This test is applicable to an MS supporting TS 62.

## 29.4.3.1.2.2 Conformance requirement

The MS supporting transparent facsimile group 3 shall perform the call setup procedure and shall support the frames and the circuits at the Um-,R- and 2w-interface according the specifications referred to in the subclause "Reference".

## Reference

3GPP TS 03.45, 3GPP TS 07.01, ITU-T Recommendation T.30.

## 29.4.3.1.2.3 Test purpose

To verify that the circuit and tone handling of the MT and FA is correct.

## 29.4.3.1.2.4 Method of test

## Initial conditions

The MS, configured for the fax call, is updated. Then the call establishment phase begins.

## Test procedure

The SS will send the SETUP message causing CT125 (see note 2) going to ON condition at the MT. The FA then sends ring current (see note 2) to the fax machine, which will connect to line. The FA sets CT108.2 (see note 2) to ON condition which causes the MT to send the CONNECT message towards the SS. When the TCH is available (indicated by the CONNECT ACK message) the synchronization phase begins, i.e. both entities start sending the synchronization pattern 1/OFF. CT106, 107, 109 have to be in OFF (see note 2) condition. Upon completion of the synchronization phase the MT sets CT107 (see note 2) to ON condition causing the FA to send the CNG tone (see note 2) while the SS turns on CT108.2 causing the CED tone to be sent. Then the SS sets CT106 and 109 to ON (see note 2) at the MT by means of the modified V.110 X and SB bits, which completes Phase A. Then the call is cleared by manual intervention at the MT or the activity progress of the call proceeds to the next phase.

## Expected sequence

| MS:<br>Step | Direction |                                             | SS:                                             |
|-------------|-----------|---------------------------------------------|-------------------------------------------------|
| 1           | SS-->MS   |                                             | <----- Send SETUP message                       |
|             |           | MT: CT125 ON (see note 2)                   |                                                 |
|             |           | FA: Cause ring current to flow (see note 2) |                                                 |
| 2           | MS-->SS   | Fax: Connect to line (see note 1)           |                                                 |
|             |           | FA: CT108.2 ON (see note 2)                 |                                                 |
|             |           | MT: Send CONNECT message                    | -----> Receive CONNECT message                  |
| 3           | SS-->MS   |                                             | Send CONN ACK message                           |

|             |           | MT: CT107 ON (see note 2), when completed   |                                                 |
|             |           | FA: Generate CNG (see note 2)               |                                                 |
|             |           | Fax: Receive CNG (see note 2)               |                                                 |
| 5           | SS-->MS   |                                             | <----- Set X and SB bit in modified V.110 frame |
|             |           | MT: CT106/109 ON (see note 2)               |                                                 |
| 6           |           | FA: Enter BCS-REC state                     | Enter BCS-TRA state                             |

#### 29.4.3.1.2.5 Test requirements

1. The condition of CT125 (see note 2) shall be verified.
2. CT108.2 to be verified (see note 2) and the CONNECT message has to be sent by the MT.
3. To be verified that at the MT CT106, 107, 109 are in OFF (see note 2) condition, that the MT begins the synchronization phase by sending the pattern 1/OFF, that CT107 is turned on (see note 2) by the MT after successful synchronization and that the CNG tone (see note 2) is sent.
4. It shall be verified that CT106 and CT109 are turned on (see note 2), when in the modified V.110 frames received from the SS the X and SB bits are set.
5. The state of the FA shall be verified (-> BCS-REC).

#### 29.4.3.2 Pre-message procedure

##### 29.4.3.2.1 Definition and applicability

This test is applicable to an MS supporting TS 61 and/or TS 62.

##### 29.4.3.2.2 Conformance requirement

The MS supporting transparent facsimile group 3 shall perform the pre-message procedure and shall support the frames and the circuits at the Um-,R- and 2w-interface according to the specifications referred to in the subclause "Reference".

##### Reference

3GPP TS 03.45, ITU-T Recommendation T.30.

##### 29.4.3.2.3 Test purpose

To verify the correct handling of the T.30 DIS/DCS/TCF frames.

##### 29.4.3.2.4 Method of test

##### Initial conditions

The activity progress of the fax call is brought to the beginning of Phase B. The fax transmission shall start using a speed of 9,6 kBit/s.

##### Test procedure

After phase A the FA being in BCS-REC state, sends the DIS\* frame in order to indicate the capabilities of the connected fax and the FA and returns to the idle state. The SS's answer to the DIS is the DCS\*. Upon detection of the BCS-REC identifier the FA enters the BCS-TRA state, receives the DCS\* and transmits the DCS to the fax. After being for  $75 \pm 20$  ms in IDLE state the FA autonomously enters the MSG-TRA state and begins transmitting the training sequence towards the fax without being triggered by the remote FA/SS. Meanwhile the SS sends the TCF\*, which is buffered by the FA. When the training is done the FA transmits the buffered TCF towards the fax. Then the CFR\* frame is transmitted to the SS. Now, phase B is completed and the data transfer phase C begins. Then the call is cleared by manual intervention at the MT or the call activity progress proceeds to the next phase.

## Expected sequence

| MS:  |           | SS:                                                                                                                                                                  |                               |

## 29.4.3.2.5 Test requirements

1. To be verified that the DIS is filtered and that the correct up-conversion to the message speed is applied. CT109 should go to OFF (see note 2).
2. The DCS shall indicate a message speed of 7 200 bit/s and the down-conversion to the BCS speed shall be verified.
3. The FA, after the reception of the DCS, sends SYNC frames for  $75 \pm 20$  ms and changes to the MSG-TRA state without being triggered by the SS. When the training is over the TCF is transmitted to the fax.
4. The condition of CT109 (see note 2), the ident octet of the STATUS frames and the up-conversion to the message speed shall be verified.

## 29.4.3.3 Message procedure

## 29.4.3.3.1 Definition and applicability

This test is applicable to an MS supporting TS 61 and/or TS 62.

## 29.4.3.3.2 Conformance requirement

The MS supporting transparent facsimile group 3 shall perform the message procedure and shall support the frames and the circuits at the Um-,R- and 2w-interface according the specifications referred to in the subclause "Reference".

## Reference

3GPP TS 03.45, ITU-T Recommendation T.30, ITU-T Recommendation T.4, ITU-T Recommendation T.21.

## 29.4.3.3.3 Test purpose

To verify the facsimile data transmission phase.

## 29.4.3.3.4 Method of test

## Initial conditions

The activity progress of the fax call is brought to the beginning of Phase C. The ECM shall not be used.

## Test procedure

The FA is in idle state. Upon reception of the MSG-REC identifier the FA enters the MSG-TRA state, sends the MSG-TRA identifier and initiates the training. While the training is in progress data being received is buffered and conveyed to the connected fax upon end of training. When the transmission is finished the FA is again in the IDLE state and Phase D begins. Then the call is cleared by manual intervention at the MT or the activity progress of the call will proceed to the next phase.

## Expected sequence

| MS:  |           | SS:                                                                                                               |                                                     |

| 3    | SS-->MS   | FA: Buffer received data during training<br>Receive fax message*<br>"<br>"<br>"<br>CT105 OFF (see note 2)<br>IDLE | <----- Send fax message*<br>"<br>"<br>"             |
|      |           | Fax: Receive training, fax message                                                                                |                                                     |

## 29.4.3.3.5 Test requirements

1. To be verified that the FA enters the MSG-TRA state and inserts the correct ident octet in the STATUS frames. Training has to be initiated (see note 2). STATUS frames have to be sent interleaved with SYNC frames.
2. The condition of CT105 (see note 2) shall be checked.

## 29.4.3.4 Post-message procedure

## 29.4.3.4.1 Definition and applicability

This test is applicable to an MS supporting TS 61 and/or TS 62.

## 29.4.3.4.2 Conformance requirement

The MS supporting transparent facsimile group 3 shall perform the post-message procedure and shall support the frames and the circuits at the Um-,R- and 2w-interface according the specifications referred to in the subclause "Reference".

## Reference

3GPP TS 03.45, ITU-T Recommendation T.30

## 29.4.3.4.3 Test purpose

To verify phase D of the facsimile transmission.

## 29.4.3.4.4 Method of test

## Initial conditions

The activity progress of the fax call is brought to the beginning of Phase D. The ECM shall not be used.

## Test procedure

The SS sends the EOP\* frame. The FA then enters the BCS-TRA state and conveys the EOP frame to the fax machine. The fax answers the EOP with the MCF frame. The FA will enter the BCS-REC state, transmit the BCS-REC identifier and will convey the MCF\* frame to the SS. Afterwards the FA enters the IDLE state. Phase D of the fax transmission is completed. Then the call is cleared by manual intervention at the MT or the activity progress of the call will proceed to the next phase.

## Expected sequence

| MS: | Direction                  | SS:                            |
|-----|----------------------------|--------------------------------|

|     | FA: CT105 ON (see note 2)  |                                |
|     | BCS-TRA                    |                                |
|     | Transmit preamble, EOP     |                                |
|     | CT105 OFF (see note 2)     |                                |
|     | IDLE                       |                                |
| 2   | MS-->SS                    | -----> Receive preamble*, MCF* |
|     | Fax: Receive preamble, EOP |                                |
|     | Fax: Send preamble, MCF    |                                |
|     | FA: CT109 ON (see note 2)  |                                |
|     | BCS-REC                    |                                |
|     | Send preamble*, MCF*       |                                |
|     | CT109 OFF (see note 2)     |                                |
|     | IDLE                       |                                |

#### 29.4.3.4.5 Test requirements

1. To be verified that the FA enters the BCS-TRA state upon detection of the BCS-REC identifier and that the correct T.30 message (down conversion to the message speed) is conveyed to the connected fax.
2. To be verified that the FA enters the BCS-REC state and that the correct STATUS frames are sent (up-conversion to the message speed).

#### 29.4.3.5 Call release procedure

##### 29.4.3.5.1 Definition and applicability

This test is applicable to an MS supporting TS 61 and/or TS 62.

##### 29.4.3.5.2 Conformance requirement

The MS supporting transparent facsimile group 3 shall perform the call release procedure and shall support the frames and the circuits at the Um-,R- and 2w-interface according the specifications referred to in the subclause "Reference".

##### Reference

3GPP TS 03.45, ITU-T Recommendation T.30.

##### 29.4.3.5.3 Test purpose

To verify phase E of the facsimile transmission.

##### 29.4.3.5.4 Method of test

##### Initial conditions

The activity progress of the fax call is brought to the beginning of Phase E.

##### Test procedure

The SS sends the preamble followed by the DCN frame. The FA then enters the BCS-TRA state and sends the DCN frame to the fax terminal. The FA enters the idle state again. CT108.2 (see note 2) will go OFF condition. The MT then sends the DISC message and the call is cleared.

##### Expected sequence

| MS:  |                            | SS:                         |
|------|----------------------------|-----------------------------|
| Step | Direction                  |                             |
| 1    | SS-->MS                    | <----- Send preamble*, DCN* |
|      | FA: CT105 ON (see note 2)  |                             |

|      | CT108.2 OFF (see note 2)   |                             |
|      | Generate preamble, DCN     |                             |
|      | CT105 OFF (see note 2)     |                             |
|      | IDLE                       |                             |
|      | Fax: Receive preamble, DCN |                             |
|      | MT: Send DISC message      | -----> Receive DISC message |

#### 29.4.3.5.5 Test requirements

To be verified that CT108.2 is turned off (see note 2) and that the correct down-conversion to the BCS speed is applied. The MT shall send the DISC message.

### 29.4.3.6 Speed conversion factor

#### 29.4.3.6.1 Definition and applicability

This test is applicable to an MS supporting TS 61 and/or TS 62.

#### 29.4.3.6.2 Conformance requirement

The MS supporting transparent facsimile group 3 shall perform the up- and down-conversion procedure and shall support the frames and the circuits at the Um-,R- and 2w-interface according the specifications referred to in the subclause "Reference".

#### Reference

3GPP TS 03.45, ITU-T Recommendation T.30.

#### 29.4.3.6.3 Test purpose

To verify the correct speed conversion for the BCS phases.

#### 29.4.3.6.4 Method of test

##### Initial conditions

The activity progress of the fax call is brought to the beginning of Phase B. The ECM shall not be used.

##### Test procedure

The following test sequence is repeated 5 times with 5 different DCS frames indicating a message speed of 9,6/7,2/4,8/2,4 and 9,6 kBit/s. This test is done to verify that the FA detects a change of the TCH access rate and due to this updates the speed conversion factor, which is used for the up-conversion of the BCS signalling to the message speed and vice versa. Then the call is cleared by manual intervention at the MT or the activity progress of the call proceeds to the next phase.

## Expected sequence

| MS:<br>Step | Direction                      |                                                                                                                                                                                                    |        | SS:                              |

- \*\*\*) only if the requested rate in the DCS differs from the existing radio channel rate (when the radio channel rate equals 9 600 kbit/s and the DCS requests 7 200 kbit/s no CMM will be executed)

#### 29.4.3.6.5 Test requirements

1. The MT shall send the CMM ACK message.
2. For 7,2/9,6 kBit/s:

The correct up- and down-conversion shall be verified (4 STATUS frames for 1 BCS octet)

For 4,8 kBit/s:

The correct up- and down-conversion shall be verified (2 STATUS frames for 1 BCS octet)

For 2,4 kBit/s:

The correct up- and down-conversion shall be verified (1 STATUS frame for 1 BCS octet)

The IDENT octet shall be set to BCS-REC in case of the up-conversion.

#### 29.4.3.7 Quality Check

##### 29.4.3.7.1 Definition and applicability

This test is applicable to all configurations supporting transparent facsimile group 3.

##### 29.4.3.7.2 Conformance requirement

The configuration supporting transparent facsimile group 3 shall decode the T.4 coding and shall generate a document.

##### Reference

3GPP TS 03.45, ITU-T Recommendation T.21, ITU-T Recommendation T.4.

##### 29.4.3.7.3 Test purpose

To verify the quality of the received document.

##### 29.4.3.7.4 Method of test

##### Initial conditions

The document has been received at the called side.

##### Test procedure

The quality of the document at the receiving side shall be checked.

##### 29.4.3.7.5 Test requirements

The contents of the transmitted and the received document shall be the same.

## 29.4.4 Notes

The following notes apply throughout the subclause 29.4.

NOTE 1: By pressing the START button on the facsimile apparatus or in case of PC fax by selecting the appropriate software menu point or automatically.

NOTE 2: Or equivalent function/means having the same result.

NOTE 3: Tested by monitoring the contents of the STATUS frame ident octet identifier.

NOTE 4: If no access is available to the 2w interface, this requirement cannot always be verified.

## 30 Speech teleservices

When an artificial ear is required, the ITU-T Recommendation P.57 [107] Type 1 artificial ear may be used for up to release 4 handsets. See below for details.

If requested by the terminal supplier, the ITU-T Recommendation P.57 [107] Type 3.2 artificial ear shall be used. In this case the following shall apply:

- either the low leakage option or the high leakage option of Type 3.2 artificial ear may be adopted;
- the force against the ear shall be as specified in ITU-T Recommendation P.57 [107];
- sound pressure measurements shall be referred to the ERP as specified in ITU-T Recommendation P.57 [107] or DRP according to the Terminal Supplier's request;
- no leakage correction shall be made in the calculation of RLR (i.e.  $L_E=0$ ).

If requested by the terminal supplier, the ITU-T Recommendation P.57 [107] Type 3.4 artificial ear may be used for Release 96 MS or later. The positioning is defined in ITU-T Recommendation P.64.

If requested by the terminal supplier, the ITU-T Recommendation P.57 [107] Type 3.3 artificial ear may be used for Release 96 MS or later. The positioning is defined in ITU-T Recommendation P.64.

Note that for measurement of STMR in release 4 or later MS as specified in 3GPP TS 26.132, the 3.2 ear with the low leakage option shall be used. For release 4 it is also possible to use the type 1 ear.

The manufacturer declares in the IXIT statement which type of artificial ear will be used for teleservices speech testings.

NOTE 1: An MS may be either a handset MS, a handsfree MS or a combined handset and handsfree MS. The test description for handsfree operation, however, at the moment only covers the stability margin as no test method could be defined for the other parameter.

NOTE 2: Frequency settings in the following tests are taken from ISO 3, R10 series or R40 series or from table 2 of ITU-T Recommendation P.79. A departure from the nominal frequencies of +5 % below 240 Hz and +2 % at 240 Hz and above is accepted. Any sub-multiple of the sampling frequency of 8 kHz shall be avoided. In the case of 4 kHz the departure is restricted to -2 %.

NOTE 3: The measurement accuracy for signal level is  $\pm 0,2$  dB and for sound pressure  $\pm 0,6$  dB.

NOTE 4: The digital test signals shall be generated as 8 bit A-law companded PCM signals, which internally in the SS are expanded according to ITU-T Recommendation G.721 ( $L_{aw}=1$ ) to 13 bit linear before being applied to the MS via the DAI.

NOTE 5: When measuring signal levels on the DAI, a digital measuring instrument is connected to the 64 kbit/s output of the A-law compression equipment in the SS, which is in turn connected to the DAI in the MS.

NOTE 6: Measurements shall be possible with and without psophometric weighting according to ITU-T Recommendation G.223, table 4.

### 30.1 Sending sensitivity/frequency response

#### 30.1.1 Definition and applicability

The sending sensitivity frequency response is, as a function of the input test signal frequency, the ratio expressed in dB between the output level at the Digital Audio Interface (DAI) or at the audio output of the reference speech decoder of the SS and the input sound pressure in the artificial mouth required to obtain this.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 up to release 1999 handset MS supporting speech.

### 30.1.2 Conformance requirement

The sending sensitivity frequency response shall be within the mask given in 3GPP TS 03.50.

3GPP TS 03.50; subclause 3.8.1.1, table 1.

### 30.1.3 Test purpose

To verify that the sending sensitivity frequency response is within the mask given in 3GPP TS 03.50, subclause 3.8.1.1, table 1.

### 30.1.4 Method of test

#### 30.1.4.1 Initial conditions

When measured at the DAI:

- a) The handset is mounted in the LRGP (see annex A of ITU-T Recommendation P.76). The earpiece is sealed to the knife-edge of the artificial ear.
- b) A pure tone with a sound pressure of -4,7 dBPa (in accordance with ITU-T Recommendation P.64) is applied at the mouth reference point (MRP) as described in ITU-T Recommendation P.64 using an artificial mouth conforming to ITU-T Recommendation P.51.
- c) A digital measuring instrument, or high quality digital decoder followed by an analogue level measuring set, is connected to the Digital Audio Interface (DAI). The DAI is set to the operating mode "Test of acoustic devices and A/D & D/A".

When measured at the output of the reference speech decoder of the SS:

- a) The handset is mounted in the LRGP and the earpiece is sealed to the knife-edge of an artificial ear.
- b) A full rate speech call is set up between the MS and the SS.
- c) Artificial speech conforming to ITU-T Recommendation P.50, shall be applied to the MRP, at a wideband sound pressure level of -4,7 dBPa. This implementation could be a real time algorithm producing the artificial speech or a pre-recorded tape of the artificial speech.
- d) The artificial speech shall comprise of a concatenation of three 10 s intervals of "male" and "female" voice. The first 10 s interval is not used for measurement purposes but allows any noise/echo cancelling devices in the MS to adapt. The second and third 10 s intervals consist of separately "male" and "female" artificial voice.

#### 30.1.4.2 Procedure

When measured at the DAI:

The SS measures the output level represented by the PCM bit stream at the DAI (pin 23) at one-twelfth-octave intervals as given by the R40 series of preferred numbers in ISO 3 for frequencies from 100 Hz to 4 000 Hz inclusive.

When measured at the output of the reference speech decoder of the SS:

The 1/3 octave filtered long-term average spectrum of the signal is measured at the analogue or digital output of the reference speech decoder of the SS and an average for the "male" and "female" voices is obtained. The sending sensitivity/frequency response is calculated as the difference between the 1/3 octave input power and the 1/3 octave output power.

### 30.1.5 Test requirement

The sending sensitivity/frequency response shall be within a mask given in table 30.1. The mask can be drawn with straight lines between the breaking points in the table on a logarithmic (frequency) vs linear (dB sensitivity) scale.

All sensitivity levels are dB on an arbitrary scale.

Table 30.1

| Frequency (Hz) | Upper Limit (dB) | Lower Limit (dB) |
|----------------|------------------|------------------|
| 100            | -12              |                  |
| 200            | 0                |                  |
| 300            | 0                | -12              |
| 1 000          | 0                | -6               |
| 2 000          | 4                | -6               |
| 3 000          | 4                | -6               |
| 3 400          | 4                | -9               |
| 4 000          | 0                |                  |

## 30.2 Sending loudness rating

### 30.2.1 Definition and applicability

The Sending Loudness Rating (SLR) is a means of expressing the sending frequency response based on objective measurements in a way which relates to how a speech signal would be perceived by a listener.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 up to release 1999 handset MS supporting speech.

### 30.2.2 Conformance requirement

The Sending Loudness Rating (SLR) shall be  $8 \pm 3$  dB.

3GPP TS 03.50; subclause 3.1.1.

### 30.2.3 Test Purpose

To verify that the Sending Loudness Rating (SLR) is  $8 \pm 3$  dB.

### 30.2.4 Method of test

#### 30.2.4.1 Initial conditions

When measured at the DAI:

- The DAI of the MS is connected to the SS and is set to the operating mode "Test of acoustic devices and A/D & D/A".

When measured at the output of the reference speech decoder of the SS:

- A full rate speech call is set up between the MS and the SS.

#### 30.2.4.2 Procedure

When measured at the DAI:

- a) The sending sensitivity is measured at each of the 14 frequencies given in table 2 of ITU-T P.79, bands 4 to 17.
- b) The sensitivity is expressed in terms of dBV/Pa and the SLR is calculated according to ITU-T Recommendation P.79 formula 4.19 b of ITU-T Recommendation P.79, over bands 4 to 17, using the sending weighting factors from ITU-T Recommendation P.79 table 2, adjusted according to table 3 of ITU-T Recommendation P.79.

When measured at the output of the reference speech decoder of the SS:

- a) The sending sensitivity from the MRP to the analogue or digital output of the reference speech decoder of the SS is determined according to subclauses 30.1.4.1 and 30.1.4.2.

- b) The sensitivity is expressed in terms of dBV/Pa and the SLR shall be calculated according to ITU-T Recommendation P.79 formula 2.1, over bands 4 to 17, and using  $m = 0,175$  and the sending weighting factors from ITU-T Recommendation P.79 table 1.

#### 30.2.5 Test requirement

The SLR shall be  $8 \pm 3$  dB.

### 30.3 Receiving sensitivity/frequency response

#### 30.3.1 Definition and applicability

The receiving sensitivity frequency response is, as a function of the input test signal frequency, the ratio expressed in dB between the output sound pressure in the artificial ear and the input level, represented by the PCM bit stream at the Digital Audio Interface (DAI) or the level at the SS audio input, required to obtain this.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 up to release 1999 handset MS supporting speech.

#### 30.3.2 Conformance requirement

The receiving sensitivity frequency response shall be within the mask given in 3GPP TS 03.50.

3GPP TS 03.50; subclause 3.8.1.2, table 2.

#### 30.3.3 Test purpose

To verify that the receiving sensitivity frequency response is within the mask given in 3GPP TS 03.50; subclause 3.8.1.2, table 2.

#### 30.3.4 Method of test

##### 30.3.4.1 Initial conditions

When measured from the DAI:

- The handset is mounted in the LRGP and the earpiece is sealed to the knife-edge of the artificial ear.
- A digital signal generator is connected at the digital interface delivering a signal equivalent to a pure tone level of -16 dBm<sub>0</sub>, see ITU-T Recommendation P.64.
- The DAI of the MS is connected to the SS and is set to the operating mode "Test of acoustic devices and A/D & D/A".

When measured from the input of the reference speech encoder of the SS:

- The handset is mounted in the LRGP and the earpiece is sealed to the knife-edge of the artificial ear.
- A full rate speech call is set up between the MS and the SS.
- Artificial speech conforming to ITU-T Recommendation P.50, shall be applied to the analogue or digital input of the reference speech encoder of the SS, at a wideband level of -16 dBm<sub>0</sub>. This implementation could be a real time algorithm producing the artificial speech or a pre-recorded tape of the artificial speech.
- The artificial speech shall comprise of a concatenation of three 10 s intervals of "male" and "female" voice. The first 10 s interval is not used for measurement purposes but allows any echo cancellation devices in the MS to adapt. The second and third 10 s intervals consist of separately "male" and "female" artificial voice.

### 30.3.4.2 Procedure

When measured from the DAI:

- Measurements are made at one twelfth-octave intervals as given in the R.40 series of preferred numbers in ISO 3 for frequencies from 100 Hz to 4 kHz inclusive. At each frequency, the sound pressure in the artificial ear is measured by connecting a suitable measuring set to the artificial ear.

When measured from the input of the reference speech encoder of the SS:

- The 1/3 octave filtered long-term average spectrum of the signal is measured and an average for the "male" and "female" voices is obtained. The receiving sensitivity/frequency response is calculated as the difference between the 1/3 octave input power and the 1/3 octave output power.

### 30.3.5 Test requirement

The receiving sensitivity/frequency response shall be within the mask given by table 30.2. The mask can be drawn with straight lines between the breaking points in the following table on a logarithmic (frequency) vs linear (dB sensitivity) scale.

All sensitivity levels are dB on an arbitrary scale.

**Table 30.2**

| Frequency (Hz)                                                                                                                                | Upper Limit (dB) | Lower Limit (dB) |
|-----------------------------------------------------------------------------------------------------------------------------------------------|------------------|------------------|
| 100                                                                                                                                           | -12              |                  |
| 200                                                                                                                                           | 0                |                  |
| 300                                                                                                                                           | 2                | -7               |
| 500                                                                                                                                           | see note         | -5               |
| 1 000                                                                                                                                         | 0                | -5               |
| 3 000                                                                                                                                         | 2                | -5               |
| 3 400                                                                                                                                         | 2                | -10              |
| 4 000                                                                                                                                         | 2                |                  |
| NOTE: The limit at intermediate frequencies lies on a straight line drawn between the given values on a log (frequency) vs linear (dB) scale. |                  |                  |

## 30.4 Receiving loudness rating

### 30.4.1 Definition and applicability

The Receiving Loudness Rating (RLR) is a means of expressing the receiving frequency response based on objective measurements in a way which relates to how a speech signal would be perceived by a listener.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 up to release 1999 handset MS supporting speech.

### 30.4.2 Conformance requirement

- 1) The nominal Receiving Loudness Rating (RLR) shall be  $2 \pm 3$  dB.

If a user controlled receive volume control is provided the equipment shall meet this nominal value for at least one setting of the control.

3GPP TS 03.50; subclause 3.1.1.

- 2) If a user controlled receive volume control is provided the Receive Loudness Rating (RLR) shall not be less than -13 dB when the control is set to maximum.

3GPP TS 03.50; subclause 3.1.1.

### 30.4.3 Test purpose

- 1) To verify that the nominal Receiving Loudness Rating (RLR) is  $2 \pm 3$  dB.
- 2) To verify that if a user controlled receive volume control is provided the Receive Loudness Rating (RLR) is not less than -13 dB when the control is set to maximum.

### 30.4.4 Method of test

#### 30.4.4.1 Initial conditions

When measured at the DAI:

- The DAI of the MS is connected to the SS and is set to the operating mode "Test of acoustic devices and A/D & D/A".

When measured at the output of the reference speech decoder of the SS:

- A full rate speech call is set up between the MS and the SS.

#### 30.4.4.2 Procedure

When measured at the DAI:

- a) The receiving sensitivity is measured at each of the 14 frequencies listed in table 2 of ITU-T Recommendation P.79, bands 4 to 17.
- b) The sensitivity is expressed in terms of dBPa/V and the RLR is calculated according to ITU-T Recommendation P.79 formula 4.19 c, over bands 4 to 17, using the receiving weighting factors from table 2 of ITU-T Recommendation P.79, adjusted according to table 3 of ITU-T Recommendation P.79.
- c) The artificial ear sensitivity must be corrected according to the real ear correction of table 4 of ITU-T Recommendation P.79.

NOTE: The values of real ear correction in ITU-T Recommendation P.79 table 4 were derived for one type of handset conforming to the shape defined in ITU-T Recommendation P.35.

These values are used in the present document because there is no measurement method agreed for the real ear correction. If a method of measurement is agreed, it is intended to change the present document to use the values appropriate to each handset.

When measured from the input of the reference speech encoder of the SS:

- a) The receiving sensitivity from the analogue or digital input of the reference speech encoder of the SS to the output of the artificial ear is determined according to subclauses 30.3.4.1 and 30.3.4.2.
- b) The sensitivity is expressed in terms of dBPa/V and the RLR shall be calculated according to ITU-T Recommendation P.79 formula 2.1, over bands 4 to 17, using  $m = 0,175$  and the receiving weighting factors from table 1 of ITU-T Recommendation P.79.

### 30.4.5 Test requirement

If no user controlled receive volume control is provided, the RLR shall be  $2 \pm 3$  dB.

If a user controlled receive volume control is provided, the RLR shall meet this nominal value for (at least) one setting of the receive volume control.

When the receive volume control is set to maximum the RLR shall not be less than (i.e. louder than) -13 dB.

## 30.5 Side tones

### 30.5.1 Side Tone Masking Rating (STMR)

#### 30.5.1.1 Definition and applicability

The sidetone loudness ratings are a means of expressing the path loss from the artificial mouth to the artificial ear based on objective single tone measurements in a way that relates to how a speaker will perceive his own voice when speaking (talker sidetone, expressed by the sidetone masking rating - STMR), or how a listener will perceive the background noise picked up by the microphone (listener sidetone rating - LSTR).

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 up to release 1999 handset MS supporting speech.

#### 30.5.1.2 Conformance requirement

The nominal value of the Side Tone Masking Rating (STMR) shall be  $13 \pm 5$  dB. Where a user controlled receiving volume control is provided the STMR shall meet the requirement at the setting where the RLR is equal to the nominal value.

3GPP TS 03.50; subclause 3.10.1.

#### 30.5.1.3 Test purpose

- 1) To verify that the Side Tone Masking Rating (STMR) is  $13 \pm 5$  dB.
- 2) To verify that is a user controlled receiving volume control is provided, the STMR is  $13 \pm 5$  dB at the setting where the RLR is equal to the nominal value.

#### 30.5.1.4 Method of test

##### 30.5.1.4.1 Initial conditions

- a) The DAI of the MS is connected to the SS and is set to the operating mode "Test of acoustic devices and A/D & D/A".
- b) The handset is mounted in the LRGP (see annex 1 of ITU-T Recommendation P.76) and the earpiece is sealed to the knife-edge of the artificial ear conforming to ITU-T Recommendation P.51.

##### 30.5.1.4.2 Procedure

- a) The SS sends a PCM bit stream coded with the value No 1 over the DAI (pin 25). Or alternatively the activation of the A/D and D/A converters is performed via a call setup, in which case the DAI connection between the MS and SS, and the PCM bit stream are optional.

NOTE: The idle channel noise in the receiving direction is the acoustic sound pressure in the artificial ear when the digital input signal at the DAI is the PCM coded value No. 1.

- b) The SS applies a pure tone with a sound pressure of  $-4,7$  dBPa at the mouth reference point as described in ITU-T P.64 using an artificial mouth conforming to ITU-T Recommendation P 51.
- c) For each frequency given in table 2 of ITU-T Recommendation P.79, bands 4 to 17, the sound pressure in the artificial ear is measured.
- d) The sidetone path loss ( $L_{meST}$ ) is expressed in dB and the STMR (in dB) is calculated from the formula 8.4 of ITU-T Recommendation P.79, using the weighting factors of column (3) in table 6 of ITU-T Recommendation P.79 (unsealed), and values of LE in accordance with table 4 of ITU-T Recommendation P.79.

### 30.5.1.5 Test requirement

The STMR shall be  $13 \pm 5$  dB.

Where a user controlled receive volume control is provided, the STMR shall meet the requirement given above at the setting where the RLR is equal to the nominal value.

## 30.5.2 Listener Side Tone Rating (LSTR)

### 30.5.2.1 Definition and applicability

The Listener Sidetone Rating (LSTR) is considered a major parameter affecting the user perception of the system.

The requirements and this test is applicable to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 up to release 1999 handset MS supporting speech.

### 30.5.2.2 Conformance requirement

The value of the Listener Sidetone Rating (LSTR) shall not be less than 15 dB.

3GPP TS 03.50, subclause 3.10.1.

### 30.5.2.3 Test purpose

To verify that the value of LSTR is not less than 15 dB.

### 30.5.2.4 Method of test

#### 30.5.2.4.1 Initial conditions

The DAI of the MS is connected to the SS and is set to the operating mode "Test of acoustic devices and A/D & D/A".

The SS sends a PCM bit stream coded with the value No. 1 over the DAI (pin 25) to the MS.

#### 30.5.2.4.2 Procedure

- a) The sound field is calibrated in the absence of any local obstacles. The averaged field shall be uniform to within +4 dB/-2 dB within a radius of 0,15 m of the MRP, when measured in one-third octave bands from 100 Hz to 8 kHz (bands 1 to 20).
- b) A calibrated half-inch microphone is mounted at MRP. The sound field is measured in one-third octave bands. The spectrum shall be "Pink noise" as described in ITU-T recommendation P.64 annex B to within  $\pm 1$  dB and the level shall be adjusted to 70 dBA (-24 dBPa(A)). The tolerance on this level is  $\pm 1$  dB.
- c) The artificial mouth and ear are placed in the correct position relative to MRP, the handset is mounted at LRGP and the earpiece is sealed to the knife-edge of the artificial ear.
- d) Measurements are made in one-third octave bands for the 14 bands centred at 200 Hz to 4 kHz (bands 4 to 17). For each band the sound pressure in the artificial ear shall be measured by connecting a suitable measuring set to the artificial ear.
- e) The listener sidetone path loss is expressed in dB and the LSTR shall be calculated from the ITU-T Recommendation P.79 formula 8-4, using the weighting factors in column (3) in table 6 of the Recommendation, and the values of LE; in accordance with table 4 of the Recommendation.

### 30.5.2.5 Test requirement

The LSTR shall not be less than 15 dB.

## 30.6 Telephone Acoustic coupling Loss (TAL)

### 30.6.1 Echo Loss (EL)

#### 30.6.1.1 Definition and applicability

The echo loss is the path loss from the input of the reference speech encoder of the SS to the output of the reference speech decoder of the SS.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 up to release 1999 handset MS supporting speech.

#### 30.6.1.2 Conformance requirement

The echo loss from the input to the output of the reference speech codec in the SS shall be at least 46 dB.

3GPP TS 03.50; subclause 3.4.3.2.

#### 30.6.1.3 Test purpose

To verify that the echo loss from the input to the output of the reference speech codec in the SS is at least 46 dB.

#### 30.6.1.4 Method of test

##### 30.6.1.4.1 Initial conditions

The DAI of the MS is connected to the SS and is set to the operating mode "Normal operation".

The SS sets up a speech call according to the generic call set up procedure.

The handset is mounted in the LRGP (see annex 1 of ITU-T Recommendation P.76) and the earpiece is sealed to the knife-edge of the artificial ear conforming to ITU-T Recommendation P.51.

Where a user controlled volume control is provided it is set to maximum.

##### 30.6.1.4.2 Procedure

An implementation of the ITU-T P.50 artificial speech is connected to the analogue or digital input of the reference speech encoder of the SS. This implementation is either a real time algorithm producing the artificial speech or a pre-recorded tape of artificial speech. Both "male" and "female" artificial speech is required.

A ten second segment of the "male" artificial speech is applied to the analogue or digital input of the reference speech encoder of the SS. The third octave power of the input signal is measured. The echo loss signal is not measured at this stage as the first ten second segment is used to allow any acoustic echo cancellation devices within the MS to adapt to the echo path.

Immediately after a second ten second segment of the "male" artificial speech is applied to the analogue or digital input of the reference speech encoder of the SS. The third octave power of the echo signal is measured at the analogue or digital output of the reference speech decoder of the SS.

The difference between the third octave input power and the third octave output power is entered into the ITU-T G.122 TCL algorithm and the acoustic echo loss calculated.

The test is repeated with the "female" artificial speech and the results of both "male" and "female" averaged to give the final result.

##### 30.6.1.5 Test requirement

The echo loss from the input to the output of the reference speech codec in the SS shall be at least 46 dB.

## 30.6.2 Stability margin

### 30.6.2.1 Definition and applicability

The receive-transmit stability margin is a measure of the gain that would have to be inserted between the go and return paths of the reference speech coder in the SS for oscillation to occur.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 up to release 1999 handset MS supporting speech.

### 30.6.2.2 Conformance requirement

The stability margin shall be at least 6 dB.

3GPP TS 03.50; subclause 3.2.

### 30.6.2.3 Test purpose

To verify that the stability margin is at least 6 dB.

### 30.6.2.4 Method of test

#### 30.6.2.4.1 Initial conditions

For handset operation the handset is placed on a hard plane surface with the transducers facing the surface.

For handsfree operation the test setup is shown in ITU-T Recommendation P.34 (figure 3), but omitting the test table.

Where a user controlled volume control is provided it is set to maximum.

#### 30.6.2.4.2 Procedure

- a) A gain equivalent to the minimum stability margin is inserted in the loop between the go and return paths of the reference speech coder in the SS and any acoustic echo control is enabled.
- b) A test signal according to ITU-T Recommendation O.131 is injected into the loop at the analogue or digital input of the reference speech codec of the SS and the stability is measured. The test signal has a level of -10 dBm0 and a duration of 1 s.

### 30.6.2.5 Test requirement

The minimum stability margin shall be 6 dB and no audible oscillation shall be detected.

## 30.7 Distortion

### 30.7.1 Sending

#### 30.7.1.1 Definition and applicability

The transmit signal to total distortion ratio is a measure of the linearity of the transmitter equipment.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 up to release 1999 handset MS supporting speech.

### 30.7.1.2 Conformance requirement

The ratio of signal to total distortion power in the sending direction measured with a psophometric filter at the DAI of the MS or at the output of the reference speech decoder of the SS shall be above the limits given in 3GPP TS 03.50; subclause 3.9.1, table 3, unless the sound pressure at MRP exceeds +10 dBPa.

3GPP TS 03.50; subclause 3.9.1.

### 30.7.1.3 Test purpose

To verify that the ratio of signal to total distortion power in the sending direction measured with psophometric filter is above the limits given in 3GPP TS 03.50; subclause 3.9.1, table 3.

### 30.7.1.4 Method of test

#### 30.7.1.4.1 Initial conditions

The handset is mounted in the LRGP (see annex 1 of ITU-T Recommendation P.76) and the earpiece is sealed to the knife-edge of the artificial ear conforming to ITU-T Recommendation P.51.

When measured at the DAI:

The DAI of the MS is connected to the SS and is set to the operating mode "Test of acoustic devices and A/D & D/A".

When measured at the output of the reference speech decoder of the SS:

A full rate speech call is set up between the MS and the SS.

#### 30.7.1.4.2 Procedure

- a) A sine-wave signal with a frequency in the range 1 004 Hz to 1 025 Hz is applied to the MRP. The level of this signal is adjusted until the level at the DAI output (pin 23) of the MS or at the analogue or digital output of the reference speech decoder of the SS corresponds to -10 dBm<sub>0</sub>. The level of the signal at the MRP is then the acoustic reference level (ARL).
- b) The test signal is applied at the following levels: -35 dB, -30 dB, -25 dB, -20 dB, -15 dB, -10 dB, -5 dB, 0 dB, 5 dB, 10 dB relative to the ARL.
- c) The ratio of signal to total distortion power is measured at the DAI of the MS or at the analogue or digital output of the reference speech decoder of the SS with the psophometric noise weighting (see ITU-T Recommendations G.714 and O.132) at each signal level.

NOTE: The measurement is not to be carried out at sound pressures exceeding +10 dBPa.

### 30.7.1.5 Test requirement

The ratio of signal to total distortion power measured with the psophometric noise weighting (see table 4/ ITU-T G.223) shall be above the limits given in table 30.3.

**Table 30.3**

| dB relative to ARL | Level ratio |
|--------------------|-------------|
| -35 dB             | 17,5 dB     |
| -30 dB             | 22,5 dB     |
| -20 dB             | 30,7 dB     |
| -10 dB             | 33,3 dB     |
| 0 dB               | 33,7 dB     |
| 7 dB               | 31,7 dB     |
| 10 dB              | 25,5 dB     |

Limits for the signal to total distortion ratio (sending) when using the sine wave method.

Limits for intermediate levels are found by drawing a straight line between breaking points in a linear (dB signal level) vs linear (dB ratio) scale.

## 30.7.2 Receiving

### 30.7.2.1 Definition and applicability

The receive signal to total distortion ratio is a measure of the linearity in the receive equipment (excluding the speech decoder).

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 handset MS supporting speech except dual mode GSM/3GPP release 4 or later handsets.

### 30.7.2.2 Conformance requirement

The ratio of signal to total distortion power in the receiving direction measured at the ERP or DRP according to the Terminal Supplier's request with psophometric filter shall be above the limits given in 3GPP TS 03.50; subclause 3.9.2, table 5.

3GPP TS 03.50; subclause 3.9.2.

### 30.7.2.3 Test purpose

To verify that the ratio of signal to total distortion power in the receiving direction measured at the ERP or DRP according to the Terminal Supplier's request with psophometric filter is above the limits given in 3GPP TS 03.50; subclause 3.9.2, table 5.

### 30.7.2.4 Method of test

#### 30.7.2.4.1 Initial conditions

The handset is mounted in the LRGP (see annex 1 of ITU-T Recommendation P.76) and the earpiece is sealed to the knife-edge of the artificial ear conforming to ITU-T Recommendation P.51.

The DAI of the MS is connected to the SS and is set to the operating mode "Test of acoustic devices and A/D & D/A".

#### 30.7.2.4.2 Procedure

- a) The SS sends, via the DAI (Pin 25), a PCM bit stream simulating a sine-wave signal with a frequency in the range 1 004 Hz to 1 025 Hz corresponding to ITU-T O.132 at the following levels: -45 dBm0, -40 dBm0, -35 dBm0, -30 dBm0, -25 dBm0, -20 dBm0, -15 dBm0, -10 dBm0, -5 dBm0, 0 dBm0.
- b) The ratio of signal to total distortion power is measured with the psophometric noise weighting in the artificial ear (see ITU-T Recommendations G.714 and O.132) at each signal level.
- c) The measurement is only carried out at sound pressures between -50 dBPa and +10 dBPa.

### 30.7.2.5 Test requirement

The ratio of signal to total distortion power measured at the artificial ear with the psophometric noise weighting (see table 4/ ITU-T Recommendation G.223) shall be above the limits given in table 30.4.

Table 30.4

| Level at the digital audio interface | Level ratio |
|--------------------------------------|-------------|
| -45 dBm0                             | 17,5 dB     |
| -40 dBm0                             | 22,5 dB     |
| -30 dBm0                             | 30,5 dB     |
| -20 dBm0                             | 33,0 dB     |
| -10 dBm0                             | 33,5 dB     |
| -3 dBm0                              | 31,2 dB     |
| 0 dBm0                               | 25,5 dB     |

Limits for the signal to total distortion ratio (receiving) when using the sine wave method.

Limits for intermediate levels are found by drawing a straight line between breaking points in a linear (dB signal level) vs linear (dB ratio) scale.

## 30.8 Sidetone distortion

### 30.8.1 Definition and applicability

The sidetone distortion expresses the linearity of the sidetone path in the handset.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 handset MS supporting speech except dual mode GSM/3GPP release 4 or later handsets.

### 30.8.2 Conformance requirement

The third harmonic distortion of the sidetone shall not be greater than 10 %.

3GPP TS 03.50; subclause 3.10.2.

### 30.8.3 Test purpose

To verify that the third harmonic distortion of the sidetone is not greater than 10 %.

### 30.8.4 Method of test

#### 30.8.4.1 Initial conditions

The DAI of the MS is connected to the SS and is set to the operating mode "Test of acoustic devices and A/D & D/A".

The handset is mounted in the LRGP (see annex 1 of ITU-T Recommendation P.76) and the earpiece is sealed to the knife-edge of the artificial ear conforming to ITU-T Recommendation P.51.

#### 30.8.4.2 Procedure

- The SS sends the PCM bit stream coded with the value No 1 over the DAI (pin 25) to the MS.
- An instrument capable of measuring the third harmonic distortion of signals with fundamental frequencies in the range 315 Hz to 1 000 Hz is connected to the artificial ear.
- A pure-tone signal of -4,7 dBPa is applied at the mouth reference point at frequencies of 315 Hz, 500 Hz, and 1 000 Hz. For each frequency the third harmonic distortion is measured in the artificial ear.

### 30.8.5 Test requirement

The third harmonic distortion generated shall not be greater than 10 %.

## 30.9 Out-of-band signals

### 30.9.1 Sending

#### 30.9.1.1 Definition and applicability

The discrimination against out-of-band input signals in the sending direction is a requirement on the in-band image frequencies created by any out-of-band input signals.

The requirements and this test apply to all types of GSM 400, GSM700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 up to release 1999 handset MS supporting speech.

#### 30.9.1.2 Conformance requirement

With any sine wave signal above 4,6 kHz and up to 8 kHz applied at the MRP at a level of -4,7 dBPa, the level of any image frequency produced at the digital interface shall be below a reference level obtained at 1 kHz (-4,7 dBPa at MRP) by at least the amount (in dB) specified in 3GPP TS 03.50; subclause 3.11.1, table 7.

3GPP TS 03.50; subclause 3.11.1.

#### 30.9.1.3 Test purpose

To verify that the conformance requirement is met for input signals with frequencies of 4,65 kHz, 5 kHz, 6 kHz, 6,5 kHz, 7 kHz and 7,5 kHz.

#### 30.9.1.4 Method of test

##### 30.9.1.4.1 Initial conditions

The handset is mounted in the LRGP (see annex 1 of ITU-T Recommendation P.76) and the earpiece is sealed to the knife-edge of the artificial ear conforming to ITU-T Recommendation P.51.

The DAI of the MS is connected to the SS and is set to the operating mode "Test of acoustic devices and A/D & D/A".

##### 30.9.1.4.2 Procedure

- a) A pure tone with a sound pressure of -4,7 dBPa is applied at the mouth reference point as described in ITU-T Recommendation P.64 using an artificial mouth conforming to ITU-T Recommendation P 51.
- b) For input signals at frequencies of 4,65 kHz, 5 kHz, 6 kHz, 6,5 kHz, 7 kHz, and 7,5 kHz, the level represented by the PCM bit stream at the DAI (Pin 23) of any image frequency is measured.

#### 30.9.1.5 Test requirement

The level of any image frequency shall be below a reference obtained at 1 kHz by at least the amount as specified in table 30.5.

**Table 30.5**

| Applied sine-wave frequency | Limit (minimum) |
|-----------------------------|-----------------|
| 4,6 kHz                     | 30 dB           |
| 8 kHz                       | 40 dB           |

Limits for the image frequency discrimination.

The limit at intermediate frequencies lies on a straight line drawn between the given values on a log(frequency) vs linear(dB) scale.

## 30.9.2 Receiving

### 30.9.2.1 Definition and applicability

The discrimination against out-of-band signals in the receiving direction is a requirement on the out-of-band signals generated in the artificial ear from in-band input signals.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 up to release 1999 handset MS supporting speech.

### 30.9.2.2 Conformance requirement

With a digitally simulated sine wave signal in the frequency range of 300 Hz to 3,4 kHz and at a level of 0 dBm applied at the digital interface, the level of spurious out-of-band image signals in the frequency range of 4,6 to 8 kHz measured selectively in the artificial ear shall be lower than the in-band acoustic level produced by a digital signal at 1 kHz set at the level specified in 3GPP TS 03.50; subclause 3.11.2, table 8.

3GPP TS 03.50; subclause 3.11.2.

### 30.9.2.3 Test purpose

To verify that the conformance requirement is met for input signals at the nominal frequencies 500 Hz, 1 000 Hz, 2 000 Hz and 3 350 Hz.

### 30.9.2.4 Method of test

#### 30.9.2.4.1 Initial conditions

The handset is mounted in the LRGP (see annex 1 of ITU-T Recommendation P.76) and the earpiece is sealed to the knife-edge of the artificial ear conforming to ITU-T Recommendation P.51.

The DAI of the MS is connected to the SS and is set to the operating mode "Test of acoustic devices and A/D & D/A".

#### 30.9.2.4.2 Procedure

- a) The SS sends over the DAI (pin 25) a PCM bit stream simulating a sine-wave signal with a level of 0 dBm0.
- b) For input signals at the nominal frequencies 500 Hz, 1 000 Hz, 2 000 Hz and 3 350 Hz (bearing in mind the restriction on sub-multiples of the sampling frequency) the level of any out-of-band signals at frequencies up to 8 kHz is measured in the artificial ear.

### 30.9.2.5 Test requirement

The level of out-of-band signals shall be lower than the in-band acoustic level obtained by a digital signal at 1 kHz set at the level specified in table 30.6.

**Table 30.6**

| Image signal frequency | Equivalent input signal level |
|------------------------|-------------------------------|
| 4,6 kHz                | -35 dBm0                      |
| 8 kHz                  | -45 dBm0                      |

Limits for the image frequency discrimination.

The limit at intermediate frequencies lies on a straight line drawn between the given values on a log(frequency) vs linear(dB) scale.

## 30.10 Idle channel noise

### 30.10.1 Sending

#### 30.10.1.1 Definition and applicability

The idle channel noise in the sending direction is the equivalent noise level produced at the DAI, when the mouth reference point is in a quiet environment.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 handset MS supporting speech except dual mode GSM/3GPP release 4 or later handsets.

#### 30.10.1.2 Conformance requirement

The idle noise in the sending direction shall not exceed -64 dBm<sub>0p</sub> at the UPCMI under silent conditions.

3GPP TS 03.50; subclause 3.6.1.

#### 30.10.1.3 Test purpose

To verify that the idle noise in the sending direction does not exceed -64 dBm<sub>0p</sub> at the UPCMI under silent conditions.

#### 30.10.1.4 Method of test

##### 30.10.1.4.1 Initial conditions

The handset is mounted in the LRGP (see annex 1 of ITU-T Recommendation P.76) and the earpiece is sealed to the knife-edge of the artificial ear conforming to ITU-T Recommendation P.51 in a quiet environment (ambient noise less than 30 dBA).

The DAI of the MS is connected to the SS and is set to the operating mode "Test of acoustic devices and A/D & D/A".

##### 30.10.1.4.2 Procedure

The noise level represented by the PCM bit stream output at the DAI (pin 23) is measured with psophometric weighting according to ITU-T Recommendation G.223, table 4.

NOTE: The ambient noise criterion should be met if the ambient noise does not exceed NR20.

##### 30.10.1.5 Test requirement

The noise produced by the MS in the sending direction shall not exceed -64 dBm<sub>0p</sub>.

### 30.10.2 Receiving

#### 30.10.2.1 Definition and applicability

The idle channel noise in the receiving direction is the acoustic sound pressure in the artificial ear when the digital input signal at the DAI, is the PCM coded value No 1.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 handset MS supporting speech except dual mode GSM/3GPP release 4 or later handsets.

### 30.10.2.2 Conformance requirement

1. If no user controlled receiving volume control is provided, or if it is provided, at the setting of the user controlled receiving volume at which the RLR is equal to the nominal value, the noise measured in the artificial ear contributed by the receiving equipment alone shall not exceed -57 dBPa (A) when driven by a PCM signal corresponding to the decoder output value No. 1.

3GPP TS 03.50; subclause 3.6.2.

2. Where a volume control is provided, the measured noise shall not exceed -54 dBPa(A) at the maximum setting of the volume control.

3GPP TS 03.50; subclause 3.6.2.

### 30.10.2.3 Test purpose

1. To verify that the idle noise in the receiving direction does not exceed -57 dBPa (A). If a user controlled receive volume control is provided it shall be set to the position where RLR is equal to the nominal value.
2. To verify that if a user controlled receive volume control is provided, the idle noise in the receiving direction does not exceed -54 dBPa(A) when the control is set to maximum.

### 30.10.2.4 Method of test

#### 30.10.2.4.1 Initial conditions

The handset is mounted in the LRGP (see annex 1 of ITU-T Recommendation P.76) and the earpiece is sealed to the knife-edge of the artificial ear conforming to ITU-T Recommendation P.51.

The DAI of the MS is connected to the SS and is set to the operating mode "Test of acoustic devices and A/D & D/A".

#### 30.10.2.4.2 Procedure

- a) The SS sends a PCM bit stream coded with the value No 1 over the DAI (Pin 25) to the MS.
- b) The level of the noise is measured in the artificial ear with any volume control set at the position at which the RLR is equal to the nominal value.
- c) Where a volume control is provided, the level of the noise is measured in the artificial ear with the volume control set to maximum.

### 30.10.2.5 Test requirement

In step b) the measured noise generated by the MS shall not exceed -57 dBPa (A).

In step c) the measured noise shall not exceed -54 dBPa (A).

## 30.11 Ambient Noise Rejection

### 30.11.1 Definition and Applicability

An MS that supports speech will typically be operated within an area of high ambient acoustic noise. A level of noise rejection will therefore be required.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM900, DCS1800 and PCS 1 900 handset R96 – R99 MS supporting full rate speech.

### 30.11.2 Conformance Requirement

Compliance shall be checked by calculating the single figure DELSM (SFDELSM) according to the following formula, the SFDELSM shall be  $\geq 0$  dB.

$$SFDELSM = -\frac{4}{5} \times \sum_{n=1}^{14} Del_n \times 10^{(-0.0175 \times W_m)}$$

where:

n = the third octave band centre frequencies from 160 Hz to 3 150 Hz inclusive.

Del<sub>n</sub> = is the 1/3 octave band pressure level centered on the n<sup>th</sup> frequency.

W<sub>m</sub> = is the SLR weighting for the nth 1/3 octave band centre frequency.

3GPP TS 03.50; subclause 3.14.1.

### 30.11.3 Test Purpose

To verify that ambient noise calculated as SFDELSM shall be rejected, by verifying that SFDELSM  $\geq 0$  dB.

### 30.11.4 Method of Test

#### 30.11.4.1 Initial Conditions

A 1/2 inch pressure microphone is calibrated using a known sound source and mounted at the MRP, without the LRGP head present. A frequency analyser is calibrated to enable the sound pressure levels at the microphone to be determined in 1/3<sup>rd</sup> octave bands.

Flood the room in which the measurement is to be made with the selected noise file, and adjust the level such that the noise level at the MRP is 70 dBA. A single noise file of real noise, covering the various noise environments that the MS could be subjected to, is used. This file is three minutes long and also commences with a three minute signal. Once this tone has been adjusted to a level of 70 dBA, the average level of the noise will be 70 dBA. The resulting sound spectrum is Pr<sub>n</sub> dBPa, measured in 1/3<sup>rd</sup> octave bands.

To ensure that the sound field is diffuse enough, the following apply:

- The diffuse sound field is calibrated in the absence of any local obstacles. The averaged field shall be uniform to within  $\pm 3$  dB within a radius of 0,15 m of the MRP, when measured in one-third octave bands from 100 Hz to 3,15 KHz.
- Where more than one loudspeaker is used to produce the desired sound field, the loudspeakers may require to be fed with non-coherent signals to eliminate standing waves and other interference effects.
- Position an LRGP in the correct relative position to the MRP and mount the MS under test. Recalibrate the 1/3<sup>rd</sup> octave frequency analyser using a known voltage source to facilitate the analysis of the Voltage V<sub>rn</sub>, where V<sub>rn</sub> is the voltage at the audio output of the System Simulator (SS) due to the noise spectrum input.

#### 30.11.4.2 Procedure

Set up a full rate speech path between the MS and the SS.

The SS determines, as a function of frequency, using the frequency analyser, in 1/3<sup>rd</sup> octave bands, the electrical output V<sub>rn</sub>, (expressed as dB rel 1V) at the audio output of the SS for the applied acoustic pressure Pr<sub>n</sub> (expressed as dB rel 1Pa) at the MRP. Since, the MS sending sensitivity is not defined above 3,4 kHz and below 300 Hz the measurement shall be cut off at 3,4 kHz and for the bands below 300 Hz. The noise level shall be referenced to the speech level at 300 Hz to yield the DELSM.

The room noise sensitivity is defined as:

$$- S_{mj_m} = V_{rn} \text{ (dBV)} - P_{rn} \text{ (dBPa)}.$$

The ambient noise send sensitivity has now been determined.

The MS speech send sensitivity is now required. The required sensitivity is defined as the electrical output from the MS, measured at the audio output of the SS, as a function of the free field sound pressure at the MRP of the artificial mouth.

The measurement is made using an artificial speech source at the MRP of the artificial mouth. The 1/2 inch pressure microphone is calibrated using a known sound source. The frequency analyser is calibrated to measure in 1/3<sup>rd</sup> octave bands. The artificial mouth output shall be in accordance with the ITU-T Recommendation P.50 male artificial voice. Whilst maintaining the ITU-T Recommendation P.50 'male' spectrum, the total signal level is adjusted to -4,7 dBPa. The resulting sound spectrum is  $P_0$  dBPa, measured in 1/3<sup>rd</sup> octave bands. The 1/3<sup>rd</sup> octave frequency analyser shall be re-calibrated, using a known voltage source, to facilitate the analysis of the voltage  $V_j$ . Where  $V_j$  is the voltage at the audio output of the SS due to the speech spectrum input. A speech path is setup between the MS and the SS. The function of the frequency is determined using the frequency analyser, and in 1/3<sup>rd</sup> octave bands, the electrical output  $V_j$ , (expressed as dB rel. 1V), at the audio output of the SS for the applied acoustic pressure,  $P_0$ , (expressed as dB rel. 1Pa/V), at the MRP.

The sending sensitivity is expressed as:

$$S_{mjs} \text{ (dB)} = V_j \text{ (dBV)} - P_o \text{ (dBPa)} \text{ dBrel1V / Pa}$$

The  $D_{SM}$  for the MS is determined as:

$$D_{SM} = S_{mj_m} - S_{mjs} \text{ (dB)}.$$

### 30.11.5 Test Requirement

The MS ambient noise rejection, calculated as a single figure DELSM (SFDELSM) shall be greater than or equal to 0 dB.

## 30.12 Sending sensitivity/frequency response

### 30.12.1 Definition and applicability

The sending sensitivity frequency response is, as a function of the input test signal frequency, the ratio expressed in dB between the output level at the Digital Audio Interface (DAI) or at the audio output of the reference speech decoder of the SS and the input sound pressure in the artificial mouth required to obtain this.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 release 4 or later handset MS supporting speech except dual mode GSM/3GPP handsets

### 30.12.2 Conformance requirement

The sending sensitivity frequency response shall be within the mask given in 3GPP TS 26.131.

3GPP TS 26.131, subclause 5.4.1, table 1

### 30.12.3 Test purpose

To verify that the sending sensitivity frequency response is within the mask given in 3GPP TS 26.131, subclause 5.4.1, table 1.

## 30.12.4 Method of test

## 30.12.4.1 Initial conditions

When measured at the DAI:

- a) The handset is mounted in the LRGP (see annex A of ITU-T Recommendation P.76). The earpiece is sealed to the knife-edge of the artificial ear.
- b) A pure tone with a sound pressure of -4,7 dBPa (in accordance with ITU-T Recommendation P.64) is applied at the mouth reference point (MRP) as described in ITU-T Recommendation P.64 using an artificial mouth conforming to ITU-T Recommendation P.51.
- c) A digital measuring instrument, or high quality digital decoder followed by an analogue level measuring set, is connected to the Digital Audio Interface (DAI). The DAI is set to the operating mode "Test of acoustic devices and A/D & D/A".

When measured at the output of the reference speech decoder of the SS:

- a) The handset is mounted in the LRGP and the earpiece is sealed to the knife-edge of an artificial ear.
- b) A full rate speech call is set up between the MS and the SS.

## 30.12.4.2 Procedure

When measured at the DAI:

- The SS measures the output level represented by the PCM bit stream at the DAI (pin 23) at one-twelfth-octave intervals as given by the R40 series of preferred numbers in ISO 3 for frequencies from 100 Hz to 4 000 Hz inclusive.

When measured at the output of the reference speech decoder of the SS:

- The test shall be performed according to the test specification as described in 3GPP TS 26.132.

## 30.12.5 Test requirement

The sending sensitivity/frequency response shall be within a mask given in table 30.1. The mask can be drawn with straight lines between the breaking points in the table on a logarithmic (frequency) vs linear (dB sensitivity) scale.

All sensitivity levels are dB on an arbitrary scale.

**Table 30.1**

| Frequency (Hz) | Upper Limit (dB) | Lower Limit (dB) |
|----------------|------------------|------------------|
| 100            | -12              |                  |
| 200            | 0                |                  |
| 300            | 0                | -12              |
| 1000           | 0                | -6               |
| 2000           | 4                | -6               |
| 3000           | 4                | -6               |
| 3400           | 4                | -9               |
| 4000           | 0                |                  |

## 30.13 Sending loudness rating

### 30.13.1 Definition and applicability

The Sending Loudness Rating (SLR) is a means of expressing the sending frequency response based on objective measurements in a way which relates to how a speech signal would be perceived by a listener.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 release 4 or later handset MS supporting speech except dual mode GSM/3GPP handsets

### 30.13.2 Conformance requirement

The Sending Loudness Rating (SLR) shall be  $8 \pm 3$  dB.

3GPP TS 26.131; subclause 5.2.2.

### 30.13.3 Test Purpose

To verify that the Sending Loudness Rating (SLR) is  $8 \pm 3$  dB.

### 30.13.4 Method of test

#### 30.13.4.1 Initial conditions

When measured at the DAI:

- The DAI of the MS is connected to the SS and is set to the operating mode "Test of acoustic devices and A/D & D/A".

When measured at the output of the reference speech decoder of the SS:

- A full rate speech call is set up between the MS and the SS.

#### 30.13.4.2 Procedure

When measured at the DAI:

- a) The sending sensitivity is measured at each of the 14 frequencies given in table 2 of ITU-T Recommendation P.79, bands 4 to 17.
- b) The sensitivity is expressed in terms of dBV/Pa and the SLR is calculated according to ITU-T Recommendation P.79 formula 4.19 b of ITU-T Recommendation P.79, over bands 4 to 17, using the sending weighting factors from ITU-T Recommendation P.79 table 2, adjusted according to table 3 of ITU-T Recommendation P.79.

When measured at the output of the reference speech decoder of the SS:

- The test shall be performed according to the test specification as described in 3GPP TS 26.132.

### 30.13.5 Test requirement

The SLR shall be  $8 \pm 3$  dB.

## 30.14 Receiving sensitivity/frequency response

### 30.14.1 Definition and applicability

The receiving sensitivity frequency response is, as a function of the input test signal frequency, the ratio expressed in dB between the output sound pressure in the artificial ear and the input level, represented by the PCM bit stream at the Digital Audio Interface (DAI) or the level at the SS audio input, required to obtain this.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 release 4 or later handset MS supporting speech. except dual mode GSM/3GPP handsets.

### 30.14.2 Conformance requirement

When measured with the type 1 artificial ear (only release 4 handsets) the receiving sensitivity frequency response shall be within the mask given in 3GPP TS 43.050.

3GPP TS 43.050; subclause 3.8.1.2, table 2.

When measured with 3.x artificial ear (release 4 and later handsets) the receiving sensitivity frequency response shall be within the mask given in 3GPP TS 26.131.

3GPP TS 26.131; subclause 5.4.2, table 2

### 30.14.3 Test purpose

To verify that the receiving sensitivity frequency response is within the mask given in 3GPP TS 43.050; subclause 3.8.1.2, table 2 when measured with the type 1 artificial ear (release 4 handsets only) or within the mask given in 3GPP TS 26.131; subclause 5.4.2, table 2 when measured with a type 3.x artificial ear.

### 30.14.4 Method of test

#### 30.14.4.1 Initial conditions

When measured from the DAI:

- a) The handset is mounted in the LRGP and the earpiece is sealed to the knife-edge of the artificial ear.
- b) A digital signal generator is connected at the digital interface delivering a signal equivalent to a pure tone level of -16 dBm0, see ITU-T Recommendation P.64.
- c) The DAI of the MS is connected to the SS and is set to the operating mode "Test of acoustic devices and A/D & D/A".

When measured from the input of the reference speech encoder of the SS:

- a) The handset is mounted in the LRGP and the earpiece is sealed to the knife-edge of the artificial ear.
- b) A full rate speech call is set up between the MS and the SS.

#### 30.14.4.2 Procedure

When measured from the DAI:

- Measurements are made at one twelfth-octave intervals as given in the R.40 series of preferred numbers in ISO 3 for frequencies from 100 Hz to 4 kHz inclusive. At each frequency, the sound pressure in the artificial ear is measured by connecting a suitable measuring set to the artificial ear.

When measured from the input of the reference speech encoder of the SS:

- The test shall be performed according to the test specification as described in 3GPP TS 26.132.

### 30.14.5 Test requirement

when measured in the type 1 artificial ear (allowed for release 4 handsets only) the receiving sensitivity/frequency response shall be within the mask given by table 30.2. The mask can be drawn with straight lines between the breaking points in the following table on a logarithmic (frequency) vs linear (dB sensitivity) scale.

All sensitivity levels are dB on an arbitrary scale.

Table 30.2

| Frequency (Hz)                                                                                                                                | Upper Limit (dB) | Lower Limit (dB) |
|-----------------------------------------------------------------------------------------------------------------------------------------------|------------------|------------------|
| 100                                                                                                                                           | -12              |                  |
| 200                                                                                                                                           | 0                |                  |
| 300                                                                                                                                           | 2                | -7               |
| 500                                                                                                                                           | see note         | -5               |
| 1 000                                                                                                                                         | 0                | -5               |
| 3 000                                                                                                                                         | 2                | -5               |
| 3 400                                                                                                                                         | 2                | -10              |
| 4 000                                                                                                                                         | 2                |                  |
| NOTE: The limit at intermediate frequencies lies on a straight line drawn between the given values on a log (frequency) vs linear (dB) scale. |                  |                  |

When measured in a type 3.x artificial ear, the receiving sensitivity/frequency response shall be within the mask given in 3GPP TS 26.131; subclause 5.4.2, table 2.

## 30.15 Receiving loudness rating

### 30.15.1 Definition and applicability

The Receiving Loudness Rating (RLR) is a means of expressing the receiving frequency response based on objective measurements in a way which relates to how a speech signal would be perceived by a listener.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 release 4 or later handset MS supporting speech except dual mode GSM/3GPP handsets

### 30.15.2 Conformance requirement

- 1) The nominal Receiving Loudness Rating (RLR) shall be  $2 \pm 3$  dB.

If a user controlled receive volume control is provided the equipment shall meet this nominal value for at least one setting of the control.

3GPP TS 26.131; subclause 5.2.2.

- 2) If a user controlled receive volume control is provided the Receive Loudness Rating (RLR) shall not be less than -13 dB when the control is set to maximum.

3GPP TS 26.131; subclause 5.2.2.

### 30.15.3 Test purpose

- 1) To verify that the nominal Receiving Loudness Rating (RLR) is  $2 \pm 3$  dB.
- 2) To verify that if a user controlled receive volume control is provided the Receive Loudness Rating (RLR) is not less than -13 dB when the control is set to maximum.

### 30.15.4 Method of test

#### 30.15.4.1 Initial conditions

When measured at the DAI:

- The DAI of the MS is connected to the SS and is set to the operating mode "Test of acoustic devices and A/D & D/A".

When measured at the output of the reference speech decoder of the SS:

- A full rate speech call is set up between the MS and the SS.

### 30.15.4.2 Procedure

When measured at the DAI:

- a) The receiving sensitivity is measured at each of the 14 frequencies listed in table 2 of ITU-T Recommendation P.79, bands 4 to 17.
- b) The sensitivity is expressed in terms of dBPa/V and the RLR is calculated according to ITU-T Recommendation P.79 formula 4.19 c, over bands 4 to 17, using the receiving weighting factors from table 2 of ITU-T Recommendation P.79, adjusted according to table 3 of ITU-T Recommendation P.79.
- c) The artificial ear sensitivity must be corrected according to the real ear correction of table 4 of ITU-T Recommendation P.79.

NOTE: The values of real ear correction in ITU-T Recommendation P.79 table 4 were derived for one type of handset conforming to the shape defined in ITU-T Recommendation P.35.

These values are used in the present document because there is no measurement method agreed for the real ear correction. If a method of measurement is agreed, it is intended to change the present document to use the values appropriate to each handset.

When measured from the input of the reference speech encoder of the SS:

- The test shall be performed according to the test specification as described in 3GPP TS 26.132.

### 30.15.5 Test requirement

If no user controlled receive volume control is provided, the RLR shall be  $2 \pm 3$  dB.

If a user controlled receive volume control is provided, the RLR shall meet this nominal value for (at least) one setting of the receive volume control.

When the receive volume control is set to maximum the RLR shall not be less than (i.e. louder than) -13 dB.

## 30.16 Side Tone Masking Rating (STMR)

### 30.16.1 Definition and applicability

The sidetone loudness ratings are a means of expressing the path loss from the artificial mouth to the artificial ear based on objective single tone measurements in a way that relates to how a speaker will perceive his own voice when speaking (talker sidetone, expressed by the sidetone masking rating - STMR), or how a listener will perceive the background noise picked up by the microphone (listener sidetone rating - LSTR).

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 release 4 or later handset MS supporting speech except dual mode GSM/3GPP handsets.

### 30.16.2 Conformance requirement

The conformance requirement is specified in 3GPP TS 26.131.

### 30.16.3 Test purpose

To verify that the requirement for STMR stated in TS 26.131 is met.

### 30.16.4 Method of test

The method of test shall be as specified in 3GPP TS 26.132.

### 30.16.5 Test requirement

The STMR shall be within the limits specified in 3GPP TS 26.131.

## 30.17 Telephone Acoustic coupling Loss (TAL)

### 30.17.1 Echo Loss (EL)

#### 30.17.1.1 Definition and applicability

The echo loss is the path loss from the input of the reference speech encoder of the SS to the output of the reference speech decoder of the SS.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 release 4 or later handset MS supporting speech except dual mode GSM/3GPP handsets.

#### 30.17.1.2 Conformance requirement

The echo loss from the input to the output of the reference speech codec in the SS shall be as specified in 3GPP TS 26.131.

#### 30.17.1.3 Test purpose

To verify that the echo loss from the input to the output of the reference speech codec in the SS is as specified in 3GPP TS 26.131.

#### 30.17.1.4 Method of test

The method of test shall be as specified in 3GPP TS 26.132.

#### 30.17.1.5 Test requirement

The echo loss from the input to the output of the reference speech codec in the SS shall be as specified in 3GPP TS 26.131.

### 30.17.2 Stability margin

#### 30.17.2.1 Definition and applicability

The receive-transmit stability margin is a measure of the gain that would have to be inserted between the go and return paths of the reference speech coder in the SS for oscillation to occur.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 release 4 or later handset MS supporting speech except dual mode GSM/3GPP handsets.

#### 30.17.2.2 Conformance requirement

The stability margin shall be as specified in 3GPP TS 26.131.

#### 30.17.2.3 Test purpose

To verify that the stability margin is as specified in 3GPP TS 26.131.

#### 30.17.2.4 Method of test

The method of test shall be as specified in 3GPP TS 26.132.

#### 30.17.2.5 Test requirement

The minimum stability margin shall be as specified in 3GPP TS 26.131.

## 30.18 Sending Distortion

### 30.18.1 Definition and applicability

The transmit signal to total distortion ratio is a measure of the linearity of the transmitter equipment.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 release 4 or later handset MS supporting speech except dual mode GSM/3GPP handsets.

### 30.18.2 Conformance requirement

The ratio of signal to total distortion power in the sending direction measured with a psophometric filter at the DAI of the MS or at the output of the reference speech decoder of the SS shall be above the limits given in 3GPP TS 03.50; subclause 3.9.1, table 3, unless the sound pressure at MRP exceeds +10 dBPa.

3GPP TS 03.50; subclause 3.9.1.

### 30.18.3 Test purpose

To verify that the ratio of signal to total distortion power in the sending direction measured with psophometric filter is above the limits given in 3GPP TS 03.50; subclause 3.9.1, table 3.

### 30.18.4 Method of test

#### 30.18.4.1 Initial conditions

The handset is mounted in the LRGP (see annex 1 of ITU-T Recommendation P.76) and the earpiece is sealed to the knife-edge of the artificial ear conforming to ITU-T Recommendation P.51.

When measured at the DAI:

- The DAI of the MS is connected to the SS and is set to the operating mode "Test of acoustic devices and A/D & D/A".

When measured at the output of the reference speech decoder of the SS:

- A full rate speech call is set up between the MS and the SS.

#### 30.18.4.2 Procedure

When measured at the DAI:

- a) A sine-wave signal with a frequency in the range 1 004 Hz to 1 025 Hz is applied to the MRP. The level of this signal is adjusted until the level at the DAI output (pin 23) of the MS or at the analogue or digital output of the reference speech decoder of the SS corresponds to -10 dBm<sub>0</sub>. The level of the signal at the MRP is then the acoustic reference level (ARL).
- b) The test signal is applied at the following levels: -35 dB, -30 dB, -25 dB, -20 dB, -15 dB, -10 dB, -5 dB, 0 dB, 5 dB and 10 dB relative to the ARL.
- c) The ratio of signal to total distortion power is measured at the DAI of the MS with the psophometric noise weighting (see ITU-T Recommendations G.714 and O.132) at each signal level.

When measured at the output of the reference speech decoder of the SS:

- The test shall be performed according to the test specification as described in 3GPP TS 26.132.

NOTE: The measurement is not to be carried out at sound pressures exceeding +10 dBPa.

### 30.18.5 Test requirement

The ratio of signal to total distortion power measured with the psophometric noise weighting (see table 4/ITU-T G.223) shall be above the limits given in table 30.3.

Table 30.3

| dB relative to ARL | Level ratio |
|--------------------|-------------|
| -35 dB             | 17,5 dB     |
| -30 dB             | 22,5 dB     |
| -20 dB             | 30,7 dB     |
| -10 dB             | 33,3 dB     |
| 0 dB               | 33,7 dB     |
| 7 dB               | 31,7 dB     |
| 10 dB              | 25,5 dB     |

Limits for the signal to total distortion ratio (sending) when using the sine wave method.

Limits for intermediate levels are found by drawing a straight line between breaking points in a linear (dB signal level) vs linear (dB ratio) scale.

## 30.19 Ambient Noise Rejection

### 30.19.1 Definition and Applicability

An MS that supports speech will typically be operated within an area of high ambient acoustic noise. A level of noise rejection will therefore be required.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM900, DCS1800 and PCS 1 900 release 4 or later handset supporting full rate speech except dual mode GSM/3GPP handsets.

### 30.19.2 Conformance Requirement

The conformance requirement shall be as specified in 3GPP TS 26.131.

### 30.19.3 Test Purpose

To verify that ambient noise rejection is conforming to the specification in 3GPP TS 26.131.

### 30.19.4 Method of Test

The test method shall be as specified in 3GPP TS 26.132.

### 30.19.5 Test Requirement

The MS ambient noise rejection shall be as specified in 3GPP TS 26.132.

---

## 31 Test of supplementary services

The general aspects of the specification of supplementary services at the layer 3 radio interface are given in 3GPP TS 04.10.

The formats and coding are given in 3GPP TS 04.80. If the value of a parameter of an uplink message (MS to network) is specified in a test, the implicit meaning is that it has to be checked; if the value is not specified, it is not to be checked unless otherwise stated.

Unless otherwise stated, the MS shall be in the idle updated state at the beginning of each test (including repetition of a test).

In each test, before the MS sends the first REGISTER message, a MM connection is established.

3GPP TS 04.81 to 3GPP TS 04.88 give the procedures used at the radio interface for normal operation, registration, erasure, activation, deactivation, invocation and interrogation of supplementary services.

The supplementary services are described in 3GPP TS 02.04 and 3GPP TS 02.81 to 3GPP TS 02.88.

Whenever activation via the standard MMI is mentioned, if the MS does not support it but supports a different procedure, this different procedure is used. In the supplementary services tests, only the applicable (see 3GPP TS 02.8x series) MMI service code groups (3GPP TS 02.30 annex 4), of the basic service code in 3GPP TS 09.02, which are supported by the MAP, will be used.

### 31.1 Number identification supplementary services

#### 31.1.1 CLIP

##### 31.1.1.1 Normal operation

Conformance requirement:

3GPP TS 04.81 subclause 1.1.

Purpose:

To test that the MS presents to the user the calling number presented to it in an incoming SETUP message.

Related PICS/PIXIT statements

- Supported MT circuit switched basic services.
- Description of display for CLIP.
- Support of displaying the calling party subaddress.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The SIM in the MS under test has CLIP enabled.

Foreseen final state of the MS

State U7

Maximum duration of test

30 s.

Procedure:

Set up an MT call to the MS under test. The SETUP message shall include a calling party BCD number information element and a calling party subaddress information element.

Expected sequence

| Step | Direction | Message                 | Comments                                                                                              |
|------|-----------|-------------------------|-------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PAGING REQUEST          | SS sends paging                                                                                       |
| 2    | MS -> SS  | CHANNEL REQUEST         |                                                                                                       |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT    | (SDCCH)                                                                                               |
| 4    | MS -> SS  | PAGING RESPONSE         |                                                                                                       |
| 5    | SS -> MS  | AUTHENTICATION REQUEST  |                                                                                                       |
| 6    | MS -> SS  | AUTHENTICATION RESPONSE |                                                                                                       |
| 7    | SS -> MS  | CIPHERING MODE COMMAND  |                                                                                                       |
| 8    | MS -> SS  | CIPHERING MODE COMPLETE |                                                                                                       |
| 9    | SS -> MS  | SETUP                   | Shall include a valid calling party BCD number and calling party subaddress                           |
| 10   | MS -> SS  | CALL CONFIRMED          | Depending on the PICS, the MS shall display the calling party BCD number and calling party subaddress |
| 11   | MS -> SS  | ALERTING                |                                                                                                       |
| 12   | MS        |                         |                                                                                                       |

### 31.1.1.2 Interrogation

#### 31.1.1.2.1 Interrogation accepted

Conformance requirement:

3GPP TS 04.81 subclause 1.2.

Applicability

MS supporting the CLIP supplementary service.

Test purpose

To test the correct operation of the interrogation procedure, and correct display of the response from the SS in the case of successful interrogation.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is "idle updated".

Related PICS/PIXIT statement(s)

Description of the user's commands and of display of the answers from the network for interrogation of CLIP.

Foreseen final state of the MS

The MS is "idle updated".

Test procedure

By means of appropriate MMI functions (using either 3GPP TS 02.30 or manufacturer defined MMI), the user requests interrogation of CLIP for all basic service groups.

Upon receipt of the operation (in a REGISTER message), the system simulator answers with a RELEASE COMPLETE message with the Facility information element containing the return result of the InterrogateSS operation.

The SS transaction is released and the dedicated channel is released.

Maximum duration of test

3 minutes.

Expected sequence

| Step | Direction | Message              | Comments                                                                                                                                                                                |
|------|-----------|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                      |                                                                                                                                                                                         |
| 2    | MS -> SS  | CHANNEL REQUEST      | The MS is made to initiate an interrogation of CLIP (all) with establishment cause "Other procedures which can be completed with an SDCCH"<br>cause: "supplementary service activation" |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT |                                                                                                                                                                                         |
| 4    | MS -> SS  | CM SERVICE REQUEST   |                                                                                                                                                                                         |
| 5    | SS -> MS  | CM SERVICE ACCEPT    |                                                                                                                                                                                         |
| 6    | MS -> SS  | REGISTER             |                                                                                                                                                                                         |
| 7    | SS -> MS  | RELEASE COMPLETE     | InterrogateSS operation Return_result provide user MMI indication                                                                                                                       |
| 8    | MS        |                      |                                                                                                                                                                                         |
| 9    | SS -> MS  | CHANNEL RELEASE      |                                                                                                                                                                                         |

Specific message content

step 6 - CLIP

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = Interrogation

Supplementary service code = CLIP.

Basic service code: no Bearer Service present, no teleservice present.

31.1.1.2.2 Interrogation rejected

Conformance requirement

3GPP TS 04.81 subclause 1.2.

Applicability

MS supporting the CLIP supplementary service.

Test purpose

To test the correct operation of the interrogation procedure, and correct display of the response from the SS in the case of an error response and an invoke problem.

## Initial conditions

## System Simulator:

1 cell, default parameters.

## Mobile Station:

The MS is in CC state U10.

## Related PICS/PIXIT statement(s)

Description of the user's commands and of display of the answers from the network for interrogation of CLIP.

## Foreseen final state of the MS

The MS is in CC state U10.

## Test procedure

By means of appropriate MMI functions (using either 3GPP TS 02.30 or manufacturer defined MMI), the user requests interrogation of CLIP for all basic service groups.

Upon receipt of the operation (in a REGISTER message), the system simulator answers with a RELEASE COMPLETE message with the Facility information element containing a Return\_error(error: SS not available) of the InterrogateSS operation.

The system simulator sends STATUS ENQUIRY, the MS responds with STATUS message indicating CC state U10.

Then again, by means of appropriate MMI functions as defined by the basic public MMI described in 3GPP TS 02.30, the user requests interrogation of CLIP for all basic service groups.

Upon receipt of the REGISTER message, the system simulator answers with the RELEASE COMPLETE message (same PD and TI that in the REGISTER message) with the Facility information element containing a reject(invoke\_problem: resource limitation) of the InterrogateSS operation.

The system simulator sends STATUS ENQUIRY, the MS responds with STATUS message indicating CC state U10.

## Maximum duration of test

3 minutes.

