The System Simulator pages the MS and after the MS has responded with a CHANNEL REQUEST, the simulator assigns a TCH/F if supported otherwise a SDCCH/8. Then the SS sends to MS a FREQUENCY REDEFINITION. The MS shall then use the new frequencies/hopping sequence.

## Maximum duration of test

3 minutes.

## Expected sequence

The sequence is performed for execution counter c=1 to 6.

| Cell Channel Description             | for c=1, use range 128 to encode the following 13 frequencies: (960, 961, 962, 963, 964, 965, 966, 967, 968, 969, 970, 971, 972)<br>for c=2, use range 256 to encode the following 13 frequencies (20, 40, 66, 73, 74, 75, 76, 77, 78, 79, 108, 114, 115)<br>for c=3, use range 512 to encode the following 13 frequencies (960, 961, 962, 963, 964, 965, 966, 967, 968, 969, 970, 971, 972)<br>for c=4, use range 1 024 to encode the following 10 frequencies (0, 30, 40, 66, 80, 964, 969, 972, 990, 1020)<br>for c=5, use variable Bitmap to encode the following 13 frequencies (960, 961, 962, 963, 964, 965, 966, 967, 968, 969, 970, 971, 972)<br>for c=6, not present (the mobile station will use the last Cell Channel Description IE received, i.e. the one broadcast in the SYSTEM INFORMATION TYPE 1 message). |
| Mobile Allocation                    | indicates the following frequencies:<br>for c=1 (964, 969, 972)<br>for c=2 (73, 76, 79, 108, 114)<br>for c=3 (960, 964, 968, 972)<br>for c=4 (30, 40, 969, 972, 990, 1020)<br>for c=5 (960, 964, 967, 970, 972)<br>for c=6 (30, 50, 70)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Starting time                        | indicates (current frame number + 100 frames) mod 42432                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

### 26.10.3 E-GSM or R-GSM signalling / Structured procedure

Conformance requirements of subclause 26.9 fully apply to any mobile station (P-GSM, E-GSM, R-GSM or DCS) in the whole supported band of the mobile station.

Besides, as an E-GSM or R-GSM mobile station shall support the P-GSM band, it shall pass successfully every test of subclause 26.9 under the described GSM 900 conditions.

The purpose of these tests is to verify that the MS performs certain elementary procedures of the RR, MM, and CC protocol correctly within a structured procedure. This tested here in an E-GSM or R-GSM context to evaluate the global behaviour of an E-GSM or R-GSM mobile station using its specific frequency capability.

One mobile originated call and one emergency call are performed.

In one of the different cases the different following situations occur: early and late assignments, call release initiated by the network and by the MS.

### 26.10.3.1 E-GSM or R-GSM signalling / Structured procedure / Mobile originated call

#### 26.10.3.1.1 Conformance requirement

- 1) An MS in MM state "idle, updated" and in RR idle mode with a TMSI assigned, when made to initiate a call for a selected teleservice that is supported by the MS, shall start to initiate an immediate assignment procedure by sending the CHANNEL REQUEST message with correct establishment cause.
- 2) Upon receipt of the ASSIGNMENT COMMAND message, the Mobile Station initiates a local end release of link layer connections, disconnects the physical channels, commands the switching to the assigned channels and initiates the establishment of lower layer connections (this includes the activation of the channels, their connection and the establishment of the data links). After the main signalling link is successfully established, the MS returns an ASSIGNMENT COMPLETE message, specifying cause "normal event", to the network on the main DCCH.
- 3, 4) The call control entity of the Mobile Station in the "call initiated" state, in the "mobile originating call proceeding" state or in the "call delivered" state, shall, upon receipt of a CONNECT message:
  - attach the user connection to the radio path;
  - return a CONNECT ACKNOWLEDGE message.

#### 26.10.3.1.2 Test purpose

- 1) To verify that the MS in MM state "idle, updated" and in RR idle mode with a TMSI assigned, when made to initiate a call for a selected teleservice that is supported by the MS as declared in a PICS/PIXIT statement, starts to initiate an immediate assignment procedure by sending the CHANNEL REQUEST message.
- 2) To verify that subsequently after receipt of an IMMEDIATE ASSIGNMENT message allocating an SDCCH, after completion of establishment of the main signalling link, after having sent a CM SERVICE REQUEST message, after having successfully performed authentication and cipher mode setting procedures, after having sent a SETUP message, after having received a CALL PROCEEDING message followed by an ALERTING message and an ASSIGNMENT COMMAND message allocating an appropriate TCH, the MS sends an ASSIGNMENT COMPLETE message.
- 3) To verify that subsequently, after the suite of actions specified in test purposes 1 and 2, the MS after receiving a CONNECT message returns a CONNECT ACKNOWLEDGE message.
- 4) To verify that after the suite of actions specified in test purposes 1 and 2, the MS after receiving a CONNECT message attaches the user connection to the radio path. (This is checked by verifying that there is a point in time after transmission of the first L2 frame containing the (complete) CONNECT message, where the MS is sending appropriate speech or data frames whenever it does not have to transmit or acknowledge an I frame on layer 2 of the FACCH.)

### 26.10.3.1.3 Method of test

#### Related PICS/PIXIT statements

- Support E-GSM or R-GSM.
- Interface to the human user (p1 = Y/N).
- Way to display the called number (only applicable if the MS has an interface to the human user).
- Way to indicate alerting (only applicable if the MS supports the feature).
- Way to make the MS accept an incoming call after alerting (possibly dependent on teleservice and configuration).
- Supported teleservices.
- Classmark.

#### Initial Conditions

##### System Simulator:

1 cell, default parameters.

##### Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

#### Foreseen Final State of the MS

The MS is in MM state "idle updated".

#### Test procedure

The following test is performed for one teleservice supported by the MS:

- A teleservice is selected that is supported by the MS; if the MS supports speech, the selected teleservice is speech. If necessary, the MS is configured for that teleservice.
- The MS is made to initiate a call. The call is established with late assignment. The release of the call is initiated by the MS.

#### Maximum Duration of Test

1 minute.

## Expected Sequence

| Step | Direction | Message                 | Comments                                                                                  |
|------|-----------|-------------------------|-------------------------------------------------------------------------------------------|
| 1    | MS        |                         | The "called number" is entered                                                            |
| 3    | MS        |                         |                                                                                           |
| 4    | MS -> SS  | CHANNEL REQUEST         | Establishment cause is "originating call and the network does not set the NECI bit to 1". |
| 5    | SS -> MS  | IMMEDIATE ASSIGNMENT    |                                                                                           |
| 6    | MS -> SS  | CM SERVICE REQUEST      | Message is contained in SABM.                                                             |
| 7    | SS -> MS  | AUTHENTICATION REQUEST  |                                                                                           |
| 8    | MS -> SS  | AUTHENTICATION RESPONSE | SRES specifies correct value.                                                             |
| 9    | SS -> MS  | CIPHERING MODE COMMAND  | SS starts deciphering after sending the message.                                          |
| 10   | MS -> SS  | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered.                |
| 11   | SS        |                         | SS starts ciphering.                                                                      |
| 12   | MS -> SS  | SETUP                   |                                                                                           |
| 13   | SS -> MS  | CALL PROCEEDING         |                                                                                           |
| 14   | SS -> MS  | ALERTING                |                                                                                           |
| 15   | MS        |                         | Depending on the PICS, an alerting indication is given.                                   |
| 16   | SS -> MS  | ASSIGNMENT COMMAND      |                                                                                           |
| 17   | MS -> SS  | ASSIGNMENT COMPLETE     |                                                                                           |
| 18   | SS -> MS  | CONNECT                 |                                                                                           |
| 19   | MS -> SS  | CONNECT ACKNOWLEDGE     |                                                                                           |
| 20   | MS        |                         | The appropriate bearer channel is through connected in both directions.                   |
| 21   | MS        |                         | If the call is a data call, the TCH shall be through connected in both directions.        |
| 22   | MS        |                         | The MS is made to release the call.                                                       |
| 23   | MS -> SS  | DISCONNECT              |                                                                                           |
| 24   | SS -> MS  | RELEASE                 |                                                                                           |
| 25   | MS -> SS  | RELEASE COMPLETE        |                                                                                           |
| 26   | SS -> MS  | CHANNEL RELEASE         | The main signalling link is released.                                                     |

## Specific Message Contents:

None.

### 26.10.3.2 E-GSM or R-GSM signalling / Structured procedures / emergency call

Emergency call establishment can be initiated by an MS whether location updating has been successful or not and whether a SIM is inserted into the MS or not; but only if the MS is equipped for speech.

This subclause is only applicable to an MS supporting speech.

#### 26.10.3.2.1 Conformance requirement

- 1) The MS in the "idle, updated" state, as after a successful location update, after the number 112 has been entered by user, shall send a CHANNEL REQUEST message with correct establishment cause ("emergency call").
- 2) After assignment of a dedicated channel the first layer message sent by the MS on the assigned dedicated channel shall be a CM SERVICE REQUEST message specifying the correct IMEI and a non-available CKSN, with CM Service Type "emergency call establishment".
- 3) After cipher mode setting acceptance by the network, the MS shall send an EMERGENCY SETUP message.
- 4, 5) The emergency call shall be correctly established. The assignment procedure shall be correctly performed.
- 6) After receipt of a CONNECT ACKNOWLEDGE message during correct establishment of the emergency call the TCH shall be through connected in both directions if an appropriate TCH is available.
- 7) The call shall be cleared correctly.

**Requirement Reference:**

For conformance requirement 1 and 2:

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.3.1.1;

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 5.2.1 and 4.5.1.5;

3GPP TS 02.30 clause 4.

For conformance requirement 3:

3GPP TS 04.08 / 3GPP TS 24.008, subclause 5.2.1.2.

For conformance requirements 4 and 5:

3GPP TS 04.08 / 3GPP TS 24.008, subclause 5.2.1.1; and

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.4.3.

For conformance requirement 6:

3GPP TS 04.08 / 3GPP TS 24.008, subclauses 5.2.1.1.6 and 5.1.3.

For conformance requirement 7:

3GPP TS 04.08 / 3GPP TS 24.008, subclause 5.4.

**26.10.3.2.2 Test purpose**

- 1) To verify that the MS in the "idle, no IMSI" state (no SIM inserted) when made to call the number 112, sends a CHANNEL REQUEST message with establishment cause "emergency call".
- 2) To verify that after assignment of a dedicated channel the first layer message sent by the MS on the assigned dedicated channel is a CM SERVICE REQUEST message specifying the correct CKSN and TMSI, with CM Service Type "emergency call establishment".
- 3) To verify that after receipt of a CM SERVICE ACCEPT message from the SS, the MS sends an EMERGENCY SETUP message.
- 4) To verify that subsequently, the SS having sent a CALL PROCEEDING message and then an ALERT message and having initiated the assignment procedure, the MS performs correctly that assignment procedure.
- 5) To verify subsequent correct performance of a connect procedure.
- 6) To verify that subsequently the MS has through connected the TCH in both directions.
- 7) To verify that the call is cleared correctly.

This is tested in the following case:

Structured procedures / emergency call / idle, no IMSI / accept case.

**26.10.3.2.3 Method of test****Related PICS/PIXIT Statements**

Support E-GSM or R-GSM.

Speech supported (Y/N).

Classmark.

**Initial Conditions**

System Simulator:

1 cell, default parameters except:

E-GSM:

BCCH ARFCN = 990.

R-GSM:

BCCH ARFCN = 965.

Mobile Station:

The MS is in MM-state "idle, no IMSI", no SIM inserted.

#### Foreseen Final State of the MS

The MS is in MM-state "idle, no IMSI", no SIM inserted.

#### Test procedure

The MS is made to initiate an emergency call. The call is established without authentication, without ciphering, with early assignment. Having reached the active state, the call is cleared by the SS.

#### Maximum Duration of Test

1 minute.

#### Expected Sequence

## 26.11 Multiband signalling

### 26.11.1 General considerations

This subclause applies only to Multiband mobile stations, as defined in 3GPP TS 02.06 subclause 3.2.1.

Conformance requirements of clause 26 fully apply to any Multiband MS in the whole supported band(s) of operation of the mobile station.

A Multiband mobile station has the functionality to perform handover, channel assignment, cell selection and re-selection between all its bands of operation within a PLMN.

A Multiband mobile station shall meet all requirements specified for each individual band. In addition it shall meet the extra functional requirements for multiband mobile stations.

The purpose of this subclause is to test these extra functional requirements for a multiband mobile station.

### 26.11.2 Multiband signalling / RR

#### 26.11.2.1 Multiband signalling / RR / Immediate assignment procedure

To inform the multiband network of the MSs additional frequency and power capability, the multiband MS has to send a CLASSMARK CHANGE as soon as possible in a connection establishment.

##### 26.11.2.1.1 Conformance requirement

Following a PAGING REQUEST message, the MS shall correctly set up an RR connection on a supported channel described in the IMMEDIATE ASSIGNMENT message. On the MS side, the procedure is terminated when the establishment of the main signalling link is confirmed. When the ES bit is set to 1 in the Classmark 1 or the Classmark 2 information element and the Early Sending Classmark Control bit is set to "high" in SI3 Rest Octets, then the MS shall send, on the first occasion, the CLASSMARK CHANGE message.

During a contention resolution procedure, if the last timeslot of the block containing a L2 UA frame occurs at time T, then the MS shall be ready to transmit the CLASSMARK CHANGE before T + 40 ms.

##### Reference(s)

3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.3.1.1.2 and 3.3.1.1.4.

3GPP TS 04.13 subclause 5.2.11.

3GPP TS 05.10 subclause 6.10.

##### 26.11.2.1.2 Test purpose

To verify that the MS can correctly set up a dedicated control channel and that a multi band MS is able to perform early sending of CLASSMARK CHANGE.

To verify the performance requirement on early sending of the CLASSMARK CHANGE message.

### 26.11.2.1.3 Method of test

#### Initial Conditions

##### System Simulator:

For 450/900 MS:

1 cell.

CCCH-CONF is set to "1 basic physical channel used for CCCH not combined with SDCCHs".

BCCH carrier number 263.

For 480/900 MS:

1 cell.

CCCH-CONF is set to "1 basic physical channel used for CCCH not combined with SDCCHs".

BCCH carrier number 310.

For 450/1 800 MS:

1 cell.

CCCH-CONF is set to "1 basic physical channel used for CCCH not combined with SDCCHs".

BCCH carrier number 263.

For 480/1 800 MS:

1 cell.

CCCH-CONF is set to "1 basic physical channel used for CCCH not combined with SDCCHs".

BCCH carrier number 310.

For 900/1 800 MS:

1 cell.

CCCH-CONF is set to "1 basic physical channel used for CCCH not combined with SDCCHs".

BCCH carrier number 20.

For 700/1 900 MS:

1 cell.

CCCH-CONF is set to "1 basic physical channel used for CCCH not combined with SDCCHs".

BCCH carrier number 457.

For 850/1 900 MS:

1 cell.

CCCH-CONF is set to "1 basic physical channel used for CCCH not combined with SDCCHs".

BCCH carrier number 147.

##### Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

## Related PICS/PIXIT Statement(s)

Type of MS (Multiband).

Frequency bands supported.

Support rate(s) of TCH: TCH/F and/or TCH/H.

## Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

## Test Procedure

The test is performed twice, first time in the lower band (BCCH carrier number 20, 263, 310, 457 or 147) and second time in the upper band (BCCH carrier number 20 or 590).

The System Simulator pages the MS and after the MS has responded with a CHANNEL REQUEST message the SS assigns an SDCCH. The MS shall go to the correct channel and send a PAGING RESPONSE message followed by a CLASSMARK CHANGE message. Then the SS initiates RR-release by sending a CHANNEL RELEASE message.

Before the procedure is repeated, the SS is reconfigured to transmit BCCH carrier in the upper band of operation (ARFCN 20 or 590).

## Maximum Duration of Test

6 seconds per value of the execution timer and 1 min for reconfiguring the SS.

## Expected Sequence

This sequence is performed for execution counter k = 1 to 2.

| Step | Direction | Message                | Comments                                                                                                                                                                                                                                                                                                                                                                                              |

### 26.11.2.2 Multiband signalling / RR / Handover

This subclause applies to any multiband mobile stations.

The purpose of this extra section is to test the handover where the target cell uses frequencies outside the frequency band of the serving cell.

### 26.11.2.2.1 Multiband signalling / RR / Handover / successful / active call / non-synchronized

#### 26.11.2.2.1.1 Conformance requirements

The MS shall correctly apply the handover procedure in the non-synchronized case when a call is in progress and when handover is performed from a TCH/F without frequency hopping in one band towards a TCH/F without frequency hopping in another band.

When the MS releases a TCH or SDCCH and returns to idle mode, it shall, as quickly as possible, camp on the BCCH carrier of the cell whose channel has just been released, ie the BCCH carrier indicated in the HANDOVER COMMAND.

A multi band mobile station shall not consider a HANDOVER COMMAND as invalid because it indicates target channel frequencies that are all in a different frequency band to that of the ARFCN in the Cell Description IE.

#### References

3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.4.4 and 9.1.15.

3GPP TS 04.13 subclause 5.2.6.2.

3GPP TS 05.08 subclause 6.7.1.

#### 26.11.2.2.1.2 Test purpose

To test that when the MS is ordered to make a non-synchronized handover it continuously sends access bursts on the main DCCH until it receives a PHYSICAL INFORMATION message from the SS. To test that the MS correctly handles the Timing Advance IE in the PHYSICAL INFORMATION message. To test that the MS activates the new channel correctly and transmits the HANDOVER COMPLETE message without undue delay. To test that upon release of the TCH, the mobile camps on the BCCH carrier of the cell indicated in the HANDOVER COMMAND.

#### 26.11.2.2.1.3 Method of test

##### Initial Conditions

##### For execution counter M =1, 2

##### System Simulator:

For 450/900 MS: 2 cells, A and B with same LAI, default parameters except:

Cell A has:

BCCH ARFCN = 263

Cell Allocation = (259, 261, 263, 265, 267, 269, 271, 273, 275, 277, 279, 281, 283, 285, 287, 289, 291)

Cell B has:

BCCH ARFCN = 20

Cell Allocation = (10, 17, 20, 26, 34, 42, 45, 46, 52, 59, 66, 73, 74, 75, 76, 108, 114)

The frame numbers of cells A and B shall be different by 100.

The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

For 480/900 MS: 2 cells, A and B with same LAI, default parameters except:

Cell A has:

BCCH ARFCN = 310

Cell Allocation = (306, 308, 310, 312, 314, 316, 318, 320, 322, 324, 326, 328, 330, 332, 334, 336, 338)

Cell B has:

BCCH ARFCN = 20

Cell Allocation = (10, 17, 20, 26, 34, 42, 45, 46, 52, 59, 66, 73, 74, 75, 76, 108, 114)

The frame numbers of cells A and B shall be different by 100.

The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

For 450/1 800 MS: 2 cells, A and B with same LAI, default parameters except:

Cell A has:

BCCH ARFCN = 263

Cell Allocation = (259, 261, 263, 265, 267, 269, 271, 273, 275, 277, 279, 281, 283, 285, 287, 289, 291)

Cell B has:

BCCH ARFCN = 764

Cell Allocation = (739, 743, 746, 749, 756, 758, 761, 764, 771, 779, 782, 791, 798, 829, 832, 844)

The frame numbers of cells A and B shall be different by 100.

The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

For 480/1 800 MS: 2 cells, A and B with same LAI, default parameters except:

Cell A has:

BCCH ARFCN = 310

Cell Allocation = (306, 308, 310, 312, 314, 316, 318, 320, 322, 324, 326, 328, 330, 332, 334, 336, 338)

Cell B has:

BCCH ARFCN = 764

Cell Allocation = (739, 743, 746, 749, 756, 758, 761, 764, 771, 779, 782, 791, 798, 829, 832, 844)

The frame numbers of cells A and B shall be different by 100.

The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

For 900/1 800 MS: 2 cells, A and B with same LAI, default parameters except:

Cell A has:

BCCH ARFCN = 20

Cell Allocation = (10, 17, 20, 26, 34, 42, 45, 46, 52, 59, 66, 73, 74, 75, 76, 108, 114)

Cell B has:

BCCH ARFCN = 764

Cell Allocation = (739, 743, 746, 749, 756, 758, 761, 764, 771, 779, 782, 791, 798, 829, 832, 844)

The frame numbers of cells A and B shall be different by 100.

The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

For 700/1 900 MS: 2 cells, A and B with same LAI, default parameters except:

Cell A has:

BCCH ARFCN = 457

Cell Allocation = (447, 454, 457, 463, 471, 479, 482, 483, 489, 496, 498, 500, 501, 502, 503, 506, 508)

Cell B has:

BCCH ARFCN = 764

Cell Allocation = (739, 743, 746, 749, 756, 758, 761, 764, 771, 779, 782, 791, 798, 803, 804, 806)

The frame numbers of cells A and B shall be different by 100.

The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

For 850/1 900 MS: 2 cells, A and B with same LAI, default parameters except:

Cell A has:

BCCH ARFCN = 147

Cell Allocation = (137, 144, 147, 153, 161, 169, 172, 173, 179, 186, 193, 200, 201, 202, 203, 235, 241)

Cell B has:

BCCH ARFCN = 764

Cell Allocation = (739, 743, 746, 749, 756, 758, 761, 764, 771, 779, 782, 791, 798, 803, 804, 806)

The frame numbers of cells A and B shall be different by 100.

The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

Mobile Station:

The MS is in the active state (U10) of a call on cell A. (for execution counter M = 1) and on cell B (for execution counter M=2).

### For execution counter M = 3

System Simulator:

For 450/900 MS: 2 cells, A and B with different LAI, default parameters except:

Cell A has:

BCCH ARFCN = 263

Cell Allocation = (259, 261, 263, 265, 267, 269, 271, 273, 275, 277, 279, 281, 283, 285, 287, 289, 291)

Cell B has:

LAI = 0003 H

BCCH ARFCN = 20

Cell Allocation = (10, 17, 20, 26, 34, 42, 45, 46, 52, 59, 66, 73, 74, 75, 76, 108, 114)

The frame numbers of cells A and B shall be the same. The timebase of cells A and B shall be such that the edges of their timeslots are coincident at the antenna connector. ie cells A and B shall be fully synchronised.

For 480/900 MS: 2 cells, A and B with different LAI, default parameters except:

Cell A has:

BCCH ARFCN = 310

Cell Allocation = (306, 308, 310, 312, 314, 316, 318, 320, 322, 324, 326, 328, 330, 332, 334, 336, 338)

Cell B has:

LAI = 0003 H

BCCH ARFCN = 20

Cell Allocation = (10, 17, 20, 26, 34, 42, 45, 46, 52, 59, 66, 73, 74, 75, 76, 108, 114)

The frame numbers of cells A and B shall be the same. The timebase of cells A and B shall be such that the edges of their timeslots are coincident at the antenna connector. ie cells A and B shall be fully synchronised.

For 450/1 800 MS: 2 cells, A and B with different LAI, default parameters except:

Cell A has:

BCCH ARFCN = 263

Cell Allocation = (259, 261, 263, 265, 267, 269, 271, 273, 275, 277, 279, 281, 283, 285, 287, 289, 291)

Cell B has:

LAI = 0003 H

BCCH ARFCN = 764

Cell Allocation = (739, 743, 746, 749, 756, 758, 761, 764, 771, 779, 782, 791, 798, 829, 832, 844)

The frame numbers of cells A and B shall be the same. The timebase of cells A and B shall be such that the edges of their timeslots are coincident at the antenna connector. ie cells A and B shall be fully synchronised.

For 480/1 800 MS: 2 cells, A and B with different LAI, default parameters except:

Cell A has:

BCCH ARFCN = 310

Cell Allocation = (306, 308, 310, 312, 314, 316, 318, 320, 322, 324, 326, 328, 330, 332, 334, 336, 338)

Cell B has:

LAI = 0003 H

BCCH ARFCN = 764

Cell Allocation = (739, 743, 746, 749, 756, 758, 761, 764, 771, 779, 782, 791, 798, 829, 832, 844)

The frame numbers of cells A and B shall be the same. The timebase of cells A and B shall be such that the edges of their timeslots are coincident at the antenna connector. ie cells A and B shall be fully synchronised.

For 900/1 800 MS: 2 cells, A and B with different LAI, default parameters except:

Cell A has:

BCCH ARFCN = 20

Cell Allocation = (10, 17, 20, 26, 34, 42, 45, 46, 52, 59, 66, 73, 74, 75, 76, 108, 114)

Cell B has:

LAI = 0003 H

BCCH ARFCN = 764

Cell Allocation = (739, 743, 746, 749, 756, 758, 761, 764, 771, 779, 782, 791, 798, 829, 832, 844)

The frame numbers of cells A and B shall be the same. The timebase of cells A and B shall be such that the edges of their timeslots are coincident at the antenna connector. ie cells A and B shall be fully synchronised.

For 700/1 900 MS: 2 cells, A and B with different LAI, default parameters except:

Cell A has:

BCCH ARFCN = 457

Cell Allocation = (447, 454, 457, 463, 471, 479, 482, 483, 489, 496, 498, 500, 501, 502, 503, 506, 508)

Cell B has:

LAI = 0003 H

BCCH ARFCN = 764

Cell Allocation = (739, 743, 746, 749, 756, 758, 761, 764, 771, 779, 782, 791, 798, 803, 804, 806)

The frame numbers of cells A and B shall be the same. The timebase of cells A and B shall be such that the edges of their timeslots are coincident at the antenna connector. ie cells A and B shall be fully synchronised.

For 850/1 900 MS: 2 cells, A and B with different LAI, default parameters except:

Cell A has:

BCCH ARFCN = 147

Cell Allocation = (137, 144, 147, 153, 161, 169, 172, 173, 179, 186, 193, 200, 201, 202, 203, 235, 241)

Cell B has:

LAI = 0003 H

BCCH ARFCN = 764

Cell Allocation = (739, 743, 746, 749, 756, 758, 761, 764, 771, 779, 782, 791, 798, 803, 804, 806)

The frame numbers of cells A and B shall be the same. The timebase of cells A and B shall be such that the edges of their timeslots are coincident at the antenna connector. ie cells A and B shall be fully synchronised.

Mobile Station:

The MS is successfully registered in the LA of cell A and the MS is in the active state (U10) of a call on cell A.

Related PICS/PIXIT Statements

Supported rate(s) of TCH: TCH/FS and/or TCH/HS.

Support for state U10 of the Call Control protocol.

Support for speech: yes/no

Support of multiband functionality

Foreseen Final State of the MS

For execution counter M = 1:

The active state (U10) of a call on cell B.

For execution counter M = 2:

The active state (U10) of a call on cell A.

For execution counter M = 3:

The MM idle state on cell A.

### Test Procedure

The MS is in the active state (U10) of a call on cell A. The SS sends a HANOVER COMMAND on the main DCCH. The MS shall begin to send access bursts on the new DCCH of the target cell. The SS observes the access bursts and after receiving n (n being randomly drawn between values according to table 26.6-2 of subclause 26.6.5) access bursts, the SS sends one PHYSICAL INFORMATION message with a Timing Advance as specified in table 26.6-1 of subclause 26.6.5. The MS shall activate the channel in sending and receiving mode. The MS shall establish a signalling link. The MS shall be ready to transmit a HANOVER COMPLETE message, before "x" ms after the end of the PHYSICAL INFORMATION message, but not before a UA frame has been sent by the SS.

The term "ready to transmit" is defined in 3GPP TS 04.13. The value of "x" depends upon the target channel and is specified in the specific message contents section.

For execution counter M = 3, the call is then released and then the SS sends a CHANNEL RELEASE message. It is then checked for 2 minutes that the MS does not access Cell B.

### Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

### Expected Sequence

This sequence is performed for an execution counter M = 1, 2, 3 for an MS which supports TCH/F.

Steps after step 7 are only performed for execution counter M = 3.

| Step | Direction | Message              | Comments                                                                                                                                        |
|------|-----------|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| 0    | MS -> SS  |                      | The MS and SS are in the active state of a call on the channel described below.                                                                 |
| 1    | SS -> MS  | HANOVER COMMAND      | See Specific message contents                                                                                                                   |
| 2    | MS -> SS  | HANOVER ACCESS       | Repeated on every burst of the uplink main DCCH until reception of PHYSICAL INFORMATION. Handover Reference as included in the HANOVER COMMAND. |
| 3    | SS -> MS  | PHYSICAL INFORMATION | Sent after reception of n HANOVER ACCESS messages. See specific message contents.                                                               |
| 4    | MS -> SS  | SABM                 | Sent without information field                                                                                                                  |
| 5    | SS -> MS  | UA                   |                                                                                                                                                 |
| 6    | MS -> SS  | HANOVER COMPLETE     | The message shall be ready to be transmitted before "x" ms after the completion of step 3.                                                      |
| 7    | MS -> SS  |                      | The MS and SS are in the active state of a call on the channel described below.                                                                 |
| 8    | SS -> MS  | RELEASE COMPLETE     | steps 8-10 are only performed for execution counter M = 3.                                                                                      |
| 9    | SS -> MS  | CHANNEL RELEASE      |                                                                                                                                                 |
| 10   | SS        |                      | The SS checks that for a period of 2 minutes, the MS does not access cell B.                                                                    |

Step 7: The MS and SS are using a full rate TCH in non hopping mode on cell B.

### 26.11.2.2.2 Multiband signalling / RR / Handover / layer 1 failure

#### 26.11.2.2.2.1 Conformance requirements

During a handover from a channel in the lower band to a channel in the upper band, or the contrary, the MS shall correctly return to the old channel in the case of an handover failure caused by a layer 1 failure on the target cell.

#### References

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.4.4.

#### 26.11.2.2.2.2 Test purpose

To check that the MS correctly returns to the old channel in the case of an handover failure caused by a layer 1 failure on the target cell, if the origin is in the lower band and the target is in the upper band or the contrary.

#### 26.11.2.2.2.3 Method of test

#### Initial Conditions

##### System Simulator:

For 450/900 MS: 2 cells, A and B with same LAI, default parameters except:

Cell A has:

BCCH ARFCN = 263.

Cell B has:

BCCH ARFCN = 20.

For 480/900 MS: 2 cells, A and B with same LAI, default parameters except:

Cell A has:

BCCH ARFCN = 310.

Cell B has:

BCCH ARFCN = 20.

For 450/1 800 MS: 2 cells, A and B with same LAI, default parameters except:

Cell A has:

BCCH ARFCN = 263.

Cell B has:

BCCH ARFCN = 764.

For 480/1 800 MS: 2 cells, A and B with same LAI, default parameters except:

Cell A has:

BCCH ARFCN = 310.

Cell B has:

BCCH ARFCN = 764.

For 900/1 800 MS: 2 cells, A and B with same LAI, default parameters except:

Cell A has:

BCCH ARFCN = 20.

Cell B has:

BCCH ARFCN = 764.

For 700/1 900 MS: 2 cells, A and B with same LAI, default parameters except:

Cell A has:

BCCH ARFCN = 457.

Cell B has:

BCCH ARFCN = 764.

For 850/1 900 MS: 2 cells, A and B with same LAI, default parameters except:

Cell A has:

BCCH ARFCN = 147.

Cell B has:

BCCH ARFCN = 764.

Mobile Station:

The MS is in the active state (U10) of a call on cell A. Used power level is the maximum supported by the MS in the band in use.

Related PICS/PIXIT Statements

Supported rate(s) of TCH: TCH/F.

Support for state U10 of the Call Control protocol.

Support for multiband functionality.

Foreseen Final State of the MS

The active state (U10) of a mobile call on cell A. Used power level is the maximum supported by the MS in the band in use.

## Test Procedure

The MS is in the active state (U10) of a call on cell A. The SS sends a HANOVER COMMAND on the main DCCH. The MS shall begin to send access bursts at the commanded power level on the new DCCH to cell B. With the exception of normal BCCH signalling, the SS does not transmit anything on cell B (thus causing a time-out of T3124). The MS shall re-establish the old link on cell A and send a HANOVER FAILURE within 3 seconds from the transmission of HANOVER COMMAND, using the old power level.

## Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

## Expected Sequence

| Step | Direction | Message         | Comments                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------|-----------|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0    | SS        | -               | The SS records the power level in the layer 1 header of the last SACCH message sent by the MS before step 1.                                                                                                                                                                                                                                                                                                                                                |
| 1    | SS -> MS  | HANOVER COMMAND | Channel description: non-hopping, full rate.                                                                                                                                                                                                                                                                                                                                                                                                                |
| 2    | MS -> SS  | HANOVER ACCESS  | Synchronisation Indication: non synchronised.                                                                                                                                                                                                                                                                                                                                                                                                               |
| 3    | MS -> SS  | HANOVER FAILURE | Several messages are sent, all with correct Handover References.<br>Sent on old channel, RR cause value ="Abnormal release, unspecified", "Abnormal release, channel unacceptable", "Abnormal release, timer expired", "Abnormal release, no activity on the radio path" or "Protocol error unspecified". Layer 1 header has the same power level as the layer 1 header in step 1. Shall be sent within 3 seconds from the transmission of HANOVER COMMAND. |
| 4    | SS        | -               | The SS checks that the power level reported in the layer 1 header of the SACCH message that is sent in the first SACCH multiframe following the SABM is the same as in step 0.                                                                                                                                                                                                                                                                              |

### 26.11.2.2.3 Multiband signalling / RR / Handover / Multiband BCCH / successful / active call / non synchronized

#### 26.11.2.2.3.1 Conformance requirements

This test relates to cells supporting frequencies in GSM 400, GSM 700, GSM 850, GSM 900 and DCS 1 800 bands.

The MS shall correctly apply the handover procedure in the non synchronized case when a call is in progress and when handover is performed from a TCH/F without frequency hopping in one band towards a TCH/F either with frequency hopping or not in another band.

#### References

3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.4.4 and 9.1.15.

3GPP TS 04.13 subclause 5.2.6.2.

3GPP TS 05.08 subclause 6.7.1.

#### 26.11.2.2.3.2 Test purpose

To test that when the MS is ordered to make a non synchronized handover it sends continuously access bursts on the main DCCH until it receives a PHYSICAL INFORMATION message from the SS. To test that the MS correctly handles the Timing Advance IE in the PHYSICAL INFORMATION. To test that the MS activates the new channel correctly and transmits the HANDOVER COMPLETE message without undue delay.

#### 26.11.2.2.3.3 Method of test

#### Initial Conditions

**For execution counter M =1, 2.**

System Simulator:

For 450/900 MS: 2 cells, A and B with same LAI, default parameters except:

Cell A has:

BCCH ARFCN = 263

GSM 450 frequencies: 259, 263, 267, 271, 275, 279, 283, 291.

GSM 900 frequencies: 10, 20, 34, 45, 52, 66, 74, 114.

Cell B has:

BCCH ARFCN = 268

GSM 450 frequencies: 260, 261, 268, 277, 281, 287, 288, 289.

GSM 900 frequencies: 14, 17, 32, 59, 73, 76, 87, 108.

For 480/900 MS: 2 cells, A and B with same LAI, default parameters except:

Cell A has:

BCCH ARFCN = 310

GSM 480 frequencies: 306, 310, 314, 318, 322, 326, 332, 338.

GSM 900 frequencies: 10, 20, 34, 45, 52, 66, 74, 114.

Cell B has:

BCCH ARFCN = 315

GSM 480 frequencies: 307, 308, 315, 324, 328, 334, 335, 336.

GSM 900 frequencies: 14, 17, 32, 59, 73, 76, 87, 108.

For 450/1 800 MS: 2 cells, A and B with same LAI, default parameters except:

Cell A has:

BCCH ARFCN = 263

GSM 450 frequencies: 259, 263, 267, 271, 275, 279, 283, 291.

DCS 1 800 frequencies: 739, 746, 756, 761, 771, 782, 798, 832.

Cell B has:

BCCH ARFCN = 268

GSM 450 frequencies: 260, 261, 268, 277, 281, 287, 288, 289.

DCS 1 800 frequencies: 743, 749, 758, 764, 779, 791, 829, 844.

For 480/1 800 MS: 2 cells, A and B with same LAI, default parameters except:

Cell A has:

BCCH ARFCN = 310

GSM 480 frequencies: 306, 310, 314, 318, 322, 326, 332, 338.

DCS 1 800 frequencies: 739, 746, 756, 761, 771, 782, 798, 832.

Cell B has:

BCCH ARFCN = 315

GSM 480 frequencies: 307, 308, 315, 324, 328, 334, 335, 336.

DCS 1 800 frequencies: 743, 749, 758, 764, 779, 791, 829, 844.

For 900/1 800 MS: 2 cells, A and B with same LAI, default parameters except:

Cell A has:

BCCH ARFCN = 20

GSM 900 frequencies: 10, 20, 34, 45, 52, 66, 74, 114.

DCS 1 800 frequencies: 739, 746, 756, 761, 771, 782, 798, 832.

Cell B has:

BCCH ARFCN = 32

GSM 900 frequencies: 14, 17, 32, 59, 73, 76, 87, 108.

DCS 1 800 frequencies: 743, 749, 758, 764, 779, 791, 829, 844.

For 700/1 900 MS: 2 cells, A and B with same LAI, default parameters except:

Cell A has:

BCCH ARFCN = 457

GSM 700 frequencies: 447, 457, 471, 482, 489, 498, 501, 508.

PCS 1 900 frequencies: 739, 746, 756, 761, 771, 782, 798, 804.

Cell B has:

BCCH ARFCN = 469

GSM 700 frequencies: 451, 454, 469, 496, 500, 503, 505, 506.

PCS 1 900 frequencies: 743, 749, 758, 764, 779, 791, 803, 806.

For 850/1 900 MS: 2 cells, A and B with same LAI, default parameters except:

Cell A has:

BCCH ARFCN = 147

GSM 850 frequencies: 137, 147, 161, 172, 179, 193, 201, 241.

PCS 1 900 frequencies: 739, 746, 756, 761, 771, 782, 798, 804.

Cell B has:

BCCH ARFCN = 159

GSM 850 frequencies: 141, 144, 159, 186, 200, 203, 214, 235.

