3. To verify that the MS selects suitable cells in descending order of received signal strength.
4. To verify that the MS does not select a cell with  $C1 < 0$ .

## 20.23.1.4 Method of test

## Initial conditions

Parameters changed from the default values in table 20.23.1.

| Parameter              | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBm)  | -75       | -80       | -70       | -60       | -70       | -80       |
| CBA2                   | 0         | 0         | 0         | 1         | 0         |           |
| RXLEV_ACCESS_MIN (dBm) |           |           |           |           |           | -90       |
| GPRS_RXLEV_ACCESS_MIN  | -90       | -90       | -90       | -90       | -60       |           |
| MNC                    |           |           | 01        |           |           |           |
| MCC                    |           |           | 002       |           |           |           |
| C1                     | 15        | 10        | 20        | 30        | -10       | 10        |

NOTE 1: For an E-GSM MS carrier 1 and carrier 5 ARFCNs are chosen in the E-GSM band, carrier 3 and carrier 4 ARFCNs in the P-GSM band.

NOTE 2: Carrier 6 is GSM BCCH and do not support GPRS/EGPRS.

## Procedure

- a) The SS activates and pages on the MS on all carriers. All Carriers are monitored for RA requests from the MS.
- b) The MS is switched on.

### 20.23.1.5 Test requirements

- 1) After step b), the first response from the MS shall be on carrier 1 within 123 s. There shall be no response from the MS on any other carrier.

## 20.23.2 Cell reselection in Packet Idle mode

### 20.23.2.1 Definition and applicability

This test is applicable for mobile stations either packet data only capable or mobile stations not supporting GSM CS services.

### 20.23.2.2 Conformance requirement

At least for every new sample or every second, whichever is the greatest, the MS shall update  $RLA\_P$  and calculate the value of  $C1$ ,  $C31$  and  $C32$  for the serving cell and the non-serving cells; 3GPP TS 05.08, subclause 10.1.2 The MS shall make a cell re-selection if:

- (i) The path loss criterion parameter ( $C1$ ) for the serving cell falls below zero.
- (ii) A non-serving suitable cell (see 3GPP TS 03.22) is evaluated to be better than the serving cell. The best cell is the cell with the highest value of  $C32$  among:
  - those cells that have the highest  $PRIORITY\_CLASS$  among those that fulfil the criterion  $C31 \geq 0$ ; or
  - all cells, if no cells fulfil the criterion  $C31 \geq 0$ ;
  - if the parameter  $C32\_QUAL$  is set, positive  $GPRS\_RESELECT\_OFFSET$  values shall only be applied to the neighbour cell with the highest  $RLA\_P$  value of those cells for which  $C32$  is compared above.

$PRIORITY\_CLASS$  and  $C32\_QUAL$  are broadcast on CPBCCCH of the serving cell.

When evaluating the best cell, the following hysteresis values shall be subtracted from the  $C32$  value for the neighbour cells:

- in standby state, if the new cell is in the same routing area: 0.
- in ready state, if the new cell is in the same routing area:
  - $GPRS\_CELL\_RESELECT\_HYSTERESIS$ . If the parameter  $C31\_HYST$  is set;
  - $GPRS\_CELL\_RESELECT\_HYSTERESIS$  shall also be subtracted from the  $C31$  value for the neighbour cells.
- in standby or ready state, if the new cell is in a different routing area:
  - $RA\_RESELECT\_HYSTERESIS$ .
- in case of a cell re-selection occurred within the previous 15 s: 5 dB.
  - $GPRS\_CELL\_RESELECT\_HYSTERESIS$ ,  $C31\_HYST$  and  $RA\_RESELECT\_HYSTERESIS$  are broadcast on CPBCCCH of the serving cell.

### 20.23.2.3 Test purpose

To verify that the MS reselects the correct cell based on the  $C32$  parameter when  $GPRS\_RESELECT\_OFFSET$ ,  $TEMPORARY\_OFFSET$  and  $PENALTY\_TIME$  parameters are transmitted in the System information messages.

1. To verify MS does not reselect on the basis of C31 as there are no HCS threshold values transmitted in the System information messages.

#### 20.23.2.4 Method of test

##### Initial conditions

Parameters changed from the default values in table 20.23.1.

| Parameter                   | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|-----------------------------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBm)       | -70       | -70       | -65       | -60       |
| GPRS_RXLEV_ACCESS_MIN (dBm) | -90       | -100      | -85       | -90       |
| GPT                         |           |           | 40 s      |           |
| GRO                         |           | -20 dB    | 20 dB     |           |
| GTO                         |           |           | 20 dB     |           |
| C1                          | 20        | 30        | 20        | 30        |
| C32                         | 20        | 10        | 20-40     | 30        |

NOTE 1: The BA(GPRS) list only contains the ARFCNs of the carriers used during the test.

NOTE 2: The HCS structure is omitted from the packet system information messages.

##### Procedure

- a) The SS activates carriers 1 and 4. The MS is paged on Carriers 1 and 4. The SS starts monitoring carriers 1 and 4 for RA requests from the MS.
- b) The MS is switched on.
- c) The SS activates carriers 2 and 3. The MS is paged on both carriers. The SS monitors carriers 2 and 3 for RA requests from the MS.

#### 20.23.2.5 Test Requirements

- 1) After step b) there should be a response on carrier 4 within 123 s.

NOTE 1: The SS should ensure that the MS final state is in Packet Idle mode on carrier 4.

- 2) After step c) there should be no response on carrier 3 within 38 s of activating the carrier but MS should respond on carrier 3 within 50 s of activating the carrier.

NOTE 2: Minimum time of 38 s set by penalty timer on carrier 4 less 2 second tolerance. Maximum time includes 42 s (40 s + 2 s tolerance) for expiry of penalty timer on carrier 4, 2 s to decode CPBCCCH, 1 s for reselection, since the MS will already have running averages on carrier 4, when the penalty timers expire, allow 50 s.

### 20.23.3 Priority of cells

#### 20.23.3.1 Definition and applicability

This test is applicable for mobile stations either packet data only capable or mobile stations not supporting GSM CS services.

#### 20.23.3.2 Conformance requirement

At least for every new sample or every second, whichever is the greatest, the MS shall update RLA\_P and calculate the value of C1, C31 and C32 for the serving cell and the non-serving cells; 3GPP TS 05.08, subclause 10.1.2 The MS shall make a cell re-selection if:

- (i) The path loss criterion parameter (C1) for the serving cell falls below zero.

(ii) A non-serving suitable cell (see 3GPP TS 03.22) is evaluated to be better than the serving cell. The best cell is the cell with the highest value of C32 among:

- those cells that have the highest PRIORITY\_CLASS among those that fulfil the criterion  $C31 \geq 0$ ; or
- all cells, if no cells fulfil the criterion  $C31 \geq 0$ ;
- if the parameter C32\_QUAL is set, positive GPRS\_RESELECT\_OFFSET values shall only be applied to the neighbour cell with the highest RLA\_P value of those cells for which C32 is compared above.

PRIORITY\_CLASS and C32\_QUAL are broadcast on CPBCCCH of the serving cell.

When evaluating the best cell, the following hysteresis values shall be subtracted from the C32 value for the neighbour cells:

- in standby state, if the new cell is in the same routing area: 0.
- in ready state, if the new cell is in the same routing area:
  - GPRS\_CELL\_RESELECT\_HYSTERESIS. If the parameter C31\_HYST is set;
  - GPRS\_CELL\_RESELECT\_HYSTERESIS shall also be subtracted from the C31 value for the neighbour cells.
- in standby or ready state, if the new cell is in a different routing area:
  - RA\_RESELECT\_HYSTERESIS.
- in case of a cell re-selection occurred within the previous 15 s: 5 dB.
  - GPRS\_CELL\_RESELECT\_HYSTERESIS, C31\_HYST and RA\_RESELECT\_HYSTERESIS are broadcast on CPBCCCH of the serving cell.

### 20.23.3.3 Test purpose

1. To verify that the MS reselects to the correct cell by calculating C31 correctly when C31\_HYST is set on the network.

### 20.23.3.4 Method of Test

#### Initial Conditions

Parameters changed from the default values in table 20.23.1.

| Parameter                                   | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 |
|---------------------------------------------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBm)                       | -60       | -80       | -65       | -70       | -70       |
| GPRS_RXLEV_ACCESS_MIN (dBm)<br>C31_HYST = 1 | -100      | -100      | -95       | -100      | -102      |
| Priority Class                              | 1         | 1         | 1         | 1         | 3         |
| GRO                                         |           | 10        | 4         | 10        | 14        |
| HCS_THR                                     | -90       | -70       | -76       | -80       | -80       |
| GCRH                                        | 10        |           |           |           |           |
| C1                                          | 40 to 15  | 20        | 30        | 30        | 32        |
| C31                                         | 20 to 5   | -10       | 11        | 10        | 10        |
| C32                                         | 40 to 15  | 20        | 24        | 30        | 36        |

NOTE 1: GRO = GPRS\_RESELECT\_OFFSET, GCRH = GPRS\_CELL\_RESELECT\_HYSTERESIS, RARH = RA\_RESELECT\_HYSTERESIS.

NOTE 2: The BA(GPRS) list only contains the ARFCNs of the carriers used during the test. The HCS structure is transmitted in the Packet system information messages.

## Procedure

- a) The MS is switched on and a downlink TBF is set-up on carrier 1.
- b) The SS waits 10 s.
- c) The RF level of Carrier 1 is reduced to -85 dBm (C1=decreases to 15).

### 20.23.3.5 Test Requirements

After step c) the MS should respond on carrier 4 within 10 s. (Carrier 2 should be rejected as  $C31 < 0$ , Carrier 5 has a lower priority class than Carrier 3 and Carrier 4 so is rejected, even though  $C32 = 36$ , out of carrier 3 and 4, Carrier 4 has highest C32 value.

NOTE: Time allowed includes 5 s for MS to determine C32 on neighbour cell is higher, 2 s to decode CPBCCCH and 1 s for re-selection.

## 20.23.4 Cell re-selection with cells in different routing area

### 20.23.4.1 Definition and applicability

This test is applicable for mobile stations either packet data only capable or mobile stations not supporting GSM CS services.

### 20.23.4.2 Conformance requirement

At least for every new sample or every second, whichever is the greatest, the MS shall update RLA\_P and calculate the value of C1, C31 and C32 for the serving cell and the non-serving cells; 3GPP TS 05.08, subclause 10.1.2 The MS shall make a cell re-selection if:

- (i) The path loss criterion parameter (C1) for the serving cell falls below zero.
- (ii) A non-serving suitable cell (see 3GPP TS 03.22) is evaluated to be better than the serving cell. The best cell is the cell with the highest value of C32 among:
  - those cells that have the highest PRIORITY\_CLASS among those that fulfil the criterion  $C31 \geq 0$ ; or
  - all cells, if no cells fulfil the criterion  $C31 \geq 0$ ;
  - if the parameter C32\_QUAL is set, positive GPRS\_RESELECT\_OFFSET values shall only be applied to the neighbour cell with the highest RLA\_P value of those cells for which C32 is compared above.

PRIORITY\_CLASS and C32\_QUAL are broadcast on CPBCCCH of the serving cell.

When evaluating the best cell, the following hysteresis values shall be subtracted from the C32 value for the neighbour cells:

- in standby state, if the new cell is in the same routing area: 0.
- in ready state, if the new cell is in the same routing area:
  - GPRS\_CELL\_RESELECT\_HYSTERESIS. If the parameter C31\_HYST is set;
  - GPRS\_CELL\_RESELECT\_HYSTERESIS shall also be subtracted from the C31 value for the neighbour cells.
- in standby or ready state, if the new cell is in a different routing area:
  - RA\_RESELECT\_HYSTERESIS.
- in case of a cell re-selection occurred within the previous 15 s: 5 dB.
  - GPRS\_CELL\_RESELECT\_HYSTERESIS, C31\_HYST and RA\_RESELECT\_HYSTERESIS are broadcast on CPBCCCH of the serving cell.

### 20.23.4.3 Test purpose

To verify that the MS reselects to the correct cell by calculating C32 correctly when one of the cells is in a different routing area.

### 20.23.4.4 Method of Test

#### Initial Conditions

Parameters changed from the default values in table 20.23.1.

| Parameter                   | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 |
|-----------------------------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBm)       | -60       | -70       | -70       | -70       | -70       |
| RAI                         |           |           |           | Different |           |
| GPRS_RXLEV_ACCESS_MIN (dBm) | -100      | -80       | -100      | -100      | -80       |
| GRO                         |           | 4         | 4         | 6         | 4         |
| GCRH                        | 4         |           |           |           |           |
| RARH                        | 14        |           |           |           |           |
| C1                          | 40 to 15  | 10        | 30        | 30        | 10        |
| C32                         | 40 to 15  | 14        | 34        | 22        | 14        |

NOTE 1: GRO = GPRS\_RESELECT\_OFFSET, GCRH = GPRS\_CELL\_RESELECT\_HYSTERESIS, RARH = RA\_RESELECT\_HYSTERESIS.

NOTE 2: The BA(GPRS) list only contains the ARFCNs of the carriers used during the test. The HCS structure is transmitted in the Packet system information messages.

#### Procedure

- a) The MS is switched on and a downlink TBF is set-up on carrier 1.
- b) The SS waits 10 s.
- c) The RF level of Carrier 1 is reduced to -85 dBm (C1=decreases to 15).

### 20.23.4.5 Test Requirements

After step c) the MS should respond on carrier 3 within 10 s. (Carrier 4 C32=22 if RA\_RESELECT\_HYSTERESIS is used correctly by MS otherwise it will be 36 and MS will select carrier 4 incorrectly.)

NOTE: Time allowed includes 5 s for MS to determine C32 on neighbour cell is higher, 2 s to decode CPBCCCH and 1 s for re-selection.

## 20.23.5 Network controlled Cell re-selection in Transfer Mode

### 20.23.5.1 Definition and applicability

This test is applicable for mobile stations either packet data only capable or mobile stations not supporting GSM CS services.

### 20.23.5.2 Conformance requirement

1. A cell re-selection command may be sent from the network to an MS. When the MS receives the command, it shall immediately re-select the cell according to the included cell description and change the network control mode according to the command (3GPP TS 04. 60, 3GPP TS 05.08 subclause 10.1.4).

### 20.23.5.3 Test purpose

To verify the MS can correctly interpret the network control commands and reselect to the correct cell.

## 20.23.5.4 Method of Test

## Initial Conditions

Parameters changed from the default values in table 20.23.1.

| Parameter                   | Carrier 1 | Carrier 2 | Carrier 3 |
|-----------------------------|-----------|-----------|-----------|
| RF Signal Level (dBm)       | -60       | -80       | -70       |
| GPRS_RXLEV_ACCESS_MIN (dBm) | -100      | -100      | -100      |
| NETWORK_CONTROL_ORDER       | NC2       | NC0       | NC2       |
| NC_REPORTING PERIOD_T (s)   | 0,96      |           | 0,96      |
| C1                          | 40-20     | 20-40     | 30        |
| C32                         | 40-20     | 20-40     | 30        |

NOTE: The HCS structure is omitted from the packet system information messages on all the cells. Therefore C31 is not used.

## Procedure

- a) The MS is switched on and a downlink TBF is set up on carrier 1.
- b) The RF level of carrier 1 is reduced to -80 dBm. (C32 becomes 20).
- c) The SS waits 15 s after the RF level of carrier 1 is reduced before sending a reselect command to the MS to select carrier 3.
- d) The RF level of carrier 2 is increased to -60 dBm. (C32 becomes 40).
- e) The SS waits 15 s after increasing the RF level of carrier 2 before the Network Control Order is changed to NC0 on carrier 3. The SS sends a RESET command to the MS.

## 20.23.5.5 Test Requirements

- 1) After step b) there should be no response on carriers 2 or 3.
- 2) After step c) there should be a response on carrier 3 within 5 s of the re-select command. (The 3 s = 2 s for CPBCCCH decoding + 1 s for re-selection + tolerance.)
- 3) After step d) there should be no response on carriers 1 or 2.
- 4) After step e) there should be a response on carrier 2 within 3 s of the SS sending the RESET command. (The 3s = 2s for CPBCCCH decoding + 1s for re-selection + tolerance.)

## 20.23.6 Cell reselection timings

## 20.23.6.1 Definition and applicability

This test is applicable for mobile stations either packet data only capable or mobile stations not supporting GSM CS services.

## 20.23.6.2 Conformance requirement

At least for every sample or every second, whichever is greatest, the MS shall calculate the value of C1, C31 and C32 for the serving cell and recalculate C1, C31 and C32 values for non serving cells (if necessary). The MS shall make a cell re-selection if:

- i) The path loss criterion parameter (C1) for the serving cells falls below zero.

## 20.23.6.3 Test purpose

1. To verify that the MS meets conformance requirement 6.2 (i) within time allowed.

## 20.23.6.4 Method of Test

## Initial Conditions

Parameters changed from the default values in table 20.23.1.

| Parameter                   | Carrier 1 | Carrier 2 |
|-----------------------------|-----------|-----------|
| RF Signal Level (dBm)       | -60       | -70       |
| GPRS_RXLEV_ACCESS_MIN (dBm) | -90       | -100      |
| GRO                         |           | -28       |
| SPLIT_PG_CYCLE              | 4         | 4         |
| C1                          | 30        | 30        |
| C32                         | 30        | 2         |

NOTE 1: The HCS structure is omitted from the system information messages on all the cells. Therefore C31 is not used.

NOTE 2: The RLA\_P should be updated every 3,84 s with SPLIT\_PG\_CYCLE = 4.

## Procedure

- a) The SS activates both carriers and pages the MS on carrier 2. The SS starts to monitor carrier 2 for responses from the MS.
- b) The MS is switched on.
- c) The SS waits 120 s before the RF level of carrier 1 is reduced to -100 dBm for 8 s. (During this period C1 becomes -10). Then the SS raises the level back to -60 dBm. The SS waits 20 s.
- d) The SS reduces the RF level on carrier 1 to -100 dBm.

## 20.23.6.5 Test Requirements

- 1) After step c) there shall be no access on carrier 2.
- 2) After step d) there shall be access on carrier 2 within 23 s (allow 20 s for c1 average to reach -10 + 2s to decode CPBCCCH).

## 20.23.7 Downlink signalling failure

## 20.23.7.1 Definition and applicability

This test is applicable for mobile stations either packet data only capable or mobile stations not supporting GSM CS services.

## 20.23.7.2 Conformance requirement

The downlink signalling failure criterion is based on the downlink signalling failure counter DSC.

1. If DRX period split is supported, DSC shall be initialised to a value equal to the nearest integer to  $\max(10, 90/64 \times \text{SPLIT\_PG\_CYCLE})$  where SPLIT\_PG\_CYCLE is a parameter defined at GPRS attach (see 3GPP TS 05.02).
2. Thereafter, whenever the MS attempts to decode a message in its paging subchannel; if a message is successfully decoded DSC is increased by 1, however never beyond the max value defined in 1.

3. Whenever the MS can not successfully decode a message in its paging subchannel the DSC is decreased by 4.
4. When DSC reaches 0, a downlink signalling failure shall be declared. A downlink signalling failure shall result in cell reselection, 3GPP TS 03.22, subclause 4.5 (ii) and 3GPP TS 05.08, subclause 6.5.

NOTE: The network sends the paging subchannel for a given MS every 64/SPLIT\_PG\_CYCLE multiframes . The requirement for network transmission on the paging subchannel is specified in 3GPP TS 04.08 / 3GPP TS 44.018. The MS is required to attempt to decode a message every time its paging subchannel is sent.

### 20.23.7.3 Test purpose

1. To verify that the MS initialises the DSC counter in accordance with the conformance requirement. This is verified indirectly.
2. To verify that whenever the MS successfully decodes a message on paging subchannel, the DSC is increased by 1, (however never beyond the nearest integer to max defined in subclause 16.2.1). This is verified indirectly.
3. To verify that whenever the MS can not successfully decode a message on paging subchannel, the DSC decreased by 4. This is verified indirectly.
4. To verify that when the DSC reaches 0, a downlink signalling failure shall be declared and the MS will perform cell reselection.

### 20.23.7.4 Method of Test

#### Initial Conditions

Parameters changed from the default values in table 20.23.1.

| Parameter                        | Carrier 1 | Carrier 2 |
|----------------------------------|-----------|-----------|
| RF Signal Level (dBµV emf) / dBm | -65       | -60       |
| GPRS_RXLEV_ACCESS_MIN (dBm)      | -95       | -100      |
| SPLIT_PG_CYCLE                   | 4         | 4         |
| C1                               | 30        | 40        |
| C32                              | 30        | 40        |

NOTE 1: The HCS structure is omitted from the system information messages on all the cells. Therefore C31 is not used.

NOTE 2: With SPLIT\_PG\_CYCLE=4 DSC should be set to 10, Paging blocks occur every 832 frames or 3,84 s.

#### Procedure

- a) The MS is switched on. On carrier 2 valid layer 3 messages shall be sent in the paging blocks, but not paging the MS. On carrier 1 the MS is paged continuously in all paging blocks.
- b) After 40 s the SS sends corrupted data (using random data, wrong parity bits see 3GPP TS 05.03, subclauses 4.3 and 4.1.2 or other lower layer error) in 2 successive paging blocks on carrier 2 and then reverts to sending normal data.

NOTE 1: Sending corrupted, i.e. non-decodable data on 2 successive paging blocks should decrease the DSC to 2.

- c) The SS monitors all accesses on both carriers for 40 s. (Allows the DSC counter to go back to maximum of 10, paging block every 3,84 s.)
- d) The SS sends corrupted data in 3 successive paging blocks on carrier 2 and then reverts to sending normal data..

NOTE 2: Sending corrupted, data on 3 successive paging blocks should decrease the DSC to < 0 (-2) and cause a cell reselection.

- e) The SS monitors all accesses on both carriers for 30 s.

### 20.23.7.5 Test requirements

- 1) There shall be no access on carrier 1 after step b).
- 2) The MS shall access on carrier 1 at test step e) within 3 s. (The time should be measured from the transmission of the complete 3<sup>rd</sup> successive paging block with errors and allows 2 secs for decoding CPBCCCH).

## 20.23.8 COMPACT Cell re-selection when target cell is BCCH supporting EGPRS and different routing area

### 20.23.8.1 Definition and applicability

This test is applicable for mobile stations either packet data only capable or mobile stations not supporting GSM CS services.

### 20.23.8.2 Conformance requirement

At least for every new sample or every second, whichever is the greatest, the MS shall update RLA\_P and calculate the value of C1, C31 and C32 for the serving cell and the non-serving cells; 3GPP TS 05.08, subclause 10.1.2 The MS shall make a cell re-selection if:

- (i) The path loss criterion parameter (C1) for the serving cell falls below zero.
- (ii) A non-serving suitable cell (see 3GPP TS 03.22) is evaluated to be better than the serving cell. The best cell is the cell with the highest value of C32 among:
  - those cells that have the highest PRIORITY\_CLASS among those that fulfil the criterion  $C31 \geq 0$ ; or
  - all cells, if no cells fulfil the criterion  $C31 \geq 0$ ;
  - if the parameter C32\_QUAL is set, positive GPRS\_RESELECT\_OFFSET values shall only be applied to the neighbour cell with the highest RLA\_P value of those cells for which C32 is compared above.

PRIORITY\_CLASS and C32\_QUAL are broadcast on CPBCCCH of the serving cell.

When evaluating the best cell, the following hysteresis values shall be subtracted from the C32 value for the neighbour cells:

- in standby state, if the new cell is in the same routing area: 0.
- in ready state, if the new cell is in the same routing area:
  - GPRS\_CELL\_RESELECT\_HYSTERESIS. If the parameter C31\_HYST is set;
  - GPRS\_CELL\_RESELECT\_HYSTERESIS shall also be subtracted from the C31 value for the neighbour cells.
- in standby or ready state, if the new cell is in a different routing area:
  - RA\_RESELECT\_HYSTERESIS.
- in case of a cell re-selection occurred within the previous 15 s: 5 dB.
  - GPRS\_CELL\_RESELECT\_HYSTERESIS, C31\_HYST and RA\_RESELECT\_HYSTERESIS are broadcast on CPBCCCH of the serving cell.

### 20.23.8.3 Test purpose

To verify that the MS is able to reselect a correct cell when target cell is non COMPACT cell supporting EGPRS.

## 20.23.8.4 Method of Test

## Initial Conditions

Parameters changed from the default values in table 20.23.1.

| Parameter                   | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 |
|-----------------------------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBm)       | -60       | -70       | -70       | -65       | -70       |
| RAI                         |           |           |           | Different |           |
| GPRS_RXLEV_ACCESS_MIN (dBm) | -100      | -80       | -100      | -100      | -80       |
| GRO                         |           | 4         | 4         | 6         | 4         |
| GCRH                        | 4         |           |           |           |           |
| RARH                        | 6         |           |           |           |           |
| C1                          | 40 to 15  | 10        | 30        | 35        | 10        |
| C32                         | 40 to 15  | 10        | 30        | 35        | 10        |

NOTE 1: GRO = GPRS\_RESELECT\_OFFSET, GCRH = GPRS\_CELL\_RESELECT\_HYSTERESIS, RARH = RA\_RESELECT\_HYSTERESIS.

NOTE 2: The BA(GPRS) list only contains the ARFCNs of the carriers used during the test. The HCS structure is transmitted in the Packet system information messages.

NOTE 3: Carrier 4 is continuous GSM BCCH supporting EGPRS.

## Procedure

- a) The MS is switched on and a downlink TBF is set-up on carrier 1.
- b) The SS waits 10 s.
- c) The RF level of Carrier 1 is reduced to -85 dBm (C1 = decreases to 15).

## 20.23.8.5 Test Requirements

1. After step c) the MS should respond on carrier 4 within 10 s. (Carrier 4 C32=35 if RA\_RESELECT\_HYSTERESIS is used correctly by MS.)

NOTE: Time allowed includes 5 s for MS to determine C32 on neighbour cell is higher, 2 s to decode CPBCCH and 1 s for re-selection.

## 20.23.9 Cell re-selection when target cell is COMPACT CPBCCH in different routing area

## 20.23.9.1 Definition and applicability

This test is applicable for mobile stations either packet data only capable or mobile stations not supporting GSM CS services.

## 20.23.9.2 Conformance requirement

At least for every new sample or every second, whichever is the greatest, the MS shall update RLA\_P and calculate the value of C1, C31 and C32 for the serving cell and the non-serving cells; 3GPP TS 05.08, subclause 10.1.2 The MS shall make a cell re-selection if:

- (i) The path loss criterion parameter (C1) for the serving cell falls below zero.
- (ii) A non-serving suitable cell (see 3GPP TS 03.22) is evaluated to be better than the serving cell. The best cell is the cell with the highest value of C32 among:
  - those cells that have the highest PRIORITY\_CLASS among those that fulfil the criterion  $C31 \geq 0$ ; or

- all cells, if no cells fulfil the criterion  $C31 \geq 0$ ;
- if the parameter C32\_QUAL is set, positive GPRS\_RESELECT\_OFFSET values shall only be applied to the neighbour cell with the highest RLA\_P value of those cells for which C32 is compared above.

PRIORITY\_CLASS and C32\_QUAL are broadcast on PBCCH of the serving cell.

When evaluating the best cell, the following hysteresis values shall be subtracted from the C32 value for the neighbour cells:

- in standby state, if the new cell is in the same routing area: 0.
- in ready state, if the new cell is in the same routing area:
  - GPRS\_CELL\_RESELECT\_HYSTERESIS. If the parameter C31\_HYST is set;
  - GPRS\_CELL\_RESELECT\_HYSTERESIS shall also be subtracted from the C31 value for the neighbour cells.
- in standby or ready state, if the new cell is in a different routing area:
  - RA\_RESELECT\_HYSTERESIS.
- in case of a cell re-selection occurred within the previous 15 s: 5 dB.
  - GPRS\_CELL\_RESELECT\_HYSTERESIS, C31\_HYST and RA\_RESELECT\_HYSTERESIS are broadcast on PBCCH of the serving cell.

### 20.23.9.3 Test purpose

To verify that the MS reselects to the correct cell by calculating C32 correctly when the target cells are supporting COMPACT.

### 20.23.9.4 Method of Test

#### Initial Conditions

Parameters changed from the default values in table 20.23.1.

| Parameter                   | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|-----------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBm)       | -60       | -60       | -70       | -70       | -65       | -70       |
| RAI                         |           |           |           |           | Different |           |
| GPRS_RXLEV_ACCESS_MIN (dBm) | -100      | -100      | -80       | -100      | -100      | -80       |
| GRO                         |           |           | 4         | 4         | 6         | 4         |
| GCRH                        | 4         |           |           |           |           |           |
| RARH                        | 6         |           |           |           |           |           |
| C1                          | 40 to 15  |           | 10        | 30        | 35        | 10        |
| C32                         | 40 to 15  |           | 10        | 30        | 35        | 10        |

NOTE 1: GRO = GPRS\_RESELECT\_OFFSET, GCRH = GPRS\_CELL\_RESELECT\_HYSTERESIS, RARH = RA\_RESELECT\_HYSTERESIS.

NOTE 2: The BA(GPRS) list only contains the ARFCNs of the carriers used during the test. The HCS structure is transmitted in the Packet system information messages.

NOTE 3: Carrier 1 is the BCCH carrier which broadcasts the position of the PBCCH channel supporting EGPRS in the cell (Carrier 2).

NOTE 4: Carriers 3, 4 and 6 are continuous GSM BCCH's supporting EGPRS.

#### Procedure

- The MS is switched on and a downlink TBF is set-up on carrier 2.

- b) The SS waits 10 s.
- c) The RF level of Carriers 1 and 2 are reduced to -85 dBm (C1 = decreases to 15).

#### 20.23.9.5 Test Requirements

After step c) the MS should respond on carrier 5 within 10 s. (Carrier 5 C32=35 if RA\_RESELECT\_HYSTERESIS is used correctly by MS.)

NOTE: Time allowed includes 5 s for MS to determine C32 on neighbour cell is higher, 2 s to decode CPBCCCH and 1 s for re-selection.

## 20.24 SoLSA Cell Selection and Reselection

All GSM test cases presented in 3GPP TS 11.10 clause 20 are applicable for SoLSA ME with or without LSA SIM. Nevertheless, if LSA SIM are used, it must be checked that no LSA subscription matches the information broadcast by the cell. Otherwise, test cases dealing with cell reselection would fail.

The cell re-selection tests defined in the following sections apply to the SoLSA MS if an LSA support exists in the serving cell. Otherwise the SoLSA MS shall perform cell re-selection according to the idle mode procedures defined in clause 6 of 3GPP TS 05.08.

The SS transmits one BCCH carrier per cell as indicated in the initial conditions for each test. These are referred to as carrier 1, carrier 2, etc. Each of these cell control channels are non-combined with SDCCHs. It is assumed that the SS can simultaneously transmit seven BCCH carriers and monitor three random access channels. In some cases, a test is performed in multiple stages in order that the requirements can be tested within the above constraints.

For any SoLSA MS all the carriers are in its supported band(s) of operation. For an E-GSM mobile station at least one of the carriers is in the extension band and one of the carriers is in the primary band.

Unless otherwise stated in the method of test, in all of the tests of this subclause:

- The SS is continuously paging the SoLSA MS on all carriers at the start of the test and does not respond to RACH requests from the SoLSA MS. Where a test specifies that the SoLSA MS is not paged on a particular carrier, only idle paging is transmitted according to 3GPP TS 04.18, subclause 3.2.2.2.
- The default values of the system information data fields given in table 20.24.1 are used.
- The SIM is in the idle updated state in the default location area with a TMSI assigned at the beginning of each test.
- The ARFCNs used for the carriers in each test are chosen from those in table 20.24.1 with adjacent carriers separated by a minimum of three channels.

The absolute accuracy of the SoLSA MS signal level measurements is assumed to be  $\pm 6$  dB. A difference of at least 8 dB is allowed for cases of discrimination between C1, C2 or C4 values and 0.

The relative accuracy of the SoLSA MS signal level measurements is assumed to be  $\pm 3$  dB for the signal levels used in the tests of this subclause. A difference of at least 5 dB is allowed for cases of discrimination between C1, C2 or C4 values on different carriers.

NOTE 1: The accuracy of SoLSA MS signal level measurements is specified in 3GPP TS 05.08. For all of the tests in this subclause, the signal levels used are greater than 1 dB above reference sensitivity level.

NOTE 2: The tolerance on timers specified in 3GPP TS 05.08 is  $\pm 10$  % except for PENALTY\_TIME where it is  $\pm 2$  s. In the tests of this subclause, the test requirements include these tolerances. Consequently, the times stated in the test requirement sometimes differ from the corresponding timer in the conformance requirement.

Where pulsed signals are specified, the SS tolerance on pulse width is  $\pm 2$  % and the SS tolerance on power level  $\pm 1$  dB.

NOTE 3: Additional to the abbreviations and definitions in 3GPP TR 21.905 the following definitions are used within this subclause.

## Definitions

|                 |                                                       |
|-----------------|-------------------------------------------------------|
| LSA cell        | A cell in which SoLSA features are possible           |
| LSA only SIM    | A SIM with LSA only access                            |
| LSA SIM         | A SIM with SoLSA files                                |
| Normal LSA cell | An LSA cell which is not an LSA exclusive access cell |
| Normal LSA SIM  | An LSA SIM which is not an LSA only SIM               |
| SoLSA ME        | An ME supporting SoLSA                                |
| SoLSA MS        | A SoLSA ME with LSA SIM                               |

Table 20.24.1: Default values of the system information fields

| Parameter                | Reference                | Abbr.       | Normal Setting                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------|--------------------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Default values of the SIM card

The "LSA only access indicator" byte of file EF<sub>SAI</sub> on the SIM card shall be disabled unless otherwise stated (see subclause 20.24).

General initial conditions:

1. Following LSA shall be defined in the fields of the EF<sub>SLL</sub> (3GPP TS 11.11, subclause 10.4.1.2) and in the LSA descriptor files (GSM 11.11, subclause 10.4.1.3) on the SIM card used for testing.

|      | LSA ID       | CI         | LAC | LAC + CI          | PLMN code (see NOTE) | LSA Priority | Idle mode support | LSA indication for idle mode |
|------|--------------|------------|-----|-------------------|----------------------|--------------|-------------------|------------------------------|
| LSA1 | 54<br>66.001 |            |     |                   | HPLMN                | 0            | On                | Off                          |
| LSA2 | 66.000       |            |     |                   | HPLMN                | 0            | Off               | On                           |
| LSA3 | 9.000.000    |            |     | 2 +<br>[250..254] | HPLMN                | 8            | On                | On                           |
| LSA4 | 9.000.001    |            |     |                   | HPLMN                | 8            | Off               | Off                          |
| LSA5 | 30.000       | [256..260] |     |                   | HPLMN                | 15           | On                | On                           |
| LSA6 | 5            |            | 1   |                   | HPLMN                | 7            | On                | On                           |
| LSA7 | 100          |            | 10  | 3 + 500           | HPLMN                | 0            | On                | On                           |
| LSA8 | 9.000.001    |            |     |                   | VPLMN                | 15           | On                | On                           |
| LSA9 | 54           |            |     |                   | VPLMN                | 8            | On                | On                           |

NOTE: VPLMN is a set of values for MCC and MNC for the LSA which shall not be in the list of the forbidden PLMNs on the SIM card.

2. List of values, that shall not be found in the SIM card, in order to be sure that the SoLSA MS is not subscribed to the LSA defined by the current carrier.

|           | LSA ID     | CI           | LAC | LAC + CI         |
|-----------|------------|--------------|-----|------------------|
| LSA value | [250..255] | [5000..5005] | 5   | 5 + [5000..5005] |

3. The initial condition "escape PLMN" is set to "Yes" in the following tables of this subclause, in case of testing with an LSA exclusive access cell.

General Remark

1) Elementary File EF<sub>SLL</sub> (3GPP TS 11.11, subclause 10.4.1.2)

The information regarding 'idle mode support' and 'LSA indication for idle mode' is contained on the SIM card, in the Elementary File EF<sub>SLL</sub> SoLSA LSA List (identifier '4F31') and, more precisely, in the 'Configuration Parameters' byte.

File EF<sub>SLL</sub> is represented in the table below, from 3GPP TS 11.11, subclause 10.4.1.2.

Each LSA is described by one record that is linked to an LSA Descriptor file. Each record contains information of the PLMN, priority of the LSA, information about the subscription and may also contain a text string and/or an icon that identifies the LSA to the user. The text string can be edited by the user.

- LSA Descriptor File Identifier:

Contents: these bytes identify the EF which contains the LSA Descriptors forming the LSA.

Coding: byte X+8: high byte of the LSA Descriptor file;  
 byte X+9: low byte of the LSA Descriptor file.

- LSA Descriptor Record Identifier:

Contents: this byte identifies the number of the first record in the LSA Descriptor file forming the LSA.

Coding: binary.

**2) Elementary Files "LSA Descriptor File" (3GPP TS 11.11, subclause 10.4.1.3)**

The information regarding the LSA identification is contained on the SIM card in the LSA descriptor files, more precisely in the byte 'LSA descriptor type and number' (see table below, from 3GPP TS 11.11, subclause 10.4.1.3).

Residing under DF<sub>SoLSA</sub>, there may be several LSA Descriptor files. These EFs contains one or more records again containing LSA Descriptors forming the LSAs. LSAs can be described in four different ways. As a list of LSA IDs, as a list of LAC + CIs, as a list of CIs or as a list of LACs. As the basic elements (LSA ID, LAC + CI, CI and LAC) of the four types of lists are of different length, they can not be mixed within one record.

Different records may contain different kinds of lists within the EFs.

| Identifier: '4FXX'         |                                | Structure: linear fixed |                      | Optional |  |

| (n-1)*X+2 to n*X+1         | n <sup>th</sup> LSA Descriptor | M                       | X bytes              |          |  |
| n*X+2                      | Record Identifier              | M                       | 1 byte               |          |  |

- LSA descriptor type and number:

Contents: The LSA descriptor type gives the format of the LSA descriptor and the number of valid LSA Descriptors within the record.

Coding:

The bit 1 and bit 2 of the first byte of the LSA descriptor file identify the LSA descriptor type.

- LSA descriptor type:

Contents: Gives the format of the LSA Descriptors.

- b2, b1: 00: LSA ID identification of the LSA is done by means of the LSA ID
- 01: LAC + CI identification of the LSA is done by means of the LAC + CI
- 10: CI identification of the LSA is done by means of the CI
- 11: LAC identification of the LSA is done by means of the LAC

**3) Elementary File EF<sub>SAI</sub> (3GPP TS 11.11, subclause 10.4.1.1)**

This EF contains the 'LSA only access indicator'. This EF shall always be allocated if DF<sub>SoLSA</sub> is present.

If the indicator is set, the network will prevent terminated and/or originated calls when the MS is camped in cells that are not included in the list of allowed LSAs in EF<sub>SLI</sub>. Emergency calls are, however, always allowed.

The EF also contains a text string which may be displayed when the MS is out of the served area(s).

|                        |                                 |                        |                      |          |         |
|------------------------|---------------------------------|------------------------|----------------------|----------|---------|
| Identifier: '4F30'     |                                 | Structure: transparent |                      | Optional |         |

- LSA only access indicator

Contents: indicates whether the MS is restricted to use LSA cells only or not.

Coding:

- LSA only access indication text

Contents: text to be displayed by the ME when it's out of LSA area.

**20.24.1 SoLSA Cell Selection suitable cell**

**20.24.1.1 Definition and applicability**

SoLSA Cell selection is a process in which a SoLSA MS, whenever a new PLMN is selected, attempts to find a "suitable cell" of that PLMN to camp on. Two methods of searching for a "suitable cell" are possible, normal cell selection and stored list cell selection. The process ensures that the SoLSA MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink. Once the SoLSA MS is camped on a cell, access to the network is allowed.

This test is applicable for all types of SoLSA MS.

**20.24.1.2 Conformance requirement**

1. The SoLSA MS shall be able to select the strongest "suitable cell" and be able to respond to paging on that cell within 30 s of switch on. This requires a valid normal LSA SIM with PIN disabled and ideal radio conditions; 3GPP TS 05.08, subclause 6.1. And it requires a list of LSAs for the subscriber stored on the SIM; 3GPP TS 11.11, subclause 10.4.1.2.

NOTE 1: For camping on an LSA cell the LSA subscription is not necessary except for camping on an LSA exclusive access cell; 3GPP TS 03.73, subclause 11.4.2.

NOTE 2: There should be no extra delay in cell selection procedure; 3GPP TS 02.43, subclause 4.2.2.

2. There are various requirements that a cell must satisfy before a SoLSA MS can perform normal camping on it:
  - 2.1 (i) It should be a cell of the selected PLMN.

2.2 (ii) It should not be "barred".

2.3 (iv) The radio path loss between SoLSA MS and BTS must be below a threshold set by the PLMN operator.

2.4 (v) It should not be an LSA exclusive access cell to which the SoLSA MS does not subscribe.

3GPP TS 03.22, subclause 3.2.1.

NOTE 3: Criteria (iii) is not applicable for Cell Selection.

3. Initially the SoLSA MS looks for a cell which satisfies these 5 constraints ("suitable cell") by checking cells in descending order of received signal strength. If a "suitable cell" is found, the SoLSA MS camps on it; 3GPP TS 03.22, subclause 3.2.1.

4. The SoLSA MS shall be able to calculate correctly the path loss criterion parameter C1, used for cell selection and reselection; 3GPP TS 05.08, subclause 6.4.

5. The LSA identification shall be stored on the SIM card in the LSA descriptor files. LSAs can be described in four different ways; 3GPP TS 11.11, subclause 10.4.1.3:

- as a list of LSA IDs (3 bytes);
- as a list of LAC + CIs (4 bytes);
- as a list of CIs (2 bytes);
- as a list of LACs (2 bytes); or
- as a combination of the lists above.

#### 20.24.1.3 Test purpose

The SoLSA MS shall be able to select a "suitable cell" according to the normal cell selection criteria. The identification of the LSA is done by using the LSA ID, the CI, the LAC or the LAC + CI.

#### 20.23.1.4 Method of tests

#### 20.24.1.4.1 SoLSA Cell Selection suitable cell / LSA identified by LSA ID

##### 20.24.1.4.1.1 Initial conditions

- a) Identification of the LSA by means of LSA ID (see subclause 20.24).
- b) Parameters changed from the default values in table 20.24.1; further initial conditions.

| Parameter/condition                | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|------------------------------------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBμV emf() / dBm) | 43/-70    | 13/-100   | 53/-60    | 63/-50    |
| CBA                                | 0         | 0         | 1         | 0         |
| RXLEV_ACCESS_MIN (dBm)             | -90       | -90       | -90       | -90       |
| MNC                                |           |           |           | 1         |
| MCC                                |           |           |           | 002       |
| C1                                 | 20        | -10       | 30        | 40        |
| LSA ID                             | 66.001    | 66.001    | 66.001    | 66.001    |
| LAC                                | 5         | 5         | 5         | 5         |
| CI                                 | 5.000     | 5.001     | 5.002     | 5.003     |
| Matching LSA on SIM                | LSA1      | LSA1      | LSA1      | -         |
| Escape PLMN                        | No        | No        | No        | No        |

- c) Parameters changed from the default values in table 20.24.1; further initial conditions (for test procedure step g)

| Parameter/condition                         | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------------------------------|-----------|-----------|-----------|-----------|
| RF Signal Level<br>(dB $\mu$ V emf() / dBm) | 43/-70    | 13/-100   | 53/-60    | OFF       |
| CBA                                         | 0         | 0         | 1         |           |
| RXLEV_ACCESS_MIN (dBm)                      | -90       | -90       | -90       |           |
| C1                                          | 20        | -10       | 30        |           |
| LSA ID                                      | 250       | 66.001    | 250       |           |
| LAC                                         | 5         | 5         | 5         |           |
| CI                                          | 5.000     | 5.001     | 5.002     |           |
| Matching LSA on SIM                         | -         | LSA1      | -         |           |
| Escape PLMN                                 | Yes       | Yes       | No        |           |

#### 20.24.1.4.1.2 Test Procedure

- a) The SS activates all carriers according to table b) and monitors carriers 1, 2 and 4 for RA requests from the SoLSA MS.
- b) The SoLSA MS is switched on.
- c) The SoLSA MS is switched off.
- d) The SS monitors carrier 3 for RA requests from the SoLSA MS.
- e) The SoLSA MS is switched on.
- f) The SoLSA MS is switched off.
- g) The SS is reconfigured according to table c). The SS monitors carriers 1, 2 and 3 for RA requests from the SoLSA MS.
- h) The SoLSA MS is switched on.
- i) The SoLSA MS is switched off.
- j) The SS is reconfigured and the level of carrier 2 increases to 33 dB $\mu$ V / - 80 dBm (C1 increases to 10 dBm). The SS monitors carriers 1, 2 and 3 for RA requests from the SoLSA MS.
- k) The SoLSA MS is switched on.

#### 20.24.1.4.1.3 Related PICS/PIXIT statement(s)

- Support of SoLSA.

#### 20.24.1.4.1.4 Test Requirements

- 1) After step b), the first response from the SoLSA MS shall be received on carrier 1 within 50 s. There shall be no response from the SoLSA MS on the other monitored carriers.

NOTE 1: 33 s for cell selection, 10 s for communicating the data between SIM and ME, 5 s for search of a matching LSA on SIM: allow 50 s.

- 2) There shall be no response from the SoLSA MS on the monitored carrier after step e) within 60 s.

NOTE 2: Any potential access is likely to occur within 50 s.

- 3) After step h), there shall be no response from the SoLSA MS on the monitored carriers within 60 s (carrier 1 is not fulfilling conformance requirement 2.4).
- 4) After step k), the first response from the SoLSA MS shall be received on carrier 2 within 50 s. There shall be no response from the SoLSA MS on the other monitored carriers.

## 20.24.1.4.2 SoLSA Cell Selection suitable cell / LSA identified by LAC + CI

## 20.24.1.4.2.1 Initial conditions

- a) Identification of the LSA by means of LAC + CI (see subclause 20.24. General remark 2).
- b) Parameters changed from the default values in table 20.24.1; further initial conditions.

| Parameter/condition                         | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------------------------------|-----------|-----------|-----------|-----------|
| RF Signal Level<br>(dB $\mu$ V emf() / dBm) | 43/-70    | 13/-100   | 53/-60    | 63/-50    |
| CBA                                         | 0         | 0         | 1         | 0         |
| RXLEV_ACCESS_MIN (dBm)                      | -90       | -90       | -90       | -90       |
| MNC                                         |           |           |           | 1         |
| MCC                                         |           |           |           | 002       |
| C1                                          | 20        | -10       | 30        | 40        |
| LSA ID                                      | 250       | 250       | 250       | 250       |
| LAC                                         | 2         | 2         | 2         | 2         |
| CI                                          | 250       | 251       | 252       | 253       |
| Matching LSA on SIM                         | LSA3      | LSA3      | LSA3      | -         |
| Escape PLMN                                 | No        | No        | No        | No        |

- c) Parameters changed from the default values in table 20.24.1; further initial conditions (for test procedure step g).

| Parameter/condition                         | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------------------------------|-----------|-----------|-----------|-----------|
| RF Signal Level<br>(dB $\mu$ V emf() / dBm) | 43/-70    | 13/-100   | 53/-60    | OFF       |
| CBA                                         | 0         | 0         | 1         |           |
| RXLEV_ACCESS_MIN (dBm)                      | -90       | -90       | -90       |           |
| C1                                          | 20        | -10       | 30        |           |

| Matching LSA on SIM                         | -         | LSA3      | -         |           |
| Escape PLMN                                 | Yes       | Yes       | No        |           |

## 20.24.1.4.2.2 Test Procedure

- a) The SS activates all carriers according to table b) and monitors carriers 1, 2 and 4 for RA requests from the SoLSA MS.
- b) The SoLSA MS is switched on.
- c) The SoLSA MS is switched off.
- d) The SS monitors carrier 3 for RA requests from the SoLSA MS.
- e) The SoLSA MS is switched on.
- f) The SoLSA MS is switched off.
- g) The SS is reconfigured according to table c). The SS monitors carriers 1, 2 and 3 for RA requests from the SoLSA MS.
- h) The SoLSA MS is switched on.
- i) The SoLSA MS is switched off.
- j) The SS is reconfigured and the level of carrier 2 increases to 33 dB $\mu$ V / - 80 dBm (C1 increases to 10 dBm). The SS monitors carriers 1, 2 and 3 for RA requests from the SoLSA MS.
- k) The SoLSA MS is switched on.

## 20.24.1.4.2.3 Related PICS/PIXIT statement(s)

- Support of SoLSA.

## 20.24.1.4.2.4 Test Requirements

- 1) After step b), the first response from the SoLSA MS shall be received on carrier 1 within 50 s. There shall be no response from the SoLSA MS on the other monitored carriers.
- 2) There shall be no response from the SoLSA MS on the monitored carrier after step e) within 60 s.

NOTE: Any potential access is likely to occur within 50 s.

- 3) After step h), there shall be no response from the SoLSA MS on the monitored carriers within 60 s.
- 4) After step k), the first response from the SoLSA MS shall be received on carrier 2 within 50 s. There shall be no response from the SoLSA MS on the other monitored carriers.

## 20.24.1.4.3 SoLSA Cell Selection suitable cell / LSA identified by CI

## 20.24.1.4.3.1 Initial conditions

- a) Identification of the LSA by means of CI (see subclause 20.24. General remark 2).
- b) Parameters changed from the default values in table 20.24.1; further initial conditions.

| Parameter/condition                      | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|------------------------------------------|-----------|-----------|-----------|-----------|
| RF Signal Level (dB $\mu$ V emf() / dBm) | 43/-70    | 13/-100   | 53/-60    | 63/-50    |
| CBA                                      | 0         | 0         | 1         | 0         |
| RXLEV_ACCESS_MIN (dBm)                   | -90       | -90       | -90       | -90       |
| MNC                                      |           |           |           | 1         |
| MCC                                      |           |           |           | 002       |
| C1                                       | 20        | -10       | 30        | 40        |
| LSA ID                                   | 250       | 250       | 250       | 250       |
| LAC                                      | 5         | 5         | 5         | 5         |
| CI                                       | 257       | 258       | 259       | 260       |
| Matching LSA on SIM                      | LSA5      | LSA5      | LSA5      | -         |
| Escape PLMN                              | No        | No        | No        | No        |

- c) Parameters changed from the default values in table 20.24.1; further initial conditions (for test procedure step g).

| Parameter/condition                      | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|------------------------------------------|-----------|-----------|-----------|-----------|
| RF Signal Level (dB $\mu$ V emf() / dBm) | 43/-70    | 13/-100   | 53/-60    | OFF       |
| CBA                                      | 0         | 0         | 1         |           |

| Escape PLMN                              | Yes       | Yes       | No        |           |

## 20.24.1.4.3.2 Test Procedure

- a) The SS activates all carriers according to table b) and monitors carriers 1, 2 and 4 for RA requests from the SoLSA MS.
- b) The SoLSA MS is switched on.
- c) The SoLSA MS is switched off.

- d) The SS monitors carrier 3 for RA requests from the SoLSA MS.
- e) The SoLSA MS is switched on.
- f) The SoLSA MS is switched off.
- g) The SS is reconfigured according to table c). The SS monitors carriers 1, 2 and 3 for RA requests from the SoLSA MS.
- h) The SoLSA MS is switched on.
- i) The SoLSA MS is switched off.
- j) The SS is reconfigured and the level of carrier 2 increases to 33 dB $\mu$ V / -80 dBm (C1 increases to 10 dBm). The SS monitors carriers 1, 2 and 3 for RA requests from the SoLSA MS.
- k) The SoLSA MS is switched on.

#### 20.24.1.4.3.3 Related PICS/PIXIT statement(s)

- Support of SoLSA.

#### 20.24.1.4.3.4 Test Requirements

- 1) After step b), the first response from the SoLSA MS shall be received on carrier 1 within 50 s. There shall be no response from the SoLSA MS on the other monitored carriers.

- 2) There shall be no response from the SoLSA MS on the monitored carrier after step e) within 60 s.

NOTE: Any potential access is likely to occur within 50 s.

- 3) After step h), there shall be no response from the SoLSA MS on the monitored carriers within 60 s.

- 4) After step k), the first response from the SoLSA MS shall be received on carrier 2 within 50 s. There shall be no response from the SoLSA MS on the other monitored carriers.

#### 20.24.1.4.4 SoLSA Cell Selection suitable cell / LSA identified by LAC

##### 20.24.1.4.4.1 Initial conditions

- a) Identification of the LSA by means of LAC (see subclause 20.24. General remark 2).
- b) Parameters changed from the default values in table 20.24.1; further initial conditions.

| Parameter/condition                      | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|------------------------------------------|-----------|-----------|-----------|-----------|
| RF Signal Level (dB $\mu$ V emf() / dBm) | 43/-70    | 13/-100   | 53/-60    | 63/-50    |
| CBA                                      | 0         | 0         | 1         | 0         |
| RXLEV_ACCESS_MIN (dBm)                   | -90       | -90       | -90       | -90       |
| MNC                                      |           |           |           | 1         |
| MCC                                      |           |           |           | 002       |
| C1                                       | 20        | -10       | 30        | 40        |
| LSA ID                                   | 250       | 250       | 250       | 250       |
| LAC                                      | 1         | 1         | 1         | 1         |
| CI                                       | 5.000     | 5.001     | 5.002     | 5.003     |
| Matching LSA on SIM                      | LSA6      | LSA6      | LSA6      | -         |
| Escape PLMN                              | No        | No        | No        | No        |

- c) Parameters changed from the default values in table 20.24.1; further initial conditions (for test procedure step g).

| Parameter/condition                         | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------------------------------|-----------|-----------|-----------|-----------|
| RF Signal Level<br>(dB $\mu$ V emf() / dBm) | 43/-70    | 13/-100   | 53/-60    | OFF       |
| CBA                                         | 0         | 0         | 1         |           |
| RXLEV_ACCESS_MIN (dBm)                      | -90       | -90       | -90       |           |
| C1                                          | 20        | -10       | 30        |           |
| LSA ID                                      | 250       | 250       | 250       |           |
| LAC                                         | 5         | 1         | 5         |           |
| CI                                          | 5.000     | 5.001     | 5.002     |           |
| Matching LSA on SIM                         | -         | LSA6      | -         |           |
| Escape PLMN                                 | Yes       | Yes       | No        |           |

#### 20.24.1.4.4.2 Test Procedure

- a) The SS activates all carriers according to table b) and monitors carriers 1, 2 and 4 for RA requests from the SoLSA MS.
- b) The SoLSA MS is switched on.
- c) The SoLSA MS is switched off.
- d) The SS monitors carrier 3 for RA requests from the SoLSA MS.
- e) The SoLSA MS is switched on.
- f) The SoLSA MS is switched off.
- g) The SS is reconfigured according to table c). The SS monitors carriers 1, 2 and 3 for RA requests from the SoLSA MS.
- h) The SoLSA MS is switched on.
- i) The SoLSA MS is switched off.
- j) The SS is reconfigured and the level of carrier 2 increases to 33 dB $\mu$ V / -80 dBm (C1 increases to 10 dBm). The SS monitors carriers 1, 2 and 3 for RA requests from the SoLSA MS.
- k) The SoLSA MS is switched on.

#### 20.24.1.4.4.3 Related PICS/PIXIT statement(s)

- Support of SoLSA.

#### 20.24.1.4.4.4 Test Requirements

- 1) After step b), the first response from the SoLSA MS shall be received on carrier 1 within 50 s. There shall be no response from the SoLSA MS on the other monitored carriers.
- 2) There shall be no response from the SoLSA MS on the monitored carrier after step e) within 60 s.

NOTE: Any potential access is likely to occur within 50 s.

- 3) After step h), there shall be no response from the SoLSA MS on the monitored carriers within 60 s.
- 4) After step k), the first response from the SoLSA MS shall be received on carrier 2 within 50 s. There shall be no response from the SoLSA MS on the other monitored carriers.

## 20.24.2 SoLSA Cell (Re)Selection Emergency Call

### 20.24.2.1 Definition and applicability

This test is applicable for all types of SoLSA MS.

## 20.24.2.2 Conformance requirement

1. The SoLSA MS shall be able to initiate emergency calls when no "suitable cells" of the selected PLMN are available, but at least one acceptable cell is available. The SoLSA MS is in limited service state. An LSA exclusive access cell is "suitable" only if the LSA of the cell is one of the allowed LSA according to the SIM. Emergency calls are always allowed if no cells are found suitable; 3GPP TS 03.73, subclause 11.4.2.
2. When in a limited service state and if not camped on a cell, the MS shall monitor the received signal level of all RF channels within its band of operation, and search for a BCCH carrier which has  $C1 > 0$  and which is not barred. When such a carrier is found, the MS shall camp on that cell, irrespective of the PLMN identity; 3GPP TS 05.08, subclause 6.8.
3. The MS shall perform cell reselection at least among the cells of the PLMN of the cell on which the MS has camped, according to the algorithm of 3GPP TS 03.22, except that a zero value of CELL\_RESELECT\_HYSTERESIS shall be used.

## 20.24.2.3 Test purpose

1. To verify that the SoLSA MS shall be able to initiate emergency calls when no "suitable cells" of selected PLMN are available, but at least one acceptable cell is available. The available cells are:
  - a) LSA exclusive access cells of the selected PLMN with no LSA subscription.
  - b) Normal LSA cell of forbidden PLMN.
2. To verify that the MS selects a cell with  $C1 > 0$  and  $CBA = 0$  when no suitable cells of the selected PLMN are available.
3. To verify that the MS, when performing cell reselection in the limited service state, uses  $CELL\_RESELECT\_HYSTERESIS = 0$ , 3GPP TS 05.08, subclause 6.8.

## 20.24.2.4 Method of test

## 20.24.2.4.1 Initial conditions

- a) Parameters changed from the default values in table 20.24.1; further initial conditions for LSA exclusive access cell.

| Parameter/condition                      | Carrier 1  | Carrier 2 | Carrier 3 | Carrier 4 |
|------------------------------------------|------------|-----------|-----------|-----------|
| RF Signal Level (db $\mu$ V emf() / dBm) | 38 / -75   | 23 / -90  | 33 / -80  | OFF       |
| RXLEV_ACCESS_MIN (dBm)                   | -90        | -80       | -90       |           |
| CBA                                      | 1 (barred) | 0         | 0         |           |
| MCC, MNC                                 | Home PLMN  | Home PLMN | Home PLMN |           |
| CRH (dB)                                 | 0          | 0         | 14        |           |
| C1                                       | 15         | -10       | 10        |           |
| LSA_ID                                   | 250        | 251       | 252       |           |
| LAC                                      | 5          | 5         | 5         |           |
| CI                                       | 5000       | 5001      | 5002      |           |
| Matching LSA on SIM                      | -          | -         | -         |           |
| Escape PLMN                              | Yes        | Yes       | Yes       |           |

- b) Parameters changed from the default values in table 20.24.1; further initial conditions for normal LSA cell.

| Parameter/condition                      | Carrier 1  | Carrier 2 | Carrier 3 | Carrier 4 |
|------------------------------------------|------------|-----------|-----------|-----------|
| RF Signal Level (dB $\mu$ V emf() / dBm) | 38 / -75   | 23 / -90  | 33 / -80  | OFF       |
| RXLEV_ACCESS_MIN (dBm)                   | -90        | -80       | -90       |           |
| CBA                                      | 1 (barred) | 0         | 0         |           |
| MCC, MNC                                 | forbidden  | forbidden | forbidden |           |
| CRH (dB)                                 | 0          | 0         | 14        |           |
| C1                                       | 15         | -10       | 10        |           |
| LSA_ID                                   | 250        | 251       | 252       |           |
| LAC                                      | 5          | 5         | 5         |           |
| CI                                       | 5000       | 5001      | 5002      |           |
| Matching LSA on SIM                      | -          | -         | -         |           |
| Escape PLMN                              | No         | No        | No        |           |

NOTE: All the BCCH carriers belong to the same PLMN, which is not the MS's home PLMN and which is in the SIM's forbidden PLMN list.

Run the following test procedure twice by using two different sets of initial conditions:

- using initial conditions a);
- using initial conditions b).

#### 20.24.2.4.2 Test Procedure

- a) The SS activates the carriers. The SS monitors carriers 1, 2 and 3 for RA requests for the duration of the test.
- b) The SoLSA MS is switched on.
- c) 60 s after switch on, an emergency call is initiated on the SoLSA MS.
- d) The SS changes the CBA of carrier 1 to 0.

NOTE 1: The MS should reselect carrier 1 because it should not take into account the CRH value of 14 but use 0 instead.

- e) After 350 s an emergency call is initiated on the SoLSA MS.

NOTE 2: 330 s to detect change of BCCH data on neighbour cell, 15 s to perform reselection of carrier 1 since the SoLSA MS already has a running average on carrier 1, 5 s for search of a matching LSA on SIM.

#### 20.24.2.4.3 Related PICS/PIXIT statement(s)

- Support of SoLSA.

#### 20.24.2.4.4 Test requirements

- 1) In step c), the first access of the SoLSA MS shall be on carrier 3.
- 2) In step e), the first access of the SoLSA MS shall be on carrier 1.

### 20.24.3 SoLSA Cell Reselection / idle mode support enabled

#### General Remark

The identification of the LSA is done by means of the LSA ID, see General Remark 2) in subclause 20.24.

#### 20.24.3.1 General conformance requirement

1. There are various requirements that a cell must satisfy before a SoLSA MS can perform normal camping on it:
  - i) It should be a cell of the selected PLMN.
  - ii) It should not be "barred".

- iii) It should not be in an LA which is in the list of "forbidden LA for roaming".
- iv) The radio path loss between SoLSA MS and BTS must be below a threshold set by the PLMN operator.
- v) It should not be an LSA exclusive access cell to which the SoLSA MS does not subscribe.

3GPP TS 03.22, subclause 3.2.1.

2. While camped on a cell of the selected PLMN ("camped normally"), the SoLSA MS may need to select a different cell ("normal cell reselection" state). The following events trigger a cell reselection:

- The cell camped on (current serving cell) has become barred.
- There is a better cell (in terms of the path loss criterion C2) in the same LA, or a much better cell in another LA of the selected PLMN (using the CRH parameter).
- The SoLSA MS will then reselect a new cell in order to fulfil the process goal.

3GPP TS 03.22, subclause 4.5.

3. At least for every new sample or every second, whichever is the greatest, the SoLSA MS calculates the value of C1, C2 and C4 for the serving cell and the non-serving cells. The SoLSA MS shall make a cell reselection if:

- i) The path loss criterion parameter (C1) for the serving cell falls below zero for a period of 5 s.
- ii) A non-serving suitable cell (see 3GPP TS 03.22) is evaluated to be better than the serving cell for a period of 5 s. The best cell is:
  - the cell with the highest value of  $C2 + \text{LSA\_OFFSET}$  among those cells that have highest LSA priority among those that fulfil the criteria  $C4 \geq 0$ ; or
  - the cell with the highest value of C2 among all cells, if no cell fulfil the criterion  $C4 \geq 0$ .

LSA\_OFFSET and LSA ID(s) are broadcast on BCCH. LSA priority is defined by the list of LSAs for the subscriber stored on the SIM. Cells with no LSA priority, e.g. non-LSA cells, are given LSA priority lower than 0. If no LSA\_OFFSET parameter is broadcast, LSA\_OFFSET shall be set to 0.

When evaluating the best cell, the following hysteresis values shall be subtracted from the C2 value for the neighbour cells:

- if the new cell is in the same location area: 0.
- if the new cell is in a different location area:
  - CELL\_RESELECT\_HYSTERESIS, which is broadcast on BCCH of the serving cell.
- in case of a cell reselection occurred within the previous 15 s: 5 dB.

3GPP TS 05.08, subclause 6.6.3.

4. Cell reselection for any other reason shall take place immediately, but the cell that the SoLSA MS was camped on shall not be returned to within 5 s if another suitable cell can be found. If valid receive level averages are not available, the SoLSA MS shall wait until these values are available and then perform the cell reselection if it is still required. The SoLSA MS may accelerate the measurement procedure within the requirements in 3GPP TS 05.08, subclause 6.6.1 to minimise the cell reselection delay. 3GPP TS 05.08, subclause 6.6.3.
5. If no suitable cell is found within 10 s, the cell selection algorithm of 3GPP TS 03.22 shall be performed. Since information concerning a number of channels is already known to the SoLSA MS, it may assign high priority to measurements on the strongest carriers from which it has not previously made attempts to obtain BCCH information, and omit repeated measurements on the known ones. 3GPP TS 05.08, subclause 6.6.3.
6. At least every 5 s the MS shall calculate the value of C1 and C2 for the serving cell and re-calculate C1 and C2 values for non serving cells (if necessary). The MS shall then check whether:
  - i) The path loss criterion (C1) for current serving cell falls below zero for a period of 5 s. This indicates that the path loss to the cell has become too high.

- ii) The calculated value of C2 for a non-serving suitable cell exceeds the value of C2 for the serving cell for a period of 5 s, except;
- a) in the case of the new cell being in a different location area or, for a GPRS MS, in a different routing area or always for a GPRS MS in ready state in which case the C2 value for the new cell shall exceed the C2 value of the serving cell by at least CELL\_RESELECT\_HYSTERESIS dB as defined by the BCCH data from the current serving cell, for a period of 5 s; or
  - b) in case of a cell reselection occurring within the previous 15 s in which case the C2 value for the new cell shall exceed the C2 value of the serving cell by at least 5 dB for a period of 5 s.

This indicates that it is a better cell.

3GPP TS 05.08, subclause 6.6.2.

7. The SoLSA MS shall attempt to decode the full BCCH data of the serving cell at least every 30 s; 3GPP TS 05.08, subclause 6.6.1.
8. The signal strength threshold criterion parameter C4 is used to determine whether prioritised LSA cell reselection shall apply and is defined by:

$$C4 = A - \text{PRIO\_THR}$$

where

$$A = \text{RLA\_C} - \text{RXLEV\_ACCESS\_MIN}$$

and PRIO\_THR is the signal threshold for applying LSA reselection. PRIO\_THR is broadcast on the BCCH. If the idle mode support is disabled for the LSA (3GPP TS 11.11, subclause 10.4.1.2) or if the cell does not belong to any LSA to which the MS is subscribed or if no PRIO\_THR parameter is broadcast, PRIO\_THR shall be set to  $\infty$ .

3GPP TS 05.08, subclause 6.4.

9. The LSA identification is stored on the SIM card within the descriptor file for the LSA. 3GPP TS 11.11, subclause 10.4.1.3.

### 20.24.3.2 SoLSA Cell Reselection / idle mode support enabled / LSA Priority

#### 20.24.3.2.1 Definition and applicability

While camped on a cell of the selected PLMN the SoLSA MS may need to select a different cell in order to fulfil the normal service state. This ensures that the SoLSA MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

Idle mode support for SoLSA on the SIM card is enabled (see General Remark 1. in subclause 20.24).

This test is applicable for all types of SoLSA MS.

#### 20.24.3.2.2 Conformance requirement

1. While camped on a cell of the selected PLMN ("camped normally"), the SoLSA MS may need to select a different cell ("normal cell reselection" state). The following events trigger a cell reselection:
  - The cell camped on (current serving cell) has become barred.
  - There is a better cell (in terms of the path loss criterion C2) in the same LA.
  - The SoLSA MS will then reselect a new cell in order to fulfil the process goal.

3GPP TS 03.22, subclause 4.5.

2. A SoLSA MS with SIM indicating LSA subscription shall always try to reselect the cell with highest LSA priority according to the information stored on the SIM. 3GPP TS 03.73, subclause 11.4.2.

## 20.24.3.2.3 Test purpose

To verify that the SoLSA MS when idle mode support for SoLSA on the SIM card is enabled shall favour camping on those LSA cells with the highest LSA priority the SoLSA MS is subscribed to.

## 20.24.3.2.4 Method of test

## 20.24.3.2.4.1 Initial conditions

- a) Identification of the LSA by means of LSA ID (see subclause 20.24. General remark 2).
- b) Parameters changed from the default values in table 20.24.1.

| Parameter                                   | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------------------------------|-----------|-----------|-----------|-----------|
| RF Signal Level<br>(dB $\mu$ V emf() / dBm) | 63/ -50   | 53/ -60   | 33 / -80  | OFF       |
| CBA                                         | 0         | 0         | 0         |           |
| RXLEV_ACCESS_MIN<br>(dBm)                   | -90       | -90       | -90       |           |
| LAC                                         |           |           |           |           |
| C1                                          | 40        | 30        | 10        |           |
| C2                                          | 40        | 30        | 10        |           |
| C4                                          | 40        | 30        | 10        |           |
| LSA IDs                                     | 66.001    | 9.000.000 | 30.000    |           |
|                                             | 250       | 66.001    | 66.001    |           |
|                                             | 251       | 250       | 9.000.000 |           |
|                                             | 252       | 251       | 250       |           |
| LAC                                         | 5         | 5         | 5         |           |
| CI                                          | 5000      | 5001      | 5002      |           |

- c) Further initial conditions (Carrier 1-3 are normal LSA cells).

| Parameter           | Carrier 1 | Carrier 2  | Carrier 3        | Carrier 4 |
|---------------------|-----------|------------|------------------|-----------|
| Matching LSA on SIM | LSA1      | LSA1, LSA3 | LSA1, LSA3, LSA5 |           |
| Escape PLMN         | No        | No         | No               |           |

- d) Further initial conditions (Carrier 1-3 are LSA exclusive access cells).

| Parameter           | Carrier 1 | Carrier 2  | Carrier 3        | Carrier 4 |
|---------------------|-----------|------------|------------------|-----------|
| Matching LSA on SIM | LSA1      | LSA1, LSA3 | LSA1, LSA3, LSA5 |           |
| Escape PLMN         | Yes       | Yes        | Yes              |           |

Run the following test procedure twice by using two different sets of initial conditions:

- using initial conditions a), b) and c);
- using initial conditions a), b) and d).

## 20.24.3.2.4.2 Test Procedure

- a) The SS activates carriers 1, 2 and 3 and monitors these carriers for RA requests from the SoLSA MS.
- b) The SoLSA MS is switched on.
- c) After approx. 60 s the SS is reconfigured and carrier 3 becomes barred (CBA = 1) in order to give the MS the time to perform cell reselection on carrier 3.
- d) The SS is reconfigured and the level of carrier 2 is decreased to 13 dB $\mu$ Vemf() / -100 dBm. (C2 decreases to -10 dB).

## 20.24.3.2.4.3 Related PICS/PIXIT statement(s)

- Support of SoLSA.

#### 20.24.3.2.4.4 Test Requirements

- 1) After step b), the first response from the SoLSA MS shall be received on carrier 1 (highest C1) within 50 s (Cell Selection).

NOTE 1: 33 s for the MS to read the BCCH of carrier 3 (30 s + 10 %), 10 s for communicating the data between SIM and ME, 5 s for search of a matching LSA on SIM. Total 48 s, allow 50 s.

- 2) The following response from the SoLSA MS shall be received on carrier 3 within 25 s after the first response on carrier 1 (Reselection, highest LSA Priority (15)).

NOTE 2: 5 s for the running average, 10 s to detect C2 differences, 2,4 s to read BCCH of carrier 1, 1 s to perform RA, 5 s for search of a matching LSA on SIM. Total 23,4 s, allow 25 s.

- 3) After step c), there shall be response from the SoLSA MS on carrier 2 within 55 s after carrier 3 has been barred (Highest LSA Priority on the SIM (8)).

NOTE 3: 30 s for the MS to read the BCCH of carrier 3, 20 s to reselect carrier 2, 5 s for search of a matching LSA on SIM: total 55 s.

- 4) After step d), there shall be response from the SoLSA MS on carrier 1 within 25 s after carrier 2 has been reconfigured.

NOTE 4: 5 s for the running average, 10 s to detect C2 differences, 2,4 s to read BCCH of carrier 1, 1 s to perform RA, 5 s for search of a matching LSA on SIM. Total 23,4 s, allow 25 s.

### 20.24.3.3 SoLSA Cell Reselection / idle mode support enabled / LSA Priority / different location area

#### 20.23.3.3.1 Definition and applicability

While camped on a cell of the selected PLMN the SoLSA MS may need to select a different cell in order to fulfil the normal service state. This ensures that the SoLSA MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

Idle mode support for SoLSA on the SIM card is enabled (See General Remark 1. of subclause 20.24).

This test is applicable for all types of SoLSA MS.

#### 20.24.3.3.2 Conformance requirement

1. While camped on a cell of the selected PLMN ("camped normally"), the SoLSA MS may need to select a different cell ("normal cell reselection" state). The following events trigger a cell reselection:

- The cell camped on (current serving cell) has become barred.
- There is a better cell (in terms of the path loss criterion C2) in the same LA, or a much better cell in another LA of the selected PLMN (using the CRH parameter).
- The SoLSA MS will then reselect a new cell in order to fulfil the process goal.

3GPP TS 03.22, subclause 4.5.

2. A SoLSA MS with SIM indicating LSA subscription shall always try to reselect the cell with highest LSA priority according to the information stored on the SIM. 3GPP TS 03.73, subclause 11.4.2.

3. The LSA identification shall be stored on the SIM card in the LSA descriptor files (EF). LSAs can be described in four different ways (see 3GPP TS 11.11, subclause 10.4.1.3):

- as a list of LSA IDs (3 bytes);
- as a list of LAC + CIs (4 bytes);
- as a list of CIs (2 bytes);

- as a list of LACs (2 bytes); or
- as a combination of the lists above.

### 20.24.3.3.3 Test purpose

To verify that the SoLSA MS when idle mode support for SoLSA on the SIM card is enabled shall favour camping on those LSA cells with the highest C2 among those cells with the highest LSA priority the SoLSA MS is subscribed to even if the cell belongs to a different location area.

### 20.24.3.3.4 Method of test

#### 20.24.3.3.4.1 Initial conditions

- a) Identification of the LSA by means of LSA ID (see subclause 20.24. General remark 2).
- b) Parameters changed from the default values in table 20.24.1.

| Parameter                                   | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------------------------------|-----------|-----------|-----------|-----------|
| RF Signal Level<br>(dB $\mu$ V emf() / dBm) | 43/ -70   | 33/ -80   | 33 / -80  | 13 / -100 |
| CBA                                         | 0         | 0         | 0         | 0         |
| RXLEV_ACCESS_MIN (dBm)                      | -90       | -90       | -90       | -90       |
| CRH (dB)                                    | 10        | 10        | 10        | 10        |
| C1                                          | 20        | 10        | 10        | -10       |
| C2                                          | 20        | 10        | 10        | -10       |
| C4                                          | 20        | 10        | 10        | -10       |
| LSA ID                                      | 54        | 54        | 54        | 30.000    |
| LAC                                         | 5         | 5         | 3         | 3         |
| CI                                          | 5000      | 5001      | 5002      | 5003      |

- c) Further initial conditions (Carrier 1-3 are normal LSA cells).

| Parameter           | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------|-----------|-----------|-----------|-----------|
| Matching LSA on SIM | LSA1      | LSA1      | LSA1      | LSA5      |
| Escape PLMN         | No        | No        | No        | No        |

- d) Further initial conditions (Carrier 1-3 are LSA exclusive access cells).

| Parameter           | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------|-----------|-----------|-----------|-----------|
| Matching LSA on SIM | LSA1      | LSA1      | LSA1      | LSA5      |
| Escape PLMN         | Yes       | Yes       | Yes       | Yes       |

- e) Identification of the LSA by means of:

- LSA ID on Carrier 1;
- LAC + CI on Carrier 2;
- LAC on Carrier 3;
- CI on carrier 4.

(see subclause 20.24. General remark 2.)

- f) Parameters changed from the default values in table 20.24.1.

| Parameter                                   | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------------------------------|-----------|-----------|-----------|-----------|
| RF Signal Level<br>(dB $\mu$ V emf() / dBm) | 43/ -70   | 33/ -80   | 33 / -80  | 13 / -100 |
| CBA                                         | 0         | 0         | 0         | 0         |
| RXLEV_ACCESS_MIN (dBm)                      | -90       | -90       | -90       | -90       |
| CRH (dB)                                    | 10        | 10        | 10        | 10        |
| C1                                          | 20        | 10        | 10        | -10       |
| C2                                          | 20        | 10        | 10        | -10       |
| C4                                          | 20        | 10        | 10        | -10       |
| LSA ID                                      | 100       | 250       | 250       | 250       |
| LAC                                         | 3         | 3         | 10        | 5         |
| CI                                          | 5000      | 500       | 5002      | 256       |

g) Further initial conditions (Carrier 1-4 are normal LSA cells).

| Parameter           | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------|-----------|-----------|-----------|-----------|
| Matching LSA on SIM | LSA7      | LSA7      | LSA7      | LSA5      |
| Escape PLMN         | No        | No        | No        | No        |

h) Further initial conditions (Carrier 1-4 are LSA exclusive access cells).

| Parameter           | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------|-----------|-----------|-----------|-----------|
| Matching LSA on SIM | LSA7      | LSA7      | LSA7      | LSA5      |
| Escape PLMN         | Yes       | Yes       | Yes       | Yes       |

Run the following test procedure twice by using four different sets of initial conditions:

- using initial conditions a), b) and c);
- using initial conditions a), b) and d);
- using initial conditions e), f) and g);
- using initial conditions e), f) and h).

#### 20.24.3.3.4.2 Test Procedure

- a) The SS activates carriers 1, 2 and 3 and monitors these carriers for RA requests from the SoLSA MS. Carrier 4 is switched off.
- b) The SoLSA MS is switched on.
- c) The SS is reconfigured and the level of carrier 3 is increased to 63 dB $\mu$ V emf() / -50 dBm (C2 increases to 40 dB).
- d) The SS is reconfigured and the level of carrier 2 is increased to 63 dB $\mu$ V emf() / -50 dBm (C2 increases to 40 dB).
- e) The SS is reconfigured and carrier 3 becomes barred (CBA = 1).
- f) The SS activates carrier 4 and monitors carriers 1, 2 and 4. Carrier 3 is switched off.
- g) The SS is reconfigured and the level of carrier 4 is increased to 33 dB $\mu$ V emf () / -80 dBm (C2 increases to 10 dB).

