## 44 Test case requirements for GPRS mobility management

### 44.1 Applicability, default conditions and default messages

All test cases for GPRS mobility management apply for all GPRS mobiles unless otherwise stated in a specific test. Within each test case, the PICS statement indicates whether the test shall be performed for mobiles that can only operate in mode - class B, only in mode - class C, or in both mode - class B and C. For some procedures, the mobile class is of no importance.

Note that only the layer 3 messages are described in the document. The mapping of the layer 3 messages to lower layers and the use of logical channels is not described in the present document.

The default conditions and default message contents not specified in this clause must be set as in "GPRS default conditions". The normal and alternative higher layer test configurations are equally valid.

Below is a list of the RAI values and the corresponding RAC, LAC and MCC used in the test cases:

RAI-1: MCC1/MNC1/LAC1/RAC1 (Used if only one cell);

RAI-2: MCC2/MNC1/LAC1/RAC1;

RAI-3: MCC1/MNC1/LAC2/RAC1;

RAI-4: MCC1/MNC1/LAC1/RAC2;

RAI-5: MCC1/MNC1/LAC1/RAC3;

RAI-6: MCC2/MNC1/LAC2/RAC1;

RAI-7: MCC2/MNC1/LAC1/RAC2;

RAI-8: MCC1/MNC2/LAC1/RAC1;

RAI-9: MCC1/MNC2/LAC2/RAC1;

RAI10: MCC1/MNC2/LAC1/RAC2.

If the mobile station initial condition specifies that the mobile has a valid IMSI but the initial condition does not mention P-TMSI, then that shall be interpreted as that the mobile has no valid P-TMSI.

### 44.2 Elementary procedures of GPRS mobility management

The tests are based on 3GPP TS 04.08 / 3GPP TS 24.008.

#### 44.2.1 GPRS attach procedure

This procedure is used to indicate for the network that the IMSI is available for traffic by establishment of a GMM context.

##### 44.2.1.1 Normal GPRS attach

The normal GPRS attach procedure is a GMM procedure used by GPRS MSs of MS operation mode B or C to IMSI attach for GPRS services only.

#### 44.2.1.1.1 GPRS attach / accepted

##### 44.2.1.1.1.1 Conformance requirement

- 1) If the network accepts the GPRS attach procedure (signalled by an IMSI) and allocates a P-TMSI, the MS shall acknowledge the P-TMSI and continue communication with the P-TMSI.
- 2) If the network accepts the GPRS attach procedure (signalled by P-TMSI) and reallocates a new P-TMSI, the MS shall acknowledge the new P-TMSI and continue communication with the new P-TMSI.
- 3) If the network accepts the GPRS attach procedure (signalled by a P-TMSI) from the MS without reallocation of the old P-TMSI, the MS shall continue communication with the old P-TMSI.

##### Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.1.

##### 44.2.1.1.1.2 Test purpose

To test the behaviour of the MS if the network accepts the GPRS attach procedure.

The following cases are identified:

- 1) P-TMSI / P-TMSI signature is allocated;
- 2) P-TMSI / P-TMSI signature is reallocated;
- 3) Old P-TMSI / P-TMSI signature is not changed.

##### 44.2.1.1.1.3 Method of test

###### Initial conditions

System Simulator:

One cell operating in network operation mode III.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated.

###### Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode B Yes/No.
- MS operation mode C Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

###### Test procedure

- 1) The MS sends an ATTACH REQUEST message with identity IMSI. The SS allocates a P-TMSI and returns ATTACH ACCEPT message with a P-TMSI. The MS acknowledges the P-TMSI by sending ATTACH COMPLETE message. Further communication MS - SS is performed by the new P-TMSI.
- 2) The MS sends an ATTACH REQUEST message with identity P-TMSI. The SS reallocates a new P-TMSI and returns ATTACH ACCEPT message with the new P-TMSI. The MS acknowledges the P-TMSI by sending ATTACH COMPLETE message. Further communication MS - SS is performed by the new P-TMSI. The MS will not answer signalling addressed to the old P-TMSI.

- 3) The MS sends an ATTACH REQUEST message with identity P-TMSI. The SS accepts the P-TMSI and returns ATTACH ACCEPT message without any P-TMSI. Further communication MS - SS is performed by the old P-TMSI.

Maximum duration of test

10 minutes.

Expected sequence

| Step | Direction | Message         | Comments                                                                                                                                 |
|------|-----------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                 | The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 26.                                     |
| 2    | MS        |                 | The MS is powered up or switched on and initiates an attach (see PICS).                                                                  |

| 26   | SS        |                | The SS is set in network operation mode II.                                                                                                                                                                                                        |
| 27   | MS        |                | The MS is set in MS operation mode B (see PICS) and the test is repeated from step 2 to step 25.                                                                                                                                                   |

#### Specific message contents

None.

#### 44.2.1.1.2 GPRS attach / rejected / IMSI invalid / illegal MS

##### 44.2.1.1.2.1 Conformance requirements

- 1) If the network rejects a GPRS attach procedure from the Mobile Station with the cause 'Illegal MS', the Mobile Station shall consider SIM invalid for GPRS services until power is switched off or SIM is removed.
- 2) If the network rejects a GPRS attach procedure from the Mobile Station with the cause 'Illegal MS' the Mobile Station shall delete the stored RAI, GPRS-CKSN, P-TMSI and P-TMSI signature.
- 3) If the network rejects a GPRS attach procedure from the Mobile Station with the cause 'Illegal MS' the Mobile Station shall delete the LAI.

#### Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.1.

##### 44.2.1.1.2.2 Test purpose

To test the behaviour of the MS if the network rejects the GPRS attach procedure of the MS with the cause 'illegal MS'.

## 44.2.1.1.2.3 Method of test

## Initial conditions

## System Simulator:

Three cells (not simultaneously activated), cell A with MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC2/RAC1, cell C in MCC2/MNC1/LAC1/RAC1.

All three cells are operating in network operation mode II (in case of MS operation mode B), or in network operation mode III (in case of MS operation mode C).

## Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated on cell A.

## Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode C Yes/No.
- MS operation mode B Yes/No (only if mode C not supported).
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

## Test procedure

The SS rejects a GPRS attach with the cause value 'Illegal MS'. The SS checks that the MS does not perform GPRS attach in the same or another PLMN.

## Maximum duration of test

5 minutes.

## Expected sequence

| Step | Direction | Message                            | Comments                                                                                                                |
|------|-----------|------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                                    | The following messages are sent and shall be received on cell A.                                                        |
| 2    | SS        |                                    | The MS is set in MS operation mode C or B (see PICS).                                                                   |
| 3    | MS        |                                    | The SS is set in network operation mode II or III and activates cell A.                                                 |
| 4    | MS -> SS  | ATTACH REQUEST                     | The MS is powered up or switched on and initiates an attach (see PICS). Cell A is preferred by the MS.                  |
| 5    | SS -> MS  | ATTACH REJECT                      | Attach type = 'GPRS attach'<br>Mobile identity = P-TMSI-1<br>Routing area identity = RAI-1<br>GMM cause = 'Illegal MS'. |
| 6    | SS        |                                    | The following messages are sent and shall be received on cell B.                                                        |
| 7    | MS        |                                    | The SS deactivates cell A and activates cell B. Cell B is preferred by the MS.                                          |
| 8    | MS        |                                    | No ATTACH REQUEST sent to the SS (SS waits 30 seconds).                                                                 |
| 9    | MS        |                                    | The MS initiates an attach by MMI or by AT command.                                                                     |
| 10   | MS        |                                    | No ATTACH REQUEST sent to the SS (SS waits 30 seconds).                                                                 |
| 11   | SS        |                                    | The following messages are sent and shall be received on cell C.                                                        |
| 12   | MS        |                                    | The SS deactivates cell B and activates cell C. Cell C is preferred by the MS.                                          |
| 13   | MS        |                                    | No ATTACH REQUEST sent to the SS (SS waits 30 seconds).                                                                 |

## Specific message contents

None.

#### 44.2.1.1.3 GPRS attach / rejected / IMSI invalid / GPRS services not allowed

##### 44.2.1.1.3.1 Conformance requirement

- 1) If the network rejects a GPRS attach procedure from the Mobile Station with the cause 'GPRS services not allowed', the Mobile Station shall consider SIM invalid for GPRS services until power is switched off or SIM is removed.
- 2) If the network rejects a GPRS attach procedure from the Mobile Station with the cause 'GPRS services not allowed' the Mobile Station shall delete the stored RAI, GPRS-CKSN, P-TMSI and P-TMSI signature.

##### Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.1.

##### 44.2.1.1.3.2 Test purpose

To test the behaviour of the MS if the network rejects the GPRS attach procedure of the MS with the cause 'GPRS services not allowed' (no valid GPRS-subscription for the IMSI).

##### 44.2.1.1.3.3 Method of test

##### Initial conditions

###### System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1 (HPLMN) and cell B in MCC2/MNC1/LAC1/RAC1.

Both cells are operating in network operation mode II.

###### Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated on cell A.

##### Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode C Yes/No.
- MS operation mode B Yes/No.
- SIM removal possible without powering down Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

##### Test procedure

The SS rejects a normal attach with the cause value 'GPRS services not allowed'. The SS checks that the MS does not perform GPRS attach in another PLMN.

##### Maximum duration of test

10 minutes.

#### 44.2.1.1.4 GPRS attach / rejected / PLMN not allowed

##### 44.2.1.1.4.1 Conformance requirement

- 1) If the network rejects a GPRS attach procedure from the Mobile Station with the cause 'PLMN not allowed' the Mobile Station shall:
  - 1.1 not perform GPRS attach when switched on in the same routing area or location area;
  - 1.2 not perform GPRS attach when in the same PLMN and when that PLMN is not selected manually;
  - 1.3 delete the stored RAI, GPRS-CKSN, P-TMSI and P-TMSI signature;
  - 1.4 store the PLMN in the 'forbidden PLMN' list.
- 2) If the network rejects a GPRS attach procedure from the Mobile Station with the cause 'PLMN not allowed' the Mobile Station shall perform GPRS attach when a new PLMN is entered.
- 3) If the network rejects a GPRS attach procedure from the Mobile Station with the cause 'PLMN not allowed' and if after that the PLMN from which this rejection was received, is manually selected, the Mobile Station shall perform a GPRS attach procedure.

##### Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.1.

##### 44.2.1.1.4.2 Test purpose

To test the behaviour of the MS if the network rejects the GPRS attach procedure of the MS with the cause 'PLMN not allowed'.

##### 44.2.1.1.4.3 Method of test

##### 44.2.1.1.4.3.1 Test procedure 1

##### Initial conditions

###### System Simulator:

Four cells (not simultaneously activated), cell A in MCC1/MNC2/LAC1/RAC1, cell B in MCC1/MNC2/LAC1/RAC1, cell C in MCC1/MNC2/LAC2/RAC1 and cell D in MCC2/MNC1/LAC1/RAC1.

- All four cells are operating in network operation mode II (in case of MS operation mode B), or in network operation mode III (in case of MS operation mode C). The PLMN of the four cells should NOT be that of the Mobile Station Home PLMN.

###### Mobile Station:

The MS has a valid P-TMSI-1 and RAI-8. MS is Idle Updated on cell A.

##### Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode C Yes/No.
- MS operation mode B Yes/No (only if mode C not supported).
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

## Test procedure

The SS rejects a GPRS attach with the cause value 'PLMN not allowed'. The SS checks that the MS does not perform GPRS attach if activated in the same routing area or location area and performs GPRS attach only when a new PLMN is entered.

## Maximum duration of test

10 minutes.

44.2.1.1.4.3.2 Test procedure 2

Initial conditions

System Simulator:

One cell operating in network operation mode II: MCC2/MNC1/LAC1/RAC1. The PLMN of the cell should NOT be that of the Mobile Station Home PLMN.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-2. MS is Idle Updated on cell A.

Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode C Yes/No.
- MS operation mode B Yes/No (only if mode C not supported).
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

Test procedure

The SS rejects a GPRS attach with the cause value 'PLMN not allowed'. The subscribers access rights is changed to allow GPRS attach. Then the PLMN from which this rejection was received is manually selected and the SS check that a GPRS attach is performed.

Maximum duration of test

5 minutes.

#### 44.2.1.1.5 GPRS attach / rejected / roaming not allowed in this location area

##### 44.2.1.1.5.1 Conformance requirement

- 1) If the network rejects a GPRS attach procedure from the Mobile Station with the cause 'roaming not allowed in this location area' the Mobile Station shall:
  - 1.1 not perform GPRS attach when in the same location area;
  - 1.2 delete the stored RAI, GPRS-CKSN, P-TMSI and P-TMSI signature;
  - 1.3 store the LA in the 'forbidden location areas for roaming' list;
  - 1.4 perform GPRS attach when a new location area is entered;
  - 1.5 Periodically search for its HPLMN.
- 2) The mobile station shall reset the list of 'Forbidden location areas for roaming' when switched off or when the SIM is removed.
- 3) The MS shall be capable of storing at least 6 entries in the list of 'Forbidden location areas for roaming'.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.1.

#### 44.2.1.1.5.2 Test purpose

##### Test purpose 1

To test that on receipt of a rejection using the 'roaming not allowed in this location area' cause code, the MS ceases trying to attach on that location area. Successful GPRS attach procedure is possible in other location areas.

##### Test purpose 2

To test that if the MS is switched off or the SIM is removed the list of 'forbidden location areas for roaming' is cleared.

##### Test purpose 3

To test that at least 6 entries can be held in the list of 'forbidden location areas for roaming' (the requirement in 3GPP TS 04.08 / 3GPP TS 24.008 is to store at least 10 entries. This is not fully tested by the third procedure).

##### Test purpose 4

To test that if a cell of the Home PLMN is available then the MS returns to it in preference to any other available cell.

#### 44.2.1.1.5.3 Method of test

##### 44.2.1.1.5.3.1 Test procedure 1

##### Initial conditions

###### System Simulator:

Three cells (not simultaneously activated), cell A in MCC2/MNC1/LAC1/RAC1 (Not HPLMN), cell B in MCC2/MNC1/LAC2/RAC1 (Not HPLMN) and cell C in MCC2/MNC1/LAC1/RAC2 (Not HPLMN).

All three cells are operating in network operation mode III.

###### Mobile Station:

The MS has a valid P-TMSI-1 and RAI-2. MS is Idle Updated on cell A.

##### Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode C Yes/No.
- MS operation mode B Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

##### Test procedure

The SS rejects a GPRS attach with the cause value 'Roaming not allowed in this area'. A new attempt for a GPRS attach is not possible. Successful GPRS attach / detach procedures are performed in another location area. A new attempt for a GPRS attach is performed in the 1<sup>st</sup> location area. This attempt shall not succeed, as the LA is on the forbidden list.

##### Maximum duration of test

10 minutes.

## Specific message contents

None.

## 44.2.1.1.5.3.2 Test procedure 2

## Initial conditions

## System Simulator:

One cell in MCC2/MNC1/LAC1/RAC1 (Not HPLMN) operating in network operation mode II.

## Mobile Station:

The MS has a valid P-TMSI-1 and RAI-2. MS is Idle Updated.

## Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode C Yes/No.
- MS operation mode B Yes/No (only if mode C not supported).
- Switch off on button Yes/No.

Automatic GPRS attach procedure at switch on or power on Yes/No.

## Test procedure

The SS rejects a GPRS attach updating with the cause value 'Roaming not allowed in this area'. The MS is switched off for 10 s and switched on again. The SS check that a GPRS attach is possible on the cell on which the GPRS attach had been rejected.

If SIM removal is possible without switching off: The SS rejects a GPRS attach with the cause value 'Roaming not allowed in this area'. The SIM is removed and inserted in the MS. The SS check that a GPRS attach is possible on the cell on which the GPRS attach had been rejected.

## Maximum duration of test

5 minutes.

## Expected sequence

## 44.2.1.1.5.3.3 Test procedure 3

## Initial conditions

## System Simulator:

Six cells (not simultaneously activated), cell A in MCC2/MNC1/LAC1/RAC1 (Not HPLMN), cell B in MCC2/MNC1/LAC2/RAC1 (Not HPLMN), cell C in MCC2/MNC1/LAC3/RAC1 (Not HPLMN), cell D in MCC2/MNC1/LAC4/RAC1 (Not HPLMN), cell E in MCC2/MNC1/LAC5/RAC1 (Not HPLMN), cell F in MCC2/MNC1/LAC6/RAC1 (Not HPLMN).

All six cells are operating in network operation mode II (in case of MS operation mode B), or in network operation mode III (in case of MS operation mode C).

## Mobile Station:

The MS has a valid P-TMSI-1 and RAI-2. MS is Idle Updated on cell A.

## Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode C Yes/No.
- MS operation mode B Yes/No (only if mode C not supported).
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

## Test procedure

The SS rejects a GPRS attach with the cause value 'Roaming not allowed in this area'. This is done for 6 different location areas. Then the SS checks that the MS does not attempt to perform an attach procedure on the non-allowed location areas.

Different types of MS may use different methods to periodically clear the list of forbidden areas (e.g. every day at 12 am) for roaming. If the list is cleared while the test is being run, it may be necessary to re-run the test.

## Maximum duration of test

20 minutes.

## Expected sequence

#### Specific message contents

None.

#### 44.2.1.1.5.3.4 Test procedure 4

#### Initial conditions

##### System Simulator:

Two cells, cell A in MCC2/MNC1/LAC1/RAC1 (not HPLMN) and cell B in MCC1/MNC1/LAC1/RAC1 (HPLMN).

Both cells are operating in network operation mode II (in case of MS operation mode B), or in network operation mode III (in case of MS operation mode C).

##### Mobile Station:

The MS has a valid P-TMSI-1 and RAI-2. MS is Idle Updated on cell A.

#### Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode C Yes/No.
- MS operation mode B Yes/No (only if mode C not supported).
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

#### Test procedure

The SS rejects a GPRS attach with the cause value 'Roaming not allowed in this area'. Two cells are then available. The cell with the weakest level belongs to the HPLMN. It is checked that the MS returns to its HPLMN.

Maximum duration of test

5 minutes.

#### 44.2.1.1.6 GPRS attach / abnormal cases / access barred due to access class control

##### 44.2.1.1.6.1 Conformance requirement

- 1) The MS shall not perform GPRS attach procedure, but stays in the current serving cell and applies normal cell reselection process.
- 2) The Mobile Station shall perform the GPRS attach procedure when:
  - 2.1 Access is granted.
  - 2.2 Cell is changed.

## Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.1.

## 44.2.1.1.6.2 Test purpose

## Test purpose 1

To test the behaviour of the MS in case of access class control (access is granted).

## Test purpose 2

To test the behaviour of the MS in case of access class control (cell is changed).

## 44.2.1.1.6.3 Method of test

## 44.2.1.1.6.3.1 Test procedure 1

## Initial conditions

An access class x (0-15) is arbitrarily chosen. The SIM is programmed with this access class x. Communication with mobile stations using access class x is initially indicated to be barred.

## System Simulator:

One cell operating in network operation mode III.

Access class x barred.

## Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated.

## Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode C Yes/No. MS operation mode B Yes/No
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

## Test procedure

The SS indicates access class x barred. A GPRS attach procedure is not performed.

The SS indicates that access class x is not barred. A GPRS attach procedure is performed.

## Maximum duration of test

10 minutes.

## 44.2.1.1.6.3.2 Test procedure 2

## Initial conditions

An access class x (0-15) is arbitrarily chosen. The SIM is programmed with this access class x. Communication with mobile stations using access class x is indicated to be barred on cell A.

## System Simulator:

Two cells, cell A in MCC1/MNC1/LAC1/RAC1 has access class x barred, cell B in MCC1/MNC1/LAC1/RAC1 has access class x not barred.

Both cells are operating in network operation mode II (in case of MS operation mode B), or in network operation mode III (in case of MS operation mode C).

## Mobile Station:

The MS has a valid P-TMSI-2 and RAI-1. MS is Idle Updated on cell A.

## Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode C Yes/No.
- MS operation mode B Yes/No (only if mode B not supported).
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

## Test procedure

The SS indicates access class x barred. A GPRS attach procedure is not performed.

A cell change is performed into a cell where access class x is not barred. A GPRS attach procedure is performed.

## Maximum duration of test

10 minutes.

## Expected sequence

## Specific message contents

None.

#### 44.2.1.1.7 GPRS attach / abnormal cases / change of cell into new routing area

##### 44.2.1.1.7.1 Conformance requirement

When a change of cell into a new routing area is performed before ATTACH ACCEPT message is received by the MS, the MS shall abort the GPRS attach procedure and re-initiate it immediately.

##### Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.1.

##### 44.2.1.1.7.2 Test purpose

To test the behaviour of the MS in case of procedure collision.

##### 44.2.1.1.7.3 Method of test

##### Initial conditions

###### System Simulator:

Two cells, cell A in MCC1/MNC1/LAC1/RAC1 and cell B in MCC1/MNC1/LAC1/RAC2.

Both cells are operating in network operation mode II (in case of MS operation mode B), or in network operation mode III (in case of MS operation mode C).

###### Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated on cell A.

##### Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode C Yes/No.
- MS operation mode B Yes/No (only if mode C not supported).
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

##### Test procedure

If the MS automatically performs a GPRS Attach on power on, is the attach procedure performed and then is the MS triggered to perform a normal GPRS Detach.

Sufficient time is given for the MS to identify the neighbour cell before the MS is triggered to initiate a GPRS attach procedure. The ATTACH ACCEPT message is delayed from the SS. The MS performs a cell reselection to a cell in a new routing area. The MS shall re-initiate a GPRS attach procedure in the new routing area.

##### Maximum duration of test

5 minutes.

## Expected sequence

| Step | Direction | Message        | Comments                                                                                                                                                                                                         |
|------|-----------|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS<br>MS  |                | The following messages are sent and shall be received on cell A.<br>The MS is set in MS operation mode C or B (see PICS).                                                                                        |
| 2    | SS        |                | The SS is set in network operation mode II or III and activates cell A and B. The RF level of cell A is -50 dBm and cell B - 60 dBm.                                                                             |
| 3    | MS        |                | The MS is powered up or switched on and initiates an attach (see PICS). Cell A is preferred by the MS.                                                                                                           |

## Specific message contents

None.

#### 44.2.1.1.8 GPRS attach / abnormal cases / power off

##### 44.2.1.1.8.1 Conformance requirement

When power is switched off before ATTACH ACCEPT message is received by the MS, the MS shall abort the GPRS attach procedure and perform a GPRS detach procedure.

##### Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.1.

##### 44.2.1.1.8.2 Test purpose

To test the behaviour of the MS in case of procedure collision.

##### 44.2.1.1.8.3 Method of test

##### Initial conditions

###### System Simulator:

One cell operating in network operation mode III.

###### Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated.

##### Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode C Yes/No.
- MS operation mode B Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

##### Test procedure

The MS is switched off after initiating an attach procedure. A GPRS detach is automatically performed by the MS before power is switched off.

##### Maximum duration of test

5 minutes.

##### Expected sequence

| Step | Direction | Message        | Comments                                                                                            |
|------|-----------|----------------|-----------------------------------------------------------------------------------------------------|
| 1    | MS        |                | The MS is set in MS operation mode C (see PICS). If MS operation mode C not supported, goto step 7. |
| 2    | MS        |                | The MS is powered up or switched on and initiates an attach (see PICS).                             |
| 3    | MS -> SS  | ATTACH REQUEST | Attach type = 'GPRS attach'<br>Mobile identity = P-TMSI-1<br>Routing area identity = RAI-1          |
| 4    | SS        |                | No response to the ATTACH REQUEST message is given by the SS.                                       |
| 5    | MS        |                | The MS is powered off and initiates a GPRS detach (with power off) by                               |
| 6    | MS -> SS  | DETACH REQUEST | Detach type = 'power switched off, GPRS detach'                                                     |
| 7    | SS        |                | The SS is set in network operation mode II.                                                         |
| 8    | MS        |                | The MS is set in MS operation mode B (see PICS) and the test is repeated from step 2 to step 6.     |

#### Specific message contents

None.

#### 44.2.1.1.9 GPRS attach / abnormal cases / GPRS detach procedure collision

##### 44.2.1.1.9.1 Conformance requirement

- 1) When a DETACH REQUEST message is received by the MS (Detach type 're-attach not required') while waiting for an ATTACH ACCEPT message, the MS shall terminate the GPRS attach procedure and continue with the GPRS detach procedure.
- 2) When a DETACH REQUEST message is received by the MS (Detach type 're-attach required') while waiting for an ATTACH ACCEPT message, the MS shall ignore the GPRS detach procedure and continue with the GPRS attach procedure.

#### Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.1.

##### 44.2.1.1.9.2 Test purpose

To test the behaviour of the MS in case of procedure collision.

##### 44.2.1.1.9.3 Method of test

#### Initial conditions

System Simulator:

One cell operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated.

#### Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode C Yes/No.

- MS operation mode B Yes/No (only if mode C not supported).
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

#### Test procedure

The MS initiates a GPRS attach procedure. The SS does not answer the GPRS attach procedure, but initiates a GPRS detach procedure (Detach type 're-attach not required'). The MS shall terminate the GPRS attach procedure and continue with the GPRS detach procedure.

The MS initiates a GPRS attach procedure. The SS does not answer the GPRS attach procedure, but initiates a GPRS detach procedure (Detach type 're-attach required'). The MS shall ignore the GPRS detach procedure and continue with the GPRS attach.

### 44.2.1.2 Combined GPRS attach

The combined GPRS attach procedure is a GMM procedure used by GPRS MSs of MS operation mode B to IMSI attach for GPRS or non-GPRS services. In order to use the combined GPRS attach procedure, the network must be in network operation mode I. All Combined GPRS test case are only applicable when the MS operates in Class-B mode.

#### 44.2.1.2.1 Combined GPRS attach / GPRS and non-GPRS attach accepted

##### 44.2.1.2.1.1 Conformance requirement

- 1) If the network accepts the combined GPRS attach procedure (signalled by an IMSI) and allocates a P-TMSI, the MS shall acknowledge the P-TMSI and continue communication with the P-TMSI.
- 2) If the network accepts the combined GPRS attach procedure (signalled by P-TMSI) and reallocates a new P-TMSI, the MS shall acknowledge the new P-TMSI and continue communication with the new P-TMSI.
- 3) If the network accepts the combined GPRS attach procedure (signalled by a P-TMSI) from the MS without reallocation of the previously used P-TMSI, the MS shall continue communication with the previously used P-TMSI.
- 4) If the network accepts the combined GPRS attach procedure and determines that IMSI shall be used in CS operations, the MS shall continue communication with the IMSI for CS operations.
- 5) If the network accepts the combined GPRS attach procedure and determines that a TMSI shall be used in CS operations, the MS shall continue communication with the TMSI for CS operations.

##### Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.2.

##### 44.2.1.2.1.2 Test purpose

To test the behaviour of the MS if the network accepts the GPRS attach procedure.

The following cases are identified:

- 1) P-TMSI / P-TMSI signature is allocated;
- 2) P-TMSI / P-TMSI signature is reallocated;
- 3) Old P-TMSI / P-TMSI signature is not changed;
- 4) Mobile terminating CS call is allowed with IMSI;
- 5) Mobile terminating CS call is not allowed with TMSI.

##### 44.2.1.2.1.3 Method of test

###### Initial conditions

System Simulator:

One cell operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated.

###### Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode B Yes/No.

- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

#### Test procedure

- 1) The MS sends an ATTACH REQUEST message with identity IMSI. The SS allocates a P-TMSI and returns ATTACH ACCEPT message with a P-TMSI. The MS acknowledge the P-TMSI by sending ATTACH COMPLETE message. Further communication MS - SS is performed by the new P-TMSI. For CS calls, the IMSI is used.
- 2) The MS is CS paged in order to verify that the IMSI is used for CS calls.
- 3) The MS is GPRS paged in order to verify that the new P-TMSI is used for GPRS services.
- 4) The MS sends an ATTACH REQUEST message with identity P-TMSI. The SS allocates a new P-TMSI and returns ATTACH ACCEPT message with the new P-TMSI and a new TMSI. The MS acknowledge the P-TMSI and the TMSI by sending ATTACH COMPLETE message. Further communication MS - SS is performed by the new P-TMSI. For CS calls, the new TMSI is used. The MS is CS paged in order to verify that the new TMSI is used for CS services.
- 5) The MS is GPRS paged in order to verify that the new P-TMSI is used for GPRS services. The MS will not answer signalling addressed to the old P-TMSI.
- 6) The MS sends an ATTACH REQUEST message with identity P-TMSI. The SS accepts the P-TMSI and returns ATTACH ACCEPT message without any P-TMSI. Further communication MS - SS is performed by the previously used P-TMSI.
- 7) The MS is GPRS paged in order to verify that the previously used P-TMSI is used for GPRS services.

#### Maximum duration of test

10 minutes.

#### Expected sequence

#### Specific message contents

None.

#### 44.2.1.2.2 Combined GPRS attach / GPRS only attach accepted

##### 44.2.1.2.2.1 Conformance requirement

- 1) If the network accepts the combined GPRS attach procedure, but GMM cause code 'IMSI unknown in HLR' is sent to the MS the Mobile Station shall delete the stored TMSI, LAI and CKSN. The Mobile Station shall consider SIM invalid for non-GPRS services until power is switched off or SIM is removed.
- 2) If the network accepts the combined GPRS attach procedure, but GMM cause code 'MSC temporarily not reachable', 'Network failure' or 'Congestion' is sent to the MS, an MS operation mode B MS may perform an MM IMSI attach procedure.

#### Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.2.

##### 44.2.1.2.2.2 Test Purpose

###### Test purpose 1

To test the behaviour of the MS if the network accepts the GPRS attach procedure with indication GPRS only, GMM cause 'IMSI unknown in HLR'.

###### Test purpose 2

To test the behaviour of the MS if the network accepts the GPRS attach procedure with indication GPRS only, GMM cause 'MSC temporarily not reachable', 'Network failure' or 'Congestion'.

44.2.1.2.2.3 Method of test

44.2.1.2.2.3.1 Test Procedure 1

#### Initial conditions

System Simulator:

One cell operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated.

#### Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode B Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

#### Test procedure

The MS sends an ATTACH REQUEST message with identity IMSI. The SS allocates a P-TMSI and returns ATTACH ACCEPT message with a P-TMSI. GMM cause 'IMSI unknown in HLR' is indicated from SS. Further communication MS - SS is performed by the P-TMSI. CS services are not possible.

#### Maximum duration of test

5 minutes.

#### Expected sequence

#### 44.2.1.2.2.3.2 Test Procedure 2

Initial conditions

System Simulator:

One cell operating in network operation mode I. T3212 is set to 6 minutes.

Mobile Station:

The MS has a valid TMSI, P-TMSI and RAI. MS is Idle Updated.

Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode B Yes/No.
- Automatic MM IMSI attach procedure for MS operation mode B MS Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

Test procedure

The MS sends an ATTACH REQUEST message. The SS allocates a P-TMSI and returns ATTACH ACCEPT message with a P-TMSI. GMM cause 'MSC temporarily not reachable', 'Network failure' or 'Congestion' is indicated from SS. The cause code is arbitrarily chosen. The MS sends a ROUTING AREA UPDATE REQUEST message. The SS returns a ROUTING AREA UPDATE ACCEPT message. GMM cause 'MSC temporarily not reachable', 'Network failure' or 'Congestion' is indicated from SS. The cause code is arbitrarily chosen. The ROUTING AREA UPDATE procedure is repeated four times. An MS operation mode B MS may then perform an MM IMSI attach procedure (according to the PICS statement). Further communication MS - SS is performed by the P-TMSI. The existence of a signalling channel is verified by a request for mobile identity.

Maximum duration of test

15 minutes.

Expected sequence

Dependent whether the option 'Automatic MM IMSI attach procedure for MS operation mode B MS' is supported or not, the steps 1-19 or 20-39 apply depending on manufacturer (see PICS).

#### 44.2.1.2.3 Combined GPRS attach / GPRS attach while IMSI attach

44.2.1.2.3.1 Void

44.2.1.2.3.2 Conformance requirement

If the GPRS MS is already attached for non-GPRS services by the MM specific attach procedure, but wants to perform an attach for GPRS services, the combined GPRS attach procedure is performed.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.2.

44.2.1.2.3.3 Test Purpose

To test the behaviour of the MS if GPRS attach performed while IMSI attached.

44.2.1.2.3.4 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode I. ATT flag is set.

Mobile Station:

The MS has a valid TMSI-1, P-TMSI-1 and RAI-1.

Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode B Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

Test procedure

The MS attaches for non-GPRS services. The MS does not answer to paging orders for GPRS. The MS attaches for GPRS services. Paging orders for GPRS are answered.

Maximum duration of test

5 minutes.

#### 44.2.1.2.4 Combined GPRS attach / rejected / IMSI invalid / illegal ME

##### 44.2.1.2.4.1 Conformance requirement

- 1) If the network rejects a combined GPRS attach procedure from the Mobile Station with the cause 'Illegal ME', the Mobile Station shall consider SIM invalid for GPRS and non-GPRS services until power is switched off or SIM is removed.
- 2) If the network rejects a combined GPRS attach procedure from the Mobile Station with the cause 'Illegal ME', the Mobile Station shall delete the stored TMSI, LAI, CSKN, RAI, GPRS-CSKN, P-TMSI and P-TMSI signature.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.2.

#### 44.2.1.2.4.2 Test purpose

To test the behaviour of the MS if the network rejects the combined GPRS attach procedure of the MS with the cause 'Illegal ME'.

#### 44.2.1.2.4.3 Method of test

##### Initial conditions

###### System Simulator:

Three cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2, cell C in MCC2/MNC1/LAC1/RAC1.

All three cells are operating in network operation mode I.

###### Mobile Station:

The MS has a valid TMSI-1, P-TMSI-1 and RAI-1. MS is Idle Updated on cell A.

##### Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode B Yes/No.
- SIM removal possible without powering down Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

##### Test procedure

The SS rejects a GPRS attach with the cause value 'Illegal ME'. The SS checks that the MS does not perform GPRS attach in the same or another PLMN. CS services are not possible as the SIM is blocked for CS services. GPRS services are not possible as the SIM is blocked for GPRS services.

##### Maximum duration of test

5 minutes.

#### Specific message contents

None.

#### 44.2.1.2.5 Combined GPRS attach / rejected / GPRS services and non-GPRS services not allowed

##### 44.2.1.2.5.1 Conformance requirement

- 1) If the network rejects a combined GPRS attach procedure from the Mobile Station with the cause 'GPRS services and non-GPRS services not allowed', the Mobile Station shall consider SIM invalid for GPRS and non-GPRS services until power is switched off or SIM is removed.
- 2) If the network rejects a combined GPRS attach procedure from the Mobile Station with the cause 'GPRS services and non-GPRS services not allowed', the Mobile Station shall delete the stored TMSI, LAI, CSKN, RAI, GPRS-CKSN, P-TMSI and P-TMSI signature.

#### Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.2.

##### 44.2.1.2.5.2 Test purpose

To test the behaviour of the MS if the network rejects the combined GPRS attach procedure of the MS with the cause 'GPRS services and non-GPRS services not allowed'.

## 44.2.1.2.5.3 Method of test

## Initial conditions

## System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1 and cell B in MCC2/MNC1/LAC1/RAC1.

Both cells are operating in network operation mode I.

## Mobile Station:

The MS has a valid TMSI, P-TMSI and RAI. MS is Idle Updated on cell A.

## Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode B Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

## Test procedure

The SS rejects a GPRS attach with the cause value 'GPRS services and non-GPRS services not allowed'. The SS checks that the MS does not perform GPRS attach in the same or another PLMN. CS services are not possible as the SIM is blocked for CS services. GPRS services are not possible as the SIM is blocked for GPRS services.

## Maximum duration of test

5 minutes.

## Expected sequence

None.

#### 44.2.1.2.6 Combined GPRS attach / rejected / GPRS services not allowed

##### 44.2.1.2.6.1 Conformance requirement

- 1) If the network rejects a combined GPRS attach procedure from the Mobile Station with the cause 'GPRS services not allowed', the Mobile Station shall consider SIM invalid for GPRS services until power is switched off or SIM is removed.
- 2) If the network rejects a combined GPRS attach procedure from the Mobile Station with the cause 'GPRS services not allowed' the Mobile Station shall delete the stored RAI, GPRS-CKSN, P-TMSI and P-TMSI signature.
- 3) A GPRS class B MS shall perform an MM IMSI attach procedure.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.2.

#### 44.2.1.2.6.2 Test purpose

To test the behaviour of the MS if the network rejects the GPRS attach procedure of the MS with the cause 'GPRS services not allowed'.

#### 44.2.1.2.6.3 Method of test

##### Initial conditions

###### System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1 and cell B in MCC2/MNC1/LAC1/RAC1.

Both cells are operating in network operation mode I.

ATT flag set to 1.

###### Mobile Station:

The MS has a valid TMSI, P-TMSI-1 and RAI-1. MS is Idle Updated on cell A.

##### Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode B Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

##### Test procedure

The SS rejects a normal attach with the cause value 'GPRS services not allowed'. The SS checks that the MS does not perform GPRS attach. GPRS services are not possible. After receiving the ATTACH REJECT message from the SS the mobile can react in several ways, due to an ambiguity in the core specification. Part 3 of the conformance requirements can be interpreted in the following ways:

1. The MS shall in any case perform a Location Update with the update type set to IMSI attach.
2. The MS shall perform the IMSI attach by means of a explicit Location update procedure only if the conditions specified for the IMSI attach procedure in 3GPP TS 04.08 / 3GSP TS 24.008, subclause 4.4.3 are fulfilled.
3. The MS shall perform a Location Update with the update type set either to IMSI attach or normal updating.

Because all three options are allowed a GPRS class B MS may perform an MM IMSI attach. Therefore step 8 in the expected sequence is an optional step.

##### Maximum duration of test

10 minutes.

## Expected sequence

#### Specific message contents

None.

#### 44.2.1.2.7 Combined GPRS attach / rejected / location area not allowed

##### 44.2.1.2.7.1 Conformance requirement

- 1) If the network rejects a combined GPRS attach procedure from the Mobile Station with the cause 'location area not allowed' the Mobile Station shall:
  - 1.1 not perform combined GPRS attach when in the same location area;
  - 1.2 delete the stored LAI, CKSN, TMSI, RAI, GPRS-CKSN, P-TMSI and P-TMSI signature;
  - 1.3 store the LA in the 'forbidden location areas for regional provision of service'.
- 2) If the network rejects a combined GPRS attach procedure from the Mobile Station with the cause 'location area not allowed' the Mobile Station shall:
  - 2.1 perform combined GPRS attach when a new location area is entered;
  - 2.2 delete the list of forbidden LAs when power is switched off.

#### Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.7.3.2.

## 44.2.1.2.7.2 Test purpose

To test the behaviour of the MS if the network rejects the combined GPRS attach procedure with the cause 'Location Area not allowed'.

To test that the MS deletes the list of forbidden LAs when power is switched off.

## 44.2.1.2.7.3 Method of test

## Initial conditions

## System Simulator:

Three cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2, cell C in MCC1/MNC1/LAC2/RAC1.

All cells are operating in network operation mode I.

## Mobile Station:

The MS has a valid TMSI, P-TMSI and RAI. MS is Idle Updated on cell A.

## Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode B Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.
- GPRS attach attempted automatically due to outstanding request Yes/No.

## Test procedure

The SS rejects a combined GPRS attach with the cause value 'Location Area not allowed'. The SS checks that the MS does not perform combined GPRS attach while in the location area, performs GPRS attach when a new location area is entered and deletes the list of forbidden LAs when switched off. CS services are not possible unless an IMSI attach procedure is performed.

Different types of MS may use different methods to periodically clear the list of forbidden location areas (e.g. every day at 12 am). If the list is cleared while the test is being run, it may be necessary to re-run the test.

## Maximum duration of test

10 minutes.

## Expected sequence

| Step | Direction | Message        | Comments                                                                                                                                        |

#### 44.2.1.2.8 Combined GPRS attach / abnormal cases / attempt counter check / miscellaneous reject causes

##### 44.2.1.2.8.1 Conformance requirement

- 1) When a combined GPRS attach procedure is rejected with the attach attempt counter less than five, the Mobile Station shall repeat the combined GPRS attach procedure after T3311 timeout.
- 2) When a combined GPRS attach procedure is rejected with the attach attempt counter five, the Mobile Station shall delete the stored TMSI, LAI, CKSN, P-TMSI, P-TMSI signature, GPRS CKSN and RAI and start T3302.
- 3) When the T3302 expire, a new combined GPRS attach procedure shall be initiated.
  - GMM cause codes that can be selected are:
    - 'TMSI unknown in HLR';
    - 'MS identity cannot be derived by the network';
    - 'Network failure';
    - 'Congestion';
    - 'retry upon entry into a new cell';
    - 'Semantically incorrect message';
    - 'Invalid mandatory information';
    - 'Message type non-existent or not implemented';
    - 'Message type not compatible with the protocol state';
    - 'Information element non-existent or not implemented';
    - 'Conditional IE error';
    - 'Message not compatible with the protocol state';
    - 'Protocol error, unspecified';

##### Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.2.

##### 44.2.1.2.8.2 Test purpose

To test the behaviour of the MS with respect to the attach attempt counter.

##### 44.2.1.2.8.3 Method of test

###### Initial conditions

###### System Simulator:

One cell operating in network operation mode I. T3302 is set to 12 minutes.

###### Mobile Station:

The MS has a valid TMSI, P-TMSI and RAI. MS is Idle Updated.

#### Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode B Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.
- Switch off on button Yes/No.

#### Test procedure

The MS initiates a combined GPRS attach procedure (attach attempt counter zero). The SS rejects the attach with an arbitrarily chosen cause code. The attach attempt counter is incremented and T3311 is started.

The MS initiates a new combined GPRS attach procedure (attach attempt counter one) after T3311 expires. The SS rejects the attach with an arbitrarily chosen cause code. The attach attempt counter is incremented and T3311 is started.

The MS initiates a new combined GPRS attach procedure (attach attempt counter two) after T3311 expires. The SS rejects the attach with an arbitrarily chosen cause code. The attach attempt counter is incremented and T3311 is started.

The MS initiates a new combined GPRS attach procedure (attach attempt counter three) after T3311 expires. The SS rejects the attach with an arbitrarily chosen cause code. The attach attempt counter is incremented and T3311 is started.

The MS initiates a new combined GPRS attach procedure (attach attempt counter four) after T3311 expires. The SS rejects the attach with an arbitrarily chosen cause code. The attach attempt counter is incremented and T3311 is not started, as the attach attempt counter is five. T3302 is started.

The MS initiates a combined GPRS attach procedure with attach attempt counter zero after T3302 expires without P-TMSI, P-TMSI signature, GPRS CKSN and RAI.

#### Maximum duration of test

20 minutes.

## Expected sequence

#### 44.2.1.2.9 Combined GPRS attach / abnormal cases / GPRS detach procedure collision

##### 44.2.1.2.9.1 Conformance requirement

##### 44.2.1.2.9.1 Conformance requirement

- 1) When a DETACH REQUEST message is received by the MS (Detach type 're-attach not required') while waiting for an ATTACH ACCEPT message or ATTACH REJECT message, the MS shall terminate the combined GPRS attach procedure and continue with the combined GPRS detach procedure.
- 2) When a DETACH REQUEST message is received by the MS (Detach type 're-attach required') while waiting for an ATTACH ACCEPT message or ATTACH REJECT message, the MS shall ignore the combined GPRS detach procedure and continue with the combined GPRS attach procedure.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.3.2.

##### 44.2.1.2.9.2 Test purpose

To test the behaviour of the MS in case of procedure collision.

##### 44.2.1.2.9.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode I.

Mobile Station:

The MS has a valid TMSI, P-TMSI and RAI. MS is Idle Updated.

Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode B Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.
- Re-attach automatically when the network commands a detach with no cause value Yes/No.

Test procedure

The MS initiates a combined GPRS attach procedure. The SS does not answer the combined GPRS attach procedure, but initiates a combined GPRS detach procedure (Detach type 're-attach not required'). The MS shall terminate the combined GPRS attach procedure and continue with the combined GPRS detach procedure.

The MS initiates a combined GPRS attach procedure. The SS does not answer the combined GPRS attach procedure, but initiates a combined GPRS detach procedure (Detach type 're-attach required'). The MS shall ignore the combined GPRS detach procedure and continue with the combined GPRS attach. CS services are also possible.

Maximum duration of test

5 minutes.

## 44.2.2 GPRS detach procedure

This procedure is used to indicate for the network that the IMSI is not available for traffic. The GMM context is removed.

## 44.2.2.1 MS initiated GPRS detach procedure

### 44.2.2.1.1 GPRS detach / power off / accepted

#### 44.2.2.1.1.1 Conformance requirement

The MS detaches the IMSI for GPRS services if the MS is switched off.

#### Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.4.1.

#### 44.2.2.1.1.2 Test purpose

To test the behaviour of the MS for the detach procedure.

#### 44.2.2.1.1.3 Method of test

#### Initial conditions

##### System Simulator:

One cell operating in network operation mode II.

##### Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated.

#### Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode C Yes/No.
- MS operation mode B Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

#### Test procedure

The MS performs a GPRS attach procedure.

The MS sends a DETACH REQUEST message to the SS.

#### Maximum duration of test

5 minutes.

#### 44.2.2.1.2 GPRS detach / accepted

##### 44.2.2.1.2.1 Conformance requirement

- 1) The MS detaches the IMSI for GPRS services if the MS is ordered to do so with MMI or AT commands.
- 2) (For R99 or after MS only) Upon completion of the subsequent attach, routing area update, service request or detach procedure the used P-TMSI signature shall be deleted.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.4.1.

3GPP TS 24.008 subclause 4.7.1.3 (additional reference for R99 or after MS only)

##### 44.2.2.1.2.2 Test purpose

To test the behaviour of the MS for the detach procedure, including treatment of P-TMSI signature by R99 and after MS.

##### 44.2.2.1.2.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode III.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated.

Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.

- MS operation mode C Yes/No.
- MS operation mode B Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.
- MS GPRS release

#### Test procedure

The MS performs a GPRS attach procedure.

The MS sends a DETACH REQUEST message to the SS.

The SS signal to the MS, but no response is received, as the signalling link is disconnected.

The MS performs a GPRS attach procedure.

The MS sends a DETACH REQUEST message to the SS.

#### Maximum duration of test

5 minutes.

#### Expected sequence

#### 44.2.2.1.3 GPRS detach / abnormal cases / attempt counter check / procedure timeout

##### 44.2.2.1.3.1 Conformance requirement

- 1) When a T3321 timeout has occurred during a GPRS detach procedure with the retransmission counter less than five, the Mobile Station shall repeat the GPRS detach procedure.
- 2) When a T3321 timeout has occurred during a GPRS detach procedure with the retransmission counter five, the Mobile Station shall not repeat the procedure.

## Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.4.1.

## 44.2.2.1.3.2 Test purpose

To test the behaviour of the MS with respect to the retransmission counter.

## 44.2.2.1.3.3 Method of test

## Initial conditions

## System Simulator:

One cell operating in network operation mode III.

## Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated.

## Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode C Yes/No.
- MS operation mode B Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.
- Switch off on button Yes/No.

## Test procedure

The MS initiates a GPRS detach procedure. The SS does not answer with DETACH ACCEPT message before T3321 timeout. The retransmission counter is set to one.

The MS initiates a new GPRS detach procedure (retransmission counter one) after T3321 expires. The SS does not answer with DETACH ACCEPT message before T3321 timeout. The retransmission counter is incremented.

The MS initiates a new GPRS detach procedure (retransmission counter two) after T3321 expires. The SS does not answer with DETACH ACCEPT message before T3321 timeout. The retransmission counter is incremented.

The MS initiates a new GPRS detach procedure (retransmission counter three) after T3321 expires. The SS does not answer with DETACH ACCEPT message before T3321 timeout. The retransmission counter is incremented.

The MS initiates a new GPRS detach procedure (retransmission counter four) after T3321 expires. The SS does not answer with DETACH ACCEPT message before T3321 timeout. The retransmission counter is incremented.

The MS then deletes the logical link since the retransmission has been repeated four times.

The MS performs a new GPRS attach procedure.

## Maximum duration of test

8 minutes.

## Expected sequence

| 26   | MS        |                | The MS is set in MS operation mode B (see PICS) and the test is repeated from step 2 to step 24.                                                                                                                                                   |

## Specific message contents

None.

#### 44.2.2.1.4 GPRS detach / abnormal cases / GMM common procedure collision

##### 44.2.2.1.4.1 Conformance requirement

When any of the GMM common messages P-TMSI REALLOCATION COMMAND, GMM STATUS or GMM INFORMATION is received by the MS while waiting for a DETACH ACCEPT message with detach cause different from "power off", the MS shall ignore the GMM common message.

##### Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.4.1.

##### 44.2.2.1.4.2 Test purpose

To test the behaviour of the MS in case of procedure collision.

##### 44.2.2.1.4.3 Method of test

##### Initial conditions

###### System Simulator:

One cell operating in network operation mode II.

###### Mobile Station:

The MS has a valid IMSI. MS is Idle Updated.

##### Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode C Yes/No.
- MS operation mode B Yes/No (only if mode C not supported).
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

##### Test procedure

The following test procedure is repeated for sequence counter k = 1, 2, 3:

- The MS performs a GPRS attach.
- The MS initiates a GPRS detach. The SS initiates a P-TMSI REALLOCATION COMMAND message (k = 1), a GMM STATUS message (k = 2) and a GMM INFORMATION message (k = 3). The MS shall ignore the GMM common messages and continue with the GPRS detach procedure. The sending of the P-TMSI REALLOCATION COMMAND message (k = 1), the GMM STATUS message (k = 2), the GMM INFORMATION message (k = 3) and the DETACH ACCEPT message shall be completed within Timer T3321 -10%.
- The SS signal to the MS, but no response is received, as the signalling link is disconnected.

##### Maximum duration of test

5 minutes.

Expected sequence

The test sequence is repeated for k = 1 ... 3

| Step                                                                       | Direction | Message                     | Comments                                                                                                                                                                                      |

#### 44.2.2.1.5 GPRS detach / power off / accepted

##### 44.2.2.1.5.1 Conformance requirement

The MS detach the IMSI for GPRS and non-GPRS services.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.4.1.

##### 44.2.2.1.5.2 Test purpose

To test the behaviour of the MS for the detach procedure.

## 44.2.2.1.5.3 Method of test

## Initial conditions

## System Simulator:

One cell operating in network operation mode I.

## Mobile Station:

The MS has a valid IMSI. MS is Idle Updated.

## Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode B Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

## Test procedure

The MS performs a combined GPRS attach procedure (for GPRS and non-GPRS services).

The MS sends a DETACH REQUEST message to the SS. The MS then deletes the logical link.

## Maximum duration of test

5 minutes.

## Expected sequence

## 44.2.2.1.6 GPRS detach / accepted / GPRS/IMSI detach

## 44.2.2.1.6.1 Conformance requirement

The MS detach the IMSI for GPRS and non-GPRS services.

## Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.4.1.

## 44.2.2.1.6.2 Test purpose

To test the behaviour of the MS for the detach procedure.

## 44.2.2.1.6.3 Method of test

## Initial conditions

## System Simulator:

One cell operating in network operation mode I.

## Mobile Station:

The MS has a valid IMSI. MS is Idle Updated.

## Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode B Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.
- User requested combined GPRS and non-GPRS detached without powering off Yes/No.

## Test procedure

The MS performs a combined GPRS attach procedure (for GPRS and non-GPRS services).

The MS sends a DETACH REQUEST message to the SS. When the MS receives the DETACH ACCEPT, the MS then deletes the logical link.

The SS signal to the MS, but no response is received, as the signalling link is disconnected.

## Maximum duration of test

5 minutes.

#### 44.2.2.1.7 GPRS detach / accepted / IMSI detach

##### 44.2.2.1.7.1 Conformance requirement

The MS shall detach for CS services.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.4.1.

##### 44.2.2.1.7.2 Test purpose

To test the behaviour of the MS for the detach procedure.

##### 44.2.2.1.7.3 Method of test

Initial conditions

System Simulator:

One cell operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated.

Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode B Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.
- User requested non-GPRS detached Yes/No.

Test procedure

The MS performs a combined GPRS attach procedure (for GPRS and non-GPRS services).

The MS performs an GPRS detach (for non-GPRS services).

CS services are not possible.

The MS attach for non-GPRS services by a routing area update procedure and CS services are again possible.

Maximum duration of test

5 minutes.

#### 44.2.2.1.8 GPRS detach / abnormal cases / change of cell into new routing area

##### 44.2.2.1.8.1 Conformance requirement

When a change of cell into a new routing area is performed before DETACH ACCEPT message is received by the MS, the MS shall abort the GPRS detach procedure and re-initiate it after the routing area update procedure.

##### Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.4.1.

##### 44.2.2.1.8.2 Test purpose

To test the behaviour of the MS in case of procedure collision.

##### 44.2.2.1.8.3 Method of test

##### Initial conditions

###### System Simulator:

Two cells, cell A in MCC1/MNC1/LAC1/RAC1 and cell B in MCC1/MNC1/LAC1/RAC2.

Both cells are operating in network operation mode I.

###### Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

##### Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode B Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.
- User requested combined GPRS and non-GPRS detached without powering off Yes/No.

##### Test procedure

The MS performs a combined GPRS attach procedure (for GPRS and non-GPRS services).

Sufficient time is given for the MS to identify the neighbour cell before the MS is triggered to initiate a GPRS detach procedure. The DETACH ACCEPT message is delayed from the SS. The MS performs a cell reselection to a cell in a new routing area and performs a routing area update procedure.

The Ms shall re-initiate a GPRS detach procedure when the routing area update procedure is finished.

The MS deletes the logical link.

##### Maximum duration of test

5 minutes.

#### 44.2.2.1.9 GPRS detach / abnormal cases / GPRS detach procedure collision

##### 44.2.2.1.9.1 Conformance requirement

When a DETACH REQUEST is received by the MS while waiting for a DETACH ACCEPT message, the MS shall answer the network initiated GPRS detach procedure.

## Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.4.1.

