Default settings for cell A:

|                          |                                            |
|--------------------------|--------------------------------------------|
| Downlink input level     | 63 dBmicroVolt emf.                        |
| Uplink output power      | minimum supported by the MS's power class. |
| Propagation profile      | static.                                    |
| BCCH/CCCH carrier number | 263                                        |

## Cell B

The contents of SYSTEM INFORMATION TYPE 1 to 6 messages for cell B are identical to those of cell A with the following exceptions:

|                                                                            |                                   |
|----------------------------------------------------------------------------|-----------------------------------|
| Cell Channel Description<br>- Format Identifier<br>- Cell Allocation ARFCN | Range 128.<br>Channel Number 261. |
|----------------------------------------------------------------------------|-----------------------------------|

NOTE 2: This IE needs modification when used in handover tests that command the MS to go to a frequency hopping channel in cell B.

### Cell Identity

- Cell Identity Value: 0002H.

Default settings for cell B:

|                          |                                            |
|--------------------------|--------------------------------------------|
| Downlink input level     | 53 dBmicroVolt emf.                        |
| Uplink output power      | minimum supported by the MS's power class. |
| Propagation profile      | static.                                    |
| BCCH/CCCH carrier number | 261                                        |

Contents of ALERTING message (SS to MS):

|                                |                               |
|--------------------------------|-------------------------------|

#### 26.13.1.6.4 Default contents of GSM 480 layer 3 messages for RR tests

This subclause contains the default values of GSM 480 L3 messages, which unless indicated otherwise in subclause 26.13 shall be transmitted by the system simulator and which are required to be received from the GSM 480 MS under test.

The necessary L3 messages are listed in alphabetic order, with the exception of the SYSTEM INFORMATION messages, where it is the information elements that are listed in alphabetic order (this is because some information elements occur in several SYSTEM INFORMATION types).

In this subclause, decimal values are normally used. However, sometimes a hexadecimal value, indicated by an "H", or a binary value, indicated by a "B" is used.

Default SYSTEM INFORMATION:

NOTE 1: SYSTEM INFORMATION 2 bis, SYSTEM INFORMATION 5 bis, SYSTEM INFORMATION 7, and SYSTEM INFORMATION 8 messages are not used.

## Cell A

Contents of information elements in SYSTEM INFORMATION TYPE 1 to 6 messages for cell A.

|                                |                                                                                 |
|--------------------------------|---------------------------------------------------------------------------------|
| (CBCH) Channel Description     | Not present.                                                                    |
| (CBCH) Mobile Allocation       | Not present.                                                                    |
| Cell Channel Description       |                                                                                 |

#### 26.13.1.6.5 Default contents of GSM 700 layer 3 messages for RR tests

This subclause contains the default values of GSM 700 L3 messages, which unless indicated otherwise in subclause 26.13 shall be transmitted by the system simulator and which are required to be received from the GSM 700 MS under test.

The necessary L3 messages are listed in alphabetic order, with the exception of the SYSTEM INFORMATION messages, where it is the information elements that are listed in alphabetic order (this is because some information elements occur in several SYSTEM INFORMATION types).

In this section, decimal values are normally used. However, sometimes a hexadecimal value, indicated by an "H", or a binary value, indicated by a "B" is used.

#### Default SYSTEM INFORMATION:

NOTE 1: SYSTEM INFORMATION 2 bis, SYSTEM INFORMATION 5 bis, SYSTEM INFORMATION 7, and SYSTEM INFORMATION 8 messages are not used.

## Cell A

Contents of information elements in SYSTEM INFORMATION TYPE 1 to 6 messages for cell A.

Default settings for cell A:

|                          |                                            |
|--------------------------|--------------------------------------------|
| Downlink input level     | 63 dBmicroVolt emf.                        |
| Uplink output power      | minimum supported by the MS's power class. |
| Propagation profile      | Static.                                    |
| BCCH/CCCH carrier number | 457                                        |

## Cell B

The contents of SYSTEM INFORMATION TYPE 1 to 6 messages for cell B are identical to those of cell A with the following exceptions:

|                                                                            |                                   |
|----------------------------------------------------------------------------|-----------------------------------|
| Cell Channel Description<br>- Format Identifier<br>- Cell Allocation ARFCN | 128 range.<br>Channel Number 447. |
|----------------------------------------------------------------------------|-----------------------------------|

NOTE 2: This IE needs modification when used in handover tests that command the MS to go to a frequency hopping channel in cell B.

### Cell Identity

- Cell Identity Value: 0002H.

Default settings for cell B:

|                          |                                            |
|--------------------------|--------------------------------------------|
| Downlink input level     | 53 dBmicroVolt emf.                        |
| Uplink output power      | minimum supported by the MS's power class. |
| Propagation profile      | static.                                    |
| BCCH/CCCH carrier number | 447                                        |

Contents of ALERTING message (SS to MS):

#### 26.13.1.6.6 Default contents of GSM 850 layer 3 messages for RR tests

This subclause contains the default values of GSM 850 L3 messages, which unless indicated otherwise in subclause 26.13 shall be transmitted by the system simulator and which are required to be received from the GSM 850 MS under test.

The necessary L3 messages are listed in alphabetic order, with the exception of the SYSTEM INFORMATION messages, where it is the information elements that are listed in alphabetic order (this is because some information elements occur in several SYSTEM INFORMATION types).

In this section, decimal values are normally used. However, sometimes a hexadecimal value, indicated by an "H", or a binary value, indicated by a "B" is used.

#### Default SYSTEM INFORMATION:

NOTE 1: SYSTEM INFORMATION 2 bis, SYSTEM INFORMATION 5 bis, SYSTEM INFORMATION 7, and SYSTEM INFORMATION 8 messages are not used.

## Cell A

Contents of information elements in SYSTEM INFORMATION TYPE 1 to 6 messages for cell A.

|                                |                                                                                 |
|--------------------------------|---------------------------------------------------------------------------------|
| (CBCH) Channel Description     | Not present.                                                                    |
| (CBCH) Mobile Allocation       | Not present.                                                                    |
| Cell Channel Description       |                                                                                 |

## 26.13.2 Multislot signalling / CC

### 26.13.2.1 Multislot signalling / CC / In-call functions

#### 26.13.2.1.1 Multislot signalling / CC / In-call functions / User initiated service level upgrade / successful

This test is applicable to all MS that supports multislot configuration.

##### 26.13.2.1.1.1 Definition and applicability

Multislot connection is established. Multislot configuration with one TCH/F is allocated. User initiated service level upgrade is successfully performed.

This test is applicable for any equipment supporting multislot connection.

##### 26.13.2.1.1.2 Conformance requirements

- 1) MS shall send MODIFY message to SS indicating that User initiated service level upgrade is initiated.
- 2) MS enters CC state 'Mobile originating modify (U26)' after sending MODIFY.
- 3) MS enters CC state 'Active (U10)' when MODIFY COMPLETE is received.

#### References

Conformance requirement 1: 3GPP TS 04.08 / 3GPP TS 24.008, subclause 9.3.13.

Conformance requirement 2: 3GPP TS 04.08 / 3GPP TS 24.008, subclause 5.3.5.1.

Conformance requirement 3: 3GPP TS 04.08 / 3GPP TS 24.008, subclause 5.3.5.2.

##### 26.13.2.1.1.3 Test purpose

- 1) To verify that the procedure is initiated by the MS in the "active" state of a multislot connection. It sends a MODIFY message including the wanted value of the "maximum number of traffic channels" and/or the "wanted air interface" parameters; and enters the "mobile originating modify" state. Other parameters of the bearer capability given in MODIFY message and already negotiated and agreed during the establishment phase of the call, may not be changed.
- 2) To verify that upon receipt of the MODIFY COMPLETE message with bearer capability negotiated at call setup in the MS enters the "active" state.

##### 26.13.2.1.1.4 Method of test

#### Initial conditions

#### Mobile station:

- MS in the active state of a service using a multislot connection.

#### System simulator:

- 1 cell, default parameters except:
  - Early classmark sending enabled in SI3 rest octets

#### Related PICS/PIXIT statement(s)

- Supported teleservices/bearer services.
- Classmark.

- Multislot class.

#### Foreseen final state of the MS

MS is in the active state of a service using a multislot connection.

#### Test procedure

MS is in the active state of a multislot connection. Multislot configuration with one TCH/F is allocated. User initiates User initiated service level upgrade by sending MODIFY message including the wanted value of the Maximum number of traffic channels, this being one supported by the MS and channel modes supported by the MS. The MS enters 'mobile originating modify' state. This is verified by a status enquiry procedure.

MS receives MODIFY COMPLETE message from SS and enters the 'active' state. This is verified by a status enquiry procedure.

#### Maximum duration of test

3 minutes.

#### Expected sequence

| Step | Direction | Message         | Comments                                                                      |
|------|-----------|-----------------|-------------------------------------------------------------------------------|
| 1    | MS -> SS  | MODIFY          | User initiated service level upgrade is initiated.                            |
| 2    | MS        |                 | MS enters the Mobile originating modify state                                 |
| 3    | SS -> MS  | STATUS ENQUIRY  |                                                                               |
| 4    | MS -> SS  | STATUS          | Cause shall be 30# (response to enq.) and state U26 Mobile originated modify. |

#### 26.13.2.1.2 Multislot signalling / CC / In-call functions / User initiated service level downgrade / successful

##### 25.13.2.1.2.1 Definition and applicability

Multislot connection is established. Multislot configuration has the maximum number of timeslots supported by the MS. User initiated service level downgrade is successfully performed.

This test is applicable for any equipment supporting multislot configuration.

##### 26.13.2.1.2.2 Conformance requirements

- 1) MS shall send MODIFY message to SS indicating that User initiated service level downgrade is initiated.

- 2) MS enters CC state 'Mobile originating modify (U26)' after sending MODIFY.
- 3) MS enters CC state 'Active (U10)' when MODIFY COMPLETE is received.

### 26.13.2.1.3 Multislot signalling / CC / In-call functions / User initiated service level upgrade / Time-out of timer T323

#### 26.13.2.1.3.1 Definition and applicability

Multislot connection is established. Multislot configuration with one TCH/F is allocated. User initiated service level upgrade is requested. Timer T323 expires. Call is cleared.

This test is applicable for any equipment supporting multislot configuration.

#### 26.13.2.1.3.2 Conformance requirements

- 1) MS shall send MODIFY message to SS indicating that User initiated service level upgrade is initiated.
- 2) After timer T323 has expired MS starts call clearing by sending DISCONNECT message.
- 3) After receipt of RELEASE message the MS sends RELEASE COMPLETE message and goes to idle updated state.

#### References

- Conformance requirement 1: 3GPP TS 04.08 / 3GPP TS 24.008, subclause 9.3.13.
- Conformance requirement 2: 3GPP TS 04.08 / 3GPP TS 24.008, subclause 9.3.7.
- Conformance requirement 3: 3GPP TS 04.08 / 3GPP TS 24.008, subclauses 9.3.18 and 5.4.4.2.2, 3GPP TS 04.08 / 3GPP TS 44.018, subclause 9.1.7.

#### 26.13.2.1.3.3 Test purpose

- 1) To verify that upon expiration of T323 (accuracy  $\pm 10\%$ ) the MS shall initiate the procedures for call clearing with cause #102 "recovery on timer expiry".

## 26.13.2.1.3.4 Method of test

## Initial conditions

## Mobile station:

- MS in the active state of a service using a multislot connection.

## System simulator:

- 1 cell, default parameters

## Related PICS/PIXIT statement(s)

- Supported teleservices/bearer services.
- Classmark.
- Multislot class.

## Foreseen final state of the MS

"Idle, updated", with TMSI allocated.

## Test procedure

MS is in the active state of a multislot connection. Multislot configuration with one TCH/F is allocated. User initiates User initiated service level upgrade by sending MODIFY message including the wanted value of the Maximum number of traffic channels, this being one supported by the MS and channel modes supported by the MS.

Timer T323 expires and MS starts call clearing procedure by sending DISCONNECT message to SS. After MS receives RELEASE message it sends RELEASE COMPLETE message. SS sends CHANNEL RELEASE message to MS and the main signalling link is released.

## Maximum duration of test

3 minutes.

## Expected sequence

| Step | Direction | Message          | Comments                                           |
|------|-----------|------------------|----------------------------------------------------|
| 1    | MS -> SS  | MODIFY           | User initiated service level upgrade is initiated. |
| 2    | MS        |                  | Timer T323 expires                                 |
| 3    | MS -> SS  | DISCONNECT       | Cause = #102 "recovery on timer expiry"            |
| 4    | SS -> MS  | RELEASE          |                                                    |
| 5    | MS -> SS  | RELEASE COMPLETE |                                                    |
| 6    | SS -> MS  | CHANNEL RELEASE  | The main signalling link is released               |

|------------------------------|-------------------------------------------------------------------------------------------|
| Bearer capability            | Maximum number of TCH/F's the MS is able to support and channel modes supported by the MS |
| Low layer comp.              | Appropriate for the basic service selected for the test                                   |
| High layer comp.             | Appropriate for the basic service selected for the test                                   |
| Reverse call setup direction | Presence and value not checked                                                            |

#### 26.13.2.1.4 Multislot signalling / CC / In-call functions / User initiated service level upgrade / modify reject

##### 26.13.2.1.4.1 Definition and applicability

Multislot connection is established. Multislot configuration with one TCH/F is allocated. User initiated service level upgrade is requested. SS responds to upgrade request by rejecting it. MS enters the active multislot connection state.

This test is applicable for any equipment supporting multislot configuration.

##### 26.13.2.1.4.2 Conformance requirements

- 1) MS shall send MODIFY message to SS indicating that User initiated service level upgrade is initiated.
- 2) MS enters CC state 'Mobile originating modify (U26)' after sending MODIFY.
- 3) MS enters CC state 'Active (U10)' when MODIFY REJECT is received.

##### References

- Conformance requirement 1: 3GPP TS 04.08 / 3GPP TS 24.008, subclause 9.3.13.  
Conformance requirement 2: 3GPP TS 04.08 / 3GPP TS 24.008, subclause 5.3.5.1.  
Conformance requirement 3: 3GPP TS 04.08 / 3GPP TS 24.008, subclause 5.3.5.3.

##### 26.13.2.1.4.3 Test purpose

- 1) To verify that upon receipt of the MODIFY REJECT message with the bearer capability negotiated at the call setup, the MS is continuously sending user information according to current call mode.

##### 26.13.2.1.4.4 Method of test

###### Initial conditions

###### Mobile station:

- MS in the active state of a service using a multislot connection.

###### System simulator:

- 1 cell, default parameters

###### Related PICS/PIXIT statement(s)

- Supported teleservices/bearer services.
- Classmark.
- Multislot class.

###### Foreseen final state of the MS

MS is in the active state of a service using a multislot connection.

###### Test procedure

MS is in the active state of a multislot connection. Multislot configuration with one TCH/F is allocated. Then user initiates User initiated service level upgrade by sending MODIFY message including the wanted value of the Maximum number of traffic channels, this being one supported by the MS and channel modes supported by the MS. The MS enters 'mobile originating modify' state. This is verified by a status enquiry procedure. SS responds to MODIFY message by sending MODIFY REJECT message to MS. MS enters the active state. This is verified by a status enquiry procedure. Maximum duration of test

1 minute.

| High layer comp.             | Appropriate for the basic service selected for the test |
| Reverse call setup direction | Presence and value not checked                          |

## MODIFY REJECT

| Information element      | Value/remark                                            |
|--------------------------|---------------------------------------------------------|
| Bearer capability        | Appropriate for the selected test                       |
| Cause                    | #58 "bearer capability not presently available".        |
| Low layer compatibility  | Appropriate for the basic service selected for the test |
| High layer compatibility | Appropriate for the basic service selected for the test |

## 26.13.3 Multislot signalling / Structured procedures

### 26.13.3.1 Multislot signalling / Structured procedures / MS originated call / early assignment / HSCSD / non-transparent

This test is applicable to all MS that supports multislot configuration.

#### 26.13.3.1.1 Conformance requirements

- 1) An MS in MM state "idle, updated" and in RR idle mode, when made to initiate a call, if it provides a human interface, shall display the dialled number.
- 2) An MS in MM state "idle, updated" and in RR idle mode, when made to initiate a call for a selected teleservice/bearer service for HSCSD that is supported by the MS, starts to initiate the immediate assignment procedure by sending a CHANNEL REQUEST message with correct establishment cause.
- 3) Subsequently after establishment of a MM connection, after MS sends its multislot class in CLASSMARK CHANGE message, the MS shall send a SETUP message with correct parameters.
- 4) The call control entity of the Mobile Station in the "call initiated" state, in the "mobile originating call proceeding" state or in the "call delivered" state, shall, upon receipt of a CONNECT message:
  - 4.1) attach the user connection to the radio path;

- 4.2) return a CONNECT ACKNOWLEDGE message;
- 4.3) establish the RLP link.
- 5) User initiated service level upgrade is initiated by sending MODIFY message. After receipt of MODIFY COMPLETE message MS enters the active state.
- 6) After receipt of a CONFIGURATION CHANGE COMMAND message MS sends CONFIGURATION CHANGE ACKNOWLEDGE message.
- 7) Subsequently when the network initiates call clearing by sending a DISCONNECT message, the MS shall proceed to release the call by sending a RELEASE message.
- 8) On receipt of a CHANNEL RELEASE message, the MS shall disconnect the main signalling link.

## Reference

- Conformance requirement 1: 3GPP TS 02.07.
- Conformance requirement 2: 3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.3.1.1, 9.1.8 and 9.1.18.
- Conformance requirement 3: 3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.4.10, 9.1.11 and 9.3.23.
- Conformance requirement 4: 3GPP TS 04.08 / 3GPP TS 24.008 subclauses 9.3.5 and 9.3.6, 3GPP TS 07.01 clause 8.

- Conformance requirement 6: 3GPP TS 04.08 / 3GPP TS 44.018 subclauses 9.1.12b and 9.1.12c.
- Conformance requirement 7: 3GPP TS 04.08 / 3GPP TS 24.008 subclauses 5.4.4.2.2, 9.3.7 and 9.3.18.
- Conformance requirement 8: 3GPP TS 04.08 / 3GPP TS 44.018 subclause 9.1.7.

### 26.13.3.1.2 Test purpose

- 1) To verify that the MS in MM state "idle, updated" with a TMSI assigned, when made to initiate a call for a selected teleservice/bearer service for HSCSD that is supported by the MS as declared in a PICS/PIXIT statement, displays the dialled number in the way described in a PICS/PIXIT statement.
- 2) To verify that the MS in MM state "idle, updated" and in RR idle mode, with a TMSI assigned, when made to initiate a call for a selected teleservice/bearer service for HSCSD that is supported by the MS as declared in a PICS/PIXIT statement, starts to initiate an immediate assignment procedure by sending the CHANNEL REQUEST message with correct establishment cause.
- 3) To verify that subsequently after receipt of an IMMEDIATE ASSIGNMENT message allocating an SDCCH, after completion of establishment of the main signalling link, after having sent a CM SERVICE REQUEST message, after MS sends its multislot class in CLASSMARK CHANGE message, after having successfully performed the authentication and cipher mode setting procedures, the MS sends a SETUP message with correct parameters.
- 4) Multislot configuration with one TCH/F is allocated. To verify that subsequently, after receipt of a CALL PROCEEDING message and of an ASSIGNMENT COMMAND message allocating an appropriate TCH, after having completed the early assignment procedure by replying with the ASSIGNMENT COMPLETE message, after receipt of an ALERTING message and a CONNECT message, the MS returns a CONNECT ACKNOWLEDGE message.
- 5) To verify that subsequently the MS has attached the user connection to the radio path. This is verified by checking that the MS establishes the RLP link correctly and sends and receives correct RLP frames in each data block.
- 6) To verify that subsequently upon user requests User initiated service level upgrade, the MS sends MODIFY message and after receipt of MODIFY COMPLETE message the MS enters the active state.

- 7) To verify that subsequently, after receipt of a CONFIGURATION CHANGE COMMAND, after MS sends CONFIGURATION CHANGE ACKNOWLEDGE, MS through connects all bi-directional channel(s) in multislot configuration in both directions and all uni-directional channels in downlink direction. Multislot configuration is upgraded from the simplest case up to the maximum number of channels supported by MS in the HSCSD configuration. This is verified by checking that the MS sends and receives correct RLP frames in each data block.
- 8) To verify that subsequently upon the network initiating call clearing by sending a DISCONNECT message, the MS proceed to release the call with RELEASE.
- 9) To verify that subsequently, on receipt of a RELEASE COMPLETE message followed by a CHANNEL RELEASE message, the MS disconnects the main signalling link.

### 26.13.3.1.3 Method of test

#### Initial conditions

#### Mobile Station:

- The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

#### System Simulator:

- 1 cell, default parameters except:
  - Early classmark sending enabled in SI3 rest octets.

#### Related PICS/PIXIT statement(s)

- Interface to human user (p1 = Y/N).
- Way to display the called number (only applicable if the MS has an interface to human user).
- Supported teleservices/bearer services.
- Classmark.
- Multislot class.

#### Foreseen final state of the MS

MS is in MM-state "idle, updated" with valid TMSI and CKSN.

#### Test procedure

The MS is made to initiate a HSCSD connection. The call is established with early assignment. MS enters the active state. Multislot configuration with one TCH/F is allocated. User initiated service level upgrade is successfully performed. The SS sends CONFIGURATION CHANGE COMMAND message to MS and it reply's with CONFIGURATION CHANGE ACKNOWLEDGE message. This is repeated from simplest case up to the maximum number of channels supported by the MS in the HSCSD configuration (this is performed within highest multislot class that the MS supports).

#### Maximum duration of test

7 minutes.

## Expected Sequence

| Step | Direction | Message                          | Comments                                                                                                                                                                                                                                                                                               |
|------|-----------|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                                  | The "called number" is entered                                                                                                                                                                                                                                                                         |
| 2    | MS        |                                  | If p1 = Y, the MS must display the called number in the way defined in PICS/PIXIT.                                                                                                                                                                                                                     |

The RLP link establishment is initiated by the MS.                                                                                                                                                                             |
| 21   | MS -> SS  | MODIFY                           | User initiated service level upgrade is initiated                                                                                                                                                                                                                                                      |
| 22   | SS -> MS  | MODIFY COMPLETE                  |                                                                                                                                                                                                                                                                                                        |
| 23   | MS        |                                  | MS enters the active state                                                                                                                                                                                                                                                                             |
| 24   |           |                                  | Next three steps are performed as many times as used multislot class has different channel combinations. Timeslot allocation starts from simplest case and is upgraded up to the maximum that MS multislot class supports, one step at the time (within highest multislot class that the MS supports). |
| 24A  | SS -> MS  | CONFIGURATION CHANGE COMMAND     | Appropriate number of timeslots is selected.                                                                                                                                                                                                                                                           |
| 24B  | MS -> SS  | CONFIGURATION CHANGE ACKNOWLEDGE |                                                                                                                                                                                                                                                                                                        |
| 24C  | MS        |                                  | TCH(s) shall be through connected in both directions                                                                                                                                                                                                                                                   |
| 25   | SS -> MS  | DISCONNECT                       |                                                                                                                                                                                                                                                                                                        |
| 26   | MS -> SS  | RELEASE                          |                                                                                                                                                                                                                                                                                                        |
| 27   | SS -> MS  | RELEASE COMPLETE                 |                                                                                                                                                                                                                                                                                                        |
| 28   | SS -> MS  | CHANNEL RELEASE                  | The main signalling link is released                                                                                                                                                                                                                                                                   |

### 26.13.3.2 Multislot signalling / Structured procedures / MS originated call / late assignment / HSCSD / non-transparent

This test is applicable to all MS that supports multislot configuration.

#### 26.13.3.2.1 Conformance requirements

- 1) An MS in MM state "idle, updated" and in RR idle mode with a TMSI assigned, when made to initiate a call for a selected teleservice/bearer service for HSCSD that is supported by the MS, shall start to initiate an immediate assignment procedure by sending the CHANNEL REQUEST message with correct establishment cause.
- 2) Subsequently after establishment of a MM connection, after MS sends its multislot class in CLASSMARK CHANGE message, the MS shall send a SETUP message with correct parameters.

- 3) Upon receipt of the ASSIGNMENT COMMAND message, the Mobile Station initiates a local end release of link layer connections, disconnects the physical channels, commands the switching to the assigned channels and initiates the establishment of lower layer connections (this includes the activation of the channels, their connection and the establishment of the data links). After the main signalling link is successfully established, the MS returns an ASSIGNMENT COMPLETE message, specifying cause "normal event", to the network on the main DCCH.
- 4) The call control entity of the Mobile Station in the "call initiated" state, in the "mobile originating call proceeding" state or in the "call delivered" state, shall, upon receipt of a CONNECT message:
  - 4.1) attach the user connection to the radio path;
  - 4.2) return a CONNECT ACKNOWLEDGE message;
  - 4.3) establish the RLP link.
- 5) MS sends User initiated service level upgrade with MODIFY message and after receipt of MODIFY COMPLETE message the MS enters the active state.
- 6) MS receives CONFIGURATION CHANGE COMMAND and answers to it by sending CONFIGURATION CHANGE ACKNOWLEDGE message.
- 7) Subsequently when the network initiates call clearing by sending a DISCONNECT message, the MS shall proceed to release the call by sending a RELEASE message.
- 8) On receipt of a CHANNEL RELEASE message, the MS shall disconnect the main signalling link.

#### Reference

- Conformance requirement 1: 3GPP TS 02.07,  
3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.3.1.1 and 9.1.8.
- Conformance requirement 2: 3GPP TS 04.08 / 3GPP TS 44.018 subclause 9.1.11,  
3GPP TS 04.08 / 3GPP TS 24.008 subclause 9.3.23.
- Conformance requirement 3: 3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.4.3, 9.1.2 and 9.1.3.
- Conformance requirement 4: 3GPP TS 04.08 / 3GPP TS 24.008 subclauses 9.3.5 and 9.3.6,  
3GPP TS 07.01 clause 8.
- Conformance requirement 5: 3GPP TS 04.08 / 3GPP TS 24.008 subclauses 9.3.13 and 9.3.14.
- Conformance requirement 6: 3GPP TS 04.08 / 3GPP TS 44.018 subclauses 9.1.12b and 9.1.12c.
- Conformance requirement 7: 3GPP TS 04.08 / 3GPP TS 24.008 subclauses 9.3.7, 9.3.18 and 5.4.4.2.2.
- Conformance requirement 8: 3GPP TS 04.08 / 3GPP TS 44.018 subclause 9.1.7.

#### 26.13.3.2.2 Test purpose

- 1) To verify that the MS in MM state "idle, updated" and in RR idle mode with a TMSI assigned, when made to initiate a call for a selected teleservice/bearer service for HSCSD that is supported by the MS as declared in a PICS/PIXIT statement, starts to initiate an immediate assignment procedure by sending the CHANNEL REQUEST message.
- 2) Multislot configuration with one TCH/F is allocated. To verify that subsequently after receipt of an IMMEDIATE ASSIGNMENT message allocating an SDCCH, after completion of establishment of the main signalling link, after having sent a CM SERVICE REQUEST message, after MS sends its multislot class in CLASSMARK CHANGE message, after having successfully performed the authentication and cipher mode setting procedures, after having sent a SETUP message, after having received of a CALL PROCEEDING message followed by an ALERTING message and an ASSIGNMENT COMMAND message allocating an appropriate TCH, the MS sends an ASSIGNMENT COMPLETE message.
- 3) To verify that subsequently, after the suite of actions specified in test purposes 1 and 2, the MS after receiving a CONNECT message returns a CONNECT ACKNOWLEDGE message.

- 4) To verify that subsequently the MS has attached the user connection to the radio path. This is verified by checking that the MS establishes the RLP link correctly and sends and receives correct RLP frames in each data block.
- 5) To verify that subsequently upon user requests User initiated service level upgrade, the MS sends MODIFY message and after receipt of MODIFY COMPLETE message the MS enters the active state.
- 6) To verify that subsequently, after receipt of a CONFIGURATION CHANGE COMMAND, after MS sends CONFIGURATION CHANGE ACKNOWLEDGE, MS through connects all bi-directional channel(s) in multislot configuration in both directions and all uni-directional channels in downlink direction. Multislot configuration is upgraded from the simplest case up to the maximum number of channels supported by MS in the HSCSD configuration. This is verified by checking that the MS sends and receives correct RLP frames in each data block.
- 7) To verify that subsequently upon the network initiating call clearing by sending a DISCONNECT message, the MS proceed to release the call with RELEASE.
- 8) To verify that subsequently, on receipt of a RELEASE COMPLETE message followed by a CHANNEL RELEASE message, the MS disconnects the main signalling link.

### 26.13.3.2.3 Method of test

#### Initial conditions

#### Mobile Station:

- The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

#### System Simulator:

- 1 cell, default parameters except:
  - Early classmark sending enabled in SI3 rest octets.

#### Related PICS/PIXIT statement(s)

- Interface to human user (p1 = Y/N).
- Way to display the called number (only applicable if the MS has an interface to human user).
- Supported teleservices/bearer services.
- Classmark.
- Multislot class.

#### Foreseen final state of the MS

MS is in MM-state "idle, updated" with valid TMSI and CKSN.

#### Test procedure

The MS is made to initiate a HSCSD connection. The call is established with late assignment. MS enters the active state. Multislot configuration with one TCH/F is allocated. User initiated service level upgrade is successfully performed. The SS sends CONFIGURATION CHANGE COMMAND message to MS and it reply's with CONFIGURATION CHANGE ACKNOWLEDGE message. This is done from simplest case up to the maximum number of channels supported by the MS in the HSCSD configuration (this is performed within highest multislot class that MS supports).

#### Maximum duration of test

7 minutes.

## Expected Sequence

| Step | Direction | Message                          | Comments                                                                                                                                                                                                                                                                                               |
|------|-----------|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                                  | The "called number" is entered                                                                                                                                                                                                                                                                         |
| 2    | MS        |                                  | If p1 = Y, the MS must display the called number in the way defined in PICS/PIXIT.                                                                                                                                                                                                                     |
| 3    | MS -> SS  | CHANNEL REQUEST                  | Establishment cause is "Originating call and TCH/F is needed, or originating call and the network does not set NECI bit to 1"                                                                                                                                                                          |
| 4    | SS -> MS  | IMMEDIATE ASSIGNMENT             |                                                                                                                                                                                                                                                                                                        |
| 5    | MS -> SS  | CM SERVICE REQUEST               | Message is contained in SABM                                                                                                                                                                                                                                                                           |
| 6    | MS -> SS  | CLASSMARK CHANGE                 | Multislot class                                                                                                                                                                                                                                                                                        |
| 7    | SS -> MS  | AUTHENTICATION REQUEST           |                                                                                                                                                                                                                                                                                                        |
| 8    | MS -> SS  | AUTHENTICATION RESPONSE          | SRES specifies correct value.                                                                                                                                                                                                                                                                          |
| 9    | SS -> MS  | CIPHERING MODE COMMAND           | SS starts deciphering after sending the message.                                                                                                                                                                                                                                                       |
| 10   | MS -> SS  | CIPHERING MODE COMPLETE          | Shall be sent enciphered. All following messages shall be sent enciphered.                                                                                                                                                                                                                             |
| 11   | SS        |                                  | SS starts ciphering.                                                                                                                                                                                                                                                                                   |
| 12   | MS -> SS  | SETUP                            | Non-transparent connection                                                                                                                                                                                                                                                                             |

| 28   | SS -> MS  | CHANNEL RELEASE                  | The main signalling link is released                                                                                                                                                                                                                                                                   |

### 26.13.3.3 Multislot signalling / Structured procedures / MS originated call / early assignment / HSCSD / Transparent

This test is applicable to all MS that supports multislot configuration.

#### 26.13.3.3.1 Conformance requirement

- 1) An MS in MM state "idle, updated" and in RR idle mode, when made to initiate a call, if it provides a human interface, shall display the dialled number.
- 2) An MS in MM state "idle, updated" and in RR idle mode, when made to initiate a call for a selected teleservice/bearer service for HSCSD that is supported by the MS, starts to initiate the immediate assignment procedure by sending a CHANNEL REQUEST message with correct establishment cause.
- 3) Subsequently after establishment of a MM connection, after MS sends its multislot class in CLASSMARK CHANGE message, the MS shall send a SETUP message with correct parameters.

- 4) The call control entity of the Mobile Station in the "call initiated" state, in the "mobile originating call proceeding" state or in the "call delivered" state, shall, upon receipt of a CONNECT message:
  - 4.1) attach the user connection to the radio path;
  - 4.2) return a CONNECT ACKNOWLEDGE message.
  - 4.3) establish the TDS link.
- 5) Subsequently when the network initiates call clearing by sending a DISCONNECT message, the MS shall proceed to release the call by sending a RELEASE message.
- 6) On receipt of a CHANNEL RELEASE message, the MS shall disconnect the main signalling link.

#### Reference

- Conformance requirement 1: 3GPP TS 02.07.
- Conformance requirement 2: 3GPP TS 02.07,  
3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.3.1.1 and 9.1.8.
- Conformance requirement 3: 3GPP TS 04.08 / 3GPP TS 44.018 subclause 9.1.11,  
3GPP TS 04.08 / 3GPP TS 24.008 subclause 9.3.23.
- Conformance requirement 4: 3GPP TS 04.08 / 3GPP TS 24.008 subclauses 9.3.5 and 9.3.6,  
3GPP TS 07.01 clause 8.
- Conformance requirement 5: 3GPP TS 04.08 / 3GPP TS 24.008 subclauses 9.3.7, 9.3.18 and 5.4.4.2.2.
- Conformance requirement 6: 3GPP TS 04.08 / 3GPP TS 44.018 subclause 9.1.7.

#### 26.13.3.3.2 Test purpose

- 1) To verify that the MS in MM state "idle, updated" with a TMSI assigned, when made to initiate a call for a selected teleservice/bearer service for HSCSD that is supported by the MS as declared in a PICS/PIXIT statement, displays the dialled number in the way described in a PICS/PIXIT statement.
- 2) To verify that the MS in MM state "idle, updated" and in RR idle mode, with a TMSI assigned, when made to initiate a call for a selected teleservice/bearer service for HSCSD that is supported by the MS as declared in a PICS/PIXIT statement, starts to initiate an immediate assignment procedure by sending the CHANNEL REQUEST message with correct establishment cause.
- 3) To verify that subsequently after receipt of an IMMEDIATE ASSIGNMENT message allocating an SDCCH, after completion of establishment of the main signalling link, after having sent a CM SERVICE REQUEST message, after MS sends its multislot class in CLASSMARK CHANGE message, after having successfully performed the authentication and cipher mode setting procedures, the MS sends a SETUP message with correct parameters.
- 4) Multislot configuration with maximum number of channels supported by MS in a HSCSD configuration, is allocated. To verify that subsequently, after receipt of a CALL PROCEEDING message and of an ASSIGNMENT COMMAND message allocating an appropriate TCHs, after having completed the early assignment procedure for all traffic channel in multislot configuration by replying with the ASSIGNMENT COMPLETE message, after receipt of an ALERTING message and a CONNECT message, the MS returns a CONNECT ACKNOWLEDGE message.
- 5) To verify that subsequently the MS has attached the user connection to the radio path. This is verified by checking that the MS synchronises correctly to the TCHs and sends and receives correct data frames in each data block.
- 6) To verify that subsequently upon the network initiating call clearing by sending a DISCONNECT message, the MS proceed to release the call with RELEASE.
- 7) To verify that subsequently, on receipt of a RELEASE COMPLETE message followed by a CHANNEL RELEASE message, the MS disconnects the main signalling link.

### 26.13.3.3.3 Method of test

#### Initial conditions

##### Mobile Station:

- The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

##### System Simulator:

- 1 cell, default parameters except:
  - Early classmark sending enabled in SI3 rest octets.

#### Related PICS/PIXIT statement(s)

- Interface to human user (p1 = Y/N).
- Way to display the called number (only applicable if the MS has an interface to human user).
- Supported teleservices/bearer services.
- Classmark.
- Multislot class.

#### Foreseen final state of the MS

MS is in MM-state "idle, updated" with valid TMSI and CKSN.

#### Test procedure

The MS is made to initiate a HSCSD connection. Maximum number of channels supported by the MS in a HSCSD configuration, is allocated. The call is established with early assignment. Having reached the active state, the call is cleared by the SS.

#### Maximum duration of test

7 minutes.

Expected sequence

| Step | Direction | Message                 | Comments                                                                                                                      |
|------|-----------|-------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                         | The "called number" is entered                                                                                                |
| 2    | MS        |                         | If p1 = Y, the MS must display the called number in the way defined in PICS/PIXIT.                                            |
| 3    | MS -> SS  | CHANNEL REQUEST         | Establishment cause is "Originating call and TCH/F is needed, or originating call and the network does not set NECI bit to 1" |
| 4    | SS -> MS  | IMMEDIATE ASSIGNMENT    |                                                                                                                               |
| 5    | MS -> SS  | CM SERVICE REQUEST      | Message is contained in SABM                                                                                                  |
| 6    | MS -> SS  | CLASSMARK CHANGE        | Multislot class                                                                                                               |
| 7    | SS -> MS  | AUTHENTICATION REQUEST  |                                                                                                                               |
| 8    | MS -> SS  | AUTHENTICATION RESPONSE | SRES specifies correct value.                                                                                                 |
| 9    | SS -> MS  | CIPHERING MODE COMMAND  | SS starts deciphering after sending the message.                                                                              |
| 10   | MS -> SS  | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered.                                                    |
| 11   | SS        |                         | SS starts ciphering.                                                                                                          |
| 12   | MS -> SS  | SETUP                   | Transparent connection                                                                                                        |
| 13   | SS -> MS  | CALL PROCEEDING         |                                                                                                                               |
| 14   | SS -> MS  | ASSIGNMENT COMMAND      | In multislot allocation maximum number of timeslots, that MS supports, is allocated.                                          |
| 15   | MS -> SS  | ASSIGNMENT COMPLETE     |                                                                                                                               |
| 16   | SS -> MS  | ALERTING                |                                                                                                                               |
| 17   | MS        |                         |                                                                                                                               |
| 18   | SS -> MS  | CONNECT                 |                                                                                                                               |
| 19   | MS -> SS  | CONNECT ACKNOWLEDGE     |                                                                                                                               |
| 20   | MS        |                         | The appropriate bearer channel is through connected in both directions                                                        |
| 21   | SS -> MS  | DISCONNECT              |                                                                                                                               |
| 22   | MS -> SS  | RELEASE                 |                                                                                                                               |
| 23   | SS -> MS  | RELEASE COMPLETE        |                                                                                                                               |
| 24   | SS -> MS  | CHANNEL RELEASE         | The main signalling link is released                                                                                          |

#### 26.13.3.4 Multislot signalling / Structured procedures / MS Terminated call / early assignment / HSCSD / non-transparent

This test is applicable to all MS that supports multislot configuration.

##### 26.13.3.4.1 Conformance requirement

- 1) The MS is in MM state "idle, updated" and in RR idle mode when being paged by the network.
- 2) The MS sends CHANNEL REQUEST message to the network and after that it receives IMMEDIATE ASSIGNMENT message from the network
- 3) The MS sends PAGING RESPONSE message to network and after that MS sends its multislot class in CLASSMARK CHANGE message to the network.
- 4) The MS performs successfully authentication and cipher mode setting procedures.
- 5) The MS shall acknowledge the SETUP message with a CALL CONFIRMED message, if compatibility checking was successful, the MS is not busy, and the user does not refuse the call.
- 6) Upon receipt of the ASSIGNMENT COMMAND message the MS continues a mobile terminating call establishment with early establishment of the traffic channel(s)
  - 6.1) by replying to the ASSIGNMENT COMMAND with an ASSIGNMENT COMPLETE message; and
  - 6.2) if the MS supports immediate connect, by continuing the call establishment by through-connecting the traffic channel(s) in both directions, or if the MS does not support immediate connect, by sending an ALERTING message.
- 7) An MS indicates acceptance of a MT call by sending CONNECT.

- 8) After receiving the CONNECT ACKNOWLEDGE message from the network the MS shall establish the RLP link.
- 9) User requests User initiated service level upgrade. MS sends MODIFY message and after receipt of MODIFY COMPLETE message the MS enters the active state.
- 10) MS receives CONFIGURATION CHANGE COMMAND message and reply's to SS by sending CONFIGURATION CHANGE ACKNOWLEDGE message.
- 11) The MS initiates call clearing of an active call by sending a DISCONNECT message.
- 12) The MS in this phase of call release, upon receipt of a RELEASE message, shall return a RELEASE COMPLETE message.
- 13) Subsequently the MS, upon receipt of a CHANNEL RELEASE message, shall disconnect the main signalling link.

## Reference

- Conformance requirement 1: 3GPP TS 02.07.
- Conformance requirement 2: 3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.3.1.1 and 9.1.8.
- Conformance requirement 3: 3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.3.2.2, 9.1.25 and 9.1.11.
- Conformance requirement 4: 3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.3.2, 9.2.2 and 9.2.3, 3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.4.7, 9.1.9 and 9.1.10.
- Conformance requirement 5: 3GPP TS 04.08 / 3GPP TS 24.008, subclauses 9.3.23 and 9.3.2.
- Conformance requirement 6: 3GPP TS 04.08 / 3GPP TS 44.018 subclauses 9.1.2 and 9.1.3 3GPP TS 04.08 / 3GPP TS 24.008 subclauses 5.2.1.5 and 9.3.1.
- Conformance requirement 7: 3GPP TS 04.08 / 3GPP TS 24.008 subclause 9.3.5.
- Conformance requirement 8: 3GPP TS 04.08 / 3GPP TS 24.008 subclause 9.3.6, 3GPP TS 07.01 clause 8.
- Conformance requirement 9: 3GPP TS 04.08 / 3GPP TS 24.008 subclauses 9.3.13 and 9.3.14.
- Conformance requirement 10: 3GPP TS 04.08 / 3GPP TS 44.018 subclauses 9.1.12b and 9.1.12c.
- Conformance requirement 11: 3GPP TS 04.08 / 3GPP TS 24.008 subclause 9.3.7.
- Conformance requirement 12: 3GPP TS 04.08 / 3GPP TS 24.008 subclauses 9.3.18, 9.3.19 and 5.4.4.2.2.
- Conformance requirement 13: 3GPP TS 04.08 / 3GPP TS 44.018 subclause 9.1.7.

### 26.13.3.4.2 Test purpose

- 1) To verify that the MS in MM state "idle, updated" and in RR idle mode with a TMSI assigned, after being paged by the network on the correct paging subchannel, after initiating the immediate assignment procedure by sending the CHANNEL REQUEST message, after receipt of an IMMEDIATE ASSIGNMENT message allocating an SDCCH, after having sent a PAGING RESPONSE message on the allocated SDCCH, after having sent multislot class in CLASSMARK CHANGE message, after having performed successful authentication and cipher mode setting procedures, after receipt of a SETUP message not containing a signal information element, returns a CALL CONFIRMED message.
- 2) Multislot configuration with one TCH/F is allocated. To verify that subsequently, the SS sending an ASSIGNMENT COMMAND message, the MS successfully continues a mobile terminating call establishment with early assignment of traffic channel(s):
  - 2.1) by replying to the ASSIGNMENT COMMAND with an ASSIGNMENT COMPLETE message; and
  - 2.2) by continuing the call establishment by either sending a CONNECT message or sending an ALERTING message depending on PICS/PIXIT statement.

- 3) To verify that the MS generates an alerting indication if an ALERTING message had to be sent.
- 4) To verify that if an ALERTING had been sent, subsequently, when the user accepts the call (possibly internal action as declared in PICS/PIXIT statement), the MS returns a CONNECT message.
- 5) To verify that the MS after receipt of a CONNECT ACKNOWLEDGE message subsequently attaches the user connection to the radio path. This is verified by checking that the MS establishes the RLP link correctly and sends and receives correct RLP frames in each data block.
- 6) To verify that subsequently upon user requests User initiated service level upgrade, the MS send MODIFY message and after receipt of MODIFY COMPLETE message the MS enters the active state.
- 7) To verify that subsequently, after receipt of a CONFIGURATION CHANGE COMMAND, after MS sends CONFIGURATION CHANGE ACKNOWLEDGE, MS through connects all bi-directional channel(s) in multislot configuration in both directions and all uni-directional channels in downlink direction. Multislot configuration is upgraded from simplest case up to the maximum number of channels supported by MS in the HSCSD configuration. This is verified by checking that the MS sends and receives correct RLP frames in each data block.
- 8) To verify that subsequently, the MS can initiate call clearing by sending DISCONNECT message.
- 9) To verify that the MS in this phase of call release, upon receipt of a RELEASE message, returns a RELEASE COMPLETE message.
- 10) To verify that subsequently the MS, upon receipt of a CHANNEL RELEASE message, disconnects the main signalling link.

#### 26.13.3.4.3 Method of test

##### Initial conditions

##### Mobile Station:

- The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

##### System Simulator:

- 1 cell, default parameters except:
  - Early classmark sending enabled in SI3 rest octets.

##### Related PICS/PIXIT statement(s)

- Interface to the human user (p1= Y/N).
- Way to indicate alerting (only applicable if the MS supports the feature).
- Way to make the MS accept an incoming call after alerting (possibly dependent on teleservice/bearer service and configuration).
- Supported teleservices/bearer service.
- Classmark.
- Immediate connect supported (Y/N).
- Multislot class.

##### Foreseen final state of the MS

MS is in MM-state "idle, updated" with valid TMSI and CKSN.

### Test procedure

The MS is paged and the resulting HSCSD connection is established. Multislot configuration with one TCH/F is allocated. User service level upgrade is performed. MS enters the active state. Then CONFIGURATION CHANGE COMMAND message is sent to MS and it reply's with CONFIGURATION CHANGE ACKNOWLEDGE message. This is done from simplest case up to the maximum number of channels supported by the MS in the HSCSD configuration (this is performed within highest multislot class that MS supports).

### Maximum duration of test

7 minutes.

Expected sequence

| Step | Direction | Message                          | Comments                                                                                                                                                                                                                                                                                               |
|------|-----------|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PAGING REQUEST TYPE 1            | Sent on the correct paging subchannel.                                                                                                                                                                                                                                                                 |
| 2    | MS -> SS  | CHANNEL REQUEST                  | Establishment cause indicates "answer to paging".                                                                                                                                                                                                                                                      |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT             |                                                                                                                                                                                                                                                                                                        |
| 4    | MS -> SS  | PAGING RESPONSE                  | Message is contained in SABM.                                                                                                                                                                                                                                                                          |
| 5    | MS -> SS  | CLASSMARK CHANGE                 | Multislot class                                                                                                                                                                                                                                                                                        |
| 6    | SS -> MS  | AUTHENTICATION REQUEST           |                                                                                                                                                                                                                                                                                                        |
| 7    | MS -> SS  | AUTHENTICATION RESPONSE          | SRES specifies correct value.                                                                                                                                                                                                                                                                          |
| 8    | SS -> MS  | CIPHERING MODE COMMAND           | SS starts deciphering after sending the message.                                                                                                                                                                                                                                                       |
| 9    | MS -> SS  | CIPHERING MODE COMPLETE          | Shall be sent enciphered. All following messages shall be sent enciphered.                                                                                                                                                                                                                             |
| 10   | SS        |                                  | SS starts ciphering.                                                                                                                                                                                                                                                                                   |
| 11   | SS -> MS  | SETUP                            | Message does not contain the signal IE. Setup indicates non-transparent connection.                                                                                                                                                                                                                    |
| 12   | MS -> SS  | CALL CONFIRMED                   | If the MS supports immediate connect then branch A applies. If the MS does not support immediate connect then branch B applies                                                                                                                                                                         |

|      |           |                                  | MS connects all bi-directional channels in both directions and all uni-directional channels in downlink direction.                                                                                                                                                                                     |
| 25   | MS        |                                  | The MS is made to release the call.                                                                                                                                                                                                                                                                    |
| 26   | MS -> SS  | DISCONNECT                       |                                                                                                                                                                                                                                                                                                        |
| 27   | SS -> MS  | RELEASE                          |                                                                                                                                                                                                                                                                                                        |
| 28   | MS -> SS  | RELEASE COMPLETE                 |                                                                                                                                                                                                                                                                                                        |
| 29   | SS -> MS  | CHANNEL RELEASE                  | The main signalling link is released.                                                                                                                                                                                                                                                                  |

### 26.13.3.5 Multislot signalling / Structured procedures / MS Terminated call / early assignment / HSCSD / Transparent

This test is applicable to all MS that supports multislot configuration.

#### 26.13.3.5.1 Conformance requirement

- 1) The MS is in MM state "idle, updated" and in RR idle mode when being paged by the network.

- 2) The MS sends CHANNEL REQUEST message to the network and after that it receives IMMEDIATE ASSIGNMENT message from the network.
- 3) The MS sends PAGING RESPONSE message to network and after that MS sends its multislot class in CLASSMARK CHANGE message to the network.
- 4) The MS performs successfully authentication and cipher mode setting procedures.
- 5) The MS shall acknowledge the SETUP message with a CALL CONFIRMED message, if compatibility checking was successful, the MS is not busy, and the user does not refuse the call.
- 6) Upon receipt of the ASSIGNMENT COMMAND message the MS continues a mobile terminating call establishment with early establishment of the traffic channel(s)
  - 6.1) by replying to the ASSIGNMENT COMMAND with an ASSIGNMENT COMPLETE message; and
  - 6.2) if the MS supports immediate connect, by continuing the call establishment by through-connecting the traffic channel(s) in both directions, or if the MS does not support immediate connect, by sending an ALERTING message.
- 7) An MS indicates acceptance of a MT call by sending CONNECT.
- 8) The mobile station shall attach the user connection and establish the TDS link when receiving the CONNECT ACKNOWLEDGE message from the network.
- 9) MS correctly uses different ciphering bit streams on the different timeslots in a multislot configuration.
- 10) The MS initiates call clearing of an active call by sending a DISCONNECT message.
- 11) The MS in this phase of call release, upon receipt of a RELEASE message, shall return a RELEASE COMPLETE message.
- 12) Subsequently the MS, upon receipt of a CHANNEL RELEASE message, shall disconnect the main signalling link.

## Reference

- Conformance requirement 1: 3GPP TS 02.07.
- Conformance requirement 2: 3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.3.1.1 and 9.1.8.
- Conformance requirement 3: 3GPP TS 04.08/ 3GPP TS 44.018 subclauses 3.3.2.2, 9.1.25 and 9.1.11.
- Conformance requirement 4: 3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.3.2, 9.2.2 and 9.2.3, 3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.4.7, 9.1.9 and 9.1.10.
- Conformance requirement 5: 3GPP TS 04.08 / 3GPP TS 24.008, subclauses 9.3.23 and 9.3.2.
- Conformance requirement 6: 3GPP TS 04.08/ 3GPP TS 44.018 subclauses 9.1.2 and 9.1.3.
- Conformance requirement 7: 3GPP TS 04.08 / 3GPP TS 24.008 subclause 9.3.5.
- Conformance requirement 8: 3GPP TS 04.08 / 3GPP TS 24.008 subclause 9.3.6, 3GPP TS 07.01 clause 8.
- Conformance requirement 9: 3GPP TS 03.34 subclause 5.2.5, 3GPP TS 04.08/ 3GPP TS 44.018 subclauses 3.4.7 and 9.1.9.
- Conformance requirement 10: 3GPP TS 04.08 / 3GPP TS 24.008 subclause 9.3.7.
- Conformance requirement 11: 3GPP TS 04.08 / 3GPP TS 24.008 subclause 9.3.19.
- Conformance requirement 12: 3GPP TS 04.08/ 3GPP TS 44.018 subclause 9.1.7.

### 26.13.3.5.2 Test purpose

- 1) To verify that the MS in MM state "idle, updated" and in RR idle mode with a TMSI assigned, after being paged by the network on the correct paging subchannel, after initiating the immediate assignment procedure by sending the CHANNEL REQUEST message, after receipt of an IMMEDIATE ASSIGNMENT message allocating an SDCCH, after having sent a PAGING RESPONSE message on the allocated SDCCH, after having sent multislot class in CLASMARK CHANGE message which has been explicitly accepted by the network, as indicated in the last reception in the accessed cell of the SYSTEM INFORMATION TYPE 3 message, after having performed successful authentication and cipher mode setting procedures, after receipt of a SETUP message not containing a signal information element, returns a CALL CONFIRMED message.
- 2) Multislot configuration with maximum number of channels supported by MS in a HSCSD configuration, is allocated. To verify that subsequently, the SS sending an ASSIGNMENT COMMAND message, the MS successfully continues a mobile terminating call establishment with early assignment of traffic channel(s):
  - 2.1) by replying to the ASSIGNMENT COMMAND with an ASSIGNMENT COMPLETE message; and
  - 2.2) by continuing the call establishment by either sending a CONNECT messages or sending an ALERTING message depending on PICS/PIXIT statement.
- 3) To verify that the MS generates an alerting indication if an ALERTING message had to be sent.
- 4) To verify that if an ALERTING had been sent, subsequently, when the user accepts the call (possibly internal action as declared in PICS/PIXIT statement), the MS returns a CONNECT message.
- 5) To verify that the MS after receipt of a CONNECT ACKNOWLEDGE message subsequently attaches the user connection to the radio path. This is verified by checking that the MS synchronises correctly to the TCHs and sends and receives correct data frames in each data block.
- 6) To verify that the MS correctly uses different ciphering bit streams on the different timeslots in a multislot configuration.
- 7) To verify that subsequently, the MS can initiate call clearing by sending a DISCONNECT message.
- 8) To verify that the MS in this phase of call release, upon receipt of a RELEASE message, returns a RELEASE COMPLETE message.
- 9) To verify that subsequently the MS, upon receipt of a CHANNEL RELEASE message, disconnects the main signalling link.

These test purposes are tested for all rates supported by the MS (full rate).

### 26.13.3.5.3 Method of test

#### Initial conditions

#### Mobile Station:

- The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

#### System Simulator:

- 1 cell, default parameters except:
  - Early classmark sending enabled in SI3 rest octets.

#### Related PICS/PIXIT statement(s)

- Interface to the human user (p1= Y/N).
- Way to indicate alerting (only applicable if the MS supports the feature).
- Way to make the MS accept an incoming call after alerting (possibly dependent on teleservice/bearer service and configuration).

- Supported teleservices/bearer service.
- Classmark.
- Immediate connect supported (Y/N).
- Multislot class.

Foreseen final state of the MS

MS is in MM-state "idle, updated" with valid TMSI and CKSN.

Test procedure

The MS is paged and the resulting HSCSD connection is established. Maximum number of channels supported by the MS in a HSCSD configuration, is allocated. Having reached the active state, the MS is made to clear the call.

Maximum duration of test

7 minutes

Expected sequence

| Step | Direction | Message                 | Comments                                                                                                                                                     |
|------|-----------|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PAGING REQUEST TYPE 1   | Sent on the correct paging subchannel.                                                                                                                       |
| 2    | MS -> SS  | CHANNEL REQUEST         | Establishment cause indicates "answer to paging".                                                                                                            |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT    |                                                                                                                                                              |
| 4    | MS -> SS  | PAGING RESPONSE         | Message is contained in SABM.                                                                                                                                |
| 5    | MS -> SS  | CLASSMARK CHANGE        | Early classmark sending Multislot class indicated                                                                                                            |
| 6    | SS -> MS  | AUTHENTICATION REQUEST  |                                                                                                                                                              |
| 7    | MS -> SS  | AUTHENTICATION RESPONSE | SRES specifies correct value.                                                                                                                                |
| 8    | SS -> MS  | CIPHERING MODE COMMAND  | SS starts deciphering after sending the message.                                                                                                             |
| 9    | MS -> SS  | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered.                                                                                   |
| 10   | SS        |                         | SS starts ciphering.                                                                                                                                         |
| 11   | SS -> MS  | SETUP                   | Message does not contain the signal IE.                                                                                                                      |
| 12   | MS -> SS  | CALL CONFIRMED          |                                                                                                                                                              |
|      |           |                         | If the MS supports immediate connect then branch A applies. If the MS does not support immediate connect then branch B applies                               |
| A13  | SS -> MS  | ASSIGNMENT COMMAND      |                                                                                                                                                              |
| A14  | MS -> SS  | ASSIGNMENT COMPLETE     |                                                                                                                                                              |
| A15  | MS -> SS  | CONNECT                 | In multislot allocation maximum number of timeslots that MS supports, is allocated.                                                                          |
| B13  | SS -> MS  | ASSIGNMENT COMMAND      |                                                                                                                                                              |
| B14  | MS -> SS  | ASSIGNMENT COMPLETE     |                                                                                                                                                              |
| B15  | MS -> SS  | ALERTING                | In multislot allocation maximum number of timeslots that MS supports, is allocated.<br>sent on the TCH/Sm channel                                            |
| B16  | MS        |                         | An alerting indication as defined in a PICS/PIXIT statement is given by the MS                                                                               |
| B17  | MS        |                         | The MS is made to accept the call in the way described in a PICS/PIXIT statement                                                                             |
| B18  | MS -> SS  | CONNECT                 |                                                                                                                                                              |
| 19   | SS -> MS  | CONNECT ACKNOWLEDGE     |                                                                                                                                                              |
| 20   | MS        |                         | The appropriate bearer channel is through connected in both directions and the MS correctly uses different ciphering bit streams on the different timeslots. |
| 21   | MS        |                         | The MS is made to release the call.                                                                                                                          |
| 22   | MS -> SS  | DISCONNECT              |                                                                                                                                                              |
| 23   | SS -> MS  | RELEASE                 |                                                                                                                                                              |
| 24   | MS -> SS  | RELEASE COMPLETE        |                                                                                                                                                              |
| 25   | SS -> MS  | CHANNEL RELEASE         | The main signalling link is released.                                                                                                                        |

### 26.13.3.6 Default test conditions during layer 3 tests

During tests in subclause 26.13 the following default test conditions shall apply if not otherwise stated within the test description. In the table below, decimal values are normally used. Sometimes a hexadecimal value, indicated with a "H", or a binary value, indicated with a "B" is given.

|                                                | GSM 450                                               | GSM 480                                               |

These information's are provided by system information 1, 2, 3 and 4 messages.

The system information elements that are broadcast on the SACCH/M during the dedicated mode should be consistent with those sent on the BCCH when the MS was in idle mode prior to the channel request.

In addition, all fill paging messages sent on the paging sub-channels will have by default, their page mode set to NORMAL PAGING.

## 26.13.3.7 Default contents of messages

ALERTING (mobile station to network direction)

| Information element | Value/remark |

| Progress indicator  | Omitted                                           |

## CHANNEL RELEASE

| Information element | Value/remark |
|---------------------|--------------|
| RR cause            | Normal event |

## CHANNEL REQUEST

| Information element | Value/remark                     |
|---------------------|----------------------------------|
| Establishment cause | Answer to paging (100)           |
| Random reference    | Arbitrary value of 5 bits length |

## CIPHERING MODE COMMAND

| Information element  | Value/remark                    |
|----------------------|---------------------------------|
| Cipher mode setting  | indicates a supported algorithm |
| algorithm identifier |                                 |
| SC                   | Start ciphering                 |
| Cipher response      | IMEI must not be included       |
| CR                   |                                 |

## CIPHERING MODE COMPLETE

| Information element       | Value/remark |
|---------------------------|--------------|
| Mobile equipment identity | Omitted      |

## CLASSMARK CHANGE

| Information element                             | Value/remark                                       |
|-------------------------------------------------|----------------------------------------------------|
| MS classmark                                    | Multislot classmark value appropriate for the test |
| Additional mobile station classmark information | Omitted                                            |

## CM SERVICE ACCEPT

| Information element   | Value/remark |
|-----------------------|--------------|
| none but message head |              |

## CM SERVICE REQUEST

| Information element           | Value/remark                                                                  |
|-------------------------------|-------------------------------------------------------------------------------|
| CM service type               | Mobile originating call establishment or packet mode connection establishment |
| Ciphering key sequence number | CKSN of the MS                                                                |
| Mobile station classmark 2    | as given by PICS.                                                             |
| Mobile identity               | TMSI of MS                                                                    |

## CONFIGURATION CHANGE COMMAND

| Information element                        | Value/remark                                          |
|--------------------------------------------|-------------------------------------------------------|
| Description of the multislot configuration | Appropriate for the teleservice selected for the test |
| Mode of channel set X (1=<X<=8)            | Appropriate channel mode is selected                  |

## CONFIGURATION CHANGE REJECT

| Information element | Value/remark                        |
|---------------------|-------------------------------------|
| RR Cause            | Cause = "Channel mode unacceptable" |

## CONNECT (network to mobile station direction)

| Information element  | Value/remark |

## 26.14 VGCS and VBS Tests

This clause applies to mobile station supporting Voice Group Call Service (TS 91) and/or Voice Broadcast Service (TS 92). The objective of this clause is to test VGCS/VBS concerned procedures. A specific VGCS/VBS SIM card is needed for testing. If a mobile supports both VGCS and VBS, the VGCS is selected for tests except when otherwise stated.

For VGCS and VBS, the following possible mobile station implementations exist:

- support of VBS listening;
- support of VBS originating;
- support of VGCS listening;
- support of VGCS talking. This always includes the implementation for VGCS listening;
- support of VGCS originating. This always includes the implementation for VGCS talking.

Apart from the explicitly mentioned combinations, all possible combinations are optional.

In this clause some L3 messages are sent in UI format to which no L2 acknowledgement/re-transmission mechanism is applied. It is important for overall tests in this clause to ensure that the radio conditions are ideal.

Tables 26.14.1 to 26.14.3 define generic procedures to bring the MS into an initial state. For establishment of group transmit mode table 26.14.1 is used if the MS supports VGCS talking. If an MS supporting VBS originating rather than VGCS, table 26.14.2 is used for establishment of a VBS call and to bring the MS into group transmit mode. For establishment of group receive mode table 26.14.3 is applied.

Unless indicated in individual sub-clauses, the default message contents in subclause 26.14.10 are applied.

**Table 26.14.1: Establishment of group transmit mode for VGCS**

## 26.14.1 VGCS-VBS / Notification

The notification procedure is mandatory for mobile stations supporting VGCS listening or VBS listening.

### 26.14.1.1 VGCS-VBS / Notification / notification indication

#### 26.14.1.1.1 Conformance requirement

1. Having received a NOTIFICATION/NCH or NOTIFICATION/FACCH which contains group call reference(s) that are active in the MS, the MS shall correctly indicate the notified group/broadcast call reference(s).
2. On request to respond to the call notification, the MS shall join the VGCS/VBS call on the correct channel if a description for the VGCS/VBS channel is included.
3. On request to respond to the call notification, the MS shall establish an RR connection to respond the notification if no description for the VGCS/VBS channel is included.
4. The MS shall ignore any NOTIFICATION/NCH or NOTIFICATION/FACCH which contains group call reference(s) that are not active in the MS.

#### Reference(s)

3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.3.3.1 and 3.3.3.2.

3GPP TS 03.68 subclauses 4.1, 11.3.1.3a and 11.3.1.3b.

3GPP TS 03.69 subclauses 4.1, 11.3.1.3a and 11.3.1.3b.

#### 26.14.1.1.2 Test purpose

1. To verify that the MS indicates correctly the notified group/broadcast call reference(s) after receiving a NOTIFICATION/NCH or NOTIFICATION/FACCH message which contains group call reference(s) that are active in the MS.
2. To verify that the MS, on request to respond to a call notification, joins the VGCS/VBS call on the correct channel if a description for the VGCS/VBS channel is included in the NOTIFICATION message.
3. To verify that the MS, on request to respond to a call notification, establishes an RR connection to respond to the notification if no description for the VGCS/VBS channel is included in the NOTIFICATION message.
4. To verify that the MS ignores any NOTIFICATION/NCH or NOTIFICATION/FACCH which contains group call reference(s) that are not active in the MS.
5. To verify that there is no uplink transmission from the MS on TCH after the MS join the call.

#### 26.14.1.1.3 Method of test

##### Initial Conditions

System Simulator:

1 cell default parameters for ASCII testing

Mobile Station:

The MS is in MM-state "idle, updated". No automatic answering is configured.

#### Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900, DCS 1 800 or PCS 1 900).
- Support VGCS listening.
- Support VGCS talking.
- Support VBS listening.
- Support VBS originating.
- Way to configure VGCS or VBS.
- Way to indicate a call notification.
- Way to accept a VGCS or VBS.
- Way to verify the downlink speech path.

#### Foreseen Final State of the MS

"Idle, updated".

#### Test Procedure

The MS is in idle mode, the SS sends NOTIFICATION/NCH containing VGCS/VBS channel description and VGCS/VBS call reference not active in the MS. It is checked that the MS ignores the message. The SS sends NOTIFICATION/NCH containing VGCS/VBS channel description and VGCS/VBS call reference active in the MS ("good reference"). It is checked whether the MS indicates correctly the notified group call reference(s) and joins VGCS/VBS call on request of responding to the notification. The group call is terminated. The SS sends NOTIFICATION/NCH which contains the "good reference" but no VGCS/VBS channel description. It is checked that the MS indicates correctly the notified group call reference(s) and establishes a RR connection to respond to the notification on request of responding to the call, then joins the call. The group call is terminated.

The MS is brought to group receive mode or CC state U10 or dedicated mode with signalling connection or group transmit mode (for k=1, 2, 3, 4 respectively), the SS sends NOTIFICATION/FACCH containing the "good reference" but no VGCS/VBS channel description. It is checked that the MS gives correct notified group call reference(s) and on request of responding to the call, establishes a RR connection to respond to the notification and joins the call. The call is terminated.

Finally, the MS is brought to group receive mode or CC state U10 or dedicated mode with signalling connection or group transmit mode (for k=1, 2, 3, 4 respectively), the SS sends NOTIFICATION/FACCH containing the "good reference" and VGCS/VBS channel description. It is checked the MS indicates correctly the notified group call reference(s) and joins VGCS/VBS call on request of responding to the notification. The group call is terminated.

#### Maximum Duration of Test

10 minutes excluding operator operations.

#### Expected Sequence

Test steps 20 to 50 are executed for k=1, 2, 3, 4 conditionally. If the MS does not support CC state U10, test steps 20 to 50 are not executed for k=2. If the MS does not support VGCS talking or VBS originating, test steps 20 to 50 are not executed for k=4.

| Step                     | Direction | Message               | Comments                                                                                                                                                                                                                                 |

## 26.14.1.2 VGCS-VBS / Notification / NCH position

### 26.14.1.2.1 Conformance requirement

The MS shall recognise correctly different NCH positions and blocks if supporting VGCS or VBS.

In the case the CCCH configuration is not compatible with the NCH position, the MS shall behave as if the NCH position field was not present.

#### Reference(s)

3GPP TS 05.02, subclauses 6.5.1 and 6.5.5, clause 7 and table 3.

3GPP TS 04.08 / 3GPP TS 44.018, subclause 10.5.2.32.

### 26.14.1.2.2 Test purpose

To verify that the MS recognises correctly different NCH positions of first block and number of blocks.

To verify that the MS behaves as if the NCH position field was not present when the CCCH configuration is not compatible with the NCH position.

### 26.14.1.2.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, BS\_AG\_BLK\_RES = 5, CCCH non-combined.

Mobile Station:

The MS is in MM-state "idle, updated". No automatic answering is configured.

#### Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900, DCS 1 800 or PCS 1 900).
- Support VGCS listening.
- Support VBS listening.
- Way to configure VGCS or VBS.
- Way to indicate a call notification.

#### Foreseen Final State of the MS

"Idle, updated".

#### Test Procedure

The MS is in idle mode, the SS sends SI 1 containing the 1st NCH block number = 3 (B3) and No. of blocks = 1. After the MS decodes the SI 1, the SS sends on the block B1 NOTIFICATION/NCH containing VGCS/VBS channel description and VGCS/VBS call reference active in the MS. It is checked that the MS ignores the notification. The SS stops sending NOTIFICATION/NCH on block B1, but sends on block B3 containing VGCS/VBS channel description and VGCS/VBS call reference active in the MS. It is checked that the MS indicates correctly the notified group call reference(s).

The SS stops sending NOTIFICATION/NCH on block B3 and changes SI 1 containing The 1st NCH block number = 1 and No. of blocks = 2. After the MS decodes the SI the SS sends NOTIFICATION/NCH on the block B2 containing VGCS/VBS channel description and VGCS/VBS call reference active in the MS. It is checked that the MS indicates correctly the notified group call reference(s).

The SS stops sending NOTIFICATION/NCH on block B2 and changes the CCCH configuration with combined SDCCH, BS\_AG\_BLK\_RES = 1. Wait 30 s. and then sends NOTIFICATION/NCH on the block B2 containing VGCS/VBS channel description and VGCS/VBS call reference active in the MS. It is checked that the MS ignores the notification.

#### Maximum Duration of Test

5 minutes.

#### Expected Sequence

### 26.14.1.3 VGCS-VBS / Notification / Reduced NCH monitoring

#### 26.14.1.3.1 Conformance requirement

1. When the mobile station in idle mode enters a cell and deduces from the BCCH that an NCH is present, it shall read the NCH until it has received at least two messages on the NCH indicating NLN, with the two last received NLN being identical. Then it may stop reading the NCH until it receives on the PCH an NLN(PCH) different from the last previously received NLN.
2. If the reduced NCH monitoring mechanism is used on the NCH, when the MS in group receive mode or group transmit mode enters a cell, it should read the NCH until it has received at least two messages on the NCH indicating NLN, with the two last received NLN being identical. Then it should stop reading the NCH until it receives on the SACCH an NLN(SACCH) different from the last previously received NLN.
3. A change of the NLN status field indicates a change of information on the NCH which is not related to new calls.

#### Reference(s)

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.3.3.3.

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.4.15.1.2.4.1.

#### 26.14.1.3.2 Test purpose

To verify that:

1. when the MS in idle mode on a cell where a reduced monitoring is activated, it reads the NCH until it has received at least two NLN (NCH) being identical. Then it stops reading the NCH until it receives a PAGING REQUEST message of any TYPE containing an NLN (PCH) different from the last previously received NLN.
2. after the MS entered in group receive mode or group transmit mode it continues the reduced monitoring until it receives SI6 containing an NLN (SACCH) different from the last previously received NLN (SACCH).
3. when the MS in group receive mode or group transmit mode enters a new cell, it reads the NCH until it has received at least two messages on the NCH indicating NLN, with the two last received NLN being identical. Then it stops reading the NCH until it receives SI6 on the SACCH an NLN(SACCH) different from the last previously received NLN.
4. the MS understands the change of the NLN status field.

#### 26.14.1.3.3 Method of test

#### Initial Conditions

System Simulator:

2 cells with default parameters for ASCII testing, same LAI.

The values specified in Table 26.14.1.3 override the values in default contents of SI messages in subclauses 26.6.14. and 26.6.15.

**Table 26.14.1.3: Default values of the system information fields**

| Parameter            | 3GPP TS 04.08 /<br>3GPP TS 44.018<br>reference | Abbr. | Normal Setting |
|----------------------|------------------------------------------------|-------|----------------|
| CELL_BAR_QUALIFY     | 10.5.2.35                                      | CBQ   | 0              |
| CELL_RESELECT_OFFSET | 10.5.2.35                                      | CRO   | 0              |

| Power Offset         | 10.5.2.35                                      | PO    | 0              |

Mobile Station:

The MS is in MM-state "idle, updated" with a TMSI allocated on cell A. No automatic answering configured.

#### Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900, DCS 1 800 or PCS 1 900).
- Support reduced NCH monitoring.
- Support VGCS listening.
- Support VGCS talking.
- Support VBS listening.
- Support VBS originating.
- Support NCH monitoring in group receive mode.
- Support NCH monitoring in group transmit mode.
- Support NCH monitoring in dedicated mode.
- Way to configure VGCS or VBS.
- Way to indicate uplink granted/rejected.
- Way to accept a VGCS or VBS.
- Way to request uplink.

#### Foreseen Final State of the MS

"Idle, updated" on cell B.

#### Test Procedure

The MS is in idle mode on cell A. The SS sends NOTIFICATION/NCH with NLN (value is '00'B) but not addressing the MS on cell A. After at least 2 such messages have been received by the MS, the SS sends another NLN value ('01'B) in the NOTIFICATION/NCH message which contains call reference active in the MS and VGCS/VBS channel description. It is checked that the MS does not indicate the notification. The SS sends PAGING REQUEST TYPE1 message on the MS's paging sub-channel on cell A with NLN(PCH) containing value '01'B. It is checked that the MS indicates the notification to the user. The MS rejects the VGCS/VBS call on request from MMI. The same procedure is repeated once except SS sends PAGING REQUEST TYPE2 message instead of PAGING REQUEST TYPE1. The NLN value is set to '10'B.

Change the RF levels of cell A and cell B so that the MS re-selects cell B. The same test procedure as described above is repeated once except the SS sends PAGING REQUEST TYPE 3 message on the MS's paging sub-channel on cell B. The NLN value is set to '11'B. The MS joins the VGCS/VBS call on request from MMI and is in group receive mode on cell B.

On cell A the SS sends NOTIFICATION/NCH containing VGCS/VBS channel description, the same call reference and NLN value as those of cell B. Adjust the RF levels of cell A and cell B so that cell B keeps suitable but the MS re-selects cell A. The MS is still in group receive mode. After the MS has consecutively received at least two identical NLN (NCH) the SS sends NOTIFICATION/NCH containing an NLN valued '01'B, VGCS/VBS channel description and call reference active in the MS. It is checked that the MS does not indicate the notification. The SS changes NLN value to '01'B in SI 6 message. It is checked that the MS indicates the notification to the user. The call is rejected. The SS changes NLN status value to '1'B in SI 6 message. It is checked that the MS does not indicate any new notification to the user.

The MS is brought into group transmit mode and handed over to cell B. After at least two NOTIFICATION/NCH messages received on cell B, the SS sends an another NOTIFICATION/NCH message with NLN value ('00'B) and addressing the MS on cell B. It is checked that the MS does not indicate the notification. The SS changes NLN value to '00'B in SI 6 message. It is checked that the MS indicates the notification to the user.

## Maximum Duration of Test

10 minutes

## Expected Sequence

Test steps 0 to 8 are executed for k=1, 2, 3. When finished the test then goes to step 9. If the MS does not support VGCS talking, test step 18 to 44 are not executed.

## 26.14.1.4 VGCS-VBS / Notification / Limited Service state

## 26.14.1.4.1 Conformance requirement

In state MM IDLE and service state LIMITED SERVICE:

1. The MS shall indicate notifications to the GCC or BCC sub-layer for which a channel description has been received in the notification by the RR sub-layer.
2. The MS shall reject requests of the GCC or BCC sub-layer to respond to notifications for which no channel description has been received in the notification by the RR sub-layer.
3. The MS shall request the RR sub-layer to receive a voice group or broadcast call if the GCC or BCC sublayer requests the reception of a voice group or broadcast call for which a channel description has been received in the notification by the RR sublayer and then go to the service state RECEIVING GROUP CALL (LIMITED SERVICE).
4. The MS shall reject any request of establishing a group call.

## Reference(s)

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.2.2.3.

## 26.14.1.4.2 Test purpose

To verify that while in state MM IDLE and service state LIMITED SERVICE:

1. The MS rejects requests from user to respond to notifications for which no channel description has been received in the notification by the RR sub-layer.
2. The MS indicates notifications for which a channel description has been received in the notification.
3. The MS accepts user requests to respond to notifications for which channel description has been received in the notification and goes to the service state RECEIVING GROUP CALL (LIMITED SERVICE).
4. The MS rejects any request of establishing a group call.

## 26.14.1.4.3 Method of test

## Initial Conditions

System Simulator:

1 cell with default parameters for ASCI testing.

Mobile Station:

The MS, with SIM, is in MM-state "idle, limited service" because LA not allowed.

## Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900, DCS 1 800 or PCS 1 900).
- Support VGCS listening.
- Support VBS listening.
- Support VGCS originating.
- Support VBS originating.
- Way to configure VGCS or VBS.
- Way to indicate a call notification.
- Way to accept VGCS or VBS call.
- Way to initiate a normal VGCS/VBS call.

## Foreseen Final State of the MS

"limited service" mode.

## Test Procedure

The MS, with SIM, is in MM idle limited service state because LA is not allowed. The SS sends NOTIFICATION/NCH message containing call reference active in the MS but no VGCS/VBS channel description. It is checked that the MS indicates the notification and rejects the request of joining the notified call. The SS sends NOTIFICATION/NCH message containing call reference active in the MS and VGCS/VBS channel description. It is checked that the MS indicates the notification, and joins the notified call on request. If the MS supports VGCS/VBS originating, the MS is requested to initiate VGCS/VBS call. It is checked that the MS rejects the request.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

| Step             | Direction                  | Message          | Comments                                                                                                                                                                                                                                                 |

## 26.14.2 VGCS-VBS / Paging

## 26.14.2.1 VGCS-VBS / Paging / Paging indication

## 26.14.2.1.1 Conformance requirement

1. Paging into on-going voice group calls shall be provided as an implementation option.
2. In group receive mode the MS shall be ready to receive paging information on the FACCH containing the mobile subscriber identity and the priority level if eMLPP applies.
3. In group transmit mode if the MS has received a paging message with the own mobile station identity on the PCH or on the voice group call channel downlink, the RR entity shall provide an indication to the upper layers, together with the related priority, if applicable.
4. In group transmit mode if the MS receives information on the voice group call channel of the existence of a paging message in its paging subgroup of the PCH, the RR entity shall pass this information to the upper layers together with the related priority.

## Reference(s)

3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.4.12, 9.1.21a, 3.4.15.1.2.4, 10.5.2.23, 10.5.2.24 and 10.5.2.25.

3GPP TS 03.68 subclause 11.3.1.3c.

3GPP TS 03.69 subclause 11.3.1.3c.

## 26.14.2.1.2 Test purpose

It is checked that:

1. When the MS in group receive mode if a NOTIFICATION/FACCH message on the voice group call channel containing in-band paging information is received, the MS provides an indication with the correct priority if applicable.
2. When the MS in group receive mode if a paging message with the own mobile station identity on PCH is received, it provides an indication with the correct priority.

3. When the MS in group transmit mode if a NOTIFICATION/FACCH message on the voice group call channel containing in-band paging information is received, the MS provides an indication with the correct priority.
4. If the MS in group transmit mode if a paging message with the own mobile station identity on PCH is received, it provides an indication with the correct priority.

#### 26.14.2.1.3 Method of test

##### Initial Conditions

System Simulator:

1 cell with default parameters for ASCI testing.

Mobile Station:

No automatic answering configured.

##### Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM , DCS 1 800 or PCS 1 900).
- Support VGCS talking.
- Support VBS originating.
- Support eMLPP.
- Support monitoring on PCH in group transmit mode.
- Way to configure VGCS or VBS.
- Way to request uplink.

##### Foreseen Final State of the MS

"Idle, updated".

##### Test Procedure

The MS is in group receive mode. The SS sends NOTIFICATION/FACCH message containing Paging Information IE which addresses the MS. It is checked that the MS indicates the paging information.

The SS changes SI 6 indicating no support of in-band paging. After waiting 5 s. the SS sends a PAGING REQUEST TYPE 1 message addressing the MS on the paging sub-channel of the MS. It is checked that the MS indicates the paging information, together with the priority level if it supports eMLPP. The test procedure is repeated for sending PAGING REQUEST TYPE 2 and PAGING REQUEST TYPE 3 messages.

The same test procedure is repeated for the MS in group transmit mode if supporting VGCS talking or VBS originating.

##### Maximum Duration of Test

5 minutes.

##### Expected Sequence

If the MS mode supports VGCS talking or VBS originating the test sequence is repeated once for k=2. If the MS supports monitoring PCH in group transmit mode steps 5 - 17 for k=2 are executed.

| Step                 | Direction                  | Message                            | Comments                                                                                                                                                                                                               |

## 26.14.2.2 VGCS-VBS / Paging / Notification

## 26.14.2.2.1 Conformance requirement

A PAGING REQUEST TYPE 1 message may have an additional notification coded in the P1 rest octets information element. It allows to notify the mobile an emergency group or broadcast call even when the MS at the moment does not monitor the NCH channel.

## Reference(s)

3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.3.2.1, 3.3.3.1 and 10.5.2.23.

## 26.14.2.2.2 Test purposes

To verify that:

1. the MS in idle mode indicates correctly an incoming broadcast or group call when having received a PAGING REQUEST TYPE 1 message whose P1 rest octets information element contains group call information addressing the MS.

2. the MS in group receive mode indicates correctly an incoming broadcast or group call when having received a PAGING REQUEST TYPE 1 message whose P1 rest octets information element contains group call information addressing the MS.

#### 26.14.2.2.3 Method of test

##### Initial Conditions

###### System Simulator:

1 cell with default parameters for ASCII testing.

###### Mobile Station:

The MS is in MM-state "idle, updated" with a TMSI allocated.

##### Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900, DCS 1 800 or PCS 1 900).
- Support VGCS listening.
- Support VGCS talking.
- Support VBS listening.
- Support VBS originating.
- Way to configure VGCS or VBS.
- Way to indicate a call notification.
- Way to accept a VGCS or VBS.
- Way to verify the downlink speech path.

##### Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

##### Test Procedure

The MS is in idle mode. The SS sends in the NCH block only access grant messages. The SS sends a PAGING REQUEST TYPE 1 message on the paging sub-channel of the MS. The Mobile Identity in the message does not address the MS. The P1 rest octets in the message contains VGCS/VBS channel description and VGCS/VBS call reference not active in the MS. It is checked that the MS ignores the paging message. Similarly, the SS sends again the PAGING REQUEST TYPE 1 message on the paging sub-channel of the MS, not addressing the MS. The message contains VGCS/VBS channel description and VGCS/VBS call reference active in the MS. It is checked that the MS indicates correctly the notified group call reference(s) and joins VGCS/VBS call on request of responding to the notification. The group call is terminated. The SS sends PAGING REQUEST TYPE 1 message on the paging sub-channel of the MS which contains the "good reference" but no VGCS/VBS channel description. The Mobile Identity in the message does not address the MS. It is checked that the MS indicates correctly the notified group call reference(s) and establishes a RR connection to respond to the notification on request of responding to the call, then joins the call. The group call is terminated.

The initial conditions for SS are set to the same as ASCII default. The MS is brought to group receive mode the test procedure is repeated once.

##### Maximum Duration of Test

5 minutes.

## Expected Sequence

Test steps 0 to 19 are executed for k=1, 2.

| Step | Direction | Message               | Comments                                                                                                                                                                                                                                                                                                                                                                                            |

## 26.14.3 VGCS-VBS / RR Procedures

### 26.14.3.1 VGCS-VBS / RR Procedures / frequency redefinition

#### 26.14.3.1.1 Conformance requirements

The MS, after receiving a FREQUENCY REDEFINITION message in group transmit mode, shall start using the new frequencies and hopping sequence in the correct time slot.

#### References

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.4.5.

#### 26.14.3.1.2 Test purpose

To verify that after receiving a FREQUENCY REDEFINITION message in group transmit mode, the MS starts using the new frequencies and hopping sequence at the time indicated in the message.

#### 26.14.3.1.3 Method of test

#### Initial Conditions

##### System Simulator:

1 cell, CCCH\_CONF set to 1 basic physical channel used for CCCH, not combined with SDCCHs. The cell allocation is set to CA<sub>450</sub>(1), CA<sub>480</sub>(1), CA<sub>P GSM</sub>(1), CA<sub>DCS</sub>(1), CA<sub>PCS</sub>(1), CA<sub>700</sub>(1) or CA<sub>850</sub>(1), depending on the band of operation of the Mobile Station (See PICS/PIXIT), before each execution of this test.

##### Mobile Station:

The MS is in group transmit mode.

#### Related PICS/PIXIT Statements

- Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or - PCS 1 900).
- Support VGCS talking.
- Support VBS originating.
- Way to configure VGCS or VBS.

- Way to accept a VGCS or VBS.

#### Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

#### Test Procedure

Test parameters:

#### **GSM 450:**

$Ca_{450}(1)$  is set to 32.

An arbitrary subset  $CA_{450}(1)$  of the set  $\{259, \dots, 293\}$  containing  $ca_{450}(1)$  elements is drawn.

An element B of the set  $CA_{450}(1)$  is arbitrarily chosen.

An arbitrary value  $ca_{450}(2)$  in the range 17, ..., 31 is chosen.

An arbitrary subset  $CA_{450}(2)$  of the set  $\{259, \dots, 293\}$  with  $ca_{450}(2)$  elements and containing B is chosen.

For  $j = 1, 2$ , values  $ma_{450}(j)$  in the range  $j, \dots, ca_{450}(j)-1$  and values  $MAIO_{450}(j)$  in the range  $0, \dots, ma_{450}(j)-1$  are arbitrarily chosen.

Subsets  $MA_{450}(j)$  of  $CA_{450}(j)$  not containing B and having  $ma(j)$  elements are arbitrarily chosen.

#### **GSM 480:**

$Ca_{480}(1)$  is set to 32.

An arbitrary subset  $CA_{480}(1)$  of the set  $\{306, \dots, 340\}$  containing  $ca_{480}(1)$  elements is drawn.

An element B of the set  $CA_{480}(1)$  is arbitrarily chosen.

An arbitrary value  $ca_{480}(2)$  in the range 17, ..., 31 is chosen.

An arbitrary subset  $CA_{480}(2)$  of the set  $\{306, \dots, 340\}$  with  $ca_{480}(2)$  elements and containing B is chosen.

For  $j = 1, 2$ , values  $ma_{480}(j)$  in the range  $j, \dots, ca_{480}(j)-1$  and values  $MAIO_{480}(j)$  in the range  $0, \dots, ma_{480}(j)-1$  are arbitrarily chosen.

Subsets  $MA_{480}(j)$  of  $CA_{480}(j)$  not containing B and having  $ma(j)$  elements are arbitrarily chosen.

#### **GSM 900:**

$ca_{PGSM}(1)$  is set to 64.

An arbitrary subset  $CA_{PGSM}(1)$  of the set  $\{1, \dots, 124\}$  containing  $ca_{PGSM}(1)$  elements is drawn.

An element B of the set  $CA_{PGSM}(1)$  is arbitrarily chosen.

An arbitrary value  $ca_{PGSM}(2)$  in the range 20, ..., 63 is chosen.

An arbitrary subset  $CA_{PGSM}(2)$  of the set  $\{1, \dots, 124\}$  with  $ca_{PGSM}(2)$  elements and containing B is chosen.

For  $j = 1, 2$ , values  $ma_{PGSM}(j)$  in the range  $j, \dots, ca_{PGSM}(j)-1$  and values  $MAIO_{PGSM}(j)$  in the range  $0, \dots, ma_{PGSM}(j)-1$  are arbitrarily chosen.

Subsets  $MA_{PGSM}(j)$  of  $CA_{PGSM}(j)$  not containing B and having  $ma(j)$  elements are arbitrarily chosen.

#### **DCS 1 800:**

$ca_{DCS}(1)$  is set to 64.

An arbitrary subset  $CA_{DCS}(1)$  of the set  $\{700, \dots, 812\}$  containing  $ca_{DCS}(1)$  elements is chosen.

An element B of the set  $CA_{DCS}(1)$  is arbitrarily chosen.  $CA_{DCS}(1)$  is then coded using the Variable Bit Map coding scheme.

An arbitrary value  $ca_{DCS}(2)$  in the range 17,...,63 is chosen.

An arbitrary subset  $CA_{DCS}(2)$  of the set {700,...,812} with  $ca_{DCS}(2)$  elements and containing B is chosen.  $CA_{DCS}(2)$  is then coded using the Variable Bit Map coding scheme.

For  $j = 1,2$ , values  $ma_{DCS}(j)$  in the range  $j, \dots, ca_{DCS}(j)-1$  and values  $MAIO_{DCS}(j)$  in the range  $0, \dots, ma_{DCS}(j)-1$  are arbitrarily chosen.

Subsets  $MA_{DCS}(j)$  of  $CA_{DCS}(j)$  not containing B and having  $ma_{DCS}(j)$  elements are arbitrarily chosen.

#### PCS 1 900:

$ca_{PCS}(1)$  is set to 64.

An arbitrary subset  $CA_{PCS}(1)$  of the set {700,...,812} containing  $ca_{PCS}(1)$  elements is chosen.

An element B of the set  $CA_{PCS}(1)$  is arbitrarily chosen.  $CA_{PCS}(1)$  is then coded using the Variable Bit Map coding scheme.

An arbitrary value  $ca_{PCS}(2)$  in the range 17,...,63 is chosen.

An arbitrary subset  $CA_{PCS}(2)$  of the set {700,...,812} with  $ca_{PCS}(2)$  elements and containing B is chosen.  $CA_{PCS}(2)$  is then coded using the Variable Bit Map coding scheme.

For  $j = 1,2$ , values  $ma_{PCS}(j)$  in the range  $j, \dots, ca_{PCS}(j)-1$  and values  $MAIO_{PCS}(j)$  in the range  $0, \dots, ma_{PCS}(j)-1$  are arbitrarily chosen.

Subsets  $MA_{PCS}(j)$  of  $CA_{PCS}(j)$  not containing B and having  $ma_{PCS}(j)$  elements are arbitrarily chosen.

#### GSM 700:

$ca_{700}(1)$  is set to 64.

An arbitrary subset  $CA_{700}(1)$  of the set {438,...,511} containing  $ca_{700}(1)$  elements is drawn.

An element B of the set  $CA_{700}(1)$  is arbitrarily chosen.

An arbitrary value  $ca_{700}(2)$  in the range 457,...,500 is chosen.

An arbitrary subset  $CA_{700}(2)$  of the set {438,...,511} with  $ca_{700}(2)$  elements and containing B is chosen.

For  $j = 1,2$ , values  $ma_{700}(j)$  in the range  $j, \dots, ca_{700}(j)-1$  and values  $MAIO_{700}(j)$  in the range  $0, \dots, ma_{PGSM}(j)-1$  are arbitrarily chosen.

Subsets  $MA_{700}(j)$  of  $CA_{700}(j)$  not containing B and having  $ma(j)$  elements are arbitrarily chosen.

#### GSM 850:

$ca_{850}(1)$  is set to 64.

An arbitrary subset  $CA_{850}(1)$  of the set {128,...,251} containing  $ca_{850}(1)$  elements is drawn.

An element B of the set  $CA_{850}(1)$  is arbitrarily chosen.

An arbitrary value  $ca_{850}(2)$  in the range 147,...,200 is chosen.

An arbitrary subset  $CA_{850}(2)$  of the set {128,...,251} with  $ca_{850}(2)$  elements and containing B is chosen.

For  $j = 1,2$ , values  $ma_{850}(j)$  in the range  $j, \dots, ca_{850}(j)-1$  and values  $MAIO_{850}(j)$  in the range  $0, \dots, ma_{850}(j)-1$  are arbitrarily chosen.

Subsets  $MA_{850}(j)$  of  $CA_{850}(j)$  not containing B and having  $ma(j)$  elements are arbitrarily chosen.

**DCS 1 800, GSM 900, GSM 450, GSM 480, PCS 1 900, GSM 700 and GSM 850**

An arbitrary value T in the range 92,...,29999 is chosen.