#### 20.24.3.3.4.3 Related PICS/PIXIT statement(s)

- Support of SoLSA.

#### 20.24.3.3.4.4 Test Requirements

- 1) After step b), the first response from the SoLSA MS shall be received on carrier 1 within 50 s. (Cell Selection, highest C1). There shall be no response from the SoLSA MS on any other carrier within 35 s after first response on carrier 1.

NOTE 1: Any potential access is likely to occur within 25 s.

- 2) After step c), there shall be response from the SoLSA MS on carrier 3 within 25 s after increasing the level of carrier 3 (now highest C2 (C2-CRH), for cells with  $C4 > 0$ ).
- 3) After step d), there shall be no response from the SoLSA MS on carrier 2 within 35 s after increasing the level of carrier 2 (still highest C2/C2-CRH for carrier 3).

NOTE 2: Any potential access is likely to occur within 25 s.

- 4) After step e), there shall be response from the SoLSA MS on carrier 2 within 55 s after carrier 3 becomes barred.
- 5) After step f), there shall be no response from the SoLSA MS on carrier 4 within 60 s after carrier 4 is switched on (Highest LSA Priority (15), but  $C2 < 0$ ).
- 6) After step g), there shall be response from the SoLSA MS on carrier 4 within 25 s after increasing level of carrier 4 (not highest C2, but  $C4 > 0$  and highest LSA Priority (15) on the SIM).

### 20.24.3.4 SoLSA Cell Reselection / idle mode support enabled / Priority Threshold

#### 20.24.3.4.1 Definition and applicability

While camped on a cell of the selected PLMN the SoLSA MS may need to select a different cell in order to fulfil the normal service state. This ensures that the SoLSA MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

Idle mode support for SoLSA on the SIM card is enabled (see General Remark 1 in subclause 20.24).

This test is applicable for all types of SoLSA MS.

#### 20.24.3.4.2 Conformance requirement

The SoLSA MS shall be able to calculate correctly the signal strength threshold criterion parameter  $C4$  which is to determine whether prioritised LSA cell reselection shall apply.

The signal strength threshold criterion parameter  $C4$  is used to determine whether prioritised LSA cell reselection shall apply and is defined by:

$$C4 = A - \text{PRIO\_THR}$$

Where:

$A$  is defined as above and  $\text{PRIO\_THR}$  is the signal threshold for applying LSA reselection.  $\text{PRIO\_THR}$  is broadcast on the BCCH. If the idle mode support is disabled for the LSA (see 3GPP TS 11.11) or if the cell does not belong to any LSA to which the MS is subscribed or if no  $\text{PRIO\_THR}$  parameter is broadcast,  $\text{PRIO\_THR}$  shall be set to  $\infty$ .

3GPP TS 05.08, subclause 6.4.

#### 20.24.3.4.3 SoLSA Cell Reselection / idle mode support enabled / Priority Threshold any value

##### 20.24.3.4.3.1 Test purpose

To verify that the SoLSA MS is able to reselect cells correctly according to parameter  $\text{PRIO\_THR}$ . (parameter  $C4$  criterion).

## 20.24.3.4.3.2 Method of test

## 20.24.3.4.3.2.1 Initial conditions

- a) Identification of the LSA by means of LSA ID (see subclause 20.24. General remark 2.)
- b) Parameters changed from the default values in table 20.24.1.

| Parameter                                   | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------------------------------|-----------|-----------|-----------|-----------|
| RF Signal Level<br>(dB $\mu$ V emf() / dBm) | 47 / - 66 | 55 / -58  | 63 / -50  | OFF       |

| CI                                          | 5000      | 5001      | 5002      |           |

NOTE: The level of PRIQ\_THR is evaluated according to 3GPP TS 05.08, clause 9 and table 1.

- c) Further initial conditions (Carrier 1-3 are normal LSA cells).

| Parameter           | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------|-----------|-----------|-----------|-----------|
| Matching LSA on SIM | LSA1      | LSA3      | LSA5      |           |
| Escape PLMN         | No        | No        | No        |           |

- d) Further initial conditions (Carrier 1-3 are LSA exclusive access cells).

| Parameter           | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------|-----------|-----------|-----------|-----------|
| Matching LSA on SIM | LSA1      | LSA3      | LSA5      |           |
| Escape PLMN         | Yes       | Yes       | Yes       |           |

Run the following test procedure twice by using two different sets of initial conditions:

- using initial conditions a), b) and c);
- using initial conditions a), b) and d).

## 20.24.3.4.3.2.2 Test Procedure

- a) The SS activates carriers 1, 2 and 3 and monitors these carriers for RA requests from the SoLSA MS.
- b) The SoLSA MS is switched on.
- c) Carrier 3 is barred (CBA = 1).
- d) The PRIQ\_THR value of carrier 2 is set to 0 dB (level 0).
- e) The PRIQ\_THR value of carrier 2 is set to 36 dB (level 6).

## 20.24.3.4.3.2.3 Related PICS/PIXIT statement(s)

- Support of SoLSA.

## 20.24.3.4.3.2.4 Test Requirements

- 1) After step b), the first response from the SoLSA MS shall be received on carrier 3 within 50 s after switch on.

- 2) After step c), the SoLSA MS shall respond on carrier 1 within 55 s after barring of carrier 3 (Highest Priority +  $C4 > 0$ ).
- 3) After step d), the SoLSA MS shall respond on carrier 2 within 55 s after changing the PRIO\_THR value of carrier 2 ( $C4 > 0$  + Highest  $C2+LSA\_OFFSET$ ).
- 4) After step e), the SoLSA MS shall respond on carrier 1 within 55 s after changing the PRIO\_THR value of carrier 2 ( $C4 > 0$ , Highest priority).

#### 20.24.3.4.4 SoLSA Cell Reselection / idle mode support enabled / Priority Threshold infinite

##### 20.24.3.4.4.1 Test purpose

To verify that the SoLSA MS is able to reselect cells correctly according to parameter C2 among those cell not fulfilling  $C4 \geq 0$ .

##### 20.24.3.4.4.2 Method of test

##### 20.24.3.4.4.2.1 Initial conditions

- a) Identification of the LSA by means of LSA ID (see subclause 20.24. General remark 2).
- b) Parameters changed from the default values in table 20.24.1.

| Parameter                                | Carrier 1      | Carrier 2      | Carrier 3      | Carrier 4 |
|------------------------------------------|----------------|----------------|----------------|-----------|
| RF Signal Level (dB $\mu$ V emf() / dBm) | 63 / -50       | 53 / -60       | 58 / -55       | 31 / -82  |
| CBA                                      | 0              | 0              | 0              | 0         |
| RXLEV_ACCESS_MIN (dBm)                   | -90            | -90            | -90            | -90       |
| CRH (dB)                                 | 10             |                |                |           |
| PRIO_THR (level / dB)                    | 7 / 'infinite' | 7 / 'infinite' | 7 / 'infinite' |           |
| C1                                       | 40             | 30             | 35             | 8         |
| C2                                       | 40             | 30             | 35             | 8         |
| C4                                       | <0             | <0             | <0             | 8         |
| LSA_OFFSET (level / dB)                  |                | <b>5 / 32</b>  |                |           |
| LSA ID                                   | 66.001         | 66.001         | 9.000.000      | 30.000    |
| LAC                                      | 5              | 5              | 3              | 3         |
| CI                                       | 5000           | 5001           | 5002           | 5003      |

- c) Further initial conditions (Carrier 1-4 are normal LSA cells).

| Parameter           | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------|-----------|-----------|-----------|-----------|
| Matching LSA on SIM | LSA1      | LSA1      | LSA3      | LSA5      |
| Escape PLMN         | No        | No        | No        | No        |

- d) Further initial conditions (Carrier 1-4 are LSA exclusive access cells).

| Parameter           | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------|-----------|-----------|-----------|-----------|
| Matching LSA on SIM | LSA1      | LSA1      | LSA3      | LSA5      |
| Escape PLMN         | Yes       | Yes       | Yes       | Yes       |

Run the following test procedure twice by using two different sets of initial conditions:

- using initial conditions a), b) and c);
- using initial conditions a), b) and d).

##### 20.24.3.4.4.2.2 Test Procedure

- a) The SS activates carriers 1, 2 and 3 and monitors these carriers for RA requests from the SoLSA MS. Carrier 4 is switched off.

- b) The SoLSA MS is switched on.
- c) The SS is reconfigured and the level of carrier 1 is decreased to 33 dB $\mu$ V emf() / -80 dBm (C2 of carrier 1 becomes 10).
- d) The SS is reconfigured and the level of carrier 3 is increased to 63 dB $\mu$ V emf() / -50 dBm (C2 of carrier 3 becomes 40).
- e) Carrier 1 is switched off. Carrier 4 is switched on. The SS monitors carriers 2, 3 and 4.

#### 20.24.3.4.4.2.3 Related PICS/PIXIT statement(s)

- Support of SoLSA.

#### 20.24.3.4.4.2.4 Test Requirements

- 1) After step b), the first response from the SoLSA MS shall be received on carrier 1 within 50 s. There shall be no response from the SoLSA MS on any other carrier within 35 s after the first response on carrier 1.

NOTE 1: Any potential access is likely to occur within 25 s.

- 2) After step c), there shall be response from the SoLSA MS on carrier 2 within 25 s after carrier 1 has been reconfigured (Highest C2/C2-CRH).
- 3) After step d), there shall be response on carrier 3 within 25 s after carrier 2 has been reconfigured (Highest C2/C2-CRH).
- 4) After step e), there shall be response on carrier 4 within 60 s after the system has been reconfigured (idle mode support enabled for carrier 4).

NOTE: 5,5 s to notice new strongest carriers on top 6 (because the updating time for the 6 strongest is 5 s ( $\pm 10\%$ )), 33 s to read BCCH, 15 s for reselection, 5 s for search of a matching LSA on SIM. Allow 60 s.

### 20.24.3.5 SoLSA Cell Reselection / idle mode support enabled / LSA Priority / LSA\_OFFSET

#### 20.24.3.5.1 Definition and applicability

While camped on a cell of the selected PLMN the SoLSA MS may need to select a different cell in order to fulfil the normal service state. This ensures that the SoLSA MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

This test is applicable for all types of SoLSA MS.

#### 20.24.3.5.2 Conformance requirement

While performing cell reselection, the SoLSA MS shall be able to calculate correctly the signal strength threshold criterion parameter consisting of C2 + LSA\_OFFSET to determine which LSA cell shall be selected among those having the same LSA priority; 3GPP TS 05.08, subclause 6.6.3.

#### 20.24.3.5.3 Test Purpose

To verify that the SoLSA MS shall be able to reselect the cell with the highest value of C2 + LSA\_OFFSET among those cells that have highest LSA priority and fulfil the criteria C4  $\geq$  0.

#### 20.24.3.5.4 Method of test

##### 20.24.3.5.4.1 Initial conditions

- a) Identification of the LSA by means of LSA ID (see subclause 20.24. General remark 2).
- b) Parameters changed from the default values in table 20.24.1.

| Parameter                                | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|------------------------------------------|-----------|-----------|-----------|-----------|
| RF Signal Level (dB $\mu$ V emf() / dBm) | 63 / -50  | 43 / -70  | 33 / -80  | OFF       |
| CBA                                      | 0         | 0         | 0         |           |
| RXLEV_ACCESS_MIN (dBm)                   | -90       | -90       | -90       |           |
| C1                                       | 40        | 20        | 10        |           |
| C2                                       | 40        | 20        | 10        |           |
| C4                                       | 40        | 20        | 10        |           |
| LSA_OFFSET (level / dB)                  | 0 / 0     | 1 / 4     | 4 / 24    |           |
| LSA ID                                   | 30.000    | 66.001    | 66.001    |           |
| LAC                                      | 5         | 5         | 5         |           |
| CI                                       | 5000      | 5001      | 5002      |           |

NOTE: The level of LSA\_OFFSET is evaluated according to 3GPP TS 05.08, clause 9 and table 1.

c) Further initial conditions (Carrier 1-3 are normal LSA cells).

| Parameter           | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------|-----------|-----------|-----------|-----------|
| Matching LSA on SIM | LSA5      | LSA1      | LSA1      |           |
| Escape PLMN         | No        | No        | No        |           |

d) Further initial conditions (Carrier 1-3 are LSA exclusive access cells).

| Parameter           | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------|-----------|-----------|-----------|-----------|
| Matching LSA on SIM | LSA5      | LSA1      | LSA1      |           |
| Escape PLMN         | Yes       | Yes       | Yes       |           |

Run the following test procedure twice by using two different sets of initial conditions:

- using initial conditions a), b) and c);
- using initial conditions a), b) and d).

#### 20.24.3.5.4.2 Test Procedure

- a) The SS activates carriers 1, 2 and 3 and monitors these carriers for RA requests from the SoLSA MS.
- b) The SoLSA MS is switched on.
- c) Carrier 1 is barred (CBA = 1).
- d) Carrier 3 is barred (CBA = 1).

#### 20.24.3.5.4.3 Related PICS/PIXIT statement(s)

- Support of SoLSA.

#### 20.24.3.5.4.4 Test Requirements

- 1) After step b), the first response from the SoLSA MS shall be received on carrier 1 after 50 s. (highest value of C1). There shall be no response from the SoLSA MS on other carriers within 35s after the first response sent on carrier 1.

NOTE: Any potential access is likely to occur within 25 s.

- 2) After step c), the SoLSA MS shall respond on carrier 3 within 55 s after carrier 1 becomes barred. (same priority as for LSA on carrier 2 but highest value of C2+LSA\_OFFSET).
- 3) After step d), the SoLSA MS shall respond on carrier 2 within 55 s after carrier 3 becomes barred.

### 20.24.3.6 SoLSA Cell Reselection / idle mode support enabled / LSA Priority / cell combinations

#### 20.24.3.6.1 Definition and applicability

This test is applicable for all types of SoLSA MS.

#### 20.24.3.6.2 Conformance requirement

1. While camped on a cell of the selected PLMN ("camped normally"), the SoLSA MS may need to select a different cell ("normal cell reselection" state). The following events trigger a cell reselection:

- The cell camped on (current serving cell) has become barred.
- There is a better cell (in terms of the path loss criterion C2) in the same LA.
- The MS will then reselect a new cell in order to fulfil the process goal.

3GPP TS 03.22, subclause 4.5.

2. The SoLSA MS shall reselect the correct cell when subscription for normal LSA cells and LSA exclusive access cells varies; GSM 03.73, subclauses 4.3.1 and 4.3.3.

The setting of the LSA only bit on the SIM shall not influence the behaviour of the cell reselection: for subscribers with LSA only access call unrelated service requests are accepted even outside of the allowed LSAs. 3GPP TS 03.73, subclause 4.5.4.

3. When MS is out of the allowed LSA it shall be registered in PLMN but indicate subscriber/service specific "out of LSA area" notification. It shall be a network controlled function to prevent terminated or/and originated calls. Emergency calls are however always allowed. 3GPP TS 02.11, subclause 5.3.

#### 20.24.3.6.3 Test purpose

To verify that the SoLSA MS shall reselect the correct cell when subscription for normal LSA cells and LSA exclusive access cells varies. The setting of LSA only bit on the SIM shall not influence the behaviour of the cell reselection.

#### 20.24.3.6.4 Method of tests

##### 20.24.3.6.4.1 Initial conditions

- a) Parameters changed from the default values in table 20.24.1.

| Parameter                         | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|-----------------------------------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBμV emf) / dBm) | 53/ -60   | 43/ -70   | 63 / -50  | OFF       |
| CBA                               | 0         | 0         | 0         |           |
| RXLEV_ACCESS_MIN (dBm)            | -90       | -90       | -90       |           |
| C1                                | 30        | 20        | 40        |           |
| C2                                | 30        | 20        | 40        |           |
| C4                                | 30        | 20        | <0        |           |

- b) Further parameters changed from the default values in table 20.24.1; further initial conditions.

| Parameter/condition | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------|-----------|-----------|-----------|-----------|
| LSA ID              | 9.000.000 | 30.000    | 250       |           |
| LAC                 | 5         | 5         | 5         |           |
| CI                  | 5000      | 5001      | 5002      |           |
| Matching LSA on SIM | LSA3      | LSA5      | -         |           |
| Escape PLMN         | Yes       | No        | No        |           |

c) Further parameters changed from the default values in table 20.24.1; further initial conditions.

| Parameter/condition | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------|-----------|-----------|-----------|-----------|
| LSA ID              | 250       | 9.000.000 | 250       |           |
| LAC                 | 5         | 5         | 5         |           |
| CI                  | 5000      | 5001      | 5002      |           |
| Matching LSA on SIM | -         | LSA3      | -         |           |
| Escape PLMN         | No        | Yes       | No        |           |

d) Further parameters changed from the default values in table 20.24.1; further initial conditions.

| Parameter/condition | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------|-----------|-----------|-----------|-----------|
| LSA ID              | 250       | 30.000    | 250       |           |
| LAC                 | 5         | 5         | 5         |           |
| CI                  | 5000      | 5001      | 5002      |           |
| Matching LSA on SIM | -         | LSA5      | -         |           |
| Escape PLMN         | No        | No        | Yes       |           |

e) Further parameters changed from the default values in table 20.24.1; further initial conditions.

| Parameter/condition | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------|-----------|-----------|-----------|-----------|
| LSA ID              | 250       | 250       | 250       |           |
| LAC                 | 5         | 5         | 5         |           |
| CI                  | 5000      | 5001      | 5002      |           |
| Matching LSA on SIM | -         | -         | -         |           |
| Escape PLMN         | Yes       | No        | No        |           |

f) Identification of the LSA by means of LSA ID (see subclause 20.24. General remark 2).

Run the following test procedures twice using two different sets of initial conditions:

- with an LSA only SIM;
- with a normal LSA SIM.

#### 20.24.3.6.4.2.1 Test Procedure

Using conditions from table a), b) and f).

- a) The SS activates the carriers 1, 2, 3 and monitors these carriers for RA requests from the SoLSA MS.
- b) The SoLSA MS is switched on.
- c) The SS is reconfigured and carrier 3 becomes barred (CBA = 1).
- d) The SS is reconfigured and carrier 2 becomes barred (CBA = 1) and carrier 3 becomes not barred (CBA = 0).

#### 20.24.3.6.4.2.2 Related PICS/PIXIT statement(s)

- Support of SoLSA.

#### 20.24.3.6.4.2.3 Test Requirements

- 1) After step b), the first response from the SoLSA MS shall be received on carrier 3 within 50 s. There shall be no response from the SoLSA MS on any other carrier within 35 s after the first response on carrier 3.

NOTE 1: Any potential access is likely to occur within 35 s.

- 2) After step c), there shall be response from the SoLSA MS on carrier 2 within 60 s after activating of carriers 2 and 3. (Highest LSA Priority on the SIM (15) for  $C4 \geq 0$  in the present subscription).

NOTE 2: 5,5 s to notice new strongest carriers on top 6 (because the updating time for the 6 strongest is 5 s ( $\pm 10\%$ )), 33 s to read BCCH, 15 s for reselection, 5 s for search of a matching LSA on SIM. Allow 60 s.

- 3) After step d), there shall be response from SoLSA MS on carrier 1 within 55 s after carrier 2 has become barred (highest priority (8) with  $C4 \geq 0$ ).

#### 20.24.3.6.4.3.1 Test Procedure

Using conditions from table a), c) and f).

- a) The SS activates carrier 1 and monitors that carrier for RA requests from the SoLSA MS. Carrier 2 and 3 are switched off.
- b) The SoLSA MS is switched on.
- c) The SS activates the carriers 2 and 3 (carrier 1 is still switched on) and monitors carriers 1, 2 and 3 for RA requests from the SoLSA MS.
- d) The SS is reconfigured and the carrier 2 becomes barred ( $CBA = 1$ ).

#### 20.24.3.6.4.3.2 Related PICS/PIXIT statement(s)

- Support of SoLSA.

#### 20.24.3.6.4.3.3 Test Requirements

- 1) After step b), the first response from the SoLSA MS shall be received on carrier 1 within 50 s.
- 2) After step c), there shall be response from the SoLSA MS on carrier 2 after 60 s (highest LSA Priority on the SIM (8) with  $C4 \geq 0$ ).
- 3) After step d), there shall be response from SoLSA MS on carrier 3 within 55 s after carrier 2 becomes barred (no subscription, Highest C2).

#### 20.24.3.6.4.4.1 Test Procedure

Using conditions from table a), d) and f).

- a) The SS activates the carrier 1 and monitors that carrier for RA requests from the SoLSA MS. Carrier 2 and 3 are switched off.
- b) The SoLSA MS is switched on.
- c) The SS activates the carriers 2 and 3 (carrier 1 is still switched on) and monitors carriers 1, 2 and 3 for RA requests from the SoLSA MS.
- d) The SS is reconfigured and carrier 2 becomes barred ( $CBA = 1$ ).

#### 20.24.3.6.4.4.2 Related PICS/PIXIT statement(s)

- Support of SoLSA.

#### 20.24.3.6.4.4.3 Test Requirements

- 1) After step b), the first response from the SoLSA MS shall be received on carrier 1 within 50 s.
- 2) After step c), there shall be response from the SoLSA MS on carrier 2 after 60 s after carrier 2 and 3 were switched on (LSA with highest Priority (15)).
- 3) After step d), there shall be response from SoLSA MS on carrier 1 within 55 s after carrier 2 has become barred (Carrier 3 is an LSA exclusive access cell with no matching subscription).

#### 20.24.3.6.4.5.1 Test Procedure

Using conditions from table a),e) and f).

- a) The SS activates carriers 1 and 3 and monitors these for RA requests from the SoLSA MS.

- b) The SoLSA MS is switched on.
- c) The SS activates carrier 2 and carrier 3 becomes barred. (CBA = 1).
- d) The SS is reconfigured and carrier 2 becomes barred. (CBA = 1).

#### 20.24.3.6.4.5.2 Related PICS/PIXIT statement(s)

- Support of SoLSA.

#### 20.24.3.6.4.5.3 Test Requirements

- 1) After step b), the first response from the SoLSA MS shall be received on carrier 3 within 50 s (Carrier 1 is an LSA exclusive access cell with no matching subscription).
- 2) After step c), there shall be response from the SoLSA MS on carrier 2 within 55 s.
- 3) After step d), there shall be no paging response from SoLSA MS on any carrier (Carrier 2 and 3 are barred, carrier 1 is an exclusive access cell, the SoLSA MS is in the limited state) within 65 s.

NOTE: Any potential access is likely to occur quicker.

### 20.24.3.7 SoLSA Cell Reselection / roaming

#### 20.24.3.7.1 Definition and applicability

While camped on a cell of the selected PLMN the SoLSA MS may need to select a different cell in order to fulfil the normal service state. This ensures that the SoLSA MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

Idle mode support for SoLSA on the SIM card is enabled (see General Remark 1. in subclause 20.24).

This test is applicable for all types of SoLSA MS.

#### 20.24.3.7.2 Conformance requirement

1. While camped on a cell of the selected PLMN ("camped normally"), the SoLSA MS may need to select a different cell ("normal cell reselection" state). The following events trigger a cell reselection:

- There is a better cell (in terms of the path loss criterion C2) in the same LA.
- The SoLSA MS will then reselect a new cell in order to fulfil the process goal.

3GPP TS 03.22, subclause 4.5.

2. A SoLSA MS with SIM indicating LSA subscription shall always try to reselect the cell with highest LSA priority according to the information stored on the SIM. 3GPP TS 03.73, subclause 11.4.2.

#### 20.24.3.7.3 Test Purpose

To verify that the SoLSA MS when idle mode support for SoLSA on the SIM card is enabled shall favour camping on those LSA cells with the highest LSA priority the SoLSA MS is subscribed to even if subscriber is outside of his HPLMN.

## 20.24.3.7.4 Method of test

## 20.24.3.7.4.1 Initial conditions

- a) Identification of the LSA by means of LSA ID (see subclause 20.24 General remark 2.).
- b) Parameters changed from the default values in table 20.24.1.

| Parameter                                   | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------------------------------|-----------|-----------|-----------|-----------|
| RF Signal Level<br>(dB $\mu$ V emf() / dBm) | 43/-70    | 53/-60    | 33/-80    | 63/-50    |
| RXLEV_ACCESS_MIN (dBm)                      | -90       | -90       | -90       | -90       |
| MCC, MNC                                    | VPLMN     | VPLMN     | VPLMN     | VPLMN     |
| C1                                          | 20        | 30        | 10        | 40        |
| C2                                          | 20        | 30        | 10        | 40        |
| C4                                          | 20        | <0        | 10        | 40        |
| LSA ID                                      | 9.000.000 | -         | 9.000.001 | 54        |
| LAC                                         | 5         | 5         | 5         | 5         |
| CI                                          | 5000      | 5001      | 5002      | 5003      |

- c) Further initial conditions (Carrier 1-3 are normal LSA cells).

| Parameter           | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------|-----------|-----------|-----------|-----------|
| Matching LSA on SIM | -         | -         | LSA8      | LSA9      |
| Escape PLMN         | No        | No        | No        | No        |

- d) Further initial conditions (Carrier 1-3 are LSA exclusive access cells).

| Parameter           | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------|-----------|-----------|-----------|-----------|
| Matching LSA on SIM | -         | -         | LSA8      | LSA9      |
| Escape PLMN         | Yes       | Yes       | Yes       | Yes       |

Run the following test procedure twice by using two different sets of initial conditions:

- using initial conditions a), b) and c);
- using initial conditions a), b) and d).

## 20.24.3.7.4.2 Test Procedure

- a) The SS activates carrier 1 and carrier 2, pages the MS on these carriers and monitors these for RA requests from the SoLSA MS. Carriers 3 and 4 are switched off.
- b) The SoLSA MS is switched on.
- c) After approx. 60 s the SS is reconfigured and level of carrier 2 decreases to 33 dB $\mu$ V/-80dBm (C2 decreases to 10). The SS monitors carriers 1 and 2 for RA requests from the SoLSA MS.
- d) The SS activates carriers 3 and 4. The SS pages the MS on carriers 3 and 4, and monitors these carriers for RA requests from the SoLSA MS.
- e) The SS is reconfigured and carrier 3 becomes barred (CBA = 1). The SS pages the MS on carrier 4, and monitors this carrier for RA requests from the SoLSA MS.

## 20.24.3.7.4.3 Related PICS/PIXIT statement(s)

- Support of SoLSA.

## 20.24.3.7.4.4 Test Requirements

- 1) After step b), the first response from the SoLSA MS shall be received on carrier 2 within 50 s.

- 2) After step c), there shall be response from the SoLSA MS on carrier 1 within 25 s after decreasing the level of carrier 2 (highest C2).
- 3) After step d), there shall be response from the SoLSA MS on carrier 3 within 55 s (highest priority on the SIM card for matching LSA subscription).
- 4) After step e), there shall be response from the SoLSA MS on carrier 4 within 55 s.

## 20.24.4 SoLSA Cell Reselection / idle mode support / any value

### General Remark

Definition of "idle mode support" is given in subclause 20.24 General Remark 1.

"Idle mode support" is only controlling if 'favouring' shall be done at cell reselection. It does not disable the LSA subscription.

#### 20.24.4.1 Definition and applicability

While camped on a cell of the selected PLMN a SoLSA MS may need to select a different cell in order to fulfil the normal service state. This ensures that the SoLSA MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

This test is applicable for all types of SoLSA MS.

#### 20.24.4.2 Conformance requirement

1. While camped on a cell of the selected PLMN ("camped normally"), the SoLSA MS may need to select a different cell ("normal cell reselection" state). The following events trigger a cell reselection:
  - The cell camped on (current serving cell) has become barred.
  - There is a better cell (in terms of the path loss criterion C2) in the same LA, or a much better cell in another LA of the selected PLMN (using the CRH parameter).
  - The SoLSA MS will then reselect a new cell in order to fulfil the process goal.

3GPP TS 03.22, subclause 4.5.

#### 20.24.4.3 Test purpose

To verify that the SoLSA MS shall not favour camping on the LSA for which support in idle mode is disabled.

#### 20.24.4.4 Method of test

#### 20.24.4.5 Initial conditions

- a) Identification of the LSA by means of LSA ID (see subclause 20.24. General remark 2).
- b) Parameters changed from the default values in table 20.24.1.

| Parameter                                   | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------------------------------|-----------|-----------|-----------|-----------|
| RF Signal Level<br>(dB $\mu$ V emf() / dBm) | 63/ -50   | 53/-60    | 58/-55    | 31 / -82  |
| CBA                                         | 0         | 0         | 0         | 0         |
| RXLEV_ACCESS_MIN (dBm)                      | -90       | -90       | -90       | -90       |
| CRH (dB)                                    | 10        |           |           |           |
| C1                                          | 40        | 30        | 35        | 8         |
| C2                                          | 40        | 30        | 35        | 8         |
| C4                                          | 40        | 30        | 35        | 8         |
| LSA ID                                      | 66.000    | 66.000    | 9.000.001 | 5         |
| LAC                                         | 5         | 5         | 3         | 3         |
| CI                                          | 5000      | 5001      | 5002      | 5003      |

c) Further initial conditions (Carrier 1-4 are normal LSA cells).

| Parameter                 | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------------|-----------|-----------|-----------|-----------|
| Idle mode support enabled | No        | No        | No        | Yes       |
| Matching LSA on SIM       | LSA2      | LSA2      | LSA4      | LSA6      |
| Escape PLMN               | No        | No        | No        | No        |

d) Further initial conditions (Carrier 1-4 are LSA exclusive access cells).

| Parameter                 | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------------|-----------|-----------|-----------|-----------|
| Idle mode support enabled | No        | No        | No        | Yes       |
| Matching LSA on SIM       | LSA2      | LSA2      | LSA4      | LSA6      |
| Escape PLMN               | Yes       | Yes       | Yes       | Yes       |

Run the following test procedure twice by using two different sets of initial conditions:

- using initial conditions a), b) and c);
- using initial conditions a), b) and d).

#### 20.24.4.6 Test Procedure

- a) The SS activates carriers 1, 2 and 3 and monitors these carriers for RA requests from the SoLSA MS. Carrier 4 is switched off.
- b) The SoLSA MS is switched on.
- c) The SS is reconfigured and the level of carrier 1 is decreased to 33 dB $\mu$ V emf() / -80 dBm (C2 of carrier 1 becomes 10).
- d) The SS is reconfigured and the level of carrier 3 is increased to 63 dB $\mu$ V emf() / -50 dBm (C2 of carrier 3 becomes 40).
- e) Carrier 1 is switched off. Carrier 4 is switched on. The SS monitors carriers 2, 3 and 4.

#### 20.24.4.7 Related PICS/PIXIT statement(s)

- Support of SoLSA.

#### 20.24.4.8 Test Requirements

- 1) After step b), the first response from the SoLSA MS shall be received on carrier 1 within 50 s. There shall be no response from the SoLSA MS on any other carrier within 35 s after the first response on carrier 1.

NOTE 1: Any potential access is likely to occur within 25 s.

- 2) After step c), there shall be response from the SoLSA MS on carrier 2 within 25 s after carrier 1 has been reconfigured (Highest C2/C2-CRH).
- 3) After step d), there shall be response on carrier 3 within 25 s after carrier 3 has been reconfigured (Highest C2/C2-CRH).
- 4) After step e), there shall be response on carrier 4 within 60 s after the system has been reconfigured (idle mode support enabled for carrier 4).

NOTE 2: 5,5 s to notice new strongest carriers on top 6 (because the updating time for the 6 strongest is 5 s ( $\pm 10\%$ )), 33 s to read BCCH, 15 s for reselection, 5 s for search of a matching LSA on SIM. Allow 60 s.

## 20.24.5 SoLSA Cell Reselection / LSA indication for idle mode

### General Remark

Definition of "LSA indication for idle mode" is given in subclause 20.24 General Remark 1.

"LSA indication for idle mode" is only controlling if indication of the LSA name shall be done. It has no influence on the LSA subscription.

### 20.24.5.1 General definition and applicability

The SoLSA MS in idle mode may inform the user whether or not the serving cell belongs to the subscribed LSA.

- The indication is dependent on the setting of the idle mode indication bit on the SIM card for that LSA.
- The indication is independent from the setting of the LSA idle mode support bit on the SIM card for that LSA (see subclause 20.24 General Remark 1).

### 20.24.5.2 General conformance requirement

1. The service subscriber can define a name (alphanumeric name, icon, etc) for each of her allowed LSAs. The MS will, in idle mode and if required by the user, indicate to the user the current LSA. The indication may be the name of the current LSA, as set by the user. The form of display and indication are left to manufacturer's choice. 3GPP TS 03.73, subclause 4.3.2.
2. In addition to indicate the registered PLMN, an MS with subscription for an LSA in the registered PLMN shall indicate this LSA when it is available. The indication towards the user is optional and may be done by displaying the stored LSA name that corresponds to the ID of the current LSA. An MS with LSA only access subscription may also give an indication towards the user, when the no subscribed LSAs are available to the user. The indication is optional and may be done by displaying the LSA only access text stored in the SIM. 3GPP TS 03.73, subclause 11.8.1.

### 20.24.5.3 SoLSA Cell Reselection / LSA indication for idle mode / idle mode support enabled

#### 20.24.5.3.1 Definition and applicability

See general definition and applicability of this subclause.

This test is applicable for all types of SoLSA MS.

#### 20.24.5.3.2 Conformance requirement

1. When both idle mode support and idle mode indication are enabled on the SIM card, the SoLSA MS shall display the name (which was defined by the service subscriber) of the current LSA to the user.
2. When idle mode support is enabled and idle mode indication is disabled on the SIM card, it is expected that the SoLSA MS does not display the LSA name (which was defined by the service subscriber) of the current LSA to the user.

3GPP TS 03.73, subclause 4.3.2; 3GPP TS 03.73, subclause 11.8.1; 3GPP TS 11.11, subclause 10.4.1.2.

#### 20.24.5.3.3 Test Purpose

1. To verify that if idle mode indication bit on the SIM card is enabled for the LSA, the SoLSA MS supports the LSA indication. The LSA name (text/icon) shall be displayed on the SoLSA MS.
2. To verify that if idle mode indication bit on the SIM card is disabled for the LSA the SoLSA MS does not support the LSA indication.

## 20.24.5.3.4 Method of test

## 20.24.5.3.4.1 Initial conditions

- a) Identification of the LSA by means of LSA ID (see subclause 20.24. General remark 2).
- b) Parameters changed from the default values in table 20.24.1; further initial conditions.

| Parameter/condition                         | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------------------------------|-----------|-----------|-----------|-----------|
| RF Signal Level<br>(dB $\mu$ V emf() / dBm) | 43/-70    | 53/-60    | 33/-80    | OFF       |
| RXLEV_ACCESS_MIN (dBm)                      | -90       | -90       | -90       |           |
| C1                                          | 20        | 30        | 10        |           |
| C2                                          | 20        | 30        | 10        |           |
| LSA ID                                      | -         | 66.001    | 9.000.000 |           |
| LAC                                         | 5         | 5         | 5         |           |
| CI                                          | 5000      | 5001      | 5002      |           |
| Matching LSA on SIM                         | -         | LSA1      | LSA3      |           |
| Escape PLMN                                 | No        | No        | No        |           |

## 20.24.5.3.4.2 Test Procedure

- a) The SS activates carrier 1, pages the MS on this carrier and monitors it for RA requests from the SoLSA MS. Carrier 2 and 3 are switched off.
- b) The SoLSA MS is switched on.
- c) Carrier 2 and Carrier 3 are switched on. The SS pages the MS on carriers 1, 2 and 3, and monitors these carriers for RA requests from the SoLSA MS.
- d) The SS is reconfigured and carrier 3 becomes barred (CBA = 1). The SS pages the MS on carriers 1, 2 and 3, and monitors these carriers for RA requests from the SoLSA MS.
- e) The SS is reconfigured and sets CBA = 0 on carrier 3. The SS pages the MS on carriers 1, 2 and 3 and monitors these carriers for RA requests from the SoLSA MS.

## 20.24.5.3.4.3 Related PICS/PIXIT statement(s)

- Support of SoLSA.
- Interface to the human user (p1=Y/N).
- Way to indicate the identity of the current LSA to the human user (only applicable if the SoLSA MS has an interface to the human user).
- Way to indicate the change of the current LSA to the human user (only applicable if the SoLSA MS has an interface to the human user).

#### 20.24.5.3.4.4 Test Requirements

- 1) After step b), the first response from the SoLSA MS shall be received on carrier 1 within 50 s. There shall be no LSA indication on the SoLSA MS (No LSA).
- 2) After step c), there shall be response from the SoLSA MS on carrier 3 within 25 s (highest LSA Priority (8) on the SIM card). An LSA indication is expected on the SoLSA MS.
- 3) After step d), there shall be response from the SoLSA MS on carrier 2 within 55 s. There shall be no indication on the SoLSA MS (highest LSA Priority on the SIM card, no indication on the SIM card).
- 4) After step e), there shall be response from the SoLSA MS on carrier 3 within 55 s (LSA carrier on the SIM card). An LSA indication is expected on the SoLSA MS (idle mode indication for that LSA is enabled).

#### 20.24.5.4 SoLSA Cell Reselection / LSA indication for idle mode / idle mode support disabled

##### 20.24.5.4.1 Definition and applicability

See general definition and applicability of this subclause.

This test is applicable for all types of SoLSA MS.

##### 20.24.5.4.2 Conformance requirement

1. When idle mode support is disabled and idle mode indication is enabled on the SIM card, it is expected that the SoLSA MS displays the LSA name (which was defined by the service subscriber) of the current LSA to the user.
2. When idle mode support is disabled and idle mode indication is disabled on the SIM card, the SoLSA MS shall not display the LSA name (which was defined by the service subscriber) of the current LSA to the user.

3GPP TS 03.73, subclause 4.3.2; 3GPP TS 03.73, subclause 11.8.1; 3GPP TS 11.11, 1subclause 0.4.1.2.

##### 20.24.5.4.3 Test Purpose

To verify that when idle mode support is disabled, the SoLSA MS shall display the LSA name in dependence from the idle mode indication bit.

## 20.24.5.4.4 Method of test

## 20.24.5.4.4.1 Initial conditions

- a) Identification of the LSA by means of LSA ID (see subclause 20.24. General remark 2).
- b) Parameters changed from the default values in table 20.24.1; further initial conditions.

| Parameter/condition                         | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------------------------------|-----------|-----------|-----------|-----------|
| RF Signal Level<br>(dB $\mu$ V emf() / dBm) | 43/-70    | 53/-60    | 33/-80    | OFF       |
| CBA                                         | 0         | 0         | 0         |           |
| RXLEV_ACCESS_MIN (dBm)                      | -90       | -90       | -90       |           |
| C1                                          | 20        | 30        | 10        |           |
| C2                                          | 20        | 30        | 10        |           |
| LSA ID                                      | 250       | 66.000    | 9.000.001 |           |
| LAC                                         | 5         | 5         | 5         |           |
| CI                                          | 5000      | 5001      | 5002      |           |
| Matching LSA on SIM                         | -         | LSA2      | LSA4      |           |
| Escape PLMN                                 | No        | No        | No        |           |

## 20.24.5.4.4.2 Test Procedure

- a) The SS activates carrier 1, pages this carrier and monitors it for RA requests from the SoLSA MS. Carriers 2 and 3 are switched off.
- b) The SoLSA MS is switched on.
- c) Carrier 2 and carrier 3 are switched on. The SS pages the MS on carriers 1, 2 and 3, and monitors these carriers for RA requests from the SoLSA MS.
- d) The SS is reconfigured and the level of carrier 3 increases to 63 dB $\mu$ Vemf / -50dBm (C2 increases to 40 dB).
- e) The SS is reconfigured and the level of carrier 3 decreases to 33 dB $\mu$ Vemf0,1,0 / - 80dBm (C2 decreases to 10 dB).

## 20.24.5.4.4.3 Related PICS/PIXIT statement(s)

- Support of SoLSA.
- Interface to the human user (p1=Y/N).
- Way to indicate the identity of the current LSA to the human user (only applicable if the SoLSA MS has an interface to the human user).
- Way to indicate the change of the current LSA to the human user (only applicable if the SoLSA MS has an interface to the human user).

## 20.24.5.4.4.4 Test Requirements

- 1) After step b), the first response from the SoLSA MS shall be received on carrier 1 within 50 s. There shall be no LSA indication on the SoLSA MS.
- 2) After step c), there shall be response from the SoLSA MS on carrier 2 within 25 s (highest C2). An LSA indication is expected on the SoLSA MS.
- 3) After step d), there shall be response from the SoLSA MS on carrier 3 within 25 s (highest C2). There shall be no LSA indication on the SoLSA MS.
- 4) After step e), there shall be response from the SoLSA MS on carrier 2 within 25 s (highest C2). An LSA indication is expected on the SoLSA MS.

## 21 Received signal measurements

For evaluating the reception quality (the basis for handover and power control) the following two criteria are used:

- signal strength (RXLEV);
- signal quality (RXQUAL).

### 21.1 Signal strength

#### 21.1.1 Definition and applicability

The MS reports RXLEV values related to the apparent received RF signal strength. It is necessary for these levels to attain sufficient accuracy for the correct functioning of the system.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800, PCS 1900 and any multiband MSs.

#### 21.1.2 Conformance requirement

1. The RMS received signal level at the receiver input shall be measured by the MS over the full range of -110 dBm to -48 dBm with a relative accuracy between signals with levels up to 20 dB difference according to table 21-1
  - 1.1 under normal conditions, 3GPP TS 05.08, subclause 8.1.2 and 3GPP TS 05.05, subclause 6.2.
  - 1.2 under extreme conditions, 3GPP TS 05.08, subclause 8.1.2, 3GPP TS 05.05, subclauses D.1 and D.2.

**Table 21-1: Tolerance for relative accuracy of receive signal measurement**

| Absolute level of lower level signal<br>dBm |                 |                       |                     |                       |                      | Tolerance<br>dB |       |             |       |
|---------------------------------------------|-----------------|-----------------------|---------------------|-----------------------|----------------------|-----------------|-------|-------------|-------|
| GSM<br>Small MS                             | GSM<br>Other MS | DCS 1800<br>Class 1&2 | DCS 1800<br>Class 3 | PCS 1900<br>Class 1&2 | PCS 1900<br>Other MS | Lower limit     |       | Upper limit |       |
|                                             |                 |                       |                     |                       |                      | Single          | Multi | Single      | Multi |
| ≥ -88                                       | ≥ -90           | ≥ -86                 | ≥ -88               | ≥ -88                 | ≥ -90                | 2               | 4     | 2           | 4     |
| ≥ -101                                      | ≥ -103          | ≥ -99                 | ≥ -101              | ≥ -101                | ≥ -103               | 3               | 5     | 2           | 5     |
| < -101                                      | < -103          | < -99                 | < -101              | < -101                | < -103               | 4               | 6     | 2           | 6     |

Single means that the measurements are on the same or different RF channel within the same frequency band.

Multi means that the measurements are on different RF channel on different frequency bands.

For measurements between ARFCN in different bands the 'Absolute level of lower level signal' column for the band including the lower level signal shall be used to determine which tolerance applies.

At extreme temperature conditions an extra 2 dB shall be added to the Multi limits in above table.

2. The RMS received signal level at the receiver input shall be measured with an absolute accuracy of  $\pm 4$  dB from -110 dBm to -70 dBm under normal conditions; 3GPP TS 05.08, subclause 8.1.2.
3. The RMS received signal level at the receiver input shall be measured with an absolute accuracy of  $\pm 6$  dB over the full range of -110 dBm to -48 dBm under both normal and extreme conditions; 3GPP TS 05.08, subclause 8.1.2.
4. If the received signal level falls below the reference sensitivity level for the type of MS then the MS shall report a level between the reference sensitivity level and the actual received level, but with the tolerances given in conformance requirements 2. and 3. above.
5. The measured signal level shall be mapped to an RXLEV value between 0 and 63 as specified in 3GPP TS 05.08, subclause 8.1.4.

### 21.1.3 Test purpose

1. To verify that the RXLEV reported by the MS does not exceed conformance requirement 1.
  - 1.1 under normal conditions;
  - 1.2 under extreme conditions.
2. To verify that the RXLEV reported by the MS does not exceed conformance requirement 2 under normal conditions.
3. To verify that the RXLEV reported by the MS does not exceed conformance requirement 3 under extreme conditions and under normal conditions from -48 dBm to -70 dBm.
4. To verify that the RXLEV reported by the MS does not exceed conformance requirement 4.

NOTE: Conformance requirement 5 is inherently tested in each of the test purposes 1. to 4.

### 21.1.4 Method of test

#### 21.1.4.1 Initial conditions

The SS is set to produce the BCCH of the serving cell at  $63 \text{ dB}\mu\text{Vemf}(\ )$  and the BCCHs of 6 surrounding cells at  $28 \text{ dB}\mu\text{Vemf}(\ )$ . The BCCH of the serving cell indicates these BCCHs, but not the BCCH of the serving cell. The ARFCN of the serving cell BCCH is chosen so as not to interfere with the other channels as shown in table 21-2. The fading profile for the BCCHs of the serving and surrounding cells will be set to static.

After 30 s, a call is set up according to the generic call set up procedure to an ARFCN, within the supported band of operation. The SACCH indicates the same surrounding cell BCCHs as the BCCH of the serving cell.

NOTE: The 30 s is to allow the MS to scan and find all BCCHs.

#### 21.1.4.2 Procedure

- a) The levels of the TCH and BCCHs are set according to table 21-2 step 1. The SS waits 20 s before continuing.

Table 21-2: Signal levels at receiver input in dB $\mu$ Vemf( )

|                    | ARFCN         | TCH                     | BCCH1                   | BCCH2                   | BCCH3                   | BCCH4                   | BCCH5                   | BCCH6                   |
|--------------------|---------------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|
| Step               | GSM 450       | 259                     | 276                     | 293                     | 264                     | 269                     | 281                     | 288                     |
|                    | GSM 480       | 306                     | 323                     | 340                     | 311                     | 316                     | 328                     | 335                     |
|                    | GSM 900:      | 1                       | 62                      | 124                     | 20                      | 40                      | 80                      | 100                     |
|                    | DCS 1 800     | 512                     | 700                     | 885                     | 585                     | 660                     | 790                     | 835                     |
|                    | PCS 1 900     | 512                     | 700                     | 805                     | 585                     | 660                     | 790                     | 550                     |

| 2 + m $\times$ 21  |               | 54,5 - m $\times$<br>10 | 63,5 - m $\times$<br>10 | 54,5 - m $\times$<br>10 | 54,5 - m $\times$<br>10 | 54,5 - m $\times$<br>10 | 54,5 - m $\times$<br>10 | 54,5 - m $\times$<br>10 |
| 3 + m $\times$ 21  |               | 54,5 - m $\times$<br>10 | 62,5 - m $\times$<br>10 | 44,5 - m $\times$<br>10 | 44,5 - m $\times$<br>10 | 44,5 - m $\times$<br>10 | 44,5 - m $\times$<br>10 | 44,5 - m $\times$<br>10 |
| .                  |               | .                       | .                       | .                       | .                       | .                       | 44,5 - m $\times$<br>10 | 44,5 - m $\times$<br>10 |
| 17 + m $\times$ 21 |               | 54,5 - m $\times$<br>10 | .                       | .                       | .                       | .                       | 44,5 - m $\times$<br>10 | 44,5 - m $\times$<br>10 |
| 18 + m $\times$ 21 |               | 44,5 - m $\times$<br>10 | .                       | .                       | .                       | .                       | 44,5 - m $\times$<br>10 | 44,5 - m $\times$<br>10 |
| .                  |               | .                       | .                       | .                       | .                       | .                       | 44,5 - m $\times$<br>10 | 44,5 - m $\times$<br>10 |
| 21 + m $\times$ 21 |               | 44,5 - m $\times$<br>10 | 44,5 - m $\times$<br>10 | 44,5 - m $\times$<br>10 | 44,5 - m $\times$<br>10 | 44,5 - m $\times$<br>10 | 44,5 - m $\times$<br>10 | 44,5 - m $\times$<br>10 |

m = 0, 1, 2, 3, 4.

- b) The measurement is done in 105 steps. The initial signal levels of the TCH of the serving cell and the BCCHs of the surrounding cells are adjusted according to table 21-2. At each step the SS keeps the signal levels stable for one reporting period, except at steps 21 + m  $\times$  21 where the level is held stable for 1,75 reporting periods. The RXLEV value for the period in which the change occurs (reported in the following period) is discarded. The SS records the RXLEV values reported for the surrounding cell BCCHs in steps 1 + m  $\times$  21 and 21 + m  $\times$  21. The RXLEV values for BCCH 1 are recorded by the SS for all 105 steps.

NOTE: This extension at steps 21 + m  $\times$  21 is to allow an extra quarter reporting period for the MS to stabilize for steps 1 + m  $\times$  21.

At steps 1 to 30 the SS simulates a base station with DTX off and at steps 31 to 105 the SS simulates a base station with DTX on.

At steps 1 to 30 the SS checks the accuracy of the measured signal strength of TCH by checking the values of the parameters RXLEV\_FULL and RXLEV\_SUB. At steps 31 to 105 the SS shall check only the value of the parameter RXLEV\_SUB.

At step 64, within every 480 ms reporting period, out of the 4 SACCH and 8 SID timeslots the SS transmits the first six active timeslots of the TCH with signal level 39,5 dB $\mu$ Vemf( ) and the last six active timeslots of the TCH with signal level 29,5 dB $\mu$ Vemf( ).

- c) Step b) is repeated under extreme conditions (annex 1, TC2,2 and TC3).

## 21.1.5 Test requirements

## 21.1.5.1 Relative accuracy of measurements on different ARFCN

For normal and each of the 4 extreme conditions tested the following applies:

- a) For each of the steps 1, 21, 22, 42, 43 and 64, of the 7 reported RXLEV values checked, the difference between the minimum reported RXLEV value and the maximum reported RXLEV value shall be no more than 4 if the measurements are on the same or on different RF channel within the same frequency band and no more than 8 (12 for extreme temperature conditions) if the measurements are on different frequency bands.
- b) For each of the steps 63 and 85, of the 7 reported RXLEV values checked, the difference between the minimum reported RXLEV value and the maximum reported RXLEV value shall be no more than 5 for small MS, DCS 1 800 and PCS 1 900 (Class 1 and 2) MS or 4 for other MS if the measurements are on the same or on different RF channel within the same frequency band and no more than 9 for small MS, DCS 1 800 and PCS 1 900 (Class 1 and 2) MS or 8 for other MS and other PCS 1 900 MS (13 and 12 for extreme temperature conditions) if the measurements are on different frequency bands.
- c) For step 84, of the 7 reported RXLEV values checked, the difference between the minimum reported RXLEV value and the maximum reported RXLEV value shall be no more than 5 if the measurements are on the same or on different RF channel within the same frequency band and no more than 9 (13 for extreme temperature conditions) if the measurements are on different frequency bands.
- d) For step 105, of the reported RXLEV values checked, the difference between the minimum reported RXLEV value and the maximum reported RXLEV value shall be no more than 6 if the measurements are on the same or on different RF channel within the same frequency band and no more than 10 (14 for extreme temperature conditions) if the measurements are on different frequency bands.

NOTE: It is not mandatory for the MS to report any of the BCCHs in step 105.

## 21.1.5.2 Relative accuracy at a single frequency (BCCH1)

For normal and each of the 4 extreme conditions tested the following applies:

For:  $n \leq 21$  and  $RXLEV_1 = 63$

$RXLEV_n - (63 - n + r)$  shall be between:

-2 and +2

NOTE 1: This formula allows for an MS with an absolute accuracy worse than +0,5 dB and therefore reporting an RXLEV of 63 for more than one step. The formula checks the relative accuracy from the lowest input level for which the MS last reports RXLEV of 63.

Otherwise:

$RXLEV_{(m*21+1)} - RXLEV_{(m*21+n)} - n + 1$  shall be between:

-2 and +2

for steps 2 to 62 and 65 to 71 for DCS 1 800 class 1/2 MS; or steps 2 to 62 and 65 to 73 for DCS 1 800 class 3, PCS 1 900 (Class 1&2) and Small GSM MS; or 2 to 75 for other MS and other PCS 1 900 MS.

-3 and +2

for steps 63 and 72 to 96 for DCS 1 800 class 1/2 MS; or steps 63 and 74 to 98 for DCS 1 800 class 3, PCS 1 900 (Class 1 and 2) and Small GSM MS; or

76 to 100 for other MS and other PCS 1 900 MS.

-4 and +2

for steps 97 to 105 for DCS 1 800 class 1/2 MS; or steps 99 to 105 for DCS 1 800 class 3, PCS 1 900 (Class 1 and 2) and Small GSM MS; or 101 to 105 for other MS and other PCS 1 900 MS.

where:  $1 < n \leq 21$  and  $0 \leq m \leq 4$  as identified in table 21-2, and  $r$  is the number of the last step where RXLEV of 63 was reported.

NOTE 2: It is not mandatory for the MS to report BCCH1 for steps greater than 99 for GSM 400, GSM 700, GSM 850 or GSM 900 Small MS or 101 for other GSM and other PCS 1 900 MS or 97 for a DCS 1 800 Class 1 or Class 2 MS and 99 for DCS 1 800 Class 3 and PCS 1 900 (Class 1 and 2) MS. If the MS reports a level and the upper limit for this step in the above formula implies a level below the reference sensitivity level for the type of MS, then the upper limit shall be considered as equal to a value corresponding to the reference sensitivity level.

### 21.1.5.3 Absolute accuracy

For each BCCH reported,  $|RXLEV_{MS} + m \times 10 - 62|$  shall be no more than:

- 4 for steps 64 and 85 under normal conditions.
- 6 for steps 64 and 85 under extreme conditions.
- 6 for steps 1, 22 and 43 under normal and extreme conditions.

where:  $0 \leq m \leq 4$  as identified in table 21-2.

## 21.2 Signal strength selectivity

### 21.2.1 Definition and applicability

The signal strength selectivity is a measure of the ability of the signal strength measuring part of the MS to discriminate against RF power from adjacent ARFCN. The RXLEV selectivity figure corresponds to the amount by which the adjacent channel power shall be attenuated.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MS.

### 21.2.2 Conformance requirement

The selectivity of the received signal measurement shall be as follows:

- for adjacent (200 kHz) channel;  $\geq 16$  dB;
- for adjacent (400 kHz) channel;  $\geq 48$  dB;
- for adjacent (600 kHz) channel;  $\geq 56$  dB.

3GPP TS 05.08, subclause 8.1.2.

### 21.2.3 Test purpose

To verify that the MS meets the conformance requirement at the 200 kHz adjacent channel above and below the wanted.

### 21.2.4 Method of test

#### 21.2.4.1 Initial conditions

For GSM 450:

A call is set up according to the generic call set up procedure on ARFCN 269 and with surrounding cell BCCH3 indicated in the BA list at ARFCN 281.

The RF level of the TCH and BCCH3 is set to 20 dB above reference sensitivity level( ).

BCCH1 and 2 at ARFCN 270 and 280 are off.

These conditions are kept for 30 s to ensure the MS has time to decode the BCCH.

For GSM 480:

A call is set up according to the generic call set up procedure on ARFCN 316 and with surrounding cell BCCH3 indicated in the BA list at ARFCN 328.

The RF level of the TCH and BCCH3 is set to 20 dB above reference sensitivity level( ).

BCCH1 and 2 at ARFCN 317 and 327 are off.

These conditions are kept for 30 s to ensure the MS has time to decode the BCCH.

For GSM 750:

A call is set up according to the generic call set up procedure on ARFCN 450 and with surrounding cell BCCH3 indicated in the BA list at ARFCN 485.

The RF level of the TCH and BCCH3 is set to 20 dB above reference sensitivity level( ).

BCCH1 and 2 at ARFCN 451 and 484 are off.

These conditions are kept for 30 s to ensure the MS has time to decode the BCCH.

For GSM 850:

A call is set up according to the generic call set up procedure on ARFCN 170 and with surrounding cell BCCH3 indicated in the BA list at ARFCN 210.

The RF level of the TCH and BCCH3 is set to 20 dB above reference sensitivity level( ).

BCCH1 and 2 at ARFCN 171 and 209 are off.

These conditions are kept for 30 s to ensure the MS has time to decode the BCCH.

For GSM 900:

A call is set up according to the generic call set up procedure on ARFCN 40 and with surrounding cell BCCH3 indicated in the BA list at ARFCN 80.

The RF level of the TCH and BCCH3 is set to 20 dB above reference sensitivity level( ).

BCCH1 and 2 at ARFCN 41 and 79 are off.

These conditions are kept for 30 s to ensure the MS has time to decode the BCCH.

For DCS 1 800 and PCS 1 900:

A call is set up according to the generic call set up procedure on ARFCN 690 and with surrounding cell BCCH3 indicated in the BA list at ARFCN 790.

The RF level of the TCH and BCCH3 is set to 20 dB above reference sensitivity level( ).

BCCH1 and 2 at ARFCN 691 and 789 are off.

These conditions are kept for 30 s to ensure the MS has time to decode the BCCH.

#### 21.2.4.2 Procedure

- a) The SS records the RXLEV values reported for the TCH and BCCH3.
- b) BCCH1 and 2 are set to 9 dB above the signal level of the TCH and BCCH3.

NOTE: The first adjacent channel interference requirement limits the level of BCCHs 1 and 2 to 9 dB. This ensures that the MS can maintain the call, and read BCCH3.

- c) These conditions are kept for 30 s.
- d) The SS records the RXLEV values reported for the TCH and BCCH3.

### 21.2.5 Test requirements

The values of RXLEV recorded in step d) shall be no more than 1 above the values recorded in step a).

NOTE: This one change in the reported value of RXLEV is calculated as follows: The level of the first adjacent interfering signal is such that C/I is -9 dB. With an RXLEV selectivity for the first adjacent channel of 16 dB, the power from the adjacent channel is equal to -7 dB with respect to the power level of the useful signal. The increase in power therefore is equal to  $10\log(1 + 10^{-0.7}) = 0,71$  dB. Thus, the value of RXLEV could increase by 1.

## 21.3 Signal quality under static conditions

### 21.3.1 Signal quality under static conditions - TCH/FS

#### 21.3.1.1 Definition and applicability

The MS must be capable of measuring the received signal quality, which is specified in terms of bit error ratio (BER) before channel decoding averaged over the reporting period of length of one SACCH multiframe defined in subclause 8.4 of 3GPP TS 05.08. The MS has to map this BER into RXQUAL values using the coding scheme defined in subclause 8.2.4 of 3GPP TS 05.08. For the full rate channel without downlink DTX, the error assessment is based on 104 TDMA frames: RXQUAL\_FULL. In case downlink DTX is used, the assessment is based on 12 TDMA frames: RXQUAL\_SUB.

The requirement and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MS supporting speech on a full rate channel.

#### 21.3.1.2 Conformance requirement

1. The received signal quality shall be measured by the MS in a manner that can be related to an equivalent average BER before channel decoding (i.e. chip error ratio), assessed over the reporting period of one SACCH multiframe. When the quality is assessed over the full-set and sub-set of frames, eight levels of RXQUAL are defined and shall be mapped to the equivalent BER before channel decoding as per the table in 3GPP TS 05.08, subclauses 8.2.2 and 8.2.4.
2. The reported parameters (RXQUAL) shall be the received signal quality, averaged over the reporting period of length one SACCH multiframe; 3GPP TS 05.08, subclause 8.2.3.

#### 21.3.1.3 Test purpose

1. To verify, under static propagation conditions, that the received signal quality is measured and mapped to the eight levels of RXQUAL\_FULL by the MS in a manner that can be related to an equivalent average BER before channel decoding (i.e. chip error ratio), assessed over the reporting period of one SACCH multiframe. The probability that the correct RXQUAL band is reported shall meet the values given in as per the table in 3GPP TS 05.08, subclause 8.2.4.
2. To verify that the reported parameters (RXQUAL) are the received signal quality, averaged over the reporting period of length one SACCH multiframe.
3. To verify that, for downlink DTX, the reported parameter RXQUAL\_SUB is the received signal quality, averaged over the correct frames (SID).

## 21.3.1.4 Method of test

## 21.3.1.4.1 Initial conditions

A call is set up by the SS according to the generic call set up procedure on a full rate speech channel in the mid ARFCN range. The RADIO\_LINK\_TIMEOUT parameter value is set to maximum.

The SS commands the MS to establish the TCH burst-by-burst loop, see subclause 36.2.1.1.3.

The SS produces a wanted signal and an independent uncorrelated interfering (unwanted) signal, both with static propagation characteristics. The wanted signal is the standard test signal C1. It is at the nominal frequency of the receiver and its level is 28 dB $\mu$ Vemf( ). The unwanted signal is the standard test signal I1, on the same timeslot on a nominal frequency 200 kHz above the nominal frequency of the wanted signal.

## 21.3.1.4.2 Procedure

- a) The SS sets the level of the unwanted signal at a value for which the BER of the looped back bursts, averaged over the reporting period as defined in 3GPP TS 05.08, subclause 8.4, is in the "Range of actual BER" for "Quality band" RXQUAL<sub>i</sub>, given in the table of 3GPP TS 05.08, subclause 8.2.4, with i equal to 0.
- b) The SS verifies that the MS reports RXQUAL and whether or not the reported level is correct by comparison with the RXQUAL level of the corresponding looped back bursts. The SS increases an event counter for each incorrect MS reported RXQUAL level and continues the test for Max-samples, as given in subclause 21.3.1.5 for every i. For i = 7, the test is performed in steps using 60 SACCH blocks. In between steps, at least 35 SACCH blocks, are transmitted with a level of the unwanted signal that allows the radio link counter in the MS to reach the maximum value.

NOTE 1: This special procedure for i = 7 is due to the high error rates involved with testing RXQUAL<sub>7</sub>, that could lead to the MS experiencing a radio link time-out.

- c) The SS repeats steps a) to b) for i equals 1, 2, ...,7.
- d) The SS removes the unwanted signal and sets downlink DTX on.
- e) The SS verifies that the MS reports RXQUAL<sub>SUB</sub> = 0 and RXQUAL<sub>FULL</sub> = 7.

NOTE 2: When testing RXQUAL<sub>SUB</sub> , on a full rate speech channel, the MS has approximately twice as many bits as the SS to assess BER. The MS has both SID and SACCH bits, whereas the SS only has the looped back SID bits. Therefore it is only tested that the MS uses the correct frames for RXQUAL<sub>SUB</sub> reporting by checking both RXQUAL<sub>SUB</sub> and RXQUAL<sub>FULL</sub> reports. No quantitative assessment is done.

- f) The SS releases the call.

## 21.3.1.5 Test requirements

The number of errors in reporting the RXQUAL bands recorded in each of the considered cases shall not exceed the corresponding value of max-events shown in the following tables, when the number of samples relevant to the case under test is equal to max-samples.

**Table 21-3: Maximum number of incorrectly reported RXQUAL<sub>FULL</sub> for TCH/FS**

| CASE | Expected RXQUAL <sub>FULL</sub> | Specified reporting error rate | Max-events | Max-samples |
|------|---------------------------------|--------------------------------|------------|-------------|
| 0    | RXQUAL <sub>0</sub>             | 10 %                           | 200        | 1 640       |
| 1    | RXQUAL <sub>1</sub>             | 25 %                           | 200        | 666         |
| 2    | RXQUAL <sub>2</sub>             | 15 %                           | 200        | 1 093       |
| 3    | RXQUAL <sub>3</sub>             | 10 %                           | 200        | 1 640       |
| 4    | RXQUAL <sub>4</sub>             | 10 %                           | 200        | 1 640       |
| 5    | RXQUAL <sub>5</sub>             | 5 %                            | 200        | 3 279       |
| 6    | RXQUAL <sub>6</sub>             | 5 %                            | 200        | 3 279       |
| 7    | RXQUAL <sub>7</sub>             | 5 %                            | 201        | 3 300       |

NOTE: In order to have a testing performance corresponding to that in clause 14 for high error rates, the multiplication factor of the tested error rate with respect to the specified error rate, and the minimum number for Max-events, need to be increased. The following figures are used for static propagation conditions:

| specified error rate | multiplication factor | min. Max-events |
|----------------------|-----------------------|-----------------|
| ≤ 25 %               | 1,22                  | 200             |

## 21.3.2 Signal quality under static conditions - TCH/HS

### 21.3.2.1 Definition and applicability

The MS shall be capable of measuring the received signal quality, which is specified in terms of bit error ratio (BER) before channel decoding averaged over the reporting period of length of one SACCH multiframe defined in subclause 8.4 of 3GPP TS 05.08. The MS shall map this BER into RXQUAL values using the coding scheme defined in subclause 8.2.4 of 3GPP TS 05.08. For the half rate channel without downlink DTX, the error assessment is based on 52 TDMA frames: RXQUAL\_FULL. In case downlink DTX is used, the assessment is based on 12 TDMA frames: RXQUAL\_SUB.

The requirement and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MS supporting speech on a half rate channel.

### 21.3.2.2 Conformance requirement

1. The received signal quality shall be measured by the MS in a manner that can be related to an equivalent average BER before channel decoding (i.e. chip error ratio), assessed over the reporting period of one SACCH multiframe. When the quality is assessed over the full-set and sub-set of frames, eight levels of RXQUAL are defined and shall be mapped to the equivalent BER before channel decoding as per the table in 3GPP TS 05.08, subclauses 8.2.2 and 8.2.4.
2. The reported parameters (RXQUAL) shall be the received signal quality, averaged over the reporting period of length one SACCH multiframe; 3GPP TS 05.08, subclause 8.2.3.

### 21.3.2.3 Test purpose

1. To verify, under static propagation conditions, that the received signal quality is measured and mapped to the eight levels of RXQUAL\_FULL by the MS in a manner that can be related to an equivalent average BER before channel decoding (i.e. chip error ratio), assessed over the reporting period of one SACCH multiframe. The probability that the correct RXQUAL band is reported shall meet the values given as per the table in 3GPP TS 05.08, subclause 8.2.4.
2. To verify that the reported parameters (RXQUAL) are the received signal quality, averaged over the reporting period of length one SACCH multiframe.
3. To verify that, for downlink DTX, the reported parameter RXQUAL\_SUB is the received signal quality, averaged over the correct frames (SID).

### 21.3.2.4 Method of test

#### 21.3.2.4.1 Initial conditions

A call is set up by the SS according to the generic call set up procedure on a half rate speech channel in the mid ARFCN range. The RADIO\_LINK\_TIMEOUT parameter value is set to maximum.

The SS commands the MS to establish the TCH burst-by-burst loop, see subclause 36.2.1.1.3.

The SS produces a wanted signal and an independent uncorrelated interfering (unwanted) signal, both with static propagation characteristics. The wanted signal is the standard test signal C1. It is at the nominal frequency of the receiver and its level is 28 dBμV<sub>emf</sub>( ). The unwanted signal is the standard test signal I1, on the same timeslot on a nominal frequency 200 kHz above the nominal frequency of the wanted signal.

## 21.3.2.4.2 Procedure

- a) The SS sets the level of the unwanted signal at a value for which the BER of the looped back bursts, averaged over the reporting period as defined in 3GPP TS 05.08, subclause 8.4, is in the "Range of actual BER" for "Quality band" RXQUAL<sub>i</sub>, given in the table of 3GPP TS 05.08, subclause 8.2.4, with i equal to 0.
- b) The SS verifies that the MS reports RXQUAL and whether or not the reported level is correct by comparison with the RXQUAL level of the corresponding looped back bursts. The SS increases an event counter for each incorrect MS reported RXQUAL level and continues the test for Max-samples, as given in subclause 21.3.2.5 for every i. For i = 7, the test is performed in steps using 60 SACCH blocks. In between steps, at least 35 SACCH blocks, are transmitted with a level of the unwanted signal that allows the radio link counter in the MS to reach the maximum value.

NOTE 1: This special procedure for i = 7 is due to the high error rates involved with testing RXQUAL<sub>7</sub>, that could lead to the MS experiencing a radio link time-out.

- c) The SS repeats steps a) to b) for i equals 1, 2, ...,7.
- d) The SS removes the unwanted signal and sets downlink DTX on.
- e) The SS verifies that the MS reports RXQUAL<sub>SUB</sub> = 0 and RXQUAL<sub>FULL</sub> = 7.

NOTE 2: When testing RXQUAL<sub>SUB</sub>, on a half rate speech channel, the MS has approximately twice as many bits as the SS to assess BER. The MS has both SID and SACCH bits, whereas the SS only has the looped back SID bits. Therefore it is only tested that the MS uses the correct frames for RXQUAL<sub>SUB</sub> reporting by checking both RXQUAL<sub>SUB</sub> and RXQUAL<sub>FULL</sub> reports. No quantitative assessment is done.

- f) The SS releases the call.

## 21.3.2.5 Test requirements

The number of errors in reporting the RXQUAL bands recorded in each of the considered cases shall not exceed the corresponding value of max-events shown in the following tables, when the number of samples relevant to the case under test is equal to max-samples.

**Table 21-6: Maximum number of incorrectly reported RXQUAL<sub>FULL</sub> for TCH/HS**

| CASE | Expected RXQUAL <sub>FULL</sub> | Specified reporting error rate | Max-events | Max-samples |
|------|---------------------------------|--------------------------------|------------|-------------|
| 0    | RXQUAL <sub>0</sub>             | 10 %                           | 200        | 1 640       |
| 1    | RXQUAL <sub>1</sub>             | 40 %                           | 300        | 660         |
| 2    | RXQUAL <sub>2</sub>             | 30 %                           | 300        | 870         |
| 3    | RXQUAL <sub>3</sub>             | 15 %                           | 200        | 1 093       |
| 4    | RXQUAL <sub>4</sub>             | 15 %                           | 200        | 1 093       |
| 5    | RXQUAL <sub>5</sub>             | 5 %                            | 200        | 3 279       |
| 6    | RXQUAL <sub>6</sub>             | 5 %                            | 200        | 3 279       |
| 7    | RXQUAL <sub>7</sub>             | 5 %                            | 201        | 3 300       |

NOTE: In order to have a testing performance corresponding to that in clause 14 for high error rates, the multiplication factor of the tested error rate with respect to the specified error rate, and the minimum number for Max-events, need to be increased. The following figures are used for static propagation conditions:

| specified error rate | multiplication factor | min. Max-events |
|----------------------|-----------------------|-----------------|
| ≤ 25 %               | 1,22                  | 200             |
| 30 - 40 %            | 1,15                  | 300             |
| > 40 %               | 1,1                   | 400             |

## 21.4 Signal quality under TUhigh propagation conditions

### 21.4.1 Definition and applicability

The MS must be capable of measuring the received signal quality, which is specified in terms of bit error ratio (BER) before channel decoding averaged over the reporting period of length of one SACCH multiframe defined in subclause 8.4 of 3GPP TS 05.08. The MS has to map this BER into RXQUAL values using the coding scheme defined in subclause 8.2.4 of 3GPP TS 05.08. For the full rate channel without downlink DTX, the error assessment is based on 104 TDMA frames: RXQUAL\_FULL.

The requirement and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1800 and PCS 1 900 MS supporting speech on a full rate channel.

### 21.4.2 Conformance requirement

1. The received signal quality shall be measured by the MS in a manner that can be related to an equivalent average BER before channel decoding (i.e. chip error ratio), assessed over the reporting period of 1 SACCH multiframe. The assessed equivalent BER before channel decoding shall be mapped to the eight levels of RXQUAL using the coding scheme defined in subclause 8.2.4 of 3GPP TS 05.08 subclauses 8.2.2 and 8.2.4.

2. The reported parameters (RXQUAL) shall be the received signal quality, averaged over the reporting period of length one SACCH multiframe.

3GPP TS 05.08, subclause 8.2.3.

### 21.4.3 Test purpose

1. To verify, under TUhigh conditions, that the received signal quality is measured and reported to the eight levels of RXQUAL\_FULL by the MS in a manner that can be related to an equivalent average BER before channel decoding (i.e. chip error ratio), assessed over the reporting period of length one SACCH multiframe for the TCH/FS. The probability that the correct RXQUAL band is reported shall meet the values given as per the table in 3GPP TS 05.08 subclause 8.2.
2. To verify that the reported parameters (RXQUAL) is the received signal quality, averaged over the reporting period of length one SACCH multiframe.

### 21.4.4 Method of test

#### 21.4.4.1 Initial conditions

The SS sets up a call according to the generic call set up procedure on a full rate speech channel in the mid ARFCN range. The RADIO\_LINK\_TIMEOUT parameter is set to maximum.

The SS commands the MS to establish the TCH burst-by-burst loop, see subclause 36.2.1.1.3.

The SS produces the standard test signal C1, with TUhigh propagation profile. It shall be at the nominal frequency of the receiver at a level of 28 dB $\mu$ V<sub>emf</sub>( ).

#### 21.4.4.2 Procedure

- a) The SS counts the number of bit errors occurring in 50 SACCH multiframes and the relevant BER is computed. If this BER does correspond to one out of the 8 different cases shown in Table 21.7, the procedure is continued from step c).

Table 21-7

| CASE | Average BER (%) |
|------|-----------------|
| 0    | < 0,10          |
| 1    | 0,26 to 0,30    |
| 2    | 0,51 to 0,64    |
| 3    | 1,0 to 1,3      |
| 4    | 1,9 to 2,7      |
| 5    | 3,8 to 5,4      |
| 6    | 7,6 to 11       |
| 7    | > 15            |

- b) The SS generates an independent, uncorrelated interfering (unwanted) signal with TUhigh propagation profile. The unwanted signal is on the same channel as the wanted signal but has no fixed relationship with the bit transitions of the wanted signal, and is modulated with random data. The SS sets the level of this signal such that the BER computed on the basis of the number of bit errors occurring in 50 SACCH multiframes corresponds to one of the cases: case\_i in table 21-7.
- c) The SS verifies that the MS reports RXQUAL. The SS also computes the RXQUAL level for the multiframe based on the looped back bits. The SS compares the RXQUAL level it computed based on the looped back bits of the multiframe with the RXQUAL level reported by the MS for that multiframe. The reported level is considered correct if RXQUAL reported by the MS is equal to RXQUAL\_i (with i = 0, 1, ... 7), or to one of the adjacent bands RXQUAL\_(i-1) (with i = 1, 2, ..., 7) and RXQUAL\_(i+1) (with i = 0, 1, ..., 6). For each failure (to be in the correct or one of the adjacent bands) that is found, if any, a counter Max-events\_i is increased by one. This step is continued for Max\_samples\_i RXQUAL\_i based on the looped back bits.

If the MS reports RXQUAL = 7 during the test period, then at least 35 SACCH multiframes, are transmitted with a level of the unwanted signal that allows the radio link counter in the MS to reach the maximum value.

NOTE: This special procedure for RXQUAL = 7 is due to the high error, that could lead to the MS experiencing a radio link time-out.

- d) The SS repeats steps b) and c) for all of the eight case\_i.

#### 21.4.5 Test requirements

The number of errors in reporting the RXQUAL bands recorded in each of the considered cases shall not exceed the corresponding value of Max-events shown in Table 21.8, when the number of samples relevant for the case is equal to Max\_samples.

Table 21-8: Maximum number of incorrectly reported RXQUAL\_FULL for TCH/FS

| CASE | Expected RXQUAL_FULL | Specified reporting error rate | Max-events | Max_samples |
|------|----------------------|--------------------------------|------------|-------------|
| 0    | RXQUAL_0/1           | 15 %                           | 200        | 1 093       |
| 1    | RXQUAL_1/0/2         | 15 %                           | 200        | 1 093       |
| 2    | RXQUAL_2/1/3         | 15 %                           | 200        | 1 093       |
| 3    | RXQUAL_3/2/4         | 10 %                           | 200        | 1 640       |
| 4    | RXQUAL_4/3/5         | 10 %                           | 200        | 1 640       |
| 5    | RXQUAL_5/4/6         | 10 %                           | 200        | 1 640       |
| 6    | RXQUAL_6/5/7         | 10 %                           | 200        | 1 640       |
| 7    | RXQUAL_7/6           | 10 %                           | 200        | 1 640       |

## 21.5 Received signal measurements in HSCSD multislot configuration

### 21.5.1 Signal strength

#### 21.5.1.1 Definition and applicability

The MS reports RXLEV values related to the apparent received RF signal strength. It is necessary for these levels to attain sufficient accuracy for the correct functioning of the system.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800, PCS 1 900 and any multiband MSs which are capable of HSCSD multislot operation.

#### 21.5.1.2 Conformance requirement

1. The RMS received signal level at the receiver input shall be measured by the MS over the full range of -110 dBm to -48 dBm with a relative accuracy between signals with levels up to 20 dB difference according to table 21.5-1

1.1 under normal conditions, 3GPP TS 05.08, subclause 8.1.2 and 3GPP TS 05.05, subclause 6.2.

1.2 under extreme conditions, 3GPP TS 05.08, subclause 8.1.2, 3GPP TS 05.05, subclauses D.1 and D.2.

**Table 21-5-1: Tolerance for relative accuracy of receive signal measurement**

| Absolute level of lower level signal dBm |              |                     |                   |                     |                    | Tolerance dB       |                   |                    |                   |
|------------------------------------------|--------------|---------------------|-------------------|---------------------|--------------------|--------------------|-------------------|--------------------|-------------------|
| GSM Small MS                             | GSM Other MS | DCS 1 800 Class 1&2 | DCS 1 800 Class 3 | PCS 1 900 Class 1&2 | PCS 1 900 Other MS | Lower limit Single | Lower limit Multi | Upper limit Single | Upper limit Multi |
| ≥ -88                                    | ≥ -90        | ≥ -86               | ≥ -88             | ≥ -88               | ≥ -90              | 2                  | 4                 | 2                  | 4                 |
| ≥ -101                                   | ≥ -103       | ≥ -99               | ≥ -101            | ≥ -101              | ≥ -103             | 3                  | 5                 | 2                  | 5                 |
| < -101                                   | < -103       | < -99               | < -101            | < -101              | < -103             | 4                  | 6                 | 2                  | 6                 |

Single means that the measurements are on the same or different RF channel within the same frequency band.