## 44.2.2.1.9.2 Test purpose

To test the behaviour of the MS in case of procedure collision.

## 44.2.2.1.9.3 Method of test

## Initial conditions

## System Simulator:

One cell operating in network operation mode I.

## Mobile Station:

The MS has a valid IMSI. MS is Idle Updated.

## Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode B Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.
- User requested combined GPRS and non-GPRS detached without powering off Yes/No.

## Test procedure

The MS performs a combined GPRS attach procedure (for GPRS and non-GPRS services).

The MS initiates a GPRS detach. The SS does not answer the detach procedure, but initiates a detach procedure (cause re-attach not required). The MS shall continue with the network initiated detach procedure.

The MS deletes the logical link.

GPRS and CS services are not possible.

## Maximum duration of test

5 minutes.

#### 44.2.2.2 Network initiated GPRS detach procedure

##### 44.2.2.2.1 GPRS detach / re-attach not required / accepted

###### 44.2.2.2.1.1 Conformance requirement

The MS detach the IMSI for GPRS services.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.4.2.

###### 44.2.2.2.1.2 Test purpose

To test the behaviour of the MS for the detach procedure.

## 44.2.2.2.1.3 Method of test

## Initial conditions

## System Simulator:

One cell operating in network operation mode II (in case of MS operation mode B), or in network operation mode III (in case of MS operation mode C).

## Mobile Station:

The MS has a valid IMSI. MS is Idle Updated.

## Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode C Yes/No.
- MS operation mode B Yes/No (only if mode C not supported).
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

## Test procedure

The MS performs a GPRS attach procedure.

The SS sends a DETACH REQUEST message to the MS. The MS then deletes the logical link.

The SS signals to the MS, but no response is received, as the signalling link is disconnected.

## Maximum duration of test

5 minutes.

#### 44.2.2.2.2 GPRS detach / rejected / IMSI invalid / GPRS services not allowed

##### 44.2.2.2.2.1 Conformance requirement

- 1) If the network performs a GPRS detach procedure with the cause 'GPRS services not allowed', the Mobile Station shall consider SIM invalid for GPRS services until power is switched off or SIM is removed.
- 2) If the network performs a GPRS detach procedure with the cause 'GPRS services not allowed' the Mobile Station shall delete the stored RAI, GPRS-CKSN, P-TMSI and P-TMSI signature.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.4.2.

##### 44.2.2.2.2.2 Test purpose

To test the behaviour of the MS if the network orders a GPRS detach procedure with the cause 'GPRS services not allowed' (no valid GPRS-subscription for the IMSI).

##### 44.2.2.2.2.3 Method of test

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1 (HPLMN) and cell B in MCC2/MNC1/LAC1/RAC1.

Both cells are operating in network operation mode II.

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated on cell A.

Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode C Yes/No.
- MS operation mode B Yes/No.
- SIM removal possible without powering down Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

Test procedure

The SS performs a detach with the cause value 'GPRS services not allowed'. The SS checks that the MS does not perform GPRS attach in another PLMN.

Maximum duration of test

10 minutes.

#### 44.2.2.2.3 GPRS detach / IMSI detach / accepted

##### 44.2.2.2.3.1 Conformance requirement

The MS detach the IMSI for GPRS services.

##### Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.4.2.

##### 44.2.2.2.3.2 Test purpose

To test the behaviour of the MS for the detach procedure.

##### 44.2.2.2.3.3 Method of test

##### Initial conditions

###### System Simulator:

One cell operating in network operation mode I.

###### Mobile Station:

The MS has a valid IMSI. MS is Idle Updated.

##### Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode B Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

##### Test procedure

The MS performs a combined GPRS attach procedure (for GPRS and non-GPRS services).

The SS sends a DETACH REQUEST message to the MS. The MS then performs an IMSI detach (detach for non-GPRS services).

The SS signal to the MS, but no response is received, as the signalling link is disconnected.

The MS attach for non-GPRS services by a routing area update procedure. Both GPRS and CS services are possible.

##### Maximum duration of test

5 minutes.

#### 44.2.2.2.4 GPRS detach / re-attach requested / accepted

##### 44.2.2.2.4.1 Conformance requirement

The MS shall deactivate the logical link and re-activate it.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.4.2.

#### 44.2.2.2.4.2 Test purpose

To test the behaviour of the MS for the detach procedure in case automatic re-attach.

#### 44.2.2.2.4.3 Method of test

##### Initial conditions

###### System Simulator:

One cell in operating in network operation mode I.

###### Mobile Station:

The MS has a valid TMSI, P-TMSI and RAI. MS is Idle Updated.

##### Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode B Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

##### Test procedure

The MS performs a combined GPRS attach procedure (for GPRS and non-GPRS services).

The SS sends a DETACH REQUEST message to the MS with cause re-attach. The MS then detaches for GPRS services. The MS automatically performs a new combined GPRS attach procedure (for GPRS and non-GPRS services) and GPRS and CS services are possible.

##### Maximum duration of test

5 minutes.

#### 44.2.2.2.5 GPRS detach / rejected / location area not allowed

##### 44.2.2.2.5.1 Conformance requirement

- 1) If the network performs a GPRS detach procedure with the cause 'location area not allowed' the Mobile Station shall:
  - 1.1 not perform combined GPRS attach when in the same location area;
  - 1.2 delete the stored LAI, CKSN, TMSI, RAI, GPRS-CKSN, P-TMSI and P-TMSI signature;
  - 1.3 store the LA in the 'forbidden location areas for regional provision of service'.
- 2) If the network performs a GPRS detach procedure with the cause 'location area not allowed' the Mobile Station shall:
  - 2.1 perform combined GPRS attach when a new location area is entered;
  - 2.2 delete the list of forbidden LAs when power is switched off.

##### Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.7.4.2.

##### 44.2.2.2.5.2 Test purpose

To test the behaviour of the MS if the network orders the GPRS detach procedure with the cause 'Location Area not allowed'.

To test that the MS deletes the list of forbidden LAs when power is switched off.

##### 44.2.2.2.5.3 Method of test

###### Initial conditions

###### System Simulator:

Three cells (not simultaneously activated), cell A in MCC2/MNC1/LAC1/RAC1 (Not HPLMN), cell B in MCC2/MNC1/LAC1/RAC2 (Not HPLMN), cell C in MCC2/MNC1/LAC2/RAC1 (Not HPLMN).

All cells are operating in network operation mode I.

###### Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

###### Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode B Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.
- GPRS attach attempted automatically due to outstanding request Yes/No.

###### Test procedure

The SS orders a GPRS detach with the cause value 'Location Area not allowed'. The SS checks that the MS does not perform combined GPRS attach while in the location area, performs GPRS attach when a new location area is entered and deletes the list of forbidden LAs when switched off. CS services are not possible unless an IMSI attach procedure is performed.

Different types of MS may use different methods to periodically clear the list of forbidden location areas (e.g. every day at 12am). If the list is cleared while the test is being run, it may be necessary to re-run the test.

Maximum duration of test

10 minutes.

### 44.2.3 Routing area updating procedure

This procedure is used to update the actual routing area of an MS in the network.

#### 44.2.3.1 Normal routing area updating

The routing area updating procedure is a GMM procedure used by GPRS MSs of MS operation mode B or C that are IMSI attached for GPRS services only.

##### 44.2.3.1.1 Routing area updating / accepted

###### 44.2.3.1.1.1 Conformance requirement

- 1) If the network accepts the routing area updating procedure and reallocates a P-TMSI, the MS shall acknowledge the new P-TMSI and continue communication with the new P-TMSI.
- 2) If the network accepts the routing area updating procedure from the MS without reallocation of the old P-TMSI, the MS shall continue communication with the old P-TMSI.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.1.

###### 44.2.3.1.1.2 Test purpose

To test the behaviour of the MS if the network accepts the routing area updating procedure.

The following cases are identified:

- 1) P-TMSI / P-TMSI signature is reallocated;
- 2) Old P-TMSI / P-TMSI signature is not changed.

#### 44.2.3.1.1.3 Method of test

##### Initial conditions

###### System Simulator:

Two cells, cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Both cells are operating in network operation mode II.

###### Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

##### Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode B Yes/No.
- MS operation mode C Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

##### Test procedure

- 1) The MS sends a ROUTING AREA UPDATE REQUEST message. The SS reallocates the P-TMSI and returns ROUTING AREA UPDATE ACCEPT message with a new P-TMSI. The MS acknowledge the new P-TMSI by sending ROUTING AREA UPDATING COMPLETE message. Further communication MS - SS is performed by the new P-TMSI. The MS will not answer signalling addressed to the old P-TMSI.
- 2) The MS sends a ROUTING AREA UPDATING REQUEST message. The SS accepts the P-TMSI and returns ROUTING AREA UPDATING ACCEPT message without any P-TMSI. Further communication MS - SS is performed by the P-TMSI.

##### Maximum duration of test

10 minutes.

## Expected sequence

### Specific message contents

None.

#### 44.2.3.1.2 Routing area updating / rejected / IMSI invalid / illegal ME

##### 44.2.3.1.2.1 Conformance requirement

- 1) If the network rejects a routing area updating procedure from the Mobile Station with the cause 'Illegal ME', the Mobile Station shall consider SIM invalid for GPRS services until power is switched off or SIM is removed.
- 2) If the network rejects a routing area updating procedure from the Mobile Station with the cause 'Illegal ME', the Mobile Station shall delete the stored RAI, GPRS-CKSN, P-TMSI and P-TMSI signature.

### Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.1.

##### 44.2.3.1.2.2 Test purpose

To test the behaviour of the MS if the network rejects the routing area updating procedure of the MS with the cause 'Illegal ME'.

##### 44.2.3.1.2.3 Method of test

### Initial conditions

#### System Simulator:

Three cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2, cell C in MCC2/MNC1/LAC1/RAC1.

All three cells are operating in network operation mode II (in case of MS operation mode B), or in network operation mode III (in case of MS operation mode C).

#### Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated on cell A.

### Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode C Yes/No.
- MS operation mode B Yes/No (only if mode C not supported).
- SIM removal possible without powering down Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

### Test procedure

The SS rejects a routing area updating with the cause value 'Illegal ME'. The SS checks that the MS does not perform GPRS attach in the same or another PLMN.

Maximum duration of test

5 minutes.

#### 44.2.3.1.3 Routing area updating / rejected / MS identity cannot be derived by the network

##### 44.2.3.1.3.1 Conformance requirement

If the network rejects a routing area updating procedure from the Mobile Station with the cause 'MS identity cannot be derived by the network', the Mobile Station shall delete the stored RAI, GPRS-CKSN, P-TMSI and P-TMSI signature.

Depending on the manufacturer the MS may or may not perform a GPRS attach procedure.

#### Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.1.

##### 44.2.3.1.3.2 Test purpose

To test the behaviour of the MS if the network rejects the routing area updating procedure of the MS with the cause 'MS identity cannot be derived by the network'.

##### 44.2.3.1.3.3 Method of test

#### Initial conditions

##### System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Both cells are operating in network operation mode II (in case of MS operation mode B), or in network operation mode III (in case of MS operation mode C).

##### Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated on cell A.

## Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode C Yes/No.
- MS operation mode B Yes/No (only if mode C not supported).
- Automatic attach procedure when MS identity cannot be derived by the network Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

## Test procedure

The SS rejects a normal routing area updating with the cause value 'MS identity cannot be derived by the network'. The MS detach locally. A new GPRS attach may be performed.

## Maximum duration of test

5 minutes.

## Expected sequence

#### 44.2.3.1.4 Routing area updating / rejected / location area not allowed

##### 44.2.3.1.4.1 Conformance requirement

- 1) If the network rejects a routing area updating procedure from the Mobile Station with the cause 'location area not allowed' the Mobile Station shall:
  - 1.1 not perform GPRS attach when in the same location area;
  - 1.2 delete the stored RAI, GPRS-CKSN, P-TMSI and P-TMSI signature;
  - 1.3 store the LA in the 'forbidden location areas for regional provision of service'.
- 2) If the network rejects a routing area updating procedure from the Mobile Station with the cause 'location area not allowed' the Mobile Station shall:
  - 2.1 perform GPRS attach when a new location area is entered;
  - 2.2 delete the list of forbidden LAs after switch off (power off).

##### Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.7.5.1.

##### 44.2.3.1.4.2 Test purpose

To test the behaviour of the MS if the network rejects the routing area updating procedure of the MS with the cause 'Location Area not allowed'.

To test that the MS deletes the list of forbidden LAs when power is switched off.

##### 44.2.3.1.4.3 Method of test

##### Initial conditions

###### System Simulator:

Three cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2, cell C in MCC1/MNC1/LAC2/RAC1.

All cells are operating in network operation mode III.

###### Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell C.

##### Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode B Yes/No.
- MS operation mode C Yes/No.
- SIM removal possible without powering down Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

## Test procedure

The SS rejects a routing area updating with the cause value 'Location Area not allowed'. The SS checks that the MS does not perform GPRS attach while in the location area, performs GPRS attach when a new location area is entered and deletes the list of forbidden LAs when switched off.

Different types of MS may use different methods to periodically clear the list of forbidden location areas (e.g. every day at 12 am). If the list is cleared while the test is being run, it may be necessary to re-run the test.

## Maximum duration of test

15 minutes.

## Expected sequence

| 43   | MS        |                             | The MS is set in MS operation mode B (see PICS), cell A is switched off and the test is repeated from step 2 to step 41.                   |

Specific message contents

None.

#### 44.2.3.1.5 Routing area updating / abnormal cases / attempt counter check / miscellaneous reject causes

##### 44.2.3.1.5.1 Conformance requirement

- 1) When a routing area updating procedure is rejected with the routing area updating attempt counter less than five, the Mobile Station shall repeat the routing area updating procedure after T3311 timeout.
- 2) When a routing area updating procedure is rejected with the routing area updating attempt counter five, the Mobile Station shall start timer T3302.
- 3) When the T3302 expires, a new routing area updating procedure shall be initiated.

##### Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.1.

##### 44.2.3.1.5.2 Test purpose

To test the behaviour of the MS with respect to the routing area updating attempt counter.

##### 44.2.3.1.5.3 Method of test

##### Initial conditions

###### System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2. T3302 is set to 12 minutes. The ATT-flag shall indicate that the MS should use IMSI attach/detach procedures.

Both cells are operating in network operation mode II (in case of MS operation mode B), or in network operation mode III (in case of MS operation mode C).

###### Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS has a valid IMSI and is Idle Updated on cell A.

##### Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode C Yes/No.
- MS operation mode B Yes/No (only if mode C not supported).
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

##### Test procedure

The MS initiates a routing area updating procedure (routing area updating attempt counter zero). The SS rejects the routing area updating procedure with a GMM cause 'congestion' code. The routing area updating attempt counter is incremented and T3311 is started.

The MS initiates a new routing area updating procedure (routing area updating attempt counter one) after T3311 expires. The SS rejects the routing area updating procedure with a GMM cause 'congestion' code. The routing area updating attempt counter is incremented and T3311 is started.

The MS initiates a new routing area updating procedure (attempt counter two) after T3311 expires. The SS rejects the routing area updating procedure with a GMM cause 'congestion' code. The routing area updating attempt counter is incremented and T3311 is started.

The MS initiates a new routing area updating procedure (attempt counter three) after T3311 expires. The SS rejects the routing area updating procedure with a GMM cause 'congestion' code. The routing area updating attempt counter is incremented and T3311 is started.

The MS initiates a new routing area updating procedure (attempt counter four) after T3311 expires. The SS rejects the routing area updating procedure with a GMM cause 'congestion' code. The routing area updating attempt counter is incremented but T3311 is not started, as the routing area updating attempt counter is five. T3302 is started.

The MS initiates a routing area updating procedure with routing area updating attempt counter zero after T3302 expires with the stored P-TMSI, P-TMSI signature, GPRS CKSN and RAI.

#### Maximum duration of test

15 minutes.

#### Expected sequence

#### 44.2.3.1.6 Routing area updating / abnormal cases / change of cell into new routing area

##### 44.2.3.1.6.1 Conformance requirement

When a change of cell into a new routing area is performed before the routing area updating procedure is finished, the MS shall abort the routing area updating procedure and re-initiate it in the new routing area.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.1.

##### 44.2.3.1.6.2 Test purpose

To test the behaviour of the MS in case of procedure collision.

##### 44.2.3.1.6.3 Method of test

Initial conditions

System Simulator:

Three cells, cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2 and cell C In MCC1/MNC1/LAC1/RAC3.

All cells are operating in network operation mode II (in case of MS operation mode B), or in network operation mode III (in case of MS operation mode C).

Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated on cell A.

Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode C Yes/No.
- MS operation mode B Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

Test procedure

The MS initiates a routing area updating procedure. The ROUTING AREA UPDATE ACCEPT message is delayed from the SS. The MS performs a cell update into a new routing area. The MS shall re-initiate a routing area updating procedure in the new routing area.

Maximum duration of test

5 minutes.

44.2.3.1.8 Routing area updating / abnormal cases / P-TMSI reallocation procedure collision

44.2.3.1.8.1 Conformance requirement

When a P-TMSI REALLOCATION COMMAND message is received by the MS while waiting for a ROUTING AREA UPDATE ACCEPT message, the MS shall ignore the P-TMSI reallocation procedure and continue with the routing area updating procedure.

## Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.1.

## 44.2.3.1.8.2 Test purpose

To test the behaviour of the MS in case of procedure collision.

## 44.2.3.1.8.3 Method of test

## Initial conditions

## System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1 and cell B in MCC1/MNC1/LAC1/RAC2.

Both cells are operating in network operation mode II (in case of MS operation mode B), or in network operation mode III (in case of MS operation mode C).

## Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

## Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode C Yes/No.
- MS operation mode B Yes/No (only if mode C not supported).
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

## Test procedure

The MS initiates a routing area updating procedure. The SS does not answer the routing area updating procedure, but initiates a P-TMSI reallocation procedure. The MS shall ignore the P-TMSI reallocation procedure and continue with the routing area updating procedure.

## Maximum duration of test

5 minutes.

Expected sequence

### 44.2.3.2 Combined routing area updating

The combined routing area updating procedure is a GMM procedure used by GPRS MSs of MS operation mode B that are IMSI attached for GPRS and non-GPRS services. In order to use the combined routing area updating procedure, the network must operate in network operation mode I.

#### 44.2.3.2.1 Combined routing area updating / combined RA/LA accepted

##### 44.2.3.2.1.1 Conformance requirement

- 1) If the network accepts the combined routing area updating procedure and reallocates a P-TMSI, the MS shall acknowledge the new P-TMSI and continue communication with the new P-TMSI.

- 2) If the network accepts the combined routing area updating procedure from the MS without reallocation of the old P-TMSI, the MS shall continue communication with the old P-TMSI.

**Reference(s):**

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.2.

**44.2.3.2.1.2 Test purpose**

To test the behaviour of the MS if the network accepts the combined routing area updating procedure.

The following cases are identified:

- 1) P-TMSI / P-TMSI signature is reallocated;
- 2) Old P-TMSI / P-TMSI signature is not changed;
- 3) Mobile terminating CS call is allowed with IMSI;
- 4) Mobile terminating CS call is allowed with TMSI.

**44.2.3.2.1.3 Method of test****Initial conditions**

System Simulator:

Two cells, cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Both cells operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

**Related PICS/PIXIT statement(s)**

- Support of GPRS service Yes/No.
- MS operation mode B Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

**Test procedure**

- 1) A combined GPRS attach procedure is performed. The MS sends a ROUTING AREA UPDATE REQUEST message. The SS reallocates the P-TMSI, unassigns the TMSI and returns ROUTING AREA UPDATE ACCEPT message with a new P-TMSI and IMSI. The MS acknowledge the new P-TMSI by sending ROUTING AREA UPDATING COMPLETE message. Further communication MS - SS is performed by the new P-TMSI. For CS calls, the IMSI is used.
- 2) The MS is CS paged in order to verify that the IMSI is used for CS calls.
- 3) The MS sends an ROUTING AREA UPDATING REQUEST message. The SS accepts the P-TMSI signature and returns ROUTING AREA UPDATING ACCEPT message without any P-TMSI and with a new TMSI. The MS acknowledge the new TMSI by sending ROUTING AREA UPDATING COMPLETE message. Further communication MS-SS is performed by the old P-TMSI. For CS calls, the new TMSI is used.
- 4) The MS is CS paged in order to verify that the TMSI is used for CS calls.

Maximum duration of test

15 minutes.

#### 44.2.3.2.2 Combined routing area updating / MS in CS operation at change of RA

##### 44.2.3.2.2.1 Conformance requirement

GPRS MS that is in an ongoing CS transaction at change of routing area shall initiate the routing area updating procedure only after the CS transaction has been released.

#### Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.2.

##### 44.2.3.2.2.2 Test purpose

To test the behaviour of the MS when using the combined routing area updating procedure in cases where the MS is CS connected at change of RA.

## 44.2.3.2.2.3 Method of test

## Initial conditions

## System Simulator:

Two cells, cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Both cells operating in network operation mode I.

## Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

## Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode B Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

## Test procedure

A combined GPRS attach procedure is performed. The MS initiates a CS call. The routing area change. MS will not send a ROUTING AREA UPDATE REQUEST message until the CS operation is terminated.

## Maximum duration of test

15 minutes.

### 44.2.3.2.3 Combined routing area updating / RA only accepted

#### 44.2.3.2.3.1 Conformance requirement

- 1) If the network accepts the combined GPRS attach procedure, but GMM cause code 'IMSI unknown in HLR' is sent to the MS the Mobile Station shall delete the stored TMSI, LAI and CKSN. The Mobile Station shall consider SIM invalid for non-GPRS services until power is switched off or SIM is removed.
- 2) If the network accepts the combined GPRS attach procedure, but GMM cause code 'MSC temporarily not reachable', 'Network failure' or 'Congestion' is sent to the MS, an MS operation mode B MS may perform an MM IMSI attach procedure.

#### Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.2.

#### 44.2.3.2.3.2 Test Purpose

##### Test purpose 1

To test the behaviour of the MS if the network accepts the routing area updating procedure with indication RA only, GMM cause 'IMSI unknown in HLR'.

##### Test purpose 2

To test the behaviour of the MS if the network accepts the routing area updating procedure with indication RA only, GMM cause 'MSC temporarily not reachable', 'Network failure' or 'Congestion'.

#### 44.2.3.2.3.3 Method of test

##### 44.2.3.2.3.3.1 Test Procedure 1

#### Initial conditions

##### System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Both cells operating in network operation mode I.

##### Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

#### Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode B Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

#### Test procedure

After attach, the MS sends an ROUTING AREA UPDATE REQUEST message. The SS allocates a P-TMSI and returns ROUTING AREA UPDATE ACCEPT message with a P-TMSI. GMM cause 'IMSI unknown in HLR' is indicated from SS. Further communication MS - SS is performed by the P-TMSI. CS services are not possible.

Maximum duration of test

5 minutes.

## 44.2.3.2.3.3.2 Test Procedure 2

## Initial conditions

## System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Both cells operating in network operation mode I. T3212 is set to 6 minutes.

## Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

## Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode B Yes/No.
- Automatic MM IMSI attach procedure for MS operation mode B MS Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

## Test procedure

After attach, the MS sends an ROUTING AREA UPDATE REQUEST message . The SS allocates a new P-TMSI signature and returns ROUTING AREA UPDATE ACCEPT message. GMM cause 'MSC temporarily not reachable', 'Network failure' or 'Congestion' is indicated from SS. The cause code is arbitrarily chosen. This procedure is repeated until the routing area updating attempt counter is equal to five. An MS operation mode B MS may perform an MM IMSI attach procedure (according to the PICS statement). Further communication MS - SS is performed by the P-TMSI. The existence of a signalling channel is verified by a request for mobile identity. It is further verified that the MS after a succesful IMSI attach procedure can perform CS services.

## Maximum duration of test

10 minutes.

## Expected sequence

Dependent whether the option 'Automatic MM IMSI attach procedure for MS operation mode B MS' is not supported or not, the steps 1-28 or 29-62 apply depending on manufacturer (see PICS).

#### 44.2.3.2.4 Combined routing area updating / rejected / PLMN not allowed

##### 44.2.3.2.4.1 Conformance requirement

- 1) If the network rejects a combined routing area updating procedure from the Mobile Station with the cause 'PLMN not allowed' the Mobile Station shall:
  - 1.1. not perform combined GPRA attach when switched on in the same location area or PLMN;
  - 1.2. delete the stored RAI, GPRS-CKSN, P-TMSI, P-TMSI signature, TMSI CKSN and LAI;
  - 1.3. store the PLMN in the 'forbidden PLMN list'.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.2.

#### 44.2.3.2.4.2 Test purpose

To test the behaviour of the MS if the network rejects the combined routing area updating procedure of the MS with the cause 'PLMN not allowed'.

#### 44.2.3.2.4.3 Method of test

##### Initial conditions

###### System Simulator:

Four cells (not simultaneously activated), cell A in MCC1/MNC2/LAC1/RAC1, cell B in MCC1/MNC2/LAC1/RAC2, cell C in MCC1/MNC2/LAC2/RAC1 and cell D in MCC2/MNC1/LAC1/RAC1.

All four cells are operating in network operation mode I.

###### Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

##### Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode B Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.
- GPRS attach attempted automatically due to outstanding request Yes/No.

##### Test Procedure

The SS rejects a combined routing area updating with the cause value 'PLMN not allowed'. The SS checks that the MS does not perform GPRS attach if activated in the same PLMN. The SS checks that the MS does not perform IMSI attach if activated in the same PLMN.

##### Maximum duration of test

10 minutes.

##### Expected sequence

#### 44.2.3.2.5 Combined routing area updating / rejected / roaming not allowed in this location area

##### 44.2.3.2.5.1 Conformance requirement

- 1) If the network rejects a combined routing area updating procedure from the Mobile Station with the cause 'roaming not allowed in this location area' the Mobile Station:
  - 1.1 shall not perform combined GPRS attach when in the same location area;
  - 1.2 shall delete the stored RAI, GPRS-CKSN, P-TMSI P-TMSI signature, TMSI, CKSN and LAI;
  - 1.3 shall store the LA in the 'forbidden location areas for roaming';
  - 1.4 may perform combined GPRS attach when a new location area is entered.
- 2) The mobile station shall reset the list of 'Forbidden location areas for roaming' when switched off or when the SIM is removed.

#### Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.2.

## 44.2.3.2.5.2 Test purpose

## Test purpose 1

To test that on receipt of a rejection using the 'Roaming not allowed in this area' cause code, the MS ceases trying a routing area updating procedure on that location area. Successful combined routing area updating procedure is possible in other location areas.

## Test purpose 2

To test that if the MS is switched off or the SIM is removed the list of 'forbidden location areas for roaming' is cleared.

## 44.2.3.2.5.3 Method of test

## 44.2.3.2.5.3.1 Test procedure 1

## Initial conditions

## System Simulator:

Two cells, cell A in MCC2/MNC1/LAC1/RAC1, cell B in MCC2/MNC1/LAC2/RAC1.

Both cells are operating in network operation mode I.

## Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

## Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode B Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.
- GPRS attach attempted automatically due to outstanding request Yes/No.

## Test procedure

The SS rejects a combined routing area updating with the cause value 'Roaming not allowed in this area'. A new attempt for a combined GPRS attach is not possible. Successful combined GPRS attach procedure is performed in another location area. The MS is moved back to the 1<sup>st</sup> location area. A combined routing area updating shall not be performed, as the LA is on the forbidden list.

## Maximum duration of test

10 minutes.

## Expected sequence

| Step                | Direction | Message                       | Comments                                                                                                                                                                                          |

| 30   | SS -> MS  |                 | SS pages the MS with mobile identity P-TMSI-2 and paging order for TBF establishment according to the channel combination of the cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 31   | MS        |                 | No response from the MS to the request. This is checked for 10 s.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

#### Specific message contents

None.

#### 44.2.3.2.5.3.2 Test procedure 2

#### Initial conditions

##### System Simulator:

Two cells, cell A in MCC2/MNC1/LAC1/RAC1, cell B in MCC2/MNC1/LAC2/RAC1.

Both cells are operating in network operation mode I.

##### Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

#### Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode B Yes/No.
- SIM removal possible without powering down Yes/No.
- Switch off on button Yes/No.

- Automatic GPRS attach procedure at switch on or power on Yes/No.

#### Test procedure

The SS rejects a combined routing area updating with the cause value 'Roaming not allowed in this area'. The MS is switched off for 10 s and switched on again. The SS checks that a combined GPRS attach is possible on the cell on which the previous combined routing area updating had been rejected.

If SIM removal is possible without switching off: The SS rejects a routing area updating with the cause value 'Roaming not allowed in this area'. The SIM is removed and inserted in the MS. The SS checks that a GPRS attach procedure and routing area updating procedure is possible on the cell on which the routing area updating had previously been rejected.

#### Maximum duration of test

10 minutes.

## Expected sequence

#### Specific message contents

None.

#### 44.2.3.2.6 Combined routing area updating / abnormal cases / access barred due to access class control

##### 44.2.3.2.6.1 Conformance requirement

- 1) The MS shall not perform combined routing area updating procedure, but stays in the current serving cell and applies normal cell reselection process.
- 2) The Mobile Station shall perform the combined routing area updating procedure when:
  - 2.1 Access is granted.
  - 2.2 Cell is changed.

#### Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.2.

##### 44.2.3.2.6.2 Test purpose

###### Test purpose 1

To test the behaviour of the MS in case of access class control (access is granted).

###### Test purpose 2

To test the behaviour of the MS in case of access class control (cell is changed).

44.2.3.2.6.3 Method of test

44.2.3.2.6.3.1 Test procedure 1

#### Initial conditions

An access class x (0-15) is arbitrarily chosen. The SIM is programmed with this access class x. Communication with mobile stations using access class x is initially indicated to be barred on Cell B.

#### System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1 has Access Class x not barred, cell B in MCC1/MNC/LAC1/RAC2 has Access Class x barred.

Both cells are operating in network operation mode I.

Access class x barred.

#### Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

#### Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode B Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

#### Test procedure

A GPRS attach procedure is performed. The routing area is changed. The SS indicates access class x barred. A routing area updating procedure is not performed.

The SS indicates that access class x is not barred. A routing area updating procedure is performed.

#### Maximum duration of test

10 minutes.

## 44.2.3.2.6.3.2 Test procedure 2

## Initial conditions

An access class x (0-15) is arbitrarily chosen. The SIM is programmed with this access class x. Communication with mobile stations using access class x is indicated to be barred on cell B.

## System Simulator:

Three cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1 has access class x not barred, cell B in MCC1/MNC1/LAC1/RAC2 has access class x barred, cell C in MCC1/MNC1/LAC1/RAC2 has access class x not barred.

All three cells are operating in network operation mode I.

## Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

## Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode B Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

## Test procedure

A GPRS attach procedure is performed. The routing area is changed. The SS indicates access class x barred. A routing area updating procedure is not performed.

A cell change is performed into a cell where access class x is not barred. A routing area updating procedure is performed.

## Maximum duration of test

10 minutes.

#### 44.2.3.2.7 Combined routing area updating / abnormal cases / attempt counter check / procedure timeout

##### 44.2.3.2.7.1 Conformance requirement

- 1) When a T3330 timeout has occurred during a routing area updating procedure, the Mobile Station shall repeat the routing area updating procedure after T3330 timeout until the procedure is repeated five times.
- 2) When a routing area updating procedure is repeated five times, the routing area updating attempt counter is incremented and five more routing area updating procedures are performed. This procedure is repeated until the routing area updating attempt counter is five, the Mobile Station shall then start timer T3302.

- 3) When the T3302 expire, a new routing area updating procedure shall be initiated.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.2.

44.2.3.2.7.2 Test purpose

To test the behaviour of the MS with respect to the routing area updating attempt counter.

44.2.3.2.7.3 Method of test

Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC/LAC1/RAC2. T3302 is set to 12 minutes.

Both cells are operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode B Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

Test procedure

The MS initiates a routing area updating procedure (routing area updating attempt counter zero). The SS does not answer with ROUTING AREA UPDATE ACCEPT message before T3330 timeout. The MS restarts the routing area updating procedure four times. The SS never answers with ROUTING AREA UPDATE ACCEPT message before T3330 timeout. After five consecutive routing area update procedures, the routing area updating attempt counter is incremented and T3311 is started.

The MS initiates a new routing area updating procedure (routing area updating attempt counter one) after T3311 expires. The SS does not answer with ROUTING AREA UPDATE ACCEPT message before T3330 timeout. The MS restarts the routing area updating procedure four times. The SS never answers with ROUTING AREA UPDATE ACCEPT message before T3330 timeout. After five consecutive routing area update procedures, the routing area updating attempt counter is incremented and T3311 is started.

The MS initiates a new routing area updating procedure (routing area updating attempt counter two) after T3311 expires. The SS does not answer with ROUTING AREA UPDATE ACCEPT message before T3330 timeout. The MS restarts the routing area updating procedure four times. The SS never answers with ROUTING AREA UPDATE ACCEPT message before T3330 timeout. After five consecutive routing area update procedures, the routing area updating attempt counter is incremented and T3311 is started.

The MS initiates a new routing area updating procedure (routing area updating attempt counter three) after T3311 expires. The SS does not answer with ROUTING AREA UPDATE ACCEPT message before T3330 timeout. The MS restarts the routing area updating procedure four times. The SS never answers with ROUTING AREA UPDATE ACCEPT message before T3330 timeout. After five consecutive routing area update procedures, the routing area updating attempt counter is incremented and T3311 is started.

The MS initiates a new routing area updating procedure (routing area updating attempt counter four) after T3311 expires. The SS does not answer with ROUTING AREA UPDATE ACCEPT message before T3330 timeout. The MS restarts the routing area updating procedure four times. The SS never answers with ROUTING AREA UPDATE ACCEPT message before T3330 timeout. After five consecutive routing area update procedures, the routing area updating attempt counter is incremented and as the routing area updating attempt counter is five. T3302 is started.

The MS may perform a Location Update procedure.

The MS initiates a routing area updating procedure with routing area updating attempt counter zero after T3302 expires with the stored P-TMSI, P-TMSI signature, GPRS CKSN and RAI.

Maximum duration of test

30 minutes.

#### Specific message contents

None.

#### 44.2.3.2.8 Combined routing area updating / abnormal cases / change of cell into new routing area

##### 44.2.3.2.8.1 Conformance requirement

When a change of cell into a new routing area is performed before the routing area updating procedure is finished, the MS shall abort the routing area updating procedure and re-initiate it in the new routing area.

#### Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.2.

#### 44.2.3.2.8.2 Test purpose

To test the behaviour of the MS in case of procedure collision.

#### 44.2.3.2.8.3 Method of test

##### Initial conditions

###### System Simulator:

Three cells, cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2, cell C in MCC1/MNC1/LAC1/RAC3.

All three cells are operating in network operation mode I.

###### Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

##### Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode B Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

##### Test procedure

The MS initiates a routing area updating procedure. The ROUTING AREA UPDATE ACCEPT message is delayed from the SS. The MS performs a cell update into a new routing area. The Ms shall re-initiate a routing area updating procedure in the new routing area. The MS shall not increment the attempt counter.

##### Maximum duration of test

10 minutes.

Expected sequence

#### 44.2.3.2.9 Combined routing area updating / abnormal cases / change of cell during routing area updating procedure

##### 44.2.3.2.9.1 Conformance requirement

When a change of cell within new routing area is performed before the routing area updating procedure is finished, the MS shall perform the cell update before the routing area updating procedure is finished.

## Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.5.2.

## 44.2.3.2.9.2 Test purpose

To test the behaviour of the MS in case of procedure collision.

## 44.2.3.2.9.3 Method of test

## Initial conditions

## System Simulator:

Three cells, cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2, cell C in MCC1/MNC1/LAC1/RAC2.

All three cells are operating in network operation mode I.

## Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

## Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode B Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

## Test procedure

The MS initiates a routing area updating procedure. The ROUTING AREA UPDATE ACCEPT message is delayed from the SS. The MS performs a cell update within the routing area. The MS then waits for the ROUTING AREA UPDATE ACCEPT message.

## Maximum duration of test

10 minutes.

## 44.2.3.2.10.3.2 Test procedure 2

## Initial conditions

System Simulator:

Two cells, cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Both cells are operating in network operation mode I.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

## Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode B Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

## Test procedure

The MS initiates a routing area updating procedure. The SS does not answer the routing area updating procedure, but initiates a GPRS detach procedure with cause 'IMSI detach'. The MS shall ignore the detach procedure and continue with the routing area updating procedure.

## Maximum duration of test

10 minutes.

### 44.2.3.3 Periodic routing area updating

#### 44.2.3.3.1 Periodic routing area updating / accepted

##### 44.2.3.3.1.1 Conformance requirement

The Mobile Station shall perform a periodic routing area update procedure after a T3312 timeout.

##### Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.2.2 and 4.7.5.1.

##### 44.2.3.3.1.2 Test purpose

To test the behaviour of the MS with respect to the periodic routing area updating procedure.

##### 44.2.3.3.1.3 Method of test

##### Initial conditions

###### System Simulator:

One cell operating in network operation mode II (in case of MS operation mode B), or in network operation mode III (in case of MS operation mode C).

###### Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated.

##### Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode C Yes/No.
- MS operation mode B Yes/No.
- SIM removal possible without powering down Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

##### Test procedure

The MS initiates a GPRS attach procedure with identity P-TMSI. The SS reallocates the P-TMSI and returns ATTACH ACCEPT message with a new P-TMSI and timer T3312. The MS acknowledge the new P-TMSI by sending ATTACH COMPLETE message. A routing area updating procedure is performed at T3312 timeout.

T3312; set to 6 minutes.

##### Maximum duration of test

20 minutes.

44.2.3.3.2 Periodic routing area updating / accepted / T3312 default value

44.2.3.3.2.1 Conformance requirement

The Mobile Station shall perform a periodic routing area update procedure after a T3312 timeout.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.2.2 and 4.7.5.2.

44.2.3.3.2.2 Test purpose

To test the behaviour of the MS with respect to the periodic routing area updating procedure.

## 44.2.3.3.2.3 Method of test

## Initial conditions

## System Simulator:

One cell operating in network operation mode I.

## Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated.

## Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode B Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

## Test procedure

The MS initiates a combined GPRS attach procedure. The SS reallocates the P-TMSI and returns ATTACH ACCEPT message with a new P-TMSI. The MS acknowledge the new P-TMSI by sending ATTACH COMPLETE message. After 54 minutes, a periodic routing area updating procedure is initiated by the MS.

T3312; default value 54 minutes.

## Maximum duration of test

60 minutes.

#### 44.2.3.3.3 Periodic routing area updating / no cell available / network mode I

##### 44.2.3.3.3.1 Conformance requirement

If the MS is both IMSI attached for GPRS and non-GPRS services, and if the MS lost coverage of the registered PLMN and timer T3312 expires; if the MS returns to coverage in a cell that supports GPRS and the network is in network operation mode I, then the MS shall perform a combined routing area update procedure indicating 'combined RA/LA updating with IMSI attach'.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.7.2.2 and 4.7.5.1..

##### 44.2.3.3.3.2 Test purpose

To test the behaviour of the MS with respect to the periodic routing area updating procedure.

##### 44.2.3.3.3.3 Method of test

Initial conditions

System Simulator:

Two cells, cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Cell A is operating in network operation mode II and cell B is in network operation mode I.

Mobile Station:

The MS has a valid TMSI-1, P-TMSI-1 and RAI-1. MS is Idle Updated on cell A.

Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode B Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

Test procedure

The MS initiates a GPRS attach procedure. The SS reallocates the P-TMSI and returns ATTACH ACCEPT message with a new P-TMSI and timer T3312. The MS acknowledge the new P-TMSI by sending ATTACH COMPLETE message. GPRS radio contact is distorted before T3312 timeout. GPRS radio contact is established again (after T3312 timeout), and a routing area updating procedure is performed immediately.

T3312; set to 6 minutes.

Maximum duration of test

15 minutes.

#### 44.2.3.3.4 Periodic routing area updating / no cell available

##### 44.2.3.3.4.1 Conformance requirement

If the MS is both IMSI attached for GPRS and non-GPRS services, and if the MS lost coverage of the registered PLMN and timer T3312 expires; if the MS returns to coverage in a cell that supports GPRS and the network is in network operation mode II, then the MS shall perform a periodic routing area update procedure and a periodic location update procedure.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.7.2.2 and 4.7.5.2.

#### 44.2.3.3.4.2 Test purpose

To test the behaviour of the MS with respect to the periodic routing area updating procedure.

#### 44.2.3.3.4.3 Method of test

##### Initial conditions

###### System Simulator:

One cell operating in network operation mode II.

###### Mobile Station:

The MS has a valid P-TMSI-1 and RAI-1. MS is Idle Updated.

##### Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode B Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

##### Test procedure

The MS initiates a GPRS attach procedure. The SS reallocates the P-TMSI and returns ATTACH ACCEPT message with a new P-TMSI and timer T3312. The MS acknowledge the new P-TMSI by sending ATTACH COMPLETE message. GPRS radio contact is distorted before T3312 timeout. GPRS radio contact is established again (after T3312 timeout), and a periodic routing area updating procedure is performed immediately (no periodic location update procedure is performed as T3212=0).

T3312; set to 6 minutes.

##### Maximum duration of test

15 minutes.

## 44.2.4 P-TMSI reallocation

### 44.2.4.1 Conformance requirement

- 1) A Mobile Station shall acknowledge a new P-TMSI when explicitly allocated.
- 2) The P-TMSI shall be updated on the SIM when the Mobile Station is correctly deactivated in accordance with the manufacturer's instructions.
- 3) A Mobile Station shall use the given P-TMSI in further communication with the network.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.6.

### 44.2.4.2 Test Purpose

To verify that the MS is able to receive and acknowledge a new P-TMSI by means of an explicit P-TMSI reallocation procedure.

To verify that the MS has stored the P-TMSI in a non-volatile memory.

The implicit reallocation procedure is tested in the attach procedure.

## 44.2.4.3 Method of test

## Initial conditions

## System Simulator:

One cell operating in network operation mode II.

## Mobile Station:

The MS has a valid IMSI. MS is Idle Updated.

## Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode B Yes/No.
- MS operation mode C Yes/No (only if mode B not supported).
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

## Test procedure

An explicit P-TMSI reallocation procedure is performed (P-TMSI reallocation command sent from the SS and acknowledged from the MS by P-TMSI reallocation complete). The MS is GPRS detached and switched off. Its power supply is interrupted for 10 s. The power supply is resumed and then the MS is switched on. A GPRS attach procedure is performed with the given P-TMSI as identity.

## Maximum duration of test

10 minutes.

## 44.2.5 GPRS authentication and ciphering

### 44.2.5.1 Test of authentication

The purpose of this procedure is to verify the user identity. A correct response is essential to guarantee the establishment of the connection. If not, the connection will drop.

#### 44.2.5.1.1 Authentication accepted

##### 44.2.5.1.1.1 Conformance requirement

A Mobile Station shall correctly respond in an authentication and ciphering procedure by sending a response with the SRES information field set to the same value as the one produced by the authentication and ciphering algorithm in the network.

##### Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.7.

##### 44.2.5.1.1.2 Test purpose

To test the behaviour of the MS if the network accepts the authentication and ciphering procedure.

##### 44.2.5.1.1.3 Method of test

##### Initial conditions

###### System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Both cells are operating in network operation mode II.

###### Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

##### Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode B Yes/No.
- MS operation mode C Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

##### Test procedure

A GPRS attach is performed, and the SS initiates an authentication and ciphering procedure.

The SS checks the value SRES sent by the MS in the AUTHENTICATION AND CIPHERING RESPONSE message.

The MS initiates a routing area updating procedure and the SS checks the value of the GPRS Ciphering Key Sequence Number sent by the MS in the ROUTING AREA REQUEST message.

##### Maximum duration of test

10 minutes.

Expected sequence

| Step | Direction | Message                               | Comments                                                                                                                                                                                            |

Specific message contents

None.

#### 44.2.5.1.2 Authentication rejected

##### 44.2.5.1.2.1 Conformance requirement

1. Upon receipt of an AUTHENTICATION AND CIPHERING REJECT message, the MS shall set the GPRS update status to GU3 ROAMING NOT ALLOWED and shall delete the P-TMSI, P-TMSI signature, RAI and GPRS ciphering key sequence number stored.
2. The SIM shall be considered as invalid until switching off or the SIM is removed.

3. If the AUTHENTICATION AND CIPHERING REJECT message is received, the MS shall abort any GMM procedure, shall stop the timers T3310 and T3330 (if running) and shall enter state GMM-DEREGISTERED.

**Reference(s):**

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.7.5.

**44.2.5.1.2.2 Test purpose**

To test the behaviour of the MS if the network rejects the authentication and ciphering procedure.

**44.2.5.1.2.3 Method of test****Initial conditions****System Simulator:**

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Both cells are operating in network operation mode II.

**Mobile Station:**

The MS has a valid IMSI. MS is Idle Updated on cell A.

**Related PICS/PIXIT statement(s)**

- Support of GPRS service Yes/No.
- MS operation mode B Yes/No.
- MS operation mode C Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

**Test procedure**

The test sequence is repeated for  $k = 1, 2$ .

A complete GPRS attach procedure is performed. The SS rejects the following authentication and ciphering procedure. The MS is paged with its former P-TMSI and shall not respond.

The Cell is changed into a new Routing Area.

The SS checks that the MS does not perform normal routing area updating.

The SS then checks that the MS does not perform a GPRS attach.

The SS checks that the MS does not perform a GPRS detach if switched off.

The MS is switched on or powered up. The SS checks that the MS performs a GPRS Attach procedure.

**Maximum duration of test**

10 minutes.

**Expected sequence**

The test sequence is repeated for  $k = 1, 2$ .

For  $k=1$ , the MS is set in MS operation mode C. If MS operation mode C not supported then  $k = 2$ .

For k = 2 the MS is set in MS operation mode B.

#### 44.2.5.2 Test of ciphering mode setting

The purpose of this procedure is to let the network to trigger the start and stop of stream ciphering.

The SS shall start and synchronise ciphering and deciphering according to 3GPP TS 03.20. The bitstream shall be generated by algorithm GEA/1.

##### 44.2.5.2.1 Ciphering mode / start ciphering

###### 44.2.5.2.1.1 Conformance requirements

1. When the MS receives the AUTHENTICATION AND CIPHERING REQUEST message during the attach procedure, with Ciphering indicator information element set to 'ciphering mode off', the Mobile Station shall:
  - 1.1. responds with an AUTHENTICATION AND CIPHERING RESPONSE message;
  - 1.2. not start ciphering.
2. When the MS receives the AUTHENTICATION AND CIPHERING REQUEST message during the routing area updating procedure, with Ciphering indicator information element set to 'ciphering mode on', the Mobile Station shall:
  - 2.1. responds with an AUTHENTICATION AND CIPHERING RESPONSE message;
  - 2.2. start ciphering and deciphering with the algorithm indicated by the Ciphering algorithm information element;
  - 2.3. the ciphering uses the cipher key determined during the authentication procedure.

###### Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.7.

###### 44.2.5.2.1.2 Test purpose

To test the behaviour of the MS if the network accepts the authentication and ciphering procedure with ciphering.

###### 44.2.5.2.1.3 Method of test

###### Initial conditions

System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Both cells are operating in network operation mode II.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

###### Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode B Yes/No.
- MS operation mode C Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

## Test procedure

A GPRS attach is performed. Authentication procedure without ciphering is performed.

The MS initiates a routing area updating procedure, and the SS initiates an authentication and ciphering procedure to start ciphering.

## Maximum duration of test

15 minutes.

## Expected sequence

None.

#### 44.2.5.2.3 Ciphering mode / IMEISV request

##### 44.2.5.2.3.1 Conformance requirements

- 1 When the MS receives the AUTHENTICATION AND CIPHERING REQUEST message during the attach procedure, with Ciphering indicator information element set to 'ciphering mode on' and 'IMEISV requested', the Mobile Station shall:
  - 1.1 responds with an AUTHENTICATION AND CIPHERING RESPONSE message;
  - 1.2 include IMEISV;
  - 1.3 start ciphering and deciphering with the algorithm indicated by the Ciphering algorithm information element;
  - 1.4 the ciphering uses the cipher key determined during the authentication procedure.
- 2 When the MS receives the AUTHENTICATION AND CIPHERING REQUEST message during the routing area updating procedure, with Ciphering indicator information element set to 'ciphering mode off' and 'IMEISV not requested', the Mobile Station shall:
  - 2.1 responds with an AUTHENTICATION AND CIPHERING RESPONSE message;
  - 2.2 not include IMEISV;
  - 2.3 not start ciphering.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.7.

##### 44.2.5.2.3.2 Test purpose

To test the behaviour of the MS with respect to return IMEISV on request only.

##### 44.2.5.2.3.3 Method of test

Initial conditions

System Simulator:

Two cells, cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC2.

Both cells are operating in network operation mode II.

Mobile Station:

The MS has a valid IMSI. MS is Idle Updated on cell A.

Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode B Yes/No.
- MS operation mode C Yes/No.
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

Test procedure

A GPRS attach is performed, and the SS initiates an authentication and ciphering procedure. IMEISV is requested.

The MS initiates a routing area updating procedure, and the SS initiates a new authentication and ciphering procedure without requesting IMEISV.

Maximum duration of test

15 minutes.

Note that due to the test of ciphering, it is in this test case indicated whether each message is ciphered or not.

Specific message contents

None.

## 44.2.6 Identification procedure

The purpose of this procedure is to check that the MS gives its identity as requested by the network. If this procedure does not work, it will not be possible for the network to rely on the identity claimed by the MS.

### 44.2.6.1 General Identification

#### 44.2.6.1.1 Conformance requirement

- 1) When requested by the network the Mobile Station shall send its IMSI.
- 2) When requested by the network the Mobile Station shall send its IMEI as stored in the Mobile Equipment.
- 3) When requested by the network the Mobile Station shall send its IMEISV as stored in the Mobile Equipment.

Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.7.8.

#### 44.2.6.1.2 Test purpose

To verify that the MS sends identity information as requested by the system. The following identities can be requested: IMSI, IMEI and IMEISV.

#### 44.2.6.1.3 Method of test

Initial conditions

System Simulator:

One cell operating in network mode II.

Mobile Station:

The MS has a valid IMSI.. MS is Idle Updated.

Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode B Yes/No.
- MS operation mode C Yes/No.

- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

#### Test procedure

The SS requests identity information from the MS:

- IMSI;
- IMEI;
- IMEISV.

#### Maximum duration of test

10 minutes.

#### Expected sequence

### 44.2.7 GMM READY timer handling

The READY timer, T3314 is used in the MS and in the network per each assigned P-TMSI to control the cell updating and paging procedure.

When the READY timer is running the MS shall perform cell update each time a new cell is selected (see 3GPP TS 03.22 [3]). If a routing area border is crossed a routing area updating procedure shall be performed instead of a cell update.

#### 44.2.7.1 Conformance requirement

- 1) When the READY timer is running the MS shall perform cell update each time a new cell is selected.
- 2) The READY timer shall be restarted in the MS when the GMM entity receives an indication from lower layers that user data or GMM or SM signalling messages have been transmitted.
- 3) The READY timer shall be stopped when force to standby is received in a signalling message from the network, after successful completion of the signalling procedure.
- 4) if the negotiated READY timer value indicates that the ready timer function is deactivated, then the MS shall behave as if READY timer never expires (i.e. the MS remains in READY state all the time).

#### Reference(s):

3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.7.2.1.

#### 44.2.7.2 Test Purpose

To verify the functionality of the READY timer.

#### 44.2.7.3 Method of test

##### 44.2.7.3.1 Test procedure 1

#### Initial conditions

##### System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC1.

Both cells are operating in network operation mode II.

##### Mobile Station:

The MS has a valid IMSI.. MS is Idle Updated on cell A.

#### Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode B Yes/No.
- MS operation mode C Yes/No (only if mode B not supported).
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

#### Test procedure

An attach is performed. The SS negotiates T3314. The MS selects a new cell within the old RA. A cell update is performed.

T3314; set to 60 s.

#### Maximum duration of test

5 minutes.

## 44.2.7.3.4 Test procedure 4

## Initial conditions

## System Simulator:

Two cells (not simultaneously activated), cell A in MCC1/MNC1/LAC1/RAC1, cell B in MCC1/MNC1/LAC1/RAC1.

Both cells are operating in network operation mode II.

## Mobile Station:

The MS has a valid IMSI.. MS is Idle Updated on cell A.

## Related PICS/PIXIT statement(s)

- Support of GPRS service Yes/No.
- MS operation mode C Yes/No.
- MS operation mode B Yes/No (only if mode C not supported).
- Switch off on button Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

## Test procedure

An attach is performed. The SS negotiates T3314. The MS selects a new cell within the old RA. A cell update is performed.

T3314; set to deactivated.

## Maximum duration of test

5 minutes.

## 45 Session Management Procedures

### 45.1 Definition and applicability

This subclause is applicable for MS supporting GPRS.

## 45.2 PDP context activation

### 45.2.1 Initiated by the mobile station

#### 45.2.1.1 Attach initiated by context activation/QoS Offered by Network is the QoS Requested

##### 45.2.1.1.1 Conformance requirement

PDP context activation shall initiate GPRS Attach by the MS when the MS is GPRS Detached.

In order to request a PDP context activation, the MS sends an ACTIVATE PDP CONTEXT REQUEST message to the network. If the QoS offered by the network is the same as the QoS requested by the mobile, then upon receipt of the message ACTIVATE PDP CONTEXT ACCEPT the MS shall stop timer T3380 and shall initiate establishment of the logical link with the offered QoS.

#### Reference

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 6.1.1 and 6.1.3.1.1.

##### 45.2.1.1.2 Test purpose

To check the MS initiates a GPRS ATTACH if one is not already active. To test the behaviour of the MS when the network responds to a PDP context activation request with the requested QoS.

##### 45.2.1.1.3 Method of test

#### Related PICS/PIXIT statements

- GPRS Supported                    yes/no.
- GPRS Auto Attach.
- Method of context activation.

#### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in GMM-state "GMM-DEREGISTERED, normal service" with valid P-TMSI and CKSN.

