with a CM SERVICE REQUEST. The SS sends a CIPHERING MODE COMMAND, ordering the MS to start cipherng with a supported algorithm. After transmission of this command the SS starts deciphering. The MS shall respond with a CIPHERING MODE COMPLETE message in the commanded ciphered mode using the stored cipher key and continue to establish the call with a SETUP message. After reception of the CIPHERING MODE COMPLETE the SS starts encipherng.

Finally the SS sends a CHANNEL RELEASE to end the test.

##### Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

## Expected Sequence

| Step | Direction | Message                 | Comments                                                                                                                            |

### 26.6.8.4 Cipherring mode / change of mode, algorithm and key

Networks can be implemented that do not have the same cipherring algorithms on all base stations. In such networks changes of algorithms and cipherring mode may occur and calls will fail if MSs incorrectly handle commands or use an incorrect cipher key.

#### 26.6.8.4.1 Conformance requirements

- 1 When the MS in the "not ciphered" mode, receives a CIPHERING MODE COMMAND message with the Cipherring Mode Setting information element set to "start cipherring", the MS shall load the cipher key stored in the SIM into the ME, use this key to start cipherring and deciphering with the algorithm indicated by the "algorithm identifier" field and, respond with a CIPHERING MODE COMPLETE message.
- 2 If the last timeslot of the message block containing a CIPHERING MODE COMMAND message occurs at time T, then the MS shall be ready to transmit the CIPHERING MODE COMPLETE message before T+500 ms.
- 3 When the MS receives an ASSIGNMENT COMMAND message containing a Cipher Mode Setting IE after receipt of a CIPHERING MODE COMMAND message, the MS shall perform the assignment, use the commanded mode and/or algorithm on the new channel, and not change the cipherring key.
- 4 When the MS receives a HANDOVER COMMAND message containing a Cipher Mode Setting IE after receipt of a CIPHERING MODE COMMAND message, the MS shall perform the handover, use the commanded mode and/or algorithm on the new channel, and not change the cipherring key.
- 5 When the MS in the "ciphered" mode receives a CIPHERING MODE COMMAND message with Cipher Mode Setting IE set to "no cipherring", the MS shall load the cipher key stored in the SIM into the ME, load the cipher key stored in the SIM into the ME, stop cipherring and deciphering and, respond with a CIPHERING MODE COMPLETE message.
- 6 When the MS receives an AUTHENTICATION REQUEST message, it shall process the challenge information and send back an AUTHENTICATION RESPONSE message to the network. The new cipherring key calculated from the challenge information shall overwrite the previous one and be stored on the SIM before the AUTHENTICATION RESPONSE message is transmitted. The cipherring key stored in the SIM shall be loaded in to the ME when any valid CIPHERING MODE COMMAND is received.
- 7 When the MS in the not ciphered mode receives a CIPHERING MODE COMMAND message with Cipher Mode Setting IE set to "no cipherring", the MS shall load the cipher key stored in the SIM into the ME, stop cipherring and deciphering and, respond with a CIPHERING MODE COMPLETE message.
- 8 If a handover fails then the operational parameters used when returning to the old channel are those applied before the HANDOVER COMMAND message was received.
- 9 If an assignment fails then the operational parameters used when returning to the old channel are those applied before the ASSIGNMENT COMMAND message was received.

### 26.6.8.4.2 Test purpose

- 1 To verify that when the MS is in the "not ciphered" mode and receives the CIPHERING MODE COMMAND message with Ciphering Mode Setting information element set to "start ciphering", the MS uses the cipher key stored in the SIM to start ciphering and deciphering with the algorithm indicated by the "algorithm identifier" field and that the MS responds with a CIPHERING MODE COMPLETE message.
- 2 To verify that the MS is ready to transmit the CIPHERING MODE COMPLETE message before 500 ms after the end of the CIPHERING MODE COMMAND message.
- 3 To verify that when the MS receives an ASSIGNMENT COMMAND message containing a Cipher Mode Setting IE after receipt of a CIPHERING MODE COMMAND message, the MS shall perform the assignment, use the commanded mode and/or algorithm on the new channel, and not change the ciphering key.
- 4 To verify that when the MS receives a HANDOVER COMMAND message containing a Cipher Mode Setting IE after receipt of a CIPHERING MODE COMMAND message, the MS shall perform the handover, use the commanded mode and/or algorithm on the new channel, and not change the ciphering key
- 5 To verify that when the MS is in the "ciphered" mode and receives the CIPHERING MODE COMMAND message with Cipher Mode Setting IE set to "no ciphering", the MS loads the cipher key stored in the SIM into the ME, stops ciphering and deciphering and, responds with a CIPHERING MODE COMPLETE message.
- 6 To verify that the MS responds to an AUTHENTICATION REQUEST message with an AUTHENTICATION RESPONSE message and continues to use the cipher key obtained from the previous authentication procedure.
- 7 To verify that when the MS is in the "not ciphered" mode and receives the CIPHERING MODE COMMAND message with Ciphering Mode Setting information element set to "no ciphering", the does not start ciphering or deciphering, but does respond with a CIPHERING MODE COMPLETE message.
- 8 To verify that when the MS receives a HANDOVER COMMAND message and the handover fails, the MS sends a HANDOVER FAILURE message on the old channel using the old ciphering mode and (if ciphered) the old algorithm and old key.
- 9 To verify that when the MS receives an ASSIGNMENT COMMAND message and the assignment fails, the MS sends an ASSIGNMENT FAILURE message on the old channel using the old ciphering mode and (if ciphered) the old algorithm and old key.

### 26.6.8.4.3 Method of test

#### Initial Conditions

##### System Simulator:

1 cell, with a legal combination of CCCH\_CONF with SDCCH/4s or SDCCH/8s is chosen arbitrarily by the SS.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated and a known cipher key, K, stored in the SIM.

#### Related PICS/PIXIT Statements

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

Supported ciphering algorithms: A5/1 and/or A5/2.

Power class of mobile station.

#### Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

#### Test Procedure

The MS is paged. The MS shall send at least one CHANNEL REQUEST message. The SS sends an IMMEDIATE ASSIGNMENT and the MS shall answer with a PAGING RESPONSE message.

The SS sends a CIPHERING MODE COMMAND, ordering the MS to start ciphering with a supported algorithm. After transmission of this command the SS starts deciphering. The MS shall respond with a CIPHERING MODE COMPLETE message in the commanded ciphered mode using the cipher key K. After reception of the CIPHERING MODE COMPLETE the SS starts enciphering. The MS shall be ready to transmit the CIPHERING MODE COMPLETE message before 500 ms after the end of the CIPHERING MODE COMMAND message.

The term "ready to transmit" is defined in 3GPP TS 04.13.

The SS sends an AUTHENTICATION REQUEST message to the MS. Cipher key L is calculated. The MS shall send an AUTHENTICATION RESPONSE message to the SS.

The SS sends a HANDOVER COMMAND (for a finely synchronized intra-BTS handover) with the Cipher Mode Setting IE set to "no ciphering". The MS shall transmit the HANDOVER COMPLETE on the commanded channel in non ciphered mode.

The SS sends an ASSIGNMENT COMMAND message containing a Cipher Mode Setting IE set to "start ciphering". The MS shall start transmitting on the commanded channel using the commanded algorithm and cipher key K. The MS shall transmit the ASSIGNMENT COMPLETE message.

The SS sends a CIPHERING MODE COMMAND, ordering the MS to stop ciphering. After transmission of this command the SS stops deciphering. The MS shall respond with a CIPHERING MODE COMPLETE message in non ciphered mode. After reception of the CIPHERING MODE COMPLETE the SS stops enciphering.

The SS sends a HANDOVER COMMAND (for a finely synchronized intra-BTS handover) with the Cipher Mode Setting IE set to "start ciphering". The MS shall transmit the HANDOVER COMPLETE on the commanded channel in ciphered mode using cipher key L and command algorithm.

The SS sends a HANDOVER COMMAND (for a finely synchronized intra-BTS handover) with the Cipher Mode Setting IE set to "start ciphering" and the algorithm identifier indicating the algorithm currently in use. The MS shall transmit the HANDOVER COMPLETE on the commanded channel in ciphered mode using the same algorithm as before the handover.

The SS sends an ASSIGNMENT COMMAND message containing a Cipher Mode Setting IE set to "no ciphering". The MS shall start transmitting on the commanded channel in non-ciphered mode. The MS shall transmit the ASSIGNMENT COMPLETE message.

The SS sends a CIPHERING MODE COMMAND, containing a Cipher Mode Setting IE set to "no ciphering". The MS shall respond with a CIPHERING MODE COMPLETE message.

The SS sends an AUTHENTICATION REQUEST message to the MS. Cipher key M is calculated. The MS shall send an AUTHENTICATION RESPONSE message to the SS.

The SS sends a HANDOVER COMMAND (for a finely synchronized intra-BTS handover) with the Cipher Mode Setting IE set to "start ciphering". The MS shall transmit the HANDOVER COMPLETE on the commanded channel using the commanded algorithm and cipher key L.

The SS sends a HANOVER COMMAND (for a finely synchronized intra-BTS handover) with the Cipher Mode Setting IE set to "no ciphering". The SS does not activate the commanded channel. The MS's transmissions on the new channel need not be monitored. The MS shall transmit the HANOVER FAILURE message on the "old" channel using the "old" algorithm and cipher key L and commanded algorithm.

The SS sends an ASSIGNMENT COMMAND message containing a Cipher Mode Setting IE set to "start ciphering". The SS does not activate the commanded channel. The MS's transmissions on the new channel need not be monitored. The MS shall transmit the ASSIGNMENT FAILURE message on the "old" channel using the "old" algorithm and cipher key L.

If the MS only supports one ciphering algorithm then the SS sends a CHANNEL RELEASE message.

If the MS supports more than one ciphering algorithm then the following steps are performed:

The SS sends an ASSIGNMENT COMMAND message containing a Cipher Mode Setting IE set to "start ciphering" and the Algorithm Identifier indicating a different supported algorithm to the one in use. The MS shall start transmitting on the commanded channel using the commanded algorithm. The MS shall transmit the ASSIGNMENT COMPLETE message.

The SS sends a HANOVER COMMAND (for a finely synchronized intra-BTS handover) containing a Cipher Mode Setting IE set to "start ciphering" and the Algorithm Identifier indicating a different supported algorithm to the one in use. The MS shall transmit the HANOVER COMPLETE on the commanded channel using the commanded algorithm.

The SS sends a CHANNEL RELEASE to end the test.

#### Maximum Duration of Test

3 minutes.

#### Expected Sequence

For MSs that only support one ciphering algorithm, the SS shall use step 61A. For MSs that support more than one ciphering algorithm, the SS shall use step 61B and the subsequent steps.

NOTE: 3GPP TS 04.08 / 3GPP TS 44.018 appears to be unclear as to whether timer T3240 shall or shall not be started as a result of the AUTHENTICATION REQUEST messages sent in steps 8 and 44. To allow a variety of test equipment implementations, the IDENTITY REQUEST messages are included in order to avoid an unexpected expiry of timer T3240 prior to the end of the expected sequence.

| Step | Direction | Message                 | Comments                                                                                                                                                                             |
|------|-----------|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PAGING REQUEST TYPE 1   |                                                                                                                                                                                      |
| 2    | MS -> SS  | CHANNEL REQUEST         |                                                                                                                                                                                      |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT    | To either SDCCH4 or SDCCH8 depending upon CCCH_CONF arbitrarily chosen.                                                                                                              |
| 4    | MS -> SS  | PAGING RESPONSE         |                                                                                                                                                                                      |
| 5    | SS -> MS  | CIPHERING MODE COMMAND  | Cipher Mode Setting = "Start Ciphering", algorithm arbitrarily selected from those supported by the MS. The SS starts deciphering with the selected algorithm.                       |
| 6    | MS -> SS  | CIPHERING MODE COMPLETE | Sent in ciphered mode using key "K", the stored cipher key, and the commanded algorithm. This message shall be ready to be transmitted before 500 ms after the completion of step 5. |
| 7    | SS        |                         | - The SS starts enciphering using key "K".                                                                                                                                           |
| 8    | SS -> MS  | AUTHENTICATION REQUEST  | Contains a new Ciphering Key Sequence Number which is associated with the new cipher key, "L".                                                                                       |
| 9    | MS -> SS  | AUTHENTICATION RESPONSE |                                                                                                                                                                                      |
| 10   | SS -> MS  | HANOVER COMMAND         | Includes Cipher Mode Setting IE set to "No Ciphering".                                                                                                                               |
| 11   | SS        | -                       | The SS activates the new channel without ciphering.                                                                                                                                  |
| 12   | MS -> SS  | HANOVER ACCESS          | These four HANOVER ACCESS messages are sent on the new channel in non ciphered mode.                                                                                                 |
| 13   | MS -> SS  | HANOVER ACCESS          |                                                                                                                                                                                      |
| 14   | MS -> SS  | HANOVER ACCESS          |                                                                                                                                                                                      |
| 15   | MS -> SS  | HANOVER ACCESS          |                                                                                                                                                                                      |
| 16   | MS -> SS  | HANOVER COMPLETE        | Sent in non ciphered mode on the new channel.                                                                                                                                        |

| Step | Direction | Message                 | Comments                                                                                                                                                       |
|------|-----------|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 17   | SS -> MS  | ASSIGNMENT COMMAND      | Includes Cipher Mode Setting IE set to "Start Ciphering", with algorithm arbitrarily selected from those supported by the MS.                                  |
| 18   | SS        |                         | The SS activates the new channel with enciphering and deciphering enabled and using cipher key "K".                                                            |
| 19   | MS -> SS  | ASSIGNMENT COMPLETE     | Sent on the new channel in ciphered mode using key "K" and the commanded algorithm.                                                                            |
| 20   | SS -> MS  | CIPHERING MODE COMMAND  | Cipher Mode Setting = "No Ciphering". The SS starts receiving in non ciphered mode.                                                                            |
| 21   | MS -> SS  | CIPHERING MODE COMPLETE | Sent in non ciphered mode. This message shall be ready to be transmitted before 500 ms after the completion of step 20.                                        |
| 22   | SS        | -                       | The SS starts transmitting in non ciphered mode.                                                                                                               |
| 23   | SS -> MS  | HANDOVER COMMAND        | Includes Cipher Mode Setting IE set to "Start Ciphering", with algorithm "X" arbitrarily selected from those supported by the MS.                              |
| 24   | SS        |                         | The SS activates the new channel with enciphering and deciphering enabled and using cipher key "L".                                                            |
| 25   | MS -> SS  | HANDOVER ACCESS         | These four HANDOVER ACCESS messages are sent on the new channel in the non ciphered mode.                                                                      |
| 26   | MS -> SS  | HANDOVER ACCESS         |                                                                                                                                                                |
| 27   | MS -> SS  | HANDOVER ACCESS         |                                                                                                                                                                |
| 28   | MS -> SS  | HANDOVER ACCESS         |                                                                                                                                                                |
| 29   | MS -> SS  | HANDOVER COMPLETE       | Sent on the new channel in ciphered mode using key "L" and algorithm "X".                                                                                      |
| 30   | SS -> MS  | IDENTITY REQUEST        |                                                                                                                                                                |
| 31   | MS -> SS  | IDENTITY RESPONSE       |                                                                                                                                                                |
| 32   | SS -> MS  | HANDOVER COMMAND        | Includes Cipher Mode Setting IE set to "Start Ciphering", with algorithm identifier set to "X".                                                                |
| 33   | SS        |                         | The SS activates the new channel with enciphering and deciphering enabled.                                                                                     |
| 34   | MS -> SS  | HANDOVER ACCESS         | These four HANDOVER ACCESS messages are sent on the new channel in the non ciphered mode.                                                                      |
| 35   | MS -> SS  | HANDOVER ACCESS         |                                                                                                                                                                |
| 36   | MS -> SS  | HANDOVER ACCESS         |                                                                                                                                                                |
| 37   | MS -> SS  | HANDOVER ACCESS         |                                                                                                                                                                |
| 38   | MS -> SS  | HANDOVER COMPLETE       | Sent on the new channel in ciphered mode using algorithm "X".                                                                                                  |
| 39   | SS -> MS  | ASSIGNMENT COMMAND      | Includes Cipher Mode Setting IE set to "No Ciphering".                                                                                                         |
| 40   | SS        |                         | The SS activates the new channel without ciphering.                                                                                                            |
| 41   | MS -> SS  | ASSIGNMENT COMPLETE     | Sent in non-ciphered mode on the new channel.                                                                                                                  |
| 42   | SS -> MS  | CIPHERING MODE COMMAND  | Cipher Mode Setting = "No Ciphering".                                                                                                                          |
| 43   | MS -> SS  | CIPHERING MODE COMPLETE | Sent in non ciphered mode. This message shall be ready to be transmitted before 500 ms after the completion of step 42.                                        |
| 44   | SS -> MS  | AUTHENTICATION REQUEST  | Contains a new Ciphering Key Sequence Number which is associated with the new cipher key, "M".                                                                 |
| 45   | MS -> SS  | AUTHENTICATION RESPONSE |                                                                                                                                                                |
| 46   | SS -> MS  | HANDOVER COMMAND        | Includes Cipher Mode Setting IE set to "Start Ciphering", with algorithm "Y" arbitrarily selected from those supported by the MS.                              |
| 47   | SS        |                         | The SS activates the new channel with enciphering and deciphering enabled and using cipher key "L".                                                            |
| 48   | MS -> SS  | HANDOVER ACCESS         | These four HANDOVER ACCESS messages are sent on the new channel in the non ciphered mode.                                                                      |
| 49   | MS -> SS  | HANDOVER ACCESS         |                                                                                                                                                                |
| 50   | MS -> SS  | HANDOVER ACCESS         |                                                                                                                                                                |
| 51   | MS -> SS  | HANDOVER ACCESS         |                                                                                                                                                                |
| 52   | MS -> SS  | HANDOVER COMPLETE       | Sent on the new channel in ciphered mode using key "L"                                                                                                         |
| 53   | SS -> MS  | HANDOVER COMMAND        | Includes Cipher Mode Setting IE set to "No Ciphering".                                                                                                         |
| 54   | SS, MS    |                         | The SS does not activate the new channel The MS's transmissions on the new channel need not be monitored. sent on old channel using algorithm "Y" and key "L". |
| 55   | MS -> SS  | HANDOVER FAILURE        |                                                                                                                                                                |
| 56   | SS -> MS  | IDENTITY REQUEST        |                                                                                                                                                                |
| 57   | MS -> SS  | IDENTITY RESPONSE       |                                                                                                                                                                |
| 58   | SS -> MS  | ASSIGNMENT COMMAND      | Includes Cipher Mode Setting IE set to "No Ciphering".                                                                                                         |

| Step | Direction | Message             | Comments                                                                                                                                                         |
|------|-----------|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 59   | SS, MS    |                     | The SS does not activate the new channel The MS's transmissions on the new channel need not be monitored. sent on old channel using algorithm "Y" and key "L".   |
| 60   | MS -> SS  | ASSIGNMENT FAILURE  |                                                                                                                                                                  |
| 61A  | SS -> MS  | CHANNEL RELEASE     |                                                                                                                                                                  |
| 61B  | SS -> MS  | ASSIGNMENT COMMAND  | Includes Cipher Mode Setting IE set to "Start Ciphering", with algorithm "Z" arbitrarily selected from those supported by the MS but different to algorithm "Y". |
| 62B  | SS        |                     | The SS activates the new channel with enciphering and deciphering enabled.                                                                                       |
| 63B  | MS -> SS  | ASSIGNMENT COMPLETE | Sent on the new channel in ciphered mode using key "L" and algorithm "Z".                                                                                        |
| 64B  | SS -> MS  | HANDOVER COMMAND    | Includes Cipher Mode Setting IE set to "Start Ciphering" and the algorithm identifier set to "Y".                                                                |
| 65B  | SS        |                     | The SS activates the new channel with enciphering and deciphering enabled.                                                                                       |
| 66B  | MS -> SS  | HANDOVER ACCESS     |                                                                                                                                                                  |
| 67B  | MS -> SS  | HANDOVER ACCESS     | These four HANDOVER ACCESS messages are sent on the new channel in the non ciphered mode.                                                                        |
| 68B  | MS -> SS  | HANDOVER ACCESS     |                                                                                                                                                                  |
| 69B  | MS -> SS  | HANDOVER ACCESS     |                                                                                                                                                                  |
| 70B  | MS -> SS  | HANDOVER COMPLETE   |                                                                                                                                                                  |
| 71B  | SS -> MS  | CHANNEL RELEASE     | Sent on the new channel in ciphered mode using key "L" and algorithm "Y".                                                                                        |

| Power Command                     |                                                               |
| - Power level                     | Chosen arbitrarily, but within the range supported by the MS. |
| Synchronization Indication        |                                                               |
| - Synchronization indication      | synchronized.                                                 |
| - Report observed time difference | not included.                                                 |
| - Normal cell indication          | out of range ignored.                                         |
| Cipher Mode setting               | As specified above.                                           |
| All other information elements:   | Not present.                                                  |

## CIPHER MODE COMMAND

| Information Element                  | value/remark        |
|--------------------------------------|---------------------|
| As default message contents, except: |                     |
| Cipher Mode Setting                  |                     |
| - Algorithm Identifier               | As specified above. |
| - Cipher Mode Set                    | As specified above. |

## 26.6.8.5 Ciphering mode / IMEISV request

If the MS does not supply the IMEISV when requested, the network will not know whether or not the MS is type approved, i.e. whether or not it has passed any tests.

If the MS supplies its IMEISV when not requested, this may cause calls to systematically fail.

## 26.6.8.5.1 Conformance requirements

1. When the MS receives the CIPHERING MODE COMMAND message with Cipher Response bit set to "IMEISV shall be included", the MS shall include the IMEISV in the Mobile Identity IE in the CIPHERING MODE COMPLETE message.
2. When the MS receives the CIPHERING MODE COMMAND message with Cipher Response bit set to "IMEISV shall not be included", the MS shall not include the Mobile Identity IE in the CIPHERING MODE COMPLETE message.

## References

Conformance requirement 1: 3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.4.7.2 and 9.1.10.1.

Conformance requirement 2: 3GPP TS 04.08 / 3GPP TS 44.018 subclause 9.1.10.1.

## 26.6.8.5.2 Test purpose

To verify that the MS supplies its IMEISV in the CIPHERING MODE COMPLETE message when it receives a CIPHERING MODE COMMAND message with a Cipher Response bit set to "IMEISV shall be included".

To verify that the MS does not supply any Mobile Identity IE in the CIPHERING MODE COMPLETE message when it receives a CIPHERING MODE COMMAND message with a Cipher Response bit set to "IMEISV shall not be included".

## 26.6.8.5.3 Method of test

## Initial Conditions

System Simulator:

1 cell.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

## Related PICS/PIXIT Statements

IMEISV of the MS.

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

## Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

## Test Procedure

The MS is paged. It shall send at least one CHANNEL REQUEST message. The SS sends an IMMEDIATE ASSIGNMENT and the MS shall answer with a PAGING RESPONSE. Then the SS sends a CIPHERING MODE COMMAND indicating "No ciphering" and with the Cipher Response bit set to "IMEISV shall not be included". The MS shall respond with a CIPHERING MODE COMPLETE message that does not include the Mobile Identity IE.

Then the SS sends a CIPHERING MODE COMMAND indicating "No ciphering" and with the Cipher Response bit set to "IMEISV shall be included". The MS shall respond with a CIPHERING MODE COMPLETE message that carries the IMEISV in the Mobile Identity IE.

Finally the SS sends a CHANNEL RELEASE to end the test.

## Maximum Duration of Test

10 s.

## Expected Sequence

| 2    | MS -> SS  | CHANNEL REQUEST         |                                                                                         |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT    |                                                                                         |
| 4    | MS -> SS  | PAGING RESPONSE         |                                                                                         |
| 5    | SS -> MS  | CIPHERING MODE COMMAND  | Cipher Mode Setting = "No Ciphering". Cipher Response = "IMEISV shall not be included". |
| 6    | MS -> SS  | CIPHERING MODE COMPLETE | Shall not include Mobile Identity IE.                                                   |
| 7    | SS -> MS  | CIPHERING MODE COMMAND  | Cipher Mode Setting = "No Ciphering". Cipher Response = "IMEISV shall be included".     |
| 8    | MS -> SS  | CIPHERING MODE COMPLETE | Shall include one Mobile Identity IE carrying the MS's IMEISV.                          |
| 9    | SS -> MS  | CHANNEL RELEASE         |                                                                                         |

Specific Message Contents

None.

## 26.6.9 Test of additional assignment

The Additional Assignment procedure is used to change an MS's channel configuration from Lm + ACCH to Lm + Lm + ACCH. It is therefore only relevant to those mobiles which perform such an operation.

No tests are specified at the moment.

## 26.6.10 Test of partial release

The Partial Release procedure is used to change an MS's channel configuration from Lm + Lm + ACCH to Lm + ACCH. It is therefore only relevant to those mobiles which perform such an operation.

No tests are specified at the moment.

## 26.6.11 Test of classmark

### 26.6.11.1 Classmark change

This procedure allows the MS to indicate to the network that a change in the classmark (e.g. due to addition of power amplification) has taken place.

#### 26.6.11.1.1 Conformance requirements

If the RF power capability of the MS is changed during a call, this change shall be signalled to the network.

If the RF power capability of the MS is changed in idle mode, the up to date RF power capability shall be signalled to the network during RR connection establishment.

### References

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.4.10.

#### 26.6.11.1.2 Test purpose

To verify that if the RF power capability or any other capability indicated in a Classmark IE of the MS is changed during a call, the change is communicated on the DCCH to the network.

To verify that if the RF power capability or any other capability indicated in a Classmark IE of the MS is changed in idle mode, the out of date capabilities are not communicated to the network during RR connection establishment.

#### 26.6.11.1.3 Method of test

### Initial Conditions

#### System Simulator:

1 cell, default parameters.

#### Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated and with no additional power amplification applied.

#### Related PICS/PIXIT Statements

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

Support for more than one RF power class: yes/no.

Support for state U10 of the Call Control protocol.

Full rate channel modes supported by the MS

#### Foreseen Final State of the MS

"Idle, updated", with TMSI allocated and with no additional power amplification applied.

#### Test Procedure

With the MS in idle mode, the RF power capability shall be changed by the addition of power amplification, after which the MS is made to originate a call. The new RF power capability shall be included in the CM SERVICE REQUEST message. After the call has reached the Call Control state U10, the RF power capability of the MS is changed by removal of the additional power amplification. The MS shall send a CLASSMARK CHANGE message indicating the new RF power capability. The RF power capability is then changed by adding the power amplification. The MS shall again send a CLASSMARK CHANGE message indicating the new RF power capability. The call is then released by the SS.

With the MS in idle mode, the power amplification is removed. The SS then pages the MS, which in the PAGING RESPONSE message shall indicate the correct RF power capability.

Finally the SS transmits a CHANNEL RELEASE to end the test.

#### Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

## Specific Message Contents

None.

### 26.6.11.2 Classmark interrogation

This procedure allows the network to request the MS to supply all its classmark information to the network.

Networks may systematically use this procedure (e.g. during location updating) and, if it is incorrectly implemented in the MS, the basic connection establishment procedure may systematically fail.

#### 26.6.11.2.1 Conformance requirements

On receipt of a CLASSMARK ENQUIRY message, the MS sends a CLASSMARK CHANGE message to the network containing the Mobile Station Classmark 2 information element and depending upon the contents of this information element, possibly the Mobile Station Classmark 3 information element.

#### References

3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.4.11 and 9.1.11.1.

3GPP TS 04.13 subclause 5.2.9.

#### 26.6.11.2.2 Test purpose

To verify that if the network requests the MS to supply all its classmark information then this information is communicated on the DCCH to the network.

## 26.6.11.2.3 Method of test

## Initial Conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

"Idle, updated", with TMSI allocated.

## Related PICS/PIXIT Statements

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

Contents of Mobile Station Classmark 2 information element.

Existence of Mobile Station Classmark 3 information element: yes/no.

Contents of Mobile Station Classmark 3 information element.

Switch off button: yes/no.

## Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

## Test Procedure

The MS is switched off (or has its power removed).

The SS then sets the IMSI attach-detach flag in the SYSTEM INFORMATION messages so that the MS shall perform a location update when switched on.

The MS is switched on (or its power is re-applied). The MS then initiates a location update attempt. After the mobile has sent the LOCATION UPDATING REQUEST message, the SS transmits a CLASSMARK ENQUIRY message. The MS shall be ready to transmit the CLASSMARK CHANGE message before 300 ms after the end of the CLASSMARK ENQUIRY message.

The term "ready to transmit" is defined in 3GPP TS 04.13.

Then the SS transmits a LOCATION UPDATING ACCEPT message that does not contain a Mobile Identity IE.

## Maximum Duration of Test

2 minutes.

## Expected Sequence

| Step | Direction | Message                   | Comments                                                                                                                                      |

## 26.6.12 Test of channel release

The purpose of this procedure is to deactivate the dedicated channels in use. When the channels are released, the MS returns to the CCCH configuration, idle mode.

### 26.6.12.1 Channel release / SDCCH

#### 26.6.12.1.1 Conformance requirements

After the acknowledgement of the Layer 2 disconnection by the network, the MS shall not produce any further RF-transmission.

#### References

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.4.13.1

#### 26.6.12.1.2 Test purpose

To verify that the MS is able to correctly release an SDCCH after having received a CHANNEL RELEASE message.

#### 26.6.12.1.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

#### Related PICS/PIXIT Statements

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

#### Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

## Test Procedure

The MS is paged and allocated a dedicated channel and the Layer 2 signalling link is established. The SS then sends a CHANNEL RELEASE message, after which the MS shall initiate a Layer 2 disconnection process on the main signalling link. After the acknowledgement of the Layer 2 disconnection by the SS, the MS shall stop transmission of Layer 2 messages. This is verified for 3 s. The MS shall return to the idle state, which is verified through the paging procedure to which the MS shall respond.

## Maximum Duration of Test

20 s.

## Expected Sequence

| Step | Direction | Message               | Comments                                                                                                      |
|------|-----------|-----------------------|---------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PAGING REQUEST TYPE 1 |                                                                                                               |
| 2    | MS -> SS  | CHANNEL REQUEST       | Establish. Cause = "Answer to paging".                                                                        |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT  | Channel Type = SDCCH/8                                                                                        |
| 4    | MS -> SS  | PAGING RESPONSE       |                                                                                                               |
| 5    | SS -> MS  | CHANNEL RELEASE       | With a valid RR cause value.                                                                                  |
| 6    | MS -> SS  | DISC                  | The MS may send the DISC message without performing a layer 2 acknowledgement of the CHANNEL RELEASE message. |
| 7    | SS -> MS  | UA                    |                                                                                                               |
|      | -----     | -----                 | The SS verifies for 3 s that the MS does not produce any Layer 2 messages.                                    |
|      | -----     | -----                 | The SS waits 12 s to allow the MS to perform cell reselection.                                                |
| 8    | SS -> MS  | PAGING REQUEST TYPE 1 |                                                                                                               |
| 9    | MS -> SS  | CHANNEL REQUEST       | Establish. Cause = "Answer to paging".                                                                        |
| 10   | SS -> MS  | IMMEDIATE ASSIGNMENT  |                                                                                                               |
| 11   | MS -> SS  | PAGING RESPONSE       |                                                                                                               |
| 12   | SS -> MS  | CHANNEL RELEASE       |                                                                                                               |

## 26.6.12.2 Channel release / SDCCH - no L2 ACK

### 26.6.12.2.1 Conformance requirements

After the expiry of timer T3110 the MS shall not produce any further RF-transmission.

## References

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.4.13.1.

### 26.6.12.2.2 Test purpose

To verify that the MS is able to correctly release a SDCCH after having received a CHANNEL RELEASE message, even if the SS does not L2 acknowledge the L2 DISC frame.

### 26.6.12.2.3 Method of test

## Initial Conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

#### Related PICS/PIXIT Statements

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

#### Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

#### Test Procedure

The MS is paged and allocated a dedicated channel and the Layer 2 signalling link is established. The SS then sends a CHANNEL RELEASE message, after which the MS shall send at least 2 L2 DISC frames. The SS does not acknowledge any of the L2 DISC frames. After 2 s, the SS verifies for 3 s that the MS has stopped transmission of Layer 2 messages. The MS shall return to the idle state, which is verified through the paging procedure to which the MS shall respond.

#### Maximum Duration of Test

25 s.

### 26.6.12.3 Channel release / TCH-F

#### 26.6.12.3.1 Conformance requirements

After the acknowledgement of the Layer 2 disconnection by the network the MS shall not produce any further RF-transmission.

#### References

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.4.13.1.

## 26.6.12.3.2 Test purpose

To verify that the MS is able to correctly release a full-rate TCH after having received a CHANNEL RELEASE message.

## 26.6.12.3.3 Method of test

## Initial Conditions

## System Simulator:

1 cell, default parameters.

## Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

## Related PICS/PIXIT Statements

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

Supported rate of TCH: TCH/F.

## Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

## Test Procedure

The MS is paged and allocated a dedicated channel and the Layer 2 signalling link is established. The SS then sends a CHANNEL RELEASE message, after which the MS shall initiate a Layer 2 disconnection process on the main signalling link. After the acknowledgement of the Layer 2 disconnection by the SS, the MS shall stop transmission of Layer 2 messages. This is verified for 3 s. The MS shall return to the idle state, which is verified through the paging procedure to which the MS shall respond.

## Maximum Duration of Test

20 s.

### 26.6.12.4 Channel release / TCH-F - no L2 ACK

#### 26.6.12.4.1 Conformance requirements

After the expiry of timer T3110 the MS shall not produce any further RF-transmission.

#### References

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.4.13.1

#### 26.6.12.4.2 Test purpose

To verify that the MS is able to correctly release a TCH/F after having received a CHANNEL RELEASE message, even if the SS does not L2 acknowledge the L2 DISC frame.

#### 26.6.12.4.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

#### Related PICS/PIXIT Statements

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

Supported rate of TCH: TCH/F.

#### Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

#### Test Procedure

The MS is paged and allocated a dedicated channel and the Layer 2 signalling link is established. The SS then sends a CHANNEL RELEASE message (with cause "abnormal release, unspecified"), after which the MS shall send at least 2 L2 DISC frames. The SS does not acknowledge any of the L2 DISC frames. After 2 s, the SS verifies for 3 s that the MS has stopped transmission of Layer 2 messages. The MS shall return to the idle state, which is verified through the paging procedure to which the MS shall respond.

#### Maximum Duration of Test

25 s.

### 26.6.13 Test of starting time

The Assignment, Handover and immediate assignment procedures can include a delayed change of frequency list, MAIO and HSN. This series of tests checks the behaviour of the Mobile Station when receiving channel allocation messages with a starting time and channel description for both before and after the starting time. Tests checking the phase 1 usage of the starting time (that is without a channel description for before the time) are included in the series related to immediate assignment, dedicated assignment and handover.

Throughout subclause 26.6.13 the defaults in subclause 26.6.14 for GSM 900, subclause 26.6.15 for DCS 1 800, subclause 26.6.16 for GSM 450, subclause 26.6.17 for GSM 480, subclause 26.6.19 for GSM 700 and subclause 26.6.20 for GSM 850 are used with the following exceptions:

Contents of IMMEDIATE ASSIGNMENT message, unless otherwise defined in the individual test cases:

| Request Reference              | Pertaining to last Channel Request sent by the MS.                                                                                                                                                |
| Timing Advance                 |                                                                                                                                                                                                   |
| - Timing advance value         | 30 bit periods.                                                                                                                                                                                   |
| Mobile Allocation              | Chosen arbitrarily, at least one frequency. In case of an MA with just one frequency, the frequency should be different from the BCCH carrier.                                                    |
| Starting Time                  | Not present.                                                                                                                                                                                      |
| IA rest octets                 | Not used (all bits set to spare).                                                                                                                                                                 |

GSM 450:

Cell A has:

BCCH ARFCN = 263.

Cell Allocation = (259, 261, 263, 265, 267, 269, 271, 273, 275, 277, 279, 281, 283, 285, 287, 289, 291).

Cell B has:

BCCH ARFCN = 274.

Cell Allocation = (260, 262, 264, 266, 268, 270, 272, 274, 276, 279, 281, 283, 285, 287, 289, 291).

Base station Colour Code = different to Cell A

The Cell Allocation of both Cell A and Cell B shall be coded using range 128 format.

(The BCCH ARFCNs are already included in the default BA-List.)

GSM 480:

Cell A has:

BCCH ARFCN = 310.

Cell Allocation = (306, 308, 310, 312, 314, 316, 318, 320, 322, 324, 326, 328, 330, 332, 334, 336, 338).

Cell B has:

BCCH ARFCN = 321.

Cell Allocation = (307, 309, 311, 313, 315, 317, 319, 321, 323, 326, 328, 330, 332, 334, 336, 338).

Base station Colour Code = different to Cell A

The Cell Allocation of both Cell A and Cell B shall be coded using range 128 format.

(The BCCH ARFCNs are already included in the default BA-List.)

**GSM 900:**

Cell A has:

BCCH ARFCN = 20.

Cell Allocation = (10, 17, 20, 26, 34, 42, 45, 46, 52, 59, 66, 73, 74, 75, 76, 108, 114).

Cell B has:

BCCH ARFCN = 40.

Cell Allocation = (14, 18, 22, 24, 30, 31, 38, 40, 60, 66, 73, 74, 75, 76, 108, 114).

Base station Colour Code = different to Cell A

The Cell Allocation of both Cell A and Cell B shall be coded using bit map 0 format.

(The BCCH ARFCNs are already included in the default BA-List.)

**DCS 1 800:**

Cell A has:

BCCH ARFCN = 747.

Cell Allocation = (737, 741, 747, 754, 759, 762, 766, 767, 773, 775, 779, 782, 791, 798, 829, 832, 844).

Base station Colour Code = different to Cell A

Cell B has:

BCCH ARFCN = 764.

Cell Allocation = (739, 743, 746, 749, 756, 758, 761, 764, 771, 779, 782, 791, 798, 829, 832, 844).

The Cell Allocation of both Cell A and Cell B shall be coded using range 256 format.

The BCCH ARFCNs shall be added to the default BA-List.

**PCS 1 900:**

Cell A has:

BCCH ARFCN = 647.

Cell Allocation = (637, 641, 647, 654, 659, 662, 666, 667, 673, 675, 679, 682, 691, 698, 729, 732, 744).

Cell B has:

BCCH ARFCN = 664.

Cell Allocation = (639, 643, 646, 649, 656, 658, 661, 664, 671, 679, 682, 691, 698, 729, 732, 744).

The Cell Allocation of both Cell A and Cell B shall be coded using range 256 format.

The BCCH ARFCNs shall be added to the default BA-List.

**GSM 700:**

Cell A has:

BCCH ARFCN = 457.

Cell Allocation = (447, 454, 457, 463, 471, 479, 482, 483, 489, 496, 498, 500, 501, 502, 503, 506, 508).

Cell B has:

BCCH ARFCN = 477.

Cell Allocation = (451, 455, 459, 461, 467, 468, 475, 477, 497, 498, 500, 501, 502, 503, 506, 508).

Base station Colour Code = different to Cell A

The Cell Allocation of both Cell A and Cell B shall be coded using bit map 0 format.

(The BCCH ARFCNs are already included in the default BA-List.)

GSM 850:

Cell A has:

BCCH ARFCN = 147.

Cell Allocation = (137, 144, 147, 153, 161, 169, 172, 173, 179, 186, 193, 200, 201, 202, 203, 235, 241).

Cell B has:

BCCH ARFCN = 167.

Cell Allocation = (141, 145, 149, 151, 157, 158, 165, 167, 187, 193, 200, 201, 202, 203, 235, 241).

Base station Colour Code = different to Cell A

The Cell Allocation of both Cell A and Cell B shall be coded using bit map 0 format.

(The BCCH ARFCNs are already included in the default BA-List.)

## 26.6.13.1 Dedicated assignment with starting time / successful case / time not elapsed

### 26.6.13.1.1 Conformance requirement

A Mobile Station receiving an ASSIGNMENT COMMAND message with a starting time and channel descriptions for both after and before the starting time, and ready to access before the indicated time has elapsed, shall perform the assignment on the channels as described for before the starting time and shall start using the new frequency parameters (frequencies and hopping sequence, or single frequency) in the correct time slot indicated by the starting time.

The Mobile Station shall accept the ASSIGNMENT COMMAND message for different message formatting, differing by the information elements used to describe frequency lists.

### Reference(s)

3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.4.3.1 and 9.1.2.

### 26.6.13.1.2 Test purpose

To verify that the MS, after receiving an ASSIGNMENT COMMAND message with a starting time and channel descriptions both for before and after the starting time, and ready to access before the indicated time, performs correctly the assignment using the description for before the time, and eventually starts using the frequency parameters for after the time at the time indicated in the message.

### 26.6.13.1.3 Method of test

### Initial condition(s)

System Simulator:

1 cell, CCCH\_CONF set to 1 basic physical channel used for CCCH, not combined with SDCCHs.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

Related PICS/PIXIT statement(s)

- TCH supported (Y/N)
- Supported rate(s) of TCH: (F/F+H).
- The supported channel mode(s) need to be declared.
- Supported frequencies (GSM 450, GSM 480, GSM 700, GSM 850, P-GSM, E-GSM, R-GSM or DCS 1 800 or PCS 1 900).

Foreseen final state of the MS

"Idle, updated", with TMSI allocated.

Test procedure

The System Simulator pages the MS and after the MS has responded with a CHANNEL REQUEST, the simulator assigns a hopping SDCCH. Then the SS sends an ASSIGNMENT COMMAND message allocating a channel (TCH/F, TCH/H or SDCCH, arbitrarily chosen among the channels supported), with a starting time and channel descriptions (hopping case) for both before and after the starting time, as detailed in the "specific message contents" clause. The indicated time is such that the Mobile Station is ready to access before that time. The Mobile Station then accesses the channel as described for before the starting time. The MS shall eventually, at the TDMA frame defined by the contents of the "Starting Time" information element of the ASSIGNMENT COMMAND message, use the new frequency parameters. The verification is performed at the RF burst level.

Test parameters:

T1 is set to T0+60 and T0+1000 (mod 42 432), where T0 is the frame number at which the first burst of the ASSIGNMENT COMMAND message is sent.

Maximum duration of test

45 s.

Expected sequence

| Step | Direction | Message               | Comments                                                                                                                                                 |

| Power level                      | Chosen arbitrarily.                                                                                                                                                                               |
| Channel Mode                     |                                                                                                                                                                                                   |
| Mode                             | Arbitrarily selected from capabilities declared for the MS for the chosen type of channel.                                                                                                        |
| Mobile Allocation, after time    | Chosen arbitrarily, at least one frequency. In case of an MA with just one frequency, the frequency should be different from the BCCH carrier.                                                    |
| Starting Time                    | T1                                                                                                                                                                                                |
| Channel Description, before time |                                                                                                                                                                                                   |
| Channel Type and TDMA offset     | Same as after time.                                                                                                                                                                               |
| Timeslot Number                  | Same as after time.                                                                                                                                                                               |
| Training Sequence Code           | Same as after time.                                                                                                                                                                               |
| Hopping                          | Yes.                                                                                                                                                                                              |
| Hopping parameters               | Chosen arbitrarily, different from "after time".                                                                                                                                                  |
| Mobile Allocation, before time   | Chosen arbitrarily, at least one frequency and different from "Mobile Allocation, after time". In case of an MA with just one frequency, the frequency should be different from the BCCH carrier. |

## 26.6.13.2 Dedicated assignment with starting time / successful case / time elapsed

### 26.6.13.2.1 Conformance requirement

A Mobile Station receiving an ASSIGNMENT COMMAND message with a starting time and channel descriptions for both after and before the starting time, and ready to access after the indicated time has elapsed, shall perform the assignment on the channels as described for after the starting time.

The Mobile Station shall accept the ASSIGNMENT COMMAND message for different message formattings, differing by the information elements used to describe frequency lists.

Reference(s):

3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.4.3.1 and 9.1.2.

### 26.6.13.2.2 Test purpose

To verify that the MS, after receiving an ASSIGNMENT COMMAND message with a starting time and channel descriptions both for before and after the starting time, performs correctly the assignment using the frequency parameters for after the time if the indicated time has already elapsed when the Mobile Station is ready to transmit.

### 26.6.13.2.3 Method of test

Initial condition(s)

System Simulator:

1 cell, CCCH\_CONF set to 1 basic physical channel used for CCCH, not combined with SDCCHs.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

Related PICS/PIXIT statement(s)

- TCH supported (Y/N).
- Supported rate(s) of TCH: (F/F+H).
- The supported channel mode(s) need to be declared.
- Supported frequencies (GSM 450, GSM 480, GSM 700, GSM 850, P-GSM, E-GSM, R-GSM or DCS 1 800 or PCS 1 900).

Foreseen final state of the MS

"Idle, updated", with TMSI allocated.

Test procedure

The System Simulator pages the MS and after the MS has responded with a CHANNEL REQUEST, the simulator assigns a hopping SDCCH. Then the SS sends an ASSIGNMENT COMMAND message allocating a channel (TCH/F, TCH/H or SDCCH, arbitrarily chosen among the channels supported), with a starting time and channel descriptions (hopping case) for both before and after the starting time, as detailed in the "specific message contents" clause. The indicated time is such that the Mobile Station is ready to access only after that time. The Mobile Station then accesses the channel as described for after the starting time. The verification is performed at the RF burst level.

Test parameters:

T1 is set to  $T0+5 \pmod{42\,432}$ , where T0 is the frame number at which the first burst of the ASSIGNMENT COMMAND message is sent.

Maximum duration of test

45 s.

Expected sequence

| Step | Direction | Message               | Comments                                                                                                                               |

| Training Sequence Code           | Same as after time.                                                                                                                                                                               |
| Hopping                          | Yes.                                                                                                                                                                                              |
| Hopping parameters               | Chosen arbitrarily, different from "after time".                                                                                                                                                  |
| Mobile Allocation, before time   | Chosen arbitrarily, at least one frequency and different from "Mobile Allocation, after time". In case of an MA with just one frequency, the frequency should be different from the BCCH carrier. |

### 26.6.13.3 Dedicated assignment with starting time and frequency redefinition / failure case / time not elapsed

#### 26.6.13.3.1 Conformance requirement

An MS, after receiving a FREQUENCY REDEFINITION message, shall keep the provided information until the time is elapsed. The Mobile Station must accept an intervening dedicated assignment, and, in case of failure of this assignment resulting in a return to the old channel before the time indicated in the FREQUENCY REDEFINITION message, shall return on the old channel with the frequency parameters in use at the moment of the reception of the FREQUENCY REDEFINITION message, and shall eventually start using the new frequency parameters in the correct time slot indicated by the starting time of the FREQUENCY REDEFINITION message.

Reference(s):

3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.4.3 and 3.4.5.

#### 26.6.13.3.2 Test purpose

To verify that the MS, after receiving a FREQUENCY REDEFINITION and then an ASSIGNMENT COMMAND message with a starting time and channel descriptions both for before and after the starting time, failing the assignment and returning on the old channel, and ready to access before the time indicated in the FREQUENCY REDEFINITION, resumes transmission on the channels used at the time of the reception of the FREQUENCY REDEFINITION message and eventually starts using the new frequency parameters at the time indicated in the FREQUENCY REDEFINITION message.

## 26.6.13.3.3 Method of test

## Initial condition(s)

## System Simulator:

1 cell, CCCH\_CONF set to 1 basic physical channel used for CCCH, not combined with SDCCHs.

## Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

## Related PICS/PIXIT statement(s)

- TCH supported (Y/N).
- Supported rate(s) of TCH: (F/F+H).
- The supported channel mode(s) need to be declared.
- Supported frequencies (GSM 450, GSM 480, GSM 700, GSM 850, P-GSM, E-GSM, R-GSM or DCS 1 800 or PCS 1 900).

## Foreseen final state of the MS

"Idle, updated", with TMSI allocated.

## Test procedure

The System Simulator pages the MS and after the MS has responded with a CHANNEL REQUEST, the simulator assigns allocating a hopping channel (TCH/F, TCH/H or SDCCH, arbitrarily chosen among the channels supported). Then the SS sends a FREQUENCY REDEFINITION message (starting time T1), which modifies the frequency parameters to be used by the MS. Then the SS sends an ASSIGNMENT COMMAND message, with a starting time (T2) and channel descriptions for both before and after the starting time. The channels and hopping sequences so allocated are distinct from those used and from those described by the FREQUENCY REDEFINITION message. The System Simulator does not activate the channels defined in the ASSIGNMENT COMMAND. The MS shall try to activate the new channel (this is not verified) and shall then reactivate the old channel and trigger the establishment of the main signalling link on the old channel. Then the MS shall send an ASSIGNMENT FAILURE message. Time T1 is chosen so it is reached only after the sending of the ASSIGNMENT FAILURE message. The MS shall eventually, at the TDMA frame defined by the contents of the "Starting Time" information element of the FREQUENCY REDEFINITION message, use the new frequency parameters. The verification is performed at the RF burst level.

## Test parameters:

T1 is set to  $T0+5000 \pmod{42\,432}$ , where T0 is the frame number at which the first burst of the FREQUENCY REDEFINITION message is sent.

T2 is set to  $T0+4000 \pmod{42\,432}$ , where T0 is the frame number at which the first burst of the FREQUENCY REDEFINITION message is sent.

## Maximum duration of test

180 s.

## 26.6.13.4 Dedicated assignment with starting time and frequency redefinition / failure case / time elapsed

### 26.6.13.4.1 Conformance requirement

An MS, after receiving a FREQUENCY REDEFINITION message, shall keep the provided information until the time is elapsed. The Mobile Station must accept an intervening dedicated assignment, and, in case of failure of this assignment resulting in a return to the old channel after the time indicated in the FREQUENCY REDEFINITION message, shall return on the old channel with the frequency parameters indicated in the FREQUENCY REDEFINITION message.

#### Reference(s):

3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.4.3 and 3.4.5.

### 26.6.13.4.2 Test purpose

To verify that the MS, after receiving a FREQUENCY REDEFINITION and then an ASSIGNMENT COMMAND message with a starting time and channel descriptions both for before and after the starting time, failing the assignment and returning on the old channel, and ready to access after the time indicated in the FREQUENCY REDEFINITION, resumes transmission using the new frequency parameters indicated in the FREQUENCY REDEFINITION message.

### 26.6.13.4.3 Method of test

#### Initial condition(s)

##### System Simulator:

1 cell, CCCH\_CONF set to 1 basic physical channel used for CCCH, not combined with SDCCHs.

##### Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

#### Related PICS/PIXIT statement(s)

- Supported frequencies (GSM 450, GSM 480, GSM 700, GSM 850, P-GSM, E-GSM, R-GSM or DCS 1 800 or PCS 1 900).

#### Foreseen final state of the MS

"Idle, updated", with TMSI allocated.