## Expected sequence

| Step | Direction | Message            | Comments                                                                                             |
|------|-----------|--------------------|------------------------------------------------------------------------------------------------------|
| 1    | MS        |                    | The MS is made to initiate an interrogation for CLIP (all) cause: "supplementary service activation" |
| 2    | MS -> SS  | CM SERVICE REQUEST |                                                                                                      |
| 3    | SS -> MS  | CM SERVICE ACCEPT  |                                                                                                      |
| 4    | MS -> SS  | REGISTER           |                                                                                                      |
| 5    | SS -> MS  | RELEASE COMPLETE   | InterrogateSS operation Return_error                                                                 |
| 6    | SS -> MS  | STATUS ENQUIRY     |                                                                                                      |
| 7    | MS -> SS  | STATUS             | CC state U10                                                                                         |
| 8    | MS        |                    | The MS is made to initiate an interrogation of CLIP (all) cause: "supplementary service activation"  |
| 9    | MS -> SS  | CM SERVICE REQUEST |                                                                                                      |
| 10   | SS -> MS  | CM SERVICE ACCEPT  |                                                                                                      |
| 11   | MS -> SS  | REGISTER           |                                                                                                      |
| 12   | SS -> MS  | RELEASE COMPLETE   | InterrogateSS operation Reject                                                                       |
| 13   | MS        |                    | provide correct MMI user indication                                                                  |

## Specific message content

### step 4, 11 - CLIP

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = Interrogation

Supplementary service code = CLIP.

Basic service code: no Bearer Service present, no teleservice present.

### step 5 - CLIP

- protocol discriminator: non call related SS message.
- transaction identifier: same TI as previous REGISTER message.
- message type: RELEASE COMPLETE.
- facility:

return error code: SS not available.

For the return error the invoke ID must be the same as in the invoke of the InterrogateSS operation.

### step 12 -

- protocol discriminator: non call related SS message.
- transaction identifier: same TI as previous REGISTER message.
- message type: RELEASE COMPLETE.
- facility:

reject code: resource limitation.

For the reject the invoke ID must be the same as in the invoke of the InterrogateSS operation.

## 31.1.2 CLIR

### 31.1.2.1 Normal operation - requesting presentation of CLI

Conformance requirement:

3GPP TS 04.81 subclause 2.2.

#### Test Purpose

To test that when the CLIR presentation mode is temporary (presentation restricted), it is possible for the subscriber to present his CLI on a per call basis.

#### Method of test

#### Related PICS/PIXIT statements

- Supported MO circuit switched basic services.

**Initial conditions****System Simulator:**

1 cell, default parameters.

**Mobile Station:**

The SIM in the MS under test has CLIR enabled with CLIR presentation mode "temporary (presentation restricted)".

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U0.1 by using table 26.8.1.2/1.

**Foreseen final state of the MS**

U1, call initiated.

**Maximum duration of test**

30 s.

**Test procedure**

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Using MMI commands, the MS is made to initiate an outgoing call with CLI presented. When the MS is requesting a MM-connection, the SS will indicate acceptance by sending a CM SERVICE ACCEPT message. The MS shall respond with SETUP. The SETUP message shall contain the CLIR suppression information element.

**Expected sequence**

| Step | Direction | Message           | Comments                                  |
|------|-----------|-------------------|-------------------------------------------|
| 1    | SS -> MS  | CM SERVICE ACCEPT |                                           |
| 2    | MS -> SS  | SETUP             | with CLIR suppression information element |

**31.1.2.2 Normal operation - requesting restriction of CLI presentation****Conformance requirement:**

3GPP TS 04.81 subclause 2.3.

**Test Purpose**

To test that when the CLIR presentation mode is temporary (presentation allowed), it is possible for the subscriber to present his CLI on a per call basis.

**Procedure**

Using MMI commands, the MS is made to initiate an outgoing call with CLI restricted.

**Requirements:**

The SETUP message sent by the MS shall include the CLIR invocation information element.

Method of test

Related PICS/PIXIT statements

### 31.1.2.3 Interrogation

#### 31.1.2.3.1 Interrogation accepted

Conformance requirement:

3GPP TS 04.81 subclause 2.4.

Applicability

MS supporting the CLIR supplementary service.

Test purpose

To test the correct operation of the interrogation procedure, and correct display of the response from the SS in the case of successful interrogation.

## Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is "idle updated".

## Related PICS/PIXIT statement(s)

Description of the user's commands and of display of the answers from the network for interrogation of CLIR.

## Foreseen final state of the MS

The MS is "idle updated".

## Test procedure

By means of appropriate MMI functions (using either 3GPP TS 02.30 or manufacturer defined MMI), the user requests interrogation of CLIR for all basic service groups.

Upon receipt of the operation (in a REGISTER message), the system simulator answers with a RELEASE COMPLETE message with the Facility information element containing the return result of the InterrogateSS operation.

The SS transaction is released and the dedicated channel is released.

## Maximum duration of test

3 minutes.

## Expected sequence

| Step | Direction | Message              | Comments                                                                                                                                                                                    |

## Specific message content

step 6 - CLIR

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = Interrogation:

Supplementary service code = CLIR.

Basic service code: no Bearer Service present, no teleservice present.

### 31.1.2.3.2 Interrogation rejected

#### Conformance requirement

3GPP TS 04.81 subclause 2.4.

#### Applicability

MS supporting the CLIR supplementary service.

#### Test purpose

To test the correct operation of the interrogation procedure, and correct display of the response from the SS in the case of an error response and an invoke problem.

#### Initial conditions

##### System Simulator:

1 cell, default parameters.

##### Mobile Station:

The MS is in CC state U10.

#### Related PICS/PIXIT statement(s)

Description of the user's commands and of display of the answers from the network for interrogation of CLIR.

#### Foreseen final state of the MS

The MS is in CC state U10.

#### Test procedure

By means of appropriate MMI functions (using either 3GPP TS 02.30 or manufacturer defined MMI), the user requests interrogation of CLIR for all basic service groups.

Upon receipt of the operation (in a REGISTER message), the system simulator answers with a RELEASE COMPLETE message with the Facility information element containing a Return\_error(error: SS not available) of the InterrogateSS operation.

The system simulator sends STATUS ENQUIRY, the MS responds with STATUS message indicating CC state U10.

Then again, by means of appropriate MMI functions as defined by the basic public MMI described in 3GPP TS 02.30, the user requests interrogation of CLIR for all basic service groups.

Upon receipt of the REGISTER message, the system simulator answers with the RELEASE COMPLETE message (same PD and TI that in the REGISTER message) with the Facility information element containing a reject(invoke\_problem: resource limitation) of the InterrogateSS operation.

The system simulator sends STATUS ENQUIRY, the MS responds with STATUS message indicating CC state U10.

#### Maximum duration of test

3 minutes.

## Expected sequence

| 14   | SS -> MS  | STATUS ENQUIRY     | CC state U10                                                                                         |
| 15   | MS -> SS  | STATUS             |                                                                                                      |

## Specific message content

## step 4, 11 - CLIR

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = Interrogation:

Supplementary service code = CLIR.

Basic service code: no Bearer Service present, no teleservice present.

## step 5 - CLIR

- protocol discriminator: non call related SS message.
- transaction identifier: same TI as previous REGISTER message.
- message type: RELEASE COMPLETE.
- facility:

return error code: SS not available.

For the return error the invoke ID must be the same as in the invoke of the InterrogateSS operation.

## step 12 -

- protocol discriminator: non call related SS message.
- transaction identifier: same TI as previous REGISTER message.
- message type: RELEASE COMPLETE.
- facility:

reject code: resource limitation.

For the reject the invoke ID must be the same as in the invoke of the InterrogateSS operation.

## 31.1.3 COLP

### 31.1.3.1 Normal operation

Conformance requirement:

3GPP TS 04.81 subclause 3.1.

Applicability

MS supporting the COLP supplementary service.

Purpose:

To test that the MS displays the connected number presented to it in an incoming CONNECT message.

Method of test

Related PICS/PIXIT statements

- Supported MO circuit switched basic services.
- Description of display for COLP.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The SIM in the MS under test has COLP enabled.

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U1 by using table 26.8.1.2/4.

Foreseen final state of the MS

U10, call active.

Maximum duration of test

30 s.

Test procedure

1. An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The CC entity of the MS is brought to the state U4. The SS sends a CONNECT message to the MS containing a connected number information element and a connected party subaddress information element. The MS shall respond by sending a CONNECT ACKNOWLEDGE message. The MS shall correctly display the connected line information.

Expected sequence, procedure 1

| Step | Direction | Message             | Comments                                                      |

### 31.1.3.2 Interrogation

#### 31.1.3.2.1 Interrogation accepted

Conformance requirement:

3GPP TS 04.81 subclause 3.2.

Applicability

MS supporting the COLP supplementary service.

Test purpose

To test the correct operation of the interrogation procedure, and correct display of the response from the SS in the case of successful interrogation.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is "idle updated".

Related PICS/PIXIT statement(s)

Description of the user's commands and of display of the answers from the network for interrogation of COLP.

Foreseen final state of the MS

The MS is "idle updated".

Test procedure

By means of appropriate MMI functions (using either 3GPP TS 02.30 or manufacturer defined MMI), the user requests interrogation of COLP for all basic service groups.

Upon receipt of the operation (in a REGISTER message), the system simulator answers with a RELEASE COMPLETE message with the Facility information element containing the return result of the InterrogateSS operation.

The SS transaction is released and the dedicated channel is released.

Maximum duration of test

3 minutes.

Expected sequence

| Step | Direction | Message              | Comments                                                                                                                                                                                |

Specific message content

step 6 - COLP

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = Interrogation:

Supplementary service code = COLP.

Basic service code: no Bearer Service present, no teleservice present.

### 31.1.3.2.2 Interrogation rejected

Conformance requirement

3GPP TS 04.81 subclause 3.2.

Applicability

MS supporting the COLP supplementary service.

Test purpose

To test the correct operation of the interrogation procedure, and correct display of the response from the SS in the case of an error response and an invoke problem.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in CC state U10.

## Related PICS/PIXIT statement(s)

Description of the user's commands and of display of the answers from the network for interrogation of COLP.

## Foreseen final state of the MS

The MS is in CC state U10.

## Test procedure

By means of appropriate MMI functions (using either 3GPP TS 02.30 or manufacturer defined MMI), the user requests interrogation of COLP for all basic service groups.

Upon receipt of the operation (in a REGISTER message), the system simulator answers with a RELEASE COMPLETE message with the Facility information element containing a Return\_error(error: SS not available) of the InterrogateSS operation.

The system simulator sends STATUS ENQUIRY, the MS responds with STATUS message indicating CC state U10.

Then again, by means of appropriate MMI functions as defined by the basic public MMI described in 3GPP TS 02.30, the user requests interrogation of COLP for all basic service groups.

Upon receipt of the REGISTER message, the system simulator answers with the RELEASE COMPLETE message (same PD and TI that in the REGISTER message) with the Facility information element containing a reject(invoke\_problem: resource limitation) of the InterrogateSS operation.

The system simulator sends STATUS ENQUIRY, the MS responds with STATUS message indicating CC state U10.

## Maximum duration of test

3 minutes.

## Expected sequence

| 14   | SS -> MS  | STATUS ENQUIRY     | CC state U10                                                                                         |
| 15   | MS -> SS  | STATUS             |                                                                                                      |

## Specific message content

### step 4, 11 - COLP

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = Interrogation:

Supplementary service code = COLP.

Basic service code: no Bearer Service present, no teleservice present.

### step 5 - COLP

- protocol discriminator: non call related SS message.
- transaction identifier: same TI as previous REGISTER message.
- message type: RELEASE COMPLETE.
- facility:

return error code: SS not available.

For the return error the invoke ID must be the same as in the invoke of the InterrogateSS operation.

### step 12 -

- protocol discriminator: non call related SS message.
- transaction identifier: same TI as previous REGISTER message.
- message type: RELEASE COMPLETE.
- facility:

reject code: resource limitation.

For the reject the invoke ID must be the same as in the invoke of the InterrogateSS operation.

## 31.1.4 COLR

### 31.1.4.1 Interrogation

#### 31.1.4.1.1 Interrogation accepted

Conformance requirement:

3GPP TS 04.81 subclause 4.2.

Applicability

MS supporting the COLR supplementary service.

Test purpose

To test the correct operation of the interrogation procedure, and correct display of the response from the SS in the case of successful interrogation.

## Initial conditions

## System Simulator:

1 cell, default parameters.

## Mobile Station:

The MS is "idle updated".

## Related PICS/PIXIT statement(s)

Description of the user's commands and of display of the answers from the network for interrogation of COLR.

## Foreseen final state of the MS

The MS is "idle updated".

## Test procedure

By means of appropriate MMI functions (using either 3GPP TS 02.30 or manufacturer defined MMI), the user requests interrogation of COLR for all basic service groups.

Upon receipt of the operation (in a REGISTER message), the system simulator answers with a RELEASE COMPLETE message with the Facility information element containing the return result of the InterrogateSS operation.

The SS transaction is released and the dedicated channel is released.

## Maximum duration of test

3 minutes.

## Expected sequence

| Step | Direction | Message              | Comments                                                                                                                                                                                    |

## Specific message content

## step 6 - COLR

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = Interrogation:

Supplementary service code = COLR.

Basic service code: no Bearer Service present, no teleservice present.

### 31.1.4.1.2 Interrogation rejected

#### Conformance requirement

3GPP TS 04.81 subclause 4.2.

#### Applicability

MS supporting the COLR supplementary service.

#### Test purpose

To test the correct operation of the interrogation procedure, and correct display of the response from the SS in the case of an error response and an invoke problem.

#### Initial conditions

##### System Simulator:

1 cell, default parameters.

##### Mobile Station:

The MS is in CC state U10.

#### Related PICS/PIXIT statement(s)

Description of the user's commands and of display of the answers from the network for interrogation of COLR.

#### Foreseen final state of the MS

The MS is in CC state U10.

#### Test procedure

By means of appropriate MMI functions (using either 3GPP TS 02.30 or manufacturer defined MMI), the user requests interrogation of COLR for all basic service groups.

Upon receipt of the operation (in a REGISTER message), the system simulator answers with a RELEASE COMPLETE message with the Facility information element containing a Return\_error(error: SS not available) of the InterrogateSS operation.

The system simulator sends STATUS ENQUIRY, the MS responds with STATUS message indicating CC state U10.

Then again, by means of appropriate MMI functions as defined by the basic public MMI described in 3GPP TS 02.30, the user requests interrogation of COLR for all basic service groups.

Upon receipt of the REGISTER message, the system simulator answers with the RELEASE COMPLETE message (same PD and TI that in the REGISTER message) with the Facility information element containing a reject(invoke\_problem: resource limitation) of the InterrogateSS operation.

The system simulator sends STATUS ENQUIRY, the MS responds with STATUS message indicating CC state U10.

#### Maximum duration of test

3 minutes.

| 15   | MS -> SS  | STATUS             |                                                                                                      |

## Specific message content

## step 4, 11 - COLR

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = Interrogation:

Supplementary service code = COLR.

Basic service code: no Bearer Service present, no teleservice present.

## step 5 - COLR

- protocol discriminator: non call related SS message.
- transaction identifier: same TI as previous REGISTER message.
- message type: RELEASE COMPLETE.
- facility:

return error code: SS not available.

For the return error the invoke ID must be the same as in the invoke of the InterrogateSS operation.

## step 12 -

- protocol discriminator: non call related SS message.
- transaction identifier: same TI as previous REGISTER message.
- message type: RELEASE COMPLETE.
- facility:

reject code: resource limitation.

For the reject the invoke ID must be the same as in the invoke of the InterrogateSS operation.

### 31.1.4.2 Normal operation

Conformance requirement:

3GPP TS 04.81 subclause 3.1.

Applicability

All MS.

Purpose:

To test that the MS is behaving correctly if the number is restricted in an incoming CONNECT message.

Method of test

Related PICS/PIXIT statements

- supported MO circuit switched basic services.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The SIM in the MS under test has COLR enabled.

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U1 by using table 26.8.1.2/4.

Foreseen final state of the MS

U10, call active.

Maximum duration of test

30 s.

Test procedure

1. An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The CC entity of the MS is brought to the state U4. The SS sends a CONNECT message to the MS containing a connected number information element indicating "presentation restricted" with no number digits. The MS shall respond by sending a CONNECT ACKNOWLEDGE message and not display any connected line information.
2. Repeat procedure 1, except that the CONNECT message includes a connected number information element indicating "Number not available due to interworking".

Expected sequence, procedure 1

| Step | Direction | Message             | Comments                                           |
|------|-----------|---------------------|----------------------------------------------------|
| 1    | SS -> MS  | CONNECT             | See specific message contents                      |
| 2    | MS -> SS  | CONNECT ACKNOWLEDGE |                                                    |
| 3    | MS        |                     | The MS shall display no connected line information |

## 31.2 Call offering supplementary services

The following abbreviations are used:

|        |                                                                    |
|--------|--------------------------------------------------------------------|
| CF:    | Call Forwarding (common name for CFU, CFB, CFNRy and CFNRc).       |
| CFB:   | Call Forwarding on mobile subscriber Busy                          |
| CFC:   | Call Forwarding Conditional (common name for CFB, CFNRy and CFNRc) |
| CFNRc: | Call Forwarding on mobile subscriber Not Reachable                 |
| CFNRy: | Call Forwarding on No Reply                                        |
| CFU:   | Call Forwarding Unconditional                                      |

NOTE: These abbreviations are also used to represent the corresponding SS-Code; e.g. CFC is the SS-Code for all conditional forwarding services.

### 31.2.1 Call forwarding supplementary services

#### 31.2.1.1 Registration

##### 31.2.1.1.1 Registration accepted

##### 31.2.1.1.1.1 Conformance requirements

For registration of any type of call forwarding with any parameters, the MS shall transmit successively:

- 1) a CHANNEL REQUEST with establishment cause set to "other services requested by the mobile user";
- 2) a CM SERVICE REQUEST with CM service type indicating "supplementary service activation";
- 3) and then the REGISTER message containing a facility IE that includes an invoke of the RegisterSS operation with parameter values according to the user's request (MMI action);

- 4) Upon receipt of the RELEASE COMPLETE message, the MS shall provide the appropriate user indication (which is to be described by the manufacturer).

#### References

- 1) 3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.3.1.1.2 and 9.1.9.
- 2) 3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.5.1.1, 9.2.9 and 10.5.33.
- 3) 3GPP TS 04.82, 3GPP TS 04.80 subclauses 2.3 and 3.6.
- 4) 3GPP TS 02.30 subclause 4.5.

#### 31.2.1.1.1.2 Test purpose

- 1) To check that the MS correctly requests a supplementary service transaction for registration of call forwarding in CHANNEL REQUEST message.
- 2) To check that the MS correctly requests a supplementary service transaction for registration of call forwarding in the subsequent CM SERVICE REQUEST.
- 3) To check that the MS sends a REGISTER message containing the invoke of the RegisterSS operation with the expected parameter values for registration of call forwarding.
- 4) To check that upon receipt of the result of the operation (in a RELEASE COMPLETE message), the MS provides the appropriate user indication (as described by the manufacturer).

These checks are done for:

- a) CFNRy, for basic service group speech.
- b) CFU, for basic service group all facsimile.

#### 31.2.1.1.1.3 Method of test

##### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is "idle updated".

##### Related PICS/PIXIT statement(s)

Description of the user's commands and of display of the answers from the network for call forwarding.

##### Foreseen final state of the MS

The MS is "idle updated".

##### Test procedure

By means of appropriate MMI functions (using either 3GPP TS 02.30 or manufacturer defined MMI), the user requests registration of CFNRy for Speech, to a number arbitrarily selected and with a no reply time value arbitrarily selected.

Upon receipt of the operation (in a REGISTER message), the system simulator answers with a RELEASE COMPLETE message with the Facility information element containing the return result of the RegisterSS operation.

The SS transaction is released and the dedicated channel is released.

Then again, by means of appropriate MMI functions as defined by the basic public MMI described in 3GPP TS 02.30, the user requests registration of CFU for all facsimile, to a number arbitrarily selected.

Upon receipt of the REGISTER message, the system simulator answers with the RELEASE COMPLETE message with the Facility information element containing the return result of the RegisterSS operation.

#### Maximum duration of test

3 minutes.

#### Expected sequence

| Step | Direction | Message              | Comments                                                                                     |
|------|-----------|----------------------|----------------------------------------------------------------------------------------------|
| 1    | MS        |                      | The MS is made to initiate a registration of call forwarding service for CFNRy (Speech)      |
| 2    | MS -> SS  | CHANNEL REQUEST      | with establishment cause "Other procedures which can be completed with an SDCCH"             |

| 12   | SS -> MS  | IMMEDIATE ASSIGNMENT |                                                                                              |
| 13   | MS -> SS  | CM SERVICE REQUEST   | cause: "supplementary service activation"                                                    |
| 14   | SS -> MS  | CM SERVICE ACCEPT    |                                                                                              |
| 15   | MS -> SS  | REGISTER             |                                                                                              |
| 16   | SS -> MS  | RELEASE COMPLETE     | RegisterSS operation Return result                                                           |
| 17   | MS        |                      | provide correct MMI user indication                                                          |
| 18   | SS -> MS  | CHANNEL RELEASE      |                                                                                              |

#### Specific message content

##### step 6 - CFNRy

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = Registration:

Supplementary service code = CFNRy.

Forwarded to number: as selected.

No reply condition time: as selected.

Basic service code: TeleService AllSpeechTransmissionServices, no Bearerservice present.

## step 7 - CFU

- protocol discriminator: non call related SS message.
- transaction identifier: same as at step 6.
- message type: RELEASE COMPLETE.
- facility:

Return Result = Registration:

Supplementary service code = CFNRy.

Forwarded to number.

No Reply condition time.

Basic service code: TeleService AllSpeechTransmissionServices, no Bearerservice present.

## step 15 - CFU

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = Registration:

Supplementary service code = CFU.

Forwarded to number: as selected.

Basic service code: no bearer service present, teleservice (all facsimile).

## step 16 - CFU

- protocol discriminator: non call related SS message.
- transaction identifier: same as at step 15.
- message type: RELEASE COMPLETE.
- facility:

Return Result = Registration:

Supplementary service code = CFU.

Forwarded to number.

Basic service code: TeleService (all facsimile), no Bearerservice present.

### 31.2.1.1.2 Registration rejected

#### 31.2.1.1.2.1 Conformance requirements

- 1) A transaction of any kind being already established, for registration of any type of call forwarding with any parameters, the MS shall establish a parallel MM transaction, sending a CM SERVICE REQUEST with CM service type indicating "supplementary service activation".
- 2) Then the MS shall send a REGISTER message related to the present SS transaction containing a facility IE that includes an invoke of the RegisterSS operation with parameter values according to the user's request (MMI action).

- 3) Upon receipt of the RELEASE COMPLETE message related to the present SS transaction, the SS transaction shall be released but the first transaction shall remain unaffected.
- 4) Upon receipt of the RELEASE COMPLETE message, the MS shall provide the appropriate user indication (which is to be described by the Manufacturer).

#### References

- 1) 3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.3.1.1.2 and 9.1.9.
- 2) 3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.5.1.1, 9.2.9 and 10.5.33.
- 3) 3GPP TS 04.82, 3GPP TS 04.80 subclauses 2.3 and 3.6.
- 4) 3GPP TS 02.30 subclause 4.5.

#### 31.2.1.1.2.2 Test purpose

- 1) To check that the MS correctly requests the establishment of a parallel MM transaction for supplementary service transaction of registration of call forwarding, sending a CM SERVICE REQUEST.
- 2) To check that the MS sends a REGISTER message containing the invoke of the RegisterSS operation with the expected parameter values for registration of call forwarding.
- 3) To check that upon receipt of the RELEASE COMPLETE message related to the present SS transaction, the first transaction remains unaffected.
- 4) To check that upon receipt of the RELEASE COMPLETE message, the MS provides the appropriate user indication (as described by the Manufacturer).

These checks are performed with a call transaction already established for:

- a) CFB, for all asynchronous services, the RELEASE COMPLETE message being sent with a facility IE containing a return\_error(error) where error is "Bearer Service not provisioned".
- b) CF, for all facsimile, the RELEASE COMPLETE message being sent with a facility IE containing a reject(involve\_problem) where involve\_problem is "resource limitation".

#### 31.2.1.1.2.3 Method of test

##### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in CC state U10.

##### Related PICS/PIXIT statement(s)

Description of the user's commands and of display of the answers from the network for call forwarding.

##### Foreseen final state of the MS

The MS is in CC state U10.

##### Test procedure

By means of appropriate MMI functions (using either 3GPP TS 02.30 or manufacturer defined MMI), the user requests registration of CFB for all asynchronous services, to a number arbitrarily selected.

Upon receipt of the operation (in a REGISTER message), the system simulator answers with a RELEASE COMPLETE message with the Facility information element containing a Return\_error(error: BearerService not provisioned) of the RegisterSS operation.

The system simulator sends STATUS ENQUIRY, the MS responds with STATUS message indicating CC state U10.

Then again, by means of appropriate MMI functions as defined by the basic public MMI described in 3GPP TS 02.30, the user requests registration of CF for all facsimile, to a number arbitrarily selected.

Upon receipt of the REGISTER message, the system simulator answers with the RELEASE COMPLETE message with the Facility information element containing a reject(involve\_problem: resource limitation) of the RegisterSS operation.

The system simulator sends STATUS ENQUIRY, the MS responds with STATUS message indicating CC state U10.

#### Maximum duration of test

3 minutes.

#### Expected sequence

| Step | Direction | Message            | Comments                                                                                                                                           |

#### Specific message content

##### step 4 - CFB

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = Registration:

Supplementary service code = CFB.

Forwarded to number: as selected.

Basic service code: Bearer Service (all asynchronous services), no teleservice present.

step 5 -

- protocol discriminator: non call related SS message.
- transaction identifier: same TI as previous REGISTER message.
- message type: RELEASE COMPLETE.
- facility:

return error code: BearerService not provisioned.

For the return error the invoke ID must be the same as in the invoke of the RegisterSS operation.

step 11 - CF

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = Registration:

Supplementary service code = CF.

Forwarded to number: as selected.

Basic service code: no bearer service present, teleservice (all facsimile)).

step 12 -

- protocol discriminator: non call related SS message.
- transaction identifier: same TI as previous REGISTER message.
- message type: RELEASE COMPLETE.
- facility:

reject code: resource limitation.

For the reject the invoke ID must be the same as in the invoke of the Register SS operation.

## 31.2.1.2 Erasure by the subscriber

### 31.2.1.2.1 Erasure accepted

#### 31.2.1.2.1.1 Conformance requirements

For erasure of any type of call forwarding, the MS shall transmit successively:

- 1) a CHANNEL REQUEST with establishment cause set to "other services requested by the mobile user";
- 2) a CM SERVICE REQUEST with CM service type indicating "supplementary service activation";
- 3) and then the REGISTER message containing a facility that includes an invoke of the EraseSS operation with the expected parameter values according to the user request (MMI action);
- 4) Upon receipt of the RELEASE COMPLETE message, the MS shall provide the appropriate user indication (which is to be described by the manufacturer).

## References

- 1) 3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.3.1.1.2 and 9.1.9.
- 2) 3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.5.1.1, 9.2.9 and 10.5.33.
- 3) 3GPP TS 04.82, 3GPP TS 04.80 subclauses 2.3 and 3.6.
- 4) 3GPP TS 02.30 subclause 4.5.

### 31.2.1.2.1.2 Test purpose

- 1) To check that the MS correctly requests supplementary service transaction for erasure of call forwarding in CHANNEL REQUEST message.
- 2) To check that the MS correctly requests supplementary service transaction for erasure of call forwarding in the subsequent CM SERVICE REQUEST.
- 3) To check that the MS sends a REGISTER message containing the invoke of the EraseSS operation with the expected parameter values for erasure of call forwarding.
- 4) To check that upon receipt of the result of the operation (in a RELEASE COMPLETE message), the MS provides the appropriate user indication (as described by the manufacturer).

These checks are done for:

- a) CFC, for basic service group all facsimile.
- b) CFNRc, for all basic service groups.

### 31.2.1.2.1.3 Method of test

#### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is "idle updated".

#### Related PICS/PIXIT statement(s)

Description of the user's commands and of display of the answers from the network for call forwarding.

#### Foreseen final state of the MS

The MS is "idle updated".

#### Test procedure

By means of appropriate MMI functions (using either 3GPP TS 02.30 or manufacturer defined MMI), the user requests erasure of CFC for all facsimile.

Upon receipt of the operation (in a REGISTER message), the system simulator answers with a RELEASE COMPLETE message with the facility information element containing a return result of the EraseSS operation.

The SS transaction is released and the dedicated channel is released.

Then again, by means of appropriate MMI functions as defined by the basic public MMI described in 3GPP TS 02.30, the user requests erasure of CFNRc for all basic service groups.

Upon receipt of the REGISTER message, the system simulator answers with the RELEASE COMPLETE message with the Facility information element containing the return result of the EraseSS operation.

The dedicated channel is released.

Maximum duration of test

3 minutes.

Specific message content

step 6 - CFC

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = Erasure:

Supplementary service code = CFC.

Basic service code: no Bearer Service, teleservice (all facsimile).

step 15 - CFNRc

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = Erasure:

Supplementary service code = CFNRc.

Basic service code: no bearer service present, no teleservice present.

### 31.2.1.2.2 Erasure rejected

#### 31.2.1.2.2.1 Conformance requirements

- 1) A transaction of any kind being already established, for erasure of any type of call forwarding with any parameters, the MS shall establish a parallel MM transaction, sending a CM SERVICE REQUEST with CM service type indicating "supplementary service activation".
- 2) Then the MS shall send a REGISTER message related to the present SS transaction containing a facility IE that includes an invoke of the EraseSS operation with parameter values according to the user's request (MMI action).
- 3) Upon receipt of the RELEASE COMPLETE message related to the present SS transaction, the SS transaction shall be released but the first transaction shall remain unaffected.
- 4) Upon receipt of the RELEASE COMPLETE message, the MS shall provide the appropriate user indication (which is to be described by the Manufacturer).

#### References

- 1) 3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.3.1.1.2 and 9.1.9.
- 2) 3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.5.1.1, 9.2.9 and 10.5.33.
- 3) 3GPP TS 04.82,  
3GPP TS 04.80 subclauses 2.3 and 3.6.
- 4) 3GPP TS 02.30 subclause 4.5.

#### 31.2.1.2.2.2 Test purpose

- 1) To check that the MS correctly requests the establishment of a parallel MM transaction for supplementary service transaction of erasure of call forwarding, sending a CM SERVICE REQUEST.
- 2) To check that the MS sends a REGISTER message containing the invoke of the EraseSS operation with the expected parameter values for erasure of call forwarding.
- 3) To check that upon receipt of the RELEASE COMPLETE message related to the present SS transaction, the first transaction remains unaffected.
- 4) To check that upon receipt of the RELEASE COMPLETE message, the MS provides the appropriate user indication (as described by the Manufacturer).

These checks are performed with a call transaction already established for:

- a) CFU, for Speech, the RELEASE COMPLETE message being sent with a facility IE containing a return\_error(error) where error is "Teleservice not provisioned".
- b) CFNRy, for all facsimile, the RELEASE COMPLETE message being sent with a facility IE containing a reject(involve\_problem) where involve\_problem is "resource limitation".

#### 31.2.1.2.2.3 Method of test

##### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in CC state U10.

## Related PICS/PIXIT statement(s)

Description of the user's commands and of display of the answers from the network for call forwarding.

## Foreseen final state of the MS

The MS is in CC state U10.

## Test procedure

By means of appropriate MMI functions (using either 3GPP TS 02.30 or manufacturer defined MMI), the user requests erasure of CFU for Speech.

Upon receipt of the operation (in a REGISTER message), the system simulator answers with a RELEASE COMPLETE message with the Facility information element containing a Return\_error(error: TeleService not provisioned) of the EraseSS operation.

The system simulator sends STATUS ENQUIRY, the MS responds with STATUS message indicating CC state U10.

Then again, by means of appropriate MMI functions as defined by the basic public MMI described in 3GPP TS 02.30, the user requests erasure of CFNRy for all facsimile.

Upon receipt of the REGISTER message, the system simulator answers with the RELEASE COMPLETE message with the Facility information element containing a reject(involve\_problem: resource limitation) of the EraseSS operation.

The system simulator sends STATUS ENQUIRY, the MS responds with STATUS message indicating CC state U10.

## Maximum duration of test

3 minutes.

## Expected sequence

| Step | Direction | Message            | Comments                                                                                  |

| 15   | MS -> SS  | STATUS             | CC state U10                                                                              |

## Specific message content

### step 4 - CFU

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = Erasure:

Supplementary service code = CFU.

Basic service code: Tele Service AllSpeechTransmissionServices, no BearerService present.

### step 5 -

- protocol discriminator: non call related SS message.
- transaction identifier: same TI as previous REGISTER message.
- message type: RELEASE COMPLETE.
- facility:

return error code: TeleService not provisioned.

For the return error the invoke ID must be the same as in the invoke of the EraseSS operation.

### step 11 - CFNRy

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = Erasure:

Supplementary service code = CFNRy.

Basic service code: no bearer service present, teleservice (all facsimile)).

### step 12 -

- protocol discriminator: non call related SS message.
- transaction identifier: same TI as previous REGISTER message.
- message type: RELEASE COMPLETE.
- facility:

reject code: resource limitation.

For the reject the invoke ID must be the same as in the invoke of the EraseSS operation.

## 31.2.1.3 Activation

### 31.2.1.3.1 Conformance requirements

For activation of any type of call forwarding with any parameters, the MS shall transmit successively

- 1) a CHANNEL REQUEST with establishment cause set to "other services requested by the mobile user";
- 2) a CM SERVICE REQUEST with CM service type indicating "supplementary service activation";

- 3) and then the REGISTER message containing a facility IE that includes an invoke of the ActivateSS operation with parameter values according to the user's request (MMI action);
- 4) upon receipt of the RELEASE COMPLETE message, the MS shall provide the appropriate user indication (which is to be described by the manufacturer).

#### References

- 1) 3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.3.1.1.2 and 9.1.9.
- 2) 3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.5.1.1, 9.2.9 and 10.5.33.
- 3) 3GPP TS 04.82,  
3GPP TS 04.80 subclauses 2.3 and 3.6.
- 4) 3GPP TS 02.30 subclause 4.5.

#### 31.2.1.3.2 Test purpose

- 1) To check that the MS correctly requests a supplementary service transaction for activation of call forwarding in CHANNEL REQUEST message.
- 2) To check that the MS correctly requests a supplementary service transaction for activation of call forwarding in the subsequent CM SERVICE REQUEST.
- 3) To check that the MS sends a REGISTER message containing the invoke of the ActivateSS operation with the expected parameter values for activation of call forwarding.
- 4) To check that upon receipt of the result of the operation (in a RELEASE COMPLETE message), the MS provides the appropriate user indication (as described by the manufacturer).

These checks are done for:

- a) CF, for basic service group "all synchronous services".
- b) CFU, for all basic service groups.

#### 31.2.1.3.3 Method of test

##### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is "idle updated".

##### Related PICS/PIXIT statement(s)

Description of the user's commands and of display of the answers from the network for call forwarding.

##### Foreseen final state of the MS

The MS is "idle updated".

##### Test procedure

By means of appropriate MMI functions (using either 3GPP TS 02.30 or manufacturer defined MMI), the user requests activation of CF for all synchronous services.

Upon receipt of the operation (in a REGISTER message), the system simulator answers with the FACILITY message with the Facility information element containing the return result of the ActivateSS operation.

The SS transaction is released and the dedicated channel is released.

Then again, by means of appropriate MMI functions as defined by the basic public MMI described in 3GPP TS 02.30, the user requests activation of CFU for all basic service groups.

Upon receipt of the REGISTER message, the system simulator answers with the RELEASE COMPLETE message with the Facility information element containing the return result of the ActivateSS operation.

Maximum duration of test

3 minutes.

| 16   | SS -> MS  | RELEASE COMPLETE     | ActivateSS operation Return result                                                                    |
| 17   | MS        |                      | provide correct MMI user indication                                                                   |
| 18   | SS -> MS  | CHANNEL RELEASE      |                                                                                                       |

Specific message contents:

step 6 - CF

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = Activation:

Supplementary service code = CF.

Basic service code: Bearer Service (all synchronous services), no teleservice present.

step 15 - CFU

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = Activation:

Supplementary service code = CFU.

Basic service code: no bearer service present, no teleservice present.

### 31.2.1.4 Deactivation

#### 31.2.1.4.1 Conformance requirements

For deactivation of any type of call forwarding with any parameters, the MS shall transmit successively:

- 1) a CHANNEL REQUEST with establishment cause set to "other services requested by the mobile user";
- 2) a CM SERVICE REQUEST with CM service type indicating "supplementary service activation";
- 3) and then the REGISTER message containing a facility IE that includes an invoke of the DeactivateSS operation with parameter values according to the user's request (MMI action);
- 4) upon receipt of the RELEASE COMPLETE message, the MS shall provide the appropriate user indication (which is to be described by the manufacturer).

#### References

- 1) 3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.3.1.1.2 and 9.1.9.
- 2) 3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.5.1.1, 9.2.9 and 10.5.33.
- 3) 3GPP TS 04.82,  
3GPP TS 04.80 subclauses 2.3 and 3.6.
- 4) 3GPP TS 02.30 subclause 4.5.

#### 31.2.1.4.2 Test purpose

- 1) To check that the MS correctly requests a supplementary service transaction for deactivation of call forwarding in CHANNEL REQUEST message.
- 2) To check that the MS correctly requests a supplementary service transaction for deactivation of call forwarding in the subsequent CM SERVICE REQUEST.
- 3) To check that the MS sends a REGISTER message containing the invoke of the DeactivateSS operation with the expected parameter values for deactivation of call forwarding.
- 4) To check that upon receipt of the result of the operation (in a RELEASE COMPLETE message), the MS provides the appropriate user indication (as described by the manufacturer).

These checks are done for:

- a) CFC, for basic service group speech.
- b) CFNRc, for basic service group all facsimile.

## 31.2.1.4.3 Method of test

## Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is "idle updated".

## Related PICS/PIXIT statement(s)

Description of the user's commands and of display of the answers from the network for call forwarding.

## Foreseen final state of the MS

The MS is "idle updated".

## Test procedure

By means of appropriate MMI functions (using either 3GPP TS 02.30 or manufacturer defined MMI), the user requests deactivation of CFC for speech.

Upon receipt of the operation (in a REGISTER message), the system simulator answers with a RELEASE COMPLETE message with the Facility information element containing the return result of the DeactivateSS operation.

The SS transaction is released and the dedicated channel is released.

Then again, by means of appropriate MMI functions as defined by the basic public MMI described in 3GPP TS 02.30, the user requests deactivation of CFNRc for all facsimile.

Upon receipt of the REGISTER message, the system simulator answers with the RELEASE COMPLETE message with the Facility information element containing the return result of the DeactivateSS operation.

The dedicated channel is released.

## Maximum duration of test

3 minutes.

## Expected sequence

| 18   | SS -> MS  | CHANNEL RELEASE      |                                                                                                                                                                                                                              |

## Specific message content

## step 6 - CFC

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = Deactivation:

Supplementary service code = CFC.

Basic service code: Bearer Service (speech), no teleservice present.

## step 15 - CFNRc

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = Deactivation:

Supplementary service code = CFNRc.

Basic service code: no bearer service present, teleservice (all facsimile).

## 31.2.1.5 Invocation

Invocation is not applicable to the MS and causes no signalling on the radio path.

### 31.2.1.6 Interrogation

#### 31.2.1.6.1 Interrogation accepted

##### 31.2.1.6.1.1 Conformance requirements

For interrogation of any specific call forwarding service (not applicable to a group of services) with any parameters, the MS shall transmit successively:

- 1) a CHANNEL REQUEST with establishment cause set to "other services requested by the mobile user";
- 2) a CM SERVICE REQUEST with CM service type indicating "supplementary service activation";
- 3) and then the REGISTER message containing a facility IE that includes an invoke of the InterrogateSS operation with parameter values according to the user's request (MMI action);
- 4) upon receipt of the RELEASE COMPLETE message, the MS shall provide the appropriate user indication (which is to be described by the manufacturer).

#### References

- 1) 3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.3.1.1.2 and 9.1.9.
- 2) 3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.5.1.1, 9.2.9 and 10.5.33.
- 3) 3GPP TS 04.82,  
3GPP TS 04.80 subclauses 2.3 and 3.6.
- 4) 3GPP TS 02.30 subclause 4.5.

##### 31.2.1.6.1.2 Test purpose

- 1) To check that the MS correctly requests a supplementary service transaction for interrogation of a specific call forwarding in CHANNEL REQUEST message.
- 2) To check that the MS correctly requests a supplementary service transaction for interrogation of call forwarding in the subsequent CM SERVICE REQUEST.
- 3) To check that the MS sends a REGISTER message containing the invoke of the InterrogateSS operation with the expected parameter values for interrogation of call forwarding.
- 4) To check that upon receipt of the result of the operation (in a RELEASE COMPLETE message), the MS provides the appropriate user indication (as described by the manufacturer).

These checks are done for:

- a) CFB, for all basic service groups.
- b) CFNRy, for basic service group speech.

##### 31.2.1.6.1.3 Method of test

#### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is "idle updated".

## Related PICS/PIXIT statement(s)

Description of the user's commands and of display of the answers from the network for call forwarding.

## Foreseen final state of the MS

The MS is "idle updated".

## Test procedure

By means of appropriate MMI functions (using either 3GPP TS 02.30 or manufacturer defined MMI), the user requests interrogation of CFB for all basic service groups.

Upon receipt of the operation (in a REGISTER message), the system simulator answers with a RELEASE COMPLETE message with the Facility information element containing the return result of the InterrogateSS operation.

The SS transaction is released and the dedicated channel is released.

Then again, by means of appropriate MMI functions as defined by the basic public MMI described in 3GPP TS 02.30, the user requests interrogation of CFNRy for speech.

Upon receipt of the REGISTER message, the system simulator answers with the RELEASE COMPLETE message with the Facility information element containing the return result of the InterrogateSS operation.

The dedicated channel is released.

## Maximum duration of test

3 minutes.

## Expected sequence

| Step | Direction | Message              | Comments                                                                               |

| 16   | MS -> SS  | REGISTER             |                                                                                        |
| 17   | SS -> MS  | RELEASE COMPLETE     | InterrogateSS operation Return result                                                  |
| 18   | MS        |                      | provide correct MMI user indication                                                    |
| 19   | SS -> MS  | CHANNEL RELEASE      |                                                                                        |

## Specific message content

### step 6 - CFB

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = Interrogation:

Supplementary service code = CFB.

Basic service code: no Bearer Service present, no teleservice present.

### step 15 - CFNRy

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = Interrogation:

Supplementary service code = CFNRy.

Basic service code: no bearer service present, teleservice (speech).

## 31.2.1.6.2 Interrogation rejected

### 31.2.1.6.2.1 Conformance requirements

- 1) A transaction of any kind being already established, for interrogation of any specific call forwarding service with any parameters, the MS shall establish a parallel MM transaction, sending a CM SERVICE REQUEST with CM service type indicating "supplementary service activation".
- 2) Then the MS shall send a REGISTER message related to the present SS transaction containing a facility IE that includes an invoke of the InterrogateSS operation with parameter values according to the user's request (MMI action).
- 3) Upon receipt of the RELEASE COMPLETE message related to the present SS transaction, the SS transaction shall be released but the first transaction shall remain unaffected.
- 4) Upon receipt of the RELEASE COMPLETE message, the MS shall provide the appropriate user indication (which is to be described by the Manufacturer).

## References

- 1) 3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.3.1.1.2 and 9.1.9.
- 2) 3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.5.1.1, 9.2.9 and 10.5.33.
- 3) 3GPP TS 04.82,  
3GPP TS 04.80 subclauses 2.3 and 3.6.
- 4) 3GPP TS 02.30 subclause 4.5.

### 31.2.1.6.2.2 Test purpose

- 1) To check that the MS correctly requests the establishment of a parallel MM transaction for supplementary service transaction of interrogation of a specific call forwarding service, sending a CM SERVICE REQUEST.
- 2) To check that the MS sends a REGISTER message containing the invoke of the InterrogateSS operation with the expected parameter values for interrogation of call forwarding.

- 3) To check that upon receipt of the RELEASE COMPLETE message related to the present SS transaction, the first transaction remains unaffected.
- 4) To check that upon receipt of the RELEASE COMPLETE message, the MS provides the appropriate user indication (as described by the Manufacturer).

These checks are performed with a call transaction already established for:

- a) CFNRc, for all basic service group, the RELEASE COMPLETE message being sent with a facility IE containing a return\_error(error) where error is "SS not available".
- b) CFB, for all facsimile, the RELEASE COMPLETE message being sent with a facility IE containing a reject(involve\_problem) where involve\_problem is "resource limitation".

#### 31.2.1.6.2.3 Method of test

##### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in CC state U10.

##### Related PICS/PIXIT statement(s)

Description of the user's commands and of display of the answers from the network for call forwarding.

##### Foreseen final state of the MS

The MS is in CC state U10.

##### Test procedure

By means of appropriate MMI functions (using either 3GPP TS 02.30 or manufacturer defined MMI), the user requests interrogation of CFNRc for all basic service groups.

Upon receipt of the operation (in a REGISTER message), the system simulator answers with a RELEASE COMPLETE message with the Facility information element containing a Return\_error(error: SS not available) of the InterrogateSS operation.

The system simulator sends STATUS ENQUIRY, the MS responds with STATUS message indicating CC state U10.

Then again, by means of appropriate MMI functions as defined by the basic public MMI described in 3GPP TS 02.30, the user requests interrogation of CFB for all facsimile.

Upon receipt of the REGISTER message, the system simulator answers with the RELEASE COMPLETE message (same PD and TI that in the REGISTER message) with the Facility information element containing a reject(involve\_problem: resource limitation) of the InterrogateSS operation.

The system simulator sends STATUS ENQUIRY, the MS responds with STATUS message indicating CC state U10.

##### Maximum duration of test

3 minutes.

| 13   | MS        |                    |                                                                                                                                                            |
| 14   | SS -> MS  | STATUS ENQUIRY     | CC state U10                                                                                                                                               |
| 15   | MS -> SS  | STATUS             |                                                                                                                                                            |

## Specific message content

## step 4 - CFNRc

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = Interrogation:

Supplementary service code = CFNRc.

Basic service code: no Bearer Service present, no teleservice present.

## step 5 -

- protocol discriminator: non call related SS message.
- transaction identifier: same TI as previous REGISTER message.
- message type: RELEASE COMPLETE.
- facility:

return error code: SS not available.

For the return error the invoke ID must be the same as in the invoke of the InterrogateSS operation.

## step 11 - CFB

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = Interrogation:

Supplementary service code = CFB.

Basic service code: no bearer service present, teleservice (all facsimile)).

step 12 -

- protocol discriminator: non call related SS message.
- transaction identifier: same TI as previous REGISTER message.
- message type: RELEASE COMPLETE.
- facility:
  - reject code: resource limitation.

For the reject the invoke ID must be the same as in the invoke of the InterrogateSS operation.

### 31.2.1.7 Normal operation

#### 31.2.1.7.1 Served mobile subscriber side

##### 31.2.1.7.1.1 Notification during an incoming call

This subscription option is only applicable to CFB and CFNRy.

##### 31.2.1.7.1.1.1 Conformance requirements

- 1) During a call transaction, call establishment or not, upon receipt of a FACILITY message notifying an incoming call, the MS shall provide the appropriate user indication (which is to be described by the manufacturer).
- 2) If a call transaction is being established or is already established when the notification of incoming call is received, the receipt of the notification has no effect on its state.

#### References

- 1) 3GPP TS 02.30 subclause 4.5.
- 2) 3GPP TS 04.82 clause 1.

##### 31.2.1.7.1.1.2 Test purpose

- 1) To check that, in state U7 or U10, upon receipt of a FACILITY message notifying an incoming call, the MS shall provide the appropriate user indication (which is to be described by the manufacturer).
- 2) To check that when the notification of incoming call is received while the MS is in CC state U7 and U10 of another incoming call, it has no effect on its state.

These checks are performed in the case of CFB.

##### 31.2.1.7.1.1.3 Method of test

#### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is "idle updated".

#### Related PICS/PIXIT statement(s)

Description of the user's commands and of display of the answers from the network for call forwarding.

Foreseen final state of the MS

The MS is "idle updated".

Test procedure

The MS is brought to the call state U7 of an incoming call.

The system simulator transmits a FACILITY message with the facility information element containing an invoke of the NotifySS operation for CFB.

The system simulator sends STATUS ENQUIRY, the MS responds with STATUS message indicating CC state U7.

The MS is brought into the call state U10 of an incoming call.

The system simulator transmits a FACILITY message with the facility information element containing an invoke of the NotifySS operation for CFB.

The system simulator sends STATUS ENQUIRY, the MS responds with STATUS message indicating CC state U10.

The transaction and the channel are released by the SS.

Maximum duration of test

1 minute.

Expected sequence

| Step | Direction | Message              | Comments                                    |
|------|-----------|----------------------|---------------------------------------------|
| 1    | SS -> MS  | PAGING               |                                             |
| 2    | MS -> SS  | CHANNEL REQUEST      | with establishment cause "answer to paging" |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT |                                             |
| 4    | MS -> SS  | PAGING RESPONSE      |                                             |
| 5    | SS -> MS  | SETUP                |                                             |
| 6    | MS -> SS  | CALL CONFIRMED       |                                             |
| 7    | SS -> MS  | ASSIGNMENT COMMAND   |                                             |
| 8    | MS -> SS  | ASSIGNMENT COMPLETE  |                                             |
| 9    | MS -> SS  | ALERTING             |                                             |
| 10   | SS -> MS  | FACILITY             | (invoke NotifySS)                           |
| 11   | SS -> MS  | STATUS ENQUIRY       |                                             |
| 12   | MS -> SS  | STATUS               | (U7)                                        |
| 13   | MS -> SS  | CONNECT              | MS off hook                                 |
| 14   | SS -> MS  | CONNECT ACKNOWLEDGE  |                                             |
| 15   | SS -> MS  | FACILITY             | (invoke NotifySS)                           |
| 16   | SS -> MS  | STATUS ENQUIRY       |                                             |
| 17   | MS -> SS  | STATUS               | (U10)                                       |
| 18   | SS -> MS  | RELEASE COMPLETE     |                                             |
| 19   | SS -> MS  | CHANNEL RELEASE      |                                             |

## Specific message contents

### Steps 10 and 15

- protocol discriminator: CC.
- transaction identifier: same as for the call transaction already established.
- message type: FACILITY.
- facility:

invoke = notification:

Supplementary service code = CFB.

SS notification = incoming call is forwarded.

(call is forwarded indication to B subscriber).

### 31.2.1.7.1.2 Notification during an outgoing call

#### 31.2.1.7.1.2.1 Conformance requirements

- 1) As an outgoing call is being established, if the ALERTING message is received with the facility information element containing an SS notification (for CFU or CFC), the MS shall correctly reach CC state U4.
- 2) As an outgoing call is being established, if the ALERTING message is received with the facility information element containing an SS notification (for CFU or CFC), the MS shall provide the appropriate user indication (which is to be described by the manufacturer).
- 3) As an outgoing call is being established, if the CONNECT message is received with the facility information element containing an SS notification (for CFU or CFC), the MS shall normally send a CONNECT ACKNOWLEDGE message and enter CC state U10.
- 4) As an outgoing call is being established, if the CONNECT message is received with the facility information element containing an SS notification (for CFU or CFC), the MS shall provide the appropriate user indication (which is to be described by the manufacturer).

## References

3GPP TS 04.80 subclause 3.6.
- 2) 3GPP TS 04.82 TBS,  
3GPP TS 04.80 subclause 3.6.

#### 31.2.1.7.1.2.2 Test purpose

- 1) To check that when an outgoing call is being established, if the ALERTING message is received with the facility information element containing an SS notification, the MS correctly reaches CC state U4. This is tested for CFU.
- 2) As an outgoing call is being established, if the ALERTING message is received with the facility information element containing an SS notification, the MS provides the appropriate user indication (which is to be described by the manufacturer). This is tested for CFU.
- 3) As an outgoing call is being established, if the CONNECT message is received with the facility information element containing an SS notification, the MS normally sends a CONNECT ACKNOWLEDGE message and enter CC state U10. This is tested for CFC.
- 4) As an outgoing call is being established, if the CONNECT message is received with the facility information element containing an SS notification (for CFU or CFC), the MS provides the appropriate user indication (which is to be described by the manufacturer). This is tested for CFC.

## 31.2.1.7.1.2.3 Method of test

## Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is "idle updated".

## Related PICS/PIXIT statement(s)

Description of the user's commands and of display of the answers from the network for call forwarding.

## Foreseen final state of the MS

The MS is "idle updated".

## Test procedure

The MS is made to place an outgoing call.

After having received a SETUP message and sent a CALL PROCEEDING message and after a TCH has been allocated the system simulator transmits an ALERTING message with the facility information element containing a notification.

The system simulator send then a STATUS ENQUIRY message. On receipt of the STATUS ENQUIRY message the MS shall send a STATUS message with CC-state U4.

After that, the system simulator transmits a CONNECT with the facility information element containing a notification.

After reception of a CONNECT ACKNOWLEDGE message the system simulator sends a STATUS ENQUIRY message.

The MS shall respond with a STATUS message indicating CC-state U10.

The transaction and the channel are released by the SS.

## Maximum duration of test

1 minute.

## Expected sequence

| Step | Direction | Message              | Comments                                |
|------|-----------|----------------------|-----------------------------------------|
| 1    | MS -> SS  | CHANNEL REQUEST      |                                         |
| 2    | SS -> MS  | IMMEDIATE ASSIGNMENT |                                         |
| 3    | MS -> SS  | CM SERVICE REQUEST   | "mobile originating call establishment" |
| 4    | SS -> MS  | CM SERVICE ACCEPT    |                                         |
| 5    | MS -> SS  | SETUP                |                                         |
| 6    | SS -> MS  | CALL PROCEEDING      |                                         |
| 7    | SS -> MS  | ASSIGNMENT COMMAND   |                                         |
| 8    | MS -> SS  | ASSIGNMENT COMPLETE  |                                         |
| 9    | SS -> MS  | ALERTING             | containing facility IE                  |
| 10   | SS -> MS  | STATUS ENQUIRY       |                                         |
| 11   | MS -> SS  | STATUS               | (U4)                                    |
| 12   | SS -> MS  | CONNECT              | containing facility IE                  |
| 13   | MS -> SS  | CONNECT ACKNOWLEDGE  |                                         |
| 14   | SS -> MS  | STATUS ENQUIRY       |                                         |
| 15   | MS -> SS  | STATUS               | (U10)                                   |
| 16   | SS -> MS  | RELEASE COMPLETE     |                                         |
| 17   | SS -> MS  | CHANNEL RELEASE      |                                         |

## Specific message contents

At step 9 -

Facility invoke = notification:

Facility invoke = notification:

- SS-Code (CFC).
- SS-Status (indicating:  
Provisioned, registered and active).

### 31.2.1.7.2 Forwarded-to mobile subscriber side

#### 31.2.1.7.2.1 Conformance requirements

- 1) Upon receipt of the SETUP message containing a notification indication that the call is a forwarded one (with any SS code except CFC), the MS shall correctly continue call establishment and enter CC state U6.
- 2) Upon receipt of the SETUP message containing a notification indication that the call is a forwarded one, or after sending CALL CONFIRMED, or after sending ALERTING, the MS shall provide the appropriate user indication (which is to be described by the manufacturer).

## References

- 1) 3GPP TS 04.82.
- 2) 3GPP TS 02.30 subclause 4.5.

#### 31.2.1.7.2.2 Test purpose

- 1) To check that, upon receipt of the SETUP message containing a notification indication that the call is a forwarded one, the MS correctly continues call establishment and enters CC state U6.
- 2) To check that upon receipt of the SETUP message containing a notification indication that the call is a forwarded one, or after sending CALL CONFIRMED, or after sending ALERTING, the MS provides the appropriate user indication (which is to be described by the manufacturer).

#### 31.2.1.7.2.3 Method of test

### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is "idle updated".

### Related PICS/PIXIT statement(s)

Description of the user's commands and of display of the answers from the network for call forwarding.

Foreseen final state of the MS

The MS is "idle updated".

Test procedure

An incoming call is given to the MS with the SETUP message with the facility information element containing an invoke of the NotifySS operation with the indication that the call is forwarded.

After the MS was brought to CC state U7, the SS sends a STATUS ENQUIRY message. The MS responds indicating CC state U7 (implying that it has travelled through CC state U6).

The transaction and the channel are released by the SS.

Maximum duration of test

1 minute.

Expected sequence

| Step | Direction | Message              | Comments                                                         |
|------|-----------|----------------------|------------------------------------------------------------------|
| 1    | SS -> MS  | PAGING               |                                                                  |

| 11   | MS -> SS  | STATUS               | (U7)                                                             |
| 12   | SS -> MS  | RELEASE COMPLETE     |                                                                  |
| 13   | SS -> MS  | CHANNEL RELEASE      |                                                                  |

Specific message contents

at step 5 -

- protocol discriminator: CC.
  - transaction identifier.
  - message type: SETUP.
  - facility.
- invoke = notification:
- SS-Code (CFU, CFB, CFNRy, CFNRc or CF).
  - SS-Notification (indicating: call is forwarded i.e.:

Call is forwarded indication to C-subscriber.

## 31.2.2 Call transfer and mobile access hunting supplementary services

(Reserved).

## 31.3 Call completion supplementary services

NOTE: In this subclause, Subscriber B is the MS under test, and subscribers A, C and D are distant parties to the calls made during the tests.

### 31.3.1 Call Waiting

#### 31.3.1.1 Waiting call indication and confirmation

Conformance requirement

3GPP TS 04.83 subclause 1.1.

Applicability

MS supporting the Call Waiting supplementary service.

Test purpose

With an active call, an MS receiving an MT call shall include Cause #17 "user busy" in the CALL CONFIRMED message sent to the SS, and indicate the waiting call to the subscriber.

Method of test

Related PICS/PIXIT statements

- Supported MT circuit switched basic services.
- Method of indicating a waiting call to the user

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has a call ("Call A-B") of a basic service supported by the MS and applicable to Call Waiting as described in 3GPP TS 02.04 table A.1 in the active state. The SIM in the MS under test has Call Waiting enabled.

Foreseen final state of the MS

Call A-B, state U10. Call C-B, state U7.

Maximum duration of test

30 s.

Procedure

The SS shall initiate Call C-B by sending a SETUP message to the MS. The MS shall respond with a CALL CONFIRMED message including cause #17 "user busy", followed by an ALERTING message.

The MS shall remain in state U10 in respect of the Call A-B, and enter state U7 "Call received" in respect of Call C-B. The MS shall indicate the existence of the waiting call to the user by a method defined by the manufacturer. The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

Expected sequence

| Step | Direction | Message        | Comments                                                                           |
|------|-----------|----------------|------------------------------------------------------------------------------------|
| 1    | SS -> MS  | SETUP          | Transaction identifier different from that of Call A-B cause #17 "user busy".      |
| 2    | MS -> SS  | CALL CONFIRMED |                                                                                    |
| 3    | MS -> SS  | ALERTING       | A waiting call indication as defined in a PICS/PIXIT statement is given by the MS. |
| 4    | MS        |                |                                                                                    |
| 5    | SS -> MS  | STATUS ENQUIRY | Transaction identifier of Call A-B                                                 |
| 6    | MS -> SS  | STATUS         | Transaction identifier of Call A-B, state U10                                      |
| 7    | SS -> MS  | STATUS ENQUIRY | Transaction identifier of Call C-B                                                 |
| 8    | MS -> SS  | STATUS         | Transaction identifier of Call C-B, state U7                                       |

### 31.3.1.2 Normal operation with successful outcome

#### 31.3.1.2.1 Waiting call accepted; existing call released

Conformance requirement

3GPP TS 04.83 subclause 1.2.1.

Applicability

MS supporting the Call Waiting supplementary service.

Test purpose

The MS shall release the active call using the call clearing procedures of 3GPP TS 04.08 / 3GPP TS 24.008, and then accept the waiting call.

Method of test

Related PICS/PIXIT statements

- Supported MT circuit switched basic services.
- Method of clearing an active call and answering a waiting call.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has Call A-B of a basic service supported by the MS and applicable to Call Waiting as described in 3GPP TS 02.04 table A.1 in the state U10 "Active" and Call C-B in the state U7 "Call Received".

Foreseen final state of the MS

Call A-B, state U0. Call C-B, state U10.

Maximum duration of test

30 s.

Procedure

Using suitable MMI commands, the MS shall clear Call A-B, and then answer Call C-B.

The MS shall send a DISCONNECT message with the transaction identifier Call A-B, and then respond to a RELEASE message from the SS with a RELEASE COMPLETE message, and then enter state U0 "Null" in respect of this call.

The MS shall then send a CONNECT in respect of Call C-B, and enter state U10 "Active" on receipt of a CONNECT ACKNOWLEDGE message. The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a RELEASE COMPLETE message with cause #81 "invalid transaction identifier value" for Call A-B and a STATUS message indicating the appropriate call state for Call C-B.

#### Expected sequence

| Step | Direction | Message             | Comments                                                                                  |
|------|-----------|---------------------|-------------------------------------------------------------------------------------------|
| 1    | MS        |                     | Call A-B is cleared using MMI commands                                                    |
| 2    | MS -> SS  | DISCONNECT          | Transaction identifier of Call A-B                                                        |
| 3    | SS -> MS  | RELEASE             | Transaction identifier of Call A-B                                                        |
| 4    | MS -> SS  | RELEASE COMPLETE    | Transaction identifier of Call A-B                                                        |
| 5    | MS        |                     | Call C-B is answered using MMI commands                                                   |
| 6    | MS -> SS  | CONNECT             | Transaction identifier of Call C-B                                                        |
| 7    | SS -> MS  | CONNECT ACKNOWLEDGE | Transaction identifier of Call C-B                                                        |
| 8    | SS -> MS  | STATUS ENQUIRY      | Transaction identifier of Call A-B                                                        |
| 9    | MS -> SS  | RELEASE COMPLETE    | Transaction identifier of Call A-B, with cause #81 "invalid transaction identifier value" |
| 10   | SS -> MS  | STATUS ENQUIRY      | Transaction identifier of Call C-B                                                        |
| 11   | MS -> SS  | STATUS              | Transaction identifier of Call C-B, state U10                                             |

### 31.3.1.2.2 Waiting call accepted; existing call on hold

#### 31.3.1.2.2.1 Waiting call accepted; existing call on hold, no additional calls

#### Conformance requirement

3GPP TS 04.83 subclause 1.2.2.

#### Applicability

MS supporting the Call Waiting supplementary service.

#### Test purpose

With one active call and one waiting call, the MS shall place the active call on hold, and then accept the waiting call.

#### Method of test

#### Related PICS/PIXIT statements

- Supported MT circuit switched basic services.
- Method of placing an active call on hold and answering a waiting call

#### Initial conditions

##### System Simulator:

1 cell, default parameters.

##### Mobile Station:

- The MS has Call A-B of a basic service supported by the MS and applicable to Call Waiting as described in 3GPP TS 02.04 table A.1 in the state U10 "Active" and Call C-B in the state U7 "Call Received".

Foreseen final state of the MS

Call A-B, state U10, auxiliary state "Call held". Call C-B, state U10.

Maximum duration of test

30 s.

Procedure

Using suitable MMI commands, the MS shall place Call A-B on hold, and then answer Call C-B.

The MS shall send a HOLD message to the SS using the transaction identifier of Call A-B and enter state U10 "Active" with auxiliary state "Call held". On receipt of a HOLD ACKNOWLEDGE from the SS the MS shall enter state U10 "Active" with auxiliary state "Call held".

The MS shall then send a CONNECT message to the SS, using the transaction identifier of Call C-B, and on receipt of a CONNECT ACKNOWLEDGE message, shall enter state U10 "Active". The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

Expected sequence

| Step | Direction | Message             | Comments                                                                   |
|------|-----------|---------------------|----------------------------------------------------------------------------|
| 1    | MS        |                     | Call A-B is placed on hold using MMI commands                              |
| 2    | MS -> SS  | HOLD                | Transaction identifier of Call A-B                                         |
| 3    | SS -> MS  | HOLD ACKNOWLEDGE    | Transaction identifier of Call A-B                                         |
| 4    | MS        |                     | Call C-B is answered using MMI commands                                    |
| 5    | MS -> SS  | CONNECT             | Transaction identifier of Call C-B                                         |
| 6    | SS -> MS  | CONNECT ACKNOWLEDGE | Transaction identifier of Call C-B                                         |
| 7    | SS -> MS  | STATUS ENQUIRY      | Transaction identifier of Call A-B                                         |

| 9    | SS -> MS  | STATUS ENQUIRY      | Transaction identifier of Call C-B                                         |
| 10   | MS -> SS  | STATUS              | Transaction identifier of Call C-B, state U10                              |

### 31.3.1.2.3 Existing call released by user A; waiting call accepted

Conformance requirement

3GPP TS 04.83 subclause 1.2.3.

Applicability

MS supporting the Call Waiting supplementary service.

Test purpose

The MS, on receipt of a DISCONNECT message from the active call, shall complete the clearance of the active call, and accept the waiting call.

Method of test

Related PICS/PIXIT statements

- Supported MT circuit switched basic services.
- Method of clearing an active call and answering a waiting call

## Initial conditions

## System Simulator:

1 cell, default parameters.

## Mobile Station:

The MS has Call A-B of a basic service supported by the MS and applicable to Call Waiting as described in 3GPP TS 02.04 table A.1 in the state U10 "Active" and Call C-B in the state U7 "Call Received".

## Foreseen final state of the MS

Call A-B, state U0. Call C-B, state U10.

## Maximum duration of test

30 s.

## Procedure

On receipt of a DISCONNECT message using the transaction identifier of Call A-B, the MS shall respond with a RELEASE message. On receipt of a RELEASE COMPLETE message, the MS shall enter state U0 "Null". The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

If necessary, MMI commands shall be entered to accept call C-B. The MS shall then send a CONNECT message using the transaction identifier of Call C-B, and on receipt of a CONNECT ACKNOWLEDGE message, shall enter state U10 "Active". The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a RELEASE COMPLETE message with cause #81 "invalid transaction identifier value" for Call A-B and a STATUS message indicating the appropriate call state for Call C-B.

## Expected sequence

| Step | Direction | Message             | Comments                                                                                  |
|------|-----------|---------------------|-------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | DISCONNECT          | Transaction identifier of Call A-B                                                        |
| 2    | MS -> SS  | RELEASE             | Transaction identifier of Call A-B                                                        |
| 3    | SS -> MS  | RELEASE COMPLETE    | Transaction identifier of Call A-B                                                        |
| 4    | MS        |                     | If necessary, call C-B is answered using MMI commands                                     |
| 5    | MS -> SS  | CONNECT             | Transaction identifier of Call C-B                                                        |
| 6    | SS -> MS  | CONNECT ACKNOWLEDGE | Transaction identifier of Call C-B                                                        |
| 7    | SS -> MS  | STATUS ENQUIRY      | Transaction identifier of Call A-B                                                        |
| 8    | MS -> SS  | RELEASE COMPLETE    | Transaction identifier of Call A-B, with cause #81 "invalid transaction identifier value" |
| 9    | SS -> MS  | STATUS ENQUIRY      | Transaction identifier of Call C-B                                                        |
| 10   | MS -> SS  | STATUS              | Transaction identifier of Call C-B, state U10                                             |

## 31.3.1.3 Normal operation with unsuccessful outcome

## 31.3.1.3.1 Waiting call released by subscriber B

## Conformance requirement

3GPP TS 04.83 subclause 1.3.1.

## Applicability

MS supporting the Call Waiting supplementary service.

**Test purpose**

To test that, using MMI commands, the MS shall clear the waiting call.

**Method of test****Related PICS/PIXIT statements**

- Supported MT circuit switched basic services.
- Method of clearing a waiting call.

**Initial conditions****System Simulator:**

1 cell, default parameters.

**Mobile Station:**

The MS has Call A-B of a basic service supported by the MS and applicable to Call Waiting as described in 3GPP TS 02.04 table A.1 in the state U10 "Active" and Call C-B in the state U7 "Call Received".

**Foreseen final state of the MS**

Call A-B, state U10. Call C-B, state U0.

**Maximum duration of test**

30 s.

**Procedure**

Using appropriate MMI commands, the MS shall clear Call C-B.

The MS shall send a DISCONNECT message with the transaction identifier of Call B, and on receipt of a RELEASE message from the network, shall send a RELEASE COMPLETE and enter state U0 "Null". The call states shall be verified by the SS sending a a RELEASE COMPLETE message with cause #81 "invalid transaction identifier value" for Call C-B and STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a RELEASE COMPLETE message with cause #81 "invalid transaction identifier value" for Call C-B and a STATUS message indicating the appropriate call state for Call A-B.

**Expected sequence**

| Step | Direction | Message          | Comments                                                                                  |
|------|-----------|------------------|-------------------------------------------------------------------------------------------|
| 1    | MS        |                  | Call C-B is cleared using MMI commands                                                    |
| 2    | MS -> SS  | DISCONNECT       | Transaction identifier of Call C-B                                                        |
| 3    | SS -> MS  | RELEASE          | Transaction identifier of Call C-B                                                        |
| 4    | MS -> SS  | RELEASE COMPLETE | Transaction identifier of Call C-B                                                        |
| 5    | SS -> MS  | STATUS ENQUIRY   | Transaction identifier of Call A-B                                                        |
| 6    | MS -> SS  | STATUS           | Transaction identifier of Call A-B, state U10                                             |
| 7    | SS -> MS  | STATUS ENQUIRY   | Transaction identifier of Call C-B                                                        |
| 8    | MS -> SS  | RELEASE COMPLETE | Transaction identifier of Call C-B, with cause #81 "invalid transaction identifier value" |

**31.3.1.3.2 Waiting call released by calling user C****Conformance requirement**

3GPP TS 04.83 subclause 1.3.2.

**Applicability**

MS supporting the Call Waiting supplementary service.

**Test purpose**

To test that the MS responds correctly to the receipt of a clearing message from the waiting call.

**Method of test****Related PICS/PIXIT statements**

- Supported MT circuit switched basic services.

**Initial conditions**

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has Call A-B of a basic service supported by the MS and applicable to Call Waiting as described in 3GPP TS 02.04 table A.1 in the state U10 "Active" and Call C-B in the state U7 "Call Received".

**Foreseen final state of the MS**

Call A-B, state U10. Call C-B, state U0.

**Maximum duration of test**

30 s.

**Procedure**

On receipt of a DISCONNECT message using the transaction identifier of Call C-B, the MS shall respond with a RELEASE message. On receipt of a RELEASE COMPLETE message, the MS shall enter state U0 "Null". Call A-B shall remain in state U10. The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a RELEASE COMPLETE message with cause #81 "invalid transaction identifier value" for Call C-B and STATUS message indicating the appropriate call state for Call A-B.

**Expected sequence**

| Step | Direction | Message          | Comments                                                                                  |
|------|-----------|------------------|-------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | DISCONNECT       | Transaction identifier of Call C-B                                                        |
| 2    | MS -> SS  | RELEASE          | Transaction identifier of Call C-B                                                        |
| 3    | SS -> MS  | RELEASE COMPLETE | Transaction identifier of Call C-B                                                        |
| 4    | SS -> MS  | STATUS ENQUIRY   | Transaction identifier of Call A-B                                                        |
| 5    | MS -> SS  | STATUS           | Transaction identifier of Call A-B, state U10                                             |
| 6    | SS -> MS  | STATUS ENQUIRY   | Transaction identifier of Call C-B                                                        |
| 7    | MS -> SS  | RELEASE COMPLETE | Transaction identifier of Call C-B, with cause #81 "invalid transaction identifier value" |

**31.3.1.4 Activation****Conformance requirement**

3GPP TS 04.83 subclause 1.4.

## Applicability

MS supporting the Call Waiting supplementary service.

## Test purpose

To test the correct operation of the activation procedure, and correctly display of the response from the SS in the following cases.

- 1) Successful activation.
- 2) Error response (reject).
- 3) Activation reject (Invoke problem).

## Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is "idle updated".

## Related PICS/PIXIT statement(s)

Description of the user's commands and of display of the answers from the network for activation of Call Waiting.

## Foreseen final state of the MS

The MS is "idle updated".

## Test procedure

By means of appropriate MMI functions (using either 3GPP TS 02.30 or manufacturer defined MMI), the user requests activation of CW for a basic service group supported by the MS.

Upon receipt of the operation (in a REGISTER message), the system simulator answers with the RELEASE COMPLETE message with the Facility information element containing the return result of the ActivateSS operation.

The SS transaction is released and the dedicated channel is released.

Then again, by means of appropriate MMI functions as defined by the basic public MMI described in 3GPP TS 02.30, the user requests activation of CW for all basic service groups.

Upon receipt of the REGISTER message, the system simulator answers with the RELEASE COMPLETE message with the Facility information element containing the return result of the ActivateSS operation.

The SS transaction is released and the dedicated channel is released.

By means of appropriate MMI functions (using either 3GPP TS 02.30 or manufacturer defined MMI), the user requests activation of CW for a basic service group supported by the MS.

Upon receipt of the operation (in a REGISTER message), the system simulator answers with the RELEASE COMPLETE message with the Facility information element containing a Return Error component with Error code:SS not available.

The SS transaction is released and the dedicated channel is released.

Then again, by means of appropriate MMI functions as defined by the basic public MMI described in 3GPP TS 02.30, the user requests activation of CW for all basic service groups.

Upon receipt of the operation (in a REGISTER message), the system simulator answers with the RELEASE COMPLETE message with the Facility information element containing a Return Error component with Error code:SS not available.

The SS transaction is released and the dedicated channel is released.

By means of appropriate MMI functions (using either 3GPP TS 02.30 or manufacturer defined MMI), the user requests activation of CW for a basic service group supported by the MS.

Upon receipt of the REGISTER message, the system simulator answers with the RELEASE COMPLETE message with the Facility information element containing a Reject component with Invoke problem (Resource limitation).

The SS transaction is released and the dedicated channel is released.

Then again, by means of appropriate MMI functions as defined by the basic public MMI described in 3GPP TS 02.30, the user requests activation of CW for all basic service groups.

Upon receipt of the REGISTER message, the system simulator answers with the RELEASE COMPLETE message with the Facility information element containing A Reject component with Invoke problem (Resource limitation).

#### Maximum duration of test

9 minutes

#### Specific message contents:

step 6, 24, 42 - CW

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = Activation:

Supplementary service code = CW.

Basic service code: the selected basic service group.

step 15, 33, 51 - CW

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = Activation:

Supplementary service code = CW.

Basic service code: no bearer service present, no teleservice present.

### 31.3.1.5 Deactivation

#### Conformance requirement

3GPP TS 04.83 subclause 1.5.

#### Applicability

MS supporting the Call Waiting supplementary service.

#### Test purpose

To test the correct operation of the deactivation procedure, and correct display of the response from the SS in the following cases.

- 1) Successful deactivation.
- 2) Error response (reject).
- 3) Activation reject (Invoke problem).

#### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is "idle updated".

#### Related PICS/PIXIT statement(s)

Description of the user's commands and of display of the answers from the network for deactivation of call waiting.

#### Foreseen final state of the MS

The MS is "idle updated".

#### Test procedure

By means of appropriate MMI functions (using either 3GPP TS 02.30 or manufacturer defined MMI), the user requests deactivation of CW for a basic service group supported by the MS.

Upon receipt of the operation (in a REGISTER message), the system simulator answers with a RELEASE COMPLETE message with the Facility information element containing the return result of the DeactivateSS operation.

The SS transaction is released and the dedicated channel is released.

Then again, by means of appropriate MMI functions as defined by the basic public MMI described in 3GPP TS 02.30, the user requests deactivation of CW for all basic service groups.

Upon receipt of the REGISTER message, the system simulator answers with the RELEASE COMPLETE message with the Facility information element containing the return result of the DeactivateSS operation.

The SS transaction is released and the dedicated channel is released.

By means of appropriate MMI functions (using either 3GPP TS 02.30 or manufacturer defined MMI), the user requests deactivation of CW for a basic service group supported by the MS.

Upon receipt of the operation (in a REGISTER message), the system simulator answers with the RELEASE COMPLETE message with the Facility information element containing a Return Error component with Error code:SS not available.

The SS transaction is released and the dedicated channel is released.

Then again, by means of appropriate MMI functions as defined by the basic public MMI described in 3GPP TS 02.30, the user requests deactivation of CW for all basic service groups.

Upon receipt of the operation (in a REGISTER message), the system simulator answers with the RELEASE COMPLETE message with the Facility information element containing a Return Error component with Error code:SS not available.

The SS transaction is released and the dedicated channel is released.

By means of appropriate MMI functions (using either 3GPP TS 02.30 or manufacturer defined MMI), the user requests deactivation of CW for a basic service group supported by the MS.

Upon receipt of the REGISTER message, the system simulator answers with the RELEASE COMPLETE message with the Facility information element containing A Reject component with Invoke problem (Resource limitation).

The SS transaction is released and the dedicated channel is released.

Then again, by means of appropriate MMI functions as defined by the basic public MMI described in 3GPP TS 02.30, the user requests deactivation of CW for all basic service groups.

Upon receipt of the REGISTER message, the system simulator answers with the RELEASE COMPLETE message with the Facility information element containing A Reject component with Invoke problem (Resource limitation).

#### Maximum duration of test

9 minutes.

#### Expected sequence

| Step | Direction | Message              | Comments                                                                                                         |

### Specific message content

step 6, 24, 42 - CW

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = Deactivation:

Supplementary service code = CW.

Basic service code: the selected basic service group.

step 15, 33, 51 - CW

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = Deactivation:

Supplementary service code = CW.

Basic service code: no bearer service present

### 31.3.1.6 Interrogation

#### 31.3.1.6.1 Interrogation accepted

Conformance requirement

3GPP TS 04.83 subclause 1.6.

Applicability

MS supporting the Call Waiting supplementary service.

Test purpose

To test the correct operation of the interrogation procedure, and correct display of the response from the SS in the case of successful interrogation.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is "idle updated".

Related PICS/PIXIT statement(s)

Description of the user's commands and of display of the answers from the network for interrogation of call waiting.

Foreseen final state of the MS

The MS is "idle updated".

Test procedure

By means of appropriate MMI functions (using either 3GPP TS 02.30 or manufacturer defined MMI), the user requests interrogation of CW for all basic service groups.

Upon receipt of the operation (in a REGISTER message), the system simulator answers with a RELEASE COMPLETE message with the Facility information element containing the return result of the InterrogateSS (BasicServiceCode(s)) operation.

The SS transaction is released and the dedicated channel is released.

Then again, by means of appropriate MMI functions as defined by the basic public MMI described in 3GPP TS 02.30, the user requests interrogation of CW for all basic service groups.

Upon receipt of the REGISTER message, the system simulator answers with the RELEASE COMPLETE message with the Facility information element containing the return result of the InterrogateSS (SS-Status) operation.

The dedicated channel is released.

Maximum duration of test

3 minutes.

Expected sequence

| Step | Direction | Message              | Comments                                                                                                                                                                                  |

Specific message content

step 6, 15 - CW

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = Interrogation:

Supplementary service code = CW.

Basic service code: no Bearer Service present, no teleservice present.

### 31.3.1.6.2 Interrogation rejected

Conformance requirement

3GPP TS 04.83 subclause 1.6.

Applicability

MS supporting the Call Waiting supplementary service.

### Test purpose

To test the correct operation of the interrogation procedure, and correct display of the response from the SS in the case of an error response and an invoke problem

### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in CC state U10.

### Related PICS/PIXIT statement(s)

Description of the user's commands and of display of the answers from the network for call waiting.

### Foreseen final state of the MS

The MS is in CC state U10.

### Test procedure

By means of appropriate MMI functions (using either 3GPP TS 02.30 or manufacturer defined MMI), the user requests interrogation of CW for all basic service groups.

Upon receipt of the operation (in a REGISTER message), the system simulator answers with a RELEASE COMPLETE message with the Facility information element containing a Return\_error(error: SS not available) of the InterrogateSS operation.

The system simulator sends STATUS ENQUIRY, the MS responds with STATUS message indicating CC state U10.

Then again, by means of appropriate MMI functions as defined by the basic public MMI described in 3GPP TS 02.30, the user requests interrogation of CW for all basic service groups.

Upon receipt of the REGISTER message, the system simulator answers with the RELEASE COMPLETE message (same PD and TI that in the REGISTER message) with the Facility information element containing a reject(invoke\_problem: resource limitation) of the InterrogateSS operation.

The system simulator sends STATUS ENQUIRY, the MS responds with STATUS message indicating CC state U10.

### Maximum duration of test

3 minutes.

## Expected sequence

| Step | Direction | Message            | Comments                                                                                              |

| 14   | SS -> MS  | STATUS ENQUIRY     | provide correct MMI user indication                                                                   |
| 15   | MS -> SS  | STATUS             | CC state U10                                                                                          |

## Specific message content

step 4, 11 - CW

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = Interrogation:

Supplementary service code = CW.

Basic service code: no Bearer Service present, no teleservice present.

step 5 -

- protocol discriminator: non call related SS message.
- transaction identifier: same TI as previous REGISTER message.
- message type: RELEASE COMPLETE.
- facility:

return error code: SS not available.

For the return error the invoke ID must be the same as in the invoke of the InterrogateSS operation.

step 12 -

- protocol discriminator: non call related SS message.
- transaction identifier: same TI as previous REGISTER message.
- message type: RELEASE COMPLETE.
- facility:

reject code: resource limitation.