#### Test procedure

If the MS is attached a detach request is sent from the SS. A context activation is then requested by the user. On receipt of the ACTIVATE PDP CONTEXT REQUEST message a ACTIVATE PDP CONTEXT ACCEPT is returned by the SS with the same requested QoS. The contents of the ACTIVATE PDP CONTEXT REQUEST message shall then be checked. The SS then waits for T3380 +10% seconds to ensure T3380 has been stopped and no more ACTIVATE PDP CONTEXT REQUEST messages are sent by the MS. The SS then sends a MODIFY PDP CONTEXT REQUEST message to which the MS shall reply with a MODIFY PDP CONTEXT ACCEPT message to ensure the context has been set up.

## 45.2.1.2 QoS Offered by Network is a lower QoS

## 45.2.1.2.1 QoS Accepted by MS

## 45.2.1.2.1.1 Conformance requirement

In order to request a PDP context activation, the MS sends an ACTIVATE PDP CONTEXT REQUEST message to the network. If the QoS offered by the network is acceptable to mobile, then upon receipt of the message ACTIVATE PDP CONTEXT ACCEPT the MS shall initiate establishment of the logical link with the offered QoS.

## Reference

3GPP TS 04.08 / 3GPP TS 24.008 subclause 6.1.3.1.1.

## 45.2.1.2.1.2 Test purpose

To test the behaviour of the MS when the network responds to a PDP context activation request with a lower QoS than that requested.

## 45.2.1.2.1.3 Method of test

## Related PICS/PIXIT statements

- GPRS Supported yes/no.
- User setting of Minimum QoS supported yes/no.
- Method of setting minimum QoS.
- Method of context activation.

## Initial conditions

## System Simulator:

1 cell, default parameters.

## Mobile Station:

The MS is in GMM-state "GMM-REGISTERED, normal service" with valid P-TMSI and CKSN.

## Test procedure

The requested QoS and Minimum QoS are set. A context activation is requested by the user. On receipt of the ACTIVATE PDP CONTEXT REQUEST message a ACTIVATE PDP CONTEXT ACCEPT is returned by the SS with a QoS lower than the requested but higher than or equal to the minimum. The SS then sends a MODIFY PDP CONTEXT REQUEST message and the MS shall respond with a MODIFY PDP CONTEXT ACCEPT message to confirm the context is active.

## Maximum duration of test

5 minutes.

## Expected sequence

| Step | Direction | Message                      | Comments                                                     |
|------|-----------|------------------------------|--------------------------------------------------------------|
| 1    | MS        |                              | Initiate a context activation                                |
| 2    | MS -> SS  | ACTIVATE PDP CONTEXT REQUEST | Request a pdp context activation                             |
| 3    | SS -> MS  | ACTIVATE PDP CONTEXT ACCEPT  | Accept a pdp context activation                              |
| 4    | SS -> MS  | MODIFY PDP CONTEXT REQUEST   | Send a modify request for the activated context              |
| 5    | MS -> SS  | MODIFY PDP CONTEXT ACCEPT    | Accept the modification request to show context is activated |

## Specific message contents

## 45.2.2 PDP context activation requested by the network, successful and unsuccessful

### Applicability

This test needs to take into account the number of contexts supported by the MS to be able to test the response when all contexts are activated and the network tries to initiate a new context.

#### 45.2.2.1 Conformance requirement

- 1) Upon receipt of a REQUEST PDP CONTEXT ACTIVATION message:
  - If the MS accepts the request the MS shall then initiate the PDP context activation procedure.
  - If the MS rejects the request, the MS shall send a REQUEST PDP CONTEXT ACTIVATION REJECT message with one of the following causes:
    - #26: insufficient resources;
    - #31: activation rejected, unspecified;
    - #40: feature not supported; or
    - #95 – 111: protocol errors.
- 2) The MS shall not ignore the request.
- 3) If the MS accepts the request, the ACTIVATE PDP CONTEXT REQUEST message sent by the MS shall contain the parameters requested by the network in the REQUEST PDP CONTEXT ACTIVATION message, except for the offered QoS which may be changed by the MS.
- 4) Whenever a REQUEST PDP CONTEXT ACTIVATION message is received by the MS specifying a transaction identifier relating to a PDP context not in state PDP-INACTIVE, the MS shall locally deactivate the old PDP context relating to the received transaction identifier. Furthermore, the MS shall continue with the activation procedure of a new PDP context as indicated in the received message.

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 6.1.3.1.2, 6.1.3.1.4 and 8.3.2 (f).

#### 45.2.2.2 Test purpose

To test the behaviour of the MS upon receipt of a context activation request from the network.

## 45.2.2.3 Method of test

## Related PICS/PIXIT statements

- GPRS Supported yes/no.
- Network requested pdp context activation supported yes/no.
- Number of network initiated pdp contexts supported.

## Initial conditions

## System Simulator:

1 cell, default parameters.

## Mobile Station:

The MS is in GMM-state "GMM-REGISTERED, normal service" with valid P-TMSI and CKSN.

## Case 1

For an MS that supports PDP Context Activation requested by the network.

## Test procedure

A REQUEST PDP CONTEXT ACTIVATION message is sent by the SS. On receipt of the ACTIVATE PDP CONTEXT REQUEST message an ACTIVATE PDP CONTEXT ACCEPT message is returned by the SS. This is repeated until the maximum number of contexts supported by the MS are activated. If the MS cannot support seven PDP contexts then one greater than the maximum supported by the MS should be requested. In response to this activation request the MS shall return a REQUEST PDP CONTEXT ACTIVATION REJECT message with cause set to 'insufficient resources', 'feature not supported', 'activation rejected, unspecified' or 'protocol errors' using cause values #26, #31, #40 or #95-#111. A REQUEST PDP CONTEXT ACTIVATION message is then sent using a currently activated context transaction identifier. The MS shall activate this context in place of the previous context.

## Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message                               | Comments                                                                                                                                                                                                      |

## 45.2.4 Abnormal cases

### 45.2.4.1 T3380 Expiry

#### 45.2.4.1.1 Conformance requirement

- 1) On the first expiry of the timer T3380, the MS shall resend the PDP CONTEXT ACTIVATION REQUEST.
- 2) On the second expiry of the timer T3380, the MS shall resend the PDP CONTEXT ACTIVATION REQUEST.
- 3) On the third expiry of the timer T3380, the MS shall resend the PDP CONTEXT ACTIVATION REQUEST.
- 4) On the fourth expiry of the timer T3380, the MS shall resend the PDP CONTEXT ACTIVATION REQUEST.
- 5) On the fifth expiry of the timer T3380, the MS shall release all resources possibly allocated for this invocation and shall abort the procedure; no automatic PDP context activation re-attempt shall be performed.

#### Reference

3GPP TS 04.08 / 3GPP TS 24.008 subclause 6.1.3.1.5.

1 cell, default parameters.

Mobile Station:

The MS is in GMM-state "GMM-REGISTERED, normal service" with valid P-TMSI and CKSN.

## Case 1

For an MS that supports PDP Context Activation requested by the network.

## Test procedure

A context activation is requested by the user with a static PDP address. After receipt of the ACTIVATE PDP CONTEXT REQUEST message the SS sends a REQUEST PDP CONTEXT ACTIVATION message followed by an ACTIVATE PDP CONTEXT ACCEPT message in a time less than T3380 (Use T3380/2). The MS shall send no messages within this time.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message                        | Comments                                                                           |
|------|-----------|--------------------------------|------------------------------------------------------------------------------------|
| 1    | MS        |                                | Initiate a context activation                                                      |
| 2    | MS -> SS  | ACTIVATE PDP CONTEXT REQUEST   | Request a pdp context activation                                                   |
| 3    | SS -> MS  | REQUEST PDP CONTEXT ACTIVATION | Request a pdp context activation request                                           |
| 4    | SS        |                                | Wait for T3380/2 seconds to ensure MS does not resend ACTIVATE PDP CONTEXT REQUEST |
| 5    | SS -> MS  | ACTIVATE PDP CONTEXT ACCEPT    | Accept the pdp context activation                                                  |

Case 2

For an MS that does not support PDP Context Activation requested by the network.

Test procedure

A context activation is requested by the user. After receipt of the ACTIVATE PDP CONTEXT REQUEST message the SS sends a REQUEST PDP CONTEXT ACTIVATION message. The MS shall send a REQUEST PDP CONTEXT ACTIVATION REJECT message with cause set to 'insufficient resources' or 'feature not supported'. The SS then sends an ACTIVATE PDP CONTEXT ACCEPT.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message                               | Comments                                                                                                                 |
|------|-----------|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                                       | Initiate a context activation                                                                                            |
| 2    | MS -> SS  | ACTIVATE PDP CONTEXT REQUEST          | Request a pdp context activation                                                                                         |
| 3    | SS -> MS  | REQUEST PDP CONTEXT ACTIVATION        | Request a pdp context activation request                                                                                 |
| 4    | MS -> SS  | REQUEST PDP CONTEXT ACTIVATION REJECT | Cause set to 'insufficient resources' or 'feature not supported' or 'service option not supported' or 'protocol errors'. |
| 5    | SS -> MS  | ACTIVATE PDP CONTEXT ACCEPT           | Accept the pdp context activation                                                                                        |

Specific message contents

As default except:

## Activate PDP Context Request

| Information Element         | Value/remark       |
|-----------------------------|--------------------|
| Transaction identifier      | In the range 0-6   |
| Transaction identifier flag | 0                  |

| SM cause                    | 'insufficient resources' or 'feature not supported' |

## 45.3 PDP context modification procedure

### 45.3.1 PDP context modification

#### Applicability

This test can only be performed if the minimum QoS can be set by the user.

#### 45.3.1.1 Conformance requirement

- 1) Upon receipt of a MODIFY PDP CONTEXT REQUEST message.
  - If the MS can accept the modification requested, the MS shall reply with the MODIFY PDP CONTEXT ACCEPT message.
  - If the MS is unable to accept the modification requested, the MS shall initiate the PDP context deactivation procedure for the NSAPI that has been indicated in the message MODIFY PDP CONTEXT REQUEST - the reject cause IE value of the DEACTIVATE PDP CONTEXT REQUEST message shall indicate "QoS not accepted".
- 2) The MS shall either accept the modification request or deactivate the PDP context, it shall not ignore the modification request.

## Reference

3GPP TS 04.08 / 3GPP TS 24.008 subclause 6.1.3.2.

## 45.3.1.2 Test purpose

To test the behaviour of the MS upon receipt of a MODIFY PDP CONTEXT REQUEST message.

## 45.3.1.3 Method of test

## Related PICS/PIXIT statements

- GPRS Supported yes/no.
- User setting of Minimum QoS supported yes/no.
- Method of setting minimum QoS.
- Method of activating a pdp context.

## Initial conditions

## System Simulator:

1 cell, default parameters.

## Mobile Station:

The MS is in GMM-state "GMM-REGISTERED, normal service" with valid P-TMSI and CKSN.

## Test procedure

A PDP context is activated by the user and accepted by the SS. A MODIFY PDP CONTEXT REQUEST message is then sent to the MS with a QoS that is acceptable to the MS (higher than or equal to the minimum QoS set in the MS). The MS shall send a MODIFY PDP CONTEXT ACCEPT message in return. A MODIFY PDP CONTEXT REQUEST message is then sent to the MS with a QoS that is not acceptable to the MS (lower than the minimum QoS set in the MS). The MS shall send a DEACTIVATE PDP CONTEXT REQUEST message in return.

## Maximum duration of test

5 minutes.

## Expected sequence

| Step | Direction | Message                        | Comments                                                                                               |
|------|-----------|--------------------------------|--------------------------------------------------------------------------------------------------------|
| 1    | MS        |                                | Initiate a context activation                                                                          |
| 2    | MS -> SS  | ACTIVATE PDP CONTEXT REQUEST   | Activate a PDP context                                                                                 |
| 3    | SS -> MS  | ACTIVATE PDP CONTEXT ACCEPT    | Accept the PDP context                                                                                 |
| 4    | SS -> MS  | MODIFY PDP CONTEXT REQUEST     | Request the modification of a pdp context                                                              |
| 5    | MS -> SS  | MODIFY PDP CONTEXT ACCEPT      | Accept the pdp context modification                                                                    |
| 6    | SS -> MS  | MODIFY PDP CONTEXT REQUEST     | Request the modification of a pdp context                                                              |
| 7    | MS -> SS  | DEACTIVATE PDP CONTEXT REQUEST | Reject the pdp context modification by deactivating the pdp context. Cause set to 'QoS not acceptable' |
| 8    | SS -> MS  | DEACTIVATE PDP CONTEXT ACCEPT  | Accept the pdp context deactivation                                                                    |

Specific message contents

As default except:

Activate PDP Context Request

| Information Element         | Value/remark       |

## Deactivate PDP Context Accept

| Information Element         | Value/remark |
|-----------------------------|--------------|
| Transaction identifier      | As above     |
| Transaction identifier flag | 1            |

## 45.4 PDP context deactivation procedure

### 45.4.1 PDP context deactivation initiated by the MS

#### 45.4.1.1 Conformance requirement

The message contains the transaction identifier in use for the PDP context to be deactivated and a cause code that typically indicates one of the following causes:

- #26: insufficient resources;
- #36: regular PDP context deactivation; or
- #37: QoS not accepted.

Upon receipt of the DEACTIVATE PDP CONTEXT ACCEPT message, the MS shall stop timer T3390.

- Whenever any session management message except REQUEST PDP CONTEXT ACTIVATION or SM-STATUS is received by the MS specifying a transaction identifier which is not recognised as relating to an active context or to a context that is in the process of activation or deactivation or has been [recently] deactivated, the MS shall send a SM-STATUS message with cause #81 "invalid transaction identifier value" using the received transaction identifier value and remain in the PDP-INACTIVE state.

#### Reference

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 6.1.3.3.1 and 8.3.2 (b).

#### 45.4.1.2 Test purpose

To test the behaviour of the MS upon receipt of a DEACTIVATE PDP CONTEXT ACCEPT message from the network.

#### 45.4.1.3 Method of test

#### Related PICS/PIXIT statements

- GPRS Supported yes/no.
- Method of activating a pdp context.
- Method of deactivating the pdp context.

## Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in GMM-state "GMM-REGISTERED, normal service" with valid P-TMSI and CKSN.

## Test procedure

A PDP context is activated by the user and accepted by the SS. The context deactivation is then requested by the user. The MS shall send a DEACTIVATE PDP CONTEXT REQUEST message to the SS. The SS shall then reply with a DEACTIVATE PDP CONTEXT ACCEPT message. The SS shall then wait for T3390 +10% seconds to ensure T3390 has been stopped and that no further messages are sent from the MS. The SS shall then send a MODIFY PDP CONTEXT REQUEST for the deactivated context and the MS shall reply with an SM STATUS message with cause #81 'transaction identifier not known'.

## Maximum duration of test

5 minutes.

## Expected sequence

| Step | Direction | Message                        | Comments                                                                              |
|------|-----------|--------------------------------|---------------------------------------------------------------------------------------|
| 1    | MS        |                                | Initiate a context activation                                                         |
| 2    | MS -> SS  | ACTIVATE PDP CONTEXT REQUEST   | Activate a pdp context                                                                |
| 3    | SS -> MS  | ACTIVATE PDP CONTEXT ACCEPT    | Accept the pdp context                                                                |
| 4    | MS        |                                | Initiate a context deactivation                                                       |
| 5    | MS -> SS  | DEACTIVATE PDP CONTEXT REQUEST | Request a deactivation of a pdp context                                               |
| 6    | SS -> MS  | DEACTIVATE PDP CONTEXT ACCEPT  | Accept the pdp context deactivation                                                   |
| 7    | SS        |                                | Wait for T3390 +10% seconds to ensure no further deactivate request messages are sent |
| 8    | SS -> MS  | MODIFY PDP CONTEXT REQUEST     | Send a modify request for the deactivated context.                                    |
| 9    | MS -> SS  | SM STATUS                      | Cause set to #81                                                                      |

## 45.4.2 PDP context deactivation initiated by the network

### 45.4.2.1 Conformance requirement

The MS shall, upon receipt of the DEACTIVATE PDP CONTEXT REQUEST message, reply with a DEACTIVATE PDP CONTEXT ACCEPT message.

- Whenever any session management message except REQUEST PDP CONTEXT ACTIVATION or SM-STATUS is received by the MS specifying a transaction identifier which is not recognised as relating to an active context or to a context that is in the process of activation or deactivation or has been [recently] deactivated, the MS shall send a SM-STATUS message with cause #81 "invalid transaction identifier value" using the received transaction identifier value and remain in the PDP-INACTIVE state.

## Reference

3GPP TS 04.08 / 3GPP TS 24.008 subclauses 6.1.3.3.2 and 8.3.2 (b).

## 45.4.2.2 Test purpose

To test the behaviour of the MS upon receipt of a DEACTIVATE PDP CONTEXT REQUEST message from the network.

## 45.4.2.3 Method of test

## Related PICS/PIXIT statements

- GPRS Supported yes/no.
- Method of activating a pdp context.

## Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in GMM-state "GMM-REGISTERED, normal service" with valid P-TMSI and CKSN.

## Test procedure

A PDP context is activated by the user and accepted by the SS. A DEACTIVATE PDP CONTEXT REQUEST message is then sent by the SS. The MS shall reply with a DEACTIVATE PDP CONTEXT ACCEPT message. The SS shall then send a MODIFY PDP CONTEXT REQUEST for the deactivated context and the MS shall reply with an SM STATUS message with cause #81 'transaction identifier not known'.

## Maximum duration of test

5 minutes.

## Expected sequence

| Step | Direction | Message                        | Comments                                           |
|------|-----------|--------------------------------|----------------------------------------------------|
| 1    | MS        |                                | Initiate a context activation                      |
| 2    | MS -> SS  | ACTIVATE PDP CONTEXT REQUEST   | Activate a PDP context                             |
| 3    | SS -> MS  | ACTIVATE PDP CONTEXT ACCEPT    | Accept the PDP context                             |
| 4    | SS -> MS  | DEACTIVATE PDP CONTEXT REQUEST | Request a deactivation of a pdp context            |
| 5    | MS -> SS  | DEACTIVATE PDP CONTEXT ACCEPT  | Accept the pdp context deactivation.               |
| 6    | SS -> MS  | MODIFY PDP CONTEXT REQUEST     | Send a modify request for the deactivated context. |
| 7    | MS -> SS  | SM STATUS                      | Cause set to #81                                   |

## Specific message contents

As default except:

## Activate PDP Context Request

| Information Element         | Value/remark       |

## 45.4.3 Abnormal cases

### 45.4.3.1 T3390 Expiry

#### 45.4.3.1.1 Conformance requirement

- 1) On the first expiry of timer T3390, the MS shall resend the message DEACTIVATE PDP CONTEXT REQUEST.
- 2) On the second expiry of timer T3390, the MS shall resend the message DEACTIVATE PDP CONTEXT REQUEST.
- 3) On the third expiry of timer T3390, the MS shall resend the message DEACTIVATE PDP CONTEXT REQUEST.
- 4) On the fourth expiry of timer T3390, the MS shall resend the message DEACTIVATE PDP CONTEXT REQUEST.
- 5) On the fifth expiry of timer T3390, the MS shall release all resources allocated and shall erase the PDP context related data.

#### Reference

3GPP TS 04.08 / 3GPP TS 24.008 subclause 6.1.3.3.3.

#### 45.4.3.1.2 Test purpose

To test the behaviour of the MS when the network does not reply to a DEACTIVATE PDP CONTEXT REQUEST message from the MS.

#### 45.4.3.1.3 Method of test

#### Related PICS/PIXIT statements

- GPRS Supported yes/no.
- Method of activating a pdp context.
- Method of deactivating a pdp context.

#### Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in GMM-state "GMM-REGISTERED, normal service" with valid P-TMSI and CKSN.

#### Test procedure

A PDP context is activated by the user and accepted by the SS. A context deactivation is then requested by the user. The MS shall send a DEACTIVATE PDP CONTEXT REQUEST message five times with  $T3390 \pm 10\%$  seconds between each message.  $T3390 + 10\%$  seconds after the fifth message the SS shall send a MODIFY PDP CONTEXT REQUEST message for the deactivated context and the MS shall reply with SM STATUS with cause set to #81 'Transaction identifier not known'.

#### Maximum duration of test

5 minutes.

Expected sequence

## 45.4.3.2 Collision of MS and network initiated PDP context deactivation requests

## 45.4.3.2.1 Conformance requirement

If the MS and the network initiated PDP context deactivation requests collide, the MS and the network shall each reply with the message DEACTIVATE PDP CONTEXT ACCEPT and shall stop timer T3390 and T3395, respectively.

## Reference

3GPP TS 04.08 / 3GPP TS 24.008 subclause 6.1.3.3.3.

## 45.4.3.2.2 Test purpose

To test the behaviour of the MS when there is a collision between an MS initiated and a network initiated context deactivation.

## 45.4.3.2.3 Method of test

## Related PICS/PIXIT statements

- GPRS Supported yes/no.
- Method of activating a pdp context.
- Method of deactivating a pdp context.

## Initial conditions

## System Simulator:

1 cell, default parameters.

## Mobile Station:

The MS is in GMM-state "GMM-REGISTERED, normal service" with valid P-TMSI and CKSN.

## Test procedure

A PDP context is activated by the user and accepted by the SS. A context deactivation is then requested by the user. Upon receipt of the DEACTIVATE PDP CONTEXT REQUEST message the SS sends a DEACTIVATE PDP CONTEXT REQUEST message. The MS shall reply with only one DEACTIVATE PDP CONTEXT ACCEPT message. Upon receipt of this message the SS sends a DEACTIVATE PDP CONTEXT ACCEPT message.

## Maximum duration of test

5 minutes.

## Expected sequence

| Step | Direction | Message                        | Comments                                |

## 45.5 Unknown or Unforeseen Transaction Identifier/Non- semantical Mandatory Information Element Errors

### 45.5.1 Error cases

#### 45.5.1.1 Conformance requirement

##### 45.5.1.1.1 Conformance requirement for release 98 and earlier MS

The mobile station shall reject a session management message other than SM-STATUS received with TI value "111" by immediately sending an SM-STATUS message with TI value "111". For a session management message received with TI different from "111", the following procedures shall apply:

- Whenever any session management message except REQUEST PDP CONTEXT ACTIVATION or SM-STATUS is received by the MS specifying a transaction identifier which is not recognised as relating to an active context or to a context that is in the process of activation or deactivation or has been [recently] deactivated, the MS shall send a SM-STATUS message with cause #81 "invalid transaction identifier value" using the received transaction identifier value and remain in the PDP-INACTIVE state.
- When a REQUEST PDP CONTEXT ACTIVATION message is received with a transaction identifier flag set to "1", this message shall be ignored.

When on receipt of a message:

- an "imperative message part" error; or
- a "missing mandatory IE" error;

is diagnosed or when a message containing:

- a syntactically incorrect mandatory IE; or
- an IE unknown in the message, but encoded as "comprehension required"; or
- an out of sequence IE encoded as "comprehension required";

is received, the mobile station shall proceed as follows:

- If the message was an SM message the SM-STATUS message with cause # 96 "invalid mandatory information" shall be returned.
- If a mobile station receives a GMM message or SM message with message type not defined for the PD or not implemented by the receiver, it shall return a status message (GMM STATUS or SM STATUS depending on the protocol discriminator) with cause #97 'message type non-existent or not implemented'.
- If the mobile station receives a message not compatible with the protocol state, the mobile station shall ignore the message except for the fact that, if an RR connection exists, it returns a status message (STATUS, MM STATUS depending on the protocol discriminator) with cause #98 "Message type not compatible with protocol state". When the message was a GMM message the GMM-STATUS message with cause #98 "Message type not compatible with protocol state" shall be returned. When the message was a SM message the SM-STATUS message with cause #98 'Message type not compatible with protocol state' shall be returned.
- Other syntactic errors.

This subclause applies to the analysis of the value part of an information element. It defines the following terminology:

- An IE is defined to be syntactically incorrect in a message if it contains at least one value defined as 'reserved', or if its value part violates syntactic rules given in the specification of the value part. However it is not a syntactical error that a type 4 standard IE specifies in its length indicator a greater length than possible according to the value part specification: extra bits are ignored.

## Reference

3GPP TS 04.08 subclauses 8.3.2 and 8.5.

3GPP TS 04.07 subclause 11.4.2.

### 45.5.1.1.2 Conformance requirement for release 99 and later MS

The mobile station and network shall ignore a session management message with TI EXT bit = 0. Otherwise, the following procedures shall apply:

- Whenever any session management message except REQUEST PDP CONTEXT ACTIVATION or SM-STATUS is received by the MS specifying a transaction identifier which is not recognized as relating to an active context or to a context that is in the process of activation or deactivation, the MS shall send a SM-STATUS message with cause #81 "invalid transaction identifier value" using the received transaction identifier value including the extension octet and remain in the PDP-INACTIVE state.
- When REQUEST PDP CONTEXT ACTIVATION message is received with a transaction identifier flag set to "1", this message shall be ignored.

When on receipt of a message,

- an "imperative message part" error; or
- a "missing mandatory IE" error;

is diagnosed or when a message containing:

- a syntactically incorrect mandatory IE; or
- an IE unknown in the message, but encoded as "comprehension required" (see 3GPP TS 24.007); or
- an out of sequence IE encoded as "comprehension required" (see 3GPP TS 24.007) is received,

the mobile station shall proceed as follows:

If the message is not one of the messages listed in subclauses 8.5.1, 8.5.2, 8.5.3, 8.5.4 and 8.5.5 a) or b), the mobile station shall ignore the message except for the fact that, if an RR connection exists, it shall return a status message (STATUS, MM STATUS depending on the protocol discriminator) with cause # 96 "Invalid mandatory information". If the message was a GMM message the GMM-STATUS message with cause #96 " Invalid mandatory information" shall be returned. If the message was an SM message the SM-STATUS message with cause # 96 "invalid mandatory information" shall be returned.

- the network shall proceed as follows:

When the message is not one of the messages listed in subclause 8.5.3 b), c), d) or e) and 8.5.5 a) or c), the network shall either:

- try to treat the message (the exact further actions are implementation dependent), or
- ignore the message except that it should return a status message (STATUS, or MM STATUS (depending on the protocol discriminator), GMM STATUS, or SM STATUS) with cause # 96 "Invalid mandatory information".

This subclause applies to the analysis of the value part of an information element. It defines the following terminology:

- An IE is defined to be syntactically incorrect in a message if it contains at least one value defined as 'reserved', or if its value part violates syntactic rules given in the specification of the value part. However it is not a syntactical error that a type 4 standard IE specifies in its length indicator a greater length than possible according to the value part specification: extra bits are ignored.

## Reference

3GPP TS 24.008 subclauses 8.3.2 and 8.5.

3GPP TS 24.007 subclause 11.4.2.

### 45.5.1.2 Test Purpose

To test the behaviour of the MS when messages with unknown or unforeseen transaction identifiers or non-semantical mandatory information element errors occur.

### 45.5.1.3 Method of test

## Related PICS/PIXIT statements

- GPRS Supported yes/no.
- Method of activating a pdp context.
- MS GPRS Release

## Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in GMM-state "GMM-REGISTERED, normal service" with valid P-TMSI and CKSN.

### Test procedure

A PDP context activation is requested by the SS with the transaction identifier set to '1'. The MS shall not respond to this request.

A PDP context is then activated from the MS. An invalid accept message is then sent by the SS. The MS shall then send an SM STATUS message. After the MS has sent an ACTIVATE PDP CONTEXT REQUEST message the SS sends a MODIFY PDP CONTEXT REQUEST message with the same transaction identifier. The MS shall reply with an SM STATUS message with the cause set to #98 'Message type not compatible with protocol state'.

After T3380 has expired  $\pm 10\%$  seconds the MS shall send another ACTIVATE PDP CONTEXT REQUEST message. The SS sends back a Session Management message with an unknown message type. The MS shall reply with an SM STATUS message with the cause set to #97 'Message type non-existent or not implemented'.

After a further T3380 has expired the MS shall send another ACTIVATE PDP CONTEXT REQUEST message  $\pm 10\%$  seconds. Another invalid accept message is sent by the SS.

After a further T3380 has expired  $\pm 10\%$  seconds a valid accept message with QoS length greater than 3 is sent by the SS. This shall be accepted by the MS.

A deactivate message is then sent from the SS coded with the extension mechanism for TI. Therefore the TIO value is set to 111 and the transaction identifier extension TIE is set to 0 (reserved value) . A MS implemented release 98 or earlier should reply with an SM STATUS message with transaction identifier set to '111'. A MS implemented release 99 or later should ignore the message.

A deactivate message is then sent from the SS with a different transaction identifier to the one used in the activate request message sent by the MS. The MS shall reply with an SM STATUS message with cause #81 'invalid transaction identifier value'.

Two invalid modification messages are then sent to the MS in turn. The MS shall respond each time with an SM-STATUS message with cause # 96 "invalid mandatory information".

### Maximum duration of test

5 minutes.

## Expected sequence

| Step | Direction | Message                        | Comments                                                                                                                                                             |
|------|-----------|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | REQUEST PDP CONTEXT ACTIVATION | Request the activation of a PDP context with the transaction identifier flag set to "1"                                                                              |
| 2    | SS        |                                | Wait 30 seconds to ensure MS does not request context activation                                                                                                     |
| 3    | MS        |                                | Initiate a context request                                                                                                                                           |
| 4    | MS -> SS  | ACTIVATE PDP CONTEXT REQUEST   | Activate a PDP context from the MS                                                                                                                                   |
| 5    | SS -> MS  | ACTIVATE PDP CONTEXT ACCEPT    | Unknown IE encoded as 'comprehension required'                                                                                                                       |
| 6    | MS -> SS  | SM STATUS                      | Cause set to #96                                                                                                                                                     |
| 7    | MS -> SS  | ACTIVATE PDP CONTEXT REQUEST   | Activate a PDP context from the MS (auto-generated)<br>This message shall be sent within T3380 seconds $\pm 10\%$ from the last ACTIVATE PDP CONTEXT REQUEST message |
| 8    | SS -> MS  | MODIFY PDP CONTEXT REQUEST     | Request the modification of the PDP context                                                                                                                          |

| 'Comprehension required IE' | 0Fh NOTE: first four bits encoded as 'comprehension required' |

Activate PDP Context Accept (used in step 14)

| Information Element            | Value/remark                                                  |
|--------------------------------|---------------------------------------------------------------|
| Transaction identifier         | As above                                                      |
| Transaction identifier flag    | 1                                                             |
| Negotiated LLC SAPI            | As above                                                      |
| Negotiated QoS                 | As above                                                      |
| Radio priority level           | Arbitrarily chosen                                            |
| Spare half octet               | 0                                                             |
| PDP address                    | omitted                                                       |
| 'Comprehension required IE'    | 07h NOTE: first four bits encoded as 'comprehension required' |
| Protocol configuration options | Minimum length with Configuration protocol of 'PPP'           |

Activate PDP Context Accept (used in step 17)

| Information Element         | Value/remark                                                                              |
|-----------------------------|-------------------------------------------------------------------------------------------|
| Transaction identifier      | As above                                                                                  |
| Transaction identifier flag | 1                                                                                         |
| Negotiated LLC SAPI         | As above                                                                                  |
| Negotiated QoS              | As above but with length set to 5 and 2 extra octets set to 0 after the normal QoS octets |
| Radio priority level        | Arbitrarily chosen                                                                        |
| Spare half octet            | 0                                                                                         |
| PDP address                 | omitted                                                                                   |

Deactivate PDP Context Request (used in step 18)

| Information Element         | Value/remark              |
|-----------------------------|---------------------------|
| Transaction identifier      | 111                       |
| Transaction identifier flag | 1                         |
| SM cause                    | 24h, regular deactivation |

Deactivate PDP Context Request (used in step 20)

| Information Element         | Value/remark                                                                            |
|-----------------------------|-----------------------------------------------------------------------------------------|
| Transaction identifier      | In the range 2-8, but different from the TI in the Activate PDP Context Request message |
| Transaction identifier flag | 1                                                                                       |
| SM cause                    | 24h, regular deactivation                                                               |

Modify PDP Context Request (used in step 22)

| Information Element         | Value/remark                |
|-----------------------------|-----------------------------|
| Transaction identifier      | As above                    |
| Transaction identifier flag | 1                           |
| Radio priority level        | As above                    |
| Spare half octet            | 0                           |
| Requested LLC SAPI          | As above                    |
| New QoS                     | This IE will NOT be present |

Modify PDP Context Request (used in step 24)

| Information Element         | Value/remark                     |
|-----------------------------|----------------------------------|
| Transaction identifier      | As above                         |
| Transaction identifier flag | 1                                |
| Radio priority level        | As above                         |
| Spare half octet            | 0                                |
| Requested LLC SAPI          | 0 NOTE: this is a reserved value |
| New QoS                     | Arbitrary value                  |

---

## 46 LLC and SNDCP Tests

### 46.1 LLC Tests

This subclause contains the test case requirements for Logical Link Control (LLC) procedures in the General Packet Radio Service (GPRS).

#### 46.1.1 Default Conditions

The default values of LLC layer parameters are as per "Table 9: LLC layer parameter default values" in clause 8.9.8 of 3GPP TS 04.64. It is possible that the MS negotiates values different from what is given in the table. In the case where the negotiated value affects the test operation, this is noted in the test.

- The MS default initial condition is that it is GPRS attached and ciphering disabled.

Unless stated otherwise, the default conditions shall apply.  $N_{MS}$  denotes the frames sent from the MS and  $N_{SS}$  denotes the frames sent from the SS.

For all timers, a measurement tolerance of  $\pm 10\%$  shall be applied.

The MS may send an XID command any time. The SS shall send an XID response accepting the values proposed by the MS, unless stated otherwise in the test case.

#### 46.1.2 Test cases

##### 46.1.2.1 Unacknowledged data transfer

###### 46.1.2.1.1 Data transmission in protected mode

###### 46.1.2.1.1.1 Conformance requirement

LLC has two modes of operation - acknowledged and unacknowledged. In the unacknowledged mode of operation, layer3 information is transmitted in numbered Unconfirmed Information (UI) frames. The UI frames are not acknowledged at the LLC layer. Neither error recovery nor reordering mechanisms is defined, but transmission and format errors are detected. Duplicate UI frames are discarded.

In the protected mode of unacknowledged operation, the FCS field protects the frame header and the information field.

Unacknowledged mode of operation is defined for all SAPIs that are not reserved.

#### Reference

3GPP TS 04.64, subclause 4.3.

###### 46.1.2.1.1.2 Test purpose

To verify that the MS performs unacknowledged data transfer for SAPIs 3, 5 and 11 in the protected mode to the network

###### 46.1.2.1.1.3 Method of test

#### Initial conditions

The MS shall be GPRS attached with ciphering enabled.

#### Related PICS/PIXIT Statement

-

## Test procedure

During GPRS attach and PDP context activation, the GMM messages are sent and received by the LLC layer at the MS using UI frames in the unacknowledged mode, on SAPI 1. This implicitly verifies bi-directional unacknowledged data transmission on SAPI 1.

After the PDP context is activated, the MS is made to initiate unacknowledged data transfer on SAPI 3. MS shall transmit UI frames with the E and PM bits set to 1, indicating that encryption and protection are on. Transmit 5 000 octets from the MS.

Repeat the test case for SAPIs 5 and 11.

## Maximum duration of the test

3 minutes.

## Expected sequence

### 46.1.2.1.2 Data transmission in unprotected mode

#### 46.1.2.1.2.1 Conformance requirement

LLC has two modes of operation - acknowledged and unacknowledged. In the unacknowledged mode of operation, layer3 information is transmitted in numbered Unconfirmed Information (UI) frames. The UI frames are not acknowledged at the LLC layer. Neither error recovery nor reordering mechanisms is defined, but transmission and format errors are detected. Duplicate UI frames are discarded.

In the unprotected mode of unacknowledged operation, the FCS field protects the frame header and the first N202 octets of the information field

Unacknowledged mode of operation is defined for all SAPIs that are not reserved.

#### Reference

3GPP TS 04.64, subclause 4.3.

#### 46.1.2.1.2.2 Test purpose

To verify that the MS performs unacknowledged data transfer without protection in the correct manner, on SAPIs 5 and 9.

#### 46.1.2.1.2.3 Method of test

#### Initial conditions

-

Related PICS/PIXIT Statement

-

Test procedure

After the PDP context is activated, the MS initiates unacknowledged data transfer on SAPI 5. The MS shall transmit UI frames with the E and PM bits set to 0, indicating that encryption and protection are off.

Repeat the test case for SAPI 9.

Maximum duration of the test

3 minutes.

Expected sequence

| 7    |           |                          | Repeat step 3 until all 2000 octets are transmitted. The MS must not send anymore DM frames. |

## 46.1.2.2 Acknowledged data transfer

### 46.1.2.2.1 Link establishment

#### 46.1.2.2.1.1 Link establishment from MS to SS

##### 46.1.2.2.1.1.1 Conformance requirement

In the acknowledged operation, layer 3 information is transmitted in numbered Information (I) frames. The I frames are acknowledged at the LLC layer. Error recovery and reordering procedures based on retransmission of unacknowledged I frames are specified.

Acknowledged operation requires that ABM operation has been initiated by an establishment procedure using the Set Asynchronous Balanced Mode (SABM) command.

Acknowledged operation is allowed for all SAPs that are not reserved except SAPs 1 and 7 for Release 97-98 and 1, 2, 7 and 8 for Release 99.

### Reference

3GPP TS 04.64, subclauses 4.4 and 8.5.2.

##### 46.1.2.2.1.1.2 Test purpose

To test the establishment and release of acknowledged mode data transfer from the MS to the SS.

##### 46.1.2.2.1.1.3 Method of test

### Initial conditions

-

### Related PICS/PIXIT Statement

-

## Test procedure

Initiate acknowledged data transfer from the MS on SAPI 3. Verify that the MS establishes a link before initiating data transfer.

Initiate data transfer from the MS and ensure that the data sent from the MS is received at the SS.

## Maximum duration of the test

5 minutes.

## Expected sequence

| Step | Direction | Message                  | Comments                                                                                                                   |
|------|-----------|--------------------------|----------------------------------------------------------------------------------------------------------------------------|
| 1    |           | {PDP Context Activation} | Macro. Initiate PDP context activation from the MS using PDP Context11. Initiate data transfer of 5000 octets from the MS. |

### 46.1.2.2.1.3 Loss of UA frame

#### 46.1.2.2.1.3.1 Conformance requirement

If timer T200 expires before the UA or DM response with the F bit set to 1 is received, the LLE shall:

- retransmit the SABM command;
- set timer T200;
- increment the retransmission counter.

#### Reference

3GPP TS 04.64, subclause 8.5.1.3.

#### 46.1.2.2.1.3.2 Test purpose

To test the MS response to the loss of a UA frame during link establishment.

#### 46.1.2.2.1.3.3 Method of test

#### Initial conditions

-

## Related PICS/PIXIT Statement

-

## Test procedure

Initiate link establishment for acknowledged data transfer from the MS, for SAPI 9. When the SS receives the SABM frame, do not send a response.

After the MS sends another SABM, respond with a UA from the SS and send some frames from the SS to ensure that the link is established.

## Maximum duration of the test

3 minutes.

## Expected sequence

## 46.1.2.2.2 MS sends I+S frames

## 46.1.2.2.2.1 Checking N(S)

## 46.1.2.2.2.1.1 Conformance requirement

Having either transmitted the UA response to a received SABM command or received the UA response to a transmitted SABM command, I frames and supervisory frames may be transmitted and received. I frames shall be transmitted in ascending N(S) order.

When there is an opportunity to transmit a frame, then the LLE shall do one of the following in the order of priority:

- If there are any I frames marked for retransmission and if the LLE is not in the peer receive busy condition, then the LLE shall increment by 1 the retransmission count variable for the I frame with lowest send sequence number N(S). If the retransmission count variable does not exceed the value of N200, then the LLE shall retransmit the frame.
- If the LLE has a new frame to retransmit, if  $V(S) < V(A) + k$  and if the LLE is not in the peer receiver busy condition, then the new I frame shall be transmitted.
- If the LLE has an acknowledgement to transmit, then the LLE shall transmit an S frame.

## Reference

3GPP TS 04.64, subclauses 8.6 and 8.6.1.

## 46.1.2.2.2.1.2 Test purpose

To verify that the MS handles the send sequence number N(S) correctly.

## 46.1.2.2.2.1.3 Method of test

## Initial conditions

-

## Related PICS/PIXIT Statement

-

## Test procedure

Initiate data transfer from the MS on SAPI 3. Send 515 I+S frames continuously. The value of N(S) shall begin from 0 and increment by 1 mod (512) for each frame.

Acknowledge each I frame by sending an RR frame to the MS, in sequence.

## Maximum duration of the test

30 minutes.

## Expected sequence

| Step | Direction | Message                  | Comments                                                                                                                                                                                         |
|------|-----------|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    |           | {PDP Context Activation} | Macro. Initiate a PDP context activation using PDP Context 11, from the MS.                                                                                                                      |

| 5    |           |                          | Repeat steps 3 and 4 until all 515 I+S frames have been transmitted from the MS. Verify that :<br>the MS does not retransmit any frame.<br>N(S) begins with 0 and is incremented by 1 mod (512). |

NOTE: The application will resend data until all data have been sent.

## 46.1.2.2.2.2 Busy condition at the peer, with RR sent for resumption of transmission

## 46.1.2.2.2.2.1 Conformance requirement

The receive not ready (RNR) command shall be used by an LLE to indicate a busy condition. The value of N(R) in the RNR frame acknowledges I frames numbered up to and including N(R) - 1 . Subsequent frames, if any, shall not be considered confirmed.

After receiving a valid RNR frame, the LLE shall:

- set a peer receiver busy condition;
- not transmit or retransmit any frames to the peer LLE;
- treat the N(R) contained in the received RNR as an acknowledgement for all the I frames that have been (re-)transmitted, up to and including N(R)- 1 and set its V(A) to the value of N(R) contained in the RNR frame;
- set T201 to initiate the inquiry process; and
- reset the retransmission count variable.

If timer T201 expires, the LLE shall:

- if the value of the retransmission count variable is less than N200:
  - transmit an appropriate supervisory frame with an A bit set to 1;
  - set timer T201; and
  - add one to its retransmission count variable.

The LLE receiving the supervisory frame with the A bit set to 1 shall respond, at the earliest opportunity, with an appropriate supervisory frame (see subclause 8.6.4.1) to indicate whether or not its own receiver busy condition still exists.

Upon receipt of the supervisory frame, the LLE shall reset timer T201, and:

- if the frame is an RR, ACK or SACK frame:
  - the peer receiver busy condition shall be cleared;
  - if timer T201 was active before the peer receiver busy condition was set, and if the associated I frame is still not acknowledged, then timer T201 shall be set and associated with the same I frame; and
  - the LLE may transmit new I frames or retransmit I frames as defined in subclauses 8.6.1 or 8.6.3, respectively.

The busy peer shall respond at the earliest opportunity, with an appropriate supervisory frame.

- If the highest numbered I frame was received with  $N(S)=V(R)$ , the appropriate supervisory frame is the RR frame.

## Reference

3GPP TS 04.64, subclauses 6.4.3.4 and 8.6.4.

### 46.1.2.2.2.2.2 Test purpose

To verify that the MS:

- Handles busy condition when an RNR is sent from the SS;
- Resumes transmission upon reception of an RR.

### 46.1.2.2.2.2.3 Method of test

#### Initial conditions

-

#### Related PICS/PIXIT Statement

-

#### Test procedure

The MS is made to send 1 I+S frame on SAPI 9. The SS acknowledges the received I+S frame with a supervisory RNR frame.

Immediately after the first RNR frame, the MS shall stop sending I+S frames and start the retransmission timer T201.

After T201 seconds, send an RR frame from the SS.

Immediately after the first RR frame, the MS shall restart the transmission of I+S frames from the point at which it ceased to receive acknowledgement.

Maximum duration of the test

5 minutes.

Expected sequence

| Step | Direction | Message                  | Comments                                                                                                                                                |

#### 46.1.2.2.2.3 Busy condition at the peer, with ACK sent for resumption of transmission

##### 46.1.2.2.2.3.1 Conformance requirement

The receive not ready (RNR) command shall be used by an LLE to indicate a busy condition. The value of N(R) in the RNR frame acknowledges I frames numbered up to and including N(R) - 1 . Subsequent frames, if any, shall not be considered confirmed.

After receiving a valid RNR frame, the LLE shall:

- set a peer receiver busy condition;
- not transmit or retransmit any frames to the peer LLE;
- treat the N(R) contained in the received RNR as an acknowledgement for all the I frames that have been (re-)transmitted, up to and including N(R)- 1 and set its V(A) to the value of N(R) contained in the RNR frame;
- set T201 to initiate the inquiry process; and
- reset the retransmission count variable.

If timer T201 expires, the LLE shall:

- if the value of the retransmission count variable is less than N200:
  - transmit an appropriate supervisory frame with an A bit set to 1;
  - set timer T201; and
  - add one to its retransmission count variable.

The LLE receiving the supervisory frame with the A bit set to 1 shall respond, at the earliest opportunity, with an appropriate supervisory frame (see subclause 8.6.4.1) to indicate whether or not its own receiver busy condition still exists.

Upon receipt of the supervisory frame, the LLE shall reset timer T201, and:

- if the frame is an RR, ACK or SACK frame:
  - the peer receiver busy condition shall be cleared;
  - if timer T201 was active before the peer receiver busy condition was set, and if the associated I frame is still not acknowledged, then timer T201 shall be set and associated with the same I frame; and
  - the LLE may transmit new I frames or retransmit I frames as defined in subclauses 8.6.1 or 8.6.3, respectively.

The busy peer shall respond at the earliest opportunity, with an appropriate supervisory frame.

- If the highest numbered frame was received with  $N(S) = V(R) + 1$ , the appropriate frame is the ACK frame.

#### Reference

3GPP TS 04.64, subclauses 6.4.3.4 and 8.6.4.

#### 46.1.2.2.2.3.2 Test purpose

To verify that the MS:

- Handles busy condition when an RNR is sent from the SS;
- Resumes transmission upon reception of an ACK.

#### 46.1.2.2.2.3.3 Method of test

#### Initial conditions

-

#### Related PICS/PIXIT Statement

-

#### Test procedure

The MS is made to send I+S frames continuously on SAPI 11. The SS acknowledges the received I+S frames with supervisory RR frames. After 1 second, it acknowledges the received I+S frames with a supervisory RNR frame.

Immediately after the first RNR frame, the MS shall stop sending I+S frames and start the retransmission timer T201. The RNR frame will indicate that all frames except the one before the last one has been received.

After T201 seconds, send an ACK frame from the SS.

Immediately after the first ACK frame, the MS shall restart the transmission of I+S frames from the point at which it ceased to receive acknowledgement. The frame before the last one shall be transmitted first from the MS.

#### Maximum duration of the test

5 minutes.

| 13   | SS -> MS  | RR                       | Acknowledge all the frames transmitted by the MS.                                                                                                                                            |

#### 46.1.2.2.2.4 SACK frame

##### 46.1.2.2.2.4.1 Conformance requirement

On receipt of a valid SACK frame, the LLE shall consider all I frames with the corresponding bit set to 1 in the SACK bitmap as acknowledged.

##### Reference

3GPP TS 04.64, subclause 8.6.3.2.

##### 46.1.2.2.2.4.2 Test purpose

To verify that the MS considers only the frames as indicated by the SACK bitmap have been received correctly and that it retransmits the frames that have not been acknowledged.

##### 46.1.2.2.2.4.3 Method of test

##### Initial conditions

-

##### Related PICS/PIXIT Statement

-

##### Test procedure

Initiate data transfer from the MS and send frames from  $N(S) = 0$  to  $N(S) = N_{MS}$ , where  $N_{MS}$  is less than  $kU$ . Acknowledge all frames until  $N_{MS} - 6$ . Do not acknowledge the frames  $N_{MS} - 6$ ,  $N_{MS} - 3$ ,  $N_{MS} - 2$  and  $N_{MS} - 1$ . Acknowledge the other frames ( $N_{MS} - 5$ ,  $N_{MS} - 4$ ,  $N_{MS}$ ) by using SACK. Verify that the MS retransmits the frames  $N_{MS} - 6$ ,  $N_{MS} - 3$ ,  $N_{MS} - 2$  and  $N_{MS} - 1$ . Acknowledge the retransmitted frames.

Maximum duration of the test

3 minutes.

Expected sequence

#### 46.1.2.2.3 Reception of I + S frames at the MS

##### 46.1.2.2.3.1 Checking N(R)

###### 46.1.2.2.3.1.1 Conformance requirement

Whenever an LLE receives a frame with the A bit set to 1, it shall transmit an I+S or S frame.

In ABM mode, all I frames and Supervisory frames contain  $N(R)$ , the expected send sequence number of the next in-sequence received I frame. At the time that a frame of the above type is designated for transmission, the value of  $N(R)$  is equal to the value of the receive state variable  $V(R)$ .  $N(R)$  indicates that the LLE transmitting the  $N(R)$  has correctly received all I frames numbered up to and including  $N(R) - 1$ .

###### Reference

3GPP TS 04.64, subclauses 6.3.5.4.5 and 8.6.3.1.

###### 46.1.2.2.3.1.2 Test purpose

To verify that the MS transmits acknowledgements with the correct  $N(R)$ .

###### 46.1.2.2.3.1.3 Method of test

Initial conditions

-

Related PICS/PIXIT Statement

-

Test procedure

Send I+S frames continuously from the SS. Send more than 512 frames. The delay between two I+S frames should be less than T201.

Do not send any data from the MS.

When the MS sends RR frames, check the value of N(R) to verify that it indicates that all frames sent from the SS has been acknowledged.

Maximum duration of the test

30 minutes.

#### 46.1.2.2.3.2 MS handling busy condition during bi-directional data transfer

##### 46.1.2.2.3.2.1 Conformance requirement

The receive not ready (RNR) command shall be used by an LLE to indicate a busy condition. The value of N(R) in the RNR frame acknowledges I frames numbered up to and including N(R) - 1. Subsequent frames, if any, shall not be considered confirmed.

After receiving a valid RNR frame, the LLE shall:

- set a peer receiver busy condition;
- not transmit or retransmit any frames to the peer LLE;
- treat the N(R) contained in the received RNR as an acknowledgement for all the I frames that have been (re-)transmitted, up to and including N(R)- 1 and set its V(A) to the value of N(R) contained in the RNR frame;
- set T201 to initiate the inquiry process; and
- reset the retransmission count variable.

The busy peer shall respond at the earliest opportunity, with an appropriate supervisory frame.

- If the highest numbered frame was received with  $N(S) = V(R) + 1$ , the appropriate frame is the ACK frame.

#### Reference

3GPP TS 04.64, subclauses 6.4.3.4 and 8.6.4.

## 46.1.2.2.3.2.2 Test purpose

To verify that the MS handles peer receiver busy condition when it is transmitting to the SS and receiving data from the SS.

## 46.1.2.2.3.2.3 Method of test

## Initial conditions

-

## Related PICS/PIXIT Statement

-

## Test procedure

Send 1 I+S frame from the SS. Verify that the MS acknowledges this frame.

Send 1 octet of data from the MS. Acknowledge this from the SS.

Send an RNR from the SS to indicate receiver busy condition, after 1 frame ( $N(S) = 0$ ) has been received at the SS. The  $N(R)$  value that is sent in the RNR frame is 0.

Verify that the MS stops transmission of I+S frames.

T201 seconds after sending the RNR frame, send an RR frame from the SS with  $N(R) = 0$  to request the MS to resume transmission.

Initiate data transmission from the MS and verify that the MS resumes transmission. The first frame sent from the MS should have its  $N(S) = 0$ .

Verify that the MS sends acknowledgements for all the I+S frames transmitted from the SS.

## Maximum duration of the test

10 minutes.

### 46.1.2.2.3.3 SACK frame

#### 46.1.2.2.3.3.1 Conformance requirement

The SACK supervisory frame shall be used by an LLE to acknowledge single or multiple frames. Frames up to and including  $N(R) - 1$ , and frames indicated by the SACK bitmap, have been received correctly.

If the LLE is in the own receiver busy condition, the appropriate supervisory frame is the RNR frame. Otherwise, if the highest numbered frame was received with  $N(S) = V(R)$ , the appropriate supervisory frame is the RR frame. Otherwise, if the highest numbered I frame was received with  $N(S) = V(R) + 1$ , the appropriate supervisory frame is the ACK frame. Otherwise, the appropriate supervisory frame is the SACK frame.

#### Reference

3GPP TS 04.64, subclauses 6.4.3.3 and 8.6.4.1.

#### 46.1.2.2.3.3.2 Test purpose

To verify whether the MS sends a SACK frame when it is required and that the SACK frame has the correct bits set.

#### 46.1.2.2.3.3.3 Method of test

##### Initial conditions

-

##### Related PICS/PIXIT Statement

-

##### Test procedure

$N_{MS} = 20$ , for this test case.

Initiate data transfer from the SS and send frames from  $N(S) = 0$  to  $N(S) = N_{MS} - 3$ . The A bit shall be set to 1 for all frames sent. Wait till all the frames are acknowledged. Send the frame with  $N(S) = N_{MS}$  with the A bit set to 1. Verify that the MS acknowledges all the frames until  $N_{MS} - 3$  using RR and negatively acknowledges the other frames ( $N_{MS} - 2$  and  $N_{MS} - 1$ ) by using SACK. Retransmit the frames  $N_{MS} - 2$  and  $N_{MS} - 1$  with A bit set to 1. Verify that the MS acknowledges the retransmitted frames.

##### Maximum duration of the test

3 minutes.

## Test procedure

For this test case,  $N_{SS}=20$ .

Send I+S frames with  $N(S) = 0$  to  $N(S) = N_{SS} - 2$  from the SS. The delay between two I+S frames should be less than T201. Set the A bit to 1 in frames 0 to  $N_{SS} - 2$ . Verify that the MS sends an RR frame as acknowledgement for these frames. Send the frame with A=1. Do not send frame  $N_{SS} - 1$ . Verify that the MS sends an ACK frame, indicating that  $N_{SS}$  and  $N_{SS} - 2$  have been received and that  $N_{SS} - 1$  has not been received. Now send a frame from the SS with  $N(S) = N_{SS} - 1$ , with A=1. Verify that the MS acknowledges all the frames received so far, including this frame, with an RR.