#### Test procedure

The System Simulator pages the MS and after the MS has responded with a CHANNEL REQUEST, the simulator assigns allocating a hopping channel (SDCCH). Then the SS sends a FREQUENCY REDEFINITION message (starting time T1), which modifies the frequency parameters to be used by the MS. Then the SS sends an ASSIGNMENT COMMAND message, with a starting time (T2) and channel descriptions for both before and after the starting time. Time T1 is chosen so it is reached after the sending of the ASSIGNMENT COMMAND message, but before the return on the old channel. The System Simulator does not activate the channels defined in the ASSIGNMENT COMMAND. The MS shall try to activate the new channel (this is not verified) and shall then reactivate the old channel with the new frequency parameters as indicated by the FREQUENCY REDEFINITION message, and trigger the establishment of the main signalling link on the old channel. Then the MS shall send an ASSIGNMENT FAILURE message. The verification is performed at the RF burst level.

Test parameters:

i.e. for SDCCH

T2 is set to  $T0+5000 \pmod{42\,432}$ , where T0 is the frame number at which the first burst of the FREQUENCY REDEFINITION message is sent.

T1 is set to  $T0+214 \pmod{42\,432}$ , where T0 is the frame number at which the first burst of the FREQUENCY REDEFINITION message is sent.

NOTE: T0 + 214 is calculated for a maximum execution time of:

|                                            |                   |            |
|--------------------------------------------|-------------------|------------|
| FREQUENCY REDEFINITION                     | using 1 L2 frame  | 51 frames  |
| ASSIGNMENT COMMAND                         | using 2 L2 frames | 102 frames |
| + 120 ms maximum time for a channel change |                   | 25 frames  |
| + some frames contention (here 36)         |                   |            |

Maximum duration of test

180 s.

| Hopping                          | Yes.                                                                                          |
| Hopping parameters               | Chosen arbitrarily.                                                                           |
| Power Command                    |                                                                                               |
| Power level                      | Chosen arbitrarily.                                                                           |
| Channel Mode                     |                                                                                               |
| Mode                             | Arbitrarily selected from capabilities declared for the MS for the chosen type of channel.    |
| Mobile Allocation, after time    | Chosen arbitrarily, at least two frequencies.                                                 |
| Starting Time                    | T2                                                                                            |
| Channel Description, before time |                                                                                               |
| Channel Type and TDMA offset     | Same as after time.                                                                           |
| Timeslot Number                  | Same as after time.                                                                           |
| Training Sequence Code           | Same as after time.                                                                           |
| Hopping                          | Yes.                                                                                          |
| Hopping parameters               | Chosen arbitrarily, different from "after time".                                              |
| Mobile Allocation, before time   | Chosen arbitrarily, at least two frequencies, different from "Mobile Allocation, after time". |

## 26.6.13.5 Handover with starting time / successful case / time not elapsed

## 26.6.13.5.1 Conformance requirement

A Mobile Station receiving an HANDOVER COMMAND message with a starting time and channel descriptions for both after and before the starting time, and ready to access before the indicated time has elapsed, shall perform the handover on the channels as described for before the starting time and shall, if specified, use the parameters in the frequency list, MAIO and HSN, in the correct time slot indicated by the starting time.

The Mobile Station shall accept the HANDOVER COMMAND message for different message formatting, differing by the information elements used to describe frequency lists.

## Reference(s):

3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.4.4.1 and 9.1.15.

## 26.6.13.5.2 Test purpose

To verify that the MS, after receiving a HANDOVER COMMAND message with a starting time and channel descriptions both for before and after the starting time, and ready to access before the indicated time, performs correctly the handover using the description for before the time, and then starts using the frequency parameters for after the time at the time indicated in the message.

## 26.6.13.5.3 Method of test

## Initial condition(s)

System Simulator:

2 cells, CCCH\_CONF set to 1 basic physical channel used for CCCH, not combined with SDCCHs.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

## Related PICS/PIXIT statement(s)

- TCH supported (Y/N).
- Supported rate(s) of TCH: (F/F+H).
- The supported channel mode(s) need to be declared.
- Supported frequencies (GSM 450, GSM 480, GSM 700, GSM 850, P-GSM, E-GSM, R-GSM or DCS 1 800 or PCS 1 900).

## Foreseen final state of the MS

"Idle, updated", with TMSI allocated, and camped on cell B.

## Test procedure

The System Simulator pages the MS and after the MS has responded with a CHANNEL REQUEST, the simulator assigns a hopping SDCCH. After the SS has received measurements concerning cell B, the SS sends a HANOVER COMMAND message allocating a channel (TCH/F, TCH/H or SDCCH, arbitrarily chosen among the channels supported), with a starting time and channel descriptions (hopping case) for both before and after the starting time, as detailed in the "specific message contents" clause. The indicated time is such that the Mobile Station is ready to access before that time. The Mobile Station then accesses the channel as described for before the starting time. The MS shall eventually, at the TDMA frame defined by the contents of the "Starting Time" information element of the HANOVER COMMAND message, use the new frequency parameters. The verification is performed at the RF burst level.

## Test parameters:

T1 is set to  $T0+1000 \pmod{42\,432}$ , where T0 is the frame number at which the first burst of the HANOVER COMMAND message is sent.

## Maximum duration of test

120 s.

## Expected sequence

| Step | Direction | Message               | Comments                                                                                                                                                  |

| Channel Description, after time  |                                                                                                                                                                                                |
| Channel Type and TDMA offset     | Chosen arbitrarily among that supported by the Mobile Station.                                                                                                                                 |
| Timeslot Number                  | Chosen arbitrarily.                                                                                                                                                                            |
| Training Sequence Code           | Chosen arbitrarily.                                                                                                                                                                            |
| Hopping                          | Yes.                                                                                                                                                                                           |
| Hopping parameters               | Chosen arbitrarily.                                                                                                                                                                            |
| Power Command                    |                                                                                                                                                                                                |
| Power level                      | Chosen arbitrarily.                                                                                                                                                                            |
| Synchronization indication       | Non synchronized.                                                                                                                                                                              |
| Cell Channel Description         | As for cell B.                                                                                                                                                                                 |
| Channel Mode                     |                                                                                                                                                                                                |
| Mode                             | Arbitrarily selected from capabilities declared for the MS for the chosen type of channel.                                                                                                     |
| Mobile Allocation, after time    | Chosen arbitrarily, at least one frequency. In case of an MA with just one frequency, the frequency should be different from the BCCH carrier.                                                 |
| Starting Time                    | T1                                                                                                                                                                                             |
| Channel Description, before time |                                                                                                                                                                                                |
| Channel Type and TDMA offset     | Same as after time.                                                                                                                                                                            |
| Timeslot Number                  | Same as after time.                                                                                                                                                                            |
| Training Sequence Code           | Same as after time.                                                                                                                                                                            |
| Hopping                          | Yes.                                                                                                                                                                                           |
| Hopping parameters               | Chosen arbitrarily, different from "after time".                                                                                                                                               |
| Mobile Allocation, before time   | Chosen arbitrarily, at least one frequency, different from "Mobile Allocation, after time". In case of an MA with just one frequency, the frequency should be different from the BCCH carrier. |

### 26.6.13.6 Handover with starting time / successful case / time elapsed

#### 26.6.13.6.1 Conformance requirement

A Mobile Station receiving a HANDOVER COMMAND message with a starting time and channel descriptions for both after and before the starting time, and ready to access after the indicated time has elapsed, shall perform the handover on the channels as described for after the starting time.

The Mobile Station shall accept the HANDOVER COMMAND message for different message formattings, differing by the information elements used to describe frequency lists.

Reference(s):

3GPP TS 04.08 / 3GPP TS 44.018 sub-clauses 3.4.4.1 and 9.1.15.

#### 26.6.13.6.2 Test purpose:

To verify that the MS, after receiving a HANDOVER COMMAND message with a starting time and channel descriptions both for before and after the starting time, and ready to transmit after the indicated time, performs correctly the handover using the frequency parameters for after the time.

## 26.6.13.6.3 Method of test

## Initial condition(s)

## System Simulator:

2 cells, CCCH\_CONF set to 1 basic physical channel used for CCCH, not combined with SDCCHs.

## Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated, and camped on cell A

## Related PICS/PIXIT statement(s)

- TCH supported (Y/N).
- Supported rate(s) of TCH: (F/F+H).
- The supported channel mode(s) need to be declared.
- Supported frequencies (GSM 450, GSM 480, GSM 700, GSM 850, P-GSM, E-GSM, R-GSM or DCS 1 800 or PCS 1 900).

## Foreseen final state of the MS

"Idle, updated", with TMSI allocated, and camped on cell B.

## Test procedure

The System Simulator pages the MS and after the MS has responded with a CHANNEL REQUEST, the simulator assigns a hopping SDCCH. After the SS has received measurements concerning cell B, the SS sends a HANDOVER COMMAND message allocating a channel (TCH/F, TCH/H or SDCCH, arbitrarily chosen among the channels supported), with a starting time and channel descriptions (hopping case) for both before and after the starting time., as detailed in the "specific message contents" clause. The indicated time is such that the Mobile Station is ready to access only after that time. The Mobile Station then accesses the channel as described for after the starting time. The verification is performed at the RF burst level.

## Test parameters:

T1 is set to  $T0+5 \pmod{42\,432}$ , where T0 is the frame number at which the first burst of the HANDOVER COMMAND message is sent.

## Maximum duration of test

120 s.

## Expected sequence

| Step | Direction | Message               | Comments                                                                                             |
|------|-----------|-----------------------|------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PAGING REQUEST TYPE 1 |                                                                                                      |
| 2    | MS -> SS  | CHANNEL REQUEST       |                                                                                                      |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT  | Hopping channel.                                                                                     |
| 4    | MS -> SS  | PAGING RESPONSE       |                                                                                                      |
| 5    | SS -> MS  | HANDOVER COMMAND      | See specific message contents.                                                                       |
| 6    | MS -> SS  | HANDOVER ACCESS       | Repeated on every burst of the uplink main DCCH until reception of PHYSICAL INFORMATION.             |
| 7    | SS -> MS  | PHYSICAL INFORMATION  |                                                                                                      |
| 8    | MS -> SS  | HANDOVER COMPLETE     | Sent on the correct channel (after time parameters) after establishment of the main signalling link. |
| 9    | SS -> MS  | CHANNEL RELEASE       |                                                                                                      |

| Hopping parameters               | Chosen arbitrarily, different from "after time".                                                                                                                                                  |
| Mobile Allocation, before time   | Chosen arbitrarily, at least one frequency and different from "Mobile Allocation, after time". In case of an MA with just one frequency, the frequency should be different from the BCCH carrier. |

### 26.6.13.7 Handover with starting time and frequency redefinition / failure case / time not elapsed

#### 26.6.13.7.1 Conformance requirement

An MS, after receiving a FREQUENCY REDEFINITION message, shall keep the provided information until the time is elapsed. The Mobile Station must accept an intervening handover, and, in case of failure of this handover resulting in a return to the old channel before the time indicated in the FREQUENCY REDEFINITION message, shall return on the old channel with the frequency parameters in use at the moment of the reception of the FREQUENCY REDEFINITION message, and shall eventually start using the new frequency parameters in the correct time slot indicated by the starting time of the FREQUENCY REDEFINITION message.

Reference(s):

3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.4.4 and 3.4.5.

#### 26.6.13.7.2 Test purpose:

To verify that the MS, after receiving a FREQUENCY REDEFINITION and then a HANDOVER COMMAND message with a starting time and channel descriptions both for before and after the starting time, failing the handover, and ready to access on the old channel before the time indicated in the FREQUENCY REDEFINITION, resumes transmission on the channels used at the time of the reception of the FREQUENCY REDEFINITION message and eventually starts using the new frequency parameters at the time indicated in the FREQUENCY REDEFINITION message.

## 26.6.13.7.3 Method of test

## Initial condition(s)

## System Simulator:

2 cells, CCCH\_CONF set to 1 basic physical channel used for CCCH, not combined with SDCCHs.

## Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated, and camped on cell A.

## Related PICS/PIXIT statement(s)

- TCH supported (Y/N).
- Supported rate(s) of TCH: (F/F+H).
- The supported channel mode(s) need to be declared.
- Supported frequencies (GSM 450, GSM 480, GSM 700, GSM 850, P-GSM, E-GSM, R-GSM or DCS 1 800 or PCS 1 900)

## Foreseen final state of the MS

"Idle, updated", with TMSI allocated, and camped on cell A.

## Test procedure

The System Simulator pages the MS and after the MS has responded with a CHANNEL REQUEST, the simulator assigns allocating a hopping channel (TCH/F, TCH/H or SDCCH, arbitrarily chosen among the channels supported). Then the SS sends a FREQUENCY REDEFINITION message (starting time T1), which modifies the frequency parameters to be used by the MS. Then the SS sends a HANDOVER COMMAND message, with a starting time (T2) and channel descriptions for both before and after the starting time. The MS shall try to activate the new channel (this is not verified) and shall then reactivate the old channel and trigger the establishment of the main signalling link on the old channel. The System Simulator does not activate the channels defined in the HANDOVER COMMAND. Then the MS shall send a HANDOVER FAILURE message. Time T1 is chosen so it is reached only after the sending of the HANDOVER FAILURE message. The MS shall eventually, at the TDMA frame defined by the contents of the "Starting Time" information element of the FREQUENCY REDEFINITION message, use the new frequency parameters. The verification is performed at the RF burst level.

## Test parameters:

T1 is set to  $T0+5000 \pmod{42\,432}$ , where T0 is the frame number at which the first burst of the FREQUENCY REDEFINITION message is sent.

T2 is set to  $T0+4000 \pmod{42\,432}$ , where T0 is the frame number at which the first burst of the FREQUENCY REDEFINITION message is sent.

## Maximum duration of test

180 s.

Expected sequence

| Synchronization indication       | Non synchronized.                                                                                                                                                                                 |
| Cell Channel Description         | As for cell B.                                                                                                                                                                                    |
| Channel Mode                     |                                                                                                                                                                                                   |
| Mode                             | Arbitrarily selected from capabilities declared for the MS for the chosen type of channel.                                                                                                        |
| Mobile Allocation, after time    | Chosen arbitrarily, at least one frequency. In case of an MA with just one frequency, the frequency should be different from the BCCH carrier.                                                    |
| Starting Time                    | T2                                                                                                                                                                                                |
| Channel Description, before time |                                                                                                                                                                                                   |
| Channel Type and TDMA offset     | Same as after time.                                                                                                                                                                               |
| Timeslot Number                  | Same as after time.                                                                                                                                                                               |
| Training Sequence Code           | Same as after time.                                                                                                                                                                               |
| Hopping                          | Yes.                                                                                                                                                                                              |
| Hopping parameters               | Chosen arbitrarily, different from "after time".                                                                                                                                                  |
| Mobile Allocation, before time   | Chosen arbitrarily, at least one frequency and different from "Mobile Allocation, after time". In case of an MA with just one frequency, the frequency should be different from the BCCH carrier. |

### 26.6.13.8 Handover with starting time and frequency redefinition / failure case / time elapsed

#### 26.6.13.8.1 Conformance requirement

An MS, after receiving a FREQUENCY REDEFINITION message, shall keep the provided information until the time is elapsed. The Mobile Station must accept an intervening handover, and, in case of failure of this handover resulting in a return to the old channel after the time indicated in the FREQUENCY REDEFINITION message, shall return on the old channel with the frequency parameters indicated in the FREQUENCY REDEFINITION message.

#### Reference(s):

3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.4.4 and 3.4.5.

#### 26.6.13.8.2 Test purpose:

To verify that the MS, after receiving a FREQUENCY REDEFINITION and then a HANDOVER COMMAND message with a starting time and channel descriptions both for before and after the starting time, failing the handover and returning on the old channel, and ready to access after the time indicated in the FREQUENCY REDEFINITION, resumes transmission using the new frequency parameters indicated in the FREQUENCY REDEFINITION message.

## 26.6.13.8.3 Method of test

## Initial condition(s)

System Simulator:

2 cells, CCCH\_CONF set to 1 basic physical channel used for CCCH, not combined with SDCCHs.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated, and camped on cell A.

## Related PICS/PIXIT statement(s)

- Supported frequencies (GSM 450, GSM 480, GSM 700, GSM 850, P-GSM, E-GSM, R-GSM or DCS 1 800 or PCS 1 900).

## Foreseen final state of the MS

"Idle, updated", with TMSI allocated, and camped on cell A.

## Test procedure

The System Simulator pages the MS and after the MS has responded with a CHANNEL REQUEST, the simulator assigns a hopping channel (SDCCH). Then the SS sends a FREQUENCY REDEFINITION message (starting time T1), which modifies the frequency parameters to be used by the MS. Then the SS sends a HANDOVER COMMAND message, with a starting time (T2) and channel descriptions for both before and after the starting time. Time T1 is chosen so it is reached after the sending of the HANDOVER COMMAND message, but before the return on the old channel. The System Simulator does not activate the channels defined in the HANDOVER COMMAND. The MS shall try to activate the new channel (this is not verified) and shall then reactivate the old channel with the new frequency parameters as indicated by the FREQUENCY REDEFINITION message, and trigger the establishment of the main signalling link on the old channel. Then the MS shall send a HANDOVER FAILURE message. The verification is performed at the RF burst level.

Test parameters:

i.e. for SDCCH

T2 is set to  $T0+5000 \pmod{42\,432}$ , where T0 is the frame number at which the first burst of the FREQUENCY REDEFINITION message is sent.

T1 is set to  $T0+265 \pmod{42\,432}$ , where T0 is the frame number at which the first burst of the FREQUENCY REDEFINITION message is sent.

NOTE:  $T0 + 265$  is calculated for a maximum execution time of:

|                                            |                   |            |
|--------------------------------------------|-------------------|------------|
| FREQUENCY REDEFINITION                     | using 1 L2 frame  | 51 frames  |
| HANDOVER COMMAND                           | using 3 L2 frames | 153 frames |
| + 120 ms maximum time for a channel change |                   | 25 frames  |
| + some frames contention (here 36)         |                   |            |

## Maximum duration of test

180 s.

Expected sequence

| Power level                      | Chosen arbitrarily.                                                                                                                                                                               |
| Synchronization indication       | Non synchronized.                                                                                                                                                                                 |
| Cell Channel Description         | As for cell B.                                                                                                                                                                                    |
| Channel Mode                     |                                                                                                                                                                                                   |
| Mode                             | Arbitrarily selected from capabilities declared for the MS for the chosen type of channel.                                                                                                        |
| Mobile Allocation, after time    | Chosen arbitrarily, at least one frequency. In case of an MA with just one frequency, the frequency should be different from the BCCH carrier.                                                    |
| Starting Time                    | T2                                                                                                                                                                                                |
| Channel Description, before time |                                                                                                                                                                                                   |
| Channel Type and TDMA offset     | Same as after time.                                                                                                                                                                               |
| Timeslot Number                  | Same as after time.                                                                                                                                                                               |
| Training Sequence Code           | Same as after time.                                                                                                                                                                               |
| Hopping                          | Yes.                                                                                                                                                                                              |
| Hopping parameters               | Chosen arbitrarily, different from "after time".                                                                                                                                                  |
| Mobile Allocation, before time   | Chosen arbitrarily, at least one frequency and different from "Mobile Allocation, after time". In case of an MA with just one frequency, the frequency should be different from the BCCH carrier. |

## 26.6.13.9 Immediate assignment with starting time / successful case / time not elapsed

## 26.6.13.9.1 Conformance requirement

A Mobile Station receiving an IMMEDIATE ASSIGNMENT message with a starting time and channel descriptions for both after and before the starting time, and ready to access before the indicated time has elapsed, shall perform the assignment on the channels as described for before the starting time and shall start using the new frequencies and hopping sequence in the correct time slot when the MS is allocated a dedicated channel.

## Reference(s):

3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.3.1.1.3.1 and 9.1.18.

## 26.6.13.9.2 Test purpose

To verify that the MS, after receiving an IMMEDIATE ASSIGNMENT message with a starting time and channel descriptions both for before and after the starting time, and ready to access before the indicated time, performs correctly the assignment using the description for before the time, and then starts using the frequency parameters for after the time at the time indicated in the message.

## 26.6.13.9.3 Method of test

## Initial condition(s)

System Simulator:

1 cell, CCCH\_CONF set to 1 basic physical channel used for CCCH, not combined with SDCCHs.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

Related PICS/PIXIT statement(s)

- TCH supported (Y/N).
- Supported rate(s) of TCH: (F/F+H).
- The supported channel mode(s) need to be declared.
- Supported frequencies (GSM 450, GSM 480, GSM 700, GSM 850, P-GSM, E-GSM,R-GSM or DCS 1 800 or PCS 1 900).

Foreseen final state of the MS

"Idle, updated", with TMSI allocated.

Test procedure

The System Simulator pages the MS and after the MS has responded with a CHANNEL REQUEST, the simulator sends an IMMEDIATE ASSIGNMENT message allocating a hopping channel (TCH/F, TCH/H or SDCCH, arbitrarily chosen among the channels supported), with a starting time and channel descriptions for both before and after the starting time. The indicated time is such that the Mobile Station is ready to access before that time. The Mobile Station then accesses the channel as described for before the starting time. The MS shall eventually, at the TDMA frame defined by the contents of the "Starting Time" information element of the IMMEDIATE ASSIGNMENT message, use the new frequency parameters. The verification is performed at the RF burst level.

Test parameters:

T1 is chosen arbitrarily to be between T0+60 and T0+100 (mod 42 432), where T0 is the frame number at which the first burst of the IMMEDIATE ASSIGNMENT COMMAND message is sent.

Maximum duration of test

45 s.

Expected sequence

| Step | Direction | Message               | Comments                                                                                                                                                                                        |

### 26.6.13.10 Immediate assignment with starting time / successful case / time elapsed

#### 26.6.13.10.1 Conformance requirement

A Mobile Station receiving an IMMEDIATE ASSIGNMENT message with a starting time and channel descriptions for both after and before the starting time, and ready to access after the indicated time has elapsed, shall perform the assignment on the channels as described for after the starting time.

#### Reference(s):

3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.3.1.1.3.1 and 9.1.18.

#### 26.6.13.10.2 Test purpose

To verify that the MS, after receiving an IMMEDIATE ASSIGNMENT message with a starting time and channel descriptions both for before and after the starting time, performs correctly the assignment using the frequencies and hopping sequence for after the time if the indicated time has already elapsed when the Mobile Station is ready to transmit.

#### 26.6.13.10.3 Method of test

#### Initial condition(s)

##### System Simulator:

1 cell, CCCH\_CONF set to 1 basic physical channel used for CCCH, not combined with SDCCHs.

##### Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

#### Related PICS/PIXIT statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).
- TCH supported (Y/N).

- Supported rate(s) of TCH: (F/F+H).
- The supported channel mode(s) need to be declared.

#### Foreseen final state of the MS

"Idle, updated", with TMSI allocated.

#### Test procedure

The System Simulator pages the MS and after the MS has responded with a CHANNEL REQUEST, the simulator sends an IMMEDIATE ASSIGNMENT message allocating a hopping channel (TCH/F, TCH/H or SDCCH, arbitrarily chosen among the channels supported), with a starting time and channel descriptions for both before and after the starting time. The indicated time is such that the Mobile Station is ready to access only after that time. The Mobile Station then accesses the channel as described for after the starting time. The verification is performed at the RF burst level.

Test parameters:

T1 is set to  $T0+5 \pmod{42\,432}$ , where T0 is the frame number at which the first burst of the IMMEDIATE ASSIGNMENT COMMAND message is sent.

#### Maximum duration of test

45 s

#### Expected sequence

| Step | Direction | Message               | Comments                                                                                                                            |

| Training Sequence Code          | Chosen arbitrarily.                                                                                                                                                                               |
| Hopping                         | Yes.                                                                                                                                                                                              |
| Hopping parameters              | Chosen arbitrarily.                                                                                                                                                                               |
| Timing Advance                  | As needed.                                                                                                                                                                                        |
| Mobile Allocation (after time)  | Chosen arbitrarily, at least one frequency. In case of an MA with just one frequency, the frequency should be different from the BCCH carrier.                                                    |
| Starting Time                   | T1                                                                                                                                                                                                |
| IA Rest Octet                   |                                                                                                                                                                                                   |
| MAIO                            | Chosen arbitrarily, different from "after time".                                                                                                                                                  |
| Mobile Allocation (before time) | Chosen arbitrarily, at least one frequency and different from "Mobile Allocation, after time". In case of an MA with just one frequency, the frequency should be different from the BCCH carrier. |

## 26.6.14 Default contents of GSM 900 layer 3 messages for RR tests

This subclause contains the default values of GSM 900 L3 messages, which unless indicated otherwise in subclause 26.6 shall be transmitted by the system simulator and which are required to be received from the GSM 900 MS under test. These values are used in order to be consistent with the phase 2 version of 26.6.

The necessary L3 messages are listed in alphabetic order, with the exception of the SYSTEM INFORMATION messages, where it is the information elements which are listed in alphabetic order (this is because some information elements occur in several SYSTEM INFORMATION types).

In this subclause, decimal values are normally used. However, sometimes a hexadecimal value, indicated by an "H", or a binary value, indicated by a "B" is used.

Default SYSTEM INFORMATION:

NOTE 1: SYSTEM INFORMATION 2 bis, SYSTEM INFORMATION 5 bis, SYSTEM INFORMATION 7, and SYSTEM INFORMATION 8 messages are not used.

## Cell A

Contents of information elements in SYSTEM INFORMATION TYPE 1 to 6 messages for cell A.

## 26.6.15 Default contents of DCS 1 800 layer 3 messages for RR tests

This subclause contains the default values of DCS 1 800 L3 messages, which unless indicated otherwise in subclause 26.6 shall be transmitted by the system simulator and which are required to be received from the DCS 1 800 MS under test. These values are used in order to be consistent with the phase 2 version of 26.6.

The necessary L3 messages are listed in alphabetic order, with the exception of the SYSTEM INFORMATION messages, where it is the information elements which are listed in alphabetic order (this is because some information elements occur in several SYSTEM INFORMATION types).

In this subclause, decimal values are normally used. However, sometimes a hexadecimal value, indicated by an "H", or a binary value, indicated by a "B" is used.

### **Default SYSTEM INFORMATION:**

NOTE 1: SYSTEM INFORMATION 2 bis, SYSTEM INFORMATION 7, and SYSTEM INFORMATION 8 messages are not used.

SYSTEM INFORMATION 5 bis is not sent as a default message. For those tests which require SYSTEM INFORMATION 5 bis see the specific message contents for that test.

## Cell A

Contents of information elements in SYSTEM INFORMATION TYPE 1 to 6 messages for cell A.

## 26.6.16 Default contents of GSM 450 layer 3 messages for RR tests

This subclause contains the default values of GSM 450 L3 messages, which unless indicated otherwise in subclause 26.6 shall be transmitted by the system simulator and which are required to be received from the GSM 450 MS under test. These values are used in order to be consistent with the phase 2 version of subclause 26.6.

The necessary L3 messages are listed in alphabetic order, with the exception of the SYSTEM INFORMATION messages, where it is the information elements which are listed in alphabetic order (this is because some information elements occur in several SYSTEM INFORMATION types).

In this subclause, decimal values are normally used. However, sometimes a hexadecimal value, indicated by an "H", or a binary value, indicated by a "B" is used.

Default SYSTEM INFORMATION:

NOTE 1: SYSTEM INFORMATION 2 bis, SYSTEM INFORMATION 5 bis, SYSTEM INFORMATION 7, and SYSTEM INFORMATION 8 messages are not used.

## Cell A

Contents of information elements in SYSTEM INFORMATION TYPE 1 to 6 messages for cell A.

|                                |                                                                                 |
|--------------------------------|---------------------------------------------------------------------------------|
| (CBCH) Channel Description     | Not present.                                                                    |
| (CBCH) Mobile Allocation       | Not present.                                                                    |
| Cell Channel Description       |                                                                                 |
| - Format identifier            | Range 128.                                                                      |
| - Cell Allocation ARFCN        | Channel Numbers 263, 267, 275 and 279.                                          |
| Cell Identity                  |                                                                                 |
| - Cell Identity Value          | 0001H                                                                           |
| Cell Options                   |                                                                                 |
| - Power Control Indicator      | Power Control Indicator is not set.                                             |
| - DTX Indicator                | MS shall not use DTX.                                                           |
| - Radio_Link_Timeout           | 8 SACCH blocks.                                                                 |
| Cell Selection Parameters      |                                                                                 |
| - Cell_Reselect_Hysteresis     | 12 dB.                                                                          |
| - MX_TXPWR_MAX_CCH             | Minimum level.                                                                  |
| - ACS                          | No addition cell parameters are present in SYSTEM INFORMATION messages 7 and 8. |
| - NECI                         | New establishment causes not supported.                                         |
| - RXLEV_ACCESS_MIN             | Minimum level.                                                                  |
| Control Channel Description    |                                                                                 |
| - Attach-Detach allowed        | No Attach/Detach.                                                               |
| - BS_AG_BLK_RES                | 0 blocks reserved for access grant.                                             |
| - CCCH_CONF                    | 1 basic physical channel used for CCCH, combined with SDCCCHs.                  |
| - BS_PA_MFRMS                  | 5 multiframe periods for transmission of paging messages.                       |
| - T3212 Time-out value         | Infinite.                                                                       |

## 26.6.17 Default contents of GSM 480 layer 3 messages for RR tests

This subclause contains the default values of GSM 480 L3 messages, which unless indicated otherwise in subclause 26.6 shall be transmitted by the system simulator and which are required to be received from the GSM 480 MS under test. These values are used in order to be consistent with the phase 2 version of 26.6.

The necessary L3 messages are listed in alphabetic order, with the exception of the SYSTEM INFORMATION messages, where it is the information elements which are listed in alphabetic order (this is because some information elements occur in several SYSTEM INFORMATION types).

In this subclause, decimal values are normally used. However, sometimes a hexadecimal value, indicated by an "H", or a binary value, indicated by a "B" is used.

Default SYSTEM INFORMATION:

NOTE 1: SYSTEM INFORMATION 2 bis, SYSTEM INFORMATION 5 bis, SYSTEM INFORMATION 7, and SYSTEM INFORMATION 8 messages are not used.

## Cell A

Contents of information elements in SYSTEM INFORMATION TYPE 1 to 6 messages for cell A.

## 26.6.18 Default contents of PCS 1 900 layer 3 messages for RR tests

This subclause contains the default values of PCS 1 900 L3 messages, which unless indicated otherwise in subclause 26.6 shall be transmitted by the system simulator and which are required to be received from the PCS 1 900 MS under test. These values are used in order to be consistent with the phase 2 version of 26.6.

The necessary L3 messages are listed in alphabetic order, with the exception of the SYSTEM INFORMATION messages, where it is the information elements which are listed in alphabetic order (this is because some information elements occur in several SYSTEM INFORMATION types).

In this subclause, decimal values are normally used. However, sometimes a hexadecimal value, indicated by an "H", or a binary value, indicated by a "B" is used.

**Default SYSTEM INFORMATION:**

NOTE 1: SYSTEM INFORMATION 2 bis, SYSTEM INFORMATION 7, and SYSTEM INFORMATION 8 messages are not used.

SYSTEM INFORMATION 5 bis is not sent as a default message. For those tests which require SYSTEM INFORMATION 5 bis see the specific message contents for that test.

## Cell A

Contents of information elements in SYSTEM INFORMATION TYPE 1 to 6 messages for cell A.

## 26.6.19 Default contents of GSM 700 layer 3 messages for RR tests

This subclause contains the default values of GSM 700 L3 messages, which unless indicated otherwise in subclause 26.6 shall be transmitted by the system simulator and which are required to be received from the GSM 700 MS under test. These values are used in order to be consistent with the phase 2 version of 26.6.

The necessary L3 messages are listed in alphabetic order, with the exception of the SYSTEM INFORMATION messages, where it is the information elements which are listed in alphabetic order (this is because some information elements occur in several SYSTEM INFORMATION types).

In this subclause, decimal values are normally used. However, sometimes a hexadecimal value, indicated by an "H", or a binary value, indicated by a "B" is used.

Default SYSTEM INFORMATION:

NOTE 1: SYSTEM INFORMATION 2 bis, SYSTEM INFORMATION 5 bis, SYSTEM INFORMATION 7, and SYSTEM INFORMATION 8 messages are not used.

## Cell A

Contents of information elements in SYSTEM INFORMATION TYPE 1 to 6 messages for cell A.

Default settings for cell A:

|                          |                                            |
|--------------------------|--------------------------------------------|
| Downlink input level     | 63 dBmicroVolt emf.                        |
| Uplink output power      | Minimum supported by the MS's power class. |
| Propagation profile      | static.                                    |
| BCCH/CCCH carrier number | 457                                        |

Cell B

The contents of SYSTEM INFORMATION TYPE 1 to 6 messages for cell B are identical to those of cell A with the following exceptions:

|                                                                            |                                   |
|----------------------------------------------------------------------------|-----------------------------------|
| Cell Channel Description<br>- Format Identifier<br>- Cell Allocation ARFCN | 128 range.<br>Channel Number 447. |
|----------------------------------------------------------------------------|-----------------------------------|

NOTE 2: This IE needs modification when used in handover tests which command the MS to go to a frequency hopping channel in cell B.

Cell Identity

- Cell Identity Value 0002H

Default settings for cell B:

|                          |                                            |
|--------------------------|--------------------------------------------|
| Downlink input level     | 53 dBmicroVolt emf.                        |
| Uplink output power      | minimum supported by the MS's power class. |
| Propagation profile      | static.                                    |
| BCCH/CCCH carrier number | 447                                        |

Contents of ALERTING message (SS to MS):

## 26.6.20 Default contents of GSM 850 layer 3 messages for RR tests

This subclause contains the default values of GSM 850 L3 messages, which unless indicated otherwise in subclause 26.6 shall be transmitted by the system simulator and which are required to be received from the GSM 850 MS under test. These values are used in order to be consistent with the phase 2 version of 26.6.

The necessary L3 messages are listed in alphabetic order, with the exception of the SYSTEM INFORMATION messages, where it is the information elements which are listed in alphabetic order (this is because some information elements occur in several SYSTEM INFORMATION types).

In this subclause, decimal values are normally used. However, sometimes a hexadecimal value, indicated by an "H", or a binary value, indicated by a "B" is used.

Default SYSTEM INFORMATION:

NOTE 1: SYSTEM INFORMATION 2 bis, SYSTEM INFORMATION 5 bis, SYSTEM INFORMATION 7, and SYSTEM INFORMATION 8 messages are not used.

## Cell A

Contents of information elements in SYSTEM INFORMATION TYPE 1 to 6 messages for cell A.

## 26.7 Elementary procedures of mobility management

The tests are based on 3GPP TS 04.08 / 3GPP TS 24.008 and 3GPP TS 03.03.

In this subclause, when the expected sequence require that "a mobile originated CM connection is attempted", it shall be for a service other than emergency call.

In this subclause, a initial CM message is either a SETUP message, a REGISTER message or a CP-DATA message (in that case the acknowledged mode of operation on SAPI 3 will have be established and this message will be sent on SAPI 3).

## 26.7.1 TMSI reallocation

The intention of the TMSI Reallocation procedure is to assign a new temporary identity for the MS. If the message is not understood by the MS, the network could not establish a link to the MS. As this is a common MM procedure, it can be initiated at any time.

### 26.7.1.1 Conformance requirement

- 1) A Mobile Station shall acknowledge a new TMSI when explicitly allocated during a location updating procedure or an incoming call.
- 2) The TMSI shall be updated on the SIM when the Mobile Station is correctly deactivated in accordance with the manufacturer's instructions.
- 3) A Mobile Station shall answer paging with this TMSI and includes it in the Paging Response message.

### Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.3.1, 3GPP TS 03.03 clause 2, 3GPP TS 02.17 subclause 6.1.

### 26.7.1.2 Test purpose

To verify that the MS is able to receive and acknowledge a new TMSI by means of an explicit TMSI reallocation procedure.

To verify that the MS has stored the TMSI in a non-volatile memory.

The implicit reallocation procedure is tested in subclause 26.7.4.1.

### 26.7.1.3 Method of test

#### Initial conditions

##### System Simulator:

Two cells A and B, belonging to different location areas a and b, default parameters.

##### Mobile Station:

The MS has valid TMSI (= TMSI1), CKSN, Kc. It is "idle updated" on cell B.

#### Related PICS/PIXIT statement(s)

Switch off button Yes/No.

Way to bring the MS into service.

#### Foreseen final state of the MS

The MS has a valid TMSI (= TMSI1), CKSN, Kc. It is "idle updated" on cell A.

#### Test Procedure

The MS is paged in cell B and the ciphering mode is established. An explicit TMSI reallocation procedure is performed. The channel is released. The MS is switched off and then its power supply is interrupted for 10 s. The power supply is resumed and then the MS is switched on and allowed sufficient time to guarantee that the MS is in service (listening to its paging subchannel). The system simulator then checks, by paging, whether the MS has stored the received TMSI.

The MS is made to select cell A. A normal location updating procedure is performed in cell A. An explicit TMSI reallocation procedure is performed and then the location updating procedure is accepted by the SS. The system simulator checks, by paging, whether the MS has stored the allocated TMSI.

Maximum duration of test

2 minutes.

Expected sequence

| Step | Direction | Message                       | Comments                                                                                                                                                                                                |

## 26.7.2 Authentication

The purpose of this procedure is to verify the user identity. A correct response is essential to guarantee the establishment of the connection. If not, the connection will drop.

The SS shall be able to handle vectors of Kc, RAND, and SRES in a similar way as the MSC/BSS entities. The SS shall incorporate a test algorithm for generating SRES and Kc from RAND and Ki which operates as described in annex 4.

### 26.7.2.1 Authentication accepted

#### 26.7.2.1.1 Conformance requirement

- 1) A Mobile Station shall correctly respond to an Authentication Request message by sending an Authentication Response message with the SRES information field set to the same value as the one produced by the authentication algorithm in the network.
- 2) A Mobile Station shall indicate in a Paging Response message the ciphering key sequence number which was allocated to it through the authentication procedure.

#### Reference(s)

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.3.2, 3GPP TS 03.03 clause 2.

#### 26.7.2.1.2 Test purpose

- 1) To check that a Mobile Station correctly responds to an Authentication Request message by sending an Authentication Response message with the SRES information field set to the same value as the one produced by the authentication algorithm in the network.
- 2) To check that a Mobile Station indicates in a Paging Response message the ciphering key sequence number which was allocated to it through the authentication procedure.

#### 26.7.2.1.3 Method of test

##### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has valid TMSI, CKSN (CKSN1), Kc. It is "idle updated" on the cell.

##### Related PICS/PIXIT statement(s)

None.

##### Foreseen final state of the MS

The MS has valid TMSI, CKSN and Kc. It is "idle updated" on the cell.

##### Test Procedure

The MS is paged. After the MS has sent a PAGING RESPONSE message to the SS, the SS initiates an authentication procedure and checks the value SRES sent by the MS in the AUTHENTICATION RESPONSE message. The channel

is released. The MS is paged and the SS checks the value of the ciphering key sequence number sent by the MS in the PAGING RESPONSE message.

Maximum duration of test

1 minute.

## 26.7.2.2 Authentication rejected

### 26.7.2.2.1 Conformance requirement

- 1) After reception of an Authentication Reject message the Mobile Station shall:
  - 1.1 not perform normal location updating.
  - 1.2 not perform periodic location updating.
  - 1.3 not respond to paging with TMSI.
  - 1.4 reject any request from CM entity for MM connection except for emergency call.
  - 1.5 not perform IMSI detach if deactivated.
- 2) After reception of an Authentication Reject message the Mobile Station, if it supports speech, shall accept a request for an emergency call by sending a CHANNEL REQUEST message with the establishment cause set to "emergency call" and include an IMEI as mobile identity in the CM SERVICE REQUEST message.
- 3) After reception of an Authentication Reject message the Mobile Station shall delete the stored LAI, CKSN and TMSI.

Reference(s)

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.3.2.5.

#### 26.7.2.2.2 Test purpose

- 1) To check that ,after reception of an Authentication Reject message, the Mobile Station:
  - 1.1 does not perform normal location updating.
  - 1.2 does not perform periodic location updating.
  - 1.3 does not respond to paging with TMSI.
  - 1.4 rejects any request from CM entity for MM connection except for emergency call.
  - 1.5 does not perform IMSI detach if deactivated.
- 2) To check that, after reception of an Authentication Reject message the Mobile Station, if it supports speech, accepts a request for an emergency call by sending a CHANNEL REQUEST message with the establishment cause set to "emergency call" and includes an IMEI as mobile identity in the CM SERVICE REQUEST message.
- 3) To check that, after reception of an Authentication Reject message and after having been deactivated and reactivated, the MS performs location updating using its IMSI as mobile identity and indicates deleted LAI and CKSN.

#### 26.7.2.2.3 Method of test

##### Initial conditions

###### System Simulator:

Two cells: A and B, belonging to different location areas a and b.

IMSI attach/detach is allowed in both cells.

The T3212 time-out value is 1/10 hour in both cells.

###### Mobile Station:

The MS has valid TMSI, CKSN (CKSN2) and Kc. It is "idle updated" on cell B.

##### Related PICS/PIXIT statement(s)

SIM removal possible while MS is powered Yes/No.

Switch off on button Yes/No.

Support of speech Yes/No.

##### Foreseen final state of the MS

The MS has valid TMSI, CKSN (CKSN1) and Kc. It is "idle updated" on cell A.

##### Test procedure

The SS rejects an authentication. The channel is released. The SS checks that the MS has entered the state MM IDLE substate NO IMSI, i.e. does not perform normal location updating, does not perform periodic updating, does not respond to paging, rejects any requests from CM entities except emergency calls and does not perform IMSI detach if SIM detachment is performed, switch off is performed, or the power is removed, depending on the MS (see PICS/PIXIT).

##### Maximum duration of test

10 minutes.

## 26.7.3 Identification

The purpose of this procedure is to check that the MS gives its identity as requested by the network. If this procedure does not work, it will not be possible for the network to rely on the identity claimed by the MS.

### 26.7.3.1 General Identification

#### 26.7.3.1.1 Conformance requirement

- 1) When requested by the network the Mobile Station shall send its IMSI.
- 2) When requested by the network the Mobile Station shall send the TMSI which it was previously allocated.
- 3) When requested by the network the Mobile Station shall send its IMEI as stored in the Mobile Equipment.
- 4) When requested by the network the Mobile Station shall send its IMEISV as stored in the Mobile Equipment.

Reference(s)

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.3.3.

#### 26.7.3.1.2 Test purpose

- 1) To verify that the MS sends identity information as requested by the system in the following cases: IMSI and TMSI are requested in non-ciphered mode, IMEI is requested in ciphered mode.
- 2) To verify that the MS sends its IMEI, when requested to do so, in non-ciphered mode.
- 3) To verify that the MS sends its IMEISV, when requested to do so, in non-ciphered mode.

#### 26.7.3.1.3 Method of test

##### 26.7.3.1.3.1 Identification / test 1

Initial conditions

System Simulator:

1 cell, default values.

Mobile Station:

The MS has a valid TMSI. It is "idle updated" on the cell.

Related PICS/PIXIT statement(s)

IMEI of the ME.

Foreseen final state of the MS

The MS has a valid TMSI. It is "idle updated" on the cell.

Test Procedure

The SS requests identity information from the MS:

- IMSI in non ciphering mode,

- allocated TMSI in non ciphering mode,
- IMEI in ciphering mode.

Maximum duration of test

30 s.

Expected sequence

| Step | Direction | Message                 | Comments                                                                                                                                                                                                                                                                                                                                                                                                                                           |

26.7.3.1.3.2 Identification / test 2

Initial conditions

System Simulator:

1 cell, default values.

Mobile Station:

The MS has a valid TMSI. It is in "idle updated".

Related PICS/PIXIT statement(s)

IMEI of the ME.

IMEISV of the ME.

Foreseen final state of the MS

The MS has a valid TMSI. It is "idle updated".

Test Procedure

The SS requests identity information from the MS:

- IMEI in non ciphering mode;
- IMEISV in non ciphering mode.

Maximum duration of test

30 s.

Expected sequence

| Step | Direction | Message               | Comments                                                                                           |

### 26.7.3.2 Handling of IMSI shorter than the maximum length

#### 26.7.3.2.1 Conformance requirement

The MS shall be capable of handling an IMSI that is not of the maximum length.

Reference(s)

3GPP TS 04.08 / 3GPP TS 24.008 subclause 10.5.1.4.

#### 26.7.3.2.2 Test purpose

To check that the MS behaves correctly when activated with an IMSI of length less than the maximum length.

In this condition, the MS shall:

- perform location updating;
- answer to paging with IMSI;
- give the correct IMSI when asked by an IDENTITY REQUEST;
- attempt CM connection establishment when requested to;
- attempt call re-establishment when needed;
- attempt IMSI detach when needed;
- erase its TMSI when the IMSI is sent by the network in a LOCATION UPDATING ACCEPT or a TMSI REALLOCATION COMMAND message.

### 26.7.3.2.3 Method of test

#### Initial conditions

##### System Simulator:

1 cell, default values.

IMSI attach/detach bit set to "1".

##### Mobile Station:

The MS has no valid TMSI.

It is "idle updated".

The IMSI has the value 001011234.

#### Related PICS/PIXIT statement(s)

On/Off switch - Yes/No.

#### Foreseen final state of MS

The MS has no valid TMSI. It is in "idle, updated".

#### Test Procedure

The MS is paged with its IMSI. The MS shall answer to paging and include the correct IMSI in the PAGING RESPONSE message. During call establishment, the SS asks for the IMSI of the MS. The MS shall answer by an IDENTITY RESPONSE message including the correct IMSI. During the active phase of the call, the SS stops sending valid SACCH frames. The MS performs call re-establishment. The MS shall include the correct IMSI in the CM RE-ESTABLISHMENT message. A TMSI REALLOCATION COMMAND including a TMSI is sent to the MS. The MS acknowledges this message. The call is release.

The MS is paged with its TMSI. The MS shall answer to paging and includes its TMSI in the PAGING RESPONSE message. During call establishment, the SS sends a TMSI REALLOCATION COMMAND including the IMSI to the MS. The MS shall acknowledge this message. The MS shall erase its TMSI. The call is released.

The MS is switched off or has its power source removed. The MS performs IMSI detach. The MS shall include the correct IMSI in the IMSI DETACH INDICATION message.

The MS is switched on or powered on. The MS performs IMSI attach. The MS shall include the correct IMSI in the LOCATION UPDATING REQUEST message. A TMSI is allocated to the MS.

The LAC of the cell is changed. The MS performs location updating. The SS includes the IMSI in the LOCATION UPDATING ACCEPT message.

A mobile originated CM connection is attempted. The MS shall include the correct IMSI in the CM SERVICE REQUEST message.

#### Maximum duration of test

5 minutes.

## Expected sequence

## Specific message contents

None.

## 26.7.4 Location updating

This procedure is used to register the MS in the network. If it is not performed correctly, no call can be established.

### 26.7.4.1 Location updating / accepted

#### 26.7.4.1.1 Conformance requirement

1.

1.1 If the network accepts a location updating from the Mobile Station and reallocates a TMSI in the Location Updating Accept message the Mobile Station shall acknowledge the reception of the new TMSI.

1.2 The Mobile Station shall answer to paging with this TMSI and include it in a Paging Response message.

2 If the network accepts a location updating from the Mobile Station and the Location Updating Accept message contains neither TMSI nor IMSI, the Mobile Station shall answer to paging when addressed with the last allocated TMSI and include it in the Paging Response message.

3.

3.1 If the network accepts a location updating from the Mobile Station by use of a Location Updating Accept message containing the IMSI of the Mobile Station, the Mobile Station shall not answer paging with the last allocated TMSI.

3.2 The Mobile Station shall still answer paging with IMSI.

4. A mobile station that supports:

only the GSM 450 band (cf. 3GPP TS 05.05); or

only the GSM 480 band (cf. 3GPP TS 05.05); or

only the GSM 700 band (cf. 3GPP TS 05.05); or

only the GSM 850 band (cf. 3GPP TS 05.05); or

only the primary GSM band P-GSM 900 (cf. 3GPP TS 05.05); or

only the DCS 1800 band (cf. 3GPP TS 05.05).

may ignore SYSTEM INFORMATION TYPE 2ter messages ; if it does so it shall assume that the SYSTEM INFORMATION TYPE 2 carries the complete BA, for selection of the cell , where it performs the location updating procedure.

This SYSTEM INFORMATION TYPE 2ter message may be sent by the network with either a L2 pseudo length of 18 or some other value.

See 3GPP TS 04.08 / 3GPP TS 44.018, subclauses 9.1.34 and 3.2.2.1.

#### Reference(s)

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.4.4.6.

#### 26.7.4.1.2 Test purpose

1) To test the behaviour of the MS if the network accepts the location updating of the MS.

For the network response three different cases are identified:

1.1) TMSI is allocated;

1.2) Location updating accept contains neither TMSI nor IMSI;

1.3) Location updating accept contains IMSI.

2) To verify that the MS , that supports only the GSM 450 band or only the GSM 480 band or only the GSM 700 band or only the GSM 850 band or only the primary GSM900 band or only the DCS1800 band is not disturbed by SYSTEM INFORMATION 2ter messages , with different values of L2pseudolength.

26.7.4.1.3 Method of test

26.7.4.1.3.1 Location Updating/accepted/test1

Initial conditions:

System Simulator:

Two cells, A and B, belonging to different location areas with location area identification a and b of the same PLMN.

IMSI attach/detach is allowed in both cells.

The T3212 time-out value is 1/10 hour in both cells.

Mobile Station:

The MS has a valid TMSI (=TMSI1) and CKSN (=CKSN1). It is "idle updated" on cell A.

Related PICS/PIXIT statement(s)

None.

Foreseen final state of the MS

The MS has no valid TMSI. It has valid CKSN and Kc. It is "idle, updated" on cell B.

Test Procedure

The MS is made to select cell B. A normal location updating with TMSI reallocation is performed in cell B. The channel is released. The SS checks, by paging, that the MS has stored the newly allocated TMSI. The channel is released. The MS is made to select cell A. A normal location updating is performed in cell A. The LOCATION UPDATING ACCEPT message contains neither IMSI nor TMSI. The SS checks, by paging, that the MS has kept the old TMSI. The channel is released. The MS is made to select cell B. A normal location updating is performed in cell B. The LOCATION UPDATING ACCEPT message contains an IMSI. The SS checks, by paging, that the MS has deleted its TMSI and responds to paging with IMSI.

Maximum duration of test

4 minutes.

## Expected sequence

| Step | Direction | Message                    | Comments                                                                                                                                                                                  |
|------|-----------|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS        |                            | The RF level of cell A is lowered until the MS selects cell B.                                                                                                                            |
| 2    | MS -> SS  | CHANNEL REQUEST            | "Establishment cause": Location updating.                                                                                                                                                 |

Specific message contents:

None.

26.7.4.1.3.2 Location Updating/accepted/test2

Initial conditions:

System Simulator:

Two cells, A and B, belonging to different location areas with location area identification a and b of the same PLMN.

System information2ter is broadcasted on the two cells (Cell A with L2pseudolength=18, Cell B with L2pseudolength=0) .

IMSI attach/detach is allowed in both cells.

The T3212 time-out value is 1/10 hour in both cells.

Mobile Station:

The MS has a valid TMSI (=TMSI1) and CKSN (=CKSN1). It is "idle updated" on cell A.