The MS is brought into group transmit mode. The SS sends a FREQUENCY REDEFINITION message. It is checked that the MS uses the new frequencies/hopping sequence at the TDMA frame defined by the contents of the "Starting Time" information element. (The range for T ensures that the MS does not start transmission on the new frequencies until the designated frame.)

The check is performed at the RF burst level. The SS checks the received pattern with the expected pattern, and the SS checks for each burst whether the burst is transmitted at the right frequency.

**Maximum Duration of Test**

T + 7

**Expected Sequence**

## 26.14.3.2 VGCS-VBS / RR Procedures / assignment

## 26.14.3.2.1 Conformance requirements

1. Upon receipt of the ASSIGNMENT COMMAND message in group transmit mode, the mobile station shall initiate a local end release of link layer connections, disconnect the physical channels, command the switching to the assigned channels and initiate the establishment of lower layer connections (this includes the activation of the channels, their connection and the establishment of the main signalling links).
2. MM-messages and CM-messages using SAPI=0 sent from the mobile station to the network shall be duplicated by the data link layer in the following case:

A channel change of dedicated channels is required (assignment or handover procedure) and the last layer 2 frame has not been acknowledged by the peer data link layer before the mobile station leaves the old channel.

In this case, the mobile station does not know whether the network has received the message correctly. Therefore, the mobile station shall send the message again after the new dedicated channel is established.

3. An ASSIGNMENT COMMAND message may indicate a frequency change in progress, with a starting time and possibly alternative channel descriptions.

In the case of the reception of an ASSIGNMENT COMMAND message which contains only the description of a channel to be used after the starting time, and if the starting time has not already elapsed, the mobile station shall wait up to the starting time before accessing the channel.

4. The MS shall apply the hopping frequencies specified in ASSIGNMENT COMMAND message in the Mobile Allocation IE or the Frequency List IE at the time of accessing the new channel using the last received Cell Allocation.
5. After receipt of the ASSIGNMENT COMMAND the MS shall perform the assignment and return an ASSIGNMENT COMPLETE without undue delay.
6. On the mobile station side, if a lower layer failure happens on the new channel before the ASSIGNMENT COMPLETE message has been sent, the mobile station deactivates the new channels, reactivates the old channels, reconnects the TCHs if any and triggers the establishment of the main signalling link. It then sends a ASSIGNMENT FAILURE message, cause "protocol error unspecified" on the main DCCH and resumes the normal operation, as if no assignment attempt had occurred. The operational parameters (e.g. ciphering mode) when returning on the old channel are those applied before the procedure.

### 26.14.3.2.2 Test purpose

1. To verify that upon receipt of an ASSIGNMENT COMMAND in group transmit mode, the MS switches to the channel defined in the ASSIGNMENT COMMAND, establishes the link and sends an ASSIGNMENT COMPLETE message.
  - 1.1 from non-hopping TCH/F to hopping TCH/F using a different timeslot;
  - 1.2 from hopping TCH/F to non-hopping TCH/F using a different timeslot.
2. To verify that the MS, supporting TCH, having sent an MM- or CM message which was not acknowledged on L2 before the channel assignment procedure was initiated and before the MS has left the old channel, repeats that message after completion of the assignment procedure without incrementing N(SD). This is tested in the special case of MM message AUTHENTICATION RESPONSE.
3. To verify that, if the MS has received an ASSIGNMENT COMMAND message which contains only the description of a channel to be used after the starting time, and if the starting time has not already elapsed, the mobile station waits up to the starting time before accessing the channel.
4. To verify that the MS having received an ASSIGNMENT COMMAND, correctly decodes the Mobile Allocation and Frequency List IEs for frequency hopping and applies the specified frequencies using the correct Cell Allocation.
5. To verify that after receipt of the ASSIGNMENT COMMAND the MS returns an ASSIGNMENT COMPLETE without undue delay.
6. To test that, when the MS fails to seize the new channel, the MS reactivates the old channel.

### 26.14.3.2.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, default parameters except:

GSM 450:

- BCCH ARFCN =263.
- Throughout the test, the CA broadcast in System Information 1 is (259, 261, 263, 265, 267, 269, 271, 273, 275, 277).
- Note that the actual CA of the cell contains other frequencies.

GSM 480:

- BCCH ARFCN =310.
- Throughout the test, the CA broadcast in System Information 1 is (306, 308, 310, 312, 314, 316, 318, 320, 322, 324).
- Note that the actual CA of the cell contains other frequencies.

## GSM 900:

- BCCH ARFCN =20.
- Throughout the test, the CA broadcast in System Information 1 is (10, 17, 20, 26, 34, 42, 45, 46, 52, 59).
- Note that the actual CA of the cell contains other frequencies.

## DCS 1 800:

- BCCH ARFCN =747.
- Throughout the test, the CA broadcast in System Information 1 is (734, 741, 747, 754, 759, 766, 773, 775, 779, 782).
- Note that the actual CA of the cell contains other frequencies.

## PCS 1 900:

- BCCH ARFCN =647.
- Throughout the test, the CA broadcast in System Information 1 is ((634, 641, 647, 654, 659, 666, 673, 675, 679, 682).
- Note that the actual CA of the cell contains other frequencies.

## GSM 700:

- BCCH ARFCN = 457.
- Throughout the test, the CA broadcast in System Information 1 is (447, 454, 457, 463, 471, 479, 482, 483, 489, 496).
- Note that the actual CA of the cell contains other frequencies.

## GSM 850:

- BCCH ARFCN =147.
- Throughout the test, the CA broadcast in System Information 1 is (137, 144, 147, 153, 161, 169, 172, 173, 179, 186).
- Note that the actual CA of the cell contains other frequencies.

## Mobile Station:

The MS is in group transmit mode.

## Related PICS/PIXIT Statements

- Support VGCS talking.
- Support VBS originating.
- Way to configure VGCS or VBS.
- Way to initiate a VBS call.

## Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

## Test Procedure

The MS is brought into group transmit mode. A hopping channel is assigned with ASSIGNMENT COMMAND, which includes a Starting Time IE. It is checked that the MS switches to the assigned channel at the time specified in Starting Time IE, establishes the link and sends an ASSIGNMENT COMPLETE message.

Then the SS sends a AUTHENTICATION REQUEST message. The MS shall answer with an AUTHENTICATION RESPONSE message, which is not acknowledged on L2 by the SS. Immediately after the AUTHENTICATION RESPONSE message is received, the SS sends an ASSIGNMENT COMMAND. It is checked that the MS switches to the assigned channel, establishes the link with the commanded power level, sends as ASSIGNMENT COMPLETE message and then MS repeats the AUTHENTICATION RESPONSE message, with the same N(SD) value.

Then the SS sends an ASSIGNMENT COMMAND, but the SS does not activate the specified new channel. It is checked that the MS re-establishes the old channel and sends ASSIGNMENT FAILURE message on the old channel.

## Maximum Duration of Test

30 s.

## Expected Sequence

| Step | Direction | Message                 | Comments                                                                                                                                                                 |
|------|-----------|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                         | the MS is in group transmit mode.                                                                                                                                        |
| 2    | SS -> MS  | ASSIGNMENT COMMAND      | See specific message contents.                                                                                                                                           |
| 3    | MS -> SS  | ASSIGNMENT COMPLETE     | Sent on the correct channel after establishment of the main signalling link. This message shall be ready to be transmitted before 600 ms after the completion of step 2. |
| 4    | SS        |                         | The SS checks that the MS reports the requested power level in the layer 1 header of the SACCH message that is sent in the first SACCH multiframe following the SABM.    |
| 5    | SS -> MS  | AUTHENTICATION REQUEST  |                                                                                                                                                                          |
| 6    | MS -> SS  | AUTHENTICATION RESPONSE | This message is not L2 acknowledged by the SS.                                                                                                                           |
| 7    | SS -> MS  | ASSIGNMENT COMMAND      | See specific message contents.                                                                                                                                           |
| 8    | MS -> SS  | ASSIGNMENT COMPLETE     | Sent on the correct channel after establishment of the main signalling link. This message shall be ready to be transmitted before 600 ms after the completion of step 7. |
| 9    | MS -> SS  | AUTHENTICATION RESPONSE | N(SD) shall be the same as in step 6.                                                                                                                                    |
| 10   | SS -> MS  | ASSIGNMENT COMMAND      | See specific message contents, the SS does not activate the new channel. The MS attempts (and fails) to establish a signalling link on the new channel.                  |
| 11   | MS        |                         | The MS re-establishes the signalling link on the old channel.                                                                                                            |
| 12   | MS -> SS  | ASSIGNMENT FAILURE      | RR cause value = "protocol error unspecified".                                                                                                                           |
| 13   | SS -> MS  | UPLINK RELEASE          |                                                                                                                                                                          |
| 14   | SS -> MS  | CHANNEL RELEASE         | UI format, the main signalling link is released.                                                                                                                         |

26.14.3.3 VGCS-VBS / RR Procedures / handover / successful in group transmit mode

This clause deals with signalling tests in non-synchronised handover in successful case.

Table 26.14.3.3.1 contains a summary of the different combinations of parameters which have to be tested. For execution counter=3, the target channel is dedicated mode.

Table 26.14.3.3.1

| From         | To           | Timing Adv. | Start Time | Sync ? | State of call     | Exec Counter |
|--------------|--------------|-------------|------------|--------|-------------------|--------------|
| TCH/F, no FH | TCH/F, no FH | 20          | 1,1s       | no     | group trans. mode | 1            |
| TCH/F, no FH | TCH/F, FH    | arbitrary   | none       | no     | group trans. mode | 2            |
| TCH/F, FH    | TCH/F, no FH | 20          | none       | no     | group trans. mode | 3            |

26.14.3.3.1 Conformance requirements

The MS shall correctly apply the handover procedure in the non-synchronised case when in group call transmit mode and when handover is performed from a traffic channel with/without frequency hopping towards a traffic channel with/without frequency hopping.

References

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.4.4.

26.14.3.3.2 Test purpose

To verify that:

1. When the MS is ordered to make a non-synchronised handover it continuously sends access bursts on the main DCCH until it receives a PHYSICAL INFORMATION message from the SS.
2. The MS correctly handles the values of any Starting Time IE in the HANDOVER COMMAND message in the case when none of the information elements referring to before the starting time are present.
3. The MS correctly handles the Timing Advance IE in the PHYSICAL INFORMATION message.
4. The MS activates the new channel correctly and transmits the HANDOVER COMPLETE message without undue delay.

## 26.14.3.3.3 Method of test

## Initial Conditions

System Simulator:

2 cells, A and B with same LAI, default parameters except:

**GSM 450:**

Cell A has:

BCCH ARFCN = 263

Cell Allocation = (259, 261, 263, 265, 267, 269, 271, 273, 275, 277, 279, 281, 283, 285, 287, 289, 291)

Cell B has:

BCCH ARFCN = 274

Cell Allocation = (260, 262, 264, 266, 268, 270, 272, 274, 276, 279, 281, 283, 285, 287, 289, 291)

The frame numbers of cells A and B shall be different by 100.

The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

**GSM 480:**

Cell A has:

BCCH ARFCN = 310

Cell Allocation = (306, 308, 310, 312, 314, 316, 318, 320, 322, 324, 326, 328, 330, 332, 334, 336, 338)

Cell B has:

BCCH ARFCN = 321

Cell Allocation = (307, 309, 311, 313, 315, 317, 319, 321, 323, 326, 328, 330, 332, 334, 336, 338)

The frame numbers of cells A and B shall be different by 100.

The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

**GSM 900:**

Cell A has:

BCCH ARFCN = 20

Cell Allocation = (10, 17, 20, 26, 34, 42, 45, 46, 52, 59, 66, 73, 74, 75, 76, 108, 114)

Cell B has:

BCCH ARFCN = 40

Cell Allocation = (14, 18, 22, 24, 30, 31, 38, 40, 60, 66, 73, 74, 75, 76, 108, 114)

The frame numbers of cells A and B shall be different by 100.

The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

**DCS 1 800:**

Cell A has:

BCCH ARFCN = 747

Cell Allocation = (734, 741, 747, 754, 759, 762, 766, 767, 773, 775, 779, 782, 791, 798, 829, 832, 844)

Cell B has:

BCCH ARFCN = 764

Cell Allocation = (739, 743, 746, 749, 756, 758, 761, 764, 771, 779, 782, 791, 798, 829, 832, 844)

The Cell Allocation of both Cell A and Cell B shall be coded using range 256 format.

The frame numbers of cells A and B shall be different by 100.

The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

**PCS 1 900:**

Cell A has:

BCCH ARFCN = 647

Cell Allocation = (634, 641, 647, 654, 659, 662, 666, 667, 673, 675, 679, 682, 691, 698, 729, 732, 744)

Cell B has:

BCCH ARFCN = 664

Cell Allocation = (639, 643, 646, 649, 656, 658, 661, 664, 671, 679, 682, 691, 698, 729, 732, 744)

The Cell Allocation of both Cell A and Cell B shall be coded using range 256 format.

The frame numbers of cells A and B shall be different by 100.

The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

**GSM 700:**

Cell A has:

BCCH ARFCN = 457.

Cell Allocation = (447, 454, 457, 463, 471, 479, 482, 483, 489, 496, 498, 500, 501, 502, 503, 506, 508).

Cell B has:

BCCH ARFCN = 477.

Cell Allocation = (451, 455, 459, 461, 467, 468, 475, 477, 497, 498, 500, 501, 502, 503, 506, 508).

The frame numbers of cells A and B shall be different by 100.

The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

**GSM 850:**

Cell A has:

BCCH ARFCN = 147.

Cell Allocation = (137, 144, 147, 153, 161, 169, 172, 173, 179, 186, 193, 200, 201, 202, 203, 235, 241).

Cell B has:

BCCH ARFCN = 167.

Cell Allocation = (141, 145, 149, 151, 157, 158, 165, 167, 187, 193, 200, 201, 202, 203, 235, 241).

The frame numbers of cells A and B shall be different by 100.

The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

Mobile Station:

The MS is in group transmit mode on cell A.

#### Related PICS/PIXIT Statements

- Type of Mobile Station (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).
- Support VGCS talking.
- Support VBS originating.
- Way to configure VGCS or VBS.
- Way to request uplink.
- Way to initiate VBS call.

#### Foreseen Final State of the MS

idle mode on cell B.

#### Test Procedure

This procedure is repeated for execution counter M = 1 to 3.

The MS is in group transmit mode. The SS sends a HANOVER COMMAND. The MS (at the time defined by the Starting Time information element, if included in the message) begins to send access bursts on the new DCCH of the target cell. The SS observes the access bursts and after receiving n (n being arbitrarily chosen between 10 - 20) access bursts, the SS sends one PHYSICAL INFORMATION message with an arbitrary Timing Advance. It is checked that the MS activates the new channel in sending and receiving mode, and it is checked that the MS is ready to transmit a HANOVER COMPLETE message, before "x" MS after the end of the PHYSICAL INFORMATION message, but not before a UA frame has been sent by the SS.

The term "ready to transmit" is defined in 3GPP TS 04.13. The value of "x" depends upon the target channel and is specified in the specific message contents clause.

#### Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

## Expected Sequence

This sequence is performed for execution counter M = 1, 2, 3.

| Step | Direction | Message              | Comments                                                                                                                                                                                                                                                                                                                                                                                                           |

Step 7: The MS and SS are using a full rate TCH in non-hopping mode on cell B.

### 26.14.3.4 VGCS-VBS / RR Procedures / handover / successful at group call establishment

This clause deals with signalling in the Handover/successful/group call establishment/non synchronised case. This subclause is aligned with subclause 26.6.5.2 ( $M = 1$  and  $M = 8$ ).

Table 26.14.3.4.1 contains a summary of the different combinations of parameters which have to be tested. If a test uses a channel rate which the MS under test does not support, the test shall be skipped.

**Table 26.14.3.4.1**

| From           | To           | Timing Adv. | Start Time | Sync | State of call                         | Exec Counter |
|----------------|--------------|-------------|------------|------|---------------------------------------|--------------|
| SDCCH/4, no FH | TCH/F, FH    | 20          | none       | no   | group or broadcast call establishment | 1            |
| SDCCH/8, FH    | TCH/F, no FH | 20          | 1,1s       | no   | group or broadcast call establishment | 2            |

**Table 26.14.3.4.2**

|    | TCH/FS                   | SDCCH |
|----|--------------------------|-------|
| n  | 10-20                    | 2-5   |
| n: | number of access bursts. |       |

#### 26.14.3.4.1 Conformance requirements

In dedicated mode or group transmit mode, an intercell or intracell change of channel(s) can be requested by the network RR sublayer. This changed may be performed through the handover procedure.

The purpose of the handover procedure is to completely modify the channels allocated to the mobile station e.g. when the cell is changed. A change in the channel configuration nature is possible. This procedure is used only while in dedicated mode or group transmit mode.

#### References

3GPP TS 04.08 / 3GPP TS 44.018, subclauses 3.4.4 and 9.1.15.

3GPP TS 04.13, subclause 5.2.6.2.

#### 26.14.3.4.2 Test purpose

To verify that:

1. The MS correctly applies the handover procedure from non frequency hopping SDCCH/4 to TCH/F with frequency hopping in the non-synchronized case during group or broadcast call establishment.
2. The mobile correctly applies the handover procedures from SDCCH/8with frequency hopping to TCH/F without frequency hopping in the non-synchronized case during group or broadcast call establishment.

3. If during call establishment a Layer 3 MM or CC message just sent by the MS is not Layer 2 acknowledged before the channel change caused by the HANDOVER COMMAND message, the MS sends the Layer 3 message to the new cell, using the same value in the N(SD) field, after the handover procedure.

#### 26.14.3.4.3 Method of test

##### Initial Conditions

System Simulator:

2 cells A and B with same LAI, default parameters, except:

##### GSM 450:

Cell A has:

BCCH ARFCN = 263

Cell Allocation = (259, 261, 263, 265, 267, 269, 271, 273, 275, 277, 279, 281, 283, 285, 287, 289, 291)

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

Cell B has:

BCCH ARFCN = 274

Cell Allocation = (260, 262, 264, 266, 268, 270, 272, 274, 276, 279, 281, 283, 285, 287, 289, 291)

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SI 1 messages containing the complete Cell Allocation of the cell, using Range 128 format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

For execution counter M = 1 a combined CCH/SDCCH is used.

For execution counter M = 2 a non combined SDCCH is used.

##### GSM 480:

Cell A has:

BCCH ARFCN = 310

Cell Allocation = (306, 308, 310, 312, 314, 316, 318, 320, 322, 324, 326, 328, 330, 332, 334, 336, 338)

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

Cell B has:

BCCH ARFCN = 321

Cell Allocation = (307, 309, 311, 313, 315, 317, 319, 321, 323, 326, 328, 330, 332, 334, 336, 338)

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SI 1 messages containing the complete Cell Allocation of the cell, using Range 128 format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

For execution counter  $M = 1$  a combined CCH/SDCCH is used.

For execution counter  $M = 2$  a non combined SDCCH is used.

#### GSM 900:

Cell A has:

BCCH ARFCN = 20

Cell Allocation = (10, 17, 20, 26, 34, 42, 45, 46, 52, 59, 66, 73, 74, 75, 76, 108, 114)

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

Cell B has:

BCCH ARFCN = 40

Cell Allocation = (14, 18, 22, 24, 30, 31, 38, 40, 60, 66, 73, 74, 75, 76, 108, 114)

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SI 1 messages containing the complete Cell Allocation of the cell, using bit map 0 format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

For execution counter  $M = 1$  a combined CCH/SDCCH is used.

For execution counter  $M = 2$  a non combined SDCCH is used.

#### DCS 1 800:

Cell A has:

BCCH ARFCN = 747

Cell Allocation = (734, 741, 747, 754, 759, 762, 766, 767, 773, 775, 779, 782, 791, 798, 829, 832, 844)

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

Cell B has:

BCCH ARFCN = 764

Cell Allocation = ( 739, 743, 746, 749, 756, 758, 761, 764, 771, 779, 782, 791, 798, 829, 832, 844)

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SI 1 messages containing the complete Cell Allocation of the cell, using Range 512 format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

For execution counter  $M = 1$  a combined CCH/SDCCH is used.

For execution counter  $M = 2$  a non combined SDCCH is used.

## PCS 1 900:

Cell A has:

BCCH ARFCN = 647

Cell Allocation = (634, 641, 647, 654, 659, 662, 666, 667, 673, 675, 679, 682, 691, 698, 729, 732, 744)

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

Cell B has:

BCCH ARFCN = 664

Cell Allocation = (639, 643, 646, 649, 656, 658, 661, 664, 671, 679, 682, 691, 698, 729, 732, 744)

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SI 1 messages containing the complete Cell Allocation of the cell, using Range 512 format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

For execution counter M = 1 a combined CCH/SDCCH is used.

For execution counter M = 2 a non combined SDCCH is used.

## GSM 700:

Cell A has:

BCCH ARFCN = 457.

Cell Allocation = (447, 454, 457, 463, 471, 479, 482, 483, 489, 496, 498, 500, 501, 502, 503, 506, 508).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

Cell B has:

BCCH ARFCN = 477.

Cell Allocation = (451, 455, 459, 461, 467, 468, 475, 477, 497, 498, 500, 501, 502, 503, 506, 508).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SI 1 messages containing the complete Cell Allocation of the cell, using 128 range format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

For execution counter M = 1 a combined CCH/SDCCH is used.

For execution counter M = 2 a non combined SDCCH is used.

## GSM 850:

Cell A has:

BCCH ARFCN = 147.

Cell Allocation = (137, 144, 147, 153, 161, 169, 172, 173, 179, 186, 193, 200, 201, 202, 203, 235, 241).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

Cell B has:

BCCH ARFCN = 167.

Cell Allocation = (141, 145, 149, 151, 157, 158, 165, 167, 187, 193, 200, 201, 202, 203, 235, 241).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SI 1 messages containing the complete Cell Allocation of the cell, using 128 range format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

For execution counter M = 1 a combined CCH/SDCCH is used.

For execution counter M = 2 a non combined SDCCH is used.

Mobile Station:

The MS is in MM-state "idle, updated" with a TMSI allocated and camped on cell A.

#### Related PICS/PIXIT Statements

- Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).
- Support VGCS originating.
- Support VBS originating.
- Way to initiate VGCS call.
- Way to initiate VBS call.

#### Foreseen Final State of the MS

"Idle, updated" with TMSI allocated and camped on cell B.

#### Test Procedure

This procedure is repeated for execution counter M = 1 and 2 (see table 26.14.3.4.1).

A VBS call is initiated on cell A by setup procedure if the MS supports VBS only, otherwise a VGCS call is initiated by setup procedure on cell A. After the MS has sent the SETUP message (and before the last L2 frame carrying the SETUP message is acknowledged by the SS) the SS sends a HANDOVER COMMAND message, ordering the MS to switch to cell B. The MS shall then begin to send access bursts on the new DCCH to cell B. The SS observes the access bursts and after receiving n (n being arbitrarily chosen between values according to table 26.14.3.4.2) access bursts, the SS sends one PHYSICAL INFORMATION message with a Timing Advance as specified in table 26.14.3.4.1. It is checked that the MS activates the new channel and the MS is ready to transmit a HANDOVER COMPLETE message before x ms after the end of the PHYSICAL INFORMATION message, but not before a UA frame has been sent by the SS. It is also checked that the MS sends again the SETUP message with the same value in the N(SD) field.

The term 'ready to transmit' is defined in 3GPP TS 04.13. The value of 'x' depends upon the target channel and is specified in the specific message contents clause.

#### Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

Expected Sequence

The sequence is performed for execution counter M = 1 and 2.

| Step | Direction | Message              | Comments                                                                                                                                        |
|------|-----------|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                      | MMI action, a VBS or a VGCS call is initiated on cell A.                                                                                        |
| 2    | MS -> SS  | CHANNEL REQUEST      |                                                                                                                                                 |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT | See specific message contents.                                                                                                                  |
| 4    | MS -> SS  | CM SERVICE REQUEST   | L2: SABM / UA                                                                                                                                   |
| 5    | MS -> SS  | SETUP                | Last L2 frame not acknowledged by the SS.                                                                                                       |
| 6    | SS -> MS  | HANDOVER COMMAND     | See specific message contents.                                                                                                                  |
| 7    | MS -> SS  | HANDOVER ACCESS      | Repeated on every burst of the uplink main DCCH until reception of PHYSICAL INFORMATION. Handover Reference as included in the HANDOVER COMMAND |
| 8    | SS -> MS  | PHYSICAL INFO        | Sent after reception of n HANDOVER ACCESS message. Timing Advance as specified in table 26.14.3.4.1.                                            |

## 26.14.3.5 VGCS-VBS / RR Procedures / handover / failure

## 26.14.3.5.1 Conformance requirements

After a HANDOVER COMMAND message and subsequent handover failure in group transmit mode, the MS shall return to the old channel.

## References

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.4.4.4.

## 26.14.3.5.2 Test purpose

To verify that after a HANDOVER COMMAND message and subsequent handover failure in group transmit mode, the MS returns to the old channel.

## 26.14.3.5.3 Method of test

## Initial Conditions

System Simulator:

2 cells with same LAI, default parameters.

Mobile Station:

The MS is in group transmit mode on cell A.

## Related PICS/PIXIT Statements

- Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).
- Support VGCS talking.
- Support VBS originating.
- Way to configure VGCS or VBS.
- Way to request uplink.
- Way to initiate VBS call.

## Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

## Test Procedure

The MS is brought to group transmit mode, then the SS sends a HANOVER COMMAND message with Power Command set to 8. The MS begins to send access bursts at the commanded power level on the new DCCH. The SS activates the SACCH, but does not send PHYSICAL INFORMATION (thus causing a time-out of T3124). It is checked that the MS re-establishes the old link and sends a HANOVER FAILURE within 3 s from the transmission of HANOVER COMMAND, using the old power level.

## Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

## Expected Sequence

| Step | Direction | Message         | Comments                                                                                                                                                                                                                                                                                                  |
|------|-----------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                 | the MS is in group transmit mode                                                                                                                                                                                                                                                                          |
| 2    | SS -> MS  | HANOVER COMMAND | Channel description: non-hopping, full rate Power Command: 8. Synchronisation Indication: non synchronised.                                                                                                                                                                                               |
| 3    | MS -> SS  | HANOVER ACCESS  | Several messages are sent, all with correct Handover References.                                                                                                                                                                                                                                          |
| 4    | MS -> SS  | HANOVER FAILURE | Sent on old channel, RR cause value = "Abnormal release, unspecified", "Abnormal release, channel unacceptable", "Abnormal release, timer expired", "Abnormal release, no activity on the radio path" or "Protocol error unspecified". Shall be sent within 3 s from the transmission of HANOVER COMMAND. |
| 5    | SS -> MS  | CHANNEL RELEASE | The MS releases L2 multiple frame link L2:DISC/UA.                                                                                                                                                                                                                                                        |

### 26.14.3.6 VGCS-VBS / RR / Measurement Report

This subclause tests measurement report of the MS in group transmit mode.

#### 26.14.3.6.1 Measurement / all neighbours present

##### 26.14.3.6.1.1 Conformance requirements

In group transmit mode the MS shall continuously send MEASUREMENT REPORT messages on every SACCH blocks and the measurement valid indication shall be set to valid (0) within the second block at the latest.

After 20 s the values in the MEASUREMENT REPORT message shall contain measurement results for the 6 strongest BCCH carriers with known and allowed NCC part of BSIC when the SS gives information of more than 6 neighbouring cells .

#### References

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.4.1.2.

3GPP TS 05.08 subclause 8.4.

##### 26.14.3.6.1.2 Test purpose

To verify that, when the SS gives information of more than 6 neighbouring cells, the MS in group transmit mode reports measurement results for the 6 strongest BCCH carriers with known and allowed NCC part of BSIC.

##### 26.14.3.6.1.3 Method of test

#### Initial Conditions

#### System Simulator:

For GSM 450 or GSM 480: 8 cells with the following settings:

| Transmitter   | Level | NCC | BSCC | ARFCN<br>(GSM 450) | ARFCN<br>(GSM 480) | Cell Identity |
|---------------|-------|-----|------|--------------------|--------------------|---------------|
| Serving, S1   | -60   | 1   | 3    | 260                | 307                | 0001H         |
| Neighbour, N1 | -85   | 1   | 5    | 264                | 311                | 0002H         |
| Neighbour, N2 | -80   | 1   | 7    | 268                | 315                | 0003H         |
| Neighbour, N3 | -75   | 1   | 1    | 272                | 319                | 0004H         |
| Neighbour, N4 | -55   | 1   | 3    | 276                | 323                | 0005H         |
| Neighbour, N5 | -50   | 1   | 5    | 280                | 327                | 0006H         |
| Neighbour, N6 | -45   | 1   | 7    | 284                | 331                | 0007H         |
| Neighbour, N7 | -40   | 1   | 1    | 288                | 335                | 0008H         |

For GSM 900 or DCS 1 800: 8 cells with the following settings:

| Transmitter   | Level | NCC | BSCC | ARFCN<br>(GSM 900) | ARFCN<br>(DCS 1 800) | ARFCN<br>(PCS 1 900) | Cell Identity |
|---------------|-------|-----|------|--------------------|----------------------|----------------------|---------------|
| Serving, S1   | -60   | 1   | 3    | 002                | 514                  | 514                  | 0001H         |
| Neighbour, N1 | -85   | 1   | 5    | 008                | 530                  | 530                  | 0002H         |
| Neighbour, N2 | -80   | 1   | 7    | 014                | 602                  | 602                  | 0003H         |
| Neighbour, N3 | -75   | 1   | 1    | 020                | 665                  | 665                  | 0004H         |
| Neighbour, N4 | -55   | 1   | 3    | 026                | 762                  | 762                  | 0005H         |
| Neighbour, N5 | -50   | 1   | 5    | 032                | 686                  | 686                  | 0006H         |
| Neighbour, N6 | -45   | 1   | 7    | 038                | 549                  | 549                  | 0007H         |
| Neighbour, N7 | -40   | 1   | 1    | 044                | 810                  | 810                  | 0008H         |

For GSM 700 or GSM 850: 8 cells with the following settings:

| Transmitter   | Level | NCC | BSCC | ARFCN<br>(GSM 700) | ARFCN<br>GSM 850) | Cell Identity |
|---------------|-------|-----|------|--------------------|-------------------|---------------|
| Serving, S1   | -60   | 1   | 3    | 439                | 129               | 0001H         |
| Neighbour, N1 | -85   | 1   | 5    | 445                | 135               | 0002H         |
| Neighbour, N2 | -80   | 1   | 7    | 451                | 141               | 0003H         |
| Neighbour, N3 | -75   | 1   | 1    | 457                | 147               | 0004H         |
| Neighbour, N4 | -55   | 1   | 3    | 463                | 153               | 0005H         |
| Neighbour, N5 | -50   | 1   | 5    | 469                | 159               | 0006H         |
| Neighbour, N6 | -45   | 1   | 7    | 475                | 165               | 0007H         |
| Neighbour, N7 | -40   | 1   | 1    | 481                | 171               | 0008H         |

With the exception of the Cell Allocation, the rest of the parameters for all eight cells are the same as the default settings and default SI 1 to 4 message contents for cell A. The Cell Allocation for the serving cell is the same as the default setting for cell A. The Cell Allocations for the neighbour cells need have only one entry, consisting of the ARFCN of that cell's BCCH.

Mobile Station:

The MS is in group transmit mode.

#### Related PICS/PIXIT Statements

- Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).
- Support VGCS talking.
- Support VBS originating.
- Way to initiate VBS call.

#### Foreseen Final State of the MS

group transmit mode.

#### Test Procedure

This test procedure is performed twice.

The MS is in group transmit mode. The SS sends SI 5 and 6 (on the second iteration of the test the SS also sends SI 5bis) on the SACCH. All 8 of the BCCHs are indicated in the BA. It is checked that the MS sends MEASUREMENT REPORTs containing measurement results for the 6 strongest carriers.

#### Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

#### Expected Sequence

This sequence is performed for execution counter,  $k = 1, 2$ .

Since when  $k = 1$ , SI 5, SI 6 and MEASUREMENT REPORT (and when  $k = 2$  an additional SI 5bis is included) are sent continuously, a table is not applicable in this test. The interval between 2 successive Layer 2 frames containing MEASUREMENT REPORTs shall not exceed one Layer 2 frame.

## 26.14.4 VGCS-VBS / Uplink Access and Uplink Reply Procedures

This subclause is applied to the MS supporting VGCS talking.

### 26.14.4.1 VGCS-VBS / Uplink Access / uplink investigation

#### 26.14.4.1.1 Conformance requirement

1. On receipt of a request from the upper layer to access the uplink and the uplink is free the MS shall start the uplink access procedure.
2. The uplink is not free when receipt of request from the upper layer to access the uplink, and before the Timer T3128 expiring the uplink is still not free, the MS shall remain in group receive mode and indicate a reject of the uplink request to the upper layer.

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.3.1.2.1.1.

#### 26.14.4.1.2 Test purpose

To verify that:

1. The MS starts the uplink access procedure on receipt of a request from the user to access the uplink and the uplink is free.
2. The MS remains in group receive mode and indicates a reject of the uplink request to the user till Timer T3128 expiring.

#### 26.14.4.1.3 Method of test

##### Initial Conditions

System Simulator:

1 cell with default parameters for ASCI testing.

Mobile Station:

The MS is in group receive mode.

##### Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900).
- Support VGCS talking.
- Way to configure VGCS.
- Way to indicate uplink granted/rejected.
- Way to accept a VGCS.
- Way to request uplink.

##### Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

##### Test Procedure

The MS is brought into group receive mode. The SS indicates uplink free to the MS. The MS is requested to access uplink by MMI action. It is checked that the MS initiates the uplink access procedure. The request is not granted (a VGCS UPLINK GRANT to irrelevant request reference and an UPLINK BUSY message). It is checked that the MS remains in group receive mode. The MS is requested to access uplink by MMI action. It is checked that the MS does not send UPLINK ACCESS message and indicates uplink access rejected.

##### Maximum Duration of Test

5 minutes.

## 26.14.4.2 Uplink Access / uplink access procedure

## 26.14.4.2.1 Conformance requirement

1. The mobile station shall send UPLINK ACCESS messages on the voice group call channel with the appropriate establishment cause. The first UPLINK ACCESS message shall be transmitted by the mobile station with a random delay between 0 and 20ms. The UPLINK ACCESS messages shall be repeated after a further period of 100ms plus a random delay between 0 and 20ms.
2. At expiration of timer T3130, the mobile station shall repeat the uplink access procedure if the uplink is free. A maximum of three attempts is allowed and after that a rejection of the uplink request is indicated to the upper layers.
3. When receiving a UPLINK BUSY or a VGCS UPLINK GRANT message aimed to another mobile station (i.e. not corresponding to one of its UPLINK ACCESS messages), the mobile station shall stop sending UPLINK ACCESS message and remain in group receive mode and shall indicate a rejection of the uplink request to the upper layers.
4. On receipt of an VGCS UPLINK GRANT message corresponding to one of its UPLINK ACCESS messages, the mobile station stops T3130, stops sending UPLINK ACCESS messages, and establishes the main signalling link with an SABM containing the TALKER INDICATION message in the information field. Controlled early classmark sending shall be performed. If a UA is received containing the message sent, the mobile station enters group transmit mode and indicates the successful seizure of the uplink to the upper layer.
5. If an uplink identity code (UIC) of the current cell has been provided by the network in the UPLINK FREE message, the mobile station shall use this UIC IE for the coding of the UPLINK ACCESS messages. If no UIC is provided, the mobile station shall use the BSIC received from the current cell, for instance from the initial synchronisation.

#### 26.14.4.2.2 Test purpose

To verify that:

1. When a request to talk is made by the user and the uplink has been free the MS in group receive mode sends UPLINK ACCESS messages on the voice group call channel with the appropriate establishment cause.
2. The first UPLINK ACCESS message is transmitted by the MS with a random delay between 0 and 20 ms. The UPLINK ACCESS messages is repeated after a further period of 100ms plus a random delay between 0 and 20 ms.
3. At expiration of timer T3130, the MS repeats the uplink access procedure if the uplink is free and maximum of attempts is three. After three failed attempts a rejection of the uplink request is indicated.
4. The MS stops sending UPLINK ACCESS message and remains in group receive mode and indicates a rejection of the uplink request when receiving a UPLINK BUSY or a VGCS UPLINK GRANT message aimed to another mobile station (i.e., not corresponding to one of its UPLINK ACCESS messages).
5. On receipt of an VGCS UPLINK GRANT message corresponding to one of its UPLINK ACCESS messages, the MS stops T3130, stops sending UPLINK ACCESS messages, and establishes the main signalling link with an SABM containing the TALKER INDICATION message in the information field. Controlled early classmark sending is performed. If a UA is received containing the message sent, the MS enters group transmit mode and indicates the successful uplink seizure.
6. If an uplink identity code (UIC) of the current cell has been provided by the network in the UPLINK FREE message, the mobile station shall use this UIC IE for the coding of the UPLINK ACCESS messages . If no UIC is provided, the mobile station shall use the BSIC received from the current cell, for instance from the initial synchronisation.

#### 26.14.4.2.3 Method of test

##### Initial Conditions

System Simulator:

1 cell with default parameters for ASCII testing.

Mobile Station:

The MS is in group receive mode.

##### Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900).
- Support VGCS talking.
- Way to configure VGCS.
- Way to indicate uplink granted/rejected.
- Way to accept a VGCS.
- Way to request uplink.

##### Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

## Test Procedure

The MS is brought into group receive mode. The SS sends UPLINK FREE without UIC. The MS is made to access uplink. It is checked that the MS initiates uplink access procedure with correct establishment cause and with random delay for transmissions and retransmissions and that the access bursts are coded with BSIC. The SS does not respond to the access request. It is checked that the MS repeats the same procedure three times, after three attempts it indicates access rejection and remains in group receive mode.

The SS sends UPLINK FREE with UIC. The MS is made to access uplink. It is checked that the access bursts are coded with UIC. After the second UPLINK ACCESS message, the SS responds with VGCS UPLINK GRANT aimed to another MS and UPLINK BUSY messages. It is checked that the MS stops sending UPLINK ACCESS, remains in group receive mode and indicates uplink access rejection. The SS sends UPLINK FREE. The MS is made to access uplink. The SS sends a message on the downlink SACCH. It is checked that the MS stops sending UPLINK ACCESS for 10 s, then the SS sends another SACCH message. It is checked that the MS is back to group receive mode and indicates access rejection. The MS is made to access uplink. The SS accepts the request. It is checked that the MS establishes the main signalling link correctly, enters group transmit mode and indicates the successful seizure of uplink.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

| Step | Direction | Message           | Comments                                                                                                                                                                                                            |

### 26.14.4.3 VGCS-VBS / Uplink Reply in VGCS receive mode

This test is applicable to the MS supporting VGCS talking.

#### 26.14.4.3.1 Conformance requirement

1. On receipt of an UPLINK FREE message with an uplink access request indication from the network on the voice group call channel downlink, the mobile station shall send two UPLINK ACCESS messages on the voice group call channel with the appropriate establishment cause and then stop immediately transmitting on the uplink.
2. The first UPLINK ACCESS message shall be transmitted by the mobile station with a random delay between 0 and 20 ms. The second UPLINK ACCESS messages shall be repeated after a further period of 100 ms plus a random delay between 0 and 20 ms.
3. If an uplink identity code (UIC) of the current cell has been provided by the network in the UPLINK FREE message, the mobile station shall use this UIC for the coding of the UPLINK ACCESS messages. If no UIC is provided, the mobile station shall use the BSIC received of the serving cell, for instance as received from the initial synchronisation.

#### Reference(s)

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.4.15.1.3.

#### 26.14.4.3.2 Test purpose

To verify that when the MS is in group receive mode:

1. On receipt of an UPLINK FREE message with an uplink access request indication from the network on the voice group call channel downlink, the MS sends two UPLINK ACCESS messages on the voice group call channel with the appropriate establishment cause and then stops immediately transmitting on the uplink.

2. The first UPLINK ACCESS message is transmitted by the MS with a random delay between 0 and 20 ms. The second UPLINK ACCESS messages is repeated after a further period of 100 ms plus a random delay between 0 and 20 ms.
3. If an uplink identity code (UIC) of the current cell has been provided by the network in the UPLINK FREE message, the MS uses this UIC for the coding of the UPLINK ACCESS messages. If no UIC is provided, the MS uses the BSIC received of the serving cell, for instance as received from the initial synchronisation.

#### 26.14.4.3.3 Method of test

##### Initial Conditions

###### System Simulator:

1 cell with default parameters for ASCII testing.

###### Mobile Station:

The MS is in group receive mode.

##### Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900).
- Support VGCS talking.
- Way to configure VGCS.
- Way to indicate uplink granted/rejected.
- Way to accept a VGCS call.
- Way to request uplink.

##### Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

##### Test Procedure

The MS is in (VGCS) group receive mode. The SS sends UPLINK FREE message with Uplink Access Request Indication Information Element but without UIC Information Element. It is checked that the MS sends two UPLINK ACCESS messages in correct scheduling and the L1 coding of the messages is with BSIC. The SS sends UPLINK FREE containing Uplink Access Request Indication Information Element and UIC Information Element. It is checked that the MS sends two UPLINK ACCESS messages in correct scheduling and the L1 coding of the messages is with UIC.

| 0    | MS        |                 | The MS is in group receive mode.                                                                                                                                                                  |
| 1    | SS -> MS  | UPLINK FREE     | Uplink access request set to 'H'. UIC indication set to 'L'.                                                                                                                                      |
| 2    | MS -> SS  | UPLINK ACCESS   | check that the establishment cause is "Reply on uplink access request" and the L1 coding is with BSIC                                                                                             |
| 3    | MS -> SS  | UPLINK ACCESS   | check that the burst and the one in step 2 is 100ms plus a value between 0 and 20ms, and check that the L1 coding is with BSIC.                                                                   |
| 4    | SS -> MS  | UPLINK FREE     | with "uplink access request indication" and UIC.                                                                                                                                                  |
| 5    | MS -> SS  | UPLINK ACCESS   | check that the establishment cause is "Reply on uplink access request" and the L1 coding is with UIC                                                                                              |
| 6    | MS -> SS  | UPLINK ACCESS   | check that the burst and the one in step 5 is 100ms plus a value between 0 and 20ms; the interval is different from the intervals in step 2 and step 3, and check that the L1 coding is with UIC. |
| 7    | SS -> MS  | CHANNEL RELEASE | UI format.                                                                                                                                                                                        |

## 26.14.5 VGCS-VBS / Leaving Group Receive or Group Transmit Mode

### 26.14.5.1 VGCS-VBS / Leaving group receive mode

#### 26.14.5.1.1 Conformance requirement

In group receive mode:

1. The MS shall return to idle mode and give an indication to the upper layer when it received a CHANNEL RELEASE message of UI format.
2. In sub-state NO CHANNEL for VGCS or RECEIVE MODE ACTIVE for VBS, when  $T_{no\ channel}$  expires, the GCC/BCC entity in the MS shall inform higher layers, ask lower sub-layers to abort resources and enter the idle state.
3. If the upper layer requests to abort group receive mode, the mobile station shall return to idle mode.

Reference(s)

3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.4.15.1.2.6 and 3.4.15.1.4.1.

3GPP TS 04.68 subclauses 6.1.2.1.10 and 6.3.1.1.

3GPP TS 04.69 subclauses 6.1.2.1.10 and 6.3.3.

#### 26.14.5.1.2 Test purpose

To verify that in group receive mode:

1. The MS enters idle mode when it received a CHANNEL RELEASE message of UI format.
2. On user's request to abort group receive mode, the MS returns to idle mode.
3. In sub-state NO CHANNEL for VGCS or RECEIVE MODE ACTIVE for VBS, when  $T_{no\ channel}$  expires the MS aborts resources and enters the idle mode.

## 26.14.5.1.3 Method of test

## Initial Conditions

System Simulator:

1 cell with default parameters for ASCI testing

Mobile Station:

The MS is in group receive mode.

## Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900).
- Support VGCS listening.
- Support VBS listening.
- Way to configure VGCS or VBS.
- Way to indicate a call notification.
- Way to accept a VGCS or VBS.
- Way to verify the downlink speech path.

## Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

## Test Procedure

The MS is in group receive mode. The SS sends CHANNEL RELEASE. It is checked that the MS returns to idle mode by sending PAGING REQUEST. The MS is brought into group receive mode. The MS is requested to stop VGCS/VBS listening by MMI action. It is checked that the MS returns to idle mode. The MS is brought into group receive mode again. The SS stops downlink transmissions on VGCS/VBS downlink channel. It is checked that the MS returns to idle mode after  $T_{no\ channel}$  times out (3 s after the SS stops downlink transmission).

## Maximum Duration of Test

5 minutes.

## Expected Sequence

| 20   | SS -> MS  | IMMEDIATE ASSIGNMENT REJECT | the first "request reference" corresponds to the CHANNEL REQUEST sent by the MS.                                                             |

## 26.14.5.2 VGCS-VBS / Leaving group transmit mode

This test is applicable to the MS support VGCS talking.

## 26.14.5.2.1 Conformance requirement

In group transmit mode (VGCS):

1. If the uplink release is requested by the upper layer the mobile station shall send an UPLINK RELEASE message on the voice group call channel uplink, perform a release of the main signalling link and go back to group receive mode.
2. If the UPLINK RELEASE message is received from the network on the voice group call channel downlink, the MS shall perform a release of the main signalling link and go back to group receive mode.
3. The talking subscriber's mobile station which has lost the contact with the network shall return immediately to group receive mode.

## Reference(s)

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.4.13.4 and 3.4.13.5.1.

3GPP TS 03.68 subclause 4.2.2.2.

### 26.14.5.2.2 Test purpose

To verify that in group transmit mode (VGCS):

1. When uplink release is requested by the user the mobile station sends an UPLINK RELEASE message on the voice group call channel uplink, performs a release of the main signalling link and goes back to group receive mode.
2. When the UPLINK RELEASE message is received from the network on the voice group call channel downlink, the MS performs a release of the main signalling link and goes back to group receive mode.
3. When a radio link failure is detected by the MS the MS shall return to idle mode and, when possible, to group receive mode.

### 26.14.5.2.3 Method of test

#### Initial Conditions

System Simulator:

1 cell with default parameters for ASCI testing.

Mobile Station:

The MS is in group transmit mode.

#### Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900).
- Support VGCS talking.
- Way to configure VGCS.
- Way to initiate VGCS talking.
- Way to verify the downlink speech path.

#### Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

#### Test Procedure

The MS is in VGCS group transmit mode. The MS is requested to quit group transmit mode by MMI action. It is checked that the MS sends an UPLINK RELEASE message and goes to group receive mode. The MS is brought into group transmit mode. The SS sends UPLINK RELEASE message. It is checked that the MS returns to group receive mode. The MS is brought into group transmit mode again. The SS stops radio transmitting on SACCH. It is checked that the MS returns to group receive mode.

#### Maximum Duration of Test

5 minutes.

## 26.14.6 VGCS-VBS / GCC-BCC Procedures

### 26.14.6.1 VGCS-VBS / GCC-BCC Procedures / MO call establishment

#### 26.14.6.1.1 Conformance requirement

1. The MS in idle updated mode shall initiate a VGCS/VBS call correctly using IMMEDIATE SETUP procedure if a priority level is requested by the user for which the user has the subscription and the fast call setup is enabled.
2. The MS in idle updated mode shall initiate a VGCS/VBS call correctly using SETUP procedure on request.
3. For VGCS call after establishment, the MS shall indicate to the user that an indication of the desire to speak should be made if he wants to speak. If this is not done within a certain time, the MS shall send an UPLINK RELEASE.

#### Reference(s)

3GPP TS 04.68 subclause 6.2.2.

3GPP TS 04.69 subclause 6.2.2.

3GPP TS 03.68 subclause 11.3.1.1.3.

### 26.14.6.1.2 Test purpose

To verify that in idle updated mode:

1. The MS initiates a VGCS/VBS call correctly using IMMEDIATE SETUP procedure if a priority level is requested by the user for which the user has the subscription and the fast call setup is enabled.
2. The MS initiates a VGCS/VBS call correctly using SETUP procedure on request.
3. After establishment of VGCS call, the MS indicates that an user action is required if he wants to speak. If such user action is not made within a certain time, the MS sends an UPLINK RELEASE.

### 26.14.6.1.3 Method of test

#### Initial Conditions

System Simulator:

1 cell with default parameters for ASCI testing.

Mobile Station:

The MS is in MM-state "idle, updated" with a TMSI allocated.

#### Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900).
- Support VGCS originating.
- Support VBS originating.
- Way to configure VGCS or VBS.
- Way to initiate a VGCS/VBS call.
- Way to select the immediate set-up or the normal set-up.
- Way to verify the downlink speech path.
- Way to indicate the desire of speaking.

The allowed duration between an indication of a required user action for speaking and an action performed by user.

#### Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

#### Test Procedure

The MS is in MM-state "idle, updated". The MS is requested to initiate a VGCS or VBS call using immediate setup procedure by selecting the subscribed priority '0' with the appropriate MMI action. The field EF<sub>eMLPP</sub> associates to the subscribed priority '0' the fast-call setup subscription. It is checked that the MS performs correctly the immediate setup procedure. The call is terminated. The MS is requested to initiate a VGCS or VBS call using setup procedure by selecting the priority '4' with the appropriate MMI action. It is checked that the MS performs correctly the setup procedure. The call is cleared.

#### Maximum Duration of Test

5 minutes.

## Expected Sequence

Steps 0 to 18 are executed if MS supports eMLPP.

| Step | Direction | Message                            | Comments                                                                                                                                                        |

## 26.14.6.2 VGCS-VBS / GCC-BCC Procedures / Transaction Identifier

### 26.14.6.2.1 Conformance requirement

1. The originator of the GCC or BCC transaction shall choose the Transaction Identifier (TI).
2. When the MS (not originator) goes to group transmit mode, it may only send GCC or BCC messages when it has received a GCC or BCC message from network, it shall use the TI value which has been used in the messages from network.

### Reference(s)

3GPP TS 04.07 subclause 11.2.3.1.3.

3GPP TS 04.68 clause 5.

3GPP TS 04.69 clause 5.

### 26.14.6.2.2 Test purpose

1. To verify that The originator of the GCC or BCC transaction chooses the Transaction Identifier (TI).
2. To verify that when the MS (not originator) goes to group transmit mode, if the MS sends GCC or BCC message to network to respond to messages from network, it uses the TI value which is used in the messages received from network.

### 26.14.6.2.3 Method of test

#### Initial Conditions

System Simulator:

1 cell with default parameters for ASCII testing.

Mobile Station:

The MS is in MM-state "idle, updated" with a TMSI allocated.

#### Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900).
- Support VGCS talking.
- Support VBS originating.
- Way to configure VGCS or VBS.
- Way to accept a group call.
- Way to request uplink access.
- Way to select the immediate set-up or the normal set-up.
- Way to initiate VBS call.

#### Foreseen Final State of the MS

MM idle updated state.

#### Test Procedure

If the MS supports only VBS, the MS is requested to initiate a VBS call using setup procedure by MMI action. In the BROADCAST CALL ACTIVE (U2) state, it is checked that the MS uses correct TI in the STATUS message to respond to the GET STATUS message.

If the MS supports VGCS, the MS is brought into group transmit mode. In the SEND and RECEIVE state (U2sr), it is checked that the MS uses correct TI in the STATUS message to respond to the GET STATUS message.

#### Maximum Duration of Test

5 minutes.

### 26.14.6.3 VGCS-VBS / GCC-BCC Procedures / Call Termination / originator / group transmit mode

This test case is applicable to the MS supporting VGCS/VBS originating.

#### 26.14.6.3.1 Conformance requirement

When in group transmit mode, on request of upper layer, the MS which is the originator of the VGCS/VBS call shall initiate the termination procedure by sending a TERMINATION REQUEST message to its peer entity in the network and setting timer  $T_{\text{term}}$ , entering state U5. The network accepts the termination or on  $T_{\text{term}}$  expiration, the MS returns to idle state.

#### Reference(s)

3GPP TS 04.68 subclause 6.4.1.

3GPP TS 04.69 subclause 6.4.1.

### 26.14.6.3.2 Test purpose

To verify that when in group transmit mode, on request of the user, the MS which is the originator of the VGCS/VBS call initiates the termination procedure by sending a TERMINATION REQUEST message to its peer entity in the network and setting timer  $T_{\text{term}}$ , entering state U5. If the termination is accepted or on  $T_{\text{term}}$  is expired, the MS returns to idle mode.

### 26.14.6.3.3 Method of test

#### Initial Conditions

##### System Simulator:

1 cell with default parameters for ASCII testing.

##### Mobile Station:

The MS is in MM-state "idle, updated" with a TMSI allocated.

#### Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900).
- Support VGCS originating.
- Support VBS originating.
- Supported rates (full / half rate).
- Way to configure VGCS or VBS.
- Way to initiate VBS call.
- Way to initiate VGCS call.
- Way to select the immediate set-up or the normal set-up.
- Way to terminate VGCS/VBS call.

#### Foreseen Final State of the MS

MM idle, updated state.

#### Test Procedure

A VGCS/VBS call is established and the MS, as the originator, is brought into group transmit mode. The MS is requested to terminate the VGCS/VBS call by MMI action. It is checked that the MS sends TERMINATION REQUEST message and enters state U5.

For execution counter  $k=1$ , before  $T_{\text{term}}$  times out, the SS accepts the termination request, the call is terminated. For  $k=2$ , the SS does not respond to the termination request. It is checked that after  $T_{\text{term}}$  times out, the MS clears the context related to the group call and returns to idle mode.

#### Maximum Duration of Test

5 minutes.

#### Expected Sequence

The test sequence is executed for  $k = 1, 2$ .

#### 26.14.6.4 VGCS-VBS / GCC-BCC Procedures / Call Termination / originator in group receive mode

This test case is applicable to the MS supporting VGCS originating.

##### 26.14.6.4.1 Conformance requirement

When in group receive mode, on request of upper layer, the MS which is the originator of the VGCS call shall enter sub-state U2ws and ask RR to enter group transmit mode. As soon as  $COMM = T$ , it shall send a TERMINATION REQUEST message to its peer entity in the network, set timer  $T_{term}$ , and enter state U5. The network accepts the termination or on  $T_{term}$  expiration, the MS returns to idle mode.

##### Reference(s)

3GPP TS 04.68 subclause 6.4.1.

#### 26.14.6.4.2 Test purpose

To verify that when in group receive mode, on request of the user, the MS which is the originator of the VGCS call enters sub-state U2ws and asks RR to enter group transmit mode. As soon as COMM = T, it sends a TERMINATION REQUEST message to its peer entity in the network, set timer  $T_{\text{term}}$ , and enters state U5. The network accepts the termination or on  $T_{\text{term}}$  expiration, the MS returns to idle mode.

#### 26.14.6.4.3 Method of test

##### Initial Conditions

###### System Simulator:

1 cell with default parameters for ASCII testing.

###### Mobile Station:

The MS is in MM-state "idle, updated" with a TMSI allocated.

##### Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900).
- Support VGCS originating.
- Supported rates (full / half rate).
- Way to configure VGCS.
- Way to initiate a VGCS call.
- Way to select the immediate set-up or the normal set-up.
- Way to terminate a VGCS call.

##### Foreseen Final State of the MS

MM idle, updated state.

##### Test Procedure

The MS originates a VGCS call and is brought into group receive mode. The MS is requested to terminate the VGCS call by MMI action. It is checked that the MS firstly enters group transmit mode and then sends TERMINATION REQUEST message, enters state U5.

For  $k = 1$ , the SS accepts the request, the call is terminated. For  $k = 2$ , the SS does not respond to the request. It is checked that after  $T_{\text{term}}$  timeout the MS aborts the call.

##### Maximum Duration of Test

5 minutes.

## Expected Sequence

The test sequence is executed for k = 1, 2.

| Step | Direction | Message                 | Comments                                                                                                          |

### 26.14.6.5 VGCS-VBS / GCC-BCC Procedures / Call Termination / not originator

#### 26.14.6.5.1 Conformance requirement

1. If the MS is not the originator of the VGCS/VBS call, on request of upper layer, the MS shall not attempt to terminate the call.

#### Reference(s)

3GPP TS 04.68, subclause 6.4.1 (implicitly).

3GPP TS 04.69, subclause 6.4.1 (implicitly).

## 26.14.6.5.2 Test purpose

To verify that when the MS is not the originator of the VGCS/VBS call, on request of the user, the MS does not attempt to terminate the call.

## 26.14.6.5.3 Method of test

## Initial Conditions

## System Simulator:

1 cell with default parameters for ASCI testing.

## Mobile Station:

The MS is in group receive mode (not originator).

## Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900).
- Support VGCS listening.
- Support VBS listening.
- Way to configure VGCS or VBS.
- Way to join a VGCS/VBS call.
- Way to terminate a call.

## Foreseen Final State of the MS

MM-state idle, updated.

## Test Procedure

The MS is brought into group receive mode (not originator). The MS is requested to terminate the call by MMI action. It is checked that the MS does not attempt the termination.

## Maximum Duration of Test

2 minutes.

## Expected Sequence

| Step | Direction | Message         | Comments                                                  |
|------|-----------|-----------------|-----------------------------------------------------------|
| 0    | MS        |                 | the MS is in group receive mode (not the originator).     |
| 1    | MS        |                 | MMI action to terminate the call.                         |
| 2    | SS        |                 | check that there is no transmission from the MS for 10 s. |
| 3    | SS -> MS  | CHANNEL RELEASE | UI format                                                 |

## 26.14.6.6 VGCS-VBS / GCC-BCC Procedures / GCC states

This test is performed if the MS supports VGCS talking.

#### 26.14.6.6.1 Conformance requirement

1. The GCC entity of the MS performs transitions between (main) states. In main state GROUP CALL ACTIVE (U2) it performs transitions between sub-states. It has certain parameters and attributes, which it sets and changes based on interaction with higher layer and lower layers and on message exchanges with its peer entity. These states and parameters shall be consistent as defined.
2. The mobile station in group transmit mode shall mute the downlink speech if SET STATUS message is received with DA bit set to 1. The mobile station shall no longer mute the downlink after receipt of a downlink SET STATUS message with a reset DA bit.

#### Reference(s)

3GPP TS 04.68, subclauses 6.1.2.1, 6.1.2.1.1 to 6.1.2.1.11, 6.5.1.1, 8.4 and 9.5.7.

#### 26.14.6.6.2 Test purpose

1. To verify that the GCC states and parameters of the MS are consistent as defined.
2. To verify that the MS in group transmit mode mutes the downlink speech if downlink SET STATUS message is received setting DA bit. The mobile station no longer mutes the downlink speech after a SET STATUS message is received.

#### 26.14.6.6.3 Method of test

#### Initial Conditions

System Simulator:

1 cell with default parameters for ASCII testing.

Mobile Station:

The MS is in MM-state "idle, updated" with a TMSI allocated.

#### Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900).
- Support VGCS originating.
- Support VGCS talking.
- Support VGCS listening.
- Way to configure VGCS.
- Way to check downlink is muted or not.
- Way to accept VGCS call.
- Way to initiate VGCS call.

#### Foreseen Final State of the MS

MM-state Idle, updated.

#### Test Procedure

If the MS supports VGCS originating, it is requested to initiate a VGCS call. It is checked by getting status that the MS goes through different GCC states with correct parameters. If the MS supports VGCS talking but not VGCS originating, it is brought to group receive mode and then group transmit mode.

When MS is in group transmit mode the SS sends SET PARAMETER message The DA bit in state attributes is set to 0. It is checked that the downlink of the MS is muted. The SS sends SET PARAMETER message with DA bit set to 1. It is checked that the downlink of the MS is unmuted.

Similarly, it is checked that the MS goes through different GCC states with correct parameters.

#### Maximum Duration of Test

5 minutes.

#### Expected Sequence

If the MS supports VGCS originating, the step 1 to step 40 are performed.

| Step | Direction | Message                            | Comments                                                                                                                                                                           |

### 26.14.6.7 VGCS-VBS / GCC-BCC Procedures / BCC states

This test is applicable to the MS supporting VBS originating.

#### 26.14.6.7.1 Conformance requirement

The BCC entity of the MS performs transitions between states. It has certain parameters and attributes, which it sets and changes based on interaction with higher layer and lower layers and on message exchanges with its peer entity. These states and parameters shall be consistent as defined.

#### Reference(s)

3GPP TS 04.69 subclauses 6.1.2.1 to 6.1.2.11 and 6.5.1.1.

#### 26.14.6.7.2 Test purpose

To verify that the BCC states and parameters of the MS are consistent as defined.

#### 26.14.6.7.3 Method of test

#### Initial Conditions

System Simulator:

1 cell with default parameters for ASCII testing.

Mobile Station:

The MS is in MM-state "idle, updated" with a TMSI allocated.

## Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900).
- Support VBS originating.
- Way to configure VBS.
- Way to select the immediate set-up or the normal set-up.
- Way to initiate VBS call.

## Foreseen Final State of the MS

MM-state Idle, updated.

## Test Procedure

The MS is requested to initiate VBS call. Then it is checked by getting status procedure that the MS goes through different GCC states with correct parameters.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

| Step | Direction | Message                            | Comments                                                                                                                                       |

## 26.14.7 VGCS-VBS / Error Handling

### 26.14.7.1 VGCS-VBS / Error Handling / short message length, unknown message type and TI

This test is applicable to the MS supporting VGCS/VBS originating.

#### 26.14.7.1.1 Conformance requirement

1. Whenever a message is received specifying a transaction identifier which is not recognised as relating to an active transaction, if COMM = T, the MS shall send a STATUS message with cause #81 "invalid transaction identifier value" using the received transaction identifier value and including, if possible, as diagnostics the complete message received (this may not be possible, e.g. due to length restrictions). and remain idle.
2. If COMM = T, the MS shall answer to a message received with TI value "111" by sending a STATUS message with same TI value, cause "invalid transaction identifier value", and including, if possible, as diagnostics the complete message received (this may not be possible, e.g. due to length restrictions).
3. When a message is received that is too short to contain a complete message type information element, that message shall be ignored.
4. If the GCC or BCC in the MS receives a message with message type not defined for the PD or not implemented by the receiver, the MS shall ignore the message except for the fact that, if COMM = T, it shall return a STATUS message with cause "message type non-existent or not implemented" and including as diagnostics the message type of the message received.
5. If the GCC or BCC in the MS receives a message not compatible with the protocol state, the MS shall ignore the message except for the fact that, if COMM = T, it shall return a STATUS message with cause "message type not compatible with protocol state" and including as diagnostic the message type of the message received.
6. When a message with semantically incorrect contents is received, the foreseen reaction of the procedural part are performed. If however no such reactions are specified, the MS shall ignore the message except for the fact that, if COMM = T, it returns a STATUS message with cause value "semantically incorrect message" and including, if possible, as diagnostics the complete message received (this may not be possible).

#### Reference(s)

3GPP TS 04.68 subclauses 7.2, 7.3, 7.4 and 7.8.

3GPP TS 04.69 subclauses 7.2, 7.3, 7.4 and 7.8.

#### 26.14.7.1.2 Test purpose

To verify that:

1. Whenever a message is received specifying a transaction identifier which is not recognised as relating to an active transaction, if COMM = T, the MS sends a STATUS message with cause #81 "invalid transaction identifier value" using the received transaction identifier value and including, if possible, as diagnostics the complete message received (this may not be possible, e.g., due to length restrictions).
2. If COMM = T, the MS answers to a message received with TI value "111" by sending a STATUS message with same TI value, cause "invalid transaction identifier value", and including, if possible, as diagnostics the complete message received (this may not be possible, e.g., due to length restrictions).
3. When a message is received that is too short to contain a complete message type information element, that message is ignored.
4. If the GCC or BCC in the MS receives a message with message type not defined for the PD or not implemented by the receiver, the MS ignores the message. In addition, if COMM = T, it returns a STATUS message with cause "message type non-existent or not implemented" and including as diagnostics the message type of the message received.

5. If the GCC or BCC in the MS receives a message not compatible with the protocol state, the MS ignores the message. In addition, if COMM = T, it returns a STATUS message with cause " message type not compatible with protocol state" and including as diagnostic the message type of the message received.
6. When a message containing semantically incorrect contents is received and no reactions are specified in the procedural part, the MS ignores the message. In addition, if COMM = T, the MS returns a STATUS message with cause value "semantically incorrect message" and as diagnostics, including the complete message received, if possible (this may not be possible).

#### 26.14.7.1.3 Method of test

##### Initial Conditions

###### System Simulator

1 cell with default parameters for ASCII testing.

###### Mobile Station:

The MS is in MM-state "idle, updated" with a TMSI allocated.

##### Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900).
- Support VGCS originating.
- Support VGCS talking.
- Support VBS originating.

##### Foreseen Final State of the MS

MM-state "Idle, updated".

##### Test Procedure

If the MS supports VGCS/VBS originating, the test starts from step 1, otherwise if the MS supports VGCS talking the test starts from step 30. If the MS supports VBS originating but no VGCS originating nor VGCS talking, the test stops on step 24.

The MS is requested to initiate a VGCS/VBS call with setup procedure. After the MS sends SETUP message, the SS sends incorrect CONNECT messages which contains incorrect TI flag or incorrect TI value or TI value set to '111'B. It is checked that the MS ignores these messages and responds with STATUS messages containing cause #81. The SS sends a message which is too short to contain a complete message. It is checked that the MS ignores this short message. Finally the SS sends a undefined message, a message not compatible with current protocol state and a message semantically incorrect. It is checked that the MS ignores these messages and returns STATUS messages containing cause #97, #98, #95 respectively. The following steps is applicable to the MS supporting VGCS talking. The MS is brought into group transmit mode. The SS sends GET STATUS message with TI='1001'B, the MS responds with STATUS message containing state U2sr, then the SS sends GET STATUS messages containing TI= '1111'B or '1010'B. It is checked that the MS ignores these messages and responds with STATUS messages containing cause #81.

##### Maximum Duration of Test

5 minutes.

## Expected Sequence

The step 30 -46 are performed if the MS supports VGCS.

| Step | Direction | Message              | Comments                                                                               |
|------|-----------|----------------------|----------------------------------------------------------------------------------------|
| 0    | MS        |                      | The MS is in idle mode.                                                                |
| 1    | MS        |                      | MMI action to initiate VGCS/VBS call using setup procedure.                            |

### 26.14.7.2 VGCS-VBS / Error Handling / incorrect information elements

The test case is applicable to the MS supporting VGCS/VBS listening.

#### 26.14.7.2.1 Conformance requirement

1. When on receipt of a message containing "imperative message part" error or "missing mandatory IE" error or syntactically incorrect mandatory IE's or unknown IE's encoded as "comprehension required" or out of sequence IE's encoded as "comprehension required", the MS shall ignore the message except for the fact that, if COMM = T, it shall return a STATUS message with cause "invalid mandatory information" and including, if possible, as diagnostics the complete message received.
2. The GCC or BCC in the MS shall ignore all unknown information elements not encoded as "comprehension required" in the non-imperative part.
3. The GCC or BCC in the MS shall ignore all out of sequence information elements not encoded as "comprehension required" in the non-imperative part.
4. The GCC or BCC in the MS shall ignore all syntactically incorrect optional information elements in the non-imperative part.
5. If an information element with format T, TV, or TLV is repeated in a message in which repetition of the information element is not specified, only the contents of the information element appearing first shall be handled and all subsequent repetitions of the information element shall be ignored. When repetition of information elements is specified, only the contents of specified repeated information elements shall be handled. If the limit on repetition of information elements is exceeded, the contents of information elements appearing first up to the limit of repetitions shall be handled and all subsequent repetitions of the information element shall be ignored.

#### Reference(s)

3GPP TS 04.68 subclauses 7.5, 7.6 and 7.7.

3GPP TS 04.69 subclauses 7.5, 7.6 and 7.7.

#### 26.14.7.2.2 Test purpose

To verify that:

1. On receipt of a message containing "imperative message part" error or "missing mandatory IE" error or syntactically incorrect mandatory IE's or unknown IE's encoded as "comprehension required" or out of sequence IE's encoded as "comprehension required", the MS ignores the message. In addition, if COMM = T, the MS returns a STATUS message with cause "invalid mandatory information" and including, if possible, as diagnostics the complete message received.
2. The MS ignores unknown information elements not encoded as "comprehension required" in the non-imperative part.
3. The MS ignores out of sequence information elements not encoded as "comprehension required" in the non-imperative part.

4. The MS ignores syntactically incorrect optional information elements in the non-imperative part.
5. The MS ignores subsequent repetition of the information element for which repetition is not specified, only the contents of the information element appearing first are handled. For specified repeated information element, the MS ignores all subsequent repetitions of the information element beyond the limit on repetition, only the contents of information element appearing first up to the limit of repetitions are handled.

#### 26.14.7.2.3 Method of test

##### Initial Conditions

###### System Simulator:

1 cell with default parameters for ASCII testing.

###### Mobile Station:

The MS is in MM-state "idle, updated" with a TMSI allocated.

##### Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900).
- Support VGCS originating.
- Support VGCS talking.
- Support VGCS listening.
- Support VBS originating.
- Support VBS listening.

##### Foreseen Final State of the MS

MM-state "Idle, updated".

##### Test Procedure

The MS is in idle updated mode. The SS sends NOTIFICATION/NCH messages with incorrect mandatory IE (skip='0001'B) or with comprehension required IE. It is checked that the MS ignores these NOTIFICATION/NCH messages. The SS sends NOTIFICATION/NCH containing unknown IE not encoded as comprehension required in non-imperative part. It is checked that the MS ignores the unknown IE and accepts the NOTIFICATION/NCH message. If the MS supports VGCS/VBS listening only, the test stops here.

If the MS supports VGCS talking the test continues on step 7. The MS joins the call. The SS sends correct UPLINK BUSY message then sends UPLINK FREE message containing incorrect mandatory IE. It is checked that the UPLINK FREE message is ignored by the MS. The SS sends correct UPLINK FREE message and the MS is requested to access the uplink. During the uplink access procedure it is checked that the MS ignores the VGCS UPLINK GRANT message in which mandatory IE is missing. After the MS enters group transmit mode, it is brought back to idle updated mode. The test stops here if the MS supports VGCS talking but not VGCS originating.

If the MS supports VGCS/VBS originating the test proceeds on step 30. The MS is requested to originate a VGCS call. During the call establishment it is checked that the MS ignores the CONNECT messages that missing mandatory IE or containing unknown IE encoded as comprehension required, and that the MS ignores unknown IE which is in non-imperative part and is not encoded as comprehension required, it is also checked that the MS ignores subsequent repetition of the information element for which repetition is not specified.

##### Maximum Duration of Test

5 minutes.

## Expected Sequence

The test steps 7 to 29 are performed if the MS supports VGCS talking. The test steps 30 to 56 are performed if the MS supports VGCS/VBS originating.

| Step | Direction | Message                            | Comments                                                                                                                                                        |

**26.14.7.3 VGCS-VBS / Messages not addressing VGCS receive mode****26.14.7.3.1 Conformance requirement**

In group receive mode the MS shall ignore messages which are allowed in group receive mode but not sent in UI format on the VGCS or VBS channel downlink.

Mobile stations in group receive mode shall ignore all messages which are not sent in UI format or which are not related to the following procedures: channel mode modify, notification and paging information, uplink status messages, channel release message, information on channel restructuring.

**Reference(s)**

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.4.15.1.2.

**26.14.7.3.2 Test purpose**

To verify that the MS in group receive mode ignores:

1. Messages which are applicable to group receive mode but not sent in UI format.
2. ASSIGNMENT COMMAND and HANDOVER COMMAND messages in which the target mode information element indicates "dedicated mode".
3. Messages which are not applicable to group receive mode.

## 26.14.7.3.3 Method of test

## Initial Conditions

System Simulator:

1 cell with default parameters for ASCI testing.

Mobile Station:

The MS is in MM-state "idle, updated" with a TMSI allocated.

## Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900).
- Support VGCS listening.
- Support VBS listening.
- Way to configure VGCS or VBS.
- Way to indicate a call notification.
- Way to accept a VGCS or VBS.
- Way to verify the downlink speech path.

## Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

## Test Procedure

The MS is brought into group receive mode. The SS sends, in UI format, the messages which are not applicable to group receive mode. It is checked that the MS ignores these messages. The SS sends, in L2 I format, messages which are applicable to group receive mode. It is checked that the MS ignores these messages.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

| Step | Direction | Message                       | Comments                                     |
|------|-----------|-------------------------------|----------------------------------------------|
| 0    | MS        |                               | The MS is in Idle updated mode.              |

| 18   | MS        |                               | check that the MS ignores the above message. |
| 19   | SS -> MS  | CHANNEL RELEASE               | UI format.                                   |

## 26.14.8 VGCS-VBS / Structured Procedures

The objective of this test group is to verify that the MS in the ASCI context performs certain elementary procedures of the RR, MM, and GCC/BCC protocol correctly within a structured procedure, especially when some channels use R-GSM frequencies with ARFCNs between 955 and 974.

### 26.14.8.1 VGCS-VBS / Structured Procedures / Very early and early assignment

This test is applicable to the MS supporting VGCS/VBS originating.

#### 26.14.8.1.1 Conformance requirement

1. The mobile station initiates immediate assignment, service request, and contention resolution.
2. After sending the CIPHERING MODE COMPLETE message, the mobile station initiates call establishment by sending the SETUP message to the network.
3. The network allocates a traffic channel to the mobile station before it initiates call establishment in the fixed network.
4. The network assigns the traffic channel at the earliest possible moment, i.e. in the immediate assignment procedure. The mode of the traffic channel is changed from signalling only to the mode necessary for the call by means of the channel mode change procedure.

#### Reference(s)

3GPP TS 04.08 / 3GPP TS 23.108 subclause 7.3.2.

#### 26.14.8.1.2 Test purposes

1. To verify that the MS initiates immediate assignment, service request using the IMMEDIATE ASSIGNMENT or CM SERVICE REQUEST message, and contention resolution.
2. To verify that the MS after sending the CIPHERING MODE COMPLETE message, initiates call establishment by sending the SETUP message to the network.
3. To check that the MS performs correctly the early assignment procedure.
4. To check that the MS performs correctly the very early assignment procedure.

#### 26.14.8.1.3 Method of test

##### Initial Conditions

###### System Simulator:

1 cell with default parameters for ASCI testing.

###### Mobile Station:

The MS is in MM-state "idle, updated" with a TMSI allocated.

##### Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900).
- Support VGCS originating.
- Support VBS originating.
- Supported speech versions.
- Way to configure a necessary radio channel rate.
- Way to configure VGCS or VBS.
- Way to select the immediate set-up or the normal set-up.
- Way to verify the downlink speech path.

##### Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

##### Test Procedure

The MS is requested to initiate a VGCS/VBS call using immediate setup procedure. The authentication and ciphering mode setting (to no ciphering) procedures are applied. The call is established by using early assignment procedure. For an R-band MS a carrier with ARFCN in the range of 955 - 974 is assigned for the traffic channel. The MS needs to be configured to use EFR codec for the test, if it supports EFR. The MS is requested to terminate the call.

The MS is requested to initiate a VGCS/VBS call using setup procedure. The authentication and ciphering mode setting (to no ciphering) procedures are applied. The call is established by using assignment procedure. For an R-band MS a carrier with ARFCN in the range of 955 - 974 is assigned for the traffic channel. The MS needs to be configured to use half rate codec for the test, if it supports dual rate. The call is terminated.

##### Maximum Duration of Test

5 minutes.

## Expected Sequence

Steps 0 to 20 are executed if MS supports eMLPP.

| Step | Direction | Message                            | Comments                                                                                                           |
|------|-----------|------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| 0    | MS        |                                    | The MS is in idle updated mode.                                                                                    |
| 1    | MS        |                                    | MMI action to select a priority level 0 and MMI action to initiate VGCS /VBS call using immediate setup procedure. |

## 26.14.9 VGCS-VBS / Cell change

This subclause applies to mobile stations supporting VGCS/VBS listening.

### 26.14.9.1 VGCS-VBS / Cell Change / Same LA

#### 26.14.9.1.1 Conformance requirement

After cell change within the same LA:

1. if no NCH is present on the new cell the MS shall leave group receive mode and go to idle mode;
2. if NCH is present on the new cell but the MS does not receive any notification message for the current group or broadcast call the MS shall leave group receive mode and go to idle mode;
3. if the MS receives a notification message for the current group or broadcast call with the related channel position and if the channel is found, the MS shall change to it and stay in group receive mode;
4. if the MS receives a notification message for the current group or broadcast call without information on the related channel position, the MS shall leave group receive mode, go to idle mode in order to establish a dedicated connection with the network to become informed on the related channel position.

#### Reference(s)

3GPP TS 03.22 subclause 5.2.3.

#### 26.14.9.1.2 Test purpose

The MS was in group receive mode. After cell change within a same LA it is verified that:

1. if no NCH is present on the new cell the MS leaves group receive mode and enters idle mode;
2. if NCH is present on the new cell but there is no NOTIFICATION / NCH for the current group or broadcast call the MS leaves group receive mode and enters idle mode;
3. if the MS receives NOTIFICATION / NCH for the current group or broadcast call with the related channel position the MS changes onto the group channel and stays in group receive mode;
4. if the MS receives NOTIFICATION / NCH for the current group or broadcast call without information on the related channel position, the MS leaves group receive mode, enters idle mode and establishes a dedicated connection with the network to get the related channel position.

26.14.9.1.3 Method of test

26.14.9.1.3.1 Initial Conditions

#### Initial Conditions

System Simulator:

2 cells within a same LA: cell A and cell B, with default parameters for this clause except:

- for k=1, no NCH on cell B;
- for k=2, 3, 4, NCH present on cell B.

Mobile Station:

The MS is in MM-state "idle, updated" with a TMSI allocated. No automatic answering is configured.

#### Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900).
- Support VGCS listening.
- Support VBS listening.
- Way to configure VGCS or VBS.
- Way to verify the downlink speech path.

#### Foreseen Final State of the MS

"Idle, updated".

#### Test Procedure

The following test procedure is repeated for k=1, 2, 3, 4 and c=1, 2.

For c=1, the MS is brought into group receive mode on cell A. Start cell B without NCH (k=1), or with NCH but NOTIFICATON/NCH containing irrelevant group call references (k=2), or with NCH whilst NOTIFICATON/NCH containing the relevant group call reference and VGCS/VBS channel description (k=3), or with NCH whilst NOTIFICATON/NCH containing the relevant group call reference but no VGCS/VBS channel description (k=4). Lower the transmission levels of cell A so that C1 of cell A becomes less than zero. After the MS re-selects to the cell B it is checked that the MS returns to idle mode on cell B (for k=1, 2), or that the MS remains in group receive mode on cell B (for k=3, 4).

The same test procedure is repeated for c=2. Instead of lowering the power level of cell A, the SACCH transmission of cell A is stopped.

#### Maximum Duration of Test

10 minutes.

## Expected Sequence

The test sequence is repeated for test counter k= 1, 2, 3, 4 and c=1, 2.

| Step                       | Direction                                    | Message                                                                           | Comments                                                                                                                                                                                                                                                  |

## 26.14.9.2 VGCS-VBS / Cell Change / Different LA

### 26.14.9.2.1 Conformance requirement

1. After a cell change the MS shall leave group receive mode and go to idle mode in order to establish a dedicated connection with the network to perform a location update if the cell belongs to a new LA.
2. If NCH is present on the new cell but the MS does not receive any notification message for the current group or broadcast call the MS shall leave group receive mode and go to idle mode.
3. If the MS receives a notification message for the current group or broadcast call with the related channel position and if the channel is found, the MS shall change to it and stay in group receive mode.
4. If the MS receives a notification message for the current group or broadcast call without information on the related channel position, the MS shall leave group receive mode, go to idle mode and in order to establish a dedicated connection with the network to become informed on the related channel position.
5. If a CHANNEL RELEASE is send to a mobile station which is in dedicated mode and which is involved in a voice group call or voice broadcast call, a group channel description may be included, describing the voice group call channel or voice broadcast channel to which the mobile station shall go after the channel release procedure.

### Reference(s)

3GPP TS 03.22 subclause 5.2.3.

3GPP TS 04.08 / 3GPP TS 44.018 subclause 9.1.7.1.

### 26.14.9.2.2 Test purpose

In group receive mode it is verified that:

1. after a cell change to a different LA, the MS leaves group receive mode, enters idle mode and establishes a dedicated connection with the network to perform location updating;
2. after location updating, if NCH is present on the new cell but there is no NOTIFICATION / NCH for the current group or broadcast call the MS stays in idle mode;
3. after location updating, if the MS receives NOTIFICATION / NCH for the current group or broadcast call with the related channel position the MS changes to the group channel and stays in group receive mode;
4. after location updating, if the MS receives NOTIFICATION / NCH for the current group or broadcast call without information on the related channel position, the MS establishes a dedicated connection with the network to get the related channel position and then enters to group receive mode;
5. it is also tested, when a mobile, in dedicated mode and involved in a voice group or broadcast call, receives CHANNEL RELEASE including a group channel description channel the mobile station goes onto the channel after the channel release procedure.

### 26.14.9.2.3 Method of test

#### Initial Conditions

System Simulator:

2 cells with different LA within a same PLMN: cell A and cell B, with default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with a TMSI allocated on cell A. No automatic answering is configured.

## Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900).
- Support VGCS listening.
- Support VBS listening.
- Way to configure VGCS or VBS.
- Way to verify the downlink speech path.
- Mobile classmark supported.

## Foreseen Final State of the MS

"Idle, updated".

## Test Procedure

The following test procedure is repeated for k = 1, 2, 3.

The MS is brought into group receive mode on cell A. Start cell B with NCH but NOTIFICATON/NCH containing irrelevant group call references (k=1), or with NOTIFICATON/NCH containing the relevant group call reference but no VGCS/VBS channel description (k=2), or with NOTIFICATON/NCH containing the relevant group call reference and VGCS/VBS channel description (k=3). Lower the transmission levels of cell A so that C1 of cell A becomes less than zero. The MS re-selects to the cell B. It is checked that the MS does location update on cell B. If it is succeeded the MS either remains in the idle mode (for k=1), or enters to group receive mode on cell B (for k=2, 3) without manual intervention.

Increase the power level of cell A to the default value and decrease the power level of cell B so that the MS re-selects the cell A. The MS attempts a location updating. The SS rejects it with cause #17 (network failure) to force the MS re-initiate location updating. The SS checks that the TCH in downlink is not connected before a location updated. The MS initiates again a new attempt for location updating, the SS accepts it, then the MS initiates a new group call and enters the group transmit mode, SS sends an UPLINK RELEASE message to bring MS to group receive mode. Then SS assigns a new group channel for it in the CHANNEL RELEASE message. It is checked that the MS enters group receive mode and the new TCH assigned in downlink is through connected.

## Maximum Duration of Test

10 minutes.

## Expected Sequence

Repeat the test sequence for test counter k= 1, 2, 3.

| Step | Direction | Message          | Comments                                                                                                                     |

### 26.14.9.3 VGCS-VBS / Cell Change / Different PLMN

#### 26.14.9.3.1 Conformance requirement

1. After a cell change to a different LA, if the selected cell belongs to an another PLMN the MS shall leave group receive mode and go to idle mode.

#### Reference(s)

3GPP 03.22 subclause 5.2.3.

#### 26.14.9.3.2 Test purpose

In group receive mode it is verified that after a cell change to a different LA of an another PLMN, the MS leaves group receive mode, enters idle mode.

#### 26.14.9.3.3 Method of test

#### Initial Conditions

System Simulator:

2 cells with different LA belonging to the different PLMN: cell A /PLMN1 and cell B / PLMN2, with default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with a TMSI allocated on cell A. No automatic answering is configured.

#### Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900).
- Support VGCS listening.
- Support VBS listening.
- Way to configure VGCS or VBS.
- Way to verify the downlink speech path.

#### Foreseen Final State of the MS

"Idle, updated".

#### Test Procedure

The following test procedure is repeated for k=1, 2.

The MS is brought into group receive mode on cell A. Start cell B with NOTIFICATON/NCH containing an another group call references (k=1), or with NOTIFICATON/NCH containing the same group call reference (k=2). Lower the transmission levels of cell A so that C1 of cell A becomes less than zero. The MS re-selects the cell B and enters idle mode. It is checked that the MS does location update on cell B. If it is succeeded the MS indicates a group/broadcast call with the reference and joins the VGCS/VBS call on MMI request.

Increase the power level of cell A to the default value and decrease the power level of cell B so that the MS re-selects the cell A. The MS does a new location updating and indicates a group/broadcast call.

#### Maximum Duration of Test

5 minutes.

## Expected Sequence

Repeat the test sequence for test counter k= 1, 2.

## 26.14.11 VGCS-VBS / User-to-Dispatcher Information

### 26.14.11.1 VGCS-VBS / User-to-Dispatcher Information / BCC MO call

#### 26.14.11.1.1 Conformance requirement

The request of the calling subscriber to set up a voice group call may specify information to be sent as user-to-dispatcher information to the network; in this case the user-to-dispatcher information is included in the signalling for call setup from the mobile station to the network. It is the responsibility of the input function to ensure that the user-to-dispatcher information has a correct format (in particular, an allowed length).

The initial signalling from the originating service subscriber informs the network that a voice group call is required and details the group ID; it may specify user-to-dispatcher information.

The User-to-dispatcher information element is included in the SETUP message.

#### References

3GPP TS 03.69 subclauses 4.2.1.1 and 11.3.1.1.1.

3GPP TS 04.69 subclause 8.5.

#### 26.14.11.1.2 Test purpose

1. To verify that upon initiation of an outgoing broadcast call with User-to-Dispatcher information by the user, the MS includes a User-to-dispatcher information element in the SETUP message.
2. To verify correct establishment and clearing of the broadcast call.

#### 26.14.11.1.3 Method of test

##### Initial Conditions

###### System Simulator:

1 cell with default parameters for ASCII testing.

###### Mobile Station:

The MS is in MM-state "idle, updated" with a TMSI allocated.

##### Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900).
- Support VBS originating.
- Support User-to-Dispatcher Information
- Way to activate User-to-Dispatcher Information
- Way to configure VBS.
- Way to initiate VBS calls.

##### Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

##### Test Procedure

By means of appropriate MMI function, the user enters a string, which shall be included in the User-to-Dispatcher Information.

Then MS is made to initiate a broadcast call. In the SETUP message, the User-to-dispatcher information element shall be present and shall include the requested string. Then, SS releases immediately the call with a TERMINATION message.

Then MS is made to initiate a second broadcast call with User-to-Dispatcher Information including a long string. In the SETUP message, the User-to-dispatcher information element shall be present with the requested string. Then it is checked that the call can be successfully established and cleared.

##### Maximum Duration of Test

2 minutes

## 26.14.11.2 VGCS-VBS / User-to-Dispatcher information / GCC MO call

### 26.14.11.2.1 Conformance requirement

The request of the calling subscriber to set up a voice group call may specify information to be sent as user-to-dispatcher information to the network; in this case the user-to-dispatcher information is included in the signalling for call setup from the mobile station to the network. It is the responsibility of the input function to ensure that the user-to-dispatcher information has a correct format (in particular, an allowed length).

The initial signalling from the originating service subscriber informs the network that a voice group call is required and details the group ID; it may specify user-to-dispatcher information.

The User-to-dispatcher information element is included in the SETUP message.

### References

3GPP TS 03.68 subclauses 4.2.1.1 and 11.3.1.1.1

3GPP TS 04.68 subclause 8.5.

### 26.14.11.2.2 Test purpose

1. To verify that upon initiation of an outgoing group call with User-to-Dispatcher Information by the user, the MS includes a User-to-dispatcher information element in the SETUP message.
2. To verify that the group call can be successfully established and cleared.

### 26.14.11.2.3 Method of test

#### Initial Conditions

System Simulator:

1 cell with default parameters for ASCII testing.

Mobile Station:

The MS is in MM-state "idle, updated" with a TMSI allocated.

#### Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900).
- Support VGCS originating.
- Support User-to-Dispatcher Information.
- Way to activate User-to-Dispatcher Information.
- Way to configure VGCS.
- Way to initiate VGCS calls.

#### Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

#### Test Procedure

By means of appropriate MMI function, the user enters a string, which shall be included in the User-to-Dispatcher Information.

Then MS is made to initiate a VGCS call. In the SETUP message, the User-to-dispatcher information element shall be present and shall include the requested string. Then, SS releases immediately the call with a TERMINATION message.

Then MS is made to initiate a second VGCS call with User-to-Dispatcher Information including a long string. In the SETUP message, the User-to-dispatcher information element shall be present with the requested string. Then it is checked that the call can be successfully established and cleared.

#### Maximum Duration of Test

2 minutes.

#### Expected Sequence

| Step | Direction | Message                | Comments                                                                                                                                                  |

### 26.14.11.3 VGCS-VBS / User-to-Dispatcher information / Compressed user information in VBS fast call set-up

#### 26.14.11.3.1 Conformance requirement

The request of the calling subscriber to set up a voice group call may specify information to be sent as user-to-dispatcher information to the network; in this case the user-to-dispatcher information is included in the signalling for call setup from the mobile station to the network. It is the responsibility of the input function to ensure that the user-to-dispatcher information has a correct format (in particular, an allowed length).

User-to-dispatcher information can be compressed or uncompressed.

The message IMMEDIATE SETUP 2 is sent by the MS to the network in order to set-up a group call immediately, i.e. without previous establishment of an MM connection, and to include compressed user-to-dispatcher information. The message shall be used if the MS has a valid TMSI.

#### References

3GPP TS 04.69 subclauses 4.2.1.1, 4.2.7, 11.3.1.1.1 and 11.3.1.1.3.

3GPP TS 04.69 subclause 6.2.2 and clause 8.

#### 26.14.11.3.2 Test purpose

To verify that upon initiation of an outgoing VBS fast call with User-to-Dispatcher Information by the user, the MS includes a Compressed User-to-Dispatcher Information information element in the IMMEDIATE SETUP 2 message;

To verify that the VBS fast call can be successfully established and cleared.

#### 26.14.11.3.3 Method of test

##### Initial Conditions

System Simulator:

1 cell with default parameters for ASCII testing.

Mobile Station:

The MS is in MM-state "idle, updated" with a TMSI allocated.

##### Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900).
- Support VBS originating.
- Support Compressed User-to-Dispatcher Information.
- Way to activate User-to-Dispatcher Information.
- Way to configure VBS.
- Way to initiate VBS fast calls set-up.

##### Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

## Test Procedure

By means of appropriate MMI function, the user enters a string, which shall be included in the User-to-Dispatcher Information. Then MS is made to initiate a VBS fast call. Check that the MS sends an IMMEDIATE SETUP 2 message, and check that the Compressed User-to-Dispatcher Information element is present. Then, it is checked that the call can be successfully established and released.

## Maximum Duration of Test

2 minutes.

## Expected Sequence

## 26.15 SoLSA signalling

### 26.15.1 General considerations

This subclause applies only to mobile stations supporting SoLSA, as defined in 3GPP TS 02.43 and 3GPP TS 03.73.

Conformance requirements of clause 26 fully apply to any SoLSA MS.

The purpose of this subclause is to test these extra functional requirements for a SoLSA mobile station.

Additional to the abbreviations and definitions in TR 21.905 the definitions in subclause 20.24 are used within this subclause.