PCS 1 900 frequencies: 743, 749, 758, 764, 779, 791, 803, 806.

Mobile Station:

For execution counter  $M = 1$ , the MS is in the active state (U10) of a call on cell A, using a TCH in the lower band.

For execution counter  $M = 2$ , the MS is in the active state (U10) of a call on cell B, using a TCH in the upper band.

### Related PICS/PIXIT Statements

Supported rate(s) of TCH: TCH/FS and/or TCH/HS.

Support for state U10 of the Call Control protocol.

Support for speech: yes/no.

Support of multiband functionality.

### Foreseen Final State of the MS

For execution counter M = 1

The active state (U10) of a call with a TCH in the upper band on cell B.

For execution counter M = 2

The active state (U10) of a call in hopping mode in the upper band on cell A.

### Test Procedure

The MS is in the active state (U10) of a call. The SS sends a HANDOVER COMMAND on the main DCCH. The MS shall begin to send access bursts on the new DCCH of the target cell. The SS observes the access bursts and after receiving n (n being randomly drawn between values [10-20]) access bursts, the SS sends one PHYSICAL INFORMATION message with an arbitrary Timing Advance. The MS shall activate the channel in sending and receiving mode. The MS shall establish a signalling link. The MS shall be ready to transmit a HANDOVER COMPLETE message, before "x" ms after the end of the PHYSICAL INFORMATION message, but not before a UA frame has been sent by the SS.

The term "ready to transmit" is defined in 3GPP TS 04.13. The value of "x" depends upon the target channel and is specified in the specific message contents section.

### Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

### Expected Sequence

This sequence is performed for an execution counter M = 1 and 2 for an MS which supports TCH/F.

| Timing Advance                       | Arbitrarily selected but different to default value. |

Step 6: x = 650 ms.

Step 7: The MS and SS are using a full rate TCH in hopping mode in the DCS band on cell A.

#### 26.11.2.2.4 Multiband signalling / RR / Handover/ Multiband BCCH / Intracell Handover - Interband Assignment

In case of multi-band networks, an intracell change of channel can be requested by upper layers in order to change the channel type (Directed Retry from a channel belonging to one frequency band to a channel belonging to another frequency band), or it may be initiated by the RR-sublayer for an intra cell and inter-band handover for cells supporting GSM 400, GSM 700, GSM 850, GSM 900 and DCS 1 800 frequencies. This change is performed using the channel assignment procedure.

##### 26.11.2.2.4.1 Dedicated assignment / successful case

This test is only applicable to an MS supporting a TCH.

#### 26.11.2.2.4.1.1 Conformance requirements

1. Upon receipt of the ASSIGNMENT COMMAND message, the mobile station initiates a local end release of link layer connections, disconnects the physical channels, commands the switching to the assigned channels and initiates the establishment of lower layer connections (this includes the activation of the channels, their connection and the establishment of the main signalling links).
2. MM-messages and CM-messages using SAPI=0 sent from the mobile station to the network can be duplicated by the data link layer in the following case:
  - a channel change of dedicated channels is required (assignment or handover procedure) and the last layer 2 frame has not been acknowledged by the peer data link layer before the mobile station leaves the old channel;
  - in this case, the mobile station does not know whether the network has received the message correctly. Therefore, the mobile station has to send the message again after the new dedicated channel is established.
3. The MS shall establish the link with the power level specified in the ASSIGNMENT COMMAND message.
  - The MS shall confirm the power control level that it is currently employing in the uplink SACCH L1 header. The indicated value shall be the power control level actually used by the mobile for the last burst of the previous SACCH period.
4. The MS shall apply the hopping frequencies specified in ASSIGNMENT COMMAND message in the Mobile Allocation IE or the Frequency List IE at the time of accessing the new channel using the last received Cell Allocation.
5. After receipt of the ASSIGNMENT COMMAND the MS shall perform the assignment and return an ASSIGNMENT COMPLETE without undue delay.

#### 26.11.2.2.4.2 Test purpose

1. To verify that upon receipt of an ASSIGNMENT COMMAND, the MS switches to the channel defined in the ASSIGNMENT COMMAND, establishes the link and sends an ASSIGNMENT COMPLETE message. This is tested for an MS supporting TCH in the special cases of a transition.

NOTE: in all cases the old and the new channel assigned belong to different frequency bands.

- 1.1 from non-hopping SDCCH in the lower band to hopping TCH/F in the upper band using a different timeslot;
  - 1.2 from hopping TCH/F in the upper band to non-hopping TCH/F in the lower band using a different timeslot;
  - 1.3 from non-hopping TCH/F in the lower band to hopping TCH/F in the upper band using a different timeslot.
  - 1.4 from hopping TCH/F in the upper band to hopping TCH/H in the lower band using a different timeslot; this test purpose is only applicable if the MS supports TCH/H;
  - 1.5 from hopping TCH/H in the lower band to non-hopping TCH/H in the upper band using a different timeslot; this test purpose is only applicable if the MS supports TCH/H;
  - 1.6 from non-hopping TCH/H in the upper band to hopping TCH/F in the lower band using a different timeslot; this test purpose is only applicable if the MS supports TCH/H.
2. To verify that an MS supporting TCH, having received an ASSIGNMENT COMMAND, is able in the case of frequency hopping to decode the Mobile Allocation and Frequency List IEs correctly and applies the specified frequencies using the correct Cell Allocation.

3. To verify that after receipt of the ASSIGNMENT COMMAND the MS returns an ASSIGNMENT COMPLETE without undue delay.

#### 26.11.2.2.4.3 Method of test

##### Initial Conditions

##### System Simulator:

For 450/900 MS: 1 cell with GSM 450 and GSM 900 frequencies, using a BCCH in the GSM 450 band, default parameters except:

BCCH ARFCN =263.

System Information 1 Cell Allocation = 259, 263, 267, 271, 275, 279, 283, 291, 10, 20, 34, 45, 52, 66, 76, 114.

For 480/900 MS: 1 cell with GSM 480 and GSM 900 frequencies, using a BCCH in the GSM 480 band, default parameters except:

BCCH ARFCN =310.

System Information 1 Cell Allocation = 306, 310, 314, 318, 322, 326, 332, 338, 10, 20, 34, 45, 52, 66, 76, 114.

For 450/1 800 MS: 1 cell with GSM 450 and DCS 1 800 frequencies, using a BCCH in the GSM 450 band, default parameters except:

BCCH ARFCN =263.

System Information 1 Cell Allocation = 259, 263, 267, 271, 275, 279, 283, 291, 739, 746, 756, 761, 771, 782, 798, 832.

For 480/1 800 MS: 1 cell with GSM 480 and DCS 1 800 frequencies, using a BCCH in the GSM 480 band, default parameters except:

BCCH ARFCN =310.

System Information 1 Cell Allocation = 306, 310, 314, 318, 322, 326, 332, 338, 739, 746, 756, 761, 771, 782, 798, 832.

For 900/1 800 MS: 1 cell with GSM and DCS 1 800 frequencies, using a BCCH in the GSM band, default parameters except:

BCCH ARFCN =20.

System Information 1 Cell Allocation = 10, 20, 34, 45, 52, 66, 76, 114, 739, 746, 756, 761, 771, 782, 798, 832.

For 700/1 900 MS: 1 cell with GSM and PCS 1 900 frequencies, using a BCCH in the GSM band, default parameters except:

BCCH ARFCN =457.

System Information 1 Cell Allocation = 447, 457, 471, 482, 489, 498, 503, 508, 739, 746, 756, 761, 771, 782, 798, 804.

For 850/1 900 MS: 1 cell with GSM and PCS 1 900 frequencies, using a BCCH in the GSM band, default parameters except:

BCCH ARFCN =147.

System Information 1 Cell Allocation = 137, 147, 161, 172, 179, 193, 203, 241, 739, 746, 756, 761, 771, 782, 798, 804.

NOTE: Cell Allocation IE broadcasted in SYSTEM INFORMATION 1 shall be coded with a format so that frequencies belonging to both lower and upper frequency band can be included. Format Identifier of Cell Channel Description IE will thus be Range 1024.

**Mobile Station:**

The MS is in the "idle, updated" state with a TMSI allocated.

**Related PICS/PIXIT Statements**

- TCH supported (Y/N).
- Supported rate(s) of TCH: TCH/F and/or TCH/H.
- The supported channel mode(s) need to be declared.
- Support of multiband functionality.

**Foreseen Final State of the MS**

"Idle, updated", with TMSI allocated.

**Test Procedure**

The SS pages the MS and allocates an SDCCH. Then three channels are assigned with ASSIGNMENT COMMANDs messages. Each time the MS shall switch to the assigned channel, establish the link and send an ASSIGNMENT COMPLETE message.

For an MS not supporting TCH/H, the SS initiates the channel release procedure and the test ends here. For an MS supporting TCH/H, the channel assignment procedure is performed another three times, with half rate channels involved, and again it is checked that the MS correctly completes the procedures, before the SS initiates the channel release procedure.

**Maximum Duration of Test**

60 s.

## Expected Sequence

| Step | Direction | Message               | Comments                                                                                                                                                                  |
|------|-----------|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PAGING REQUEST TYPE 1 |                                                                                                                                                                           |

| Frequency list IE              | Not included                                                                                                    |
| Cell Channel Description       | Range 1024 format encodes: (259, 263, 267, 271, 275, 279, 283, 291, 10, 20, 34, 45, 52, 66, 76, 114).           |
| Mobile Allocation              | Indicates frequencies (259, 263, 267, 271, 275, 279, 283, 291).                                                 |
| Starting Time                  | Not included                                                                                                    |

## Step 13

## ASSIGNMENT COMMAND:

|                                |                                                                         |
|--------------------------------|-------------------------------------------------------------------------|
| Channel Description            | TCH/H                                                                   |
| - Channel Type and TDMA offset | (N+5) mod 8                                                             |
| - Timeslot Number              | Chosen arbitrarily                                                      |
| - Training Sequence Code       | Single RF Channel                                                       |
| - Hopping                      | chosen arbitrarily from CA of the BCCH in the GSM 900 part of the list. |
| - ARFCN                        |                                                                         |
| Power Command                  | Chosen arbitrarily but with a changed value.                            |
| - Power level                  |                                                                         |
| Channel Mode                   | signalling                                                              |
| Frequency list IE              | Not included                                                            |
| Cell Channel Description       | Not included                                                            |
| Mobile Allocation              | Not included                                                            |
| Starting Time                  | not included                                                            |

## Step 15

## ASSIGNMENT COMMAND:

|                          |                                                                                                                      |
|--------------------------|----------------------------------------------------------------------------------------------------------------------|
| Channel Description      | TCH/F                                                                                                                |
| - Channel Type           | Chosen arbitrarily                                                                                                   |
| TDMA offset              | (N+6) mod 8                                                                                                          |
| - Timeslot Number        | Chosen arbitrarily                                                                                                   |
| - Training Sequence Code | RF hopping channel                                                                                                   |
| - Hopping                | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of GSM 450 frequencies in the Frequency List IE. |
| - MAIO                   | Chosen arbitrarily from the set (1 to 63)                                                                            |
| - HSN                    |                                                                                                                      |
| Power Command            | Chosen arbitrarily but with a changed value.                                                                         |
| - Power level            |                                                                                                                      |
| Channel Mode             | A non-signalling mode arbitrarily selected from the half rate capabilities declared for the MS                       |
| Cell Channel Description | Not included                                                                                                         |
| Frequency list IE        | Use Range 128 to encode (259, 263, 267, 271, 275, 279, 283, 291).                                                    |
| Mobile Allocation        | Not included                                                                                                         |
| Starting Time            | Not included                                                                                                         |

For 480/900 MS:

## Step 3

## IMMEDIATE ASSIGNMENT:

|                                    |                                                                                |
|------------------------------------|--------------------------------------------------------------------------------|
| As default message contents except |                                                                                |
| Channel Description                | SDCCH/8                                                                        |
| - Channel Type                     | Chosen arbitrarily                                                             |
| TDMA offset                        | N, chosen arbitrarily                                                          |
| - Timeslot Number                  | Chosen arbitrarily                                                             |
| - Training Sequence Code           | Single RF Channel                                                              |
| - Hopping                          | chosen arbitrarily from CA of the common BCCH in the GSM 480 part of the list. |
| - ARFCN                            |                                                                                |

## Step 5

## ASSIGNMENT COMMAND:

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description            | TCH/F                                                                                                           |
| - Channel Type and TDMA offset | (N+1) mod 8                                                                                                     |
| - Timeslot Number              | Chosen arbitrarily                                                                                              |
| - Training Sequence Code       | RF hopping channel                                                                                              |
| - Hopping                      | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - MAIO                         | Chosen arbitrarily from the set (1 to 63)                                                                       |
| - HSN                          |                                                                                                                 |
| Power Command                  | Chosen arbitrarily but with a changed value.                                                                    |
| - Power level                  |                                                                                                                 |
| Frequency list IE              | Not included                                                                                                    |
| Channel Mode                   |                                                                                                                 |
| - Mode                         | Signalling                                                                                                      |
| Mobile Allocation              | Indicates only GSM 900 frequencies of the CA (broadcast on the BCCH).<br>(10, 20, 45, 52, 66, 114)              |
| Starting Time                  | Not included                                                                                                    |

## Step 7

## ASSIGNMENT COMMAND:

|                                |                                                               |
|--------------------------------|---------------------------------------------------------------|
| Channel Description            | TCH/F                                                         |
| - Channel Type and TDMA offset | (N+2) mod 8                                                   |
| - Timeslot Number              | Chosen arbitrarily                                            |
| - Training Sequence Code       | Single RF Channel                                             |
| - Hopping                      | chosen arbitrarily from CA of the common BCCH in the          |
| - ARFCN                        | GSM 480 part of the list.                                     |
| Power Command                  | Chosen arbitrarily but with a changed value.                  |
| - Power level                  | A non-signalling mode arbitrarily selected from the full rate |
| Channel Mode                   | capabilities declared for the MS                              |
| Frequency list IE              | Not Included                                                  |
| Cell Channel Description       | Range 1024 format encodes: (318, 322, 326, 332, 338,          |
|                                | 10, 20, 34, 45, 52, 66, 76, 114.).                            |
| Mobile Allocation              | Not included                                                  |
| Starting Time                  | Not included                                                  |

## Step 9

## ASSIGNMENT COMMAND:

|                                |                                                               |
|--------------------------------|---------------------------------------------------------------|
| Channel Description            | TCH/F                                                         |
| - Channel Type and TDMA offset | (N+3) mod 8                                                   |
| - Timeslot Number              | Chosen arbitrarily                                            |
| - Training Sequence Code       | RF Hopping Channel                                            |
| - Hopping                      | Chosen arbitrarily from the set (0, 1 to N-1) where           |
| - MAIO                         | N is the number of frequencies in the Mobile Allocation IE.   |
| - HSN                          | Chosen arbitrarily from the set (1 to 63).                    |
| Power Command                  | Chosen arbitrarily but with a changed value.                  |
| - Power level                  | A non-signalling mode arbitrarily selected from the full rate |
| Channel Mode                   | capabilities declared for the MS                              |
| Frequency list IE              | Not Included                                                  |
| Mobile Allocation              | Indicates GSM 900 frequencies (10, 45, 114).                  |
| Starting Time                  | Not included                                                  |

## Step 11

## ASSIGNMENT COMMAND:

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description            | TCH/H                                                                                                           |
| - Channel Type and TDMA offset | (N+4) mod 8                                                                                                     |
| - Timeslot Number              | Chosen arbitrarily                                                                                              |
| - Training Sequence Code       | RF hopping channel                                                                                              |
| - Hopping                      | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - MAIO                         | Chosen arbitrarily from the set (1 to 63)                                                                       |
| - HSN                          |                                                                                                                 |
| Power Command                  | Chosen arbitrarily but with a changed value.                                                                    |
| - Power level                  |                                                                                                                 |
| Channel Mode                   | Not included                                                                                                    |
| Frequency list IE              | Not included                                                                                                    |
| Cell Channel Description       | Range 1024 format encodes: (306, 310, 314, 318, 322, 326, 332, 338, 10, 20, 34, 45, 52, 66, 76, 114.).          |
| Mobile Allocation              | Indicates frequencies (306, 310, 314, 318, 322, 326, 332, 338).                                                 |
| Starting Time                  | Not included                                                                                                    |

## Step 13

## ASSIGNMENT COMMAND:

|                                |                                                                         |
|--------------------------------|-------------------------------------------------------------------------|
| Channel Description            | TCH/H                                                                   |
| - Channel Type and TDMA offset | (N+5) mod 8                                                             |
| - Timeslot Number              | Chosen arbitrarily                                                      |
| - Training Sequence Code       | Single RF Channel                                                       |
| - Hopping                      | chosen arbitrarily from CA of the BCCH in the GSM 900 part of the list. |
| - ARFCN                        |                                                                         |
| Power Command                  | Chosen arbitrarily but with a changed value.                            |
| - Power level                  |                                                                         |
| Channel Mode                   | signalling                                                              |
| Frequency list IE              | Not included                                                            |
| Cell Channel Description       | Not included                                                            |
| Mobile Allocation              | Not included                                                            |
| Starting Time                  | not included                                                            |

## Step 15

## ASSIGNMENT COMMAND:

|                          |                                                                                                                      |
|--------------------------|----------------------------------------------------------------------------------------------------------------------|
| Channel Description      | TCH/F                                                                                                                |
| - Channel Type           | Chosen arbitrarily                                                                                                   |
| TDMA offset              | (N+6) mod 8                                                                                                          |
| - Timeslot Number        | Chosen arbitrarily                                                                                                   |
| - Training Sequence Code | RF hopping channel                                                                                                   |
| - Hopping                | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of GSM 480 frequencies in the Frequency List IE. |
| - MAIO                   | Chosen arbitrarily from the set (1 to 63)                                                                            |
| - HSN                    |                                                                                                                      |
| Power Command            | Chosen arbitrarily but with a changed value.                                                                         |
| - Power level            |                                                                                                                      |
| Channel Mode             | A non-signalling mode arbitrarily selected from the half rate capabilities declared for the MS                       |
| Cell Channel Description | Not included                                                                                                         |
| Frequency list IE        | Uses Range 128 to encode (306, 310, 314, 318, 322, 326, 332, 338).                                                   |
| Mobile Allocation        | Not included                                                                                                         |
| Starting Time            | Not included                                                                                                         |

For 450/1 800 MS:

## Step 3

## IMMEDIATE ASSIGNMENT:

|                                    |                                                                                |
|------------------------------------|--------------------------------------------------------------------------------|
| As default message contents except |                                                                                |
| Channel Description                | SDCCH/8                                                                        |
| - Channel Type                     | Chosen arbitrarily                                                             |
| TDMA offset                        | N, chosen arbitrarily                                                          |
| - Timeslot Number                  | Chosen arbitrarily                                                             |
| - Training Sequence Code           | Single RF Channel                                                              |
| - Hopping                          | chosen arbitrarily from CA of the common BCCH in the GSM 450 part of the list. |
| - ARFCN                            |                                                                                |

## Step 5

## ASSIGNMENT COMMAND:

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description            | TCH/F                                                                                                           |
| - Channel Type and TDMA offset | (N+1) mod 8                                                                                                     |
| - Timeslot Number              | Chosen arbitrarily                                                                                              |
| - Training Sequence Code       | RF hopping channel                                                                                              |
| - Hopping                      | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - MAIO                         | Chosen arbitrarily from the set (1 to 63)                                                                       |
| - HSN                          |                                                                                                                 |
| Power Command                  | Chosen arbitrarily but with a changed value.                                                                    |

| - Channel Type           | Chosen arbitrarily                                                                                                   |
| TDMA offset              | (N+6) mod 8                                                                                                          |
| - Timeslot Number        | Chosen arbitrarily                                                                                                   |
| - Training Sequence Code | RF hopping channel                                                                                                   |
| - Hopping                | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of GSM 450 frequencies in the Frequency List IE. |
| - MAIO                   | Chosen arbitrarily from the set (1 to 63)                                                                            |
| - HSN                    |                                                                                                                      |
| Power Command            | Chosen arbitrarily but with a changed value.                                                                         |
| - Power level            |                                                                                                                      |
| Channel Mode             | A non-signalling mode arbitrarily selected from the half rate capabilities declared for the MS                       |
| Cell Channel Description | Not included                                                                                                         |
| Frequency list IE        | Use Range 128 to encode (259, 263, 267, 271, 275, 279, 283, 291).                                                    |
| Mobile Allocation        | Not included                                                                                                         |
| Starting Time            | Not included                                                                                                         |

For 480/1 800 MS:

## Step 3

## IMMEDIATE ASSIGNMENT:

|                                    |                                                                                |
|------------------------------------|--------------------------------------------------------------------------------|
| As default message contents except |                                                                                |
| Channel Description                | SDCCH/8                                                                        |
| - Channel Type                     | Chosen arbitrarily                                                             |
| TDMA offset                        | N, chosen arbitrarily                                                          |
| - Timeslot Number                  | Chosen arbitrarily                                                             |
| - Training Sequence Code           | Single RF Channel                                                              |
| - Hopping                          | chosen arbitrarily from CA of the common BCCH in the GSM 480 part of the list. |
| - ARFCN                            |                                                                                |

## Step 5

## ASSIGNMENT COMMAND:

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description            | TCH/F                                                                                                           |
| - Channel Type and TDMA offset | (N+1) mod 8                                                                                                     |
| - Timeslot Number              | Chosen arbitrarily                                                                                              |
| - Training Sequence Code       | RF hopping channel                                                                                              |
| - Hopping                      | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - MAIO                         | Chosen arbitrarily from the set (1 to 63)                                                                       |
| - HSN                          |                                                                                                                 |
| Power Command                  | Chosen arbitrarily but with a changed value.                                                                    |
| - Power level                  |                                                                                                                 |
| Frequency list IE              | Not included                                                                                                    |
| Channel Mode                   |                                                                                                                 |
| - Mode                         | Signalling                                                                                                      |
| Mobile Allocation              | Indicates only DCS 1 800 frequencies of the CA (broadcast on the BCCH). (739, 746, 761, 771, 782, 832)          |
| Starting Time                  | Not included                                                                                                    |

## Step 7

## ASSIGNMENT COMMAND:

|                                |                                                                                                |
|--------------------------------|------------------------------------------------------------------------------------------------|
| Channel Description            | TCH/F                                                                                          |
| - Channel Type and TDMA offset | (N+2) mod 8                                                                                    |
| - Timeslot Number              | Chosen arbitrarily                                                                             |
| - Training Sequence Code       | Single RF Channel                                                                              |
| - Hopping                      | chosen arbitrarily from CA of the common BCCH in the GSM 480 part of the list.                 |
| - ARFCN                        |                                                                                                |
| Power Command                  | Chosen arbitrarily but with a changed value.                                                   |
| - Power level                  | A non-signalling mode arbitrarily selected from the full rate capabilities declared for the MS |
| Channel Mode                   | Not Included                                                                                   |
| Frequency list IE              | Range 1024 format encodes: (318, 322, 326, 332, 338, 739, 746, 756, 761, 771, 782, 798, 832).  |
| Cell Channel Description       |                                                                                                |
| Mobile Allocation              | Not included                                                                                   |
| Starting Time                  | Not included                                                                                   |

## Step 9

## ASSIGNMENT COMMAND:

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description            | TCH/F                                                                                                           |
| - Channel Type and TDMA offset | (N+3) mod 8                                                                                                     |
| - Timeslot Number              | Chosen arbitrarily                                                                                              |
| - Training Sequence Code       | RF Hopping Channel                                                                                              |
| - Hopping                      | Chosen arbitrarily from the set (O, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - MAIO                         | Chosen arbitrarily from the set (1 to 63).                                                                      |
| - HSN                          |                                                                                                                 |
| Power Command                  | Chosen arbitrarily but with a changed value.                                                                    |
| - Power level                  | A non-signalling mode arbitrarily selected from the full rate capabilities declared for the MS                  |
| Channel Mode                   | Not Included                                                                                                    |
| Frequency list IE              | Indicates DCS frequencies (739, 761, 832).                                                                      |
| Mobile Allocation              |                                                                                                                 |
| Starting Time                  | Not included                                                                                                    |

## Step 11

## ASSIGNMENT COMMAND:

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description            | TCH/H                                                                                                           |
| - Channel Type and TDMA offset | (N+4) mod 8                                                                                                     |
| - Timeslot Number              | Chosen arbitrarily                                                                                              |
| - Training Sequence Code       | RF hopping channel                                                                                              |
| - Hopping                      | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - MAIO                         | Chosen arbitrarily from the set (1 to 63)                                                                       |
| - HSN                          |                                                                                                                 |
| Power Command                  | Chosen arbitrarily but with a changed value.                                                                    |
| - Power level                  |                                                                                                                 |

|------------------------------------|----------------------------------------------------------------------------|
| As default message contents except |                                                                            |
| Channel Description                | SDCCH/8                                                                    |
| - Channel Type                     | Chosen arbitrarily                                                         |
| TDMA offset                        | N, chosen arbitrarily                                                      |
| - Timeslot Number                  | Chosen arbitrarily                                                         |
| - Training Sequence Code           | Single RF Channel                                                          |
| - Hopping                          | chosen arbitrarily from CA of the common BCCH in the GSM part of the list. |
| - ARFCN                            |                                                                            |

## Step 5

## ASSIGNMENT COMMAND:

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description            | TCH/F                                                                                                           |
| - Channel Type and TDMA offset | (N+1) mod 8                                                                                                     |
| - Timeslot Number              | Chosen arbitrarily                                                                                              |
| - Training Sequence Code       | RF hopping channel                                                                                              |
| - Hopping                      | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - MAIO                         | Chosen arbitrarily from the set (1 to 63)                                                                       |
| - HSN                          |                                                                                                                 |
| Power Command                  | Chosen arbitrarily but with a changed value.                                                                    |
| - Power level                  |                                                                                                                 |
| Frequency list IE              | Not included                                                                                                    |
| Channel Mode                   |                                                                                                                 |
| - Mode                         | Signalling                                                                                                      |
| Mobile Allocation              | Indicates only PCS 1 900 frequencies of the CA (broadcast on the BCCH). (739, 746, 761, 771, 782, 804)          |
| Starting Time                  | Not included                                                                                                    |

## Step 7

## ASSIGNMENT COMMAND:

|                                |                                                                                                |
|--------------------------------|------------------------------------------------------------------------------------------------|
| Channel Description            | TCH/F                                                                                          |
| - Channel Type and TDMA offset | (N+2) mod 8                                                                                    |
| - Timeslot Number              | Chosen arbitrarily                                                                             |
| - Training Sequence Code       | Single RF Channel                                                                              |
| - Hopping                      | chosen arbitrarily from CA of the common BCCH in the GSM part of the list.                     |
| - ARFCN                        |                                                                                                |
| Power Command                  | Chosen arbitrarily but with a changed value.                                                   |
| - Power level                  | A non-signalling mode arbitrarily selected from the full rate capabilities declared for the MS |
| Channel Mode                   | Not Included                                                                                   |
| Frequency list IE              | Not Included                                                                                   |
| Cell Channel Description       | Range 1024 format encodes: (482, 489, 498, 503, 508, 739, 746, 756, 761, 771, 782, 798, 804).  |
| Mobile Allocation              | Not included                                                                                   |
| Starting Time                  | Not included                                                                                   |

## Step 9

## ASSIGNMENT COMMAND:

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description            | TCH/F                                                                                                           |
| - Channel Type and TDMA offset | (N+3) mod 8                                                                                                     |
| - Timeslot Number              | Chosen arbitrarily                                                                                              |
| - Training Sequence Code       | RF Hopping Channel                                                                                              |
| - Hopping                      | Chosen arbitrarily from the set (O, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - MAIO                         | Chosen arbitrarily from the set (1 to 63).                                                                      |
| - HSN                          |                                                                                                                 |
| Power Command                  | Chosen arbitrarily but with a changed value.                                                                    |
| - Power level                  | A non-signalling mode arbitrarily selected from the full rate capabilities declared for the MS                  |
| Channel Mode                   | Not Included                                                                                                    |
| Frequency list IE              | Not Included                                                                                                    |
| Mobile Allocation              | Indicates PCS frequencies (739, 761, 804).                                                                      |
| Starting Time                  | Not included                                                                                                    |

Step 11

ASSIGNMENT COMMAND:

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description            | TCH/H                                                                                                           |
| - Channel Type and TDMA offset | (N+4) mod 8                                                                                                     |
| - Timeslot Number              | Chosen arbitrarily                                                                                              |
| - Training Sequence Code       | RF hopping channel                                                                                              |
| - Hopping                      | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - MAIO                         | Chosen arbitrarily from the set (1 to 63)                                                                       |
| - HSN                          |                                                                                                                 |
| Power Command                  | Chosen arbitrarily but with a changed value.                                                                    |
| - Power level                  |                                                                                                                 |
| Channel Mode                   | Not included                                                                                                    |
| Frequency list IE              | Not included                                                                                                    |
| Cell Channel Description       | Range 1024 format encodes: (447, 457, 471, 482, 489, 498, 503, 508, 739, 746, 756, 761, 771, 782, 798, 804).    |
| Mobile Allocation              | Indicates frequencies ( 447, 457, 471, 482, 489, 498, 503, 508).                                                |
| Starting Time                  | Not included                                                                                                    |

Step 13

ASSIGNMENT COMMAND:

|                                |                                                                           |
|--------------------------------|---------------------------------------------------------------------------|

| Starting Time                  | not included                                                              |

## Step 15

## ASSIGNMENT COMMAND:

|                          |                                                                                                                  |
|--------------------------|------------------------------------------------------------------------------------------------------------------|
| Channel Description      | TCH/F                                                                                                            |
| - Channel Type           | Chosen arbitrarily                                                                                               |
| TDMA offset              | (N+6) mod 8                                                                                                      |
| - Timeslot Number        | Chosen arbitrarily                                                                                               |
| - Training Sequence Code | RF hopping channel                                                                                               |
| - Hopping                | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of GSM frequencies in the Frequency List IE. |
| - MAIO                   | Chosen arbitrarily from the set (1 to 63)                                                                        |
| - HSN                    |                                                                                                                  |
| Power Command            | Chosen arbitrarily but with a changed value.                                                                     |
| - Power level            |                                                                                                                  |
| Channel Mode             | A non-signalling mode arbitrarily selected from the half rate capabilities declared for the MS                   |
| Cell Channel Description | Not included                                                                                                     |
| Frequency list IE        | Uses 128 range to indicate ( 447, 457, 471, 482, 489, 498, 503, 508).                                            |
| Mobile Allocation        | Not included                                                                                                     |
| Starting Time            | Not included                                                                                                     |

For 850/1 900 MS:

## Step 3

## IMMEDIATE ASSIGNMENT:

|                                    |                                                                            |
|------------------------------------|----------------------------------------------------------------------------|
| As default message contents except |                                                                            |
| Channel Description                | SDCCH/8                                                                    |
| - Channel Type                     | Chosen arbitrarily                                                         |
| TDMA offset                        | N, chosen arbitrarily                                                      |
| - Timeslot Number                  | Chosen arbitrarily                                                         |
| - Training Sequence Code           | Single RF Channel                                                          |
| - Hopping                          | chosen arbitrarily from CA of the common BCCH in the GSM part of the list. |
| - ARFCN                            |                                                                            |

## Step 5

## ASSIGNMENT COMMAND:

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description            | TCH/F                                                                                                           |
| - Channel Type and TDMA offset | (N+1) mod 8                                                                                                     |
| - Timeslot Number              | Chosen arbitrarily                                                                                              |
| - Training Sequence Code       | RF hopping channel                                                                                              |
| - Hopping                      | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - MAIO                         | Chosen arbitrarily from the set (1 to 63)                                                                       |
| - HSN                          |                                                                                                                 |
| Power Command                  | Chosen arbitrarily but with a changed value.                                                                    |
| - Power level                  |                                                                                                                 |
| Frequency list IE              | Not included                                                                                                    |
| Channel Mode                   |                                                                                                                 |
| - Mode                         | Signalling                                                                                                      |
| Mobile Allocation              | Indicates only PCS 1 900 frequencies of the CA (broadcast on the BCCH). (739, 746, 761, 771, 782, 804)          |
| Starting Time                  | Not included                                                                                                    |

## Step 7

## ASSIGNMENT COMMAND:

|                                |                                                                                                |
|--------------------------------|------------------------------------------------------------------------------------------------|
| Channel Description            | TCH/F                                                                                          |
| - Channel Type and TDMA offset | (N+2) mod 8                                                                                    |
| - Timeslot Number              | Chosen arbitrarily                                                                             |
| - Training Sequence Code       | Single RF Channel                                                                              |
| - Hopping                      | chosen arbitrarily from CA of the common BCCH in the GSM part of the list.                     |
| - ARFCN                        |                                                                                                |
| Power Command                  | Chosen arbitrarily but with a changed value.                                                   |
| - Power level                  | A non-signalling mode arbitrarily selected from the full rate capabilities declared for the MS |
| Channel Mode                   | Not Included                                                                                   |
| Frequency list IE              | Range 1024 format encodes: (172, 179, 193, 203, 241, 739, 746, 756, 761, 771, 782, 798, 804).  |
| Cell Channel Description       |                                                                                                |
| Mobile Allocation              | Not included                                                                                   |
| Starting Time                  | Not included                                                                                   |

## Step 9

## ASSIGNMENT COMMAND:

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description            | TCH/F                                                                                                           |
| - Channel Type and TDMA offset | (N+3) mod 8                                                                                                     |
| - Timeslot Number              | Chosen arbitrarily                                                                                              |
| - Training Sequence Code       | RF Hopping Channel                                                                                              |
| - Hopping                      | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - MAIO                         | Chosen arbitrarily from the set (1 to 63).                                                                      |
| - HSN                          |                                                                                                                 |
| Power Command                  | Chosen arbitrarily but with a changed value.                                                                    |
| - Power level                  | A non-signalling mode arbitrarily selected from the full rate capabilities declared for the MS                  |
| Channel Mode                   | Not Included                                                                                                    |
| Frequency list IE              | Indicates PCS frequencies (739, 761, 804).                                                                      |
| Mobile Allocation              |                                                                                                                 |
| Starting Time                  | Not included                                                                                                    |

## Step 11

## ASSIGNMENT COMMAND:

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description            | TCH/H                                                                                                           |
| - Channel Type and TDMA offset | (N+4) mod 8                                                                                                     |
| - Timeslot Number              | Chosen arbitrarily                                                                                              |
| - Training Sequence Code       | RF hopping channel                                                                                              |
| - Hopping                      | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - MAIO                         | Chosen arbitrarily from the set (1 to 63)                                                                       |

| Frequency list IE              | Not included                                                                                                    |
| Cell Channel Description       | Range 1024 format encodes: (137, 147, 161, 172, 179, 193, 203, 241, 739, 746, 756, 761, 771, 782, 798, 804).    |
| Mobile Allocation              | Indicates frequencies ( 137, 147, 161, 172, 179, 193, 203, 241).                                                |
| Starting Time                  | Not included                                                                                                    |

## Step 13

## ASSIGNMENT COMMAND:

|                                |                                                                           |
|--------------------------------|---------------------------------------------------------------------------|
| Channel Description            | TCH/H                                                                     |
| - Channel Type and TDMA offset | (N+5) mod 8                                                               |
| - Timeslot Number              | Chosen arbitrarily                                                        |
| - Training Sequence Code       | Single RF Channel                                                         |
| - Hopping                      | chosen arbitrarily from CA of the BCCH in the PCS 1 900 part of the list. |
| - ARFCN                        |                                                                           |
| Power Command                  | Chosen arbitrarily but with a changed value.                              |
| - Power level                  |                                                                           |
| Channel Mode                   | Signalling                                                                |
| Frequency list IE              | Not included                                                              |
| Cell Channel Description       | Not included                                                              |
| Mobile Allocation              | Not included                                                              |
| Starting Time                  | not included                                                              |

## Step 15

## ASSIGNMENT COMMAND:

|                          |                                                                                                                  |
|--------------------------|------------------------------------------------------------------------------------------------------------------|
| Channel Description      |                                                                                                                  |
| - Channel Type           | TCH/F                                                                                                            |
| TDMA offset              | Chosen arbitrarily                                                                                               |
| - Timeslot Number        | (N+6) mod 8                                                                                                      |
| - Training Sequence Code | Chosen arbitrarily                                                                                               |
| - Hopping                | RF hopping channel                                                                                               |
| - MAIO                   | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of GSM frequencies in the Frequency List IE. |
| - HSN                    | Chosen arbitrarily from the set (1 to 63)                                                                        |
| Power Command            |                                                                                                                  |
| - Power level            | Chosen arbitrarily but with a changed value.                                                                     |
| Channel Mode             | A non-signalling mode arbitrarily selected from the half rate capabilities declared for the MS                   |
| Cell Channel Description | Not included                                                                                                     |
| Frequency list IE        | Uses 128 range to indicate ( 137, 147, 161, 172, 179, 193, 203, 241).                                            |
| Mobile Allocation        | Not included                                                                                                     |
| Starting Time            | Not included                                                                                                     |

## 26.11.2.3 Multiband signalling / RR / Measurement reporting

This test applies to any multiband MSs supporting simultaneous multiband operation.

## 26.11.2.3.1 Conformance requirements

The MS shall continuously send MEASUREMENT REPORT messages on every SACCH blocks and the measurement valid indication shall be set to valid (0) within the second block at the latest. After 20 s the values in the MEASUREMENT REPORT message shall contain measurement results for up to the 6 strongest BCCH carriers among those with known and allowed NCC part of BSIC on which the mobile is asked to report. For a multi band MS the number of neighbour cells, for each frequency band supported, which shall be included is indicated by the parameter MULTIBAND\_REPORTING.

## 26.11.2.3.2 Test purpose

To test that, when the SS gives information about neighbouring cells, the MS reports the appropriate results and correctly orders the BA list made from System Information 5 and System Information 5ter.