Related PICS/PIXIT statement(s)

None.

Foreseen final state of the MS

The MS has no valid TMSI. It has valid CKSN and Kc. It is "idle, updated" on cell B.

Test Procedure

The MS is made to select cell B. A normal location updating with TMSI reallocation is performed in cell B. The channel is released. The SS checks, by paging, that the MS has stored the newly allocated TMSI. The channel is released. The MS is made to select cell A. A normal location updating is performed in cell A. The LOCATION UPDATING ACCEPT message contains neither IMSI nor TMSI. The SS checks, by paging, that the MS has kept the old TMSI. The channel is released. The MS is made to select cell B. A normal location updating is performed in cell B. The LOCATION UPDATING ACCEPT message contains an IMSI. The SS checks, by paging, that the MS has deleted its TMSI and responds to paging with IMSI.

Maximum duration of test

4 minutes.

## Expected sequence

| Step | Direction | Message                    | Comments                                                                                                                                                                                  |

## 26.7.4.2 Location updating / rejected

### 26.7.4.2.1 Location updating / rejected / IMSI invalid

#### 26.7.4.2.1.1 Conformance requirement

- 1) If the network rejects a location updating from the Mobile Station with the cause "IMSI unknown in HLR", "Illegal MS" or "Illegal ME" the Mobile Station shall:

- 1.1 not perform normal location updating;
- 1.2 not perform periodic location updating;
- 1.3 not respond to paging with IMSI;
- 1.4 not respond to paging with TMSI;
- 1.5 reject any request from CM entity for MM connection other than for emergency call;
- 1.6 not perform IMSI detach if it is switched off or has its power source removed.

- 2) If the network rejects a location updating from the Mobile Station with the cause "IMSI unknown in HLR", "Illegal MS" or "Illegal ME" the Mobile Station, if it supports speech, shall accept a request for an emergency call by sending a Channel Request message with the establishment cause set to "emergency call" and include an IMEI as mobile identity in the CM SERVICE REQUEST message.
- 3) If the network rejects a location updating from the Mobile Station with the cause "IMSI unknown in HLR", "Illegal MS" or "Illegal ME" the Mobile Station shall delete the stored LAI, CKSN and TMSI.

#### Reference(s)

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.4.4.7.

#### 26.7.4.2.1.2 Test purpose

To test the behaviour of the MS if the network rejects the location updating of the MS with the cause "IMSI unknown in HLR", "illegal MS" or "Illegal ME".

#### 26.7.4.2.1.3 Method of test

#### Initial conditions

##### System Simulator:

Two cells: A and B, belonging to different location areas of the same PLMN.

IMSI attach/detach is allowed in both cells.

The T3212 time-out value is 1/10 hour in both cells.

##### Mobile Station:

The MS has valid TMSI, CKSN and Kc. It is "idle updated" on cell A.

#### Related PICS/PIXIT statement(s)

SIM removal possible while the MS is powered Yes/No.

Switch off on button Yes/No.

Support for speech Yes/No.

#### Foreseen final state of the MS

The MS has valid TMSI, CKSN and Kc. It is "idle updated" on cell A.

#### Test Procedure

The SS rejects a normal location updating with the cause value "IMSI unknown in HLR". The channel is released. The SS checks that the MS has entered the state MM IDLE and the substate NO IMSI, i.e. does not perform normal location updating when a new cell of the same or another PLMN is entered, does not perform periodic updating, does not respond to paging, rejects any requests from CM entities except emergency calls and does not perform IMSI detach if it is switched off or has its power source removed.

The test is repeated with cause value "Illegal MS" and with cause value "Illegal ME".

#### Maximum duration of test

35 minutes.

## Expected sequence

The sequence is executed for execution counter  $k = 1, 2, 3$ .

| Step | Direction | Message                   | Comments                                                                                                                                                                                                            |

#### 26.7.4.2.2 Location updating / rejected / PLMN not allowed

##### 26.7.4.2.2.1 Conformance requirement

- 1) If the network reject a location updating from the Mobile Station with the cause "PLMN not allowed" the Mobile Station shall:
  - 1.1 not perform periodic updating;
  - 1.2 not perform IMSI detach when switched off;
  - 1.3 not perform IMSI attach when switched on in the same location area;
  - 1.4 not perform normal location updating when in the same PLMN and when that PLMN is not selected manually;
  - 1.5 reject any request from CM entity for MM connection other than for emergency call.
- 2) If the network rejects a location updating from the Mobile Station with the cause "PLMN not allowed" the Mobile Station shall:
  - 2.1 perform normal location updating when a new PLMN is entered;
  - 2.2 accept a request for an emergency call, if it supports speech, by sending a Channel Request message with the establishment cause set to "emergency call".
- 3) If the network rejects a location updating from the Mobile Station with the cause "PLMN not allowed" and if after that the PLMN from which this rejection was received, is manually selected, the Mobile Station shall perform a normal location updating procedure.

Reference(s)

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.4.4.7.

##### 26.7.4.2.2.2 Test purpose

To test the behaviour of the MS if the network rejects the location updating of the MS with the cause "PLMN not allowed".

26.7.4.2.2.3 Method of test

26.7.4.2.2.3.1 Location updating / rejected / PLMN not allowed / test 1

#### Initial conditions

##### System Simulator:

One cell: C, belonging to PLMN1.

Two cells: A and B, belonging to different location areas a and b and belonging to PLMN2. PLMN2 is different from HPLMN and from PLMN1.

IMSI attach/detach is allowed in cells A and B but not in cell C.

The T3212 time-out value is 1/10 hour in cells A and B.

##### Mobile Station:

The MS has a valid TMSI. It is "idle updated" on cell C.

The MS is in manual mode for PLMN selection.

#### Related PICS/PIXIT statement(s)

SIM removal possible while the MS is powered Yes/No.

Switch off on button Yes/No.

The MS is automatically in automatic mode after switch on Yes/No.

Support for speech Yes/No.

#### Foreseen final state of the MS

The MS has a valid TMSI. It is "idle updated" on cell C. The MS is in automatic mode for PLMN selection.

#### Test Procedure

The SS rejects a normal location updating with the cause value "PLMN not allowed". The channel is released. The SS checks that the MS does not perform periodic updating, does not perform IMSI detach, does not perform IMSI attach if activated in the same location area, rejects any request for CM connection establishment other than emergency call, accepts a request for an emergency call and performs normal location updating only when a new PLMN is entered.

#### Maximum duration of test

12 minutes.

## Expected sequence

| Step | Direction | Message                   | Comments                                                                                                                                                                                                                                                                                                    |
|------|-----------|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                           | The following messages are sent and shall be received on cell B.                                                                                                                                                                                                                                            |
| 2    | SS        |                           | The MS is switched off (or power is removed).                                                                                                                                                                                                                                                               |
| 3    | MS        |                           | The SS activates cells A and B and deactivates cell C. Cell B has a level higher by at least 5 dB than cell A. The MS is switched on. (or power is reapplied) If necessary the MS is put in manual selection mode. The MS shall offer the new PLMN as available to the user. The PLMN is manually selected. |
| 4    | MS -> SS  | CHANNEL REQUEST           | "Establishment cause": Location updating.                                                                                                                                                                                                                                                                   |

Specific message contents:

None.

26.7.4.2.2.3.2 Location updating / rejected / PLMN not allowed / test 2

Initial conditions

System Simulator:

One cell C, belonging to PLMN1.

Two cells A and B, belonging to different location areas a and b and belonging to PLMN2. PLMN2 is different from HPLMN.

IMSI attach/detach is allowed in cells A and B but not in cell C.

The T3212 time-out value is 1/10 hour in cells A and B.

Mobile Station:

The MS has a valid TMSI. It is "idle updated" on cell C.

Related PICS/PIXIT statement(s)

SIM removal possible while MS is powered Yes/No.

Switch off on button Yes/No.

The MS is automatically in automatic mode after switch on Yes/No.

Foreseen final state of the MS

The MS has a valid TMSI. It is "idle, updated" on cell C.

The MS is in automatic mode for PLMN selection.

Test Procedure

The SS rejects a normal location updating with the cause value "PLMN not allowed". The channel is released. Then the PLMN from which this rejection was received is manually selected and the SS checks that a normal location updating is performed.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message                    | Comments                                                                                                                                                                      |

### 26.7.4.2.3 Location updating / rejected / location area not allowed

#### 26.7.4.2.3.1 Conformance requirement

- 1) If the network rejects a location updating from the Mobile Station with the cause "Location Area not allowed" the Mobile Station shall:

- 1.1 not perform periodic updating;

- 1.2 not respond to paging with TMSI;

- 1.3 reject any request from CM entity for MM connection other than for emergency call;
- 1.4 not perform IMSI detach.
- 2) If the network rejects a location updating from the Mobile Station with the cause "Location Area not allowed" the Mobile Station shall:
  - 2.1 perform normal location updating when a new location area is entered;
  - 2.2 accept a request for an emergency call, if it supports speech, by sending a Channel Request message with the establishment cause set to "emergency call";
  - 2.3 delete the list of forbidden LAs after switch off (power off).

#### Reference(s)

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.4.4.7.

#### 26.7.4.2.3.2 Test purpose

To test the behaviour of the MS if the network rejects the location updating of the MS with the cause "Location Area not allowed".

To test that the MS deletes the list of forbidden LAs after switch off (power off).

#### 26.7.4.2.3.3 Method of test

##### Initial conditions

###### System Simulator:

Two cells: A and B, belonging to different location areas a and b.

IMSI attach/detach is allowed in both cells.

The T3212 time-out value is 1/10 hour in both cells.

###### Mobile Station:

The MS has a valid TMSI. It is "idle updated" on cell A.

##### Related PICS/PIXIT statement(s)

Switch off on button Yes/No.

Support for speech Yes/No.

Method to clear the list of forbidden location areas periodically.

##### Foreseen final state of the MS

The MS has a valid TMSI. It is "idle updated" on cell A.

##### Test Procedure

The SS rejects a normal location updating with the cause value "Location Area not allowed". The channel is released. The SS checks that the MS does not perform periodic updating, does not respond to paging with TMSI, rejects any requests from CM entities for MM-connections except emergency calls, does not perform IMSI detach, performs normal location updating when a new location area is entered and deletes the list of forbidden LAs when switched off.

Different types of MS may use different methods to periodically clear the list of forbidden location areas (e.g. every day at 12am). If the list is cleared while the test is being run, it may be necessary to re-run the test.

Maximum duration of test

12 minutes.

Expected sequence

| Step | Direction | Message                    | Comments                                                                                                                                                            |
|------|-----------|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS        |                            | The following messages are sent and shall be received on cell B.                                                                                                    |
| 2    | MS -> SS  | CHANNEL REQUEST            | The RF level of cell A is lowered so that cell B is selected, while keeping the C1 and C2 of cell A greater than 10.                                                |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT       | "Establishment cause": Location updating.                                                                                                                           |
| 4    | MS -> SS  | LOCATION UPDATING REQUEST  |                                                                                                                                                                     |
| 5    | SS -> MS  | LOCATION UPDATING REJECT   | "Reject cause" = "Location Area not allowed".                                                                                                                       |
| 6    | SS -> MS  | CHANNEL RELEASE            | After the sending of this message, the SS waits for the disconnection of the mainsignalling link. The SS waits for a possible location updating for 7 minutes.      |
| 7    | SS        |                            |                                                                                                                                                                     |
| 8    | MS        |                            | The MS shall not initiate an RR-connection establishment either on cell A or cell B.                                                                                |
| 9    | SS -> MS  | PAGING REQUEST TYPE 1      | The MS is paged in cell B. "Mobile identity" = TMSI.                                                                                                                |
| 10   | MS        |                            | The MS shall ignore this message. This is checked during 3 s.                                                                                                       |
| 11   | MS        |                            | A MO CM connection is attempted.                                                                                                                                    |
| 12   | MS        |                            | The MS shall not initiate an RR connection establishment on cell A or cell B. This is checked during 3 s.                                                           |
| 13   | MS        |                            | If the MS supports speech (see PICS), it is made to perform an emergency call.                                                                                      |

#### 26.7.4.2.4 Location updating / rejected / roaming not allowed in this location area

##### 26.7.4.2.4.1 Conformance requirement

- 1) If the network rejects a location updating from the Mobile Station with the cause "Roaming not allowed in this area" the Mobile Station shall:
  - 1.1 not perform periodic updating;
  - 1.2 not respond to paging with TMSI;
  - 1.3 reject any request from CM entity for MM connection other than for emergency call;
  - 1.4 not perform IMSI detach.
- 2) If the network rejects a location updating from the Mobile Station with the cause "Roaming not allowed in this area" the Mobile Station shall:
  - 2.1 perform normal location updating when a new location area is entered;
  - 2.2 accept a request for an emergency call, if it supports speech, by sending a Channel Request message with the establishment cause set to "emergency call";
  - 2.3 periodically search for its HPLMN.
- 3) The mobile station shall reset the list of "Forbidden location areas for roaming" when it is switched off or has its power source removed or when the SIM is removed.
- 4) The MS shall be capable of storing at least 6 entries in the list of "Forbidden location areas for roaming".

##### Reference(s)

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.4.4.7.

##### 26.7.4.2.4.2 Test purposes

###### Test purpose 1

To test that on receipt of a rejection using the Roaming cause code, the MS ceases trying to update on that cell, that this situation continues for at least one periodic location interval period, and that the corresponding list is re-set by switching off the MS or removing its power source.

###### Test purpose 2

To test that if no cell is available, the MS does not answer to paging with TMSI, rejects a request from CM entity other than for emergency calls.

###### Test purpose 3

To test that at least 6 entries can be held in the list of "forbidden location areas for roaming" (the requirement in 3GPP TS 04.08 / 3GPP TS 24.008 is to store at least 10 entries. This is not fully tested by the third procedure).

###### Test purpose 4

To test that if a cell of the Home PLMN is available then the MS returns to it in preference to any other available cell.

###### Test purpose 5

To test that if the SIM is removed the list of "forbidden location areas for roaming" is cleared.

## 26.7.4.2.4.3 Method of test

## Initial conditions

The initial conditions shall be met before each of the different procedures.

## System Simulator:

For procedures 1, 2, 3 and 5: Two cells A and B, belonging to different location areas of the same PLMN with LAI a and b. The MCC of that PLMN is the same as that of the HPLMN. The MNC of that PLMN is different from that of the HPLMN.

For procedure 4: three cells A, B, C of the same PLMN which is not the HPLMN with 3 different location area codes. Cells should differ in signal strength by 10 dB with cell A being the strongest and cell C the weakest. There should be a 20 dB range between A and C. A should be set to a level of - 40 dBm.

IMSI attach/detach is allowed in every cell.

The T3212 time-out value is 1/10 hour in every cell.

## Mobile Station:

Procedures 1, 2, 3 and 5: The MS has valid TMSI, CKSN and Kc. It is "idle updated" on cell B.

Procedure 4: The MS has valid TMSI, CKSN and Kc. It is "idle updated" on cell A.

The list of "forbidden location areas for roaming" shall be empty (this may be achieved by either removing the SIM or switching the MS OFF then ON or removing the MS power source depending on PICS).

## Related PICS/PIXIT statement(s)

SIM removal possible while MS is powered Yes/No.

Switch off on button Yes/No.

Support of speech Yes/No.

Method to clear the list of location areas for roaming periodically.

The MS is automatically in automatic mode after switch on Yes/No.

## Foreseen final state of the MS

Procedures 1 and 5: The MS has no valid TMSI and no CKSN. It is "idle updated" on cell A.

Procedure 2 and 3: The MS has no valid TMSI and no CKSN. It is in the "limited service" state on cell A.

Procedure 4: The MS has no valid TMSI and no CKSN. It is "idle updated" on cell C.

## Test Procedures

## Procedure 1:

The SS rejects a normal location updating with the cause value "Roaming not allowed in this area". The channel is released. The SS checks that the MS does not perform periodic location updating procedure. The MS is turned off and then on. The SS checks that the MS performs location updating on the cell on which its location update request had been rejected (this checks that the LA is not the forbidden list after switch on). This procedure is performed another time but the deletion of the list is checked while removing the SIM (instead of turning off the MS).

## Procedure 2:

The SS rejects a normal location updating with the cause value "Roaming not allowed in this area". The channel is released. The SS checks that the MS does not answer to a paging message with TMSI, rejects a request from CM entity but supports an emergency call.

## Procedure 3:

The SS rejects a normal location updating with the cause value "Roaming not allowed in this area". This is done for 6 different location areas. Then the SS checks that the MS does not attempt to begin a location updating procedure on the non-allowed location areas.

## Procedure 4:

The SS accepts a periodic location updating on a cell not belonging to the HPLMN. Then when the MS attempts to perform a periodic location updating to this cell, the SS rejects this location updating with the cause value "Roaming not allowed in this area". Two cells are then available, one belonging to the HPLMN but with the weakest level. It is checked that the MS returns to its HPLMN.

## Procedure 5: If SIM removal is possible while MS is powered:

The SS rejects a normal location updating with the cause value "Roaming not allowed in this area". The channel is released. The SS checks that the MS does not perform periodic location updating procedure. The SIM is removed and inserted in the MS. The SS checks that the MS performs location updating on the cell on which its location update request had been rejected (this checks that the LA is not the forbidden list after switch on).

Different types of MS may use different methods to periodically clear the list of forbidden areas (e.g. every day at 12am) for roaming. If the list is cleared while the test is being run, it may be necessary to re-run the test.

## Maximum duration of test

Procedures 1 and 5: 12 minutes each.

Procedure 2: 6 minutes.

Procedure 3: 17 minutes.

Procedure 4: 16 minutes.

## Expected sequence

The following procedure is used during the test:

## Change\_LAI (x):

- The purpose of this procedure is to change the value of Location Area Identifier of cell x.
- The Location Area Identifier of cell x shall be changed. The code shall be chosen arbitrarily but shall be different from any previously used in this procedure. The code shall have the same MCC as the Home PLMN and shall not have the same MNC as the Home PLMN.

## Procedure 1

| Step | Direction | Message                   | Comments                                                                                                           |
|------|-----------|---------------------------|--------------------------------------------------------------------------------------------------------------------|
| 1    | SS        |                           | The following messages are sent and shall be received on cell A.                                                   |
| 2    | MS -> SS  | CHANNEL REQUEST           | The RF level of cell B is lowered until cell B is no more suitable and the MS selects cell A.                      |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT      | "Establishment cause": Location updating.                                                                          |
| 4    | MS -> SS  | LOCATION UPDATING REQUEST |                                                                                                                    |
| 5    | SS -> MS  | LOCATION UPDATING REJECT  | "Reject cause" IE is "Roaming not allowed in this location area".                                                  |
| 6    | SS -> MS  | CHANNEL RELEASE           | After the sending of this message, the SS waits for the disconnection of the main signalling link.                 |
| 7    | SS        |                           | The SS waits at least 7 minutes for a possible location updating.                                                  |
| 8    | MS        |                           | The MS shall not initiate an RR connection establishment on cell A or on cell B.                                   |
| 9    | MS        |                           | If possible (see PICS) the MS is switched off. Otherwise if possible the power is removed.                         |
| 10   | MS        |                           | Depending on what has been performed in step 9 the MS is brought back to operation and placed in a automatic mode. |
| 11   | MS -> SS  | CHANNEL REQUEST           | "Establishment cause": Location updating.                                                                          |
| 12   | SS -> MS  | IMMEDIATE ASSIGNMENT      |                                                                                                                    |
| 13   | MS -> SS  | LOCATION UPDATING REQUEST | Location Updating Type = normal.                                                                                   |
| 14   | SS -> MS  | LOCATION UPDATING ACCEPT  | IE Mobile Identity not present.                                                                                    |
| 15   | SS -> MS  | CHANNEL RELEASE           | After the sending of this message, the SS waits for the disconnection of the main signalling link.                 |

## Procedure 2

| Step | Direction | Message                   | Comments                                                                                                                                     |
|------|-----------|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS        |                           | The following messages are sent and shall be received on cell A.                                                                             |
| 2    | MS -> SS  | CHANNEL REQUEST           | The RF level of cell B is lowered until the MS selects cell A. The level of cell B shall be such that cell B is suitable for cell selection. |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT      | "Establishment cause": Location updating This message is sent on cell A.                                                                     |
| 4    | MS -> SS  | LOCATION UPDATING REQUEST |                                                                                                                                              |
| 5    | SS -> MS  | LOCATION UPDATING REJECT  | "Reject cause" IE is "Roaming not allowed in this location area".                                                                            |
| 6    | SS -> MS  | CHANNEL RELEASE           | After the sending of this message, the SS waits for the disconnection of the main signalling link.                                           |
| 7    | MS -> SS  | CHANNEL REQUEST           | The following messages are sent and shall be received on cell B.                                                                             |
| 8    | SS -> MS  | IMMEDIATE ASSIGNMENT      | "Establishment cause": Location updating.                                                                                                    |
| 9    | MS -> SS  | LOCATION UPDATING REQUEST |                                                                                                                                              |
| 10   | SS -> MS  | LOCATION UPDATING REJECT  | "Reject cause" IE is "Roaming not allowed in this location area".                                                                            |
| 11   | SS -> MS  | CHANNEL RELEASE           | After the sending of this message, the SS waits for the disconnection of the main signalling link.                                           |
| 12   | SS        |                           | The SS waits for a possible location updating procedure on both cells A and B for 2 minutes.                                                 |
| 13   | MS        |                           | The MS shall not initiate an RR connection establishment on cell A or on cell B within 2 minutes after the end of step 11.                   |
| 14   | SS -> MS  | PAGING REQUEST TYPE 1     | "Mobile identity" = TMSI. This message is sent on cell A and on cell B.                                                                      |
| 15   | MS        |                           | The MS shall not initiate an RR connection on cell A or on cell B. This is checked during 3 s.                                               |
| 16   | MS        |                           | A MO CM connection is attempted.                                                                                                             |
| 17   | MS        |                           | The MS shall not initiate an RR connection establishment on cell A or on cell B. This is checked during 3 s.                                 |
| 18   | MS        |                           | The following messages are sent and shall be received on cell A Steps 20 to 27 are performed if the MS supports speech.                      |
| 19   | MS -> SS  | CHANNEL REQUEST           | An emergency call is attempted.                                                                                                              |
| 20   | SS -> MS  | IMMEDIATE ASSIGNMENT      | "Establishment cause":                                                                                                                       |
| 21   | MS -> SS  | CM SERVICE REQUEST        | "CM service type": Emergency call establishment.                                                                                             |
| 22   | SS -> MS  | CM SERVICE ACCEPT         |                                                                                                                                              |
| 23   | MS -> SS  | EMERGENCY SETUP           |                                                                                                                                              |
| 24   | SS -> MS  | RELEASE COMPLETE          | "Cause" = unassigned number.                                                                                                                 |
| 25   | SS -> MS  | CHANNEL RELEASE           | After the sending of this message, the SS waits for the disconnection of the main signalling link.                                           |

## Procedure 3

| Step | Direction | Message                   | Comments                                                                                                                                     |
|------|-----------|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS        |                           | The following messages are sent and shall be received on cell A                                                                              |
| 2    | MS -> SS  | CHANNEL REQUEST           | The RF level of cell B is lowered until the MS selects cell A. The level of cell B shall be such that cell B is suitable for cell selection. |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT      | "Establishment cause": Location updating.                                                                                                    |
| 4    | MS -> SS  | LOCATION UPDATING REQUEST |                                                                                                                                              |
| 5    | SS -> MS  | LOCATION UPDATING REJECT  | "Reject cause" IE is "Roaming not allowed in this location area".                                                                            |
| 6    | SS -> MS  | CHANNEL RELEASE           | After the sending of this message, the SS waits for the disconnection of the main signalling link.                                           |
| 9    | MS -> SS  | CHANNEL REQUEST           | The following messages are sent and shall be received on cell B.                                                                             |
| 10   | SS -> MS  | IMMEDIATE ASSIGNMENT      | "Establishment cause": Location updating.                                                                                                    |
| 11   | MS -> SS  | LOCATION UPDATING REQUEST |                                                                                                                                              |
| 12   | SS -> MS  | LOCATION UPDATING REJECT  | "Reject cause" IE is "Roaming not allowed in this location area".                                                                            |
| 13   | SS -> MS  | CHANNEL RELEASE           | After the sending of this message, the SS waits for the disconnection of the main signalling link.                                           |
| 14   | SS        |                           | Change_LAI (A) within 5 s after step 12.                                                                                                     |
| 17   | MS -> SS  | CHANNEL REQUEST           | The following messages are sent and shall be received on cell A.                                                                             |
| 18   | SS -> MS  | IMMEDIATE ASSIGNMENT      | "Establishment cause": Location updating.                                                                                                    |
| 19   | MS -> SS  | LOCATION UPDATING REQUEST |                                                                                                                                              |
| 20   | SS -> MS  | LOCATION UPDATING REJECT  | "Reject cause" IE is "Roaming not allowed in this location area".                                                                            |
| 21   | SS -> MS  | CHANNEL RELEASE           | After the sending of this message, the SS waits for the disconnection of the main signalling link.                                           |
| 22   | SS        |                           | Change_LAI (B) within 5 s after step 20.                                                                                                     |
| 25   | MS -> SS  | CHANNEL REQUEST           | The following messages are sent and shall be received on cell B.                                                                             |

| 12   | SS -> MS  | IMMEDIATE ASSIGNMENT      |                                                                                                    |
| 13   | MS -> SS  | LOCATION UPDATING REQUEST | Location Updating Type = normal.                                                                   |
| 14   | SS -> MS  | LOCATION UPDATING ACCEPT  | IE Mobile Identity not present.                                                                    |
| 15   | SS -> MS  | CHANNEL RELEASE           | After the sending of this message, the SS waits for the disconnection of the main signalling link. |

Specific message contents:

None.

### 26.7.4.3 Location updating / abnormal cases

#### 26.7.4.3.1 Location updating / abnormal cases / random access fails

##### 26.7.4.3.1.1 Conformance requirement

If during the RR connection establishment phase of a normal location updating procedure, channel requests are not answered by the network, the Mobile Station shall:

1. send (Max-Retrans+1) Channel Request messages;
2. not try to establish a connection during a period of T3213;
3. then perform a normal location updating procedure as it is still necessary;
4. not repeat the complete procedure if the original cause of the location updating procedure has disappeared.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.4.4.9 and 3GPP TS 05.08 subclause 6.6.2.

##### 26.7.4.3.1.2 Test purpose

To verify that when during the RR connection establishment phase of a location updating procedure, channel requests are not answered by the network, after expiry of T3213 (= 4s in Phase 2) and when the cell reselection procedure is finished the complete procedure is repeated if still necessary.

## 26.7.4.3.1.3 Method of test

## Initial conditions

## System Simulator:

Two cells: A and B of the same PLMN, belonging to different location areas with LAI a and b.

The RF power level of cell B is higher than the one of cell A.

IMSI attach/detach is not allowed in both cells.

The T3212 time-out value is set to infinite in both cells.

## Mobile Station:

The MS has a valid TMSI, CKSN and Kc. It is "Idle updated" on cell B.

## Related PICS/PIXIT statement(s)

None.

## Foreseen final state of the MS

The MS is "Idle updated" on cell A.

## Test Procedure

The SS causes a random access failure in the MS during a normal location updating procedure. After the expiry of T3213 and when the cell reselection procedure is finished the MS will try to restart the normal location updating procedure.

The test is repeated but the original cause of the location updating procedure has disappeared. The SS then checks that the MS will not restart the location updating procedure.

## Maximum duration of test

1 minute.

Expected sequence

#### 26.7.4.3.2 Location updating / abnormal cases / attempt counter less or equal to 4, LAI different

##### 26.7.4.3.2.1 Conformance requirement

- 1) When a failure such as cases d), f) and g) of subclause 4.4.4.9 of 3GPP TS 04.08 / 3GPP TS 24.008 has occurred during a normal location updating procedure, if the attempt counter is smaller than 4 and after expiry of T3211, the Mobile Station shall resend its Location Updating Request message with the Mobile Identity IE set to its IMSI, CKSN IE set to "no key is available" and the Location Updating type set to "normal location updating".
- 2) When a failure such as cases d), f) and g) of subclause 4.4.4.9 of 3GPP TS 04.08 / 3GPP TS 24.008 has occurred during a normal location updating procedure the Mobile Station shall:
  - 2.1 not answer to paging with the previously allocated TMSI;
  - 2.2 not perform the IMSI detach procedure, when switched off.

- 3) When a failure such as case e) of subclause 4.4.4.9 of 3GPP TS 04.08 / 3GPP TS 24.008 has occurred during a normal location updating procedure and when an emergency call establishment is requested by the user the Mobile Station, if it supports speech, shall send a CM Service Request message with CM Service Type IE set to "emergency call establishment", CKSN IE set to "no key available" and Mobile Identity IE set to its IMSI and after acceptance by the network it shall send an Emergency Setup message.
- 4) When a failure such as cases d), f) and g) of subclause 4.4.4.9 of 3GPP TS 04.08 / 3GPP TS 24.008 has occurred during a normal location updating procedure the Mobile Station shall use a request from CM entity other than emergency call as a trigger for a normal location updating procedure and shall send a Location Updating Request message with the Mobile Identity IE set to its IMSI, CKSN IE set to "no key is available" and the Location Updating type IE set to "normal location updating".
- 5) When a failure such as cases d), f) and g) of subclause 4.4.4.9 of 3GPP TS 04.08 / 3GPP TS 24.008 has occurred during a normal location updating procedure the Mobile Station shall answer to paging with IMSI and shall send a Paging Response message with CKSN IE set to "no key available" and Mobile Identity IE set to its IMSI.
- 6) When a failure such as cases d), f) and g) of subclause 4.4.4.9 of 3GPP TS 04.08 / 3GPP TS 24.008 has occurred during a normal location updating procedure the Mobile Station shall perform a normal location updating procedure as soon as it enters a new cell.

## References

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.4.4.2 and 4.4.4.9 and in 3GPP TS 05.08 subclause 6.6.2.

### 26.7.4.3.2.2 Test purpose

To verify that the MS performs normal location updating procedures when its attempt counter is smaller than 4.

To check that the MS does not perform the IMSI detach procedure when "idle not updated".

To verify that when "idle not updated" the MS can perform an emergency call.

To verify that when "idle not updated" the MS uses requests from CM layer other than emergency call as triggering of a normal location updating procedure.

To verify that the MS performs a normal location updating procedure if it enters a new cell while being "idle not updated".

### 26.7.4.3.2.3 Method of test

#### Initial conditions

System Simulator:

Two cells: A and B of the same PLMN, belonging to different location areas with LAI a and b.

ATT flag shall be set to IMSI attach/detach allowed.

Mobile Station:

The MS is "idle updated" on cell A. A valid CKSN value is stored in the SIM and is noted "initial CKSN". A TMSI is allocated.

#### Related PICS/PIXIT statements

SIM removal possible while MS is powered Yes/No.

Switch off on button Yes/No.

Support for speech Yes/No.

#### Foreseen final state of the MS

The MS is "Idle updated" on cell A with a valid CKSN and a TMSI.

## Test Procedure

The MS is made to perform a normal location updating procedure. Four types of failure cases are triggered:

- sending of a Location Updating Reject with cause randomly chosen between all defined cause values except 2, 3, 6, 11, 12 and 13 (which trigger a different action) (case g of 3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.4.4.9);
- RR-connection failure (case d);
- sending of a CHANNEL RELEASE message before the normal end of the procedure (case f);
- T3210 time-out (case e).

As there is no stored LAI or the stored LAI is different from the broadcast LAI, and the attempt counter in the MS shall be lower than 4, the MS enters the state MM IDLE and substate ATTEMPTING TO UPDATE and waits for T3211 seconds before trying again a location updating procedure.

Then the behaviour of the MS in the MM IDLE ATTEMPTING TO UPDATE SERVICE state is checked, that is:

- not answer to paging with TMSI;
- not perform an IMSI detach procedure;
- support request for emergency call;
- use requests from CM layer other than emergency call as triggering of a normal location updating procedure;
- perform normal location updating procedure when a new cell is entered.

## Maximum duration of test

9 minutes.

## Expected sequence

| Step                                                             | Direction | Message                    | Comments                                                                                                                                                                                         |

## 26.7.4.3.3 Location updating / abnormal cases / attempt counter equal to 4

### 26.7.4.3.3.1 Conformance requirement

- 1) When four failures such as cases d) to g) of subclause 4.4.4.9 of 3GPP TS 04.08 / 3GPP TS 24.008 have occurred during a normal location updating procedure the Mobile Station shall:
  - 1.1 perform location updating after T3212 expiry by sending a Location Updating Request message with the Mobile Identity IE set to its IMSI, CKSN IE set to "no key is available" and the Location Updating type set to "normal updating".
  - 1.2 if the T3212 initiated location updating was unsuccessful, then after T3211 expiry the Mobile Station shall send a Location Updating Request message with the Mobile Identity IE set to its IMSI, CKSN IE set to "no key is available" and the Location Updating type IE set to "normal location updating".
- 2) When four failures such as cases d), f), g) of subclause 4.4.4.9 of 3GPP TS 04.08 / 3GPP TS 24.008 have occurred during a normal location updating procedure the Mobile Station, if it supports speech, shall be able to perform an emergency call i.e. the Mobile Station is able to send a CM Service Request message with the CM Service Type IE set to "emergency call establishment", CKSN IE set to "no key is available" and Mobile Identity IE set to its IMSI and then send an Emergency Setup message.
- 3) When four failures such as cases d), f), g) of subclause 4.4.4.9 of 3GPP TS 04.08 / 3GPP TS 24.008 have occurred during a normal location updating procedure:
  - 3.1 the Mobile Station shall use a request from CM entity for MM connection for a service other than emergency call as a trigger for a normal location updating procedure and shall send a Location Updating Request message with the Mobile Identity IE set to its IMSI, CKSN IE set to "no key is available" and the Location Updating type IE set to "normal location updating".
  - 3.2 after a location updating triggered by a request from the CM layer which was .unsuccessful, after T3211 expiry the Mobile Station shall send a Location Updating Request message with the Mobile Identity IE set to its IMSI, CKSN IE set to "no key is available" and the Location Updating type IE set to "normal location updating".
- 4) When four failures such as cases d), f), g) of subclause 4.4.4.9 of 3GPP TS 04.08 / 3GPP TS 24.008 have occurred during a normal location updating procedure:
  - 4.1 the Mobile Station shall perform a normal location updating procedure if it enters a new cell.
  - 4.2 if this location updating is unsuccessful, after T3211 expiry the Mobile Station shall send a Location Updating Request message with the Mobile Identity IE set to its IMSI, CKSN IE set to "no key is available" and the Location Updating type IE set to "normal location updating".

## References

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.4.4.9 and 3GPP TS 05.08 subclause 6.6.2.

### 26.7.4.3.3.2 Test purpose

To verify that the MS performs normal location updating procedures after T3212 expiry, when its attempt counter has reached value 4 and that the MS reset its attempt counter after a timer T3212 expiry.

To verify that the MS still follows the MM IDLE ATTEMPTING TO UPDATE state requirements after its attempt counter has reached value 4.

To verify that the attempt counter is reset in the cases where it has to be done.

### 26.7.4.3.3.3 Method of test

#### Initial conditions

##### System Simulator:

Two cells: A and B, belonging to different location areas a and b.

IMSI attach/detach is allowed in both cells.

T3212 is set to 6 minutes.

##### Mobile Station:

The MS is "Idle updated" on cell B with a valid CKSN and a TMSI.

#### Related PICS/PIXIT statements

SIM removal possible while MS is powered Yes/No.

Switch off on button Yes/No.

Support of speech Yes/No.

#### Foreseen final state of the MS

The MS is "Idle updated" on cell A with a valid CKSN and a TMSI.

#### Test Procedure

The MS is made to perform a normal location updating. The SS triggers a failure in this procedure. After T3211 expiry the MS will try again the location updating procedure. The SS triggers again a failure. This is done again 2 times. At this point the attempt counter shall be equal to 4. It is then checked that T3212 has been started and that at its expiry the MS will try a normal location updating procedure. It is verified that the MS has reset its attempt counter after timer T3212 expiry.

Then it is checked that, when the attempt counter has reached the value of 4, the MS is in the MM IDLE state and ATTEMPTING TO UPDATE substate, that is:

- not perform an IMSI detach procedure;
- support request for emergency call;
- use requests from CM layer other than emergency call as triggering of a normal location updating procedure;
- perform normal location updating procedure when a new cell is entered.

#### Maximum duration of test

20 minutes.

#### 26.7.4.3.4 Location updating / abnormal cases / attempt counter less or equal to 4, stored LAI equal to broadcast LAI

##### 26.7.4.3.4.1 Conformance requirement

- 1) When a failure such as cases d), f) and g) of subclause 4.4.4.9 of 3GPP TS 04.08 / 3GPP TS 24.008 has occurred during a periodic location updating procedure (the broadcast LAI is equal to the stored LAI):

- 1.1 the Mobile Station shall be able to establish an MM connection i.e. send a Channel Request and then a CM Service Request message, CKSN and LAI set to those which have been allocated to the Mobile Station, Mobile Identity IE set to the TMSI which has been allocated to the Mobile Station;

- 1.2 then the Mobile Station shall not attempt a location updating procedure.

- 2) When a failure such as cases d), f) and g) of subclause 4.4.4.9 of 3GPP TS 04.08 / 3GPP TS 24.008 has occurred during an IMSI attach procedure (the broadcast LAI is equal to the stored LAI):

- 2.1 the Mobile Station shall be able to establish an MM connection i.e. send a Channel Request and then a CM Service Request message, CKSN and LAI set to those which have been allocated to the Mobile Station, Mobile Identity IE set to the TMSI which has been allocated to the Mobile Station;

- 2.2 then the Mobile Station shall not attempt a location updating procedure.

- 3) When a failure such as cases d), f) and g) of subclause 4.4.4.9 of 3GPP TS 04.08 / 3GPP TS 24.008 has occurred during a periodic location updating procedure and the attempt counter is smaller than 4 the Mobile Station shall send, after T3211 expiry, a Location Updating Request message with the Mobile Identity IE set to the TMSI which has been allocated to the Mobile Station, CKSN IE and LAI set to those which have been allocated to the Mobile Station and the Location Updating type set to "periodic updating".

When the Mobile Station's attempt counter reaches the value 4 (four failures such as cases d), f) and g) of subclause 4.4.4.9 of 3GPP TS 04.08 / 3GPP TS 24.008 have occurred during a periodic location updating procedure) after T3212 expiry it shall send a Location Updating Request message with the Mobile Identity IE set to its IMSI, CKSN IE set to "no key is available" and the Location Updating type set to "normal".

- 4) When the Mobile Station's attempt counter reaches the value 4 (four failures such as cases d), f) and g) of subclause 4.4.4.9 of 3GPP TS 04.08 / 3GPP TS 24.008 have occurred during a periodic location updating procedure) it shall use a request for a CM connection other than emergency call as a trigger for a location updating procedure.

- 5) When a failure such as cases d), f) and g) of subclause 4.4.4.9 of 3GPP TS 04.08 / 3GPP TS 24.008 has occurred during an IMSI attach procedure and the attempt counter is smaller than 4 the Mobile Station shall send, after T3211 expiry, a Location Updating Request message with the Mobile Identity IE set to the TMSI which has been allocated to the Mobile Station, CKSN IE and LAI set to those which have been allocated to the Mobile Station and the Location Updating type set to "IMSI attach".

When the Mobile Station's attempt counter reaches the value 4 (four failures such as cases d), f) and g) of subclause 4.4.4.9 of 3GPP TS 04.08 / 3GPP TS 24.008 have occurred during an IMSI attach procedure) after T3212 expiry it shall send a Location Updating Request message with the Mobile Identity IE set to its IMSI, CKSN IE set to "no key is available" and the Location Updating type set to "normal".

- 6) When the Mobile Station's attempt counter reaches the value 4 (four failures such as cases d), f) and g) of subclause 4.4.4.9 of 3GPP TS 04.08 / 3GPP TS 24.008 have occurred during an IMSI attach procedure) it shall use a request for a CM connection other than emergency call as a trigger for a location updating procedure.

#### References

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.4.4.9.

#### 26.7.4.3.4.2 Test purpose

To verify that in the case when the attempt counter is smaller than 4 and the broadcast LAI is equal to the stored LAI, the MS is in the MM IDLE state and NORMAL SERVICE substate. To verify that timer T3211 is stopped after a MM connection establishment.

To verify that the MS uses the T3211 timer, and that it enters the MM IDLE state and NORMAL SERVICE substate when its attempt counter reaches value 4 even in the case where the stored LAI is equal to the broadcast LAI.

#### 26.7.4.3.4.3 Method of test

##### Initial conditions

###### System Simulator:

One cell: B, belonging to location area b.

IMSI attach/detach is allowed.

T3212 is set to 6 minutes.

###### Mobile Station:

The MS is "Idle updated" on cell B with a valid CKSN and a TMSI.

##### Related PICS/PIXIT statements

SIM removal possible while MS is powered Yes/No.

Switch off on button Yes/No.

##### Foreseen final state of the MS

The MS is "idle updated" on cell B with a valid CKSN and a TMSI.

##### Test Procedure

A failure during the periodic location updating is triggered: as the broadcast LAI is equal to the stored LAI, the MS is still in the MM IDLE state and NORMAL SERVICE substate and timer T3211 is started. A CM connection other than for emergency call is attempted. It is checked that this is possible and that T3211 is stopped. Same test is performed with a failure during an IMSI attach procedure.

Then failures are triggered during the periodic location updating to let the attempt counter to reach the value of 4. The MS shall enter the MM IDLE LIMITED SERVICE state and delete any TMSI, stored LAI, ciphering key sequence number and ciphering key. When the attempt counter reaches the value of 4, timer T3212 shall be started. At timer T3212 expiry a location updating procedure is started. A request for CM connection other than emergency call shall trigger a location updating procedure.

Same tests are performed when the failures are triggered during an IMSI attach procedure.

##### Maximum duration of test

40 minutes.

## Expected sequence

| Step  | Direction | Message                   | Comments                                                                                                                                         |

NOTE 1: the MS can include both types of Location updating. As T3212 expires it can be a periodic location updating procedure and as there is no stored LAI it can be a normal one.

NOTE 2: same problem as in note 1. Three types of location updating procedures should be allowed.

#### Specific message contents

None.

### 26.7.4.4 Location updating / release / expiry of T3240

#### 26.7.4.4.1 Conformance requirement

The mobile station receiving a LOCATION UPDATING REJECT message shall start T3240: it shall abort the RR connection at the expiry of timer T3240.

#### References

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.4.4.8 and 11.2.

#### 26.7.4.4.2 Test purpose

To verify that the MS aborts the RR-connection at the expiry of timer T3240.

## 26.7.4.4.3 Method of test

## Initial conditions

System Simulator:

Two cells: A and B, belonging to different location areas a and b.

Mobile Station:

The MS has a valid TMSI. It is "idle updated" on cell A.

## Related PICS/PIXIT statements

None.

## Foreseen final state of the MS

The MS is "idle updated" on cell B.

## Test Procedure

A normal location updating procedure is performed. The RR-connection is not released by the SS within the timer T3240. It is checked that the MS aborts the RR-connection.

## Maximum duration of test

1 minute.

## Expected sequence

| Step | Direction | Message                   | Comments                                                         |
|------|-----------|---------------------------|------------------------------------------------------------------|
| 1    | SS        |                           | The RF level of cell A is lowered until the MS selects cell B.   |
| 2    | MS -> SS  | CHANNEL REQUEST           | "Establishment cause": Location updating.                        |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT      |                                                                  |
| 4    | MS -> SS  | LOCATION UPDATING REQUEST |                                                                  |
| 5    | SS -> MS  | LOCATION UPDATING ACCEPT  |                                                                  |
| 6    | SS        |                           | The SS waits T3240 expiry.                                       |
| 7    | MS        |                           | The MS shall abort the RR connection (disconnection of layer 2). |

## Specific message contents

None.

## 26.7.4.5 Location updating / periodic

## 26.7.4.5.1 Location updating / periodic spread

## 26.7.4.5.1.1 Conformance requirement

- 1) The Mobile Stations shall perform spreading of the time before performing a periodic location updating when the location updating timer value is reduced.
- 2) The Mobile Station shall reset timer T3212 when the Mobile Station is deactivated, and shall start with a value between zero and the broadcasted value when reactivated in the same cell, IMSI attach being forbidden.
- 3) When activated the Mobile Station shall start timer T3212 with a value randomly drawn in the allowed range.

NOTE: This conformance requirement is not covered by a test purpose. It is intended to be covered by a manufacturer declaration.

## References

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.4.2.

### 26.7.4.5.1.2 Test purpose

- 1) To check that when the location updating timer is reduced, the timer running in the MS is started with a value depending on the current timer value and the new broadcasted T3212 value.
- 2) To verify that when the MS is reactivated in the same cell (as the one in which it was deactivated), IMSI attach being forbidden, the MS starts the timer T3212 with a value between zero and the broadcasted value.

NOTE: It is not tested that the value is random.

### 26.7.4.5.1.3 Method of test

#### Initial conditions

##### System Simulator:

One cell, T3212 is set to 30 minutes.

IMSI attach is allowed in the cell.

##### Mobile Station:

The MS is deactivated. The stored MCC, MNC and LAC correspond to the broadcasted values. The stored update status is "updated".

#### Related PICS/PIXIT statements

None.

#### Foreseen final state of the MS

The MS has a valid TMSI. It is "idle updated".

#### Test procedure

The MS is activated. It performs IMSI attach. 3 minutes after the end of the IMSI attach procedure, the value of T3212 is set to 6 minutes. The MS shall perform periodic location updating 6 minutes after the end of the IMSI attach procedure.

Then, the IMSI attach/detach is forbidden. T3212 is still set to 6 minutes.

The MS is deactivated. The MS is reactivated. It is checked that the MS performs a periodic location updating during the 6 minutes following activation.

#### Maximum duration of test

20 minutes.

## Expected sequence

| Step | Direction | Message                   | Comments                                                                                                                          |
|------|-----------|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------|

## 26.7.4.5.2 Location updating / periodic normal / test 1

## 26.7.4.5.2.1 Conformance requirement

- 1 The Mobile Station shall stop and reset the timer T3212 of the periodic location updating procedure when the first MM message is received or ciphering mode setting is completed in the case of MM connection establishment.
- 2 The Mobile Station shall stop and reset the timer T3212 of the periodic location updating procedure when the Mobile Station has responded to paging and thereafter has received the first correct L3 message that is not an RR message.

## References

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.4.2.

## 26.7.4.5.2.2 Test purpose

To verify that the MS stops and resets the timer T3212 of the periodic location updating procedure when:

- the first MM-message is received in the case of MM-connection establishment, ciphering mode being not set;
- the MS has responded to paging and the first correct L3 message that is not an RR message is received.

NOTE: T3212 is stopped when the MM-idle state is left and restarted when the MM sublayer returns to that state, substate NORMAL SERVICE or ATTEMPTING TO UPDATE. As a consequence, the exact time when T3212 is reset between those two events cannot be tested.

#### 26.7.4.5.2.3 Method of test

##### Initial conditions

###### System Simulator:

1 cell, default parameters.

IMSI attach/detach is not allowed.

The T3212 time-out value is 2/10 hour.

###### Mobile Station:

The MS has a valid TMSI. It is "idle updated".

##### Related PICS/PIXIT statements

None.

##### Foreseen final state of the MS

The MS has a valid TMSI. It is "idle updated".

##### Test procedure

An MS originated MM connection is established and cleared. The channel is released. It is checked that the MS performs a periodic location updating 12 minutes after the release of the channel.

One minute after the periodic location updating, the MS is paged, it sends a CHANNEL REQUEST message and the SS responds with an IMMEDIATE ASSIGNMENT message, a call is established and then cleared. It is checked that the MS performs a periodic location updating 12 minutes after the release of the link.

##### Maximum duration of test

30 minutes.

## 26.7.4.5.3 Location updating / periodic normal / test 2

## 26.7.4.5.3.1 Conformance requirement

When a LOCATION UPDATING ACCEPT or a LOCATION UPDATING REJECT message is received, the timer T3212 is stopped and reset and the Mobile Station shall perform a periodic location updating after T3212 expiry.

## References

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.4.2.

## 26.7.4.5.3.2 Test purpose

To verify that the MS stops and resets the timer T3212 of the periodic location updating procedure when a LOCATION UPDATING ACCEPT message is received.

NOTE: T3212 is stopped when the MM-idle state is left and restarted when the MM sublayer returns to that state, substate NORMAL SERVICE or ATTEMPTING TO UPDATE. As a consequence, the exact time when T3212 is reset between those two events cannot be tested.

## 26.7.4.5.3.3 Method of test

## Initial conditions

## System Simulator:

2 cells, IMSI attach/detach is allowed in both cells.

T3212 is set to 6 minutes.

## Mobile Station:

The MS has a valid TMSI. It is "idle updated" on cell A.

## Related PICS/PIXIT statements

SIM removal possible while MS is powered Yes/No

Switch off on button yes/No

## Foreseen final state of the MS

The MS has a valid TMSI. It is "idle updated" on cell B.

## Test procedure

A normal location updating is performed. The channel is released. One minute later, the MS is deactivated, then reactivated in the same cell. It is checked that the MS performs an IMSI attach and a periodic location updating 6 minutes after the IMSI attach.

## Maximum duration of test

20 minutes.

## Specific message contents

None.

#### 26.7.4.5.4 Location updating / periodic HPLMN search

##### 26.7.4.5.4.1 Location updating / periodic HPLMN search / MS waits time T

##### 26.7.4.5.4.1.1 Conformance requirement

When in automatic mode and roaming in the home country, the MS shall make an attempt to access the HPLMN, if the MS is on the VPLMN at time T after since the last attempt.

NOTE: This test is not intended to test every value in the range 6 minutes to 8 hours or the default of 30 minutes, but is intended to check that the mobile is capable of using the value stored on the SIM.

#### References

3GPP TS 02.11 subclause 3.2.2.5.2.

3GPP TS 03.22 subclause 4.4.3.3.

##### 26.7.4.5.4.1.2 Test purpose

To verify that when a cell of the HPLMN becomes available, following the successful location request on the VPLMN of the home country and after the first search the mobile has failed to find its HPLMN, that the MS shall perform a location update request on the HPLMN after time T. Where T is the HPLMN Search Period stored in the SIM.

##### 26.7.4.5.4.1.3 Method of test

#### Initial conditions

##### System Simulator:

Two cells A and B, belonging to different location areas with location identification a and b. Cell A shall be a cell of the HPLMN and Cell B shall be a cell of the VPLMN with a Country Code the same as that of Cell A. Initially Cell A shall not be broadcasting. IMSI attach/detach is not allowed on either cell.

##### Mobile Station:

The MS is switched off. The HPLMN Search Period on the SIM shall be set to 6 minutes. The location area information on the SIM is "deleted".

#### Related PICS/PIXIT statements

Switch on/off button Yes/No.

#### Foreseen final state of the MS

The MS is "idle updated" on Cell A.