### 26.15.1.1 Default message content

Default contents SYSTEM INFORMATION messages and default settings

For cell A and B:

For GSM<sup>o</sup>900 use subclause 26.6.14;

For DCS<sup>o</sup>1800 use subclause 26.6.15;

For GSM<sup>o</sup>450 use subclause 26.6.16;

For GSM<sup>o</sup>480 use subclause 26.6.17;

For PCS 1 900 use subclause 26.6.18;

For GSM 700 use subclause 26.6.19, and

For GSM 850 use subclause 26.6.20.

The following parameters shall be coded into the system information messages. Parameters shall be coded according to 3GPP TS 04.18.

SYSTEM INFORMATION TYPE 2bis, SYSTEM INFORMATION TYPE 5bis messages are not used.

#### SYSTEM INFORMATION TYPE 3

Default except:

| Information Element                                | Value/remark                         |
|----------------------------------------------------|--------------------------------------|
| SI3 rest octets<br>Early Classmark Sending Control | Early Sending is explicitly accepted |

Default message contents for other messages:

|                       |                             |
|-----------------------|-----------------------------|
| For subclause 26.15.2 | same as in subclause 26.7.6 |
| For subclause 26.15.3 | same as in subclause 26.7.6 |
| For subclause 26.15.4 | same as in subclause 26.7.6 |
| For subclause 26.15.5 | same as in subclause 26.9.9 |

### 26.15.1.2 General initial conditions for SIM card

- Following LSA values shall be defined in the fields of the EF<sub>SLL</sub> (GSM 11.11, subclause 10.4.1.2) and in the LSA descriptor files (GSM 11.11, subclause 10.4.1.3) on the SIM card used for testing:

|             | LSA ID       | CI | LAC | LAC + CI          | PLMN code | LSA Priority | Idle mode support | LSA indication for idle mode |
|-------------|--------------|----|-----|-------------------|-----------|--------------|-------------------|------------------------------|
| <b>LSA1</b> | 54<br>66.001 | -  |     |                   | HPLMN     | 0            | On                | Off                          |
| <b>LSA3</b> | 9.000.000    |    |     | 2 +<br>[250..254] | HPLMN     | 8            | On                | On                           |

2. List of values, that shall not be found in the SIM card, in order to be sure that the SoLSA MS is not subscribed to the LSA defined by the current carrier:

|           | LSA ID     | CI           | LAC | LAC + CI         |
|-----------|------------|--------------|-----|------------------|
| LSA value | [250..255] | [5000..5005] | 5   | 5 + [5000..5005] |

## 26.15.2 SoLSA signalling / RR

### 26.15.2.1 SoLSA signalling / RR / classmark interrogation

This procedure allows the network to request the MS to supply all its classmark information to the network.

Networks may systematically use this procedure (e.g. during location updating) and, if it is incorrectly implemented in the MS, the basic connection establishment procedure may systematically fail.

#### 26.15.2.1.1 Conformance requirements

On receipt of a CLASSMARK ENQUIRY message, the MS sends a CLASSMARK CHANGE message to the network containing the Mobile Station Classmark 2 information element and depending upon the contents of this information element, possibly the Mobile Station Classmark 3 information element.

#### References

3GPP TS 04.18 subclauses 3.3.1.1.4.1, 3.4.11 and 9.1.11.

3GPP TS 04.13 subclause 5.2.9.

#### 26.6.11.2.2 Test purpose

To verify that if the network requests the SoLSA MS to supply all its classmark information then this information is communicated on the DCCH to the network.

#### 26.6.11.2.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

"Idle, updated", with TMSI allocated.

#### Related PICS/PIXIT Statements

- Support of SoLSA
- Contents of Mobile Station Classmark 2 information element.
- Existence of Mobile Station Classmark 3 information element: yes/no.
- Contents of Mobile Station Classmark 3 information element.
- Switch off button: yes/no.

#### Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

## Test Procedure

The MS is switched off (or has its power removed).

The SS then sets the IMSI attach-detach flag in the SYSTEM INFORMATION messages so that the MS shall perform a location update when switched on.

The MS is switched on (or its power is re-applied). The MS then initiates a location update attempt. After the successful completion of the location update procedure (with TMSI reallocation) the SS transmits a CLASSMARK ENQUIRY message. The MS shall be ready to transmit the CLASSMARK CHANGE message before 300 ms after the end of the CLASSMARK ENQUIRY message.

The term "ready to transmit" is defined in 3GPP TS 04.13.

Then the channel is released.

## Maximum Duration of Test

2 minutes.

## Expected Sequence

| Step | Direction | Message                       | Comments                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

### 26.15.3 SoLSA signalling / MM

#### 26.15.3.1 SoLSA signalling / MM / location updating

This procedure is used to register the MS in the network. If it is not performed correctly, no call can be established.

##### 26.15.3.1.1 Location updating / accepted

To inform the network of the MSs additional SoLSA capability, the SoLSA MS has to send a CLASSMARK CHANGE as soon as possible during a normal location update procedure.

##### 26.15.3.1.1.1 Conformance requirement

If the network accepts a location updating from the Mobile where the ES IND bit is set to 1 in the Classmark 1 and the Classmark 2 information element, the SoLSA bit is set to 1 in the classmark 2 information element and the Early Classmark Sending Control bit is set to high in SI3 Rest Octets, then the MS shall send, on the first occasion, the CLASSMARK CHANGE message.

During a contention resolution procedure, if the last timeslot of the block containing a L2 UA frame occurs at time T, then the MS shall be ready to transmit the CLASSMARK CHANGE before T + 40 ms.

The Mobile Station shall, after receiving a Location updating Accept message, store the relevant received informations and answer correctly to a paging request from the network.

This test is applicable for any SoLSA MSs with an LSA SIM supporting the SoLSA operations.

#### Reference(s)

3GPP TS 24.008 subclauses 4.4.4.6, 9.2.15, 10.5.1.5 and 10.5.1.6.

3GPP TS 04.18 subclauses 3.3.1.1.4.1, 9.1.11 and 10.5.2.34.

##### 26.15.3.1.1.2 Test purpose

To verify that the SoLSA MS supports "early classmark sending procedure", e.g. sending information to the network about SoLSA support during location update procedure.

## 26.15.3.1.1.3 Method of test

## Initial conditions:

## System Simulator:

Two cells, A and B, belonging to different location areas with location area identification a and b of the same PLMN.

IMSI attach/detach is allowed in both cells.

The T3212 time-out value is 1/10 hour in both cells.

## Mobile Station:

The MS has a valid TMSI (=TMSI1) and CKSN (=CKSN1). It is "idle updated" on cell A.

## Related PICS/PIXIT statement(s)

- Support of SoLSA.

## Foreseen final state of the MS

The MS has no valid TMSI. It has valid CKSN and Kc. It is "idle, updated" on cell B.

## Test Procedure

The MS is made to select cell B. A normal location updating with TMSI reallocation is performed in cell B. The channel is released. The SS checks, by paging, that the MS has stored the newly allocated TMSI. The channel is released. The MS is made to select cell A. A normal location updating is performed in cell A. The LOCATION UPDATING ACCEPT message contains neither IMSI nor TMSI. The SS checks, by paging, that the MS has kept the old TMSI. The channel is released. The MS is made to select cell B. A normal location updating is performed in cell B. The LOCATION UPDATING ACCEPT message contains an IMSI. The SS checks, by paging, that the MS has deleted its TMSI and responds to paging with IMSI.

## Maximum duration of test

4 minutes.

## Expected sequence

## 26.15.3.2 SoLSA signalling / MM / MM information

## 26.15.3.2.1 General remark

1. The network has total control of the LSA indication in active mode.
2. Whatever the System Informations are, the LSA ID transmitted in the MM Information message has higher priority.
3. The indication of the current LSA in active mode is independent from the setting of the configurations parameters "LSA indication in idle mode" and "idle mode support" stored in the SIM in EF<sub>SLL</sub> (see 3GPP TS 11.11, subclause 10.4.1.2).

## 26.15.3.2.2 Definition and applicability

The SoLSA MS in active mode may inform the user whether or not the serving cell is an LSA cell. The information about a serving cell is indicated in the display of the SoLSA MS.

The change out of an LSA or into an LSA may be indicated by the SoLSA MS, e.g. using a beep.

## 26.15.3.2.3 Conformance requirement

1. It shall be possible to assign a subscriber defined identifier by the operator to each LSA (alphanumeric text up to 10 characters), which can be provided to the user in idle and active mode. As an MS manufacturer option the user may assign an icon or another form of indication to each LSA.

It shall be possible to indicate a change of localised service area during idle and active mode.

The indication is a network option (activated/deactivated by the network).

2. The network decides when to send a notification to the MS about a change of current LSA. The information will be sent from the MSC to the MS and will contain the LSA ID. This is done by adding the LSA ID of the current cell to the MM INFORMATION message. If no LSA ID is included in the MM Information message the MS shall assume that the current cell does not belong to any of the allowed LSAs for the subscriber.

The indication towards the user is optional and can be heard as e.g. a beep in the receiver or by displaying the stored LSA name that corresponds to the received LSA ID.

3. The MM INFORMATION message support is optional in the network. The MM information procedure may be invoked by the network at any time during an RR connection.

The MM information procedure consists only of the MM INFORMATION message sent from the network to the mobile station. During an RR connection, the network shall send none, one, or more MM INFORMATION messages to the mobile station. If more than one MM INFORMATION message is sent, the messages need not have the same content.

NOTE: The network may be able to select particular instants where it can send the MM INFORMATION message without adding delay to, or interrupting, any CM layer transaction, e.g. immediately after the AUTHENTICATION REQUEST message.

When the mobile station (supporting the MM INFORMATION message) receives an MM INFORMATION message, it shall accept the message and optionally use the contents to update appropriate information stored within the mobile station.

If the mobile station does not support the MM INFORMATION message the mobile station shall ignore the contents of the message and return an MM STATUS message with cause #97.

4. This IE (LSA Identity IE) may be sent by the network. The contents of this IE indicate the LSA identity of the serving cell.
5. The form of display and indication are left to manufacturer's choice.
6. If the Length of the LSA Identifier content is equal to 0, then no LSA ID is included. This is used to indicate that the MS has moved to an area where there is no LSA available for that MS.

### 26.15.3.2.4 Test Purpose

To verify that the SoLSA MS correctly handles the LSA information received in MM INFORMATION and performs indication accordingly.

### 26.15.3.2.5 Method of test

#### 26.15.3.2.5.1 Initial Conditions

- a) The SoLSA MS is in the active state of a call (U10).
- b) The serving cell is cell 1 (carrier 1).
- c) Parameters: same default values defined in table 20.24.1, except for the following values:

| Parameter/condition | Carrier 1          |
|---------------------|--------------------|
| LSA ID              | 54, 9.000.000, 250 |
| LAC                 | 5                  |
| CI                  | 5000               |
| Matching LSA on SIM | LSA1, LSA3         |
| Escape PLMN         | No                 |

Run the following test procedure twice by using two different sets of initial conditions:

- with an LSA only SIM (see Definitions in subclause 20.24);
- with a normal LSA SIM (see Definitions in subclause 20.24).

#### 26.15.3.2.5.2 Test Procedure

- a) A MM INFORMATION message including the LSA Identity IE is sent by the SS. The LSA Identity IE contains the LSA ID = 54 (LSA stored in the SIM).
- b) A MM INFORMATION message including the LSA Identity IE is sent by the SS. The LSA Identity IE contains the LSA ID = 250 (LSA not stored in the SIM).
- c) A MM INFORMATION message including the LSA Identity IE is sent by the SS. The LSA Identity IE contains the LSA ID = 54 (LSA stored in the SIM).
- d) The SS sends an MM INFORMATION message without an LSA Identity IE.
- e) A MM INFORMATION message including the LSA Identity IE is sent by the SS. The LSA Identity IE contains the LSA ID = 54 (LSA stored in the SIM).
- f) The SS sends an MM INFORMATION message which contains an LSA Identity IE. The value of the Length of LSA Identifier (octet 2) is set to zero (i.e. there are no LSA IDs included).
- g) A MM INFORMATION message including the LSA Identity IE is sent by the SS. The LSA Identity IE contains the LSA ID = 54 (LSA stored in the SIM).
- h) A MM INFORMATION message including the LSA Identity IE is sent by the SS. The LSA Identity IE contains the LSA ID = 9.000.000 (LSA stored in the SIM).

#### 26.15.3.2.5.3 Related PICS/PIXIT statement(s)

- Support of SoLSA.
- Interface to the human user (p1 = Y/N).
- Way to indicate the identity of the current LSA to the human user (only applicable if the SoLSA MS has an interface to the human user).
- Way to indicate the change of the current LSA to the human user (only applicable if the SoLSA MS has an interface to the human user).

#### 26.15.3.2.5.4 Test Requirements

- 1) After step a) the SoLSA MS indicates a change of LSA (a subscribed LSA is entered).
- 2) After step b) the SoLSA MS indicates a change of LSA (a not subscribed LSA is entered).
- 3) After step c) the SoLSA MS indicates a change of LSA (a subscribed LSA is entered).
- 4) After step d) the SoLSA MS indicates a change of LSA (a not subscribed LSA is entered).
- 5) After step e) the SoLSA MS indicates a change of LSA (a subscribed LSA is entered).
- 6) After step f) the SoLSA MS indicates a change of LSA (a not subscribed LSA is entered).
- 7) After step g) the SoLSA MS indicates a change of LSA (a subscribed LSA is entered).
- 8) After step h) the SoLSA MS indicates a change of LSA (another subscribed LSA is entered).

### 26.15.4 SoLSA signalling / CC

#### 26.15.4.1 SoLSA signalling / CC / call re-establishment / call present

##### 26.15.4.1.1 Conformance requirement

- 1) If the call is in the "active" state or "mobile originating modify" state, the indication from MM that re-establishment is possible shall cause call control to request re-establishment from the MM-connection, suspend any further message to be sent and await the completion of the re-establishment procedure.

- 2) After the initial message the SoLSA MS shall send a CLASSMARK CHANGE message in the uplink block followed direct after the Layer 2 UA message sent from the network. The CLASSMARK CHANGE message shall contain information elements Mobile Station Classmark 2.
- 3) When the call control entity is notified that the MM-connection is re-established, it shall then resume the transmission of possibly suspended messages and resume user data exchange when an appropriate channel is available.

### 26.15.4.1.2 Test purpose

To verify that the SoLSA MS supports "early classmark sending procedure", e.g. sending information to the network about SoLSA support during the re-establishment of an ongoing call.

### 26.15.4.1.3 Method of test

#### Related PICS/PIXIT statements

- Support of SoLSA.
- supported teleservices.

#### Initial conditions

##### System Simulator:

The SS simulates cells A and B. The LAC of cell A is different from the LAC of cell B. The PLMN identities of cell A and B are equal.

The call re-establishment parameter concerning cell A is set to an arbitrary value.

Cell B is not barred, the RACH control parameters information element sent in SYSTEM INFORMATION TYPE 1 to 4 messages of cell A and B specifies "call reestablishment allowed in the cell", the NCC of cell B is indicated as permitted in the PLMN permitted information element of SYSTEM INFORMATION TYPE 2 and 6 messages of cell A. Cell B is indicated as a neighbour cell of cell A in SYSTEM INFORMATION TYPE 2 and 5 messages of cell A. Cell reselect hysteresis parameter of cell A is set to zero.

##### Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN on cell A.

#### Foreseen final state of the MS

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

#### Maximum duration of test

1 minute.

## Test procedure

The MS is brought to active state by using procedure 26.9.2, "structured procedures, MS originated call, early assignment". The RF level of cell A is lowered so that cell B is to be selected (when the MS performs re-establishment after radio link failure), while keeping the C1 and C2 of cell A greater than zero. SS waits for at least 5 seconds. Then the SS stops transmission on the TCH/SACCH. The MS shall re-establish the call on cell B using a CM RE-ESTABLISHMENT message. The SS performs ciphering mode setting and assignment procedures. The MS shall through-connect the appropriate bearer channel. Then, the call is cleared by the SS.

## Expected sequence

| Step | Direction | Message                         | Comments                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------|-----------|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    |           |                                 | Steps 1-21 of test case 26.15.3.1 are performed (the appropriate bearer channel is through connected in both directions in TCH)                                                                                                                                                                                                                                                                                                     |
| 2    | SS        |                                 | The RF level of cell A is lowered. The SS waits at least 5 seconds. The SS stops transmission on the TCH/SACCH.                                                                                                                                                                                                                                                                                                                     |
| 3    | MS -> SS  | CHANNEL REQUEST                 | this is sent on cell B. Establ. Cause shall be "call re-establishment; TCH/F was in use,..."                                                                                                                                                                                                                                                                                                                                        |
| 4    | SS -> MS  | IMMEDIATE ASSIGNMENT            |                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 5    | MS -> SS  | CM REESTABLISHMENT REQUEST      | note specific message contents                                                                                                                                                                                                                                                                                                                                                                                                      |
| 6    | SS -> MS  | UA (CM REESTABLISHMENT REQUEST) |                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 7    | MS -> SS  | CLASSMARK CHANGE                | Shall be ready to transmit (see 3GPP TS 05.10 subclause 06.10) within 40 ms after the completion of step 5. "mobile station classmark 2" includes settings for ES IND and SoLSA<br>Note: In this case 'ready to transmit' shall result in the actual transmission of the Classmark Change 51 frames later ( $51 * 4.62\text{ms} = 235.62\text{ms}$ ). Therefore receipt of the Classmark Change within 250ms of step 5 is required. |
| 7    | SS -> MS  | CIPHERING MODE COMMAND          | SS starts deciphering after sending the message.                                                                                                                                                                                                                                                                                                                                                                                    |
| 8    | MS -> SS  | CIPHERING MODE COMPLETE         | Shall be sent enciphered. All following messages shall be sent enciphered.                                                                                                                                                                                                                                                                                                                                                          |
| 9    | SS        |                                 | SS starts ciphering.                                                                                                                                                                                                                                                                                                                                                                                                                |
| 10   | SS -> MS  | ASSIGNMENT COMMAND              |                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## 26.15.5 SoLSA signalling / structured procedures

These tests applies only to SoLSA mobile stations.

### 26.15.5.1 SoLSA signalling / structured procedures / MS originated call / early assignment

#### 26.15.5.1.1 Conformance requirements

- 1) An MS in MM state "idle, updated" and in RR idle mode, when made to initiate a call, if it provides a human interface, shall display the dialled number.
- 2) An MS in MM state "idle, updated" and in RR idle mode, when made to initiate a call for a selected teleservice that is supported by the MS, shall start to initiate the immediate assignment procedure by sending a CHANNEL REQUEST message with correct establishment cause.
- 3) After the initial message the SoLSA MS shall send a CLASSMARK CHANGE message in the uplink block followed direct after the Layer 2 UA message sent from the network. The CLASSMARK CHANGE message shall contain information elements Mobile Station Classmark 2.
- 4) Subsequently after establishment of an MM connection, the MS shall send a SETUP message with correct parameters.
- 5) The call control entity of the Mobile Station in the "call initiated" state, in the "mobile originating call proceeding" state or in the "call delivered" state, shall, upon receipt of a CONNECT message:
  - attach the user connection to the radio path;
  - return a CONNECT ACKNOWLEDGE message.
- 6) Subsequently when the network initiates call clearing by sending a DISCONNECT message, the MS shall proceed to release the call by sending a RELEASE message.
- 7) On receipt of a CHANNEL RELEASE message, the MS shall disconnect the main signalling link.

### 26.15.5.1.2 Test purpose

To verify that the SoLSA MS supports "early classmark sending procedure", e.g. sending information to the network about SoLSA support during a mobile originating call (MOC) with early assignment procedure.

### 26.15.5.1.3 Method of test

#### Related PICS/PIXIT Statements

- Support of SoLSA.
- Supported rates (full rate/half rate).
- Supported speech versions (full rate version 1, full rate version 2, half rate version 1).
- Interface to the human user (p1 = Y/N).
- Way to display the called number (only applicable if the MS has an interface to the human user).
- Way to indicate alerting (only applicable if the MS supports the feature).
- SS version.
- Supported teleservices.
- Classmark.

#### Initial Conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

#### Foreseen Final State of the MS

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

#### Test procedure

The following test is performed for all rates (full rate/half rate) supported by the MS:

- A teleservice is selected that is supported by the MS; if the MS supports speech, the selected teleservice is speech. If necessary, the MS is configured for that teleservice.
- The MS is made to initiate a call on any frequency band supported by the MS. The call is established with early assignment. Having reached the active state, the call is cleared by the SS.

#### Maximum Duration of Test

1 minute.

## Expected Sequence

| 5    | MS -> SS  | CM SERVICE REQUEST      | Message is contained in SABM. Indicating early sending of CLASSMARK CHANGE and SoLSA support                                                                                                                                                                                                                                                                                                                       |
| 6    | SS -> MS  | UA (CM SERVICE REQUEST) |                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 7    | MS -> SS  | CLASSMARK CHANGE        | Shall be ready to transmit (see 3GPP TS 05.10 subclause 06.10) within 40 ms after the completion of step 5. "mobile station classmark 2" includes settings for ES IND and SoLSA<br>Note: In this case 'ready to transmit' shall result in the actual transmission of the Classmark Change 51 frames later (51 * 4.62ms = 235.62 ms). Therefore receipt of the Classmark Change within 250ms of step 5 is required. |
| 8    | SS -> MS  | AUTHENTICATION REQUEST  |                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 9    | MS -> SS  | AUTHENTICATION RESP     | SRES specifies correct value.                                                                                                                                                                                                                                                                                                                                                                                      |
| 10   | SS -> MS  | CIPHERING MODE COMMAND  | SS starts deciphering after sending the message.                                                                                                                                                                                                                                                                                                                                                                   |
| 11   | MS -> SS  | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered.                                                                                                                                                                                                                                                                                                                                         |

## 26.15.5.2 SoLSA signalling / structured procedures / MS originated call / late assignment

### 26.15.5.2.1 Conformance requirements

- 1) An MS in MM state "idle, updated" and in RR idle mode, when made to initiate a call, if it provides a human interface, shall display the dialled number.
- 2) An MS in MM state "idle, updated" and in RR idle mode, when made to initiate a call for a selected teleservice that is supported by the MS, shall start to initiate the immediate assignment procedure by sending a CHANNEL REQUEST message with correct establishment cause.
- 3) After the initial message the SoLSA MS shall send a CLASSMARK CHANGE message in the uplink block followed direct after the Layer 2 UA message sent from the network. The CLASSMARK CHANGE message shall contain information element Mobile Station Classmark 2.
- 4) Upon receipt of the ASSIGNMENT COMMAND message, the Mobile Station initiates a local end release of link layer connections, disconnects the physical channels, commands the switching to the assigned channels and initiates the establishment of lower layer connections (this includes the activation of the channels, their connection and the establishment of the data links). After the main signalling link is successfully established, the MS returns an ASSIGNMENT COMPLETE message, specifying cause "normal event", to the network on the main DCCCH.
- 5, 6) The call control entity of the Mobile Station in the "call initiated" state, in the "mobile originating call proceeding" state or in the "call delivered" state, shall, upon receipt of a CONNECT message:
  - attach the user connection to the radio path;
  - return a CONNECT ACKNOWLEDGE message.
- 7) Subsequently when the network initiates call clearing by sending a DISCONNECT message, the MS shall proceed to release the call by sending a RELEASE message.
- 8) On receipt of a CHANNEL RELEASE message, the MS shall disconnect the main signalling link.

### 26.15.5.2.2 Test purpose

To verify that the SoLSA MS supports "early classmark sending procedure", e.g. sending information to the network about SoLSA support during a mobile originating call (MOC) with late assignment procedure.

## 26.15.5.2.3 Method of test

## Related PICS/PIXIT Statements

- Support of SoLSA.
- Supported rates (full rate/half rate).
- Supported speech versions (full rate version 1, full rate version 2, half rate version 1).
- Interface to the human user (p1 = Y/N).
- Way to display the called number (only applicable if the MS has an interface to the human user).
- Way to indicate alerting (only applicable if the MS supports the feature).
- SS version.
- Supported teleservices.
- Classmark.

## Initial Conditions

## System Simulator:

1 cell, default parameters

## Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

## Foreseen Final State of the MS

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

## Test procedure

The following test is performed for all rates (full rate/half rate) supported by the MS:

- A teleservice is selected that is supported by the MS; if the MS supports speech, the selected teleservice is speech. If necessary, the MS is configured for that teleservice.
- The MS is made to initiate a call on any frequency band supported by the MS. The call is established with late assignment. Having reached the active state, the call is cleared by the SS.

## Maximum Duration of Test

1 minute.

## Expected Sequence

| Step | Direction | Message                 | Comments                                                                                                                                                                                                                                                                                                                                                                                                           |
|------|-----------|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                         | The "called number" is entered                                                                                                                                                                                                                                                                                                                                                                                     |
| 2    | MS        |                         | If p1 = Y, the MS must display the called number in the way defined in PICS/PIXIT.                                                                                                                                                                                                                                                                                                                                 |
| 3    | MS -> SS  | CHANNEL REQUEST         | Establishment cause is "originating call and the network does not set the NECI bit to 1".                                                                                                                                                                                                                                                                                                                          |
| 4    | SS -> MS  | IMMEDIATE ASSIGNMENT    |                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 5    | MS -> SS  | CM SERVICE REQUEST      | Message is contained in SABM. Indicating early sending of CLASSMARK CHANGE and SoLSA support                                                                                                                                                                                                                                                                                                                       |
| 6    | SS -> MS  | UA (CM SERVICE REQUEST) |                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 7    | MS -> SS  | CLASSMARK CHANGE        | Shall be ready to transmit (see 3GPP TS 05.10 subclause 06.10) within 40 ms after the completion of step 5. "mobile station classmark 2" includes settings for ES IND and SoLSA<br>Note: In this case 'ready to transmit' shall result in the actual transmission of the Classmark Change 51 frames later (51 * 4.62ms = 235.62 ms). Therefore receipt of the Classmark Change within 250ms of step 5 is required. |
| 8    | SS -> MS  | AUTHENTICATION REQUEST  |                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 9    | MS -> SS  | AUTHENTICATION RESP     | SRES specifies correct value.                                                                                                                                                                                                                                                                                                                                                                                      |
| 10   | SS -> MS  | CIPHERING MODE COMMAND  | SS starts deciphering after sending the message.                                                                                                                                                                                                                                                                                                                                                                   |
| 11   | MS -> SS  | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered.                                                                                                                                                                                                                                                                                                                                         |

### 26.15.5.3 SoLSA signalling / structured procedures / MS terminated call / early assignment

#### 26.15.5.3.1 Conformance requirement

- 1) After the initial message the SoLSA MS shall send a CLASSMARK CHANGE message in the uplink block followed direct after Layer 2 UA message sent from the network.
- 2) The MS shall acknowledge the SETUP message with a CALL CONFIRMED message, if compatibility checking was successful, the MS is not busy, and the user does not refuse the call.
- 3, 4) Upon receipt of the ASSIGNMENT COMMAND message the MS continues a mobile terminating call establishment with early establishment of the traffic channel
  - a) by replying to the ASSIGNMENT COMMAND with an ASSIGNMENT COMPLETE message; and
  - b) if the MS supports immediate connect, by continuing the call establishment by through-connecting the traffic channel in both directions, or if the MS does not support immediate connect, by sending an ALERTING message.
- 5) An MS indicates acceptance of a MT call by sending CONNECT.
- 6) For speech calls:

The mobile station shall attach the user connection at latest when sending the connect message, except if there is no compatible radio resource available at this time. In this case the attachment shall be delayed until such a resource becomes available.

For data calls:

The mobile station shall attach the user connection when receiving the CONNECT ACKNOWLEDGE message from the network.

- 7) The MS initiates call clearing of an active call by sending a DISCONNECT message.
- 8) The MS in this phase of call release, upon receipt of a RELEASE message, shall return a RELEASE COMPLETE message.
- 9) Subsequently the MS, upon receipt of a CHANNEL RELEASE message, shall disconnect the main signalling link.

#### Requirement reference:

- Conformance requirement 1: 3GPP TS 04.18 subclauses 3.3.1.1.4.1 and 9.1.11,  
3GPP TS 03.73 subclause 11.4.1,  
3GPP TS 24.008 subclauses 9.2.9, 9.2.15, 10.5.1.5 and 10.5.1.6.
- Conformance requirements 2: 3GPP TS 24.008 subclauses 5.2.2.3.1.
- Conformance requirement 3, 4: 3GPP TS 04.18 subclauses 3.4.3.1 and 3.4.3.2.
- Conformance requirement 5: 3GPP TS 24.008 subclause 5.2.2.5.
- Conformance requirement 6: 3GPP TS 24.008 subclause 5.2.2.9.
- Conformance requirement 7: 3GPP TS 24.008 subclause 5.4.3.1.
- Conformance requirement 8: 3GPP TS 24.008 subclause 5.4.3.3.
- Conformance requirement 9: 3GPP TS 04.18 subclause 3.4.13.1.

#### 26.15.5.3.2 Test Purpose

To verify that the SoLSA MS supports "early classmark sending procedure", e.g. sending information to the network about SoLSA support during a mobile terminated call (MTC) with early assignment procedure.

### 26.15.5.3.3 Method of test

#### Related PICS/PIXIT statements

- Support of SoLSA.
- Supported rates (full rate/half rate).
- Supported speech versions (full rate version 1, full rate version 2, half rate version 1).
- Interface to the human user (p1 = Y/N).
- Way to display the called number (only applicable if the MS has an interface to the human user).
- Way to indicate alerting (only applicable if the MS supports the feature).
- Supported teleservices.
- Classmark.
- Immediate connect supported (Y/N).

#### Initial Conditions

##### System Simulator:

1 cell, default parameters.

##### Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

#### Test procedure

The following test is performed for all rates (full rate/half rate) supported by the MS:

- A teleservice is selected that is supported by the MS; if the MS supports speech, the selected teleservice is speech. If necessary, the MS is configured for that teleservice.
- The MS is paged and the resulting call is established. Having reached the active state, the MS is made to clear the call.

#### Maximum Duration of Test

1 minute.

## Expected Sequence

### 26.15.5.4 SoLSA signalling / structured procedures / MS terminated call / late assignment

#### 26.15.5.4.1 Conformance requirement

- 1) After the initial message the SoLSA MS shall send a CLASSMARK CHANGE message in the uplink block followed direct after Layer 2 UA message sent from the network.
- 2) The MS shall acknowledge the SETUP message with a CALL CONFIRMED message, if compatibility checking was successful, the MS is not busy, and the user does not refuse the call.
- 3) An MS indicates acceptance of a MT call by sending CONNECT. If the MS does not support immediate connect, it sends an ALERTING message
- 4, 5) Upon receipt of the ASSIGNMENT COMMAND message the MS continues a mobile terminating call establishment with late establishment of the traffic channel:
  - a) by replying to the ASSIGNMENT COMMAND with an ASSIGNMENT COMPLETE message.
- 6) For speech calls:
 

The mobile station shall attach the user connection at latest when sending the connect message, except if there is no compatible radio resource available at this time. In this case the attachment shall be delayed until such a resource becomes available.

For data calls:

The mobile station shall attach the user connection when receiving the CONNECT ACKNOWLEDGE message from the network.
- 7) The MS initiates call clearing of an active call by sending a DISCONNECT message.
- 8) The MS in this phase of call release, upon receipt of a RELEASE message, shall return a RELEASE COMPLETE message.
- 9) Subsequently the MS, upon receipt of a CHANNEL RELEASE message, shall disconnect the main signalling link.

#### Requirement reference:

Conformance requirement 1: 3GPP TS 04.18 subclauses 3.3.1.1.4.1 and 9.1.11,  
3GPP TS 03.73 subclause 11.4.1,  
3GPP TS 24.008 subclauses 9.2.9, 9.2.15, 10.5.1.5 and 10.5.1.6.

Conformance requirements 2: 3GPP TS 24.008 section 5.2.2.3.1.

Conformance requirement 3, 4: 3GPP TS 04.18 subclauses 3.4.3.1 and 3.4.3.2.

Conformance requirement 5: 3GPP TS 24.008 subclause 5.2.2.5.

Conformance requirement 6: 3GPP TS 24.008 subclause 5.2.2.9.

Conformance requirement 7: 3GPP TS 24.008 subclause 5.4.3.1.

Conformance requirement 8: 3GPP TS 24.008 subclause 5.4.3.3.

Conformance requirement 9: 3GPP TS 04.18 subclause 3.4.13.1.

#### 26.15.5.4.2 Test Purpose

To verify that the SoLSA MS supports "early classmark sending procedure", e.g. sending information to the network about SoLSA support during a mobile terminated call (MTC) with late assignment procedure.

#### 26.15.5.4.3 Method of test

##### Related PICS/PIXIT statements

- Support of SoLSA.
- Supported rates (full rate/half rate).
- Supported speech versions (full rate version 1, full rate version 2, half rate version 1).
- Interface to the human user (p1 = Y/N).
- Way to display the called number (only applicable if the MS has an interface to the human user).
- Way to indicate alerting (only applicable if the MS supports the feature).
- Supported teleservices.
- Classmark.
- Immediate connect supported (Y/N).

##### Initial Conditions

###### System Simulator:

1 cell, default parameters.

###### Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

##### Test procedure

The following test is performed for all rates (full rate/half rate) supported by the MS:

- A teleservice is selected that is supported by the MS; if the MS supports speech, the selected teleservice is speech. If necessary, the MS is configured for that teleservice.
- The MS is paged and a MT call is established with late assignment (after CONNECT). Having reached the active state, the MS is made to clear the call.

##### Maximum Duration of Test

1 minute.

## Expected Sequence

| Step | Direction | Message                 | Comments                                                                                                                                                                                                                                                                                                                                                                                                                            |

## 26.15.5.5 SoLSA signalling / structured procedures / emergency call / idle updated

## 26.15.5.5.1 Conformance requirements

- 1) The MS in the "idle, updated" state, as after a successful location update, after the number 112 (for GSM 900 and 1800 MS), or 911 (for GSM 700, GSM 850 and PCS 1 900 MS in USA and Canada), or 08 (for GSM 700, GSM 850 and PCS 1 900 MS in Mexico) has been entered by user, shall send a CHANNEL REQUEST message with correct establishment cause ("emergency call").
- 2) After assignment of a dedicated channel the first layer message sent by the MS on the assigned dedicated channel shall be a CM SERVICE REQUEST message specifying the correct CKSN and TMSI, with CM Service Type "emergency call establishment" and indicating early sending of classmark change and SoLSA support.
- 3) After the initial message the SoLSA MS shall send a CLASSMARK CHANGE message in the uplink block followed direct after the Layer 2 UA message sent from the network. The CLASSMARK CHANGE message shall contain information elements Mobile Station Classmark 2.
- 4) Authentication and cipher mode setting shall be performed successfully.
- 5) After cipher mode setting acceptance by the network, the MS shall send an EMERGENCY SETUP message.
- 6), 7) The emergency call shall be correctly established. The assignment procedure shall be correctly performed.
- 8) After receipt of a CONNECT ACKNOWLEDGE message during correct establishment of the emergency call the TCH shall be through connected in both directions if an appropriate TCH is available.
- 9) The call shall be cleared correctly.

## Requirement Reference:

- Conformance requirement 1 and 2: 3GPP TS 04.18 subclause 3.3.1.1,  
3GPP TS 24.008 subclauses 5.2.1 and 4.5.1.5,  
3GPP TS 02.30 subclause 4.2.2.
- Conformance requirement 3: 3GPP TS 04.18 subclauses 3.3.1.1.4.1 and 9.1.11,  
3GPP TS 03.73 subclause 11.4.1,  
3GPP TS 24.008 subclauses 9.2.9, 9.2.15, 10.5.1.5 and 10.5.1.6.
- Conformance requirement 4: 3GPP TS 04.18, subclause 3.4.7,  
3GPP TS 24.008 subclause 4.3.2.
- Conformance requirement 5: 3GPP TS 24.008, subclause 5.2.1.
- Conformance requirement 6 and 7: 3GPP TS 04.18, subclause 3.4.3.
- Conformance requirement 8: 3GPP TS 24.008, section 5.2.1.6.

Conformance requirement 9: 3GPP TS 24.008, subclause 5.4.

#### 26.15.5.5.2 Test purpose

To verify that the SoLSA MS supports "early classmark sending procedure", e.g. sending information to the network about SoLSA support during an Emergency Call.

#### 26.15.5.5.3 Method of test

##### Related PICS/PIXIT Statements

- Support of SoLSA.
- Speech supported.
- Supported rate for speech: (p1 = F/H, F).
- Classmark.

##### Initial Conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

##### Foreseen Final State of the MS

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

##### Test procedure

The MS is made to initiate an emergency call. The call is established with late assignment. Having reached the active state, the call is cleared by the SS.

##### Maximum Duration of Test

1 minute.

## Expected Sequence

|------|-----------|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                         | The appropriate emergency call number is entered.                                                                                                                                                                                                                                                                                                                                                                                   |
| 2    | MS -> SS  | CHANNEL REQUEST         | Establishment cause is emergency call establishment.                                                                                                                                                                                                                                                                                                                                                                                |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT    |                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 4    | MS -> SS  | CM SERVICE REQUEST      | Message is contained in SABM. The CM service type IE indicates "emergency call establishment". The classmark 2 IE indicates early sending of CLASSMARK CHANGE and SoLSA support                                                                                                                                                                                                                                                     |
| 5    | SS -> MS  | UA (CM SERVICE REQUEST) |                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 6    | MS -> SS  | CLASSMARK CHANGE        | Shall be ready to transmit (see 3GPP TS 05.10 subclause 06.10) within 40 ms after the completion of step 4. "mobile station classmark 2" includes settings for ES IND and SoLSA<br>Note: In this case 'ready to transmit' shall result in the actual transmission of the Classmark Change 51 frames later ( $51 * 4.62\text{ms} = 235.62\text{ms}$ ). Therefore receipt of the Classmark Change within 250ms of step 4 is required. |
| 7    | SS -> MS  | AUTHENTICATION REQUEST  |                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 8    | MS -> SS  | AUTHENTICATION RESPONSE | SRES specifies correct value.                                                                                                                                                                                                                                                                                                                                                                                                       |
| 9    | SS -> MS  | CIPHERING MODE COMMAND  | SS starts deciphering after sending the message.                                                                                                                                                                                                                                                                                                                                                                                    |
| 10   | MS -> SS  | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered.                                                                                                                                                                                                                                                                                                                                                          |
| 11   | SS        |                         | SS starts ciphering.                                                                                                                                                                                                                                                                                                                                                                                                                |
| 12   | MS -> SS  | EMERGENCY SETUP         | If p1 = F/H, the message must contain one bearer capability IE indicating in the radio channel requirement field "dual rate/half rate preferred" or "dual rate/full rate preferred". If p1 = F, the message must either contain no bearer capability IE or contain one bearer capability IE indicating in the radio channel requirement field "full rate channel".                                                                  |
| 13   | SS -> MS  | CALL PROCEEDING         |                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 14   | SS -> MS  | ALERTING                |                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 15   | SS -> MS  | ASSIGNMENT COMMAND      | The rate of the channel is that one indicated by the EMERGENCY SETUP message, if that message did not offer a choice, and the rate is the preferred one else.                                                                                                                                                                                                                                                                       |

## 26.15.5.6 SoLSA signalling / structured procedures / emergency call / idle, no IMSI

## 26.15.5.6.1 Conformance requirements

- 1) The MS in the "idle, updated" state, as after a successful location update, after the number 112 (for GSM 900 and 1800 MS), or 911 (for GSM 700, GSM 850 and PCS 1 900 MS in USA and Canada), or 08 (for GSM 700, GSM 850 and PCS 1 900 MS in Mexico) has been entered by user, shall send a CHANNEL REQUEST message with correct establishment cause ("emergency call").
- 2) After assignment of a dedicated channel the first layer message sent by the MS on the assigned dedicated channel shall be a CM SERVICE REQUEST message specifying the correct IMEI and a non-available CKSN, with CM Service Type "emergency call establishment" and indicating early sending of classmark change and SoLSA support.
- 3) After the initial message the SoLSA MS shall send a CLASSMARK CHANGE message in the uplink block followed direct after the Layer 2 UA message sent from the network. The CLASSMARK CHANGE message shall contain information elements Mobile Station Classmark 2.
- 4) After cipher mode setting acceptance by the network, the MS shall send an EMERGENCY SETUP message.
- 5), 6) The emergency call shall be correctly established. The assignment procedure shall be correctly performed.
- 7) After receipt of a CONNECT ACKNOWLEDGE message during correct establishment of the emergency call the TCH shall be through connected in both directions if an appropriate TCH is available.
- 8) The call shall be cleared correctly.

## Requirement Reference:

- Conformance requirement 1 and 2: 3GPP TS 04.18 subclause 3.3.1.1,  
3GPP TS 24.008 subclauses 5.2.1 and 4.5.1.5,  
3GPP TS 02.30 subclause 4.2.2.
- Conformance requirement 3: 3GPP TS 04.18 subclauses 3.3.1.1.4.1 and 9.1.11,  
3GPP TS 03.73 subclause 11.4.1,  
3GPP TS 24.008 subclauses 9.2.9, 9.2.15, 10.5.1.5 and 10.5.1.6.
- Conformance requirement 4: 3GPP TS 24.008, subclause 5.2.1.
- Conformance requirement 5 and 6: 3GPP TS 04.18, subclause 3.4.3.
- Conformance requirement 7: 3GPP TS 24.008, subclause 5.2.1.6.
- Conformance requirement 8: 3GPP TS 24.008, subclause 5.4.

## 26.15.5.6.2 Test purpose

To verify that the SoLSA MS in the "idle, no IMSI" state (no SIM inserted), supports "early classmark sending procedure", e.g. sending information to the network about SoLSA support during an Emergency Call.

## 26.15.5.6.3 Method of test

## Related PICS/PIXIT Statements

- Support of SoLSA.
- Speech supported.
- Supported rate for speech: (p1 = F/H, F).
- Classmark.

## Initial Conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, no IMSI" no SIM inserted.

## Foreseen Final State of the MS

The MS is in MM-state "idle, no IMSI" no SIM inserted.

## Test procedure

The MS is made to initiate an emergency call. The call is established without authentication, without ciphering, with late assignment. Having reached the active state, the call is cleared by the SS.

## Maximum Duration of Test

1 minute.

Expected Sequence

| Step | Direction | Message                 | Comments                                                                                                                                                                                                                                                                                                                                                                                                           |
|------|-----------|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                         | The appropriate emergency call number is entered.                                                                                                                                                                                                                                                                                                                                                                  |
| 2    | MS -> SS  | CHANNEL REQUEST         | Establishment cause is emergency call establishment.                                                                                                                                                                                                                                                                                                                                                               |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT    |                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 4    | MS ->     | CM SERVICE REQUEST      | Message is contained in SABM. The CM service type IE indicates "emergency call establishment". The mobile identity IE specifies the IMEI of the MS. The cipher key sequence number IE indicates "no key is available". The classmark 2 IE indicates early sending of CLASSMARK CHANGE and SoLSA support                                                                                                            |
| 5    | SS -> MS  | UA (CM SERVICE REQUEST) |                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 6    | MS -> SS  | CLASSMARK CHANGE        | Shall be ready to transmit (see 3GPP TS 05.10 subclause 06.10) within 40 ms after the completion of step 4. "mobile station classmark 2" includes settings for ES IND and SoLSA<br>Note: In this case 'ready to transmit' shall result in the actual transmission of the Classmark Change 51 frames later (51 * 4.62ms = 235.62 ms). Therefore receipt of the Classmark Change within 250ms of step 4 is required. |
| 7    | SS -> MS  | CM SERVICE ACCEPT       |                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 8    | MS -> SS  | EMERGENCY SETUP         | If p1 = F/H, the message must contain one bearer capability IE indicating in the radio channel requirement field "dual rate/half rate preferred" or "dual rate/full rate preferred". If p1 = F, the message must either contain no bearer capability IE or contain one bearer capability IE indicating in the radio channel requirement field "full rate channel".                                                 |
| 9    | SS -> MS  | CALL PROCEEDING         |                                                                                                                                                                                                                                                                                                                                                                                                                    |

## 26.16 Adaptive Multi Rate Signalling

This subclause only applies to MS supporting the multi rate speech codec in the GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 band.

As the multi-rate mobile station necessarily supports the speech full rate version 1 or both speech full rate version 1 and speech half rate version 1, conformance requirements of clause 26 fully apply to this mobile.

If the handset also supports the EFR speech codec this subclause does not alter the testing that is completed in subclause 26.12.

The purpose of this subclause is to test the different procedures, which may be impacted by the multi rate codec.

### 26.16.0 Default contents of layer 3 messages for AMR signalling tests

Same as subclause 26.6.14 for GSM 900 MS, subclause 26.6.15 for DCS 1 800 MS, subclause 26.6.16 for GSM 450 MS, subclause 26.6.17 for GSM 480, subclause 26.6.18 for PCS 1 900, subclause 26.6.19 for GSM 700 and subclause 26.6.20 for GSM 850.

### 26.16.1 Inband Signalling, Downlink Codec Adaptation

#### 26.16.1.1 Conformance Requirement

Ideal frequency hopping without DTX is activated, the MS shall produce Codec Mode Requests with the following accuracy:

- When a carrier to interferer ratio 4 dB higher than a defined upper threshold is applied to the antenna connector, the MS shall request a higher mode with a probability exceeding 90%. This shall be measured immediately after a settling-time of 200 ms.
- When a carrier to interferer ratio 4 dB lower than a defined lower threshold is applied to the antenna connector, the MS shall request a lower mode with a probability exceeding 90%. This shall be measured immediately after a settling-time of 200 ms.

This test is not intended to verify these conformance requirements, but to verify the correctness of the involved layer 1 and layer 3 signalling.

#### References:

3GPP TS 05.09 subclauses 3.3 and 3.4.

#### 26.16.1.2 Test Purpose

This test is concerned with the downlink link adaptation for AMR and the related inband signalling. The test shall verify that the MS can monitor the downlink quality of the dedicated channel and generate Codec Mode Requests according to the thresholds provided by the network at call setup, with an allowance for the statistical significance of the test.

NOTE 1: The test is performed under static conditions, since the power variation under TU50 during the measurement time of 200ms can be neglected.

NOTE 2: The inband signals are L1 signalling transmitted every speech frame, as defined in 3GPP TS 05.09: In uplink directions Codec Mode Requests and Codec Mode Indications are transmitted alternately, whereas downlink signalling contains of alternate Codec Mode Commands and Codec Mode Indications.

### 26.16.1.3 Method of Test

#### Initial Conditions

The MS is "idle updated", with TMSI allocated.

#### Related PICS/PIXIT Statements

The MS supports the multi-rate speech codec.

#### Foreseen Final State of MS

"Idle, updated", with TMSI allocated.

#### Test Procedure

- a) A mobile originated call is initiated, following the CHANNEL REQUEST received from the MS the SS sends an IMMEDIATE ASSIGNMENT to the MS commanding it to go to a SDCCH. The MS indicates to the SS that it supports the multi-rate speech codec. The SS allocates the MS a TCH/AFS and signals the allowed codec subset and adaptation thresholds as part of the ASSIGNMENT COMMAND. DTX shall not be activated. Hopping is activated. The hopping band is centred around an ARFCN in the Mid ARFCN range. The hopping frequencies are chosen from those defined in clause 6.

The following active codec mode subset shall apply:

| Codec Mode   | TCH/AFS in kbit/s |
|--------------|-------------------|
| CODEC_MODE_1 | 4,75              |
| CODEC_MODE_2 | 5,9               |
| CODEC_MODE_3 | 7,95              |
| CODEC_MODE_4 | 12,2              |

The following decision threshold and hysteresis values in terms of normalized carrier to interference ratio ( $C/I_{norm}$ ), shall apply for Codec Mode Command / Request (MC', MR'):

| MC'/MR'      | THR_MC_Dn(MC')/<br>THR_MR_Dn(MR') | THR_MC_Up(MC')/<br>THR_MR_Up(MR') |
|--------------|-----------------------------------|-----------------------------------|
| CODEC_MODE_4 | 18,5 dB                           | + ∞                               |
| CODEC_MODE_3 | 12,5 dB                           | 20,5 dB                           |
| CODEC_MODE_2 | 6,5 dB                            | 14,5 dB                           |
| CODEC_MODE_1 | - ∞                               | 8,5 dB                            |

- b) In addition to the wanted signal, the SS produces an independent, uncorrelated interfering signal, Standard Test Signal II (unwanted signal).
- The unwanted signal is continuous and has no fixed relationship with the bit transitions of the wanted signal. Its amplitude is 64 dB below that of the wanted signal.
- c), d) The downlink radio environment is altered by changing the carrier to interference ratio. When the radio condition crosses an adaptation threshold the MS changes the Codec Mode Request to reflect the changed signal quality. The SS will change the downlink codec to the requested mode and change the downlink Codec Mode Indication accordingly..This is continued for all thresholds given for the Active Codec Set.
- e) If the MS supports TCH/AHS the SS sends a HANDOVER\_COMMAND allocating the MS a TCH/AHS and signals the allowed codec subset and adaptation thresholds as part of the HANDOVER\_COMMAND. DTX shall not be activated. Hopping is activated. The hopping band is centred around an ARFCN in the Mid ARFCN range. The hopping frequencies are chosen from those defined in clause 6.

The following active codec mode subset shall apply:

| Codec Mode   | TCH/AHS in kbit/s |
|--------------|-------------------|
| CODEC_MODE_1 | 5,15              |
| CODEC_MODE_2 | 6,7               |
| CODEC_MODE_3 | 7,95              |

The following decision threshold and hysteresis values in terms of normalized carrier to interference ratio ( $C/I_{norm}$ ), shall apply for Codec Mode Command / Request (MC', MR'):

| MC'/MR'      | THR_MC_Dn(MC')/<br>THR_MR_Dn(MR') | THR_MC_Up(MC')/<br>THR_MR_Up(MR') |
|--------------|-----------------------------------|-----------------------------------|
| CODEC_MODE_3 | 13,0 dB                           | $+\infty$                         |
| CODEC_MODE_2 | 7,0 dB                            | 15,0 dB                           |
| CODEC_MODE_1 | $-\infty$                         | 9,0 dB                            |

- f) Step b) to d) are repeated for the settings given in step e).

Maximum Duration of Test

2 minutes.

Expected Sequence in step c), d)

NOTE: Inband signalling is transmitted every frame, but are mentioned only where changes occur. If no new Codec Mode Indications or Codec Mode Commands are to be sent, previous indication respectively request is being repeated. If Active Codec Set contains less than 4 codecs, the steps corresponding to nonassigned codecs shall be ignored.

| Step | Direction | Message                                         | Comments                                                                                                                            |

## 26.16.2 Inband Signalling, Uplink Codec Adaptation

### 26.16.2.1 Conformance Requirement

The MS shall after reception of a Codec Mode Command apply the corresponding codec mode in the uplink direction for the next possible speech frame and no more than three speech frames later. This test is not intended to verify these conformance requirements, but to verify the correctness of the involved layer 1 and layer 3 signalling.

References:

3GPP TS 05.09 subclauses 3.3 and 3.4.

### 26.16.2.2 Test Purpose

This test is concerned with the link adaptation for AMR uplink and the related inband signalling. The test shall verify that the MS in the uplink direction applies the codec mode indicated by the network transmitted Codec Mode Commands, and that the MS correctly signals the used codec as Codec Mode Indication in the uplink inband signalling.

NOTE: The inband signals are L1 signalling transmitted every speech frame, as defined in 3GPP TS 05.09: In uplink directions Codec Mode Requests and Codec Mode Indications are transmitted alternately, whereas downlink signalling contains of alternately Codec Mode Commands and Codec Mode Indications.

### 26.16.2.3 Method of Test

#### Initial Conditions

The MS is "idle updated", with TMSI allocated.

#### Related PICS/PIXIT Statements

The MS supports the multi-rate speech codec.

#### Foreseen Final State of MS

"Idle, updated", with TMSI allocated.

#### Test Procedure

- a) A mobile originated call is initiated, following the CHANNEL REQUEST received from the MS the SS sends an IMMEDIATE ASSIGNMENT to the MS commanding it to go to a SDCCH. The MS indicates to the SS that it supports the multi-rate speech codec. The SS allocates the MS a TCH/AFS and signals the allowed codec subset and adaptation thresholds as part of the ASSIGNMENT COMMAND. DTX shall not be activated. Hopping is activated. The hopping band is centred around an ARFCN in the Mid ARFCN range. The hopping frequencies are chosen from those defined in clause 6.

The following active codec mode subset shall apply:

| Codec Mode   | TCH/AFS in kbit/s |
|--------------|-------------------|
| CODEC_MODE_1 | 4,75              |
| CODEC_MODE_2 | 5,9               |
| CODEC_MODE_3 | 7,95              |
| CODEC_MODE_4 | 12,2              |

The following decision threshold and hysteresis values in terms of normalized carrier to interference ratio ( $C/I_{norm}$ ), shall apply for Codec Mode Command / Request (MC', MR'):

| MC'/MR'      | THR_MC_Dn(MC')/<br>THR_MR_Dn(MR') | THR_MC_Up(MC')/<br>THR_MR_Up(MR') |
|--------------|-----------------------------------|-----------------------------------|
| CODEC_MODE_4 | 16,5 dB                           | + ∞                               |
| CODEC_MODE_3 | 11,5 dB                           | 18,5 dB                           |
| CODEC_MODE_2 | 6,5 dB                            | 13,5 dB                           |
| CODEC_MODE_1 | - ∞                               | 8,5 dB                            |

- b) The SS signals that a new codec is wanted in uplink direction by changing the value of the Codec Mode Command. The MS shall apply the commanded mode in uplink by changing the mode and correspondingly the value of the Codec Mode Indication to match the used codec. This is repeated for all neighbouring mode transitions in the Active Codec Set.
- c) If the MS supports TCH/AHS the SS sends a HANDOVER\_COMMAND allocating the MS a TCH/AHS and signals the allowed codec subset and adaptation thresholds as part of the HANDOVER\_COMMAND. DTX shall not be activated. Hopping is activated. The hopping band is centred around an ARFCN in the Mid ARFCN range. The hopping frequencies are chosen from those defined in clause 6.

The following active codec mode subset shall apply:

| Codec Mode   | TCH/AHS in kbit/s |
|--------------|-------------------|
| CODEC_MODE_1 | 5,15              |
| CODEC_MODE_2 | 6,7               |
| CODEC_MODE_3 | 7,95              |

The following decision threshold and hysteresis values in terms of normalized carrier to interference ratio ( $C/I_{norm}$ ), shall apply for Codec Mode Command / Request (MC', MR'):

| MC'/MR'      | THR_MC_Dn(MC')/<br>THR_MR_Dn(MR') | THR_MC_Up(MC')/<br>THR_MR_Up(MR') |
|--------------|-----------------------------------|-----------------------------------|
| CODEC_MODE_3 | 12,5 dB                           | + ∞                               |
| CODEC_MODE_2 | 11,0 dB                           | 15,0 dB                           |
| CODEC_MODE_1 | - ∞                               | 13,0 dB                           |

- d) Step b) is repeated for the settings given in step c).

Maximum Duration of Test

2 minutes

Expected Sequence in step b)

| Step | Direction | Message                      | Comments                                                                                  |
|------|-----------|------------------------------|-------------------------------------------------------------------------------------------|
| A1   | SS->MS    | Codec Mode Command change    | Codec Mode 3 is commanded by inband signalling                                            |
| A2   | MS->SS    | Codec Mode Indication change | Codec Mode Indication shows current active mode in uplink, thus changed when mode changes |
| 3    | SS->MS    | Codec Mode Command change    | Codec Mode 2 is commanded by inband signalling                                            |
| 4    | MS->SS    | Codec Mode Indication change | Codec Mode 2 is indicated in inband signalling with first frame using Codec Mode 2        |
| 5    | SS->MS    | Codec Mode Command change    | Codec Mode 1 is commanded by changing inband signal                                       |
| 6    | MS->SS    | Codec Mode Indication change | Codec Mode 1 is indicated in inband signalling with first frame using Codec Mode 1.       |
| 7    | SS->MS    | Codec Mode Command change    | Codec Mode 2 is commanded by changing inband signal                                       |
| 8    | MS->SS    | Codec Mode Indication change | Codec Mode 2 is indicated in inband signalling with first frame using Codec Mode 2.       |
| 9    | SS->MS    | Codec Mode Command change    | Codec Mode 3 is commanded by changing inband signal                                       |
| 10   | MS->SS    | Codec Mode Indication change | Codec Mode 3 is indicated in inband signalling with first frame using Codec Mode 3.       |
| A11  | SS->MS    | Codec Mode Command change    | Codec Mode 4 is commanded by changing inband signal                                       |
| A12  | MS->SS    | Codec Mode Indication change | Codec Mode 4 is indicated in inband signalling with first frame using Codec Mode 4        |

In TCH/AHS the Active Codec Set contains only three of four possible codecs, thus steps prefixing A are not implemented in this case.

### 26.16.3 Structured procedures / MS terminated call / early assignment / no initial codec mode

This test applies to mobiles supporting the AMR speech codec.

NOTE: this test is derived from the one described in subclause 26.12 and entitled: "Structured procedures / MS terminated call / early assignment"

#### 26.16.3.1 Conformance requirement

- 1) In acceptance to a SETUP message indicating speech, the MS shall indicate and include in the CALL CONFIRMED message all the speech versions that it supports.
- 2) Upon receipt of the ASSIGNMENT COMMAND message specifying using CHx-FR or CHx/HR the Mobile Station continues a mobile terminating call establishment with early assignment of traffic channel:
  - a) by replying to the ASSIGNMENT command with an ASSIGNMENT COMPLETE message; and
  - b) by continuing the call establishment by through connecting TCH in both directions if it supports immediate connect or by sending an ALERTING message otherwise.
- 3) The ASSIGNMENT command will not specify which of the codec modes the MS should use, but allow the handset to select the default codec mode.
- 4) For speech calls, the mobile station shall attach the user connection at latest when sending the connect message, except if there is no compatible radio resource available at this time. In this case the attachment shall be delayed until such a resource becomes available.

CHx: identifies any of the Channel Codec mode.

FR: full rate channel.

HR: half rate channel.

#### References:

3GPP TS 04.08 / 3GPP TS 44.018 subclauses 9.1.2 and 9.1.5.

3GPP TS 05.09 subclause 3.4.

#### 26.16.3.2 Test purpose

- 1) To verify that, in acceptance to a SETUP message indicating speech, the MS indicates and includes in the CALL CONFIRMED message all the speech versions that it supports.
- 2) To verify that upon receipt of the ASSIGNMENT COMMAND message specifying using CHx-FR or CHx/HR the Mobile Station continues a mobile terminating call establishment with early assignment of traffic channel:
  - a) by replying to the ASSIGNMENT COMMAND with an ASSIGNMENT COMPLETE message; and

- b) by continuing the call establishment by through connecting TCH in both directions if it supports immediate connect or by sending an ALERTING message otherwise.
- 3) To verify that upon receipt of an ASSIGNMENT COMMAND with no codec mode specified, the MS shall use the default codec mode.
- 4) To verify that for speech calls, the mobile station shall attach the user connection at latest when sending the connect message, except if there is no compatible radio resource available at this time. In this case the attachment shall be delayed until such a resource becomes available.

### 26.16.3.3 Method of Test

#### Initial Conditions

SS 1 cell, default parameters.

MS in MM-state "idle, updated" with valid TMSI and CKSN.

#### Related PICS/PIXIT Statements

- Way to indicate alerting.
- Way to make the MS accept an incoming call after alerting.
- Speech supported for full rate version 3.
- Speech supported for half rate version 3.

#### Foreseen Final State of MS

"Idle, updated", with TMSI allocated.

#### Test Procedure

The following test is performed for both channel modes of the multi-rate codec, i.e. full rate and half rate:

- A teleservice is selected that is supported by the MS; if the MS supports speech, the selected teleservice is speech. If necessary, the MS is configured for that teleservice.
- The MS is paged and the resulting call is established. Having reached the active state, the MS is made to clear the call.

#### Maximum Duration of Test

3 minutes

#### Expected Sequence

This test is repeated for M = 1, 2, 3, 4.

This test is repeated for K=1, and where the MS supports half rate version 3 K=2.

| Step | Direction | Message                 | Comments                                                                                                                                                                                                                                                                   |

### 26.16.3a Structured procedures / MS terminated call / early assignment / specified initial codec mode

This test applies to mobiles supporting the AMR speech codec.

NOTE: this test is derived from the one described in subclause 26.12 and entitled: "Structured procedures / MS terminated call / early assignment"

#### 26.16.3a.1 Conformance requirement

- 1) In acceptance to a SETUP message indicating speech, the MS shall indicate and include in the CALL CONFIRMED message all the speech versions that it supports.
- 2) Upon receipt of the ASSIGNMENT COMMAND message specifying using CHx-FR or CHx/HR the Mobile Station continues a mobile terminating call establishment with early assignment of traffic channel:
  - a) by replying to the ASSIGNMENT command with an ASSIGNMENT COMPLETE message; and
  - b) by continuing the call establishment by through connecting TCH in both directions if it supports immediate connect or by sending an ALERTING message otherwise.
- 3) The ASSIGNMENT COMMAND will specify the subset of codec modes that the MS is allowed to use for the call, the thresholds and the initial codec mode for immediate use by the MS.
- 4) For speech calls, the mobile station shall attach the user connection at latest when sending the connect message, except if there is no compatible radio resource available at this time. In this case the attachment shall be delayed until such a resource becomes available.

CHx: identifies any of the Channel Codec mode.

FR: full rate channel.

HR: half rate channel.

3GPP TS 04.08 / 3GPP TS 44.018 subclauses 9.12 and 9.1.5.

3GPP TS 05.09 subclause 3.4.

#### 26.16.3a.2 Test purpose

- 1) To verify that, in acceptance to a SETUP message indicating speech, the MS indicates and includes in the CALL CONFIRMED message all the speech versions that it supports.
- 2) To verify that upon receipt of the ASSIGNMENT COMMAND message specifying using CHx-FR or CHx/HR the Mobile Station continues a mobile terminating call establishment with early assignment of traffic channel:
  - a) by replying to the ASSIGNMENT command with an ASSIGNMENT COMPLETE message; and
  - b) by continuing the call establishment by through connecting TCH in both directions if it supports immediate connect or by sending an ALERTING message otherwise.
- 3) To verify that upon receipt of an ASSIGNMENT COMMAND with codec mode specified, the MS shall use that specified codec mode.
- 4) To verify that for speech calls, the mobile station shall attach the user connection at latest when sending the connect message, except if there is no compatible radio resource available at this time. In this case the attachment shall be delayed until such a resource becomes available.

#### 26.16.3a.3 Method of Test

##### Initial Conditions

SS 1 cell, default parameters

MS in MM-state "idle, updated" with valid TMSI and CKSN

#### Related PICS/PIXIT Statements

Way to indicate alerting.

Way to make the MS accept an incoming call after alerting.

Speech supported for full rate version 3.

Speech supported for half rate version 3.

#### Foreseen Final State of MS

"Idle, updated", with TMSI allocated.

#### Test Procedure

The following test is performed for both channel modes of the multi-rate codec, ie full rate and half rate:

A teleservice is selected that is supported by the MS; if the MS supports speech, the selected teleservice is speech. If necessary, the MS is configured for that teleservice.

The MS is paged and the resulting call is established. Having reached the active state, the MS is made to clear the call.

#### Maximum Duration of Test

3 minutes

#### Expected Sequence

This test is repeated for M=1,2,3,4.

This test is repeated for K=1, and where the MS supports half rate version 3 K=2.

## 26.16.4 Structured procedures / MS originated call / late assignment / specified initial codec mode

This test applies to mobiles supporting the AMR speech codec.

NOTE: This test is derived from the one described in subclause 26.12 and entitled: "Structured procedures / MS terminated call / early assignment".

### 26.16.4.1 Conformance requirement

- 1) The MS shall indicate and include in the mobile originating SETUP for speech call all the speech versions that it supports.
- 2) Upon receipt of the ASSIGNMENT COMMAND message using full rate version 1, 2 or 3 or half rate version 1, the Mobile Station starts a normal channel assignment procedure. It means that the MS initiates a local end release of link layer connections, disconnects the physical channels, commands the switching to the assigned channels and initiates the establishment of lower layer connections (this includes the activation of the channels, their connection and the establishment of the data links). After the main signalling link is successfully established, the MS returns an ASSIGNMENT COMPLETE message, specifying cause 'normal event', to the network on the main DCCH.

### References:

3GPP TS 04.08 / 3GPP TS 44.018 subclauses 9.12 and 9.1.5.

3GPP TS 05.09 subclause 3.4.

### 26.16.4.2 Test purpose

- 1) To verify that the MS indicates and includes in the mobile originating SETUP for speech call all the speech versions that it supports.
- 2) To verify that subsequently after receipt of an IMMEDIATE ASSIGNMENT message allocating an SDCCH, after completion of establishment of the main signalling link, after having sent a CM SERVICE REQUEST message, after having successfully performed authentication and cipher mode setting procedures, after having sent a SETUP message, after having received a CALL PROCEEDING message followed by an ALERTING message and an ASSIGNMENT COMMAND message allocating using speech full rate version 1, 2 or 3 or speech half rate version 1, the MS sends an ASSIGNMENT COMPLETE message. The ASSIGNMENT COMMAND message will also identify which codec mode the MS is allowed to use for the call, the threshold values and the initial codec mode for immediate use.

### 26.16.4.3 Method of Test

#### Initial Conditions

SS 1 cell, default parameters.

MS in MM-state "idle, updated" with valid TMSI and CKSN.

#### Related PICS/PIXIT Statements

- Way to indicate alerting.
- Way to make the MS accept an incoming call after alerting.
- Speech supported for full rate version 3.
- Speech supported for half rate version 3.

#### Foreseen Final State of MS

The MS has a MO call in state U10, "active".

Test Procedure

The following test is performed for both channel modes of the multi-rate codec, ie full rate and half rate.

The MS is made to initiate a speech call. The call is established with a late assignment.

Maximum Duration of Test

3 minutes.

Expected Sequence

This test is repeated for M = 1, 2, 3, 4.

This test is repeated for K=1, and where the MS supports half rate version 3 K=2.

| Step | Direction | Message                 | Comments                                                                                                                   |
|------|-----------|-------------------------|----------------------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                         | The "called number" is entered                                                                                             |
| 2    | MS->SS    | CHANNEL REQUEST         |                                                                                                                            |
| 3    | SS->MS    | IMMEDIATE ASSIGNMENT    |                                                                                                                            |
| 4    | MS->SS    | CM SERVICE REQUEST      | Message is contained in SABM                                                                                               |
| 5    | SS->MS    | AUTHENTICATION REQUEST  |                                                                                                                            |
| 6    | MS->SS    | AUTHENTICATION RESPONSE | SRES specifies correct value                                                                                               |
| 7    | SS->MS    | CIPHERING MODE COMMAND  | SS starts deciphering after sending the message                                                                            |
| 8    | MS->SS    | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered.                                                 |
| 9    | SS        |                         | SS starts ciphering                                                                                                        |
| 10   | MS->SS    | SETUP                   | The MS indicates it supports the FR version 3 speech, and FR version 1, 2 speech and HR version 1 speech can be supported. |
| 11   | SS->MS    | CALL PROCEEDING         |                                                                                                                            |
| 12   | SS->MS    | ALERTING                |                                                                                                                            |
| 13   | MS        |                         | An alerting indication as defined in the PICS/PIXIT statement is given by the MS.                                          |
| 14   | SS->MS    | ASSIGNMENT COMMAND      | SS allocates allowed subset codec modes, but does identifies a mode for immediate operation.                               |
| 15   | MS->SS    | ASSIGNMENT COMPLETE     |                                                                                                                            |
| 16   | SS->MS    | CONNECT                 |                                                                                                                            |
| 17   | MS        |                         | The TCH shall be through connected by both directions in the dedicated mode, using the codec mode specified.               |

## 26.16.4a Structured procedures / MS originated call / late assignment / no initial codec mode

This test applies to mobiles supporting the AMR speech codec.

NOTE: This test is derived from the one described in subclause 26.16.4 and entitled: "Structured procedures / MS originated call / late assignment / specified initial codec mode".

### 26.16.4a.1 Conformance requirement

- 1) The MS shall indicate and include in the mobile originating SETUP for speech call all the speech versions that it supports.
- 2) Upon receipt of the ASSIGNMENT COMMAND message using full rate version 3 or half rate version 3, the Mobile Station starts a normal channel assignment procedure. It means that the MS initiates a local end release of link layer connections, disconnects the physical channels, commands the switching to the assigned channels and initiates the establishment of lower layer connections (this includes the activation of the channels, their connection and the establishment of the data links). After the main signalling link is successfully established, the MS returns an ASSIGNMENT COMPLETE message, specifying cause 'normal event', to the network on the main DCCH. The ASSIGNMENT COMMAND message will also specify the subset of codec modes that the MS is allowed to use for the call and the threshold values. The ASSIGNMENT COMMAND will not specify the initial codec mode but will, rather, allow the MS to select the default codec mode.

If the Initial Codec Mode is not signalled, then the default Initial Codec Mode is given by the following implicit rule. If the Active Codec Set contains:

- 1 mode, then this shall be the Initial Codec Mode.
- 2 or 3 modes, then the Initial Codec mode shall be the most robust mode of the set (with lowest bit rate).
- 4 modes, then the Initial Codec Mode shall be the second most robust mode of the set (with second lowest bit rate). If the Active Codec Set is changed during the call, then this default Initial Codec Mode shall be used until an other ICM is explicitly signalled.

3GPP TS 05.09 subclause 3.4.

### 26.16.4a.2 Test purpose

- 1) To verify that the MS indicates and includes in the mobile originating SETUP for speech call all the speech versions that it supports.
- 2) To verify that subsequently after receipt of an IMMEDIATE ASSIGNMENT message allocating an SDCCH, after completion of establishment of the main signalling link, after having sent a CM SERVICE REQUEST message, after having successfully performed authentication and cipher mode setting procedures, after having sent a SETUP message, after having received a CALL PROCEEDING message followed by an ALERTING message and an ASSIGNMENT COMMAND message allocating using speech full rate version 3 or speech half rate version 3, the MS sends an ASSIGNMENT COMPLETE message. The ASSIGNMENT COMMAND message will also specify the subset of codec modes that the MS is allowed to use for the call and the threshold values. The ASSIGNMENT COMMAND will not specify the initial codec mode but will, rather, allow the MS to select the default codec mode.

### 26.16.4a.3 Method of Test

#### Initial Conditions

SS 1 cell, default parameters

MS in MM-state "idle, updated" with valid TMSI and CKSN

## Related PICS/PIXIT Statements

- Way to indicate alerting.
- Way to make the MS accept an incoming call after alerting.
- Speech supported for full rate version 3.
- Speech supported for half rate version 3.

## Foreseen Final State of MS

The MS has a MO call in state U10, "active".

## Test Procedure

The following test is performed for both channel modes of the multi-rate codec, ie full rate and half rate.

The MS is made to initiate a speech call. The call is established with a late assignment.

## Maximum Duration of Test

3 minutes

## Expected Sequence

This test is repeated for M=1,2,3,4.

This test is repeated for K=1, and where the MS supports half rate version 3 K=2.

## 26.16.5 AMR signalling / Handover / active call / successful case

A number of different parameters have been identified that may affect the call handover, these are:

- GSM 700, GSM 850, GSM 900 or GSM1800 or PCS 1 900;
- Frequency hopping on, frequency hopping off;
- Channel mode: TCH/F or TCH/H;
- DTX on or DTX off;
- Codec mode (TCH/F: CH1 – CH8 and TCH/H: CH9 – CH14).

This test applies to mobiles supporting the AMR speech codec.

This test applies only to MS supporting the GSM 700, GSM 850, R-GSM, E-GSM, P-GSM 900, GSM 1800 or the PCS 1 900 frequency band.

NOTE: This test is derived from 26.12.2 – EFR Signalling/Handover/active call/successful case.

### References:

3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.4.3.1, 3.4.6, 9.1.2, 9.1.5 and 9.1.15.

### 26.16.5.1 Conformance requirements

The MS shall correctly apply the handover procedure in the non-synchronised case when:

- a call is in progress; and
- handover is performed from a TCH/F with/without frequency hopping towards a TCH/F with/without frequency hopping;
- handover is performed from a cell with DTX on/off to a cell with DTX on/off;
- handover is performed from a cell where the dedicated channel is TCH/F or H to a cell where the dedicated channel will be TCH/F or H;
- handover is performed where the codec mode is set to any valid mode (dependant on the channel allocation) to a cell where codec mode will become any valid mode (dependant on the channel allocation).

### 26.16.5.2 Test Purpose

To ensure that the terminal handovers correctly, when the cells have different parameter settings. The call shall be established before the handover is made and verified that it is still active after the handover.

The tests below indicate the cell parameter settings from the cell that has the call established to the new cell parameter settings that will maintain the call.

### 26.16.5.3 Method of Test

#### Initial Conditions

MS in call active state U10 on cell A.

SS 2 cells, A and B with same LAI, default parameters except:

#### GSM 900:

Cell A has:

BCCH ARFCN = 20

Cell Allocation = (10, 17, 20, 26, 34, 42, 45, 46, 52, 59, 66, 73, 74, 75, 76, 108, 114)

Cell B has:

BCCH ARFCN = 40

Cell Allocation = (14, 18, 22, 24, 30, 31, 38, 40, 60, 66, 73, 74, 75, 76, 108, 114)

The frame numbers of cells A and B shall be different by 100.

The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

#### GSM1800:

Cell A has:

BCCH ARFCN = 747

Cell Allocation = (734, 741, 747, 754, 759, 762, 766, 767, 773, 775, 779, 782, 791, 798, 829, 832, 844)

Cell B has:

BCCH ARFCN = 764

Cell Allocation = (739, 743, 746, 749, 756, 758, 761, 764, 771, 779, 782, 791, 798, 829, 832, 844)

The Cell Allocation of both Cell A and Cell B shall be coded using range 256 format.

The frame numbers of cells A and B shall be different by 100.

The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

#### PCS 1 900:

Cell A has:

BCCH ARFCN = 647

Cell Allocation = (634, 641, 647, 654, 659, 662, 666, 667, 673, 675, 679, 682, 691, 698, 729, 732, 744)

Cell B has:

BCCH ARFCN = 664

Cell Allocation = (639, 643, 646, 649, 656, 658, 661, 664, 671, 679, 682, 691, 698, 729, 732, 744)

The Cell Allocation of both Cell A and Cell B shall be coded using range 256 format.

The frame numbers of cells A and B shall be different by 100.

The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

#### GSM 700:

Cell A has:

BCCH ARFCN = 457.

Cell Allocation = (447, 454, 457, 463, 471, 479, 482, 483, 489, 496, 498, 500, 501, 502, 503, 506, 508).

Cell B has:

BCCH ARFCN = 477.

Cell Allocation = (451, 455, 459, 461, 467, 468, 475, 477, 497, 498, 500, 501, 502, 503, 506, 508).

The frame numbers of cells A and B shall be different by 100.

The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

**GSM 850:**

Cell A has:

BCCH ARFCN = 147.

Cell Allocation = (137, 144, 147, 153, 161, 169, 172, 173, 179, 186, 193, 200, 201, 202, 203, 235, 241).

Cell B has:

BCCH ARFCN = 167.

Cell Allocation = (141, 145, 149, 151, 157, 158, 165, 167, 187, 193, 200, 201, 202, 203, 235, 241).

The frame numbers of cells A and B shall be different by 100.

The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

#### Related PICS/PIXIT Statements

- Speech supported for MR version 1 and full rate version1.
- Support for state U10 of the Call Control protocol.
- Support for the multi-rate speech version 1.
- Type of Mobile Station (GSM 700, GSM 850, P-GSM or E-GSM or R-GSM or GSM1800 or PCS 1 900).

#### Foreseen Final State of MS

The MS has a MO call in state U10, "active".

#### Maximum Duration of Test

10 minutes.

#### Expected Sequence

The following test sequence shall be used for each of the test cases described below.

| Step | Direction | Message              | Comments                                                                                                                                                                                                                                                                                                                                                                                                          |
|------|-----------|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0    | MS -> SS  |                      | The MS and SS are in the active state of a call on the channel described below.                                                                                                                                                                                                                                                                                                                                   |
| 1    | SS -> MS  | HANDOVER COMMAND     | See Specific message contents                                                                                                                                                                                                                                                                                                                                                                                     |
| 2    | MS -> SS  | HANDOVER ACCESS      | Repeated on every burst of the uplink main DCCH until reception of PHYSICAL INFORMATION. Handover Reference as included in the HANDOVER COMMAND. If the HANDOVER COMMAND includes a starting time IE then the first HANDOVER ACCESS message shall be transmitted in the indicated frame (unless the indicated frame is not used by that channel, in which case the next frame used by that channel shall be used) |
| 3    | SS -> MS  | PHYSICAL INFORMATION | Sent after reception of n HANDOVER ACCESS messages. See specific message contents.                                                                                                                                                                                                                                                                                                                                |
| 4    | MS -> SS  | SABM                 | Sent without information field                                                                                                                                                                                                                                                                                                                                                                                    |
| 5    | SS -> MS  | UA                   |                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 6    | MS -> SS  | HANDOVER COMPLETE    | The message shall be ready to be transmitted before 'x' ms after the completion of step 3.                                                                                                                                                                                                                                                                                                                        |
| 7    | MS -> SS  |                      | The MS and SS are in the active state of a call on the TCH described below. The SS checks that the TCH is through connected in the correct mode.                                                                                                                                                                                                                                                                  |

## Test Cases

## Test 26.16.5.3.1

| Cell Parameters                            | Cell A | Cell B |
|--------------------------------------------|--------|--------|
| Frequency Hopping                          | ON     | ON     |
| Frequency Band                             | 900    | 900    |
| DTX                                        | OFF    | OFF    |
| Traffic Channel                            | FR     | FR     |
| Speech Codec                               | AMR    | AMR    |
| Handover specifies Multirate configuration |        | YES    |
| Handover specifies ICM                     |        | YES    |

## Test 26.16.5.3.2

| Cell Parameters                            | Cell A | Cell B |
|--------------------------------------------|--------|--------|
| Frequency Hopping                          | ON     | OFF    |
| Frequency Band                             | 900    | 900    |
| DTX                                        | ON     | OFF    |
| Traffic Channel                            | HR     | FR     |
| Speech Codec                               | AMR    | AMR    |
| Handover specifies Multirate configuration |        | YES    |
| Handover specifies ICM                     |        | YES    |

## Test 26.16.5.3.3

| Cell Parameters                            | Cell A | Cell B |
|--------------------------------------------|--------|--------|
| Frequency Hopping                          | ON     | ON     |
| Frequency Band                             | 900    | 1800   |
| DTX                                        | ON     | ON     |
| Traffic Channel                            | FR     | HR     |
| Speech Codec                               | AMR    | AMR    |
| Handover specifies Multirate configuration |        | YES    |
| Handover specifies ICM                     |        | YES    |

## Test 26.16.5.3.4

| Cell Parameters                            | Cell A | Cell B |
|--------------------------------------------|--------|--------|
| Frequency Hopping                          | OFF    | ON     |
| Frequency Band                             | 900    | 1800   |
| DTX                                        | OFF    | ON     |
| Traffic Channel                            | HR     | HR     |
| Speech Codec                               | AMR    | AMR    |
| Handover specifies Multirate configuration |        | YES    |
| Handover specifies ICM                     |        | YES    |

## Test 26.16.5.3.5

| Cell Parameters                            | Cell A | Cell B |
|--------------------------------------------|--------|--------|
| Frequency Hopping                          | OFF    | ON     |
| Frequency Band                             | 1800   | 1800   |
| DTX                                        | ON     | ON     |
| Traffic Channel                            | FR     | FR     |
| Speech Codec                               | AMR    | AMR    |
| Handover specifies Multirate configuration |        | YES    |
| Handover specifies ICM                     |        | YES    |

## Test 26.16.5.3.6

| Cell Parameters                            | Cell A | Cell B |
|--------------------------------------------|--------|--------|
| Frequency Hopping                          | ON     | ON     |
| Frequency Band                             | 1800   | 900    |
| DTX                                        | ON     | ON     |
| Traffic Channel                            | FR     | FR     |
| Speech Codec                               | AMR    | EFR    |
| Handover specifies Multirate configuration |        | N/A    |
| Handover specifies ICM                     |        | N/A    |

## Test 26.16.5.3.7

| Cell Parameters                            | Cell A | Cell B |
|--------------------------------------------|--------|--------|
| Frequency Hopping                          | ON     | ON     |
| Frequency Band                             | 700    | 700    |
| DTX                                        | OFF    | OFF    |
| Traffic Channel                            | FR     | FR     |
| Speech Codec                               | AMR    | AMR    |
| Handover specifies Multirate configuration |        | YES    |
| Handover specifies ICM                     |        | YES    |

## Test 26.16.5.3.8

| Cell Parameters                            | Cell A | Cell B |
|--------------------------------------------|--------|--------|
| Frequency Hopping                          | ON     | OFF    |
| Frequency Band                             | 700    | 700    |
| DTX                                        | ON     | OFF    |
| Traffic Channel                            | HR     | FR     |
| Speech Codec                               | AMR    | AMR    |
| Handover specifies Multirate configuration |        | YES    |
| Handover specifies ICM                     |        | YES    |

## Test 26.16.5.3.9

| Cell Parameters                            | Cell A | Cell B |
|--------------------------------------------|--------|--------|
| Frequency Hopping                          | ON     | ON     |
| Frequency Band                             | 850    | 850    |
| DTX                                        | OFF    | OFF    |
| Traffic Channel                            | FR     | FR     |
| Speech Codec                               | AMR    | AMR    |
| Handover specifies Multirate configuration |        | YES    |
| Handover specifies ICM                     |        | YES    |

## Test 26.16.5.3.10

| Cell Parameters                            | Cell A | Cell B |
|--------------------------------------------|--------|--------|
| Frequency Hopping                          | ON     | OFF    |
| Frequency Band                             | 850    | 850    |
| DTX                                        | ON     | OFF    |
| Traffic Channel                            | HR     | FR     |
| Speech Codec                               | AMR    | AMR    |
| Handover specifies Multirate configuration |        | YES    |
| Handover specifies ICM                     |        | YES    |

## Test 26.16.5.3.11

| Cell Parameters                            | Cell A | Cell B |
|--------------------------------------------|--------|--------|
| Frequency Hopping                          | ON     | ON     |
| Frequency Band                             | 850    | 1900   |
| DTX                                        | ON     | ON     |
| Traffic Channel                            | FR     | HR     |
| Speech Codec                               | AMR    | AMR    |
| Handover specifies Multirate configuration |        | YES    |
| Handover specifies ICM                     |        | YES    |

## Test 26.16.5.3.12

| Cell Parameters                            | Cell A | Cell B |
|--------------------------------------------|--------|--------|
| Frequency Hopping                          | OFF    | ON     |
| Frequency Band                             | 850    | 1900   |
| DTX                                        | OFF    | ON     |
| Traffic Channel                            | HR     | HR     |
| Speech Codec                               | AMR    | AMR    |
| Handover specifies Multirate configuration |        | YES    |
| Handover specifies ICM                     |        | YES    |

## Test 26.16.5.3.13

| Cell Parameters                            | Cell A | Cell B |
|--------------------------------------------|--------|--------|
| Frequency Hopping                          | ON     | ON     |
| Frequency Band                             | 1900   | 850    |
| DTX                                        | ON     | ON     |
| Traffic Channel                            | FR     | FR     |
| Speech Codec                               | AMR    | EFR    |
| Handover specifies Multirate configuration |        | N/A    |
| Handover specifies ICM                     |        | N/A    |

## Test 26.16.5.3.14

| Cell Parameters                            | Cell A | Cell B |
|--------------------------------------------|--------|--------|
| Frequency Hopping                          | ON     | ON     |
| Frequency Band                             | 900    | 900    |
| DTX                                        | OFF    | OFF    |
| Traffic Channel                            | FR     | FR     |
| Speech Codec                               | AMR    | AMR    |
| Handover specifies Multirate configuration |        | NO     |
| Handover specifies ICM                     |        | NO     |

## Test 26.16.5.3.15

| Cell Parameters                            | Cell A | Cell B |
|--------------------------------------------|--------|--------|
| Frequency Hopping                          | ON     | ON     |
| Frequency Band                             | 900    | 900    |
| DTX                                        | OFF    | OFF    |
| Traffic Channel                            | FR     | FR     |
| Speech Codec                               | AMR    | AMR    |
| Handover specifies Multirate configuration |        | YES    |
| Handover specifies ICM                     |        | NO     |

## Test 26.16.5.3.16

| Cell Parameters                            | Cell A | Cell B |
|--------------------------------------------|--------|--------|
| Frequency Hopping                          | ON     | OFF    |
| Frequency Band                             | 900    | 900    |
| DTX                                        | ON     | OFF    |
| Traffic Channel                            | HR     | FR     |
| Speech Codec                               | AMR    | AMR    |
| Handover specifies Multirate configuration |        | YES    |
| Handover specifies ICM                     |        | NO     |

## Test 26.16.5.3.17

| Cell Parameters                            | Cell A | Cell B |
|--------------------------------------------|--------|--------|
| Frequency Hopping                          | ON     | ON     |
| Frequency Band                             | 900    | 1800   |
| DTX                                        | ON     | ON     |
| Traffic Channel                            | FR     | HR     |
| Speech Codec                               | AMR    | AMR    |
| Handover specifies Multirate configuration |        | YES    |
| Handover specifies ICM                     |        | NO     |

## Test 26.16.5.3.18

| Cell Parameters                            | Cell A | Cell B |
|--------------------------------------------|--------|--------|
| Frequency Hopping                          | ON     | OFF    |
| Frequency Band                             | 1800   | 900    |
| DTX                                        | ON     | OFF    |
| Traffic Channel                            | HR     | HR     |
| Speech Codec                               | AMR    | AMR    |
| Handover specifies Multirate configuration |        | NO     |
| Handover specifies ICM                     |        | NO     |

## Test 26.16.5.3.19

| Cell Parameters                            | Cell A | Cell B |
|--------------------------------------------|--------|--------|
| Frequency Hopping                          | OFF    | ON     |
| Frequency Band                             | 900    | 1800   |
| DTX                                        | OFF    | ON     |
| Traffic Channel                            | HR     | HR     |
| Speech Codec                               | AMR    | AMR    |
| Handover specifies Multirate configuration |        | YES    |
| Handover specifies ICM                     |        | NO     |

## Test 26.16.5.3.20

| Cell Parameters                            | Cell A | Cell B |
|--------------------------------------------|--------|--------|
| Frequency Hopping                          | ON     | ON     |
| Frequency Band                             | 700    | 700    |
| DTX                                        | OFF    | OFF    |
| Traffic Channel                            | FR     | FR     |
| Speech Codec                               | AMR    | AMR    |
| Handover specifies Multirate configuration |        | NO     |
| Handover specifies ICM                     |        | NO     |

## Test 26.16.5.3.21

| Cell Parameters                            | Cell A | Cell B |
|--------------------------------------------|--------|--------|
| Frequency Hopping                          | ON     | ON     |
| Frequency Band                             | 700    | 700    |
| DTX                                        | OFF    | OFF    |
| Traffic Channel                            | FR     | FR     |
| Speech Codec                               | AMR    | AMR    |
| Handover specifies Multirate configuration |        | YES    |
| Handover specifies ICM                     |        | NO     |

## Test 26.16.5.3.22

| Cell Parameters                            | Cell A | Cell B |
|--------------------------------------------|--------|--------|
| Frequency Hopping                          | ON     | OFF    |
| Frequency Band                             | 700    | 700    |
| DTX                                        | ON     | OFF    |
| Traffic Channel                            | HR     | FR     |
| Speech Codec                               | AMR    | AMR    |
| Handover specifies Multirate configuration |        | YES    |
| Handover specifies ICM                     |        | NO     |

## Test 26.16.5.3.23

| Cell Parameters                            | Cell A | Cell B |
|--------------------------------------------|--------|--------|
| Frequency Hopping                          | ON     | ON     |
| Frequency Band                             | 850    | 850    |
| DTX                                        | OFF    | OFF    |
| Traffic Channel                            | FR     | FR     |
| Speech Codec                               | AMR    | AMR    |
| Handover specifies Multirate configuration |        | NO     |
| Handover specifies ICM                     |        | NO     |

## Test 26.16.5.3.24

| Cell Parameters                            | Cell A | Cell B |
|--------------------------------------------|--------|--------|
| Frequency Hopping                          | ON     | ON     |
| Frequency Band                             | 850    | 850    |
| DTX                                        | OFF    | OFF    |
| Traffic Channel                            | FR     | FR     |
| Speech Codec                               | AMR    | AMR    |
| Handover specifies Multirate configuration |        | YES    |
| Handover specifies ICM                     |        | NO     |

## Test 26.16.5.3.25

| Cell Parameters                            | Cell A | Cell B |
|--------------------------------------------|--------|--------|
| Frequency Hopping                          | ON     | OFF    |
| Frequency Band                             | 850    | 850    |
| DTX                                        | ON     | OFF    |
| Traffic Channel                            | HR     | FR     |
| Speech Codec                               | AMR    | AMR    |
| Handover specifies Multirate configuration |        | YES    |
| Handover specifies ICM                     |        | NO     |

## Test 26.16.5.3.26

| Cell Parameters                            | Cell A | Cell B |
|--------------------------------------------|--------|--------|
| Frequency Hopping                          | ON     | ON     |
| Frequency Band                             | 850    | 1900   |
| DTX                                        | ON     | ON     |
| Traffic Channel                            | FR     | HR     |
| Speech Codec                               | AMR    | AMR    |
| Handover specifies Multirate configuration |        | YES    |
| Handover specifies ICM                     |        | NO     |

## Test 26.16.5.3.27

| Cell Parameters                            | Cell A | Cell B |
|--------------------------------------------|--------|--------|
| Frequency Hopping                          | ON     | OFF    |
| Frequency Band                             | 1900   | 850    |
| DTX                                        | ON     | OFF    |
| Traffic Channel                            | HR     | HR     |
| Speech Codec                               | AMR    | AMR    |
| Handover specifies Multirate configuration |        | NO     |
| Handover specifies ICM                     |        | NO     |

## Test 26.16.5.3.28

| Cell Parameters                            | Cell A | Cell B |
|--------------------------------------------|--------|--------|
| Frequency Hopping                          | OFF    | ON     |
| Frequency Band                             | 850    | 1900   |
| DTX                                        | OFF    | ON     |
| Traffic Channel                            | HR     | HR     |
| Speech Codec                               | AMR    | AMR    |
| Handover specifies Multirate configuration |        | YES    |
| Handover specifies ICM                     |        | NO     |

## Test 26.16.5.3.29

| Cell Parameters                            | Cell A | Cell B |
|--------------------------------------------|--------|--------|
| Frequency Hopping                          | ON     | ON     |
| Frequency Band                             | 1800   | 900    |
| DTX                                        | OFF    | OFF    |
| Traffic Channel                            | HR     | FR     |
| Speech Codec                               | AMR    | EFR    |
| Handover specifies Multirate configuration |        | N/A    |
| Handover specifies ICM                     |        | N/A    |

## Test 26.16.5.3.30

| Cell Parameters                            | Cell A | Cell B |
|--------------------------------------------|--------|--------|
| Frequency Hopping                          | ON     | ON     |
| Frequency Band                             | 1800   | 1800   |
| DTX                                        | ON     | OFF    |
| Traffic Channel                            | FR     | FR     |
| Speech Codec                               | EFR    | AMR    |
| Handover specifies Multirate configuration |        | YES    |
| Handover specifies ICM                     |        | YES    |

## Test 26.16.5.3.31

| Cell Parameters                            | Cell A | Cell B |
|--------------------------------------------|--------|--------|
| Frequency Hopping                          | ON     | ON     |
| Frequency Band                             | 900    | 900    |
| DTX                                        | OFF    | ON     |
| Traffic Channel                            | FR     | HR     |
| Speech Codec                               | EFR    | AMR    |
| Handover specifies Multirate configuration |        | YES    |
| Handover specifies ICM                     |        | YES    |

## Test 26.16.5.3.32

| Cell Parameters                            | Cell A | Cell B |
|--------------------------------------------|--------|--------|
| Frequency Hopping                          | ON     | ON     |
| Frequency Band                             | 1900   | 850    |
| DTX                                        | OFF    | OFF    |
| Traffic Channel                            | HR     | FR     |
| Speech Codec                               | AMR    | EFR    |
| Handover specifies Multirate configuration |        | N/A    |
| Handover specifies ICM                     |        | N/A    |

## Test 26.16.5.3.33

| Cell Parameters                            | Cell A | Cell B |
|--------------------------------------------|--------|--------|
| Frequency Hopping                          | ON     | ON     |
| Frequency Band                             | 1900   | 1900   |
| DTX                                        | ON     | OFF    |
| Traffic Channel                            | FR     | FR     |
| Speech Codec                               | EFR    | AMR    |
| Handover specifies Multirate configuration |        | YES    |
| Handover specifies ICM                     |        | YES    |

## Test 26.16.5.3.34

| Cell Parameters                            | Cell A | Cell B |
|--------------------------------------------|--------|--------|
| Frequency Hopping                          | ON     | ON     |
| Frequency Band                             | 850    | 850    |
| DTX                                        | OFF    | ON     |
| Traffic Channel                            | FR     | HR     |
| Speech Codec                               | EFR    | AMR    |
| Handover specifies Multirate configuration |        | YES    |
| Handover specifies ICM                     |        | YES    |

## Test 26.16.5.3.35

| Cell Parameters                            | Cell A | Cell B |
|--------------------------------------------|--------|--------|
| Frequency Hopping                          | OFF    | ON     |
| Frequency Band                             | 1900   | 1900   |
| DTX                                        | ON     | ON     |
| Traffic Channel                            | FR     | FR     |
| Speech Codec                               | AMR    | AMR    |
| Handover specifies Multirate configuration |        | YES    |
| Handover specifies ICM                     |        | YES    |

NOTE 1: FR: indicates Full Rate traffic channel assigned for AMR use.