## 26.11.2.3.3 Method of test

## Initial Conditions

System Simulator:

For 450/900 MS: 8 cells with the following settings:

| Transmitter   | Level | NCC | BCC | ARFCN | Cell identity |
|---------------|-------|-----|-----|-------|---------------|
| Serving, S1   | -60   | 1   | 3   | 259   | 0001H         |
| Neighbour, N1 | -85   | 1   | 5   | 002   | 0002H         |
| Neighbour, N2 | -79   | 1   | 7   | 261   | 0003H         |
| Neighbour, N3 | -75   | 1   | 1   | 263   | 0004H         |
| Neighbour, N4 | -55   | 1   | 3   | 088   | 0005H         |
| Neighbour, N5 | -50   | 1   | 5   | 274   | 0006H         |
| Neighbour, N6 | -45   | 1   | 7   | 114   | 0007H         |
| Neighbour, N7 | -40   | 1   | 1   | 278   | 0008H         |

For 480/900 MS: 8 cells with the following settings:

| Transmitter   | Level | NCC | BCC | ARFCN | Cell identity |
|---------------|-------|-----|-----|-------|---------------|
| Serving, S1   | -60   | 1   | 3   | 306   | 0001H         |
| Neighbour, N1 | -85   | 1   | 5   | 002   | 0002H         |
| Neighbour, N2 | -79   | 1   | 7   | 308   | 0003H         |
| Neighbour, N3 | -75   | 1   | 1   | 310   | 0004H         |
| Neighbour, N4 | -55   | 1   | 3   | 088   | 0005H         |
| Neighbour, N5 | -50   | 1   | 5   | 321   | 0006H         |
| Neighbour, N6 | -45   | 1   | 7   | 114   | 0007H         |
| Neighbour, N7 | -40   | 1   | 1   | 325   | 0008H         |

For 450/1 800 MS: 8 cells with the following settings:

| Transmitter   | Level | NCC | BCC | ARFCN | Cell identity |
|---------------|-------|-----|-----|-------|---------------|
| Serving, S1   | -60   | 1   | 3   | 259   | 0001H         |
| Neighbour, N1 | -85   | 1   | 5   | 520   | 0002H         |
| Neighbour, N2 | -79   | 1   | 7   | 261   | 0003H         |
| Neighbour, N3 | -75   | 1   | 1   | 263   | 0004H         |
| Neighbour, N4 | -55   | 1   | 3   | 780   | 0005H         |
| Neighbour, N5 | -50   | 1   | 5   | 274   | 0006H         |
| Neighbour, N6 | -45   | 1   | 7   | 880   | 0007H         |
| Neighbour, N7 | -40   | 1   | 1   | 278   | 0008H         |

For 480/1 800 MS: 8 cells with the following settings:

| Transmitter   | Level | NCC | BCC | ARFCN | Cell identity |
|---------------|-------|-----|-----|-------|---------------|
| Serving, S1   | -60   | 1   | 3   | 306   | 0001H         |
| Neighbour, N1 | -85   | 1   | 5   | 520   | 0002H         |
| Neighbour, N2 | -79   | 1   | 7   | 308   | 0003H         |
| Neighbour, N3 | -75   | 1   | 1   | 310   | 0004H         |
| Neighbour, N4 | -55   | 1   | 3   | 780   | 0005H         |
| Neighbour, N5 | -50   | 1   | 5   | 321   | 0006H         |
| Neighbour, N6 | -45   | 1   | 7   | 880   | 0007H         |
| Neighbour, N7 | -40   | 1   | 1   | 325   | 0008H         |

For 900/1 800 MS: 8 cells with the following settings:

| Transmitter   | Level | NCC | BCC | ARFCN | Cell Identity |
|---------------|-------|-----|-----|-------|---------------|
| Serving, S1   | -60   | 1   | 3   | 002   | 0001H         |
| Neighbour, N1 | -85   | 1   | 5   | 520   | 0002H         |
| Neighbour, N2 | -79   | 1   | 7   | 014   | 0003H         |
| Neighbour, N3 | -75   | 1   | 1   | 020   | 0004H         |
| Neighbour, N4 | -55   | 1   | 3   | 780   | 0005H         |
| Neighbour, N5 | -50   | 1   | 5   | 032   | 0006H         |
| Neighbour, N6 | -45   | 1   | 7   | 880   | 0007H         |
| Neighbour, N7 | -40   | 1   | 1   | 044   | 0008H         |

For 700/1 900 MS: 8 cells with the following settings:

| Transmitter   | Level | NCC | BCC | ARFCN | Cell Identity |
|---------------|-------|-----|-----|-------|---------------|
| Serving, S1   | -60   | 1   | 3   | 439   | 0001H         |
| Neighbour, N1 | -85   | 1   | 5   | 520   | 0002H         |
| Neighbour, N2 | -79   | 1   | 7   | 451   | 0003H         |
| Neighbour, N3 | -75   | 1   | 1   | 457   | 0004H         |
| Neighbour, N4 | -55   | 1   | 3   | 780   | 0005H         |
| Neighbour, N5 | -50   | 1   | 5   | 469   | 0006H         |
| Neighbour, N6 | -45   | 1   | 7   | 805   | 0007H         |
| Neighbour, N7 | -40   | 1   | 1   | 481   | 0008H         |

For 850/1 900 MS: 8 cells with the following settings:

| Transmitter   | Level | NCC | BCC | ARFCN | Cell Identity |
|---------------|-------|-----|-----|-------|---------------|
| Serving, S1   | -60   | 1   | 3   | 129   | 0001H         |
| Neighbour, N1 | -85   | 1   | 5   | 520   | 0002H         |
| Neighbour, N2 | -79   | 1   | 7   | 141   | 0003H         |
| Neighbour, N3 | -75   | 1   | 1   | 147   | 0004H         |
| Neighbour, N4 | -55   | 1   | 3   | 780   | 0005H         |
| Neighbour, N5 | -50   | 1   | 5   | 159   | 0006H         |
| Neighbour, N6 | -45   | 1   | 7   | 805   | 0007H         |
| Neighbour, N7 | -40   | 1   | 1   | 171   | 0008H         |

With the exception of the Cell Allocation, the rest of the parameters for all eight cells are the same as the default settings and default SYSTEM INFORMATION TYPE 1, 2 and 4 message contents for cell A. The Cell Allocation for the serving cell is the same as the default setting for cell A. The Cell Allocations for the neighbour cells need have only one entry, consisting of the ARFCN of that cell's BCCH.

Mobile Station:

The MS is in the active state of a call (U10).

Related PICS/PIXIT Statements

Support for state U10 of the Call Control protocol.

Type of MS (multiband GSM 450/900, GSM 480/900, GSM 450/DCS 1 800, GSM 480/DCS 1 800, GSM 700/PCS 1 900, GSM 850/PCS 1 900 or GSM 900/DCS 1 800 MS supporting simultaneous multiband operation).

Foreseen Final State of the MS

Active state of a call (U10).

Test Procedure

This test procedure is performed three times.

With the MS having a call in progress, the SS sends SYSTEM INFORMATION TYPE 5, 5ter & 6 on the SACCH. All 8 of the BCCHs "on air" are indicated in the BA. The MS shall send MEASUREMENT REPORTs back to the SS, and it shall be indicated in these that measurement results for the 6 strongest carriers, on which the mobile is asked to report (indicated by the parameter MULTIBAND\_REPORTING), have been obtained.

#### Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

#### Expected Sequence

This sequence is performed for execution counter,  $k = 1, 2, 3$ .

Since SYSTEM INFORMATION TYPE 5, SYSTEM INFORMATION TYPE 5ter, SYSTEM INFORMATION TYPE 6 and MEASUREMENT REPORT are sent continuously, a table is not applicable in this test. The interval between 2 successive Layer 2 frames containing MEASUREMENT REPORTs shall not exceed one Layer 2 frame.

#### Specific Message Contents

For 450/900 MS:

#### SYSTEM INFORMATION TYPE 2ter:

## 26.11.3 Multiband signalling / MM

### 26.11.3.1 Multiband signalling / MM / Location updating

This procedure is used to register the MS in the network. If it is not performed correctly, no call can be established.

#### 26.11.3.1.1 Location updating / accepted

This test is applicable for any Multiband MSs supporting simultaneous multiband operation.

##### 26.11.3.1.1.1 Conformance requirement

If the network accepts a location updating from the Mobile, the Mobile Station shall, after receiving a Location updating Accept message, store the received LAI, stop timer T3210, reset the attempt counter and set the update status in the SIM to updated.

A mobile station that makes use of System information 2ter (to choose correct cell for location updating), shall not ignore this message if it has a L2 pseudolength different from 18.

## Reference(s)

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.4.4.6.

## 26.11.3.1 1.2 Test purpose

To test the behaviour of the MS if the network accepts the location updating of the MS, irrespective of frequency band used.

To test the behaviour of the MS if it receives a System information 2ter with L2pseudolength different from 18 .

## 26.11.3.1.1.3 Method of test

## Initial conditions:

## System Simulator:

Two cells, A and B, belonging to different location areas with location area identification a and b of the same PLMN and using frequencies from different frequency bands.

IMSI attach/detach is allowed in both cells.

The T3212 time-out value is 1/10 hour in both cells.

## Mobile Station:

The MS has a valid TMSI. It is "idle updated" on cell A.

## Related PICS/PIXIT statement(s)

Frequency bands supported (GSM 450, GSM 480, GSM 700, GSM 850, P-GSM, E-GSM, R-GSM or DCS 1 800).

## Foreseen final state of the MS

The MS has a valid TMSI. It is "idle, updated" on cell A.

## Test Procedure

The MS is made to select cell B. A normal location updating is performed in cell B. The channel is released. The MS is made to select cell A. A normal location updating is performed in cell A.

The LOCATION UPDATING ACCEPT message contains neither IMSI nor TMSI.

## Maximum duration of test

3 minutes.

Expected sequence

| Step | Direction | Message                       | Comments                                                                                                                                                                                                                                                                                    |

## 26.11.3.1.2 Location updating / periodic

This test is applicable for any Multiband MSs supporting simultaneous multiband operation.

## 26.11.3.1.2.1 Conformance requirement

- 1) If the Mobile Station is in service state NO CELL AVAILABLE, LIMITED SERVICE, PLMN SEARCH or PLMN SEARCH-NORMAL SERVICE when the timer expires the location updating procedure is delayed until this service state is left.
- 2) The T3212 time-out value shall not be changed in the NO CELL AVAILABLE, LIMITED SERVICE, PLMN SEARCH and PLMN SEARCH-NORMAL SERVICE states.
- 3) If the selected cell is in the location area where the mobile station is registered and IMSI ATTACH is not required and timer T3212 has not expired, then the state is NORMAL SERVICE.

## References

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.4.2 and 4.2.1.1.

## 26.11.3.1.2.2 Test purpose

- 1) To check that if the PLU timer expires while the MS is out of coverage, the MS informs the network of its return to coverage, irrespective of frequency band used.
- 2) To check that the PLU timer is not disturbed by cells of forbidden PLMNs.
- 3) To check that if the PLU timer does not expire while out of coverage and if the mobile returns to the LA where it is updated, the mobile does not inform the network of its return to coverage.

## 26.11.3.1.2.3 Method of test

## Initial conditions

System Simulator:

Two cells, A and B, belonging to the same location area but using different frequency bands.

Cell A is switched on and cell B is switched off.

T3212 is set to 12 minutes on cell A and cell B.

IMSI attach is allowed in both cells.

Mobile Station:

The MS has a valid TMSI. It is "idle updated" on cell A.

Related PICS/PIXIT statements

Frequency bands supported (GSM 450, GSM 480, GSM 700, GSM 850, P-GSM, E-GSM, R-GSM or DCS 1 800).

Foreseen final state of the MS

The MS is "idle updated" on cell A.

Test procedure

The MS is deactivated. The MS is then activated and placed in automatic network selection mode. It performs IMSI attach. 1 minute after the end of the IMSI attach procedure, cell A is switched off. 8 minutes after the end of the IMSI attach procedure, cell B is switched on. The MS shall not location update on cell B before 11,75 minutes after the end of the IMSI attach procedure. The MS shall perform a periodic location update on cell B between 11,75 minutes and 12,25 minutes after the end of the IMSI attach procedure.

3 minutes after the end of the periodic location updating procedure, cell B is switched off. 14 minutes after the end of the periodic location updating procedure, cell A is switched on. The MS shall perform a location update on cell A before 17 minutes after the end of the periodic location updating procedure.

Maximum duration of test

35 minutes.

## 26.11.4 Multiband signalling / CC

Reserved for future use.

## 26.11.5 Multiband signalling / Structured procedures

These tests applies only to multiband mobile stations.

### 26.11.5.1 Multiband signalling / Structured procedures / MS originated call / early assignment

#### 26.11.5.1.1 Conformance requirements

- 1) An MS in MM state "idle, updated" and in RR idle mode, when made to initiate a call, if it provides a human interface, shall display the dialled number.
- 2) An MS in MM state "idle, updated" and in RR idle mode, when made to initiate a call for a selected teleservice that is supported by the MS, shall start to initiate the immediate assignment procedure by sending a CHANNEL REQUEST message with correct establishment cause.
- 3) After the initial message the multiband MS shall send a CLASSMARK CHANGE message in the uplink block followed direct after the Layer 2 UA message sent from the network. The CLASSMARK CHANGE message shall contain information elements Mobile Station Classmark 2 and Mobile Station Classmark 3.
- 4) Subsequently after establishment of an MM connection, the MS shall send a SETUP message with correct parameters.
- 5) The call control entity of the Mobile Station in the "call initiated" state, in the "mobile originating call proceeding" state or in the "call delivered" state, shall, upon receipt of a CONNECT message:
  - attach the user connection to the radio path;
  - return a CONNECT ACKNOWLEDGE message.
- 6) Subsequently when the network initiates call clearing by sending a DISCONNECT message, the MS shall proceed to release the call by sending a RELEASE message.
- 7) On receipt of a CHANNEL RELEASE message, the MS shall disconnect the main signalling link.

### 26.11.5.1.2 Test purpose

- 1) To verify that the MS in MM state "idle, updated" with a TMSI assigned, when made to initiate a call for a selected teleservice that is supported by the MS as declared in a PICS/PIXIT statement, displays the dialled number in the way described in a PICS/PIXIT statement.
- 2) To verify that the MS in MM state "idle, updated" and in RR idle mode, with a TMSI assigned, when made to initiate a call for a selected teleservice that is supported by the MS as declared in a PICS/PIXIT statement, starts to initiate an immediate assignment procedure by sending the CHANNEL REQUEST message with correct establishment cause.
- 3) To verify that a multiband MS is able to send an early CLASSMARK CHANGE on the DCCH uplink.
- 4) To verify that subsequently after receipt of an IMMEDIATE ASSIGNMENT message allocating an SDCCH, after completion of establishment of the main signalling link, after having sent a CM SERVICE REQUEST message, after having successfully performed the authentication and cipher mode setting procedures, the MS sends a SETUP message with correct parameters.
- 5) To verify that subsequently, after receipt of a CALL PROCEEDING message and of an HANDOVER COMMAND message allocating an appropriate TCH in another band, after having completed the traffic channel early assignment procedure by replying with the HANDOVER COMPLETE message, after receipt of an ALERTING message and a CONNECT message, the MS returns a CONNECT ACKNOWLEDGE message.

To verify that subsequently the MS has attached the user connection to the radio path. (This is checked by verifying that there is a point in time after transmission of the first L2 frame containing the (complete) CONNECT message, where the MS is sending appropriate speech or data frames whenever it does not have to transmit or acknowledge an I frame on layer 2 of the FACCH.)

- 6) To verify that subsequently upon the network initiating call clearing by sending a DISCONNECT message, the MS proceed to release the call with RELEASE.
- 7) To verify that subsequently, on receipt of a RELEASE COMPLETE message followed by a CHANNEL RELEASE message, the MS disconnects the main signalling link.

### 26.11.5.1.3 Method of test

#### Related PICS/PIXIT Statements

- Interface to the human user (p1 = Y/N).
- Way to display the called number (only applicable if the MS has an interface to the human user).
- Way to indicate alerting (only applicable if the MS supports the feature).
- Way to make the MS accept an incoming call after alerting (possibly dependent on teleservice and configuration).
- Supported teleservices.

- Classmark.
- Frequency bands supported.

#### Initial Conditions

##### System Simulator:

###### For 450/900 MS:

2 cells, A and B, with same LAI.

Cell A is a GSM 450 cell with default parameters.

Cell B is a GSM 900 cell with default parameters.

###### For 480/900 MS:

2 cells, A and B, with same LAI.

Cell A is a GSM 480 cell with default parameters.

Cell B is a GSM 900 cell with default parameters.

###### For 450/1800 MS:

2 cells, A and B, with same LAI.

Cell A is a GSM 450 cell with default parameters.

Cell B is a DCS 1 800 cell with default parameters.

###### For 480/1800 MS:

2 cells, A and B, with same LAI.

Cell A is a GSM 480 cell with default parameters.

Cell B is a DCS 1 800 cell with default parameters.

###### For 900/1 800 MS:

2 cells, A and B, with same LAI.

Cell A is a GSM 900 cell with default parameters.

Cell B is a DCS 1 800 cell with default parameters.

###### For 700/1900 MS:

2 cells, A and B, with same LAI.

Cell A is a GSM 700 cell with default parameters.

Cell B is a PCS 1 900 cell with default parameters.

###### For 850/1900 MS:

2 cells, A and B, with same LAI.

Cell A is a GSM 850 cell with default parameters.

Cell B is a PCS 1 900 cell with default parameters.

##### Mobile Station:

The MS is in MM-state idle, updated on cell A with valid TMSI.

## Foreseen Final State of the MS

The MS is in MM-state idle, updated on cell B with valid TMSI.

## Test procedure

The following test is performed for one teleservice supported by the MS:

- A teleservice is selected that is supported by the MS; if the MS supports speech, the selected teleservice is speech. If necessary, the MS is configured for that teleservice.
- The MS is made to initiate a call on any frequency band supported by the MS. The call is established with early assignment. Having reached the active state, the call is cleared by the SS.

## Maximum Duration of Test

1 minute.

## Expected Sequence

| Step | Direction | Message                 | Comments                                                                                                 |
|------|-----------|-------------------------|----------------------------------------------------------------------------------------------------------|
| 1    | MS        |                         | The "called number" is entered                                                                           |
| 2    | MS -> SS  | CHANNEL REQUEST         | Establishment cause is "originating call and the network does not set the NECI bit to 1".                |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT    |                                                                                                          |
| 4    | MS -> SS  | CM SERVICE REQUEST      | Message is contained in SABM. Indicating early sending of CLASSMARK CHANGE                               |
| 5    | SS -> MS  | UA (CM SERVICE REQUEST) |                                                                                                          |
| 6    | MS -> SS  | CLASSMARK CHANGE        | Indicating the frequency and power capability of the MS                                                  |
| 7    | SS -> MS  | AUTHENTICATION REQUEST  |                                                                                                          |
| 8    | MS -> SS  | AUTHENTICATION RESP     | SRES specifies correct value.                                                                            |
| 9    | SS -> MS  | CIPHERING MODE COMMAND  | SS starts deciphering after sending the message.                                                         |
| 10   | MS -> SS  | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered.                               |
| 11   | SS        |                         | SS starts ciphering.                                                                                     |
| 12   | MS -> SS  | SETUP                   |                                                                                                          |
| 13   | SS -> MS  | CALL PROCEEDING         |                                                                                                          |
| 14   | SS -> MS  | HANDOVER COMMAND        | See specific message contents below.                                                                     |
| 15   | MS -> SS  | HANDOVER ACCESS         | May or may not be sent. The sending of the HANDOVER ACCESS is optional as indicated in HANDOVER COMMAND. |
|      | MS -> SS  | HANDOVER ACCESS         |                                                                                                          |
|      | MS -> SS  | HANDOVER ACCESS         |                                                                                                          |
|      | MS -> SS  | HANDOVER ACCESS         | Handover Reference is included in the HANDOVER COMMAND.                                                  |
| 16   | MS -> SS  | SABM                    | Sent without information field                                                                           |
| 17   | SS -> MS  | UA                      |                                                                                                          |
| 18   | MS -> SS  | HANDOVER COMPLETE       |                                                                                                          |
| 19   | SS -> MS  | ALERTING                |                                                                                                          |
| 20   | MS        |                         | Depending on the PICS, an alerting indication is given                                                   |
| 21   | SS -> MS  | CONNECT                 |                                                                                                          |

## 26.11.5.2 Structured procedures / MS terminated call / late assignment

### 26.11.5.2.1 Conformance requirement

- 1) After the initial message the multiband MS shall send a CLASSMARK CHANGE message in the uplink block followed direct after Layer 2 UA message sent from the network.
- 2) The MS shall acknowledge the SETUP message with a CALL CONFIRMED message, if compatibility checking was successful, the MS is not busy, and the user does not refuse the call.
- 3) The MS on acceptance of the call sends a CONNECT, otherwise user alerting is initiated.

- 4) The MS indicates acceptance of a call by sending a CONNECT message.
- 5) HANDOVER COMMAND is answered by HANDOVER COMPLETE.
- 6) For speech calls:

The mobile station shall attach the user connection at latest when sending the connect message, except if there is no compatible radio resource available at this time. In this case the attachment shall be delayed until such a resource becomes available.

For data calls:

The mobile station shall attach the user connection when receiving the CONNECT ACKNOWLEDGE message from the network.

#### Requirement reference:

| Conformance requirement 6:        | 3GPP TS 04.08 / 3GPP TS 24.008, subclause 5.2.2.9.                           |

#### 26.11.5.2.2 Test purpose

- 1) To verify that a multiband MS is able to send an early CLASSMARK CHANGE message on the DCCH uplink.
- 2) To verify that the MS in "Idle, Updated" state with a TMSI assigned, after being paged by the network on the correct paging subchannel, after initiating the immediate assignment procedure by sending the CHANNEL REQUEST message, after receipt of an IMMEDIATE ASSIGNMENT message allocating an SDCCH, after having established the main signalling link, after having sent a PAGING RESPONSE message, after having performed successful authentication and cipher mode setting procedures, after receipt of a SETUP message containing a signal information element, returns a CALL CONFIRMED message followed by:
  - an ALERTING message;
  - or a CONNECT message.
- 3) To verify that in the situation of test purpose 1, if the MS sends an ALERTING message, the MS generates an alerting indication in the way described in a PICS/PIXIT statement.
- 4) To verify that subsequently the MS, if it had not yet sent a CONNECT message, upon acceptance of the call, sends a CONNECT message.
- 5) To verify that subsequently after receipt of an HANDOVER COMMAND ALLOCATING A tch IN another band, the MS sends an HANDOVER COMPLETE message.
- 6) To verify that subsequently the MS:
  - if the call is a speech call: after sending the HANDOVER COMPLETE message has through connected the TCH in both directions (this is checked by verifying that after transmission of the first L2 frame containing the (complete) HANDOVER COMPLETE message, the MS is sending appropriate speech or data frames whenever it does not have to transmit or acknowledge an I frame on layer 2 of the FACCH).
  - if the call is a data call: after receipt of a subsequent CONNECT ACKNOWLEDGE message through connects the TCH in both directions (this is checked by verifying that there is a point in time after transmission of the first L2 frame containing the (complete) CONNECT ACKNOWLEDGE message, where the MS is sending appropriate speech or data frames whenever it does not have to transmit or acknowledge an I frame on layer 2 of the FACCH).

## 26.11.5.2.3 Method of test

## Related PICS/PIXIT statements

- Interface to the human user (p1 = Y/N).
- Way to display the called number (only applicable if the MS has an interface to the human user).
- Way to indicate alerting (only applicable if the MS supports the feature).
- Way to make the MS accept an incoming call after alerting (possibly dependent on teleservice and configuration).
- Supported teleservices.
- Classmark.
- Frequency bands supported.
- Immediate connect supported (Y/N).

## Initial Conditions

## System Simulator:

For 450/900 MS:

2 cells, A and B, with same LAI.

Cell A is a GSM 450 cell with default parameters.

Cell B is a GSM 900 cell with default parameters.

For 480/900 MS:

2 cells, A and B, with same LAI.

Cell A is a GSM 480 cell with default parameters.

Cell B is a GSM 900 cell with default parameters.

For 450/1 800 MS:

2 cells, A and B, with same LAI.

Cell A is a GSM 450 cell with default parameters.

Cell B is a DCS 1 800 cell with default parameters.

For 480/1 800 MS:

2 cells, A and B, with same LAI.

Cell A is a GSM 480 cell with default parameters.

Cell B is a DCS 1 800 cell with default parameters.

For 900/1 800 MS:

2 cells, A and B, with same LAI.

Cell A is a GSM 900 cell with default parameters.

Cell B is a DCS 1 800 cell with default parameters.

For 700/1 900 MS:

2 cells, A and B, with same LAI.

Cell A is a GSM 700 cell with default parameters.

Cell B is a PCS 1 900 cell with default parameters.

For 850/1 900 MS:

2 cells, A and B, with same LAI.

Cell A is a GSM 850 cell with default parameters.

Cell B is a PCS 1 900 cell with default parameters.

Mobile Station:

The MS is in MM-state idle, updated on cell A with valid TMSI.

Foreseen Final State of the MS

The MS is in MM-state idle, updated on cell B with valid TMSI.

Test procedure

A teleservice is selected that is supported by the MS; if the MS supports speech, the selected teleservice is speech. If necessary, the MS is configured for that teleservice.

The MS is paged on any frequency band supported by the MS and a MT call is established with late assignment (after CONNECT). The release of the call is initiated by the MS.

Maximum Duration of Test

40 s.

## Expected Sequence

| Step | Direction | Message                 | Comments                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Timing Advance              | same as in IMMEDIATE ASSIGNMENT                                                                       |
| Mode of the first channel   | appropriate for the selected bearer service                                                           |

## 26.11.6 Multiband signalling / Default messages contents

## Default SYSTEM INFORMATION

The following parameters shall be coded into the system information messages. Parameters shall be coded according to 3GPP TS 04.08 / 3GPP TS 44.018.

SYSTEM INFORMATION TYPE 2bis, SYSTEM INFORMATION TYPE 5bis, SYSTEM INFORMATION TYPE 7 and SYSTEM INFORMATION TYPE 8 messages are not used.

For 450/900 MS:

## SYSTEM INFORMATION TYPE 1

| Information Element      | Value/remark                |
|--------------------------|-----------------------------|
| Cell channel description |                             |
| For Cell A               |                             |
| - Format identifier      | Range 128                   |
| - Cell Allocation ARFCN  | ARFCN 263, 267, 275 and 279 |
| For Cell B               |                             |
| - Format identifier      | Bit map 0                   |
| - Cell Allocation ARFCN  | ARFCN 20, 30, 50 and 70     |
| RACH control parameters  | see below                   |
| SI1 rest octets          | see below                   |

## SYSTEM INFORMATION TYPE 2

| Information Element        | Value/remark                                      |
|----------------------------|---------------------------------------------------|
| BCCH Frequency list        |                                                   |
| For Cell A                 |                                                   |
| - Format identifier        | Range 128                                         |
| - BCCH Allocation Sequence | 0                                                 |
| - BCCH Allocation ARFCN    | ARFCN 261, 263, 282, 284, 287, 290, 293           |
| - EXT-IND                  | "The information element carries the complete BA" |
| For Cell B                 |                                                   |
| - Format identifier        | Bit map 0                                         |
| - BCCH Allocation Sequence | 0                                                 |
| - BCCH Allocation ARFCN    | ARFCN 10, 20, 80, 90, 100, 110 and 120            |
| - EXT-IND                  | "This IE carries the complete BA"                 |
| NCC permitted              | see below                                         |
| RACH control parameters    | see below                                         |

## SYSTEM INFORMATION TYPE 2ter

| Information Element           | Value/remark                            |
|-------------------------------|-----------------------------------------|
| Neighbour Cells Description 2 | 0                                       |
| Multiband reporting           |                                         |
| For Cell A                    |                                         |
| - Format notation             | Range 1024                              |

| For Cell B                    |                                         |
| - Format notation             | Range 128                               |
| - BA_IND                      | 0                                       |
| - BCCH Allocation ARFCN       | ARFCN 261, 263, 282, 284, 287, 290, 293 |
| SI 2ter rest octets           | see below                               |

## SYSTEM INFORMATION TYPE 3

| Information Element             | Value/remark                         |
|---------------------------------|--------------------------------------|
| Cell identity                   | see below                            |
| Location Area Identification    | see below                            |
| Control Channel Description     | see below                            |
| Cell options                    | see below                            |
| Cell selection parameters       | see below                            |
| RACH control parameters         | see below                            |
| SI3 rest octets                 |                                      |
| SI 2ter Indicator               | System Information 2ter is available |
| Early Sending Classmark Control | Early Sending is explicitly accepted |

## SYSTEM INFORMATION TYPE 4

| Information Element          | Value/remark |
|------------------------------|--------------|
| Location Area Identification | see below    |
| Cell selection parameters    | see below    |
| RACH control parameters      | see below    |
| CBCH Channel Description     | see below    |
| CBCH Mobile Allocation       | see below    |
| SI4 rest octets              | see below    |

## SYSTEM INFORMATION TYPE 5

| Information Element        | Value/remark                                      |
|----------------------------|---------------------------------------------------|
| BCCH Frequency list        |                                                   |
| For Cell A                 |                                                   |
| - Format identifier        | Range 128                                         |
| - BCCH Allocation Sequence | 0                                                 |
| - BCCH Allocation ARFCN    | ARFCN 261, 263, 282, 284, 287, 290, 293           |
| - EXT-IND                  | "The information element carries the complete BA" |
| For Cell B                 |                                                   |
| - Format identifier        | Bit map 0                                         |
| - BCCH Allocation Sequence | 0                                                 |
| - BCCH Allocation ARFCN    | ARFCN 10, 20, 80, 90, 100, 110 and 120            |
| - EXT-IND                  | This IE carries the complete BA                   |

## SYSTEM INFORMATION TYPE 5ter

| Information Element           | Value/remark                            |
|-------------------------------|-----------------------------------------|
| Neighbour Cells Description 2 | 0                                       |
| Multiband reporting           |                                         |
| For Cell A                    |                                         |
| - Format notation             | Range 1024                              |
| - BA_IND                      | 0                                       |
| - BCCH Allocation ARFCN       | ARFCN 10, 20, 80, 90, 100, 110 and 120  |
| For Cell B                    |                                         |
| - Format notation             | Range 128                               |
| - BA_IND                      | 0                                       |
| - BCCH Allocation ARFCN       | ARFCN 261, 263, 282, 284, 287, 290, 293 |

## SYSTEM INFORMATION TYPE 6

| Information Element          | Value/remark |
|------------------------------|--------------|
| Cell identity                | see below    |
| Location Area Identification | see below    |
| Cell options                 | see below    |
| NCC permitted                | see below    |

Common contents of information elements in SYSTEM INFORMATION TYPE 1 to 6 messages.

|                                          |                                                                 |
|------------------------------------------|-----------------------------------------------------------------|

| BCCH/CCCH            | ARFCN 147                   |

## Default settings for cell B

|                      |                             |
|----------------------|-----------------------------|
| Downlink input level | 53 dBmicroVolt emf          |
| Uplink output power  | Minimum supported by the MS |
| Propagation profile  | Static                      |
| BCCH/CCCH            | ARFCN 590                   |

**Default message contents for other messages**

For subclause 26.11.2 same as in subclause 26.6.14 for GSM 900 messages and subclause 26.6.15 for DCS 1 800 messages and subclause 26.6.16 for GSM 450 messages and subclause 26.6.17 for GSM 480 messages and subclause 26.6.19 for GSM 700 and subclause 26.6.20 for GSM 850 and subclause 26.6.18 for PCS 1 900.

For subclause 26.11.3 same as in subclause 26.7.

For subclause 26.11.4 no tests yet defined.

For subclause 26.11.5 same as in subclause 26.9.7.

## 26.12 Enhanced Full Rate signalling

This subclause only applies to MS supporting enhanced full rate speech.

As an EFR mobile station necessarily supports the speech full rate version 1 or both speech full rate version 1 and speech half rate version 1, conformance requirements of clause 26 fully apply to this mobile.

The purpose of this extra section is to test the different procedures which may be impacted when Enhanced full rate speech codec is used.

### 26.12.1 EFR signalling/ test of the channel mode modify procedure

**NOTE:** This test is derived from the tests in subclauses 26.6.7.1 and 26.6.7.2 respectively entitled "Test of the channel mode modify procedure / full rate" and "Test of the channel mode modify procedure / half rate".

This test is only applicable to an enhanced full rate speech MS.

#### 26.12.1.1 Conformance requirement

The MS with a TCH/F allocated acknowledges a CHANNEL MODE MODIFY message by sending a CHANNEL MODE MODIFY ACKNOWLEDGE message specifying the new mode and by switching to this mode when this one is set to:

- speech full rate or half rate version 1.
- speech full rate or half rate version 2.
- any other mode declared supported by the mobile.

If the mobile station does not support the indicated mode, it shall retain the old mode and return the associated channel mode information in the CHANNEL MODE MODIFY ACKNOWLEDGE message.

#### References

3GPP TS 02.06, subclause 3.2.3.

3GPP TS 04.08 / 3GPP TS 44.018, subclauses 3.4.6.1.1 and 3.4.6.1.2.

### 26.12.1.2 Test purpose

To verify that the MS with a TCH/F allocated acknowledges a CHANNEL MODE MODIFY message by sending a CHANNEL MODE MODIFY ACKNOWLEDGE message specifying the new mode and by switching to this mode when this one is set to:

- speech full rate or half rate version 1.
- speech full rate or half rate version 2.
- any other mode declared supported by the mobile.

To verify that the MS, in an RR connected state, acknowledges a CHANNEL MODE MODIFY message by sending a CHANNEL MODE MODIFY ACKNOWLEDGE message specifying the old mode when the new mode is not declared as supported by the mobile

### 26.12.1.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is "idle updated", with TMSI allocated.

#### Related PICS/PIXIT Statements

- Type of MS (GSM 400 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).
- The MS supports speech full rate version 2:
  - Bearer Capabilities supported by the MS;
  - Channel modes supported by the MS:
    - \* MS supports speech full rate version 3 (p1 = Y/N);
    - \* MS supports data 12 Kb/s (p2 = Y/N);
    - \* MS supports data 6 Kb/s full rate (p3 = Y/N);
    - \* MS supports data 3,6 Kb/s full rate (p4 = Y/N).

#### Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

#### Test procedure

A Mobile Terminated call is initiated, however following the CHANNEL REQUEST received from the Mobile Station, the SS sends an IMMEDIATE ASSIGNMENT to the MS commanding it to go to a TCH/F. This sets the Channel Mode automatically to "Signalling Only".

The SS then sends a series of CHANNEL MODE MODIFY messages to the MS. Each time it is checked that the MS responds with a CHANNEL MODE MODIFY ACKNOWLEDGE message specifying:

- the channel mode that has been specified in the CHANNEL MODE MODIFY message, if the MS supports that mode (this mode then becomes the "channel mode in use"). If necessary, the MS shall be correctly configured in order to accept this mode.
- the channel mode that was in use when the CHANNEL MODE MODIFY message has been received, if the MS does not support the channel mode specified in the CHANNEL MODE MODIFY message.

Maximum Duration of Test

50 s.

## 26.12.2 EFR signalling/ tests of handover

With the Handover procedure, it is possible to completely alter the channels allocated to a MS. This makes it possible in particular to switch a call in progress from one cell to another. The procedure is always initiated by the network and with the MS in a dedicated mode.

Subclause 26.12.2.1 contains generic test procedures to be used for executing successful Handover tests dealing with EFR mode.

It deals with EFR signalling in the Handover/successful/active call/non synchronised case.

Table 1 contains a summary of the different combinations of parameters which have to be tested, together with a reference to the appropriate generic test procedure. If a test uses a channel rate which the MS under test does not support, the test shall be skipped.

sv1 stands for speech full/half rate version 1.

sv2 stands for speech full/half rate version 2 (enhanced full rate).

Table 1

| From              | To                | Timing Adv. | Start Time | Syn ? | State of call | Subclause | Exec Counter |
|-------------------|-------------------|-------------|------------|-------|---------------|-----------|--------------|

### 26.12.2.1 EFR signalling / Handover / active call / successful case

NOTE: This test is derived from the one defined in subclause 26.6.5.1 "Handover/successful/active call/non-synchronized".

This test only applies for MS supporting full rate speech version 2 (enhanced full rate speech).

#### 26.12.2.1.1 Conformance requirements

The MS shall correctly apply the handover procedure in the non-synchronized case when:

- a call is in progress; and
- handover is performed from a TCH/F with/without frequency hopping towards a TCH/F with/without frequency hopping; and
- the mode of either the current or the target channel is set to full rate speech version 2 (enhanced full rate speech).

The MS also supporting half rate shall correctly apply the handover procedure in the non-synchronized case when:

- a call is in progress; and
- a handover is performed between a TCH/H with/without frequency hopping and a TCH/F with/without frequency hopping; and
- the mode of the TCH/F is set to full rate speech version 2.

#### References

3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.4.4 and 9.1.15.

3GPP TS 04.13 subclause 5.2.6.2.

### 26.12.2.1.2 Test purpose

To test that the MS shall correctly apply the handover procedure in the non-synchronized case when:

- a call is in progress; and
- handover is performed from a TCH/F with/without frequency hopping towards a TCH/F with/without frequency hopping; and
- the mode of either the current or the target channel is set to full rate speech version 2 (enhanced full rate speech).

To test that the MS also supporting half rate shall correctly apply the handover procedure in the non-synchronized case when:

- a call is in progress; and
- a handover is performed between a TCH/H with/without frequency hopping and a TCH/F with/without frequency hopping; and
- the mode of the TCH/F is set to full rate speech version 2.

### 26.12.2.1.3 Method of test

#### Initial Conditions

System Simulator:

2 cells, A and B with same LAI, default parameters except.

#### GSM 450:

Cell A has:

BCCH ARFCN = 263

Cell Allocation = (259, 261, 263, 265, 267, 269, 271, 273, 275, 277, 279, 281, 283, 285, 287, 289, 291)

Cell B has: BCCH ARFCN = 274

Cell Allocation = (260, 262, 264, 266, 268, 270, 272, 274, 276, 279, 281, 283, 285, 287, 289, 291)

The frame numbers of cells A and B shall be different by 100.