## Maximum duration of the test

5 minutes.

## Expected sequence

| 2                     |           |                          | Initiate acknowledged mode data transmission from the SS.                                                                                                           |
| 3                     | SS -> MS  | I+S frame                | A = 1                                                                                                                                                               |
| A4<br>(Optional step) | MS -> SS  | RNR                      | If the MS sends an RNR, do not transmit data until it has sent an RR.                                                                                               |
| 4                     | MS -> SS  | RR                       |                                                                                                                                                                     |
| 5                     |           |                          | Repeat steps 3 to 5 until frames 0 to $N_{SS} - 2$ have been sent. Verify that RR frames are sent to acknowledge frames from $N(S) = 0$ until $N(S) = N_{SS} - 2$ . |
| 6                     | SS -> MS  | I+S frame                | Send the frame $N_{SS}$ with A=1. Do not send the frame with $N(S) = N_{SS} - 1$ .                                                                                  |
| A7<br>(Optional step) | MS -> SS  | RNR                      | $N(R) = N_{SS} - 2$ . If the MS sends an RNR, do not transmit data until it sends an ACK.                                                                           |
| 7                     | MS -> SS  | ACK                      | Verify that an ACK frame is sent to acknowledge the frames $N_{SS} - 2$ and $N_{SS}$ , with $N(R) = N_{SS} - 1$                                                     |
| 8                     | SS -> MS  | I+S frame                | $N(S) = N_{SS} - 1$ , with A=1.                                                                                                                                     |
| A9<br>(Optional step) | MS -> SS  | RNR                      | Verify that $N(R) = N_{SS} + 1$                                                                                                                                     |
| 9                     | MS -> SS  | RR                       | Verify that an RR frame is received to acknowledge frame $N_{SS} - 1$ with $N(R) = N_{SS} + 1$                                                                      |

## 46.1.2.2.4 Link Reestablishment

## 46.1.2.2.4.1 Reestablishment due to reception of SABM

## 46.1.2.2.4.1.1 Conformance requirement

The criteria for re-establishing the ABM mode of operation are defined in this clause by the following conditions:

- the receipt, while in the ABM state, of a SABM;
- the receipt of an LL-ESTABLISH-REQ primitive from layer 3;
- the occurrence of N200 retransmission failures;
- the occurrence of a frame rejection condition; and
- the receipt of an unsolicited DM response with F bit set to 0 while in ABM state.

In Asynchronous Balanced Mode, only I frames contain  $N(S)$ , the send sequence number of transmitted I frames. At the time that an in-sequence I frame is designated for transmission, the value of  $N(S)$  is set equal to the value of the send state variable  $V(S)$ .

An LLE receiving a SABM command, if it is able to enter the ABM state, shall:

- inform layer 3 using the LL-ESTABLISH-IND primitive;
- if the received SABM command contains a Layer-3 Parameters XID parameter, wait for the receipt of an LL-ESTABLISH-RES primitive from layer 3;
- respond with a UA response with the F bit set to the same binary value as the P bit in the received SABM command (i.e., F=1);
- reset timer T200 if active;
- set V(S), V(R), V(A), and B to 0;
- enter the ABM state;
- clear all existing exception conditions; and
- clear any existing peer receiver busy condition.

#### Reference

3GPP TS 04.64, subclauses 8.7.1, 6.3.5.4.3 and 8.5.1.2.

#### 46.1.2.2.4.1.2 Test purpose

To verify whether the MS initiates reestablishment of the link if it receives a SABM while in ABM state.

#### 46.1.2.2.4.1.3 Method of test

#### Initial conditions

-

#### Related PICS/PIXIT Statement

-

#### Test procedure

After establishing a link, initiate data transfer from the MS. After receiving 1 frame from the MS, send a SABM from the SS and verify whether the MS responds with a UA. After the link is re-established, verify that the MS resumes data transmission.

#### Maximum duration of the test

5 minutes.

Expected sequence

|      |           |                          | Discard all the I+S frames received.                                                   |
| 6    | MS -> SS  | UA                       | Verify that the MS responds with a UA.                                                 |
| 7    | MS -> SS  | I+S                      | Verify that that N(S) begins from 0.                                                   |
| 8    | SS -> MS  | RR                       | Acknowledge the frame sent from the MS.                                                |
| 9    |           |                          | Repeat steps 7 and 8 until all the frames from the MS are transmitted.                 |

#### 46.1.2.2.4.2 Reestablishment due to N200 failures

##### 46.1.2.2.4.2.1 Conformance requirement

The criteria for re-establishing the ABM mode of operation are defined in this clause by the following conditions:

- the receipt, while in the ABM state, of a SABM;
- the receipt of an LL-ESTABLISH-REQ primitive from layer 3;
- the occurrence of N200 retransmission failures;
- the occurrence of a frame rejection condition; and
- the receipt of an unsolicited DM response with F bit set to 0 while in ABM state.

In case of a re-establishment, all NSAPIs mapped to the affected SAPI shall enter the recovery state and all buffered N-PDUs (i.e. the ones whose complete reception has not been acknowledged and the ones that have not been transmitted yet) shall be transmitted starting with the oldest N-PDU when the link is re-established

## Test procedure

After establishing a link, initiate data transfer from the MS, to send 1 octet of data. Do not acknowledge the data frame sent from the SS. The MS shall retransmit the frame N200 times. Wait for  $(N200 * T201)$  seconds and see if the MS initiates link reestablishment by sending a SABM. After the link is re-established verify that the MS resumes data transmission.

### Maximum duration of the test

5 minutes.

### Expected sequence

| Step | Direction | Message                  | Comments                                                                                                                                                              |
|------|-----------|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    |           | {PDP Context Activation} | Macro.Initiate PDP context activation from the MS using PDP context 11.                                                                                               |
| 2    |           |                          | Initiate acknowledged mode data transfer from the MS.                                                                                                                 |
| 3    | MS -> SS  | I + S                    | Send 1 octet of data. Do not acknowledge this frame from the SS.                                                                                                      |
| 4    | MS -> SS  | I + S                    | Verify that the MS retransmits the I+S frame N200 times and that it does not send any SABM frames during retransmission. SS does not acknowledge any of these frames. |
| 5    | MS -> SS  | SABM                     | Verify that the MS sends a SABM and that it stops sending anymore data to the SS. Verify that this occurs after T201 seconds after the last I+S frame in step 4.      |
| 6    | SS -> MS  | UA                       |                                                                                                                                                                       |
| 7    | MS -> SS  | I+S                      | Verify that the MS resumes transmission of data from step 2.                                                                                                          |
| 8    | SS -> MS  | RR                       | Acknowledge the frame transmitted from the MS.                                                                                                                        |

## 46.1.2.2.4.3 Reestablishment due to reception of DM

### 46.1.2.2.4.3.1 Conformance requirement

The criteria for re-establishing the ABM mode of operation are defined in this clause by the following conditions:

- the receipt, while in the ABM state, of a SABM;
- the receipt of an LL-ESTABLISH-REQ primitive from layer 3;
- the occurrence of N200 retransmission failures;
- the occurrence of a frame rejection condition; and
- the receipt of an unsolicited DM response with F bit set to 0 while in ABM state.

In case of a re-establishment, all NSAPIs mapped to the affected SAPI shall enter the recovery state and all buffered N-PDUs (i.e. the ones whose complete reception has not been acknowledged and the ones that have not been transmitted yet) shall be transmitted starting with the oldest N-PDU when the link is re-established.

| 4    | SS -> MS  | RR                       | Send RR frames as acknowledgements from the SS.                                                                                    |
| 5    |           |                          | Repeat steps 3 and 4 once.                                                                                                         |
| 6    | MS -> SS  | I+S                      |                                                                                                                                    |
| 7    | SS -> MS  | DM                       | Send a DM with the F bit set to 0 from the SS.                                                                                     |
|      |           |                          | Discard all the I+S frames received at the SS.                                                                                     |
| 8    | MS -> SS  | SABM                     | Verify that the MS re-establishes the link with a SABM                                                                             |
| 9    | SS -> MS  | UA                       | Respond with a UA                                                                                                                  |
| 10   | MS -> SS  | I+S                      | Verify that the MS resumes data transmission , with N(S) set to 0, only for the first frame sent after resumption of transmission. |
| 11   | SS -> MS  | RR                       | Acknowledge all frames sent from the MS.                                                                                           |
| 12   |           |                          | Repeat steps 10 and 11 until all the frames from the MS are transmitted.                                                           |

## 46.1.2.3 Collision of commands and responses

## 46.1.2.3.1 Collision of SABM

## 46.1.2.3.2 Conformance requirement

If the transmitted and received unnumbered commands are SABM commands and a Layer-3 Parameters XID parameter is present in both or in neither, then the SABM command transmitted by the SGSN shall be ignored and treated as not transmitted. The LLE in the SGSN shall send the UA response at the earliest possible opportunity if it is able to enter ABM.

## Reference

3GPP TS 04.64 subclause 8.5.5.1

## 46.1.2.3.3 Test purpose

To verify that the MS ignores a SABM command received from the SS when it (the MS) is waiting for a UA response, when a Layer-3 Parameters XID parameter is present in both.

## 46.1.2.3.3 Method of test

## Initial conditions

-

## Related PICS/PIXIT Statement

-

## Test procedure

Initiate link establishment from the MS by sending a SABM with Layer-3 Parameters XID parameter present. Upon reception of the SABM at the SS, send a SABM with Layer-3 Parameters XID parameter present. Verify that the MS ignores the SABM sent by the SS. Wait for T200 seconds at the SS after receiving the SABM from the MS see if the MS resends the SABM. After reception of the SABM, respond with a UA. Initiate data transmission from the MS. Acknowledge all the frames sent from the MS.

## Maximum duration of the test

3 minutes.

## Expected sequence

| Step | Direction | Message                  | Comments                                                                                                               |
|------|-----------|--------------------------|------------------------------------------------------------------------------------------------------------------------|
| 1    |           | {PDP Context Activation} | Macro. Initiate PDP context activation from the MS with PDP Context 11.                                                |
| 2    | MS -> SS  | SABM                     | Verify that P/F = 1. A layer-3 XID parameter shall be present in the SABM received from the MS.                        |
| 3    | SS -> MS  | SABM                     | Send a SABM with P/F =1 to simulate collision. Send the SABM from the SS with a layer 3 XID parameter.                 |
| 4    | MS -> SS  | SABM                     | Wait for T200 seconds after the reception of SABM at the SS to ensure that the MS resends the SABM.                    |
| 5    | SS -> MS  | UA                       | Send UA from the SS before T200 can expire at the MS.                                                                  |
| 6    | MS -> SS  | I + S                    | Initiate data transfer from the MS.                                                                                    |
| 7    | SS -> MS  | RR                       | Send a supervisory frame as acknowledgement. Wait for T201 seconds to ensure that the MS does not retransmit the data. |

## 46.1.2.3.2 Collision of SABM and DISC

## 46.1.2.3.2.1 Conformance requirement

If the transmitted and received unnumbered commands are a SABM and DISC command, the LLEs shall issue a DM response at the earliest possible opportunity. Upon receipt of a DM response with the F bit set to 1, the LLE shall enter the ADM state and notify layer3 by means of the appropriate primitive.

## Reference

3GPP TS 04.64, subclause 8.5.5.2.

## 46.1.2.3.2.2 Test purpose

To verify that when the MS receives a DISC after sending a SABM, it shall send a DM response to the SS. Upon reception of a DM response, it shall enter the ADM state.

## 46.1.2.3.2.3 Method of test

Initial conditions

-

Related PICS/PIXIT Statement

-

Test procedure

Initiate link establishment from the MS by sending a SABM command. Send a DISC command in response to this from the SS. Verify that the MS sends a DM and upon reception of a DM from the SS, it enters the ADM state. Send numbered frames from the SS and verify that the MS does not acknowledge them.

Maximum duration of the test

3 minutes.

Expected sequence

| Step                | Direction | Message                  | Comments                                                                                                    |

| A8<br>(Conditional) | MS -> SS  | SABM                     | The MS may try to establish ABM.<br>This step should be done if step B8 was not executed.                   |
| B8<br>(Conditional) | MS -> SS  | DM                       | The MS may send a DM as response to the I+S frame.<br>This step should be done if step A8 was not executed. |

## 46.1.2.3.3 Collision of SABM and XID commands

## 46.1.2.3.3.1 Conformance requirement

If the transmitted unnumbered command is a SABM command and the received unnumbered command is an XID command, then the LLE shall ignore the received XID command.

Reference

3GPP TS 04.64 subclause 8.5.5.2.

## 46.1.2.3.3.2 Test purpose

To verify that the MS ignores the XID command if it collides with a SABM command.

## 46.1.2.3.3.3 Method of test

Initial conditions

-

Related PICS/PIXIT Statement

-

Test procedure

When the MS initiates link establishment using a SABM, send an XID command. Verify that the XID command is ignored.

Maximum duration of the test

3 minutes.

Expected sequence

| Step | Direction | Message                  | Comments                                                                                                                                                      |
|------|-----------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    |           | {PDP Context Activation} | Macro. Initiate PDP context activation from the MS using PDP Context 12.                                                                                      |
| 2    | MS -> SS  | SABM                     | Verify that P/F = 1.                                                                                                                                          |
| 3    | SS -> MS  | XID                      | Send an XID command without layer3 parameters.                                                                                                                |
| 4    | MS -> SS  | SABM                     | Wait for T200 seconds at the SS to ensure that the MS does not send an XID response and resends the SABM.                                                     |
| 5    | SS -> MS  | UA                       | Send UA from the SS before T200 can expire at the MS. Wait for T200 seconds after the transmission of UA to ensure that the MS does not send an XID response. |

#### 46.1.2.4 Unsolicited response frames

##### 46.1.2.4.1 Unsolicited DM

###### 46.1.2.4.1.1 Conformance requirement

When a DM response with the F bit set to 0 is received by an LLE, a collision between a transmitted SABM or DISC command and the unsolicited DM response may have occurred.

A DM response with the F bit set to 0 colliding with a SABM or DISC shall be ignored.

An LLE shall ignore a DM response received with F=0 when it is in the Local Establishment state.

Reference

3GPP TS 04.64 subclauses 8.5.6 and 8.8.4.

###### 46.1.2.4.1.2 Test purpose

To verify that the MS ignores a DM response sent with F=0 when LLC is in the Local Establishment state.

###### 46.1.2.4.1.3 Method of test

Initial conditions

-

Related PICS/PIXIT Statement

-

## Test procedure

Send SABM with P/F =1 from the MS to establish a link. Send a DM response with F=0 from the SS, in response to this. Verify that the MS ignores this DM response and sends SABM after expiry of T200. Respond with UA from the SS after receiving SABM. Send 1 I+S frame from the SS and verify that the MS acknowledges it.

## Maximum duration of the test

3 minutes.

## Expected sequence

| Step                     | Direction | Message                  | Comments                                                                |
|--------------------------|-----------|--------------------------|-------------------------------------------------------------------------|
| 1                        |           | {PDP Context Activation} | Macro. Initiate PDP context activation from the MS with PDP Context 11. |
| 2                        | MS -> SS  | SABM                     | Initiate data transfer from the MS. Verify that P/F = 1.                |
| 3                        | SS -> MS  | DM                       | Send a DM response with F=0                                             |
| 4                        | MS -> SS  | SABM                     | Ensure that the second SABM is sent after T200 seconds.                 |
| 5                        | SS -> MS  | UA                       | Send UA from the SS before T200 expires at the MS.                      |
| 6                        | SS -> MS  | I+S frame                | Send one I+S frame from the SS.                                         |
| A7<br>(Optional<br>step) | MS -> SS  | RNR                      | Verify that the RNR acknowledges the frame transmitted in step 6.       |
| 7                        | MS -> SS  | RR frame                 | Verify that the MS acknowledges the I+S frame transmitted from the SS.  |

## 46.1.2.5 FRMR frames

### 46.1.2.5.1 Sending FRMR due to undefined command control field

#### 46.1.2.5.1.1 Conformance requirement

The FRMR unnumbered response may be received by an LLE as a report of a frame rejection condition not recoverable by retransmission of the identical frame:

- receipt of a command or response control field that is undefined or not implemented;
- receipt of a supervisory or unnumbered frame with incorrect length; or
- receipt of an I frame with an information field that exceeds the maximum established length.

Upon occurrence of a frame rejection condition, the LLME shall issue an LLGMM-STATUS-IND primitive; and the LLE shall:

- discard the frame causing the frame rejection condition;
- transmit a FRMR response frame; and
- if the LLE is in ABM operation, initiate re-establishment.

## Reference

3GPP TS 04.64, subclauses 6.4.1.5 and 8.8.2.

### 46.1.2.5.1.2 Test purpose

To verify that if the MS receives a frame with a command control field that is not implemented, it sends an FRMR frame and re-establishes the link.

## 46.1.2.5.1.3 Method of test

## Initial conditions

-

## Related PICS/PIXIT Statement

-

## Test procedure

After establishing a link, initiate data transfer from the MS . After receiving the first frame, send a supervisory frame from the SS to acknowledge the last I+S frame received. In this set the first byte of the S frame control field to 1110 0000. Verify whether the MS sends an FRMR. After the link is re-established, verify that the MS resumes data transmission.

## Maximum duration of the test

5 minutes.

## Expected sequence

| Step | Direction | Message                  | Comments                                                                                                                                                                                                                          |
|------|-----------|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    |           | {PDP Context Activation} | Macro. Initiate PDP context activation from the MS with PDP context 11.                                                                                                                                                           |
| 2    |           |                          | Initiate acknowledged mode data transfer of 1 octet from the MS.                                                                                                                                                                  |

| 8    | MS -> SS  | I+S                      | Verify that the MS resumes data transmission, with N(S)=0, for the first frame transmitted                                                                                                                                        |
| 9    | SS -> MS  | RR                       | Acknowledge all frames sent from the MS.                                                                                                                                                                                          |

## 46.1.2.5.2 Sending FRMR due to reception of an S frame with incorrect length

## 46.1.2.5.2.1 Conformance requirement

The FRMR unnumbered response may be received by an LLE as a report of a frame rejection condition not recoverable by retransmission of the identical frame:

- receipt of a command or response control field that is undefined or not implemented;
- receipt of a supervisory or unnumbered frame with incorrect length; or
- receipt of an I frame with an information field that exceeds the maximum established length.

Upon occurrence of a frame rejection condition whilst in ABM operation, the LLME shall issue an LLGMM-STATUS-IND primitive; and the LLE shall initiate re-establishment.

## Reference

3GPP TS 04.64, subclauses 6.4.1.5 and 8.8.2.

## 46.1.2.5.2.2 Test purpose

To verify that if the MS receives an S frame with incorrect length, it sends an FRMR frame and re-establishes the link.

## 46.1.2.5.2.3 Method of test

Initial conditions

-

Related PICS/PIXIT Statement

-

Test procedure

After establishing a link, initiate data transfer from the MS. After receiving 2 frames at the SS, send an RR with incorrect length, from the SS, when an I+S frame with the A bit set is received. Verify whether the MS sends an FRMR. After the link is re-established, verify that the MS resumes data transmission.

Maximum duration of the test

5 minutes.

Expected sequence

Initiate PDP context activation from the MS with PDP context 12.                                                                                                                                                                                                                         |
| 2    |           |                          | Initiate acknowledged mode data transfer from the MS.                                                                                                                                                                                                                                           |
| 3    | MS -> SS  | I + S                    | Initiate data transfer of 5000 octets from the MS.                                                                                                                                                                                                                                              |
| 4    | SS -> MS  | RR                       | Send RR frames as acknowledgements from the SS.                                                                                                                                                                                                                                                 |
| 5    |           |                          | Repeat steps 3 and 4 until 2 frames are transmitted.                                                                                                                                                                                                                                            |
| 6    | SS -> MS  | RR                       | For one of the I+S frames with an A bit set received at the SS, send an RR from the SS. There shall be an extra octet in this RR frame, before the FCS. The RR frame shall appear as follows:<br>Address field (1 octet)<br>Control field (2 octets)<br>Extra field (1 octet)<br>FCS (3 octets) |
| 7    | MS -> SS  | FRMR                     | Verify that the control field of the RR message is sent back in the FRMR response. C/R field shall be set to 1. W1, W3 and W4 shall be set to 1. The content of W2 shall not be checked.                                                                                                        |
| 8    | MS -> SS  | SABM                     | Verify that the MS re-establishes the link with a SABM and that it stops sending anymore data to the SS.                                                                                                                                                                                        |
| 9    | SS -> MS  | UA                       | Respond with a UA                                                                                                                                                                                                                                                                               |
| 10   | MS -> SS  | I+S                      | Verify that the MS resumes transmission of data.                                                                                                                                                                                                                                                |
| 11   | SS -> MS  | RR                       | Acknowledge all frames sent from the MS.                                                                                                                                                                                                                                                        |
| 12   |           |                          | Repeat 10 and 11 until all the frames from the MS are transmitted and acknowledged.                                                                                                                                                                                                             |

## 46.1.2.5.3 Sending FRMR due to reception of an I frame information field exceeding the maximum length

## 46.1.2.5.3.1 Conformance requirement

The FRMR unnumbered response may be received by an LLE as a report of a frame rejection condition not recoverable by retransmission of the identical frame:

- receipt of a command or response control field that is undefined or not implemented;

- receipt of a supervisory or unnumbered frame with incorrect length; or
- receipt of an I frame with an information field that exceeds the maximum established length.

Upon occurrence of a frame rejection condition whilst in ABM operation, the LLME shall issue an LLGMM-STATUS-IND primitive; and the LLE shall initiate re-establishment.

#### Reference

3GPP TS 04.64, subclauses 6.4.15 and 8.8.2.

#### 46.1.2.5.3.2 Test purpose

To verify that if the MS receives an I frame with an information field that exceeds the maximum established length, it sends an FRMR frame and re-establishes the link.

#### 46.1.2.5.3.3 Method of test

#### Initial conditions

-

#### Related PICS/PIXIT Statement

-

#### Test procedure

After establishing a link, initiate data transfer from the SS. After sending 5 frames from the SS, send an I+S frame with length greater than  $N_{201-I}$ , from the SS. Verify whether the MS sends an FRMR. After the link is re-established, send frames from the SS with  $N(S) = 0$  until  $N(S) = 5$ . Verify that the MS acknowledges all the data sent.

#### Maximum duration of the test

5 minutes.

Expected sequence

| Step                   | Direction | Message                  | Comments                                                                                                                                                                                                                                                                                |

#### 46.1.2.5.4 Frame reject condition during establishment of ABM

##### 46.1.2.5.4.1 Conformance requirement

The FRMR unnumbered response may be received by an LLE as a report of a frame rejection condition not recoverable by retransmission of the identical frame:

- receipt of a command or response control field that is undefined or not implemented;
- receipt of a supervisory or unnumbered frame with incorrect length; or
- receipt of an I frame with an information field that exceeds the maximum established length.

Upon occurrence of a frame rejection condition whilst in ABM operation, the LLME shall issue an LLGMM-STATUS-IND primitive; and the LLE shall initiate re-establishment.

Upon occurrence of a frame rejection condition during establishment of or release from ABM operation, or whilst in ADM state, the LLE shall discard the frame.

3GPP TS 04.64, subclauses 6.4.15 and 8.8.2.

##### 46.1.2.5.4.2 Test purpose

To verify that if the MS receives a U frame with its frame type not implemented during ABM establishment, it shall ignore the message.

## 46.1.2.5.4.3 Method of test

## Initial conditions

-

## Related PICS/PIXIT Statement

-

## Test procedure

Initiate link establishment from the MS by sending a SABM. Send an invalid U frame as response. Wait for T200 seconds and check if the MS resends the SABM. Respond with a UA. Initiate data transfer from the MS and acknowledge all the frames sent from the MS.

## Maximum duration of the test

5 minutes.

## Expected sequence

| Step | Direction | Message                  | Comments                                                                                        |
|------|-----------|--------------------------|-------------------------------------------------------------------------------------------------|
| 1    |           | {PDP Context Activation} | Macro. Initiate PDP context activation from the MS using PDP Context 13.                        |
| 2    | MS -> SS  | SABM                     | Initiate acknowledged mode data transfer from the MS. Verify that P/F = 1.                      |
| 3    | SS -> MS  | Invalid U frame          | Send a U frame with its control field M4 M3 M2 M1 = 0010                                        |

| 7    | MS -> SS  | I + S                    | Initiate data transfer from the MS.                                                             |
| 8    | SS -> MS  | RR                       | Acknowledge all frames sent from the MS.                                                        |

## 46.1.2.6 Multiple Connections

## 46.1.2.6.1 Simultaneous acknowledged and unacknowledged data transfer on the same SAPI

## Applicability

This test is applicable to mobiles which support more than one PDP context simultaneously on the same SAPI.

## 46.1.2.6.1.1 Conformance requirement

The purpose of LLC is to convey information between layer-3 entities in the MS and SGSN. Specifically, LLC shall support:

- multiple MSs, at the Um interface;
- multiple layer-3 entities within the MS.

## Reference

3GPP TS 04.64, subclause 4.2.

## 46.1.2.6.1.2 Test purpose

To verify that LLC supports simultaneous acknowledged and unacknowledged data transfer in the same direction on the same SAPI.

## 46.1.2.6.1.3 Method of test

## Initial conditions

-

## Related PICS/PIXIT Statement

- Support of more than one PDP context activation simultaneously on the same SAPI Yes/No

## Test procedure

Initiate acknowledged data transfer from the MS on SAPI 3. Send 300 frames continuously. The value of N(S) shall begin from 0 and increment by 1 mod (512) for each frame. Initiate unacknowledged data transfer from the MS on the same SAPI within 1 minute from initiation of the acknowledged data transfer.

Acknowledge all the I frames sent from the SS by sending RR frames to the MS.

## Maximum duration of the test

20 minutes.

## Expected sequence

## 46.1.2.6.2 Simultaneous acknowledged and unacknowledged data transfer on different SAPIs

## Applicability

This test is applicable to mobiles which support more than one PDP context simultaneously.

#### 46.1.2.6.2.1 Conformance requirement

The purpose of LLC is to convey information between layer-3 entities in the MS and SGSN. Specifically, LLC shall support:

- multiple MSs, at the Um interface;
- multiple layer-3 entities within the MS.

#### Reference

3GPP TS 04.64, subclause 4.2.

#### 46.1.2.6.2.2 Test purpose

To verify that LLC supports simultaneous acknowledged and unacknowledged data transfer on different SAPIs in different directions.

#### 46.1.2.6.2.3 Method of test

##### Initial conditions

-

##### Related PICS/PIXIT Statement

-

##### Test procedure

Initiate unacknowledged data transfer from the MS on SAPI 5. Initiate acknowledged data transfer from the SS on SAPI 3 after the first *i* frames have been received from the MS. Send 300 I+S frames continuously from the SS. The value of *N(S)* shall begin from 0 and increment by 1 mod (512) for each frame.

Verify that the MS acknowledges all the I frames sent from the SS. Verify that the UI frames are received at the SS in sequence.

##### Maximum duration of the test

15 minutes.

Expected sequence

| Step | Direction | Message                  | Comments                                                                                                                                                                                                                                                                              |

| 7    |           |                          | Repeat steps 5 and 6 until all 300 I+S frames have been transmitted for the acknowledged mode from the SS and 200 UI frames for the unacknowledged mode to the SS. Verify that :<br>-The MS acknowledges all I+S frames sent.<br>-The MS sends all UI frames in the correct sequence. |

#### 46.1.2.7 XID Negotiation

##### 46.1.2.7.1 Negotiation initiated by the SS during ABM, for T200 and N200

###### 46.1.2.7.1.1 Conformance requirement

The negotiation procedure is one-step, i.e., one side shall start the process by sending an XID command, offering a certain set of parameters from the applicable parameter repertoire the sending entity wants to negotiate, proposing values within the allowed range. In return, the other side shall send an XID response, either confirming these requested values, or offering higher or lower ones in their place.

XID frames shall always be used with the P/F bit set to 1.

T200, N200 and N201-U can be negotiated in ADM and ABM.

###### Reference

3GPP TS 04.64, subclause 6.4.1.6.

###### 46.1.2.7.1.2 Test purpose

To verify that when the SS initiates XID negotiations with a certain value of T200 and N200, the MS complies with the final negotiated values

###### 46.1.2.7.1.3 Method of test

Initial conditions

-

Related PICS/PIXIT Statement

-

## Test procedure

Initiate XID negotiation from the SS, with  $N200 = 4$  and  $T200 = 10$  s. The MS will send an XID response. Initiate data transfer from the MS. Send an XID command with layer3 parameters and verify that the MS complies with the values of  $T200$  and  $N200$  that were agreed upon.

## Maximum duration of the test

5 minutes.

## Expected sequence

| Step | Direction | Message                  | Comments                                                                                                                                                            |
|------|-----------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    |           | {PDP Context Activation} | Macro. Initiate PDP context activation from the MS for PDP Context 11                                                                                               |
| 2    | SS -> MS  | XID                      | XID command with $N200 = 4$ , $T200 = 10$ s. Check if the P/F bit is set to 1.                                                                                      |
| 3    | MS -> SS  | XID                      | XID response. Check if the P/F bit is set to 1. The values, if received in this message shall be the negotiated values, else the values are deemed to be confirmed. |
| 4    |           |                          | Initiate acknowledged mode data transfer of 1 octet from the MS.                                                                                                    |
| 5    | MS -> SS  | I + S                    |                                                                                                                                                                     |
| 6    |           |                          | Do not respond with an RR.                                                                                                                                          |
| 7    | MS -> SS  | I+S                      | Verify that the MS resends the I+S frame every $T200$ seconds $N200$ times.                                                                                         |
| 8    | MS -> SS  | SABM                     | Verify that the MS sends a SABM to re-establish the link                                                                                                            |
| 9    | SS -> MS  | UA                       | Respond with a UA within $T200$ seconds.                                                                                                                            |

### 46.1.2.7.2 Negotiation initiated by the SS during ADM, for N201-I

#### 46.1.2.7.2.1 Conformance requirement

The negotiation procedure is one-step, i.e., one side shall start the process by sending an XID command, offering a certain set of parameters from the applicable parameter repertoire the sending entity wants to negotiate, proposing values within the allowed range. In return, the other side shall send an XID response, either confirming these requested values, or offering higher or lower ones in their place.

XID frames shall always be used with the P/F bit set to 1.

$N201-I$ ,  $mD$ ,  $mU$ ,  $kD$  and  $kU$  can be negotiated to any value in Range in ADM. In ABM,  $N201-I$ ,  $mD$ ,  $mU$ ,  $kD$  and  $kU$  can only be negotiated to the same or higher value as previously used.

#### Reference

3GPP TS 04.64, subclause 6.4.1.6.

#### 46.1.2.7.2.2 Test purpose

To verify that when the SS initiates XID negotiations with a certain value of  $N201-I$  during ADM, the MS complies with the final negotiated values.

#### 46.1.2.7.2.3 Method of test

#### Initial conditions

-

#### Related PICS/PIXIT Statement

-

## Test procedure

Initiate PDP context activation from the MS and in the UA response from the SS send a value of 140 for N201-I .. If the MS responds with an XID command, in the XID response, give N201-I = 140.

Initiate data transfer from the SS. Send an I+S frame of length N201-I with the A bit set to 1. Verify that the MS acknowledges this I+S frame.

The next I+S frame sent from the SS shall be of length N201-I + 1. Verify that the MS sends FRMR and re-establishes the link.

## Maximum duration of the test

5 minutes.

## Expected sequence

### 46.1.2.7.3 Negotiation initiated by the SS (using SABM, for IOV-I)

#### 46.1.2.7.3.1 Conformance requirement

The negotiation procedure is one-step, i.e., one side shall start the process by sending an XID command, offering a certain set of parameters from the applicable parameter repertoire the sending entity wants to negotiate, proposing values within the allowed range. In return, the other side shall send an XID response, either confirming these requested values, or offering higher or lower ones in their place.

XID frames shall always be used with the P/F bit set to 1.

LLC layer and layer-3 parameters may be negotiated with the exchange of XID frames or with the exchange of SABM and UA frames. After successful negotiations of SABM and UA frames, the LLE shall be in ABM mode of operation.

IOV-I shall only be negotiated with SABM and UA frames. IOV-UI and IOV-I shall only be transmitted in the downlink direction.

## Reference

3GPP TS 04.64, subclauses 6.4.1.6 and 8.5.3.

## 46.1.2.7.3.2 Test purpose

To verify that when the SS sends IOV-I to the MS in a SABM, the MS shall cipher its output using this value of IOV-I.

## 46.1.2.7.3.3 Method of test

## Initial conditions

The MS shall be GPRS attached with ciphering enabled.

## Related PICS/PIXIT Statement

-

## Test procedure

Initiate link establishment from the SS. In the SABM command, send a new value of IOV-I, different from the default used. Send 1000 octets from the MS and verify that the frames have been ciphered as per the new value of IOV-I.

## Maximum duration of the test

5 minutes.

| 5    | MS -> SS  | I+S                        | Initiate data transfer from the MS. Send 1000 octets.                                                                                 |
| 6    | SS -> MS  | RR                         | Verify that ciphering is as per the new value of IOV-I. The SS shall check this by analyzing the FCS. Acknowledge all the I+S frames. |
| 7    | SS -> MS  | I + S                      | Initiate data transfer from the SS. Send 1 I+S frame with A=1                                                                         |
| A8   | MS -> SS  | RNR                        | Verify that the MS acknowledges the frame sent in step 7.                                                                             |
| B8   | MS -> SS  | RR                         | Verify that the MS acknowledges the frames.                                                                                           |

## 46.1.2.7.4 Negotiation initiated by the SS (during ADM, for N201-U)

## 46.1.2.7.4.1 Conformance requirement

The negotiation procedure is one-step, i.e., one side shall start the process by sending an XID command, offering a certain set of parameters from the applicable parameter repertoire the sending entity wants to negotiate, proposing values within the allowed range. In return, the other side shall send an XID response, either confirming these requested values, or offering higher or lower ones in their place.

XID frames shall always be used with the P/F bit set to 1.

T200, N200 and N201-U can be negotiated in ADM and ABM.

N201-U is used for U and UI frames.

## Reference

3GPP TS 04.64, subclauses 6.4.1.6 and 8.9.5.

## 46.1.2.7.4.2 Test purpose

To verify that when the SS initiates XID negotiations with a certain value of N201-U during ADM, the MS complies with the final negotiated values.

## 46.1.2.7.4.3 Method of test

## Initial conditions

-

## Related PICS/PIXIT Statement

-

## Test procedure

Initiate XID negotiation from the SS, with N201-U = 140. The MS shall send an XID response. The value of N201-U in the XID response shall be regarded as the final negotiated value.

Initiate data transfer from the MS. Verify that the length of the UI frames sent from the MS never exceeds the negotiated value of N201-U.

## Maximum duration of the test

5 minutes.

## Expected sequence

| Step | Direction | Message                  | Comments                                                                                                                                                               |
|------|-----------|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    |           | {PDP Context Activation} | Macro. Initiate PDP context activation from the MS using PDP Context 9.                                                                                                |
| 2    | SS -> MS  | XID                      | XID command with N201-U = 140                                                                                                                                          |
| 3    | MS -> SS  | XID                      | XID response. Check if the P/F bit is set to 1. The N201-U value, if received in this message shall be the negotiated value, else the value is deemed to be confirmed. |
| 4    |           |                          | Initiate unacknowledged data transfer of 1000 octets from the MS.                                                                                                      |
| 5    | MS -> SS  | UI                       | Verify that the frame length does not exceed the negotiated value of N201-U.                                                                                           |
| 6    |           |                          | Repeat step 5 until 1000 octets have been sent from the MS.                                                                                                            |

## 46.1.2.7.5 Negotiation initiated by the SS (during ADM, for IOV-UI)

## 46.1.2.7.5.1 Conformance requirement

The negotiation procedure is one-step, i.e., one side shall start the process by sending an XID command, offering a certain set of parameters from the applicable parameter repertoire the sending entity wants to negotiate, proposing values within the allowed range. In return, the other side shall send an XID response, either confirming these requested values, or offering higher or lower ones in their place.

XID frames shall always be used with the P/F bit set to 1.

IOV-UI shall only be negotiated in ADM, and only before ciphering is enabled. IOV-UI and IOV-I shall only be transmitted in the downlink direction.

IOV-UI is associated with a TLLI.

## Reference

3GPP TS 04.64, subclauses 6.4.1.6, 8.5.3 and 8.9.

3GPP TS 04.08 subclause 4.7.12.

#### 46.1.2.7.5.2 Test purpose

To verify that when the SS sends IOV-UI to the MS in an XID command, before ciphering is enabled:

- The MS shall cipher its output using this value of IOV-UI.
- This value of IOV-UI shall be applicable for all SAPIs using this TLLI.
- Identity Response sent from the MS shall not be ciphered.

#### 46.1.2.7.5.3 Method of test

Initial conditions

-

Related PICS/PIXIT Statement

-

Test procedure

Send a value of IOV-UI from the SS, different from the default used. Send 1 000 octets from the MS and verify that the frames have been ciphered as per the new value of IOV-UI.

Send 1 000 octets from the MS on SAPI 11. Verify that the frames have been ciphered as per the new value of IOV-UI.

Maximum duration of the test

3 minutes.

| 11   |           | {PDP Context Activation}                   | Macro. Activate PDP Context 9.                                                                                                                                                                                            |
| 12   |           |                                            | Initiate a data transfer of 50 octets from the MS on SAPI 11 for the same value of TLLI as before.                                                                                                                        |
| 13   | MS -> SS  | UI                                         | Verify that ciphering is as per the new value of IOV-UI.                                                                                                                                                                  |

#### 46.1.2.7.6 Negotiation initiated by the SS (during ABM, for Reset)

Send Reset during unacknowledged mode data transfer and check if N(S) begins from 0.

##### Applicability

This test is applicable to only those mobiles which can support more than one PDP context simultaneously.

##### 46.1.2.7.6.1 Conformance requirement

The negotiation procedure is one-step, i.e., one side shall start the process by sending an XID command, offering a certain set of parameters from the applicable parameter repertoire the sending entity wants to negotiate, proposing values within the allowed range. In return, the other side shall send an XID response, either confirming these requested values, or offering higher or lower ones in their place.

XID frames shall always be used with the P/F bit set to 1.

Reset shall only be negotiated with an XID frame, and only transmitted in the downlink direction. If Reset is present in an XID frame, it shall be the first parameter in the XID information field.

The Reset parameter shall be used, in the SGSN originating Reset and the MS receiving Reset, to:

- set all LLC layer parameters to the default values given in table 9;
- change any LLEs in ABM state to ADM state;
- set the unconfirmed state variable V(U) to value 0;
- set the unconfirmed receive state variable V(UR) to 0;
- set the OCs for unacknowledged information transfer to 0.

The Reset parameter shall be treated before any additional XID parameters present in the same XID frame.

##### Reference

3GPP TS 04.64, subclauses 6.4.1.6 and 8.5.3.1.

##### 46.1.2.7.6.2 Test purpose

To verify that when the SS sends the Reset parameter to the MS in an XID:

- it sets all LLC layer parameters to the default values;
- change any LLEs in ABM state to ADM state;
- set the unconfirmed state variable V(U) to value 0;
- set the unconfirmed receive state variable V(UR) to 0;
- set the OCs for unacknowledged information transfer to 0.

##### 46.1.2.7.6.3 Method of test

##### Initial conditions

##### System simulator

The System Simulator shall support two cells, each in a different SGSN Routing Area.

##### Mobile station:

The MS shall be GPRS attached with ciphering enabled.

## Related PICS/PIXIT Statement

-

## Test procedure

For this test case,  $N_{MS} = N_{SS} = 200$ .

Initiate unacknowledged data transfer from the MS. Send  $N_{MS}$  UI frames.

Initiate unacknowledged data transfer from the SS. Send  $N_{SS}$  UI frames.

During PDP context activation for Context 11, initiate XID negotiation from the SS, with  $N200 = 4$  and  $T200 = 10$ . Initiate data transfer from the MS. Do not acknowledge the first frame sent from the MS and verify that the MS complies with the values of  $T200$  and  $N200$  that were agreed upon.

Initiate inter-SGSN Routing Area Update from the MS, which will make the SS send an XID command with the Reset parameter. Send I+S frames from the MS, with the A bit set to 1. Do not acknowledge the first I+S frame. Verify that the MS sends the I+S frame  $N200$  times, every  $T201$  seconds. Verify that the values of  $N200$  and  $T201$  are the default values.

Initiate unacknowledged data transfer from the MS for the same SAPI and for the same TLLI used before sending Reset from the SS. Verify that the frames are numbered from 0 and not from  $N_{MS} + 1$ . Verify that the frames can be decrypted using  $OC = 0$ .

Initiate unacknowledged data transfer from the SS for the same SAPI and for the same TLLI used before sending Reset from the SS. The first frame shall have its sequence number set to  $N_{SS}$ . Verify that the MS does not discard these frames.

## Maximum duration of the test

3 minutes.

Expected sequence

| 3    |           |                                  | Repeat step 2 until N <sub>MS</sub> frames are sent.                                                                                                                                                                                                                                             |
| 4    | SS -> MS  | UI frame                         |                                                                                                                                                                                                                                                                                                  |
| 5    |           |                                  | Repeat step 4 until N <sub>SS</sub> frames are sent.                                                                                                                                                                                                                                             |
| 6    |           | {PDP Context Activation}         | Macro. Initiate PDP context activation from the MS for PDP Context 11.                                                                                                                                                                                                                           |
| 7    | MS -> SS  | SABM                             |                                                                                                                                                                                                                                                                                                  |
| 8    | SS -> MS  | UA                               | Send N200 = 4, T200 = 10 s in the UA response. If the MS sends an XID command, respond accepting the proposed values.                                                                                                                                                                            |
| 9    |           |                                  | Initiate acknowledged mode data transfer of 1 octet from the MS.                                                                                                                                                                                                                                 |
| 10   | MS -> SS  | I + S                            |                                                                                                                                                                                                                                                                                                  |
| 11   |           |                                  | Do not respond with an RR..Verify that the MS retransmits the I+S frame N200 times every T200 seconds.                                                                                                                                                                                           |
| 12   | MS -> SS  | SABM                             | Verify that the MS sends a SABM to re-establish the link                                                                                                                                                                                                                                         |
| 13   | SS -> MS  | UA                               | Respond with a UA within T200 seconds.                                                                                                                                                                                                                                                           |
| 14   |           | {Inter-SGSN Routing Area Update} | Macro. Initiate Inter-SGSN Routing Area Update from the MS. (This procedure sends XID reset). The MS shall reselect the new cell and do a Routing Area Update with the new SGSN.                                                                                                                 |
| 15   | SS->MS    | SABM                             |                                                                                                                                                                                                                                                                                                  |
| 16   | MS-> SS   | UA                               |                                                                                                                                                                                                                                                                                                  |
| 17   | MS -> SS  | I + S                            | Resume data transfer from the MS.                                                                                                                                                                                                                                                                |
| 18   |           |                                  | Do not respond with an RR from the SS. Check that the MS retransmits the frame after T201 seconds, N200 times. T201 and N200 shall be as per the values negotiated, if any, after link re-establishment and not as per the values of N200 and T200 negotiated before sending a Reset, in step 8. |
| 19   | MS -> SS  | SABM                             | Verify that the MS sends a SABM to re-establish the link                                                                                                                                                                                                                                         |
| 20   | SS -> MS  | UA                               | Respond with a UA within T200 seconds.                                                                                                                                                                                                                                                           |
| 21   | MS -> SS  | UI                               | Initiate unacknowledged data transfer from the MS and send 50 octets for the same SAPI and for the same TLLI used before sending Reset from the SS. Verify that These frames have been ciphered with OC = 0. These frames are numbered from 0 and not from N <sub>MS</sub> .                     |

#### 46.1.2.7.7 XID command with unrecognised type field

##### 46.1.2.7.7.1 Conformance requirement

If a SABM or XID command with an invalid XID information field is received, then the SABM or XID command, respectively, shall be ignored.

If a SABM or XID command with unrecognised type field is received, then this parameter shall be ignored.

##### Reference

3GPP TS 04.64, subclause 8.5.3.3.

##### 46.1.2.7.7.2 Test purpose

To test the MS response to an XID command with an unrecognised type field.

## 46.1.2.7.7.3 Method of test

Initial conditions

-

Related PICS/PIXIT Statement

-

Test procedure

Send an XID frame from the SS with  $N200 = 5$  and another parameter with type = 15. Verify that the MS responds with an XID response. Send an I+S frame from the MS with the A bit set to 1. Do not respond with an RR. Verify that the MS retransmits the I+S frame  $N200$  times, every  $T201$  seconds, with  $N200$  taking the negotiated value.

Maximum duration of the test

3 minutes.

Expected sequence

| Step | Direction | Message                  | Comments                                                                                                                                                                                                                                                    |
|------|-----------|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    |           | {PDP Context Activation} | Macro. Initiate a PDP context from the MS using PDP Context 11.                                                                                                                                                                                             |
| 2    | SS -> MS  | XID                      | Send an XID command with $N200 = 5$ and an XID parameter with its type = 15, length =4 and value = 1500.                                                                                                                                                    |
| 3    | MS -> SS  | XID                      | Verify the XID response received. If the MS has requested for a new XID value, verify that the new values are within range the sense of negotiation is correct<br>The values received in the XID response shall be regarded as the final negotiated values. |
| 4    |           |                          | Initiate acknowledged mode data transfer of 1 octet from the MS.                                                                                                                                                                                            |
| 5    | MS -> SS  | I+S                      | Initiate data transfer from the MS. Send an I+S frame from the MS with the A bit set to 1. Do not acknowledge the frame from the SS.<br>Verify that<br>The MS sends an I+S frame every $T201$ seconds, $N200$ times.                                        |
| 6    | MS -> SS  | SABM                     | Verify that the MS re-establishes the link by sending a SABM, after all retransmissions are complete.                                                                                                                                                       |
| 7    | SS -> MS  | UA                       | Respond with a UA                                                                                                                                                                                                                                           |

## 46.1.2.7.8 XID Response with out of range values

## 46.1.2.7.8.1 Conformance requirement

If UA or XID response with an invalid XID information field is received, then the UA or XID response shall be ignored, the SABM or XID command shall be retransmitted, and the retransmission counter shall be incremented.

Reference

3GPP TS 04.64, subclause 8.5.3.3.

## 46.1.2.7.8.2 Test purpose

To test the MS response to an XID response with the  $N201-I$  value out of range.

## 46.1.2.7.8.3 Method of test

## Initial conditions

-

## Test procedure

Send an XID frame within SABM, from the MS with layer3 parameters. Respond from the SS with an XID, with N201-I = 1600. Verify that the MS ignores this response and resends the SABM with the XID command. Now accept the XID values received at the SS. Send an I+S frame with length less than N201-I and the A bit set to 1 and verify that the MS responds with an RR. Send an I+S frame from the SS with its length larger than the maximum negotiated value of N201-I and verify that the MS sends an FRMR and re-establishes the link.

## Maximum duration of the test

3 minutes.

## Expected sequence

| Step                     | Direction | Message                  | Comments                                                                                                                                                  |

## 46.2 SNDCP Tests

This clause contains the test case requirements for Subnetwork Dependent Convergence Protocol(SNDCP) procedures in the General Packet Radio Service (GPRS).

### 46.2.1 Default Conditions

- The MS default initial condition is that it is GPRS attached.
- Data and header compression are off.

The N-PDU size shall be more than the negotiated values of N201-U and N201-I so that segmentation at SNDCP is ensured. Unless stated otherwise, the default conditions shall apply.

If the MS sends an XID command with XID parameters any time before a data transfer, the SS shall send an XID response, accepting the values proposed by the MS.

## 46.2.2 Test cases

### 46.2.2.1 Data transfer

#### 46.2.2.1.1 Mobile originated normal data transfer with LLC in acknowledged mode

##### 46.2.2.1.1.1 Conformance requirement

The SNDCP entity shall initiate acknowledged data transmission only if the PDP context for the NSAPI identified in the SN-DATA.request has been activated and if acknowledged LLC operation has been established.

The N-PDU number in acknowledged mode is a number assigned to each N-PDU received by SNDCP through an SN-DATA.request. N-PDU numbers for different NSAPIs shall be assigned independently. The N-PDU number shall be included in the SNDCP header of the first segment of an N-PDU.

Upon reception of an SN-DATA.request, the SNDCP entity shall assign to the N-PDU received the current value of the Send N-PDU number as the N-PDU number, increment the Send N-PDU number by 1, perform the compression and segmentation functions, then forward the SN-PDU(s) in LL-DATA.request to the LLC layer. The N-PDU shall be stored into a buffer in the SNDCP entity. The buffered N-PDU shall be deleted when the SN-DATA PDU carrying the last segment of the N-PDU is confirmed by an LL-DATA.confirm primitive.

A (possibly compressed) N-PDU shall be segmented into one or more SN-PDUs. The length of each SN-PDU shall not be greater than N201-I (for acknowledged mode) or N201-U (for unacknowledged mode).

#### Reference

3GPP TS 04.65, subclauses 6.9.1 and 6.7.1.1.

##### 46.2.2.1.1.2 Test purpose

To verify that:

- The MS sends the N-PDU number in the first segment of every N-PDU.
- The MS increments the N-PDU number properly.
- The size of a segment must not be greater than N201-I.

##### 46.2.2.1.1.3 Method of test

#### Initial conditions

-

#### Related PICS/PIXIT Statement

-

#### Test procedure

Activation of PDP context 13 is initiated from MS.

Verify that the first segment of the first N-PDU received has N-PDU number 0. Acknowledge all the segments received from the MS. For the subsequent N-PDUs received, verify that the N-PDU number is incremented properly.

Repeat the test case for PDP contexts 11 and 12.

#### Maximum duration of the test

3 minutes.

Expected sequence

| Step | Direction | Message                  | Comments                                                                                                                                                                                 |
|------|-----------|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    |           | {PDP Context Activation} | Macro. Initiate PDP context activation from the MS. The PDP context used here is PDP context 13.                                                                                         |
| 2    |           |                          | Initiate data transfer of 5000 octets from the MS .                                                                                                                                      |
| 3    | MS -> SS  | SN-DATA PDU              | Verify that the number of octets in the SN-DATA PDU does not exceed N201-I.<br>Verify that the first SN-DATA PDU received has M=1, T=0, F=1, X = 0, DCOMP = PCOMP = 0, N-PDU number = 0. |
| 4    |           |                          | Verify that the last segment of every N-PDU received has M=0, T=0, and F=0.                                                                                                              |
| 5    |           |                          | Verify that for the subsequent N-PDUs, the N-PDU number is incremented properly                                                                                                          |
| 6    |           |                          | Repeat step 3 to 5 until 5000 octets are sent.                                                                                                                                           |
| 7    |           |                          | Repeat the test case for SAPIs 3 and 9. The PDP context used for SAPI 3 is PDP Context 11 and the one for SAPI 9 is PDP Context 12.                                                      |

#### 46.2.2.1.2 Mobile originated normal data transfer with LLC in unacknowledged mode

##### 46.2.2.1.2.1 Conformance requirement

The SNDSCP entity shall initiate unacknowledged data transmission only if the PDP context for the NSAPI identified in the SN-DATA.request has been activated. The SNDSCP entity may initiate unacknowledged data transmission even if the acknowledged peer-to-peer operation is not established for that NSAPI. The N-PDU number in unacknowledged mode is a number assigned to each N-PDU received by SNDSCP through an SN-UNITDATA.request. N-PDU numbers for different NSAPIs shall be assigned independently. The N-PDU number shall be included in the SNDSCP header of every SN-UNITDATA PDU.

A variable, the Send N-PDU number (unacknowledged), shall be maintained for each NSAPI using unacknowledged peer-to-peer LLC operation. When an NSAPI using unacknowledged peer-to-peer LLC operation is activated, the Send N-PDU number (unacknowledged) shall be set to 0. The Send N-PDU number (unacknowledged) shall also be set as described in subclauses 5.1.2.1 and 5.1.2.22. Modulo 4096 operation shall be applied to the Send N-PDU number (unacknowledged).

Upon reception of an SN-UNITDATA request, the SNDSCP entity shall assign the current value of the Send N-PDU number (unacknowledged) as the N-PDU number of the N-PDU received, increment Send N-PDU number (unacknowledged) by 1, compress and segment the information, then forward the SN-PDU(s) in LL-UNITDATA.request to the LLC layer. The N-PDU shall be deleted immediately after the data has been delivered to the LLC layer.

A (possibly compressed) N-PDU shall be segmented into one or more SN-PDUs. The length of each SN-PDU shall not be greater than N201-I (for acknowledged mode) or N201-U (for unacknowledged mode).

The segment number is a sequence number assigned to each SN-UNITDATA PDU. The sequence number shall set to 0 in the first SN-UNITDATA PDU of an N-PDU, and incremented by 1 for each subsequent SN-UNITDATA PDU. Modulo 16 operation is applied. N-PDU number is included in every SN-UNITDATA PDU.

The SNDSCP entity shall perform the mapping function of SN\_UNITDATA primitives onto LL\_UNITDATA primitives

#### Reference

3GPP TS 04.65, subclauses 6.9.2, 6.7.1.1, 6.7.3 and 5.2.

#### 46.2.2.1.2.2 Test purpose

To verify that:

- The MS sends the N-PDU number in every segment of every N-PDU.
- The MS increments the N-PDU number and segment number properly and modulo 16 operation is applied.
- The size of a segment shall not be greater than N201-U.
- The MS maps the SN\_UNITDATA PDUs onto SAPIs allocated by Network.

#### 46.2.2.1.2.3 Method of test

Initial conditions

-

Related PICS/PIXIT Statement

-

Test procedure

PDP context 10 is initiated from MS.

Initiate unacknowledged data transfer from MS.