#### Test Procedure

Only Cell B shall be broadcasting. The MS shall be switched on either by using the Power Switch or by applying power. A normal location updating is performed on Cell B. Cell A shall be made available after 8 minutes, thus ensuring the MS fails to find the HPLMN during its first attempt. It is verified that the MS performs a location update request on Cell A, within 6 minutes after broadcasting of Cell A.

#### Maximum duration of test

17 minutes.

26.7.4.5.4.2 Location updating / periodic HPLMN search / MS in manual mode

26.7.4.5.4.2.1 Conformance requirement

The periodic attempts shall only be performed if in automatic mode when the MS is roaming in its home country.

## References

3GPP TS 02.11 subclause 3.2.2.5.2.

3GPP TS 03.22 subclause 4.4.3.3.

26.7.4.5.4.2.2 Test purpose

To verify that no HPLMN Search is performed when the MS is not in automatic mode.

26.7.4.5.4.2.3 Method of test

## Initial conditions

System Simulator:

Two cells A and B, belonging to different location areas with location identification a and b. Cell A shall be a cell of the HPLMN and Cell B shall be a cell of the VPLMN with a Country Code the same as that of Cell A. Initially Cell A shall not be broadcasting. IMSI attach/detach is not allowed on either cell.

Mobile Station:

The MS is switched off. The HPLMN Search Period on the SIM shall be set to 6 minutes. The location area information on the SIM is "deleted".

## Related PICS/PIXIT statements

Switch on/off button Yes/No.

## Foreseen final state of the MS

The MS is "idle updated" on Cell B.

## Test Procedure

Only Cell B shall be broadcasting. The MS shall be switched on either by using the Power Switch or by applying power. A normal location updating is performed on Cell B. The MS is forced into manual selection mode. Cell A is made available. It is verified that the MS does not attempt to perform a location update on Cell A.

## Maximum duration of test

7 minutes.

## Expected sequence

## 26.7.4.6 Location updating / interworking of attach and periodic

### 26.7.4.6.1 Conformance requirement

- 1) If the Mobile Station is in service state NO CELL AVAILABLE, LIMITED SERVICE, PLMN SEARCH or PLMN SEARCH-NORMAL SERVICE when the timer expires the location updating procedure is delayed until this service state is left.
- 2) The T3212 time-out value shall not be changed in the NO CELL AVAILABLE, LIMITED SERVICE, PLMN SEARCH and PLMN SEARCH-NORMAL SERVICE states.
- 3) If the selected cell is in the location area where the mobile station is registered and IMSI ATTACH is not required and timer T3212 has not expired, then the state is NORMAL SERVICE.

### 26.7.4.6.2 Test purpose

- 1) To check that if the PLU timer expires while the MS is out of coverage, the MS informs the network of its return to coverage.
- 2) To check that the PLU timer is not disturbed by cells of forbidden PLMNs.
- 3) To check that if the PLU timer does not expire while out of coverage and if the mobile returns to the LA where it is updated, the mobile does not inform the network of its return to coverage.

### 26.7.4.6.3 Method of test

#### Initial conditions

System Simulator:

Two cells, a and b, of different PLMNs.

T3212 is set to 12 minutes on cell a.

T3212 is set to 6 minutes on cell b.

IMSI attach is allowed in both cells.

Mobile Station:

The MS is deactivated. The PLMN of cell b is entered in the SIM's forbidden PLMN list.

#### Related PICS/PIXIT statements

None.

#### Foreseen final state of the MS

The MS is "idle updated". The PLMN of cell b is entered in the SIM's forbidden PLMN list.

## Test procedure

The MS is activated and placed in automatic network selection mode. It performs IMSI attach. 1 minute after the end of the IMSI attach procedure, cell a is switched off. The MS shall not location update on cell b. 8 minutes after the end of the IMSI attach procedure, cell a is switched on. The MS shall not location update on cell a before 11,75 minutes after the end of the IMSI attach procedure. The MS shall perform a periodic location update on cell a between 11,75 minutes and 12,25 minutes after the end of the IMSI attach procedure.

3 minutes after the end of the periodic location updating procedure, cell a is switched off. The MS shall not location update on cell b. 14 minutes after the end of the periodic location updating procedure, cell a is switched on and cell b is switched off. The MS shall perform a location update on cell a before 17 minutes after the end of the periodic location updating procedure.

## Maximum duration of test

35 minutes.

## Expected sequence

| Step | Direction | Message                   | Comments                                                                                           |
|------|-----------|---------------------------|----------------------------------------------------------------------------------------------------|
| 1    | MS        |                           | The MS is activated in automatic network selection mode.                                           |
| 2    | MS -> SS  | CHANNEL REQUEST           |                                                                                                    |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT      |                                                                                                    |
| 4    | MS -> SS  | LOCATION UPDATING REQUEST | "location updating type": IMSI attach.                                                             |
| 5    | SS -> MS  | LOCATION UPDATING ACCEPT  |                                                                                                    |
| 6    | SS -> MS  | CHANNEL RELEASE           | After the sending of this message, the SS waits for the disconnection of the main signalling link. |
| 7    | SS        |                           | 1 minute after step 6, cell a is switched off.                                                     |
| 8    | SS        |                           | 8 minutes after step 6, cell a is switched on.                                                     |
| 9    | MS -> SS  | CHANNEL REQUEST           | This message shall be sent by the MS between 11 minutes 45s and 12 minutes 15s after step 6.       |
| 10   | SS -> MS  | IMMEDIATE ASSIGNMENT      |                                                                                                    |
| 11   | MS -> SS  | LOCATION UPDATING REQUEST | "location updating type": periodic updating.                                                       |
| 12   | SS -> MS  | LOCATION UPDATING ACCEPT  |                                                                                                    |
| 13   | SS -> MS  | CHANNEL RELEASE           | After the sending of this message, the SS waits for the disconnection of the main signalling link. |
| 14   | SS        |                           | 3 minutes after step 13, cell a is switched off.                                                   |
| 15   | SS        |                           | 14 minutes after step 13, cell a is switched on and cell b is switched off.                        |
| 16   | MS -> SS  | CHANNEL REQUEST           | This message shall be sent by the MS before 17 minutes after step 13.                              |
| 17   | SS -> MS  | IMMEDIATE ASSIGNMENT      |                                                                                                    |
| 18   | MS -> SS  | LOCATION UPDATING REQUEST | "Location updating type" = periodic.                                                               |
| 19   | SS -> MS  | LOCATION UPDATING ACCEPT  |                                                                                                    |
| 22   | SS -> MS  | CHANNEL RELEASE           | After the sending of this message, the SS waits for the disconnection of the main signalling link. |

## Specific message contents

None.

## 26.7.5 MM connection

### 26.7.5.1 Introduction

[tbd]

## 26.7.5.2 MM connection / establishment with cipher

### 26.7.5.2.1 Conformance requirement

- 1) The Mobile Station shall be able to correctly set up an MM connection in a Mobile Originating CM connection attempt and send a CM Service Request message with CKSN information element as stored in the SIM and Mobile Identity information element set to the TMSI.
- 2) The Mobile Station shall be able to interpret cipher mode setting as acceptance of its CM service request i.e. send a CM message.

### References

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.5.1.1.

### 26.7.5.2.2 Test purpose

To verify that the MS can correctly set up an MM connection in an origination and interpret cipher mode setting as acceptance of its CM service request.

### 26.7.5.2.3 Method of test

#### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has a valid TMSI. It is "idle updated".

#### Related PICS/PIXIT statements

None.

#### Foreseen final state of the MS

The MS has valid TMSI, CKSN. It is "idle updated".

#### Test Procedure

A mobile originating CM connection is initiated. After the MS has sent the CM SERVICE REQUEST message to the SS, an authentication procedure and a ciphering mode setting procedure are performed. Then, the MS sends a CM message and the SS clears the call and releases the channel.

#### Maximum duration of test

One minute.

### 26.7.5.3 MM connection / establishment without cipher

#### 26.7.5.3.1 Conformance requirement

Upon reception of the CM SERVICE ACCEPT message, the MS shall send a CM message.

References

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.5.1.1.

#### 26.7.5.3.2 Test purpose

To verify that the MS can correctly set up an MM connection in an originating CM connection establishment when ciphering mode setting is not required.

#### 26.7.5.3.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has a valid TMSI. It is "idle updated".

Related PICS/PIXIT statements

None.

Foreseen final state of the MS

The MS has a valid TMSI. It is "idle updated".

## Test Procedure

A mobile originating CM connection is attempted. The MM-connection is established without invoking the ciphering mode setting procedure.

Then, the MS sends a CM message and the SS releases the channel.

### Maximum duration of test

one minute.

### Expected sequence

| Step | Direction | Message              | Comments                                                                                           |

### Specific message contents

None.

## 26.7.5.4 MM connection / establishment rejected

### 26.7.5.4.1 Conformance requirement

Upon reception of a CM SERVICE REJECT message, the MS shall not send any layer 3 message, start timer T3240 and enter the "wait for network command" state.

### References

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.5.1.1.

### 26.7.5.4.2 Test purpose

To verify that the MS does not send a layer 3 message when the service request is rejected by the SS.

### 26.7.5.4.3 Method of test

#### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has a valid TMSI. It is "idle updated".

## Related PICS/PIXIT statements

None.

## Foreseen final state of the MS

The MS has a valid TMSI; It is "idle updated".

## Test Procedure

A mobile originating CM connection is attempted. After the MS has sent the CM SERVICE REQUEST message to the SS, the SS responds with a CM SERVICE REJECT message with reject cause "requested service option not subscribed". It is checked that the MS does not send a layer 3 message.

## Maximum duration of test

1 minute.

## Expected sequence

| Step | Direction | Message              | Comments                                                                                           |

| 5    | SS -> MS  | CM SERVICE REJECT    | "Reject cause" IE: "requested service option not subscribed".                                      |
| 6    | SS        |                      | The MS shall not send a layer 3 message. This is checked during 5 s.                               |
| 7    | SS -> MS  | CHANNEL RELEASE      | After the sending of this message, the SS waits for the disconnection of the main signalling link. |

## Specific message contents

None.

## 26.7.5.5 MM connection / establishment rejected cause 4

## 26.7.5.5.1 Conformance requirement

- 1) The Mobile Station shall be able to correctly set up an MM connection in a Mobile Originating CM connection attempt and send a CM Service Request message with CKSN information element as stored in the SIM and Mobile Identity information element set to the TMSI.
- 2) The Mobile Station, when receiving a CM SERVICE REJECT message with reject cause "IMSI unknown in VLR" shall wait for the network to release the RR connection.
- 3) The Mobile Station shall then be able to perform a location updating procedure.

## References

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.5.1.1.

## 26.7.5.5.2 Test purpose

To verify that the MS can correctly accept a CM SERVICE REJECT message with reject cause "IMSI unknown in VLR".

## 26.7.5.5.3 Method of test

## Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has a valid TMSI. It is "idle updated".

## Related PICS/PIXIT statements

None.

## Foreseen final state of the MS

The MS has valid TMSI, CKSN. It is "idle updated".

## Test Procedure

A mobile originating CM connection is attempted. After the MS has sent the CM SERVICE REQUEST message to the SS, the SS responds with a CM SERVICE REJECT message with reject cause "IMSI unknown in VLR". On receipt of this message, the MS shall delete any TMSI, LAI, cipher key and cipher key sequence number. The channel is released. It is checked that the MS performs a normal location updating procedure.

## Maximum duration of test

One minute.

## Expected sequence

## 26.7.5.6 MM connection / expiry T3230

### 26.7.5.6.1 Conformance requirement

At T3230 expiry (i.e. no response is given but an RR connection is available) the MM connection establishment shall be aborted.

### References

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.5.1.2 and 11.2.

### 26.7.5.6.2 Test purpose

To verify that at T3230 expiry, the MS aborts the MM-connection establishment.

### 26.7.5.6.3 Method of test

#### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has a valid TMSI. It is "idle updated".

#### Related PICS/PIXIT statements

None.

#### Foreseen final state of the MS

The MS has a valid TMSI. It is "idle updated".

#### Test Procedure

A mobile originating CM connection is attempted. After the MS has sent the CM SERVICE REQUEST message to the SS, the SS waits for expiry of timer T3230. It is checked that the MS does not send a layer 3 message but waits for the release of the RR-connection.

#### Maximum duration of test

1 minute.

#### Expected sequence

### 26.7.5.7 MM connection / abortion by the network

#### 26.7.5.7.1 MM connection / abortion by the network / cause #6

##### 26.7.5.7.1.1 Conformance requirement

- 1) Upon reception of an ABORT message, the MS shall release any ongoing MM connection and enter the "wait for network command" state.
- 2) If the cause in the ABORT message was cause #6, the Mobile Station shall:
  - 2.1 not perform normal location updating;
  - 2.2 not perform periodic location updating;
  - 2.3 not respond to paging with TMSI;
  - 2.4 reject any request for Mobile Originating call establishment except Emergency call;
  - 2.5 not perform IMSI detach if deactivated.
- 3) After reception of an ABORT message with cause #6, the Mobile Station, if it supports speech, shall accept a request for an emergency call by sending a Channel Request message with the establishment cause set to "emergency call".
- 4) After reception of an ABORT message with cause #6, the Mobile Station shall delete the stored LAI, CKSN and TMSI.

##### Reference(s)

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.3.5.

##### 26.7.5.7.1.2 Test purpose

To check that upon reception of an ABORT message with cause #6 during call establishment:

- the MS does not send any layer 3 message;
- after reception of an ABORT message and after having been deactivated and reactivated, the MS performs location updating using its IMSI as mobile identity and indicates deleted LAI and CKSN;
- the MS does not perform location updating, does not answer to paging with TMSI, rejects any request for mobile originating call except emergency call, does not perform IMSI detach;
- the MS accepts a request for emergency call.

##### 26.7.5.7.1.3 Method of test

##### Initial Conditions

System Simulator:

2 cells, default parameters.

Mobile Station:

The MS has a valid TMSI, CKSN and Kc. It is "idle updated" on cell B.

**Related PICS/PIXIT Statement(s)**

SIM removal possible while MS is powered Yes/No.

Switch off on button Yes/No.

Support of speech Yes/No.

**Foreseen final state of the MS**

The MS has a valid TMSI. It is "idle updated" on cell A.

**Test procedure**

A mobile originating CM connection is attempted. Upon reception of the AUTHENTICATION RESPONSE message, the SS sends an ABORT message with cause #6. The SS waits for 5 s. The MS shall not send any layer 3 message. The SS releases the RR connection.

The SS checks that the MS has entered the state MM IDLE substate NO IMSI, i.e. does not perform normal location updating, does not perform periodic updating, does not respond to paging, rejects any requests from CM entities except emergency calls and does not perform IMSI detach if deactivated.

**Maximum Duration Of Test**

10 minutes.

| 33                                                               | SS -> MS  | AUTHENTICATION REQUEST     | "CKSN" = CKSN1.                                                                                                                                                                                                     |
| 34                                                               | MS -> SS  | AUTHENTICATION RESPONSE    |                                                                                                                                                                                                                     |
| 35                                                               | SS -> MS  | LOCATION UPDATING ACCEPT   | "Mobile Identity" = TMSI.                                                                                                                                                                                           |
| 36                                                               | MS -> SS  | TMSI REALLOCATION COMPLETE |                                                                                                                                                                                                                     |
| 37                                                               | SS -> MS  | CHANNEL RELEASE            | After the sending of this message, the SS waits for the disconnection of the main signalling link.                                                                                                                  |

Specific message contents

None.

26.7.5.7.2 MM connection / abortion by the network / cause not equal to #6

26.7.5.7.2.1 Conformance requirement

Upon reception of an ABORT message, the MS shall release any ongoing MM connection and enter the "wait for network command" state.

Reference(s)

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.3.5.

26.7.5.7.2.2 Test purpose

1. When multiple MM connections are established, the MS releases all MM connections upon reception of an ABORT message, in the case when the two MM connections are established for a mobile terminating call and a non call related supplementary service operation.
2. The TMSI isn't deleted from MS after reseption of ABORT message with cause another than #6.

26.7.5.7.2.3 Method of test

Initial Conditions

System Simulator:

- 1 cell, default parameters.
- T3212 is set to 6 minutes.

Mobile Station:

The MS is in state U10 of a mobile terminating call.

Related PICS/PIXIT Statement(s)

The MS supports a non call related supplementary service operation during an active call Yes/No.

Foreseen final state of the MS

The MS has a valid TMSI. It is "idle updated".

Test procedure

A non call related supplementary service operation is attempted at the MS. Upon reception of the REGISTER message, the SS sends an ABORT message with cause # 17. The SS waits for 5 s. The MS shall not send any layer 3 message. The SS releases the RR connection. The MS shall perform periodic location updating 6 minutes after the CHANNEL RELEASE message. TMSI shall be used as an MS Identity in LOCATION UPDATING REQUEST

Maximum Duration Of Test

15 minutes.

## Expected Sequence

This procedure is performed if the MS supports non call related supplementary service operation.

| Step | Direction | Message                   | Comments                                                                                                                          |

| 2    | MS -> SS  | CM SERVICE REQUEST        |                                                                                                                                   |
| 3    | SS -> MS  | CM SERVICE ACCEPT         |                                                                                                                                   |
| 4    | MS -> SS  | REGISTER                  |                                                                                                                                   |
| 5    | SS -> MS  | ABORT                     | "reject cause" = #17.                                                                                                             |
| 6    | SS        |                           | The SS waits for 5 seconds. The MS shall not send any layer 3 message during that time.                                           |
| 7    | SS -> MS  | CHANNEL RELEASE           | After the sending of this message, the SS waits for the disconnection of the main signalling link.                                |
| 8    | MS -> SS  | CHANNEL REQUEST           | "Establishment cause": Location updating This message shall be sent by the MS between 5minutes 45s and 6minutes 15s after step 7. |
| 9    | SS -> MS  | IMMEDIATE ASSIGNMENT      |                                                                                                                                   |
| 10   | MS -> SS  | LOCATION UPDATING REQUEST | "location updating type": periodic updating. Mobile identity IE specifies the TMSI of the MS.                                     |
| 11   | SS -> MS  | LOCATION UPDATING ACCEPT  |                                                                                                                                   |
| 12   | SS -> MS  | CHANNEL RELEASE           | After the sending of this message, the SS waits for the disconnection of the main signalling link.                                |

## Specific message contents

None.

## 26.7.5.8 MM connection / follow-on request pending

## 26.7.5.8.1 MM connection / follow-on request pending / test 1

## 26.7.5.8.1.1 Conformance requirement

The MS shall not attempt to establish a new MM connection after location updating on the same RR connection if not allowed by the network.

## Reference(s)

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.4.4.6.

## 26.7.5.8.1.2 Test purpose

To check that when the network does not include the follow on proceed IE in a LOCATION UPDATING ACCEPT message, a MS that has a CM application request pending does not attempt to establish a new MM connection on that RR connection.

## 26.7.5.8.1.3 Method of test

## Initial Conditions

System Simulator:

1 cell, ATT flag is set to "MSs in the cell shall apply IMSI attach and detach procedure".

Mobile Station:

The MS has a valid TMSI and is deactivated.

## Related PICS/PIXIT Statement(s)

None.

## Foreseen final state of the MS

The MS has a valid TMSI. It is "idle updated".

## Test procedure

The MS is activated and a CM connection is attempted during the location updating procedure. The SS does not include the follow on proceed information element in the LOCATION UPDATING ACCEPT message. The SS waits for at least 8 seconds. The MS shall not send any layer 3 message for 8 seconds.

## Maximum Duration of Test

60 s.

## Expected Sequence

| Step | Direction | Message                   | Comments                                                                                                             |
|------|-----------|---------------------------|----------------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                           | The MS is activated.                                                                                                 |
| 2    | MS -> SS  | CHANNEL REQUEST           |                                                                                                                      |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT      |                                                                                                                      |
| 4    | MS -> SS  | LOCATION UPDATING REQUEST | location updating type = IMSI attach.<br>Then the SS waits for 15 s. During this delay a CM connection is attempted. |
| 5    | SS -> MS  | LOCATION UPDATING ACCEPT  | follow on proceed IE not included.                                                                                   |
| 6    | SS        |                           | The SS wait for at least 8 seconds.                                                                                  |
| 7    | MS        |                           | The MS shall not send any layer 3 message for 8 seconds after reception of the LOCATION UPDATING ACCEPT message.     |
| 8    | SS -> MS  | CHANNEL RELEASE           | After the sending of this message, the SS waits for the disconnection of the main signalling link.                   |

## Specific message contents

None.

## 26.7.5.8.2 MM connection / follow-on request pending / test 2

## 26.7.5.8.2.1 Conformance requirement

A MS supporting the follow-on request procedure and having a CM connection request pending shall correctly establish an MM connection following a location update when allowed by the network.

## Reference(s)

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.4.4.6.

## 26.7.5.8.2.2 Test purpose

To check that when the network includes the follow on proceed IE in a LOCATION UPDATING ACCEPT message, a MS that supports the follow on request procedure and that has a CM application request pending establishes successfully a new MM connection on that RR connection.

## 26.7.5.8.2.3 Method of test

## Initial Conditions

System Simulator:

1 cell, ATT flag is set to "MSs in the cell shall apply IMSI attach and detach procedure".

Mobile Station:

The MS has a valid TMSI and is deactivated.

Related PICS/PIXIT Statement(s)

MS supports the follow on request procedure Yes/No.

Foreseen final state of the MS

The MS has a valid TMSI. It is "idle updated".

Test procedure

The MS is activated and a CM connection is attempted during the location updating procedure. The SS includes the follow on proceed information element in the LOCATION UPDATING ACCEPT message. The SS waits for at least 8 seconds.

If the MS supports the follow on request procedure:

The MS shall send a CM SERVICE REQUEST. Upon reception of that message, the SS sends a CM SERVICE ACCEPT message. The MS shall send an initial CM message. Upon reception of that message, the SS releases the RR connection.

If the MS does not support the follow on request procedure:

The MS shall not send any layer 3 message for 8 seconds.

Maximum Duration of Test

60 s.

Expected Sequence

| Step | Direction | Message                   | Comments                                                                                                                            |
|------|-----------|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                           | The MS is activated.                                                                                                                |
| 2    | MS -> SS  | CHANNEL REQUEST           |                                                                                                                                     |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT      |                                                                                                                                     |

### 26.7.5.8.3 MM connection / follow-on request pending / test 3

#### 26.7.5.8.3.1 Conformance requirement

- 1) The MS shall not set the follow on request bit in a LOCATION UPDATING REQUEST message if no MM connection request is pending.
- 2) When the network includes the follow on proceed IE in a LOCATION UPDATING ACCEPT message, a MS that has no CM application request pending shall not attempt to establish a new MM connection on that RR connection.
- 3) The MS shall correctly handle a CM connection established by the network on the RR connection that was used for the location updating procedure.

#### Reference(s)

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.4.4.6.

#### 26.7.5.8.3.2 Test purpose

- 1) To check that a MS that has no CM application request pending sets the Follow-On-Request bit to No follow-on request pending in a LOCATION UPDATING REQUEST message.
- 2) To check that when the network includes the follow on proceed IE in a LOCATION UPDATING ACCEPT message, a MS that has no CM application request pending does not attempt to establish a new MM connection on that RR connection.
- 3) To check that the MS accepts establishment by the network of a new MM connection on the existing RR connection.

#### 26.7.5.8.3.3 Method of test

##### Initial Conditions

###### System Simulator:

1 cell, ATT flag is set to "MSs in the cell shall apply IMSI attach and detach procedure".

###### Mobile Station:

The MS has a valid TMSI and is deactivated.

##### Related PICS/PIXIT Statement(s)

Supported services on TCH.

##### Foreseen final state of the MS

The MS has a valid TMSI. It is "idle updated".

##### Test procedure

The MS is activated. The MS performs location updating. The MS shall set the FOR bit to No follow-on request pending in the LOCATION UPDATING REQUEST message. The SS includes the follow on proceed information element in the LOCATION UPDATING ACCEPT message. The SS waits for 5 s. The MS shall not send any layer 3 message for 5 s. The SS sends a SETUP message to the MS requesting a basic service supported by the MS. The MS shall send either a CALL CONFIRMED message if it supports a service on TCH or a RELEASE COMPLETE with cause #88.

##### Maximum Duration of Test

20 s.

## Expected Sequence

| A9   | MS -> SS  | CALL CONFIRMED            | If the MS supports a basic service on TCH.                                                                 |
| B9   | MS -> SS  | RELEASE COMPLETE          | If the MS does not support any basic service on TCH. cause #88.                                            |
| 10   | SS -> MS  | CHANNEL RELEASE           | After the sending of this message, the SS waits for the disconnection of the main signalling link.         |

## Specific message contents

None.

## 26.7.6 Default contents of messages

### Default contents SYSTEM INFORMATION messages and default settings

For cell A and B

For GSM use 26.6.14. For DCS use 26.6.15, for PCS 1 900 use 26.6.18, for GSM 450 use 26.6.16, for GSM 480 use 26.6.17, for GSM 700 use 26.6.19 and for GSM 850 use 26.6.20.

### Cell C

The contents of SYSTEM INFORMATION TYPE 1 to 6 messages for cell C are identical to those of cell A with the following exceptions:

|                                                 |                                                                                                                                                                                                                                          |

## PAGING RESPONSE

| Information element           | Value/remark              |
|-------------------------------|---------------------------|
| Ciphering key sequence number | According to SIM contents |
| Spare half octet              | 0000                      |
| Mobile station classmark 2    | See PICS/PIXIT            |
| Mobile identity               | TMSI of the MS under test |

## TMSI REALLOCATION COMMAND

| Information element          | Value/remark              |
|------------------------------|---------------------------|
| Location area identification | As in subclause 26.1.1    |
| Mobile identity              | TMSI of the MS under test |

## TMSI REALLOCATION COMPLETE

| Information element   | Value/remark |
|-----------------------|--------------|
| None but message head | omitted      |

## 26.8 Tests related to circuit switched call control

### 26.8.1 Circuit switched Call Control (CC) state machine verification

#### 26.8.1.1 General on CC state machine verification

The principle of checking the call control functions consists in the validation of each call control identified state.

State U0 as an initial state is not verified in the tests of 26.8.1.2 (establishment of an outgoing call).

State U0.1 is never verified.

The steps to be followed within each performed test are:

- bring the MS into the required state;
- trigger the tested event;
- check the MS response and new state.

In subclauses 26.8.1.2 and 26.8.1.3 different tables are defined to bring the MS into the required initial state. The exact table to be chosen is specified individually in subclause "Initial conditions" of "Method of test" for each test case.

For each test, unless otherwise specified, a circuit switched basic service among those supported by the MS but excluding the emergency call teleservice shall be chosen arbitrarily, and the test shall be performed according to that basic service. If the only circuit switched basic service supported by the mobile is emergency call, then the incoming call tests shall not be performed and the other call control tests shall be performed with the EMERGENCY SETUP message replacing the SETUP message.

The initial states are to be checked through STATUS ENQUIRY messages sent by the SS, when feasible. This is not explicitly stated in the tables of expected sequences of signalling messages. The checking of final states are explicitly included into the expected sequences of signalling messages.

The following postamble may be used by the SS to bring MS back to idle mode in those test cases, in which it is not already included into expected sequence of signalling messages:

**Table 26.8.1.1/1: A postamble to bring the MS back to idle mode.**

| Step | Direction | Message         | Comments                                                |
|------|-----------|-----------------|---------------------------------------------------------|
| n    | SS -> MS  | CHANNEL RELEASE |                                                         |
| n+1  | MS        |                 | the MS shall release the main signalling link (DISC/UA) |

The postamble has not been included into the all of the tests in order to leave an option to concatenate the procedures in the future by using a final state of a test case as an initial state to another one.

For the special case of U0, the state is checked by sending STATUS ENQUIRY message with all possible values of transaction identifier (seven values) as U0 is the only state in which for every TI the MS will answer with release complete with cause #81. If U0 is to be verified when no RR connection exists, first a mobile terminating radio connection must be established.

The MS responses are either call management messages received by the SS or lower layers functions activated within the MS or MMI actions (e.g. the buzzing of an alerting tone).

A time-out within the MS is triggered by the SS when it does not answer back an MS expected response.

The test sequences may be split in 3 main groups:

- establishment and release of an outgoing call;
- establishment and release of an incoming call;
- in-call functions.

Remark on verification of transient states:

Some call control states of the mobile station may be transient, depending on implementation, configuration of the MS and previous messages (see annex 3, subclause 3.1.6).

If a test starts in a transient state, then the test is executed without verification of the starting state.

## 26.8.1.2 Establishment of an outgoing call

### Initial conditions

As a minimum requirement the MS is updated and has been given a TMSI, a ciphering key and cipher key sequence number, and the layer 2, RR and MM functionalities have been verified.

There are as many CM initial conditions as states to be checked.

The tables below describe message exchanges which bring the MS in the requested initial states.

A state may be taken as initial only when all the states which lead to this initial states have been validated. The order followed in the test procedure will be U0, U0.1, U1, U3, U4, U10, U12, U19, U11 as seen in the table underneath.

The MS is brought again in the initial state starting with U0 at each new test performed.

**Table 26.8.1.2/1: Establishment of an outgoing call, procedure 1 (late assignment)**

| Step                                                                                                                                   | Direction | Message                 | Comments/actions/next state |
|----------------------------------------------------------------------------------------------------------------------------------------|-----------|-------------------------|-----------------------------|
| 1                                                                                                                                      | MS -> SS  | CHANNEL REQUEST         | initiate outgoing call      |
| 2                                                                                                                                      | SS -> MS  | IMMEDIATE ASSIGNMENT    | SDCCH, U0                   |
| 3                                                                                                                                      | MS -> SS  | CM SERVICE REQUEST      | U0.1                        |
| 4                                                                                                                                      | SS -> MS  | CIPHERING MODE COMMAND  |                             |
| 5                                                                                                                                      | MS -> SS  | CIPHERING MODE COMPLETE |                             |
| 6                                                                                                                                      | MS -> SS  | SETUP                   | U1                          |
| 7                                                                                                                                      | SS -> MS  | CALL PROCEEDING         | U3                          |
| 8                                                                                                                                      | SS -> MS  | ALERTING                | U4                          |
| 9                                                                                                                                      | SS -> MS  | ASSIGNMENT COMMAND      | TCH                         |

### 26.8.1.2.1 Outgoing call / U0 null state

#### 26.8.1.2.1.1 Outgoing call / U0 null state / MM connection requested

##### 26.8.1.2.1.1.1 Definition and applicability

The call control entity of the Mobile Station requests the MM-sublayer to establish a mobile originating MM-connection. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

##### 26.8.1.2.1.1.2 Conformance requirement

- 1) Upon initiation of an outgoing basic call by user the MS shall initiate establishment of an MM connection, using as first MM message a CM SERVICE REQUEST message with CM service type "Mobile originating call establishment or packet mode connection establishment".

#### References

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 5.2.1.1, 4.5.1.1 and 3.3.1.1.

##### 26.8.1.2.1.1.3 Test purpose

To verify that upon initiation of an outgoing basic call by user the MS initiates establishment of an MM connection, using as first MM message a CM SERVICE REQUEST message with CM service type "Mobile originating call establishment or packet mode connection establishment".

##### 26.8.1.2.1.1.4 Method of test

#### Related PICS/PIXIT statements

- supported MO circuit switched basic services.

## Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

## Foreseen final state of the MS

U0, null.

## Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. When the SS receives CM SERVICE REQUEST, the contents of it shall be checked.

## Maximum duration of test

30 s.

## Expected sequence

## 26.8.1.2.2 Outgoing call / U0.1 MM connection pending

## 26.8.1.2.2.1 Outgoing call / U0.1 MM connection pending / CM service rejected

## 26.8.1.2.2.1.1 Definition and applicability

A request for MM connection is rejected by the SS. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

## 26.8.1.2.2.1.2 Conformance requirement

Upon receiving indication of an MM-connection establishment being rejected, CC entity should inform upper layer of this rejection.

## References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 4.5.1.1, 3GPP TS 04.07, subclause 6.2.2.

## 26.8.1.2.2.1.3 Test purpose

To verify that a CC entity of the MS in CC-state U0.1, "MM-connection pending", upon the MS receiving a CM SERVICE REJECT message, returns to CC state U0, "Null".

## 26.8.1.2.2.1.4 Method of test

## Related PICS/PIXIT statements

- supported MO circuit switched basic services.

## Initial conditions

## System Simulator:

1 cell, default parameters.

## Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U0.1 by using table 26.8.1.2/1.

## Foreseen final state of the MS

U0, null.

## Maximum duration of test

30 s.

## Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. When the SS receives CM SERVICE REQUEST, the contents of it shall be checked. The SS rejects it by CM SERVICE REJECT. Then the SS will check the state of the MS by using STATUS ENQUIRY with all the relevant transaction identifiers.

## Expected sequence

## 26.8.1.2.2.2 Outgoing call / U0.1 MM connection pending / CM service accepted

## 26.8.1.2.2.2.1 Definition and applicability

A CM request is accepted for the MM-connection by the SS. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

## 26.8.1.2.2.2 Conformance requirement

A CC entity of the MS in CC-state U0.1, "MM-connection pending", upon the MS receiving a CM SERVICE ACCEPT message, shall send a SETUP message specifying the Called party BCD number that was entered into the MS and then enter CC state U1, "Call initiated".

## References

3GPP TS 04.08 / 3GPP TS 24.008, subclauses 4.5.1.1 and 5.2.1.1.

## 26.8.1.2.2.3 Test purpose

To verify that a CC entity of the MS in CC-state U0.1, "MM-connection pending", upon the MS receiving a CM SERVICE ACCEPT message, sends a SETUP message specifying the Called party BCD number that was entered into the MS and then enters CC state U1, "Call initiated".

## 26.8.1.2.2.4 Method of test

## Related PICS/PIXIT statements

- supported MO circuit switched basic services.

## Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U0.1 by using table 26.8.1.2/1.

## Foreseen final state of the MS

U1, call initiated.

## Maximum duration of test

30 s.

## Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. When the MS is requesting a MM-connection, the SS will indicate acceptance by sending a CM SERVICE ACCEPT message. The MS shall respond with SETUP. Then the SS will check the state of the call control entity by STATUS ENQUIRY with the relevant transaction identifiers.

## Expected sequence

| Step | Direction | Message           | Comments                                                           |

26.8.1.2.2.3           Outgoing call / U0.1 MM connection pending / lower layer failure

26.8.1.2.2.3.1       Definition and applicability

The call control entity of the MS being in the state, U0.1, a lower layer failure is accomplished at the MS and consequently, communication at layer 3 level with the peer entity is terminated. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.2.3.2       Conformance requirement

- 1) Upon a lower layer failure the MS releases the MM connection in progress and returns to idle mode. In that state no call exists, and the CC entities relating to the seven mobile originating transaction identifiers are in state U0, "Null".

References

3GPP TS 04.08 / 3GPP TS 24.008, subclauses 4.5.1.2, 5.2.1.1, 5.5.3.2 and 8.3.

26.8.1.2.2.3.3       Test purpose

To verify that after the MS with a CC entity in state U0.1, "MM-connection pending", has detected a lower layer failure and has returned to idle mode, the CC entities relating to the seven mobile originating transaction identifiers are in state U0, "Null".

26.8.1.2.2.3.4       Method of test

Related PICS/PIXIT statements

- supported MO circuit switched basic services.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U0.1 by using table 26.8.1.2/1.

Foreseen final state of the MS

U0, null.

Maximum duration of test

1 min.

## Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. When the MS has sent a CM SERVICE REQUEST message, the SS generates a lower layer failure at the MS. The SS waits long enough to enable the MS to return to idle state listening to paging, and then pages MS to create RR-connection. Finally, the SS will check the state of the MS by using STATUS ENQUIRY with the relevant transaction identifiers.

## Expected sequence

| Step | Direction | Message              | Comments                                                                   |
|------|-----------|----------------------|----------------------------------------------------------------------------|
| 1    | SS        |                      | SS generates lower layer failure.                                          |
| 2    | SS        |                      | SS waits 20 s for the MS to return to listening to paging.                 |
| 3    | SS -> MS  | PAGING REQUEST       |                                                                            |
| 4    | MS -> SS  | CHANNEL REQUEST      |                                                                            |
| 5    | SS -> MS  | IMMEDIATE ASSIGNMENT |                                                                            |
| 6    | MS -> SS  | PAGING RESPONSE      |                                                                            |
| 7    | SS -> MS  | STATUS ENQUIRY       |                                                                            |
| 8    | MS -> SS  | RELEASE COMPLETE     | cause shall be 81# (invalid TI value).                                     |
| 9    | SS        |                      | repeat steps 7-8 to cover all the transaction identifiers from 000 ...110. |
| 10   | SS -> MS  | CHANNEL RELEASE      | the main signalling link shall be released by the MS (L2: DISC/UA).        |

### 26.8.1.2.3 Outgoing call / U1 call initiated

#### 26.8.1.2.3.1 Outgoing call / U1 call initiated / receiving CALL PROCEEDING

##### 26.8.1.2.3.1.1 Definition and applicability

The call control entity of the MS being in the state, U1, a CALL PROCEEDING message is sent by the SS. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

##### 26.8.1.2.3.1.2 Conformance requirement

- 1) A CC entity of the MS in CC-state U1, "Call initiated", upon receipt of a CALL PROCEEDING message, shall enter CC state U3, "Mobile originating call proceeding".

## References

3GPP TS 04.08 / 3GPP TS 24.008, subclauses 5.2.1.1, 5.2.1.2 and 5.2.1.3.

##### 26.8.1.2.3.1.3 Test purpose

To verify that a CC entity of the MS in CC-state U1, "Call initiated", upon receipt of a CALL PROCEEDING message, enters CC state U3, "Mobile originating call proceeding".

##### 26.8.1.2.3.1.4 Method of test

## Related PICS/PIXIT statements

- supported MO circuit switched basic services.

## Initial conditions

## System Simulator:

1 cell, default parameters.

## Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U1 by using table 26.8.1.2/2.

## Foreseen final state of the MS

U3, Mobile originating call proceeding.

## Maximum duration of test

30 s.

## Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The CC entity of the MS is brought to the state U1. The SS sends a CALL PROCEEDING message to the MS. The SS checks by using the status enquiry procedure that the CC entity has entered the state U3.

## Expected sequence

| Step | Direction | Message         | Comments                      |
|------|-----------|-----------------|-------------------------------|
| 1    | SS -> MS  | CALL PROCEEDING | tone generation not mandatory |
| 2    | SS -> MS  | STATUS ENQUIRY  |                               |
| 3    | MS -> SS  | STATUS          | cause 30#, state U3           |

## Specific message contents:

None.

26.8.1.2.3.2           Outgoing call / U1 call initiated / rejecting with RELEASE COMPLETE

26.8.1.2.3.2.1       Definition and applicability

The call control entity of the MS being in the state, U1, the call is rejected by a RELEASE COMPLETE message sent by the SS. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.3.2.2       Conformance requirement

- 1) A CC entity of the MS in CC-state U1, "Call initiated", upon receipt of a RELEASE COMPLETE message with valid cause value, shall enter CC state U0, "Null".
- 2) On returning to idle mode, the CC entities relating to the seven mobile originating transaction identifiers shall be in state U0, "Null".
- 3) On releasing the MM-connection, the MS shall wait for MM layer release initiated by the network.

3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.4.13.1

#### 26.8.1.2.3.2.3 Test purpose

- 1) To verify that a CC entity of the MS in CC-state U1, "Call initiated", upon receipt of a RELEASE COMPLETE message with valid cause value, enters CC state U0, "Null".
- 2) To verify that in returning to idle mode, the CC entities relating to the seven mobile originating transaction identifiers are in state U0, "Null".
- 3) To verify that in releasing the MM-connection, the MS shall wait for MM layer release initiated by SS.

#### 26.8.1.2.3.2.4 Method of test

##### Related PICS/PIXIT statements

- supported MO circuit switched basic services.

##### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U1 by using table 26.8.1.2/2.

##### Foreseen final state of the MS

U0, null.

##### Maximum duration of test

30 s.

##### Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The CC entity of the MS is brought to the state U1. The SS sends a RELEASE COMPLETE message to the MS. The SS checks by using the status enquiry procedure that the CC entity has entered the state U0 with all the relevant transaction identifiers.

##### Expected sequence

| Step | Direction | Message          | Comments                                                                                                                                                                                                                   |
|------|-----------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | RELEASE COMPLETE | See specific message content below.<br><br>cause 81# (invalid TI value)<br>repeat steps 2-3 to cover all the transaction identifiers from 000...110<br>the main signalling link shall be released by the MS (L2: DISC/UA). |
| 2    | SS -> MS  | STATUS ENQUIRY   |                                                                                                                                                                                                                            |
| 3    | MS -> SS  | RELEASE COMPLETE |                                                                                                                                                                                                                            |
| 4    | SS        |                  |                                                                                                                                                                                                                            |
| 5    | SS -> MS  | CHANNEL RELEASE  |                                                                                                                                                                                                                            |

26.8.1.2.3.3           Outgoing call / U1 call initiated / T303 expiry

26.8.1.2.3.3.1       Definition and applicability

The call control entity of the MS being in the state, U1, if no response is then received from the SS, timer T303 expires at the MS side. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.3.3.2       Conformance requirement

- 1) A CC entity of the MS in CC-state U1, "Call initiated", upon expiry of T303 shall send a DISCONNECT message to its peer entity and enter state U11, "Disconnect request".

References

3GPP TS 04.08 / 3GPP TS 24.008, subclauses 5.2.1.1 and 5.4.

26.8.1.2.3.3.3       Test purpose

- 1) To verify that a CC entity of the MS in CC-state U1, "Call initiated", upon expiry of T303 (accuracy  $\pm 20\%$  between reception of CM SERVICE REQUEST and DISCONNECT by SS) sends a DISCONNECT message to its peer entity and enters state U11, "Disconnect request".

26.8.1.2.3.3.4       Method of test

Related PICS/PIXIT statements

- supported MO circuit switched basic services.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U1 by using table 26.8.1.2/2.

Foreseen final state of the MS

U11, disconnect request.

Maximum duration of test

1 minute.

Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The CC entity of the MS is brought to the state U1. When T303 expires at the MS, the MS shall send DISCONNECT. The SS checks by using the status enquiry procedure that the CC entity has entered the state U11, disconnect request.

Expected sequence

| Step | Direction | Message        | Comments                                                                 |
|------|-----------|----------------|--------------------------------------------------------------------------|
| 1    | SS        |                | SS waits for T303 expiry.                                                |
| 2    | MS -> SS  | DISCONNECT     | Shall be transmitted between 24 s and 36 s after the CM SERVICE REQUEST. |
| 3    | SS -> MS  | STATUS ENQUIRY |                                                                          |

26.8.1.2.3.4           Outgoing call / U1 call initiated / lower layer failure

26.8.1.2.3.4.1       Definition and applicability

The call control entity of the MS being in the state, U1, a lower layer failure is accomplished at the MS and consequently, communication at layer 3 level with the peer entity is terminated. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.3.4.2       Conformance requirement

Upon a lower layer failure MM informs the relevant CM entities that the MM connection has been interrupted. As call re-establishment is not allowed, the CC entity must perform a local release. The MS returns to idle mode. In that state no call exists, and the CC entities relating to the seven mobile originating transaction identifiers are in state U0, "Null".

References

3GPP TS 04.08 / 3GPP TS 24.008, subclauses 4.5.2.3, 5.2.1.1 and 5.5.3.2.

26.8.1.2.3.4.3       Test purpose

To verify that after the MS with a CC entity in state U1 "Call initiated", has detected a lower layer failure and has returned to idle mode, the CC entities relating to the seven mobile originating transaction identifiers are in state U0, "Null".

## 26.8.1.2.3.4.4 Method of test

## Related PICS/PIXIT statements

- supported MO circuit switched basic services.

## Initial conditions

## System Simulator:

1 cell, default parameters.

## Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U1 by using table 26.8.1.2/4.

## Foreseen final state of the MS

U0, null.

## Maximum duration of test

1 min.

## Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The MS is brought to the state U1. The SS generates a lower layer failure at the MS. The SS waits long enough to enable the MS to return to idle state listening to paging, and then pages MS to create RR-connection. Finally, the SS will check the state of the MS by using STATUS ENQUIRY with the relevant transaction identifiers.

## Expected sequence

| Step | Direction | Message              | Comments                                                                  |
|------|-----------|----------------------|---------------------------------------------------------------------------|
| 1    | SS        |                      | SS generates lower layer failure.                                         |
| 2    | SS        |                      | SS waits 20 s for the MS to return to listening to paging.                |
| 3    | SS -> MS  | PAGING REQUEST       |                                                                           |
| 4    | MS -> SS  | CHANNEL REQUEST      |                                                                           |
| 5    | SS -> MS  | IMMEDIATE ASSIGNMENT |                                                                           |
| 6    | MS -> SS  | PAGING RESPONSE      |                                                                           |
| 7    | SS -> MS  | STATUS ENQUIRY       |                                                                           |
| 8    | MS -> SS  | RELEASE COMPLETE     | cause 81# (invalid TI value).                                             |
| 9    | SS        |                      | repeat steps 7-8 to cover all the transaction identifiers from 000...110. |
| 10   | SS -> MS  | CHANNEL RELEASE      |                                                                           |
| 11   | MS        |                      | the MS shall release the main signalling link (DISC/UA).                  |

## Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The CC entity of the MS is brought to the state U3. The SS sends a CONNECT message to the MS. The MS shall respond by sending a CONNECT ACKNOWLEDGE message. The SS checks by using the status enquiry procedure that the CC entity has entered the state U10, active.

## Expected sequence

| Step | Direction | Message             | Comments                                                              |
|------|-----------|---------------------|-----------------------------------------------------------------------|
| 1    | SS -> MS  | CONNECT             | the MS shall stop tone generation, if any<br><br>cause 30#, state U10 |
| 2    | MS -> SS  | CONNECT ACKNOWLEDGE |                                                                       |
| 3    | SS -> MS  | STATUS ENQUIRY      |                                                                       |
| 4    | MS -> SS  | STATUS              |                                                                       |

## 26.8.1.2.4.3 Outgoing call / U3 MS originating call proceeding / PROGRESS received without in band information

## 26.8.1.2.4.3.1 Definition and applicability

The call control entity of the MS being in the state, U3, a PROGRESS message is received by the MS. The PROGRESS message does not contain indication of in-band information availability. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

## 26.8.1.2.4.3.2 Conformance requirement

- 1) A CC-entity of the MS in CC-state U3, "Mobile Originating Call Proceeding", upon receipt of a PROGRESS message with valid cause values shall stay in CC-state U3.
- 2) After receipt of the PROGRESS message timer T310 shall be stopped.

## References

Conformance requirement 1: 3GPP TS 04.08 / 3GPP TS 24.008 subclause 5.2.1.4.

Conformance requirement 2: 3GPP TS 04.08 / 3GPP TS 24.008 subclause 11.3.

## 26.8.1.2.4.3.3 Test purpose

- 1) To verify that a CC-entity of the MS in CC-state U3, "Mobile Originating Call Proceeding", upon receipt of a PROGRESS message with valid cause values stays in CC-state U3.
- 2) To verify that after receipt of the PROGRESS message timer T310 is stopped.

## 26.8.1.2.4.3.4 Method of test

## Related PICS/PIXIT statements

- supported MO circuit switched basic services.

## Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U3 by using table 26.8.1.2/2.

## Foreseen final state of the MS

U3, mobile originating call proceeding.

## Maximum duration of test

1 min.

## Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The CC entity of the MS is brought to the state U3. The SS sends a PROGRESS message not containing indication of in-band information availability to the MS. The SS checks that the MS has stopped T310, i.e. at T310 time-out no DISCONNECT message is sent by the MS. Then the SS checks by using the status enquiry procedure that the state of the CC entity has remained unchanged.

## Expected sequence

| Step | Direction | Message        | Comments                                                          |
|------|-----------|----------------|-------------------------------------------------------------------|
| 1    | SS -> MS  | PROGRESS       | (note)                                                            |
| 2    | SS -> MS  | STATUS ENQUIRY |                                                                   |
| 3    | MS -> SS  | STATUS         | cause 30#, state U3                                               |
| 4    | SS        |                | SS waits at least 45 s and checks no DISCONNECT is sent by the MS |
| 5    | SS -> MS  | STATUS ENQUIRY |                                                                   |
| 6    | MS -> SS  | STATUS         | cause 30#, state U3                                               |

NOTE: Tested with a valid cause value among:

- #4 call has returned to PLMN/ISDN;
- #32 call is end-to-end PLMN/ISDN; or
- any value in the set #(21-127).

Specific message contents:

None.

26.8.1.2.4.4           Outgoing call / U3 MS originating call proceeding / PROGRESS with in band information

26.8.1.2.4.4.1       Definition and applicability

The call control entity of the MS being in the state, U3, a PROGRESS message indicating availability of in band information is received by the MS. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.4.4.2       Conformance requirement

- 1) A CC-entity of the MS in CC-state U3, "Mobile Originating Call Proceeding", upon receipt of a PROGRESS message indicating in-band announcement shall through-connect the traffic channel for speech, if TCH is in a speech mode. If TCH is not in speech mode, the MS shall not through-connect the TCH.
- 2) After receipt of the PROGRESS message, T310 shall be stopped.

References

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.4.3,

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 5.1.3, 5.2.1.4, 5.2.1.9, 5.5.1 and 11.3.

26.8.1.2.4.4.3       Test purpose

- 1) To verify that a CC-entity of the MS in CC-state U3, "Mobile Originating Call Proceeding", upon receipt of a PROGRESS message indicating in-band announcement through-connects the traffic channel for speech, if TCH is in speech mode. If TCH is not in a speech mode, the MS does not through-connect the TCH.
- 2) To verify that after receipt of the PROGRESS message, T310 is stopped.

26.8.1.2.4.8 Outgoing call / U3 MS originating call proceeding / termination requested by the user

26.8.1.2.4.8.1 Definition and applicability

The call control entity of the MS being in the state, U3, the user requests to terminate the call. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.4.8.2 Conformance requirement

- 1) A CC-entity of the MS in CC-state U3, "Mobile Originating Call Proceeding", upon request by the user to terminate will send a DISCONNECT message and enter the CC-state U11, "Disconnect Request".

## References

- 3GPP TS 04.07 subclause 6.2.2,  
3GPP TS 04.08 / 3GPP TS 24.008 subclause 5.4.3.

## 26.8.1.2.4.8.3 Test purpose

To verify that a CC-entity of the MS in CC-state U3, "Mobile Originating Call Proceeding", upon request by the user to terminate will send a DISCONNECT message and enter the CC-state U11, "Disconnect Request".

## 26.8.1.2.4.8.4 Method of test

## Related PICS/PIXIT statements

- supported MO circuit switched basic services.

## Initial conditions

- System Simulator: 1 cell, default parameters.  
Mobile Station: The MS is in MM-state "idle, updated" with valid TMSI and CKSN.  
The MS is brought into the state U3 by using table 26.8.1.2/3.

## Foreseen final state of the MS

U11, disconnect request.

## Maximum duration of test

30 s.

## Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The CC entity of the MS is brought to the state U3. The user requests termination of the call. The MS shall send a DISCONNECT message. The SS checks by using the status enquiry procedure that the CC entity has entered the state U11, disconnect request.