The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

#### GSM 480:

Cell A has:

BCCH ARFCN = 310

Cell Allocation = (306, 308, 310, 312, 314, 316, 318, 320, 322, 324, 326, 328, 330, 332, 334, 336, 338)

Cell B has:

BCCH ARFCN = 321

Cell Allocation = (307, 309, 311, 313, 315, 317, 319, 321, 323, 326, 328, 330, 332, 334, 336, 338)

The frame numbers of cells A and B shall be different by 100.

The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

**GSM 900:**

Cell A has:

BCCH ARFCN = 20

Cell Allocation = (10, 17, 20, 26, 34, 42, 45, 46, 52, 59, 66, 73, 74, 75, 76, 108, 114)

Cell B has:

BCCH ARFCN = 40

Cell Allocation = (14, 18, 22, 24, 30, 31, 38, 40, 60, 66, 73, 74, 75, 76, 108, 114)

The frame numbers of cells A and B shall be different by 100.

The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

**DCS 1 800:**

Cell A has:

BCCH ARFCN = 747

Cell Allocation = (734, 741, 747, 754, 759, 762, 766, 767, 773, 775, 779, 782, 791, 798, 829, 832, 844)

Cell B has:

BCCH ARFCN = 764

Cell Allocation = (739, 743, 746, 749, 756, 758, 761, 764, 771, 779, 782, 791, 798, 829, 832, 844)

The Cell Allocation of both Cell A and Cell B shall be coded using range 256 format.

The frame numbers of cells A and B shall be different by 100.

The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

**PCS 1 900:**

Cell A has:

BCCH ARFCN = 647

Cell Allocation = (634, 641, 647, 654, 659, 662, 666, 667, 673, 675, 679, 682, 691, 698, 729, 732, 744)

Cell B has:

BCCH ARFCN = 664

Cell Allocation = (639, 643, 646, 649, 656, 658, 661, 664, 671, 679, 682, 691, 698, 729, 732, 744)

The Cell Allocation of both Cell A and Cell B shall be coded using range 256 format.

The frame numbers of cells A and B shall be different by 100.

The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

**GSM 700:**

Cell A has:

BCCH ARFCN = 457

Cell Allocation = (447, 454, 457, 463, 471, 479, 482, 483, 489, 496, 498, 500, 501, 502, 503, 506, 508)

Cell B has:

BCCH ARFCN = 477

Cell Allocation = (451, 455, 459, 461, 467, 468, 475, 477, 497, 498, 500, 501, 502, 503, 506, 508)

The frame numbers of cells A and B shall be different by 100.

The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

**GSM 850:**

Cell A has:

BCCH ARFCN = 147

Cell Allocation = (137, 144, 147, 153, 161, 169, 172, 173, 179, 186, 193, 200, 201, 202, 203, 235, 241)

Cell B has:

BCCH ARFCN = 167

Cell Allocation = (141, 145, 149, 151, 157, 158, 165, 167, 187, 193, 200, 201, 202, 203, 235, 241)

The frame numbers of cells A and B shall be different by 100.

The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

Mobile Station:

The MS is in the active state (U10) of a call on cell A.

#### Related PICS/PIXIT Statements

Supported rate(s) of TCH: TCH/F and/or TCH/H.

Support for state U10 of the Call Control protocol.

Support for full rate speech version 2 (enhanced full rate speech).

Supported radio interface rates: 12 kbps, 6 kbps, 3,6 kbps.

Type of Mobile Station (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

#### Foreseen Final State of the MS

The active state (U10) of a call on cell A.

#### Test Procedure

This procedure is repeated for execution counter M = 1 to 15.

The MS is in the active state (U10) of a call. The SS sends a HANOVER COMMAND on the main DCCH. The MS shall (at the time defined by the Starting Time information element, if included in the message) begin to send access bursts on the new DCCH of the target cell. The SS observes the access bursts and after receiving n (n being arbitrarily chosen between values according to table 2 of subclause 26.12.2) access bursts, the SS sends one PHYSICAL INFORMATION message with a Timing Advance as specified in table 1 of subclause 26.12.2. The MS shall activate the channel in sending and receiving mode. The MS shall establish a signalling link. The MS shall be ready to transmit a HANOVER COMPLETE message, before 'x' MS after the end of the PHYSICAL INFORMATION message, but not before a UA frame has been sent by the SS.

The term 'ready to transmit' is defined in 3GPP TS 04.13. The value of 'x' depends upon the target channel and is specified in the specific message contents section.

Maximum Duration of Test

10 minutes, including 1 minute for any necessary operator actions.

Expected Sequence

This sequence is performed for an execution counter M = 1, 2.. 9 for an MS which supports enhanced full speech codec and only TCH/F .

This sequence is performed for an execution counter M = 1, 2.. 15 for an MS which supports enhanced full speech codec and TCH/F and H.

### 26.12.3 EFR Signalling / Structured procedures / MS originated call / late assignment

NOTE: this test is derived from the one defined in subclause 26.9.3 and entitled "Structured procedures / MS originated call / late assignment".

#### 26.12.3.1 Conformance requirement

- 1) The MS shall indicate and include in the mobile originating SETUP for speech call all the speech versions that it supports.

- 2) Upon receipt of the ASSIGNMENT COMMAND message specifying either speech full rate version 1 or speech full rate version 2 or speech half rate version 1 (for an MS also supporting half rate), the Mobile Station starts a normal channel assignment procedure. It means that the MS initiates a local end release of link layer connections, disconnects the physical channels, commands the switching to the assigned channels and initiates the establishment of lower layer connections (this includes the activation of the channels, their connection and the establishment of the data links). After the main signalling link is successfully established, the MS returns an ASSIGNMENT COMPLETE message, specifying cause 'normal event', to the network on the main DCCH.
- 3, 4) The call control entity of the Mobile Station in the "call initiated" state, in the "mobile originating call proceeding" state or in the "call delivered" state, shall, upon receipt of a CONNECT message:
  - attach the user connection to the radio path;
  - return a CONNECT ACKNOWLEDGE message.

## References

- Conformance requirement 1: 3GPP TS 04.08 / 3GPP TS 24.008 subclauses 10.5.4.5 and 10.5.4.5.1, and 3GPP TS 02.06 subclause 3.2.3.
- Conformance requirement 2: 3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.4.3.1 and 3.4.3.2.
- Conformance requirement 3: 3GPP TS 04.08 / 3GPP TS 24.008 subclause 5.2.1.6.

### 26.12.3.2 Test purpose

- 1) To verify that the MS indicates and includes in the mobile originating SETUP for speech call all the speech versions that it supports.
- 2) To verify that subsequently after receipt of an IMMEDIATE ASSIGNMENT message allocating an SDCCH, after completion of establishment of the main signalling link, after having sent a CM SERVICE REQUEST message, after having successfully performed authentication and cipher mode setting procedures, after having sent a SETUP message, after having received a CALL PROCEEDING message followed by an ALERTING message and an ASSIGNMENT COMMAND message allocating either speech full rate version 1 TCH or speech full rate version 2 TCH or speech half rate version 1 TCH (for an MS also supporting half rate), the MS sends an ASSIGNMENT COMPLETE message.
- 3) To verify that subsequently, after the suite of actions specified in test purposes 1 and 2, the MS after receiving a CONNECT message returns a CONNECT ACKNOWLEDGE message.
- 4) To verify that after the suite of actions specified in test purposes 1 and 2, the MS after receiving a CONNECT message attaches the user connection to the radio path. (This is checked by verifying that there is a point in time after transmission of the first L2 frame containing the (complete) CONNECT message, where the MS is sending appropriate speech or data frames whenever it doesn't have to transmit or acknowledge an I frame on layer 2 of the FACCH.)

### 26.12.3.3 Method of test

#### Related PICS/PIXIT statements

- Enhanced full rate speech MS.
- Supported speech versions.
- Interface to the human user (p1 = Y/N).
- Way to display the called number (only applicable if the MS has an interface to the human user).
- Way to indicate alerting (only applicable if the MS supports the feature).
- Supported teleservices.
- Classmark.

## Initial Conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

## Foreseen Final State of the MS

The MS has a MO call in state U10, "active".

## Test procedure

The following test is performed for all rates (full rate/half rate) supported by the MS:

The MS is made to initiate a speech call. The call is established with late assignment.

## Maximum Duration of Test

3 minutes.

## Expected Sequence

This test is repeated for execution counter M = 1, 2 for an MS supporting full rate channels only.

This test is repeated for execution counter M = 1, 2, 3 for an MS supporting both half and full rate channels.

| Channel Description<br>- TDMA offset<br>Mode of the first channel<br>- Mode | TCH/H+ACCHs<br><br>speech full rate or half rate version 1 |
|-----------------------------------------------------------------------------|------------------------------------------------------------|

#### SETUP

same contents as subclause 26.12.8 but the supported speech versions and their preferred order indicated in octet\_3a\_etc(s) shall be as declared by the manufacturer.

## 26.12.4 Structured procedures / MS terminated call / I early assignment

NOTE: this test is derived from the one described in subclause 26.9.4 and entitled "Structured procedures / MS terminated call / early assignment".

### 26.12.4.1 Conformance requirement

- 1) In acceptance to a SETUP message indicating speech, the MS shall indicate and include in the CALL CONFIRMED message all the speech versions that it supports.
- 2) Upon receipt of the ASSIGNMENT COMMAND message specifying either speech full rate version 1 or speech full rate version 2 or speech half rate version 1 (for an MS also supporting half rate), the Mobile Station continues a mobile terminating call establishment with early assignment of traffic channel:
  - a) by replying to the ASSIGNMENT command with an ASSIGNMENT COMPLETE message; and
  - b) by continuing the call establishment by through connecting TCH in both directions if it supports immediate connect or by sending an ALERTING message otherwise.

- 3) For speech calls, the mobile station shall attach the user connection at latest when sending the connect message, except if there is no compatible radio resource available at this time. In this case the attachment shall be delayed until such a resource becomes available.

## References

- Conformance requirement 1: 3GPP TS 04.08 / 3GPP TS 24.008 subclauses 10.5.4.5 and 10.5.4.5.1  
3GPP TS 02.06 subclause 3.2.3.
- Conformance requirement 2: 3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.4.3.1 and 3.4.3.2.
- Conformance requirement 3: 3GPP TS 04.08 / 3GPP TS 24.008 subclause 5.2.2.9.

### 26.12.4.2 Test purpose

- 1) To verify that, in acceptance to a SETUP message indicating speech, the MS indicates and includes in the CALL CONFIRMED message all the speech versions that it supports.
- 2) To verify that upon receipt of the ASSIGNMENT COMMAND message specifying either speech full rate version 1 or speech full rate version 2 or speech half rate version 1 (for an MS also supporting half rate), the Mobile Station continues a mobile terminating call establishment with early assignment of traffic channel
  - a) by replying to the ASSIGNMENT command with an ASSIGNMENT COMPLETE message; and
  - b) by continuing the call establishment by through connecting TCH in both directions if it supports immediate connect or by sending an ALERTING message otherwise.
- 3) To verify that for speech calls, the mobile station shall attach the user connection at latest when sending the connect message, except if there is no compatible radio resource available at this time. In this case the attachment shall be delayed until such a resource becomes available.

### 26.12.4.3 Method of test

#### Related PICS/PIXIT statements

- Enhanced full rate speech MS.
- Supported speech versions.
- Interface to the human user (p1 = Y/N).
- Way to indicate alerting (only applicable if the MS supports the feature).
- Way to make the MS accept an incoming call after alerting (possibly dependent on teleservice and configuration).
- Supported teleservices.
- Classmark.
- Immediate connect supported (Y/N).

#### Initial Conditions

##### System Simulator:

1 cell, default parameters.

##### Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

## Foreseen Final State of the MS

CC state U10-call active.

## Test procedure

The following test is performed for all rates (full rate/half rate) supported by the MS:

- A teleservice is selected that is supported by the MS; if the MS supports speech, the selected teleservice is speech. If necessary, the MS is configured for that teleservice.
- The MS is paged and the resulting call is established. Having reached the active state, the MS is made to clear the call.

## Maximum Duration of Test

3 minutes.

## Expected Sequence

This test is repeated for execution counter M = 1, 2 for an MS supporting full rate channels only.

This test is repeated for execution counter M = 1, 2, 3 for an MS supporting both half and full rate channels.

#### ASSIGNMENT COMMAND

Same as for default message contents except:

|                                                                             |                                                            |
|-----------------------------------------------------------------------------|------------------------------------------------------------|
| Channel Description<br>- TDMA offset<br>Mode of the first channel<br>- Mode | TCH/H+ACCHs<br><br>speech full rate or half rate version 1 |
|-----------------------------------------------------------------------------|------------------------------------------------------------|

#### CALL CONFIRMED

Same contents as subclause 26.12.8 but all the speech versions supported by the MS shall be indicated in octet\_3a\_etc(s).

## 26.12.5 Structured procedures / emergency call

NOTE: This test is derived from the ones described in subclauses 26.9.6.1.1 and 26.9.6.1.2 and respectively entitled "Structured procedures / emergency call / idle updated, preferred channel rate " and "Structured procedures / emergency call / idle updated, non-preferred channel rate".

This test applies to mobiles supporting Enhanced Full Rate speech.

### 26.12.5.1 Conformance requirement

- 1) The MS in the "idle, updated" state, as after a successful location update, after the number 112 (for GSM 900 and 1 DCS 800 MS), or 911 (for GSM 700, GSM 850, PCS 1 900 MS in USA and Canada), or 08 (for GSM 700, GSM 850, PCS 1 900 MS in Mexico) has been entered by user, shall send a CHANNEL REQUEST message with correct establishment cause ("emergency call").

- 2) After assignment of a dedicated channel the first layer message sent by the MS on the assigned dedicated channel shall be a CM SERVICE REQUEST message specifying the correct CKSN and TMSI , with CM Service Type "emergency call establishment".
- 3) Authentication and cipher mode setting shall be performed successfully.
- 4) After cipher mode setting acceptance by the network, the MS shall send an EMERGENCY SETUP message.
- 5) The EFR mobile station shall accept channel assignment to a TCH full rate speech version 1 or 2 and if it supports half rate, in addition it shall accept channel assignment to a TCH half rate speech version 1.
- 6) After receipt of a CONNECT ACKNOWLEDGE message during correct establishment of the emergency call the TCH shall be through connected in both directions if an appropriate TCH is available.
- 7) The call shall be cleared correctly.

#### Requirement Reference:

- For conformance requirement 1 and 2: 3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.3.1.1,  
3GPP TS 04.08 / 3GPP TS 24.008, subclauses 5.2.1 and 4.5.1.5,  
3GPP TS 02.30, clause 4.
- For conformance requirement 3: 3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.4.7,  
3GPP TS 04.08 / 3GPP TS 24.008, subclause 4.3.2.
- For conformance requirement 4: 3GPP TS 04.08 / 3GPP TS 24.008, subclause 5.2.1.1.
- For conformance requirement 5: 3GPP TS 04.08 / 3GPP TS 24.008, subclause 5.2.1.1,  
3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.4.3,  
3GPP TS 02.06, subclause 3.2.3.
- For conformance requirement 6: 3GPP TS 04.08 / 3GPP TS 24.008, subclause 5.2.1.6.
- For conformance requirement 7: 3GPP TS 04.08 / 3GPP TS 24.008, subclause 5.4.

#### 26.12.5.2 Test purpose

- 1) To verify that an MS supporting speech in the MM state "idle, updated", when made to call the number 112, (for GSM 900 and DCS 1800 MS), or 911 (for GSM 700, GSM 850 and PCS 1 900 MS in USA and Canada), or 08 (for GSM 700, GSM 850 and PCS 1 900 MS in Mexico) sends a CHANNEL REQUEST message with establishment cause "emergency call".
- 2) To verify that after assignment of a dedicated channel the first layer message sent by the MS on the assigned dedicated channel is a CM SERVICE REQUEST message specifying the correct CKSN and TMSI, with CM Service Type "emergency call establishment".
- 3) To verify that authentication and cipher mode setting are performed successfully.
- 4) To verify that after cipher mode setting acceptance by the SS, the MS sends an EMERGENCY SETUP message.
- 5) To verify that the EFR mobile station shall both accept channel assignment to a TCH full rate speech versions 1 or 2 and if it supports half rate, in addition it shall accept channel assignment to a TCH half rate speech version 1.
- 6) To verify that subsequently the MS has through connected the TCH in both directions.
- 7) To verify that the call is cleared correctly.

#### 26.12.5.3 Method of test

##### Related PICS/PIXIT Statements

- Speech supported (Y/N).
- Supported rate for speech: (F/H, F).

- Speech version supported.
- Classmark.
- Inclusion of the bearer capability IE in the emergency setup.

#### Initial Conditions

##### System Simulator:

1 cell, default parameters.

##### Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

#### Foreseen Final State of the MS

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

#### Test procedure

The MS is made to initiate an emergency call. The call is established with late assignment. Having reached the active state, the call is cleared by the SS. This procedure is repeated so that the assignment is made with all the channel rates and speech versions supported by the mobile station.

#### Maximum Duration of Test

3 minutes

#### Expected Sequence

The expected sequence is executed for M = 1 and 2, for a full rate only mobile station which includes the bearer capabilityv IE in the emergency setup message.

The expected sequence is executed for M = 1, 2 and 3, for a dual rate mobile station which includes the bearer capabilityv IE in the emergency setup message.

The expected sequence is executed for M = 1, for a mobile which does not include the bearer capability IE in the emergency setup message.

| Step | Direction | Message                 | Comments                                                                                                                    |
|------|-----------|-------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                         | The appropriate emergency number is entered                                                                                 |
| 3    | MS -> SS  | CHANNEL REQUEST         | Establishment cause is emergency call establishment.                                                                        |
| 4    | SS -> MS  | IMMEDIATE ASSIGNMENT    |                                                                                                                             |
| 5    | MS -> SS  | CM SERVICE REQUEST      | Message is contained in SABM. The CM service type IE indicates "emergency call establishment".                              |
| 6    | SS -> MS  | AUTHENTICATION REQUEST  |                                                                                                                             |
| 7    | MS -> SS  | AUTHENTICATION RESPONSE | SRES specifies correct value.                                                                                               |
| 8    | SS -> MS  | CIPHERING MODE COMMAND  | SS starts deciphering after sending the message.                                                                            |
| 9    | MS -> SS  | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered.                                                  |
| 10   | SS        |                         | SS starts ciphering.                                                                                                        |
| 11   | MS -> SS  | EMERGENCY SETUP         | If the bearer capability IE is including, it shall be checked that all the speech versions supported by the MS are present. |
| 12   | SS -> MS  | CALL PROCEEDING         |                                                                                                                             |
| 13   | SS -> MS  | ALERTING                |                                                                                                                             |
| 14   | SS -> MS  | ASSIGNMENT COMMAND      | See specific message contents.                                                                                              |
| 15   | MS -> SS  | ASSIGNMENT COMPLETE     |                                                                                                                             |
| 16   | SS -> MS  | CONNECT                 |                                                                                                                             |
| 17   | MS -> SS  | CONNECT ACKNOWLEDGE     |                                                                                                                             |
| 18   | MS        |                         | The TCH is through connected in both directions in the correct mode.                                                        |
| 19   | SS -> MS  | DISCONNECT              |                                                                                                                             |

## 26.12.6 EFR Signalling / Directed Retry / Mobile Originated Call

This test is applicable to all MS which support EFR speech.

NOTE: This test is derived from the one defined in subclause 26.9.7 and entitled "Directed Retry / MS originated call".

### 26.12.6.1 Conformance requirements

The MS shall correctly apply the Directed Retry procedure from SDCCH/8 (no frequency hopping) to TCH/EFR with frequency hopping in the non-synchronized case during call establishment. The call control entity of the Mobile Station in the "mobile originating call proceeding" state shall, upon receipt of a CONNECT message, attach the EFR speech connection to the radio path and return a CONNECT ACKNOWLEDGE message to the SS.

#### References

3GPP TS 04.08 / 3GPP TS 44.018, subclauses 3.4.4 and 9.1.15.

3GPP TS 04.08 / 3GPP TS 24.008 subclause 5.2.1.6.

3GPP TS 04.13, subclause 5.2.6.2.

### 26.12.6.2 Test purpose

To test that, when the MS is ordered to perform a non-synchronized handover after the CALL PROCEED message, it continuously sends access bursts on the main DCCH until it receives a PHYSICAL INFORMATION message from the SS. To test that the MS correctly takes the values of the Timing Advance information element in the PHYSICAL INFORMATION message into account. To test that the MS activates the new channel correctly and transmits the HANDOVER COMPLETE message without undue delay. To test that the call control entity of the Mobile Station in the "mobile originating call proceeding" state, upon receipt of a CONNECT message, attaches the EFR speech connection to the radio path and returns a CONNECT ACKNOWLEDGE message to the SS.

### 26.12.6.3 Method of test

#### Initial Conditions

System Simulator:

2 cells A and B with same LAI, default parameters, except:

GSM 450:

Cell A has:

BCCH ARFCN = 263.

Cell Allocation = (259, 261, 263, 265, 267, 269, 271, 273, 275, 277, 279, 281, 283, 285, 287, 289, 291).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

PLMN\_PERM = 00001010.

Cell B has:

BCCH ARFCN = 274.

Cell Allocation = (260, 262, 264, 266, 268, 270, 272, 274, 276, 279, 281, 283, 285, 287, 289, 291).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using Range 128 format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

A non-combined SDCCH is used.

GSM 480:

Cell A has:

BCCH ARFCN = 310.

Cell Allocation = (306, 308, 310, 312, 314, 316, 318, 320, 322, 324, 326, 328, 330, 332, 334, 336, 338).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

PLMN\_PERM = 00001010.

Cell B has:

BCCH ARFCN = 321.

Cell Allocation = (307, 309, 311, 313, 315, 317, 319, 321, 323, 326, 328, 330, 332, 334, 336, 338).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using Range 128 format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

A non-combined SDCCH is used.

GSM 900:

Cell A has:

BCCH ARFCN = 20.

Cell Allocation = (10, 17, 20, 26, 34, 42, 45, 46, 52, 59, 66, 73, 74, 75, 76, 108, 114).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

PLMN\_PERM = 00001010.

Cell B has:

BCCH ARFCN = 40.

Cell Allocation = (14, 18, 22, 24, 30, 31, 38, 40, 60, 66, 73, 74, 75, 76, 108, 114).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using bit map 0 format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

A non-combined SDCCH is used.

DCS 1 800:

Cell A has:

BCCH ARFCN = 747.

Cell Allocation = (734, 741, 747, 754, 759, 762, 766, 767, 773, 775, 779, 782, 791, 798, 829, 832, 844).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

PLMN\_PERM = 00001010.

Cell B has:

BCCH ARFCN = 764.

Cell Allocation = (739, 743, 746, 749, 756, 758, 761, 764, 771, 779, 782, 791, 798, 829, 832, 844).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using Range 512 format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

A non combined SDCCH is used.

PCS 1 900:

Cell A has:

BCCH ARFCN = 647.

Cell Allocation = (634, 641, 647, 654, 659, 662, 666, 667, 673, 675, 679, 682, 691, 698, 729, 732, 744).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

PLMN\_PERM = 00001010.

Cell B has:

BCCH ARFCN = 664.

Cell Allocation = (639, 643, 646, 649, 656, 658, 661, 664, 671, 679, 682, 691, 698, 729, 732, 744).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using Range 512 format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

A non combined SDCCH is used.

GSM 700:

Cell A has:

BCCH ARFCN = 457.

Cell Allocation = (447, 454, 457, 463, 471, 479, 482, 483, 489, 496, 498, 500, 501, 502, 503, 506, 508).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

PLMN\_PERM = 00001010.

Cell B has:

BCCH ARFCN = 477.

Cell Allocation = (451, 455, 459, 461, 467, 468, 475, 477, 497, 498, 500, 501, 502, 503, 506, 508).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using bit map 0 format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

A non-combined SDCCH is used.

GSM 850:

Cell A has:

BCCH ARFCN = 147.

Cell Allocation = (137, 144, 147, 153, 161, 169, 172, 173, 179, 186, 193, 200, 201, 202, 203, 235, 241).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

PLMN\_PERM = 00001010.

Cell B has:

BCCH ARFCN = 167.

Cell Allocation = (141, 145, 149, 151, 157, 158, 165, 167, 187, 193, 200, 201, 202, 203, 235, 241).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using bit map 0 format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

A non-combined SDCCH is used.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated and camped on cell A.

#### Related PICS/PIXIT Statements

Supported rate(s) of TCH: TCH/EFR.

Support for MO calls.

Way to indicate alerting (only applicable if the MS supports the feature).

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

#### Foreseen Final State of the MS

"Idle, updated" with TMSI allocated and camped on cell B.

#### Test Procedure

The MS is made to initiate a speech call on Cell A. After the SS has sent the CALL PROCEEDING message the SS sends a HANDOVER COMMAND message, ordering the MS to switch to cell B. The MS shall then begin to send access bursts on the new DCCH to cell B. The SS observes the access bursts and after receiving n (n being arbitrarily chosen between values according to table 26.6-2 of subclause 26.6.5) access bursts, the SS sends one PHYSICAL INFORMATION message with an arbitrarily chosen Timing Advance. The MS shall activate the channel in sending and receiving mode. The MS shall establish a signalling link. The MS shall be ready to transmit a HANDOVER COMPLETE message before x ms after the end of the PHYSICAL INFORMATION message, but not before a UA frame has been sent by the SS. After the successful handover procedure the SS sends the ALERTING message. The correct alerting indication shall be given to the user (only applicable if the MS supports this feature). The SS sends the CONNECT message indicating that the call has been answered. The EFR speech channel shall be through connected in both directions. The MS shall send then the CONNECT ACKNOWLEDGE message as the response on the CONNECT message. Having reached the active state, the call is cleared by the SS.

The term "ready to transmit" is defined in 3GPP TS 04.13. The value of "x" depends upon the target channel and is specified in the specific message contents section.

#### Maximum Duration of Test

1 minute, including 30 s for any necessary operator actions.

## Expected Sequence

| Step | Direction | Message                 | Comments                                                                                                                                         |
|------|-----------|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | -----     | -----                   | A MO call is initiated on cell A.                                                                                                                |
| 2    | MS -> SS  | CHANNEL REQUEST         | Establishment cause is "originating call and the network does not set the NECI bit to 1".                                                        |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT    | See specific message contents.                                                                                                                   |
| 4    | MS -> SS  | CM SERVICE REQUEST      | CM Service Type = Mobile Originating Call Establishment.                                                                                         |
| 5    | SS -> MS  | AUTHENTICATION REQUEST  |                                                                                                                                                  |
| 6    | MS -> SS  | AUTHENTICATION RESPONSE | SRES specifies correct value.                                                                                                                    |
| 7    | SS -> MS  | CIPHERING MODE COMMAND  | SS starts deciphering after sending the message.                                                                                                 |
| 8    | MS -> SS  | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered.                                                                       |
| 9    | SS        |                         | SS starts ciphering.                                                                                                                             |
| 10   | MS -> SS  | SETUP                   | EFR speech                                                                                                                                       |
| 11   | SS -> MS  | CALL PROCEEDING         |                                                                                                                                                  |
| 12   | SS -> MS  | HANDOVER COMMAND        | See specific message contents.                                                                                                                   |
| 13   | MS -> SS  | HANDOVER ACCESS         | Repeated on every burst of the uplink main DCCH until reception of PHYSICAL INFORMATION. Handover Reference as included in the HANDOVER COMMAND. |
| 14   | SS -> MS  | PHYSICAL INFORMATION    | Sent after reception of n HANDOVER ACCESS message. Timing Advance is arbitrarily chosen.                                                         |
| 15   | MS -> SS  | SABM                    | Sent without information field.                                                                                                                  |
| 16   | SS -> MS  | UA                      |                                                                                                                                                  |
| 17   | MS -> SS  | HANDOVER COMPLETE       | This message shall be ready to be transmitted before "x" ms after the completion of step 14.                                                     |
| 18   | SS -> MS  | ALERTING                |                                                                                                                                                  |
| 19   | MS        |                         | Depending on the PICS, an alerting indication is given.                                                                                          |
| 20   | SS -> MS  | CONNECT                 |                                                                                                                                                  |
| 21   | MS -> SS  | CONNECT ACKNOWLEDGE     |                                                                                                                                                  |
| 22   | MS        |                         | The EFR speech channel is through connected in both directions.                                                                                  |
| 23   | SS -> MS  | DISCONNECT              |                                                                                                                                                  |
| 24   | MS -> SS  | RELEASE                 |                                                                                                                                                  |
| 25   | SS -> MS  | RELEASE COMPLETE        |                                                                                                                                                  |
| 26   | SS -> MS  | CHANNEL RELEASE         | The main signalling link is released.                                                                                                            |

| - Channel Type                                | TCH/F + ACCHs                                                                                                                        |
| - TDMA offset                                 | Chosen arbitrarily.                                                                                                                  |
| - Timeslot number                             | Chosen arbitrarily but not zero.                                                                                                     |
| - Training Sequence Code                      | Chosen arbitrarily.                                                                                                                  |
| - Hopping                                     | RF hopping channel.                                                                                                                  |
| - MAIO                                        | Chosen arbitrarily from the set (0, 1 to N-1), where N is the number of frequencies encoded in the Frequency List IE.                |
| - HSN                                         | Zero (this gives cyclic hopping).                                                                                                    |
| Synchronization Indication IE is not included |                                                                                                                                      |
| Frequency list after time                     |                                                                                                                                      |
| - Frequency List                              | Uses 128 range to allocate the following 15 frequencies (141, 145, 149, 151, 157, 158, 165, 187, 193, 200, 201, 202, 203, 235, 241). |
| Channel Mode IE                               | Speech (full rate version 2 or half rate version 2).                                                                                 |

Step 17: "x" = 500.

## 26.12.7 EFR Signalling / Directed Retry / Mobile Terminated Call

This test is applicable to all MS which support EFR speech.

NOTE: This test is derived from the one defined in subclause 26.9.8 and entitled "Directed Retry / MS originated call".

### 26.12.7.1 Conformance requirements

The MS shall correctly apply the Directed Retry procedure from SDCCH/8 with frequency hopping to TCH/EFR with frequency hopping and starting time in the non-synchronized case during call establishment. The call control entity of the Mobile Station in the "call delivered" state shall, if the MS supports immediate connect, continue the call establishment by through-connecting the EFR traffic channel in both directions, or if the MS does not support immediate connect, send an ALERTING message. The MS indicates acceptance of a MT call by sending CONNECT.

The mobile station shall attach the user connection at latest when sending the CONNECT message, except if there is no compatible radio resource available at this time. In this case the attachment shall be delayed until such a resource becomes available.

### 26.12.7.2 Test purpose

To test that when the MS is ordered to perform a non-synchronized handover after the CALL CONFIRM message, it continuously sends access bursts on the main DCCH until it receives a PHYSICAL INFORMATION message from the SS. To test that the MS correctly takes the values of the Timing Advance information element in the PHYSICAL INFORMATION message into account. To test that the MS activates the new channel correctly and transmits the HANDOVER COMPLETE message without undue delay. To test that the call control entity of the Mobile Station in the "call delivered" state, if the MS supports immediate connect, continues the call establishment by through-connecting the EFR traffic channel in both directions, or if the MS does not support immediate connect, sends an ALERTING message. To test that the MS indicates acceptance of a MT call by sending CONNECT.

To test that the mobile station attaches the user connection at latest when sending the CONNECT message, except if there is no compatible radio resource available at this time. To test that in this case the attachment is delayed until such a resource becomes available.

### 26.12.7.3 Method of test

#### Initial Conditions

System Simulator:

2 cells A and B with same LAI, default parameters, except:

GSM 450:

Cell A has:

BCCH ARFCN = 263.

Cell Allocation = (259, 261, 263, 265, 267, 269, 271, 273, 275, 277, 279, 281, 283, 285, 287, 289, 291).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

PLMN\_PERM = 00001010.

Cell B has:

BCCH ARFCN = 274.

Cell Allocation = (260, 262, 264, 266, 268, 270, 272, 274, 276, 279, 281, 283, 285, 287, 289, 291).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using Range 128 format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

A non-combined SDCCH is used.

GSM 480:

Cell A has:

BCCH ARFCN = 310.

Cell Allocation = (306, 308, 310, 312, 314, 316, 318, 320, 322, 324, 326, 328, 330, 332, 334, 336, 338).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

PLMN\_PERM = 00001010.

Cell B has:

BCCH ARFCN = 321.

Cell Allocation = (307, 309, 311, 313, 315, 317, 319, 321, 323, 326, 328, 330, 332, 334, 336, 338).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using Range 128 format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

A non-combined SDCCH is used.

GSM 900:

Cell A has:

BCCH ARFCN = 20.

Cell Allocation = (10, 17, 20, 26, 34, 42, 45, 46, 52, 59, 66, 73, 74, 75, 76, 108, 114).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

PLMN\_PERM = 00001010.

Cell B has:

BCCH ARFCN = 40.

Cell Allocation = (14, 18, 22, 24, 30, 31, 38, 40, 60, 66, 73, 74, 75, 76, 108, 114).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using bit map 0 format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

A non-combined SDCCH is used.

DCS 1 800:

Cell A has:

BCCH ARFCN = 747.

Cell Allocation = (734, 741, 747, 754, 759, 762, 766, 767, 773, 775, 779, 782, 791, 798, 829, 832, 844).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

PLMN\_PERM = 00001010.

Cell B has:

BCCH ARFCN = 764.

Cell Allocation = (739, 743, 746, 749, 756, 758, 761, 764, 771, 779, 782, 791, 798, 829, 832, 844).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using Range 512 format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

A non combined SDCCH is used.

PCS 1 900:

Cell A has:

BCCH ARFCN = 647.

Cell Allocation = (634, 641, 647, 654, 659, 662, 666, 667, 673, 675, 679, 682, 691, 698, 729, 732, 744).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

PLMN\_PERM = 00001010.

Cell B has:

BCCH ARFCN = 664.

Cell Allocation = (639, 643, 646, 649, 656, 658, 661, 664, 671, 679, 682, 691, 698, 729, 732, 744).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using Range 512 format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

A non combined SDCCH is used.

GSM 700:

Cell A has:

BCCH ARFCN = 457.

Cell Allocation = (447, 454, 457, 463, 471, 479, 482, 483, 489, 496, 498, 500, 501, 502, 503, 506, 508).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

PLMN\_PERM = 00001010.

Cell B has:

BCCH ARFCN = 477.

Cell Allocation = (451, 455, 459, 461, 467, 468, 475, 477, 497, 498, 500, 501, 502, 503, 506, 508).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using 128 range format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

A non-combined SDCCH is used.

GSM 850:

Cell A has:

BCCH ARFCN = 147.

Cell Allocation = (137, 144, 147, 153, 161, 169, 172, 173, 179, 186, 193, 200, 201, 202, 203, 235, 241).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

PLMN\_PERM = 00001010.

Cell B has:

BCCH ARFCN = 167.

Cell Allocation = (141, 145, 149, 151, 157, 158, 165, 167, 187, 193, 200, 201, 202, 203, 235, 241).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using 128 range format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

A non-combined SDCCH is used.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated and camped on cell A.

Related PICS/PIXIT Statements

Supported rate(s) of TCH: TCH/EFR.

Support for MT calls.

Way to indicate alerting (only applicable if the MS supports the feature).

Way to make the MS accept an incoming call after alerting.

Immediate connect supported (Y/N).

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

## Foreseen Final State of the MS

"Idle, updated" with TMSI allocated and camped on cell B.

## Test Procedure

The MS is paged on Cell A. The MS responds to the PAGING REQUEST message and establishes a mobile terminated speech call on Cell A. If the MS supports immediate connect, it continues the call establishment by through-connecting the traffic channel in both directions, or if the MS does not support immediate connect, it sends an ALERTING message. The MS indicates acceptance of a MT call by sending CONNECT.

After the MS has sent the CALL CONFIRMED message (if the MS supports immediate connect then the MS sends the CONNECT message after the CALL CONFIRMED message on the old channel) the SS sends a HANDOVER COMMAND message, ordering the MS to switch to cell B. The MS shall then begin to send access bursts on the new DCCH to cell B. The SS observes the access bursts and after receiving  $n$  ( $n$  being arbitrarily chosen between values according to table 26.6-2 of subclause 26.6.5) access bursts, the SS sends one PHYSICAL INFORMATION message with an arbitrarily chosen Timing Advance. The MS shall activate the channel in sending and receiving mode. The MS shall establish a signalling link. The MS shall be ready to transmit a HANDOVER COMPLETE message before  $x$  ms after the end of the PHYSICAL INFORMATION message, but not before a UA frame has been sent by the SS. After the successful handover procedure the MS sends the ALERTING message (if the MS runs the immediate connect procedure then the MS does not send an ALERTING message). The correct alerting indication shall be given to the user (only applicable if the MS supports the feature or if the MS is not using the immediate connect procedure). After the MS sent the CONNECT message the EFR speech channel shall be through connected in both directions. The SS sends then the CONNECT ACKNOWLEDGE message as the response on the CONNECT message. Having reached the active state, the call is cleared by the SS.

The term "ready to transmit" is defined in 3GPP TS 04.13. The value of " $x$ " depends upon the target channel and is specified in the specific message contents section.

## Maximum Duration of Test

1 minute, including 30 s for any necessary operator actions.

## Expected Sequence

| Step | Direction | Message                 | Comments                                                                                                                                                                                                                                                                                                                                                  |

## 26.13 Multislot signalling

### 26.13.1 Multislot signalling / RR

#### 26.13.1.1 Multislot signalling / RR / Measurement

##### 26.13.1.1.1 Multislot signalling / RR / Measurement / symmetric

This test is applicable to all MS that supports multislot configuration.

##### 26.13.1.1.1.1 Conformance requirements

The MS shall continuously send MEASUREMENT REPORT messages, on every uplink HSCSD channel used, on every SACCH blocks and the measurement valid indication shall be set to valid (0) within the second block at the latest. After 20 s the values in the MEASUREMENT REPORT message shall contain measurement results for the 4 strongest BCCH carriers with known and allowed NCC part of BSIC.