Verify that the first segment of the first N-PDU received has N-PDU number 0. For the subsequent N-PDUs received, verify that the N-PDU number is incremented properly.

Verify that the SN-UNITDATA PDUs are numbered correctly.

Verify the SAPI number on which the data PDU is received.

Verify that Modulo 16 operation is applied.

Maximum duration of the test

2 minutes.

Expected sequence

#### 46.2.2.1.3 Usage of acknowledged mode for data transmission before and after PDP Context modification, on different SAPIs

##### 46.2.2.1.3.1 Conformance Requirement

Upon reception of the SNSM-MODIFY.indication from the SM sublayer:

- the SNDCP entity shall, if necessary, establish the acknowledged peer-to-peer LLC operation for the indicated SAPI (the establishment criteria and procedure are described in subclause 6.2.1);
- the SNDCP entity shall also, if necessary, release the acknowledged peer-to-peer LLC operation for the originally-assigned SAPI (the release criteria and procedure are described in subclause 6.2.2); In addition, if the newly-assigned SAPI is different from the original SAPI:
  - LL-DATA.indication, LL-DATA.confirm and LL-UNITDATA.indication received on the old SAPI shall be ignored;
  - LL-DATA.request and LL-UNITDATA.request shall be sent on the new SAPI; and
  - if acknowledged peer-to-peer LLC operation is used both before and after the receipt of the SNSM-MODIFY. indication, then all buffered N-PDUs (i.e., the ones whose complete reception has not been acknowledged and the ones that have not been transmitted yet) shall be transmitted starting from the oldest N-PDU.

#### Reference

3GPP TS 04.65, subclause 5.1.2.23.

##### 46.2.2.1.3.2 Test purpose

To verify that after the PDP context modification:

- the MS resumes acknowledged data transfer correctly with the oldest N-PDU which is buffered after a PDP context modification.

## 46.2.2.1.3.3 Method of test

## Initial conditions

-

## Related PICS/PIXIT Statement

-

## Test procedure

PDP Context 11 is initiated from MS.

After the first N-PDU is correctly received in acknowledged mode, the last segment of the second N-PDU (N-PDU number=1) is not acked and a PDP context modification is initiated from SS to PDP context 12, ie: using SAPI 9 in acknowledged mode.

After the modification procedure is complete, the first SN-DATA PDU received shall have the N-PDU number 1. The N-PDU received shall be the same as the last one before the modification procedure was triggered.

## Maximum duration of the test

2 minutes.

## Expected sequence

| 14   |           |                            | Repeat steps 11 to 13 until 5000 octets are sent.                                                                                                                                                                              |

#### 46.2.2.1.4 Reset indication during unacknowledged mode

##### 46.2.2.1.4.1 Conformance Requirement

Upon receipt of the LL-RESET.indication, the SNDTCP layer shall:

- reset all SNDTCP XID parameters to their default values;
- in the MS, for every NSAPI using unacknowledged peer-to-peer LLC operation, set the Send N-PDU number (unacknowledged) to 0.

##### Reference

3GPP TS 04.65, subclause 5.1.2.1.

##### 46.2.2.1.4.2 Test purpose

To verify that the MS resets the Send N-PDU number to 0 on link reset during an unacknowledged mode data transfer.

##### 46.2.2.1.4.3 Method of test

##### Initial conditions

-

##### Related PICS/PIXIT Statement

-

##### Test procedure

PDP Context 10 is initiated from MS.

An XID command is sent with reset from SS during unacknowledged data transfer, after receiving N-PDU number 2 from MS. The next N-PDU number from MS shall be 0.

##### Maximum duration of the test

2 minutes.

Expected sequence

| Step | Direction | Message                  | Comments                                                                                                                                                                                                                                                                                                        |

#### 46.2.2.1.5 Reset indication during acknowledged mode

##### 46.2.2.1.5.1 Conformance Requirement

Upon receipt of the LL-RESET.indication, the SNDSCP layer shall:

- reset all SNDSCP XID parameters to their default values;
- for every NSAPI using acknowledged peer-to-peer LLC operation, enter the recovery state and suspend the transmission of SN-PDUs until an SNSM-SEQUENCE.indication primitive is received for the NSAPI.

##### Reference

3GPP TS 04.65, subclause 5.1.2.1.

##### 46.2.2.1.5.2 Test purpose

To verify that the MS suspends the data transfer in acknowledged mode on link reset and resume when indicated by the SS.

##### 46.2.2.1.5.3 Method of test

##### Initial conditions

Two cells , cell A and B need to be supported. B is in a routing area (in a new SGSN) and location area different from that of A. The power level of cell A shall be higher than that of cell B so that the MS selects cell A.

##### Related PICS/PIXIT Statement

-

##### Test procedure

PDP Context 13 is initiated from MS.

Acknowledge the first 2 N-PDUs received from MS during the data transfer.

Initiate an inter SGSN Routing Area Update procedure from MS. An XID command is sent with reset from SS, after receiving N-PDU number N from MS. Specify the Receive N-PDU number to be 3 in the Routing Area Update Accept message. Verify that the data transfer is resumed and the MS sends the next N-PDU with N-PDU number 3. The MS shall not send the buffered N-PDU with N-PDU number 2.

Maximum duration of the test

2 minutes.

NOTE: This test assumes that the LLC layer in the MS has sufficient window size to support two outstanding N-PDUs.

## 46.2.2.2 Segmentation

### 46.2.2.2.1 LLC link re-establishment on reception of SN-DATA PDU with F=0 in ack mode in the Receive First Segment state

#### 46.2.2.2.1.1 Conformance Requirement

Receive First Segment state:

- If an SN-DATA PDU is received with the F bit set to 0, the SN-DATA PDU shall be discarded, and the acknowledged LLC operation shall be re-established for the SAPI used.

Reference

3GPP TS 04.65, subclause 6.7.4.1.

## 46.2.2.2.1.2 Test purpose

To verify that the MS re-establishes the LLC SAPI on reception of an SN-DATA PDU with F=0 as the first segment in the acknowledged mode data transfer.

## 46.2.2.2.1.3 Method of test

## Initial conditions

-

## Related PICS/PIXIT Statement

-

## Test procedure

PDP Context 13 is initiated from MS.

An acknowledged mode data transfer is started from SS with the first SN\_DATA PDU with F=0.

Verify that the MS shall re-establish the LLC SAPI 11.

## Maximum duration of the test

2 minutes.

## Expected sequence

| Step | Direction | Message                  | Comments                                                                                    |
|------|-----------|--------------------------|---------------------------------------------------------------------------------------------|
| 1    |           | {PDP Context Activation} | Macro. Initiate PDP context activation from the MS. Use PDP context 13.                     |

| 3    | SS -> MS  | SN-DATA PDU              | Send the first SN-DATA PDU with M=1, T=0, F=0, X = 0, DCOMP = PCOMP = 0, N-PDU number = 0 . |
| 4    | MS->SS    | SABM                     | MS re-establishes the LLC SAPI 11                                                           |
| 5    | SS->MS    | UA                       |                                                                                             |
| 6    | SS -> MS  | SN-DATA PDU              | Send the first SN-DATA PDU with M=1, T=0, F=1, X = 0, DCOMP = PCOMP = 0, N-PDU number = 0   |
| 7    |           |                          | Repeat step 6 until 5000 octets are sent. Verify that all SN-DATA PDUs are acknowledged.    |

## 46.2.2.2.2 LLC link re-establishment on receiving second segment with F=1 and with different PCOMP and DCOMP values in the acknowledged mode data transfer

## 46.2.2.2.2.1 Conformance Requirement

Receive Subsequent Segment state:

- If an SN-DATA PDU is received with the F bit set to 1, and if DCOMP, PCOMP or N-PDU number is different from those in the first segment, then the SN-DATA PDU and all previous segments belonging to the same N-PDU shall be discarded, and the acknowledged LLC operation shall be re-established for the SAPI used.

## Reference

3GPP TS 04.65, subclause 6.7.4.2.

## 46.2.2.2.2 Test purpose

To verify that the MS re-establishes the LLC SAPI on reception of the second SN-DATA PDU with F=1 and with PCOMP and DCOMP values different from those of the previous segment, in the second segment in acknowledged mode data transfer.

## 46.2.2.2.3 Method of test

Initial conditions

-

Related PICS/PIXIT Statement

-

Test procedure

PDP Context 13 is initiated from MS.

AN acknowledged mode data transfer is started from SS with the first SN\_DATA PDU with F=1. Send the second SN-DATA PDU from SS with F=1 and with PCOMP and DCOMP values different from those in the first segment.

Verify that the MS shall re-establish the LLC SAPI 11.

Maximum duration of the test

2 minutes.

Expected sequence

| Step | Direction | Message                  | Comments                                                                                    |
|------|-----------|--------------------------|---------------------------------------------------------------------------------------------|
| 1    |           | {PDP Context Activation} | Macro. Initiate PDP context activation from the MS. Use PDP context 13.                     |
| 2    |           |                          | Initiate acknowledged data transfer for 5000 octets, from the SS.                           |
| 3    | SS -> MS  | SN-DATA PDU              | Send the first SN-DATA PDU with M=1, T=0, F=1, X = 0, DCOMP = PCOMP = 0, N-PDU number = 0.  |
| 4    | SS->MS    | SN-DATA PDU              | Send the second SN-DATA PDU with M=1, T=0, F=1, X = 0, DCOMP = PCOMP = 1, N-PDU number = 0. |
| 5    | MS->SS    | SABM                     | Re-establishment of LLC link on SAPI 11.                                                    |
| 6    | SS->MS    | UA                       |                                                                                             |

## 46.2.2.2.3 Single segment N-PDU from MS

## 46.2.2.2.3.1 Conformance Requirement

- The F bit in the SNDCP header shall be set to 1 for the first segment, and 0 for all subsequent segments. For unacknowledged peer-to-peer LLC operation, DCOMP and PCOMP shall be included in the header when the F bit is set to 1, and shall not be included when the F bit is set to 0. For acknowledged peer-to-peer LLC operation, DCOMP, PCOMP and N-PDU number shall be included in the header when the F bit is set to 1, and shall not be included when the F bit is set to 0.
- The M bit in the SNDCP header shall be set to 0 for the last segment, and 1 for all previous segments. If only one SN-PDU is generated for an N-PDU, the F bit shall be set to 1 and the M bit set to 0.

## Reference

3GPP TS 04.65, subclause 6.7.1.1.

## 46.2.2.2.3.2 Test purpose

To verify that for a single segment N-PDU, the MS shall send the SN\_UNITDATA PDU with F=1 and M=0 during unacknowledged data transfer.

## 46.2.2.2.3.3 Method of test

## Initial conditions

-

## Related PICS/PIXIT Statement

-

## Test procedure

PDP Context 10 is initiated from MS.

An unacknowledged mode data transfer is started from MS for a data size less than N201-U. Verify that the MS sends the SN-UNITDATA PDU with M=0 and F=1.

## Maximum duration of the test

2 minutes.

## Expected sequence

| Step | Direction | Message                  | Comments                                                                |
|------|-----------|--------------------------|-------------------------------------------------------------------------|
| 1    |           | {PDP Context Activation} | Macro. Initiate PDP context activation from the MS. Use PDP context 10. |
| 2    |           |                          | Initiate unacknowledged data transfer for 1 octet, from the MS.         |
| 3    | MS -> SS  | SN-UNITDATA PDU          | Verify that the single SN-UNITDATA PDU is received with M=0 and F=1.    |

## 46.2.2.3 Link Release

## 46.2.2.3.1 LLC link release on receiving DM from the SS during link establishment

## 46.2.2.3.1.1 Conformance Requirement

If the originator of the establishment procedure receives an LL-RELEASE.indication with Cause "DM received", it shall inform the SM sub-layer using the SNSM-STATUS.request primitive with Cause "DM received". SM shall then deactivate all PDP contexts for that SAPI requiring acknowledged peer-to-peer LLC operation.

## Reference

3GPP TS 04.65, subclause 6.2.1.4.

## 46.2.2.3.1.2 Test purpose

To verify that in MS, the LLC SAPI is released and the PDP context is deactivated on reception of DM response from SS during link establishment.

## 46.2.2.3.1.3 Method of test

Initial conditions

-

Related PICS/PIXIT Statement

-

Test procedure

PDP Context 13 is initiated from MS.

A DM response is sent from SS, after receiving a SABM from the MS for link establishment. The MS shall release the LLC SAPI 11 and the PDP context for the NSAPI shall be deactivated.

Maximum duration of the test

2 minutes.

Expected sequence

| Step | Direction | Message                  | Comments                                                                |
|------|-----------|--------------------------|-------------------------------------------------------------------------|
| 1    |           | {PDP Context Activation} | Macro. Initiate PDP context activation from the MS. Use PDP context 13. |
| 2    | MS -> SS  | SABM                     | SABM sent for link establishment during PDP context activation          |
| 3    | SS->MS    | DM                       | Initiate a DM response with F=1 from the SS.                            |
| 4    |           |                          | Verify that the MS initiates PDP Context Deactivation.                  |

## 46.2.2.4 XID negotiation

## 46.2.2.4.1 Response from MS on receiving XID request from the SS

## 46.2.2.4.1.1 Conformance Requirement

The XID negotiation is a one-step procedure; i.e., the initiating end proposes parameter values, and the responding end either accepts these or offers different values in their place according to the XID negotiation rules described in the present document; the rules limit the range of parameter values as well as the sense of negotiation. The initiating end accepts (or rejects) the values in the response; this concludes the negotiation.

A bit set to 0 means that the compression entity is not applicable to the corresponding NSAPI. A bit set to 1 means that the compression entity is applicable to the corresponding NSAPI.

Reference

3GPP TS 04.65, subclause 6.8.1.

## 46.2.2.4.1.2 Test purpose

To verify that:

- the MS which does not support compression, responds with applicable NSAPI field with 0 for an XID request from the SS with some compression entity;
- the MS which supports compression responds with the applicable NSAPI field set to 1 for an XID request from the SS with some compression entity.

## 46.2.2.4.1.3 Method of test

## Initial conditions

-

## Related PICS/PIXIT Statement

MS supporting compression has compression turned on.

## Test procedure

PDP Context 13 is initiated from MS. The MS supporting compression will also trigger an XID negotiation. Modify the PDP Context to PDP Context 12 from the SS.

After PDP context modification, trigger compression by sending an XID Request from SS including a L3-parameter with some compression entity for the NSAPI assigned for the PDP context.

The MS which does not support compression or has a lack of resources shall respond with XID response setting the applicable NSAPI field set to 0, indicating that compression is not supported/wanted.

The MS which support compression and has compression turned on shall respond with XID response setting the applicable NSAPI field set to 1, indicating that compression is supported.

## Maximum duration of the test

2 minutes.

## Expected sequence

| Step | Direction | Message                    | Comments                                                                                                                                                                                                                                                                                      |
|------|-----------|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    |           | {PDP Context Activation}   | Macro. Initiate PDP context activation from the MS. Use PDP context 13. The MS supporting compression will also trigger an XID negotiation.                                                                                                                                                   |
| 2    |           | {PDP Context Modification} | Macro. Initiate PDP Context Modification from the SS. The new context is PDP Context 12.                                                                                                                                                                                                      |
| 3    | SS -> MS  | XID Request                | In the layer3 XID parameters, send a PCOMP entity with parameter type = 2, entity number = 1 and algorithm type = 0, a DCOMP entity with parameter type = 1, entity number = 1 and algorithm type = 0. In the applicable NSAPI field, set the bit for the NSAPI assigned for the PDP context. |
| A4   | MS -> SS  | XID Response               | Verify that the MS which does not support compression, has compression turned off or has a lack of resources responds with the assigned NSAPI field set to 0.                                                                                                                                 |
| B4   | MS -> SS  | XID Response               | Verify that the MS which supports compression and has compression turned on responds with the assigned NSAPI field set to 1.                                                                                                                                                                  |
| 5    |           |                            | Initiate acknowledged data transfer for 5000 octets, from the MS.                                                                                                                                                                                                                             |
| 6    | MS -> SS  | SN-DATA PDU                | Verify that the number of octets in the SN-DATA PDU does not exceed N201-l.                                                                                                                                                                                                                   |

#### 46.2.2.4.2 Response from MS on receiving an XID request from the SS with an unassigned entity number

##### 46.2.2.4.2.1 Conformance Requirement

In the originating SNDCP XID block, if an unassigned entity number is included with the P bit set to 0, then the Applicable NSAPIs field in the response shall be set to 0.

##### Reference

3GPP TS 04.65, subclause 6.8.3.

##### 46.2.2.4.2.2 Test purpose

To verify that in the originating SNDCP XID block, if an unassigned entity number is included with the P bit set to 0, the Applicable NSAPIs field in the response shall be set to 0.

##### 46.2.2.4.2.3 Method of test

##### Initial conditions

-

##### Related PICS/PIXIT Statement

-

##### Test procedure

PDP Context 11 is initiated from MS.

Send an XID command from the SS with P bit set to 0, with an unassigned entity number.

The MS shall respond with XID response setting the applicable NSAPI field set to 0, indicating that compression is not supported.

##### Maximum duration of the test

2 minutes.

##### Expected sequence

| Step | Direction | Message                  | Comments                                                                                                                                                             |
|------|-----------|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    |           | {PDP Context Activation} | Macro. Initiate PDP context activation from the MS. Use PDP context 11.                                                                                              |
| 2    | SS -> MS  | XID                      | In the layer3 XID parameters, send a PCOMP entity with parameter type = 2 and algorithm type = 0. Set the P bit to 0 and the entity number to a number not assigned. |
| 3    | MS -> SS  | XID                      | Verify that the MS responds with the assigned NSAPI field set to 0.                                                                                                  |

#### 46.2.2.4.3 Response from MS on receiving an XID response from the SS with unrecognised type field

##### 46.2.2.4.3.1 Conformance Requirement

If the responding SNDCP XID block includes a parameter with unrecognised Type field, unsupported length, an out-of-range value or a value violating the sense of negotiation, a parameter type 1 or 2 which violates the rules in subclause 6.8.1, a parameter with duplicated instances, contains prohibited changes (see subclauses 6.5.1.2 and 6.6.1.2) to the parameters of compression entities used with acknowledged peer-to-peer LLC operation when the SNDCP XID block is sent on LL-XID primitives, or a compression field with the P bit set to 1, then the originator shall ignore the block and reinitiate the negotiation.

##### Reference

3GPP TS 04.65, subclause 6.8.3.

##### 46.2.2.4.3.2 Test purpose

To verify that in the XID response, if an unrecognised type field is specified, the originator shall ignore the block and reinitiate XID negotiation.

##### 46.2.2.4.3.3 Method of test

##### Initial conditions

-

##### Related PICS/PIXIT Statement

-

##### Test procedure

PDP Context 11 is initiated from MS.

In the response to SABM, in the UA, send parameter type = 30.

The MS shall resend the SABM command.

##### Maximum duration of the test

2 minutes.

##### Expected sequence

| Step | Direction | Message                  | Comments                                                                |
|------|-----------|--------------------------|-------------------------------------------------------------------------|
| 1    |           | {PDP Context Activation} | Macro. Initiate PDP context activation from the MS. Use PDP context 11. |
| 2    | MS -> SS  | SABM                     |                                                                         |
| 3    | SS -> MS  | UA                       | Include a layer3 XID parameter with parameter type = 30.                |
| 4    | MS -> SS  | SABM                     | Verify that the MS resends SABM.                                        |

## 46.2.2.5 LLC link release on receiving "Invalid XID response" from the network during link establishment procedure

### 46.2.2.5.1 Conformance Requirement

If the originator of the establishment procedure receives an LL-RELEASE.indication with Cause "Invalid XID response", it shall inform the SM sub-layer using the SNSM-STATUS.request primitive with Cause "Invalid XID response". SM shall then deactivate all PDP contexts for that SAPI.

### Reference

3GPP TS 04.65, subclause 6.2.1.4.

3GPP TS 04.64, subclause 8.5.3.3.

### 46.2.2.5.2 Test purpose

To verify that in the MS, the PDP context is deactivated on reception of "Invalid XID response" from network during link establishment.

### 46.2.2.5.3 Method of test

#### Initial conditions

-

#### Related PICS/PIXIT Statement

-

#### Test procedure

Activation of PDP Context 13 is initiated from MS.

The MS sends a SABM from the MS for link establishment.

The SS responds to the SABM with a UA with Invalid XID information field.

The MS shall ignore this response and re-transmit the SABM N200 times.

The SS shall respond with the UA with Invalid XID information, N200 times.

Verify that the MS releases the LLC SAPI and the PDP context for the SAPI is deactivated.

#### Maximum duration of the test

3 minutes.

Expected sequence

---

## 47 Dual Transfer Mode

### 47.1 Reallocation of CS resources

#### 47.1.1 Reallocation of CS resources / Assignment Command

##### 47.1.1.1 Conformance requirements

While in dual transfer mode an inter-frequency change of channel can be performed through the dedicated channel assignment procedure.

Upon receipt of the ASSIGNMENT COMMAND message, the MS shall abandon the packet resource immediately, enter dedicated mode and then initiate a local end release of link layer connections and disconnects the physical channels. The MS then commands the switching to the assigned channels and initiates the establishment of lower layer connections.

After the main signalling link is successfully established, the MS returns an ASSIGNMENT COMPLETE message, specifying cause "normal event", to the network on the main DCCH.

The sending of this message on the MS side and its receipt on the network side allow the resumption of the transmission of signalling layer messages other than those belonging to RR management which include the Packet Assignment signalling to re-establish DTM.

##### References

3GPP TS 04.18 / 44.018, sub-clause 3.4.3

##### 47.1.1.2 Test purpose

To verify that the channel assignment procedure can completely modify the physical channel configuration of the MS within the current frequency band and that the MS can re-establish successfully the PS resources.

##### 47.1.1.3 Method of test

##### Initial Conditions

###### System Simulator:

1 cell, Cell A, with both TCH of cell activated and DTM supported.

###### Mobile Station:

The MS is in the active state (U10) of a call, on cell A, with a TMSI and P-TMSI allocated and the PDP context 1 activated but no allocated TBFs.

##### Related PICS/PIXIT Statement(s)

- DTM Multislot Class 1;
- DTM Multislot Class 5;
- DTM Multislot Class 9.

##### Test Procedure

Once the MS is in DTM, the SS attempts to modify the resources of the MS. The MS is allocated a timeslot, in the different frequency band, on the current cell. The re-allocation of the MS resources is realised by the MS receiving an ASSIGNMENT COMMAND message from the SS. The ASSIGNMENT COMMAND message instructs the switching of the MS to the newly assigned channel and initiates the establishment of lower layer connections. The establishment

of the lower layer connections includes the activation of the channels, the connection to the channels and the establishment of the main signalling link. Once the CS connection is established, the MS should return an ASSIGNMENT COMPLETE message on the new main signalling link. The SS then sends the PACKET ASSIGNMENT message to the MS over the main signalling link to establish the packet resources and the MS enters DTM.

MS of type DTM Multislot class 1 shall follow only complete test for k=1, whereas MSs of types DTM Multislot class 5 or 9 shall complete testing for k=1 and k=2.

#### Maximum Duration of Test

5 minutes

#### Expected Sequence

The test sequence is repeated for k = 1,2.

| Step | Direction | Message                        | Comments                                                                                                                                                                                                                                          |

## 47.1.2 Reallocation of CS resources / Handover Command

### 47.1.2.1 Conformance requirements

While in dual transfer mode an intra-cell change of channel can be performed, when requested by the network, through the handover procedure.

Upon receipt of the HANDOVER COMMAND message, the MS shall immediately abandon the packet resources entering dedicated mode. Once the packet resources have been released the MS initiates the release of link layer connections and disconnects the physical channels. The MS then commands the switching to the assigned channels and initiates the establishment of lower layer connections.

After the main signalling link is successfully established, the MS returns a HANDOVER COMPLETE message to the network on the main DCCH, then the TBFs can be re-established using the Packet Assignment procedure.

### References

3GPP TS 04.18/44.018, sub-clauses 3.4.4.1, 3.4.4.3 & 3.4.23

### 47.1.2.2 Test purpose

To verify that when the MS changes the CS resources to a different timeslot in the same frequency band using the Handover procedure, the MS successfully re-establishes the CS and PS resources.

### 47.1.2.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, DTM supported.

Mobile Station:

The MS is in the active state (U10) of a call, on cell A, with a TMSI and P-TMSI allocated and the PDP context 1 activated but no allocated TBFs.

#### Related PICS/PIXIT Statement(s)

- DTM Multislot Class 1;
- DTM Multislot Class 5;
- DTM Multislot Class 9.

## Test Procedure

Once the MS is in DTM, the SS attempts to modify the resources of the MS by allocating a different timeslot, in the same frequency band, on the current cell. The re-allocation of the MS resources is realised by the MS receiving a HANOVER COMMAND message from the SS. The HANOVER COMMAND message instructs the switching of the MS to the newly assigned channel and the establishment of lower layer connections. Once the CS connection is established, the MS should return a HANOVER COMPLETE message on the new main signalling link. The PACKET ASSIGNMENT message is then sent to the MS over the main signalling link to establish the packet resources and the MS re-enters DTM.

MS of type DTM Multislot class 1 shall follow only complete test for  $k=1$ , whereas MSs of types DTM Multislot class 5 or 9 shall complete testing for  $k=1$  and  $k=2$ .

## Maximum Duration of Test

5 minutes

## Expected Sequence

The test sequence is repeated for  $k = 1, 2$ .

## 47.3 Handover

### 47.3.1 Handover to same routing area

#### 47.3.1.1 Handover to same routing area whilst in dedicated mode & MM Ready / Completed on the main DCCH

##### 47.3.1.1.1 Conformance requirements

In GSM, if a previous ROUTING AREA UPDATE ACCEPT message contained a Cell Notification information element, then the MS shall then start to use the LLC NULL frame to perform cell updates, when no user data is waiting to be sent.

##### References

3GPP TS 24.008, sub-clause 4.7.5.1.3.

3GPP TS 04.64 / 44.064, sub-clause 6.4.1.7.

##### 47.3.1.1.2 Test purpose

To verify that when the network completes the CS handover of the MS to a different cell, the MS sends a cell update on the main DCCH in the new cell.

##### 47.3.1.1.3 Method of test

##### Initial Conditions

System Simulator:

3 cells, A, B and C, with B and C in the same RA and DTM supported in all.  
Cell A is active, but cells B and C are not.

Mobile Station:

The MS is in packet idle mode, camped on cell A, with P-TMSI-2 allocated.

##### Related PICS/PIXIT Statement(s)

- Support of DTM

##### Test Procedure

The MS is camped on cell A in packet idle mode

The SS then activates cell B and then lowers the power of cell A until the MS prefers cell B. The MS performs RA update procedure on the new RA. The ROUTING AREA ACCEPT message received by the MS shall include the Cell Notification IE, which indicates that the MS can use an LLC-NUL frame as a CELL UPDATE message. Once the MS is successfully camped on cell B, the SS pages the MS and CS call is established. After the CS connection has been established for 30 seconds, the SS instructs the MS to complete the Handover procedure to cell C. Once the Handover procedure is complete the MS should perform the Cell Update procedure using the LLC NULL frame on the main DCCH.

#### Maximum Duration of Test

5 minutes

#### Expected Sequence

### 47.3.1.2 Handover to same routing area whilst in DTM with downlink TBF Established

#### 47.3.1.2.1 Conformance requirements

The handover procedure includes the:

- abortion of the downlink packet resources;
- disconnection and the deactivation of previously assigned channels and their release (layer 1);

- activation of the new channels, and their connection if applicable;
- triggering of the establishment of data link connection for SAPI = 0 on the new channels.

Then if DTM is supported in the new cell, the downlink TBF should be re-established.

## References

3GPP TS 04.18 / 44.018, sub-clause 3.4.4.

### 47.3.1.2.2 Test purpose

To verify that the downlink packet resources can be successfully aborted, then re-established in the new cell after the handover of CS resources.

### 47.3.1.2.3 Method of test

## Initial Conditions

### System Simulator:

2 cells, A and B with same LAI, default parameters and both support DTM.

### Mobile Station:

The MS is in the active state (U10) of a call on Timeslot N (chosen arbitrarily) of cell A and has the PDP context 1 activated.

## Related PICS/PIXIT Statement(s)

- DTM Multislot Class 1;
- DTM Multislot Class 5;
- DTM Multislot Class 9.

## Test Procedure

After the MS is in DTM with an active downlink TBF, the SS initiates the Handover procedure. Once the MS has successfully completed the handover procedure to the new cell, the SS sends the DTM INFORMATION message, informing the MS of new cell parameters. The MS shall then accept the establishment of a downlink TBF, initiated by the SS with a PACKET ASSIGNMENT message.

MS of type DTM Multislot class 1 shall follow only complete test for k=1, whereas MSs of types DTM Multislot class 5 or 9 shall complete testing for k=1 and k=2.

## Maximum Duration of Test

5 minutes

Expected Sequence

The test sequence is repeated for k = 1,2.

### 47.3.1.3 Handover to same routing area whilst in DTM with both DL & UL TBFs

#### 47.3.1.3.1 Handover to same routing area whilst in DTM with both DL & UL TBFs / Successful case

##### 47.3.1.3.1.1 Conformance requirements

The handover procedure includes:

- the abortion of the downlink and uplink packet resources;
- the disconnection and the deactivation of previously assigned channels and their release (layer 1);
- the activation of the new channels, and their connection if applicable;
- the triggering of the establishment of data link connection for SAPI = 0 on the new channels.

Then if DTM is supported in the new cell, the downlink and uplink TBF should be re-established if still required.

#### References

3GPP TS 04.18/44.018, sub-clause 3.4.4

##### 47.3.1.3.1.2 Test purpose

To verify that when no errors occur in the CS handover to a different cell in the same routing area, the MS shall successfully re-establish the CS connection and the downlink and uplink PS resources.

## 47.3.1.3.1 Method of test

## Initial Conditions

## System Simulator:

2 cells, A and B with same LAI, DTM supported, default parameters.

## Mobile Station:

The MS is in the active state (U10) of a call on Timeslot N (chosen arbitrarily) of cell A and has the PDP context 1 activated.

## Related PICS/PIXIT Statement(s)

- DTM Multislot Class 1;
- DTM Multislot Class 5;
- DTM Multislot Class 9.

## Test Procedure

After the MS is in DTM with both uplink and downlink TBFs active, the SS initiates the Handover procedure. Once the MS has successfully completed the handover procedure to the new cell, the SS sends the DTM INFORMATION message, informing the MS of new cell parameters. The MS shall then request the establishment of an uplink TBF with the DTM Request command and the SS assigns an uplink TBF.

MS of type DTM Multislot class 1 shall follow only complete test for  $k=1$ , whereas MSs of types DTM Multislot class 5 or 9 shall complete testing for  $k=1$  and  $k=2$ .

## Maximum Duration of Test

5 minutes

## Expected Sequence

The test sequence is repeated for  $k = 1, 2$ .

### 47.3.1.3.2 Handover to same routeing area whilst in DTM with both DL & UL TBFs / Abnormal case / Handover Failure

#### 47.3.1.3.2.1 Conformance requirements

If a lower layer failure happens on the new channel before the HANDOVER COMPLETE message has been sent, the MS deactivates the new channels, reactivates the old channels, reconnects the TCHs if any and triggers the establishment of the main signalling link. It then sends a HANDOVER FAILURE message on the main signalling link and resumes normal operation as if no handover attempt had occurred.

#### References

3GPP TS 04.18/44.018, sub-clause 3.4.4.4

#### 47.3.1.3.2.2 Test purpose

To verify that if an error occurs when attempting handover to a different cell, the MS shall abort all CS operations in the new cell and successfully attempt to re-establish CS and uplink PS resources in the old cell.

#### 47.3.1.3.2.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, DTM supported, default parameters

Mobile Station:

The MS is in the active state (U10) of a call on Timeslot N (chosen arbitrarily) of cell A and has the PDP context 1 activated.

#### Related PICS/PIXIT Statement(s)

- DTM Multislot Class 1;
- DTM Multislot Class 5;
- DTM Multislot Class 9.

## Test Procedure

After the MS is in DTM with both uplink and downlink TBFs active, the SS initiates the Handover procedure. If the SS does not accept the MS on the new channel, the MS shall revert back to the original channel in the old cell. The MS shall then send a HANDOVER FAILURE message on the main DCCH in the old cell. The MS then shall request the establishment of an uplink TBF with the Packet Request procedure and the SS assigns an uplink TBF followed by a downlink TBF.

MS of type DTM Multislot class 1 shall follow only complete test for  $k=1$ , whereas MSs of types DTM Multislot class 5 or 9 shall complete testing for  $k=1$  and  $k=2$ .

## Maximum Duration of Test

5 minutes

## Expected Sequence

The test sequence is repeated for  $k = 1, 2$ .

### 47.3.3 Handover to different routing area whilst in DTM

#### 47.3.3.1 Handover to different routing area whilst in DTM / Performed on TBFs

##### 47.3.3.1.1 Handover to different routing area whilst in DTM / Performed on TBFs / RAU complete before CS release

###### 47.3.3.1.1.1 Conformance requirements

In dedicated mode or dual transfer mode, an intercell or an intracell change of channel can be requested by the network RR sublayer. This change may be performed through the handover procedure.

Upon receipt of the HANDBOVER COMMAND message, the mobile station initiates, the release of link layer connections, disconnects the physical channels (including the packet resources, if in class A mode of operation), commands the switching to the assigned channels and initiates the establishment of lower layer connections (this includes the activation of the channels, their connection and the establishment of the data links).

In, GSM, user data transmission in the MS shall be suspended during the routing area updating procedure; user data reception shall be possible.

###### 47.3.3.1.1.2 Test purpose

To verify that a MS in DTM can complete Handover to a cell in a different routing area, where the RA update procedure is performed on TBFs, before the CS resources are released.

## 47.3.3.1.1.3 Method of test

## Initial Conditions

## System Simulator:

2 cells, A and B with same LAI but different RAI, both supporting DTM and with default parameters.

## Mobile Station:

The MS is in the active state (U10) of a call, on Timeslot N (chosen arbitrarily) of cell A, with a TMSI and P-TMSI allocated and the PDP context 1 activated but no allocated TBFs.

## Related PICS/PIXIT Statement(s)

- DTM Multislot Class 1;
- DTM Multislot Class 5;
- DTM Multislot Class 9.

## Test Procedure

A MS in dedicated mode with an active CS call is triggered to establish an uplink TBF. The MS sends a DTM REQUEST message appealing for uplink resources. Upon receiving the DTM request message the SS allocates uplink resources. Once the MS has entered DTM and has had at least ten RLC data blocks acknowledged, the SS sends a HANDOVER COMMAND message to the MS and completes the Handover procedure to a cell in the new RA. The Handover procedure is complete by the MS sending a HANDOVER COMPLETE message to the SS. Once the Handover procedure is complete the SS sends the MS a DTM INFORMATION message, providing the MS with the minimum information required to establish packet resources with the cell. The MS having received the DTM INFORMATION message indicating DTM support in the current cell, initiates the RA Update procedure. The RAU procedure is initiated by sending the ROUTING AREA UPDATE REQUEST message, encapsulated in GTTP, on the main DCCH. The SS completes the RA Update procedure by returning a ROUTING AREA UPDATE ACCEPT message on the main DCCH without re-allocating the P-TMSI. The MS can then again initiate the establishment of an uplink TBF.

MS of type DTM Multislot class 1 shall follow only complete test for  $k=1$ , whereas MSs of types DTM Multislot class 5 or 9 shall complete testing for  $k=1$  and  $k=2$ .

## Maximum Duration of Test

5 minutes

## Expected Sequence

The test sequence is repeated for  $k = 1, 2$ .

#### 47.3.3.1.2 Handover to different routing area whilst in DTM / Performed on TBFs / CS release before RAU complete

##### 47.3.3.1.2.1 Conformance requirements

In dedicated mode or dual transfer mode, an intercell or an intracell change of channel can be requested by the network RR sublayer. This change may be performed through the handover procedure.

Upon receipt of the HANOVER COMMAND message, the mobile station initiates, the release of link layer connections, disconnects the physical channels (including the packet resources, if in class A mode of operation), commands the switching to the assigned channels and initiates the establishment of lower layer connections (this includes the activation of the channels, their connection and the establishment of the data links).

In, GSM, user data transmission in the MS shall be suspended during the routing area updating procedure; user data reception shall be possible.

##### References

3GPP TS 04.18/44.018 sub-clause 3.4.4

3GPP TS 24.008 sub-clause 4.7.5

##### 47.3.3.1.2.2 Test purpose

To verify that a MS in DTM can complete the Handover procedure to a cell in a different routing area, where the RA update is performed on TBFs, but the CS resources are released before the completion of the update. The MS then has to complete the update on new TBFs.

## 47.3.3.1.2.3 Method of test

## Initial Conditions

## System Simulator:

2 cells, A and B with same LAI but different RAI, both supporting DTM, PBCCH and with default parameters.

## Mobile Station:

The MS is in the active state (U10) of a call, on Timeslot N of cell A, with a TMSI and P-TMSI allocated and the PDP context 1 activated but no allocated TBFs.

## Related PICS/PIXIT Statement(s)

- DTM Multislot Class 1;
- DTM Multislot Class 5;
- DTM Multislot Class 9.

## Test Procedure

A MS in dedicated mode with an active CS call is triggered to establish an uplink TBF. The MS sends a DTM REQUEST message appealing for uplink resources. Upon receiving the DTM request message the SS allocates uplink resources. Once the MS has entered DTM and has had at least ten RLC data blocks acknowledged, the SS sends a HANDOVER COMMAND message to the MS and completes the Handover procedure to a cell in a new RA. The Handover procedure is completed by the MS sending a HANDOVER COMPLETE message to the SS. Once the Handover procedure is complete the SS sends the MS a DTM INFORMATION message, providing the MS with the minimum information required to establish packet resources with the cell. The MS having received the DTM INFORMATION message indicating DTM support in the current cell, initiates the RA Update procedure. The RA Update procedure is initiated by the MS sending the ROUTING AREA UPDATE REQUEST message, encapsulated in GTTP, on the main DCCH. The SS then releases the CS connection to the MS and allocates downlink PS resources to the MS with an PACKET DOWNLINK ASSIGNMENT message. The SS then completes the RAU procedure by sending the RAU ACCEPT message to the MS, allowing the MS to request uplink PS resources.

MS of type DTM Multislot class 1 shall follow only complete test for  $k=1$ , whereas MSs of types DTM Multislot class 5 or 9 shall complete testing for  $k=1$  and  $k=2$ .

## Maximum Duration of Test

5 minutes

## Expected Sequence

The test sequence is repeated for  $k = 1,2$ .

## 50      EGPRS Default Conditions, Message Contents and Macros

The following clause 50 details default conditions, messages and macros that shall be used for the EGPRS test cases. These conditions, messages and macros are derived from the "GPRS default conditions, message contents and macros" (see clause 40). In the following subclauses only those parameters are listed which deviate from the "GPRS default conditions, message contents and macros".

Where values have not been specified the equivalent overall GPRS default values (see subclause 40.1) should be used. If values need to be removed from the overall GPRS defaults then these should be specified as 'OMITTED'.

In case of ambiguity EGPRS settings take precedence over GPRS settings.

### 50.1      EGPRS Default Test Conditions

Since GPRS and EGPRS make use of the same channel combinations subclause 40.1 applies to both GPRS and EGPRS.

### 50.2      EGPRS Default Message Contents.

#### 50.2.1      EGPRS System Information Messages

##### 50.2.1.1      Cell A

The EGPRS system information messages for cell A are identical to the corresponding GPRS system information messages for cell A (see subclause 40.2.1.1) with the following exception in the tables given below. In these tables only the information elements (IE's) are listed differing in specific EGPRS bit fields from the corresponding GPRS IE's.

NOTE: In this subclause all information element values are in binary. Numeric values written within quotes are in decimal.

## 50.2.1.1.1 Contents of information elements in SYSTEM INFORMATION TYPE 13 message

### 50.2.1.2 Cell B

The EGPRS system information messages for cell B are identical to the corresponding GPRS system information messages for cell B. Therefore system information messages for cell B shall be used as specified for GPRS, see subclause 40.1.2.1.2.

## 50.2.2 EGPRS Packet System Information messages

### 50.2.2.1 Cell A

This subclause contains default sets of PSI message contents for two GSM EGPRS neighbour cells followed by default sets of PSI message contents for two DCS EGPRS neighbour cells. All cells are operating with channel combination xi).

The EGPRS PSI message contents for the GSM and DCS EGPRS neighbour cells are identical to the GSM and DCS GPRS PSI message contents (see subclause 40.2.2) with the following exception in the tables given below. In these tables only the information elements (IE's) are listed differing in specific EGPRS bit fields from the corresponding GPRS IE's.

NOTE: In this subclause all information element values are in binary. Numeric values written within quotes are in decimal.

### 50.2.2.2 Cell B

The EGPRS packet system information messages for cell B are identical to the corresponding EGPRS packet system information messages for cell A (see subclause 50.2.2.1) with the exceptions given in subclause 40.2.2.2 Cell B for GPRS.

### 50.2.3 EGPRS default contents of Layer 2 messages

The EGPRS default contents of Layer 2 messages are identical to the GPRS default contents of Layer 2 messages (see subclause 40.1.2.3) with the following exception in the tables given below. In these tables only those layer 2 messages are listed differing in specific EGPRS information elements (IE's) from the corresponding GPRS IE's.

NOTE: In this subclause all information element values are in binary. Numeric values written within quotes are in decimal.

## 50.2.3.1 PACKET UPLINK ASSIGNMENT message

## 50.2.4 EGPRS Default contents of Layer 3 messages

This subclause contains the default values of L3 messages, which unless indicated otherwise in clause 40 and 50 resp., shall be transmitted by the system simulator and which are required to be received from the MS under test.

The EGPRS default contents of Layer 3 messages are identical to the GPRS default contents of Layer 3 messages (see subclause 40.1.2.3) with the following exception in the tables given below. In these tables only those layer 3 messages are listed differing in specific EGPRS information elements (IE's) from the corresponding GPRS IE's.

NOTE: In this subclause all information element values are in binary. Numeric values written within quotes are in decimal.

50.2.4.1 IMMEDIATE ASSIGNMENT message

## 50.3 Default EGPRS Conditions, Message Contents and Macros for the Higher Layer Test Cases

Since the EGPRS higher layers (LLC, GPRS Mobility Management, Session Management and SNDCP) are identical with the GPRS higher layers the same test cases shall also apply to EGPRS.

## 50.4 EGPRS Macros

### 50.4.1 Overview

The following subclause presents macros for EGPRS test cases. Definition and syntax (see subclauses 40.4.1.1 and 40.4.1.2) of the macros for EGPRS test cases are identical to the definition and syntax of the macros of the GPRS test cases.

### 50.4.2 EGPRS Default Message Contents

The EGPRS default message contents of the macros for the EGPRS test cases are identical to the GPRS default message contents of the macros for the GPRS test cases (see subclause 40.4.2).

### 50.4.3 EGPRS Macro Message Sequences

The macros for EGPRS test cases are identical to the macros for the GPRS test cases (see subclause 40.4.) with the following exceptions in the tables given below. In these tables only those EGPRS macro sequences are listed differing from the corresponding GPRS macro sequences.

#### 50.4.3.1 Acknowledged downlink data

| Step | Direction | Message                        | Comments |
|------|-----------|--------------------------------|----------|
|      | SS ↔ MS   | { Acknowledged downlink data } | Macro    |
| 1    | SS → MS   | { Downlink data }              | Macro    |
| 2    | MS → SS   | EGPRS PACKET DOWNLINK ACK/NACK |          |

#### 50.4.3.2 Downlink data transfer

| Step                              | Direction | Message                        | Comments                                                                            |
|-----------------------------------|-----------|--------------------------------|-------------------------------------------------------------------------------------|
|                                   | SS ↔ MS   | { Downlink data transfer }     | Macro                                                                               |
| <b>a. RLC unacknowledged mode</b> |           |                                |                                                                                     |
| 1                                 | SS → MS   | { Downlink data }              | Macro                                                                               |
| 2                                 | SS → MS   | RLC DOWNLINK DATA              | FBI bit set to '1' and valid RRBP field                                             |
| 3                                 | MS → SS   | PACKET CONTROL ACKNOWLEDGMENT  | In the uplink block specified by the RRBP field                                     |
| <b>b. RLC acknowledged mode</b>   |           |                                |                                                                                     |

| N+2  | MS → SS   | PACKET CONTROL<br>ACKNOWLEDGEMENT |                                                                                                                               |

NOTE 1: SI bit set to '0' in all data blocks.

NOTE 2: The SS sends a PACKET UPLINK ACK/NACK message at least every k-1 RLC UPLINK DATA messages, being k the window size with a value according to the number of timeslots allocated in the direction (uplink or downlink) of the TBF operating in EGPRS TBF mode, see 3GPP TS 44.060.

NOTE 3: The field CV in the RLC UPLINK DATA messages verifies:

$$CV' = \text{round}\left(\frac{TBC - BSN' - 1}{NTS}\right)$$

$$CV = \begin{cases} CV' & x \leq BS\_CV\_MAX \\ 15 & \text{otherwise} \end{cases}$$

where:

- TBC: total number of RLC data blocks that will be transmitted in the TBF;
- BSN': absolute block sequence number of the RLC data block, from 0 to (TBC - 1);
- NTS: number of timeslots assigned to the uplink TBF, with range 1 to 8;
- the function round() rounds upwards to the nearest integer;
- BS\_CV\_MAX is a parameter broadcast in the system information;
- the division operation is non-integer and results in zero only for (TBC - BSN' - 1) = 0.

NOTE 4: In the case of Dynamic MAC mode, the macro reference in the corresponding test case may contain a certain frequency (in seconds<sup>-1</sup> or frames<sup>-1</sup>) for the SS to indicate the USF allocated to the mobile so that the MS is allowed to transmit. Otherwise, mobile's USF is indicated in every available block.

NOTE 5: When an EGPRS RLC/MAC block for data transfer consists of two RLC data blocks, the CV of the RLC/MAC header refers to the second RLC data block.

50.4.3.4 Uplink dynamic allocation one phase access

| 4    | SS -> MS  | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on PACCH containing USF assigned to the MS.                                                                                           |
| 5    | MS -> SS  | UPLINK RLC DATA BLOCK               | LLC PDU implicitly indicating paging response, containing TLLI in the RLC/MAC header. Received on uplink PDTCH assigned in step 3.         |
| 6    | SS -> MS  | PACKET UPLINK ACK/NACK              | Acknowledge the received RLC data block. Sent on uplink PACCH.                                                                             |
| 7    | MS -> SS  | PACKET CONTROL ACKNOWLEDGEMENT      | Acknowledge the RLC control message. Received on uplink PACCH.                                                                             |
| 8    | SS -> MS  | PACKET DOWNLINK ASSIGNMENT          | Downlink Assignment, TLLI value as received. Sent on PPCH. Three macro parameters as assigned in the test cases. EGPRS TBF mode indicated. |

## 50.5 Test PDP contexts

The PDP contexts used in the EGPRS dynamic allocation and EGPRS RLC testcases are identical to the PDP contexts used in the GPRS dynamic allocation and RLC testcases (see 40.5) with the following exception in the table given below.

Test PDP context30 is the default Test PDP context which is used in the test cases where no particular Test PDP contexts are specified. Compression is always turned off if nothing else is stated explicitly in the test case.

NOTE: In this subclause all information element values are in decimal.

Table 50.5: Test PDP contexts

## 51 EGPRS Paging, TBF establishment/release and DCCH related procedures

### 51.1 RR / Paging

The paging procedure is used by the network to cause the MS to establish either an RR connection for circuit switched services or a downlink TBF for EGPRS packet transfer. Normally the MS listens to its paging sub-channel when DRX is used, but this can be modified by the use of different page mode. The correct monitoring of its paging sub-channel on PCCCH or CCCH in different control channel configurations and correct implementation of the paging procedure in the MS are essential. They are the test objectives of this clause.

The clause is applicable for all MS supporting EGPRS service.

#### 51.1.1 RR / Paging / on PCCCH for EGPRS service successful

All test cases in this subclause test the MS paging behaviours in a network operating in Mode I or Mode III.

##### 51.1.1.1 RR / Paging / on PCCCH for EGPRS service / normal paging with P-TMSI successful

###### 51.1.1.1.1 Conformance requirements

1. In packet idle mode, the mobile station monitors the relevant paging sub-channels on PCCCH, if such is present in the cell. The determination of the paging group for the mobile station is defined in 3GPP 05.02.
2. MS in a specific PCCCH GROUP shall monitor the radio blocks on PCCCH corresponding to the PCCCH GROUP the mobile station belongs to and where paging may appear.
3. A PACKET PAGING REQUEST message on PCCCH may include more than one mobile station identification.
4. In response to a PACKET PAGING REQUEST, the mobile station shall initiate the uplink TBF using a PACKET CHANNEL REQUEST with cause value of 'Page Response'.

###### References

3GPP TS 04.60, subclauses 5.5.1, 5.5.1.5, 6.1.2, 6.2, 6.2.2 and 6.2.3.

3GPP TS 05.02, subclauses 6.5.1 and 6.5.6.

###### 51.1.1.1.2 Test purpose

To verify that upon receipt of a PACKET PAGING REQUEST message with paging mode set to normal, the MS in packet idle mode, GPRS attached state, is able to determine its PCCCH group and PAGING group and that the MS responds correctly with PACKET CHANNEL REQUEST with cause value of 'Page Response'.

###### 51.1.1.1.3 Method of test

###### Initial Conditions

System Simulator:

1 cell, CCCH combined with SDCCH, EGPRS supported, PCCCH present, Max-Retrans = 2, access burst type = 11 bits, BS\_PAG\_BLK\_RES = 2, BS\_PBCCH\_BLK = 3, BS\_PCC\_CHANS = 1, BS\_PRACH\_BLK = 1 in PSII.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated.

## Related PICS/PIXIT Statement(s)

- Type of MS GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900.
- Support EGPRS service.

## Test Procedure

The SS sends a PACKET PAGING REQUEST message to the MS. The paging message contains a P-TMSI addressing the MS for TBF establishment. The MS attempts two random accesses for PACKET CHANNEL REQUEST. The SS responds to the 2<sup>nd</sup> one by assigning an uplink channel. The MS sends a correct LLC PDU containing TLLI in the RLC/MAC header implicitly indicating a paging response.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

| Step | Direction | Message                                    | Comments                                                                                                                                                |
|------|-----------|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PACKET PAGING REQUEST                      | 1 <sup>st</sup> Repeated Page info for RR connection, 2 <sup>nd</sup> Repeated Page info contains P-TMSI of the MS for TBF establishment. Sent on PPCH. |
| 2    | MS -> SS  | PACKET CHANNEL REQUEST                     | ACCESS TYPE = " Page Response ". Received on PRACH.                                                                                                     |
| 3    | MS -> SS  | PACKET CHANNEL REQUEST                     | ACCESS TYPE = " Page Response ". Received on PRACH.                                                                                                     |
| 4    | SS -> MS  | PACKET UPLINK ASSIGNMENT                   | Random Reference = pertaining to the message received in step 3. Sent on PAGCH.                                                                         |
| 5    | SS -> MS  | PACKET DOWNLINK DUMMY CONTROL BLOCK        | Sent on PACCH containing USF assigned to the MS.                                                                                                        |
| 6    | MS -> SS  | UPLINK RLC DATA BLOCK (without L3 Message) | LLC PDU implicitly indicating paging response, containing TLLI in the RLC/MAC header. Received on uplink PDTCH assigned in step 4.                      |
| 7    | SS -> MS  | PACKET UPLINK ACK/NACK                     | acknowledge the received RLC data block, Final Ack Indicator = '1', a valid RRBP. Sent on PACCH.                                                        |
| 8    | MS -> SS  | PACKET CONTROL ACKNOWLEDGEMENT             | acknowledge the RLC control message. Received on PACCH.                                                                                                 |

### 51.1.1.2 RR / Paging / on PCCCH for EGPRS service / normal paging with IMSI successful

#### 51.1.1.2.1 Conformance requirements

Paging for GPRS services using IMSI is an abnormal procedure used for error recovery in the network.

The network may initiate paging using IMSI if the P-TMSI is not available due to a network failure.

In GSM, to initiate the procedure the GMM entity in the network requests the RR sublayer to start paging (see 3GPP TS 04.18 and 3GPP TS 04.60).

Upon reception of a paging indication for GPRS services using IMSI, the MS shall locally deactivate any active PDP contexts and locally detach from GPRS. The local detach includes deleting any RAI, P-TMSI, P-TMSI signature and GPRS ciphering key sequence number stored, setting the GPRS update status to GU2 NOT UPDATED and changing state to GMM-DEREGISTERED.

After performing the local detach, the MS shall then perform a GPRS attach or combined GPRS attach procedure.

After performing the attach, a MS should activate PDP context(s) to replace any previously active PDP context(s).

#### References

3GPP TS 24.008, subclause 4.7.9.1.2.

#### 51.1.1.2.2 Test purpose

To verify that the MS is able to respond to PACKET PAGING REQUEST for EGPRS service when the MS is addressed with its IMSI and that the MS then performs a GPRS attach or combined GPRS attach procedure.

#### 51.1.1.2.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, CCCH combined with SDCCH, EGPRS supported, PCCCH present, Max-Retrans = 2, access burst type = 11 bits, BS\_PAG\_BLK\_RES = 3, BS\_PBCCH\_BLK = 3, BS\_PCC\_CHANS = 1, BS\_PRACH\_BLK = 1 in PSII.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated.

## Related PICS/PIXIT Statement(s)

- Type of MS GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900.
- Support EGPRS service.