Multi means that the measurements are on different RF channel on different frequency bands.

For measurements between ARFCN in different bands the 'Absolute level of lower level signal' column for the band including the lower level signal shall be used to determine which tolerance applies.

At extreme temperature conditions an extra 2 dB shall be added to the Multi limits in above table.

2. The RMS received signal level at the receiver input shall be measured with an absolute accuracy of  $\pm 4$  dB from -110 dBm to -70 dBm under normal conditions; 3GPP TS 05.08, subclause 8.1.2.
3. The RMS received signal level at the receiver input shall be measured with an absolute accuracy of  $\pm 6$  dB over the full range of -110 dBm to -48 dBm under both normal and extreme conditions; 3GPP TS 05.08, subclause 8.1.2.
4. If the received signal level falls below the reference sensitivity level for the type of MS then the MS shall report a level between the reference sensitivity level and the actual received level, but with the tolerances given in conformance requirements 2. and 3. above.
5. The measured signal level shall be mapped to an RXLEV value between 0 and 63 as specified in 3GPP TS 05.08, subclause 8.1.4.

#### 21.5.1.3 Test purpose

1. To verify that the RXLEV reported by the MS in HSCSD multislot configuration does not exceed conformance requirement 1.

1.1 under normal conditions;

- 1.2 under extreme conditions.
2. To verify that the RXLEV reported by the MS in HSCSD multislot configuration does not exceed conformance requirement 2 under normal conditions.
3. To verify that the RXLEV reported by the MS in HSCSD multislot configuration does not exceed conformance requirement 3 under extreme conditions and under normal conditions from -48 dBm to -70 dBm.
4. To verify that the RXLEV reported by the MS in HSCSD multislot configuration does not exceed conformance requirement 4.

NOTE: Conformance requirement 5 is inherently tested in each of the test purposes 1. to 4.

#### 21.5.1.4 Method of test

##### 21.5.1.4.1 Initial conditions

The SS is set to produce the BCCH of the serving cell at  $63 \text{ dB}\mu\text{Vemf}(\ )$  and the BCCHs of 6 surrounding cells at  $28 \text{ dB}\mu\text{Vemf}(\ )$ . The BCCH of the serving cell indicates these BCCHs, but not the BCCH of the serving cell. The ARFCN of the serving cell BCCH is chosen so as not to interfere with the other channels as shown in table 21.5-2. The fading profile for the BCCHs of the serving and surrounding cells will be set to static.

After 30 s, a call is set up according to the generic call set up procedure for multislot HSCSD to an ARFCN, within the supported band of operation. The SACCH indicates the same surrounding cell BCCHs as the BCCH of the serving cell.

SS commands the MS to operate in the multislot class with maximum number of bidirectional channels.

NOTE: The 30 s is to allow the MS to scan and find all BCCHs.

## 21.5.1.4.2 Procedure

- a) The levels of the TCH and BCCHs are set according to table 21.5-2 step 1. The SS waits 20 s before continuing. Same TCH levels are set to all multislot subchannels.

**Table 21.5-2: Signal levels at receiver input in dB $\mu$ Vemf( )**

|                    | ARFCN         | TCH                     | BCCH1                   | BCCH2                   | BCCH3                   | BCCH4                   | BCCH5                   | BCCH6                   |
|--------------------|---------------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|
| Step               | GSM 450       | 259                     | 276                     | 293                     | 264                     | 269                     | 281                     | 288                     |
|                    | GSM 480       | 306                     | 323                     | 340                     | 311                     | 316                     | 328                     | 335                     |
|                    | GSM 900:      | 1                       | 62                      | 124                     | 20                      | 40                      | 80                      | 100                     |
|                    | DCS 1 800     | 512                     | 700                     | 885                     | 585                     | 660                     | 790                     | 835                     |
|                    | PCS 1 900     | 512                     | 700                     | 805                     | 585                     | 660                     | 790                     | 550                     |
|                    | 450/900       | 259                     | 124                     | 276                     | 293                     | 269                     | 288                     | 1                       |
|                    | 480/900       | 306                     | 124                     | 323                     | 340                     | 316                     | 335                     | 1                       |
|                    | 450/1 800     | 259                     | 885                     | 276                     | 293                     | 269                     | 288                     | 512                     |
|                    | 480/1 800     | 306                     | 885                     | 323                     | 340                     | 316                     | 335                     | 512                     |
|                    | 900/1 800     | 1                       | 885                     | 62                      | 124                     | 40                      | 100                     | 512                     |

| 3 + m $\times$ 21  |               | 54,5 - m $\times$<br>10 | 62,5 - m $\times$<br>10 | 44,5 - m $\times$<br>10 | 44,5 - m $\times$<br>10 | 44,5 - m $\times$<br>10 | 44,5 - m $\times$<br>10 | 44,5 - m $\times$<br>10 |
| .                  |               | .                       | .                       | .                       | .                       | .                       | 44,5 - m $\times$<br>10 | 44,5 - m $\times$<br>10 |
| 17 + m $\times$ 21 |               | 54,5 - m $\times$<br>10 | .                       | .                       | .                       | .                       | 44,5 - m $\times$<br>10 | 44,5 - m $\times$<br>10 |
| 18 + m $\times$ 21 |               | 44,5 - m $\times$<br>10 | .                       | .                       | .                       | .                       | 44,5 - m $\times$<br>10 | 44,5 - m $\times$<br>10 |
| .                  |               | .                       | .                       | .                       | .                       | .                       | 44,5 - m $\times$<br>10 | 44,5 - m $\times$<br>10 |
| 21 + m $\times$ 21 |               | 44,5 - m $\times$<br>10 | 44,5 - m $\times$<br>10 | 44,5 - m $\times$<br>10 | 44,5 - m $\times$<br>10 | 44,5 - m $\times$<br>10 | 44,5 - m $\times$<br>10 | 44,5 - m $\times$<br>10 |

m = 0, 1, 2, 3, 4.

- b) The measurement is done in 105 steps. The initial signal levels of each multislot TCH of the serving cell and the BCCHs of the surrounding cells are adjusted according to table 21.5-2. At each step the SS keeps the signal levels stable for one reporting period, except at steps 21 + m  $\times$  21 where the level is held stable for 1.75 reporting periods. The RXLEV value for the period in which the change occurs (reported in the following period) is discarded. The SS records the RXLEV values reported for the surrounding cell BCCHs in steps 1 + m  $\times$  21 and 21 + m  $\times$  21. The RXLEV values for BCCH 1 are recorded by the SS for all 105 steps.

NOTE: This extension at steps 21 + m  $\times$  21 is to allow an extra quarter reporting period for the MS to stabilize for steps 1 + m  $\times$  21.

At steps 1 to 30 the SS simulates a base station with DTX off and at steps 31 to 105 the SS simulates a base station with DTX on.

At steps 1 to 30 the SS checks the accuracy of the measured signal strength of TCH by checking the values of the parameters RXLEV\_FULL and RXLEV\_SUB. At steps 31 to 105 the SS shall check only the value of the parameter RXLEV\_SUB.

At step 64, within every 480 ms reporting period, out of the 4 SACCH and 8 SID timeslots the SS transmits the first six active timeslots of the TCH with signal level 39,5 dB $\mu$ Vemf( ) and the last six active timeslots of the TCH with signal level 29,5 dB $\mu$ Vemf( ).

- c) The SS sets signal levels for all multislot subchannels and BCCH as in step 50 of the table 21.5-2. The SS lowers the signal level on one of the subchannels in 6 steps of 1 dB. This is repeated on all subchannels. The SS simulates a base station with DTX off.
- d) Steps b) and c) are repeated under extreme conditions (annex 1, TC2,2 and TC3).

### 21.5.1.5 Test requirements

#### 21.5.1.5.1 Relative accuracy of measurements on different ARFCN

For normal and each of the 4 extreme conditions for all multislot subchannels tested the following applies:

- a) For each of the steps 1, 21, 22, 42, 43, and 64, of the at least 7 (depending on the multislot class the MS is capable) reported RXLEV values checked, the difference between the minimum reported RXLEV value and the maximum reported RXLEV value shall be no more than 4 if the measurements are on the same or on different RF channel within the same frequency band and no more than 8 (12 for extreme temperature conditions) if the measurements are on different frequency bands.
- b) For each of the steps 63 and 85, of the at least 7 reported RXLEV values checked, the difference between the minimum reported RXLEV value and the maximum reported RXLEV value shall be no more than 5 for small MS, DCS 1 800 and PCS 1 900 (Class 1 and 2) MS or 4 for other MS if the measurements are on the same or on different RF channel within the same frequency band and no more than 9 for small MS, DCS 1 800 and PCS 1 900 (Class 1 and 2) MS or 8 for other MS and other PCS 1 900 MS (13 and 12 for extreme temperature conditions) if the measurements are on different frequency bands.
- c) For step 84, of the at least 7 reported RXLEV values checked, the difference between the minimum reported RXLEV value and the maximum reported RXLEV value shall be no more than 5 if the measurements are on the same or on different RF channel within the same frequency band and no more than 9 (13 for extreme temperature conditions) if the measurements are on different frequency bands.
- d) For step 105, of the reported RXLEV values checked, the difference between the minimum reported RXLEV value and the maximum reported RXLEV value shall be no more than 6 if the measurements are on the same or on different RF channel within the same frequency band and no more than 10 (14 for extreme temperature conditions) if the measurements are on different frequency bands.

NOTE: It is not mandatory for the MS to report any of the BCCHs in step 105.

#### 21.5.1.5.2 Relative accuracy at a single frequency (BCCH1)

For normal and each of the 4 extreme conditions tested the following applies:

For:  $n \leq 21$  and  $RXLEV_1 = 63$

$RXLEV_n - (63 - n + r)$  shall be between:

-2 and +2

NOTE 1: This formula allows for an MS with an absolute accuracy worse than +0,5 dB and therefore reporting an RXLEV of 63 for more than one step. The formula checks the relative accuracy from the lowest input level for which the MS last reports RXLEV of 63.

Otherwise:

$RXLEV_{(m*21+1)} - RXLEV_{(m*21+n)} - n + 1$  shall be between:

-2 and +2

for steps 2 to 62 and 65 to 71 for DCS 1 800 class 1/2 MS; or steps 2 to 62 and 65 to 73 for DCS 1 800 class 3, PCS 1 900 (Class 1 and 2) and Small GSM MS; or 2 to 75 for other MS and other PCS 1 900 MS.

-3 and +2

for steps 63 and 72 to 96 for DCS 1 800 class 1/2 MS; or steps 63 and 74 to 98 for DCS 1 800 class 3, PCS 1 900 (Class 1 and 2) and Small GSM MS; or 76 to 100 for other MS and other PCS 1 900 MS.

-4 and +2

for steps 97 to 105 for DCS 1 800 class 1/2 MS; or steps 99 to 105 for DCS 1 800 class 3, PCS 1 900 (Class 1 and 2) and Small GSM MS; or 101 to 105 for other MS and other PCS 1 900 MS.

where:

$1 < n \leq 21$  and  $0 \leq m \leq 4$  as identified in table 21-2, and  $r$  is the number of the last step where RXLEV of 63 was reported.

NOTE 2: It is not mandatory for the MS to report BCCH1 for steps greater than 99 for GSM 400, GSM 700, GSM 850 or GSM 900 Small MS or 101 for other GSM and other PCS 1 900 MS or 97 for a DCS 1 800 Class 1 or Class 2 MS and 99 for DCS 1 800 Class 3 and PCS 1 900 (Class 1 and 2) MS. If the MS reports a level and the upper limit for this step in the above formulae implies a level below the reference sensitivity level for the type of MS, then the upper limit shall be considered as equal to a value corresponding to the reference sensitivity level.

#### 21.5.1.5.3 Absolute accuracy

For each BCCH reported,  $|RXLEV_{MS} + m \times 10 - 62|$  shall be no more than:

- 4 for steps 64 and 85 under normal conditions.
- 6 for steps 64 and 85 under extreme conditions.
- 6 for steps 1, 22 and 43 under normal and extreme conditions.

where:  $0 \leq m \leq 4$  as identified in table 21.5-2.

#### 21.5.1.5.4 Relative accuracy of measurements of different subchannel

In step c) the RXLEV values reported for all subchannels are checked, allowing  $\pm 2$  dB relative accuracy. Reporting shall be independent on all bidirectional subchannels.

## 21.6 COMPACT Signal strength

### 21.6.1 Definition and applicability

The MS reports RXLEV values related to the apparent received RF signal strength. It is necessary for these levels to attain sufficient accuracy for the correct functioning of the system.

The requirements and this test apply to all types of MSs supporting COMPACT.

### 21.6.2 Conformance requirement

1. The RMS received signal level at the receiver input shall be measured by the MS over the full range of -110 dBm to -48 dBm with a relative accuracy between signals with levels up to 20 dB difference according to table 21-6.
  - 1.1 under normal conditions, 3GPP TS 05.08, subclause 8.1.2 and 3GPP TS 05.05, subclause 6.2.
  - 1.2 under extreme conditions, 3GPP TS 05.08, subclause 8.1.2, 3GPP TS 05.05, subclause D.1 and D.2.

**Table 21-6: Tolerance for relative accuracy of receive signal measurement**

| Absolute level of lower level signal dBm |                                    |                                  |                              | Tolerance dB       |       |                    |       |
|------------------------------------------|------------------------------------|----------------------------------|------------------------------|--------------------|-------|--------------------|-------|
| GSM 400, 700, 850 and 900 Small MS       | GSM 400, 700, 850 and 900 Other MS | DCS 1 800, PCS 1 900 Class 1 & 2 | DCS 1 800, PCS 1 900 Class 3 | Lower limit Single | Multi | Upper limit Single | Multi |
| ≥ -88                                    | ≥ -90                              | ≥ -86                            | ≥ -88                        | 2                  | 4     | 2                  | 4     |
| ≥ -101                                   | ≥ -103                             | ≥ -99                            | ≥ -101                       | 3                  | 5     | 2                  | 5     |
| < -101                                   | < -103                             | < -99                            | < -101                       | 4                  | 6     | 2                  | 6     |

Single means that the measurements are on the same or different RF channel within the same frequency band.

Multi means that the measurements are on different RF channel on different frequency bands.

For measurements between ARFCN in different bands the 'Absolute level of lower level signal' column for the band including the lower level signal shall be used to determine which tolerance applies.

At extreme temperature conditions an extra 2 dB shall be added to the Multi limits in above table.

- The RMS received signal level at the receiver input shall be measured with an absolute accuracy of  $\pm 4$  dB from -110 dBm to -70 dBm under normal conditions; 3GPP TS 05.08, subclause 8.1.2.
- The RMS received signal level at the receiver input shall be measured with an absolute accuracy of  $\pm 6$  dB over the full range of -110 dBm to -48 dBm under both normal and extreme conditions; 3GPP TS 05.08, subclause 8.1.2.
- If the received signal level falls below the reference sensitivity level for the type of MS then the MS shall report a level between the reference sensitivity level and the actual received level, but with the tolerances given in conformance requirements 2. and 3. above.
- The measured signal level shall be mapped to an RXLEV value between 0 and 63 as specified in 3GPP TS 05.08, subclause 8.1.4.

### 21.6.3 Test purpose

- To verify that the RXLEV reported by the MS does not exceed conformance requirement 1.
  - under normal conditions;
  - under extreme conditions.
- To verify that the RXLEV reported by the MS does not exceed conformance requirement 2 under normal conditions.
- To verify that the RXLEV reported by the MS does not exceed conformance requirement 3 under extreme conditions and under normal conditions from -48 dBm to -70 dBm.
- To verify that the RXLEV reported by the MS does not exceed conformance requirement 4.
- To Verify that the MS is able to adjust measurement timing.
- To verify that the MS is able to decode BSIC from the neighbors.

NOTE: Conformance requirement 5 is inherently tested in each of the test purposes 1. to 4.

### 21.6.4 Method of test

#### Initial conditions

The SS is set to produce the CPBCCCH of the serving cell at  $63 \text{ dB}\mu\text{Vemf}(\ )$  and the CPBCCCHs of 6 surrounding cells at  $28 \text{ dB}\mu\text{Vemf}(\ )$ . The CPBCCCH of the serving cell indicates these CPBCCCHs, but not the CPBCCCH of the serving cell. The ARFCN of the serving cell CPBCCCH is chosen so as not to interfere with the other channels as shown in table 21-6. The fading profile for the CPBCCCHs of the serving and surrounding cells will be set to static.

After 120 s, a downlink TBF is set up according to the generic TBF set up procedure to an ARFCN, within the supported band of operation. Furthermore, the MS is forced to establish an uplink TBF applying EGPRS test mode, see 3GPP TS 04.14. All blocks are used for timeslot 0 for both downlink and uplink transactions. MCS-1 coding is used.

NOTE: The 120 s is to allow the MS to scan and find all CPBCCHs.

The SS must broadcast to MS a parameter NETWORK\_CONTROL\_ORDER set to value NC2. The MS shall send measurement reports to the network and the MS shall not perform autonomous cell re-selection. Parameter NC\_REPORTINGPERIOD\_T (time period for cell reselection measurement reporting for packet transfer mode) is set to 1,92 s (corresponding  $8 \times 52$ multiframes). The MS is able to take at least 18 samples / timegroup in every  $4 \times 52$  multiframe. The average number of samples / carrier should be  $(4 \times 18) \times 2 / 6 = 24$ . In every TDMA frame possible, a received signal level measurement sample shall be taken on at least one of the CPBCCH carriers, as evenly distributed as possible among the neighbours.

#### Procedure

- a) The TimeGroups are set according to table 21-6-1.

**Table 21-6-1: CPBCCH Timegroups**

| CPBCCH | TG |
|--------|----|
| 1, 5   | 0  |
| 2, 6   | 1  |
| 3      | 2  |
| 4      | 3  |

- b) The levels of the PDTCH and CPBCCHs are set according to table 21-6-2 step 1. The SS waits 20 s before continuing.

Table 21-6-2: Signal levels at receiver input in dB $\mu$ Vemf( )

| Step               | ARFCN         | PDTCH                | CPBCCH1              | CPBCCH2              | CPBCCH3              | CPBCCH4              | CPBCCH5              | CPBCCH6              |
|--------------------|---------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|
|                    | GSM 450       | 259                  | 276                  | 293                  | 264                  | 269                  | 281                  | 288                  |
|                    | GSM 480       | 306                  | 323                  | 340                  | 311                  | 316                  | 328                  | 335                  |
|                    | GSM 900:      | 1                    | 62                   | 124                  | 20                   | 40                   | 80                   | 100                  |
|                    | DCS 1 800     | 512                  | 700                  | 885                  | 585                  | 660                  | 790                  | 835                  |

| 18 + m $\times$ 21 |               | 44,5 - m $\times$ 10 | .                    | .                    | .                    | .                    | 44,5 - m $\times$ 10 | 44,5 - m $\times$ 10 |
| .                  |               | .                    | .                    | .                    | .                    | .                    | 44,5 - m $\times$ 10 | 44,5 - m $\times$ 10 |
| 21 + m $\times$ 21 |               | 44,5 - m $\times$ 10 | 44,5 - m $\times$ 10 | 44,5 - m $\times$ 10 | 44,5 - m $\times$ 10 | 44,5 - m $\times$ 10 | 44,5 - m $\times$ 10 | 44,5 - m $\times$ 10 |

m = 0, 1, 2, 3, 4.

- b) The first measurement is done in 105 steps. The initial signal levels of the PDTCH of the serving cell and the CPBCCHs of the surrounding cells are adjusted according to table 21-6-2. At each step the SS keeps the signal levels stable for one reporting period, except at steps  $21 + m \times 21$  where the level is held stable for 1,75 reporting periods. The RXLEV value for the period in which the change occurs (reported in the following period) is discarded. The SS records the RXLEV values reported for the surrounding cell CPBCCHs in steps  $1 + m \times 21$  and  $21 + m \times 21$ . The RXLEV values for CPBCCH 1 are recorded by the SS for all 105 steps.

NOTE: This extension at steps  $21 + m \times 21$  is to allow an extra quarter reporting period for the MS to stabilize for steps  $1 + m \times 21$ .

At steps 1 to 105 the SS checks the accuracy of the measured signal strength of PDTCH by checking the values of the parameter RXLEV.

The second part of test (105 steps) is done by following the rules defined above with the inclusion that the SS shall delay the transmission (CBCCH's) from surrounding cells by  $n \times 3$  bits ( $n = 1, 2, 3, \dots, 21$ ), where  $n$  is incremented by 1 after every 5 performed measurement steps (5,10,15,20,....,100).

- c) Step b) is repeated under extreme conditions (annex 1, TC2,2 and TC3).

## 21.6.5 Test requirements

## 21.6.5.1 Relative accuracy of measurements on different ARFCN

For normal and each of the 4 extreme conditions (both with and without the delay) tested the following applies:

- a) For each of the steps 1, 21, 22, 42, 43, and 64, of the 7 reported RXLEV values checked, the difference between the minimum reported RXLEV value and the maximum reported RXLEV value shall be no more than 4 if the measurements are on the same or on different RF channel within the same frequency band and no more than 8 (12 for extreme temperature conditions) if the measurements are on different frequency bands.
- b) For each of the steps 63 and 85, of the 7 reported RXLEV values checked, the difference between the minimum reported RXLEV value and the maximum reported RXLEV value shall be no more than 5 for small MS and DCS 1 800/PCS 1900 MS or 4 for other MS if the measurements are on the same or on different RF channel within the same frequency band and no more than 9 for small MS and DCS 1 800/PCS 1900 MS or 8 for other MS (13 and 12 for extreme temperature conditions) if the measurements are on different frequency bands.
- c) For step 84, of the 7 reported RXLEV values checked, the difference between the minimum reported RXLEV value and the maximum reported RXLEV value shall be no more than 5 if the measurements are on the same or on different RF channel within the same frequency band and no more than 9 (13 for extreme temperature conditions) if the measurements are on different frequency bands.
- d) For step 105, of the reported RXLEV values checked, the difference between the minimum reported RXLEV value and the maximum reported RXLEV value shall be no more than 6 if the measurements are on the same or on different RF channel within the same frequency band and no more than 10 (14 for extreme temperature conditions) if the measurements are on different frequency bands.
- e) For Step 1, check that the MS reports correctly the BSIC from all the neighbors and the reported BSIC value is unchanged during the whole tests

NOTE: It is not mandatory for the MS to report any of the CPBCCCHs in step 105.

## 21.6.5.2 Relative accuracy at a single frequency (CPBCCCH1)

For normal and each of the 4 extreme conditions tested the following applies:

For:  $n \leq 21$  and  $RXLEV_1 = 63$

$RXLEV_n - (63 - n + r)$  shall be between:

-2 and +2

NOTE 1: This formula allows for an MS with an absolute accuracy worse than +0,5 dB and therefore reporting an RXLEV of 63 for more than one step. The formula checks the relative accuracy from the lowest input level for which the MS last reports RXLEV of 63.

Otherwise:

$RXLEV_{(m*21+1)} - RXLEV_{(m*21+n)} - n + 1$  shall be between:

-2 and +2

for steps 2 to 62 and 65 to 71 for DCS 1 800/ PCS 1900 class 1/2 MS; or steps 2 to 62 and 65 to 73 for DCS 1 800/PCS 1900 class 3 and Small GSM MS; or 2 to 75 for other MS.

-3 and +2

for steps 63 and 72 to 96 for DCS 1 800/PCS 1 900 class 1/2 MS; or steps 63 and 74 to 98 for DCS 1 800/PCS 1900 class 3 and Small GSM MS; or 76 to 100 for other MS.

-4 and +2

for steps 97 to 105 for DCS 1 800/PCS 1900 class 1/2 MS; or steps 99 to 105 for DCS 1 800/ PCS 1900 class 3 and Small GSM MS; or 101 to 105 for other MS.

where:

$1 < n \leq 21$  and  $0 \leq m \leq 4$  as identified in table 21-6, and  $r$  is the number of the last step where RXLEV of 63 was reported.

NOTE 2: It is not mandatory for the MS to report CPBCCCH1 for steps greater than 99 for GSM 400, GSM 700, GSM 850 OR GSM 900 Small MS or 101 for other GSM MS or 97 for a DCS 1 800/PCS 1 900 Class 1 or Class 2 MS and 99 for DCS 1 800/PCS 1 900 Class 3 MS. If the MS reports a level and the upper limit for this step in the above formulae implies a level below the reference sensitivity level for the type of MS, then the upper limit shall be considered as equal to a value corresponding to the reference sensitivity level.

### 21.6.5.3 Absolute accuracy

For each BCCH reported,  $|RXLEV_{MS} + m \times 10 - 62|$  shall be no more than:

- 4 for steps 64 and 85 under normal conditions.
- 6 for steps 64 and 85 under extreme conditions.
- 6 for steps 1, 22 and 43 under normal and extreme conditions.

where:  $0 \leq m \leq 4$  as identified in table 21-2.

## 21.7 COMPACT Signal strength selectivity

### 21.7.1 Definition and applicability

The signal strength selectivity is a measure of the ability of the signal strength measuring part of the MS to discriminate against RF power from adjacent ARFCN. The RXLEV selectivity figure corresponds to the amount by which the adjacent channel power shall be attenuated.

The requirements and this test apply to all types of MS supporting COMPACT.

### 21.7.2 Conformance requirement

The selectivity of the received signal measurement shall be as follows:

- for adjacent (200 kHz) channel,  $\geq 16$  dB;
- for adjacent (400 kHz) channel,  $\geq 48$  dB;
- for adjacent (600 kHz) channel,  $\geq 56$  dB.

3GPP TS 05.08, subclause 8.1.2.

### 21.7.3 Test purpose

To verify that the MS meets the conformance requirement at the 200 kHz adjacent channel above and below the wanted.

### 21.7.4 Method of test

All CPBCCCH's are using time group 0.

The SS must broadcast to MS a parameter NETWORK\_CONTROL\_ORDER set to value NC2. The MS shall send measurement reports to the network and the MS shall not perform autonomous cell re-selection. Parameter NC\_REPORTINGPERIOD\_T (time period for cell reselection measurement reporting for packet transfer mode) is set to 0,96 s (corresponding  $4 \times 52$ multiframes).

## Initial conditions

### For GSM 450:

A TBF is set up according to the generic downlink TBF set up procedure on ARFCN 269 and with surrounding cell CPBCCH3 indicated in the BA list at ARFCN 281. Furthermore, the MS is forced to establish an uplink TBF applying EGPRS test mode, see 3GPP TS 04.14. All blocks are used for timeslot 0 for both downlink and uplink transactions. The received data is transmitted back on the uplink blocks assigned for mobile station. MCS-1 coding is used.

The RF level of the PDTCH and CPBCCH3 is set to 20 dB above reference sensitivity level( ).

CPBCCH1 and 2 at ARFCN 270 and 280 are off.

These conditions are kept for 30 s to ensure the MS has time to decode the CPBCCH.

### For GSM 480:

A TBF is set up according to the generic downlink TBF set up procedure on ARFCN 316 and with surrounding cell CPBCCH3 indicated in the BA list at ARFCN 328. Furthermore, the MS is forced to establish an uplink TBF applying EGPRS test mode, see 3GPP TS 04.14. All blocks are used for timeslot 0 for both downlink and uplink transactions. The received data is transmitted back on the uplink blocks assigned for mobile station. MCS-1 coding is used.

The RF level of the PDTCH and CPBCCH3 is set to 20 dB above reference sensitivity level( ).

CPBCCH1 and 2 at ARFCN 317 and 327 are off.

These conditions are kept for 30 s to ensure the MS has time to decode the CPBCCH.

### For GSM 750:

A TBF is set up according to the generic downlink TBF set up procedure on ARFCN 450 and with surrounding cell CPBCCH3 indicated in the BA list at ARFCN 485. Furthermore, the MS is forced to establish an uplink TBF applying EGPRS test mode, see 3GPP TS 04.14. All blocks are used for timeslot 0 for both downlink and uplink transactions. The received data is transmitted back on the uplink blocks assigned for mobile station. MCS-1 coding is used.

The RF level of the PDTCH and CPBCCH3 is set to 20 dB above reference sensitivity level( ).

CPBCCH1 and 2 at ARFCN 451 and 484 are off.

These conditions are kept for 30 s to ensure the MS has time to decode the CPBCCH.

### For GSM 850:

A TBF is set up according to the generic downlink TBF set up procedure on ARFCN 170 and with surrounding cell CPBCCH3 indicated in the BA list at ARFCN 210. Furthermore, the MS is forced to establish an uplink TBF applying EGPRS test mode, see 3GPP TS 04.14. All blocks are used for timeslot 0 for both downlink and uplink transactions. The received data is transmitted back on the uplink blocks assigned for mobile station. MCS-1 coding is used.

The RF level of the PDTCH and CPBCCH3 is set to 20 dB above reference sensitivity level( ).

CPBCCH1 and 2 at ARFCN 171 and 209 are off.

These conditions are kept for 30 s to ensure the MS has time to decode the CPBCCH.

### For GSM 900:

A TBF is set up according to the generic downlink TBF set up procedure on ARFCN 40 and with surrounding cell CPBCCH3 indicated in the BA list at ARFCN 80. Furthermore, the MS is forced to establish an uplink TBF applying EGPRS test mode, see 3GPP TS 04.14. All blocks are used for timeslot 0 for both downlink and uplink transactions. The received data is transmitted back on the uplink blocks assigned for mobile station. MCS-1 coding is used.

The RF level of the PDTCH and CPBCCH3 is set to 20 dB above reference sensitivity level( ).

CPBCCH1 and 2 at ARFCN 41 and 79 are off.

These conditions are kept for 30 s to ensure the MS has time to decode the CPBCCCH.

For DCS 1 800:

A TBF is set up according to the generic downlink TBF set up procedure on ARFCN 690 and with surrounding cell CPBCCCH3 indicated in the BA list at ARFCN 790. Furthermore, the MS is forced to establish an uplink TBF applying EGPRS test mode, see 3GPP TS 04.14. All blocks are used for timeslot 0 for both downlink and uplink transactions. The received data is transmitted back on the uplink blocks assigned for mobile station. MCS-1 coding is used.

The RF level of the PDTCH and CPBCCCH3 is set to 20 dB above reference sensitivity level( ).

CPBCCCH1 and 2 at ARFCN 691 and 789 are off.

These conditions are kept for 30 s to ensure the MS has time to decode the CPBCCCH.

For PCS 1 900:

A TBF is set up according to the generic downlink TBF set up procedure on ARFCN 650 and with surrounding cell CPBCCCH3 indicated in the BA list at ARFCN 710. Furthermore, the MS is forced to establish an uplink TBF applying EGPRS test mode, see 3GPP TS 04.14. All blocks are used for timeslot 0 for both downlink and uplink transactions. The received data is transmitted back on the uplink blocks assigned for mobile station. MCS-1 coding is used.

The RF level of the PDTCH and CPBCCCH3 is set to 20 dB above reference sensitivity level( ).

CPBCCCH1 and 2 at ARFCN 651 and 709 are off.

These conditions are kept for 30 s to ensure the MS has time to decode the CPBCCCH.

#### Procedure

- a) The SS records the RXLEV values reported for the PDTCH and CPBCCCH3.
- b) CPBCCCH1 and 2 are set to 9 dB above the signal level of the PDTCH and CPBCCCH3.

NOTE: The first adjacent channel interference requirement limits the level of CPBCCCHs 1 and 2 to 9 dB. This ensures that the MS can maintain the call, and read CPBCCCH3.

- c) These conditions are kept for 30 s.
- d) The SS records the RXLEV values reported for the PDTCH and CPBCCCH3.

#### 21.7.5 Test requirements

The values of RXLEV recorded in step d) shall be no more than 1 above the values recorded in step a).

NOTE: This one change in the reported value of RXLEV is calculated as follows: The level of the first adjacent interfering signal is such that C/I is -9 dB. With an RXLEV selectivity for the first adjacent channel of 16 dB, the power from the adjacent channel is equal to -7 dB with respect to the power level of the useful signal. The increase in power therefore is equal to  $10\log(1 + 10^{-0.7}) = 0,71$  dB. Thus, the value of RXLEV could increase by 1.

---

## 22 Transmit power control timing and confirmation

### 22.1 Transmit power control timing and confirmation, single slot

#### 22.1.1 Definition and applicability

The RF power level to be employed by the MS is indicated by means of the 5 bit TXPWR field sent in the layer 1 header of each downlink SACCH message block and may be sent in a dedicated signalling block.

When a power change is signalled the MS must change its power control level to the new level at a certain rate of change.

The MS shall confirm the power level that it is currently employing by setting the MS\_TXPWR\_CONF field in the uplink SACCH L1 header.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1900 MS.

#### 22.1.2 Conformance requirement

1. The RF power control level to be employed by the MS is indicated by means of the power control information sent in the layer 1 header of each downlink SACCH message block and may be sent in a dedicated signalling block; 3GPP TS 05.08, subclause 4.2.
2. The MS shall confirm the power level that it is currently employing in the uplink SACCH L1 header. The indicated value shall be the power control level actually used by the MS for the last burst of the previous SACCH period; 3GPP TS 05.08, subclause 4.2.
3. Upon receipt of a command on the SACCH to change its RF power level, the MS shall change to the new level at a rate of one nominal 2 dB power control step every 60 ms; 3GPP TS 05.08, subclause 4.7.
4. The change (in conformance requirement 3) shall commence at the first TDMA frame belonging to the next reporting period; 3GPP TS 05.08, subclause 4.7.
5. In case of channel change the commanded power level shall be applied on the new channel immediately; 3GPP TS 05.08, subclause 4.7.

#### 22.1.3 Test purpose

1. To verify that the MS will set its transmitter output power in accordance with conformance requirement 1.
2. To verify that the MS will confirm the power level it is currently employing according to conformance requirement 2.
3. To verify that the MS, upon receipt of a command from the SACCH to change its RF power level, will change according to conformance requirement 3.
4. To verify that the MS will commence the change of power level at least by the sixth TDMA frame belonging to the next reporting period.
5. To verify that in case of new channel assignment the commanded power level is applied on the new channel according to conformance requirement 5.

#### 22.1.4 Method of test

NOTE: The method of measuring the MS transmitter output power is given in subclause 13.3.

##### 22.1.4.1 Initial conditions

A call is set up by the SS according to the generic call set up procedure on a channel with ARFCN in the Mid ARFCN range (see table 3.3), power control level set to maximum power.

##### 22.1.4.2 Procedure

- a) The SS signals minimum power control level to the MS in the SACCH.
- b) The SS measures the MS transmitter output power on TDMA frames 6, 19, 32 and every subsequent 13th TDMA frame to TDMA frame 214. The SS also monitors the MS\_TXPWR\_CONF field in the uplink SACCH L1 header for the four SACCH multiframes after the SS signals the power change.
- c) The SS now sets TXPWR in the SACCH to the maximum peak power appropriate to the class of the MS.

- d) The SS measures the MS transmitter output power on TDMA frames 6, 19, 32 and every subsequent 13th TDMA frame to TDMA frame 214. The SS also monitors the MS\_TXPWR\_CONF field in the uplink SACCH L1 header for the four SACCH multiframes after the SS signals the power change.
- e) The SS now sets the SACCH TXPWR to 8.
- f) After 3 s the SS sets the SACCH TXPWR to 9.
- g) The SS measures the MS transmitter output power on TDMA frame 6.
- h) The SS sets the SACCH TXPWR to 8.
- i) The SS measures the MS transmitter output power on TDMA frame 6.
- j) The channel assignment is changed and the demanded power within the channel assignment is set to the minimum power control level of the MS.
- k) When the MS has changed channel its output power is measured on the first burst on the new channel.

### 22.1.5 Test requirements

NOTE: Refer to tables 13-2, 13-3 and 13-4 for relationship between the power class, power control level, transmitter output power and the relevant tolerances.

- a) In steps b) and d), the transmitter output power shall change by one power step towards the new level signalled for each measured burst until the MS is operating at the closest supported power control level and from then on, all transmissions shall be at that level.
- b) In steps b) and d), the value of the MS\_TXPWR\_CONF field in the uplink SACCH L1 header shall correspond to the actual power control level used for the last transmitted burst of the previous SACCH multiframe. The first one shall indicate the initial transmitted power control level, the subsequent ones shall change by 8 each time until the final power control level has been reached in which case that value shall be indicated.
- c) In steps g) and i) the transmitter output power of TDMA frame 6 shall correspond to the new commanded power control level.
- d) In step k) the MS output power, measured on the new channel shall correspond to the power control level in the channel assignment.

## 22.2 Transmit power control timing and confirmation in HSCSD multislots configurations

### 22.2.1 Definition and applicability

The RF power level to be employed by the MS is indicated by means of the 5 bit TXPWR field sent in the layer 1 header of each downlink SACCH message block and may be sent in a dedicated signalling block.

When a power change is signalled the MS must change its power control level to the new level at a certain rate of change.

The MS shall confirm the power level that it is currently employing by setting the MS\_TXPWR\_CONF field in the uplink SACCH L1 header.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1900 MS and any multiband MS which are capable of HSCSD multislots operation.

### 22.2.2 Conformance requirement

1. The RF power control level to be employed by the MS is indicated by means of the power control information sent in the layer 1 header of each downlink SACCH message block and may be sent in a dedicated signalling block; 3GPP TS 05.08, subclause 4.2.

2. The MS shall confirm the power level that it is currently employing in the uplink SACCH L1 header. The indicated value shall be the power control level actually used by the MS for the last burst of the previous SACCH period; 3GPP TS 05.08, subclause 4.2.
3. Upon receipt of a command on the SACCH to change its RF power level, the MS shall change to the new level at a rate of one nominal 2 dB power control step every 60 ms; 3GPP TS 05.08, subclause 4.7.
4. The change (in conformance requirement 3) shall commence at the first TDMA frame belonging to the next reporting period; 3GPP TS 05.08, subclause 4.7.
5. In case of channel change the commanded power level shall be applied on the new channel immediately; 3GPP TS 05.08, subclause 4.7.

#### 22.2.3 Test purpose

1. To verify that the MS will set its transmitter output power in accordance with conformance requirement 1.
2. To verify that the MS will confirm the power level it is currently employing according to conformance requirement 2.
3. To verify that the MS, upon receipt of a command from the SACCH to change its RF power level, will change according to conformance requirement 3.
4. To verify that the MS will commence the change of power level at least by the sixth TDMA frame belonging to the next reporting period.
5. To verify that in case of new channel assignment the commanded power level is applied on the new channel according to conformance requirement 5.

#### 22.2.4 Method of test

NOTE: The method of measuring the MS transmitter output power is given in subclause 13.3.

##### 22.2.4.1 Initial conditions

A call is set up by the SS according to the generic call set up procedure for multislot configuration on a channel with ARFCN in the Mid ARFCN range (see table 3.3), power control level set to maximum power.

The SS commands the MS to operate in multislot configuration where it has highest possible number of Tx slots.

##### 22.2.4.2 Procedure

- a) The SS signals minimum power control level to the MS in the SACCH for one of the subchannels.
- b) The SS measures the MS transmitter output power on TDMA frames 6, 19, 32 and every subsequent 13th TDMA frame to TDMA frame 214. The SS also monitors the MS\_TXPWR\_CONF field in the uplink SACCH L1 header for the four SACCH multiframes after the SS signals the power change.
- c) The SS now sets TXPWR in the SACCH to the maximum peak power appropriate to the class of the MS.
- d) The SS measures the MS transmitter output power on TDMA frames 6, 19, 32 and every subsequent 13th TDMA frame to TDMA frame 214. The SS also monitors the MS\_TXPWR\_CONF field in the uplink SACCH L1 header for the four SACCH multiframes after the SS signals the power change.
- e) The SS now sets the SACCH TXPWR to 8.
- f) After 3 s the SS sets the SACCH TXPWR to 9.
- g) The SS measures the MS transmitter output power on TDMA frame 6.
- h) The SS sets the SACCH TXPWR to 8.
- i) The SS measures the MS transmitter output power on TDMA frame 6.

- j) The channel assignment is changed and the demanded power within the channel assignment is set to the minimum power control level of the MS.
- k) When the MS has changed channel its output power is measured on the first burst on the new channel.
- l) Steps a) to k) are repeated on the next subchannel until each is tested.

### 22.2.5 Test requirements

NOTE: Refer to tables 13-2, 13-3 and 13-4 for relationship between the power class, power control level, transmitter output power and the relevant tolerances.

- a) In steps b) and d), the transmitter output power shall change by one power step towards the new level signalled for each measured burst until the MS is operating at the closest supported power control level and from then on, all transmissions shall be at that level.
- b) In steps b) and d), the value of the MS\_TXPWR\_CONF field in the uplink SACCH L1 header shall correspond to the actual power control level used for the last transmitted burst of the previous SACCH multiframe. The first one shall indicate the initial transmitted power control level, the subsequent ones shall change by 8 each time until the final power control level has been reached in which case that value shall be indicated.
- c) In steps g) and i) the transmitter output power of TDMA frame 6 shall correspond to the new commanded power control level.
- d) In step k) the MS output power, measured on the new channel shall correspond to the power control level in the channel assignment.

## 22.3 GPRS Uplink Power Control - Use of $\alpha$ and $\Gamma_{CH}$ parameters

### 22.3.1 Definition and applicability

Power control is important for spectrum efficiency as well as for power consumption in a cellular system. Power control for a packet oriented connection is more complicated than for a circuit switched connection, since there is no continuous two-way connection.

The RF output power,  $P_{CH}$ , to be employed by the MS on each individual uplink PDCH shall be:

$$P_{CH} = \min(\Gamma_0 - \Gamma_{CH} - \alpha \times (C + 48), P_{MAX}),$$

Where:

- $\Gamma_{CH}$  is an MS and channel specific power control parameter, sent to the MS in an RLC control message (see 3GPP TS 04.60).
- $\Gamma_0$  = 39 dBm for GSM 400, GSM 700, GSM 850 and GSM 900  
= 36 dBm for DCS 1 800 and PCS 1900.
- $\alpha$  is a system parameter, broadcast on PBCCH or optionally sent to MS in an RLC control message (see 3GPP TS 04.08 / 3GPP TS 24.008 and 3GPP TS 04.60).
- C is the normalised received signal level at the MS as defined in 3GPP TS 05.08, subclause 10.2.3.1.
- P<sub>MAX</sub> is the maximum allowed output power in the cell =  
GPRS\_MS\_TXPWR\_MAX\_CCH if PBCCH exists  
MS\_TXPWR\_MAX\_CCH otherwise

All power values are expressed in dBm. (Note that the constants  $\Gamma_0$  and 48 are included only for optimising the coding of  $\Gamma_{CH}$  and C-value).

This is a flexible tool that can be used for different power control algorithms.

A pure open loop is achieved by setting  $\alpha = 1$  and keeping  $\Gamma_{CH}$  constant. With this method the output power is based on the received signal level assuming the same path loss in uplink and downlink. This is useful in the beginning of a packet transmission.

A pure closed loop is achieved by setting  $\alpha = 0$ . With this method the output power is commanded by the network based on received signal level measurements made in the BTS in a similar way as for a circuit switched connection.

This test applies to all GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1900 which support GPRS.

### 22.3.2 Conformance requirement

The MS shall use the same output power on all four bursts within one radio block. 3GPP TS 05.08, subclause 10.2.1.

If a calculated output power is not supported by the MS, the MS shall use the supported output power which is closest to the calculated output power. 3GPP TS 05.08, subclause 10.2.1.

When the MS receives new  $\Gamma_{CH}$  or  $\alpha$  values, the MS shall use the new value to update  $P_{CH}$  2 radio blocks after the end of the frame containing the last timeslot of the message block containing the new value. 3GPP TS 05.08, subclause 10.2.1.

The transmitted power shall be a monotonic function of the calculated output power and any change of 2 dB in the calculated value shall correspond to a change of  $2 \pm 1,5$  dB in the transmitted value. The MS may round the calculated output power to the nearest nominal output power value. 3GPP TS 05.08, subclause 10.2.1.

### 22.3.3 Test purpose

To verify the MS uses that the same output power on all four bursts of a radio block under normal conditions.

To verify that the highest power supported by the MS is used if the calculated power is greater.

To verify that the MS applies new  $\Gamma_{CH}$  or  $\alpha$  values 2 radio blocks after the end of the frame containing the last timeslot of the message block containing the new value.

To verify that any change of 2 dB in the calculated power corresponds to a change of  $2 \pm 1,5$  dB in the transmitted value under normal conditions.

NOTE: For changes in calculated power which are less than the tolerances specified for absolute power accuracy in a MS, the transmitted power as a function of calculated power cannot be tested for monotonicity. Monotonicity between power control steps is implicitly tested in subclause 13.16.

### 22.3.4 Method of test

#### 22.3.4.1 Initial conditions

The SS establishes a BCCH and a PBCCH on the same carrier in the mid ARFCN range. GPRS\_MS\_TXPWR\_MAX\_CCH is set to the maximum level (39 dBm for GSM and 36 dBm for DCS and PCS). The  $\Gamma_{CH}$  value is set such that  $(\Gamma_0 - \Gamma_{CH})$  equals the maximum power control level supported by the Power Class of the MS under test. The  $\alpha$  value is set to 0.

The SS establishes a downlink TBF on the same ARFCN as the BCCH and PBCCH. The MS shall transmit on the uplink. This is achieved using the GPRS test mode by transmitting a GPRS\_TEST\_MODE\_CMD (see 3GPP TS 04.14, subclause 5.4). The downlink power level is adjusted until a stable C-value of  $-52$ dBm is reported by the MS in the channel quality report (see 3GPP TS 05.08, subclause 10.2.3).

#### 22.3.4.2 Procedure

- a) The SS shall trigger a transmitter output power measurement on each of the four bursts of any radio block.

The method of power measurement is described in subclause 13.16.

- b) The SS shall modify the  $\Gamma_{CH}$  value such that  $(\Gamma_0 - \Gamma_{CH})$  equals the minimum power control level supported by the MS under test (5 dBm for GSM 400, GSM 700, GSM 850 and GSM 900 and 0dBm for DCS 1 800 and PCS 1 900). If the transmission of the RLC control message containing the new  $\Gamma_{CH}$  value is completed in radio

block N, the SS shall trigger a transmitter output power measurement on each of the four bursts of radio block N+3.

- c) The SS shall modify the  $\Gamma_{CH}$  value such that  $(\Gamma_0 - \Gamma_{CH})$  equals the maximum power control level supported by the power class of the MS under test. If the transmission of the RLC control message containing the new  $\Gamma_{CH}$  value is completed in radio block N, the SS shall trigger a transmitter output power measurement on each of the four bursts of radio block N+3.
- d) The SS shall modify the  $\Gamma_{CH}$  value such that  $(\Gamma_0 - \Gamma_{CH})$  equals the value 4dB below the maximum power control level supported by the power class of the MS under test. The  $\alpha$  value is set to 1.
- e) The SS shall decrement the  $\alpha$  value with a step size of 0.1 until  $\alpha$  equals 0. For each step change in  $\alpha$  value, if the transmission of the RLC control message containing the new  $\alpha$  value is completed in radio block N, the SS shall trigger a transmitter output power measurement on each of the four bursts of radio block N+3.
- f) For each value of  $\alpha$ , the SS shall note the maximum and minimum power values measured from the four bursts of the radio block in step e). The SS shall then calculate the maximum and minimum changes in output power measured for the following pairs of  $\alpha$  values: 1.0 and 0.5; 0.9 and 0.4; 0.8 and 0.3; 0.7 and 0.2; 0.6 and 0.1; 0.5 and 0. The maximum change is calculated by subtracting the minimum power measured from the smaller value of  $\alpha$  from the maximum power measured for the larger value of  $\alpha$ . The minimum step change is calculated by subtracting the maximum power measured from the smaller value of  $\alpha$  from the minimum power measured for the larger value of  $\alpha$ .

NOTE: If the power values measured for the four bursts of the radio block with  $\alpha$  equal to 1.0 are:

$$- P_{m0}, P_{m1}, P_{m2}, P_{m3}.$$

And, the power values measured for the four bursts of the radio block with  $\alpha$  equal to 0.5 are:

$$- P_{n0}, P_{n1}, P_{n2}, P_{n3}.$$

Then:

$$- P_{m(max)} = \text{MAX}(P_{m0}, P_{m1}, P_{m2}, P_{m3});$$

$$- P_{m(min)} = \text{MIN}(P_{m0}, P_{m1}, P_{m2}, P_{m3});$$

$$- P_{n(max)} = \text{MAX}(P_{n0}, P_{n1}, P_{n2}, P_{n3});$$

$$- P_{n(min)} = \text{MIN}(P_{n0}, P_{n1}, P_{n2}, P_{n3}).$$

The maximum and minimum step sizes are:

$$- \text{STEP(MAX)} = P_{m(max)} - P_{n(min)};$$

$$- \text{STEP(MIN)} = P_{m(min)} - P_{n(max)}.$$

- g) The SS shall modify the  $\Gamma_{CH}$  value such that  $(\Gamma_0 - \Gamma_{CH})$  equals the midrange power control level supported by the MS under test. The  $\alpha$  value is set to 0.
- h) The SS shall increment the  $\alpha$  value with a step size of 0.1 until  $\alpha$  equals 1. For each step change in  $\alpha$  value, if the transmission of the RLC control message containing the new  $\alpha$  value is completed in radio block N, the SS shall trigger a transmitter output power measurement on each of the four bursts of radio block N+3.
- i) For each value of  $\alpha$ , the SS shall note the maximum and minimum power values measured from the four bursts of the radio block in step h). The SS shall then calculate the maximum and minimum changes in output power measured for the following pairs of  $\alpha$  values: 1.0 and 0.5; 0.9 and 0.4; 0.8 and 0.3; 0.7 and 0.2; 0.6 and 0.1; 0.5 and 0. The maximum change is calculated by subtracting the minimum power measured from the smaller value of  $\alpha$  from the maximum power measured for the larger value of  $\alpha$ . The minimum step change is calculated by subtracting the maximum power measured from the smaller value of  $\alpha$  from the minimum power measured for the larger value of  $\alpha$ .

- j) The SS shall modify the  $\Gamma_{CH}$  value such that  $(\Gamma_0 - \Gamma_{CH})$  equals the minimum power control level supported by the MS under test (5dBm for GSM 400, GSM 700, GSM 850 and GSM 900 and 0dBm for DCS 1 800 and PCS 1900). The  $\alpha$  value is set to 0.
- k) The SS shall increment the  $\alpha$  value with a step size of 0.1 until  $\alpha$  equals 1. For each step change in  $\alpha$  value, if the transmission of the RLC control message containing the new  $\alpha$  value is completed in radio block N, the SS shall trigger a transmitter output power measurement on each of the four bursts of radio block N+3.
- l) For each value of  $\alpha$ , the SS shall note the maximum and minimum power values measured from the four bursts of the radio block in step k). The SS shall then calculate the maximum and minimum changes in output power measured for the following pairs of  $\alpha$  values: 1.0 and 0.5; 0.9 and 0.4; 0.8 and 0.3; 0.7 and 0.2; 0.6 and 0.1; 0.5 and 0. The maximum change is calculated by subtracting the minimum power measured from the smaller value of  $\alpha$  from the maximum power measured for the larger value of  $\alpha$ . The minimum step change is calculated by subtracting the maximum power measured from the smaller value of  $\alpha$  from the minimum power measured for the larger value of  $\alpha$ .

### 22.3.5 Test requirements

1. The power of all four bursts within the radio block measured in step a) and c) shall be within the accuracies specified for the power class of the mobile under test, as indicated in the following table.

| Power class | GSM 400, GSM 700, GSM 850 & GSM 900<br>Nominal Maximum output power | DCS 1 800<br>Nominal Maximum output power | PCS 1900<br>Nominal Maximum output power | Tolerance (dB)<br>for normal conditions |
|-------------|---------------------------------------------------------------------|-------------------------------------------|------------------------------------------|-----------------------------------------|
| 1           | -----                                                               | 1 W (30 dBm)                              | 1 W (30dBm)                              | $\pm 2$                                 |
| 2           | 8 W (39 dBm)                                                        | 0,25 W (24 dBm)                           | 0,25 W (24 dBm)                          | $\pm 2$                                 |
| 3           | 5 W (37 dBm)                                                        | 4 W (36 dBm)                              | 2 W (33 dBm)                             | $\pm 2$                                 |
| 4           | 2 W (33 dBm)                                                        |                                           |                                          | $\pm 2$                                 |
| 5           | 0,8 W (29 dBm)                                                      |                                           |                                          | $\pm 2$                                 |

2. The power of all four bursts within the radio block measured in step b) shall be 5dBm for a GSM 400, GSM 700, GSM 850 or GSM 900 MS and 0dBm for a DCS 1 800 and PCS 1900 MS with an accuracy of  $\pm 5$  dB in both cases.
3. In steps f), i) and l), the maximum change in transmitted power between each identified pair of  $\alpha$  values shall be 3,5 dB within a range of  $\pm 1$  dB with respect to tolerances of the SS and the ME.
4. In steps f), i) and l), the minimum change in transmitted power between each identified pair of  $\alpha$  values shall be 0,5 dB within a range of (-0.5 to +1dB) with respect to tolerances of the SS and the ME.

## 22.4 GPRS Uplink Power Control - Independence of TS Power Control

### 22.4.1 Definition and applicability

This test applies to all GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1900 MS which support multislots GPRS on the uplink.

## 22.4.2 Conformance requirement

For a GPRS multislot MS supporting 2 or more uplink PDCHs, power control shall be employed by the MS on each individual uplink PDCH. 3GPP TS 05.08, subclause 10.2.1.

## 22.4.3 Test purpose

To verify that for a GPRS multislot MS supporting 2 or more uplink PDCHs, power control shall be employed by the MS on each individual uplink PDCH.

## 22.4.4 Method of test

### 22.4.4.1 Initial conditions

The MS shall transmit on the uplink with the maximum number of TS for the multislot class of the MS.. This is achieved using the GPRS test mode by first establishing a downlink TBF and transmitting a GPRS\_TEST\_MODE\_CMD (see 3GPP TS 04.14, subclause 5.4). Each TS is transmitting on its maximum power. The  $\alpha$ -value is set to 0.

### 22.4.4.2. Procedure

- The SS shall modify the  $\Gamma_{CH}$  value of one TS such that  $(\Gamma_0 - \Gamma_{CH})$  equals the minimum power control level supported by the MS under test (5 dBm for GSM 400, GSM 700, GSM 850 and GSM 900 and 0dBm for DCS 1 800 and PCS 1900).
- The SS shall trigger a transmitter output power measurement on each of the four bursts of any radio block of the TS under test.
- The SS shall trigger a transmitter output power measurement on each of the four bursts of any radio block of the other active TS.
- The SS shall modify the  $\Gamma_{CH}$  value for the TS under test such that  $(\Gamma_0 - \Gamma_{CH})$  equals the maximum power control level supported by the MS under test.
- Steps a) to d) shall be repeated for each TS of the multislot configuration.

### 22.4.5. Test requirements

- The power of all four bursts within the radio block measured in step b) shall be 5dBm for a GSM 400, GSM 700, GSM 850 or GSM 900 MS and 0dBm for a DCS 1 800 and PCS 1900 MS with an accuracy of  $\pm 5$  dB in both cases.
- For all TS, the power of all four bursts within the radio block measured in step c) shall be within the accuracies specified for the power class of the mobile under test, as indicated in the following table.

| Power class | GSM 400, GSM 700, GSM 850 & GSM 900<br>Nominal Maximum output power | DCS 1 800<br>Nominal Maximum output power | PCS 1900<br>Nominal Maximum output power | Tolerance (dB)<br>for normal conditions |
|-------------|---------------------------------------------------------------------|-------------------------------------------|------------------------------------------|-----------------------------------------|
| 1           | -----                                                               | 1 W (30 dBm)                              | 1 W (30dBm)                              | $\pm 2$                                 |
| 2           | 8 W (39 dBm)                                                        | 0,25 W (24 dBm)                           | 0,25 W (24 dBm)                          | $\pm 2$                                 |
| 3           | 5 W (37 dBm)                                                        | 4 W (36 dBm)                              | 2 W (33 dBm)                             | $\pm 2$                                 |
| 4           | 2 W (33 dBm)                                                        |                                           |                                          | $\pm 2$                                 |
| 5           | 0,8 W (29 dBm)                                                      |                                           |                                          | $\pm 2$                                 |

## 22.5 [Reserved for future GPRS test]

Void.

## 22.6 Normal transmit power control timing and confirmation in ECSD

### 22.6.1 Definition and applicability

The RF power level to be employed by the MS is indicated by means of the 5 bit TXPWR field sent in the layer 1 header of each downlink SACCH message block and may be sent in a dedicated signalling block.

When a power change is signalled the MS must change its power control level to the new level at a certain rate of change.

The MS shall confirm the power level that it is currently employing by setting the MS\_TXPWR\_CONF field in the uplink SACCH L1 header.

The requirements and this test apply to all types of MSs which are capable of ECSD operation.

### 22.6.2 Test conformance

1. The RF power control level to be employed by the MS is indicated by means of the power control information sent in the layer 1 header of each downlink SACCH message block and may be sent in a dedicated signalling block; 3GPP TS 05.08, subclause 4.2.
2. The MS shall confirm the power level that it is currently employing in the uplink SACCH L1 header. The indicated value shall be the power control level actually used by the MS for the last burst of the previous SACCH period; 3GPP TS 05.08, subclause 4.2.
3. Upon receipt of a command on the SACCH to change its RF power level, the MS shall change to the new level at a rate of one nominal 2 dB power control step every 60 ms; 3GPP TS 05.08, subclause 4.7.
4. The change (in conformance requirement 3) shall commence at the first TDMA frame belonging to the next reporting period; 3GPP TS 05.08, subclause 4.7.
5. In case of channel change the commanded power level shall be applied on the new channel immediately; 3GPP TS 05.08, subclause 4.7.

### 22.6.3 Test purpose

1. To verify that the MS will set its transmitter output power in accordance with conformance requirement 1.
2. To verify that the MS will confirm the power level it is currently employing according to conformance requirement 2.
3. To verify that the MS, upon receipt of a command from the SACCH to change its RF power level, will change according to conformance requirement 3.
4. To verify that the MS will commence the change of power level at least by the sixth TDMA frame belonging to the next reporting period.
5. To verify that in case of new channel assignment the commanded power level is applied on the new channel according to conformance requirement 5.

### 22.6.4 Test method

NOTE: The method of measuring the MS transmitter output power is given in subclause 13.3. For 8PSK modulation, a measurement method for estimating the long term average power from a single burst shall be employed. See subclause 13.17.3.

#### 22.6.4.1 Initial conditions

A call is set up by the SS according to the generic call set up procedure for multislot configuration on a channel with ARFCN in the Mid ARFCN range (see table 3.3), power control level set to maximum power.

The SS commands the MS to operate in multislot configuration where it has highest possible number of Tx slots.

#### 22.6.4.2 Procedure

If the MS supports both GMSK and 8PSK modulation on the uplink, the test is repeated with each modulation format.

- a) The SS signals minimum power control level to the MS in the SACCH for one of the subchannels.
- b) The SS measures the MS transmitter output power on TDMA frames 6, 19, 32 and every subsequent 13th TDMA frame to TDMA frame 214. The SS also monitors the MS\_TXPWR\_CONF field in the uplink SACCH L1 header for the four SACCH multiframes after the SS signals the power change.
- c) The SS now sets TXPWR in the SACCH to the maximum peak power appropriate to the class of the MS.
- d) The SS measures the MS transmitter output power on TDMA frames 6, 19, 32 and every subsequent 13th TDMA frame to TDMA frame 214. The SS also monitors the MS\_TXPWR\_CONF field in the uplink SACCH L1 header for the four SACCH multiframes after the SS signals the power change.
- e) The SS now sets the SACCH TXPWR to 8.
- f) After 3 s the SS sets the SACCH TXPWR to 9.
- g) The SS measures the MS transmitter output power on TDMA frame 6.
- h) The SS sets the SACCH TXPWR to 8.
- i) The SS measures the MS transmitter output power on TDMA frame 6.
- j) The channel assignment is changed and the demanded power within the channel assignment is set to the minimum power control level of the MS.
- k) When the MS has changed channel its output power is measured on the first burst on the new channel.
- l) Steps a) to k) are repeated on the next subchannel until each is tested.

#### 22.6.5 Test requirement

NOTE: Refer to tables 13.17.3-1, 13.17.3-2, 13.17.3-3 and 13.17.3-4 for relationship between the power class, power control level, transmitter output power and the relevant tolerances.

- a) In steps b) and d), the transmitter output power shall change by one power step towards the new level signalled for each measured burst until the MS is operating at the closest supported power control level and from then on, all transmissions shall be at that level.
- b) In steps b) and d), the value of the MS\_TXPWR\_CONF field in the uplink SACCH L1 header shall correspond to the actual power control level used for the last transmitted burst of the previous SACCH multiframe. The first one shall indicate the initial transmitted power control level, the subsequent ones shall change by 8 each time until the final power control level has been reached in which case that value shall be indicated.
- c) In steps g) and i) the transmitter output power of TDMA frame 6 shall correspond to the new commanded power control level.
- d) In step k) the MS output power, measured on the new channel shall correspond to the power control level in the channel assignment.

## 22.7 ECSD Fast Power Control (FPC) timing and interworking with normal power control

### 22.7.1 Definition and applicability

Using the SACCH L1 header, normal uplink power control modifies the MS transmit power at a maximum rate of one power control level change per SACCH period (480ms). Under Fast Power Control the output power of an MS, in E-TCH mode, is updated each fast power reporting period. There are 24 fast power reporting periods in a 104 frame SACCH period.

The requirements and this test apply to all types of MSs which are capable of class B ECSD operation.

## 22.7.2 Test conformance

1. In the E-TCH mode, the MS shall, if so indicated by the BSS in the SACCH L1 header or Assignment command, use FPC (fast power control); 3GPP TS 05.08, subclause 4.2
2. Switching between the normal power control mechanism and FPC shall be done if FPC is enabled or disabled via signalling in the SACCH L1 header. The respective power control mechanism to be used shall then be active as from the first TDMA frame belonging to the next reporting period; 3GPP TS 05.08, subclause 4.7
3. The initial power control level to be used by the MS immediately after switching between normal and fast power control mechanisms shall, in both cases, be the level last commanded by the normal power control mechanism; 3GPP TS 05.08, subclause 4.7
4. The fast power control mechanism shall use the differential power control mechanism defined in the table of 3GPP TS 05.08, subclause 4.3
5. The MS shall employ the most recently commanded fast power control level on each uplink E-TCH channel; 3GPP TS 05.08, subclause 4.2
6. If a power control command is received but the requested output power is not supported by the MS, the MS shall use the supported output power which is closest to the requested output power; 3GPP TS 05.08, subclause 4.3
7. If FPC is in use, the MS shall report, in the SACCH L1 header, the power control level used at the end of the normal power control reporting period; 3GPP TS 05.08, subclause 4.2
8. In case of a multislot configuration, each bi-directional channel shall be power controlled individually by the corresponding SACCH or fast inband signalling link, whichever is applicable; 3GPP TS 05.08, subclause 4.2

## 22.7.3 Test purpose

1. To verify that the MS switches between normal power control and fast power control mechanisms in accordance with conformance requirements 1 and 2.
2. To verify that the initial power control level used by the MS after switching between normal and fast power control mechanisms is in accordance with conformance requirement 3.
3. To verify that power level changes using the fast power control are implemented by the MS in accordance with conformance requirements 4 and 5.
4. To verify that power control commands requesting levels not supported by the MS are treated in accordance with conformance requirement 6.
5. To verify that the power reported by the MS at the end of the normal power control reporting period is in accordance with conformance requirement 7.
6. To verify that in a multislot configuration the MS implements fast power control independently on each bi-directional E-TCH in accordance with conformance requirement 8.

## 22.7.4 Test method

### 22.7.4.1 Initial conditions

A call is set up by the SS according to the generic call set up procedure for multislot configuration on a channel with ARFCN in the Mid ARFCN range (see table 3.3).

The SS commands the MS to operate in multislot configuration where it has the highest possible number of bi-directional E-TCHs. Using normal power control, the level of each TX slot is set to maximum power.

### 22.7.4.2 Procedure

For the purpose of this test the SS shall randomly select one bi-directional E-TCH to exercise. All other E-TCHs shall maintain the state defined under the initial conditions. In this procedure these other E-TCHs are referred to as the active but unselected channels.

- a) Using the normal power control mechanism, the SS shall command the MS to transmit at power level 15 in the case of GSM400, GSM 700, GSM 850 and GSM 900 or power level 8 in the case of DCS 1 800 and PCS 1 900 on the selected E-TCH. After 1s, a power measurement shall be made on each TX slot of the multislot configuration.

NOTE: The method of measuring the MS transmitter output power is given in subclause 13.3. For 8PSK modulation, a measurement method for estimating the long term average power from a single burst shall be employed. See subclause 13.17.3.

- b) The SS shall command the MS to switch between the normal power control and the fast power control mechanism by means of the SACCH L1 header (see 3GPP TS 04.04). Each power control mechanism shall be maintained for a single SACCH period. This cycle shall be repeated until all power measurements specified in steps c) to h) have been completed.

During the SACCH periods when normal power control is active, the SS shall command the MS to maintain the power levels set in step a). During the SACCH period when Fast Power Control is active, the SS shall command the MS to follow the schedule of fast power control detailed in the table below.

| FPC Reporting Period Number | Fast Power Control Command | Nominal Output Power during FPC Reporting period<br>GSM400, GSM 700,<br>GSM 850 & GSM 900 | Nominal Output Power during FPC Reporting Period<br>DCS 1 800 & PCS 1 900 | P <sub>n</sub>  |
|-----------------------------|----------------------------|-------------------------------------------------------------------------------------------|---------------------------------------------------------------------------|-----------------|
| 0                           | 2 Step Decrease            | 13 dBm                                                                                    | 14 dBm                                                                    | P <sub>0</sub>  |
| 1                           | 2 Step Decrease            | 11 dBm                                                                                    | 12 dBm                                                                    |                 |
| 2                           | 2 Step Decrease            | 9 dBm                                                                                     | 10 dBm                                                                    |                 |
| 3                           | 2 Step Decrease            | 7 dBm                                                                                     | 8 dBm                                                                     |                 |
| 4                           | 2 Step Decrease            | 5 dBm                                                                                     | 6 dBm                                                                     |                 |
| 5                           | 2 Step Decrease            | 5 dBm                                                                                     | 4 dBm                                                                     |                 |
| 6                           | 2 Step Decrease            | 5 dBm                                                                                     | 2 dBm                                                                     |                 |
| 7                           | 2 Step Decrease            | 5 dBm                                                                                     | 0 dBm                                                                     |                 |
| 8                           | 4 Step Increase            | 5 dBm                                                                                     | 0 dBm                                                                     | P <sub>34</sub> |
| 9                           | 4 Step Increase            | 9 dBm                                                                                     | 4 dBm                                                                     |                 |
| 10                          | 4 Step Increase            | 13 dBm                                                                                    | 8 dBm                                                                     |                 |
| 11                          | 4 Step Increase            | 17 dBm                                                                                    | 12 dBm                                                                    |                 |
| 12                          | 4 Step Increase            | 21 dBm                                                                                    | 16 dBm                                                                    |                 |
| 13                          | 4 Step Increase            | Max (25 dBm, P <sub>max</sub> )                                                           | 20 dBm                                                                    |                 |
| 14                          | 4 Step Increase            | Max (29 dBm, P <sub>max</sub> )                                                           | Max (24 dBm, P <sub>max</sub> )                                           |                 |
| 15                          | 4 Step Increase            | Max (33 dBm, P <sub>max</sub> )                                                           | Max (28 dBm, P <sub>max</sub> )                                           |                 |
| 16                          | 2 Step Decrease            | P <sub>max</sub>                                                                          | P <sub>max</sub>                                                          | P <sub>69</sub> |
| 17                          | 1 Step Increase            | P <sub>max</sub> – 4 dB                                                                   | P <sub>max</sub> – 4 dB                                                   | P <sub>73</sub> |
| 18                          | 2 Step Decrease            | P <sub>max</sub> – 2 dB                                                                   | P <sub>max</sub> – 2 dB                                                   | P <sub>78</sub> |
| 19                          | 3 Step Increase            | P <sub>max</sub> – 6 dB                                                                   | P <sub>max</sub> – 6 dB                                                   | P <sub>82</sub> |
| 20                          | 2 Step Decrease            | P <sub>max</sub>                                                                          | P <sub>max</sub>                                                          | P <sub>86</sub> |
| 21                          | 2 Step Decrease            | P <sub>max</sub> – 4 dB                                                                   | P <sub>max</sub> – 4 dB                                                   | P <sub>91</sub> |
| 22                          | 4 Step Increase            | P <sub>max</sub> – 8 dB                                                                   | P <sub>max</sub> – 8 dB                                                   | P <sub>95</sub> |
| 23                          | No Change                  | P <sub>max</sub>                                                                          | P <sub>max</sub>                                                          | P <sub>99</sub> |

P<sub>max</sub> is the maximum power for the mobile class.

P<sub>n</sub> values refer to the power measured in the nth frame of the SACCH period.

- a) The SS shall make power measurements on each active, but unselected timeslot of the multislot configuration during frames 0 and 103 of the SACCH period when normal power control is active.
- b) The SS shall make power measurements on each active, but unselected timeslot of the multislot configuration during frames 0, 34, 69, 73, 78, 82, 86, 91, 95 and 99 of the SACCH period when fast power control is active.
- c) The SS shall make power measurements of the selected timeslots during frames 0 and 103 of the SACCH period when normal power control is active.
- d) The SS shall make power measurements on the selected timeslot during frames 0, 34, 69, 73, 78, 82, 86, 91, 95 and 99 of the SACCH period when fast power control is active. These power measurements shall be referred to as P<sub>0</sub>, P<sub>34</sub>, P<sub>69</sub>, P<sub>73</sub>, P<sub>78</sub>, P<sub>82</sub>, P<sub>86</sub>, P<sub>91</sub>, P<sub>95</sub> and P<sub>99</sub> respectively.

- e) The SS shall note the MS TX power reported by the MS for the selected timeslot in the SACCH reporting period following the change from fast power control to normal power control.
- f) The SS shall note the MS TX power reported by the MS for the selected timeslot in the SACCH reporting period following the change from normal power control to fast power control.

### 22.7.5 Test requirement

- a) The powers measured for the unselected timeslots in steps a), c) and d) shall conform with the Pmax specification for the MS power class given in the following table.

| Power class | GSM400, GSM 700, GSM 850 & GSM 900<br>Nominal Maximum output power (MS TX Level) | GSM400, GSM 700, GSM 850 & GSM 900<br>Tolerance (dB) for normal conditions | DCS 1 800<br>Nominal Maximum output power | PCS 1900<br>Nominal Maximum Output Power (MS TX Level) | DCS 1 800 & PCS 1 900<br>Tolerance (dB) for normal conditions |
|-------------|----------------------------------------------------------------------------------|----------------------------------------------------------------------------|-------------------------------------------|--------------------------------------------------------|---------------------------------------------------------------|
| E1          | 33 dBm (5)                                                                       | ±2                                                                         | 30 dBm                                    | 30 dBm (0)                                             | ±2                                                            |
| E2          | 27 dBm (8)                                                                       | ±3                                                                         | 26 dBm                                    | 26 dBm (2)                                             | -4/+3                                                         |
| E3          | 23 dBm (10)                                                                      | ±3                                                                         | 22 dBm                                    | 22 dBm (4)                                             | ±3                                                            |

- b) The power measured for the selected timeslot in steps a) and e) shall be 13dBm in the case of GSM 400, GSM 700, GSM 850 and GSM 900, and 14dBm in the case of DCS 1 800 and PCS 1 900. In all cases the tolerance shall be ±3 dB.
- c) The powers measured in step f) shall conform with the power specifications in the following table.

| Pn  | GSM400/GSM700/<br>GSM 850/GSM 900 | DCS 1 800/PCS 1 900 | Tolerance |
|-----|-----------------------------------|---------------------|-----------|
| P0  | 13 dBm                            | 14 dBm              | ±3 dB     |
| P34 | 5 dBm                             | 0 dBm               | ±5 dB     |
| P69 | Pmax                              | Pmax                | ±2 dB     |
| P73 | Pmax – 4 dB                       | Pmax – 4 dB         | ±3 dB     |
| P78 | Pmax – 2 dB                       | Pmax – 2 dB         | ±3 dB     |
| P82 | Pmax – 6 dB                       | Pmax – 6 dB         | ±3 dB     |
| P86 | Pmax                              | Pmax                | ±2 dB     |
| P91 | Pmax – 4 dB                       | Pmax – 4 dB         | ±3 dB     |
| P95 | Pmax – 8 dB                       | Pmax – 8 dB         | ±3 dB     |
| P99 | Pmax                              | Pmax                | ±2 dB     |

See table in test requirement a) for Pmax value for MS power class.

- a) The power level reported by the MS in step g) shall be MS TX level corresponding to Pmax for the MS power class. See the table in test requirement a).
- b) The power level reported by the MS in step h) shall be MS TX Level 15 in the case of GSM400, GSM 700, GSM 850 and GSM 900 and MS TX Level 8 in the case of DSC1800 and PCS 1 900.

## 22.8 EGPRS Uplink Power Control - Use of $\alpha$ and $\Gamma_{CH}$ parameters

### 22.8.1 Definition and applicability

Power control is important for spectrum efficiency as well as for power consumption in a cellular system. Power control for a packet oriented connection is more complicated than for a circuit switched connection, since there is no continuous two-way connection.

The RF output power,  $P_{CH}$ , to be employed by the MS on each individual uplink PDCH shall be:

$$P_{CH} = \min(\Gamma_0 - \Gamma_{CH} - \alpha \times (C + 48), P_{MAX}),$$

Where:

|                  |                                                                                                                                                      |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| $\Gamma_{CH}$    | is an MS and channel specific power control parameter, sent to the MS in an RLC control message (see 3GPP TS 04.60).                                 |
| $\Gamma_0$       | = 39 dBm for GSM400, GSM 700, GSM 850 and GSM 900<br>= 36 dBm for DCS 1 800 and PCS 1 900.                                                           |
| $\alpha$         | is a system parameter, broadcast on PBCCH or optionally sent to MS in an RLC control message (see 3GPP TS 04.08 / 3GPP TS 24.008 and 3GPP TS 04.60). |
| C                | is the normalised received signal level at the MS as defined in 3GPP TS 05.08, subclause 10.2.3.1.                                                   |
| P <sub>MAX</sub> | is the maximum allowed output power in the cell =<br>GPRS_MS_TXPWR_MAX_CCH if PBCCH exists<br>MS_TXPWR_MAX_CCH otherwise.                            |

All power values are expressed in dBm. (Note that the constants  $\Gamma_0$  and 48 are included only for optimising the coding of  $\Gamma_{CH}$  and C-value).

This is a flexible tool that can be used for different power control algorithms.

A pure open loop is achieved by setting  $\alpha = 1$  and keeping  $\Gamma_{CH}$  constant. With this method the output power is based on the received signal level assuming the same path loss in uplink and downlink. This is useful in the beginning of a packet transmission.

A pure closed loop is achieved by setting  $\alpha = 0$ . With this method the output power is commanded by the network based on received signal level measurements made in the BTS in a similar way as for a circuit switched connection.

This test applies to all types of MSs which support EGPRS.

### 22.8.2 Conformance requirement

1. The MS shall use the same output power on all four bursts within one radio block. 3GPP TS 3GPP TS 05.08, subclause 10.2.1.
2. If a calculated output power is not supported by the MS, the MS shall use the supported output power which is closest to the calculated output power. 3GPP TS 05.08, subclause 10.2.1.
3. When the MS receives new  $\Gamma_{CH}$  or  $\alpha$  values, the MS shall use the new value to update  $P_{CH}$  2 radio blocks after the end of the frame containing the last timeslot of the message block containing the new value. 3GPP TS 05.08, subclause 10.2.1.
4. The transmitted power shall be a monotonic function of the calculated output power and any change of 2 dB in the calculated value shall correspond to a change of  $2 \pm 1,5$  dB in the transmitted value. The MS may round the calculated output power to the nearest nominal output power value. 3GPP TS 05.08, subclause 10.2.1.

### 22.8.3 Test purpose

1. To verify the MS uses that the same output power on all four bursts of a radio block under normal conditions.
2. To verify that the highest power supported by the MS is used if the calculated power is greater.
3. To verify that the MS applies new  $\Gamma_{CH}$  or  $\alpha$  values 2 radio blocks after the end of the frame containing the last timeslot of the message block containing the new value.
4. To verify that any change of 2 dB in the calculated power corresponds to a change of  $2 \pm 1,5$  dB in the transmitted value under normal conditions.

NOTE: For changes in calculated power which are less than the tolerances specified for absolute power accuracy in a MS, the transmitted power as a function of calculated power cannot be tested for monotonicity. Monotonicity between power control steps is implicitly tested in subclause 13.16.

## 22.8.4 Test method

### 22.8.4.1 Initial conditions

The SS establishes a BCCH and a PBCCH on the same carrier in the mid ARFCN range. GPRS\_MS\_TXPWR\_MAX\_CCH is set to the maximum level (39dBm for GSM400, GSM 700, GSM 850 and GSM 900 and 36dBm for DCS 1 800 and PCS 1 900). The  $\Gamma_{CH}$  value is set such that  $(\Gamma_0 - \Gamma_{CH})$  equals the maximum power control level supported by the Power Class of the MS under test. The  $\alpha$  value is set to 0.

The SS establishes a downlink TBF on the same ARFCN as the BCCH and PBCCH. The SS orders the MS to transmit on the uplink. This is achieved using the EGPRS test mode by transmitting a EGPRS\_TEST\_MODE\_CMD (see 3GPP TS 04.14, clause TBD).

The downlink power level is adjusted until a stable C-value of  $-52$ dBm is reported by the MS in the channel quality report (see 3GPP TS 05.08, subclause 10.2.3).

### 22.8.4.2 Procedure

If the MS supports both GMSK and 8PSK modulation on the uplink, the test is repeated with each modulation format.

- a) The SS shall trigger a transmitter output power measurement on each of the four bursts of any radio block.
- b) The method of power measurement is described in subclause 13.17.3.