For the reject the invoke ID must be the same as in the invoke of the InterrogateSS operation.

## 31.3.2 Call Hold

### 31.3.2.1 Hold invocation

#### Conformance requirement

3GPP TS 04.83 subclause 2.1.2.

#### Applicability

MS supporting the Call Hold supplementary service.

#### Test purpose

To test the correct operation of the Hold procedure, and the MS reaction to the following messages sent in response to the HOLD message.

1. HOLD REJECT.
2. HOLD ACKNOWLEDGE.

#### Method of test

#### Related PICS/PIXIT statements

- Method of placing a call on hold.

#### Initial conditions

##### System Simulator:

1 cell, default parameters.

##### Mobile Station:

The MS shall have a call of a basic service supported by the MS and applicable to Call Hold as described in 3GPP TS 02.04 table A.1 in state U10 "Active"

#### Foreseen final state of the MS

State U10, Auxiliary state "Call Held".

#### Maximum duration of test

30 s.

#### Procedure

Using suitable MMI commands, the MS shall request that the call is placed on hold. The MS shall send a HOLD message and enter auxiliary state "hold request". On receipt of a HOLD REJECT message from the SS shall return to state U10 "Active". The call state shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of the call, and receiving a STATUS message indicating the appropriate call state and auxiliary state.

Using suitable MMI commands, the MS shall again request that the call is placed on hold. The MS shall send a HOLD message and enter auxiliary state "hold request". On receipt of a HOLD ACKNOWLEDGE message from the SS shall enter to state U10 "Active " with auxiliary state "Call held". The call state shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of call, and receiving a STATUS message indicating the appropriate call state and auxiliary state.

Expected sequence

| Step | Direction | Message          | Comments                                           |
|------|-----------|------------------|----------------------------------------------------|
| 1    | MS        |                  | Using MMI commands, the MS places the call on hold |
| 2    | MS -> SS  | HOLD             |                                                    |
| 3    | SS -> MS  | STATUS ENQUIRY   |                                                    |
| 4    | MS -> SS  | STATUS           | State U10, auxiliary state "Hold request"          |
| 5    | SS -> MS  | HOLD REJECT      |                                                    |
| 6    | SS -> MS  | STATUS ENQUIRY   |                                                    |
| 7    | MS -> SS  | STATUS           | State U10, no auxiliary state                      |
| 8    | SS        |                  | Check that the TCH is through-connected            |
| 9    | MS        |                  | Using MMI commands, the MS places the call on hold |
| 10   | MS -> SS  | HOLD             |                                                    |
| 11   | SS -> MS  | STATUS ENQUIRY   |                                                    |
| 12   | MS -> SS  | STATUS           | State U10, auxiliary state "Hold request"          |
| 13   | SS -> MS  | HOLD ACKNOWLEDGE |                                                    |
| 14   | SS -> MS  | STATUS ENQUIRY   |                                                    |
| 15   | MS -> SS  | STATUS           | State U10, auxiliary state "Call held"             |

### 31.3.2.2 Retrieve procedure

Conformance requirement

3GPP TS 04.83 subclause 2.1.3.

Applicability

MS supporting the Call Hold supplementary service.

Test purpose

To test the correct operation of the retrieve procedure, and the MS reaction to the following messages sent in response to the RETRIEVE message.

- 1) RETRIEVE REJECT.
- 2) RETRIEVE ACKNOWLEDGE.

Initial conditions

The MS shall have a call of a basic service supported by the MS and applicable to Call Hold as described in 3GPP TS 02.04 table A.1 in state U10 "Active" with auxiliary state "Call held".

Method of test

Related PICS/PIXIT statements

- Method of retrieving a held call.

Initial conditions

System Simulator:

- 1 cell, default parameters.

Mobile Station:

- The MS shall have a call of a basic service supported by the MS and applicable to Call Hold as described in 3GPP TS 02.04 table A.1 in state U10 "Active" with auxiliary state "Call held".

Foreseen final state of the MS

State U10, no auxiliary state.

Maximum duration of test

30 s.

Procedure

Using suitable MMI commands, the MS shall request that the call is placed on RETRIEVE. The MS shall send a RETRIEVE message and enter auxiliary state "retrieve request". On receipt of a RETRIEVE REJECT message from the SS, the MS shall return to state U10 "Active" with auxiliary state "Call held". The call state shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of call, and receiving a STATUS message indicating the appropriate call state and auxiliary state.

Using suitable MMI commands, the MS shall again request that the call is placed on RETRIEVE. The MS shall send a RETRIEVE message and enter auxiliary state "retrieve request". On receipt of a RETRIEVE ACKNOWLEDGE message from the SS, the MS shall enter state U10 "Active". The call state shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of call, and receiving a STATUS message indicating the appropriate call state and auxiliary state.

Expected sequence

| Step | Direction | Message              | Comments                                           |
|------|-----------|----------------------|----------------------------------------------------|
| 1    | MS        |                      | Using MMI commands, the MS retrieves the held call |
| 2    | MS -> SS  | RETRIEVE             |                                                    |
| 3    | SS -> MS  | STATUS ENQUIRY       |                                                    |
| 4    | MS -> SS  | STATUS               | State U10, auxiliary state "Retrieve request"      |
| 5    | SS -> MS  | RETRIEVE REJECT      |                                                    |
| 6    | SS -> MS  | STATUS ENQUIRY       |                                                    |

### 31.3.2.3 Alternate from one call to the other

Conformance requirement

3GPP TS 04.83 subclause 2.1.4.

Applicability

MS supporting the Call Hold supplementary service.

Test purpose

To test that the MS correctly alternates between one call and the other, by placing the active call on hold, and retrieving the previously held call.

To test that the MS correctly returns to the original call states in the event of receipt of a HOLD REJECT or RETRIEVE REJECT.

## Method of test

### Related PICS/PIXIT statements

- Method of alternating between an active call and a held call.

### Initial conditions

#### System Simulator:

1 cell, default parameters.

#### Mobile Station:

The MS shall have Call A-B in state U10 "Active", and Call C-B in state U10 "Active" with auxiliary state "Call held". Both calls shall be of a basic service supported by the MS and applicable to Call Hold as described in 3GPP TS 02.04 table A.1.

### Foreseen final state of the MS

Call A-B: State U10, Auxiliary State "Call Held".

Call C-B: State U10, No Auxiliary State.

### Maximum duration of test

30 s.

### Procedure

Using suitable MMI commands, the MS shall alternate between Call A-B and Call C-B. The MS shall send a HOLD message with the transaction identifier for Call A-B and enter auxiliary state "hold request", and send a RETRIEVE message with the transaction identifier for Call C-B and enter auxiliary state "retrieve request". On receipt of a HOLD ACKNOWLEDGE and RETRIEVE ACKNOWLEDGE message, the MS shall have Call A-B in state U10 "Active" with auxiliary state "Call held", and Call C-B in state U10 "Active". The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state and auxiliary state.

Using suitable MMI commands, the MS shall alternate between Call A-B and Call C-B. The MS shall send a HOLD message with the transaction identifier for Call C-B and enter auxiliary state "hold request", and send a RETRIEVE message with the transaction identifier for Call A-B and enter auxiliary state "retrieve request". On receipt of a HOLD REJECT and RETRIEVE REJECT message, the MS shall have Call A-B remain in state U10 "Active" with auxiliary state "Call held", and Call C-B in state U10 "Active". The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state and auxiliary state.

Expected sequence

| Step | Direction | Message              | Comments                                                                           |
|------|-----------|----------------------|------------------------------------------------------------------------------------|
| 1    | MS        |                      | Using MMI commands, the MS changes from call A-B to call C-B                       |
| 2    | MS -> SS  | HOLD                 | Transaction identifier for call A-B                                                |
| 3    | MS -> SS  | RETRIEVE             | Transaction identifier for call C-B                                                |
| 4    | SS -> MS  | STATUS ENQUIRY       | Transaction identifier for call A-B                                                |

## 31.4 Multi-party supplementary services

NOTE: In this subclause, subscriber A is the MS under test, and subscribers B to G are distant parties in the calls used in the tests.

### 31.4.1 Beginning the MultiParty service

#### 31.4.1.1 Beginning the MultiParty service, successful case

Conformance requirement

3GPP TS 04.84 subclause 1.1.

Applicability

MS supporting the MultiParty supplementary service.

### Test purpose

To test that the MS correctly starts the MultiParty service when it has an active call and a held call, and reacts correctly to a response from the SS indicating success.

### Method of test

### Related PICS/PIXIT statements

- Method of joining two calls into a MultiParty call.

### Initial conditions

#### System Simulator:

1 cell, default parameters.

#### Mobile Station:

The MS shall have Call A-B in state U10 "Active" and Call A-C in state U10 "Active" with Auxiliary state "Call held". Both calls shall be of a basic service supported by the MS and relevant to the MultiParty supplementary service as stated in 3GPP TS 02.04 table A.1.

### Foreseen final state of the MS

Call A-B, state U10, auxiliary state "Call in MPTY". Call A-C, state U10, auxiliary state "Call in MPTY".

### Maximum duration of test

30 s.

### Procedure

Using suitable MMI commands, the MS shall join the two calls in a MultiParty call. The MS shall send a FACILITY message containing an invoke component set to BuildMPTY, and with the transaction identifier for either Call A-B or Call A-C. Both calls shall enter auxiliary state "MPTY request". The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

On receipt of a FACILITY message including a Return Result component, the MS shall enter the state U10 "Active" with auxiliary state "Call in MPTY". The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

Expected sequence

| Step | Direction | Message        | Comments                                                                                 |
|------|-----------|----------------|------------------------------------------------------------------------------------------|
| 1    | MS        |                | Using MMI commands, join the two calls                                                   |
| 2    | MS -> SS  | FACILITY       | TI for Call A-B or Call A-C, BuildMPTY Invoke component                                  |
| 3    | SS -> MS  | STATUS ENQUIRY | Transaction identifier of Call A-B                                                       |
| 4    | MS -> SS  | STATUS         | Transaction identifier of Call A-B, state U10, auxiliary state "MPTY request"            |
| 5    | SS -> MS  | STATUS ENQUIRY | Transaction identifier of Call A-C                                                       |
| 6    | MS -> SS  | STATUS         | Transaction identifier of Call A-C, state U10, auxiliary state "MPTY request, call held" |
| 7    | SS -> MS  | FACILITY       | Same TI as step 2, Return Result component                                               |
| 8    | SS -> MS  | STATUS ENQUIRY | Transaction identifier of Call A-B                                                       |
| 9    | MS -> SS  | STATUS         | Transaction identifier of Call A-B, state U10, auxiliary state "Call in MPTY"            |
| 10   | SS -> MS  | STATUS ENQUIRY | Transaction identifier of Call A-C                                                       |
| 11   | MS -> SS  | STATUS         | Transaction identifier of Call A-C, state U10, auxiliary state "Call in MPTY"            |
| 12   | SS        |                | Check that the TCH is through-connected                                                  |

### 31.4.1.2 Beginning the MultiParty service, unsuccessful case

Conformance requirement

3GPP TS 04.84 subclause 1.1.

Applicability

MS supporting the MultiParty supplementary service.

Test purpose

To test that the MS correctly starts the MultiParty service when it has an active call and a held call, and reacts correctly to the following responses from the SS.

- 1) Return error.
- 2) Reject.

Method of test

Related PICS/PIXIT statements

- Method of joining two calls into a MultiParty call.

Initial conditions

System Simulator:

- 1 cell, default parameters.

Mobile Station:

- The MS shall have Call A-B in state U10 "Active" and Call A-C in state U10 "Active" with Auxiliary state "Call held". Both calls shall be of a basic service supported by the MS and relevant to the MultiParty supplementary service as stated in 3GPP TS 02.04 table A.1.

Foreseen final state of the MS

Call A-B, state U10, no auxiliary state. Call A-C, state U10, auxiliary state "Call Held".

Maximum duration of test

45 s.

#### Procedure

Using suitable MMI commands, the MS shall initiate a MultiParty call. The MS shall send a FACILITY message containing an invoke component set to BuildMPTY, and with the transaction identifier for either Call A-B or Call A-C. Both calls shall enter auxiliary state "MPTY request". The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

On receipt of a FACILITY message including a Return Error component, the MS shall return both calls to their original call states. The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

Using suitable MMI commands, the MS shall initiate a MultiParty call. The MS shall send a FACILITY message containing an invoke component set to BuildMPTY, and with the transaction identifier for boeither Call A-B or Call A-C. Both calls shall enter auxiliary state "MPTY request". The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

On receipt of a FACILITY message including a Reject component, the MS shall return both calls to their original call states. The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

#### Expected sequence

| Step | Direction | Message        | Comments                                                                                 |
|------|-----------|----------------|------------------------------------------------------------------------------------------|
| 1    | MS        |                | Using MMI commands, set up a MultiParty call                                             |
| 2    | MS -> SS  | FACILITY       | TI for Call A-B or Call A-C, BuildMPTY Invoke component                                  |
| 3    | SS -> MS  | STATUS ENQUIRY | Transaction identifier of Call A-B                                                       |
| 4    | MS -> SS  | STATUS         | Transaction identifier of Call A-B, state U10, auxiliary state "MPTY request"            |
| 5    | SS -> MS  | STATUS ENQUIRY | Transaction identifier of Call A-C                                                       |

| 22   | MS -> SS  | STATUS         | Transaction identifier of Call A-C, state U10, auxiliary state "Call Held"               |

### 31.4.1.3 Beginning the MultiParty service, expiry of timer T(BuildMPTY)

#### Conformance requirement

3GPP TS 04.84 subclause 1.1.

#### Applicability

MS supporting the MultiParty supplementary service.

#### Test purpose

To test that the MS correctly starts the MultiParty service when it has an active call and a held call, and on expiry of timer T(BuildMPTY) returns both calls to their original states.

#### Method of test

#### Related PICS/PIXIT statements

- Method of joining two calls into a MultiParty call.

#### Initial conditions

##### System Simulator:

1 cell, default parameters.

##### Mobile Station:

The MS shall have Call A-B in state U10 "Active" and Call A-C in state U10 "Active" with Auxiliary state "Call held". Both calls shall be of a basic service supported by the MS and relevant to the MultiParty supplementary service as stated in 3GPP TS 02.04 table A.1.

#### Foreseen final state of the MS

Branch A - Call A-B, state U10, no auxiliary state. Call A-C, state U10, auxiliary state "Call Held".

Branch B - Call A-B, state U10, auxiliary state "MPTY Request". Call A-C, state U10, auxiliary state "MPTY Request".

#### Maximum duration of test

45 s.

#### Procedure

Using suitable MMI commands, the MS shall initiate a MultiParty call. The MS shall send a FACILITY message containing an invoke component set to BuildMPTY, and with the transaction identifier for either Call A-B or Call A-C. Both calls shall enter auxiliary state "MPTY request". The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

Not less than 5s and not more than 30s after sending the FACILITY message, one of the following shall have occurred:

- both calls shall be in their original call states and the MS shall have indicated the failure to the user; or
- the MS shall have sent another FACILITY message with the same contents.

The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

Expected sequence

| Step | Direction | Message        | Comments                                                                                     |
|------|-----------|----------------|----------------------------------------------------------------------------------------------|
| 1    | MS        |                | Using MMI commands, set up a MultiParty call                                                 |
| 2    | MS -> SS  | FACILITY       | TI for Call A-B or Call A-C, BuildMPTY Invoke component                                      |
| 3    | SS -> MS  | STATUS ENQUIRY | Transaction identifier of Call A-B                                                           |
| 4    | MS -> SS  | STATUS         | Transaction identifier of Call A-B, state U10, auxiliary state "MPTY request"                |
| 5    | SS -> MS  | STATUS ENQUIRY | Transaction identifier of Call A-C                                                           |
| 6    | MS -> SS  | STATUS         | Transaction identifier of Call A-C, state U10, auxiliary state "MPTY request, call held"     |
| 7    | SS        |                | Wait 30 s from receiving FACILITY message                                                    |
| A8   | SS -> MS  | STATUS ENQUIRY | Take this branch if no message is received within 30 s                                       |
| A9   | MS -> SS  | STATUS         | Transaction identifier of Call A-B                                                           |
| A10  | SS -> MS  | STATUS ENQUIRY | Transaction identifier of Call A-B, state U10, no auxiliary state                            |
| A11  | MS -> SS  | STATUS         | Transaction identifier of Call A-C                                                           |
|      |           |                | Transaction identifier of Call A-C, state U10, auxiliary state "Call Held"                   |
| B8   | MS -> SS  | FACILITY       | Take this branch if a message is received within 30 s                                        |

|      |           |                | Transaction identifier of Call A-C, state U10, auxiliary state "MPTY request, call held"     |

## 31.4.2 Managing an active MultiParty call

### 31.4.2.1 Served mobile subscriber

#### 31.4.2.1.1 Put the MultiParty call on hold

##### 31.4.2.1.1.1 Put the MultiParty call on hold, successful case

Conformance requirement

3GPP TS 04.84 subclause 1.2.1.1.

Applicability

MS supporting the MultiParty supplementary service.

Test purpose

To test that the MS correctly places an active MultiParty call on hold, and reacts correctly to a response from the SS indicating success.

Method of test

Related PICS/PIXIT statements

- Method of placing a MultiParty call on hold.

## Initial conditions

## System Simulator:

1 cell, default parameters.

## Mobile Station:

The MS shall have a MultiParty call to two destinations (Call A-B and Call A-C) active. Both call states shall be U10 "Active" with auxiliary state "Call in MPTY". The call shall be of a basic service supported by the MS and relevant to the MultiParty supplementary service as stated in 3GPP TS 02.04 table A.1.

NOTE: The MultiParty call may be set up using the procedures of subclause 31.4.1.1.

## Foreseen final state of the MS

Call A-B, state U10, auxiliary state "Call in MPTY, call held". Call A-C, state U10, auxiliary state "Call in MPTY, call held".

## Maximum duration of test

30 s.

## Procedure

Using suitable MMI commands, the MS shall place the MultiParty call on hold. The MS shall send a FACILITY message containing one of the transaction identifiers of the call, and containing an invoke component HoldMPTY. Both calls shall enter the auxiliary state "Call in MPTY, hold request". The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

On receipt of a FACILITY message with the same transaction identifier and containing a return result component, the MS shall enter the state U10 "Active" with auxiliary state "Call in MPTY, call held" for both transaction identifiers. The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

## Expected sequence

| Step | Direction | Message        | Comments                                                                                    |
|------|-----------|----------------|---------------------------------------------------------------------------------------------|
| 1    | MS        |                | Using MMI commands, put the MultiParty call on hold                                         |
| 2    | MS -> SS  | FACILITY       | TI for Call A-B or Call A-C, HoldMPTY Invoke component                                      |
| 3    | SS -> MS  | STATUS ENQUIRY | Transaction identifier of Call A-B                                                          |
| 4    | MS -> SS  | STATUS         | Transaction identifier of Call A-B, state U10, auxiliary state "Call in MPTY, hold request" |
| 5    | SS -> MS  | STATUS ENQUIRY | Transaction identifier of Call A-C                                                          |
| 6    | MS -> SS  | STATUS         | Transaction identifier of Call A-C, state U10, auxiliary state "Call in MPTY, hold request" |
| 7    | SS -> MS  | FACILITY       | Same TI as step 2, Return Result component                                                  |
| 8    | SS -> MS  | STATUS ENQUIRY | Transaction identifier of Call A-B                                                          |
| 9    | MS -> SS  | STATUS         | Transaction identifier of Call A-B, state U10, auxiliary state "Call in MPTY, call held"    |
| 10   | SS -> MS  | STATUS ENQUIRY | Transaction identifier of Call A-C                                                          |
| 11   | MS -> SS  | STATUS         | Transaction identifier of Call A-C, state U10, auxiliary state "Call in MPTY, call held"    |

31.4.2.1.1.2 Put the MultiParty call on hold, unsuccessful case

## Conformance requirement

3GPP TS 04.84 subclause 1.2.1.1.

## Applicability

MS supporting the MultiParty supplementary service.

## Test purpose

To test that the MS correctly places an active MultiParty call on hold, and reacts correctly to a response from the SS indicating an error or a reject condition.

## Method of test

### Related PICS/PIXIT statements

- Method of placing a MultiParty call on hold.

## Initial conditions

### System Simulator:

1 cell, default parameters.

### Mobile Station:

The MS shall have a MultiParty call to two destinations (Call A-B and Call A-C) active. Both call states shall be U10 "Active" with auxiliary state "Call in MPTY". The call shall be of a basic service supported by the MS and relevant to the MultiParty supplementary service as stated in 3GPP TS 02.04 table A.1.

NOTE: The MultiParty call may be set up using the procedures of subclause 31.4.1.1.

## Foreseen final state of the MS

Call A-B, state U10, auxiliary state "Call in MPTY". Call A-C, state U10, auxiliary state "Call in MPTY".

## Maximum duration of test

45 s.

## Procedure

Using suitable MMI commands, the MS shall place the MultiParty call on hold. The MS shall send a FACILITY message containing one of the transaction identifiers of the call, and containing an invoke component HoldMPTY. Both calls shall enter the auxiliary state "Call in MPTY, hold request". The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

On receipt of a FACILITY message with the same transaction identifier and containing a return error component, the MS shall return to the original states for both transaction identifiers. The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

Using suitable MMI commands, the MS shall place the MultiParty call on hold. The MS shall send a FACILITY message containing one of the transaction identifiers of the call, and containing an invoke component HoldMPTY. Both calls shall enter the auxiliary state "Call in MPTY, hold request". The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

On receipt of a FACILITY message with the same transaction identifier and containing a Reject component, the MS shall return to the original states for both transaction identifiers. The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

Expected sequence

### 31.4.2.1.1.3 Put the MultiParty call on hold, expiry of timer T(HoldMPTY)

Conformance requirement

3GPP TS 04.84 subclause 1.2.1.1.

Applicability

MS supporting the MultiParty supplementary service.

Test purpose

To test that the MS correctly places an active MultiParty call on hold, and on expiry of T(HoldMPTY) returns the MultiParty call to the auxiliary state "Call in MPTY".

Method of test

Related PICS/PIXIT statements

- Method of placing a MultiParty call on hold.

Initial conditions

System Simulator:

- 1 cell, default parameters.

Mobile Station:

The MS shall have a MultiParty call to two destinations (Call A-B and Call A-C) active. Both call states shall be U10 "Active" with auxiliary state "Call in MPTY". The call shall be of a basic service supported by the MS and relevant to the MultiParty supplementary service as stated in 3GPP TS 02.04 table A.1.

NOTE: The MultiParty call may be set up using the procedures of subclause 31.4.1.1.

Foreseen final state of the MS

Branch A, Call A-B, state U10, auxiliary state "Call in MPTY". Call A-C, state U10, auxiliary state "Call in MPTY".

Branch B, Call A-B, state U10, auxiliary state "Call in MPTY, hold request". Call A-C, state U10, auxiliary state "Call in MPTY, hold request".

Maximum duration of test

45 s.

Procedure

Using suitable MMI commands, the MS shall place the MultiParty call on hold. The MS shall send a FACILITY message containing one of the transaction identifiers of the call, and containing an invoke component HoldMPTY. Both calls shall enter the auxiliary state "Call in MPTY, hold request". The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

Not less than 5s and not more than 30s after sending the FACILITY message, one of the following shall have occurred:

- both calls shall be in their original call states and the MS shall have indicated the failure to the user; or
- the MS shall have sent another FACILITY message with the same contents.

The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

Expected sequence

| Step | Direction | Message        | Comments                                                                                     |

| A10  | SS -> MS  | STATUS ENQUIRY | Transaction identifier of Call A-C                                                           |
| A11  | MS -> SS  | STATUS         | Transaction identifier of Call A-C, state U10, auxiliary state "Call in MPTY"                |
| B8   | MS -> SS  | FACILITY       | Take this branch if a message is received within 30 s                                        |
| B9   | SS -> MS  | STATUS ENQUIRY | Same as Step 2. Message shall not be received less than 5 s after the first FACILITY message |
| B10  | MS -> SS  | STATUS         | Transaction identifier of Call A-B                                                           |
| B11  | SS -> MS  | STATUS ENQUIRY | Transaction identifier of Call A-B, state U10, auxiliary state "Call in MPTY, hold request"  |
| B12  | MS -> SS  | STATUS         | Transaction identifier of Call A-C                                                           |
|      |           |                | Transaction identifier of Call A-C, state U10, auxiliary state "Call in MPTY, hold request"  |

### 31.4.2.1.2 Create a private communication with one of the remote parties

#### 31.4.2.1.2.1 Create a private communication with one of the remote parties, successful case

##### Conformance requirement

3GPP TS 04.84 subclause 1.2.1.2.

##### Applicability

MS supporting the MultiParty supplementary service.

##### Test purpose

To test that the MS correctly splits an active MultiParty call, and reacts correctly to a response from the SS indicating success.

##### Method of test

##### Related PICS/PIXIT statements

- Method of creating a private communication with one party of a MultiParty call.

##### Initial conditions

###### System Simulator:

1 cell, default parameters.

###### Mobile Station:

The MS shall have a MultiParty call to two destinations (Call A-B and Call A-C) active. Both call states shall be U10 "Active" with auxiliary state "Call in MPTY". The call shall be of a basic service supported by the MS and relevant to the MultiParty supplementary service as stated in 3GPP TS 02.04 table A.1.

NOTE: The MultiParty call may be set up using the procedures of subclause 31.4.1.1.

##### Foreseen final state of the MS

Call A-B, state U10, no auxiliary state. Call A-C, state U10, auxiliary state "Call Held".

##### Maximum duration of test

30 s.

##### Procedure

Using suitable MMI commands, the MS shall request a private communication with Call A-B. The MS shall send a FACILITY message containing the transaction identifier for Call A-B and an invoke component SplitMPTY. Call A-B shall enter the auxiliary state "split request" and call A-C shall remain in state "Call in MPTY". The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

On receipt of a FACILITY message containing the same transaction identifier and a return result component, Call A-B shall enter the state U10 "Active", and Call A-C shall enter the state U10 "Active" with auxiliary state "Call held". The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

Expected sequence

| Step | Direction | Message        | Comments                                                                       |
|------|-----------|----------------|--------------------------------------------------------------------------------|

31.4.2.1.2.2 Create a private communication with one of the remote parties, unsuccessful case

Conformance requirement

3GPP TS 04.84 subclause 1.2.1.2.

Applicability

MS supporting the MultiParty supplementary service.

Test purpose

To test that the MS correctly splits an active MultiParty call, and reacts correctly to a response from the SS indicating an error or reject condition.

Method of test

Related PICS/PIXIT statements

- Method of creating a private communication with one party of a MultiParty call.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS shall have a MultiParty call to two destinations (Call A-B and Call A-C) active. Both call states shall be U10 "Active" with auxiliary state "Call in MPTY". The call shall be of a basic service supported by the MS and relevant to the MultiParty supplementary service as stated in 3GPP TS 02.04 table A.1.

NOTE: The MultiParty call may be set up using the procedures of subclause 31.4.1.1.

Foreseen final state of the MS

Call A-B, state U10, auxiliary state "Call in MPTY". Call A-C, state U10, auxiliary state "Call in MPTY".

Maximum duration of test

30 s.

#### Procedure

Using suitable MMI commands, the MS shall request a private communication with Call A-B. The MS shall send a FACILITY message containing the transaction identifier for Call A-B and an invoke component SplitMPTY. Call A-B shall enter the auxiliary state "Split request" and call A-C shall remain in state "Call in MPTY". The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

On receipt of a FACILITY message containing the same transaction identifier and a return error component, both calls shall return to their initial states. The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

Using suitable MMI commands, the MS shall request a private communication with Call A-B. The MS shall send a FACILITY message containing the transaction identifier for Call A-B and an invoke component SplitMPTY. Call A-B shall enter the auxiliary state "Split request" and call A-C shall remain in state "Call in MPTY". The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

On receipt of a FACILITY message containing the same transaction identifier and a Reject component, both calls shall return to their initial states. The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

#### Expected sequence

| Step | Direction | Message        | Comments                                                                       |

31.4.2.1.2.3 Create a private communication with one of the remote parties, expiry of timer T(SplitMPTY)

#### Conformance requirement

3GPP TS 04.84 subclause 1.2.1.2.

#### Applicability

MS supporting the MultiParty supplementary service.

#### Test purpose

To test that the MS correctly splits an active MultiParty call, and on expiry of T(SplitMPTY) returns the call to the auxiliary state "Call in MPTY".

#### Method of test

#### Related PICS/PIXIT statements

- Method of creating a private communication with one party of a MultiParty call.

#### Initial conditions

##### System Simulator:

1 cell, default parameters.

##### Mobile Station:

The MS shall have a MultiParty call to two destinations (Call A-B and Call A-C) active. Both call states shall be U10 "Active" with auxiliary state "Call in MPTY". The call shall be of a basic service supported by the MS and relevant to the MultiParty supplementary service as stated in 3GPP TS 02.04 table A.1.

NOTE: The MultiParty call may be set up using the procedures of subclause 31.4.1.1.

#### Foreseen final state of the MS

Branch A, Call A-B, state U10, auxiliary state "Call in MPTY". Call A-C, state U10, auxiliary state "Call in MPTY".

Branch B, Call A-B, state U10, auxiliary state "Call in MPTY". Call A-C, state U10, auxiliary state "Call in MPTY".

#### Maximum duration of test

30 s.

#### Procedure

Using suitable MMI commands, the MS shall request a private communication with Call A-B. The MS shall send a FACILITY message containing the transaction identifier for Call A-B and an invoke component SplitMPTY. Call A-B shall enter the auxiliary state "Split request" and call A-C shall remain in state "Call in MPTY". The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

After not less than 5s and not more than 30s, the MS shall either:

- return both calls to their original states; or
- send another FACILITY message with the same contents.

The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

Expected sequence

| Step | Direction | Message        | Comments                                                                                     |
|------|-----------|----------------|----------------------------------------------------------------------------------------------|
| 1    | MS        |                | Using MMI commands, request a private communication with Call A-B                            |
| 2    | MS -> SS  | FACILITY       | TI for Call A-B, SplitMPTY Invoke component                                                  |
| 3    | SS -> MS  | STATUS ENQUIRY | Transaction identifier of Call A-B                                                           |
| 4    | MS -> SS  | STATUS         | Transaction identifier of Call A-B, state U10, auxiliary state "Split request"               |
| 5    | SS -> MS  | STATUS ENQUIRY | Transaction identifier of Call A-C                                                           |
| 6    | MS -> SS  | STATUS         | Transaction identifier of Call A-C, state U10, auxiliary state "Call in MPTY"                |
| 7    | SS        |                | Wait 30 s from receiving FACILITY message                                                    |
| A8   | SS -> MS  | STATUS ENQUIRY | Take this branch if no message is received within 30 s                                       |
| A9   | MS -> SS  | STATUS         | Transaction identifier of Call A-B                                                           |
| A10  | SS -> MS  | STATUS ENQUIRY | Transaction identifier of Call A-B, state U10, auxiliary state "Call in MPTY"                |
| A11  | MS -> SS  | STATUS         | Transaction identifier of Call A-C                                                           |
|      |           |                | Transaction identifier of Call A-C, state U10, auxiliary state "Call in MPTY"                |
| B8   | MS -> SS  | FACILITY       | Take this branch if a message is received within 30 s                                        |
| B9   | SS -> MS  | STATUS ENQUIRY | Same as Step 2. Message shall not be received less than 5 s after the first FACILITY message |
| B10  | MS -> SS  | STATUS         | Transaction identifier of Call A-B                                                           |
| B11  | SS -> MS  | STATUS ENQUIRY | Transaction identifier of Call A-B, state U10, auxiliary state "Split request"               |
| B12  | MS -> SS  | STATUS         | Transaction identifier of Call A-C                                                           |
|      |           |                | Transaction identifier of Call A-C, state U10, auxiliary state "Call in MPTY"                |

### 31.4.2.1.3 Terminate the entire MultiParty call

Conformance requirement

3GPP TS 04.84 subclause 1.2.1.3.

Applicability

MS supporting the MultiParty supplementary service.

Test purpose

To test that the MS correctly terminates an entire MultiParty call by implementing the call clearance procedure for each call in turn.

Method of test

Related PICS/PIXIT statements

- Method of terminating a MultiParty call.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS shall have a MultiParty call to two destinations (Call A-B and Call A-C) active. Both call states shall be U10 "Active" with auxiliary state "Call in MPTY". The call shall be of a basic service supported by the MS and relevant to the MultiParty supplementary service as stated in 3GPP TS 02.04 table A.1.

NOTE: The MultiParty call may be set up using the procedures of subclause 31.4.1.1.

Foreseen final state of the MS

Call A-B, state U0. Call A-C, state U0.

Maximum duration of test

30 s.

Procedure

Using suitable MMI commands, the MS shall initiate a clearance of the entire MultiParty call. The MS shall send a DISCONNECT message in respect of each of the transaction identifiers of the call. On receipt of a RELEASE message in respect of each transaction identifier, the MS shall respond with a RELEASE COMPLETE message, and enter state U0 "Null". The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a RELEASE COMPLETE message with cause #81 "invalid transaction identifier value".

Expected sequence

| Step | Direction | Message          | Comments                                                                                  |
|------|-----------|------------------|-------------------------------------------------------------------------------------------|
| 1    | MS        |                  | Using MMI commands, terminate the entire MultiParty call                                  |
| 2    | MS -> SS  | DISCONNECT       | Steps 2 and 3 may occur in any order<br>Transaction identifier of Call A-B                |
| 3    | MS -> SS  | DISCONNECT       | Transaction identifier of Call A-C                                                        |
| 4    | SS -> MS  | RELEASE          | Transaction identifier of Call A-B                                                        |
| 5    | MS -> SS  | RELEASE COMPLETE | Transaction identifier of Call A-B                                                        |
| 6    | SS -> MS  | RELEASE          | Transaction identifier of Call A-C                                                        |
| 7    | MS -> SS  | RELEASE COMPLETE | Transaction identifier of Call A-C                                                        |
| 8    | SS -> MS  | STATUS ENQUIRY   | Transaction identifier of Call A-B                                                        |
| 9    | MS -> SS  | RELEASE COMPLETE | Transaction identifier of Call A-B, with cause #81 "invalid transaction identifier value" |
| 10   | SS -> MS  | STATUS ENQUIRY   | Transaction identifier of Call A-C                                                        |
| 11   | MS -> SS  | RELEASE COMPLETE | Transaction identifier of Call A-C, with cause #81 "invalid transaction identifier value" |

#### 31.4.2.1.4 Explicitly disconnect a remote party

Conformance requirement

3GPP TS 04.84 subclause 1.2.1.4.

Applicability

MS supporting the MultiParty supplementary service.

Test purpose

To test that the MS correctly disconnects a single remote party by implementing the call clearance procedure for that party.

Method of test

Related PICS/PIXIT statements

- Method of disconnecting one party of a MultiParty call.

## Initial conditions

## System Simulator:

1 cell, default parameters.

## Mobile Station:

The MS shall have a MultiParty call to two destinations (Call A-B and Call A-C) active. Both call states shall be U10 "Active" with auxiliary state "Call in MPTY". The call shall be of a basic service supported by the MS and relevant to the MultiParty supplementary service as stated in 3GPP TS 02.04 table A.1.

NOTE: The MultiParty call may be set up using the procedures of subclause 31.4.1.1.

## Foreseen final state of the MS

Call A-B, state U0. Call A-C, state U10, with auxiliary state "Call in MPTY".

## Maximum duration of test

30 s.

## Procedure

Using suitable MMI commands, the MS shall initiate a clearance of the Call A-B. The MS shall send a DISCONNECT message containing the transaction identifier of Call A-B. On receipt of a RELEASE message the MS shall respond with a RELEASE COMPLETE message, and enter state U0 "Null" for Call A-B. Call A-C shall enter state U10 "Active" with, auxiliary state "Call in MPTY". The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating state U10, with auxiliary state "Call in MPTY" for Call A-C, and receiving a RELEASE COMPLETE message with cause #81 "invalid transaction identifier value" for Call A-B.

## Expected sequence

| Step | Direction | Message          | Comments                                                                                  |
|------|-----------|------------------|-------------------------------------------------------------------------------------------|
| 1    | MS        |                  | Using MMI commands, clear call A-B                                                        |
| 2    | MS -> SS  | DISCONNECT       | Transaction identifier of Call A-B                                                        |
| 3    | SS -> MS  | RELEASE          | Transaction identifier of Call A-B                                                        |
| 4    | MS -> SS  | RELEASE COMPLETE | Transaction identifier of Call A-B                                                        |
| 5    | SS -> MS  | STATUS ENQUIRY   | Transaction identifier of Call A-B                                                        |
| 6    | MS -> SS  | RELEASE COMPLETE | Transaction identifier of Call A-B, with cause #81 "invalid transaction identifier value" |
| 7    | SS -> MS  | STATUS ENQUIRY   | Transaction identifier of Call A-C                                                        |
| 8    | MS -> SS  | STATUS           | Transaction identifier of Call A-C, state U10, with auxiliary state "Call in MPTY"        |

## 31.4.2.2 Remote parties

## 31.4.2.2.1 Release from the MultiParty call

## Conformance requirement

3GPP TS 04.84 subclause 1.2.1.4.

## Applicability

MS supporting the MultiParty supplementary service.

## Test purpose

To test that the MS responds correctly to a call clearance from one of the remote parties.

Method of test

Related PICS/PIXIT statements

None

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS shall have a MultiParty call to two destinations (Call A-B and Call A-C) active. Both call states shall be U10 "Active" with auxiliary state "Call in MPTY". The call shall be of a basic service supported by the MS and relevant to the MultiParty supplementary service as stated in 3GPP TS 02.04 table A.1.

NOTE: The MultiParty call may be set up using the procedures of subclause 31.4.1.1.

Foreseen final state of the MS

Call A-B, state U0. Call A-C, state U10, with auxiliary state "Call in MPTY".

Maximum duration of test

30 s.

Procedure

On receipt of a DISCONNECT message containing the transaction identifier of Call A-B, the MS shall send a RELEASE message. On receipt of a RELEASE COMPLETE message the MS shall enter state U0 "Null" for Call A-B. Call A-C shall enter state U10 "Active", with auxiliary state "Call in MPTY". The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating state U10, with auxiliary state "Call in MPTY" for Call A-C, and receiving a RELEASE COMPLETE message with cause #81 "invalid transaction identifier value" for Call A-B.

Expected sequence

| Step | Direction | Message          | Comments                                                                                  |

### 31.4.3 Managing a held MultiParty call

#### 31.4.3.1 Retrieve the held MultiParty call

##### 31.4.3.1.1 Retrieve the held MultiParty call, successful case

Conformance requirement

3GPP TS 04.84 subclause 1.3.1.1.

## Applicability

MS supporting the MultiParty supplementary service.

## Test purpose

To test that the MS correctly retrieves a held MultiParty call, and reacts correctly to a response from the SS indicating success.

## Method of test

### Related PICS/PIXIT statements

- Method of retrieveing a held MultiParty call.

## Initial conditions

### System Simulator:

1 cell, default parameters.

### Mobile Station:

The MS shall have a held MultiParty call to two destinations (Call A-B and Call A-C). Both call states shall be U10 "Active" with auxiliary state "Call in MPTY, call held". The call shall be of a basic service supported by the MS and relevant to the MultiParty supplementary service as stated in 3GPP TS 02.04 table A.1.

NOTE: The MultiParty call may be set up using the procedures of subclause 31.4.2.1.1.1.

## Foreseen final state of the MS

Call A-B, state U10, auxiliary state "Call in MPTY". Call A-C, state U10, auxiliary state "Call in MPTY".

## Maximum duration of test

30 s.

## Procedure

Using suitable MMI commands, the MS shall retrieve the MultiParty call. The MS shall send a FACILITY message containing one of the transaction identifiers of the call, and containing an invoke component RetrieveMPTY. Both calls shall enter the auxiliary state "Call in MPTY, retrieve request". The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

On receipt of a FACILITY message with the same transaction identifier and containing a return result component, the MS shall enter the state U10 "Active" with auxiliary state "Call in MPTY" for both transaction identifiers. The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

Expected sequence

| Step | Direction | Message        | Comments                                                                                        |
|------|-----------|----------------|-------------------------------------------------------------------------------------------------|
| 1    | MS        |                | Using MMI commands, retrieve the MultiParty call                                                |

### 31.4.3.1.2 Retrieve the held MultiParty call, unsuccessful case

Conformance requirement

3GPP TS 04.84 subclause 1.3.1.1.

Applicability

MS supporting the MultiParty supplementary service.

Test purpose

To test that the MS correctly retrieves a held MultiParty call, and reacts correctly to a response from the SS indicating an error or a reject condition.

Method of test

Related PICS/PIXIT statements

- Method of retrieving a held MultiParty call.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS shall have a held MultiParty call to two destinations (Call A-B and Call A-C). Both call states shall be U10 "Active" with auxiliary state "Call in MPTY, call held". The call shall be of a basic service supported by the MS and relevant to the MultiParty supplementary service as stated in 3GPP TS 02.04 table A.1.

NOTE: The MultiParty call may be set up using the procedures of subclause 31.4.2.1.1.1.

Foreseen final state of the MS

Call A-B, state U10, auxiliary state "Call in MPTY, call held". Call A-C, state U10, auxiliary state "Call in MPTY, call held".

Maximum duration of test

30 s.

#### Procedure

Using suitable MMI commands, the MS shall retrieve the MultiParty call. The MS shall send a FACILITY message containing one of the transaction identifiers of the call, and containing an invoke component RetrieveMPTY. Both calls shall enter the auxiliary state "Call in MPTY, retrieve request". The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

On receipt of a FACILITY message with the same transaction identifier and containing a return error component, the MS shall return to the original states for both transaction identifiers. The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

Using suitable MMI commands, the MS shall retrieve the MultiParty call. The MS shall send a FACILITY message containing one of the transaction identifiers of the call, and containing an invoke component RetrieveMPTY. Both calls shall enter the auxiliary state "Call in MPTY, retrieve request". The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

On receipt of a FACILITY message with the same transaction identifier and containing a reject component, the MS shall return to the original states for both transaction identifiers. The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

#### Expected sequence

### 31.4.3.1.3 Retrieve the held MultiParty call, expiry of timer T(RetrieveMPTY)

#### Conformance requirement

3GPP TS 04.84 subclause 1.3.1.1.

#### Applicability

MS supporting the MultiParty supplementary service.

#### Test purpose

To test that the MS correctly retrieves a MultiParty call on hold, and on expiry of T(RetrieveMPTY) returns the MultiParty call to the auxiliary state "Call in MPTY, call held".

#### Method of test

#### Related PICS/PIXIT statements

- Method of retrieveing a held MultiParty call.

#### Initial conditions

##### System Simulator:

1 cell, default parameters.

##### Mobile Station:

The MS shall have a held MultiParty call to two destinations (Call A-B and Call A-C). Both call states shall be U10 "Active" with auxiliary state "Call in MPTY, call held". The call shall be of a basic service supported by the MS and relevant to the MultiParty supplementary service as stated in 3GPP TS 02.04 table A.1.

NOTE: The MultiParty call may be set up using the procedures of subclause 31.4.2.1.1.1.

#### Foreseen final state of the MS

Branch A, Call A-B, state U10, auxiliary state "Call in MPTY, call held". Call A-C, state U10, auxiliary state "Call in MPTY, call held".

Branch B, Call A-B, state U10, auxiliary state "Call in MPTY, retrieve request". Call A-C, state U10, auxiliary state "Call in MPTY, retrieve request".

#### Maximum duration of test

45 s.

#### Procedure

Using suitable MMI commands, the MS shall retrieve the MultiParty call. The MS shall send a FACILITY message containing one of the transaction identifiers of the call, and containing an invoke component RetrieveMPTY. Both calls shall enter the auxiliary state "Call in MPTY, retrieve request". The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

Not less than 5s and not more than 30s after sending the FACILITY message, one of the following shall have occurred:

- both calls shall be in their original call states and the MS shall have indicated the failure to the user; or
- the MS shall have sent another FACILITY message with the same contents.

The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

#### Expected sequence

| Step | Direction | Message        | Comments                                                                                        |
|------|-----------|----------------|-------------------------------------------------------------------------------------------------|
| 1    | MS        |                | Using MMI commands, retrieve the held MultiParty call                                           |
| 2    | MS -> SS  | FACILITY       | TI for Call A-B or Call A-C, RetrieveMPTY Invoke component                                      |
| 3    | SS -> MS  | STATUS ENQUIRY | Transaction identifier of Call A-B                                                              |

| 5    | SS -> MS  | STATUS ENQUIRY | Transaction identifier of Call A-C                                                              |
| 6    | MS -> SS  | STATUS         | Transaction identifier of Call A-C, state U10, auxiliary state "Call in MPTY, retrieve request" |
| 7    | SS        |                | Wait 30 s from receiving FACILITY message                                                       |
| A8   | SS -> MS  | STATUS ENQUIRY | Take this branch if no message is received within 30 s                                          |
| A9   | MS -> SS  | STATUS         | Transaction identifier of Call A-B                                                              |
| A10  | SS -> MS  | STATUS ENQUIRY | Transaction identifier of Call A-B, state U10, auxiliary state "Call in MPTY, call held"        |
| A11  | MS -> SS  | STATUS         | Transaction identifier of Call A-C                                                              |
|      |           |                | Transaction identifier of Call A-C, state U10, auxiliary state "Call in MPTY, call held"        |
| B8   | MS -> SS  | FACILITY       | Take this branch if a message is received within 30 s                                           |
| B9   | SS -> MS  | STATUS ENQUIRY | Same as Step 2. Message shall not be received less than 5 s after the first FACILITY message    |
| B10  | MS -> SS  | STATUS         | Transaction identifier of Call A-B                                                              |
| B11  | SS -> MS  | STATUS ENQUIRY | Transaction identifier of Call A-B, state U10, auxiliary state "Call in MPTY, retrieve request" |
| B12  | MS -> SS  | STATUS         | Transaction identifier of Call A-C                                                              |
|      |           |                | Transaction identifier of Call A-C, state U10, auxiliary state "Call in MPTY, retrieve request" |

### 31.4.3.2 Initiate a new call

#### Conformance requirement

3GPP TS 04.84 subclause 1.3.1.2.

#### Applicability

MS supporting the MultiParty supplementary service.

#### Test purpose

To test that the MS can set up a new outgoing call with a held MultiParty call.

#### Method of test

#### Related PICS/PIXIT statements

- Method of making a new outgoing call.

#### Initial conditions

System Simulator:

- 1 cell, default parameters.

Mobile Station:

The MS shall have a held MultiParty call to two destinations (Call A-B and Call A-C). Both call states shall be U10 "Active" with auxiliary state "Call in MPTY, call held". The call shall be of a basic service supported by the MS and relevant to the MultiParty supplementary service as stated in 3GPP TS 02.04 table A.1.

NOTE: The MultiParty call may be set up using the procedures of subclause 31.4.2.1.1.1.

Foreseen final state of the MS

Call A-B, state U10, auxiliary state "Call in MPTY, call held". Call A-C, state U10, auxiliary state "Call in MPTY, call held". Call A-D State U10.

Maximum duration of test

30 s.

Procedure

Using suitable MMI commands, the MS shall initiate a new outgoing call A-D. The MS shall send a SETUP message with a new transaction identifier and enter state U1 "Call initiated". On receipt of an ALERTING message followed by a CONNECT message, the MS shall send a CONNECT ACKNOWLEDGE message and enter state U10 "Active". The call state of the MultiParty call shall not be affected. The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

Expected sequence

| Step | Direction | Message             | Comments                                                                                 |
|------|-----------|---------------------|------------------------------------------------------------------------------------------|
| 1    | MS        |                     | Using MMI commands, make a new call                                                      |
| 2    | MS -> SS  | SETUP               | TI different from Call A-B or Call A-C (new Call A-D)                                    |
| 3    | SS -> MS  | ALERTING            | Transaction identifier of Call A-D                                                       |
| 4    | SS -> MS  | CONNECT             | Transaction identifier of Call A-D                                                       |
| 5    | MS -> SS  | CONNECT ACKNOWLEDGE | Transaction identifier of Call A-D                                                       |
| 6    | SS -> MS  | STATUS ENQUIRY      | Transaction identifier of Call A-B                                                       |
| 7    | MS -> SS  | STATUS              | Transaction identifier of Call A-B, state U10, auxiliary state "Call in MPTY, call held" |
| 8    | SS -> MS  | STATUS ENQUIRY      | Transaction identifier of Call A-C                                                       |
| 9    | MS -> SS  | STATUS              | Transaction identifier of Call A-C, state U10, auxiliary state "Call in MPTY, call held" |
| 10   | SS -> MS  | STATUS ENQUIRY      | Transaction identifier of Call A-D                                                       |
| 11   | MS -> SS  | STATUS              | Transaction identifier of Call A-D, state U10, no auxiliary state.                       |

### 31.4.3.3 Process a call waiting request

Conformance requirement

3GPP TS 04.84 subclause 1.3.1.3.

Applicability

MS supporting the MultiParty supplementary service.

Test purpose

To test that the MS can correctly process a Call Waiting request with a held MultiParty call.

Method of test

Related PICS/PIXIT statements

- Method of answering a waiting call.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS shall have a MultiParty call to two destinations (Call A-B and Call A-C) active. Both calls states shall be U10 "Active" with auxiliary state "Call in MPTY". The MS shall also have a Call A-D in state U7 "Call received". The Multiparty call shall be of a basic service supported by the MS and relevant to the MultiParty supplementary service as stated in 3GPP TS 02.04 table A.1.

NOTE: The MultiParty call may be set up using the procedures of subclause 31.4.1.1.

Foreseen final state of the MS

Call A-B, state U10, auxiliary state "Call in MPTY, call held". Call A-C, state U10, auxiliary state "Call in MPTY, call held". Call A-D State U10.

Maximum duration of test

30 s.

Procedure

Using suitable MMI commands, the MS shall place the MultiParty on hold, and answer Call A-D.

The MS shall send a FACILITY message to the SS using any one of the transaction identifiers of the MultiParty call and containing an invoke component HoldMPTY, and shall enter state U10 "Active", with auxiliary state "call in MPTY, hold request" in respect of each of the transaction identifiers.

On receipt of a FACILITY message using the same transaction identifier and containing a return result component, the MS shall enter state U10 "Active" with auxiliary state "Call in MPTY, call held" for each of the transaction identifiers.

The MS shall then send a CONNECT message to the SS, using the transaction identifier of Call A-D, and on receipt of a CONNECT ACKNOWLEDGE message, shall enter state U10 "Active". The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

Expected sequence

| Step | Direction | Message             | Comments                                                                                 |
|------|-----------|---------------------|------------------------------------------------------------------------------------------|
| 1    | MS        |                     | Using MMI commands, place the multiparty call on hold and answer the waiting call        |
| 2    | MS -> SS  | FACILITY            | Transaction identifier of Call A-B or A-C, HoldMPTY invoke component                     |
| 3    | SS -> MS  | FACILITY            | Same transaction identifier as step 2                                                    |
| 4    | MS -> SS  | CONNECT             | Transaction identifier of Call A-D                                                       |
| 5    | SS -> MS  | CONNECT ACKNOWLEDGE | Transaction identifier of Call A-D                                                       |
| 6    | SS -> MS  | STATUS ENQUIRY      | Transaction identifier of Call A-B                                                       |

| 11   | MS -> SS  | STATUS              | Transaction identifier of Call A-D, state U10, no auxiliary state.                       |

### 31.4.3.4 Terminate the held MultiParty call

Conformance requirement

3GPP TS 04.84 subclause 1.3.1.4.

Applicability

MS supporting the MultiParty supplementary service.

Test purpose

To test that the MS correctly terminates a held MultiParty call by initiating call clearance for each party in turn.

Method of test

Related PICS/PIXIT statements

- Method of terminating a held MultiParty call.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS shall have a held MultiParty call to two destinations (Call A-B and Call A-C). Both call states shall be U10 "Active" with auxiliary state "Call in MPTY, call held". The call shall be of a basic service supported by the MS and relevant to the MultiParty supplementary service as stated in 3GPP TS 02.04 table A.1.

NOTE: The MultiParty call may be set up using the procedures of subclause 31.4.2.1.1.1.

Foreseen final state of the MS

Call A-B, state U0. Call A-C, state U0.

Maximum duration of test

30 s.

## Procedure

Using suitable MMI commands, the MS shall initiate a clearance of the entire held MultiParty call. The MS shall send a DISCONNECT message in respect of each of the transaction identifiers of the call. On receipt of a RELEASE message in respect of each transaction identifier, the MS shall respond with a RELEASE COMPLETE message, and enter state U0 "Null". The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call and receiving a RELEASE COMPLETE message with cause #81 "invalid transaction identifier value" for each call.

## Expected sequence

| Step | Direction | Message          | Comments                                                                                  |
|------|-----------|------------------|-------------------------------------------------------------------------------------------|
| 1    | MS        |                  | Using MMI commands, terminate the entire MultiParty call                                  |
| 2    | MS -> SS  | DISCONNECT       | Steps 2 and 3 may occur in any order<br>Transaction identifier of Call A-B                |
| 3    | MS -> SS  | DISCONNECT       | Transaction identifier of Call A-C                                                        |
| 4    | SS -> MS  | RELEASE          | Transaction identifier of Call A-B                                                        |
| 5    | MS -> SS  | RELEASE COMPLETE | Transaction identifier of Call A-B                                                        |
| 6    | SS -> MS  | RELEASE          | Transaction identifier of Call A-C                                                        |
| 7    | MS -> SS  | RELEASE COMPLETE | Transaction identifier of Call A-C                                                        |
| 8    | SS -> MS  | STATUS ENQUIRY   | Transaction identifier of Call A-B                                                        |
| 9    | MS -> SS  | RELEASE COMPLETE | Transaction identifier of Call A-B, with cause #81 "invalid transaction identifier value" |
| 10   | SS -> MS  | STATUS ENQUIRY   | Transaction identifier of Call A-C                                                        |
| 11   | MS -> SS  | RELEASE COMPLETE | Transaction identifier of Call A-C, with cause #81 "invalid transaction identifier value" |

## 31.4.4 Managing a single call and a MultiParty call

### 31.4.4.1 Served mobile subscriber

#### 31.4.4.1.1 Disconnect the single call

##### 31.4.4.1.1.1 Disconnect active single call

### Conformance requirement

3GPP TS 04.84 subclause 1.4.1.1.

### Applicability

MS supporting the MultiParty supplementary service.

### Test purpose

To test that the MS correctly clears the single call when the single call is active and the MultiParty call is held.

### Initial conditions

The MS shall have a MultiParty call to two destinations (A-B and A-C) both in state U10 "Active" with auxiliary state "Call in MPTY, call held". The MS shall have in addition a single call (A-D) in state U10 "Active" with no auxiliary state. Both calls shall be of a basic service supported by the MS and relevant to the MultiParty supplementary service as stated in 3GPP TS 02.04 table A.1.

NOTE: The MultiParty call may be set up using the procedures of subclause 31.4.2.1.1.2.

Method of test

Related PICS/PIXIT statements

- Method of clearing the single call.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS shall have a MultiParty call to two destinations (A-B and A-C) both in state U10 "Active" with auxiliary state "Call in MPTY, call held". The MS shall have in addition a single call (A-D) in state U10 "Active" with no auxiliary state. Both calls shall be of a basic service supported by the MS and relevant to the MultiParty supplementary service as stated in 3GPP TS 02.04 table A.1.

NOTE: The MultiParty call may be set up using the procedures of subclause 31.4.2.1.1.2.

Foreseen final state of the MS

Call A-B, state U10, auxiliary state "Call in MPTY, call held". Call A-C, state U10, auxiliary state "Call in MPTY, call held". Call A-D State U0.

Maximum duration of test

30 s.

Procedure

Using suitable MMI commands, the MS shall clear Call A-D. The MS shall send a DISCONNECT message with the transaction identifier for Call A-D. On receipt of a RELEASE message the SM shall send a RELEASE COMPLETE message and enter state U0 "Null" for Call A-D.

Within 5 s of sending the RELEASE COMPLETE message, the MS may send a FACILITY message to retrieve the Held Call. The SS must reject this request. The call state and auxiliary state for Call A-B and Call A-C shall not change. The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state for Calls A-B and A-C, and receiving a RELEASE COMPLETE message with cause #81 "invalid transaction identifier value" for Call A-D.

Expected sequence

| Step | Direction | Message          | Comments                                                                                  |
|------|-----------|------------------|-------------------------------------------------------------------------------------------|
| 1    | MS        |                  | Using MMI commands, clear call A-D                                                        |
| 2    | MS -> SS  | DISCONNECT       | Transaction identifier of Call A-D                                                        |
| 3    | SS -> MS  | RELEASE          | Transaction identifier of Call A-D                                                        |

#### 31.4.4.1.1.2 Disconnect held single call

Conformance requirement

3GPP TS 04.84 subclause 1.4.1.1.

Applicability

MS supporting the MultiParty supplementary service.

Test purpose

To test that the MS correctly clears the single call when the single call is held and the MultiParty call is active.

Method of test

Related PICS/PIXIT statements

- Method of clearing the held single call.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS shall have a MultiParty call to two destinations (A-B and A-C) both in state U10 "Active" with auxiliary state "Call in MPTY". The MS shall have in addition a single call (A-D) in state U10 "Active" with auxiliary state "Call held". Both calls shall be of a basic service supported by the MS and relevant to the MultiParty supplementary service as stated in 3GPP TS 02.04 table A.1.

NOTE: The MultiParty call may be set up using the procedures of subclause 31.4.1.1.

#### Foreseen final state of the MS

Call A-B, state U10, auxiliary state "Call in MPTY". Call A-C, state U10, auxiliary state "Call in MPTY". Call A-D State U0.

#### Maximum duration of test

30 s.

#### Procedure

Using suitable MMI commands, the MS shall clear Call A-D. The MS shall send a DISCONNECT message with the transaction identifier for Call A-D. On receipt of a RELEASE message the MS shall send a RELEASE COMPLETE message and enter state U0 "Null" for Call A-D. The call state and auxiliary state for Call A-B and Call A-C shall not change. The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state for Calls A-B and A-C, and receiving a RELEASE COMPLETE message with cause #81 "invalid transaction identifier value" for Call A-D.

#### Expected sequence

| 10   | MS -> SS  | RELEASE COMPLETE | Transaction identifier of Call A-D, with cause #81 "invalid transaction identifier value" |

#### 31.4.4.1.2 Disconnect the MultiParty call

31.4.4.1.2.1 Void

31.4.4.1.2.2 Void

31.4.4.1.2.3 Clear all parties of held MultiParty call

#### Conformance requirement

3GPP TS 04.84 subclause 1.4.1.2.

#### Applicability

MS supporting the MultiParty supplementary service.

#### Test purpose

To test that the MS correctly clears the MultiParty call by clearing all remote parties to a held MultiParty call.

### Initial conditions

The MS shall have a MultiParty call to two destinations (A-B and A-C) both in state U10 "Active" with auxiliary state "Call in MPTY, Call held". The MS shall have in addition a single call (A-D) in state U10 "Active" with no auxiliary state. Both calls shall be of a basic service supported by the MS and relevant to the MultiParty supplementary service as stated in 3GPP TS 02.04 table A.1.

NOTE: The MultiParty call may be set up using the procedures of subclause 31.4.2.1.1.2.

### Method of test

#### Related PICS/PIXIT statements

- Method of clearing a held MultiParty call.

### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS shall have a MultiParty call to two destinations (A-B and A-C) both in state U10 "Active" with auxiliary state "Call in MPTY, Call held". The MS shall have in addition a single call (A-D) in state U10 "Active" with no auxiliary state. Both calls shall be of a basic service supported by the MS and relevant to the MultiParty supplementary service as stated in 3GPP TS 02.04 table A.1.

### Foreseen final state of the MS

Call A-B, state U0. Call A-C, state U0. Call A-D State U10, no auxiliary state.

### Maximum duration of test

30 s.

### Procedure

Using suitable MMI commands, the MS shall clear the MultiParty call. The MS shall send DISCONNECT messages with the transaction identifier for Call A-B and A-C. On receipt of a RELEASE message to each DISCONNECT the MS shall send a RELEASE COMPLETE message and enter state U0 "Null. Call A-B and Call A-C shall enter state U0 "Null". The call state and auxiliary state for Call A-D shall not change. The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state for Call A-D, and receiving a RELEASE COMPLETE message with cause #81 "invalid transaction identifier value" for Calls A-B and A-C.

| 13   | MS -> SS  | STATUS           | Transaction identifier of Call A-D, state U10                                             |

#### 31.4.4.1.2.4 Clear all parties of active MultiParty call

Conformance requirement

3GPP TS 04.84 subclause 1.4.1.2.

Applicability

MS supporting the MultiParty supplementary service.

Test purpose

To test that the MS correctly clears the MultiParty call by clearing all remote parties to an active MultiParty call.

Method of test

Related PICS/PIXIT statements

- Method of clearing an active MultiParty call.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS shall have a MultiParty call to two destinations (A-B and A-C) both in state U10 "Active" with auxiliary state "Call in MPTY". The MS shall have in addition a single call (A-D) in state U10 "Active" with auxiliary state "Call held". Both calls shall be of a basic service supported by the MS and relevant to the MultiParty supplementary service as stated in 3GPP TS 02.04 table A.1.

Foreseen final state of the MS

Call A-B, state U0. Call A-C, state U0. Call A-D State U10, auxiliary state "Call Held".

Maximum duration of test

30 s.

## Procedure

Using suitable MMI commands, the MS shall clear the MultiParty call. The MS shall send DISCONNECT messages with the transaction identifier for Call A-B and A-C. On receipt of a RELEASE message to each DISCONNECT the MS shall send a RELEASE COMPLETE message and enter state U0 "Null. Call A-B and Call A-C shall enter state U0 "Null". Within 5 s of sending the RELEASE COMPLETE message, the MS may send a RETRIEVE message to retrieve the Held Call. The SS shall reject this request. The call state and auxiliary state for Call A-D shall not change. The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state. for Call A-D, and receiving a RELEASE COMPLETE message with cause #81 "invalid transaction identifier value" for Calls A-B and A-C.

## Expected sequence

| Step | Direction | Message          | Comments                                                                                   |
|------|-----------|------------------|--------------------------------------------------------------------------------------------|
| 1    | MS        |                  | Using MMI commands, terminate the entire MultiParty call                                   |

### 31.4.4.2 Disconnect all calls

#### Conformance requirement

3GPP TS 04.84 subclause 1.4.1.3.

#### Applicability

MS supporting the MultiParty supplementary service.

#### Test purpose

To test the MS correctly clears all active calls, by clearing in turn each connected party.

Method of test

Related PICS/PIXIT statements

- Method of clearing all active calls.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS shall have a MultiParty call to two destinations (A-B and A-C) both in state U10 "Active" with auxiliary state "Call in MPTY". The MS shall have in addition a single call (A-D) in state U10 "Active" with auxiliary state "Call held". Both calls shall be of a basic service supported by the MS and relevant to the MultiParty supplementary service as stated in 3GPP TS 02.04 table A.1.

Foreseen final state of the MS

Call A-B, state U0. Call A-C, state U0. Call A-D state U0.

Maximum duration of test

30 s.

Procedure

Using suitable MMI commands, the MS shall clear all calls. The MS shall send DISCONNECT messages with the transaction identifier for Call A-B, Call A-C and Call A-D. On receipt of a RELEASE message to each DISCONNECT the MS shall send a RELEASE COMPLETE message and enter state U0 "Null". Call A-B, Call A-C Call A-D shall enter state U0 "Null". The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a RELEASE COMPLETE message with cause #81 "invalid transaction identifier value" for each call.

Expected sequence

| Step | Direction | Message          | Comments                                                                                  |
|------|-----------|------------------|-------------------------------------------------------------------------------------------|
| 1    | MS        |                  | Using MMI commands, terminate the entire MultiParty call                                  |
| 2    | MS -> SS  | DISCONNECT       | Transaction identifier of Call A-B                                                        |
| 3    | MS -> SS  | DISCONNECT       | Transaction identifier of Call A-C                                                        |
| 4    | MS -> SS  | DISCONNECT       | Transaction identifier of Call A-D                                                        |
| 5    | SS -> MS  | RELEASE          | Transaction identifier of Call A-B                                                        |
| 6    | MS -> SS  | RELEASE COMPLETE | Transaction identifier of Call A-B                                                        |
| 7    | SS -> MS  | RELEASE          | Transaction identifier of Call A-C                                                        |
| 8    | MS -> SS  | RELEASE COMPLETE | Transaction identifier of Call A-C                                                        |
| 9    | SS -> MS  | RELEASE          | Transaction identifier of Call A-D                                                        |
| 10   | MS -> SS  | RELEASE COMPLETE | Transaction identifier of Call A-D                                                        |
| 11   | SS -> MS  | STATUS ENQUIRY   | Transaction identifier of Call A-B                                                        |

| 14   | MS -> SS  | RELEASE COMPLETE | Transaction identifier of Call A-C, with cause #81 "invalid transaction identifier value" |
| 15   | SS -> MS  | STATUS ENQUIRY   | Transaction identifier of Call A-D                                                        |
| 16   | MS -> SS  | RELEASE COMPLETE | Transaction identifier of Call A-D, with cause #81 "invalid transaction identifier value" |

### 31.4.4.3 Add the single call to the MPTY

#### 31.4.4.3.1 Add the single call to the MPTY, successful case

##### Conformance requirement

3GPP TS 04.84 subclause 1.4.1.4.

##### Applicability

MS supporting the MultiParty supplementary service.

##### Test purpose

To test that the MS correctly adds a single held call to an active MultiParty call, and reacts correctly to a response from the SS indicating success.

##### Method of test

##### Related PICS/PIXIT statements

- Method of adding the single call to the MultiParty call.

##### Initial conditions

###### System Simulator:

1 cell, default parameters.

###### Mobile Station:

The MS shall have a MultiParty call to two destinations (A-B and A-C) both in state U10 "Active" with auxiliary state "Call in MPTY". The MS shall have in addition a single call (A-D) in state U10 "Active" with auxiliary state "Call held". Both calls shall be of a basic service supported by the MS and relevant to the MultiParty supplementary service as stated in 3GPP TS 02.04 table A.1.

NOTE: The MultiParty call may be set up using the procedures of subclause 31.4.1.1.

##### Foreseen final state of the MS

Call A-B, state U10, auxiliary state "Call in MPTY". Call A-C, state U10, auxiliary state "Call in MPTY". Call A-D state U10, auxiliary state "Call in MPTY".

##### Maximum duration of test

30 s.

##### Procedure

Using suitable MMI commands, the MS shall add the single call to the MultiParty call. The MS shall send a FACILITY message containing one of the transaction identifiers A-B, A-C or A-D and containing a BuildMPTY invoke component. Calls A-B and A-C shall remain in state U10 "Active" with auxiliary state "Call in MPTY". Call A-D shall enter state U10 "Active" with auxiliary state "MPTY request, call held". The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

On receipt of a FACILITY message containing a return result component, all calls shall enter state U10 "Active" with auxiliary state "Call in MPTY". The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

Expected sequence

| Step | Direction | Message        | Comments                                                                                 |
|------|-----------|----------------|------------------------------------------------------------------------------------------|
| 1    | MS        |                | Using MMI commands, join the single call to the MultiParty call                          |
| 2    | MS -> SS  | FACILITY       | TI for Call A-B, Call A-C or call A-D, BuildMPTY Invoke component                        |
| 3    | SS -> MS  | STATUS ENQUIRY | Transaction identifier of Call A-B                                                       |
| 4    | MS -> SS  | STATUS         | Transaction identifier of Call A-B, state U10, auxiliary state "Call in MPTY"            |
| 5    | SS -> MS  | STATUS ENQUIRY | Transaction identifier of Call A-C                                                       |

| 13   | MS -> SS  | STATUS         | Transaction identifier of Call A-C, state U10, auxiliary state "Call in MPTY"            |
| 14   | SS -> MS  | STATUS ENQUIRY | Transaction identifier of Call A-D                                                       |
| 15   | MS -> SS  | STATUS         | Transaction identifier of Call A-D, state U10, auxiliary state "Call in MPTY"            |
| 16   | SS        |                | Check that the TCH is through-connected                                                  |

#### 31.4.4.3.2 Add the single call to the MPTY, maximum number of participants exceeded

Conformance requirement

3GPP TS 04.84 subclause 1.4.1.4.

Applicability

MS supporting the MultiParty supplementary service.

Test purpose

To test that the MS correctly adds a single held call to an active MultiParty call, and reacts correctly to a response from the SS indicating maximum number of participants exceeded.

Method of test

Related PICS/PIXIT statements

- Method of adding the single call to the MultiParty call.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS shall have a MultiParty call to five destinations (A-B, A-C and A-D) all in state U10 "Active" with auxiliary state "Call in MPTY". The MS shall have in addition a single call (A-E) in state U10 "Active" with auxiliary state "Call held". Both calls shall be of a basic service supported by the MS and relevant to the MultiParty supplementary service as stated in 3GPP TS 02.04 table A.1.

### Foreseen final state of the MS

Call A-B, state U10, auxiliary state "Call in MPTY". Call A-C, state U10, auxiliary state "Call in MPTY". Call A-D state U10, auxiliary state "Call in MPTY", Call A-E state U10, auxiliary state "Call Held".

### Maximum duration of test

30 s.

### Procedure

Using suitable MMI commands, the MS shall add the single call to the MultiParty call. The MS shall send a FACILITY message containing any one of the transaction identifiers and containing a BuildMPTY invoke component. Calls A-B to A-D shall remain in state U10 "Active" with auxiliary state "Call in MPTY". Call A-E shall enter state U10 "Active" with auxiliary state "MPTY request, call held". The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

On receipt of a FACILITY message containing a return error component "MaxNumberOfMPTY-ParticipantsExceeded", then all calls shall return to their original states. The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

### Expected sequence

| Step | Direction | Message        | Comments                                                                                 |
|------|-----------|----------------|------------------------------------------------------------------------------------------|
| 1    | MS        |                | Using MMI commands, join the single call to the MultiParty call                          |

| 9    | SS -> MS  | STATUS ENQUIRY | Transaction identifier of Call A-E                                                       |
| 10   | MS -> SS  | STATUS         | Transaction identifier of Call A-E, state U10, auxiliary state "MPTY request, Call held" |
| 11   | SS -> MS  | FACILITY       | Same TI as step 2, Return error component "MaxNumberOfMPTY-ParticipantsExceeded"         |
| 12   | SS -> MS  | STATUS ENQUIRY | Transaction identifier of Call A-B                                                       |
| 13   | MS -> SS  | STATUS         | Transaction identifier of Call A-B, state U10, auxiliary state "Call in MPTY"            |
| 14   | SS -> MS  | STATUS ENQUIRY | Transaction identifier of Call A-C                                                       |
| 15   | MS -> SS  | STATUS         | Transaction identifier of Call A-C, state U10, auxiliary state "Call in MPTY"            |
| 16   | SS -> MS  | STATUS ENQUIRY | Transaction identifier of Call A-D                                                       |
| 17   | MS -> SS  | STATUS         | Transaction identifier of Call A-D, state U10, auxiliary state "Call in MPTY"            |
| 18   | SS -> MS  | STATUS ENQUIRY | Transaction identifier of Call A-E                                                       |
| 19   | MS -> SS  | STATUS         | Transaction identifier of Call A-E, state U10, auxiliary state "Call Held"               |

#### 31.4.4.4 Alternate between the MPTY call and the single call

##### Conformance requirement

3GPP TS 04.84 subclause 1.4.1.5.

## Applicability

MS supporting the MultiParty supplementary service.

## Test purpose

To test that the MS correctly alternates between the single call and the MultiParty call, by proper use of the hold and retrieve procedures.

## Method of test

### Related PICS/PIXIT statements

- Method of alternating between the single call to the MultiParty call.

## Initial conditions

### System Simulator:

1 cell, default parameters.

### Mobile Station:

The MS shall have a MultiParty call to two destinations (A-B and A-C) both in state U10 "Active" with auxiliary state "Call in MPTY". The MS shall have in addition a single call (A-D) in state U10 "Active" with auxiliary state "Call held". Both calls shall be of a basic service supported by the MS and relevant to the MultiParty supplementary service as stated in 3GPP TS 02.04 table A.1.

## Foreseen final state of the MS

Call A-B, state U10, auxiliary state "Call in MPTY". Call A-C, state U10, auxiliary state "Call in MPTY". Call A-D state U10, auxiliary state "Call Held",

## Maximum duration of test

30 s.

## Procedure

Using suitable MMI commands, the MS shall alternate between the single call and the MultiParty call. The MS shall send a FACILITY message containing one of the transaction identifiers of the MultiParty call, and containing an invoke component HoldMPTY. The MS shall then send a RETRIEVE message with the transaction identifier for Call A-D. Call A-B and Call A-C shall enter the auxiliary state "Call in MPTY, hold request". Call A-D shall enter auxiliary state "retrieve request". The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

The SS shall send a FACILITY message with a return result component and then send a RETRIEVE ACKNOWLEDGE message. On receipt of these messages, Calls A-B and A-C shall enter auxiliary state "Call in MPTY, call held", and Call A-D shall enter state U10 "Active" with no auxiliary state. The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

Using suitable MMI commands, the MS shall again alternate between the single call and the MultiParty call. The MS shall send a FACILITY message containing one of the transaction identifiers of the MultiParty call, and containing an invoke component RetrieveMPTY. The MS shall also send a HOLD message with the transaction identifier for Call A-D. Call A-B and Call A-C shall enter the auxiliary state "Call in MPTY, retrieve request". Call A-D shall enter auxiliary state "hold request". The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

The SS shall send a FACILITY message with a return result component and shall also send a HOLD ACKNOWLEDGE message. On receipt of these messages, Call A-B and A-C shall enter auxiliary state "Call in MPTY", and Call A-D shall enter state U10 "Active" with auxiliary state "Call held". The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

## Expected sequence

| Step | Direction | Message              | Comments                                                                                        |
|------|-----------|----------------------|-------------------------------------------------------------------------------------------------|
| 1    | MS        |                      | Using MMI commands, alternate between the active and held calls                                 |
| 2    | MS -> SS  | FACILITY             | TI for Call A-B or call A-C, HoldMPTY Invoke component                                          |
| 3    | MS -> SS  | RETRIEVE             | Transaction identifier of Call A-D                                                              |
| 4    | SS -> MS  | STATUS ENQUIRY       | Transaction identifier of Call A-B                                                              |
| 5    | MS -> SS  | STATUS               | Transaction identifier of Call A-B, state U10, auxiliary state "Call in MPTY, Hold request"     |
| 6    | SS -> MS  | STATUS ENQUIRY       | Transaction identifier of Call A-C                                                              |

| 28   | SS -> MS  | FACILITY             | Same TI as step 20, Return result component                                                     |
| 29   | SS -> MS  | STATUS ENQUIRY       | Transaction identifier of Call A-B                                                              |
| 30   | MS -> SS  | STATUS               | Transaction identifier of Call A-B, state U10, auxiliary state "Call in MPTY"                   |
| 31   | SS -> MS  | STATUS ENQUIRY       | Transaction identifier of Call A-C                                                              |
| 32   | MS -> SS  | STATUS               | Transaction identifier of Call A-C, state U10, auxiliary state "Call in MPTY"                   |
| 33   | SS -> MS  | STATUS ENQUIRY       | Transaction identifier of Call A-D                                                              |
| 34   | MS -> SS  | STATUS               | Transaction identifier of Call A-D, state U10, auxiliary state "Call Held"                      |
| 35   | SS        |                      | Check that the TCH is through-connected                                                         |

## 31.4.5 Adding extra remote parties

### Conformance requirement

3GPP TS 04.84 subclause 1.5.

### Applicability

MS supporting the MultiParty supplementary service.

### Test purpose

To test that the MS adds extra remote parties to the MultiParty call.

### Method of test

### Related PICS/PIXIT statements

- Method of alternating between the single call to the MultiParty call.

### Initial conditions

#### System Simulator:

1 cell, default parameters.

#### Mobile Station:

The MS shall have a MultiParty call to two destinations (Call A-B and Call A-C) active. Both call states shall be U10 "Active" with auxiliary state "Call in MPTY". The call shall be of a basic service supported by the MS and relevant to the MultiParty supplementary service as stated in 3GPP TS 02.04 table A.1.

### Foreseen final state of the MS

Call A-B, state U10, auxiliary state "Call in MPTY". Call A-C, state U10, auxiliary state "Call in MPTY". Call A-D state U10, auxiliary state "Call in MPTY".

### Maximum duration of test

30 s.

### Procedure

The procedure of test 34.4.2.1.1.1 "Put the MultiParty call on hold, successful case" shall be performed followed by the procedure of 34.4.3.2 "Initiate a new call", followed by the procedure of 31.4.4.3.1 " Add the single call to the MPTY, successful case".

Expected sequence

| Step | Direction | Message             | Comments                                                                      |
|------|-----------|---------------------|-------------------------------------------------------------------------------|
| 1    | MS        |                     | Using MMI commands, put the MultiParty call on Hold                           |
| 2    | MS -> SS  | FACILITY            | TI for Call A-B or call A-C, HoldMPTY Invoke component                        |
| 3    | SS -> MS  | FACILITY            | Same TI as step 2, Return Result component                                    |
| 4    | MS -> SS  | SETUP               | TI different from Call A-B or Call A-C (new Call A-D)                         |
| 5    | SS -> MS  | ALERTING            | Transaction identifier of Call A-D                                            |
| 6    | SS -> MS  | CONNECT             | Transaction identifier of Call A-D                                            |
| 7    | MS -> SS  | CONNECT ACKNOWLEDGE | Transaction identifier of Call A-D                                            |
| 8    | MS -> SS  | FACILITY            | TI for Call A-B, Call A-C or call A-D, BuildMPTY Invoke component             |
| 9    | SS -> MS  | FACILITY            | TI same as step 8, Return Result component                                    |
| 10   | SS -> MS  | STATUS ENQUIRY      | Transaction identifier of Call A-B                                            |
| 11   | MS -> SS  | STATUS              | Transaction identifier of Call A-B, state U10, auxiliary state "Call in MPTY" |
| 12   | SS -> MS  | STATUS ENQUIRY      | Transaction identifier of Call A-C                                            |
| 13   | MS -> SS  | STATUS              | Transaction identifier of Call A-C, state U10, auxiliary state "Call in MPTY" |
| 14   | SS -> MS  | STATUS ENQUIRY      | Transaction identifier of Call A-D                                            |
| 15   | MS -> SS  | STATUS              | Transaction identifier of Call A-D, state U10, auxiliary state "Call in MPTY" |
| 16   | SS        |                     | Check that the TCH is through-connected                                       |

## 31.5 Community of interest supplementary services

(Reserved).

## 31.6 Charging supplementary services

The following Advice of Charge abbreviations are used in this subclause:

|        |                                  |
|--------|----------------------------------|
| AoC    | Advice of Charge                 |
| AoCC   | Advice of Charge Charging        |
| AoCI   | Advice of Charge Information     |
| ACM    | Accumulated Charge Meter         |
| ACMmax | Accumulated Charge Meter Maximum |
| CCM    | Current Call Meter               |
| CAI    | Charge Advice Information        |
| CDUR   | Chargeable Duration              |

The following other abbreviations are used:

|     |                              |
|-----|------------------------------|
| IE  | Information Element          |
| FIE | Facility Information Element |
| TCH | Traffic CHannel              |

General on Advice of Charge.

The purpose of these tests is to verify that the MS under test correctly performs procedures related to the AoC supplementary service.

The reasons for these test purposes are:

- One example of a possible use for AoCC is in applications where the subscriber hires out a GSM ME and SIM to a user and bills the user according to the charge stored on the SIM at the end of the hire period. If a mobile station claims to support AoCC but does so incorrectly or not at all, this may cause the subscriber to mischarge the user of the hire phone. Hence an MS claiming to support AoCC must be shown to be reliable in that context.
- Since AoCC offers the use of telecommunication services according to the charge stored independently in the MS, the AoCC service must not be susceptible to fraud at the MS end.
- To ensure that a mobile station **not** claiming to support AoCC does not respond with a signal to the network indicating that it does. This could cause the network to allow the call to be placed without any charge being inserted on to the SIM.

Mobile originating and terminating speech AoC calls are tested and if supported, Call Hold and Multi-party calls. The type testing of data calls (i.e. those calls with a volume related charging component) will not be specified at the phase 2 stage but will be deferred to phase 2+ since the interaction of AoC with packet services is not yet defined in 3GPP TS 09.06 and 3GPP TS 09.07.

Tests are made on the ME-SIM interface to ensure that call charges are being correctly stored in the ACM field of the SIM in several situations. The AoC ACMmax function is also tested for incoming and outgoing calls.

Basic service verification tests for the AoCC, Call Hold, and Multi-party supplementary services which have direct relevance to the testing of AoC have been added to 3GPP TS 11.10, subclauses 11.3, 11.4 and 11.5 respectively.

## 31.6.1 Advice of Charge Charging

### 31.6.1.1 AoCC time related charging / MS originated call

Purpose:

- 1) To verify that when the MS receives the AoCC parameters in a Facility IE which is contained in the CONNECT message and when a TCH has already been assigned, the MS returns a FACILITY message containing the acknowledgement within 1 s.
- 2) To verify that when the MS receives the AoCC parameters in a Facility IE which is contained in a CONNECT message and when a TCH has already been assigned, the MS stores the correct value in the ACM field of the SIM.
- 3) To verify that when the call has no volume related component the MS ignores non-zero AoCC e5, e6 parameters sent to it.