## Test Procedure

The SS sends a PACKET PAGING REQUEST message containing the IMSI of the MS for TBF establishment. The MS attempts two random accesses for PACKET CHANNEL REQUEST. The SS responds to the 2<sup>nd</sup> one by assigning an uplink channel for an open-end TBF. The MS sends an LLC PDU containing TLLI in the RLC/MAC header and ATTACH REQUEST, implicitly indicating a paging response. The SS verifies the completeness of ATTACH REQUEST and acknowledges the received two RLC data blocks with a valid RRBP and Final Ack indicator = '1'.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

### 51.1.1.3 RR / Paging / on PCCCH for EGPRS service / extended paging with P-TMSI successful

#### 51.1.1.3.1 Conformance requirements

1. The network may send page mode information in any downlink message on PCCCH. The page mode information controls possible additional requirements on a mobile station receiving the message.
2. In packet idle mode, the paging sub-channels on PCCCH shall be monitored (by the mobile station) according to the current DRX mode and the values of the PAGING\_GROUP parameter defined for the mobile station, and possible page mode information received on PCCCH.
3. The mobile station shall take into account the page mode information received in any message received in a radio block on PCCCH corresponding to one of the paging groups defined by the different PAGING\_GROUP values for the mobile station.
4. In the extended paging mode, the mobile station is required in addition (to normal paging) to receive and analyse the possible message in the third block period on PCCCH where paging may occur (PPCH), following the block corresponding to MS's paging group.

## References

3GPP TS 04.60, subclauses 5.5.1, 5.5.1.5 and 5.5.1.6.

### 51.1.1.3.2 Test purpose

1. To verify that the MS operates in the extended page mode when it is ordered by the SS in PACKET PAGING REQUEST which does not address the MS, but on the paging sub-channel corresponding to the MS identity.
2. To verify that the MS operates in the extended page mode when it is ordered by the SS in PACKET UPLINK ASSIGNMENT on the paging sub-channel corresponding to the MS identity.
3. To verify that the MS operates in the extended page mode when it is ordered by the SS in PACKET ACCESS REJECT on the paging sub-channel corresponding to the MS identity.
4. To verify that the MS operates in the extended page mode when it is ordered by the SS in PACKET DOWNLINK ASSIGNMENT on the paging sub-channel corresponding to the MS identity.
5. To verify that the MS operates in the extended page mode when it is ordered by the SS in PACKET QUEUEING NOTIFICATION on the paging sub-channel corresponding to the MS identity.
6. To verify that the MS operates in the extended page mode when it is ordered by the SS in PACKET CELL CHANGE ORDER on the paging sub-channel corresponding to the MS identity.
7. To verify that the MS operates in the extended page mode when it is ordered by the SS in PACKET DOWNLINK DUMMY CONTROL BLOCK on the paging sub-channel corresponding to the MS identity.
8. To verify that the MS operates in the extended page mode when it is ordered by the SS in PACKET PRACH PARAMETERS on the paging sub-channel corresponding to the MS identity.
9. To verify that the MS operates in the extended page mode when it is ordered by the SS in PACKET POLLING REQUEST on the paging sub-channel corresponding to the MS identity.

### 51.1.1.3.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, CCCH combined with SDCCH, EGPRS supported, PCCCH present, Max-Retrans = 2  
BS\_PAG\_BLK\_RES = 2, BS\_PBCCH\_BLK = 4, BS\_PRACH\_BLK = 1 and BS\_PCC\_CHAN = 2 in  
PSI1.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated.

#### Related PICS/PIXIT Statement(s)

- Type of MS GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900.
- Support EGPRS service.

#### Test Procedure

The test is repeated 9 times. Each time at the start, the SS sends one of the relevant messages listed in the corresponding test purpose to carry the Extended Paging mode. The MS is paged for TBF establishment and the paging mode is reset to Normal. After two attempts of the random access from the MS, the SS rejects the access.

#### Maximum Duration of Test

5 minutes.

## Expected Sequence

The test sequence is repeated for  $k = 1 \dots 9$ .

#### 51.1.1.4 RR / Paging / on PCCCH for EGPRS service / paging reorganisation successful

##### 51.1.1.4.1 Conformance requirements

1. In the paging reorganisation mode the mobile station shall receive all messages on the PCCCH regardless of the BS\_PAG\_BLK\_RES setting. It is required to receive all PBCCH messages.
2. When the mobile station receives the next message to a (possibly new) PAGING\_GROUP defined for the mobile station, subsequent action is defined by the possible page mode information received in that message.
3. When the mobile station selects a new set of PAGING\_GROUP values, the initial page mode in the mobile station shall be set to paging reorganisation.
4. The BS\_PCC\_REL field in PSI1 control channel description indicates, if set = 1, that the last PDCH carrying PCCCH and PBCCH will be released shortly. All mobile stations on PCCCH shall then as soon as this information has been received return to CCCH and there obey the information sent on BCCH as specified in 3GPP TS 24.008. If the field is set = 0, no channel release is pending.

##### References

3GPP TS 04.60, subclauses 5.5.1.5 and 11.2.18.

##### 51.1.1.4.2 Test purpose

1. To verify that the MS, after reception of a message with page mode set to "paging reorganisation", answers to paging messages (with page mode set to "normal paging") sent on its old PCCCH in paging blocks which do not belong to the MS's paging sub-channel.
2. To test that the MS correctly determines its new paging sub-channel when the number of allocated PBCCH blocks BS\_PBCCH\_BLK and the number of reserved blocks BS\_PAG\_BLK\_RES are changed.
3. To test that the MS correctly determines its new paging sub-channel when the number of PCCCH channels is changed.
4. To test that the MS understands the control channel release bit in control channel description.

##### 51.1.1.4.3 Method of test

###### Initial Conditions

System Simulator:

1 cell, CCCH combined with SDCCH, EGPRS supported, PCCCH present, Max-Retrans = 2, access burst type = 8 bits, BS\_PAG\_BLK\_RES = 2, BS\_PBCCH\_BLK = 3, BS\_PRACH\_BLK = 1 and BS\_PCC\_CHAN = 1.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated.

###### Related PICS/PIXIT Statement(s)

- Type of MS GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900.
- Support EGPRS service.

###### Test Procedure

The SS sends PACKET PAGING REQUEST on PCCCH and sets Paging Mode to paging reorganisation. The MS is paged on a former access grant block. After receipt the 1<sup>st</sup> random access from the MS with the correct access type for the paging response, the SS rejects the packet access and sets the paging mode to paging reorganisation.

The test procedure is similarly repeated twice. Each time the SS changes the PCCCH organisation parameters (see the following test sequence). Then the MS is paged. The random access from the MS is rejected by the SS.

The SS resets the default system setting, but sets BS\_PCC\_REL. The MS is then paged on PCH. After the MS starting random access on RACH, the access from the MS is rejected.

#### Maximum Duration of Test

5 minutes.

#### Expected Sequence

| Step | Direction | Message                             | Comments                                                                                                                                                                                           |

## 51.1.2 RR / Paging / on PCCCH for circuit-switched services / paging successful

### 51.1.2.0 Definition and applicability

These test cases apply to Mobile Station supporting EGPRS that can operate in mode A or mode B.

### 51.1.2.1 Conformance requirements

1. When answering to a paging message the purpose of which is to trigger the establishment of an RR connection, the mobile station, whatever its MS class mode of operation, shall follow the paging response procedures as specified in 3GPP TS 24.008.
2. The MS shall enter GPRS ATTACHED.SUSPENDED sub-state when entering dedicated mode and when the MS limitations makes it unable to communicate on GPRS channels. In this sub-state, no user data should be sent and no signalling information shall be sent. The MS shall leave this sub-state when leaving dedicated mode.

## References

3GPP TS 04.60, subclause 6.1.4.

3GPP TS 24.008, subclauses 3.3.2.2 and 4.1.3.1.3.2.

### 51.1.2.2 Test purpose

1. To verify that the MS in packet idle mode, GPRS attached state, is able to determine its PCCCH group and PAGING group, and that the MS responds correctly on RACH with CHANNEL REQUEST containing cause value of 'Page Response' upon receipt of a PACKET PAGING REQUEST message for establishment of an RR connection.
2. To verify that the MS is able to respond to PACKET PAGING REQUEST for establishment of an RR connection when the MS is addressed with its TMSI and, but an another field of the paging message contains an IMSI different from that of the MS.
3. To verify that the MS is able to respond to PACKET PAGING REQUEST for establishment of an RR connection when the MS is addressed with its IMSI.

### 51.1.2.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, CCCH combined with SDCCH, EGPRS supported, Network mode I, PCCCH present, Max-Retrans = 2, access burst type = 11 bits, BS\_PAG\_BLKES\_RES=2, BS\_PBCCH\_BLKES=3, BS\_PRACH\_BLKES=1, BS\_PCC\_CHANS=1. Early Classmark Sending is disabled

Mobile Station:

The MS is GPRS attached with a P-TMSI and a TMSI allocated and SPLIT PG CYCLE negotiated.

#### Related PICS/PIXIT Statement(s)

- Type of MS GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900.
- Support EGPRS service.
- Supporting GPRS: MS class A.

- Supporting GPRS: MS class B.

### Test Procedure

The MS is paged with the TMSI on the MS's PPCH sub-channel for RR establishment. After two random accesses from the MS on RACH the SS assigns a SDCCH. The MS responds with PAGING RESPONSE. The test is repeated with PACKET PAGING REQUEST containing the IMSI of the MS.

### Maximum Duration of Test

5 minutes.

### Expected Sequence

The test sequence is repeated for k = 1 ... 2

| Step | Direction | Message                 | Comments                                                                                                                                                                                                                                                                                                                              |

### 51.1.3 RR / Paging / on PCCCH / paging ignored

The MS shall ignore paging not addressing to it. If paging is not implemented correctly unnecessary accesses will be provoked on PCCCH which is shared by all MS in a same cell. This kind of the wrong paging behaviour of the same type of MS in a GSM network can block the use of PCCCH and will, therefore, cause an unacceptable degradation of the GSM services to other users of the mobile stations.

#### 51.1.3.1 Conformance requirements

1. MS in a specific PCCCH GROUP shall monitor the radio blocks on PCCCH corresponding to the PCCCH GROUP the mobile station belongs to and where paging may appear.
2. A PACKET PAGING REQUEST message on PCCCH may include more than one mobile station identification.

#### References

3GPP TS 04.60, subclauses 5.5.1 and 6.1.2.

#### 51.1.3.2 Test purpose

1. To verify that the MS ignores PACKET PAGING REQUEST (for EGPRS service) where both P-TMSI and IMSI do not address the MS although the PACKET PAGING REQUEST message is sent on specific PCCCH to which the MS belongs.

2. To verify that the MS ignores PACKET PAGING REQUEST (for circuit-switched service) where both P-TMSI and IMSI do not address the MS although the PACKET PAGING REQUEST message is sent on specific PCCCH to which the MS belongs.

NOTE: The 2<sup>nd</sup> test purpose is valid for GPRS MS class A and B.

### 51.1.3.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, CCCH combined with SDCCH, EGPRS supported, PCCCH present, Max-Retrans=2, access burst type=8 bits, BS\_PAG\_BLK\_RES=2, BS\_PBCCH\_BLKS =3, BS\_PRACH\_BLKS= 1 and BS\_PCC\_CHANS=1.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and SPLIT PG CYCLE negotiated. If the MS has the class A or B of mode of operation the MS is idle, updated with a TMSI allocated.

#### Related PICS/PIXIT Statement(s)

- Type of MS GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900.
- Support EGPRS service.
- Supporting GPRS: MS class A.
- Supporting GPRS: MS class B.
- Supporting GPRS: MS class C.

#### Test Procedure

The MS is paged for TBF establishment. The MS attempts a random access which is rejected. The MS is paged again for TBF establishment. PACKET PAGING REQUEST contains two mobility identity which do not address the MS. The MS shall not initiate the random access. The same test is repeated, but the MS is paged for RR connection establishment.

#### Maximum Duration of Test

5 minutes.

#### Expected Sequence

The test sequence is repeated for  $k = 1, 2$ . The 2<sup>nd</sup> time ( $k=2$ ) is executed if the MS has the class A or B of mode of operation.

## 51.1.4 RR / Paging / on PACCH for circuit-switched services

This subclause tests the MS paging behaviours in the packet transfer mode in a network operating in Mode I. The subclause is applicable to mobile stations supporting GPRS MS operation mode A or B.

### 51.1.4.1 RR / Paging / on PACCH for circuit-switched services/ paging successful

This subclause is applicable for the MS in the class B of mode of operation.

#### 51.1.4.1.1 Conformance requirements

1. Paging initiation using PACCH applies to a mobile station supporting GPRS MS class A or B when such mobile station is in packet transfer mode and when the network operates according to mode I.
2. A mobile station operating in class B mode of operation shall abort the current EGPRS data transfer(s) if it was in packet transfer mode, and suspend any EGPRS activity until return to idle mode.
3. (For an MS in the mode of operation of class B) when responding to a paging message for other GSM services, the MS shall establish the connection for that incoming service (i.e. enter dedicated mode) and suspend EGPRS activity. EGPRS activity is resumed upon return to idle mode.

#### References

3GPP TS 04.60, subclauses 6.1.3 and 6.1.4.

3GPP TS 22.060, subclause 6.1.

#### 51.1.4.1.2 Test purpose

1. To verify that upon receipt of a PACKET PAGING REQUEST message on PACCH for RR establishment, the class B mobile in packet transfer mode is able to respond correctly on RACH with CHANNEL REQUEST containing cause value of 'Page Response'.
2. To verify that the MS is able to respond to PACKET PAGING REQUEST when the MS is addressed with its TMSI and even if another field of PACKET PAGING REQUEST contains an IMSI different from that of the MS.
3. To verify that the MS is able to respond to PACKET PAGING REQUEST when the MS is addressed with its IMSI.

## 51.1.4.1.3 Method of test

## Initial Conditions

## System Simulator:

1 cell, CCCH combined with SDCCH, EGPRS supported, PCCCH present, Max-Retrans = 2, access burst type = 11 bits, BS\_PAG\_BLK\_RES = 2, BS\_PBCCH\_BLKS = 3 and BS\_PCC\_CHANS = 1.

## Mobile Station:

The MS is in packet transfer mode.

## Related PICS/PIXIT Statement(s)

- Type of MS GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900.
- Support EGPRS service.
- Supporting GPRS: MS class A.
- Supporting GPRS: MS class B.
- Supporting GPRS: MS class C.

## Test Procedure

The MS is in the packet transfer mode. An USF is assigned to the MS. After receiving the first uplink RLC data block from the MS it is paged on PACCH for an RR connection establishment with the allocated TMSI. The MS sends CHANNEL REQUEST for Answer to Paging. The access attempt is rejected.

The test is repeated once. The difference of the second time lies in the PACKET PAGING REQUEST on PACCH containing IMSI instead of PTMSI addressing the MS.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

The test sequence is repeated for  $k = 1, 2$

#### 51.1.4.2 RR / Paging / on PACCH for circuit-switched services/ paging ignored

The MS shall ignore paging not addressing to it. If paging is not implemented correctly unnecessary accesses will be provoked on the CCCH which is shared by all MSs in a same cell. This kind of the wrong paging behaviour of the same type of MS in a GSM network can block the use of CCCH and will, therefore, cause an unacceptable degradation of the GSM services to other users of the mobile stations.

##### 51.1.4.2.1 Conformance requirements

The MS shall ignore paging not addressing to it.

##### References

3GPP TS 04.60, clause 6.

##### 51.1.4.2.2 Test purpose

To verify that the MS ignores a PACKET PAGING REQUEST message where both TMSI and IMSI do not address the MS although the PACKET PAGING REQUEST message is sent on PACCH allocated to the MS.

##### 51.1.4.2.3 Method of test

##### Initial Conditions

System Simulator:

1 cell, CCCH combined with SDCCH, EGPRS supported, PCCCH present, Max-Retrans = 2, access burst type = 8 bits, BS\_PAG\_BLKES\_RES = 2, BS\_PBCCH\_BLKES = 3, BS\_PRACH\_BLKES = 1 and BS\_PCC\_CHANS = 1.

Mobile Station:

The MS is in packet transfer mode.

## Related PICS/PIXIT Statement(s)

- Type of MS GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900.
- Support EGPRS service.
- Supporting GPRS: MS class A.
- Supporting GPRS: MS class B.
- Supporting GPRS: MS class C.

## Test Procedure

The MS is brought to the packet transfer mode. A PACKET PAGING message not addressing the MS is sent on PACCH for RR connection establishment. It is checked that the MS can continue sending the uplink RLC data blocks and does not attempt any random accesses on RACH for 10 s.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

## 51.1.5 RR / Paging / on CCCH for EGPRS service

### 51.1.5.1 RR / Paging / on CCCH for EGPRS service / normal paging

#### 51.1.5.1.1 RR / Paging / on CCCH for EGPRS service / normal paging with P-TMSI successful

##### 51.1.5.1.1.1 Conformance requirements

1. The network initiates the paging procedure by sending a paging request message on an appropriate paging sub-channel on CCCH. Paging initiation using a paging sub-channel on CCCH is used when sending paging information to a mobile station and PCCCH is not present in the cell.
2. The mobile station in packet idle mode is required to receive and analyse the paging messages and immediate assignment messages sent on the paging sub-channels on CCCH corresponding to the paging groups determined for it in packet idle mode.
3. A PAGING REQUEST message may include more than one mobile station identification.
4. In a PAGING REQUEST message used for the packet paging procedure, the mobile station shall be identified by the P-TMSI (GPRS TMSI) or its IMSI. If the mobile station is identified by the P-TMSI, it shall indicate the receipt of a paging request to the MM sub-layer.

If the mobile station identified by its IMSI, it shall parse the message for a corresponding *Packet Page Indication* field:

- if the *Packet Page Indication* field indicates a paging procedure for RR connection establishment, or the field is not present in the message, the mobile station shall initiate the immediate assignment procedure;
  - if the *Packet Page Indication* field indicates a packet paging procedure, the mobile station shall indicate the receipt of a paging request to the MM sub-layer.
5. The mobile station initiates the packet access procedure by scheduling the sending of CHANNEL REQUEST messages on RACH.

#### References

3GPP TS 24.008, subclauses 3.3.2.1.1, 3.5.1.1, 3.5.1.2 and 3.5.2.1.

3GPP TS 05.02, subclause 6.5.6.

##### 51.1.5.1.1.2 Test purpose

1. To verify that the MS in packet idle mode, GPRS attached state, is able to determine its CCCH group and PAGING group and that the MS responds correctly with CHANNEL REQUEST on RACH with cause value of 'packet access' upon receipt of a PAGING REQUEST TYPE 1 message for packet access with paging mode set to normal.
2. To verify that the MS is able to respond to PAGING REQUEST TYPE 1 for packet access when the MS is addressed with its P-TMSI, but another field of the paging message contains an IMSI different from that of the MS.
3. To verify that the MS is able to respond to PAGING REQUEST TYPE 2 for packet access when the MS is addressed with its P-TMSI, but other fields of the paging message contain a TMSI and an IMSI different from that of the MS.
4. To verify that the MS is able to respond to PAGING REQUEST TYPE 3 for packet access when the MS is addressed with its P-TMSI, but other fields of the paging message contain TMSIs different from that of the MS.

## 51.1.5.1.1.3 Method of test

## Initial Conditions

## System Simulator:

1 cell, CCCH combined with SDCCH, EGPRS supported, PCCCH absent, Max-Retrans = 2, BS\_AG\_BLK\_RES = 2, BS\_PA\_MFRMS = 6, SPLIT\_PG\_CYCLE is supported on CCCH in the cell.

## Mobile Station:

The MS is GPRS attached with a TMSI and a P-TMSI allocated, SPLIT PG CYCLE negotiated.

## Related PICS/PIXIT Statement(s)

- Type of MS GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900.
- Support EGPRS service.

## Test Procedure

The test is repeated three times. Each time the MS is paged for the packet paging procedure through a different paging request type message. After receiving a CHANNEL REQUEST with the establishment cause 'one phase access', an open-end TBF is assigned. A USF is assigned to the MS to enable it to transfer an uplink RLC data block. The received data block is acknowledged by the SS with , Final Ack Indicator = '1' , a valid RRBP. The MS sends PACKET CONTROL ACKNOWLEDGEMENT.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

The test sequence is repeated for k = 1 ... 3.

## 51.1.5.1.2 RR / Paging / on CCCH for EGPRS service / normal paging with IMSI successful

## 51.1.5.1.2.1 Conformance requirements

1. If the MS was paged by the network with the IMSI (for EGPRS service), the MS shall delete any RAI, P-TMSI, P-TMSI signature and GPRS ciphering key sequence number stored. The MS shall then perform a GPRS attach or combined GPRS attach procedure.

## References

3GPP TS 24.008, subclauses 4.9.7.1 and 3.3.1.3.

## 51.1.5.1.2.2 Test purpose

To verify that the MS is able to respond to PAGING REQUEST TYPE 1 when the MS is addressed with its IMSI with *Packet Page Indication* set to packet paging procedure, and that the MS then performs a GPRS attach or combined GPRS attach procedure.

## 51.1.5.1.2.3 Method of test

## Initial Conditions

## System Simulator:

1 cell, CCCH combined with SDCCH, EGPRS supported, PCCCH absent, Max-Retrans = 2, BS\_AG\_BLK\_RES = 2, BS\_PA\_MFRMS = 9.

## Mobile Station:

The MS is in GPRS attached with a TMSI and a P-TMSI allocated, SPLIT PG CYCLE negotiated.

## Related PICS/PIXIT Statement(s)

- Type of MS GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900.
- Support EGPRS service.

## Test Procedure

The MS is paged on PCH with IMSI for packet paging procedure. After receiving the CHANNEL REQUEST from the MS aTBF is assigned. The MS sends an LLC PDU containing TLLI in the RLC/MAC header and ATTACH REQUEST, implicitly indicating a paging response. The SS verifies the completeness of ATTACH REQUEST and acknowledges the received two RLC data blocks with a valid RRBP and Final Ack indicator = '1'.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

| Step | Direction | Message                                | Comments                                                                                                                                                            |
|------|-----------|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PAGING REQUEST TYPE 1                  | 1 <sup>st</sup> Mobile Identity contains IMSI of the MS, second Mobile Identity not present. Packet page indication indicates packet paging procedure. Sent on PCH. |
| 2    | MS -> SS  | CHANNEL REQUEST                        | Establishment Cause = "one phase packet access". Received on RACH.                                                                                                  |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT                   | Random Reference = pertaining to the message received in step 2. Assign an SDCCH channel. Sent on AGCH.                                                             |
| 4    | MS -> SS  | UPLINK RLC DATA BLOCK (ATTACH REQUEST) | LLC PDU containing a TLLI and the first part of ATTACH REQUEST, the implicit paging response to step 1.                                                             |
| 5    | SS -> MS  | PACKET UPLINK ACK/NACK                 | Received on the uplink PDTCH assigned in step 6. Contention resolution, acknowledge the received RLC data blocks, USF assigned. Sent on PACCH.                      |
| 6    | MS -> SS  | UPLINK RLC DATA BLOCK                  | Completely receive ATTACH REQUEST                                                                                                                                   |
| 7    | SS -> MS  | PACKET UPLINK ACK/NACK                 | Final Ack indicator = '1', containing valid RRBP, sent on PACCH.                                                                                                    |
| 8    | MS -> SS  | PACKET CONTROL ACKNOWLEDGEMENT         | Acknowledge the RLC control messages. Received on PACCH.                                                                                                            |

## 51.1.5.1.3 RR / Paging / on CCCH for EGPRS service / normal paging with P-TMSI ignored

The MS shall ignore paging not addressing to it. If paging is not implemented correctly unnecessary accesses will be provoked on CCCH which is shared by all MS in a same cell. This kind of the wrong paging behaviour of the same type of MS in a GSM network can block the use of CCCH and will, therefore, cause an unacceptable degradation of the both GSM EGPRS and circuit-switched services to other users of the mobile stations.

## 51.1.5.1.3.1 Conformance requirements

Paging initiation using the paging subchannel on CCCH is used when sending paging information to a mobile station in idle mode. It is also used when sending paging information to a mobile station in packet idle mode, if PCCCH is not present in the cell.

In a PAGING REQUEST message used for the packet paging procedure, the mobile station shall be identified by the P-TMSI (GPRS TMSI) or its IMSI. If the mobile station is identified by the P-TMSI, it shall proceed as specified in 3GPP TS 04.18, subclause 3.5.1.2.

## References

3GPP TS 04.18, subclauses 3.3.2.1.1 and 3.5.1.1.

## 51.1.5.1.3.2 Test purpose

To verify that the MS ignores a PAGING REQUEST TYPE 1, 2 messages where both P-TMSI and IMSI do not address the MS although the paging message is sent on the CCCH to which the CCCH\_GROUP belongs.

## 51.1.5.1.3.3 Method of test

## Initial Conditions

System Simulator:

1 cell, CCCH combined with SDCCH, EGPRS supported, PCCCH absent, Max-Retrans = 2, BS\_AG\_BLK\_RES = 2, BS\_PA\_MFRMS = 7.

Mobile Station:

The MS is GPRS attached with a TMSI and a P-TMSI allocated and SPLIT PG CYCLE negotiated.

#### Related PICS/PIXIT Statement(s)

- Type of MS GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900.
- Support EGPRS service.

#### Test Procedure

The test is repeated twice. Each time a different paging message not addressing the MS is sent on the PCH belonging to the MS. It is checked that the no access attempt is made by the MS for 5 s.

The MS is then paged for packet paging. The MS attempts a random access which is rejected.

#### Maximum Duration of Test

5 minutes.

#### Expected Sequence

The test steps 1 - 2 is repeated for k = 1 .. 2

| Step | Direction | Message                     | Comments                                                                                                                                                                                                                                         |

## 51.1.5.2 RR / Paging / on CCCH for EGPRS service / extended paging

## 51.1.5.2.1 RR / Paging / on CCCH for EGPRS service / extended paging with P-TMSI successful

## 51.1.5.2.1.1 Conformance requirements

The paging and immediate assignment type messages contain a page mode information element. This information element controls possible additional requirements on mobile stations belonging to the paging subgroup corresponding to the paging subchannel the message was sent on. This implies that a given mobile station shall take into account the page mode information element of any message sent on its own paging subchannel whatever the nature of this message (paging messages or immediate assignment messages). This further implies that the mobile station does not take into account page mode information element of messages sent on paging subchannels other than its own paging subchannel. The requirements yielded by the page mode information element are as follows:

- b) extended paging: the mobile station is required in addition to receive and analyse the next but one message on the PCH.

## References

3GPP TS 04.18, subclauses 3.3.2.1.1, 9.1.18, 9.1.19 and 9.1.20.

## 51.1.5.2.1.2 Test purpose

1. To verify that the MS operates in the extended page mode when it is ordered by the SS in PAGING REQUEST TYPE 1 which does not address the MS, but on the paging sub-channel corresponding to the MS identity.
2. To verify that the MS operates in the extended page mode when it is ordered by the SS in PAGING REQUEST TYPE 2 which does not address the MS, but on the paging sub-channel corresponding to the MS identity.
3. To verify that the MS operates in the extended page mode when it is ordered by the SS in PAGING REQUEST TYPE 3 which does not address the MS, but on the paging sub-channel corresponding to the MS identity.
4. To verify that the MS operates in the extended page mode when it is ordered by the SS in IMMEDIATE ASSIGNMENT on the paging sub-channel corresponding to the MS identity.

5. To verify that the MS operates in the extended page mode when it is ordered by the SS in IMMEDIATE ASSIGNMENT EXTENDED on the paging sub-channel corresponding to the MS identity.
6. To verify that the MS operates in the extended page mode when it is ordered by the SS in IMMEDIATE ASSIGNMENT REJECT on the paging sub-channel corresponding to the MS identity.

#### 51.1.5.2.1.3 Method of test

##### Initial Conditions

###### System Simulator:

1 cell, EGPRS supported, PCCCH absent, Max-Retrans = 2, CCCH\_CONF = 1 basic physical channel used for CCCH with non-combined SDCCH, BS\_AG\_BLK\_RES = 3, BS\_PA\_MFRMS = 8.

###### Mobile Station:

The MS is GPRS attached with a TMSI and a P-TMSI allocated and SPLIT PG CYCLE negotiated.

##### Related PICS/PIXIT Statement(s)

- Type of MS GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900.
- Support EGPRS service.

##### Test Procedure

The test is repeated 6 times. Each time a different downlink message is sent on PCH or AGCH for setting the page mode to extended paging. The MS is paged on the next but one page block for the packet paging procedure. The MS starts a random accesses which are rejected by the SS.

##### Maximum Duration of Test

5 minutes.

##### Expected Sequence

The test sequence is repeated for  $k = 1 \dots 6$

| Step | Direction | Message                       | Comments                                                                                                                                                                                                                                                      |

| 5    | SS -> MS  | IMMEDIATE ASSIGNMENT REJECT   | Request Reference = pertaining to the message received in step 4. Page mode is set to "normal paging". Sent on AGCH.                                                                                                                                          |

### 51.1.5.3 RR / Paging / on CCCH for EGPRS service / paging reorganisation

#### 51.1.5.3.1 Conformance requirements

The paging and immediate assignment type messages contain a page mode information element. This information element controls possible additional requirements on mobile stations belonging to the paging subgroup corresponding to the paging subchannel the message was sent on. This implies that a given mobile station shall take into account the page mode information element of any message sent on its own paging subchannel whatever the nature of this message (paging messages or immediate assignment messages). This further implies that the mobile station does not take into account page mode information element of messages sent on paging subchannels other than its own paging subchannel. The requirements yielded by the page mode information element are as follows:

- c) paging reorganization: The mobile station shall receive all messages on the CCCH regardless of the BS-AG-BLKS-RES setting. It is required to receive all BCCH messages. When the mobile station receives the next message to its (possibly new) paging subgroup the subsequent action is defined in the page mode information element in that message.

#### References

3GPP TS 04.18, subclause 3.3.2.1.1.

### 51.1.5.3.2 Test purpose

1. To verify that the MS, after reception of a message with page mode set to "paging reorganisation", answers to paging messages (with page mode set to "normal paging") sent on its old CCCH in paging blocks which do not belong to the MS's paging sub-channel.
2. To test that the MS correctly determines its new paging sub-channel when the number of reserved blocks, BS\_AG\_BLK\_RES, and the number of 51-multiframes between transmissions of paging messages for mobile stations of the same paging group BS\_PA\_MFRMS are changed.
3. To test that the MS correctly determines its new paging sub-channel when the number of basic physical channels for CCCH is changed.
4. To test that the MS correctly determines its new paging sub-channel on PCCCH when PCCCH is established.

### 51.1.5.3.3 Method of test

#### Initial Conditions

##### System Simulator:

1 cell, EGPRS supported, PCCCH absent, Max-Retrans = 2, CCCH\_CONF = 1 basic physical channel used for CCCH with non-combined SDCCH, BS\_AG\_BLK\_RES = 3, BS\_PA\_MFRMS = 6.

##### Mobile Station:

The MS is GPRS attached with a TMSI and a P-TMSI allocated and SPLIT PG CYCLE negotiated.

#### Related PICS/PIXIT Statement(s)

- Type of MS GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900.
- Support EGPRS service.

#### Test Procedure

The page mode is set to paging reorganisation. The MS is paged for packet paging procedure through PAGING REQUEST TYPE 1 which is sent before the MS's original paging sub-channel re-occurs, but later than the next paging block of that CCCH. The MS starts the random access. The access attempt is rejected.

The SS changes the CCCH configuration with BS\_AG\_BLK\_RES=2 and BS\_PA\_MFRMS=5 and waits two SI13 repeat periods, and then sets the page mode to Normal Paging. The MS is paged for packet paging procedure through PAGING REQUEST TYPE 2 sent on the new paging sub-channel. The MS starts the random access. The access attempt is rejected via IMMEDIATE ASSIGNMENT REJECT which sets the page mode to 'paging reorganisation'.

Two additional CCCHs are activated by the SS. The same test procedure as above is repeated.

The SS restores all default radio parameters (in subclause 40.1), sets a non-combined CCCH and starts to transmitting PSIs on PBCCH. The SS waits two SI3 repeat periods + two PSI1 repeat periods. The MS is paged on PPCH. The random accesses from the MS are observed and are rejected.

#### Maximum Duration of Test

5 minutes.

### 51.1.6 RR / Paging / Before T3172 expiry

#### 51.1.6.1 Conformance requirements

On receipt of a PACKET ACCESS REJECT message containing a WAIT\_INDICATION field in a Reject structure addressed to the mobile station, where the Packet Request Reference in the Reject structure corresponds to one of its 3 last PACKET CHANNEL REQUEST messages, the mobile station shall stop sending PACKET CHANNEL REQUEST messages, start timer T3172 with the value indicated in the WAIT\_INDICATION field. During the time T3172 is running, the mobile station shall ignore all received PACKET PAGING REQUEST messages except paging request to trigger RR connection establishment.

#### References

3GPP TS 04.60, subclause 7.1.2.2.4.

#### 51.1.6.2 Test purpose

To verify that during the time T3172 is running, the MS ignores all received PACKET PAGING REQUEST messages except paging request to trigger RR connection establishment.

## 51.1.6.3 Method of test

## Initial Conditions

## System Simulator:

1 cell, CCCH combined with SDCCH, EGPRS supported, PCCCH present, Max-Retrans = 2, access burst type = 11 bits, BS\_PAG\_BLK\_RES = 2, BS\_PBCCH\_BLK = 3, BS\_PCC\_CHANS = 1 and BS\_PRACH\_BLK = 1.

## Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated.

## Related PICS/PIXIT Statement(s)

- Type of MS GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900.
- Support EGPRS service.
- Supporting GPRS: MS class A.
- Supporting GPRS: MS class B.
- Supporting GPRS: MS class C.

## Test Procedure

The MS is paged for initiation of a random access. The access attempt is rejected with a WAIT\_INDICATION = 30 s. in PACKET ACCESS REJECT. The MS is then continuously paged for TBF establishment for 5s. The SS checks that there is no transmission from the MS on PRACH for 8 s. after having sent PACKET ACCESS REJECT. The MS is paged for an RR connection establishment. The MS of class A or B shall start random accesses for channel request with cause 'answer to paging'. The access attempt is rejected.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

| Step     | Direction | Message                     | Comments                                                                                                                                                                   |
|----------|-----------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1        | SS -> MS  | PACKET PAGING REQUEST       | 1 <sup>st</sup> Repeated Page info contains P-TMSI of the MS, 2 <sup>nd</sup> Repeated Page info contains IMSI not addressing the MS, for TBF establishment. Sent on PPCH. |
| 2        | MS -> SS  | PACKET CHANNEL REQUEST      | Received on PRACH.                                                                                                                                                         |
| 3        | SS -> MS  | PACKET ACCESS REJECT        | Containing WAIT_INDICATION = 12 s. and packet request reference = pertaining to the message received in step 2. Sent on PAGCH.                                             |
| 4        | SS -> MS  | PACKET PAGING REQUEST       | 1 <sup>st</sup> Repeated Page info contains P-TMSI of the MS, 2 <sup>nd</sup> Repeated Page info contains IMSI not addressing the MS, for TBF establishment. Sent on PPCH. |
| 5        | SS        |                             | Repeat step 4 for 5 s. and check that there is no transmission from the MS on PRACH for 8 s. after step 4.                                                                 |
| 6        | SS -> MS  | PACKET PAGING REQUEST       | 1 <sup>st</sup> Repeated Page info contains TMSI of the MS, for RR connection establishment, Channel Needed = " TCH/F ", PAGE_MODE = " normal paging ", sent on PPCH.      |
| 8A<br>9A | MS -> SS  |                             | For MS class C of mode of operation                                                                                                                                        |
| 8B       | MS -> SS  | CHANNEL REQUEST             | For GPRS MS class A and B of mode of operation, answer to paging, received on RACH.                                                                                        |
| 9B       | SS -> MS  | IMMEDIATE ASSIGNMENT REJECT | Request Reference = pertaining to message received in step 8B. Sent on AGCH.                                                                                               |

## Specific Message Contents

## 51.2 RR procedures on CCCH related to temporary block flow establishment

This clause presents tests for "RR procedures on CCCH related to temporary block flow establishment" which are specified in 3GPP TS 04.18 subclause 3.5.

### Applicability and default conditions

The clause is applicable for mobiles supporting EGPRS.

The SS default conditions simulate one cell with default settings as defined in the EGPRS general defaults section, except:

- SI 13 Rest Octets contains no PCCCH description (PCCCH is not supported by the network).

The MS default initial condition is GPRS/EGPRS attached. Unless otherwise stated, no PDP context is required.

Default message contents and signaling macros are also defined in the GPRS general defaults section, except for those messages and macros specified at the end of this clause.

### 51.2.1 Permission to access the network

#### 51.2.1.1 Permission to access the network / priority classes

##### 51.2.1.1.1 Conformance requirements

Access to the network is allowed:

- if packet access is allowed in the cell for the priority class associated with the packet transfer, as indicated by the PRIORITY\_ACCESS\_THR parameter broadcast in SI 13 message.

### References

3GPP TS 04.18 subclause 3.5.2.1.1.

##### 51.2.1.1.2 Test purpose

To verify that the MS accesses the network only if packet access is allowed in the cell for the priority class associated with the packet transfer.

## 51.2.1.1.3 Method of test

## Initial conditions

System Simulator:

-

Mobile Station:

For PRIORITY\_ACCESS\_THR >2 MS is GPRS attached and EGPRS capable, a PDP context has been established and the MS is in Packet Idle mode.

For PRIORITY\_ACCESS\_THR <=2 MS is Idle Updated

## Related PICS/PIXIT statement

- Support of PDP context.
- Support EGPRS.

## Test procedure

For PRIORITY\_ACCESS\_THR >2 MS is triggered to transfer data. The SS verifies that the MS accesses the network as appropriate.

For PRIORITY\_ACCESS\_THR <=2 MS is triggered to perform an attach procedure. The SS verifies that the MS does not try to access the Network.

Specific test parameters:

- PRIORITY\_ACCESS\_THR is chosen from {0, 1, 2, 3, 4, 5, 6, 7}.
- priority level is chosen from { 1, 2,3 }

## Expected sequence

For PRIORITY\_ACCESS\_THR >2

| Step | Direction | Message | Comments                             |
|------|-----------|---------|--------------------------------------|
| 1    |           |         | The MS is triggered to transfer data |
| 2    | SS        |         | See verification                     |

Verification:

The SS verifies for 10 s that MS access (or not) to the network according to the PRIORITY\_ACCESS\_THR values below.

- 0 1 1 packet access is allowed for priority level 1;
- 1 0 0 packet access is allowed for priority level 1 to 2;
- 1 0 1 packet access is allowed for priority level 1 to 3;
- 1 1 0 packet access is allowed for priority level 1 to 4;
- 1 1 1 spare, shall be interpreted as (packet access allowed).

For PRIORITY\_ACCESS\_THR <=2

| Step | Direction | Message | Comments                                                                |
|------|-----------|---------|-------------------------------------------------------------------------|
| 1    |           |         | The MS is triggered to do Attach procedure                              |
| 2    | SS        |         | The SS verifies for 10 s that MS does not try to access to the network. |

## 51.2.2 Initiation of the packet access procedure

### 51.2.2.1 Initiation of the packet access procedure / establishment causes

#### 51.2.2.1.1 Conformance requirements

The EGPRS PACKET CHANNEL REQUEST messages are sent on RACH, if the SI13 indicates that the cell is EGPRS capable and EGPRS PACKET CHANNEL REQUEST on RACH is supported in the cell. The EGPRS PACKET CHANNEL REQUEST contain the parameters:

- an establishment cause which indicates packet access, and as applicable, a request for one phase packet access or two phase packet access;
- a random reference which is drawn randomly from a uniform probability distribution for every new transmission.

If the purpose of the packet access procedure is to send a Page Response, Cell Update, for a GPRS Mobility Management or a GPRS Session Management procedure the mobile station shall request a one-phase packet access.

If the requested RLC mode is *unacknowledged EGPRS mode TBF*, the mobile station shall request and attempt a two phase packet access.

#### References

3GPP TS 04.18 subclause 3.5.2.1.2.

#### Justification

#### 51.2.2.1.2 Test purpose

To verify that the EGPRS PACKET CHANNEL REQUEST message sent by the MS contains the correct establishment cause when initiating a packet access procedure.

#### 51.2.2.1.3 Method of test

#### Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached.

#### Related PICS/PIXIT statement

- Support of PDP context.
- Support of EGPRS.

#### Test procedure

The MS is triggered to initiate a GPRS attach procedure. The SS verifies that the MS attempts a one phase packet access.

If the MS supports PDP context, a PDP context for RLC unacknowledged is established and the MS is triggered to transfer RLC data blocks. The SS verifies that the MS correctly sets the Establishment Cause in the CHANNEL REQUEST message.

Maximum duration of the test

5 minutes.

Expected sequence

| Step | Direction | Message                                                                                     | Comments                                                           |
|------|-----------|---------------------------------------------------------------------------------------------|--------------------------------------------------------------------|

## 51.2.2.2 Random references for two phase packet access

### 51.2.2.2.1 Conformance requirements

The random reference in the EGPRS PACKET CHANNEL REQUEST messages shall be randomly drawn from a uniform probability distribution for every new transmission.

### References

3GPP TS 04.18 subclause 3.5.2.1.2.

### 51.2.2.2.2 Test purpose

To verify that the MS produces different Random References when accessing the network for two phase access.

### 51.2.2.2.3 Method of test

### Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH, Parameter MAX\_RETRANS is set to 4 retransmissions.

Mobile Station:

MS is GPRS attached, a PDP context in RLC unacknowledged mode has been established and the MS is in Packet Idle mode.

## Related PICS/PIXIT statement

- Support of EGPRS.

## Test procedure

The MS is triggered to transfer data, it shall attempt a Two Phase packet access (3GPP TS 04.18 / 3.5.2.1.2). The SS does not answer to the access bursts but stores N (= 80) Random References and verifies that the MS uses all possible values (0 ... 7) in its Random Reference.

## Justification

The length of the Random Reference is 3 bits for single block packet access (3GPP TS 04.18 / table 9.9). This test verifies that the MS uses all values (0 ... 7) in its Random Reference.

The probability that in a sequence of N samples one of the possible value does not appear is  $8^{-(7/8)^{**}N}$  for large N.

## Note

The number of samples N has been computed such that the probability of refusing a correct MS is less than 0,02 %.

## Maximum duration of the test

5 minutes.

## Expected sequence

| Step | Direction | Message                      | Comments                                                                               |
|------|-----------|------------------------------|----------------------------------------------------------------------------------------|
| 1    | MS        |                              | MS is triggered to transfer data.<br>(Two phase Packet Access)                         |
| 2    | MS -> SS  | EGPRS PACKET CHANNEL REQUEST | SS stores the value of Request References                                              |
| 3    | MS -> SS  | EGPRS PACKET CHANNEL REQUEST | SS stores the value of Request References                                              |
| 4    | MS -> SS  | EGPRS PACKET CHANNEL REQUEST | SS stores the value of Request References                                              |
| 5    | MS -> SS  | EGPRS PACKET CHANNEL REQUEST | SS stores the value of Request References                                              |
| 6    | MS -> SS  | EGPRS PACKET CHANNEL REQUEST | SS stores the value of Request References                                              |
| 7    | MS<->SS   |                              | Steps 1 to 6 are repeated N/5 = 16 times                                               |
| 8    | SS        |                              | SS verifies that all Request Reference values (0 to 7) come out in the stored samples. |

## 51.2.2.3 Random references for one phase packet access

## 51.2.2.3.1 Conformance requirements

The random reference in the EGPRS PACKET CHANNEL REQUEST messages shall be randomly drawn from a uniform probability distribution for every new transmission.

## References

3GPP TS 04.18 subclause 3.5.2.1.2.

## 51.2.2.3.2 Test purpose

To verify that the MS produces different Random References when accessing the network for one phase access.

## 51.2.2.3.3 Method of test

## Initial conditions

System Simulator: default settings except:

Parameter MAX\_RETRANS is set to 4 retransmissions.

Mobile Station:

MS is switched off.

## Related PICS/PIXIT statement

- Support of EGPRS.

## Test procedure

The MS is triggered to initiate the GPRS attach procedure, it shall attempt a one phase packet access . The SS does not answer to the access bursts but stores N (= 80) Random References and verifies that the MS uses all possible values (0 ... 7) in its Random Reference (see 3GPP TS 04.60 / 11.2.5a).

## Justification

Possible values for Random Reference for one phase packet access are 0 to 7. This test verifies that the MS uses all values (0 ... 7) in its Random Reference.

The probability that in a sequence of N samples one of the possible value does not appear is  $8 \cdot (7/8)^N$  for large N.

## Note:

The number of samples N has been computed such that the probability of refusing a correct MS is less than 0,02 %.

## Maximum duration of the test

5 minutes.

## Expected sequence

| 9    | MS<->SS   |                                    | Macro for Location Updating.<br>Steps 2 to 8 are repeated N/5 = 16 times               |
| 10   | SS        |                                    | SS verifies that all Request Reference values (0 to 7) come out in the stored samples. |

## 51.2.2.4 Initiation of the packet access procedure / timer T3146

### 51.2.2.4.1 Conformance requirements

Having sent the maximum number of EGPRS PACKET CHANNEL REQUEST messages, the mobile station starts timer T3146. At expiry of timer T3146, the packet access procedure is aborted and a packet access failure is indicated to upper layers.

#### Reference

3GPP TS 04.18 subclause 3.5.2.1.2.

### 51.2.2.4.2 Test purpose

To verify that the MS waits T3146 seconds before aborting the packet access procedure.

### 51.2.2.4.3 Method of test

#### Initial conditions

System Simulator: Default settings except:

System Information parameter MAX\_RETRANS is set to 2 retransmissions.

CCCH combined with SDCCH.

System Information parameter TX\_INTEGER in RACH Control Parameters is set to 3.

Mobile Station:

MS is GPRS attached, PDP Context is activated and the MS is in packet idle mode.

#### Related PICS/PIXIT statement

- Support of EGPRS.

#### Test procedure

The MS is triggered to initiate uplink data transfer, the SS waits until the MS sends all M+1 EGPRS PACKET CHANNEL REQUEST messages, where M is the parameter Max Retrans broadcast on BCCH. The SS waits until the maximum value of T3146 seconds elapse and sends an IMMEDIATE ASSIGNMENT which shall be ignored by the MS since the access procedure should be aborted.

The MS shall retry the access procedure (according to 04.60/7.1.2.3). Again, the SS waits until the MS sends all M+1 EGPRS PACKET CHANNEL REQUEST messages, and then sends an IMMEDIATE ASSIGNMENT before minimum value of T3146 seconds elapse. In this case the MS shall correctly send the LLC PDU on the assigned PDCH.

#### Note:

Timer T3146 (3GPP TS 04.18 clause 11) depends on parameter TX\_INTEGER broadcast on BCCH.

The minimum value of the timer is  $2 * S + TX\_INTEGER$  slots, where S is given in 3GPP TS 04.08 / 3GPP TS 44.018, Table 3.1.

The maximum value of this timer is 5 seconds. (41.2.3.6 Subclause 11.1.1 in 04.08)

#### Maximum duration of the test

5 minutes.

| 9    | MS -> SS  | EGPRS PACKET CHANNEL REQUEST                |                                                                                                                                                                                                                                                                      |
| 10   | SS        |                                             |                                                                                                                                                                                                                                                                      |
| 11   | SS -> MS  | IMMEDIATE ASSIGNMENT                        |                                                                                                                                                                                                                                                                      |
| 12   | SS <-> MS | Completion of macro {Uplink data transfer } |                                                                                                                                                                                                                                                                      |

The complete test is repeated for:

- TX\_INTEGER set to 20 (MS shall set timer T3146 to 1.1s); and for
- TX\_INTEGER set to 32 (MS shall set timer T3146 to 2.1s).

### 51.2.2.5 Initiation of the packet access procedure / Request Reference

#### 51.2.2.5.1 Conformance requirements

On receipt of an IMMEDIATE ASSIGNMENT message corresponding to one of its 3 last EGPRS PACKET CHANNEL REQUEST messages, the mobile stops sending EGPRS PACKET CHANNEL REQUEST messages and switches to the assigned PDCH.

#### Reference

3GPP TS 04.18 subclause 3.5.2.1.3.1.

#### 51.2.2.5.2 Test purpose

1. To verify that the MS continues sending EGPRS PACKET CHANNEL REQUEST messages when receiving an IMMEDIATE ASSIGNMENT containing an incorrect Request Reference.
2. To verify that the MS stops sending EGPRS PACKET CHANNEL REQUEST messages and switches to the assigned PDCH when receiving an IMMEDIATE ASSIGNMENT containing a Request Reference IE corresponding to one of its last 3 EGPRS PACKET CHANNEL REQUEST messages.

#### 51.2.2.5.3 Method of test

#### Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH, Parameter MAX\_RETRANS is set to 7 retransmissions.

Mobile Station:

MS is GPRS attached, PDP Context is activated and the MS is in packet idle mode.

#### Related PICS/PIXIT statement

- Support of EGPRS.

#### Test procedure

The MS is triggered to initiate uplink data transfer. After 3 EGPRS PACKET CHANNEL REQUEST messages, the SS sends an IMMEDIATE ASSIGNMENT including an incorrect Request Reference. The SS verifies that the MS continues sending EGPRS PACKET CHANNEL REQUEST messages.

After the 5<sup>th</sup> CHANNEL REQUEST message the SS sends an IMMEDIATE ASSIGNMENT including a correct Request Reference. The SS verifies that the MS stops sending EGPRS PACKET CHANNEL REQUEST messages, switches to the assigned PDCH and completes the uplink data transfer.

#### Maximum duration of the test

5 minutes.

#### Expected sequence

## 51.2.3 Packet immediate assignment / One phase packet access

### 51.2.3.1 Two-message assignment / Successful case

#### 51.2.3.1.1 Conformance requirements

If the mobile station receives an IMMEDIATE ASSIGNMENT message and the Dedicated mode or TBF information element indicates that this is the first message in a two-message assignment, the mobile station shall continue to listen to the full CCCH. The network may send a second IMMEDIATE ASSIGNMENT message within two multiframes.

periods following the first IMMEDIATE ASSIGNMENT, specifying the packet channel description and, if required, a mobile allocation for the assignment.

On receipt of an IMMEDIATE ASSIGNMENT message or, in case of a two-message assignment, a matching pair of IMMEDIATE ASSIGNMENT messages corresponding to one of its 3 last EGPRS PACKET CHANNEL REQUEST messages, the mobile station stops T3146 (if running), stops sending EGPRS PACKET CHANNEL REQUEST messages, and switches to the assigned PDCH.

#### Reference

3GPP TS 04.18 subclause 3.5.2.1.3.1.

#### 51.2.3.1.2 Test purpose

To verify that the MS correctly decodes a two-message assignment and switches to the assigned PDCH.

#### 51.2.3.1.3 Method of test

#### Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached, PDP Context is activated and the MS is in packet idle mode.

#### Related PICS/PIXIT statement

- Support of EGPRS.

#### Test procedure

The MS is triggered to initiate uplink data transfer. After reception of EGPRS PACKET CHANNEL REQUEST the SS sends a two-message IMMEDIATE ASSIGNMENT which actually describe a default IMMEDIATE ASSIGNMENT message, except that it is split in two parts: basically, the first part contains the IA Rest Octets, and the second part the Packet Channel Description IE.

The SS verifies that the MS correctly switches to the assigned PDCH and completes the uplink data transfer.

#### Maximum duration of the test

5 minutes.

#### Expected sequence

| Step | Direction | Message                                    | Comments                                                                                 |
|------|-----------|--------------------------------------------|------------------------------------------------------------------------------------------|
| 1    | MS        |                                            | The MS is triggered to transfer 200 octets of data.                                      |
| 2    | MS -> SS  | EGPRS PACKET CHANNEL REQUEST               |                                                                                          |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT                       | first message of two-message assignment                                                  |
| 4    | SS -> MS  | IMMEDIATE ASSIGNMENT                       | second message (see specific message contents), sent within two multiframe after step 3. |
| 5    | MS<->SS   | Completion of macro {Uplink data transfer} | SS allows MS to complete the uplink data transfer.                                       |

Specific message contents:

#### IMMEDIATE ASSIGNMENT (first message)

| Information Element         | Value                                            |
|-----------------------------|--------------------------------------------------|
| as default except:          |                                                  |
| Dedicated mode or TBF:      |                                                  |
| - TMA                       | 1 (is first message of a two-message assignment) |
| - Downlink                  | 0                                                |
| - T/D                       | 1 (assign a TBF)                                 |

| Timing Advance:             | as default              |
| Starting Time:              | not present             |
| IA Rest Octets:             | Second Part Assignment. |

### 51.2.3.2 Two-message assignment / Failure cases

#### 51.2.3.2.1 Conformance requirements

If the indirect encoding is used, the IMMEDIATE ASSIGNMENT message may contain a CHANGE\_MARK\_1 field. If that is present, the mobile station shall verify the validity of the SI13\_CHANGE\_MARK associated with the GPRS mobile allocation to which the message refers, see 3GPP TS 04.60. If the CHANGE\_MARK\_1 field and the SI13\_CHANGE\_MARK do not match, the message does not satisfactorily define a PDCH.

The two IMMEDIATE ASSIGNMENT messages in a two-message assignment shall have the same contents of the Request Reference information elements.

If the mobile station does not receive the second IMMEDIATE ASSIGNMENT messages in a two-message assignment within two multiframe periods following the first message, the mobile station shall discard the first IMMEDIATE ASSIGNMENT message received.

#### Reference

3GPP TS 04.18 subclause 3.5.2.1.3.1.

#### 51.2.3.2.2 Test purpose

To verify that the MS does not respond to a two-message assignment if:

- CHANGE\_MARK\_1 does not match SI13 CHANGE\_MARK.
- the second IMMEDIATE ASSIGNMENT message is not received within two multiframe periods after the first message.
- Request References in both messages do not have same contents.

## 51.2.3.2.3 Method of test

## Initial conditions

## System Simulator:

1 cell, CCCH combined with SDCCH, CHANGE\_MARK in SI13 is set to 1, TX-INTEGGER = 7.

MAX\_RETRANS = 7.

## Mobile Station:

MS is GPRS attached, PDP Context is activated and the MS is in packet idle mode.

## Related PICS/PIXIT statement

- Support of EGPRS.