NOTE 1: For 8PSK modulation, a measurement method for estimating the long term average power from a single burst shall be employed. See subclause 13.17.3.

- c) Void.
- d) The SS shall modify the  $\Gamma_{CH}$  value such that  $(\Gamma_0 - \Gamma_{CH})$  equals the minimum power control level supported by the MS under test (5dBm for GSM400, GSM 700, GSM 850 and GSM 900 and 0dBm for DCS 1 800 and PCS 1 900). If the transmission of the RLC control message containing the new  $\Gamma_{CH}$  value is completed in radio block N, the SS shall trigger a transmitter output power measurement on each of the four bursts of radio block N+3.
- e) The SS shall modify the  $\Gamma_{CH}$  value such that  $(\Gamma_0 - \Gamma_{CH})$  equals the maximum power control level supported by the power class of the MS under test. If the transmission of the RLC control message containing the new  $\Gamma_{CH}$  value is completed in radio block N, the SS shall trigger a transmitter output power measurement on each of the four bursts of radio block N+3.
- f) The SS shall modify the  $\Gamma_{CH}$  value such that  $(\Gamma_0 - \Gamma_{CH})$  equals the value 4dB below the maximum power control level supported by the power class of the MS under test. The  $\alpha$  value is set to 1.
- g) The SS shall decrement the  $\alpha$  value with a step size of 0.1 until  $\alpha$  equals 0. For each step change in  $\alpha$  value, if the transmission of the RLC control message containing the new  $\alpha$  value is completed in radio block N, the SS shall trigger a transmitter output power measurement on each of the four bursts of radio block N+3.
- h) For each value of  $\alpha$ , the SS shall note the maximum and minimum power values measured from the four bursts of the radio block in step e). The SS shall then calculate the maximum and minimum changes in output power measured for the following pairs of  $\alpha$  values: 1.0 and 0.5; 0.9 and 0.4; 0.8 and 0.3; 0.7 and 0.2; 0.6 and 0.1; 0.5 and 0. The maximum change is calculated by subtracting the minimum power measured from the smaller value of  $\alpha$  from the maximum power measured for the larger value of  $\alpha$ . The minimum step change is calculated by subtracting the maximum power measured from the smaller value of  $\alpha$  from the minimum power measured for the larger value of  $\alpha$ .

NOTE 2: If the power values measured for the four bursts of the radio block with  $\alpha$  equal to 1.0 are:

$$- P_{m0}, P_{m1}, P_{m2}, P_{m3}.$$

And, the power values measured for the four bursts of the radio block with  $\alpha$  equal to 0.5 are:

$$- P_{n0}, P_{n1}, P_{n2}, P_{n3}.$$

Then:

- $P_{m(max)} = \text{MAX}(P_{m0}, P_{m1}, P_{m2}, P_{m3});$
- $P_{m(min)} = \text{MIN}(P_{m0}, P_{m1}, P_{m2}, P_{m3});$
- $P_{n(max)} = \text{MAX}(P_{n0}, P_{n1}, P_{n2}, P_{n3});$
- $P_{n(min)} = \text{MIN}(P_{n0}, P_{n1}, P_{n2}, P_{n3}).$

The maximum and minimum step sizes are:

- $\text{STEP}(\text{MAX}) = P_{m(max)} - P_{n(min)};$
- $\text{STEP}(\text{MIN}) = P_{m(min)} - P_{n(max)}.$

- g) The SS shall modify the  $\Gamma_{CH}$  value such that  $(\Gamma_0 - \Gamma_{CH})$  equals the midrange power control level supported by the MS under test. The  $\alpha$  value is set to 0.
- h) The SS shall increment the  $\alpha$  value with a step size of 0.1 until  $\alpha$  equals 1. For each step change in  $\alpha$  value, if the transmission of the RLC control message containing the new  $\alpha$  value is completed in radio block N, the SS shall trigger a transmitter output power measurement on each of the four bursts of radio block N+3.
- i) For each value of  $\alpha$ , the SS shall note the maximum and minimum power values measured from the four bursts of the radio block in step h). The SS shall then calculate the maximum and minimum changes in output power measured for the following pairs of  $\alpha$  values: 1.0 and 0.5; 0.9 and 0.4; 0.8 and 0.3; 0.7 and 0.2; 0.6 and 0.1; 0.5 and 0. The maximum change is calculated by subtracting the minimum power measured from the smaller value of  $\alpha$  from the maximum power measured for the larger value of  $\alpha$ . The minimum step change is calculated by subtracting the maximum power measured from the smaller value of  $\alpha$  from the minimum power measured for the larger value of  $\alpha$ .
- j) The SS shall modify the  $\Gamma_{CH}$  value such that  $(\Gamma_0 - \Gamma_{CH})$  equals the minimum power control level supported by the MS under test (5dBm for GSM400, GSM 700, GSM 850 and GSM 900 and 0dBm for DCS 1 800 and PCS 1 900). The  $\alpha$  value is set to 0.
- k) The SS shall increment the  $\alpha$  value with a step size of 0.1 until  $\alpha$  equals 1. For each step change in  $\alpha$  value, if the transmission of the RLC control message containing the new  $\alpha$  value is completed in radio block N, the SS shall trigger a transmitter output power measurement on each of the four bursts of radio block N+3.
- l) For each value of  $\alpha$ , the SS shall note the maximum and minimum power values measured from the four bursts of the radio block in step k). The SS shall then calculate the maximum and minimum changes in output power measured for the following pairs of  $\alpha$  values: 1.0 and 0.5; 0.9 and 0.4; 0.8 and 0.3; 0.7 and 0.2; 0.6 and 0.1; 0.5 and 0. The maximum change is calculated by subtracting the minimum power measured from the smaller value of  $\alpha$  from the maximum power measured for the larger value of  $\alpha$ . The minimum step change is calculated by subtracting the maximum power measured from the smaller value of  $\alpha$  from the minimum power measured for the larger value of  $\alpha$ .

### 22.8.5 Test requirement

1. The power of all four bursts within the radio block measured in step a) and c) shall be within the accuracies specified for the power class of the mobile under test, as indicated in the following table.

| Power class | GSM400, GSM 700, GSM 850 & GSM 900 Nominal Maximum output power | GSM400, GSM 700, GSM 850 & GSM 900 Tolerance (dB) for normal conditions | DCS 1 800 Nominal Maximum output power | PCS 1900 Nominal Maximum Output power | DCS 1 800 & PCS 1 900 Tolerance (dB) for normal conditions |
|-------------|-----------------------------------------------------------------|-------------------------------------------------------------------------|----------------------------------------|---------------------------------------|------------------------------------------------------------|
| 1           | -----                                                           |                                                                         | 30 dBm                                 | 30 dBm                                | ±2                                                         |

| E3          | 23 dBm                                                          | ±3                                                                      | 22 dBm                                 | 22 dBm                                | ±3                                                         |

2. The power of all four bursts within the radio block measured in step b) shall be 5dBm for a GSM400, GSM 700, GSM 850 and GSM 900 MS and 0dBm for a DCS 1 800 or PCS 1 900 MS with an accuracy of ±5 dB in all cases.
3. In steps f), i) and l), the maximum change in transmitted power between each identified pair of  $\alpha$  values shall be 3,5 dB.
4. In steps f), i) and l), the minimum change in transmitted power between each identified pair of  $\alpha$  values shall be 0,5 dB.

## 22.9 EGPRS Uplink Power Control - Independence of TS Power Control

### 22.9.1 Definition and applicability

This test applies to all types of MS and all multiband MSs which support multislot EGPRS.

### 22.9.2 Test conformance

For an EGPRS multislot MS supporting 2 or more uplink PDCHs, power control shall be employed by the MS on each individual uplink PDCH. 3GPP TS 05.08, subclause 10.2.1.

### 22.9.3 Test purpose

To verify that EGPRS power control is applied to each PDCH in a multislot configuration independently.

### 22.9.4 Test method

#### 22.9.4.1 Initial conditions

The SS establishes a downlink TBF. The SS orders the MS to transmit on the maximum number of timeslots for the multislot class of the MS on the uplink. This is achieved using the EGPRS test mode by transmitting a EGPRS\_TEST\_MODE\_CMD (see 3GPP TS 04.14, clause TBD).

Each timeslot is transmitting on its maximum power. The  $\alpha$ -value is set to 0.

#### 22.9.4.2 Procedure

If the MS supports both GMSK and 8PSK modulation on the uplink, the test is repeated with each modulation format.

- a) The SS shall modify the  $\Gamma_{CH}$  value of one timeslot such that  $(\Gamma_0 - \Gamma_{CH})$  equals the minimum power control level supported by the MS under test (5dBm for GSM400, GSM 700, GSM 850 and GSM 900 and 0dBm for DCS 1 800 and PCS 1 900).

- b) The SS shall make a transmitter output power measurement on each of the four bursts of any radio block of the timeslot under test.

NOTE: For 8PSK modulation, a measurement method for estimating the long term average power from a single burst shall be employed. See subclause 13.17.3.

- c) The SS shall make a transmitter output power measurement on each of the four bursts of any radio block of the other active timeslots.
- d) The SS shall modify the  $\Gamma_{CH}$  value for the timeslot under test such that  $(\Gamma_0 - \Gamma_{CH})$  equals the maximum power control level supported by the MS under test.
- e) Steps a) to d) shall be repeated for each timeslot of the multislot configuration.

### 22.9.5 Test requirement

- The power of all four bursts within the radio block measured in step b) shall be 5dBm for a GSM400, GSM 700, GSM 850 and GSM 900 MS and 0dBm for a DCS 1 800 or PCS 1 900 MS with an accuracy of  $\pm 5$  dB in all cases.
- For all TS, the power of all four bursts within the radio block measured in step c) shall be within the accuracies specified for the power class of the mobile under test, as indicated in the following table.

| Power class | GSM400, GSM 700, GSM 850 & GSM 900<br>Nominal Maximum output power | GSM400, GSM 700, GSM 850 & GSM 900<br>Tolerance (dB) for normal conditions | DCS 1 800<br>Nominal Maximum output power | PCS 1900<br>Nominal Maximum Output power | DCS 1 800 & PCS 1 900<br>Tolerance (dB) for normal conditions |
|-------------|--------------------------------------------------------------------|----------------------------------------------------------------------------|-------------------------------------------|------------------------------------------|---------------------------------------------------------------|
| 1           | -----                                                              |                                                                            | 30 dBm                                    | 30 dBm                                   | $\pm 2$                                                       |
| 2           | 39 dBm                                                             |                                                                            | 24 dBm                                    | 24 dBm                                   | $\pm 2$                                                       |
| 3           | 37 dBm                                                             |                                                                            | 36 dBm                                    | 33 dBm                                   | $\pm 2$                                                       |
| 4           | 33 dBm                                                             |                                                                            |                                           |                                          | $\pm 2$                                                       |
| 5           | 29 dBm                                                             |                                                                            |                                           |                                          | $\pm 2$                                                       |
| E1          | 33 dBm                                                             | $\pm 2$                                                                    | 30 dBm                                    | 30 dBm                                   | $\pm 2$                                                       |
| E2          | 27dBm                                                              | $\pm 3$                                                                    | 26 dBm                                    | 26 dBm                                   | -4/+3                                                         |
| E3          | 23dBm                                                              | $\pm 3$                                                                    | 22 dBm                                    | 22 dBm                                   | $\pm 3$                                                       |

## 22.10 [Reserved for future EGPRS test]

Void.

---

## 23 Single frequency reference

### 23.1 Definition and applicability

The MS is required to use one single frequency reference for both RF generation/reception and baseband signals. A test method to verify this is not available.

The requirement applies to all types of MSs.

### 23.2 Conformance requirement

The MS shall use the same frequency source for both RF frequency generation and clocking the timebase; 3GPP TS 05.10, subclause 6.1.

### 23.3 Test purpose

There is no test specified.

---

## 24 Tests of the layer 1 signalling functions

Testing of Layer 1 signalling functions is included in the tests in clauses 15, 16, 17, 18, 19, 20, 21, 22, 23. Other Layer 1 functions are tested in clauses 12, 13 and 14. Some testing of Layer 1 functions is integrated with Layer 3 signalling testing (26).

---

## 25 Tests of the layer 2 signalling functions

References:

- 1 3GPP TS 04.06 and 3GPP TS 04.08/ 3GPP TS 24.008 / 3GPP TS 44.018, 3GPP TS 04.05.
- 2 ITU-T Recommendation X.290: OSI Conformance Testing Methodology and Framework for CCITT applications, Part 2: Abstract Test Suite Specification.

### 25.1 Introduction, objective and scope

#### 25.1.1 General

The objective of clause 25 is to provide detail of how Layer 2 of the MS is tested to verify conformance to the testable parameters given in 3GPP TS 04.06. The tests cover SAPI = 0, and they will be carried out on SDCCCH and FACCH/F and on FACCH/H if the MS supports half-rate. Testing of unnumbered information transfer on SACCHs is covered implicitly by the test in subclause 26.6.3.

The testing is performed using the test configuration described in subclause 25.1.1.2. This configuration does not provide for testing of conformance of any maintenance functions.

The MS under test shall conform to the test configuration, and the Remote Single layer (RS) test method (ITU-T Recommendation X.290, subclause 8.1.4) will be used.

#### 25.1.2 Test configurations

The Layer 2 test configuration defines the Layer 2 functional blocks of a MS being tested and the access arrangement between MS and tester.

**NOTE:** These functional blocks provide the Layer 2 basic capabilities which have to be implemented in accordance with the specification given in 3GPP TS 04.06. However, the definition of Layer 2 in the form of a number of functional blocks places no requirements on the Layer 2 implementation in a MS.

An example of a functional composition of the MS Layer 2 is given in 3GPP TS 04.05. These function blocks provide basic capabilities which have to be implemented in accordance with 3GPP TS 04.05 and 3GPP TS 04.06.

Also there are alternatives or options included in 3GPP TS 04.05 and 3GPP TS 04.06, these are provided as complementary capabilities.

#### 25.1.3 Pre-conditions

Before carrying out any Layer 2 tests the tests specified in clauses 12, 13, 14 and 15 to 23 (Layer 1 tests) shall be performed.

Apart from powering up the MS to be tested and being able to establish a call the only access to the MS needed and used for Layer 2 testing is the radio interface. It therefore is necessary that the MS is able to synchronize to the System Simulator and to decode its BCCH and CCCH. Furthermore, the MS must be able to perform the following elementary Layer 3 procedures:

- Paging;
- Immediate Assignment;

- Dedicated Channel Assignment;
- Handover;
- Channel Release.

It is necessary that the tests are performed in the order specified, except where the starting point is set (subclause 25.1.5).

The data link is maintained by the MS and the SS sending fill frames (see 3GPP TS 04.06, subclause 5.4.2.3) on the SDCCH when no other frames are to be transmitted. Fill frames are also sent on the FACCH while the channel mode is set to signalling. The default mode is signalling. The tests will normally be performed with the MS sending fill frames on the main DCCH (i.e. FACCH or SDCCH). Consequently throughout the tests fill frames will be sent and received even while waiting for other Layer 2 frames. The scheduling of the fill frame sending cannot be specified as this sending is closely linked to the processing times in the MS. Therefore, the instants of transmission of fill frames cannot be tested nor the number of these transmissions however, in certain circumstances, the fact that a fill frame is sent can be used as proof that the MS requirement has been fulfilled.

## 25.1.4 Layer 2 test frames

The Layer 2 conformance test is accomplished by sequences of those frames which are contained in 3GPP TS 04.06 (Layer 2 frame repertoire etc.).

These frame sequences are under control of the System Simulator and are related to the state that the System Simulator perceives the MS to be in as a result of frames transferred across the MS-BS interface.

These frame sequences shall comply with the following rules:

- 1) The test sequences exchanged between the System Simulator and MS are assumed to be free from transmission errors.
- 2) The tester may introduce errors in the direction tester to MS by inserting wrong parameters in the address, control and length indication field.
- 3) The tester may simulate errors in the direction MS to tester by ignoring the receipt of frames from the MS.
- 4) The tester may violate the protocol rules related to the control of state variables to provoke sequence gaps.
- 5) There is no contention on the Dm channel at Layer 1 (Layer 1 point-to-point).
- 6) With respect to contention on the Dm channel at Layer 2, two distinct situations are defined:
  - i) Test of the protocol procedure supported by a single entity. In this case there is no contention on the Dm channel (one peer-to-peer information transfer invoked at a time). This test applies to all MSs and is performed for SAPI = 0.
  - ii) Test of Layer 2 multiplexing and MS processing capacity in terms of the number of SAPs and links which a MS is able to support simultaneously. In this case there is contention on the Dm channel at Layer 2 and this contention is resolved within Layer 2 based on the SAPI. This test applies to MSs which are designed for supporting SAPI in addition to SAPI = 0.

Examples of special GSM Layer 2 functions to be tested:

- Correct L2 functions on specific GSM control channels;
- Length indication;
- Fill bits;
- Segmentation, more data bit;
- SABM/UA containing information for contention resolution;
- Abnormal release.

### 25.1.5 Establishment of the dedicated physical resource

The System Simulator shall simulate a BS with BCCH/CCCH on one carrier. The MS shall be listening to this CCCH and able to respond to paging messages. The system simulator sends Paging Request to the MS on the paging channel. The MS shall respond with Channel Request on the random access channel. The system simulator sends Immediate Assign to the MS, thereby ordering the MS either to a SDCCH or to a TCH, that is FACCH. Each test is performed once on SDCCH, once on FACCH/F and once on FACCH/H if the MS supports half-rate. However tests that explicitly check SDCCH and FACCH are performed once if the MS does not support half-rate and twice (once with FACCH/F and once with FACCH/H) if the MS supports half-rate.

### 25.1.6 Release of the dedicated physical resource

After a test has been performed the System Simulator shall initiate the release of the SDCCH or FACCH, as laid out in 3GPP TS 04.08 / 3GPP TS 23.108, subclause 7.1.6. This shall return the MS to the idle mode, i.e. the MS shall again be listening to the CCCH of the System Simulator.

## 25.2 Test sequences

Timing requirement:

The MS shall respond to a command within T200 as defined in 3GPP TS 04.06.

The MS shall repeat a command after time-out of T200 if the command has not been acknowledged as defined in 3GPP TS 04.06.

Constant bit values:

In each frame from the MS:

- bits 6 through 8 of the address field shall be set to zero as defined in 3GPP TS 04.06.
- except for test 25.2.7, the address extension bit (EA bit) shall be set to 1 as defined in 3GPP TS 04.06.
- except for test 25.2.7, the length indicator field extension bit (EL bit) shall be set to 1 as defined in 3GPP TS 04.06.

This shall be checked each time a frame from the MS is received.

Fill bits:

The fill bits transmitted with each frame from the MS whose length indicator L is less than N201 as defined in 3GPP TS 04.06 shall be set as defined in 3GPP TS 04.06.

## Frame format description

The frames are described by the following parameter sets:

SABM (C, P, M = 0, L = 0) (\* SABM without an information field\*)

SABM (C, P, M = 0, L > 0) (\* SABM with an information field\*)

DISC (C, P, M = 0, L = 0)

UA, (F, M = 0, L = 0) (\* UA without an information field\*)

UA, (F, M = 0, L > 0) (\* UA with an information field\*)

DM (R, F, M = 0, L = 0)

RR (C, P, M = 0, L = 0, N(R))

RR (R, F, M = 0, L = 0, N(R))

REJ (C, P, M = 0, L = 0, N(R))

REJ (R, F, M = 0, L = 0, N(R))

I (C, P, M = 0, L < N201, N(S), N(R))

I (C, P, M = 1, L = N201, N(S), N(R))

UI (C, P = 0, M = 0, L = 0)

UI (C, P = 0, M = 0, L < N201)

where:

C = command

R = response

P = poll

F = final

M = M bit

L = length indicator

N(S) = send sequence number

N(R) = receive sequence number

## 25.2.1 Initialization

### 25.2.1.1 Initialization when contention resolution required

#### 25.2.1.1.1 Normal initialization

##### 25.2.1.1.1.1 Test purpose

To test the normal establishment of multiple frame operation between the SS and the MS when contention resolution is required.

##### 25.2.1.1.1.2 Method of test

The MS is paged as described in the Layer 2 tests general section at 25.1.5.

The MS shall then continue the setup by sending a SABM frame.

The SS responds with a UA frame.

The MS shall send a UI fill frame.

The SS waits for at least T200 after the UA to ensure the SABM frame is not repeated. This confirms that the UA has been received.

The MS is returned to the idle state as described in subclause 25.1.1.6.

Expected sequence

The frames from the SS will be:

2: One UA frame containing:

SAPI = 0, R = 0, F = 1, M = 0, L = L of SABM.

information field = information field of SABM.

#### 25.2.1.1.1.3 Test requirements

The frames from the MS shall be:

1: One SABM frame containing:

SAPI = 0, C = 0, P = 1, M = 0,  $0 \leq L \leq N201$ .

information field = Page Response.

3: One UI frame containing:

C = 0, P = 0, M = 0, L = 0.

#### 25.2.1.1.2 Initialization failure

##### 25.2.1.1.2.1 Loss of UA frame

###### 25.2.1.1.2.1.1 Test purpose

To test the MS response to the loss of a Layer 2 UA frame during initialization.

###### 25.2.1.1.2.1.2 Method of test

The MS is paged as described in the Layer 2 tests general section at 25.1.5.

The MS shall then continue the setup by sending an SABM frame.

The SS ignores the first SABM frame from the MS.

The MS shall wait for time-out of timer T200 and then send a second SABM frame.

The SS responds with a UA frame.

The MS shall send a UI fill frame.

The SS waits for at least T200 to ensure the SABM frame is not repeated

The MS is returned to the initial condition by clearing of the call (not part of this test).

Expected sequence

The frames from the SS will be:

2: One UA frame containing:

SAPI = 0, R = 0, F = 1, M = 0, L = L of SABM.

information field = information field of SABM.

#### 25.2.1.1.2.1.3 Test requirements

The frames from the MS shall be:

1: One SABM frame (occurs twice) containing:

SAPI = 0, C = 0, P = 1, M = 0,  $0 \leq L \leq N201$ .

information field = Page Response.

The second SABM frame shall follow the first SABM frame after.

time-out of timer T200.

3: One UI frame containing:

C = 0, P = 0, M = 0, L = 0.

#### 25.2.1.1.2.2 UA frame with different information field

##### 25.2.1.1.2.2.1 Test purpose

To test that the MS will leave the channel and return to the idle state when multiple frame establishment fails because a UA frame with a different information field is received in response to the SABM frame.

To test that the MS will thereafter repeat the immediate assignment procedure returning to the idle state when multiple frame establishment fails because a UA frame with a different information field is received in response to the SABM frame.

To test that MS will not attempt to perform the immediate assignment procedure after the first repetition.

## 25.2.1.1.2.2.2 Method of test

The MS is paged as described in the general section for Layer 2 testing in subclause 25.1.5. The MS is now in a condition to test the Layer 2 aspects of multiple frame establishment with contention resolution and a UA frame with an information field different from the one in its SABM frame.

The MS shall send an SABM frame.

The SS shall respond with an UA frame whose information field is different from the one in the SABM frame.

The MS shall send an SABM frame.

The SS shall respond with an UA frame whose information field is different from the one in the SABM frame.

The SS shall wait for  $3 \times T200$  to check that the MS does not send any L2 frames other than L2 fill frames on the assigned channel.

After a time equal to  $3 \times T200$  the SS checks that there are no more Layer 2 frames on the assigned channel, for a period of 1 s.

NOTE 1: Possible fill frames are allowed in order to take into account processing time inside the MS.

NOTE 2: There are no further attempts of immediate assignment procedure after the repetition.

15 s after sending the UA frame in response to the repetition of the immediate assignment procedure the SS pages the MS according to subclause 25.2.1.1.1, to make sure that the MS has returned to the idle state.

|                                                              |    |
|--------------------------------------------------------------|----|
| MS                                                           | SS |
| <-----PAGING REQUEST-----                                    | 1  |
| 2 ----- CHANNEL REQUEST----->                                |    |
| < ----- IMMEDIATE ASSIGNMENT-----                            | 3  |
| 4 ----- SABM (SAPI, C, P, M, L)----->                        |    |
| < ----- UA (SAPI, R, F, M, L)-----                           | 5  |
| 6 ----- CHANNEL REQUEST----->                                |    |
| < ----- IMMEDIATE ASSIGNMENT-----                            | 7  |
| 8 ----- SABM (SAPI, C, P, M, L)----->                        |    |
| < ----- UA (SAPI, R, F, M, L)-----                           | 9  |
| Wait for at least $3 \times T200$ , fill frames may occur.   |    |
| There are no Layer 2 frames on the assigned channel for 1 s. |    |
| The MS is paged 15 s after step 9.                           |    |
| MS is in idle state.                                         |    |
| <-----PAGING REQUEST-----                                    | 10 |
| 11 ----- CHANNEL REQUEST----->                               |    |

The frames from the SS will be:

5, 9: Two UA frames containing:

SAPI = 0, R = 0, F = 1, M = 0, L = 0.

## 25.2.1.1.2.2.3 Test requirements

The frames from the MS shall be:

4, 8: Two SABM frames containing:

SAPI = 0, C = 0, P = 1, M = 0,  $0 < L \leq N201$ .

information field = Page Response.

25.2.1.1.2.3 Information frame and supervisory frames in response to an SABM frame

25.2.1.1.2.3.1 Test purpose

To test that the MS will ignore receipt of frames other than a UA when received in response to the SABM frame.

25.2.1.1.2.3.2 Method of test

As in subclause 25.2.1.1.2.2, but instead of returning a UA frame the SS will respond with an I frame, RR frame, REJ frame. (So this test will actually be performed 3 times.) The MS shall ignore receipt of the frames sent by the SS and therefore resend its SABM frame after time-out of T200.

Expected Sequence

The frames from the SS will be:

2: One I frame containing:

SAPI = 0, C = 1, P = 1, M = 0, 0 <= L <= N201 (arbitrary), N(R), N(S) arbitrary.

information field arbitrary.

or One RR frame containing:

SAPI = 0, C = 1, P = 1, N(R) arbitrary.

or One REJ frame containing:

SAPI = 0, C = 1, P = 1, N(R) arbitrary.

25.2.1.1.2.3.3 Test requirements

The frames from the MS shall be:

1: One SABM frame (occurs twice) containing:

SAPI = 0, C = 0, P = 1, M = 0, 0 <= L <= N201.

information field = Page Response.

The second SABM frame shall follow the first SABM frame after time-out of timer T200.

25.2.1.1.3 Initialization denial

25.2.1.1.3.1 Test purpose

To test that the MS takes appropriate action if the network side indicates that it can not enter the multiple frame established state.

### 25.2.1.1.3.2 Method of test

The MS is paged as described in the Layer 2 tests general section at 25.1.5.

The MS shall then continue the setup by sending a SABM frame.

The SS responds with a DM frame.

The SS then waits at least T200 for the MS to transmit.

The MS shall not repeat the SABM frame.

#### Expected Sequence

The frames from the SS will be:

2: One DM frame containing:

SAPI = 0, R = 0, F = 1, M = 0, L = 0.

### 25.2.1.1.3.3 Test requirements

The frames from the MS shall be:

1: One SABM frame containing:

SAPI = 0, C = 0, P = 1, M = 0,  $0 \leq L \leq N201$ .

information field = Page Response.

### 25.2.1.1.4 Total initialization failure

#### 25.2.1.1.4.1 Test purpose

To test the MS response to the lack of the system to respond to requests to initialize the data link.

#### 25.2.1.1.4.2 Method of test

The MS is paged as described in the Layer 2 tests general section at 25.1.5.

The MS shall then continue the setup by sending a SABM frame.

The SS ignores the first SABM frame from the MS.

The MS shall wait for time-out of timer T200 and then send a second SABM frame.

This is repeated until the MS has sent the SABM frame six times. The MS shall not send the SABM any more than six times.

The SS continues to send paging messages on the BCCH/CCCH and the test continues as in test 25.2.1.1.1.

## Expected Sequence

## 25.2.1.1.4.3 Test requirements

The frames from the MS shall be:

1: One SABM frame (occurs six times) containing:

SAPI = 0, C = 0, P = 1, M = 0,  $\leq L \leq N201$ .

information field = Page Response.

The subsequent SABM frames shall follow the previous SABM frame after time-out of timer T200.

## 25.2.1.2 Initialization, contention resolution not required

This procedure is used after a data link has been established with contention resolution and a new data link is established on a new channel e.g. handover, dedicated channel assignment.

## 25.2.1.2.1 Normal initialization without contention resolution

## 25.2.1.2.1.1 Test purpose

To test the normal initialization of multiple-frame operation when contention resolution is not required.

## 25.2.1.2.1.2 Method of test

The data link is setup between the MS and the SS as in test 25.2.1.1.1.

After the MS has sent the UI frame the SS initiates the dedicated channel assignment procedure to assign an SDCCH.

The MS shall then continue the setup by sending a SABM frame without contention resolution.

The SS responds with a UA frame.

The MS shall then send an I frame containing the assignment complete message.

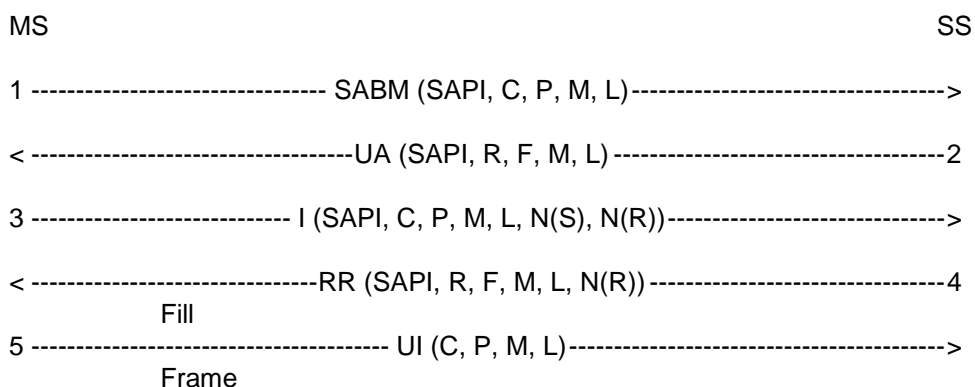

The SS shall acknowledge the I frame with an RR frame.

The SS then waits for the MS to send a UI fill frame.

The SS then initiates the dedicated channel assignment procedure to assign an FACCH.

The expected sequence is then repeated. The SS waits for at least T200 to ensure that the SABM is not repeated.

## Expected Sequence

The frames from the SS will be:

2: One UA frame containing:

SAPI = 0, R = 0, F = 1, M = 0, L = 0.

4: One RR frame containing:

SAPI = 0, R = 0, F = 0, M = 0, L = 0, N(R) = 1.

#### 25.2.1.2.1.3 Test requirements

The frames from the MS shall be:

1: One SABM frame containing:

SAPI = 0, C = 0, P = 1, M = 0, L = 0.

3: One I frame containing:

SAPI = 0, C = 0, P = 0, M = 0,  $0 \leq L \leq N201$ , N(S) = 0, N(R) = 0.

Information field = Assignment Complete.

5: One UI frame containing:

C = 0, P = 0, M = 0, L = 0.

#### 25.2.1.2.2 Initialization failure

##### 25.2.1.2.2.1 Test purpose

To test the MS response to the loss of a Layer 2 UA frame during initialization.

##### 25.2.1.2.2.2 Method of test

The SS initiates the dedicated channel assignment procedure to assign an SDCCH.

The MS shall then continue the setup by sending a SABM frame.

The SS ignores the first SABM frame from the MS.

The MS shall wait for time-out of timer T200 and then send a second SABM frame.

The SS responds with a UA frame.

The MS shall then send an I frame containing the assignment complete message.

The SS shall acknowledge the I frame with an RR frame.

The SS then waits for the MS to send a UI fill frame.

The SS then initiates the dedicated channel assignment procedure to assign a FACCH.

The expected sequence is then repeated. The SS waits for at least T200 to ensure that the SABM is not repeated.

The MS is returned to the idle state as described in subclause 25.1.1.6.

#### Expected Sequence

The frames from the SS will be:

2: One UA frame containing:

SAPI = 0, R = 0, F = 1, M = 0, L = 0.

4: One RR frame containing:

SAPI = 0, R = 0, F = 0, M = 0, L = 0, N(R) = 1.

#### 25.2.1.2.2.3 Test requirements

The frames from the MS shall be:

1: One SABM frame (occurs twice) containing:

SAPI = 0, C = 0, P = 1, M = 0, L = 0.

The second SABM frame shall follow the first SABM frame after time-out of timer T200.

3: One I frame containing:

SAPI = 0, C = 0, P = 0, M = 0,  $0 \leq L \leq N201$ , N(S) = 0, N(R) = 0

Information field = Assignment Complete

5: One UI frame containing:

C = 0, P = 0, M = 0, L = 0.

#### 25.2.1.2.3 Initialization denial

##### 25.2.1.2.3.1 Test purpose

To test that the MS takes appropriate action if the data link can not be initialized if the network side indicates the Layer 3 process is busy.

### 25.2.1.2.3.2 Method of test

The data link is setup between the MS and the SS as in test 25.2.1.1.1.

After the MS has sent the UI frame the SS initiates the dedicated channel assignment procedure to assign a SDCCH.

The MS shall then continue the setup by sending a SABM frame.

The SS responds with a DM frame.

The SS then waits at least T200.

The MS shall not repeat the SABM frame. However the MS will attempt to re-establish the link on the previous channel.

The test is repeated, but a FACCH is assigned in place of the SDCCH.

#### Expected Sequence

The frames from the SS will be:

2: One DM frame containing:

SAPI = 0, R = 0, F = 1, M = 0, L = 0.

### 25.2.1.2.3.3 Test requirements

The frames from the MS shall be:

1: One SABM frame containing:

SAPI = 0, C = 0, P = 1, M = 0, L = 0.

### 25.2.1.2.4 Total initialization failure

#### 25.2.1.2.4.1 Test purpose

To test the MS response to the lack of the system to respond to requests to initialize the data link.

#### 25.2.1.2.4.2 Method of test

The data link is setup between the MS and the SS as in test 25.2.1.1.1.

After the MS has sent the UI frame the SS initiates the dedicated channel assignment procedure to assign a SDCCH.

The MS shall then continue the setup by sending a SABM frame.

The SS ignores the first SABM frame from the MS.

The MS shall wait for time-out of timer T200 and then send a second SABM frame.

This is repeated until the MS has sent the SABM frame six times.

The MS shall not send the SABM any more than six times.

The test is repeated, but a FACCH is assigned in place of the SDCCH.

## Expected Sequence

## 25.2.1.2.4.3 Test requirements

The frames from the MS shall be:

1: One SABM frame (occurs six times) containing:

SAPI = 0, C = 0, P = 1, M = 0, L = 0.

The subsequent SABM frames shall follow the previous SABM frame after time-out of timer T200.

## 25.2.2 Normal information transfer

## 25.2.2.1 Sequence counting and I frame acknowledgements

## 25.2.2.1.1 Test purpose

To test the operation of Layer 2 sequence numbering. Since there are 8 sequence numbers the test cycles through 9 information frame transfers.

## 25.2.2.1.2 Method of test

The MS is brought into the multiple frame established state as described in test 25.2.1.1.1.

The SS sends an Identity Request message asking for IMEI to the MS.

The MS shall acknowledge this I frame with an Identity Response I frame or a RR frame.

This is repeated a further 8 times as rapidly as possible assuming a window size 1.

The MS Layer 3 response time should be less than  $4 \cdot T200$  and therefore the MS responses to at least the 5th, 6th, 7th, 8th and 9th I frames must be an I frame on the SDCCH. On the FACCH it is possible that all MS responses at Layer 2 will be RR frames.

The frames from the SS will be:

1, 3, 5, 7, 9, 11, 13, 15, 17: One I frame (occurs nine times) containing:

SAPI = 0, C = 1, P = 0, M = 0,  $0 \leq L \leq N201$ .

$N(S) = 0, 1, 2, 3 \dots 7, 0$ .

$N(R) = (\text{number of I frames received in the test sequence hitherto}) \bmod 8$ .

information field = Identity Request (IMEI).

19, 21, and so on, until the SS has received 9 I frames from the MS: One RR frame containing:

$SAPI = 0, R = 0, F = 0, M = 0, L = 0.$

$N(R) = (\text{number of I frames received in the test sequence hitherto}) \bmod 8.$

#### 25.2.2.1.3 Test requirements

There shall be an integer  $k \geq 0$  such that for  $i = 1, 2, \dots, k + 9$  the following conditions (a) and (b) both hold:

(a) The MS sends 9 I frames and  $k$  RR frames during the test.

(b) The frames sent by the MS in step  $2 \times i$  are:

(b1) If the frame is an RR frame (occurs  $k$  times): one RR frame containing:

$SAPI = 0, R = 1, F = 0, M = 0, L = 0.$

$N(R) = ((\text{Value of } N(S) \text{ in the last received I frame from the SS}) + 1) \bmod 8.$

(b2) If the frame is an I frame (occurs 9 times): one I frame containing:

$SAPI = 0, C = 0, P = 0, M = 0, 0 \leq L \leq N201.$

$N(R) = ((\text{Value of } N(S) \text{ in the last received I frame from the SS}) + 1) \bmod 8.$

$N(S) = (\text{number of I frame sent hitherto by the MS to SS excluding the actual I frame}) \bmod 8.$

information field = Identity Response (IMEI).

Example of expected sequence (assuming  $3 \times T200 < L3 \text{ reaction time} < 4 \times T200$ ):

|         |                                       |    |
|---------|---------------------------------------|----|
| MS      |                                       | SS |

| 16----- | I (SAPI, C, P, M, L, N(S), N(R))----- | >  |
| <-----  | I (SAPI, C, P, M, L, N(S), N(R))----- | 17 |
| 18----- | I (SAPI, C, P, M, L, N(S), N(R))----- | >  |
| <-----  | RR (SAPI, R, M, L, N(R), F)-----      | 19 |
| 20----- | I (SAPI, C, P, M, L, N(S), N(R))----- | >  |
| <-----  | RR (SAPI, R, M, L, N(R), F)-----      | 21 |
| 22----- | I (SAPI, C, P, M, L, N(S), N(R))----- | >  |
| <-----  | RR (SAPI, R, M, L, N(R), F)-----      | 23 |
| 24----- | I (SAPI, C, P, M, L, N(S), N(R))----- | >  |
| <-----  | RR (SAPI, R, M, L, N(R), F)-----      | 25 |
| 26----- | I (SAPI, C, P, M, L, N(S), N(R))----- | >  |
| <-----  | RR (SAPI, R, M, L, N(R), F)-----      | 27 |

The frames from the SS will be:

1, 3, 5, 7, 9, 11, 13, 15, 17: One I frame (occurs nine times) containing:

$SAPI = 0, C = 1, P = 0, M = 0, 0 \leq L \leq N201.$

$N(S) = 0, 1, 2, 3, \dots, 7, 0.$

$N(R) = 0, 0, 0, 0, 0, 1, 2, 3, 4.$

information field = Identity Request (IMEI).

19, 21, 23, 25, 27: One RR frame (occurs five times) containing:

$SAPI = 0, R = 0, F = 0, M = 0, L = 0.$

$N(R) = 5, 6, 7, 0, 1.$

The frames from the MS shall be:

2, 4, 6, 8: One RR frame (occurs four times) containing:

$SAPI = 0, R = 1, F = 0, M = 0, L = 0.$

$N(R) = 1, 2, 3, 4.$

10, 12, 14, 16, 18, 20, 22, 24, 26: One I frame (occurs nine times) containing:

$SAPI = 0, C = 0, P = 0, M = 0, 0 \leq L \leq N201.$

$N(R) = 5, 6, 7, 0, 1, 1, 1, 1, 1.$

$N(S) = 0, 1, 2, 3, 4, 5, 6, 7, 0.$

information field = Identity Response (IMEI).

## 25.2.2.2 Receipt of an I frame in the timer recovery state

### 25.2.2.2.1 Test purpose

To test that the MS is able to respond to I frames whilst in the timer recovery state.

### 25.2.2.2.2 Method of test

The MS is brought into the multiple frame established state as described in test 25.2.1.1.1.

The SS sends an Identity Request message asking for IMEI to the MS.

The MS shall respond with a RR frame though this may be incorporated with the Identity Response I frame.

The SS does not respond to the I frame.

The MS shall wait for expiry of timer T200 and then repeat the I frame but with the P bit set to 1.

The SS then sends a valid Identity Request I frame asking for IMEI which does not acknowledge receipt of the I frame from the MS.

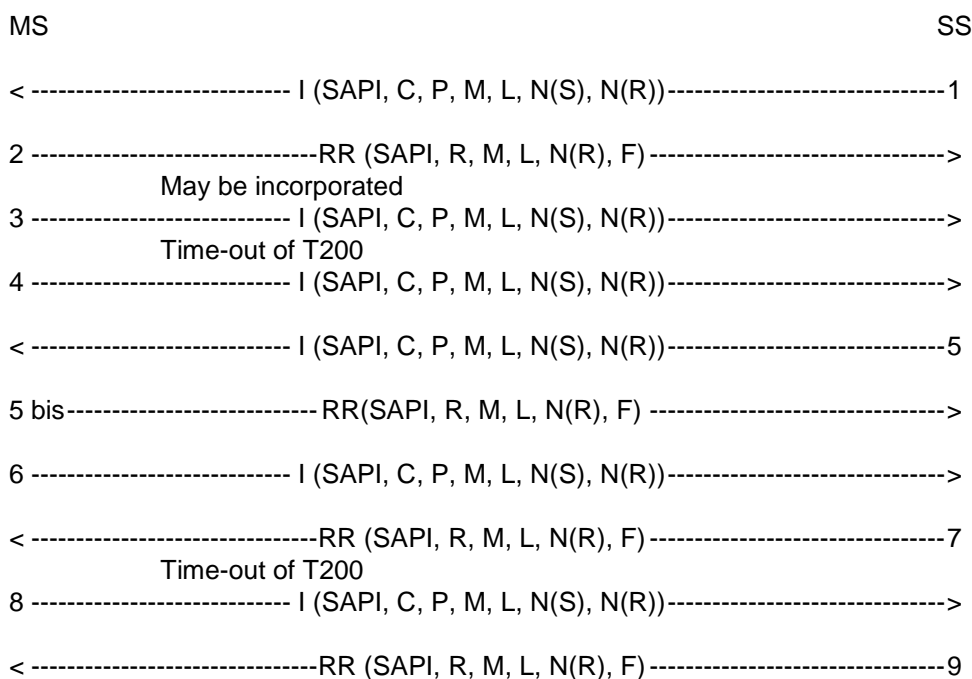

On the FACCH the MS may send an RR frame acknowledging the I frame.

The MS shall repeat the I frame, this frame will acknowledge receipt of the second I frame from the SS.

The SS then acknowledges receipt of the MS I frame by sending a RR frame.

The MS shall send the next I frame. The SS acknowledges this I frame.

## Expected Sequence

The frames from the SS will be:

1, 5: One I frame (occurs twice) containing:

SAPI = 0, C = 1, P = 0, M = 0,  $0 \leq L \leq N201$ , N(S) = 0, 1, N(R) = 0.

information field = Identity Request.

7, 9: One RR frame (occurs twice) containing:

SAPI = 0, R = 0, F = 1, 0, M = 0, L = 0, N(R) = 1, 2.

### 25.2.2.2.3 Test requirements

The frames from the MS shall be:

2: One RR frame containing:

SAPI = 0, R = 1, F = 0, M = 0, L = 0, N(R) = 1.

3, 8: One I frame (occurs twice) containing:

SAPI = 0, C = 0, P = 0, M = 0,  $0 \leq L \leq N201$ , N(R) = 1, 2, N(S) = 0, 1

information field = Identity Response

4, 6: One I frame (occurs twice) containing:

SAPI = 0, C = 0, P = 1, M = 0,  $0 \leq L \leq N201$ , N(R) = 1, 2, N(S) = 0.

information field = Identity Response.

5 bis: (possible only on the FACCH) One RR frame containing:

SAPI = 0, R = 1, F = 0, M = 0, L = 0, N(R) = 2.

### 25.2.2.3 Segmentation and concatenation

#### 25.2.2.3.1 Test purpose

To test the proper use of segmentation and concatenation, suspend and resume.

#### 25.2.2.3.2 Method of test

If the MS supports the UnStructuredSSData operation, then the MS is made to activate an unknown supplementary service as defined in 3GPP TS 02.30 with the following sequence \*NN\*si#: NN is chosen to be undefined in 3GPP TS 02.30 annex 2 and is an IA5. Total length of \*NN\*si# shall be 20 characters.

If the MS does not support the UnStructuredSSData operation, then the MS is made to initiate a call.

The SS responds with the Immediate Assign procedure firstly allocating a SDCCH and on the second repeat of the test a TCH.

The MS is brought into the multiple frame established state by continuing as described in test 25.2.1.1.1. The layer three message element in the SABM will be CM Serv Request.

The SS sends the UA and waits for 10 s. The SS then sends an I frame with CM Serv Accept.

The MS sends either:

- a REGISTER message which is segmented between two I frames; or
- a SETUP message.

The SS shall acknowledge only the I frame with more bit set to 1 (if any) but it shall not acknowledge the I frame with more bit set to 0.

The SS then performs a handover (in the case of SDCCH this shall be finely synchronized) while still on the assigned channel and without acknowledging the last I frame of the MS layer 3 message, making sure to fill the handover command to more than 21 octets (for example by using the cell channel description element).

On the SDCCH the MS will go into timer recovery and resend the last I frame of the layer 3 message with the P bit set to 1 when it acknowledges the two I frames of the handover command. On the FACCH the MS may simply acknowledge both I frames.

The MS does not attempt to resend the last I frame of the REGISTER or SETUP message on the old channel but instead goes to the new channel where it performs a random access using the Handover Access message and then multiple frame establishment without contention resolution as described in test 25.2.1.2.1.

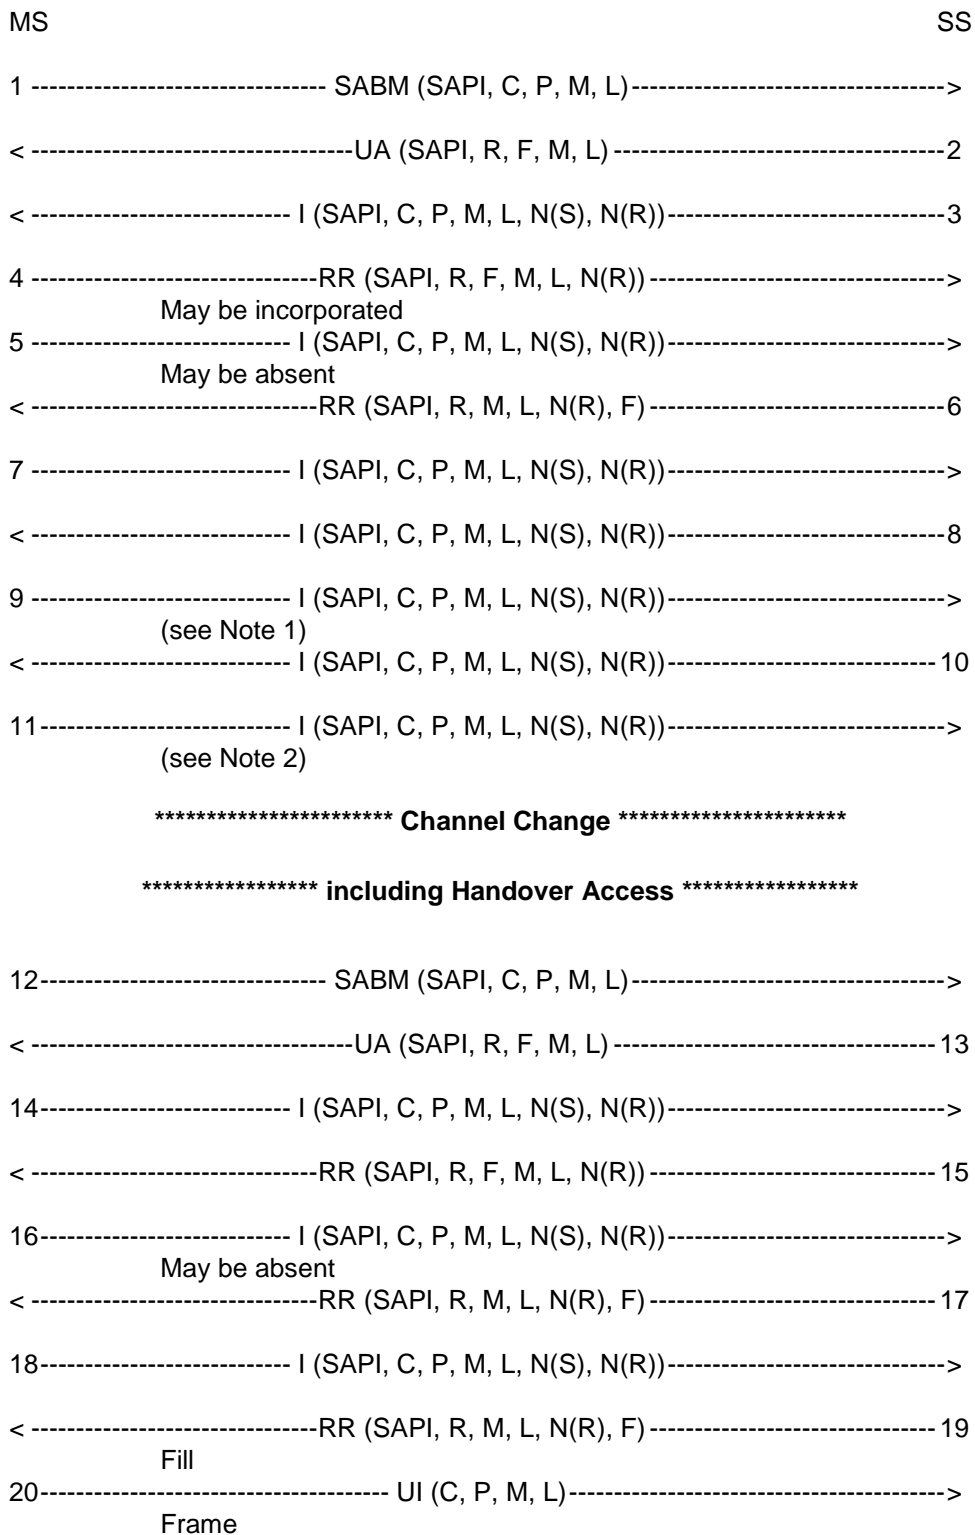

The MS shall then send an I frame with the Handover complete message. Assuming this is a finely synchronized handover.

The SS acknowledges this I frame.

The MS shall then resend the previous REGISTER or SETUP message, that is all frames which are acknowledged in the usual way.

The test has to be repeated on the FACCH.

Expected Sequence

NOTE 1: The MS may send RR frames on the FACCH in addition to the I frames in 9 and 11.

NOTE 2: The I frame in 11 is optional.

The frames from the SS will be:

2: One UA frame containing:

SAPI = 0, R = 0, F = 1, M = 0, L = L of SABM.

information field = information field of SABM.

3: One I frame containing:

SAPI = 0, C = 1, P = 0, M = 0,  $0 < L < N201$ , N(S) = 0, N(R) = 0.

information field = CM Service Accept.

6: One RR frame containing: (This frame is sent only if frame 5 was received)

SAPI = 0, R = 0, F = 0, M = 0, L = 0, N(R) = 1.

8, 10: Two I frames containing:

SAPI = 0, C = 1, P = 0, M = 1, 0, L = N201,  $\leq N201$ , N(S) = 1, 2, N(R) = 1 or 0.

information field = Handover.

13: One UA frame containing:

SAPI = 0, R = 0, F = 1, M = 0, L = 0.

15, 17, 19: Two or three RR frames containing:

SAPI = 0, R = 0, F = 0, M = 0, L = 0, N(R) = 1, 2 or 1, 2, 3.

#### 25.2.2.3.3 Test requirements

The frames from the MS shall be:

1: One SABM frame containing:

SAPI = 0, C = 0, P = 1, M = 0,  $0 \leq L \leq N201$ .

information field = CM Service Request.

4: One RR frame containing:

SAPI = 0, R = 1, F = 0, M = 0, L = 0, N(R) = 1.

5, 7: Two I frames containing: (The first I frame may be missing)

SAPI = 0, C = 0, P = 0, M = 1, 0, L = N201,  $\leq N201$ , N(S) = 0, 1 or 0, N(R) = 1.

information field = Register or Setup.

9, 11: Two I frames containing:

SAPI = 0, C = 0, P = 1, M = 0,  $0 < L \leq N201$ , N(S) = 1 or 0, N(R) = 2, 3.

information field = Register or Setup.

NOTE: The I frame in 11 is optional.

12: One SABM frame containing:

SAPI = 0, C = 0, P = 1, M = 0, L = 0.

14: One I frame containing:

SAPI = 0, C = 0, P = 0, M = 0,  $0 < L < N201$ , N(S) = 0, N(R) = 0.

information field = Handover Complete.

16, 18: Two I frames containing: (The first I frame may be missing)

SAPI = 0, C = 0, P = 0, M = 1, 0, L = N201,  $0 < L \leq N201$ , N(S) = 1, 2 or 1, N(R) = 0.

information field = Register or Setup.

20: UI frame containing:

C = 0, P = 0, M = 0, L = 0.

## 25.2.3 Normal layer 2 disconnection

### 25.2.3.1 Test purpose

To test the normal data link disconnection sequences.

### 25.2.3.2 Method of test

The data link is setup between the MS and the SS as in test 25.2.1.1.1.

The SS sends a Layer 2 Disconnect message to the MS.

The MS shall respond with a UA frame and return to the idle state; no more Layer 2 (I, S or U) frames, except possibly one or more "Fill" frames, shall be sent. The SS may receive "Fill" frames after the sending of the DISC frame. If this occurs this may only happen for up to T200 after the sending of the DISC frame. The checking for Layer 2 frames, and the recording of any "Fill" frames, is done for a time defined as  $4 \times T200$ .

The SS confirms that the MS has returned to the idle state by performing test 25.2.1.1.1.

#### Expected Sequence

The frames from the SS will be:

1: One DISC frame containing:

SAPI = 0, C = 1, P = 1, M = 0, L = 0.

### 25.2.3.3 Test requirements

The frames from the MS shall be:

2: One UA frame containing:

SAPI = 0, R = 1, F = 1, M = 0, L = 0.

No other Layer 2 (I, S or U) frames shall occur. If "Fill" frames are sent this may only be done for up to T200 after the sending of the DISC frame.

## 25.2.4 Test of link failure

### 25.2.4.1 I frame loss (MS to SS)

#### 25.2.4.1.1 Test purpose

To test that the MS repeats an I frame N200 times with T200 between two I frames and that the MS releases the layer 2 link after N200 repetitions of the I frame in the case when no answer to the I frame is received.

#### 25.2.4.1.2 Method of test

The MS is brought into the multiple frame established state as described in test 25.2.1.1.1.

The SS sends an Identity Request message asking for IMEI to the MS.

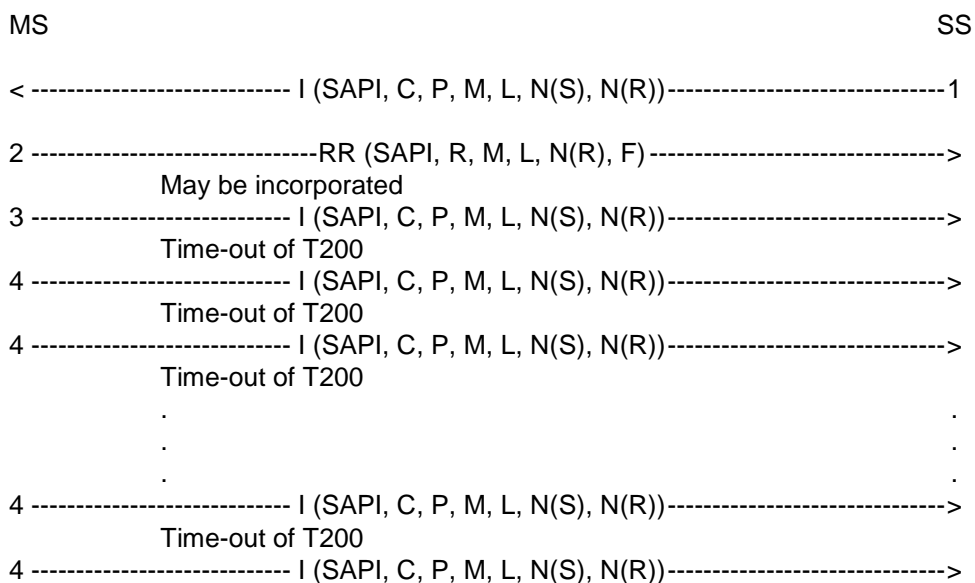

The MS shall respond with a RR frame though this may be incorporated with the Identity Response I frame.

The SS does not respond to the I frame.

The MS shall wait for expiry of timer T200 and then repeat the I frame but with the P bit set to 1.

This is repeated until the MS has sent the I frame N200+1 times. The MS shall not send any layer 2 frame. This is checked for a time of  $4 \times T200$ . The MS shall return to the idle state. This is checked by performing test 25.2.1.1.1.

#### Expected Sequence

The frames from the SS will be:

1: One I frame containing:

SAPI = 0, C = 1, P = 0, M = 0,  $0 \leq L \leq N201$ , N(S) = 0, N(R) = 0.

information field = Identity Request.

#### 25.2.4.1.3 Test requirements

The frames from the MS shall be:

2: One RR frame containing:

SAPI = 0, R = 1, F = 0, M = 0, L = 0, N(R) = 1.

3: One I frame containing:

SAPI = 0, C = 0, P = 0, M = 0,  $0 \leq L \leq N201$ , N(R) = 1, N(S) = 0.

information field = Identity Response.

4: One I frame (occurs N200 times) containing:

SAPI = 0, C = 0, P = 1, M = 0,  $0 \leq L \leq N201$ , N(R) = 1, N(S) = 0.

information field = Identity Response.

### 25.2.4.2 RR response frame loss (SS to MS)

Covered in test 25.2.2.2.

### 25.2.4.3 RR response frame loss (MS to SS)

#### 25.2.4.3.1 Test purpose

To test the Layer 2 recovery mechanism in the event of RR frame loss.

#### 25.2.4.3.2 Method of test

The MS is brought into the multiple frame established state as described in test 25.2.1.1.1.

The SS sends a I frame containing a Layer 3 message using PD = 1111 (e.g. OFH) to the MS. The L3 message is TEST INTERFACE with tested device equal to 0.

The MS shall respond with a RR frame.

The SS ignores the RR frame from the MS but after T200 from the I frame sent by the SS the SS repeats the I frame but with the P bit set to 1. This simulates loss of the RR from the MS.

The MS shall respond with either an RR or REJ frame.

NOTE: This requirement is less restrictive than 3GPP TS 04.06.

#### Expected Sequence

The frames from the SS will be:

1: One I frame containing:

SAPI = 0, C = 1, P = 0, M = 0, L = 3, N(S) = 0, N(R) = 0.

3: One I frame containing:

$SAPI = 0, C = 1, P = 1, M = 0, L = 3, N(S) = 0, N(R) = 0.$

#### 25.2.4.3.3 Test requirements

The frames from the MS shall be:

2: One RR frame containing:

$SAPI = 0, R = 1, F = 0, M = 0, L = 0, N(R) = 1.$

4: One RR frame containing:

$SAPI = 0, R = 1, F = 1, M = 0, L = 0, N(R) = 1.$

OR

4: One REJ frame containing:

$SAPI = 0, R = 1, F = 1, M = 0, L = 0, N(R) = 1.$

## 25.2.5 Test of frame transmission with incorrect C/R values

### Purpose of tests

To test that the MS will react correctly upon the reception of a frame with incorrect C/R value.

### Initial Conditions

Perform the establishment of the dedicated physical resource according to 25.1.5 and initialize the link as in subclause 25.2.1.1.1. Then proceed as stated below.

#### 25.2.5.1 I frame with C bit set to zero

##### 25.2.5.1.1 Test purpose

To test that the MS will take no action when it receives an I frame with the C bit set to zero (R).

##### 25.2.5.1.2 Method of test

The data link is set up between the MS and the SS as in test 25.2.1.1.1.

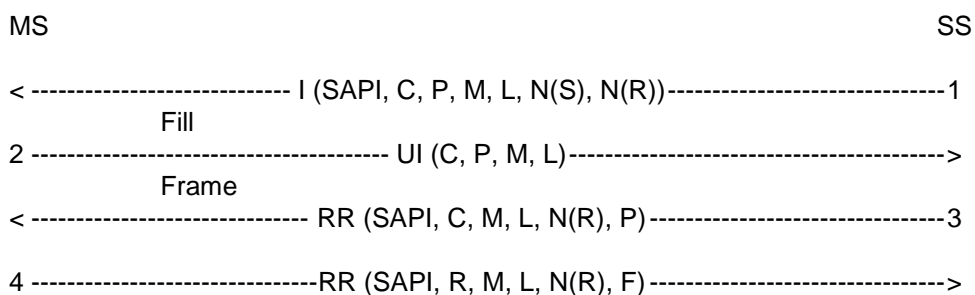

The SS shall send an I frame with the C bit set to zero to the MS.

The SS shall then wait for at least 4 times T200 to make sure that the MS does not respond to that I frame but that the MS keeps sending fill frames.

The SS shall after 4 times T200 send a RR command, P bit set to 1.

The MS shall respond with a RR response, F bit set to 1.

## Expected Sequence

The frames from the SS will be:

1: One I frame containing:

SAPI = 0, C = 0, P = 1, M = 0,  $0 \leq L \leq N201$ , N(R) = 0, N(S) = 0.

Information field = Identity Request.

3: One RR frame containing:

SAPI = 0, C = 1, P = 1, M = 0, L = 0, N(R) = 0.

#### 25.2.5.1.3 Test requirements

The frames from the MS shall be:

2: UI frames containing:

C = 0, P = 0, M = 0, L = 0.

4: One RR frame containing:

SAPI = 0, R = 1, F = 1, M = 0, L = 0, N(R) = 0.

### 25.2.5.2 SABM frame with C bit set to zero

#### 25.2.5.2.1 Test purpose

To test that the MS will take no action when it receives an SABM frame with the C bit set to zero (R).

#### 25.2.5.2.2 Method of test

The MS is brought into the multiple frame established state as described in test 25.2.1.1.1.

The SS sends an I frame containing a Layer 3 message using PD=1111 (e.g. 0FH) in order to raise V(R) in the MS to 1. The L3 message is TEST INTERFACE with tested device equal to 0.

The MS shall acknowledge this by the appropriate RR frame.

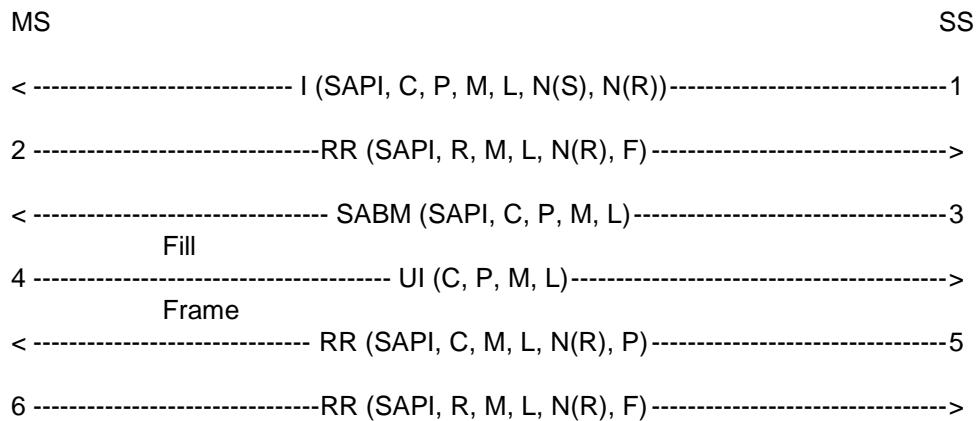

The SS sends SABM with the C bit set to zero.

The SS shall after 4 times T200 send a RR command, P bit set to 1.

The MS shall respond with a RR response, F bit set to 1.

The MS is returned to the idle state as described in subclause 25.2.1.1.6.

## Expected Sequence

The frames from the SS will be:

1: One I frame containing:

SAPI = 0, C = 1, P = 0, M = 0, L = 3, N(S) = 0, N(R) = 0.

3: One SABM frame containing:

SAPI = 0, C = 0, P = 1, M = 0, L = 0.

5: One RR frame containing:

SAPI = 0, C = 1, P = 1, M = 0, L = 0, N(R) = 0.

### 25.2.5.2.3 Test requirements

The frames from the MS shall be:

2: One RR frame containing:

SAPI = 0, R = 1, F = 0, M = 0, L = 0, N(R) = 1.

4: One UI frame containing:

C = 0, P = 0, M = 0, L = 0.

6: One RR frame containing:

SAPI = 0, R = 1, F = 1, M = 0, L = 0, N(R) = 1.

## 25.2.6 Test of errors in the control field

### Purpose of tests

To test that the MS will react in the proper way to errors in the Control Field.

### 25.2.6.1 N(S) sequence error

#### 25.2.6.1.1 Test purpose

To test that the MS will ignore the contents of the I field of an out-of-sequence I frame from the SS.

## 25.2.6.1.2 Method of test

The MS is brought into the multiple frame established state as described in test 25.2.1.1.1.

The SS shall send a correct I frame containing Identity Request.

The MS shall acknowledge this in a RR frame or piggy back the acknowledgement onto the I frame carrying Identity Response.

The SS shall then send an I frame containing Identity Request with incorrect N(S) but correctly acknowledging the MS's I frame; P bit set to zero.

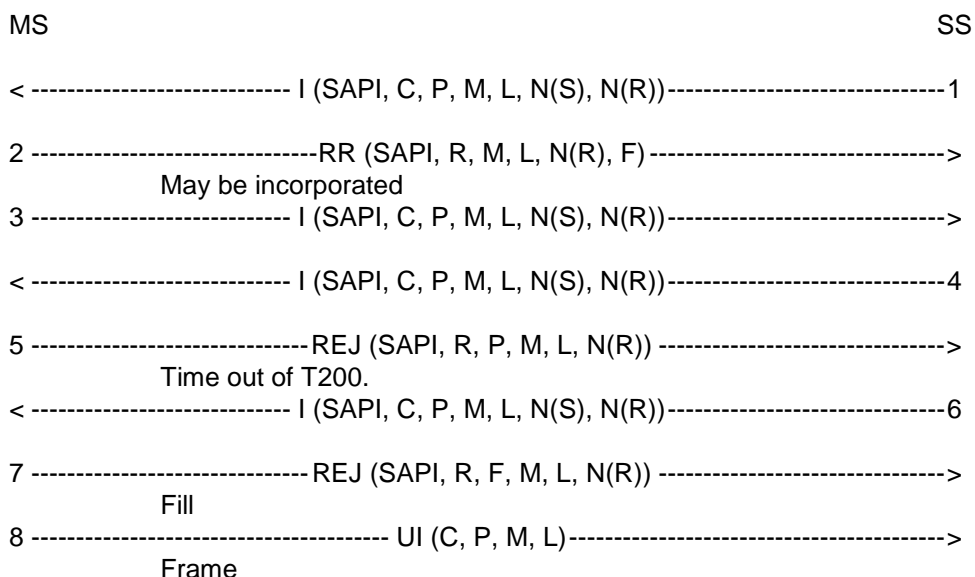

The MS shall send a REJ frame.

The SS shall, after T200, send another I frame with incorrect N(S), P bit set to 1 this time.

The MS shall respond with a REJ, F bit set to 1.

The MS shall resume the transmission of fill frames.

## Expected Sequence

The frames from the SS will be:

1: One I frame containing:

SAPI = 0, C = 1, P = 0, M = 0,  $0 \leq L \leq N201$ , N(S) = 0, N(R) = 0.

information field = Identity Request.

4: One I frame containing:

SAPI = 0, C = 1, P = 0, M = 0,  $0 \leq L \leq N201$ , N(S) = 0, N(R) = 1

information field = Identity Request

6: One I frame containing:

SAPI = 0, C = 1, P = 1, M = 0,  $0 \leq L \leq N201$ , N(S) = 0, N(R) = 1

information field = Identity Request

The frames from the SS are:

1: One I frame:

SAPI = 0, C = 1, P = 0, M = 1, L = N201, N(R) = 1, N(S) = 0.

In case a):

3: One UA frame:

SAPI = 0, R = 0, F = 1, M = 0, L = 0.

### 25.2.6.2.3 Test requirements

The frame from the MS in case a) shall be:

2: One DISC frame:

SAPI = 0, C = 0, P = 1, M = 0, L = 0.

### 25.2.6.3 Improper F bit

#### 25.2.6.3.1 Test purpose

To test that the MS, being in the timer recovery state, will return to the multiple frame established state only after having received an RR response with the F bit set to 1. This test is covered in test 25.2.2.2.

## 25.2.7 Test on receipt of invalid frames

### 25.2.7.1 Test purpose

To test that the MS will ignore all invalid frames.

### 25.2.7.2 Method of test

The data link is set up between the MS and the SS as in test 25.2.1.1.1.

The SS shall then transmit an:

- RR frame with the Length indicator greater than zero and a faulty N(R);
- REJ frame with the EA bit set to zero and a faulty N(R);
- SABM frame with the EL bit set to zero;
- DM frame with the Length indicator greater than zero;
- DISC frame with the M bit set to 1;
- UA frame with the EA bit set to zero;
- I frame with the Length indicator greater than N201;
- I frame with the M bit set to 1 and the Length indicator less than N201;
- command frames with correct Address and Length indicator field and a non-implemented control field.

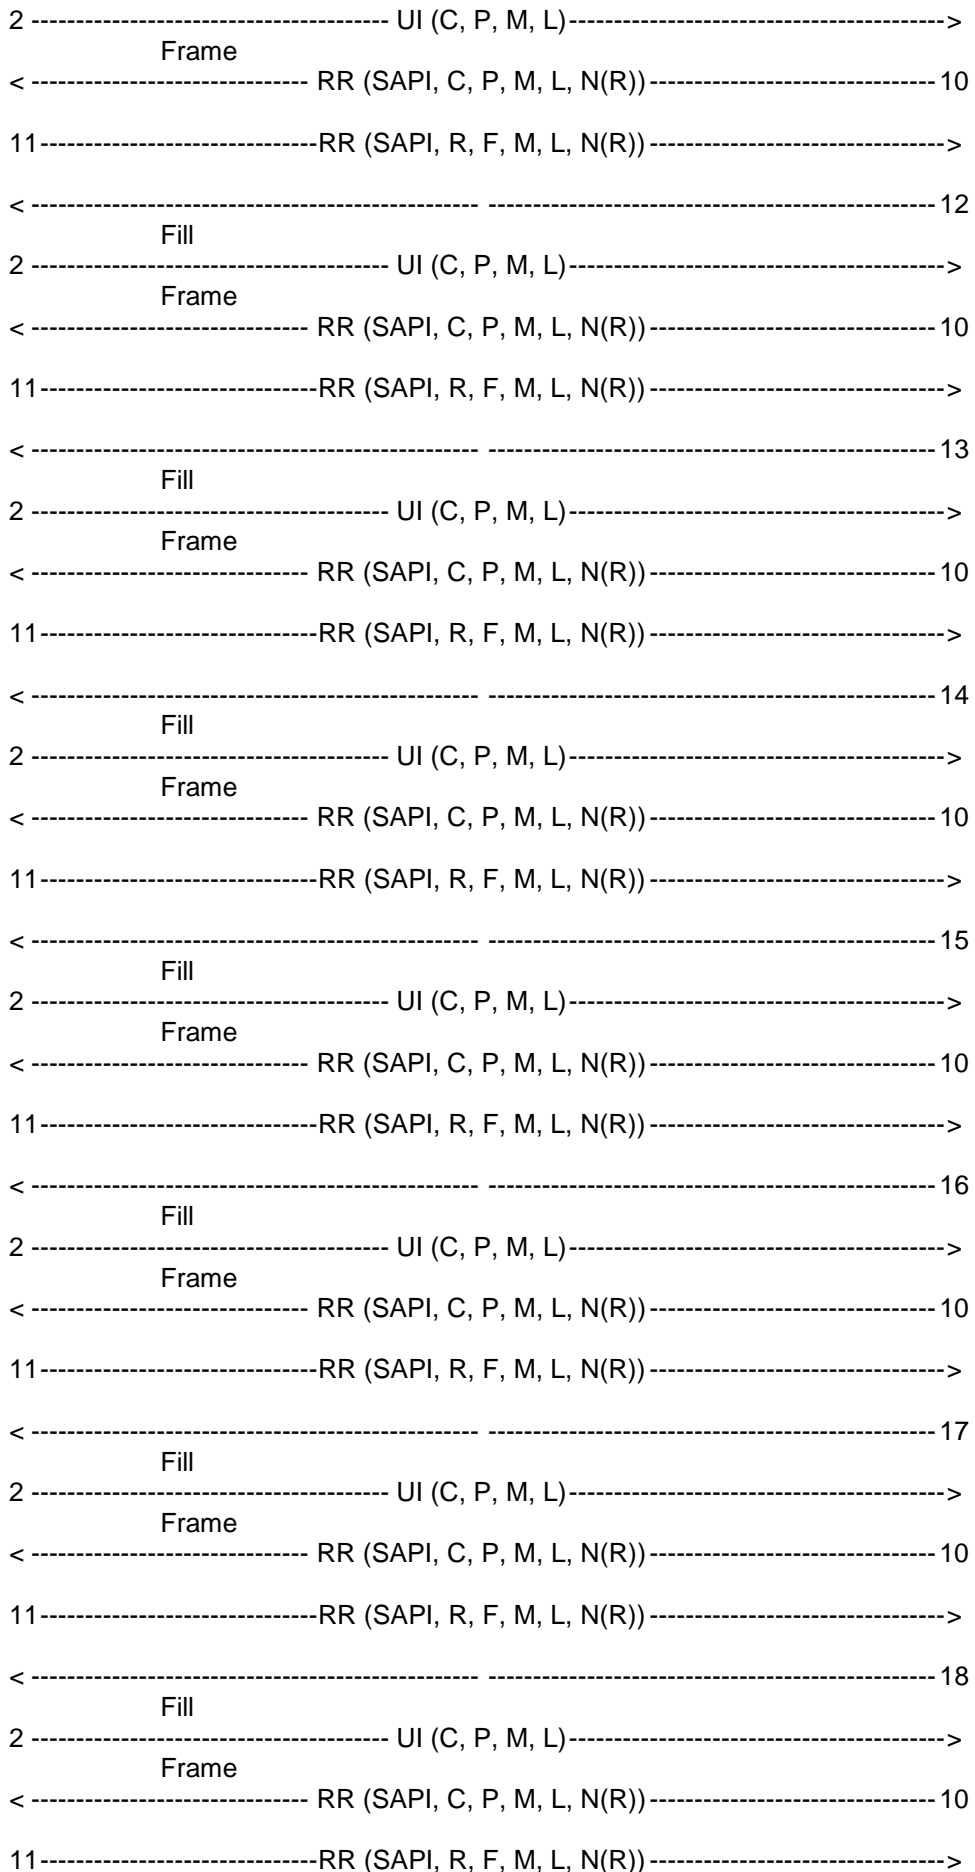

After T200 the SS shall in every case transmit an RR command, P bit set to 1.

The MS shall respond with an RR response, F bit set to 1.

## Expected Sequence

| MS                                          | SS |
|---------------------------------------------|----|
| <-----RR (SAPI, R, F, M, L, N(R))-----      | 1  |

| 11-----RR (SAPI, R, F, M, L, N(R))----->    |    |
| <-----UA (SAPI, R, F, M, L)----->           | 7  |
| Fill                                        |    |
| 2-----UI (C, P, M, L)----->                 |    |
| Frame                                       |    |
| <-----RR (SAPI, C, P, M, L, N(R))-----      | 10 |
| 11-----RR (SAPI, R, F, M, L, N(R))----->    |    |
| <-----I (SAPI, C, P, M, L, N(R), N(S))----- | 8  |
| Fill                                        |    |
| 2-----UI (C, P, M, L)----->                 |    |
| Frame                                       |    |
| <-----RR (SAPI, C, P, M, L, N(R))-----      | 10 |
| 11-----RR (SAPI, R, F, M, L, N(R))----->    |    |
| <-----I (SAPI, C, P, M, L, N(R), N(S))----- | 9  |
| Fill                                        |    |

The frames from the SS are:

1: One RR frame:

$SAPI = 0, R = 0, F = 0, M = 0, L > 0, N(R) = 1.$

3: One REJ frame:

$SAPI = 0, R = 0, F = 0, M = 0, L = 0, N(R) = 1, EA = 0.$

4: One SABM frame:

$SAPI = 0, C = 1, P = 1, M = 0, L = 0, EL = 0.$

5: One DM frame:

$SAPI = 0, R = 0, F = 1, M = 0, L > 0.$

6: One DISC frame:

$SAPI = 0, C = 1, P = 1, M = 1, L = 0.$

7: One UA frame:

$SAPI = 0, R = 0, F = 0, M = 0, L = 0, EA = 0.$

8: One I frame:

$SAPI = 0, C = 1, P = 0, M = 0, L > N201, N(R) = 0, N(S) = 6.$

9: One I frame:

$SAPI = 0, C = 1, P = 0, M = 1, L < N201, N(R) = 0, N(S) = 7.$

10: One RR frame:

$SAPI = 0, C = 1, P = 1, M = 0, L = 0, N(R) = 0.$

12: One command frame with

Control Field = xxx1 1101.

13: One command frame with

Control field = xxx1 1011.

14: One command frame with

Control field = xxx1 0111.

15: One command frame with

Control field = 01x1 1111.

16: One command frame with

Control field = 1xx1 1111.

17: One command frame with

Control field = 0011 0011.

18: One command frame with

Control field = 1xx1 0011.

NOTE: An "x" stands for an arbitrary bit value.