Conformance Requirement(s):

- 1) When the MS receives the AoCC parameters in a Facility IE which is contained in a CONNECT message and when a TCH has already been assigned, the MS shall return a FACILITY message containing the acknowledgement within 1 s.
- 2) When the MS receives the AoCC parameters in a Facility IE which is contained in a CONNECT or FACILITY message and when a TCH has already been assigned, the MS shall store the correct value in the ACM field of the SIM.
- 3) When the call has no volume related component the MS shall ignore non-zero AoC e5 and e6 parameters sent to it.

## Reference(s):

Conformance requirement 1: 3GPP TS 03.86, 3GPP TS 04.13, 3GPP TS 04.86.

Conformance requirement 2: 3GPP TS 02.24.

Conformance requirement 3: 3GPP TS 02.24.

## Related PICS/PIXIT Statement(s):

- Support of AoCC.
- Supported rates (full rate/half rate).
- Method of reading ACM from the SIM via the ME.
- Supported teleservices.
- Support for active state of the call control protocol (U10).

## Initial Conditions:

## System Simulator:

1 cell, default parameters, IMSI attach/detach disabled.

## Mobile Station:

The MS is in MM-state "idle, updated".

## Foreseen Final State of the MS:

The MS is in MM-state "idle, updated".

## Method of Test:

The MS is made to initiate a call. The call is established with certain AoCC e-parameters sent in a Facility IE in the CONNECT message. The MS shall return the AoCC acknowledgement within 1 s of the CONNECT message. It is an implementation option whether the AoCC acknowledge is sent by the MS before or after the CONNECT ACKNOWLEDGE.

The SS sends the DISCONNECT y seconds after sending the CONNECT message containing the CAI. The MS shall have stored the correct amount on the SIM according to the e-parameters sent. The test is repeated for several different sets of e-parameters as defined below.

## Maximum Duration of Test:

30 minutes.

Expected Sequence:

The sequence step 1-20 is executed for execution counter k = 1,...,5.

| Step | Direction | Message              | Comments                                                                                                                      |
|------|-----------|----------------------|-------------------------------------------------------------------------------------------------------------------------------|
| 0    |           |                      | At start of test only, read and note value of ACM on SIM                                                                      |
| 1    | MS        |                      | The MS is made to initiate a call                                                                                             |
| 2    | MS -> SS  | CHANNEL REQUEST      |                                                                                                                               |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT |                                                                                                                               |

|      |           |                      | Either A or B branch is taken                                                                                                 |
| A12  | MS -> SS  | CONNECT ACKNOWLEDGE  |                                                                                                                               |
| A13  | MS -> SS  | FACILITY             | As default message except contains Facility IE with contents as indicated in ii below                                         |
| B12  | MS -> SS  | FACILITY             | As default message except contains Facility IE with contents as indicated in ii below                                         |
| B13  | MS -> SS  | CONNECT ACKNOWLEDGE  |                                                                                                                               |
| 14   |           |                      | call duration y seconds after CAI information sent by SS                                                                      |
| 15   | SS -> MS  | DISCONNECT           |                                                                                                                               |
| 16   | MS -> SS  | RELEASE              |                                                                                                                               |
| 17   | SS -> MS  | RELEASE COMPLETE     |                                                                                                                               |
| 18   | SS -> MS  | CHANNEL RELEASE      | The main signalling link is released.                                                                                         |
| 19   | MS        |                      | SIM contents checked (either via MMI or by removing the SIM and using SIM reader). ACM shall have been incremented correctly. |

NOTE: The value of y is given below.

The correct value of the ACM is found from the general AoC formula given in 3GPP TS 02.24 clause 4 with CDUR = y seconds and e parameters as defined below.

Specific Message Contents:

i) FACILITY Information Element with Invoke = ForwardChargeAdvice component type as defined in 3GPP TS 04.80 subclause 3.6.1 table 3.3.

For ASN.1 description see default message contents in subclause 31.6.4.

y is set to a constant value of 90 s.

The values of the e-parameters within the parameter part of the Facility Information Element shall be set as below:

| k-value | e-parameter |    |   |     |    |    |    | CCM Total at call end increased by | Step 0 ACM value             |
|---------|-------------|----|---|-----|----|----|----|------------------------------------|------------------------------|
|         | 1           | 2  | 3 | 4   | 5  | 6  | 7  |                                    |                              |
| 1       | 6           | 14 | 1 | 25  | 0  | 0  | 60 | 43                                 | 43                           |
| 2       | 0           | 0  | 1 | 100 | 0  | 0  | 0  | 100                                | 143                          |
| 3       | 250         | 16 | 2 | 500 | 0  | 0  | 60 | 2 000                              | 2 143                        |
| 4       | 1           | 1  | 1 | 0   | 10 | 10 | 1  | 89 or 90                           | 2 232 or 2 233               |
| 5       | 12,5        | 30 | 1 | 25  | 10 | 10 | 30 | 50 or 62,5                         | 2 295, 2 296, 2 282 or 2 283 |

Values shown in table are in the format and have units as in 3GPP TS 02.24 clause 3.

The ASN.1 description for each e-parameter allows integers in the range 0 to 8191 to be transmitted but some e-parameters have different actual ranges (e.g. e1 can take any value 0..819,1 with 0,1 resolution). The MS knows how to interpret the received parameter (e.g. received e1 refers to 10 times actual e1, see 3GPP TS 04.80 subclause 4.4.3). Therefore e1=12,5 would be sent to the MS as 125. The MS knows the value sent is 10 times the "real" e1 and hence interprets the value as 12,5.

The non-zero e5 and e6 values for the k=4 and k=5 execution of the test are to check that the MS ignores the volume related parameters when carrying out time only related charging.

ii) FACILITY Information Element with Return Result component type as defined in 3GPP TS 04.80 subclause 3.6.1 table 3.4.

For ASN.1 description see default message contents in subclause 31.6.4.

### 31.6.1.2 AoCC time related charging / MS terminated call

Purpose:

- 1) To verify that when the MS receives certain AoCC e-parameters in a Facility IE which is contained in a FACILITY message sent after the CONNECT message and when a TCH has already been assigned, the MS returns a FACILITY message containing the acknowledgement within 1 s.
- 2) To verify that when the MS receives the AoCC parameters in a Facility IE which is contained in a FACILITY message and when a TCH has already been assigned, the MS stores the correct value in the ACM field of the SIM.

Conformance Requirement(s):

- 1) When the MS receives the AoCC parameters in a Facility IE which is contained in a FACILITY message sent after the CONNECT message and when a TCH has already been assigned, the MS shall return a Facility message containing the acknowledgement within 1 s.
- 2) When the MS receives the AoCC parameters in a Facility IE which is contained in a FACILITY message and when a TCH has already been assigned, the MS shall store the correct value in the ACM field of the SIM.

Reference(s):

Conformance requirement 1: 3GPP TS 03.86, 3GPP TS 04.13, 3GPP TS 04.86.

Conformance requirement 2: 3GPP TS 02.24.

Related PICS/PIXIT Statement(s):

- Support of AoCC.
- Supported rates (full rate/half rate).
- Method of reading ACM from the SIM via the ME.
- Supported teleservices.
- Support for active state of the call control protocol (U10).

Initial Conditions:

System Simulator:

1 cell, default parameters, IMSI attach/detach disabled.

Mobile Station:

The MS is in MM-state "idle, updated".

Foreseen Final State of the MS:

The MS is in MM-state "idle, updated".

Method of Test:

The SS is made to initiate a call. The call is established and certain AoCC e-parameters are sent to the MS in a Facility IE contained within a FACILITY message. The MS shall return the AoCC acknowledgement within 1 s of the FACILITY message. It is an implementation option whether the AoCC e-parameters and the AoCC acknowledge are sent before or after the CONNECT ACKNOWLEDGE.

The SS sends the DISCONNECT  $y$  seconds after sending the FACILITY message. The MS shall have stored the correct amount on the SIM according to the e-parameters sent. The test is repeated for several different sets of e-parameters as defined below.

Maximum Duration of Test:

30 minutes.

Expected Sequence:

The sequence step 1-20 is executed for execution counter  $k = 1, \dots, 5$ .

| Step | Direction | Message              | Comments                                                                                                                     |
|------|-----------|----------------------|------------------------------------------------------------------------------------------------------------------------------|
| 0    |           |                      | At start of test only, read and note value of ACM on SIM                                                                     |
| 1    | SS        |                      | The SS is made to initiate a call                                                                                            |
| 2    | SS -> MS  | PAGING REQUEST       |                                                                                                                              |
| 3    | MS -> SS  | CHANNEL REQUEST      |                                                                                                                              |
| 4    | SS -> MS  | IMMEDIATE ASSIGNMENT |                                                                                                                              |
| 5    | MS -> SS  | PAGING RESPONSE      |                                                                                                                              |
| 6    | SS -> MS  | SETUP                |                                                                                                                              |

| 15   |           |                      | call duration $y$ seconds after CAI information sent by SS                                                                   |
| 16   | SS -> MS  | DISCONNECT           |                                                                                                                              |
| 17   | MS -> SS  | RELEASE              |                                                                                                                              |
| 18   | SS -> MS  | RELEASE COMPLETE     |                                                                                                                              |
| 19   | SS -> MS  | CHANNEL RELEASE      | The main signalling link is released.                                                                                        |
| 20   | MS        |                      | SIM contents checked (either via MMI or by removing the SIM and using SIM reader) ACM shall have been incremented correctly. |

NOTE: The value of  $y$  is given below.

The correct value of the ACM is found from the general AoC formula given in 3GPP TS 02.24 clause 4 with  $CDUR = y$  seconds and e parameters as defined below.

Specific Message Contents:

- i) FACILITY Information Element with Invoke = ForwardChargeAdvice component type as defined in 3GPP TS 04.80 subclause 3.6.1 table 3.3.

For ASN.1 description see default message contents in subclause 31.6.4.

y is set to a constant value of 90 s.

The values of the e-parameters within the parameter part of the Facility Information Element shall be set as below:

| k-value | e-parameter |    |   |     |   |   |    | CCM total at call end increased by | Step 0 ACM value     |
|---------|-------------|----|---|-----|---|---|----|------------------------------------|----------------------|
|         | 1           | 2  | 3 | 4   | 5 | 6 | 7  |                                    |                      |
| 1       | 0           | 0  | 0 | 0   | 0 | 0 | 0  | 0                                  | 0                    |
| 2       | 0           | 0  | 1 | 100 | 0 | 0 | 0  | 100                                | 100                  |
| 3       | 6           | 14 | 1 | 25  | 0 | 0 | 60 | 43                                 | 143                  |
| 4       | 1           | 1  | 1 | 0   | 0 | 0 | 1  | 89 or 90                           | 233 or 232           |
| 5       | 12,5        | 30 | 1 | 25  | 0 | 0 | 30 | 50 or 62,5                         | 296, 295, 282 or 283 |

Values shown in table are in the format and have units as in 3GPP TS 02.24 clause 3.

- ii) FACILITY Information Element with Return Result component type as defined in 3GPP TS 04.80 subclause 3.6.1 table 3.4.

For ASN.1 description see default message contents in subclause 31.6.4.

### 31.6.1.3 AoCC volume related charging / MS originated call

Future addition at GSM Phase 2+ stage.

### 31.6.1.4 AoCC volume related charging / MS terminated call

Future addition at GSM Phase 2+ stage.

### 31.6.1.5 Change in charging information during a call

Purpose:

- 1) To verify that when the MS receives new AoCC parameters mid-way through a call in a Facility IE which is contained within a FACILITY message the MS returns a FACILITY message containing the acknowledgement within 1 s.
- 2) To verify that when the MS receives new charging information mid-way through a call in the form of a Facility IE contained within a FACILITY message the MS correctly indicates the total charge considering both sets of charging information.

Conformance Requirement(s):

- 1) When the MS receives new AoCC parameters mid-way through a call in a Facility IE which is contained within a FACILITY message the MS shall return a FACILITY message containing the acknowledgement within 1 s.
- 2) When the MS receives new charging information mid-way through a call in the form of a Facility IE contained within a FACILITY message the MS correctly indicates the total charge considering both sets of charging information.

## Reference(s):

Conformance requirement 1: 3GPP TS 03.86, 3GPP TS 04.13, 3GPP TS 04.86.

Conformance requirement 2: 3GPP TS 02.24.

## Related PICS/PIXIT Statement(s):

- Support of AoCC.
- Supported rates (full rate/half rate).
- Method of reading ACM from the SIM via the ME.
- Supported teleservices.
- Support for active state of the call control protocol (U10).

## Initial Conditions:

## System Simulator:

1 cell, default parameters, IMSI attach/detach disabled.

## Mobile Station:

The MS is in MM-state "idle, updated".

## Foreseen Final State of the MS:

The MS is in MM-state "idle, updated".

## Method of Test:

The MS is made to initiate a call. The call is established with certain AoCC e-parameters sent in a Facility IE in a FACILITY message sent after the CONNECT message. The MS shall return the AoCC acknowledgement within 1 s of the FACILITY message. x seconds after sending the original CAI, new (and different) e-parameters are sent to the MS in a Facility IE contained within a FACILITY message. The MS shall return the AoCC acknowledgement within 1 s of the FACILITY message.

The SS sends the DISCONNECT y seconds after sending the first CAI in the FACILITY message. The MS shall have stored the correct amount on the SIM according to the two sets of e-parameters sent and the times for the two parts of the call.

## Maximum Duration of Test:

10 minutes.

Expected Sequence:

| Step | Direction | Message              | Comments                                                                                                                                                 |
|------|-----------|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0    |           |                      | At start of test only, read and note value of ACM on SIM                                                                                                 |
| 1    | MS        |                      | The MS is made to initiate a call                                                                                                                        |

| 21   | SS -> MS  | CHANNEL RELEASE      | The main signalling link is released.                                                                                                                    |
| 22   | MS        |                      | SIM contents checked (either via MMI or by removing the SIM and using SIM reader) ACM shall have been incremented correctly                              |

NOTE The values of x and y are given below.

The correct value of the ACM is found from the general AoC formula given in 3GPP TS 02.24 clause 4 with CDUR = x, y seconds and e parameters as defined below.

Specific Message Contents:

- i) FACILITY Information Element with Invoke = ForwardChargeAdvice component type as defined in 3GPP TS 04.80 subclause 3.6.1 table 3.3.

For ASN.1 description see default message contents in subclause 31.6.4.

The values of the e-parameters within the parameter part of the Facility Information Element shall be set as defined below:

| e-parameter |    |   |    |   |   |    | CCM total<br>at call end<br>increased by | Step 0 ACM<br>value |
|-------------|----|---|----|---|---|----|------------------------------------------|---------------------|
| 1           | 2  | 3 | 4  | 5 | 6 | 7  |                                          |                     |
| 10          | 28 | 1 | 10 | 0 | 0 | 60 | (30)                                     | (30)                |

Values shown in table are in the format and have units as in 3GPP TS 02.24 clause 3.

- ii) FACILITY Information Element with Return Result component type as defined in 3GPP TS 04.80 subclause 3.6.1 table 3.4.

For ASN.1 description see default message contents in subclause 31.6.4.

- iii) FACILITY Information Element with Invoke = ForwardChargeAdvice component type as defined in 3GPP TS 04.80 subclause 3.6.1 table 3.3.

For ASN.1 description see default message contents in subclause 31.6.4.

x is set to a constant value of 80 s.

y is set to a constant value of 180 s.

The values of the e-parameters within the parameter part of the Facility Information Element shall be set to:

| e-parameter |    |   |   |   |   |    | CCM total<br>at call end<br>increased by | Step 0 ACM<br>value |
|-------------|----|---|---|---|---|----|------------------------------------------|---------------------|
| 1           | 2  | 3 | 4 | 5 | 6 | 7  |                                          |                     |
| 10          | 14 | 1 | 5 | 0 | 0 | 60 | 65                                       | 65                  |

Values shown in table are in the format and have units as in 3GPP TS 02.24 clause 3.

### 31.6.1.6 Different formats of charging information

Purpose:

- 1) To verify that when the MS receives a Facility IE in which certain e-parameters are set to zero the total charge accumulated is the same as that when the same e-parameters are completely omitted from the Facility IE.
- 2) To verify the operation of a shortened channel release procedure where the SS does not send DISCONNECT but only the RELEASE COMPLETE and CHANNEL RELEASE messages or just the CHANNEL RELEASE message.

Conformance Requirement(s):

- 1) When the MS receives a Facility IE in which certain e-parameters are set to zero the total charge accumulated shall be the same as that when the same e-parameters are completely omitted from the Facility IE.
- 2) The channel shall be correctly released when a shortened channel release procedure is used - the SS does not send DISCONNECT but only the RELEASE COMPLETE and CHANNEL RELEASE messages or just the CHANNEL RELEASE message.

## Reference(s):

Conformance requirement 1: 3GPP TS 02.24.

Conformance requirement 2: 3GPP TS 04.08 / 3GPP TS 44.018.

## Related PICS/PIXIT Statement(s):

- Support of AoCC.
- Supported rates (full rate/half rate).
- Method of reading ACM from the SIM via the ME.
- Supported teleservices.
- Support for active state of the call control protocol (U10).

## Initial Conditions:

## System Simulator:

1 cell, default parameters, IMSI attach/detach disabled.

## Mobile Station:

The MS is in MM-state "idle, updated".

## Foreseen Final State of the MS:

The MS is in MM-state "idle, updated".

## Method of Test:

## Part 1:

The MS is made to initiate a call. The call is established with certain AoCC e-parameters sent in a Facility IE in a FACILITY message sent before the CONNECT message.

The SS sends the DISCONNECT  $y$  seconds after sending the FACILITY message containing the e-parameters. The MS shall have stored the correct amount on the SIM according to the e-parameters sent.

## Part 2:

Part 1 is repeated twice with the e-parameters that were set to zero above now omitted completely from the Facility IE. The shortened release procedures are used. The MS shall have stored the correct amount on the SIM.

The results of parts 1 and 2 are compared. The value for the charge calculated by the MS shall be identical for parts 1 and 2.

## Maximum Duration of Test:

20 minutes.

Expected Sequence:

The sequence step 1-20 is executed for execution counter  $k = 1, \dots, 3$ .

| Step | Direction | Message              | Comments                                                                                                                     |
|------|-----------|----------------------|------------------------------------------------------------------------------------------------------------------------------|
| 0    |           |                      | At start of test only, read and note value of ACM on SIM                                                                     |

| E17  | SS -> MS  | CHANNEL RELEASE      | The main signalling link is released.                                                                                        |
| F16  | SS -> MS  | CHANNEL RELEASE      |                                                                                                                              |
| 20   | MS        |                      | SIM contents checked (either via MMI or by removing the SIM and using SIM reader) ACM shall have been incremented correctly. |

NOTE The value of  $y$  is given below.

The correct value of the ACM is found from the general AoC formula given in 3GPP TS 02.24 clause 4 with  $CDUR = y$  seconds and  $e$  parameters as defined below.

Specific Message Contents:

- i) FACILITY Information Element with Invoke = ForwardChargeAdvice component type as defined in 3GPP TS 04.80 subclause 3.6.1 table 3.3.

For ASN.1 description see default message contents in subclause 31.6.4.

$y$  is set to a constant value of 90 s.

The values of the  $e$ -parameters within the parameter part of the Facility Information Element shall be set to:

| k-value | e-parameter |    |   |                   |   |   |   | CCM total at call end increased by | Step 0 ACM value |
|---------|-------------|----|---|-------------------|---|---|---|------------------------------------|------------------|
|         | 1           | 2  | 3 | 4                 | 5 | 6 | 7 |                                    |                  |
| 1       | 10          | 40 | 1 | 0                 | 0 | 0 | 0 | 20                                 | 20               |
| 2       | 10          | 40 | 1 | -----omitted----- |   |   |   | 20                                 | 40               |
| 3       | 10          | 40 | 1 | -----omitted----- |   |   |   | 20                                 | 60               |

Values shown in table are in the format and have units as in 3GPP TS 02.24 clause 3.

ii) FACILITY Information Element with Return Result component type as defined in 3GPP TS 04.80 subclause 3.6.1 table 3.4.

For ASN.1 description see default message contents in subclause 31.6.4.

### 31.6.1.7 AoCC on a Call Hold call

Purpose:

- 1) To verify that when the MS invokes a Call Hold call and hence receives Facility IEs containing AoCC e-parameters for each chargeable call the MS returns a FACILITY message containing the AoCC acknowledgement within 1 s of transmission of each set of e-parameters.
- 2) To verify that when the MS invokes a Call Hold call and hence receives Facility IEs containing CAI elements for each chargeable call the CCM records the sum of all the charges for the services currently being used and hence that the ME inserts the correct charge in the ACM field of the SIM.

Conformance Requirement(s)

- 1) When the MS invokes a Call Hold call and hence receives Facility IEs containing AoCC e-parameters for each chargeable call the MS shall return a FACILITY message containing the AoCC acknowledgement within 1 s of receiving each set of e-parameters.
- 2) When the MS invokes a Call Hold call and hence receives Facility IEs containing CAI elements for each chargeable call the CCM shall record the sum of all the charges for the services currently being used and hence the ME shall insert the correct charge in the ACM field of the SIM.

Reference(s):

Conformance requirement 1: 3GPP TS 04.13.

Conformance requirement 2: 3GPP TS 02.24, 3GPP TS 04.83, 3GPP TS 04.84, 3GPP TS 04.86.

Related PICS/PIXIT Statement(s):

- Support of AoCC.
- Supported rates (full rate/half rate).
- Method of reading ACM from the SIM via the ME.
- Supported teleservices.
- Support for active state of the call control protocol (U10).

Initial Conditions:

System Simulator:

1 cell, default parameters, IMSI attach/detach disabled.

Mobile Station:

The MS is in MM-state "idle, updated".

**Foreseen Final State of the MS:**

The MS is in MM-state "idle, updated".

**Method of Test:**

The MS is made to initiate a call. The call is established with certain AoCC e-parameters sent in a Facility IE in the CONNECT message. The MS shall return the AoCC acknowledgement within 1 s of transmission of the CONNECT message.

The call (call B) is then put on hold by sending a HOLD message from the MS to the SS. The SS shall reply with a HOLD ACKNOWLEDGE. The traffic channel is now available to originate another call.

The MS is made to initiate a second call (call C). The call is established with certain AoCC e-parameters sent in a Facility IE in the CONNECT message. The MS shall return the AoCC acknowledgement in a FACILITY message within 1 s of transmission of the CONNECT message.

The SS sends the DISCONNECT to the MS for call B x seconds after sending the call B CAI in the CONNECT/FACILITY message and the DISCONNECT for call C y seconds after sending the call C CAI in the CONNECT/FACILITY message. The MS shall have stored the correct amount on the SIM according to the two sets of e-parameters sent and call times x and y.

**Maximum Duration of Test:**

10 minutes.

Expected Sequence:

| Step | Direction | Message              | Comments                                                                                                                               |
|------|-----------|----------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| 0    |           |                      | At start of test only, read and note value of ACM on SIM                                                                               |
| 1    | MS        |                      | The MS is made to initiate a call                                                                                                      |
| 2    | MS -> SS  | CHANNEL REQUEST      |                                                                                                                                        |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT |                                                                                                                                        |

| I26  | SS -> MS  | DISCONNECT           | For call B                                                                                                                             |
| I27  | MS -> SS  | RELEASE              | x seconds after call B CAI sent                                                                                                        |
| I28  | SS -> MS  | RELEASE COMPLETE     |                                                                                                                                        |
| 29   | SS -> MS  | CHANNEL RELEASE      | The main signalling link is released                                                                                                   |
| 30   | MS        |                      | SIM contents checked (either via MMI or by removing the SIM and using SIM reader) ACM shall have been incremented correctly.           |

NOTE The value of x and y are given below.

The correct value of the ACM is found from the general AoC formula given in 3GPP TS 02.24 clause 4 with CDUR = x,y seconds and e parameters as defined below.

Specific Message Contents:

- i) FACILITY Information Element with Invoke = ForwardChargeAdvice component type as defined in 3GPP TS 04.80 subclause 3.6.1 table 3.3.

For ASN.1 description see default message contents in subclause 31.6.4.

x set to 180 s, y is set to 90 s.

The values of the e-parameters within the parameter part of the Facility Information Element shall be set to:

| Call             | e-parameter |    |   |   |   |   |   | CCM total at call end increased by | Step 0 ACM value |
|------------------|-------------|----|---|---|---|---|---|------------------------------------|------------------|
|                  | 1           | 2  | 3 | 4 | 5 | 6 | 7 |                                    |                  |
| <b>B(time x)</b> | 7           | 40 | 1 | 0 | 0 | 0 | 0 |                                    |                  |
| <b>C(time y)</b> | 13          | 40 | 1 | 0 | 0 | 0 | 0 | 54                                 | 54               |

Values shown in table are in the format and have units as in 3GPP TS 02.24 clause 3.

- ii) FACILITY Information Element with Return Result component type as defined in 3GPP TS 04.80 subclause 3.6.1 table 3.4.

For ASN.1 description see default message contents in subclause 31.6.4.

### 31.6.1.8 AoCC on a Multi-party call

Purpose:

- 1) To verify that when the MS invokes a Multi-party call and hence receives Facility IEs containing AoCC e-parameters for each chargeable call the MS returns a FACILITY message containing the AoCC acknowledgement within 1 s of transmission of each set of e-parameters.
- 2) To verify that when the MS originates a Multi-party call and hence receives Facility IEs containing CAI elements for each chargeable call the CCM records the sum of all the charges for the services currently being used and hence the ME inserts the correct charge in the ACM field of the SIM.

Conformance Requirement(s):

- 1) When the MS invokes a Multi-party call and hence receives Facility IEs containing AoCC e-parameters for each chargeable call the MS shall return a FACILITY message containing the AoCC acknowledgement within 1 s of receiving each set of e-parameters.
- 2) When the MS originates a Multi-party call and hence receives Facility IEs containing CAI elements for each chargeable call the CCM shall record the sum of all the charges for the services currently being used and hence the ME shall insert the correct charge in the ACM field of the SIM.

Reference(s):

Conformance requirement 1: 3GPP TS 04.13.

Conformance requirement 2: 3GPP TS 02.24, 3GPP TS 04.83, 3GPP TS 04.84, 3GPP TS 04.86.

## Related PICS/PIXIT Statement(s):

- Support of AoCC.
- Supported rates (full rate/half rate).
- Method of reading ACM from the SIM via the ME.
- Supported teleservices.
- Support for active state of the call control protocol (U10).

## Initial Conditions:

## System Simulator:

1 cell, default parameters, IMSI attach/detach disabled.

## Mobile Station:

The MS is in MM-state "idle, updated".

## Foreseen Final State of the MS:

The MS is in MM-state "idle, updated".

## Method of Test:

The MS is made to initiate a call. The call is established with certain AoCC e-parameters sent in a FACILITY IE in the CONNECT message. The MS shall return the AoCC acknowledgement within 1 s of transmission of the CONNECT message.

The call (call B) is then put on hold by sending a HOLD message from the MS to the SS. The SS shall reply with a HOLD ACKNOWLEDGE. The traffic channel is now available to originate another call.

The MS is made to initiate a second call (call C). The call is established with certain AoCC e-parameters sent in a FACILITY IE in the CONNECT message. The MS shall return the AoCC acknowledgement within 1 s of transmission of the CONNECT message.

The MS invokes the multi-party service by sending a FACILITY message to the SS containing the BuildMPTY request.

The SS accepts the request and connects the MS with the other existing connections (active call C and held call B) and confirms with a FACILITY message.

The SS sends the DISCONNECT to the MS for call B x seconds after sending the call B CAI in the CONNECT message and the DISCONNECT for call C y seconds after sending the call C CAI in the CONNECT message. The MS shall have stored the correct amount on the SIM according to the two sets of e-parameters sent and call times x and y.

## Maximum Duration of Test:

10 minutes.

Expected Sequence:

| Step | Direction | Message               | Comments                                                                                                                                                             |
|------|-----------|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0    |           |                       | At start of test only, read and note value of ACM on SIM                                                                                                             |
| 1    | MS        |                       | The MS is made to initiate a call                                                                                                                                    |
| 2    | MS -> SS  | CHANNEL REQUEST       |                                                                                                                                                                      |

| I29  | MS -> SS  | RELEASE               | x seconds after call B CAI sent                                                                                                                                      |
| I30  | SS -> MS  | RELEASE COMPLETE      |                                                                                                                                                                      |
| 31   | SS -> MS  | CHANNEL RELEASE       | The main signalling link is released.                                                                                                                                |
| 32   | MS        |                       | SIM contents checked (either via MMI or by removing the SIM and using SIM reader) ACM shall have been incremented correctly.                                         |

NOTE: A-B/A-C indicates a choice. the transaction identifier (TI) used must be that of the active call or the held call (ref. 3GPP TS 04.84).

The values of x and y are given below.

The correct value of the ACM is found from the general AoC formula given in 3GPP TS 02.24 clause 4 with CDUR = x,y seconds and e parameters as defined below.

Specific Message Contents:

i) FACILITY Information Element with Invoke = ForwardChargeAdvice component type as defined in 3GPP TS 04.80 subclause 3.6.1 table 3.3.

For ASN.1 description see default message contents in subclause 31.6.4.

x set to 180 s, y set to 90 s.

The values of the e-parameters within the parameter part of the Facility Information Element shall be set to:

| Call             | e-parameter |    |   |   |   |   |   | CCM total at call end increased by | Step 0 ACM value |
|------------------|-------------|----|---|---|---|---|---|------------------------------------|------------------|
|                  | 1           | 2  | 3 | 4 | 5 | 6 | 7 |                                    |                  |
| <b>B(time x)</b> | 19          | 40 | 1 | 0 | 0 | 0 | 0 |                                    |                  |
| <b>C(time y)</b> | 29          | 40 | 1 | 0 | 0 | 0 | 0 | 134                                | 134              |

Values shown in table are in the format and have units as in 3GPP TS 02.24 clause 3.

ii) FACILITY Information Element with Return Result component type as defined in 3GPP TS 04.80 subclause 3.6.1 table 3.4.

For ASN.1 description see default message contents in subclause 31.6.4.

iii) FACILITY Information Element with Invoke = BuildMPTY component type as defined in 3GPP TS 04.80 subclause 3.6.1 table 3.4.

The following abbreviations are used in the descriptions below:

- U Universal tag class.
- CS Context Specific tag class.
- P Primitive tag form.
- C Constructed tag form.
- FIE Facility Information Element.

## 31.6.2 Charge Storage

### 31.6.2.1 Removal of SIM during an active call

Purpose:

- 1) To verify that when the SIM is removed from the ME during an active AoCC call the ME immediately terminates the call.
- 2) To verify that when the SIM is removed during an active AoCC call the ME has written the total charge up to that point in the call to the ACM field of the SIM.

Conformance Requirement(s):

- 1) When the SIM is removed from the ME during an active AoCC call the ME shall immediately terminate the call.
- 2) When the SIM is removed during an active AoCC call midway through an AoC charging time interval (e7 or e2) the ME shall have written the total charge up to the point in the call where the charging time interval last expired to the ACM field of the SIM.

Reference(s):

Conformance requirement 1: 3GPP TS 02.17.

Conformance requirement 1: 3GPP TS 02.24.

Related PICS/PIXIT Statement(s):

- Support of AoCC.
- Supported rates (full rate/half rate).
- Removal of the SIM is possible without disconnection of power supply.
- Supported teleservices.
- Support for active state of the call control protocol (U10).

Initial Conditions:

System Simulator:

1 cell, default parameters, IMSI attach/detach disabled.

Mobile Station:

The MS is in MM-state "idle, updated".

Foreseen Final State of the MS:

The MS is in MM-state "idle, updated".

Method of Test:

This test is only performed if it is possible to remove SIM without disconnecting the power supply. If the battery pack must be removed to get at the SIM see subclause 31.6.2.2.

The MS is made to initiate a call. The call is established with certain AoCC e-parameters sent in a Facility IE in the CONNECT message. It is an implementation option whether the AoCC acknowledge is sent before or after the CONNECT ACKNOWLEDGE.

If possible, without removing the power supply, the SIM is removed from the ME y seconds after the SS sends the CAI in the CONNECT/FACILITY message. The call shall be terminated immediately by the MS and the MS shall have stored the correct amount on the SIM according to the e-parameters sent.

Maximum Duration of Test:

5 minutes.

Expected Sequence:

| Step | Direction | Message              | Comments                                                                                                    |
|------|-----------|----------------------|-------------------------------------------------------------------------------------------------------------|
| 0    |           |                      | At start of test only, read and note value of ACM on SIM                                                    |
| 1    | MS        |                      | The MS is made to initiate a call                                                                           |
| 2    | MS -> SS  | CHANNEL REQUEST      |                                                                                                             |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT |                                                                                                             |
| 4    | MS -> SS  | CM SERVICE REQUEST   |                                                                                                             |

| C17  | MS -> SS  | RELEASE COMPLETE     |                                                                                                             |
| C18  | SS -> MS  | CHANNEL RELEASE      | The main signalling link is released.                                                                       |
| D15  | MS -> SS  | RELEASE COMPLETE     |                                                                                                             |
| D16  | SS -> MS  | CHANNEL RELEASE      | The main signalling link is released.                                                                       |
| E15  | MS -> SS  | Layer 2 DISC         |                                                                                                             |
| E16  | SS -> MS  | UA                   |                                                                                                             |
| F15  |           |                      | No further messages are sent                                                                                |
| 19   |           |                      | SIM contents checked (by removing the SIM and using SIM reader). ACM shall have been incremented correctly. |

NOTE: The value of y is given below.

The correct value of the ACM is found from the general AoC formula given in 3GPP TS 02.24 clause 4 with CDUR = y seconds and e parameters as defined below.

Specific Message Contents:

- i) FACILITY Information Element with Invoke = ForwardChargeAdvice component type as defined in 3GPP TS 04.80 subclause 3.6.1 table 3.3.

For ASN.1 description see default message contents in subclause 31.6.4.

The SIM is removed after approximately  $y=90$  s.

The values of the e-parameters within the parameter part of the Facility Information Element shall be set to:

| k-value | e-parameter |    |   |    |   |   |    | CCM total at call end increased by | Step 0 ACM value |
|---------|-------------|----|---|----|---|---|----|------------------------------------|------------------|
|         | 1           | 2  | 3 | 4  | 5 | 6 | 7  |                                    |                  |
|         | 10          | 55 | 1 | 10 | 0 | 0 | 10 | 30                                 | 30               |

Values shown in table are in the format and have units as in 3GPP TS 02.24 clause 3.

- ii) FACILITY Information Element with Return Result component type as defined in 3GPP TS 04.80 subclause 3.6.1 table 3.4.

For ASN.1 description see default message contents in subclause 31.6.4.

### 31.6.2.2 Interruption of power supply during an active call

Purpose:

To verify that when the power supply of the MS is removed during an active AoCC call the ME has written the total charge up to that point in the call to the ACM field of the SIM.

Conformance Requirement(s):

When the power supply of the MS is removed during an active AoCC call midway through an AoC charging time interval (e7 or e2) the ME shall have written the total charge up to the point in the call where the charging time interval last expired to the ACM field of the SIM.

Reference(s):

Conformance requirement 1: 3GPP TS 02.24.

Related PICS/PIXIT Statement(s):

- Support of AoCC.
- Supported rates (full rate/half rate).
- Method of removing power supply.
- Supported teleservices.
- Support for active state of the call control protocol (U10).

Initial Conditions:

System Simulator:

1 cell, default parameters, IMSI attach/detach disabled.

Mobile Station:

The MS is in MM-state "idle, updated".

Foreseen Final State of the MS:

The MS is switched off.

Method of Test:

The MS is made to initiate a call. The call is established with certain AoCC e-parameters sent in a Facility IE in the CONNECT message. It is an implementation option whether the AoCC acknowledge is sent before or after the CONNECT ACKNOWLEDGE.

The ME power is switched off by pressing power button on MMI during the active call. The call shall be terminated immediately and the MS shall have stored the correct amount on the SIM according to the e-parameters sent.

The test is repeated for ME power being lost by removal of battery pack. The call shall be terminated immediately and the MS shall have stored the correct amount on the SIM according to the e-parameters sent.

Maximum Duration of Test:

10 minutes.

Expected Sequence:

The sequence step 1-20 is executed for execution counter k = 1,2.

| Step | Direction | Message              | Comments                                                                                                                                                                          |
|------|-----------|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0    |           |                      | At start of test only, read and note value of ACM on SIM                                                                                                                          |
| 1    | MS        |                      | The MS is made to initiate a call                                                                                                                                                 |
| 2    | MS -> SS  | CHANNEL REQUEST      |                                                                                                                                                                                   |

| 4    | MS -> SS  | CM SERVICE REQUEST   |                                                                                                                                                                                   |
| 5    | SS -> MS  | CM SERVICE ACCEPT    |                                                                                                                                                                                   |
| 6    | MS -> SS  | SETUP                |                                                                                                                                                                                   |
| 7    | SS -> MS  | CALL PROCEEDING      |                                                                                                                                                                                   |
| 8    | SS -> MS  | ASSIGNMENT COMMAND   | to a supported channel type                                                                                                                                                       |
| 9    | MS -> SS  | ASSIGNMENT COMPLETE  |                                                                                                                                                                                   |
| 10   | SS -> MS  | ALERTING             |                                                                                                                                                                                   |
| 11   | SS -> MS  | CONNECT              | As default message except contains Facility IE with contents as indicated in i below                                                                                              |
|      |           |                      | Either A or B branch is taken                                                                                                                                                     |
| A12  | MS -> SS  | CONNECT ACKNOWLEDGE  |                                                                                                                                                                                   |
| A13  | MS -> SS  | FACILITY             | As default message except contains Facility IE with contents as indicated in ii below                                                                                             |
| B12  | MS -> SS  | FACILITY             | As default message except contains Facility IE with contents as indicated in ii below                                                                                             |
| B13  | MS -> SS  | CONNECT ACKNOWLEDGE  |                                                                                                                                                                                   |
| 14   |           |                      | ME power interrupted y seconds after CAI information sent by SS by: MMI power switch (for k=1) Removing battery pack (for k=2) Depending on the value of k C or D branch is taken |
| 15   |           |                      | SIM contents checked (by removing the SIM and using SIM reader). ACM shall have been incremented correctly.                                                                       |

NOTE: The value of y is given below.

The correct value of the ACM is found from the general AoC formula given in 3GPP TS 02.24 clause 4 with CDUR = y seconds and e parameters as defined below.

Specific Message Contents:

- i) FACILITY Information Element with Invoke = ForwardChargeAdvice component type as defined in 3GPP TS 04.80 subclause 3.6.1 table 3.3.

For ASN.1 description see default message contents in subclause 31.6.4.

The ME power is removed after approximately  $y=90$  s.

The values of the e-parameters within the parameter part of the Facility Information Element shall be set to:

| k-value | e-parameter |    |   |    |   |   |    | CCM total at call end increased by | Step 0 ACM value |
|---------|-------------|----|---|----|---|---|----|------------------------------------|------------------|
|         | 1           | 2  | 3 | 4  | 5 | 6 | 7  |                                    |                  |
|         | 10          | 55 | 1 | 10 | 0 | 0 | 10 | 30                                 | 30               |

Values shown in table are in the format and have units as in 3GPP TS 02.24 clause 3.

- ii) FACILITY Information Element with Return Result component type as defined in 3GPP TS 04.80 subclause 3.6.1 table 3.4.

For ASN.1 description see default message contents in subclause 31.6.4.

### 31.6.2.3 MS going out of coverage during an active AoCC call

**NOTE:** At present the core recommendations for AoCC in the case where the radio link is lost during an active call are vague. Does the mobile go on charging for a fixed period after radio link loss and continue as usual if radio link reestablishment occurs, or does charging stop? Input from people involved in charging for GSM is required.

Hence this test will be enhanced in the future when the requirements become clearer.

**Purpose:**

To verify that when the MS goes out of radio coverage area and an active call is dropped the ME has written the total charge up to that point in the call to the ACM field of the SIM.

**Conformance Requirement(s):**

When the MS goes out of radio coverage area during an active AoCC call midway through an AoC charging time interval (e7 or e2) and the call is dropped the ME shall have written the total charge up to the point in the call where the charging time interval last expired to the ACM field of the SIM.

**Reference(s):**

Conformance requirement 1: 3GPP TS 02.24.

**Related PICS/PIXIT Statement(s):**

- Support of AoCC.
- Supported rates (full rate/half rate).
- Method of reading ACM from the SIM via the ME.
- Supported teleservices.
- Support for active state of the call control protocol (U10).

## Initial Conditions:

## System Simulator:

1 cell, default parameters, IMSI attach/detach disabled.

## Mobile Station:

The MS is in MM-state "idle, updated".

## Foreseen Final State of the MS:

The MS is in MM-state "idle, updated".

## Method of Test:

The MS is made to initiate a call. The call is established with certain AoCC e-parameters sent in a Facility IE in the CONNECT message. It is an implementation option whether the AoCC acknowledge is sent before or after the CONNECT ACKNOWLEDGE.

The cell simulated by the system simulator is then switched off to model the MS losing radio coverage. The MS shall have stored the correct amount on the SIM according to the e-parameters sent. [What happens on call reestablishment?]

## Maximum Duration of Test:

5 minutes.

## Expected Sequence:

| Step | Direction | Message              | Comments                                                                                                                                                          |

| A12  | MS -> SS  | CONNECT ACKNOWLEDGE  |                                                                                                                                                                   |
| A13  | MS -> SS  | FACILITY             | As default message except contains Facility IE with contents as indicated in ii below                                                                             |
| B12  | MS -> SS  | FACILITY             | As default message except contains Facility IE with contents as indicated in ii below                                                                             |
| B13  | MS -> SS  | CONNECT ACKNOWLEDGE  |                                                                                                                                                                   |
| 14   |           |                      | SS cell switched off y seconds after CAI information sent by SS Failure of radio path, end of call (CEND) occurs and MS stops charging (ref. 3GPP TS 02.24 sec 2) |
| 15   |           |                      | SIM contents checked (either via MMI or by removing the SIM and using SIM reader). ACM shall have been incremented correctly.                                     |

NOTE: The value of y is given below.

The correct value of the ACM is found from the general AoC formula given in 3GPP TS 02.24 clause 4 with CDUR = y seconds and e parameters as defined below.

Specific Message Contents:

- i) FACILITY Information Element with Invoke = ForwardChargeAdvice component type as defined in 3GPP TS 04.80 subclause 3.6.1 table 3.3.

For ASN.1 description see default message contents in subclause 31.6.4.

The cell being simulated by the SS is switched off after approximately  $y=90$  s.

The values of the e-parameters within the parameter part of the Facility Information Element shall be set to:

| k-value | e-parameter |    |   |    |   |   |    | CCM total at call end increased by | Step 0 ACM value |
|---------|-------------|----|---|----|---|---|----|------------------------------------|------------------|
|         | 1           | 2  | 3 | 4  | 5 | 6 | 7  |                                    |                  |
|         | 10          | 55 | 1 | 10 | 0 | 0 | 10 | 30                                 | 30               |

Values shown in table are in the format and have units as in 3GPP TS 02.24 clause 3.

- ii) FACILITY Information Element with Return Result component type as defined in 3GPP TS 04.80 subclause 3.6.1 table 3.4.

For ASN.1 description see default message contents in subclause 31.6.4.

### 31.6.2.4 ACMmax operation / Mobile Originating

Purpose:

- 1) To verify that when the value stored in the ACM becomes equal to or exceeds its maximum value, the ACMmax, any outgoing calls in progress for which a non-zero CAI exists are terminated by the ME, with cause value #68 once the chargeable interval determined by the CAI has elapsed, with an appropriate indication given to the user.
- 2) To verify that when the value stored in the ACM becomes equal to or exceeds its maximum limit, the ACMmax, the making of non-emergency calls is inhibited.
- 3) To verify that when the value stored in the ACM becomes equal to or exceeds its maximum limit, the ACMmax, the making of emergency calls is uninhibited.

Conformance Requirement(s):

- 1) When the value stored in the ACM becomes equal to or exceeds its maximum value, the ACMmax, any outgoing calls in progress for which a non-zero CAI exists shall be terminated by the ME with cause value #68, once the chargeable interval determined by the CAI has elapsed, with an appropriate indication given to the user.
- 2) When the value stored in the ACM becomes equal to or exceeds its maximum limit, the ACMmax, the making of further non-emergency calls shall be inhibited.
- 3) When the value stored in the ACM becomes equal to or exceeds its maximum limit, the ACMmax, the making of emergency calls shall be uninhibited.

Reference(s):

Conformance requirement 1: 3GPP TS 02.24,  
3GPP TS 04.86 subclause 2.3.

Conformance requirement 2: 3GPP TS 02.24.

Conformance requirement 3: 3GPP TS 02.24.

**Related PICS/PIXIT Statement(s):**

- Support of AoCC.
- Supported rates (full rate/half rate).
- Method of reading ACM from the SIM via the ME.
- Type of user indication when ACMmax exceeded.
- Supported teleservices.
- Support for active state of the call control protocol (U10).

**Initial Conditions:****System Simulator:**

1 cell, default parameters, IMSI attach/detach disabled.

**Mobile Station:**

The MS is in MM-state "idle, updated".

PIN 2 is entered into the MS allowing modification of both the ACM and ACMmax fields on the SIM. The ACM is reset to zero and the ACMmax is set to 2 units.

**Foreseen Final State of the MS:**

The MS is in MM-state "idle, updated".

**Method of Test:**

The MS is made to initiate a call. The call is established with certain AoCC non-zero e-parameters sent in a Facility IE in the CONNECT message. It is an implementation option whether the AoCC acknowledge is sent before or after the CONNECT ACKNOWLEDGE.

After the ACM has been incremented to 2 units (60 s) the call shall be terminated by the MS once an additional chargeable interval of 30 s has elapsed, and an indication given to the user. The call duration is recorded and the ACM is checked to ensure it has been incremented to 2 units.

The MS is then made to attempt to originate an ordinary call to the MS for which a non-zero CAI exists for the calling party and shall be unsuccessful. The MS shall not send a CHANNEL REQUEST for that call.

The MS is then made to attempt to originate an emergency call and shall be successful.

**Maximum Duration of Test:**

10 minutes.

Expected Sequence:

| Step                                                                 | Direction                                                                                                                      | Message                                                                                                                                                                                          | Comments                                                                                                                                                                                                                                                                                                                                                      |

k=1 - Non zero CAI call attempted by MS and should succeed.

k=2 - Non zero CAI call attempted by MS and should fail.

k=3 - Emergency call attempted by MS and should succeed.

NOTE: The values of x and y are given below.

The correct value of the ACM is found from the general AoC formula given in 3GPP TS 02.24 clause 4 with CDUR = x,y seconds and e parameters as defined below.

Specific Message Contents:

- i) FACILITY Information Element with Invoke = ForwardChargeAdvice component type as defined in 3GPP TS 04.80 subclause 3.6.1 table 3.3.

For ASN.1 description see default message contents in subclause 31.6.4.

x shall be  $90 \pm 2$  s.

y shall be set to 120 s.

The values of the e-parameters within the parameter part of the Facility Information Element shall be set to:

| k-value | e-parameter |    |   |   |   |   |   | CCM total at call end increased by | Step 0 ACM value |
|---------|-------------|----|---|---|---|---|---|------------------------------------|------------------|
|         | 1           | 2  | 3 | 4 | 5 | 6 | 7 |                                    |                  |
| 1       | 1           | 30 | 1 | 0 | 0 | 0 | 0 | 2                                  | 2                |
| 2       | 1           | 30 | 1 | 0 | 0 | 0 | 0 | 0                                  | 2                |
| 3       | 0           | 0  | 0 | 0 | 0 | 0 | 0 | 0                                  | 2                |

Values shown in table are in the format and have units as in 3GPP TS 02.24 clause 3.

- ii) FACILITY Information Element with Return Result component type as defined in 3GPP TS 04.80 subclause 3.6.1 table 3.4.

For ASN.1 description see default message contents in subclause 31.6.4.

### 31.6.2.5 ACMmax operation / Mobile Terminating

Purpose:

- 1) To verify that when the value stored in the ACM becomes equal to or exceeds its maximum value, the ACMmax, any mobile terminating calls in progress for which a non-zero CAI exists are terminated by the ME with cause value #68, once the chargeable interval determined by the CAI has elapsed, with an appropriate indication given to the user.
- 2) To verify that when the value stored in the ACM becomes equal to or exceeds its maximum value, the ACMmax, and an incoming call is received for which subsequently a non-zero CAI is received, then the call is terminated by the ME using cause value #68 with an appropriate indication given to the user.
- 3) To verify that when the value stored in the ACM becomes equal to or exceeds its maximum limit, the ACMmax, the receiving of calls for which the CAI is zero is uninhibited.

Conformance Requirement(s):

- 1) When the value stored in the ACM becomes equal to or exceeds its maximum value, the ACMmax, any mobile terminating calls in progress for which a non-zero CAI exists shall be terminated by the ME with cause value #68, once the chargeable interval determined by the CAI has elapsed, with an appropriate indication given to the user.
- 2) When the value stored in the ACM becomes equal to or exceeds its maximum value, the ACMmax, and an incoming call is received for which subsequently a non-zero CAI is received, the call shall be terminated by the ME using cause value #68 with an appropriate indication given to the user.
- 3) When the value stored in the ACM becomes equal to or exceeds its maximum limit, the ACMmax, the receiving of calls for which the CAI is zero shall be uninhibited.

Reference(s):

- Conformance requirement 1: 3GPP TS 02.24,  
3GPP TS 04.86 subclause 2.3.

Conformance requirement 2: 3GPP TS 02.24,  
3GPP TS 04.86 subclause 2.3.

Conformance requirement 2: 3GPP TS 02.24.

#### Related PICS/PIXIT Statement(s):

- Support of AoCC.
- Supported rates (full rate/half rate).
- Method of reading ACM from the SIM via the ME.
- Type of user indication when ACMmax exceeded.
- Supported teleservices.
- Support for active state of the call control protocol (U10).

#### Initial Conditions:

##### System Simulator:

1 cell, default parameters, IMSI attach/detach disabled.

##### Mobile Station:

The MS is in MM-state "idle, updated".

PIN 2 is entered into the MS allowing modification of both the ACM and ACMmax fields on the SIM. The ACM is reset to zero and the ACMmax is set to 2 units.

#### Foreseen Final State of the MS:

The MS is in MM-state "idle, updated".

#### Method of Test:

The SS is made to initiate a call. The call is established with certain non-zero AoCC e-parameters sent in a FACILITY IE contained in a FACILITY message sent before the CONNECT message. It is an implementation option whether the AoCC e-parameters and AoCC acknowledge are sent before or after the CONNECT ACKNOWLEDGE.

After the ACM has been incremented to 2 units (60s) the call shall be terminated by the MS once an additional chargeable interval of 30s has elapsed and an indication given to the user. The ACM shall be checked to ensure that it has been incremented to 2 units.

The SS is then made to attempt to make an ordinary call to the MS for which a non-zero CAI exists for the called party and shall be unsuccessful. The MS shall terminate the call with a DISCONNECT message.

The SS is then made to attempt to make an ordinary call to the MS for which a zero CAI exists for the called party and shall be successful.

#### Maximum Duration of Test:

10 minutes.

Expected Sequence:

The sequence step 1-20 is executed for execution counter  $k = 1, \dots, 3..$

| Step | Direction | Message              | Comments                                                                                                                      |
|------|-----------|----------------------|-------------------------------------------------------------------------------------------------------------------------------|
| 0    |           |                      | At start of test only, read and note value of ACM on SIM                                                                      |
| 1    | SS        |                      | The SS is made to initiate a call                                                                                             |

| G17  | SS -> MS  | CHANNEL RELEASE      | The main signalling link is released.                                                                                         |
|      |           |                      | For $k=3$                                                                                                                     |
| H15  |           |                      | Call duration y seconds after CAI information sent by SS                                                                      |
| H16  | MS -> SS  | DISCONNECT           | MS terminates call                                                                                                            |
| H17  | SS -> MS  | RELEASE              |                                                                                                                               |
| H18  | MS -> SS  | RELEASE COMPLETE     |                                                                                                                               |
| H19  | SS -> MS  | CHANNEL RELEASE      | The main signalling link is released.                                                                                         |
| 20   |           |                      | ACM checked (should be 2 units)                                                                                               |

$k=1$  - Non zero CAI call attempted to MS and should succeed.

$k=2$  - Non zero CAI call attempted to MS and should fail.

$k=3$  - Zero CAI call attempted to MS and should succeed.

NOTE: The values of x and y are given below.

The correct value of the ACM is found from the general AoC formula given in 3GPP TS 02.24 clause 4 with CDUR = x,y seconds and e parameters as defined below.

Specific Message Contents:

- i) FACILITY Information Element with Invoke = ForwardChargeAdvice component type as defined in 3GPP TS 04.80 subclause 3.6.1 table 3.3.

For ASN.1 description see default message contents in subclause 31.6.4.

x shall be  $90 \pm 2$  s.

y shall be set to 120 s.

The values of the e-parameters within the parameter part of the Facility Information Element shall be set to:

| k-value | e-parameter |    |   |   |   |   |   | CCM total at call end increased by | Step 0 ACM value |
|---------|-------------|----|---|---|---|---|---|------------------------------------|------------------|
|         | 1           | 2  | 3 | 4 | 5 | 6 | 7 |                                    |                  |
| 1       | 1           | 30 | 1 | 0 | 0 | 0 | 0 | 2                                  | 2                |
| 2       | 1           | 30 | 1 | 0 | 0 | 0 | 0 | 0                                  | 2                |
| 3       | 0           | 0  | 0 | 0 | 0 | 0 | 0 | 0                                  | 2                |

Values shown in table are in the format and have units as in 3GPP TS 02.24 clause 3.

- ii) FACILITY Information Element with Return Result component type as defined in 3GPP TS 04.80 subclause 3.6.1 table 3.4.

For ASN.1 description see default message contents in subclause 31.6.4.

### 31.6.3 Advice of Charge Information

#### 31.6.3.1 AoCI time related charging / MS originated call

Purpose:

- 1) To verify that when the MS receives the AoCI parameters in a Facility IE which is contained in the CONNECT message and when a TCH has already been assigned, the MS returns a FACILITY message containing the acknowledgement within 1 s.
- 2) To verify that when the call has no volume related component the MS ignores non-zero AoCI e5, e6 parameters sent to it.

Conformance Requirement(s):

- 1) When the MS receives the AoCI parameters in a Facility IE which is contained in a CONNECT message and when a TCH has already been assigned, the MS shall return a FACILITY message containing the acknowledgement within 1 s.
- 2) When the call has no volume related component the MS shall ignore non-zero AoC e5 and e6 parameters sent to it.

## Reference(s):

Conformance requirement 1: 3GPP TS 03.86,  
3GPP TS 04.13,  
3GPP TS 04.86.

Conformance requirement 2: 3GPP TS 02.24.

## Related PICS/PIXIT Statement(s):

- Support of AoCI.
- Supported rates (full rate/half rate).
- Supported teleservices.
- Support for active state of the call control protocol (U10).
- MMI method of reading the AoCI information

## Initial Conditions:

## System Simulator:

1 cell, default parameters, IMSI attach/detach disabled.

## Mobile Station:

The MS is in MM-state "idle, updated".

## Foreseen Final State of the MS:

The MS is in MM-state "idle, updated".

## Method of Test:

The MS is made to initiate a call. The call is established with certain AoCI e-parameters sent in a Facility IE in the CONNECT message. The MS shall return the AoCI acknowledgement within 1 s of the CONNECT message. It is an implementation option whether the AoCI acknowledge is sent by the MS before or after the CONNECT ACKNOWLEDGE.

The SS sends the DISCONNECT y seconds after sending the CONNECT message containing the CAI. The test is repeated for several different sets of e-parameters as defined below.

## Maximum Duration of Test:

30 minutes.

Expected Sequence:

The sequence step 1-20 is executed for execution counter k = 1,...,5.

| Step | Direction | Message              | Comments                                                                                                                                                                                          |
|------|-----------|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                      | The MS is made to initiate a call<br><br>to a supported channel type<br><br>As default message except contains Facility IE with contents as indicated in i below<br>Either A or B branch is taken |

NOTE: The value of y is given below.

The correct value of the ACM is found from the general AoC formula given in 3GPP TS 02.24 clause 4 with CDUR = y seconds and e parameters as defined below.

Specific Message Contents:

i) FACILITY Information Element with Invoke = ForwardChargeAdvice component type as defined in 3GPP TS 04.80 subclause 3.6.1 table 3.3.

For ASN.1 description see default message contents in subclause 31.6.4.

y is set to a constant value of 90 s.

The values of the e-parameters within the parameter part of the Facility Information Element shall be set as below:

| k-value | e-parameter |    |   |     |    |    |    | CCM total at call end increased by | Step 0 ACM value             |
|---------|-------------|----|---|-----|----|----|----|------------------------------------|------------------------------|
|         | 1           | 2  | 3 | 4   | 5  | 6  | 7  |                                    |                              |
| 1       | 6           | 14 | 1 | 25  | 0  | 0  | 60 | 43                                 | 43                           |
| 2       | 0           | 0  | 1 | 100 | 0  | 0  | 0  | 100                                | 143                          |
| 3       | 250         | 16 | 2 | 500 | 0  | 0  | 60 | 2 000                              | 2 143                        |
| 4       | 1           | 1  | 1 | 0   | 10 | 10 | 1  | 89 or 90                           | 2 232 or 2 233               |
| 5       | 12,5        | 30 | 1 | 25  | 10 | 10 | 30 | 50 or 62,5                         | 2 295, 2 296, 2 282 or 2 283 |

Values shown in table are in the format and have units as in 3GPP TS 02.24 clause 3.

The ASN.1 description for each e-parameter allows integers in the range 0 to 8 191 to be transmitted but some e-parameters have different actual ranges (e.g. e1 can take any value 0..819,1 with 0,1 resolution). The MS knows how to interpret the received parameter (e.g. received e1 refers to 10 times actual e1, see 3GPP TS 04.80 subclause 4.4.3).

Therefore  $e1=12,5$  would be sent to the MS as 125. The MS knows the value sent is 10 times the "real"  $e1$  and hence interprets the value as 12,5.

The non-zero  $e5$  and  $e6$  values for the  $k=4$  and  $k=5$  execution of the test are to check that the MS ignores the volume related parameters when carrying out time only related charging.

ii) FACILITY Information Element with Return Result component type as defined in 3GPP TS 04.80 subclause 3.6.1 table 3.4.

For ASN.1 description see default message contents in subclause 31.6.4.

### 31.6.3.2 AoCI time related charging / MS terminated call

Purpose:

- 1) To verify that when the MS receives certain AoCI e-parameters in a Facility IE which is contained in a FACILITY message sent after the CONNECT message and when a TCH has already been assigned, the MS returns a FACILITY message containing the acknowledgement within 1 s.

Conformance Requirement(s):

- 1) When the MS receives the AoCI parameters in a Facility IE which is contained in a FACILITY message sent after the CONNECT message and when a TCH has already been assigned, the MS shall return a Facility message containing the acknowledgement within 1 s.

Reference(s):

Conformance requirement 1: 3GPP TS 03.86,  
3GPP TS 04.13,  
3GPP TS 04.86.

Conformance requirement 2: 3GPP TS 02.24.

Related PICS/PIXIT Statement(s):

- Support of AoCI.
- Supported rates (full rate/half rate).
- Supported teleservices.
- Support for active state of the call control protocol (U10).
- MMI method of reading the AoCI information

Initial Conditions:

System Simulator:

1 cell, default parameters, IMSI attach/detach disabled.

Mobile Station:

The MS is in MM-state "idle, updated".

Foreseen Final State of the MS:

The MS is in MM-state "idle, updated".

## Method of Test:

The SS is made to initiate a call. The call is established and certain AoCI e-parameters are sent to the MS in a Facility IE contained within a FACILITY message. The MS shall return the AoCI acknowledgement within 1 s of the FACILITY message. It is an implementation option whether the AoCI e-parameters and the AoCI acknowledge are sent before or after the CONNECT ACKNOWLEDGE.

The SS sends the DISCONNECT y seconds after sending the FACILITY message. The test is repeated for several different sets of e-parameters as defined below.

## Maximum Duration of Test:

30 minutes.

## Expected Sequence:

The sequence step 1-20 is executed for execution counter k = 1,...,5.

| Step | Direction | Message              | Comments                                                                              |
|------|-----------|----------------------|---------------------------------------------------------------------------------------|
| 0    |           |                      | At start of test only, read and note value of ACM on SIM                              |
| 1    | SS        |                      | The SS is made to initiate a call                                                     |

| 4       | 1           | 1  | 1 | 0   | 0 | 0 | 1  | 89 or 90                           | 233 or 232              |
| 5       | 12,5        | 30 | 1 | 25  | 0 | 0 | 30 | 50 or 62,5                         | 296, 295,<br>282 or 283 |

Values shown in table are in the format and have units as in 3GPP TS 02.24 clause 3.

ii) FACILITY Information Element with Return Result component type as defined in 3GPP TS 04.80 subclause 3.6.1 table 3.4.

For ASN.1 description see default message contents in subclause 31.6.4.

### 31.6.3.3 AoCI volume related charging / MS originated call

Future addition at GSM Phase 2+ stage.

### 31.6.3.4 AoCI volume related charging / MS terminated call

Future addition at GSM Phase 2+ stage.

### 31.6.3.5 Change in charging information during a call

Purpose:

- 1) To verify that when the MS receives new AoCI parameters mid-way through a call in a Facility IE which is contained within a FACILITY message the MS returns a FACILITY message containing the acknowledgement within 1 s.
- 2) To verify that when the MS receives new charging information mid-way through a call in the form of a Facility IE contained within a FACILITY message the MS correctly indicates the total charge considering both sets of charging information.

Conformance Requirement(s):

- 1) When the MS receives new AoCI parameters mid-way through a call in a Facility IE which is contained within a FACILITY message the MS shall return a FACILITY message containing the acknowledgement within 1 s.
- 2) When the MS receives new charging information mid-way through a call in the form of a Facility IE contained within a FACILITY message the MS correctly indicates the total charge considering both sets of charging information.

Reference(s):

Conformance requirement 1: 3GPP TS 03.86, 3GPP TS 04.13, 3GPP TS 04.86.

Conformance requirement 2: 3GPP TS 02.24.

## Related PICS/PIXIT Statement(s):

- Support of AoCI.
- Supported rates (full rate/half rate).
- Supported teleservices.
- Support for active state of the call control protocol (U10).
- MMI method of reading the AoCI information

## Initial Conditions:

## System Simulator:

1 cell, default parameters, IMSI attach/detach disabled.

## Mobile Station:

The MS is in MM-state "idle, updated".

## Foreseen Final State of the MS:

The MS is in MM-state "idle, updated".

## Method of Test:

The MS is made to initiate a call. The call is established with certain AoCI e-parameters sent in a Facility IE in a FACILITY message sent after the CONNECT message. The MS shall return the AoCI acknowledgement within 1 s of the FACILITY message. x seconds after sending the original CAI, new (and different) e-parameters are sent to the MS in a Facility IE contained within a FACILITY message. The MS shall return the AoCI acknowledge within 1 s of the FACILITY message.

The SS sends the DISCONNECT y seconds after sending the first CAI in the FACILITY message.

## Maximum Duration of Test:

10 minutes.

Expected Sequence:

| Step | Direction | Message              | Comments                                                                                                                                                 |

| 18   | SS -> MS  | DISCONNECT           |                                                                                                                                                          |
| 19   | MS -> SS  | RELEASE              |                                                                                                                                                          |
| 20   | SS -> MS  | RELEASE COMPLETE     |                                                                                                                                                          |
| 21   | SS -> MS  | CHANNEL RELEASE      | The main signalling link is released.                                                                                                                    |
| 22   | MS        |                      | MS display is checked to determine whether the correct call charge has been indicated                                                                    |

NOTE The values of x and y are given below.

The correct value of the ACM is found from the general AoC formula given in 3GPP TS 02.24 clause 4 with CDUR = x, y seconds and e parameters as defined below.

Specific Message Contents:

- i) FACILITY Information Element with Invoke = ForwardChargeAdvice component type as defined in 3GPP TS 04.80 subclause 3.6.1 table 3.3.

For ASN.1 description see default message contents in subclause 31.6.4.

The values of the e-parameters within the parameter part of the Facility Information Element shall be set as defined below:

| k-value | e-parameter |    |   |    |   |   |    | CCM total at call end increased by | Step 0 ACM value |
|---------|-------------|----|---|----|---|---|----|------------------------------------|------------------|
|         | 1           | 2  | 3 | 4  | 5 | 6 | 7  |                                    |                  |
|         | 10          | 28 | 1 | 10 | 0 | 0 | 60 | (30)                               | (30)             |

Values shown in table are in the format and have units as in 3GPP TS 02.24 clause 3.

- ii) FACILITY Information Element with Return Result component type as defined in 3GPP TS 04.80 subclause 3.6.1 table 3.4.

For ASN.1 description see default message contents in subclause 31.6.4.

- iii) FACILITY Information Element with Invoke = ForwardChargeAdvice component type as defined in 3GPP TS 04.80 subclause 3.6.1 table 3.3.

For ASN.1 description see default message contents in subclause 31.6.4.

x is set to a constant value of 80 s.

y is set to a constant value of 180 s.

The values of the e-parameters within the parameter part of the Facility Information Element shall be set to:

|  | e-parameter |    |   |   |   |   |    | CCM total at call end increased by | Step 0 ACM value |
|--|-------------|----|---|---|---|---|----|------------------------------------|------------------|
|  | 1           | 2  | 3 | 4 | 5 | 6 | 7  |                                    |                  |
|  | 10          | 14 | 1 | 5 | 0 | 0 | 60 | 65                                 | 65               |

Values shown in table are in the format and have units as in 3GPP TS 02.24 clause 3.

### 31.6.3.6 Different formats of charging information

Purpose:

- 1) To verify that when the MS receives a Facility IE in which certain e-parameters are set to zero the total charge accumulated is the same as that when the same e-parameters are completely omitted from the Facility IE.
- 2) To verify the operation of a shortened channel release procedure where the SS does not send DISCONNECT but only the RELEASE COMPLETE and CHANNEL RELEASE messages or just the CHANNEL RELEASE message.

Conformance Requirement(s):

- 1) When the MS receives a Facility IE in which certain e-parameters are set to zero the total charge accumulated shall be the same as that when the same e-parameters are completely omitted from the Facility IE.
- 2) The channel shall be correctly released when a shortened channel release procedure is used - the SS does not send DISCONNECT but only the RELEASE COMPLETE and CHANNEL RELEASE messages or just the CHANNEL RELEASE message.

## Reference(s):

Conformance requirement 1: 3GPP TS 02.24.

Conformance requirement 2: 3GPP TS 04.08 / 3GPP TS 44.018.

## Related PICS/PIXIT Statement(s):

- Support of AoCI.
- Supported rates (full rate/half rate).
- Supported teleservices.
- Support for active state of the call control protocol (U10).
- MMI method of reading the AoCI information

## Initial Conditions:

## System Simulator:

1 cell, default parameters, IMSI attach/detach disabled.

## Mobile Station:

The MS is in MM-state "idle, updated".

## Foreseen Final State of the MS:

The MS is in MM-state "idle, updated".

## Method of Test:

## Part 1:

The MS is made to initiate a call. The call is established with certain AoCI e-parameters sent in a Facility IE in a FACILITY message sent before the CONNECT message.

The SS sends the DISCONNECT  $y$  seconds after sending the FACILITY message containing the e-parameters. The MS shall have stored the correct amount on the SIM according to the e-parameters sent.

## Part 2:

Part 1 is repeated twice with the e-parameters that were set to zero above now omitted completely from the Facility IE. The shortened release procedures are used. The MS shall have stored the correct amount on the SIM.

The results of parts 1 and 2 are compared. The value for the charge calculated by the MS shall be identical for parts 1 and 2.

## Maximum Duration of Test:

20 minutes.

Expected Sequence:

The sequence step 1-20 is executed for execution counter  $k = 1,..3$ .

| Step | Direction | Message              | Comments                                                                              |
|------|-----------|----------------------|---------------------------------------------------------------------------------------|
| 0    |           |                      | At start of test only, read and note value of ACM on SIM                              |
| 1    | MS        |                      | The MS is made to initiate a call                                                     |
| 2    | MS -> SS  | CHANNEL REQUEST      |                                                                                       |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT |                                                                                       |
| 4    | MS -> SS  | CM SERVICE REQUEST   |                                                                                       |
| 5    | SS -> MS  | CM SERVICE ACCEPT    |                                                                                       |
| 6    | MS -> SS  | SETUP                |                                                                                       |
| 7    | SS -> MS  | CALL PROCEEDING      |                                                                                       |
| 8    | SS -> MS  | ASSIGNMENT COMMAND   | to a supported channel type                                                           |
| 9    | MS -> SS  | ASSIGNMENT COMPLETE  |                                                                                       |
| 10   | SS -> MS  | ALERTING             |                                                                                       |
| 11   | SS -> MS  | FACILITY             | As default message except contains Facility IE with contents as indicated in i below  |
|      |           |                      | Either A, B or C branch is taken                                                      |
| A12  | SS -> MS  | CONNECT              |                                                                                       |
| A13  | MS -> SS  | CONNECT ACKNOWLEDGE  |                                                                                       |
| A14  | MS -> SS  | FACILITY             | As default message except contains Facility IE with contents as indicated in ii below |
| B12  | SS -> MS  | CONNECT              |                                                                                       |
| B13  | MS -> SS  | FACILITY             | As default message except contains Facility IE with contents as indicated in ii below |
| B14  | MS -> SS  | CONNECT ACKNOWLEDGE  |                                                                                       |
| C12  | MS -> SS  | FACILITY             | As default message except contains Facility IE with contents as indicated in ii below |
| C13  | SS -> MS  | CONNECT              |                                                                                       |
| C14  | MS -> SS  | CONNECT ACKNOWLEDGE  |                                                                                       |
| 15   |           |                      | call duration y seconds after CAI information sent by SS                              |
|      |           |                      | Branch D, E and F shall be taken for $k= 1,2$ and 3 respectively                      |
| D16  | SS -> MS  | DISCONNECT           |                                                                                       |
| D17  | MS -> SS  | RELEASE              |                                                                                       |
| D18  | SS -> MS  | RELEASE COMPLETE     |                                                                                       |
| D19  | SS -> MS  | CHANNEL RELEASE      | The main signalling link is released.                                                 |
| E16  | SS -> MS  | RELEASE COMPLETE     | Shortened channel release procedure                                                   |
| E17  | SS -> MS  | CHANNEL RELEASE      | The main signalling link is released.                                                 |
| F16  | SS -> MS  | CHANNEL RELEASE      |                                                                                       |
| 20   | MS        |                      | MS display is checked to determine whether the correct call charge has been indicated |

NOTE The value of y is given below.

The correct value of the ACM is found from the general AoC formula given in 3GPP TS 02.24 clause 4 with  $CDUR = y$  seconds and e parameters as defined below.

Specific Message Contents:

i) FACILITY Information Element with Invoke = ForwardChargeAdvice component type as defined in 3GPP TS 04.80 subclause 3.6.1 table 3.3.

For ASN.1 description see default message contents in subclause 31.6.4.

y is set to a constant value of 90 s.

The values of the e-parameters within the parameter part of the Facility Information Element shall be set to:

| k-value | e-parameter |    |   |                   |   |   |   | CCM total at call end increased by | Step 0 ACM value |
|---------|-------------|----|---|-------------------|---|---|---|------------------------------------|------------------|
|         | 1           | 2  | 3 | 4                 | 5 | 6 | 7 |                                    |                  |
| 1       | 10          | 40 | 1 | 0                 | 0 | 0 | 0 | 20                                 | 20               |
| 2       | 10          | 40 | 1 | -----omitted----- |   |   |   | 20                                 | 40               |
| 3       | 10          | 40 | 1 | -----omitted----- |   |   |   | 20                                 | 60               |

Values shown in table are in the format and have units as in 3GPP TS 02.24 clause 3.

ii) FACILITY Information Element with Return Result component type as defined in 3GPP TS 04.80 subclause 3.6.1 table 3.4.

For ASN.1 description see default message contents in subclause 31.6.4.

### 31.6.3.7 AoCI on a Call Hold call

Purpose:

- 1) To verify that when the MS invokes a Call Hold call and hence receives Facility IEs containing AoCI e-parameters for each chargeable call the MS returns a FACILITY message containing the AoCI acknowledgement within 1 s of transmission of each set of e-parameters.

Conformance Requirement(s):

- 1) When the MS invokes a Call Hold call and hence receives Facility IEs containing AoCI e-parameters for each chargeable call the MS shall return a FACILITY message containing the AoCI acknowledgement within 1 s of receiving each set of e-parameters.

Reference(s):

Conformance requirement 1: 3GPP TS 04.13.

Conformance requirement 2: 3GPP TS 02.24, 3GPP TS 04.83, 3GPP TS 04.84, 3GPP TS 04.86.

Related PICS/PIXIT Statement(s):

- Support of AoCI.
- Supported rates (full rate/half rate).
- Supported teleservices.
- Support for active state of the call control protocol (U10).
- MMI method of reading the AoCI information.

Initial Conditions:

System Simulator:

1 cell, default parameters, IMSI attach/detach disabled.

Mobile Station:

The MS is in MM-state "idle, updated".

Foreseen Final State of the MS:

The MS is in MM-state "idle, updated".

**Method of Test:**

The MS is made to initiate a call. The call is established with certain AoCI e-parameters sent in a Facility IE in the CONNECT message. The MS shall return the AoCI acknowledgement within 1 s of transmission of the CONNECT message.

The call (call B) is then put on hold by sending a HOLD message from the MS to the SS. The SS shall reply with a HOLD ACKNOWLEDGE. The traffic channel is now available to originate another call.

The MS is made to initiate a second call (call C). The call is established with certain AoCI e-parameters sent in a Facility IE in the CONNECT message. The MS shall return the AoCI acknowledgement in a FACILITY message within 1 s of transmission of the CONNECT message.

The SS sends the DISCONNECT to the MS for call B x seconds after sending the call B CAI in the CONNECT/FACILITY message and the DISCONNECT for call C y seconds after sending the call C CAI in the CONNECT/FACILITY message.

**Maximum Duration of Test:**

10 minutes.

Expected Sequence:

| Step | Direction | Message              | Comments                                                                                                                               |
|------|-----------|----------------------|----------------------------------------------------------------------------------------------------------------------------------------|

| I26  | SS -> MS  | DISCONNECT           | For call B                                                                                                                             |
| I27  | MS -> SS  | RELEASE              | x seconds after call B CAI sent                                                                                                        |
| I28  | SS -> MS  | RELEASE COMPLETE     |                                                                                                                                        |
| 29   | SS -> MS  | CHANNEL RELEASE      | The main signalling link is released                                                                                                   |
| 30   | MS        |                      | MS display is checked to determine whether the correct call charge has been indicated                                                  |

NOTE The value of x and y are given below.

The correct value of the ACM is found from the general AoC formula given in 3GPP TS 02.24 clause 4 with CDUR = x,y seconds and e parameters as defined below.

Specific Message Contents:

- i) FACILITY Information Element with Invoke = ForwardChargeAdvice component type as defined in 3GPP TS 04.80 subclause 3.6.1 table 3.3.

For ASN.1 description see default message contents in subclause 31.6.4.

x set to 180 s, y is set to 90 s.

The values of the e-parameters within the parameter part of the Facility Information Element shall be set to:

| Call             | e-parameter |    |   |   |   |   |   | CCM total at call end increased by | Step 0 ACM value |
|------------------|-------------|----|---|---|---|---|---|------------------------------------|------------------|
|                  | 1           | 2  | 3 | 4 | 5 | 6 | 7 |                                    |                  |
| <b>B(time x)</b> | 7           | 40 | 1 | 0 | 0 | 0 | 0 |                                    |                  |
| <b>C(time y)</b> | 13          | 40 | 1 | 0 | 0 | 0 | 0 | 54                                 | 54               |

Values shown in table are in the format and have units as in 3GPP TS 02.24 clause 3.

- ii) FACILITY Information Element with Return Result component type as defined in 3GPP TS 04.80 subclause 3.6.1 table 3.4.

For ASN.1 description see default message contents in subclause 31.6.4.

### 31.6.3.8 AoCI on a Multi-party call

Purpose:

- 1) To verify that when the MS invokes a Multi-party call and hence receives Facility IEs containing AoCI e-parameters for each chargeable call the MS returns a FACILITY message containing the AoCI acknowledgement within 1 s of transmission of each set of e-parameters.
- 2) To verify that when the MS originates a Multi-party call and hence receives Facility IEs containing CAI elements for each chargeable call the CCM records the sum of all the charges for the services currently being used and hence the ME inserts the correct charge in the ACM field of the SIM.

Conformance Requirement(s):

- 1) When the MS invokes a Multi-party call and hence receives Facility IEs containing AoCI e-parameters for each chargeable call the MS shall return a FACILITY message containing the AoCI acknowledgement within 1 s of receiving each set of e-parameters.
- 2) When the MS originates a Multi-party call and hence receives Facility IEs containing CAI elements for each chargeable call the CCM shall record the sum of all the charges for the services currently being used and hence the ME shall insert the correct charge in the ACM field of the SIM.

Reference(s):

Conformance requirement 1: 3GPP TS 04.13.

Conformance requirement 2: 3GPP TS 02.24, 3GPP TS 04.83, 3GPP TS 04.84, 3GPP TS 04.86.

**Related PICS/PIXIT Statement(s):**

- Support of AoCI.
- Supported rates (full rate/half rate).
- MMI method of reading the AoCI information
- Supported teleservices.
- Support for active state of the call control protocol (U10).

**Initial Conditions:****System Simulator:**

1 cell, default parameters, IMSI attach/detach disabled.

**Mobile Station:**

The MS is in MM-state "idle, updated".

**Foreseen Final State of the MS:**

The MS is in MM-state "idle, updated".

**Method of Test:**

The MS is made to initiate a call. The call is established with certain AoCI e-parameters sent in a Facility IE in the CONNECT message. The MS shall return the AoCI acknowledgement within 1 s of transmission of the CONNECT message.

The call (call B) is then put on hold by sending a HOLD message from the MS to the SS. The SS shall reply with a HOLD ACKNOWLEDGE. The traffic channel is now available to originate another call.

The MS is made to initiate a second call (call C). The call is established with certain AoCI e-parameters sent in a Facility IE in the CONNECT message. The MS shall return the AoCI acknowledgement within 1 s of transmission of the CONNECT message.

The MS invokes the multi-party service by sending a FACILITY message to the SS containing the BuildMPTY request.

The SS accepts the request and connects the MS with the other existing connections (active call C and held call B) and confirms with a FACILITY message.

The SS sends the DISCONNECT to the MS for call B x seconds after sending the call B CAI in the CONNECT message and the DISCONNECT for call C y seconds after sending the call C CAI in the CONNECT message. The MS shall have stored the correct amount on the SIM according to the two sets of e-parameters sent and call times x and y.

**Maximum Duration of Test:**

10 minutes.

Expected Sequence:

| Step | Direction | Message               | Comments                                                                                                                                                             |
|------|-----------|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0    |           |                       | At start of test only, read and note value of ACM on SIM                                                                                                             |
| 1    | MS        |                       | The MS is made to initiate a call                                                                                                                                    |
| 2    | MS -> SS  | CHANNEL REQUEST       |                                                                                                                                                                      |

| I30  | SS -> MS  | RELEASE COMPLETE      |                                                                                                                                                                      |
| 31   | SS -> MS  | CHANNEL RELEASE       | The main signalling link is released.                                                                                                                                |
| 32   | MS        |                       | MS display is checked to determine whether the correct call charge has been indicated                                                                                |

NOTE: A-B/A-C indicates a choice. the transaction identifier (TI) used must be that of the active call or the held call (ref. 3GPP TS 04.84).

The values of x and y are given below.

The correct value of the ACM is found from the general AoC formula given in 3GPP TS 02.24 clause 4 with CDUR = x,y seconds and e parameters as defined below.

Specific Message Contents:

i) FACILITY Information Element with Invoke = ForwardChargeAdvice component type as defined in 3GPP TS 04.80 subclause 3.6.1 table 3.3.

For ASN.1 description see default message contents in subclause 31.6.4.

x set to 180 s, y set to 90 s.

The values of the e-parameters within the parameter part of the Facility Information Element shall be set to:

| Call             | e-parameter |    |   |   |   |   |   | CCM total at call end increased by | Step 0 ACM value |
|------------------|-------------|----|---|---|---|---|---|------------------------------------|------------------|
|                  | 1           | 2  | 3 | 4 | 5 | 6 | 7 |                                    |                  |
| <b>B(time x)</b> | 19          | 40 | 1 | 0 | 0 | 0 | 0 |                                    |                  |
| <b>C(time y)</b> | 29          | 40 | 1 | 0 | 0 | 0 | 0 | 134                                | 134              |

Values shown in table are in the format and have units as in 3GPP TS 02.24 clause 3.

ii) FACILITY Information Element with Return Result component type as defined in 3GPP TS 04.80 subclause 3.6.1 table 3.4.

For ASN.1 description see default message contents in subclause 31.6.4.

iii) FACILITY Information Element with Invoke = BuildMPTY component type as defined in 3GPP TS 04.80 subclause 3.6.1 table 3.4.

The following abbreviations are used in the descriptions below:

- U Universal tag class.
- CS Context Specific tag class.
- P Primitive tag form.
- C Constructed tag form.
- FIE Facility Information Element.

### 31.6.4 Default contents of messages

As default message contents in 3GPP TS 11.10 subclause 26.8. These messages shall not contain SS version IEs.

Where indicated in specific tests CONNECT and FACILITY messages have Facility Information Elements as defined below.

#### Default contents of ForwardChargeAdvice Facility Information Elements

The following abbreviations are used in the descriptions below:

- U Universal tag class.
- CS Context Specific tag class.
- P Primitive tag form.
- C Constructed tag form.
- FIE Facility Information Element.