## Expected sequence

| Step | Direction | Message        | Comments                   |
|------|-----------|----------------|----------------------------|
| 1    |           |                | MMI action, terminate call |
| 2    | MS -> SS  | DISCONNECT     |                            |
| 3    | SS -> MS  | STATUS ENQUIRY |                            |
| 4    | MS -> SS  | STATUS         |                            |

## Specific message contents:

## 26.8.1.2.4.9 Outgoing call / U3 MS originating call proceeding / traffic channel allocation

## 26.8.1.2.4.9.1 Definition and applicability

The call control entity of the MS being in the state, U3, a traffic channel assignment procedure is performed. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

## 26.8.1.2.4.9.2 Conformance requirement

- 1) A CC-entity of the MS in CC-state U3, "Mobile Originating Call Proceeding", when allocated a traffic channel by the network performing the assignment procedure, shall perform a layer 2 establishment on the FACCH without changing the state of the call in progress.

## References

- 3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.4.3,  
3GPP TS 04.08 / 3GPP TS 24.008 subclause 5.2.1.9.

## 26.8.1.2.4.9.3 Test purpose

To verify that a CC-entity of the MS in CC-state U3, "Mobile Originating Call Proceeding", when allocated a traffic channel by the network performing the assignment procedure, performs a layer 2 establishment on the FACCH without changing the state of the call in progress.

## 26.8.1.2.4.9.4 Method of test

## Related PICS/PIXIT statements

- supported MO circuit switched basic services.

## Initial conditions

System Simulator:

- 1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U3 by using table 26.8.1.2/3.

## Foreseen final state of the MS

U3, mobile originating call proceeding.

## Maximum duration of test

30 s.

## Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The CC entity of the MS is brought to the state U3. The SS sends an ASSIGNMENT COMMAND for traffic channel to the MS. The MS shall establish layer 2 link on the newly allocated channel and respond with an ASSIGNMENT COMPLETE message. The SS checks by using the status enquiry procedure that the state of the CC entity has remained unchanged.

## Expected sequence

| Step | Direction | Message             | Comments                                                 |
|------|-----------|---------------------|----------------------------------------------------------|
| 1    | SS -> MS  | ASSIGNMENT COMMAND  | (TCH) the MS shall perform L2 establishment on the FACCH |
| 2    | MS -> SS  | ASSIGNMENT COMPLETE |                                                          |
| 3    | SS -> MS  | STATUS ENQUIRY      |                                                          |
| 4    | MS -> SS  | STATUS              | cause 30#, state U3                                      |

26.8.1.2.4.10           Outgoing call / U3 MS originating call proceeding / timer T310 time-out

26.8.1.2.4.10.1       Definition and applicability

The call control entity of the MS being in the state, U3, if no response is then received from the SS, timer T310 expires at the MS side. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.4.10.2       Conformance requirement

- 1) A CC-entity of the MS in CC-state U3, "Mobile Originating Call Proceeding" shall, upon expiry of timer T310, and not before, initiate call release by sending DISCONNECT and enter the CC-state U11, "Disconnect Request".

References

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 5.2.1.3./Abnormal case, 5.4.3 and 11.3.

26.8.1.2.4.10.3       Test purpose

To verify that a CC-entity of the MS in CC-state U3, "Mobile Originating Call Proceeding" will, upon expiry of timer T310 (accuracy minus 2 %, plus 50 %), initiate call release by sending DISCONNECT and enter the CC-state U11, "Disconnect Request".

26.8.1.2.4.10.4       Method of test

Related PICS/PIXIT statements

- supported MO circuit switched basic services.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U3 by using table 26.8.1.2/3.

Foreseen final state of the MS

U11, disconnect request.

Maximum duration of test

1 minute.

Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The CC entity of the MS is brought to the state U3. The T310 expires at the MS and the MS shall send DISCONNECT. The SS checks timer T310 accuracy and that the CC entity has entered the state U11, disconnect request.

Expected sequence

| Step | Direction | Message        | Comments                                               |
|------|-----------|----------------|--------------------------------------------------------|
| 1    | SS        |                |                                                        |
| 2    | MS -> SS  | DISCONNECT     | the SS waits for T310 time-out                         |
| 3    | SS -> MS  | STATUS ENQUIRY | check the timer T310 accuracy (minus 2 % to plus 50 %) |
| 4    | MS -> SS  | STATUS         | cause 30#, state U11                                   |

Specific message contents:

None.

26.8.1.2.4.11           Outgoing call / U3 MS originating call proceeding / lower layer failure

26.8.1.2.4.11.1        Definition and applicability

The call control entity of the MS being in the state, U3, a lower layer failure is accomplished at the MS and consequently, communication at layer 3 level with the peer entity is terminated. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.4.11.2        Conformance requirement

- 1) If a CC-entity of the MS in CC-state U3, "Mobile Originating Call Proceeding" has detected a lower layer failure and has returned to idle mode, the CC entities relating to the seven mobile originating transaction identifiers shall be in state U0, "Null".

References

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.5.2.3, 4.5.3 and 5.5.3.2.

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.4.13.2.1.

26.8.1.2.4.11.3        Test purpose

To verify that a CC-entity of the MS in CC-state U3, "Mobile Originating Call Proceeding" having detected a lower layer failure and having returned to idle mode, the CC entities relating to the seven mobile originating transaction identifiers are in state U0, "Null".

26.8.1.2.4.11.4        Method of test

Related PICS/PIXIT statements

- supported MO circuit switched basic services.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U3 by using table 26.8.1.2/4.

Foreseen final state of the MS

U0, null.

## Maximum duration of test

1 minute 30 s.

## Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The MS is brought to the state U3. The SS generates a lower layer failure at the MS. The SS waits long enough to enable the MS to return to idle state listening to paging, and then pages MS to create RR-connection. Finally, the SS will check the state of the MS by using STATUS ENQUIRY with the relevant transaction identifiers.

## Expected sequence

| Step | Direction | Message              | Comments                                                                   |
|------|-----------|----------------------|----------------------------------------------------------------------------|
| 1    | SS        |                      | SS generates lower layer failure                                           |
| 2    | SS        |                      | SS waits 20 s for the MS to return to listening to paging                  |
| 3    | SS -> MS  | PAGING REQUEST       |                                                                            |
| 4    | MS -> SS  | CHANNEL REQUEST      |                                                                            |
| 5    | SS -> MS  | IMMEDIATE ASSIGNMENT |                                                                            |
| 6    | MS -> SS  | PAGING RESPONSE      |                                                                            |
| 7    | SS -> MS  | STATUS ENQUIRY       |                                                                            |
| 8    | MS -> SS  | RELEASE COMPLETE     | cause 81# (invalid TI value)                                               |
| 9    | SS        |                      | repeat steps 18-19 to cover all the transaction identifiers from 000...110 |
| 10   | SS -> MS  | CHANNEL RELEASE      | the main signalling link shall be released by the MS (L2: DISC/UA).        |

None.

26.8.1.2.4.12            Outgoing call / U3 MS originating call proceeding / unknown message received

26.8.1.2.4.12.1        Definition and applicability

The call control entity of the MS being in the state, U3, an unknown message is received by the MS. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.4.12.2        Conformance requirement

- 1) A CC-entity of the MS in CC-state U3, "Mobile Originating Call Proceeding" having received an unknown message from its peer entity shall return a STATUS message.

## References

3GPP TS 04.08 / 3GPP TS 24.008 subclause 8.5.

26.8.1.2.4.12.3        Test purpose

To verify that a CC-entity of the MS in CC-state U3, "Mobile Originating Call Proceeding" having received an unknown message from its peer entity returns a STATUS message.

26.8.1.2.4.12.4        Method of test

## Related PICS/PIXIT statements

- supported MO circuit switched basic services.

## Initial conditions

## System Simulator:

1 cell, default parameters.

## Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U3 by using table 26.8.1.2/1.

## Foreseen final state of the MS

U3, mobile originating call proceeding.

## Maximum duration of test

30 s.

## Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The CC entity of the MS is brought to the state U3. The SS sends a message with message type not defined for the protocol discriminator to the MS. The MS shall respond with a STATUS message, and finally the SS checks by using the status enquiry procedure that the state of the CC entity has remained unchanged.

## Expected sequence

| Step | Direction | Message         | Comments                        |
|------|-----------|-----------------|---------------------------------|
| 1    | SS -> MS  | unknown message | message type not defined for PD |
| 2    | MS -> SS  | STATUS          | cause 97#, state U3             |
| 3    | SS -> MS  | STATUS ENQUIRY  |                                 |
| 4    | MS -> SS  | STATUS          | cause 30#, state U3             |

## Specific message contents:

None.

26.8.1.2.4.13            Outgoing call / U3 MS originating call proceeding / Internal alerting indication

26.8.1.2.4.13.1        Definition and applicability

The call control entity of the MS being in the state, U3, an ALERTING message is sent to the MS when the user connection is not attached to the radio path. This test is applicable for any equipment supporting mobile originated circuit switched basic service for telephony.

26.8.1.2.4.13.2        Conformance requirement

- 1) When the call control entity of the MS in the "mobile originating call proceeding" state receives an ALERTING message then it shall enter "call delivered" state and, for speech calls, if the user connection is not attached to the radio path, the MS shall internally generate an alerting indication.

## References

3GPP TS 04.08 / 3GPP TS 24.008 subclause 5.2.1.5.

## 26.8.1.2.4.13.3 Test purpose

When the call control entity of the MS in the "mobile originating call proceeding" state receives an ALERTING message then it enters "call delivered" state and, for speech calls, if the user connection is not attached to the radio path, the MS generates internally an alerting indication.

## 26.8.1.2.4.13.4 Method of test

## Related PICS/PIXIT statements

- supported MO circuit switched basic services.
- way to give internally generated alerting indication for outgoing calls

## Initial conditions

## System Simulator:

1 cell, default parameters.

## Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U3 by using table 26.8.1.2/1.

## Foreseen final state of the MS

U4, call delivered.

## Maximum duration of test

30 s.

## Test procedure

The SS sends an ALERTING message to the MS. The SS checks by using the status enquiry procedure that the CC entity has entered the state U4, call delivered. Also it is checked that the MS generates internally alerting indication to the user in the way described in the PICS/PIXIT statements.

## Expected sequence

| Step | Direction | Message        | Comments                                                                                                   |
|------|-----------|----------------|------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | ALERTING       | the MS shall generate an alerting indication to the user in the way described in the PICS/PIXIT statements |
| 2    | SS -> MS  | STATUS ENQUIRY |                                                                                                            |
| 3    | MS -> SS  | STATUS         | cause 30#, state U4                                                                                        |

26.8.1.2.5.3           Outgoing call / U4 call delivered / DISCONNECT with in band tones

26.8.1.2.5.3.1       Definition and applicability

The call control entity of the MS being in the state, U4, a DISCONNECT message indicating availability of in band information is received by the MS. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.5.3.2       Conformance requirement

- 1) A CC-entity of the MS in CC-state U4, "Call Delivered" shall, upon receipt of a DISCONNECT with a progress indicator indicating in-band information, shall through-connect the speech channel to make in-band announcements available, if traffic channel is in speech mode. If TCH is not in speech mode, the MS shall send a RELEASE message.

References

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.4.3,

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 5.4.4.1, 5.5.1 and 5.2.1.9.

26.8.1.2.5.3.3       Test purpose

To verify that a CC-entity of the MS in CC-state U4, "Call Delivered", upon receipt of a DISCONNECT with a progress indicator indicating in-band information, through-connects the speech channel to make in-band announcements available, if traffic channel is in speech mode. If TCH is not in speech mode, the MS shall send a RELEASE message.

26.8.1.2.5.3.4       Method of test

Related PICS/PIXIT statements

- supported MO circuit switched basic services.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U4 by using table 26.8.1.2/2.

Foreseen final state of the MS

U12, disconnect indication.

Maximum duration of test

30 s.

Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The CC entity of the MS is brought to the state U4. The SS sends a DISCONNECT message containing indication of in-band information availability to the MS. The SS checks that if channel mode is MO telephony, the TCH shall be through connected and the MS enters state U12, disconnect indication. If channel mode is not speech, the TCH shall not be through connected and the MS shall enter state U19, release request.

26.8.1.2.5.6           Outgoing call / U4 call delivered / lower layer failure

26.8.1.2.5.6.1        Definition and applicability

The call control entity of the MS being in the state, U4, a lower layer failure is accomplished at the MS and consequently, communication at layer 3 level with the peer entity is terminated. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.5.6.2        Conformance requirement

- 1) When CC-entity of the MS in CC-state U4, "Call Delivered" has detected a lower layer failure and has returned to idle mode, the CC-entities relating to the seven mobile originating transaction identifiers shall be in CC-state U0, "Null".

26.8.1.2.6.3 U10 call active / DISCONNECT with in band tones

26.8.1.2.6.3.1 Definition and applicability

The call control entity of the MS being in the state, U10, a DISCONNECT message indicating availability of in band information is received by the MS. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.6.3.2 Conformance requirement

- 1) A CC-entity of the MS in CC-state U10, "Call Active", upon receipt of a DISCONNECT message with a Progress Indicator indicating in-band information, shall through-connect the speech channel to make in-band announcements available, if traffic channel is in speech mode. If TCH is not in speech mode, the MS shall send a RELEASE message.

References

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 5.4.4.1 and 5.5.1.

26.8.1.2.6.3.3 Test purpose

To verify that a CC-entity of the MS in CC-state U10, "Call Active", upon receipt of a DISCONNECT message with a Progress Indicator indicating in-band information, through-connects the speech channel to make in-band announcements available, if traffic channel is in speech mode. If TCH is not in speech mode, the MS sends a RELEASE message.

26.8.1.2.6.3.4 Method of test

Related PICS/PIXIT statements

- supported MO circuit switched basic services.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U10 by using table 26.8.1.2/2.

Foreseen final state of the MS

U12, disconnect indication.

Maximum duration of test

30 s.

Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The CC entity of the MS is brought to the state U10. The SS sends a DISCONNECT message containing indication of in-band information availability to the MS. The SS checks that if channel mode is speech, the TCH shall be through connected and the MS enters state U12, disconnect indication. If channel mode is not speech, the TCH shall not be through connected and the MS enters state U19, release request.

Expected sequence

26.8.1.2.6.4 U10 call active / DISCONNECT without in band tones

26.8.1.2.6.4.1 Definition and applicability

The call control entity of the MS being in the state, U10, a DISCONNECT message is received by the MS. The DISCONNECT message does not contain indication of in-band information availability. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.6.4.2 Conformance requirement

- 1) A CC-entity of the MS in CC-state U10, "Call Active", upon receipt of a DISCONNECT message without progress indicator, shall return a RELEASE message and enter the CC-state U19, "Release Request".

References

3GPP TS 04.08 / 3GPP TS 24.008 subclause 5.4.4.

26.8.1.2.6.4.3 Test purpose

To verify that the a CC-entity of the MS in CC-state U10, "Call Active", upon receipt of a DISCONNECT message without progress indicator, returns a RELEASE message and enters the CC-state U19, "Release Request".

## 26.8.1.2.6.4.4 Method of test

## Related PICS/PIXIT statements

- supported MO circuit switched basic services.

## Initial conditions

## System Simulator:

1 cell, default parameters.

## Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U10 by using table 26.8.1.2/2.

## Foreseen final state of the MS

U19, release request.

## Maximum duration of test

30 s.

## Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The CC entity of the MS is brought to the state U10. The SS sends a DISCONNECT message not containing indication of in-band information availability to the MS. The MS shall respond with a RELEASE message. The SS checks by using the status enquiry procedure that the CC entity of the MS has entered the state U19, release request.

## Expected sequence

| Step | Direction | Message        | Comments             |

## 26.8.1.2.6.5 U10 call active / RELEASE COMPLETE received

## 26.8.1.2.6.5.1 Definition and applicability

The call control entity of the MS being in the state, U10, the call is cleared by a RELEASE COMPLETE message sent by the SS. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

## 26.8.1.2.6.5.2 Conformance requirement

- 1) A CC entity of the MS in CC-state U10, "active", upon receipt of a RELEASE COMPLETE message with valid cause value, shall enter CC state U0, "Null".

- 2) On returning to idle mode, the CC entities relating to the seven mobile originating transaction identifiers shall be in state U0, "Null".

#### References

Conformance requirement 1: 3GPP TS 04.08 / 3GPP TS 24.008, subclauses 5.4.2 and 5.4.4.

Conformance requirement 2: 3GPP TS 04.08 / 3GPP TS 24.008, subclause 5.4.4.3.

#### 26.8.1.2.6.5.3 Test purpose

- 1) To verify that a CC entity of the MS in CC-state U10, "Call active" upon receipt of a RELEASE COMPLETE message with valid cause value, enters CC state U0, "Null".
- 2) To verify that in returning to idle mode, the CC entities relating to the seven mobile originating transaction identifiers are in state U0, "Null".

#### 26.8.1.2.6.5.4 Method of test

#### Related PICS/PIXIT statements

- supported MO circuit switched basic services.

#### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U10 by using table 26.8.1.2/2.

#### Foreseen final state of the MS

U0, null.

#### Maximum duration of test

30 s.

#### Test procedure

The SS sends a RELEASE COMPLETE message to the MS. The SS checks by using the status enquiry procedure that the CC entity has entered the state U0 with all the relevant transaction identifiers.

#### Expected sequence

| Step | Direction | Message          | Comments                                                                 |
|------|-----------|------------------|--------------------------------------------------------------------------|
| 1    | SS -> MS  | RELEASE COMPLETE | note 1                                                                   |
| 2    | SS -> MS  | STATUS ENQUIRY   | note 2                                                                   |
| 3    | MS -> SS  | RELEASE COMPLETE | cause 81# (invalid TI value),                                            |
| 4    | SS        |                  | repeat steps 2-3 to cover all the transaction identifiers from 000...110 |
| 5    | SS -> MS  | CHANNEL RELEASE  | the main signalling link shall be released by the MS (L2: DISC/UA).      |

Specific message contents:

NOTE 1: With the cause value chosen arbitrarily.

NOTE 2: TI flag has the value indicating the MS as a originator of the call.

#### 26.8.1.2.6.6 U10 call active / SETUP received

##### 26.8.1.2.6.6.1 Definition and applicability

If the MS does not react correctly when receiving a SETUP message on a new Transaction Identifier during an active call, the active call may be lost.

This test is applicable for all GSM 400, GSM 700, GSM 850, GSM 900 and DCS 1 800 MS supporting at least one mobile originated circuit switched basic service.

##### 26.8.1.2.6.6.2 Conformance requirement

- 1) A Mobile Station that has a call established when receiving a SETUP message shall respond either with a CALL CONFIRMED message or a RELEASE COMPLETE message, both with cause #17 "user busy".
- 2) The call control state of the existing transaction shall not be affected by the incoming SETUP message.

Reference(s):

Conformance requirement 1: 3GPP TS 04.08 / 3GPP TS 24.008, subclause 5.2.2.3.1.

Conformance requirement 2: 3GPP TS 04.08 / 3GPP TS 24.008, subclause 5.1.1.

##### 26.8.1.2.6.6.3 Test purpose

- 1) To verify that a Mobile Station that has a call established and receives a SETUP message answers either with a CALL CONFIRMED message with cause "user busy" if it supports call waiting, or with a RELEASE COMPLETE message with cause "user busy" otherwise.
- 2) To verify that after having sent this message, the MS is still in state U10 for the established call.

##### 26.8.1.2.6.6.4 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is idle updated with valid TMSI and CKSN.

The MS is brought into the state U10 by using table 26.8.1.2/14.

Related PICS/PIXIT statement(s)

- supported MO circuit switched basic services.
- support of call waiting Y/N.

Foreseen final state of the MS

U10, call active.

Maximum duration of test

30 s.

### Test Procedure

The MS has a mobile originated call in the U10 state.

The SS sends a SETUP message to the MS (with signal IE indicating "call waiting tone on").

If the MS does not support call waiting it shall answer by a RELEASE COMPLETE message.

If the MS supports call waiting it shall answer by a CALL CONFIRMED message followed by an ALERTING. The second transaction is then released by the SS with a RELEASE COMPLETE message.

In both cases the SS checks by using the status enquiry procedure that the CC entity of the MS is still in state U10, active call for the original call.

### Expected sequence

| Step | Direction | Message          | Comments                                                                                                                                                                           |
|------|-----------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | SETUP            | this message establishes a second transaction The TI value shall be the same as the one that is in use for the MO call. The TI flag shall have the value specified for an MT call. |
| A2   | MS -> SS  | RELEASE COMPLETE | if the MS does not support call waiting with cause user busy" with the TI of the second transaction                                                                                |
| B2   | MS -> SS  | CALL CONFIRMED   | if the MS supports call waiting with cause user busy" with the TI of the second transaction                                                                                        |
| B3   | MS -> SS  | ALERTING         | with the TI of the second transaction                                                                                                                                              |
| B4   | SS -> MS  | RELEASE COMPLETE | with the TI of the second transaction                                                                                                                                              |
| 5    | SS -> MS  | STATUS ENQUIRY   | with the TI of the original transaction                                                                                                                                            |
| 6    | MS -> SS  | STATUS           | cause 30#, state U10 with the TI of the original transaction                                                                                                                       |

NOTE: The Transaction Identifier of the second transaction shall be different from the one of the already established transaction.

### Specific message contents

SETUP message contains a Signal IE with value "call waiting tone on" (H'07).

#### 26.8.1.2.7 U11 disconnect request

##### 26.8.1.2.7.1 U11 disconnect request / clear collision

###### 26.8.1.2.7.1.1 Definition and applicability

The call control entity of the MS being in the state, U11, a DISCONNECT message is received by the MS. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

###### 26.8.1.2.7.1.2 Conformance requirement

- 1) A CC-entity of the MS in CC-state U11, "Disconnect Request", upon receipt of a DISCONNECT message, shall return to its peer entity the RELEASE message and enter the CC-state U19, "Release Request".

### References

3GPP TS 04.08 / 3GPP TS 24.008 subclause 5.4.5.

## 26.8.1.2.7.1.3 Test purpose

To verify that the a CC-entity of the MS in CC-state U11, "Disconnect Request", upon receipt of a DISCONNECT message, returns to its peer entity the RELEASE message and enters the CC-state U19, "Release Request".

26.8.1.2.7.3 U11 disconnect request / timer T305 time-out

26.8.1.2.7.3.1 Definition and applicability

The call control entity of the MS being in the state, U11, if no response is then received from the SS, timer T305 expires at the MS side. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.7.3.2 Conformance requirement

- 1) A CC-entity of the MS in CC-state U11, "Disconnect Request" shall on expiry of T305, proceed with the connection release procedure by sending the RELEASE message to its peer entity and shall enter the CC-state U19, "Release Request".

References

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 5.4.3 and 11.3.

26.8.1.2.7.3.3 Test purpose

To verify that the CC-entity of the MS in CC-state U11, "Disconnect Request" shall on expiry of T305 (accuracy  $\pm 10\%$ ), proceed with the connection release procedure by sending the RELEASE message to its peer entity and enters the CC-state U19, "Release Request".

26.8.1.2.7.3.4 Method of test

Related PICS/PIXIT statements

- supported MO circuit switched basic services.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U11 by using table 26.8.1.2/3.

Foreseen final state of the MS

U19, release request.

### Maximum duration of test

1 minute.

### Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The CC entity of the MS is brought to the state U11. Then T305 expires at the MS and the MS shall send a RELEASE message. The SS checks timer T305 accuracy and that the CC entity has entered the state U19, release request.

### Expected sequence

| Step | Direction | Message        | Comments                                                                |
|------|-----------|----------------|-------------------------------------------------------------------------|
| 1    | SS        |                | SS waits until T305 expires at the MS                                   |
| 2    | MS -> SS  | RELEASE        | SS checks the time between DISCONNECT and RELEASE (note), (T305 ± 10 %) |
| 3    | SS -> MS  | STATUS ENQUIRY |                                                                         |
| 4    | MS -> SS  | STATUS         | cause 30#, state U19                                                    |

### Specific message contents:

NOTE: With the same cause value as originally contained in the DISCONNECT message. An additional cause information element (#102 recovery on timer expiry) may be included.

#### 26.8.1.2.7.4 U11 disconnect request / lower layer failure

##### 26.8.1.2.7.4.1 Definition and applicability

The call control entity of the MS being in the state, U11, a lower layer failure is accomplished at the MS and consequently, communication at layer 3 level with the peer entity is terminated. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

##### 26.8.1.2.7.4.2 Conformance requirement

- 1) A CC-entity of the MS in CC-state U11, "Disconnect Request" having detected a lower layer failure shall return to the idle mode. The CC entities relating to the seven mobile originating transaction identifiers shall be in state U0, "Null".

### References

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.5.2.3, 4.5.3, 5.5.3.2 and 8.3.

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.4.13.2.1.

##### 26.8.1.2.7.4.3 Test purpose

To verify that the a CC-entity of the MS in CC-state U11, "Disconnect Request" having detected a lower layer failure returns to the idle mode. The CC entities relating to the seven mobile originating transaction identifiers are thus in state U0, "Null".

##### 26.8.1.2.7.4.4 Method of test

### Related PICS/PIXIT statements

- supported MO circuit switched basic services.

## Initial conditions

## System Simulator:

1 cell, default parameters.

## Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U11 by using table 26.8.1.2/4.

## Foreseen final state of the MS

U0, null.

## Maximum duration of test

1 minute 30 s.

## Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The MS is brought to the state U11. The SS generates a lower layer failure at the MS. The SS waits long enough to enable the MS to return to idle state listening to paging, and then pages MS to create RR-connection. Finally, the SS will check the state of the MS by using STATUS ENQUIRY with the relevant transaction identifiers.

## Expected sequence

| Step | Direction | Message              | Comments                                                                 |
|------|-----------|----------------------|--------------------------------------------------------------------------|
| 1    | SS        |                      | SS generates lower layer failure                                         |
| 2    | SS        |                      | SS waits 20 s for the MS to return to listening to paging                |
| 3    | SS -> MS  | PAGING REQUEST       |                                                                          |
| 4    | MS -> SS  | CHANNEL REQUEST      |                                                                          |
| 5    | SS -> MS  | IMMEDIATE ASSIGNMENT |                                                                          |
| 6    | MS -> SS  | PAGING RESPONSE      |                                                                          |
| 7    | SS -> MS  | STATUS ENQUIRY       |                                                                          |
| 8    | MS -> SS  | RELEASE COMPLETE     | cause 81# (invalid TI value)                                             |
| 9    | SS        |                      | repeat steps 7-8 to cover all the transaction identifiers from 000...110 |
| 10   | SS -> MS  | CHANNEL RELEASE      | the main signalling link shall be released by the MS (L2: DISC/UA).      |

26.8.1.2.7.5 U11 disconnect request / unknown message received

26.8.1.2.7.5.1 Definition and applicability

The call control entity of the MS being in the state, U4, an unknown message is received by the MS. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.7.5.2 Conformance requirement

- 1) A CC-entity of the MS in CC-state U100, "Call Delivered", having received an unknown message from its peer entity shall return a STATUS message.

## References

3GPP TS 04.08 / 3GPP TS 24.008 subclause 8.4.

## 26.8.1.2.7.5.3 Test purpose

To verify that a CC-entity of the MS in CC-state U11, "Call Delivered", having received an unknown message from its peer entity returns a STATUS message.

## 26.8.1.2.7.5.4 Method of test

## Related PICS/PIXIT statements

- supported MO circuit switched basic services.

## Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U11 by using table 26.8.1.2/4.

## Foreseen final state of the MS

U11, disconnect request.

## Maximum duration of test

30 s.

## Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The CC entity of the MS is brought to the state U11. The SS sends a message with message type not defined for the protocol discriminator to the MS. The MS shall respond with a STATUS message, and finally the SS checks by using the status enquiry procedure that the state of the CC entity has remained unchanged.

## Expected sequence

| Step | Direction | Message         | Comments                        |

### 26.8.1.2.8 U12 disconnect indication

26.8.1.2.8.1 U12 disconnect indication / call releasing requested by the user

26.8.1.2.8.1.1 Definition and applicability

The call control entity of the MS being in the state, U12, the user requests to terminate the call. This test is applicable only for mobile stations supporting bearer capability for speech.

26.8.1.2.8.1.2 Conformance requirement

- 1) A CC-entity of the MS in CC-state U12, "Disconnect Indication" being in network initiated call release phase, shall, upon receiving a call release request from the user send a RELEASE to its peer entity and enter CC-state U19, "Release Request".

#### References

3GPP TS 04.07 subclause 6.2.2,

3GPP TS 04.08 / 3GPP TS 24.008 subclause 5.4.4.

26.8.1.2.8.1.3 Test purpose

To verify that a CC-entity of the MS in CC-state U12, "Disconnect Indication" being in network initiated call release phase, shall, upon receiving a call release request from the user sends a RELEASE to its peer entity and enters CC-state U19, "Release Request"

### 26.8.1.2.9 Outgoing call / U19 release request

#### 26.8.1.2.9.1 Outgoing call / U19 release request / timer T308 time-out

##### 26.8.1.2.9.1.1 Definition and applicability

The call control entity of the MS being in the state, U19, if no response is then received from the SS, timer T308 expires at the MS side. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

##### 26.8.1.2.9.1.2 Conformance requirement

- 1) A CC-entity of the MS in CC-state U19, "Release Request" will, upon the first expiry of timer T308 send the RELEASE message to its peer entity and remain in the CC-state U19.

#### References

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 5.4.4.3.1 and 11.3.

##### 26.8.1.2.9.1.3 Test purpose

To verify that a CC-entity of the MS in CC-state U19, "Release Request" will, upon the first expiry of timer T308 (accuracy  $\pm 10\%$ ) send the RELEASE message to its peer entity and remain in the CC-state U19.

##### 26.8.1.2.9.1.4 Method of test

#### Related PICS/PIXIT statements

- supported MO circuit switched basic services.

#### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U19 by using table 26.8.1.2/4.

#### Foreseen final state of the MS

U19, release request.

#### Maximum duration of test

1 min.

#### Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The CC entity of the MS is brought to the state U19. When T308 expires at the MS, the MS shall send a RELEASE message. The SS checks timer T308 accuracy and that the state of the CC entity has remained unchanged.

Expected sequence

| Step | Direction | Message        | Comments                                                          |
|------|-----------|----------------|-------------------------------------------------------------------|
| 1    | SS        |                | SS waits until T308 at the MS                                     |
| 2    | MS -> SS  | RELEASE        | SS checks the time between the two RELEASE messages (T308 ± 10 %) |
| 3    | SS -> MS  | STATUS ENQUIRY |                                                                   |
| 4    | MS -> SS  | STATUS         | cause 30#, state U19                                              |

26.8.1.2.9.2           Outgoing call / U19 release request / 2nd timer T308 time-out

26.8.1.2.9.2.1        Definition and applicability

The call control entity of the MS being in the state, U19, if no response is then received after timer T308 has expired two times in success at the MS. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.9.2.2        Conformance requirement

- 1) A CC-entity of the MS in CC-state U19, "Release Request", upon the 2nd expiry of the timer T308, shall enter the CC-state U0, "Null".
- 2) Subsequently the MS shall proceed with releasing the MM-connection and enter the idle mode with the CC entities relating to the seven mobile originating transaction identifiers in state U0, "Null".

References

Conformance requirement 1: 3GPP TS 04.08 / 3GPP TS 24.008 subclauses 5.4.4.3.1 and 11.3.

Conformance requirement 2: 3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.5.3 and 5.5.3.2.

26.8.1.2.9.2.3        Test purpose

- 1) To verify that a CC-entity of the MS in CC-state U19, "Release Request", upon the 2nd expiry of the timer T308, enters the CC-state U0, "Null".
- 2) To verify that subsequently the MS proceeds with releasing the MM-connection and enters the idle mode with the CC entities relating to the seven mobile originating transaction identifiers in state U0, "Null".

26.8.1.2.9.2.4        Method of test

Related PICS/PIXIT statements

- supported MO circuit switched basic services.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U19 by using table 26.8.1.2/4.

Foreseen final state of the MS

U0, null.

Maximum duration of test

2 min 30 s.

Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The CC entity of the MS is brought to the state U19. The SS allows T308 expiry at the MS, and the MS shall repeat sending the RELEASE message and start timer T308 again. The SS allows again T308 expiry at the MS. The MS shall abort the RR-connection (DISC/UA). The SS waits long enough to enable the MS to return to idle state listening to paging, and then pages MS to create RR-connection. Finally, the SS will check the state of the MS by using STATUS ENQUIRY with the relevant transaction identifiers.

Expected sequence

| Step | Direction | Message              | Comments                                                                   |
|------|-----------|----------------------|----------------------------------------------------------------------------|
| 1    | SS        |                      | SS waits until T308 expiry at the MS                                       |
| 2    | MS -> SS  | RELEASE              |                                                                            |
| 3    | SS -> MS  | STATUS ENQUIRY       |                                                                            |
| 4    | MS -> SS  | STATUS               | cause 30#, state U19                                                       |
| 5    | SS        |                      | SS waits until the second T308 expiry at the MS                            |
| 6    | SS        |                      | SS waits T3240 expiry at the MS                                            |
| 7    | MS        |                      | the main signalling link shall be released by the MS (L2: DISC/UA).        |
| 8    | SS        |                      | SS waits 10 s for the MS to return to listening to paging                  |
| 9    | SS -> MS  | PAGING REQUEST       |                                                                            |
| 10   | MS -> SS  | CHANNEL REQUEST      |                                                                            |
| 11   | SS -> MS  | IMMEDIATE ASSIGNMENT |                                                                            |

26.8.1.2.9.3            Outgoing call / U19 release request / RELEASE received

26.8.1.2.9.3.1        Definition and applicability

The call control entity of the MS being in the state, U19, a RELEASE message is received by the MS. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.9.3.2        Conformance requirement

- 1) A CC-entity of the MS in CC-state U19, "Release Request", upon receipt of a RELEASE, shall release the MM-connection and enter the CC-state U0, "Null" with the CC entities relating to the seven mobile originating transaction identifiers in state U0, "Null".

References

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 5.4.5, 11.3 and 5.5.3.2.

## 26.8.1.2.9.3.3 Test purpose

To verify that a CC-entity of the MS in CC-state U19, "Release Request", upon receipt of a RELEASE, shall release the MM-connection and enters the CC-state U0, "Null" with the CC entities relating to the seven mobile originating transaction identifiers in state U0, "Null".

## 26.8.1.2.9.3.4 Method of test

## Related PICS/PIXIT statements

- supported MO circuit switched basic services.

## Initial conditions

## System Simulator:

1 cell, default parameters.

## Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U19 by using table 26.8.1.2/4.

## Foreseen final state of the MS

U0, null.

## Maximum duration of test

1 min 30 s.

## Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The CC entity of the MS is brought to the state U19. The SS sends a RELEASE message to the MS. The MS shall release the MM-connection. The SS checks by using the status enquiry procedure that the CC entity has entered the state U0 with all the relevant transaction identifiers.

## Expected sequence

| Step | Direction | Message          | Comments                                                                 |
|------|-----------|------------------|--------------------------------------------------------------------------|
| 1    | SS -> MS  | RELEASE          | (note)                                                                   |
| 2    | SS -> MS  | STATUS ENQUIRY   |                                                                          |
| 3    | MS -> SS  | RELEASE COMPLETE | cause 81# (invalid TI value)                                             |
| 4    | SS        |                  | repeat steps 2-3 to cover all the transaction identifiers from 000...110 |
| 5    | SS -> MS  | CHANNEL RELEASE  | the main signalling link shall be released by the MS (L2: DISC/UA).      |

26.8.1.2.9.5           Outgoing call / U19 release request / lower layer failure

26.8.1.2.9.5.1       Definition and applicability

The call control entity of the MS being in the state, U19, a lower layer failure is accomplished at the MS and consequently, communication at layer 3 level with the peer entity is terminated. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.9.5.2       Conformance requirement

A CC-entity of the MS in CC-state U19, "Release Request", having detected a lower layer failure, shall return to the idle mode, the CC entities relating to the seven mobile originating transaction identifiers shall be in state U0, "Null".

References

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.5.2.3, 4.5.3, 5.5.3.2 and 8.3.

26.8.1.2.9.5.3       Test purpose

To verify that a CC-entity of the MS in CC-state U19, "Release Request", having detected a lower layer failure, returns to the idle mode, the CC entities relating to the seven mobile originating transaction identifiers are in state U0, "Null".

26.8.1.2.9.5.4       Method of test

Related PICS/PIXIT statements

- supported MO circuit switched basic services.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U19 by using table 26.8.1.2/1.

Foreseen final state of the MS

U0, null.

Maximum duration of test

1 min 30 s.

Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The MS is brought to the state U19. The SS generates a lower layer failure at the MS. The SS waits long enough to enable the MS to return to idle state listening to paging, and then pages MS to create RR-connection. Finally, the SS will check the state of the MS by using STATUS ENQUIRY with the relevant transaction identifiers.

Expected sequence

| Step | Direction | Message              | Comments                                                                 |

### 26.8.1.3 Establishment of an incoming call / Initial conditions

The tables below describe message exchanges which bring the MS in the requested initial states in case of an incoming call.

A state may be taken as initial only when all the states which lead to this initial states have been validated. The order will be U0, U6, U9, U7, U8, U10, U26 etc. as in the following tables.

**Table 26.8.1.3/1: Establishment of an incoming call, procedure 1**

| Step                                                                                                                               | Direction | Message                 | Comments            |
|------------------------------------------------------------------------------------------------------------------------------------|-----------|-------------------------|---------------------|
| 1                                                                                                                                  | SS -> MS  | PAGING REQUEST          |                     |
| 2                                                                                                                                  | MS -> SS  | CHANNEL REQUEST         |                     |

### 26.8.1.3.1 Incoming call / U0 null state

#### 26.8.1.3.1.1 Incoming call / U0 null state / SETUP received with a non supported bearer capability

##### 26.8.1.3.1.1.1 Definition and applicability

The call control entity of the MS being in the state, U0, a SETUP message is received with only one bearer capability and this bearer capability is not supported by the MS. This test is applicable for all equipment.

#### 26.8.1.3.1.1.2 Conformance requirement

- 1) A CC entity of the MS, upon receipt of SETUP containing one bearer capability and this bearer capability is not supported, shall return a RELEASE COMPLETE with correct cause value to its peer entity and return to the idle mode. The CC-entities relating to the seven mobile terminating transaction identifiers shall be in the state U0,"Null".

#### References

3GPP TS 04.08 / 3GPP TS 24.008 subclause 5.2.2.2 and annex B.

#### 26.8.1.3.1.1.3 Test purpose

To verify that a CC entity of the MS, upon receipt of SETUP containing one bearer capability and this bearer capability is not supported, returns a RELEASE COMPLETE with correct cause value to its peer entity, and returns to the idle mode. To verify that the CC-entities relating to the seven mobile terminating transaction identifiers are then in the state U0,"Null".

#### 26.8.1.3.1.1.4 Method of test

#### Related PICS/PIXIT statements

- supported MO circuit switched basic services.

#### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

#### Foreseen final state of the MS

U0, null.

#### Maximum duration of test

30 s.

## Test procedure

A mobile terminated call is initiated. The MS receives a SETUP message that contains a bearer capability not supported by the MS. The MS returns a RELEASE COMPLETE message. The SS checks by using the status enquiry procedure that the CC entity is still in the state U0 with all the relevant transaction identifiers.

## Expected sequence

| Step | Direction | Message                 | Comments                                                                                                      |

NOTE 1: With one bearer capability and that bearer capability is not supported by the MS.

NOTE 2: With cause #88 incompatible destination.

### 26.8.1.3.2 Incoming call / U6 call present

#### 26.8.1.3.2.1 Incoming call / U6 call present / automatic call rejection

##### 26.8.1.3.2.1.1 Definition and applicability

Although the state U6 is transient, the ability to refuse a call (automatically) in this state is tested, if it is implemented at the MS. The test is applicable for those equipments described above supporting at least one mobile terminating circuit switched basic service.

##### 26.8.1.3.2.1.2 Conformance requirement

- 1) A CC entity of the MS in CC-state U6, "Call Present", upon receipt of a rejection indication of the incoming call from the user, send RELEASE COMPLETE with the appropriate cause value to its peer entity and enter the CC-state U0, "Null". The CC entities relating to the seven mobile terminating transaction identifiers shall be in state U0, "Null".

## References

- 3GPP TS 11.10, annex B (for PICS/PIXIT statement),
- 3GPP TS 04.07 subclause 6.2.2,
- 3GPP TS 04.08 / 3GPP TS 24.008 subclauses 5.2.2.3.1, 5.5.3.2 and 8.3.

## 26.8.1.3.2.1.3 Test purpose

To verify that a CC entity of the MS in CC-state U6, "Call Present", shall upon receipt of a rejection indication of the incoming call from the user, shall send RELEASE COMPLETE with the appropriate cause value to its peer entity and enter the CC-state U0, "Null". The CC entities relating to the seven mobile terminating transaction identifiers are then in state U0, "Null".

## 26.8.1.3.2.1.4 Method of test

## Related PICS/PIXIT statements

- supported teleservices;
- the MS supports an ability to refuse a call after receipt of a SETUP message.

## Initial conditions

## System Simulator:

1 cell, default parameters.

## Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U6 by using table 26.8.1.3/2.

## Foreseen final state of the MS

U0, null.

## Maximum duration of test

1 min 30 s.

## Test procedure

A teleservice is selected that is supported by the MS; if the MS supports speech, the selected teleservice is speech. If necessary, the MS is configured for that teleservice. Then a mobile terminated call is initiated. The call control entire of the MS is brought to the state U6 (Note: The state U6 is not checked, since it is not stable). The MS is made to refuse the call (the refusal may require some preliminary preparations in order to achieve refusal at this point). The MS shall send a RELEASE COMPLETE message and enter a call control state U0. The SS checks by using the status enquiry procedure that the CC entity has entered the state U0 with all the relevant transaction identifiers.

## Expected sequence

| Step | Direction | Message          | Comments                                                                 |
|------|-----------|------------------|--------------------------------------------------------------------------|
| 1    |           |                  | the MS is made to refuse the call                                        |
| 2    | MS -> SS  | RELEASE COMPLETE | (note)                                                                   |
| 3    | SS -> MS  | STATUS ENQUIRY   |                                                                          |
| 4    | MS -> SS  | RELEASE COMPLETE | cause 81# (invalid TI value)                                             |
| 5    | SS        |                  | repeat steps 3-4 to cover all the transaction identifiers from 000...110 |
| 6    | SS -> MS  | CHANNEL RELEASE  | the main signalling link shall be released by the MS (L2: DISC/UA).      |

## Specific message contents:

NOTE: With cause value #21 call rejected.

### 26.8.1.3.3 Incoming call / U9 mobile terminating call confirmed

#### 26.8.1.3.3.1 Incoming call / U9 mobile terminating call confirmed / alerting or immediate connecting

##### 26.8.1.3.3.1.1 Definition and applicability

The call control entity of the MS having entered the state, U9, with signal information received in the preceding SETUP message, the subsequent behaviour of the MS is tested. This test is applicable for any equipment supporting at least one mobile terminating circuit switched basic service.

##### 26.8.1.3.3.1.2 Conformance requirement

- 1) A CC entity in CC-state U9, "MS Terminating Call Confirmed", (if signalled by the network in previous SETUP message that it may alert) shall either send a ALERTING message to its peer entity and enter state U7, or send a CONNECT message to its peer entity and enter U8.

### References

3GPP TS 04.08 / 3GPP TS 24.008 subclause 5.2.2.3.2,  
3GPP TS 11.10, annex 3 and subclause 2.2.

##### 26.8.1.3.3.1.3 Test purpose

To verify that a CC entity in CC-state U9, "MS Terminating Call Confirmed", (if signalled by the network in previous SETUP message that it may alert) will either send a ALERTING message to its peer entity and enter state U7, or send a CONNECT message to its peer entity and enter U8.

##### 26.8.1.3.3.1.4 Method of test

### Related PICS/PIXIT statements

- supported MT circuit switched basic services;
- MT circuit switched basic services for which immediate connect is not used.

### Initial conditions

#### System Simulator:

1 cell, default parameters.

#### Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U9 by using table 26.8.1.3/2.

### Foreseen final state of the MS

- U8, connect request, if the MS supports immediate connect for the selected basic service;
- otherwise U7, call received.

### Maximum duration of test

30 s.

## Test procedure

An MT circuit switched basic service is selected that is supported by the MS; if the MS supports MT telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then a mobile terminated call is initiated. The CC entity of the MS is brought to the state U9 by using a SETUP message containing signalling information element. (The state U9 is not a stable state in this case, and consequently it is not checked as an initial state.) If the MS supports immediate connect for the selected basic service ( $p = Y$ ), it sends a CONNECT message and enters the state U8, connect request. Otherwise ( $p = N$ ) the MS sends an ALERTING message and enters the state U7, call receiving. The SS checks by using the status enquiry procedure that the CC entity has entered its state as described.

## Expected sequence

| Step | Direction | Message        | Comments                       |
|------|-----------|----------------|--------------------------------|
| A11  | MS -> SS  | CONNECT        | $p = Y$<br>cause 30#, state U8 |
| A12  | SS -> MS  | STATUS ENQUIRY |                                |
| A13  | MS -> SS  | STATUS         |                                |
| B11  | MS -> SS  | ALERTING       | $p = N$<br>cause 30#, state U7 |
| B12  | SS -> MS  | STATUS ENQUIRY |                                |
| B13  | MS -> SS  | STATUS         |                                |

## Specific message contents:

None.

26.8.1.3.3.2 Incoming call / U9 mobile terminating call confirmed / TCH assignment

26.8.1.3.3.2.1 Definition and applicability

The call control entity of the MS being in the state, U9, an assignment procedure is performed for traffic channel. This test is applicable for any equipment supporting at least one MT circuit switched basic service, for which immediate connect is not used.

26.8.1.3.3.2.2 Conformance requirement

- 1) A CC-entity of the MS in CC-state U9, "MS Terminating Call Confirmed", when allocated a traffic channel by the network performing the assignment procedure, shall perform a layer 2 establishment on the FACCH, send a ALERTING message and enter state U7.

## References

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 3.4.3, 5.2.2.7 and 5.2.2.3.2.

26.8.1.3.3.2.3 Test purpose

To verify that a CC-entity of the MS in CC-state U9, "MS Terminating Call Confirmed", when allocated a traffic channel by the network performing the assignment procedure, performs a layer 2 establishment on the FACCH, sends a ALERTING message and enters state U7.

26.8.1.3.3.2.4 Method of test

## Related PICS/PIXIT statements

- supported MT circuit switched basic services;
- MT circuit switched basic services for which immediate connect is not used.

## Initial conditions

## System Simulator:

1 cell, default parameters.

## Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U9 by using table 26.8.1.3/4.

## Foreseen final state of the MS

U9, mobile terminating call confirmed.

## Maximum duration of test

30 s.

## Test procedure

An MT circuit switched basic service is selected that is supported by the MS and for which the MS does not use immediate connection; if the MS supports MT telephony without immediate connection, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then a mobile terminated call is initiated. The CC entity of the MS is brought to the state U9 (by using a SETUP message not containing the signal information element). The SS sends an ASSIGNMENT COMMAND for traffic channel to the MS. The MS shall establish layer 2 link on the newly allocated channel and respond with an ASSIGNMENT COMPLETE message. The MS sends an ALERTING message and enters state U7, call received. The SS verifies by using the status enquiry procedure that the MS has entered the correct state.

## Expected sequence

| Step | Direction | Message             | Comments                                                                  |
|------|-----------|---------------------|---------------------------------------------------------------------------|
| 1    | SS -> MS  | ASSIGNMENT COMMAND  | TCH, an appropriate non-signalling mode<br>the MS shall establish L2 link |
| 2    | MS        |                     |                                                                           |
| 3    | MS -> SS  | ASSIGNMENT COMPLETE |                                                                           |
| 4    | MS -> SS  | ALERTING            |                                                                           |
| 5    | SS -> MS  | STATUS ENQUIRY      |                                                                           |
| 6    | MS -> SS  | STATUS              | cause 30#, state U7                                                       |

## Specific message contents:

26.8.1.3.3.3 Incoming call / U9 mobile terminating call confirmed / termination requested by the user

26.8.1.3.3.3.1 Definition and applicability

The call control entity of the MS being in the state, U9, the user requests for releasing of the call. This test is applicable for any equipment supporting at least one MT circuit switched basic service for which immediate connection is not used and, in addition to this, the facility to send a DISCONNECT message in state U9.

26.8.1.3.3.3.2 Conformance requirement

- 1) A CC-entity of the MS in CC-state U9, "MS Terminating Call Confirmed", upon request by the user to terminate shall send a DISCONNECT message and enter the CC-state U11, "Disconnect Request".

## References

3GPP TS 04.07 subclause 6.2.2,  
3GPP TS 04.08 / 3GPP TS 24.008 subclause 5.4.3.

## 26.8.1.3.3.3.3 Test purpose

To verify that a CC-entity of the MS in CC-state U9, "MS Terminating Call Confirmed", upon request by the user to terminate will send a DISCONNECT message and enter the CC-state U11, "Disconnect Request".

## 26.8.1.3.3.3.4 Method of test

## Related PICS/PIXIT statements

- supported MT circuit switched basic services;
- MT circuit switched basic services for which immediate connect is not used;
- the MS supports user requested call clearing in the state U9.

## Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U9 by using table 26.8.1.3/4.

## Foreseen final state of the MS

U11, disconnect request.

## Maximum duration of test

30 s.

## Test procedure

An MT circuit switched basic service is selected that is supported by the MS and for which the MS does not use immediate connection; if the MS supports MT telephony without immediate connection, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then a mobile terminated call is initiated. The CC entity of the MS is brought to the state U9 (by using a SETUP message not containing the signal information element). Then the user requests termination of the call, if possible. The MS sends a DISCONNECT message and enters state U11, disconnect request. The SS verifies by using the status enquiry procedure that the MS has entered the correct state.

## Expected sequence

| Step | Direction | Message        | Comments                         |
|------|-----------|----------------|----------------------------------|
| 1    |           |                | the MS is made to clear the call |
| 2    | MS -> SS  | DISCONNECT     |                                  |
| 3    | SS -> MS  | STATUS ENQUIRY |                                  |
| 4    | MS -> SS  | STATUS         |                                  |

26.8.1.3.3.6 Incoming call / U9 mobile terminating call confirmed / lower layer failure

26.8.1.3.3.6.1 Definition and applicability

The call control entity of the MS being in the state, U9, a lower layer failure is accomplished at the MS and consequently, communication at layer 3 level with the peer entity is terminated. This test is applicable for any equipment supporting at least one MT circuit switched basic service, for which immediate connect is not used.

26.8.1.3.3.6.2 Conformance requirement

- 1) A CC entity of the MS in CC-state U9, "MS Terminating Call Confirmed", having detected a lower layer failure shall return to idle mode with the CC entities relating to the seven mobile terminating transaction identifiers in CC-state U0, "Null".

References

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.5.2.3, 4.5.3, 5.5.3.2 and 8.3.

26.8.1.3.3.6.3 Test purpose

To verify that a CC entity of the MS in CC-state U9, "MS Terminating Call Confirmed", having detected a lower layer failure returns to idle mode with the CC entities relating to the seven mobile terminating transaction identifiers in CC-state U0, "Null".