## Test procedure

The MS is triggered to initiate uplink data transfer. After reception of EGPRS PACKET CHANNEL REQUEST the SS sends a two-message IMMEDIATE assignment:

- **first attempt:** CHANGE\_MARK does not match SI13 CHANGE\_MARK. MS shall re-initiate packet access (see 3GPP TS 04.18 subclause 4.7.3.1.5, GPRS attach procedure / Abnormal cases).
- **second attempt:** the second IMMEDIATE ASSIGNMENT message is not received within two multiframes after the first message. MS shall re-initiate packet access.
- **third attempt:** Request References in both messages do not have same contents. MS shall re-initiate packet access.
- **fourth attempt:** the second IMMEDIATE ASSIGNMENT message is received in the last access grant block before the second multiframes after the first message. In this case the MS shall successfully switch to the assigned PDCH and complete the uplink data transfer.

## Maximum duration of the test

5 minutes.

Expected sequence

| Step | Direction | Message                                     | Comments                                                                                                                                                                  |
|------|-----------|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                                             | The MS is triggered to initiate uplink data transfer.                                                                                                                     |
| 2    | MS -> SS  | EGPRS PACKET CHANNEL REQUEST                |                                                                                                                                                                           |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT                        | first message of two-message assignment with contents as specified below (see specific message contents).                                                                 |
| 4    | SS -> MS  | IMMEDIATE ASSIGNMENT                        | second message (see specific message contents) except: Packet Channel Description IE describes a hopping channel including CHANGE_MARK_1 different from SI13 CHANGE_MARK. |
| 5    | MS -> SS  | EGPRS PACKET CHANNEL REQUEST                | MS shall re-initiate packet access                                                                                                                                        |
| 6    | SS -> MS  | IMMEDIATE ASSIGNMENT                        | first message of two-message assignment (see specific message contents)                                                                                                   |
| 7    | SS -> MS  | IMMEDIATE ASSIGNMENT                        | second message (see specific message contents) sent after two multiframe after the first message.                                                                         |
| 8    | MS -> SS  | EGPRS PACKET CHANNEL REQUEST                | MS shall re-initiate packet access                                                                                                                                        |
| 9    | SS -> MS  | IMMEDIATE ASSIGNMENT                        | first message of two-message assignment (see specific message contents) including a Request Reference corresponding to step 8.                                            |
| 10   | SS -> MS  | IMMEDIATE ASSIGNMENT                        | second message (see specific message contents) except: Request Reference is different from that in step 8.                                                                |
| 11   | MS -> SS  | EGPRS PACKET CHANNEL REQUEST                | MS shall re-initiate packet access                                                                                                                                        |
| 12   | SS -> MS  | IMMEDIATE ASSIGNMENT                        | first message of two-message assignment (see specific message contents)                                                                                                   |
| 13   | SS -> MS  | IMMEDIATE ASSIGNMENT                        | second message (see specific message contents) sent in the last access grant block before the second multiframe after the first message elapses.                          |
| 14   | MS<->SS   | Completion of macro { Uplink data transfer} | SS allows MS to complete the uplink data transfer.                                                                                                                        |

## 51.2.3.3 Packet uplink assignment / Polling bit set

## 51.2.3.3.1 Conformance requirement

If the Polling bit is set to 1, MS shall send a PACKET CONTROL ACKNOWLEDGEMENT message (see 04.60) on the assigned PDCH, in the uplink block specified by the TBF Starting Time. In this case the TBF Starting Time is used both to indicate when the assigned PDCH becomes valid and to specify the uplink block.

## Reference

3GPP TS 04.18 subclause 3.5.2.1.3.2.

## 51.2.3.3.2 Test purpose

To verify that the MS sends a PACKET CONTROL ACKNOWLEDGEMENT message in the correct uplink block if the Polling bit is set in packet uplink assignment construction.

## 51.2.3.3.3 Method of test

## Initial conditions

## System Simulator:

1 cell, CCCH combined with SDCCH.

## Mobile Station:

MS is GPRS attached, PDP Context is activated and the MS is in packet idle mode.

## Related PICS/PIXIT statement

- Support of EGPRS.

## Test procedure

The MS is triggered to initiate uplink data transfer. The SS assigns packet uplink resources in an IMMEDIATE ASSIGNMENT message indicating one phase packet access and with the Polling bit set. The MS shall send a PACKET CONTROL ACKNOWLEDGMENT on the assigned uplink block and then complete the GPRS attach procedure.

## Maximum duration of the test

5 minutes.

### 51.2.3.4 One phase packet access / Contention resolution / Successful case

#### 51.2.3.4.1 Conformance requirements

After receiving an IMMEDIATE ASSIGNMENT message in which one phase packet access for an uplink transfer is granted, the mobile station shall start timer T3164 and proceed with the contention resolution at one phase access defined in 3GPP TS 04.60.

#### Reference

3GPP TS 04.18 subclause 3.5.2.1.3.2.

3GPP TS 04.60 subclause 7.1.2.3.

#### 51.2.3.4.2 Test purpose

To verify that the MS includes the correct TLLI (Temporary Logical Link Identifier) in the first RLC data blocks until contention resolution is completed.

#### 51.2.3.4.3 Method of test

#### Initial conditions

System Simulator:

1cell, CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached, a PDP context has been established and the MS is in Packet Idle mode.

#### Related PICS/PIXIT statement

- Support of PDP context.
- Support of EGPRS.

## Test procedure

The MS is triggered to transfer data. The SS assigns packet uplink resources in an IMMEDIATE ASSIGNMENT message indicating one phase packet access. The MS shall start transferring RLC data blocks including the correct TLLI in the RLC data blocks which are sent preceding the reception of PACKET UPLINK ACK/NACK.

### Maximum duration of the test

5 minutes.

### Expected sequence

| Step | Direction | Message                                    | Comments                                            |
|------|-----------|--------------------------------------------|-----------------------------------------------------|
| 0    | MS        |                                            | The MS is triggered to transfer 200 octets of data. |

## 51.2.3.5 One phase packet access / Contention resolution / TLLI mismatch

### 51.2.3.5.1 Conformance requirement

If the TLLI in the PACKET UPLINK ACK/NACK message differs from that sent by the MS in the RLC block headers, the MS shall immediately stop transmitting on this TBF and re-initiate the packet access procedure unless it has already been repeated 4 times.

#### Reference

3GPP TS 04.18 subclause 3.5.2.1.3.2.

3GPP TS 04.60 subclause 7.1.2.3.

### 51.2.3.5.2 Test purpose

To verify that the MS immediately stops transmitting if it receives a PACKET UPLINK ACK/NACK with incorrect TLLI.

### 51.2.3.5.3 Method of test

#### Initial conditions

System Simulator:

1cell, CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached, a PDP context has been established and the MS is in Packet Idle mode.

#### Related PICS/PIXIT statement

- Support of PDP context.
- Support of EGPRS.

#### Test procedure

The MS is triggered to transfer data. The SS assigns packet uplink resources in an IMMEDIATE ASSIGNMENT message indicating one phase packet access. The MS shall start transferring RLC data blocks including the correct TLLI in the first three blocks. The SS acknowledges the RLC block transfer with a PACKET UPLINK ACK/NACK including an incorrect TLLI. The SS shall verify that the MS 'immediately' stops transmitting (see note below) and retries packet access procedure.

NOTE: The MS is allowed to transmit n RLC blocks after the block containing the PACKET UPLINK ACK/NACK message (the exact value of n is specified in 3GPP TS 05.10 subclause 6.11).

#### Maximum duration of the test

5 minutes.

#### Expected sequence

### 51.2.3.6 One phase packet access / Contention resolution / Counter N3104

#### 51.2.3.6.1 Conformance requirement

The contention resolution has failed on the mobile station when the counter N3104 has reached its maximum value.

## Reference

3GPP TS 04.60 subclause 7.1.2.3.

### 51.2.3.6.2 Test purpose

To verify that the MS correctly sets and considers counter N3104.

NOTE: Counter N3104 is incremented by 1 with each new RLC/MAC block the mobile station sends until the first PACKET UPLINK ACK/NACK message is received.

Its maximum value is  $N3104\_MAX = 3 * (BS\_CV\_MAX + 3) * \text{no-of-timeslots-assigned}$ , where BS\_CV\_MAX is broadcast in SI 13 Rest Octets.

### 51.2.3.6.3 Method of test

#### Initial conditions

System Simulator: Default settings except:

1 cell, CCCH combined with SDCCH, BS\_CV\_MAX value in System Information Type 13 arbitrarily chosen in the range 3 to 10.

Mobile Station:

MS is GPRS attached, a PDP context has been established and the MS is in Packet Idle mode.

#### Related PICS/PIXIT statement

- Support of PDP context.
- Support of EGPRS.

#### Test procedure

The MS is triggered to transfer 1000 octets of data. The SS assigns packet uplink resources in an IMMEDIATE ASSIGNMENT message indicating one phase packet access. SS assigns radio resource to the MS. The MS shall start transferring RLC data blocks. The SS verifies that the MS sends N3104\_MAX data blocks. The SS verifies that the MS stops transmitting after sending N3104\_MAX radio blocks and restarts packet access procedure.

At the second attempt, the SS sends PACKET UPLINK ACK/NACK exactly after N3104\_MAX - 1 data blocks. The SS verifies that this time the MS does not abort the access procedure and successfully completes uplink transfer.

#### Maximum duration of the test

5 minutes.

### 51.2.3.7 One phase packet access / Contention resolution / Timer T3166

#### 51.2.3.7.1 Conformance requirement

The contention resolution has failed on the mobile station when the counter N3104 has reached its maximum value, or on expiry of timer T3166.

#### Reference

3GPP TS 04.60 subclause 7.1.2.3.

#### 51.2.3.7.2 Test purpose

To verify that the MS correctly considers timer T3166.

#### 51.2.3.7.3 Method of test

#### Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH, BS\_CV\_MAX value in System Information Type 13 is set to 15.

Mobile Station:

MS is GPRS attached, a PDP context has been established and the MS is in Packet Idle mode.

#### Related PICS/PIXIT statement

- Support of PDP context.
- Support of EGPRS.

#### Test procedure

The MS is triggered to transfer 1 000 octets of data. The SS assigns packet uplink resources in an IMMEDIATE ASSIGNMENT message indicating one phase packet access and dynamic allocation. The MS shall start transferring RLC data blocks. The SS reduces the block transfer rate by controlling the USF flag. In this way, the SS forces T3166 (with value 5 s.) to expire before counter N3104 reaches N3104\_MAX (with value 45 blocks for current settings). The SS verifies that the MS stops transmitting and restarts packet access procedure.

At the second attempt, the SS sends PACKET UPLINK ACK/NACK before T3166 seconds. The SS verifies that this time the MS does not abort the access procedure and successfully completes the data transfer.

#### Maximum duration of the test

5 minutes.

Expected sequence

### 51.2.3.8 One phase packet access / Contention resolution / 4 access repetition attempts

#### 51.2.3.8.1 Conformance requirement

If contention resolution for packet access fails, the mobile station shall reinitiate the packet access procedure unless it has already been repeated 4 times.

#### Reference

3GPP TS 04.60 subclause 7.1.2.3.

#### 51.2.3.8.2 Test purpose

To verify that the MS repeats the packet access initiation 4 times.

#### 51.2.3.8.3 Method of test

#### Initial conditions

System Simulator:

1cell, CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached, a PDP context has been established and the MS is in Packet Idle mode.

#### Related PICS/PIXIT statement

- Support of PDP context.
- Support of EGPRS.

#### Test procedure

The MS is triggered to transfer 200 octets of data. The SS assigns packet uplink resources in an IMMEDIATE ASSIGNMENT message indicating one phase packet access. The MS shall start transferring RLC data blocks including the correct TLLI in the first three blocks. The SS acknowledges the RLC block transfer with a PACKET UPLINK ACK/NACK including a TLLI not corresponding to the MS. The SS shall verify that the MS stops transmitting blocks and reinitiates packet access, which shall be repeated four times.

#### Note:

The MS is allowed to transmit n RLC blocks after the block containing the PACKET UPLINK ACK/NACK message (the exact value of n is specified in 3GPP TS 05.10 subclause 6.11).

#### Maximum duration of the test

5 minutes.

### 51.2.3.9 One phase packet access / TBF starting time

#### 51.2.3.9.1 Conformance requirement

In case the packet uplink assignment construction contains a TBF starting time and the mobile station receives the IMMEDIATE ASSIGNMENT message before the TBF starting time has expired, it shall wait until the frame number indicated by the TBF starting time before accessing the channel. If the mobile station receives the message after the TBF starting time has expired, it shall ignore the TBF starting time and may immediately access the channel.

#### Reference

3GPP TS 04.18 subclause 3.5.2.1.3.2.

3GPP TS 04.60 subclause 8.1.1.5.

#### 51.2.3.9.2 Test purpose

To verify that the MS correctly considers the TBF Starting Time included in the IMMEDIATE ASSIGNMENT message.

#### 51.2.3.9.3 Method of test

#### Initial conditions

System Simulator:

1cell, CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached, a PDP context has been established and the MS is in Packet Idle mode.

Related PICS/PIXIT statement

- Support of PDP context.
- Support of EGPRS.

Test procedure

The MS is triggered to transfer data. The SS assigns packet uplink resources in an IMMEDIATE ASSIGNMENT message indicating one phase packet access and containing a TBF starting time. The MS may start transferring RLC data blocks at the exact frame specified by the TBF starting time.

The test is repeated with a TBF starting time in the past. In this case the MS shall 'immediately' (see note below) send RLC data blocks.

NOTE: The MS shall start transmitting RLC blocks within n blocks after the block containing the IMMEDIATE ASSIGNMENT message (the exact value of n is specified in 3GPP TS 05.10 subclause 6.11).

Maximum duration of the test

5 minutes.

### 51.2.3.10 One phase packet access / Timing Advance Index present

#### 51.2.3.10.1 Conformance requirement

If the timing advance index (TAI) is included in the packet uplink assignment construction, the mobile station shall use the continuous update timing advance mechanism, see 3GPP TS 05.10, using PTCCH in the same timeslot as the assigned PDCH.

## Reference

3GPP TS 04.18 subclause 3.5.2.1.3.2.

3GPP TS 03.64 subclause 6.5.7.2.

## 51.2.3.10.2 Test purpose

To verify that the MS uses the continuous update timing advance mechanism and sends access bursts in the PTCCH slots as determined by the Timing Advance Index (TAI) sent in the IMMEDIATE ASSIGNMENT.

## 51.2.3.10.3 Method of test

## Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached, a PDP context has been established and the MS is in Packet Idle mode.

## Related PICS/PIXIT statement

- Support of PDP context.
- Support of EGPRS.

## Test procedure

The MS is triggered for uplink data transfer. The SS assigns packet uplink resources in an IMMEDIATE ASSIGNMENT message indicating one phase packet access and containing a Timing Advance Index. During TBF transfer, the SS shall verify the access bursts sent by the MS in the PTCCH.

## Maximum duration of the test

5 minutes.

## Expected sequence

| Step | Direction | Message                                    | Comments                                                                                  |
|------|-----------|--------------------------------------------|-------------------------------------------------------------------------------------------|
| 0    | MS        |                                            | The MS is triggered to transfer 2000 octets of data.                                      |
| 1    | MS -> SS  | EGPRS PACKET CHANNEL REQUEST               |                                                                                           |
| 2    | SS -> MS  | IMMEDIATE ASSIGNMENT                       | For one phase packet access, dynamic allocation and including Timing Advance Index TAI=0. |
| 3    | MS -> SS  | RLC data blocks                            |                                                                                           |
| 4    | SS -> MS  | PACKET UPLINK ACK/NACK                     | Including correct TLLI.                                                                   |
| 5    | MS<->SS   | Completion of macro {Uplink data transfer} | SS allows MS to complete data transfer.                                                   |

## Verification

During TBF transfer (steps 3 to 5) the SS monitors access bursts on PTCCH which are located on slots with numbers FN, such that  $(FN \bmod (8 \cdot 52)) = 12$  for TAI = 0 (3GPP TS 03.64/6.5.7.2 and 3GPP TS 05.02/Table 6). The access burst contents shall be '01111111'.

The test is repeated once more with an arbitrarily chosen TAI in the range 1 to 15. SS shall verify that the access bursts are sent in the correct PTCCH slots as specified in 3GPP TS 05.02 table 6.

### 51.2.3.11 One phase packet access / Timing Advance Index not present

#### 51.2.3.11.1 Conformance requirement

If a timing advance index (TAI) field is not included, the continuous update timing advance mechanism shall not be used.

#### Reference

3GPP TS 04.18 subclause 3.5.2.1.3.2.

#### 51.2.3.11.2 Test purpose

To verify that the MS does not send any access bursts on PTCCH (i.e. it does not use the continuous update timing advance mechanism) if TAI is not present in the IMMEDIATE ASSIGNMENT message.

#### 51.2.3.11.3 Method of test

#### Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached, a PDP context has been established and the MS is in Packet Idle mode.

#### Related PICS/PIXIT statement

- Support of PDP context.
- Support EGPRS.

#### Test procedure

The MS is triggered to transfer data. The SS assigns packet uplink resources in an IMMEDIATE ASSIGNMENT message not including a Timing Advance Index. During TBF transfer, the SS shall verify that the MS does not send any access bursts in idle frames.

#### Maximum duration of the test

5 minutes.

#### Expected sequence

| Step | Direction | Message                                    | Comments                                             |
|------|-----------|--------------------------------------------|------------------------------------------------------|
| 0    | MS        |                                            | The MS is triggered to transfer 2000 octets of data. |
| 1    | MS -> SS  | EGPRS PACKET CHANNEL REQUEST               |                                                      |
| 2    | SS -> MS  | IMMEDIATE ASSIGNMENT                       | not including Timing Advance Index                   |
| 3    | MS -> SS  | 3 RLC data blocks                          |                                                      |
| 4    | SS -> MS  | PACKET UPLINK ACK/NACK                     | Including correct TLLI.                              |
| 5    | MS -> SS  | RLC data blocks                            |                                                      |
| 6    | SS<->MS   | Completion of macro {Uplink data transfer} | SS allows MS to complete data transfer               |

## Verification

The SS verifies that the MS does not transmit in idle frames during data block transfer (steps 3 to 6). Idle frame numbers are 12, 25, 38 and 51 in the 52-multiframe structure.

### Specific Message Contents:

#### IMMEDIATE ASSIGNMENT, Steps 2:

| Information Element           | value/ remark                |
|-------------------------------|------------------------------|
| EGPRS Window Size             | 192 Max Window size for 1 TS |
| Link Quality Measurement Mode | 00                           |

## 51.2.4 Packet immediate assignment / Multiblock packet access

### 51.2.4.1 Multiblock packet access / Packet Resource Request

#### 51.2.4.1.1 Conformance requirement

The network shall use the TBF starting time to indicate the first frame number belonging to the multiblock period granted for packet access. If a multiple block packet access is granted, it forces the mobile station to perform a two phase packet access.

#### Reference

3GPP TS 04.18 subclauses 3.5.2.1.3.1 and 3.5.2.1.3.3a.

#### 51.2.4.1.2 Test purpose

To verify that the MS sends PACKET RESOURCE REQUEST in the assigned block as indicated by the TBF starting time when it is triggered for uplink transfer.

#### 51.2.4.1.3 Method of test

#### Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached, a PDP context has been established and the MS is in Packet Idle mode.

#### Related PICS/PIXIT statement

- Support of PDP context .
- Support EGPRS.

#### Test procedure

The MS is triggered to initiate uplink data transfer. The SS assigns packet uplink resources for multiblock in an IMMEDIATE ASSIGNMENT message including a TBF starting time. The SS verifies that the MS sends a PACKET RESOURCE REQUEST at the first allowed block as indicated by the TBF starting frame.

#### Maximum duration of the test

5 minutes.

Expected sequence

| Step | Direction | Message                      | Comments                                                                                                                                                                                                     |

51.2.4.2 Void

## 51.2.5 Packet immediate assignment / Packet access rejection

51.2.5.1 Packet access rejection / wait indication

51.2.5.1.1 Conformance requirement

On receipt of an IMMEDIATE ASSIGNMENT REJECT message corresponding to one of its 3 last CHANNEL REQUEST messages, the mobile station stops sending CHANNEL REQUEST messages, starts timer T3142 with the indicated value, ("wait indication" information element), starts T3146 if it has not already been started, and listens to the downlink CCCH until T3146 expires. During this time, additional IMMEDIATE ASSIGNMENT REJECT messages are ignored, but any immediate assignment corresponding to any other of its 3 last CHANNEL REQUEST messages make the mobile station follow the assignment procedure. If no such immediate assignment is received, the mobile station returns to packet idle mode.

Reference

3GPP TS 04.18 subclause 3.5.2.1.3.4.

51.2.5.1.2 Test purpose

To verify that the MS stops sending CHANNEL REQUEST messages when receiving an IMMEDIATE ASSIGNMENT REJECT containing a Request Reference IE corresponding to one of its last 3 CHANNEL REQUEST messages.

Further on, the SS verifies that the MS makes a new attempt for uplink transfer only after T3142 seconds ("wait indication" timer) after last IMMEDIATE ASSIGNMENT REJECT elapse.

51.2.5.1.3 Method of test

Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH, Parameter MAX\_RETRANS is set to 7 retransmissions.

Mobile Station:

MS is switched off.

Related PICS/PIXIT statement

- Support of EGPRS.

Foreseen final state of the MS

- Packet Idle state.

Test procedure

The MS is triggered to initiate the GPRS attach procedure. After reception of 3 CHANNEL REQUEST messages, the SS sends an IMMEDIATE ASSIGNMENT REJECT with correct Request Reference and including a waiting indication (T3142). The SS verifies that the MS stops sending CHANNEL REQUEST messages and does not attempt a new packet access until T3142 seconds elapse.

Maximum duration of the test

5 minutes.

Expected sequence

| 2    | MS -> SS  | CHANNEL REQUEST                             |                                                                                                                                       |
| 3    | MS -> SS  | CHANNEL REQUEST                             |                                                                                                                                       |
| 4    | SS -> MS  | IMMEDIATE ASSIGNMENT REJECT                 | including Request Reference corresponding to the CHANNEL REQUEST in step 1, and waiting time indication with value T3142=50s.         |
| 5    | SS        |                                             | SS verifies that MS does not send any further access bursts (see note below).                                                         |
| 6    | MS -> SS  | CHANNEL REQUEST                             | SS verifies that the access burst does not arrive before $T3142 - 0.1 * T3142 (=45s)$ after last IMMEDIATE ASSIGNMENT REJECT message. |
| 7    | SS -> MS  | IMMEDIATE ASSIGNMENT                        | for uplink TBF, one phase access                                                                                                      |
| 8    | MS<->SS   | Completion of macro {GPRS attach procedure} | SS allows MS to complete GPRS attach.                                                                                                 |

The test is repeated with an arbitrarily chosen value of T3142 in the range 2 to 255 s.

NOTE: The number of frames between successive access bursts considering the default Sys Info parameters used in the test is larger than 58 frames (see 3GPP TS 04.08 / 3GPP TS 44.018 table 3.1). This value is large enough to allow the MS to respond to the IMMEDIATE ASSIGNMENT REJECT message by stopping sending the next access bursts.

Specific Message Contents:

IMMEDIATE ASSIGNMENT, Step 7:

| Information Element           | value/ remark                |
|-------------------------------|------------------------------|
| EGPRS Window Size             | 192 Max Window size for 1 TS |
| Link Quality Measurement Mode | 00                           |

## 51.2.5.2 Packet access rejection / assignment before T3142 expires

### 51.2.5.2.1 Conformance requirement

On receipt of an IMMEDIATE ASSIGNMENT REJECT message corresponding to one of its 3 last CHANNEL REQUEST messages, the mobile station stops sending CHANNEL REQUEST messages, starts timer T3142 with the indicated value, ("wait indication" information element), starts T3146 if it has not already been started, and listens to the downlink CCCH until T3146 expires. During this time, additional IMMEDIATE ASSIGNMENT REJECT messages are ignored, but any immediate assignment corresponding to any other of its 3 last CHANNEL REQUEST messages make the mobile station follow the assignment procedure. If no such immediate assignment is received, the mobile station returns to packet idle mode.

#### Reference

subclause 3.5.2.1.3.4.

### 51.2.5.2.2 Test purpose

To verify that the MS stops sending CHANNEL REQUEST messages when receiving an IMMEDIATE ASSIGNMENT REJECT and, if an IMMEDIATE ASSIGNMENT containing a correct Request Reference arrives before  $T = \min \{T3142, T3146\}$  seconds elapse, then the MS shall accept this assignment. (See below for a note on T3146).

### 51.2.5.2.3 Method of test

#### Initial conditions

System Simulator: Default settings except:

Parameter MAX\_RETRANS is set to 7 retransmissions.

Parameter TX\_INTEGER is set to 32.

CCCH combined with SDCCH.

Mobile Station:

MS is switched off.

#### Related PICS/PIXIT statement

- Support of EGPRS.

#### Foreseen final state of the MS

- GPRS Attach State.

#### Test procedure

The MS is triggered to initiate GPRS attach. After reception of 3 CHANNEL REQUEST messages, the SS sends an IMMEDIATE ASSIGNMENT REJECT with correct Request Reference and including a waiting indication (T3142). The SS verifies that the MS stops sending CHANNEL REQUEST messages.

Before  $T = \min \{T3142, T3146\}$  seconds elapse, the SS sends an IMMEDIATE ASSIGNMENT with correct Request Reference. The MS shall switch to the assigned PDCH and transfer the data.

#### Note on T3146:

NOTE: T3146 is started when sending the last CHANNEL REQUEST or when receiving the IMMEDIATE ASSIGNMENT REJECT. At its expiry, the packet access is aborted.

The value of T3146 is given by  $T+2*S$  (3GPP TS 04.08 / 3GPP TS 44.018, clause 11.1.1), where T is TX\_INTEGER and S is given in 3GPP TS 04.08 / 3GPP TS 44.018, Table 3.1. The value of T3146 is 2.15 s. for the current settings.

Maximum duration of the test

5 minutes.

## 51.2.6 Packet downlink assignment procedure using CCCH

### 51.2.6.1 Initiation of packet downlink assignment procedure / MS listens to correct CCCH block

#### 51.2.6.1.1 Conformance requirement

The network initiates the packet downlink assignment procedure by sending an IMMEDIATE ASSIGNMENT message in unacknowledged mode on the CCCH timeslot corresponding to CCCH group the mobile station belongs to.

On receipt of an IMMEDIATE ASSIGNMENT message [the MS] stops monitoring downlink CCCH and switches to the assigned PDCH and starts listening for downlink RLC/MAC blocks identified by the assigned TFI; it starts timer T3190.

Reference

3GPP TS 04.18 subclause 3.5.3.1.2.

#### 51.2.6.1.2 Test purpose

To verify that the MS responds to an IMMEDIATE ASSIGNMENT for downlink TBF sent on PCH blocks corresponding to the MS's paging group.

## 51.2.6.1.3 Method of test

## Initial conditions

System Simulator:

EGPRS supported.

Default settings except:

Parameters CCCH\_CONF, BS\_AG\_BLK\_RES, and BS\_PA\_MFRMS are arbitrarily chosen.

Mobile Station:

MS is GPRS attached, DRX have been negotiated, MS is in Ready state.

A PDP context has been established and the MS is in Packet Idle mode.

## Related PICS/PIXIT statement

- Support of EGPRS
- Support of PDP context
- Support of DRX

## Test procedure

The SS sends an IMMEDIATE ASSIGNMENT for downlink transfer on a PCH block corresponding to its paging group (see 3GPP TS 05.02 subclause 6.5.2) which depends on Sys Info parameters and the MS's IMSI. The MS shall switch to the assigned PDCH and exercise downlink transfer.

## Maximum duration of the test

NA

## Expected sequence

| Step | Direction | Message                                      | Comments                                                                                                              |
|------|-----------|----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | IMMEDIATE ASSIGNMENT                         | sent on a PCH block corresponding to the MS's paging group, including a packet downlink assignment with correct TLLI. |
| 2    | MS<->SS   | Completion of macro {Downlink data transfer} | SS completes downlink transfer of 200 octets of data.                                                                 |

## Specific Message Contents:

## IMMEDIATE ASSIGNMENT, Step 1:

| Information Element           | value/ remark                |
|-------------------------------|------------------------------|
| EGPRS Window Size             | 192 Max Window size for 1 TS |

## 51.2.6.2 Initiation of packet downlink assignment procedure / timer T3190

## 51.2.6.2.1 Conformance requirement

On receipt of an IMMEDIATE ASSIGNMENT message [the MS] stops monitoring downlink CCCH and switches to the assigned PDCH and starts listening for downlink RLC/MAC blocks identified by the assigned TFI; it then starts timer T3190.

If the mobile station does not receive a RLC/MAC block on the assigned PDCHs before timer T3190 expires, then a TBF establishment failure has occurred.

#### Reference

3GPP TS 04.18 subclause 3.5.3.1.2.

#### 51.2.6.2.2 Test purpose

To verify that the MS returns to packet idle updated if RLC/MAC blocks are sent after T3190 seconds, and that the MS correctly receives RLC/MAC blocks if they are sent before T3190 seconds.

#### 51.2.6.2.3 Method of test

#### Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH.

EGPRS Supported.

Mobile Station:

MS is GPRS attached, a PDP context has been established and the MS is in Packet Idle mode.

#### Related PICS/PIXIT statement

- Support of EGPRS.
- Support of PDP context.

#### Test procedure

The SS assigns a PDCH for downlink transfer but does not send any RLC/MAC blocks until T3190 seconds have elapsed. The MS shall return to packet idle updated and ignore the RLC/MAC blocks.

To verify that the MS returned to packet idle updated, the SS again assigns a PDCH and sends RLC/MAC blocks before T3190 seconds elapse. The SS shall successfully transfer all RLC data blocks.

#### Maximum duration of the test

5 minutes.

#### Expected sequence

| Step | Direction | Message                                      | Comments                                                                                                                                                                                                                                                |
|------|-----------|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | IMMEDIATE ASSIGNMENT                         | for downlink TBF on a PCH block corresponding to the MS, including a packet downlink assignment. SS waits T3190 + 10% (=5.5s) after the last IMMEDIATE ASSIGNMENT. SS sends data SS verifies for 10s. that the MS does not respond.                     |
| 2    | SS        |                                              |                                                                                                                                                                                                                                                         |
| 3    | SS -> MS  | RLC data blocks                              |                                                                                                                                                                                                                                                         |
| 4    | SS        |                                              |                                                                                                                                                                                                                                                         |
| 5    | SS -> MS  | IMMEDIATE ASSIGNMENT                         | SS assigns again a PDCH. SS waits T3190 - 10% (=4.5s) after the last IMMEDIATE ASSIGNMENT SS starts sending 200 octets of data, including FB=0, RRPB valid value, ESPB set indicating correct reception of data blocks. SS completes downlink transfer. |
| 6    | SS        |                                              |                                                                                                                                                                                                                                                         |
| 7    | SS -> MS  | RLC data blocks                              |                                                                                                                                                                                                                                                         |

### 51.2.6.3 Initiation of packet downlink assignment procedure / TBF starting time

#### 51.2.6.3.1 Conformance requirement

The IMMEDIATE ASSIGNMENT message may indicate a TBF starting time. If the mobile station receives the message before the TBF starting time has expired, it shall wait until the frame number indicated by the TBF starting time, start timer T3190 and switch to the assigned PDCH. If the mobile station receives the message after the TBF starting time has expired, it shall ignore the indicated TBF starting time, immediately start timer T3190 and switch to the assigned PDCH.

#### Reference

3GPP TS 04.18 subclause 3.5.3.1.2.

#### 51.2.6.3.2 Test purpose

To verify that the MS correctly considers the TBF starting time during downlink assignment.

#### 51.2.6.3.3 Method of test

#### Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH.

EGPRS Supported.

Mobile Station:

MS is GPRS attached, a PDP context has been established and the MS is in Packet Idle mode.

#### Related PICS/PIXIT statement

- Support of EGPRS.
- Support of PDP context.

#### Test procedure

The SS assigns a PDCH via an IMMEDIATE ASSIGNMENT including a TBF starting time. The SS does not send RLC data blocks after TBF starting time + T3190 elapses. The MS shall return to packet idle updated and ignore the RLC data blocks.

The SS assigns again a PDCH, and this time the SS sends RLC data blocks before TBF starting time + T3190 expires. The MS shall successfully receive the RLC data blocks.

Finally, the SS assigns the third time a PDCH, but including a TBF starting time which expired. The SS immediately sends RLC data blocks which shall be acknowledged by the MS.

Maximum duration of the test

5 minutes.

Expected sequence

NOTE: The requirements to uplink and downlink assignment reaction times are stated in 3GPP TS 05.10 subclause 6.11: An MS shall be ready to transmit and receive using a new assignment no later than the next occurrence of block  $B((x+3) \bmod 12)$  where block  $B(x)$  is the last radio block containing the uplink assignment.

#### 51.2.6.4 Initiation of packet downlink assignment procedure / incorrect TFI

##### 51.2.6.4.1 Conformance requirement

On receipt of an IMMEDIATE ASSIGNMENT message [the MS] stops monitoring downlink CCCH and switches to the assigned PDCH and starts listening for downlink RLC/MAC blocks identified by the assigned Temporary Flow Identifier (TFI).

##### Reference

3GPP TS 04.18 subclause 3.5.3.1.2.

##### 51.2.6.4.2 Test purpose

To verify that the MS correctly considers the TFI in the RLC/MAC blocks.

##### 51.2.6.4.3 Method of test

##### Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH.

EGPRS Supported.

Mobile Station:

MS is GPRS attached, a PDP context has been established and the MS is in Packet Idle mode.

##### Related PICS/PIXIT statement:

- Support for EGPRS.
- Support of PDP context.

##### Test procedure

The SS assigns a PDCH and starts transmitting RLC/MAC blocks with incorrect TFI. The MS shall ignore these RLC/MAC blocks and, after T3190 expires, return to packet idle mode.

To prove that the MS returns to idle mode, the SS assigns again a PDCH, and this time the SS sends RLC/MAC blocks with correct TFI. The MS shall successfully receive the data packets.

##### Maximum duration of the test

5 minutes.

## 51.3 MAC/RLC Release

All test cases in this clause apply to the MSs which support the EGPRS service and are capable of activation of at least one PDP context.

The maximum duration of each test is per default 5 minutes.

### 51.3.1 TBF Release / Uplink / Normal / MS initiated

#### 51.3.1.1 TBF Release / Uplink / Normal / MS initiated / Acknowledged mode

##### 51.3.1.1.1 Conformance requirements

1. The MS initiates release of the uplink TBF by beginning the countdown process. When the MS has sent the RLC data block with CV = 0 and there are no elements in the V(B) array set to the value Nacked, it shall start timer T3182 and stop timer T3180, if running. The MS shall continue to send RLC data blocks on each assigned uplink data block, according to the algorithm defined in 3GPP TS 04.60, subclause 9.1.3.2.
2. Upon reception of a PACKET UPLINK ACK/NACK message the MS shall stop timer T3182.
3. If the PACKET UPLINK ACK/NACK message has the Final Ack Indicator bit set to '1', the MS shall transmit the PACKET CONTROL ACKNOWLEDGEMENT message and release the TBF. If there is no ongoing downlink TBF the MS shall enter packet idle mode.

4. If the PACKET UPLINK ACK/NACK message requests retransmission of RLC data blocks, the MS shall if necessary wait for allocation of uplink resources and then retransmit the RLC data blocks requested, restarting timer T3180 after each block is transmitted. The MS shall then start timer T3182 and wait for a PACKET UPLINK ACK/NACK message as above.
5. Upon transition from the packet transfer mode to the packet idle mode, a MS shall enter the Transfer non-DRX mode period.
6. Upon a receipt of a commanding message or indication from the network requiring an action by the MS, if the reaction time for such action is not specified elsewhere, the MS shall begin to perform the required action no later than the next occurrence of block B((x+6) mod 12), where block B(x) is the radio block containing the commanding message or indication from the network.

3GPP TS 05.10, subclause 6.11.4.

### 51.3.1.1.2 Test purpose

To verify that in RLC acknowledged mode:

1. the MS initiates release of an uplink TBF by beginning countdown process. After CV = 0 and no elements in the V(B) array set to the value "Nacked" the MS continues to send RLC data blocks on each assigned uplink data block in the way defined in 3GPP TS 04.60, subclause 9.1.3 and waits for PACKET UPLINK ACK/NACK.
2. the MS retransmits the requested RLC data blocks if the PACKET UPLINK ACK/NACK message requests to do so. The MS then waits for another PACKET UPLINK ACK/NACK message.
3. the MS transmits the PACKET CONTROL ACKNOWLEDGEMENT message and release the TBF upon reception of a PACKET UPLINK ACK/NACK with the Final Ack Indicator bit set to '1'. If there is no ongoing downlink TBF the MS shall enter packet idle mode.

### 51.3.1.1.3 Method of test

#### Initial Conditions

System Simulator:

EGPRS supported.

cell, default setting, BS\_PBCCH\_BLKs = 3, BS\_CV\_MAX = 10.

Mobile Station:

EGPRS capable.

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated and PDP test context2 activated.

#### Related PICS/PIXIT Statement(s)

- Support EGPRS service.
- Support activation of at least one PDP context.
- The way to trigger the MS initiating an uplink packet transfer.
- Support EGPRS multislot class.

#### Test Procedure

The test has three parts.

1. The MS is triggered to transfer user data. A TBF of dynamic allocation in acknowledged mode with USF\_GRANULARITY = 1 block is assigned. The countdown values are checked during the RLC data transferring. The SS acknowledges the all received RLC data blocks with the Final Ack Indicator bit set to '1'. The SS assigns a downlink TBF, transfers a number of downlink data blocks and polls the MS. The MS responds the polling.
2. The MS is assigned a TBF of dynamic allocation in acknowledged mode with USF\_GRANULARITY = 4 blocks. The countdown values are checked during the RLC data transferring. The SS acknowledges the all received RLC data blocks with the Final Ack Indicator bit set to '1'.
3. The MS is triggered to transfer user data. A TBF of dynamic allocation on two timeslots in acknowledged mode with USF\_GRANULARITY = 4 block is assigned. The countdown values are checked during the RLC data transferring. The SS acknowledges the all received RLC data blocks with the Final Ack Indicator bit set to '1'.

### Expected Sequence

| Step                | Direction | Message                                                                 | Comments                                                                                                                                                                                                                                               |

| 51   | MS -> SS  | PACKET CONTROL ACKNOWLEDGEMENT               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

### 51.3.1.2 TBF Release / Uplink / Normal / MS initiated / Unacknowledged mode

#### 51.3.1.2.1 Conformance requirements

The MS initiates release of the uplink TBF by beginning the countdown process. It indicates the end of the TBF by setting the CV value to 0 and starts timer T3182.

Upon reception of a PACKET UPLINK ACK/NACK message the MS shall stop timer T3182. If the PACKET UPLINK ACK/NACK message has the Final Ack Indicator bit set to '1', the MS shall transmit the PACKET CONTROL ACKNOWLEDGEMENT message and release the TBF. If there is no ongoing downlink TBF the MS shall enter packet idle mode.

If timer T3182 expires the MS shall release the TBF as if a PACKET UPLINK ACK/NACK message was received.

#### References

3GPP TS 04.60, subclause 9.3.3.3.

### 51.3.1.2.2 Test purpose

To verify that in RLC unacknowledged mode:

1. the MS initiates release of an uplink TBF by beginning the countdown process and indicates the end of the TBF by setting the CV value to 0.
2. the MS transmits the PACKET CONTROL ACKNOWLEDGEMENT message and release the TBF upon reception of a PACKET UPLINK ACK/NACK message with the Final Ack Indicator bit set to '1' after CV=0. If there is no ongoing downlink TBF the MS enters packet idle mode.
3. the MS releases the TBF as if a PACKET UPLINK ACK/NACK message was received when timer T3182 expires.

### 51.3.1.2.3 Method of test

#### Initial Conditions

System Simulator:

EGPRS supported.

1 cell, default setting, BS\_PBCCH\_BLKs = 3, BS\_CV\_MAX = 12.

Mobile Station:

EGPRS capable.

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated and PDP test context3 activated.

#### Related PICS/PIXIT Statement(s)

- Support EGPRS service.
- Support activation of at least one PDP context.
- The way to trigger the MS initiating an uplink packet transfer.
- Support EGPRS multislot class.

#### Test Procedure

The test procedure has three parts.

1. The MS is triggered to transfer data. A TBF of dynamic allocation in unacknowledged mode is assigned. The countdown values are checked during the RLC data transferring. The SS acknowledges the all received RLC data blocks with the Final Ack Indicator bit set to '1' and polls the MS. The MS sends PACKET CONTROL ACKNOWLEDGEMENT in response of polling. After 6 blocks the SS assigns a downlink TBF in unacknowledged mode, sends a number downlink data blocks and polls the MS with a valid RRBp. The MS responses the polling.
2. The MS is triggered to transfer data. A TBF of dynamic allocation in unacknowledged mode is assigned. The countdown values are checked during the RLC data transferring. The SS does not acknowledge the received RLC data blocks. After CV = 0 the SS waits for 6s (T3182 expires). Once CV=0 the SS checks that the MS does not transfer further RLC data blocks on the assigned TBF.
3. The MS is triggered to transfer data. A TBF of dynamic allocation on two timeslots in unacknowledged mode is assigned. The countdown values are checked during the RLC data transferring. The SS does not acknowledge the received RLC data blocks. Once CV=0 the SS checks that the MS does not transfer further RLC data blocks on the assigned TBF.

| 17   | MS -> SS  | EGPRS UPLINK RLC DATA BLOCKS                 | Received on the assigned PDTCH <sub>7</sub> and PDTCH <sub>0</sub> .<br><br>Check the CV decrement from BS_CV_MAX (=12) to 0 in the received data blocks. After CV=0 no further data blocks are transmitted. The check is done for 6 s. The MS may retransmit the UPLINK RLC DATA BLOCK with countdown value CV=0 at most four times. In this case the 6 seconds wait shall be started after the reception of the last retransmitted block with countdown value CV=0 has been received. |

The MS may send PACKET RESOURCE REQUEST when repeating step 12 and 17. The SS shall ignore the requests.

### 51.3.1.3 TBF Release / Uplink / Normal / MS initiated / Channel coding change during countdown

#### 51.3.1.3.1 Conformance requirements

If the MS receives a change in the EGPRS Channel Coding Command in a PACKET UPLINK ACK/NACK message during the countdown procedure, the MS shall act upon the new EGPRS Channel Coding Command. The MS shall then recalculate the CV values for any untransmitted RLC data blocks using the new RLC data block size.

#### References

3GPP TS 04.60, subclause 9.3.1.

#### 51.3.1.3.2 Test purpose

It is verified that the MS acts upon the new EGPRS Channel Coding Command and recalculates the CV values for any untransmitted RLC data blocks using the new RLC data block size when the MS receives a change of EGPRS Channel Coding Command in a PACKET UPLINK ACK/NACK message during the countdown procedure.

#### 51.3.1.3.3 Method of test

#### Initial Conditions

System Simulator:

EGPRS supported.

1 cell, default setting, BS\_PBCCH\_BLKs = 3, BS\_CV\_MAX = 7.

Mobile Station:

EGPRS capable.

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated and PDP context3 activated.

#### Related PICS/PIXIT Statement(s)

- Support EGPRS service.
- Support activation of at least one PDP context.
- The way to trigger the MS initiating an uplink packet transfer.

#### Test Procedure

1. The MS is triggered to transfer data. A TBF of dynamic allocation with channel coding MCS-4 in unacknowledged mode is assigned. The countdown values are checked during the RLC data transferring.
2. Once CV=7 (BS\_CV\_MAX) the SS acknowledges the all received RLC data blocks and changes the channel coding to MCS-1. In the next received RLC data block CV=15. The countdown values are checked during the RLC data transferring.
3. When CV=7 is reached the SS acknowledges the all received RLC data blocks and changes the channel coding to MCS-2. The SS checks the next received RLC data block containing CV=5. The countdown values are checked during the RLC data transferring until CV=0. The SS acknowledges all received RLC data blocks with the Final Ack Indicator bit set to '1'.

## 51.3.2 TBF Release / Uplink / Normal / Network initiated

### 51.3.2.1 TBF Release / Uplink / Normal / Network initiated / Acknowledged mode

#### 51.3.2.1.1 Conformance requirements

The network may initiate release of an uplink TBF by transmitting a PACKET TBF RELEASE message to the mobile station on the PACCH. A cause value indicates the reason for release.

If the cause value is "Normal release" the mobile station shall continue to the next LLC PDU boundary, starting the count down procedure at whatever value of CV is appropriate to count down to zero at the LLC PDU boundary, and then release the TBF according to the procedures in 3GPP TS 04.60, subclause 9.3.2.3.

#### References

3GPP TS 04.60, subclause 8.1.1.4.

#### 51.3.2.1.2 Test purpose

To verify that when the MS, in an uplink TBF of the RLC acknowledged mode, receives a PACKET TBF RELEASE message with cause value "Normal release":

1. the MS continues the TBF to the next LLC PDU boundary;
2. the MS starts the count down procedure at whatever value of CV is appropriate to count down to zero at the LLC PDU boundary;
3. the MS then releases the TBF according to uplink acknowledged mode release procedure.

#### 51.3.2.1.3 Method of test

##### Initial Conditions

System Simulator:

EGPRS supported.

1 cell, default setting, BS\_PBCCH\_BLKs = 3, BS\_CV\_MAX = 7.

Mobile Station:

EGPRS capable.

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated and PDP context 2 activated, L2 is reset via the XID parameter Reset command.

##### Related PICS/PIXIT Statement(s)

- Support EGPRS service;
- Support activation of at least one PDP context;
- The way to trigger the MS initiating an uplink packet transfer.

## Test Procedure

1. The MS is triggered to transfer 1200 octets user data. A TBF of dynamic allocation in acknowledged mode is assigned. After the MS transfers several RLC data blocks the SS sends PACKET TBF RELEASE with cause value "Normal release. The length indicator, M and E bit in data block headers are checked during the RLC data transferring until CV=0 to ensure that the MS has transmitted only the RLC data block of the first LLC PDU.

## 51.3.2.2 TBF Release / Uplink / Normal / Network initiated / Unacknowledged mode

## 51.3.2.2.1 Conformance requirements

The network may initiate release of an uplink TBF by transmitting a PACKET TBF RELEASE message to the mobile station on the PACCH. A cause value indicates the reason for release.

If the cause value is "Normal release" a mobile station shall continue to the next LLC PDU boundary, starting the count down procedure at whatever value of CV is appropriate to count down to zero at the LLC PDU boundary, and then release the TBF according to the procedures in 3GPP TS 04.60, subclause 9.3.3.3.

## References

3GPP TS 04.60, subclauses 8.1.1.4 and 9.3.3.3.

#### 51.3.2.2.2 Test purpose

To verify that when the MS receives a PACKET TBF RELEASE message with cause value "Normal release" during an unacknowledged mode uplink TBF:

1. the MS continues the TBF to the next LLC PDU boundary;
2. the MS starts the count down procedure at whatever value of CV is appropriate to count down to zero at the LLC PDU boundary;
3. the MS then releases the TBF according to uplink unacknowledged mode release procedure.

#### 51.3.2.2.3 Method of test

##### Initial Conditions

System Simulator:

EGPRS supported.

1 cell, default setting, BS\_PBCCH\_BLKs = 3, BS\_CV\_MAX = 15.

Mobile Station:

EGPRS capable.

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated and PDP context3 activated.

##### Related PICS/PIXIT Statement(s)

- Support EGPRS service.
- Support activation of at least one PDP context.
- The way to trigger the MS initiating an uplink packet transfer.

##### Test Procedure

1. The MS is triggered to transfer 1200 octets user data. A TBF of dynamic allocation in unacknowledged mode is assigned. After the MS transfers several RLC data blocks the SS sends PACKET TBF RELEASE with cause value "Normal release. The length indicator, M and E bit in data block headers are checked during the RLC data transferring until CV=0 to ensure that the MS has transmitted only the RLC data block of the first LLC PDU.

### 51.3.3 TBF Release / Uplink / Network initiated / Abnormal release

#### 51.3.3.1 Conformance requirements

The network may initiate release of an uplink TBF by transmitting a PACKET TBF RELEASE message to the mobile station on the PACCH. If the cause value is "Abnormal release" the mobile station shall immediately stop transmitting and follow the abnormal release with random access procedure.

#### References

3GPP TS 04.60, subclause 8.1.1.4.

#### 51.3.3.2 Test purpose

To verify that the MS immediately stops transmitting and follows the abnormal release with random access procedure when it receives a PACKET TBF RELEASE message on the PACCH with cause value "Abnormal release".

#### 51.3.3.3 Method of test

##### Initial Conditions

System Simulator:

EGPRS supported.

1 cell, default setting, BS\_PBCCH\_BLKs = 3, BS\_CV\_MAX = 9.

Mobile Station:

EGPRS capable.

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated and PDP context2 activated.

##### Related PICS/PIXIT Statement(s)

- Support EGPRS service.

- Support activation of at least one PDP context.
- The way to trigger the MS initiating an uplink packet transfer.

### Test Procedure

The MS is triggered to transfer user data. A TBF of dynamic allocation in acknowledged mode is assigned. After the MS transfers several RLC data blocks the SS sends PACKET TBF RELEASE with cause value "Abnormal release. The MS reinitiates a random access for one or two phase access request.

## 51.3.4 TBF Release / Downlink / Normal / Network initiated

### 51.3.4.1 TBF Release / Downlink / Normal / Network initiated / Acknowledged mode

#### 51.3.4.1.1 Conformance requirements

If the mobile station receives an RLC data block with the FBI bit set the value '1' and with a valid RRBP field, the mobile station shall transmit a EGPRS PACKET DOWNLINK ACK/NACK message in the specified uplink block. The mobile station shall continue to monitor all assigned PDCHs.

Whenever the mobile station receives an RLC data block with a valid RRBP and the mobile station has received all RLC data blocks of the TBF, the mobile station shall send the PACKET DOWNLINK ACK/NACK message with the Final Ack Indicator bit set to '1', stop timer T3190 and start or restart timer T3192.

If the mobile station receives more than one RLC data block with the FBI set to '1', it shall accept the data from only the first one of these blocks.

If the mobile station, after sending the EGPRS PACKET DOWNLINK ACK/NACK message with the Final Ack Indicator bit set to '1', receives a PACKET DOWNLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message with the Control Ack bit set to '1' while timer T3192 is running, the mobile station shall stop timer T3192, consider the previous downlink TBF released and act upon the new assignment.

When timer T3192 expires the mobile station shall stop monitoring its assigned downlink PDCHs. If the mobile station is operating in half duplex mode and received an uplink assignment during the TBF release procedure, the mobile station shall then immediately act upon the assignment. Otherwise, and if there is no ongoing uplink TBF, enter packet idle mode.

### References

3GPP TS 04.60, subclause 9.3.2.5.

#### 51.3.4.1.2 Test purpose

To verify that in a downlink TBF of acknowledged mode:

1. The MS sends EGPRS PACKET DOWNLINK ACK/NACK in the specified uplink block and continues monitoring all assigned PDCHs when it receives an RLC data block with a valid RRBP field and the Final Block Indicator (FBI) = '1'.
2. Whenever the MS receives an RLC data block with a valid RRBP and has received all RLC data blocks of the TBF, it sends EGPRS PACKET DOWNLINK ACK/NACK with the Final Ack Indicator bit set to '1'.
3. If the MS receives more than one RLC data block with the FBI set to '1', it accepts the data from only the first one of these blocks.
4. While timer T3192 is running, if the MS receives, after sending EGPRS PACKET DOWNLINK ACK/NACK with the Final Ack Indicator bit set to '1', PACKET DOWNLINK ASSIGNMENT with the Control Ack bit set to '1', the MS acts upon the new downlink assignment.
5. The MS stops monitoring its assigned downlink PDCHs and enters packet idle mode when timer T3192 expires if there is no ongoing uplink TBF.

#### 51.3.4.1.3 Method of test

##### Initial Conditions

System Simulator:

EGPRS supported.

1 cell, default setting, BS\_PBCCH\_BLKs = 3, BS\_CV\_MAX = 15.

Mobile Station:

EGPRS capable.

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated and PDP context2 activated.

##### Related PICS/PIXIT Statement(s)

- Support EGPRS service.
- Support activation of at least one PDP context.

##### Test Procedure

1. The MS receives PACKET DOWNLINK ASSIGNMENT on its PPCH. The SS transmits 10 downlink RLC data blocks with consecutive BSN. The SS then transmits a downlink RLC data block with the highest BSN which is ten higher than the BSN of the last RLC data block. The SS sets FBI bit and polls the MS with a valid RRBP in the header of the RLC data block. The MS acknowledges the received data blocks and request a retransmission for the missing 9 data blocks in SSN and RBB fields.
2. The SS sends another 5 RLC data blocks and polls the MS with a valid RRBP. The MS acknowledges the received data blocks and request the retransmission of the missing 4 RLC data blocks. The SS transmits the last 4 RLC data blocks and polls the MS with RRBP=N+26. While the MS waiting for transmission of the final Acknowledgement the SS transmits a RLC data block which sets FBI bit and has same BSN as in the first FBI set beforehand. The MS ignores the downlink data and acknowledges the entire TBF with FINAL\_ACK\_INDICATION set. The SS transmits another data block with FBI set and polls the MS. The MS acknowledges the entire TBF with FINAL\_ACK\_INDICATION set. The SS waits 3 s.
3. The MS receives PACKET DOWNLINK ASSIGNMENT on its PPCH. The SS transmits a number of downlink RLC data blocks, sets FBI bit and polls the MS with a valid RRBP. The MS acknowledges the entire TBF with FINAL\_ACK\_INDICATION set.