#### References

3GPP TS 04.08 / 3GPP TS 44.018, subclauses 3.4.1.2 and 9.1.21.

3GPP TS 05.08, subclause 8.4.

##### 26.13.1.1.1.2 Test purpose

- 1) To test that, when a combination of normal neighbours, and non-permitted NCCs is "on air", the MS reports only on normal neighbours and that in symmetric HSCSD configuration the neighbouring cell measurement reports are copied on every uplink HSCSD channel used.

##### 26.13.1.1.1.3 Method of test

#### Initial Conditions

#### System Simulator:

For GSM 450 or GSM 480: 8 cells with the following settings:

| Transmitter   | Level | NCC | BSCC | ARFCN<br>(GSM 450) | ARFCN<br>(GSM 480) | Cell Identity |
|---------------|-------|-----|------|--------------------|--------------------|---------------|
| Serving, S1   | -60   | 1   | 3    | 260                | 307                | 0001H         |
| Neighbour, N1 | -85   | 1   | 5    | 264                | 311                | 0002H         |
| Neighbour, N2 | -80   | 1   | 7    | 268                | 315                | 0003H         |
| Neighbour, N3 | -75   | 2   | 1    | 272                | 319                | 0004H         |
| Neighbour, N4 | -55   | 3   | 3    | 276                | 323                | 0005H         |
| Neighbour, N5 | -50   | 4   | 5    | 280                | 327                | 0006H         |
| Neighbour, N6 | -45   | 1   | 7    | 284                | 331                | 0007H         |
| Neighbour, N7 | -40   | 1   | 1    | 288                | 335                | 0008H         |

For GSM 900 or DCS 1 800: 8 cells with the following settings:

| Transmitter   | Level | NCC | BSCC | ARFCN<br>(GSM 900) | ARFCN<br>(DCS 1 800) | Cell Identity |
|---------------|-------|-----|------|--------------------|----------------------|---------------|
| Serving, S1   | -60   | 1   | 3    | 002                | 514                  | 0001H         |
| Neighbour, N1 | -85   | 1   | 5    | 008                | 530                  | 0002H         |
| Neighbour, N2 | -80   | 1   | 7    | 014                | 602                  | 0003H         |
| Neighbour, N3 | -75   | 2   | 1    | 020                | 665                  | 0004H         |
| Neighbour, N4 | -55   | 3   | 3    | 026                | 762                  | 0005H         |
| Neighbour, N5 | -50   | 4   | 5    | 032                | 686                  | 0006H         |
| Neighbour, N6 | -45   | 1   | 7    | 038                | 549                  | 0007H         |
| Neighbour, N7 | -40   | 1   | 1    | 044                | 810                  | 0008H         |

For GSM 700 or GSM 850: 8 cells with the following settings:

| Transmitter   | Level | NCC | BSCC | ARFCN<br>(GSM 700) | ARFCN<br>(GSM 850) | Cell Identity |
|---------------|-------|-----|------|--------------------|--------------------|---------------|
| Serving, S1   | -60   | 1   | 3    | 439                | 129                | 0001H         |
| Neighbour, N1 | -85   | 1   | 5    | 445                | 135                | 0002H         |
| Neighbour, N2 | -80   | 1   | 7    | 451                | 141                | 0003H         |
| Neighbour, N3 | -75   | 2   | 1    | 457                | 147                | 0004H         |
| Neighbour, N4 | -55   | 3   | 3    | 463                | 153                | 0005H         |
| Neighbour, N5 | -50   | 4   | 5    | 469                | 159                | 0006H         |
| Neighbour, N6 | -45   | 1   | 7    | 475                | 165                | 0007H         |
| Neighbour, N7 | -40   | 1   | 1    | 481                | 171                | 0008H         |

With the exception of the Cell Allocation, the rest of the parameters for all eight cells are the same as the default settings and default SYSTEM INFORMATION TYPE 1 to 4 message contents for cell A. The Cell Allocation for the serving cell is the same as the default setting for cell A. The Cell Allocations for the neighbour cells need have only one entry, consisting of the ARFCN of that cell's BCCH.

Mobile Station:

The MS is in the active state of a service using symmetric multislots connection.

Related PICS/PIXIT Statements

- Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800).
- Multislots class.
- Supported teleservices/bearer services.

Foreseen Final State of the MS

Active state of a service using symmetric multislots connection.

Test Procedure

This test procedure is repeated for all the symmetric multislots configurations MS supports.

With the MS having a multislots connection in progress, the SS sends SYSTEM INFORMATION TYPE 5 & 6 on the SACCH/M. All 7 of the BCCHs "on air" are indicated in the BA (N1 is excluded). The MS shall send MEASUREMENT REPORTs back to the SS on every uplink HSCSD channel, and it shall be indicated in these that measurement results for the 4 strongest carriers have been obtained.

Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

## Expected Sequence

SYSTEM INFORMATION TYPE 5, SYSTEM INFORMATION TYPE 6 and MEASUREMENT REPORT are sent continuously, a table is not applicable in this test. The interval between 2 successive Layer 2 frames containing MEASUREMENT REPORTs shall not exceed one Layer 2 frame.

## Specific Message Contents

This message shall contain one report on each of N7, N6, S1 and N2.

GSM 850 end:

NOTE 1: These actual values are not checked.

NOTE 2: The Measurement Valid Indication shall be set to valid within the second SACCH block at the latest.

### 26.13.1.1.2 Multislot signalling / RR / Measurement / asymmetric

This test is applicable to all MS that supports multislot configuration.

## 26.13.1.1.2.1 Conformance requirements

The MS shall continuously send MEASUREMENT REPORT messages, on every uplink HSCSD channel used, on every SACCH blocks and the measurement valid indication shall be set to valid (0) within the second block at the latest. After 20 s the values in the MEASUREMENT REPORT message shall contain measurement results for the 4 strongest BCCH carriers with known and allowed NCC part of BSIC.

## References

3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.4.1.2 and 9.1.21.

3GPP TS 05.08 subclause 8.4.

## 26.13.1.1.2.2 Test purpose

- 1) To test that, when a combination of normal neighbours, barred cells and non-permitted NCCs is "on air", the MS reports only on normal neighbours and that in asymmetric HSCSD configuration the neighbouring cell measurement reports are copied on every uplink HSCSD channel used.

## 26.13.1.1.2.3 Method of test

## Initial Conditions

## System Simulator:

For GSM 450 or GSM 480: 8 cells with the following settings:

| Transmitter   | Level | NCC | BSCC | ARFCN<br>(GSM 450) | ARFCN<br>(GSM 480) | Cell Identity |
|---------------|-------|-----|------|--------------------|--------------------|---------------|
| Serving, S1   | -60   | 1   | 3    | 260                | 307                | 0001H         |
| Neighbour, N1 | -85   | 1   | 5    | 264                | 311                | 0002H         |
| Neighbour, N2 | -80   | 1   | 7    | 268                | 315                | 0003H         |
| Neighbour, N3 | -75   | 2   | 1    | 272                | 319                | 0004H         |
| Neighbour, N4 | -55   | 3   | 3    | 276                | 323                | 0005H         |
| Neighbour, N5 | -50   | 4   | 5    | 280                | 327                | 0006H         |
| Neighbour, N6 | -45   | 1   | 7    | 284                | 331                | 0007H         |
| Neighbour, N7 | -40   | 1   | 1    | 288                | 335                | 0008H         |

For GSM 900 or DCS 1 800: 8 cells with the following settings:

| Transmitter   | Level | NCC | BSCC | ARFCN<br>(GSM 900) | ARFCN<br>(DCS 1 800) | Cell Identity |
|---------------|-------|-----|------|--------------------|----------------------|---------------|
| Serving, S1   | -60   | 1   | 3    | 002                | 514                  | 0001H         |
| Neighbour, N1 | -85   | 1   | 5    | 008                | 530                  | 0002H         |
| Neighbour, N2 | -80   | 1   | 7    | 014                | 602                  | 0003H         |
| Neighbour, N3 | -75   | 2   | 1    | 020                | 665                  | 0004H         |
| Neighbour, N4 | -55   | 3   | 3    | 026                | 762                  | 0005H         |
| Neighbour, N5 | -50   | 4   | 5    | 032                | 686                  | 0006H         |

For GSM 700 or GSM 850: 8 cells with the following settings:

| Transmitter   | Level | NCC | BSCC | ARFCN<br>(GSM 700) | ARFCN<br>GSM 850) | Cell Identity |
|---------------|-------|-----|------|--------------------|-------------------|---------------|
| Serving, S1   | -60   | 1   | 3    | 439                | 129               | 0001H         |
| Neighbour, N1 | -85   | 1   | 5    | 445                | 135               | 0002H         |
| Neighbour, N2 | -80   | 1   | 7    | 451                | 141               | 0003H         |
| Neighbour, N3 | -75   | 2   | 1    | 457                | 147               | 0004H         |
| Neighbour, N4 | -55   | 3   | 3    | 463                | 153               | 0005H         |
| Neighbour, N5 | -50   | 4   | 5    | 469                | 159               | 0006H         |
| Neighbour, N6 | -45   | 1   | 7    | 475                | 165               | 0007H         |
| Neighbour, N7 | -40   | 1   | 1    | 481                | 171               | 0008H         |

With the exception of the Cell Allocation, the rest of the parameters for all eight cells are the same as the default settings and default SYSTEM INFORMATION TYPE 1 to 4 message contents for cell A. The Cell Allocation for the serving cell is the same as the default setting for cell A. The Cell Allocations for the neighbour cells need have only one entry, consisting of the ARFCN of that cell's BCCH.

#### Mobile Station:

The MS is in the active state of a service using asymmetric multislot connection.

#### Related PICS/PIXIT Statements

- Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800).
- Multislot class.
- Supported teleservices/bearer services.

#### Foreseen Final State of the MS

Active state of a service using asymmetric multislot connection.

#### Test Procedure

This test procedure is performed twice.

MS having a multislot connection with maximum number of timeslots in the downlink and one slot in uplink direction in progress, the SS sends SYSTEM INFORMATION TYPE 5 & 6 (on the second iteration of the test two timeslots are used in the downlink and one in uplink direction the SS also sends SYSTEM INFORMATION TYPE 5bis) on the SACCH/M. All 7 of the BCCHs "on air" are indicated in the BA (N1 is excluded). The MS shall send MEASUREMENT REPORTs back to the SS on every uplink HSCSD channel, and it shall be indicated in these that measurement results for the 4 strongest carriers have been obtained.

#### Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

#### Expected Sequence

This sequence is performed for execution counter,  $k = 1, 2$ .

Since when  $k = 1$ , SYSTEM INFORMATION TYPE 5, SYSTEM INFORMATION TYPE 6 and MEASUREMENT REPORT (and when  $k = 2$  an additional SYSTEM INFORMATION TYPE 5bis is included) are sent continuously, a table is not applicable in this test. The interval between 2 successive Layer 2 frames containing MEASUREMENT REPORTs shall not exceed one Layer 2 frame.

This message shall contain one report on each of N7, N6, S1 and N2.

GSM 850 end:

NOTE 1: These actual values are not checked.

NOTE 2: The Measurement Valid Indication shall be set to valid within the second SACCH block at the latest.

### 26.13.1.1.3 Multislot signaling / RR / Measurement / asymmetric / change of the reported subchannel

This test is applicable to all MS that supports multislot configuration.

## 26.13.1.1.3.1 Conformance requirements

The MS shall continuously send MEASUREMENT REPORT messages, on the main channel, reporting the worst subchannel. One of the other subchannels is made worse than the one originally reported one and the MEASUREMENT REPORTs sent on the main channel are based on the new worst subchannel.

## References

3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.4.1.2 and 9.1.21.

3GPP TS 05.08 subclause 8.4.

## 26.13.1.1.3.2 Test purpose

- 1) To test that the MS shall report on the main SACCH: RXLEV\_FULL and RXLEV\_SUB from the main channel and the worst RXQUAL\_FULL values and RXQUAL\_SUB values from the main channel and the unidirectional channels.
- 2) To test that, when an another subchannel becomes the worst, MEASUREMENT REPORTs sent on the main channel are based on the new worst subchannel.

## 26.13.1.1.3.3 Method of test

## Initial Conditions

System Simulator:

For GSM 450 or GSM 480: 1 cell with the following settings:

| Transmitter | Level | NCC | BCC | ARFCN<br>(GSM 450) | ARFCN<br>(GSM 480) | Cell Identity |
|-------------|-------|-----|-----|--------------------|--------------------|---------------|
| Serving, S1 | -60   | 1   | 3   | 260                | 307                | 0001H         |

For GSM 900 or DCS 1 800: 1 cell with the following settings:

| Transmitter | Level | NCC | BCC | ARFCN<br>(GSM 900) | ARFCN<br>(DCS 1 800) | Cell Identity |
|-------------|-------|-----|-----|--------------------|----------------------|---------------|
| Serving, S1 | -60   | 1   | 3   | 002                | 514                  | 0001H         |

For GSM 700 or GSM 850: 1 cell with the following settings:

| Transmitter | Level | NCC | BCC | ARFCN<br>(GSM 700) | ARFCN<br>(GSM 850) | Cell Identity |
|-------------|-------|-----|-----|--------------------|--------------------|---------------|
| Serving, S1 | -60   | 1   | 3   | 439                | 129                | 0001H         |

Mobile Station:

The MS is in the active state of a service using asymmetric multislot connection.

## Related PICS/PIXIT Statements

- Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800).
- Multislot class.
- Supported teleservices/bearer services.

## Foreseen Final State of the MS

Active state of a service using asymmetric multislot connection.

## Test Procedure

MS having a multislot connection with maximum number of timeslots in the downlink and one slot in uplink direction in progress, the SS sends SYSTEM INFORMATION TYPE 5 & 6 on the SACCH/M. The MS shall send MEASUREMENT REPORTs back to the SS on the main channel based on the worst subchannel. The SS allows 2 seconds for the MS to get used to the RF conditions and then records the reported RXQUAL\_FULL\_SERVING\_CELL and RXQUAL\_SUB\_SERVING\_CELL values.

Then an arbitrarily chosen uni-directional subchannel is made the worst from the RX quality point of view by switching off the ciphering in the SS on this channel. The MS shall send MEASUREMENT REPORTs back to the SS on the main channel based on the new worst channel. The SS allows 2 seconds for the MS to get used to the new RF conditions and then records the reported RXQUAL\_FULL\_SERVING\_CELL and RXQUAL\_SUB\_SERVING\_CELL values.

The difference between the RXQUAL values recorded before and after the change in RX quality shall be greater than 3.

## Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

## Expected Sequence

Since SYSTEM INFORMATION TYPE 5, SYSTEM INFORMATION TYPE 6 and MEASUREMENT REPORT are sent continuously, a table is not applicable in this test. The interval between 2 successive Layer 2 frames containing MEASUREMENT REPORTs shall not exceed one Layer 2 frame.

NOTE 1: These actual values are not checked.

NOTE 2: The Measurement Valid Indication shall be set to valid within the second SACCH block at the latest.

## 26.13.1.2 Multislot signalling / RR / Dedicated assignment

### 26.13.1.2.1 Multislot signalling / RR / Dedicated assignment / successful case

This test is applicable to all MS that supports multislot configuration.

#### 26.13.1.2.1.1 Conformance requirements

- 1) Upon receipt of the ASSIGNMENT COMMAND message, the mobile station initiates a local end release of link layer connections, disconnects the physical channels, commands the switching to the assigned channels and initiates the establishment of lower layer connections (this includes the activation of the channels, their connection and the establishment of the main signalling links).
- 2) MM-messages and CM-messages using SAPI=0 sent from the mobile station to the network can be duplicated by the data link layer in the following case:
  - a channel change of dedicated channels is required (assignment or handover procedure) and the last layer 2 frame has not been acknowledged by the peer data link layer before the mobile station leaves the old channel;
  - in this case, the mobile station does not know whether the network has received the message correctly. Therefore, the mobile station has to send the message again after the new dedicated channel is established.
- 3) The MS shall establish the link with the power level specified in the ASSIGNMENT COMMAND message.

The MS shall confirm the power control level that it is currently employing in the uplink SACCH L1 header. The indicated value shall be the power control level actually used by the mobile for the last burst of the previous SACCH period.
- 4) The MS shall apply the hopping frequencies specified in ASSIGNMENT COMMAND message in the Mobile Allocation IE or the Frequency List IE at the time of accessing the new channel using the last received Cell Allocation.
- 5) After receipt of the ASSIGNMENT COMMAND the MS shall perform the assignment and return an ASSIGNMENT COMPLETE without undue delay.

#### References

- Conformance requirements 1), 4) 3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.4.3 and 9.1.2.
- Conformance requirements 2) 3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.1.4.3.
- Conformance requirements 3) 3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.4.3 and 9.1.2;  
3GPP TS 05.08, subclause 4.2.
- Conformance requirements 5) 3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.4.3 and 9.1.3,  
3GPP TS 04.13 subclause 5.2.4.

#### 26.13.1.2.1.2 Test purpose

- 1) To verify that upon receipt of an ASSIGNMENT COMMAND, the MS switches to the channel(s) defined in the ASSIGNMENT COMMAND, establishes the link and sends an ASSIGNMENT COMPLETE message. This is tested for an MS supporting TCH and multislot configuration in the special cases of a transition.
  - 1.1) from non-hopping SDCCH to hopping multislot configuration;
  - 1.2) from hopping multislot configuration to non-hopping multislot configuration;
  - 1.3) from non-hopping multislot configuration to hopping multislot configuration;

- 1.4) from hopping symmetric multislot configuration to hopping asymmetric multislot configuration, resource upgrading used;

NOTE: The step 1.5 is applicable to all MS that supports multislot configuration  $T_x > 1$  and  $Sum > 3$ .

- 1.5) from hopping asymmetric multislot configuration to hopping symmetric multislot configuration;
  - 1.6) from hopping multislot configuration to non-hopping multislot configuration, resources downgrading to one TCH/F;
  - 1.7) from non-hopping multislot configuration with one TCH/F to non-hopping multislot configuration, resource upgrading used;
  - 1.8) from non-hopping multislot configuration to hopping multislot configuration, relocating all channels in multislot configuration call without changing the number of TCH/Fs allocated;
  - 1.9) from hopping multislot configuration to non-hopping multislot configuration, partially relocating the channels in multislot configuration call without changing the number of TCH/Fs allocated;
  - 1.10) from non-hopping multislot configuration to hopping multislot configuration, resource downgrading to one TCH/F;
- 2) To verify that an MS supporting TCH and multislot configuration, having sent a MM- or CM message that was not acknowledged on L2 before the channel assignment procedure was initiated and before the MS has left the old channel, repeats that message after completion of the assignment procedure without incrementing N(SD). This is tested in the special case of MM message AUTHENTICATION RESPONSE.
  - 3) To verify that an MS supporting TCH and multislot configuration, having received an ASSIGNMENT COMMAND, having sent an SABM frame to establish the main signalling link on the assigned main channel of the multislot configuration, reports the power level(s) specified in the ASSIGNMENT COMMAND message, in the uplink SACCH L1 header of the SACCH message sent in the SACCH period following the transmission of the SABM frame.
  - 4) To verify that an MS supporting TCH and multislot configuration, having received an ASSIGNMENT COMMAND, is able in the case of frequency hopping to decode the Mobile Allocation and Frequency List IEs correctly and applies the specified frequencies using the correct Cell Allocation.
  - 5) To verify that after receipt of the ASSIGNMENT COMMAND the MS returns an ASSIGNMENT COMPLETE without undue delay.

#### 26.13.1.2.1.3 Method of test

##### Initial Conditions

System Simulator:

- 1 cell, default parameters except:
  - Early classmark sending enabled in SI3 rest octets.

GSM 450:

- BCCH ARFCN =263.
- Throughout the test, the CA broadcast in System Information 1 is (259, 261, 263, 265, 267, 269, 271, 273, 275, 277).
- Note that the actual CA of the cell contains other frequencies.

GSM 480:

- BCCH ARFCN =310.
- Throughout the test, the CA broadcast in System Information 1 is (306, 308, 310, 312, 314, 316, 318, 320, 322, 324).

- Note that the actual CA of the cell contains other frequencies.

#### GSM 900:

- BCCH ARFCN =20.
- Throughout the test, the CA broadcast in System Information 1 is (10, 17, 20, 26, 34, 42, 45, 46, 52, 59).
- Note that the actual CA of the cell contains other frequencies.

#### DCS 1 800:

- BCCH ARFCN =747.
- Throughout the test, the CA broadcast in System Information 1 is (734, 741, 747, 754, 759, 766, 773, 775, 779, 782).
- Note that the actual CA of the cell contains other frequencies.

#### GSM 700:

- BCCH ARFCN =457.
- Throughout the test, the CA broadcast in System Information 1 is (447, 454, 457, 463, 471, 479, 482, 483, 489, 496).
- Note that the actual CA of the cell contains other frequencies.

#### GSM 850:

- BCCH ARFCN =147.
- Throughout the test, the CA broadcast in System Information 1 is (137, 144, 147, 153, 161, 169, 172, 173, 179, 186).
- Note that the actual CA of the cell contains other frequencies.

#### Mobile Station:

- The MS is in the "idle, updated" state with a TMSI allocated.

#### Related PICS/PIXIT Statements

- Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800).
- Multislot class.
- Classmark.

#### Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

#### Test Procedure

The SS pages the MS and allocates an SDCCH. Each time the MS shall switch to the assigned channel, establish the link and send an ASSIGNMENT COMPLETE message.

Then the SS sends an AUTHENTICATION REQUEST message. The MS shall answer with an AUTHENTICATION RESPONSE message, which is not acknowledged on L2 by the SS. Immediately after the AUTHENTICATION RESPONSE message is received, the SS sends an ASSIGNMENT COMMAND. The MS shall switch to the assigned channel, establish the link with the commanded power level and send as ASSIGNMENT COMPLETE message. Then MS shall repeat the AUTHENTICATION RESPONSE message, with the same N(SD) value.

Then the SS sends an ASSIGNMENT COMMAND, which includes a Starting Time IE. The MS shall react as specified above, but this shall be done at the time specified in Starting Time IE.

The SS initiates the channel release procedure and the main signalling link is released.

#### Maximum Duration of Test

30 s.

#### Expected Sequence

| Step         | Direction                                                                                                              | Message                 | Comments                                                                                                                                                                  |
|--------------|------------------------------------------------------------------------------------------------------------------------|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Step 9

## ASSIGNMENT COMMAND

|                                |                                                                                                                      |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------|
| Channel Description 2          |                                                                                                                      |
| - Channel Type and TDMA offset | 10XXX (Maximum number of possible additional bidirectional TCH/Fs and SACCH/Ms subtracted by one, minimum being one) |
| - Timeslot Number              | A suitable value for multislot configuration, chosen arbitrarily                                                     |
| - Training Sequence Code       | Chosen arbitrarily                                                                                                   |
| - Hopping                      | Single RF Channel                                                                                                    |
| - ARFCN                        | the ARFCN of the BCCH carrier                                                                                        |
| Power Command                  |                                                                                                                      |
| - Power level                  | Chosen arbitrarily but with a changed value.                                                                         |
| Frequency list IE              | Not Included                                                                                                         |
| Cell Channel Description       | Use Range 128 to encode (271, 273, 275, 277, 279, 281, 283, 285, 287, 289, 291)                                      |
| Channel Mode                   |                                                                                                                      |
| - Mode                         | Data, 12.0 kbit/s radio interface rate                                                                               |
| Mobile Allocation              | Not included                                                                                                         |
| Starting Time                  | Not included                                                                                                         |

## Step 11

## ASSIGNMENT COMMAND

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description 2          |                                                                                                                 |
| - Channel Type and TDMA offset | 00000                                                                                                           |
| - Timeslot Number              | A suitable value for multislot configuration, chosen arbitrarily                                                |
| - Training Sequence Code       | Chosen arbitrarily                                                                                              |
| - Hopping                      | RF hopping channel                                                                                              |
| - MAIO                         | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - HSN                          | Chosen arbitrarily from the set (1 to 63)                                                                       |
| Power Command                  |                                                                                                                 |
| - Power level                  | Chosen arbitrarily but with a changed value.                                                                    |
| Frequency list IE              | Not included                                                                                                    |
| Cell Channel Description       | Not included                                                                                                    |
| Multislot allocation           |                                                                                                                 |
| - Downlink assignment          | Appropriate for the test. Depending on Multislot class, Shall not have maximum number of timeslots.             |
| - Uplink assignment            | Appropriate for the test, but as many as in downlink assignment                                                 |
| - Channel set X (1=<X<=8)      | Appropriate for the test                                                                                        |

| Channel Mode<br>- Mode                                  | Data, 12.0 kbit/s radio interface rate                                                                          |
| Mobile Allocation                                       | Indicate frequencies (273, 281, 283)                                                                            |
| Starting Time                                           | Not included                                                                                                    |

## Step 25

## ASSIGNMENT COMMAND

|                                                         |                                                                                 |
|---------------------------------------------------------|---------------------------------------------------------------------------------|
| Channel Description 2<br>- Channel Type and TDMA offset | 00000                                                                           |
| - Timeslot Number                                       | Same as in step 19                                                              |
| - Training Sequence Code                                | Chosen arbitrarily                                                              |
| - Hopping                                               | Single RF Channel                                                               |
| - ARFCN                                                 | the ARFCN of the BCCH carrier                                                   |
| Power Command<br>- Power level                          | Chosen arbitrarily but with a changed value.                                    |
| Frequency list IE                                       | Not Included                                                                    |
| Cell Channel Description                                | Use Range 128 to encode (271, 273, 275, 277, 279, 281, 283, 285, 287, 289, 291) |
| Multislot allocation<br>- Downlink assignment           | Indicate same timeslots as step 19.                                             |
| - Uplink assignment                                     | Appropriate for the test according to MS Class described in Annex B 05.02.      |
| - Channel set X (1=<X<=8)                               | Appropriate for the test                                                        |
| Channel Mode<br>- Mode                                  | Data, 12.0 kbit/s radio interface rate                                          |
| Mobile Allocation                                       | Not included                                                                    |
| Starting Time                                           | Not included                                                                    |

## Step 28

## ASSIGNMENT COMMAND

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Step 6

## ASSIGNMENT COMMAND

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description 2          |                                                                                                                 |
| - Channel Type and TDMA offset | 00000                                                                                                           |
| - Timeslot Number              | A suitable value for multislot configuration, chosen arbitrarily                                                |
| - Training Sequence Code       | Chosen arbitrarily                                                                                              |
| - Hopping                      | RF hopping channel                                                                                              |
| - MAIO                         | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - HSN                          | Chosen arbitrarily from the set (1 to 63)                                                                       |
| Power Command                  |                                                                                                                 |
| - Power level                  | Chosen arbitrarily but with a changed value.                                                                    |
| Frequency list IE              | Not included                                                                                                    |
| Multislot allocation           |                                                                                                                 |
| - Downlink assignment          | Maximum number of timeslots supported by the MS                                                                 |
| - Uplink assignment            | Maximum number of timeslots supported by the MS after specifying Downlink timeslots                             |
| - Channel set X (1=<X<=8)      | Appropriate for the test                                                                                        |
| Channel Mode                   |                                                                                                                 |
| - Mode                         | Data, 12.0 kbit/s radio interface rate                                                                          |
| Mobile Allocation              | Indicates all of the CA (broadcast on the BCCH) except for the BCCH carrier.                                    |
| Starting Time                  | Not included                                                                                                    |

## Step 9

## ASSIGNMENT COMMAND

|                                |                                                                                                                      |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------|
| Channel Description 2          |                                                                                                                      |
| - Channel Type and TDMA offset | 10XXX (Maximum number of possible additional bidirectional TCH/Fs and SACCH/Ms subtracted by one, minimum being one) |
| - Timeslot Number              | A suitable value for multislot configuration, chosen arbitrarily                                                     |
| - Training Sequence Code       | Chosen arbitrarily                                                                                                   |
| - Hopping                      | Single RF Channel                                                                                                    |
| - ARFCN                        | the ARFCN of the BCCH carrier                                                                                        |
| Power Command                  |                                                                                                                      |
| - Power level                  | Chosen arbitrarily but with a changed value.                                                                         |
| Frequency list IE              | Not Included                                                                                                         |
| Cell Channel Description       | Use Range 128 to encode (318, 320, 322, 324, 326, 328, 330, 332, 334, 336, 338)                                      |
| Channel Mode                   |                                                                                                                      |
| - Mode                         | Data, 12.0 kbit/s radio interface rate                                                                               |
| Mobile Allocation              | Not included                                                                                                         |
| Starting Time                  | Not included                                                                                                         |

## Step 11

## ASSIGNMENT COMMAND

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description 2          |                                                                                                                 |
| - Channel Type and TDMA offset | 00000                                                                                                           |
| - Timeslot Number              | A suitable value for multislot configuration, chosen arbitrarily                                                |
| - Training Sequence Code       | Chosen arbitrarily                                                                                              |
| - Hopping                      | RF hopping channel                                                                                              |
| - MAIO                         | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - HSN                          | Chosen arbitrarily from the set (1 to 63)                                                                       |
| Power Command                  |                                                                                                                 |
| - Power level                  | Chosen arbitrarily but with a changed value.                                                                    |
| Frequency list IE              | Not included                                                                                                    |
| Cell Channel Description       | Not included                                                                                                    |
| Multislot allocation           |                                                                                                                 |
| - Downlink assignment          | Appropriate for the test. Depending on Multislot class, Shall not have maximum number of timeslots.             |
| - Uplink assignment            | Appropriate for the test, but as many as in downlink assignment                                                 |
| - Channel set X (1= $X$ ≤8)    | Appropriate for the test                                                                                        |
| Channel Mode                   |                                                                                                                 |
| - Mode                         | Data, 12.0 kbit/s radio interface rate                                                                          |
| Mobile Allocation              | Indicates frequencies (318, 320, 328, 330, 332, 334, 336, 338)                                                  |
| Starting Time                  | Not included                                                                                                    |

## Step 13

## ASSIGNMENT COMMAND

|                                |                                                                                                                                                                                        |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Channel Description 2          |                                                                                                                                                                                        |
| - Channel Type and TDMA offset | 11XXX<br>(Appropriate number of additional unidirectional TCH/FDs and SACCH/MDs<br>or<br>Additional bidirectional TCH/F and SACCH/M and additional unidirectional TCH/FD and SACCH/MD) |
| - Timeslot Number              | Number of downlink timeslots shall be more than in step 11)<br>A suitable value for multislot configuration, chosen arbitrarily                                                        |
| - Training Sequence Code       | Chosen arbitrarily                                                                                                                                                                     |
| - Hopping                      | RF hopping channel                                                                                                                                                                     |
| - MAIO                         | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE.                                                                        |
| - HSN                          | Chosen arbitrarily from the set (1 to 63)                                                                                                                                              |
| Power Command                  |                                                                                                                                                                                        |

| - Downlink assignment          | Appropriate for the test. Must be more than one.                                                                |
| - Uplink assignment            | Appropriate for the test, but as many as in downlink direction.                                                 |
| - Channel set X (1=<X<=8)      | Appropriate for the test                                                                                        |
| Channel Mode                   |                                                                                                                 |
| - Mode                         | Data, 12.0 kbit/s radio interface rate                                                                          |
| Mobile Allocation              | Indicates frequencies (318, 320, 328, 330, 332, 334, 336, 338)                                                  |
| Starting Time                  | Not included                                                                                                    |

## Step 17

## ASSIGNMENT COMMAND

|                                |                                                                                 |
|--------------------------------|---------------------------------------------------------------------------------|
| Channel Description 2          |                                                                                 |
| - Channel Type and TDMA offset | 10000 (no additional timeslots)                                                 |
| - Timeslot Number              | A suitable value for multislot configuration, chosen arbitrarily                |
| - Training Sequence Code       | Chosen arbitrarily                                                              |
| - Hopping                      | Single RF Channel                                                               |
| - ARFCN                        | the ARFCN of the BCCH carrier                                                   |
| Power Command                  |                                                                                 |
| - Power level                  | Chosen arbitrarily but with a changed value.                                    |
| Frequency list IE              | Not Included                                                                    |
| Cell Channel Description       | Use Range 128 to encode (318, 320, 322, 324, 326, 328, 330, 332, 334, 336, 338) |
| Channel Mode                   |                                                                                 |
| - Mode                         | Data, 12.0 kbit/s radio interface rate                                          |
| Mobile Allocation              | Not included                                                                    |
| Starting Time                  | Not included                                                                    |

## Step 19

## ASSIGNMENT COMMAND

|                                |                                                                                           |
|--------------------------------|-------------------------------------------------------------------------------------------|
| Channel Description 2          | 00000                                                                                     |
| - Channel Type and TDMA offset | A suitable value for multislot configuration, chosen arbitrarily                          |
| - Timeslot Number              | Chosen arbitrarily                                                                        |
| - Training Sequence Code       | Single RF Channel                                                                         |
| - Hopping                      | the ARFCN of the BCCH carrier                                                             |
| - ARFCN                        |                                                                                           |
| Power Command                  | Chosen arbitrarily but with a changed value.                                              |
| - Power level                  | Not Included                                                                              |
| Frequency list IE              | Use Range 128 to encode (318, 320, 322, 324, 326, 328, 330, 332, 334, 336, 338)           |
| Cell Channel Description       |                                                                                           |
| Multislot allocation           | Appropriate for the test, but more than one timeslot allocated and excluding timeslot 0.. |
| - Downlink assignment          | Appropriate for the test according to MS Class described in Annex B 05.02.                |
| - Uplink assignment            | Appropriate for the test                                                                  |
| - Channel set X (1=<X<=8)      |                                                                                           |
| Channel Mode                   | Data, 12.0 kbit/s radio interface rate                                                    |
| - Mode                         | Not included                                                                              |
| Mobile Allocation              | Not included                                                                              |
| Starting Time                  | Not included                                                                              |

## Step 21

## ASSIGNMENT COMMAND

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description 2          | 10XXX (Same number of TCH/Fs and timeslot mapping as in step 19)                                                |
| - Channel Type and TDMA offset | Same as in step 19                                                                                              |
| - Timeslot Number              | Chosen arbitrarily                                                                                              |
| - Training Sequence Code       | Frequency hopping                                                                                               |
| - Hopping                      | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - MAIO                         | Chosen arbitrarily from the set (1 to 63)                                                                       |
| - HSN                          |                                                                                                                 |
| Power Command                  | Chosen arbitrarily but with a changed value.                                                                    |
| - Power level                  | Not Included                                                                                                    |
| Frequency list IE              | Use Range 128 to encode (318, 320, 322, 324, 326, 328, 330, 332, 334, 336, 338)                                 |
| Cell Channel Description       |                                                                                                                 |
| Channel Mode                   | Data, 12.0 kbit/s radio interface rate                                                                          |
| - Mode                         | Indicate frequencies (320, 328, 330)                                                                            |
| Mobile Allocation              | Not included                                                                                                    |
| Starting Time                  |                                                                                                                 |

## Step 25

## ASSIGNMENT COMMAND

|                                  |                                                                                 |
|----------------------------------|---------------------------------------------------------------------------------|
| Channel Description 2            | 00000                                                                           |
| - Channel Type and TDMA offset   | Same as in step 19                                                              |
| - Timeslot Number                | Chosen arbitrarily                                                              |
| - Training Sequence Code         | Single RF Channel                                                               |
| - Hopping                        | the ARFCN of the BCCH carrier                                                   |
| - ARFCN                          |                                                                                 |
| Power Command                    |                                                                                 |
| - Power level                    | Chosen arbitrarily but with a changed value.                                    |
| Frequency list IE                | Not Included                                                                    |
| Cell Channel Description         | Use Range 128 to encode (318, 320, 322, 324, 326, 328, 330, 332, 334, 336, 338) |
| Multislot allocation             |                                                                                 |
| - Downlink assignment            | Indicate same timeslots as step 19.                                             |
| - Uplink assignment              | Appropriate for the test according to MS Class described in Annex B 05.02.      |
| - Channel set X (1= $X \leq 8$ ) | Appropriate for the test                                                        |
| Channel Mode                     |                                                                                 |
| - Mode                           | Data, 12.0 kbit/s radio interface rate                                          |
| Mobile Allocation                | Not included                                                                    |
| Starting Time                    | Not included                                                                    |

## Step 28

## ASSIGNMENT COMMAND

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description 2          | 10000 (no additional timeslots)                                                                                 |
| - Channel Type and TDMA offset | Same as in step 19                                                                                              |
| - Timeslot Number              | Chosen arbitrarily                                                                                              |
| - Training Sequence Code       | Frequency hopping                                                                                               |
| - Hopping                      | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - MAIO                         | Chosen arbitrarily from the set (1 to 63)                                                                       |
| - HSN                          |                                                                                                                 |
| Power Command                  |                                                                                                                 |
| - Power level                  | Chosen arbitrarily but with a changed value.                                                                    |
| Frequency list IE              | Not Included                                                                                                    |
| Cell Channel Description       | Not included                                                                                                    |
| Channel Mode                   |                                                                                                                 |
| - Mode                         | Data, 12.0 kbit/s radio interface rate                                                                          |
| Mobile Allocation              | Indicate frequencies (320, 328, 330)                                                                            |
| Starting Time                  | Chosen arbitrarily                                                                                              |

GSM 480 end:

GSM 900 begin:

Step 3

IMMEDIATE ASSIGNMENT:

|                                                                                                                                                                                                                                                                              |                                                                                                                                    |

## Step 21

## ASSIGNMENT COMMAND

|                                                         |                                                                                                                 |
|---------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description 2<br>- Channel Type and TDMA offset | 10XXX (Same number of TCH/Fs and timeslot mapping as in step 19)                                                |
| - Timeslot Number                                       | Same as in step 19                                                                                              |
| - Training Sequence Code                                | Chosen arbitrarily                                                                                              |
| - Hopping                                               | Frequency hopping                                                                                               |
| - MAIO                                                  | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - HSN                                                   | Chosen arbitrarily from the set (1 to 63)                                                                       |
| Power Command<br>- Power level                          | Chosen arbitrarily but with a changed value.                                                                    |
| Frequency list IE                                       | Not Included                                                                                                    |
| Cell Channel Description                                | Bit map zero encodes (45, 46, 52, 59, 66, 73, 74, 75, 76, 108, 114)                                             |
| Channel Mode<br>- Mode                                  | Data, 12.0 kbit/s radio interface rate                                                                          |
| Mobile Allocation                                       | Indicate frequencies (46, 73 74)                                                                                |
| Starting Time                                           | Not included                                                                                                    |