NOTE 2: HR: indicates Half Rate traffic channel assigned for AMR use.

NOTE 3: N/A: indicates not applicable since handover is to non-multirate codec.

## 26.16.6 Structured procedures / emergency call

This test applies to mobiles supporting the AMR speech codec.

NOTE: this test is derived from subclause 26.15.5 - Structured procedures / emergency call.

### 26.16.6.1 Conformance requirement

- 1) The MS in the "idle, updated" state, after a successful location update, the number 112 (for GSM 900 and DCS 1800 MS), or 911 (for GSM 700, GSM 850 and PCS 1 900 MS in USA and Canada), or 08 (for GSM 700, GSM 850 and PCS 1 900 MS in Mexico) has been entered by user, shall send a CHANNEL REQUEST message with correct establishment cause ("emergency call").
- 2) After assignment of a dedicated channel the first layer message sent by the MS on the assigned dedicated channel shall be a CM SERVICE REQUEST message specifying the correct CKSN and TMSI , with CM Service Type "emergency call establishment".
- 3) Authentication and cipher mode setting shall be performed successfully.
- 4) After cipher mode setting acceptance by the network, the MS shall send an EMERGENCY SETUP message.
- 5) The AMR mobile station shall accept channel assignment to a TCH/F or TCH/H depending what the network signals to the mobile and also select the correct codec mode. The call shall be set up using the AMR codec.
- 6) After receipt of a CONNECT ACKNOWLEDGE message during correct establishment of the emergency call the TCH shall be through connected in both directions if an appropriate TCH is available.
- 7) The call shall be cleared correctly.

### 26.16.6.2 Test purpose

- 1) To verify that an MS supporting speech in the MM state "idle, updated", when made to call the number 112 (for GSM 900 and DCS 1800 MS), or 911 (for GSM 700, GSM 850 and PCS 1 900 MS in USA and Canada), or 08 (for GSM 700, GSM 850 and PCS 1 900 MS in Mexico), sends a CHANNEL REQUEST message with establishment cause "emergency call".
- 2) To verify that after assignment of a dedicated channel the first layer message sent by the MS on the assigned dedicated channel is a CM SERVICE REQUEST message specifying the correct CKSN and TMSI, with CM Service Type "emergency call establishment".
- 3) To verify that authentication and cipher mode setting are performed successfully.
- 4) To verify that after cipher mode setting acceptance by the SS, the MS sends an EMERGENCY SETUP message.
- 5) To verify that the AMR mobile station shall both accept channel assignment to a TCH/F or TCH/H depending what the network signals to the mobile and also select the correct codec mode. The call shall be set up using the AMR codec.
- 6) To verify that subsequently the MS has through connected the TCH in both directions.
- 7) To verify the call is cleared correctly.

### 26.16.6.3 Method of Test

#### Initial Conditions

SS: 1 cell default parameters.

MS: The MS is in the MM-state "idle, updated" with valid TMSI and CKSN.

#### Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" with valid TMSI and CKSN.

#### Related PICS/PIXIT Statements

- Speech supported for MR version 1 and full rate version1.

#### Test Procedure

The MS is made to initiate an emergency call. The call is established with late assignment. Having reached the active state, the call is cleared by the SS. This procedure is repeated so that the assignment is made with all the channel rates and speech versions supported by the MS.

#### Maximum Duration of Test

3 minutes.

## Expected Sequence

| Step | Direction | Message                 | Comments                                                                                                     |
|------|-----------|-------------------------|--------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                         | The appropriate emergency call number is entered                                                             |
| 2    | MS->SS    | CHANNEL REQUEST         | Establishment cause is emergency call establishment.                                                         |
| 3    | SS->MS    | IMMEDIATE ASSIGNMENT    |                                                                                                              |

## 26.16.7 AMR Signalling / Directed Retry / Mobile Originated Call

This test is applicable to all MS which support AMR speech.

This test applies only to MS supporting the GSM 700, GSM 850, R-GSM, E-GSM, P-GSM 900, DCS 1 800 or PCS 1 900 frequency band.

NOTE: This test is derived from the one defined in subclause 26.12.6 and entitled "EFR Signalling / Directed Retry / Mobile Originated Call".

## 26.16.7.1 Conformance requirements

The MS shall correctly apply the Directed Retry procedure from SDCCH/8 (no frequency hopping) to TCH/AMR with frequency hopping in the non-synchronized case during call establishment. The call control entity of the Mobile Station in the "mobile originating call proceeding" state shall, upon receipt of a CONNECT message, attach the AMR speech connection to the radio path and return a CONNECT ACKNOWLEDGE message to the SS.

### 26.16.7.2 Test purpose

To test that, when the MS is ordered to perform a non-synchronized handover after the CALL PROCEED message, it continuously sends access bursts on the main DCCH until it receives a PHYSICAL INFORMATION message from the SS. To test that the MS correctly takes the values of the Timing Advance information element in the PHYSICAL INFORMATION message into account. To test that the MS activates the new channel correctly and transmits the HANDOVER COMPLETE message without undue delay. To test that the call control entity of the Mobile Station in the "mobile originating call proceeding" state, upon receipt of a CONNECT message, attaches the AMR speech connection to the radio path and returns a CONNECT ACKNOWLEDGE message to the SS.

### 26.16.7.3 Method of test

#### Initial Conditions

System Simulator:

2 cells A and B with same LAI, default parameters, except:

GSM 900:

Cell A has:

BCCH ARFCN = 20.

Cell Allocation = (10, 17, 20, 26, 34, 42, 45, 46, 52, 59, 66, 73, 74, 75, 76, 108, 114).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

NCC\_PERM = 00001010.

Cell B has:

BCCH ARFCN = 40.

Cell Allocation = (14, 18, 22, 24, 30, 31, 38, 40, 60, 66, 73, 74, 75, 76, 108, 114).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using bit map 0 format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

A non-combined SDCCH is used.

DCS 1 800:

Cell A has:

BCCH ARFCN = 747.

Cell Allocation = (734, 741, 747, 754, 759, 762, 766, 767, 773, 775, 779, 782, 791, 798, 829, 832, 844).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

NCC\_PERM = 00001010.

Cell B has:

BCCH ARFCN = 764.

Cell Allocation = (739, 743, 746, 749, 756, 758, 761, 764, 771, 779, 782, 791, 798, 829, 832, 844).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using Range 512 format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

A non-combined SDCCH is used.

PCS 1 900:

Cell A has:

BCCH ARFCN = 647.

Cell Allocation = (634, 641, 647, 654, 659, 662, 666, 667, 673, 675, 679, 682, 691, 698, 729, 732, 744).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

NCC\_PERM = 00001010.

Cell B has:

BCCH ARFCN = 664.

Cell Allocation = (639, 643, 646, 649, 656, 658, 661, 664, 671, 679, 682, 691, 698, 729, 732, 744).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using Range 512 format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

A non-combined SDCCH is used.

GSM 700:

Cell A has:

BCCH ARFCN = 457.

Cell Allocation = (447, 454, 457, 463, 471, 479, 482, 483, 489, 496, 498, 500, 501, 502, 503, 506, 508).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

NCC\_PERM = 00001010.

Cell B has:

BCCH ARFCN = 477.

Cell Allocation = (451, 455, 459, 461, 467, 468, 475, 477, 497, 498, 500, 501, 502, 503, 506, 508).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using 128 range format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

A non-combined SDCCH is used.

GSM 850:

Cell A has:

BCCH ARFCN = 147.

Cell Allocation = (137, 144, 147, 153, 161, 169, 172, 173, 179, 186, 193, 200, 201, 202, 203, 235, 241).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

NCC\_PERM = 00001010.

Cell B has:

BCCH ARFCN = 167.

Cell Allocation = (141, 145, 149, 151, 157, 158, 165, 167, 187, 193, 200, 201, 202, 203, 235, 241).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using 128 range format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

A non-combined SDCCH is used.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated and camped on cell A.

#### Related PICS/PIXIT Statements

- Speech supported for MR version 1 and full rate version1.
- Support for MO calls.
- Way to indicate alerting (only applicable if the MS supports the feature).
- Type of MS (GSM 700 or GSM 850 or P-GSM 900 or EGSM or RGSM or DCS 1 800 or PCS 1 900).

#### Foreseen Final State of the MS

"Idle, updated" with TMSI allocated and camped on cell B.

## Test Procedure

The MS is made to initiate a speech call on Cell A. After the SS has sent the CALL PROCEEDING message the SS sends a HANDOVER COMMAND message, ordering the MS to switch to cell B. The MS shall then begin to send access bursts on the new DCCH to cell B. The SS observes the access bursts and after receiving n (n being arbitrarily chosen between values according to table 26.6-2 of subclause 26.6.5) access bursts, the SS sends one PHYSICAL INFORMATION message with an arbitrarily chosen Timing Advance. The MS shall activate the channel in sending and receiving mode. The MS shall establish a signalling link. The MS shall be ready to transmit a HANDOVER COMPLETE message before x ms after the end of the PHYSICAL INFORMATION message, but not before a UA frame has been sent by the SS. After the successful handover procedure the SS sends the ALERTING message. The correct alerting indication shall be given to the user (only applicable if the MS supports this feature). The SS sends the CONNECT message indicating that the call has been answered. The AMR speech channel shall be through connected in both directions. The MS shall send then the CONNECT ACKNOWLEDGE message as the response on the CONNECT message. Having reached the active state, the call is cleared by the SS.

The term "ready to transmit" is defined in 3GPP TS 04.13. The value of "x" depends upon the target channel and is specified in the specific message contents section.

## Maximum Duration of Test

1 minute, including 30 s for any necessary operator actions.

## Expected Sequence

| Step | Direction | Message                 | Comments                                                                                                                                         |
|------|-----------|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    |           |                         | A MO call is initiated on cell A.                                                                                                                |
| 2    | MS -> SS  | CHANNEL REQUEST         | Establishment cause is "originating call and the network does not set the NECI bit to 1".                                                        |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT    | See specific message contents.                                                                                                                   |
| 4    | MS -> SS  | CM SERVICE REQUEST      | CM Service Type = Mobile Originating Call Establishment.                                                                                         |
| 5    | SS -> MS  | AUTHENTICATION REQUEST  |                                                                                                                                                  |
| 6    | MS -> SS  | AUTHENTICATION RESPONSE | SRES specifies correct value.                                                                                                                    |
| 7    | SS -> MS  | CIPHERING MODE COMMAND  | SS starts deciphering after sending the message.                                                                                                 |
| 8    | MS -> SS  | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered.                                                                       |
| 9    | SS        |                         | SS starts ciphering.                                                                                                                             |
| 10   | MS -> SS  | SETUP                   | AMR speech                                                                                                                                       |

Step 17: "x" = 500.

## 26.16.8 AMR Signalling / Directed Retry / Mobile Terminated Call

This test is applicable to all MS which support AMR speech.

This test applies only to MS supporting the GSM 700, GSM 850, R-GSM, E-GSM, P-GSM 900, DCS 1 800 or the PCS 1 900 frequency band.

NOTE: This test is derived from the one defined in subclause 26.12.7 and entitled "EFR Signalling / Directed Retry / Mobile Terminated Call".

### 26.16.8.1 Conformance requirements

The MS shall correctly apply the Directed Retry procedure from SDCCH/8 with frequency hopping to TCH/AMR with frequency hopping and starting time in the non-synchronized case during call establishment. The call control entity of the Mobile Station in the "call delivered" state shall, if the MS supports immediate connect, continue the call establishment by through-connecting the AMR traffic channel in both directions, or if the MS does not support immediate connect, send an ALERTING message. The MS indicates acceptance of a MT call by sending CONNECT.

The mobile station shall attach the user connection at latest when sending the CONNECT message, except if there is no compatible radio resource available at this time. In this case the attachment shall be delayed until such a resource becomes available.

- 3GPP TS 04.13, subclause 5.2.6.2.

### 26.16.8.2 Test purpose

To test that when the MS is ordered to perform a non-synchronized handover after the CALL CONFIRM message, it continuously sends access bursts on the main DCCH until it receives a PHYSICAL INFORMATION message from the SS. To test that the MS correctly takes the values of the Timing Advance information element in the PHYSICAL INFORMATION message into account. To test that the MS activates the new channel correctly and transmits the HANDOVER COMPLETE message without undue delay. To test that the call control entity of the Mobile Station in the "call delivered" state, if the MS supports immediate connect, continues the call establishment by through-connecting the AMR traffic channel in both directions, or if the MS does not support immediate connect, sends an ALERTING message. To test that the MS indicates acceptance of a MT call by sending CONNECT.

To test that the mobile station attaches the user connection at latest when sending the CONNECT message, except if there is no compatible radio resource available at this time. To test that in this case the attachment is delayed until such a resource becomes available.

### 26.16.8.3 Method of test

#### Initial Conditions

System Simulator:

2 cells A and B with same LAI, default parameters, except:

GSM 900:

Cell A has:

BCCH ARFCN = 20.

Cell Allocation = (10, 17, 20, 26, 34, 42, 45, 46, 52, 59, 66, 73, 74, 75, 76, 108, 114).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

NCC\_PERM = 00001010.

Cell B has:

BCCH ARFCN = 40.

Cell Allocation = (14, 18, 22, 24, 30, 31, 38, 40, 60, 66, 73, 74, 75, 76, 108, 114).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using bit map 0 format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

A non-combined SDCCH is used.

DCS 1 800:

Cell A has:

BCCH ARFCN = 747.

Cell Allocation = (734, 741, 747, 754, 759, 762, 766, 767, 773, 775, 779, 782, 791, 798, 829, 832, 844).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

NCC\_PERM = 00001010.

Cell B has:

BCCH ARFCN = 764.

Cell Allocation = (739, 743, 746, 749, 756, 758, 761, 764, 771, 779, 782, 791, 798, 829, 832, 844).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using Range 512 format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

A non-combined SDCCH is used.

PCS 1 900:

Cell A has:

BCCH ARFCN = 647.

Cell Allocation = (634, 641, 647, 654, 659, 662, 666, 667, 673, 675, 679, 682, 691, 698, 729, 732, 744).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

NCC\_PERM = 00001010.

Cell B has:

BCCH ARFCN = 664.

Cell Allocation = (639, 643, 646, 649, 656, 658, 661, 664, 671, 679, 682, 691, 698, 729, 732, 744).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using Range 512 format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

A non-combined SDCCH is used.

GSM 700:

Cell A has:

BCCH ARFCN = 457.

Cell Allocation = (447, 454, 457, 463, 471, 479, 482, 483, 489, 496, 498, 500, 501, 502, 503, 506, 508).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

NCC\_PERM = 00001010.

Cell B has:

BCCH ARFCN = 477.

Cell Allocation = (451, 455, 459, 461, 467, 468, 475, 477, 497, 498, 500, 501, 502, 503, 506, 508).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using 128 range format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

A non-combined SDCCH is used.

GSM 850:

Cell A has:

BCCH ARFCN = 147.

Cell Allocation = (137, 144, 147, 153, 161, 169, 172, 173, 179, 186, 193, 200, 201, 202, 203, 235, 241).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

NCC\_PERM = 00001010.

Cell B has:

BCCH ARFCN = 167.

Cell Allocation = (141, 145, 149, 151, 157, 158, 165, 167, 187, 193, 200, 201, 202, 203, 235, 241).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using 128 range format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

A non-combined SDCCH is used.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated and camped on cell A.

#### Related PICS/PIXIT Statements

- Speech supported for MR version 1 and full rate version1.
- Support for MT calls.
- Way to indicate alerting (only applicable if the MS supports the feature).
- Way to make the MS accept an incoming call after alerting.
- Immediate connect supported (Y/N).
- Type of MS (GSM 700 or GSM 850 or P-GSM 900 or EGSM or RGSM or DCS 1 800 or PCS 1 900).

#### Foreseen Final State of the MS

"Idle, updated" with TMSI allocated and camped on cell B.

#### Test Procedure

The MS is paged on Cell A. The MS responds to the PAGING REQUEST message and establishes a mobile terminated speech call on Cell A. If the MS supports immediate connect, it continues the call establishment by through-connecting

the traffic channel in both directions, or if the MS does not support immediate connect, it sends an ALERTING message. The MS indicates acceptance of a MT call by sending CONNECT.

After the MS has sent the CALL CONFIRMED message (if the MS supports immediate connect then the MS sends the CONNECT message after the CALL CONFIRMED message on the old channel) the SS sends a HANDOVER COMMAND message, ordering the MS to switch to cell B. The MS shall then begin to send access bursts on the new DCCH to cell B. The SS observes the access bursts and after receiving  $n$  ( $n$  being arbitrarily chosen between values according to table 26.6-2 of subclause 26.6.5) access bursts, the SS sends one PHYSICAL INFORMATION message with an arbitrarily chosen Timing Advance. The MS shall activate the channel in sending and receiving mode. The MS shall establish a signalling link. The MS shall be ready to transmit a HANDOVER COMPLETE message before  $x$  ms after the end of the PHYSICAL INFORMATION message, but not before a UA frame has been sent by the SS. After the successful handover procedure the MS sends the ALERTING message (if the MS runs the immediate connect procedure then the MS does not send an ALERTING message). The correct alerting indication shall be given to the user (only applicable if the MS supports the feature or if the MS is not using the immediate connect procedure). After the MS sent the CONNECT message the AMR speech channel shall be through connected in both directions. The SS sends then the CONNECT ACKNOWLEDGE message as the response on the CONNECT message. Having reached the active state, the call is cleared by the SS.

The term "ready to transmit" is defined in 3GPP TS 04.13. The value of " $x$ " depends upon the target channel and is specified in the specific message contents section.

#### Maximum Duration of Test

1 minute, including 30 s for any necessary operator actions.

## Expected Sequence

| Step | Direction | Message                 | Comments                                                                                                                                                                                                                                                                                                                                                  |
|------|-----------|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PAGING REQUEST TYPE 1   | Sent on the correct paging subchannel on cell A.                                                                                                                                                                                                                                                                                                          |

## 26.16.9 AMR RATSCCH Protocol

### 26.16.9.1 AMR Configuration Change (normal)

#### 26.16.9.1.1 Conformance requirements

The AMR\_CONFIG\_REQ message may be sent by the BTS during a call to change the AMR configuration on the radio interface without interruption of the speech transmission.

The ACK\_OK message serves as an acknowledgement that a RATSCCH REQ message has been detected, correctly decoded (no CRC error) and that it is defined for the Addressee. It defines the exact activation time in direction from Addressee to Initiator.

#### Reference

3GPP TS 05.09 sub-clauses: 3.2.2.3.1, 3.2.2.3.5

#### 26.16.9.1.2 Test purpose

This test will verify that the MS is able to handle a properly formatted AMR\_CONFIG\_REQ message.

#### 26.16.9.1.3 Method of test

#### Initial Conditions

System Simulator:

1 cell with default parameters

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated and camped on cell A.

#### Related PICS/PIXIT Statements

- Speech supported for full rate version 3.
- Speech supported for half rate version 3.

#### Foreseen Final State of the MS

Idle Updated, TMSI allocated and camped on cell A.

#### Test Procedure

This sequence is performed for execution counter, k = 1, 2.

When k = 1, DTX is not used:

- 1) User initiates a Mobile Originated call.
- 2) The network and the MS indicate Bearer capabilities IE with the AMR speech Full Rate and Half Rate (Version 3).
- 3) The network performs an assignment on a TCH channel with MultiRate configuration to the MS.
- 4) The call is maintained during a programmable time without variation of RxLev /RxQual.
- 5) The SS shall send a properly formatted AMR\_CONFIG\_REQ message during the call at a programmable time.

- 6) The MS answers with a ACK\_OK message within 3 speech frames
- 7) The network initiates the call release.

When k = 2, DTX is used:

- 1) In the serving cell, the DTX indicator is set to "MS shall use discontinuous transmission".
- 2) User initiates a Mobile Originated call.
- 3) The network and the MS indicate Bearer capabilities IE with the AMR speech Full Rate and Half Rate (Version 3).
- 4) The network performs an assignment on a TCH channel with MultiRate configuration to the MS.
- 5) The call is maintained during a programmable time without variation of RxLev /RxQual.
- 6) The SS shall send a properly formatted AMR\_CONFIG\_REQ message during the call at a programmable time.
- 7) The MS answers with a ACK\_OK message within 3 speech frames.
- 8) The network initiates the call release.

This test is repeated for M=1, and where the MS supports half rate version 3 M=2.

#### Maximum Duration of Test

5 minutes

#### Expected Sequence

When k=1:

| Step | Direction | Message              | Comments                                                                                                     |
|------|-----------|----------------------|--------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                      | MS is in idle mode                                                                                           |
| 2    | MS        |                      | MS initiates Mobile Originated call                                                                          |

### 26.16.9.2 AMR Configuration Change (abnormal)

#### 26.16.9.2.1 Conformance requirements

The AMR\_CONFIG\_REQ message may be sent by the BTS during a call to change the AMR configuration on the radio interface without interruption of the speech transmission.

The ACK\_ERR message serves as a negative acknowledgement that a RATSCCH REQ message has been detected, i.e. the RATSCCH pattern was detected, but could not be decoded correctly (CRC error), or its content is not understandable by the addressee.

#### Reference:

3GPP TS 05.09 sub-clauses: 3.2.2.3.2, 3.2.2.3.5

### 26.16.9.2.2 Test purpose

This test will verify that the MS is able to handle an improperly formatted AMR\_CONFIG\_REQ message.

### 26.16.9.2.3 Method of test

#### Initial Conditions

##### System Simulator:

1 cell with default parameters

##### Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated and camped on cell A.

#### Related PICS/PIXIT Statements

- Speech supported for full rate version 3.
- Speech supported for half rate version 3.

#### Foreseen Final State of the MS

Idle Updated, TMSI allocated and camped on cell A.

#### Test Procedure

- 1) User initiates a Mobile Originated call.
- 2) The network and the MS indicate Bearer capabilities IE with the AMR speech Full Rate and Half Rate (Version 3).
- 3) The network performs an assignment on a TCH channel with MultiRate configuration to the MS.
- 4) The call is maintained during a programmable time without variation of RxLev /RxQual.
- 5) The SS shall send an AMR\_CONFIG\_REQ message, with an incorrect CRC, during the call at a programmable time.
- 6) The MS answers with a ACK\_ERR message within 3 speech frames
- 7) The network initiates the call release.

This test is repeated for M=1, and where the MS supports half rate version 3 M=2.

#### Maximum Duration of Test

5 minutes

## 26.16.9.3 Codec Mode Phase Change (normal)

## 26.16.9.3.1 Conformance requirements

The CMI\_PHASE\_REQ message may be sent by the BTS to change the phase of the Codec Mode Indication in downlink.

The ACK\_OK message serves as an acknowledgement that a RATSCCH\_REQ message has been detected, correctly decoded (no CRC error) and that it is defined for the Addressee. It defines the exact activation time in direction from Addressee to Initiator.

**Reference:**

3GPP TS 05.09 sub-clauses: 3.2.2.3.1, 3.2.2.3.4

**26.16.9.3.2 Test purpose**

This test will verify that the MS can correctly handle a properly formatted CMI\_PHASE\_REQ message.

**26.16.9.3.3 Method of test****Initial Conditions****System Simulator:**

1 cell with default parameters

**Mobile Station:**

The MS is in the "idle, updated" state, with a TMSI allocated and camped on cell A.

**Related PICS/PIXIT Statements**

- Speech supported for full rate version 3.
- Speech supported for half rate version 3.

**Foreseen Final State of the MS**

Idle Updated, TMSI allocated and camped on cell A.

**Test Procedure**

- 1) User initiates a Mobile Originated call.
- 2) The network and the MS indicate Bearer capabilities IE with the AMR speech Full Rate and Half Rate (Version 3).
- 3) The network performs an assignment on a TCH channel with MultiRate configuration to the MS.
- 4) The call is maintained during a programmable time without variation of RxLev /RxQual.
- 5) The SS shall send the CMI\_PHASE\_REQ message during the call at a programmable time. The CMI\_PHASE\_REQ shall be sent either in place of a "CMI" speech frame, or in place of a "CMC" speech frame, to cover both kinds of changes.
- 6) The MS answers with a ACK\_OK message within 3 speech frames.
- 7) The downlink CMI phase is changed (or not) according to the CMI\_PHASE\_REQ message starting with speech frame N+12.
- 8) The network initiates the call release.

This test is repeated for M=1, and where the MS supports half rate version 3 M=2.

**Maximum Duration of Test**

5 minutes

## 26.16.9.4 Codec Mode Phase Change (abnormal)

## 26.16.9.4.1 Conformance requirements

The CMI\_PHASE\_REQ message may be sent by the BTS to change the phase of the Codec Mode Indication in downlink.

The ACK\_ERR message serves as a negative acknowledgement that a RATSCCH REQ message has been detected, i.e. the RATSCCH pattern was detected, but could not be decoded correctly (CRC error), or its content is not understandable by the addressee.

## Reference

3GPP TS 05.09 sub-clauses: 3.2.2.3.2, 3.2.2.3.4

#### 26.16.9.4.2 Test purpose

This test will verify that the MS can correctly handle an improperly formatted CMI\_PHASE\_REQ message.

#### 26.16.9.4.3 Method of test

##### Initial Conditions

###### System Simulator:

1 cell with default parameters

###### Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated and camped on cell A.

##### Related PICS/PIXIT Statements

- Speech supported for full rate version 3.
- Speech supported for half rate version 3.

##### Foreseen Final State of the MS

Idle Updated, TMSI allocated and camped on cell A.

##### Test Procedure

- 1) User initiates a Mobile Originated call.
- 2) The network and the MS indicate Bearer capabilities IE with the AMR speech Full Rate and Half Rate (Version 3).
- 3) The network performs an assignment on a TCH channel with MultiRate configuration to the MS.
- 4) The call is maintained during a programmable time without variation of RxLev /RxQual.
- 5) The SS shall send the CMI\_PHASE\_REQ message, with an incorrect CRC, during the call at a programmable time. The CMI\_PHASE\_REQ shall be sent either in place of a "CMI" speech frame, or in place of a "CMC" speech frame, to cover both kinds of changes.
- 6) The MS answers with a ACK\_ERR message within 3 speech frames.
- 7) The network initiates the call release.

This test is repeated for M=1, and where the MS supports half rate version 3 M=2.

##### Maximum Duration of Test

5 minutes

## 26.16.9.5 Threshold Change (normal)

## 26.16.9.5.1 Conformance requirements

The THRESH\_REQ message may be sent by the BTS to change the thresholds in the DL Mode Request Generator.

The ACK\_OK message serves as an acknowledgement that a RATSCCH REQ message has been detected, correctly decoded (no CRC error) and that it is defined for the Addressee. It defines the exact activation time in direction from Addressee to Initiator.

## Reference:

3GPP TS 05.09 sub-clauses: 3.2.2.3.1, 3.2.2.3.6

## 26.16.9.5.2 Test purpose

This test will verify that an RATSCCH capable MS is able to handle a properly formatted THRESH\_REQ message

## 26.16.9.5.3 Method of test

## Initial Conditions

System Simulator:

1 cell with default parameters

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated and camped on cell A.

## Related PICS/PIXIT Statements

- Speech supported for full rate version 3.
- Speech supported for half rate version 3.

## Foreseen Final State of the MS

Idle Updated, TMSI allocated and camped on cell A.

## Test Procedure

- 1) User initiates a Mobile Originated call.
- 2) The network and the MS indicate Bearer capabilities IE with the AMR speech Full Rate and Half Rate (Version 3).
- 3) The network performs an assignment on a TCH channel with MultiRate configuration to the MS.
- 4) The call is maintained during a programmable time without variation of RxLev /RxQual.
- 5) The SS shall send a properly formatted THRESH\_REQ message during the call at a programmable time.
- 6) The MS answers with a ACK\_OK message within 3 speech frames
- 7) The network initiates the call release.

This test is repeated for M=1, and where the MS supports half rate version 3 M=2.

## Maximum Duration of Test

5 minutes

## 26.16.9.6 Threshold Change (abnormal)

## 26.16.9.6.1 Conformance requirements

The THRESH\_REQ message may be sent by the BTS to change the thresholds in the DL Mode Request Generator.

The ACK\_ERR message serves as a negative acknowledgement that a RATSCCH REQ message has been detected, i.e. the RATSCCH pattern was detected, but could not be decoded correctly (CRC error), or its content is not understandable by the addressee.

## Reference:

3GPP TS 05.09 sub-clauses: 3.2.2.3.2, 3.2.2.3.6

#### 26.16.9.6.2 Test purpose

This test will verify that an RATSCCH capable MS is able to handle an improperly formatted THRESH\_REQ message.

#### 26.16.9.6.3 Method of test

##### Initial Conditions

###### System Simulator:

1 cell with default parameters

###### Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated and camped on cell A.

##### Related PICS/PIXIT Statements

- Speech supported for full rate version 3.
- Speech supported for half rate version 3.

##### Foreseen Final State of the MS

Idle Updated, TMSI allocated and camped on cell A.

##### Test Procedure

- 1) User initiates a Mobile Originated call.
- 2) The network and the MS indicate Bearer capabilities IE with the AMR speech Full Rate and Half Rate (Version 3).
- 3) The network performs an assignment on a TCH channel with MultiRate configuration to the MS.
- 4) The call is maintained during a programmable time without variation of RxLev /RxQual.
- 5) The SS shall send an improperly formatted THRESH\_REQ message, with an incorrect CRC, during the call at a programmable time.
- 6) The MS answers with a ACK\_ERR message within 3 speech frames
- 7) The network initiates the call release.

This test is repeated for M=1, and where the MS supports half rate version 3 M=2.

##### Maximum Duration of Test

5 minutes

## 26.16.9.7 Unknown RATSCCH REQ Message

## 26.16.9.7.1 Conformance requirements

The ACK\_UNKNOWN message serves as an acknowledgement that a RATSCCH REQ message has been detected and correctly decoded, but was unknown to the Addressee.

## Reference:

3GPP TS 05.09 sub-clause: 3.2.2.3.3

### 26.16.9.7.2 Test purpose

This test will verify that the MS can correctly handle an unknown RATSCCH REQ message.

### 26.16.9.7.3 Method of test

#### Initial Conditions

##### System Simulator:

1 cell with default parameters

##### Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated and camped on cell A.

#### Related PICS/PIXIT Statements

- Speech supported for full rate version 3.
- Speech supported for half rate version 3.

#### Foreseen Final State of the MS

Idle Updated, TMSI allocated and camped on cell A.

#### Test Procedure

- 1) User initiates a Mobile Originated call.
- 2) The network and the MS indicate Bearer capabilities IE with the AMR speech Full Rate and Half Rate (Version 3).
- 3) The network performs an assignment on a TCH channel with MultiRate configuration to the MS.
- 4) The call is maintained during a programmable time without variation of RxLev /RxQual.
- 5) The SS shall send an unknown RATSCCH\_REQ message, with message content as all zeros, during the call at a programmable time.
- 6) The MS answers with a ACK\_UNKNOWN message within 3 speech frames
- 7) The network initiates the call release.

This test is repeated for M=1, and where the MS supports half rate version 3 M=2.

#### Maximum Duration of Test

5 minutes

## Expected Sequence

## 26.16.9.8 Ignore subsequent REQ prior to expiry of REQ\_Activation counter

## 26.16.9.8.1 Conformance requirements

If another REQ message is received by the MS before the REQ\_Activation counter has elapsed, the MS shall ignore the message.

## Reference:

3GPP TS 05.09 sub-clause: 3.2.2.2

## 26.16.9.8.2 Test purpose

This test will verify that the MS ignores a REQ message which is received before the REQ\_Activation counter has elapsed. The test will verify that both the following conditions are satisfied:

- the MS ignores a subsequent REQ message received after the original REQ message but before it has sent the ACK\_OK
- the MS ignores a subsequent REQ message received after it has sent the ACK\_OK but before the REQ\_Activation counter has elapsed.

### 26.16.9.8.3 Method of test

#### Initial Conditions

##### System Simulator:

1 cell with default parameters

##### Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated and camped on cell A.

#### Related PICS/PIXIT Statements

- Speech supported for full rate version 3.
- Speech supported for half rate version 3.

#### Foreseen Final State of the MS

Idle Updated, TMSI allocated and camped on cell A.

#### Test Procedure

- 1) User initiates a Mobile Originated call.
- 2) The network and the MS indicate Bearer capabilities IE with the AMR speech Full Rate and Half Rate (Version 3).
- 3) The network performs an assignment on a TCH channel with MultiRate configuration to the MS.
- 4) The call is maintained during a programmable time without variation of RxLev /RxQual.
- 5) The SS shall send an AMR\_CONFIG\_REQ message during the call at a programmable time.
- 6) The SS shall send a subsequent AMR\_CONFIG\_REQ message in the speech frame immediately following the first AMR\_CONFIG\_REQ.
- 7) The MS answers the original AMR\_CONFIG\_REQ with an ACK\_OK message within 3 speech frames of the first AMR\_CONFIG\_REQ.
- 8) The SS shall send a further AMR\_CONFIG\_REQ message within 11 speech frames of receiving the ACK\_OK.
- 9) The SS shall verify that the codec mode used by the MS after the REQ\_Activation counter has elapsed is consistent with the first AMR\_CONFIG\_REQ message, and not the subsequent AMR\_CONFIG\_REQ messages.
- 10) The SS initiates the call release.

This test is repeated for M=1, and where the MS supports half rate version 3 M=2.

#### Maximum Duration of Test

5 minutes

## Specific Message Contents

## ASSIGNMENT COMMAND

| Information Element                 | value/remarks                     |
|-------------------------------------|-----------------------------------|
| Channel description                 | M=1: TCH/F<br>M=2: TCH/H          |
| Mode of the first channel<br>- Mode | Full rate or half rate version 3. |

## AMR\_CONFIG\_REQ

In step 15:

| Information Element | value/remarks               |
|---------------------|-----------------------------|
| ICM                 | CODEC_MODE_1                |
| ACS                 | 2 codec modes               |
| HYST2               | Not defined (set to all 1s) |
| THRESH2             | Not defined (set to all 1s) |
| HYST1               | 2 dB                        |
| THRESH1             | 12.5 dB                     |

In steps 16 and 18:

| Information Element | value/remarks                                                               |
|---------------------|-----------------------------------------------------------------------------|
| ICM                 | CODEC_MODE_1                                                                |
| ACS                 | 1 codec mode – different to any codec mode specified in the ACS in step 15. |
| HYST2               | Not defined (set to all 1s)                                                 |
| THRESH2             | Not defined (set to all 1s)                                                 |
| HYST1               | Not defined (set to all 1s)                                                 |
| THRESH1             | Not defined (set to all 1s)                                                 |

### 26.16.9.9 Initialization of Transaction with ACK\_OK, ACK\_ERR or ACK\_UNKNOWN

#### 26.16.9.9.1 Conformance requirements

If at the MS an ACK\_OK, ACK\_ERR or ACK\_UNKNOWN is received although no corresponding REQ has been sent before, the ACK message shall be ignored.

#### Reference:

3GPP TS 05.09 sub-clause: 3.2.2.2

#### 26.16.9.9.2 Test purpose

This test will verify that the MS ignores any ACK\_OK, ACK\_ERR or ACK\_UNKNOWN which is received without a corresponding REQ having been sent.

#### 26.16.9.9.3 Method of test

#### Initial Conditions

##### System Simulator:

1 cell with default parameters

##### Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated and camped on cell A.

#### Related PICS/PIXIT Statements

- Speech supported for full rate version 3.
- Speech supported for half rate version 3.

#### Foreseen Final State of the MS

Idle Updated, TMSI allocated and camped on cell A.

#### Test Procedure

- 1) User initiates a Mobile Originated call.
- 2) The network and the MS indicate Bearer capabilities IE with the AMR speech Full Rate and Half Rate (Version 3).
- 3) The network performs an assignment on a TCH channel with MultiRate configuration to the MS.
- 4) The call is maintained during a programmable time without variation of RxLev /RxQual.
- 5) The SS shall send an ACK\_OK message during the call at a programmable time.
- 6) The SS verifies that no message is received from the MS on the RATSCCH within 12 speech frames.

- 7) The SS shall send an ACK\_ERR message during the call at a programmable time.
- 8) The SS verifies that no message is received from the MS on the RATSCCH within 12 speech frames.
- 9) The SS shall send an ACK\_UNKNOWN message during the call at a programmable time.
- 10) The SS verifies that no message is received from the MS on the RATSCCH within 12 speech frames.
- 11) The network initiates the call release.

This test is repeated for M=1, and where the MS supports half rate version 3 M=2.

#### Maximum Duration of Test

5 minutes

#### Expected Sequence

| Step | Direction | Message              | Comments                                                                                                     |

## 26.16.9.10 Inversion of the Phase of the CMR/CMI

### 26.16.9.10.1 Conformance requirements

The phase of the Codec Mode Indication in the downlink can be changed during a call by using a CMI\_PHASE\_REQ message sent on the RATSCCH.

The CMI\_PHASE\_REQ message may be sent by the BTS during a call to change the phase of the Codec Mode Indication in the downlink without interruption of the speech transmission.

The ACK\_OK message serves as an acknowledgement that a RATSCCH REQ message has been detected, correctly decoded (no CRC error) and that it is defined for the Addressee.

#### References:

3GPP TS 05.09 clauses 3.2.1.3 and 3.2.2.3.4.

### 26.16.9.10.2 Test purpose

This test shall verify that the MS is able to change the phase of the Codec Mode Indication in the downlink using the RATSCCH protocol.

### 26.16.9.10.3 Method of test

#### Initial Conditions

System Simulator:

1 cell with default parameters

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated and camped on cell A.

#### Related PICS/PIXIT Statements

- Speech supported for full rate version 3.
- Speech supported for half rate version 3.

#### Foreseen Final State of the MS

Idle Updated, TMSI allocated and camped on cell A.

#### Test Procedure

- 1) User initiates a Mobile Originated call.
- 2) The network and the MS indicate Bearer capabilities IE with the AMR speech Full Rate and Half Rate (Version 3).
- 3) The network performs an assignment on a TCH channel with MultiRate configuration to the MS.
- 4) The network shall indicate Codec Mode Command = 0 and Codec Mode Indication = 1.
- 5) The SS sends a series of CMI\_PHASE\_REQ messages during the call to change the phase of the Codec Mode Indication in the downlink.
- 6) The MS responds to each CMI\_PHASE\_REQ message with an ACK\_OK message on the RATSCCH.
- 7) The SS shall ensure that the phase request has been handled correctly by checking the Uplink CMI = 0 for 20 speech frames following the receipt of the ACK\_OK.

8) The network initiates the call release.

This test is repeated for M=1, and where the MS supports half rate version 3 M=2.

Maximum Duration of Test

5 minutes

Expected Sequence

| Step | Direction | Message              | Comments                                                                                                     |

| 29   | SS->MS    | Release Complete     |                                                                                                              |
| 30   | SS->MS    | Channel Release      |                                                                                                              |

Specific Message Contents

ASSIGNMENT COMMAND

| Information Element                 | value/remarks                     |
|-------------------------------------|-----------------------------------|
| Channel description                 | M=1: TCH/F<br>M=2: TCH/H          |
| Mode of the first channel<br>- Mode | Full rate or half rate version 3. |

In step 15:

CMI\_PHASE\_REQ

| Information Element | value/remark                             |
|---------------------|------------------------------------------|
| CMIP                | 0: CMI transmitted in even speech frames |

This message should be sent in a RATSCCH frame where the RATSCCH frame (or RATSCCH\_DATA part for AHS) replaces a speech frame which would have carried a Codec Mode Command.

In step 18:

CMI\_PHASE\_REQ

| Information Element | value/remark                                              |
|---------------------|-----------------------------------------------------------|
| CMIP                | 1: CMI transmitted in odd speech frames (back to default) |

This message should be sent in a RATSCCH frame where the RATSCCH frame (or RATSCCH\_DATA part for AHS) replaces a speech frame which would have carried a Codec Mode Command.

In step 21:

CMI\_PHASE\_REQ

| Information Element | value/remark                             |
|---------------------|------------------------------------------|
| CMIP                | 0: CMI transmitted in even speech frames |

This message should be sent in a RATSCCH frame where the RATSCCH frame (or RATSCCH\_DATA part for AHS) replaces a speech frame which would have carried a Codec Mode Indication.

In step 24:

CMI\_PHASE\_REQ

| Information Element | value/remark                                              |
|---------------------|-----------------------------------------------------------|
| CMIP                | 1: CMI transmitted in odd speech frames (back to default) |

This message should be sent in a RATSCCH frame where the RATSCCH frame (or RATSCCH\_DATA part for AHS) replaces a speech frame which would have carried a Codec Mode Indication.

### 26.16.9.11 Change of Active Codec Set

The verification of correct implementation of threshold and hysteresis parameters is derived from sub-clause 26.16.1.

#### 26.16.9.11.1 Conformance requirements

AMR codec mode adaptation is done within a set of 4 codec modes. The codec mode set (Active Codec Set) to be used by the BSS and the MS is defined during call setup and/or handover by layer 3 signalling. The ACS can be changed during a call using an AMR\_CONFIG\_REQ message sent on the RATSCCH.

The AMR\_CONFIG\_REQ message may be sent by the BTS during a call to change the AMR configuration on the radio interface without interruption of the speech transmission.

The ACK\_OK message serves as an acknowledgement that a RATSCCH REQ message has been detected, correctly decoded (no CRC error) and that it is defined for the Addressee.

## References:

3GPP TS 05.09 clauses 3.2.2.3.5 and 3.4.

### 26.16.9.11.2 Test purpose

This test shall verify that the MS is able to change its Active Codec Set using the RATSCCH protocol, with change of thresholds, and with non-specification of thresholds.

### 26.16.9.11.3 Method of test

## Initial Conditions

### System Simulator:

1 cell with default parameters

### Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated and camped on cell A.

## Related PICS/PIXIT Statements

- Speech supported for full rate version 3.
- Speech supported for half rate version 3.

## Foreseen Final State of the MS

Idle Updated, TMSI allocated and camped on cell A.

## Test Procedure

- 1) User initiates a Mobile Originated call.
- 2) The network and the MS indicate Bearer capabilities IE with the AMR speech Full Rate and Half Rate (Version 3).
- 3) The network performs an assignment on a TCH channel with MultiRate configuration to the MS.
- 4) In addition to the wanted signal, the SS produces an independent, uncorrelated interfering signal, Standard Test Signal I1 (unwanted signal).  
  
The unwanted signal is continuous and has no fixed relationship with the bit transitions of the wanted signal. Its amplitude is 64 dB below that of the wanted signal.
- 5) The SS uses the codec with the highest bit-rate in the current ACS for the Codec Mode Indication, and that with the lowest bit-rate for the Codec Mode Command.
- 6) The SS sends an AMR\_CONFIG\_REQ message during the call to reconfigure the Multirate settings.
- 7) The MS responds to each AMR\_CONFIG\_REQ message with an ACK\_OK message on the RATSCCH.
- 8) The SS shall ensure that the change occurs correctly for downlink (12 speech frames after AMR\_CONFIG\_REQ message was sent), and for uplink (12 speech frames after ACK\_OK was received) by checking parity of received speech frames, and correct implementation of Uplink Codec mode Request and Codec Mode Indication. The SS shall ensure that as the downlink change is activated, the CMI and CMC shall once again be set the codec with highest and lowest bit rates respectively.
- 9) The SS shall ensure that the hysteresis and threshold parameters have been implemented correctly by the MS by modification of the C/I conditions as follows.

The downlink radio environment is altered by changing the carrier to interference ratio. When the radio condition crosses an adaptation threshold the MS changes the Codec Mode Request to reflect the changed signal

quality. The SS records the carrier to interference ratio at which the MS sends the Codec Mode Request. The SS will change the downlink codec to the requested mode and change the downlink Codec Mode Indication accordingly. This is continued for all thresholds given for the Active Codec Set.

10) Steps 4 to 7 shall be repeated for differing AMR\_CONFIG\_REQ parameters and sending conditions.

11) The network initiates the call release.

This test is repeated for M=1, and where the MS supports half rate version 3 M=2.

#### Maximum Duration of Test

5 minutes

#### Expected Sequence

| Step | Direction | Message              | Comments                                                                                                     |
|------|-----------|----------------------|--------------------------------------------------------------------------------------------------------------|

| 34   | MS->SS    | Release              |                                                                                                              |
| 35   | SS->MS    | Release Complete     |                                                                                                              |
| 36   | SS->MS    | Channel Release      |                                                                                                              |

## Specific Message Contents

In all cases, the Active Codec Set field of the AMR\_CONFIG\_REQ messages should be programmed to ensure that the codec rate changes when the new configuration takes effect.

## ASSIGNMENT COMMAND

| Information Element                 | value/remarks                     |
|-------------------------------------|-----------------------------------|
| Channel description                 | M=1: TCH/F<br>M=2: TCH/H          |
| Mode of the first channel<br>- Mode | Full rate or half rate version 3. |

In step 15:

## AMR\_CONFIG\_REQ

| Information Element | value/remark                                             |
|---------------------|----------------------------------------------------------|
| ICM                 | CODEC_MODE_1                                             |
| ACS                 | 1 codec mode (different from that in Assignment Command) |
| HYST2               | n/a – set to all 1's                                     |
| THRESH2             | n/a – set to all 1's                                     |
| HYST1               | n/a – set to all 1's                                     |
| THRESH1             | n/a – set to all 1's                                     |

This message should be sent in a RATSCCH frame where the RATSCCH frame (or RATSCCH\_DATA part for AHS) replaces a speech frame which would have carried a Codec Mode Command.

In step 18:

## AMR\_CONFIG\_REQ

| Information Element | value/remark         |
|---------------------|----------------------|
| ICM                 | CODEC_MODE_1         |
| ACS                 | 2 codec modes        |
| HYST2               | n/a – set to all 1's |
| THRESH2             | n/a – set to all 1's |
| HYST1               | 2 dB                 |
| THRESH1             | 12.5 dB              |

This message should be sent in a RATSCCH frame where the RATSCCH frame (or RATSCCH\_DATA part for AHS) replaces a speech frame which would have carried a Codec Mode Command.

In step 21:

## AMR\_CONFIG\_REQ

| Information Element | value/remark  |
|---------------------|---------------|
| ICM                 | CODEC_MODE_2  |
| ACS                 | 3 codec modes |
| HYST2               | 2.5 dB        |
| THRESH2             | 12.5 dB       |
| HYST1               | 2 dB          |
| THRESH1             | 8 dB          |

This message should be sent in a RATSCCH frame where the RATSCCH frame (or RATSCCH\_DATA part for AHS) replaces a speech frame which would have carried a Codec Mode Indication.

In step 24:

AMR\_CONFIG\_REQ

| Information Element | value/remark               |
|---------------------|----------------------------|
| ICM                 | CODEC_MODE_2               |
| ACS                 | 3 codec modes              |
| HYST2               | Undefined – set to all 1's |
| THRESH2             | Undefined – set to all 1's |
| HYST1               | Undefined – set to all 1's |
| THRESH1             | Undefined – set to all 1's |

This message should be sent in a RATSCCH frame where the RATSCCH frame (or RATSCCH\_DATA part for AHS) replaces a speech frame which would have carried a Codec Mode Command.

Following the change, the MS should indicate CMR=CODEC\_MODE\_2 for all C/I conditions.

In step 27:

AMR\_CONFIG\_REQ

| Information Element | value/remark  |
|---------------------|---------------|
| ICM                 | CODEC_MODE_3  |
| ACS                 | 4 codec modes |
| HYSTc               | 2 dB          |
| THRESH3             | 16.5 dB       |
| THRESH2             | 11.5 dB       |
| THRESH1             | 6.5 dB        |

This message should be sent in a RATSCCH frame where the RATSCCH frame (or RATSCCH\_DATA part for AHS) replaces a speech frame which would have carried a Codec Mode Indication.

In step 30:

AMR\_CONFIG\_REQ

| Information Element | value/remark               |
|---------------------|----------------------------|
| ICM                 | CODEC_MODE_4               |
| ACS                 | 4 codec modes              |
| HYSTc               | Undefined – set to all 1's |
| THRESH3             | Undefined – set to all 1's |
| THRESH2             | Undefined – set to all 1's |
| THRESH1             | Undefined – set to all 1's |

This message should be sent in a RATSCCH frame where the RATSCCH frame (or RATSCCH\_DATA part for AHS) replaces a speech frame which would have carried a Codec Mode Command.

Following the change, the MS should indicate CMR=CODEC\_MODE\_4 for all C/I conditions.

## 26.16.9.12 Change of Thresholds without changing ACS

### 26.16.9.12.1 Conformance requirements

The thresholds used by the MS for codec mode adaptation can be changed without changing the ACS during a call by using a THRESH\_REQ message sent on the RATSCCH.

The THRESH\_REQ message may be sent by the BTS during a call to change the codec mode adaptation thresholds on the radio interface without interruption of the speech transmission.

The ACK\_OK message serves as an acknowledgement that a RATSCCH REQ message has been detected, correctly decoded (no CRC error) and that it is defined for the Addressee.

#### References:

3GPP TS 05.09 clauses 3.2.2.3.6 and 3.4.2.

#### 26.16.9.12.2 Test purpose

This test shall verify that the MS is able to change the thresholds used by the MS for codec mode adaptation using the RATSCCH protocol.

#### 26.16.9.12.3 Method of test

#### Initial Conditions

##### System Simulator:

1 cell with default parameters

##### Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated and camped on cell A.

#### Related PICS/PIXIT Statements

- Speech supported for full rate version 3.
- Speech supported for half rate version 3.

#### Foreseen Final State of the MS

Idle Updated, TMSI allocated and camped on cell A.

#### Test Procedure

- 1) User initiates a Mobile Originated call.
- 2) The network and the MS indicate Bearer capabilities IE with the AMR speech Full Rate and Half Rate (Version 3).
- 3) The network performs an assignment on a TCH channel with MultiRate configuration to the MS.
- 4) In addition to the wanted signal, the SS produces an independent, uncorrelated interfering signal, Standard Test Signal I1 (unwanted signal).  
  
The unwanted signal is continuous and has no fixed relationship with the bit transitions of the wanted signal. Its amplitude is 64 dB below that of the wanted signal.
- 5) The SS uses the codec with the highest bit-rate in the current ACS for the Codec Mode Indication, and that with the lowest bit-rate for the Codec Mode Command.
- 6) The SS sends an AMR\_CONFIG\_REQ message during the call to reconfigure the Active Codec Set. The AMR\_CONFIG\_REQ message shall indicate that the threshold and hysteresis values are undefined.
- 7) The MS responds to each AMR\_CONFIG\_REQ message with an ACK\_OK message on the RATSCCH.
- 8) The SS sends a THRESH\_REQ message during the call to set the threshold and hysteresis values.
- 9) The MS responds to the THRESH\_REQ message with an ACK\_OK message on the RATSCCH.
- 10) The SS shall ensure that the hysteresis and threshold parameters have been implemented correctly by the MS by modification of the C/I conditions as follows:

The downlink radio environment is altered by changing the carrier to interference ratio. When the radio condition crosses an adaptation threshold the MS changes the Codec Mode Request to reflect the changed signal quality. The SS records the carrier to interference ratio at which the MS sends the Codec Mode Request. The SS will change the downlink codec to the requested mode and change the downlink Codec Mode Indication accordingly. This is continued for all thresholds given for the Active Codec Set.

11) Steps 4 to 8 shall be repeated for differing AMR\_CONFIG\_REQ and THRESH\_REQ parameters.

12) The network initiates the call release.

This test is repeated for  $M=1$ , and where the MS supports half rate version 3  $M=2$ .

#### Maximum Duration of Test

5 minutes

## Expected Sequence

| Step | Direction | Message              | Comments                                                                                                     |
|------|-----------|----------------------|--------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                      | MS is in idle mode                                                                                           |
| 2    | MS        |                      | MS initiates Mobile Originated call                                                                          |

| 32   | MS        |                      | Check that ACS, hyst and thresh changes have been implemented correctly.                                     |
| 33   | SS->MS    | Disconnect           |                                                                                                              |
| 34   | MS->SS    | Release              |                                                                                                              |
| 35   | SS->MS    | Release Complete     |                                                                                                              |
| 36   | SS->MS    | Channel Release      |                                                                                                              |

## Specific Message Contents

In all cases, the Active Codec Set field of the AMR\_CONFIG\_REQ messages should be programmed to ensure that the codec rate changes when the new configuration takes effect.

## ASSIGNMENT COMMAND

| Information Element                 | value/remarks                     |
|-------------------------------------|-----------------------------------|
| Channel description                 | M=1: TCH/F<br>M=2: TCH/H          |
| Mode of the first channel<br>- Mode | Full rate or half rate version 3. |

In step 15:

#### AMR\_CONFIG\_REQ

| Information Element | value/remark               |
|---------------------|----------------------------|
| ICM                 | CODEC_MODE_1               |
| ACS                 | 2 codec modes              |
| HYST2               | n/a – set to all 1's       |
| THRESH2             | n/a – set to all 1's       |
| HYST1               | Undefined – set to all 1's |
| THRESH1             | Undefined – set to all 1's |

This message should be sent in a RATSCCH frame where the RATSCCH frame (or RATSCCH\_DATA part for AHS) replaces a speech frame which would have carried a Codec Mode Command.

In step 18:

#### THRESH\_REQ

| Information Element | value/remark         |
|---------------------|----------------------|
| HYST3               | n/a – set to all 1's |
| THRESH3             | n/a – set to all 1's |
| HYST2               | n/a – set to all 1's |
| THRESH2             | n/a – set to all 1's |
| HYST1               | 2 dB                 |
| THRESH1             | 12.5 dB              |

This message should be sent in a RATSCCH frame where the RATSCCH frame (or RATSCCH\_DATA part for AHS) replaces a speech frame which would have carried a Codec Mode Command.

In step 21:

#### AMR\_CONFIG\_REQ

| Information Element | value/remark               |
|---------------------|----------------------------|
| ICM                 | CODEC_MODE_2               |
| ACS                 | 3 codec modes              |
| HYST2               | Undefined – set to all 1's |
| THRESH2             | Undefined – set to all 1's |
| HYST1               | Undefined – set to all 1's |
| THRESH1             | Undefined – set to all 1's |

This message should be sent in a RATSCCH frame where the RATSCCH frame (or RATSCCH\_DATA part for AHS) replaces a speech frame which would have carried a Codec Mode Command.

In step 24:

#### THRESH\_REQ

| Information Element | value/remark         |
|---------------------|----------------------|
| HYST3               | n/a – set to all 1's |
| THRESH3             | n/a – set to all 1's |
| HYST2               | 2.5 dB               |
| THRESH2             | 12.5 dB              |
| HYST1               | 2 dB                 |
| THRESH1             | 8 dB                 |

This message should be sent in a RATSCCH frame where the RATSCCH frame (or RATSCCH\_DATA part for AHS) replaces a speech frame which would have carried a Codec Mode Indication.

In step 27:

AMR\_CONFIG\_REQ

| Information Element | value/remark               |
|---------------------|----------------------------|
| ICM                 | CODEC_MODE_4               |
| ACS                 | 4 codec modes              |
| HYSTc               | Undefined – set to all 1's |
| THRESH3             | Undefined – set to all 1's |
| THRESH2             | Undefined – set to all 1's |
| THRESH1             | Undefined – set to all 1's |

This message should be sent in a RATSCCH frame where the RATSCCH frame (or RATSCCH\_DATA part for AHS) replaces a speech frame which would have carried a Codec Mode Command.

In step 30:

THRESH\_REQ

| Information Element | value/remark |
|---------------------|--------------|
| HYST3               | 2 dB         |
| THRESH3             | 16.5 dB      |
| HYST2               | 2 dB         |
| THRESH2             | 11.5 dB      |
| HYST1               | 2 dB         |
| THRESH1             | 6.5 dB       |

This message should be sent in a RATSCCH frame where the RATSCCH frame (or RATSCCH\_DATA part for AHS) replaces a speech frame which would have carried a Codec Mode Indication.

## 26.16.10 AMR signalling/ test of the channel mode modify procedure

NOTE: This test is derived from the test in sub-clause 26.12.1 entitled "EFR signalling / Test of the channel mode modify procedure".

This test is only applicable to mobiles supporting the AMR speech codec.

### 26.16.10.1 Conformance requirement

The MS with a TCH/F or TCH/H allocated acknowledges a CHANNEL MODE MODIFY message by sending a CHANNEL MODE MODIFY ACKNOWLEDGE message specifying the new mode and by switching to this mode.

### References

3GPP TS 04.08 / 3GPP TS 44.018, subclauses 3.4.6.1.1 and 3.4.6.1.2

### 26.16.10.2 Test purpose

To verify that the MS with a TCH/F or TCH/H allocated acknowledges a CHANNEL MODE MODIFY message by sending a CHANNEL MODE MODIFY ACKNOWLEDGE message specifying the new mode and by switching to this mode.

### 26.16.10.3 Method of test

#### Initial Conditions

System Simulator: 1 cell, default parameters.

Mobile Station: The MS is "idle updated", with TMSI allocated.

#### Related PICS/PIXIT Statements

- Speech supported for full rate version 3.
- Speech supported for half rate version 3.

#### Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

#### Test procedure

A Mobile Terminated call is initiated, however following the CHANNEL REQUEST received from the Mobile Station, the SS sends an IMMEDIATE ASSIGNMENT to the MS commanding it to go to a TCH/F. This sets the Channel Mode automatically to "Signalling Only".

The SS then sends a series of CHANNEL MODE MODIFY messages to the MS. Each time it is checked that the MS responds with a CHANNEL MODE MODIFY ACKNOWLEDGE message specifying the channel mode that has been specified in the CHANNEL MODE MODIFY message

If the MS supports speech half rate version 3, then the SS shall send an ASSIGNMENT COMMAND to a TCH/H as signalling only using a timeslot one greater than that used for the TCH/F, with all other physical aspects of the channel remaining unchanged.

The SS then sends a further series of CHANNEL MODE MODIFY messages to the MS. Each time it is checked as for TCH/F.

If the MS does not support half rate version 3, steps 20 to 29 shall be ignored.

#### Maximum Duration of Test

50 seconds.

Expected Sequence

| Step | Direction | Message                         | Comments                                                                                   |
|------|-----------|---------------------------------|--------------------------------------------------------------------------------------------|
| 1    | SS->MS    | PAGING REQUEST TYPE 1           | Sent on correct paging subchannel                                                          |
| 2    | MS->SS    | CHANNEL REQUEST                 | Establishment cause indicates "answer to paging"                                           |
| 3    | SS->MS    | IMMEDIATE ASSIGNMENT            | Assignment to a non hopping TCH/F signalling only                                          |
| 4    | MS->SS    | PAGING RESPONSE                 | Message is contained in the SABM                                                           |
| 5    | SS->MS    | AUTHENTICATION REQUEST          |                                                                                            |
| 6    | MS->SS    | AUTHENTICATION RESPONSE         | SRES specifies correct value                                                               |
| 7    | SS->MS    | CIPHERING MODE COMMAND          | SS starts deciphering after sending the message                                            |
| 8    | MS->SS    | CIPHERING MODE COMPLETE         | Shall be sent enciphered. All following messages shall be sent enciphered.                 |

## 26.16.11 Handover / layer 1 failure

This test applies to mobiles supporting the AMR speech codec.

Note: This test is derived from 26.6.5.9 Handover / layer 1 failure.

### 26.16.11.1 Conformance requirements

The MS shall return to the old channel in the case of a handover failure caused by a layer 1 failure on the target cell. On the old channel the MS shall use the AMR Parameters that it was previously using on that channel.

### References

3GPP TS 04.08 / 3GPP TS 44.018 section 3.4.4.

### 26.16.11.2 Test purpose

To verify the contents in the message HANDOVER FAILURE and in the layer 1 header on the SACCH

To verify the mobile returns to the correct channel configuration prior to handover following the handover failure.

### 26.16.11.3 Method of test

#### Initial Conditions

System Simulator:

2 cells with same LAI, default parameters.

Mobile Station:

The MS is in the active state (U10) of a call (on cell A). Used power level is the maximum supported by the MS.

#### Related PICS/PIXIT Statements

Speech supported for full rate version 2.

Speech supported for full rate version 3.

Speech supported for half rate version 1.

Speech supported for half rate version 3.

#### Foreseen Final State of the MS

The active state (U10) of a mobile call (on cell A). Used power level is the maximum supported by the MS.

#### Test Procedure

The MS is in the active state (U10) of a call on cell A. The SS sends a HANDOVER COMMAND on the main DCCH. The MS shall begin to send access bursts at the commanded power level on the new DCCH to cell B. With the exception of normal BCCH signalling, the SS does not transmit anything on cell B (thus causing a time-out of T3124). The MS shall re-establish the old link on cell A and send a HANDOVER FAILURE within 3 seconds from the transmission of HANDOVER COMMAND.

#### Maximum Duration of Test

10 minutes

## Expected Sequence

This test is repeated for M=1, M=2 (only if MS supports half rate version 3), M=3, M=4, M=5 (only if MS supports half rate version 3), M=6 (only if MS supports half rate version 3), M=7 (only if MS supports full rate version 2), M=8 (only if MS supports half rate version 1).

This test is repeated for K=1, K=2 (only if MS supports half rate version 3).

## 27 Testing of the SIM/ME interface

The following sequence of tests confirms:

- a) the correct interpretation of data read from the SIM (Subscriber Identification Module) by the ME;
- b) the correct writing of data to the SIM by the ME;
- c) the initiation of appropriate procedures by the ME;
- d) low level protocols;
- e) electrical characteristics;
- f) physical characteristics.

All tests apply to GSM, DCS 1 800 and PCS 1 900 MEs using either ID.1 or Plug-in SIM.

NOTE 0: In the entire clause 27, the term GSM defines the tests applicable for GSM 450, GSM 480 and GSM 900 MS. In addition the term PCS 1 900 defines the tests applicable for GSM 700, GSM 850 and PCS 1 900 MS.

A SIM simulator will be required as part of the SS. Alternatively, to perform the logical tests, SIMs programmed with specific data may be used. The SIM data is not defined within the initial conditions of the tests unless it differs from the default values defined below.

### Definition of default values for SIM/ME interface testing

A SIM containing the following default values is used for all tests of this subclause unless otherwise stated.

For each data item, the logical default values and the coding within the elementary files (EF) of the SIM follow.

NOTE 1: Bx represents Byte x of the coding.

NOTE 2: Unless otherwise defined, the coding values are hexadecimal.

## Definition of FDN SIM

Some test cases require a different configuration than the one described above. For that purpose a default FDN SIM is defined. In general the values of the FDN SIM are identical to the default SIM, with the following exceptions.

EF<sub>SST</sub> (SIM Service Table)

Logically: CHV1 disable function allocated and activated.  
Abbreviated dialling numbers allocated and activated.  
PLMN selector allocated and activated.  
Fixed dialling numbers allocated and activated.  
Advice of Charge allocated and activated.

Coding: B1 B2 B3 B4  
xx111111 0011xx11 xxxxxxxx 0000xxxx (binary)

The coding of EF<sub>SST</sub> shall conform with the capabilities of the SIM used.

EF<sub>FDN</sub> (Fixed Dialling Numbers)

Logically:

Record 1: Length of alpha identifier: 6 characters  
Alpha identifier: "FDN111"  
Length of BCD number: "06"  
TON and NPI: Telephony and International  
Dialled number: +1357924680  
CCI: None  
Ext1: None

## 27.1 MS identification by short IMSI

### 27.1.1 MS identification by short IMSI - Normal case

#### 27.1.1.1 Definition and applicability

The IMSI is used for unique identification of the MS by a GSM network. The IMSI is stored in the SIM and read during the SIM/ME initialization procedure.

This test applies to GSM, DCS 1 800 and PCS 1 900 MEs using either ID.1 or Plug-in SIM.

### 27.1.1.2 Conformance requirement

On the receipt of an IMMEDIATE ASSIGNMENT message the MS shall send PAGING RESPONSE containing the IMSI of the SIM.

3GPP TS 11.11, subclauses 11.2.1 and 11.4.2, 3GPP TS 04.08 / 3GPP TS 24.008, subclause 10.5.1.4.

### 27.1.1.3 Test purpose

- 1) To verify that the ME uses the IMSI of the SIM.
- 2) To verify that the ME can handle an IMSI of less than the maximum length.

### 27.1.1.4 Method of test

#### 27.1.1.4.1 Initial conditions

The SS transmits on the BCCH, with the following network parameters:

|                    |               |                        |
|--------------------|---------------|------------------------|
| Attach/detach:     | disabled.     |                        |
| LAI (MCC/MNC/LAC): | 246/81/0001   | for GSM and DCS 1 800; |
|                    | 246/813/0001  | for PCS 1 900.         |
| Access control:    | unrestricted. |                        |

The default SIM is installed into the ME and the MS is powered on.

#### 27.1.1.4.2 Procedure

- a) The SS sends PAGING REQUEST to the MS using the IMSI stored in the SIM.
- b) After receipt of a CHANNEL REQUEST from the MS, the SS sends IMMEDIATE ASSIGNMENT to the MS.
- c) After receipt of a PAGING RESPONSE from the MS, the SS sends CHANNEL RELEASE to the MS.

### 27.1.1.5 Test requirement

After step b) the MS shall send PAGING RESPONSE to the SS containing the IMSI stored in the SIM.

## 27.1.2 MS identification by short IMSI, Phase 1 DCS SIM

### 27.1.2.1 Definition and applicability

Different from Phase 2, the IMSI in a Phase 1 DCS SIM is stored in a directory DF<sub>DCS1800</sub> with the specific identifier "7F 21". To ensure backwards compatibility, if selection of the phase 2 identifier "7F 20" fails, the MS shall select "7F 21". Otherwise access to the IMSI and other data is impossible with a Phase 1 DCS SIM

This test applies to DCS 1 800 MEs.

### 27.1.2.2 Conformance requirement

If selection of DFGSM by the identifier "7F 20" fails, the ME shall select DF<sub>DCS1800</sub> with "7F 21".

3GPP TS 11.11, subclause 10.4.

### 27.1.2.3 Test purpose

To verify that the ME uses the identifier "7F 21" to select DF<sub>DCS1800</sub> in a Phase 1 DCS SIM.

#### 27.1.2.4 Method of test

##### 27.1.2.4.1 Initial conditions

The SS transmits on the BCCH, with the following network parameters:

Attach/detach: disabled.

LAI (MCC/MNC/LAC): 246/81/0001.

Access control: unrestricted.

A phase 1 DCS SIM (identifier of  $DF_{DCS1800}$  is "7F 21",  $DF_{GSM}$  not existing) with default values is installed into the ME and the MS is powered on.

##### 27.1.2.4.2 Procedure

- a) The SS sends PAGING REQUEST to the MS using the IMSI stored in the SIM.
- b) After receipt of a CHANNEL REQUEST from the MS, the SS sends IMMEDIATE ASSIGNMENT to the MS.
- c) After receipt of a PAGING RESPONSE from the MS, the SS sends CHANNEL RELEASE to the MS.

##### 27.1.2.5 Test requirement

After step b) the MS shall send PAGING RESPONSE to the SS containing the IMSI stored in the SIM.

## 27.2 MS identification by short TMSI

### 27.2.1 Definition and applicability

The TMSI is temporarily used for identification of the MS by a GSM network. It will have been previously assigned by the network. The TMSI is stored in the SIM by the ME and read during the SIM/ME initialization procedure.

This test applies to GSM, DCS 1 800 and PCS 1 900 MEs using either ID.1 or Plug-in SIM.

### 27.2.2 Conformance requirement

On the receipt of an IMMEDIATE ASSIGNMENT message the MS shall send PAGING RESPONSE containing the TMSI stored in the SIM.

3GPP TS 11.11, subclauses 11.2.1 and 11.4.5, 3GPP TS 04.08 / 3GPP TS 24.008, subclause 10.5.1.4.

### 27.2.3 Test purpose

- 1) To verify that the ME uses the TMSI stored in the SIM.
- 2) To verify that the ME can handle a TMSI of less than maximum length.

### 27.2.4 Method of test

#### 27.2.4.1 Initial conditions

The SS transmits on the BCCH, with the following network parameters:

Attach/detach: disabled.

LAI (MCC/MNC/LAC): 246/81/0001.

Access control: unrestricted.

The default SIM is used with the following exception.

#### GSM and DCS 1 800 begin

EF<sub>LOCI</sub> (Location Information)

Logically:      LAI-MCC: 246  
                   LAI-MNC: 81  
                   LAI-LAC: 0001

TMSI: "2143"

|         |    |    |    |    |    |    |    |    |    |     |     |
|---------|----|----|----|----|----|----|----|----|----|-----|-----|
| Coding: | B1 | B2 | B3 | B4 | B5 | B6 | B7 | B8 | B9 | B10 | B11 |
|         | 00 | 00 | 21 | 43 | 42 | F6 | 18 | 00 | 01 | FF  | 00  |

#### GSM and DCS 1 800 end

#### PCS 1 900 begin

EF<sub>LOCI</sub> (Location Information)

Logically:      LAI-MCC: 246  
                   LAI-MNC: 813  
                   LAI-LAC: 0001  
                   TMSI:       "2143"

|         |    |    |    |    |    |    |    |    |    |     |     |
|---------|----|----|----|----|----|----|----|----|----|-----|-----|
| Coding: | B1 | B2 | B3 | B4 | B5 | B6 | B7 | B8 | B9 | B10 | B11 |
|         | 00 | 00 | 21 | 43 | 42 | 36 | 18 | 00 | 01 | FF  | 00  |

#### PCS 1 900 end

The SIM is installed into the ME and the MS is powered on.

#### 27.2.4.2 Procedure

- The SS sends PAGING REQUEST to the MS using the TMSI stored in the SIM.
- After receipt of a CHANNEL REQUEST from the MS, the SS sends IMMEDIATE ASSIGNMENT to the MS.
- After receipt of a PAGING RESPONSE from the MS, the SS sends CHANNEL RELEASE to the MS.

#### 27.2.5 Test requirement

After step b) the MS shall send PAGING RESPONSE to the SS containing the TMSI stored in the SIM.

## 27.3 MS identification by long TMSI

### 27.3.1 Definition and applicability

The TMSI is temporarily used for identification of the MS by a GSM network. It will have been previously assigned by the network. The TMSI is stored in the SIM by the ME and read during the SIM/ME initialization procedure.

This test applies to GSM, DCS 1 800 and PCS 1 900 MEs using either ID.1 or Plug-in SIM.

### 27.3.2 Conformance requirement

On the receipt of an IMMEDIATE ASSIGNMENT message the MS shall send PAGING RESPONSE containing the correct TMSI stored in the SIM.

3GPP TS 11.11, subclauses 11.2.1 and 11.4.5, 3GPP TS 04.08 / 3GPP TS 24.008, subclause 10.5.1.4.

### 27.3.3 Test purpose

- 1) To verify that the ME uses the TMSI stored in the SIM.
- 2) To verify that the ME can handle a TMSI of maximum length.
- 3) To verify that the ME does not respond to page requests containing a previous TMSI.

### 27.3.4 Method of test

#### 27.3.4.1 Initial conditions

Prior to this test, the ME shall have been operated with a SIM containing TMSI "2143". This may be achieved by executing the previous test (27.2) prior to this test. Only under this condition will test purpose 3) be verified.

The SS transmits on the BCCH, with the following network parameters:

Attach/detach: disabled.

LAI (MCC/MNC/LAC): 246/81/0001 for GSM and DCS 1 800;  
246/813/0001 for PCS 1 900.

Access control: unrestricted.

The default SIM is used with the following exception:

#### GSM and DCS 1 800 begin

##### EF<sub>LOCI</sub> (Location Information)

|            |          |            |    |    |    |    |    |    |    |     |     |
|------------|----------|------------|----|----|----|----|----|----|----|-----|-----|
| Logically: | LAI-MCC: | 246        |    |    |    |    |    |    |    |     |     |
|            | LAI-MNC: | 81         |    |    |    |    |    |    |    |     |     |
|            | LAI-LAC: | 0001       |    |    |    |    |    |    |    |     |     |
|            | TMSI:    | "21430000" |    |    |    |    |    |    |    |     |     |

| Coding: | B1 | B2 | B3 | B4 | B5 | B6 | B7 | B8 | B9 | B10 | B11 |
|         | 21 | 43 | 00 | 00 | 42 | 36 | 18 | 00 | 01 | FF  | 00  |

PCS 1 900 end

The SIM is installed into the ME and the MS is powered on.

#### 27.3.4.2 Procedure

- The SS sends PAGING REQUEST to the MS using the TMSI "2143".
- The SS sends PAGING REQUEST to the MS using the TMSI stored in the SIM.
- After receipt of a CHANNEL REQUEST from the MS, the SS sends IMMEDIATE ASSIGNMENT to the MS.
- After receipt of a PAGING RESPONSE from the MS, the SS sends CHANNEL RELEASE to the MS.

#### 27.3.5 Test requirement

- After step a) the MS shall not respond to the PAGING REQUEST.
- After step c) the MS shall send PAGING RESPONSE to the SS containing the TMSI stored in the SIM.

## 27.4 MS identification by long IMSI, TMSI updating and cipher key sequence number assignment

### 27.4.1 Definition and applicability

The IMSI and TMSI are used for identification of the MS by a GSM network. They are read from the SIM during the SIM/ME initialization procedure. Within the authentication procedure the network sends a cipher key sequence number to the MS. In addition the network may allocate a new TMSI to the MS. Cipher key sequence number and TMSI are stored in the SIM after call termination and/or at GSM session termination.

Test purpose 2) will only be verified if this test sequentially follows the previous test (27.3).

The test applies to GSM, DCS 1 800 and PCS 1 900 MEs using either ID.1 or Plug-in SIM.

### 27.4.2 Conformance requirement

- On the receipt of an IMMEDIATE ASSIGNMENT message the MS shall send PAGING RESPONSE containing the correct IMSI stored in the SIM.  
3GPP TS 11.11, subclauses 11.2.1 and 11.4.2, 3GPP TS 04.08 / 3GPP TS 24.008, subclause 10.5.1.4.
- After call termination the SIM shall contain the cipher key sequence number and TMSI received by the MS during the authentication and TMSI reallocation procedures.  
3GPP TS 11.11, subclauses 11.2.2, 11.4.5 and 11.4.6, 3GPP TS 02.17, subclause 6.1.

### 27.4.3 Test purpose

- To verify that the ME uses the IMSI stored in the SIM.
- To verify that the ME does not respond to page requests containing a previous IMSI.
- To verify that the ME can handle an IMSI of maximum length.
- To verify that the ME correctly updates the cipher key sequence number at call termination.
- To verify that the ME correctly updates the TMSI at call termination.

## 27.4.4 Method of test

## 27.4.4.1 Initial conditions

Prior to this test, the ME shall have been operated with a SIM containing IMSI "246813579". This may be achieved by executing the previous test (27.3) prior to this test. Only under this condition will test purpose 2) be verified.

The SS transmits on the BCCH, with the following network parameters:

Attach/detach: disabled.  
 LAI (MCC/MNC/LAC): 246/81/0001 for GSM and DCS 1 800;  
 246/813/0001 for PCS 1 900.  
 Access control: unrestricted.

The default SIM is used with the following exception:

## GSM and DCS 1 800 begin

EF<sub>IMSI</sub> (IMSI)

Logically: 2468111111111111  
 Coding: B1 B2 B3 B4 B5 B6 B7 B8 B9  
 08 29 64 18 11 11 11 11 11

## GSM and DCS 1 800 end

## PCS 1 900 begin

EF<sub>IMSI</sub> (IMSI)

Logically: 2468131111111111  
 Coding: B1 B2 B3 B4 B5 B6 B7 B8 B9  
 08 29 64 18 13 11 11 11 11

## PCS 1 900 end

The SIM is installed into the ME and the MS is powered on.

## 27.4.4.2 Procedure

- a) The SS sends PAGING REQUEST to the MS using the IMSI "246813579".
- b) The SS sends PAGING REQUEST to the MS using the IMSI stored in the SIM.
- c) After receipt of a CHANNEL REQUEST from the MS, the SS sends IMMEDIATE ASSIGNMENT to the MS.
- d) After receipt of a PAGING RESPONSE from the MS, the SS sends AUTHENTICATION REQUEST to the MS containing cipher key sequence number set to binary 010.
- e) After receipt of AUTHENTICATION RESPONSE from the MS, the SS sends TMSI REALLOCATION to the MS containing TMSI "32547698".
- f) Within 5 s after receipt of TMSI REALLOCATION COMPLETE from the MS, the SS sends CHANNEL RELEASE to the MS.

- g) To allow examination of the values in the SIM after call termination the MS shall not be soft powered down. If the test is performed with a SIM simulator, the simulation is stopped. If the test is performed with a SIM, the SIM is removed without soft powering down the MS. If this is not possible, the power supply of the ME is removed and then the SIM removed.

#### 27.4.5 Test requirement

- 1) After step a) the MS shall not respond to the PAGING REQUEST.
- 2) After step c) the MS shall send PAGING RESPONSE to the SS containing the IMSI stored in the SIM.
- 3) After step e) the MS shall send TMSI REALLOCATION COMPLETE to the SS.
- 4) After step g) the SIM shall contain the following values.

#### GSM and DCS 1 800 begin

##### EF<sub>LOCI</sub> (Location Information)

|            | xx           | xx                                          | xx | xx | xx | xx | xx | xx | xx | 02 |  |

## 27.5 Forbidden PLMNs, location updating and undefined cipher key

### 27.5.1 Definition and applicability

A list of forbidden PLMNs stored in the SIM and providing storage for up to 4 entries is managed by the MS. In automatic PLMN selection mode the MS controls location updating attempts to appropriate networks with respect to this list of forbidden PLMNs. As a result of a location update reject with the cause "PLMN not allowed" the MS stores the PLMN which rejected the update request in the SIM.

After a location update, which is not followed by an authentication procedure, the cipher key sequence number indicates that the cipher key is undefined.

This test applies to GSM, DCS 1 800 and PCS 1 900 MEs using either ID.1 or Plug-in SIM.

### 27.5.2 Conformance requirement

1. In automatic PLMN selection mode the MS shall only attempt a LOCATION UPDATE if it receives a BCCH containing a LAI that is not indicated in the EF<sub>FPLMN</sub> in the SIM.

3GPP TS 02.11, subclause 2.3, 3GPP TS 11.11, subclauses 11.2.1 and 11.4.8.

2. After receipt of a LOCATION UPDATE REJECT message with the cause "PLMN not allowed" the ME shall update the EF<sub>FPLMN</sub> in the SIM.

3GPP TS 02.11, subclause 2.3, 3GPP TS 11.11, subclauses 11.2.1 and 11.4.8.

3. After call termination the SIM shall contain the correct cipher key sequence number.

3GPP TS 11.11, subclauses 11.2.2, 11.4.5 and 11.4.6, 3GPP TS 02.17, subclause 6.1.

4. After call termination the SIM shall contain the correct TMSI and location information received by the MS.

3GPP TS 11.11, subclauses 11.2.2, 11.4.5 and 11.4.6, 3GPP TS 02.17, subclause 6.1.

### 27.5.3 Test purpose

- 1) To verify that in automatic PLMN selection mode the MS does not attempt to access PLMNs stored in EF<sub>FPLMN</sub> on the SIM.
- 2) To verify that the EF<sub>FPLMN</sub> is correctly updated by the ME after receipt of a LOCATION UPDATE REJECT message with cause "PLMN not allowed".
- 3) To verify that the EF<sub>Kc</sub> has been correctly updated by the ME.
- 4) To verify that the EF<sub>LOCI</sub> has been correctly updated by the ME.

### 27.5.4 Method of test

#### 27.5.4.1 Initial conditions

The SS transmits on the BCCH, with the following network parameters:

Attach/detach: disabled.

LAI (MCC/MNC/LAC): 234/02/0001 for GSM and DCS 1 800;  
234/023/0001 for PCS 1 900.

Access control: unrestricted.

The default SIM is used with the following exception:

### GSM and DCS 1 800 begin

## 27.5.4.2 Procedure

- a) The MS is powered on.
- b) The SS stops all RF output on the BCCH for a long enough period of time to cause a cell reselection procedure in the MS. The BCCH is changed to contain:

LAI (MCC/MNC): 234/03 for GSM and DCS 1 800;  
234/034 for PCS 1 900.

The SS then resumes RF output on the BCCH.

- c) The SS stops all RF output on the BCCH for a long enough period of time to cause a cell reselection procedure in the MS. The BCCH is changed to contain:

LAI (MCC/MNC): 234/04 for GSM and DCS 1 800;  
234/045 for PCS 1 900.

The SS then resumes RF output on the BCCH.

- d) The SS stops all RF output on the BCCH for a long enough period of time to cause a cell reselection procedure in the MS. The BCCH is changed to contain:

LAI (MCC/MNC): 234/05 for GSM and DCS 1 800;  
234/056 for PCS 1 900.

The SS then resumes RF output on the BCCH.

- e) The SS stops all RF output on the BCCH for a long enough period of time to cause a cell reselection procedure in the MS. The BCCH is changed to contain:

LAI (MCC/MNC): 234/01 for GSM and DCS 1 800;  
234/012 for PCS 1 900.

The SS then resumes RF output on the BCCH.

- f) After receipt of a CHANNEL REQUEST from the MS, the SS sends IMMEDIATE ASSIGNMENT to the MS.

- g) After receipt of a LOCATION UPDATE REQUEST from the MS, the SS sends LOCATION UPDATE REJECT to the MS with cause "PLMN Not Allowed", followed by CHANNEL RELEASE.

The SS stops all RF output on the BCCH for a long enough period of time to cause a cell reselection procedure in the MS. The BCCH is changed to contain:

LAI (MCC/MNC): 234/06 for GSM and DCS 1 800;  
234/067 for PCS 1 900.

The SS then resumes RF output on the BCCH.

- h) After receipt of a CHANNEL REQUEST from the MS, the SS sends IMMEDIATE ASSIGNMENT to the MS.

- i) After receipt of a LOCATION UPDATE REQUEST from the MS, the SS sends LOCATION UPDATE ACCEPT with:

LAI (MCC/MNC): 234/06 for GSM and DCS 1 800;  
234/067 for PCS 1 900.

TMSI: "43658709".

to the MS.

- j) After receipt of a TMSI REALLOCATION COMPLETE from the MS, the SS sends CHANNEL RELEASE to the MS.
- k) The MS is soft powered down.

### 27.5.5 Test requirement

- 1) After each of the steps a) to d) the MS shall not attempt a LOCATION UPDATE.
- 2) After step f) the MS shall send LOCATION UPDATE REQUEST to the SS.
- 3) After step h) the MS shall send LOCATION UPDATE REQUEST to the SS.
- 4) After step i) the MS shall respond with TMSI REALLOCATION COMPLETE.
- 5) After step k) the SIM shall contain the following values:

#### GSM and DCS 1 800 begin

##### EF<sub>LOCI</sub> (Location Information)

|            |          |            |    |    |    |    |    |    |    |     |     |  |

## 27.6 MS updating forbidden PLMNs

### 27.6.1 Definition and applicability

A list of forbidden PLMNs stored in the SIM provides storage for up to 4 entries, and is managed by the MS. In automatic PLMN selection mode the MS controls location updating attempts to appropriate networks with respect to this list of forbidden PLMNs. As a result of a location update reject with the cause "PLMN not allowed" the MS stores the PLMN which rejected the update request in the SIM.

This test applies to GSM, DCS 1 800 and PCS 1 900 MEs using either ID.1 or Plug-in SIM.

### 27.6.2 Conformance requirement

After the receipt of a LOCATION UPDATE REJECT message with the cause "PLMN not allowed" the MS shall update the EF<sub>FPLMN</sub> in the SIM.

3GPP TS 02.11, subclause 3.2.2.4.

### 27.6.3 Test purpose

To verify that the MS correctly updates the EF<sub>FPLMN</sub>, i.e. fill up existing gaps in the elementary file before overwriting any existing entries.

## 27.6.4 Method of test

## 27.6.4.1 Initial conditions

The SS transmits on the BCCH, with the following network parameters:

Attach/detach: disabled.  
 LAI (MCC/MNC/LAC): 234/03/0001 for GSM and DCS 1 800;  
 234/034/0001 for PCS 1 900.  
 Access control: unrestricted.

The default SIM is used with the following exception:

## GSM and DCS 1 800 begin

EF<sub>FPLMN</sub> (Forbidden PLMNs)

Logically: PLMN1: 234 02 (MCC MNC)

## 27.7 MS deleting forbidden PLMNs

### 27.7.1 Definition and applicability

In manual PLMN selection mode the MS allows location update attempts to all available PLMNs, including forbidden PLMNs (as indicated by the forbidden PLMN list on the SIM). As a result of a successful location update procedure onto a PLMN which is in the forbidden PLMN list, the forbidden PLMN list is automatically updated by the MS.

This test applies to GSM, DCS 1 800 and PCS 1 900 MEs using either ID.1 or Plug-in SIM.

### 27.7.2 Conformance requirement

1. In manual PLMN selection mode the MS shall be able to perform a LOCATION UPDATE attempt to a PLMN which is in the forbidden PLMN list.

3GPP TS 02.11, subclause 3.2.2.2.

2. After receipt of LOCATION UPDATE ACCEPT the MS shall delete the forbidden PLMN from the forbidden PLMN list.

3GPP TS 02.11, subclause 3.2.2.4.

### 27.7.3 Test purpose

- 1) To verify that in automatic PLMN selection mode the MS does not attempt to access PLMNs stored in EF<sub>FPLMN</sub> on the SIM.
- 2) To verify that the MS is able to perform a LOCATION UPDATE on a forbidden PLMN in manual PLMN selection mode.
- 3) To verify that the MS after a successful LOCATION UPDATE deletes the PLMN in the EF<sub>FPLMN</sub> on the SIM.

### 27.7.4 Method of test

#### 27.7.4.1 Initial conditions

The SS transmits on the BCCH, with the following network parameters:

|                    |               |                        |
|--------------------|---------------|------------------------|
| Attach/detach:     | disabled.     |                        |
| LAI (MCC/MNC/LAC): | 234/01/0001   | for GSM and DCS 1 800; |
|                    | 234/012/0001  | for PCS 1 900.         |
| Access control:    | unrestricted. |                        |

The default SIM is used with the following exception:

GSM and DCS 1 800 begin

EF<sub>FPLMN</sub> (Forbidden PLMNs)

Logically: PLMN1: empty  
 PLMN2: empty  
 PLMN3: 234 01 (MCC MNC)

PLMN4: empty

|         |    |    |    |    |    |    |    |    |    |     |     |     |
|---------|----|----|----|----|----|----|----|----|----|-----|-----|-----|
| Coding: | B1 | B2 | B3 | B4 | B5 | B6 | B7 | B8 | B9 | B10 | B11 | B12 |
|         | FF | FF | FF | FF | FF | FF | 32 | F4 | 10 | FF  | FF  | FF  |

GSM and DCS 1 800 end

PCS 1 900 begin

EF<sub>FPLMN</sub> (Forbidden PLMNs)

Logically: PLMN1: empty  
 PLMN2: empty  
 PLMN3: 234 012 (MCC MNC)  
 PLMN4: empty

|         |    |    |    |    |    |    |    |    |    |     |     |     |
|---------|----|----|----|----|----|----|----|----|----|-----|-----|-----|
| Coding: | B1 | B2 | B3 | B4 | B5 | B6 | B7 | B8 | B9 | B10 | B11 | B12 |
|         | FF | FF | FF | FF | FF | FF | 32 | 24 | 10 | FF  | FF  | FF  |

PCS 1 900 end

The SIM is installed into the ME and the MS is set to automatic PLMN selection mode.

#### 27.7.4.2 Procedure

- a) The MS is powered on.
- b) PLMN with MCC/MNC of 234/01 (PCS 1 900: 234/012) is manually selected.
- c) After receipt of a CHANNEL REQUEST from the MS, the SS sends IMMEDIATE ASSIGNMENT to the MS.
- d) After receipt of a LOCATION UPDATE REQUEST from the MS, the SS sends LOCATION UPDATE ACCEPT with:
 

|                |         |                        |
|----------------|---------|------------------------|
| LAI (MCC/MNC): | 234/01  | for GSM and DCS 1 800; |
|                | 234/012 | for PCS 1 900.         |

TMSI: "12345678".

to the MS.
- e) After receipt of TMSI REALLOCATION COMPLETE from the MS, the SS sends CHANNEL RELEASE.
- f) The MS is soft powered down.