## 26.8.1.3.3.6.4 Method of test

## Related PICS/PIXIT statements

- supported MT circuit switched basic services;
- MT circuit switched basic services for which immediate connect is not used.

## Initial conditions

## System Simulator:

1 cell, default parameters.

## Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U9 by using table 26.8.1.3/4.

## Foreseen final state of the MS

U0, null.

## Maximum duration of test

1 min 30 s.

## Test procedure

An MT circuit switched basic service is selected that is supported by the MS and for which the MS does not use immediate connection; if the MS supports MT telephony without immediate connection, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then a mobile terminated call is initiated. The MS is brought to the state U9. The SS generates a lower layer failure at the MS. The SS waits long enough to enable the MS to return to idle state listening to paging, and then pages MS to create RR-connection. Finally, the SS will check the state of the MS by using STATUS ENQUIRY with the relevant transaction identifiers.

## Expected sequence

| Step | Direction | Message              | Comments                                                                 |
|------|-----------|----------------------|--------------------------------------------------------------------------|
| 1    | SS        |                      | SS generates lower layer failure                                         |
| 2    | SS        |                      | SS waits 20 s for the MS to return to listening to paging                |
| 3    | SS -> MS  | PAGING REQUEST       |                                                                          |
| 4    | MS -> SS  | CHANNEL REQUEST      |                                                                          |
| 5    | SS -> MS  | IMMEDIATE ASSIGNMENT |                                                                          |
| 6    | MS -> SS  | PAGING RESPONSE      |                                                                          |
| 7    | SS -> MS  | STATUS ENQUIRY       |                                                                          |
| 8    | MS -> SS  | RELEASE COMPLETE     | cause 81# (invalid TI value)                                             |
| 9    | SS        |                      | repeat steps 7-8 to cover all the transaction identifiers from 000...110 |
| 10   | SS -> MS  | CHANNEL RELEASE      | the main signalling link shall be released by the MS (L2: DISC/UA).      |

26.8.1.3.3.7 Incoming call / U9 mobile terminating call confirmed / unknown message received

26.8.1.3.3.7.1 Definition and applicability

The call control entity of the MS being in the state, U9, an unknown message is received by the MS. This test is applicable for any equipment supporting at least MT circuit switched basic service, for which immediate connect is not used.

26.8.1.3.3.7.2 Conformance requirement

- 1) A CC-entity of the MS in CC-state U9, "MS Terminating Call Confirmed" having received an unknown message from its peer entity shall return a STATUS message.

#### References

3GPP TS 04.08 / 3GPP TS 24.008 subclause 8.4.

26.8.1.3.3.7.3 Test purpose

To verify that a CC-entity of the MS in CC-state U9, "MS Terminating Call Confirmed" having received an unknown message from its peer entity returns a STATUS message.

26.8.1.3.3.7.4 Method of test

#### Related PICS/PIXIT statements

- supported MT circuit switched basic services;
- MT circuit switched basic services for which immediate connect is not used.

#### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U9 by using table 26.8.1.3/4.

#### Foreseen final state of the MS

U9, mobile terminating call proceeding.

#### Maximum duration of test

30 s.

#### Test procedure

A MT circuit switched basic service is selected that is supported by the MS and for which the MS does not use immediate connection; if the MS supports MT telephony without immediate connection, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then a mobile terminated call is initiated. The CC entity of the MS is brought to the state U9. The SS sends a message with message type not defined for the protocol discriminator to the MS. The MS shall respond with a STATUS message, and finally the SS checks by using the status enquiry procedure that the state of the CC entity has remained unchanged.

Expected sequence

| Step | Direction | Message         | Comments                        |
|------|-----------|-----------------|---------------------------------|
| 1    | SS -> MS  | unknown message | message type not defined for PD |
| 2    | MS -> SS  | STATUS          | cause 97#, state U9             |
| 3    | SS -> MS  | STATUS ENQUIRY  |                                 |
| 4    | MS -> SS  | STATUS          | cause 30#, state U9             |

Specific message contents:

None.

26.8.1.3.4 Incoming call / U7 call received

26.8.1.3.4.1 Incoming call / U7 call received / call accepted

26.8.1.3.4.1.1 Definition and applicability

The call control entity of the MS being in the state, U7, a user accepts the incoming call. This test is applicable for any equipment supporting at least one mobile terminating circuit switched basic service for which immediate connect is not used.

26.8.1.3.4.1.2 Conformance requirement

- 1) A CC entity of a MS in CC-state U7, "Call Received", upon a user accepting the incoming call, shall send a CONNECT message to its peer entity and enter the CC-state U8, "Connect Request".

References

3GPP TS 04.07 subclause 6.2.2,  
3GPP TS 04.08 / 3GPP TS 24.008 subclause 5.2.2.5.

26.8.1.3.4.1.3 Test purpose

To verify that a CC entity of a MS in CC-state U7, "Call Received", upon a user accepting the incoming call, shall send a CONNECT message to its peer entity and enter the CC-state U8, "Connect Request"

26.8.1.3.4.1.4 Method of test

Related PICS/PIXIT statements

- supported MT circuit switched basic services;
- MT circuit switched basic services for which immediate connect is not used.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U7 by using table 26.8.1.3/3.

Foreseen final state of the MS

U8, connect request.

Maximum duration of test

30 s.

Test procedure

An MT circuit switched basic service is selected that is supported by the MS and for which the MS does not use immediate connection; if the MS supports MT telephony without immediate connection, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then a mobile terminated call is initiated. The CC entity of the MS is brought to the state U7. The user accepts the incoming call. The MS sends a CONNECT message. The SS checks by using the status enquiry procedure that the CC entity has entered state U8, connect request.

Expected sequence

| Step | Direction | Message        | Comments                                      |
|------|-----------|----------------|-----------------------------------------------|
| 1    |           |                | the MS is made to accept the call by the user |
| 2    | MS -> SS  | CONNECT        |                                               |
| 3    | SS -> MS  | STATUS ENQUIRY |                                               |
| 4    | MS -> SS  | STATUS         | cause 30#, state U8                           |

Specific message contents:

26.8.1.3.4.2 Incoming call / U7 call received / termination requested by the user

26.8.1.3.4.2.1 Definition and applicability

The call control entity of the MS being in the state, U7, a user requests to terminate incoming call. This test is applicable for any equipment supporting at least one mobile terminating circuit switched basic service for which immediate connect is not used.

26.8.1.3.4.2.2 Conformance requirement

- 1) A CC entity of a MS in CC-state U7, "Call Received", upon request by the user to terminate shall send a DISCONNECT message and enter the CC-state U11, "Disconnect Request".

References

3GPP TS 04.07 subclause 6.2.2,  
3GPP TS 04.08 / 3GPP TS 24.008 subclause 5.4.3.

26.8.1.3.4.2.3 Test purpose

To verify that a CC entity of a MS in CC-state U7, "Call Received", upon request by the user to terminate will send a DISCONNECT message and enter the CC-state U11, "Disconnect Request".

26.8.1.3.4.2.4 Method of test

Related PICS/PIXIT statements

- supported MT circuit switched basic services;
- MT circuit switched basic services for which immediate connect is not used.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U7 by using table 26.8.1.3/3.

Foreseen final state of the MS

U11, disconnect request.

Maximum duration of test

30 s.

Test procedure

An MT circuit switched basic service is selected that is supported by the MS and for which the MS does not use immediate connection; if the MS supports MT telephony without immediate connection, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then a mobile terminated call is initiated. The CC entity of the MS is brought to the state U7. The user initiates clearing the incoming call. The MS sends a DISCONNECT message. The SS checks by using the status enquiry procedure that the CC entity has entered state U11, disconnect request.

Expected sequence

| Step | Direction | Message        | Comments                                                                |
|------|-----------|----------------|-------------------------------------------------------------------------|
| 1    |           |                | the MS is made to terminate/reject the call<br><br>cause 30#, state U11 |
| 2    | MS -> SS  | DISCONNECT     |                                                                         |
| 3    | SS -> MS  | STATUS ENQUIRY |                                                                         |
| 4    | MS -> SS  | STATUS         |                                                                         |

26.8.1.3.4.5 Incoming call / U7 call received / lower layer failure

26.8.1.3.4.5.1 Definition and applicability

The call control entity of the MS being in the state, U7, a lower layer failure is accomplished at the MS and consequently, communication at layer 3 level with the peer entity is terminated. This test is applicable for any equipment supporting at least one mobile terminating circuit switched basic service for which immediate connect is not used.

26.8.1.3.4.5.2 Conformance requirement

- 1) A CC entity of a MS in CC-state U7, "Call Received", having detected a lower layer failure shall return to idle mode with the CC entities relating to the seven mobile terminating transaction identifiers in CC-state U0, "Null".

References

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.5.2.3, 4.5.3, 5.5.3.2 and 8.3.

26.8.1.3.4.5.3 Test purpose

To verify that a CC entity of a MS in CC-state U7, "Call Received", having detected a lower layer failure returns to idle mode with the CC entities relating to the seven mobile terminating transaction identifiers in CC-state U0, "Null".

26.8.1.3.4.5.4 Method of test

Related PICS/PIXIT statements

- supported MT circuit switched basic services;
- MT circuit switched basic services for which immediate connect is not used.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U7 by using table 26.8.1.3/2.

## Foreseen final state of the MS

U0, null.

## Maximum duration of test

1 min 30 s.

## Test procedure

An MT circuit switched basic service is selected that is supported by the MS and for which the MS does not use immediate connection; if the MS supports MT telephony without immediate connection, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then a mobile terminated call is initiated. The MS is brought to the state U7. The SS generates a lower layer failure at the MS. The SS waits long enough to enable the MS to return to idle state listening to paging, and then pages MS to create RR-connection. Finally, the SS will check the state of the MS by using STATUS ENQUIRY with the relevant transaction identifiers.

## Expected sequence

| Step | Direction | Message              | Comments                                                                 |
|------|-----------|----------------------|--------------------------------------------------------------------------|
| 1    | SS        |                      | SS generates lower layer failure                                         |
| 2    | SS        |                      | SS waits 20 s for the MS to return to listening to paging                |

26.8.1.3.4.6 Incoming call / U7 call received / unknown message received

26.8.1.3.4.6.1 Definition and applicability

The call control entity of the MS being in the state, U7, an unknown message is received by the MS. This test is applicable for any equipment supporting at least one mobile terminating circuit switched basic service for which immediate connect is not used.

26.8.1.3.4.6.2 Conformance requirement

- 1) A CC entity of a MS in CC-state U7, "Call Received", having received an unknown message from its peer entity shall return a STATUS message.

## References

3GPP TS 04.08 / 3GPP TS 24.008 subclause 8.4.

26.8.1.3.4.6.3 Test purpose

To verify that a CC entity of a MS in CC-state U7, "Call Received", having received an unknown message from its peer entity returns a STATUS message.

## 26.8.1.3.4.6.4 Method of test

## Related PICS/PIXIT statements

- supported MT circuit switched basic services;
- MT circuit switched basic services for which immediate connect is not used.

## Initial conditions

## System Simulator:

1 cell, default parameters.

## Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U7 by using table 26.8.1.3/3.

## Foreseen final state of the MS

U7, call received.

## Maximum duration of test

30 s.

## Test procedure

An MT circuit switched basic service is selected that is supported by the MS and for which the MS does not use immediate connection; if the MS supports MT telephony without immediate connection, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then a mobile terminated call is initiated. The CC entity of the MS is brought to the state U7. The SS sends a message with message type not defined for the protocol discriminator to the MS. The MS shall respond with a STATUS message, and finally the SS checks by using the status enquiry procedure that the state of the CC entity has remained unchanged.

## Expected sequence

| Step | Direction | Message         | Comments                        |
|------|-----------|-----------------|---------------------------------|
| 1    | SS -> MS  | unknown message | message type not defined for PD |
| 2    | MS -> SS  | STATUS          | cause 97#, state U7             |
| 3    | SS -> MS  | STATUS ENQUIRY  |                                 |
| 4    | MS -> SS  | STATUS          | cause 30#, state U7             |

## Specific message contents:

None.

## 26.8.1.3.4.7 Incoming call / U7 call received / TCH assignment

## 26.8.1.3.4.7.1 Definition and applicability

The call control entity of the MS being in the state, U7, an assignment procedure is performed for traffic channel. This test is applicable for any equipment supporting at least one mobile terminating circuit switched basic service for which immediate connect is not used.

#### 26.8.1.3.4.7.2 Conformance requirement

- 1) A CC entity of a MS in CC-state U7, "Call Received", when allocated a traffic channel by the network performing the assignment procedure, shall perform a layer 2 establishment on the FACCH without changing the state of the call in progress.

#### References

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.4.3,  
3GPP TS 04.08 / 3GPP TS 24.008 subclause 5.2.2.7.

#### 26.8.1.3.4.7.3 Test purpose

To verify that a CC entity of a MS in CC-state U7, "Call Received", when allocated a traffic channel by the network performing the assignment procedure, shall perform a layer 2 establishment on the FACCH without changing the state of the call in progress.

#### 26.8.1.3.4.7.4 Method of test

#### Related PICS/PIXIT statements

- supported MT circuit switched basic services;
- MT circuit switched basic services for which immediate connect is not used.

#### Initial conditions

##### System Simulator:

1 cell, default parameters.

##### Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U7 by using table 26.8.1.3/1.

#### Foreseen final state of the MS

U7, call received.

#### Maximum duration of test

30 s.

#### Test procedure

An MT circuit switched basic service is selected that is supported by the MS and for which the MS does not use immediate connection; if the MS supports MT telephony without immediate connection, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then a mobile terminated call is initiated. The CC entity of the MS is brought to the state U7. The SS sends an ASSIGNMENT COMMAND for traffic channel to the MS. The MS shall establish layer 2 link on the newly allocated channel and respond with an ASSIGNMENT COMPLETE message. The SS verifies by using the status enquiry procedure that the state of the CC entity has remained unchanged.

Expected sequence

| Step | Direction | Message             | Comments                              |
|------|-----------|---------------------|---------------------------------------|
| 1    | SS -> MS  | ASSIGNMENT COMMAND  | TCH<br>the MS shall establish L2 link |
| 2    | MS        |                     |                                       |
| 3    | MS -> SS  | ASSIGNMENT COMPLETE | cause 30#, state U7                   |
| 4    | SS -> MS  | STATUS ENQUIRY      |                                       |
| 5    | MS -> SS  | STATUS              |                                       |

Specific message contents:

26.8.1.3.4.8 Incoming call / U7 call received / RELEASE COMPLETE received

26.8.1.3.4.8.1 Definition and applicability

The call control entity of the MS being in the state, U7, the call is cleared by a RELEASE COMPLETE message sent by the SS. This test is applicable for any equipment supporting at least one mobile terminating circuit switched basic service, for which immediate connect is not used.

26.8.1.3.4.8.2 Conformance requirement

- 1) A CC entity of the MS in CC-state U7, "call received", upon receipt of a RELEASE COMPLETE message with valid cause value, shall enter CC state U0, "Null".
- 2) On returning to idle mode, the CC entities relating to the seven mobile terminating transaction identifiers shall be in state U0, "Null".

References

Conformance requirement 1: 3GPP TS 04.08 / 3GPP TS 24.008, subclauses 5.4.2 and 5.4.4.

Conformance requirement 2: 3GPP TS 04.08 / 3GPP TS 24.008, subclause 5.4.4.3.

26.8.1.3.4.8.3 Test purpose

- 1) To verify that a CC entity of the MS in CC-state U7, "Call received", upon receipt of a RELEASE COMPLETE message with valid cause value, enters CC state U0, "Null".
- 2) To verify that in returning to idle mode, the CC entities relating to the seven mobile terminating transaction identifiers are in state U0, "Null".

26.8.1.3.4.8.4 Method of test

Related PICS/PIXIT statements

- supported MT circuit switched basic services;  
MT circuit switched basic services for which immediate connect is not used.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U7 by using table 26.8.1.3/1.

Foreseen final state of the MS

U0, null.

Maximum duration of test

30 s.

Test procedure

An MT circuit switched basic service is selected that is supported by the MS and for which the MS does not use immediate connection; if the MS supports MT telephony without immediate connection, the selected service is telephony. If necessary, the MS is configured for that basic service. The a mobile terminated call is initiated. the CC entity of the MS is brought to U7. The SS sends a RELEASE COMPLETE message to the MS. The SS checks by using the status enquiry procedure that the CC entity has entered the state U0 with all the relevant transaction identifiers.

Expected sequence

| Step | Direction | Message          | Comments                                                                                                         |
|------|-----------|------------------|------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | RELEASE COMPLETE | note 1                                                                                                           |
| 2    | SS -> MS  | STATUS ENQUIRY   |                                                                                                                  |
| 3    | MS -> SS  | RELEASE COMPLETE | cause 81# (invalid TI value), note 2<br>repeat steps 2-3 to cover all the transaction identifiers from 000...110 |
| 4    | SS        |                  |                                                                                                                  |
| 5    | SS -> MS  | CHANNEL RELEASE  | the main signalling link shall be released by the MS (L2: DISC/UA).                                              |

Specific message contents:

NOTE 1: With the cause value chosen arbitrarily.

NOTE 2: TI flag has the value indicating the SS as a originator of the call.

#### 26.8.1.3.5 Incoming call / U8 connect request

##### 26.8.1.3.5.1 Incoming call / U8 connect request / CONNECT acknowledged

###### 26.8.1.3.5.1.1 Definition and applicability

The call control entity of the MS being in the state, U8, a CONNECT ACKNOWLEDGE message is received by the MS. This test is applicable for any equipment supporting at least one mobile terminating circuit switched basic service.

###### 26.8.1.3.5.1.2 Conformance requirement

A CC entity of a MS in CC-state U8, "Connect Request", upon receipt of CONNECT ACKNOWLEDGE shall enter the CC-state U10, "Call Active".

References

3GPP TS 04.08 / 3GPP TS 24.008 subclause 5.2.2.6.

###### 26.8.1.3.5.1.3 Test purpose

To verify that a CC entity of a MS in CC-state U8, "Connect Request", upon receipt of CONNECT ACKNOWLEDGE shall enter the CC-state U10, "Call Active".

## 26.8.1.3.5.1.4 Method of test

## Related PICS/PIXIT statements

- supported MT circuit switched basic services;
- MT circuit switched basic services for which immediate connect is not used.

## Initial conditions

## System Simulator:

1 cell, default parameters.

## Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U8 by using table 26.8.1.3/2.

## Foreseen final state of the MS

U10, active.

## Maximum duration of test

30 s.

## Test procedure

An MT circuit switched basic service is selected that is supported by the MS; if the MS supports MT telephony, the selected basic service is telephony. If necessary the MS is configured for that basic service. Then a mobile terminated call is initiated. The CC entity of the MS is brought to the state U8 (if the MS uses immediate connection for the selected basic service then p = Y, otherwise p = N). The SS sends a CONNECT ACKNOWLEDGE message. The SS checks by using the status enquiry procedure that the CC entity of the MS has entered state U10, active.

## Expected sequence

| Step | Direction | Message             | Comments             |
|------|-----------|---------------------|----------------------|
| A1   | SS -> MS  | ASSIGNMENT COMMAND  | p = Y                |
| A2   | MS -> SS  | ASSIGNMENT COMPLETE |                      |
| 3    | SS -> MS  | CONNECT ACKNOWLEDGE | cause 30#, state U10 |

## 26.8.1.3.5.2 Incoming call / U8 connect request / timer T313 time-out

## 26.8.1.3.5.2.1 Definition and applicability

The call control entity of the MS being in the state, U8, if no response is then received from the SS, timer T313 expires at the MS side. This test is applicable for any equipment supporting at least one mobile terminating circuit switched basic service.

#### 26.8.1.3.5.2.2 Conformance requirement

A CC entity of a MS in CC-state U8, "Connect Request", having waited for a reasonable length of time (e.g. expiry of timer T313) without receiving the appropriate protocol message to complete the incoming call, shall initiate the clearing of that incoming call by sending the CC message DISCONNECT and enter the CC-state U11, "Disconnect Request".

If an MS disconnects too early then, in the case of very late assignment of a traffic channel, systematic waste of radio resources may occur.

#### References

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 5.2.2.6 and 5.4.3.

#### 26.8.1.3.5.2.3 Test purpose

26.8.1.3.5.3 Incoming call / U8 connect request / termination requested by the user

26.8.1.3.5.3.1 Definition and applicability

The call control entity of the MS being in the state, U10, the user requests for releasing of the call. This test is applicable for any equipment supporting at least one mobile terminating circuit switched basic service.

26.8.1.3.5.3.2 Conformance requirement

- 1) A CC entity of a MS in CC-state U8, "Connect Request", upon request by the user to terminate shall send a DISCONNECT message and enter the CC-state U11, "Disconnect Request".

References

3GPP TS 04.07 subclause 6.2.2,  
3GPP TS 04.08 / 3GPP TS 24.008 subclause 5.4.3,  
3GPP TS 11.10, annex 3 and subclause 2.2.

26.8.1.3.5.3.3 Test purpose

To verify that a CC entity of a MS in CC-state U8, "Connect Request", upon request by the user to terminate will send a DISCONNECT message and enter the CC-state U11, "Disconnect Request".

26.8.1.3.5.3.4 Method of test

Related PICS/PIXIT statements

- supported MT circuit switched basic services;
- MT circuit switched basic services for which immediate connect is not used.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U8 by using table 26.8.1.3/2.

Foreseen final state of the MS

U11, disconnect request.

Maximum duration of test

30 s.

Test procedure

An MT circuit switched basic service is selected that is supported by the MS; if the MS supports MT telephony, the selected basic service is telephony. If necessary the MS is configured for that basic service. Then a mobile terminated call is initiated. The CC entity of the MS is brought to the state U8 (if the MS uses immediate connection for the selected basic service then p = Y, otherwise p = N). Then the user requests termination of the call. The MS sends a DISCONNECT message and enters state U11, disconnect request. The SS verifies by using the status enquiry procedure that the MS has entered the correct state.

Expected sequence

26.8.1.3.5.4 Incoming call / U8 connect request / DISCONNECT received with in-band information

26.8.1.3.5.4.1 Definition and applicability

The call control entity of the MS being in the state, U8, a DISCONNECT message indicating availability of in band information is received by the MS. This test is applicable for any equipment supporting at least one mobile terminating circuit switched basic service.

26.8.1.3.5.4.2 Conformance requirement

A CC entity of a MS in CC-state U8, "Connect Request", upon receipt of a DISCONNECT with progress indicator #8 shall enter CC-state U12, if the traffic channel is in speech mode. If the TCH is not in speech mode, the MS shall send a RELEASE message and enter CC-state U19.

References

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 5.4.4 and 5.5.1.

26.8.1.3.5.4.3 Test purpose

To verify that a CC entity of a MS in CC-state U8, "Connect Request", upon receipt of a DISCONNECT with progress indicator #8 enters CC-state U12, if the traffic channel is in speech mode, and that the MS sends a RELEASE message and enters CC-state U19 if the TCH is not in speech mode.

26.8.1.3.5.4.4 Method of test

Related PICS/PIXIT statements

- supported MT circuit switched basic services.

## Initial conditions

## System Simulator:

1 cell, default parameters.

## Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN. The MS is brought into the state U8 by using table 26.8.1.3/3.

## Foreseen final state of the MS

U12, disconnect indication or U19 depending on the bearer capabilities.

## Maximum duration of test

30 s.

## Test procedure

An MT circuit switched basic service is selected that is supported by the MS; if the MS supports MT telephony, the selected basic service is telephony. If necessary the MS is configured for that basic service. Then a mobile terminated call is initiated. The CC entity of the MS is brought to the state U8. The SS sends a DISCONNECT message containing indication of in-band information availability to the MS. If channel mode is speech, the MS enters state U12, disconnect indication. If channel mode is not speech, the MS sends a RELEASE message and enters state U19, release request.

## Expected sequence

26.8.1.3.5.5 Incoming call / U8 connect request / DISCONNECT received without in-band information

26.8.1.3.5.5.1 Definition and applicability

The call control entity of the MS being in the state, U8, a DISCONNECT message is received by the MS. The DISCONNECT message does not contain indication of in-band information availability. This test is applicable for any equipment supporting at least one mobile terminating circuit switched basic service.

26.8.1.3.5.5.2 Conformance requirement

- 1) A CC entity of a MS in CC-state U8, "Connect Request", upon receipt of a DISCONNECT without progress indicator, shall return a RELEASE message and enter the CC-state U19, "Release Request".

## References

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 5.4.4 and 5.4.4.2.

## 26.8.1.3.5.5.3 Test purpose

To verify that a CC entity of a MS in CC-state U8, "Connect Request", upon receipt of a DISCONNECT without progress indicator, returns a RELEASE message and enters the CC-state U19, "Release Request".

## 26.8.1.3.5.5.4 Method of test

## Related PICS/PIXIT statements

- supported MT circuit switched basic services.

## Initial conditions

## System Simulator:

1 cell, default parameters.

## Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U8 by using table 26.8.1.3/3.

## Foreseen final state of the MS

U19, release request.

## Maximum duration of test

30 s.

## Test procedure

An MT circuit switched basic service is selected that is supported by the MS; if the MS supports MT telephony, the selected basic service is telephony. If necessary the MS is configured for that basic service. Then a mobile terminated call is initiated. The CC entity of the MS is brought to the state U8. The SS sends a DISCONNECT message not containing indication of in-band information availability to the MS. The MS shall respond with a RELEASE message. The SS checks by using the status enquiry procedure that the CC entity of the MS has entered the state U19, release request.

## Expected sequence

| Step | Direction | Message        | Comments             |
|------|-----------|----------------|----------------------|
| 1    | SS -> MS  | DISCONNECT     | (note)               |
| 2    | MS -> SS  | RELEASE        |                      |
| 3    | SS -> MS  | STATUS ENQUIRY |                      |
| 4    | MS -> SS  | STATUS         | cause 30#, state U19 |

## Specific message contents:

NOTE: Without a progress indicator indicating in-band information.

## 26.8.1.3.5.6 Incoming call / U8 connect request / RELEASE received

## 26.8.1.3.5.6.1 Definition and applicability

The call control entity of the MS being in the state, U8, a RELEASE message is received by the MS. This test is applicable for any equipment supporting at least one mobile terminating circuit switched basic service.

#### 26.8.1.3.5.6.2 Conformance requirement

- 1) A CC entity of a MS in CC-state U8, "Connect Request", upon receipt of a RELEASE shall return a RELEASE COMPLETE and enter the CC-state U0, "Null".
- 2) On returning to the idle mode the MS shall release the MM-connection and the CC-entities relating to the seven mobile terminating transaction identifiers shall be in CC-state U0, "Null".

#### References

Conformance requirement 1: 3GPP TS 04.08 / 3GPP TS 24.008 subclause 5.4.4.

Conformance requirement 2: 3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.5.3 and 5.5.3.2.

#### 26.8.1.3.5.6.3 Test purpose

- 1) To verify that a CC entity of a MS in CC-state U8, "Connect Request", upon receipt of a RELEASE will return a RELEASE COMPLETE and enter the CC-state U0, "Null".
- 2) To verify that the MS on returning to the idle mode releases the MM-connection and that the CC-entities relating to the seven mobile terminating transaction identifiers are in CC-state U0, "Null".

#### 26.8.1.3.5.6.4 Method of test

#### Related PICS/PIXIT statements

- supported MT circuit switched basic services.

#### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U8 by using table 26.8.1.3/3.

#### Foreseen final state of the MS

U0, null.

#### Maximum duration of test

1 min.

#### Test procedure

An MT circuit switched basic service is selected that is supported by the MS; if the MS supports MT telephony, the selected basic service is telephony. If necessary the MS is configured for that basic service. Then a mobile terminated call is initiated. The CC entity of the MS is brought to the state U8. The SS sends a RELEASE message. The MS responds with a RELEASE COMPLETE message. The SS checks by using the status enquiry procedure that the CC entity has entered state U0, null, with the relevant transaction identifiers.

Expected sequence

| Step | Direction | Message          | Comments                                                                 |
|------|-----------|------------------|--------------------------------------------------------------------------|
| 1    | SS -> MS  | RELEASE          | with cause "Normal, unspecified"                                         |
| 2    | MS -> SS  | RELEASE COMPLETE |                                                                          |
| 3    | SS -> MS  | STATUS ENQUIRY   |                                                                          |
| 4    | MS -> SS  | RELEASE COMPLETE | cause 81# (invalid TI value)                                             |
| 5    | SS        |                  | repeat steps 3-4 to cover all the transaction identifiers from 000...110 |
| 6    | SS -> MS  | CHANNEL RELEASE  | the main signalling link shall be released by the MS (L2: DISC/UA).      |

26.8.1.3.5.7 Incoming call / U8 connect request / lower layer failure

26.8.1.3.5.7.1 Definition and applicability

The call control entity of the MS being in the state, U8, a lower layer failure is accomplished at the MS and consequently, communication at layer 3 level with the peer entity is terminated. This test is applicable for any equipment supporting at least one mobile terminating circuit switched basic service.

26.8.1.3.5.7.2 Conformance requirement

- 1) A CC entity of a MS in CC-state U8, "Connect Request", having detected a lower layer failure shall return to idle mode with the CC entities relating to the seven mobile terminating transaction identifiers in CC-state U0, "Null".

References

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.5.2.3, 4.5.3 and 5.5.3.2.

26.8.1.3.5.7.3 Test purpose

To verify that a CC entity of a MS in CC-state U8, "Connect Request", having detected a lower layer failure returns to idle mode with the CC entities relating to the seven mobile terminating transaction identifiers in CC-state U0, "Null".

26.8.1.3.5.7.4 Method of test

Related PICS/PIXIT statements

- supported MT circuit switched basic services.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U8 by using table 26.8.1.3/1.

Foreseen final state of the MS

U0, null.

## Maximum duration of test

1 min 30 s.

## Test procedure

An MT circuit switched basic service is selected that is supported by the MS; if the MS supports MT telephony, the selected basic service is telephony. If necessary the MS is configured for that basic service. Then a mobile terminated call is initiated. The MS is brought to the state U8. The SS generates a lower layer failure at the MS. The SS waits long enough to enable the MS to return to idle state listening to paging, and then pages MS to create RR-connection. Finally, the SS will check the state of the MS by using STATUS ENQUIRY with the relevant transaction identifiers.

## Expected sequence

| Step | Direction | Message              | Comments                                                                 |
|------|-----------|----------------------|--------------------------------------------------------------------------|
| 1    | SS        |                      | SS generates lower layer failure                                         |
| 2    | SS        |                      | SS waits 20 s for the MS to return to listening to paging                |
| 3    | SS -> MS  | PAGING REQUEST       |                                                                          |
| 4    | MS -> SS  | CHANNEL REQUEST      |                                                                          |
| 5    | SS -> MS  | IMMEDIATE ASSIGNMENT |                                                                          |
| 6    | MS -> SS  | PAGING RESPONSE      |                                                                          |
| 7    | SS -> MS  | STATUS ENQUIRY       |                                                                          |
| 8    | MS -> SS  | RELEASE COMPLETE     | cause 81# (invalid TI value)                                             |
| 9    | SS        |                      | repeat steps 7-8 to cover all the transaction identifiers from 000...110 |
| 10   | SS -> MS  | CHANNEL RELEASE      | the main signalling link shall be released by the MS (L2: DISC/UA).      |

26.8.1.3.5.8 Incoming call / U8 connect request / TCH assignment

26.8.1.3.5.8.1 Definition and applicability

The call control entity of the MS being in the state, U8, an assignment procedure is performed for traffic channel. This test is applicable for any equipment supporting at least one mobile terminating circuit switched basic service.

26.8.1.3.5.8.2 Conformance requirement

- 1) A CC entity of a MS in CC-state U8, "Connect Request", when allocated a traffic channel by the network performing the assignment procedure, shall perform a layer 2 establishment on the FACCH without changing the state of the call in progress.

## References

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.4.3,  
3GPP TS 04.08 / 3GPP TS 24.008 subclause 5.2.2.7.

26.8.1.3.5.8.3 Test purpose

To verify that a CC entity of a MS in CC-state U8, "Connect Request", when allocated a traffic channel by the network performing the assignment procedure, shall perform a layer 2 establishment on the FACCH without changing the state of the call in progress.

26.8.1.3.5.8.4 Method of test

## Related PICS/PIXIT statements

- supported MT circuit switched basic services.

## Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U8 by using table 26.8.1.3/1.

## Foreseen final state of the MS

U8, connect request.

## Maximum duration of test

30 s.

## Test procedure

An MT circuit switched basic service is selected that is supported by the MS; if the MS supports MT telephony, the selected basic service is telephony. If necessary the MS is configured for that basic service. Then a mobile terminated call is initiated. The CC entity of the MS is brought to the state U8. The SS sends an ASSIGNMENT COMMAND for traffic channel to the MS. The MS shall establish layer 2 link on the newly allocated channel and respond with an ASSIGNMENT COMPLETE message. The SS verifies by using the status enquiry procedure that the state of the CC entity has remained unchanged.

## Expected sequence

| Step | Direction | Message             | Comments            |
|------|-----------|---------------------|---------------------|
| 1    | SS -> MS  | ASSIGNMENT COMMAND  | TCH                 |
| 2    | MS -> SS  | ASSIGNMENT COMPLETE |                     |
| 3    | SS -> MS  | STATUS ENQUIRY      |                     |
| 4    | MS -> SS  | STATUS              | cause 30#, state U8 |

26.8.1.3.5.9 Incoming call / U8 connect request / unknown message received

26.8.1.3.5.9.1 Definition and applicability

The call control entity of the MS being in the state, U8, an unknown message is received by the MS. This test is applicable for any equipment supporting at least one mobile terminating circuit switched basic service.

26.8.1.3.5.9.2 Conformance requirement

- 1) A CC entity of a MS in CC-state U8, "Connect Request", having received an unknown message from its peer entity shall return a STATUS message.

## References

3GPP TS 04.08 / 3GPP TS 24.008 subclause 8.4.

26.8.1.3.5.9.3 Test purpose

To verify that a CC entity of a MS in CC-state U8, "Connect Request", having received an unknown message from its peer entity returns a STATUS message.

## 26.8.1.3.5.9.4 Method of test

## Related PICS/PIXIT statements

- supported MT circuit switched basic services.

## Initial conditions

## System Simulator:

1 cell, default parameters.

## Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U8 by using table 26.8.1.3/1.

## Foreseen final state of the MS

U8, connect request.

## Maximum duration of test

30 s.

## Test procedure

An MT circuit switched basic service is selected that is supported by the MS; if the MS supports MT telephony, the selected basic service is telephony. If necessary the MS is configured for that basic service. Then a mobile terminated call is initiated. The CC entity of the MS is brought to the state U8. The SS sends a message with message type not defined for the protocol discriminator to the MS. The MS shall respond with a STATUS message, and finally the SS checks by using the status enquiry procedure that the state of the CC entity has remained unchanged.

## Expected sequence

| Step | Direction | Message         | Comments                        |

## 26.8.1.4 In call functions

## 26.8.1.4.1 In-call functions / DTMF information transfer

## 26.8.1.4.1.1 In-call functions / DTMF information transfer / basic procedures

## 26.8.1.4.1.1.1 Definition and applicability

Dual Tone Multi Frequency (DTMF) is an inband one out of four plus one out of four signalling system primarily used from terminal instruments in telecommunication networks.

The support of DTMF is only permitted when a bearer capability for speech is in use or during the speech phase of alternate speech/data and alternate speech/facsimile teleservices.

#### 26.8.1.4.1.1.2 Conformance requirement

- 1) An MS supporting the Mobile originating DTMF protocol control procedure, having a CC entity for speech in state U10, "Active": when made to send a DTMF tone, shall send a START DTMF message on the correct DCCH.

#### References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 5.3.3.

- 2) An MS supporting the Mobile originating DTMF protocol control procedure, having a CC entity for speech in state U10, "Active": when made to send a DTMF tone (the corresponding IA5 character being selected from among the ones supported), shall send a START DTMF message specifying the correct IA5 character in the "keypad information" field of the keypad facility information element.

2.1 3GPP TS 04.08 / 3GPP TS 24.008, subclause 5.3.3.

#### 26.8.1.4.1.1.3 Test purpose

- 1) To verify that an MS supporting the Mobile originating DTMF protocol control procedure, having a CC entity for speech in state U10, "Active": when made to send a DTMF tone, sends a START DTMF message on the correct DCCH.
- 2) To verify that an MS supporting the Mobile originating DTMF protocol control procedure, having a CC entity for speech in state U10, "Active": when made to send a DTMF tone (the corresponding IA5 character being selected from among the ones supported), sends a START DTMF message specifying the correct IA5 character in the "keypad information" field of the keypad facility information element.

#### 26.8.1.4.1.1.4 Method of test

##### Related PICS/PIXIT statements

- supported teleservices;
- supported character set (e.g. 0-9, #, \*, A, B, C, D);
- if and how DTMF tone is indicated to the user.

##### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in CC-state "active".

##### Foreseen final state of the MS

CC-state "active".

##### Maximum duration of test

1 min.

## Test procedure

The MS being in the call active state, a user causes a DTMF tone to be generated e.g. by depression of a key in the MS. A DTMF digit corresponding to the digit indicated by the user is sent in a START DTMF message by the MS. The SS will return a START DTMF ACKNOWLEDGE message to the MS. This acknowledgement may be used in the MS to generate an indication as a feedback for a successful transmission. Then the user indicates that the DTMF sending should cease e.g. by releasing the key. The MS will send a STOP DTMF message to the network which is acknowledged with STOP DTMF ACKNOWLEDGE by the SS.

The sequence described above is repeated for each of the applicable characters 0-9, #, \*, A, B, C, and D.

Then a case of rejecting a DTMF tone is tested and the state of the MS is verified.

## Expected sequence

| Step | Direction      | Message                | Comments                                                                                                                          |

### 26.8.1.4.2 In-call functions / user notification

User notification procedure allows the network to notify a MS of any call-related event during the "active" state of a call. It also may allow a MS to notify the remote user of any appropriate call-related event during the "active" state of a call by sending a NOTIFY message containing a notification indicator to the network. No state change occurs at any of the interface sides during this procedure.

#### 26.8.1.4.2.1 In-call functions / User notification / MS terminated

##### 26.8.1.4.2.1.1 Definition and applicability

This is a case for testing user notification procedure terminated by the mobile station. The test is applicable for those equipments supporting at least one circuit switched basic service.

##### 26.8.1.4.2.1.2 Conformance requirement

- 1) A CC entity of a MS in CC-state U10, "active", upon receiving of a NOTIFY message shall remain in the active state.

## References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 5.3.1.

## 26.8.1.4.2.1.3 Test purpose

To verify that a CC entity of a MS in CC-state U10, "active", upon receiving of a NOTIFY message remains in the active state.

## 26.8.1.4.2.1.4 Method of test

## Related PICS/PIXIT statements

- supported circuit switched basic services.

## Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in CC-state "active".

## Foreseen final state of the MS

CC-state "active".

## Maximum duration of test

10 s.

## Test procedure

The MS being in the call active state, the SS will send a NOTIFY message to the MS. The state of the MS is checked after that.

## Expected sequence

| Step | Direction | Message        | Comments             |
|------|-----------|----------------|----------------------|
| 1    | SS -> MS  | NOTIFY         |                      |
| 2    | SS -> MS  | STATUS ENQUIRY |                      |
| 3    | MS -> SS  | STATUS         | cause 30#, state U10 |

## Specific message contents:

None.

## 26.8.1.4.3 In-call functions / channel changes

The two following test cases are for testing some elementary radio resource level procedures during an active state of a call to ensure call maintenance also during physical channel changes.

26.8.1.4.3.1 In-call functions / channel changes / a successful channel change in active state/  
Handover and Assignment Command

## 26.8.1.4.3.1.1 Definition and applicability

This is a case to test a change of a physical channel during active state of a call. This test is applicable for any equipment supporting at least one mobile terminating circuit switched basic service.

#### 26.8.1.4.3.1.2 Conformance requirement

- 1) The MS being in the call active state after having successfully completed a channel assignment or a handover command, shall remain in the call active state.

#### References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 5.3.4.3.2,  
3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.4.6.1

#### 26.8.1.4.3.1.3 Test purpose

To verify that the MS being in the call active state after having successfully completed a channel assignment or having completed a handover command remains in the call active state.

#### 26.8.1.4.3.1.4 Method of test

#### Related PICS/PIXIT statements

- supported MT circuit switched basic services;
- Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

#### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in CC-state "active".

#### Foreseen final state of the MS

CC-state "active".

#### Maximum duration of test

10 s.

#### Test procedure

The SS initiates a call to the Mobile Station, using an arbitrarily chosen MT circuit switched basic service (see clause 10 for generic call set up procedures).

The MS being in the call active state, the SS initiates channel assignment procedure causing an intracell change of channel by sending ASSIGNMENT COMMAND message to the MS. The MS performs channel assignment procedure and after the main signalling link is successfully established, the MS returns an ASSIGNMENT COMPLETE message. The state of the MS is then checked.

The SS then initiates a Finely Synchronized handover intra cell procedure. On the successful completion of this procedure the state of the MS is checked.

26.8.1.4.3.2 In-call functions / channel changes / an unsuccessful channel change in active mode/  
Handover and Assignment Command

26.8.1.4.3.2.1 Definition and applicability

This is a case to test an unsuccessful change of a physical channel during active state of a call. This test is applicable for any equipment supporting at least one mobile terminating circuit switched basic service.

26.8.1.4.3.2.2 Conformance requirement

- 1) The MS, when returning to the old channel after handover or Assignment failure and having established the link, shall remain in the call active state.

#### References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 5.3.4.3.

26.8.1.4.3.2.3 Test purpose

To verify that the MS, when returning to the old channel after handover or Assignment failure and correctly establishing the link, will remain in the call active state.

26.8.1.4.3.2.4 Method of test

#### Related PICS/PIXIT statements

- supported MT circuit switched basic services;
- Type of Mobile Station (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

#### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in CC-state "active".

#### Foreseen final state of the MS

CC-state "active".

#### Maximum duration of test

30 s.

#### Test procedure

The SS initiates a call to the Mobile Station, using an arbitrarily chosen circuit switched basic service (see clause 10 for generic call set up procedures).

The MS being in the call active state, the SS initiates non synchronized handover procedure to cell B. The MS begins to send access bursts on the new DCCH. The SS activates the SACCH, but does not send a PHYSICAL INFORMATION MESSAGE, thus causing timer T3124 to time-out. Then the MS shall return back to the old channel and re-establish the signalling link on cell A and send a HANDOVER FAILURE message. The state of the MS is then checked.

The SS sends an Assignment command message allocating a hopping TCH/F, but does not activate the assigned channel. The MS shall attempt try to activate the new channel (this is not verified) and shall then reactivate the "old" channel and trigger the

establishment of the main signalling link on the old channel. The MS shall send an ASSIGNMENT FAILURE message. The state of the MS is then checked.

Expected sequence

| Step | Direction | Message            | Comments                                                                                                                                                                                                                                             |

#### 26.8.1.4.4 In-call functions / MS terminated in-call modification

26.8.1.4.4.1 In-call functions / MS terminated in-call modification / modify when new mode is not supported

##### 26.8.1.4.4.1.1 Definition and applicability

This is to test a special case of a in-call modification procedure, in which the new mode is not supported (and consequently not one of those negotiated and agreed during the establishment phase of the call). This test is applicable for any equipment supporting at least one circuit switched basic service.

##### 26.8.1.4.4.1.2 Conformance requirement

- 1) In the case that the MS supports the network originated in-call modification procedure, the MS after having received a MODIFY message with a new mode which is not the actual one and cannot be supported by the MS shall reject it by sending a MODIFY REJECT message or a STATUS message.
- 2) In the case that the MS does not support the network originated in-call modification procedure, the MS shall, when receiving a MODIFY message, treat the message as unknown and respond with a STATUS message.

## 26.8.1.4.4.1.3 Test purpose

- 1) To verify that an MS supporting the network originated in-call modification procedure, after having received a MODIFY message with a new mode which is not the actual one and cannot be supported by the MS, rejects it by sending a MODIFY REJECT.
- 2) To verify that an MS not supporting the network originated in-call modification procedure, after having received a MODIFY message, responds with a STATUS message.

## 26.8.1.4.4.1.4 Method of test

## Related PICS/PIXIT statements

- supported circuit switched basic services;
- the MS supports the network originated in-call modification procedure (p = Yes/No).

## Initial conditions

## System Simulator:

1 cell, default parameters.

## Mobile Station:

The MS is in CC-state "active".

## Foreseen final state of the MS

CC-state "active".

## Maximum duration of test

10 s.

## Test procedure

The MS being in the call active state, the SS initiates in-call modification procedure by sending a MODIFY message with new mode different from actual mode and one of those not supported by the MS. The MS either returns a MODIFY REJECT message with the old bearer capability or a STATUS message with reject cause #97, depending on the PICS/PIXIT statement. The state of the MS is then checked.

## Expected sequence

| Step | Direction | Message        | Comments                                    |
|------|-----------|----------------|---------------------------------------------|
| 1    | SS -> MS  | MODIFY         | with new mode different from actual one     |
| 2a   | MS -> SS  | MODIFY REJECT  | with the old call mode included OR, p = Yes |
| 2b   | MS -> SS  | STATUS         | cause #97, state U10, p = No                |
| 3    | SS -> MS  | STATUS ENQUIRY |                                             |
| 4    | MS -> SS  | STATUS         | cause 30#, state U10                        |

## Specific message contents:

None.

#### 26.8.1.4.5 In-call functions / MS originated in-call modification

##### 26.8.1.4.5.1 In-call functions / MS originated in-call modification / a successful case of modifying

###### 26.8.1.4.5.1.1 Definition and applicability

This test is to test a successful case of in-call modification, which is triggered by the calling tone identification (CNG) received by the MS. This test is applicable for any equipment supporting any dual mode bearer capability service (BS61 - Alternate Speech/Data, BS81 - Speech followed by Data, Teleservice 61 - Alternate Speech/Group 3 fax).

###### 26.8.1.4.5.1.2 Conformance requirement

- 1) The procedure shall be initiated by the MS in the "active" state of the call. It shall send a MODIFY message including the new mode to be changed to; and enter the "mobile originating modify" state. The new mode given in the MODIFY message shall be one of those already negotiated and agreed during the establishment phase of the call. The MS shall stop sending Bm-channel information according to the old mode and enter the state U26 "Mobile Originating Modify".
- 2) Upon receipt of the MODIFY COMPLETE message the MS shall start sending channel information according to the new call mode and enter the "active" state.

#### References

Conformance requirement 1: 3GPP TS 04.08 / 3GPP TS 24.008, subclause 5.3.4.3.1.

Conformance requirement 2: 3GPP TS 04.08 / 3GPP TS 24.008, subclause 5.3.4.3.2.

###### 26.8.1.4.5.1.3 Test purpose

- 1) To verify that the procedure is initiated by the MS in the "active" state of the call. It sends a MODIFY message including the new mode to be changed to; and enters the "mobile originating modify" state. The new mode given in the MODIFY message is one of those already negotiated and agreed during the establishment phase of the call. The MODIFY originating side stops sending Bm-channel information.
- 2) To verify that upon receipt of the MODIFY COMPLETE message the MS starts sending channel information according to the new call mode and enters the "active" state.

###### 26.8.1.4.5.1.4 Method of test

#### Related PICS/PIXIT statements

- a way to activate a dual mode call;
- a way to activate in-call modification;
- support of dual bearer capability services.

#### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

#### Foreseen final state of the MS

CC-state "active".

Maximum duration of test

10 s.

Test procedure

The MS initiates a call for one of the supported dual mode services. The MS being in the call active state, in-call modification procedure is initiated for the selected service from the MS side. The MS shall send a MODIFY message with the new mode to the SS and the state of the MS is checked. The channel mode is modified with the CHANNEL MODE MODIFY message including the appropriate channel mode for the new service. The SS then returns a MODIFY COMPLETE message. The state of the MS is then checked.

NOTE: ICM can be initiated by manual intervention at the MS.

Expected sequence

Specific message contents:

As specified in subclause 26.8.1.4.5.10.

26.8.1.4.5.2 In-call functions / MS originated in-call modification / modify rejected

26.8.1.4.5.2.1 Definition and applicability

This is to test a special case of a in-call modification procedure, in which the in-call modification is rejected. This test is applicable for any equipment supporting any dual mode bearer capability service (BS61 - Alternate Speech/Data, BS81 - Speech followed by Data, Teleservice 61 - Alternate Speech/Group 3 fax).

26.8.1.4.5.2.2 Conformance requirement

- 1) Upon receipt of the MODIFY REJECT message with the old bearer capability the MS shall: resume sending Bm-channel information according to the present call mode; resume interpreting received Bm-channel information according to the present call mode; and enter the "active" state.

### 26.8.1.4.5.2.3 Test purpose

To verify that upon receipt of the MODIFY REJECT message with the old bearer capability the MS resumes sending Bm-channel information according to the present call mode; resumes interpreting received Bm-channel information according to the present call mode; and enters the "active" state.

### 26.8.1.4.5.2.4 Method of test

#### Related PICS/PIXIT statements

- supported teleservices;
- support of dual bearer capability services.

#### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

#### Foreseen final state of the MS

CC-state "active".

#### Maximum duration of test

10 s.

#### Test procedure

The MS initiates a call for one of the supported dual mode services. The MS being in the call active state, in-call modification procedure is initiated for the selected service from the MS side. The MS shall send a MODIFY message with new mode to the SS. The SS returns a MODIFY REJECT message. The state of the MS is then checked.

Specific message contents:

As specified in subclause 26.8.1.4.5.10.

26.8.1.4.5.3 In-call functions / MS originated in-call modification / an abnormal case of acceptance

26.8.1.4.5.3.1 Definition and applicability

This is to test a special case of a in-call modification procedure, in which the in-call modification is accepted incorrectly. This test is applicable for any equipment supporting any dual mode bearer capability service (BS61 - Alternate Speech/Data, BS81 - Speech followed by Data, Teleservice 61 - Alternate Speech/Group 3 fax).

26.8.1.4.5.3.2 Conformance requirement

- 1) Upon receipt of the MODIFY COMPLETE message indicating a call mode which does not correspond to the requested one the MS shall discard it and take no action.

References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 5.3.4.4.

26.8.1.4.5.3.3 Test purpose

To verify that upon receipt of the MODIFY COMPLETE message indicating a call mode which does not correspond to the requested one the MS discards it and takes no action.

26.8.1.4.5.3.4 Method of test

Related PICS/PIXIT statements

- supported teleservices;
- support of dual bearer capability services.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

Foreseen final state of the MS

CC-state U26 "Mobile Originating Modify".

Maximum duration of test

10 s.

Test procedure

The MS initiates a call for one of the supported dual mode services. The MS being in the call active state, in-call modification procedure is initiated for the selected service from the MS side. The MS shall send a MODIFY message with new mode to the SS. The SS returns a MODIFY COMPLETE message specifying a mode that does not correspond to the requested one. It will be verified then that the MS shall not take any action and the state of the MS will be checked.

3GPP TS 04.08 / 3GPP TS 24.008, subclause 5.3.4.3.4.3.