## Step 25

## ASSIGNMENT COMMAND

|                                                         |                                                                            |
|---------------------------------------------------------|----------------------------------------------------------------------------|
| Channel Description 2<br>- Channel Type and TDMA offset | 00000                                                                      |
| - Timeslot Number                                       | Same as in step 19                                                         |
| - Training Sequence Code                                | Chosen arbitrarily                                                         |
| - Hopping                                               | Single RF Channel                                                          |
| - ARFCN                                                 | the ARFCN of the BCCH carrier                                              |
| Power Command<br>- Power level                          | Chosen arbitrarily but with a changed value.                               |
| Frequency list IE                                       | Not Included                                                               |
| Cell Channel Description                                | Bit map zero encodes (45, 46, 52, 59, 66, 73, 74, 75, 76, 108, 114)        |
| Multislot allocation<br>- Downlink assignment           | Indicate same timeslots as step 19.                                        |
| - Uplink assignment                                     | Appropriate for the test according to MS Class described in Annex B 05.02. |
| - Channel set X (1=<X<=8)                               | Appropriate for the test                                                   |
| Channel Mode<br>- Mode                                  | Data, 12.0 kbit/s radio interface rate                                     |
| Mobile Allocation                                       | Not included                                                               |
| Starting Time                                           | Not included                                                               |

Step 28

ASSIGNMENT COMMAND

|                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| - Mode                         | Data, 12.0 kbit/s radio interface rate                                                                          |
| Mobile Allocation              | Indicates frequencies (773, 775, 779, 829, 832, 844)                                                            |
| Starting Time                  | Not included                                                                                                    |

## Step 17

## ASSIGNMENT COMMAND

|                                |                                                                       |
|--------------------------------|-----------------------------------------------------------------------|
| Channel Description 2          |                                                                       |
| - Channel Type and TDMA offset | 10000 (no additional timeslots)                                       |
| - Timeslot Number              | A suitable value for multislot configuration, chosen arbitrarily      |
| - Training Sequence Code       | Chosen arbitrarily                                                    |
| - Hopping                      | Single RF Channel                                                     |
| - ARFCN                        | the ARFCN of the BCCH carrier                                         |
| Power Command                  |                                                                       |
| - Power level                  | Chosen arbitrarily but with a changed value.                          |
| Frequency list IE              | Not Included                                                          |
| Cell Channel Description       | Use Range 128 to encode (773, 775, 779, 782, 791, 798, 829, 832, 844) |
| Channel Mode                   |                                                                       |
| - Mode                         | Data, 12.0 kbit/s radio interface rate                                |
| Mobile Allocation              | Not included                                                          |
| Starting Time                  | Not included                                                          |

## Step 19

## ASSIGNMENT COMMAND

|                                |                                                                                          |
|--------------------------------|------------------------------------------------------------------------------------------|
| Channel Description 2          | 00000                                                                                    |
| - Channel Type and TDMA offset | A suitable value for multislot configuration, chosen arbitrarily                         |
| - Timeslot Number              | Chosen arbitrarily                                                                       |
| - Training Sequence Code       | Single RF Channel                                                                        |
| - Hopping                      | the ARFCN of the BCCH carrier                                                            |
| - ARFCN                        |                                                                                          |
| Power Command                  | Chosen arbitrarily but with a changed value.                                             |
| - Power level                  | Not Included                                                                             |
| Frequency list IE              | Use Range 128 to encode (773, 775, 779, 782, 791, 798, 829, 832, 844)                    |
| Cell Channel Description       |                                                                                          |
| Multislot allocation           | Appropriate for the test, but more than one timeslot allocated and excluding timeslot 0. |
| - Downlink assignment          | Appropriate for the test according to MS Class described in Annex B 05.02.               |
| - Uplink assignment            | Appropriate for the test                                                                 |
| - Channel set X (1=<X<=8)      |                                                                                          |
| Channel Mode                   | Data, 12.0 kbit/s radio interface rate                                                   |
| - Mode                         | Not included                                                                             |
| Mobile Allocation              | Not included                                                                             |
| Starting Time                  | Not included                                                                             |

## Step 21

## ASSIGNMENT COMMAND

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description 2          | 10XXX (Same number of TCH/Fs and timeslot mapping as in step 19)                                                |
| - Channel Type and TDMA offset | Same as in step 19                                                                                              |
| - Timeslot Number              | Chosen arbitrarily                                                                                              |
| - Training Sequence Code       | Frequency hopping                                                                                               |
| - Hopping                      | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - MAIO                         | Chosen arbitrarily from the set (1 to 63)                                                                       |
| - HSN                          |                                                                                                                 |
| Power Command                  | Chosen arbitrarily but with a changed value.                                                                    |
| - Power level                  | Not Included                                                                                                    |
| Frequency list IE              | Use Range 128 to encode (773, 775, 779, 782, 791, 798, 829, 832, 844)                                           |
| Cell Channel Description       |                                                                                                                 |
| Channel Mode                   | Data, 12.0 kbit/s radio interface rate                                                                          |
| - Mode                         | Indicate frequencies (782, 791, 798)                                                                            |
| Mobile Allocation              | Not included                                                                                                    |
| Starting Time                  |                                                                                                                 |

## Step 25

## ASSIGNMENT COMMAND

|                                |                                                                            |
|--------------------------------|----------------------------------------------------------------------------|
| Channel Description 2          |                                                                            |
| - Channel Type and TDMA offset | 00000                                                                      |
| - Timeslot Number              | Same as in step 19                                                         |
| - Training Sequence Code       | Chosen arbitrarily                                                         |
| - Hopping                      | Single RF Channel                                                          |
| - ARFCN                        | the ARFCN of the BCCH carrier                                              |
| Power Command                  |                                                                            |
| - Power level                  | Chosen arbitrarily but with a changed value.                               |
| Frequency list IE              | Not Included                                                               |
| Cell Channel Description       | Use Range 128 to encode (773, 775, 779, 782, 791, 798, 829, 832, 844)      |
| Multislot allocation           |                                                                            |
| - Downlink assignment          | Indicate same timeslots as step 19.                                        |
| - Uplink assignment            | Appropriate for the test according to MS Class described in Annex B 05.02. |
| - Channel set X (1=<X<=8)      | Appropriate for the test                                                   |
| Channel Mode                   |                                                                            |
| - Mode                         | Data, 12.0 kbit/s radio interface rate                                     |
| Mobile Allocation              | Not included                                                               |
| Starting Time                  | Not included                                                               |

## Step 28

## ASSIGNMENT COMMAND

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description 2          |                                                                                                                 |
| - Channel Type and TDMA offset | 10000 (no additional timeslots)                                                                                 |
| - Timeslot Number              | Same as in step 19                                                                                              |
| - Training Sequence Code       | Chosen arbitrarily                                                                                              |
| - Hopping                      | Frequency hopping                                                                                               |
| - MAIO                         | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - HSN                          | Chosen arbitrarily from the set (1 to 63)                                                                       |
| Power Command                  |                                                                                                                 |
| - Power level                  | Chosen arbitrarily but with a changed value.                                                                    |

| - Channel set X (1=<X<=8)      | Appropriate for the test                                                                                        |
| Channel Mode                   |                                                                                                                 |
| - Mode                         | Data, 12.0 kbit/s radio interface rate                                                                          |
| Mobile Allocation              | Indicates frequencies (172, 173, 200, 201, 202, 203, 235, 241)                                                  |
| Starting Time                  | Not included                                                                                                    |

## Step 17

## ASSIGNMENT COMMAND

|                                |                                                                           |
|--------------------------------|---------------------------------------------------------------------------|
| Channel Description 2          |                                                                           |
| - Channel Type and TDMA offset | 10000 (no additional timeslots)                                           |
| - Timeslot Number              | A suitable value for multislot configuration, chosen arbitrarily          |
| - Training Sequence Code       | Chosen arbitrarily                                                        |
| - Hopping                      | Single RF Channel                                                         |
| - ARFCN                        | the ARFCN of the BCCH carrier                                             |
| Power Command                  |                                                                           |
| - Power level                  | Chosen arbitrarily but with a changed value.                              |
| Frequency list IE              | Not Included                                                              |
| Cell Channel Description       | 128 range encodes (172, 173, 179, 186, 193, 200, 201, 202, 203, 235, 241) |
| Channel Mode                   |                                                                           |
| - Mode                         | Data, 12.0 kbit/s radio interface rate                                    |
| Mobile Allocation              | Not included                                                              |
| Starting Time                  | Not included                                                              |

Step 19

ASSIGNMENT COMMAND

|                                |                                                                                           |
|--------------------------------|-------------------------------------------------------------------------------------------|
| Channel Description 2          | 00000                                                                                     |
| - Channel Type and TDMA offset | A suitable value for multislot configuration, chosen arbitrarily                          |
| - Timeslot Number              | Chosen arbitrarily                                                                        |
| - Training Sequence Code       | Single RF Channel                                                                         |
| - Hopping                      | the ARFCN of the BCCH carrier                                                             |
| - ARFCN                        |                                                                                           |
| Power Command                  | Chosen arbitrarily but with a changed value.                                              |
| - Power level                  | Not Included                                                                              |
| Frequency list IE              | 128 range encodes (172, 173, 179, 186, 193, 200, 201, 202, 203, 235, 241)                 |
| Cell Channel Description       |                                                                                           |
| Multislot allocation           | Appropriate for the test, but more than one timeslot allocated and excluding timeslot 0.. |
| - Downlink assignment          | Appropriate for the test according to MS Class described in Annex B 05.02.                |
| - Uplink assignment            | Appropriate for the test                                                                  |
| - Channel set X (1=<X<=8)      |                                                                                           |
| Channel Mode                   | Data, 12.0 kbit/s radio interface rate                                                    |
| - Mode                         | Not included                                                                              |
| Mobile Allocation              | Not included                                                                              |
| Starting Time                  | Not included                                                                              |

Step 21

ASSIGNMENT COMMAND

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description 2          | 10XXX (Same number of TCH/Fs and timeslot mapping as in step 19)                                                |
| - Channel Type and TDMA offset | Same as in step 19                                                                                              |
| - Timeslot Number              | Chosen arbitrarily                                                                                              |
| - Training Sequence Code       | Frequency hopping                                                                                               |
| - Hopping                      | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - MAIO                         | Chosen arbitrarily from the set (1 to 63)                                                                       |
| - HSN                          |                                                                                                                 |
| Power Command                  | Chosen arbitrarily but with a changed value.                                                                    |
| - Power level                  | Not Included                                                                                                    |
| Frequency list IE              | 128 range encodes (172, 173, 179, 186, 193, 200, 201, 202, 203, 235, 241)                                       |
| Cell Channel Description       |                                                                                                                 |
| Channel Mode                   | Data, 12.0 kbit/s radio interface rate                                                                          |
| - Mode                         | Indicate frequencies (173, 200, 201)                                                                            |
| Mobile Allocation              | Not included                                                                                                    |
| Starting Time                  |                                                                                                                 |

## Step 25

## ASSIGNMENT COMMAND

|                                  |                                                                            |
|----------------------------------|----------------------------------------------------------------------------|
| Channel Description 2            |                                                                            |
| - Channel Type and TDMA offset   | 00000                                                                      |
| - Timeslot Number                | Same as in step 19                                                         |
| - Training Sequence Code         | Chosen arbitrarily                                                         |
| - Hopping                        | Single RF Channel                                                          |
| - ARFCN                          | the ARFCN of the BCCH carrier                                              |
| Power Command                    |                                                                            |
| - Power level                    | Chosen arbitrarily but with a changed value.                               |
| Frequency list IE                | Not Included                                                               |
| Cell Channel Description         | 128 range encodes (172, 173, 179, 186, 193, 200, 201, 202, 203, 235, 241)  |
| Multislot allocation             |                                                                            |
| - Downlink assignment            | Indicate same timeslots as step 19.                                        |
| - Uplink assignment              | Appropriate for the test according to MS Class described in Annex B 05.02. |
| - Channel set X (1= $X \leq 8$ ) | Appropriate for the test                                                   |
| Channel Mode                     |                                                                            |
| - Mode                           | Data, 12.0 kbit/s radio interface rate                                     |
| Mobile Allocation                | Not included                                                               |
| Starting Time                    | Not included                                                               |

## Step 28

## ASSIGNMENT COMMAND

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description 2          |                                                                                                                 |
| - Channel Type and TDMA offset | 10000 (no additional timeslots)                                                                                 |
| - Timeslot Number              | Same as in step 19                                                                                              |
| - Training Sequence Code       | Chosen arbitrarily                                                                                              |
| - Hopping                      | Frequency hopping                                                                                               |
| - MAIO                         | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - HSN                          | Chosen arbitrarily from the set (1 to 63)                                                                       |

GSM 850 end:

### 26.13.1.2.2 Multislot signalling / RR / Dedicated assignment / failure / general case

This test is applicable to all MS that supports multislot configuration.

#### 26.13.1.2.2.1 Conformance requirements

On the mobile station side, if a lower layer failure happens on the new channel before the ASSIGNMENT COMPLETE message has been sent, the mobile station deactivates the new channels, reactivates the old channels, reconnects the TCHs if any and triggers the establishment of the main signalling link. It then sends an ASSIGNMENT FAILURE message, cause "protocol error unspecified" on the main DCCH and resumes the normal operation, as if no assignment attempt had occurred. The operational parameters (e.g. ciphering mode) when returning on the old channel are those applied before the procedure.

## References

Conformance requirements: 3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.4.3, 9.1.3 and 9.1.4.

### 26.13.1.2.2.2 Test purpose

- 1) To test that, when the MS fails to seize the new channel, the MS reactivates the old channel.
- 2) This is tested in the special cases of transition:
  - 2.1) from non-hopping SDCCH to hopping symmetric multislot configuration;
  - 2.2) from hopping asymmetric multislot configuration to non-hopping symmetric;
  - 2.3) from non hopping symmetric multislot configuration to non-hopping symmetric multislot configuration, resource upgrading used;
  - 2.4) from non-hopping asymmetric multislot configuration to non-hopping asymmetric multislot configuration, resource upgrading used;
  - 2.5) from hopping symmetric multislot configuration to hopping asymmetric multislot configuration, resource upgrading used;
  - 2.6) from hopping asymmetric multislot configuration to non-hopping multislot configuration, resources downgrading to one TCH/F.

### 26.13.1.2.2.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is "idle updated".

#### Related PICS/PIXIT Statements

- Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800).
- Multislot class.

#### Foreseen Final State of the MS

The MS is "idle updated".

#### Test Procedure

A mobile terminated RR connection is established on an SDCCH. The following is repeated six times with different parameters:

The SS sends an ASSIGNMENT COMMAND message allocating a hopping/non-hopping symmetric/asymmetric multislot configuration with or without resource upgrading/downgrading, but does not activate the assigned channels. The MS shall try to activate the new channel (this is not verified) and shall then reactivate the old channel and trigger the establishment of the main signalling link on the old channel. Then the MS shall send an ASSIGNMENT FAILURE.

The SS initiates the channel release procedure and the test ends here.

#### Maximum Duration of Test

30 s.

## Expected Sequence

| Step | Direction | Message               | Comments                                                                                                                                                                                          |
|------|-----------|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PAGING REQUEST TYPE 1 |                                                                                                                                                                                                   |
| 2    | MS -> SS  | CHANNEL REQUEST       |                                                                                                                                                                                                   |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT  | Channel Type: SDCCH/4.                                                                                                                                                                            |
| 4    | MS -> SS  | PAGING RESPONSE       |                                                                                                                                                                                                   |
| 5    | SS -> MS  | ASSIGNMENT COMMAND    | See specific message contents below. The MS attempts (and fails) to establish a signalling link on the new channel.                                                                               |
| 6    |           |                       | The MS re-establishes the signalling link on the old channel.                                                                                                                                     |
| 7    | MS -> SS  | ASSIGNMENT FAILURE    | RR cause value = "protocol error unspecified".                                                                                                                                                    |
| 8    | SS        |                       | The SS checks that the MS reports the old power level (prior to the Assignment command) in the layer 1 header of the SACCH message that is sent in the first SACCH multiframe following the SABM. |
| 9    | SS -> MS  | ASSIGNMENT COMMAND    | See specific message contents below.                                                                                                                                                              |
| 10   | MS -> SS  | ASSIGNMENT COMPLETE   | Assignment command is successfully performed.                                                                                                                                                     |
| 11   | SS -> MS  | ASSIGNMENT COMMAND    | Channel Type = TCH/F, non-hopping, symmetric multislot configuration. The MS attempts (and fails) to establish a signalling link on the new channel.                                              |
| 12   |           |                       | The MS re-establishes the signalling link on the old channel.                                                                                                                                     |
| 13   | MS -> SS  | ASSIGNMENT FAILURE    | RR cause value = "protocol error unspecified".                                                                                                                                                    |
| 14   | SS -> MS  | ASSIGNMENT COMMAND    | Assignment command to non-hopping, symmetric multislot configuration is successfully performed.                                                                                                   |

| Channel Description 2          | 00000                                                                                                           |
| - Channel Type and TDMA offset | A suitable value for multislot configuration, chosen arbitrarily                                                |
| - Timeslot Number              |                                                                                                                 |
| - Training Sequence Code       | Chosen arbitrarily                                                                                              |
| - Hopping                      | RF hopping channel                                                                                              |
| - MAIO                         | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - HSN                          | Chosen arbitrarily from the set (1 to 63)                                                                       |
| Power Command                  | Chosen arbitrarily but with a changed value.                                                                    |
| - Power level                  | Not Included                                                                                                    |
| Frequency list IE              | Use Range 128 to encode (271, 273, 275, 277, 279, 281, 283, 285, 287, 289, 291)                                 |
| Cell Channel Description       |                                                                                                                 |
| Multislot allocation           | Maximum number of symmetrical timeslots assigned.                                                               |
| - Downlink assignment          | As many timeslots as downlink direction.                                                                        |
| - Uplink assignment            | Appropriate for the test                                                                                        |
| - Channel set X (1= $X$ ≤8)    |                                                                                                                 |
| Channel Mode                   | Data, 12.0 kbit/s radio interface rate                                                                          |
| - Mode                         | Arbitrarily chosen from Cell channel description                                                                |
| Mobile Allocation              |                                                                                                                 |
| Starting Time                  | Not included                                                                                                    |

Step 9:

## ASSIGNMENT COMMAND

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description 2          | 00000                                                                                                           |
| - Channel Type and TDMA offset | A suitable value for multislot configuration, chosen arbitrarily                                                |
| - Timeslot Number              |                                                                                                                 |
| - Training Sequence Code       | Chosen arbitrarily                                                                                              |
| - Hopping                      | RF hopping channel                                                                                              |
| - MAIO                         | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - HSN                          | Chosen arbitrarily from the set (1 to 63)                                                                       |
| Power Command                  | Chosen arbitrarily but with a changed value.                                                                    |
| - Power level                  | Not Included                                                                                                    |
| Frequency list IE              | Use Range 128 to encode (271, 273, 275, 277, 279, 281, 283, 285, 287, 289, 291)                                 |
| Cell Channel Description       |                                                                                                                 |
| Multislot allocation           | Maximum number of timeslots that MS supports.                                                                   |
| - Downlink assignment          | Less timeslots assigned than downlink direction.                                                                |
| - Uplink assignment            | Appropriate for the test                                                                                        |
| - Channel set X (1= $X$ ≤8)    |                                                                                                                 |
| Channel Mode                   | Data, 12.0 kbit/s radio interface rate                                                                          |
| - Mode                         | Arbitrarily chosen from Cell channel description                                                                |
| Mobile Allocation              |                                                                                                                 |
| Starting Time                  | Not included                                                                                                    |

Step 11:

ASSIGNMENT COMMAND

|                                                                              |                                                                                 |
|------------------------------------------------------------------------------|---------------------------------------------------------------------------------|
| Channel Description 2<br>- Channel Type and TDMA offset<br>- Timeslot Number | 00000<br>A suitable value for multislot configuration, chosen arbitrarily       |
| - Training Sequence Code                                                     | Chosen arbitrarily                                                              |
| - Hopping                                                                    | Single RF channel                                                               |
| - ARFCN                                                                      | the ARFCN of the BCCH carrier                                                   |
| Power Command<br>- Power level                                               | Chosen arbitrarily but with a changed value.                                    |
| Frequency list IE                                                            | Not Included                                                                    |
| Cell Channel Description                                                     | Use Range 128 to encode (271, 273, 275, 277, 279, 281, 283, 285, 287, 289, 291) |
| Multislot allocation<br>- Downlink assignment                                | Maximum number of symmetrical timeslots supported by MS assigned.               |
| - Uplink assignment                                                          | As many timeslots as in downlink direction.                                     |
| - Channel set X (1=<X<=8)                                                    | Appropriate for the test                                                        |
| Channel Mode<br>- Mode                                                       | Data, 12.0 kbit/s radio interface rate                                          |
| Mobile Allocation                                                            | Not included                                                                    |
| Starting Time                                                                | Not included                                                                    |

Step 14:

ASSIGNMENT COMMAND

|                                                                              |                                                                                 |
|------------------------------------------------------------------------------|---------------------------------------------------------------------------------|
| Channel Description 2<br>- Channel Type and TDMA offset<br>- Timeslot Number | 00000<br>A suitable value for multislot configuration, chosen arbitrarily       |
| - Training Sequence Code                                                     | Chosen arbitrarily                                                              |
| - Hopping                                                                    | Single RF channel                                                               |
| - ARFCN                                                                      | the ARFCN of the BCCH carrier                                                   |
| Power Command<br>- Power level                                               | Chosen arbitrarily but with a changed value.                                    |
| Frequency list IE                                                            | Not Included                                                                    |
| Cell Channel Description                                                     | Use Range 128 to encode (271, 273, 275, 277, 279, 281, 283, 285, 287, 289, 291) |
| Multislot allocation<br>- Downlink assignment                                | Only one timeslot is assigned in downlink direction.                            |
| - Uplink assignment                                                          | Only one timeslot is assigned in uplink direction.                              |
| - Channel set X (1=<X<=8)                                                    | Appropriate for the test                                                        |
| Channel Mode<br>- Mode                                                       | Data, 12.0 kbit/s radio interface rate                                          |
| Mobile Allocation                                                            | Not included                                                                    |
| Starting Time                                                                | Not included                                                                    |

Step 16:

## ASSIGNMENT COMMAND

|                                |                                                                                 |
|--------------------------------|---------------------------------------------------------------------------------|
| Channel Description 2          | 00000                                                                           |
| - Channel Type and TDMA offset | A suitable value for multislot configuration, chosen arbitrarily                |
| - Timeslot Number              | Chosen arbitrarily                                                              |
| - Training Sequence Code       | Single RF channel                                                               |
| - Hopping                      | the ARFCN of the BCCH carrier                                                   |
| - ARFCN                        |                                                                                 |
| Power Command                  | Chosen arbitrarily but with a changed value.                                    |
| - Power level                  | Not Included                                                                    |
| Frequency list IE              | Use range 128 to encode (271, 273, 275, 277, 279, 281, 283, 285, 287, 289, 291) |
| Cell Channel Description       |                                                                                 |
| Multislot allocation           | Maximum number of timeslots that MS supports.                                   |
| - Downlink assignment          | Maximum number of timeslots that MS supports.                                   |
| - Uplink assignment            | Appropriate for the test                                                        |
| - Channel set X (1=<X<=8)      |                                                                                 |
| Channel Mode                   | Data, 12.0 kbit/s radio interface rate                                          |
| - Mode                         | Not included                                                                    |
| Mobile Allocation              | Not included                                                                    |
| Starting Time                  | Not included                                                                    |

Step 19:

## ASSIGNMENT COMMAND

|                                |                                                                                                     |
|--------------------------------|-----------------------------------------------------------------------------------------------------|
| Channel Description 2          | 00000                                                                                               |
| - Channel Type and TDMA offset | A suitable value for multislot configuration, chosen arbitrarily                                    |
| - Timeslot Number              | Chosen arbitrarily                                                                                  |
| - Training Sequence Code       | Single RF channel                                                                                   |
| - Hopping                      | the ARFCN of the BCCH carrier                                                                       |
| - ARFCN                        |                                                                                                     |
| Power Command                  | Chosen arbitrarily but with a changed value.                                                        |
| - Power level                  | Not Included                                                                                        |
| Frequency list IE              | Use Range 128 to encode (271, 273, 275, 277, 279, 281, 283, 285, 287, 289, 291)                     |
| Cell Channel Description       |                                                                                                     |
| Multislot allocation           | More than one timeslot but less than maximum number of timeslots is assigned in downlink direction. |
| - Downlink assignment          | Only one timeslot is assigned in uplink direction.                                                  |
| - Uplink assignment            | Appropriate for the test                                                                            |
| - Channel set X (1=<X<=8)      |                                                                                                     |
| Channel Mode                   | Data, 12.0 kbit/s radio interface rate                                                              |
| - Mode                         | Not included                                                                                        |
| Mobile Allocation              | Not included                                                                                        |
| Starting Time                  | Not included                                                                                        |

Step 21:

## ASSIGNMENT COMMAND

|                                  |                                                                                 |
|----------------------------------|---------------------------------------------------------------------------------|
| Channel Description 2            | 00000                                                                           |
| - Channel Type and TDMA offset   | A suitable value for multislot configuration, chosen arbitrarily                |
| - Timeslot Number                | Chosen arbitrarily                                                              |
| - Training Sequence Code         | Single RF channel                                                               |
| - Hopping                        | the ARFCN of the BCCH carrier                                                   |
| - ARFCN                          |                                                                                 |
| Power Command                    | Chosen arbitrarily but with a changed value.                                    |
| - Power level                    | Not Included                                                                    |
| Frequency list IE                | Use Range 128 to encode (271, 273, 275, 277, 279, 281, 283, 285, 287, 289, 291) |
| Cell Channel Description         |                                                                                 |
| Multislot allocation             | Maximum number of timeslots that MS supports.                                   |
| - Downlink assignment            | Less timeslots assigned than downlink direction.                                |
| - Uplink assignment              | Appropriate for the test                                                        |
| - Channel set X (1= $X \leq 8$ ) |                                                                                 |
| Channel Mode                     | Data, 12.0 kbit/s radio interface rate                                          |
| - Mode                           | Not included                                                                    |
| Mobile Allocation                | Not included                                                                    |
| Starting Time                    | Not included                                                                    |

Step 24:

## ASSIGNMENT COMMAND

|                                  |                                                                                                                 |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description 2            | 00000                                                                                                           |
| - Channel Type and TDMA offset   | A suitable value for multislot configuration, chosen arbitrarily                                                |
| - Timeslot Number                | Chosen arbitrarily                                                                                              |
| - Training Sequence Code         | RF hopping channel                                                                                              |
| - Hopping                        |                                                                                                                 |
| - MAIO                           | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - HSN                            | Chosen arbitrarily from the set (1 to 63)                                                                       |
| Power Command                    | Chosen arbitrarily but with a changed value.                                                                    |
| - Power level                    | Not Included                                                                                                    |
| Frequency list IE                | Use Range 128 to encode (271, 273, 275, 277, 279, 281, 283, 285, 287, 289, 291)                                 |
| Cell Channel Description         |                                                                                                                 |
| Multislot allocation             | Only one timeslot is assigned in downlink direction.                                                            |
| - Downlink assignment            | Only one timeslot is assigned in uplink direction.                                                              |
| - Uplink assignment              | Appropriate for the test                                                                                        |
| - Channel set X (1= $X \leq 8$ ) |                                                                                                                 |
| Channel Mode                     | Data, 12.0 kbit/s radio interface rate                                                                          |
| - Mode                           | Chosen arbitrarily from the Cell channel description                                                            |
| Mobile Allocation                | Not included                                                                                                    |
| Starting Time                    | Not included                                                                                                    |

Step 26:

## ASSIGNMENT COMMAND

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description 2          | 00000                                                                                                           |
| - Channel Type and TDMA offset | A suitable value for multislot configuration, chosen arbitrarily                                                |
| - Timeslot Number              | Chosen arbitrarily                                                                                              |
| - Training Sequence Code       | RF hopping channel                                                                                              |
| - Hopping                      |                                                                                                                 |
| - MAIO                         | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - HSN                          | Chosen arbitrarily from the set (1 to 63)                                                                       |
| Power Command                  |                                                                                                                 |
| - Power level                  | Chosen arbitrarily but with a changed value.                                                                    |
| Frequency list IE              | Not Included                                                                                                    |
| Cell Channel Description       | Use Range 128 to encode (271, 273, 275, 277, 279, 281, 283, 285, 287, 289, 291)                                 |
| Multislot allocation           |                                                                                                                 |
| - Downlink assignment          | Maximum number of timeslots that MS supports.                                                                   |
| - Uplink assignment            | Less timeslots assigned than in downlink direction.                                                             |
| - Channel set X (1= $X$ ≤8)    | Appropriate for the test                                                                                        |
| Channel Mode                   |                                                                                                                 |
| - Mode                         | Data, 12.0 kbit/s radio interface rate                                                                          |
| Mobile Allocation              | Chosen arbitrarily from the Cell channel description                                                            |
| Starting Time                  | Not included                                                                                                    |

Step 29:

## ASSIGNMENT COMMAND

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description 2          | 00000                                                                                                           |
| - Channel Type and TDMA offset | A suitable value for multislot configuration, chosen arbitrarily                                                |
| - Timeslot Number              | Chosen arbitrarily                                                                                              |
| - Training Sequence Code       | RF hopping channel                                                                                              |
| - Hopping                      |                                                                                                                 |
| - MAIO                         | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - HSN                          | Chosen arbitrarily from the set (1 to 63)                                                                       |
| Power Command                  |                                                                                                                 |
| - Power level                  | Chosen arbitrarily but with a changed value.                                                                    |
| Frequency list IE              | Not Included                                                                                                    |
| Cell Channel Description       | Use Range 128 to encode (271, 273, 275, 277, 279, 281, 283, 285, 287, 289, 291)                                 |
| Multislot allocation           |                                                                                                                 |
| - Downlink assignment          | Maximum number of timeslots that MS supports.                                                                   |
| - Uplink assignment            | Less timeslots assigned than in downlink direction.                                                             |
| - Channel set X (1= $X$ ≤8)    | Appropriate for the test                                                                                        |
| Channel Mode                   |                                                                                                                 |
| - Mode                         | Data, 12.0 kbit/s radio interface rate                                                                          |
| Mobile Allocation              | Chosen arbitrarily from the Cell channel description                                                            |
| Starting Time                  | Not included                                                                                                    |

Step 31:

## ASSIGNMENT COMMAND

|                                |                                                                                 |
|--------------------------------|---------------------------------------------------------------------------------|
| Channel Description 2          |                                                                                 |
| - Channel Type and TDMA offset | 00000                                                                           |
| - Timeslot Number              | A suitable value for multislot configuration, chosen arbitrarily                |
| - Training Sequence Code       | Chosen arbitrarily                                                              |
| - Hopping                      | Single RF channel                                                               |
| - ARFCN                        | the ARFCN of the BCCH carrier                                                   |
| Power Command                  |                                                                                 |
| - Power level                  | Chosen arbitrarily but with a changed value.                                    |
| Frequency list IE              | Not Included                                                                    |
| Cell Channel Description       | Use Range 128 to encode (271, 273, 275, 277, 279, 281, 283, 285, 287, 289, 291) |
| Multislot allocation           |                                                                                 |
| - Downlink assignment          | Only one timeslot is assigned in downlink direction.                            |
| - Uplink assignment            | Only one timeslot is assigned in uplink direction.                              |
| - Channel set X (1=<X<=8)      | Appropriate for the test                                                        |
| Channel Mode                   |                                                                                 |
| - Mode                         | Data, 12.0 kbit/s radio interface rate                                          |
| Mobile Allocation              | Not included                                                                    |
| Starting Time                  | Not included                                                                    |

GSM 450 end:

GSM 480 begin:

Step 5:

## ASSIGNMENT COMMAND

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|

Step 9:

ASSIGNMENT COMMAND

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description 2          | 00000                                                                                                           |
| - Channel Type and TDMA offset | A suitable value for multislot configuration, chosen arbitrarily                                                |
| - Timeslot Number              | Chosen arbitrarily                                                                                              |
| - Training Sequence Code       | RF hopping channel                                                                                              |
| - Hopping                      |                                                                                                                 |
| - MAIO                         | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - HSN                          | Chosen arbitrarily from the set (1 to 63)                                                                       |
| Power Command                  |                                                                                                                 |
| - Power level                  | Chosen arbitrarily but with a changed value.                                                                    |
| Frequency list IE              | Not Included                                                                                                    |
| Cell Channel Description       | Use Range 128 to encode (318, 320, 322, 324, 326, 328, 330, 332, 334, 336, 338)                                 |
| Multislot allocation           |                                                                                                                 |
| - Downlink assignment          | Maximum number of timeslots that MS supports.                                                                   |
| - Uplink assignment            | Less timeslots assigned than downlink direction.                                                                |
| - Channel set X (1=<X<=8)      | Appropriate for the test                                                                                        |
| Channel Mode                   |                                                                                                                 |
| - Mode                         | Data, 12.0 kbit/s radio interface rate                                                                          |
| Mobile Allocation              | Arbitrarily chosen from Cell channel description                                                                |
| Starting Time                  | Not included                                                                                                    |

Step 11:

ASSIGNMENT COMMAND

|                                |                                                                                 |
|--------------------------------|---------------------------------------------------------------------------------|
| Channel Description 2          | 00000                                                                           |
| - Channel Type and TDMA offset | A suitable value for multislot configuration, chosen arbitrarily                |
| - Timeslot Number              | Chosen arbitrarily                                                              |
| - Training Sequence Code       | Single RF channel                                                               |
| - Hopping                      | the ARFCN of the BCCH carrier                                                   |
| - ARFCN                        |                                                                                 |
| Power Command                  |                                                                                 |
| - Power level                  | Chosen arbitrarily but with a changed value.                                    |
| Frequency list IE              | Not Included                                                                    |
| Cell Channel Description       | Use Range 128 to encode (318, 320, 322, 324, 326, 328, 330, 332, 334, 336, 338) |
| Multislot allocation           |                                                                                 |
| - Downlink assignment          | Maximum number of symmetrical timeslots supported by MS assigned.               |
| - Uplink assignment            | As many timeslots as in downlink direction.                                     |
| - Channel set X (1=<X<=8)      | Appropriate for the test                                                        |
| Channel Mode                   |                                                                                 |
| - Mode                         | Data, 12.0 kbit/s radio interface rate                                          |
| Mobile Allocation              | Not included                                                                    |
| Starting Time                  | Not included                                                                    |

Step 14:

## ASSIGNMENT COMMAND

|                                |                                                                                 |
|--------------------------------|---------------------------------------------------------------------------------|
| Channel Description 2          | 00000                                                                           |
| - Channel Type and TDMA offset | A suitable value for multislot configuration, chosen arbitrarily                |
| - Timeslot Number              | Chosen arbitrarily                                                              |
| - Training Sequence Code       | Single RF channel                                                               |
| - Hopping                      | the ARFCN of the BCCH carrier                                                   |
| - ARFCN                        |                                                                                 |
| Power Command                  | Chosen arbitrarily but with a changed value.                                    |
| - Power level                  | Not Included                                                                    |
| Frequency list IE              | Use Range 128 to encode (318, 320, 322, 324, 326, 328, 330, 332, 334, 336, 338) |
| Cell Channel Description       |                                                                                 |
| Multislot allocation           | Only one timeslot is assigned in downlink direction.                            |
| - Downlink assignment          | Only one timeslot is assigned in uplink direction.                              |
| - Uplink assignment            | Appropriate for the test                                                        |
| - Channel set X (1=<X<=8)      |                                                                                 |
| Channel Mode                   | Data, 12.0 kbit/s radio interface rate                                          |
| - Mode                         | Not included                                                                    |
| Mobile Allocation              | Not included                                                                    |
| Starting Time                  | Not included                                                                    |

Step 16:

## ASSIGNMENT COMMAND

|                                |                                                                                 |
|--------------------------------|---------------------------------------------------------------------------------|
| Channel Description 2          | 00000                                                                           |
| - Channel Type and TDMA offset | A suitable value for multislot configuration, chosen arbitrarily                |
| - Timeslot Number              | Chosen arbitrarily                                                              |
| - Training Sequence Code       | Single RF channel                                                               |
| - Hopping                      | the ARFCN of the BCCH carrier                                                   |
| - ARFCN                        |                                                                                 |
| Power Command                  | Chosen arbitrarily but with a changed value.                                    |
| - Power level                  | Not Included                                                                    |
| Frequency list IE              | Use Range 128 to encode (318, 320, 322, 324, 326, 328, 330, 332, 334, 336, 338) |
| Cell Channel Description       |                                                                                 |
| Multislot allocation           | Maximum number of timeslots that MS supports.                                   |
| - Downlink assignment          | Maximum number of timeslots that MS supports.                                   |
| - Uplink assignment            | Appropriate for the test                                                        |
| - Channel set X (1=<X<=8)      |                                                                                 |
| Channel Mode                   | Data, 12.0 kbit/s radio interface rate                                          |
| - Mode                         | Not included                                                                    |
| Mobile Allocation              | Not included                                                                    |
| Starting Time                  | Not included                                                                    |

Step 19:

ASSIGNMENT COMMAND

|                                                                              |                                                                                                     |
|------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------|
| Channel Description 2<br>- Channel Type and TDMA offset<br>- Timeslot Number | 00000<br>A suitable value for multislot configuration, chosen arbitrarily                           |
| - Training Sequence Code                                                     | Chosen arbitrarily                                                                                  |
| - Hopping                                                                    | Single RF channel                                                                                   |
| - ARFCN                                                                      | the ARFCN of the BCCH carrier                                                                       |
| Power Command<br>- Power level                                               | Chosen arbitrarily but with a changed value.                                                        |

| Channel Description 2          | 00000                                                               |
| - Channel Type and TDMA offset | A suitable value for multislot configuration, chosen arbitrarily    |
| - Timeslot Number              | Chosen arbitrarily                                                  |
| - Training Sequence Code       | Single RF channel                                                   |
| - Hopping                      | the ARFCN of the BCCH carrier                                       |
| - ARFCN                        |                                                                     |
| Power Command                  | Chosen arbitrarily but with a changed value.                        |
| - Power level                  | Not Included                                                        |
| Frequency list IE              | Not Included                                                        |
| Cell Channel Description       | Bit map zero encodes (45, 46, 52, 59, 66, 73, 74, 75, 76, 108, 114) |
| Multislot allocation           | Only one timeslot is assigned in downlink direction.                |
| - Downlink assignment          | Only one timeslot is assigned in uplink direction.                  |
| - Uplink assignment            | Appropriate for the test                                            |
| - Channel set X (1=<X<=8)      |                                                                     |
| Channel Mode                   | Data, 12.0 kbit/s radio interface rate                              |
| - Mode                         |                                                                     |
| Mobile Allocation              | Not included                                                        |
| Starting Time                  | Not included                                                        |

Step 16:

ASSIGNMENT COMMAND

|                                                                              |                                                                           |
|------------------------------------------------------------------------------|---------------------------------------------------------------------------|
| Channel Description 2<br>- Channel Type and TDMA offset<br>- Timeslot Number | 00000<br>A suitable value for multislot configuration, chosen arbitrarily |
| - Training Sequence Code                                                     | Chosen arbitrarily                                                        |
| - Hopping                                                                    | Single RF channel                                                         |
| - ARFCN                                                                      | the ARFCN of the BCCH carrier                                             |
| Power Command<br>- Power level                                               | Chosen arbitrarily but with a changed value.                              |
| Frequency list IE                                                            | Not Included                                                              |
| Cell Channel Description                                                     | Bit map zero encodes (45, 46, 52, 59, 66, 73, 74, 75, 76, 108, 114)       |
| Multislot allocation<br>- Downlink assignment                                | Maximum number of timeslots that MS supports.                             |
| - Uplink assignment                                                          | Maximum number of timeslots that MS supports.                             |
| - Channel set X (1=<X<=8)                                                    | Appropriate for the test                                                  |
| Channel Mode<br>- Mode                                                       | Data, 12.0 kbit/s radio interface rate                                    |
| Mobile Allocation                                                            | Not included                                                              |
| Starting Time                                                                | Not included                                                              |

Step 19:

ASSIGNMENT COMMAND

|                                                                              |                                                                                                     |
|------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------|
| Channel Description 2<br>- Channel Type and TDMA offset<br>- Timeslot Number | 00000<br>A suitable value for multislot configuration, chosen arbitrarily                           |
| - Training Sequence Code                                                     | Chosen arbitrarily                                                                                  |
| - Hopping                                                                    | Single RF channel                                                                                   |
| - ARFCN                                                                      | the ARFCN of the BCCH carrier                                                                       |
| Power Command<br>- Power level                                               | Chosen arbitrarily but with a changed value.                                                        |

| Multislot allocation           |                                                                                                                 |
| - Downlink assignment          | Maximum number of symmetrical timeslots assigned.                                                               |
| - Uplink assignment            | As many timeslots as downlink direction.                                                                        |
| - Channel set X (1=<X<=8)      | Appropriate for the test                                                                                        |
| Channel Mode                   |                                                                                                                 |
| - Mode                         | Data, 12.0 kbit/s radio interface rate                                                                          |
| Mobile Allocation              | Arbitrarily chosen from Cell channel description                                                                |
| Starting Time                  | Not included                                                                                                    |

Step 9:

## ASSIGNMENT COMMAND

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description 2          |                                                                                                                 |
| - Channel Type and TDMA offset | 00000                                                                                                           |
| - Timeslot Number              | A suitable value for multislot configuration, chosen arbitrarily                                                |
| - Training Sequence Code       | Chosen arbitrarily                                                                                              |
| - Hopping                      | RF hopping channel                                                                                              |
| - MAIO                         | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - HSN                          | Chosen arbitrarily from the set (1 to 63)                                                                       |
| Power Command                  |                                                                                                                 |
| - Power level                  | Chosen arbitrarily but with a changed value.                                                                    |
| Frequency list IE              | Not Included                                                                                                    |
| Cell Channel Description       | Use Range 128 to encode (773, 775, 779, 782, 791, 798, 829, 832, 844)                                           |
| Multislot allocation           |                                                                                                                 |
| - Downlink assignment          | Maximum number of timeslots that MS supports.                                                                   |
| - Uplink assignment            | Less timeslots assigned than downlink direction.                                                                |
| - Channel set X (1=<X<=8)      | Appropriate for the test                                                                                        |
| Channel Mode                   |                                                                                                                 |
| - Mode                         | Data, 12.0 kbit/s radio interface rate                                                                          |
| Mobile Allocation              | Arbitrarily chosen from Cell channel description                                                                |
| Starting Time                  | Not included                                                                                                    |

Step 11:

## ASSIGNMENT COMMAND

|                                |                                                                       |
|--------------------------------|-----------------------------------------------------------------------|
| Channel Description 2          |                                                                       |
| - Channel Type and TDMA offset | 00000                                                                 |
| - Timeslot Number              | A suitable value for multislot configuration, chosen arbitrarily      |
| - Training Sequence Code       | Chosen arbitrarily                                                    |
| - Hopping                      | Single RF channel                                                     |
| - ARFCN                        | the ARFCN of the BCCH carrier                                         |
| Power Command                  |                                                                       |
| - Power level                  | Chosen arbitrarily but with a changed value.                          |
| Frequency list IE              | Not Included                                                          |
| Cell Channel Description       | Use Range 128 to encode (773, 775, 779, 782, 791, 798, 829, 832, 844) |
| Multislot allocation           |                                                                       |
| - Downlink assignment          | Maximum number symmetrical of timeslots supported by MS assigned.     |
| - Uplink assignment            | As many timeslots as in downlink direction.                           |
| - Channel set X (1=<X<=8)      | Appropriate for the test                                              |
| Channel Mode                   |                                                                       |
| - Mode                         | Data, 12.0 kbit/s radio interface rate                                |
| Mobile Allocation              | Not included                                                          |
| Starting Time                  | Not included                                                          |

Step 14:

## ASSIGNMENT COMMAND

|                                |                                                                       |
|--------------------------------|-----------------------------------------------------------------------|
| Channel Description 2          | 00000                                                                 |
| - Channel Type and TDMA offset | A suitable value for multislot configuration, chosen arbitrarily      |
| - Timeslot Number              | Chosen arbitrarily                                                    |
| - Training Sequence Code       | Single RF channel                                                     |
| - Hopping                      | the ARFCN of the BCCH carrier                                         |
| - ARFCN                        |                                                                       |
| Power Command                  | Chosen arbitrarily but with a changed value.                          |
| - Power level                  | Not Included                                                          |
| Frequency list IE              | Use Range 128 to encode (773, 775, 779, 782, 791, 798, 829, 832, 844) |
| Cell Channel Description       |                                                                       |
| Multislot allocation           | Only one timeslot is assigned in downlink direction.                  |
| - Downlink assignment          | Only one timeslot is assigned in uplink direction.                    |
| - Uplink assignment            | Appropriate for the test                                              |
| - Channel set X (1=<X<=8)      |                                                                       |
| Channel Mode                   | Data, 12.0 kbit/s radio interface rate                                |
| - Mode                         | Not included                                                          |
| Mobile Allocation              | Not included                                                          |
| Starting Time                  | Not included                                                          |

Step 16:

## ASSIGNMENT COMMAND

|                                |                                                                       |
|--------------------------------|-----------------------------------------------------------------------|
| Channel Description 2          | 00000                                                                 |
| - Channel Type and TDMA offset | A suitable value for multislot configuration, chosen arbitrarily      |
| - Timeslot Number              | Chosen arbitrarily                                                    |
| - Training Sequence Code       | Single RF channel                                                     |
| - Hopping                      | the ARFCN of the BCCH carrier                                         |
| - ARFCN                        |                                                                       |
| Power Command                  | Chosen arbitrarily but with a changed value.                          |
| - Power level                  | Not Included                                                          |
| Frequency list IE              | Use Range 128 to encode (773, 775, 779, 782, 791, 798, 829, 832, 844) |
| Cell Channel Description       |                                                                       |
| Multislot allocation           | Maximum number of timeslots that MS supports.                         |
| - Downlink assignment          | Maximum number of timeslots that MS supports.                         |
| - Uplink assignment            | Appropriate for the test                                              |
| - Channel set X (1=<X<=8)      |                                                                       |
| Channel Mode                   | Data, 12.0 kbit/s radio interface rate                                |
| - Mode                         | Not included                                                          |
| Mobile Allocation              | Not included                                                          |
| Starting Time                  | Not included                                                          |

Step 19:

## ASSIGNMENT COMMAND

|                                |                                                                                                     |
|--------------------------------|-----------------------------------------------------------------------------------------------------|
| Channel Description 2          |                                                                                                     |
| - Channel Type and TDMA offset | 00000                                                                                               |
| - Timeslot Number              | A suitable value for multislot configuration, chosen arbitrarily                                    |
| - Training Sequence Code       | Chosen arbitrarily                                                                                  |
| - Hopping                      | Single RF channel                                                                                   |
| - ARFCN                        | the ARFCN of the BCCH carrier                                                                       |
| Power Command                  |                                                                                                     |
| - Power level                  | Chosen arbitrarily but with a changed value.                                                        |
| Frequency list IE              | Not Included                                                                                        |
| Cell Channel Description       | Use Range 128 to encode (773, 775, 779, 782, 791, 798, 829, 832, 844)                               |
| Multislot allocation           |                                                                                                     |
| - Downlink assignment          | More than one timeslot but less than maximum number of timeslots is assigned in downlink direction. |
| - Uplink assignment            | Only one timeslot is assigned in uplink direction.                                                  |
| - Channel set X (1=<X<=8)      | Appropriate for the test                                                                            |
| Channel Mode                   |                                                                                                     |
| - Mode                         | Data, 12.0 kbit/s radio interface rate                                                              |
| Mobile Allocation              | Not included                                                                                        |
| Starting Time                  | Not included                                                                                        |

Step 21:

## ASSIGNMENT COMMAND

|                                |                                                                       |
|--------------------------------|-----------------------------------------------------------------------|
| Channel Description 2          |                                                                       |
| - Channel Type and TDMA offset | 00000                                                                 |
| - Timeslot Number              | A suitable value for multislot configuration, chosen arbitrarily      |
| - Training Sequence Code       | Chosen arbitrarily                                                    |
| - Hopping                      | Single RF channel                                                     |
| - ARFCN                        | the ARFCN of the BCCH carrier                                         |
| Power Command                  |                                                                       |
| - Power level                  | Chosen arbitrarily but with a changed value.                          |
| Frequency list IE              | Not Included                                                          |
| Cell Channel Description       | Use Range 128 to encode (773, 775, 779, 782, 791, 798, 829, 832, 844) |
| Multislot allocation           |                                                                       |
| - Downlink assignment          | Maximum number of timeslots that MS supports.                         |
| - Uplink assignment            | Less timeslots assigned than downlink direction.                      |
| - Channel set X (1=<X<=8)      | Appropriate for the test                                              |
| Channel Mode                   |                                                                       |
| - Mode                         | Data, 12.0 kbit/s radio interface rate                                |
| Mobile Allocation              | Not included                                                          |
| Starting Time                  | Not included                                                          |

Step 24:

## ASSIGNMENT COMMAND

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description 2          |                                                                                                                 |
| - Channel Type and TDMA offset | 00000                                                                                                           |
| - Timeslot Number              | A suitable value for multislot configuration, chosen arbitrarily                                                |
| - Training Sequence Code       | Chosen arbitrarily                                                                                              |
| - Hopping                      | RF hopping channel                                                                                              |
| - MAIO                         | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - HSN                          | Chosen arbitrarily from the set (1 to 63)                                                                       |
| Power Command                  |                                                                                                                 |
| - Power level                  | Chosen arbitrarily but with a changed value.                                                                    |
| Frequency list IE              | Not Included                                                                                                    |
| Cell Channel Description       | Use Range 128 to encode (773, 775, 779, 782, 791, 798, 829, 832, 844)                                           |
| Multislot allocation           |                                                                                                                 |
| - Downlink assignment          | Only one timeslot is assigned in downlink direction.                                                            |
| - Uplink assignment            | Only one timeslot is assigned in uplink direction.                                                              |
| - Channel set X (1=<X<=8)      | Appropriate for the test                                                                                        |
| Channel Mode                   |                                                                                                                 |
| - Mode                         | Data, 12.0 kbit/s radio interface rate                                                                          |
| Mobile Allocation              | Chosen arbitrarily from the Cell channel description                                                            |
| Starting Time                  | Not included                                                                                                    |

Step 26:

## ASSIGNMENT COMMAND

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description 2          |                                                                                                                 |
| - Channel Type and TDMA offset | 00000                                                                                                           |
| - Timeslot Number              | A suitable value for multislot configuration, chosen arbitrarily                                                |
| - Training Sequence Code       | Chosen arbitrarily                                                                                              |
| - Hopping                      | RF hopping channel                                                                                              |
| - MAIO                         | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - HSN                          | Chosen arbitrarily from the set (1 to 63)                                                                       |
| Power Command                  |                                                                                                                 |
| - Power level                  | Chosen arbitrarily but with a changed value.                                                                    |
| Frequency list IE              | Not Included                                                                                                    |
| Cell Channel Description       | Use Range 128 to encode (773, 775, 779, 782, 791, 798, 829, 832, 844)                                           |
| Multislot allocation           |                                                                                                                 |
| - Downlink assignment          | Maximum number of timeslots that MS supports.                                                                   |
| - Uplink assignment            | Less timeslots assigned than in downlink direction.                                                             |
| - Channel set X (1=<X<=8)      | Appropriate for the test                                                                                        |
| Channel Mode                   |                                                                                                                 |
| - Mode                         | Data, 12.0 kbit/s radio interface rate                                                                          |
| Mobile Allocation              | Chosen arbitrarily from the Cell channel description                                                            |
| Starting Time                  | Not included                                                                                                    |

Step 29:

## ASSIGNMENT COMMAND

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description 2          |                                                                                                                 |
| - Channel Type and TDMA offset | 00000                                                                                                           |
| - Timeslot Number              | A suitable value for multislot configuration, chosen arbitrarily                                                |
| - Training Sequence Code       | Chosen arbitrarily                                                                                              |
| - Hopping                      | RF hopping channel                                                                                              |
| - MAIO                         | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - HSN                          | Chosen arbitrarily from the set (1 to 63)                                                                       |

| - Power level                  | Chosen arbitrarily but with a changed value.                              |
| Frequency list IE              | Not Included                                                              |
| Cell Channel Description       | 128 range encodes (172, 173, 179, 186, 193, 200, 201, 202, 203, 235, 241) |
| Multislot allocation           |                                                                           |
| - Downlink assignment          | Maximum number of symmetrical timeslots supported by MS assigned.         |
| - Uplink assignment            | As many timeslots as in downlink direction.                               |
| - Channel set X (1=<X<=8)      | Appropriate for the test                                                  |
| Channel Mode                   |                                                                           |
| - Mode                         | Data, 12.0 kbit/s radio interface rate                                    |
| Mobile Allocation              | Not included                                                              |
| Starting Time                  | Not included                                                              |

Step 14:

## ASSIGNMENT COMMAND

|                                |                                                                           |
|--------------------------------|---------------------------------------------------------------------------|
| Channel Description 2          | 00000                                                                     |
| - Channel Type and TDMA offset | A suitable value for multislot configuration, chosen arbitrarily          |
| - Timeslot Number              | Chosen arbitrarily                                                        |
| - Training Sequence Code       | Single RF channel                                                         |
| - Hopping                      | the ARFCN of the BCCH carrier                                             |
| - ARFCN                        |                                                                           |
| Power Command                  | Chosen arbitrarily but with a changed value.                              |
| - Power level                  | Not Included                                                              |
| Frequency list IE              | 128 range encodes (172, 173, 179, 186, 193, 200, 201, 202, 203, 235, 241) |
| Cell Channel Description       |                                                                           |
| Multislot allocation           | Only one timeslot is assigned in downlink direction.                      |
| - Downlink assignment          | Only one timeslot is assigned in uplink direction.                        |
| - Uplink assignment            | Appropriate for the test                                                  |
| - Channel set X (1=<X<=8)      |                                                                           |
| Channel Mode                   | Data, 12.0 kbit/s radio interface rate                                    |
| - Mode                         | Not included                                                              |
| Mobile Allocation              | Not included                                                              |
| Starting Time                  | Not included                                                              |

Step 16:

## ASSIGNMENT COMMAND

|                                |                                                                           |
|--------------------------------|---------------------------------------------------------------------------|
| Channel Description 2          | 00000                                                                     |
| - Channel Type and TDMA offset | A suitable value for multislot configuration, chosen arbitrarily          |
| - Timeslot Number              | Chosen arbitrarily                                                        |
| - Training Sequence Code       | Single RF channel                                                         |
| - Hopping                      | the ARFCN of the BCCH carrier                                             |
| - ARFCN                        |                                                                           |
| Power Command                  | Chosen arbitrarily but with a changed value.                              |
| - Power level                  | Not Included                                                              |
| Frequency list IE              | 128 range encodes (172, 173, 179, 186, 193, 200, 201, 202, 203, 235, 241) |
| Cell Channel Description       |                                                                           |
| Multislot allocation           | Maximum number of timeslots that MS supports.                             |
| - Downlink assignment          | Maximum number of timeslots that MS supports.                             |
| - Uplink assignment            | Appropriate for the test                                                  |
| - Channel set X (1=<X<=8)      |                                                                           |
| Channel Mode                   | Data, 12.0 kbit/s radio interface rate                                    |
| - Mode                         | Not included                                                              |
| Mobile Allocation              | Not included                                                              |
| Starting Time                  | Not included                                                              |

Step 19:

## ASSIGNMENT COMMAND

|                                |                                                                                                     |
|--------------------------------|-----------------------------------------------------------------------------------------------------|
| Channel Description 2          | 00000                                                                                               |
| - Channel Type and TDMA offset | A suitable value for multislot configuration, chosen arbitrarily                                    |
| - Timeslot Number              | Chosen arbitrarily                                                                                  |
| - Training Sequence Code       | Single RF channel                                                                                   |
| - Hopping                      | the ARFCN of the BCCH carrier                                                                       |
| - ARFCN                        |                                                                                                     |
| Power Command                  | Chosen arbitrarily but with a changed value.                                                        |
| - Power level                  | Not Included                                                                                        |
| Frequency list IE              | 128 range encodes (172, 173, 179, 186, 193, 200, 201, 202, 203, 235, 241)                           |
| Cell Channel Description       |                                                                                                     |
| Multislot allocation           | More than one timeslot but less than maximum number of timeslots is assigned in downlink direction. |
| - Downlink assignment          | Only one timeslot is assigned in uplink direction.                                                  |
| - Uplink assignment            | Appropriate for the test                                                                            |
| - Channel set X (1=<X<=8)      |                                                                                                     |
| Channel Mode                   | Data, 12.0 kbit/s radio interface rate                                                              |
| - Mode                         | Not included                                                                                        |
| Mobile Allocation              | Not included                                                                                        |
| Starting Time                  | Not included                                                                                        |

Step 21:

## ASSIGNMENT COMMAND

|                                |                                                                           |
|--------------------------------|---------------------------------------------------------------------------|
| Channel Description 2          | 00000                                                                     |
| - Channel Type and TDMA offset | A suitable value for multislot configuration, chosen arbitrarily          |
| - Timeslot Number              | Chosen arbitrarily                                                        |
| - Training Sequence Code       | Single RF channel                                                         |
| - Hopping                      | the ARFCN of the BCCH carrier                                             |
| - ARFCN                        |                                                                           |
| Power Command                  | Chosen arbitrarily but with a changed value.                              |
| - Power level                  | Not Included                                                              |
| Frequency list IE              | 128 range encodes (172, 173, 179, 186, 193, 200, 201, 202, 203, 235, 241) |
| Cell Channel Description       |                                                                           |
| Multislot allocation           | Maximum number of timeslots that MS supports.                             |
| - Downlink assignment          | Less timeslots assigned than downlink direction.                          |
| - Uplink assignment            | Appropriate for the test                                                  |
| - Channel set X (1=<X<=8)      |                                                                           |
| Channel Mode                   | Data, 12.0 kbit/s radio interface rate                                    |
| - Mode                         | Not included                                                              |
| Mobile Allocation              | Not included                                                              |
| Starting Time                  | Not included                                                              |

Step 24:

## ASSIGNMENT COMMAND

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description 2          |                                                                                                                 |
| - Channel Type and TDMA offset | 00000                                                                                                           |
| - Timeslot Number              | A suitable value for multislot configuration, chosen arbitrarily                                                |
| - Training Sequence Code       | Chosen arbitrarily                                                                                              |
| - Hopping                      | RF hopping channel                                                                                              |
| - MAIO                         | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - HSN                          | Chosen arbitrarily from the set (1 to 63)                                                                       |
| Power Command                  |                                                                                                                 |
| - Power level                  | Chosen arbitrarily but with a changed value.                                                                    |

GSM 850 end:

### 26.13.1.3 Test of handover

With the Handover procedure, it is possible to completely alter the channels allocated to a MS. This makes it possible in particular to switch a call in progress from one cell to another. The procedure is always initiated by the network and with the MS in a dedicated mode.

Subclauses 26.13.1.3.1 to 26.13.1.3.5 contain test procedures to be used for executing successful Handover tests in multislot configuration. Table 26.13.1.3-1 contains a summary of the different combinations of parameters that have to be tested, together with a reference to the appropriate test procedure.

**Table 26.13.1.3-1**

| From                                                    | To                                                      | Timing Adv. | Start Time | Syn ?  | State of call | Subclause   | Exec Counter |

NOTE: The MS is in the "idle, updated" state, with a TMSI allocated and camped on cell A.

#### 26.13.1.3.1 Multislot signalling / RR / Handover / successful / active call / non-synchronized

This test is applicable to all MS that supports multislot configuration.

##### 26.13.1.3.1.1 Conformance requirements

- 1) The MS shall correctly apply the handover procedure in the non-synchronized case when a multislot connection is in progress and when handover is performed from a non-hopping multislot configuration towards a hopping multislot configuration.

##### References

Conformance requirement 1: 3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.4.4 and 9.1.15.  
3GPP TS 04.13 subclause 5.2.6.2.

##### 26.13.1.3.1.2 Test purpose

- 1) To test that when the MS is ordered to make a non-synchronized handover from non-hopping multislot configuration to hopping multislot configuration, it continuously sends access bursts on the main DCCH until it receives a PHYSICAL INFORMATION message from the SS.
- 2) To test that the MS correctly handles the Timing Advance IE in the PHYSICAL INFORMATION message.
- 3) To test that the MS activates the new channels correctly and transmits the HANDOVER COMPLETE message without undue delay.

## 26.13.1.3.1.3 Method of test

## Initial Conditions

System Simulator:

- 2 cells, A and B with same LAI, default parameters except:
- Early classmark sending enabled in SI3 rest octets

## GSM 450:

Cell A has:

- BCCH ARFCN = 263

Cell B has:

- BCCH ARFCN = 274
- Cell Allocation = (260, 262, 264, 266, 268, 270, 272, 274, 276, 279, 281, 283, 285, 287, 289, 291)
- The Cell Allocation of Cell B shall be coded using range 256 format.
- The frame numbers of cells A and B shall be different by 100.
- The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

## GSM 480:

Cell A has:

- BCCH ARFCN = 310

Cell B has:

- BCCH ARFCN = 321
- Cell Allocation = (307, 309, 311, 313, 315, 317, 319, 321, 323, 326, 328, 330, 332, 334, 336, 338)
- The Cell Allocation of Cell B shall be coded using range 256 format.
- The frame numbers of cells A and B shall be different by 100.
- The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

## GSM 900:

Cell A has:

- BCCH ARFCN = 20

Cell B has:

- BCCH ARFCN = 40
- Cell Allocation = (14, 18, 22, 24, 30, 31, 38, 40, 60, 66, 73, 74, 75, 76, 108, 114)
- The Cell Allocation of Cell B shall be coded using range 256 format.
- The frame numbers of cells A and B shall be different by 100.
- The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

## DCS 1 800:

Cell A has:

- BCCH ARFCN = 747

Cell B has:

- BCCH ARFCN = 764
- Cell Allocation = (739, 743, 746, 749, 756, 758, 761, 764, 771, 779, 782, 791, 798, 829, 832, 844)
- The Cell Allocation of Cell B shall be coded using range 256 format.
- The frame numbers of cells A and B shall be different by 100.
- The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

## GSM 700:

Cell A has:

- BCCH ARFCN = 457

Cell B has:

- BCCH ARFCN = 477
- Cell Allocation = (451, 455, 459, 461, 467, 468, 475, 477, 497, 498, 500, 501, 502, 503, 506, 508)
- The Cell Allocation of Cell B shall be coded using range 256 format.
- The frame numbers of cells A and B shall be different by 100.
- The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

## GSM 850:

Cell A has:

- BCCH ARFCN = 147

Cell B has:

- BCCH ARFCN = 167
- Cell Allocation = (141, 145, 149, 151, 157, 158, 165, 167, 187, 193, 200, 201, 202, 203, 235, 241)
- The Cell Allocation of Cell B shall be coded using range 256 format.
- The frame numbers of cells A and B shall be different by 100.
- The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

## Mobile Station:

- The MS is in the active state (U10) of a service using a multislot connection on cell A.

## Related PICS/PIXIT Statements

- Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800).
- Multislot class.
- Supported teleservices/bearer services.

- Classmark.

### Foreseen Final State of the MS

The active state (U10) of a multislot connection on cell B.

### Test Procedure

The MS is in the active state (U10) of a multislot connection. The SS sends a HANOVER COMMAND on the main DCCH. The MS shall begin to send access bursts on the new DCCH of the target cell. The SS observes the access bursts and after receiving 10-20 access bursts, the SS sends one PHYSICAL INFORMATION message with a Timing Advance arbitrarily selected. The MS shall activate the new channels that belongs to same multislot configuration. The MS shall establish a signalling link. The MS shall be ready to transmit a HANOVER COMPLETE message, before 500 ms after the end of the PHYSICAL INFORMATION message, but not before a UA frame has been sent by the SS.

The term "ready to transmit" is defined in 3GPP TS 04.13.

### Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

### Expected Sequence

| Step | Direction | Message              | Comments                                                                                                                                                                                                                                                                         |
|------|-----------|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0    | MS, SS    |                      | The MS and SS are using a maximum multislot configuration according to the MS multislot class (highest class that MS supports) in non-hopping mode on cell A. See Specific message contents.                                                                                     |
| 1    | SS -> MS  | HANOVER COMMAND      |                                                                                                                                                                                                                                                                                  |
| 2    | MS -> SS  | HANOVER ACCESS       | Repeated on every burst of the uplink main DCCH until reception of PHYSICAL INFORMATION. Handover Reference as included in the HANOVER COMMAND. Sent after reception of n HANOVER ACCESS messages. See specific message contents.                                                |
| 3    | SS -> MS  | PHYSICAL INFORMATION |                                                                                                                                                                                                                                                                                  |
| 4    | MS -> SS  | SABM                 |                                                                                                                                                                                                                                                                                  |
| 5    | SS -> MS  | UA                   | Sent without information field.                                                                                                                                                                                                                                                  |
| 6    | MS -> SS  | HANOVER COMPLETE     |                                                                                                                                                                                                                                                                                  |
| 7    | MS, SS    |                      | The message shall be ready to be transmitted before 500 ms after the completion of step 3.<br>The MS and SS are using a maximum multislot configuration according to the MS multislot class (highest class that MS supports) in hopping mode on cell B and state U10 is reached. |

## 26.13.1.3.2 Multislot signalling / RR / Handover / successful / call under establishment / non synchronized / resource upgrading

This test is applicable to all MS that supports multislot configuration.

## 26.13.1.3.2.1 Conformance requirements

- 1) The MS shall correctly apply the handover procedure from non-hopping multislot configuration to non-hopping multislot configuration in the non-synchronized case during call establishment.
- 2) The MS shall activate the new channels that belongs to same multislot configuration correctly, taking into account upgraded resources.
- 3) If during call establishment a Layer 3 MM or CC message just sent by the MS is not Layer 2 acknowledged before the channel change caused by the HANDOVER COMMAND message, the MS shall send the Layer 3 message to the new cell, using the same value in the N(SD) field, after the handover procedure.

## References

Conformance requirements: 3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.4.4 and 9.1.15.  
3GPP TS 04.13 subclause 5.2.6.2

### 26.13.1.3.2.2 Test purpose

- 1) To test that when the MS is ordered to make a non-synchronized handover from non-hopping multislot configuration to a non-hopping multislot configuration, it continuously sends access bursts on the main DCCH until it receives a PHYSICAL INFORMATION message from the SS.
- 2) To test that the MS correctly takes the values of the Timing Advance information element in the PHYSICAL INFORMATION message into account.
- 3) To test that the MS activates the new channels that belongs to same multislot configuration correctly, taking into account upgraded resources and transmits the HANDOVER COMPLETE message without undue delay.
- 4) To test that MS correctly retransmits Layer 3 MM or CC messages, that were not acknowledged by Layer 2 before the Handover, after completion of the Handover.

### 26.13.1.3.2.3 Method of test

#### Initial Conditions

##### System Simulator:

- 2 cells, A and B with same LAI, default parameters except:
  - Early classmark sending enabled in SI3 rest octets

#### GSM 450:

##### Cell A has:

- BCCH ARFCN = 263
- PLMN colour code, NCC = as defaults.
- BS colour code, BCC = as defaults.
- PLMN\_PERM = 00001010.

##### Cell B has:

- BCCH ARFCN = 274
- PLMN colour code, NCC = 3.
- BS colour code, BCC = 0.
- The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

#### GSM 480:

##### Cell A has:

- BCCH ARFCN = 310
- PLMN colour code, NCC = as defaults.
- BS colour code, BCC = as defaults.
- PLMN\_PERM = 00001010.

##### Cell B has:

- BCCH ARFCN = 321
- PLMN colour code, NCC = 3.
- BS colour code, BCC = 0.

- The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

## GSM 900:

Cell A has:

- BCCH ARFCN = 20
- PLMN colour code, NCC = as defaults.
- BS colour code, BCC = as defaults.
- PLMN\_PERM = 00001010.

Cell B has:

- BCCH ARFCN = 40
- PLMN colour code, NCC = 3.
- BS colour code, BCC = 0.
- The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

## DCS 1 800:

Cell A has:

- BCCH ARFCN = 747
- PLMN colour code, NCC = as defaults.
- BS colour code, BCC = as defaults.
- PLMN\_PERM = 00001010.

Cell B has:

- BCCH ARFCN = 764
- PLMN colour code, NCC = 3.
- BS colour code, BCC = 0.
- The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

## GSM 700:

Cell A has:

- BCCH ARFCN = 457
- PLMN colour code, NCC = as defaults.
- BS colour code, BCC = as defaults.
- PLMN\_PERM = 00001010.

Cell B has:

- BCCH ARFCN = 477
- PLMN colour code, NCC = 3.
- BS colour code, BCC = 0.

- The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

#### GSM 850:

Cell A has:

- BCCH ARFCN = 147
- PLMN colour code, NCC = as defaults.
- BS colour code, BCC = as defaults.
- PLMN\_PERM = 00001010.

Cell B has:

- BCCH ARFCN = 167
- PLMN colour code, NCC = 3.
- BS colour code, BCC = 0.
- The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

#### Mobile Station:

- The MS is in the "idle, updated" state, with a TMSI allocated and camped on cell A..

#### Related PICS/PIXIT Statements

- Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800).
- Multislot class.
- Supported teleservices/bearer services.
- Classmark.

#### Foreseen Final State of the MS

"idle, updated" with a TMSI allocated and camped on cell B.

#### Test Procedure

A Mobile Originating Call is initiated on Cell A. After the MS has sent the SETUP message (and before the last L2 frame carrying the SETUP message is acknowledged by the SS) the SS sends ASSIGNMENT COMMAND message to MS defining used multislot configuration. Multislot configuration with one TCH/F is allocated. MS responds with ASSIGNMENT COMPLETE message. Then the SS sends a HANDOVER COMMAND message, ordering the MS to switch to cell B. The MS shall then begin to send access bursts on the new DCCH to cell B. The SS observes the access bursts and after receiving 10-20 access bursts, the SS sends one PHYSICAL INFORMATION message with a Timing Advance as specified in table 26.13.1.3-1 of subclause 26.13.1.3.6. The MS shall activate the channels that belongs to same multislot configuration correctly, taking into account upgraded resources. The MS shall establish a signalling link. The MS shall be ready to transmit a HANDOVER COMPLETE message before 650 ms after the end of the PHYSICAL INFORMATION message, but not before a UA frame has been sent by the SS. The MS shall then again send the SETUP message to the SS, using the same value in the N(SD) field. Finally the SS sends a CHANNEL RELEASE to end the test.

The term "ready to transmit" is defined in 3GPP TS 04.13.

#### Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

## Expected Sequence

| Step | Direction | Message                 | Comments                                                                                                                                        |
|------|-----------|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | -----     | -----                   | An MO call is initiated on cell A.                                                                                                              |
| 2    | MS -> SS  | CHANNEL REQUEST         | Establish. Cause = "Originating call, NECI not set to 1"                                                                                        |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT    |                                                                                                                                                 |
| 4    | MS -> SS  | CM SERVICE REQUEST      | CM Service Type = Mobile Originating Call Establishment.                                                                                        |
| 5    | MS -> SS  | CLASSMARK CHANGE        | Multislot class                                                                                                                                 |
| 6    | SS -> MS  | AUTHENTICATION REQUEST  |                                                                                                                                                 |
| 7    | MS -> SS  | AUTHENTICATION RESPONSE |                                                                                                                                                 |
| 8    | SS -> MS  | CIPHERING MODE COMMAND  |                                                                                                                                                 |
| 9    | MS -> SS  | CIPHERING MODE COMPLETE |                                                                                                                                                 |
| 10   | MS -> SS  | SETUP                   | Last L2 frame not acknowledged by the SS.                                                                                                       |
| 11   | SS -> MS  | ASSIGNMENT COMMAND      | Multislot configuration is sent to MS. Multislot configuration with one TCH/F is allocated. See specific message contents below.                |
| 12   | MS -> SS  | ASSIGNMENT COMPLETE     |                                                                                                                                                 |
| 13   | SS -> MS  | HANDOVER COMMAND        | See specific message contents. Resource upgrading.                                                                                              |
| 14   | MS -> SS  | HANDOVER ACCESS         | Repeated on every burst of the uplink main DCCH until reception of PHYSICAL INFORMATION. Handover Reference as included in the HANDOVER COMMAND |
| 15   | SS -> MS  | PHYSICAL INFORMATION    | Sent after reception of n HANDOVER ACCESS message. Timing Advance as specified in table 26.13.1.3-1 of subclause 26.13.1.3.6.                   |
| 16   | MS -> SS  | SABM                    | Sent without information field.                                                                                                                 |
| 17   | SS -> MS  | UA                      |                                                                                                                                                 |
| 18   | MS -> SS  | HANDOVER COMPLETE       | This message shall be ready to be transmitted before 650 ms after the completion of step 15.                                                    |
| 19   | MS -> SS  | SETUP                   | Same N(SD) as in step 10.                                                                                                                       |
| 20   | SS -> MS  | CHANNEL RELEASE         | The main signalling link is released.                                                                                                           |

### 26.13.1.3.3 Multislot signalling / RR / Handover / successful / active call / finely synchronized / resource downgrading

This test is applicable to all MS that supports multislot configuration.

#### 26.13.1.3.3.1 Conformance requirements

- 1) The MS shall correctly apply the handover procedure from multislot configuration with frequency hopping to multislot configuration without frequency hopping in the finely synchronized case when a call is in progress. Resources are downgraded in handover procedure.

#### References

Conformance requirement 1: 3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.4.4, 9.1.14, 9.1.15 and 9.1.16.

#### 26.13.1.3.3.2 Test purpose

- 1) To test that when the MS is ordered to make a finely synchronized handover to a synchronized cell from a hopping multislot configuration to a non-hopping multislot configuration, it sends 4 access bursts on the main DCCH and then activates the channels correctly, taking into account power command, downgraded resources and correctly calculating the timing advance to use.
- 2) To test the MS activates the new channels that belongs to same multislot configuration correctly, taking into account downgraded resources and transmits the HANDOVER COMPLETE message without undue delay.

## 26.13.1.3.3.3 Method of test

## Initial Conditions

System Simulator:

- 2 cells, A and B, with same LAI, default parameters, except:
  - Early classmark sending enabled in SI3 rest octets- The BCCH of cell A is sent k bit periods before the BCCH of cell B. The timing advance in cell A sent to the MS is y bit periods. k and y are selected such that  $0 < (2k+y) \bmod 256 < 60$ .

GSM 450:

- Cell B has BCCH ARFCN = 274.

GSM 480:

- Cell B has BCCH ARFCN = 321.

P-GSM 900:

- Cell B has BCCH ARFCN = 40.

DCS 1 800:

- Cell B has BCCH ARFCN = 764.

GSM 700:

- Cell B has BCCH ARFCN = 477.

GSM 850:

- Cell B has BCCH ARFCN = 167.

Mobile Station:

- The MS is in the active state (U10) of a service using a multislot connection (on cell A). The MS is using a power level P. Where P is a power level within the supported range of that type of MS.

## Related PICS/PIXIT Statements

- Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800).
- Multislot class.
- Supported teleservices/bearer services.

## Foreseen Final State of the MS

The active state (U10) of a multislot connection (on cell B).