- i) FACILITY Information Element with Invoke = ForwardChargeAdvice component type as defined in 3GPP TS 04.80 subclause 3.6.1 table 3.3.

| Contents                  | Value/remark                       | Coding                                 |

## 31.7 Additional information transfer supplementary services

(Reserved).

## 31.8 Call restriction supplementary services

The following abbreviations are used:

|           |                                                                                        |
|-----------|----------------------------------------------------------------------------------------|
| BO:       | Barring of Outgoing calls.                                                             |
| BAOC:     | Barring of All Outgoing Calls.                                                         |
| BOIC:     | Barring of Outgoing International Calls.                                               |
| BOICExHC: | Barring of Outgoing International Call EXcept those directed to the Home PLMN country. |
| BI:       | Barring of Incoming calls.                                                             |
| BAIC:     | Barring of All Incoming calls.                                                         |
| BICRoam:  | Barring of Incoming when Roaming outside the home PLMN country.                        |
| B:        | Barring (common name for BAOC, BOIC, BOICExHC, BAIC and BICRoam).                      |

These abbreviations are also used to represent the corresponding SS-Code; e.g. B is the SS-Code for all barring services.

NOTE: The password(s) to be used during tests of this subclause 31.8 may be randomly chosen - unless otherwise stated - in accordance with 3GPP TS 02.04 subclause 5.2.

### 31.8.1 Registration of a password

#### 31.8.1.1 Registration accepted

##### 31.8.1.1.1 Conformance requirements

- 1) For registration of a password for all barring services, the MS shall transmit successively:
  - 1.1) a CHANNEL REQUEST with establishment cause set to "other services requested by the mobile user";
  - 1.2) a CM SERVICE REQUEST with CM service type indicating "supplementary service activation";
  - 1.3) and then the REGISTER message containing a facility IE that includes an invoke of the RegisterPassword operation with parameter values according to the user's request (MMI action).
- 2) When the mobile subscriber wants to register a new password, the old password, the new password and the repeat of the new password shall be entered into the MS. Then the MS sends to the network an invoke component of the operation "register password".
- 3) The MS shall be able to send a password by sending a FACILITY message in accordance to the user request (MMI actions).
- 4) Upon receipt of the result of the procedure, contained in RELEASE COMPLETE or FACILITY message, the MS shall provide the appropriate user indication (which is to be described by the manufacturer).

#### References

- 1.1) 3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.3.1.1.2 and 9.1.9.
- 1.2) 3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.5.1.1, 9.2.9 and 10.5.33.
- 1.3) 3GPP TS 04.88, 3GPP TS 04.80 subclauses 2.3 and 3.6.
- 2) 3GPP TS 04.10 subclause 4.2.
- 3) 3GPP TS 04.80.
- 4) 3GPP TS 02.30.

### 31.8.1.1.2 Test purpose

- 1) To check that the MS correctly requests a supplementary service transaction for registration of a password for all barring services in CHANNEL REQUEST message.
- 2) To check that the MS correctly requests a supplementary service transaction for registration of a password for all barring services in the subsequent CM SERVICE REQUEST.
- 3) To check that the MS sends a REGISTER message containing the invoke of the RegisterPassword operation with the expected parameter values for registration of a password for all barring services.
- 4) To check that when the mobile subscriber wants to register a new password, the old password, the new password and the repeat of the new password shall be entered into the MS before the MS sends to the network a CHANNEL REQUEST.
- 5) To check that the MS is able to send a password by sending a FACILITY message in accordance to the user request (MMI actions).
- 6) To check that upon receipt of the result of the procedure, contained in RELEASE COMPLETE or FACILITY message, the MS provides the appropriate user indication (as described by the manufacturer).

These checks are done for:

- All barring services, the result of the operation being sent in a RELEASE COMPLETE message.

### 31.8.1.1.3 Method of test

#### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is "idle updated".

#### Related PICS/PIXIT statement(s)

Description of the user's commands and of display of the answers from the network for call barring.

#### Foreseen final state of the MS

The MS is "idle updated".

#### Test procedure

By means of appropriate MMI functions (using either 3GPP TS 02.30 or manufacturer defined MMI), the user requests registration of a new password for all barring services by entering the old password, new password and a repeat of the old password.

Upon receipt of the operation (in a REGISTER message), the system simulator answers with the FACILITY message with the Facility information element containing an invoke of the GetPassword operation requiring the old password.

Upon receipt of the FACILITY message, the system simulator answers with the FACILITY message with the Facility information element containing an invoke of the GetPassword operation requiring a new password.

Upon receipt of the FACILITY message, the system simulator answers with the FACILITY message with the Facility information element containing an invoke of the GetPassword operation requiring again the new password.

Upon receipt of the FACILITY message, the system simulator answers with the RELEASE COMPLETE message with the Facility information element containing the return result of the RegisterPassword operation.

Maximum duration of test

3 minutes.

Expected sequence

| Step | Direction | Message              | Comments                                                                                                                                                                                                                                                                                                  |

Specific message content

step 6 -

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:  
invoke = RegisterPassword:

Supplementary service code = B.

steps 7, 9, and 11 -

- protocol discriminator: non call related SS message.
- message type: FACILITY.
- facility:  
invoke = GetPassword:

Guidance info: Password (step 7), new password (step 9), new password again (step 11).

The linked ID must be the same as the invoke ID in the invoke of the RegisterPassword operation.

## 31.8.1.2 Registration rejected

### 31.8.1.2.1 Rejection after invoke of the RegisterPassword operation

#### 31.8.1.2.1.1 Conformance requirements

- 1) A transaction of any kind being already established, for registration of a password for all call restriction services, the MS shall establish a parallel MM transaction, sending a CM SERVICE REQUEST with CM service type indicating "supplementary service activation",
- 2) Then the MS shall send a REGISTER message related to the present SS transaction containing a facility IE that includes an invoke of the RegisterPassword operation with parameter values according to the user's request (MMI action).
- 3) Upon receipt of the RELEASE COMPLETE message related to the present SS transaction, the SS transaction shall be released but the first transaction shall remain unaffected.
- 4) Upon receipt of the RELEASE COMPLETE message, the MS shall provide the appropriate user indication (which is to be described by the Manufacturer).

3GPP TS 04.80 subclauses 2.3 and 3.6.
- 4) 3GPP TS 02.30 subclause 4.5.

#### 31.8.1.2.1.2 Test purpose

- 1) To check that, when a call transaction is already established, the MS correctly requests the establishment of a parallel MM transaction for supplementary service transaction of registration of a password for all call restriction services, sending a CM SERVICE REQUEST.
- 2) To check that the MS sends a REGISTER message containing the invoke of the RegisterPassword operation with the expected parameter values for registration of a password for all call restriction services.
- 3) To check that upon receipt of the RELEASE COMPLETE message related to the present SS transaction, the first transaction remains unaffected.
- 4) To check that upon receipt of the RELEASE COMPLETE message, the MS provides the appropriate user indication (as described by the Manufacturer).

Those checks are performed with a call transaction already established for:

- all call restriction services, the RELEASE COMPLETE message being sent at the beginning of the procedure with a facility IE containing a return\_error(error) where error is "SS subscription violation".

#### 31.8.1.2.1.3 Method of test

##### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in CC state U10.

## Related PICS/PIXIT statement(s)

Description of the user's commands and of display of the answers from the network for call barring.

## Foreseen final state of the MS

The MS is in CC state U10.

## Test procedure

By means of appropriate MMI functions (using either 3GPP TS 02.30 or manufacturer defined MMI), the user requests registration of a new password for all call restriction services by entering the old password, the new password and a repeat of the new password.

Upon receipt of the operation (in a REGISTER message), the system simulator answers with the RELEASE COMPLETE (PD and TI of the SS transaction) message with the Facility information element containing a Return\_error(error: SS subscription violation) of the RegisterPassword operation.

Upon receipt of the FACILITY message, the system simulator sends STATUS ENQUIRY, the MS responds with STATUS message indicating CC state U10.

## Maximum duration of test

2 minutes.

## Expected sequence

| Step | Direction | Message            | Comments                                                                                                                                                                        |

| 8    | MS -> SS  | STATUS             | CC staTE U10                                                                                                                                                                    |

## Specific message content

step 4 -

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = RegisterPassword:

Supplementary service code = all call restrictions.

step 5 -

- protocol discriminator: non call related SS message.
- transaction identifier: same TI as previous REGISTER message.
- message type: RELEASE COMPLETE.
- facility:

return error code: SS subscription violation.

For the return error the invoke ID must be the same as in the invoke of the RegisterPassword operation.

### 31.8.1.2.2 Rejection after password check with negative result

#### 31.8.1.2.2.1 Conformance requirements

- 1) A transaction of any kind being already established, for registration of a password for all call restriction services, the MS shall establish a parallel MM transaction, sending a CM SERVICE REQUEST with CM service type indicating "supplementary service activation".
- 2) Then the MS shall send a REGISTER message related to the present SS transaction containing a facility IE that includes an invoke of the RegisterPassword operation with parameter values according to the user's request (MMI action).
- 3) Upon receipt of the RELEASE COMPLETE message related to the present SS transaction, the SS transaction shall be released but the first transaction shall remain unaffected.
- 4) Upon receipt of the RELEASE COMPLETE message, the MS shall provide the appropriate user indication (which is to be described by the Manufacturer).

3GPP TS 03.11 clause 3.
- 4) 3GPP TS 02.30 subclause 4.5.

#### 31.8.1.2.2.2 Test purpose

- 1) To check that, when a call transaction is already established, the MS correctly requests the establishment of a parallel MM transaction for supplementary service transaction of registration of a password for all call restriction services, sending a CM SERVICE REQUEST.
- 2) To check that the MS sends a REGISTER message containing the invoke of the RegisterPassword operation with the expected parameter values for registration of a password for all call restriction services.
- 3) To check that upon receipt of the RELEASE COMPLETE message related to the present SS transaction, the first transaction remains unaffected.
- 4) To check that upon receipt of the RELEASE COMPLETE message, the MS provides the appropriate user indication (as described by the Manufacturer).

Those checks are performed with a call transaction already established for:

- all call restriction services, the RELEASE COMPLETE message being sent at the end of the procedure with a facility IE containing a return\_error(error) where error is "NegativePasswordCheck".

## 31.8.1.2.2.3 Method of test

## Initial conditions

## System Simulator:

1 cell, default parameters.

WPA > 3.

## Mobile Station:

The MS is in CC state U10.

## Related PICS/PIXIT statements

Description of the user's commands and of display of the answers from the network for call barring.

## Foreseen final state of the MS

The MS is in CC state U10.

## Test procedure

By means of appropriate MMI functions (using either 3GPP TS 02.30 or manufacturer defined MMI), the user requests registration of a new password for all call restriction services. By means of appropriate MMI functions the user enters the old and new passwords.

Upon receipt of the REGISTER message, the system simulator answers with the FACILITY message with the Facility information element containing an invoke of the GetPassword operation requiring the old password.

Upon receipt of the FACILITY message, the system simulator answers with the RELEASE COMPLETE message (PD and TI of the SS transaction) with the Facility information element containing a Return\_error(error: NegativePasswordCheck) of the RegisterPassword operation.

The system simulator sends STATUS ENQUIRY, the MS responds with STATUS message indicating CC state U10.

## Maximum duration of test

5 minutes.

## Expected sequence

## Specific message content

step 4 -

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = RegisterPassword:

Supplementary service code = B.

step 6 -

- protocol discriminator: non call related SS message.
- transaction identifier: same TI as previous REGISTER message.
- message type: RELEASE COMPLETE.
- facility:

error code: NegativePasswordCheck.

For the reject the invoke ID must be the same as in the invoke of the Registerpassword operation.

step 5 -

- protocol discriminator: non call related SS message.
- transaction identifier: in FACILITY same as previous REGISTER message.
- message type: FACILITY.
- facility:

invoke = GetPassword:

Guidance info: Password (step 1).

### 31.8.1.2.3 Rejection after new password mismatch

#### 31.8.1.2.3.1 Conformance requirements

- 1) A transaction of any kind being already established, for registration of a password for all call restriction services, the MS shall establish a parallel MM transaction, sending a CM SERVICE REQUEST with CM service type indicating "supplementary service activation".
- 2) Then the MS shall send a REGISTER message related to the present SS transaction containing a facility IE that includes an invoke of the RegisterPassword operation with parameter values according to the user's request (MMI action).
- 3) Upon receipt of the RELEASE COMPLETE message related to the present SS transaction, the SS transaction shall be released but the first transaction shall remain unaffected.
- 4) Upon receipt of the RELEASE COMPLETE message, the MS shall provide the appropriate user indication (which is to be described by the Manufacturer).

## References

- 2) 3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.5.1.1, 9.2.9 and 10.5.33.
- 3) 3GPP TS 04.88,  
3GPP TS 04.80 subclauses 2.3 and 3.6.
- 4) 3GPP TS 02.30 subclause 4.5.
- 5) 3GPP TS 04.10 subclause 4.2.

### 31.8.1.2.3.2 Test purpose

- 1) To check that, when a call transaction is already established, the MS correctly requests the establishment of a parallel MM transaction for supplementary service transaction of registration of a password for all call restriction services, sending a CM SERVICE REQUEST.
- 2) To check that the MS sends a REGISTER message containing the invoke of the RegisterPassword operation with the expected parameter values for registration of a password for all call restriction services.
- 3) To check that upon receipt of the RELEASE COMPLETE message related to the present SS transaction, the first transaction remains unaffected.
- 4) To check that upon receipt of the RELEASE COMPLETE message, the MS provides the appropriate user indication (as described by the Manufacturer).

Those checks are performed with a call transaction already established for:

- all call restriction services, the RELEASE COMPLETE message being sent at the end of the procedure with a facility IE containing a return\_error(error) where error is "PasswordRegistrationFailure" with diagnostic "new password mismatch".

### 31.8.1.2.3.3 Method of test

#### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in CC state U10.

#### Related PICS/PIXIT statements

Description of the user's commands and of display of the answers from the network for call barring.

#### Foreseen final state of the MS

The MS is in CC state U10.

#### Test procedure

By means of appropriate MMI functions (using either 3GPP TS 02.30 or manufacturer defined MMI), the user requests registration of a new password for all call restriction services by entering the old password, the new password and a repeat of the new password.

Upon receipt of the REGISTER message, the system simulator answers with the FACILITY message with the Facility information element containing an invoke of the GetPassword operation requiring the old password.

Upon receipt of the FACILITY message, the system simulator answers with the FACILITY message with the Facility information element containing an invoke of the GetPassword operation requiring the new password.

Upon receipt of the FACILITY message, the system simulator answers with the FACILITY message with the Facility information element containing an invoke of the GetPassword operation requiring again the new password.

Upon receipt of the FACILITY message, the system simulator answers with the RELEASE COMPLETE message (PD and TI of the SS transaction) with the Facility information element containing a Return\_error(error: PasswordRegistrationFailure, parameter: NewPasswordMismatch) of the RegisterPassword operation.

The system simulator sends STATUS ENQUIRY, the MS responds with STATUS message indicating CC state U10.

#### Maximum duration of test

3 minutes.

#### Expected sequence

| Step | Direction | Message            | Comments                                                                                                                                                                                                                                                                                                                                |

| 14   | MS -> SS  | STATUS             |                                                                                                                                                                                                                                                                                                                                         |

#### Specific message content

step 4 -

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = RegisterPassword:

Supplementary service code = B.

step 11 -

- protocol discriminator: non call related SS message.
- transaction identifier: same TI as previous REGISTER message.
- message type: RELEASE COMPLETE.
- facility:
  - error code: PasswordRegistrationFailure.
  - parameter: NewPasswordMismatch.

For the reject the invoke ID must be the same as in the invoke of the Registerpassword operation.

steps 5, 7, and 8 -

- protocol discriminator: non call related SS message.
- transaction identifier: in FACILITY same as previous REGISTER message.
- message type: FACILITY.
- facility:
  - invoke = GetPassword:
    - Supplementary service code = B.
    - Guidance info: Password (step 5), new password (step 7), new password again (step 8).

## 31.8.2 Erasure

Not applicable.

## 31.8.3 Activation

### 31.8.3.1 Activation accepted

#### 31.8.3.1.1 Conformance requirements

- 1) For activation of any specific call restriction service with any parameters, the MS shall transmit successively
  - 1.1) a CHANNEL REQUEST with establishment cause set to "other services requested by the mobile user";
  - 1.2) a CM SERVICE REQUEST with CM service type indicating "supplementary service activation";
  - 1.3) and then the REGISTER message containing a facility IE that includes an invoke of the ActivateSS operation with parameter values according to the user's request (MMI action).
- 2) Upon receipt of FACILITY message requiring the password, the MS shall be able to send a password by sending a FACILITY message.
- 3) Upon receipt of the RELEASE COMPLETE message, the MS shall provide the appropriate user indication (which is to be described by the manufacturer).

#### References

- 1) 3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.3.1.1.2 and 9.2.9.
- 2) 3GPP TS 04.88,  
3GPP TS 04.80 subclauses 2.3 and 3.6.
- 3) 3GPP TS 02.30 subclause 4.5.

### 31.8.3.1.2 Test purpose

- 1) To check that the MS correctly requests a supplementary service transaction for activation of a specific call restriction service in CHANNEL REQUEST message.
- 2) To check that the MS correctly requests a supplementary service transaction for activation of call restriction service in the subsequent CM SERVICE REQUEST.
- 3) To check that the MS sends a REGISTER message containing the invoke of the ActivateSS operation with the expected parameter values for activation of a specific call restriction service.
- 4) To check that upon receipt of FACILITY message requiring the password, the MS is able to send a password by sending a FACILITY.
- 5) To check that upon receipt of the RELEASE COMPLETE message, the MS provides the appropriate user indication (which is to be described by the manufacturer).

These checks are done for:

- a) BAOC, for basic service group "all synchronous services".
- b) BICRoam, for all basic service groups.

### 31.8.3.1.3 Method of test

#### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is "idle updated".

#### Related PICS/PIXIT statements

Description of the user's commands and of display of the answers from the network for call barring.

#### Foreseen final state of the MS

The MS is "idle updated".

#### Test procedure

By means of appropriate MMI functions (using either 3GPP TS 02.30 or manufacturer defined MMI), the user requests activation of BAOC, for basic service group "all synchronous services".

Upon receipt of the operation (in a REGISTER message), the system simulator answers with the FACILITY message with the Facility information element containing an invoke of the GetPassword operation requiring the current password.

If the manufacturer defined MMI has been used to request the activation of BAOC, then the MS may, by means of appropriate manufacturer defined MMI functions, prompt the user to give a password, depending on the implementation of the manufacturer defined MMI functions.

Upon receipt of the FACILITY message, the system simulator answers with a RELEASE COMPLETE message with the Facility information element containing the Return\_result of the ActivateSS operation.

The SS transaction and the dedicated channel are released.

Then again, by means of appropriate MMI functions, the user requests activation of BICRoam, for all basic service groups.

Upon receipt of the operation (in a REGISTER message), the system simulator answers with the FACILITY message with the Facility information element containing an invoke of the GetPassword operation requiring the current password.

If the manufacturer defined MMI has been used to request the activation of BICRoam, then the MS may, by means of appropriate manufacturer defined MMI functions, prompt the user to give a password, depending on the implementation of the manufacturer defined MMI functions.

Upon receipt of the FACILITY message, the system simulator answers with a RELEASE COMPLETE message with the Facility information element containing the Return\_result of the ActivateSS operation.

The dedicated channel is released.

Maximum duration of test

3 minutes.

Expected sequence

Specific message contents

step 6 - BAOC

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = Activation:

Supplementary service code = BAOC.

Basic service code: Bearer Service (all synchronous services), no teleservice present.

step 17 - BICRoam

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = Activation:

Supplementary service code = BICRoam.

Basic service code: no bearer service present, no teleservice present.

steps 7, 18 -

- protocol discriminator: non call related SS message.
- transaction identifier: in FACILITY same as previous REGISTER message.
- message type: FACILITY.
- facility:

invoke = GetPassword:

Guidance info: Password.

### 31.8.3.2 Activation rejected

#### 31.8.3.2.1 Rejection after invoke of ActivateSS operation

##### 31.8.3.2.1.1 Conformance requirements

- 1) A transaction of any kind being already established, for activation of one specific barring services, the MS shall establish a parallel MM transaction, sending a CM SERVICE REQUEST with CM service type indicating "supplementary service activation".
- 2) Then the MS shall send a REGISTER message related to the present SS transaction containing a facility IE that includes an invoke of the ActivateSS operation with parameter values according to the user's request (MMI action).
- 3) Upon receipt of the RELEASE COMPLETE message related to the present SS transaction, the SS transaction shall be released but the first transaction shall remain unaffected.
- 4) Upon receipt of the RELEASE COMPLETE message, the MS shall provide the appropriate user indication (which is to be described by the Manufacturer).

#### References

- 1) 3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.3.1.1.2 and 9.1.9.
- 2) 3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.5.1.1, 9.2.9 and 10.5.33.
- 3) 3GPP TS 04.88,  
3GPP TS 04.80 subclauses 2.3 and 3.6.
- 4) 3GPP TS 02.30 subclause 4.5.

##### 31.8.3.2.1.2 Test purpose

- 1) To check that, when a call transaction is already established, the MS correctly requests the establishment of a parallel MM transaction for supplementary service transaction of specific call barring service, sending a CM SERVICE REQUEST.

- 2) To check that the MS sends a REGISTER message containing the invoke of the ActivateSS operation with the expected parameter values for specific call barring service.
- 3) To check that upon receipt of the RELEASE COMPLETE message related to the present SS transaction, the first transaction remains unaffected.
- 4) To check that upon receipt of the RELEASE COMPLETE message, the MS provides the appropriate user indication (as described by the Manufacturer).

Those checks are performed with a call transaction already established for:

- BOIC, the RELEASE COMPLETE message being sent at the beginning of the procedure with a facility IE containing a return\_error(error) where error is "SS subscription violation".

### 31.8.3.2.1.3 Method of test

#### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in CC state U10.

#### Related PICS/PIXIT statements

Description of the user's commands and of display of the answers from the network for call barring.

#### Foreseen final state of the MS

The MS is in CC state U10.

#### Test procedure

By means of appropriate MMI functions (using either 3GPP TS 02.30 or manufacturer defined MMI), the user requests activation of BOIC.

Upon receipt of the operation (in a REGISTER message), the system simulator answers with the RELEASE COMPLETE (PD and TI of the SS transaction) message with the Facility information element containing a Return\_error(error: SS subscription violation) of the ActivateSS operation.

The system simulator then sends STATUS ENQUIRY, and the MS responds with STATUS message indicating CC state U10.

#### Maximum duration of test

2 minutes.

#### Expected sequence

| Step | Direction | Message            | Comments                                                                                                          |
|------|-----------|--------------------|-------------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                    | The MS is made to initiate a registration of a new password for BOIC<br>cause: "supplementary service activation" |
| 2    | MS -> SS  | CM SERVICE REQUEST |                                                                                                                   |
| 3    | SS -> MS  | CM SERVICE ACCEPT  |                                                                                                                   |
| 4    | MS -> SS  | REGISTER           |                                                                                                                   |
| 5    | SS -> MS  | RELEASE COMPLETE   | RegisterPassword operation Return_error<br>provide correct MMI user indication                                    |
| 6    | MS        |                    |                                                                                                                   |
| 7    | SS -> MS  | STATUS ENQUIRY     |                                                                                                                   |
| 8    | MS -> SS  | STATUS             | CC state U10                                                                                                      |

## Specific message content

### step 4 -

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = ActivateSS:

Supplementary service code = BOIC.

### step 5 -

- protocol discriminator: non call related SS message.
- transaction identifier: same TI as previous REGISTER message.
- message type: RELEASE COMPLETE.
- facility:

return error code: SS subscription violation.

For the return error the invoke ID must be the same as in the invoke of the ActivateSS operation.

## 31.8.3.2.2 Rejection after use of password procedure

### 31.8.3.2.2.1 Conformance requirements

- 1) A transaction of any kind being already established, for activation of any specific call restriction services, the MS shall establish a parallel MM transaction, sending a CM SERVICE REQUEST with CM service type indicating "supplementary service activation".
- 2) Then the MS shall send a REGISTER message related to the present SS transaction containing a facility IE that includes an invoke of the ActivateSS operation with parameter values according to the user's request (MMI action).
- 3) Upon receipt of the RELEASE COMPLETE message related to the present SS transaction, the SS transaction shall be released but the first transaction shall remain unaffected.
- 4) Upon receipt of the RELEASE COMPLETE message, the MS shall provide the appropriate user indication (which is to be described by the Manufacturer).

## References

- 1) 3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.3.1.1.2 and 9.1.9.
- 2) 3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.5.1.1, 9.2.9 and 10.5.33.
- 3) 3GPP TS 04.88,  
3GPP TS 04.80 subclauses 2.3 and 3.6.
- 4) 3GPP TS 02.30 subclause 4.5.

### 31.8.3.2.2.2 Test purpose

- 1) To check that, when a call transaction is already established, the MS correctly requests the establishment of a parallel MM transaction for supplementary service transaction of activation of one specific call restriction service, sending a CM SERVICE REQUEST.
- 2) To check that the MS sends a REGISTER message containing the invoke of the ActivateSS operation with the expected parameter values for activation of one specific call restriction service.

- 3) To check that upon receipt of the RELEASE COMPLETE message related to the present SS transaction, the first transaction remains unaffected.
- 4) To check that upon receipt of the RELEASE COMPLETE message, the MS provides the appropriate user indication (as described by the Manufacturer).

Those checks are performed with a call transaction already established for:

- BAIC, the RELEASE COMPLETE message being sent at the end of the procedure with a facility IE containing a return\_error(error) where error is "NegativePasswordCheck".

#### 31.8.3.2.2.3 Method of test

##### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in CC state U10.

##### Related PICS/PIXIT statements

Description of the user's commands and of display of the answers from the network for call barring.

##### Foreseen final state of the MS

The MS is in CC state U10.

##### Test procedure

By means of appropriate MMI functions (using either 3GPP TS 02.30 or manufacturer defined MMI), the user requests activation of BAIC.

Upon receipt of the REGISTER message, the system simulator answers with the FACILITY message with the Facility information element containing an invoke of the GetPassword operation requiring the current password.

If the manufacturer defined MMI has been used to request the activation of BAIC, then the MS may, by means of appropriate manufacturer defined MMI functions, prompt the user to give a password, depending on the implementation of the manufacturer defined MMI functions.

Upon receipt of the FACILITY message, the system simulator sends RELEASE COMPLETE message (PD and TI of the SS transaction) with the Facility information element containing a Return\_error(error: NegativePasswordCheck) of the GetPassword operation.

The system simulator sends STATUS ENQUIRY, the MS responds with STATUS message indicating CC state U10.

##### Maximum duration of test

3 minutes.

## Expected sequence

| Step | Direction | Message            | Comments                                                                                                                                                 |

| 7    | SS -> MS  | RELEASE COMPLETE   |                                                                                                                                                          |
| 8    | MS        |                    |                                                                                                                                                          |
| 9    | SS -> MS  | STATUS ENQUIRY     | CC state U10                                                                                                                                             |
| 10   | MS -> SS  | STATUS             |                                                                                                                                                          |

## Specific message content

## step 4 - BAIC

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = Activation:

Supplementary service code = BAIC.

## step 5 - All Barring services

- protocol discriminator: non call related SS message.
- transaction identifier: in FACILITY same as previous REGISTER message.
- message type: FACILITY.
- facility:

invoke = GetPassword:

Guidance info: Password (step 5).

## step 8 -

- protocol discriminator: non call related SS message.
- transaction identifier: same TI as previous REGISTER message.
- message type: RELEASE COMPLETE.
- facility:

reject code: NegativePasswordCheck.

For the reject the invoke ID must be the same as in the invoke of the GetPassword operation.

## 31.8.4 Deactivation

### 31.8.4.1 Deactivation accepted

#### 31.8.4.1.1 Conformance requirements

- 1) For deactivation of any group of call restriction services with any parameters, the MS shall transmit successively
  - 1.1) a CHANNEL REQUEST with establishment cause set to "other services requested by the mobile user";
  - 1.2) a CM SERVICE REQUEST with CM service type indicating "supplementary service activation";
  - 1.3) and then the REGISTER message containing a facility IE that includes an invoke of the DeactivateSS operation with parameter values according to the user's request (MMI action).
- 2) Upon receipt of FACILITY message requiring the password, the MS shall be able to send a password by sending a FACILITY message.
- 3) Upon receipt of the RELEASE COMPLETE message, the MS shall provide the appropriate user indication (which is to be described by the manufacturer).

#### References

- 1) 3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.3.1.1.2 and 9.2.9.
- 2) 3GPP TS 04.88,  
3GPP TS 04.80 subclauses 2.3 and 3.6.
- 3) 3GPP TS 02.30 subclause 4.5.

#### 31.8.4.1.2 Test purpose

- 1) To check that the MS correctly requests a supplementary service transaction for deactivation of a group of call barring services in CHANNEL REQUEST message.
- 2) To check that the MS correctly requests a supplementary service transaction for deactivation of a group of call barring services in the subsequent CM SERVICE REQUEST.
- 3) To check that the MS sends a REGISTER message containing the invoke of the DeactivateSS operation with the expected parameter values for deactivation of a group of call restriction services.
- 4) To check that upon receipt of FACILITY message requiring the password, the MS is able to send a password by sending a FACILITY message.
- 5) To check that upon receipt of the RELEASE COMPLETE message, the MS provides the appropriate user indication (which is to be described by the manufacturer).

These checks are done for:

- a) all restrictions, for basic service group "speech".
- b) barring of outgoing calls, for all facsimile.

#### 31.8.4.1.3 Method of test

##### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is "idle updated".

### Related PICS/PIXIT statements

Description of the user's commands and of display of the answers from the network for call barring.

### Foreseen final state of the MS

The MS is "idle updated".

### Test procedure

By means of appropriate MMI functions (using either 3GPP TS 02.30 or manufacturer defined MMI), the user requests deactivation of all restrictions, for speech.

Upon receipt of the operation (in a REGISTER message), the system simulator answers with the FACILITY message with the Facility information element containing an invoke of the GetPassword operation requiring the current password.

If the manufacturer defined MMI has been used to request the deactivation of all restrictions for speech, then the MS may, by means of appropriate manufacturer defined MMI functions, prompt the user to give a password, depending on the implementation of the manufacturer defined MMI functions.

Upon receipt of the FACILITY message, the system simulator answers with the FACILITY message with the Facility information element containing the Return\_result of the DeactivateSS operation.

The SS transaction and the dedicated channel are released.

Then again, by means of appropriate MMI functions, the user requests deactivation of barring of outgoing calls, for all facsimile.

Upon receipt of the operation (in a REGISTER message), the system simulator answers with the FACILITY message with the Facility information element containing an invoke of the GetPassword operation requiring the current password.

If the manufacturer defined MMI has been used to request the deactivation of barring of outgoing calls for all facsimile, then the MS may, by means of appropriate manufacturer defined MMI functions, prompt the user to give a password, depending on the implementation of the manufacturer defined MMI functions.

Upon receipt of the FACILITY message, the system simulator answers with a RELEASE COMPLETE message with the Facility information element containing the Return\_result of the DeactivateSS operation.

The dedicated channel is released.

### Maximum duration of test

5 minutes.

## Expected sequence

| Step | Direction | Message              | Comments                                                                                                                                                                                                             |
|------|-----------|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                      | The MS is made to initiate a deactivation of all call restrictions(speech) with establishment cause "Other procedures which can be completed with an SDCCH"<br>cause: "supplementary service activation"             |
| 2    | MS -> SS  | CHANNEL REQUEST      |                                                                                                                                                                                                                      |

## Specific message contents

step 6 - all call restrictions:

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = Deactivation:

Supplementary service code = B.

Basic service code: no Bearer Service present, teleservice: speech.

step 16 - barring of outgoing calls,

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = Deactivation:

Basic service code: no bearer service present, teleservice: all facsimile.

steps 7, 17 -

- protocol discriminator: non call related SS message.
- transaction identifier: in FACILITY same as previous REGISTER message.
- message type: FACILITY.
- facility:

invoke = GetPassword:

Guidance info: Password.

## 31.8.4.2 Deactivation rejected

### 31.8.4.2.1 Rejection after invoke of DeactivateSS operation

#### 31.8.4.2.1.1 Conformance requirements

- 1) A transaction of any kind being already established, for deactivation of a group of call restriction services, the MS shall establish a parallel MM transaction, sending a CM SERVICE REQUEST with CM service type indicating "supplementary service activation".
- 2) Then the MS shall send a REGISTER message related to the present SS transaction containing a facility IE that includes an invoke of the DeactivateSS operation with parameter values according to the user's request (MMI action).
- 3) Upon receipt of the RELEASE COMPLETE message related to the present SS transaction, the SS transaction shall be released but the first transaction shall remain unaffected.
- 4) Upon receipt of the RELEASE COMPLETE message, the MS shall provide the appropriate user indication (which is to be described by the Manufacturer).

#### References

- 1) 3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.3.1.1.2 and 9.1.9.
- 2) 3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.5.1.1, 9.2.9 and 10.5.33.
- 3) 3GPP TS 04.88,  
3GPP TS 04.80 subclauses 2.3 and 3.6.
- 4) 3GPP TS 02.30 subclause 4.5.

#### 31.8.4.2.1.2 Test purpose

- 1) To check that, when a call transaction is already established, the MS correctly requests the establishment of a parallel MM transaction for supplementary service transaction of a group of call barring services, sending a CM SERVICE REQUEST.
- 2) To check that the MS sends a REGISTER message containing the invoke of the DeactivateSS operation with the expected parameter values for a group of call barring services.
- 3) To check that upon receipt of the RELEASE COMPLETE message related to the present SS transaction, the first transaction remains unaffected.
- 4) To check that upon receipt of the RELEASE COMPLETE message, the MS provides the appropriate user indication (as described by the Manufacturer).

These checks are performed with a call transaction already established for:

BOIC, the RELEASE COMPLETE message being sent at the beginning of the procedure with a facility IE containing a return\_error(error) where error is "SS subscription violation".

## 31.8.4.2.1.3 Method of test

## Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in CC state U10.

## Related PICS/PIXIT statements

Description of the user's commands and of display of the answers from the network for call barring.

## Foreseen final state of the MS

The MS is in CC state U10.

## Test procedure

By means of appropriate MMI functions (using either 3GPP TS 02.30 or manufacturer defined MMI), the user requests deactivation of incoming calls.

Upon receipt of the operation (in a REGISTER message), the system simulator answers with the RELEASE COMPLETE (PD and TI of the SS transaction) message with the Facility information element containing a Return\_error(error: SS subscription violation) of the DeactivateSS operation.

The system simulator then sends STATUS ENQUIRY, and the MS responds with STATUS message indicating CC state U10.

## Maximum duration of test

30 s.

## Expected sequence

| 4    | MS -> SS  | REGISTER           |                                                                                            |
| 5    | SS -> MS  | RELEASE COMPLETE   | DeactivateSS operation Return_error                                                        |
| 6    | MS        |                    | provide correct MMI user indication                                                        |
| 7    | SS -> MS  | STATUS ENQUIRY     |                                                                                            |
| 8    | MS -> SS  | STATUS             | CC state U10                                                                               |

## Specific message content

step 4 -

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = DeactivateSS:

Supplementary service code = bi.

step 5 -

- protocol discriminator: non call related SS message.
- transaction identifier: same TI as previous REGISTER message.
- message type: RELEASE COMPLETE.
- facility:

return error code: SS subscription violation.

For the return error the invoke ID must be the same as in the invoke of the DeactivateSS operation.

#### 31.8.4.2.2 Rejection after use of password procedure

##### 31.8.4.2.2.1 Conformance requirements

- 1) A transaction of any kind being already established, for deactivation of a group of call restriction services, the MS shall establish a parallel MM transaction, sending a CM SERVICE REQUEST with CM service type indicating "supplementary service activation".
- 2) Then the MS shall send a REGISTER message related to the present SS transaction containing a facility IE that includes an invoke of the DeactivateSS operation with parameter values according to the user's request (MMI action).
- 3) Upon receipt of the RELEASE COMPLETE message related to the present SS transaction, the SS transaction shall be released but the first transaction shall remain unaffected.
- 4) Upon receipt of the RELEASE COMPLETE message, the MS shall provide the appropriate user indication (which is to be described by the Manufacturer).

#### References

- 1) 3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.3.1.1.2 and 9.1.9.
- 2) 3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.5.1.1, 9.2.9 and 10.5.33.
- 3) 3GPP TS 04.88,  
3GPP TS 04.80 subclauses 2.3 and 3.6.
- 4) 3GPP TS 02.30 subclause 4.5.

##### 31.8.4.2.2.2 Test purpose

- 1) To check that, when a call transaction is already established, the MS correctly requests the establishment of a parallel MM transaction for supplementary service transaction of deactivation of a group of call restriction services, sending a CM SERVICE REQUEST.
- 2) To check that the MS sends a REGISTER message containing the invoke of the DeactivateSS operation with the expected parameter values for deactivation of a group of call restriction service.
- 3) To check that upon receipt of the RELEASE COMPLETE message related to the present SS transaction, the first transaction remains unaffected.
- 4) To check that upon receipt of the RELEASE COMPLETE message, the MS provides the appropriate user indication (as described by the Manufacturer).

Those checks are performed with a call transaction already established for:

BOICExHC, the RELEASE COMPLETE message being sent at the end of the procedure with a facility IE containing a return\_error(error) where error is "NegativePasswordCheck".

## 31.8.4.2.2.3 Method of test

## Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in CC state U10.

## Related PICS/PIXIT statements

Description of the user's commands and of display of the answers from the network for call barring.

## Foreseen final state of the MS

The MS is in CC state U10.

## Test procedure

By means of appropriate MMI functions (using either 3GPP TS 02.30 or manufacturer defined MMI), the user requests deactivation of a group of call restriction services.

Upon receipt of the REGISTER message, the system simulator answers with the FACILITY message with the Facility information element containing an invoke of the DeactivateSS operation requiring the current password.

If the manufacturer defined MMI has been used to request the deactivation of a group of call restriction services, then the MS may, by means of appropriate manufacturer defined MMI functions, prompt the user to give a password, depending on the implementation of the manufacturer defined MMI functions.

Upon receipt of the FACILITY message, the system simulator sends RELEASE COMPLETE message (PD and TI of the SS transaction) with the Facility information element containing a Return\_error(error: NegativePasswordCheck) of the GetPassword operation.

The system simulator sends STATUS ENQUIRY, the MS responds with STATUS message indicating CC state U10.

## Maximum duration of test

3 minutes.

## Expected sequence

## Specific message content

### step 4 -

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = DeactivateSS:

Supplementary service code = BOICExHC.

### step 7 -

- protocol discriminator: non call related SS message.
- transaction identifier: same TI as previous REGISTER message.
- message type: RELEASE COMPLETE.
- facility:

reject code: NegativePasswordCheck.

For the reject the invoke ID must be the same as in the invoke of the DeactivateSS operation.

### step 5 -

- protocol discriminator: non call related SS message.
- transaction identifier: in FACILITY same as previous REGISTER message.
- message type:FACILITY.
- facility:

invoke = GetPassword:

Guidance info: Password (step 5).

## 31.8.5 Invocation

Invocation is not applicable.

## 31.8.6 Interrogation

### 31.8.6.1 Interrogation accepted

#### 31.8.6.1.1 Conformance requirements

- 1) For interrogation of any specific call restriction service with any parameters, the MS shall transmit successively:
  - 1.1) a CHANNEL REQUEST with establishment cause set to "other services requested by the mobile user";
  - 1.2) a CM SERVICE REQUEST with CM service type indicating "supplementary service activation";
  - 1.3) and then the REGISTER message containing a facility IE that includes an invoke of the InterrogateSS operation with parameter values according to the user's request (MMI action).
- 2) Upon receipt of the RELEASE COMPLETE message, the MS shall provide the appropriate user indication (which is to be described by the manufacturer).

## References

- 1) 3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.3.1.1.2 and 9.1.9.
- 2) 3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.5.1.1, 9.2.9 and 10.5.33.
- 3) 3GPP TS 04.88,  
3GPP TS 04.80 subclauses 2.3 and 3.6.
- 4) 3GPP TS 02.30 subclause 4.5.

### 31.8.6.1.2 Test purpose

- 1) To check that the MS correctly requests a supplementary service transaction for interrogation of a specific call barring service in CHANNEL REQUEST message.
- 2) To check that the MS correctly requests a supplementary service transaction for interrogation of a call barring service in the subsequent CM SERVICE REQUEST.
- 3) To check that the MS sends a REGISTER message containing the invoke of the InterrogateSS operation with the expected parameter values for interrogation of one call restriction service.
- 4) To check that upon receipt of the RELEASE COMPLETE message, the MS provides the appropriate user indication (which is to be described by the manufacturer).

These checks are done for:

- a) BAIC, the result of the operation being a Basic Service code.
- b) BOICExHC, the result of the operation being a SS-status.

### 31.8.6.1.3 Method of test

#### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is "idle updated".

#### Related PICS/PIXIT statements

Description of the user's commands and of display of the answers from the network for call barring.

#### Foreseen final state of the MS

The MS is "idle updated".

#### Test procedure

By means of appropriate MMI functions (using either 3GPP TS 02.30 or manufacturer defined MMI), the user requests interrogation of BAIC.

Upon receipt of the operation (in a REGISTER message), the system simulator answers with a RELEASE COMPLETE message with the Facility information element containing the Return\_result (basic service) of the InterrogateSS operation.

The SS transaction and the dedicated channel are released.

Then again, by means of appropriate MMI functions, the user requests interrogation of BOICExHC.

Upon receipt of the operation (in a REGISTER message), the system simulator answers with a RELEASE COMPLETE message with the Facility information element containing the Return\_result(SS-status) of the InterrogateSS operation.

The dedicated channel is released.

Maximum duration of test

3 minutes.

Specific message contents

step 6 - BOIC

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = Interrogation:

Supplementary service code = BAIC.

step 14 - BOICExHC

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = Interrogation:

Supplementary service code = BOICExHC.

## 31.8.6.2 Interrogation rejected

### 31.8.6.2.1 Conformance requirements

- 1) A transaction of any kind being already established, for interrogation of any specific call barring with any parameters, the MS shall establish a parallel MM transaction, sending a CM SERVICE REQUEST with CM service type indicating "supplementary service activation".
- 2) Then the MS shall send a REGISTER message related to the present SS transaction containing a facility IE that includes an invoke of the InterrogateSS operation with parameter values according to the user's request (MMI action).
- 3) Upon receipt of the RELEASE COMPLETE message related to the present SS transaction, the SS transaction shall be released but the first transaction shall remain unaffected.
- 4) Upon receipt of the RELEASE COMPLETE message, the MS shall provide the appropriate user indication (which is to be described by the Manufacturer).

### References

- 1) 3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.3.1.1.2 and 9.1.9.
- 2) 3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.5.1.1, 9.2.9 and 10.5.33.
- 3) 3GPP TS 04.88,  
3GPP TS 04.80 subclauses 2.3 and 3.6.
- 4) 3GPP TS 02.30 subclause 4.5.

### 31.8.6.2.2 Test purpose

- 1) To check that the MS correctly requests the establishment of a parallel MM transaction for supplementary service transaction of interrogation of a specific call barring service message, sending a CM SERVICE REQUEST.
- 2) To check that the MS sends a REGISTER message containing the invoke of the InterrogateSS operation with the expected parameter values for interrogation of call barring.
- 3) To check that upon receipt of the RELEASE COMPLETE message related to the present SS transaction, the first transaction remains unaffected.
- 4) To check that upon receipt of the RELEASE COMPLETE message, the MS provides the appropriate user indication (as described by the Manufacturer).

These checks are performed with a call transaction already established for:

- a) BICRoam, the RELEASE COMPLETE message being sent with a facility IE containing a return\_error(error) where error is "SS not available".
- b) BOIC, the RELEASE COMPLETE message being sent with a facility IE containing a reject(involve\_problem) where involve\_problem is "resource limitation".

### 31.8.6.2.3 Method of test

#### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in CC state U10.

## Related PICS/PIXIT statements

Description of the user's commands and of display of the answers from the network for call barring.

## Foreseen final state of the MS

The MS is in CC state U10.

## Test procedure

By means of appropriate MMI functions (using either 3GPP TS 02.30 or manufacturer defined MMI), the user requests interrogation of BICRoam.

Upon receipt of the operation (in a REGISTER message), the system simulator answers with a RELEASE COMPLETE message with the Facility information element containing a Return\_error(error: SS not available) of the InterrogateSS operation.

The system simulator sends STATUS ENQUIRY, the MS responds with STATUS message indicating CC state U10.

Then again, by means of appropriate MMI functions, the user requests interrogation of BOIC.

Upon receipt of the REGISTER message, the system simulator answers with the RELEASE COMPLETE message (same PD and TI that in the REGISTER message) with the Facility information element containing a reject(invoke\_problem: resource limitation) of the InterrogateSS operation.

The system simulator sends STATUS ENQUIRY, the MS responds with STATUS message indicating CC state U10.

## Maximum duration of test

3 minutes.

## Specific message content

step 4 - BICRoam

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = Interrogation:

Supplementary service code = BICRoam.

step 5 -

- protocol discriminator: non call related SS message.
- transaction identifier: same TI as previous REGISTER message.
- message type: RELEASE COMPLETE.
- facility:

return error code: SS not available.

For the return error the invoke ID must be the same as in the invoke of the InterrogateSS operation.

step 11 - BOIC

- protocol discriminator: non call related SS message.
- message type: REGISTER.
- facility:

invoke = Interrogation:

Supplementary service code = BOIC.

step 12 -

- protocol discriminator: non call related SS message.
- transaction identifier: same TI as previous REGISTER message.
- message type: RELEASE COMPLETE.
- facility:

reject code: resource limitation.

For the reject the invoke ID must be the same as in the invoke of the InterrogateSS operation.

## 31.8.7 Normal operation

In case of barring of outgoing call the calling mobile receives information about the activation of supplementary services subscribed.

In case of barring of incoming call the calling mobile receives information about the activation of supplementary services subscribed by the other party (the mobile called).

### 31.8.7.1 Conformance requirements

Upon receipt of the RELEASE COMPLETE message the MS shall provide the appropriate user indication (which is to be described by the manufacturer).

#### References

### 31.8.7.2 Test purpose

To check that upon receipt of the RELEASE COMPLETE message the MS provides the appropriate user indication (as described by the manufacturer).

This is tested in the case of an MS making a call to a mobile with incoming calls barred.

## 31.8.7.3 Method of test

## Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is "idle updated".

## Related PICS/PIXIT statements

Description of the user's commands and of display of the answers from the network for call barring.

## Foreseen final state of the MS

The MS is "idle updated".

## Test procedure

The MS is made to initiate a call.

Upon receipt of the SETUP message, the system simulator answers with the negative acknowledgement RELEASE COMPLETE (to simulate a case where call barring is activated).

## Maximum duration of test

1 minute.

## Expected sequence

| Step | Direction | Message              | Comments                            |
|------|-----------|----------------------|-------------------------------------|
| 1    | MS -> SS  | CHANNEL REQUEST      |                                     |
| 2    | SS -> MS  | IMMEDIATE ASSIGNMENT |                                     |
| 3    | MS -> SS  | CM SERVICE REQUEST   |                                     |
| 4    | SS -> MS  | CM SERVICE ACCEPT    |                                     |
| 5    | MS -> SS  | SETUP                |                                     |
| 6    | SS -> MS  | RELEASE COMPLETE     | provide correct MMI user indication |
| 7    | SS -> MS  | CHANNEL RELEASE      |                                     |

## Specific message content

## RELEASE COMPLETE

- protocol discriminator.
- transaction identifier.
- message type.
- facility:

invoke = notification:

SS code = BI.

SS status = activation indicator (indicating: Provisioned, registered and active).

## 31.9 Handling of undefined (future) GSM supplementary services

### 31.9.1 Mobile station initiated Unstructured supplementary service data operation

#### 31.9.1.1 ProcessUnstructuredSS-request/accepted

##### Conformance requirements

- 1) The mobile station shall invoke an USSD request by sending a REGISTER message to the network containing a ProcessUnstructuredSS-Request invoke component. This message will contain the alphabet indicator set to "SMS default alphabet" and the language indicator set to "language unspecified". The ussd-string parameter shall contain the following digits and symbols depending on the operation initiated:

Activation: \*NN(N)# (no supplementary information included)  
 \*NN(N)\*SI# (one field of supplementary infor. included)  
 \*NN(N)\*SIA\*SIB# (two fields of supplementary infor. included)

Deactivation: #NN(N)#  
 #NN(N)\*SI#  
 #NN(N)\*SIA\*SIB#

Interrogation: \*#NN(N)#  
 \*#NN(N)\*SI#  
 \*#NN(N)\*SIA\*SIB#

Registration \*\*NN(N)#  
 \*\*NN(N)\*SI#  
 \*\*NN(N)\*SIA\*SIB#

Erasure ##NN(N)#  
 ##NN(N)\*SI#  
 ##NN(N)\*SIA\*SIB#

Operations not yet: see conformance requirement 2).

defined in 3GPP TS 02.30.

NN(N) features a set of service codes which have not yet been allocated for GSM supplementary services (see 3GPP TS 02.30 for service codes already specified).

N is a digit within 1..9 and SI, SIA, SIB strings of characters.

- 2) Concerning operations which are not yet specified in 3GPP TS 02.30, the MS shall proceed as follows:

The entry of 1 or 2 characters defined in the 3GPP TS 03.38 default alphabet followed by "SEND" shall be interpreted by the MS as an USSD request unless the MS is not engaged in a call and the first of the two

character entry followed by "SEND" is a "1". Except if the 1 or 2 characters are MS manufacturer defined procedure in idle mode.

- 3) For supplementary service procedures independent of any call, the initiating side shall establish a MM-connection between the network and the mobile station according to the rules given in 3GPP TS 04.08 / 3GPP TS 24.008.
- 4) Within a call, the MS shall transmit a USSD request from the user if any. See 3GPP TS 04.07 and 3GPP TS 04.08 / 3GPP TS 24.008 for the handling of multiple MM connections.
- 5) Upon receipt of the RELEASE COMPLETE message, the MS shall display the information contained to the user in a way described by the manufacturer.

Operations not yet: see 2).

defined in 3GPP TS 02.30

NN(N) features a set of service codes which have not yet been allocated for GSM supplementary services (see 3GPP TS 02.30 for service codes already specified).

N is a digit within 1..9 and SI, SIA, SIB strings of characters.

- 2) To check that the entry of 1 or 2 characters defined in the 3GPP TS 03.38 default alphabet followed by "SEND" shall be interpreted by the MS as an USSD request unless the MS is not engaged in a call and the first of the two character entry followed by "SEND" is a "1". Except if the 1 or 2 characters are MS manufacturer defined procedure in idle mode.
- 3) To verify that, for supplementary service procedures independent of any call, the initiating side must establish a MM-connection between the network and the mobile station according to the rules given in 3GPP TS 04.07 and 3GPP TS 04.08 / 3GPP TS 24.008.
- 4) To verify that, within a call the MS shall transmit a USSD request if any. See 3GPP TS 04.07 and 3GPP TS 04.08 / 3GPP TS 24.008 for the handling of multiple MM connections.
- 5) To check that upon receipt of the RELEASE COMPLETE message, the MS shall display the information contained to the user in a way described by the manufacturer.

#### Related PICS/PIXIT Statements

- Support of USSD.
- Description of the user's commands and of display of USSD.
- Full rate supported.
- Supported teleservices.
- Support of active state of the call control protocol (U10).
- Identification of the short strings defining MS manufacturer defined procedure in idle mode (1 or 2 characters defined in the 3GPP TS 03.38 default alphabet followed by "SEND").

#### Initial Conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in the MM-state "idle updated".

#### Foreseen final state of the MS

MM-state "idle updated".

#### Test Procedure

By means of appropriate MMI functions (using either 3GPP TS 02.30 or manufacturer defined MMI) the mobile is made to initiate an Unstructured SS data operation. The mobile first establishes a MM-connection with the SS. Then, a REGISTER message is sent to the SS. Upon receipt of this message, the system simulator answers with the RELEASE COMPLETE message. Then a CHANNEL RELEASE message is sent to the MS to release the main signalling link.

The mobile station is forced to originate a call. After the MS has received a CONNECT ACKNOWLEDGE, MMI keys are depressed on the mobile in order to initiate an Unstructured SS data operation. Then a REGISTER message is sent to the SS. Upon receipt of this message, the system simulator answers with the RELEASE COMPLETE message. Finally, the main signalling link is released by transferring a CHANNEL RELEASE message to the MS.

## Expected Sequence

The sequence is executed for execution counters  $c=1, \dots, 16$ .

The second part of the sequence, namely from step 9 to step 18, is executed for execution counter  $c=17$ .

Counter  $c$  determines the ussd-string selected by the user and sent by the MS (see specific message contents concerning the REGISTER message).

| Step | Direction | Message              | Comments                                                                                                                                                                                                                       |

### 31.9.1.2 ProcessUnstructuredSS-request/cross phase compatibility and error handling

#### Conformance requirements

- 1) If a mobile initiated USSD request using protocol version 2 is rejected by the network, and the reason for the rejection is indicated either by the problem code "unrecognized operation" or a cause "facility rejected", the mobile station shall assume that the network only supports protocol version 1 of USSD operations. The mobile station shall re-attempt the request by using the appropriate protocol version 1 USSD operation without a SS version indicator if the unstructured data entered by the user can be coded as an IA5 string.
- 2) Upon receipt of the RELEASE COMPLETE message, the MS shall provide the appropriate user indication (which is to be described by the manufacturer). If ussd-String information is included this shall be given to the user (in a way described by the manufacturer).

#### References

Conformance requirement1: 3GPP TS 04.90 subclause 6.2.1.

Conformance requirement2: 3GPP TS 03.90.

#### Test Purpose

- 1) To verify that If a mobile initiated USSD request using protocol version 2 is rejected by the network, and the reason for the rejection is indicated either by the problem code "unrecognized operation" or a cause "facility rejected", the mobile station shall assume that the network only supports protocol version 1 of USSD operations. The mobile station shall re-attempt the request by using the appropriate protocol version 1 USSD operation without a SS version indicator if the unstructured data entered by the user can be coded as an IA5 string.
- 2) To check that, upon receipt of the RELEASE COMPLETE message, the MS shall provide the appropriate user indication (which is to be described by the manufacturer). If ussd-String information is included this shall be given to the user (in a way described by the manufacturer).

### Related PICS/PIXIT Statements

- Support of USSD.
- Full rate supported.
- Supported teleservices.
- Support of active state of the call control protocol (U10).

### Initial Conditions

#### System Simulator:

1 cell, default parameters.

#### Mobile Station:

The MS is in the MM-state "idle updated".

### Foreseen final state of the MS

MM-state "idle updated".

### Test Procedure

Appropriate MMI keys are pressed on the mobile in order to activate an USSD service. The mobile first establishes a MM-connection with the SS. Then, a REGISTER message is sent to the SS. Upon receipt of this message, the system simulator answers with the RELEASE COMPLETE message with the problem code set to "unrecognized operation", the main signalling link is released. Then the SS checks that the MS re-establishes a MM-connection and re-attempts the request by using a REGISTER message containing an invoke of the ProcessUnstructuredData operation. The SS answers with a normal RELEASE COMPLETE to terminate the transaction. Finally the main signalling link is released by transferring to the MS a CHANNEL RELEASE.

Appropriate MMI keys are pressed on the mobile in order to activate an USSD service. The mobile first establishes a MM-connection with the SS. Then, a REGISTER message is sent to the SS. Upon receipt of this message, the system simulator answers with the RELEASE COMPLETE message with the cause element set to "Facility rejected", the main signalling link is released. Then the SS checks that the MS re-establishes a MM-connection and re-attempts the request by using a REGISTER message containing an invoke of the ProcessUnstructuredData operation. Then the SS answers with a normal RELEASE COMPLETE to terminate the transaction. Finally the main signalling link is released by transferring to the MS a CHANNEL RELEASE.

The mobile station is forced to originate a call. After the SS has sent a CONNECT ACKNOWLEDGE, MMI keys are pressed on the mobile in order to activate an USSD service. A REGISTER message is sent to the SS. Upon receipt of this message, the system simulator answers with the RELEASE COMPLETE message containing a return error with an error or a reject with a problem. Then the radio link is release by transferring to the MS a CHANNEL RELEASE message. This substest is repeated with different errors and problems in the RELEASE COMPLETE message.

## 31.9.2 Network initiated unstructured supplementary service operations

### 31.9.2.1 UnstructuredSS-Notify/accepted

#### Conformance requirements

- 1) For a USSD notification, the MS shall display the text provided and await user input. The MS shall acknowledge the operation by sending a FACILITY message containing an empty result component to the network.
- 2) The MS shall include alphabet and language indicators in the response to the network. The alphabet indicator shall indicate "SMS default alphabet". The language indicator shall indicate "language unspecified".
- 3) At any stage while the MS is registered with a network, the network may send an unstructured string to the MS. So, the MS shall be able to process the operation during a call or out of a call.

#### References

- Conformance requirement 1: 3GPP TS 04.90 subclause 5.2.1.  
 Conformance requirement 2: 3GPP TS 02.90 subclause 4.2.2.  
 Conformance requirement 3: 3GPP TS 02.90 subclause 4.2.1.

#### Test Purpose

- 1) To verify that for a USSD notification, the MS shall display the text provided and await user input. If the user enters a response, the MS shall acknowledge the operation by sending a FACILITY message containing an empty result component to the network.
- 2) To verify that the MS shall include alphabet and language indicators in the response to the network. The alphabet indicator shall indicate "SMS default alphabet". The language indicator shall indicate "language unspecified".
- 3) To check that the MS shall be able to process the operation during a call or out of a call.

#### Related PICS/PIXIT Statements

- Support of USSD.
- Full rate supported.
- Supported teleservices.
- Support of active state of the call control protocol (U10).

#### Initial Conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in the MM-state "idle updated".

#### Foreseen final state of the MS

MM-state "idle updated".

#### Test Procedure

- The MS is paged and a RR-connection is established. Then, the SS sends a REGISTER message containing a facility information element with operation code set to ProcessUnstructuredSS-Notify. The user checks that the ussd string sent by the SS is correctly displayed by the MS. The MS has to send a FACILITY message with an empty return result component.
- Then the SS originates a call to the MS. When the MS is in the U10 state, the SS releases the transaction identifier concerning USSD transaction by sending a RELEASE COMPLETE. The SS initiates a new ussd transaction by sending a REGISTER message containing a facility information element with operation code set to UnstructuredSS-Notify. The user checks that the ussd string sent by the SS is correctly displayed by the MS. The MS has to send a FACILITY message with an empty return result component. Finally the SS releases both MM connections and the radio link.

| Step | Direction | Message               | Comments                                                                               |
|------|-----------|-----------------------|----------------------------------------------------------------------------------------|

### 31.9.2.2 UnstructuredSS-Notify/rejected on user busy

#### Conformance requirements

- 1) When the mobile station receives an USSD operation in parallel to any call independent supplementary transaction, it shall respond with a return error component in a RELEASE COMPLETE message, containing the "USSD-Busy" error.

#### References

Conformance requirement 1: 3GPP TS 04.90 subclause 5.1.1.

#### Test Purpose

- 1) To verify that when the mobile station receives an USSD operation in parallel to any call independent supplementary transaction, it responds with a return error component in a RELEASE COMPLETE message, containing the "USSD-Busy" error.

## Related PICS/PIXIT Statements

- Support of USSD.
- Full rate supported.
- Supported teleservices.
- Support of active state of the call control protocol (U10).

## Initial Conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in the MM-state "idle updated".

## Foreseen final state of the MS

MM-state "idle updated".

## Test Procedure

- The MS is paged and a RR-connection is established. Then, the SS sends a REGISTER message containing a facility information element with operation code set to UnstructuredSS-Notify. The SS initiates an other USSD transaction by sending a REGISTER message with transaction identifier different from the previous one. The SS checks that the MS answers with a RELEASE COMPLETE message with an error component set to "USSD busy". Then the SS releases the radio link.

## Test Procedure

| Step | Direction | Message               | Comments                                                                                                       |
|------|-----------|-----------------------|----------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PAGING REQUEST TYPE 1 |                                                                                                                |
| 2    | MS -> SS  | CHANNEL REQUEST       |                                                                                                                |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT  | a SDCCH is allocated to the MS.                                                                                |
| 4    | MS -> SS  | PAGING RESPONSE       |                                                                                                                |
| 5    | SS -> MS  | REGISTER              | initiation of the transaction concerning the USSD notification operation. See i).                              |
| 6    |           |                       | The MS has to display the USSD string sent from the SS. See ii).                                               |
| 7    | MS -> SS  | FACILITY              |                                                                                                                |
| 8    | SS -> MS  | REGISTER              | initiation of an other USSD notification. The transaction identifier is different from that in step 5. See i). |
| 9    | MS -> SS  | RELEASE COMPLETE      | error set to "USSD busy". Transaction initiated in step 6 by the network is rejected by the MS. See iii).      |
| 10   | SS -> MS  | RELEASE COMPLETE      | normal release of transaction initiated in step 5. See iii).                                                   |
| 11   | SS -> MS  | CHANNEL RELEASE       | release of the main signalling link.                                                                           |

Specific message contents.

### 31.9.2.3 UnstructuredSS-Request/accepted

#### Conformance requirements

- 1) For a USSD request, the MS shall display the text provided and await user input. if the user enters a response, the MS shall return the response to the network, maintaining the transaction.
- 2) The MS shall include alphabet and language indicators in the response to the network. The alphabet indicator shall indicate "SMS default alphabet". The language indicator shall indicate "language unspecified".
- 3) At any stage while the MS is registered with a network, the network may send an unstructured string to the MS. So, the MS shall be able to process the operation during a call or out of a call.

#### References

- Conformance requirement 1: 3GPP TS 03.90 subclause 5.2.5.  
 Conformance requirement 2: 3GPP TS 02.90 subclause 4.2.2.  
 Conformance requirement 3: 3GPP TS 02.90 subclause 4.2.1.

### Test Purpose

- 1) To test that, for a USSD request, the MS shall display the text provided and await user input. If the user enters a response, the MS shall return the response to the network, maintaining the transaction.
- 2) To verify that the MS shall include alphabet and language indicators in the response to the network. The alphabet indicator shall indicate "SMS default alphabet". The language indicator shall indicate "language unspecified".
- 3) To check that the MS shall be able to process the operation during a call or out of a call.

### Related PICS/PIXIT Statements

- Support of USSD.
- Full rate supported.
- Supported teleservices.
- Support of active state of the call control protocol (U10).

### Initial Conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in the MM-state "idle updated".

### Foreseen final state of the MS

MM-state "idle updated".

### Test Procedure

- The MS is paged and a RR-connection is established. Then, the SS sends a REGISTER message containing a facility information element with operation code set to ProcessUnstructuredSS-Request. The user checks that the ussd string sent by the SS is correctly displayed by the MS and answers the request by depressing MMI keys. Then the MS has to send a FACILITY message with ussd string exactly containing the digits and symbols expressed on the mobile equipment keypad.
- Then the SS originates a call to the MS. When the MS is in the U10 state, the SS releases the transaction identifier concerning USSD transaction by sending a RELEASE COMPLETE. The SS initiates a new ussd transaction by sending a REGISTER message containing a facility information element with operation code set to UnstructuredSS-Request. The user checks that the ussd string sent by the SS is correctly displayed by the MS and answers the request by depressing MMI keys. Then the MS has to send a FACILITY message with ussd string exactly containing the digits and symbols expressed on the mobile equipment keypad. Finally the SS releases both MM connections and the radio link.

| Length of FIE contents |                                                                                                      |
| Component type tag     | Return Result from 3GPP TS 04.80                                                                     |
| Component length       | depending on the length of ussd-string                                                               |
| InvokeID tag           | From 3GPP TS 04.80                                                                                   |
| Invoke ID length       | 1                                                                                                    |
| Invoke ID              | The same as the invoke of the UnstructuredSS-Request                                                 |
| Sequence Identifier    |                                                                                                      |
| Sequence length        |                                                                                                      |
| Operation Code tag     | 1                                                                                                    |
| Operation Code length  | 1                                                                                                    |
| Operation Code         | UnstructuredSS-Request                                                                               |
| ussd-dataCodingScheme  | 1 octet long. Alphabet indicator set to "default alphabet".<br>Language indicator set to "undefined" |
| ussd-string            | contains exactly the digits and symbols expressed on the mobile equipment keypad.                    |

iii) RELEASE COMPLETE message.

| Contents                      | Value/remark                                      |
|-------------------------------|---------------------------------------------------|
| Protocol Discriminator        | set to "Supplementary service (call independent)" |
| Transaction identifier        | same as REGISTER transaction identifier           |
| Release Complete message type | As 3GPP TS 04.80                                  |
| Facility Information Element  | omitted                                           |

iv) RELEASE COMPLETE message.

| Contents                      | Value/remark                                  |
|-------------------------------|-----------------------------------------------|
| Protocol Discriminator        | set to "Supplementary service (call control)" |
| Transaction identifier        | same as current call.                         |
| Release Complete message type | As 3GPP TS 04.08 / 3GPP TS 24.008             |

#### 31.9.2.4 UnstructuredSS-Request/rejected on user busy

##### Conformance requirements

- 1) When the mobile station receives an USSD operation in parallel to any call independent supplementary transaction, it shall respond with a return error component in a RELEASE COMPLETE message, containing the "USSD-Busy" error.

##### References

- Conformance requirement 1: 3GPP TS 04.90 subclause 5.1.1.

### Test Purpose

- 1) To verify that when the mobile station receives an USSD operation in parallel to any call independent supplementary transaction, it responds with a return error component in a RELEASE COMPLETE message, containing the "USSD-Busy" error.

### Related PICS/PIXIT Statements

- Support of USSD.
- Full rate supported.
- Supported teleservices.
- Support of active state of the call control protocol (U10).

### Initial Conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in the MM-state "idle updated".

### Foreseen final state of the MS

MM-state "idle updated".

### Test Procedure

- The MS is paged and a RR-connection is established. Then, the SS sends a REGISTER message containing a facility information element with operation code set to UnstructuredSS-Request. The SS initiates an other USSD transaction by sending a REGISTER message with transaction identifier different from the previous one. The SS checks that the MS answers with a RELEASE COMPLETE message with an error component set to "USSD busy". Then the SS releases the radio link.

### Test Procedure

| Step | Direction | Message               | Comments                                                                                                                                               |
|------|-----------|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PAGING REQUEST TYPE 1 |                                                                                                                                                        |
| 2    | MS -> SS  | CHANNEL REQUEST       |                                                                                                                                                        |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT  | a SDCCH is allocated to the MS.                                                                                                                        |
| 4    | MS -> SS  | PAGING RESPONSE       |                                                                                                                                                        |
| 5    | SS -> MS  | REGISTER              | initiation of the transaction concerning the USSD Request operation. See i).                                                                           |
| 6    |           |                       | The MS has to display the USSD string sent from the network and waits for the user response. By depressing MMI keys followed by SEND the user answers. |
| 7    | MS -> SS  | FACILITY              | signalling message sent by the MS as the response to the request. See ii).                                                                             |
| 8    | SS -> MS  | REGISTER              | initiation of an other USSD request. The transaction identifier is different from that in step 5. See i).                                              |
| 9    | MS -> SS  | RELEASE COMPLETE      | error set to "USSD busy". Transaction initiated in step 6 by the network is rejected by the MS. See iii).                                              |
| 10   | SS -> MS  | RELEASE COMPLETE      | normal release of transaction initiated in step 5. See iii).                                                                                           |
| 11   | SS -> MS  | CHANNEL RELEASE       | release of the main signalling link.                                                                                                                   |

| Error Code tag         | As 3GPP TS 04.80                                     |
| Error Code length      |                                                      |
| Error Code             | USSD Busy                                            |

## 31.10 MMI input for USSD

### 31.10.1 Conformance requirements

If the MS cannot interpret the MMI input as a defined GSM Supplementary Services, SIM control procedure or MS manufacturer-defined procedure, and if the MMI input is in the form:

- "entry of any characters defined in the 3GPP TS 03.38 Default Alphabet (up to the maximum defined in 3GPP TS 04.80) followed by #SEND"; or
- "entry of 1 or 2 characters defined in the 3GPP TS 03.38 Default Alphabet followed by SEND";

then it shall be interpreted by the MS as Unstructured SS Data and sent transparently towards the network, unless the MS is not engaged in a call and the first digit of the 2 character entry, followed by SEND, is a "1". In this case the MS shall transmit this as a call-setup request.

## References

3GPP TS 02.30 subclause 4.5.3.

## 31.10.2 Test purpose

To check that the entry of 2 digits in the form 1X (X in the set 0,...9) followed by SEND is accepted by the mobile station in idle mode as a normal call establishment for the 1X number. It is checked that the MS sends a CHANNEL REQUEST, sends CM SERVICE REQUEST message for mobile originated call (after having received an IMMEDIATE ASSIGNMENT), and then sends the SETUP message containing the 1X phone number as called number (after having received the CM SERVICE ACCEPT message).

## 31.10.3 Method of test

## Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station

The MS is "idle updated";

## Related PICS/PIXIT statement(s)

Foreseen final state of the MS:

The MS is "idle updated."

## Test procedure

The user requests call establishment successively for every 2 digit phone number of the 1X form (X in the set 0,...9) allowing ten seconds between each attempts.

## Maximum duration of test

3 minutes.

## Expected Sequence

The following sequence is executed for execution counter k = 1 to 10.

| Step | Direction | Message              | Comments                                                                          |
|------|-----------|----------------------|-----------------------------------------------------------------------------------|
| 1    | MS        |                      | The MS is made to initiate call establishment for phone number 1X (where X = k-1) |
| 2    | MS -> SS  | CHANNEL REQUEST      | with establishment cause related to mobile originating call                       |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT |                                                                                   |
| 4    | MS -> SS  | CM SERVICE REQUEST   | "mobile originating call"                                                         |
| 5    | SS -> MS  | CM SERVICE ACCEPT    |                                                                                   |
| 6    | MS -> SS  | SETUP                | called BCD number is 1X                                                           |
| 7    | SS -> MS  | RELEASE COMPLETE     |                                                                                   |
| 8    |           |                      | Wait for 10 seconds                                                               |

Specific message contents.

None.

## 31.11 Specific message contents and ASN.1 codings

### Introduction

In this subclause a mixed form of ASN.1 coding has been used in ASN.1 components within the messages.

Some components use the indefinite form of coding, and some use the short definite form.

An example of a FACILITY message using indefinite form of coding is described below.

The same message using short definite form of coding is described in Test 31.2.1.1.1 Step 7 of this subclause.

| Contents                       | Value/remark                         | Coding      |

Step 9 & 20: short messages

Step 10 and 22 messages can be coded using this shorter form:

Message containing only the "Return result"

| Contents               | Value/remark         | Coding      |
|------------------------|----------------------|-------------|
| Length of FIE contents | 5                    | 05          |
| Component type tag     | <b>Return Result</b> | A2 (note 1) |
| Component length       | 3                    | 03          |
| Invoke ID tag          |                      | 02          |
| Invoke ID length       | 1                    | 01          |
| Invoke ID              | As received          | --          |

Message containing the "Return result" and the "Operation Code"

| Contents               | Value/remark         | Coding      |
|------------------------|----------------------|-------------|
| Length of FIE contents | 12                   | 0C          |
| Component type tag     | <b>Return Result</b> | A2 (note 1) |
| Component length       | indefinite           | 80          |
| Invoke ID tag          |                      | 02          |
| Invoke ID length       | 1                    | 01          |
| Invoke ID              | As received          | --          |
| Sequence identifier    |                      | 30 (note 1) |
| Sequence length        | 3                    | 03          |
| Operation code tag     |                      | 02          |
| Operation code length  | 1                    | 01          |
| Operation code         | <b>ActivateSS</b>    | 0C          |
| End-Of-Content Tag     | 0                    | 00          |
| Length Indicator       | 0                    | 00          |

Test 31.8.3.2.1. Rejection after invoke of ActivateSS operation

MMI sequence: \*331\*1234#

Step 4: MS -> SS REGISTER

| Contents               | Value/remark      | Coding      |
|------------------------|-------------------|-------------|
| Length of FIE contents | 13                | 0D          |

## 31.12 eMLPP Service

This subclause is applicable to the mobile stations supporting eMLPP service. The eMLPP is applicable to teleservices 1x, 6x, 9x and bearer services 2x, 3x, 4x, 5x.

For an MS supporting speech the test procedures in subclauses 31.12.1 and 31.12.2 are performed for full rate speech (teleservice 11, telephony). For an MS not supporting speech but supporting at least one of telecommunication services (TS6x, BS2x, BS3x, BS4x, BS5x), for each of the test procedures 31.12.1 and 31.12.2 a full rate service supported by the MS (see PICS/PIXIT statement) is chosen, and the test is performed corresponding to that service.

### 31.12.1 eMLPP Service / priority level of MO call

#### 31.12.1.1 Conformance requirement

For the MS supporting MO calls:

1. Mobile stations indicate the priority of their call in the signalling that takes place during the call establishment process.
2. The MS shall verify the selected priority level against the priority levels stored in the SIM. If the selected priority is not allowed, then the priority of the call shall be modified to that of the nearest allowed priority level below the requested level.
3. In case of no priority selection or use of a non-compatible Mobile Station the Mobile Station shall send a standard service request message.
4. Signalling information required for the prioritisation at mobile originating call establishment. (see figure 1 of 3GPP TS 04.67 subclause 4.1.1) and Signalling information between the network and the calling mobile station required for the prioritisation in case of a VGCS or VBS call (figure 4 of 3GPP TS 04.67 subclause 4.1.4).
5. The user or the network may wish to omit or postpone authentication and ciphering in order to provide for a faster call set-up.

#### Reference(s)

3GPP TS 03.67 subclauses 11.3.1.1, 11.3.1.2, 11.6 and 11.3.1.3.

3GPP TS 02.67 clause 4.

3GPP TS 04.67 subclauses 4.1.1 and 4.1.4.

#### 31.12.1.2 Test purpose

For the MS supporting MO, to verify that:

1. When user selects priority level for normal MO call, the priority level is indicated in the signalling message.
2. The MS verifies the selected priority level against the priority levels stored in the SIM. If the selected priority is not allowed, then the priority of the call shall be modified to that of the nearest allowed priority level below the requested level.
3. If the user does not select a priority level, the priority level is not indicated in the signalling message.
4. If a priority selection is performed by the user the MS provides the priority level information element in L3-MM CM SERVICE REQUEST message when a group call is initiated.
5. The mobile is able to establish a normal MO call with a priority level or a group call with a priority level according to the procedure specified in 3GPP TS 04.67 subclause 4.1.1 and the procedure in 3GPP TS 04.67 subclause 4.1.4.
6. The mobile is able to initiate a fast call set-up without authentication and ciphering.

### 31.12.1.3 Method of test

#### Initial Conditions

System Simulator:

1 cell with default parameters.

Mobile Station:

The MS is in idle mode with SIM in which the available priority levels are level 2, level 3, and level 4

#### Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900, DCS 1800 or PCS 1 900).
- Support mobile originating call.
- Support mobile emergency call (TS12).
- Support VGCS originating.
- Support VBS originating.
- Support eMLPP.
- Way to select a priority level.

#### Foreseen Final State of the MS

"Idle, updated".

#### Test Procedure

The test steps 1 to 26 are repeated for k=1, 2, 3. After the repetition is finished the steps 27 to 71 are performed.

The test steps 1 to 7 are performed if the mobile station supports normal MO call. The steps 8 to 13 are executed if the MS supports TS12. The test steps 20 to step 26 are executed for k= 1, 2, 3, if the mobile station supports VGCS/VBS originating.

An allowed priority level (level 3) or a priority level (level 1) higher than allowed level or no priority level is selected by MMI action (for k=1, 2, 3 respectively). An MO call is attempted. It is checked that the MS indicates the selected priority level (for k=1) or the nearest allowed priority level below the selected level (for k=2) or no priority level (for k=3) in the signalling message.

A normal MO call is attempted with an allowed priority level (level 3). It is checked that the MS establishes completely this call.

If the mobile station supports VGCS/VBS originating a VGCS/VBS call is initiated via the MMI by using the SETUP procedure.

A MO VGCS/VBS call is attempted with the allowed priority level 0. It is checked that the MS establishes completely this call using the immediate setup procedure without authentication and ciphering.

#### Maximum Duration of Test

5 minutes.

## 31.12.2 eMLPP Service / automatic answering point-to-point MT call

### 31.12.2.1 Conformance requirement

For the MS supporting MT call:

1. Automatic answering or, if necessary, called-party pre-emption has to be performed by the Mobile Station as defined in the following:
  - point-to-point calls:

If the user is in idle mode, the Mobile Station shall automatically connect to an incoming call of a sufficient priority level. If the user is in dedicated mode and has a subscription to Call Waiting, a Call Waiting indication including the priority level of the call shall be given to the Mobile Station which automatically accepts the waiting call.
2. In dedicated mode, in the case where the called subscriber has a subscription for eMLPP and for Call Waiting and is using a compatible Mobile Station, the Mobile Station shall be informed of the priority of the new call together with the call waiting indication. The Mobile Station will then consult the internal service configuration list stored on the SIM to establish whether it should automatically accept the waiting call without consulting the user, or whether the call waiting facility will be used as normal.
3. In the case where the called subscriber has a subscription for eMLPP and for CW, the mobile station shall be informed of the priority of the new call together with the CW indication. On reception of the set-up message the compatible mobile station decides on called party pre-emption. If called party pre-emption applies, the mobile station shall automatically accept the waiting call and send a hold message to the network. If a hold acknowledge is received, the waiting call is accepted. If a hold reject is received for any reason, e.g. there is no subscription for hold, the other call shall be released and the waiting call accepted. If the ongoing call is not a TS11 call, the mobile station should not send a hold message to the network but release the call and accept the waiting call.

### Reference(s)

3GPP TS 02.67 subclause 4, 5.9.

3GPP TS 03.67 clause 4, subclauses 11.3.2.4, 11.3.2.5 and 11.6.

3GPP TS 04.67 subclause 4.1.3.

3GPP TS 04.83 subclauses 1.1 and 1.2.

### 31.12.2.2 Test purpose

For the MS supporting MT call, to verify that:

1. In idle mode the MS automatically accepts an incoming point-to-point call of priority level for which automatic answering is enabled.
2. In idle mode the MS alerts an incoming point-to-point call of a priority level for which automatic answering is disabled.
3. In dedicated mode and supporting Call Waiting, when a Call Waiting indication includes a level for which automatic answering is enabled and the priority level is higher than the ongoing point-to-point call, the MS automatically confirms the waiting call and sends a hold message to the network. If a hold reject is received the other call is released and the waiting call is accepted.
4. In dedicated mode and supporting Call Waiting, when a Call Waiting indication includes a priority level for which automatic answering is enabled and the priority level is equal or lower than the priority level of the ongoing call, the MS indicates the waiting call.
5. In group receive mode the MS automatically responds to the paging message containing a priority level for which automatic answering is enabled and the priority level is higher than the priority level of the ongoing call.
6. In group receive mode the MS indicates an incoming point-to-point call of a priority level for which automatic answering is enabled and the priority level is equal or lower than the priority level of the ongoing call.

## 31.12.2.3 Method of test

## Initial Conditions

System Simulator:

1 cell with default parameters.

Mobile Station:

The MS is in idle mode.

The auto answering priority level is set to higher than priority level 2.

## Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900, DCS 1800 or PCS 1 900).
- Support VGCS listening.
- Support VBS listening.
- Support call waiting.
- Support hold.
- Support eMLPP.
- Way to configure automatic answering.
- Way to indicate a call has been automatically answered.

## Foreseen Final State of the MS

"Idle, updated".

## Test Procedure

The call waiting is activated. The MS is in idle mode and automatic answering for priority level 2 is disabled. A PAGING REQUEST message containing priority level 2 is sent. It is checked that the MS indicates the incoming call to the user. The automatic answering for level 1 is enabled. A PAGING REQUEST message with priority level 2 is sent. It is checked that the MS automatically accepts the incoming normal call. The call is released. A PAGING REQUEST message without priority level is sent, and during the call set-up the SETUP message contains priority level 1. It is checked that the MS automatically accepts the incoming normal call.

The MS is in dedicated mode (If the MS supports TS11, TS11 service shall be selected for the dedicated mode testing). a SETUP message with priority level higher enough for auto answering is sent by the SS. It is checked that the MS automatically accepts the incoming normal call. A SETUP message containing low priority level without auto answering is sent. It is checked that the MS indicates the incoming call to the user.

The MS is in group receive mode, a NOTIFICATION/FACCH message containing paging information and a PAGING REQUEST message with priority level 0 are sent. It is checked that the MS automatically accepts the incoming normal call. The MS is brought into group receive mode. A NOTIFICATION/FACCH message containing paging information and a PAGING REQUEST message containing low priority level are sent. It is checked that the MS indicates the incoming call to the user.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

### 31.12.3 eMLPP Service / automatic answering MT VGCS or VBS call

#### 31.12.3.1 Conformance requirement

For the MS supporting VGCS/VBS listening:

1. Automatic answering or, if necessary, called-party pre-emption has to be performed by the Mobile Station as defined in the following:

- voice group calls and voice broadcast calls:

Notifications for other voice group calls, voice broadcast calls or information on paging for point-to-point calls shall be given to the Mobile Stations involved in on-going voice group calls or voice broadcast calls as defined in 3GPP TS 03.68 and 3GPP TS 03.69, respectively. The notifications include the related priority level of the call. In case of a notified call with higher priority where called-party pre-emption applies, the Mobile Station shall automatically leave the on-going voice group call or voice broadcast call and react according to the type of the notified call type.