## 25.2.7.3 Test requirements

The frames from the MS shall be:

2: One UI frame (occurs fifteen times):

$C = 0, P = 0, M = 0, L = 0.$

11: One RR frame (occurs fifteen times):

$SAPI = 0, R = 1, F = 1, M = 0, L = 0, N(R) = 0.$

## 26 Testing of layer 3 functions

Ref.: 3GPP TS 04.08 / 3GPP TS 24.008 / 3GPP TS 44.018

NOTE: The tests on functioning of the elementary procedures in the MS are grouped as the description of those procedures in 3GPP TS 04.08 / 3GPP TS 24.008 / 3GPP TS 44.018. However, the test procedures are carried out in an order which is more logic for the purpose of testing.

### 26.1 Default conditions and structured sequence of tests

#### 26.1.1 Default test conditions during layer 3 tests

During tests in clause 26 the following default test conditions shall apply if not otherwise stated within the test description. In the table below, decimal values are normally used. Sometimes a hexadecimal value, indicated with a "H", or a binary value, indicated with a "B" is given.

|                                                | GSM 900                                               | DCS 1 800                                             |

These informations are provided by system information 1, 2, 3 and 4 messages.

The system information elements which are broadcast on the SACCH during the dedicated mode should be consistent with those sent on the BCCH when the MS was in idle mode prior to the channel request.

In addition, all fill paging messages sent on the paging sub-channels will have by default, their page mode set to NORMAL PAGING.

## 26.1.2 Structured sequence of the tests

The tests shall be performed in the order as indicated in the following table.

The validity of the tests depends upon the results of the tests performed before.

|                                                   |    |                          |

## 26.1.3 General rules for message parameters

The following rules concerning message parameters apply to clause 26:

- 1) Those values of parameters which are a consequence of the context of a test and which are not specific to that test need not be defined.
- 2) If the value of a parameter of an uplink message (MS to Network) is specified in a test, the implicit meaning is that it has to be checked; if the value is not specified, it is not to be checked unless stated otherwise.
- 3) An optional field or optional Information Element of a downlink message (Network to MS), the presence of which is not a consequence of a test description, shall be absent in that test.
- 4) If an optional field or Information Element is not indicated for the uplink (MS to Network) - unless specified otherwise -, it may be included or not.
- 5) The Protocol Discriminator, Transaction Identifier and Message Type of all uplink messages have to be checked.

## 26.1.4 General rules for layer 3 testing

Unless otherwise specified, before the SS pages the MS, the MS must be given the necessary time to be able to receive paging (see clause 20). In addition and unless otherwise specified, the SS must wait at least 1s after the last time slot of the message block containing a CHANNEL RELEASE, before sending a PAGING to the mobile (see 3GPP TS 04.13).

In the signalling tests, where the following statement is used:

- 'the RF level of cell x is set sufficiently low to ensure that cell x is not suitable as defined in 3GPP TS 05.08 subclause 6.6.2';

this means that for the cell to be "not suitable" by virtue of its RF level, the RF level is to be lowered until C1 is below 0.

## 26.1.5 Format of layer 3 test descriptions

In subclauses 26.2, 26.5, 26.6, 26.7, 26.9, 26.10 and 26.11 a rigorous description technique is used which is defined here.

For every test, a subclause titled "method of test" and a subclause titled "expected sequence" define the exact test steps and the verifications to be performed in the test. These subclauses are normative and give requirements for the MS behaviour. The information of both subclauses applies.

For the message contents further normative requirements for the MS behaviour are defined in the following parts which apply in the following order (starting with the highest) on basis of the general rules of 26.1.3:

- specifications in the "method of test" and "expected sequence" subclauses;
- specifications in the subclause titled "specific message contents";
- specifications in the subclause "default message contents" at the end of the relevant subclauses 26.5, 26.6, 26.7, 26.9, 26.10 or 26.11;
- specifications of default conditions in subclause 26.1.

The relevant section may contain the definition of abbreviations of L3 message names that are used in that section.

In many cases, a test description contains an introductory subclause explaining the background of the relevant procedures and explaining why the tests of that description are essential.

For every test, test purposes are given. In general conformance testing methodology, the correspondence between test purposes and test cases can be n to m: To one test purpose more than one test case may correspond (e.g. different test cases checking data variations); also a test case may serve more than one test purpose. In some contexts a structure of conformance test descriptions is advisable which specifies in one part (non-duplicated) test purposes with references to corresponding test suites serving the test purposes, in another part test suites realizing the test purposes; this structuring is especially useful for gaining completeness and avoiding duplications. In the present document, however, it is preferred to group descriptions by test cases. The reasons are:

- The structure is more sought to assist the test execution and evaluation than test development. It must be easy to determine why a wrong behaviour leads to a verdict.
- The structure is to be close to GSM 11.10 phase 1.

For every test purpose of a test, a conformance requirement is given.

For each conformance requirement in a test description, references to core specifications are given.

For every test, the related PICS/PIXIT statements that are necessary for performing the test are given.

For every test, initial conditions for both the System Simulator and the Mobile Station are given. Unless otherwise specified, these initial conditions apply together with the default conditions of 26.1, the initial conditions of the test prevailing over the default conditions of 26.1.

For every test, the foreseen final state of the MS after the test and the maximum duration of the test are specified. These parts are non-normative and do not contain a description of verifications to be performed. The contained information might be used for sequencing different tests and for the decision when a test is to be interrupted.

The expected sequence specifies the actions in numbered steps in a tabular form. In the column "direction", "SS -> MS" denotes a message sent from the SS to the MS, "MS -> SS" denotes a message sent from the MS to the SS, "SS" denotes an action at the SS, "MS" denotes an action at the MS (e.g. interaction with the user or higher layers). The column "message" defines the L3 messages to be sent or expected by the SS. In the "comments" column, further normative information is to be found, e.g. message parameters. In some cases, different alternative behaviours are possible in a test. Then test steps in alternative sequences are numbered as:

"A n", "A n + 1", ..., "A n + k";

"B n", "B n + 1", ..., "B n + l";

"C n", "C n + 1", ..., "C n + m";

etc. (n, m, l, k integers > 0).

and step numbering of a re-unified sequence resumes with the lowest of  $n + k + 1$ ,  $n + l + 1$ ,  $n + m + 1$ .

In some cases the test steps of a test are to be repeated. Then an execution counter is introduced for the test.

## 26.2 Initial tests

### 26.2.1 Channel request

The random access procedure is used by the MS to ask for resources to the network. If it is not performed correctly, the MS could prevent other MSs from obtaining resources, or the network could be overloaded if the MS does not respect the duration between 2 CHANNEL REQUEST messages.

#### 26.2.1.1 Channel request / initial time

##### 26.2.1.1.1 Conformance requirement

- 1) The MS shall start the initial access procedure at the latest 0,7 s after reception of the paging message.
- 2) The MS shall spread the initial CHANNEL REQUEST with equal probability on the correct number of time slots.

##### Reference(s)

3GPP TS 04.08 / 3GPP TS 44.018, subclauses 3.3.1.1.2 and 3.3.2.2.

##### 26.2.1.1.2 Test purpose

- 1) To verify that the MS answers to a PAGING message by sending a CHANNEL REQUEST message within 0,7 s after reception of the PAGING message.
- 2) To verify that the MS does not always use the same delay between reception of paging message and sending of the CHANNEL REQUEST message. If an MS uses a fixed delay, there is a high probability that different MSs of the same product series use the same delay. There would then be a high risk of collision.

##### 26.2.1.1.3 Method of test

##### Initial Conditions

##### System Simulator:

1 cell, Tx-Integer = 5. The CCCH is either combined or not with SDCCH. This is arbitrarily chosen.

Mobile Station:

The MS has a valid TMSI. It is "idle updated".

Related PICS/PIXIT Statement(s)

None.

Foreseen Final State of the MS

The MS has a valid TMSI. It is "idle updated".

Test Procedure

Specific test parameters:

$K = 200$ .

The MS is paged. The SS measures and stores the number of CCCH RACH slots between the sending of the PAGING REQUEST message and the reception of the CHANNEL REQUEST from the MS, excluding the slots containing the messages themselves. The SS sends an IMMEDIATE ASSIGNMENT REJECT. The sequence is performed K times.

Maximum Duration of Test

30 min.

Between two consecutive executions (for k and k+1), the SS must wait for an amount of time which is enough to guarantee that the MS is in service (listening to its paging subchannel).

Expected Sequence

The sequence is executed for execution counter  $k = 1, \dots, K$ .

| Step | Direction | Message                     | Comments                                                                                                                                                  |
|------|-----------|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PAGING REQUEST TYPE 1       | "Mobile Identity" IE contains the TMSI allocated to the MS.                                                                                               |
| 2    | SS        |                             | The SS measures the number f of CCCH RACH slots between the sending of PAGING REQUEST message and the reception of a CHANNEL REQUEST message from the MS. |
| 3    | SS        |                             | The SS stores f. $f(k)$ shall be lower than $700/4,615+8$ if the CCCH is not combined or lower than $81+8$ if the CCCH is combined with SDCCH.            |
| 4    | MS -> SS  | CHANNEL REQUEST             | "Establishment Cause" = Answer to paging.                                                                                                                 |
| 5    | SS -> MS  | IMMEDIATE ASSIGNMENT REJECT | the first "request reference" corresponds to the CHANNEL REQUEST sent by the MS.                                                                          |

NOTE: The test limit has been computed to give a confidence of [99,74 %] that a unit which follows the requirements will pass. The number of samples (200) has been chosen to get a good compromise between the test time and the risk of passing a bad unit.

#### 26.2.1.1.4 Test requirements

$S(n) = \text{CARD} \{k \mid f(k) = n\}$

The following requirements shall be met:

$S(n) \leq 41$  for all n.

NOTE:  $\text{CARD} \{k \mid f(k) = n\}$  is mathematical notation for the number of times that f(k) equals n.

## 26.2.1.2 Channel request / repetition time

### 26.2.1.2.1 Conformance requirement

- 1) The MS shall spread retransmissions of a CHANNEL REQUEST message, with equal probability on Tx-Integer timeslots and with the correct delay after the reception of the PAGING REQUEST.
- 2) The MS shall not retransmit another CHANNEL REQUEST message when Max-retrans is reached.

### Reference(s)

3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.3.1.1.2.

### 26.2.1.2.2 Test purpose

- 1) To verify that the MS spreads retransmission of a CHANNEL REQUEST message with equal probability on Tx-Integer time slots and correctly applies the fixed delay when the following conditions apply:
  - the CCCH is combined or not combined with SDCCHs;
  - the maximum number of retransmissions is equal to one of the following values: 1, 2, 4, 7;
  - Tx-Integer is put to any of the allowed values among those which are greater or equal to 6.
- 2) To verify that the MS retransmits exactly Max\_Retrans times a CHANNEL REQUEST message if the network never responds to the CHANNEL REQUEST message.

### 26.2.1.2.3 Method of test

#### Initial Conditions

System Simulator:

1 cell.

Tx-Integer is arbitrarily chosen in the set {6, 7, 8, 9, 10, 11, 12, 14, 16, 20, 25, 32, 50}.

Max\_Retrans is arbitrarily chosen in the set {1, 2, 4, 7}.

Mobile Station:

The MS has a valid TMSI. It is "idle updated".

#### Related PICS/PIXIT Statement(s)

None.

#### Foreseen Final State of the MS

The MS has a valid TMSI. It is "idle updated".

#### Test Procedure

Specific test parameters

K equals the upper rounded value of  $230/\text{Max\_Retrans}$ .

m equals the upper rounded value of  $0,5 \times \text{Tx-Integer}$ .

Counter M = 0.

Parameter S: according to table 3.1/3GPP TS 04.08 / 3GPP TS 44.018 (this parameter depend on the value chosen for Tx-Integer).

$N0 = \max(8, T_x - \text{Integer})$ .

The MS is paged. The MS sends a CHANNEL REQUEST message. The MS retransmits CHANNEL REQUEST messages  $\text{Max\_Retrans}$  times. The SS measures the number of CCCH RACH slots  $f(i,k)$  between the moment where a CHANNEL REQUEST message has been received, and the reception of the following CHANNEL REQUEST message, excluding the slots containing the messages themselves. The SS updates the counter  $M$ . The SS does not answer to the CHANNEL REQUEST messages  $\text{Max\_Retrans}$  times. After the last CHANNEL REQUEST message in every sequence where  $k$  is lower than  $K$ , the SS sends an IMMEDIATE ASSIGNMENT REJECT. In the last sequence ( $k = K$ ), the SS does not respond to the MS. The MS shall not send any other CHANNEL REQUEST message.

### Maximum Duration of Test

The execution of one sequence (for one value  $k$ ): 10 s.

Between two consecutive executions (for  $k$  and  $k+1$ ), the SS must wait for 35 s, which is enough to guarantee that the MS is in service (listening to its paging subchannel).

### Expected Sequence

The sequence is executed for execution counter  $k = 1, \dots, K$  for each of the 2 test cases.

| Step | Direction | Message                     | Comments                                                                                                                                                                                                                                                                                                                                                                |
|------|-----------|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PAGING REQUEST TYPE 1       | "Mobile Identity" = TMSI of the MS.                                                                                                                                                                                                                                                                                                                                     |
| 2    | MS -> SS  | CHANNEL REQUEST             | "Establishment Cause" = Answer to paging.                                                                                                                                                                                                                                                                                                                               |
| 3    | MS -> SS  | CHANNEL REQUEST             | Steps 3, 4, 5 are executed for execution counter $i = 1, \dots, \text{Max\_Retrans}$ .                                                                                                                                                                                                                                                                                  |
| 4    | SS        |                             | "Establishment Cause" = Answer to paging.<br>The SS measures the number $f(i,k)$ of CCCH RACH slots between: - the moment where the last CHANNEL REQUEST message has been received, and - the reception of the new CHANNEL REQUEST message from the MS, excluding the slots containing the messages themselves. $f(i,k)$ shall be in the set $\{S, S+1, \dots, S+T-1\}$ |
| 5    | SS        |                             | If $f(i,k) - S \geq m$ , $M = M+1$                                                                                                                                                                                                                                                                                                                                      |
| A6   | SS -> MS  | IMMEDIATE ASSIGNMENT REJECT | Depending on the value of $k$ , step A6 or B6 is performed:<br>$k < K$ The third "Request Reference" IE corresponds to the last CHANNEL REQUEST message received. The third "Wait Indication" IE specifies 0 s. Other fields do not address the MS under test.                                                                                                          |
| B6   | SS        |                             | $k = K$ The SS checks that the MS sends no more CHANNEL REQUEST messages. This is verified during 3 s.                                                                                                                                                                                                                                                                  |
| 7    | SS        |                             | $M / (K * \text{Max\_Retrans})$ shall be inside the following interval: $[0,8 - m/T_x - \text{Integer} ; 1,2 - m/T_x - \text{Integer}]$                                                                                                                                                                                                                                 |

NOTE: The confidence interval in step 7, and the number of samples are chosen in such a way that the possibility of not accepting a correct MS is less than [0,26 %].

## 26.2.1.3 Channel request / random reference

### 26.2.1.3.1 Conformance requirement

A CHANNEL REQUEST message sent by the MS shall include a random reference randomly drawn from a uniform probability distribution for every new transmission.

### Reference(s)

3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.3.1.1.23.3.1.2.

## 26.2.1.3.2 Test purpose

To verify that an MS produces different random references for a CHANNEL REQUEST. If a MS always produces the same random reference, it makes possible that different MSs of the same product series produce the same random reference.

## 26.2.1.3.3 Method of test

## Initial Conditions

System Simulator:

1 cell, CCCH not combined with SDCCH.

Mobile Station:

The MS has a valid TMSI. It is "idle updated".

## Related PICS/PIXIT Statement(s)

None.

## Foreseen Final State of the MS

The MS has a valid TMSI. It is in the MM-state "idle, updated" and in the RR idle-mode.

## Test Procedure

Specific test parameters:

$K = 7$ .

$D = 4$ .

The SS sends a PAGING REQUEST message. The SS stores the "Random Reference"  $r(k)$  contained as a parameter in the CHANNEL REQUEST message sent by the MS. This sequence is performed  $K$  times, and it is verified that the MS produces different values  $r(k)$ .

## Maximum Duration of Test

6 min

Between two consecutive executions (for  $k$  and  $k+1$ ), the SS must wait for an amount of time which is enough to guarantee that the MS is in service (listening to its paging subchannel).

## Expected Sequence

The sequence is executed for execution counter  $k = 1, \dots, K$ .

| Step | Direction | Message               | Comments                                                                       |
|------|-----------|-----------------------|--------------------------------------------------------------------------------|
| 1    | SS -> MS  | PAGING REQUEST TYPE 1 |                                                                                |
| 2    | MS -> SS  | CHANNEL REQUEST       | "Establishment Cause" = Answer to paging.                                      |
| 3    | SS        |                       | The SS stores the "Random Reference" contained in the CHANNEL REQUEST message. |

## 26.2.1.3.4 Test requirements

At least  $D$  values of  $r(1), \dots, r(k)$  shall be different.

NOTE:  $D$  has been computed such that the probability of refusing a correct MS is less than [0,027 %].

## 26.2.2 IMSI detach and IMSI attach

The IMSI detach/attach procedures are used to indicate to the network that the MS is deactivated/activated. These procedures are allowed or not by the network (ATT flag set to "MSs in the cell shall apply IMSI attach and detach procedure" or "MSs in the cell are not allowed to apply IMSI attach and detach procedure").

If the IMSI attach procedure does not work correctly then the network would in certain situations not try to establish Mobile Terminating call even if the MS is "idle updated".

If an MS performs an unwanted IMSI detach procedure or does not perform IMSI detach when required, network resources are wasted.

### 26.2.2.1 Conformance requirement

- 1) When the Attach-detach flag in the Control Channel Description of the System Information Type 3 indicates "MSs in the cell are not allowed to apply IMSI attach and detach procedure", the MS shall not perform the IMSI detach procedure upon deactivation.
- 2) When the Attach-detach flag in the Control Channel Description of the System Information Type 3 indicates "MSs in the cell are not allowed to apply IMSI attach and detach procedure", the MS shall not perform the IMSI attach procedure upon activation.
- 3) The MS shall not perform the IMSI detach procedure if the Subscriber Identity Module is removed when the Attach-detach flag in the Control Channel Description of the System Information Type 3 indicates "MSs in the cell are not allowed to apply IMSI attach and detach procedure".
- 4) The MS shall not perform the IMSI attach procedure if the Subscriber Identity Module is inserted, when the Attach-detach flag in the Control Channel Description of the System Information Type 3 indicates "MSs in the cell are not allowed to apply IMSI attach and detach procedure".
- 5) The MS shall correctly perform the IMSI detach procedure, upon switch off, when it is required by the network to do so.
- 6) The MS shall correctly perform the IMSI attach procedure upon switch on when the IMSI attach procedure is required by the network. The MS shall correctly acknowledge the implicit TMSI reallocation procedure, which is part of this IMSI attach procedure, this means that the MS shall send a TMSI REALLOCATION COMPLETE message.
- 7) The MS shall correctly perform the IMSI detach procedure upon SIM removal when it is required by the network to do so.
- 8) The MS shall correctly perform the IMSI attach procedure, following SIM insertion and switch on when the IMSI attach procedure is required by the network. The MS shall correctly acknowledge the implicit TMSI reallocation procedure which is part of this IMSI attach procedure. This means that the MS shall send a TMSI REALLOCATION COMPLETE message.

#### Reference(s):

3GPP TS 02.07, normative annex B, subclause B1.17.

3GPP TS 04.08 / 3GPP TS 24.008, subclauses 4.4.3 and 4.4.4.

### 26.2.2.2 Test purpose

- 1) To verify that the MS correctly performs IMSI detach/attach procedures when it is required by the network and upon deactivation/activation or SIM removal/insertion and does not perform these procedures when not required.
- 2) To verify that the mobile station acknowledges a re-allocated TMSI during IMSI attach.

## 26.2.2.3 Method of test

## Initial Conditions

## System Simulator:

1 cell, default parameters.

For procedures 1 and 2 ATT flag is set to "MSs in the cell are not allowed to apply IMSI attach and detach procedure".

For procedures 3 and 4 ATT flag is set to "MSs in the cell should apply IMSI attach and detach procedure".

## Mobile Station:

The MS has a valid TMSI. It is "idle updated".

## Related PICS/PIXIT Statement(s)

|    |                                                    |           |
|----|----------------------------------------------------|-----------|
| a: | SIM removal possible without removing power source | Yes / No. |
| b: | On/off switch                                      | Yes / No. |
| c: | IMSI detach after SIM removal                      | Yes / No. |
| d: | IMSI detach after removing power source            | Yes / No. |

## Foreseen Final State of the MS

The MS has a valid TMSI which may be different from the initial one. It is "idle updated".

## Test Procedure

The SS indicates that IMSI detach/attach is not allowed. If possible the MS is switched off, then switched on, otherwise it has its power source removed and then restored (see b in PICS). The SS checks that the MS does not perform IMSI detach/attach procedures. If possible (if a = Yes, see PICS), the SIM is removed, then the SIM is inserted. The SS checks that the MS does not perform IMSI detach/attach procedures.

The SS indicates that IMSI detach/attach is allowed. After a delay of 35s the MS should have detected The SS indicates now, that IMSI detach/attach is allowed. If possible (if b = Yes, see PICS) the MS is switched off, otherwise it has its power source removed (if d = Yes, see PICS). The MS initiates an IMSI detach procedure. Then depending on what has been performed before, the MS is switched on or has its power source restored. It initiates an IMSI attach procedure. The location updating procedure contains an implicit TMSI reallocation. The SIM is removed. If (a = yes and c = yes) or (a = no and d = yes) the MS initiates an IMSI detach procedure. Then the SIM is inserted, it initiates an IMSI attach procedure, the location updating procedure contains an implicit TMSI reallocation.

## Maximum Duration of Test

4 min

## Expected Sequence

## Procedure 1

| Step | Direction | Message | Comments                                                                                           |
|------|-----------|---------|----------------------------------------------------------------------------------------------------|
| 1    | MS        |         | If possible the MS is switched off (see b in PICS), otherwise the MS has its power source removed. |
| 2    | MS        |         | The MS shall not initiate the IMSI detach procedure. This is checked by the SS during 5 s.         |
| 3    | MS        |         | Depending on what has been performed in step 1, the MS is brought back to operation.               |
| 4    | MS        |         | The MS shall not initiate an IMSI attach procedure. This is checked by the SS during 30 s.         |

## Procedure 2

|   |    |  |                                                                                                                                                                                                                                                                                                |
|---|----|--|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | MS |  | If possible (a = Yes, see PICS), the SIM is removed from the MS.<br>The MS shall not initiate the IMSI detach procedure. This is checked by the SS during 5 s.<br>The SIM is inserted in the MS.<br>The MS shall not initiate an IMSI attach procedure. This is checked by the SS during 30 s. |
| 2 | MS |  |                                                                                                                                                                                                                                                                                                |
| 3 | MS |  |                                                                                                                                                                                                                                                                                                |
| 4 | MS |  |                                                                                                                                                                                                                                                                                                |

## Procedure 3

|    |          |                            |                                                                                                                                                                                                                                    |
|----|----------|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1  | MS       |                            | The MS is switched off, or has its power source removed , depending on value b in the PICS file. If b = Yes or d = Yes the MS initiates an IMSI detach procedure (steps A2, A3, A4, A5), otherwise the SS goes straight to step 6. |
| A2 | MS -> SS | CHANNEL REQUEST            | After the sending of this message, the SS waits the disconnection of the main signalling link.                                                                                                                                     |
| A3 | SS -> MS | IMMEDIATE ASSIGNMENT       |                                                                                                                                                                                                                                    |
| A4 | MS -> SS | IMSI DETACH INDICATION     |                                                                                                                                                                                                                                    |
| A5 | SS -> MS | CHANNEL RELEASE            |                                                                                                                                                                                                                                    |
| 6  | MS       |                            | Depending on what has been performed in step 1, the MS is brought back to operation.                                                                                                                                               |
| 7  | MS -> SS | CHANNEL REQUEST            | The MS initiates an IMSI attach procedure.                                                                                                                                                                                         |
| 8  | SS -> MS | IMMEDIATE ASSIGNMENT       |                                                                                                                                                                                                                                    |
| 9  | MS -> SS | LOCATION UPDATING REQUEST  | "Location Updating Type" = IMSI attach.                                                                                                                                                                                            |
| 10 | SS -> MS | LOCATION UPDATING ACCEPT   | The SS allocates a new TMSI                                                                                                                                                                                                        |
| 11 | MS -> SS | TMSI REALLOCATION COMPLETE |                                                                                                                                                                                                                                    |
| 12 | SS -> MS | CHANNEL RELEASE            | After the sending of this message, the SS waits the disconnection of the main signalling link.                                                                                                                                     |

Specific message contents:

| Control Channel Description<br>- Attach/Detach allowed | MS shall apply IMSI attach and detach procedures. |

## 26.2.3 Sequenced MM / CM message transfer

The RR sublayer of the MS shall have an associated send state variable V(SD) for sending MM and CM messages. This send state variable has been introduced to avoid the duplication of MM and CM messages. It is useful for the network after a handover or a change of channel to identify duplicated messages.

If the MS started V(SD) with 1 instead of 0 the network would incorrectly diagnose loss of message.

If the MS later on does not handle correctly incrementation of V(SD) the network would not be able to continue the dialogue.

### 26.2.3.1 Conformance requirement

The MS shall implement correctly the "send state variable V(SD)" ("Send duplicated"), included in transmitted MM and CM messages.

#### Reference(s)

3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.1.4.3.

### 26.2.3.2 Test purpose

To verify that V(SD) is correctly set to 0 at the beginning of the establishment of the first RR connection and to verify that the MS handles correctly this variable in the special case of IDENTITY REQUEST messages, which are MM messages.

## 26.2.3.3 Method of test

## Initial Conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has a valid TMSI. It is "idle updated".

## Related PICS/PIXIT Statement(s)

None.

## Foreseen Final State of the MS

The MS has a valid TMSI. It is "idle updated".

## Test Procedure

The MS is paged. After reception of the PAGING RESPONSE message from the MS, the SS sends an IDENTITY REQUEST message. The MS sends an IDENTITY RESPONSE message where N(SD) = 0. The SS repeats its IDENTITY REQUEST message 10 times. The MS transmits IDENTITY RESPONSE message with the value 1 and 0 in the N(SD) field alternately.

## Maximum Duration of Test

1 min

## Expected Sequence

| Step | Direction | Message               | Comments                                                                                       |

| 1    | SS -> MS  | PAGING REQUEST TYPE 1 |                                                                                                |
| 2    | MS -> SS  | CHANNEL REQUEST       |                                                                                                |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT  |                                                                                                |
| 4    | MS -> SS  | PAGING RESPONSE       |                                                                                                |
| 5    | SS -> MS  | IDENTITY REQUEST      |                                                                                                |
| 6    | MS -> SS  | IDENTITY RESPONSE     | N(SD) = 0                                                                                      |
| 7    | SS -> MS  | IDENTITY REQUEST      | Steps 7, 8, 9 and 10 are repeated 5 times.                                                     |
| 8    | MS -> SS  | IDENTITY RESPONSE     | N(SD) = 1.                                                                                     |
| 9    | SS -> MS  | IDENTITY REQUEST      |                                                                                                |
| 10   | MS -> SS  | IDENTITY RESPONSE     | N(SD) = 0.                                                                                     |
| 11   | SS -> MS  | CHANNEL RELEASE       | After the sending of this message, the SS waits the disconnection of the main signalling link. |

## 26.2.4 Establishment cause

The establishment cause set by the MS in the CHANNEL REQUEST message shall be consistent with the requested service or function, with the capabilities of the MS and with the indications given by the network.

If the MS uses a wrong establishment cause, the network might assign an inappropriate or incompatible resource.

In the case of Emergency call a wrong priority might be used.

If a reserved value is used, the network may discard the channel request.

#### 26.2.4.1 Conformance requirements

In the CHANNEL REQUEST message, the MS shall include an establishment cause which correspond to the establishment cause given by the MM sublayer and the broadcasted NECI value, or which correspond to one of the establishment causes "answer to paging" given by the RR entity in response to a PAGING REQUEST message including the Channel Needed information.

#### Reference(s)

3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.3.1.1.2.

#### 26.2.4.2 Test purpose

To verify that the establishment cause sent by the MS in the Max-Retrans+1 CHANNEL REQUEST messages is consistent with the requested service, with the capabilities of the MS and with the indications of the network in the following cases:

- 1) If the MS supports a service on a traffic channel:
  - 1.1 when the NECI bit is set to 0 and call re-establishment is attempted and the call was established on TCH/H if the MS supports a service on half rate channel or on TCH/F otherwise.
- 2) If the MS supports a service on half rate channel:
  - 2.1 when the NECI bit is set to 1 and call re-establishment is attempted and the call was established on TCH/H.
- 3) If the MS supports speech:
  - 3.1 when the NECI bit is set to 0 and a speech call is attempted.
  - 3.2 when the NECI bit is set to 1 and a speech call is attempted.
- 4) If the MS supports a data service:
  - 4.1 when the NECI bit is set to 0 and a data call is attempted.
  - 4.2 when the NECI bit is set to 1 and a data call is attempted for a service supported on half rate channel (if the MS does not support any data call on half rate channel any data service is used).
- 5)
  - 5.1 when the NECI bit is set to 0 and the MS is paged with the paging indication set to "any channel".
  - 5.2 when the NECI bit is set to 0 and the MS is paged with the paging indication set to "SDCCH".
  - 5.3 when the NECI bit is set to 0 and the MS is paged with the paging indication set to "TCH/F".
  - 5.4 when the NECI bit is set to 0 and the MS is paged with the paging indication set to "TCH/H or TCH/F".
- 6)
  - 6.1 when the NECI bit is set to 0 and IMSI attach is attempted.
  - 6.2 when the NECI bit is set to 0 and normal location updating is attempted.
  - 6.3 when the NECI bit is set to 0 and periodic location updating is attempted.
  - 6.4 when the NECI bit is set to 0 and IMSI detach is attempted.
  - 6.5 when the NECI bit is set to 1 and IMSI attach is attempted.
  - 6.6 when the NECI bit is set to 1 and normal location updating is attempted.
  - 6.7 when the NECI bit is set to 1 and periodic location updating is attempted.
  - 6.8 when the NECI bit is set to 1 and IMSI detach is attempted.

7) If the MS supports a non call related supplementary service operation:

7.1 when the NECI bit is set to 0 and a supplementary service operation is attempted at the MS.

7.2 when the NECI bit is set to 1 and a supplementary service operation is attempted at the MS.

8) If the MS supports SMS/PP MO:

8.1 when the NECI bit is set to 0 and a mobile originated short message service transaction is attempted.

8.2 when the NECI bit is set to 1 and a mobile originated short message service transaction is attempted.

NOTE: To verify that when the MS supports speech and an emergency call is attempted and the NECI bit is set to 0, then the MS sends a CHANNEL REQUEST message with an establishment cause consistent with the requested service, with the capabilities of the MS and with the indications of the network is done in test 26.9.6.1.1 test purpose 1.

### 26.2.4.3 Method of test

#### Initial Conditions

System Simulator:

for all procedures: 1 cell, Max-Retrans = 7 slots. The NECI bit is set to 0.

Mobile Station:

The MS has a valid TMSI. It is "idle updated".

#### Related PICS/PIXIT Statement(s)

|                                                  |          |
|--------------------------------------------------|----------|
| a: MS supports speech on TCH/F                   | Yes / No |
| b: MS supports speech on TCH/H                   | Yes / No |
| c: MS supports data on TCH/F                     | Yes / No |
| d: MS supports data on TCH/H                     | Yes / No |
| e: MS only supports SDCCH                        | Yes / No |
| f: MS supports a supplementary service operation | Yes / No |
| g: MS supports SMS/PP MO                         | Yes / No |
| h: On/Off switch                                 | Yes / No |

NOTE: In the above PICS, data and speech refer to the Radio Resource Channel Mode.

#### Foreseen Final State of the MS

The MS has a valid TMSI. It is "idle updated".

#### Test Procedures

NOTE: If the procedures are chained, the SS shall ensure that at the beginning of each procedure, the initial conditions are reached and that the MS had enough time to decode the broadcasted parameters.

#### Procedure 1

If the MS supports a service on a traffic channel:

A call is established on TCH/H if the MS supports a service on half rate channel or on TCH/F otherwise. The SS stops transmission on the SACCH. The MS attempts call reestablishment. The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "110".

#### Procedure 2

If the MS supports a service on half rate channel:

The NECI bit is set to 1. A call is established on TCH/H. The SS stops transmission on the SACCH. The MS attempts call reestablishment. The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "011010".

#### Procedure 3

If the MS supports speech:

A speech call is attempted. The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "111". The NECI bit is set to 1. A speech call is attempted. The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "111" if the MS does not support speech on half rate channel or "0100" if the MS supports speech on half rate channel.

#### Procedure 4

If the MS supports a data service:

A data call is attempted. The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "111". The NECI bit is set to 1. A data call is attempted for a service supported on half rate channel (if the MS does not support any data call on half rate channel any data service is used). The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "111" if the MS does not support a data service on half rate channel or "0101" if the MS supports a data service on half rate channel.

#### Procedure 5

The MS is paged with the paging indication set to "any channel". The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "100". The SS waits for a time sufficient for the MS to be "idle updated". The MS is paged with the paging indication set to "SDCCH". The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "0001". The SS waits for a time sufficient for the MS to be "idle updated". The MS is paged with the paging indication set to "TCH/F". The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "100" if the MS capability is full rate only, "0010" if the MS capability is dual rate and "0001" if the MS capability is SDCCH only. The SS waits for a time sufficient for the MS to be "idle updated". The MS is paged with the paging indication set to "TCH/H or TCH/F". The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message.

The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "100" if the MS capability is full rate only, "0011" if the MS capability is dual rate and "0001" if the MS capability is SDCCH only.

#### Procedure 6

This procedure is performed twice. Once for NECI = 0 and once for NECI = 1.

The MS is switched off or powered off. Then system information messages are altered so that IMSI attach/detach is allowed in the cell. The MS is switched on or powered on. The MS performs IMSI attach. The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the values "0000" when NECI = 1, or "000" when NECI = 0. The IMSI attach procedure is followed. The location area code of the cell is changed, T3212 is set to 1 deci-hour. The MS performs a location updating. The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the values "0000" when NECI = 1, or "000" when NECI = 0. The location updating procedure is followed. The SS waits for at least 7 minutes. The MS performs a periodic updating. The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the values "0000". The location updating procedure is followed. The MS is switched off or powered off. If the MS has an On/off switch (see PICS), it attempts IMSI detach. The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "0001" when NECI = 1, or "111" when NECI = 0.

#### Procedure 7

This procedure is performed twice. Once for NECI = 0 and once for NECI = 1.

If the MS supports a non call related supplementary service operation:

A supplementary service operation is attempted at the MS. The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "0001".

#### Procedure 8

If the MS supports SMS/PP MO:

A mobile originated short message service transaction is attempted. The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "0001" when NECI = 1, or "111" when NECI = 0.

#### Maximum Duration of Test

For procedures 1, 2, 3, 4 and 5: 5 minutes, including 1 minute for any necessary operator actions.

For procedure 6: 20 minutes, including 2 minutes for any necessary operator actions.

For procedures 7, 8: 10 minutes, including 2 minutes for any necessary operator actions.

## Expected Sequence

## Procedure 1

This procedure is performed if the MS supports a service on a traffic channel.

| Step | Direction | Message                        | Comments                                                                                                                                          |
|------|-----------|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    |           |                                | a call is established on TCH/H if the MS supports a service on half rate channel or on TCH/F otherwise. The generic call setup procedure is used. |
| 2    | SS        |                                | the SS stops transmission on the SACCH.                                                                                                           |
| 3    | MS -> SS  | 8 CHANNEL REQUEST              | all messages have establishment cause set to "110"                                                                                                |
| 4    | SS -> MS  | IMMEDIATE ASSIGNMENT<br>REJECT |                                                                                                                                                   |

## Procedure 2

This procedure is performed if the MS supports a service on half rate channel.

| Step | Direction | Message                        | Comments                                                                                            |
|------|-----------|--------------------------------|-----------------------------------------------------------------------------------------------------|
| 1    | SS        |                                | The NECI bit is set to 1, a call is established on TCH/H. The generic call setup procedure is used. |
| 2    |           |                                |                                                                                                     |
| 3    | SS        |                                | the SS stops transmission on the SACCH.                                                             |
| 4    | MS -> SS  | 8 CHANNEL REQUEST              | all messages have establishment cause set to "011010"                                               |
| 5    | SS -> MS  | IMMEDIATE ASSIGNMENT<br>REJECT |                                                                                                     |

## Procedure 3

This procedure is performed if the MS supports speech.

| Step | Direction | Message                        | Comments                                                                                                             |
|------|-----------|--------------------------------|----------------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                                | a speech call is attempted                                                                                           |
| 2    | MS -> SS  | 8 CHANNEL REQUEST              | all messages have establishment cause set to "111"                                                                   |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT<br>REJECT |                                                                                                                      |
| 4    | SS        |                                | The NECI bit is set to 1                                                                                             |
| 5    | SS        |                                | The SS waits for 30 s                                                                                                |
| 6    | MS        |                                | a speech call is attempted                                                                                           |
| 7    | MS -> SS  | 8 CHANNEL REQUEST              | all messages have establishment cause set to "0100" if the MS supports speech on half rate or set to "111" otherwise |
| 8    | SS -> MS  | IMMEDIATE ASSIGNMENT<br>REJECT |                                                                                                                      |

## Procedure 4

This procedure is performed if the MS supports a data service.

| Step | Direction | Message                     | Comments                                                                                                                                                |
|------|-----------|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                             | a data call is attempted                                                                                                                                |
| 2    | MS -> SS  | 8 CHANNEL REQUEST           | all messages have establishment cause set to "111"                                                                                                      |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT REJECT |                                                                                                                                                         |
| 4    | SS        |                             |                                                                                                                                                         |
| 5    | SS        |                             | The NECI bit is set to 1                                                                                                                                |
| 6    | MS        |                             | The SS waits for 30 s                                                                                                                                   |
| 7    | MS -> SS  | 8 CHANNEL REQUEST           | a data call is attempted for a service supported by the MS on half rate (for any data service if the MS does not support any data service on half rate) |
| 8    | SS -> MS  | IMMEDIATE ASSIGNMENT REJECT | all messages have establishment cause set to "0101" if the MS supports a data service on half rate or set to "111" otherwise                            |

## Procedure 5

| Step | Direction | Message                     | Comments                           |
|------|-----------|-----------------------------|------------------------------------|
| 1    | SS -> MS  | PAGING REQUEST TYPE 1       | paging indication = any channel    |
| 2    | MS -> SS  | 8 CHANNEL REQUEST           |                                    |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT REJECT |                                    |
| 4    | SS        |                             | The SS waits for 5 s               |
| 5    | SS -> MS  | PAGING REQUEST TYPE 1       | paging indication = SDCCH          |
| 6    | MS -> SS  | 8 CHANNEL REQUEST           |                                    |
| 7    | SS -> MS  | IMMEDIATE ASSIGNMENT REJECT |                                    |
| 8    | SS        |                             | The SS waits for 5 s               |

| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT REJECT |                                                                                                                                                                                                                  |

## 26.3 Test of MS functions in idle mode

### 26.3.1 Initial conditions

The SIM shall contain a PLMN-Selector that contains only the HPLMN of the MS, and an empty forbidden PLMN list.

#### Related PICS/PIXIT statements

Type of mobile station (GSM 400, GSM 700, GSM 850, P-GSM 900, E-GSM 900, R-GSM 900, DCS 1 800 or PCS 1 900)

During the tests in subclauses 26.3.2 and 26.3.3, the following parameters apply according to the above PICS/PIXIT statement:

#### RACH control parameters

In cells:

|                      |         |
|----------------------|---------|
| GSM 400:             | 1 to 7; |

| 7    | +55                                    | 810        |
| 8    | +53                                    | 251        |

For testing an E-GSM Mobile station (see PICS/PIXIT), the BCCH ARFCN of cell 7 at GSM 900 column shall be 985 (instead of 97). For testing an R-GSM Mobile station (see PICS/PIXIT), the BCCH ARFCN of cell 7 at GSM 900 column shall be 965 (instead of 97).

NOTE 4: The SIM should contain a PLMN-Selector that contains only the HPLMN of the MS, and an empty forbidden PLMN list.

## 26.3.2 MS indication of available PLMNs

### 26.3.2.1 Test purpose

To verify that a MS can present the available PLMNs to the user when asked to do so in manual mode according to the requirements of 3GPP TS 05.08 and 3GPP TS 02.11.

### 26.3.2.2 Method of test

- a) The MS is switched on, equipped with a SIM containing default values except for those values listed under subclause 26.3.1 (initial conditions).
- b) The MS is put into manual network selection mode (see PIXIT).

### 26.3.2.3 Test requirements

- 1) On entering manual network selection mode, the MS shall present a list of available PLMNs in all its bands of operation (MCC and MNC values, or any other valid indications, see PIXIT), within 2 minutes. Any PLMN shall only be presented once. The list shall include the MCC and MNC of:

GSM 400, GSM 700, GSM 850 and GSM 900: cells 1 to 7, but not of cell 8.

DCS 1 800: cells 1 to 6, but not of cell 7.

PCS 1 900: cells 1 to 6, but not of cell 7.

Multiband: cells 2, 3, 4, 6, 7 and 1 or 5 (cell 1 and 5 have the same MCC and MNC), but not of cell 8.

## 26.3.3 MS will send only if BSS is "on air"

### 26.3.3.1 Test purpose

To verify that the MS will not produce any RF transmission if no BSS is received.

### 26.3.3.2 Method of test

- a) The RF-signal for the BCCHs of:

GSM 400, GSM 700, GSM 850 and GSM 900: cell 1 to 8 is switched off.

DCS 1 800: cell 1 to 7 is switched off.

PCS 1 900: cell 1 to 7 is switched off.

Any Multiband: cell 1 to 8 is switched off.

- b) The SS shall wait 20 s to allow the MS to detect the loss of cells.
- c) By MMI, an attempt to originate a call is made.
- d) By MMI, an attempt to originate an emergency call is made.

Step d) is only performed if the MS supports speech (see PICS/PIXIT statement).

### 26.3.3.3 Test requirements

- 1) The MS must not give "service indication".
- 2) In steps c) and d) the MS shall not produce any RF output.

## 26.3.4 Manual mode of PLMN selection

### 26.3.4.1 Conformance requirements

In manual mode, the MS can try to obtain normal service on any available VPLMN and it shall try to obtain normal service on a VPLMN if and only if the user makes a manual selection of this VPLMN.

#### Reference

3GPP TS 03.22 subclause 3.1.

### 26.3.4.2 Test purpose

To check that in manual mode the MS is able to obtain normal service on a PLMN which is neither the better nor a preferred PLMN and that it tries to obtain service on VPLMN if and only if the user selects it manually.

### 26.3.4.3 Method of test

#### Initial conditions

##### System Simulator:

2 cells, defaults parameter unless otherwise specified.

The SS transmits 2 BCCH carriers in the supported band(s) of the mobile station (for a multiband MS carrier A and B shall be in different bands) with the initial following parameters:

|           |        | level (dB $\mu$ Vemf) |
|-----------|--------|-----------------------|
| carrier A | PLMN 1 | 38                    |
| carrier B | PLMN 2 | 33                    |

##### Mobile Station:

The MS is "idle updated" on PLMN1 (HPLMN) and is in manual mode.

The preferred PLMN list does not contain PLMN2, it contains PLMN 3.

#### Related PICS/PIXIT statement(s)

Description of the manual PLMN selector.

Support of multiband functionality

Foreseen final state of the MS

The MS is "idle updated".

Test procedure

For the different networks and during the whole test, "IMSI attach" flag is set in the BCCH data.

Carrier A is turned off. The MS does not attempt a location updating during 2 minutes.

Carrier A is turned back on with a different MCC-MNC (indicating PLMN 3) and with a higher level (48 dBmVemf) than PLMN 2. The MS does not attempt a location updating during 2 minutes.

PLMN 2 is selected manually. The MS performs a location updating on PLMN 2. Carrier B is turned off. The MS does not attempt a location updating during 2 minutes.

Maximum duration of test

10 minutes.

## 26.4 Lower layer failures in layer 3 testing

### 26.4.1 Introduction

The text in this subclause is intended to develop a standardized way of creating lower layer failures whilst testing the performance of Layer 3 signalling.

There are two groups of lower layer failures:

- 1) Detected by analysis of reception at Layer 1 (3GPP TS 05.08, 3GPP TS 04.08 / 3GPP TS 44.018),
- 2) Data link layer failures.

References

3GPP TS 04.08 / 3GPP TS 44.018, 3GPP TS 04.06, 3GPP TS 05.08

## 26.4.2 Layer 1 reception failures

The absence of reception of correct frames on the SACCH until the S counter reaches value 0 will be interpreted as a Layer 1 failure.

## 26.4.3 Data link layer failures

Many kinds of error cases can be caused in Layer 2. For example too many "T200 - time-out/retrying" - pairs.

NOTE 1: All types of data link failures are indicated similarly to the RR layer (Release Indication).

NOTE 2: All types of L1 failures are indicated similarly to each layer (Abort Indication, Error Indication).

## 26.4.4 Lower layer failures, used for the tests in clause 25

For L3 testing different lower layer failures are performed:

- 1) T100 time-out in Layer 1.
- 2) Too many T200 time-outs consecutively in Layer 2.

## 26.5 Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions

### 26.5.1 Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions / unknown protocol discriminator

An MS ignores messages with unknown protocol discriminator. This allows for the introduction of new messages which will be ignored by MS of earlier phases.

#### 26.5.1.1 Conformance requirements

If the mobile station receives a standard L3 message with a protocol discriminator different from those specified in table 9.2/3GPP TS 04.07, the mobile station shall ignore the message.

#### References

3GPP TS 04.07, subclause 11.2.1.

#### 26.5.1.2 Test purpose

To verify that a MS supporting TCH and the call control protocol ignores a message containing an undefined protocol discriminator in the special case of a message coded otherwise like a CC STATUS ENQUIRY message received by the MS having a mobile terminating call in CC-state U10, "active".

#### 26.5.1.3 Method of test

##### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has been paged and an RR connection has been established.

If the MS supports the call control protocol, the test may alternatively be performed with the MS having a mobile terminating call in the CC-state U10, "active".

## Related PICS/PIXIT statements

- At least one circuit switched basic service supported (Y/N).

## Foreseen Final State of the MS

Same as in the initial conditions.

## Test Procedure

The SS sends a message to the MS which is coded like a CC STATUS ENQUIRY message relating to the active call except for the fact that the protocol discriminator of the message is undefined.

## Maximum duration of test

11 s.

## Expected sequence

| Step | Direction | Message         | Comments                                                                                                                           |
|------|-----------|-----------------|------------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | UNKNOWN MESSAGE | The SS waits between 5 s and 10 s verifying during this period that the MS does not send a L3 message on the main signalling link. |
| 2    | SS        |                 |                                                                                                                                    |

## Specific message contents

## UNKNOWN MESSAGE

| Information element    | Value/remark                                                                                        |
|------------------------|-----------------------------------------------------------------------------------------------------|
| Protocol discriminator | 0000                                                                                                |
| TI flag                | transaction originated by SS                                                                        |
| TI value               | TI value of the active call if the test is performed in state U10 otherwise the value is arbitrary. |
| Message Type           | H'34                                                                                                |

## 26.5.2 Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions / TI and skip indicator

### 26.5.2.1 TI and skip indicator / RR

The MS ignores RR messages with skip indicator different to 0. This allows for the introduction of new RR messages which will be ignored by MS of earlier phases, especially on the downlink CCCH and BCCH.

#### 26.5.2.1.1 TI and skip indicator / RR / Idle Mode

##### 26.5.2.1.1.1 Conformance requirements

A radio resource message received with skip indicator different from 0000 shall be ignored.

## Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008, subclause 10.3.1.

##### 26.5.2.1.1.2 Test purpose

To verify that the MS ignores an RR message with skip indicator different from H'0 in the special case of a PAGING REQUEST TYPE 1 message received in the MM-state "idle, updated" and in RR-idle mode.

## 26.5.2.1.1.3 Method of test

## Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in the MM-state "idle, updated" and in RR-idle mode. It has a valid TMSI.

## Related PICS/PIXIT statements

None.

## Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode. It has a valid TMSI.

## Test Procedure

For every binary value  $x$  in the range 0001 - 0110 (binary) and for binary value  $x = 1\ 000$ , the following procedure is performed: The SS sends a PAGING REQUEST TYPE 1 message to the MS with skip indicator set to  $x$ . It is verified that the MS does not answer to the paging request message.

## Maximum duration of test

5 s for each execution.

## Expected sequence

The sequence is executed for execution counter  $k = 1, 2, 3, 4, 5, 6, 8$ .

| Step | Direction | Message               | Comments                                                                      |
|------|-----------|-----------------------|-------------------------------------------------------------------------------|
| 1    | SS -> MS  | PAGING REQUEST TYPE 1 | The value of the skip indicator IE is the binary encoding of $k$ .            |
| 2    | SS        |                       | During 3 s the SS verifies that the MS does not send any message on the RACH. |

## Specific message contents

None.

## 26.5.2.1.2 TI and skip indicator / RR / RR-Connection established

## 26.5.2.1.2.1 Conformance requirements

A radio resource message received with skip indicator different from H'0 shall be ignored.

## Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008, subclause 10.3.1.

## 26.5.2.1.2.2 Test purpose

To verify that the MS ignores RR messages with skip indicator different from H'0 in the case of a message being received during the RR-connection establishment in the MM-state "idle, updated" / "wait for network command" and in RR-connected mode.

### 26.5.2.1.2.3 Method of test

#### Initial conditions

##### System Simulator:

1 cell, default parameters, max retrans = 2.

##### Mobile Station:

The MS is in the MM-state "idle, updated" and in RR-idle mode. It has a valid TMSI.

#### Related PICS/PIXIT statements

None.

#### Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode. It has a valid TMSI.

#### Test Procedure

The SS sends a PAGING REQUEST TYPE 1 message to the MS with skip indicator set to H'0. The first CHANNEL REQUEST message will be answered with an IMMEDIATE ASSIGNMENT addressing the MS but with skip indicator set to H'1. Transmission of the second CHANNEL REQUEST message verifies that the MS has ignored the IMMEDIATE ASSIGNMENT message.

The second CHANNEL REQUEST message is answered by an IMMEDIATE ASSIGNMENT REJECT message addressing the MS but with skip indicator set to H'2 and a reject time set to 255 s. Transmission of the third CHANNEL REQUEST message verifies that the MS has ignored the IMMEDIATE ASSIGNMENT REJECT message.

The third CHANNEL REQUEST message from the MS will be answered with a correct IMMEDIATE ASSIGNMENT addressing the MS and having skip indicator set to H'0.

In the RR-Connected mode messages such as CIPHERING MODE COMMAND, HANDOVER COMMAND, ASSIGNMENT COMMAND and CHANNEL RELEASE are sent with the skip indicator  $\langle \rangle$  H'0 and it is checked that the MS does not take any action on these commands.

#### Maximum duration of test

40 s.

Expected sequence

| Step | Direction | Message                        | Comments                                                                                                        |
|------|-----------|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PAGING REQUEST TYPE 1          | The value of the skip indicator IE is H'0                                                                       |
| 2    | MS -> SS  | CHANNEL REQUEST                |                                                                                                                 |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT           | skip indicator set to H'1                                                                                       |
| 4    | MS -> SS  | CHANNEL REQUEST                |                                                                                                                 |
| 5    | SS -> MS  | IMMEDIATE ASSIGNMENT<br>REJECT | skip indicator = H'2, reject time = 255 s                                                                       |
| 6    | MS -> SS  | CHANNEL REQUEST                | Cause, answer to paging                                                                                         |
| 7    | SS -> MS  | IMMEDIATE ASSIGNMENT           | skip indicator = H'0                                                                                            |
| 8    | MS -> SS  | PAGING RESPONSE                | RR connection established                                                                                       |
| 9    | SS -> MS  | AUTHENTICATION REQUEST         |                                                                                                                 |
| 10   | MS -> SS  | AUTHENTICATION RESPONSE        |                                                                                                                 |
| 11   | SS -> MS  | CIPHERING MODE COMMAND         | skip indicator = H'3                                                                                            |
| 12   | SS        |                                | the SS neither starts ciphering nor deciphering                                                                 |
| 13   | SS -> MS  | IDENTITY REQUEST               | with IMSI requested                                                                                             |
| 14   | MS -> SS  | IDENTITY RESPONSE              | to check the MS still uses unciphered mode                                                                      |
| 15   | SS -> MS  | ASSIGNMENT COMMAND             | skip indicator = H'4                                                                                            |
| 16   | SS        |                                | SS checks no SABM is sent by the MS on the new channel                                                          |

### 26.5.2.2 TI and skip indicator / MM

The MS ignores MM messages with skip indicator different to 0. This allows for the introduction of new MM messages which will be ignored by MS of earlier phases.

#### 26.5.2.2.1 Conformance requirements

A mobility management message received with skip indicator different from 0000 shall be ignored.

#### References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 10.3.1.

#### 26.5.2.2.2 Test purpose

To verify that the MS ignores an MM message with skip indicator different from H'0 in the special case of an IDENTITY REQUEST message received.

#### 26.5.2.2.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has a mobile terminating call in CC-state U10, "active", or alternatively, the MS has been paged and an RR connection has been established.

Related PICS/PIXIT statements

At least one circuit switched basic service supported (Y/N).

Foreseen Final State of the MS

Same as in the initial conditions.

Test Procedure

For every binary value x in the range 0001 - 0110 and for the binary value x = 1 000, the following procedure is performed: The SS sends an IDENTITY REQUEST message to the MS with skip indicator set to x. It is verified during 5 s that the MS does not answer to the IDENTITY REQUEST message.

Maximum duration of test

15 s.

Expected sequence

| Step | Direction | Message          | Comments                                                                                                                                                       |
|------|-----------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | IDENTITY REQUEST | Skip indicator IE has value H'1.                                                                                                                               |
| 2    | SS        |                  | The SS starts verifying that the MS does not send any L3 message on the main signalling link. This verification continues until step 16 of this test sequence. |
| 3    | SS        |                  | The SS waits 1 second.                                                                                                                                         |
| 4    | SS -> MS  | IDENTITY REQUEST | Skip indicator IE has value H'2.                                                                                                                               |
| 5    | SS        |                  | The SS waits 1 second.                                                                                                                                         |
| 6    | SS -> MS  | IDENTITY REQUEST | Skip indicator IE has value H'3.                                                                                                                               |
| 7    | SS        |                  | The SS waits 1 second.                                                                                                                                         |
| 8    | SS -> MS  | IDENTITY REQUEST | Skip indicator IE has value H'4.                                                                                                                               |
| 9    | SS        |                  | The SS waits 1 second.                                                                                                                                         |
| 10   | SS -> MS  | IDENTITY REQUEST | Skip indicator IE has value H'5.                                                                                                                               |
| 11   | SS        |                  | The SS waits 1 second.                                                                                                                                         |
| 12   | SS -> MS  | IDENTITY REQUEST | Skip indicator IE has value H'6.                                                                                                                               |
| 13   | SS        |                  | The SS waits 1 second.                                                                                                                                         |
| 14   | SS -> MS  | IDENTITY REQUEST | Skip indicator IE has value H'8.                                                                                                                               |
| 15   | SS        |                  | The SS waits 5 s.                                                                                                                                              |
| 16   | SS        |                  | The SS stops verifying that the MS does not send any L3 message on the main signalling link.                                                                   |

### 26.5.2.3 TI and skip indicator / CC

#### 26.5.2.3.1 Conformance requirements

- a) Whenever any call control message except SETUP or RELEASE COMPLETE is received specifying a transaction identifier with a value different from 111, which is not recognized as relating to an active call or to a call in progress, the receiving entity shall send a RELEASE COMPLETE message with cause value #81 "invalid transaction identifier value" using the received transaction identifier value and remain in the Null state.
- b1) When a RELEASE COMPLETE message is received specifying a transaction identifier with a value different from 111, which is not recognized as relating to an active call or to a call in progress, the MM-connection associated with that transaction identifier shall be released.

- b2) When a SETUP message is received with a transaction identifier flag set to "1", this message shall be ignored.
- b3) When a SETUP message is received specifying a transaction identifier which is recognized as relating to an active call or to a call in progress, this SETUP message shall be ignored.
- c) When a CC message with a TI value = 111 is received, this message shall be ignored.

## References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 8.3.

### 26.5.2.3.2 Test purpose

- a) To verify that the MS having a mobile terminating call in CC-state U10, "active", on receipt of a DISCONNECT message which includes a transaction identifier with a value different from 111, which is not recognized as relating to an active call or a call in progress, sends a RELEASE COMPLETE message with cause value #81 and referring to the latter TI without changing the state of the active call (this is verified by use of the status enquiry procedure).
- b) To verify that the MS having a mobile terminating call in CC-state U10, "active", on receipt of a:
  - b1) RELEASE COMPLETE message which includes a transaction identifier with a value different from 111, which is not recognized as relating to an active call or a call in progress, or a
  - b2) SETUP message with TI flag referring to a transaction originated by the MS (in the special case where the TI value is equal to the TI value relating to the active call), or a
  - b3) SETUP message with TI referring to the active call, ignores that message without changing the state of the active call (this is verified by use of the status enquiry procedure).
- c) To verify that the MS ignores a CC message with a TI value of 111.

The test is only applicable to an MS supporting the call control protocol for at least one BC.

### 26.5.2.3.3 Method of test

#### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has a mobile terminating call in CC-state U10, "active". No other call is active or in progress.

#### Related PICS/PIXIT statements

At least one circuit switched basic service supported (Y/N).

#### Foreseen Final State of the MS

The MS has a mobile terminating call in CC-state U10, "active". No other call is active or in progress.

#### Test Procedure

The SS sends a DISCONNECT message to the MS with a TI not relating to the active call. The MS shall respond with a RELEASE COMPLETE message including cause value #81 and specifying the same transaction. By means of the status enquiry procedure the SS checks that the CC-state of the active call did not change.

Then the SS sends the following call control messages to the MS:

- a RELEASE COMPLETE message, where the TI does not refer to the active call;

- a SETUP message with TI flag set to 1;
- a SETUP message with TI referring to the active call;
- a DISCONNECT message with a TI value of 111.

Each time the SS verifies that the MS does not respond to the message and each time the SS verifies by means of the status enquiry procedure that the CC-state of the active call has not been changed.

#### Maximum duration of test

40 s.

#### Expected sequence

| Step | Direction | Message          | Comments                                                                                            |
|------|-----------|------------------|-----------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | DISCONNECT       | TI flag = 0; TI does not refer to the active call.                                                  |
| 2    | MS -> SS  | RELEASE COMPLETE | TI flag = 1; TI value is equal to TI value received in step 1; Cause IE indicates cause value #81.  |
| 3    | SS -> MS  | STATUS ENQUIRY   | TI refers to the active call.                                                                       |
| 4    | MS -> SS  | STATUS           | TI refers to the active call; Cause IE indicates cause value #30. Call state IE indicates state U10 |
| 5    | SS -> MS  | RELEASE COMPLETE | TI flag = 0; TI does not refer to the active call.                                                  |
| 6    | SS        |                  | The SS verifies during 5 s that the MS does not send any L3 message on the main signalling link.    |
| 7    | SS -> MS  | STATUS ENQUIRY   | TI refers to the active call.                                                                       |
| 8    | MS -> SS  | STATUS           | TI refers to the active call; Cause IE indicates cause value #30. Call state IE indicates state U10 |
| 9    | SS -> MS  | SETUP            | TI flag = 1; TI value is equal to TI value of the active call.                                      |
| 10   | SS        |                  | The SS verifies during 5 s that the MS does not send any L3 message on the main signalling link.    |
| 11   | SS -> MS  | STATUS ENQUIRY   | TI refers to the active call.                                                                       |
| 12   | MS -> SS  | STATUS           | TI refers to the active call; Cause IE indicates cause value #30. Call state IE indicates state U10 |
| 13   | SS -> MS  | SETUP            | TI flag = 0; TI refers to the active call.                                                          |
| 14   | SS        |                  | The SS verifies during 5 s that the MS does not send any L3 message on the main signalling link.    |
| 15   | SS -> MS  | STATUS ENQUIRY   | TI refers to the active call.                                                                       |
| 16   | MS -> SS  | STATUS           | TI refers to the active call; Cause IE indicates cause value #30. Call state IE indicates state U10 |
| 17   | SS -> MS  | DISCONNECT       | TI flag = 0; TI value is 111.                                                                       |
| 18   | SS        |                  | The SS verifies during 5 s that the MS does not send any L3 message on the main signalling link.    |
| 19   | SS -> MS  | STATUS ENQUIRY   | TI refers to the active call.                                                                       |
| 20   | MS -> SS  | STATUS           | TI refers to the active call; Cause IE indicates cause value #30. Call state IE indicates state U10 |

#### Specific message contents

None.

### 26.5.3 Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions / undefined or unexpected message type

#### 26.5.3.1 Undefined or unexpected message type / undefined message type / CC

##### 26.5.3.1.1 Conformance requirements

If the Mobile Station receives a message with message type not defined for the PD, it shall ignore the message except for the fact that, if an RR-connection exists, it returns a status message (STATUS, RR STATUS or MM STATUS depending on the protocol discriminator) with cause value #97 "message type non-existent or not implemented".

## References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 8.4; 3GPP TS 04.07, subclause 11.2.4.

## 26.5.3.1.2 Test purpose

To verify that a MS supporting the call control protocol for at least one BC, having a mobile terminating call in CC-state U10, "active", on receipt of a message with CC protocol discriminator and an arbitrary undefined message type, returns a STATUS message with cause value #97 to the peer CC entity without changing the state of the active call (this is verified by use of the status enquiry procedure).

## 26.5.3.1.3 Method of test

## Initial conditions

## System Simulator:

1 cell, default parameters.

## Mobile Station:

The MS has a mobile terminating call in CC-state U10, "active".

## Related PICS/PIXIT statements

At least one circuit switched basic service supported (Y/N).

## Foreseen Final State of the MS

The MS has a mobile terminating call in CC-state U10, "active".

## Test Procedure

The SS sends a message to the MS the PD of which refers to call control, the TI of which refers to the active call, and the message type of which is undefined in the call control protocol (however bit 7 of the message type is "0"). The SS then checks that the MS responds with a STATUS message specifying cause value #97. The SS then sends a STATUS ENQUIRY message to the MS and verifies that the MS responds with a STATUS message specifying cause value #30 and call state U10, "active".

## Maximum duration of test

10 s.

## Expected sequence

| Step | Direction | Message        | Comments                                                                                                                                                                                        |
|------|-----------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## 26.5.3.2 Undefined or unexpected message type / undefined message type / MM

### 26.5.3.2.1 Conformance requirements

If the Mobile Station receives a message with message type not defined for the PD, it shall ignore the message except for the fact that, if an RR-connection exists, it returns a status message (STATUS, RR STATUS or MM STATUS depending on the protocol discriminator) with cause value #97 "message type non-existent or not implemented".

### References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 8.4.

### 26.5.3.2.2 Test purpose

To verify that a MS supporting the call control protocol for at least one BC, having a mobile terminating call in CC-state U10, "active", on receipt of a message with MM protocol discriminator and message type undefined for the mobility management protocol, returns an MM STATUS message with reject cause value #97 without changing the state of the active call (this is verified by use of the status enquiry procedure.) This is tested in the special case where the CC TI has value 0 (so that it has the same encoding as the skip indicator when sent from the SS) and where the message type has the same encoding as DISCONNECT in CC.

### 26.5.3.2.3 Method of test

#### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has a mobile terminating call in CC-state U10, "active". The TI of that mobile terminating call has value 0.

#### Related PICS/PIXIT statements

At least one circuit switched basic service supported (Y/N).

#### Foreseen Final State of the MS

The MS has a mobile terminating call in CC-state U10, "active".

#### Test Procedure

The SS sends a message to the MS the PD of which refers to mobility management, the skip indicator of which is "0000", and the message type of which is "0000 0000". The SS then checks that the MS responds with an MM STATUS message specifying reject cause value #97. The SS then sends a STATUS ENQUIRY message to the MS and verifies that the MS responds with a STATUS message specifying cause #30 and call state U10, "active".

#### Maximum duration of test

10 s.

Expected sequence

| Step | Direction | Message        | Comments                                                                                                                     |
|------|-----------|----------------|------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | see comments   | PD = "mobility management messages" Skip indicator = "0000" Message type = "0000 0000" rest of the message is H'02 H'E0 H'90 |
| 2    | MS -> SS  | MM STATUS      | Reject cause IE indicates reject cause value #97.                                                                            |
| 3    | SS -> MS  | STATUS ENQUIRY |                                                                                                                              |
| 4    | MS -> SS  | STATUS         | TI refers to the active call; Cause IE indicates cause value #30. Call state IE indicates state U10                          |

### 26.5.3.3 Undefined or unexpected message type / undefined message type / RR

#### 26.5.3.3.1 Conformance requirements

If the Mobile Station receives a message with message type not defined for the PD, it shall ignore the message except for the fact that, if an RR-connection exists, it returns a status message (STATUS, RR STATUS or MM STATUS depending on the protocol discriminator) with cause value #97 "message type non-existent or not implemented".

Reference(s)

3GPP TS 04.08 / 3GPP TS 44.018, subclause 8.4.

#### 26.5.3.3.2 Test purpose

To verify that an MS in RR connected mode on receipt of a message with RR protocol discriminator and message type undefined for the RR protocol, returns an RR STATUS message with reject cause value #97 without changing its state (this is checked by observing that the MS does not send L3 messages).

#### 26.5.3.3.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has been paged and an RR connection has been established.

Related PICS/PIXIT statement(s)

- At least one circuit switched basic service supported (p = Y/N).

Foreseen Final State of the MS

The MS is in "idle updated" state.

## Test Procedure

The SS sends a message to the MS the PD of which refers to radio resources management, the skip indicator of which is "0000", and the message type of which is "0010 1010". The SS then checks that the MS responds with an RR STATUS message specifying reject cause value #97. The SS then verifies during 5 s that the MS does not send a L3 message on the main signalling link but continues sending L2 fill frames on the main signalling link. Then the SS sends a SETUP message to the MS. This message specifies a BC that is supported by the MS, if there exists any; if the MS does not support any BC, the SETUP message specifies an arbitrary BC. The SS then verifies that the MS responds with a CALL CONFIRMED message if the SETUP had specified a BC supported by the MS, and that the MMS responds with a RELEASE COMPLETE message otherwise. Then the SS sends a CHANNEL RELEASE to the MS and waits for the disconnection of the main signalling link.

## Maximum duration of test

15 s.

## Expected sequence

| Step | Direction | Message          | Comments                                                                                                                                                                      |
|------|-----------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS->MS    | see comments     | PD = "radio resources management messages" Skip indicator = "0000" Message type = "0010 0101" rest of the message is H'02 H'E0 H'90                                           |
| 2    | MS->SS    | RR STATUS        | RR cause IE indicates RR cause value #97.                                                                                                                                     |
| 3    | SS        |                  | During 5 s the SS verifies that the MS does not send a L3 message on the main signalling link but still continues to send L2 fill frames on the main signalling link.         |
| 4    | SS->MS    | SETUP            | If the MS supports at least one BC (p = Y), the SETUP specifies a bearer capability supported by the MS. Otherwise (p = N) the SETUP message specifies any bearer capability. |
| A5   | MS->SS    | CALL CONFIRMED   | This message shall be sent by the MS if p = Y.                                                                                                                                |
| B5   | MS->SS    | RELEASE COMPLETE | This message shall be sent by the MS if p = N.                                                                                                                                |
| 6    | SS->MS    | CHANNEL RELEASE  | The SS waits for disconnection of the main signalling link.                                                                                                                   |

## Specific message contents

None.

## 26.5.3.4 Undefined or unexpected message type / unexpected message type / CC

### 26.5.3.4.1 Conformance requirements

If the Mobile Station receives a message not consistent with the protocol state, the Mobile Station shall ignore the message except for the fact that, if an RR-connection exists, it returns a status message (STATUS, RR STATUS or MM STATUS depending on the protocol discriminator) with cause value #98 "Message type not compatible with protocol state".

## References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 8.4.

### 26.5.3.4.2 Test purpose

To verify that a MS supporting the call control protocol for at least one BC, having a call in CC-state U10, "active", on receipt of an inopportune CC message, returns a STATUS message with reject cause value #98 without changing the state of the active call (this is verified by use of the status enquiry procedure.) This is tested in the special case where the inopportune CC message is a CALL PROCEEDING message relating to the active call.

## 26.5.3.4.3 Method of test

## Initial conditions

## System Simulator:

1 cell, default parameters.

## Mobile Station:

The MS has a call in CC-state U10, "active".

## Related PICS/PIXIT statements

At least one circuit switched basic service supported(Y/N).

## Foreseen Final State of the MS

The MS has a call in CC-state U10, "active".

## Test Procedure

The SS sends a CALL PROCEEDING message to the MS. The SS then checks that the MS responds with a STATUS message specifying reject cause value #98. The SS then sends a STATUS ENQUIRY message to the MS and verifies that the MS responds with a STATUS message specifying cause #30 and call state U10, "active".

## Maximum duration of test

10 s.

## Expected sequence

| Step | Direction | Message         | Comments                                                                                            |
|------|-----------|-----------------|-----------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | CALL PROCEEDING |                                                                                                     |
| 2    | MS -> SS  | STATUS          | Cause IE indicates cause value #98.                                                                 |
| 3    | SS -> MS  | STATUS ENQUIRY  |                                                                                                     |
| 4    | MS -> SS  | STATUS          | TI refers to the active call; Cause IE indicates cause value #30. Call state IE indicates state U10 |

## Specific message contents

None.

## 26.5.4 Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions / unforeseen information elements in the non-imperative message part

### 26.5.4.1 Unforeseen information elements in the non-imperative message part / duplicated information elements

#### 26.5.4.1.1 Conformance requirements

If an information element with format T, TV, or TLV is repeated in a message in which repetition of the information element is not specified, only the contents of the information element appearing first shall be handled and all subsequent repetitions of the information element shall be ignored.

## References

3GPP TS 04.08 / 3GPP TS 24.008 / 3GPP TS 44.018, subclause 8.6.3.

#### 26.5.4.1.2 Test purpose

To verify that the MS ignores an unforeseen second occurrence of an information element with format T, TV, or TLV in the special case of the mobile identity IE which has format TLV in the LOCATION UPDATING ACCEPT message.

#### 26.5.4.1.3 Method of test

##### Initial conditions

###### System Simulator:

2 cells A and B belonging to different location areas, default parameters.

###### Mobile Station:

The MS is in the MM-state "idle, updated" and in RR-idle mode, listening to the BCCH/CCCH of cell A. It has a valid TMSI.

##### Related PICS/PIXIT statements

None.

##### Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode, listening to the BCCH/CCCH of cell B. It does not have a valid TMSI.

##### Test Procedure

The RF level of cell A is lowered until the MS selects cell B (according to the cell-reselection procedures of 3GPP TS 05.08). The MS shall establish an RR connection and initiate the normal location updating procedure (using TMSI). The SS responds to the location update request with the LOCATION UPDATING ACCEPT message containing the mobile identity IE specifying the IMSI of the MS followed by an additional mobile identity IE specifying the TMSI that was assigned to the MS in the initial conditions (i.e. duplication of information element).

The SS then pages the MS using the PAGING REQUEST TYPE 1 message including the TMSI which was previously used in the LOCATION UPDATE ACCEPT message. The SS then verifies during 5 s that the MS does not answer to paging. The SS then pages the MS with its IMSI. The SS verifies that the MS responds on cell B by initiating the immediate assignment procedure using the CHANNEL REQUEST message.

##### Maximum duration of test

20 s.

Expected sequence

During 3 s the SS verifies that the MS does not send any message on the RACH.

| Step | Direction | Message                     | Comments                                                                                                        |
|------|-----------|-----------------------------|-----------------------------------------------------------------------------------------------------------------|
| 1    | SS        |                             | The RF level of cell A is lowered until the MS selects cell B.                                                  |
| 2    | MS -> SS  | CHANNEL REQUEST             |                                                                                                                 |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT        |                                                                                                                 |
| 4    | MS -> SS  | LOCATION UPDATING REQUEST   | Mobile identity IE specifies the TMSI of the MS.                                                                |
| 5    | SS -> MS  | LOCATION UPDATING ACCEPT    | (see below)                                                                                                     |
| 6    | SS -> MS  | CHANNEL RELEASE             |                                                                                                                 |
| 7    | SS        |                             | The SS waits at least 5 s to give the MS time to become pageable                                                |
| 8    | SS -> MS  | PAGING REQUEST TYPE 1       | Mobile identity 1 IE specifies the TMSI of the MS. Mobile identity 2 is omitted.                                |
| 9    | SS        |                             | The SS waits at least 5 s During that period the SS verifies that the MS does not send any message on the RACH. |
| 10   | SS -> MS  | PAGING REQUEST TYPE 1       | Mobile identity 1 IE specifies the IMSI of the MS. Mobile identity 2 is omitted.                                |
| 11   | MS -> SS  | CHANNEL REQUEST             | Establishment cause = answer to paging.                                                                         |
| 12   | SS -> MS  | IMMEDIATE ASSIGNMENT REJECT |                                                                                                                 |

## 26.5.5 Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions / non-semantic mandatory IE errors

### 26.5.5.1 Non-semantic mandatory IE errors / RR

#### 26.5.5.1.1 Non-semantic mandatory IE errors / RR / missing mandatory IE error

##### 26.5.5.1.1.1 Non-semantic mandatory IE errors / RR / missing mandatory IE error / special case

The MS shall accept a CHANNEL RELEASE message whether it contains an RR cause or not. This allows for the shortening of the message in the future.

##### 26.5.5.1.1.1.1 Conformance requirements

When on receipt of a message a "missing mandatory IE" error is diagnosed the MS shall proceed as follows: If the message is a CHANNEL RELEASE message, the actions taken shall be the same as specified for a normal RR-connection release.

## References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 8.5.

## 26.5.5.1.1.1.2 Test purpose

To verify that the MS in RR connected mode releases the connection upon receipt of a CHANNEL RELEASE message with missing RR cause (which is "mandatory" in that message).

## 26.5.5.1.1.1.3 Method of test

## Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in the MM-state "idle, updated" and in RR-idle mode. It has a valid TMSI.

## Related PICS/PIXIT statements

None.

## Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode. It has a valid TMSI.

## Test Procedure

A mobile terminating RR connection is established. Then the SS sends a CHANNEL RELEASE message in which the RR cause IE is missing. It is verified that the MS releases the main signalling link by sending a L2 DISC frame. The main signalling link release is then completed.

## Maximum duration of test

10 s.

## Expected sequence

| Step | Direction | Message               | Comments                                                                                                                      |
|------|-----------|-----------------------|-------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PAGING REQUEST TYPE 1 |                                                                                                                               |
| 2    | MS -> SS  | CHANNEL REQUEST       |                                                                                                                               |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT  |                                                                                                                               |
| 4    | MS -> SS  | PAGING RESPONSE       |                                                                                                                               |
| 5    | SS -> MS  | CHANNEL RELEASE       | The mandatory RR cause IE is missing (the message consists only of protocol discriminator, skip indicator, and message type). |
| 6    | MS -> SS  |                       | The main signalling link is released (this is observed by a L2 DISC frame sent from the MS to the SS).                        |

## Specific message contents

None.

## 26.5.5.1.1.2 Non-semantical mandatory IE errors / RR / missing mandatory IE error / general case

In the general case, the MS has to report an RR message with missing mandatory IE by the use of an RR STATUS message, but otherwise to ignore it. This is a recovery mechanism for unforeseen states.

### 26.5.5.1.1.2.1 Conformance requirements

When on receipt of a message a "missing mandatory IE" error is diagnosed the MS shall proceed as follows: If the message is not one of the messages listed in subclauses 8.5.1, 8.5.2, and 8.5.3 of 3GPP TS 04.08 / 3GPP TS 24.008, the Mobile Station shall ignore the message except for the fact that, if an RR-connection exists, it returns a status message (STATUS, RR STATUS or MM STATUS depending on the protocol discriminator) with cause value #96 "invalid mandatory information".

#### References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 8.5.

### 26.5.5.1.1.2.2 Test purpose

To verify that the MS in RR connected mode ignores a ciphering mode command message in which the ciphering mode setting IE and cipher response IE are missing except for the fact that it returns a RR STATUS message.

### 26.5.5.1.1.2.3 Method of test

#### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in the MM-state "idle, updated" and in RR-idle mode. It has a valid TMSI.

#### Related PICS/PIXIT statements

None.

#### Foreseen Final State of the MS

The MS is in RR-connected mode.

#### Test Procedure

A mobile terminating RR connection is established. Then the SS sends a ciphering mode command message in which the ciphering mode setting IE and cipher response IE are missing. The SS verifies that the MS does not start ciphering and returns a RR STATUS message.

#### Maximum duration of test

10 s.

#### Expected sequence

| Step | Direction | Message                | Comments                                                                    |
|------|-----------|------------------------|-----------------------------------------------------------------------------|
| 1    | SS -> MS  | PAGING REQUEST TYPE 1  |                                                                             |
| 2    | MS -> SS  | CHANNEL REQUEST        |                                                                             |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT   |                                                                             |
| 4    | MS -> SS  | PAGING RESPONSE        |                                                                             |
| 5    | SS -> MS  | CIPHERING MODE COMMAND | The mandatory ciphering mode setting IE and cipher response IE are missing. |
| 6    | MS -> SS  | RR STATUS              | RR cause IE specifies RR cause value #96.                                   |

#### Specific message contents

None.