## 27.7.5 Test requirement

- 1) After step a) the MS shall not attempt a LOCATION UPDATE.
- 2) After step c) the MS shall send LOCATION UPDATE REQUEST to the SS.
- 3) After step d) the MS shall respond with TMSI REALLOCATION COMPLETE.
- 4) After step f) the SIM shall contain the following values:

## GSM and DCS 1 800 begin

EF<sub>LOCI</sub> (Location Information)

PCS 1 900 end

## 27.8 MS updating the PLMN selector list

### 27.8.1 Definition and applicability

The PLMN selector list gives in priority order the preferred PLMNs on which the MS shall register. The list is stored on the SIM in the EF<sub>PLMNsel</sub>. Update and deletion of PLMNs may be performed by the subscriber.

This test applies to GSM, DCS 1 800 and PCS 1 900 MEs using either ID.1 or Plug-in SIM.

### 27.8.2 Conformance requirement

The MS shall correctly replace the selected PLMN in the PLMN selector list.

3GPP TS 11.11, subclause 11.5.5.

### 27.8.3 Test purpose

To verify that the MS correctly updates the EF<sub>PLMNsel</sub>.

### 27.8.4 Method of test

#### 27.8.4.1 Initial conditions

No SS is required for this test.

The default SIM is used.

The SIM is installed into the ME and the MS is powered on.

#### 27.8.4.2 Procedure

- a) The user shall initiate an MMI dependent procedure to change the second PLMN in the PLMN selector list to MCC/MNC of 567/01 (PCS 1 900: 567/018).
- b) The MS is soft powered down.

### 27.8.5 Test requirement

After step b) the SIM shall contain the following values:

GSM and DCS 1 800 begin

EF<sub>PLMNsel</sub> (PLMN Selector)

|            |           |                  |
|------------|-----------|------------------|
| Logically: | 1st PLMN: | 234 01 (MCC MNC) |
|            | 2nd PLMN: | 567 01           |
|            | 3rd PLMN: | 234 03           |

PCS 1 900 end

## 27.9 MS recognizing the priority order of the PLMN selector list

### 27.9.1 Definition and applicability

The PLMN selector list gives in priority order the preferred PLMNs on which the MS shall register. The list is stored on the SIM in the EF<sub>PLMNsel</sub>. Update and deletion of PLMNs may be performed by the subscriber by the use of the PIN.

This test applies to GSM, DCS 1 800 and PCS 1 900 MEs using either ID.1 or Plug-in SIM.

### 27.9.2 Conformance requirement

When registering onto a VPLMN the MS shall take into account the priority order of the PLMNs in the preferred list on the SIM.

3GPP TS 02.11, subclause 3.2.2.2.

### 27.9.3 Test purpose

To verify that the PLMN with the higher priority (defined by its position in EF<sub>PLMNsel</sub>) takes precedence over the PLMN with the lower priority when the MS performs a network selection.

## 27.9.4 Method of test

## 27.9.4.1 Initial conditions

The SS transmits on two BCCHs, with the following network parameters:

Attach/detach: disabled.

LAI (MCC/MNC/LAC): 234/33/0001 for GSM and DCS 1 800;  
234/334/0001 for PCS 1 900.

Access control: unrestricted.

Attach/detach: disabled.

LAI (MCC/MNC/LAC): 234/34/0001 for GSM and DCS 1 800;  
234/345/0001 for PCS 1 900.

Access control: unrestricted.

The default SIM is used with the following exception:

## GSM and DCS 1 800 begin

EF<sub>PLMNsel</sub> (PLMN Selector)

Logically: 1st PLMN: 234 01 (MCC MNC)  
2nd PLMN: 234 02

PCS 1 900 end

The SIM is installed into the ME and the MS is set to automatic PLMN selection mode.

#### 27.9.4.2 Procedure

- The MS is powered on.
- After receipt of a CHANNEL REQUEST from the MS, the SS sends IMMEDIATE ASSIGNMENT to the MS.
- After receipt of a LOCATION UPDATE REQUEST from the MS, the SS sends LOCATION UPDATE ACCEPT with:

|                |         |                        |
|----------------|---------|------------------------|
| LAI (MCC/MNC): | 234/34  | for GSM and DCS 1 800; |
|                | 234/345 | for PCS 1 900.         |

TMSI: "34567890".

to the MS

- After receipt of a TMSI REALLOCATION COMPLETE from the MS, the SS sends CHANNEL RELEASE to the MS.
- The MS is soft powered down.

#### 27.9.5 Test requirement

- After step b) the MS shall send LOCATION UPDATE REQUEST containing an MCC/MNC of 234/34 (PCS 1 900: 234/345) to the SS.
- After step c) the MS shall respond with TMSI REALLOCATION COMPLETE.
- After step e) the SIM shall contain the following values:

GSM and DCS 1 800 begin

EF<sub>LOC1</sub> (Location Information)

|            |          |            |

## 27.10 MS access control management

### 27.10.1 Definition and applicability

Access Control allows restriction of call access attempts. All mobile stations are assigned to a "low order class", and optionally (for priority uses) also to one or more "high order classes".

A "high order class" is only valid in the HPLMN or HPLMN country. Otherwise, the "low order class" is used.

The classes are programmed on the SIM. The network controls which classes at any time may be barred.

In addition, there is a separate mechanism for control of network access for emergency call attempts.

This test applies to GSM, DCS 1 800 and PCS 1 900 MEs using ID.1 or Plug-in SIM.

### 27.10.2 Conformance requirement

1. The ME shall read the access control value as part of the SIM/ME initialization procedure, and subsequently adopt this value.

3GPP TS 11.11, subclause 11.2.1.

2. If the MS is a member of at least one access class which corresponds to the permitted classes as signalled over the air interface, and the access class is applicable in the serving network, the MS may make call attempts. Otherwise call access attempts are not allowed.

If access class 10 is barred, MS of classes 0 - 9 and ME without SIMs shall not make emergency call attempts.

MS of classes 11 - 15 are not allowed to make emergency call attempts if access class 10 and the relevant access class(es) between 11 and 15 are barred. Otherwise, emergency call attempts are allowed irrespective of the conditions of access class 10.

All options are shown in figure 27-1 and are referenced to the tests.

3GPP TS 02.11, subclauses 4.3 and 4.4.

3. For PCS 1 900: The test requirements 1 and 2 above are also tested for emergency call number 911.

### 27.10.3 Test purpose

- 1) To verify that the ME reads the access control value as part of the SIM/ME initialization procedure, and subsequently adopts this value.
- 2) To verify that the MS controls its network access in accordance with its access control class and the conditions imposed by the serving network.

3) For PCS 1 900: To verify the requirements in 1 and 2 above by using the emergency call number 911.

The tests verify ME performance for the following:

Tests (a) and (b) No SIM in ME.

Tests (c) to (e) MS with access class 0 to 9.

Test (f) MS with access class 11 and 15 not in HPLMN; and  
MS with access class 12,13 and 14 not in HPLMN country.

Test (g) and (h) MS with access class 11 and 15 in HPLMN; and  
MS with access class 12,13 and 14 in HPLMN country.

Each of the above are tested against all relevant combinations of access control and emergency call bits signalled by the network, as shown in table 27-1.

#### 27.10.4 Method of test

##### 27.10.4.1 Initial conditions

The SS transmits on the BCCH, with the following network parameters:

Attach/detach: disabled.  
LAI (MCC/MNC/LAC): see table 27-1.  
Access control: see table 27-1.  
RACH: see table 27-1.

A SIM is installed in the ME containing IMSI and access control values as given in table 27-1 and the MS is powered on.

NOTE: Depending on the initial value of the  $EF_{LOCI}$ , the MS may perform a location update. This will be accepted by the SS.

#### Coding details

SIM IMSI: Data Field 6F 07

|        | Value 246813579 | Value 2468135x9 |
|--------|-----------------|-----------------|
| byte 1 | 05H             | 05H             |
| byte 2 | 29H             | 29H             |
| byte 3 | 64H             | 64H             |
| byte 4 | 18H             | 18H             |
| byte 5 | 53H             | 53H             |

| byte 9 | FFH             | FFH             |

Access class: Data field 6F 78

See 3GPP TS 11.11.

#### NETWORK (SS)

RACH: As defined in 3GPP TS 04.08 / 3GPP TS 44.018 subclause 10.5.2.29.

octet 1 01111000  
octet 2 00001000

octet 3            }  
 octet 4            } as table 27-1

#### 27.10.4.2 Procedure

- a) Using the MMI or EMMI a normal call set-up is attempted.
- b) Using the MMI or EMMI an emergency call set-up is attempted.
- c) The test is repeated for each set of values in table 27-1.

#### 27.10.5 Test requirement

After steps a) and b) the MS shall access the network, or shall make no access attempt, in accordance with table 27-1.

NOTE: For type approval, to limit testing, in tests (c), (d) and (e) it is only necessary that one of the access classes is tested.

**ACCESS CONTROL**

ECs = Emergency Calls

Access Class in SIM - See GSM 11.11 Data Field 6F 78

EC bit = bit3 of octet 3 of RACH Control Parameters - See GSM 04.08 Para 10.5.2.29

AC bit = See bytes 3 & 4 of RACHControl Parameters

\* ) Mobile adopts Access Class 0-9, based on IMSI. See GSM 02.11

## 27.11 Exchange protocol tests

### 27.11.1 Character transmission

#### 27.11.1.1 Bit/character duration during the transmission from the ME to the SIM

##### 27.11.1.1.1 Definition and applicability

Data is transmitted serially across the SIM/ME interface. A character comprises:

- the start bit;
- eight data bits;
- the parity bit.

This test applies to GSM, DCS 1 800 and PCS 1 900 MEs using either ID.1 or Plug-in SIM.

##### 27.11.1.1.2 Conformance requirement

The bit/character duration and the delay between two consecutive characters (between start leading edges) sent by the ME shall be in the range specified.

3GPP TS 11.11, subclause 5.9.

##### 27.11.1.1.3 Test purpose

To verify the timing during the transmission from the ME to the SIM.

##### 27.11.1.1.4 Method of test

###### 27.11.1.1.4.1 Initial conditions

The ME is connected to the SIM simulator, and powered on.

###### 27.11.1.1.4.2 Procedure

A number of characters are transmitted from the ME to the SIM simulator. The SIM simulator shall measure the bit/character duration and the delay between two consecutive characters for all characters transmitted by the ME.

###### 27.11.1.1.5 Test requirement

The timing shall be in the range specified.

#### 27.11.1.2 Bit/character duration during the transmission from the SIM simulator to the ME

##### 27.11.1.2.1 Definition and applicability

Data is transmitted serially across the SIM/ME interface. A character comprises:

- the start bit;
- eight data bits;
- the parity bit.

This test applies to GSM, DCS 1 800 and PCS 1 900 MEs using either ID.1 or Plug-in SIM.

#### 27.11.1.2.2 Conformance requirement

Responses with maximum and minimum bit/character duration times shall be accepted by the ME.

3GPP TS 11.11, subclause 5.9.

#### 27.11.1.2.3 Test purpose

To verify the acceptance of maximum and minimum bit/character duration during the transmission from the SIM to the ME.

#### 27.11.1.2.4 Method of test

##### 27.11.1.2.4.1 Initial conditions

The ME is connected to the SIM simulator, and powered on.

##### 27.11.1.2.4.2 Procedure

The SIM simulator shall send responses with the maximum and minimum bit/character durations specified in 3GPP TS 11.11.

#### 27.11.1.2.5 Test requirement

The ME shall accept the response and act accordingly.

### 27.11.1.3 Inter-character delay

#### 27.11.1.3.1 Definition and applicability

The inter-character delay is defined as the time between the start edge of a character and the start edge of the previous character. It is given by:

- the length of a character plus an extra guard time of  $N$  etu during transmission from the ME to the SIM.  $N$  is indicated in ATR character TC1;
- the work waiting time during transmission from the SIM to the ME.

This test applies to GSM, DCS 1 800 and PCS 1 900 MEs using either ID.1 or Plug-in SIM.

#### 27.11.1.3.2 Conformance requirement

- 1) If TC1 is 0 or 255 the ME shall work with the SIM.
- 2) If TC1 is not 0 or 255 the ME shall repeat the reset at least 2 times before it rejects the SIM.
- 3) The ME shall accept characters sent by the SIM with the work waiting time within the specified range.

3GPP TS 11.11, clause 5.9.

#### 27.11.1.3.3 Test purpose

- 1) To verify the correct evaluation of the character TC1 indicated in the ATR.
- 2) To verify that the ME accepts the minimum and maximum work waiting time during the transmission from the SIM to the ME.

#### 27.11.1.3.4 Method of test

##### 27.11.1.3.4.1 Initial conditions

The ME is connected to the SIM simulator, and powered on.

## 27.11.1.3.4.2 Procedure

a) Upon reception of a reset the SIM simulator transmits the ATR as follows:

a.1)  $N = 0$ .

| character name | content | meaning                                                                  |
|----------------|---------|--------------------------------------------------------------------------|
| TS             | 3B      | direct convention                                                        |
| T0             | 40      | TA1, TB1, TD1 not transmitted, TC1 transmitted, no historical characters |
| TA1            | 00      | $N = 0$                                                                  |

a.2)  $N = 255$ .

| character name | content | meaning                                                                  |
|----------------|---------|--------------------------------------------------------------------------|
| TS             | 3B      | direct convention                                                        |
| T0             | 40      | TA1, TB1, TD1 not transmitted, TC1 transmitted, no historical characters |
| TA1            | FF      | $N = 255$                                                                |

a.3)  $N = \text{Value other than 0 and 255}$ .

| character name | content        | meaning                                                                  |
|----------------|----------------|--------------------------------------------------------------------------|
| TS             | 3B             | direct convention                                                        |
| T0             | 40             | TA1, TB1, TD1 not transmitted, TC1 transmitted, no historical characters |
| TA1            | $00 < XX < FF$ | $0 < N < 255$                                                            |

b) The SIM simulator transmits with a work-waiting-time of 12 etu.

c) The SIM simulator transmits with a work-waiting-time of 9 600 etu.

## 27.11.1.3.5 Test requirement

In steps a.1) and a.2) the ME shall work with the SIM simulator.

In step a.3) the ME shall repeat the reset at least 2 times and then reject the SIM simulator.

In steps b) and c) the ME shall work with the SIM simulator.

## 27.11.1.4 Error handling during the transmission from the ME to the SIM

## 27.11.1.4.1 Definition and applicability

Error checking is done for each character transmitted by making use of the parity bit. If the SIM detects a parity error, an error signal is sent to the ME, and the ME retransmits that character.

This test applies to GSM, DCS 1 800 and PCS 1 900 MEs using either ID.1 of Plug-in SIM.

## 27.11.1.4.2 Conformance requirement

Subsequent to Answer to Reset and the protocol type selection, the error detection and character repetition procedure specified in GSM 11.11 is mandatory for transmission on the basis of  $T = 0$ . On receipt of an error signal, the ME shall repeat the previously transmitted character.

3GPP TS 11.11, subclause 5.10.

#### 27.11.1.4.3 Test purpose

To verify the error handling during the transmission from the ME to the SIM.

#### 27.11.1.4.4 Method of test

##### 27.11.1.4.4.1 Initial conditions

The ME is connected to the SIM simulator, and powered on.

##### 27.11.1.4.4.2 Procedure

The SIM simulator shall transmit an error signal in response to a received character in accordance with ISO 7816-3, subclause 6.1.3.

##### 27.11.1.4.5 Test requirement

The ME shall repeat the character in accordance with ISO 7816-3, subclause 6.1.3.

### 27.11.1.5 Error handling during transmission from the SIM to the ME

#### 27.11.1.5.1 Definition and applicability

Error checking is done for each character transmitted by making use of the parity bit. If the ME detects a parity error, an error signal is sent to the SIM, and the SIM retransmits that character.

This test applies to GSM, DCS 1 800 and PCS 1 900 MEs using either ID.1 of Plug-in SIM.

#### 27.11.1.5.2 Conformance requirement

Subsequent to Answer to Reset and the protocol type selection, the error detection and character repetition procedure specified in GSM 11.11 is mandatory for transmission on the basis of  $T = 0$ . On receipt of a response with a parity error, the ME shall send an error signal and expect the previously transmitted character to be repeated.

3GPP TS 11.11, subclause 5.10.

#### 27.11.1.5.3 Test purpose

To verify the error handling during the transmission from the SIM to the ME.

#### 27.11.1.5.4 Method of test

##### 27.11.1.5.4.1 Initial conditions

The ME is connected to the SIM simulator, and powered on.

##### 27.11.1.5.4.2 Procedure

The SIM simulator shall send a response with a parity error and check that the ME performs error handling in accordance with ISO/IEC 7816-3, subclause 6.3.3.

##### 27.11.1.5.5 Test requirement

The ME shall send an error signal in accordance with ISO/IEC 7816-3, subclause 6.3.3, and expect a repetition of the character. The ME shall correctly evaluate the character when repeated by the SIM simulator.

### 27.11.2 Answer to reset (RST)

#### 27.11.2.1 Void

## 27.11.2.2 Acceptance of SIMs with active low RST

### 27.11.2.2.1 Definition and applicability

Active low RST is one possible implementation of reset, and MEs must be able to accept SIMs with active low reset.

This test applies to GSM, DCS 1 800 and PCS 1 900 MEs using either ID.1 or Plug-in SIM.

### 27.11.2.2.2 Conformance requirement

The ME shall accept a SIM with active low reset by putting the RST contact to state H. The signal timing shall be in accordance with the specification.

3GPP TS 11.11, clause 5.

ISO/IEC 7816-3, subclause 5.3.2.

### 27.11.2.2.3 Test purpose

To verify that the ME accepts a SIM with active low reset. The timing of the RST signal shall be in accordance with the specification.

### 27.11.2.2.4 Method of test

#### 27.11.2.2.4.1 Initial conditions

The SIM simulator is configured for active low reset. The ME is connected to the SIM simulator and powered on.

#### 27.11.2.2.4.2 Procedure

The SIM simulator measures the timing of the RST signal.

### 27.11.2.2.5 Test requirement

The ME shall accept the SIM simulator with active low reset. The RST signal shall be put to state H after a minimum of (400/fi)s.

## 27.11.2.3 Characters of the answer to reset

### 27.11.2.3.1 Definition and applicability

When the SIM is reset, it sends up to 33 characters to the ME, containing information which must be interpreted by the ME to ascertain the transmission protocol to be used.

This test applies to GSM, DCS 1 800 and PCS 1 900 MEs using either ID.1 or Plug-in SIM.

### 27.11.2.3.2 Conformance requirement

1. The ME shall adopt the data encoding convention and initial etu time defined in the initial character TS of the ATR.

3GPP TS 11.11, subclause 5.8.

- The ME shall be able to receive interface characters for other transmission protocols than T = 0, historical characters and a check byte, even if only T = 0 is used by the ME.

3GPP TS 11.11, subclause 5.8.1.

### 27.11.2.3.3 Test purpose

- To verify that the ME adopts the appropriate data encoding convention and initial elementary time unit (etu) defined in the initial character TS of the Answer to Reset.
- To verify that the ME accepts interface characters for transmission protocols other than T=0, historical characters and the check byte.

### 27.11.2.3.4 Method of test

#### 27.11.2.3.4.1 Initial conditions

The ME is connected to the SIM (or SIM simulator).

#### 27.11.2.3.4.2 Procedure

- The ME is powered on
- The SIM (or SIM simulator) sends an ATR as follows:

| character name | content                                         | meaning                                                                  |
|----------------|-------------------------------------------------|--------------------------------------------------------------------------|
| TS             | 3B                                              | direct convention                                                        |
| T0             | 9F                                              | TB1, TC1 not transmitted, TA1, TD1 transmitted, 15 historical characters |
| TA1            | 11                                              | default values F = 372, D = 1                                            |
| TD1            | 80                                              | TA2, TB2, TC2 not transmitted, TD2 transmitted, protocol T=0 offered     |
| TD2            | 01                                              | TA2, TB2, TC2, TD2 not transmitted, protocol T=1 offered                 |
| Ti             | 53 49 4D 20 53 55 42 47 52 4F 55<br>50 20 39 35 | historical characters                                                    |
| TCK            | 4F                                              | check byte                                                               |

- The ME is made to send further commands to the SIM (or SIM simulator) (e.g. by entering the PIN).
- The ME is switched off and on. This time the SIM (or SIM simulator) sends an ATR as follows:

| character name | content                                         | meaning                                                                  |
|----------------|-------------------------------------------------|--------------------------------------------------------------------------|
| TS             | 3F                                              | inverse convention                                                       |
| T0             | 9F                                              | TB1, TC1 not transmitted, TA1, TD1 transmitted, 15 historical characters |
| TA1            | 11                                              | default values F = 372, D = 1                                            |
| TD1            | 80                                              | TA2, TB2, TC2 not transmitted, TD2 transmitted, protocol T=0 offered     |
| TD2            | 01                                              | TA2, TB2, TC2, TD2 not transmitted, protocol T=1 offered                 |
| Ti             | 53 49 4D 20 53 55 42 47 52 4F 55<br>50 20 39 35 | historical characters                                                    |
| TCK            | 4F                                              | check byte                                                               |

- The ME is made to send further commands to the SIM (e.g. by entering the PIN).

### 27.11.2.3.5 Test requirement

- After step b), the ME shall work with the SIM (or SIM simulator).

2. After step d), the ME shall work with the SIM (or SIM simulator).

## 27.11.2.4 PTS procedure

### 27.11.2.4.1 Definition and applicability

The PTS procedure is required to select the standard transmission protocol if the SIM does not use this as a default.

This test applies to GSM, DCS 1 800 and PCS 1 900 MEs using either ID.1 or Plug-in SIM.

### 27.11.2.4.2 Conformance requirement

If the ME receives an Answer to Reset where TA1 is not equal to "11", it shall initiate the PTS procedure as defined in 3GPP TS 11.11.

3GPP TS 11.11, subclause 5.8.2.

### 27.11.2.4.3 Test purpose

To verify that ME uses the PTS procedure as specified in GSM 11.11.

### 27.11.2.4.4 Method of test

#### 27.11.2.4.4.1 Initial conditions

The ME is connected to the SIM (or SIM simulator).

#### 27.11.2.4.4.2 Procedure

- a) The ME is powered on.
- b) The SIM (or the SIM simulator) sends an ATR as follows:

| character name | content | meaning                                                                  |
|----------------|---------|--------------------------------------------------------------------------|
| TS             | 3B      | direct convention                                                        |
| T0             | 10      | TB1, TC1, TD1 not transmitted, TA1 transmitted, no historical characters |
| TA1            | 77      | invalid values for F and D                                               |

### 27.11.2.4.5 Test requirement

After step b), the ME shall send to the SIM (or the SIM simulator) "FF00FF".

## 27.11.2.5 Reset repetition

### 27.11.2.5.1 Definition and applicability

If transmission errors result in the ATR being unintelligible to the ME, the ME performs the reset again. The minimum number of reset attempts is three.

This test applies to GSM, DCS 1 800 and PCS 1 900 MEs using either ID.1 or Plug-in SIM.

### 27.11.2.5.2 Conformance requirement

Following receipt of a wrong ATR, the ME shall perform a reset. The ME shall not reject the SIM until at least three consecutive wrong ATRs are received.

3GPP TS 11.11, subclause 5.10.

### 27.11.2.5.3 Test purpose

To verify that the ME repeats the reset procedure on receipt of a wrong ATR, and does not reject the SIM unless at least three consecutive wrong ATRs are received.

### 27.11.2.5.4 Method of test

#### 27.11.2.5.4.1 Initial conditions

The ME is connected to the SIM simulator.

#### 27.11.2.5.4.2 Procedure

- a) The ME is powered on.
- b) The SIM simulator sends a non understandable answer to reset to the ME. (e.g. a wrong TS byte), at each reset initiated by the ME.

### 27.11.2.5.5 Test requirement

After step b), the ME shall repeat the reset at least two times.

## 27.11.2.6 Speed Enhancement

### 27.11.2.6.1 Definition and applicability

MEs that support speed enhancement use a specific PTS sequence to indicate the use of different transmission parameters F and D. If this PTS fails, the ME retries with standard parameters.

This test applies to GSM, DCS 1 800 and PCS 1 900 MEs supporting speed enhancement.

### 27.11.2.6.2 Conformance requirement

1. If speed enhancement is implemented in the ME, it is mandatory to support F=512 and D=8 (in addition to the default values F=372 and D=1).

3GPP TS 11.11, subclause 5.8.3.

2. If the SIM does not answer the PTS request within the initial waiting time, the ME shall reset the SIM. After two failed PTS attempts using F=512 and D=8 (i.e. no PTS response from the SIM) the ME shall initiate a PTS procedure using default values F=372 and D=1.

3GPP TS 11.11, subclause 5.8.3.

### 27.11.2.6.3 Test purpose

1. To verify that the ME supports the transmission parameters F=512 and D=8.
2. To verify that the ME resets the SIM if the SIM does not answer the PTS request within the initial waiting time and initiates a PTS procedure using default values F=372 and D=1 after the second failed PTS attempt.

### 27.11.2.6.4 Method of test

#### 27.11.2.6.4.1 Initial conditions

The ME is connected to the SIM simulator.

#### 27.11.2.6.4.2 Procedure

- a) The ME is powered on.
- b) The SIM simulator sends an ATR as follows:

| character name | content | meaning                                                                  |
|----------------|---------|--------------------------------------------------------------------------|
| TS             | 3B      | direct convention                                                        |
| T0             | 10      | TB1, TC1, TD1 not transmitted, TA1 transmitted, no historical characters |
| TA1            | 94      | F=512, D=8                                                               |

- c) After receipt of the PTS Request, the SIM simulator answers with the PTS Response "FF 10 94 7B" using a work waiting time of 9600 etu (initial waiting time).
- d) The SIM simulator transmits with enhanced speed (F=512, D=8).
- e) The ME is switched off and on. The SIM simulator sends an ATR as in step b).
- f) After receipt of the PTS Request, the SIM simulator does not answer.

#### 27.11.2.6.5 Test requirement

After step b) the ME shall send to the SIM simulator the PTS Request "FF 10 94 7B".

After step c) the ME shall work with the SIM simulator.

After step e) the ME shall send to the SIM simulator the PTS Request "FF 10 94 7B" and repeat that once. After that, the ME shall send to the SIM simulator the PTS Request "FF 00 FF".

### 27.11.3 Command processing, procedure bytes

#### 27.11.3.1 Definition and applicability

The procedure bytes ACK, NULL, and SW1 are sent from the SIM to the ME, and give the ME an acknowledgement for the previous instruction, information concerning transfer of data and the card status at the end of the command.

This test applies to GSM, DCS 1 800 and PCS 1 900 MEs using either ID.1 or Plug-in SIM.

#### 27.11.3.2 Conformance requirement

On the basis of protocol T = 0, the ME shall correctly use the different modes of data transmission defined in ISO/IEC 7816-3, subclause 8.2.2.

3GPP TS 11.11, clause 5

ISO/IEC 7816: 1990, subclause 8.2.2.

#### 27.11.3.3 Test purpose

To verify that the ME uses correctly the different modes of data transmission.

#### 27.11.3.4 Method of test

##### 27.11.3.4.1 Initial conditions

The ME is connected to the SIM simulator and powered on.

##### 27.11.3.4.2 Procedure

- a) The ME is made to initiate a VERIFY CHV command.
- b) The SIM simulator answers the first 3 bytes with ACK=INS complemented.
- c) The SIM simulator answers the next data byte with NULL (NULL="60").

- d) The SIM simulator then sends ACK=INS. This byte is sent when the elapsed time since step b) is greater than the work waiting time.
- e) The SIM simulator answers the transmission of the rest of the data with NULL.
- f) The SIM simulator then sends SW1 and SW2, indicating correct execution of the command ("90" and "00" for SW1 and SW2 respectively). These bytes are sent when the elapsed time since step d) is greater than the work waiting time.

#### 27.11.3.5 Test requirement

The command shall be executed correctly.

## 27.12 Evaluation of directory characteristics

### 27.12.1 Operating speed in authentication procedure

#### 27.12.1.1 Definition and applicability

Authentication is performed by a GSM network on the SIM, by sending a random number to the SIM. The SIM then performs a calculation on the random number, and sends the result to the network for verification.

This test applies to GSM, DCS 1 800 and PCS 1 900 MEs using either ID.1 or Plug-in SIM.

#### 27.12.1.2 Conformance requirement

If bit b2 of the file characteristics is set to 1, then the ME shall provide a clock frequency of at least 13/4 MHz to enable the SIM to run the authentication process in the required time.

3GPP TS 11.11, subclause 5.4.

#### 27.12.1.3 Test purpose

To verify that the authentication procedure is done with a frequency of at least 13/4 MHz if the bit b2 of the file characteristics (byte 1 of the directory characteristics) is set to 1.

#### 27.12.1.4 Method of test

##### 27.12.1.4.1 Initial conditions

System simulator:

1 cell, default parameters.

Mobile Equipment:

Connected to a SIM-simulator with bit b2 of the file characteristics set to 1.

ME is powered on.

##### 27.12.1.4.2 Procedure

An authentication is made in the same way as in test [26.7.2. Authentication]. The MS is paged. After the MS has responded with a PAGING RESPONSE message to the SS, the SS initiates an authentication procedure, sending the MS the value RAND. During authentication, the SIM simulator checks the frequency of the clock supplied by the ME. Following the AUTHENTICATION RESPONSE from the MS, the SS sends CHANNEL RELEASE.

#### 27.12.1.5 Test requirement

The frequency of the clock shall be at least 13/4 MHz during the authentication procedure.

## 27.12.2 Clock stop

### 27.12.2.1 Definition and applicability

The ME may switch off the clock signal to the SIM, but only if the SIM indicates that it supports this feature.

This test applies to GSM, DCS 1 800 and PCS 1 900 MEs using either ID.1 or Plug-in SIM.

### 27.12.2.2 Conformance requirement

1. The ME shall not stop the clock, unless the requirements indicated in byte 1 of the file characteristics are met.

3GPP TS 11.11, subclauses 5.6 and 9.2.1.

2. The ME shall wait at least 1 860 clock cycles after having received the last character including the minimum guard time (2 etu) of the response before switching off the clock. The ME shall wait at least 744 clock cycles before it sends the first command after having restarted the clock.

3GPP TS 11.11, subclause 5.6.

### 27.12.2.3 Test purpose

1. To verify that the clock is only switched off if requirements are met as indicated in the file characteristics (byte 1 of the directory characteristics).
2. To verify that the timing of the clock switching is as specified.

### 27.12.2.4 Method of test

#### 27.12.2.4.1 Initial conditions

The ME is connected to a SIM simulator. CHV 1 is enabled.

#### 27.12.2.4.2 Procedure

- a) A SIM simulator is used with bits set as follows:

| Bit b1 | Bit b3 | Bit b4 |
|--------|--------|--------|
| 0      | 0      | 0      |

- b) The ME is powered on. When the ME is in mode PIN check, 10 s shall elapse before the PIN is entered.

- c) The ME is powered off, and a SIM simulator is used with bits set as follows:

| Bit b1 | Bit b3 | Bit b4 |
|--------|--------|--------|
| 0      | 1      | 0      |

- d) The ME is powered on. When the ME is in mode PIN check, 10 s shall elapse before the PIN is entered.

- e) The ME is powered off, and a SIM simulator is used with bits set as follows:

| Bit b1 | Bit b3 | Bit b4 |
|--------|--------|--------|
| 0      | 0      | 1      |

- f) The ME is powered on. When the ME is in mode PIN check, 10 s shall elapse before the PIN is entered.

- g) The ME is powered off, and a SIM simulator is used with bits set as follows:

| Bit b1 | Bit b3 | Bit b4 |
|--------|--------|--------|
| 1      | 0      | 0      |

h) The ME is powered on. When the ME is in mode PIN check, 10 s shall elapse before the PIN is entered.

#### 27.12.2.5 Test requirement

1. During step b), the ME shall not switch off the clock.
2. During step d), the ME shall not switch off the clock, unless at high level.
3. During step f), the ME shall not switch off the clock, unless at low level.
4. During steps d), f) and h), the ME shall not switch off the clock until at least 1 860 clock cycles after having received the last character of the response including the minimum guard time (2 etu).
5. During steps d), f) and h), the ME shall wait at least 744 clock cycles before it sends the first command after having restarted the clock.

## 27.13 Mechanical tests

### 27.13.1 Contact pressure

#### 27.13.1.1 Definition and applicability

The contacts of the card reader must exert a force to maintain a good electrical contact, but the force must not be excessive and damage the SIM.

This test applies to GSM, DCS 1 800 and PCS 1 900 MEs using either ID.1 or Plug-in SIM.

#### 27.13.1.2 Conformance requirement

A contact force may not be greater than 0,5 N per contact.

3GPP TS 11.11, subclause 4.3.4.

#### 27.13.1.3 Test purpose

To verify that the contact pressure of each contacting element is not greater than 0,5 N when each of the following types of card is used:

- i) Unembossed.
- ii) Embossed on the contact side.
- iii) Embossed on the opposite side to the contacts.

NOTE: Only type i) applies to the plug-in SIM.

#### 27.13.1.4 Method of test

##### 27.13.1.4.1 Initial conditions

The ME manufacturers shall provide a separate card reader (mechanical components) to make the measurement possible.

##### 27.13.1.4.2 Procedure

The pressure of each contacting element is measured.

##### 27.13.1.5 Test requirement

The contact pressure of each contacting element shall be not greater than 0,5 N.

## 27.13.2 Shape of contacts for IC card SIM card reader

### 27.13.2.1 Definition and applicability

The shape of the contacts is important to maintain a good electrical contact, but must not damage the SIM.

This test applies to GSM, DCS 1 800 and PCS 1 900 MEs using either ID.1 or Plug-in SIM.

### 27.13.2.2 Conformance requirement

The radius of curvature of the contacting elements shall be greater than or equal to 0,8 mm in the contact area of both axes.

3GPP TS 11.11, subclause 4.3.4.

### 27.13.2.3 Test purpose

To verify that the radius of curvature of the contacting elements is greater than or equal to 0,8 mm in the contact area on both axes.

### 27.13.2.4 Method of test

#### 27.13.2.4.1 Initial conditions

The ME manufacturers shall provide a separate card reader (mechanical components) to make the measurement possible.

#### 27.13.2.4.2 Procedure

The radius of curvature of the contacting elements is measured on both axes.

### 27.13.2.5 Test requirement

The radius of curvature of the contacting elements shall be greater than or equal to 0,8 mm in the contact area on both axes.

## 27.14 Secret code usage

### 27.14.1 Entry of PIN

#### 27.14.1.1 Definition and applicability

The PIN is a number used to authenticate the user to the SIM for security. Entry of the correct PIN allows PIN-protected data to be accessed over the SIM-ME interface.

This test applies to all ME.

#### 27.14.1.2 Conformance requirement

Following insertion of the SIM and switching on the MS, the ME shall check the state of the PIN. If the PIN is enabled, the ME asks the user for PIN verification.

The VERIFY CHV function verifies the PIN presented by the ME to the SIM.

#### Reference:

3GPP TS 02.30, subclause 4.6.1; 3GPP TS 11.11, subclauses 8.9, 9.2.9 and 11.3.1.

### 27.14.1.3 Test purpose

1. To verify that the PIN verification procedure is performed by the ME correctly.
2. To verify that the GSM basic public MMI string is supported.

### 27.14.1.4 Method of test

#### 27.14.1.4.1 Initial conditions

The ME is connected to a SIM or SIM-simulator with the PIN enabled, and powered off.

The default SIM is used.

#### 27.14.1.4.2 Procedure

- a) The ME is powered on.
- b) When the MS is in mode "PIN check" enter "2468#".

### 27.14.1.5 Test requirement

- 1) The ME shall send a VERIFY CHV command to the SIM, with CHV number = "01".
- 2) The MS shall give an indication "OK", following a successful execution of the command.

## 27.14.2 Change of PIN

### 27.14.2.1 Definition and applicability

The PIN may be changed by the user, by entering the old and new PINs. The length of the PIN is between 4 and 8 digits.

This test applies to all MEs.

### 27.14.2.2 Conformance requirement

The ME shall support the change of PIN procedure as defined in 3GPP TS 02.30 and 3GPP TS 11.11.

#### Reference:

3GPP TS 02.30, subclause 4.6.2; 3GPP TS 11.11, subclauses 8.10, 9.2.10 and 11.3.2.

### 27.14.2.3 Test purpose

1. To verify that the PIN substitution procedure is performed correctly by the ME.
2. To verify that the GSM basic public MMI string is supported.

### 27.14.2.4 Method of test

#### 27.14.2.4.1 Initial conditions

The ME is connected to a SIM or SIM-simulator with the PIN enabled.

The default SIM is used.

The ME is powered-on, with the correct PIN entered.

#### 27.14.2.4.2 Procedure

- a) Enter "\*\*\*04\*2468\*01234567\*01234567#".
- b) The MS is switched off and on.
- c) When the MS is in mode "PIN-check", the sequence "01234567#" is entered.
- d) The MS is switched off and on.
- e) When the MS is in mode "PIN check" enter "2468#".

#### 27.14.2.5 Test requirement

- 1) After step a), the ME shall send a CHANGE CHV command to the SIM, with CHV number set to "01".
- 2) Following the successful execution of the command, the MS shall give an indication that the new PIN is accepted.
- 3) After step c), the MS shall give an indication "OK".
- 4) After step e), the MS shall give an indication that the entered PIN is not accepted.

### 27.14.3 Disabling the PIN

#### 27.14.3.1 Definition and applicability

Entry of the PIN may be disabled by the user, depending on the service table of the SIM. It is the responsibility of the ME to check the SIM service table.

This test applies to GSM, DCS 1 800 and PCS 1 900 MEs using either ID.1 or Plug-in SIM that support a feature to disable the PIN.

#### 27.14.3.2 Conformance requirement

Disabling PIN is achieved through the DISABLE CHV command. If the PIN disable function in the SIM service table is not allocated or activated, then the ME shall not attempt to disable the PIN.

#### Reference:

3GPP TS 11.11, subclauses 8.11, 9.2.11, 10.2.7, 11 and 11.3.3.

#### 27.14.3.3 Test purpose

To verify that the ME does not attempt to disable the PIN.

#### 27.14.3.4 Method of test

##### 27.14.3.4.1 Initial conditions

The ME is connected to the SIM simulator.

Elementary files in the SIM simulator shall be default, with the exception of:

#### EF<sub>SST</sub> (SIM Service Table)

- Logically:
- CHV1 disable function not activated.
  - Abbreviated dialling numbers allocated and activated.
  - PLMN selector allocated and activated.
  - Fixed dialling numbers not activated.

|         |          |          |          |                   |
|---------|----------|----------|----------|-------------------|
| Coding: | B1       | B2       | B3       | B4                |
|         | xx0x110x | 0011xxxx | xxxxxxxx | 0000xxxx (binary) |

The coding of EF<sub>SST</sub> shall conform with the capabilities of the SIM simulator.

The ME is powered on and a correct PIN entered.

#### 27.14.3.4.2 Procedure

Using the ME's MMI procedure, an attempt is made to disable the PIN.

#### 27.14.3.5 Test requirement

The ME shall not send a DISABLE CHV command across the SIM/ME interface.

### 27.14.4 PUK entry

#### 27.14.4.1 Definition and applicability

After three consecutive wrong entries of the PIN, the PIN becomes blocked. The PUK is used to unblock the PIN. This function may be performed whether or not the PIN is blocked.

This test applies to GSM, DCS 1 800 and PCS 1 900 MEs using either ID.1 or Plug-in SIM.

#### 27.14.4.2 Conformance requirement

The ME shall support the procedure to unblock PIN using PUK, as defined in 3GPP TS 02.30 and 3GPP TS 11.11.

#### Reference:

3GPP TS 02.30, subclause 4.6.3; 3GPP TS 11.11, subclauses 8.13, 9.2.13 and 11.3.5.

#### 27.14.4.3 Test purpose

1. To verify that the CHV unblocking procedure is performed correctly.
2. To verify that the GSM basic public MMI string is supported.

#### 27.14.4.4 Method of test

##### 27.14.4.4.1 Initial conditions

The ME is connected to the SIM simulator.

The default SIM is used.

##### 27.14.4.4.2 Procedure

- a) The ME is powered on.
- b) Enter "\*\*\*05\*13243546\*1234\*1234#"
- c) The ME is powered off and on.
- d) Enter the new PIN: "1234".
- e) The ME is powered off and on.
- f) Enter a wrong PIN three times.
- g) Enter "\*\*\*05\*13243546\*2468\*2468#".

- h) The ME is powered off and on.
- i) Enter the new PIN: "2468".

#### 27.14.4.5 Test requirements

1. After step b), the ME shall send an UNBLOCK CHV command to the SIM, with CHV number = "00".
2. After step d), the ME shall indicate that the PIN has been accepted.
3. After step f), the ME shall indicate that the PIN has been blocked.
4. After step g), the ME shall send an UNBLOCK CHV command to the SIM, with CHV number = "00".
5. After step j), the ME shall indicate that the PIN has been accepted.

### 27.14.5 Entry of PIN2

#### 27.14.5.1 Definition and applicability

PIN2 is a number used to authenticate the user to the SIM for security. Entry of the correct PIN2 allows PIN2-protected data to be accessed over the SIM-ME interface.

This test applies to all ME that support a feature requiring entry of PIN2, such as AoC or FDN.

#### 27.14.5.2 Conformance requirement

Where entry of PIN2 is necessary for security access, the ME shall indicate that PIN2 is to be entered.

The VERIFY CHV function verifies the PIN presented by the ME to the SIM.

#### Reference:

3GPP TS 02.30, subclause 4.6.1; 3GPP TS 11.11, subclauses 8.9, 9.2.9 and 11.3.1.

#### 27.14.5.3 Test purpose

To verify that entry of PIN2 is processed by the ME correctly.

#### 27.14.5.4 Method of test

##### 27.14.5.4.1 Initial conditions

The ME is connected to a SIM or SIM-simulator and powered on, with the correct PIN entered.

A default FDN SIM is used.

##### 27.14.5.4.2 Procedure

- a) A feature is accessed which requires the entry of PIN2, e.g. resetting ACM for Advice of Charge, or changing a Fixed Dialling Number.
- b) The MMI is used to enter PIN2: "3579".

##### 27.14.5.5 Test requirement

- 1) After step b), the ME shall send a VERIFY CHV command to the SIM, with CHV number = "02".
- 2) Following the successful execution of the command, the MS shall give an indication that PIN2 was accepted.

## 27.14.6 Change of PIN2

### 27.14.6.1 Definition and applicability

The PIN2 may be changed by the user, by entering the old and new PIN2s. The length of the PIN is between 4 and 8 digits.

This test applies to all MEs that support PIN2.

### 27.14.6.2 Conformance requirement

The ME shall support the change of PIN2 procedure as defined in 3GPP TS 02.30 and 3GPP TS 11.11.

#### Reference:

3GPP TS 02.30, subclause 4.6.2; 3GPP TS 11.11, subclauses 8.10, 9.2.10 and 11.3.2.

### 27.14.6.3 Test purpose

1. To verify that PIN2 substitution procedure is performed correctly by the ME.
2. To verify that the GSM basic public MMI string is supported.

### 27.14.6.4 Method of test

#### 27.14.6.4.1 Initial conditions

The ME is connected to a SIM or SIM-simulator.

The default FDN SIM is used, with PIN enabled.

The ME is powered on, with the correct PIN entered.

#### 27.14.6.4.2 Procedure

- a) Enter "\*\*\*042\*3579\*12345678\*12345678#".
- b) The MS is switched off and on, and PIN entered: "2468".
- c) Enter "\*\*\*042\*3579\*12345678\*12345678#".
- d) Enter "\*\*\*042\*12345678\*3579\*3579#".

### 27.14.6.5 Test requirement

- 1) After step a), the ME shall send a CHANGE CHV command to the SIM, with CHV number set to "02".
- 2) Following the successful execution of the command, the MS shall give an indication that the new PIN2 is accepted.
- 3) After step c), the MS shall give an indication that the new PIN2 is not accepted.
- 4) After step d), the MS shall give an indication that the new PIN2 is accepted.

## 27.14.7 PUK2 entry

### 27.14.7.1 Definition and applicability

After three consecutive wrong entries of PIN2, it becomes blocked. PUK2 is used to unblock PIN2. This function may be performed whether or not PIN2 is blocked.

This test applies to GSM, DCS 1 800 and PCS 1 900 MEs using either ID.1 or Plug-in SIM, that support PIN2.

### 27.14.7.2 Conformance requirement

The ME shall support the procedure to unblock PIN2 using PUK2, as defined in 3GPP TS 02.30 and 3GPP TS 11.11.

Reference:

3GPP TS 02.30, subclause 4.6.3; 3GPP TS 11.11, subclauses 8.13, 9.2.13 and 11.3.5.

### 27.14.7.3 Test purpose

1. To verify that the PUK2 unblock procedure is performed correctly by the ME.
2. To verify that the GSM basic public MMI string is supported.

### 27.14.7.4 Method of test

#### 27.14.7.4.1 Initial conditions

The ME is connected to the SIM simulator.

The default FDN SIM is used, with PIN enabled.

#### 27.14.7.4.2 Procedure

- a) The ME is powered on and a correct PIN entered.
- b) Enter "\*\*\*052\*08978675\*1234\*1234#".
- c) The MS is powered off and on, and PIN entered: "2468".
- d) A feature is selected requiring the entry of PIN2, and the new PIN2 "1234" is entered.
- e) A wrong PIN2 is entered three times.
- f) Enter "\*\*\*052\*08978675\*3579\*3579#".
- g) A feature is selected requiring the entry of PIN2, and the new PIN2 "3579" is entered.

#### 27.14.7.5 Test requirements

1. After step b), the ME shall send an UNBLOCK CHV command to the SIM, with CHV number = "02".
2. After step d), the ME shall send a VERIFY CHV command, with CHV number = "02". Following the successful execution of the command, the ME shall indicate that the PIN2 has been accepted.
3. After step e), the ME shall indicate that PIN2 has been blocked.
4. After step f), the ME shall send an UNBLOCK CHV command to the SIM, with CHV number = "02".
5. After step g), the ME shall indicate that PIN2 has been accepted.

## 27.15 Abbreviated Dialling Numbers (ADN)

### 27.15.1 Definition and applicability

Abbreviated Dialling Numbers contain subscriber number and supplementary service control strings. They may also contain alpha identifiers.

This test applies to both GSM, DCS 1 800 and PCS 1 900 MEs using either ID.1 or plug-in SIMs, that support ADN.

### 27.15.2 Conformance requirement

The ME shall be able to manage the storage and retrieval of ADNs from the SIM, and set up calls to these numbers.

Reference:

3GPP TS 02.07, subclause B.3.1; 3GPP TS 02.30 subclause 4.6.4; 3GPP TS 11.11, subclause 11.5.1.

### 27.15.3 Test purpose

To verify that the ME manages the storage and retrieval of ADNs from the SIM.

### 27.15.4 Method of Test

#### 27.15.4.1 Initial conditions

Coding of elementary files in the SIM shall be as default, with the addition of:

EF<sub>ADN</sub> (Abbreviated Dialling Number)

Logically:

At least 101 records.

|                       |                                   |               |
|-----------------------|-----------------------------------|---------------|
| Record 1:             | Length of alpha identifier:       | 32 characters |
| Alpha identifier:     | "ABCDEFGHJKLMNOPQRSTUVWXYZABCDEF" |               |
| Length of BCD number: | "03"                              |               |
| TON and NPI:          | Telephony and Unknown             |               |
| Dialled number:       | 123                               |               |
| CCI:                  | None                              |               |
| Ext1:                 | None                              |               |

Coding:

|               |    |    |    |     |     |     |     |     |     |     |     |     |     |     |
|---------------|----|----|----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| For record 1: | B1 | B2 | B3 | ... | B32 | B33 | B34 | B35 | B36 | B37 | B38 | B39 | ... | B46 |
|               | 41 | 42 | 43 | ... | 46  | 03  | 81  | 21  | F3  | FF  | FF  | FF  | ... | FF  |

The ME is installed with the default SIM or SIM simulator, and switched on.

#### 27.15.4.2 Procedure

- The code "+123456789012345" is stored (entered) in the MS as abbreviated dialling entry number 7 on the SIM.
- The code "00112233" is stored (entered) in the MS as abbreviated dialling entry number 6 on the SIM.
- The code "\*\*\*21\*44556677#" is stored (entered) in the MS as abbreviated dialling entry number 101 on the SIM.
- Retrieve data from SIM entry number 7 using the procedure N(N)(N)#.
- Retrieve data from SIM entry number 6 using the procedure N(N)(N)#.
- Retrieve data from SIM entry number 101 using the procedure N(N)(N)#.
- Retrieve data from SIM entry number 1 using the procedure N(N)(N)#, and display the alpha identifier.

### 27.15.5 Test requirements

- After step d), the number "+123456789012345" shall be displayed.
- After step e), the number "00112233" shall be displayed.
- After step f), the number "\*\*\*21\*44556677#" (or an equivalent representation) shall be displayed.

4) After step g), the ME shall display at least part of the alpha identifier, and shall sustain normal operation.

## 27.16 MMI reaction to SIM status encoding

### 27.16.1 Definition and applicability

The SIM gives status information in response to instructions, as two-byte codes. Some of these codes give valuable information to the user, and appropriate indication by the ME is mandatory.

This test applies to GSM, DCS 1 800 and PCS 1 900 MEs using either ID.1 or plug-in SIMs.

### 27.16.2 Conformance requirement

It is mandatory to give the user an appropriate indication when any of the codes given below appear.

#### Reference:

3GPP TS 02.30, subclause 4.6.5.

### 27.16.3 Test purpose

To verify that the ME gives an appropriate indication to the user in response to status information return codes from the SIM.

### 27.16.4 Method of test

#### 27.16.4.1 Initial conditions

The ME is connected to the SIM simulator. All elementary files are coded as default.

The ME is powered on.

#### 27.16.4.2 Procedure.

The SIM simulator is used to send the following error codes as reaction on an instruction from the ME:

- 9240 Memory Problem;
- 9804 Access security policy not fulfilled or secret code rejected;
- 9840 Secret code locked;
- 6FXX Technical problem with no diagnostic given as reaction on an instruction from the ME.

### 27.16.5 Test requirement

For each error code, the ME shall give an appropriate MMI indication.

## 27.17 Electrical tests

### General test purpose

Testing of electrical characteristics of the SIM/ME interface.

Whilst non-conformance in this area would be unlikely to cause difficulties to other users or the network (type approval criteria), significant deviations from the specifications (3GPP TS 11.11 and ISO 7816) may damage the SIM. If an attempt is then made to use the SIM in a different ME, then its failure may reflect badly on both that ME and the network.

This subclause lists the electrical tests to be performed.

They include:

- i) tests during activation and deactivation phases; and
- ii) tests to be performed on each contact in both static and dynamic states: e.g. voltages, currents and signal characteristics.

However, due to the likely difficulty of accessing the terminals of the SIM/ME interface for the purposes of measurements, the ME manufacturer shall provide a test interface in accordance with subclause 36.5 for the purpose of conformance testing.

These tests apply to GSM, DCS 1 800 and PCS 1 900 MEs using either ID.1 or plug-in SIMs with any one of the following types of SIM/ME interface:

- a) 5V SIM interface: The interface only supports the 5V operation mode as specified in 3GPP TS 11.11 and ISO/IEC 7816-3. The following conformance requirements apply:

27.17.1.1.2

27.17.1.2.2 a)

27.17.1.3.2 a)

27.17.1.4.2 a)

27.17.2.1.1.2 a)

27.17.2.1.2.2 a)

27.17.2.2.2 a)

27.17.2.3.2 a.1,2,3,4)

27.17.2.5.2 a.1,2,3,4)

- b) 3V SIM interface: The interface only supports the 3V operation mode as specified in 3GPP TS 11.12. The following conformance requirements apply:

27.17.1.1.2

27.17.1.2.2 b)

27.17.1.4.2 b)

27.17.1.5.1.2

27.17.1.5.2.2

27.17.2.1.1.2 b)

27.17.2.1.2.2 b)

27.17.2.2.2 b)

27.17.2.3.2 b.1,2,3,4)

27.17.2.5.2 b.1,2,3,4)

- c) 3V/5V SIM interface: The interface supports both the 5V operation mode as specified in 3GPP TS 11.11 and ISO 7816-3 and the 3V operation mode as specified in 3GPP TS 11.12. It recognizes the type of SIM and switches the interface accordingly. The following conformance requirements apply:

27.17.1.1.2

27.17.1.2.2 c.1,2)

27.17.1.3.2 c)

|               |                    |
|---------------|--------------------|
| 27.17.1.4.2   | c.1,2)             |
| 27.17.1.5.3.2 |                    |
| 27.17.1.5.4.2 |                    |
| 27.17.2.1.1.2 | c.1,2)             |
| 27.17.2.1.2.2 | c.1,2)             |
| 27.17.2.2.2   | c.1,2)             |
| 27.17.2.3.2   | c.1,2,3,4,5,6,7,8) |
| 27.17.2.5.2   | c.1,2,3,4,5,6,7,8) |

- d) 1,8V SIM interface: The interface only supports the 1.81,8V operation mode as specified in 3GPP TS 11.18. The following conformance requirements apply:

|               |            |
|---------------|------------|
| 27.17.1.1.2   |            |
| 27.17.1.2.2   | d)         |
| 27.17.1.4.2   | d)         |
| 27.17.1.5.1.2 |            |
| 27.17.1.5.2.2 |            |
| 27.17.2.1.1.2 | d)         |
| 27.17.2.1.2.2 | d)         |
| 27.17.2.2.2   | d)         |
| 27.17.2.3.2   | d.1,2,3,4) |
| 27.17.2.5.2   | d.1,2,3,4) |

- e) 1,8V/3V SIM interface: The interface supports both the 3V operation mode as specified in 3GPP TS 11.12 and the 1,8V operation mode as specified in 3GPP TS 11.18. It recognizes the type of SIM and switches the interface accordingly. The following conformance requirements apply:

|               |                    |
|---------------|--------------------|
| 27.17.1.1.2   |                    |
| 27.17.1.2.2   | e.1,2)             |
| 27.17.1.3.2   | e)                 |
| 27.17.1.4.2   | e.1,2)             |
| 27.17.1.5.3.2 |                    |
| 27.17.1.5.4.2 |                    |
| 27.17.2.1.1.2 | e.1,2)             |
| 27.17.2.1.2.2 | e.1,2)             |
| 27.17.2.2.2   | e.1,2)             |
| 27.17.2.3.2   | e.1,2,3,4,5,6,7,8) |
| 27.17.2.5.2   | e.1,2,3,4,5,6,7,8) |

#### General measurement conventions

For the 5V interface operation mode, the measurement conventions are specified in ISO/IEC 7816-3 subclause 4.2.1.

For the 3V and 1,8V interface operation mode these conditions apply in an analogous way.

## 27.17.1 Test of the power transition phases

### 27.17.1.1 Phase preceding ME power on

#### 27.17.1.1.1 Definition and applicability

When the mobile equipment is switched off, the contacts of the SIM/ME interface remain in an inactive state in order to prevent any damage to the SIM.

This test applies to GSM, DCS 1 800 and PCS 1 900 MEs.

#### 27.17.1.1.2 Conformance requirement

The residual voltage across the contacts of the SIM/ME interface (C1, C2, C3, C6, C7) shall not exceed  $\pm 0,4$  Volts referenced to GND.

#### Reference:

3GPP TS 11.11, subclause 4.3.3.

#### 27.17.1.1.3 Test purpose

To verify that the residual voltage across the contacts of the SIM/ME interface (C1, C2, C3, C6, C7) is not greater than  $\pm 0,4$  Volts referenced to GND.

#### 27.17.1.1.4 Method of test

##### 27.17.1.1.4.1 Initial condition

The ME is connected to a SIM Simulator.

The contact C1 (Vcc) of the SIM/ME interface is loaded with an impedance of 10 kOhm.

The other contacts (C2, C3, C6, C7) are loaded with an impedance of 50 kOhm.

##### 27.17.1.1.4.2 Procedure

The residual voltage on each contact is measured.

##### 27.17.1.1.5 Test requirement

The residual voltage on each contact shall not exceed  $\pm 0,4$  Volts referenced to GND.

### 27.17.1.2 Phase during SIM power on

#### 27.17.1.2.1 Definition and applicability

When the mobile station is switched on or when the SIM/ME interface is being activated after 3V/5V or 1,8V/3V switching, the contacts shall be activated in a defined sequence in order to prevent any damage to the SIM.

The timing of this sequence is not defined, a measurement resolution better than or equivalent to 100 ns is assumed.

An ME supporting both 5V and 3V interface operation mode may switch from 3V to 5V after it has read the SIM type identification in the SIM status information by deactivating the SIM and activating it at the new supply voltage.

An ME supporting both 3V and 1,8V interface operation mode may switch from 1,8V to 3V after it has read the SIM type identification in the SIM status information by deactivating the SIM and activating it at the new supply voltage.

This test applies to GSM, DCS 1 800 and PCS 1 900 MEs with:

- a) 5V SIM interface;
- b) 3V SIM interface;
- c) 3V/5V SIM interface;
- d) 1,8V SIM interface;
- e) 1,8V/3V SIM interface.

#### 27.17.1.2.2 Conformance requirement

- a) When the MS is soft powered on, the contacts of the SIM/ME interface shall be activated in the following order:
  - 1. RST in state L;
  - 2. Vcc powered;
  - 3. I/O (ME) in reception mode;
  - 4. Clock signal provided with a suitable and stable clock.

When Vpp is connected to Vcc, as allowed by 3GPP TS 11.11 (subclauses 4.3.2 and 5.3), then Vpp is activated together with Vcc, at the time of Vcc (step 2 in the sequence above).

- b) When the MS is soft powered on, the contacts of the SIM/ME interface shall be activated in the following order:
  - 1. RST in state L;
  - 2. Vcc powered;
  - 3. I/O (ME) in reception mode;
  - 4. Clock signal provided with a suitable and stable clock.
- c.1) When the MS is soft powered on, the contacts of the SIM/ME interface shall be activated to 3V mode in the following order:
  - 1. RST in state L;
  - 2. Vcc powered;
  - 3. I/O (ME) in reception mode;
  - 4. Clock signal provided with a suitable and stable clock.
- c.2) When the SIM/ME interface is being activated after the 3V/5V switching the contacts shall be activated to 5V mode in the order given in c.1).
- d) When the MS is soft powered on, the contacts of the SIM/ME interface shall be activated in the following order:
  - 1. RST in state L;
  - 2. Vcc powered;
  - 3. I/O (ME) in reception mode;
  - 4. Clock signal provided with a suitable and stable clock.
- e.1) When the MS is soft powered on, the contacts of the SIM/ME interface shall be activated to 1.8V mode in the following order:
  - 1. RST in state L;

2. Vcc powered;
  3. I/O (ME) in reception mode;
  4. Clock signal provided with a suitable and stable clock.
- e.2) When the SIM/ME interface is being activated after the 1.8V/3V switching the contacts shall be activated to 3V mode in the order given in ce.1).

**Reference:**

- a): 3GPP TS 11.11, subclause 4.3.2.  
b), c.1), c.2): 3GPP TS 11.12, subclause 4.4 and subclause 4.5.  
d), e.1), e.2): 3GPP TS 11.18, subclause 4.4 and subclause 4.5.

**27.17.1.2.3 Test purpose**

To verify that the contacts of the SIM/ME interface are activated in the correct order, as described in the conformance requirement.

**27.17.1.2.4 Method of test****27.17.1.2.4.1 Initial condition**

The ME is connected to a SIM Simulator.

**27.17.1.2.4.2 Procedure**

To test the requirements a), b), c.1), d) and e.1) the MS is soft powered on.

To test the requirement c.2) and e.2), the ME is caused to switch the voltage on the SIM/ME interface.

The verification of each activation procedure starts with the first contact leaving the inactive state. The SIM/ME interface is monitored until it is fully activated.

**27.17.1.2.5 Test requirement**

The contacts of the SIM/ME interface shall be activated in the correct order, as described in the conformance requirement.

**27.17.1.3 Phase during ME power off with clock stop forbidden****27.17.1.3.1 Definition and applicability**

When the mobile station is soft powered off, the contacts shall be deactivated in a defined sequence in order to prevent any damage to the SIM.

The timing of this sequence is not defined, a measurement resolution better than or equivalent to 100 ns is assumed.

NOTE 1: If during MS operation the SIM is physically removed it is impractical to ensure correct sequencing of deactivation and the possible damage to the SIM cannot be safeguarded by a type approval test. Furthermore, in this situation the integrity of SIM data is not guaranteed (see 3GPP TS 02.17).

NOTE 2: Since 3V technology SIMs and 1,8V technology SIMs shall not indicate that clock stop is forbidden, this test applies only to MEs with a 5V interface and MEs with a 3V/5V interface when powered down from 5V mode.

This test applies to GSM, DCS 1 800 and PCS 1 900 MEs with:

- a) 5V SIM interface;

- b) [not applicable for 3V SIM interface or 1,8V SIM interface];
- c) 3V/5V SIM interface.

#### 27.17.1.3.2 Conformance requirement

- a) When the ME is soft powered down, the contacts of the SIM/ME interface shall be deactivated in the following order:
  - 1. RST at low state;
  - 2. Clock stopped at low state;
  - 3. Vpp inactive (only if Vpp is provided independent of Vcc, see 3GPP TS 11.11 subclause 5.3);
  - 4. I/O at state A;
  - 5. Vcc inactive.
- b) When Vpp is connected to Vcc, as allowed by 3GPP TS 11.11 (subclause 5.3), then Vpp is deactivated together with Vcc, at the time of Vcc (step 5 in the sequence above).
- c) When the ME is soft powered down from 5V mode, the contacts of the SIM/ME interface shall be deactivated in the following order:
  - 1. RST at low state;
  - 2. Clock stopped at low state;
  - 3. I/O at status A;
  - 4. Vcc inactive.

#### Reference:

- a) 3GPP TS 11.11, subclause 4.3.2.
- c) 3GPP TS 11.12, subclause 4.5.

#### 27.17.1.3.3 Test purpose

To verify that the contacts of the SIM/ME interface become deactivated in the correct order, as given in the conformance requirement.

#### 27.17.1.3.4 Method of test

##### 27.17.1.3.4.1 Initial condition

The ME is connected to a SIM Simulator.

The file characteristics of the directories (byte 14 of STATUS information) shall indicate a 5V SIM with clock stop forbidden.

##### 27.17.1.3.4.2 Procedure

The MS is soft powered off.

The SIM/ME interface is monitored until it is fully deactivated.

#### 27.17.1.3.5 Test requirement

The contacts of the SIM/ME interface shall be deactivated in the correct order, as given in the conformance requirement.

## 27.17.1.4 Phase during ME power off with clock stop allowed

### 27.17.1.4.1 Definition and applicability

When the mobile station is soft powered off or when the SIM/ME interface is being deactivated for 3V/5V or 1,8V/3V switching, the contacts shall be deactivated in a defined sequence in order to prevent any damage to the SIM.

The timing of this sequence is not defined, a measurement resolution better than or equivalent to 100 ns is assumed.

NOTE: If during MS operation the SIM is physically removed it is impractical to ensure correct sequencing of deactivation and the possible damage to the SIM cannot be safeguarded by a type approval test. Furthermore, in this situation the integrity of the SIM data is not guaranteed (see 3GPP TS 02.17).

This test applies to GSM, DCS 1 800 and PCS 1 900 MEs with:

- a) 5V SIM interface;
- b) 3V SIM interface;
- c) 3V/5V SIM interface;
- d) 1,8V SIM interface;
- e) 1,8V/3V SIM interface.

### 27.17.1.4.2 Conformance requirement

- a) Depending on the state of the clock at the time of deactivation, the contacts of the SIM/ME shall be deactivated in one of two ways.

If the clock is running, the contacts of the SIM/ME interface shall be deactivated in the following order:

1. RST at low level;
2. Clock stopped at low level;
3. Vpp inactive (only if Vpp is provided independent of Vcc, see 3GPP TS 11.11 subclause 5.3);
4. I/O at status A;
5. Vcc inactive.

When Vpp is connected to Vcc, as allowed by 3GPP TS 11.11 (subclause 5.3), then Vpp is deactivated together with Vcc, at the time of Vcc (step 5 in the sequence above).

If the clock is stopped and is not restarted, the ME is allowed to deactivate all the contacts in any order, provided that all signals reach low level before Vcc leaves high level.

- b) Depending on the state of the clock at the time of deactivation, the contacts of the SIM/ME shall be deactivated in one of two ways.

If the clock is running, the contacts of the SIM/ME interface shall be deactivated in the following order:

1. RST at low level;
2. Clock stopped at low level;
3. I/O at status A;
4. Vcc inactive.

If the clock is stopped and is not restarted, the ME is allowed to deactivate all the contacts in any order, provided that all signals reach low level before Vcc leaves high level.

- c.1) Depending on the state of the clock at the time of deactivation, the contacts of the SIM/ME interface shall be deactivated in one of two ways.

If the clock is running, the contacts of the SIM/ME interface shall be deactivated in the following order:

1. RST at low level;
2. Clock stopped at low level;
3. I/O at status A;
4. Vcc inactive.

If the clock is stopped and is not restarted, the ME is allowed to deactivate all the contacts in any order, provided that all signals reach low level before Vcc leaves high level.

- c.2) When the SIM/ME interface is deactivated for 3V/5V switching, the contacts shall be deactivated as given in c.1).

- d) Depending on the state of the clock at the time of deactivation, the contacts of the SIM/ME shall be deactivated in one of two ways.

If the clock is running, the contacts of the SIM/ME interface shall be deactivated in the following order:

1. RST at low level;
2. Clock stopped at low level;
3. I/O at status A;
4. Vcc inactive.

If the clock is stopped and is not restarted, the ME is allowed to deactivate all the contacts in any order, provided that all signals reach low level before Vcc leaves high level.

- e.1) Depending on the state of the clock at the time of deactivation, the contacts of the SIM/ME interface shall be deactivated in one of two ways.

If the clock is running, the contacts of the SIM/ME interface shall be deactivated in the following order:

1. RST at low level;
2. Clock stopped at low level;
3. I/O at status A;
4. Vcc inactive.

If the clock is stopped and is not restarted, the ME is allowed to deactivate all the contacts in any order, provided that all signals reach low level before Vcc leaves high level.

- e.2) When the SIM/ME interface is deactivated for 1,8V/3V switching, the contacts shall be deactivated as given in e.1).

#### Reference:

- a): 3GPP TS 11.11, subclause 4.3.2.  
b), c.1), c.2): 3GPP TS 11.12, subclause 4.5.  
d), e.1), e.2): 3GPP TS 11.18, subclause 4.5.

#### 27.17.1.4.3 Test purpose

To verify that, depending on the state of the clock (running or stopped), the contacts of the SIM/ME interface become deactivated in the correct order, as given in the conformance requirement.

#### 27.17.1.4.4 Method of test

##### 27.17.1.4.4.1 Initial condition

The ME is connected to a SIM Simulator.

The file characteristics of the directories (byte 14 of STATUS information) shall indicate that clock stop is allowed.

##### 27.17.1.4.4.2 Procedure

To test the requirements a), b), c.1), d) and e.1), the MS is soft powered off.

To test the requirement c.2) and e.2), the ME is caused to switch the voltage on the SIM/ME interface.

The SIM/ME interface is monitored until it is fully deactivated.

##### 27.17.1.4.5 Test requirement

The contacts of the SIM/ME interface shall be deactivated in the correct order, as given in the conformance requirements.

### 27.17.1.5 SIM Type Recognition and Voltage Switching

#### 27.17.1.5.1 Reaction of 3V only MEs on SIM type recognition failure

##### 27.17.1.5.1.1 Definition and applicability

When a 3V only ME detects a failure during the SIM type recognition procedure, the ME shall reject the SIM in order to prevent any damage to the SIM.

This test applies to GSM, DCS 1 800 and PCS 1 900 MEs with a 3V SIM interface.

##### 27.17.1.5.1.2 Conformance requirement

- 1) The procedure for deriving the identification bit (SIM type recognition procedure) shall be performed by the ME immediately after the ATR and before issuing any other command. The procedure shall consist of the two commands "SELECT GSM" and "STATUS/GET RESPONSE".
- 2) If a 3V only ME cannot complete the SIM type recognition procedure the ME shall deactivate the SIM/ME interface and reject the SIM immediately without issuing any further command.

This procedure shall be finished within 5 s after the "STATUS/GET RESPONSE" command.

#### Reference:

3GPP TS 11.12 subclauses 4.3 and 4.5.

##### 27.17.1.5.1.3 Test purpose

- 1) To verify that a 3V only ME correctly performs the SIM type recognition procedure.
- 2) To verify that a 3V only ME deactivates the SIM/ME interface and rejects the SIM in case that the SIM does not respond to the "STATUS/GET RESPONSE" command.

#### 27.17.1.5.1.4 Method of test

##### 27.17.1.5.1.4.1 Initial condition

The ME is connected to a SIM Simulator simulating a 3V technology SIM with nominal test conditions according to table 27.2-2. All elementary files are coded as default.

The ME is powered on.

##### 27.17.1.5.1.4.2 Procedure

After sending the ATR the SIM simulator checks the presence of the commands "SELECT GSM" and "STATUS/GET RESPONSE" as the first and only commands of the GSM card session.

The SIM simulator does not respond to the "STATUS/GET RESPONSE" command.

The SIM/ME interface is monitored for at least 1 minute until the MS is switched off.

##### 27.17.1.5.1.5 Test requirement

- 1) Immediately after the ATR only the two commands "SELECT GSM" and "STATUS/GET RESPONSE" shall be sent by the ME.
- 2) The 3V only ME shall deactivate the SIM/ME interface within 5 s and reject the SIM (i.e. not activate the SIM/ME interface within the test procedure).

#### 27.17.1.5.2 Reaction of 3V only MEs on type recognition of 5V only SIMs

##### 27.17.1.5.2.1 Definition and applicability

When a 3V only ME detects a 5V only SIM during the SIM type recognition procedure, the ME shall reject the SIM in order to prevent any damage to the SIM.

This test applies to GSM, DCS 1 800 and PCS 1 900 MEs with 3V SIM interface.

##### 27.17.1.5.2.2 Conformance requirement

- 1) The procedure for deriving the identification bit (SIM type recognition procedure) shall be performed by the ME immediately after the ATR and before issuing any other command. The procedure shall consist of the two commands "SELECT GSM" and "STATUS/GET RESPONSE"
- 2) If a 3V only ME identifies a 5V only SIM during the SIM type recognition procedure the ME shall deactivate the SIM/ME interface and reject the SIM immediately without issuing any further command.

#### Reference:

3GPP TS 11.12 subclauses 4.3 and 4.5.

##### 27.17.1.5.2.3 Test purpose

- 1) To verify that a 3V only ME correctly performs the SIM type recognition procedure.
- 2) To verify that a 3V only ME deactivates the SIM/ME interface and rejects the SIM if a 5V only SIM is applied.

##### 27.17.1.5.2.4 Method of test

###### 27.17.1.5.2.4.1 Initial condition

The ME is connected to a SIM Simulator simulating a 3V technology SIM (to ensure that the ME can perform the SIM type recognition procedure) with nominal test conditions according to table 27.2-2. All elementary files are coded as default. Bit 5 in byte 14 of the status information is set to "0" (i.e. 5V only SIM).

The ME is powered on.

#### 27.17.1.5.2.4.2 Procedure

After sending the ATR the SIM simulator checks the presence of the commands "SELECT GSM" and "STATUS/GET RESPONSE" as the first and only commands of the GSM card session.

The SIM simulator responds to the "STATUS/GET RESPONSE" command with a status information indicating a 5V only SIM.

The SIM/ME interface is monitored for at least 1 minute until the MS is switched off.

#### 27.17.1.5.2.5 Test requirement

- 1) Immediately after the ATR only the two command "SELECT GSM" and "STATUS/GET RESPONSE" shall be sent by the ME.
- 2) The 3V only ME shall deactivate the SIM/ME interface immediately after receipt of the status information from the SIM (but not later than 5 s after the "STATUS/GET RESPONSE" command) and reject the SIM (i.e. not activate the SIM/ME interface again within the test procedure).

#### 27.17.1.5.3 Reaction of 3V technology MEs on type recognition of 5V only SIMs

##### 27.17.1.5.3.1 Definition and applicability

When a 3V technology ME detects a 5V only SIM during the SIM type recognition procedure, the ME shall switch to 5V operation.

This test applies to GSM, DCS 1 800 and PCS 1 900 MEs with the 3V/5V SIM interface.

##### 27.17.1.5.3.2 Conformance requirement

- 1) A 3V technology ME shall initially activate the SIM at 3V (i.e. the first activation of a GSM card session).
- 2) The procedure for deriving the identification bit (SIM type recognition procedure) shall be performed by the ME immediately after the ATR procedure and before issuing any other command. The procedure shall consist of the two commands "SELECT GSM" and "STATUS/GET RESPONSE".
- 3) If a 3V technology ME identifies a 5V only SIM during the SIM type recognition procedure, the ME shall switch to 5V operation mode. Switching from 3V to 5V shall only be performed by deactivating the SIM and activating it with 5V supply voltage immediately after the SIM type recognition procedure without issuing any further command.

#### Reference:

3GPP TS 11.12 subclauses 4.3 and 4.4.

##### 27.17.1.5.3.3 Test purpose

- 1) To verify that a 3V technology ME initially activates the SIM with 3V.
- 2) To verify that a 3V technology ME correctly performs the SIM type recognition procedure.
- 3) To verify that a 3V technology ME deactivates the SIM/ME interface immediately after the SIM type recognition procedure (in order to switch the supply voltage) without issuing any further command.

#### 27.17.1.5.3.4 Method of test

##### 27.17.1.5.3.4.1 Initial condition

The ME is connected to a SIM Simulator simulating a 5V only SIM with nominal test conditions according to table 27.2-1. All elementary files are coded as default. Bit 5 in byte 14 of the status information is set to "0" (i.e. 5V only SIM).

The ME is powered on.

##### 27.17.1.5.3.4.2 Procedure

After sending the ATR the SIM simulator checks the presence of the commands "SELECT GSM" and "STATUS/GET RESPONSE" as the first and only commands of the GSM card session.

The SIM simulator responds to the "STATUS/GET RESPONSE" command with a status information indicating a 5V only SIM.

The SIM/ME interface is monitored for at least 1 minute until the MS is switched off.

##### 27.17.1.5.3.5 Test requirement

- 1) The initial activation of the SIM/ME interface shall be performed with 3V supply voltage.
- 2) Immediately after the ATR the two commands "SELECT GSM" and "STATUS/GET RESPONSE" shall be sent by the ME before issuing further commands.
- 3) The 3V technology ME shall deactivate the SIM/ME interface immediately after receipt of the status information from the SIM.

#### 27.17.1.5.4 Reaction of 3V technology MEs on type recognition of 3V technology SIMs

##### 27.17.1.5.4.1 Definition and applicability

When a 3V technology ME detects a 3V technology SIM during the SIM type recognition procedure the ME may either switch to 5V operation or stay in 3V operation.

This test applies to GSM, DCS 1 800 and PCS 1 900 MEs with 3V/5V SIM interface.

##### 27.17.1.5.4.2 Conformance requirement

- 1) A 3V technology ME shall initially activate the SIM with a 3V (i.e. the first activation of a GSM card session).
- 2) The procedure for deriving the identification bit (SIM type recognition procedure) shall be performed by the ME immediately after the ATR and before issuing any other command. the procedure shall consist of the two commands "SELECT GSM" and "STATUS/GET RESPONSE".
- 3) If a 3V technology ME identifies a 3V technology SIM during the SIM type recognition the ME may switch to 5V operation. Switching from 3V to 5V shall only be performed by deactivating the SIM and activating it with 5V supply voltage immediately after the SIM type recognition procedure without issuing any further commands.

#### Reference:

3GPP TS 11.12, subclauses 4.3, 4.4 and 4.7.

##### 27.17.1.5.4.3 Test purpose

- 1) To verify that a 3V technology ME initially activates the SIM with 3V.
- 2) To verify that a 3V technology ME correctly performs the SIM type recognition procedure.

- 3) To verify that a 3V technology ME deactivates the SIM/ME interface immediately after the recognition of a 3V technology SIM (in order to switch the supply voltage) or proceeds with the 3V operation during the whole GSM card session without switching to 5V supply voltage.

#### 27.17.1.5.4.4 Method of test

##### 27.17.1.5.4.4.1 Initial condition

The ME is connected to a SIM Simulator simulating a 3V technology SIM with nominal test conditions according to table 27.2-2. All elementary files are coded as default. Bit 5 in byte 14 of the status information is set to "1" (i.e. 3V technology SIM.)

The ME is powered on.

##### 27.17.1.5.4.4.2 Procedure

After sending the ATR the SIM simulator checks the presence of commands "SELECT GSM" and "STATUS/GET RESPONSE" as the first and only commands of the GSM card session.

The SIM simulator responds to the "STATUS/GET RESPONSE" command with a status information indicating a 3V technology SIM.

The SIM/ME interface is monitored for at least 1 minute until the MS is switched off.

##### 27.17.1.5.4.5 Test requirement

- 1) The initial activation of the SIM/ME interface shall be performed with 3V supply voltage.
- 2) Immediately after the ATR the two commands "SELECT GSM" and "STATUS/GET RESPONSE" shall be sent by the ME.
- 3) The ME shall react in one of the following ways:
  - a) The ME deactivates the SIM/ME interface immediately after the receipt of the status information from the SIM.
  - b) the ME proceeds with the GSM card session without switching to another supply voltage.

#### 27.17.1.5.5 Reaction of 1,8V only MEs on SIM type recognition failure

##### 27.17.1.5.5.1 Definition and applicability

When a 1,8V only ME detects a failure during the SIM type recognition procedure, the ME shall reject the SIM in order to prevent any damage to the SIM.

This test applies to MEs with a 1,8V only SIM interface.

##### 27.17.1.5.5.2 Conformance requirement

- 1) The procedure for deriving the identification bit (SIM type recognition procedure) shall be performed by the ME immediately after the ATR and before issuing any other command. The procedure shall consist of the two commands "SELECT GSM" and "STATUS/GET RESPONSE".
- 2) If a 1,8V only ME cannot complete the SIM type recognition procedure the ME shall deactivate the SIM/ME interface and reject the SIM immediately without issuing any further command.

This procedure shall be finished within 5 s after the "STATUS/GET RESPONSE" command.

#### Reference:

3GPP TS 11.18 subclauses 4.3 and 4.5.

#### 27.17.1.5.5.3 Test purpose

- 1) To verify that a 1,8V only ME correctly performs the SIM type recognition procedure.
- 2) To verify that a 1,8V only ME deactivates the SIM/ME interface and rejects the SIM in case that the SIM does not respond to the "STATUS/GET RESPONSE" command.

#### 27.17.1.5.5.4 Method of test

##### 27.17.1.5.5.4.1 Initial condition

The ME is connected to a SIM Simulator simulating a 1,8V technology SIM with nominal test conditions according to table 27.2-3. All elementary files are coded as default.

The ME is powered on.

##### 27.17.1.5.5.4.2 Procedure

After sending the ATR the SIM simulator checks the presence of the commands "SELECT GSM" and "STATUS/GET RESPONSE" as the first and only commands of the GSM card session.

The SIM simulator does not respond to the "STATUS/GET RESPONSE" command.

The SIM/ME interface is monitored for at least 1 minute until the MS is switched off.

#### 27.17.1.5.5.5 Test requirement

- 1) Immediately after the ATR only the two commands "SELECT GSM" and "STATUS/GET RESPONSE" shall be sent by the ME.
- 2) The 1,8V only ME shall deactivate the SIM/ME interface within 5 s and reject the SIM (i.e. not activate the SIM/ME interface within the test procedure).

#### 27.17.1.5.6 Reaction of 1,8V only MEs on type recognition of 3V SIMs

##### 27.17.1.5.6.1 Definition and applicability

When a 1,8V only ME detects a 3V technology SIM during the SIM type recognition procedure, the ME shall reject the SIM in order to prevent any damage to the SIM.

This test applies to MEs with a 1,8V only SIM interface.

##### 27.17.1.5.6.2 Conformance requirement

- 1) The procedure for deriving the identification bit (SIM type recognition procedure) shall be performed by the ME immediately after the ATR and before issuing any other command. The procedure shall consist of the two commands "SELECT GSM" and "STATUS/GET RESPONSE"
- 2) If a 1,8V only ME identifies a 3V technology SIM during the SIM type recognition procedure the ME shall deactivate the SIM/ME interface and reject the SIM immediately without issuing any further command.

#### Reference:

3GPP TS 11.18 subclauses 4.3 and 4.5.

#### 27.17.1.5.6.3 Test purpose

- 1) To verify that a 1,8V only ME correctly performs the SIM type recognition procedure.
- 2) To verify that a 1,8V only ME deactivates the SIM/ME interface and rejects the SIM if a 3V technology SIM is applied.

#### 27.17.1.5.6.4 Method of test

##### 27.17.1.5.6.4.1 Initial condition

The ME is connected to a SIM Simulator simulating a 1,8V technology SIM (to ensure that the ME can perform the SIM type recognition procedure) with nominal test conditions according to table 27.2-3. All elementary files are coded as default. Bits 6 and 5 in byte 14 of the status information are set to "01" (i.e. 3V technology SIM).

The ME is powered on.

##### 27.17.1.5.6.4.2 Procedure

After sending the ATR the SIM simulator checks the presence of the commands "SELECT GSM" and "STATUS/GET RESPONSE" as the first and only commands of the GSM card session.

The SIM simulator responds to the "STATUS/GET RESPONSE" command with a status information indicating a 3V technology SIM.

The SIM/ME interface is monitored for at least 1 minute until the MS is switched off.

##### 27.17.1.5.6.5 Test requirement

- 1) Immediately after the ATR only the two command "SELECT GSM" and "STATUS/GET RESPONSE" shall be sent by the ME.
- 2) The 1,8V only ME shall deactivate the SIM/ME interface immediately after receipt of the status information from the SIM (but not later than 5 s after the "STATUS/GET RESPONSE" command) and reject the SIM (i.e. not activate the SIM/ME interface again within the test procedure).

#### 27.17.1.5.7 Reaction of 1,8V technology MEs on type recognition of 3V technology SIMs

##### 27.17.1.5.7.1 Definition and applicability

When a 1,8V technology ME detects a 3V technology SIM during the SIM type recognition procedure, the ME shall switch to 3V operation.

This test applies to MEs with the 1,8V/3V SIM interface.

##### 27.17.1.5.7.2 Conformance requirement

- 1) A 1,8V technology ME shall initially activate the SIM at 1,8V (i.e. the first activation of a GSM card session).
- 2) The procedure for deriving the identification bit (SIM type recognition procedure) shall be performed by the ME immediately after the ATR procedure and before issuing any other command. The procedure shall consist of the two commands "SELECT GSM" and "STATUS/GET RESPONSE".
- 3) If a 1,8V technology ME identifies a 3V technology SIM during the SIM type recognition procedure, the ME shall switch to 3V operation mode. Switching from 1,8V to 3V shall only be performed by deactivating the SIM and activating it with 3V supply voltage immediately after the SIM type recognition procedure without issuing any further command.

#### Reference:

3GPP TS 11.18 subclauses 4.3 and 4.4.

##### 27.17.1.5.7.3 Test purpose

- 1) To verify that a 1,8V technology ME initially activates the SIM with 1,8V.
- 2) To verify that a 1,8V technology ME correctly performs the SIM type recognition procedure.
- 3) To verify that a 1,8V technology ME deactivates the SIM/ME interface immediately after the SIM type recognition procedure (in order to switch the supply voltage) without issuing any further command.

#### 27.17.1.5.7.4 Method of test

##### 27.17.1.5.7.4.1 Initial condition

The ME is connected to a SIM Simulator simulating a 3V technology SIM with nominal test conditions according to table 27.2-2. All elementary files are coded as default. Bits 6 and 5 in byte 14 of the status information are set to "01" (i.e. 3V technology SIM).

The ME is powered on.

##### 27.17.1.5.7.4.2 Procedure

After sending the ATR the SIM simulator checks the presence of the commands "SELECT GSM" and "STATUS/GET RESPONSE" as the first and only commands of the GSM card session.

The SIM simulator responds to the "STATUS/GET RESPONSE" command with a status information indicating a 3V technology SIM.

The SIM/ME interface is monitored for at least 1 minute until the MS is switched off.

##### 27.17.1.5.7.5 Test requirement

- 1) The initial activation of the SIM/ME interface shall be performed with 1,8V supply voltage.
- 2) Immediately after the ATR the two commands "SELECT GSM" and "STATUS/GET RESPONSE" shall be sent by the ME before issuing further commands.
- 3) The 1,8V technology ME shall deactivate the SIM/ME interface immediately after receipt of the status information from the SIM.

#### 27.17.1.5.8 Reaction of 1,8V technology MEs on type recognition of 1,8V technology SIMs

##### 27.17.1.5.8.1 Definition and applicability

When a 1,8V technology ME detects a 1,8V technology SIM during the SIM type recognition procedure the ME may either switch to 3V operation or stay in 1,8V operation.

This test applies to MEs with 1,8V/3V SIM interface.

##### 27.17.1.5.8.2 Conformance requirement

- 1) A 1,8V technology ME shall initially activate the SIM with a 1,8V (i.e. the first activation of a GSM card session).
- 2) The procedure for deriving the identification bit (SIM type recognition procedure) shall be performed by the ME immediately after the ATR and before issuing any other command. the procedure shall consist of the two commands "SELECT GSM" and "STATUS/GET RESPONSE".
- 3) If a 1,8V technology ME identifies a 1,8V technology SIM during the SIM type recognition the ME may switch to 3V operation. Switching from 1,8V to 3V shall only be performed by deactivating the SIM and activating it with 3V supply voltage immediately after the SIM type recognition procedure without issuing any further commands.

#### Reference:

3GPP TS 11.18, subclauses 4.3, 4.4 and 4.7.

##### 27.17.1.5.8.3 Test purpose

- 1) To verify that a 1,8V technology ME initially activates the SIM with 1,8V.
- 2) To verify that a 1,8V technology ME correctly performs the SIM type recognition procedure.

- 3) To verify that a 1,8V technology ME deactivates the SIM/ME interface immediately after the recognition of a 1,8V technology SIM (in order to switch the supply voltage) or proceeds with the 1,8V operation during the whole GSM card session without switching to 3V supply voltage.

#### 27.17.1.5.8.4 Method of test

##### 27.17.1.5.8.4.1 Initial condition

The ME is connected to a SIM Simulator simulating a 1,8V technology SIM with nominal test conditions according to table 27.2-3. All elementary files are coded as default. Bits 6 and 5 in byte 14 of the status information are set to "11" (i.e. 1,8V technology SIM.)

The ME is powered on.

##### 27.17.1.5.8.4.2 Procedure

After sending the ATR the SIM simulator checks the presence of commands "SELECT GSM" and "STATUS/GET RESPONSE" as the first and only commands of the GSM card session.

The SIM simulator responds to the "STATUS/GET RESPONSE" command with a status information indicating a 1,8V technology SIM.

The SIM/ME interface is monitored for at least 1 minute until the MS is switched off.

##### 27.17.1.5.8.5 Test requirement

- 1) The initial activation of the SIM/ME interface shall be performed with 1,8V supply voltage.
- 2) Immediately after the ATR the two commands "SELECT GSM" and "STATUS/GET RESPONSE: shall be sent by the ME.
- 3) The ME shall react in one of the following ways:
  - a) The ME deactivates the SIM/ME interface immediately after the receipt of the status information from the SIM.
  - b) the ME proceeds with the GSM card session without switching to another supply voltage.

## 27.17.2 Electrical tests on each ME contact

The following tables give the electrical conditions that must be applied by the SIM simulator to all contacts during a test if not stated otherwise.

**Table 27.2-1: Nominal test conditions on 5V SIM/ME interface**

| Contacts  | Low level        | High level      | Max. capacitive load |
|-----------|------------------|-----------------|----------------------|
| C1 (Vcc)  | ---              | I = 10 mA       |                      |
| C2 (RST)  | I = -200 $\mu$ A | I = +20 $\mu$ A | 30 pF                |
| C3 (CLK)  | I = -200 $\mu$ A | I = +20 $\mu$ A | 30 pF                |
| C5 (GND)  | ---              | ---             |                      |
| C6 ((Vpp) | ---              | I = 0 mA        |                      |
| C7 (I/O)  |                  |                 | 30 pF                |
| ME input  | V = 0 V          | I = +20 $\mu$ A |                      |
| ME output | I = -1 mA        | I = +20 $\mu$ A |                      |

**Table 27.2-2: Nominal test conditions on 3V SIM/ME interface**

| Contacts  | Low level        | High level       | Max. capacitive load |
|-----------|------------------|------------------|----------------------|
| C1 (Vcc)  | ---              | I = 6 mA         |                      |
| C2 (RST)  | I = -200 $\mu$ A | I = +200 $\mu$ A | 30 pF                |
| C3 (CLK)  | I = -20 $\mu$ A  | I = +20 $\mu$ A  | 30 pF                |
| C5 (GND)  | ---              | ---              |                      |
| C6 ((Vpp) | ---              | ---              |                      |
| C7 (I/O)  |                  |                  | 30 pF                |
| ME input  | V = 0 V          | I = +20 $\mu$ A  |                      |
| ME output | I = -1 mA        | I = +20 $\mu$ A  |                      |

**Table 27.2-3: Nominal test conditions on 1,8V SIM/ME interface**

| Contacts  | Low level        | High level       | Max. capacitive load |
|-----------|------------------|------------------|----------------------|
| C1 (Vcc)  | ---              | I = 4 mA         |                      |
| C2 (RST)  | I = -200 $\mu$ A | I = +200 $\mu$ A | 30 pF                |
| C3 (CLK)  | I = -20 $\mu$ A  | I = +20 $\mu$ A  | 30 pF                |
| C5 (GND)  | ---              | ---              |                      |
| C6 ((Vpp) | ---              | ---              |                      |
| C7 (I/O)  |                  |                  | 30 pF                |
| ME input  | V = 0 V          | I = +20 $\mu$ A  |                      |
| ME output | I = -1 mA        | I = +20 $\mu$ A  |                      |

NOTE 1: Measurements of contacts voltage levels can be done at any time since the beginning of activation of the SIM and the end of deactivation of the SIM (ISO/IEC 7816-3 subclause 5.1).

NOTE 2: The reference point of all measurements is the contact C5 (Ground).

NOTE 3: Currents flowing into the SIM are considered positive.

### 27.17.2.1 Electrical tests on contact C1

C1 = Card power supply (Vcc).

#### 27.17.2.1.1 Test 1

##### 27.17.2.1.1.1 Definition and applicability

When the mobile station is activated, the supply voltage on the SIM/ME interface shall remain in the specified range in order to ensure correct operation and to prevent any damage to the SIM.

This test applies to GSM, DCS 1 800 and PCS 1 900 MEs with:

- a) 5V SIM interface;
- b) 3V SIM interface;
- c) 3V/5V SIM interface;
- d) 1,8V SIM interface;
- e) 1,8V/3V SIM interface.