2. In dedicated mode, in the case where the called subscriber has a subscription for eMLPP and for Call Waiting and is using a compatible Mobile Station, the Mobile Station shall be informed of the priority of the new call together with the call waiting indication. The Mobile Station will then consult the internal service configuration list stored on the SIM to establish whether it should automatically accept the waiting call without consulting the user, or whether the call waiting facility will be used as normal.
3. In the case where the called subscriber has a subscription for eMLPP and for CW, the mobile station shall be informed of the priority of the new call together with the CW indication. On reception of the notification message the compatible mobile station decides on called party pre-emption. If called party pre-emption applies, the mobile station shall automatically release the call and join the new call.

## Reference(s)

3GPP TS 02.67 clause 4.

3GPP TS 03.68 clause 4, subclauses 11.3.1.3 and 11.3.1.4.

3GPP TS 03.67 clause 4.

3GPP TS 04.67 subclause 4.1.5.

### 31.12.3.2 Test purpose

For the MS supporting VGCS/VBS listening, to verify that:

1. In idle mode the MS automatically accepts an incoming VGCS or VBS call of sufficient priority level.
2. In idle mode the MS indicates an incoming VGCS or VBS call of priority level not high enough for automatic answering.
3. In dedicated mode, the MS automatically accepts an incoming VGCS or VBS call of sufficient priority level.
4. In dedicated mode, the MS indicates an incoming VGCS or VBS call of priority level not high enough for automatic answering.
5. In group receive mode the MS automatically accepts an incoming VGCS or VBS call of sufficient priority level.
6. In group receive mode the MS indicates an incoming VGCS or VBS call of priority level not high enough for automatic answering.

### 31.12.3.3 Method of test

#### Initial Conditions

System Simulator:

1 cell with default parameters.

Mobile Station:

The MS is in idle mode.

The auto answering priority level is set to higher than priority level 2.

#### Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900, DCS 1800 or PCS 1 900).
- Support eMLPP.
- Way to configure automatic answering.
- Way to indicate that a VGCS/VBS call has been automatically accepted.

#### Foreseen Final State of the MS

"Idle, updated".

#### Test Procedure

The MS is in idle mode. a NOTIFICATION/NCH message with priority level higher enough for auto answering is sent. It is checked that the MS automatically accepts the incoming VGCS/VBS call. The call is released. A NOTIFICATION/NCH message containing low priority level without auto answering is sent. It is checked that the MS indicates the incoming VGCS/VBS call to the user.

The MS is in dedicated mode. a NOTIFICATION/FACCH message with priority level higher enough for auto answering is sent. It is checked that the MS automatically accepts the incoming VGCS/VBS call. A NOTIFICATION/FACCH message containing low priority level without auto answering is sent. It is checked that the MS indicates the incoming VGCS/VBS call to the user.

The MS is in group receive mode. a NOTIFICATION/FACCH message with priority level higher enough for auto answering and containing VGCS/VBS channel description is sent. It is checked that the MS automatically accepts the incoming VGCS/VBS call. A NOTIFICATION/FACCH message containing priority level not higher enough for auto answering and containing VGCS/VBS channel description is sent. It is checked that the MS indicates the incoming VGCS/VBS call to the user.

#### Maximum Duration of Test

5 minutes.

#### Expected Sequence

## 31.12.4 eMLPP Service / registration

### 31.12.4.1 Conformance requirement

For registration of eMLPP default priority level, the MS shall transmit successively:

1. A CHANNEL REQUEST with establishment cause set to "other services requested by the mobile user".
2. A CM SERVICE REQUEST with CM service type indicating "supplementary service activation".
3. An eMLPP registration request from a mobile user shall include the SS-Code of the eMLPP service and the default priority level.

### Reference(s)

3GPP TS 04.67 subclause 4.2 (figure 6).

3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.3.1.2 and 9.1.8.

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.5.1.1 and 9.2.9.

### 31.12.4.2 Test purpose

To check that the MS:

1. Correctly requests a supplementary service transaction for registration of eMLPP in CHANNEL REQUEST message.
2. Correctly requests a supplementary service transaction for registration of eMLPP in the subsequent CM SERVICE REQUEST.
3. Then sends a REGISTER message containing the invoke of the RegisterSS operation with the expected parameter values for registration of eMLPP default priority level.
4. Provides the appropriate user indication (as described by the manufacturer) upon receipt of the result of the operation (in a RELEASE COMPLETE message).

### 31.12.4.3 Method of test

#### Initial Conditions

System Simulator:

1 cell with default parameters.

Mobile Station:

the MS is in idle mode

#### Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900, DCS 1800 or PCS 1 900).
- Support eMLPP.
- Way to select a priority level.
- Way to initiate eMLPP registration.
- Way to indicate the result of the eMLPP registration.

#### Foreseen Final State of the MS

"Idle, updated".

## Test Procedure

By means of appropriate MMI functions (using either 3GPP TS 02.30 or manufacturer defined MMI), the user requests registration of eMLPP for a default priority level DefaultPriorityLevel arbitrarily selected.

Upon receipt of the operation (in a REGISTER message), the system simulator answers with a RELEASE COMPLETE message with the Facility information element containing the return result of the RegisterSS operation.

The SS transaction is released and the dedicated channel is released.

Then check the MS provides a correct user indication.

## Maximum Duration of Test

3 minutes.

## Expected Sequence

| Step | Direction | Message              | Comments                                                                         |
|------|-----------|----------------------|----------------------------------------------------------------------------------|
| 1    | MS        |                      | The MS is made to initiate a registration of eMLPP default priority level        |
| 2    | MS -> SS  | CHANNEL REQUEST      | with establishment cause "Other procedures which can be completed with an SDCCH" |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT |                                                                                  |
| 4    | MS -> SS  | CM SERVICE REQUEST   | cause: "supplementary service activation"                                        |
| 5    | SS -> MS  | CM SERVICE ACCEPT    |                                                                                  |
| 6    | MS -> SS  | REGISTER             | RegisterSS(eMLPP, DefaultPriorityLevel)                                          |
| 7    | SS -> MS  | RELEASE COMPLETE     | RegisterSS operation Return_result                                               |
| 8    | MS        |                      | provide correct MMI user indication                                              |
| 9    | SS -> MS  | CHANNEL RELEASE      |                                                                                  |

## Special Message Contents

REGISTER:

## 31.12.5 eMLPP Service / interrogation

### 31.12.5.1 Conformance requirement

For interrogation of eMLPP default priority level, the MS shall transmit successively:

1. A CHANNEL REQUEST with establishment cause set to "other services requested by the mobile user".
2. A CM SERVICE REQUEST with CM service type indicating "supplementary service activation".
3. And then the REGISTER message containing a facility IE that includes an invoke of the InterrogateSS operation with parameter values eMLPP (MMI action) (see figure 7 of 3GPP TS 04.67 subclause 4.5).

## Reference(s)

3GPP TS 04.67 subclause 4.5 (figure 7).

3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.3.1.2 and 9.1.9.

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.5.1.1 and 9.2.9.

### 31.12.5.2 Test purpose

To check that the MS:

1. Correctly requests a supplementary service transaction for interrogation of eMLPP in CHANNEL REQUEST message.
2. Correctly requests a supplementary service transaction for interrogation of eMLPP in the subsequent CM SERVICE REQUEST.
3. Then sends a REGISTER message containing the invoke of the InterrogateSS operation with the expected parameter values for interrogation of eMLPP default priority level.
4. Provides the appropriate user indication (as described by PIXIT) upon receipt of the result of the operation (in a RELEASE COMPLETE message).

### 31.12.5.3 Method of test

#### Initial Conditions

System Simulator:

1 cell with default parameters.

Mobile Station:

the MS is in idle mode

#### Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900, DCS 1800 or PCS 1 900).
- Support eMLPP.
- Way to select a priority level.
- Way to initiate eMLPP interrogation.
- Way to indicate the result of the eMLPP interrogation.

#### Foreseen Final State of the MS

"Idle, updated".

#### Test Procedure

1. By means of appropriate MMI functions (using either 3GPP TS 02.30 or manufacturer defined MMI), the user requests interrogation of eMLPP.
2. Upon receipt of the operation (in a REGISTER message), the system simulator answers with a RELEASE COMPLETE message with the Facility information element containing the return result of the InterrogateSS operation.
3. The SS transaction is released and the dedicated channel is released.
4. Then check the MS provides a correct user indication.

Maximum Duration of Test

## 31.13 Explicit Call Transfer (ECT)

NOTE: In this subclause, Subscriber A is the MS under test, and subscribers B and C are distant parties to the calls made during the tests.

### 31.13.1 Explicit Call Transfer invocation

#### 31.13.1.1 Explicit Call Transfer invocation, successful case, both calls active, clearing using DISCONNECT

Conformance requirement

3GPP TS 04.91 subclauses 4.1 and 4.2.

Applicability

MS supporting the Explicit Call Transfer supplementary service.

Test purpose

To test that the MS invokes explicit call transfer between two active calls by sending a FACILITY message with the correct invoke component, and reacts correctly on receipt of a DISCONNECT response from the network.

Method of test

Related PICS/PIXIT statements

- Method of performing Explicit Call transfer on two active calls.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS shall have Call A-B in state U10 "Active" with auxiliary state "Call held" and Call A-C in state U10 "Active" with no auxiliary state. Both calls shall be of a basic service supported by the MS and applicable to the ECT supplementary service as described in 3GPP TS 02.04 table A.1.

Foreseen final state of the MS

Call A-B, state U0. Call A-C, state U0.

Maximum duration of test

30 s.

Procedure

Using suitable MMI commands, the MS shall invoke an explicit call transfer between the two calls. The MS shall send a FACILITY message with a transaction identifier for either call A-B or call A-C and containing an ExplicitCT invoke component. The call state of both calls shall be unchanged. The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

On receipt of a DISCONNECT message with respect to one of the calls containing a return result component, followed by a DISCONNECT message for the other call, the MS shall respond with a RELEASE message for each call. On receipt of a RELEASE COMPLETE message for each call, the MS shall enter state U0 "Null". The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a RELEASE COMPLETE message with cause #81 "invalid transaction identifier value".

Expected sequence

### 31.13.1.3 Explicit Call Transfer invocation, successful case, both calls active, clearing using RELEASE COMPLETE

Conformance requirement

3GPP TS 04.91 subclauses 4.1 and 4.2.

Applicability

MS supporting the Explicit Call Transfer supplementary service.

Test purpose

1. To test that the MS invokes explicit call transfer between two active calls by sending a FACILITY message with the correct invoke component, and reacts correctly on receipt of a RELEASE COMPLETE response from the network.

Method of test

Related PICS/PIXIT statements

- Method of performing Explicit Call transfer on two active calls.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS shall have Call A-B in state U10 "Active" with auxiliary state "Call held" and Call A-C in state U10 "Active" with no auxiliary state. Both calls shall be of a basic service supported by the MS and applicable to the ECT supplementary service as described in 3GPP TS 02.04 table A.1.

Foreseen final state of the MS

Call A-B, state U0. Call A-C, state U0.

Maximum duration of test

30 s.

Procedure

Using suitable MMI commands, the MS shall invoke an explicit call transfer between the two calls. The MS shall send a FACILITY message with a transaction identifier for either call A-B or call A-C and containing an ExplicitCT invoke component. The call state of both calls shall be unchanged. The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

On receipt of a RELEASE COMPLETE message with respect to one of the calls containing a return result component, followed by a RELEASE COMPLETE message for the other call, the MS shall enter state U0 "Null". The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a RELEASE COMPLETE message with cause #81 "invalid transaction identifier value".

Expected sequence

| Step | Direction | Message          | Comments                                                                                  |

| 10   | MS -> SS  | RELEASE COMPLETE | Transaction identifier of Call A-B, with cause #81 "invalid transaction identifier value" |
| 11   | SS -> MS  | STATUS ENQUIRY   | Transaction identifier of Call A-C                                                        |
| 12   | MS -> SS  | RELEASE COMPLETE | Transaction identifier of Call A-C, with cause #81 "invalid transaction identifier value" |

#### 31.13.1.4 Explicit Call Transfer invocation, successful case, second call alerting

Conformance requirement

3GPP TS 04.91 subclauses 4.1 and 4.2.

Applicability

MS supporting the Explicit Call Transfer supplementary service.

Test purpose

1. To test that the MS invokes explicit call transfer between an active held call and an alerting call by sending a FACILITY message with the correct invoke component, and reacts correctly on receipt of clearing messages from the network.

Method of test

Related PICS/PIXIT statements

- Method of performing Explicit Call transfer on an active call and an alerting call.

## Initial conditions

## System Simulator:

1 cell, default parameters.

## Mobile Station:

The MS shall have Call A-B in state U10 "Active" with auxiliary state "Call held" and Call A-C in state U4 "Call Delivered" with no auxiliary state. Both calls shall be of a basic service supported by the MS and applicable to the ECT supplementary service as described in 3GPP TS 02.04 table A.1.

## Foreseen final state of the MS

Call A-B, state U0. Call A-C, state U0.

## Maximum duration of test

30 s.

## Procedure

Using suitable MMI commands, the MS shall invoke an explicit call transfer between the two calls. The MS shall send a FACILITY message with a transaction identifier for either call A-B or call A-C and containing an ExplicitCT invoke component. The call state of both calls shall be unchanged. The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

On receipt of a DISCONNECT message with respect to one of the calls containing a return result component, followed by a DISCONNECT message for the other call, the MS shall respond with a RELEASE message for each call. On receipt of a RELEASE COMPLETE message for each call, the MS shall enter state U0 "Null". The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a RELEASE COMPLETE message with cause #81 "invalid transaction identifier value".

## Expected sequence

## 31.13.1.5 Explicit Call Transfer invocation, unsuccessful case

## Conformance requirement

3GPP TS 04.91 subclauses 4.1 and 4.2

## Applicability

MS supporting the Explicit Call Transfer supplementary service.

## Test purpose

1. To test that the MS invokes explicit call transfer between an active held call and an alerting call by sending a FACILITY message with the correct invoke component, and returns both calls to their original states on receipt of an error or reject response.

## Initial conditions

The MS shall have Call A-B in state U10 "Active" with auxiliary state "Call held" and Call A-C in state U10 "Active" with no auxiliary state. Both calls shall be of a basic service supported by the MS and applicable to the ECT supplementary service as described in 3GPP TS 02.04 Table A.1.

## Method of test

### Related PICS/PIXIT statements

- Method of performing Explicit Call transfer on two active calls.

## Initial conditions

### System Simulator:

- 1 cell, default parameters.

### Mobile Station:

The MS shall have Call A-B in state U10 "Active" with auxiliary state "Call held" and Call A-C in state U10 "Active" with no auxiliary state. Both calls shall be of a basic service supported by the MS and applicable to the ECT supplementary service as described in 3GPP TS 02.04 table A.1.

## Foreseen final state of the MS

Call A-B, state U10, auxiliary state "Call held". Call A-C, Call A-C, state U10, no auxiliary state.

## Maximum duration of test

30 s.

## Procedure

Using suitable MMI commands, the MS shall invoke an explicit call transfer between the two calls. The MS shall send a FACILITY message with a transaction identifier for either call A-B or call A-C and containing an ExplicitCT invoke component. The call state of both calls shall be unchanged. The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

On receipt of a FACILITY message using the same transaction identifier and including a return error component, the MS shall not send any further messages in respect of the transfer attempt, and shall remain in the same call state for both calls. The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

Using suitable MMI commands, the MS shall again invoke an explicit call transfer between the two calls. The MS shall send a FACILITY message with a transaction identifier for either call A-B or call A-C and containing an ExplicitCT invoke component. The call state of both calls shall be unchanged. The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

On receipt of a FACILITY message using the same transaction identifier and including a reject component, the MS shall not send any further messages in respect of the transfer attempt, and shall remain in the same call state for both calls. The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

| 18   | SS -> MS  | FACILITY       | TI same as step 2, Reject component                                        |
| 19   | SS -> MS  | STATUS ENQUIRY | Transaction identifier of Call A-B                                         |
| 20   | MS -> SS  | STATUS         | Transaction identifier of Call A-B, state U10, auxiliary state "Call held" |
| 21   | SS -> MS  | STATUS ENQUIRY | Transaction identifier of Call A-C                                         |
| 22   | MS -> SS  | STATUS         | Transaction identifier of Call A-C, state U10, no auxiliary state          |

### 31.13.1.6 Explicit Call Transfer invocation, expiry of T(ECT)

#### Conformance requirement

3GPP TS 04.91 subclauses 4.1 and 4.2.

3GPP TS 04.80 subclause 4.2.

#### Applicability

MS supporting the Explicit Call Transfer supplementary service.

#### Test purpose

To test that the MS invokes explicit call transfer between an active held call and an alerting call by sending a FACILITY message with the correct invoke component, and returns both calls to their original states on expiry of T(ECT).

#### Method of test

#### Related PICS/PIXIT statements

- Method of performing Explicit Call transfer on two active calls.

## Initial conditions

### System Simulator:

1 cell, default parameters.

### Mobile Station:

The MS shall have Call A-B in state U10 "Active" with auxiliary state "Call held" and Call A-C in state U10 "Active" with no auxiliary state. Both calls shall be of a basic service supported by the MS and applicable to the ECT supplementary service as described in 3GPP TS 02.04 table A.1.

## Foreseen final state of the MS

Call A-B, state U10, auxiliary state "Call held". Call A-C, Call A-C, state U10, no auxiliary state.

## Maximum duration of test

45 s.

## Procedure

Using suitable MMI commands, the MS shall invoke an explicit call transfer between the two calls. The MS shall send a FACILITY message with a transaction identifier for either call A-B or call A-C and containing an ExplicitCT invoke component. The call state of both calls shall be unchanged. The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

Between 5s and 15s after sending the FACILITY message, the MS shall either:

- remain in the same call states and indicate failure to the user; or
- send another FACILITY message with the same contents.

The call states shall be verified by the SS sending a STATUS ENQUIRY message in respect of the transaction identifier of each call, and receiving a STATUS message indicating the appropriate call state.

Expected sequence

| Step | Direction | Message        | Comments                                                                                     |
|------|-----------|----------------|----------------------------------------------------------------------------------------------|
| 1    | MS        |                | Using MMI commands, perform an explicit call transfer                                        |
| 2    | MS -> SS  | FACILITY       | TI for Call A-B or Call A-C, ExplicitCT Invoke component                                     |
| 3    | SS -> MS  | STATUS ENQUIRY | Transaction identifier of Call A-B                                                           |
| 4    | MS -> SS  | STATUS         | Transaction identifier of Call A-B, state U10, auxiliary state "Call held"                   |
| 5    | SS -> MS  | STATUS ENQUIRY | Transaction identifier of Call A-C                                                           |
| 6    | MS -> SS  | STATUS         | Transaction identifier of Call A-C, state U10, no auxiliary state                            |
| 7    | SS        |                | Wait 15 s from receiving FACILITY message                                                    |
| A8   | SS -> MS  | STATUS ENQUIRY | Take this branch if no message is received within 15 s                                       |
| A9   | MS -> SS  | STATUS         | Transaction identifier of Call A-B                                                           |
| A10  | SS -> MS  | STATUS ENQUIRY | Transaction identifier of Call A-B, state U10, auxiliary state "Call held"                   |
| A11  | MS -> SS  | STATUS         | Transaction identifier of Call A-C                                                           |
|      |           |                | Transaction identifier of Call A-C, state U10, no auxiliary state                            |
| B8   | MS -> SS  | FACILITY       | Take this branch if a message is received within 15 s                                        |
| B9   | SS -> MS  | STATUS ENQUIRY | Same as Step 2. Message shall not be received less than 5 s after the first FACILITY message |
| B10  | MS -> SS  | STATUS         | Transaction identifier of Call A-B                                                           |
| B11  | SS -> MS  | STATUS ENQUIRY | Transaction identifier of Call A-B, state U10, auxiliary state "Call held"                   |
| B12  | MS -> SS  | STATUS         | Transaction identifier of Call A-C                                                           |
|      |           |                | Transaction identifier of Call A-C, state U10, no auxiliary state                            |

## 31.14 User-to-User Signalling (UUS)

This subclause applies to mobile station supporting User-to-User Signalling (UUS). The objective of this clause is to test UUS concerned procedures.

Unless indicated in individual sub-clauses, the default message contents in subclause 26.8.4 are applied for CC calls and default message contents in subclause 26.14.10 are applied for VGCS/VBS calls.

### 31.14.1 UUS / Implicit UUS1

#### 31.14.1.1 UUS / Implicit UUS1 / CC MO call

##### 31.14.1.1.1 Conformance requirement

The UUI service is activated implicitly by the presence of UUI in the set-up request from the mobile station.

To activate UUS1 implicitly, the MS shall include a User-user information element in the SETUP message as part of a normal call request.

The MS shall accept the presence of User-user information element in the ALERTING, CONNECT, DISCONNECT, RELEASE or RELEASE COMPLETE messages (as indicated in 3GPP TS 24.087, figure 1 in subclause 4.1.1).

#### References

3GPP TS 23.087 subclauses 4.1.1 and 5.2.1.2.1.

3GPP TS 24.087 subclause 4.1.1.

### 31.14.1.1.2 Test purpose

1. To verify that upon initiation of an outgoing basic call with implicit UUS1 by the user, the MS includes a User-user information element in the SETUP message.
2. To verify that inclusion of the User-user information element with different data length in either of the downlink messages ALERTING, CONNECT, DISCONNECT or RELEASE COMPLETE, causes no adverse effects on the operation of the MS.

### 31.14.1.1.3 Method of test

#### Initial conditions

##### System Simulator:

1 cell, default parameters.

##### Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

#### Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM480, GSM 700, GSM 850, P-, E-, R-GSM900, DCS 1800 or PCS 1 900).
- Support MO telephony.
- Support UUS.
- Support implicit UUS1.
- Way to activate implicit UUS1.
- Description of display of the User-user data received from the network.

#### Foreseen final state of the MS

The MS is in MM-state "idle, updated" with valid TMSI.

#### Test procedure

By means of appropriate MMI function, the user requests implicit UUS1 and enters a string, which shall be included in the UUS1. Then MS is made to initiate a call. In the SETUP message, the User-user information element shall be present and shall include the requested string. Then, SS releases the call.

The MS is made to initiate a second call with implicit UUS1. In the SETUP message, the User-user information element shall be present with the requested string. SS releases the call, by sending a RELEASE COMPLETE message including a User-user information element with a long data value. It is checked that the MS is not disturbed by the optional User-user information element.

The MS is made to initiate a third call with implicit UUS1. In the SETUP message, the User-user information element shall be present with the requested string. Then SS shall include User-user information element in the ALERTING and in the CONNECT message with respectively short and long data value, it is checked that MS does not respond adversely to the inclusion of the optional User-user information element. After 10 seconds, SS initiates call clearing. SS sends DISCONNECT and RELEASE COMPLETE messages with User-user information element respectively without data and with a short data value, again the MS shall not respond adversely to the inclusion of the User-user information element, but shall continue to clear down the call normally.

#### Maximum Duration of Test

2 minutes.

## Expected Sequence

| Step | Direction | Message                 | Comments/actions/next state                                                                                                                                                             |

Specific message contents:

## SETUP

As default message contents as defined in subclause 26.8.4 (mobile station to network direction), except:

| Information Element | value/remark                                  |
|---------------------|-----------------------------------------------|
| User-user           |                                               |
| - IEI               | '7E'O                                         |
| - length            | 1 + the entered string length                 |
| - PD                | User specific protocol                        |
| - user-user         | The string as entered coded in IA5 characters |

## ALERTING

As default message contents as defined in subclause 26.8.4 (network to mobile station direction), except:

| Information Element | value/remark                                      |
|---------------------|---------------------------------------------------|
| User-user           |                                                   |
| - IEI               | '7E'O                                             |
| - length            | 2                                                 |
| - PD                | User specific protocol                            |
| - user-user         | The following string coded in IA5 characters: "A" |

## CONNECT

As default message contents as defined in subclause 26.8.4 (network to mobile station direction), except:

| Information Element | value/remark                                                                                                            |
|---------------------|-------------------------------------------------------------------------------------------------------------------------|
| User-user           |                                                                                                                         |
| - IEI               | '7E'O                                                                                                                   |
| - length            | 101                                                                                                                     |
| - PD                | User specific protocol                                                                                                  |
| - user-user         | The following string with a length of 100 octets coded in IA5 characters: "abcdefghijklmnopqrstuvwxy0123456789abc....." |

## DISCONNECT

As default message contents as defined in subclause 26.8.4 (network to mobile station direction), except:

| Information Element | value/remark           |
|---------------------|------------------------|
| User-user           |                        |
| - IEI               | '7E'O                  |
| - length            | 1                      |
| - PD                | User specific protocol |
| - user-user         | -                      |

**RELEASE COMPLETE – step 15**

As default message contents as defined in subclause 26.8.4 (network to mobile station direction), except:

| Information Element                                   | value/remark                                                                                                                    |
|-------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| User-user<br>- IEI<br>- length<br>- PD<br>- user-user | '7E'O<br>37<br>User specific protocol<br>The following string coded in IA5 characters:<br>"0123456789abcdefghijklmnopqrstuvwxy" |

**RELEASE COMPLETE – step 38**

As default message contents as defined in subclause 26.8.4 (network to mobile station direction), except:

| Information Element                                   | value/remark                                                                                              |
|-------------------------------------------------------|-----------------------------------------------------------------------------------------------------------|
| User-user<br>- IEI<br>- length<br>- PD<br>- user-user | '7E'O<br>17<br>User specific protocol<br>The following string coded in IA5 characters: "RELEASE COMPLETE" |

**31.14.1.2 UUS / Implicit UUS1 / CC MT call****31.14.1.2.1 Conformance requirement**

The MS shall accept the presence of User-user information element in the SETUP and DISCONNECT messages (as indicated in 3GPP TS 23.087, figure 5.2.1.2.1.1).

The MS may include User-user information element in the ALERTING or CONNECT messages (as indicated in 3GPP TS 23.087, figure 5.2.1.2.1.1).

**References**

3GPP TS 23.087 subclause 5.2.1.2.1.

3GPP TS 24.087.

**31.14.1.2.2 Test purpose**

1. To verify that, the receipt of SETUP message including user-user information element with a short or large data value causes no adverse effects on the call establishment operation of the MS.
2. To verify that MS could include User-user information element in either of the uplink messages ALERTING or CONNECT.
3. To verify that inclusion of the User-user information element with different data length in either of the downlink message DISCONNECT or RELEASE COMPLETE, causes no adverse effects on the operation of the MS.

**31.14.1.2.3 Method of test****Initial conditions**

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

#### Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM480, GSM 700, GSM 850, P-, E-, R-GSM900, DCS 1800 or PCS 1 900).
- Support MT telephony.
- Support UUS.
- Support implicit UUS1.
- Support the sending of UUS1 information element in ALERTING message.
- Support the sending of UUS1 information element in CONNECT message.
- Way to activate implicit UUS1.
- Description of display of the User-user data received from the network.

#### Foreseen final state of the MS

The MS is in MM-state "idle, updated" with valid TMSI.

#### Test procedure

SS initiates a call. In the SETUP message, the User-user information element shall be present. It is checked that the MS, in a way described by the manufacturer, displays the user-user data. Then, SS releases the call immediately after the MS call confirmation.

The SS initiates a second call and in the SETUP message, the User-user information element shall contain a larger data value. It is checked that the MS, in a way described by the manufacturer, displays the user-user data. Then the SS releases the call immediately after the MS call confirmation. In the RELEASE COMPLETE message, the User-user information element shall also contain a large data value. It is checked that the MS is not disturbed by the User-user optional information element.

By means of appropriate MMI function and if MS supports User-user information element in ALERTING or CONNECT messages, the user enters a string, which shall be included in the UUS1. The SS initiates a third call and in the SETUP message, the User-user information element shall be included without data. After the MS call confirmation and depending on the MS capability, it is checked that the MS sends in the User-user information element of the ALERTING message the string as requested. When the TCH is allocated and depending on the MS capability, it is checked that the MS sends in the User-user information element of the CONNECT message the string as requested. When the call is established, the SS releases the call and shall include in the DISCONNECT message the optional User-user information element. It is checked that the MS is not disturbed by the User-user information element. The SS shall also include in the RELEASE COMPLETE message the optional User-user information element. It is checked that the MS is not disturbed by the User-user information element.

#### Maximum Duration of Test

2 minutes.

## Expected Sequence

| Step | Direction | Message                 | Comments/actions/next state                                                                                        |

### 31.14.1.3 UUS / Implicit UUS1 / Interactions with Call Waiting and call HOLD supplementary services

#### 31.14.1.3.1 Conformance requirement

There are no interactions between UUS and the Call hold (HOLD) and Call waiting (CW) supplementary services.

To activate UUS1 implicitly, the MS shall include a User-user information element in the SETUP message as part of a normal call request.

The MS shall accept the presence of User-user information element in the SETUP and DISCONNECT messages (as indicated in 3GPP TS 23.087, figure 5.2.1.2.1.1).

#### References

3GPP TS 23.087 subclauses 4.1.1, 5.2.1.2.1.1 and 5.2.1.2.1.

3GPP TS 24.087 subclauses 4.1.1, 6.4 and 6.5.

#### 31.14.1.3.2 Test purpose

1. To verify that when in active Call State and supporting Call Hold, to initiate a second call with implicit UUS1, the MS places the first call on hold and sends a SETUP message with the User-user information element. Verify that the second call is successfully established.
2. In call active state and supporting Call Waiting, when a Call Waiting indication includes a User-user information element, the MS accepts the waiting call and places the first call on hold and successfully establishes the second call.

#### 31.14.1.3.3 Method of test

##### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has a call ("Call A-B") in the active state. The SIM in the MS under test has Call Waiting enabled.

##### Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM480, GSM 700, GSM 850, P-, E-, R-GSM900, DCS 1800 or PCS 1 900).
- Support MO telephony.
- Support MT telephony.
- Support UUS.
- Support implicit UUS1.
- Support hold.
- Way to activate implicit UUS1.
- Description of display of the User-user data received from the network.

##### Foreseen final state of the MS

The MS is in MM-state "idle, updated" with valid TMSI.

## Test procedure

A call is established between the MS and SS. This call is the active call named Call A-B.

Using suitable MMI commands, the MS shall request that the call A-B be placed on hold. The MS shall send a HOLD message and enter auxiliary state "hold request". On receipt of a HOLD ACKNOWLEDGE message from the SS, the MS is made to initiate a second call with implicit UUS1. It is checked that the MS includes the User-user information element in the SETUP message. Then the SS sends an ALERTING message including the optional User-user information. It is checked that the MS, in a way described by the manufacturer, displays the User-user data value. Then the SS sends a CONNECT message including the optional User-user information element. It is checked that the MS, in a way described by the manufacturer, displays the User-user data value. On receipt of a CONNECT ACKNOWLEDGE message, MS shall enter state U10 "Active". The SS releases the second call A-C and shall include in the DISCONNECT message the optional User-user information element. It is checked that the MS is not disturbed by the User-user information element. The SS shall also include in the RELEASE COMPLETE message the optional User-user information element. It is checked that the MS is not disturbed by the User-user information element.

The Call A-B is still alive. By means of appropriate MMI function, the user enters a string, which shall be included in the UUS1 sent by the MS. The SS sends a SETUP message including a User-user information element and indicating the request of a new call, named Call C-A. It is checked with the appropriate MMI function, that the MS displays the contents of the User-user information element. Then the MS shall place Call A-B on hold, and answer Call C-A. The MS shall send a HOLD message to the SS using the transaction identifier of Call A-B. On receipt of a HOLD ACKNOWLEDGE from the SS, the MS shall send a CALL CONFIRMED message and an ALERTING message to the SS, using the transaction identifier of Call C-A, and depending on the MS capability including the optional User-user information element as requested by the user. Then the MS shall send a CONNECT message to the SS, using the transaction identifier of Call C-A, and depending on the MS capability including the optional User-user information element as entered by the user. On receipt of a CONNECT ACKNOWLEDGE message, MS shall enter state U10 "Active". The SS releases the call C-A and shall include in the DISCONNECT message the optional User-user information element. It is checked that the MS is not disturbed by the User-user information element. The SS shall also include in the RELEASE COMPLETE message the optional User-user information element. It is checked that the MS is not disturbed by the User-user information element.

Then SS releases the first call A-B.

## Maximum Duration of Test

2 minutes.

## Expected Sequence

| Step | Direction | Message             | Comments/actions/next state                                                                                                                     |
|------|-----------|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| 0    | MS        |                     | Active call state with call A-B.                                                                                                                |
| 1    | MS        |                     | If supported, MMI actions to initiate implicit UUS1 with the string '12345'.                                                                    |
| 2    | MS        |                     | Call A-C is requested using MMI commands and Call A-B is placed on hold using MMI commands                                                      |
| 3    | MS -> SS  | CM SERVICE REQUEST  | Transaction identifier of Call A-C                                                                                                              |
| 4    | SS -> MS  | CM SERVICE ACCEPT   | Transaction identifier of Call A-C                                                                                                              |
| 5    | MS -> SS  | SETUP               | Check User-user IE is included, transaction identifier of Call A-C, see Specific message contents.                                              |
| 6    | SS -> MS  | ALERTING            | Message contains the User-user IE with a short data value, transaction identifier of Call A-C, see Specific message contents                    |
| 7    | MS        |                     | Check that the MS, in a way described by the manufacturer, displays the User-user data value.                                                   |
| 8    | MS -> SS  | HOLD                | Transaction identifier of Call A-B                                                                                                              |
| 9    | SS -> MS  | HOLD ACKNOWLEDGE    | Transaction identifier of Call A-B                                                                                                              |
| 10   | SS -> MS  | CONNECT             | Message contains the User-user IE with a long data value, transaction identifier of Call A-C, see Specific message contents                     |
| 11   | MS        |                     | Check that the MS, in a way described by the manufacturer, displays the User-user data value.                                                   |
| 12   | MS -> SS  | CONNECT ACKNOWLEDGE | Transaction identifier of Call A-C                                                                                                              |

Specific message contents:

### SETUP – step 5

As default message contents as defined in subclause 26.8.4 (mobile station to network direction), except:

| Information Element                                   | value/remark                                                                                                       |
|-------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| User-user<br>- IEI<br>- length<br>- PD<br>- user-user | '7E'O<br>1 + the entered string length<br>User specific protocol<br>The string as entered, coded in IA5 characters |

### SETUP – step 31

As default message contents as defined in subclause 26.8.4 (network direction to mobile station), except:

| Information Element                                   | value/remark                                                                                 |
|-------------------------------------------------------|----------------------------------------------------------------------------------------------|
| User-user<br>- IEI<br>- length<br>- PD<br>- user-user | '7E'O<br>4<br>User specific protocol<br>The following string coded in IA5 characters : "012" |

### ALERTING– step 6

As default message contents as defined in subclause 26.8.4 (network to mobile station direction), except:

| Information Element                                   | value/remark                                                                                 |
|-------------------------------------------------------|----------------------------------------------------------------------------------------------|
| User-user<br>- IEI<br>- length<br>- PD<br>- user-user | '7E'O<br>4<br>User specific protocol<br>The following string coded in IA5 characters : "012" |

### ALERTING– step 38

As default message contents as defined in subclause 26.8.4 (mobile station to network direction), except:

| Information Element                                   | value/remark                                                                                                       |
|-------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| User-user<br>- IEI<br>- length<br>- PD<br>- user-user | '7E'O<br>1 + the entered string length<br>User specific protocol<br>The string as entered, coded in IA5 characters |

**CONNECT– step 10**

As default message contents as defined in subclause 26.8.4 (network to mobile station direction), except:

| Information Element                                   | value/remark                                                                                                                      |
|-------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| User-user<br>- IEI<br>- length<br>- PD<br>- user-user | '7E'O<br>37<br>User specific protocol<br>The following string coded in IA5 characters :<br>"abcdefghijklmnopqrstuvwxyz0123456789" |

**CONNECT– step 39**

As default message contents as defined in subclause 26.8.4 (mobile station to network direction), except:

| Information Element                                   | value/remark                                                                                                |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------|
| User-user<br>- IEI<br>- length<br>- PD<br>- user-user | '7E'O<br>1 + the entered string length<br>User specific protocol<br>The string as entered in IA5 characters |

**DISCONNECT**

As default message contents as defined in subclause 26.8.4 (network to mobile station direction), except:

| Information Element                                   | value/remark                              |
|-------------------------------------------------------|-------------------------------------------|
| User-user<br>- IEI<br>- length<br>- PD<br>- user-user | '7E'O<br>1<br>User specific protocol<br>- |

**RELEASE COMPLETE**

As default message contents as defined in subclause 26.8.4 (network to mobile station direction), except:

| Information Element                                   | value/remark                                                                              |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------|
| User-user<br>- IEI<br>- length<br>- PD<br>- user-user | '7E'O<br>2<br>User specific protocol<br>The following string coded in IA5 characters: "A" |

**31.15 Follow Me (FM)**

This subclause applies to mobile station supporting Follow Me (FM). The objective of this clause is to test FM concerned procedures.

Unless indicated in individual sub-clauses, the default message contents in subclause 31.11 are applied.

**31.15.1 Follow Me (FM) / Registration****31.15.1.1 Conformance requirement**

1. The initiating subscriber registers the Follow Me feature with respect to a particular remote party. The initiating subscriber shall provide the following information to the network: the number of the remote party. The initiating subscriber shall receive an indication if the FM registration request was accepted or rejected by the network.

2. MS shall behave as indicated in the Information flow as indicated in 3GPP TS 23.094, figure 4.1.
3. As an operator's option additional information (such as passwords) for registration may be required from the initiating subscriber. This information shall be coded as a USSD string with a length not exceeding 30 characters.
4. All the messages between MS and the mobile network and internal to the mobile network, which are used for control of Follow Me, are USSD Phase 2 messages.
5. If a mobile initiated USSD request using protocol version 2 is rejected by the network, and the reason for the rejection is indicated either by the problem code "unrecognized operation" or a cause "Facility rejected", the MS shall assume that the network only supports protocol version 1 of USSD operations. The MS shall re-attempt the request by using the appropriate protocol version 1 USSD operation without an SS version indicator if the unstructured data entered by the user can be coded as an IA5 string.

## References

3GPP TS 22.094 subclause 6.3.

3GPP TS 24.090 subclause 6.1.

### 31.15.1.2 Test purpose

1. To check that the MS correctly requests a supplementary service transaction for registration of FM in CHANNEL REQUEST message and in the subsequent CM SERVICE REQUEST.
2. To check that the MS sends a REGISTER message using USSD phase 2 and containing the FM-request control message for registration.
3. To check that upon receipt of the result or the error of the operation (in a RELEASE COMPLETE message), the MS provides the appropriate user indication (as described by the manufacturer).
4. To check that upon receipt of a rejection from the network with the problem code "unrecognized operation" or a cause "Facility rejected", the MS re-attempt the request by using USSD version 1.

### 31.15.1.3 Method of test

#### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

#### Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM480, GSM 700, GSM 850, P-, E-, R-GSM900, DCS 1800 or PCS 1 900).
- Support FM.
- Way to activate the registration of FM.
- Description of display of the FM answers from the network.

#### Foreseen final state of the MS

The MS is in MM-state "idle, updated" with valid TMSI.

## Test procedure

By means of appropriate MMI functions, the user requests registration of FM for a remote number. Upon receipt of the REGISTER message, SS answers with the RELEASE COMPLETE message with an unsuccessful FM-result information. Check that the MS provides the appropriate user indication (as described by the manufacturer). Then SS transaction is released. This procedure is executed for all possible error values.

The user requests registration of FM for another remote subscriber. Upon receipt of the operation (in a REGISTER message), SS answers with a RELEASE COMPLETE message with a successful FM-response information. Check that the MS provides the appropriate user indication (as described by the manufacturer). The SS transaction is released.

Then user request again two registrations, upon receipt of the REGISTER message, SS answers with a RELEASE COMPLETE message including a rejection with respectively the problem code "unrecognized operation" or a cause "facility rejected". Check that MS re-attempt the request by using USSD version 1: without the SS version indicator information element included in the REGISTER message.

## Maximum Duration of Test

2 minutes.

## Expected Sequence

Test steps 1 to 10 are executed for k=1 to 13 with respectively the following error values:

1. Illegal interaction with incoming barring.
2. Unauthorised request.
3. Unknown remote party.
4. FM not subscribed.
5. Remote party already registered.
6. Unauthorised changes to remote party.
7. Illegal interaction with call forwarding.
8. Illegal interaction with call barring.
9. Request to own MSISDN not possible.
10. Forwarded-to number is invalid directory number.
11. Insufficient information.
12. Forwarded-to number is a special code.
13. Conflicting situation with other supplementary services.

## 31.15.2 Follow Me (FM) / Interrogation

### 31.15.2.1 Conformance requirement

1. An initiating subscriber (also the FM service supervisor) shall be able to interrogate the Follow Me data of any remote party, for which she is authorised to become initiating subscriber.
2. In case the remote party corresponds to a subscriber the remote party shall be able to interrogate her own Follow Me data stored in the network.
3. As an operator's option additional information (such as passwords) for interrogation may be required from the subscriber. The registration procedure shall transport this information from the subscriber to the network of the remote party. This information shall be coded as a USSD string with a length not exceeding 30 characters.
4. All the messages between MS and the mobile network and internal to the mobile network, which are used for control of Follow Me, are USSD Phase 2 messages.
5. MS shall behave as indicated in the Information flow as indicated in 3GPP TS 23.094, figure 4.1.

### References

3GPP TS 22.094 subclauses 6.8 and 7.3.

3GPP TS 23.094 subclauses 4.1, 4.2 and 4.4.

3GPP TS 24.090 subclause 6.1.

### 31.15.2.2 Test purpose

1. To check that the MS (as initiating subscriber or remote party) correctly requests a supplementary service transaction for interrogation of FM in CHANNEL REQUEST message and in the subsequent CM SERVICE REQUEST.
2. To check that the MS sends a REGISTER message using USSD version 2 and containing the FM-request control message for interrogation.
3. To check that upon receipt of the result or the error of the operation (in a RELEASE COMPLETE message), the MS provides the appropriate user indication (as described by the manufacturer).

### 31.15.2.3 Method of test

#### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN. The MS is registered to FM with respect to a remote party B.

#### Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM480, GSM 700, GSM 850, P-, E-, R-GSM900, DCS 1800 or PCS 1 900).
- Support FM.
- Way to activate the interrogation of FM.
- Description of display of the FM answers from the network.

### Foreseen final state of the MS

The MS is in MM-state "idle, updated" with valid TMSI.

### Test procedure

MS is registered to FM.

By means of appropriate MMI functions, the user requests interrogation of FM for a remote number. Upon receipt of the REGISTER message, SS answers with the RELEASE COMPLETE message with an unsuccessful FM-result in a facility information element. Check that the MS provides the appropriate user indication (was described by the manufacturer). Then SS transaction is released. This procedure is executed for all possible error values.

The user requests interrogation of FM for another remote subscriber. Upon receipt of the operation (in a REGISTER message), SS answers with a RELEASE COMPLETE message with a successful FM-response information. Check that the MS provides the appropriate user indication (as described by the manufacturer). The SS transaction is released.

### Maximum Duration of Test

2 minutes.

### Expected Sequence

Test steps 1 to 10 are executed for k=1 to 6 with respectively the following error values:

1. Illegal interaction with incoming barring.
2. Unauthorised request.
3. Unknown remote party.
4. FM not subscribed.
5. FM not registered to remote party.
6. Conflicting situation with other supplementary services.

## 31.15.3 Follow Me (FM) / Erasure

### 31.15.3.1 Conformance requirement

A previous FM registration can be erased in either of the following ways:

- The initiating subscriber can specifically erase her previous registration with an appropriate control procedure.
- In case the remote party corresponds to a subscriber the remote party can erase any previous registration with an appropriate control procedure.
- The FM service supervisor can erase any previous registration to any remote party with an appropriate control procedure (forced erasure).

The subscriber who initiates the FM erase request shall be informed of the outcome of the request by the network.

As an operator's option additional information (such as passwords) for erasure may be required from the subscriber. The registration procedure shall transport this information from the subscriber to the network of the remote party. This information shall be coded as a USSD string with a length not exceeding 30 characters.

MS shall behave as indicated in the Information flow as indicated in 3GPP TS 23.094, figure 4.1.

All the messages between MS and the mobile network and internal to the mobile network, which are used for control of Follow Me, are USSD Phase 2 messages.

## References

3GPP TS 22.094 subclause 6.4.

3GPP TS 23.094 subclauses 4.1, 4.2 and 4.4.

3GPP TS 24.090 subclause 6.1.

### 31.15.3.2 Test purpose

1. To check that the MS, acting as an initiating subscriber or as a remote party, correctly requests a supplementary service transaction for erasure of FM in CHANNEL REQUEST message and in the subsequent CM SERVICE REQUEST.
2. To check that the MS as initiating subscriber or remote party sends a REGISTER message containing the FM-request control message for erasure.
3. To check that the MS, acting as a supervisor, correctly requests a supplementary service transaction for erasure of FM in CHANNEL REQUEST message and in the subsequent CM SERVICE REQUEST
4. To check that the MS as supervisor sends a REGISTER message containing the FM-request control message for forced-erasure.
5. To check that upon receipt of the result or the error of the operation (in a RELEASE COMPLETE message), the MS provides the appropriate user indication (as described by the manufacturer).

### 31.15.3.3 Method of test

#### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN. The MS is registered to FM with respect to a remote party B.

#### Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM480, GSM 700, GSM 850, P-, E-, R-GSM900, DCS 1800 or PCS 1 900).
- Support FM.
- Way to activate the erasure of FM.
- Description of display of the FM answers from the network.

#### Foreseen final state of the MS

The MS is in MM-state "idle, updated" with valid TMSI.

## Test procedure

MS is registered to FM.

By means of appropriate MMI functions, the user requests erasure of FM for a remote number. Upon receipt of the REGISTER message, SS answers with the RELEASE COMPLETE message with an unsuccessful FM-result information. Check that the MS provides the appropriate user indication (as described by the manufacturer). Then SS transaction is released. This procedure is executed for all possible error values.

The user requests erasure of FM for another remote subscriber. Upon receipt of the operation (in a REGISTER message), SS answers with a RELEASE COMPLETE message with a successful FM-response information. Check that the MS provides the appropriate user indication (as described by the manufacturer). The SS transaction is released.

By means of appropriate MMI functions, the user requests forced-erasure of FM for a remote number. Upon receipt of the REGISTER message, SS answers with the RELEASE COMPLETE message with an unsuccessful FM-result information. Check that the MS provides the appropriate user indication (which is to be described by the manufacturer). Then SS transaction is released. This procedure is executed for all possible error values.

The user requests forced-erasure of FM for another remote subscriber. Upon receipt of the operation (in a REGISTER message), SS answers with a RELEASE COMPLETE message with a successful FM-response information. Check that the MS provides the appropriate user indication (as described by the manufacturer). The SS transaction is released.

## Maximum Duration of Test

2 minutes.

## Expected Sequence

Test steps 1 to 10 and 25 to 34 are executed for k=1 to 10 with respectively the following error values:

1. Illegal interaction with incoming barring.
2. Unauthorised request.
3. Unknown remote party.
4. FM not subscribed.
5. FM not registered to remote party.
6. Remote party not registered to this MSISDN.
7. Unauthorised changes to remote party.
8. Illegal interaction with call barring.
9. Insufficient information.
10. Inconsistent with registration.

## 32 Testing of speech transcoding functions

The test sequences for speech transcoding and DTX tests, both for input and required output, are defined in 3GPP TS 06.10, clause 5, and 3GPP TS 06.32, clause 4 for the full rate speech codec. For the half rate speech codec the test sequences are defined in 3GPP TS 06.20, clause 5 and 3GPP TS 06.42 clause 7. They are available on floppy disks in IBM/AT MS-DOS format from ETSI publications department.

The Digital Audio Interface (DAI) is described in subclause 36.4.

NOTE: For a definition of the term "traffic frame" used in this clause, refer to 3GPP TS 06.32 and 3GPP TS 06.42.

### 32.1 Full Rate Downlink speech transcoding

#### 32.1.1 Definition and applicability

Downlink speech transcoding transforms the 13 kbit/s net bit stream obtained by channel decoding the incoming bit stream from the air interface to 13 bit linear PCM.

The requirements and this test apply to all MS supporting TCH/FS.

#### 32.1.2 Conformance requirement

The output bit stream from the speech transcoder shall be continuous and bit by bit exactly the same as the predefined output sequence (SEQ01.OUT, SEQ03.OUT, SEQ04.OUT and SEQ05.OUT).

3GPP TS 06.01, clause2.

3GPP TS 06.10, subclauses 5.2 and 5.2.2.

#### 32.1.3 Test purpose

To verify that the speech transcoding of the MS can transform all predefined sequences (SEQ01.OUT, SEQ03.OUT, SEQ04.OUT and SEQ05.OUT) at 13 kbits/s level to 104 kbit/s (13 bit linear PCM at 8 kHz) level correctly.

#### 32.1.4 Method of test

##### 32.1.4.1 Initial conditions

DTX is off.

The DAI of the MS is connected to the SS and is set to the operating mode "Test of speech decoder/DTX functions (downlink)".

##### 32.1.4.2 Procedure

- a) The SS resets the speech decoder of the MS via the DAI.
- b) The SS sends test sequence SEQ01.COD at 13 kbit/s to the MS via the air interface after passing it through the SS channel encoder.

NOTE: These test sequence files contain 16 bit words for all speech encoded parameters and are justified as described in 3GPP TS 06.10 table 5.1. 76 words are used as input in a period of 20 ms.

- c) The SS records the 104 kbit/s output bit stream from the MS on the digital audio interface.
- d) The test is repeated using the test sequences SEQ03.COD, SEQ04.COD and SEQ05.COD.

### 32.1.5 Test requirements

The bit stream output shall be continuous and bit by bit exactly the same as the sequence given in the files SEQ01.OUT, SEQ03.OUT, SEQ04.OUT and SEQ05.OUT.

NOTE: These files contain 16 bit words of 13 bit linear PCM left justified.

## 32.2 Full Rate Downlink receiver DTX functions

### 32.2.1 Definition and applicability

The DTX receiver functions consist of a SID frame detector, comfort noise generator functions and lost frame substitution and muting functions.

The requirements and this test apply to all MS supporting TCH/FS.

### 32.2.2 Conformance requirement

- 1) The output level of the decoder has to be constant for an input signal consisting of identical speech frames.  
3GPP TS 06.10.
- 2/3) When, after the first lost speech frame subsequent speech frames are lost, a muting technique shall be used that will gradually decrease the output level, resulting in the silencing of the output after a maximum of 320 ms. Speech frames with the FACCH flag set provoke a Bad Frame Indication (BFI = 1) and are hence regarded as lost speech frames.  
3GPP TS 06.01, clause 6; 3GPP TS 06.11, subclauses 2.1 and 2.2, clause 3 for requirement 2 (first part).  
3GPP TS 06.01, clause 6; 3GPP TS 06.11, subclauses 2.1 and 2.2, clause 3; 3GPP TS 06.31, subclauses 1.2.2 and 3.1.1 for requirement 3 (second part).
- 4/5) A valid SID-frame followed by a sequence of lost speech frames shall result in comfort noise generation with constant block amplitude parameters. Speech frames with the FACCH flag set provoke a Bad Frame Indication (BFI = 1) and are hence regarded as lost speech frames.  
3GPP TS 06.01, clauses 3 and 5; 3GPP TS 06.12, clause 3 and subclause 3.1.  
3GPP TS 06.31, subclauses 1.2.2, 3.1, 3.1.1 and 3.1.2 for requirement 4 (first part).  
3GPP TS 06.01, clauses 3, 5 and 6; 3GPP TS 06.11, subclauses 2.1 and 2.2; 3GPP TS 06.12, clause 3 and subclause 3.1.  
3GPP TS 06.31, subclauses 1.2.2, 3.1, 3.1.1 and 3.1.2 for requirement 5 (second part).
- 6/7) An invalid SID-frame followed by a sequence of lost speech frames shall result in comfort noise generation, using the set of parameters from the last valid SID-frame. Speech frames with the FACCH flag set provoke a Bad Frame Indication (BFI = 1) and are hence regarded as lost speech frames.  
3GPP TS 06.01, clauses 3 and 5; 3GPP TS 06.12, clause 3 and subclause 3.1.  
3GPP TS 06.31, subclauses 1.2.2, 3.1, 3.1.1 and 3.1.2 for requirement 6 (first part).  
3GPP TS 06.01, clauses 3, 5 and 6; 3GPP TS 06.11, subclauses 2.1 and 2.2; 3GPP TS 06.12, clause 3 and subclause 3.1.  
3GPP TS 06.31, subclauses 1.2.2, 3.1, 3.1.1 and 3.1.2 for requirement 7 (second part).
- 8) The energy of the output signal is controlled by the block amplitude parameter,  $x_{maxc}$ .  
3GPP TS 06.10, subclauses 3.1.20, 3.1.21 and 3.2.1.

- 9/10) The first SID-frame that is expected and not received shall be substituted by the last valid SID-frame and the procedure for valid SID-frames shall be applied. For the second lost SID-frame, a muting technique shall be used that will gradually decrease the output level, resulting in silencing the output after a maximum of 320 ms. Speech frames with the FACCH flag set provoke a Bad Frame Indication (BFI = 1) and are hence regarded as lost speech frames.

3GPP TS 05.08, subclause 8.3; 3GPP TS 06.01, clause 6; 3GPP TS 06.11, subclauses 2.3 and 2.4.

3GPP TS 06.31, subclauses 1.2.2, 3.1.1 and 3.1.2.

### 32.2.3 Test purpose

- 1) To verify that the signal energy at the output of the decoder is constant with a tolerance of  $\pm 3$  dB if a sequence of identical speech frames is applied at the receiver input.
- 2) To verify that the muting function of the receiver is within the required limits if a sequence of lost speech frames is applied at the receiver input.
- 3) To verify that the muting function of the receiver is within the required limits if a sequence of speech frames with the FACCH flag set is applied at the receiver input.
- 4) To verify the function of comfort noise generation when a valid SID-frame is received followed by a sequence of lost speech frames. The signal energy at the output of the decoder shall be constant with a tolerance of  $\pm 3$  dB.
- 5) To verify the function of comfort noise generation when a valid SID-frame is received followed by a sequence of speech frames with the FACCH flag set. The signal energy at the output of the decoder shall be constant with a tolerance of  $\pm 3$  dB.
- 6) To verify the function of comfort noise generation when an invalid SID-frame is received followed by a sequence of lost speech frames. The signal energy at the output of the decoder shall be constant with a tolerance of  $\pm 3$  dB.
- 7) To verify the function of comfort noise generation when an invalid SID-frame is received followed by a sequence of speech frames with the FACCH flag set. The signal energy at the output of the decoder shall be constant with a tolerance of  $\pm 3$  dB.
- 8) To verify that the signal energy at the output of the decoder depends on the block amplitude  $x_{maxc}$  of the input frames if a sequence of speech frames is applied to the decoder. The signal energy at the output of the decoder shall be constant with a tolerance of  $\pm 3$  dB.
- 9) To verify the SID-frame substitution and muting functions on the comfort noise, if two consecutive expected SID-frames are lost with the other frames being lost speech frames.
- 10) To verify the SID-frame substitution and muting functions on the comfort noise, if two consecutive expected SID-frames are lost with the other frames being speech frames with the FACCH flag set.

### 32.2.4 Method of test

#### 32.2.4.1 Initial conditions

Uplink DTX is off.

The DAI of the MS is connected to the SS and is set to the operating mode "Test of speech decoder/DTX functions (downlink)".

#### 32.2.4.2 Procedure

- a) The SS transmits coded "speech" traffic frames on the air interface after passing them through the SS channel encoder. They contain a special test signal at 13 kbit/s as defined below. All traffic frames are identical with the exception of some frames which are SID frames as defined in 3GPP TS 06.32.
- b) The energy of the PCM signal is evaluated (as a mean square average) at the digital audio interface of the MS at 104 kbit/s level (13 bit, 8 kHz linear PCM) and recorded for each block of 20 ms synchronized to the 20 ms speech frame structure.

- c) The SS transmission of the TDMA frames of the TCH/FS on the air interface is ramped "on" and "off" on a traffic frame by traffic frame basis, taking into account the block diagonal interleaving scheme defined in 3GPP TS 05.03. The first traffic frame in step 1 occurs one frame after the window of the SACCH multiframe (TDMA frame 60 modulo 104), allocated for the SID frame (see 3GPP TS 05.02 and 3GPP TS 05.08). The SACCH will also be transmitted.

NOTE 1: 8 timeslots in 8 consecutive TCH/FS TDMA frames are seen as one traffic frame, and the next traffic frame starts in the middle of the previous one (i.e. after 4 TDMA frames of the previous one) due to the block diagonal interleaving scheme defined in 3GPP TS 05.03.

- d) The special test frame is an encoded "speech" traffic frame of 260 bits obtained from white Gaussian noise band limited to 300 Hz to 3 400 Hz. When repeated, the special test frame results in a humming sound with a fairly constant level when decoded, and is defined in table 32-1.

**Table 32-1: Table of special test traffic frame for receiver DTX tests**

| Encoded parameter       | Value         |     |    |     |
|-------------------------|---------------|-----|----|-----|
| LARc(1)                 | 38            |     |    |     |
| LARc(2)                 | 42            |     |    |     |
| LARc(3)                 | 24            |     |    |     |
| LARc(4)                 | 20            |     |    |     |
| LARc(5)                 | 10            |     |    |     |
| LARc(6)                 | 9             |     |    |     |
| LARc(7)                 | 5             |     |    |     |
| LARc(8)                 | 3             |     |    |     |
|                         | Sub-block no: |     |    |     |
|                         | 0             | 1   | 2  | 3   |
| Grid position (Mc)      | 1             | 3   | 2  | 0   |
| Block amplitude (xmaxc) | 40            | 40  | 40 | 40  |
| LTP gain (Bc)           | 0             | 0   | 0  | 0   |
| LTP lag (Nc)            | 40            | 120 | 40 | 120 |
| RPE pulses (xmc)        |               |     |    |     |
| - pulse no 1            | 4             | 6   | 6  | 6   |
| - pulse no 2            | 4             | 5   | 4  | 3   |
| - pulse no 3            | 2             | 1   | 3  | 4   |
| - pulse no 4            | 6             | 2   | 1  | 3   |
| - pulse no 5            | 3             | 6   | 4  | 1   |
| - pulse no 6            | 5             | 1   | 6  | 3   |
| - pulse no 7            | 5             | 2   | 5  | 5   |
| - pulse no 8            | 5             | 6   | 2  | 1   |
| - pulse no 9            | 1             | 3   | 4  | 4   |
| - pulse no 10           | 3             | 2   | 4  | 3   |
| - pulse no 11           | 5             | 5   | 4  | 5   |
| - pulse no 12           | 6             | 1   | 2  | 2   |
| - pulse no 13           | 1             | 3   | 4  | 3   |

NOTE 2: The signal energy of the decoded special test frame is controlled with the block amplitude parameter (xmaxc). Reducing xmaxc from 40 to 32 reduces the signal energy by 6 dB, and reducing xmaxc from 40 to 24 reduces the signal energy by 12 dB.

- e) The sequence of traffic frames on the air interface is as follows:
- e.1) 23 test frames "on".
  - e.2) 20 frames "off".
  - e.3) 20 test frames "on".
  - e.4) 1 SID frame followed by 6 frames "off", another identical SID frame and 23 frames "off". Except for the SID codeword, the SID frames are identical to the test frame.
  - e.5) 1 different SID frame, however with 2 to 15 errors inserted in the SID codeword, followed by 23 frames "off".
  - e.6) 20 test frames "on", but with the block amplitude parameter xmaxc = 24.

- e.7) 1 SID frame followed by 50 frames "off". Except for the SID codeword, the SID frames are identical to the test frame.
- e.8) The whole test is repeated, but the frames "off" are replaced by frames "on" with the FACCH flag set.

### 32.2.5 Test requirements

- 1) In step e.1), the signal energy shall be fairly constant within  $\pm 3$  dB.
- 2) In step e.2), the signal energy shall decrease to less than -60 dBm within 17 frames.
- 3) In step e.4), comfort noise shall be generated. The same requirements as in step e.1) apply.
- 4) In step e.5), the same requirements as in step e.4) apply.
- 5) In step e.6), the same requirements as in step e.1) apply. However, the signal energy shall be 12 dB lower.
- 6) In step e.7), the signal energy shall be fairly constant within  $\pm 3$  dB for 28 frames. Then the signal energy shall decrease to less than -60 dBm within 16 frames.
- 7) In step e.8), the same requirements as in all previous steps apply.

## 32.3 Full Rate Uplink speech transcoding

### 32.3.1 Definition and applicability

Uplink speech transcoding transforms 13 bit linear PCM to the 13 kbit/s net bit stream. This net bit stream is to be channel encoded for transmission on the air interface.

The requirements and this test apply to all MS supporting TCH/FS.

### 32.3.2 Conformance requirement

The output bit stream from the speech transcoder shall be bit by bit exactly the same as the predefined output sequence (SEQ01.OUT, SEQ02.OUT, SEQ03.OUT and SEQ04.OUT).

3GPP TS 06.01, clause 2.

3GPP TS 06.10, subclauses 5.2 and 5.2.1.

### 32.3.3 Test purpose

To verify that the speech transcoder on the MS can transform all predefined sequences (SEQ01.INP, SEQ02.INP, SEQ03.INP and SEQ04.INP) at 104 kbit/s (13 bit linear PCM at 8 kHz) level to 13 kbit/s level correctly.

### 32.3.4 Method of test

#### 32.3.4.1 Initial conditions

Uplink DTX is off.

The DAI of the MS is connected to the SS and is set to the operating mode "Test of speech encoder/DTX functions (uplink)".

#### 32.3.4.2 Procedure

- a) The SS resets the speech decoder on the MS (see subclause 36.4).
- b) The SS sends a test sequence SEQ01.INP to the MS at 104 kbit/s level via the digital audio interface.

NOTE: These files contain 16 bit words for 13 bit linear PCM left justified. See also 3GPP TS 06.10 table 5.1.

- c) The SS records the 13 kbit/s output bit stream obtained by channel decoding the incoming bit stream from the air interface.
- d) The test is repeated using the test sequences SEQ02.INP, SEQ03.INP and SEQ04.INP.

### 32.3.5 Test requirements

The bit stream output shall be bit by bit exactly the same as the sequence given in the files SEQ01.COD, SEQ02.COD, SEQ03.COD and SEQ04.COD.

NOTE: These files contain 16 bit words of all the 76 parameters in a speech frame justified as in 3GPP TS 06.10 table 5.1. 76 codewords shall occur in a frame of 20 ms.

## 32.4 Full Rate Uplink transmitter DTX functions

### 32.4.1 Definition and applicability

The VAD/DTX transmitter functions consist of a Voice Activity Detector (VAD) and a surrounding Discontinuous Transmission (DTX) system introducing additional "speech" traffic frames on the air interface compared to those the VAD itself would classify as speech frames containing real speech. The additional traffic frames on the air are introduced due to:

- 1) A "hangover" period at the end of speech bursts in order to be certain that the traffic frames contain only noise and to evaluate the background acoustic noise characteristics when no real speech is present.
- 2) Special traffic frames (SID frames) added on the air at regular intervals containing only the evaluated background acoustic noise characteristics. These frames are used for generation of comfort noise in speaker silence periods on the receiving side.

The requirements and this test apply to all MS supporting TCH/FS.

### 32.4.2 Conformance requirement

The MS VAD and DTX function allows only those frames to be transmitted that are either marked with SP = 1 or that are properly positioned SID-frames.

3GPP TS 05.08, subclause 8.3; 3GPP TS 06.01, clauses 3 and 4; 3GPP TS 06.31, subclauses 2.1, 2.1.1 and 2.1.2; 3GPP TS 06.32, clauses 1 and 2, subclauses 2.1 and 2.2.8.

### 32.4.3 Test purpose

To verify that the combination of VAD and DTX operates correctly.

### 32.4.4 Method of test

#### 32.4.4.1 Initial conditions

A call is set up on a TCH/FS according to the generic call set-up procedure.

Uplink DTX is on.

The DAI of the MS is connected to the SS and is set to the operating mode "Test of speech encoder/DTX functions (uplink)".

#### 32.4.4.2 Procedure.

- a) The SS sends a test sequence SPEC\_A1.INP of PCM samples, which are grouped into frames of 20 ms synchronized to the TDMA and traffic frame structure on the air interface, on the digital audio interface in the MS at 104 kbits/s (13 bit, 8 kHz linear PCM).

The start of the test sequences is synchronized with the radio transmission on the air interface so that the first traffic frame on the air occurs just after the traffic frame allocated for the SID frame (TDMA frame 56 modulo 104, see 3GPP TS 05.02 and 3GPP TS 05.08).

NOTE: 8 timeslots in 8 consecutive TCH/FS TDMA frames are seen as one traffic frame and the next traffic frame starts in the middle of the previous one (i.e. after 4 TDMA frames of the previous one) due to the block diagonal interleaving scheme defined in 3GPP TS 05.03.

- b) The SS detects whether or not there is any power transmitted over the radio path on a timeslot basis excluding SACCH frames. The speech frame by speech frame on/off transmission (on = 1) is recorded.
- c) The test is repeated for all test sequences \*.INP described in 3GPP TS 06.32 clause 4.

#### 32.4.5 Test requirements

- 1) In step b), the traffic frame on/off sequence recorded shall be bit exact like the sequence of SP flags stored as bit 15 of LAR(2) on the respective reference files \*.COD described in 3GPP TS 06.32, with the following exceptions:
  - 1.1) The occurrence of a SID frame in its allowed window within the SACCH multiframe as defined in 3GPP TS 05.08.
  - 1.2) The occurrence of a SID frame after 1 or more real speech frames consecutively transmitted on the air.

## 32.5 Full Rate Speech channel transmission delay

### 32.5.1 Definition and applicability

The total transmission delay within the various elements of a GSM system are specified as round trip delays. For the MS this would be equivalent to applying an RF equivalent of a speech signal to the MS receiver, closing an acoustic path from the ERP to the MRP, detecting the corresponding RF signal at the MS transmitter output and measuring the time interval between the signal originally fed to the MS receiver and that transmitted by the MS transmitter.

This simple approach cannot be demonstrated to be accurate due to the inherent non linear characteristic of the speech transcoder. The overall delay therefore is split into four identifiable and measurable delays. The delays are respectively:

- the downlink delay from RF input to DAI output;
- DAI output to ERP;
- MRP to DAI output; and
- DAI to uplink RF output.

Each delay is defined and its method of test described in the following subclauses.

The requirements and this test apply to all MS supporting TCH/FS.

### 32.5.2 Conformance requirement

The overall speech channel transmission delay shall be less than 143,9 ms.

3GPP TS 03.50, subclause 3.3.6.1.

### 32.5.3 Test purpose

To verify that the round trip delay, of a speech channel for a MS, which consists of the sum of:

- the downlink delay from RF input to DAI output;
- DAI output to ERP;
- MRP to DAI output; and
- DAI to uplink RF output;

meets the requirements when using the predefined test sequences SEQ01.COD, SEQ03.COD, SEQ04.COD and SEQ05.COD.

### 32.5.4 Downlink processing delay

#### 32.5.4.1 Definition and applicability

The downlink processing delay is the delay from the first bit of a speech block transmitted from the RF output of the SS up to the last bit of the corresponding speech block received at the DAI on the output of the speech transcoder.

The requirements and this test apply to all MS supporting TCH/FS.

#### 32.5.4.2 Method of test

##### 32.5.4.2.1 Initial conditions

DTX is off.

The DAI of the MS is connected to the SS and is set to the operating mode "Test of speech decoder/DTX functions (downlink)".

##### 32.5.4.2.2 Procedure

- a) The test set up is that described in subclause 32.1 for downlink speech transcoding.
- b) The SS transmits one of the test patterns SEQ01.COD, SEQ03.COD, SEQ04.COD or SEQ05.COD to the MS.
- c) The SS measures for each speech block it transmits the time between the first bit at the air interface and the last bit of that speech block on the DAI. This difference is the delay measured.
- d) Step c) is repeated 20 times and the maximum delay measured in ms is the downlink processing delay TDP.

NOTE: This is to account for the fact that the processing time may not be constant.

### 32.5.5 Downlink coding delay

#### 32.5.5.1 Definition and applicability

The downlink coding delay is defined as the delay between the digital representation of an acoustic signal on the DAI and the corresponding acoustic signal at the ERP.

The requirements and this test apply to all MS supporting TCH/FS.

### 32.5.5.2 Method of test

#### 32.5.5.2.1 Initial conditions

The DAI of the MS is connected to the SS and is set to the operating mode "Test of acoustic devices and A/D & D/A".

The handset is mounted in the LRGP (see annex 1 of ITU-T Recommendation P.76) and the earpiece is sealed to the knife edge of the artificial ear conforming to ITU-T Recommendation P.51.

#### 32.5.5.2.2 Procedure

- a) The SS generates on the DAI a digital representation of a sine wave with a frequency of 1 000 Hz.
- b) The SS measures the "phase shift"  $\varnothing_1$ , in the range of 0 to 360 degrees, between the equivalent sine wave generated at the DAI and the sine wave at the input to the artificial ear.
- c) The frequency is increased to 1100 Hz and the resulting phase shift  $\varnothing_2$  noted.
- d) The downlink coding delay TDC is calculated from either:

$$\text{TDC} = (\varnothing_2 - \varnothing_1)/36 \text{ ms for } \varnothing_2 > \varnothing_1; \text{ or}$$

$$\text{TDC} = (\varnothing_2 + 360 - \varnothing_1)/36 \text{ ms for } \varnothing_2 < \varnothing_1$$

## 32.5.6 Uplink processing delay

### 32.5.6.1 Definition and applicability

The uplink processing delay is the delay from the first bit of a speech block on the DAI to the last bit of that speech block being transmitted on the air interface of the MS.

The requirements and this test apply to all MS supporting TCH/FS.

### 32.5.6.2 Method of test

#### 32.5.6.2.1 Initial conditions

The DAI of the MS is connected to the SS and is set to the operating mode "Test of speech encoder/DTX functions (uplink)".

#### 32.5.6.2.2 Procedure

- a) The test set up is that described in subclause 32.3 for uplink speech transcoding.
- b) The SS sends one of the test patterns SEQ01.INP, SEQ03.INP, SEQ04.INP or SEQ05.INP to the DAI of the MS.
- c) The SS measures the time between the first bit on the DAI, and the last transmitted bit of the block at the air interface for each speech block the SS sends on the DAI. This time difference is the delay measured.
- d) Step c) is repeated 20 times. The maximum delay measured in ms is the uplink coding delay TUP.

NOTE: This is to account for the fact that the processing time may not be constant.

## 32.5.7 Uplink coding delay

### 32.5.7.1 Definition and applicability

The uplink coding delay is defined as the delay between an acoustic signal at the MRP and the digital representation of that signal on the DAI.

The requirements and this test apply to all MS supporting TCH/FS.

### 32.5.7.2 Method of test

#### 32.5.7.2.1 Initial conditions

The DAI of the MS is connected to the SS and is set to the operating mode "Test of acoustic devices and A/D & D/A".

The handset is mounted in the LRGP (see annex 1 of ITU-T recommendation P.76) and the earpiece is sealed to the knife edge of the artificial ear conforming to ITU-T recommendation P.51.

#### 32.5.7.2.2 Procedure

- a) The SS generates an acoustic signal at the artificial mouth of the LRGP, being a pure sine wave with a frequency of 1 000 Hz.
- b) The SS measures the "phase shift"  $\varnothing_1$ , in the range of 0 to 360 degrees, between the signal at the MRP and its digital representation on the DAI.
- c) The SS set the generated frequency to 1 100 Hz and measures the resulting phase shift  $\varnothing_2$ .
- d) The uplink coding delay TUC is calculated from either:

$$\text{TUC} = (\varnothing_2 - \varnothing_1)/36 \text{ ms for } \varnothing_2 > \varnothing_1; \text{ or}$$

$$\text{TUC} = (\varnothing_2 + 360 - \varnothing_1)/36 \text{ ms for } \varnothing_2 < \varnothing_1$$

### 32.5.8 Test requirement

The sum of the delays {TDP + TDC + TUP + TUC} shall be less than 144,9 ms.

NOTE 1: This limit includes an allowance of 4\*0,25 ms delay from the DAI to the MS transmission path.

NOTE 2: No allowances have been made for any delays within the measurement system. These must either be calibrated out or subtracted from the individual delays before performing the sum above.

## 32.6 Half Rate Downlink speech transcoding

### 32.6.1 Definition and applicability

Downlink speech transcoding transforms the 5,6 kbit/s net bit stream obtained by channel decoding the incoming bit stream from the air interface to 104 kbit/s (13 bit linear PCM at 8 kHz) level.

The requirements and this test apply to all MS supporting TCH/HS.

### 32.6.2 Conformance requirement:

The output bit stream from the speech transcoder shall be continuous and bit by bit exactly the same as the predefined output sequences contained in SEQ01.OUT, SEQ02.OUT, SEQ03.OUT and SEQ04.OUT.

3GPP TS 06.02, clause 5; 3GPP TS 06.20.

### 32.6.3 Test purpose:

To verify that the speech transcoder of the MS can transform all the predefined sequences (SEQ01.DEC, SEQ02.DEC, SEQ03.DEC and SEQ04.DEC) at 5,6 kbit/s level to 104 kbit/s (13 bit linear PCM at 8 kHz) level correctly.

### 32.6.4 Method of test

#### 32.6.4.1 Initial conditions

Uplink DTX is off.

The DAI of the MS is connected to the SS and is set to the operating mode "Test of speech decoder/DTX functions (downlink)".

Frequency hopping is on, where the BCCH carrier is part of the hopping sequence. Frequency hopping shall be performed over four carriers using random frequency hopping. Downlink power control shall be activated and a difference of 30 dB between the level of the BCCH carrier and the other carriers adjusted.

NOTE: Frequency hopping is used to ensure that the MS can cope with the reception of bursts (on the BCCH carrier) that have a power level that is different from the rest of the bursts.

#### 32.6.4.2 Procedure

- a) The SS sends a reset pulse to the MS on the digital audio interface. This reset pulse will start the clock output of the MS at 104 kHz (pin 24 of the DAI).
- b) The SS sends test sequence SEQ01.DEC at 5,6 kbit/s to the MS via the air interface after passing it through the SS channel encoder. The speech decoder of the MS is reset by the special reset sequence which is at the beginning of the test sequence.
- c) The SS records the 104 kbit/s output bit stream from the MS on the digital audio interface. The recording shall be triggered by the reception of the encoder homing frame. The encoder homing frame itself shall not be recorded.
- d) The test is repeated using test sequences SEQ02.DEC, SEQ03.DEC and SEQ04.DEC.

#### 32.6.5 Test requirement

The bit stream output shall be continuous and bit by bit exactly the same as the sequence describing the speech data contained in the files SEQ01.OUT, SEQ02.OUT, SEQ03.OUT and SEQ04.OUT. The two encoder homing frames at the beginning of each test sequence \*.OUT shall be disregarded for this comparison.

## 32.7 Half Rate Downlink receiver DTX functions

### 32.7.1 Definition and applicability

The DTX receiver functions consist of a SID frame detector, comfort noise generator functions and lost frame substitution and muting functions.

The requirements and this test apply to all MS supporting TCH/HS.

### 32.7.2 Conformance requirement

The output bit stream from the speech transcoder shall be continuous and bit by bit exactly the same as the predefined output sequences contained in DTX\*.OUT described in 3GPP TS 06.07 subclause 7.

3GPP TS 06.02, clauses 6 and 8; 3GPP TS 06.22; 3GPP TS 06.41.

### 32.7.3 Test purpose

To verify that the MS generates comfort noise correctly.

### 32.7.4 Method of test

#### 32.7.4.1 Initial conditions

The DAI of the MS is connected to the SS and is set to the operating mode "Test of speech decoder/DTX functions (downlink)".

Frequency Hopping is on, where the BCCH carrier is part of the hopping sequence. Frequency Hopping shall be done over four carriers using random Frequency Hopping.

NOTE: Frequency Hopping is used to ensure that the MS can cope with the reception of dummy bursts (on the BCCH frequency) during DTX.

#### 32.7.4.2 Procedure

- a) The SS sends a reset pulse to the MS on the digital audio interface. This reset pulse will start the clock output of the MS at 104 kHz (pin 24 of the DAI).
- b) The SS sends test sequence DTX01.DEC at 5,6 kbit/s to the MS via the air interface after passing it through the SS channel encoder. The speech decoder of the MS will be reset by the special reset sequence which is at the beginning of the test sequence.
- c) The SS transmission of the TDMA frames of the TCH/HS on the air interface is ramped "on" and "off" on a traffic frame by traffic frame basis, taking into account the block diagonal interleaving scheme defined in 3GPP TS 05.03. The first traffic frame in step b occurs one frame after the window of the SACCH multiframe (TDMA frame 0 or 52 modulo 104 for subchannel 0 and TDMA frame 1 or 53 modulo 104 for subchannel 1), allocated for the SID frame (see 3GPP TS 05.02 and 3GPP TS 05.08). The SACCH will also be transmitted.
- d) The information whether to ramp the transmitter of the SS "on" or "off" is derived from the sequence of SP-flags contained in the file DTX01.COD (see file format description in 3GPP TS 06.07 clause 5 for the position of the SP-flag).
- e) The SS records the 104 kbit/s output bit stream from the MS on the digital audio interface. The recording shall be triggered by the reception of the encoder homing frame. The encoder homing frame itself is not recorded.
- f) The test is repeated using test sequences \*.DEC described in 3GPP TS 06.07 clause 7.

#### 32.7.5 Test requirement

The bit stream output shall be continuous and bit by bit exactly the same as the sequence describing the speech data contained in the files DTX\*.OUT described in 3GPP TS 06.07 subclause 7. The two encoder homing frames at the beginning of each test sequence \*.OUT shall be disregarded for this comparison.

## 32.8 Half Rate Uplink speech transcoding

### 32.8.1 Definition and applicability

Uplink speech transcoding transforms 104 kbit/s (13 bit linear PCM at 8 kHz) level to the 5,6 kbit/s net bit stream. This net bit stream is to be channel encoded for transmission on the air interface.

The requirements and this test applies to all MS supporting TCH/HS.

### 32.8.2 Conformance requirement

The output bit stream from the speech transcoder shall be bit by bit exactly the same as the predefined sequences contained in SEQ01.COD, SEQ02.COD and SEQ03.COD described in 3GPP TS 06.07 clause 6.

3GPP TS 06.02, clause 5; 3GPP TS 06.20.

### 32.8.3 Test purpose

To verify that the speech transcoder of the MS can transform all the predefined sequences SEQ01.INP, SEQ02.INP and SEQ03.INP at 104 kbit/s (13 bit linear PCM at 8 kHz) level to 5,6 kbit/s level correctly.

### 32.8.4 Method of test

#### 32.8.4.1 Initial conditions

Uplink DTX is off.

The DAI of the MS is connected to the SS and is set to the operating mode "Test of speech encoder/DTX functions (uplink)".

Frequency hopping is on.

#### 32.8.4.2 Procedure

- a) The SS sends a reset pulse to the MS on the digital audio interface. This reset pulse will start the clock output of the MS at 104 kHz (pin 24 of the DAI).
  - b) The SS synchronizes the input of the test sequences via the digital audio interface to the framing of the MS in the uplink. This can be done in two steps as follows:
    - b.1) The SS sends to the MS at 104 kbit/s level via the digital audio interface 13 triplets of input frames, each triplet consisting of 480 samples. The 480 samples of one triplet shall all be identical. The 13 bits of one sample shall all be set to "zero" except for one which is set to "one". The position of the bit within the 13 bits of a sample that is set to "one" shall vary in such a way, that all possible 13 positions are exercised within the 13 triplets of input frames. An example for such a sequence is given in test sequence BITSYNC.INP described in 3GPP TS 06.07 subclause 8. The SS records the 5,6 kbit/s output bit stream obtained by channel decoding the incoming bit stream from the air interface. As soon as the decoder homing frame is detected at the output, the framing of the MS with respect to the 13 bit long input words is known by looking at the corresponding input frame that has caused the decoder homing frame at the output.
- NOTE: The encoder homing frame consists of 160 identical samples, each 13 bit long left justified, with the least significant bit set to "one" and all other bits set to "zero" (0008 hex). The speech encoder will go to its predefined home state at the end of the first received encoder homing frame. Consecutive encoder homing frames will produce the decoder homing frame at the output of the speech encoder.
- b.2) Synchronized to the 13 bit framing of the MS, the SS now sends test sequence SEQSYNC.INP described in 3GPP TS 06.07 subclause 8 to the MS at 104 kbit/s level via the digital audio interface. The SS records the 5,6 kbit/s output bit stream obtained by channel decoding the incoming bit stream from the air interface. The recording shall be triggered by the reception of the decoder homing frame. By comparing the first recorded frame that is not a decoder homing frame with the 160 possible output frames contained in sequences SYNC\*.COD, the offset of the input to the 20 ms framing of the MS is known.
  - c) Synchronized to the 20 ms framing of the MS, the SS sends a test sequence SEQ01.INP to the MS at 104 kbit/s level via the digital audio interface. The speech encoder of the MS is reset by the special homing sequence which is at the beginning of the test sequence.
  - d) The SS records the 5,6 kbit/s output bit stream obtained by channel decoding the incoming bit stream from the air interface. The recording shall be triggered by the reception of the decoder homing frame. The decoder homing frame itself is not recorded.
  - e) The test is repeated using test sequences SEQ02.INP and SEQ03.INP.