26.8.1.4.5.5.3 Test purpose

To verify that upon expiration of T323 (accuracy  $\pm 10\%$ ) the MS shall initiate the procedures for call clearing with cause #102 "recovery on timer expiry".

26.8.1.4.5.5.4 Method of test

Related PICS/PIXIT statements

- supported circuit switched basic services;
- support of dual bearer capability services.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

Foreseen final state of the MS

CC-state U11 "disconnect request".

Maximum duration of test

1 minute.

Test procedure

The MS initiates a call for one of the supported dual mode services. The MS being in the call active state, in-call modification procedure is initiated for the selected service from the MS side. The MS shall send a MODIFY message with new mode to the SS. The SS does not respond until timer T323 expires at the MS. The MS is expected to respond with a DISCONNECT message. The SS checks timer T323 accuracy between emission of MODIFY and reception of DISCONNECT messages, the state of the MS and a cause value from the DISCONNECT message.

Specific message contents:

As specified in subclause 26.8.1.4.5.10.

26.8.1.4.5.6 In-call functions / MS originated in-call modification / a successful channel change in state mobile originating modify

26.8.1.4.5.6.1 Definition and applicability

This is to test a special case of a in-call modification procedure, in which a change of a physical channel occurs in state U26, mobile originating modify. This test is applicable for any equipment supporting any dual mode bearer capability service (BS61 - Alternate Speech/Data, BS81 - Speech followed by Data, Teleservice 61 - Alternate Speech/Group 3 fax).

26.8.1.4.5.6.2 Conformance requirement

- 1) A CC-entity of the MS in CC-state U26, "Mobile Originating Modify", after successful completion of a channel assignment procedure or channel mode modify procedure shall remain in the call state U26.
- 2) Upon receipt of the MODIFY COMPLETE message the MS shall start sending channel information according to the new call mode and enter the "active" state.

References

- 1) 3GPP TS 04.08 / 3GPP TS 24.008, subclause 5.3.4.3.2,  
3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.4.6.1.
- 2) 3GPP TS 04.08, subclause 5.3.4.3.2.

26.8.1.4.5.6.3 Test purpose

- 1) To verify that a CC-entity of the MS in CC-state U26, "Mobile Originating Modify", after successful completion of a channel assignment procedure remains in the call state U26.
- 2) To verify that upon receipt of the MODIFY COMPLETE message the MS starts sending channel information according to the new call mode and enters the "active" state.

## 26.8.1.4.5.6.4 Method of test

## Related PICS/PIXIT statements

- supported circuit switched basic services;
- support of dual bearer capability services.

## Initial conditions

## System Simulator:

1 cell, default parameters.

## Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

## Foreseen final state of the MS

CC-state U10, active.

## Maximum duration of test

10 s.

## Test procedure

The MS initiates a call for one of the supported dual mode services. The MS being in the call active state, in-call modification procedure is initiated for the selected service from the MS side. The MS shall send a MODIFY message with a new mode to the SS. The SS does not respond immediately, but performs channel assignment procedure including the appropriate channel mode for the new service. The state of the MS is then checked. The SS then returns a MODIFY COMPLETE message. The state of the MS is checked finally.

## Expected sequence

## Specific message contents:

As specified in subclause 26.8.1.4.5.10.

26.8.1.4.5.7 In-call functions / MS originated in-call modification / an unsuccessful channel change in state mobile originating modify

26.8.1.4.5.7.1 Definition and applicability

This is to test a special case of a in-call modification procedure, in which an unsuccessful change of a physical channel occurs in state U26, mobile originating modify. This test is applicable for any equipment supporting any dual mode bearer capability service (BS61 - Alternate Speech/Data, BS81 - Speech followed by Data, Teleservice 61 - Alternate Speech/Group 3 fax).

26.8.1.4.5.7.2 Conformance requirement

- 1) A CC-entity of the MS in CC-state U26, "Mobile Originating Modify", when returning to the old channel after handover failure and having established the link, shall remain in the call state U26.

#### References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 5.3.4.3.2.

26.8.1.4.5.7.3 Test purpose

To verify that a CC-entity of the MS in CC-state U26, "Mobile Originating Modify", when returning to the old channel after handover failure and having established the link, remains in the call state U26.

26.8.1.4.5.7.4 Method of test

#### Related PICS/PIXIT statements

- supported teleservices;
- support of dual bearer capability services.

#### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

#### Foreseen final state of the MS

CC-state U26, mobile originating modify.

#### Maximum duration of test

10 s.

#### Test procedure

The MS initiates a call for one of the supported dual mode services. The MS being in the call active state, in-call modification procedure is initiated for the selected service from the MS side. The MS shall send a MODIFY message with a new mode to the SS. The SS initiates handover procedure. When the MS tries to establish the main signalling link, it is prohibited by the SS. Then the MS shall return back to the old channel and re-establish correctly the link. The state of the MS is then checked.

## Test procedure

The MS initiates a call for one of the supported dual mode services. The MS being in the call active state, in-call modification procedure is initiated for the selected service from the MS side. The MS shall send a MODIFY message with a new mode to the SS. The SS sends a message with message type not defined for the protocol discriminator. The state of the MS is then checked.

## Specific message contents:

As specified in subclause 26.8.1.4.5.10.

26.8.1.4.5.9 In-call functions / MS originated in-call modification / a release complete received

26.8.1.4.5.9.1 Definition and applicability

The call control entity of the MS being in the state, U26, the call is cleared by a RELEASE COMPLETE message sent by the SS. This test is applicable for any equipment supporting any dual mode bearer capability service (BS61 - Alternate Speech / Data, BS81 - Speech followed by Data, Teleservice 61 - Alternate Speech / Group 3 fax).

#### 26.8.1.4.5.9.2 Conformance requirement

- 1) A CC entity of the MS in CC-state U26, "mobile originating modify", upon receipt of a RELEASE COMPLETE message with valid cause value, shall enter CC state U0, "Null".
- 2) On returning to idle mode, the CC entities relating to the seven mobile originating transaction identifiers shall be in state U0, "Null".

#### Reference(s)

Conformance requirement 1: 3GPP TS 04.08 / 3GPP TS 24.008 subclauses 5.4.2 and 5.4.4.

Conformance requirement 2: 3GPP TS 04.08 / 3GPP TS 24.008 subclause 5.4.4.3.

#### 26.8.1.4.5.9.3 Test purpose

- 1) To verify that a CC entity of the MS in CC-state U26, "mobile originating modify", upon receipt of a RELEASE COMPLETE message with valid cause value, enters CC state U0, "Null".
- 2) To verify that on returning to idle mode, the CC entities relating to the seven mobile originating transaction identifiers are in state U0, "Null".

#### 26.8.1.4.5.9.4 Method of test

#### Related PICS/PIXIT statements

- a way to activate a dual mode call;
- a way to activate in-call modification;
- support of dual bearer capability services.

#### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

#### Foreseen final state of the MS

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

#### Maximum duration of test

30 s.

#### Test Procedure

The MS initiates a call for one of the supported dual mode services. The MS being in the call active state, in-call modification procedure is initiated for the selected service from the MS side. The MS shall send a MODIFY message with the new mode to the SS and the state of the MS is checked. The SS sends a RELEASE COMPLETE message to the MS. The SS checks by using the status enquiry procedure that the CC entity has entered the state U0 with all the relevant transaction identifiers.

NOTE: ICM can be initiated by manual intervention at the MS.

## CALL PROCEEDING

If the MS offers a choice in a SETUP message with respect to its bearer capabilities (this choice is restricted to the connection element), the bearer capabilities 1 and 2 and BC repeat indicator must all be present in this message. Otherwise, all three IEs are omitted.

| Information element | Value/remark                     |
|---------------------|----------------------------------|
| Repeat Indicator    | See above                        |
| Repeat indication   | As received in the SETUP message |
| Bearer Capability 1 | Same as in subclause 10.4        |
| Bearer Capability 2 | Same as in subclause 10.4        |
| Facility            | Omitted                          |
| Progress indicator  | Omitted                          |

## 26.8.2 Call Re-establishment

### 26.8.2.1 Call Re-establishment/call present, re-establishment allowed

#### 26.8.2.1.1 Definition and applicability

This is to test a successful case of a call re-establishment procedure. This test is applicable for any equipment supporting at least one bearer capability. If the MS does not perform call re-establishment procedure correctly, the network will waste resources.

#### 26.8.2.1.2 Conformance requirement

- 1) If the call is in the "active" state or "mobile originating modify" state, the indication from MM that re-establishment is possible shall cause call control to request re-establishment from the MM-connection, suspend any further message to be sent and await the completion of the re-establishment procedure.

- 2) When the call control entity is notified that the MM-connection is re-established, it shall then resume the transmission of possibly suspended messages and resume user data exchange when an appropriate channel is available.

#### References

- 1) 3GPP TS 04.08 / 3GPP TS 24.008, subclauses 4.5.1.6 and 5.5.4.2.
- 2) 3GPP TS 04.08 / 3GPP TS 24.008, subclauses 4.5.1.6 and 5.5.4.3.

#### 26.8.2.1.3 Test purpose

The purpose of this test is to verify that the MS can correctly perform a call re-establishment procedure.

#### 26.8.2.1.4 Method of test

#### Related PICS/PIXIT statements

- supported teleservices.

#### Initial conditions

##### System Simulator:

The SS simulates cells A and B. The LAC of cell A is different from the LAC of cell B. The PLMN identities of cell A and B are equal.

The call re-establishment parameter concerning cell A is set to an arbitrary value.

Cell B is not barred, the RACH control parameters information element sent in SYSTEM INFORMATION TYPE 1 to 4 messages of cell A and B specifies "call reestablishment allowed in the cell", the NCC of cell B is indicated as permitted in the PLMN permitted information element of SYSTEM INFORMATION TYPE 2 and 6 messages of cell A. Cell B is indicated as a neighbour cell of cell A in SYSTEM INFORMATION TYPE 2 and 5 messages of cell A. Cell reselect hysteresis parameter of cell A is set to zero.

##### Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN on cell A.

#### Foreseen final state of the MS

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

#### Maximum duration of test

1 minute.

#### Test procedure

The MS is brought to active state by using procedure 26.9.2, "structured procedures, MS originated call, early assignment". The RF level of cell A is lowered so that cell B is to be selected (when the MS performs re-establishment after radio link failure), while keeping the C1 and C2 of cell A greater than zero. SS waits for at least 5 s. Then the SS stops transmission on the TCH/SACCH. The MS shall re-establish the call on cell B using a CM RE-ESTABLISHMENT message. The SS performs ciphering mode setting and assignment procedures. The MS shall through-connect the appropriate bearer channel. Then, the call is cleared by the SS.

Expected sequence

| Step | Direction | Message                    | Comments                                                                                                                     |
|------|-----------|----------------------------|------------------------------------------------------------------------------------------------------------------------------|
| 1    |           |                            | Steps 1-19 of test case 26.9.2 are performed (the appropriate bearer channel is through connected in both directions in TCH) |
| 2    | SS        |                            | The RF level of cell A is lowered. The SS waits at least 5 s. The SS stops transmission on the TCH/SACCH.                    |
| 3    | MS -> SS  | CHANNEL REQUEST            | this is sent on cell B. Establ. cause shall be "call re-establishment; TCH/F was in use,..."                                 |
| 4    | SS -> MS  | IMMEDIATE ASSIGNMENT       |                                                                                                                              |
| 5    | MS -> SS  | CM REESTABLISHMENT REQUEST | note specific message contents                                                                                               |
| 6    | SS -> MS  | CIPHERING MODE COMMAND     | SS starts deciphering after sending the message.                                                                             |
| 7    | MS -> SS  | CIPHERING MODE COMPLETE    | Shall be sent enciphered. All following messages shall be sent enciphered.                                                   |
| 8    | SS        |                            | SS starts ciphering.                                                                                                         |
| 9    | SS -> MS  | ASSIGNMENT COMMAND         |                                                                                                                              |
| 10   | MS -> SS  | ASSIGNMENT COMPLETE        |                                                                                                                              |

### 26.8.2.2 Call Re-establishment/call present, re-establishment not allowed

#### 26.8.2.2.1 Definition and applicability

This is to test a special case of a call re-establishment, in which it is not allowed for a MS to attempt re-establishment of a call. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

#### 26.8.2.2.2 Conformance requirement

When a lower layer failure occurs while an MM-connection is active, if a cell allowing call re-establishment is not available, the MS shall release the MM-connection and shall not attempt call re-establishment.

#### References

3GPP TS 04.08 / 3GPP TS 24.008, subclauses 4.5.1.6 and 5.5.4.

#### 26.8.2.2.3 Test purpose

The purpose of this test is to verify that the MS does not attempt call re-establishment when it is not allowed to take place because of the unavailability of a cell allowing call re-establishment.

## 26.8.2.2.4 Method of test

## Related PICS/PIXIT statements

- supported MO circuit switched basic services.

## Initial conditions

## System Simulator:

The SS simulates cell A.

Cell A is not barred, the NCC of cell A is indicated as permitted in the PLMN permitted information element of SYSTEM INFORMATION TYPE 2 and 6 messages. The RE field of the RACH control parameters information element broadcast in messages SYSTEM INFORMATION TYPE 1, 2, 3 and 4 of cell A are set to "call reestablishment not allowed in the cell".

## Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

## Foreseen final state of the MS

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

## Maximum duration of test

1 minute.

## Test procedure

The MS is brought to active state by using procedure 26.9.2, "structured procedures, MS originated call, early assignment". The SS stops transmission on the TCH/SACCH. The MS shall not require re-establishment of the call.

## Expected sequence

| Step | Direction | Message | Comments                                                                                                                     |
|------|-----------|---------|------------------------------------------------------------------------------------------------------------------------------|
| 1    |           |         | Steps 1-19 of test case 26.9.2 are performed (the appropriate bearer channel is through connected in both directions in TCH) |
| 2    | SS        |         | the SS stops transmission on the TCH/SACCH                                                                                   |
| 3    | MS        |         | the MS shall not attempt re-establishment on cell A. This is checked for 30 s after the radio link failure.                  |

## Specific message contents:

None.

## 26.8.2.3 Call Re-establishment/call under establishment, transmission stopped

## 26.8.2.3.1 Definition and applicability

This is to test a special case of a call re-establishment, in which it is not allowed for a MS to attempt re-establishment of a call, since the call has not been established yet. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

## 26.8.2.3.2 Conformance requirement

When a lower layer failure occurs while an MM-connection is active, if the state of the call control entity is not "active", the MS shall release the MM-connection and shall not attempt call re-establishment.

## References

3GPP TS 04.08 / 3GPP TS 24.008, subclauses 4.5.1.6 and 5.5.4.2.

### 26.8.2.3.3 Test purpose

The purpose of this test is to verify that the MS does not attempt call re-establishment when it is not allowed to take place because of the call control state.

### 26.8.2.3.4 Method of test

## Related PICS/PIXIT statements

- supported MO circuit switched basic services.

## Initial conditions

### System Simulator:

The SS simulates cell A.

Cell A is not barred, the RACH control parameters information element sent in SYSTEM INFORMATION TYPE 1 to 4 messages of cell A specifies "call reestablishment allowed in the cell", the NCC of cell A is indicated as permitted in the PLMN permitted information element of SYSTEM INFORMATION TYPE 2 and 6 messages.

### Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

## Foreseen final state of the MS

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

## Maximum duration of test

1 minute.

## Test procedure

The call control entity of the MS is brought to state U4, "call delivered" by using initial part of procedure 26.9.2, "structured procedures, MS originated call, early assignment". The SS stops transmission on the TCH/SACCH. The MS shall not require re-establishment of the call on cell A.

Expected sequence

## 26.8.3 User to user signalling

### 26.8.3.1 Definition and applicability

The "user to user" information element is used to convey information between the mobile user and a remote ISDN user. This test is therefore applicable for any equipment supporting at least one mobile terminating circuit switched basic service.

NOTE: There is no test for an MS originating call including a "user-user" information element since it is not a mandatory MS feature.

### 26.8.3.2 Conformance requirement

The inclusion of the "user-user" information element in downlink call control messages shall cause no adverse effects on the operation of the MS.

### References

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 5.2.2, 9.3.7, 9.3.23.1 and 10.5.4.25.

### 26.8.3.3 Purpose of the test

The purpose of this test is to verify that inclusion of the "user-user" information element in either of the down link messages, SETUP or DISCONNECT causes no adverse effects on the operation of the MS.

### 26.8.3.4 Method of test

#### Related PICS/PIXIT statement(s)

Supported MT circuit switched basic services.

Support of user-user information element, and details of suitable codings.

Initial conditions.

System Simulator:

The SS simulates 1 cell, with default parameters.

Mobile Station:

The MS is in MM-state "idle updated", with a valid TMSI and CKSN.

Foreseen final state of the MS

The MS is in MM-state "idle updated", with a valid TMSI and CKSN.

Maximum duration of test

2 minutes.

Test procedure

The SS attempts to set up a mobile terminated call, with one of the supported circuit switched basic services which has been arbitrarily chosen, using one of the generic call set up procedures,(either speech or data) as specified in clause 10. The default SETUP message contents are modified to include the user-user Information Element. The MS shall not respond adversely to the inclusion of the user-user information element.

After 30 s the SS sends a DISCONNECT message, again the MS shall not respond adversely to the inclusion of the user-user information element, but shall continue to clear down the call normally.

Expected sequence

| Step | Direction | Message          | Comments                                                                                                                                                                                           |

## DISCONNECT

As default message contents as defined in subclause 26.8.4, except:

| Information Element                          | value/remark                                                                                                                                                                            |
|----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| user-user<br>- length<br>- PD<br>- user-user | Length of user-user contents (note)<br>IA5 characters (note)<br>The following string coded in IA5 characters: "Call Disconnect" (note)                                                  |
| NOTE:                                        | The codings above are for example only. For the case of an MS which supports "user-user" signalling it may be necessary to add meaning to the data fields, see PICS/PIXIT statement(s). |

## 26.8.4 Default contents of message

ALERTING (mobile station to network direction)

No default requirements defined for this message.

ALERTING (network to mobile station direction)

| Information element | Value/remark |
|---------------------|--------------|
| Facility            | Omitted      |
| Progress indicator  | Omitted      |
| User-user           | Omitted      |

## ASSIGNMENT COMMAND

| Information element               | Value/remark                                                           |
|-----------------------------------|------------------------------------------------------------------------|
| Description of the first channel  | describes non-hopping Bm+ACCHs or Lm+ACCHs as appropriate for the test |
| Power Command                     | As in subclause 6.3                                                    |
| Frequency list                    | Omitted                                                                |
| Cell channel description          | Omitted                                                                |
| Mode of the first channel         | appropriate for the bearer capability chosen for the test              |
| Description of the second channel | Omitted                                                                |
| Mode of the second channel        | Omitted                                                                |
| Mobile allocation                 | Omitted                                                                |
| Starting time                     | Omitted                                                                |
| Cipher mode setting               | Omitted                                                                |

## ASSIGNMENT COMPLETE

| Information element | Value/remark |
|---------------------|--------------|
| RR cause            | not checked  |

## AUTHENTICATION REQUEST

| Information element           | Value/remark             |
|-------------------------------|--------------------------|
| Ciphering key sequence number | Arbitrary excluding 111B |
| Spare half octet              | (spare bits)             |
| Authentication parameter RAND | Arbitrary                |

## AUTHENTICATION RESPONSE

| Information element           | Value/remark |
|-------------------------------|--------------|
| Authentication parameter SRES | not checked  |

## CALL CONFIRMED

No default requirements defined for this message.

## CALL PROCEEDING

| Information element | Value/remark                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Repeat Indicator    | Omitted                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Bearer Capability 1 | Omitted if the SETUP message did not specify in the bearer capability 1 IE a connection element value "both, transparent preferred" or "both, non-transparent preferred". Otherwise included; in that case the connection element specifies the value that is appropriate for the selected basic service (either value "transparent" or value "non transparent (RLP)"), all other parameters are same as in the bearer capability 1 IE of the received SETUP message. |
| Bearer Capability 2 | Omitted                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Facility            | Omitted                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Progress indicator  | Omitted                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## CHANNEL MODE MODIFY

| Information element | Value/remark                                                           |
|---------------------|------------------------------------------------------------------------|
| Channel description | describes non-hopping Bm+ACCHs or Lm+ACCHs as appropriate for the test |
| Channel mode        | appropriate for the bearer capability chosen for the test              |

## CHANNEL MODE MODIFY ACKNOWLEDGE

| Information element | Value/remark                                                       |
|---------------------|--------------------------------------------------------------------|
| Channel description | as sent by the SS in the corresponding CHANNEL MODE MODIFY message |
| Channel mode        | as sent by the SS in the corresponding CHANNEL MODE MODIFY message |

## CHANNEL RELEASE

| Information element | Value/remark |
|---------------------|--------------|
| RR cause            | Normal event |

## CHANNEL REQUEST

| Information element | Value/remark                                                                   |
|---------------------|--------------------------------------------------------------------------------|
| Establishment cause | If in response to paging, then "100"; if a mobile originating call, then "111" |
| Random reference    | Arbitrary value of 5 bits length                                               |

## CIPHERING MODE COMMAND

| Information element                         | Value/remark                    |
|---------------------------------------------|---------------------------------|
| Cipher mode setting<br>algorithm identifier | indicates a supported algorithm |
| SC                                          | Start ciphering                 |
| Cipher response<br>CR                       | IMEI must not be included       |

## CIPHERING MODE COMPLETE

No default requirements defined for this message.

## CM SERVICE ACCEPT

No default values defined for this message.

## CM SERVICE REJECT

| Information element | Value/remark                                 |
|---------------------|----------------------------------------------|
| Reject cause        | Service or option not available, unspecified |

## CM SERVICE REQUEST

No default requirements defined for this message.

## CONNECT (network to mobile station direction)

| Information element  | Value/remark |
|----------------------|--------------|
| Facility             | Omitted      |
| Progress indicator   | Omitted      |
| Connected number     | Omitted      |
| Connected subaddress | Omitted      |
| User-user            | Omitted      |

## CONNECT (mobile station to network direction)

No default requirements defined for this message.

## CONNECT ACKNOWLEDGE

No default requirements defined for this message.

## DISCONNECT (network to mobile station direction)

| Information element | Value/remark    |

## 26.9 Structured procedures

### 26.9.1 Structured procedures / general

The purpose of these tests is to verify that the MS performs certain elementary procedures of the RR, MM, and CC protocol correctly within a structured procedure. The term "structured procedure" is defined in 3GPP TS 04.08 / 3GPP TS 23.108, clause 7, where also examples of structured procedures are given.

The reason for this test purposes is twofold:

- The behaviour of the MS in an elementary procedure may depend on the preamble which precedes the elementary procedure.
- Structured procedures tested in this subclause are used in other parts of this Technical Specification as preambles to establish the initial conditions for other tests; correct behaviour of an implementation under test in a preamble is essential for the validity of a test.

Mobile originating and terminating calls are tested in cases of both early and late assignment of the traffic channel; in one of the cases call release initiated by the network is tested, in another one, call release initiated by the MS.

The feature Directed Retry is tested in both Mobile Originated and Mobile Terminated Call. The configuration of the assigned channels is described in table 26.9-1:

**Table 26.9-1**

| Directed Retry from | To              | Call direction | Start Time | Sync. | Subclause | Exec. Counter |
|---------------------|-----------------|----------------|------------|-------|-----------|---------------|
| SDCCH/4             | TCH/F, cycl. FH | MOC            | None       | No    | 26.9.7    | 1             |
| SDCCH/8, cycl. FH   | TCH/H, rand. FH | MOC            | None       | No    | 26.9.7    | 2             |
| SDCCH/4             | TCH/F, no FH    | MTC            | None       | No    | 26.9.8    | 1             |
| SDCCH/8, rand. FH   | TCH/H, cycl. FH | MTC            | 1.1 sec.   | No    | 26.9.8    | 2             |

The tests in this subclause only cover the successful outcome of elementary procedures (i.e. they do not deal with abnormal cases).

In this subclause, the emergency call service is tested for mobile stations that do not support the full rate speech version 2 in the following cases:

- emergency call initiated in the idle, updated state with authentication and ciphering, for speech full rate version 1 and if supported, speech half rate version 1;
- emergency call initiated in the idle, no IMSI state (hence without authentication and without ciphering), the network accepting the call, for either speech full rate version 1 or, provided it is supported, speech half rate version 1;
- emergency call initiated in the idle, no IMSI state (hence without authentication and without ciphering), the network rejecting the call, for either speech full rate version 1 or, provided it is supported, speech half rate version 1.

These tests on emergency calls are only applicable to an MS supporting speech.

For an MS supporting speech the test procedures in 26.9.2, 26.9.3, 26.9.4, 26.9.5, 26.9.7 and 26.9.8 are performed for speech (teleservice 11, telephony), once for speech full rate version 1 and, if supported, once for speech half rate version 1.

For an MS not supporting speech but supporting at least one teleservice, for each of the test procedures in subclauses 26.9.2, 26.9.3, 26.9.4, 26.9.5, 26.9.7 and 26.9.8 and each supported rate (full rate/half rate) a teleservice supported by the MS (see PICS/PIXIT statement) is chosen, and the test is performed corresponding to that teleservice (note that this teleservice is never a dual service).

In cases where a mobile originated call for the tested teleservice can be initiated both

- via the MMI; and
- via the R or S interface,

procedures 26.9.2 and 26.9.7 (m = 1) shall be performed when initiating the mobile originated call via the MMI and procedures 26.9.3 and 26.9.7 (m = 2) shall be performed when initiating the mobile originated call via an appropriate interface (R or S).

## 26.9.2 Structured procedures / MS originated call / early assignment

### 26.9.2.1 Conformance requirements

- 1) An MS in MM state "idle, updated" and in RR idle mode, when made to initiate a call, if it provides a human interface, shall display the dialled number.
- 2) An MS in MM state "idle, updated" and in RR idle mode, when made to initiate a call for a selected teleservice that is supported by the MS, shall start to initiate the immediate assignment procedure by sending a CHANNEL REQUEST message with correct establishment cause.
- 3) Subsequently after establishment of an MM connection, the MS shall send a SETUP message with correct parameters.
- 4) The call control entity of the Mobile Station in the "call initiated" state, in the "mobile originating call proceeding" state or in the "call delivered" state, shall, upon receipt of a CONNECT message:
  - attach the user connection to the radio path;
  - return a CONNECT ACKNOWLEDGE message.
- 5) Subsequently when the network initiates call clearing by sending a DISCONNECT message, the MS shall proceed to release the call by sending a RELEASE message.
- 6) On receipt of a CHANNEL RELEASE message, the MS shall disconnect the main signalling link.

### 26.9.2.2 Test purpose

- 1) To verify that the MS in MM state "idle, updated" with a TMSI assigned, when made to initiate a call for a selected teleservice that is supported by the MS as declared in a PICS/PIXIT statement, displays the dialled number in the way described in a PICS/PIXIT statement.
- 2) To verify that the MS in MM state "idle, updated" and in RR idle mode, with a TMSI assigned, when made to initiate a call for a selected teleservice that is supported by the MS as declared in a PICS/PIXIT statement, starts to initiate an immediate assignment procedure by sending the CHANNEL REQUEST message with correct establishment cause.
- 3) To verify that subsequently after receipt of an IMMEDIATE ASSIGNMENT message allocating an SDCCH, after completion of establishment of the main signalling link, after having sent a CM SERVICE REQUEST message, after having successfully performed the authentication and cipher mode setting procedures, the MS sends a SETUP message with correct parameters.
- 4) To verify that subsequently, after receipt of a CALL PROCEEDING message and of an ASSIGNMENT COMMAND message allocating an appropriate TCH, after having completed the traffic channel early assignment procedure by replying with the ASSIGNMENT COMPLETE message, after receipt of an ALERTING message and a CONNECT message, the MS returns a CONNECT ACKNOWLEDGE message.
- 5) To verify that subsequently the MS has attached the user connection to the radio path. (This is checked by verifying that there is a point in time after transmission of the first L2 frame containing the (complete) CONNECT message, where the MS is sending appropriate speech or data frames whenever it does not have to transmit or acknowledge an I frame on layer 2 of the FACCH.)
- 6) To verify that subsequently upon the network initiating call clearing by sending a DISCONNECT message, the MS proceed to release the call with RELEASE.
- 7) To verify that subsequently, on receipt of a RELEASE COMPLETE message followed by a CHANNEL RELEASE message, the MS disconnects the main signalling link.

These test purposes are tested for all rates supported by the MS (full rate/half rate).

### 26.9.2.3 Method of test

#### Related PICS/PIXIT Statements

- Supported rates (full rate/half rate).
- Supported speech versions (full rate version 1, full rate version 2, half rate version 1)
- Interface to the human user (p1 = Y/N).
- Way to display the called number (only applicable if the MS has an interface to the human user).
- Way to indicate alerting (only applicable if the MS supports the feature).
- SS version
- Supported teleservices.

- Classmark.

#### Initial Conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

#### Foreseen Final State of the MS

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

#### Test procedure

The following test is performed for all rates (full rate/half rate) supported by the MS:

A teleservice is selected that is supported by the MS; if the MS supports speech, the selected teleservice is speech. If necessary, the MS is configured for that teleservice.

The MS is made to initiate a call. The call is established with early assignment. Having reached the active state, the call is cleared by the SS.

#### Maximum Duration of Test

1 minute.

#### Expected Sequence

| Step | Direction | Message                 | Comments                                                                                  |
|------|-----------|-------------------------|-------------------------------------------------------------------------------------------|
| 1    | MS        |                         | The "called number" is entered.                                                           |
| 2    | MS        |                         | If p1 = Y, the MS must display the called number in the way defined in PICS/PIXIT.        |
| 3    | MS -> SS  | CHANNEL REQUEST         | Establishment cause is "originating call and the network does not set the NECI bit to 1". |
| 4    | SS -> MS  | IMMEDIATE ASSIGNMENT    |                                                                                           |
| 5    | MS -> SS  | CM SERVICE REQUEST      | Message is contained in SABM.                                                             |
| 6    | SS -> MS  | AUTHENTICATION REQUEST  |                                                                                           |
| 7    | MS -> SS  | AUTHENTICATION RESPONSE | SRES specifies correct value.                                                             |
| 8    | SS -> MS  | CIPHERING MODE COMMAND  | SS starts deciphering after sending the message.                                          |
| 9    | MS -> SS  | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered.                |
| 10   | SS        |                         | SS starts ciphering.                                                                      |
| 11   | MS -> SS  | SETUP                   |                                                                                           |
| 12   | SS -> MS  | CALL PROCEEDING         |                                                                                           |
| 13   | SS -> MS  | ASSIGNMENT COMMAND      |                                                                                           |
| 14   | MS -> SS  | ASSIGNMENT COMPLETE     |                                                                                           |
| 15   | SS -> MS  | ALERTING                |                                                                                           |
| 16   | MS        |                         | Depending on the PICS, an alerting indication is given.                                   |
| 17   | SS -> MS  | CONNECT                 |                                                                                           |
| 18   | MS -> SS  | CONNECT ACKNOWLEDGE     |                                                                                           |
| 19   | MS        |                         | The appropriate bearer channel is through connected in both directions.                   |
| 20   | SS -> MS  | DISCONNECT              |                                                                                           |
| 21   | MS -> SS  | RELEASE                 |                                                                                           |
| 22   | SS -> MS  | RELEASE COMPLETE        |                                                                                           |
| 23   | SS -> MS  | CHANNEL RELEASE         | The main signalling link is released.                                                     |

## 26.9.3 Structured procedures / MS originated call / late assignment

### 26.9.3.1 Conformance requirement

- 1) An MS in MM state "idle, updated" and in RR idle mode with a TMSI assigned, when made to initiate a call for a selected teleservice that is supported by the MS, shall start to initiate an immediate assignment procedure by sending the CHANNEL REQUEST message with correct establishment cause.
- 2) Upon receipt of the ASSIGNMENT COMMAND message, the Mobile Station initiates a local end release of link layer connections, disconnects the physical channels, commands the switching to the assigned channels and initiates the establishment of lower layer connections (this includes the activation of the channels, their connection and the establishment of the data links). After the main signalling link is successfully established, the MS returns an ASSIGNMENT COMPLETE message, specifying cause "normal event", to the network on the main DCCH.
- 3, 4) The call control entity of the Mobile Station in the "call initiated" state, in the "mobile originating call proceeding" state or in the "call delivered" state, shall, upon receipt of a CONNECT message:
  - attach the user connection to the radio path;
  - return a CONNECT ACKNOWLEDGE message.

### References

Conformance requirement 1: 3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.3.1.1

Conformance requirement 2: 3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.4.3.1 and 3.4.3.2.

Conformance requirement 3: 3GPP TS 04.08 / 3GPP TS 24.008 subclause 5.2.1.6.

### 26.9.3.2 Test purpose

- 1) To verify that the MS in MM state "idle, updated" and in RR idle mode with a TMSI assigned, when made to initiate a call for a selected teleservice that is supported by the MS as declared in a PICS/PIXIT statement, starts to initiate an immediate assignment procedure by sending the CHANNEL REQUEST message.
- 2) To verify that subsequently after receipt of an IMMEDIATE ASSIGNMENT message allocating an SDCCH, after completion of establishment of the main signalling link, after having sent a CM SERVICE REQUEST message, after having successfully performed authentication and cipher mode setting procedures, after having sent a SETUP message, after having received a CALL PROCEEDING message followed by an ALERTING message and an ASSIGNMENT COMMAND message allocating an appropriate TCH, the MS sends an ASSIGNMENT COMPLETE message.
- 3) To verify that subsequently, after the suite of actions specified in test purposes 1 and 2, the MS after receiving a CONNECT message returns a CONNECT ACKNOWLEDGE message.
- 4) To verify that after the suite of actions specified in test purposes 1 and 2, the MS after receiving a CONNECT message attaches the user connection to the radio path. (This is checked by verifying that there is a point in time after transmission of the first L2 frame containing the (complete) CONNECT message, where the MS is sending appropriate speech or data frames whenever it does not have to transmit or acknowledge an I frame on layer 2 of the FACCH.)

These test purposes are tested for all rates supported by the MS (full rate/half rate).

### 26.9.3.3 Method of test

#### Related PICS/PIXIT statements

- Supported rates (full rate/half rate).
- Interface to the human user (p1 = Y/N).
- Way to display the called number (only applicable if the MS has an interface to the human user).

- Way to indicate alerting (only applicable if the MS supports the feature).
- Supported teleservices.
- Classmark.

#### Initial Conditions

##### System Simulator:

1 cell, default parameters.

##### Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

#### Foreseen Final State of the MS

The MS has a MO call in state U10, "active".

#### Test procedure

The following test is performed for all rates (full rate/half rate) supported by the MS:

A teleservice is selected that is supported by the MS; if the MS supports speech, the selected teleservice is speech. If necessary, the MS is configured for that teleservice.

The MS is made to initiate a call. The call is established with late assignment.

#### Maximum Duration of Test

30 s.

#### Expected Sequence

| Step | Direction | Message                 | Comments                                                                                  |
|------|-----------|-------------------------|-------------------------------------------------------------------------------------------|
| 1    | MS        |                         | The "called number" is entered.                                                           |
| 2    | MS        |                         |                                                                                           |
| 3    | MS -> SS  | CHANNEL REQUEST         | Establishment cause is "originating call and the network does not set the NECI bit to 1". |
| 4    | SS -> MS  | IMMEDIATE ASSIGNMENT    |                                                                                           |
| 5    | MS -> SS  | CM SERVICE REQUEST      | Message is contained in SABM.                                                             |
| 6    | SS -> MS  | AUTHENTICATION REQUEST  |                                                                                           |
| 7    | MS -> SS  | AUTHENTICATION RESPONSE | SRES specifies correct value.                                                             |
| 8    | SS -> MS  | CIPHERING MODE COMMAND  | SS starts deciphering after sending the message.                                          |
| 9    | MS -> SS  | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered.                |
| 10   | SS        |                         | SS starts ciphering.                                                                      |
| 11   | MS -> SS  | SETUP                   |                                                                                           |
| 12   | SS -> MS  | CALL PROCEEDING         |                                                                                           |
| 13   | SS -> MS  | ALERTING                |                                                                                           |
| 14   | MS        |                         | Depending on the PICS, an alerting indication is given.                                   |
| 15   | SS -> MS  | ASSIGNMENT COMMAND      |                                                                                           |
| 16   | MS -> SS  | ASSIGNMENT COMPLETE     |                                                                                           |
| 17   | SS -> MS  | CONNECT                 |                                                                                           |
| 18   | MS -> SS  | CONNECT ACKNOWLEDGE     |                                                                                           |
| 19   | MS        |                         | The appropriate bearer channel is through connected in both directions.                   |

## 26.9.4 Structured procedures / MS terminated call / early assignment

### 26.9.4.1 Conformance requirements

- 1) The MS shall acknowledge the SETUP message with a CALL CONFIRMED message, if compatibility checking was successful, the MS is not busy, and the user does not refuse the call.
- 2, 3) Upon receipt of the ASSIGNMENT COMMAND message the MS continues a mobile terminating call establishment with early establishment of the traffic channel
  - a) by replying to the ASSIGNMENT COMMAND with an ASSIGNMENT COMPLETE message, and
  - b) if the MS supports immediate connect, by continuing the call establishment by through-connecting the traffic channel in both directions, or if the MS does not support immediate connect, by sending an ALERTING message
- 4) An MS indicates acceptance of a MT call by sending CONNECT.
- 5)

For speech calls:

The mobile station shall attach the user connection at latest when sending the connect message, except if there is no compatible radio resource available at this time. In this case the attachment shall be delayed until such a resource becomes available.

For data calls:

The mobile station shall attach the user connection when receiving the CONNECT ACKNOWLEDGE message from the network.

- 6) The MS initiates call clearing of an active call by sending a DISCONNECT message.
- 7) The MS in this phase of call release, upon receipt of a RELEASE message, shall return a RELEASE COMPLETE message.
- 8) Subsequently the MS, upon receipt of a CHANNEL RELEASE message, shall disconnect the main signalling link.

### 26.9.4.2 Test purpose

- 1) To verify that the MS in MM state "idle, updated" and in RR idle mode with a TMSI assigned, after being paged by the network on the correct paging subchannel, after initiating the immediate assignment procedure by sending the CHANNEL REQUEST message, after receipt of an IMMEDIATE ASSIGNMENT message allocating an SDCCH, after having sent a PAGING RESPONSE message on the allocated SDCCH, after having performed successful authentication and cipher mode setting procedures, after receipt of a SETUP message not containing a signal information element, returns a CALL CONFIRMED message.
- 2) To verify that subsequently, the SS sending an ASSIGNMENT COMMAND message, the MS successfully continues a mobile terminating call establishment with early assignment of traffic channel:
  - a) by replying to the ASSIGNMENT COMMAND with an ASSIGNMENT COMPLETE message, and

- b) by continuing the call establishment by either:
- sending a CONNECT messages and through connecting the TCH in both directions; or
  - sending an ALERTING message.
- 3) To verify that if after sending a CALL PROCEEDING message, the MS sends an ALERTING message during MTC establishment with early assignment, it generates an alerting indication.
- 4) To verify that if an ALERTING had been sent, subsequently, when the user accepts the call (possibly internal action as declared in PICS/PIXIT statement), the MS returns a CONNECT message.
- 5) To verify that the MS:
- if the call is a speech call: after sending the CONNECT message has through connected the TCH in both directions (this is checked by verifying that after transmission of the first L2 frame containing the (complete) CONNECT message, the MS is sending appropriate speech or data frames whenever it does not have to transmit or acknowledge an I frame on layer 2 of the FACCH.)
  - if the call is a data call: after receipt of a subsequent CONNECT ACKNOWLEDGE message through connects the TCH in both directions (this is checked by verifying that there is a point in time after transmission of the first L2 frame containing the (complete) CONNECT ACKNOWLEDGE message, where the MS is sending appropriate speech or data frames whenever it does not have to transmit or acknowledge an I frame on layer 2 of the FACCH.)
- 6) To verify that subsequently, the MS can initiate call clearing by sending a DISCONNECT message.
- 7) To verify that the MS in this phase of call release, upon receipt of a RELEASE message, returns a RELEASE COMPLETE message.
- 8) To verify that subsequently the MS, upon receipt of a CHANNEL RELEASE message, disconnects the main signalling link.

These test purposes are tested for all rates supported by the MS (full rate/half rate).

#### 26.9.4.3 Method of test

##### Related PICS/PIXIT statements

- Supported rates (full rate/half rate).
- Supported speech versions (full rate version 1, full rate version 2, half rate version 1)
- Interface to the human user (p1 = Y/N).
- Way to display the called number (only applicable if the MS has an interface to the human user).
- Way to indicate alerting (only applicable if the MS supports the feature).
- Way to make the MS accept an incoming call after alerting (possibly dependent on teleservice and configuration).
- Supported teleservices.
- Classmark.
- Immediate connect supported (Y/N).

##### Initial Conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

#### Foreseen Final State of the MS

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

#### Test procedure

The following test is performed for all rates (full rate/half rate) supported by the MS:

A teleservice is selected that is supported by the MS; if the MS supports speech, the selected teleservice is speech. If necessary, the MS is configured for that teleservice.

The MS is paged and the resulting call is established. Having reached the active state, the MS is made to clear the call.

#### Maximum Duration of Test

1 minute.

#### Expected Sequence

| Step | Direction | Message                 | Comments                                                                                                                       |
|------|-----------|-------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PAGING REQUEST TYPE 1   | Sent on the correct paging subchannel.                                                                                         |
| 2    | MS -> SS  | CHANNEL REQUEST         |                                                                                                                                |

## 26.9.5 Structured procedures / MS terminated call / late assignment

### 26.9.5.1 Conformance requirement

TP1, TP2: The MS shall acknowledge the SETUP message with a CALL CONFIRMED message, if compatibility checking was successful, the MS is not busy, and the user does not refuse the call. The MS on acceptance of the call sends a CONNECT, otherwise user alerting is initiated.

TP3: The MS indicates acceptance of a call by sending a CONNECT message.

TP4: ASSIGNMENT COMMAND is answered by ASSIGNMENT COMPLETE.

TP5: For speech calls:

The mobile station shall attach the user connection at latest when sending the connect message, except if there is no compatible radio resource available at this time. In this case the attachment shall be delayed until such a resource becomes available.

For data calls:

The mobile station shall attach the user connection when receiving the CONNECT ACKNOWLEDGE message from the network.

Requirement reference:

Conformance requirements 1, 2, 3: 3GPP TS 04.08 / 3GPP TS 24.008, subclauses 5.2.2.3.1, 5.2.2.3.2 and 5.2.2.5.

Conformance requirement 4: 3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.4.3.1.

Conformance requirement 5: 3GPP TS 04.08 / 3GPP TS 24.008, subclause 5.2.2.9.

### 26.9.5.2 Test purpose

- 1) To verify that the MS in "Idle, Updated" state with a TMSI assigned, after being paged by the network on the correct paging subchannel, after initiating the immediate assignment procedure by sending the CHANNEL REQUEST message, after receipt of an IMMEDIATE ASSIGNMENT message allocating an SDCCH, after having established the main signalling link, after having sent a PAGING RESPONSE message, after having performed successful authentication and cipher mode setting procedures, after receipt of a SETUP message containing a signal information element, returns a CALL CONFIRMED message followed by:
  - an ALERTING message;
  - or a CONNECT message.
- 2) To verify that in the situation of test purpose 1, if the MS sends an ALERTING message, the MS generates an alerting indication in the way described in a PICS/PIXIT statement.
- 3) To verify that subsequently the MS, if it had not yet sent a CONNECT message, upon acceptance of the call, sends a CONNECT message.
- 4) To verify that subsequently after receipt of an ASSIGNMENT COMMAND, the MS sends an ASSIGNMENT COMPLETE message.

5) To verify that subsequently the MS:

- if the call is a speech call: after sending the ASSIGNMENT COMPLETE message has through connected the TCH in both directions (this is checked by verifying that after transmission of the first L2 frame containing the (complete) ASSIGNMENT COMPLETE message, the MS is sending appropriate speech or data frames whenever it does not have to transmit or acknowledge an I frame on layer 2 of the FACCH.)
- if the call is a data call: after receipt of a subsequent CONNECT ACKNOWLEDGE message through connects the TCH in both directions (this is checked by verifying that there is a point in time after transmission of the first L2 frame containing the (complete) CONNECT ACKNOWLEDGE message, where the MS is sending appropriate speech or data frames whenever it does not have to transmit or acknowledge an I frame on layer 2 of the FACCH.)

These test purposes are tested for all rates supported by the MS (full rate/half rate).

### 26.9.5.3 Method of test

#### Related PICS/PIXIT statements

- Supported rates (full rate/half rate).
- Supported speech versions (full rate version 1, full rate version 2, half rate version 1)
- Interface to the human user (p1 = Y/N).
- Way to display the called number (only applicable if the MS has an interface to the human user).
- Way to indicate alerting (only applicable if the MS supports the feature).
- Way to make the MS accept an incoming call after alerting (possibly dependent on teleservice and configuration).
- Supported teleservices.
- Classmark.
- Immediate connect supported (Y/N).

#### Initial Conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

#### Foreseen Final State of the MS

CC state U10-call active.

#### Test procedure

The following test is performed for all rates (full rate/half rate) supported by the MS:

- A teleservice is selected that is supported by the MS; if the MS supports speech, the selected teleservice is speech. If necessary, the MS is configured for that teleservice.
- The MS is paged and a MT call is established with late assignment (after CONNECT).

#### Maximum Duration of Test

40 s.

## Expected Sequence

| Step | Direction | Message                 | Comments                                                                             |
|------|-----------|-------------------------|--------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PAGING REQUEST TYPE 1   | Sent on the correct paging subchannel.                                               |
| 2    | MS -> SS  | CHANNEL REQUEST         | Establishment cause indicates "answer to paging".                                    |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT    |                                                                                      |
| 4    | MS -> SS  | PAGING RESPONSE         | Message is contained in SABM.                                                        |
| 5    | SS -> MS  | AUTHENTICATION REQUEST  |                                                                                      |
| 6    | MS -> SS  | AUTHENTICATION RESPONSE | SRES specifies correct value.                                                        |
| 7    | SS -> MS  | CIPHERING MODE COMMAND  | SS starts deciphering after sending the message.                                     |
| 8    | MS -> SS  | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered.           |
| 9    | SS        |                         | SS starts ciphering.                                                                 |
| 10   | SS -> MS  | SETUP                   | Message contains the signal IE.                                                      |
| 11   | MS -> SS  | CALL CONFIRMED          |                                                                                      |
| A12  | MS -> SS  | CONNECT                 |                                                                                      |
| B12  | MS -> SS  | ALERTING                |                                                                                      |
| B13  | MS        |                         | An alerting indication as defined in an PICS/PIXIT statement is given by the MS.     |
| B14  | MS        |                         | The MS is made to accept the call in the way described in a PICS/PIXIT statement.    |
| B15  | MS -> SS  | CONNECT                 |                                                                                      |
| 16   | SS -> MS  | ASSIGNMENT COMMAND      |                                                                                      |
| 17   | MS -> SS  | ASSIGNMENT COMPLETE     |                                                                                      |
| 18   | MS        |                         | If the call is a speech call, the TCH shall be through connected in both directions. |
| 19   | SS -> MS  | CONNECT ACKNOWLEDGE     |                                                                                      |
| 20   | MS        |                         | If the call is a data call, the MS shall through connect the TCH in both directions. |

## Specific Message Contents:

None.

## 26.9.6 Structured procedures / emergency call

Emergency call establishment can be initiated by an MS whether location updating has been successful or not and whether a SIM is inserted into the MS or not; but only if the MS is equipped for speech.

If the procedures tested in this subclause are not correctly implemented in the MS, establishment, maintenance and clearing of connections might fail in the essential case of emergency calls.

The tests of this subclause are only applicable to an MS supporting speech.

### 26.9.6.1 Structured procedures / emergency call / idle updated

#### 26.9.6.1.1 Structured procedures / emergency call / idle updated / preferred channel rate

##### 26.9.6.1.1.1 Conformance requirement

- 1) The MS in the "idle, updated" state, as after a successful location update, after the number 112 (for GSM 900 and 1800 MS), or 911 (for GSM 700, GSM 850 and PCS 1 900 MS in USA and Canada), or 08 (for GSM 700, GSM 850 and PCS 1 900 MS in Mexico) has been entered by user, shall send a CHANNEL REQUEST message with correct establishment cause ("emergency call").
- 2) After assignment of a dedicated channel the first layer message sent by the MS on the assigned dedicated channel shall be a CM SERVICE REQUEST message specifying the correct CKSN and TMSI, with CM Service Type "emergency call establishment".
- 3) Authentication and cipher mode setting shall be performed successfully.
- 4) After cipher mode setting acceptance by the network, the MS shall send an EMERGENCY SETUP message.

- 5), 6) The emergency call shall be correctly established. The assignment procedure shall be correctly performed.
- 7) After receipt of a CONNECT ACKNOWLEDGE message during correct establishment of the emergency call the TCH shall be through connected in both directions if an appropriate TCH is available.
- 8) The call shall be cleared correctly.

#### Requirement Reference:

For conformance requirement 1 and 2:

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.3.1.1,  
3GPP TS 04.08 / 3GPP TS 24.008 subclauses 5.2.1 and 4.5.1.5,  
3GPP TS 02.30 clause 4.

For conformance requirement 3:

3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.4.7,  
3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.3.2.

For conformance requirement 4:

3GPP TS 04.08 / 3GPP TS 24.008, subclause 5.2.1.1.

For conformance requirement 5 and 6:

3GPP TS 04.08 / 3GPP TS 24.008, subclauses 5.2.1.1,  
3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.4.3.

For conformance requirement 7:

3GPP TS 04.08 / 3GPP TS 24.008, subclauses 5.2.1.6 and 5.1.3.

For conformance requirement 8:

3GPP TS 04.08 / 3GPP TS 24.008, subclause 5.4.

#### 26.9.6.1.1.2 Test purpose

- 1) To verify that an MS supporting speech in the MM state "idle, updated", when made to call the number 112 (for GSM 900 and 1800 MS), or 911 (for GSM 700, GSM 850 and PCS 1 900 MS in USA and Canada), or 08 (for GSM 700, GSM 850 and PCS 1 900 MS in Mexico), sends a CHANNEL REQUEST message with establishment cause "emergency call".
- 2) To verify that after assignment of a dedicated channel the first layer message sent by the MS on the assigned dedicated channel is a CM SERVICE REQUEST message specifying the correct CKSN and TMSI, with CM Service Type "emergency call establishment".
- 3) To verify that authentication and cipher mode setting are performed successfully.
- 4) To verify that after cipher mode setting acceptance by the SS, the MS sends an EMERGENCY SETUP message.
- 5) To verify that subsequently, the SS having sent a CALL PROCEEDING message and then an ALERT message and having initiated the assignment procedure of an appropriate speech traffic channel, which, if the MS supports both TCH/FS and TCH/HS, is at the preferred rate, the MS performs correctly that assignment procedure.
- 6) To verify subsequent correct performance of a connect procedure.
- 7) To verify that subsequently the MS has through connected the TCH in both directions.
- 8) To verify that the call is cleared correctly.