## 26.5.5.1.2 Non-semantic mandatory IE errors / RR / comprehension required

### 26.5.5.1.2.1 Conformance requirements

When an RR message containing an IE unknown in the message, but encoded as "comprehension required" (see subclause 10.5 of 3GPP TS 04.08 / 3GPP TS 24.008) is received, the MS shall proceed as follows: When the message is not one of the messages listed in 3GPP TS 04.08 subclauses 8.5.1, 8.5.2 and 8.5.3, the Mobile Station shall ignore the message except for the fact that, if an RR-connection exists, it returns a RR STATUS message with cause value #96 "invalid mandatory information".

### References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 8.5.

### 26.5.5.1.2.2 Test purpose

To verify that the MS having an RR-connection established ignores a HANOVER COMMAND message containing in the non-imperative part an IE encoded as comprehension required except for the fact that it returns a RR STATUS message with cause # 96 "invalid mandatory information".

### 26.5.5.1.2.3 Method of test

#### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has an MT call in state U10, "active"; or alternatively, the MS has been paged and an RR-connection has been established.

#### Related PICS/PIXIT statements

At least one circuit switched basic service supported (Y/N).

#### Foreseen Final State of the MS

As in the initial conditions.

#### Test Procedure

The SS sends a HANOVER command message containing in the non-imperative part an IE encoded as comprehension required. The SS verifies that the MS returns a RR STATUS message with cause value #96 without changing the dedicated channel.

#### Maximum duration of test

10 s.

#### Expected sequence

| Step | Direction | Message         | Comments                                                           |
|------|-----------|-----------------|--------------------------------------------------------------------|
| 1    | SS -> MS  | HANOVER COMMAND | See below.                                                         |
| 2    | MS -> SS  | RR STATUS       | Sent on the old channel. RR cause IE specifies RR cause value #96. |

Specific message contents

## HANDOVER COMMAND

| Information element        | value/remark |
|----------------------------|--------------|
| cell description           | as required  |
| channel description        | as required  |
| handover reference         | as required  |
| power command              | as required  |
| comprehension required IEI | 0000 0000    |
| length                     | 0000 0001    |
| unrecognized IE contents   | xxxx xxxx    |

### 26.5.5.2 Non-semantical mandatory IE errors / MM

The MS shall ignore MM messages with syntactically incorrect mandatory IE. This allows to use reserved values in later phases.

#### 26.5.5.2.1 Non-semantical mandatory IE errors / MM / syntactically incorrect mandatory IE

Test 26.5.5.2.1 is only applicable for an MS supporting at least one BC, whereas test 26.5.5.2.2 is applicable to all types of MS.

##### 26.5.5.2.1.1 Conformance requirements

When an MM message containing a syntactically incorrect mandatory IE is received, the Mobile Station shall ignore the message except for the fact that, if an RR-connection exists, it returns a MM STATUS message with cause value #96 "invalid mandatory information".

#### References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 8.5.

##### 26.5.5.2.1.2 Test purpose

To verify that an MS supporting at least one BC, having a CC entity in state U10, "active", ignores an MM message with syntactically incorrect IE except for the fact that it sends an MM STATUS message with reject cause #96. This is tested in the special case of an IDENTITY REQUEST message in which the (mandatory) identity type IE specifies a reserved value for the type of identity; that the MS otherwise ignores the message is checked by means of the status enquiry procedure.

##### 26.5.5.2.1.3 Method of test

#### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has a mobile terminating call in the CC-state U10, "active".

#### Related PICS/PIXIT statements

At least one circuit switched basic service supported (Y/N).

#### Foreseen Final State of the MS

The MS has a mobile terminating call in the CC-state U10, "active".

## Test Procedure

The SS sends an IDENTITY REQUEST message in which the (mandatory) identity type IE specifies a reserved value for the type of identity. The SS verifies that the MS returns an MM STATUS message specifying cause value #96 but does not change its state (this is verified by use of the status enquiry procedure).

### Maximum duration of test

10 s.

### Expected sequence

| Step | Direction | Message          | Comments                                                                                                    |
|------|-----------|------------------|-------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | IDENTITY REQUEST | The identity type IE is encoded as "1111" (so that the type of identity contains the reserved value "111"). |
| 2    | MS -> SS  | MM STATUS        | Reject cause IE indicates reject cause value #96.                                                           |
| 3    | SS -> MS  | STATUS ENQUIRY   | TI refers to the active call.                                                                               |
| 4    | MS -> SS  | STATUS           | TI refers to the active call; Cause IE indicates cause value #30. Call state IE indicates state U10.        |

### Specific message contents

None.

## 26.5.5.2.2 Non-semantic mandatory IE errors / MM / syntactically incorrect mandatory IE

Test 26.5.5.2.1 is only applicable for an MS supporting at least one BC, whereas this test (26.5.5.2.2) is applicable to all types of MS.

### 26.5.5.2.2.1 Conformance requirement(s)

When an MM message containing a syntactically incorrect mandatory IE is received, the Mobile Station shall ignore the message except for the fact that, if an RR-connection exists, it returns an MM STATUS message with cause value #96 "invalid mandatory information".

### Reference(s)

3GPP TS 04.08 / 3GPP TS 24.008, subclause 8.5.

### 26.5.5.2.2.2 Test purpose

To verify that an MS having been paged and having an RR connection established ignores an MM message with syntactically incorrect IE except for the fact that it sends an MM STATUS message with reject cause #96. This is tested in the special case of an IDENTITY REQUEST message in which the (mandatory) *identity type* IE specifies a reserved value for the type of identity; the fact that the MS otherwise ignores the message is checked by testing that it answers as usual to an incoming SETUP message.

### 26.5.5.2.2.3 Method of test

#### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has been paged; an RR connection has been established.

The MS has a valid TMSI.

## Related PICS/PIXIT statements

At least one circuit switched basic service supported (p=Y/N).

## Foreseen final state of the MS

The MS is in the MM-state "idle updated" listening to the BCCH/CCCH of the cell. It has a valid TMSI.

## Test Procedure

The SS sends an IDENTITY REQUEST message in which the (mandatory) identity type IE specifies a reserved value for the type of identity. The SS verifies that the MS returns an MM STATUS message specifying cause value #96 but does not change its state; this is verified as follows:

The SS sends a SETUP message to the MS. This message specifies a BC that is supported by the MS, if there exists any; if the MS does not support any BC, the SETUP message specifies an arbitrary BC. The SS then verifies that the MS responds with a CALL CONFIRMED message if the SETUP had specified a BC supported by the MS, and that the MS responds with a RELEASE COMPLETE message otherwise.

Then the SS sends a CHANNEL RELEASE to the MS and waits for the disconnection of the main signalling link.

## Maximum duration of test

10 s.

## Expected sequence

| Step | Direction | Message          | Comments                                                                                                                                                                      |
|------|-----------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | IDENTITY REQUEST | The identity type IE is encoded as "1111" (so that the type of identity contains the reserved value "111").                                                                   |
| 2    | MS -> SS  | MM STATUS        | Reject cause IE indicates reject cause value #96.                                                                                                                             |
| 3    | SS -> MS  | SETUP            | If the MS supports at least one BC (p = Y), the SETUP specifies a bearer capability supported by the MS. Otherwise (p = N) the SETUP message specifies any bearer capability. |
| A4   | MS -> SS  | CALL CONFIRMED   | This message shall be sent by the MS if p = Y.                                                                                                                                |
| B4   | MS -> SS  | RELEASE COMPLETE | This message shall be sent by the MS if p = N.                                                                                                                                |
| 5    | SS -> MS  | CHANNEL RELEASE  | The SS waits for disconnection of the main signalling link.                                                                                                                   |

## Specific message contents

None.

### 26.5.5.2.3 Non-semantical mandatory IE errors / MM / comprehension required

The "comprehension required" mechanism allows for the introduction of essential new information elements into messages, such that a message is ignored and a report is sent if the new information element is not understood.

#### 26.5.5.2.3.1 Conformance requirements

When an MM message containing an IE unknown in the message, but encoded as "comprehension required" (see subclause 10.5 of 3GPP TS 04.08 / 3GPP TS 24.008) is received, the MS shall ignore the message except for the fact that, if an RR-connection exists, it returns an MM STATUS message with cause value #96 "invalid mandatory information".

## References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 8.5.

#### 26.5.5.2.3.2 Test purpose

To verify that the MS on receipt of an MM message containing an IE unknown in the message, but encoded as "comprehension required" ignores the message except for the fact that it returns an MM STATUS message with cause value #96 "invalid mandatory information"; this in the special case of the MM message being a LOCATION UPDATING ACCEPT responding to a LOCATION UPDATING REQUEST from the MS.

#### 26.5.5.2.3.3 Method of test

##### Initial conditions

###### System Simulator:

The SS simulates two cells, A and B, belonging to different location areas, default parameters.

###### Mobile Station:

The MS is in the MM-state "idle, updated" listening to the BCCH/CCCH of cell A. It has a valid TMSI.

##### Related PICS/PIXIT statements

None.

##### Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" listening to the BCCH/CCCH of cell B. It has a valid TMSI.

##### Test Procedure

The Rf level of cell A is lowered until the MS selects cell B. The SS verifies that the MS establishes an RR connection and performs the normal location updating procedure using its TMSI. The SS responds to the location updating request with the LOCATION UPDATING ACCEPT message containing an optional information element coded as "comprehension required". The SS verifies that the MS returns the MM STATUS message with cause #96 in response to the LOCATION UPDATING ACCEPT. The SS then waits for the MS to abort the RR-connection. The SS verifies that the MS establishes a new RR connection and starts a new location updating procedure.

On receipt of the new LOCATION UPDATING REQUEST, the SS sends a correctly coded LOCATION UPDATING ACCEPT allocating a new TMSI.

The SS verifies that the MS sends a TMSI REALLOCATION COMPLETE message. The SS then initiates the RR connection release.

##### Maximum duration of test

30 s.

Expected sequence

| Step | Direction | Message                    | Comments                                                                                                |
|------|-----------|----------------------------|---------------------------------------------------------------------------------------------------------|
| 1    | SS        |                            | The RF level of cell A is lowered until the MS selects cell B.                                          |
| 2    | MS -> SS  | CHANNEL REQUEST            |                                                                                                         |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT       |                                                                                                         |
| 4    | MS -> SS  | LOCATION UPDATING REQUEST  | The mobile identity IE specifies the TMSI of the MS.                                                    |
| 5    | SS -> MS  | LOCATION UPDATING ACCEPT   | See below.                                                                                              |
| 6    | MS -> SS  | MM STATUS                  | Reject cause IE specifies reject cause value #96.                                                       |
| 7    | MS        |                            | The MS aborts the RR connection (it initiates release of L2 on SAPI 0) using the L2 DISC / UA exchange. |
| 8    | MS -> SS  | CHANNEL REQUEST            |                                                                                                         |
| 9    | SS -> MS  | IMMEDIATE ASSIGNMENT       |                                                                                                         |
| 10   | MS -> SS  | LOCATION UPDATING REQUEST  | The mobile identity IE specifies the IMSI of the MS.                                                    |
| 11   | SS -> MS  | LOCATION UPDATING ACCEPT   | see below                                                                                               |
| 12   | MS -> SS  | TMSI REALLOCATION COMPLETE |                                                                                                         |
| 13   | SS -> MS  | CHANNEL RELEASE            | The RR connection is released.                                                                          |

Specific message contents

LOCATION UPDATING ACCEPT - first occurrence

| Information element          | value/remark                |
|------------------------------|-----------------------------|
| Location area identification | LAI of cell B               |
| Comprehension required IEI   | 0000 0000                   |
| length                       | 1                           |
| unrecognized IE contents     | xxxx xxxx (arbitrary octet) |

LOCATION UPDATING ACCEPT - second occurrence

| Information element          | value/remark            |
|------------------------------|-------------------------|
| Location area identification | specifies LAI of cell B |
| Mobile Identity              | specifies a TMSI        |

### 26.5.5.3 Non-semantical mandatory IE errors / CC

#### 26.5.5.3.1 Non-semantical mandatory IE errors / CC / missing mandatory IE

##### 26.5.5.3.1.1 Non-semantical mandatory IE errors / CC / missing mandatory IE / disconnect message

###### 26.5.5.3.1.1.1 Conformance requirements

When on receipt of a message a "missing mandatory IE" error is diagnosed, the MS shall proceed as follows: If the message is a DISCONNECT message, a RELEASE message shall be returned with cause value # 96 "invalid mandatory information" and normal call clearing applies.

References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 8.5.

## 26.5.5.3.1.1.2 Test purpose

To verify that the MS having an MT call in state U10, "active", on receipt of a DISCONNECT message in which the mandatory cause IE is missing shall return a RELEASE message with cause value #96 "invalid mandatory information".

## 26.5.5.3.1.1.3 Method of test

## Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has an MT call in the CC-state U10, "active".

## Related PICS/PIXIT statements

At least one circuit switched basic service supported(Y/N).

## Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode.

## Test Procedure

The SS sends a DISCONNECT message in which the (mandatory) cause IE is missing. The SS verifies that the MS returns a RELEASE message specifying cause value #96. The SS then sends a RELEASE COMPLETE message and performs the RR connection release.

## Maximum duration of test

15 s.

## Expected sequence

| Step | Direction | Message          | Comments                               |
|------|-----------|------------------|----------------------------------------|
| 1    | SS -> MS  | DISCONNECT       | The mandatory cause IE is missing.     |
| 2    | MS -> SS  | RELEASE          | The cause IE indicates cause value #96 |
| 3    | SS -> MS  | RELEASE COMPLETE |                                        |
| 4    | SS -> MS  | CHANNEL RELEASE  | The RR connection is released.         |

## Specific message contents

None.

## 26.5.5.3.1.2 Non-semantical mandatory IE errors / CC / missing mandatory IE / general case

## 26.5.5.3.1.2.1 Conformance requirements

When on receipt of a message a "missing mandatory IE" error is diagnosed, the MS shall proceed as follows: If the message is not a SETUP, RELEASE, DISCONNECT, RELEASE COMPLETE, HOLD REJECT or RETRIEVE REJECT message, it shall ignore the message except for the fact that it returns a STATUS message specifying cause value #96.

## References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 8.5.

### 26.5.5.3.1.2.2 Test purpose

To verify that the MS having an MT call in state U10, "active", on receipt of a STATUS message in which the mandatory cause IE and call state IE are missing shall ignore the message except for the fact that it return a STATUS message with cause value #96 "invalid mandatory information" (that the MS does not change state is checked by use of the status enquiry procedure).

### 26.5.5.3.1.2.3 Method of test

#### Initial conditions

##### System Simulator:

1 cell, default parameters.

##### Mobile Station:

The MS has an MT call in the CC-state U10, "active".

#### Related PICS/PIXIT statements

At least one circuit switched basic service supported (Y/N).

#### Foreseen Final State of the MS

The MS has an MT call in the CC-state U10, "active".

#### Test Procedure

The SS sends a STATUS message in which the mandatory cause IE and call state IE are missing. The SS verifies that the MS returns a STATUS message with cause value #96 "invalid mandatory information". Then the SS sends a STATUS ENQUIRY message and checks that the MS returns a STATUS message indicating cause value #30 and call state U10, "active".

#### Maximum duration of test

15 s.

#### Expected sequence

| Step | Direction | Message        | Comments                                                                                            |
|------|-----------|----------------|-----------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | STATUS         | The mandatory cause IE and call state IE are missing.                                               |
| 2    | MS -> SS  | STATUS         | The cause IE indicates cause value #96                                                              |
| 3    | SS -> MS  | STATUS ENQUIRY | TI refers to the active call.                                                                       |
| 4    | MS -> SS  | STATUS         | TI refers to the active call; Cause IE indicates cause value #30. Call state IE indicates state U10 |

#### Specific message contents

None.

### 26.5.5.3.2 Non-semantic mandatory IE errors / CC / comprehension required

This test is applicable to all MS which support at least one MO circuit switched basic service.

#### 26.5.5.3.2.1 Conformance requirements

When a CC message containing an IE unknown in the message, but encoded as "comprehension required" (see 3GPP TS 04.08 / 3GPP TS 24.008, subclause 10.5) is received, the MS shall proceed as follows: When the message is not one of the messages listed in 3GPP TS 04.08 / 3GPP TS 24.008 subclauses 8.5.1, 8.5.2 and 8.5.3, the Mobile Station

shall ignore the message except for the fact that, if an RR-connection exists, it returns a STATUS message with cause value #96 "invalid mandatory information".

#### References

3GPP TS 04.08 / 3GPP TS 24.008, subclauses 8.5 and 10.5.

#### 26.5.5.3.2.2 Test purpose

To verify that an MS supporting the call control protocol for at least one BC having a call control entity in state U3 ignores a CONNECT message containing in the non-imperative part an IE encoded as comprehension required except for the fact that it returns a STATUS message with cause value #96 "invalid mandatory information".

#### 26.5.5.3.2.3 Method of test

##### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has a call control entity in CC state U3.

##### Related PICS/PIXIT statements

At least one circuit switched basic service supported (Y/N).

The MS supports MO calls.

##### Foreseen Final State of the MS

The MS has a call control entity in CC state U3.

##### Test Procedure

The SS sends a CONNECT message containing an optional information element coded as "comprehension required". The SS verifies that the MS returns a STATUS message specifying cause value #96 "invalid mandatory information". The SS checks by use of the status enquiry procedure that the MS did not change the state.

##### Maximum duration of test

5 s.

##### Expected sequence

| Step | Direction | Message        | Comments                                                                                                 |
|------|-----------|----------------|----------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | CONNECT        | See below.                                                                                               |
| 2    | MS -> SS  | STATUS         | TI refers to the call in progress; cause IE indicates cause value #96.                                   |
| 3    | SS -> MS  | STATUS ENQUIRY | TI refers to the call in progress.                                                                       |
| 4    | MS -> SS  | STATUS         | TI refers to the call in progress; Cause IE indicates cause value #30. Call state IE indicates state U3. |

Specific message contents

## CONNECT

| Information element | value/remark                     |
|---------------------|----------------------------------|
| Unknown IE length   | 0000 0000                        |
| unknown IE contents | 1<br>xxxx xxxx (arbitrary octet) |

## 26.5.6 Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions / unknown IE, comprehension not required

### 26.5.6.1 Unknown information elements in the non-imperative message part / MM

#### 26.5.6.1.1 Unknown IE, comprehension not required / MM / IE unknown in the protocol

##### 26.5.6.1.1.1 Conformance requirements

The MS shall ignore all IEs unknown in a message which are not encoded as "comprehension required".

#### References

3GPP TS 04.08 / 3GPP TS 24.008, subclauses 8.6.1, 8.6.2 and 10.5.

##### 26.5.6.1.1.2 Test purpose

To verify that the MS on receipt of an MM message containing an IE unknown in the message and unknown in the MM protocol which is not encoded as "comprehension required" ignores that IE; this in the special case of the MM message being a LOCATION UPDATING ACCEPT responding to a LOCATION UPDATING REQUEST from the MS.

##### 26.5.6.1.1.3 Method of test

#### Initial conditions

##### System Simulator:

The SS simulates two cells, A and B, belonging to different location areas, default parameters.

##### Mobile Station:

The MS is in the MM-state "idle, updated" listening to the BCCH/CCCH of cell B. It has a valid TMSI.

#### Related PICS/PIXIT statements

None.

#### Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" listening to the BCCH/CCCH of cell A. It has a valid TMSI.

#### Test Procedure

The RF level of cell B is lowered until the MS selects cell A. The SS verifies that the MS establishes an RR connection and performs the normal location updating procedure using its TMSI. The SS responds to the location updating request with the LOCATION UPDATING ACCEPT message containing an optional information element not coded as "comprehension required" the IE of which is unknown in the MM protocol. The LOCATION UPDATING ACCEPT message contains a new TMSI in the mobile identity IE which is placed after the unknown IE. The MS shall send the TMSI REALLOCATION COMPLETE message.

Maximum duration of test

20 s.

Expected sequence

| Step | Direction | Message                    | Comments                                                       |
|------|-----------|----------------------------|----------------------------------------------------------------|
| 1    | SS        |                            | The RF level of cell B is lowered until the MS selects cell A. |
| 2    | MS -> SS  | CHANNEL REQUEST            |                                                                |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT       |                                                                |
| 4    | MS -> SS  | LOCATION UPDATING REQUEST  | The mobile identity IE specifies the TMSI of the MS.           |
| 5    | SS -> MS  | LOCATION UPDATING ACCEPT   | See below.                                                     |
| 6    | MS -> SS  | TMSI REALLOCATION COMPLETE |                                                                |
| 7    | SS -> MS  | CHANNEL RELEASE            | The main signalling link is released.                          |

Specific message contents

LOCATION UPDATING ACCEPT

| Information element          | value/remark                     |
|------------------------------|----------------------------------|

| Unknown IEI                  | 1010 xxx0 (where x is arbitrary) |
| Mobile Identity IEI          |                                  |
| length                       | 5                                |
| Type of identity             | TMSI                             |
| Identity                     | 4 octets of "new" TMSI           |

26.5.6.1.2 Unknown IE, comprehension not required / MM / IE unknown in the message

26.5.6.1.2.1 Conformance requirements

The MS shall ignore all IEs unknown in a message which are not encoded as "comprehension required".

References

3GPP TS 04.08 / 3GPP TS 24.008, subclauses 8.6.1, 8.6.2 and 10.5.

26.5.6.1.2.2 Test purpose

To verify that the MS on receipt of an MM message containing an IE unknown in the message, but known in the MM protocol, which is not encoded as "comprehension required" ignores that IE; this in the special case of the MM message being a LOCATION UPDATING ACCEPT responding to a LOCATION UPDATING REQUEST from the MS.

26.5.6.1.2.3 Method of test

Initial conditions

System Simulator:

The SS simulates two cells, A and B, belonging to different location areas, default parameters.

Mobile Station:

The MS is in the MM-state "idle, updated" listening to the BCCH/CCCH of cell B. It has a valid TMSI.

## Related PICS/PIXIT statements

None.

## Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" listening to the BCCH/CCCH of cell A. It has a valid TMSI.

## Test Procedure

The RF level of cell B is lowered until the MS selects cell A. The SS verifies that the MS establishes an RR connection and performs the normal location updating procedure using its TMSI. The SS responds to the location updating request with the LOCATION UPDATING ACCEPT message containing an optional information element not coded as "comprehension required" the IEI of which is unknown in the message but is used as the location area identification IEI in other messages of the MM protocol. The LOCATION UPDATING ACCEPT message contains a new TMSI in the mobile identity IE which is placed after the unknown IE. The MS shall send the TMSI REALLOCATION COMPLETE message.

## Maximum duration of test

20 s.

## Expected sequence

| Step | Direction | Message                    | Comments                                                       |
|------|-----------|----------------------------|----------------------------------------------------------------|
| 1    | SS        |                            | The RF level of cell B is lowered until the MS selects cell A. |
| 2    | MS -> SS  | CHANNEL REQUEST            |                                                                |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT       |                                                                |

## 26.5.6.2 Unknown information elements in the non-imperative message part / CC

## 26.5.6.2.1 Unknown information elements in the non-imperative message part / CC / Call establishment

This test is applicable to all MS which support at least one MO circuit switched basic service.

## 26.5.6.2.1.1 Conformance requirements

The MS shall ignore all IEs unknown in a message which are not encoded as "comprehension required".

## References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 8.6.1.

## 26.5.6.2.1.2 Test purpose

To verify that an MS supporting the CC protocol for at least one BC receiving a CC message containing an IE unknown in the message which is not encoded as "comprehension required" ignores that IE; this in the special case of the CC message being a CALL PROCEEDING message received by the MS in state U1.

## 26.5.6.2.1.3 Method of test

## Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has a call control entity in CC state U1.

## Related PICS/PIXIT statements

At least one circuit switched basic service supported (Y/N).

## Foreseen Final State of the MS

The MS has a call control entity in CC state U3.

## Test Procedure

The SS sends a CALL PROCEEDING message containing an optional information element not coded as "comprehension required" the IEI of which is unknown in the message, but used for a called party BCD number IE in other messages of the protocol. The SS verifies by use of the status enquiry procedure that the MS did not change the state.

## Maximum duration of test

30 s.

## Expected sequence

| Step | Direction | Message         | Comments                                                                                            |
|------|-----------|-----------------|-----------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | CALL PROCEEDING | See below.                                                                                          |
| 2    | SS -> MS  | STATUS ENQUIRY  | TI refers to the call in progress.                                                                  |
| 3    | MS -> SS  | STATUS          | TI refers to the active call; Cause IE indicates cause value #30. Call state IE indicates state U3. |

## Specific message contents

## CALL PROCEEDING

| Information element | value/remark                |

| Unknown IEI         | 0101 1110                   |
| length              | 1                           |
| unknown IE contents | xxxx xxxx (arbitrary octet) |

## 26.5.6.2.2 Unknown information elements in the non-imperative message part / CC / disconnect

### 26.5.6.2.2.1 Conformance requirements

The MS shall ignore all IEs unknown in a message which are not encoded as "comprehension required".

#### References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 8.6.1.

### 26.5.6.2.2.2 Test purpose

To verify that an MS supporting the CC protocol for at least one BC receiving a CC message containing an IE unknown in the message which is not encoded as "comprehension required" ignores that IE; this in the special case of a DISCONNECT message received by the MS in state U10.

### 26.5.6.2.2.3 Method of test

#### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has a call control entity in CC state U10.

#### Related PICS/PIXIT statements

At least one circuit switched basic service supported (Y/N).

#### Foreseen Final State of the MS

The MS has a call control entity in CC state U19.

#### Test Procedure

The SS sends a DISCONNECT message containing an optional information element not coded as "comprehension required" the IEI of which is unknown in the message, but used for a connected number IE in other messages of the protocol. The SS verifies that the MS responds with a RELEASE message; the SS verifies by use of the status enquiry procedure that the MS has entered state U19.

#### Maximum duration of test

5 s.

#### Expected sequence

| Step | Direction | Message        | Comments                                                                                 |
|------|-----------|----------------|------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | DISCONNECT     | See below.<br><br>Cause IE indicates cause value #30. Call state IE indicates state U19. |
| 2    | MS -> SS  | RELEASE        |                                                                                          |
| 3    | SS -> MS  | STATUS ENQUIRY |                                                                                          |
| 4    | MS -> SS  | STATUS         |                                                                                          |

Specific message contents

## DISCONNECT

| Information element | value/remark                     |
|---------------------|----------------------------------|
| Unknown IE length   | 0100 1100                        |
| unknown IE contents | 1<br>xxxx xxxx (arbitrary octet) |

### 26.5.6.2.3 Unknown information elements in the non-imperative message part / CC / release

#### 26.5.6.2.3.1 Conformance requirements

The MS shall ignore all IEs unknown in a message which are not encoded as "comprehension required".

#### References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 8.6.1.

#### 26.5.6.2.3.2 Test purpose

To verify that an MS supporting the CC protocol for at least one BC receiving a CC message containing an IE unknown in the message which is not encoded as "comprehension required" ignores that IE; this in the special case of a RELEASE message received by the MS having sent in state U10 a DISCONNECT message.

#### 26.5.6.2.3.3 Method of test

#### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has a call control entity in CC state U10.

#### Related PICS/PIXIT statements

At least one circuit switched basic service supported (Y/N).

#### Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode.

#### Test Procedure

The MS is made to send a DISCONNECT message. The SS responds with a RELEASE message containing an optional information element not coded as "comprehension required" the IEI of which is unknown in the message, but used for a high layer compatibility IE in other messages of the protocol. The SS verifies that the MS responds with a RELEASE COMPLETE message; the SS then releases the RR connection.

#### Maximum duration of test

10 s.

Expected sequence

| Step | Direction | Message          | Comments                                  |
|------|-----------|------------------|-------------------------------------------|
| 1    | MS        |                  | The MS is made to initiate call clearing. |
| 2    | MS -> SS  | DISCONNECT       |                                           |

| 5    | SS -> MS  | CHANNEL RELEASE  | The RR connection is released.            |

Specific message contents

RELEASE

| Information element | value/remark      |
|---------------------|-------------------|
| Unknown IE          | 0111 1101         |
| length              | 1                 |
| unknown IE contents | 1 arbitrary octet |

26.5.6.2.4 Unknown information elements in the non-imperative message part / CC / release complete

26.5.6.2.4.1 Conformance requirements

The MS shall ignore all IEs unknown in a message which are not encoded as "comprehension required".

References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 8.6.1.

26.5.6.2.4.2 Test purpose

To verify that an MS supporting the CC protocol for at least one BC receiving a CC message containing an IE unknown in the message which is not encoded as "comprehension required" ignores that IE; this in the special case of a RELEASE COMPLETE message received by the MS in state U19.

26.5.6.2.4.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has a call control entity in CC state U10.

Related PICS/PIXIT statements

At least one circuit switched basic service supported(Y/N).

Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode.

## Test Procedure

The SS sends a DISCONNECT message. The SS verifies that the MS responds with a RELEASE message. The SS answers with a RELEASE COMPLETE message containing an optional information element not coded as "comprehension required" the IEI of which is unknown in the message, but used for an auxiliary states IE in other messages of the protocol. The SS verifies that the MS releases the link after some time.

### Maximum duration of test

20 s.

### Expected sequence

| Step | Direction | Message          | Comments                                                               |
|------|-----------|------------------|------------------------------------------------------------------------|
| 1    | SS -> MS  | DISCONNECT       |                                                                        |
| 2    | MS -> SS  | RELEASE          |                                                                        |
| 3    | SS -> MS  | RELEASE COMPLETE | See below.                                                             |
| 4    | MS        |                  | The MS aborts the RR connection (it initiates release of L2 on SAPI 0) |

### Specific message contents

#### RELEASE COMPLETE

| Information element | value/remark      |
|---------------------|-------------------|
| Unknown IEI         | 0010 0100         |
| length              | 1                 |
| unknown IE contents | 1 arbitrary octet |

## 26.5.6.3 Unknown IE in the non-imperative message part, comprehension not required / RR

### 26.5.6.3.1 Conformance requirements

The MS shall ignore all IEs unknown in a message which are not encoded as "comprehension required".

### References

3GPP TS 04.08 / 3GPP TS 44.018, subclauses 8.6.1, 8.6.2 and 10.5.

### 26.5.6.3.2 Test purpose

To verify that the MS ignores an IE which is unknown in a message for Radio Resource Management in the special cases of CIPHERING MODE COMMAND, ASSIGNMENT COMMAND and CHANNEL RELEASE.

### 26.5.6.3.3 Method of test

#### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in the MM-state "idle, updated" and in the RR-idle mode. It has a valid TMSI.

## Related PICS/PIXIT statements

Supported frequency bands, GSM 450 or GSM 480 or GSM 700 or GSM 850 or PGSM or EGSM or DCS 1 800 or PCS 1 900.

## Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in the RR-idle mode. It has a valid TMSI.

## Test Procedure

In the normal call establishment the CIPHERING MODE COMMAND and ASSIGNMENT COMMAND contain additional IEs unknown in the message which are not encoded as "comprehension required", and therefore should be ignored by the MS. After sending an ASSIGNMENT COMPLETE, the subsequent CHANNEL RELEASE received by the MS also contains an IE unknown in a message which is not encoded as "comprehension required". The MS should ignore this IE.

## Maximum duration of test

10 s.

## Expected sequence

| Step | Direction | Message                 | Comments                                                                |
|------|-----------|-------------------------|-------------------------------------------------------------------------|
| 1    | SS -> MS  | PAGING REQUEST TYPE 1   |                                                                         |
| 2    | MS -> SS  | CHANNEL REQUEST         |                                                                         |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT    |                                                                         |
| 4    | MS -> SS  | PAGING RESPONSE         |                                                                         |
| 5    | SS -> MS  | CIPHERING MODE COMMAND  | See specific message contents                                           |
| 6    | MS -> SS  | CIPHERING MODE COMPLETE |                                                                         |
| 7    | SS -> MS  | ASSIGNMENT COMMAND      | See specific message contents                                           |
| 8    | MS -> SS  | ASSIGNMENT COMPLETE     | On the dedicated channel                                                |
| 9    | SS -> MS  | CHANNEL RELEASE         | See specific message contents                                           |
| 10   | SS        |                         | The SS checks the release of the main signalling link at layer 2 level. |

## Specific message contents

None.

## Step 5: CIPHERING MODE COMMAND

|                        |                            |
|------------------------|----------------------------|
| Cipher mode setting    |                            |
| - algorithm identifier | cipher with A5/1           |
| - SC                   | start ciphering            |
| Cipher Response        | IMEI shall not be included |
| Unknown IE (type 2)    | 1001 0010                  |

## Step 7: ASSIGNMENT COMMAND

|                            |                                                                                                                                                                                                                                                                                                                                                                                                         |

## 26.5.7 Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions / spare bits

### 26.5.7.1 Spare bits / RR

#### 26.5.7.1.1 Spare bits / RR / paging channel

##### 26.5.7.1.1.1 Conformance requirements

The MS shall ignore the value of spare bits.

#### References

3GPP TS 04.08 / 3GPP TS 44.018, subclause 10.5.

##### 26.5.7.1.1.2 Test purpose

To verify that the MS in the MM-state "idle, updated" and in RR-idle mode ignores the value of spare bits in the special case of the spare bits occurring in the P1 Rest Octets IE of a PAGING REQUEST TYPE 1 message. That the spare bits are ignored is checked by addressing the MS in that PAGING REQUEST message and verifying that the MS responds to that paging.

## 26.5.7.1.1.3 Method of test

## Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in the MM-state "idle, updated" and in RR-idle mode.

## Related PICS/PIXIT statements

None.

## Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode.

## Test Procedure

The SS sends a PAGING REQUEST TYPE 1 message containing at least one octet in the P1 rest octets IE that is different from 0010 1011.

## Maximum duration of test

10 s.

## Expected sequence

| Step | Direction | Message                     | Comments   |
|------|-----------|-----------------------------|------------|
| 1    | SS -> MS  | PAGING REQUEST TYPE 1       | See below. |
| 2    | MS -> SS  | CHANNEL REQUEST             |            |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT REJECT |            |

## Specific message contents

## PAGING REQUEST TYPE 1

| Information element                 | Value/remark                                                     |
|-------------------------------------|------------------------------------------------------------------|
| L2 pseudo length                    | k+3 where k is the sum of the length of the mobile identity 1 IE |
| Page Mode                           | Normal paging                                                    |
| Channels needed for Mobiles 1 and 2 |                                                                  |
| Channel (first)                     | Any channel                                                      |

| Mobile identity 1                   | IMSI or TMSI of MS under test                                    |
| Mobile identity 2                   | Omitted                                                          |
| P1 rest octets                      | not all octets are "0010 1011"                                   |

## 26.5.7.1.2 Spare bits / RR / BCCH

## 26.5.7.1.2.1 Conformance requirements

The MS shall ignore the value of spare bits.

## References

3GPP TS 04.08 / 3GPP TS 44.018, subclause 10.5.

## 26.5.7.1.2.2 Test purpose

To verify that the MS in the MM-state "idle, updated" and in RR-idle mode ignores the value of spare bits in the special case where these spare bits are contained in the SI3 and SI4 messages. That the MS ignores the value of the spare bits is checked by changing the LAI in those message and observing the MS initiating a location update though the spare bits do not all have the default value.

## 26.5.7.1.2.3 Method of test

## Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in the MM-state "idle, updated" and in RR-idle mode.

## Related PICS/PIXIT statements

None.

## Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode.

## Test Procedure

The SS simulates a BCCH where continuously for at least 30 s at least one octet of the SI3 Rest Octets IE in all SYSTEM INFORMATION TYPE 3 messages and at least one octet of the SI4 Rest Octets IE in all SYSTEM INFORMATION TYPE 4 messages is different from 0010 1011 and the location area identification IE denotes a location area different from the current location area held by the MS. The SS verifies that the MS sends a CHANNEL REQUEST message on the RACH including the establishment cause "location updating". The SS responds with an IMMEDIATE ASSIGNMENT REJECT message.

## Maximum duration of test

10 s.

## Expected sequence

| Step | Direction | Message                     | Comments                                                                                                                                                       |
|------|-----------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  |                             | The SS starts sending modified SYSTEM INFORMATION TYPE 3 and SYSTEM INFORMATION TYPE 4 messages (as defined below) continuously for at least 30 s on the BCCH. |
| 2    | MS -> SS  | CHANNEL REQUEST             | Establishment cause = "location updating (SDCCH needed)". This message may be received during the 30 s.                                                        |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT REJECT |                                                                                                                                                                |

#### 26.5.7.1.3 Spare bits / RR / AGCH

##### 26.5.7.1.3.1 Conformance requirements

The MS shall ignore the value of spare bits.

##### References

3GPP TS 04.08 / 3GPP TS 44.018, subclause 10.5.

##### 26.5.7.1.3.2 Test purpose

To verify that the MS in the MM-state "idle, updated" and in RR-idle mode ignores the value of spare bits in the special case of the spare bits occurring in the Page Mode IE, the Spare Half Octet IE, the Channel Description IE, the Timing Advance IE, the IA Rest Octet IE, and in the IAR Rest Octet IE.

##### 26.5.7.1.3.3 Method of test

##### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in the MM-state "idle, updated" and in RR-idle mode.

##### Related PICS/PIXIT statements

None.

##### Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode.

## Test Procedure

The SS sends an IMMEDIATE ASSIGNMENT message containing arbitrary spare bits in the Page Mode IE, in the Spare Half Octet IE, in the Channel Description IE, in the Timing Advance IE, and in the IA Rest Octet IE.

It is checked that the MS answers on the dedicated channel with a PAGING RESPONSE message and releases the main signalling link after a CHANNEL RELEASE message.

After a new paging of the MS an IMMEDIATE ASSIGNMENT REJECT is sent to test the spare bits in the IAR Rest Octet IE.

The MS is then paged again to check the idle state.

## Maximum duration of test

20 s.

## Expected sequence

| Step | Direction | Message                     | Comments                                                                                                    |
|------|-----------|-----------------------------|-------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PAGING REQUEST TYPE 1       | Addressing the MS under test                                                                                |
| 2    | MS -> SS  | CHANNEL REQUEST             |                                                                                                             |

## 26.5.7.1.4 Spare bits / RR / Connected Mode

## 26.5.7.1.4.1 Conformance requirements

The MS shall ignore the value of spare bits.

## References

3GPP TS 04.08 / 3GPP TS 44.018, subclause 10.5.

## 26.5.7.1.4.2 Test purpose

To verify that the MS in the MM-state "MM-Connection active" and in RR-Connected mode ignores the value of spare bits in the special case of the spare bits occurring in the Cell Channel Description IE and in the Power Command IE.

## 26.5.7.1.4.3 Method of test

## Initial conditions

## System Simulator:

1 cell, default parameters, except:

GSM 450 mobiles are assigned to ARFCN 293 in step 10.

GSM 480 mobiles are assigned to ARFCN 340 in step 10.

GSM 700 mobiles are assigned to ARFCN 511 in step 10.

GSM 850 mobiles are assigned to ARFCN 251 in step 10.

PGSM and EGSM mobiles are assigned to ARFCN 124 in step 10.

DCS 1 800 and PCS 1 900 mobiles are assigned to ARFCN 801 in step 10.

## Mobile Station:

The MS is in the MM-state "idle, updated" and in RR-idle mode.

## Related PICS/PIXIT statements

Mobile's frequency capabilities, GSM 450 or GSM 480 or GSM 700 or GSM 850 or PGSM or EGSM or DCS 1 800 or PCS 1 900.

## Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode.

## Test Procedure

In the procedure of a normal call establishment the ASSIGNMENT COMMAND will be modified to test the spare bits in the Cell Channel Description IE and in the Power Command IE.

## Maximum duration of test

10 s.

## Expected sequence

## 26.5.7.2 Spare bits / MM

### 26.5.7.2.1 Conformance requirements

The MS shall ignore the value of spare bits.

#### References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 10.5.

## 26.5.7.2.2 Test purpose

To verify that the MS in the MM-state "wait net cmd" and in RR-Connected mode ignores the value of spare bits in the special case of the spare bits occurring in the Cipher Key Seq. Number IE or in the Identity Type IE.

## 26.5.7.2.3 Method of test

## Initial conditions

## System Simulator:

1 cell, default parameters.

## Mobile Station:

The MS is in the MM-state "idle, updated" and in RR-idle mode.

## Related PICS/PIXIT statements

None.

## Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode.

## Test Procedure

After the establishment of the RR-connection, in the AUTHENTICATION REQUEST message the spare bits of the Ciphering Key Sequence Number and of the Spare Half Octet IE will be randomly chosen. The spare bits of the Identity Type IE and the Spare Half Octet IE in the IDENTITY REQUEST message will also be chosen arbitrarily.

## Maximum duration of test

10 s.

## Expected sequence

| Step | Direction | Message                 | Comments                                                   |

Specific message contents

#### AUTHENTICATION REQUEST

| Information element           | Value/remark                                                   |
|-------------------------------|----------------------------------------------------------------|
| Ciphering Key Sequence Number | x000 (where "x" is set to 1)                                   |
| Spare Half Octet              | xxxx (where "xxxx" is arbitrary, with at least 1 bit set to 1) |
| Auth. Parameter RAND          | standard value                                                 |

#### IDENTITY REQ

| Information element | Value/remark                                                   |
|---------------------|----------------------------------------------------------------|
| Identity Type       | x100 (where "x" is set to 1)                                   |
| Spare Half Octet    | xxxx (where "xxxx" is arbitrary, with at least 1 bit set to 1) |

### 26.5.7.3 Spare bits / CC

This test is applicable to all MS supporting at least one MT circuit switched basic service.

#### 26.5.7.3.1 Conformance requirements

The MS shall ignore the value of spare bits.

#### References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 10.5.

#### 26.5.7.3.2 Test purpose

To verify that the MS in the MM-state "connection established" and in RR-Connected mode ignores the value of spare bits in the special case of the spare bits occurring in the Calling Party BCD Number IE, Calling Party Subaddress IE, Called Party Subaddress IE, Cause IE and Progress Indicator IEs.

#### 26.5.7.3.3 Method of test

##### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in the MM-state "idle, updated" and in RR-idle mode.

##### Related PICS/PIXIT statements

At least one circuit switched basic service supported.

MT calls supported.

##### Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode.

## Test Procedure

After the establishment of the MM-connection, in the SETUP message the spare bits of the Calling Party BCD Number, Calling Party Subaddress and Called Party Subaddress will be arbitrarily chosen and also in the DISCONNECT message the spare bits of the Progress Indicator IE and of the Cause IE will be arbitrarily chosen.

## Maximum duration of test

10 s.

## Expected sequence

| Step | Direction | Message                 | Comments                                |           |

## 26.6 Test of the elementary procedures for radio resource management

NOTE: For SS implementor: if tests are concatenated, it is important that unused fields in IMMEDIATE ASSIGNMENT REJECT messages do not use Request References that relate to CHANNEL REQUEST messages recently transmitted by the MS.

### 26.6.1 Immediate assignment

The immediate assignment procedure is used by the network to establish a dedicated control channel for the MS and network to communicate the detail of the service requested. If the Mobile Station does not implement the procedure correctly, radio resources can be wasted as the Mobile Station might use the wrong channels.

#### 26.6.1.1 Immediate assignment / SDCCH or TCH assignment

##### 26.6.1.1.1 Conformance requirement

1. Following a PAGING REQUEST message, the MS shall correctly set up an RR connection on the SDCCH/8 described in the IMMEDIATE ASSIGNMENT message.
2. Following a PAGING REQUEST message, the MS shall correctly set up an RR connection on the TCH/FACCH described in the IMMEDIATE ASSIGNMENT message.

##### Reference(s)

3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.3.1.1.2.

##### 26.6.1.1.2 Test purpose

To verify that the MS can correctly set up a dedicated SDCCH control channel and that the MS can correctly set up a dedicated TCH/FACCH control channel.

##### 26.6.1.1.3 Method of test

##### Initial Conditions

System Simulator:

1 cell, except that CCCH\_CONF is set to "1 basic physical channel used for CCCH not combined with SDCCHs".

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

##### Related PICS/PIXIT Statement(s)

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

Support rate(s) of TCH: TCH/F and/or TCH/H.

##### Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

##### Test Procedure

The System Simulator pages the MS and after the MS has responded with a CHANNEL REQUEST message the SS assigns an SDCCH. The MS shall go to the correct channel and send a PAGING RESPONSE message. Then the SS initiates RR-release by sending a CHANNEL RELEASE message.

If TCH/F is supported by the MS, the test is repeated with the SS assigning a TCH/F.

If TCH/H is supported by the MS, the test is repeated with the SS assigning a TCH/H.

#### Maximum Duration of Test

6 s per value of the execution timer.

#### Expected Sequence

This sequence is performed for execution counter,  $K = 1, 2, 3$  (unless the TCH is not supported).

| Step | Direction | Message               | Comments                             |
|------|-----------|-----------------------|--------------------------------------|
| 1    | SS -> MS  | PAGING REQUEST TYPE 1 |                                      |
| 2    | MS -> SS  | CHANNEL REQUEST       |                                      |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT  | Channel Type: see below              |
| 4    | MS -> SS  | PAGING RESPONSE       | Shall be sent on the correct channel |
| 5    | SS -> MS  | CHANNEL RELEASE       |                                      |

#### Specific Message Contents

##### IMMEDIATE ASSIGNMENT

$K=1$ , SDCCH test: Channel Type = SDCCH/8.

$K=2$ , TCH/F test: Channel Type = Bm + ACCHs.

$K=3$ , TCH/H test: Channel Type = Lm + ACCHs, subchannel arbitrarily chosen.

#### 26.6.1.2 Immediate assignment / extended assignment

NOTE 2: In these tests the SS must send the immediate assignment messages in due time to allow for the MS to receive them and send a PAGING RESPONSE rather than another random access. This applies to the whole of clause 26.

##### 26.6.1.2.1 Conformance requirements

1. The MS shall go to the allocated SDCCH/4 and send a PAGING RESPONSE message containing its identity and its classmark.
2. The MS shall go to the allocated SDCCH/8 and send a PAGING RESPONSE message containing its identity and its classmark.
3. The MS shall correctly identify its own assignment in either the Request Reference 1 or the Request Reference 2 information element in an extended assignment message.
4. The MS shall only react to an Immediate Assignment which references one of the last 3 CHANNEL REQUEST messages from the MS.

#### References

3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.3.

##### 26.6.1.2.2 Test purpose

To verify that the MS goes to the allocated SDCCH/4 and sends a PAGING RESPONSE message containing its identity and its classmark.

To verify that the MS goes to the allocated SDCCH/8 and sends a PAGING RESPONSE message containing its identity and its classmark.

To verify that the MS can correctly identify its own assignment in either the Request Reference 1 or the Request Reference 2 information element in an extended assignment message.

To verify that the MS only reacts to an Immediate Assignment which references one of the last 3 CHANNEL REQUEST messages from the MS.

#### 26.6.1.2.3 Method of test

##### Initial Conditions

System Simulator:

1 cell, Max-retrans is set to 7.

Mobile Station:

The MS is in the "idle, updated" state. with a TMSI allocated.

##### Related PICS/PIXIT Statements

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

##### Foreseen Final State of the MS

"Idle, updated", with a TMSI allocated.

##### Test Procedure

In the first part of the test, the SS pages the MS, which shall react by sending CHANNEL REQUEST messages. Immediately after reception of the n-th CHANNEL REQUEST message (n being arbitrarily chosen by the SS from the set {1, 2 ... 8}) the SS sends an IMMEDIATE ASSIGNMENT EXTENDED message, which references one of the last 3 CHANNEL REQUEST messages from the MS. The MS shall then go to the correct channel and send a PAGING RESPONSE message. The SS will then release the channel.

In the second part of the test, the SS again pages the MS, which shall react by sending CHANNEL REQUEST messages. Immediately after reception of the k-th CHANNEL REQUEST message (k being arbitrarily chosen by the SS from the set {4, 5 ... 8}) the SS sends an IMMEDIATE ASSIGNMENT EXTENDED message which, instead of referencing one of the last 3 CHANNEL REQUEST messages from the MS, references an earlier CHANNEL REQUEST message. The MS shall then ignore the IMMEDIATE ASSIGNMENT EXTENDED message and continue to send CHANNEL REQUEST messages until the Max-Retrans value has been reached. Then a period of 7 seconds shall elapse in order to allow the MS to perform cell reselection (this allows for the time between the last CHANNEL REQUEST message and the beginning of cell reselection).

In the third part of the test, the CCCH\_CONF of the SS is set to non-combined and the SS pages the MS, which shall react by sending CHANNEL REQUEST messages. Immediately after reception of the r-th CHANNEL REQUEST message (r being arbitrarily chosen by the SS from the set {4, 5 ... 8}) the SS sends an IMMEDIATE ASSIGNMENT EXTENDED message which, in the second request reference, references one of the last 3 CHANNEL REQUEST messages from the MS. The associated Channel Description allocates SDCCH(S) (S being arbitrarily chosen by the SS from the set {0,1 ... 7}). The MS shall then go to the correct channel and send a PAGING RESPONSE message. The SS will then release the channel.

##### Maximum Duration of Test

90 s.

## Expected Sequence

| Step | Direction | Message                       | Comments                                                                                                                     |
|------|-----------|-------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PAGING REQUEST TYPE 1         |                                                                                                                              |
| 2    | MS -> SS  | CHANNEL REQUEST               | n CHANNEL REQUESTs (n being arbitrarily chosen from {1... 8}) are sent, all with Establ. Cause = "Answer to paging".         |

| 4    | SS -> MS  | IMMEDIATE ASSIGNMENT EXTENDED | see note 1.                                                                                                                  |
| 5    | MS -> SS  | PAGING RESPONSE               |                                                                                                                              |
| 6    | SS -> MS  | CHANNEL RELEASE               |                                                                                                                              |
| 7    | -----     | -----                         | The SS waits 12 s to allow the MS to perform cell reselection.                                                               |
| 8    | SS -> MS  | PAGING REQUEST TYPE 1         |                                                                                                                              |
| 9    | MS -> SS  | CHANNEL REQUEST               | k CHANNEL REQUESTs (k being arbitrarily chosen from the set {4, 5, 8}) are sent all with Establ. Cause = "Answer to paging". |
| 10   | MS -> SS  | CHANNEL REQUEST               |                                                                                                                              |
| 11   | SS -> MS  | IMMEDIATE ASSIGNMENT EXTENDED | see note 2.                                                                                                                  |
| 12   | MS -> SS  | CHANNEL REQUEST               | 8-k CHANNEL REQUESTs are sent, all with Establ. Cause = "Answer to paging".                                                  |
| 13   | MS -> SS  | CHANNEL REQUEST               |                                                                                                                              |
| 14   | SS        |                               | The SS verifies that the MS does not transmit any Layer 2 frames for at least 3 s.                                           |
| 15   | SS        |                               | The SS sets CCCH_CONF to non-combined.                                                                                       |
| 16   | SS        |                               | The SS waits 40 s to allow the MS to perform cell reselection and to read the BCCH information.                              |
| 17   | SS -> MS  | PAGING REQUEST TYPE 1         |                                                                                                                              |
| 18   | MS -> SS  | CHANNEL REQUEST               | r CHANNEL REQUESTs (r being arbitrarily chosen from {4, 5... 8}) are sent, all with Establ. Cause = "Answer to paging".      |
| 19   | MS -> SS  | CHANNEL REQUEST               |                                                                                                                              |
| 20   | SS -> MS  | IMMEDIATE ASSIGNMENT EXTENDED | see note 3.                                                                                                                  |
| 21   | MS -> SS  | PAGING RESPONSE               |                                                                                                                              |
| 22   | SS -> MS  | CHANNEL RELEASE               |                                                                                                                              |

## Specific Message Contents

NOTE 1: The first Request Reference is the one which pertains to the i-th CHANNEL REQUEST sent by the MS, where i is an integer in the set {max (1,n-2) ... n}, its value being arbitrarily chosen by the SS. The second Request Reference shall be different from any Request Reference the MS has generated in this test.

NOTE 2: The first Request Reference is the one which pertains to the i-th CHANNEL REQUEST sent by the MS, where i is an integer in the set {1 ... k-3}, its value being arbitrarily chosen by the SS. The second Request Reference shall be different from any Request Reference the MS has generated in this test.

NOTE 3: The second Request Reference is the one which pertains to the i-th CHANNEL REQUEST sent by the MS, where i is an integer in the set {r-2, r-1, r}, its value being arbitrarily chosen by the SS. The first Request Reference shall be different from any Request Reference the MS has generated in this test.

## 26.6.1.3 Immediate assignment / assignment rejection

## 26.6.1.3.1 Conformance requirements

1. The MS shall respond to the Paging Request message by sending a Channel Request message with establishment cause set to "Answer to Paging". After the reception of IMMEDIATE ASSIGNMENT REJECT, the MS shall not transmit during the time indicated in the "Wait Indication" field of the IMMEDIATE ASSIGNMENT REJECT message, and then it shall answer to the new paging requests.
2. After an assignment rejection, the MS shall perform a cell reselection (idle mode operation) and the MS shall not transmit unless a different cell is selected.

## References

3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.3.1.1.3 and 3GPP TS 04.13 subclause 5.2.2.

### 26.6.1.3.2 Test purpose

To verify that the MS can accept an IMMEDIATE ASSIGNMENT REJECT.

To verify that the MS can respond to paging after an IMMEDIATE ASSIGNMENT REJECT is received on a different cell.

### 26.6.1.3.3 Method of test

#### Initial Conditions

System Simulator:

2 cells with the same LAI, Max-Retrans is 7.

Mobile Station:

The MS is camped on cell A and is in the "idle, updated" state, with a TMSI allocated.

#### Related PICS/PIXIT Statements

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

#### Foreseen Final State of the MS

The MS is camped on cell B and is in the "idle, updated" state, with a TMSI allocated.

#### Test Procedure

The SS pages the MS, which shall react by sending CHANNEL REQUESTs. Immediately after reception of the n-th CHANNEL REQUEST (n being an integer from the set {1, 2 ... 8}, arbitrarily chosen by the SS) the SS sends an IMMEDIATE ASSIGNMENT REJECT message, which references one of the last 3 CHANNEL REQUESTs from the MS, and with the Wait Indication set to x seconds (x being an integer from the set {5, 6 ... 255}, arbitrarily chosen by the SS). The SS continues to send paging messages for that mobile station in every block of the mobile station's paging subgroup for x+2 s. The MS shall not answer to the PAGING REQUEST TYPE 1 messages sent before x seconds have elapsed. The MS may respond to any one of the PAGING REQUEST TYPE 1 messages sent after x seconds have elapsed, but at the latest it shall respond to the first PAGING REQUEST TYPE 1 sent after x+1 seconds have elapsed.

The SS responds to this CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message with the Wait Indication set to 255 s.

Immediately afterwards the SS changes the power levels so the MS selects cell B. After 20 s have elapsed the SS pages the MS in cell B and the MS shall answer to this page. In order to avoid another cell reselection the SS then sends another IMMEDIATE ASSIGNMENT REJECT.

#### Maximum Duration of Test

5 minutes.

## Expected Sequence

| Step                                                                                                                                                                                                     | Direction | Message                     | Comments                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| NOTE 1: The Request Reference is the one which pertains to the i-th CHANNEL REQUEST sent by the MS, where i is an integer from the set {max(1,n-2) ... n}, its value being arbitrarily chosen by the SS. |           |                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| NOTE 2: the value of k is not important in this test.                                                                                                                                                    |           |                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Specific Message Contents

None.

## 26.6.1.4 Immediate assignment / ignore assignment

## 26.6.1.4.1 Conformance requirements

1. An MS waiting for a response from the network, following the sending of a CHANNEL REQUEST, shall ignore an IMMEDIATE ASSIGNMENT message with a request reference containing a wrong frame number.
2. An MS is waiting for an assignment of its own, shall ignore an IMMEDIATE ASSIGNMENT message with a request reference containing a wrong random access information.

## References

3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.3.1.1.2

## 26.6.1.4.2 Test purpose

To verify that the MS ignores an assignment for another MS while it is waiting for an assignment of its own.

## 26.6.1.4.3 Method of test

## Initial Conditions

System Simulator:

1 cell.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

## Related PICS/PIXIT Statements

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

## Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

## Test Procedure

The SS pages the MS, which reacts with CHANNEL REQUESTs. The SS responds to the first CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT containing a wrong Request Reference (in the first run of the test the frame number is wrong, in the repetition it is the random access info that is wrong). It is verified for 2 s that the MS does not start signalling on the SDCCH. The MS shall ignore the assignment and send another CHANNEL REQUEST message. In order to avoid cell reselection the SS now answers with a correct IMMEDIATE ASSIGNMENT REJECT and repeats the test once.

## Maximum Duration of Test

12 s.

## Expected Sequence

| Step | Direction | Message                     | Comments                                                                                                                                         |
|------|-----------|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PAGING REQUEST TYPE 1       |                                                                                                                                                  |
| 2    | MS -> SS  | CHANNEL REQUEST             | Establish. Cause = "Answer to paging".                                                                                                           |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT        | Frame number in Request Reference is 2 too high. The MS shall not start signalling on the assigned SDCCH. This is verified for a period of 2 s.  |
| 4    | MS -> SS  | CHANNEL REQUEST             | Establish. Cause = "Answer to paging".                                                                                                           |

## 26.6.1.5 Immediate assignment after immediate assignment reject

### 26.6.1.5.1 Conformance requirement

Following an IMMEDIATE ASSIGNMENT REJECT message, the MS shall listen for IMMEDIATE ASSIGNMENTS until T3126 expires.

#### Reference

3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.3.1.1.3

### 26.6.1.5.2 Test purpose

To verify that the MS correctly responds to an IMMEDIATE ASSIGNMENT message sent after an IMMEDIATE ASSIGNMENT REJECT message.

### 26.6.1.5.3 Method of test

#### Initial conditions

##### System Simulator:

1 cell;

CCCH\_CONF is set to "1 basic physical channel used for CCCH not combined with SDCCHs";

Max retrans is set to 7;

TX-integer is set to 7;

##### Mobile Station:

The MS is in "idle, updated" state, with a TMSI allocated.

#### Related PICS/PIXIT statement(s)

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

#### Foreseen final state of the MS

"idle, updated", with TMSI allocated.

#### Test Procedure

The SS pages the MS, which shall react by sending CHANNEL REQUESTs. Immediately after reception of the third CHANNEL REQUEST the SS sends an IMMEDIATE ASSIGNMENT REJECT message which references the first CHANNEL REQUEST from the MS and has the Wait Indication IE set to 6 s.

Between 0,75 s and 1,25 s after sending the IMMEDIATE ASSIGNMENT REJECT message the SS sends an IMMEDIATE ASSIGNMENT message referencing the second CHANNEL REQUEST message, and assigning an SDCCH. The MS shall go to the correct channel and send a PAGING RESPONSE message. Then the SS initiates RR-release by sending a CHANNEL RELEASE message.

#### Maximum duration of test

10 s.

## Expected Sequence

| Step | Direction | Message                  | Comments                                                                                                                                     |
|------|-----------|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PAGING REQUEST TYPE 1    |                                                                                                                                              |
| 2    | MS -> SS  | CHANNEL REQUEST          | first request.                                                                                                                               |
| 3    | MS -> SS  | CHANNEL REQUEST          | second request.                                                                                                                              |
| 4    | MS -> SS  | CHANNEL REQUEST          | third request.                                                                                                                               |
| 5    | SS -> MS  | IMMEDIATE ASSIGNMENT REJ | references the first request from MS, Wait Indication IE set to 6 s.                                                                         |
| 6    | SS -> MS  | IMMEDIATE ASSIGNMENT     | references the second request from the MS Channel type set to SDCCH/8 message sent between 0,75 s and 1,25 s after the completion of step 5. |
| 7    | MS -> SS  | PAGING RESPONSE          |                                                                                                                                              |
| 8    | SS -> MS  | CHANNEL RELEASE          | shall be sent on the correct channel.                                                                                                        |

## 26.6.2 Test of paging

The Paging procedure is used by the network to cause the Mobile Station to establish a radio connection. Normally the Mobile Station listens to its paging subchannel, but this can be modified by the use of different page modes. The correct implementation of the paging procedure in the Mobile Station is essential for the basic establishment of a connection.

### 26.6.2.1 Normal paging

#### 26.6.2.1.1 Paging / normal / type 1

##### 26.6.2.1.1.1 Conformance requirements

1. The MS shall respond correctly to various PAGING REQUEST TYPE 1 messages, when the page mode is set to normal paging, in the following cases:
  - 1.1 The MS is addressed with its IMSI in the first Mobile Identity field. The optional Mobile Identity field is not present.
  - 1.2. The MS is addressed with its TMSI in the first Mobile Identity field. The optional Mobile Identity field specifies an IMSI different from that of the MS.
  - 1.3. The first Mobile Identity field specifies a TMSI different from that of the MS. The optional Mobile Identity field addresses the MS by its IMSI.
  - 1.4 The first Mobile Identity field specifies a TMSI different from that of the MS. The optional Mobile Identity field contains the correct TMSI of the MS.
2. An MS shall ignore PAGING REQUEST TYPE 1 messages with incorrect information, when the page mode is set to normal paging, in the following case:
  - 2.1 The MS is addressed with its TMSI in the first Mobile Identity field, but the type of identity in this field is set to "No Identity". The optional Mobile Identity field is not present.

#### 26.6.2.1.1.2 Test purpose

To test that the MS is able to determine its CCCH group and paging group correctly and that the MS responds correctly to various PAGING REQUEST TYPE 1 messages when the page mode is set to normal paging. All valid ways of addressing the MS are tested. It is tested that the MS responds with the same type of identity that is used in the PAGING REQUEST TYPE 1 message. It is tested that the MS ignores fill paging.

#### 26.6.2.1.1.3 Method of test

##### Initial Conditions

###### System Simulator:

1 cell, Max-Retrans = 2, a legal combination of CCCH\_CONF, BS\_AG\_BLKES\_RES and BS\_PA\_MFRMS is chosen arbitrarily by the SS.

###### Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

##### Related PICS/PIXIT Statements

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

##### Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

##### Test Procedure

The SS pages the MS 5 times with different PAGING REQUEST TYPE 1 messages on the paging subchannel which corresponds to the MS's IMSI.

In the first 4 cases, where the MS is addressed by its IMSI or its TMSI, the MS shall answer to the paging by sending CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST by assigning a channel, and the MS shall then send a correct PAGING RESPONSE. The SS then releases the channel.

In the last case, it is tested that the MS does not answer to paging that does not address it.

##### Maximum Duration of Test

2 minutes.

## Expected Sequence

## 26.6.2.1.2 Paging / normal / type 2

### 26.6.2.1.2.1 Conformance requirements

1. The MS shall respond correctly (by sending CHANNEL REQUEST messages with an Establishment Cause set to "Answer to Paging") to various PAGING REQUEST TYPE 2 messages, when the page mode is set to normal paging, in the following cases:
  - 1.1 The MS is addressed in the first TMSI field.
  - 1.2 The MS is addressed in the second TMSI field.
  - 1.3 The MS is addressed in the optional Mobile Identity field with its TMSI.
  - 1.4 The MS is addressed in the optional Mobile Identity field with its IMSI.
2. The MS shall ignore PAGING REQUEST TYPE 2 messages with incorrect information, when the page mode is set to normal paging, in the following case:
  - 2.1 The MS is addressed in the optional Mobile Identity field with its TMSI, but the type of identity in this field is set to "No Identity".

### References

### 26.6.2.1.3 Paging / normal / type 3

#### 26.6.2.1.3.1 Conformance requirements

An MS shall respond correctly to various PAGING REQUEST TYPE 3 messages, when the page mode is set to normal paging. The MS shall send CHANNEL REQUEST messages, with an Establishment Cause set to "Answer to Paging", until the network answers. The number of CHANNEL REQUEST messages shall be limited by the parameter Max-retrans. After the assignment procedure, the MS shall send a PAGING RESPONSE message on the channel assigned by the network.

#### References

3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.3.2.

#### 26.6.2.1.3.2 Test purpose

To test that the MS is able to determine its CCCH group and paging group correctly and that the MS responds correctly to various PAGING REQUEST TYPE 3 messages when the page mode is set to normal paging. All valid ways of addressing the MS are tested.

#### 26.6.2.1.3.3 Method of test

##### Initial Conditions

###### System Simulator:

1 cell, Max-Retrans = 2, a legal combination of CCCH\_CONF, BS\_AG\_BLKES\_RES and BS\_PA\_MFRMS is chosen arbitrarily by the SS.

###### Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

##### Related PICS/PIXIT Statements

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

##### Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

##### Test Procedure

The SS pages the MS 4 times with different PAGING REQUEST TYPE 3 messages on the paging subchannel which corresponds to the MS's IMSI.

In all the cases the MS shall answer to the paging by sending CHANNEL REQUESTs. The SS responds to the second request by assigning a channel, and the MS shall then send a correct PAGING RESPONSE. The SS then releases the channel.

##### Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

## Expected Sequence

| Step | Direction | Message               | Comments                                                           |
|------|-----------|-----------------------|--------------------------------------------------------------------|
| 1    | SS -> MS  | PAGING REQUEST TYPE 3 | 1st TMSI addresses MS; 2nd, 3rd and 4th TMSIs address other MSs.   |
| 2    | MS -> SS  | CHANNEL REQUEST       | Establish. Cause = "Answer to paging".                             |
| 3    | MS -> SS  | CHANNEL REQUEST       | Establish. Cause = "Answer to paging".                             |
| 4    | SS -> MS  | IMMEDIATE ASSIGNMENT  | Request Reference = pertaining to the message received in step 3.  |
| 5    | MS -> SS  | PAGING RESPONSE       | Mobile Ident: TMSI.                                                |
| 6    | SS -> MS  | CHANNEL RELEASE       |                                                                    |
|      | -----     | -----                 | The SS waits 12 s to allow the MS to perform cell reselection.     |
| 7    | SS -> MS  | PAGING REQUEST TYPE 3 | 2nd TMSI addresses MS; 1st, 3rd and 4th TMSIs address other MSs.   |
| 8    | MS -> SS  | CHANNEL REQUEST       | Establish. Cause = "Answer to paging".                             |

## 26.6.2.2 Paging / extended

## 26.6.2.2.1 Conformance requirements

1. The MS shall operate in the extended page mode when this is ordered by the network in a PAGING REQUEST TYPE 1 message not addressing the MS but on the paging subchannel which corresponds to the MS's identity.
2. The MS shall operate in the extended page mode when this is ordered by the network in a PAGING REQUEST TYPE 2 message not addressing the MS but on the paging subchannel which corresponds to the MS's identity.
3. The MS shall operate in the extended page mode when this is ordered by the network in a PAGING REQUEST TYPE 3 message not addressing the MS but on the paging subchannel which corresponds to the MS's identity.
4. The MS shall operate in the extended page mode when this is ordered by the network in an IMMEDIATE ASSIGNMENT message on the paging subchannel which corresponds to the MS's identity.
5. The MS shall operate in the extended page mode when this is ordered by the network in an IMMEDIATE ASSIGNMENT EXTENDED message on the paging subchannel which corresponds to the MS's identity.

### 26.6.2.2.2 Test purpose

To test that the MS is operating in the extended page mode when this is ordered by the SS in either a PAGING REQUEST message or an IMMEDIATE ASSIGNMENT message.

### 26.6.2.2.3 Method of test

## Initial Conditions

### System Simulator:

1 cell, Max-Retrans = 2, a legal combination of CCCH\_CONF, BS\_AG\_BLKES\_RES and BS\_PA\_MFRMS is chosen arbitrarily by the SS.

### Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

## Related PICS/PIXIT Statements

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

## Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

## Test Procedure

The SS sends a PAGING REQUEST TYPE 1 message not addressing the MS under test but on the paging subchannel which corresponds to the MS's identity. The page mode is set to "extended paging". In the next but one paging subblock on the same CCCH the SS sends a PAGING REQUEST TYPE 1 message specifying an arbitrarily chosen page mode and addressing the MS by its TMSI. The MS shall respond to the last page by sending CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message.

The SS then sends an IMMEDIATE ASSIGNMENT on the paging subchannel which corresponds to the MS's identity. The random reference is different to those used by the Mobile Station in the last two CHANNEL REQUEST messages. (Phase 2 requires a Mobile Station to react on an IMMEDIATE ASSIGNMENT after a rejection.) The page mode is again set to "extended paging". In the next but one paging subblock on the same CCCH the SS sends a PAGING REQUEST TYPE 2 message specifying an arbitrarily chosen page mode and addressing the MS by its TMSI. The MS shall respond with CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message.

The SS then sends an IMMEDIATE ASSIGNMENT EXTENDED on the paging subchannel which corresponds to the MS's identity. The random references are different to those used by the Mobile Station in the last three CHANNEL REQUEST messages. The page mode is again set to "extended paging". In the next but one paging subblock on the same CCCH the SS sends a PAGING REQUEST TYPE 3 message specifying an arbitrarily chosen page mode and addressing the MS by its TMSI. The MS shall respond with CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message.

The SS then sends a PAGING REQUEST TYPE 3 message not addressing the MS under test but on the paging subchannel which corresponds to the MS's identity. The page mode is set to "extended paging". In the next but one paging subblock on the same CCCH the SS sends a PAGING REQUEST TYPE 2 message specifying an arbitrarily chosen page mode and addressing the MS by its IMSI. The MS shall respond to the last page by sending CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message.

The SS then sends a PAGING REQUEST TYPE 2 message not addressing the MS under test but on the paging subchannel which corresponds to the MS's identity. The page mode is set to "extended paging". In the next but one paging subblock on the same CCCH the SS sends a PAGING REQUEST TYPE 1 message specifying an arbitrarily chosen page mode and addressing the MS by its IMSI. The MS shall respond to the last page by sending CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message.

#### Maximum Duration of Test

10 s.

### 26.6.2.3 Paging / reorganization

#### 26.6.2.3.1 Paging / reorganization / procedure 1

##### 26.6.2.3.1.1 Conformance requirements

1. An MS, after reception of a message with page mode set to "paging reorganization", shall answer to paging messages (with page mode set to "normal paging") sent on its old CCCH in paging blocks which do not belong to the MS's paging sub-channel.
2. When the network changes the paging group of the MS by modifying BCCH parameters (to CCCH\_CONF set to "1 basic physical channel used for CCCH combined with SDCCH", and BS\_AG\_BLK\_RES set to "2 blocks reserved for access grant"), the MS shall calculate its new paging group and answer to paging messages on its new paging subchannel.
3. When the network changes the paging group of the MS by modifying BCCH parameters (to CCCH\_CONF set to "2 basic physical channels used for CCCH, not combined with SDCCHs" and BS\_AG\_BLK\_RES set to "2 blocks reserved for access grant"), the MS shall calculate its new paging group and answer to paging messages on its new paging subchannel.

## References

3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.3.2.1; 3GPP TS 05.02, subclause 6.5.

##### 26.6.2.3.1.2 Test purpose

To test that the MS correctly determines its new paging subchannel when the CCCH structure is changed from non-combined to combined and when the number of CCCHs is changed.

##### 26.6.2.3.1.3 Method of test

## Initial Conditions

### System Simulator:

1 cell, Max-Retrans = 2, CCCH\_CONF set to "1 basic physical channel used for CCCH, not combined with SDCCHs", a legal combination of BS\_AG\_BLK\_RES and BS\_PA\_MFRMS is chosen arbitrarily by the SS, with the exception that BS\_PA\_MFRMS shall not be set to 9.

### Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated. The IMSI of the MS is from a defined/default range that ensures its paging channel changes when the broadcast parameters are changed.

## Related PICS/PIXIT Statements

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

## Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

## Test Procedure

The SS sends an IMMEDIATE ASSIGNMENT EXTENDED message on the MS's paging subchannel, with the page mode element set to "paging reorganization" and Request References that do not pertain to the MS. Before the MS's original paging subchannel re-occurs, the SS pages it on the CCCH corresponding to the Mobile Station's IMSI with a PAGING REQUEST TYPE 2 message (page mode = normal paging) containing the MS's TMSI in some paging block which does not belong to the Mobile Station's paging subchannel. The MS shall respond by sending CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT (in order to avoid a cell reselection) on an arbitrarily selected paging subchannel.

Then the SS starts sending messages (PAGING REQUEST TYPE 1 or PAGING REQUEST TYPE 2 or PAGING REQUEST TYPE 3 or IMMEDIATE ASSIGNMENT or IMMEDIATE ASSIGNMENT EXTENDED or IMMEDIATE ASSIGNMENT REJECT) with page mode set to "paging reorganization" on all paging subchannels.

After 5 s (to ensure T3126 expires) the SS pages the MS with its TMSI on an arbitrarily selected paging subchannel (on the CCCH corresponding to the Mobile Station's IMSI). The MS shall respond by sending CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT (in order to avoid a cell reselection).

The SS changes the paging parameters.

Then the SS sets the page mode to "normal paging".

The SS then waits for the duration of five 51-TDMA multiframes (4 to allow the MS to read all the system information type 1, 2, 3, and 4 messages on the BCCH, and one to calculate the new paging group). Not before 5 s after the last IMMEDIATE ASSIGNMENT REJECT message addressing the MS (to ensure T3126 expires), the MS is paged with a PAGING REQUEST TYPE 1 on its new paging subchannel. The MS shall respond by sending CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT (in order to avoid a cell reselection) and then waits 5 s (to ensure T3126 expires).

Then the MS is paged with a PAGING REQUEST TYPE 2 on its new paging subchannel. The MS shall respond by sending CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT (in order to avoid a cell reselection).

## Maximum Duration of Test

60 s.

## Expected Sequence

This sequence is performed for execution counter, K =1, 2.

| Step | Direction | Message                       | Comments                                                                                                               |
|------|-----------|-------------------------------|------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | IMMEDIATE ASSIGNMENT EXTENDED | Sent on the MS's paging channel. Page mode set to "paging reorganization". Request Reference not pertaining to the MS. |
| 2    | SS -> MS  | PAGING REQUEST TYPE 2         | Sent before the MS's original paging subchannel re-occurs, but later than the next paging block of that CCCH.          |
| 3    | MS -> SS  | CHANNEL REQUEST               |                                                                                                                        |

### 26.6.2.3.2 Paging / reorganization / procedure 2

#### 26.6.2.3.2.1 Conformance requirement

An MS, after reception of a message with page mode set to "paging reorganization", shall answer to paging messages (with page mode set to "normal paging") sent in a former Access Grant block.

#### References

3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.3.2.1.

#### 26.6.2.3.2.2 Test purpose

To test that the MS is operating in the "paging reorganization" page mode when this is ordered by the SS and the MS is paged in its former access grant channel.

#### 26.6.2.3.2.3 Method of test

#### Initial Conditions

##### System Simulator:

1 cell, Max-Retrans = 1, with the constraint that BS\_AG\_BLK\_RES > 0, a legal combination of CCCH\_CONF, BS\_AG\_BLK\_RES and BS\_PA\_MFRMS is chosen arbitrarily by the SS.

##### Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated. The IMSI of the MS is from a defined/default range that ensures its paging channel changes when the broadcast parameters are changed.

#### Related PICS/PIXIT Statements

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

#### Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

#### Test Procedure

The SS sends an IMMEDIATE ASSIGNMENT EXTENDED on the MS's paging subchannel, with the page mode element set to "paging reorganization". The MS is then paged immediately in a former Access Grant block with a PAGING REQUEST TYPE 2 message. The MS shall respond by sending CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT (in order to avoid a cell reselection).

#### Maximum Duration of Test

5 s.

#### Expected Sequence

| Step | Direction | Message                       | Comments                                 |
|------|-----------|-------------------------------|------------------------------------------|
| 1    | SS -> MS  | IMMEDIATE ASSIGNMENT EXTENDED | Page mode set to "paging reorganization" |
| 2    | SS -> MS  | PAGING REQUEST TYPE 2         | Sent in a former access grant block.     |
| 3    | MS -> SS  | CHANNEL REQUEST               |                                          |
| 4    | MS -> SS  | CHANNEL REQUEST               |                                          |
| 5    | SS -> MS  | IMMEDIATE ASSIGNMENT REJECT   |                                          |
|      |           |                               |                                          |

## Specific Message Contents

None.

### 26.6.2.4 Paging / same as before

#### 26.6.2.4.1 Conformance requirements

An MS, after first receiving a message on its paging subchannel with page mode set to "extended paging" and then the next message on its paging subchannel with page mode set to "same as before", shall remember the page mode from the previous message and answer to paging messages in the next but one paging sub block.

#### References

3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.3.2.1; 3GPP TS 05.02, subclause 6.5.

#### 26.6.2.4.2 Test purpose

To test that the MS remembers the page mode from the previous paging request message.

#### 26.6.2.4.3 Method of test

#### Initial Conditions

##### System Simulator:

1 cell, Max-Retrans = 2, a legal combination of CCCH\_CONF, BS\_AG\_BLKES\_RES and BS\_PA\_MFRMS is chosen arbitrarily by the SS.

##### Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

#### Related PICS/PIXIT Statements

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

#### Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

#### Test Procedure

The SS sends an IMMEDIATE ASSIGNMENT REJECT on the MS's paging subchannel, with the page mode element set to "extended paging". In the next but one subblock on the same CCCH, nothing addresses the MS. When the MS's specific paging subchannel reoccurs, a PAGING REQUEST TYPE 3 is sent, not addressing the MS under test and with page mode set to "same as before". In the next but one subblock on the same CCCH the SS sends a PAGING REQUEST TYPE 1 message specifying paging reorganization and addressing the MS. The MS shall respond by sending CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT (in order to avoid a cell reselection).

#### Maximum Duration of Test

10 s.

## Expected Sequence

| Step | Direction | Message                        | Comments                                                                                                                                                                                                                  |
|------|-----------|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | IMMEDIATE ASSIGNMENT<br>REJECT | Page mode set to "extended paging".                                                                                                                                                                                       |
| 2    | SS -> MS  | XXXX                           | In the next but one subblock nothing addresses the MS. This is sent in the next paging subblock on the MS's specific paging subchannel. The page mode is set to "same as before", and the MS under test is not addressed. |
| 3    | SS -> MS  | PAGING REQUEST TYPE 3          |                                                                                                                                                                                                                           |
| 4    | SS -> MS  | PAGING REQUEST TYPE 1          |                                                                                                                                                                                                                           |
| 5    | MS -> SS  | CHANNEL REQUEST                | The MS is addressed in this "next but one subblock". Page mode set to "paging reorganization".                                                                                                                            |
| 6    | MS -> SS  | CHANNEL REQUEST                |                                                                                                                                                                                                                           |
| 7    | SS -> MS  | IMMEDIATE ASSIGNMENT<br>REJECT |                                                                                                                                                                                                                           |

## 26.6.2.5 Paging / multislots CCCH

## 26.6.2.5.1 Conformance requirements

The MS shall respond correctly to a PAGING REQUEST TYPE 1 message, when the page mode is set to normal paging, when a multislots CCCH is used and the MS is addressed with its IMSI in the first Mobile Identity field, the optional Mobile Identity field being not present.