## Test Procedure

The MS is in the active state (U10) of a multislot connection on cell A. Maximum number of channels supported by the MS in a HSCSD configuration, is allocated. The SS sends a HANOVER COMMAND on the main DCCH. In the case that the MS supports only 1 timeslot in uplink direction the HANOVER COMMAND'S Uplink assignment shall be one timeslot. The MS shall send 4 access bursts, in 4 successive slots on the new DCCH to cell B. Then the MS shall establish a signalling link indicating the correct Timing Advance and power level and send a HANOVER COMPLETE message.

The MS shall be "ready to transmit" a HANOVER COMPLETE message before 650 ms after the end of the HANOVER COMMAND message, but not before a UA frame has been sent by the SS.

The term "ready to transmit" is defined in 3GPP TS 04.13.

## Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

## Expected Sequence

| Step | Direction | Message           | Comments                                                                                                                                                                                                                                                  |
|------|-----------|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| - Base Station Colour Code              | 5                                                                                                              |
| - BCCH Carrier Number                   | 167                                                                                                            |
| Channel Description 2                   |                                                                                                                |
| - Channel type                          | 00000                                                                                                          |
| - Timeslot Number                       | A suitable value for multislot configuration, chosen arbitrarily.                                              |
| - Training Sequence Code                | Chosen arbitrarily.                                                                                            |
| - Hopping                               | Single RF Channel.                                                                                             |
| - ARFCN                                 | 167                                                                                                            |
| Handover Reference                      |                                                                                                                |
| - Value                                 | Chosen arbitrarily from the range (0, 1..255).                                                                 |
| Power command                           |                                                                                                                |
| - Power Level                           | Arbitrarily chosen, but different to the one already in use and within the range supported by that type of MS. |
| Synchronization Indication              |                                                                                                                |
| - Report Observed Time Difference       | Shall not be included.                                                                                         |
| - Synchronization Indication            | "Synchronized".                                                                                                |
| - Normal Cell Indication                | Ignore out of range timing advance.                                                                            |
| Description of the multislot connection |                                                                                                                |
| - Uplink assignment                     | If possible fewer timeslots are allocated than before HANDOVER COMMAND                                         |
| - Downlink assignment                   | Less timeslots are allocated than before HANDOVER COMMAND                                                      |
| - Channel set X (1= $X \leq 8$ )        | Appropriate for the test                                                                                       |

## HANDOVER ACCESS

| Information Element                 | value/remark             |
|-------------------------------------|--------------------------|
| As default message contents except: |                          |
| Handover Reference                  |                          |
| - Value                             | Same as HANDOVER COMMAND |

#### 26.13.1.3.4 Multislot signalling / RR / Handover / successful / call under establishment / finely synchronized / relocation of channels

This test is applicable to all MS that supports multislot configuration.

##### 26.13.1.3.4.1 Conformance requirements

- 1) The MS shall correctly apply the handover procedure from hopping, multislot configuration, finely synchronized case to hopping, multislot configuration, synchronized case during call establishment.
- 2) The MS shall not change number of channels in multislot configuration but the place of each channel is changed.
- 3) If during call establishment a Layer 3 MM or CC message just sent by the MS is not Layer 2 acknowledged before the channel change caused by the HANDOVER COMMAND message, the MS shall send the Layer 3 message to the new cell, using the same value in the N(SD) field, after the handover procedure.

#### References

Conformance requirements: 3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.4.4 and 9.1.15.  
3GPP TS 04.13 subclause 5.2.6.2.

#### 26.13.1.3.4.2 Test purpose

- 1) To test that when the MS is ordered to make a finely synchronized handover to a synchronized cell, it sends 4 access bursts on the main DCCH and then activates the channel correctly, taking into account power command, new order of channels in multislot configuration and correctly calculating the timing advance to use. Handover is done from hopping multislot configuration to hopping multislot configuration, number of channels in multislot configuration is not changed but the place of each channel is changed.
- 2) To test that MS correctly retransmits Layer 3 MM or CC messages, that were not acknowledged by Layer 2 before the Handover, after completion of the Handover.
- 3) To verify the MS transmits the HANDOVER COMPLETE message without undue delay.

#### 26.13.1.3.4.3 Method of test

##### Initial Conditions

##### System Simulator:

- 2 cells, A and B, with same LAI, default parameters, except:
  - Early classmark sending enabled in SI3 rest octets.
- The BCCH of cell A is sent k bit periods before the BCCH of cell B. The timing advance in cell A sent to the MS is y bit periods. k and y are selected such that  $0 < (2k + y) \bmod 256 < 60$ .
- The frame numbers of cells A and B shall be different by 100.

##### GSM 450:

###### Cell A has:

- BCCH ARFCN = 263.
- Cell Allocation = (259, 261, 263, 265, 267, 269, 271, 273, 275, 277, 279, 281, 283, 285, 287, 289, 291).

###### Cell B has:

- BCCH ARFCN = 274.
- Cell Allocation = (260, 262, 264, 266, 268, 270, 272, 274, 276, 279, 281, 283, 285, 287, 289, 291).

##### GSM 480:

###### Cell A has:

- BCCH ARFCN = 310.
- Cell Allocation = (306, 308, 310, 312, 314, 316, 318, 320, 322, 324, 326, 328, 330, 332, 334, 336, 338).

###### Cell B has:

- BCCH ARFCN = 321.
- Cell Allocation = (307, 309, 311, 313, 315, 317, 319, 321, 323, 326, 328, 330, 332, 334, 336, 338).

##### GSM 900:

###### Cell A has:

- BCCH ARFCN = 20.
- Cell Allocation = (10, 17, 20, 26, 34, 42, 45, 46, 52, 59, 66, 73, 74, 75, 76, 108, 114).

Cell B has:

- BCCH ARFCN = 40.
- Cell Allocation = (14, 18, 22, 24, 30, 31, 38, 40, 60, 66, 73, 74, 75, 76, 108, 114).

DCS 1 800:

Cell A has:

- BCCH ARFCN = 747.
- Cell Allocation = (734, 741, 747, 754, 759, 762, 766, 767, 773, 775, 779, 782, 791, 798, 829, 832, 844).

Cell B has:

- BCCH ARFCN = 764.
- Cell Allocation = (739, 743, 746, 749, 756, 758, 761, 764, 771, 779, 782, 791, 798, 829, 832, 844).

GSM 700:

Cell A has:

- BCCH ARFCN = 457.
- Cell Allocation = (447, 454, 457, 463, 471, 479, 482, 483, 489, 496, 498, 500, 501, 502, 503, 506, 508).

Cell B has:

- BCCH ARFCN = 477.
- Cell Allocation = (451, 455, 459, 461, 467, 468, 475, 477, 497, 498, 500, 501, 502, 503, 506, 508).

GSM 850:

Cell A has:

- BCCH ARFCN = 147.
- Cell Allocation = (137, 144, 147, 153, 161, 169, 172, 173, 179, 186, 193, 200, 201, 202, 203, 235, 241).

Cell B has:

- BCCH ARFCN = 167.
- Cell Allocation = (141, 145, 149, 151, 157, 158, 165, 167, 187, 193, 200, 201, 202, 203, 235, 241).

Mobile Station:

- The MS is in the "idle, updated" state, with a TMSI allocated and camped on cell A.

Related PICS/PIXIT Statements

- Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800).
- Multislot class.
- Supported teleservices/bearer services.
- Classmark.

Foreseen Final State of the MS

"Idle, updated" with TMSI allocated and camped on cell B.

## Test Procedure

A Mobile Originating Call is initiated on cell A. After the MS has sent the SETUP message (and before the last L2 frame carrying the SETUP message is acknowledged by the SS) the SS sends ASSIGNMENT COMMAND message to MS defining used multislot configuration. MS responds with ASSIGNMENT COMPLETE message. Then the SS sends a HANDOVER COMMAND message, ordering the MS to switch to cell B. After the handover timeslots are relocated. Timeslots are also overlapped (this is described in specific message contents). The MS shall then send 4 access bursts, in successive slots on the new DCCH to cell B. Then the MS shall establish a signalling link indicating the correct timing advance and power level (number of channels in multislot configuration is not changed but the place of each channel is changed) and send a HANDOVER COMPLETE message. The MS shall be "ready to transmit" the HANDOVER COMPLETE message before 1500 ms after the end of the HANDOVER COMMAND message, but not before a UA frame has been sent by the SS. The MS shall then again send the SETUP message to the SS, using the same value in the N(SD) field. Finally the SS sends a CHANNEL RELEASE to end the test.

The term "ready to transmit" is defined in 3GPP TS 04.13.

## Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

## Expected Sequence

| Step | Direction | Message                 | Comments                                                                                                                                                                                                                                                  |
|------|-----------|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | -----     | -----                   | An MO call is initiated.                                                                                                                                                                                                                                  |

## ASSIGNMENT COMMAND

| Information element                        | Value/remark                                                       |
|--------------------------------------------|--------------------------------------------------------------------|
| Channel description 2                      | describes hopping Bm+ACCHs or Lm+ACCHs as appropriate for the test |
| Power Command                              | As in subclause 26.1.1                                             |
| Frequency list                             | Omitted                                                            |
| Cell channel description                   | Omitted                                                            |
| Description of the multislot configuration |                                                                    |
| - Uplink assignment                        | Appropriate for the test                                           |
| - Downlink assignment                      | Appropriate for the test                                           |
| - Channel set X (1= $X$ ≤8)                | Appropriate for the test                                           |
| Mode of the channel set X (1= $X$ ≤8)      | Appropriate for the test                                           |
| Description of the second channel          | Omitted                                                            |
| Mode of the second channel                 | Omitted                                                            |
| Mobile allocation                          | Arbitrarily chosen from Cell channel description                   |
| Starting time                              | Omitted                                                            |
| Cipher mode setting                        | Omitted                                                            |

## IMMEDIATE ASSIGNMENT

| Information Element                 | value/remark                                                                                                          |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| As default message contents except: |                                                                                                                       |
| Channel Description                 | Channel Description.                                                                                                  |
| - Channel Type                      | SDCCH/8                                                                                                               |
| - TDMA offset                       | As default message contents.                                                                                          |
| - Timeslot number                   | Arbitrary value, but not zero.                                                                                        |
| - Training Sequence Code            | Chosen arbitrarily.                                                                                                   |
| - Hopping                           | RF hopping channel.                                                                                                   |
| - MAIO                              | Chosen arbitrarily from the set (0, 1 to N-1), where N is the number of frequencies encoded in the Mobile Allocation. |
| - HSN                               | Chosen arbitrarily from the set. (1,2,..63).                                                                          |
| Mobile Allocation                   | Indicates all of the CA of cell A except for the BCCH frequency.                                                      |

## HANDOVER COMMAND

| Information Element                        | value/remark                                                                                                                                                                                                                                                                                        |

| - TDMA offset                              | Chosen arbitrarily.                                                                                                                                                                                                                                                                                 |
| - Timeslot number                          | A suitable value for multislot configuration, chosen arbitrarily.                                                                                                                                                                                                                                   |
| - Training Sequence Code                   | Chosen arbitrarily.                                                                                                                                                                                                                                                                                 |
| - Hopping                                  | RF hopping channel.                                                                                                                                                                                                                                                                                 |
| - MAIO                                     | Chosen arbitrarily from the set (0, 1 to N-1), where N is the number of frequencies encoded in the Frequency List IE.                                                                                                                                                                               |
| - HSN                                      | Zero (this gives cyclic hopping).                                                                                                                                                                                                                                                                   |
| Handover Reference                         |                                                                                                                                                                                                                                                                                                     |
| - Value                                    | Chosen arbitrarily from the range (0, 1..255).                                                                                                                                                                                                                                                      |
| Power command                              |                                                                                                                                                                                                                                                                                                     |
| - Power Level                              | Arbitrarily chosen, but different to the one already in use and within the range supported by the MS.                                                                                                                                                                                               |
| Synchronization Indication                 |                                                                                                                                                                                                                                                                                                     |
| - Report Observed Time Difference          | Shall not be included.                                                                                                                                                                                                                                                                              |
| - Synchronization Indication               | "Synchronized".                                                                                                                                                                                                                                                                                     |
| - Normal Cell Indication                   | Ignore out of range timing advance.                                                                                                                                                                                                                                                                 |
| Frequency List after time                  |                                                                                                                                                                                                                                                                                                     |
| - Frequency List                           | Use Range 512 to encode the complete CA of Cell B.                                                                                                                                                                                                                                                  |
| Description of the multislot configuration |                                                                                                                                                                                                                                                                                                     |
| - Downlink assignment                      | For Type 1 MS timeslots are shifted one position to right if timeslot 7 is not used. If timeslot 7 is used then timeslots are shifted one position to left. For type 2 MS timeslots are shifted one position to right taking into account rules of multislot capability described in 05.02 Annex B. |
| - Uplink assignment                        | For Type 1 MS timeslots are shifted one position to right if timeslot 7 is not used. If timeslot 7 is used then timeslots are shifted one position to left. For type 2 MS timeslots are shifted one position to right taking into account rules of multislot capability described in 05.02 Annex B. |
| - Channel set X (1=<X<=8)                  | Appropriate for the test.                                                                                                                                                                                                                                                                           |

| - TDMA offset                              | Chosen arbitrarily.                                                                                                                                                                                                                                                                                 |
| - Timeslot number                          | A suitable value for multislot configuration, chosen arbitrarily.                                                                                                                                                                                                                                   |
| - Training Sequence Code                   | Chosen arbitrarily.                                                                                                                                                                                                                                                                                 |
| - Hopping                                  | RF hopping channel.                                                                                                                                                                                                                                                                                 |
| - MAIO                                     | Chosen arbitrarily from the set (0, 1 to N-1), where N is the number of frequencies encoded in the Frequency List IE.                                                                                                                                                                               |
| - HSN                                      | Zero (this gives cyclic hopping).                                                                                                                                                                                                                                                                   |
| Handover Reference                         |                                                                                                                                                                                                                                                                                                     |
| - Value                                    | Chosen arbitrarily from the range (0, 1..255).                                                                                                                                                                                                                                                      |
| Power command                              |                                                                                                                                                                                                                                                                                                     |
| - Power Level                              | Arbitrarily chosen, but different to the one already in use and within the range supported by the MS.                                                                                                                                                                                               |
| Synchronization Indication                 |                                                                                                                                                                                                                                                                                                     |
| - Report Observed Time Difference          | Shall not be included.                                                                                                                                                                                                                                                                              |
| - Synchronization Indication               | "Synchronized".                                                                                                                                                                                                                                                                                     |
| - Normal Cell Indication                   | Ignore out of range timing advance.                                                                                                                                                                                                                                                                 |
| Frequency List after time                  |                                                                                                                                                                                                                                                                                                     |
| - Frequency List                           | Use Range 512 to encode the complete CA of Cell B.                                                                                                                                                                                                                                                  |
| Description of the multislot configuration |                                                                                                                                                                                                                                                                                                     |
| - Downlink assignment                      | For Type 1 MS timeslots are shifted one position to right if timeslot 7 is not used. If timeslot 7 is used then timeslots are shifted one position to left. For type 2 MS timeslots are shifted one position to right taking into account rules of multislot capability described in 05.02 Annex B. |
| - Uplink assignment                        | For Type 1 MS timeslots are shifted one position to right if timeslot 7 is not used. If timeslot 7 is used then timeslots are shifted one position to left. For type 2 MS timeslots are shifted one position to right taking into account rules of multislot capability described in 05.02 Annex B. |
| - Channel set X (1=<X<=8)                  | Appropriate for the test.                                                                                                                                                                                                                                                                           |

| - Report Observed Time Difference          | Shall not be included.                                                                                                                                                                                                                                                                              |
| - Synchronization Indication               | "Synchronized".                                                                                                                                                                                                                                                                                     |
| - Normal Cell Indication                   | Ignore out of range timing advance.                                                                                                                                                                                                                                                                 |
| Frequency List after time                  |                                                                                                                                                                                                                                                                                                     |
| - Frequency List                           | Use Range 512 to encode the complete CA of Cell B.                                                                                                                                                                                                                                                  |
| Description of the multislot configuration |                                                                                                                                                                                                                                                                                                     |
| - Downlink assignment                      | For Type 1 MS timeslots are shifted one position to right if timeslot 7 is not used. If timeslot 7 is used then timeslots are shifted one position to left. For type 2 MS timeslots are shifted one position to right taking into account rules of multislot capability described in 05.02 Annex B. |
| - Uplink assignment                        | For Type 1 MS timeslots are shifted one position to right if timeslot 7 is not used. If timeslot 7 is used then timeslots are shifted one position to left. For type 2 MS timeslots are shifted one position to right taking into account rules of multislot capability described in 05.02 Annex B. |
| - Channel set X (1=<X<=8)                  | Appropriate for the test.                                                                                                                                                                                                                                                                           |

## HANDOVER ACCESS

| Information Element                 | value/remark             |
|-------------------------------------|--------------------------|

| - Channel Type                             | 00000                                                                                                                                                                                                                                                                                               |
| - TDMA offset                              | Chosen arbitrarily.                                                                                                                                                                                                                                                                                 |
| - Timeslot number                          | A suitable value for multislot configuration, chosen arbitrarily.                                                                                                                                                                                                                                   |
| - Training Sequence Code                   | Chosen arbitrarily.                                                                                                                                                                                                                                                                                 |
| - Hopping                                  | RF hopping channel.                                                                                                                                                                                                                                                                                 |
| - MAIO                                     | Chosen arbitrarily from the set (0, 1 to N-1), where N is the number of frequencies encoded in the Frequency List IE.                                                                                                                                                                               |
| - HSN                                      | Zero (this gives cyclic hopping).                                                                                                                                                                                                                                                                   |
| Handover Reference                         |                                                                                                                                                                                                                                                                                                     |
| - Value                                    | Chosen arbitrarily from the range (0, 1..255).                                                                                                                                                                                                                                                      |
| Power command                              |                                                                                                                                                                                                                                                                                                     |
| - Power Level                              | Arbitrarily chosen, but different to the one already in use and within the range supported by the MS.                                                                                                                                                                                               |
| Synchronization Indication                 |                                                                                                                                                                                                                                                                                                     |
| - Report Observed Time Difference          | Shall not be included.                                                                                                                                                                                                                                                                              |
| - Synchronization Indication               | "Synchronized".                                                                                                                                                                                                                                                                                     |
| - Normal Cell Indication                   | Ignore out of range timing advance.                                                                                                                                                                                                                                                                 |
| Frequency List after time                  |                                                                                                                                                                                                                                                                                                     |
| - Frequency List                           | Use Range 512 to encode the complete CA of Cell B.                                                                                                                                                                                                                                                  |
| Description of the multislot configuration |                                                                                                                                                                                                                                                                                                     |
| - Downlink assignment                      | For Type 1 MS timeslots are shifted one position to right if timeslot 7 is not used. If timeslot 7 is used then timeslots are shifted one position to left. For type 2 MS timeslots are shifted one position to right taking into account rules of multislot capability described in 05.02 Annex B. |
| - Uplink assignment                        | For Type 1 MS timeslots are shifted one position to right if timeslot 7 is not used. If timeslot 7 is used then timeslots are shifted one position to left. For type 2 MS timeslots are shifted one position to right taking into account rules of multislot capability described in 05.02 Annex B. |
| - Channel set X (1=<X<=8)                  | Appropriate for the test.                                                                                                                                                                                                                                                                           |

| - Frequency List                           | Use Range 512 to encode the complete CA of Cell B.                                                                                                                                                                                                                                                  |
| Description of the multislot configuration |                                                                                                                                                                                                                                                                                                     |
| - Downlink assignment                      | For Type 1 MS timeslots are shifted one position to right if timeslot 7 is not used. If timeslot 7 is used then timeslots are shifted one position to left. For type 2 MS timeslots are shifted one position to right taking into account rules of multislot capability described in 05.02 Annex B. |
| - Uplink assignment                        | For Type 1 MS timeslots are shifted one position to right if timeslot 7 is not used. If timeslot 7 is used then timeslots are shifted one position to left. For type 2 MS timeslots are shifted one position to right taking into account rules of multislot capability described in 05.02 Annex B. |
| - Channel set X (1=<X<=8)                  | Appropriate for the test.                                                                                                                                                                                                                                                                           |

## HANDOVER ACCESS

| Information Element                 | value/remark             |
|-------------------------------------|--------------------------|
| As default message contents except: |                          |
| Handover Reference                  |                          |
| - Value                             | Same as HANDOVER COMMAND |

### 26.13.1.3.5 Multislot signalling / RR /Handover / successful / call under establishment / pre-synchronized / resource upgrading

If an MS does not implement the pre-synchronized handover procedure correctly then calls may fail.

If an MS does not report the observed time difference between cells correctly then pseudo synchronized handovers might not be possible for any MS.

This test is applicable to all MS that supports multislot configuration.

#### 26.13.1.3.5.1 Conformance requirements

- 1) If during call establishment a Layer 3 MM or CC message just sent by the MS is not Layer 2 acknowledged before the channel change caused by the HANOVER COMMAND message, the MS shall send the Layer 3 message to the new cell, using the same value in the N(SD) field, after the handover procedure.
- 2) When the Timing Advance information element is included in the HANOVER COMMAND, the MS shall access the new cell with the timing advance included in the Timing Advance IE.
- 3) The MS shall be ready to transmit the HANOVER COMPLETE message within 650 ms of the end of the HANOVER COMMAND message.
- 4) When requested to do so in the HANOVER COMMAND message, the MS shall return the Mobile Time Difference IE in the HANOVER COMPLETE message indicating the sum of the observed time difference between the cells and the timing advance used on the old cell.

Conformance requirement 1: 3GPP TS 04.08 / 3GPP TS 44.018, subclauses 3.1.4.3 and 9.1.5.

Conformance requirement 2: 3GPP TS 05.10, subclause 6.6, 3GPP TS 04.08 subclause 9.1.16.

Conformance requirement 3: 3GPP TS 04.13, subclause 5.2.6.1.

Conformance requirement 4: 3GPP TS 04.08 / 3GPP TS 44.018, subclause 10.5.2.39.

#### 26.13.1.3.5.2 Test purpose

- 1) To verify that when the MS is ordered to make a pre-synchronized handover from hopping multislot configuration to non-hopping multislot configuration, it sends 4 access bursts on the main DCCH and then activates the channel correctly and correctly calculates the time to transmit.
- 2) To test that the MS activates the new channels that belong to same multislot configuration correctly, taking into account upgraded resources and transmits the HANOVER COMPLETE message without undue delay.

#### 26.13.1.3.5.3 Method of test

##### Initial Conditions

System Simulator:

- 2 cells, A and B, with same LAI, default parameters, except:
  - Early classmark sending enabled in SI3 rest octets.
- The BCCH of cell A is sent k bit periods before the BCCH of cell B.

Mobile Station:

- The MS is in the "idle, updated" state, with a TMSI allocated and camped on cell A.

##### Related PICS/PIXIT Statements

- Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800).
- Multislot class.
- Classmark.

##### Foreseen Final State of the MS

"Idle, updated" with TMSI allocated and camped on cell B.

## Test Procedure

A Mobile Originating Call is initiated. The SS sends an IMMEDIATE ASSIGNMENT message allocating an SDCCH/4. The MS is commanded to use a timing advance of  $y$  bit periods on cell A. After the MS has sent the SETUP message (and before the last L2 frame carrying the SETUP message is acknowledged by the SS) the SS sends ASSIGNMENT COMMAND message to MS specifying used multislot configuration. MS responds by sending ASSIGNMENT COMPLETE message to SS. Then the SS sends a HANDOVER COMMAND, ordering the MS to switch to cell B. The MS shall then send 4 access bursts, at the commanded power level, in 4 successive slots of the new DCCH to cell B. Then the MS shall establish a signalling link using the correct timing advance and send a HANDOVER COMPLETE message. The MS shall be ready to transmit the HANDOVER COMPLETE message before 650 ms after the end of the HANDOVER COMMAND message, but not before a UA frame has been sent by the SS.

The term "ready to transmit" is defined in 3GPP TS 04.13.

The MS shall then again send the SETUP message to the SS, using the same value in the N(SD) field. Finally the SS sends a CHANNEL RELEASE to end the test.

## Maximum Duration of Test

20 s.

## Expected Sequence

| Step | Direction | Message                 | Comments                                                                                                                                                                                                                                           |
|------|-----------|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Timing Advance                            | 9 bit periods.                                                    |

## 26.13.1.4 Multislot signalling / RR / Test of the channel mode modify procedure

This test is applicable to all MS that supports multislot configuration.

## 26.13.1.4.1 Conformance requirements

- 1) When the MS has received the CHANNEL MODE MODIFY message, the mobile station changes the mode for the indicated channel and then replies by a CHANNEL MODE MODIFY ACKNOWLEDGE message indicating the new channel mode.
- 2) If the mobile station does not support the indicated mode, it shall retain the old mode and return the associated channel mode information in the CHANNEL MODE MODIFY ACKNOWLEDGE message.

## References

Conformance requirement: 3GPP TS 04.08 / 3GPP TS 44.018, subclauses 3.4.6 and 9.1.5 and 9.1.6.

### 26.13.1.4.2 Test purpose

- 1) To verify that the MS, in an RR connected state, acknowledges a CHANNEL MODE MODIFY message by sending a CHANNEL MODE MODIFY ACKNOWLEDGEMENT message specifying and switching to the correct mode for the channels in a multislot configuration:
  - the new mode if that mode is supported;
  - the old mode if the new mode is not supported.
- 2) This shall be verified for all existing channel modes:
  - data 9,6 Kb/s:
  - data 4,8 Kb/s full rate:
  - data 14,4 Kb/s.

### 26.13.1.4.3 Method of test

#### Initial Conditions

##### System Simulator:

- 1 cells, default parameters except:
- Early classmark sending enabled in SI3 rest octets

##### Mobile Station:

- The MS is "idle updated", with TMSI allocated.

#### Related PICS/PIXIT statement(s)

- Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800).
- Supported tesleservices/bearer services.
- Channel modes supported by the MS:
  - MS supports data 9,6 Kb/s (p1 = Y/N);
  - MS supports data 4,8 Kb/s full rate (p2 = Y/N);
  - MS supports data 14.4 Kb/s (p3 = Y/N).
- Multislot class.
- Classmark.

#### Foreseen final state of the MS

"Idle, updated " with TMSI allocated.

## Test procedure

- 1) A Mobile Terminated multislot connection is initiated, however following the Channel Request received from the Mobile Station, the SS sends an Immediate Assignment to the MS commanding it to go to a TCH/F. This sets the Channel Mode automatically to "Signalling Only".
- 2) The SS then sends a series of CHANNEL MODE MODIFY messages to the MS. Each time it is checked that the MS responds with a CHANNEL MODE MODIFY ACKNOWLEDGE message specifying:
  - 2.1) the channel mode that has been specified in the CHANNEL MODE MODIFY message, if the MS supports that mode (this mode then becomes the "channel mode in use");
  - 2.2) the channel mode that was in use when the CHANNEL MODE MODIFY message has been received, if the MS does not support the channel mode specified in the CHANNEL MODE MODIFY message.

## Maximum duration of test

3 minutes.

## Expected Sequence

| Step | Direction | Message                            | Comments                                                     |
|------|-----------|------------------------------------|--------------------------------------------------------------|
| 1    | SS->MS    | PAGING REQUEST TYPE 1              | Sent on correct paging subchannel.                           |
| 2    | MS->SS    | CHANNEL REQUEST                    | Establishment cause indicates "answer to paging".            |
| 3    | SS->MS    | IMMEDIATE ASSIGNMENT               | Assignment to a non hopping TCH/F.                           |

### 26.13.1.5 Multislot signalling / RR / Early classmark sending

This test is applicable to all MS that supports multislot configuration.

#### 26.13.1.5.1 Conformance requirement

- 1) MS uses Controlled Early Classmark Sending procedure when indicated in SYSTEM INFORMATION TYPE 3 (ES ind bit in SI 3 Rest Octets).
  - 1.1) If Controlled Early Classmark Sending is not allowed by network the MS does not send a CLASSMARK CHANGE message.
  - 1.2) If Controlled Early Classmark Sending is allowed by network the MS shall send its multislot class in Mobile Station Classmark 3 in a CLASSMARK CHANGE message.

#### Reference

Conformance requirement 1: 3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.3.1.1.4 and 3.4.10.

#### 26.13.1.5.2 Test purpose

- 1) To verify that the MS sends its multislot class in Mobile Station Classmark 3 using Controlled Early Classmark Sending procedure if allowed by network.
- 2) To verify that the MS does not perform Early Classmark Sending if it is not allowed.

#### 26.13.1.5.3 Method of test

##### Initial conditions

##### Mobile Station:

- The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

##### System Simulator:

- 1 cell, default parameters except:
  - Early classmark sending enabled in SI3 rest octets

##### Related PICS/PIXIT statement(s)

- Classmark.
- Multislot class.

##### Foreseen final state of the MS

MS is in MM-state "idle, updated" with valid TMSI and CKSN.

##### Test procedure

The MS is made to initiate a multislot connection. In the first case Controlled Early Classmark Sending procedure is allowed by network, the MS performs Early Classmark sending. In the second case Controlled Early Classmark Sending procedure is not allowed by network, the MS does not send a CLASSMARK CHANGE message.

SS checks Controlled Early Classmark Change procedure from CLASSMARK CHANGE message. If Controlled Early Classmark Sending procedure is allowed by the network ES ind bit in SI 3 Resr Octets is set. If this bit is not set SS sends CHANNEL RELEASE and the main signalling link is released. If ES ind bit was set then the MS's multislot class is sent in Mobile Station Classmark 3 (octet 4) in the CLASSMARK CHANGE message.

Maximum duration of test

2 minutes.

Expected sequence

This test is executed with the following sequences in allowed and not allowed cases respectively.

After the first sequence Early classmark sending is disabled from SI3 rest octets.

| Step | Direction | Message               | Comments                                                                  |
|------|-----------|-----------------------|---------------------------------------------------------------------------|
|      | SS        |                       | Controlled Early Classmark Sending procedure is allowed by the network.   |
| 1    | SS -> MS  | PAGING REQUEST TYPE 1 | Sent on the correct paging subchannel.                                    |
| 2    | MS -> SS  | CHANNEL REQUEST       | Establishment cause is: answer to paging                                  |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT  |                                                                           |
| 4    | MS -> SS  | PAGING RESPONSE       | Message is contained in SABM.                                             |
| 5    | MS -> SS  | CLASSMARK CHANGE      | SS checks that MS sent its multislot class in Mobile Station Classmark 3. |
| 7    | SS -> MS  | CHANNEL RELEASE       | The main signalling link is released                                      |

| Step | Direction | Message               | Comments                                                                    |
|------|-----------|-----------------------|-----------------------------------------------------------------------------|
|      | SS        |                       | Controlled Early Classmark Sending procedure is not allowed by the network. |
| 1    | SS -> MS  | PAGING REQUEST TYPE 1 | Sent on the correct paging subchannel.                                      |
| 2    | MS -> SS  | CHANNEL REQUEST       | Establishment cause is: answer to paging                                    |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT  |                                                                             |
| 4    | MS -> SS  | PAGING RESPONSE       | Message is contained in SABM                                                |
| 5    | SS        |                       | SS checks for 2 seconds that no CLASSMARK CHANGE message is sent by the MS. |
| 6    | SS -> MS  | CHANNEL RELEASE       | The main signalling link is released.                                       |

NOTE: Step 5: 3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.3.1.1.4.1 states that the MS shall send CLASSMARK CHANGE as early as possible. 2 seconds are chosen as a reasonable value to verify that the MS does not send a CLASSMARK CHANGE message.

## 26.13.1.6 Default contents of layer 3 messages for RR tests

### 26.13.1.6.1 Default contents of GSM 900 layer 3 messages for RR tests

This subclause contains the default values of GSM 900 L3 messages, which unless indicated otherwise in subclause 26.13 shall be transmitted by the system simulator and which are required to be received from the GSM 900 MS under test.

The necessary L3 messages are listed in alphabetic order, with the exception of the SYSTEM INFORMATION messages, where it is the information elements that are listed in alphabetic order (this is because some information elements occur in several SYSTEM INFORMATION types).

In this subclause, decimal values are normally used. However, sometimes a hexadecimal value, indicated by an "H", or a binary value, indicated by a "B" is used.

Default SYSTEM INFORMATION:

NOTE 1: SYSTEM INFORMATION 2 bis, SYSTEM INFORMATION 5 bis, SYSTEM INFORMATION 7, and SYSTEM INFORMATION 8 messages are not used.

## Cell A

Contents of information elements in SYSTEM INFORMATION TYPE 1 to 6 messages for cell A.

|                                |                                                                                 |
|--------------------------------|---------------------------------------------------------------------------------|
| (CBCH) Channel Description     | Not present.                                                                    |
| (CBCH) Mobile Allocation       | Not present.                                                                    |
| Cell Channel Description       |                                                                                 |
| - Format identifier            | bit map 0.                                                                      |
| - Cell Allocation ARFCN        | Channels 20, 30, 50 and 70.                                                     |
| Cell Identity                  |                                                                                 |
| - Cell Identity Value          | 0001H                                                                           |

Default settings for cell A:

|                          |                                            |
|--------------------------|--------------------------------------------|
| Downlink input level     | 63 dBmicroVolt emf.                        |
| Uplink output power      | minimum supported by the MS's power class. |
| Propagation profile      | static.                                    |
| BCCH/CCCH carrier number | 20                                         |

Cell B

The contents of SYSTEM INFORMATION TYPE 1 to 6 messages for cell B are identical to those of cell A with the following exceptions:

|                                                                            |                                  |
|----------------------------------------------------------------------------|----------------------------------|
| Cell Channel Description<br>- Format Identifier<br>- Cell Allocation ARFCN | Bit map 0.<br>Channel Number 10. |
|----------------------------------------------------------------------------|----------------------------------|

NOTE 2: This IE needs modification when used in handover tests that command the MS to go to a frequency hopping channel in cell B.

Cell Identity

- Cell Identity Value: 0002H.

Default settings for cell B:

|                          |                                            |
|--------------------------|--------------------------------------------|
| Downlink input level     | 53 dBmicroVolt emf.                        |
| Uplink output power      | minimum supported by the MS's power class. |
| Propagation profile      | static.                                    |
| BCCH/CCCH carrier number | 10                                         |

Contents of ALERTING message (SS to MS):

### 26.13.1.6.2 Default contents of DCS 1 800 layer 3 messages for RR tests

This subclause contains the default values of DCS 1 800 L3 messages, which unless indicated otherwise in subclause 26.6 shall be transmitted by the system simulator and which are required to be received from the DCS 1 800 MS under test. These values are used in order to be consistent with the phase 2 version of 26.6.

The necessary L3 messages are listed in alphabetic order, with the exception of the SYSTEM INFORMATION messages, where it is the information elements that are listed in alphabetic order (this is because some information elements occur in several SYSTEM INFORMATION types).

In this subclause, decimal values are normally used. However, sometimes a hexadecimal value, indicated by an "H", or a binary value, indicated by a "B" is used.

**Default SYSTEM INFORMATION:**

NOTE 1: SYSTEM INFORMATION 2 bis, SYSTEM INFORMATION 7, and SYSTEM INFORMATION 8 messages are not used.  
SYSTEM INFORMATION 5 bis is not sent as a default message. For those tests that require SYSTEM INFORMATION 5 bis see the specific message contents for that test.

## Cell A

Contents of information elements in SYSTEM INFORMATION TYPE 1 to 6 messages for cell A.

### 26.13.1.6.3 Default contents of GSM 450 layer 3 messages for RR tests

This subclause contains the default values of GSM 450 L3 messages, which unless indicated otherwise in subclause 26.13 shall be transmitted by the system simulator and which are required to be received from the GSM 450 MS under test.

The necessary L3 messages are listed in alphabetic order, with the exception of the SYSTEM INFORMATION messages, where it is the information elements that are listed in alphabetic order (this is because some information elements occur in several SYSTEM INFORMATION types).

In this subclause, decimal values are normally used. However, sometimes a hexadecimal value, indicated by an "H", or a binary value, indicated by a "B" is used.

#### Default SYSTEM INFORMATION:

NOTE 1: SYSTEM INFORMATION 2 bis, SYSTEM INFORMATION 5 bis, SYSTEM INFORMATION 7, and SYSTEM INFORMATION 8 messages are not used.

## Cell A

Contents of information elements in SYSTEM INFORMATION TYPE 1 to 6 messages for cell A.

| (CBCH) Mobile Allocation       | Not present.                                                                    |
| Cell Channel Description       |                                                                                 |
| - Format identifier            | Range 128.                                                                      |
| - Cell Allocation ARFCN        | Channels 263, 267, 275 and 279.                                                 |
| Cell Identity                  |                                                                                 |
| - Cell Identity Value          | 0001H                                                                           |
| Cell Options                   |                                                                                 |
| - Power Control Indicator      | Power Control Indicator is not set.                                             |
| - DTX Indicator                | MS shall not use DTX.                                                           |
| - Radio_Link_Timeout           | 8 SACCH blocks.                                                                 |
| Cell Selection Parameters      |                                                                                 |
| - Cell_Reselect_Hysteresis     | 12 dB.                                                                          |
| - MX_TXPWR_MAX_CCH             | Minimum level.                                                                  |
| - ACS                          | No addition cell parameters are present in SYSTEM INFORMATION messages 7 and 8. |
| - NECI                         | New establishment causes not supported.                                         |
| - RXLEV_ACCESS_MIN             | Minimum level.                                                                  |
| Control Channel Description    |                                                                                 |
| - Attach-Detach allowed        | No Attach/Detach.                                                               |
| - BS_AG_BLK_RES                | 0 blocks reserved for access grant.                                             |
| - CCCH_CONF                    | 1 basic physical channel used for CCCH, combined with SDCCCHs.                  |
| - BS_PA_MFRMS                  | 5 multiframe periods for transmission of paging messages.                       |
| - T3212 Time-out value         | Infinite.                                                                       |
| L2 pseudo length               |                                                                                 |
| - System information 1         | 21                                                                              |
| - System information 2         | 22                                                                              |
| - System information 3         | 18                                                                              |