## 26.9.6.1.1.3 Method of test

## Related PICS/PIXIT Statements

- Speech supported (Y/N).
- Supported rate for speech: (p1 = F/H, F).
- Classmark.

## Initial Conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

## Foreseen Final State of the MS

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

## Test procedure

The MS is made to initiate an emergency call. The call is established with late assignment. Having reached the active state, the call is cleared by the SS.

## Maximum Duration of Test

1 minute.

## Expected Sequence

| Step | Direction | Message                 | Comments                                                                                                                                                                                                                                                                                                                                                           |
|------|-----------|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                         | The appropriate emergency call number is entered.                                                                                                                                                                                                                                                                                                                  |
| 3    | MS -> SS  | CHANNEL REQUEST         | Establishment cause is emergency call establishment.                                                                                                                                                                                                                                                                                                               |

| 21   | SS -> MS  | RELEASE COMPLETE        |                                                                                                                                                                                                                                                                                                                                                                    |
| 23   | SS -> MS  | CHANNEL RELEASE         | The main signalling link is released.                                                                                                                                                                                                                                                                                                                              |

## Specific Message Contents:

None.

### 26.9.6.1.2 Structured procedures / emergency call / idle updated, non-preferred channel rate

The test is performed if the MS supports both TCH/HS and TCH/FS (see PICS/PIXIT statement).

It is identical to the test in subclause 26.9.6.1.1 except that in step 14 the assigned TCH has the non-preferred rate.

### 26.9.6.2 Structured procedures / emergency call / idle, no IMSI

#### 26.9.6.2.1 Structured procedures / emergency call / idle, no IMSI / accept case

##### 26.9.6.2.1.1 Conformance requirement

- 1) The MS in the "idle, updated" state, as after a successful location update, after the number 112 (for GSM 900 and 1800 MS), or 911 (for GSM 700, GSM 850 and PCS 1 900 MS in USA and Canada), or 08 (for GSM 700, GSM 850 and PCS 1 900 MS in Mexico) has been entered by user, shall send a CHANNEL REQUEST message with correct establishment cause ("emergency call").
- 2) After assignment of a dedicated channel the first layer message sent by the MS on the assigned dedicated channel shall be a CM SERVICE REQUEST message specifying the correct IMEI and a non-available CKSN, with CM Service Type "emergency call establishment".
- 3) After cipher mode setting acceptance by the network, the MS shall send an EMERGENCY SETUP message.

- 4),5) The emergency call shall be correctly established. The assignment procedure shall be correctly performed.
- 6) After receipt of a CONNECT ACKNOWLEDGE message during correct establishment of the emergency call the TCH shall be through connected in both directions if an appropriate TCH is available.
- 7) The call shall be cleared correctly.

#### Requirement Reference:

For conformance requirement 1 and 2:

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.3.1.1,  
3GPP TS 04.08 / 3GPP TS 24.008 subclauses 5.2.1 and 4.5.1.5,  
3GPP TS 02.30 clause 4.

For conformance requirement 3:

3GPP TS 04.08 / 3GPP TS 24.008, subclause 5.2.1.1.

For conformance requirements 4 and 5:

3GPP TS 04.08 / 3GPP TS 24.008, subclause 5.2.1.1,  
3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.4.3.

For conformance requirement 6:

3GPP TS 04.08 / 3GPP TS 24.008, subclauses 5.2.1.6 and 5.1.3.

For conformance requirement 7:

3GPP TS 04.08 / 3GPP TS 24.008, subclause 5.4.

#### 26.9.6.2.1.2 Test purpose

- 1) To verify that the MS in the "idle, no IMSI" state (no SIM inserted) when made to call the number 112 (for GSM 900 and 1800 MS), or 911 (for GSM 700, GSM 850 and PCS 1 900 MS in USA and Canada), or 08 (for GSM 700, GSM 850 and PCS 1 900 MS in Mexico), sends a CHANNEL REQUEST message with establishment cause "emergency call".
- 2) To verify that after assignment of a dedicated channel the first layer message sent by the MS on the assigned dedicated channel is a CM SERVICE REQUEST message in which the cipher key sequence number IE indicates "no key is available", the CM service type IE indicates "emergency number establishment", and the mobile identity IE specifies the IMEI of the MS.
- 3) To verify that after receipt of a CM SERVICE ACCEPT message from the SS, the MS sends an EMERGENCY SETUP message.
- 4) To verify that subsequently, the SS having sent a CALL PROCEEDING message and then an ALERT message and having initiated the assignment procedure of an appropriate speech traffic channel, which, if the MS supports both TCH/FS and TCH/HS, is at the preferred rate, the MS performs correctly that assignment procedure.
- 5) To verify subsequent correct performance of a connect procedure.
- 6) To verify that subsequently the MS has through connected the TCH in both directions.
- 7) To verify that the call is cleared correctly.

#### 26.9.6.2.1.3 Method of test

#### Related PICS/PIXIT Statements

- Speech supported (Y/N).
- Classmark.

## Initial Conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, no IMSI", no SIM inserted.

## Foreseen Final State of the MS

The MS is in MM-state "idle, no IMSI", no SIM inserted.

## Test procedure

The MS is made to initiate an emergency call. The call is established without authentication, without ciphering, with late assignment. Having reached the active state, the call is cleared by the SS.

## Maximum Duration of Test

1 minute.

## Expected Sequence

| Step | Direction | Message              | Comments                                                                                                                                                                                                                                                                                                              |                                                                          |
|------|-----------|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------|
| 1    | MS        |                      | The appropriate emergency call number is entered.                                                                                                                                                                                                                                                                     |                                                                          |
| 3    | MS -> SS  | CHANNEL REQUEST      | Establishment cause is "emergency call".                                                                                                                                                                                                                                                                              |                                                                          |
| 4    | SS -> MS  | IMMEDIATE ASSIGNMENT |                                                                                                                                                                                                                                                                                                                       |                                                                          |
| 5    | MS -> SS  | CM SERVICE REQUEST   | Message is contained in SABM. The CM service type IE indicates "emergency call establishment". The mobile identity IE specifies the IMEI of the MS. The cipher key sequence number IE indicates "no key is available". The mobile station classmark IE is as specified by the manufacturer in a PICS/PIXIT statement. |                                                                          |

## 26.9.6.2.2 Structured procedures / emergency call / idle, no IMSI / reject case

## 26.9.6.2.2.1 Conformance requirement

- 1) The MS in the "idle, no IMSI" state (no SIM inserted), after the number 112 (for GSM 900 and 1800 MS), or 911 (for GSM 700, GSM 850 and PCS 1 900 MS in USA and Canada), or 08 (for GSM 700, GSM 850 and PCS 1 900 MS in Mexico) has been entered, shall send a CHANNEL REQUEST message with correct establishment cause ("emergency call").

- 2) After assignment of a dedicated channel the first layer message sent by the MS on the assigned dedicated channel shall be a CM SERVICE REQUEST message specifying the correct IMEI and a non-available CKSN, with CM Service Type "emergency call establishment".
- 3) In the situation at the end of test purpose 2, when the MS receives a CM SERVICE REJECT message, it shall abandon the emergency call.

#### Requirement Reference:

For conformance requirement 1 and 2:

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.3.1.1,  
3GPP TS 04.08 / 3GPP TS 24.008 subclauses 5.2.1 and 4.5.1.5,  
3GPP TS 02.30 clause 4.

For conformance requirement 3:

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.4.7,  
3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.5.1.1.

#### 26.9.6.2.2.2 Test purpose

- 1) To verify that the MS in the "idle, no IMSI" state (no SIM inserted) when made to call the number 112, (for GSM 900 and 1800 MS), or 911 (for GSM 700, GSM 850 and PCS 1 900 MS in USA and Canada), or 08 (for GSM 700, GSM 850 and PCS 1 900 MS in Mexico) sends a CHANNEL REQUEST message with establishment cause "emergency call".
- 2) To verify that after assignment of a dedicated channel the first layer message sent by the MS on the assigned dedicated channel is a CM SERVICE REQUEST message in which the cipher key sequence number IE indicates "no key is available", the CM service type IE indicates "emergency call establishment", and the mobile identity IE specifies the IMEI of the MS.
- 3) To verify that after receipt of a CM SERVICE REJECT message from the SS, the MS abandons the emergency call establishment.

#### 26.9.6.2.2.3 Method of test

##### Related PICS/PIXIT statements

- Speech supported (Y/N).
- Classmark.

##### Initial Conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, no IMSI", no SIM inserted.

##### Foreseen Final State of the MS

The MS is in MM-state "idle, no IMSI", no SIM inserted.

## Test procedure

The MS is made to initiate an emergency call. The call is established without authentication, without ciphering, with early assignment. The SS responds to the CM SERVICE REQUEST from the MS with a CM SERVICE REJECT message specifying in the reject cause IE the reject cause value "IMEI not accepted". The SS then verifies for during 5 s that the MS does not send a layer 3 message. Then the call is cleared by the SS. The SS verifies during 20 s after disconnection of the main signalling link that the MS does not initiate an RR connection establishment.

## Maximum Duration of Test

1 minute.

## Expected Sequence

| Step | Direction | Message              | Comments                                                                                                                                                                                                                                                                                                                                                                                        |
|------|-----------|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                      | The appropriate call number is entered.                                                                                                                                                                                                                                                                                                                                                         |
| 3    | MS -> SS  | CHANNEL REQUEST      | Establishment cause is "emergency call".                                                                                                                                                                                                                                                                                                                                                        |
| 4    | SS -> MS  | IMMEDIATE ASSIGNMENT |                                                                                                                                                                                                                                                                                                                                                                                                 |
| 5    | MS -> SS  | CM SERVICE REQUEST   |                                                                                                                                                                                                                                                                                                                                                                                                 |
| 4    | SS -> MS  | CM SERVICE REJECT    | Message is contained in SABM. The CM service type IE indicates "emergency call establishment". The mobile identity IE specifies the IMEI of the MS. The cipher key sequence number IE indicates "no key is available". The mobile station classmark IE is as specified by the manufacturer in a PICS/PIXIT statement. the reject cause IE specifies reject cause value #5, "IMEI not accepted". |
| 5    | SS        |                      | During 5 s, the SS verifies that the MS does not send L3 messages.                                                                                                                                                                                                                                                                                                                              |
| 6    | SS -> MS  | CHANNEL RELEASE      | The main signalling link is released.                                                                                                                                                                                                                                                                                                                                                           |
| 7    | SS        |                      | During 20 s, the SS verifies that the MS does not initiate an RR connection establishment.                                                                                                                                                                                                                                                                                                      |

## 26.9.7 Directed Retry / Mobile Originated Call

This test is applicable to all MS which support at least one MO circuit switched basic service.

### 26.9.7.1 Conformance requirements

The MS shall correctly apply the Directed Retry procedure from SDCCH/8 (with frequency hopping) or SDCCH/4 to TCH/F or TCH/H with or without frequency hopping in the non-synchronized case during call establishment. The call control entity of the Mobile Station in the "mobile originating call proceeding" state shall, upon receipt of a CONNECT message, attach the appropriate user connection to the radio path and return a CONNECT ACKNOWLEDGE message to the SS.

## References

- 3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.4.4,
- 3GPP TS 04.08 / 3GPP TS 24.008 subclauses 5.2.1.6. and 9.1.15.
- 3GPP TS 04.13, subclause 5.2.6.2.

### 26.9.7.2 Test purpose

To test that, when the MS is ordered to perform a non-synchronized handover after the CALL PROCEED message, it continuously sends access bursts on the main DCCH until it receives a PHYSICAL INFORMATION message from the SS. To test that the MS correctly takes the values of the Timing Advance information element in the PHYSICAL INFORMATION message into account. To test that the MS activates the new channel correctly and transmits the HANDOVER COMPLETE message without undue delay. To test that the call control entity of the Mobile Station in the "mobile originating call proceeding" state, upon receipt of a CONNECT message, attaches the appropriate user connection to the radio path and returns a CONNECT ACKNOWLEDGE message to the SS.

### 26.9.7.3 Method of test

#### Initial Conditions

System Simulator:

2 cells A and B with same LAI, default parameters, except:

GSM 450:

Cell A has:

BCCH ARFCN = 263.

Cell Allocation = (259, 261, 263, 265, 267, 269, 271, 273, 275, 277, 279, 281, 283, 285, 287, 289, 291).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

PLMN\_PERM = 00001010.

Cell B has:

BCCH ARFCN = 274

Cell Allocation = (260, 262, 264, 266, 268, 270, 272, 274, 276, 279, 281, 283, 285, 287, 289, 291).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using range 128 format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

For execution counter M = 1 a combined CCH/SDCCH is used.

For execution counter M = 2 a non-combined SDCCH is used.

GSM 480:

Cell A has:

BCCH ARFCN = 310.

Cell Allocation = (306, 308, 310, 312, 314, 316, 318, 320, 322, 324, 326, 328, 330, 332, 334, 336, 338).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

PLMN\_PERM = 00001010.

Cell B has:

BCCH ARFCN = 321.

Cell Allocation = (307, 309, 311, 313, 315, 317, 319, 321, 323, 326, 328, 330, 332, 334, 336, 338).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using range 128 format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

For execution counter M = 1 a combined CCH/SDCCH is used.

For execution counter M = 2 a non-combined SDCCH is used.

GSM 900:

Cell A has:

BCCH ARFCN = 20.

Cell Allocation = (10, 17, 20, 26, 34, 42, 45, 46, 52, 59, 66, 73, 74, 75, 76, 108, 114).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

PLMN\_PERM = 00001010.

Cell B has:

BCCH ARFCN = 40.

Cell Allocation = (14, 18, 22, 24, 30, 31, 38, 40, 60, 66, 73, 74, 75, 76, 108, 114).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using bit map 0 format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

For execution counter M = 1 a combined CCH/SDCCH is used.

For execution counter M = 2 a non-combined SDCCH is used.

DCS 1 800:

Cell A has:

BCCH ARFCN = 747.

Cell Allocation = (734, 741, 747, 754, 759, 762, 766, 767, 773, 775, 779, 782, 791, 798, 829, 832, 844).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

PLMN\_PERM = 00001010.

Cell B has:

BCCH ARFCN = 764.

Cell Allocation = (739, 743, 746, 749, 756, 758, 761, 764, 771, 779, 782, 791, 798, 829, 832, 844).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using Range 512 format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

For execution counter M = 1 a combined CCH/SDCCH is used.

For execution counter M = 2 a non combined SDCCH is used.

GSM 700:

Cell A has:

BCCH ARFCN = 457.

Cell Allocation = (447, 454, 457, 463, 471, 479, 482, 483, 489, 496, 498, 500, 501, 502, 503, 506, 508).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

PLMN\_PERM = 00001010.

Cell B has:

BCCH ARFCN = 477.

Cell Allocation = (451, 455, 459, 461, 467, 468, 475, 477, 497, 498, 500, 501, 502, 503, 506, 508).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using 128 range format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

For execution counter M = 1 a combined CCH/SDCCH is used.

For execution counter M = 2 a non-combined SDCCH is used.

GSM 850:

Cell A has:

BCCH ARFCN = 147.

Cell Allocation = (137, 144, 147, 153, 161, 169, 172, 173, 179, 186, 193, 200, 201, 202, 203, 235, 241).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

PLMN\_PERM = 00001010.

Cell B has:

BCCH ARFCN = 167.

Cell Allocation = (141, 145, 149, 151, 157, 158, 165, 167, 187, 193, 200, 201, 202, 203, 235, 241).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using 128 range format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

For execution counter M = 1 a combined CCH/SDCCH is used.

For execution counter M = 2 a non-combined SDCCH is used.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated and camped on cell A.

#### Related PICS/PIXIT Statements

Supported rate(s) of TCH: TCH/F and/or TCH/H.

Support for MO calls.

Supported teleservices.

Way to indicate alerting (only applicable if the MS supports the feature).

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800).

#### Foreseen Final State of the MS

"Idle, updated" with TMSI allocated and camped on cell B.

#### Test Procedure

This procedure is repeated for execution counter M = 1..2.

A teleservice is selected that is supported by the MS; if the MS supports speech, the selected teleservice is speech. If necessary, the MS is configured for that teleservice.

The MS is made to initiate a call on Cell A. After the SS has sent the CALL PROCEEDING message the SS sends a HANDOVER COMMAND message, ordering the MS to switch to cell B. The MS shall then begin to send access bursts on the new DCCH to cell B. The SS observes the access bursts and after receiving n (n being arbitrarily chosen between values according to table 26.6-2 of subclause 26.6.5) access bursts, the SS sends one PHYSICAL INFORMATION message with an arbitrarily chosen Timing Advance. The MS shall activate the channel in sending and receiving mode. The MS shall establish a signalling link. The MS shall be ready to transmit a HANDOVER COMPLETE message before x ms after the end of the PHYSICAL INFORMATION message, but not before a UA frame has been sent by the SS. After the successful handover procedure the SS sends the ALERTING message. The correct alerting indication shall be given to the user (only applicable if the MS supports this feature). The SS sends the CONNECT message indicating that the call has been answered. The appropriate bearer channel shall be through connected in both directions. The MS shall send then the CONNECT ACKNOWLEDGE message as the response on the CONNECT message. Having reached the active state, the call is cleared by the SS.

The term "ready to transmit" is defined in 3GPP TS 04.13. The value of "x" depends upon the target channel and is specified in the specific message contents section.

#### Maximum Duration of Test

2 minutes, including 1 minute for any necessary operator actions.

## Expected Sequence

The sequence is performed for execution counter M = 1..2 (unless a particular TCH is not supported).

| Step | Direction | Message                 | Comments                                                                                                                                         |
|------|-----------|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | -----     | -----                   | A MO call is initiated on cell A.                                                                                                                |
| 2    | MS -> SS  | CHANNEL REQUEST         | Establishment cause is "originating call and the network does not set the NECI bit to 1".                                                        |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT    | See specific message contents.                                                                                                                   |
| 4    | MS -> SS  | CM SERVICE REQUEST      | CM Service Type = Mobile Originating Call Establishment.                                                                                         |

| - HSN                                | Chosen arbitrarily from the set (1, 2.. 63).                                                                          |
| Synchronization Indication           |                                                                                                                       |
| - Report Observed Time Difference    | Shall not be included.                                                                                                |
| - Synchronization Indication         | "Non synchronized".                                                                                                   |
| - Normal Cell Indication             | Ignore out of range timing advance.                                                                                   |
| Cell Channel Description             | uses 128 range to encode: (167, 193, 200, 201, 202, 203, 235, 241) only.                                              |
| Mobile Allocation after time         | Indicates channel (200, 201, 202) only.                                                                               |
| Channel Mode IE                      | speech (full rate version 1 or half rate version 1).                                                                  |

Step 17: "x" = 750.

Specific Message Contents For Mobiles not Supporting Speech

The message contents shall be the same for the declared type of Mobile Station (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or DCS 1 800 supporting speech, except for:

For M = 1 (TCH/F):

HANDOVER COMMAND

| Information Element   | value/remarks                                     |
|-----------------------|---------------------------------------------------|
| Mode of first channel | Arbitrary from those supported (12, 6, 3.6 kbps). |

For M = 2 (TCH/H):

HANDOVER COMMAND

| Information Element   | value/remarks                                 |
|-----------------------|-----------------------------------------------|
| Mode of first channel | Arbitrary from those supported (6, 3.6 kbps). |

### 26.9.8 Directed Retry / Mobile Terminated Call

This test is applicable to all MS which support at least one MT circuit switched basic service.

#### 26.9.8.1 Conformance requirements

The MS shall correctly apply the Directed Retry procedure from SDCCH/8 (with frequency hopping) or SDCCH/4 to TCH/F or TCH/H with or without frequency hopping in the non-synchronized case during call establishment. The call control entity of the Mobile Station in the "call delivered" state shall, if the MS supports immediate connect, continue the call establishment by through-connecting the traffic channel in both directions, or if the MS does not support immediate connect, send an ALERTING message. The MS indicates acceptance of a MT call by sending CONNECT.

For speech calls the mobile station shall attach the user connection at latest when sending the CONNECT message, except if there is no compatible radio resource available at this time. In this case the attachment shall be delayed until such a resource becomes available.

For Data Calls the mobile station shall attach the user connection when receiving the CONNECT ACKNOWLEDGE message from the network.

### 26.9.8.2 Test purpose

To test that when the MS is ordered to perform a non-synchronized handover after the CALL CONFIRM message, it continuously sends access bursts on the main DCCH until it receives a PHYSICAL INFORMATION message from the SS. To test that the MS correctly takes the values of the Timing Advance information element in the PHYSICAL INFORMATION message into account. To test that the MS activates the new channel correctly and transmits the HANDOVER COMPLETE message without undue delay. To test that the call control entity of the Mobile Station in the "call delivered" state, if the MS supports immediate connect, continues the call establishment by through-connecting the traffic channel in both directions, or if the MS does not support immediate connect, sends an ALERTING message. To test that the MS indicates acceptance of a MT call by sending CONNECT.

To test that for speech calls the mobile station attaches the user connection at latest when sending the CONNECT message, except if there is no compatible radio resource available at this time. To test that in this case the attachment is delayed until such a resource becomes available.

To test that for Data Calls the mobile station attaches the user connection when receiving the CONNECT ACKNOWLEDGE message from the network.

### 26.9.8.3 Method of test

#### Initial Conditions

System Simulator:

2 cells A and B with same LAI, default parameters, except:

GSM 450:

Cell A has:

BCCH ARFCN = 263.

Cell Allocation = (259, 261, 263, 265, 267, 269, 271, 273, 275, 277, 279, 281, 283, 285, 287, 289, 291).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

PLMN\_PERM = 00001010.

Cell B has:

BCCH ARFCN = 274

Cell Allocation = (260, 262, 264, 266, 268, 270, 272, 274, 276, 279, 281, 283, 285, 287, 289, 291).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using range 128 format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

For execution counter M = 1 a combined CCH/SDCCH is used.

For execution counter M = 2 a non-combined SDCCH is used.

GSM 480:

Cell A has:

BCCH ARFCN = 310.

Cell Allocation = (306, 308, 310, 312, 314, 316, 318, 320, 322, 324, 326, 328, 330, 332, 334, 336, 338).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

PLMN\_PERM = 00001010.

Cell B has:

BCCH ARFCN = 321.

Cell Allocation = (307, 309, 311, 313, 315, 317, 319, 321, 323, 326, 328, 330, 332, 334, 336, 338).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using range 128 format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

For execution counter M = 1 a combined CCH/SDCCH is used.

For execution counter M = 2 a non-combined SDCCH is used.

GSM 900:

Cell A has:

BCCH ARFCN = 20.

Cell Allocation = (10, 17, 20, 26, 34, 42, 45, 46, 52, 59, 66, 73, 74, 75, 76, 108, 114).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

PLMN\_PERM = 00001010.

Cell B has:

BCCH ARFCN = 40.

Cell Allocation = (14, 18, 22, 24, 30, 31, 38, 40, 60, 66, 73, 74, 75, 76, 108, 114).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using bit map 0 format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

For execution counter M = 1 a combined CCH/SDCCH is used.

For execution counter M = 2 a non-combined SDCCH is used.

DCS 1 800:

Cell A has:

BCCH ARFCN = 747.

Cell Allocation = (734, 741, 747, 754, 759, 762, 766, 767, 773, 775, 779, 782, 791, 798, 829, 832, 844).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

PLMN\_PERM = 00001010.

Cell B has:

BCCH ARFCN = 764.

Cell Allocation = (739, 743, 746, 749, 756, 758, 761, 764, 771, 779, 782, 791, 798, 829, 832, 844).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using Range 512 format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

For execution counter M = 1 a combined CCH/SDCCH is used.

For execution counter M = 2 a non combined SDCCH is used.

GSM 700:

Cell A has:

BCCH ARFCN = 457.

Cell Allocation = (447, 454, 457, 463, 471, 479, 482, 483, 489, 496, 498, 500, 501, 502, 503, 506, 508).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

PLMN\_PERM = 00001010.

Cell B has:

BCCH ARFCN = 477.

Cell Allocation = (451, 455, 459, 461, 467, 468, 475, 477, 497, 498, 500, 501, 502, 503, 506, 508).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using 128 range format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

For execution counter M = 1 a combined CCH/SDCCH is used.

For execution counter  $M = 2$  a non-combined SDCCH is used.

GSM 850:

Cell A has:

BCCH ARFCN = 147.

Cell Allocation = (137, 144, 147, 153, 161, 169, 172, 173, 179, 186, 193, 200, 201, 202, 203, 235, 241).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

PLMN\_PERM = 00001010.

Cell B has:

BCCH ARFCN = 167.

Cell Allocation = (141, 145, 149, 151, 157, 158, 165, 167, 187, 193, 200, 201, 202, 203, 235, 241).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using 128 range format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

For execution counter  $M = 1$  a combined CCH/SDCCH is used.

For execution counter  $M = 2$  a non-combined SDCCH is used.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated and camped on cell A.

#### Related PICS/PIXIT Statements

Supported rate(s) of TCH: TCH/F and/or TCH/H

Support for MT calls.

Supported teleservices.

Way to indicate alerting (only applicable if the MS supports the feature).

Way to make the MS accept an incoming call after alerting (possibly dependent on teleservice and configuration).

Immediate connect supported (Y/N).

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800).

#### Foreseen Final State of the MS

"Idle, updated" with TMSI allocated and camped on cell B.

#### Test Procedure

This procedure is repeated for execution counter  $M = 1..2$ .

A teleservice is selected that is supported by the MS; if the MS supports speech, the selected teleservice is speech. If necessary, the MS is configured for that teleservice.

The MS is paged on Cell A. The MS responds to the PAGING REQUEST message and establishes a mobile terminated call on Cell A. If the MS supports immediate connect, it continues the call establishment by through-connecting the traffic channel in both directions, or if the MS does not support immediate connect, it sends an ALERTING message. The MS indicates acceptance of a MT call by sending CONNECT.

After the MS has sent the CALL CONFIRMED message (if the MS supports immediate connect then the MS sends the CONNECT message after the CALL CONFIRMED message on the old channel) the SS sends a HANDOVER COMMAND message, ordering the MS to switch to cell B. The MS shall then begin to send access bursts on the new DCCH to cell B. The SS observes the access bursts and after receiving  $n$  ( $n$  being arbitrarily chosen between values according to table 26.6-2 of subclause 26.6.5) access bursts, the SS sends one PHYSICAL INFORMATION message with an arbitrarily chosen Timing Advance. The MS shall activate the channel in sending and receiving mode. The MS shall establish a signalling link. The MS shall be ready to transmit a HANDOVER COMPLETE message before  $x$  ms after the end of the PHYSICAL INFORMATION message, but not before a UA frame has been sent by the SS. After the successful handover procedure the MS sends the ALERTING message (if the MS runs the immediate connect procedure then the MS does not send an ALERTING message). The correct alerting indication shall be given to the user (only applicable if the MS supports the feature or if the MS is not using the immediate connect procedure). After the MS sent the CONNECT message the appropriate bearer channel shall be through connected in both directions. The SS sends then the CONNECT ACKNOWLEDGE message as the response on the CONNECT message. Having reached the active state, the call is cleared by the SS.

The term "ready to transmit" is defined in 3GPP TS 04.13. The value of " $x$ " depends upon the target channel and is specified in the specific message contents section.

#### Maximum Duration of Test

2 minutes, including 1 minute for any necessary operator actions.

## Expected Sequence

The sequence is performed for execution counter M = 1..2 (unless a particular TCH is not supported).

| Step | Direction | Message                 | Comments                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| - Channel Type                       | TCH/H + ACCHs                                                                                                                                           |
| - TDMA offset                        | Chosen arbitrarily.                                                                                                                                     |
| - Timeslot number                    | Chosen arbitrarily, but not Zero.                                                                                                                       |
| - Training Sequence Code             | Chosen arbitrarily.                                                                                                                                     |
| - Hopping                            | RF hopping channel.                                                                                                                                     |
| - MAIO                               | Chosen arbitrarily from the set (0, 1 to N-1), where N is the number of frequencies encoded in the Frequency List IE.                                   |
| - HSN                                | Zero (this gives cyclic hopping).                                                                                                                       |
| Frequency List after time            |                                                                                                                                                         |
| - Frequency List                     | use 128 range to allocate the following 12 frequencies: (141, 145, 149, 151, 187, 193, 200, 201, 202, 203, 235, 241).                                   |
| Synchronization Indication           |                                                                                                                                                         |
| - Report Observed Time Difference    | Shall not be included.                                                                                                                                  |
| - Synchronization Indication         | "Non synchronized".                                                                                                                                     |
| - Normal Cell Indication             | Ignore out of range timing advance.                                                                                                                     |
| Mode of First Channel                | Speech (full rate version 1 or half rate version 1).                                                                                                    |
| Starting Time                        | Indicates the frame number of cell B. that will occur approximately 1,1 seconds (238 frames have elapsed) after the HANDOVER COMMAND is sent by cell A. |

Step A18 / B17: "x" = 750.

## Specific Message Contents For Mobiles not Supporting Speech

The message contents shall be the same for the declared type of Mobile Station (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or DCS 1 800 supporting speech, except for:

For M = 1 (TCH/F):

## HANDOVER COMMAND

| Information Element   | value/remarks                                     |
|-----------------------|---------------------------------------------------|
| Mode of first channel | Arbitrary from those supported (12, 6, 3.6 kbps). |

For  $M = 2$  (TCH/H):

#### HANDOVER COMMAND

| Information Element   | value/remarks                                 |
|-----------------------|-----------------------------------------------|
| Mode of first channel | Arbitrary from those supported (6, 3.6 kbps). |

## 26.9.9 Default contents of messages

ALERTING (mobile station to network direction)

| Information element | Value/remark |
|---------------------|--------------|
| Facility            | Not checked  |
| User-user           | Not checked  |
| SS version          | Not checked  |

ALERTING (network to mobile station direction)

| Information element | Value/remark |
|---------------------|--------------|
| Facility            | Omitted      |
| Progress indicator  | Omitted      |
| User-user           | Omitted      |

#### ASSIGNMENT COMMAND

| Information element               | Value/remark                                                           |
|-----------------------------------|------------------------------------------------------------------------|
| Description of the first channel  | describes non-hopping Bm+ACCHs or Lm+ACCHs as appropriate for the test |
| Power Command                     | As in subclause 26.1.1                                                 |
| Frequency list                    | Omitted                                                                |
| Cell channel description          | Omitted                                                                |
| Mode of the first channel         | appropriate for one bearer capability chosen for the test              |
| Description of the second channel | Omitted                                                                |
| Mode of the second channel        | Omitted                                                                |
| Mobile allocation                 | Omitted                                                                |
| Starting time                     | Omitted                                                                |
| Cipher mode setting               | Omitted                                                                |

#### ASSIGNMENT COMPLETE

| Information element | Value/remark |
|---------------------|--------------|
| RR cause            | normal event |

#### AUTHENTICATION REQUEST

| Information element           | Value/remark |
|-------------------------------|--------------|
| Ciphering key sequence number | Arbitrary    |
| Spare half octet              | (spare bits) |
| Authentication parameter RAND | Arbitrary    |

#### AUTHENTICATION RESPONSE

| Information element           | Value/remark           |
|-------------------------------|------------------------|
| Authentication parameter SRES | Correct for given SRES |

## CALL CONFIRMED

| Information element | Value/remark                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## 26.10 E-GSM or R-GSM signalling

### 26.10.1 E-GSM or R-GSM signalling / general considerations

Subclause 26.10 only applies to E-GSM and R-GSM mobile stations. E-GSM signalling testing and R-GSM signalling testing in the subclause are mutually exclusive. An E-GSM MS needs E-GSM signalling tests while an R-GSM MS needs the R-GSM signalling tests. It is not necessary for an R-GSM MS to be tested under E-GSM test parameters. The details of frequencies used in different test cases are listed below.

**Table 26.1: Frequencies used for E-GSM or R-GSM signalling tests**

| Test Case   | Frequencies used in the test case                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

Conformance requirements of clause 26 fully apply to any mobile station (P-GSM, E-GSM, R-GSM or DCS) in the whole supported band of the mobile station.

Besides, as an E-GSM or R-GSM mobile station shall support the P-GSM band, it shall pass successfully every test of clause 26 under the described GSM 900 conditions.

The purpose of this extra section is to test the different procedures which may be impacted when some channel uses E-GSM or R-GSM frequency(ies).

## 26.10.2 E-GSM or R-GSM signalling / RR

### 26.10.2.1 E-GSM or R-GSM signalling / RR / Measurement

This test applies to E-GSM or R-GSM mobile stations.

Conformance requirements of subclause 26.6.3 fully apply to any mobile station (P-GSM, E-GSM, R-GSM or DCS) in the whole supported band of the mobile station.

Besides, as an E-GSM or R-GSM mobile station shall support the P-GSM band, it shall pass successfully every test of subclause 26.6.3 under the described GSM 900 conditions.

The purpose of this extra section is to test the reporting of measurements in the case where cells use E-GSM or R-GSM frequency(s). Several coding formats may be used by the network in the SYSTEM INFORMATION message.

#### 26.10.2.1.1 Conformance requirements

The MS shall continuously send MEASUREMENT REPORT messages on every SACCH blocks and the measurement valid indication shall be set to valid (0) within the second block at the latest. After 20 s the values in the MEASUREMENT REPORT message shall contain measurement results for the 6 th strongest cells belonging to the set of cells indicated either in SI5 and SI5bis messages or in SI5 and SI5ter messages.

#### References

3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.4.1.2 and 9.1.39,  
3GPP TS 05.08 subclause 8.4.

#### 26.10.2.1.2 Test purpose

To test that, when the SS gives information about neighbouring cells indicated either in SI5 and SI5bis messages or in SI5 and SI5ter messages, the MS reports appropriate results.

## 26.10.2.1.3 Method of test

## Initial Conditions

System Simulator:

8 cells with the following settings:

E-GSM:

| Transmitter   | Level | NCC | BCC | ARFCN | Cell Identity |
|---------------|-------|-----|-----|-------|---------------|
| Serving, S1   | -60   | 1   | 3   | 002   | 0001H         |
| Neighbour, N1 | -85   | 1   | 5   | 990   | 0002H         |
| Neighbour, N2 | -80   | 1   | 7   | 1005  | 0003H         |
| Neighbour, N3 | -75   | 1   | 1   | 000   | 0004H         |
| Neighbour, N4 | -55   | 1   | 3   | 026   | 0005H         |
| Neighbour, N5 | -50   | 1   | 5   | 1020  | 0006H         |
| Neighbour, N6 | -45   | 1   | 7   | 038   | 0007H         |
| Neighbour, N7 | -40   | 1   | 1   | 1003  | 0008H         |

R-GSM:

| Transmitter   | Level | NCC | BCC | ARFCN | Cell Identity |
|---------------|-------|-----|-----|-------|---------------|
| Serving, S1   | -60   | 1   | 3   | 002   | 0001H         |
| Neighbour, N1 | -85   | 1   | 5   | 990   | 0002H         |
| Neighbour, N2 | -80   | 1   | 7   | 970   | 0003H         |
| Neighbour, N3 | -75   | 1   | 1   | 000   | 0004H         |
| Neighbour, N4 | -55   | 1   | 3   | 026   | 0005H         |
| Neighbour, N5 | -50   | 1   | 5   | 1020  | 0006H         |
| Neighbour, N6 | -45   | 1   | 7   | 038   | 0007H         |
| Neighbour, N7 | -40   | 1   | 1   | 960   | 0008H         |

With the exception of the Cell Allocation, the rest of the parameters for all eight cells are the same as the default settings and default SYSTEM INFORMATION TYPE 1 to 4 message contents for cell A. The Cell Allocation for the serving cell is the same as the default setting for cell A. The Cell Allocations for the neighbour cells need have only one entry, consisting of the ARFCN of that cell's BCCH.

Mobile Station:

The MS is in the active state of a call (U10).

## Related PICS/PIXIT Statements

Support E-GSM or R-GSM.

Support for state U10 of the Call Control protocol.

## Foreseen Final State of the MS

Active state of a call (U10).

## Test Procedure

The test is performed for execution counter, c=1 to 9.

For c=1 to 6, the following procedure applies:

With the MS having a call in progress, the SS sends SYSTEM INFORMATION TYPE 5, 5bis and 6 on the SACCH. The MS shall send MEASUREMENT REPORTs back to the SS, and it shall be indicated in these that measurement results for the 6 strongest present carriers of the supported band have been obtained.

For c=7 to 9, the following procedure applies:

With the MS having a call in progress, the SS sends SYSTEM INFORMATION TYPE 5, 5ter and 6 on the SACCH. The MS shall send MEASUREMENT REPORTs back to the SS, and it shall be indicated in these that measurement results for the 6 strongest present carriers of the supported band have been obtained.

#### Maximum Duration of Test

8 minutes, including 1 minute for any necessary operator actions.

#### Expected Sequence

This sequence is performed for execution counter, c= 1 to 9.

Since SYSTEM INFORMATION TYPE 5, SYSTEM INFORMATION TYPE 6 and MEASUREMENT REPORT are sent continuously, a table is not applicable in this test. The interval between 2 successive Layer 2 frames containing MEASUREMENT REPORTs shall not exceed one Layer 2 frame.

#### Specific Message Contents

E-GSM:

#### SYSTEM INFORMATION TYPE 5:

| Information Element         | value/remark                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

### 26.10.2.2 E-GSM or R-GSM signalling / RR / Immediate assignment

This subclause only applies to E-GSM or R-GSM mobile stations.

Conformance requirements of subclause 26.6.1 fully apply to any mobile station (P-GSM, E-GSM, R-GSM or DCS) in the whole supported band of the mobile station.

Besides, as an E-GSM or R-GSM mobile station shall support the P-GSM band, it shall pass successfully every test of subclause 26.6.1 under the described GSM 900 conditions.

The purpose of this extra section is to test the immediate assignment procedure in the case where the target channel is E-GSM or R-GSM frequency.

#### 26.10.2.2.1 Conformance requirement

Following a PAGING REQUEST message, the MS shall correctly set up an RR connection on a supported channel described in the IMMEDIATE ASSIGNMENT message, using some E-GSM or R-GSM frequency.

## Reference(s)

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.3.1.1.2.

### 26.10.2.2.2 Test purpose

To verify that the MS can correctly set up a dedicated control channel when E-GSM or R-GSM frequencies are used.

This tested for a SDCCH/8.

### 26.10.2.2.3 Method of test

#### Initial Conditions

System Simulator:

1 cell.

E-GSM:

CCCH-CONF is set to "1 basic physical channel used for CCCH not combined with SDCCHs".

SYSTEM INFORMATION type 1 message contains the following frequencies in the Cell Channel Description IE: 0, 30, 40, 66, 80, 1 005, 1 010, 1 015 (use range 1 024 to encode).

BCCH carrier number 1 015.

R-GSM:

CCCH-CONF is set to "1 basic physical channel used for CCCH not combined with SDCCHs".

SYSTEM INFORMATION type 1 message contains the following frequencies in the Cell Channel Description IE: 0, 30, 40, 66, 80, 958, 1010, 972 (use range 1 024 to encode).

BCCH carrier number 972.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

#### Related PICS/PIXIT Statement(s)

Support E-GSM or R-GSM.

#### Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

#### Test Procedure

This test procedure is performed twice.

The System Simulator pages the MS and after the MS has responded with a CHANNEL REQUEST message the SS assigns an SDCCH channel using some E-GSM or R-GSM frequencies. The MS shall go to the correct channel and send a PAGING RESPONSE message. Then the SS initiates RR-release by sending a CHANNEL RELEASE message.

#### Maximum Duration of Test

15 seconds.

## Expected Sequence

The sequence is performed for execution counter k = 1 to 2.

| Step | Direction | Message               | Comments                             |
|------|-----------|-----------------------|--------------------------------------|
| 1    | SS -> MS  | PAGING REQUEST TYPE 1 |                                      |
| 2    | MS -> SS  | CHANNEL REQUEST       | cause "answer to paging"             |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT  | Channel Type: see below              |
| 4    | MS -> SS  | PAGING RESPONSE       | Shall be sent on the correct channel |

## 26.10.2.3 E-GSM or R-GSM signalling / RR / channel assignment procedure

This test is only applicable to an E-GSM or R-GSM mobile station.

Conformance requirements of subclause 26.6.4 fully apply to any mobile station (P-GSM, E-GSM, R-GSM or DCS) in the whole supported band of the mobile station.

Besides, as an E-GSM or R-GSM mobile station shall support the P-GSM band, it shall pass successfully every test of subclause 26.6.4 under the described GSM 900 conditions.

The purpose of this extra section is to test the assignment in the case where the allocated channel uses E-GSM or R-GSM frequency(s): in the case of frequency hopping several coding formats may be used by the network in the ASSIGNMENT COMMAND message.

#### 26.10.2.3.1 Conformance requirements

1. Upon receipt of the ASSIGNMENT COMMAND message, the mobile station initiates a local end release of link layer connections, disconnects the physical channels, commands the switching to the assigned channels and initiates the establishment of lower layer connections (this includes the activation of the channels, their connection and the establishment of the main signalling links).
2. The MS shall apply the hopping frequencies specified in ASSIGNMENT COMMAND message in the mobile allocation or frequency list or frequency short list at the time accessing the new channel.

#### References

3GPP TS 04.08 / 3GPP TS 44.018, subclauses 3.4.3 and 9.1.2.

#### 26.10.2.3.2 Test purpose

1. To verify that upon receipt of an ASSIGNMENT COMMAND, the MS switches to the channel defined in the ASSIGNMENT COMMAND, establishes the link and sends an ASSIGNMENT COMPLETE message.
2. To verify that an MS, having received an ASSIGNMENT COMMAND, is able in case of frequency hopping to decode the mobile allocation and frequency list correctly and applies the specified frequencies.

#### 26.10.2.3.3 Method of test

##### Initial Conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in the "idle, updated" state with a TMSI allocated.

##### Related PICS/PIXIT Statements

- Support E-GSM or R-GSM.
- TCH supported (Y/N).
- The supported channel mode(s) need to be declared.

##### Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

##### Test Procedure

The test procedure is performed 2 times.

The SS pages the MS and allocates an SDCCH. Then a channel is assigned with ASSIGNMENT COMMAND. Each time the MS shall switch to the assigned channel, establish the link and send an ASSIGNMENT COMPLETE message.

The SS initiates the channel release procedure.

## Maximum Duration of Test

3 minutes.

## Expected Sequence

The test sequence is performed for execution counter k=1 to 2.

## 26.10.2.4 E-GSM or R-GSM signalling / RR / Handover

This subclause only applies to E-GSM or R-GSM mobile stations.

Conformance requirements of subclause 26.6.5 fully apply to any mobile station (P-GSM, E-GSM, R-GSM or DCS) in the whole supported band of the mobile station.

Besides, as an E-GSM or R-GSM mobile station shall support the P-GSM band, it shall pass successfully every test of subclause 26.6.5 under the described GSM 900 conditions.

The purpose of this extra section is to test the handover in the case where the target channel uses E-GSM or R-GSM frequency(s): in the case of frequency hopping several coding formats may be used by the network in the HANDOVER COMMAND message.

### 26.10.2.4.1 E-GSM or R-GSM signalling / RR / Handover / Successful handover

#### 26.10.2.4.1.1 Conformance requirements

The MS shall correctly apply the handover procedure from a channel without frequency hopping in the primary band to a channel with frequency hopping using P-GSM and E-GSM or P-GSM and R-GSM frequencies whatever the coding used for the frequency hopping description.

#### References

3GPP TS 04.08 / 3GPP TS 44.018, subclauses 3.4.4 and 9.1.15.

#### 26.10.2.4.1.2 Test purpose

To check that the MS correctly performs a non-synchronized handover, from a non hopping primary band SDCCH to a hopping TCH or SDCCH using E-GSM or R-GSM frequencies, whatever the coding used for the hopping sequence description and that it activates the new channel correctly.

This is tested in the following case:

E-GSM or R-GSM signalling / Handover / successful / call under establishment / non-synchronized /:

- from SDCCH/8 to TCH/F if the MS supports a TCH;
- from SDCCH/8 to SDCCH/8 if not.

#### 26.10.2.4.1.3 Method of test

#### Initial Conditions

System Simulator:

E-GSM:

2 cells A and B with same LAI, default parameters;

except for Cell A: the broadcasted Cell Channel Description in SYSTEM INFORMATION type 1 message contains the following frequencies: 20, 40, 66, 73, 74, 75, 76, 77, 78, 79, 108, 114 (encoded using Bit Map 0 format);

The broadcasted BCCH frequency list for Cell A in SYSTEM INFORMATION type 2 and 5 contains the following frequencies: 10, 20, 40, 80, 90, 100, 110 and 120 (encoded in Bit Map 0 format).

**R-GSM:**

2 cells A and B with same LAI, default parameters;

except for Cell A: the broadcasted Cell Channel Description in SYSTEM INFORMATION type 1 message contains the following frequencies: 20, 40, 66, 73, 74, 75, 76, 77, 78, 79, 108, 114 (encoded using Bit Map 0 format);

Except for Cell B: the BCCH carrier number is 965.

**Mobile Station:**

The MS is in the "idle, updated" state, with a TMSI allocated and camped on cell A.

**Related PICS/PIXIT Statements**

Support E-GSM or R-GSM.

Support of TCH (Y/N).

Support of speech (Y/N).

Support for state U10 of the Call Control protocol.

**Foreseen Final State of the MS**

"Idle, updated" with TMSI allocated and camped on cell B.

**Test Procedure**

The test procedure is performed 18 times.

A Mobile Originating Call is initiated on cell A. After the MS has sent the SETUP message (and before the last L2 frame carrying the SETUP message is acknowledged by the SS) the SS sends a HANDOVER COMMAND message, ordering the MS to switch to cell B.

The MS shall then begin to send access bursts on the new channel, a TCH/F if supported (see PICS/PIXIT) or an SDCCH if not, to cell B.

The SS observes the access bursts. After receiving  $n$  access bursts,  $n$  being randomly drawn between 10 and 20 for the TCH case, 2 and 5 for the SDCCH (see table 26.6-2 of subclause 26.6.5), the SS sends one PHYSICAL INFORMATION message with a Timing Advance of 20 (see table 26.6-1 of subclause 26.6.5).

The MS shall activate the channel in sending and receiving mode. Then the MS shall establish a signalling link using the correct timing advance. The MS shall be ready to transmit a HANDOVER COMPLETE message before  $x$  ms after the end of the PHYSICAL INFORMATION message but not before a UA frame has been sent by the SS. The MS shall then again send the SETUP message to the SS, using the same value in the N(SD) field. Finally the SS sends a CHANNEL RELEASE to end the test.

The term "ready to transmit" is specified in 3GPP TS 04.13. The value of " $x$ " depends upon the target channel:

- case SDCCH/8  $x = 750$ ;
- case TCH/F  $x = 500$ .

**Maximum Duration of Test**

10 minutes.

## Expected Sequence

The sequence is performed for execution counter k=1 to 3 and c=1 to 6.

| Step | Direction | Message                 | Comments                                                                                                                                        |

#### 26.10.2.4.2 E-GSM or R-GSM signalling / RR / Handover / layer 1 failure

##### 26.10.2.4.2.1 Conformance requirements

During a handover from a channel in the E-GSM or R-GSM band to a channel in the P-GSM band, or the contrary, the MS shall correctly return to the old channel in the case of an handover failure caused by a layer 1 failure on the target cell.

##### References

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.4.4.

##### 26.10.2.4.2.2 Test purpose

To check that the MS correctly returns to the old channel in the case of an handover failure caused by a layer 1 failure on the target cell, even if the origin is in the P-GSM band and the target in the E-GSM or R-GSM band.

##### 26.10.2.4.2.3 Method of test

##### Initial Conditions

###### System Simulator:

###### E-GSM:

2 cells with same LAI, default parameters.

###### R-GSM:

2 cells with same LAI, default parameters, except the BCCH carrier number of Cell A is 990, the BCCH carrier number of Cell B is 965.

###### Mobile Station:

###### E-GSM:

The MS is in the active state (U10) of a call on a P-GSM channel of cell A. power level = 10.

###### R-GSM:

The MS is in the active state (U10) of a call on a E-GSM channel of cell A, power level = 10.

##### Related PICS/PIXIT Statements

Support E-GSM or R-GSM.

Supported rate(s) of TCH: TCH/F.

Supported mode(s).

Support for state U10 of the Call Control protocol.

### Foreseen Final State of the MS

The active state (U10) of a mobile call (on cell A), used power level 10.

### Test Procedure

The MS is in the active state (U10) of a call on a P-GSM channel (on an E-GSM channel for R-GSM testing) of cell A (used power level 10). The SS sends a HANOVER COMMAND on the main DCCH. The MS shall begin to send access bursts at the commanded power level on the new DCCH to cell B (power level 12). With the exception of normal BCCH signalling, the SS does not transmit anything on cell B (thus causing a time-out of T3124). The MS shall re-establish the old link on cell A and send a HANOVER FAILURE within 3 seconds from the transmission of HANOVER COMMAND, using the old power level.

### Maximum Duration of Test

1 minute.

### Expected Sequence

| Step | Direction | Message         | Comments                                                                                                                                                                                                                                                                                                                                                                                 |
|------|-----------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### 26.10.2.5 E-GSM or R-GSM signalling / RR / Frequency Redefinition

This subclause only applies to E-GSM and R-GSM mobile stations.

Conformance requirements of subclause 26.6.6 fully apply to any mobile station (P-GSM, E-GSM, R-GSM or DCS) in the whole supported band of the mobile station.

Besides, as an E-GSM or R-GSM mobile station shall support the P-GSM band, it shall pass successfully every test of subclause 26.6.6 under the described GSM 900 conditions.

The purpose of this extra section is to test the frequency redefinition procedure in the case where the target channel uses E-GSM or R-GSM frequency(ies): in the case of frequency hopping several coding formats may be used by the network in the FREQUENCY REDEFINITION message.

#### 26.10.2.5.1 Conformance requirements

- 1) To verify that the MS, after receiving a FREQUENCY REDEFINITION message, correctly starts using the new frequencies, and hopping sequence when some E-GSM or R-GSM frequencies are used.
- 2) The last received Cell Channel Description information element is used to decode the Mobile Allocation IE received on the FREQUENCY REDEFINITION message.

#### References

3GPP TS 04.08 / 3GPP TS 44.018, subclauses 3.4.5 and 9.1.13.

#### 26.10.2.5.2 Test purpose

- 1) To verify that the MS, after receiving a FREQUENCY REDEFINITION message, starts using the new frequencies and hopping sequence when some E-GSM or R-GSM frequencies are used.
- 2) To check that the last received Cell Channel Description information element is used to decode the Mobile Allocation IE received in the FREQUENCY REDEFINITION message.

## 26.10.2.5.3 Method of test

## Initial conditions

System Simulator:

1 cell; default parameters.

Mobile Station:

The MS is in "idle, updated" state with TMSI allocated.

## Related PICS/PIXIT statement(s)

Support E-GSM or R-GSM.

Support of a TCH (Y/N)

## Foreseen final state of the MS

"Idle, updated", with TMSI allocated.

## Test procedure

The test procedure is performed six times.