##### 27.17.2.1.1.2 Conformance requirement

- a) The voltage on contact C1 of the SIM/ME interface shall be  $5V \pm 10\%$  for  $I_{cc}$  up to 10 mA.
- b) The voltage on contact C1 of the SIM/ME interface shall be  $3V \pm 10\%$  for  $I_{cc}$  up to 6 mA.
- c.1) The voltage on contact C1 of the SIM/ME interface shall be  $5V \pm 10\%$  for  $I_{cc}$  up to 10 mA when the interface is in 5V operation mode.

- c.2) The voltage on contact C1 of the SIM/ME interface shall be  $3V \pm 10\%$  for  $I_{cc}$  up to 6 mA when the interface is in 3V operation mode.
- d) The voltage on contact C1 of the SIM/ME interface shall be  $1,8V \pm 10\%$  for  $I_{cc}$  up to 4 mA.
- e.1) The voltage on contact C1 of the SIM/ME interface shall be  $3V \pm 10\%$  for  $I_{cc}$  up to 6 mA when the interface is in 3V operation mode.
- e.2) The voltage on contact C1 of the SIM/ME interface shall be  $1,8V \pm 10\%$  for  $I_{cc}$  up to 4 mA when the interface is in 1,8V operation mode.

**Reference:**

- a), c.1): 3GPP TS 11.11, subclause 5.1.
- b), c.2), e.1): 3GPP TS 11.12, clause 5.
- d), e.2): 3GPP TS 11.18, clause 5.

**27.17.2.1.1.3 Test purpose**

To verify that the ME keeps the voltage on contact C1 of the SIM/ME interface within the ranges specified in the conformance requirements.

**27.17.2.1.1.4 Method of test****Initial condition**

The ME is connected to a SIM Simulator.

The MS is activated.

The remaining contacts of the SIM/ME interface are in nominal test conditions (see 3GPP TS 11.10 subclause 27.17.2).

**Test Procedure**

The voltage of contact C1 ( $V_{cc}$ ) of the SIM/ME interface is measured.

**27.17.2.1.1.5 Test requirement**

The voltage on contact C1 of the SIM/ME interface shall be within the ranges specified in the conformance requirements.

**27.17.2.1.2 Test 2****27.17.2.1.2.1 Definition and applicability**

When the mobile station is activated, the supply voltage on the SIM/ME interface shall be able to counteract spikes in the current consumption of the SIM up to the limits given in the conformance requirement, ensuring that the supply voltage stays in the specified range.

This test applies to GSM, DCS 1 800 and PCS 1 900 MEs with:

- a) 5V SIM interface;
- b) 3V SIM interface;
- c) 3V/5V SIM interface;
- d) 1,8V SIM interface;
- e) 1,8V/3V SIM interface.

#### 27.17.2.1.2.2 Conformance requirement

- a) The voltage on contact C1 of the SIM/ME interface shall be  $5V \pm 10\%$  for spikes in the current consumption with a maximum charge of 40 nAs with no more than 400 ns duration and an amplitude of at most 200 mA.
- b) The voltage on contact C1 of the SIM/ME interface shall be  $3V \pm 10\%$  for spikes in the current consumption with a maximum charge of 12 nAs with no more than 400 ns duration and an amplitude of at most 60 mA.
- c.1) The voltage on contact C1 of the SIM/ME interface shall be  $5V \pm 10\%$  for spikes in the current consumption with a maximum charge of 40 nAs with no more than 400 ns duration and an amplitude of at most 200 mA when the interface is in 5V operation mode.
- c.2) The voltage on contact C1 of the SIM/ME interface shall be  $3V \pm 10\%$  for spikes in the current consumption with a maximum charge of 12 nAs with no more than 400 ns duration and an amplitude of at most 60 mA when the interface is in 3V operation mode.
- d) The voltage on contact C1 of the SIM/ME interface shall be  $1,8V \pm 10\%$  for spikes in the current consumption with a maximum charge of 12 nAs with no more than 400 ns duration and an amplitude of at most 60 mA.
- e.1) The voltage on contact C1 of the SIM/ME interface shall be  $3V \pm 10\%$  for spikes in the current consumption with a maximum charge of 12 nAs with no more than 400 ns duration and an amplitude of at most 60 mA when the interface is in 3V operation mode.
- e.2) The voltage on contact C1 of the SIM/ME interface shall be  $1,8V \pm 10\%$  for spikes in the current consumption with a maximum charge of 12 nAs with no more than 400 ns duration and an amplitude of at most 60 mA when the interface is in 1,8V operation mode.

#### Reference:

- a), c.1): 3GPP TS 11.11, subclause 5.2.
- b), c.2), e.1): 3GPP TS 11.12, clause 5.
- d), e.2): 3GPP TS 11.18, clause 5.

#### 27.17.2.1.2.3 Test purpose

To verify that the ME keeps the voltage on contact C1 of the SIM/ME interface within the specified range for the conditions given in the conformance requirement.

#### 27.17.2.1.2.4 Method of test

##### Initial condition

The ME is connected to a SIM Simulator.

The MS is activated.

The remaining contacts of the SIM/ME interface are held in nominal test condition (see 3GPP TS 11.10 subclause 27.17.2).

##### Procedure

To test the requirements a) and c-1), the voltage on contact C1 of the SIM/ME interface is monitored and the following current spikes are applied:

- 1) continuous spikes:
  - current amplitude 20 mA
  - current offset 0 mA
  - Duration 100 ns

Pause 100 ns

2) continuous spikes:

current 20 mA

current offset 0 mA

Duration 400 ns

Pause 400 ns

3) continuous spikes:

current amplitude 15 mA

current offset 5 mA

(i.e. maximum amplitude = 5 mA + 15 mA = 20 mA)

Duration 150 ns

Pause 300 ns

4) random spikes:

current amplitude 200 mA

current offset 0 mA

Duration 200 ns

Pause between 0,1 ms and 500 ms, randomly varied

5) random spikes:

current amplitude 100 mA

current offset 0 mA

Duration 400 ns

Pause between 0,1 ms and 500 ms, randomly varied

6) random spikes

current amplitude 195 mA

current offset 5mA

(i.e. maximum amplitude = 5 mA + 195 mA = 200 mA)

Duration 200 ns

Pause between 0,1 ms and 500 ms, randomly varied

To test the requirements b), c.2), d), e.1) and e.2) the voltage on contact C1 of the SIM/ME interface is monitored and the following current spikes are applied:

1) continuous spikes:

current amplitude 12 mA

current offset 0 mA

Duration 100 ns

Pause 100 ns

## 2) continuous spikes:

current 12 mA

current offset 0 mA

Duration 400 ns

Pause 400 ns

## 3) continuous spikes:

current amplitude 9 mA

current offset 3 mA

(i.e. maximum amplitude = 3 mA + 9 mA = 12 mA)

Duration 150 ns

Pause 300 ns

## 4) random spikes:

current amplitude 60 mA

current offset 0 mA

Duration 200 ns

Pause between 0,1 ms and 500 ms, randomly varied

## 5) random spikes:

current amplitude 30 mA

current offset 0 mA

Duration 400 ns

Pause between 0,1 ms and 500 ms, randomly varied

## 6) random spikes

current amplitude 57 mA

current offset 3 mA

(i.e. maximum amplitude = 3 mA + 57 mA = 60 mA)

Duration 200 ns

Pause between 0,1 ms and 500 ms, randomly varied

NOTE: The specified spike durations are measured at 50 % of the spike amplitude.

#### 27.17.2.1.2.5 Test requirement

The voltage on contact C1 of the SIM/ME interface shall be within the ranges specified in the conformance requirements.

#### 27.17.2.2 Electrical tests on contact C2

C2 = Reset (RST).

#### 27.17.2.2.1 Definition and applicability

When the mobile station is activated, the voltage on contact C2 of the SIM/ME interface shall remain in the specified range in order to ensure correct operation and to prevent any damage to the SIM.

This test applies to GSM, DCS 1 800 and PCS 1 900 MEs with:

- a) 5V SIM interface;
- b) 3V SIM interface;
- c) 3V/5V SIM interface;
- d) 1,8V SIM interface;
- e) 1,8V/3V SIM interface.

#### 27.17.2.2.2 Conformance requirement

- a) The voltage on contact C2 (RST) of the SIM/ME interface shall be between -0,3V and +0,6V for a current of -200  $\mu$ A in low state and between 3,8V and  $V_{cc} + 0,3V$  for a current of +20  $\mu$ A in high state.
- b) The voltage on contact C2 (RST) of the SIM/ME interface shall be between -0,3V and +0,7V for a current of -200  $\mu$ A in low state and between 2,15 V and  $V_{cc} + 0,3V$  for a current of +200  $\mu$ A in high state.
- c.1) The voltage on contact C2 (RST) of the SIM/ME interface shall be between -0,3V and +0,6V for a current of -200  $\mu$ A in low state and between 3,8V and  $V_{cc} + 0,3V$  for a current of +20  $\mu$ A in high state when the interface is in 5V operation mode.
- c.2) The voltage on contact C2 (RST) of the SIM/ME interface shall be between -0,3V and +0,7V for a current of -200  $\mu$ A in low state and between 2,15 V and  $V_{cc} + 0,3V$  for a current of +200  $\mu$ A in high state when the interface is in 3V operation mode.
- d) The voltage on contact C2 (RST) of the SIM/ME interface shall be between -0,3V and +0,47V for a current of -200  $\mu$ A in low state and between 1,3 V and  $V_{cc} + 0,3V$  for a current of +200  $\mu$ A in high state.
- e.1) The voltage on contact C2 (RST) of the SIM/ME interface shall be between -0,3V and +0,7V for a current of -200  $\mu$ A in low state and between 2,15 V and  $V_{cc} + 0,3V$  for a current of +200  $\mu$ A in high state when the interface is in 3V operation mode.
- e.2) The voltage on contact C2 (RST) of the SIM/ME interface shall be between -0,3V and +0,47V for a current of -200  $\mu$ A in low state and between 1,3 V and  $V_{cc} + 0,3V$  for a current of +200  $\mu$ A in high state when the interface is in 1,8V operation mode.

#### Reference:

- a), c.1): 3GPP TS 11.11, clause 5.
- b), c.2), e.1): 3GPP TS 11.12, clause 5.
- d), e.2): 3GPP TS 11.18, clause 5.

#### 27.17.2.2.3 Test purpose

To verify that the ME keeps the voltage on contact C2 (RST) of the SIM/ME interface within the specified range, as given in the conformance requirement.

#### 27.17.2.2.4 Method of test

##### 27.17.2.2.4.1 Initial condition

The ME is connected to a SIM Simulator.

The MS is activated.

The remaining contacts of the SIM/ME interface are held in nominal test conditions (see 3GPP TS 11.10 subclause 27.17.2).

#### 27.17.2.2.4.2 Procedure

The voltage on contact C2 (RST) of the SIM/ME interface is measured.

#### 27.17.2.2.5 Test requirement

The voltage on contact C2 (RST) of the SIM/ME interface shall be within the range specified in the conformance requirement.

### 27.17.2.3 Electrical tests on contact C3

C3 = Clock (CLK).

#### 27.17.2.3.1 Definition and applicability

When the mobile station is activated, the voltage, the rise/fall time of the signal, the clock cycle ratio and the frequency on contact C3 of the SIM/ME interface shall remain in the specified range in order to ensure correct operation and to prevent any damage to the SIM.

This test applies to GSM, DCS 1 800 and PCS 1 900 MEs with:

- a) 5V SIM interface;
- b) 3V SIM interface;
- c) 3V/5V SIM interface;
- d) 1,8V SIM interface;
- e) 1,8V/3V SIM interface.

#### 27.17.2.3.2 Conformance requirement

- a.1) The voltage on contact C3 (CLK) of the SIM/ME interface shall be between -0,3V and +0,5V for a current of -200  $\mu$ A in low state and between 3,15V and  $V_{cc}$  +0,3V for a current of +20  $\mu$ A in high state.
- a.2) The rise and the fall time of the clock signal shall not exceed 9 % of the clock period .
- a.3) The cycle ratio of the clock signal shall be between 40 % and 60 % of the period, in steady state.
- a.4) The frequency of the clock signal shall be between 1 MHz and 5 MHz.
- b.1) The voltage on contact C3 (CLK) of the SIM/ME interface shall be between -0,3V and +0,6V for a current of -20  $\mu$ A in low state and between 1,9V and  $V_{cc}$  +0,3V for a current of +20  $\mu$ A in high state.
- b.2) The rise and the fall time of the clock signal shall not exceed 50 ns.
- b.3) The cycle ratio of the clock signal shall be between 40 % and 60 % of the period, in steady state.
- b.4) The frequency of the clock signal shall be between 1 MHz and 4 MHz.
- c.1) The voltage on contact C3 (CLK) of the SIM/ME interface shall be between -0,3V and +0,5V for a current of -200  $\mu$ A in low state and between 3,15V and  $V_{cc}$  +0,3V for a current of +20  $\mu$ A in high state when the interface is in 5V operation mode.
- c.2) The rise and the fall time of the clock signal shall not exceed 9 % of the clock period when the interface is in 5V operation mode.
- c.3) The cycle ratio of the clock signal shall be between 40 % and 60 % of the period, in steady state when the interface is in 5V operation mode.

- c.4) The frequency of the clock signal shall be between 1 MHz and 5 MHz when the interface is in 5V operation mode.
- c.5) The voltage on contact C3 (CLK) of the SIM/ME interface shall be between -0,3V and +0,6V for a current of -20  $\mu$ A in low state and between 1,9V and  $V_{cc}$  +0,3V for a current of +20  $\mu$ A in high state when the interface is in 3V operation mode.
- c.6) The rise and the fall time of the clock signal shall not exceed 50 ns when the interface is in 3V operation mode.
- c.7) The cycle ratio of the clock signal shall be between 40 % and 60 % of the period, in steady state when the interface is in 3V operation mode.
- c.8) The frequency of the clock signal shall be between 1 MHz and 4 MHz when the interface is in 3V operation mode.
- d.1) The voltage on contact C3 (CLK) of the SIM/ME interface shall be between -0,3V and +0,47V for a current of -20  $\mu$ A in low state and between 1,21V and  $V_{cc}$  +0,3V for a current of +20  $\mu$ A in high state.
- d.2) The rise and the fall time of the clock signal shall not exceed 50 ns.
- d.3) The cycle ratio of the clock signal shall be between 40 % and 60 % of the period, in steady state.
- d.4) The frequency of the clock signal shall be between 1 MHz and 4 MHz.
- e.1) The voltage on contact C3 (CLK) of the SIM/ME interface shall be between -0,3V and +0,47V for a current of -20  $\mu$ A in low state and between 1,21V and  $V_{cc}$  +0,3V for a current of +20  $\mu$ A in high state when the interface is in 1,8V operation mode.
- e.2) The rise and the fall time of the clock signal shall not exceed 50 ns when the interface is in 1,8V operation mode.
- e.3) The cycle ratio of the clock signal shall be between 40 % and 60 % of the period, in steady state when the interface is in 1,8V operation mode.
- e.4) The frequency of the clock signal shall be between 1 MHz and 4 MHz when the interface is in 1,8V operation mode.
- e.5) The voltage on contact C3 (CLK) of the SIM/ME interface shall be between -0,3V and +0,6V for a current of -20  $\mu$ A in low state and between 1,9V and  $V_{cc}$  +0,3V for a current of +20  $\mu$ A in high state when the interface is in 3V operation mode.
- e.6) The rise and the fall time of the clock signal shall not exceed 50 ns when the interface is in 3V operation mode.
- e.7) The cycle ratio of the clock signal shall be between 40 % and 60 % of the period, in steady state when the interface is in 3V operation mode.
- e.8) The frequency of the clock signal shall be between 1 MHz and 4 MHz when the interface is in 3V operation mode.

**Reference:**

- a), c.1,2,3,4) 3GPP TS 11.11, clause 5 and subclause 5.4.
- b), c.5,6,7,8), e.1,2,3,4) 3GPP TS 11.12, subclause 4.2 and clause 5.
- d), e.5,6,7,8) 3GPP TS 11.18, subclause 4.2 and clause 5.

**27.17.2.3.3 Test purpose**

To verify that the ME keeps the voltage, the rise and fall time, the cycle ratio and the frequency on contact C3 (CLK) of the SIM/ME interface within the ranges specified in the conformance requirements.

#### 27.17.2.3.4 Method of test

##### 27.17.2.3.4.1 Initial condition

The ME is connected to a SIM Simulator.

The MS is activated.

The remaining contacts of the SIM/ME interface are held in nominal test conditions (see 3GPP TS 11.10 subclause 27.17.2).

##### 27.17.2.3.4.2 Procedure

The voltage, the rise/fall time, the clock cycle ratio and the frequency on contact C3 (CLK) of the SIM/ME interface are measured.

##### 27.17.2.3.5 Test requirement

The voltage, the rise and fall time, the cycle ratio and the frequency on contact C3 (CLK) of the SIM/ME interface shall be within the ranges specified in the conformance requirements.

#### 27.17.2.4 [Not used]

#### 27.17.2.5 Electrical tests on contact C7

C7 = Input - output (I/O).

##### 27.17.2.5.1 Definition and applicability

When the mobile station is activated, the ME shall keep the voltage, the current and the rise/fall time of the signal on contact C7 of the SIM/ME interface within the specified range in order to ensure correct operation and to prevent any damage to the SIM.

This test applies to GSM, DCS 1 800 and PCS 1 900 MEs with:

- a) 5V SIM interface;
- b) 3V SIM interface;
- c) 3V/5V SIM interface;
- d) 1,8V SIM interface;
- e) 1,8V/3V SIM interface.

##### 27.17.2.5.2 Conformance requirement

###### a.1) ME receiving state A (low state):

With an imposed voltage of 0V the current flowing out of the ME shall not exceed 1 mA.

###### a.2) ME transmitting state A (low state):

The voltage shall be between -0,3V and 0,4V when a current of 1 mA flowing into the ME is applied.

###### a.3) ME transmitting or receiving state Z (high state):

The voltage shall be between +3,8V and  $V_{cc} + 0,3V$  when a current of 20  $\mu A$  flowing out of the ME is applied.

###### a.4) The rise time and the fall time of the I/O signal shall not exceed 1 $\mu s$ .

## b.1) ME receiving state A (low state):

With an imposed voltage of 0V the current flowing out of the ME shall not exceed 1 mA.

## b.2) ME transmitting state A (low state):

The voltage shall be between -0,3V and 0,4V when a current of 1 mA flowing into the ME is applied.

## b.3) ME transmitting or receiving state Z (high state):

The voltage shall be between  $0,7 \cdot V_{cc}$  and  $V_{cc} + 0,3V$  when a current of 20  $\mu A$  flowing out of the ME is applied.

b.4) The rise time and the fall time of the I/O signal shall not exceed 1  $\mu s$ .

## c.1) ME receiving state A (low state):

With an imposed voltage of 0V the current flowing out of the ME shall not exceed 1 mA when the ME is in 5V operation mode.

## c.2) ME transmitting state A (low state):

The voltage shall be between -0,3V and 0,4V when a current of 1 mA flowing into the ME is applied when the ME is in 5V operation mode.

## c.3) ME transmitting or receiving state Z (high state):

The voltage shall be between +3,8V and  $V_{cc} + 0,3V$  when a current of 20  $\mu A$  flowing out of the ME is applied when the ME is in 5V operation mode.

c.4) The rise time and the fall time of the I/O signal shall not exceed 1  $\mu s$  when the ME is in 5V operation mode.

## c.5) ME receiving state A (low state):

With an imposed voltage of 0V the current flowing out of the ME shall not exceed 1 mA when the ME is in 3V operation mode.

## c.6) ME transmitting state A (low state):

The voltage shall be between -0,3V and 0,4V when a current of 1 mA flowing into the ME is applied when the ME is in 3V operation mode.

## c.7) ME transmitting or receiving state Z (high state):

The voltage shall be between  $0,7 \cdot V_{cc}$  and  $V_{cc} + 0,3V$  when a current of 20  $\mu A$  flowing out of the ME is applied when the ME is in 3V operation mode.

c.8) The rise time and the fall time of the I/O signal shall not exceed 1  $\mu s$  when the ME is in 3V operation mode.

## d.1) ME receiving state A (low state):

With an imposed voltage of 0V the current flowing out of the ME shall not exceed 1 mA.

## d.2) ME transmitting state A (low state):

The voltage shall be between -0,3V and 0,3V when a current of 1 mA flowing into the ME is applied.

## d.3) ME transmitting or receiving state Z (high state):

The voltage shall be between  $0,7 \cdot V_{cc}$  and  $V_{cc} + 0,3V$  when a current of 20  $\mu A$  flowing out of the ME is applied.

d.4) The rise time and the fall time of the I/O signal shall not exceed 1  $\mu s$ .

## e.1) ME receiving state A (low state):

With an imposed voltage of 0V the current flowing out of the ME shall not exceed 1 mA when the ME is in 3V operation mode.

## e.2) ME transmitting state A (low state):

The voltage shall be between -0,3V and 0,4V when a current of 1 mA flowing into the ME is applied when the ME is in 3V operation mode.

## e.3) ME transmitting or receiving state Z (high state):

The voltage shall be between  $0,7 \cdot V_{cc}$  and  $V_{cc} + 0,3V$  when a current of 20  $\mu A$  flowing out of the ME is applied when the ME is in 3V operation mode.

e.4) The rise time and the fall time of the I/O signal shall not exceed 1  $\mu s$  when the ME is in 3V operation mode.

## e.5) ME receiving state A (low state):

With an imposed voltage of 0V the current flowing out of the ME shall not exceed 1 mA when the ME is in 1,8V operation mode.

## e.6) ME transmitting state A (low state):

The voltage shall be between -0,3V and 0,3V when a current of 1 mA flowing into the ME is applied when the ME is in 1,8V operation mode.

## e.7) ME transmitting or receiving state Z (high state):

The voltage shall be between  $0,7 \cdot V_{cc}$  and  $V_{cc} + 0,3V$  when a current of 20  $\mu A$  flowing out of the ME is applied when the ME is in 1,8V operation mode.

e.8) The rise time and the fall time of the I/O signal shall not exceed 1  $\mu s$  when the ME is in 3V operation mode.

## Reference:

- a), c.1,2,3,4) 3GPP TS 11.11, clause 5.
- b), c-5,6,7,8), e.1,2,3,4) 3GPP TS 11.12, clause 5.
- d), e-5,6,7,8) 3GPP TS 11.18, clause 5.

## 27.17.2.5.3 Test purpose

To verify that the ME keeps the voltage, the current and the rise and fall times of the signal on contact C7 (I/O) of the SIM/ME interface within the ranges specified in the conformance requirements.

## 27.17.2.5.4 Method of test

## 27.17.2.5.4.1 Initial condition

The ME is connected to a SIM Simulator.

The MS is activated.

The remaining contacts of the SIM/ME interface are held in nominal test conditions (see 3GPP TS 11.10 subclause 27.17.2).

## 27.17.2.5.4.2 Procedure

The voltage, the current and the rise/fall time on contact C7 (I/O) of the SIM/ME interface are measured.

#### 27.17.2.5.5 Test requirement

The voltage, the current and the rise and fall times of the signal on contact C7 (I/O) of the SIM/ME interface shall be within the ranges specified in the conformance requirements.

## 27.18 Fixed Number Dialling (FND)

### 27.18.1 ME and SIM with FND activated

#### 27.18.1.1 EF<sub>ADN</sub> invalidated and not readable or updatable

##### 27.18.1.1.1 Definition and applicability

Fixed Number Dialling (FND) is a service defined for the SIM. An activated FND service results in call restrictions for the MS. The call restrictions are controlled by the ME. To ascertain the type of SIM and state of FND the MS runs the FDN capability request procedure during SIM/ME initialization.

This test applies to GSM, DCS 1 800 and PCS 1 900 MEs using either ID.1 or Plug-in SIM and supporting the FDN service.

##### 27.18.1.1.2 Conformance requirement

1. Recognizing the state of the SIM (FND enabled) the MS shall perform the SIM initialization procedure as specified.
2. The MS allows call set-up to a directory number as stored in EF<sub>FDN</sub>.
3. The MS allows call set-up to a directory number as stored in EF<sub>FDN</sub> and extended by digits in the end.
4. The MS does not allow call set-up to a directory number stored in EF<sub>FDN</sub> but with missing digits at the end.
5. The MS does not allow call set-up to a directory number having no reference in EF<sub>FDN</sub>.
6. The MS allows call set-up of an emergency call.
7. For PCS 1 900: To verify the requirement 6 above by using the emergency call number 911.

##### Reference:

3GPP TS 11.11, subclauses 9.3, 10.2.7, 10.3.2, 11.2.1 and 11.5.1, 3GPP TS 02.07, subclause 3.2.

##### 27.18.1.1.3 Test purpose

1. To verify that the ME as a result of the state of the SIM rehabilitates EF<sub>IMSI</sub> and EF<sub>LOCI</sub> during SIM/ME initialization procedure.
2. To verify that the ME allows call set-up to a FDN number.
3. To verify that the ME allows call set-up to a FDN number extended by some digits in the end.
4. To verify that the ME rejects call set-up to a FDN number not completely corresponding to an entry in EF<sub>FDN</sub>.
5. To verify that the ME rejects call set-up to number having no reference in EF<sub>FDN</sub>.
6. To verify that the ME allows emergency call set-up.
7. For PCS 1 900: To verify the requirement 6 above by using the emergency call number 911.

#### 27.18.1.1.4 Method of test

##### 27.18.1.1.4.1 Initial conditions

The SS transmits on the BCCH, with the following network parameters

Attach/detach: disabled.

LAI (MCC/MNC/LAC): 246/81/0001 for GSM and DCS 1 800;  
246/813/0001 for PCS 1 900.

Access control: unrestricted.

The default FDN-SIM with FDN service enabled and EF<sub>ADN</sub> invalidated and neither readable nor updatable is installed into the ME.

##### 27.18.1.1.4.2 Procedure

- a) The MS is powered on and PIN1 is entered.
- b) Using the MMI a call set-up to the fixed dialling number 1 is attempted.
- c) Using the MMI a call set-up to the fixed dialling number 2 extended by "123" in the end is attempted.
- d) Using the MMI a call set-up to a number which is equal to the fixed dialling number 3 without the last digit is attempted, e.g. by recalling the fixed dialling number 3 and deleting the last digit (only in display).
- e) Using the MMI a call set-up to the number "1234567" is attempted.
- f) Using the MMI an emergency call set-up is attempted.

##### 27.18.1.1.5 Test requirement

- 1) After step a) the MS is registered and in idle state.
- 2) After steps b) and c) the MS shall allow call set-up and send the requested number across the air interface.
- 3) After steps d) and e) the MS shall prevent call set-up.
- 4) After step f) the MS shall allow emergency call set-up and send the requested number across the air interface.

#### 27.18.1.2 EF<sub>ADN</sub> invalidated but readable and updatable

##### 27.18.1.2.1 Definition and applicability

Fixed Number Dialling (FDN) is a service defined for the SIM. An activated FDN service results in call restrictions for the MS. The call restrictions are controlled by the ME.

This test applies to GSM, DCS 1800 and PCS 1 900 MEs using either ID.1 or Plug-in SIM, which allow for invalidated EF to be read and updated, and supporting the FDN service.

##### 27.18.1.2.2 Conformance requirement

The MS allows call set-up to a directory number as stored in EF<sub>FDN</sub> and extended by digits added from an EF<sub>ADN</sub>.

##### Reference:

3GPP TS 11.11, subclauses 9.3, 10.2.7, 10.3.2, 11.2.1 and 11.5.1, 3GPP TS 02.07, subclause 3.2.

##### 27.18.1.2.3 Test purpose

To verify that the ME allows call set-up to a FDN number extended by digits from an EF<sub>ADN</sub>.

#### 27.18.1.2.4 Method of test

##### 27.18.1.2.4.1 Initial conditions

The SS transmits on the BCCH, with the following network parameters

Attach/detach: disabled.

LAI (MCC/MNC/LAC): 246/81/0001 for GSM and DCS 1 800;  
246/813/0001 for PCS 1 900.

Access control: unrestricted.

The default FDN-SIM with FDN service enabled and  $EF_{ADN}$  invalidated but readable and updatable is installed into the ME.

##### 27.18.1.2.4.2 Procedure

- a) The MS is powered on and PIN1 is entered.
- b) Using the MMI a call set-up to the fixed dialling number 1 extended by the abbreviated dialling number 1 in the end is attempted.

##### 27.18.1.2.5 Test requirement

- 1) After step a) the MS is registered and in idle state.
- 2) After steps b) the MS shall allow call set-up and send the requested number across the air interface.

## 27.18.2 ME and SIM with FND deactivated

### 27.18.2.1 Definition and applicability

Fixed Number Dialling (FND) is a service defined for the SIM. An activated FND service results in call restrictions for the MS. Only directory numbers which are stored in the  $EF_{FND}$  may be dialled by the MS. The call restrictions are controlled by the ME. To ascertain the type of SIM and state of FND the MS runs the FND capability request procedure during SIM/ME initialization. Deactivation of the service by the subscriber is possible under the control of PIN2 and switches the SIM into a "normal", non restrictive SIM.

This test apply to GSM, DCS 1 800 and PCS 1 900 MEs using either ID.1 or Plug-in SIM and supporting the FND service.

### 27.18.2.2 Conformance requirement

1. Recognizing the state of the SIM (FND disabled) the MS correctly performs the SIM initialization procedure.
2. The MS allows call set-up to a directory number as stored in  $EF_{FND}$ .
3. The MS allows call set-up to a directory number as stored in  $EF_{ADN}$ .
4. The MS allows call set-up to a directory number given in manually.

#### Reference:

3GPP TS 11.11, subclauses 10.2.7, 10.3.2, 11.2.1 and 11.5.1, 3GPP TS 02.07, subclause 3.2.

### 27.18.2.3 Test purpose

1. To verify that the ME as a result of the state of the SIM correctly performs the SIM/ME initialization procedure.
2. To verify that the ME allows call set-up to a FND number.

3. To verify that the ME allows call set-up to a ADN number.
4. To verify that the ME allows call set-up to manually given number.

#### 27.18.2.4 Method of test

##### 27.18.2.4.1 Initial conditions

The SS transmits on the BCCH, with the following network parameters

- Attach/detach: disabled.
- LAI (MCC/MNC/LAC): 246/81/0001 for GSM and DCS 1 800;  
246/813/0001 for PCS 1 900.
- Access control: unrestricted.

The default FDN SIM with FDN service disabled is installed into the ME and the MS is powered on.

##### 27.18.2.4.2 Procedure

- a) Using the MMI a call set-up to the fixed dialling number 1 is attempted.
- b) Using the MMI a call set-up to the abbreviated dialling number 1 is attempted.
- c) Using the MMI a call set-up to the number "1234567" is attempted.

##### 27.18.2.5 Test requirement

After steps a), b) and c) the MS shall allow call set-up and send the requested number across the air interface.

## 27.18.3 Enabling, disabling and updating of FND

### 27.18.3.1 Definition and applicability

FND may be enabled and disabled by the subscriber under control of PIN2. Fixed dialling numbers are read with PIN and updated under control of PIN2.

This test apply to GSM, DCS 1 800 and PCS 1 900 MEs using either ID.1 or Plug-in SIM and supporting the FDN service.

### 27.18.3.2 Conformance requirement

1. Recognizing the state of the SIM (FND enabled) the MS shall perform the SIM initialization procedure as specified.
2. The MS shall allow updating of EF<sub>FND</sub> by the use of PIN2.
3. The MS provides means to disable the FND service by the use of PIN2.
4. The MS shall allow the use of EF<sub>ADN</sub> after disabling of FND.

#### Reference:

3GPP TS 11.11, subclauses 10.2.7, 10.3.2, 11.2.1 and 11.5.1, 3GPP TS 02.07, subclause 3.2.

### 27.18.3.3 Test purpose

1. To verify that the ME as a result of the state of the SIM rehabilitates EF<sub>IMSI</sub> and EF<sub>LOCI</sub> during SIM/ME initialization procedure.
2. To verify that the ME correctly performs the update of a number in EF<sub>FND</sub>.

3. To verify that the ME correctly disables FDN service.
4. To verify that the ME recognizes disabling of FDN and allows access to EF<sub>ADN</sub>.

#### 27.18.3.4 Method of test

##### 27.18.3.4.1 Initial conditions

The SS transmits on the BCCH, with the following network parameters

Attach/detach: disabled.

LAI (MCC/MNC/LAC): 246/81/0001 for GSM and DCS 1 800;  
246/813/0001 for PCS 1 900.

Access control: unrestricted.

The default FDN SIM with FDN service enabled is installed into the ME and the MS is powered on.

##### 27.18.3.4.2 Procedure

- a) The MS is powered on and PIN 1 is entered.
- b) Using the MMI the directory number "+876543210" is stored in EF<sub>FDN</sub> as fixed dialling number 1 (The alpha identifier is not changed).
- c) Using the MMI the FDN disabling procedure is performed. On request of the MS PIN2 is entered.
- d) Using the MMI a call set-up to the abbreviated dialling number 1 is attempted.
- e) The MS is soft-powered down.

##### 27.18.3.5 Test requirement

- 1) After step a) the MS is registered and in idle state.
- 2) After step c) the MS shall indicate that the FDN disabling procedure has been successful.
- 3) After step d) the MS shall allow call set-up and send the requested number across the air interface.
- 4) After step e) the value of bit 1 of byte 12 in the response data of EF<sub>ADN</sub> in the SIM shall be "1" and record 1 in EF<sub>FDN</sub>, shall contain the following values:

|     |     |     |     |     |     |     |    |    |     |     |     |     |
|-----|-----|-----|-----|-----|-----|-----|----|----|-----|-----|-----|-----|
| B1  | B2  | B3  | B4  | B5  | B6  | B7  | B8 | B9 | B10 | B11 | B12 | B13 |
| 46  | 44  | 4E  | 31  | 31  | 31  | 06  | 91 | 78 | 56  | 34  | 12  | F0  |
| B14 | B15 | B16 | B17 | B18 | B19 | B20 |    |    |     |     |     |     |
| FF  | FF  | FF  | FF  | FF  | FF  | FF  |    |    |     |     |     |     |

## 27.19 Phase identification

### 27.19.1 Definition and applicability

The phase of the SIM is indicated in the Elementary File EF<sub>PHASE</sub>. This allows the ME to identify the phase of the SIM and adapt its functionality accordingly.

This test applies to GSM, DCS 1 800 and PCS 1 900 MEs using either ID.1 or plug-in SIMs.

### 27.19.2 Conformance requirement

The phase of the card shall be determined as part of the initialization procedure.

Reference:

3GPP TS 11.11, subclauses 10.2.16 and 11.2.1.

#### 27.19.3 Test purpose

To verify that the ME requests the SIM phase as part of the initialization procedure.

#### 27.19.4 Method of test

##### 27.19.4.1 Initial conditions

The ME is connected to the SIM simulator, and powered off.

The default values are used.

##### 27.19.4.2 Procedure

- a) The mobile is powered on.
- b) The SIM simulator monitors the SIM initialization procedure.

#### 27.19.5 Test requirement

The ME shall request the phase of the SIM as part of the initialization procedure.

## 27.20 SIM presence detection

#### 27.20.1 Definition and applicability

The presence of the SIM is an essential requirement for setting up and maintaining a call. The ME detects the presence of the SIM electronically.

#### 27.20.2 Conformance requirement

To ensure that the SIM has not been removed during a card session, the ME shall send STATUS commands at frequent intervals of no longer than 30 s during a call. If the ME detects that the SIM has been removed, a possibly ongoing call shall be terminated by the ME within 5 s at the latest after having detected the SIM removal.

Reference:

3GPP TS 11.11, subclause 11.2.7.

#### 27.20.3 Test purpose

1. To verify that the ME sends STATUS messages at frequent intervals of no longer than 30s during a call.
2. To verify that the ME terminates a call within 5 s at the latest after having received a wrong response to the STATUS command.

#### 27.20.4 Method of test

##### 27.20.4.1 Initial conditions

The ME is connected to the SIM-simulator.

All elementary files are coded as default.

#### 27.20.4.2 Procedure

- a) A call is set up using the generic call setup.
- b) The SIM simulator monitors the time interval between STATUS commands sent by the ME.
- c) After 3 minutes, the call is cleared.
- d) A call is set up using the generic call setup.
- e) After one minute after the call was successfully set up, the SIM simulator responds to a STATUS command with the response data of the MF.

#### 27.20.5 Test requirements

1. During step b), the time interval between STATUS commands shall not be longer than 30 s.
2. After step e), the ME shall terminate the call within 5 s at the latest after having received the wrong response to the STATUS command.

## 27.21 Advice of Charge (AoC)

### 27.21.1 AoC not supported by SIM

#### 27.21.1.1 Definition and applicability

If the ME under test supports Advice of Charge Charging, it shall still look at the capability of the SIM, before responding to any AoCC information from the network.

This test is applicable to all MEs supporting AoCC.

#### 27.21.1.2 Conformance requirement

1. An MS not supporting AoCC and in the outgoing call / U4 call delivered state, on receipt of a CONNECT message containing AoCC information shall acknowledge the CONNECT message but ignore and not acknowledge the AoCC information sent within the CONNECT.
2. An MS not supporting AoCC and in the outgoing call / U4 call delivered state, on receipt of a FACILITY message containing AoCC information shall ignore and not acknowledge the AoCC information sent within the FACILITY.
3. An MS not supporting AoCC and in the incoming call / U9 call confirmed state, on receipt of a FACILITY message containing AoCC information shall ignore and not acknowledge the AoCC information sent within the FACILITY.
4. An MS not supporting AoCC and in the U10 call active state, on receipt of a FACILITY message containing AoCC information, shall ignore and not acknowledge the AoCC information sent within the FACILITY.

#### References:

3GPP TS 03.86, subclauses 1.2, 1.3, 2.2, 2.3; 3GPP TS 04.86, clause 2.

#### 27.21.1.3 Test purpose

1. To verify that an MS not supporting AoCC (where the ME does support AoCC but the SIM does not) and in the outgoing call / U4 call delivered state, on receipt of a CONNECT message containing AoCC information shall acknowledge the CONNECT message but ignore and not acknowledge the AoCC information sent within the CONNECT.
2. To verify that an MS not supporting AoCC (where the ME does support AoCC but the SIM does not) and in the outgoing call / U4 call delivered state, on receipt of a FACILITY message containing AoCC information shall ignore and not acknowledge the AoCC information sent within the FACILITY.

3. To verify that an MS not supporting AoCC (where the ME does support AoCC but the SIM does not) and in the incoming call / U9 call confirmed state, on receipt of a FACILITY message containing AoCC information shall ignore and not acknowledge the AoCC information sent within the FACILITY.
4. To verify that an MS not supporting AoCC (where the ME does support AoCC but the SIM does not) and in the U10 call active state, on receipt of a FACILITY message containing AoCC information, shall ignore and not acknowledge the AoCC information sent within the FACILITY.

#### 27.21.1.4 Method of test

##### 27.21.1.4.1 Initial conditions

The ME shall be installed with a SIM or SIM simulator, with all elementary files coded as for the default SIM, with the exception of:

#### EF<sub>SST</sub> (SIM Service Table)

Logically: CHV1 disable function allocated and activated.  
 Abbreviated dialling numbers allocated and activated.  
 PLMN selector allocated and activated.  
 Fixed dialling numbers not activated.  
 AoC not activated.

|         |          |          |          |                   |
|---------|----------|----------|----------|-------------------|
| Coding: | B1       | B2       | B3       | B4                |
|         | xx0x1111 | 0011xx0x | xxxxxxxx | 0000xxxx (binary) |

The coding of EF<sub>SST</sub> shall conform with the capabilities of the SIM used.

The generic call set up procedures are followed up to and including the reception, or transmission of the ALERTING message by the MS.

##### 27.21.1.4.2 Procedure

- a) For an MO call in the U4 state the SS transmits CONNECT containing AoCC information.
- b) For an MO call in the U4 state the SS transmits FACILITY containing AoCC information.
- c) For an MTcall in the U9 state the SS transmits FACILITY containing AoCC information.
- d) For an MO call in the U10 state the SS transmits FACILITY containing AoCC information.

##### 27.21.1.5 Test requirement

In all cases, the MS shall ignore the AoCC information sent to it in the Facility information elements as part of the CONNECT/FACILITY messages and not send any AoCC information acknowledgement. It shall be checked for 15 s that the MS does not transmit any AoCC information acknowledgement after the receipt of AoCC information.

## 27.21.2 Maximum frequency of ACM updating

### 27.21.2.1 Definition and applicability

The ACM shall be updated at the end of every interval, where the interval length is given by parameter e2. The ME shall update the ACM not more frequently than once every 5 s, even if the interval is less than 5 s. More frequent updating may affect the SIM's read/write cycles.

This test applies to all ME supporting AoC.

### 27.21.2.2 Conformance requirement

The ACM shall be incremented when the CCM is incremented or once every 5 s, whichever is the longer period.

Reference:

3GPP TS 02.24, subclause 4.3, part h.

### 27.21.2.3 Test purpose

To verify that the interval between increments is 5 s.

### 27.21.2.4 Method of test

#### 27.21.2.4.1 Initial conditions

The ME shall be connected to the SIM simulator, with all elementary files coded as default with the exception of:

$EF_{SST}$  (SIM Service Table)

Logically:      CHV1 disable function allocated and activated.  
                   Abbreviated dialling numbers allocated and activated.  
                   PLMN selector allocated and activated.  
                   Fixed dialling numbers not activated.  
                   AoC allocated and activated.

Coding:            B1            B2            B3            B4  
                   xx0x1111    0011xx11    xxxxxxxx    0000xxxx (binary)

The coding of  $EF_{SST}$  shall conform with the capabilities of the SIM used.

$EF_{ACM}$  (Accumulated call meter)

Logically:      50 units

$EF_{ACMmax}$  (Accumulated call meter maximum)

Logically:      150 units

System Simulator:

1 cell, default parameters, IMSI attach/detach disabled.

Mobile Station:

The MS is in MM-state "idle, updated".

#### 27.21.2.4.2 Procedure

- a) The MS is made to initiate a call. The call is established with AoCC e-parameters sent in a Facility IE in the CONNECT message, as given below. The MS returns the AoCC acknowledgement within 1 second of the CONNECT message. It is an implementation option whether the AoCC acknowledge is sent by the MS before or after the CONNECT ACKNOWLEDGE.
- b) The call is maintained for 90 s, then terminated by the SS. During the call, the SIM-simulator monitors the time intervals between successive INCREMENT commands.

Maximum Duration of Test:

2 minutes.

Expected Sequence:

| Step | Direction | Message              | Comments                                                                                                                                                         |
|------|-----------|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                      | The MS is made to initiate a call<br><br>to a supported channel type<br><br>As default message except contains Facility IE with contents as indicated in i below |
| 2    | MS -> SS  | CHANNEL REQUEST      |                                                                                                                                                                  |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT |                                                                                                                                                                  |
| 4    | MS -> SS  | CM SERVICE REQUEST   |                                                                                                                                                                  |
| 5    | SS -> MS  | CM SERVICE ACCEPT    |                                                                                                                                                                  |
| 6    | MS -> SS  | SETUP                |                                                                                                                                                                  |
| 7    | SS -> MS  | CALL PROCEEDING      |                                                                                                                                                                  |
| 8    | SS -> MS  | ASSIGNMENT COMMAND   |                                                                                                                                                                  |
| 9    | MS -> SS  | ASSIGNMENT COMPLETE  |                                                                                                                                                                  |
| 10   | SS -> MS  | ALERTING             |                                                                                                                                                                  |
| 11   | SS -> MS  | CONNECT              |                                                                                                                                                                  |
|      |           |                      | Either A or B branch is taken                                                                                                                                    |
| A12  | MS -> SS  | CONNECT ACKNOWLEDGE  | As default message except contains Facility IE with contents as indicated in ii below                                                                            |
| A13  | MS -> SS  | FACILITY             |                                                                                                                                                                  |
| B12  | MS -> SS  | FACILITY             | As default message except contains Facility IE with contents as indicated in ii below                                                                            |
| B13  | MS -> SS  | CONNECT ACKNOWLEDGE  |                                                                                                                                                                  |
| 14   |           |                      | call duration 90 s after CAI information sent by SS,                                                                                                             |
| 15   | SS -> MS  | DISCONNECT           | The main signalling link is released.                                                                                                                            |
| 16   | MS -> SS  | RELEASE              |                                                                                                                                                                  |
| 17   | SS -> MS  | RELEASE COMPLETE     |                                                                                                                                                                  |
| 18   | SS -> MS  | CHANNEL RELEASE      |                                                                                                                                                                  |

Specific Message Contents:

**i) FACILITY Information Element** with **Invoke = ForwardChargeInformation** component type as defined in 3GPP TS 04.80 subclause 3.6.1 table 3.3.

For ASN.1 description see default message contents in subclause 31.6.1.3.

The values of the e-parameters within the parameter part of the Facility Information Element shall be set as below:

| parameter | e-parameters |   |   |   |   |   |   |
|-----------|--------------|---|---|---|---|---|---|
|           | 1            | 2 | 3 | 4 | 5 | 6 | 7 |
| value     | 1            | 1 | 1 | 0 | 0 | 0 | 0 |

Values shown in table are in the format and have units as in 3GPP TS 02.24 subclause 3.

**ii) FACILITY Information Element** with **Return Result** component type as defined in 3GPP TS 04.80 subclause 3.6.1 table 3.4.

For ASN.1 description see default message contents in subclause 31.6.1.3.

#### 27.21.2.5 Test requirement

The MS shall send INCREMENT commands to the SIM every 5 s.

### 27.21.3 Call terminated when ACM greater than ACMmax

#### 27.21.3.1 Definition and applicability

ACMmax gives the maximum value of ACM, at which the current calls shall be terminated and no further outgoing calls and charged incoming calls may be made (except emergency calls).

This test applies to all ME supporting AoCC.

### 27.21.3.2 Conformance requirement

ACM shall be incremented by the value of CCM.

If the ACMmax is valid, and the ACM becomes equal to or exceeds the value of the ACMmax, then all calls in progress, chargeable to the user, shall be terminated by the MS with cause value #68, once the chargeable interval determined by the CAI has elapsed, (except emergency calls).

#### Reference:

3GPP TS 02.24, subclause 4.3 part h and subclause 4.2.2.

3GPP TS 04.86, subclause 2.3.

### 27.21.3.3 Test purpose

1. To verify that the ME increments the ACM by the correct number of units, even though this may take ACM above ACMmax.
2. To verify that the ME terminates the call with cause value #68.

### 27.21.3.4 Method of test

#### 27.21.3.4.1 Initial conditions

The ME shall be connected to a SIM or the SIM simulator, with all elementary files coded as default with the exception of:

#### EF<sub>SST</sub> (SIM Service Table)

Logically: CHV1 disable function allocated and activated.  
 Abbreviated dialling numbers allocated and activated.  
 PLMN selector allocated and activated.  
 Fixed dialling numbers not activated.  
 AoC allocated and activated.

|         |          |          |          |                   |
|---------|----------|----------|----------|-------------------|
| Coding: | B1       | B2       | B3       | B4                |
|         | xx0x1111 | 0011xx11 | xxxxxxxx | 0000xxxx (binary) |

The coding of EF<sub>SST</sub> shall conform with the capabilities of the SIM used.

#### EF<sub>ACM</sub> (Accumulated call meter)

Logically: 80 units

#### EF<sub>ACMmax</sub> (Accumulated call meter maximum)

Logically: 94 units

#### System Simulator:

1 cell, default parameters, IMSI attach/detach disabled.

#### Mobile Station:

The MS is in MM-state "idle, updated".

27.21.3.4.2 Procedure

- a) The MS is made to initiate a call. The call is established with AoCC e-parameters sent in a Facility IE in the CONNECT message, as given below. The MS returns the AoCC acknowledgement within 1 second of the CONNECT message. It is an implementation option whether the AoCC acknowledge is sent by the MS before or after the CONNECT ACKNOWLEDGE.
- b) The call is maintained until cleared by the MS (after 30 s) with cause value #68.
- c) The contents of ACM are checked.

Maximum Duration of Test:

2 minutes.

Expected Sequence:

| Step | Direction | Message                                           | Comments                                                                              |
|------|-----------|---------------------------------------------------|---------------------------------------------------------------------------------------|
| 1    | MS        |                                                   | The MS is made to initiate a call                                                     |
| 2    | MS -> SS  | CHANNEL REQUEST                                   |                                                                                       |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT                              |                                                                                       |

|      |           |                                                   | The main signalling link is released.                                                 |

Specific Message Contents:

i) **FACILITY Information Element** with **Invoke = ForwardChargeInformation** component type as defined in 3GPP TS 04.80 subclause 3.6.1 table 3.3.

For ASN.1 description see default message contents in subclause 31.6.1.3.

The values of the e-parameters within the parameter part of the Facility Information Element shall be set as below:

| parameter | e-parameters |    |   |   |   |   |   |
|-----------|--------------|----|---|---|---|---|---|
|           | 1            | 2  | 3 | 4 | 5 | 6 | 7 |
| value     | 10           | 10 | 1 | 0 | 0 | 0 | 0 |

Values shown in table are in the format and have units as in 3GPP TS 02.24 clause 3.

ii) **FACILITY Information Element** with **Return Result** component type as defined in 3GPP TS 04.80 subclause 3.6.1 table 3.4.

For ASN.1 description see default message contents in subclause 31.6.1.3.

### 27.21.3.5 Test requirement

- 1) The MS shall terminate the call correctly 30 s after CAI was sent.
- 2) The value of ACM shall be 100 units.

## 27.21.4 Response codes of increase command

### 27.21.4.1 Definition and applicability

ACM has a maximum value in terms of coding, and an attempt by the ME to exceed that value by sending an INCREASE command shall result in an error message from the SIM.

This test applies to all MEs supporting AoCC.

### 27.21.4.2 Conformance requirement

The ME shall perform the increasing procedure, sending the amount to be increased.

The running accumulated charge shall be stored in the ACM of the SIM.

Where this charge cannot be stored in the MS, use of the telecommunications service shall be prevented.

#### References:

3GPP TS 11.11, subclause 11.5.3; 3GPP TS 02.86, subclauses 2.2.1 and 2.1.

### 27.21.4.3 Test purpose

To verify that the ME clears a charged call if the SIM indicates that the ACM cannot be increased.

### 27.21.4.4 Method of test

#### 27.21.4.4.1 Initial conditions

The ME shall be connected to the SIM simulator, with all elementary files coded as default with the exception of:

#### EF<sub>SST</sub> (SIM Service Table)

Logically: CHV1 disable function allocated and activated.  
 Abbreviated dialling numbers allocated and activated.  
 PLMN selector allocated and activated.  
 Fixed dialling numbers not activated.  
 AoC allocated and activated.

|         |          |          |          |                   |
|---------|----------|----------|----------|-------------------|
| Coding: | B1       | B2       | B3       | B4                |
|         | xx0x1111 | 0011xx11 | xxxxxxxx | 0000xxxx (binary) |

The coding of EF<sub>SST</sub> shall conform with the capabilities of the SIM used.

#### EF<sub>ACM</sub> (Accumulated call meter)

Logically: (Maximum-10) units

#### EF<sub>ACMmax</sub> (Accumulated call meter maximum)

Logically: (Maximum-2) units

System Simulator:

1 cell, default parameters, IMSI attach/detach disabled.

Mobile Station:

The MS is in MM-state "idle, updated".

#### 27.21.4.4.2 Procedure

- a) The MS is made to initiate a call. The call is established with AoCC e-parameters sent in a Facility IE in the CONNECT message, as given below. The MS returns the AoCC acknowledgement within 1 second of the CONNECT message. It is an implementation option whether the AoCC acknowledge is sent by the MS before or after the CONNECT ACKNOWLEDGE.
- b) After an interval has elapsed, the ME increments the ACM. When an INCREASE command is received, the SIM-sim sends back the error "98 50".
- c) Conditions are reset to those described in the initial conditions. Steps a) and b) of the test are repeated, except that the error code sent by the SIM simulator at step b) is now "6F xx".
- d) Conditions are reset to those described in the initial conditions. Steps a) and b) of the test are repeated, except that the error code sent by the SIM simulator at step b) is now "92 40".

Maximum Duration of Test:

3 minutes.

Expected Sequence:

| Step | Direction | Message                                           | Comments                                                                              |
|------|-----------|---------------------------------------------------|---------------------------------------------------------------------------------------|

|      |           |                                                   | The main signalling link is released.                                                 |

Specific Message Contents:

**i) FACILITY Information Element** with **Invoke = ForwardChargeInformation** component type as defined in 3GPP TS 04.80 subclause 3.6.1 table 3.3.

The values of the e-parameters within the parameter part of the Facility Information Element shall be set as below:

| parameter | e-parameters |    |   |   |   |   |   |
|-----------|--------------|----|---|---|---|---|---|
|           | 1            | 2  | 3 | 4 | 5 | 6 | 7 |
| value     | 20           | 10 | 1 | 0 | 0 | 0 | 0 |

Values shown in table are in the format and have units as in 3GPP TS 02.24 subclause 3.

ii) **FACILITY Information Element** with **Return Result** component type as defined in 3GPP TS 04.80 subclause 3.6.1 table 3.4.

#### 27.21.4.5 Test requirement

In each of the three cases, as described in steps b), c) and d) of the procedure, the MS shall terminate the call correctly when it receives an indication from the SIM that the ACM cannot be incremented.

## 28 Test of autocalling restrictions

### 28.1 General

It is essential that all autocalling apparatus is prevented from continuously dialling a given number, to avoid machines repeatedly disturbing PSTN subscribers in error, or numerous repeat attempts to unobtainable numbers which cause waste of valuable network resources. Therefore autocalling restrictions are defined by 3GPP TS 02.07.

The tests shall be performed using all of the call methods specified by the supplier in the PIXIT statement (annex 3). The supplier shall state any autocalling procedures implemented and how many times they can be repeated to a single number and the minimum re-attempt interval(s), i.e. the complete re-try schedule or algorithm with parameter values. The supplier shall further describe any automatic methods for making repeated calls to a single number. The supplier shall also state in the PIXIT statement (annex 3) the number of B-party numbers that can be stored on the list of blacklisted numbers as described in 3GPP TS 02.07, annex A.

For an external R-interface the supplier shall state in the PIXIT statement (annex 3) the procedure for autocalling restrictions for that interface and the possible parameter settings for the number of times the LTE can make a re-attempt and the minimum accepted time between re-attempts accepted by the MS. The conditions for clearing the autocalling constraints shall be stated in the PIXIT statement (annex 3).

For external interfaces the LTE must be programmed so that it clearly attempts to violate the autocalling constraints.

### 28.2 Constraining the access to a single number (3GPP TS 02.07 category 3)

During this test the SETUP messages shall contain the same B-party number.

No manual intervention shall be performed except to initiate and end the test.

#### 28.2.1 Conformance requirement

A repeat call attempt may be made when a call attempt is unsuccessful for the reasons listed below (as defined in 3GPP TS 04.08 / 3GPP TS 24.008).

These reasons are classified in three major categories:

1. "Busy destination".
2. "Unobtainable destination - temporary".
3. "Unobtainable destination - permanent/long term".

NOTE: Cause values for each category are defined in 3GPP TS 02.07, annex A.

The table below describes a repeat call restriction pattern to any B number. This pattern defines a maximum number (n) of call repeat attempts; when this number n is reached, the associated B number shall be blacklisted by the MT until a manual re-set at the MT is performed in respect of that B number. When a repeat attempt to anyone B number fails, or is blacklisted, this does not prevent calls being made to other B numbers.

For the categories 1 and 2 above, n shall be 10; for category 3, n shall be 1.

| Call attempt         | Minimum duration between call attempts |
|----------------------|----------------------------------------|
| Initial call attempt | -                                      |
| 1st repeat attempt   | 5 s                                    |
| 2nd repeat attempt   | 1 min                                  |
| 3rd repeat attempt   | 1 min                                  |
| 4th repeat attempt   | 1 min                                  |
| 5th repeat attempt   | 3 min                                  |
| .                    |                                        |
| .                    |                                        |
| nth repeat attempt   | 3 min                                  |

#### Reference:

3GPP TS 02.07, annex A.

#### Purpose of the test

##### 28.2.2 Test purpose

To ensure the correct behaviour of the MS to 3GPP TS 02.07 Category 3.

##### 28.2.3 Method of test

#### Initial condition.

There shall be no numbers in the list of blacklisted numbers in the MS. The time set between the first re-attempt and the next re-attempt is set to the minimum value possible. The number of re-attempts is set to the lowest possible number, greater than 1, that is supported by the MS. The autocalling function is invoked for the B-party number to be used during the test.

#### Related PICS/PIXIT Statement(s)

PICS: Cause number 27 implemented in:

- category 2 (preferred);
- category 3.

PIXIT: Description of auto calling management:

- selection of the auto calling;
- indication that the call failed and a re-try is attempted;
- indication that a call finally failed;
- number of B-party numbers that can be stored in the list of blacklisted numbers.

Non standard keystroke sequences to be used on the EMMI (in line with 3GPP TS 11.10, clause 36).

#### Foreseen Final State of the MS

The MS has a valid TMSI. It is "idle updated".

## Test Procedure

A MS initiated generic call setup is performed upto and including CIPHERING MODE COMPLETE. The SS then releases the establishment with a cause value from Category 3 3GPP TS 02.07 annex A.

The MS will make one further generic call setup attempt invoked by the auto calling function after a channel release is sent out by the SS.

| Step | Direction | Message                 | Comments                                                                                             |
|------|-----------|-------------------------|------------------------------------------------------------------------------------------------------|
| 1    | MS        |                         | "called number" entered                                                                              |

| 23   | MS -> SS  | CIPHERING MODE COMPLETE |                                                                                                      |
| 24   | SS        |                         | SS starts ciphering.                                                                                 |
| 25   | MS -> SS  | SETUP                   |                                                                                                      |
| 26   | SS -> MS  | CIPHERING MODE COMMAND  |                                                                                                      |
| 27   | MS -> SS  | CIPHERING MODE COMPLETE |                                                                                                      |
| 28   | SS        |                         | SS stops ciphering                                                                                   |
| 29   | SS -> MS  | RELEASE COMPLETE        | Cause value from category 3 of 3GPP TS 02.07, annex A.                                               |
| 30   | SS -> MS  | CHANNEL RELEASE         | The main signalling link is released                                                                 |
| 31   | MS        |                         | Clear the auto calling constraint by manual intervention after a minimum of 2 minutes from step 30.  |

## 28.3 Constraining the access to a single number (3GPP TS 02.07 categories 1 and 2)

During this test the SETUP messages shall contain the same B-party number.

No manual intervention shall be performed except to initiate and end the test.

### 28.3.1 Conformance requirement

The MS must fulfil the requirements for category 1 and 2, see subclause 28.2.1

Reference:

3GPP TS 02.07, annex A.

### 28.3.2 Test purpose

To ensure the correct behaviour of the MS to 3GPP TS 02.07 Categories 1 and 2.

### 28.3.3 Method of test

#### Initial condition.

There shall be no numbers in the list of blacklisted numbers in the MS. The re-try scheme is set to give the shortest possible intervals between re-tries. The number of re-attempts is set to the maximum possible number (N), that is supported by the MS. The autocalling function is invoked for the B-party number to be used during the test.

#### Related PICS/PIXIT Statement(s)

PICS: Cause number 27 implemented in:

- category 2 (preferred);
- category 3.

PIXIT: Description of auto calling management:

- selection of the auto calling;
- indication that the call failed and a re-try is attempted;
- indication that a call finally failed;
- number of B-party numbers that can be stored in the list of blacklisted numbers.

Non standard keystroke sequences to be used on the EMMI (in line with 3GPP TS 11.10, clause 36).

#### Foreseen Final State of the MS

The MS has a valid TMSI. It is "idle updated".

#### Test Procedure

A, MS initiated, generic call setup is performed up to and including CIPHERING MODE COMPLETE. The SS then releases the establishment with a cause value from category 1 or 2 ( 3GPP TS 02.07, annex A).

The MS is continuously making new generic call setup attempts invoked by the auto calling function after each CHANNEL RELEASE from the SS.

| Step | Direction | Message                 | Comments                                                                                                                                                                                                                                                                                                                                                     |

| 30   | SS -> MS  | CHANNEL RELEASE         |                                                                                                                                                                                                                                                                                                                                                              |
| 31   |           |                         | The auto calling function shall repeat step 16 to 30 (N-1) times. The MS shall not make more than maximum 10 re-attempts.                                                                                                                                                                                                                                    |
| 32   | MS        |                         | Clear the auto calling constraint by manual intervention after a minimum of 4 minutes from step 31. Following the final completion of step 31 the MS initiate a call prior to manual intervention.                                                                                                                                                           |

## 28.4 Behaviour of the MS when its list of blacklisted numbers is full

The number of B-party numbers that can be stored in the list of blacklisted numbers, as stated in the PIXIT statement (annex 3), is M.

This test shall only apply to MS that are capable of autocalling more than M B-party numbers.

#### 28.4.1 Conformance requirement

The number of B numbers that can be held in the blacklist is at the manufacturers discretion but there shall be at least 8. However, when the blacklist is full the MT shall prohibit further automatic call attempts to any one number until the blacklist is manually cleared at the MT in respect of one or more B numbers.

#### Reference:

3GPP TS 02.07, annex A.

#### 28.4.2 Test purpose

To ensure the correct behaviour of the MS when its list of blacklisted numbers is full.

#### 28.4.3 Method of test

Initial condition.

The list of blacklisted numbers, in the MS, shall be full. This may be achieved as described in the procedure in subclause 28.2, applied to M B-party numbers.

#### Related PICS/PIXIT Statement(s)

PICS: Cause number 27 implemented in:

- category 2 (preferred);
- category 3.

PIXIT: Description of auto calling management:

- selection of the auto calling;
- indication that the call failed and a re-try is attempted;
- indication that a call finally failed;
- number of B-party numbers that can be stored in the list of blacklisted numbers.

Non standard keystroke sequences to be used on the EMMI (in line with 3GPP TS 11.10, clause 36).

#### Foreseen Final State of the MS

The MS has a valid TMSI. It is "idle updated".

#### Test Procedure

The autocalling function is invoked for a B-party number that is not in the list of blacklisted numbers.

Clear the autocalling constraint by manual intervention after a minimum of 2 minutes.

## 28.4.4 Test requirements

The MS must not initiate a call.

| 15   | SS -> MS  | CHANNEL RELEASE         | The main signalling link is released                                                                                                                                                                                           |
| 16   |           |                         | The MS is invoking the auto calling function. The time between step 15 and 17 must be minimum 5 sec.                                                                                                                           |
| 17   | MS -> SS  | CHANNEL REQUEST         | Establishment cause indicates "originating call".                                                                                                                                                                              |
| 18   | SS -> MS  | IMMEDIATE ASSIGNMENT    |                                                                                                                                                                                                                                |
| 19   | MS -> SS  | CM SERVICE REQUEST      | Message is contained in SABM.                                                                                                                                                                                                  |
| 20   | SS -> MS  | AUTHENTICATION REQUEST  |                                                                                                                                                                                                                                |
| 21   | MS -> SS  | AUTHENTICATION RESPONSE |                                                                                                                                                                                                                                |
| 22   | SS -> MS  | CIPHERING MODE COMMAND  | SS starts deciphering after sending the message.                                                                                                                                                                               |
|      | MS -> SS  | CIPHERING MODE COMPLETE |                                                                                                                                                                                                                                |
| 23   | SS        |                         | SS starts ciphering.                                                                                                                                                                                                           |
| 24   | MS -> SS  | SETUP                   |                                                                                                                                                                                                                                |
| 25   | SS -> MS  | CIPHERING MODE COMMAND  | SS stops deciphering after sending the message.                                                                                                                                                                                |
| 26   | MS -> SS  | CIPHERING MODE COMPLETE |                                                                                                                                                                                                                                |
| 27   | SS        |                         | SS stops ciphering.                                                                                                                                                                                                            |
| 28   | SS -> MS  | RELEASE COMPLETE        | Cause value from category 3 of 3GPP TS 02.07, annex A. This shall be chosen randomly. Cause no. 27 shall be excluded if the MS has implemented in category 2 of 3GPP TS 02.07, as declared in PIXIT statement                  |
| 29   | SS -> MS  | CHANNEL RELEASE         | The main signalling link is released.                                                                                                                                                                                          |
| 30   |           |                         | The test shall be repeated from steps 1 to 29 using a different B party number each time until the blacklist is full as declared in PIXIT statement. The MS shall not make more than a maximum of 1 re-attempt on each number. |
| 31   |           |                         | The test shall be repeated from steps 1 to 29 using a non-blacklisted B party number                                                                                                                                           |
| 32   | MS        |                         | Clear the auto calling constraint by manual intervention after a minimum of 2 minutes from step 29.                                                                                                                            |

## 29 Testing of bearer services

### 29.1 General

In 3GPP TS 07.01, subclause 2 the reference configurations for access to the data services of a GSM PLMN are described. For testing purposes only the following classifications are used:

- MT2 configuration (Um- and R-interface available for testing).
- Configurations (only Um-interface available for testing) where it is possible to enable the MS to issue or accept a data call and send data over the Um-interface. An MT1 connected to an ISDN TE belongs to this type.

- For efficient testing it is essential that such configurations have some means to specifically activate every function towards the Um-interface the MS will perform during operation.
- The correctness of the data bits transferred to the Um-interface will not be tested in these configurations. However the correctness of the 3GPP TS 04.21 frames sent by the MS will be tested.

Testing the S-interface for the MT1 configuration is for further study.

For some tests it is of no importance whether the call is MO or MT. However, there might be configurations allowing the call to be established only from one side. In this case the appropriate actions shall be taken to establish the call.

In all other cases the data call shall be set up by the SS (i.e. MT) with an appropriate BC-IE which is supported by the MS.

At the beginning of all tests the MS shall be in the idle updated state.

## 29.2 Testing of transparent data services

During all the tests the 3GPP TS 04.21 frames received as output of the channel coder in the SS shall be checked for correctness against 3GPP TS 04.21; this means checking that:

- S bits are coded as zeroes unless otherwise specified;
- the E bits have the correct value (for the synchronous services);
- the data bits correctly include the start and stop bits (for the asynchronous services).

### 29.2.1 Verification of synchronization

#### 29.2.1.1 Definition and applicability

This test applies to Mobile Stations supporting data services in transparent mode.

#### 29.2.1.2 Conformance requirement

A Mobile Stations in MT2 configuration has to comply with all requirements whilst for other configurations some of the requirements are not relevant. These restrictions are explicitly indicated in subclause 29.2.1.5.

#### 29.2.1.3 Test purpose

This test verifies the correct synchronization procedure of user data and status information which are mapped on modified ITU-T Recommendation V.110 frames (as per 3GPP TS 04.21).

As V-series interfaces are supported in full duplex mode, it will test the capability to synchronize these frames in the direction from the TAF to the IWF and vice versa.

#### 29.2.1.4 Method of test

The test shall be carried out under ideal radio conditions for all bearer services and user rates in transparent mode that are supported by the MS in case of mobile originated and terminated calls and in-call modification. The setting of Bearer Capability Information Elements in signalling messages sent to the MS by the SS must be supported by the MS for the bearer service(s) to be tested.

NOTE 1: Since "steady state" is implementation dependent, there is no means to define a test "steady state detected". However, the whole testing procedure is limited to 1s. This includes an implicit upper time limit for the MS to detect a steady state. A MS failing this test is highly estimated to never detect a steady state under real radio conditions.

NOTE 2: *t<sub>i</sub>*, as used in the description of the test procedures, are points of time, not timers.

#### 29.2.1.4.1 Procedure for Mobile Originated Calls

- a) The MS is connected to the System Simulator at the Um interface and to the LTE using the appropriate R interface in case of MT2 only.
- b) The MS is configured for data transmission. In the case of MT2 configurations, the LTE shall set the signalling lines of the R interface Ct 105, Ct 108.2 for V-series interface to ON.
- c) A mobile originated call shall be set up.
- d) At the reception of the SETUP message sent by the MS the SS shall send a CONNECT message and starts sending "1/OFF". t1 is at the completion of the CONNECT message.
- e) The reception of "1/OFF" at the SS side (see table 29-1) defines t2. t2 will be reset at the reception of again "1/OFF" after an interruption of continuous "1/OFF" pattern.
- f) The SS checks bits S1, S3, S6 and S8 of the modified ITU-T Recommendation V.110 frames (as described in 3GPP TS 04.21). Let t3 be the time when all four bits change from OFF to ON (i.e. if  $t < t3$ , (S1,S3,S6,S8)  $\langle$  (0,0,0,0) and  $t \geq t3$ , (S1,S3,S6,S8) = (0,0,0,0)).

#### 29.2.1.4.2 Procedure for Mobile Terminated Calls

- a) The MS is connected to the System Simulator at the Um interface and to the LTE using the appropriate R interface in case of MT2 only.
- b) The MS is configured for data transmission. In the case of MT2 configurations, The LTE shall set the signalling lines of the R interface Ct. 105, Ct 108.2 for V-series interface to ON.
- c) A mobile terminated call shall be set up.
- d) At the reception of CONNECT the SS sends CONNECT ACKNOWLEDGE. t1 is at the completion of the CONNECT ACKNOWLEDGE message.
- e) The reception of "1/OFF" at the SS side (see table 29-1) defines t2. t2 will be reset at the reception of again "1/OFF" after an interruption of continuous "1/OFF" pattern.
- f) The SS checks bits S1, S3, S6 and S8 of the modified ITU-T Recommendation V.110 frames (as described in 3GPP TS 04.21). Let t3 be the time when all four bits change from OFF to ON (i.e. if  $t < t3$ , (S1,S3,S6,S8)  $\langle$  (0,0,0,0) and  $t \geq t3$ , (S1,S3,S6,S8) = (0,0,0,0)).

#### 29.2.1.4.3 Procedure for In Call Modification

- a) The MS is connected to the System Simulator at the Um interface and to the LTE using the appropriate R interface in case of MT2 only.
- b) The MS is configured for data transmission. In the case of MT2 configurations, the LTE shall set the signalling lines of the R interface Ct. 105, Ct 108.2 for V-series interface to ON.
- c) A speech call shall be established with a SETUP message containing two bearer capabilities for speech and the bearer service to be tested.
- d) The MS shall start the ICM procedure with a bearer capability information element supporting the bearer service to be tested.
- e) At the reception of the MODIFY message sent by the MS the SS shall send a CHANNEL MODE MODIFY message.
- f) At the reception of the CHANNEL MODE MODIFY ACKNOWLEDGE message the SS shall send a MODIFY COMPLETE message. t1 is at the completion of the MODIFY COMPLETE message.
- g) The reception of "1/OFF" (see table 29-1) defines t2. t2 will be reset at the reception of again "1/OFF" after an interruption of continuous "1/OFF" pattern.

- h) The SS checks bits S1, S3, S6 and S8 of the modified ITU-T Recommendation V.110 frames (as described in 3GPP TS 04.21). Let  $t_3$  be the time when all four bits change from OFF to ON (i.e. if  $t < t_3$ ,  $(S1, S3, S6, S8) \langle (0, 0, 0, 0)$  and  $t \geq t_3$ ,  $(S1, S3, S6, S8) = (0, 0, 0, 0)$ ).

#### 29.2.1.5 Test requirements

##### 29.2.1.5.1 Test requirements for Mobile Originated Calls

- 1) After step b) Cts 106, 107, 109 must be in the "OFF" condition, dataline 104 shall be set to "1".
- 2) At  $t_1 + 500$  ms Ct 107 must still be in the "OFF" condition.
- 3) Between  $t_1 + 500$  ms and  $t_1 + 1\ 000$  ms Ct 107 must switch to the "ON" condition. This indicates successful synchronization of TAF towards IFE.
- 4) Between  $t_2$  and  $t_3$  the SS must receive continuous "1/OFF" frames.
- 5) The time between  $t_2$  and  $t_3$  must be more than 450 ms.
- 6) At  $t_1 + 1000$ ms the SS must check 3GPP TS 04.21 frames sent by the MS with SA and SB bits (i.e. bits S1, S3, S4, S6, S8 and S9) set to "ON". This indicates successful synchronization of IFE towards TAF. At this point of time the whole synchronization procedure has been completed successfully.

NOTE: If the MS is not MT2, only requirements 4 to 6 apply.

##### 29.2.1.5.2 Test requirements for Mobile Terminated Calls

- 1) After step b) Cts 106, 107, 109 must be in the "OFF" condition, dataline 104 shall be set to "1".
- 2) At  $t_1 + 500$  ms Ct 107 must still be in the "OFF" condition.
- 3) Between  $t_1 + 500$  ms and  $t_1 + 1\ 000$  ms Ct 107 must switch to the "ON" condition. This indicates successful synchronization of TAF towards IFE.
- 4) Between  $t_2$  and  $t_3$  the SS must receive continuous "1/OFF" frames.
- 5) The time between  $t_2$  and  $t_3$  must be more than 450 ms.
- 6) At  $t_1 + 1000$  ms the SS must check 3GPP TS 04.21 frames sent by the MS with SA and SB bits (i.e. bits S1, S3, S4, S6, S8 and S9) set to "ON". This indicates successful synchronization of IFE towards TAF. At this point of time the whole synchronization procedure has been completed successfully.

NOTE: If the MS is not MT2, only requirements 4 to 6 apply.

##### 29.2.1.5.3 Test requirements for In Call Modification

- 1) After step b) Cts 106, 107, 109 must be in the "OFF" condition, dataline 104 shall be set to "1".
- 2) At  $t_1 + 500$  ms Ct 107 must still be in the "OFF" condition.
- 3) Between  $t_1 + 500$  ms and  $t_1 + 1\ 000$  ms Ct 107 must switch to the "ON" condition. This indicates successful synchronization of TAF towards IFE.
- 4) Between  $t_2$  and  $t_3$  the SS must receive continuous "1/OFF" frames.
- 5) The time between  $t_2$  and  $t_3$  must be more than 450 ms.
- 6) At  $t_1 + 1\ 000$  ms the SS must check 3GPP TS 04.21 frames sent by the MS with SA and SB bits (i.e. bits S1, S3, S4, S6, S8 and S9) set to "ON". This indicates successful synchronization of IFE towards TAF. At this point of time the whole synchronization procedure has been completed successfully.

NOTE: If the MS is not MT2, only requirements 4 to 6 apply.

## 29.2.2 Filtering of channel control information for transparent BCs

### 29.2.2.1 Definition and applicability

This test is only applicable to the MT2 configuration.

### 29.2.2.2 Conformance requirement

An MS supporting data services shall decode and filter channel control information received over the Um-interface.

1. 3GPP TS 04.21, clause 7;
2. 3GPP TS 07.01, subclause 8.2.2;
3. 3GPP TS 07.02, subclause 3.2.1 (for asynchronous bearer services only);
4. 3GPP TS 07.03, subclauses 4.2.1 and 4.2.2 (for synchronous bearer services only).

### 29.2.2.3 Test purpose

The purpose of this test is to verify the correct decoding and filtering of channel control information from the 3GPP TS 04.21 frames to the V.24/X.21 interface circuits. The tests apply after synchronization has been completed.

### 29.2.2.4 Method of test

The Test shall be carried out for all user data rates supported by the MS (see below) and the circuits CT106 (V.24) (interface circuit bit X) and CT109 (V.24) (interface circuit bit SB) and I (X.21) (S-bits). The test shall be carried out only for those frame formats and circuits which are supported by the MS. The test is to be repeated for all circuits.

Let T(ON-OFF) and T(OFF-ON) be the timers to integrate the ON-OFF and the OFF-ON transition respectively for the circuit to be tested as stated in 3GPP TS 07.01, subclause 8.2.2.

#### Procedure:

- a) A data call shall be set up between the SS and the MS with a combination of BCIEs (see below) supported by the MS. The interface circuit bit(s) in the 3GPP TS 04.21 frame shall be set to OFF. The next step shall be entered 6 s after CT107 has been set to ON by the MS.

- b) The SS shall set the interface circuit bit(s) to continuously ON, wait half of T(OFF-ON) and then set the interface circuit bit(s) again to continuously OFF. The SS shall wait 6 s before entering the next step.
- c) The SS shall set the interface circuit bit(s) to continuously ON, wait twice T(OFF-ON) and then set the interface circuit bit(s) again to continuously OFF. The SS shall wait 6 s before entering the next step.
- d) The SS shall set interface circuit bit(s) to continuously ON and wait 6 s before entering the next step
- e) The SS shall set the interface circuit bit(s) to continuously OFF, wait half of T(ON-OFF) and then set the interface circuit bit(s) again to continuously ON. The SS shall wait 6 s before entering the next step.
- f) The SS shall set the interface circuit bit(s) to continuously OFF, wait twice T(ON-OFF) and then set the interface circuit bit(s) again to continuously ON. The SS shall wait 6 s before entering the next step.

#### 29.2.2.5 Test requirements

- 1) After step a) the interface circuit at the R-interface shall be OFF.
- 2) During step b) the interface circuit at the R-interface shall not change.
- 3) During step c) the interface circuit at the R-interface shall change to ON and then again to OFF.
- 4) After step d) the interface circuit at the R-interface shall be ON.
- 5) During step e) the interface circuit at the R-interface shall not change.
- 6) During step f) the interface circuit at the R-interface shall change to OFF and then again to ON.

#### 29.2.2.6 BCIE

The following combinations shall be considered (ref. 3GPP TS 07.01, annex 2):

- a) User Rate = 9,6 kbit/s;
- b) User Rate = 4,8 kbit/s;
- c) User Rate = 2,4 kbit/s;
- d) User Rate = 1,2 kbit/s;
- e) User Rate = 1 200/75 bit/s (only with asynchronous Bearer Services);
- f) User Rate = 300 bit/s (only with asynchronous Bearer Services).

The remaining parameters of the BCIE and the channel type (FR/HR) shall be set to a value supported by the MS.

### 29.2.3 Correct Terminal Compatibility Decision

#### 29.2.3.1 Negotiation of Radio Channel Requirement (RCR)

##### 29.2.3.1.1 Test purpose

To verify that the MS ignores the RCR field in a mobile terminating setup and negotiates according to its capabilities and to the service requested. A Dual Rate support MS shall accept the channel rate chosen by the network in the ASSIGNMENT COMMAND message.

##### 29.2.3.1.2 Initial conditions

For an MS with an external interface, the interface shall be setup in such a way that the MS is able to successfully receive the call for the service in question. The manufacturer shall state how this is done in a PIXIT statement. The same applies to features which must be activated by MMI before an incoming call can be accepted.

#### 29.2.3.1.3 Test method

- a) The SS transmits a SETUP message containing a BC-IE among those declared as supported by the MS and with the RCR field set to "01".
- b) The SS sends a ASSIGNMENT COMMAND message with a channel type set to "Full Rate" unless the CALL CONFIRM message indicates "dual rate mobile station/full rate preferred". In that case, the channel type is set to "Half Rate".
- c) The call is released and steps a) and b) are repeated with RCR field set to "00".
- d) The call is released and steps a) and b) are repeated with RCR field set to "10".
- e) The call is released and steps a) and b) are repeated with RCR field set to "11".

#### 29.2.3.1.4 Test requirements

- 1) After step a), the MS shall send a CALL CONFIRM message. If present, the BC-IE shall be coded according to 3GPP TS 07.01. If any other parameters than those listed below have different values than those of the BC-IE included in the SETUP, then the test shall be failed:
  - Number of stop bits, number of data bits, parity;
  - Connection Element, Structure, Intermediate rate, User Information Layer 2 Protocol, Modem Type, NIRR;
  - Radio Channel Requirement.
- 2) After step b), the MS shall answer to the ASSIGNMENT COMMAND message with an ASSIGNMENT COMPLETE message.

### 29.2.3.2 Negotiation of Connection Element (CE)

#### 29.2.3.2.1 Test purpose

To verify that the MS accepts a CE equal to "Both, Transparent Preferred" or "Both Non Transparent Preferred" and indicates its choice in the CALL CONFIRM message.

#### 29.2.3.2.2 Initial condition

For an MS with an external interface, the interface shall be setup in such a way that the MS is able to successfully receive the call for the service in question. The manufacturer shall state how this is done in a PIXIT statement. The same applies to features which must be activated by MMI before an incoming call can be accepted.

#### 29.2.3.2.3 Test method

- a) The SS transmits a SETUP message containing a BC-IE among those declared as supported by the MS and with the CE field set to "Both Transparent Preferred". The RCR parameter shall be set to "Full Rate". The UIL2P is not included (i.e. octet 7 is absent). The NIRR is set to "no meaning" (i.e. 0). The IR is set to "16 kbit/s". The modem type is any according to declared capabilities. The user rate is any according to declared capabilities and modem type.
- b) The call is released and step a) is repeated with CE field set to "Both Non Transparent Preferred".

#### 29.2.3.2.4 Test requirements

After step a), the MS shall send a CALL CONFIRM message. The BC-IE shall be present and shall be coded according to 3GPP TS 07.01 and shall correspond to a Bearer Service or Teleservice supported by the MS. The CE shall be set to either "Transparent" or "Non Transparent" If any other parameters than those listed bellow have different values than those of the BC-IE included in the SETUP, then the test shall be failed:

- number of stop bits, number of data bits, parity;
- Connection Element, Structure, Intermediate rate, User Information Layer 2 Protocol, Modem Type, NIRR;

- Radio Channel Requirement.

### 29.2.3.3 Negotiation of Number of Stop Bits, Number of Data bits, and Parity

#### 29.2.3.3.1 Test purpose

To verify that the MS accepts any value for the parameters Number of Stop Bits, Number of Data bits, and Parity in a mobile terminating Setup and negotiates according to its capabilities and to the service requested.

This test only applies to Mobile Stations supporting asynchronous services.

#### 29.2.3.3.2 Initial condition

For an MS with an external interface, the interface shall be setup in such a way that the MS is able to successfully receive the call for the service in question. The manufacturer shall state how this is done in a PIXIT statement. The same applies to features which must be activated by MMI before an incoming call can be accepted.

#### 29.2.3.3.3 Test method

- The SS transmits a SETUP message containing a BC-IE among those declared as supported by the MS and corresponding to an asynchronous Bearer Service, and with the Number of Stop Bits (NSB) field set to "1 bit", the Number of Data Bits (NDB) field set to "8 bits", and the Parity field set to "none".
- The call is released and step a) is repeated with the Number of Stop Bits (NSB) field set to "2 bit", the Number of Data Bits (NDB) field set to "7 bits", and the Parity field set to "odd".

#### 29.2.3.3.4 Test requirements

After steps a) and b), the MS shall send a CALL CONFIRMED message. If present, the BC-IE shall be coded according to 3GPP TS 07.01 and shall correspond to a Bearer Service supported by the MS. If any other parameters than those listed below have different values than those of the BC-IE included in the SETUP, then the test shall be failed:

- Number of stop bits, number of data bits, parity;
- Connection Element, Structure, Intermediate rate, User Information Layer 2 Protocol, Modem Type, NIRR;
- Radio Channel Requirement.

### 29.2.3.4 Negotiation of Modem Type

#### 29.2.3.4.1 Test purpose

To verify that the MS accepts the value "autobauding type 1" for the parameter Modem Type in a mobile terminating Setup and negotiates according to its capabilities and to the service requested.

This test only applies to Mobile Stations supporting non transparent services.

NOTE: It is not clear if the MS should also accept any possible value for the Modem Type field.

#### 29.2.3.4.2 Initial condition

For an MS with an external interface, the interface shall be setup in such a way that the MS is able to successfully receive the call for the service in question. The manufacturer shall state how this is done in a PIXIT statement. The same applies to features which must be activated by MMI before an incoming call can be accepted.

#### 29.2.3.4.3 Test method

- The SS transmits a SETUP message containing a BC-IE among those declared as supported by the MS and corresponding to a non transparent Bearer Service (the Connection Element field is coded "Non transparent"), and with the Modem Type field set to "autobauding type 1".

- b) The call is released and step a) is repeated with the same BC in the SETUP message, but with the Connection Element set to "both, non-transparent preferred".

#### 29.2.3.4.4 Test requirements

After steps a) and b), the MS shall send a CALL CONFIRMED message. If present, the BC-IE shall be coded according to 3GPP TS 07.01 and shall correspond to a Bearer Service or Teleservice supported by the MS. If any other parameters than those listed below have different values than those of the BC-IE included in the SETUP, then the test shall be failed:

- Number of stop bits, number of data bits, parity;
- Connection Element, Structure, Intermediate rate, User Information Layer 2 Protocol, Modem Type, NIRR;
- Radio Channel Requirement.

#### 29.2.3.5 Negotiation of Intermediate Rate

##### 29.2.3.5.1 Test purpose

To verify that the MS responds correctly to a request for a negotiation of the Intermediate Rate parameter in a mobile terminating Setup and negotiates according to its capabilities and to the service requested.

This test only applies to Mobile Stations supporting non transparent services with a full rate channel at a user rate of 4,8 kbit/s or lower.

NOTE: The MS may support these services with a 6 Kbit/s or (non exclusive) 12 Kbit/s radio interface rate.

##### 29,2,3.5.2 Initial condition

For an MS with an external interface, the interface shall be setup in such a way that the MS is able to successfully receive the call for the service in question. The manufacturer shall state how this is done in a PIXIT statement. The same applies to features which must be activated by MMI before an incoming call can be accepted.

##### 29.2.3.5.3 Test method

- a) The SS transmits a SETUP message containing a BC-IE among those declared as supported by the MS and corresponding to a non transparent Bearer Service (the Connection Element field is coded "Non transparent") with the user rate lower to or equal 4,8 kbit/s, and with the NIRR field set to "No meaning". The RCR field is set to "full rate", and the Intermediate Rate field is set to "16 kbit/s".
- b) The call is released and step a) is repeated with the same BC in the SETUP message, but with the Connection Element set to "both, non-transparent preferred".
- c) The call is released and steps a) and b) are repeated with the NIRR field of the SETUP message set to "6 kbit/s".

##### 29.2.3.5.4 Test requirements

- 1) After steps a), b) and c), the MS shall send a CALL CONFIRMED message. If present, the BC-IE shall be coded according to 3GPP TS 07.01 and shall correspond to a Bearer Service or Teleservice supported by the MS. If any other parameters than those listed below have different values than those of the BC-IE included in the SETUP, then the test shall be failed:
  - Number of stop bits, number of data bits, parity;
  - Connection Element, Structure, Intermediate rate, User Information Layer 2 Protocol, Modem Type, NIRR;
  - Radio Channel Requirement.
- 2) If the BC-IE is present in the CALL CONFIRMED message after step c) and if the Connection Element field contains the value "non transparent", the Intermediate Rate field shall indicate:
  - 8 kbit/s if the NIRR field is set to "6 kbit/s";

- 16 kbit/s if the NIRR field is set to "no meaning".

### 29.2.3.6 Negotiation of User Information Layer 2 Protocol

#### 29.2.3.6.1 Test purpose

To verify that the MS accepts any value (including the absence of) the UIL2P parameter in a mobile terminating Setup and negotiates according to its capabilities and to the service requested.

This test only applies to Mobile Stations supporting asynchronous bearer services in non transparent mode.

#### 29.2.3.6.2 Initial condition

For an MS with an external interface, the interface shall be setup in such a way that the MS is able to successfully receive the call for the service in question. The manufacturer shall state how this is done in a PIXIT statement. The same applies to features which must be activated by MMI before an incoming call can be accepted.

#### 29.2.3.6.3 Test method

- The SS transmits a SETUP message containing a BC-IE among those declared as supported by the MS and corresponding to a non transparent Bearer Service (the Connection Element field is coded "Non transparent") and with no UIL2P parameter (i.e. octet 7 of the BC IE is absent).
- The call is released and step a) is repeated with the same BC in the SETUP message, but with the value "ISO6429, codeset 0 (DC1/DC3)" in the UIL2P parameter.
- The call is released and step b) is repeated with the same BC in the SETUP message, but with the value "COPnoFLCt" in the UIL2P parameter.
- The call is released and steps a), b) and c) are repeated with the same BC in the SETUP message, but with the Connection Element set to "both, non-transparent preferred".

#### 29.2.3.6.4 Test requirements

- After steps a), b) and c), the MS shall send a CALL CONFIRMED message. If present, the BC-IE shall be coded according to 3GPP TS 07.01 and shall correspond to a Bearer Service or Teleservice supported by the MS. If any other parameters than those listed below have different values than those of the BC-IE included in the SETUP, then the test shall be failed:
  - Number of stop bits, number of data bits, parity;
  - Connection Element, Structure, Intermediate rate, User Information Layer 2 Protocol, Modem Type, NIRR;
  - Radio Channel Requirement.
- If the BC-IE is present in the CALL CONFIRMED message, and if the Connection Element is set to "transparent", octet 7 (containing the UIL2P parameter) shall be absent.

### 29.2.3.7 Negotiation between TS 61 and TS 62: Mobile Originated call

#### 29.2.3.7.1 Test purpose

To verify that the MS accepts a negotiation from TS 61 to TS 62.

This test only applies to Mobile Stations supporting TS 61.

#### 29.2.3.7.2 Initial condition

For an MS with an external interface, the interface shall be setup in such a way that the MS is able to successfully set up a call for TS 61. The manufacturer shall state how this is done in a PIXIT statement. The same applies to features which must be activated by MMI before an outgoing call can be set up.

#### 29.2.3.7.3 Test method

- a) The MS is made to set up a call for TS 61. If the MS supports it, the first phase of the call is speech.
- b) The SS responds to the SETUP message with a CALL PROCEEDING message containing a BC-IE coded according to 3GPP TS 07.01 and corresponding to TS 62.
- c) The SS sends an ALERTING message followed by a CONNECT message.
- d) If the MS supports it, steps a), b) and c) are repeated with a call setup for TS 61 with the first phase of the call being fax.

#### 29.2.3.7.4 Test requirements

- 1) After step b), the MS shall accept the call (i.e. it shall not reject the call with a DISCONNECT message).
- 2) After step c), the MS shall answer with a CONNECT ACKNOWLEDGE message.

### 29.2.3.8 Negotiation between TS 61 and TS 62: Mobile Terminated call

#### 29.2.3.8.1 Test purpose

To verify that an MS that does not support TS 61 accepts a Mobile Terminated call setup request for TS 61 and negotiates the demand to TS 62.

This test only applies to Mobile Stations supporting TS 62 and not supporting TS 61.

#### 29.2.3.8.2 Initial condition

For an MS with an external interface, the interface shall be setup in such a way that the MS is able to successfully receive the call for the service in question. The manufacturer shall state how this is done in a PIXIT statement. The same applies to features which must be activated by MMI before an incoming call can be accepted.

#### 29.2.3.8.3 Test method

- a) The SS transmits a SETUP message containing two BC-IEs: the first BC shall indicate speech, the second BC shall indicate fax group 3.
- b) The call is released, and the SS transmits a SETUP message containing two BC-IEs: the first BC shall indicate fax group 3, the second BC shall indicate speech.

#### 29.2.3.8.4 Test requirements

After steps a) and b), the MS shall send a CALL CONFIRMED message with one and only one BC-IE. The BC-IE shall be coded according to 3GPP TS 07.01 and shall correspond to TS 62.

## 29.2.4 Data Rate Adaptation for Synchronous Transparent Bearer Capabilities

#### 29.2.4.1 Definition and applicability

This test is applicable to the MT2 configuration and, in a restricted way, to other configurations where the MS is able to send data over the Um-interface.