### 32.8.5 Test requirements

The bit stream output shall be bit by bit exactly the same as the sequences describing the speech parameters contained in the files SEQ01.COD, SEQ02.COD and SEQ03.COD. The two decoder homing frames at the beginning of each test sequence \*.COD shall be disregarded for this comparison.

## 32.9 Half Rate Uplink transmitter DTX functions

### 32.9.1 Definition and applicability

The VAD/DTX transmitter functions consist of a Voice Activity Detector (VAD) that inhibits the transmitter during speech pauses, and a surrounding Discontinuous Transmission (DTX) system introducing Silence Descriptor (SID) frames on the air interface.

The requirements and this test apply to all MS supporting TCH/HS.

### 32.9.2 Conformance requirement

The MS VAD and DTX function allow only those frames to be transmitted that are either properly positioned SID-frames, SACCH-frames or frames marked with SP-flag = 1.

For the transmitted frames, the output bit stream from the speech transcoder shall be bit by bit exactly the same as the predefined sequences contained in DTX\*.COD described in 3GPP TS 06.07 subclause 6.

3GPP TS 05.08, subclause 8.3; 3GPP TS 06.02, clauses 6 and 7; 3GPP TS 06.41; 3GPP TS 06.42.

### 32.9.3 Test purpose

To verify that the combination of VAD and DTX operates correctly.

### 32.9.4 Method of test

#### 32.9.4.1 Initial conditions

Uplink DTX is on.

The DAI of the MS is connected to the SS and is set to the operating mode "Test of speech encoder/DTX functions (uplink)".

Frequency Hopping is on.

#### 32.9.4.2 Procedure

- a) The SS sends a reset pulse to the MS on the digital audio interface. This reset pulse will start the clock output of the MS at 104 kHz (pin 24 of the DAI).
- b) The SS synchronizes the input of the test sequences via the digital audio interface to the framing of the MS in the uplink. This can be done in two steps as follows:
  - b.1) The SS sends to the MS at 104 kbit/s level via the digital audio interface 13 triplets of input frames, each triplet consisting of 480 samples. The 480 samples of one triplet shall all be identical. The 13 bits of one sample shall all be set to "zero" except for one which is set to "one". The position of the bit within the 13 bits of a sample that is set to "one" shall vary in such a way, that all possible 13 positions are exercised within the 13 triplets of input frames. An example for such a sequence is given in test sequence BITSYNC.INP described in 3GPP TS 06.07 subclause 8. The SS records the 5,6 kbit/s output bit stream obtained by channel decoding the incoming bit stream from the air interface. As soon as the decoder homing frame is detected at the output, the framing of the MS with respect to the 13 bit long input words is known by looking at the corresponding input frame that has caused the decoder homing frame at the output.

NOTE: The encoder homing frame consists of 160 identical samples, each 13 bit long left justified, with the least significant bit set to "one" and all other bits set to "zero" (0008 hex). The speech encoder will go to its predefined home state at the end of the first received encoder homing frame. Consecutive encoder homing frames will produce the decoder homing frame at the output of the speech encoder.

- b.2) Synchronized to the 13 bit framing of the MS, the SS now sends test sequence SEQSYNC.INP described in 3GPP TS 06.07 subclause 8 to the MS at 104 kbit/s level via the digital audio interface. The SS records the 5,6 kbit/s output bit stream obtained by channel decoding the incoming bit stream from the air interface. The recording shall be triggered by the reception of the decoder homing frame. By comparing the first recorded frame that is not a decoder homing frame with the 160 possible output frames contained in sequences SYNC\*.COD, the offset of the input to the 20 ms framing of the MS is known.
- c) The SS sends test sequence DTX01.INP of PCM samples described in 3GPP TS 06.07 clause 7 on the digital audio interface in the MS at 104 kbit/s (13 bit linear PCM at 8 kHz). The speech encoder of the MS will be reset by the special homing sequence which is at the beginning of the test sequence.
- d) The start of the test sequence is synchronized with the radio transmission on the air interface so that the first traffic frame on the air caused by the first encoder homing frame in the test sequence occurs just after the traffic frame allocated for the SID frame (TDMA frame 0 or 52 modulo 104 for subchannel 0 and TDMA frame 1 or 53 modulo 104 for subchannel 1), allocated for the SID frame (see 3GPP TS 05.02 and 3GPP TS 05.08).
- e) The SS detects whether or not there is any power transmitted over the radio path on a time slot basis excluding SACCH frames. The speech frame by speech frame on/off transmission (on = 1) is calculated and recorded. The recording shall be triggered by the reception of the decoder homing frame. The flag marking the decoder homing frame itself is not recorded.
- f) The SS records the 5,6 kbit/s output bit stream obtained by channel decoding the incoming bit stream from the air interface. The recording shall be triggered by the reception of the decoder homing frame. The decoder homing frame itself is not recorded.
- g) The test is repeated for all test sequences DTX\*.INP described in 3GPP TS 06.07 clause 7.

### 32.9.5 Test requirements

- 1) The bit stream recorded in step e) shall be continuous and bit by bit exactly the same as the sequence of SP-flags contained in the files DTX\*.COD (see file format description in 3GPP TS 06.07 subclause 5 for the position of the SP-flag), except for the bits marking those frames that are SID frames scheduled for transmission according to 3GPP TS 06.41. The first two frames in the reference files \*.COD shall be disregarded for this comparison.
- 2) The bit stream recorded in step f) shall be continuous and bit by bit exactly the same as the sequence describing the speech parameters contained in the files \*.COD described in 3GPP TS 06.07 subclause 7, except for the bits of the speech frames marked with SP-flag=0. The two decoder homing frames at the beginning of each test sequence \*.COD shall be disregarded for this comparison.

## 32.10 Half Rate Speech channel transmission delay

### 32.10.1 Definition and applicability

The total transmission delay within the various elements of a GSM system are specified as round trip delays. For the MS this would be equivalent to applying an RF equivalent of a speech signal to the MS receiver, closing an acoustic path from the ERP to the MRP, detecting the corresponding RF signal at the MS transmitter output and measuring the time interval between the signal originally fed to the MS receiver and that transmitted by the MS transmitter.

This simple approach cannot be demonstrated to be accurate due to the inherent non linear characteristic of the speech transcoder. The overall delay therefore is split into four identifiable and measurable delays. The delays are respectively:

- the downlink delay from RF input to DAI output;
- DAI output to ERP;
- MRP to DAI output; and
- DAI to uplink RF output.

Each delay is defined and its method of test described in the following subclauses.

The requirements and this test applies to all MS supporting TCH/HS.

## 32.10.2 Conformance requirement

The overall speech channel transmission delay shall be less than 143,9 ms.

3GPP TS 03.50 subclause 3.3.6.2.

## 32.10.3 Test purpose

To verify that the round trip delay of a speech channel for a MS which consists of the sum of:

- the downlink delay from RF input to DAI output;
- DAI output to ERP;
- MRP to DAI output; and
- DAI to uplink RF output;

meets the requirements when using the predefined test sequences SEQ01.INP and SEQ01.DEC.

## 32.10.4 Downlink processing delay

### 32.10.4.1 Definition and applicability

The downlink processing delay is the delay from the first bit of a speech block transmitted from the RF output of the SS up to the last bit of the corresponding speech block received at the DAI on the output of the speech transcoder.

The requirements and this test apply to all MS supporting TCH/HS.

### 32.10.4.2 Method of test

#### 32.10.4.2.1 Initial conditions

The DAI of the MS is connected to the SS and is set to the operating mode "Test of speech decoder/DTX functions (downlink)".

#### 32.10.4.2.2 Procedure

- a) The test set up is that described in subclause 32.6.4.2 for downlink speech transcoding.
- b) The SS transmits the test pattern SEQ01.DEC described in 3GPP TS 06.07 subclause 6 to the MS.
- c) The SS measures for each speech block it transmits the time between the first bit at the air interface and the last bit of that speech block on the DAI. This time difference is the delay measured.
- d) Step c) is repeated 20 times and the maximum delay measured in ms is the downlink processing delay TDP.

NOTE: This is to account for the fact that the processing time may not be constant.

## 32.10.5 Downlink coding delay

### 32.10.5.1 Definition and applicability

The downlink coding delay is defined as the delay between the digital representation of an acoustic signal on the DAI and the corresponding acoustic signal at the ERP.

The requirements and this test applies to all MS supporting TCH/HS.

### 32.10.5.2 Method of test

#### 32.10.5.2.1 Initial conditions

The DAI of the MS is connected to the SS and is set to the operating mode "Test of acoustic devices and A/D & D/A".

The handset is mounted in the LRGP (see annex 1 of ITU-T recommendation P.76) and the earpiece is sealed to the knife edge of the artificial ear conforming to ITU-T recommendation P.51.

#### 32.10.5.2.2 Procedure

- The SS generates on the DAI a digital representation of a sine wave with a frequency of 1 000 Hz.
- The SS measures the "phase shift"  $\varnothing_1$ , in the range of 0 to 360 degrees, between the equivalent sine wave generated at the DAI and the sine wave at the input to the artificial ear.
- The frequency is increased to 1 100 Hz and the resulting phase shift  $\varnothing_2$  noted.
- The downlink coding delay TDC is calculated from either:

$$\text{TDC} = (\varnothing_2 - \varnothing_1) \text{ ms}/36 \quad \text{for } \varnothing_2 > \varnothing_1; \text{ or}$$

$$\text{TDC} = (\varnothing_2 + 360 - \varnothing_1) \text{ ms}/36 \quad \text{for } \varnothing_2 < \varnothing_1$$

## 32.10.6 Uplink processing delay

### 32.10.6.1 Definition and applicability

The uplink processing delay is the delay from the first bit of a speech block on the DAI to the last bit of that speech block being transmitted on the air interface of the MS.

The requirements and this test apply to all MS supporting TCH/HS.

### 32.10.6.2 Method of test

#### 32.10.6.2.1 Initial conditions

The DAI of the MS is connected to the SS and is set to the operating mode "Test of speech encoder/DTX functions (uplink)".

#### 32.10.6.2.2 Procedure

- The test set up is that described in subclause 32.8.4.2 for uplink speech transcoding.
- The SS sends one of the test patterns SEQ01.INP described in 3GPP TS 06.07 subclause 6 to the DAI of the MS.
- The SS measures the time between the first bit on the DAI, and the last transmitted bit of the block at the air interface for each speech block the SS sends on the DAI. This time difference is the delay measured.
- Step c) is repeated 20 times. The maximum delay measured in ms is the uplink coding delay TUP.

NOTE: This is to account for the fact that the processing time may not be constant.

## 32.10.7 Uplink coding delay

### 32.10.7.1 Definition and applicability

The uplink coding delay is defined as the delay between an acoustic signal at the MRP and the digital representation of that signal on the DAI.

The requirements and this test applies to all MS supporting TCH/HS.

### 32.10.7.2 Method of test

#### 32.10.7.2.1 Initial conditions

The handset is mounted in the LRGP (see annex 1 of ITU-T recommendation P.76) and the earpiece is sealed to the knife edge of the artificial ear conforming to ITU-T recommendation P.51.

#### 32.10.7.2.2 Procedure

- a) The SS generates an acoustic signal at the artificial mouth of the LRGP, being a pure sine wave with a frequency of 1 000 Hz.
- b) The SS measures the "phase shift"  $\varnothing_1$ , in the range of 0 to 360 degrees, between the signal at the MRP and its digital representation on the DAI.
- c) The SS sets the generated frequency to 1 100 Hz, and measures the resulting phase shift  $\varnothing_2$ .
- d) The uplink coding delay TUC is calculated from either:

$$TDC = (\varnothing_2 - \varnothing_1) \text{ ms}/36 \quad \text{for } \varnothing_2 > \varnothing_1; \text{ or}$$

$$TDC = (\varnothing_2 + 360 - \varnothing_1) \text{ ms}/36 \quad \text{for } \varnothing_2 < \varnothing_1$$

### 32.10.8 Test requirement

The sum of the delays TDP, TDC, TUP, and TUC shall be less than 144,9 ms.

NOTE: This limit includes an allowance of 4\*0,25 ms delay from the DAI to the MS transmission path.

## 32.11 Intra cell channel change from a TCH/HS to a TCH/FS

### 32.11.1 Definition and applicability

Dual rate MSs support an intra cell channel change from a TCH/HS to a TCH/FS by switching the Speech and channel codec used from HR to FR.

The requirements and this test apply to all MS supporting TCH/HS.

### 32.11.2 Conformance requirement:

- 1) When commanded to perform an intra cell channel change from a TCH/HS to a TCH/FS, the MS shall switch channels from HR to FR. The maximum time allowed for the MS to perform this switch in rates is 20 ms.

3GPP TS 05.10, subclause 6.8.

- 2) For an intra cell channel change, the time between the end of the last complete speech or data frame or message block sent on the old channel and the time the MS is ready to transmit on the new channel shall be less than 20 ms.

3GPP TS 05.10, subclause 6.8.

### 32.11.3 Test purpose:

- 1) To verify that the MS encodes speech correctly after performing an intra cell channel change from a TCH/HS to a TCH/FS.
- 2) To verify that the MS, when commanded to perform an intracell channel change to a new ARFCN and/or timeslot number within the same cell, if the starting time is not used in the ASSIGNMENT COMMAND, is

ready to transmit on the new channel within 20 ms of the last complete speech frame or message block sent on the old channel.

#### 32.11.4 Method of test

##### 32.11.4.1 Initial conditions

Uplink DTX is off.

The SS sets up a call according to the generic call set up procedure on a HR channel in the low ARFCN range on timeslot 1.

##### 32.11.4.2 Procedure

- a) The SS records the sequence of BFI flags obtained by channel decoding the incoming bit stream from the uplink air interface using the HR channel decoder on the old channel and at the same time records the sequence of BFI flags obtained by channel decoding the incoming bit stream from the uplink air interface using the FR channel decoder on the channel to which the channel change will take place.
- b) The SS sends an ASSIGNMENT COMMAND to the MS allocating a FR channel in the high ARFCN range on timeslot 2, and with a power command of 7. These old and new carriers have a relative frequency tolerance of 0, and a relative timing tolerance of 1/4 bit.
- c) The time at which the sequence of BFI flags at the output of the HR channel decoder performs the first transition from 0 to 1 is registered ( $t_1$ ). In case of occurrence of speech frames after an RR frame, the next transition of the BFI flag from 0 to 1 after the reception of the RR frame is defined as  $t_1$ .
- d) The time values at which the sequence of BFI flags at the output of the FR channel decoder performs transitions from 1 to 0 are registered. The time  $t_2$  is defined as the time where the BFI flag at the output of the FR channel decoder toggles from 1 to 0 due to a correctly received speech traffic frame received at the channel decoder. Transitions due to the occurrence of an ASSIGNMENT COMPLETE frame or an SABM frame after the reception of good speech frames shall not be considered. If the first frame sent on the new traffic channel was an SABM frame,  $t_2$  is defined as the time the BFI flag toggles from 1 to 0 due to a correctly received speech traffic frame after the reception of the SABM frame.

NOTE: There shall be an allowance of at maximum two transitions for this BFI flag from 0 to 1 and back to zero again after  $t_2$ . These transitions are caused by the SABM frame if it was not the first frame to be sent on the new TCH, or the ASSIGNMENT COMPLETE frame, or both. Since both frames are FACCH frames, each would cause exactly one BFI=1 indications.

- e) The time difference  $Dt = t_2 - t_1$  shall be calculated.

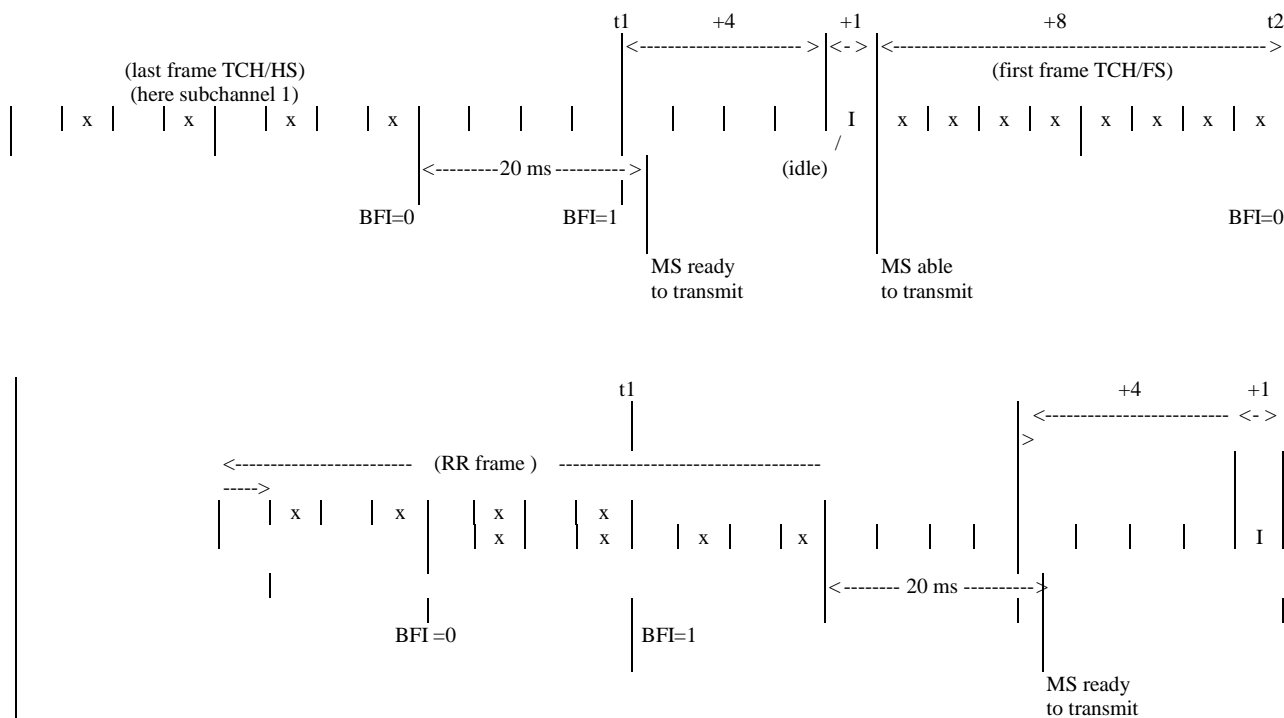

##### 32.11.5 Test requirement

- 1) The last transition of the BFI flag at the output of the FR channel decoder from 1 to 0 shall be followed by a sequence of at least 50 zeroes, interrupted by at maximum two transitions to 1, each interruption containing exactly one BFI=1 flag, caused by the SABM or the ASSIGNMENT COMPLETE frames.
- 2) The calculated time difference  $Dt$  shall not exceed 13 TDMA frames. If the first frame sent on the new channel was an SABM frame, an additional time difference of 4 frames is allowed. If the last frame sent on the old channel was an RR frame, an additional time difference of 9 frames is allowed.

NOTE: The BFI of the old channel will toggle from 0 to 1 only four frames after the reception of the last bit of the speech frame sent on the old channel. The time between the last bit of the last complete speech or data frame or message block sent on the old channel and the time the MS is ready to transmit on the new channel shall be less than 20 ms (3GPP TS 05.10, subclause 6.8). This time will expire 4 frames and 3 timeslots after the sending of the last bit of the last complete speech frame on the old channel, i.e. the MS may not be able to transmit in the corresponding timeslot in the current frame, but must wait approx. 4 frames until the next allowed frame (FN mod 13 = 0, 4 or 8) is reached. The next frame could be an idle frame, so the MS must wait for another frame. This equates to 5 frames, after which the MS is able to start transmission on the new channel. Additionally, 8 frames will be needed due to interleaving until the last bit of the first speech frame on the new channel is received and the BFI flag toggles from 1 to 0. This makes a total of 13 frames or 60 ms between the frame number when the BFI toggles from 0 to 1 on the old channel and the frame number when the BFI toggles from 1 to 0 on the new channel. See diagram below.

If SABM is the first frame received on the new channel, 4 more frames are allowed.

If RR is the last frame sent on the old channel, additionally 9 more frames are allowed (RR frames plus an idle frame).

## 32.12 Intra cell channel change from a TCH/FS to a TCH/HS

### 32.12.1 Definition and applicability

Dual rate MSs support an intra cell channel change from a TCH/FS to a TCH/HS by switching the Speech and channel codec used from FR to HR.

The requirements and this test apply to all MS supporting TCH/HS.

### 32.12.2 Conformance requirement:

- 1) When commanded to perform an intra cell channel change from a TCH/FS to a TCH/HS, the MS shall switch channels from FR to HR.

3GPP TS 05.10 subclause 6.8.

- 2) For an intra cell channel change, the time between the end of the last complete speech or data frame or message block sent on the old channel and the time the MS is ready to transmit on the new channel shall be less than 20 ms.

3GPP TS 05.10, subclause 6.8.

### 32.12.3 Test purpose:

- 1) To verify that the MS encodes speech correctly after performing an intra cell channel change from a TCH/FS to a TCH/HS.
- 2) To verify that the MS, when commanded to perform an intra cell channel change to a new ARFCN and/or new timeslot number within the same cell, if the starting time is not used in the ASSIGNMENT COMMAND, is ready to transmit on the new channel within 20 ms of the last complete speech frame or message block sent on an old channel.

### 32.12.4 Method of test

#### 32.12.4.1 Initial conditions

Uplink DTX is off.

The SS sets up a call according to the generic call set up procedure on a FR channel in the low ARFCN range on timeslot 1.

#### 32.12.4.2 Procedure

- a) The SS records the sequence of BFI flags obtained by channel decoding the incoming bit stream from the uplink air interface using the FR channel decoder on the old channel and at the same time the sequence of BFI flags obtained by channel decoding the incoming bit stream from the uplink air interface using the HR channel decoder on the channel to which the channel change will take place.
- b) The SS sends an ASSIGNMENT COMMAND to the MS allocating a HR channel in the high ARFCN range on timeslot 2, and with a power command of 7. These old and new carriers have a relative frequency tolerance of 0, and a relative timing tolerance of 1/4 bit.
- c) The time at which the sequence of BFI flags at the output of the FR channel decoder performs the first transition from 0 to 1 is registered ( $t_1$ ). In case of occurrence of speech frames after an RR frame, the next transition of the BFI flag from 0 to 1 after the reception of the RR frame is defined as  $t_1$ .
- d) The time values at which the sequence of BFI flags at the output of the HR channel decoder performs transitions from 1 to 0 are registered. The time  $t_2$  is defined as the time where the BFI flag at the output of the FR channel decoder toggles from 1 to 0 due to a correctly encoded speech traffic frame received at the channel decoder. Transitions due to the occurrence of an ASSIGNMENT COMPLETE frame or and SABM frame after the reception of good speech frames shall not be considered. If the first frame sent on the new traffic channel was an SABM frame,  $t_2$  is defined as the time the BFI flag toggles from 1 to 0 due to a correctly received speech traffic frame after the reception of the SABM frame.

NOTE: There shall be an allowance of at maximum two transitions for this BFI flag from 0 to 1 and back to zero again after  $t_2$ . These transitions are caused by the SABM frame if it was not the first frame to be sent on the new TCH, or the ASSIGNMENT COMPLETE frame, or both. Since both frames are FACCH frames, each would cause exactly two BFI=1 indications.

- e) The time difference  $Dt = t_2 - t_1$  shall be calculated.

### 32.12.5 Test requirement

- 1) The last transition of the BFI flag at the output of the HR channel decoder from 1 to 0 shall be followed by a sequence of at least 50 zeroes, interrupted by at maximum two transitions to 1, each interruption containing exactly two BFI=1 flags, caused by the SABM or the ASSIGNMENT COMPLETE frames.

- 2) The calculated time difference  $Dt$  shall not exceed 12 TDMA frames. if the first frame sent on the new channel was an SABM frame,an additional time difference of 9 frames is allowed. If the last frame sent on the old channel was an RR frame, an additional time difference of 5 frames is allowed.

NOTE: The BFI of the old channel will toggle from 0 to 1 only 4 frames after the reception of the last bit of the last speech frame sent on the old channel. The BFI on the old channel will toggle from 0 to 1 only four frames after the reception of the last bit of the last complete speech or data frame or message block sent on the old channel.

The time between the last bit of the last complete speech frame sent on the old channel and the time the MS is ready to transmit on the new channel shall be less than 20 ms (3GPP TS 05.10, subclause 6.8). This time will expire 4 frames and 3 timeslots after the sending of the last bit of the last complete speech frame on the old channel, i.e. the MS may not be able to transmit in the corresponding new timeslot in its current frame, but must wait approx. 4 frames until the next allowed frame (FN mod 13 = 0, 4 or 8) is reached.

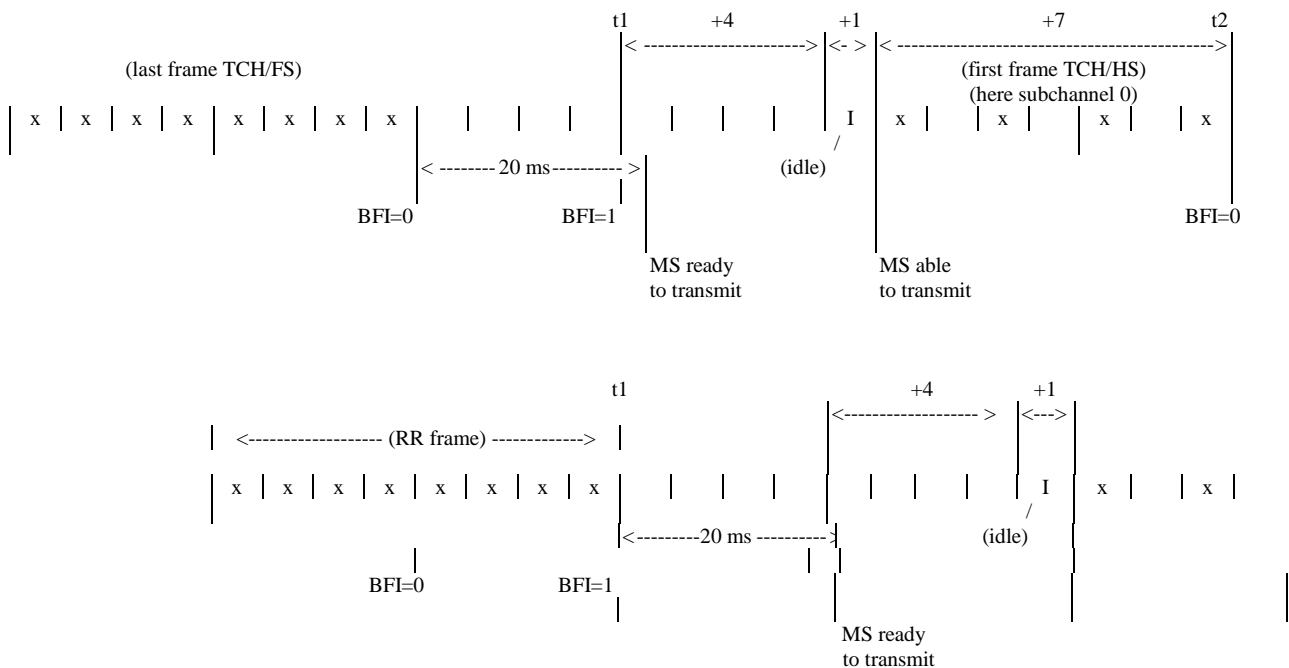

The next frame could be an idle frame, so the MS must wait for another frame. This equates to 5 frames, after which the MS is able to start transmission on the new channel.

Additionally, 7 frames will be needed due to interleaving until the last bit of the first speech frame on the new channel is received and the BFI flag toggles from 1 to 0.

This makes a total of 12 frames or 55,4 ms between the frame number when the BFI toggles from 0 to 1 on the old channel and the frame number when the BFI toggles from 1 to 0 on the new channel. See diagram below.

If SABM is the first frame received on the new channel, 9 more frames are allowed.

If RR is the last frame sent on the old channel, 5 more frames are allowed.

---

## 33 Mobile station features

3GPP TS 02.07 defines mandatory and optional MS features. Their presence and appropriate functioning are verified by the following tests.

### 33.1 Entry and display of called number

#### 33.1.1 Definition and applicability

The entry and display of a called number is the ability of a MS to correctly display and signal to the network the user required number.

The requirements and this test apply to all MS.

#### 33.1.2 Conformance requirement

- 1) The number of the called subscriber is included in the Called party BCD number Information element of the SETUP message for an outgoing call.

The "Display of Called number" shall be implemented in an MS where a human interface is provided.

- 2) The "Numbering plan identification" is included in the Called party BCD number Information element of the SETUP message for an outgoing call.

An MS with MMI shall as default use the Numbering Plan Identification ITU-T E164, unless otherwise indicated by the user.

- 3) The "Type of number" is included in the Called party BCD number Information element of the SETUP message for an outgoing call.

An MS with MMI shall, if the "+" is not entered, and a number is entered, set the Type of Number to "unknown".

- 4) The "Type of number" is included in the Called party BCD number Information element of the SETUP message for an outgoing call.

An MS with MMI shall, if the "+" is entered, and a number is entered, set the Type of Number to "International".

#### 33.1.3 Test purpose

- 1) To verify that an MS with human interface, in a SETUP message sent to originate a call, includes the same "Number digits" in the "Called party BCD number" of the SETUP message as displayed.
- 2) To verify that an MS with MMI, when made to establish a call sends a SETUP message, which includes the "Numbering plan identification" in the "Called party BCD number" of the SETUP message for an outgoing call with the value "ISDN/telephony numbering plan (E.164/E.163)".
- 3) To verify that an MS with MMI, when made to establish a call without use of the "+-key" function, sends a SETUP message, which includes the "Type of number" in the "Called party BCD number" of the SETUP message for an outgoing call with the value "unknown".
- 4) To verify that an MS with MMI, implementing the "+-key" function, when made to establish a call with use of the "+-key" function, sends a SETUP message, which includes the "Type of number" in the "Called party BCD number" of the SETUP message for an outgoing call with the value "international number".

#### 33.1.4 Method of test

##### 33.1.4.1 Initial conditions

The MS is registered in a cell of the SS.

### 33.1.4.2 Procedure

- a) A number (not including "+ function") is entered and then a call is set up.
- b) After the SS has accepted the call the number displayed on the MS and the number received in the SS are compared.
- c) The NPI and TON are examined in the SS.
- d) Steps a) to c) are repeated, but in a), the number entered starts with the "+ function".

NOTE: This test may also be performed automatically using the EMMI.

### 33.1.5 Test requirements

- 1) In step b), both numbers shall be identical.
- 2) In step c), the NPI shall be "E164" and the TON shall be "unknown".
- 3) In step d), the NPI shall be "E164" and the TON shall be "international".

## 33.2 Indication of call progress signals

### 33.2.1 Definition and applicability

Void.

### 33.2.2 Conformance requirement

Void.

### 33.2.3 Test purpose

Void.

### 33.2.4 Ringing tone

#### 33.2.4.1 Method of test

- a) According to subclause "Structured procedures, Mobile originating call, early assignment, Method of test", paragraphs a) to j).

#### 33.2.4.2 Requirements

- 1) According to subclause "Structured procedures, Mobile originating call, early assignment, Requirements", paragraphs 1) to 7).
- 2) The ringing tone characteristics shall be as follows:

| Tone         | Frequency | Tolerance | Type                              |
|--------------|-----------|-----------|-----------------------------------|
| Ringing tone | 425 Hz    | 15 Hz     | Periodic tone on 1 s, silence 4 s |

## 33.2.5 Busy tone

### 33.2.5.1 Method of test

- a) According to subclause "Structured procedures, Mobile originating call, early assignment, Method of test", paragraphs a) to h).
- b) The SS then sends message DISCONNECT with cause number 17.

| Message: DISCONNECT (3GPP TS 04.08 / 3GPP TS 24.008, subclause 9.3.7) to the MS: |                 |
|----------------------------------------------------------------------------------|-----------------|
| Information element                                                              | Comment         |
| Protocol discriminator                                                           | CM              |
| Transaction identifier                                                           | MS orig.        |
| Message type                                                                     |                 |
| Cause                                                                            |                 |
| - Coding standard                                                                | GSM             |
| - Location                                                                       | User            |
| - Cause value                                                                    | #17 "user busy" |

### 33.2.5.2 Requirements

- 1) According to subclause "Structured procedures, Mobile originating call, early assignment, Requirements", paragraphs 1) to 5).
- 2) After the reception of DISCONNECT a busy tone shall be generated. The busy tone characteristics shall be as follows:

| Tone      | Frequency | Tolerance | Type                                    |
|-----------|-----------|-----------|-----------------------------------------|
| Busy tone | 425 Hz    | 15 Hz     | Periodic tone on 500 ms, silence 500 ms |

## 33.2.6 Congestion tone

### 33.2.6.1 Method of test

- a) According to subclause "Structured procedures, Mobile originating call, early assignment, Method of test", paragraphs a) to h).
- b) The SS then sends message DISCONNECT with cause number 42.

DISCONNECT message: As in subclause 33.2.3.1 with cause value #42 "Switching equipment congestion" (0101010).

### 33.2.6.2 Requirements

- 1) According to subclause "Structured procedures, Mobile originating call, early assignment, Requirements", paragraphs 1) to 5).
- 2) After the reception of DISCONNECT a congestion tone shall be generated.
- 3) The congestion tone characteristics shall be as follows:

| Tone            | Frequency | Tolerance | Type                                    |
|-----------------|-----------|-----------|-----------------------------------------|
| Congestion tone | 425 Hz    | 15 Hz     | Periodic tone on 200 ms, silence 200 ms |

## 33.2.7 Authentication failure tone

### 33.2.7.1 Method of test

- a) According to subclause "Structured procedures, Mobile originating call, early assignment, Method of test", paragraphs a) to e).
- b) After reception of message AUTHENTICATION RESPONSE the SS sends message AUTHENTICATION REJECT.

| <b>Message: AUTHENTICATION REJECT (3GPP TS 04.08 / 3GPP TS 24.008, 9.2.1) to the MS:</b> |                |
|------------------------------------------------------------------------------------------|----------------|
| <b>Information element</b>                                                               | <b>Comment</b> |
| Protocol discriminator                                                                   | MM             |
| Transaction identifier                                                                   | not relevant   |
| Message type                                                                             |                |

### 33.2.7.2 Requirements

- 1) According to subclause "Structured procedures, Mobile originating call, early assignment, Requirements", paragraphs 1) to 4).
- 2) After reception of AUTHENTICATION REJECT a tone shall be generated indicating authentication failure.
- 3) The authentication failure tone is the error/special information tone with characteristics as follows:

| <b>Tone</b>      | <b>Frequency</b> | <b>Tolerance</b> | <b>Type</b>     |
|------------------|------------------|------------------|-----------------|
| Error/Special    | 950 Hz           | 50 Hz            | Triple tone     |
| Information tone | 1400 Hz          | 50 Hz            | tones on 330 ms |
|                  | 1800 Hz          | 50 Hz            | silence 1,0 s   |

## 33.2.8 Number unobtainable tone

### 33.2.8.1 Method of test

- a) According to subclause "Structured procedures, Mobile originating call, early assignment, Method of test", paragraphs a) to h).
- b) The SS then sends message DISCONNECT with cause number 1.

DISCONNECT message: As in subclause 33.2.3.1 with cause value #1 "Unassigned (unallocated) number" (000001).

### 33.2.8.2 Requirements

- 1) According to subclause "Structured procedures, Mobile originating call, early assignment, Requirements", paragraphs 1) to 5).
- 2) After reception of DISCONNECT a tone shall be generated indicating that the called number is unobtainable.

The number unobtainable tone is the error/special information tone with characteristics as in subclause 33.2.7.2.

## 33.2.9 Call dropped tone

### 33.2.9.1 Method of test

- a) According to subclause "Structured procedures, Mobile originating call, early assignment, Method of test", paragraphs a) to l). However, it shall be indicated in the system information messages that call re-establishment shall not be attempted (RACH control parameters).

- b) When the call has been established the SS stops transmitting on the TCH/SACCH.

### 33.2.9.2 Requirements

- 1) According to subclause "Structured procedures, Mobile originating call, early assignment, Requirements", paragraphs 1) to 8).
- 2) After the radio link time-out period has expired a tone shall be generated indicating that the call has been dropped.

The call dropped tone characteristics shall be as follows:

| Tone              | Frequency | Tolerance | Type                                                    |
|-------------------|-----------|-----------|---------------------------------------------------------|
| Call dropped tone | 425 Hz    | 15 Hz     | Tone on 200 ms,<br>silence 200 ms<br>3 bursts of on/off |

## 33.3 Network selection / indication

### 33.3.1 Definition and applicability

Network selection and indication is the ability of the MS to correctly select a network and display to the user in accordance with 3GPP TS 02.11 and 3GPP TS 03.22.

The requirements and this test apply to all MS.

Tests concerning the MS behaviour after having received a location updating reject message with specific causes are included in subclause 26.7.4.2.

Tests concerning the MS handling of the forbidden PLMN list are also included in subclause 26.7.4.

### 33.3.2 Conformance requirement

- 1) Upon switching on, when an IMSI is available and there is no registered PLMN on the SIM, the MS shall select its Home PLMN and perform the cell selection procedure.
- 2) If the MS loses radio coverage for its registered PLMN, and the MS is in automatic PLMN selection mode, it shall attempt to select its Home PLMN.
- 3) If the Registered PLMN is unavailable due to the loss of radio coverage and the MS is in automatic PLMN selection mode and the HPLMN is also unavailable, it shall attempt to select a suitable cell and access the PLMNs in turn, in the order of priority as stored in the SIM.
- 4) If there is no registered PLMN in the SIM or the registered PLMN is unavailable and If the Home PLMN is unavailable and the MS is in automatic PLMN selection mode, it shall attempt to select a suitable cell and accesses the PLMNs in turn, in the order of priority as stored in the SIM, upon switching on and when the IMSI is available.
- 5) An MS, roaming in a VPLMN whose MCC is the same as the MCC of the IMSI, shall periodically attempt to obtain service on its Home PLMN in automatic mode. For this purpose, a value T minutes, which is the HPLMN search period, may be stored in the SIM; T is either in the range 6 minutes to 8 hours in 6 minutes step or it indicates that no periodic attempt shall be made. If no HPLMN search value is available on the SIM the mobile equipment shall use a default value of 30 minutes.
- 6) At switch on, the MS selects and attempts to perform a Location Update on the Registered PLMN if it exists. If the registered PLMN is a VPLMN of the SIM's home country, the MS shall wait at least 2 minutes before attempting to obtain service on its home PLMN.

### 33.3.3 Test purpose

- 1) To verify that the MS with SIM containing in the PLMN selector field at least one PLMN different from the Home PLMN and containing no registered PLMN, when in automatic PLMN selection mode, selects its Home

PLMN, if available, upon switching on and when the IMSI is available. (This is verified by observation of the location updating procedure).(Steps 1.1 through 1.5).

- 2) To verify that if the MS loses radio coverage for its registered PLMN, and the MS is in automatic PLMN selection mode, it shall attempt to select its Home PLMN. (Steps 1.14C through 1.16C).
- 3) To verify that the MS, when it loses radio coverage for its selected PLMN (i.e. Registered PLMN) and in automatic PLMN selection mode, selects the PLMN with the highest priority among the PLMNs stored on the SIM, if the Home PLMN is unavailable. (Steps 1.10 through 1.12).
- 4) If there is no registered PLMN in the SIM or the registered PLMN is unavailable and If the Home PLMN is unavailable and the MS is in automatic PLMN selection mode, it shall attempt to select a suitable cell and accesses the PLMNs in turn, in the order of priority as stored in the SIM, upon switching on and when the IMSI is available. (Steps 1.22 through 1.25).
- 5) To verify that an MS, roaming in a VPLMN whose MCC is the same as the MCC of the IMSI, shall attempt to obtain service on its Home PLMN in automatic mode with a period of T. To verify that the MS shall not attempt to obtain service on its home PLMN in automatic mode when T is set to "no periodic attempts shall be made". To verify that a default value of 30 min is used when no HPLMN search timer value is available on the SIM. (Steps 1.13 A through 1.15A, 1.13B through 1.15B and 1.13C.)
- 6) To verify that, at switch on, the MS selects and attempts to perform a Location Update on the registered PLMN if it exists. If the registered PLMN is a VPLMN of the SIM's home country, the MS shall wait at least 2 minutes before attempting to obtain service on its home PLMN. (Steps 1.25 through 1.28).

## Reference

- Requirements 1, 2, 3: see 3GPP TS 03.22 subclause 4.4.3.1.  
 Requirements 4: see 3GPP TS 03.22 subclause 3.1.  
 Requirement 5, 6: see 3GPP TS 03.22 subclause 4.4.3.3.

### 33.3.4 Method of Test

Procedure 1: This procedure applies to both automatic and manual mode for PLMN selection. This procedure is run for each of the following cases:

- case A) Timer T is set to 6 min in the SIM.
- case B) No HPLMN search timer value is available on the SIM.
- case C) Timer T is set to "no periodic attempt to obtain service on the HPLMN shall be made" in the SIM.

Procedure 2: This procedure applies to the manual mode for PLMN selection.

#### 33.3.4.1 Procedure 1

- 1.1) The MS is set up with a SIM which contains, in the "PLMN selector" data field, a list of 3 PLMN in the priority order PLMN2 (highest priority), PLMN3, PLMN4 (lowest priority). PLMN1 is the Home PLMN of the MS as defined in the IMSI. The "Forbidden PLMN" data field shall contain NULL values. "registered PLMN" data field shall contain Null values.
  - case A) Timer T is set to 6 min in the SIM.
  - case B) No HPLMN search timer value is available on the SIM.
  - case C) Timer T is set to "no periodic attempt to obtain service on the HPLMN shall be made" in the SIM.
- 1.2) The SS transmits 4 BCCH carriers with the following parameters:

|           | PLMN                             | Level dB $\mu$ Vemf( ) |
|-----------|----------------------------------|------------------------|
| Carrier 1 | PLMN1 any value for MCC          | 28                     |
| Carrier 2 | PLMN2 any value for MCC          | 33                     |
| Carrier 3 | PLMN3 with the same MCC as PLMN1 | 38                     |
| Carrier 4 | PLMN4 any value for MCC          | 43                     |

Each carrier has the "IMSI attach" (ATT) flag set in the BCCH data. (The purpose of this is to force the MS to do location updating whenever it is switched on, so that the SS can determine which PLMN has been selected).

The other system information parameters are as in table 33-1.

- 1.3) The MS is brought into the "on" condition with automatic selection mode active.
- 1.4) The SS checks that the MS sends a "location updating request" on carrier 1.
- 1.5) The SS sends a "location updating accept" message to the MS on carrier 1. After 5 s, the MS "selected PLMN indicator" is checked.
- 1.6) The SS switches off carriers 1.
- 1.7) The SS checks that the MS sends a "location updating request" on carrier2.
- 1.8) The SS sends a "location updating accept" message to the MS on carrier 2. After 5 s, the MS "selected PLMN indicator" is checked.
- 1.9) Carrier 2 is turned off.
- 1.10) The SS checks that the MS sends a "location updating request" on carrier 3.
- 1.11) The SS sends a "location updating accept" message on carrier 3. After 5 s, the MS "selected PLMN indicator" is checked.
- 1.12) Carriers 1 and 2 are turned on with the same parameters as in step 1.2) above.

In case A for which T is set to 6 min, take branch A.

In case B for which default value for T is applied take branch B.

In case C for which T is set to "no periodic attempt shall be made", take branch C.

#### Branch A

- 1.13A) The SS checks that the MS does not send a "location updating request" on either carrier 1 or 2 during 6 minutes after step 1.11 is completed.
- 1.14A) The SS checks that the MS sends a "location updating request" on channel 1 between 6 and 12 min after step 1.11 is completed.
- 1.15A) The SS sends a "location updating accept" message on carrier 1. After 5 s, the MS "selected PLMN indicator" is checked.

#### Branch B

- 1.13B) The SS checks that the MS does not send a "location updating request" on either carrier 1 or 2 during 30 minutes after step 1.11 is completed.
- 1.14B) The SS checks that the MS sends a "location updating request" on channel 1 between 30 and 60 min after step 1.11 is completed.
- 1.15B) The SS sends a "location updating accept" message on carrier 1. After 5 s, the MS "selected PLMN indicator" is checked.

#### Branch C

- 1.13C) The SS checks that the MS does not send a "location updating request" on either carrier 1 or 2 during 40 min.
- 1.14C) The SS switches off carrier 3.
- 1.15C) The SS checks that the MS sends a "location updating request" on channel 1.
- 1.16C) The SS sends a "location updating accept" message on carrier 1. After 5 s, the MS "selected PLMN indicator" is checked.
- 1.17) The SS switches off carrier 1 and switches on carrier 3.
- 1.18) The SS checks that the MS sends a "location updating request" on carrier 2.
- 1.19) The SS sends a "location updating accept" message on carrier 2. After 5 s, the MS "selected PLMN indicator" is checked.
- 1.20) The mobile station is switched off.
- 1.21) The SS switches off carrier 2.
- 1.22) The mobile station is switched on.
- 1.23) The SS checks that the MS sends a "location updating request" on carrier 3.
- 1.24) The SS sends a "location updating accept" message on carrier 3. After 5 s, the MS "selected PLMN indicator" is checked.
- 1.25) The MS is switched off.
- 1.26) The SS switches on carrier 1.
- 1.27) The mobile station is switched on.
- 1.28) The SS checks that the MS does not send a "location updating request" on carrier 1. After 2 minutes, the MS "selected PLMN indicator" is checked.

### 33.3.4.2 Requirements 1

Requirement 1.1) is mandatory for all MS. Requirements 1.2) and 1.3) only apply to MS with a human interface.

- 1.1) The MS shall make a response as indicated in steps 1.4, 1.7, 1.10, 1.13A, 1.13B, 1.14A, 1.14B, 1.15C, 1.18, 1.23 above. In cases 1.4, 1.7, 1.10, 1.15C, 1.18 and 1.23, the MS shall respond within 30 s.
- 1.2) The selected PLMN shall be indicated:

|                 |       |       |       |         |       |
|-----------------|-------|-------|-------|---------|-------|
| End of Step     | 1,5   | 1,8   | 1,11  | 1,15A/B | 1,16C |
| PLMN indicated: | PLMN1 | PLMN2 | PLMN3 | PLMN1   | PLMN1 |
| End of Step     | 1,19  | 1,24  | 1,28  |         |       |
| PLMN indicated: | PLMN2 | PLMN3 | PLMN3 |         |       |

### 33.3.4.3 Procedure 2

- 2a) The MS is set up with a SIM which contains NULL values in the "PLMN selector" data field. PLMN1 is the Home PLMN of the MS as defined in the IMSI. The "forbidden PLMN" data field shall contain PLMN3. the "registered PLMN" field is set to PLMN2.
- 2b) The SS transmits 4 BCCH carriers with the following parameters:

|           | PLMN  | Level dB $\mu$ V <sub>emf</sub> ( ) |
|-----------|-------|-------------------------------------|
| Carrier 1 | PLMN1 | 28                                  |
| Carrier 2 | PLMN2 | 33                                  |
| Carrier 3 | PLMN3 | 38                                  |
| Carrier 4 | PLMN4 | 43                                  |

Each carrier has the "IMSI attach" (ATT) flag set in the BCCH data. (The purpose of this is to force the MS to do location updating whenever it is switched on, so that the SS can determine which PLMN has been selected.)

The other system information parameters are as in table 33-1.

2c) The MS is brought into the "on" condition with manual selection mode active.

2d) The SS checks that the MS sends a "location updating request" on carrier 2.

#### 33.3.4.4 Requirements 2

2.1) The MS shall make a response as indicated in step 2d). The MS shall respond within 30 s.

**Table 33-1: Normal system information fields**

| Parameter                | Reference in 3GPP TS 04.08 /<br>3GPP TS 24.008 /<br>3GPP TS 44.018 | Abbreviation | Normal setting                              |
|--------------------------|--------------------------------------------------------------------|--------------|---------------------------------------------|
| Cell Channel Description | 10.5.2.1                                                           | -            | Any values                                  |

## 33.4 Invalid and blocked PIN indicators

### 33.4.1 Definition and applicability

The requirements and this test apply to all MS.

### 33.4.2 Conformance requirement

Void.

### 33.4.3 Test purpose

Void.

#### 33.4.4 Method of test

##### 33.4.4.1 Initial conditions

The MS contains a SIM with the PIN enabled, and the SIM unblocking counter set to zero by previous presentation of the personal unblocking key.

##### 33.4.4.2 Procedure

- a) The MS is switched on.
- b) Three wrong PIN are entered.

Activation may be either manual or via the EMMI.

##### 33.4.5 Test requirements

For the first and second incorrect PIN the MS shall indicate that the PIN code has been rejected.

For the third incorrect PIN the MS shall indicate that the PIN is blocked.

## 33.5 Service indicator

##### 33.5.1 Definition and applicability

The requirements and this test apply to all MS.

##### 33.5.2 Conformance requirement

Void.

##### 33.5.3 Test purpose

Void.

##### 33.5.4 Method of test

###### 33.5.4.1 Initial conditions

- a) The MS is in idle mode, unregistered.
- b) The SS shall emulate perfect radio conditions so that the MS is able to register and to set up or receive a call.

###### 33.5.4.2 Procedure

- a) The MS is brought in an active state by either switching it on or by inserting a SIM.

##### 33.5.5 Test requirements

- 1) The successful registration and the good condition shall be indicated by the MS indicator and by the SS.

## 33.6 Subscription identity management

##### 33.6.1 Definition and applicability

Subscription identity management is the ability of the MS to prevent the establishment of MO (except MO emergency calls) and MT calls without a valid subscription.

The requirements and this test apply to all MS.

### 33.6.2 Conformance requirement

An MS can only be operated, if a valid IMSI is present.

### 33.6.3 Test purpose

- 1) To verify that during an established call: either
  - 1.1) on removal of the SIM from an MS, the MS will perform an IMSI detach; or
  - 1.2) after removing the power source from the MS, removing the SIM, and restoring the power source to the MS, the MS may perform an IMSI detach.
- 2) To verify that an MS without SIM card will not establish a MO call which is not an emergency call.
- 3) To verify that an MS without SIM card will not accept an incoming call.

### 33.6.4 Method of test

#### 33.6.4.1 Initial conditions

Void.

#### 33.6.4.2 Procedure

- a) A call is set up.
- b) (Reserved).
- c) Either:
  - (i) the SIM is removed; or
  - (ii) where this is not possible, the power source is removed from the MS, the SIM is removed and the power source is restored to the MS.

The SS observes whether or not the MS performs IMSI detach.

- d) An attempt to establish a MO call is made (not an emergency call).
- e) An attempt to establish a MT call is made.

### 33.6.5 Test requirements

- 1) Either:
  - 1.1) in step c(i), the MS shall perform an IMSI detach; or
  - 1.2) in step c(ii), the MS may perform an IMSI detach.
- 2) In step d) the MS shall not attempt to set up a new call via the Um interface.
- 3) In step e), the MS shall not respond to the attempt to set up a new call via the Um interface.

## 33.7 Barring of outgoing calls

### 33.7.1 Definition and applicability

The barring of outgoing calls is an optional feature. It is the ability of the MS to prevent all MO calls except emergency calls.

The requirements and this test apply to all MS supporting this feature.

### 33.7.2 Conformance requirement

An MS may have an optional facility to bar outgoing calls. Such barring facility shall not prevent the transmission on emergency calls.

### 33.7.3 Test purpose

To verify that an MS for which a local facility to bar outgoing calls has been declared as being implemented, is able to establish an emergency call if this facility is activated.

### 33.7.4 Method of test

#### 33.7.4.1 Initial conditions

Void.

#### 33.7.4.2 Procedure

- a) The local facility to bar outgoing calls is activated.
- b) Via MMI, the MS is actioned to establish an emergency call.

### 33.7.5 Test requirements

- 1) The MS shall establish an emergency call.

## 33.8 Prevention of unauthorized calls

### 33.8.1 Definition and applicability

The prevention of unauthorized calls is an optional feature in the MS. It is the ability of the MS to prevent unauthorized use by using a key or keyword protection facility. When activated the MS does not prevent the establishment of except emergency calls.

The requirements and this test apply to all MS supporting this feature.

### 33.8.2 Conformance requirement

An MS may have an optional facility to prevent unauthorized use. Such facility shall not prevent the transmission on emergency calls.

### 33.8.3 Test purpose

To verify that an MS for which a local facility to prevent unauthorized use has been declared to be implemented, is able to establish an emergency call, if this facility is activated.

### 33.8.4 Method of test

#### 33.8.4.1 Initial conditions

#### 33.8.4.2 Procedure

- a) The local facility to restrict operation such that the MS can only be operated by using a key or a keyword is activated. The most restrictive situation is created.
- b) Via MMI, the MS is actioned to establish an emergency call.

### 33.8.5 Test requirements

- 1) The MS shall establish an emergency call.

---

## 34 Short message service (SMS)

Ref.: 3GPP TS 03.40, 3GPP TS 04.11 (point to point)  
3GPP TS 03.41, 3GPP TS 04.12 (cell broadcast)

### 34.1 General

The purpose of these tests is to verify that the MS can handle GSM functions when submitting or receiving Short Messages (SM) between MS and a short message service centre as described in 3GPP TS 03.40.

The procedures are based upon services provided by the Mobility Management (MM) sublayer which is not tested in this case.

The SMS comprises three basic services. The SMS point to point services shall work in an active MS at any time independent of whether or not there is a speech or data call in progress. The SMS cell broadcast service only works when the MS is in idle mode.

Since the timer TC1M currently is not standardized, the value of TC1M shall be declared by the manufacturer (to be used in subclauses 34.2.1 and 34.2.2).

The manufacturer shall declare whether SMS messages are stored in the SIM and/or the ME. This shall be referred to as the SMS message store in the following tests.

Unless otherwise stated default message contents from subclause 26.6.14 applies for GSM 900 and default message contents from subclause 26.6.15 applies for DCS 1 800 and default message contents from subclause 26.6.16 applies for GSM 450 and default message contents from subclause 26.6.17 applies for GSM 480 and default message contents from subclause 26.6.18 applies for PCS 1 900 and default message contents from subclause 26.6.19 applies for GSM 700 and default message contents from subclause 26.6.20 applies for GSM 850.

### 34.2 Short message service point to point

#### 34.2.1 SMS mobile terminated

##### 34.2.1.1 Conformance requirements

An active MS shall be able to receive short message TPDU (SMS-DELIVER) at any time, independently of whether or not there is a speech or data call in progress. A report will always be returned to the SC, confirming that the MS has received the short message.

##### Reference

3GPP TS 03.40; 3.1.

##### 34.2.1.2 Test purpose

To verify the ability of a MS to receive and decode the SMS where provided for the point to point service.

##### 34.2.1.3 Method of test

##### Initial Conditions

System simulator:

1 cell, default parameters.

Mobile Station:

The MS shall be in "Idle, updated" state.

The SMS message storage shall be empty.

#### Related PICS/PIXIT Statements

- Support for Short message MT/PP.
- Description of the basic procedures to display a mobile terminated short message.
- The value of timer TC1M.
- Whether SMS messages are stored in the SIM and/or the ME.
- Support for call control state U10.

#### Foreseen Final State of MS

Idle, updated.

#### Test Procedure

- a) The SS initiates the transmission of a short message using a paging request. Upon response of the MS to the paging the SS assigns an SDCCH, authenticates the MS and activates ciphering. Then the SS establishes SAPI 3 by sending a SABM frame with SAPI 3 on the SDCCH.

When a UA frame (SAPI 3) is received in response, the SS sends a CP-DATA message. The information element of the CP-DATA message will be RP-DATA RPDU (SMS DELIVER TPDU).

- b) The SS waits a maximum of 25 s for the CP-ACK message and then a maximum of 60 s for the CP-DATA message containing the RP-ACK RPDU.
- c) The SS sends a CP-ACK to the MS within TC1M with no further CP-DATA messages and the SS initiates channel release.
- d) Steps a), b) and c) are repeated but the first CP-DATA message from the MS is not acknowledged. The second CP-DATA message from the MS is acknowledged by a CP-ACK within a time TC1M.
- e) Steps a) and b) are repeated. The SS is configured not to send CP-ACK. Then maximum 3 CP-DATA retransmissions may occur. After a duration of TC1M + 5 s after the last CP-DATA retransmission the SS then initiates the channel release. The 5 s is the appropriate time to wait to verify that the MS does not send more than the maximum allowed (3) CP-DATA retransmissions.
- f) The SMS message store shall be cleared manually by the operator.
- g) A data or speech call is established on a TCH with the SS and the state U10 of call control is entered. The SS sends a SABM frame with SAPI-3 on the SACCH associated to the TCH.

When a UA frame (SAPI-3) is received in response, the SS sends a CP-DATA message. The information element of the CP-DATA message will be RP-DATA RPDU (SMS DELIVER TPDU). The SS waits a maximum of 25 s for the CP-ACK message and then a maximum of 60 s for the CP-DATA message containing the RP-ACK RPDU.

- h) The SS sends a CP-ACK to the MS within TC1M with no further CP-DATA messages and the SS initiates channel release. The SMS message store shall be cleared manually by the operator.
- i) Steps g) and h) are repeated but the first CP-DATA message from the MS is not acknowledged. The second CP-DATA message from the MS is acknowledged by a CP-ACK within a time TC1M.
- j) Step g) is repeated. The SS is configured not to send CP-ACK. Then maximum 3 CP-DATA retransmissions may occur. After a duration of TC1M + 15 s after the last CP-DATA retransmission the SS initiates the channel release. The 15 s is the appropriate time to wait to verify that the MS does not send more than the maximum allowed (3) CP-DATA retransmissions (during a call in progress).

- k) A data or speech call is established on a TCH with the SS and the state U10 of call control shall be entered. The SS sends a SABM frame with SAPI-3 on the SACCH associated to the TCH. After the UA response on SAPI-3, the speech call is cleared by the SS with a disconnect message. (The call clearing is continued on the FACCH in parallel to the following exchange of messages related to SMS).

The SS sends a CP-DATA RPDU (SMS DELIVER TPDU) message. The information element of the CP-DATA message is RP-DATA.

The SS waits a maximum of 25 s for the CP-ACK message and then a maximum of 60 s for the CP-DATA message containing the RP-ACK RPDU.

The SS sends a CP-ACK to the MS within TC1M with no further CP-DATA messages and the SS initiates channel release.

The SMS message store shall be cleared manually by the operator.

- l) A data or speech call is established on a TCH with the SS and the state U10 of call control is entered. The SS sends a SABM frame with SAPI-3 on the SACCH associated to the TCH. After the UA response on SAPI-3, the speech call shall be cleared from the MS. (The call clearing is continued on the FACCH in parallel to the following exchange of messages related to SMS).

The SS sends a CP-DATA message. The information element of the CP-DATA message is RP-DATA RPDU (SMS DELIVER TPDU).

The SS waits a maximum of 25 s for the CP-ACK message and then a maximum of 60 s for the CP-DATA message containing the RP-ACK RPDU.

The SS sends a CP-ACK to the MS within TC1M with no further CP-DATA messages and the SS initiates channel release.

The SMS message store shall be cleared manually by the operator.

#### Maximum Duration of Test

20 minutes.

#### Expected Sequence

| Step | Direction | Message                 | Comments                                                                                                                                                       |
|------|-----------|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PAGING REQUEST          |                                                                                                                                                                |
| 2    | MS -> SS  | CHANNEL REQUEST         | Establishment cause is "Answer to paging"                                                                                                                      |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT    | SS assigns an SDCCH                                                                                                                                            |
| 4    | MS -> SS  | PAGING RESPONSE         | Message is contained in SABM.                                                                                                                                  |
| 5    | SS -> MS  | AUTHENTICATION REQUEST  |                                                                                                                                                                |
| 6    | MS -> SS  | AUTHENTICATION RESPONSE | SRES specifies correct value.                                                                                                                                  |
| 7    | SS -> MS  | CIPHERING MODE COMMAND  | SS starts deciphering after sending the message.                                                                                                               |
| 8    | MS -> SS  | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered.                                                                                     |
| 9    | SS        |                         | SS starts ciphering.                                                                                                                                           |
| 10   | SS -> MS  | SABM (SAPI=3)           | SS establishes SAPI 3                                                                                                                                          |
| 11   | MS -> SS  | UA (SAPI=3)             | MS shall respond to SABM in step 10                                                                                                                            |
| 12   | SS -> MS  | CP-DATA                 | Contains RP-DATA RPDU (SMS DELIVER TPDU)                                                                                                                       |
| 13   | SS        |                         | Waits max 25 s for CP-ACK                                                                                                                                      |
| 14   | MS -> SS  | CP-ACK                  |                                                                                                                                                                |
| 15   | SS        |                         | Waits max 60 s for RP-ACK RPDU                                                                                                                                 |
| 16   | MS -> SS  | CP-DATA                 | Contains RP-ACK RPDU                                                                                                                                           |

| 96   | MS -> SS  | CP-DATA          | First CP-DATA from MS, contains RP-ACK RPDU                                                                                                                             |
| 97   | SS        |                  | First CP-DATA message not acknowledged by SS                                                                                                                            |
| 98   | MS -> SS  | CP-DATA          | Transmitted CP-DATA message within twice TC1M after step 96, contains RP-ACK RPDU                                                                                       |
| 99   | SS        |                  | Retransmitted CP-DATA message not acknowledged by SS                                                                                                                    |
| 100  | MS        |                  | Depending on the maximum number of CP-DATA retransmissions implemented, step 98-99 may be repeated. The maximum number of retransmissions may however not exceed three. |
| 101  | SS -> MS  | CHANNEL RELEASE  | The main signalling link is released after a duration of TC1M + 15 s after the last CP-DATA retransmission.                                                             |
| 102  | MS        |                  | The MS shall indicate that an SM has arrived. If the MS provides the functionality to display MT messages, it is checked that the correct message is displayed          |
| 103  | MS        |                  | Clear the SMS message store                                                                                                                                             |
| 104  | SS        |                  | A data or speech call is established on a TCH and the state U10 of call control is entered.                                                                             |
| 105  | SS -> MS  | SABM (SAPI=3)    | Sent on SACCH associated with the TCH                                                                                                                                   |
| 106  | MS -> SS  | UA (SAPI=3)      | The MS shall respond to the SABM                                                                                                                                        |
| 107  | SS -> MS  | DISCONNECT       | The speech call is cleared by the SS. The call clearing is continued on the FACCH in parallel to the following exchange of messages related to SMS.                     |
| 108  | SS -> MS  | CP-DATA          | Contains RP-DATA RPDU (SMS DELIVER TPDU)                                                                                                                                |
| 109  | SS        |                  | Waits max 25 s for CP-ACK                                                                                                                                               |

| Step | Direction | Message          | Comments                                                                                                                                                       |
|------|-----------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 110  | MS -> SS  | CP-ACK           |                                                                                                                                                                |
| 111  | SS        |                  | Waits max 60 s for RP-ACK RPDU                                                                                                                                 |
| 112  | MS -> SS  | CP-DATA          | Contains RP-ACK RPDU                                                                                                                                           |
| 113  | SS -> MS  | CP-ACK           |                                                                                                                                                                |
| 114  | MS        |                  | There should be no further CP-DATA messages until the MS aborts the RR connection (disconnection of layer 2).                                                  |
| 115  | MS        |                  | The MS shall indicate that an SM has arrived. If the MS provides the functionality to display MT messages, it is checked that the correct message is displayed |
| 116  | MS        |                  | Clear the SMS message store                                                                                                                                    |
| 117  | SS        |                  | A data or speech call is established on a TCH and the state U10 of call control is entered.                                                                    |
| 118  | SS -> MS  | SABM (SAPI=3)    | Sent on SACCH associated with the TCH                                                                                                                          |
| 119  | MS -> SS  | UA (SAPI=3)      | The MS shall respond to the SABM                                                                                                                               |
| 120  | MS -> SS  | DISCONNECT       | The speech call is cleared from the MS.                                                                                                                        |
| 121  | SS -> MS  | CP-DATA          | Contains RP-DATA RPDU (SMS DELIVER TPDU)                                                                                                                       |
| 122  | SS -> MS  | RELEASE          | This message is likely to be sent on the FACCH before all of the CP-DATA message has been sent on the SACCH.                                                   |
| 123  | MS -> SS  | RELEASE COMPLETE |                                                                                                                                                                |
| 124  | MS -> SS  | CP-ACK           | shall be sent before 25 s after the start of step 121                                                                                                          |
| 125  | SS        |                  | Waits max 60 s for RP-ACK RPDU                                                                                                                                 |
| 126  | MS -> SS  | CP-DATA          | Contains RP-ACK RPDU                                                                                                                                           |
| 127  | SS -> MS  | CP-ACK           |                                                                                                                                                                |
| 128  | MS        |                  | There should be no further CP-DATA messages until the MS aborts the RR connection (disconnection of layer 2).                                                  |
| 129  | MS        |                  | The MS shall indicate that an SM has arrived. If the MS provides the functionality to display MT messages, it is checked that the correct message is displayed |
| 130  | MS        |                  | Clear the SMS message store                                                                                                                                    |

NOTE: Time values for SS wait time are chosen sufficiently high to be sure that the MS has enough time to respond to the different messages.

Specific Message Contents:

SMS DELIVER TPDU

| Information element | Comment                             | Value       |
|---------------------|-------------------------------------|-------------|
| TP-MTI              | SMS DELIVER                         | "00"B       |
| TP-MMS              | more messages are waiting in SC     | "0"B        |
| TP-RP               | no reply path                       | "0"B        |
| TP-UDHI             | TP-UD contains only the SM          | "0"B        |
| TP-SRI              | no status report returned           | "0"B        |
| TP-OA               | an international number coded E.164 |             |
| TP-PID              | default                             | "00000000"B |
| TP-DCS              | default alphabet                    | "00000000"B |
| TP-SCTS             | any legal value (cf. 3GPP TS 03.40) |             |
| TP-UDL              | 160                                 |             |
| TP-UD (140 octets)  | text of message (160 characters)    |             |

NOTE: The 160 characters shall include at least one occurrence of each character in the default alphabet (see 3GPP TS 03.40 annex 2).

## 34.2.2 SMS mobile originated

### 34.2.2.1 Conformance requirements

An active MS shall be able to submit short message TPDU (SMS-SUBMIT) at any time, independently of whether or not there is a speech or data call in progress.

## Reference

3GPP TS 03.40; subclause 3.1.

### 34.2.2.2 Test purpose

To verify that the MS is able to correctly send a short message where the SMS is provided for the point to point service. The test also verifies that the MS is capable of simultaneously receive a network originated SM whilst sending a mobile originated SM.

### 34.2.2.3 Method of test

## Initial Conditions

System simulator:

1 cell, default parameters.

Mobile Station:

The MS shall be in "Idle, updated" state.

The SMS message storage shall be empty.

## Related PICS/PIXIT Statements

- Support for Short message MO/PP.
- Description of the basic procedures to display a mobile originated short message.
- Support for state U10 of call control.
- The value of timer TC1M.
- Whether SMS messages are stored in the SIM and/or the ME.
- Maximum length (characters) of a mobile originated short message.

## Foreseen Final State of MS

Idle, updated.

## Test Procedure

- a) The MS shall be set up to send a SM to the SS. The SS responds to the channel request message by allocating an SDCCH. The SS answers correctly to the SABM on SAPI 0 and then performs the authentication and ciphering procedures.
- b) The SS responds with a UA frame SAPI-3 to the MS.
- c) The SS responds to the CP-DATA containing RP-DATA RPDU (SMS SUBMIT TPDU) from the MS with a CP-ACK message within TC1M followed by a CP-DATA message containing the correct RP-ACK RPDU. The SS waits a maximum of 25 s for the CP-ACK message.
- d) The SS sends a channel release message to the MS.
- e) Steps a) and b) are repeated. The SS is configured not to send the CP-ACK message. Then maximum 3 CP-DATA retransmissions may occur. After a duration of TC1M + 5 s after the last CP-DATA retransmission the SS initiates channel release. The 5 s is the appropriate time to wait to verify that the MS does not send more than the maximum CP-DATA retransmissions.
- f) Steps a) and b) are repeated. On receipt of the CP-DATA from the MS the SS sends a CP-ERROR message within TC1M containing a "Network Failure" cause. Then the SS initiates channel release.

- g) A data or speech call is established on a TCH with the SS and the state U10 of call control is entered. The MS is setup to send an SM to the SS. After the reception of the CM SERVICE REQUEST, the SS sends a CM SERVICE ACCEPT message. The SS responds with a UA frame SAPI-3 to the SABM with SAPI-3 received from the MS.
- h) The SS responds to the CP-DATA containing RP-DATA RPDU (SMS SUBMIT TPDU) from the MS with a CP-ACK message within TC1M followed by a CP-DATA message containing the correct RP-ACK RPDU. The SS waits a maximum of 25 s for the CP-ACK message. Then the SS sends a channel release message to the MS.
- i) Step g) is repeated. The SS is configured not to send the CP-ACK message. Then maximum 3 CP-DATA retransmissions may occur. After a duration of TC1M + 15 s after the last CP-DATA retransmission the SS initiates channel release. The 15 s is the appropriate time to wait to verify that the MS does not send more than the maximum CP-DATA retransmissions (during a call in progress).
- j) The SS is configured to receive a mobile originated SM. Steps a) and b) are repeated and, using the end of the CP-DATA message from the MS as a trigger, the SS sends a SM to the MS. In this case a new transaction identifier shall be used in the CP messages of SMS mobile terminated.
- k) The MS is set up to send an SM to the SS. On receipt of the CM SERVICE REQUEST the SS sends a CM SERVICE REJECT message with the reject cause set to "Service Option not supported" or "Service Option temporarily out of order". After 5 s the SS initiates channel release.

#### Maximum Duration of Test

20 minutes.

#### Expected Sequence

| Step | Direction | Message                 | Comments                                                                                |
|------|-----------|-------------------------|-----------------------------------------------------------------------------------------|
| 1    | MS -> SS  | CHANNEL REQUEST         | Establishment cause is "Other procedures which can be completed with an SDDCH" NECI = 0 |
| 2    | SS -> MS  | IMMEDIATE ASSIGNMENT    | SS assigns an SDCCH                                                                     |
| 3    | MS -> SS  | CM SERVICE REQUEST      | Message is contained in SABM on SAPI 0. CM service type set to "Short message transfer" |
| 4    | SS -> MS  | AUTHENTICATION REQUEST  |                                                                                         |
| 5    | MS -> SS  | AUTHENTICATION RESPONSE | SRES specifies correct value.                                                           |
| 6    | SS -> MS  | CIPHERING MODE COMMAND  | SS starts deciphering after sending the message.                                        |
| 7    | MS -> SS  | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered.              |
| 8    | SS        |                         | SS starts ciphering.                                                                    |
| 9    | MS -> SS  | SABM (SAPI=3)           | MS establishes SAPI 3                                                                   |
| 10   | SS -> MS  | UA (SAPI=3)             |                                                                                         |
| 11   | MS -> SS  | CP-DATA                 | Contains RP-DATA RPDU (SMS SUBMIT TPDU)                                                 |
| 12   | SS -> MS  | CP-ACK                  | Sent within TC1M after step 11                                                          |
| 13   | SS -> MS  | CP-DATA                 | Contains RP-ACK RPDU                                                                    |
| 14   | SS        |                         | Waits max 25 s for CP-ACK                                                               |
| 15   | MS -> SS  | CP-ACK                  |                                                                                         |
| 16   | SS -> MS  | CHANNEL RELEASE         | The main signalling link is released.                                                   |
| 17   | MS -> SS  | DISC (SAPI=0)           | MS shall respond to channel release with a layer 2 DISC frame with SAPI 0               |
| 18   | MS -> SS  | CHANNEL REQUEST         | Establishment cause is "Other procedures which can be completed with an SDDCH" (NECI=0) |
| 19   | SS -> MS  | IMMEDIATE ASSIGNMENT    | SS assigns an SDCCH                                                                     |
| 20   | MS -> SS  | CM SERVICE REQUEST      | Message is contained in SABM on SAPI 0.                                                 |
| 21   | SS -> MS  | AUTHENTICATION REQUEST  |                                                                                         |
| 22   | MS -> SS  | AUTHENTICATION RESPONSE | SRES specifies correct value.                                                           |
| 23   | SS -> MS  | CIPHERING MODE COMMAND  | SS starts deciphering after sending the message.                                        |
| 24   | MS -> SS  | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered.              |
| 25   | SS        |                         | SS starts ciphering.                                                                    |
| 26   | MS -> SS  | SABM (SAPI=3)           | MS establishes SAPI 3                                                                   |

| 82   | SS -> MS  | CP-DATA                 | Contains RP-DATA RPDU (SMS DELIVER TPDU)                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 83   | MS        |                         | The MS shall correctly receive the SM and indicate that a message has arrived. If the MS provides the functionality to display MT messages, it is checked that the correct message is displayed. In the MO case the MS shall send the CP-ACK message with transaction identifier assigned to this transfer. In the MT case the MS shall send a CP-ACK message and a CP-DATA message containing the RP-ACK RPDU. The transaction identifier shall be the same as chosen by the SS for the MT transfer. |
| 84   | MS -> SS  | CHANNEL REQUEST         | Establishment cause is "Other procedures which can be completed with an SDDCH" (NEC1=0)                                                                                                                                                                                                                                                                                                                                                                                                               |

### 34.2.3 Test of memory full condition and memory available notification:

The Memory Available Notification provides a means for the MS to notify the network that it has memory available to receive one or more short messages. The SMS status field in the SIM contains status information on the "memory available" notification flag.

### 34.2.3.1 Conformance requirement

1. When a mobile terminated message is Class 2, the MS shall ensure that the message has been transferred to the SMS data field in the SIM before sending an acknowledgement to the SC. The MS shall return a protocol error message if the short message cannot be stored in the SIM and there is other short message storage available in the MS. If all the short message storage in the MS is already in use, the MS shall return "memory capability exceeded".
2. When the MS rejects a short message due to lack of available memory capability the need to transfer notification shall be stored in the SIM.
3. If the memory capability becomes available because memory is cleared, the value of the memory capability exceeded notification flag in the SIM is read. If the flag is set, the MS notifies the network that memory capability is now available. After a positive acknowledgement from the network, the ME unsets the memory capability exceeded notification flag in the SIM.

3GPP TS 03.40, subclause 10.3 (operation 14).

### 34.2.3.2 Test purpose

1. To verify that the MS sends the correct acknowledgement when its memory in the SIM becomes full.
2. To verify that the MS sends the correct acknowledgement when its memory in the ME and the SIM becomes full, and sets the "memory exceeded" notification flag in the SIM.
3. To verify that the MS performs the "memory available" procedure when its message store becomes available for receiving short messages, and only at this moment.

### 34.2.3.3 Method of test

#### Initial conditions

System Simulator:

1 cell, default parameters

Mobile Station:

The MS shall be in the idle updated state.

The SMS message storage shall be empty.

The MS shall be connected to the SIM simulator. The following shall be present in the SIM simulator:

- EF<sub>SMS</sub> with at least one record;
- EF<sub>SMSstatus</sub>, with SMS "Memory Cap. Exceed" notification flag set to "memory available";
- Service no. 4 (SMS) in EF<sub>SST</sub> set to allocated and activated.

For storing of Class 1 Short Messages the MS shall be set up to store Short Messages in the ME memory (by way of MMI, as described in PICS/PIXIT statement).

## Related PICS/PIXIT Statements

- Support for Short message MT/PP.
- Description of the basic procedures to display a mobile terminated short message.
- Whether SMS messages are stored in the SIM and/or the ME.
- The value of timer TC1M.

## Foreseen Final State of MS

Idle, updated.

## Test Procedure

- a) step a) of subclause 34.2.5.3 (test of Class 2 Short Messages) is repeated until the MS sends a negative acknowledgement (RP-ERROR). The SIM simulator shall indicate if the "memory capability exceeded" notification flag has been set on the SIM.
- b) a Class 1 Short Message is sent to the MS.
- c) step b) is repeated until the MS sends a negative acknowledgement (RP-ERROR). The SIM simulator shall indicate if the "memory capability exceeded" notification flag has been set on the SIM.
- d) a Short Message is sent to the MS with the DCS field of the SMS-DELIVER TPDU set to 0.
- e) the SS prompts the operator to read a short message and to remove it from the message store of the MS.
- f) the SS waits for a CHANNEL REQUEST from the MS, and sends an IMMEDIATE ASSIGNMENT allocating an SDCCH.
- g) the SS answers correctly to the SABM on SAPI 0.
- h) the SS answers correctly to the SABM on SAPI 3.
- i) the SS answers to the RP-SMMA from the MS with a CP-DATA containing a RP-ACK RPDU.
- j) after the MS has acknowledged the CP-DATA with a CP-ACK, the SS releases the channel with a CHANNEL RELEASE message. The SIM simulator shall indicate if the "memory capability exceeded" notification flag has been unset on the SIM.
- k) step e) is repeated.

## Maximum Duration of Test

-

## Expected Sequence

| Step | Direction | Message                 | Comments                                                                   |
|------|-----------|-------------------------|----------------------------------------------------------------------------|
| 1    | SS -> MS  | PAGING REQUEST          |                                                                            |
| 2    | MS -> SS  | CHANNEL REQUEST         | Establishment cause is "Answer to paging"                                  |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT    | SS assigns an SDCCH                                                        |
| 4    | MS -> SS  | PAGING RESPONSE         | Message is contained in SABM.                                              |
| 5    | SS -> MS  | AUTHENTICATION REQUEST  |                                                                            |
| 6    | MS -> SS  | AUTHENTICATION RESPONSE | SRES specifies correct value.                                              |
| 7    | SS -> MS  | CIPHERING MODE COMMAND  | SS starts deciphering after sending the message.                           |
| 8    | MS -> SS  | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered. |
| 9    | SS        |                         | SS starts ciphering.                                                       |
| 10   | SS -> MS  | SABM (SAPI=3)           | SS establishes SAPI 3                                                      |
| 11   | MS -> SS  | UA (SAPI=3)             |                                                                            |
| 12   | SS -> MS  | CP-DATA                 | Contains RP-DATA RPDU (SMS DELIVER TPDU), Class 2 Short Message            |
| 13   | SS        |                         | Waits max 25 s for CP-ACK                                                  |

| Step | Direction | Message                 | Comments                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------|-----------|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 14   | MS -> SS  | CP-ACK                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 15   | SS        |                         | Waits max 60 s for RP-ACK RPDU                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 16   | MS -> SS  | CP-DATA                 | Contains RP-ACK RPDU                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 17   | SS -> MS  | CP-ACK                  | Within TC1M after step 16                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 18   | SS -> MS  | CHANNEL RELEASE         | The main signalling link is released. Step 1-18 is repeated until MS sends a negative acknowledgement (RP-ERROR) in step 16. The RP-ERROR RPDU cause field shall be "Protocol error, unspecified" if there is message capability in the ME, or "Memory capability exceeded" if there is no message capability in the ME. If the total memory store of the MS is full, the ME shall set the "memory capability exceeded" notification flag on the SIM. |
| 19   | SS -> MS  | PAGING REQUEST          |                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 20   | MS -> SS  | CHANNEL REQUEST         | Establishment cause is "Answer to paging"                                                                                                                                                                                                                                                                                                                                                                                                             |
| 21   | SS -> MS  | IMMEDIATE ASSIGNMENT    | SS assigns an SDCCH                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 22   | MS -> SS  | PAGING RESPONSE         | Message is contained in SABM.                                                                                                                                                                                                                                                                                                                                                                                                                         |

| 69   | MS        |                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

NOTE: Time values for SS wait time are chosen sufficiently high to be sure that the MS has enough time to respond to the different messages.

| TP-UD (140 octets)  | text of message (160 characters)    |             |

SMS-DELIVER TPDU in step 30

same as in step 12 except:

|        |                           |             |
|--------|---------------------------|-------------|
| TP-DCS | default alphabet, class 1 | "11110001"B |
|--------|---------------------------|-------------|

SMS-DELIVER TPDU in step 48

same as in step 12 except:

|        |                  |             |
|--------|------------------|-------------|
| TP-DCS | default alphabet | "00000000"B |
|--------|------------------|-------------|

### 34.2.4 Test of the status report capabilities and of SMS-COMMAND:

This test applies to MSs which support the status report capabilities.

#### 34.2.4.1 Conformance requirement

The SMS offers the SC the capabilities of informing the MS of the status of a previously sent mobile originated short message. This is achieved by the SC returning a status report TPDU (SMS-STATUS-REPORT) to the originating MS.

SMS-COMMAND enables an MS to invoke an operation at the SC.

The MS shall increment TP-MR by 1 for each SMS-SUBMIT or SMS-COMMAND being submitted.

#### References

3GPP TS 03.40; subclause 3.2.9.

3GPP TS 03.40; subclause 9.2.3.6.

#### 34.2.4.2 Test purpose

- 1) To verify that the MS is able to accept a SMS-STATUS-REPORT TPDU.
- 2) To verify that the MS is able to use the SMS-COMMAND functionality correctly and sends an SMS-COMMAND TPDU with the correct TP-Message-Reference.

#### 34.2.4.3 Method of test

##### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS shall be in the idle updated state.

##### Related PICS/PIXIT Statements

- Support of SMS MO/PP and MT/PP.

##### Foreseen Final State of MS

Idle, updated.