## References

3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.3.2, 3GPP TS 05.02 subclause 6.5.

## 26.6.2.5.2 Test purpose

- 1) To test that the MS is able to determine its CCCH group and paging group correctly in the case of a CCCH configuration on more than one timeslot when it is paged on a timeslot other than 0. The MS is addressed with a PAGING REQUEST TYPE 1 message when the page mode is set to normal paging. The MS is paged with its IMSI in the 1st Mobile Identity field, the optional Mobile Identity field being not present, is the only way of addressing tested.
- 2) To test that in such conditions the MS answers to the paging message on the timeslot on which the paging message was sent.

## 26.6.2.5.3 Method of test

## Initial Conditions

## System Simulator:

1 cell, a legal combination of CCCH\_CONF, BS\_AG\_BLKES\_RES and BS\_PA\_MFRMS is chosen arbitrarily under the following constraint:

CCCH\_CONF is in the set:

- 2 basic physical channels used for CCCH, not combined with SDCCHs
- 3 basic physical channels used for CCCH, not combined with SDCCHs
- 4 basic physical channels used for CCCH, not combined with SDCCHs

## Mobile Station:

The IMSI last 3 digits are so that the CCCH\_GROUP of the MS under test is other than 0. According to subclause 6.5.2 of recommendation 3GPP TS 05.02, this means that:

$$(IMSI \bmod 1000) \bmod (BS\_CC\_CHANS \times N) \text{ is greater or equal to } N, \text{ where} \\ N = BS\_PA\_MFRMS \times (9 - BS\_AG\_BLKS\_RES).$$

The MS is in the "idle, updated" state.

#### Related PICS/PIXIT Statements

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

#### Foreseen Final State of the MS

"Idle updated".

#### Test Procedure

The SS pages the MS once with a PAGING REQUEST TYPE 1 message on the timeslot and paging subchannel which correspond to the MS's IMSI.

The MS shall send the CHANNEL REQUEST on the same timeslot as the paging message.

The SS sends an IMMEDIATE ASSIGNMENT on the same timeslot as the paging message.

#### Maximum Duration of Test

10 s.

#### Expected Sequence

| Step | Direction | Message               | Comments                                                                        |
|------|-----------|-----------------------|---------------------------------------------------------------------------------|
| 1    | SS -> MS  | PAGING REQUEST TYPE 1 | 1st Mobile Ident contains IMSI of MS, 2nd Mobile Ident not present.             |
| 2    | MS -> SS  | CHANNEL REQUEST       | Establ. Cause = "Answer to paging". on the same timeslot as the paging message. |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT  | on the same timeslot as the paging message.                                     |
| 4    | MS -> SS  | PAGING RESPONSE       | Mobile Ident: IMSI.                                                             |
| 5    | SS -> MS  | CHANNEL RELEASE       |                                                                                 |

#### Specific Message Contents

### 26.6.3 Test of measurement report

When an RR-connection exists, the MS shall send measurement reports. These reports contain reception characteristics from serving and neighbouring cells. The measurement report procedure is described in subclause 3.4.1.2 of 3GPP TS 04.08 / 3GPP TS 44.018.

NOTE 8: The capability to calculate RxLev and RxQual is tested in clauses 15 and 16. In this test only the signalling aspect is verified.

#### 26.6.3.1 Measurement / no neighbours

This test applies to GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 mobile stations.

##### 26.6.3.1.1 Conformance requirements

The MS shall continuously send MEASUREMENT REPORT messages on every SACCH block and the measurement valid indication shall be set to valid (0) within the second block at the latest.

## References

3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.4.1.2, 3GPP TS 05.08 subclause 8.4.

## 26.6.3.1.2 Test purpose

To test that, when the SS gives absolutely no information about neighbouring cells, the MS does not report on neighbouring cells.

## 26.6.3.1.3 Method of test

## Initial Conditions

System Simulator:

For GSM 900, DCS 1800 and PCS 1 900: 8 cells with the following settings:

| Transmitter   | Level | NCC | BCC | ARFCN<br>(GSM900) | ARFCN<br>(DCS1800) | ARFCN<br>(PCS1900) | Cell Identity |
|---------------|-------|-----|-----|-------------------|--------------------|--------------------|---------------|
| Serving, S1   | -60   | 1   | 3   | 002               | 514                | 514                | 0001H         |
| Neighbour, N1 | -85   | 1   | 5   | 008               | 530                | 530                | 0002H         |
| Neighbour, N2 | -80   | 1   | 7   | 014               | 602                | 602                | 0003H         |
| Neighbour, N3 | -75   | 1   | 1   | 020               | 665                | 665                | 0004H         |
| Neighbour, N4 | -55   | 1   | 3   | 026               | 762                | 762                | 0005H         |

| Neighbour, N3 | -75   | 1   | 1   | 147               | 457               | 0004H         |
| Neighbour, N4 | -55   | 1   | 3   | 153               | 463               | 0005H         |
| Neighbour, N5 | -50   | 1   | 5   | 159               | 469               | 0006H         |
| Neighbour, N6 | -45   | 1   | 7   | 165               | 475               | 0007H         |
| Neighbour, N7 | -40   | 1   | 1   | 171               | 481               | 0008H         |

With the exception of the Cell Allocation, the rest of the parameters for all eight cells are the same as the default settings and default SYSTEM INFORMATION TYPE 1 to 4 message contents for cell A. The Cell Allocation for the serving cell is the same as the default setting for cell A. The Cell Allocations for the neighbour cells need have only one entry, consisting of the ARFCN of that cell's BCCH.

Mobile Station:

The MS is in the active state of a call (U10).

### Related PICS/PIXIT Statements

Support for state U10 of the Call Control protocol.

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

### Foreseen Final State of the MS

Active state of a call (U10).

### Test Procedure

This test procedure is performed twice.

With the MS having a call in progress, the SS sends SYSTEM INFORMATION TYPE 5 & 6 (on the second iteration of the test the SS also sends SYSTEM INFORMATION TYPE 5bis) on the SACCH. The BA is indicated as empty. The MS shall send MEASUREMENT REPORTs back to the SS, and it shall be indicated in these that no measurement results have been obtained.

### Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

### Expected Sequence

This sequence is performed for execution counter,  $k = 1, 2$ .

Since when  $k = 1$ , SYSTEM INFORMATION TYPE 5, SYSTEM INFORMATION TYPE 6 and MEASUREMENT REPORT (and when  $k = 2$  an additional SYSTEM INFORMATION TYPE 5bis is included) are sent continuously, a table is not applicable in this test. The interval between 2 successive Layer 2 frames containing MEASUREMENT REPORTs shall not exceed one Layer 2 frame.

### Specific Message Contents

GSM 450 and 480 begin:

#### SYSTEM INFORMATION TYPE 5:

| Information Element               | value/remark                                                                                                        |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------|
| Neighbour Cells Description       |                                                                                                                     |
| - Format Identifier               | 128 range                                                                                                           |
| - BCCH Allocation Sequence number | 1                                                                                                                   |
| - BCCH Allocation ARFCN           | No channels belong to the BCCH allocation.                                                                          |
| - EXT IND                         | $k = 1$ . Information Element carries the complete BA. $k = 2$ . Information Element carries only a part of the BA. |

#### SYSTEM INFORMATION TYPE 5bis (Sent only when $k = 2$ ):

| Information Element         | value/remark                                                 |
|-----------------------------|--------------------------------------------------------------|
| Protocol Discriminator      | RR management                                                |
| Message Type                | Sys Info 5bis.                                               |
| Neighbour Cells Description |                                                              |
| - Format                    | 1024 range                                                   |
| - EXT IND                   | $k = 2$ . Information Element carries only a part of the BA. |
| - W(i)                      | Only channel 500 belongs to the BCCH allocation.             |

## MEASUREMENT REPORT:

| Information Element      | value/remark                                                                                        |

GSM 700 and 850 end:

NOTE 1: The actual values are not checked.

NOTE 2: The Measurement Valid Indication shall be set to valid within the second SACCH block at the latest.

### 26.6.3.2 Measurement / all neighbours present

This test applies to GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 PCS 1 900 mobile stations.

#### 26.6.3.2.1 Conformance requirements

The MS shall continuously send MEASUREMENT REPORT messages on every SACCH blocks and the measurement valid indication shall be set to valid (0) within the second block at the latest. The MEASUREMENT REPORT message shall contain measurement results for the 6 strongest BCCH carriers with known and allowed NCC part of BSIC.

#### References

3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.4.1.2, 3GPP TS 05.08 subclause 8.4.

#### 26.6.3.2.2 Test purpose

To test that, when the SS gives information about neighbouring cells, the MS reports appropriate results.

#### 26.6.3.2.3 Method of test

#### Initial Conditions

System Simulator:

For GSM 900, DCS 1800 and PCS 1 900: 8 cells with the following settings:

| Transmitter   | Level | NCC | BCC | ARFCN<br>(GSM900) | ARFCN<br>(DCS1800) | ARFCN<br>(PCS1900) | Cell Identity |
|---------------|-------|-----|-----|-------------------|--------------------|--------------------|---------------|
| Serving, S1   | -60   | 1   | 3   | 002               | 514                | 514                | 0001H         |
| Neighbour, N1 | -85   | 1   | 5   | 008               | 530                | 530                | 0002H         |
| Neighbour, N2 | -80   | 1   | 7   | 014               | 602                | 602                | 0003H         |
| Neighbour, N3 | -75   | 1   | 1   | 020               | 665                | 665                | 0004H         |
| Neighbour, N4 | -55   | 1   | 3   | 026               | 762                | 762                | 0005H         |
| Neighbour, N5 | -50   | 1   | 5   | 032               | 686                | 686                | 0006H         |
| Neighbour, N6 | -45   | 1   | 7   | 038               | 549                | 549                | 0007H         |
| Neighbour, N7 | -40   | 1   | 1   | 044               | 810                | 810                | 0008H         |

For GSM 450 and GSM 480: 8 cells with the following settings:

| Transmitter   | Level | NCC | BCC | ARFCN<br>(GSM450) | ARFCN<br>(GSM 480) | Cell Identity |
|---------------|-------|-----|-----|-------------------|--------------------|---------------|
| Serving, S1   | -60   | 1   | 3   | 260               | 307                | 0001H         |
| Neighbour, N1 | -85   | 1   | 5   | 264               | 311                | 0002H         |
| Neighbour, N2 | -80   | 1   | 7   | 268               | 315                | 0003H         |
| Neighbour, N3 | -75   | 1   | 1   | 272               | 319                | 0004H         |
| Neighbour, N4 | -55   | 1   | 3   | 276               | 323                | 0005H         |
| Neighbour, N5 | -50   | 1   | 5   | 280               | 327                | 0006H         |
| Neighbour, N6 | -45   | 1   | 7   | 284               | 331                | 0007H         |
| Neighbour, N7 | -40   | 1   | 1   | 288               | 335                | 0008H         |

For GSM 700 and GSM 850: 8 cells with the following settings:

| Transmitter   | Level | NCC | BCC | ARFCN<br>(GSM850) | ARFCN<br>(GSM700) | Cell Identity |
|---------------|-------|-----|-----|-------------------|-------------------|---------------|
| Serving, S1   | -60   | 1   | 3   | 129               | 439               | 0001H         |
| Neighbour, N1 | -85   | 1   | 5   | 135               | 445               | 0002H         |
| Neighbour, N2 | -80   | 1   | 7   | 141               | 451               | 0003H         |
| Neighbour, N3 | -75   | 1   | 1   | 147               | 457               | 0004H         |
| Neighbour, N4 | -55   | 1   | 3   | 153               | 463               | 0005H         |
| Neighbour, N5 | -50   | 1   | 5   | 159               | 469               | 0006H         |
| Neighbour, N6 | -45   | 1   | 7   | 165               | 475               | 0007H         |
| Neighbour, N7 | -40   | 1   | 1   | 171               | 481               | 0008H         |

With the exception of the Cell Allocation, the rest of the parameters for all eight cells are the same as the default settings and default SYSTEM INFORMATION TYPE 1 to 4 message contents for cell A. The Cell Allocation for the serving cell is the same as the default setting for cell A. The Cell Allocations for the neighbour cells need have only one entry, consisting of the ARFCN of that cell's BCCH.

Mobile Station:

The MS is in the active state of a call (U10).

Related PICS/PIXIT Statements

Support for state U10 of the Call Control protocol.

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

Foreseen Final State of the MS

Active state of a call (U10).

Test Procedure

This test procedure is performed twice.

With the MS having a call in progress, the SS sends SYSTEM INFORMATION TYPE 5 and 6 (on the second iteration of the test the SS also sends SYSTEM INFORMATION TYPE 5bis) on the SACCH. All 8 of the BCCHs "on air" are indicated in the BA. The MS shall send MEASUREMENT REPORTs back to the SS, and it shall be indicated within 20 s in these that measurement results for the 6 strongest carriers have been obtained.

**Maximum Duration of Test**

5 minutes, including 1 minute for any necessary operator actions.

**Expected Sequence**

This sequence is performed for execution counter, k = 1, 2.

Since when k = 1, SYSTEM INFORMATION TYPE 5, SYSTEM INFORMATION TYPE 6 and MEASUREMENT REPORT (and when k = 2 an additional SYSTEM INFORMATION TYPE 5bis is included) are sent continuously, a table is not applicable in this test. The interval between 2 successive Layer 2 frames containing MEASUREMENT REPORTs shall not exceed one Layer 2 frame.

**Specific Message Contents**

GSM 850 end:

NOTE 1: These actual values are not checked.

NOTE 2: The Measurement Valid Indication shall be set to valid within the second SACCH block at the latest.

### 26.6.3.3 Measurement / barred cells and non-permitted NCCs

This test applies to GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 mobile stations.

#### 26.6.3.3.1 Conformance requirements

The MS shall continuously send MEASUREMENT REPORTs on every SACCH blocks and the measurement valid indication shall be set to valid (0) within the second block at the latest. After 20 s the messages shall contain measurement results only for the 4 BCCH carriers on which the MS is allowed to report.

#### References

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.4.1.2, 3GPP TS 05.08 subclause 8.4.

#### 26.6.3.3.2 Test purpose

To test that, when a combination of normal neighbours, barred cells and non-permitted NCCs is "on air", the MS reports only on normal neighbours.

#### 26.6.3.3.3 Method of test

#### Initial Conditions

System Simulator:

For GSM 900, DCS 1800 and PCS 1 900: 8 cells with the following settings:

| Transmitter   | Level | NCC | BCC | ARFCN<br>(GSM900) | ARFCN<br>(DCS1800) | ARFCN<br>(PCS1900) | Cell Identity |
|---------------|-------|-----|-----|-------------------|--------------------|--------------------|---------------|
| Serving, S1   | -60   | 1   | 3   | 002               | 514                | 514                | 0001H         |
| Neighbour, N1 | -85   | 1   | 5   | 008               | 530                | 530                | 0002H         |
| Neighbour, N2 | -80   | 1   | 7   | 014               | 602                | 602                | 0003H         |
| Neighbour, N3 | -75   | 2   | 1   | 020               | 665                | 665                | 0004H         |

| Neighbour, N5 | -50   | 4   | 5   | 159               | 469               | 0006H         |
| Neighbour, N6 | -45   | 1   | 7   | 165               | 475               | 0007H         |
| Neighbour, N7 | -40   | 1   | 1   | 171               | 481               | 0008H         |

With the exception of the Cell Allocation, the rest of the parameters for all eight cells are the same as the default settings and default SYSTEM INFORMATION TYPE 1 to 4 message contents for cell A. The Cell Allocation for the serving cell is the same as the default setting for cell A. The Cell Allocations for the neighbour cells need have only one entry, consisting of the ARFCN of that cell's BCCH.

NOTE 1: The BA sent in SYSTEM INFORMATION TYPE 5 does not include N1, N4 and N5. N1 may be the case of a barred cell, N3 simulates the case where another operator is transmitting on the same frequency (e.g. in border areas), N4 & N5 simulate the case where other operators are transmitting on other frequencies.

Mobile Station:

The MS is in the active state of a call (U10).

#### Related PICS/PIXIT Statements

Support for state U10 of the Call Control protocol.

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

#### Foreseen Final State of the MS

Active state of a call (U10).

#### Test Procedure

This test procedure is performed twice.

With the MS having a call in progress, the SS sends SYSTEM INFORMATION TYPE 5 and 6 (on the second iteration of the test the SS also sends SYSTEM INFORMATION TYPE 5bis) on the SACCH. 5 of the 8 BCCHs "on air" are indicated in the BA. The MS shall send MEASUREMENT REPORTs back to the SS, and it shall be indicated in these that measurement results for the 4 strongest permitted carriers have been obtained (one of the carriers in the BA belongs to a non-permitted NCC).

#### Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

#### Expected Sequence

This sequence is performed for execution counter,  $k = 1, 2$ .

Since when  $k = 1$  SYSTEM INFORMATION TYPE 5, SYSTEM INFORMATION TYPE 6 and MEASUREMENT REPORT (and when  $k = 2$  an additional SYSTEM INFORMATION TYPE 5bis is included) messages are sent continuously, a table is not applicable in this test. The interval between 2 successive Layer 2 frames containing MEASUREMENT REPORTs shall not exceed one Layer 2 frame.

GSM 850 end:

NOTE 2: These actual values are not checked.

NOTE 3: The Measurement Valid Indication shall be set to valid within the second SACCH block at the latest.

### 26.6.3.4 Measurement / DTX

This test applies to GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 mobile stations.

#### 26.6.3.4.1 Conformance requirements

After the sending of the HANDOVER COMPLETE, the MS shall continuously send measurement reports in every SACCH blocks, the measurement valid indication shall be set to valid (0) within the second block at the latest. After 20 s the order of values in the MEASUREMENT REPORT message shall contain measurement results for the 6 strongest BCCH carriers among those monitored by the MS. Further, in a quiet environment, the DTX\_USED field shall be set by the MS to "DTX used".

## References

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.4.1.2, 3GPP TS 05.08 subclause 8.4.

## 26.6.3.4.2 Test purpose

To test that, in the case of the MS using DTX and the SS indicating that power control is in use, the MS reports appropriate results.

## 26.6.3.4.3 Method of test

## Initial Conditions

System Simulator:

For GSM 900, DCS 1800 and PCS 1 900: 8 cells with the following settings:

| Transmitter   | Level | NCC | BCC | ARFCN<br>(GSM900) | ARFCN<br>(DCS1800) | ARFCN<br>(PCS1900) | Cell Identity |
|---------------|-------|-----|-----|-------------------|--------------------|--------------------|---------------|
| Serving, S1   | -60   | 1   | 3   | 002               | 514                | 514                | 0001H         |
| Neighbour, N1 | -85   | 1   | 5   | 008               | 530                | 530                | 0002H         |
| Neighbour, N2 | -80   | 1   | 7   | 014               | 602                | 602                | 0003H         |
| Neighbour, N3 | -75   | 1   | 1   | 020               | 665                | 665                | 0004H         |
| Neighbour, N4 | -55   | 1   | 3   | 026               | 762                | 762                | 0005H         |
| Neighbour, N5 | -50   | 1   | 5   | 032               | 686                | 686                | 0006H         |
| Neighbour, N6 | -45   | 1   | 7   | 038               | 549                | 549                | 0007H         |
| Neighbour, N7 | -40   | 1   | 1   | 044               | 810                | 810                | 0008H         |

For GSM 450 and GSM 480: 8 cells with the following settings:

| Transmitter   | Level | NCC | BCC | ARFCN<br>(GSM450) | ARFCN<br>(GSM 480) | Cell Identity |
|---------------|-------|-----|-----|-------------------|--------------------|---------------|
| Serving, S1   | -60   | 1   | 3   | 260               | 307                | 0001H         |
| Neighbour, N1 | -85   | 1   | 5   | 264               | 311                | 0002H         |
| Neighbour, N2 | -80   | 1   | 7   | 268               | 315                | 0003H         |
| Neighbour, N3 | -75   | 1   | 1   | 272               | 319                | 0004H         |
| Neighbour, N4 | -55   | 1   | 3   | 276               | 323                | 0005H         |
| Neighbour, N5 | -50   | 1   | 5   | 280               | 327                | 0006H         |
| Neighbour, N6 | -45   | 1   | 7   | 284               | 331                | 0007H         |
| Neighbour, N7 | -40   | 1   | 1   | 288               | 335                | 0008H         |

For GSM 700 and GSM 850: 8 cells with the following settings:

| Transmitter   | Level | NCC | BCC | ARFCN<br>(GSM850) | ARFCN<br>(GSM700) | Cell Identity |
|---------------|-------|-----|-----|-------------------|-------------------|---------------|
| Serving, S1   | -60   | 1   | 3   | 129               | 439               | 0001H         |
| Neighbour, N1 | -85   | 1   | 5   | 135               | 445               | 0002H         |
| Neighbour, N2 | -80   | 1   | 7   | 141               | 451               | 0003H         |
| Neighbour, N3 | -75   | 1   | 1   | 147               | 457               | 0004H         |
| Neighbour, N4 | -55   | 1   | 3   | 153               | 463               | 0005H         |
| Neighbour, N5 | -50   | 1   | 5   | 159               | 469               | 0006H         |
| Neighbour, N6 | -45   | 1   | 7   | 165               | 475               | 0007H         |
| Neighbour, N7 | -40   | 1   | 1   | 171               | 481               | 0008H         |

In the serving cell, the DTX indicator is set to "MS shall use discontinuous transmission".

With the exception of the Cell Allocation, the rest of the parameters for all eight cells are the same as the default settings and default SYSTEM INFORMATION TYPE 1 to 4 message contents for cell A. The Cell Allocation for the serving cell is the same as the default setting for cell A. The Cell Allocations for the neighbour cells need have only one entry, consisting of the ARFCN of that cell's BCCH.

Mobile Station:

The MS is in the active state of a call (U10).

The MS has just completed a handover into the serving cell, S1.

#### Related PICS/PIXIT Statements

Support for state U10 of the Call Control protocol.

Support for transparent data services only: yes/no.

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

#### Foreseen Final State of the MS

Active state of a call (U10).

#### Test Procedure

This test procedure is performed twice.

With the MS having a call in progress on an arbitrary cell, the MS is handed over to cell S1. On cell S1, the SS sends SYSTEM INFORMATION TYPE 5 and 6 (on the second iteration of the test the SS also sends SYSTEM INFORMATION TYPE 5bis) on the SACCH with all 8 of the BCCHs "on air" indicated in the BA. Cell S1 also indicates that DTX shall be used. The MS shall send MEASUREMENT REPORTs back to the SS, and it shall be indicated in these that measurement results for the 6 strongest carriers have been obtained and that DTX has been used. (The MS is positioned in an environment free from acoustic noise.)

#### Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

#### Expected Sequence

This sequence is performed twice for execution counter,  $k = 1, 2$ .

Since when  $k = 1$ , SYSTEM INFORMATION TYPE 5, SYSTEM INFORMATION TYPE 6 and MEASUREMENT REPORT (and when  $k = 2$  an additional SYSTEM INFORMATION TYPE 5bis is included) messages are sent continuously, a table is not applicable in this test. The interval between 2 successive Layer 2 frames containing MEASUREMENT REPORTs shall not exceed one Layer 2 frame.

#### Specific Message Contents

GSM 850 end:

NOTE 1: These actual values are not checked.

NOTE 2: The Measurement Valid Indication shall be set to valid within the second SACCH block after the HANDOVER COMPLETE message at the latest.

NOTE 3: For an MS that only supports transparent data services, the value of DTX\_used shall not be checked.

### 26.6.3.5 Measurement / Frequency Formats

This test applies to GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 mobile stations.

#### 26.6.3.5.1 Conformance Requirement

The MS shall continuously send MEASUREMENT REPORT messages on every SACCH blocks and the measurement valid indication shall be set to valid (0) within the second block at the latest. After 20 s the values in the MEASUREMENT REPORT message shall contain measurement results for the cells on which the mobile is allowed to report.

#### References

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.4.1.2, 3GPP TS 05.08 subclause 8.4.

#### 26.6.3.5.2 Test Purpose

To test that, when the SS gives information about neighbouring cells, the MS reports appropriate results.

#### 26.6.3.5.3 Method of test

#### Initial Conditions

System Simulator:

For GSM 900, DCS 1800 and PCS 1 900: 2 cells with the following settings:

| Transmitter   | Level | NCC | BCC | ARFCN<br>(GSM900) | ARFCN<br>(DCS1800) | ARFCN<br>(PCS1900) | Cell Identity |
|---------------|-------|-----|-----|-------------------|--------------------|--------------------|---------------|
| Serving, S1   | -60   | 1   | 3   | 002               | 715                | 715                | 0001H         |
| Neighbour, N1 | -85   | 1   | 5   | 008               | 815                | 805                | 0002H         |

For GSM 400: 2 cells with the following settings:

| Transmitter   | Level | NCC | BCC | ARFCN<br>(GSM450) | ARFCN<br>(GSM480) | Cell Identity |
|---------------|-------|-----|-----|-------------------|-------------------|---------------|
| Serving, S1   | -60   | 1   | 3   | 260               | 307               | 0001H         |
| Neighbour, N1 | -85   | 1   | 5   | 264               | 311               | 0002H         |

For GSM 700, GSM 850: 2 cells with the following settings:

| Transmitter   | Level | NCC | BCC | ARFCN<br>(GSM700) | ARFCN<br>(GSM850) | Cell Identity |
|---------------|-------|-----|-----|-------------------|-------------------|---------------|
| Serving, S1   | -60   | 1   | 3   | 439               | 129               | 0001H         |
| Neighbour, N1 | -85   | 1   | 5   | 445               | 135               | 0002H         |

With the exception of the Cell Allocation, the rest of the parameters for both cells are the same as the default settings and default SYSTEM INFORMATION TYPE 1 to 4 message contents for cell A. The Cell Allocation for the serving cell is the same as the default setting for cell A. The Cell Allocations for the neighbour cells need have only one entry, consisting of the ARFCN of that cell's BCCH.

Mobile Station:

The MS is in the active state of a call (U10).

#### Related PICS/PIXIT Statements

Support for state U10 of the Call Control protocol.

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

## Foreseen Final State of the MS

Active state of a call (U10).

## Test Procedure

This test procedure is performed three times.

With the MS having a call in progress, the SS sends SYSTEM INFORMATION TYPE 5, 5bis and 6 on the SACCH. Both of the BCCHs "on air" are indicated in the BA. The MS shall send MEASUREMENT REPORTs back to the SS, and it shall be indicated in these that no measurement results have been obtained.

For each iteration of the test the frequency format of the BA list contained in the System Information 5 and 5bis message shall change according to the specific message contents.

## Maximum Duration Of Test

5 minutes, including 1 minute for any necessary operator actions.

## Expected Sequence

This sequence is performed for execution counter,  $K = 1, 2, 3$ .

Since SYSTEM INFORMATION TYPE 5, SYSTEM INFORMATION 5bis, SYSTEM INFORMATION TYPE 6 and MEASUREMENT REPORT are sent continuously, a table is not applicable in this test. The interval between 2 successive Layer 2 frames containing MEASUREMENT REPORTs shall not exceed one Layer 2 frame.

## Specific Message Contents

GSM 850 end:

NOTE 1: These actual values are not checked.

NOTE 2: The Measurement Valid Indication shall be set to valid within the second SACCH block at the latest.

### 26.6.3.6 Measurement / multiband environment

This test applies to GSM 400, GSM 850, GSM 900 and DCS 1 800 mobile stations.

#### 26.6.3.6.1 Conformance requirements

The MS shall continuously send MEASUREMENT REPORT messages on every SACCH blocks and the measurement valid indication shall be set to valid (0) within the second block at the latest. The MEASUREMENT REPORT message shall contain measurement results for up to the 6 strongest BCCH carriers among those with known and allowed NCC part of BSIC on which the mobile is asked to report.

#### References

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.4.1.2, 3GPP TS 05.08 subclause 8.4.

#### 26.6.3.6.2 Test purpose

To test that, when the SS gives information about neighbouring cells using SYSTEM INFORMATION TYPE 2ter/5ter, the MS reports appropriate results.

#### 26.6.3.6.3 Method of test

#### Initial Conditions

System Simulator:

For GSM 900 and DCS 1800: 8 cells with the following settings:

| Transmitter   | Level | NCC | BSCC | ARFCN<br>(GSM900) | ARFCN<br>(DCS1800) | Cell Identity |
|---------------|-------|-----|------|-------------------|--------------------|---------------|
| Serving, S1   | -60   | 1   | 3    | 002               | 514                | 0001H         |
| Neighbour, N1 | -85   | 1   | 5    | 008               | 530                | 0002H         |
| Neighbour, N2 | -80   | 1   | 7    | 014               | 602                | 0003H         |
| Neighbour, N3 | -75   | 1   | 1    | 020               | 665                | 0004H         |
| Neighbour, N4 | -55   | 1   | 3    | 026               | 762                | 0005H         |
| Neighbour, N5 | -50   | 1   | 5    | 032               | 686                | 0006H         |
| Neighbour, N6 | -45   | 1   | 7    | 038               | 549                | 0007H         |
| Neighbour, N7 | -40   | 1   | 1    | 044               | 810                | 0008H         |

For GSM 450 and GSM 480: 8 cells with the following settings:

| Transmitter   | Level | NCC | BSCC | ARFCN<br>(GSM450) | ARFCN<br>(GSM480) | Cell identity |
|---------------|-------|-----|------|-------------------|-------------------|---------------|
| Serving, S1   | -60   | 1   | 3    | 260               | 307               | 0001H         |
| Neighbour, N1 | -85   | 1   | 5    | 264               | 311               | 0002H         |
| Neighbour, N2 | -80   | 1   | 7    | 268               | 315               | 0003H         |
| Neighbour, N3 | -75   | 1   | 1    | 272               | 319               | 0004H         |
| Neighbour, N4 | -55   | 1   | 3    | 276               | 323               | 0005H         |
| Neighbour, N5 | -50   | 1   | 5    | 280               | 327               | 0006H         |
| Neighbour, N6 | -45   | 1   | 7    | 284               | 331               | 0007H         |
| Neighbour, N7 | -40   | 1   | 1    | 288               | 335               | 0008H         |

For GSM 850: 8 cells with the following settings:

| Transmitter   | Level | NCC | BCC | ARFCN<br>(GSM850) | Cell Identity |
|---------------|-------|-----|-----|-------------------|---------------|
| Serving, S1   | -60   | 1   | 3   | 129               | 0001H         |
| Neighbour, N1 | -85   | 1   | 5   | 135               | 0002H         |
| Neighbour, N2 | -80   | 1   | 7   | 141               | 0003H         |
| Neighbour, N3 | -75   | 1   | 1   | 147               | 0004H         |
| Neighbour, N4 | -55   | 1   | 3   | 153               | 0005H         |
| Neighbour, N5 | -50   | 1   | 5   | 159               | 0006H         |
| Neighbour, N6 | -45   | 1   | 7   | 165               | 0007H         |
| Neighbour, N7 | -40   | 1   | 1   | 171               | 0008H         |

With the exception of the Cell Allocation, the rest of the parameters for all eight cells are the same as the default settings and default SYSTEM INFORMATION TYPE 1, 2 and 4 message contents for cell A. The Cell Allocation for the serving cell is the same as the default setting for cell A. The Cell Allocations for the neighbour cells need have only one entry, consisting of the ARFCN of that cell's BCCH.

Mobile Station:

The MS is in the active state of a call (U10).

Related PICS/PIXIT Statements

Support for state U10 of the Call Control protocol.

Type of MS (GSM 450 or GSM 480 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800).

Foreseen Final State of the MS

Active state of a call (U10).

Test Procedure

This test procedure is performed once.

With the MS having a call in progress, the SS sends SYSTEM INFORMATION TYPE 5, 5ter & 6 on the SACCH. All 8 of the BCCHs "on air" are indicated in the BA. The MS shall send MEASUREMENT REPORTs back to the SS, and it shall be indicated within 20 s in these that measurement results for the 6 strongest carriers, on which the mobile is asked to report, have been obtained.

Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

Expected Sequence

Since SYSTEM INFORMATION TYPE 5, SYSTEM INFORMATION TYPE 5ter, SYSTEM INFORMATION TYPE 6 and MEASUREMENT REPORT are sent continuously, a table is not applicable in this test. The interval between 2 successive Layer 2 frames containing MEASUREMENT REPORTs shall not exceed one Layer 2 frame.

| NOTE 1: These actual values are not checked.                                                                |                                          |
| NOTE 2: report on ARFCNs 129, 147, 153, 159, 165 and 171.                                                   |                                          |
| NOTE 3: The Measurement Valid Indication shall be set to valid within the second SACCH block at the latest. |                                          |

GSM 850 end

## 26.6.3.7 Measurement / new cell reporting

This test applies to GSM 400 and GSM 700 and GSM 850 and GSM 900 and DCS 1 800 and PCS 1 900 mobile stations.

## 26.6.3.7.1 Conformance requirements

The MS shall continuously send MEASUREMENT REPORT messages on every SACCH blocks and the measurement valid indication shall be set to valid (0) within the second block at the latest. The MS shall report a new strongest cell in the measurement report at the latest 5 s after a new strongest cell (which is part of the BA(SACCH)) has been activated under the following network conditions: Initial serving cell at RXLEV= -70 dBm, with 6 neighbours at RXLEV= -75 dBm. Then the new BCCH carrier is switched on at RXLEV= -60 dBm.

NOTE: Because of test equipment limitations it is acceptable to activate the new carrier to replace one of the 6 neighbours.

## References

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.4.1.2, 3GPP TS 05.08 subclause 7.2.

## 26.6.3.7.2 Test purpose

To test that, when the SS activates a new strongest neighbour cell, the MS reports that cell with a maximum delay of 5 s.

## 26.6.3.7.3 Method of test

## Initial Conditions

System Simulator:

For GSM 900 or DCS 1800 or PCS 1 900: 7 cells with the following settings:

| Transmitter   | Level | NCC | BSCC | ARFCN | ARFCN<br>(GSM900) | ARFCN<br>(DCS1800) | Cell identity<br>(PCS 1 900) |
|---------------|-------|-----|------|-------|-------------------|--------------------|------------------------------|
| Serving, S1   | -70   | 1   | 3    | 002   | 514               | 514                | 0001H                        |
| Neighbour, N1 | -75   | 1   | 5    | 008   | 530               | 530                | 0002H                        |
| Neighbour, N2 | -75   | 1   | 7    | 014   | 602               | 602                | 0003H                        |
| Neighbour, N3 | -75   | 1   | 1    | 020   | 665               | 665                | 0004H                        |
| Neighbour, N4 | -75   | 1   | 3    | 026   | 762               | 762                | 0005H                        |
| Neighbour, N5 | -75   | 1   | 5    | 032   | 686               | 686                | 0006H                        |
| Neighbour, N6 | -75   | 1   | 7    | 038   | 549               | 549                | 0007H                        |

For GSM 450 or GSM 480: 7 cells with the following settings:

| Transmitter   | Level | NCC | BSCC | ARFCN | ARFCN<br>(GSM 450) | Cell identity<br>(GSM 480) |
|---------------|-------|-----|------|-------|--------------------|----------------------------|
| Serving, S1   | -70   | 1   | 3    | 260   | 307                | 0001H                      |
| Neighbour, N1 | -75   | 1   | 5    | 264   | 311                | 0002H                      |
| Neighbour, N2 | -75   | 1   | 7    | 268   | 315                | 0003H                      |
| Neighbour, N3 | -75   | 1   | 1    | 272   | 319                | 0004H                      |
| Neighbour, N4 | -75   | 1   | 3    | 276   | 323                | 0005H                      |
| Neighbour, N5 | -75   | 1   | 5    | 280   | 327                | 0006H                      |
| Neighbour, N6 | -75   | 1   | 7    | 284   | 331                | 0007H                      |

For GSM 700 and GSM 850: 7 cells with the following settings:

| Transmitter   | Level | NCC | BCC | ARFCN<br>(GSM850) | ARFCN<br>(GSM700) | Cell Identity |
|---------------|-------|-----|-----|-------------------|-------------------|---------------|
| Serving, S1   | -70   | 1   | 3   | 129               | 439               | 0001H         |
| Neighbour, N1 | -75   | 1   | 5   | 135               | 445               | 0002H         |
| Neighbour, N2 | -75   | 1   | 7   | 141               | 451               | 0003H         |
| Neighbour, N3 | -75   | 1   | 1   | 147               | 457               | 0004H         |
| Neighbour, N4 | -75   | 1   | 3   | 153               | 463               | 0005H         |
| Neighbour, N5 | -75   | 1   | 5   | 159               | 469               | 0006H         |
| Neighbour, N6 | -75   | 1   | 7   | 165               | 475               | 0007H         |

With the exception of the Cell Allocation, the rest of the parameters for all seven cells are the same as the default settings and default SYSTEM INFORMATION TYPE 1 to 4 message contents for cell A. The Cell Allocation for the serving cell is the same as the default setting for cell A. The Cell Allocations for the neighbour cells need have only one entry, consisting of the ARFCN of that cell's BCCH.

Mobile Station:

The MS is in the active state of a call (U10).

## Related PICS/PIXIT Statements

Support for state U10 of the Call Control protocol.

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM or E-GSM or R-GSM or DCS 1 800 or PCS 1 900).

## Foreseen Final State of the MS

Active state of a call (U10).

## Test Procedure

The test is performed in two steps a) and b).

### Step a)

With the MS having a call in progress, the SS sends SYSTEM INFORMATION TYPE 5 & 6 on the SACCH. All 7 of the BCCHs "on air" are indicated in the BA. The MS shall send MEASUREMENT REPORTs back to the SS, and it shall be indicated within 20 s in these that measurement results for the 6 strongest carriers have been obtained.

### Step b)

The SS replaces neighbour cell N1 with neighbour cell N7 with a signal strength of  $-60$  dBm, in order to have the following new settings:

For GSM 900 or DCS 1800 or PCS 1 900:

| Transmitter   | Level | NCC | BSCC | ARFCN | ARFCN (GSM900) | ARFCN (DCS1800) | Cell identity PCS 1 900 |
|---------------|-------|-----|------|-------|----------------|-----------------|-------------------------|
| Serving, S1   | -70   | 1   | 3    | 002   | 514            | 514             | 0001H                   |
| Neighbour, N7 | -60   | 1   | 1    | 044   | 810            | 530             | 0008H                   |
| Neighbour, N2 | -75   | 1   | 7    | 014   | 602            | 602             | 0003H                   |
| Neighbour, N3 | -75   | 1   | 1    | 020   | 665            | 665             | 0004H                   |
| Neighbour, N4 | -75   | 1   | 3    | 026   | 762            | 762             | 0005H                   |
| Neighbour, N5 | -75   | 1   | 5    | 032   | 686            | 686             | 0006H                   |
| Neighbour, N6 | -75   | 1   | 7    | 038   | 549            | 549             | 0007H                   |

For GSM 450 or GSM 480:

| Transmitter   | Level | NCC | BSCC | ARFCN | ARFCN (GSM450) | Cell identity (GSM480) |
|---------------|-------|-----|------|-------|----------------|------------------------|
| Serving, S1   | -70   | 1   | 3    | 260   | 307            | 0001H                  |
| Neighbour, N7 | -60   | 1   | 1    | 288   | 335            | 0008H                  |
| Neighbour, N2 | -75   | 1   | 7    | 268   | 315            | 0003H                  |
| Neighbour, N3 | -75   | 1   | 1    | 272   | 319            | 0004H                  |
| Neighbour, N4 | -75   | 1   | 3    | 276   | 323            | 0005H                  |
| Neighbour, N5 | -75   | 1   | 5    | 280   | 327            | 0006H                  |
| Neighbour, N6 | -75   | 1   | 7    | 284   | 331            | 0007H                  |

For GSM 700 and GSM 850: 7 cells with the following settings:

| Transmitter   | Level | NCC | BCC | ARFCN (GSM850) | ARFCN (GSM700) | Cell Identity |
|---------------|-------|-----|-----|----------------|----------------|---------------|
| Serving, S1   | -70   | 1   | 3   | 129            | 439            | 0001H         |
| Neighbour, N7 | -60   | 1   | 5   | 171            | 481            | 0002H         |
| Neighbour, N2 | -75   | 1   | 7   | 141            | 451            | 0003H         |
| Neighbour, N3 | -75   | 1   | 1   | 147            | 457            | 0004H         |
| Neighbour, N4 | -75   | 1   | 3   | 153            | 463            | 0005H         |
| Neighbour, N5 | -75   | 1   | 5   | 159            | 469            | 0006H         |
| Neighbour, N6 | -75   | 1   | 7   | 165            | 475            | 0007H         |

With a maximum delay of 5 s, the neighbour cell N7 is included in the measurement report messages.

### Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

## Expected Sequence

Since SYSTEM INFORMATION TYPE 5, SYSTEM INFORMATION TYPE 6 and MEASUREMENT REPORT are sent continuously, a table is not applicable in this test. The interval between 2 successive Layer 2 frames containing MEASUREMENT REPORTs shall not exceed one Layer 2 frame.

## Specific Message Contents

GSM 450 begin:

## SYSTEM INFORMATION TYPE 5:

| Format Identifier           | bit map 0                                                                                                                                                                     |
| BCCH Allocation Sequence    | 1                                                                                                                                                                             |
| BCCH Allocation ARFCN       | The channel numbers 2, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 16, 17, 18, 19, 20, 21, 22, 23, 24, 26, 28, 29, 30, 32, 34, 35, 36, 38, 40 and 44 belong to the BCCH allocation. |
| - EXT IND                   | Information Element carries complete BA.                                                                                                                                      |

## MEASUREMENT REPORT: Step a)

| Information Element      | value/remark                                               |
|--------------------------|------------------------------------------------------------|
| Protocol Discriminator   | RR Management                                              |
| Transaction Identifier   | 0000                                                       |
| Message Type             | MEASUREMENT REPORT                                         |
| Measurement Results      |                                                            |
| BA_used                  | 1                                                          |
| DTX_used                 | DTX was not used                                           |
| RXLEV_FULL_SERVING_CELL  | See note 1                                                 |
| RXLEV_SUB_SERVING_CELL   | See note 1                                                 |
| MEAS_VALID               | See note 2                                                 |
| RXQUAL_FULL_SERVING_CELL | See note 1                                                 |
| RXQUAL_SUB_SERVING_CELL  | See note 1                                                 |
| NO_NCELL_M               | 6 neighbour cell measurement results                       |
| RXLEV_NCELL_1            | See note 1                                                 |
| BCCH_FREQ_NCELL_1        | Shall correspond to S1 or N1 or N2 or N3 or N4 or N5 or N6 |
| BSIC_NCELL_1             | Corresponds to that of BCCH_FREQ_NCELL_1                   |
| RXLEV_NCELL_2            | See note 1                                                 |
| BCCH_FREQ_NCELL_2        | Shall correspond to S1 or N1 or N2 or N3 or N4 or N5 or N6 |
| BSIC_NCELL_2             | Corresponds to that of BCCH_FREQ_NCELL_2                   |
| RXLEV_NCELL_3            | See note 1                                                 |
| BCCH_FREQ_NCELL_3        | Shall correspond to S1 or N1 or N2 or N3 or N4 or N5 or N6 |
| BSIC_NCELL_3             | Corresponds to that of BCCH_FREQ_NCELL_3                   |
| RXLEV_NCELL_4            | See note 1                                                 |
| BCCH_FREQ_NCELL_4        | Shall correspond to S1 or N1 or N2 or N3 or N4 or N5 or N6 |
| BSIC_NCELL_4             | Corresponds to that of BCCH_FREQ_NCELL_4                   |
| RXLEV_NCELL_5            | See note 1                                                 |
| BCCH_FREQ_NCELL_5        | Shall correspond to S1 or N1 or N2 or N3 or N4 or N5 or N6 |
| BSIC_NCELL_5             | Corresponds to that of BCCH_FREQ_NCELL_5                   |
| RXLEV_NCELL_6            | See note 1                                                 |
| BCCH_FREQ_NCELL_6        | Shall correspond to S1 or N1 or N2 or N3 or N4 or N5 or N6 |
| BSIC_NCELL_6             | Corresponds to that of BCCH_FREQ_NCELL_6                   |

## MEASUREMENT REPORT: Step b)

| BSIC_NCELL_3             | Corresponds to that of BCCH_FREQ_NCELL_3                   |
| RXLEV_NCELL_4            | See note 1                                                 |
| BCCH_FREQ_NCELL_4        | Shall correspond to S1 or N2 or N3 or N4 or N5 or N6 or N7 |
| BSIC_NCELL_4             | Corresponds to that of BCCH_FREQ_NCELL_4                   |
| RXLEV_NCELL_5            | See note 1                                                 |
| BCCH_FREQ_NCELL_5        | Shall correspond to S1 or N2 or N3 or N4 or N5 or N6 or N7 |
| BSIC_NCELL_5             | Corresponds to that of BCCH_FREQ_NCELL_5                   |
| RXLEV_NCELL_6            | See note 1                                                 |
| BCCH_FREQ_NCELL_6        | Shall correspond to S1 or N2 or N3 or N4 or N5 or N6 or N7 |
| BSIC_NCELL_6             | Corresponds to that of BCCH_FREQ_NCELL_6                   |

GSM 850 end:

NOTE 1: These actual values are not checked.

NOTE 2: The Measurement Valid Indication shall be set to valid within the second SACCH block at the latest.

NOTE 3: Cell S1 shall be included in the Measurement Report sent by the MS.

## 26.6.4 Test of the channel assignment procedure

An intracell change of channel can be requested by upper layers in order to change the channel type, or it may be initiated by the RR-sublayer, e.g. for an intra cell handover. This change is performed using the channel assignment procedure. If the procedure is incorrectly implemented in the MS, the establishment and maintenance of connections is endangered. This applies for the successful case and for the assignment failure: the MS's correct return to the old channel after assignment failure is a necessary part of the GSM system design.

### 26.6.4.1 Dedicated assignment / successful case

This test is only applicable to an MS supporting a TCH.

#### 26.6.4.1.1 Conformance requirements

1. Upon receipt of the ASSIGNMENT COMMAND message, the mobile station initiates a local end release of link layer connections, disconnects the physical channels, commands the switching to the assigned channels and initiates the establishment of lower layer connections (this includes the activation of the channels, their connection and the establishment of the main signalling links).
2. MM-messages and CM-messages using SAPI=0 sent from the mobile station to the network can be duplicated by the data link layer in the following case:
  - a channel change of dedicated channels is required (assignment or handover procedure) and the last layer 2 frame has not been acknowledged by the peer data link layer before the mobile station leaves the old channel.

In this case, the mobile station does not know whether the network has received the message correctly. Therefore, the mobile station has to send the message again after the new dedicated channel is established.

3. An ASSIGNMENT COMMAND message may indicate a frequency change in progress, with a starting time and possibly alternative channel descriptions.

In the case of the reception of an ASSIGNMENT COMMAND message which contains only the description of a channel to be used after the starting time, and if the starting time has not already elapsed, the mobile station shall wait up to the starting time before accessing the channel.

4. The MS shall establish the link with the power level specified in the ASSIGNMENT COMMAND message.

The MS shall confirm the power control level that it is currently employing in the uplink SACCH L1 header. The indicated value shall be the power control level actually used by the mobile for the last burst of the previous SACCH period.

5. The MS shall apply the hopping frequencies specified in ASSIGNMENT COMMAND message in the Mobile Allocation IE or the Frequency List IE at the time of accessing the new channel using the last received Cell Allocation.
6. After receipt of the ASSIGNMENT COMMAND the MS shall perform the assignment and return an ASSIGNMENT COMPLETE without undue delay.

#### 26.6.4.1.2 Test purpose

1. To verify that upon receipt of an ASSIGNMENT COMMAND, the MS switches to the channel defined in the ASSIGNMENT COMMAND, establishes the link and sends an ASSIGNMENT COMPLETE message. This is tested for an MS supporting TCH in the special cases of a transition.
  - 1.1 from non-hopping SDCCH to hopping TCH/F using a different timeslot;
  - 1.2 from hopping TCH/F to non-hopping TCH/F using a different timeslot;
  - 1.3 from non-hopping TCH/F to non-hopping TCH/F using a different timeslot;
  - 1.4 from non-hopping TCH/F to hopping TCH/H using a different timeslot; this test purpose is only applicable if the MS supports TCH/H;
  - 1.5 from hopping TCH/H to non-hopping TCH/H using a different timeslot; this test purpose is only applicable if the MS supports TCH/H;
  - 1.6 from non-hopping TCH/H to hopping TCH/F using a different timeslot; this test purpose is only applicable if the MS supports TCH/H.

2. To verify that an MS supporting TCH, having sent an MM- or CM message which was not acknowledged on L2 before the channel assignment procedure was initiated and before the MS has left the old channel, repeats that message after completion of the assignment procedure without incrementing N(SD). This is tested in the special case of MM message AUTHENTICATION RESPONSE.
3. To verify that, if an MS supporting TCH has received an ASSIGNMENT COMMAND message which contains only the description of a channel to be used after the starting time, and if the starting time has not already elapsed, the mobile station shall wait up to the starting time before accessing the channel.
4. To verify that an MS supporting TCH, having received an ASSIGNMENT COMMAND, having sent an SABM frame to establish the main signalling link on the assigned channel, reports the power level specified in the ASSIGNMENT COMMAND message, in the uplink SACCH L1 header of the SACCH message sent in the SACCH period following the transmission of the SABM frame.
5. To verify that an MS supporting TCH, having received an ASSIGNMENT COMMAND, is able in the case of frequency hopping to decode the Mobile Allocation and Frequency List IEs correctly and applies the specified frequencies using the correct Cell Allocation.
6. To verify that after receipt of the ASSIGNMENT COMMAND the MS returns an ASSIGNMENT COMPLETE without undue delay.

#### 26.6.4.1.3 Method of test

##### Initial Conditions

System Simulator:

1 cell, default parameters except:

GSM 450:

BCCH ARFCN =263.

Throughout the test, the CA broadcast in System Information 1 is (259, 261, 263, 265, 267, 269, 271, 273, 275 and 277).

Note that the actual CA of the cell contains other frequencies.

GSM 480:

BCCH ARFCN =310.

Throughout the test, the CA broadcast in System Information 1 is (306, 308, 310, 312, 314, 316, 318, 320, 322 and 324).

Note that the actual CA of the cell contains other frequencies.

GSM 900:

BCCH ARFCN =20.

Throughout the test, the CA broadcast in System Information 1 is (10, 17, 20, 26, 34, 42, 45, 46, 52, 59).

Note that the actual CA of the cell contains other frequencies.

DCS 1 800:

BCCH ARFCN =747.

Throughout the test, the CA broadcast in System Information 1 is (734, 741, 747, 754, 759, 766, 773, 775, 779, 782).

Note that the actual CA of the cell contains other frequencies.

PCS 1 900:

BCCH ARFCN =647.

Throughout the test, the CA broadcast in System Information 1 is (634, 641, 647, 654, 659, 666, 673, 675, 679, 682).

Note that the actual CA of the cell contains other frequencies.

GSM 700:

BCCH ARFCN = 457.

Throughout the test, the CA broadcast in System Information 1 is (447, 454, 457, 463, 471, 479, 482, 483, 489, 496).

Note that the actual CA of the cell contains other frequencies.

GSM 850:

BCCH ARFCN = 147.

Throughout the test, the CA broadcast in System Information 1 is (137, 144, 147, 153, 161, 169, 172, 173, 179, 186).

Note that the actual CA of the cell contains other frequencies.

Mobile Station:

The MS is in the "idle, updated" state with a TMSI allocated.

#### Related PICS/PIXIT Statements

- TCH supported (Y/N).
- Supported rate(s) of TCH: (F/F+H).
- The supported channel mode(s) need to be declared.
- The supported frequencies (GSM 450, GSM 480, GSM 700, GSM 850, P-GSM, E-GSM, R-GSM or DCS 1 800 or PCS 1 900).

#### Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

#### Test Procedure

The SS pages the MS and allocates an SDCCH. Then 2 different channels are assigned with ASSIGNMENT COMMANDs. Each time the MS shall switch to the assigned channel, establish the link and send an ASSIGNMENT COMPLETE message.

Then the SS sends a AUTHENTICATION REQUEST message. The MS shall answer with an AUTHENTICATION RESPONSE message, which is not acknowledged on L2 by the SS. Immediately after the AUTHENTICATION RESPONSE message is received, the SS sends an ASSIGNMENT COMMAND. The MS shall switch to the assigned channel, establish the link with the commanded power level and send as ASSIGNMENT COMPLETE message. Then MS shall repeat the AUTHENTICATION RESPONSE message, with the same N(SD) value.

Then the SS sends an ASSIGNMENT COMMAND, which includes a Starting Time IE. The MS shall react as specified above, but this shall be done at the time specified in Starting Time IE.

For an MS not supporting TCH/H, the SS initiates the channel release procedure and the test ends here. For an MS supporting TCH/H, the channel assignment procedure is performed another three times, with half rate channels involved, and again it is checked that the MS correctly completes the procedures, before the SS initiates the channel release procedure.

## Maximum Duration of Test

30 s.

## Expected Sequence

NOTE: 3GPP TS 04.08 / 3GPP TS 44.018 appears to be unclear as to whether timer T3240 shall or shall not be started as a result of the AUTHENTICATION REQUEST message sent in step 10. To allow a variety of test equipment implementations, the IDENTITY REQUEST message is included in order to avoid an unexpected expiry of timer T3240 prior to the end of the expected sequence.

|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Step 12

## ASSIGNMENT COMMAND:

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description            | TCH/F                                                                                                           |
| - Channel Type and TDMA offset | (N+4) mod 8                                                                                                     |
| - Timeslot Number              | Chosen arbitrarily                                                                                              |
| - Training Sequence Code       | RF hopping channel                                                                                              |
| - Hopping                      | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - MAIO                         | Chosen arbitrarily from the set (1 to 63)                                                                       |
| - HSN                          |                                                                                                                 |
| Power Command                  | Chosen arbitrarily but with a changed value.                                                                    |
| - Power level                  |                                                                                                                 |
| Channel Mode                   | Not included                                                                                                    |
| Frequency list IE              | Not included                                                                                                    |
| Cell Channel Description       | Not included (thus the CA from step 8 is used to decode the MA)                                                 |
| Mobile Allocation              | Indicates frequencies (271, 273, 279, 281, 282, 284, 287 and 289)                                               |
| Starting Time                  | Not included                                                                                                    |

## Step 15

## ASSIGNMENT COMMAND:

|                                |                                                          |
|--------------------------------|----------------------------------------------------------|
| Channel Description            | TCH/F                                                    |
| - Channel Type and TDMA offset | (N+5) mod 8                                              |
| - Timeslot Number              | Chosen arbitrarily                                       |
| - Training Sequence Code       | Single RF Channel                                        |
| - Hopping                      | 259                                                      |
| - ARFCN                        |                                                          |
| Power Command                  | Chosen arbitrarily but with a changed value.             |
| - Power level                  |                                                          |
| Channel Mode                   | signalling                                               |
| Frequency list IE              | Not included                                             |
| Cell Channel Description       | Not included                                             |
| Mobile Allocation              | Not included                                             |
| Starting Time                  | indicates (current frame number + 100 frames) mod 42 432 |

## Step 19

## ASSIGNMENT COMMAND:

|                          |                                                                                                              |
|--------------------------|--------------------------------------------------------------------------------------------------------------|
| Channel Description      | TCH/H                                                                                                        |
| - Channel Type           | Chosen arbitrarily                                                                                           |
| TDMA offset              | (N+6) mod 8                                                                                                  |
| - Timeslot Number        | Chosen arbitrarily                                                                                           |
| - Training Sequence Code | RF hopping channel                                                                                           |
| - Hopping                | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Frequency List IE. |
| - MAIO                   | 0                                                                                                            |
| - HSN                    |                                                                                                              |
| Power Command            | Chosen arbitrarily but with a changed value.                                                                 |
| - Power level            |                                                                                                              |
| Channel Mode             | A non-signalling mode arbitrarily selected from the half rate capabilities declared for the MS               |
| Cell Channel Description | Not included                                                                                                 |
| Frequency list IE        | Uses 128 range to indicate (259, 267, 275, 279, 287 and 289).                                                |
| Mobile Allocation        | Not included                                                                                                 |
| Starting Time            | Not included                                                                                                 |

## Step 21

## ASSIGNMENT COMMAND:

|                          |                                              |
|--------------------------|----------------------------------------------|
| Channel Description      | TCH/H                                        |
| - Channel Type           | Chosen arbitrarily                           |
| TDMA offset              | (N+7) mod 8                                  |
| - Timeslot Number        | Chosen arbitrarily                           |
| - Training Sequence Code | Single RF Channel                            |
| - Hopping                | Chosen arbitrarily, but not the BCCH carrier |
| - ARFCN                  |                                              |
| Power Command            | Chosen arbitrarily but with a changed value. |
| - Power level            |                                              |
| Channel Mode             | Not included                                 |
| Frequency list IE        | Not included                                 |
| Cell Channel Description | Not included                                 |
| Mobile Allocation        | Not included                                 |
| Starting Time            | Not included                                 |

## Step 23

## ASSIGNMENT COMMAND:

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description            | TCH/F                                                                                                           |
| - Channel Type and TDMA offset | (N+1) mod 8                                                                                                     |
| - Timeslot Number              | Chosen arbitrarily                                                                                              |
| - Training Sequence Code       | RF hopping channel                                                                                              |
| - Hopping                      | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - MAIO                         | Chosen arbitrarily from the set (1 to 63)                                                                       |
| - HSN                          |                                                                                                                 |
| Power Command                  | Chosen arbitrarily but with a changed value.                                                                    |
| - Power level                  |                                                                                                                 |
| Cell Channel Description       | Uses 128 range to indicate (261 and 263)                                                                        |
| Frequency list IE              | Not included                                                                                                    |
| Mobile Allocation              | Indicates ARFCN 261 only                                                                                        |

## Step 12

## ASSIGNMENT COMMAND:

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description            | TCH/F                                                                                                           |
| - Channel Type and TDMA offset | (N+4) mod 8                                                                                                     |
| - Timeslot Number              | Chosen arbitrarily                                                                                              |
| - Training Sequence Code       | RF hopping channel                                                                                              |
| - Hopping                      | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - MAIO                         | Chosen arbitrarily from the set (1 to 63)                                                                       |
| - HSN                          |                                                                                                                 |
| Power Command                  | Chosen arbitrarily but with a changed value.                                                                    |
| - Power level                  |                                                                                                                 |
| Channel Mode                   | Not included                                                                                                    |
| Frequency list IE              | Not included                                                                                                    |
| Cell Channel Description       | Not included (thus the CA from step 8 is used to decode the MA)                                                 |
| Mobile Allocation              | Indicates frequencies (318, 320, 326, 328, 329, 331, 334 and 336).                                              |
| Starting Time                  | Not included                                                                                                    |

## Step 15

## ASSIGNMENT COMMAND:

|                                |                                                          |
|--------------------------------|----------------------------------------------------------|
| Channel Description            | TCH/F                                                    |
| - Channel Type and TDMA offset | (N+5) mod 8                                              |
| - Timeslot Number              | Chosen arbitrarily                                       |
| - Training Sequence Code       | Single RF Channel                                        |
| - Hopping                      | 306                                                      |
| - ARFCN                        |                                                          |
| Power Command                  | Chosen arbitrarily but with a changed value.             |
| - Power level                  |                                                          |
| Channel Mode                   | signalling                                               |
| Frequency list IE              | Not included                                             |
| Cell Channel Description       | Not included                                             |
| Mobile Allocation              | Not included                                             |
| Starting Time                  | indicates (current frame number + 100 frames) mod 42 432 |

## Step 19

## ASSIGNMENT COMMAND:

|                          |                                                                                                              |
|--------------------------|--------------------------------------------------------------------------------------------------------------|
| Channel Description      | TCH/H                                                                                                        |
| - Channel Type           | Chosen arbitrarily                                                                                           |
| TDMA offset              | (N+6) mod 8                                                                                                  |
| - Timeslot Number        | Chosen arbitrarily                                                                                           |
| - Training Sequence Code | RF hopping channel                                                                                           |
| - Hopping                | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Frequency List IE. |
| - MAIO                   | 0                                                                                                            |
| - HSN                    |                                                                                                              |
| Power Command            | Chosen arbitrarily but with a changed value.                                                                 |
| - Power level            |                                                                                                              |
| Channel Mode             | A non-signalling mode arbitrarily selected from the half rate capabilities declared for the MS               |
| Cell Channel Description | Not included                                                                                                 |
| Frequency list IE        | Uses 128 range to indicate (306, 314, 322, 326, 334 and 336 ).                                               |
| Mobile Allocation        | Not included                                                                                                 |
| Starting Time            | Not included                                                                                                 |

## Step 21

## ASSIGNMENT COMMAND:

|                          |                                              |
|--------------------------|----------------------------------------------|
| Channel Description      | TCH/H                                        |
| - Channel Type           | Chosen arbitrarily                           |
| TDMA offset              | (N+7) mod 8                                  |
| - Timeslot Number        | Chosen arbitrarily                           |
| - Training Sequence Code | Single RF Channel                            |
| - Hopping                | Chosen arbitrarily, but not the BCCH carrier |
| - ARFCN                  |                                              |
| Power Command            |                                              |
| - Power level            | Chosen arbitrarily but with a changed value. |
| Channel Mode             | Not included                                 |
| Frequency list IE        | Not included                                 |
| Cell Channel Description | Not included                                 |
| Mobile Allocation        | Not included                                 |
| Starting Time            | Not included                                 |

## Step 23

## ASSIGNMENT COMMAND:

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description            | TCH/F                                                                                                           |
| - Channel Type and TDMA offset | (N+1) mod 8                                                                                                     |
| - Timeslot Number              | Chosen arbitrarily                                                                                              |
| - Training Sequence Code       | RF hopping channel                                                                                              |
| - Hopping                      | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - MAIO                         | Chosen arbitrarily from the set (1 to 63)                                                                       |
| - HSN                          |                                                                                                                 |
| Power Command                  |                                                                                                                 |
| - Power level                  | Chosen arbitrarily but with a changed value.                                                                    |
| Cell Channel Description       | Uses 128 range to indicate (308,310)                                                                            |
| Frequency list IE              | Not included                                                                                                    |
| Mobile Allocation              | Indicates ARFCN 308 only                                                                                        |
| Starting Time                  | Not included                                                                                                    |

GSM 480 end:

GSM 900 begin:

## Step 3

## IMMEDIATE ASSIGNMENT:

|                                    |                               |
|------------------------------------|-------------------------------|
| As default message contents except |                               |
| Channel Description                | SDCCH/8                       |
| - Channel Type                     | Chosen arbitrarily            |
| TDMA offset                        | N, chosen arbitrarily         |
| - Timeslot Number                  | Chosen arbitrarily            |
| - Training Sequence Code           | Single RF Channel             |
| - Hopping                          | the ARFCN of the BCCH carrier |
| - ARFCN                            |                               |

## Step 5

## ASSIGNMENT COMMAND:

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description            | TCH/F                                                                                                           |
| - Channel Type and TDMA offset | (N+1) mod 8                                                                                                     |
| - Timeslot Number              | Chosen arbitrarily                                                                                              |
| - Training Sequence Code       | RF hopping channel                                                                                              |
| - Hopping                      | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - MAIO                         | Chosen arbitrarily from the set (1 to 63)                                                                       |
| - HSN                          |                                                                                                                 |
| Power Command                  | Chosen arbitrarily but with a changed value.                                                                    |
| - Power level                  | Not included                                                                                                    |
| Frequency list IE              |                                                                                                                 |
| Channel Mode                   | Signalling                                                                                                      |
| - Mode                         | Indicates all of the CA (broadcast on the BCCH) except for the BCCH carrier.                                    |
| Mobile Allocation              |                                                                                                                 |
| Starting Time                  | Not included                                                                                                    |

## Step 8

## ASSIGNMENT COMMAND:

|                                |                                                                                                |
|--------------------------------|------------------------------------------------------------------------------------------------|
| Channel Description            | TCH/F                                                                                          |
| - Channel Type and TDMA offset | (N+3) mod 8                                                                                    |
| - Timeslot Number              | Chosen arbitrarily                                                                             |
| - Training Sequence Code       | Single RF Channel                                                                              |
| - Hopping                      | the ARFCN of the BCCH carrier                                                                  |
| - ARFCN                        |                                                                                                |
| Power Command                  | Chosen arbitrarily but with a changed value.                                                   |
| - Power level                  | A non-signalling mode arbitrarily selected from the full rate capabilities declared for the MS |
| Channel Mode                   | Not Included                                                                                   |
| Frequency list IE              | Not Included                                                                                   |
| Cell Channel Description       | Bit map zero encodes (45, 46, 52, 59, 66, 73, 74, 75, 76, 108, 114)                            |
| Mobile Allocation              | Not included                                                                                   |
| Starting Time                  | Not included                                                                                   |

## Step 12

## ASSIGNMENT COMMAND:

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description            | TCH/F                                                                                                           |
| - Channel Type and TDMA offset | (N+4) mod 8                                                                                                     |
| - Timeslot Number              | Chosen arbitrarily                                                                                              |
| - Training Sequence Code       | RF hopping channel                                                                                              |
| - Hopping                      | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - MAIO                         | Chosen arbitrarily from the set (1 to 63)                                                                       |
| - HSN                          |                                                                                                                 |
| Power Command                  | Chosen arbitrarily but with a changed value.                                                                    |
| - Power level                  | Not included                                                                                                    |
| Channel Mode                   | Not included                                                                                                    |
| Frequency list IE              | Not included                                                                                                    |
| Cell Channel Description       | Not included (thus the CA from step 8 is used to decode the MA)                                                 |
| Mobile Allocation              | Indicates frequencies (45, 46, 73, 74, 75, 76, 108, 114)                                                        |
| Starting Time                  | Not included                                                                                                    |

## Step 15

## ASSIGNMENT COMMAND:

|                                |                                                          |
|--------------------------------|----------------------------------------------------------|
| Channel Description            |                                                          |
| - Channel Type and TDMA offset | TCH/F                                                    |
| - Timeslot Number              | (N+5) mod 8                                              |
| - Training Sequence Code       | Chosen arbitrarily                                       |
| - Hopping                      | Single RF Channel                                        |
| - ARFCN                        | 10                                                       |
| Power Command                  |                                                          |
| - Power level                  | Chosen arbitrarily but with a changed value.             |
| Channel Mode                   | signalling                                               |
| Frequency list IE              | Not included                                             |
| Cell Channel Description       | Not included                                             |
| Mobile Allocation              | Not included                                             |
| Starting Time                  | indicates (current frame number + 100 frames) mod 42 432 |

## Step 19

## ASSIGNMENT COMMAND:

|                          |                                                                                                              |
|--------------------------|--------------------------------------------------------------------------------------------------------------|
| Channel Description      |                                                                                                              |
| - Channel Type           | TCH/H                                                                                                        |
| TDMA offset              | Chosen arbitrarily                                                                                           |
| - Timeslot Number        | (N+6) mod 8                                                                                                  |
| - Training Sequence Code | Chosen arbitrarily                                                                                           |
| - Hopping                | RF hopping channel                                                                                           |
| - MAIO                   | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Frequency List IE. |
| - HSN                    | 0                                                                                                            |
| Power Command            |                                                                                                              |
| - Power level            | Chosen arbitrarily but with a changed value.                                                                 |
| Channel Mode             | A non-signalling mode arbitrarily selected from the half rate capabilities declared for the MS               |
| Cell Channel Description | Not included                                                                                                 |
| Frequency list IE        | Uses bit map 0 to indicate (10, 34, 52, 73, 108, 114).                                                       |
| Mobile Allocation        | Not included                                                                                                 |
| Starting Time            | Not included                                                                                                 |

## Step 21

## ASSIGNMENT COMMAND:

|                          |                                              |
|--------------------------|----------------------------------------------|
| Channel Description      |                                              |
| - Channel Type           | TCH/H                                        |
| TDMA offset              | Chosen arbitrarily                           |
| - Timeslot Number        | (N+7) mod 8                                  |
| - Training Sequence Code | Chosen arbitrarily                           |
| - Hopping                | Single RF Channel                            |
| - ARFCN                  | Chosen arbitrarily, but not the BCCH carrier |
| Power Command            |                                              |
| - Power level            | Chosen arbitrarily but with a changed value. |
| Channel Mode             | Not included                                 |
| Frequency list IE        | Not included                                 |
| Cell Channel Description | Not included                                 |
| Mobile Allocation        | Not included                                 |
| Starting Time            | Not included                                 |

Step 23

ASSIGNMENT COMMAND:

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description            |                                                                                                                 |
| - Channel Type and TDMA offset | TCH/F                                                                                                           |
| - Timeslot Number              | (N+1) mod 8                                                                                                     |
| - Training Sequence Code       | Chosen arbitrarily                                                                                              |
| - Hopping                      | RF hopping channel                                                                                              |
| - MAIO                         | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - HSN                          | Chosen arbitrarily from the set (1 to 63)                                                                       |
| Power Command                  |                                                                                                                 |
| - Power level                  | Chosen arbitrarily but with a changed value.                                                                    |
| Cell Channel Description       | Uses bit map 0 to indicate (17, 20)                                                                             |
| Frequency list IE              | Not included                                                                                                    |
| Mobile Allocation              | Indicates ARFCN 17 only                                                                                         |
| Starting Time                  | Not included                                                                                                    |

GSM 900 end:

DCS 1 800 begin:

Step 3

IMMEDIATE ASSIGNMENT:

|                                    |                               |
|------------------------------------|-------------------------------|
| As default message contents except |                               |
| Channel Description                |                               |
| - Channel Type                     | SDCCH/8                       |
| TDMA offset                        | Chosen arbitrarily            |
| - Timeslot Number                  | N, chosen arbitrarily         |
| - Training Sequence Code           | Chosen arbitrarily            |
| - Hopping                          | Single RF Channel             |
| - ARFCN                            | the ARFCN of the BCCH carrier |

Step 5

ASSIGNMENT COMMAND:

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description            |                                                                                                                 |
| - Channel Type and TDMA offset | TCH/F                                                                                                           |
| - Timeslot Number              | (N+1) mod 8                                                                                                     |
| - Training Sequence Code       | Chosen arbitrarily                                                                                              |
| - Hopping                      | RF hopping channel                                                                                              |
| - MAIO                         | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - HSN                          | Chosen arbitrarily from the set (1 to 63)                                                                       |
| Power Command                  |                                                                                                                 |
| - Power level                  | Chosen arbitrarily but with a changed value.                                                                    |
| Frequency list IE              | Not included                                                                                                    |
| Channel Mode                   |                                                                                                                 |
| - Mode                         | Signalling                                                                                                      |
| Mobile Allocation              | Indicates all of the CA (broadcast on the BCCH) except for the BCCH carrier.                                    |
| Starting Time                  | Not included                                                                                                    |

## Step 8

## ASSIGNMENT COMMAND:

|                                |                                                                                                |
|--------------------------------|------------------------------------------------------------------------------------------------|
| Channel Description            | TCH/F                                                                                          |
| - Channel Type and TDMA offset | (N+3) mod 8                                                                                    |
| - Timeslot Number              | Chosen arbitrarily                                                                             |
| - Training Sequence Code       | Single RF Channel                                                                              |
| - Hopping                      | the ARFCN of the BCCH carrier                                                                  |
| - ARFCN                        |                                                                                                |
| Power Command                  | Chosen arbitrarily but with a changed value.                                                   |
| - Power level                  |                                                                                                |
| Channel Mode                   | A non-signalling mode arbitrarily selected from the full rate capabilities declared for the MS |
| Frequency list IE              | Not Included                                                                                   |
| Cell Channel Description       | Use Range 128 to encode (773, 775, 779, 782, 791, 798, 829, 832, 844)                          |
| Mobile Allocation              | Not included                                                                                   |
| Starting Time                  | Not included                                                                                   |

## Step 12

## ASSIGNMENT COMMAND:

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description            | TCH/F                                                                                                           |
| - Channel Type and TDMA offset | (N+4) mod 8                                                                                                     |
| - Timeslot Number              | Chosen arbitrarily                                                                                              |
| - Training Sequence Code       | RF hopping channel                                                                                              |
| - Hopping                      | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - MAIO                         | Chosen arbitrarily from the set (1 to 63)                                                                       |
| - HSN                          |                                                                                                                 |
| Power Command                  | Chosen arbitrarily but with a changed value.                                                                    |
| - Power level                  |                                                                                                                 |
| Channel Mode                   | Not included                                                                                                    |
| Frequency list IE              | Not included                                                                                                    |
| Cell Channel Description       | Not included (thus the CA from step 8 is used to decode the MA)                                                 |
| Mobile Allocation              | Indicates frequencies (773, 775, 779, 829, 832, 844)                                                            |
| Starting Time                  | Not included                                                                                                    |

## Step 15

## ASSIGNMENT COMMAND:

|                                |                                                          |
|--------------------------------|----------------------------------------------------------|
| Channel Description            | TCH/F                                                    |
| - Channel Type and TDMA offset | (N+5) mod 8                                              |
| - Timeslot Number              | Chosen arbitrarily                                       |
| - Training Sequence Code       | Single RF Channel                                        |
| - Hopping                      | 734                                                      |
| - ARFCN                        |                                                          |
| Power Command                  | Chosen arbitrarily but with a changed value.             |
| - Power level                  |                                                          |
| Channel Mode                   | signalling                                               |
| Frequency list IE              | Not included                                             |
| Cell Channel Description       | Not included                                             |
| Mobile Allocation              | Not included                                             |
| Starting Time                  | indicates (current frame number + 100 frames) mod 42 432 |

## Step 19

## ASSIGNMENT COMMAND:

|                          |                                                                                                              |
|--------------------------|--------------------------------------------------------------------------------------------------------------|
| Channel Description      | TCH/H                                                                                                        |
| - Channel Type           | Chosen arbitrarily                                                                                           |
| TDMA offset              | (N+6) mod 8                                                                                                  |
| - Timeslot Number        | Chosen arbitrarily                                                                                           |
| - Training Sequence Code | RF hopping channel                                                                                           |
| - Hopping                | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Frequency List IE. |
| - MAIO                   | 0                                                                                                            |
| - HSN                    |                                                                                                              |
| Power Command            | Chosen arbitrarily but with a changed value.                                                                 |
| - Power level            |                                                                                                              |
| Channel Mode             | A non-signalling mode arbitrarily selected from the half rate capabilities declared for the MS               |
| Cell Channel Description | Not included                                                                                                 |
| Frequency list IE        | Uses Range 1024 to indicate (734, 741, 759, 766, 773, 832, 844)                                              |
| Mobile Allocation        | Not included                                                                                                 |
| Starting Time            | Not included                                                                                                 |

## Step 21

## ASSIGNMENT COMMAND:

|                          |                                              |
|--------------------------|----------------------------------------------|
| Channel Description      | TCH/H                                        |
| - Channel Type           | Chosen arbitrarily                           |
| TDMA offset              | (N+7) mod 8                                  |
| - Timeslot Number        | Chosen arbitrarily                           |
| - Training Sequence Code | Single RF Channel                            |
| - Hopping                | Chosen arbitrarily, but not the BCCH carrier |
| - ARFCN                  |                                              |
| Power Command            | Chosen arbitrarily but with a changed value. |
| - Power level            |                                              |
| Channel Mode             | Not included                                 |
| Frequency list IE        | Not included                                 |
| Cell Channel Description | Not included                                 |
| Mobile Allocation        | Not included                                 |
| Starting Time            | Not included                                 |

## Step 23

## ASSIGNMENT COMMAND:

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description            | TCH/F                                                                                                           |
| - Channel Type and TDMA offset | (N+1) mod 8                                                                                                     |
| - Timeslot Number              | Chosen arbitrarily                                                                                              |
| - Training Sequence Code       | RF hopping channel                                                                                              |
| - Hopping                      | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - MAIO                         | Chosen arbitrarily from the set (1 to 63)                                                                       |
| - HSN                          |                                                                                                                 |
| Power Command                  | Chosen arbitrarily but with a changed value.                                                                    |
| - Power level                  |                                                                                                                 |
| Cell Channel Description       | Uses Variable Range Format to indicate (741, 747)                                                               |
| Frequency list IE              | Not included                                                                                                    |
| Mobile Allocation              | Indicates ARFCN 741 only                                                                                        |
| Starting Time                  | Not included                                                                                                    |

DCS 1 800 end:

## Step 12

## ASSIGNMENT COMMAND:

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description            | TCH/F                                                                                                           |
| - Channel Type and TDMA offset | (N+4) mod 8                                                                                                     |
| - Timeslot Number              | Chosen arbitrarily                                                                                              |
| - Training Sequence Code       | RF hopping channel                                                                                              |
| - Hopping                      | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - MAIO                         | Chosen arbitrarily from the set (1 to 63)                                                                       |
| - HSN                          |                                                                                                                 |
| Power Command                  | Chosen arbitrarily but with a changed value.                                                                    |
| - Power level                  |                                                                                                                 |
| Channel Mode                   | Not included (thus the CA from step 8 is used to decode the MA)                                                 |
| Frequency list IE              | Not included                                                                                                    |
| Cell Channel Description       | Not included                                                                                                    |
| Mobile Allocation              | Indicates frequencies (673, 675, 679, 722, 732, 744)                                                            |
| Starting Time                  | Not included                                                                                                    |