#### 29.2.4.2 Conformance requirement

An MS supporting synchronous transparent bearer capabilities shall perform data rate adaptation and support the frames at the Um-interface according to the following specifications:

1. 3GPP TS 04.21, clauses 5 and 7.

#### 29.2.4.3 Test purpose

The purpose of these tests is to verify:

- that the format and the data bits of the 3GPP TS 04.21 frames sent by the MS are consistent with the data input and data rate at the R-interface; and
- that the data bits output by the MS at the R-interface are consistent with the received 3GPP TS 04.21 frames.

#### 29.2.4.4 Method of test

The Test shall be carried out for all possible user data rates which are supported by the MS (see below). In case of an MT2 configuration, the interface circuits CT105 and CT108 shall be set to the ON condition from the start.

Procedure:

- a) A data call shall be set up between the SS and the MS with a BCIE (see below) supported by the MS. The next step shall be entered immediately after TCH synchronization has been completed at the SS side.
- b) The interface circuit bit(s) in the 3GPP TS 04.21 frame shall be set to ON and the SS shall start to transmit pseudo random data bits in the 3GPP TS 04.21 frames over the Um-interface to the MS.
- c) MT2 configuration: The SS shall input pseudo random data over the R-interface of the MS.  
MT0 configuration: the transmission of data from the MS over the Um-interface shall be stimulated (if it does not start automatically).
- d) Approximately 5 s after the data have been received by the SS over the Um-interface the test shall be stopped.

#### 29.2.4.5 Test requirements

- 1) During the test no 3GPP TS 04.21 frame with incorrect format (i.e. format not compliant to 3GPP TS 04.21 (see conformance requirement) or not corresponding to the user data rate currently under test) shall have been received by the SS.
- 2) Only MT2 configuration: the user data stream input to the R-interface shall match bit-exactly the user data stream sent to the SS over the Um-interface and the user data stream output from the R-interface shall match bit-exactly the user data stream sent by the SS over the Um-interface.

#### 29.2.4.6 BCIE

The following combinations shall be considered (ref. 3GPP TS 07.01, annex 2):

- a) User Rate = 9,6 kbit/s;
- b) User Rate = 4,8 kbit/s;
- c) User Rate = 2,4 kbit/s;
- d) User Rate = 1,2 kbit/s.

The remaining parameters of the BCIE and the channel type (FR/HR) shall be set to a value supported by the MS.

### 29.2.5 Network Independent Clocking

For further study.

## 29.2.6 Asynchronous Transparent Bearer Capabilities

### 29.2.6.1 Data Rate Adaptation

#### 29.2.6.1.1 Definition and applicability

This test is applicable to the MT2 configuration and, in a restricted way, to the MT0 configuration where the MS is able to send data over the Um-interface and to use the Bearer Services for asynchronous data.

#### 29.2.6.1.2 Conformance requirement

An MS supporting asynchronous transparent bearer capabilities shall perform data rate adaptation and support the frames at the Um-interface according to the following specifications:

1. 3GPP TS 04.21, subclauses 4.1 and 4.4, clauses 5 and 7.

#### 29.2.6.1.3 Test purpose

The purpose of these tests is to verify the conversion between an asynchronous data stream at the R-interface and the 3GPP TS 04.21 frames at the Um-interface.

#### 29.2.6.1.4 Method of test

The Test shall be carried out for all possible user data rates which are supported by the MS in asynchronous mode (see below).

#### Procedure:

- a) A data call shall be set up between the SS and the MS with a BCIE (see below) supported by the MS. The next step shall be entered immediately after TCH synchronization has been completed at the SS side.
- b) The interface circuit bit(s) in the 3GPP TS 04.21 frame shall be set to ON and the SS shall start to transmit pseudo random characters as described below to the MS.
- c) MT2 configuration: The SS shall input pseudo random characters as described below over the R-interface to the MS.

MT0 configuration: the transmission of data from the MS over the Um-interface shall be stimulated (if it does not start automatically).

- d) Approximately 5 s after the data have been received by the SS over the Um-interface the test shall be stopped.

#### 29.2.6.1.5 Test requirements

- 1) During the test no 3GPP TS 04.21 frame with incorrect format (i.e. format not compliant to 3GPP TS 04.21 (see conformance requirement) or not corresponding to the user data rate currently under test) shall have been received by the SS.
- 2) MT2 configuration only: the user data stream input to the R-interface shall match character by character the user data stream sent to the SS over the Um-interface and the user data streams output from the R-interface shall match character by character the user data stream sent by the SS over the Um-interface.

#### 29.2.6.1.6 Generation of the asynchronous pseudo random characters

#### Downlink direction:

The 3GPP TS 04.21 frames shall contain a bit stream which consists of repeating:

- a character which is generated pseudo randomly every time;
- n stop bits, where n is drawn pseudo randomly from the interval 1..15 every time.

Uplink direction:

The data stream at the R-interface consists of repeating:

- a character which is generated pseudo randomly every time;
- 1 stop bit;
- $1,13 \pm 1$  % bit frames (i.e.  $1/\text{nominal data rate}$ ) of stop polarity.

#### 29.2.6.1.7 BCIE

Same as subclause 29.2.3.

The Number of Data Bits per character (excl. parity) shall be 8. No parity bit shall be used. The Number of Stop Bits shall be 1. If the MS does not support these values different ones shall be chosen.

The remaining parameters of the BCIE shall and the channel type (FR/HR) be set to a value supported by the MS.

### 29.2.6.2 Passage of the Break Signal

#### 29.2.6.2.1 Definition and applicability

This test is applicable to the MT2 configuration only.

#### 29.2.6.2.2 Conformance requirement

An MS supporting asynchronous transparent bearer capabilities shall perform passage of the break signal in uplink and downlink direction according to:

1. 3GPP TS 04.21, subclauses 4.1, 4.2 and 4.4, clauses 5 and 7.

#### 29.2.6.2.3 Test purpose

The purpose of these tests is to verify the ability of the MS to transfer a Break Signal to the R-interface and vice versa.

#### 29.2.6.2.4 Method of test

The Test shall be carried out for all possible user data rates which are supported by the MS in asynchronous mode (see below).

Procedure:

- a) A data call shall be set up between the SS and the MS with a BCIE (see below) supported by the MS. The next step shall be entered immediately after TCH synchronization has been completed at the SS side.
- b) The interface circuit bit(s) in the 3GPP TS 04.21 frame shall be set to ON.
- c) The SS shall send pseudo random characters with start and stop bit(s) (as selected by the BCIE) in the 3GPP TS 04.21 frames to the MS for approximately 5 s. Then it shall send the following bit sequence in the 3GPP TS 04.21 frames:
  - $2M+3$  bits of start polarity;
  - $2M$  bits of stop polarity.

d) The SS shall send pseudo random characters with start and stop bit(s) (as selected by the BCIE) in the 3GPP TS 04.21 frames to the MS for approximately 2 s. Then it shall send the following bit sequence in the 3GPP TS 04.21 frames:

- for 1 s bits of start polarity;
- 2M bits of stop polarity,

where M is as defined in 3GPP TS 04.21, subclause 4.2, and then again pseudo random characters as above.

e) The SS shall input pseudo random characters with start and stop bit(s) (as selected by the BCIE) over the R-interface to the MS for approximately 2 s. Then it shall input the following bit sequence to the R-interface:

- M bits of start polarity;
- 2M bits of stop polarity.

f) The SS shall input pseudo random characters with start and stop bit(s) (as selected by the BCIE) over the R-interface to the MS for approximately 2 s. Then it shall input the following bit sequence to the R-interface:

- for 1 s bits of start polarity;
- 2M bits of stop polarity,

where M is as defined in 3GPP TS 04.21, subclause 4.2, and then again pseudo random characters as above.

g) the test shall be stopped 2 s later.

#### 29.2.6.2.5 Test requirements

- 1) During the test no 3GPP TS 04.21 frame with incorrect format (i.e. format not compliant to 3GPP TS 04.21 (see conformance requirement) or not corresponding to the user data rate currently under test) shall have been received by the SS.
- 2) The user data stream sent over the Um-interface by the SS shall match character by character the user data stream output at the R-interface.
- 3) The two Break Signals shall be detectable at the R-interface between the same characters as having been sent.
- 4) The user data stream received over the Um-interface by the SS shall match character by character the user data stream input at the R-interface.
- 5) The two Break Signals shall be detectable at the Um-interface between the same characters as having been input.

#### 29.2.6.2.6 BCIE

Same as subclause 29.2.2.6.

### 29.2.6.3 Overspeed/Underspeed Handling (Local Terminal)

#### 29.2.6.3.1 Definition and applicability

This test is applicable to the MT2 configuration only.

#### 29.2.6.3.2 Conformance requirement

An MS supporting asynchronous transparent bearer capabilities shall handle overspeed and underspeed of the local terminal according to:

1. 3GPP TS 04.21, subclauses 4.1, 4.3 and 4.4, clauses 5 and 7.

### 29.2.6.3.3 Test purpose

The purpose of these tests is to verify the ability of the MS to deal with plesiosynchronous bit clocks in the MS and the TE in case of asynchronous Bearer Capabilities.

### 29.2.6.3.4 Method of test

The Test shall be carried out for all possible user data rates supported by the MS in asynchronous mode (see below).

#### Procedure:

- a) A data call shall be set up between the SS and the MS with a BCIE (see below) supported by the MS. The next step shall be entered immediately after CT107 has been set to on by the MS.
- b) The interface circuit bit(s) in the 3GPP TS 04.21 frame shall be set to ON.
- c) The SS shall input continuously pseudo random characters with a bit clock of:
  - nominal user data rate +2,5 % bit/s in case of less than 600 bit/s user data rate;
  - nominal user data rate +1 % in the other cases.(ref. 3GPP TS 04.21, subclause 4.3) to the R-interface of the MS for approximately 5 s.
- d) The SS shall input continuously pseudo random characters with a bit clock of nominal user rate -2,5 % (ref. ITU-T Recommendation V.14, clause 3) to the R-interface of the MS for approximately 5 s.
- e) The test shall be stopped.

### 29.2.6.3.5 Test requirements

- 1) During the test no 3GPP TS 04.21 frame with incorrect format (i.e. format not compliant to 3GPP TS 04.21 (see conformance requirement) or not corresponding to the user data rate currently under test) shall have been received by the SS.
- 2) The user data stream input to the R-interface shall match character by character the user data stream sent to the SS over the Um-interface.

### 29.2.6.3.6 BCIE

Same as subclause 29.2.2.6.

The Number of Data Bits per character (excl. parity) shall be 8. No parity bit shall be used. The Number of Stop Bits shall be 1. If the MS does not support these values different ones shall be chosen.

The remaining parameters of the BCIE and the channel type (FR/HR) shall be set to a value supported by the MS.

## 29.2.6.4 Overspeed/Underspeed Handling (Remote Terminal)

### 29.2.6.4.1 Definition and applicability

This test is applicable to the MT2 configuration only.

### 29.2.6.4.2 Conformance requirement

An MS supporting asynchronous transparent bearer capabilities shall handle overspeed and underspeed of the remote terminal (which shows in the structure of the 3GPP TS 04.21 frames received over the Um-interface) according to:

1. 3GPP TS 04.21, subclauses 4.1, 4.3 and 4.4, clauses 5 and 7.

#### 29.2.6.4.3 Test purpose

The purpose of these tests is to verify the ability of the MS to deal with plesiosynchronous bit clocks in the MS and the remote Terminal in case of asynchronous Bearer Capabilities.

The case of underspeed is covered by subclause 29.6.1. The case of overspeed shall be tested as follows.

#### 29.2.6.4.4 Method of test

The Test shall be carried out for all possible user data rates supported by the MS in asynchronous mode (see below).

Procedure:

- a) A data call shall be set up between the SS and the MS with a BCIE (see below) supported by the MS. The next step shall be entered immediately after CT107 has been set to on by the MS.
- b) The interface circuit bit(s) in the 3GPP TS 04.21 frame shall be set to ON.
- c) The SS shall start sending pseudo random characters in the 3GPP TS 04.21 frames over the Um-interface with minimal number of stop bits between the characters and where one stop bit is omitted every 8th character.
- e) The test shall be stopped 5 s later.

#### 29.2.6.4.5 Test requirements

- 1) During the test no 3GPP TS 04.21 frame with incorrect format (i.e. format not compliant to 3GPP TS 04.21 (see conformance requirement) or not corresponding to the user data rate currently under test) shall have been received by the SS.
- 2) The user data stream sent by the SS over the Um-interface shall match character by character the user data stream sent by the MS over the R-interface.

#### 29.2.6.4.6 BCIE

Same as subclause 29.2.6.3.6.

### 29.2.7 Interchange circuit mapping for transparent bearer capabilities

#### 29.2.7.1 Definition and applicability

This test is applicable to the MT2 configuration only. However, it cannot be applied fully to MSs which support e.g.:

- CT108/2 for releasing the call (e.g. support of ITU-T Recommendation V.25bis) and/or
- similar use of the circuit C for ITU-T Recommendation X.21.

Therefore the test shall be applied only for those interchange circuits which do not influence Layer 3 signalling.

In case of circuit C the X.21-byte timing circuit B shall not be used.

#### 29.2.7.2 Conformance requirement

- 1) An MS supporting transparent bearer capabilities with a V-series R-interface shall map the interchange circuits CT105 and CT108/2 to the 3GPP TS 04.21 frames sent over the Um-interface according to:
  - 1.1 3GPP TS 04.21, subclauses 4.1 and 4.4, clauses 5 and 7.
  - 1.2 3GPP TS 07.02, subclause 3.2.1.

- 2) An MS supporting transparent bearer capabilities with an X-series R-interface shall map the interchange circuit C to the 3GPP TS 04.21 frames sent over the Um-interface according to:

2.1 3GPP TS 04.21, subclauses 4.1 and 4.4, clauses 5 and 7.

2.2 3GPP TS 07.03, subclauses 4.2.1 and 4.2.2.

#### 29.2.7.3 Test purpose

The purpose of these tests is to verify the ability of the MS to correctly convey changes of the interface circuits at the R-interface to the 3GPP TS 04.21 frame sent over the Um-interface in case of Transparent Bearer Capabilities.

#### 29.2.7.4 Method of test

The Test shall be carried out for all user data rates supported by the MS (see below) and the circuits CT105 and CT108/2 (ITU-T Recommendation V.24) and C (ITU-T Recommendation X.21). The test shall be carried out only for those frame formats and circuits which are supported by the MS (exceptions see above).

#### Procedure:

- a) A data call shall be set up between the SS and the MS with a BCIE (see below) supported by the MS. The next step shall be entered immediately after CT107 has been set to ON by the MS.
- b) The interface circuit bit(s) in the 3GPP TS 04.21 frame shall be set to ON and the SS shall input continuously pseudo random data to the R-interface during the following steps. The SS shall wait for approximately 1 s before entering the next step.
- c) The SS shall set the interchange circuit at the R-interface to OFF and wait for 2 s.
- d) The SS shall again set the interchange circuit at the R-interface to ON.
- e) After further 2 s the test shall be stopped.

#### 29.2.7.5 Test requirements

- 1) During the test no 3GPP TS 04.21 frame with incorrect format (i.e. format not compliant to 3GPP TS 04.21 (see conformance requirement) or not corresponding to the user data rate currently under test) shall have been received by the SS.
- 2) The change of the interchange circuit signal level shall be indicated in the 3GPP TS 04.21 frames as required by 3GPP TS 04.21 and ITU-T Recommendation V.110 (i.e. OFF state shall start and end in the correct 3GPP TS 04.21 frame).

#### 29.2.7.6 BCIE

Same as subclause 29.2.2.5.

## 29.3 Testing of non transparent data services (RLP tests)

SS sends NULL (C/R=0, P/F=0) frames when it has nothing else to send in ADM mode.

SS does not use DTX if not explicitly indicated in the test and sends supervisory RR (C/R=0, P/F=0) frames when it has nothing else to send in ABM mode. N(R) is equal to N(R) of the previous frame. For the first frame N(R)=0.

The information field of the Supervisory frames sent by the SS is fully coded with "1".

The tolerance on timers or delays is  $\pm 10\%$ .

The SS will check FSI (Frame Start Identifier) alignment in all received RLP frames. The information field of the Supervisory frames sent by the MS is never verified.

The SABM-UA exchange for RLP link establishment is initiated by the MS.

Immediately upon RLP link connection, the MS may send an I+S frame containing updated status bits SA, SB and X and the SS must send it.

## 29.3.1 Initialization

### 29.3.1.1 Normal initialization done by the MS

#### 29.3.1.1.1 Test purpose

To test the normal establishment of multiple frame operation between the SS and the MS.

This test is performed twice for testing MO and MT data calls:

#### 29.3.1.1.2 Method of test

##### Initial Conditions

##### System Simulator:

The SS is configured to use default RLP parameters.

##### Mobile Station:

The MS is configured to use default RLP parameters.

##### MO data call:

The MS is made to establish a MO non transparent data call, so that the initial conditions are that the MS is in call state U10 ("Call Active") after having sent a CONNECT ACKNOWLEDGE message.

##### MT data call:

The SS establishes a MT non transparent data call, so that the initial conditions are that the MS is in call state U10 ("Call Active") after having received a CONNECT ACKNOWLEDGE message from the SS.

Case a: No negotiation will be initiated by the MS.

Case b: The MS initiates negotiation of RLP default parameters.

**NOTE:** The MS is allowed to initiate the negotiation of the RLP default parameters, within allowed ranges, defined in 3GPP TS 04.22. The MS shall do this in the ADM, after having sent a CONNECT ACKNOWLEDGE message (MO-case) or after having received a CONNECT ACKNOWLEDGE message from the SS (MT-case). The SS shall accept and use the new RLP parameters till the end of the test.

##### Procedure

The MS shall send a SABM frame.

The SS responds with a correct UA frame (within T1).

The SS waits for  $2 \cdot T1$  after the UA to ensure the SABM frame is not repeated. This confirms that the UA has been received.

The MS shall be in ABM mode. After optional status bits exchange between the MS and the SS, this is verified by sending an I + S frame and waiting for the acknowledgement from the MS.

The MS is returned to the idle state by clearing the call.

Expected sequence

The frames from the SS will be:

2: One UA frame containing:

R=0, F=1.

3: One correct I+S frame in a RR frame with N(S)=0.

### 29.3.1.1.3 Test requirements

The frames from the MS shall be:

1: One SABM frame containing:

C=1, P=1.

The SABM shall not be repeated.

4: One S or I+S frame with N(R)=1 acknowledging the I+S frame.

### 29.3.1.2 Initialization failure

#### 29.3.1.2.1 Loss of UA frame

##### 29.3.1.2.1.1 Test purpose

To test the MS response to the loss of an UA frame during initialization.

##### 29.3.1.2.1.2 Method of test

#### Initial Conditions

System Simulator:

The SS is configured to use default RLP parameters.

Mobile Station:

The MS is configured to use default RLP parameters. The MS is made to establish a MO non transparent data call so that the initial conditions are that the MS is in call state U10 ("Call Active") after having sent a CONNECT ACKNOWLEDGE message.

Case a: No negotiation will be initiated by the MS.

Case b: The MS initiates negotiation of RLP default parameters.

NOTE: The MS is allowed to initiate the negotiation of the RLP default parameters, within allowed ranges, defined in 3GPP TS 04.22. The MS shall do this in the ADM, after having sent a CONNECT ACKNOWLEDGE message (MO-case) or after having received a CONNECT ACKNOWLEDGE message from the SS (MT-case). The SS shall accept and use the new RLP parameters till the end of the test.

### Procedure

The MS shall send an SABM frame.

The SS ignores the first SABM frame from the MS.

The MS shall wait for time-out of timer T1 and then send a second SABM frame.

The SS responds to the second SABM frame with an UA frame (within T1).

The MS enters in ABM mode. After optional status bits exchange between the MS and the SS, this is verified by sending an I+S frame and waiting for the acknowledgement from the MS.

The MS is returned to the idle state by clearing the call.

### Expected sequence

The frames from the SS will be:

3: One UA frame containing:

R=0, F=1.

within T1 after the second SABM.

4: One correct I+S frame in a RR frame with N(S)=0.

#### 29.3.1.2.1.3 Test requirements

The frames from the MS shall be:

1, 2: One SABM frame containing:

C=1, P=1.

The second SABM frame shall follow the first SABM frame after time-out of timer T1.

5: One S or I+S frame with N(R)=1 acknowledging the I+S frame.

#### 29.3.1.2.2 Total loss of UA frame

##### 29.3.1.2.2.1 Test purpose

To test the MS response to a total loss of UA frame during initialization.

29.3.1.2.2.2 Method of test

Initial Conditions

System Simulator:

The SS is configured to use default RLP parameters.

Mobile Station:

The MS is configured to use default RLP parameters.

The MS is made to establish a MO non transparent data call so that the initial conditions are that the MS is in call state U10 ("Call Active") after having sent a CONNECT ACKNOWLEDGE message.

Case a: No negotiation will be initiated by the MS.

Case b: The MS initiates negotiation of RLP default parameters.

NOTE: The MS is allowed to initiate the negotiation of the RLP default parameters, within allowed ranges, defined in 3GPP TS 04.22. The MS shall do this in the ADM, after having sent a CONNECT ACKNOWLEDGE message (MO-case) or after having received a CONNECT ACKNOWLEDGE message from the SS (MT-case). The SS shall accept and use the new RLP parameters till the end of the test.

Procedure

The MS shall send an SABM frame.

The SS ignores the SABM frame from the MS.

The MS shall wait for time-out of timer T1 and then send a new SABM frame.

The SS ignores the SABM frame sent by the MS. These 2 last steps are repeated N2 times.

The SS waits for 2 \* T1 to ensure the SABM frame is not repeated.

The MS shall not enter in ABM mode. This is verified by sending an I+S frame. The MS shall ignore this frame.

The MS is returned to the idle state by clearing the call.

Expected sequence:

The frames from the SS will be:

8: One correct I+S frame in a RR frame containing with N(S)=0.

29.3.1.2.2.3 Test requirements:

The frames from the MS shall be:

1, .... N2: One SABM frame containing:

C=1, P=1.

An SABM frame follows the previous one after time-out of timer T1.

## 29.3.2 Data transfer

### 29.3.2.1 Default conditions

The initial conditions are that the MS is in call state U10 ("Call Active") and in RLP ABM mode.

During the synchronization of the traffic channel, the MS and the SS have transmitted I+S frames. Unless, other indication in the test, each test of this subclause will begin in the following conditions:

- the MS has previously sent I+S frames numbered  $N(S)=0, \dots, NMS-1 \text{ mod}(62)$  and has previously sent a frame containing  $N(R) = NSS \text{ mod}(62)$ ;
- the SS has previously sent I+S frames numbered  $N(S)=0, \dots, NSS-1 \text{ mod}(62)$  and has previously sent a frame containing  $N(R) = NMS \text{ mod}(62)$ .

The first I+S frame that an MS will send in a test will be numbered  $N(S)= NMS$  and the first I+S frame that the SS will send will be numbered NSS.

### 29.3.2.2 MS sends I+S frames

#### 29.3.2.2.1 N(S) sequence number

##### 29.3.2.2.1.1 Test purpose

To test the correct handling of the N(S) sequence number.

##### 29.3.2.2.1.2 Method of test

#### Initial Conditions

##### System Simulator:

The SS is configured to use default RLP parameters.

##### Mobile Station:

The MS is configured to use RLP default parameters except the window size from MS to IWF (SS), called KMI.

A non transparent data call will be established, so that the MS is in call state U10 ("Call Active").

Since some RLP parameters are different from the default parameters, a negotiation procedure will be initiated by the MS after the CONNECKT ACKNOWLEDGE message. The MS may negotiate the RLP default parameters within allowed ranges, defined in 3GPP TS 04.22, except the window size from MS to IWF (SS), called KMI, which has to be a non default value.

The SS shall accept and use the new RLP parameters till the end of the test.

After the negotiation procedure the ABM will be entered. This test is performed twice with 2 different values of KMI, randomly chosen.

#### Procedure

After optional status bits exchange between the MS and the SS, the MS is made to send continuously I+S frames (more than  $2*64$  frames). The MS shall send I+S frames with N(S) incremented by  $1 \text{ mod}(62)$  in each frame.

The SS acknowledges the I+S frames in RR frame in sequence.

The MS is returned to the idle state by clearing the call.

Expected sequence

The frames from the SS will be:

0',...,i': One supervisory RR frame containing:

$$N(R) = NMS+1, \dots, NMS+i+1 \text{ mod}(62).$$

#### 29.3.2.2.1.3 Test requirements

The frames from the MS shall be:

0, ..., i: One I+S frame containing:

$$N(S) = NMS, \dots, NMS+i \text{ mod}(62)$$

#### 29.3.2.2.2 Transmission window

##### 29.3.2.2.2.1 Test purpose

To test the correct handling of the transmission window.

##### 29.3.2.2.2.2 Method of test

#### Initial Conditions

System Simulator:

The SS is configured to use default RLP parameters.

Mobile Station:

The MS is configured to use RLP default parameters except the window size from MS to IWF (SS), called KMI.

A non transparent data call will be established, so that the MS is in call state U10 ("Call Active").

Since some RLP parameters are different from the default parameters, a negotiation procedure will be initiated by the MS after the CONNECKT ACKNOWLEDGE message. The MS may negotiate the RLP default parameters within allowed ranges, defined in 3GPP TS 04.22, except the window size from MS to IWF (SS), called KMI, which has to be a non default value.

The SS shall accept and use the new RLP parameters till the end of the test.

After the negotiation procedure the ABM will be entered.

This test is performed twice with 2 different values of KMI, randomly chosen.

#### Procedure

The MS is made to send continuously I+S frames with a delay inferior to T1 between each frame.

The SS does not acknowledge the first KMI frames.

The MS stops sending I+S frames after having sent KMI frames, due to the window size.

The SS waits for  $0,5 * T1$  after the last frame of the sequence ( $N(S) = NMS + KMI - 1$ ) to acknowledge the first  $j$  frames, with  $j < KMI$ .

The MS shall transmit  $j$  new I+S frames and stop sending I+S frames after having sent them, due to the window size.

The SS waits for  $0,5 * T1$  after the last frame of the sequence ( $N(S) = NMS + KMI - 1 + j \text{ mod } (62)$ ) to acknowledge all frames transmitted by the MS.

The MS shall transmit all the following I+S frames.

The SS acknowledges the I+S frames sequentially (i.e. 1 after 1).

The MS is returned to the idle state by clearing the call.

Expected sequence

The frames from the SS will be:

0',...,i-1': One RR frame containing:

$$N(R) = NMS \text{ mod } (62).$$

i': One RR frame containing:

$$N(R) = NMS + j \text{ mod } (62) \text{ with } j < KMI,$$

after a delay of  $0,5 * T1$  after the last received I+S frame.

i+1',...,n-1': One RR frame containing:

$$N(R) = NMS + j \text{ mod } (62).$$

n': One RR frame containing:

$$N(R) = NMS + KMI + j \text{ mod}(62),$$

after a delay of  $0,5 * T1$  after the last received I+S frame.

n+1', n+2',...: One RR frame containing:

$$N(R) = NMS + KMI + j + 1, NMS + KMI + j + 2, \dots \text{ mod}(62).$$

### 29.3.2.2.2.3 Test requirements

The frames from the MS shall be:

0,...,KMI-1: One I+S frame containing:

$$N(S) = NMS, \dots, NMS + KMI - 1 \text{ mod}(62).$$

MS stops sending I+S frames until reception of an acknowledgement of at least one I+S frame.

KMI,...,i: One S frame.

i+1,...,i+j: One I+S frame containing:

$$N(S) = NMS + KMI, \dots, NMS + KMI + j - 1 \text{ mod}(62).$$

MS stops sending I+S frames until reception of an acknowledgement of at least one I+S frame.

i+j+1,...,n: One S frame.

n+1,n+2...: One I+S frame containing:

$$N(S) = NMS + KMI + j, NMS + KMI + j + 1, \dots \text{ mod}(62).$$

### 29.3.2.2.3 Busy condition

#### 29.3.2.2.3.1 Test purpose

To test the correct handling of a RNR frame received.

#### 29.3.2.2.3.2 Method of test

##### Initial Conditions

System Simulator:

The SS is configured to use default RLP parameters.

Mobile Station:

The MS is configured to use default RLP parameters.

A non transparent data call will be established, so that the MS is in call state U10 ("Call Active").

Case a: No negotiation will be initiated by the MS.

Case b: The MS initiates negotiation of RLP default parameters.

**NOTE:** The MS is allowed to initiate the negotiation of the RLP default parameters, within allowed ranges, defined in 3GPP TS 04.22. The MS shall do this in the ADM, after having sent a CONNECT ACKNOWLEDGE message (MO-case) or after having received a CONNECT ACKNOWLEDGE message from the SS (MT-case). The SS shall accept and use the new RLP parameters till the end of the test.

The ABM will be entered.

#### Procedure

The MS is made to send continuously I+S frames.

The SS acknowledges the received I+S frames in supervisory RR frames. After 1 second it acknowledged the received I+S frames in supervisory RNR frames.

After the first RNR frame, the MS shall stop sending I+S frames and shall start sending supervisory frames within T2.

After 1 second receiving supervisory frames, the SS sends RR frames instead of RNR.

After the first RR frame, the MS will restart the transmission of I+S frames within T2.

The MS is returned to the idle state by clearing the call.

#### Expected sequence

| MS                                    | SS |
|---------------------------------------|----|
| 0 -----I+S----->                      |    |
| <-----RR-----0'                       |    |
| ...-----etc...----->                  |    |
| i-1-----I+S----->                     |    |
| <-----RR-----i-1'                     |    |
| i-----I+S----->                       |    |
| <-----RNR-----i'                      |    |
| stops sending I+S frames within T2    |    |
| i+1-----S----->                       |    |
| <-----RNR-----i+1'                    |    |
| ...-----etc...----->                  |    |
| n+i-1-----S----->                     |    |
| <-----RNR-----n+i-1'                  |    |
| n+i-----S----->                       |    |
| <-----RR-----n+i'                     |    |
| restarts sending I+S frames within T2 |    |
| n+i+1-----I+S----->                   |    |
| <-----RR-----n+i+1'                   |    |
| ...-----etc...----->                  |    |

The frames from the SS will be:

0',...,i-1': One RR frame containing:

$$N(R)=NMS+1,\dots,NMS+i \bmod(62).$$

i',...,n+i-1': One RNR frame containing:

$$N(R)=NMS+i+1 \bmod(62).$$

n+i': One RR frame containing:

$$N(R)=NMS+i+1 \bmod(62).$$

n+i+1',n+i+2',...: One RR frame containing:

$$N(R)=NMS+i+2,NMS+i+3,\dots \bmod(62).$$

#### 29.3.2.2.3.3 Test requirements

The frames from the MS shall be:

0',...,i: One I+S frame containing:

$$N(S)=NMS,\dots,NMS+i \bmod(62).$$

MS stops sending I+S frames within T2 after the reception of the first RNR frame from the SS.

$i+1, \dots, n+i$ : One S frame.

MS restarts sending I+S frames within T2 after the reception of the first RR frame from the SS.

$n+i+1, n+i+2, \dots$ : One I+S frame containing:

$$N(S) = N_{MS+i+1}, N_{MS+i+2}, \dots \text{ mod}(62).$$

### 29.3.2.3 SS sends I+S frames

#### 29.3.2.3.1 N(R) sequence number

##### 29.3.2.3.1.1 Test purpose

To test the correct handling of the N(R) sequence number.

##### 29.3.2.3.1.2 Method of test

#### Initial Conditions

##### System Simulator:

The SS is configured to use default RLP parameters.

##### Mobile Station:

The MS is configured to use RLP default parameters except the window size from IWF (SS) to MS, called KIM.

A non transparent data call will be established, so that the MS is in call state U10 ("Call Active").

Since some RLP parameters are different from the default parameters, a negotiation procedure will be initiated by the MS after the CONNECKT ACKNOWLEDGE message. The MS may negotiate the RLP default parameters within allowed ranges, defined in 3GPP TS 04.22, except the window size from IWF (SS) to MS, called KIM, which has to be a non default value.

The SS shall accept and use the new RLP parameters till the end of the test.

After the negotiation procedure the ABM will be entered. This test is performed twice with 2 different values of KIM, randomly chosen.

#### Procedure

The SS is made to send continuously I+S frames (more than  $2 \cdot 64$  frames). The delay between two I+S frames shall be superior to T2 and inferior to T1.

The MS is made to send no data i.e. no I+S frame.

NOTE: The MS may have previously sent I+S frames.

The SS sends I+S frames in I+S RR frames.

The MS shall acknowledge the I+S frames in RR frame sequentially within T2.

The MS is returned to the idle state by clearing the call.

Expected sequence

The frames from the SS will be:

0,...,i': One I+S frame containing

$$N(S)=N_{SS}, \dots, N_{SS}+i \text{ mod}(62).$$

### 29.3.2.3.1.3 Test requirements

The frames from the MS shall be:

0,...,i: One S frame containing:

$$N(R)=N_{SS}+1, \dots, N_{SS}+i+1 \text{ mod}(62).$$

The MS shall acknowledge the I+S frames sent by the SS within T2.

NOTE: If T2 parameter is equal to default T2 (<80 ms), the SS has to checked that the MS acknowledges an I+S frame within 80 ms.

### 29.3.2.3.2 Busy condition

#### 29.3.2.3.2.1 Test purpose

To test the correct handling of a RNR frame with information received.

#### 29.3.2.3.2.2 Method of test

##### Initial Conditions

System Simulator:

The SS is configured to use default RLP parameters.

Mobile Station:

The MS is configured to use default RLP parameters.

A non transparent data call will be established, so that the MS is in call state U10 ("Call Active").

Case a: No negotiation will be initiated by the MS.

Case b: The MS initiates negotiation of RLP default parameters.

NOTE: The MS is allowed to initiate the negotiation of the RLP default parameters, within allowed ranges, defined in 3GPP TS 04.22. The MS shall do this in the ADM, after having sent a CONNECT ACKNOWLEDGE message (MO-case) or after having received a CONNECT ACKNOWLEDGE message from the SS (MT-case). The SS shall accept and use the new RLP parameters till the end of the test.

The ABM will be entered.

Procedure

The SS is made to send continuously I+S frames. The delay between two consecutive I+S frames shall be inferior to T1.

The MS is made to send continuously I+S frames with a delay inferior to T1 between each frame.

The SS acknowledges the received I+S frames in I+S RR frames. After 1 second, it acknowledged the received I+S frames in supervisory RNR frames. The MS shall acknowledge the I+S frames in I+S RR frame sequentially.

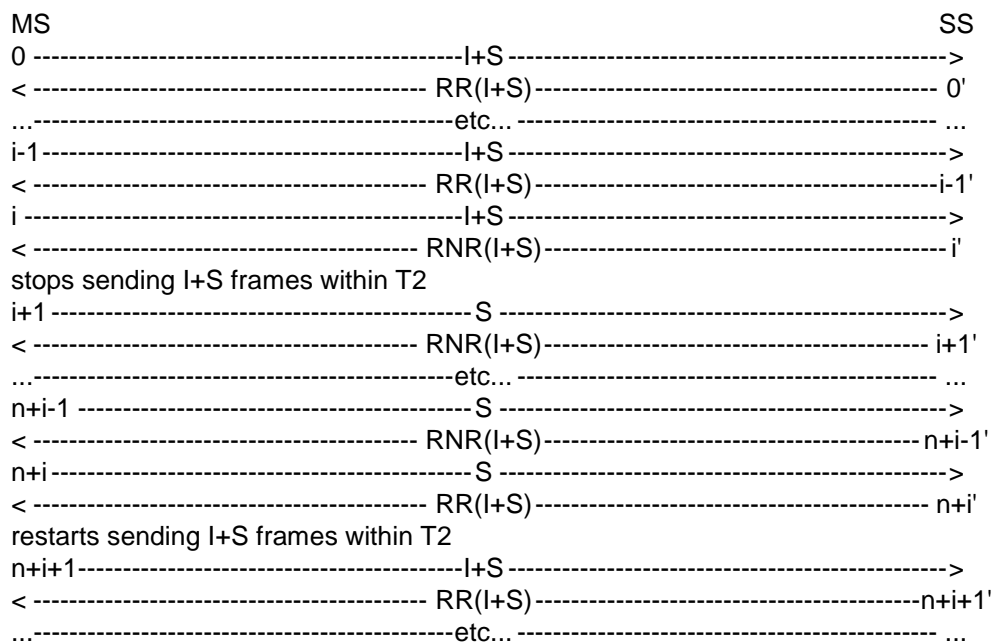

After the first RNR frame, the MS shall stop sending I+S frames and shall acknowledge the I+S received frame in supervisory frames within T2.

After 1 second receiving supervisory frames, the SS sends I+S RR frames instead of RNR.

After the first RR frame, the MS will restart the transmission of I+S frames, it shall acknowledge the I+S received frame in I+S frame within T2.

The MS is returned to the idle state by clearing the call.

Expected sequence

The frames from the SS will be:

0',...,i-1': One I+S RR frame containing:

$$N(S)=N_{SS}, \dots, N_{SS+i-1} \text{ mod}(62),$$

$$N(R)=N_{MS+1}, \dots, N_{MS+i} \text{ mod}(62).$$

i',...,n+i-1': One I+S RNR frame containing:

$$N(S)=N_{SS+i}, \dots, N_{SS+n+i-1} \text{ mod}(62),$$

$$N(R)=N_{MS+i+1} \text{ mod}(62).$$

n+i',n+i+1',...: One I+S RR frame containing:

$$N(S)=N_{SS+n+i}, N_{SS+n+i+1}, \dots \text{ mod}(62),$$

$$N(R)=N_{MS+i+1}, N_{MS+i+2}, \dots \text{ mod}(62).$$

### 29.3.2.3.2.3 Test requirements

The frames from the MS shall be:

0,...,i: One I+S frame containing:

$$N(S)=NMS,\dots,NMS+i \text{ mod}(62),$$

$$N(R)=Nss,\dots,Nss+i \text{ mod}(62).$$

MS stops sending I+S frames within T2 after the reception of the first RNR frame from the SS.

i+1,...,n+i: One S frame containing:

$$N(R)=Nss+i+1,\dots,Nss+n+i \text{ mod}(62).$$

MS restarts sending I+S frames within T2 after the reception of the first RR frame from the SS.

n+i+1,n+i+2,...: One I+S frame containing:

$$N(S)=NMS+i+1,NMS+i+2,\dots \text{ mod}(62),$$

$$N(R)=Nss+n+i+1,Nss+n+i+1 \dots \text{ mod}(62).$$

### 29.3.2.4 SS rejects I+S frames

#### 29.3.2.4.1 REJ frame

##### 29.3.2.4.1.1 Test purpose

To test the correct handling of a REJ frame received.

##### 29.3.2.4.1.2 Method of test

###### Initial Conditions

The window size from MS to IWF (SS) is called KMI.

System Simulator:

The SS is configured to use default RLP parameters.

Mobile Station:

The MS is configured to use default RLP parameters.

A non transparent data call will be established, so that the MS is in call state U10 ("Call Active").

Case a: No negotiation will be initiated by the MS.

Case b: The MS initiates negotiation of RLP default parameters.

**NOTE:** The MS is allowed to initiate the negotiation of the RLP default parameters, within allowed ranges, defined in 3GPP TS 04.22. The MS shall do this in the ADM, after having sent a CONNECT ACKNOWLEDGE message (MO-case) or after having received a CONNECT ACKNOWLEDGE message from the SS (MT-case). The SS shall accept and use the new RLP parameters till the end of the test.

The ABM will be entered.

###### Procedure

The MS is made to send continuously I+S frames with a delay inferior to T1 between each frame.

The SS acknowledges the i first I+S frames in supervisory RR frames.

The SS does not acknowledge the following I+S frames.

The SS rejects the 2 last I+S frames with a REJ and then send UI frames.

The MS shall retransmit the rejected I+S frames and the continue to send I+S frames.

The MS shall stop sending I+S frame when the transmission window is full.

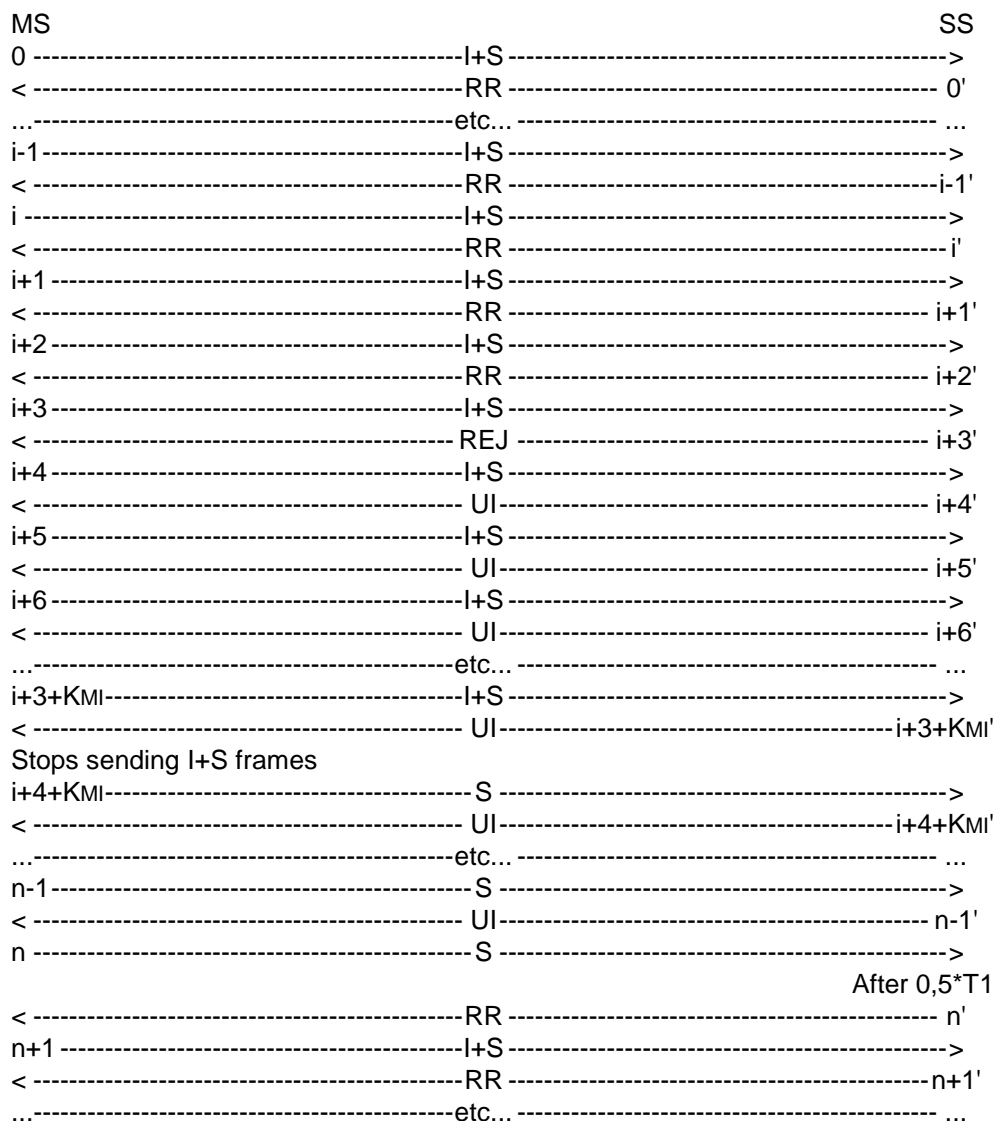

The SS acknowledges all the received I+S frames with a RR frame after a delay of  $0,5 * T1$  after the last received I+S frame.

The MS restarts sending I+S frame.

The SS acknowledges the received I+S frames.

The MS is returned to the idle state by clearing of the call.

Expected sequence

The frames from the SS will be:

0',...,i-1': One RR frame containing:

$$N(R) = NMS + 1, \dots, NMS + i \text{ mod}(62).$$

$i', \dots, i+2'$ : One RR frame containing:

$$N(R) = NMS + i \pmod{62}.$$

$i+3'$ : One REJ frame containing:

$$N(R) = NMS + i + 2 \pmod{62}.$$

$i+4', \dots, n-1'$ : One UI frame.

$n'$ : One RR frame containing:

$$N(R) = NMS + i + 2 + KMI \pmod{62},$$

after a delay of  $0,5 * T1$  after the last received I+S frame.

$n+1', \dots$ : One RR frame containing

$$N(R) = NMS + i + 3 + KMI, \dots \pmod{62}.$$

### 29.3.2.4.1.3 Test requirements

The frames from the MS shall be:

$0, \dots, i+3$ : One I+S frame containing

$$N(S) = NMS, \dots, NMS + i + 3 \pmod{62}.$$

$i+4, i+5$ : One I+S frame containing

$$N(S) = NMS + i + 2, NMS + i + 3 \pmod{62}.$$

$i+6, \dots, i+3+KMI$ : One I+S frame containing:

$$N(S) = NMS + i + 4, \dots, NMS + i + KMI + 1 \pmod{62}.$$

$i+4+KMI, \dots, n$ : One S frame.

MS stops sending I+S frames until reception of an acknowledging of at least 1 I+S frame of the window (received  $N(R)$  from  $NMS + i + 3$  to  $NMS + i + 2 + KMI \pmod{62}$ ).

$n+1, \dots$ : One I+S frame containing:

$$N(S) = NMS + i + KMI, \dots \pmod{62}.$$

### 29.3.2.4.2 SREJ frame

#### 29.3.2.4.2.1 Test purpose

To test the correct handling of a SREJ frame received.

#### 29.3.2.4.2.2 Method of test

##### Initial Conditions

The window size from MS to IWF (SS) is called KMI.

System Simulator:

The SS is configured to use default RLP parameters.

Mobile Station:

The MS is configured to use default RLP parameters.

A non transparent data call will be established, so that the MS is in call state U10 ("Call Active").

Case a: No negotiation will be initiated by the MS.

Case b: The MS initiates negotiation of RLP default parameters.

NOTE: The MS is allowed to initiate the negotiation of the RLP default parameters, within allowed ranges, defined in 3GPP TS 04.22. The MS shall do this in the ADM, after having sent a CONNECT ACKNOWLEDGE message (MO-case) or after having received a CONNECT ACKNOWLEDGE message from the SS (MT-case). The SS shall accept and use the new RLP parameters till the end of the test.

### **The ABM will be entered.**

#### Procedure

The MS is made to send continuously I+S frames with a delay inferior to T1 between each frame.

The SS acknowledges the i first I+S frames in supervisory RR frames.

The SS does not acknowledge the following I+S frames.

The SS rejects one I+S frame with a SREJ and then send UI frames.

The MS shall retransmit the rejected I+S frame and the continue to send I+S frames.

The MS shall stop sending I+S frame when the transmission window is full.

The SS acknowledges all the received I+S frames with a RR frame after a delay of  $0,5 * T1$  after the last received I+S frame.

The MS restarts sending I+S frame.

The SS acknowledges the received I+S frames.

The MS is returned to the idle state by clearing of the call.

Expected sequence

The frames from the SS will be:

0',...,i-1': One RR frame containing:

$$N(R)=NMS+1,\dots,NMS+i \bmod(62).$$

i',...,i+2': One RR frame containing:

$$N(R)=NMS+i \bmod(62).$$

i+3': One SREJ frame containing:

$$N(R)=NMS+i+2 \bmod(62).$$

i+4',...,n-1': One UI frame.

n': One RR frame containing:

$$N(R)=NMS+i+KMI \bmod(62),$$

after a delay of  $0,5 * T1$  after the last received I+S frame.

n+1',...: One RR frame containing:

$$N(R)=NMS+i+1+KMI \bmod(62).$$

#### 29.3.2.4.2.3 Test requirements

The frames from the MS shall be:

0',...,i+3: One I+S frame containing:

$$N(S)=NMS,\dots,NMS+i+3 \bmod(62).$$

i+4: One I+S frame containing:

$$N(S)=NMS+i+2 \bmod(62).$$

i+5',...,i+KMI: One I+S frame containing:

$$N(S)=NMS+i+4,\dots,NMS+i+KMI-1 \bmod(62).$$

i+1+KMI',...,n: One S frame.

MS stops sending I+S frames until reception of an acknowledging of at least 1 I+S frame of the window (received  $N(R)$  from  $NMS+i+1$  to  $NMS+i+KMI \bmod(62)$ ).

n+1',...: One I+S frame containing:

$$N(S)=NMS+i+KMI,\dots \bmod(62).$$

#### 29.3.2.4.3 I+S reject frame

##### 29.3.2.4.3.1 Test purpose

To test the correct handling of a I+S reject frame received.

## 29.3.2.4.3.2 Method of test

**Initial Conditions**

The window size from MS to IWF (SS) is called KMI.

System Simulator:

The SS is configured to use default RLP parameters.

Mobile Station:

The MS is configured to use default RLP parameters.

A non transparent data call will be established, so that the MS is in call state U10 ("Call Active").

Case a: No negotiation will be initiated by the MS.

Case b: The MS initiates negotiation of RLP default parameters.

**NOTE:** The MS is allowed to initiate the negotiation of the RLP default parameters, within allowed ranges, defined in 3GPP TS 04.22. The MS shall do this in the ADM, after having sent a CONNECT ACKNOWLEDGE message (MO-case) or after having received a CONNECT ACKNOWLEDGE message from the SS (MT-case). The SS shall accept and use the new RLP parameters till the end of the test.

**The ABM will be entered.****Procedure**

The MS is made to send continuously I+S frames with a delay inferior to T1 between each frame.

The SS acknowledges the i first I+S frames in supervisory RR frames.

The SS does not acknowledge the following I+S frames.

The SS rejects the 2 last I+S frames with a REJ.

The MS shall retransmit the 2 rejected I+S frames.

The SS acknowledges these 2 frames.

The MS shall continue sending I+S frames.

The SS does not acknowledge these frames.

The SS rejects one I+S frame with a SREJ.

The MS shall retransmit the rejected I+S frame and continue sending I+S frames.

The SS acknowledges the received I+S frames.

The MS is returned to the idle state by clearing of the call.

Expected sequence

The frames from the SS will be:

0',...,i-1': One RR frame containing:

$$N(R)=NMS+1, \dots, NMS+i \text{ mod}(62).$$

i',i+1': One RR frame containing:

$$N(R)=NMS+i \text{ mod}(62).$$

i+2': One I+S REJ frame containing:

$$N(R)=NMS+i+1 \text{ mod}(62),$$

$$N(S)=Nss \text{ mod}(62).$$

$i+3, i+4$ : One RR frame containing:

$$N(R) = NMS+i+2, NMS+i+3 \pmod{62}.$$

$i+5$ : One RR frame containing:

$$N(R) = NMS+i+3 \pmod{62}.$$

$i+6$ : One I+S REJ frame containing:

$$N(R) = NMS+i+3 \pmod{62},$$

$$N(S) = NSS+1 \pmod{62}.$$

$i+7$ : One RR frame containing:

$$N(R) = NMS+i+3 \pmod{62}.$$

$i+8$ : One RR frame containing:

$$N(R) = NMS+i+6, \dots \pmod{62}.$$

#### 29.3.2.4.3.3 Test requirements

The frames from the MS shall be:

$0, \dots, i+2$ : One I+S frame containing:

$$N(S) = NMS, \dots, NMS+i+2 \pmod{62}.$$

$i+3, i+4$ : One I+S frame containing:

$$N(S) = NMS+i+1, NMS+i+2 \pmod{62}.$$

$i+5, i+6$ : One I+S frame containing:

$$N(S) = NMS+i+3, NMS+i+4 \pmod{62}.$$

$i+7$ : One I+S frame containing:

$$N(S) = NMS+i+3 \pmod{62}.$$

$i+8, \dots$ : One I+S frame containing:

$$N(S) = NMS+i+5, \dots \pmod{62}.$$

The MS shall acknowledge the I+S frames sent by the SS within T2.

#### 29.3.2.5 MS rejects I+S frames

##### 29.3.2.5.1 Rejection with REJ or SREJ supervisory frames

###### 29.3.2.5.1.1 Conformance requirements

The MS shall be able to detect that an I+S frame is out of sequence, and to indicate to the network that some information needs to be retransmitted. This shall be done by using either a REJ or a SREJ RLP frame. The MS has the freedom to choose either one of these frames, but it shall correctly indicate which frames need to be retransmitted.

#### References

3GPP TS 04.22 subclauses 5.2.3.4, 5.2.3.6 and 5.3.2.

### 29.3.2.5.1.2 Test purpose

To test that the MS is able to send correct REJ or SREJ supervisory frames to ask for the transmission of a sequence when an out of sequence information frame has been received.

### 29.3.2.5.1.3 Test method

#### Initial Conditions

The window size from IWF (SS) to MS is called  $K_{IM}$ .

System Simulator:

The SS is configured to use default RLP parameters.

Mobile Station:

The MS is configured to use default RLP parameters.

A non transparent data call will be established, so that the MS is in call state U10 ("Call Active").

Case a: No negotiation will be initiated by the MS.

Case b: The MS initiates negotiation of RLP default parameters.

NOTE: The MS is allowed to initiate the negotiation of the RLP default parameters, within allowed ranges, defined in 3GPP TS 04.22. The MS shall do this in the ADM, after having sent a CONNECT ACKNOWLEDGE message (MO-case) or after having received a CONNECT ACKNOWLEDGE message from the SS (MT-case). The SS shall accept and use the new RLP parameters till the end of the test.

#### **The ABM will be entered.**

#### Related PICS/PIXIT statements

Supported bearer services; characteristics of non-transparent services.

#### Foreseen final state of the MS

Idle.

#### Test procedure

The SS is made to send continuously I+S frames. The delay between two consecutive I+S frames shall be inferior to T1.

The MS is made to send no user data. It sends only supervisory frames.

The SS sends a I+S frame numbered Nss. The MS shall acknowledge this frame. Then the SS sends a I+S frame numbered Nss+2.

The MS shall ask for the retransmission of the missing frame numbered Nss+1. The MS may send a SREJ frame (see case a). If it cannot send SREJ, it shall send a REJ frame (see case b).

Case a: If the MS chooses to send a SREJ, it shall send a SREJ frame containing  $N(R)=Nss+1$ .

The SS sends a I+S frame numbered Nss+4.

The MS shall ask for the retransmission of the missing frame numbered Nss+3. The MS may send a SREJ frame (see case a/a). If it cannot send SREJ, it shall send a REJ frame (see case a/b).

Case a/a: If the MS chooses to send a SREJ, it shall send a SREJ frame containing  $N(R)=Nss+3$ .

The SS sends a I+S frame numbered Nss+1 and the MS shall acknowledge this frame ( $N(R)=Nss+3$ ).

The SS sends a I+S frame numbered Nss+3 and the MS shall acknowledge this frame ( $N(R)=Nss+5$ ).

Case a/b: If the MS chooses to send a REJ, it shall send a REJ frame containing  $N(R)=N_{ss}+1$ .

The SS sends I+S frames numbered  $N_{ss}+1$ , ...,  $N_{ss}+4$  and the MS shall acknowledge these frames ( $N(R)=N_{ss}+2$ , ...,  $N_{ss}+5$ ).

Case b: If the MS chooses to send a REJ, it shall send a REJ frame containing  $N(R)=N_{ss}+1$ .

The SS sends I+S frames numbered  $N_{ss}+1$ ,  $N_{ss}+2$  and the MS shall acknowledge this frame ( $N(R)=N_{ss}+2$ ,  $N_{ss}+3$ ).

The SS sends a I+S frame numbered  $N_{ss}+4$ .

The MS shall ask for the retransmission of the missing frame numbered  $N_{ss}+3$ . The MS may send a SREJ frame (see case b/a). If it cannot send SREJ, it shall send a REJ frame (see case b/b).

Case b/a: If the MS chooses to send a SREJ, it shall send a SREJ frame containing  $N(R)=N_{ss}+3$ .

The SS sends a I+S frame numbered  $N_{ss}+3$  and the MS shall acknowledge this frame ( $N(R)=N_{ss}+5$ ).

Case b/b: If the MS chooses to send a REJ, it shall send a REJ frame containing  $N(R)=N_{ss}+3$ .

The SS sends I+S frames numbered  $N_{ss}+3$ ,  $N_{ss}+4$  and the MS shall acknowledge these frames ( $N(R)=N_{ss}+4$ ,  $N_{ss}+5$ ).

The SS sends a I+S frame numbered  $N_{ss}+5$ . The MS shall acknowledge this frame. Then the SS sends a I+S frame numbered  $N_{ss}+5+K_{IM}$ .

The MS shall ask for the retransmission of the missing frame numbered  $N_{ss}+6$  to  $N_{ss}+4+K_{IM}$ . The MS may send a SREJ frame (see sequence c with  $k=1$ ). If it cannot send SREJ, it shall send a REJ frame (see sequence d with  $k=1$ ).

Sequence c: If the MS chooses to send a SREJ, it shall send a SREJ frame containing  $N(R)=N_{ss}+5+k$ .

The SS sends a I+S frame numbered  $N_{ss}+5+k$ .

When using SREJ frames, the MS shall send RR frames to acknowledge the received I+S frames. The time when these RR frames are sent is not tested.

If  $k < K_{IM}-1$ , the MS shall ask for the retransmission of the missing frames numbered  $N_{ss}+5+k+1$  to  $N_{ss}+4+K_{IM}$ . The MS may send a SREJ frame (see sequence c with  $k=k+1$ ). If it cannot send SREJ, it shall send a REJ frame (see sequence d with  $k=k+1$ ).

If  $k=K_{IM}-1$ , the MS has no more frame to reject. It shall acknowledge the frame numbered  $N_{ss}+5+K_{IM}$  with a frame containing  $N(R)=N_{ss}+6+K_{IM}$ . The SS sends I+S frames numbered  $N_{ss}+6+K_{IM}$ , etc... and the MS shall acknowledge these frames ( $N(R)=N_{ss}+7+K_{IM}$ , etc).

Sequence d: If the MS chooses to send a REJ, it shall send a REJ frame containing  $N(R)=N_{ss}+5+k$ .

The SS sends a I+S frame numbered  $N_{ss}+5+k$  and the MS shall acknowledge this frame ( $N(R)=N_{ss}+5+k+1$ ).

The SS sends a I+S frame numbered  $N_{ss}+5+K_{IM}$ .

If  $k < K_{IM}-1$ , the MS shall ask for the retransmission of the missing frames numbered  $N_{ss}+5+k+1$  to  $N_{ss}+4+K_{IM}$ . The MS may send a SREJ frame (see sequence c with  $k=k+1$ ). If it cannot send SREJ, it shall send a REJ frame (see sequence d with  $k=k+1$ ).

If  $k=K_{IM}-1$ , the MS has no more frame to reject. It shall acknowledge the frame numbered  $N_{ss}+5+K_{IM}$  with a frame containing  $N(R)=N_{ss}+6+K_{IM}$ . The SS sends I+S frames numbered  $N_{ss}+6+K_{IM}$ , etc... and the MS shall acknowledge these frames ( $N(R)=N_{ss}+7+K_{IM}$ , etc).

The MS is returned to the idle state by clearing of the call.

Maximum duration of test

1 minute.

The frames from the SS will be:

0': One I+S frame containing  $N(S)=N_{ss} \bmod(62)$ ,  $N(R)=N_{ms}+1 \bmod(62)$ .

1': One I+S frame containing  $N(S)=N_{ss}+2 \bmod(62)$ ,  $N(R)=N_{ms}+1 \bmod(62)$ .

Case a:

a - 2': One I+S frame containing  $N(S)=N_{ss}+4 \bmod(62)$ ,  $N(R)=N_{ms}+1 \bmod(62)$ .

Case a/a:

a/a - 2': One I+S frame containing  $N(S)=N_{ss}+1 \bmod(62)$ ,  $N(R)=N_{ms}+1 \bmod(62)$ .

a/a - 3': One I+S frame containing  $N(S)=N_{ss}+3 \bmod(62)$ ,  $N(R)=N_{ms}+1 \bmod(62)$ .

Case a/b:

a/b - 2': One I+S frame containing  $N(S)=N_{ss}+1 \bmod(62)$ ,  $N(R)=N_{ms}+1 \bmod(62)$ .

a/b - 3': One I+S frame containing  $N(S)=N_{ss}+2 \bmod(62)$ ,  $N(R)=N_{ms}+1 \bmod(62)$ .

a/b - 4': One I+S frame containing  $N(S)=N_{ss}+3 \bmod(62)$ ,  $N(R)=N_{ms}+1 \bmod(62)$ .

a/b - 5': One I+S frame containing  $N(S)=N_{ss}+4 \bmod(62)$ ,  $N(R)=N_{ms}+1 \bmod(62)$ .

Case b:

b - 2': One I+S frame containing  $N(S)=N_{ss}+1 \bmod(62)$ ,  $N(R)=N_{ms}+1 \bmod(62)$ .

b - 3': One I+S frame containing  $N(S)=N_{ss}+2 \bmod(62)$ ,  $N(R)=N_{ms}+1 \bmod(62)$ .

b - 4': One I+S frame containing  $N(S)=N_{ss}+4 \bmod(62)$ ,  $N(R)=N_{ms}+1 \bmod(62)$ .

Case b/a:

b/a - 2': One I+S frame containing  $N(S)=N_{ss}+3 \bmod(62)$ ,  $N(R)=N_{ms}+1 \bmod(62)$ .

Case b/b:

b/b - 2': One I+S frame containing  $N(S)=N_{ss}+3 \bmod(62)$ ,  $N(R)=N_{ms}+1 \bmod(62)$ .

b/b - 3': One I+S frame containing  $N(S)=N_{ss}+4 \bmod(62)$ ,  $N(R)=N_{ms}+1 \bmod(62)$ .

i': One I+S frame containing  $N(S)=N_{ss}+5 \bmod(62)$ ,  $N(R)=N_{ms}+1 \bmod(62)$ .

i+1': One I+S frame containing  $N(S)=N_{ss}+5+K_{IM} \bmod(62)$ ,  $N(R)=N_{ms}+1 \bmod(62)$ .

Sequence c (with  $k=1$  to  $K_{IM}-1$ ):

c/k - 0': One I+S frame containing  $N(S)=N_{ss}+5+k \bmod(62)$ ,  $N(R)=N_{ms}+1 \bmod(62)$ .

Sequence d (with  $k=1$  to  $K_{IM}-1$ ):

d/k - 0': One I+S frame containing  $N(S)=N_{ss}+5+k \bmod(62)$ ,  $N(R)=N_{ms}+1 \bmod(62)$ .

d/k - 1': One I+S frame containing  $N(S)=N_{ss}+5+K_{IM} \bmod(62)$ ,  $N(R)=N_{ms}+1 \bmod(62)$ .

j',...: One I+S frame containing  $N(S)=N_{ss}+K_{IM}+6,... \bmod(62)$ ,  $N(R)=N_{ms}+1 \bmod(62)$ .

### Specific message content

The frames from the MS shall be:

0: One RR frame containing  $N(R)=N_{ss}+1 \bmod(62)$ .

1: The MS shall reject the missing I+S frame numbered  $N_{ss}+1$ . It may send a SREJ frame (see case a). If it cannot send SREJ, it shall send a REJ frame (see case b).

Case a

a - 1: One supervisory SREJ frame containing  $N(R)=N_{ss}+1 \bmod(62)$ .

a - 2: The MS shall reject the missing I+S frame numbered  $N_{ss}+3$ . It may send a SREJ frame (see case a). If it cannot send SREJ, it shall send a REJ frame (see case b).

Case a/a

a/a - 1: One supervisory SREJ frame containing  $N(R)=N_{ss}+3 \bmod(62)$ .

a/a - 2: One RR frame containing  $N(R)=N_{ss}+3 \bmod(62)$ .

a/a - 3: One RR frame containing  $N(R)=N_{ss}+5 \bmod(62)$ .

Case a/b

a/b - 1: One supervisory REJ frame containing  $N(R)=N_{ss}+1 \bmod(62)$ .

a/b - 2: One RR frame containing  $N(R)=N_{ss}+2 \bmod(62)$ .

a/b - 3: One RR frame containing  $N(R)=N_{ss}+3 \bmod(62)$ .

a/b - 4: One RR frame containing  $N(R)=N_{ss}+4 \bmod(62)$ .

a/b - 5: One RR frame containing  $N(R)=N_{ss}+5 \bmod(62)$ .

Case b

b - 1: One supervisory REJ frame containing  $N(R)=N_{ss}+1 \bmod(62)$ .

b - 2: One RR frame containing  $N(R)=N_{ss}+2 \bmod(62)$ .

b - 3: One RR frame containing  $N(R)=N_{ss}+3 \bmod(62)$ .

b - 4: The MS shall reject the missing I+S frame numbered  $N_{ss}+2$ . It may send a SREJ frame (see case a). If it cannot send SREJ, it shall send a REJ frame (see case b).

Case b/a

b/a - 1: One supervisory SREJ frame containing  $N(R)=N_{ss}+2 \bmod(62)$ .

b/a - 2: One RR frame containing  $N(R)=N_{ss}+5 \bmod(62)$ .

Case b/b

b/b - 1: One supervisory REJ frame containing  $N(R)=N_{ss}+2 \bmod(62)$ .

b/b - 2: One RR frame containing  $N(R)=N_{ss}+4 \bmod(62)$ .

b/b - 3: One RR frame containing  $N(R)=N_{ss}+5 \bmod(62)$ .

i: One RR frame containing  $N(R)=N_{ss}+6 \bmod(62)$ .

i+1: The MS shall reject all missing I+S frames (i.e.  $K_{IM}-1$  frames). It may send a SREJ frame (see sequence c with  $k=1$ ). If it cannot send SREJ, it shall send a REJ frame (see sequence d with  $k=1$ ).

Sequence c (with  $k=1$  to  $K_{IM}-1$ ):

c/k - 0: One SREJ frame containing  $N(R)=N_{ss}+5+k \bmod(62)$ .

c/k - 1: If  $k < K_{IM}-1$ , the MS shall reject all missing I+S frames (i.e.  $K_{IM}-1$  frames). It may send a SREJ frame (see sequence c with  $k=k+1$ ). If it cannot send SREJ, it shall send a REJ frame (see sequence d with  $k=k+1$ ). If  $k=K_{IM}-1$ , the MS has no more frame to reject (see frame numbered j).

Sequence d (with  $k=1$  to  $K_{IM}-1$ ):

d/k - 0: One REJ frame containing  $N(R)=N_{ss}+5+k \bmod(62)$ .

d/k - 1: One RR frame containing  $N(R)=N_{ss}+5+k+1 \bmod(62)$ .

d/k - 2: If  $k < K_{IM}-1$ , the MS shall reject all missing I+S frames (i.e.  $K_{IM}-1$  frames). It may send a SREJ frame (see sequence c with  $k=k+1$ ). If it cannot send SREJ, it shall send a REJ frame (see sequence d with  $k=k+1$ ). If  $k=K_{IM}-1$ , the MS has no more frame to reject (see frame numbered j).

j,...: One RR frame containing  $N(R)=N_{ss}+K_{IM}+6,... \bmod(62)$ .

### 29.3.2.5.2 Retransmission of REJ or SREJ frames

#### 29.3.2.5.2.1 Conformance requirements

The MS shall not retransmit a REJ frame upon time-out. It may repeat SREJ frames.

#### References

3GPP TS 04.22 subclauses 5.2.3.4 and 5.2.3.6.

#### 29.3.2.5.2.2 Test purpose

To test that the MS is able to retransmit a SREJ supervisory frames, and does not retransmit a REJ frame.

#### 29.3.2.5.2.3 Test method

#### Initial Conditions

The window size from IWF (SS) to MS is called  $K_{IM}$ .

System Simulator:

The SS is configured to use default RLP parameters.

Mobile Station:

The MS is configured to use default RLP parameters.

A non transparent data call will be established, so that the MS is in call state U10 ("Call Active").

Case a: No negotiation will be initiated by the MS.

Case b: The MS initiates negotiation of RLP default parameters.

NOTE: The MS is allowed to initiate the negotiation of the RLP default parameters, within allowed ranges, defined in 3GPP TS 04.22. The MS shall do this in the ADM, after having sent a CONNECT ACKNOWLEDGE message (MO-case) or after having received a CONNECT ACKNOWLEDGE message from the SS (MT-case). The SS shall accept and use the new RLP parameters till the end of the test.

### **The ABM will be entered.**

#### Related PICS/PIXIT statements

Supported bearer services; characteristics of non-transparent services.

#### Foreseen final state of the MS

Idle.

#### Test procedure

After optional status bits exchange between the MS and the SS, the SS is made to send continuously I+S frames. The delay between two consecutive I+S frames shall be inferior to T1.

The MS is made to send no user data. It sends only supervisory frames.

The SS sends a I+S frame numbered Nss. The MS shall acknowledge this frame. Then the SS sends a I+S frame numbered Nss+2.

The MS shall ask for the retransmission of the missing frame numbered Nss+1. The MS may send a SREJ frame (see case a). If it cannot send SREJ, it shall send a REJ frame (see case b).

Case a: If the MS chooses to send a SREJ, it shall send a SREJ frame containing  $N(R)=Nss+1$ .

The SS does not retransmit the rejected frame.

The MS may repeat (see case a1) or not (see case a2) the reject SREJ frame.

Case a1: If the MS chooses to retransmit the SREJ, it shall send a SREJ frame containing  $N(R)=Nss+1$ , at the expiry of T1.

The SS sends a I+S frame numbered Nss+1 and the MS shall acknowledge this frame ( $N(R)=Nss+3$ ).

The SS sends a I+S frame numbered Nss+4.

The MS shall ask for the retransmission of the missing frame numbered Nss+3. The MS shall send a SREJ frame containing  $N(R)=Nss+3$ .

At expiry of T1, the MS shall send a new SREJ frame containing  $N(R)=Nss+3$ . This step is repeated N2 times.

The SS checks for  $2*T1$  that the SREJ frame is not repeated by the MS.

Case a2: If the MS chooses not to repeat the SREJ frame, The SS checks for  $2 \cdot T1$  that the SREJ frame is not repeated by the MS.

Case b: If the MS chooses to send a REJ, it shall send a REJ frame containing  $N(R)=N_{ss}+1$ .

The SS does not retransmit the rejected frame.

The MS shall not repeat the reject REJ frame.

The SS checks for  $2 \cdot T1$  that the SREJ frame is not repeated by the MS.

The MS is returned to the idle state by clearing of the call.

Maximum duration of test

1 minute.

a1 - 2': One I+S frame containing  $N(S)=N_{ss}+4 \bmod(62)$ ,  $N(R)=N_{ms}+1 \bmod(62)$ .

## Specific message content

The frames from the MS shall be:

0: One RR frame containing  $N(R)=N_{ss}+1 \text{ mod}(62)$ .

1: The MS shall reject the missing I+S frame numbered  $N_{ss}+1$ . It may send a SREJ frame (see case a). If it cannot send SREJ, it shall send a REJ frame (see case b).

### Case a

a - 1: One supervisory SREJ frame containing  $N(R)=N_{ss}+1 \text{ mod}(62)$ .

a - 2: SREJ frame may be repeated, (see case a1) or not (see case a2).

### Case a1

a1 - 1: On T1 Time-out, one supervisory SREJ frame containing  $N(R)=N_{ss}+1 \text{ mod}(62)$ .

a1 - 2: One RR frame containing  $N(R)=N_{ss}+3 \text{ mod}(62)$ .

a1 - 3,...,b2 - 3+N2: On T1 Time-out, one supervisory SREJ frame containing  $N(R)=N_{ss}+3 \text{ mod}(62)$ .

### Case b

b - 1: One supervisory REJ frame containing  $N(R)=N_{ss}+1 \text{ mod}(62)$ .

## 29.3.2.5.3 I+S reject frame

### 29.3.2.5.3.1 Conformance requirements

The MS shall be able to use I+S frames to carry a REJ or SREJ frame when it detects that one or more numbered information frame is received out of sequence.

### References

3GPP TS 04.22 subclauses 5.2.3.4 and 5.2.3.6.

### 29.3.2.5.3.2 Test purpose

To test the MS is able to send SREJ or REJ frames in I+S frames when an out of sequence information frame has been received.

### 29.3.2.5.3.3 Test method

#### Initial Conditions

The window size from IWF (SS) to MS is called  $K_{IM}$ .

#### System Simulator:

The SS is configured to use default RLP parameters.

#### Mobile Station:

The MS is configured to use default RLP parameters.

A non transparent data call will be established, so that the MS is in call state U10 ("Call Active").

Case a: No negotiation will be initiated by the MS.

Case b: The MS initiates negotiation of RLP default parameters.

NOTE: The MS is allowed to initiate the negotiation of the RLP default parameters, within allowed ranges, defined in 3GPP TS 04.22. The MS shall do this in the ADM, after having sent a CONNECT ACKNOWLEDGE message (MO-case) or after having received a CONNECT ACKNOWLEDGE message from the SS (MT-case). The SS shall accept and use the new RLP parameters till the end of the test.

### The ABM will be entered.

#### Related PICS/PIXIT statements

Supported bearer services; characteristics of non-transparent services.

#### Foreseen final state of the MS

Idle.

#### Test procedure

The SS is made to send continuously I+S frames. The delay between two consecutive I+S frames shall be inferior to T1.

The SS acknowledges all the received I+S frames.

The MS is made to send continuously I+S frames.

The SS sends a I+S frame numbered Nss. The MS shall acknowledge this frame. Then the SS sends a I+S frame numbered Nss+2.

The MS shall ask for the retransmission of the missing frame numbered Nss+1. The MS may send a SREJ frame (see case a). If it cannot send SREJ, it shall send a REJ frame (see case b). The MS has user data to transmit, it shall use an I+S frame (instead of supervisory frame) to reject the missing frame.

Case a: If the MS chooses to send a SREJ, it shall send a I+S SREJ frame containing  $N(R)=Nss+1$ .

The SS sends a I+S frame numbered Nss+1 and the MS acknowledges this frame ( $N(R)=Nss+3$ ).

The SS sends a I+S frame numbered Nss+3, etc... and the MS acknowledges these frames ( $N(R)=Nss+4$ , etc...).

Case b: If the MS chooses to send a REJ, it shall send a I+S REJ frame containing  $N(R)=Nss+1$ .

The SS sends I+S frames numbered Nss+1, Nss+2, etc... and the MS shall acknowledge this frame ( $N(R)=Nss+2$ , Nss+3, etc...).

The MS is returned to the idle state by clearing of the call.

#### Maximum duration of test

1 minute.

|        |       | <----- I+S -----    | b - 3' |
| b - 3  | ----- | I+S ----->          |        |
| ...    |       | etc...              | ...    |

The frames from the SS will be:

0': One I+S frame containing  $N(S)=N_{ss} \bmod(62)$ ,  $N(R)=N_{ms}+1 \bmod(62)$ .

1': One I+S frame containing  $N(S)=N_{ss}+2 \bmod(62)$ ,  $N(R)=N_{ms}+2 \bmod(62)$ .

Case a:

a - 2': One I+S frame containing  $N(S)=N_{ss}+1 \bmod(62)$ ,  $N(R)=N_{ms}+3 \bmod(62)$ .

a - 3': One I+S frame containing  $N(S)=N_{ss}+3 \bmod(62)$ ,  $N(R)=N_{ms}+4 \bmod(62)$ .

Case b:

b - 2': One I+S frame containing  $N(S)=N_{ss}+1 \bmod(62)$ ,  $N(R)=N_{ms}+3 \bmod(62)$ .

b - 3': One I+S frame containing  $N(S)=N_{ss}+2 \bmod(62)$ ,  $N(R)=N_{ms}+4 \bmod(62)$ .

## Specific message content

The frames from the MS shall be:

0: One I+S RR frame containing  $N(S)=N_{ms}+1$ ,  $N(R)=N_{ss}+1 \bmod(62)$ .

1: The MS shall reject the missing I+S frame numbered  $N_{ss}+1$ . It may send a I+S SREJ frame (see case a). If it cannot send SREJ, it shall send a I+S REJ frame (see case b).

## Case a

a - 1: One I+S SREJ frame containing  $N(S)=N_{MS}+2$ ,  $N(R)=N_{SS}+1 \text{ mod}(62)$ .

a - 2: One I+S RR frame containing  $N(S)=N_{MS}+3$ ,  $N(R)=N_{SS}+3 \text{ mod}(62)$ .

a - 3: One I+S RR frame containing  $N(S)=N_{MS}+4$ ,  $N(R)=N_{SS}+4 \text{ mod}(62)$ .

## Case b

b - 1: One I+S REJ frame containing  $N(S)=N_{MS}+2$ ,  $N(R)=N_{SS}+1 \text{ mod}(62)$ .

b - 2: One I+S RR frame containing  $N(S)=N_{MS}+3$ ,  $N(R)=N_{SS}+2 \text{ mod}(62)$ .

b - 3: One I+S RR frame containing  $N(S)=N_{MS}+4$ ,  $N(R)=N_{SS}+3 \text{ mod}(62)$ .

### 29.3.2.6 Checkpoint recovery

#### 29.3.2.6.1 SS in checkpoint recovery mode

##### 29.3.2.6.1.1 Test purpose

To test the correct handling of received frame with  $P=1$ .

##### 29.3.2.6.1.2 Method of test

#### Initial Conditions

##### System Simulator:

The SS is configured to use default RLP parameters.

##### Mobile Station:

The MS is configured to use default RLP parameters.

A non transparent data call will be established, so that the MS is in call state U10 ("Call Active").

Case a: No negotiation will be initiated by the MS.

Case b: The MS initiates negotiation of RLP default parameters.

**NOTE:** The MS is allowed to initiate the negotiation of the RLP default parameters, within allowed ranges, defined in 3GPP TS 04.22. The MS shall do this in the ADM, after having sent a CONNECT ACKNOWLEDGE message (MO-case) or after having received a CONNECT ACKNOWLEDGE message from the SS (MT-case). The SS shall accept and use the new RLP parameters till the end of the test.

#### **The ABM will be entered.**

#### Procedure

The MS is made to send continuously I+S frames with a delay inferior to  $T1$  between each frame.

The SS is made to send continuously I+S frames with a delay superior to  $T2$  and inferior to  $T1$  between each frame.

The SS acknowledges the received I+S frames in its sending I+S frames.

The MS shall acknowledge the received I+S frames in its sending I+S frames.

After having sent  $i$  I+S frames, the SS sends a I+S frame with  $P$  bit set to 1.

The MS shall answer with a supervisory RR or RNR frame with  $F$  bit set to 1 and  $N(R)$  coded to the next frame waited by the MS.

The SS continue sending I+S frames and acknowledging the I+S frames received from the MS.

The MS shall continue sending I+S frames and acknowledging the I+S frames received from the SS.

The SS rejects 1 I+S frame in a supervisory SREJ frame with P bit set to 1.

The MS shall answer with a supervisory RR or RNR frame with F bit set to 1 and N(R) coded to the next frame waited by the MS.

Then the MS shall retransmit the rejected I+S frame.

The SS continue sending I+S frames and acknowledging the I+S frames received from the MS.

The MS shall continue sending I+S frames and acknowledging the I+S frames received from the SS.

After having sent j I+S frames, the SS sends a supervisory RR frame with P bit set to 1.

The MS shall answer with a supervisory RR or RNR frame with F bit set to 1 and N(R) coded to the next frame waited by the MS.

The SS continue sending I+S frames and acknowledging the I+S frames received from the MS.

The MS shall continue sending I+S frames and acknowledging the I+S frames received from the SS.

The MS is returned to the idle state by clearing of the call.

Expected sequence

The frames from the SS will be:

0',...,i-1': One I+S RR frame containing:

$$N(S)=N_{SS},\dots,N_{SS+i-1} \bmod(62),$$

$$N(R)=N_{MS},\dots,N_{MS+i-1} \bmod(62).$$

i': One I+S RR frame containing:

$$C/R=1,$$

$$P/F=1,$$

$$N(S)=N_{SS+i} \bmod(62),$$

$$N(R)=N_{MS+i} \bmod(62).$$

i+1',...,n-1': One I+S RR frame containing:

$$N(S)=N_{SS+i+1},\dots,N_{SS+n-1} \bmod(62),$$

$$N(R)=N_{MS+i-1},\dots,N_{MS+n-3} \bmod(62).$$

n: One I+S RR frame containing:

$$N(S)=N_{SS+n} \bmod(62),$$

$$N(R)=N_{MS+n-3} \bmod(62).$$

n+1: One supervisory SREJ frame containing:

$$C/R=1,$$

$$P/F=1,$$

$$N(R)=N_{MS+n-2} \bmod(62).$$

n+2': One I+S RR frame containing:

$$N(S)=N_{SS+n+1} \bmod(62),$$

$$N(R)=N_{MS+n-2} \bmod(62).$$

n+3',...,n+j-1': One I+S RR frame containing:

$$N(S)=N_{SS+n+2},\dots,N_{SS+n+j} \bmod(62),$$

$$N(R)=N_{MS+n},\dots,N_{MS+n+j-3} \bmod(62).$$

n+j: One supervisory SREJ frame containing:

$$C/R=1,$$

$$P/F=1,$$

$$N(R)=N_{MS+n-2} \bmod(62).$$

n+j+1',...: One I+S RR frame containing:

$$N(S)=N_{SS+n+j+1},\dots \bmod(62),$$

$$N(R)=N_{MS+n+j-2},\dots \bmod(62).$$

### 29.3.2.6.1.3 Test requirements

The frames from the MS shall be:

0,...,i-1: One I+S frame containing:

$$N(S)=NMS,\dots,NMS+i-1 \text{ mod}(62),$$

$$N(R)=Nss+1,\dots,Nss+i \text{ mod}(62).$$

i': One supervisory RR frame containing:

$$C/R=0,$$

$$P/F=1,$$

$$N(R)=Nss+i+1 \text{ mod}(62).$$

i+1,...,n: One I+S frame containing:

$$N(S)=NMS+i,\dots,NMS+n-1 \text{ mod}(62),$$

$$N(R)=Nss+i+2,\dots,Nss+n+1 \text{ mod}(62).$$

n+1: One supervisory RR frame containing:

$$C/R=0,$$

$$P/F=1,$$

$$N(R)=Nss+n+1 \text{ mod}(62).$$

n+2: One I+S frame containing:

$$N(S)=NMS+n-2 \text{ mod}(62),$$

$$N(R)=Nss+n+2 \text{ mod}(62).$$

n+3,...,n+j-1: One I+S frame containing:

$$N(S)=NMS+n,\dots,NMS+n+j-3 \text{ mod}(62),$$

$$N(R)=Nss+n+3,\dots,Nss+n+j+1 \text{ mod}(62).$$

n+j: One supervisory RR frame containing:

$$C/R=0,$$

$$P/F=1,$$

$$N(R)=Nss+n+j+1 \text{ mod}(62).$$

n+j+1,...: One I+S frame containing:

$$N(S)=NMS+n+j-2 \text{ mod}(62),$$

$$N(R)=Nss+n+j+2,\dots \text{ mod}(62).$$

### 29.3.2.6.2 End of the window

#### 29.3.2.6.2.1 Test purpose

To test the correct handling of checkpoint recovery at the end of the window.

## 29.3.2.6.2.2 Method of test

**Initial Conditions****System Simulator:**

The SS is configured to use default RLP parameters.

**Mobile Station:**

The MS is configured to use RLP default parameters except the window size from MS to IWF (SS), called KMI.

A non transparent data call will be established, so that the MS is in call state U10 ("Call Active").

Since some RLP parameters are different from the default parameters, a negotiation procedure will be initiated by the MS after the CONNECKT ACKNOWLEDGE message. The MS may negotiate the RLP default parameters within allowed ranges, defined in 3GPP TS 04.22, except the window size from MS to IWF (SS), called KMI, which has to be a non default value.

The SS shall accept and use the new RLP parameters till the end of the test.

After the negotiation procedure the ABM will be entered. This test is repeated twice with 2 different values of KMI, randomly chosen.

**Procedure**

The MS is made to send continuously I+S frames with a delay inferior to T1 between each frame.

The SS does not acknowledge the received I+S frames in RR frames.

The MS stops sending I+S frames after having sent KMI frames without acknowledgement, due to the window size.

At the expiry of T1 after the last sending I+S frame, the MS shall send a supervisory command RR frame with P bit set to 1.

The SS answer in a RR response frame with F bit set to 1 and acknowledging  $j < KMI$  frames (j is randomly chosen).

The MS shall retransmit the  $KMI - j$  lost I+S frames and then shall continue to send I+S frames.

The SS acknowledges the received I+S frames in RR frames.

The MS is returned to the idle state by clearing of the call.

Expected sequence

The frames from the SS will be:

0',...,n-1': One RR frame containing:

$$N(R) = NMS \text{ mod}(62).$$

n': One supervisory RR frame containing:

$$C/R = 0,$$

$$P/F = 1,$$

$$N(R) = NMS + i - 1 + j \text{ mod}(62).$$

$n+1', \dots$ : One supervisory RR frame containing:

$$N(R) = NMS + i + j \text{ mod}(62).$$

### 29.3.2.6.2.3 Test requirements

The frames from the MS shall be:

$0, \dots, KMI-1$ : One I+S frame containing:

$$N(S) = NMS, \dots, NMS + KMI - 1 \text{ mod}(62).$$

$KMI, \dots, n-1$ : The MS stops sending I+S frames. It sends S frames.

$n$ : On T1 Time-out after the last sent I+S frame, the MS sends a S frame containing C/R=1 and P/F=1.

$n+1, \dots, m$ : The MS retransmits the lost I+S frames, it send I+S frames containing  $N(S) = NMS - 1 + j, \dots, NMS + KMI - 1 \text{ mod}(62)$ .

$m+1, \dots$ : One I+S frames containing:

$$N(S) = NMS + KMI, \dots \text{ mod}(62)$$

### 29.3.2.6.3 End of a sequence

#### 29.3.2.6.3.1 Test purpose

To test the correct handling of checkpoint recovery at the end of a sequence of frames

#### 29.3.2.6.3.2 Method of test

##### Initial Conditions

System Simulator:

The SS is configured to use default RLP parameters.

Mobile Station:

The MS is configured to use RLP default parameters except the window size from MS to IWF (SS), called KMI.

A non transparent data call will be established, so that the MS is in call state U10 ("Call Active").

Since some RLP parameters are different from the default parameters, a negotiation procedure will be initiated by the MS after the CONNECKT ACKNOWLEDGE message. The MS may negotiate the RLP default parameters within allowed ranges, defined in 3GPP TS 04.22, except the window size from MS to IWF (SS), called KMI, which has to be a non default value.

The SS shall accept and use the new RLP parameters till the end of the test.

After the negotiation procedure the ABM will be entered.

**This test is repeated twice with 2 different values of KMI, randomly chosen.**

##### Procedure

The MS is made to send a sequence of  $i$  I+S frames ( $1 < i < KIM$ ) with a delay inferior to T1 between each frame.

The SS does not acknowledge the received I+S frames.

The MS sends S frames.

At the expiry of T1 after the last sending I+S frame, the MS shall send a supervisory command RR frame with P bit set to 1.

The SS answer in a RR response frame with F bit set to 1 and acknowledging  $j < i$  frames ( $j$  is randomly chosen).

The MS shall retransmit the  $i-j$  lost I+S frames.

The SS acknowledges the received I+S frames in RR frames.

The MS is returned to the idle state by clearing of the call.

Expected sequence

The frames from the SS will be:

0',...,n-1': One RR frame containing:

$$N(R) = NMS \text{ mod}(62).$$

n': One supervisory RR frame containing:

$$C/R = 0,$$

$$P/F = 1,$$

$$N(R) = NMS + j \text{ mod}(62).$$

$n+1', \dots$ : One supervisory RR frame containing:

$$N(R) = N_{MS} + j \pmod{62}.$$

### 29.3.2.6.3.3 Test requirements

The frames from the MS shall be:

$0, \dots, i-1$ : One I+S frame containing:

$$N(S) = N_{MS}, \dots, N_{MS} + i - 1 \pmod{62}.$$

$i-1, \dots, n-1$ : The MS sends S frames.

$n$ : On T1 Time-out after the last sent I+S frame, the MS sends a S frame containing C/R=1 and P/F=1.

$n+1, \dots, m$ : The MS retransmits the lost I+S frames, it send I+S frames containing  $N(S) = N_{MS} + j, \dots, N_{MS} + i - 1 \pmod{62}$ .

### 29.3.2.6.4 Time-out of one frame

#### 29.3.2.6.4.1 Test purpose

To test the correct handling of checkpoint recovery when a frame is not acknowledge.

#### 29.3.2.6.4.2 Method of test

#### Initial Conditions

System Simulator:

The SS is configured to use default RLP parameters.

Mobile Station:

The MS is configured to use default RLP parameters.

A non transparent data call will be established, so that the MS is in call state U10 ("Call Active").

Case a: No negotiation will be initiated by the MS.

Case b: The MS initiates negotiation of RLP default parameters.

NOTE: The MS is allowed to initiate the negotiation of the RLP default parameters, within allowed ranges, defined in 3GPP TS 04.22. The MS shall do this in the ADM, after having sent a CONNECT ACKNOWLEDGE message (MO-case) or after having received a CONNECT ACKNOWLEDGE message from the SS (MT-case). The SS shall accept and use the new RLP parameters till the end of the test.

### The ABM will be entered.

#### Procedure

The MS is made to send only one I+S frames.

The SS does not acknowledge the received I+S frame.

At the expiry of T1 after the sending of the I+S frame, the MS shall send a supervisory command RR frame with P bit set to 1.

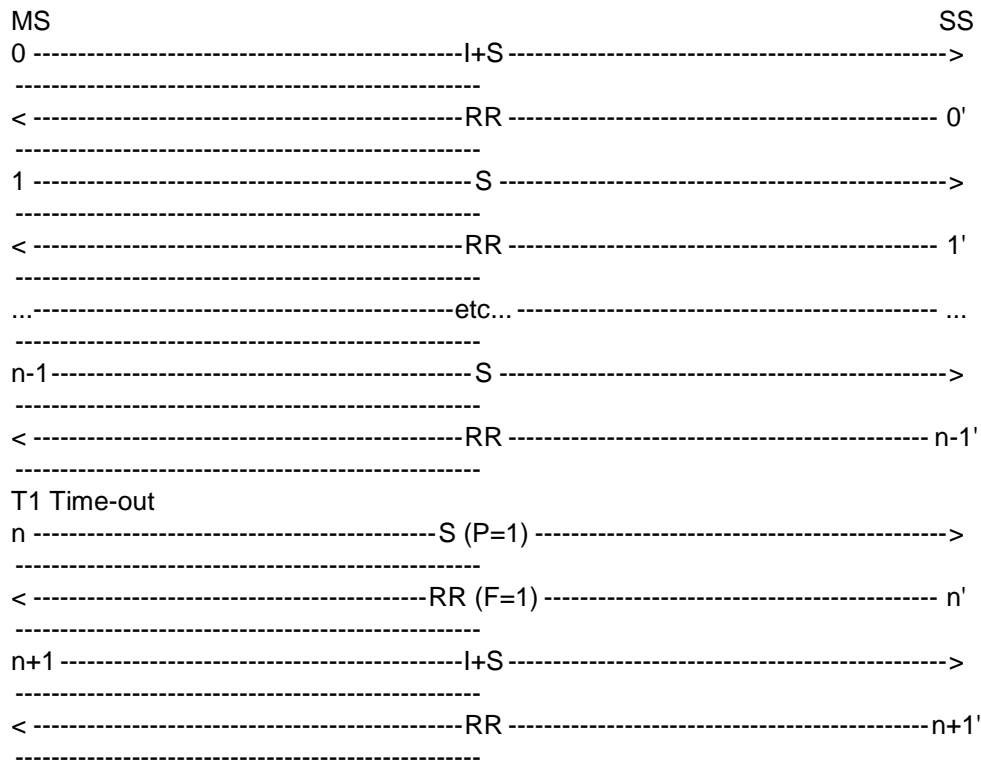

The SS answer in a RR response frame with F bit set to 1 and N(R) corresponding to the I+S frame sent by the MS.