##### Test Procedure

- a) The MS is made to send a Mobile Originated short message as in steps a) to d) of test 34.2.2 (SMS Mobile originated).
- b) The SS establishes a data link on SAPI-3 with the MS, then sends a CP-DATA message containing a RP-DATA RPDU itself containing an SMS-STATUS-REPORT TPDU.
- c) The SS sends a CHANNEL RELEASE message.
- d) The MS is made to send an SMS-COMMAND message enquiring about the previously submitted short message.
- e) The SS responds to the MS so as to enable it to establish a data link on SAPI-3 on an SDCCH.
- f) The SS acknowledges the CP-DATA message from the MS with a CP-ACK followed by a CP-DATA message containing an RP-ACK RPDU.
- g) After receiving the CP-ACK from the MS, the SS releases the channel by using a CHANNEL RELEASE message.
- h) The MS is made to send an SMS-COMMAND message requiring to delete the previously submitted short message.

- i) steps e) to g) are repeated.

#### Maximum Duration of Test

-

#### Expected Sequence

| Step | Direction | Message                               | Comments                                                                                  |
|------|-----------|---------------------------------------|-------------------------------------------------------------------------------------------|
| 1    | MS -> SS  | CHANNEL REQUEST                       | Establishment cause is "Other procedures which can be completed with an SDCCH " (NECI=0)  |
| 2    | SS -> MS  | IMMEDIATE ASSIGNMENT                  | SS assigns an SDCCH                                                                       |
| 3    | MS -> SS  | CM SERVICE REQUEST                    | Message is contained in SABM.                                                             |
| 4    | SS -> MS  | AUTHENTICATION REQUEST                |                                                                                           |
| 5    | MS -> SS  | AUTHENTICATION RESPONSE               | SRES specifies correct value.                                                             |
| 6    | SS -> MS  | CIPHERING MODE COMMAND                | SS starts deciphering after sending the message.                                          |
| 7    | MS -> SS  | CIPHERING MODE COMPLETE               | Shall be sent enciphered. All following messages shall be sent enciphered.                |
| 8    | SS        |                                       | SS starts ciphering.                                                                      |
| 9    | MS -> SS  | SABM (SAPI=3)                         | MS establishes SAPI 3                                                                     |
| 10   | SS -> MS  | UA (SAPI=3)                           |                                                                                           |
| 11   | MS -> SS  | CP-DATA                               | Contains RP-DATA RPDU (SMS SUBMIT TPDU)                                                   |
| 12   | SS -> MS  | CP-ACK                                | Sent within TC1M after step 11                                                            |

| TP-CD               | not checked                                |             |

## 34.2.5 Test of message class 0 to 3

The tests under this subclause only apply to a MS capable of displaying short messages (see PICS/PIXIT).

### 34.2.5.1 Short message class 0

#### 34.2.5.1.1 Conformance requirement

When a mobile terminated message is class 0 and the MS has the capability of displaying short messages, the MS shall display the message immediately and send an acknowledgement to the SC when the message has successfully reached the MS irrespective of whether there is memory available in the SIM or ME. The message shall not be automatically stored in the SIM or ME.

#### References

3GPP TS 03.38, clause 4.

#### 34.2.5.1.2 Test purpose

To verify that the MS will accept and display but not store a class 0 message, and that it will accept and display a class 0 message if its message store is full.

NOTE: failure of this test in a mobile could cause it to reject a class 0 message when its SMS memory becomes full. This could lead to unwanted repetitions between the MS and the service centre.

#### 34.2.5.1.3 Method of test

#### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS shall be in the idle updated state.

The MS message store shall be empty.

#### Related PICS/PIXIT Statements

- Support for Short message MT/PP.
- Description of the basic procedures to display a mobile terminated short message.
- The value of timer TC1M.
- Whether SMS messages are stored in the SIM and/or the ME.

#### Foreseen Final State of MS

Idle, updated.

#### Test Procedure

- a) The SS sends a class 0 message by using the method described in step a) of subclause 34.2.1 but with the TPDU described in this subclause.
- b) The MS message store shall be filled (for example by using the method of 34.2.3 test of the memory available notification) with the same SMS-DELIVER TPDU except that TP-DCS is set to class 1.
- c) The SS sends a class 0 message as in step a).

#### Maximum Duration of Test

-

#### Expected Sequence

| TP-UD (140 octets)  | text of message (160 characters)    |              |

### 34.2.5.2 Test of class 1 short messages

This test shall apply to MSs which support:

- storing of received Class 1 Short Messages; and
- displaying of stored Short Messages.

#### 34.2.5.2.1 Conformance requirement

When a mobile terminated message is class 1, the MS shall send an acknowledgement to the SC when the message has successfully reached the MS and can be stored, either in the ME or in the SIM.

## References

3GPP TS 03.38, clause 4.

### 34.2.5.2.2 Test purpose

This procedure verifies that the MS acts correctly on receiving a class 1 message, i.e. that it stores the message in the ME or SIM and sends an acknowledgement (at RP and CP-Layer).

### 34.2.5.2.3 Method of test

#### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS shall be in the idle updated state.

The MS message store shall be empty.

For storing of class 1 Short Messages, the MS shall be set up to store Short Messages in the ME memory (by way of MMI, as described in PICS/PIXIT statement).

#### Related PICS/PIXIT Statements

- Support for Short message MT/PP.
- Description of the basic procedures to display a mobile terminated short message.
- The value of timer TC1M.
- Whether SMS messages are stored in the SIM and/or the ME.

#### Foreseen Final State of MS

Idle, updated.

#### Test Procedure

- a) the SS delivers a Short Message of class 1 to the MS as specified in subclause 34.2.1, step a).
- b) the Short Message is recalled (e.g. by means of the MMI).

#### Maximum Duration of Test

-

## 34.2.5.3 Test of class 2 short messages

## 34.2.5.3.1 Definition and applicability

Class 2 Short Messages are defined as SIM specific, and the MS shall ensure that a message of this class is stored on the SIM.

This test shall apply to MSs which support:

- storing of received Class 2 Short Messages in the SIM.

#### 34.2.5.3.2 Conformance requirement

When a mobile terminated message is Class 2, the MS shall ensure that the message has been correctly transferred to the SMS data field in the SIM before sending an acknowledgement to the SC. The MS shall return a "protocol error, unspecified" error message if the short message cannot be stored in the SIM and there is other short message storage available at the MS. If all the short message storage at the MS is already in use, the MS shall return "memory capacity exceeded".

#### Reference(s)

3GPP TS 03.40, subclause 9.2.3.10; 3GPP TS 03.38, clause 4; 3GPP TS 11.11, subclause 10.3.3.

#### 34.2.5.3.3 Test purpose

This procedure verifies that the MS acts correctly on receiving a class 2 message, i.e. that it stores the message correctly in the SIM, and if this is not possible, returns a protocol error message, with the correct error cause, to the network.

There are 2 cases:

- 1) If the MS supports storing of short messages in the SIM and in the ME, and storage in the ME is not full, and the short message cannot be stored in the SIM, the error cause shall be "protocol error, unspecified".
- 2) If the MS supports storing of short messages in the SIM and not in the ME, and storage in the ME is not full, and the short message cannot be stored in the SIM, the error cause shall be "memory capacity exceeded".

NOTE: If the MS supports storing of short messages in the SIM and the ME, and storage in the ME is full, and the short message cannot be stored in the SIM, the error cause shall be "memory capacity exceeded". This case is not tested in this test.

#### 34.2.5.3.4 Test method

##### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS shall be in the idle updated state.

The ME message store shall be empty.

The ME shall be connected to the SIM simulator. The following shall be present in the SIM simulator:

- EF<sub>SMS</sub> with at least two free records and one full record;
- EF<sub>SMSstatus</sub>, with SMS "Memory Cap. Exceed" notification flag set to "memory available";
- Service no. 4 (SMS) in EF<sub>SST</sub> set to allocated and activated;

For storing of Class 1 Short Messages the MS shall be set up to store Short Messages in the ME memory (by way of MMI, as described in PICS/PIXIT statement).

##### Related PICS/PIXIT Statements

- Support for Short message MT/PP.
- The value of timer TC1M.
- Whether SMS messages are stored in the SIM and/or the ME.

## Foreseen Final State of MS

Idle, updated.

## Test Procedure

- a) the SS delivers a Short Message of class 2 to the MS as specified in subclause 34.2.1, step b).
- b) following an attempt by the ME to store the short message in a free record of EF<sub>SMS</sub> in the SIM, the SIM simulator returns the status response "OK" ("90 00").
- c) step a) is repeated.
- d) following an attempt by the ME to store the short message in a free record of EF<sub>SMS</sub> in the SIM, the SIM simulator returns the status response "memory problem" ("92 40").
- e) the SIM simulator indicates if an attempt was made in steps a) and c) to store the messages and if the messages are stored according to the requirement.

## Maximum Duration of Test

-

## Expected Sequence

| Step | Direction | Message                 | Comments                                                                                                                                                                                                                                                                                                                                                                                                                                             |

#### 34.2.5.4 Test of class 3 short messages

For further study.

### 34.2.6 Test of short message type 0 (Ph2, R96...R99 and REL-4)

#### 34.2.6.1 Conformance requirement

When a mobile terminated message is type 0, the MS shall acknowledge receipt of the short message to the SC but may discard its contents.

Note: Ideally the MS is able to receive the type 0 message irrespective of whether there is memory available in the SIM or ME and does not indicate the receipt of the type 0 short message to the user. The message should not be automatically stored in the SIM or ME.

This test shall apply to all MSs that have a Ph2, R96...R99 or REL-4 short message type 0 implementation.

#### References

3GPP TS 03.40 / 3GPP TS 23.040, subclause 9.2.3.9.

## 34.2.6.2 Test purpose

To verify that the MS will acknowledge receipt of the short message to the SC. The MS should discard its contents.

NOTE: failure of this test in a mobile could cause it to reject a type 0 message when the network is trying to reach the MS. This could lead to unwanted repetitions between the MS and the service centre.

## 34.2.6.3 Method of test

## Initial conditions

## System Simulator:

1 cell, default parameters.

## Mobile Station:

The MS shall be in the idle updated state.

## Related PICS/PIXIT Statements

Support for Short message MT/PP.

## Foreseen Final State of MS

Idle, updated.

## Test Procedure

The SS sends a type 0 message by using the method described in step a) of section 34.2.1 but with the TPDU described in this section.

## Maximum Duration of Test

1 minute

## Expected Sequence

| Step | Direction | Message                 | Comments                                                                                                                                                                                                                                                            |

### 34.2.6a Test of short message type 0 ( $\geq$ REL 5)

#### 34.2.6a.1 Conformance requirement

When a mobile terminated message is type 0, the MS shall acknowledge receipt of the short message to the SC but shall discard its contents. This means that

- the MS shall be able to receive the type 0 short message irrespective of whether there is memory available in the SIM or ME or not,
- the MS shall not indicate the receipt of the type 0 short message to the user,
- the short message shall neither be stored in the SIM nor ME.

This test shall apply to all MSs that have a  $\geq$  REL-5 short message type 0 implementation.

#### References

3GPP TS 23.040, subclause 9.2.3.9.

#### 34.2.6a.2 Test purpose

To verify that the MS will acknowledge receipt of the short message to the SC. The MS shall discard its contents. This means that

- the MS shall be able to receive the type 0 short message irrespective of whether there is memory available in the SIM or ME or not,
- the MS shall not indicate the receipt of the type 0 short message to the user,
- the short message shall neither be stored in the SIM nor ME.

**NOTE:** failure of this test in a MS could cause it to reject a type 0 message when the network is trying to reach the MS. This could lead to unwanted repetitions between the MS and the service centre. In addition service affecting restrictions could happen to the customer.

### 34.2.6a.3 Method of test

#### Initial conditions

##### System Simulator:

1 cell, default parameters.

##### Mobile Station:

The MS shall be in the idle updated state.

the ME- and SIM message store shall be empty.

#### Related PICS/PIXIT Statements

Support for Short message MT/PP.

#### Foreseen Final State of MS

Idle, updated.

#### Test Procedure

- a) The SS sends a type 0 short message by using the method described in step a) of clause 34.2.1 but with the TPDU described in this section.
- b) The ME- and SIM short message store shall be filled (for example by using the method of clause 34.2.3 test of the memory available notification).
- c) The SS sends a type 0 short message as in step a).

#### Maximum Duration of Test

5 minutes.

## Expected Sequence

| Step | Direction | Message                 | Comments                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                                                                                                                                                                                                                                                                           |

## 34.2.7 Test of the replace mechanism for SM type 1-7

### 34.2.7.1 Definition and applicability

This test shall apply to MSs which support:

- Replace Short Messages; and
- display of received Short Messages.

#### 34.2.7.2a Conformance requirement for MS with implementation up to and including Rel. 97

On receipt of a short message, the MS shall check to see if the associated Protocol Identifier contains a Replace Short Message Type code. If such a code is present, then the MS will check the associated SC address (RP-OA) and originating address (TP-OA) and replace any existing stored message having the same Protocol Identifier code, SC address and originating address with the new short message.

#### Reference(s)

3GPP TS 03.40; subclause 9.2.3.9.

#### 34.2.7.2b Conformance requirement for MS with implementation after Rel.98 and later

On receipt of a short message, the MS shall check to see if the associated Protocol Identifier contains a Replace Short Message Type code. If such a code is present, then the MS will check the originating address and replace any existing stored message having the same Protocol Identifier code and originating address with the new short message and other parameter values. If there is no message to be replaced, the MS shall store the message in the normal way. The MS may also check the SC address as well as the Originating Address. However, in a network which has multiple SCs, it is possible for a Replace Message type for a SM to be sent via different SCs and so it is recommended that the SC address should not be checked by the MS unless the application specifically requires such a check.

#### Reference(s)

3GPP TS 03.40 / 3GPP TS 23.040, subclause 9.2.3.9.

### 34.2.7.3 Test purpose

This procedure verifies the correct implementation of the replace mechanism for Replace Short Messages.

NOTE: The test will not check the correct SC address for any releases.

## 34.2.7.4 Test method

## Initial conditions

## System Simulator:

1 cell, default parameters.

## Mobile Station:

The MS shall be in the idle updated state.

The MS message store shall be empty.

## Related PICS/PIXIT Statements

- Support for Short message MT/PP.
- Description of the basic procedures to display a mobile terminated short message.
- The value of timer TC1M.

## Foreseen Final State of MS

Idle, updated.

## Test Procedure

- a) two different numbers n and m are drawn randomly between 1 and 7. Two different addresses for TP-Originating-Address (TPOA1 and TPOA2) are drawn.
- b) the SS delivers a short message to the MS as specified in subclause 34.2.1 step a). In the SMS-DELIVER TPDU, the TP-Protocol-Identifier parameter is "Replace Short Message Type n", the TP-Originating-Address is TPOA1, and the RP-Originating-Address is RPOA.
- c) step b) is repeated but with a different TP-Originating-Address (TPOA2), and different contents of TP-User-Data in the SMS-DELIVER TPDU. The other parameters are the same as in step b).
- d) step c) is repeated but with the TP-Protocol-Identifier equal to "Replace Short Message Type m", and contents of TP-User-Data different from the former two messages. The other parameters are the same as in step c).
- e) step d) is repeated but the contents of TP-User-Data are different from that used in step d).
- f) the SS prompts the operator to display the Short Messages stored in the MS.

## Maximum Duration of Test

-

## Expected Sequence

| Step | Direction | Message                 | Comments                                                                   |
|------|-----------|-------------------------|----------------------------------------------------------------------------|
| 1    | SS -> MS  | PAGING REQUEST          |                                                                            |
| 2    | MS -> SS  | CHANNEL REQUEST         | Establishment cause is "Answer to paging"                                  |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT    | SS assigns an SDCCH                                                        |
| 4    | MS -> SS  | PAGING RESPONSE         | Message is contained in SABM.                                              |
| 5    | SS -> MS  | AUTHENTICATION REQUEST  |                                                                            |
| 6    | MS -> SS  | AUTHENTICATION RESPONSE | SRES specifies correct value.                                              |
| 7    | SS -> MS  | CIPHERING MODE COMMAND  | SS starts deciphering after sending the message.                           |
| 8    | MS -> SS  | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered. |
| 9    | SS        |                         | SS starts ciphering.                                                       |
| 10   | SS -> MS  | SABM (SAPI=3)           | SS establishes SAPI 3                                                      |

## 34.2.8 Test of the reply path scheme

### 34.2.8.1 Definition and applicability

This test applies to MSs which support:

- reply procedures (the class of MSs for which this is mandatory is described in 3GPP TS 03.40, annex 4):
- displaying of received Short Messages: and
- submitting Short Messages.

Steps b) and d) are only executed for MSs which support storing of Short messages.

### 34.2.8.2 Conformance requirement

When a replying MS receives an original mobile terminated short message it has:

- originating SME = TP-Originating Address in the SMS-DELIVER TPDU;
- original SC = RP-Originating Address in the RP-MT-DATA.

When submitting the reply mobile originated short message, the replying MS should use parameters as follows:

- TP-Destination Address in SMS-SUBMIT TPDU = originating SME;
- RP-Destination Address in RP-MO-DATA = original SC.

Reference(s)

3GPP TS 03.40 annex 4, clauses 5 and 6.

### 34.2.8.3 Test purpose

This procedure verifies that the MS is able to send a Reply Short Message back to the correct originating SME even if in the meantime it receives another Short Message.

#### 34.2.8.4 Test method

##### Initial conditions

###### System Simulator:

1 cell, default parameters.

###### Mobile Station:

The MS shall be in the idle updated state.

The MS message store shall be empty.

##### Related PICS/PIXIT Statements

- Support for Short message MT/PP.
- Support for Short message MO/PP.
- Description of the basic procedures to display a mobile terminated short message.
- Description of the basic procedures to send a mobile originated short message.
- The value of timer TC1M.

##### Foreseen Final State of MS

Idle, updated.

##### Test Procedure

- a) the SS delivers a Short Message as specified in subclause 34.2.1, step b) with TP-Reply-Path set to 1.
- b) step a) is repeated but with:
  - different TP-Originating-Address for the originating SME;
  - different RP-Originating-Address for the original SC; and
  - different message contents TP-User-Data.
- c) one of the two Short Messages is displayed (e.g. by means of the MMI) and the Reply Short Message is submitted (e.g. by means of the MMI).
- d) step c) is repeated for the other Short Message.

##### Maximum Duration of Test

-

## Expected Sequence

| Step | Direction | Message                 | Comments                                                                                                                                          |
|------|-----------|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PAGING REQUEST          |                                                                                                                                                   |
| 2    | MS -> SS  | CHANNEL REQUEST         | Establishment cause is "Answer to paging"                                                                                                         |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT    | SS assigns an SDCCH                                                                                                                               |
| 4    | MS -> SS  | PAGING RESPONSE         | Message is contained in SABM.                                                                                                                     |
| 5    | SS -> MS  | AUTHENTICATION REQUEST  |                                                                                                                                                   |
| 6    | MS -> SS  | AUTHENTICATION RESPONSE | SRES specifies correct value.                                                                                                                     |
| 7    | SS -> MS  | CIPHERING MODE COMMAND  | SS starts deciphering after sending the message.                                                                                                  |
| 8    | MS -> SS  | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered.                                                                        |
| 9    | SS        |                         | SS starts ciphering.                                                                                                                              |
| 10   | SS -> MS  | SABM (SAPI=3)           | SS establishes SAPI 3                                                                                                                             |
| 11   | MS -> SS  | UA (SAPI=3)             |                                                                                                                                                   |
| 12   | SS -> MS  | CP-DATA                 | Contains RP-DATA RPDU (SMS DELIVER TPDU) TP-RP set to 1                                                                                           |
| 13   | MS -> SS  | CP-ACK                  | Sent within TC1M after step 12                                                                                                                    |
| 14   | MS -> SS  | CP-DATA                 | Contains RP-ACK RPDU.                                                                                                                             |

## 34.2.9 Multiple SMS mobile originated

### 34.2.9.1 MS in idle mode

This test applies to MS supporting the ability of sending multiple short messages on the same RR connection when there is no call in progress.

#### 34.2.9.1.1 Conformance requirements

When the MS chooses to use the same RR connection to send another short message or a memory available notification, then:

- the MS shall transmit a CM SERVICE REQUEST for the new CM connection before the final CP-ACK (e.g. the one that acknowledges the CP-DATA that carried the RP-ACK) for the old MM connection is transmitted;
- before transmission of the first CP-DATA on the new MM connection, the MS shall transmit the CP-ACK for the old MM connection;
- the Transaction Identifier used on the new MM connection shall be different to that used on the old MM connection; and
- the MS shall not initiate establishment of the new MM connection before the final CP-DATA (e.g. the one carrying the RP-ACK) has been received.

## Reference

3GPP TS 03.40; subclause 3.1

3GPP TS 04.11; subclause 5.4

3GPP TS 04.13; subclause 5.6

### 34.2.9.1.2 Test purpose

To verify that the MS is able to correctly send multiple short messages on the same RR connection when using an SDCCH.

### 34.2.9.1.3 Method of test

#### Initial conditions

System simulator:

1 cell, default parameters.

Mobile Station:

The MS shall be in "Idle, updated" state.

The SMS message storage shall be empty.

#### Related PICS/PIXIT statements

- Support for multiple short message MO/PP on the same RR connection.
- Description of how to enter multiple SMS.
- Description of the basic procedures to display a mobile originated short message.
- Whether SMS messages are stored in the SIM and/or the ME.

#### Foreseen final state of MS

Idle, updated.

#### Test procedure

- a) The MS shall be set up to send 3 short messages as multiple SM to the SS. The SS responds to the channel request message by allocating an SDCCH. The SS answers correctly to the SABM on SAPI 0 and then performs the authentication and ciphering procedures.
- b) The SS responds with a UA frame SAPI-3 to the MS.
- c) The SS responds to the CP-DATA containing RP-DATA RPDU (SMS SUBMIT TPDU) from the MS with a CP-ACK message followed by a CP-DATA message containing the correct RP-ACK RPDU. The Transaction Identifier used on this MM connection is 'x'.
- d) the MS shall transmit a CM SERVICE REQUEST for the new CM connection (for the second short message) before the final CP-ACK (the one that acknowledges the CP-DATA that carried the RP-ACK before) for the old MM connection is transmitted. The MS shall not initiate establishment of the new MM connection before the final CP-DATA (i.e. the one carrying the RP-ACK for the first short message) has been received. Before transmission of the first CP-DATA on the new MM connection, the MS shall transmit the CP-ACK for the old MM connection. The Transaction Identifier used on the new MM connection shall be y, where  $y <> x$  (see procedure c)).
- e) The SS waits a maximum of 5 s after receiving the CM SERVICE REQUEST for the CP-ACK message from the MS.

- f) The SS responds to the CP-DATA containing RP-DATA RPDU (SMS SUBMIT TPDU) from the MS with a CP-ACK message followed by a CP-DATA message containing the correct RP-ACK RPDU.
- g) the MS shall transmit a CM SERVICE REQUEST for the new CM connection (for the third short message) before the final CP-ACK (the one that acknowledges the CP-DATA that carried the RP-ACK before) for the old MM connection is transmitted. Before transmission of the first CP-DATA on the new MM connection, the MS shall transmit the CP-ACK for the old MM connection. The Transaction Identifier used on the new MM connection shall be z, where  $z <> y$  (see procedure d). The MS shall not initiate establishment of the new MM connection before the final CP-DATA (i.e. the one carrying the RP-ACK for the second short message) has been received.
- h) The SS waits a maximum of 5 s after receiving the CM SERVICE REQUEST for the CP-ACK message from the MS.
- i) The SS responds to the CP-DATA containing RP-DATA RPDU (SMS SUBMIT TPDU) from the MS with a CP-ACK message followed by a CP-DATA message containing the correct RP-ACK RPDU.
- j) The SS waits a maximum of 5 s after sending CP-DATA for the CP-ACK message from the MS.
- k) The SS sends a Channel Release message to the MS.

#### Maximum duration of test

5 minutes.

#### Expected sequence

| Step | Direction | Message                 | Comments                                                                                                                                      |

### 34.2.9.2 MS in active mode

This test applies to MS supporting the ability of sending multiple short messages when there is a call in progress.

#### 34.2.9.2.1 Conformance requirements

When the MS chooses to use the same RR connection to send another short message or a memory available notification, then:

- the MS shall transmit a CM SERVICE REQUEST for the new CM connection before the final CP-ACK (e.g. the one that acknowledges the CP-DATA that carried the RP-ACK) for the old MM connection is transmitted;
- before transmission of the first CP-DATA on the new MM connection, the MS shall transmit the CP-ACK for the old MM connection;
- the Transaction Identifier used on the new MM connection shall be different to that used on the old MM connection; and
- the MS shall not initiate establishment of the new MM connection before the final CP-DATA (e.g. the one carrying the RP-ACK) has been received.

#### Reference

3GPP TS 03.40; subclause 3.1.

3GPP TS 04.11; subclause 5.4.

3GPP TS 04.13; subclause 5.6.

#### 34.2.9.2.2 Test purpose

To verify that the MS is able to correctly send multiple short messages on the same RR connection when sent parallel to a call.

#### 34.2.9.2.3 Method of test

##### Initial conditions

System simulator:

1 cell, default parameters.

## Mobile Station:

The MS shall be in "Idle, updated" state.

The SMS message storage shall be empty.

## Related PICS/PIXIT statements

- Support for multiple short message MO/PP on the same RR connection.
- Description of how to enter multiple SMS.
- Description of the basic procedures to display a mobile originated short message.
- Support for state U10 of call control.
- Whether SMS messages are stored in the SIM and/or the ME.

## Foreseen final state of MS

Idle, updated.

## Test procedure

- a) A data or speech call is established on a TCH with the SS and the state U10 of call control is entered. The MS is set up to send 3 short messages as multiple SM to the SS. After the reception of the CM SERVICE REQUEST, the SS sends a CM SERVICE ACCEPT message. The SS responds with a UA frame SAPI-3 to the SABM with SAPI-3 received from the MS.
- b) Steps c) to k) of the test procedure in subclause 34.2.9.1.3 are repeated.

## Maximum duration of test

5 minutes.

## Expected Sequence

| Step | Direction | Message            | Comments                                                                                                                                  |
|------|-----------|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS        |                    | A data or speech call is established on a TCH and the state U10 of call control is entered.                                               |
| 2    | MS        |                    | The MS is set up to send 3 short messages as multiple SM                                                                                  |
| 3    | MS -> SS  | CM SERVICE REQUEST | Sent in a layer 2 frame on the FACCH. CM service type set to "short message transfer"                                                     |
| 4    | SS -> MS  | CM SERVICE ACCEPT  |                                                                                                                                           |
| 5    | MS -> SS  | SABM (SAPI=3)      | Sent on SACCH associated with the TCH                                                                                                     |
| 6    | SS -> MS  | UA (SAPI=3)        |                                                                                                                                           |
| 7    | MS -> SS  | CP-DATA            | Contains RP-DATA RPDU (SMS SUBMIT TPDU). The Transaction Identifier used in steps 7, 8, 9 and 11 shall be x.                              |
| 8    | SS -> MS  | CP-ACK             |                                                                                                                                           |
| 9    | SS -> MS  | CP-DATA            | Contains RP-ACK RPDU                                                                                                                      |
| 10   | MS -> SS  | CM SERVICE REQUEST | Sent in a layer 2 frame on the FACCH. CM service type set to "short message transfer"                                                     |
| 11   | MS -> SS  | CP-ACK             | Shall be sent within 5 s of step 10                                                                                                       |
| 12   | SS -> MS  | CM SERVICE ACCEPT  |                                                                                                                                           |
| 13   | MS -> SS  | CP-DATA            | Contains RP-DATA RPDU (SMS SUBMIT TPDU). The Transaction Identifier used in steps 13, 14, 15 and 17 shall be y where y <> x (see step 7). |

## 34.3 Short message service cell broadcast

This test applies to all MSs.

### 34.3.1 Conformance requirements

If the MS supports SMS-CB, it is responsible for recombination of the four blocks received via the radio path into a single block which constitutes the cell broadcast short message.

In idle mode, the MS listens to the BCCH and to the paging sub-channel for the paging group it belongs to. The MS is required to receive and analyse the paging messages and immediate assignment messages sent on the paging subchannel corresponding to its paging subgroup.

#### Reference

3GPP TS 03.41; clause 8.

3GPP TS 04.08 / 3GPP TS 44.018, subclauses 3.2.1 and 3.3.2.1.

### 34.3.2 Test purpose

This test verifies that an MS supporting SMS-CB is able to receive SMS-CB messages.

This test verifies that an MS is able to respond to a paging requested during the transmission of a cell broadcast short message.

## 34.3.3 Test method

## Initial conditions

## System Simulator:

1 cell, default parameters, except BS\_PA\_MFRMS = 2.

The SS provides a BCCH/CCCH to support the MS in idle mode.

Periodic location updating is disabled.

## Mobile Station:

The MS shall be in the idle updated state.

## Related PICS/PIXIT Statements

- Support for short message transmission cell broadcast.
- Description of the basic procedures to display a cell broadcasted short message.

## Foreseen Final State of MS

Idle, updated.

## Test Procedure

- a) Three Cell Broadcast (CB) messages are sent by the SS on the CBCH with serial numbers 0,1,1.
- b) Step a) is repeated, but the SS pages the MS during the transmission of the second CB message. This shall be achieved by paging the MS immediately after the first block of the CB message has been sent. The SS shall ensure that the page is transmitted on the radio interface prior to the transmission of the 4th block of the CB message.

NOTE: The use of BS\_PA\_MFRMS = 2 ensures that this can be achieved irrespective of the IMSI.

The MS shall respond to the page.

## Maximum Duration of Test

-

## Expected Sequence

Since the SMS-CB messages are sent continuously, a table is not applicable in this test.

## 35 Low battery voltage detection

### 35.1 Definition and applicability

Low battery or shutdown voltage detection is used to trigger inhibition of all RF transmission before the MS supply voltage reaches a level where effective use of the radio frequency spectrum is no longer guaranteed.

The requirements and this test apply to all types of GSM 450, GSM 480, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MS.

### 35.2 Conformance requirement

1. The MS shall not make ineffective use of the radio frequency spectrum. In no case shall the MS exceed the transmitted levels as defined in 3GPP TS 05.05 for extreme operation.

3GPP TS 05.05, subclause D.2.2.

2. The MS shall inhibit all RF transmission when the power supply voltage is below the manufacturer declared approximate shutdown voltage.

3GPP TS 05.05, subclause D.2.2.

### 35.3 Test purpose

1. To verify that the MS does not make ineffective use of the RF spectrum.
2. To verify that the MS inhibits all RF transmission when the battery voltage falls below the manufacturer declared shutdown level.

### 35.4 Method of test

#### 35.4.1 Initial conditions

The SS transmits a BCCH with a location updating time set to 0,1 hours.

The SS sends a paging request message to the MS.

The MS responds with a channel request message.

The SS sends an immediate assignment message establishing an SDCCH.

#### 35.4.2 Procedure

- a) The SS gradually reduces the power supply voltage until the MS ceases the production of RF output.

The RF output spectrum shall be monitored for any anomalies while the supply voltage is being reduced.

NOTE 1: The declared approximate shutdown voltage gives an indication of the voltage where the MS will cease RF output.

NOTE 2: If any anomalies occur, then additional testing using the transmitter tests at the voltage where the anomaly occurred is performed to determine in an objective manner, whether or not the conformance requirement is met.

- c) After 7 minutes, the SS sends a paging message to the MS.

d) The SS observes whether or not the MS produces any RF output.

This measurement is performed over the relevant transmit band.

The spectrum analyser is set to:

Bandwidth: 3 MHz.

Peak Hold.

e) The SS modifies the location area of the BCCH.

f) For 7 minutes, the SS observes whether or not the MS produces any RF output.

NOTE 3: It is anticipated that the MS might attempt location updating.

g) The MS is switched off and on.

h) The SS pages the MS.

i) The SS observes whether or not the MS produces any RF output.

### 35.5 Test requirement

1. In step a) no anomalies shall occur.
2. In step a), the MS shall cease the production of RF output.
3. In steps d), f) and i), the MS shall not produce any RF output above -30 dBm.

---

## 36 Individual equipment type requirements and interworking - special conformance testing functions

Refer to 3GPP TS 04.14 for complete specification

---

37 Void

---

38 Void

---

## 39 Additional CTS-MS testcases

### 39.1 General paragraph

Void.

### 39.2 Tests for CTS-MS/PLMN interface

#### 39.2.1 CTS not allowed by GSM Network

The normal location updating procedure is used to update the registration of the actual Location Area of a Mobile Station in the network.

##### 39.2.1.1 Conformance requirements

The network may grant authorisation for the mobile station to use GSM-Cordless Telephony System (CTS) in the Location Area and its immediate neighbourhood. The mobile should memorise this permission in non-volatile memory. If the "CTS permission" IE is not present in the message, the mobile is not authorised to use GSM-CTS, and shall accordingly delete any memorised permission.

##### 39.2.1.2 Test purpose

To check that the CTS-MS is able to delete any memorised CTS permission when CTS permission is not allowed by a GSM network.

#### References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 4.4.4.6.

##### 39.2.1.3 Method of test

#### Related PICS/PIXIT statements

-

#### Initial conditions

CTS-MS:

CTS-MS is OFF and under coverage of a GSM network.

CTS-MS is enrolled on at least one CTS-FP.

#### Foreseen Final State of the CTS-MS

CTS-MS is "idle, updated".

#### Test procedure

The CTS-MS is switched ON. The CTS-MS shall perform a Location Registration procedure. The SS answers with a LOCATION UPDATE ACCEPT without including "CTS permission" IE. The CTS-MS shall accordingly delete any memorised CTS permission. The SS establishes a BCH channel. The CTS-MS had one entry in the DF\_CTS of the SIM corresponding to the FPBI broadcasted by the SS, before the location updating procedure. The CTS-MS shall not perform an Attachment procedure.

Maximum Duration of Test

[TBD]

## 39.3 RF tests for CTS-MS/FP interface

### 39.3.1 Transmit power control timing and confirmation

#### 39.3.1.1 Definition and applicability

The RF power level to be employed by the CTS-MS is indicated by means of the 5 bit TXPWR field sent in the layer 1 header of each downlink SACCH message block and may be sent in a dedicated signalling block.

When a power change is signalled the CTS-MS must change its power control level to the new level at a certain rate of change.

The CTS-MS shall confirm the power level that it is currently employing by setting the CTS-MS\_TXPWR\_CONF field in the uplink SACCH L1 header.

The requirements and this test apply to all types of GSM 900 and DCS 1 800 CTS-MS.

#### 39.3.1.2 Conformance requirement

1. The RF power control level to be employed by the CTS-MS is indicated by means of the power control information sent in the layer 1 header of each downlink SACCH message block and may be sent in a dedicated signalling block; 3GPP TS 05.08, subclause 11.3.2.
2. The CTS-MS shall confirm the power level that it is currently employing in the uplink SACCH L1 header. The indicated value shall be the power control level actually used by the CTS-MS for the last burst of the previous SACCH period; 3GPP TS 05.08, subclause 11.3.2.
3. Upon receipt of a command on the SACCH to change its RF power level, the CTS-MS shall change to the new level at a rate of one nominal 2 dB power control step every 60 ms; 3GPP TS 05.08, subclause 11.3.7.

4. The change (in conformance requirement 3) shall commence at the first TDMA frame belonging to the next reporting period; 3GPP TS 05.08, subclause 11.3.7.
5. In case of channel change the commanded power level shall be applied on the new channel immediately; 3GPP TS 05.08, subclause 11.3.7.

#### 39.3.1.3 Test purpose

1. To verify that the CTS-MS will set its transmitter output power in accordance with conformance requirement 1.
2. To verify that the CTS-MS will confirm the power level it is currently employing according to conformance requirement 2.
3. To verify that the CTS-MS, upon receipt of a command from the SACCH to change its RF power level, will change according to conformance requirement 3.
4. To verify that the CTS-MS will commence the change of power level at least by the sixth TDMA frame belonging to the next reporting period.
5. To verify that in case of new channel assignment the commanded power level is applied on the new channel according to conformance requirement 5.

#### 39.3.1.4 Method of test

NOTE: The method of measuring the CTS-MS transmitter output power is given in subclause 13.3. For CTS-MS transmission, the nominal maximum output power is:

- 11 dBm (0.015 W) in GSM 900 i.e. power control level 16;
- 12 dBm (0.016 W) in DCS 1 800 i.e. power control level 19. (see 3GPP TS 05.05, subclause 4.1.1).

#### Initial conditions

A call is set up by the SS according to the generic call set up procedure on a channel with ARFCN in the Mid ARFCN range (see table 3.3), power control level set to maximum power.

#### Procedure

- a) The SS signals minimum power control level to the CTS-MS in the SACCH.
- b) The SS measures the CTS-MS transmitter output power on TDMA frames 6, 19, 32 and every subsequent 13th TDMA frame to TDMA frame 214. The SS also monitors the CTS-MS\_TXPWR\_CONF field in the uplink SACCH L1 header for the four SACCH multiframes after the SS signals the power change.
- c) The SS now sets TXPWR in the SACCH to the maximum peak power appropriate to the CTS-MS.
- d) The SS measures the CTS-MS transmitter output power on TDMA frames 6, 19, 32 and every subsequent 13th TDMA frame to TDMA frame 214. The SS also monitors the CTS-MS\_TXPWR\_CONF field in the uplink SACCH L1 header for the four SACCH multiframes after the SS signals the power change.
- e) The SS now sets the SACCH TXPWR to 17 in GSM 900 or 11 in DCS 1 800.
- f) After 3 s the SS sets the SACCH TXPWR to 18 in GSM 900 or 12 in DCS 1 800.
- g) The SS measures the CTS-MS transmitter output power on TDMA frame 6.
- h) The SS sets the SACCH TXPWR to 17 in GSM 900 or 11 in DCS 1 800.
- i) The SS measures the CTS-MS transmitter output power on TDMA frame 6.
- j) The channel assignment is changed and the demanded power within the channel assignment is set to the minimum power control level of the CTS-MS.
- k) When the CTS-MS has changed channel its output power is measured on the first burst on the new channel.

## Test requirements

NOTE: Refer to tables 13-2 and 13-4 for relationship between the power control level, transmitter output power and the relevant tolerances.

- a) In steps b) and d), the transmitter output power shall change by one power step towards the new level signalled for each measured burst until the CTS-MS is operating at the closest supported power control level and from then on, all transmissions shall be at that level.
- b) In steps b) and d), the value of the CTS-MS\_TXPWR\_CONF field in the uplink SACCH L1 header shall correspond to the actual power control level used for the last transmitted burst of the previous SACCH multiframe. The first one shall indicate the initial transmitted power control level, the subsequent ones shall change by 17 in GSM 900 or 11 in DCS 1 800 each time until the final power control level has been reached in which case that value shall be indicated.
- c) In steps g) and i) the transmitter output power of TDMA frame 6 shall correspond to the new commanded power control level.
- d) In step k) the CTS-MS output power, measured on the new channel shall correspond to the power control level in the channel assignment.

## 39.3.2 CTS Fixed Part selection

### 39.3.2.1 Definition and applicability

CTS-FP selection is a process in which a CTS-MS attempts to find a suitable CTS-FP. Two methods of searching for a suitable CTS-FP are possible, automatic mode and manual mode. The process ensures that the CTS-MS is attached to a CTS-FP from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink. Once the CTS-MS is attached to a CTS-FP, access to the network is allowed.

In CTS mode only or in automatic mode with CTS preferred, the CTS-MS normally operates on CTS fixed part on which the mobile station is already enrolled. If the CTS-MS loses coverage in these modes, it shall attempt periodically to select again a CTS fixed part.

There are two modes for CTS-FP selection:

- i) automatic mode : This mode uses a list of CTS-FP in priority order. The highest priority CTS-FP available is selected.
- ii) Manual mode : The user selects one of the CTS-FP on which the MS is enrolled. The MS shall attempt only to attach to the selected CTS-FP.

To select a CTS fixed part, the CTS-MS shall listen to the CTSBCH frequencies of all the fixed parts on which the MS is currently enrolled.

This test is applicable for all types of GSM 900 and DCS 1 800 MSs.

### 39.3.2.2 Conformance requirement

1. In CTS mode only, the CTS-MS shall be able to synchronise to the CTSBCH carrier and to transmit on CTSARCH within 30 s.
2. There are various requirements that a CTS fixed part must satisfy before an CTS-MS can perform normal camping on it:
  - 2.1 (i) It should be a CTS fixed part on which the CTS-MS is enrolled with.
  - 2.2 (ii) The radio path loss between CTS-MS and CTS fixed part must be below a threshold set by the CTS operator. This is estimated as shown in subclause 3GPP TS 05.08, subclause 11.1.2.
3. The MS shall be able to calculate correctly the path loss criterion parameter C1, used for CTS fixed part cell selection; 3GPP TS 05.08, subclause 11.1.2.

### 39.3.2.3 Test purpose

1. To verify that the MS meets conformance requirement 1.
2. To verify that the CTS-MS does not select a CTS fixed part on which it is not enrolled.
3. To verify that the MS does not select a cell with  $C1 < 0$ .

### 39.3.2.4 Method of test

#### Initial conditions

| Parameter                                    | Carrier 1 | Carrier 2 |
|----------------------------------------------|-----------|-----------|
| RF Signal Level<br>(dB $\mu$ V emf() / dBm ) | 48 / -65  | 38 / -75  |
| CBA                                          | 1         | 0         |
| RXLEV_ACCESS_MIN<br>(dBm)                    | -90       | -67       |
| C1                                           | 25        | -8        |

The CTS-MS is enrolled with the SS.

#### Procedure

- a) The SS activates the carriers and monitors carriers 1 and 2 for Access requests from the CTS-MS.
- b) The CTS-MS which is in CTS mode only, is switched on.

#### Test requirements

After step b), the CTS-MS shall be able to send a CTSARCH on carrier 1 within 30 s. There shall be no Access requests from the CTS-MS on carrier 2.

## 39.3.3 Monitoring of CTSBCH

### 39.3.3.1 Definition and applicability

Whilst in CTS idle mode, the CTS-MS shall measure the received signal level of the CTSBCH and shall calculate the received level average of the CTSBCH carrier. This ensure that the CTS-MS is attached on a CTS-FP from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

This test is applicable for all types of GSM 900 and DCS 1 800 CTS-MSs.

### 39.3.3.2 Conformance requirement

1. The CTS-MS shall measure the received signal level of the CTSBCH and shall calculate the received level average of the CTSBCH carrier on at least five collected measurement samples; 3GPP TS 05.08, subclause 11.1.3.1.
2. There are various requirements that a cell must satisfy before an CTS-MS can perform normal camping on it:
  - 2.1 (i) It should be a CTS fixed part on which the CTS-MS is enrolled with.
  - 2.2 (ii) The radio path loss between CTS-MS and CTS fixed part must be below a threshold set by the CTS operator. This is estimated as shown in subclause 3GPP TS 05.08, subclause 11.1.2.

NOTE: Criterion (ii) refers to the C1 parameter.

3. The CTS-MS shall be able to calculate correctly the path loss criterion parameter C2 used for the monitoring of received signal level everytime that it decodes the CTSBCH in its CTS paging group; 3GPP TS 05.08, subclause 11.1.3.1.

### 39.3.3.3 Test purpose

1. To verify that the CTS-MS meets conformance requirement 1.
2. To verify that:
  - 2.1 The CTS-MS does not "reselect" a fixed part on which it is not enrolled with.
  - 2.2 The CTS-MS does not "reselect" a CTS cell which has a  $C1 < 0$ .
3. To verify that the CTS-MS calculates the C2 parameter correctly.

### 39.3.3.4 Method of test

#### Initial conditions

The CTS-MS is enrolled with the SS.

The CTS-MS is in CTS preferred mode.

| Parameter                                     | Carrier 1 | Carrier 2 |
|-----------------------------------------------|-----------|-----------|
| RF Signal Level<br>(dB $\mu$ V emf() / dBm )  | 63 / -50  | 33 / -80  |
| RXLEV_ACCESS_MIN<br>(dB $\mu$ V emf() / dBm ) | 43 / -70  | 23 / -90  |
| CTS_CELL_RESELECT_OFFSET                      | 5         | 0         |
| C1                                            | 20        | 10        |
| C2                                            | 35        | 10        |

#### Procedure

- a) The SS activates the carriers. The CTS-MS is not paged on carrier 1. The SS monitors CTSBCH on carrier 1 and BCCH on carrier 2 for Access requests from the CTS-MS.
- b) The CTS-MS which is in CTS preferred mode is switched on.
- c) The SS reduces signal level on carrier 1 to -80 dBm / 33 dB $\mu$ V emf() for 4 s. Then, the SS raises the level back to -50 dBm / 63 dB $\mu$ V emf(). (C1 becomes -10 dB and C2, -5 dB during this period).
- d) The SS reduces signal level on carrier 1 to -80 dBm / 33 dB $\mu$ V emf().

### 39.3.3.5 Test requirements

- 1) After step b), the CTS-MS shall be able to transmit a CTSARCH on carrier 1 within 30 s and there shall be no access request from the CTS-MS on carrier 2.
- 2) After step c), the CTS-MS is still "attached to carrier 1" and there shall be no access on carrier 2.
- 3) After step d), the CTS-MS shall consider itself as de-attached to carrier 1 and perform a GSM cell selection by sending a RACH on carrier 2 within 30 s.

## 39.3.4 AFA measurement and reporting

### 39.3.4.1 Definition and applicability

A precise frequency planning can not be applied to the CTS-FP/MS pair, as the CTS is intended to be developed by the end-user. Therefore, a list of frequencies (GFL) on which it is allowed to operate is given to the CTS. With the AFA, interference measurements will be performed on the frequencies in the GFL to provide a ranking in the AFA table, in order to exclude unacceptably interfered frequencies from the usage in CTS. A set of frequencies shall be selected from the AFA table by the CTS-FP for effective use by the CTS-FP and CTS-MS performing frequency hopping. This subset of frequencies is called the TFH carrier list.

The requirements and this test apply to all types of GSM 900 and DCS 1 800 CTS-MS.

#### 39.3.4.2 Conformance requirement

1. For each carrier of the AMFL (AFA monitoring frequency list) the CTS-MS shall perform NAMC (Number of AFA monitoring cycles) basic measurements, where a basic measurement shall be the average received signal level on the 8 timeslots of the TDMA frame, over the full range of -110 dBm to -48 dBm ; 3GPP TS 05.08, subclause 11.1.4.1.
2. The RMS received signal level at the receiver input for each frequency specified in the AMFL shall be measured with an absolute accuracy of  $\pm 6$  dB over the full range of -110 dBm to -48 dBm under normal conditions; 3GPP TS 05.08, subclause 8.1.2.
3. When ordered by the CTS-FP, the CTS-MS shall report in the next AFA monitoring report message a table of received interference level of the AMFL, AMFL\_INTERF\_LEV (1,...,n) with the tolerances given in conformance requirements 2. Above, together with the minimum of the numbers of performed AFA monitoring cycles, NAMC\_REAL; 3GPP TS 05.08, subclause 11.1.4.1.

#### 39.3.4.3 Test purpose

1. To check that the CTS-MS is able to perform AFA monitoring procedure.
2. To check that the CTS-MS is able to perform AFA monitoring reporting when order by the CTS-FP.

#### 39.3.4.4 Method of test

##### Initial conditions

The CTS-MS is in the "Attached, idle, updated" mode, with a CTS-MSI allocated.

AFML:

| Parameter                                   | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 | Carrier 7 |
|---------------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF signal level<br>(dB $\mu$ V emf ( )/dBm) | 53 / -60  | 48 / -65  | 43 / -70  | 38 / -75  | 33 / -80  | 33 / -80  | 38 / -75  |

NAMC= 50

##### Procedure

- a) The SS activates carriers 1 to 7. The CTS-MS is not paged on any of the carriers.
- b) The attached CTS-MS shall respond to a pending CTS\_PAGING\_REQUEST message.
- c) The CTS-MS shall send CTS\_ACCESS\_REQUEST messages until the SS answered.
- d) The SS sends a CTS\_AFA\_MONITORING\_COMMAND to ask the CTS\_MS to performed 50 basic average received signal measurement on each of the seven carriers representing the AMFL. The received interference level of the carrier shall be the maximum of the NAMC basic measurement.
- e) The SS shall wait (NAMC\*5 + 20) seconds ie. Approximately five minutes before starting the AFA reporting procedure to let the CTS-MS enough time to perform the monitoring procedure during NAMC cycles.
- f) When ordered by the SS, the CTS\_MS shall report in the CTS\_AFA\_MONITORING\_REPORT message a table of received interference level for all frequencies of the AFA list.

##### Test requirements

1. After step d), the CTS-MS shall perform 50 basic measurements on each of the frequencies contained in the AMFL.

2. After step f), the CTS-MS shall report to the SS an ordered table of received interference level of the carriers of AMFL containing the seven carriers with the average received signal level at the receiver input for each frequency measured with an absolute accuracy of  $\pm 6$  dB as specified in the subclause 39.3.4.4.1.

## 39.4 L2 tests for CTS-MS/FP interface

Void.

## 39.5 L3 tests for CTS-MS/FP interface

### 39.5.1 to 39.5.3 Void

#### 39.5.3.1 Elementary Procedures

##### 39.5.3.1.1 System Access

###### 39.5.3.1.1.1 Not corresponding FPBI

The purpose of the immediate assignment procedure is to establish an RR connection between the mobile station and the CTS-FP.

###### 39.5.3.1.1.1.1 Conformance requirements

The MS when attached to GSM, but not registered to the CTS-FP, and with a user selection for parallel mode or automatic mode with CTS preferred, shall register with the CTS-FP within 2 minutes after coming in range of the CTS-FP.

The FPBI field indicates the identity of the CTS-FP, in such a way that invalid attachment attempts by CTS-MS which are not enrolled (see 3GPP TS 03.56) with this CTS-FP are minimised.

###### 39.5.3.1.1.1.2 Test purpose

To verify that the CTS-MS does not access to a CTS-FP if the FPBI does not match.

#### References

3GPP TS 02.56 subclause 5.6.

3GPP TS 03.56 subclause 10.1.4.

###### 39.5.3.1.1.1.3 Method of test

#### Related PICS/PIXIT statements

-

#### Initial conditions

SS:

Radio\_Link\_Timeout set to [TBC].

CTS-MS:

The CTS-MS is OFF.

The CTS-MS does not have the FPBI nor IFPEI of the SS in the DF-CTS field of the SIM.

The CTS-MS is enrolled on a CTS-FP with a different FPBI but with the same CTSBCH ARFCN.

## Foreseen Final State of the CTS-MS

Scanning for an available Network.

## Test procedure

The CTS-MS is switched ON. The CTS-MS is looking for a suitable Network. It shall not select nor send a CTS ACCESS REQUEST message to start attachment to the SS as long as its FPBI is not known.

## Maximum Duration of Test

[TBD]

## Expected Sequence

| Step | Direction | Message | Comments                                                              |
|------|-----------|---------|-----------------------------------------------------------------------|
| 1    |           |         | The CTS-MS is looking for a suitable Network.                         |
| 2    |           |         | Check that the CTS-MS does not send CTS ACCESS REQUEST for 2 minutes. |

## Specific Message Contents

None.

## 39.5.3.1.1.2 Retransmission of CTS Access Request

## 39.5.3.1.1.2.1 Conformance requirements

After sending the first CTS ACCESS REQUEST, the CTS-MS shall start listening continuously to the CTSAGCH. After having sent MCTS + 1 CTS ACCESS REQUEST messages, the CTS-RR entity of the CTS-MS shall start timer TC3150. At expiry of this timer, the immediate assignment procedure is aborted. If the immediate assignment procedure was triggered by a request from the CTS-MM sublayer, a access failure is indicated to the CTS-MM sublayer.

## 39.5.3.1.1.2.2 Test purpose

To check that the CTS-MS well manages MCTS and TC3150.

## References

3GPP TS 04.56 subclause 4.3.1.1.2

## 39.5.3.1.1.2.3 Method of test

-

## Initial conditions

SS:

Radio\_Link\_Timeout set to [TBC].

CTS-MS:

The CTS-MS is OFF.

## Foreseen Final State of the CTS-MS

Scanning for available Network.

### Test procedure

The attached CTS-MS is switched ON. The CTS-MS sends a CTS ACCESS REQUEST. As long as the SS does not send a CTS IMMEDIATE ASSIGNMENT, the CTS-MS shall send MCTS CTS ACCESS REQUEST. Then the CTS-MS shall start timer TC3150. When TC3150 expires the CTS-MS shall report the Immediate Assignment failure to upper layers.

The attached CTS-MS is switched OFF then ON. The CTS-MS sends a CTS ACCESS REQUEST. As long as the SS does not send a CTS IMMEDIATE ASSIGNMENT, the CTS-MS shall send MCTS CTS ACCESS REQUEST. Then the CTS-MS shall start timer TC3150. Before expiry of TC3150, the SS sends the CTS IMMEDIATE ASSIGNMENT. The CTS-MS should complete the attachment procedure.

### Maximum Duration of Test

[TBD]

## Expected Sequence

| Step | Direction    | Message                        | Comments                                                                                       |

## 39.5.3.1.1.3 No access request when FP is in busy state

In cases where the CTS-FP has no resources to handle accesses from a CTS-MS, the CTSBCH shall indicate that no CTS-MS shall attempt to access the CTS-FP.

## 39.5.3.1.1.3.1 Conformance requirements

Access to the CTS-FP is allowed to any enrolled CTS-MS when the CTSBCH status field indicates idle. CTS-MS shall not try to access the CTS-FP when the status field indicates busy.

## 39.5.3.1.1.3.2 Test purpose

To check that the CTS-MS is able to manage dynamically the CTSBCH status field.

## References

3GPP TS 03.52 subclause 10.1.

3GPP TS 04.56 subclause 4.3.1.1.1.

### 39.5.3.1.1.3.3 Method of test

## Related PICS/PIXIT statements

-

## Initial conditions

SS:

Status Bit in CTSBCH-SB set to Busy.

Radio\_Link\_Timeout set to [TBC].

CTS-MS:

The CTS-MS is OFF.

The CTS-MS was previously attached on that CTS-FP.

## Foreseen Final State of the CTS-MS

"Attached, idle, update", with CTS-MSI allocated.

## Test procedure

The attached CTS-MS is switched ON. As long as the CTSBCH-SB Status Bit is set to Busy, the CTS-MS shall not send CTS ACCESS REQUEST. The CTS-MS shall go back to reselection mode.

The CTSBCH-SB Status Bit is set to Idle. The CTS-MS shall periodically scan the CTSBCH-SB Status Bit and send a CTS ACCESS REQUEST message to start the attachment procedure.

The CTSBCH-SB Status Bit is set to Busy. The CTS-MS is made to start an outgoing call. As long as the CTSBCH-SB Status Bit is set to Busy, the CTS-MS shall not send CTS ACCESS REQUEST.

## Maximum Duration of Test

[TBD]

## Expected Sequence

## 39.5.3.1.2 Immediate Assignment

## 39.5.3.1.2.1 Immediate assignment success

The immediate assignment procedure is used by the CTS-FP to establish a dedicated control channel for the attached CTS-MS and CTS-FP to communicate the detail of the service requested.

## 39.5.3.1.2.1.1 Conformance requirements

Following a CTS PAGING REQUEST message, the attached CTS-MS shall correctly set up an RR connection on the dedicated channel TCH/F described in the CTS IMMEDIATE ASSIGNMENT message

## 39.5.3.1.2.1.2 Test purpose

To check that the attached CTS-MS is able to accept a CTS IMMEDIATE ASSIGNMENT message and to switch to the indicated channel by sending a CTS PAGING RESPONSE message.

## References:

3GPP TS 04.56 subclause 4.3.1.

## 39.5.3.1.2.1.3 Method of test

Related PICS/PIXIT statements:

-

Initial conditions:

CTS-MS:

"Idle, updated", with CTS-MSI allocated.

Foreseen Final State of the CTS-MS

"Idle, updated", with CTS-MSI allocated.

Test procedure

The SS pages the attached CTS-MS and after the CTS-MS has responded with an CTS ACCESS REQUEST message the SS assigns a dedicated channel. The CTS-MS shall go to the correct channel and send a CTS PAGING RESPONSE message. Then the SS initiates RR-release by sending a CTS CHANNEL RELEASE message.

Maximum Duration of Test

6 s.

Expected Sequence

| Step | Direction    | Message                  | Comments                             |

39.5.3.1.2.2 Immediate Assignment after Immediate assignment rejection

39.5.3.1.2.2.1 Conformance requirements

If no channel is available for assignment, the CTS-FP may send to the CTS-MS a CTS IMMEDIATE ASSIGNMENT REJECT in unacknowledged mode in the CTSAGCH channel. This message contains an access request reference and a wait indication.

39.5.3.1.2.2.2 Test purpose

To verify that the MS correctly responds to an CTS IMMEDIATE ASSIGNMENT message sent after an CTS IMMEDIATE ASSIGNMENT REJECT message before expiration of Wait indication.

3GPP TS 04.56 subclause 4.3.1.1.3.2.

## 39.5.3.1.2.2.3 Method of test

## Related PICS/PIXIT statements

-

## Initial conditions

SS:

Radio\_Link\_Timeout set to [TBC].

CTS-MS:

The CTS-MS is in the "Attached, idle, updated" mode, with a CTS-MSI allocated.

## Foreseen Final State of the CTS-MS

Scanning for available Network.

## Test procedure

The SS pages the CTS-MS, which shall react by sending a CTS CHANNEL REQUEST. Immediately after reception of the CTS CHANNEL REQUEST the SS sends a CTS IMMEDIATE ASSIGNMENT REJECT message which has the Wait Indication IE set to 6 s.

Between 0,75 s and 1,25 s after sending the CTS IMMEDIATE ASSIGNMENT REJECT message the SS sends a CTS IMMEDIATE ASSIGNMENT message. The MS shall go to the correct channel and send a CTS PAGING RESPONSE message. Then the SS initiates RR-release by sending a CTS CHANNEL RELEASE message.

## Maximum Duration of Test

## 39.5.3.1.2.3 Immediate assignment / ignore assignment

The purpose of the immediate assignment procedure is to establish an RR connection between the mobile station and the CTS-FP.

## 39.5.3.1.2.3.1 Conformance requirements

A CTS-MS waiting for a response from the CTS-FP, following the sending of a CTS ACCESS REQUEST, shall ignore a CTS IMMEDIATE ASSIGNMENT message with an Access Request Reference containing another CTS-MSI.

## 39.5.3.1.2.3.2 Test purpose

To verify that the CTS-MS ignores an assignment for another CTS-MS while waiting for an assignment of its own.

## References

3GPP TS 04.56 subclause 4.3.1.1.3.

## 39.5.3.1.2.3.3 Method of test

## Related PICS/PIXIT statements

-

## Initial conditions

SS:

Radio\_Link\_Timeout set to [TBC].

CTS-MS:

The CTS-MS is in the "Attached, idle, updated" mode, with a CTS-MSI allocated.

## Foreseen Final State of the CTS-MS

Scanning for available Network.

## Test procedure

The SS pages the CTS-MS, which shall react by sending CTS ACCESS REQUEST. Immediately after reception of the third CTS ACCESS REQUEST the SS sends a CTS IMMEDIATE ASSIGNMENT message which has another CTS-MSI in the access request reference field. The CTS-MS shall ignore the assignment and send another CTS ACCESS REQUEST message.

## Maximum Duration of Test

[TBD]

### 39.5.3.1.3 Paging

#### 39.5.3.1.3.1 Paging with current CTS-MSI

The Paging procedure is used by the CTS-FP to cause the CTS Mobile Station to establish a radio connection. Normally the CTS Mobile Station listens to its paging subchannel but the correct implementation of the paging procedure in the CTS Mobile Station is essential for the basic establishment of a connection.

##### 39.5.3.1.3.1.1 Conformance requirements:

The attached CTS-MS shall respond correctly to various CTS PAGING REQUEST messages. The MS shall send CTS ACCESS REQUEST messages, with an Establishment Cause set to "Answer to Paging", until the CTS-FP answers. The number of CTS ACCESS REQUEST messages shall be limited by the parameter Max-retrans. After the assignment procedure, the CTS-MS shall send a CTS PAGING RESPONSE message on the channel assigned by the CTS-FP.

##### 39.5.3.1.3.1.2 Test purpose:

To test that the attached CTS-MS is able to determine its paging subgroup correctly and that the CTS-MS responds correctly to various CTS PAGING REQUEST messages. All valid ways of addressing the CTS-MS are tested. It is tested that the CTS-MS responds with the same last issued CTS-MS Identity that is used in the CTS PAGING REQUEST message.

##### References:

3GPP TS 04.56 subclause 4.3.2.

##### 39.5.3.1.3.1.3 Method of test

##### Related PICS/PIXIT statements:

-

##### Initial conditions:

SS:

Max-Retrans = 2.

CTS-MS:

The CTS-MS is in the "Attached, idle, updated", with a CTS-MSI allocated.

##### Foreseen Final State of the CTS-MS

"Attached, idle, updated", with CTS-MSI allocated.

##### Test procedure

The SS pages the attached CTS-MS 5 times with different CTS PAGING REQUEST messages on the paging subchannel which corresponds to the CTS-MS's IMSI (CTS-IMSI).

In all the cases the attached CTS-MS shall answer to the paging by sending CTS ACCESS REQUESTs. The SS responds to the second CTS ACCESS REQUEST by assigning a channel, and the CTS-MS shall then send a correct CTS PAGING RESPONSE.

##### Maximun Duration of Test

5 minutes.

## Foreseen Final State of the CTS-MS

"Attached, idle, updated", with CTS-MSI allocated.

## Test procedure

The CTS-MS is paged and allocated a dedicated channel and the Layer 2 signalling link is established. The SS then sends a CTS CHANNEL RELEASE after which the MS shall send at least 2 L2 DISC frames. The SS does not acknowledge any of the L2 DISC frames. After 2 s, the SS verifies for 3 s that the CTS-MS has stopped transmission of Layer 2 messages. The CTS-MS shall return to the idle state, which is verified through the paging procedure to which the CTS-MS shall respond.

## Maximum Duration of Test

## 39.5.3.1.10 Authentication

## 39.5.3.1.10.1 Local Mutual Authentication failure

According to 3GPP TS 03.20 annex E, subclause 3.2.1.1, an authentication failure occurs if:

- the CTS-MS and the CTS-FP have different Ka; or/and
- the algorithms B3 and/or B4 are not implemented as specified (i.e. non type approved equipment).

## 39.5.3.1.10.1.1 Conformance requirements:

After reception of a CTS Authentication Response message from the CTS-FP and SRES2 does not match with the local XSRES2, the CTS Mobile Station shall disconnect the main signalling link by sending a DISC L2 frame to the CTS-FP.

## 39.5.3.1.10.1.2 Test purpose:

To check that the CTS-MS is able to process B3 and B4 algorithms.

To check that the CTS-MS abort the RR connection if the authentication of the fixed part fails.

## 39.5.3.1.10.1.3 Method of test

## Related PICS/PIXIT statements:

-

Initial conditions:

SS:

The SS has valid Ka, Kc.

CTS-MS:

The CTS-MS is in the "Attached, idle, updated", with valid CTS-MSI1, Ka', Kc'.

Ka # Ka'

Foreseen Final State of the CTS-MS

"Attached, idle, updated", with CTS-MSI2, Ka', Kc' allocated.

Test procedure

The attached CTS-MS is paged. After the CTS-MS has sent a CTS PAGING RESPONSE message to the SS, the SS initiates a CTS authentication procedure by sending a CTS MS AUTHENTICATION REQUEST with an unpredictable number CH1. The CTS-MS shall send in turn a CTS FP AUTHENTICATION REQUEST with an unpredictable number CH2 and checks the value SRES2 sent by the SS in the CTS FP AUTHENTICATION RESPONSE message. Ka and Ka' are different so the checked SRES2 value is not valid, then CTS-MS shall disconnect the main signalling link by sending a DISC L2 frame to the SS.

Maximun Duration of Test

[TBD]

39.5.3.1.13 Radio Link Management

39.5.3.1.13.1 AFA Measurement and Reporting

The CTS radio interface has been designed to meet a requirement of low generated interference, either from the CTS to existing overlaying PLMNS, either from a CTS to another CTS. This requirement is achieved by the combined usage of the three concepts : beacon concept, AFA concept and TFH concept.

### 39.5.3.1.13.1.1 Conformance requirements

A precise radio frequency planning can not be applied to the CTS-FP/MS pair, as the CTS is intended to be deployed by the end-user. Therefore, a list of frequencies (the GFL) on which it is allowed to operate is given to the CTS. With the AFA, interference measurements will be performed on the frequencies in the GFL to provide a ranking in the AFA table, in order to exclude unacceptably interfered frequencies from the usage in CTS.

### 39.5.3.1.13.1.2 Test purpose

To check that the CTS-MS is able to perform AFA monitoring procedure.

To check that the CTS-MS is able to perform AFA monitoring reporting when order by the CTS-FP.

### 39.5.3.1.13.1.3 Method of test

### Related PICS/PIXIT statements

-

### Initial conditions

CTS-MS:

The CTS-MS is in the "Attached, idle, updated" mode, with a CTS-MSI allocated.

### Foreseen Final State of the CTS-MS

The CTS-MS is in the "Attached, idle, updated" mode, with a CTS-MSI allocated.

### Test procedure

The attached CTS-MS shall respond to a pending CTS PAGING REQUEST message. The CTS-MS shall send CTS ACCESS REQUEST messages, with an Establishment Cause set to "Answer to Paging", until the SS answers. The general access procedure is then performed. The SS sends a CTS AFA MONITORING COMMAND. Finally the SS sends a CTS CHANNEL RELEASE. For each carrier of the AFA List, the CTS-MS shall perform NAMC basic measurements, where a basic measurement shall be the average received signal level on the 8 timeslots of the TDMA frame. The delay between two consecutive basic measurements shall be at least 5 seconds. The received interference level of the carrier shall be the maximum of the NAMC basic measurements. The maximum processing time for this procedure shall be  $NAMC \times 10$  s.

The SS shall wait ( $NAMC \times 10 + 20$ ) seconds before starting the AFA reporting procedure to let the CTS-MS enough time to perform the monitoring procedure during NAMC cycle. When ordered by the SS with the CTS AFA MONITORING ENQUIRY, the CTS-MS shall report in the CTS AFA MONITORING REPORT message a table of received interference level for all frequencies of the AFA List, together with the AFA monitoring cycles equal to NAMC. Finally the SS sends a CTS CHANNEL RELEASE.

### Maximum Duration of Test

[TBD]

## 39.5.3.1.13.2 Total Frequency Hopping List update

The CTS radio interface has been designed to meet a requirement of low generated interference, either from the CTS to existing overlaying PLMNS, either from a CTS to another CTS. This requirement is achieved by the combined usage of the three concepts : beacon concept, AFA concept and TFH concept.

## 39.5.3.1.13.2.1 Conformance requirements

A precise radio frequency planning can not be applied to the CTS-FP/MS pair, as the CTS is intended to be deployed by the end-user. Therefore, a list of frequencies (the GFL) on which it is allowed to operate is given to the CTS. With the AFA, interference measurements will be performed on the frequencies in the GFL to provide a ranking in the AFA table, in order to exclude unacceptably interfered frequencies from the usage in CTS.

The remaining frequencies are used by the Total Frequency Hopping algorithm in order to reduce the interference of the CTS with the overlaying PLMN and other CTS-FP/MS pairs. With TFH the interference caused by the CTS link is spread across multiple GSM links (interference averaging) and the co-channel interference is due to different users at different locations (interference diversity).

## 39.5.3.1.13.2.2 Test purpose

To check that the CTS-MS is able to store the new TFH list broadcast by the CTS-FP on a dedicated channel. To check that the CTS-MS is able to establish a TCH/F channel in total frequency hopping mode using the new TFH list.

## 39.5.3.1.13.2.3 Method of test

### Related PICS/PIXIT statements

-

### Initial conditions

#### CTS-FP:

Radio\_Link\_Timeout set to [TBC].

#### CTS-MS:

The CTS-MS is in the "Attached, idle, updated" mode, with a CTS-MSI allocated.

### Foreseen Final State of the CTS-MS

The CTS-MS is in the "Attached, idle, updated" mode, with a CTS-MSI allocated.

### Test procedure

The attached CTS-MS shall respond to a pending CTS PAGING REQUEST message. The CTS-MS shall send CTS ACCESS REQUEST messages, with an Establishment Cause set to "Answer to Paging", until the SS answers. The general access procedure is then performed. The SS sends a CTS FREQUENCY HOPPING REDEFINITION. The CTS-MS should store the new TFH list without erasing the old one as long as the frame number broadcast in the Starting Time field as not occurred.

Finally the SS sends a CTS CHANNEL RELEASE.

The SS wait until the new TFH list is applicable.

The SS send a CTS PAGING REQUEST with the last known CTS-MS's CTS-MSI. The CTS-MS should establish a TCH/F channel in total frequency hopping mode using the new TFH list.

### Maximum Duration of Test

[TBD]

## 39.5.3.2 Structured Procedures

## 39.5.3.2.1 Attachment

## 39.5.3.2.1.1 CTS attachment retry with same FPBI and BCH carrier

## 39.5.3.2.1.1.1 Conformance requirements

If the fixed part identity is not the expected one, the mobile station shall start the timer TC3256. The mobile shall not attempt to attach to any fixed part having the same FPBI before expiration of the timer TC3256. This does not forbid attachment to fixed parts having another FPBI.

## 39.5.3.2.1.1.2 Test purpose

To check that the CTS-MS does not start the CTS attachment procedure if there was a failed CTS attachment with the same FPBI, same BCH carrier and same relative frame position of the BCH SB in the BCH superframe within the last 10 minutes.

## 39.5.3.2.1.1.3 Method of test

## Related PICS/PIXIT statements

-

#### Initial conditions

SS:

Radio\_Link\_Timeout set to [TBC].

CTS-MS:

The CTS-MS is in the "Enrolled, idle, updated" mode, with a CTS-MSI allocated.

#### Foreseen Final State of the CTS-MS

The CTS-MS is in the "Enrolled, idle, updated" mode, with a CTS-MSI allocated.

#### Test procedure

1. The enrolled CTS-MS is made to register on a SS. The CTS-MS is locked on the BCH carrier with a known FPBI identity. It shall send at least one CTS ACCESS REQUEST message with establishment cause set to "CTS attachment", the SS sends a CTS IMMEDIATE ASSIGNMENT. The CTS-MS shall send a CTS ATTACHMENT REQUEST message. The SS does not identify the CTS-MSI so it starts an identification procedure to get the IMSI of the CTS-MS. The SS returns a CTS ATTACHMENT REJECT message with Reject cause = "not enrolled". The SS sends a CTS CHANNEL RELEASE. The CTS-MS shall not initiate a RR connection establishment during 10 minutes.
2. The test is started again. Now the CTS-MSI is recognised but the keys Ka and Kinit does not match so the authentication of the CTS-MS fails. In this case, the SS shall send a CTS AUTHENTICATION REJECT, and the CTS attachment reject is implicit. The SS sends a CTS CHANNEL RELEASE. The CTS-MS shall not initiate a RR connection establishment during 10 minutes.

#### Maximum Duration of Test

[TBD]

## 39.5.3.2.2 Detachment

## 39.5.3.2.2.1 CTS detachment upon CTS-MS power off

The CTS detachment procedure is used to detach an enattached CTS-MS from a CTS-FP.

## 39.5.3.2.2.1.1 Conformance requirements

The purpose of the CTS detach procedure is to detach a mobile station from a fixed part. The mobile station may launch the detach procedure during the CTS mode deactivation (e.g. at the power off, when the SIM is extracted, when the mobile station is set in GSM mode only).

The CTS detach procedure is always initiated by the mobile station.

## 39.5.3.2.2.1.2 Test purpose

To check that the CTS- MS starts the CTS detachment procedure if:

- it is switched off within the range of the CTS-FP;
- the SIM is extracted;
- the mobile station is set in GSM mode only.

## References:

3GPP TS 04.56 subclause 5.2.1.

39.5.3.2.2.1.3 Method of test

## Related PICS/PIXIT statements:

-

## Initial conditions:

SS:

Radio\_Link\_Timeout set to [TBC].

CTS-MS:

The CTS-MS is in the "Attached, idle, updated", with a CTS-MSI allocated. The CTS-MS is in CTS mode only.

## Foreseen Final State of the CTS-MS

"Enrolled, idle, updated", with CTS-MSI allocated.

## Test procedure

1. The attached CTS-MS is switched off. It shall send at least one CTS ACCESS REQUEST message with establishment cause set to " detachment ", the SS sends a CTS IMMEDIATE ASSIGNMENT. The CTS-MS shall send a CTS DETACHMENT INDICATION message. Finally the SS sends a CTS CHANNEL RELEASE to end the test.
2. The CTS-MS is switched on. It shall starts the attach procedure. When the attachment procedure is completed, the SIM is removed from the CTS-MS. The CTS-MS should start the detach procedure as described in phase 1.
3. The CTS-MS is switched on. It shall starts the attach procedure. When the attachment procedure is completed, the CTS-MS is switched to GSM mode only. The CTS-MS should start the detach procedure as described in phase 1.

## Maximun Duration of Test

[TBD]

39.5.3.2.7 Handover

39.5.3.2.7.1 Handover / successful / active call / total frequency hopping

39.5.3.2.7.1.1 Conformance requirements

The MS shall correctly apply the handover procedure when a call is in progress and when handover is performed from a TCH/F with total frequency hopping towards a TCH/F with total frequency hopping.

39.5.3.2.7.1.2 Test purpose

To test that the MS correctly handles the values of any Starting Time IE in the CTS HANDOVER COMMAND message. To test that the CTS-MS activates the new channel correctly and transmits the SABM on a correct frame number.

#### References

3GPP TS 04.56 subclause 4.4.3.

39.5.3.2.7.1.3 Method of test

#### Related PICS/PIXIT statements

-

#### Initial conditions

SS:

Radio\_Link\_Timeout set to [TBC].

CTS-MS:

The CTS-MS is in the active state of a call using a full rate TCH in total frequency hopping mode.

#### Foreseen Final State of the CTS-MS

The CTS-MS is in the active state of a call using a full rate TCH in total frequency hopping mode.

#### Test procedure

The CTS-MS is in the active state of a call. The SS send a CTS INTRACELL HANDOVER COMMAND on the main DCCH. The CTS-MS shall (at the time defined by the Starting Time information element) activate the channel by sending a SABM message. The CTS-MS shall be ready to transmit a CTS HANDOVER COMPLETE message, after a UA frame has been sent by the SS.

#### Maximum Duration of Test

## 39.5.3.2.8

## 39.5.3.2.8.1 Handover / Layer 1 Failure

## 39.5.3.2.8.1.1 Conformance requirements

The MS shall return to the old channel in the case of an handover failure caused by the non establishment of the new channel. On the old channel the MS shall use the old channel description or channel mode.

## 39.5.3.2.8.1.2 Test purpose

To test that the CTS-MS try to activates the new channel correctly and transmits the SABM. To test that CTS-MS switch ack to the old channel if the activation of the new channel fails.

## References

## 39.5.3.2.8.1.3 Method of test

## Related PICS/PIXIT statements

-

## Initial conditions

SS:

Radio\_Link\_Timeout set to [TBC].

CTS-MS:

The CTS-MS is in the active state of a call using a full rate TCH in total frequency hopping mode.

## Foreseen Final State of the CTS-MS

The CTS-MS is in the active state of a call using a full rate TCH in total frequency hopping mode.

## Test procedure

The CTS-MS is in the active state of a call. The SS send a CTS INTRACELL HANDOVER COMMAND on the main DCCH. The CTS-MS shall (at the time defined by the Starting Time information element) activate the channel by sending a SABM message and start timer T200. When timer T200 ends, the CTS-MS should retransmits the Layer 2 SABM up to N200 times. Then the CTS-MS sends the SABM frame on the old time slot, wait for the UA frame and sends the CTS INTRACELL HANDOVER FAILURE on the old time slot.

Maximum Duration of Test

[TBD]

### 39.5.3.3 Initialisation

#### 39.5.3.3.1 Enrolment

##### 39.5.3.3.1.1 Enrolment with non CTS SIM

To check that the CTS-MS does not ask for CTS services with a non CTS SIM.

##### 39.5.3.3.1.1.1 Conformance requirements

The MS-SIM verification follows the normal GSM requirements. The GSM subscription is checked whenever the CTS-MS accesses the PLMN (authentication performed using the IMSI, Ki and A3 in the MS-SIM card).

##### 39.5.3.3.1.1.2 Test purpose

To check that the CTS-MS checks for the DF-CTS presence in the SIM before starting enrolment procedure.

References

3GPP TS 03.20 annex E and subclause 4.6.

##### 39.5.3.3.1.1.3 Method of test

Related PICS/PIXIT statements

-

Initial conditions

SS:

Enrolment procedure ready at the SS side.

CTS-MS:

The CTS-MS is OFF.

The DF-CTS field is not available in the SIM.

## Foreseen Final State of the CTS-MS

Scanning for an available Network.

## Test procedure

The CTS-MS is switched ON. The CTS-MS is made to start enrolment procedure. It shall not start the enrolment procedure as long as the SIM has no DF-CTS entry.

## Maximum Duration of Test

[TBD]

## Expected Sequence

| Step | Direction | Message | Comments                                                             |
|------|-----------|---------|----------------------------------------------------------------------|
| 1    |           |         | The CTS-MS is looking for a suitable GSM only Network.               |
| 2    |           |         | Check that the CTS-MS doesn't send CTS ACCESS REQUEST for 2 minutes. |

## 39.5.3.3.1.2 CTS-FP not ready for Enrolment

The CTS-MS/CTS-FP enrolment is the procedure, which generates an association between a certain CTS-MS and a certain CTS-FP, i.e. a CTS-MS/CTS-FP pair is established.

## 39.5.3.3.1.2.1 Conformance requirements

In order to perform the enrolment of a CTS-MS, a special procedure shall be implemented in the CTS-FP, by which the initial synchronisation of a CTS-MS with the CTS-FP is eased. This procedure of synchronisation for CTS-MS enrolment shall be triggered by the CTS upper layers.

## 39.5.3.3.1.2.2 Test purpose

To check that the CTS-MS is looking at the enrolment state of the CTS-FP before starting enrolment procedure.

## References

3GPP TS 03.20 annex E and subclause 3.4.1.1.

3GPP TS 05.08 subclause 11.1.1.2.

## 39.5.3.3.1.2.3 Method of test

-

## Initial conditions

SS:

Enrolment procedure not ready at the SS side.

CTS-MS:

The CTS-MS is not enrolled on the SS, and idle.

## Foreseen Final State of the CTS-MS

Scanning for an available Network.

## Test procedure

The CTS-MS is not enrolled with that SS, i.e. the CTS-IFPSI nor the CTS-IFPEI of that SS are stored in the SIM of the CTS-MS. The SS is not switched to the CTS enrolment mode. The CTS-MS is made to start enrolment to that SS. It shall not start the procedure as long as the SS is not in the enrolment mode.

## Maximum Duration of Test

[TBD]

## Expected Sequence

39.5.3.3.2 Reserved

39.5.3.3.3 De-enrolment

39.5.3.3.3.1 Attached CTS-MS de-enrolment

The de-enrolment of a CTS-MS is the procedure which cancel the association between a certain CTS-MS and a certain CTS-FP.

39.5.3.3.3.1.1 Conformance requirements

The fixed part initiates the CTS de-enrolment procedure by sending a CTS DE-ENROLMENT INDICATION to the mobile station. Then the fixed part will request the RR sublayer to release the RR connection.

39.5.3.3.3.1.2 Test purpose

To check that the CTS-MS is able to execute the CTS-MS CTS de-enrolment procedure and to erase the corresponding entry in the SIM.

## References

## Related PICS/PIXIT statements

-

## Initial conditions

SS:

Radio\_Link\_Timeout set to [TBC].

CTS-MS:

The CTS-MS is in the "Attached, idle, updated" mode, with a CTS-MSI allocated.

## Foreseen Final State of the CTS-MS

The CTS-MS is not enrolled one that SS, and idle

## Test procedure

The attached CTS-MS shall respond to a pending CTS PAGING REQUEST message. The CTS-MS shall send CTS ACCESS REQUEST messages, with an Establishment Cause set to "Answer to Paging", until the SS answers. The general access procedure is then performed. The SS sends a CTS DE-ENROLMENT INDICATION.

Finally the SS sends a CTS CHANNEL RELEASE.

The CTS-MS should remove the corresponding data entry in the SIM.

The SS send a CTS-PAGING REQUEST with the last known CTS-MS's CTS-MSI.

## Maximum Duration of Test

## 40 GPRS default conditions, message contents and macros

### 40.1 Default test conditions

The following default test conditions shall apply if not otherwise stated within an individual test description.

The testcases for higher layers shall use the second set of default test conditions for channel combination v), xi) and xiii) as specified in subclause 40.3.

In the tables following, decimal values will normally be used. Where a hexadecimal value is used, it indicated with an "H". A binary value will be indicated with a "B".

For MSs that cannot be configured to send an exact number of octets in RLC data blocks of uplink data transfer, test cases specifying 'uplink transfer of **n** octets data' shall be interpreted as 'uplink transfer of *at least n* octets data', unless otherwise stated in the test case.

#### 40.1.1 Default settings for cell A

## 40.2 Default message contents

### 40.2.1 System Information messages

#### 40.2.1.1 Cell A

With the SYSTEM INFORMATION messages, the information elements are listed in alphabetic order (this is because some information elements occur in several SYSTEM INFORMATION types).

NOTE: BCCH can send 1 instance of SYSTEM INFORMATION 13.

##### 40.2.1.1.1 Contents of information elements in SYSTEM INFORMATION TYPE 1 to 13 messages.

## 40.2.2 Packet System Information messages

### 40.2.2.1 Cell A

This subclause contains default sets of PSI message contents for two GSM GPRS neighbour cells followed by default sets of PSI message contents for two DCS GPRS neighbour cells. All cells are operating with channel combination xi).

In this subclause all information element values are in binary. Numeric values in comments are in decimal.