## Step 15

## ASSIGNMENT COMMAND:

|                                |                                                          |
|--------------------------------|----------------------------------------------------------|
| Channel Description            | TCH/F                                                    |
| - Channel Type and TDMA offset | (N+5) mod 8                                              |
| - Timeslot Number              | Chosen arbitrarily                                       |
| - Training Sequence Code       | Single RF Channel                                        |
| - Hopping                      | 634                                                      |
| - ARFCN                        |                                                          |
| Power Command                  | Chosen arbitrarily but with a changed value.             |
| - Power level                  |                                                          |
| Channel Mode                   | signalling                                               |
| Frequency list IE              | Not included                                             |
| Cell Channel Description       | Not included                                             |
| Mobile Allocation              | Not included                                             |
| Starting Time                  | indicates (current frame number + 100 frames) mod 42 432 |

## Step 19

## ASSIGNMENT COMMAND:

|                          |                                                                                                              |
|--------------------------|--------------------------------------------------------------------------------------------------------------|
| Channel Description      | TCH/H                                                                                                        |
| - Channel Type           | Chosen arbitrarily                                                                                           |
| TDMA offset              | (N+6) mod 8                                                                                                  |
| - Timeslot Number        | Chosen arbitrarily                                                                                           |
| - Training Sequence Code | RF hopping channel                                                                                           |
| - Hopping                | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Frequency List IE. |
| - MAIO                   | 0                                                                                                            |
| - HSN                    |                                                                                                              |
| Power Command            | Chosen arbitrarily but with a changed value.                                                                 |
| - Power level            |                                                                                                              |
| Channel Mode             | A non-signalling mode arbitrarily selected from the half rate capabilities declared for the MS               |
| Cell Channel Description | Not included                                                                                                 |
| Frequency list IE        | Uses Range 1024 to indicate (634, 641, 659, 666, 673, 732, 744)                                              |
| Mobile Allocation        | Not included                                                                                                 |
| Starting Time            | Not included                                                                                                 |

## Step 21

## ASSIGNMENT COMMAND:

|                          |                                              |
|--------------------------|----------------------------------------------|
| Channel Description      | TCH/H                                        |
| - Channel Type           | Chosen arbitrarily                           |
| TDMA offset              | (N+7) mod 8                                  |
| - Timeslot Number        | Chosen arbitrarily                           |
| - Training Sequence Code | Single RF Channel                            |
| - Hopping                | Chosen arbitrarily, but not the BCCH carrier |
| - ARFCN                  |                                              |
| Power Command            |                                              |
| - Power level            | Chosen arbitrarily but with a changed value. |
| Channel Mode             | Not included                                 |
| Frequency list IE        | Not included                                 |
| Cell Channel Description | Not included                                 |
| Mobile Allocation        | Not included                                 |
| Starting Time            | Not included                                 |

## Step 23

## ASSIGNMENT COMMAND:

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description            | TCH/F                                                                                                           |
| - Channel Type and TDMA offset | (N+1) mod 8                                                                                                     |
| - Timeslot Number              | Chosen arbitrarily                                                                                              |
| - Training Sequence Code       | RF hopping channel                                                                                              |
| - Hopping                      | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - MAIO                         | Chosen arbitrarily from the set (1 to 63)                                                                       |
| - HSN                          |                                                                                                                 |
| Power Command                  |                                                                                                                 |
| - Power level                  | Chosen arbitrarily but with a changed value.                                                                    |
| Cell Channel Description       | Uses Variable Range Format to indicate (641, 647)                                                               |
| Frequency list IE              | Not included                                                                                                    |
| Mobile Allocation              | Indicates ARFCN 641 only                                                                                        |
| Starting Time                  | Not included                                                                                                    |

## Step 8

## ASSIGNMENT COMMAND:

|                                |                                                                                                |
|--------------------------------|------------------------------------------------------------------------------------------------|
| Channel Description            | TCH/F                                                                                          |
| - Channel Type and TDMA offset | (N+3) mod 8                                                                                    |
| - Timeslot Number              | Chosen arbitrarily                                                                             |
| - Training Sequence Code       | Single RF Channel                                                                              |
| - Hopping                      | the ARFCN of the BCCH carrier                                                                  |
| - ARFCN                        |                                                                                                |
| Power Command                  | Chosen arbitrarily but with a changed value.                                                   |
| - Power level                  | A non-signalling mode arbitrarily selected from the full rate capabilities declared for the MS |
| Channel Mode                   | Not Included                                                                                   |
| Frequency list IE              | 128 range encodes (482, 483, 489, 496, 498, 500, 501, 502, 503, 506, 508)                      |
| Cell Channel Description       |                                                                                                |
| Mobile Allocation              | Not included                                                                                   |
| Starting Time                  | Not included                                                                                   |

## Step 12

## ASSIGNMENT COMMAND:

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description            | TCH/F                                                                                                           |
| - Channel Type and TDMA offset | (N+4) mod 8                                                                                                     |
| - Timeslot Number              | Chosen arbitrarily                                                                                              |
| - Training Sequence Code       | RF hopping channel                                                                                              |
| - Hopping                      | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - MAIO                         | Chosen arbitrarily from the set (1 to 63)                                                                       |
| - HSN                          |                                                                                                                 |
| Power Command                  | Chosen arbitrarily but with a changed value.                                                                    |
| - Power level                  | Not included                                                                                                    |
| Channel Mode                   | Not included                                                                                                    |
| Frequency list IE              | Not included                                                                                                    |
| Cell Channel Description       | Not included (thus the CA from step 8 is used to decode the MA)                                                 |
| Mobile Allocation              | Indicates frequencies (482, 483, 500, 501, 502, 503, 506, 508)                                                  |
| Starting Time                  | Not included                                                                                                    |

## Step 15

## ASSIGNMENT COMMAND:

|                                |                                                          |
|--------------------------------|----------------------------------------------------------|
| Channel Description            |                                                          |
| - Channel Type and TDMA offset | TCH/F                                                    |
| - Timeslot Number              | (N+5) mod 8                                              |
| - Training Sequence Code       | Chosen arbitrarily                                       |
| - Hopping                      | Single RF Channel                                        |
| - ARFCN                        | 447                                                      |
| Power Command                  |                                                          |
| - Power level                  | Chosen arbitrarily but with a changed value.             |
| Channel Mode                   | Signalling                                               |
| Frequency list IE              | Not included                                             |
| Cell Channel Description       | Not included                                             |
| Mobile Allocation              | Not included                                             |
| Starting Time                  | Indicates (current frame number + 100 frames) mod 42 432 |

## Step 19

## ASSIGNMENT COMMAND:

|                          |                                                                                                              |
|--------------------------|--------------------------------------------------------------------------------------------------------------|
| Channel Description      |                                                                                                              |
| - Channel Type           | TCH/H                                                                                                        |
| TDMA offset              | Chosen arbitrarily                                                                                           |
| - Timeslot Number        | (N+6) mod 8                                                                                                  |
| - Training Sequence Code | Chosen arbitrarily                                                                                           |
| - Hopping                | RF hopping channel                                                                                           |
| - MAIO                   | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Frequency List IE. |
| - HSN                    | 0                                                                                                            |
| Power Command            |                                                                                                              |
| - Power level            | Chosen arbitrarily but with a changed value.                                                                 |
| Channel Mode             | A non-signalling mode arbitrarily selected from the half rate capabilities declared for the MS               |
| Cell Channel Description | Not included                                                                                                 |
| Frequency list IE        | Uses 128 range to indicate (447, 471, 489, 500, 506, 508).                                                   |
| Mobile Allocation        | Not included                                                                                                 |
| Starting Time            | Not included                                                                                                 |

## Step 21

## ASSIGNMENT COMMAND:

|                          |                                              |
|--------------------------|----------------------------------------------|
| Channel Description      |                                              |
| - Channel Type           | TCH/H                                        |
| TDMA offset              | Chosen arbitrarily                           |
| - Timeslot Number        | (N+7) mod 8                                  |
| - Training Sequence Code | Chosen arbitrarily                           |
| - Hopping                | Single RF Channel                            |
| - ARFCN                  | Chosen arbitrarily, but not the BCCH carrier |
| Power Command            |                                              |
| - Power level            | Chosen arbitrarily but with a changed value. |
| Channel Mode             | Not included                                 |
| Frequency list IE        | Not included                                 |
| Cell Channel Description | Not included                                 |
| Mobile Allocation        | Not included                                 |
| Starting Time            | Not included                                 |

## Step 23

## ASSIGNMENT COMMAND:

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description            |                                                                                                                 |
| - Channel Type and TDMA offset | TCH/F                                                                                                           |
| - Timeslot Number              | (N+1) mod 8                                                                                                     |
| - Training Sequence Code       | Chosen arbitrarily                                                                                              |
| - Hopping                      | RF hopping channel                                                                                              |
| - MAIO                         | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - HSN                          | Chosen arbitrarily from the set (1 to 63)                                                                       |
| Power Command                  |                                                                                                                 |
| - Power level                  | Chosen arbitrarily but with a changed value.                                                                    |
| Cell Channel Description       | Uses 128 range to indicate (454, 457)                                                                           |
| Frequency list IE              | Not included                                                                                                    |
| Mobile Allocation              | Indicates ARFCN 454 only                                                                                        |
| Starting Time                  | Not included                                                                                                    |

GSM 700 end:

GSM 850 begin:

## Step 3

## IMMEDIATE ASSIGNMENT:

|                                    |                               |
|------------------------------------|-------------------------------|
| As default message contents except |                               |
| Channel Description                |                               |
| - Channel Type                     | SDCCH/8                       |
| TDMA offset                        | Chosen arbitrarily            |
| - Timeslot Number                  | N, chosen arbitrarily         |
| - Training Sequence Code           | Chosen arbitrarily            |
| - Hopping                          | Single RF Channel             |
| - ARFCN                            | the ARFCN of the BCCH carrier |

## Step 5

## ASSIGNMENT COMMAND:

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description            |                                                                                                                 |

| - ARFCN                        |                                                                                                |
| Power Command                  | Chosen arbitrarily but with a changed value.                                                   |
| - Power level                  |                                                                                                |
| Channel Mode                   | A non-signalling mode arbitrarily selected from the full rate capabilities declared for the MS |
| Frequency list IE              | Not Included                                                                                   |
| Cell Channel Description       | 128 range encodes (172, 173, 179, 186, 193, 200, 201, 202, 203, 235, 241)                      |
| Mobile Allocation              | Not included                                                                                   |
| Starting Time                  | Not included                                                                                   |

## Step 12

## ASSIGNMENT COMMAND:

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description            | TCH/F                                                                                                           |
| - Channel Type and TDMA offset | (N+4) mod 8                                                                                                     |
| - Timeslot Number              | Chosen arbitrarily                                                                                              |
| - Training Sequence Code       | RF hopping channel                                                                                              |
| - Hopping                      | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - MAIO                         | Chosen arbitrarily from the set (1 to 63)                                                                       |
| - HSN                          |                                                                                                                 |
| Power Command                  | Chosen arbitrarily but with a changed value.                                                                    |
| - Power level                  |                                                                                                                 |
| Channel Mode                   | Not included                                                                                                    |
| Frequency list IE              | Not included                                                                                                    |
| Cell Channel Description       | Not included (thus the CA from step 8 is used to decode the MA)                                                 |
| Mobile Allocation              | Indicates frequencies (172, 173, 200, 201, 202, 203, 235, 241)                                                  |
| Starting Time                  | Not included                                                                                                    |

## Step 15

## ASSIGNMENT COMMAND:

|                                |                                                          |
|--------------------------------|----------------------------------------------------------|
| Channel Description            | TCH/F                                                    |
| - Channel Type and TDMA offset | (N+5) mod 8                                              |
| - Timeslot Number              | Chosen arbitrarily                                       |
| - Training Sequence Code       | Single RF Channel                                        |
| - Hopping                      | 137                                                      |
| - ARFCN                        |                                                          |
| Power Command                  | Chosen arbitrarily but with a changed value.             |
| - Power level                  |                                                          |
| Channel Mode                   | Signalling                                               |
| Frequency list IE              | Not included                                             |
| Cell Channel Description       | Not included                                             |
| Mobile Allocation              | Not included                                             |
| Starting Time                  | Indicates (current frame number + 100 frames) mod 42 432 |

## Step 19

## ASSIGNMENT COMMAND:

|                          |                                                                                                              |
|--------------------------|--------------------------------------------------------------------------------------------------------------|
| Channel Description      | TCH/H                                                                                                        |
| - Channel Type           | Chosen arbitrarily                                                                                           |
| TDMA offset              | (N+6) mod 8                                                                                                  |
| - Timeslot Number        | Chosen arbitrarily                                                                                           |
| - Training Sequence Code | RF hopping channel                                                                                           |
| - Hopping                | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Frequency List IE. |
| - MAIO                   | 0                                                                                                            |
| - HSN                    |                                                                                                              |
| Power Command            | Chosen arbitrarily but with a changed value.                                                                 |
| - Power level            |                                                                                                              |
| Channel Mode             | A non-signalling mode arbitrarily selected from the half rate capabilities declared for the MS               |
| Cell Channel Description | Not included                                                                                                 |
| Frequency list IE        | Uses 128 range to indicate (137, 161, 179, 200, 235, 241).                                                   |
| Mobile Allocation        | Not included                                                                                                 |
| Starting Time            | Not included                                                                                                 |

## Step 21

## ASSIGNMENT COMMAND:

|                          |                                              |
|--------------------------|----------------------------------------------|
| Channel Description      | TCH/H                                        |
| - Channel Type           | Chosen arbitrarily                           |
| TDMA offset              | (N+7) mod 8                                  |
| - Timeslot Number        | Chosen arbitrarily                           |
| - Training Sequence Code | Single RF Channel                            |
| - Hopping                | Chosen arbitrarily, but not the BCCH carrier |
| - ARFCN                  |                                              |
| Power Command            | Chosen arbitrarily but with a changed value. |
| - Power level            |                                              |
| Channel Mode             | Not included                                 |
| Frequency list IE        | Not included                                 |
| Cell Channel Description | Not included                                 |
| Mobile Allocation        | Not included                                 |
| Starting Time            | Not included                                 |

## Step 23

## ASSIGNMENT COMMAND:

|                                |                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Channel Description            | TCH/F                                                                                                           |
| - Channel Type and TDMA offset | (N+1) mod 8                                                                                                     |
| - Timeslot Number              | Chosen arbitrarily                                                                                              |
| - Training Sequence Code       | RF hopping channel                                                                                              |
| - Hopping                      | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - MAIO                         | Chosen arbitrarily from the set (1 to 63)                                                                       |
| - HSN                          |                                                                                                                 |
| Power Command                  | Chosen arbitrarily but with a changed value.                                                                    |
| - Power level                  |                                                                                                                 |
| Cell Channel Description       | Uses 128 range to indicate (144, 147)                                                                           |
| Frequency list IE              | Not included                                                                                                    |
| Mobile Allocation              | Indicates ARFCN 144 only                                                                                        |
| Starting Time                  | Not included                                                                                                    |

GSM 850 end:

## 26.6.4.2 Dedicated assignment / failure

### 26.6.4.2.1 Dedicated assignment / failure / failure during active state

This test is only applicable to an MS supporting the call control protocol.

#### 26.6.4.2.1.1 Conformance requirements

On the mobile station side, if a lower layer failure happens on the new channel before the ASSIGNMENT COMPLETE message has been sent, the mobile station deactivates the new channels, reactivates the old channels, reconnects the TCHs if any and triggers the establishment of the main signalling link. It then sends a ASSIGNMENT FAILURE message, cause "protocol error unspecified" on the main DCCH and resumes the normal operation, as if no assignment attempt had occurred. The operational parameters (e.g. ciphering mode) when returning on the old channel are those applied before the procedure.

#### References

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.4.3.3.

3GPP TS 05.08 subclause 4.2.

3GPP TS 05.05 subclause 4.1.1.

#### 26.6.4.2.1.2 Test purpose

To test that, when the MS fails to seize the new channel, the MS reactivates the old channel, reporting use of the last power level used on the old channel.

This is tested in the special cases of a transition:

- from TCH/F to hopping TCH/F in state U10 if the MS supports TCH/F and call control;
- from TCH/H to hopping TCH/H in state U10 if the MS supports TCH/H and call control.

#### 26.6.4.2.1.3 Method of test

##### Initial Conditions

System Simulator:

1 cell, default parameters. The SS orders the MS to use a power level P. Where P is a power level within the range supported by the Type of MS.

Mobile Station:

The MS is in the active state (U10) of a mobile terminated call.

##### Related PICS/PIXIT Statements

- Support for TCH/F.
- Support for TCH/H.
- Support for state U10 of the Call Control protocol.
- Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).
- Power Class of MS.

## Foreseen Final State of the MS

The active state (U10) of a mobile terminated call.

## Test Procedure

The MS is in the active state (U10) of a mobile terminated call. The SS sends an ASSIGNMENT COMMAND allocating a new TCH/F, but does not activate the new channel. It is checked that the MS triggers the establishment of the main signalling link on the old channel and then sends an ASSIGNMENT FAILURE.

## Maximum Duration of Test

30 s.

## Expected Sequence

The test is repeated for execution counter  $k = 1, 2$  if the MS supports TCH/H.

| Step | Direction | Message            | Comments                                                                                                                                                                                                                                                                                    |
|------|-----------|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | ASSIGNMENT COMMAND | Channel Type = TCH/F, if $k = 1$ , Channel Type = TCH/H, if $k = 2$ . Power level specified in power command is different to P, again where P is a power level within the range supported by the Type of MS. The MS attempts (and fails) to establish a signalling link on the new channel. |
| 2    |           |                    | The MS re-establishes the signalling link on the old channel.                                                                                                                                                                                                                               |
| 3    | MS -> SS  | ASSIGNMENT FAILURE | RR cause value = "protocol error unspecified".                                                                                                                                                                                                                                              |
| 4    | SS        |                    | The SS checks that the MS reports power level P in the L1 header of the SACCH message that is sent in the first SACCH multiframe following the SABM.                                                                                                                                        |

### 26.6.4.2.2 Dedicated assignment / failure / general case

#### 26.6.4.2.2.1 Conformance requirements

On the mobile station side, if a lower layer failure happens on the new channel before the ASSIGNMENT COMPLETE message has been sent, the mobile station deactivates the new channels, reactivates the old channels, reconnects the TCHs if any and triggers the establishment of the main signalling link. It then sends a ASSIGNMENT FAILURE message, cause "protocol error unspecified" on the main DCCH and resumes the normal operation, as if no assignment attempt had occurred. The operational parameters (e.g. ciphering mode) when returning on the old channel are those applied before the procedure.

## References

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.4.3.3.

#### 26.6.4.2.2.2 Test purpose

To test that, when the MS fails to seize the new channel, the MS reactivates the old channel.

This is tested in the special cases of a transition:

- from SDCCH to hopping TCH/F; this test part is only applicable if the MS supports TCH/F.
- from non-hopping SDCCH to hopping TCH/H; this test part is only applicable if the MS supports TCH/H.
- from hopping TCH/F to hopping TCH/H; this test part is only applicable if the MS supports TCH/H.

NOTE: Subclause 26.6.8.4 contains the case of an assignment failure SDCCH -> SDCCH.

#### 26.6.4.2.2.3 Method of test

##### Initial Conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is "idle updated".

##### Related PICS/PIXIT Statements

- Support for TCH/F.
- Support for TCH/H.
- Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

##### Foreseen Final State of the MS

The MS is "idle updated".

##### Test Procedure

A mobile terminated RR connection is established on an SDCCH. The SS sends an ASSIGNMENT COMMAND message allocating a hopping TCH/F, but does not activate the assigned channels. The MS shall try to activate the new channel (this is not verified) and shall then reactivate the old channel and trigger the establishment of the main signalling link on the old channel. Then the MS shall send an ASSIGNMENT FAILURE.

For an MS not supporting TCH/H, the SS initiates the channel release procedure and the test ends here. For an MS supporting TCH/H, the test sequence is repeated another two times, with half rate channels involved, and again it is checked that the MS correctly returns to the old channels, before the SS initiates the channel release procedure.

##### Maximum Duration of Test

30 s.

## Expected Sequence

| Step | Direction | Message               | Comments                                                                                                      |
|------|-----------|-----------------------|---------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PAGING REQUEST TYPE 1 |                                                                                                               |
| 2    | MS -> SS  | CHANNEL REQUEST       |                                                                                                               |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT  | Channel Type: SDCCH.                                                                                          |
| 4    | MS -> SS  | PAGING RESPONSE       |                                                                                                               |
| 5    | SS -> MS  | ASSIGNMENT COMMAND    | Channel Type = TCH/F, hopping. The MS attempts (and fails) to establish a signalling link on the new channel. |
| 6    |           |                       | The MS re-establishes the signalling link on the old channel.                                                 |
| 7    | MS -> SS  | ASSIGNMENT FAILURE    | RR cause value = "protocol error unspecified".                                                                |
| A    |           |                       | This test part is performed if the MS does not support TCH/H.                                                 |
| A8   | SS -> MS  | CHANNEL RELEASE       | The main signalling link is released.                                                                         |
| B    |           |                       | This test part is performed if the MS supports TCH/H.                                                         |
| B8   | SS -> MS  | ASSIGNMENT COMMAND    | Channel Type = TCH/H, hopping. The MS attempts (and fails) to establish a signalling link on the new channel. |
| B9   |           |                       | The MS re-establishes the signalling link on the old channel.                                                 |
| B10  | MS -> SS  | ASSIGNMENT FAILURE    | RR cause value = "protocol error unspecified".                                                                |
| B11  | SS -> MS  | ASSIGNMENT COMMAND    | Channel Type = TCH/F, hopping.                                                                                |
| B12  | MS -> SS  | ASSIGNMENT COMPLETE   | Sent on the assigned channel after establishment of the main signalling link.                                 |
| B13  | SS -> MS  | ASSIGNMENT COMMAND    | Channel Type = TCH/H, hopping. The MS attempts (and fails) to establish a signalling link on the new channel. |
| B14  |           |                       | The MS re-establishes the signalling link on the old channel.                                                 |
| B15  | MS -> SS  | ASSIGNMENT FAILURE    | RR cause value = "protocol error unspecified".                                                                |
| B16  | SS -> MS  | CHANNEL RELEASE       | The main signalling link is released.                                                                         |

## 26.6.5 Test of handover

With the Handover procedure, it is possible to completely alter the channels allocated to a MS. This makes it possible in particular to switch a call in progress from one cell to another. The procedure is always initiated by the network and with the MS in a dedicated mode.

Subclauses 26.6.5.1 to 26.6.5.4 contain generic test procedures to be used for executing successful Handover tests. Table 26.6-1 contains a summary of the different combinations of parameters which have to be tested, together with a reference to the appropriate generic test procedure. If a test uses a channel rate which the MS under test does not support, the test shall be skipped.

Table 26.6-1

| From           | To             | Timing Adv.    | Start Time | Syn ? | State of call | Subclause | Exec Counter |
|----------------|----------------|----------------|------------|-------|---------------|-----------|--------------|

|   | TCH/FS | TCH/HS | SDCCH |
|---|--------|--------|-------|
| n | 10-20  | 5-10   | 2-5   |

In addition to the successful case of Handover, 2 unsuccessful cases shall be tested. These tests are described in subclauses 26.6.5.8 and 26.6.5.9.

### 26.6.5.1 Handover / successful / active call / non-synchronized

#### 26.6.5.1.1 Conformance requirements

The MS shall correctly apply the handover procedure in the non-synchronized case when a call is in progress and when handover is performed from a TCH/F without frequency hopping towards a TCH/F without frequency hopping.

The MS shall correctly apply the handover procedure in the non-synchronized case when a call is in progress and when handover is performed from a TCH/H without frequency hopping to a TCH/H with frequency hopping. This does not apply to MSs not supporting TCH/H.

#### References

3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.4.4 and 9.1.15.

3GPP TS 04.13 subclause 5.2.6.2.

### 26.6.5.1.2 Test purpose

To test that when the MS is ordered to make a non-synchronized handover it continuously sends access bursts on the main DCCH until it receives a PHYSICAL INFORMATION message from the SS. To test that the MS correctly handles the values of any Starting Time IE in the HANDOVER COMMAND message in the case when none of the information elements referring to before the starting time are present. To test that the MS correctly handles the Timing Advance IE in the PHYSICAL INFORMATION message. To test that the MS activates the new channel correctly and transmits the HANDOVER COMPLETE message without undue delay.

### 26.6.5.1.3 Method of test

#### Initial Conditions

System Simulator:

2 cells, A and B with same LAI, default parameters except:

#### GSM 450:

Cell A has:

BCCH ARFCN = 263

Cell Allocation = (259, 261, 263, 265, 267, 269, 271, 273, 275, 277, 279, 281, 283, 285, 287, 289, 291)

Cell B has:

BCCH ARFCN = 274

Cell Allocation = (260, 262, 264, 266, 268, 270, 272, 274, 276, 279, 281, 283, 285, 287, 289, 291)

The Cell Allocation of both Cell A and Cell B shall be coded using range 128 format.

The frame numbers of cells A and B shall be different by 100.

The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

#### GSM 480:

Cell A has:

BCCH ARFCN = 310

Cell Allocation = (306, 308, 310, 312, 314, 316, 318, 320, 322, 324, 326, 328, 330, 332, 334, 336, 338)

Cell B has:

BCCH ARFCN = 321

Cell Allocation = (307, 309, 311, 313, 315, 317, 319, 321, 323, 326, 328, 330, 332, 334, 336, 338)

The Cell Allocation of both Cell A and Cell B shall be coded using range 128 format.

The frame numbers of cells A and B shall be different by 100.

The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

#### GSM 900:

Cell A has:

BCCH ARFCN = 20

Cell Allocation = (10, 17, 20, 26, 34, 42, 45, 46, 52, 59, 66, 73, 74, 75, 76, 108, 114)

Cell B has:

BCCH ARFCN = 40

Cell Allocation = (14, 18, 22, 24, 30, 31, 38, 40, 60, 66, 73, 74, 75, 76, 108, 114)

The frame numbers of cells A and B shall be different by 100.

The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

DCS 1 800:

Cell A has:

BCCH ARFCN = 747

Cell Allocation = (734, 741, 747, 754, 759, 762, 766, 767, 773, 775, 779, 782, 791, 798, 829, 832, 844)

Cell B has:

BCCH ARFCN = 764

Cell Allocation = (739, 743, 746, 749, 756, 758, 761, 764, 771, 779, 782, 791, 798, 829, 832, 844)

The Cell Allocation of both Cell A and Cell B shall be coded using range 256 format.

The frame numbers of cells A and B shall be different by 100.

The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

GSM 1900:

Cell A has:

BCCH ARFCN = 647

Cell Allocation = (634, 641, 647, 654, 659, 662, 666, 667, 673, 675, 679, 682, 691, 698, 729, 732, 744)

Cell B has:

BCCH ARFCN = 664

Cell Allocation = (639, 643, 646, 649, 656, 658, 661, 664, 671, 679, 682, 691, 698, 729, 732, 744)

The Cell Allocation of both Cell A and Cell B shall be coded using range 256 format.

The frame numbers of cells A and B shall be different by 100.

The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

GSM 700:

Cell A has:

BCCH ARFCN = 457

Cell Allocation = (447, 454, 457, 463, 471, 479, 482, 483, 489, 496, 498, 500, 501, 502, 503, 506, 508)

Cell B has:

BCCH ARFCN = 477

Cell Allocation = (451, 455, 459, 461, 467, 468, 475, 477, 497, 498, 500, 501, 502, 503, 506, 508)

The Cell Allocation of both Cell A and Cell B shall be coded using range 128 format.

The frame numbers of cells A and B shall be different by 100.

The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

#### GSM 850:

Cell A has:

BCCH ARFCN = 147

Cell Allocation = (137, 144, 147, 153, 161, 169, 172, 173, 179, 186, 193, 200, 201, 202, 203, 235, 241)

Cell B has:

BCCH ARFCN = 167

Cell Allocation = (141, 145, 149, 151, 157, 158, 165, 167, 187, 193, 200, 201, 202, 203, 235, 241)

The Cell Allocation of both Cell A and Cell B shall be coded using range 128 format.

The frame numbers of cells A and B shall be different by 100.

The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

#### Mobile Station:

The MS is in the active state (U10) of a call on cell A.

#### Related PICS/PIXIT Statements

Supported rate(s) of TCH: TCH/F and/or TCH/H.

Support for state U10 of the Call Control protocol.

Support for speech: yes/no.

supported radio interface rates: 12kbps, 6kbps, 3,6kbps.

Type of Mobile Station (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

#### Foreseen Final State of the MS

The active state (U10) of a call on cell A.

#### Test Procedure

This procedure is repeated for execution counter M = 1 to 8 (see table 26.6-1).

The MS is in the active state (U10) of a call. The SS sends a HANOVER COMMAND on the main DCCH. The MS shall (at the time defined by the Starting Time information element, if included in the message) begin to send access bursts on the new DCCH of the target cell. The SS observes the access bursts and after receiving n (n being arbitrarily chosen between values according to table 26.6-2 of subclause 26.6.5) access bursts, the SS sends one PHYSICAL INFORMATION message with a Timing Advance as specified in table 26.6-1 of subclause 26.6.5. The MS shall activate the channel in sending and receiving mode. The MS shall establish a signalling link. The MS shall be ready to transmit a HANOVER COMPLETE message, before "x" MS after the end of the PHYSICAL INFORMATION message, but not before a UA frame has been sent by the SS.

The term "ready to transmit" is defined in 3GPP TS 04.13. The value of "x" depends upon the target channel and is specified in the specific message contents section.

#### Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

## Expected Sequence

This sequence is performed for an execution counter  $M = 1, 2, 3$  for an MS which only supports TCH/F.

This sequence is performed for an execution counter  $M = 1, 2.. 8$  for an MS which supports TCH/F and H

Step 6:  $x = 500$ .

Step 7: The MS and SS are using a full rate TCH in non-hopping mode on cell A.

## Specific Message Contents For Mobiles not Supporting Speech

If the mobile station supports half rate, then the 12 kbps radio interface rate is not used for this test. With this restriction, the radio interface rate is selected arbitrarily from those support.

The message contents shall be the same for the declared type of Mobile Station (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or DCS 1 800 or PCS 1 900) supporting speech , except for:

M = 3 and 7:

## HANDOVER COMMAND

| Information Element   | value/remarks                                                 |
|-----------------------|---------------------------------------------------------------|
| Mode of first channel | Data, with the full rate radio interface rate that is in use. |

## 26.6.5.2 Handover / successful / call under establishment / non-synchronized

This test is applicable to all MS which support at least one MO circuit switched basic service.

## 26.6.5.2.1 Conformance requirements

The MS shall correctly apply the handover procedure from SDCCH/8, TCH/F or TCH/H with or without frequency hopping to SDCCH/8, TCH/F or TCH/H with or without frequency hopping in the non-synchronized case during call establishment. The mobile shall correctly apply the handover procedures from non frequency hopping SDCCH/4 to SDCCH/8, TCH/F or TCH/H with or without frequency hopping. If during call establishment a Layer 3 MM or CC message just sent by the MS is not Layer 2 acknowledged before the channel change caused by the HANDOVER COMMAND message, the MS shall send the Layer 3 message to the new cell, using the same value in the N(SD) field, after the handover procedure.

## References

3GPP TS 04.08 / 3GPP TS 44.018, subclauses 3.1.4.2, 3.4.4 and 9.1.15.

3GPP TS 04.13, subclause 5.2.6.2.

## 26.6.5.2.2 Test purpose

To test that when the MS is ordered to make a non-synchronized handover, it continuously sends access bursts on the main DCCH until it receives a PHYSICAL INFORMATION message from the SS. To test that the MS correctly takes the values of the Timing Advance information element in the PHYSICAL INFORMATION message into account. To test that the MS activates the new channel correctly and transmits the HANDOVER COMPLETE message without undue delay. To test that the MS correctly retransmits Layer 3 MM or CC messages, that were not acknowledged by Layer 2 before the Handover, after completion of the Handover.

## 26.6.5.2.3 Method of test

## Initial Conditions

System Simulator:

2 cells A and B with same LAI, default parameters, except:

GSM 450:

Cell A has:

BCCH ARFCN = 263.

Cell Allocation = (259, 261, 263, 265, 267, 269, 271, 273, 275, 277, 279, 281, 283, 285, 287, 289, 291).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

PLMN\_PERM = 00001010.

Cell B has:

BCCH ARFCN = 274.

Cell Allocation = (260, 262, 264, 266, 268, 270, 272, 274, 276, 279, 281, 283, 285, 287, 289, 291).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using range 128 format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

For execution counter M = 1, 2 and 3 a combined CCH/SDCCH is used.

For execution counter M = 4 to 10 a non combined SDCCH is used.

GSM 480:

Cell A has:

BCCH ARFCN = 310.

Cell Allocation = (306, 308, 310, 312, 314, 316, 318, 320, 322, 324, 326, 328, 330, 332, 334, 336, 338).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

PLMN\_PERM = 00001010.

Cell B has:

BCCH ARFCN = 321.

Cell Allocation = (307, 309, 311, 313, 315, 317, 319, 321, 323, 326, 328, 330, 332, 334, 336, 338).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using range 128 format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

For execution counter M = 1, 2 and 3 a combined CCH/SDCCH is used.

For execution counter M = 4 to 10 a non combined SDCCH is used.

GSM 900:

Cell A has:

BCCH ARFCN = 20.

Cell Allocation = (10, 17, 20, 26, 34, 42, 45, 46, 52, 59, 66, 73, 74, 75, 76, 108, 114).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

PLMN\_PERM = 00001010.

Cell B has:

BCCH ARFCN = 40.

Cell Allocation = (14, 18, 22, 24, 30, 31, 38, 40, 60, 66, 73, 74, 75, 76, 108, 114).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using bit map 0 format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

For execution counter M = 1, 2 and 3 a combined CCH/SDCCH is used.

For execution counter M = 4 to 10 a non combined SDCCH is used.

DCS 1 800:

Cell A has:

BCCH ARFCN = 747.

Cell Allocation = (734, 741, 747, 754, 759, 762, 766, 767, 773, 775, 779, 782, 791, 798, 829, 832, 844).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

PLMN\_PERM = 00001010.

Cell B has:

BCCH ARFCN = 764.

Cell Allocation = (739, 743, 746, 749, 756, 758, 761, 764, 771, 779, 782, 791, 798, 829, 832, 844).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using Range 512 format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

For execution counter M = 1, 2 and 3 a combined CCH/SDCCH is used.

For execution counter M = 4 to 10 a non combined SDCCH is used.

PCS 1 900:

Cell A has:

BCCH ARFCN = 647.

Cell Allocation = (634, 641, 647, 654, 659, 662, 666, 667, 673, 675, 679, 682, 691, 698, 729, 732, 744).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

PLMN\_PERM = 00001010.

Cell B has:

BCCH ARFCN = 664.

Cell Allocation = (639, 643, 646, 649, 656, 658, 661, 664, 671, 679, 682, 691, 698, 729, 732, 744).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using Range 512 format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

For execution counter M = 1, 2 and 3 a combined CCH/SDCCH is used.

For execution counter M = 4 to 10 a non combined SDCCH is used.

GSM 700:

Cell A has:

BCCH ARFCN = 457.

Cell Allocation = (447, 454, 457, 463, 471, 479, 482, 483, 489, 496, 498, 500, 501, 502, 503, 506, 508).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

PLMN\_PERM = 00001010.

Cell B has:

BCCH ARFCN = 477.

Cell Allocation = (451, 455, 459, 461, 467, 468, 475, 477, 497, 498, 500, 501, 502, 503, 506, 508).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using 128 range format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

For execution counter M = 1, 2 and 3 a combined CCH/SDCCH is used.

For execution counter M = 4 to 10 a non combined SDCCH is used.

GSM 850:

Cell A has:

BCCH ARFCN = 147.

Cell Allocation = (137, 144, 147, 153, 161, 169, 172, 173, 179, 186, 193, 200, 201, 202, 203, 235, 241).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

PLMN\_PERM = 00001010.

Cell B has:

BCCH ARFCN = 167.

Cell Allocation = (141, 145, 149, 151, 157, 158, 165, 167, 187, 193, 200, 201, 202, 203, 235, 241).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using 128 range format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

For execution counter M = 1, 2 and 3 a combined CCH/SDCCH is used.

For execution counter M = 4 to 10 a non combined SDCCH is used.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated and camped on cell A.

#### Related PICS/PIXIT Statements

Supported rate(s) of TCH: TCH/F and/or TCH/H.

Support for MO calls.

Supported speech and data rates.

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

#### Foreseen Final State of the MS

"Idle, updated" with TMSI allocated and camped on cell B.

#### Test Procedure

This procedure is repeated for execution counter M = 1, 2 .. 10 (See table 26.6-1.)

A Mobile Originating Call is initiated on Cell A. After the MS has sent the SETUP message (and before the last L2 frame carrying the SETUP message is acknowledged by the SS) the SS sends a HANDOVER COMMAND message, ordering the MS to switch to cell B. The MS shall then begin to send access bursts on the new DCCH to cell B. The SS observes the access bursts and after receiving n (n being arbitrarily chosen between values according to table 26.6-2 of subclause 26.6.5) access bursts, the SS sends one PHYSICAL INFORMATION message with a Timing Advance as specified in table 26.6-1 of subclause 26.6.5. The MS shall activate the channel in sending and receiving mode. The MS shall establish a signalling link. The MS shall be ready to transmit a HANDOVER COMPLETE message before x ms after the end of the PHYSICAL INFORMATION message, but not before a UA frame has been sent by the SS. The MS shall then again send the SETUP message to the SS, using the same value in the N(SD) field. Finally the SS sends a CHANNEL RELEASE to end the test.

The term "ready to transmit" is defined in 3GPP TS 04.13. The value of "x" depends upon the target channel and is specified in the specific message contents section.

#### Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

#### Expected Sequence

The sequence is performed for execution counter M = 1, 2..10 (unless a particular TCH is not supported).

| Step | Direction | Message                 | Comments                                                                                                                                        |

| Mode of first channel | Arbitrary from those supported (6, 3,6 kbps). |

## 26.6.5.3 Handover / successful / active call / finely synchronized

### 26.6.5.3.1 Conformance requirements

The MS shall correctly apply the handover procedure from TCH/F with frequency hopping to TCH/F without frequency hopping in the finely synchronized case when a call is in progress.

The MS shall correctly apply the handover procedure from TCH/H with frequency hopping to TCH/H without frequency hopping in the finely synchronized case when a call is in progress. This requirement does not apply to MSs not supporting TCH/H.

3GPP TS 05.05 subclause 4.1.1.

3GPP TS 05.10, subclause 6.6.

### 26.6.5.3.2 Test purpose

To test that when the MS is ordered to make a finely synchronized handover to a synchronized cell, it sends 4 access bursts on the main DCCH and then activates the channel correctly, taking into account the value of any Starting Time information element, power command and correctly calculating the timing advance to use. To test the MS activates the new channel correctly and transmits the HANDOVER COMPLETE message without undue delay.

### 26.6.5.3.3 Method of test

#### Initial Conditions

System Simulator:

2 cells, A and B, with same LAI, default parameters, except:

The BCCH of cell A is sent k bit periods before the BCCH of cell B. The timing advance in cell A sent to the MS is y bit periods. k and y are selected such that  $0 < (2k+y) \bmod 256 < 60$ .

GSM 450:

Cell B has BCCH ARFCN = 274.

GSM 480:

Cell B has BCCH ARFCN = 321.

P-GSM 900:

Cell B has BCCH ARFCN = 40.

DCS 1 800:

Cell B has BCCH ARFCN = 764.

PCS 1 900:

Cell B has BCCH ARFCN = 764.

GSM 700:

Cell B has BCCH ARFCN = 477.

GSM 850:

Cell B has BCCH ARFCN = 167.

Mobile Station:

The MS is in the active state (U10) of a call (on cell A). The MS is using a power level P. Where P is a power level within the supported range of that type of MS.

#### Related PICS/PIXIT Statements

Supported rate(s) of TCH: TCH/F and/or TCH/H.

Support for state U10 of the Call Control protocol.

Supported speech and data rates.

Type of Mobile Station (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

Power class of Mobile Station.

#### Foreseen Final State of the MS

The active state (U10) of a mobile call (on cell B).

#### Test Procedure

This procedure is repeated for execution counter M = 1 to 2. (See table 26.6-1.)

The MS is in the active state (U10) of a call on cell A. The SS sends a HANOVER COMMAND on the main DCCH. The MS shall (at the time specified in the Starting Time information element, if included) send 4 access bursts, in 4 successive slots on the new DCCH to cell B. Then the MS shall establish a signalling link indicating the correct Timing Advance and power level and send a HANOVER COMPLETE message.

The MS shall be "ready to transmit" a HANOVER COMPLETE message before "x" ms after the end of the HANOVER COMMAND message, but not before a UA frame has been sent by the SS.

The term "ready to transmit" is defined in 3GPP TS 04.13. The value of "x" depends upon the target channel and is specified in the specific message contents section.

## Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

## Expected Sequence

This sequence is performed for execution counter  $M = 1$  for an MS which only supports TCH/F.

This sequence is performed for execution counter  $M = 1$  to 2 for an MS which supports TCH/F and H.

| Step                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Direction | Message           | Comments                                                                                                                                                                                                                                                                                                          |

| 9                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | SS        |                   | The header of the next uplink SACCH is examined and the Timing Advance and Power Level indications are examined. The correct timing advance shall be indicated. A tolerance of $\pm 2$ bit periods is allowed. The power level indication shall indicate the power level used in the handover command (see note). |
| 10                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | MS, SS    |                   | $M = 1$ , The MS and SS are using a full rate TCH in non-hopping mode on cell B $M = 2$ , The MS and SS are using a half rate TCH in non-hopping mode on cell B.                                                                                                                                                  |
| NOTE: In case the Handover procedure is completed within 1 SACCH multiframe, the powerlevel indication, of the power level used in the handover command, will be done in the second uplink SACCH sent on the target cell. As the indicated value shall be the power control level actually used by the mobile for the last burst of the previous SACCH period, the first uplink SACCH header will indicate the powerlevel used by the MS on the old cell, if the Handover procedure is completed within 1 SACCH multiframe. In this case the powerlevel examination shall be done in the second uplink SACCH header sent on the target cell. Reference: 05.08/45.008 clause 4.2. |           |                   |                                                                                                                                                                                                                                                                                                                   |

| - Normal Cell Indication             | Ignore out of range timing advance.                                                                                                                                 |
| Mode of First Channel                | If speech is supported:<br>Speech (full rate version 1 or half rate version 1).<br>If speech is not supported:<br>Arbitrary from those supported, 12, 6, 3,6 kbps). |

**HANDOVER ACCESS**

| Information Element                 | value/remark             |
|-------------------------------------|--------------------------|
| As default message contents except: |                          |
| Handover Reference                  |                          |
| - Value                             | Same as HANDOVER COMMAND |

Step 8:  $x = 900$  ms.

**26.6.5.4 Handover / successful / call under establishment / finely synchronized**

This test is applicable to all MS which support at least one MO circuit switched basic service.

**26.6.5.4.1 Conformance requirements**

The MS shall correctly apply the handover procedure from SDCCH/8 or TCH/F with or without frequency hopping to SDCCH4, SDCCH/8 or TCH/F with or without frequency hopping in the finely synchronized case, during call establishment.

If during call establishment a Layer 3 MM or CC message just sent by the MS is not Layer 2 acknowledged before the channel change caused by the HANDOVER COMMAND message, the MS shall send the Layer 3 message to the new cell, using the same value in the N(SD) field, after the handover procedure.

#### 26.6.5.4.2 Test purpose

To test that when the MS is ordered to make a finely synchronized handover to a synchronized cell, it sends 4 access bursts on the main DCCH and then activates the channel correctly, taking into account the value of any Starting Time information element, power command and correctly calculating the timing advance to use. To test that the MS correctly retransmits Layer 3 MM or CC messages that were not acknowledged by Layer 2 before the Handover, after completion of the Handover. To verify the MS transmits the HANDOVER COMPLETE message without undue delay.

#### 26.6.5.4.3 Method of test

##### Initial Conditions

###### System Simulator:

2 cells, A and B, with same LAI, default parameters, except:

The BCCH of cell A is sent  $k$  bit periods before the BCCH of cell B. The timing advance in cell A sent to the MS is  $y$  bit periods.  $k$  and  $y$  are selected such that  $0 < (2k + y) \bmod 256 < 60$ .

The frame numbers of cells A and B shall be different by 100.

###### GSM 450:

###### Cell A has:

BCCH ARFCN = 263.

Cell Allocation = (259, 261, 263, 265, 267, 269, 271, 273, 275, 277, 279, 281, 283, 285, 287, 289, 291).

###### Cell B has:

BCCH ARFCN = 274.

Cell Allocation = (260, 262, 264, 266, 268, 270, 272, 274, 276, 279, 281, 283, 285, 287, 289, 291).

###### GSM 480:

###### Cell A has:

BCCH ARFCN = 310.

Cell Allocation = (306, 308, 310, 312, 314, 316, 318, 320, 322, 324, 326, 328, 330, 332, 334, 336, 338).

###### Cell B has:

BCCH ARFCN = 321.

Cell Allocation = (307, 309, 311, 313, 315, 317, 319, 321, 323, 326, 328, 330, 332, 334, 336, 338).

###### GSM 900:

###### Cell A has:

BCCH ARFCN = 20.

Cell Allocation = (10, 17, 20, 26, 34, 42, 45, 46, 52, 59, 66, 73, 74, 75, 76, 108, 114).

###### Cell B has:

BCCH ARFCN = 40.

Cell Allocation = (14, 18, 22, 24, 30, 31, 38, 40, 60, 66, 73, 74, 75, 76, 108, 114).

DCS 1 800:

Cell A has:

BCCH ARFCN = 747.

Cell Allocation = (734, 741, 747, 754, 759, 762, 766, 767, 773, 775, 779, 782, 791, 798, 829, 832, 844).

Cell B has:

BCCH ARFCN = 764.

Cell Allocation = (739, 743, 746, 749, 756, 758, 761, 764, 771, 779, 782, 791, 798, 829, 832, 844).

PCS 1 900:

Cell A has:

BCCH ARFCN = 647.

Cell Allocation = (634, 641, 647, 654, 659, 662, 666, 667, 673, 675, 679, 682, 691, 698, 729, 732, 744).

Cell B has:

BCCH ARFCN = 664.

Cell Allocation = (639, 643, 646, 649, 656, 658, 661, 664, 671, 679, 682, 691, 698, 729, 732, 744).

GSM 700:

Cell A has:

BCCH ARFCN = 457.

Cell Allocation = (447, 454, 457, 463, 471, 479, 482, 483, 489, 496, 498, 500, 501, 502, 503, 506, 508).

Cell B has:

BCCH ARFCN = 477.

Cell Allocation = (451, 455, 459, 461, 467, 468, 475, 477, 497, 498, 500, 501, 502, 503, 506, 508).

GSM 850:

Cell A has:

BCCH ARFCN = 147.

Cell Allocation = (137, 144, 147, 153, 161, 169, 172, 173, 179, 186, 193, 200, 201, 202, 203, 235, 241).

Cell B has:

BCCH ARFCN = 167.

Cell Allocation = (141, 145, 149, 151, 157, 158, 165, 167, 187, 193, 200, 201, 202, 203, 235, 241).

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated and camped on cell A. The MS is using a power level P, where P is a power level within the supported range of that type of MS.

#### Related PICS/PIXIT Statements

Supported rate(s) of TCH: TCH/F.

Support for state MO calls.

Supported speech and data rates.

Type of Mobile Station (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

Power class of Mobile Station.

#### Foreseen Final State of the MS

"Idle, updated" with TMSI allocated and camped on cell B.

#### Test Procedure

This procedure is repeated for execution counter  $M = 1, 2, 3, 4$  (see table 26.6-1).

A Mobile Originating Call is initiated on cell A. After the MS has sent the SETUP message (and before the last L2 frame carrying the SETUP message is acknowledged by the SS) the SS sends a HANOVER COMMAND message, ordering the MS to switch to cell B. The MS shall then (at the time specified in the Starting Time information element, if included) send 4 access bursts, in successive slots on the new DCCH to cell B. Then the MS shall establish a signalling link indicating the correct timing advance and power level and send a HANOVER COMPLETE message. The MS shall be "ready to transmit" the HANOVER COMPLETE message before "x" ms after the end of the HANOVER COMMAND message, but not before a UA frame has been sent by the SS. The MS shall then again send the SETUP message to the SS, using the same value in the N(SD) field. Finally the SS sends a CHANNEL RELEASE to end the test.

The term "ready to transmit" is defined in 3GPP TS 04.13. The value "x" depends upon the target channel and is specified in the specific message contents section.

#### Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

#### Expected Sequence

This procedure is repeated for execution counter  $M = 1, 2, 3, 4$  (unless a particular TCH is not supported).

| Step                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Direction | Message                 | Comments                                                                                                                                                                                                                                                                                                          |

| 15                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | MS -> SS  | HANDOVER COMPLETE       | The message shall be ready to be transmitted before "x" ms after the completion of step 8.                                                                                                                                                                                                                        |
| 16                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | SS        |                         | The header of the next uplink SACCH is examined and the Timing Advance and Power Level indications are examined. The correct timing advance shall be indicated. A tolerance of $\pm 2$ bit periods is allowed. The power level indication shall indicate the power level used in the handover command (see note). |
| 17                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | MS -> SS  | SETUP                   | Same N(SD) as in step 7.                                                                                                                                                                                                                                                                                          |
| 18                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | SS -> MS  | CHANNEL RELEASE         |                                                                                                                                                                                                                                                                                                                   |
| <p><b>NOTE:</b> In case the Handover procedure is completed within 1 SACCH multiframe, the powerlevel indication, of the power level used in the handover command, will be done in the second uplink SACCH sent on the target cell. As the indicated value shall be the power control level actually used by the mobile for the last burst of the previous SACCH period, the first uplink SACCH header will indicate the powerlevel used by the MS on the old cell, if the Handover procedure is completed within 1 SACCH multiframe. In this case the powerlevel examination shall be done in the second uplink SACCH header sent on the target cell. Reference: 05.08/45.008 clause 4.2.</p> |           |                         |                                                                                                                                                                                                                                                                                                                   |

## HANDOVER ACCESS

| Information Element                 | value/remark             |
|-------------------------------------|--------------------------|
| As default message contents except: |                          |
| Handover Reference                  |                          |
| - Value                             | Same as HANDOVER COMMAND |

Step 15:  $x = 650$  ms.

## 26.6.5.5 Pre-synchronized handovers

## 26.6.5.5.1 Handover / successful / active call / pre-synchronized / Timing Advance IE not included

If an MS does not implement the pre-synchronized handover procedure correctly then calls may fail.

## 26.6.5.5.1.1 Conformance requirements

- 1 The MS shall correctly apply the handover procedure from TCH/F without frequency hopping to TCH/F without frequency hopping in the pre-synchronized case when a call is active.
- 2 When the Timing Advance information element is not included in the HANDOVER COMMAND, the MS shall access the new cell with the default timing advance of 1 bit period.
- 3 The MS shall be ready to transmit the HANDOVER COMPLETE message within 650 ms of the end of the HANDOVER COMMAND message.

## References

Conformance requirement 1: 3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.4.4.

Conformance requirement 2: 3GPP TS 05.10, subclause 6.6.

Conformance requirement 3: 3GPP TS 04.13, subclause 5.2.6.1.

## 26.6.5.5.1.2 Test purpose

To verify that when the MS is ordered to make a pre-synchronized handover to another cell, it sends 4 access bursts on the main DCCH and then activates the channel correctly and correctly calculates the time to transmit.

## 26.6.5.5.1.3 Method of test

## Initial Conditions

## System Simulator:

2 cells, A and B, with same LAI, default parameters.

The BCCH of cell A is sent k bit periods before the BCCH of cell B. k is arbitrarily selected.

## Mobile Station:

The MS is in the active state (U10) of a call (on cell A) using a full rate TCH in non-hopping mode.

## Related PICS/PIXIT Statements

Supported rate(s) of TCH: TCH/F.

Support for state U10 of the Call Control protocol.

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

## Foreseen Final State of the MS

The active state (U10) of a mobile call (on cell B) using a full rate TCH in non-hopping mode.

## Test Procedure

The MS is in the active state (U10) of a call on cell A. The SS sends a HANDOVER COMMAND for a pre-synchronized handover without the Timing Advance IE on the main DCCH. The MS shall send 4 access bursts, at the commanded power level, in 4 successive slots of the new DCCH to cell B with a Timing Advance of zero. Then the MS shall establish a signalling link using a Timing Advance of one and send a HANDOVER COMPLETE message. The MS shall be ready to transmit the HANDOVER COMPLETE message before 650 ms after the end of the HANDOVER COMMAND message, but not before a UA frame has been sent by the SS.

The term "ready to transmit" is defined in 3GPP TS 04.13.

## Maximum Duration of Test

5 s.

## Expected Sequence

#### 26.6.5.5.2 Handover / successful / call being established / pre-synchronized / timing advance IE is included / reporting of observed time difference requested

This test is applicable to all MS which support at least one MO circuit switched basic service.

If an MS does not implement the pre-synchronized handover procedure correctly then calls may fail.

If an MS does not report the observed time difference between cells correctly then pseudo synchronized handovers might not be possible for any MS.

##### 26.6.5.5.2.1 Conformance requirements

- 1 The MS shall correctly apply the handover procedure from an SDCCH/4 to a TCH/F without frequency hopping in the pre-synchronized case while a call is being established.
- 2 If during call establishment a Layer 3 MM or CC message just sent by the MS is not Layer 2 acknowledged before the channel change caused by the HANDOVER COMMAND message, the MS shall send the Layer 3 message to the new cell, using the same value in the N(SD) field, after the handover procedure.
- 3 When the Timing Advance information element is included in the HANDOVER COMMAND, the MS shall access the new cell with the timing advance included in the Timing Advance IE.
- 4 The MS shall be ready to transmit the HANDOVER COMPLETE message within 650 ms of the end of the HANDOVER COMMAND message.
- 5 When requested to do so in the HANDOVER COMMAND message, the MS shall return the Mobile Time Difference IE in the HANDOVER COMPLETE message indicating the sum of the observed time difference between the cells and the timing advance used on the old cell.

##### 26.6.5.5.2.2 Test purpose

To test that when the MS is ordered to make a pre-synchronized handover to another cell, it sends 4 access bursts on the main DCCH and then activates the channel correctly and correctly calculates the time to transmit. To test that the MS correctly retransmits Layer 3 MM or CC messages that were not acknowledged by Layer 2 before the Handover, after completion of the Handover. To test that the MS correctly reports on the time difference between the cells.

##### 26.6.5.5.2.3 Method of test

#### Initial Conditions

System Simulator:

2 cells, A and B, with same LAI, default parameters.

The BCCH of cell A is sent  $k$  bit periods before the BCCH of cell B.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated and camped on cell A.

#### Related PICS/PIXIT Statements

Supported rate(s) of TCH: TCH/F.

Support for state MO calls.

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

#### Foreseen Final State of the MS

"Idle, updated" with TMSI allocated and camped on cell B.

#### Test Procedure

A Mobile Originating Call is initiated. The SS sends an IMMEDIATE ASSIGNMENT message allocating an SDCCH/4. The MS is commanded to use a timing advance of  $y$  bit periods on cell A. After the MS has sent the SETUP message (and before the last L2 frame carrying the SETUP message is acknowledged by the SS) the SS sends a HANDOVER COMMAND, ordering the MS to switch to cell B. The MS shall then send 4 access bursts, at the commanded power level, in 4 successive slots of the new DCCH to cell B. Then the MS shall establish a signalling link using the correct timing advance and send a HANDOVER COMPLETE message. The MS shall be ready to transmit the HANDOVER COMPLETE message before 650 ms after the end of the HANDOVER COMMAND message, but not before a UA frame has been sent by the SS.

The term "ready to transmit" is defined in 3GPP TS 04.13.

The MS shall then again send the SETUP message to the SS, using the same value in the N(SD) field. Finally the SS sends a CHANNEL RELEASE to end the test.

#### Maximum Duration of Test

20 s.

## 26.6.5.6 Handover / successful / active call / pseudo synchronized

This test only applies to MSs that claim to support the pseudo synchronized handover procedure. If MSs that claim to support this procedure do not correctly implement it, then calls may fail.

## 26.6.5.6.1 Conformance requirements

- 1 The MS shall correctly apply the handover procedure from TCH/F without frequency hopping to TCH/F without frequency hopping in the pseudo synchronized case when a call is in progress.
- 2 The MS shall access the new cell with the correct timing advance.
- 3 The MS shall be ready to transmit the HANDOVER COMPLETE message within 650 ms of the end of the HANDOVER COMMAND message.
- 4 When requested to do so in the HANDOVER COMMAND message, the MS shall return the Mobile Time Difference IE in the HANDOVER COMPLETE message indicating the sum of the observed time difference between the cells and the timing advance used on the old cell.

## References

Conformance requirement 1: 3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.4.4.

Conformance requirement 2: 3GPP TS 05.10, subclause 6.6.

Conformance requirement 3: 3GPP TS 04.13, subclause 5.2.6.1.

Conformance requirement 4: 3GPP TS 04.08 / 3GPP TS 44.018, subclause 10.5.2.39.

#### 26.6.5.6.2 Test purpose

To test that when the MS is ordered to make a pseudo synchronized handover to another cell, it sends 4 access bursts on the main DCCH and then activates the channel correctly and correctly calculates the time to transmit. To test that the MS correctly reports the time difference between the cells.

#### 26.6.5.6.3 Method of test

##### Initial Conditions

System Simulator:

2 cells, A and B, with same LAI, default parameters.

The BCCH of cell A is sent  $k$  bit periods before the BCCH of cell B.  $k$  is arbitrarily selected.

The MS is being commanded to use a timing advance of  $y$  bit periods on cell A, where  $y$  is arbitrarily selected from the set  $\{11, 12, \dots, 62\}$ .

Mobile Station:

The MS is in the active state (U10) of a call (on cell A) using a full rate TCH in non-hopping mode.

##### Related PICS/PIXIT Statements

Supported rate(s) of TCH: TCH/F.

Support for state U10 of the Call Control protocol.

Support for pseudo synchronization.

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

##### Foreseen Final State of the MS

The active state (U10) of a mobile call (on cell B) using a full rate TCH in non-hopping mode.

##### Test Procedure

The MS is in the active state (U10) of a call on cell A. The SS sends a HANOVER COMMAND for a pseudo-synchronized handover with the Real Time Difference IE included. The Time Difference value is set to  $(2k+10)$  modulo 256. The MS shall send 4 access bursts, at the commanded power level, in 4 successive slots of the new DCCH to cell B with a Timing Advance of zero. Then the MS shall establish a signalling link using a Timing Advance of  $(y-10)$  bit periods and send a HANOVER COMPLETE message. The MS shall be ready to transmit the HANOVER COMPLETE message before 650 ms after the end of the HANOVER COMMAND message, but not before a UA frame has been sent by the SS.

The term "ready to transmit" is defined in 3GPP TS 04.13.

##### Maximum Duration of Test

5 s.

## Expected Sequence

## 26.6.5.7 Handover / successful / active call / non-synchronized / reporting of observed time difference requested

If an MS does not report the observed time difference between cells correctly then pseudo synchronized handovers might not be possible for any MS.

## 26.6.5.7.1 Conformance requirements

- 1 The MS shall correctly apply the handover procedure from a TCH/F without frequency hopping to a TCH/F without frequency hopping in the non-synchronized case while a call is active.
- 2 When requested to do so in the HANDOVER COMMAND message, the MS shall return the Mobile Time Difference IE in the HANDOVER COMPLETE message indicating the sum of the observed time difference between the cells and the timing advance used on the old cell.

## References

Conformance requirement 1: 3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.4.4.

Conformance requirement 2: 3GPP TS 04.08 / 3GPP TS 44.018, subclause 10.5.2.39.

## 26.6.5.7.2 Test purpose

To verify that when the MS is ordered to make a non-synchronized handover to another cell and is ordered to report on the time difference between the cells, that it does so correctly.

## 26.6.5.7.3 Method of test

## Initial Conditions

## System Simulator:

2 cells, A and B with default parameters except the LAI of cell B has MNC = 02 (PCS 1 900: MNC = 021) decimal,  
MCC = 315 decimal, and LAC = 5344 H.

The BCCH of cell A is sent k bit periods before the BCCH of cell B.

The MS is commanded to use a timing advance of y bit periods on cell A.

## Mobile Station:

The MS is in the active state (U10) of a call (on cell A) using a full rate TCH in non-hopping mode.

## Related PICS/PIXIT Statements

Supported rate(s) of TCH: TCH/F.

Support for state U10 of the Call Control protocol.

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

## Foreseen Final State of the MS

The active state (U10) of a mobile call (on cell B) using a full rate TCH in non-hopping mode.

## Test Procedure

The MS is in the active state (U10) of a call on cell A. The SS sends a HANOVER COMMAND on the main DCCH. The HANOVER COMMAND includes a Synchronization Indication IE that instructs the MS to supply the observed time difference between the cells. The MS shall begin to send access bursts on the new DCCH to cell B and the SS sends one PHYSICAL INFORMATION message. The MS shall activate the channel in sending and receiving mode and establish a signalling link using the correct timing advance. The MS shall transmit a HANOVER COMPLETE message containing the Mobile Time Difference IE with a correct value.

## Maximum Duration of Test

5 s.

## Expected Sequence

## 26.6.5.8 Handover / layer 3 failure

## 26.6.5.8.1 Conformance requirements

The MS shall return to the old channel in the case of an handover failure caused by the non reception of the PHYSICAL INFORMATION message. On the old channel the MS shall use the Power Level that it was previously using on that channel.

## References

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.4.4.

## 26.6.5.8.2 Test purpose

To verify the function of timer T3124 and the contents in the message HANDOVER FAILURE and in the layer 1 header on the SACCH.

## 26.6.5.8.3 Method of test

## Initial Conditions

System Simulator:

2 cells with same LAI, default parameters.

Mobile Station:

The MS is in the active state (U10) of a call (on cell A). Used power level is the maximum supported by the MS.

## Related PICS/PIXIT Statements

Supported rate(s) of TCH: TCH/F.

Support for state U10 of the Call Control protocol.

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

## Foreseen Final State of the MS

The active state (U10) of a mobile call (on cell A). Used power level is the maximum supported by the MS.

## Test Procedure

The MS is in the active state (U10) of a call on cell A. The SS sends a HANDOVER COMMAND with Power Command set to 8 on the main DCCH. The MS shall begin to send access bursts at the commanded power level on the new DCCH to cell B. The SS activates the SACCH, but does not send PHYSICAL INFORMATION (thus causing a time-out of T3124). The MS shall re-establish the old link on cell A and send a HANDOVER FAILURE within 3 s from the transmission of HANDOVER COMMAND, using the old power level.

## Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

## Expected Sequence

| Step | Direction | Message          | Comments                                                                                                                                                                                                                                                                                                   |
|------|-----------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### 26.6.5.9 Handover / layer 1 failure

#### 26.6.5.9.1 Conformance requirements

The MS shall return to the old channel in the case of an handover failure caused by a layer 1 failure on the target cell. On the old channel the MS shall use the Power Level that it was previously using on that channel.

## References

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.4.4.

#### 26.6.5.9.2 Test purpose

To verify the function of timer T3124 and the contents in the message HANDOVER FAILURE and in the layer 1 header on the SACCH.

#### 26.6.5.9.3 Method of test

## Initial Conditions

System Simulator:

2 cells with same LAI, default parameters.

Mobile Station:

The MS is in the active state (U10) of a call (on cell A). Used power level is the maximum supported by the MS.

## Related PICS/PIXIT Statements

Supported rate(s) of TCH: TCH/F.

Support for state U10 of the Call Control protocol.

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

## Foreseen Final State of the MS

The active state (U10) of a mobile call (on cell A). Used power level is the maximum supported by the MS.

## Test Procedure

The MS is in the active state (U10) of a call on cell A. The SS sends a HANOVER COMMAND on the main DCCH. The MS shall begin to send access bursts at the commanded power level on the new DCCH to cell B. With the exception of normal BCCH signalling, the SS does not transmit anything on cell B (thus causing a time-out of T3124). The MS shall re-establish the old link on cell A and send a HANOVER FAILURE within 3 s from the transmission of HANOVER COMMAND, using the old power level.

## Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

## Expected Sequence

| Step | Direction | Message         | Comments                                                                                                                                                                                                                                                                                                  |
|------|-----------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0    | SS        | -               | The SS records the power level in the layer 1 header of the last SACCH message sent by the MS before step 1.                                                                                                                                                                                              |

## 26.6.6 Test of frequency redefinition

The Frequency Redefinition procedure is used by the network to change the frequencies and hopping sequences of the allocated channels.

### 26.6.6.1 Frequency redefinition

#### 26.6.6.1.1 Conformance requirements

An MS, after receiving a FREQUENCY REDEFINITION message, shall start using the new frequencies and hopping sequence in the correct time slot when the MS is allocated a dedicated channel.

The behaviour described in the test purpose is applied for each combination of the value T(k) (k = 1,2,3) and for each supported dedicated channel type.

## References

3GPP TS 04.08 / 3GPP TS 44.018 subclauses 3.4.5, 9.1.13 and 10.5.2.13.

### 26.6.6.1.2 Test purpose

To verify that the MS, after receiving a Frequency Redefinition message, starts using the new frequencies and hopping sequence at the time indicated in the message.

### 26.6.6.1.3 Method of test

#### Initial Conditions

##### System Simulator:

1 cell, CCCH\_CONF set to 1 basic physical channel used for CCCH, not combined with SDCCHs. The cell allocation is set to CA<sub>PGSM</sub>(1) or CA<sub>DCS</sub>(1), depending on the band of operation of the Mobile Station (See PICS/PIXIT), before each execution of this test.

##### Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

#### Related PICS/PIXIT Statements

Supported rate(s) of TCH: TCH/F and/or TCH/H.

Type of MS (GSM 450 or GSM 480 or GSM 700 or GSM 850 or P-GSM 900 or EGSM or DCS 1 800 or PCS 1 900).

#### Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

#### Test Procedure

Test parameters:

##### **P-GSM 900:**

ca<sub>PGSM</sub>(1) is set to 64.

An arbitrary subset CA<sub>PGSM</sub>(1) of the set {1,...,124} containing ca<sub>PGSM</sub>(1) elements is drawn.

An element B of the set CA<sub>PGSM</sub>(1) is arbitrarily chosen.

An arbitrary value ca<sub>PGSM</sub>(2) in the range 20,...,63 is chosen.

An arbitrary subset CA<sub>PGSM</sub>(2) of the set {1,...,124} with ca<sub>PGSM</sub>(2) elements and containing B is chosen.

An arbitrary value ca<sub>PGSM</sub>(3) in the range 4,...,19 is chosen.

An arbitrary subset CA<sub>PGSM</sub>(3) of the set {1,...,124} with ca<sub>PGSM</sub>(3) elements and containing B is chosen.

For j = 1,2,3, values ma<sub>PGSM</sub>(j) in the range j,...,ca<sub>PGSM</sub>(j)-1 and values MAIO<sub>PGSM</sub>(j) in the range 0,...,ma<sub>PGSM</sub>(j)-1 are arbitrarily chosen.

Subsets MA<sub>PGSM</sub>(j) of CA<sub>PGSM</sub>(j) not containing B and having ma(j) elements are arbitrarily chosen.

##### **DCS 1 800:**

ca<sub>DCS</sub>(1) is set to 64.

An arbitrary subset CA<sub>DCS</sub>(1) of the set {700,...,812} containing ca<sub>DCS</sub>(1) elements is chosen.

An element B of the set CA<sub>DCS</sub>(1) is arbitrarily chosen. CA<sub>DCS</sub>(1) is then coded using the Variable Bit Map coding scheme.

An arbitrary value ca<sub>DCS</sub>(2) in the range 17,...,63 is chosen.

An arbitrary subset  $CA_{DCS}(2)$  of the set  $\{700, \dots, 812\}$  with  $ca_{DCS}(2)$  elements and containing B is chosen.  $CA_{DCS}(2)$  is then coded using the Variable Bit Map coding scheme.

An arbitrary value  $ca_{DCS}(3)$  in the range  $4, \dots, 16$  is chosen.

An arbitrary subset  $CA_{DCS}(3)$  of the set  $\{700, \dots, 812\}$  with  $ca_{DCS}(3)$  elements and containing B is chosen.  $CA_{DCS}(3)$  is then coded according to the specific message contents.

For  $j = 1, 2, 3$ , values  $ma_{DCS}(j)$  in the range  $j, \dots, ca_{DCS}(j)-1$  and values  $MAIO_{DCS}(j)$  in the range  $0, \dots, ma_{DCS}(j)-1$  are arbitrarily chosen.

Subsets  $MA_{DCS}(j)$  of  $CA_{DCS}(j)$  not containing B and having  $ma_{DCS}(j)$  elements are arbitrarily chosen.

#### PCS 1 900:

$ca_{GSM1900}(1)$  is set to 64.

An arbitrary subset  $CA_{GSM1900}(1)$  of the set  $\{700, \dots, 810\}$  containing  $ca_{GSM1900}(1)$  elements is chosen.

An element B of the set  $CA_{GSM1900}(1)$  is arbitrarily chosen.  $CA_{GSM1900}(1)$  is then coded using the Variable Bit Map coding scheme.

An arbitrary value  $ca_{GSM1900}(2)$  in the range  $17, \dots, 63$  is chosen.

An arbitrary subset  $CA_{GSM1900}(2)$  of the set  $\{700, \dots, 810\}$  with  $ca_{GSM1900}(2)$  elements and containing B is chosen.  $CA_{GSM1900}(2)$  is then coded using the Variable Bit Map coding scheme.

An arbitrary value  $ca_{GSM1900}(3)$  in the range  $4, \dots, 16$  is chosen.

An arbitrary subset  $CA_{GSM1900}(3)$  of the set  $\{700, \dots, 810\}$  with  $ca_{GSM1900}(3)$  elements and containing B is chosen.  $CA_{GSM1900}(3)$  is then coded according to the specific message contents.

For  $j = 1, 2, 3$ , values  $ma_{GSM1900}(j)$  in the range  $j, \dots, ca_{GSM1900}(j)-1$  and values  $MAIO_{GSM1900}(j)$  in the range  $0, \dots, ma_{GSM1900}(j)-1$  are arbitrarily chosen.

Subsets  $MA_{GSM1900}(j)$  of  $CA_{GSM1900}(j)$  not containing B and having  $ma_{GSM1900}(j)$  elements are arbitrarily chosen.

#### GSM 450:

$ca_{450}(1)$  is set to 32.

An arbitrary subset  $CA_{450}(1)$  of the set  $\{259, \dots, 293\}$  containing  $ca_{450}(1)$  elements is chosen.

An element B of the set  $CA_{450}(1)$  is arbitrarily chosen.  $CA_{450}(1)$  is then coded using the Range 128 coding scheme.

An arbitrary value  $ca_{450}(2)$  in the range  $17, \dots, 31$  is chosen.

An arbitrary subset  $CA_{450}(2)$  of the set  $\{259, \dots, 293\}$  with  $ca_{450}(2)$  elements and containing B is chosen.  $CA_{450}(2)$  is then coded using the Range 128 coding scheme.

An arbitrary value  $ca_{450}(3)$  in the range  $4, \dots, 16$  is chosen.

An arbitrary subset  $CA_{450}(3)$  of the set  $\{259, \dots, 293\}$  with  $ca_{450}(3)$  elements and containing B is chosen.  $CA_{450}(3)$  is then coded according to the specific message contents.

For  $j = 1, 2, 3$ , values  $ma_{450}(j)$  in the range  $j, \dots, ca_{450}(j)-1$  and values  $MAIO_{450}(j)$  in the range  $0, \dots, ma_{450}(j)-1$  are arbitrarily chosen.

Subsets  $MA_{450}(j)$  of  $CA_{450}(j)$  not containing B and having  $ma_{450}(j)$  elements are arbitrarily chosen.

#### GSM 480:

$ca_{480}(1)$  is set to 32.

An arbitrary subset  $CA_{480}(1)$  of the set  $\{306, \dots, 340\}$  containing  $ca_{480}(1)$  elements is chosen.

An element B of the set  $CA_{480}(1)$  is arbitrarily chosen.  $CA_{480}(1)$  is then coded using the Range 128 coding scheme.

An arbitrary value  $ca_{480}(2)$  in the range 17,...,31 is chosen.

An arbitrary subset  $CA_{480}(2)$  of the set {306,...,340} with  $ca_{480}(2)$  elements and containing B is chosen.  $CA_{480}(2)$  is then coded using the Range 128 coding scheme.

An arbitrary value  $ca_{480}(3)$  in the range 4,...,16 is chosen.

An arbitrary subset  $CA_{480}(3)$  of the set {306,...,340} with  $ca_{480}(3)$  elements and containing B is chosen.  $CA_{480}(3)$  is then coded according to the specific message contents.

For  $j = 1,2,3$ , values  $ma_{480}(j)$  in the range  $j, \dots, ca_{480}(j)-1$  and values  $MAIO_{480}(j)$  in the range  $0, \dots, ma_{480}(j)-1$  are arbitrarily chosen.

Subsets  $MA_{480}(j)$  of  $CA_{480}(j)$  not containing B and having  $ma_{480}(j)$  elements are arbitrarily chosen.

#### **GSM 700:**

$Ca_{700}(1)$  is set to 64.

An arbitrary subset  $CA_{700}(1)$  of the set {438,...,511} containing  $ca_{700}(1)$  elements is drawn.

An element B of the set  $CA_{700}(1)$  is arbitrarily chosen.

An arbitrary value  $ca_{700}(2)$  in the range 19,...,62 is chosen.

An arbitrary subset  $CA_{700}(2)$  of the set {438,...,511} with  $ca_{700}(2)$  elements and containing B is chosen.

An arbitrary value  $ca_{700}(3)$  in the range 3,...,18 is chosen.

An arbitrary subset  $CA_{700}(3)$  of the set {438,...,511} with  $ca_{PGSM}(3)$  elements and containing B is chosen.

For  $j = 1,2,3$ , values  $ma_{700}(j)$  in the range  $j, \dots, ca_{700}(j)-1$  and values  $MAIO_{700}(j)$  in the range  $0, \dots, ma_{700}(j)-1$  are arbitrarily chosen.

Subsets  $MA_{700}(j)$  of  $CA_{700}(j)$  not containing B and having  $ma(j)$  elements are arbitrarily chosen.

#### **GSM 850:**

$Ca_{850}(1)$  is set to 64.

An arbitrary subset  $CA_{850}(1)$  of the set {128,...,251} containing  $ca_{850}(1)$  elements is drawn.

An element B of the set  $CA_{850}(1)$  is arbitrarily chosen.  $CA_{850}(1)$  is then encoded using the Variable Bit Map coding scheme.

An arbitrary value  $ca_{850}(2)$  in the range 19,...,62 is chosen.

An arbitrary subset  $CA_{850}(2)$  of the set {128,...,251} with  $ca_{850}(2)$  elements and containing B is chosen.

An arbitrary value  $ca_{850}(3)$  in the range 3,...,18 is chosen.

An arbitrary subset  $CA_{850}(3)$  of the set {128,...,251} with  $ca_{PGSM}(3)$  elements and containing B is chosen.  $CA_{850}(3)$  is then coded according to the specific message contents

For  $j = 1,2,3$ , values  $ma_{850}(j)$  in the range  $j, \dots, ca_{850}(j)-1$  and values  $MAIO_{850}(j)$  in the range  $0, \dots, ma_{850}(j)-1$  are arbitrarily chosen.

Subsets  $MA_{850}(j)$  of  $CA_{850}(j)$  not containing B and having  $ma(j)$  elements are arbitrarily chosen.

#### **PCS 1 900, DCS 1 800, GSM 900, GSM 450, GSM 480, GSM 700 and GSM 850**

Let  $T(1) = 91$ ,  $T(2) = 42\ 000$ .

An arbitrary value  $T(3)$  in the range 92,...,29999 is chosen.

The System Simulator pages the MS and after the MS has responded with a CHANNEL REQUEST, the simulator assigns a dedicated channel (TCH/F, TCH/H or SDCCH, as defined by the execution counter R). Then the SS sends a FREQUENCY REDEFINITION message, which modifies the frequencies/hopping sequence to be used by the MS. The MS shall then, at the TDMA frame defined by the contents of the "Starting Time" information element, use the new frequencies/hopping sequence. (The value of T(2) ensures that the MS believes the Starting Time has passed and so the MS shall start transmitting immediately. Immediately being in the scope of this test no later than 73 Frames for SDCCH/8 or TCH/F and 90 Frames for TCH/H after the SS sends the last burst of the first L2 frame containing the beginning of the FREQUENCY REDEFINITION message. The range for T(3) ensures that the MS has to wait until the designated frame before starting transmission on the new frequencies.)

The verification is performed at the RF burst level. The MS transmits the standard test signal C1 (annex 5), and for the TCH case, the SS checks the received pattern with the expected pattern. For the SDCCH case the MS transmits fill frames, and the SS checks for each burst whether the burst is transmitted at the right frequency.

#### Maximum Duration of Test

$3 * (\text{number of supported channels} * T(3) + 7)$

#### Expected Sequence

This sequence is performed for every combination of execution counters  $K = 1,2,3$  and  $R = 1,2,3$ :

| Step | Direction | Message                | Comments                                                                                                                      |

|------------------------------|---------------------------------------------------------------------------------------------------------|
| L2 pseudo length             | value dependent on the length of the Mobile Allocation and thus on the number of channels in CAPGSM(1). |
| Channel Description          |                                                                                                         |
| Channel type and TDMA offset | SDCCH/8 arbitrary offset, for R=1<br>Bm + ACCHs for R=2<br>Lm + ACCHs arbitrary offset, for R=3         |
| Timeslot number              | arbitrarily selected by                                                                                 |
| TSC                          | arbitrarily selected                                                                                    |
| Hopping channel              | RF hopping channel                                                                                      |
| MAIO                         | MAIOPGSM(1)                                                                                             |
| HSN                          | 0                                                                                                       |
| Request reference            | corresponds to the Channel Request                                                                      |
| Timing advance               | 30 bit periods                                                                                          |
| Mobile Allocation            | corresponds to set MAPGSM(1)                                                                            |
| Starting Time                | not present                                                                                             |
| IA rest octets               | all bits are set to spare                                                                               |

## FREQUENCY REDEFINITION (Description 1)