The MS shall retransmit the I+S frame.

The SS acknowledges the received I+S frame in RR frame.

The MS is returned to the idle state by clearing of the call.

Expected sequence

The frames from the SS will be:

0',...,n-1': One RR frame containing:

$$N(R)=NMS \text{ mod}(62).$$

n': One supervisory RR frame containing:

$$C/R=0,$$

$$P/F=1,$$

$$N(R)=NMS \text{ mod}(62).$$

n+1': One supervisory RR frame containing:

$$N(R)=NMS+1 \text{ mod}(62).$$

### 29.3.2.6.4.3 Test requirements

The frames from the MS shall be:

0,: One I+S frame containing:

$$N(S)=NMS \text{ mod}(62).$$

1,...,n-1: The MS sends S frames.

n: On T1 Time-out after the I+S frame, the MS sends a S frame containing C/R=1 and P/F=1.

n+1: The MS retransmits the I+S frame containing  $N(S)=NMS \text{ mod}(62)$ .

### 29.3.2.6.5 No response to checkpointing

#### 29.3.2.6.5.1 Test purpose

To test the correct repetition of a frame with P=1 if SS does not answer to checkpointing.

#### 29.3.2.6.5.2 Method of test

##### Initial Conditions

###### System Simulator:

The SS is configured to use default RLP parameters.

###### Mobile Station:

The MS is configured to use default RLP parameters.

A non transparent data call will be established, so that the MS is in call state U10 ("Call Active").

Case a: No negotiation will be initiated by the MS.

Case b: The MS initiates negotiation of RLP default parameters.

**NOTE:** The MS is allowed to initiate the negotiation of the RLP default parameters, within allowed ranges, defined in 3GPP TS 04.22. The MS shall do this in the ADM, after having sent a CONNECT ACKNOWLEDGE message (MO-case) or after having received a CONNECT ACKNOWLEDGE message from the SS (MT-case). The SS shall accept and use the new RLP parameters till the end of the test.

### **The ABM will be entered.**

#### Procedure

The MS is made to send only one I+S frames.

The SS does not acknowledge the received I+S frame.

At the expiry of T1 after the sending of the I+S frame, the MS shall send a supervisory command RR frame with P bit set to 1.

The SS answer in a RR response frame with F bit set to 0 and N(R) acknowledging the I+S frame sent by the MS.

At the expiry of T1 after the sending of the frame with P=1, the MS shall send a new supervisory command RR frame with P bit set to 1.

The SS answer in a RR response frame with F bit set to 1 and N(R) corresponding to the I+S frame sent by the MS.

The MS shall retransmit the I+S frame.

The SS acknowledges the received I+S frame in RR frame.

The MS is returned to the idle state by clearing of the call.

Expected sequence

The frames from the SS will be:

0',...,n-1': One RR frame containing:

$$N(R)=NMS \text{ mod}(62).$$

n': One supervisory RR frame containing:

$$C/R=0,$$

$$P/F=0,$$

$$N(R)=NMS+1 \text{ mod}(62).$$

n+1': One supervisory RR frame containing:

$$C/R=0,$$

$$P/F=1,$$

$$N(R)=NMS \text{ mod}(62).$$

n+2': One supervisory RR frame containing:

$$N(R)=NMS+1 \text{ mod}(62).$$

### 29.3.2.6.5.3 Test requirements

The frames from the MS shall be:

0,: One I+S frame containing:

$$N(S)=NMS \bmod(62).$$

1,...,n-1: The MS sends S frames.

n: On T1 Time-out after the I+S frame, the MS sends a S frame containing C/R=1 and P/F=1.

n+1: On T1 Time-out after the sending of the first frame with P=1, the MS sends a S frame containing C/R=1 and P/F=1.

n+2: The MS retransmits the I+S frame containing  $N(S)=NMS \bmod(62)$ .

### 29.3.2.6.6 Incorrect response to checkpointing

#### 29.3.2.6.6.1 Test purpose

To test the correct repetition of a frame with P=1 if the answer to checkpointing is incorrect.

#### 29.3.2.6.6.2 Method of test

##### Initial Conditions

System Simulator:

The SS is configured to use default RLP parameters.

Mobile Station:

The MS is configured to use default RLP parameters.

A non transparent data call will be established, so that the MS is in call state U10 ("Call Active").

Case a: No negotiation will be initiated by the MS.

Case b: The MS initiates negotiation of RLP default parameters.

NOTE: The MS is allowed to initiate the negotiation of the RLP default parameters, within allowed ranges, defined in 3GPP TS 04.22. The MS shall do this in the ADM, after having sent a CONNECT ACKNOWLEDGE message (MO-case) or after having received a CONNECT ACKNOWLEDGE message from the SS (MT-case). The SS shall accept and use the new RLP parameters till the end of the test.

#### **The ABM will be entered.**

##### Procedure

The MS is made to send only one I+S frames.

The SS does not acknowledge the received I+S frame.

The MS sends supervisory frame with P set to 0 when it has nothing else to send.

At the expiry of T1 after the sending of the I+S frame, the MS shall send a supervisory command RR frame with P bit set to 1.

The SS answer in a supervisory SREJ response frame with F bit set to 1 and N(R) rejecting the I+S frame sent by the MS.

At the expiry of T1 after the sending of the frame with P=1, the MS shall send a new supervisory command RR frame with P bit set to 1.

The SS answer in a supervisory REJ response frame with F bit set to 1 and N(R) rejecting the I+S frame sent by the MS.

At the expiry of T1 after the sending of the frame with P=1, the MS shall send a new supervisory command RR frame with P bit set to 1.

The SS answer in a RR response frame with F bit set to 1 and N(R) corresponding to the I+S frame sent by the MS.

The MS shall retransmit the I+S frame.

The SS acknowledges the received I+S frame in RR frame.

The MS is returned to the idle state by clearing of the call.

Expected sequence

The frames from the SS will be:

0',...,n-1': One RR frame containing:

$$N(R)=NMS \text{ mod}(62).$$

n': One supervisory SREJ frame containing:

C/R=0,  
P/F=1,  
 $N(R)=NMS \bmod(62)$ .

m+1',...,p-1': One RR frame containing:

$N(R)=NMS \bmod(62)$ .

p': One supervisory REJ frame containing:

C/R=0,  
P/F=1,  
 $N(R)=NMS \bmod(62)$ .

p+1',...,q-1': One RR frame containing:

$N(R)=NMS \bmod(62)$ .

q': One supervisory RR frame containing:

C/R=0,  
P/F=1,  
 $N(R)=NMS \bmod(62)$ .

q+1': One RR frame containing:

$N(R)=NMS+1 \bmod(62)$ .

### 29.3.2.6.6.3 Test requirements

The frames from the MS shall be:

0,: One I+S frame containing:

$N(S)=NMS \bmod(62)$ .

1,...,n-1: The MS sends S frames.

n: On T1 Time-out after the I+S frame, the MS sends a S frame containing:

C/R=1,  
P/F=1.

n+1,...,p-1: The MS sends S frames.

p: On T1 Time-out after the I+S frame, the MS sends a S frame containing:

C/R=1,  
P/F=1.

p+1,...,q-1: The MS sends S frames.

q: On T1 Time-out after the I+S frame, the MS sends a S frame containing:

C/R=1,  
P/F=1.

q+1: The MS retransmits the I+S frame containing:

$$N(S)=N_{MS} \bmod(62).$$

### 29.3.2.6.7 Total loss of response to checkpointing

#### 29.3.2.6.7.1 Definition and applicability

The last frame of a sequence of numbered information frames is guarded by timer T1. Failure to receive an acknowledgement, or a reject, within a time T1, shall result in the RLP entity starting a checkpoint recovery procedure. If the RLP peer entity fails to respond to a checkpoint command, which is also guarded by timer T1, the checkpoint recovery procedure shall be repeated, up to N2 times.

#### 29.3.2.6.7.2 Conformance requirements

The MS shall start the checkpoint procedure after failure to receive acknowledgement of a numbered information frame within a time T1. 3GPP TS 04.22, subclauses 5.3.3 and 5.3.3.2.

The MS shall repeat the checkpoint procedure, up to N2 times, if the peer RLP entity fails to respond to a checkpoint command within a time T1. 3GPP TS 04.22, subclause 5.3.3.2.

The MS shall disconnect or reset the RLP link after the checkpoint procedure has been performed N2+1 times, 3GPP TS 04.22, subclause 5.3.3.2.

#### References

3GPP TS 04.22 subclauses 5.3.3 and 5.3.3.2.

#### 29.3.2.6.7.3 Test purpose

To test the correct handling of a total loss of response to checkpointing.

#### 29.3.2.6.7.4 Method of test

##### Initial Conditions

###### System Simulator:

The SS is configured to use default RLP parameters.

###### Mobile Station:

If possible, the MS is configured to use RLP default parameters except the number of retransmission N2. If a MS cannot be configured to use a non default N2 value, the SS shall use XID negotiation to modify the value of N2 to be used during the test.

A non transparent data call will be established, so that the MS is in call state U10 ("Call Active").

Since some RLP parameters are different from the default parameters, a negotiation procedure will be initiated by the MS after the CONNECKT ACKNOWLEDGE message. The MS may negotiate the RLP default parameters within allowed ranges, defined in 3GPP TS 04.22, except the number of retransmission N2, which has to be a non default value.

The SS shall accept and use the new RLP parameters till the end of the test.

After the negotiation procedure the ABM will be entered.

Once in ABM, the SS shall initiate the transmission of an I+S frame, which will transfer L2RCOP status information between peer L2RCOP entities (SS to MS). The MS may respond with an I+S frame containing L2RCOP status information. The SS shall be capable of initiating this sequence, or responding to an I+S L2RCOP status frame from the MS.

**This test is repeated twice with 2 different values of N2, randomly chosen.**

#### Test Procedure

The MS is made to send only one I+S frames.

The SS does not acknowledge the received I+S frame.

At the expiry of T1 after the sending of the I+S frame, the MS shall send a supervisory command RR frame with P bit set to 1.

The SS answer in a RR response frame with F bit set to 0 and N(R) acknowledging the I+S frame sent by the MS.

At the expiry of T1 after the sending of the frame with P=1, the MS shall send a new supervisory command RR frame with P bit set to 1.

The SS answer in a RR response frame with F bit set to 0 and N(R) corresponding to the I+S frame sent by the MS.

These 2 last steps are repeated N2 times.

At the expiry of T1 after the sending of the frame with P=1, the MS shall reset (SABM) or disconnect (DISC) the link.

The SS answer with an UA frame.

The MS is returned to the idle state by clearing of the call.

Expected sequence

The frames from the SS will be:

0 / i',...,0 / i': One RR frame containing:

P/F=0,

$N(R) = NMS \bmod(62)$ .

$i = 0, \dots, n-1$ .

$k / i', \dots, k / i'$ : One RR frame containing:

$P/F=0$ ,

$N(R) = NMS \bmod(62)$ .

$k = 1, \dots, N2+1, i = 0, \dots, n-1$ .

$N2+2'$ : One UA frame containing:

$C/R=0$ ,

$P/F = P/F$  received in the DISC or SABM.

### 29.3.2.6.7.5 Test requirements

The frames from the MS shall be:

$0 / 0$ : One I+S frame containing:

$N(S) = NMS \bmod(62)$ .

$0 / 1, \dots, 0 / n-1$ : The MS sends S frames.

$k / 0$ : On T1 Time-out after the I+S frame, the MS sends a S frame containing:

$C/R=1$ ,

$P/F=1$ .

$k = 1, \dots, N2+1$ .

$k / 1, \dots, k / n-1$ : The MS sends S frames.

$N2+2$ : The MS sends a SABM ( $C/R=1, P/F=1$ ) or a DISC( $C/R=1$ ) frame.

### 29.3.2.6.8 Retransmission of a sequence

#### 29.3.2.6.8.1 Test purpose

To test the correct repetition of a sequence of frame.

#### 29.3.2.6.8.2 Method of test

##### Initial Conditions

##### System Simulator:

The SS is configured to use default RLP parameters.

##### Mobile Station:

The MS is configured to use RLP default parameters except the number of retransmission  $N2$ .

A non transparent data call will be established, so that the MS is in call state U10 ("Call Active").

Since some RLP parameters are different from the default parameters, a negotiation procedure will be initiated by the MS after the CONNECKT ACKNOWLEDGE message. The MS may negotiate the RLP default parameters within allowed ranges, defined in 3GPP TS 04.22, except the number of retransmission  $N2$ , which has to be a non default value.

The SS shall accept and use the new RLP parameters till the end of the test.

After the negotiation procedure the ABM will be entered.

This test is repeated twice with 2 different values of  $N_2$ , randomly chosen. The window size from MS to IWF (SS) is called KMI.

#### Procedure

The MS is made to send a sequence of  $i$  I+S frames ( $1 < i < KIM$ ) with a delay inferior to  $T_1$  between each frame.

The SS does not acknowledge the received I+S frames.

The MS starts sending supervisory frames after having sent  $i$  frames.

At the expiry of  $T_1$  after the last sending I+S frame, the MS shall send a supervisory command RR frame with P bit set to 1.

The SS answers in a RR response frame with F bit set to 1 and acknowledging no frames.

The MS shall retransmit the all I+S frames. Then the MS shall sends supervisory frames.

At the expiry of  $T_1$  after the last sending I+S frame, the MS shall send a supervisory command RR frame with P bit set to 1.

The SS answers in a RR response frame with F bit set to 1 and acknowledging  $j < i$  frames. ( $j$  randomly chosen).

The MS shall retransmit the  $i-j$  lost I+S frames.

$0,25 * T_1$  after the last I+S frame of the sequence, the SS acknowledges all the received I+S frames in RR frame.

The MS is returned to the idle state by clearing of the call.

Expected sequence

The frames from the SS will be:

0',...,n-1': One RR frame containing:

$$N(R)=NMS \bmod(62).$$

n': One supervisory RR frame containing:

$$C/R=0,$$

$$P/F=1,$$

$$N(R)=NMS \bmod(62).$$

n+1',...,m-1': One supervisory RR frame containing:

$$N(R)=NMS \bmod(62).$$

m': One supervisory RR frame containing:

$$C/R=0,$$

$$P/F=1,$$

$$N(R)=NMS+j \bmod(62).$$

m+1',...,p-2': One supervisory RR frame containing:

$$N(R)=NMS+j \bmod(62).$$

p-1': 0,25\*T1 after the last received I+S frame, the SS sends a supervisory RR frame containing:

$$N(R)=NMS+i \bmod(62).$$

p',...,q': during at least T1, the SS sends supervisory frames.

### 29.3.2.6.8.3 Test requirements

The frames from the MS shall be:

0,...,i-1: One I+S frame containing:

$$N(S)=NMS,\dots,NMS+i-1 \text{ mod}(62).$$

i,...,n-1: The MS sends S frames with P bit set to 0.

n: On T1 Time-out after the I+S frame, the MS sends a S frame containing:

$$C/R=1,$$

$$P/F=1.$$

n+1,...,n+i: The MS retransmits the I+S frames containing:

$$N(S)=NMS,\dots,NMS+i-1 \text{ mod}(62).$$

n+i+1,...,m-1: The MS sends S frames with P bit set to 0.

m: On T1 Time-out after the I+S frame, the MS sends a S frame containing:

$$C/R=1,$$

$$P/F=1.$$

m+1,...,m+i-j: The MS retransmits the I+S frames containing:

$$N(S)=NMS+j,\dots,NMS+i-1 \text{ mod}(62).$$

m+i-j+1,...,q: The MS sends S frames with P bit set to 0.

### 29.3.2.6.9 N2 retransmission of a sequence

#### 29.3.2.6.9.1 Definition and applicability

The last frame of a sequence of numbered information frames is guarded by timer T1. Failure to receive an acknowledgement, or a reject, within a time T1, shall result in the RLP entity starting a checkpoint recovery procedure. If the peer RLP entity responds with a Supervisory frame with the F-bit set to "1", the MS shall retransmit the numbered frames, if appropriate.

#### 29.3.2.6.9.2 Conformance requirements

The MS shall start the checkpoint procedure after failure to receive acknowledgement of a numbered information frame within a time T1. 3GPP TS 04.22, subclauses 5.3.3 and 5.3.3.2.

The MS shall retransmit the I+S frame sequence starting at N(R), upon reception of a Supervisory frame with the F-bit set to "1" from the peer RLP entity. This shall constitute a retransmission of the original I+S sequence only if N(R) remains constant, 3GPP TS 04.22, subclause 5.3.3.

The MS shall disconnect or reset the RLP link after the I+S sequence and checkpoint procedure has been performed N2+1 times, 3GPP TS 04.22, subclause 5.3.3.2.

#### References

3GPP TS 04.22 subclauses 5.3.3 and 5.3.3.2.

#### 29.3.2.6.9.3 Test purpose

To test the correct repetition of a sequence of frame.

#### 29.3.2.6.9.4 Method of test

##### Initial Conditions

System Simulator:

The SS is configured to use default RLP parameters.

Mobile Station:

If possible, the MS is configured to use RLP default parameters except the number of retransmission N2. If a MS cannot be configured to use a non default N2 value, the SS shall use XID negotiation to modify the value of N2 to be used during the test.

A non transparent data call will be established, so that the MS is in call state U10 ("Call Active").

Since some RLP parameters are different from the default parameters, a negotiation procedure will be initiated by the MS after the CONNECKT ACKNOWLEDGE message. The MS may negotiate the RLP default parameters within allowed ranges, defined in 3GPP TS 04.22, except the number of retransmission N2, which has to be a non default value.

The SS shall accept and use the new RLP parameters till the end of the test.

After the negotiation procedure the ABM will be entered.

Once in ABM, the SS shall initiate the transmission of an I+S frame, which will transfer L2RCOP status information between peer L2RCOP entities (SS to MS). The MS may respond with an I+S frame containing L2RCOP status information. The SS shall be capable of initiating this sequence, or responding to an I+S L2RCOP status frame from the MS.

This test is repeated twice with 2 different values of N2, randomly chosen.

The window size from MS to IWF (SS) is called KMI.

##### Test Procedure

The MS is made to send a sequence of  $i$  I+S frames ( $1 < i < KMI$ , and  $i > N2$ ) with a delay inferior to T1 between each frame.

The SS does not acknowledge the received I+S frames.

The MS shall send S frames after having sent the  $i$  I+S frames.

At the expiry of T1 after the last sending I+S frame, the MS shall send a supervisory command RR frame with P bit set to 1.

The SS answer in a RR response frame with F bit set to 1 and acknowledging 1 frame.

The MS shall retransmit the  $i-1$  lost I+S frames.

The SS does not acknowledge the received I+S frames.

The MS shall send S frames after having sent the  $i$  I+S frames.

The 5 last steps are repeated N2 times.

At the expiry of T1 after the last sending I+S frame, the MS shall send a supervisory command RR frame with P bit set to 1.

The SS answer in a RR response frame with F bit set to 1 and acknowledging 1 frame.

After the reception of the last RR response the MS shall reset or disconnect the RLP link by sending an SABM (C/R=1, P/F=1) or a DISC (C/R=1) frame.

The SS answer with an UA frame.

The MS is returned to the idle state by clearing of the call.

Expected sequence

The frames from the SS will be:

0',...,n': One RR frame containing:

$$N(R) = NMS \text{ mod}(62).$$

k / 0': One supervisory RR frame containing:

$$C/R = 0,$$

$$P/F = 1,$$

$$N(R) = NMS + k \text{ mod}(62).$$

$$k = 1, \dots, N2 + 1.$$

k / 1',...,k / nk': One RR frame containing:

$$N(R) = NMS + k \text{ mod}(62).$$

$$k = 1, \dots, N2.$$

One UA frame with P/F bit equal to the P/F received.

#### 29.3.2.6.9.5 Test requirements

The frames from the MS shall be:

0,...,i-1: One I+S frame containing:

$$N(S) = NMS, \dots, NMS + i - 1 \text{ mod}(62).$$

i,..., n: The MS sends S frames.

k / 0: The MS stops sending I+S frames. It sends S frames. On T1 Time-out after the last sent I+S frame, the MS sends a S frame containing:

$$C/R = 1,$$

$$P/F = 1.$$

$$k = 1, \dots, N2 + 1.$$

k / 1,..., k / i-k: The MS retransmits the I+S frames containing:

$$N(S) = NMS + k, \dots, NMS + i - 1 \text{ mod}(62).$$

$$k = 1, \dots, N2.$$

k / i-k+1,..., k / nk: The MS sends S frames. k= 1, ..., N2.

The MS shall reset to disconnect the RLP link. It shall send an SABM (C/R=1, P/F=1) or a DISC (C/R=1).

### 29.3.3 Negotiation of the RLP parameters

#### 29.3.3.1 Negotiation initiated by the SS

##### 29.3.3.1.1 Conformance requirements

The MS shall be able to respond to a negotiation request from the network and to configure its RLP parameters accordingly. It shall do so in ABM mode as well as in ADM mode.

#### References

3GPP TS 04.22 subclause 5.2.2.6.

##### 29.3.3.1.2 Test purpose

To test the correct handling of the MS to a received XID frame in ADM or ABM mode.

##### 29.3.3.1.3 Test method

#### Initial Conditions

System Simulator:

The SS is configured to use default RLP parameters.

Mobile Station:

The MS is configured to use RLP default parameters. The window size from IWF (SS) to MS is called  $K_{IM}$ .

The MS is made to establish a MO non transparent data call. In initial conditions MS is in call state U10 ("Call Active") after having sent a CONN\_ACK message.

Case a: No negotiation will be initiated by the MS.

Case b: The MS initiates negotiation of RLP default parameters.

NOTE: The MS is allowed to initiate the negotiation of the RLP default parameters, within allowed ranges, defined in 3GPP TS 04.22. The MS shall do this in the ADM, after having sent a CONNECT ACKNOWLEDGE message (MO-case) or after having received a CONNECT ACKNOWLEDGE message from the SS (MT-case.)

#### Related PICS/PIXIT statements

Supported bearer services; characteristics of non-transparent services.

#### Foreseen final state of the MS

Idle.

#### Test procedure

Case 1: Testing of the correct handling of the MS to a received XID frame in ADM

Immediately after having received the "CONN\_ACK", the SS sends a correct XID frame containing randomly chosen parameters different from the default parameters and supported by the MS.

If the MS initiates a negotiation procedure, before the SS is able to transmit the XID frame (timing conflict), the SS should accept this - XID frame from the MS and start his own negotiation afterwards.

The MS shall respond with a XID frame. If parameters sent in this frame are different from those chosen by the SS, the correct sense of negotiation is checked. The final parameters are noted (T1, T2, N2, K<sub>IM</sub> (window IWF (SS) -> MS), K<sub>MI</sub> (window MS -> IWF (SS))).

The MS sends a SABM and the SS answers with an UA. Note: the SABM frame may be sent by the MS before the XID response frame. In such a case, the SS waits for the XID response before sending the UA.

Case 2: Testing of the correct handling of the MS to a received XID frame in ABM

The MS sends a SABM and the SS answer with an UA.

The SS sends a correct XID frame containing parameters different from the default parameters and supported by the MS.

The MS shall respond with a XID frame. If parameters sent in this frame are different from those chosen by the SS, the correct sense of negotiation is checked. The final parameters are noted (T1, T2, N2, K<sub>IM</sub> (window IWF (SS) -> MS), K<sub>MI</sub> (window MS -> IWF (SS))).

The SS checks that the MS uses the new parameters determined during the negotiation procedure.

#### Verification of T2

After optional status bits exchange between the MS and the SS, the SS is configured to send I+S frames with a delay inferior to T1 between each frame. The MS is made to send no user data, it sends only supervisory frame.

The SS sends an I+S frame numbered  $N(S)=N_{ss} \bmod(62)$ , the MS shall acknowledge this frame within T2.

#### Verification of K<sub>IM</sub>

The SS sends an I+S frame numbered  $N_{ss}+K_{IM}+1 \bmod(62)$ . The MS shall ignore this frame (out of the window), it shall not acknowledge or reject it. This is checked during at least T2.

The SS sends an I+S frame numbered  $N(S)=N_{ss}+1 \bmod(62)$ , the MS shall acknowledge this frame.

The SS sends an I+S frame numbered  $N_{ss}+K_{IM}+1 \bmod(62)$ . The MS shall reject all the lost frames numbered  $N_{ss}+2 \bmod(62)$  to  $N_{ss}+K_{IM} \bmod(62)$ . It shall send a REJ or SREJ frame with  $N(R)=N_{ss}+2 \bmod(62)$ .

If REJ frame is used by the MS, the SS restarts the transmission of I+S frames from frame numbered  $N_{ss}+2 \bmod(62)$ . The MS shall acknowledge these frames. After having sent at least the frame numbered  $N_{ss}+K_{IM}+2 \bmod(62)$ , the SS stops sending I+S frames.

If SREJ frame is used by the MS, the SS restarts the transmission of I+S frames from frame numbered  $N_{ss}+2 \bmod(62)$ . It does send the frame numbered  $N_{ss}+K_{IM}+1 \bmod(62)$  a second time. The MS shall acknowledge these frames. After having sent at least the frame numbered  $N_{ss}+K_{IM}+2 \bmod(62)$ , the SS stops sending I+S frames.

#### Verification of $K_{MI}$

The MS is now configured to send continuously I+S frames with a delay inferior to  $T_1$  between each frame.

The MS sends I+S frames, the SS does not acknowledge these frames.

After having sent  $K_{MI}$  I+S frames, the MS shall stop sending I+S frames (end of the window).

#### Verification of $T_1$

At the expiry of  $T_1$  after the last I+S frame, the MS shall enter in "checkpoint recovery" mode, it shall send a supervisory RR frame with  $C=1$  and  $P=1$ .

The SS does not answer to checkpointing.

#### Verification of $N_2$

At the expiry of  $T_1$  after the last RR ( $C=1$ ,  $P=1$ ) frame, the MS shall resend a supervisory RR frame with  $C=1$  and  $P=1$ . The SS does not answer to checkpointing. This is repeated  $N_2$  times.

After  $N_2$  retransmissions of the same RR frame ( $C=1$ ,  $P=1$ ), The MS shall reset or disconnect the RLP link by sending a SABM ( $C=1, P=1$ ) or a DISC ( $C=1$ ) frame. The SS answers with an UA ( $R=0$ ) frame with F bit set to P bit received in SABM or DISC frame.

The MS is returned to the idle state by clearing of the call.

The test is performed for case 1 and 2.

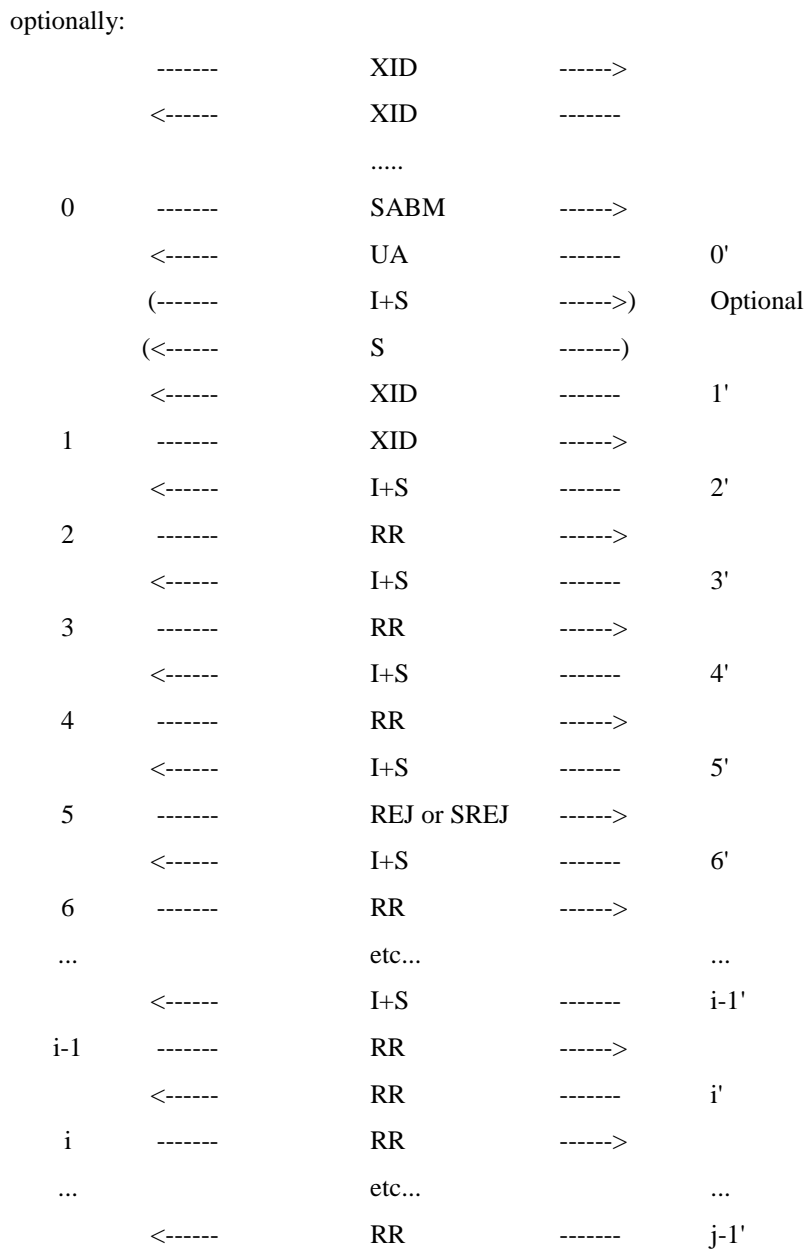

#### Maximum duration of test

1 minute.

Expected sequence

Case 2

|                         |        |             |        |                          |

|                         | <----- | RR          | -----  | j+K <sub>MI</sub> +1'    |
| ...                     |        | etc...      |        | ...                      |
| j+K <sub>MI</sub> +N2   | -----  | RR (P=1)    | -----> |                          |
|                         | <----- | RR          | -----  | j+K <sub>MI</sub> +N2'   |
| j+K <sub>MI</sub> +N2+1 | -----  | SABM / DISC | -----> |                          |
|                         | <----- | UA          | -----  | j+K <sub>MI</sub> +N2+1' |

The frame from the SS will be:

Case 1:

0': One XID frame containing: C=1, P=1.

1': One UA frame containing: R=0, F=1. Note: If SABM is received before the reception of the XID response frame, the SS will wait for the XID before sending the UA frame.

Case 2:

0': One UA frame containing: R=0, F=1.

1': One XID frame containing: C=1, P=1.

2': One I+S frame containing  $N(S)=N_{ss} \bmod(62)$ ,  $N(R)=N_{ms} \bmod(62)$ .

3': One I+S frame containing  $N(S)=N_{ss}+K_{IM}+1 \bmod(62)$ ,  $N(R)=N_{ms} \bmod(62)$ .

4': A delay D ( $T_2 < D < T_1$ ) after step 3', one I+S frame containing  $N(S)=N_{ss}+1 \bmod(62)$ ,  $N(R)=N_{ms} \bmod(62)$ .

5': One I+S frame containing  $N(S)=N_{ss}+K_{IM}+1 \bmod(62)$ ,  $N(R)=N_{ms} \bmod(62)$ .

If REJ frame is used by the MS:

6',..., K<sub>IM</sub>+5': One I+S frame containing  $N(S)=N_{ss}+2, \dots, N_{ss}+K_{IM}+1 \bmod(62)$ ,  $N(R)=N_{ms} \bmod(62)$ .

K<sub>IM</sub>+6',...,i-1': One I+S frame containing  $N(S)=N_{ss}+K_{IM}+2, \dots, k-1 \bmod(62)$ ,  $N(R)=N_{ms} \bmod(62)$ .

If SREJ frame is used by the MS:

6',..., K<sub>IM</sub>+4': One I+S frame containing  $N(S)=N_{ss}+2, \dots, N_{ss}+K_{IM} \bmod(62)$ ,  $N(R)=N_{ms} \bmod(62)$ .

K<sub>IM</sub>+5',...,i-1': One I+S frame containing  $N(S)=N_{ss}+K_{IM}+2, \dots, k-1 \bmod(62)$ ,  $N(R)=N_{ms} \bmod(62)$ .

The SS stops sending I+S frames.

i',...,j-1': One RR frame containing,  $N(R)=N_{ms} \bmod(62)$ .

j',...,j+K<sub>MI</sub>-1': One RR frame containing  $N(R)=N_{ms} \bmod(62)$ .

j+K<sub>MI</sub>',...,j+K<sub>MI</sub>+N2': One RR (R=0, F=0) frame containing  $N(R)=N_{ms} \bmod(62)$ .

$j+K_{MI}+N_2+1$ : One UA (R=0) frame with F bit set to P bit received in SABM or DISC frame.

### Specific message content

The frame from the MS shall be:

Case 1:

0: One XID frame containing: R=0, F=1. The MS may changed the RLP parameters. In this case the SS verifies the correct sense of negotiation. The final parameters are noted (T1, T2, N2,  $K_{IM}$ ,  $K_{MI}$ ).

1: One SABM frame containing: C=1,P=1.

NOTE: The MS may send an SABM frame before the XID.

Case 2:

0: One SABM frame containing: C=1,P=1.

1: One XID frame containing: R=0, F=1. The MS may changed the RLP parameters. In this case the SS verifies the correct sense of negotiation. The final parameters are noted (T1, T2, N2,  $K_{IM}$ ,  $K_{MI}$ ).

2: One RR frame containing  $N(R)=N_{ss}+1 \bmod (62)$  within T2.

3: One RR frame containing  $N(R)=N_{ss}+1 \bmod (62)$ .

4: One RR frame containing  $N(R)=N_{ss}+2 \bmod (62)$ .

5: One REJ or SREJ frame containing  $N(R)=N_{ss}+2 \bmod (62)$ .

If REJ frame is used by the MS:

6,...,  $K_{IM}+5$ : One RR frame containing  $N(R)=N_{ss}+3, \dots, N_{ss}+K_{IM}+2 \bmod(62)$ .

$K_{IM}+6, \dots, i-1$ : One RR frame containing  $N(R)=N_{ss}+K_{IM}+3, \dots, k \bmod(62)$ .

If SREJ frame is used by the MS:

6,...,  $K_{IM}+3$ : One RR frame containing  $N(R)=N_{ss}+3, \dots, N_{ss}+K_{IM} \bmod(62)$ .

$K_{IM}+4$ : One RR frame containing  $N(R)=N_{ss}+K_{IM}+2 \bmod(62)$ .

$K_{IM}+5, \dots, i-1$ : One RR frame containing  $N(R)=N_{ss}+K_{IM}+3, \dots, k \bmod(62)$ .

$i, \dots, j-1$ : One RR frame containing,  $N(R)=k \bmod (62)$ .

The MS starts sending data.

$j, \dots, j+K_{MI}-1$ : One I+S frame containing  $N(S)=N_{MS}, \dots, N_{MS}+K_{MI}-1 \bmod(62)$ ,  $N(R)=k \bmod (62)$ .

$j+K_{MI}$ : T1 after the last I+S frame sent, one supervisory RR (C=1, P=1) frame containing  $N(R)=k \bmod (62)$ .

$j+K_{MI}+1, \dots, j+K_{MI}+N_2$ : At T1 expiry, one supervisory RR (C=1, P=1) frame containing  $N(R)=k \bmod (62)$ .

$j+K_{MI}+N_2+1$ : One SABM (C=1, P=1) or DISC (C=1) frame.

## 29.3.3.2 Negotiation initiated by the MS

### 29.3.3.2.1 Definition and applicability

The XID negotiation procedure allows RLP parameters to be negotiated between peer RLP entities.

This test is only applicable to those MS's which support non-default RLP parameters.

### 29.3.3.2.2 Conformance requirements

The MS shall be able to initiate a negotiation with the network when its RLP parameters are set to non default values. It shall then configure its RLP parameters accordingly. It shall do so in ABM mode as well as in ADM mode.  
3GPP TS 04.22, subclause 5.2.2.6.

#### References

3GPP TS 04.22 subclause 5.2.2.6.

### 29.3.3.2.3 Test purpose

To test that the MS initiate the negotiation if RLP parameters are different from default parameters.

### 29.3.3.2.4 Method of test

#### Initial Conditions

##### System Simulator:

The SS is configured to use default RLP parameters.

##### Mobile Station:

The MS is configured to use RLP arbitrary chosen parameters different from the default parameters.

1. The MS is made to establish a MO non transparent data call. In initial conditions MS is in call state U10 ("Call Active") after having sent a CONN\_ACK message.
2. The MS is made to establish a MT non transparent data call. In initial conditions MS is in call state U10 ("Call Active") after having received a CONN\_ACK message.

This test is performed for initial conditions 1 and 2.

Once in ABM, the SS shall initiate the transmission of an I+S frame, which will transfer L2RCOP status information between peer L2RCOP entities (SS to MS). The MS may respond with an I+S frame containing L2RCOP status information. The SS shall be capable of initiating this sequence, or responding to an I+S L2RCOP status frame from the MS.

#### Related PICS/PIXIT statements

Supported bearer services; characteristics of non-transparent services.

#### Foreseen final state of the MS

Idle.

#### Test procedure

The MS shall send an XID (C=1, P=1) frame containing a set of RLP parameters different from the default set. The SS answers with XID (R=0, F=1) containing new parameters randomly chosen, the sense of negotiation is correct. Optionally, a renegotiation initiated by the MS should be possible, if the parameters, randomly chosen by the SS are not supported by the MS. In this case, the SS should accept the parameters renegotiated by the MS, if they are within the allowed range defined in 3GPP TS 04.22. The final parameters are noted (T1, T2, N2, K<sub>IM</sub> (window IWF (SS) -> MS), K<sub>MI</sub> (window MS -> IWF (SS))).

The MS established the ABM mode by sending a SABM (C=1, P=1) frame. The SS answers with a UA (R=0, F=1) frame. The SABM frame may be sent by the MS before the XID. In such a case, the SS answers to the XID after having established the ABM mode (i.e. after having sent the UA).

The SS checks that the MS uses the new parameters determined during the negotiation procedure.

Verification of T2:

The SS is configured to send I+S frames with a delay inferior to T1 between each frame. The MS is made to send no user data, it sends only supervisory frame.

The SS sends an I+S frame numbered  $N(S)=N_{ss} \bmod(62)$ , the MS shall acknowledge this frame within T2.

#### Verification of $K_{IM}$ :

The SS sends an I+S frame numbered  $N_{ss}+K_{IM}+1 \bmod(62)$ . The MS shall ignore this frame (out of the window), it shall not acknowledge or reject it. This is checked during at least T2.

The SS sends an I+S frame numbered  $N(S)=N_{ss}+1 \bmod(62)$ , the MS shall acknowledge this frame.

The SS sends an I+S frame numbered  $N_{ss}+K_{IM}+1 \bmod(62)$ . The MS shall reject all the lost frames numbered  $N_{ss}+2 \bmod(62)$  to  $N_{ss}+K_{IM} \bmod(62)$ . It shall send a REJ or SREJ frame with  $N(R)=N_{ss}+2 \bmod(62)$

If REJ frame is used by the MS, the SS restarts the transmission of I+S frames from frame numbered  $N_{ss}+2 \bmod(62)$ . The MS shall acknowledge these frames. After having sent at least the frame numbered  $N_{ss}+K_{IM}+2 \bmod(62)$ , the SS stops sending I+S frames.

If SREJ frame is used by the MS, the SS restarts the transmission of I+S frames from frame numbered  $N_{ss}+2 \bmod(62)$ . It does send the frame numbered  $N_{ss}+K_{IM}+1 \bmod(62)$  a second time. The MS shall acknowledge these frames. After having sent at least the frame numbered  $N_{ss}+K_{IM}+2 \bmod(62)$ , the SS stops sending I+S frames.

#### Verification of $K_{MI}$ :

The MS is now configured to send continuously I+S frames with a delay inferior to T1 between each frame.

The MS sends I+S frames, the SS does not acknowledge these frames.

After having sent  $K_{MI}$  I+S frames, the MS shall stop sending I+S frames (end of the window).

#### Verification of T1:

At the expiry of T1 after the last I+S frame, the MS shall enter in "checkpoint recovery" mode, it shall send a supervisory RR frame with C=1 and P=1.

The SS does not answer to checkpointing.

#### Verification of N2:

At the expiry of T1 after the last RR (C=1, P=1) frame, the MS shall resend a supervisory RR frame with C=1 and P=1. The SS does not answer to checkpointing. This is repeated N2 times.

After N2 retransmissions of the same RR frame (C=1, P=1), The MS shall reset or disconnect the RLP link by sending a SABM (C=1,P=1) or a DISC (C=1) frame. The SS answers with an UA (R=0) frame with F bit set to P bit received in SABM or DISC frame.

The MS is returned to the idle state by clearing of the call.

| j+K <sub>MI</sub>       | -----> | RR          | -----> |                       |
|                         | <----- | RR          | -----  | j+K <sub>MI</sub> '   |

The frame from the SS will be:

- 0': One XID frame containing: R=0, F=1. The RLP parameters are changed by the SS, the sense of negotiation is correct. The final parameters are noted (T1, T2, N2,  $K_{IM}$ ,  $K_{MI}$ ).
- 1': One UA frame containing: R=0, F=1. Note: If SABM is received before the XID, the SS answers to the XID after having established the ABM mode (i.e. after having sent the UA).
- 2': One I+S frame containing  $N(S)=N_{SS} \bmod(62)$ ,  $N(R)=N_{MS} \bmod(62)$ .
- 3': One I+S frame containing  $N(S)=N_{SS}+K_{IM}+1 \bmod(62)$ ,  $N(R)=N_{MS} \bmod(62)$ .
- 4': A delay D ( $T2 < D < T1$ ) after step 3', one I+S frame containing  $N(S)=N_{SS}+1 \bmod(62)$ ,  $N(R)=N_{MS} \bmod(62)$ .
- 5': One I+S frame containing  $N(S)=N_{SS}+K_{IM}+1 \bmod(62)$ ,  $N(R)=N_{MS} \bmod(62)$ .

If REJ frame is used by the MS:

- $6', \dots, K_{IM}+5'$ : One I+S frame containing  $N(S)=N_{SS}+2, \dots, N_{SS}+K_{IM}+1 \bmod(62)$ ,  $N(R)=N_{MS} \bmod(62)$ .
- $K_{IM}+6', \dots, i-1'$ : One I+S frame containing  $N(S)=N_{SS}+K_{IM}+2, \dots, k-1 \bmod(62)$ ,  $N(R)=N_{MS} \bmod(62)$ .

If SREJ frame is used by the MS:

- $6', \dots, K_{IM}+4'$ : One I+S frame containing  $N(S)=N_{SS}+2, \dots, N_{SS}+K_{IM} \bmod(62)$ ,  $N(R)=N_{MS} \bmod(62)$ .
- $K_{IM}+5', \dots, i-1'$ : One I+S frame containing  $N(S)=N_{SS}+K_{IM}+2, \dots, k-1 \bmod(62)$ ,  $N(R)=N_{MS} \bmod(62)$ .

The SS stops sending I+S frames.

- $i', \dots, j-1'$ : One RR frame containing,  $N(R)=N_{MS} \bmod(62)$ .
- $j', \dots, j+K_{MI}-1'$ : One RR frame containing  $N(R)=N_{MS} \bmod(62)$ .
- $j+K_{MI}', \dots, j+K_{MI}+N2'$ : One RR (R=0, F=0) frame containing  $N(R)=N_{MS} \bmod(62)$ .
- $j+K_{MI}+N2+1'$ : One UA (R=0) frame with F bit set to P bit received in SABM or DISC frame.

### 29.3.3.2.5 Test requirements

#### Specific message content

The frame from the MS shall be:

- 0: One XID frame containing: C=1, P=1.
  - 1: One SABM frame containing: C=1, P=1.
- NOTE: The MS may send the SABM frame before the XID.
- 2: One RR frame containing  $N(R)=N_{SS}+1 \bmod(62)$  within T2.
  - 3: One RR frame containing  $N(R)=N_{SS}+1 \bmod(62)$ .

4: One RR frame containing  $N(R)=N_{ss}+2 \bmod (62)$ .

5: One REJ or SREJ frame containing  $N(R)=N_{ss}+2 \bmod (62)$ .

If REJ frame is used by the MS:

6,...,  $K_{IM}+5$ : One RR frame containing  $N(R)=N_{ss}+3, \dots, N_{ss}+K_{IM}+2 \bmod(62)$ .

$K_{IM}+6, \dots, i-1$ : One RR frame containing  $N(R)=N_{ss}+K_{IM}+3, \dots, k \bmod(62)$ .

If SREJ frame is used by the MS:

6,...,  $K_{IM}+3$ : One RR frame containing  $N(R)=N_{ss}+3, \dots, N_{ss}+K_{IM} \bmod(62)$ .

$K_{IM}+4$ : One RR frame containing  $N(R)=N_{ss}+K_{IM}+2 \bmod(62)$ .

$K_{IM}+5, \dots, i-1$ : One RR frame containing  $N(R)=N_{ss}+K_{IM}+3, \dots, k \bmod(62)$ .

$i, \dots, j-1$ : One RR frame containing,  $N(R)=k \bmod (62)$ .

The MS starts sending data.

$j, \dots, j+K_{MI}-1$ : One I+S frame containing  $N(S)=N_{MS}, \dots, N_{MS}+K_{MI}-1 \bmod(62)$ ,  $N(R)=k \bmod (62)$ .

$j+K_{MI}$ : T1 after the last I+S frame sent, one supervisory RR (C=1, P=1) frame containing  $N(R)=k \bmod (62)$ .

$j+K_{MI}+1, \dots, j+K_{MI}+N2$ : At T1 expiry, one supervisory RR (C=1, P=1) frame containing  $N(R)=k \bmod (62)$ .

$j+K_{MI}+N2+1$ : One SABM (C=1, P=1) or DISC (C=1) frame.

### 29.3.3.3 Collision of XID frames

#### 29.3.3.3.1 Definition and applicability

The XID negotiation procedure allows RLP parameters to be negotiated between peer RLP entities. If a collision of XID frames occurs, the MS shall ignore all XID frames and restart the parameter negotiation on expiry of timer T1.

This test is only applicable to those MS's which support non-default RLP parameters.

#### 29.3.3.3.2 Conformance requirements

The MS shall be able to ignore an XID frame from the network in the case where it has sent a XID frame asking for a negotiation to the network, and to restart the negotiation procedure after expiry of timer T1. 3GPP TS 04.22, 5.2.2.6.

#### References

3GPP TS 04.22 subclause 5.2.2.6.

#### 29.3.3.3.3 Test purpose

To test that the correct reaction of the MS to a collision of XID frames.

#### 29.3.3.3.4 Method of test

##### Initial Conditions

System Simulator:

The SS is configured to use default RLP parameters.

Mobile Station:

The MS is configured to use RLP parameters different from the default parameters and arbitrary chosen.

The MS is made to establish a MO non transparent data call. In initial conditions MS is in call state U10 ("Call Active") after having sent a CONN\_ACK message.

Once in ABM, the SS shall initiate the transmission of an I+S frame, which will transfer L2RCOP status information between peer L2RCOP entities (SS to MS). The MS may respond with an I+S frame containing L2RCOP status information. The SS shall be capable of initiating this sequence, or responding to an I+S L2RCOP status frame from the MS.

#### Related PICS/PIXIT statements

Supported bearer services; characteristics of non-transparent services.

#### Foreseen final state of the MS

Idle.

#### Test procedure

The MS shall send an XID (C=1, P=1) frame containing a set of RLP parameters different from the default set. The SS sends a XID (C=1, P=1) command frame containing new parameters. After a delay the MS shall resend the same XID that it has previously sent. The SS answers with XID (R=0, F=1) accepting the parameters chosen by the MS. These parameters are noted (T1, T2, N2, K<sub>IM</sub> (window IWF (SS) -> MS), K<sub>MI</sub> (window MS -> IWF (SS))).

The MS established the ABM mode by sending a SABM (C=1, P=1) frame. The SS answers with a UA (R=0, F=1) frame. The SABM frame may be sent by the MS at any instant (i.e. just after having received an XID, before having sent the response). In such a case, the SS answers to the XID after having established the ABM mode (i.e. after having sent the UA).

The SS checks that the MS uses the new parameters determined during the negotiation procedure.

#### Verification of T2:

The SS is configured to send I+S frames with a delay inferior to T1 between each frame. The MS is made to send no user data, it sends only supervisory frame.

The SS sends an I+S frame numbered  $N(S)=N_{ss} \bmod(62)$ , the MS shall acknowledge this frame within T2.

#### Verification of K<sub>IM</sub>:

The SS sends an I+S frame numbered  $N_{ss}+K_{IM}+1 \bmod(62)$ . The MS shall ignore this frame (out of the window), it shall not acknowledge or reject it. This is checked during at least T2.

The SS sends an I+S frame numbered  $N(S)=N_{ss}+1 \bmod(62)$ , the MS shall acknowledge this frame.

The SS sends an I+S frame numbered  $N_{ss}+K_{IM}+1 \bmod(62)$ . The MS shall reject all the lost frames numbered  $N_{ss}+2 \bmod(62)$  to  $N_{ss}+K_{IM} \bmod(62)$ . It shall send a REJ or SREJ frame with  $N(R)=N_{ss}+2 \bmod(62)$ .

If REJ frame is used by the MS, the SS restarts the transmission of I+S frames from frame numbered  $N_{ss}+2 \bmod(62)$ . The MS shall acknowledge these frames. After having sent at least the frame numbered  $N_{ss}+K_{IM}+2 \bmod(62)$ , the SS stops sending I+S frames.

If SREJ frame is used by the MS, the SS restarts the transmission of I+S frames from frame numbered  $N_{ss}+2 \bmod(62)$ . It does send the frame numbered  $N_{ss}+K_{IM}+1 \bmod(62)$  a second time. The MS shall acknowledge these frames. After having sent at least the frame numbered  $N_{ss}+K_{IM}+2 \bmod(62)$ , the SS stops sending I+S frames.

#### Verification of K<sub>MI</sub>:

The MS is now configured to send continuously I+S frames with a delay inferior to T1 between each frame.

The MS sends I+S frames, the SS does not acknowledge these frames.

After having sent K<sub>MI</sub> I+S frames, the MS shall stop sending I+S frames (end of the window).

#### Verification of T1:

At the expiry of T1 after the last I+S frame, the MS shall enter in "checkpoint recovery" mode, it shall send a supervisory RR frame with C=1 and P=1.

The SS does not answer to checkpointing.

Verification of N2:

At the expiry of T1 after the last RR (C=1, P=1) frame, the MS shall resend a supervisory RR frame with C=1 and P=1. The SS does not answer to checkpointing. This is repeated N2 times.

After N2 retransmissions of the same RR frame (C=1, P=1), The MS shall reset or disconnect the RLP link by sending a SABM (C=1,P=1) or a DISC (C=1) frame. The SS answers with an UA (R=0) frame with F bit set to P bit received in SABM or DISC frame.

The MS is returned to the idle state by clearing of the call.

Maximum duration of test

1 minute.

Expected sequence

| MS                      |        |                    | SS                       |

| ...                     |        | etc...             | ...                      |
|                         | <----- | RR                 | j-1'                     |
| j-1                     | -----  | RR ----->          |                          |
| j                       | -----  | I+S ----->         |                          |
|                         | <----- | RR                 | j'                       |
| ...                     |        | etc...             | ...                      |
| j+K <sub>MI</sub> -1    | -----  | I+S ----->         |                          |
|                         | <----- | RR                 | j+K <sub>MI</sub> -1'    |
| j+K <sub>MI</sub>       | -----  | RR ----->          |                          |
|                         | <----- | RR                 | j+K <sub>MI</sub> '      |
| j+K <sub>MI</sub> +1    | -----  | RR ----->          |                          |
|                         | <----- | RR                 | j+K <sub>MI</sub> +1'    |
| ...                     |        | etc...             | ...                      |
| j+K <sub>MI</sub> +N2   | -----  | RR ----->          |                          |
|                         | <----- | RR                 | j+K <sub>MI</sub> +N2'   |
| j+K <sub>MI</sub> +N2+1 | -----  | SABM / DISC -----> |                          |
|                         | <----- | UA                 | j+K <sub>MI</sub> +N2+1' |

The frame from the SS will be:

- 0': One XID frame containing: C=1, P=1.
- 1': One XID frame containing: R=0, F=1. The RLP parameters are changed by the SS, the sense of negotiation is correct. The final parameters are noted (T1, T2, N2, K<sub>IM</sub>, K<sub>MI</sub>).
- 2': One UA frame containing: R=0, F=1. Note: If SABM is received before one of the XID frames, the SS will answer to the XID after having established the ABM mode (i.e. after having sent the UA).
- 3': One I+S frame containing  $N(S)=N_{ss} \bmod(62)$ ,  $N(R)=N_{ms} \bmod(62)$ .
- 4': One I+S frame containing  $N(S)=N_{ss}+K_{IM}+1 \bmod(62)$ ,  $N(R)=N_{ms} \bmod(62)$ .
- 5': A delay D ( $T_2 < D < T_1$ ) after step 3', one I+S frame containing  $N(S)=N_{ss}+1 \bmod(62)$ ,  $N(R)=N_{ms} \bmod(62)$ .
- 6': One I+S frame containing  $N(S)=N_{ss}+K_{IM}+1 \bmod(62)$ ,  $N(R)=N_{ms} \bmod(62)$ .

If REJ frame is used by the MS:

- 7',..., K<sub>IM</sub>+6': One I+S frame containing  $N(S)=N_{ss}+2, \dots, N_{ss}+K_{IM}+1 \bmod(62)$ ,  $N(R)=N_{ms} \bmod(62)$ .
- K<sub>IM</sub>+7',...,i-1': One I+S frame containing  $N(S)=N_{ss}+K_{IM}+2, \dots, k-1 \bmod(62)$ ,  $N(R)=N_{ms} \bmod(62)$ .

If SREJ frame is used by the MS:

- 7',..., K<sub>IM</sub>+5': One I+S frame containing  $N(S)=N_{ss}+2, \dots, N_{ss}+K_{IM} \bmod(62)$ ,  $N(R)=N_{ms} \bmod(62)$ .
- K<sub>IM</sub>+6',...,i-1': One I+S frame containing  $N(S)=N_{ss}+K_{IM}+2, \dots, k-1 \bmod(62)$ ,  $N(R)=N_{ms} \bmod(62)$ .

The SS stops sending I+S frames.

- i',...,j-1': One RR frame containing,  $N(R)=N_{ms} \bmod(62)$ .
- j',...,j+K<sub>MI</sub>-1': One RR frame containing  $N(R)=N_{ms} \bmod(62)$ .
- j+K<sub>MI</sub>',...,j+K<sub>MI</sub>+N<sub>2</sub>': One RR (R=0, F=0) frame containing  $N(R)=N_{ms} \bmod(62)$ .
- j+K<sub>MI</sub>+N<sub>2</sub>+1': One UA (R=0) frame with F bit set to P bit received in SABM or DISC frame.

### 29.3.3.3.5 Test requirements

#### Specific message content

The frame from the MS shall be:

- 0: One XID frame containing: C=1, P=1.
  - 1: After T1(def) expiry, one XID frame containing: C=1, P=1.
- NOTE: The MS may send an SABM frame before the 1st or the 2nd XID frame.
- 2: One SABM frame containing: C=1,P=1.
  - 3: One RR frame containing  $N(R)=N_{ss}+1 \bmod(62)$  within T2.
  - 4: One RR frame containing  $N(R)=N_{ss}+1 \bmod(62)$ .
  - 5: One RR frame containing  $N(R)=N_{ss}+2 \bmod(62)$ .
  - 6: One REJ or SREJ frame containing  $N(R)=N_{ss}+2 \bmod(62)$ .

If REJ frame is used by the MS:

- 7',..., K<sub>IM</sub>+6: One RR frame containing  $N(R)=N_{ss}+3, \dots, N_{ss}+K_{IM}+2 \bmod(62)$ .
- K<sub>IM</sub>+7',...,i-1: One RR frame containing  $N(R)=N_{ss}+K_{IM}+3, \dots, k \bmod(62)$ .

If SREJ frame is used by the MS:

7,...,  $K_{IM}+4$ : One RR frame containing  $N(R)=N_{ss}+3, \dots, N_{ss}+K_{IM} \bmod(62)$ .

$K_{IM}+5$ : One RR frame containing  $N(R)=N_{ss}+K_{IM}+2 \bmod(62)$ .

$K_{IM}+6, \dots, i-1$ : One RR frame containing  $N(R)=N_{ss}+K_{IM}+3, \dots, k \bmod(62)$ .

$i, \dots, j-1$ : One RR frame containing,  $N(R)=k \bmod(62)$ .

The MS starts sending data.

$j, \dots, j+K_{MI}-1$ : One I+S frame containing  $N(S)=N_{MS}, \dots, N_{MS}+K_{MI}-1 \bmod(62)$ ,  $N(R)=k \bmod(62)$ .

$j+K_{MI}$ : T1 after the last I+S frame sent, one supervisory RR (C=1, P=1) frame containing  $N(R)=k \bmod(62)$ .

$j+K_{MI}+1, \dots, j+K_{MI}+N2$ : At T1 expiry, one supervisory RR (C=1, P=1) frame containing  $N(R)=k \bmod(62)$ .

$j+K_{MI}+N2+1$ : One SABM (C=1, P=1) or DISC (C=1) frame.

### 29.3.3.4 Loss of XID frames

#### 29.3.3.4.1 Conformance requirements

The MS shall repeat an XID frame upon expiry of RLP timer T1 if the network has not acknowledged it by a correct XID frame.

#### References

3GPP TS 04.22 subclause 5.2.2.6.

#### 29.3.3.4.2 Test purpose

To test that the MS repeats the XID frame if the SS does not answer correctly.

#### 29.3.3.4.3 Test method

#### Initial Conditions

System Simulator:

The SS is configured to use default RLP parameters.

Mobile Station:

The MS is configured to use RLP parameters different from the default parameters (T1 different from T1(def)).

The MS is made to establish a MO non transparent data call. In initial conditions MS is in call state U10 ("Call Active") after having sent a CONN\_ACK message.

#### Related PICS/PIXIT statements

Supported bearer services; characteristics of non-transparent services.

#### Foreseen final state of the MS

Idle.

#### Test procedure

The MS shall send an XID (C=1, P=1) frame containing a set of RLP parameters different from the default set. The SS sends a XID (R=0, F=0) command frame. The MS shall ignore this frame.

After a delay the MS shall resend the same XID that it has previously sent. The SS does not answer.

After a delay the MS shall resend the same XID that it has previously sent. The SS answers with XID (R=0, F=1) accepting the parameters chosen by the MS.

The MS established the ABM mode by sending a SABM (C=1, P=1) frame. The answer with a UA (R=0, F=1) frame. The SABM frame may be sent by the MS at any instant (i.e. just after having received an XID). In such a case, the SS answers to the XID after having established the ABM mode (i.e. after having sent the UA).

The MS is returned to the idle state by clearing of the call.

#### Maximum duration of test

1 minute.

#### Expected sequence

| MS |        |      | SS |
|----|--------|------|----|
| 0  | -----> | XID  |    |
|    | <----- | XID  | 0' |
| 1  | -----> | XID  |    |
| 2  | -----> | XID  |    |
|    | <----- | XID  | 2' |
| 3  | -----> | SABM |    |
|    | <----- | UA   | 3' |

The frame from the SS will be:

0': One XID frame containing: R=0, F=0.

2': One XID frame containing: R=0, F=1. The RLP parameters are accepted by the SS.

3': One UA frame containing: R=0, F=1. Note: If SABM is received before the XID, the SS will answer to the XID after having established the ABM mode (i.e. after having sent the UA).

#### Specific message content

The frame from the MS shall be:

0: One XID frame containing: C=1, P=1.

1: After T1(def) expiry, one XID frame containing: C=1, P=1.

2: After T1(def) expiry, one XID frame containing: C=1, P=1.

3: One SABM frame containing: C=1,P=1.

NOTE: The MS may send the SABM frame before XID(s), at any moment.

### 29.3.3.5 Total loss of XID frames

#### 29.3.3.5.1 Definition and applicability

The XID negotiation procedure allows RLP parameters to be negotiated between peer RLP entities. An unsuccessful XID exchange shall be repeated on expiry of T1. After N2 times of unsuccessful repetition, the RLP link shall be disconnected.

This test is only applicable to those MS's which support non-default RLP parameters.

### 29.3.3.5.2 Conformance requirements

The MS shall not repeat an unacknowledged XID frame more than N2 times. After N2 repetition it shall disconnect the RLP link if it had been connected earlier. 3GPP TS 04.22, subclause 5.2.2.6.

#### References

3GPP TS 04.22 subclause 5.2.2.6.

### 29.3.3.5.3 Test purpose

To test that the MS repeats the XID frame no more than N2 times, if the SS does not answer correctly.

### 29.3.3.5.4 Method of test

#### Initial Conditions

##### System Simulator:

The SS is configured to use default RLP parameters.

##### Mobile Station:

The MS is configured to use RLP parameters different from the default parameters.

The MS is made to establish a MO non transparent data call. In initial conditions MS is in call state U10 ("Call Active") after having sent a CONN\_ACK message.

#### Related PICS/PIXIT statements

Supported bearer services; characteristics of non-transparent services.

#### Foreseen final state of the MS

Idle.

#### Test procedure

Case a: The MS sends an XID (C=1, P=1) frame in ADM mode

Case b: The MS enters the ABM mode and sends an XID (C=1, P=1) frame after optional status bits exchange between the MS and the SS.

The SS does not answer.

After a delay T1 (def), the MS shall resend the same XID that it has previously sent. The SS does not answer. This step is repeated N2 (def) times.

Case a: After N2 (def) retransmissions the SS waits for  $2 * T1$  to ensure that the XID frame is not repeated any more.

Case b: After N2 (def) retransmissions the link shall be disconnected. The MS shall send a DISC (C=1) frame, and the SS answers with a UA (R=0, F equal to the P bit received in the DISC).

The MS is returned to the idle state by clearing of the call.

#### Maximum duration of test

1 minute.

Expected sequence

MS

SS

Case a:

|           |        |        |        |               |
|-----------|--------|--------|--------|---------------|
| 1         | -----> | XID    | -----> |               |
| 2         | -----> | XID    | -----> |               |
| ...       |        | etc... |        | ...           |
| N2(def)+1 | -----> | XID    | -----> |               |
|           |        |        |        | Wait for 2*T1 |

Case b:

|           |         |        |         |          |
|-----------|---------|--------|---------|----------|
| 0         | ----->  | SABM   | ----->  |          |
|           | <-----  | UA     | -----   | 0'       |
|           | (-----  | I+S    | ----->) | Optional |
|           | (<----- | S      | ----->) |          |
| 1         | ----->  | XID    | ----->  |          |
| 2         | ----->  | XID    | ----->  |          |
| ...       |         | etc... |         | ...      |
| N2(def)+1 | ----->  | XID    | ----->  |          |
| N2(def)+2 | ----->  | DISC   | ----->  |          |
|           | <-----  | UA     | ----->  | N2+2'    |

The frame from the SS will be:

0': One UA frame containing: R=0, F=1, if the MS sends a SABM.

N2+2': One UA frame containing: R=0, F equal to P bit received in DISC frame.

### 29.3.3.5.5 Test requirements

#### Specific message content

The frame from the MS shall be:

0: The MS may send a SABM frame containing: C=1, P=1. This frame may be sent at any instant. This is not verified.

1: One XID frame containing: C=1, P=1.

2,...,N2(def)+1: After T1 (def) expiry, one XID frame containing: C=1, P=1.

N2(def)+2: If the MS has previously established the ABM mode (SABM/UA exchange), it shall disconnect the link by sending a DISC (C=1) frame.

## 29.4 Facsimile tests for the transparent network support

### 29.4.1 General

According to ITU-T Recommendation T.30 a facsimile call can be divided into the following phases:

- Phase A - call establishment procedure;
- Phase B - pre-message procedure (identification and selection of required facilities);
- Phase C - message transmission according to ITU-T Recommendation T.4;
- Phase D - post-message procedure;
- Phase E - call release procedure.

For each phase a single test sequence was drafted, i.e. the verification of the basic procedures of a fax call will at least consist of 5 tests, in order to verify the above described phases.

In the IDLE state the fax adapter, originating or terminating, will send continuously SYNC frames containing the pattern specified in 3GPP TS 03.45 (CT105 (see note 2) and 109 (see note 2) are in OFF condition).

For the test of the facsimile data transmission, i.e. the phase C, test chart #2 according to ITU-T Recommendation T.21 should be used.

The T.4/30 messages marked with the '\*' sign indicate that for the transmission across the radio interface in case of the BCS phase STATUS frames are used, and in case of the message phase the usage of DATA frames is implied.

Manufacturer-declared fax equipment should be connected to the MS, i.e. where possible a fax adapter and a fax machine Group 3. Measuring devices to monitor the T.4/T.30 protocol, the circuits and the SYNC, STATUS and DATA frames should be provided. Configurations, where no access to the interfaces to monitor the protocol and circuits is possible, might exist.

## 29.4.2 Mobile originated call

### 29.4.2.1 Call establishment procedure

#### 29.4.2.1.1 Alternate speech / facsimile

##### 29.4.2.1.1.1 Definition and applicability

This test is applicable to an MS supporting TS 61.

##### 29.4.2.1.1.2 Conformance requirement

An MS supporting transparent facsimile group 3 shall perform the ICM and shall support the frames and circuits at the Um-, R- and 2w-interface according to the specifications referred to in the subclause "Reference".

##### Reference

3GPP TS 03.45, 3GPP TS 07.01, ITU-T Recommendation T.30.

##### 29.4.2.1.1.3 Test purpose

To verify the transition from speech to fax in case of an MS supporting TS 61 and that the circuit and tone handling of the MT and FA is correct.

##### 29.4.2.1.1.4 Method of test

##### Initial conditions

A TS 61 s/f call is set up. The speech phase is active.

## Test procedure

The transition from speech to fax is initiated by manual intervention at both ends of the connection. The data call direction DCD is mobile originated. Upon connection to line the FA turns on CT108.2 (see note 2) as a basic requirement for the transition from speech to fax. Now, within the next 3 seconds the FA has to detect the DCD, which is in this case is mobile originated, i.e. CT105 is set to ON (see note 2) condition. The following ICM procedure via the MODIFY message is carried out by the MT 3 seconds after circuit CT108.2 was set to ON (see note 2) condition. On completion of the ICM procedure the synchronization of the TCH begins and after its completion the MT has to set CT107 to ON (see note 2) condition and the FA has to send the CED tone (see note 2) towards the connected fax. When CT106/109 are set to ON (see note 2) phase A is completed. Then the call is cleared by manual intervention at the MT or the activity progress of the call proceeds to the next phase.

## Expected sequence

| MS:  | SS:                                                                      |
|------|--------------------------------------------------------------------------|
| Step | Direction                                                                |
| 1    | MS-->SS                                                                  |
|      | Fax: Connect to line (see note 1)                                        |

|      | FA: Enter BCS-TRA state Enter BCS-REC state                              |

### 29.4.2.1.1.5 Test requirements

1. The condition of CT108.2 and CT105 is verified (see note 2); CT106, 107, 109 have to be in OFF (see note 2) condition. The MODIFY message has to be sent 3 seconds after circuit CT108.2 has gone to ON condition (see note 2).
2. To be verified that the MT begins the synchronization phase by sending the pattern 1/OFF after the reception of the MODIFY COMPLETE message, that CT107 is turned on (see note 2) by the MT after successful synchronization and that the CED tone (see note 2) is transmitted by the FA after CT107 has gone to ON condition (see note 2).
3. To be verified that CT106 and CT109 are turned on (see note 2), when in the modified V.110 frames received from the SS the X and SB bits are set. The state of the FA shall be verified (-> BCS-TRA).

### 29.4.2.1.2 Automatic facsimile

#### 29.4.2.1.2.1 Definition and applicability

This test is applicable to an MS supporting TS 62.

#### 29.4.2.1.2.2 Conformance requirement

The MS supporting transparent facsimile group 3 shall perform the call setup procedure and shall support the frames and the circuits at the Um-,R- and 2w-interface according the specifications referred to in the subclause "Reference".

## Reference

3GPP TS 03.45, 3GPP TS 07.01, ITU-T Recommendation T.30.

### 29.4.2.1.2.3 Test purpose

To verify that the circuit and tone handling of the MT and FA is correct.

### 29.4.2.1.2.4 Method of test

#### Initial conditions

The MS, configured for the TS 62 fax call, is updated. Then the call establishment phase A begins.

#### Test procedure

The FA sets CT108.2 to ON (see note 2) condition and passes the dialling information to the MT. A SETUP message is then sent by the MT towards the SS. When the TCH is available (indicated by the CONNECT message) the synchronization phase begins, i.e. both entities start sending the synchronization pattern 1/OFF. CT106, 107, 109 have to be in OFF condition (see note 2). Upon completion of the synchronization phase the MT sets CT107 to ON condition (see note 2) causing the FA to connect the fax to line. The SS sets CT106 and CT109 to ON at the MT by means of the V.110 X and SB bits. The FA then generates the CED tone (see note 2), which completes phase A. Then the call is cleared by manual intervention at the MT or the activity progress of the call proceeds to the next phase.

#### Expected sequence

| MS:  | SS:                                             |

|      | TCH Synchronization                             |
|      | MT: CT107 ON (see note 2), when synchronized    |
|      | <-----> TCH Synchronization                     |
| 4    | SS-->MS                                         |
|      | MT: CT106/109 ON (see note 2)                   |
|      | FA: Generate CED (see note 2)                   |
|      | Fax: Detect CED (see note 2)                    |
|      | <----- Set X and SB bit in V.110 frame          |
| 5    | FA: Enter BCS-TRA state (see note 3)            |
|      | Enter BCS-REC state                             |

### 29.4.2.1.2.5 Test requirements

1. The condition of CT108.2 (see note 2) is verified and the SETUP message should contain the BC-IE for TS 62.
2. To be verified that at the MT CT106, 107, 109 are in OFF (see note 2) condition, that the MT begins the synchronization phase by sending the pattern 1/OFF and that CT107 (see note 2) is turned on by the MT after successful synchronization.
3. To be verified that CT106 and CT109 are turned on (see note 2), when in the V.110 frames received from the SS the X and SB bits are set and that the FA sends the CED (see note 2) tone towards the fax machine.
4. The state of the FA shall be verified (-> BCS-TRA).

## 29.4.2.2 Pre-message procedure

### 29.4.2.2.1 Definition and applicability

This test is applicable to an MS supporting TS 61 and/or TS 62.

### 29.4.2.2.2 Conformance requirement

The MS supporting transparent facsimile group 3 shall perform the pre-message procedure and shall support the frames and the circuits at the Um-,R- and 2w-interface according to the specifications referred to in the subclause "Reference".

## Reference

3GPP TS 03.45, ITU-T Recommendation T.30.

## 29.4.2.2.3 Test purpose

To verify the correct handling of the T.30 DIS/DCS/TCF frames.

## 29.4.2.2.4 Method of test

## Initial conditions

The activity progress of the fax call is brought to the beginning of Phase B.

## Test procedure

After phase A the FA is in BCS-TRA state and sends SYNC frames. The SS being in BCS-REC state sends the T.30 DIS embedded in STATUS frames indicating its capabilities. The received DIS is checked, if necessary edited by the FA and sent to the fax. Then the FA returns to the idle state. The fax checks whether the indicated capabilities are in line with its own or not, and chooses the capabilities which are supported end-to-end by the connected fax machines by answering with the DCS frame preceded by the preamble. The FA enters the BCS-REC state and the BCS information is transmitted using the STATUS frames. Afterwards the FA returns to the idle state. Upon reception of the training sequence the FA enters the MSG-REC state without waiting for an acknowledge from the SS, i.e. the TCF is conveyed by means of the DATA frames. The FA enters the idle state and sends at least 5 SYNC frames to indicate that the message phase is over. Then the CFR frame is received, i.e. the FA enters the BCS-TRA state and receives the CFR in STATUS frames. Now, phase B is completed and the data transfer phase C begins. Then the call is cleared by manual intervention at the MT or the activity progress of the call proceeds to the next phase.

## Expected sequence

| MS:<br>Step | Direction |                                                                                                                                                                     | SS:                           |

#### 29.4.2.2.5 Test requirements

1. To be verified that SYNC frames are transmitted across the radio interface in BCS-TRA and in the IDLE state and that CT105 is set to OFF (see note 2). The correct generation of the T.30 BCS shall be verified (down-conversion to the BCS speed according to 3GPP TS 03.45).
2. The condition of CT109 shall be verified (see note 2); that the DCS is correctly inserted into the STATUS frames and that the IDENT octet contains the BCS-REC identifier. At CT109=OFF (see note 2), the FA returns to the idle state and sends SYNC frames (pattern according to 3GPP TS 03.45).
3. To be verified that the FA turns on CT109 (see note 2), enters the MSG-REC state and sends the TCF embedded in DATA frames without waiting for the confirmation that the SS has entered the MSG-TRA state. The ident octet has to be checked (-> MSG-REC). CT109 shall be in OFF condition (see note 2).
4. The condition of CT105 (see note 2) is to be verified. The correct generation of the T.30 BCS shall be checked. In IDLE state SYNC frames have to be sent.

#### 29.4.2.3 Message procedure

##### 29.4.2.3.1 Definition and applicability

This test is applicable to an MS supporting TS 61 and/or TS 62.

##### 29.4.2.3.2 Conformance requirement

The MS supporting transparent facsimile group 3 shall perform the message procedure and shall support the frames and the circuits at the Um-,R- and 2w-interface according the specifications referred to in the subclause "Reference".

##### Reference

3GPP TS 03.45, ITU-T Recommendation T.30, ITU-T Recommendation T.4, ITU-T Recommendation T.21.

##### 29.4.2.3.3 Test purpose

To verify the facsimile data transmission phase.

##### 29.4.2.3.4 Method of test

##### Initial conditions

The activity progress of the fax call is brought to the beginning of Phase C. The ECM shall not be used.

##### Test procedure

The FA is in IDLE state. The connected fax starts transmitting the fax message. Upon reception of the training sequence the FA enters the MSG-REC state and sends STATUS frames, which contain the ident octet set to MSG-REC, interleaved with SYNC frames to the SS. When the SS has entered the MSG-TRA state, which is indicated to the FA by means of the ident octet set to MSG-TRA, the FA starts sending the fax coded data (received from the connected fax) embedded in DATA frames. When the transmission is finished the FA is again in the idle state for at least 5 SYNC frames to indicate that the message phase is over and Phase D begins. Then the call is cleared by manual intervention at the MT or the activity progress of the call proceeds to the next phase.

## Expected sequence

| MS:   | SS:                             |
|-------|---------------------------------|
| Step  | Direction                       |
| ----- |                                 |

|       | "                               |
|       | "                               |
|       | "                               |
|       | CT109 OFF (see note 2)          |
|       | IDLE                            |
| 4     | MS-->SS                         |
|       | FA: Send at least               |
|       | 5 SYNC frames                   |
|       | -----> Receive SYNC frames      |

## 29.4.2.3.5 Test requirements

1. To be verified that the FA enters the MSG-REC state and inserts the correct ident octet in the STATUS frames interleaved with SYNC frames.
2. To be verified that the FA sends the fax message after the SS has sent the STATUS frames containing the MSG-TRA identifier.
3. At the end of the document transmission the condition of CT109 (see note 2) shall be checked.
4. It shall be verified that at least 5 SYNC frames are sent in order to indicate the end of phase C.

## 29.4.2.4 Post-message procedure

## 29.4.2.4.1 Definition and applicability

This test is applicable to an MS supporting TS 61 and/or TS 62.

## 29.4.2.4.2 Conformance requirement

The MS supporting transparent facsimile group 3 shall perform the post-message procedure and shall support the frames and the circuits at the Um-,R- and 2w-interface according the specifications referred to in the subclause "Reference".

## Reference

3GPP TS 03.45, ITU-T Recommendation T.30.

## 29.4.2.4.3 Test purpose

To verify phase D of the facsimile transmission.

#### 29.4.2.4.4 Method of test

##### Initial conditions

The activity progress of the fax call is brought to the beginning of Phase D. The ECM shall not be used.

##### Test procedure

The fax sends the preamble followed by the EOP frame. The FA then enters the BCS-REC state after having transmitted at least 5 SYNC frames since the last transition to the idle state and sends the EOP frame embedded in STATUS frames to the SS. The FA enters the idle state again. Upon detection of the BCS-REC identifier octet the BCS-TRA state is entered in order to receive the MCF frame issued by the SS. Then the preamble and the MCF frame are conveyed to the connected fax by the FA. The FA enters the idle state. Phase D of the fax transmission is completed. Then the call is cleared by manual intervention at the MT or the activity progress of the call proceeds to the next phase.

##### Expected sequence

| MS:  |           | SS:                                                                                                                            |                                |
|------|-----------|--------------------------------------------------------------------------------------------------------------------------------|--------------------------------|
| Step | Direction |                                                                                                                                |                                |

| 2    | SS-->MS   | FA: CT105 ON (see note 2)<br>BCS-TRA<br>Transmit preamble, MCF<br>CT105 OFF (see note 2)<br>IDLE<br>Fax: Receive preamble, MCF | <----- Send preamble*, MCF*    |

#### 29.4.2.4.5 Test requirements

- To be verified that the FA enters the BCS-REC state and inserts the correct ident octet in the STATUS frames. The up-conversion to the message speed has to be checked.. The condition of CT109 has to be verified (see note 2). The contents of the SYNC frames shall be checked.
- To be verified that the FA enters the BCS-TRA state upon detection of the BCS-REC identifier and that the correct T.30 message is conveyed to the connected fax machine (down-conversion to the BCS speed). The condition of CT105 should be checked (see note 2).

#### 29.4.2.5 Call release procedure

##### 29.4.2.5.1 Definition and applicability

This test is applicable to an MS supporting TS 61 and/or TS 62.

##### 29.4.2.5.2 Conformance requirement

The MS supporting transparent facsimile group 3 shall perform the call release procedure and shall support the frames and the circuits at the Um-,R- and 2w-interface according the specifications referred to in the subclause "Reference".

##### Reference

3GPP TS 03.45, ITU-T Recommendation T.30.

### 29.4.2.5.3 Test purpose

To verify phase E of the facsimile transmission.

### 29.4.2.5.4 Method of test

#### Initial conditions

The activity progress of the fax call is brought to the beginning of Phase E.

#### Test procedure

The fax sends the preamble followed by the DCN frame. The FA then enters the BCS-REC state and sends the DCN frame embedded in STATUS frames to the SS. The FA enters the IDLE state again. CT108.2 will go OFF condition (see note 2) and after 200ms CT109 will go to OFF condition (see note 2) too. The MT then sends the DISC message and the call is cleared.

#### Expected sequence

| MS:               | SS:                                                                                                                                                                                                |

### 29.4.2.5.5 Test requirements

To be verified that CT108.2 is turned off (see note 2) and that CT109 is set to OFF (see note 2) 200ms after the DCN frame has been sent. The contents of the STATUS frames including the ident octet has to be checked (up-conversion to the message speed according to 3GPP TS 03.45). The MT shall send the DISC message.

## 29.4.2.6 CTC processing - 4th PPR for the same block

### 29.4.2.6.1 Definition and applicability

This test is applicable to an MS supporting TS 61 and/or TS 62. The FA and the facsimile device have to support the error correction mode.

### 29.4.2.6.2 Conformance requirement

The MS supporting transparent facsimile group 3 shall perform the CTC processing procedure and shall support the frames and the circuits at the Um-,R- and 2w-interface according the specifications referred to in the subclause "Reference".

#### Reference

3GPP TS 03.45, ITU-T Recommendation T.30.

### 29.4.2.6.3 Test purpose

To verify phase D of the facsimile transmission in case of a 4th PPR for the same block.

## 29.4.2.6.4 Method of test

## Initial conditions

The activity progress of the fax call is brought to the beginning of Phase C. The ECM shall be used. The fax transmission shall start a speed of 9,6 kBit/s.

## Test procedure

The fax sends the preamble followed by the PPS-NULL(0,0) frame. The FA then enters the BCS-REC state and sends the PPS\* frame embedded in STATUS frames to the SS. The SS responds with the PPR\* frame requesting corrupted frames to be retransmitted. This test sequence is repeated 4 times causing the fax machine to send the CTC frame which indicates the fallback bit rate of 7 200 kBit/s. The FA sends the CTC\* after recognizing the new message speed to the SS. The SS responds with the CTR\* frame and the fax machine retransmits the corrupted frames which are inserted into DATA frames by the FA. After every third DATA frame the FA has to insert a SYNC frame. After the retransmission, the fax machine sends the PPS-NULL(0,0) which is answered by the SS with the MCF\* frame. Phase D of the fax transmission is completed. Then the call is cleared by manual intervention at the MT or the activity progress of the call proceeds to the next phase.

## Expected sequence

| MS:  | SS:                             |
|------|---------------------------------|
| Step | Direction                       |
| 1    | MS-->SS                         |
|      | Fax: Send training, fax message |
|      | FA: CT109 ON (see note 2)       |
|      | MSG-REC                         |

#### 29.4.2.6.5 Test requirement

It shall be verified that the FA transmits 1 SYNC frame every 3 DATA frames.

### 29.4.2.7 Transition from Facsimile to Speech - Procedure interrupt generated by receiving station

#### 29.4.2.7.1 Definition and applicability

This test is applicable to an MS supporting TS 61.

#### 29.4.2.7.2 Conformance requirement

The MS supporting transparent facsimile group 3 shall perform the ICM procedure and shall support the frames and the circuits at the Um-,R- and 2w-interface according the specifications referred to in the subclause "Reference".

#### Reference

3GPP TS 03.45, ITU-T Recommendation T.30.

#### 29.4.2.7.3 Test purpose

To verify the transition from fax to speech in case of an MS supporting TS 61.

## 29.4.2.7.4 Method of test

## Initial conditions

The activity progress of the fax call is brought to phase C (message phase). The ECM shall not be used.

## Test procedure

During the message phase a procedure interrupt is generated by the SS, which is executed as soon as phase D is entered. The SS then sends the PIP frame causing an alert at the mobile side. When the operator at the mobile side goes on line the PRI-Q frame is generated and results in an alarm at the SS side. The operator at this side going on line completes the PRI handshaking by causing the PIP frame to be sent. Upon completion of the PRI handshaking the MT executes the MODIFY procedure, which leads to the speech phase. Then the call is cleared by manual intervention at the MT or the facsimile phase maybe reselected.

## Expected sequence

| MS:  | SS:                                                                                                                                                                                                     |                                                         |
|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------|
| Step | Direction                                                                                                                                                                                               |                                                         |

## SPEECH PHASE

#### 29.4.2.7.5 Test requirements

1. To be verified that CT106/109 are in OFF (see note 2) condition.
2. To be verified that CT108.2 goes to OFF (see note 2) upon completion of the PRI handshaking, that this transition to OFF triggers the MODIFY message to be sent and that the reception of the MODIFY COMPLETE message causes CT107 to be set to OFF (see note 2) condition by the MT. In addition the availability of the speech channel shall be checked.

### 29.4.2.8 Transition from Facsimile to Speech - Procedure interrupt generated by transmitting station

#### 29.4.2.8.1 Definition and applicability

This test is applicable to an MS supporting TS 61.

#### 29.4.2.8.2 Conformance requirement

The MS supporting transparent facsimile group 3 shall perform the ICM procedure and shall support the frames and the circuits at the Um-,R- and 2w-interface according the specifications referred to in the subclause "Reference".

#### Reference

3GPP TS 03.45, ITU-T Recommendation T.30.

#### 29.4.2.8.3 Test purpose

To verify the transition from fax to speech in case of an MS supporting TS 61.

#### 29.4.2.8.4 Method of test

##### Initial conditions

The activity progress of the fax call is brought to phase C (message phase). The ECM shall not be used.

##### Test procedure

During the message phase a procedure interrupt is generated at the MS side, which is executed as soon as phase D is entered. The fax then sends the PRI-EOP frame causing an alert at the SS side. When the operator at the SS side goes on line the PIP frame is generated and results in an alarm at the MS side. The operator at this side going on line completes the PRI handshaking by causing the PRI-EOP frame to be sent. Upon completion of the PRI handshaking the MT executes the MODIFY procedure, which leads to the speech phase. Then the call is cleared by manual intervention at the MT or the facsimile phase maybe reselected.

## Expected sequence

| MS:          | Direction                                                                                                                                                                                               | SS:                                                     |

## 29.4.2.8.5 Test requirements

1. To be verified that CT106/109 are in OFF (see note 2) condition.
2. To be verified that CT108.2 goes to OFF (see note 2) upon completion of the PRI handshaking, that this transition to OFF triggers the MODIFY message to be sent and that the reception of the MODIFY COMPLETE message causes CT107 to be set to OFF (see note 2) condition by the MT. In addition the availability of the speech channel shall be checked.

## 29.4.2.9 Quality check

## 29.4.2.9.1 Definition and applicability

This test is applicable to all configurations supporting transparent facsimile group 3.

## 29.4.2.9.2 Conformance requirement

The configuration supporting transparent facsimile group 3 shall decode the T.4 coding and shall generate a document.

## Reference

3GPP TS 03.45, ITU-T Recommendation T.21, ITU-T Recommendation T.4.

#### 29.4.2.9.3 Test purpose

To verify the quality of the received document.

#### 29.4.2.9.4 Method of test

##### Initial conditions

The document has been received at the called side.

##### Test procedure

The quality of the received document at the SS side shall be checked.

#### 29.4.2.9.5 Test requirement

The contents of the transmitted and the received document shall be the same.

### 29.4.3 Mobile terminated call

#### 29.4.3.1 Call Establishment Procedure

##### 29.4.3.1.1 Alternate Speech/Facsimile

###### 29.4.3.1.1.1 DCD Mobile Terminated

###### 29.4.3.1.1.1.1 Definition and applicability

This test is applicable to an MS supporting TS 61.

###### 29.4.3.1.1.1.2 Conformance requirement

The MS supporting transparent facsimile group 3 shall perform the ICM procedure and shall support the frames and the circuits at the Um-,R- and 2w-interface according the specifications referred to in the subclause "Reference".

##### Reference

3GPP TS 03.45, ITU-T Recommendation T.30.

###### 29.4.3.1.1.1.3 Test purpose

To verify the transition from speech to fax in case of an MS supporting TS 61 and that the circuit and tone handling of the MT and FA is correct in case of an MT DCD.

###### 29.4.3.1.1.1.4 Method of test

##### Initial conditions

A TS 61 s/f call is set up. The speech phase is active.

## Test procedure

The transition from speech to fax is initiated by manual intervention at both ends of the connection, i.e. the data call direction DCD is mobile terminated. Upon connection to line the FA turns on CT108.2 (see note 2) as a basic requirement for the transition from speech to fax. Now, within the next 3 seconds the FA has to detect the DCD, which is in this case mobile terminated, i.e. CT105 is set to OFF condition (see note 2). The following ICM procedure via the MODIFY message is carried out by the MT 3 seconds after circuit CT108.2 (see note 2) was set to ON condition. On completion of the ICM the synchronization of the TCH begins and after its completion the MT has to set CT107 to ON condition (see note 2). When CT106/109 are set to ON (see note 2) phase A is completed. Then the call is cleared by manual intervention at the MT or the activity progress of the call proceeds to the next phase.

## Expected sequence

| MS:  | SS:       |                                                                                                                                                                             |                                                        |

### 29.4.3.1.1.1.5 Test requirements

1. The condition of CT108.2 and CT105 is verified (see note 2); CT106, 107, 109 have to be in OFF (see note 2) condition. The MODIFY message has to be sent 3 seconds  $\pm$  10% after circuit CT108.2 has gone to ON (see note 2) condition.
2. The RCSD-IE shall not be included in the MODIFY message.
3. To be verified that the MT begins the synchronization phase by sending the pattern 1/OFF after the reception of the MODIFY COMPLETE message, that CT107 is turned on (see note 2) by the MT after successful synchronization.
4. To be verified that CT106 and CT109 are turned on (see note 2), when in the V.110 frames received from the SS the X and SB bits are set. The state of the FA shall be verified (->BCS-REC).

### 29.4.3.1.1.2 DCD mobile originated

#### 29.4.3.1.1.2.1 Definition and applicability

This test is applicable to an MS supporting TS 61.

#### 29.4.3.1.1.2.2 Conformance requirement

The MS supporting transparent facsimile group 3 shall perform the ICM procedure and shall support the frames and the circuits at the Um-,R- and 2w-interface according the specifications referred to in the subclause "Reference".

## Reference

3GPP TS 03.45, ITU-T Recommendation T.30.

## 29.4.3.1.1.2.3 Test purpose

To verify the transition from speech to fax in case of an MS supporting TS 61 and that the circuit and tone handling of the MT and FA is correct in case of an MO DCD.

## 29.4.3.1.1.2.4 Method of test

## Initial conditions

A TS 61 s/f call is set up. The speech phase is active.

## Test procedure

The transition from speech to fax is initiated by manual intervention at both ends of the connection, i.e. the data call direction DCD is mobile originated. Upon connection to line the FA turns on CT108.2 (see note 2) as a basic requirement for the transition from speech to fax. Now, within the next 3 seconds the FA has to detect the DCD, which is in this case mobile originated, i.e. CT105 is set to ON condition (see note 2), indicating that the MT has to include the RCSD-IE in the MODIFY message. The following ICM procedure via the MODIFY message is carried out by the MT 3 seconds after circuit CT108.2 (see note 2) was set to ON condition. On completion of the ICM the synchronization of the TCH begins and after its completion the MT has to set CT107 to ON condition (see note 2). When CT106/109 are set to ON (see note 2), phase A is completed. Then the call is cleared by manual intervention at the MT or the activity progress of the call proceeds to the next phase.

## 29.4.3.1.1.2.5 Test requirements

1. The condition of CT108.2 and CT105 is verified (see note 2); CT106, 107, 109 have to be in OFF (see note 2) condition.
2. The MODIFY message containing the RCSD-IE has to be sent 3 seconds  $\pm$  10% after circuit CT108.2 has gone to ON (see note 2) condition.
3. To be verified that the MT begins the synchronization phase by sending the pattern 1/OFF after the reception of the MODIFY COMPLETE message, that CT107 is turned on (see note 2) by the MT after successful synchronization. The CED (see note 2) tone has to be transmitted by the FA.
4. To be verified that CT106 and CT109 are turned on (see note 2), when in the modified V.110 frames received from the SS the X and SB bits are set. The state of the FA shall be verified (-> BCS-TRA).