4. The SS sends another PACKET DOWNLINK ASSIGNMENT on the assigned PACCH with Control ACK bit set. The SS transmits a number of downlink RLC data blocks on the new assigned PDTCH, sets FBI bit and polls the MS with a valid RRBP. The MS acknowledges the entire TBF with FINAL\_ACK\_INDICATION set.

| 27   |           |                                | Repeat step 26 ten times                                                                                                                                                                                       |
| 28   | SS -> MS  | EGPRS DOWNLINK RLC DATA BLOCK  | One data block with FBI = '1' and valid RRBP.                                                                                                                                                                  |
| 29   | MS -> SS  | EGPRS PACKET DOWNLINK ACK/NACK | Received on the block specified by RRBP in step 28. Check that the Final Ack indicator = '1'.                                                                                                                  |

## Specific Message Contents

EGPRS PACKET DOWNLINK ACK/NACK message in step 15:

| Information Element        | value/ remark                                      |
|----------------------------|----------------------------------------------------|
| Ack/Nack Description       |                                                    |
| - FINAL_ACK_INDICATION     | 1 (final ack)                                      |
| - STARTING_SEQUENCE_NUMBER | V( R )                                             |
| - RECEIVED_BLOCK_BITMAP    | Acknowledges all data blocks transmitted by the MS |

PACKET DOWNLINK ASSIGNMET message in step 25:

| Information Element            | value/ remark                                                          |
|--------------------------------|------------------------------------------------------------------------|
| CONTROL_ACK                    | 1                                                                      |
| TIMESLOT_ALLOCATION            | Single slot arbitrarily chosen but different from the value in step 19 |
| {L H<DOWNLINK_TFI_ASSIGNMENT>} | H (assign downlink TFI)                                                |
| - DOWNLINK_TFI_ASSIGNMENT      | Arbitrarily chosen but different from the value in step 19             |

### 51.3.4.2 TBF Release / Downlink / Normal / Network initiated / Unacknowledged mode

#### 51.3.4.2.1 Conformance requirements

For each RLC data block with the FBI bit set to '1' and with a valid RRBp field, the mobile station shall transmit the PACKET CONTROL ACKNOWLEDGEMENT message in the uplink block specified by the RRBp field. The mobile station shall continue to read the assigned downlink PDCHs until the block period pointed to by the RRBp. If the mobile station receives more than one RLC data block with the FBI bit set to '1' and with valid RRBp fields that point the same uplink block period, the mobile station shall transmit the PACKET CONTROL ACKNOWLEDGEMENT message only once. The mobile station shall then stop timer T3190, start timer T3192 and continue to monitor all assigned downlink PDCHs. If the mobile station then receives a subsequent RLC data block with a valid RRBp and the FBI bit set to '1', the mobile station shall retransmit the PACKET CONTROL ACKNOWLEDGEMENT message and restart timer T3192.

If the mobile station receives more than one RLC data block with the FBI set to '1', it shall accept the data from only the first one of these blocks.

If the mobile station, after sending the PACKET CONTROL ACKNOWLEDGEMENT message, receives a PACKET DOWNLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message with the Control Ack bit set to '1' while timer T3192 is running, the mobile station shall stop timer T3192, consider the previous downlink TBF released and act upon the new assignment.

When timer T3192 expires the mobile station shall stop monitoring its assigned downlink PDCHs.

#### References

3GPP TS 04.60, subclause 9.3.3.5.

#### 51.3.4.2.2 Test purpose

To verify that in a downlink TBF of unacknowledged mode:

1. The MS transmits PACKET CONTROL ACKNOWLEDGEMENT in the uplink block specified by the RRBp field whenever it receives an RLC data block with a valid RRBp field and the Final Block Indicator (FBI) set to the value '1'.
2. After sending PACKET CONTROL ACKNOWLEDGEMENT the MS continues to monitor all assigned downlink PDCHs.

3. While timer T3192 is running, if the MS receives, after sending EGPRS PACKET DOWNLINK ACK/NACK with the Final Ack Indicator bit set to '1', PACKET DOWNLINK ASSIGNMENT with the Control Ack bit set to '1', the MS acts upon the new downlink assignment.
4. The MS stops monitoring its assigned downlink PDCHs and enters packet idle mode when timer T3192 expires.

#### 51.3.4.2.3 Method of test

##### Initial Conditions

System Simulator:

EGPRS supported.

1 cell, default setting, BS\_PBCCH\_BLKs = 3, BS\_CV\_MAX = 15, T3192 = 1,5 s.

Mobile Station:

EGPRS capable.

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated and PDP context3 activated.

##### Related PICS/PIXIT Statement(s)

- Support EGPRS service.
- Support activation of at least one PDP context.

##### Test Procedure

1. The MS receives PACKET DOWNLINK ASSIGNMENT on its PPCH. The SS transmits 11 downlink RLC data blocks with consecutive BSN. The SS then transmits a downlink RLC data block with the BSN which is ten higher than the BSN of the last RLC data block. The SS polls the MS with a valid RRBP in the header of the RLC data block. The MS acknowledges the received data blocks.
2. The SS sends another RLC data block and polls the MS with a valid RRBP and with the FBI bit set. The MS sends PACKET CONTROL ACKNOWLEDGEMENT.
3. The SS resends the RLC data block and polls the MS with a valid RRBP and with the FBI bit set. The MS sends PACKET CONTROL ACKNOWLEDGEMENT. The SS waits 1.2s and resends the RLC data block and polls the MS with a valid RRBP and with the FBI bit set. The MS responds with PACKET CONTROL ACKNOWLEDGEMENT. The SS waits till T3192 expires. . The SS resends the RLC data block with FBI set and a valid RRBP and checks that the MS does not transmit any data block on RRBP block.
4. The MS receives PACKET DOWNLINK ASSIGNMENT on its PPCH. The SS transmits a number of downlink RLC data blocks, sets FBI bit and polls the MS with a valid RRBP. The MS responds with PACKET CONTROL ACKNOWLEDGEMENT.
5. The SS sends PACKET DOWNLINK ASSIGNMENT on the assigned PACCH with Control ACK bit set. The SS transmits a number of downlink RLC data blocks on the new assigned PDTCH, sets FBI bit and polls the MS with a valid RRBP. The MS responds with PACKET CONTROL ACKNOWLEDGEMENT.

## 51.3.5 PDCH Release

### 51.3.5.1 Void

### 51.3.5.2 PDCH Release / With TIMESLOTS\_AVAILABLE

#### 51.3.5.2.1 Conformance requirements

When a mobile station receives a PACKET PDCH RELEASE message containing a TIMESLOTS\_AVAILABLE field, it shall immediately stop transmitting and receiving on all assigned PDCHs, which are indicated as not present in the TIMESLOTS\_AVAILABLE field, remove those PDCHs from its list of assigned PDCHs.

If all of the mobile station's assigned PDCHs are removed from its list of assigned PDCH, and, if an uplink TBF was in progress, the mobile station shall perform an abnormal release with random access. If no uplink TBF was in progress, the mobile station shall perform an abnormal release with return to CCCH or PCCCH.

#### References

3GPP TS 04.60, subclause 8.2.

#### 51.3.5.2.2 Test purpose

To verify that when the MS receives a PACKET PDCH RELEASE message with a TIMESLOTS\_AVAILABLE field indicating that one or more timeslots is no longer available for packet data service:

1. it immediately stops transmitting and receiving on all assigned PDCHs which are not presented in the TIMESLOTS\_AVAILABLE field.
2. it performs an abnormal release with random access when all of the MS's assigned PDCHs are removed, and an uplink TBF was in progress.
3. it performs an abnormal release with return to CCCH or PCCCH when all of the MS's assigned PDCHs are removed, and no uplink TBF was in progress.

#### 51.3.5.2.3 Method of test

##### Initial Conditions

System Simulator:

EGPRS supported.

1 cell, default setting, BS\_PBCCH\_BLKs = 3, BS\_CV\_MAX = 15.

Mobile Station:

EGPRS capable.

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated and PDP context2 activated.

##### Related PICS/PIXIT Statement(s)

- Support EGPRS service.
- Support EGPRS multislot class.
- Support activation of at least one PDP context.
- The way to trigger the MS initiating an uplink packet transfer.

## Test Procedure

1. The MS is triggered to transfer user data. A TBF on one slot of dynamic allocation in acknowledged mode is assigned. After the MS transfers several RLC data blocks the SS sends PACKET PDCH RELEASE with TIMESLOTS\_AVAILABLE indicating no timeslot available. It is checked that the MS initiates a random access for one or two phase access request. A TBF is assigned to the MS to allow it to complete the uplink data transferring.
2. The MS is triggered to transfer user data. A TBF on two consecutive slots of dynamic allocation in acknowledged mode is assigned. After the MS transfers several RLC data blocks the SS sends PACKET PDCH RELEASE with TIMESLOTS\_AVAILABLE indicating that only a timeslot is available and the assigned downlink control timeslot is no more available. The MS uses the available timeslot to complete the uplink data transferring.
3. The MS receives PACKET DOWNLINK ASSIGNMENT on its PPCH. A downlink TBF with a timeslot is assigned. The SS transmits several downlink RLC data blocks. Then SS sends PACKET PDCH RELEASE with TIMESLOTS\_AVAILABLE indicating no timeslot available and polls the MS with a valid RRBP for acknowledgement. It is checked that the MS does not react upon the polling.
4. A downlink TBF with two timeslots is assigned. The SS transmits several downlink RLC data blocks. Then SS sends PACKET PDCH RELEASE with TIMESLOTS\_AVAILABLE indicating only a timeslot available and polls the MS with a valid RRBP for acknowledgement. It is checked that the MS does not react upon the polling and continues receiving the downlink data on the available timeslot. The SS sends another PACKET PDCH RELEASE with TIMESLOTS\_AVAILABLE indicating no timeslot available and polls the MS with a valid RRBP for acknowledgement. It is checked that the MS does not react upon the polling.

## 52 EGPRS Test of Medium Access Control (MAC) protocol

### 52.1 Test of Medium Access Control (MAC) Procedures on PCCCH in idle mode

This subclause presents tests for "Medium Access Control (MAC) Procedures on PCCCH in idle mode" for EGPRS mobiles which are specified in 3GPP TS 04.60 clause 7.

#### Applicability and default conditions

The clause is applicable for all mobiles supporting EGPRS unless otherwise stated in a specific test.

The SS default conditions simulate one cell with default settings as defined in the EGPRS general default section.

The MS default initial condition is GPRS attached. Unless otherwise stated, no PDP context is required.

The default message contents and signaling macro not specified in the end of this subclause shall be set as in "EGPRS default conditions" clause 50. Specific message contents for a test case is specified in each test case.

Conditions or message contents specified in a test case have the highest precedence. In addition, the default message contents described in the end of this subclause override those specified in "EGPRS default conditions".

In case the test case not expected "short access" as access type for Packet Channel Request the amount of RLC data specified in the comments in expected sequence is not necessary to be exactly the specified amount of data. It only has to be more than the limit for short access. If the test case need a specific amount of data this is specified in the test case.

#### 52.1.1 Packet Channel Request

##### 52.1.1.1 Packet Channel Request / Message format

###### 52.1.1.1.1 Conformance requirements

There are two formats of the PACKET CHANNEL REQUEST message containing either 8 bits or 11 bits of information. The format to be applied on PRACH is controlled by the parameter ACC\_BURST\_TYPE that is broadcast on PBCCH.

#### Reference

3GPP TS 04.60 subclause 7.1.2.1.

###### 52.1.1.1.2 Test purpose

To verify that the mobile station applies the correct PACKET CHANNEL REQUEST message format on PRACH according to the ACC\_BURST\_TYPE parameter broadcast on PBCCH.

###### 52.1.1.1.3 Method of test

#### Initial conditions

##### System Simulator:

1 cell supporting GPRS. The packet system information ACCESS\_BURST\_TYPE indicates 11 bit access.

##### Mobile Station:

The MS is switched off.

## Related PICS/PIXIT statement

- Support GPRS service.
- Method of trigger GPRS attach.
- Switch On/off Yes / No.

## Test procedure

The MS is switched on and triggered to perform a GPRS attach. The MS shall send PACKET CHANNEL REQUEST message. The SS verifies that the MS requests 11 bit access format. Switch off the MS.

Change the ACCESS\_BURST\_TYPE parameter in Packet System Information to 8 bit format and repeat the test procedure. The SS verifies that the MS requests 8 bit access format.

## Maximum duration of the test

1 minute.

## Expected sequence

| Step | Direction | Message                          | Comments                                                                                                        |
|------|-----------|----------------------------------|-----------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                                  | The MS is switched on and triggered to perform a GPRS attach.                                                   |
| 2    | MS -> SS  | PACKET CHANNEL REQUEST           | ACCESS TYPE = "Mobility Management procedure".<br>Received on PRACH.                                            |
| 3    | SS        |                                  | SS verifies the requested access bit format.                                                                    |
| 4    | MS        |                                  | If possible the MS is powered down or switched off otherwise it has its power source removed and then restored. |
| 5    | SS        | PACKET SYSTEM INFORMATION Type 1 | Change ACCESS_BURST_TYPE to indicate 8 bit access. Sent on PBCCH.                                               |
| 6    |           |                                  | Repeat step 1 to 3.                                                                                             |

## Specific message contents

None.

### 52.1.1.2 Packet Channel Request / Support of EGPRS PACKET CHANNEL REQUEST

#### 52.1.1.2.1 Conformance requirements

EGPRS capable MSs shall monitor the GPRS Cell Options IE on the BCCH (SI13)/PBCCH(PSI1/PSI13) for the cell's EGPRS capability. In PSI1 (and PSI13) it is indicated if the EGPRS PACKET CHANNEL REQUEST is supported in a cell. If the cell is EGPRS capable and EGPRS PACKET CHANNEL REQUEST is supported in the cell the, EGPRS PACKET CHANNEL REQUEST messages shall be used at one-phase access attempts, two-phase access attempts and short access attempts.

If the cell is EGPRS capable and EGPRS PACKET CHANNEL REQUEST messages are not supported in the cell the EGPRS mobile station shall use the PACKET CHANNEL REQUEST message according to parameter ACC\_BURST\_TYPE and shall initiate a two phase access request.

## Reference

3GPP TS 04.60 subclause 7.1.2.1.

### 52.1.1.2.2 Test purpose

To verify that the EGPRS capable mobile station uses PACKET CHANNEL REQUEST to initiate a two phase access, if EGPRS CHANNEL REQUEST MESSAGE is not supported in the cell.

### 52.1.1.2.3 Method of test

#### Initial conditions

##### System Simulator:

1 cell supporting EGPRS. The packet system information ACCESS\_BURST\_TYPE indicates 8 bit access and MAX\_RETRANS indicates 7 allowed retransmission. The EGPRS PACKET CHANNEL REQUEST not supported in GPRS cell options.

##### Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

#### Related PICS/PIXIT statement

- Support EGPRS service.
- Supporting GPRS MS class A, B or C Yes/No.
- Support PDP context.
- Method of triggering the MS to initiate an uplink packet transfer.

#### Test procedure

The MS is triggered to initiate an uplink packet transfer. The SS verifies that the MS uses PACKET CHANNEL REQUEST to initiate a two phase access request.

#### Maximum duration of the test

1 minute.

#### Expected sequence

| Step | Direction | Message                | Comments                                                                                                                                                                |
|------|-----------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                        | The MS is triggered to send 200 octets data. EGPRS supported by cell in GPRS cell options. EGPRS PACKET CHANNEL REQUEST not supported by the cell in GPRS cell options. |
| 2    | MS -> SS  | PACKET CHANNEL REQUEST | ACCESS TYPE = "Two Phase Access Request". Received on PRACH.                                                                                                            |
| 5    | SS -> MS  | PACKET ACCESS REJECT   | Sent on PAGCH.                                                                                                                                                          |

### 52.1.1.3 Packet Channel Request / Response to Packet Paging/Non-RR Connection Paging

#### 52.1.1.3.1 Conformance requirements

EGPRS capable MSs shall monitor the GPRS Cell Options IE on the BCCH (SI13)/PBCCH (PSI1/PSI13) for the cell's EGPRS capability. In PSI1 (and PSI13) it is indicated if the EGPRS PACKET CHANNEL REQUEST is supported in a cell. If the cell is EGPRS capable and EGPRS PACKET CHANNEL REQUEST is supported in the cell the, EGPRS PACKET CHANNEL REQUEST messages shall be used at one-phase access attempts, two-phase access attempts and short access attempts.

This message may be sent by an EGPRS capable mobile station in a cell supporting EGPRS and where the EGPRS\_PACKET\_CHANNEL\_REQUEST parameter indicates that this message shall be used. The message shall be used to perform EGPRS one-phase access request, EGPRS short access request or EGPRS two-phase access request, for all other purposes (page response, cell update etc.) the standard PACKET CHANNEL REQUEST message shall be used (see subclause 11.2.5).

If the purpose of the packet access procedure is to send a Page Response, the mobile station shall indicate 'Page Response' in the PACKET CHANNEL REQUEST message.

A mobile station in class A or class B mode of operation shall respond to a PACKET PAGING REQUEST message indicating an RR connection establishment. A mobile station in class B mode of operation may abort the packet access procedure at the receipt of a PACKET PAGING REQUEST message indicating an establishment of a RR connection. PACKET PAGING REQUEST messages indicating a non-RR connection shall be ignored.

Mobile stations in class C mode of operating shall not respond to any type of PACKET PAGING REQUEST messages during the packet access procedure but decode the PERSISTENCE\_LEVEL parameter if included in the message.

## Reference

3GPP TS 04.60 subclause 7.1.2.1.

### 52.1.1.3.2 Test purpose

To verify that the mobile station uses Packet Channel Request Message for Page Response.

To verify that the mobile station ignores PACKET PAGING REQUEST messages indicating a non-RR connection after scheduling the sending of PACKET CHANNEL REQUEST messages.

### 52.1.1.2.3 Method of test

#### Initial conditions

System Simulator:

1 cell supporting EGPRS. The packet system information ACCESS\_BURST\_TYPE indicates 8 bit access and MAX\_RETRANS indicates 7 allowed retransmission.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

#### Related PICS/PIXIT statement

- Support EGPRS service.
- Supporting GPRS MS class A, B or C Yes/No.
- Support PDP context.
- Method of triggering the MS to initiate an uplink packet transfer.

#### Test procedure

All MS classes, non-RR connection paging.

SS pages the mobile to establish a TBF. The mobile shall respond back with a Packet Channel Request message indicating Page Response.

The MS is triggered to initiate an uplink packet transfer. When SS has received the first PACKET CHANNEL REQUEST message shall PACKET PAGING REQUEST message indicating a non-RR connection be sent to the MS. The MS shall ignore the PACKET PAGING REQUEST message and continue to send PACKET CHANNEL REQUEST messages requesting one or two phase access. The SS sends PACKET ACCESS REJECT to end the test case.

Maximum duration of the test

1 minute.

Expected sequence

All MS classes, non-RR connection paging.

| Step | Direction | Message                | Comments                                          |
|------|-----------|------------------------|---------------------------------------------------|
| 1    | SS -> MS  | PACKET PAGING REQUEST  | Sent on PPCH for TBF establishment.               |
| 2    | MS -> SS  | PACKET CHANNEL REQUEST | ACCESS TYPE = "Page Response". received on PRACH. |
| 3    | SS -> MS  | PACKET ACCESS REJECT   | Sent on PAGCH.                                    |

All MS classes, non-RR connection paging.

| Step | Direction | Message                      | Comments                                                                                                                                         |
|------|-----------|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                              | The MS is triggered to send 200 octets data. EGPRS supported by cell in GPRS cell options.                                                       |
| 2    | MS -> SS  | EGPRS PACKET CHANNEL REQUEST | ACCESS TYPE = "One or Two Phase Access Request". Received on PRACH.                                                                              |
| 3    | SS -> MS  | PACKET PAGING REQUEST        | Sent on PPCH for TBF establishment.                                                                                                              |
| 4    | MS -> SS  | EGPRS PACKET CHANNEL REQUEST | ACCESS TYPE = "One or Two Phase Access Request". Received on PRACH. The SS verifies that the MS continue request One or Two Phase packet Access. |
| 5    | SS -> MS  | PACKET ACCESS REJECT         | Sent on PAGCH.                                                                                                                                   |

#### 52.1.1.4 Packet Channel Request / Response to Packet Paging/RR Connection Paging

##### 52.1.1.4.1 Conformance requirements

EGPRS capable MSs shall monitor the GPRS Cell Options IE on the BCCH (SI13)/PBCCH(PSI1/PSI13) for the cell's EGPRS capability. In PSI1 (and PSI13) it is indicated if the EGPRS PACKET CHANNEL REQUEST is supported in a cell. If the cell is EGPRS capable and EGPRS PACKET CHANNEL REQUEST is supported in the cell the, EGPRS PACKET CHANNEL REQUEST messages shall be used at one-phase access attempts, two-phase access attempts and short access attempts.

This message may be sent by an EGPRS capable mobile station in a cell supporting EGPRS and where the EGPRS\_PACKET\_CHANNEL\_REQUEST parameter indicates that this message shall be used. The message shall be used to perform EGPRS one-phase access request, EGPRS short access request or EGPRS two-phase access request, for all other purposes (page response, cell update etc.) the standard PACKET CHANNEL REQUEST message shall be used (see subclause 11.2.5).

If the purpose of the packet access procedure is to send a Page Response, the mobile station shall indicate 'Page Response' in the PACKET CHANNEL REQUEST message.

A mobile station in class A or class B mode of operation shall respond to a PACKET PAGING REQUEST message indicating an RR connection establishment. A mobile station in class B mode of operation may abort the packet access procedure at the receipt of a PACKET PAGING REQUEST message indicating an establishment of a RR connection. PACKET PAGING REQUEST messages indicating a non-RR connection shall be ignored.

Mobile stations in class C mode of operating shall not respond to any type of PACKET PAGING REQUEST messages during the packet access procedure but decode the PERSISTENCE\_LEVEL parameter if included in the message.

## Reference

3GPP TS 04.60 subclause 7.1.2.1.

### 52.1.1.4.2 Test purpose

To verify that a mobile station in class A or class B mode of operation shall respond to a PACKET PAGING REQUEST message indicating an RR connection establishment after scheduling the sending of PACKET CHANNEL REQUEST messages.

To verify that a mobile station in class C mode of operating shall not respond to any type of PACKET PAGING REQUEST messages during the packet access procedure.

### 52.1.1.4.3 Method of test

#### Initial conditions

##### System Simulator:

1 cell supporting EGPRS. The packet system information ACCESS\_BURST\_TYPE indicates 8 bit access and MAX\_RETRANS indicates 7 allowed retransmission.

##### Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

#### Related PICS/PIXIT statement

- Support EGPRS service.
- Supporting GPRS MS class A, B or C Yes/No.
- Support PDP context.
- Method of triggering the MS to initiate an uplink packet transfer.

#### Test procedure

##### MS class A and class B, RR connection paging.

The MS is triggered to initiate an uplink packet transfer. When SS has received the first PACKET CHANNEL REQUEST message shall PACKET PAGING REQUEST message indicating a RR connection be sent to the MS. The MS shall send CHANNEL REQUEST messages with establishment cause = "Answer to paging". SS verify that the MS request RR connection. The SS sends IMMEDIATE ASSIGNMENT REJECT to end the test case.

##### MS class C, RR connection paging.

The MS is triggered to initiate an uplink packet transfer. When SS has received the first PACKET CHANNEL REQUEST message shall PACKET PAGING REQUEST message indicating a RR connection be sent to the MS. The MS shall ignore the PACKET PAGING REQUEST message and continue to send PACKET CHANNEL REQUEST messages requesting one or two phase access. The SS sends PACKET ACCESS REJECT to end the test case.

#### Maximum duration of the test

1 minute.

Expected sequence

MS class A and class B, RR connection paging.

Only Network mode I.

### 52.1.1.5 EGPRS Packet Channel Request / Access type

#### 52.1.1.5.1 Conformance requirements

If the mobile station intends to use the TBF to send user data, it shall request two phase access if the requested RLC mode is unacknowledged mode. If the requested RLC mode is acknowledged mode and the amount of data can fit in 8 or less than 8 RLC/MAC blocks, the mobile station shall indicate Short Access as access type. The number of blocks shall be calculated assuming channel coding scheme CS-1 for standard GPRS TBFs, and MCS-1 for EGPRS TBFs. If the requested RLC mode is acknowledged mode and the amount of data to send takes more than 8 RLC/MAC blocks, the mobile station shall request either one phase access or two phase access.

EGPRS capable MSs shall monitor the GPRS Cell Options IE on the BCCH (SI13)/PBCCH (PSI1/PSI13) for the cell's EGPRS capability. In PSI1 (and PSI13) it is indicated if the EGPRS PACKET CHANNEL REQUEST is supported in a cell. If the cell is EGPRS capable and EGPRS PACKET CHANNEL REQUEST is supported in the cell the, EGPRS PACKET CHANNEL REQUEST messages shall be used at one-phase access attempts, two-phase access attempts and short access attempts.

## Reference

3GPP TS 04.60 subclause 7.1.2.1.

### 52.1.1.5.2 Test purpose

1. To verify that the mobile station indicates Short Access as access type if the amount of data to send can fit in 8 or less than 8 RLC/MAC blocks if the requested RLC mode is acknowledged mode.
2. To verify that the mobile station requests either one phase or two phase access if the amount of data to send takes more than 8 RLC/MAC blocks if the requested RLC mode is acknowledged mode.
3. To verify that the mobile station requests two phase access if the requested RLC mode is unacknowledged mode.

### 52.1.1.5.3 Method of test

#### Initial conditions

System Simulator:

1 cell supporting EGPRS. The Cell supports EGPRS Packet Channel Request. (Indicated in PSI1)

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

#### Related PICS/PIXIT statement

- Support EGPRS service.
- Support PDP context.
- Method of triggering the MS to initiate an uplink packet data transfer.

#### Test procedure

The MS is triggered to send data that can fit in 8 or less RLC data blocks. The SS verifies that the MS indicates Short Access Request as the access type in the PACKET CHANNEL REQUEST message. The SS sends PACKET ACCESS REJECT to end the test case.

The MS is triggered to send data where the amount of data takes more than 8 RLC blocks. The SS verifies that the MS indicates One or Two Phase Access Request as the access type in the PACKET CHANNEL REQUEST message. The SS sends PACKET ACCESS REJECT to end the test case.

Repeat above tests with RLC unacknowledged mode.

#### Maximum duration of the test

20 s.

Expected sequence

| Step | Direction | Message                      | Comments                                                                                    |
|------|-----------|------------------------------|---------------------------------------------------------------------------------------------|
| 1    | MS        |                              | The MS is triggered to send data that can fit in 8 or less RLC data blocks.                 |
| 2    | MS -> SS  | EGPRS PACKET CHANNEL REQUEST | SS verifies that the MS indicates Short Access Request as access type. Received on PRACH.   |
| 3    | SS -> MS  | PACKET ACCESS REJECT         | Sent on PAGCH.                                                                              |
| 4    | MS        |                              | The MS is triggered to send data where the amount of data takes more than 8 RLC/MAC blocks. |
| 5    | MS -> SS  | EGPRS PACKET CHANNEL REQUEST | SS verifies that the MS indicate One or Two Phase Access Request. Received on PRACH.        |
| 6    | SS -> MS  | PACKET ACCESS REJECT         | Sent on PAGCH.                                                                              |

Repeat above tests with RLC unacknowledged mode. The SS shall verify that the MS request Two Phase Access in the EGPRS PACKET CHANNEL REQUEST messages.

Specific message contents

None.

### 52.1.1.6 Packet Channel Request / Access persistence control on PRACH

#### 52.1.1.6.1 Packet Channel Request / Access persistence control on PRACH / M+1 attempts

##### 52.1.1.6.1.1 Conformance requirements

The mobile station shall make maximally  $M + 1$  attempts to send a PACKET CHANNEL REQUEST message.

Having made  $M + 1$  attempts to send a PACKET CHANNEL REQUEST, the mobile station shall stop timer T3186 and start timer T3170. At expiry of timer T3170, the packet access procedure shall be aborted, a packet access failure shall be indicated to the upper layer and the mobile station shall return to packet idle mode.

Reference

3GPP TS 04.60 subclause 7.1.2.1.1.

##### 52.1.1.6.1.2 Test purpose

To verify that the mobile station makes a maximum of  $M + 1$  attempts to send a PACKET CHANNEL REQUEST message,  $M$  is the parameter MAX\_RETRANS broadcast on PBCCH.

To verify that the mobile station aborts the packet access procedure when the network does not respond to the PACKET CHANNEL REQUEST messages.

##### 52.1.1.6.1.3 Method of test

Initial conditions

System Simulator:

1 cell supporting EGPRS. The packet system information ACCESS\_BURST\_TYPE indicates 8 bit access, MAX\_RETRANS indicate 1 retransmission and PERSISTENCE\_LEVEL  $P(i)=0$ .

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

## Related PICS/PIXIT statement

- Support EGPRS service.
- Support PDP context.

## Test procedure

The SS send PACKET PAGING REQUEST message. The MS is expected to send M+1 PACKET CHANNEL REQUEST messages, M is the parameter MAX\_RETRANS broadcast on PBCCH. The SS monitors the MS transmission for a period equal to the maximum length of time it can take to send M+1 PACKET CHANNEL REQUEST messages plus the duration of timer T3170. The SS verifies that the MS makes maximally M+1 attempts to send PACKET CHANNEL REQUEST messages in this period. When the SS not respond the MS shall abort the packet access procedure and perform an abnormal release. The SS sends PACKET UPLINK ASSIGNMENT message corresponding to one of its 3 last PACKET CHANNEL REQUEST messages after a time higher than the duration of timer T3170 and the MS shall not respond to the message.

Repeat the test procedure with the different MAX\_RETRANS parameters {2, 4, 7} sent in Packet System Information.

## Maximum duration of the test

4 minutes.

## Expected sequence

| Step | Direction | Message                   | Comments                                                                                                                                                                                |
|------|-----------|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PACKET PAGING REQUEST     | Sent on PPCH.                                                                                                                                                                           |

## 52.1.1.6.2 Packet Channel Request / Access persistence control on PRACH / Persistence level

## 52.1.1.6.2.1 Conformance requirements

The first attempt to send a PACKET CHANNEL REQUEST message, may be initiated at the first possible TDMA frame containing PRACH on PDCH defined by the PCCCH\_GROUP for the mobile station (see 3GPP TS 05.02). For each attempt, the mobile station shall draw a random value R with uniform probability distribution in the set {0, 1, ..., 15}. The mobile station is allowed to transmit a PACKET CHANNEL REQUEST message if P(i), where i is the radio priority of the TBF being established, is less than or equal to R.

## Reference

3GPP TS 04.60 subclause 7.1.2.1.1.

### 52.1.1.6.2.2 Test purpose

To verify that for each attempt, the mobile station shall draw a random value R with uniform probability distribution in the set {0, 1, ..., 15}. The mobile station is only allowed to transmit a PACKET CHANNEL REQUEST message if P(i), where i is the radio priority of the TBF being established, is less than or equal to R.

### 52.1.1.6.2.3 Method of test

#### Initial conditions

System Simulator:

1 cell supporting EGPRS. The packet system information indicates BS\_PCC\_CHANS = 1, BS\_PAG\_BLK\_RES = 2 and BS\_PBCCH\_BLK = 3, BS\_PRACH\_BLK = 12 (all Blocks reserved for PRACH).

Mobile Station:

The MS is GPRS attached and in packet idle mode.

#### Related PICS/PIXIT statement

- Support EGPRS service.

#### Test procedure

Specific test parameters:

- K equals the value of  $120/(MAX\_RETRANS+1)$ .
- MAX\_RETRANS is chosen from {1, 2, 4, 7}.
- PERSISTENCE\_LEVEL P(i) is chosen from {0, 1, 2, ..., 14, 16}.
- Counter J is initialized with 0 (total number of received Packet Channel Requests).

The SS sends PACKET PAGING REQUEST message. The MS shall send between 0 and M+1 PACKET CHANNEL REQUEST message indicating page response. The SS verifies that the MS draw a random value R for each attach. Every received Packet Channel Request in response to Packet Paging Request increment counter J by 1. This test sequence is performed K times.

The test is performed with Persistence level set to at least P(i)=0, P(i)=8 and P(i)=16.

#### Maximum duration of the test

The execution of one sequence (for one value k): 30 s.

Between two consecutive executions (for k and k+1), the SS must wait for amount of time which is enough to guarantee that the MS is in service (listening to its paging subchannel).

Expected sequence

The sequence is executed for execution counter  $k = 1, \dots, K$ .

| Step | Direction | Message                | Comments                                                                                                                                                                                                  |
|------|-----------|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PACKET PAGING REQUEST  | Sent on PPCH.                                                                                                                                                                                             |

| :    | :         | :                      |                                                                                                                                                                                                           |
| M+2  | MS -> SS  | PACKET CHANNEL REQUEST |                                                                                                                                                                                                           |
| M+3  | SS        |                        | SS waits for expiry of T3170                                                                                                                                                                              |
| M+4  | SS        |                        | SS waits to allow Cell Reselection                                                                                                                                                                        |

Editors note:

The 10 s in steps 2 to M+2 is derived from the following consideration:

- Answer time for the first Packet Channel Request:  $0,7 \text{ s} + 8 \cdot 4,615 \text{ ms}$
- Maximum TDMA frame spread between two successive Packet Channel Requests:
- $\max\{S+T-1\} \cdot 4,615 \text{ ms} = 266 \cdot 4,615 \text{ ms} \Rightarrow$  maximum time to send M+1 Packet Channel Requests
- $0,7 \text{ s} + 8 \cdot 4,615 \text{ ms} + M \cdot 266 \cdot 4,615 \text{ ms} = 9,33 \text{ s}$ .

Verification

According the test procedure J is  $B(120; 1-P(i)/16)$  distributed. i.e. we will accept MSs, when the following inequality holds  $(1-P(i)/16) - 0,0161 \cdot \sqrt{P(i) \cdot (16 - P(i))} \leq J/120 \leq (1-P(i)/16) + 0,0161 \cdot \sqrt{P(i) \cdot (16 - P(i))}$ .

this confidence interval is chosen in such a way that the possibility of non accepting a correct MS is less than 0,5 %.

Remark: If  $P(i) = 0$  the above inequality is simplified to  $1 \leq J/120 \leq 1$ , i.e.  $J = 120$ , i.e. the MS has to answer every PACKET PAGING REQUEST with M+1 PACKET CHANNEL REQUESTS. And if  $P(i) = 16$  the above inequality is simplified to  $0 \leq J/120 \leq 0$ , i.e.  $J = 0$ , i.e. the MS is not allowed to send PACKET CHANNEL REQUESTS.

None.

### 52.1.1.6.3 Packet Channel Request / Access persistence control on PRACH / Successive Attempts

#### 52.1.1.6.3.1 Conformance requirements

The first attempt to send a PACKET CHANNEL REQUEST message, may be initiated at the first possible TDMA frame containing PRACH on PDCH defined by the PCCCH\_GROUP for the mobile station (see 3GPP TS 05.02). For each attempt, the mobile station shall draw a random value R with uniform probability distribution in the set  $\{0, 1, \dots, 15\}$ . The mobile station is allowed to transmit a PACKET CHANNEL REQUEST message if  $P(i)$ , where i is the radio priority of the TBF being established, is less than or equal to R.

After each attempt, the S and T parameters are used to determine the next TDMA frame in which it may be allowed to make a successive attempt. The number of TDMA frames belonging to the PRACH on the PDCH defined by the PCCCH group for the mobile station between two successive attempts to send a PACKET CHANNEL REQUEST message excluding the TDMA frames potentially containing the messages themselves is a random value drawn for each transmission with uniform probability distribution in the set  $\{S, S + 1, \dots, S + T - 1\}$ .

## Reference

3GPP TS 04.60 subclause 7.1.2.1.1.

### 52.1.1.6.3.2 Test purpose

To verify that the number of TDMA frames belonging to the PRACH on the PDCH defined by the PCCCH group for the mobile station between two successive attempts to send a PACKET CHANNEL REQUEST message excluding the TDMA frames potentially containing the messages themselves is a random value drawn for each transmission with uniform probability distribution in the set  $\{S, S + 1, \dots, S + T - 1\}$ .

### 52.1.1.6.3.3 Method of test

#### Initial conditions

##### System Simulator:

1 cell supporting EGPRS. The packet system information:

BS\_PCC\_CHANS = 1, BS\_PAG\_BLKES\_RES = 2 and BS\_PBCCH\_BLKES = 3. MAX\_RETRANS is arbitrarily chosen in the set  $\{1, 2, 4, 7\}$ .

TX\_INT is arbitrarily chosen in the set  $\{6, 7, 8, 9, 10, 12, 14, 16, 20, 25, 32, 50\}$ .

S is arbitrarily chosen in the set  $\{12, 15, 20, 30, 41, 55, 76, 109, 163, 217\}$ .

PERSISTENCE\_LEVEL  $P(i) = 0$ .

##### Mobile Station:

The MS is GPRS attached and in packet idle mode.

#### Related PICS/PIXIT statement

- Support EGPRS service.

#### Test procedure

##### Specific test parameters:

- K equals the upper rounded value of  $230/M$ .

The SS sends PACKET PAGING REQUEST message. The MS shall send PACKET CHANNEL REQUEST messages  $M+1$  times indicating page response. After each attempt, the S and T parameters are used to determine the next TDMA frame in which it may be allowed to make a successive attempt. The SS measure the number of TDMA frames  $f(n,k)$  between each attempt, excluding the slots containing the messages themselves. The SS does not answer the PACKET CHANNEL REQUEST messages MAX\_RETRANS times. The SS sends an PACKET ACCESS REJECT message. The test sequence is executed K times.

- M is the value of the parameter MAX\_RETRANS.
- T is the value of the parameter TX\_INT.
- S is the value of the parameter S.

#### Maximum duration of the test

The execution of one sequence (for one value k): 10 s.

Between two consecutive executions (for k and k+1), the SS must wait for amount of time which is enough to guarantee that the MS is in service (listening to its paging subchannel).

Expected sequence

The sequence is executed for execution counter  $k = 1, \dots, K$ .

| Step | Direction | Message                | Comments                                                                                                                                 |
|------|-----------|------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PACKET PAGING REQUEST  | Sent on PPCH.                                                                                                                            |
| 2    | MS -> SS  | PACKET CHANNEL REQUEST | ACCESS TYPE = "Page Response". Received on PRACH.                                                                                        |
| 3    | MS -> SS  | PACKET CHANNEL REQUEST | Step 3 and 4 are executed for execution counter $n=1, \dots, \text{MAX\_RETRANS}$ .<br>ACCESS TYPE = "Page Response". Received on PRACH. |
| 4    | SS        |                        | See verification.                                                                                                                        |
| 5    | SS -> MS  | PACKET ACCESS REJECT   | Sent on PAGCH.                                                                                                                           |

Verification

In step 4 the SS measure the number of TDMA frames belonging to the PRACH on the PDCH defined by the PCCCH group for the MS between two successive attempts to send a PACKET CHANNEL REQUEST message excluding the TDMA frames potentially containing the messages themselves.  $f(n,k)$  shall be in the set  $\{S, S + 1, \dots, S + T - 1\}$ . The SS stores  $f$ .

Test:

The following requirement shall be met

$$\left( \left( \left( \text{sq}(\text{Sum}(S)) + \text{sq}(\text{Sum}(S+1)) + \dots + \text{sq}(\text{Sum}(S+T-1)) \right) \right) * T / (K * M) \right) - (K * M) \leq$$

$$\frac{1}{2} * \text{sq}(\text{sqrt}(2T-3) + 2,58) + 1,1$$

$\text{Sum}(X) := \text{CARD} \{ k \mid f(n,k) = X \} :=$  the number of times that  $f(n,k)$  equals  $X$ .

The test and the number of sample are chosen in such a way that the possibility of non-accepting a correct MS is less than [0,5%].

Specific message contents

None.

## 52.1.2 Packet Uplink/Downlink Assignment

### 52.1.2.1 Packet uplink assignment procedure

#### 52.1.2.1.1 Packet Uplink Assignment / Packet access queuing notification procedure

##### 52.1.2.1.1.1 Packet Uplink Assignment / Packet queuing notification / Stop sending Packet Channel Requests

##### 52.1.2.1.1.1.1 Conformance requirements

On receipt of a PACKET QUEUING NOTIFICATION message corresponding to one of its 3 last PACKET CHANNEL REQUEST messages, the mobile station shall stop timers T3186 and T3170 if running, start timer T3162, and stop sending PACKET CHANNEL REQUEST messages.

Reference

3GPP TS 04.60 subclause 7.1.2.2.2.

## 52.1.2.1.1.1.2 Test purpose

To verify that the mobile station stops sending PACKET CHANNEL REQUEST messages on receipt of a PACKET QUEUING NOTIFICATION message.

## 52.1.2.1.1.1.3 Method of test

## Initial conditions

## System Simulator:

1 cell supporting EGPRS. The packet system information MAX\_RETRANS indicates 7 allowed retransmission.

## Mobile Station:

The MS is switched off.

## Related PICS/PIXIT statement

- Support EGPRS service.
- Switch off on button Yes/No.
- Method of trigger GPRS attach.

## Test procedure

The MS is switched on and triggered to perform a GPRS attach. The SS sends PACKET QUEUING NOTIFICATION message corresponding to one of the last three PACKET CHANNEL REQUEST messages. The SS verifies that the MS stops sending PACKET CHANNEL REQUEST messages. The SS sends PACKET ACCESS REJECT message to end the test procedure.

## Maximum duration of the test

15 s.

## Expected sequence

| Step | Direction | Message                     | Comments                                                                                                                                      |

52.1.2.1.1.2 Packet Uplink Assignment / Packet queuing notification / Ignoring Packet Queuing Notification

## 52.1.2.1.1.2.1 Conformance requirements

If the mobile station receives a PACKET QUEUING NOTIFICATION message while waiting for the TBF Starting Time of a valid PACKET UPLINK ASSIGNMENT message, the mobile station shall ignore the PACKET QUEUING NOTIFICATION.

## Reference

3GPP TS 04.60 subclause 7.1.2.2.2.

## 52.1.2.1.1.2.2 Test purpose

To verify that the mobile station ignores the PACKET QUEUEING NOTIFICATION if the mobile station receives a PACKET QUEUEING NOTIFICATION message while waiting for the TBF Starting Time of a valid PACKET UPLINK ASSIGNMENT message.

## 52.1.2.1.1.2.3 Method of test

## Initial conditions

System Simulator:

1 cell supporting EGPRS.

Mobile Station:

The MS is switched off.

## Related PICS/PIXIT statement

- Support EGPRS service.
- Switch off on button Yes/No.
- Method of trigger GPRS attach.

## Test procedure

The MS is switched on and triggered to perform a GPRS attach. The SS sends PACKET UPLINK ASSIGNMENT message containing a TBF Starting Time. While the MS is waiting for the TBF Starting Time the SS sends a PACKET QUEUEING NOTIFICATION message. The MS shall ignore PACKET QUEUEING NOTIFICATION message and at the frame number indicated by the TBF Starting Time, the MS shall start to send the uplink RLC data in the allocated uplink resources. The SS allows the MS to complete the GPRS attach procedure.

## Maximum duration of the test

15 s.

## Expected sequence

| Step | Direction | Message                      | Comments                                                                                                                                                       |

52.1.2.1.1.3 Packet Uplink Assignment / Packet queuing notification / Assigned PDCHs

52.1.2.1.1.3.1 Conformance requirements

On receipt of a PACKET UPLINK ASSIGNMENT message following a PACKET QUEUING NOTIFICATION message, the mobile station shall stop timer T3162, and follow the procedures defined in subclause 7.1.2.2.1.

If the PACKET UPLINK ASSIGNMENT message does not specify a TBF starting time, the mobile station shall switch to the assigned PDCHs, start timer T3164 and proceed with contention resolution of the one phase access procedure according to subclause 7.1.2.3.

#### Reference

3GPP TS 04.60 subclauses 7.1.2.2.2 and 7.1.2.2.1.

52.1.2.1.1.3.2 Test purpose

To verify that the mobile station switches to the assigned PDCHs on receipt of a PACKET UPLINK ASSIGNMENT message after a PACKET QUEUING NOTIFICATION message.

52.1.2.1.1.3.3 Method of test

#### Initial conditions

System Simulator:

1 cell supporting EGPRS. The packet system information ACCESS\_BURST\_TYPE indicates 8 bit access.

Mobile Station:

The MS is switched off.

#### Related PICS/PIXIT statement

- Support EGPRS service.
- Switch off on button Yes/No.
- Method of trigger GPRS attach.

#### Test procedure

The MS is switched on and triggered to perform a GPRS attach. The SS send PACKET QUEUING NOTIFICATION message and sends then PACKET UPLINK ASSIGNMENT message. The SS allows the MS to complete the GPRS attach procedure.

#### Maximum duration of the test

15 s.

Expected sequence

52.1.2.1.1.4 Packet Uplink Assignment / Packet queuing notification / Expiry of timer T3162

52.1.2.1.1.4.1 Conformance requirements

On receipt of a PACKET QUEUING NOTIFICATION message corresponding to one of its 3 last PACKET CHANNEL REQUEST messages the mobile station shall stop timer T3170 and T3186 if running and stop sending PACKET CHANNEL REQUEST messages. On receipt of a PACKET UPLINK ASSIGNMENT message following a PACKET QUEUING NOTIFICATION message, the mobile station shall stop timer T3162 and follow the procedures defined in subclause 7.1.2.2.1. At expiry of timer T3162, the packet access procedure shall be aborted and a packet access failure indicated to the upper layer and the mobile station shall return to packet idle mode.

Reference

3GPP TS 04.60 subclauses 7.1.2.2.2 and 13.1.

52.1.2.1.1.4.2 Test purpose

1. To verify that the MS waits T3162 seconds before aborting the packet access procedure on receipt of a PACKET QUEUING NOTIFICATION message.
2. To verify that the mobile station listening to its paging channel after a time greater than timer T3162.

52.1.2.1.1.4.3 Method of test

Initial conditions

System Simulator:

1 cell supporting EGPRS.

Mobile Station:

The MS is GPRS attached and in packet idle mode.

Related PICS/PIXIT statement

- Support EGPRS service.

Test procedure

The SS page the MS with a PACKET PAGING REQUEST message. The SS sends PACKET QUEUING NOTIFICATION message corresponding to one of its 3 last PACKET CHANNEL REQUEST messages. The SS waits until T3162 seconds elapse and sends an PACKET UPLINK ASSIGNMENT message which shall be ignored by the MS since the access procedure should be aborted.

The SS page the MS with a PACKET PAGING REQUEST message. The SS verifies that the MS respond to the paging request and sends PACKET QUEUING NOTIFICATION message corresponding to one of its 3 last PACKET CHANNEL REQUEST messages. The SS sends a PACKET UPLINK ASSIGNMENT message before T3162 seconds elapse and the MS shall complete the uplink data transfer containing the paging response.

Maximum duration of the test

1 minute.

Expected sequence

| Step | Direction | Message                        | Comments                                                                                     |
|------|-----------|--------------------------------|----------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PACKET PAGING REQUEST          | Sent on PPCH.                                                                                |
| 2    | MS -> SS  | PACKET CHANNEL REQUEST         | ACCESS TYPE = "Page response". Received on PRACH.                                            |
| 3    | SS -> MS  | PACKET QUEUING NOTIFICATION    | Allocate a TQI to the MS. Sent on PAGCH.                                                     |
| 4    | SS        |                                | The SS waits T3162 + 0.1*T3162 .                                                             |
| 5    | SS -> MS  | PACKET UPLINK ASSIGNMENT       | Include same TQI as in step 3 and dynamic allocation struct. Sent on PAGCH.                  |
| 6    | SS        |                                | The SS verifies for 5 s that the MS does not respond.                                        |
| 7    | SS -> MS  | PACKET PAGING REQUEST          | Sent on PPCH.                                                                                |
| 8    | MS -> SS  | PACKET CHANNEL REQUEST         | ACCESS TYPE = "Page response". Received on PRACH.                                            |
| 9    | SS -> MS  | PACKET QUEUING NOTIFICATION    | Allocate a TQI to the MS. Sent on PAGCH.                                                     |
| 10   | SS        |                                | The SS waits T3162 - 0.1*T3162 .                                                             |
| 11   | SS -> MS  | PACKET UPLINK ASSIGNMENT       | Include same TQI as in step 9, dynamic allocation struct. Sent on PAGCH.                     |
| 12   | MS -> SS  | UPLINK RLC DATA BLOCK          | LLC PDU implicitly indicating paging response. Received on uplink PDTCH assigned in step 11. |
| 13   | SS -> MS  | PACKET UPLINK ACK/NACK         | Acknowledge the received RLC data block, Final Ack Indicator = "1". Sent on PACCH            |
| 14   | MS -> SS  | PACKET CONTROL ACKNOWLEDGEMENT | Acknowledge the RLC control message. Received on PACCH.                                      |

None.

#### 52.1.2.1.2 Packet Uplink Assignment / Response to packet polling request

##### 52.1.2.1.2.1 Conformance requirements

On receipt of a PACKET POLLING REQUEST message, the mobile station shall respond to the network with the PACKET CONTROL ACKNOWLEDGEMENT message in the reserved uplink radio block specified by the RRB field.

Reference

3GPP TS 04.60 subclause 7.1.2.2.3.

##### 52.1.2.1.2.2 Test purpose

To verify that the mobile station responds to the Network with a PACKET CONTROL ACKNOWLEDGEMENT message in the reserved uplink radio block specified by the RRB field on receipt of a PACKET POLLING REQUEST message.

## 52.1.2.1.2.3 Method of test

## Initial conditions

## System Simulator:

1 cell supporting EGPRS. The packet system information ACCESS\_BURST\_TYPE indicates 8 bit access and CONTROL\_ACK\_TYPE indicates four access bursts.

## Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

## Related PICS/PIXIT statement

- Support EGPRS service.
- Support PDP context.
- Method of triggering the MS to initiate an uplink packet data transfer.

## Test procedure

The MS is triggered to transfer data. The SS sends a PACKET QUEUING NOTIFICATION message and sends then a PACKET POLLING REQUEST message. On receipt of PACKET POLLING REQUEST message the MS shall respond with PACKET CONTROL ACKNOWLEDGEMENT message as four access bursts. The SS verifies that MS sends the PACKET CONTROL ACKNOWLEDGEMENT and send PACKET UPLINK ASSIGNMENT message. The uplink data transfer is completed.

## Maximum duration of the test

30 s.

## Expected sequence

| Step | Direction | Message                                    | Comments                                                                                                |
|------|-----------|--------------------------------------------|---------------------------------------------------------------------------------------------------------|
| 1    | MS        |                                            | The MS is triggered to transfer 200 octets data.                                                        |
| 2    | MS -> SS  | EGPRS PACKET CHANNEL REQUEST               | Received on PRACH.                                                                                      |
| 3    | SS -> MS  | PACKET QUEUING NOTIFICATION                | Allocate a TQI to the MS. Sent on PAGCH.                                                                |
| 4    | SS -> MS  | PACKET POLLING REQUEST                     | Include same TQI as step 3. Sent on PAGCH.                                                              |
| 5    | MS -> SS  | PACKET CONTROL<br>ACKNOWLEDGEMENT          | Received on the uplink block specified by the RRBP field on PACCH as four access bursts.                |
| 6    | SS        |                                            | SS verifies that the message in step 5 was received.                                                    |
| 7    | SS -> MS  | PACKET UPLINK ASSIGNMENT                   | Include same TQI as step 3, dynamic allocation struct and USF_GRANULARITY = four blocks. Sent on PAGCH. |
| 8    |           | {Uplink data transfer, dynamic allocation} | Macro. Completion from step 4 in the TBF procedure.                                                     |

### 52.1.2.1.3 Packet Uplink Assignment / Packet access reject procedure

#### 52.1.2.1.3.1 Packet Uplink Assignment / Packet access reject / Action during Wait\_Indication

##### 52.1.2.1.3.1.1 Conformance requirements

On receipt of a PACKET ACCESS REJECT message containing a Reject structure addressed to the mobile station, where the Packet Request Reference in the Reject structure corresponds to one of its three last PACKET CHANNEL REQUEST messages, the mobile station shall stop sending PACKET CHANNEL REQUEST messages, start timer T3172 with the value indicated in the WAIT\_INDICATION field if present, start timer T3170 if it has not already been started and listen to the downlink PCCCH until timer T3170 expires. During this time, the mobile station shall ignore additional PACKET ACCESS REJECT message, but on reception of any PACKET UPLINK ASSIGNMENT message corresponding to any other of its 3 last PACKET CHANNEL REQUEST MESSAGE the mobile station shall stop timers T3170 and T3172 if running and follow the procedure defined in subclause 7.1.2.2.1.

#### Reference

3GPP TS 04.60 subclause 7.1.2.2.4.

##### 52.1.2.1.3.1.2 Test purpose

To verify that the mobile station stops sending PACKET CHANNEL REQUEST messages on receipt of a PACKET ACCESS REJECT message containing a WAIT\_INDICATION field.

To verify that the mobile station ignores additional PACKET ACCESS REJECT messages, but on reception of any PACKET UPLINK ASSIGNMENT message corresponding to any other of its 3 last PACKET CHANNEL REQUEST messages the mobile station shall switch to the assigned PDCHs if the message is received before timer T3170 expire.

##### 52.1.2.1.3.1.3 Method of test

#### Initial conditions

##### System Simulator:

1 cell supporting EGPRS. The packet system information MAX\_RETRANS indicates 7 retransmissions, TX\_INT indicates 50 slots to spread transmission and parameter S indicates the value 217.

##### Mobile Station:

The MS is switched off.

#### Related PICS/PIXIT statement

- Support EGPRS service.
- Switch off on button Yes/No.
- Method of trigger GPRS attach.

#### Test procedures

The MS is switched on and triggered to perform a GPRS attach. The SS sends PACKET ACCESS REJECT message with WAIT\_INDICATION field corresponding to one of the last three PACKET CHANNEL REQUEST messages. The SS verifies that the MS does not send further PACKET CHANNEL REQUEST messages. The SS sends a new PACKET ACCESS REJECT message without WAIT\_INDICATION field. The SS shall then send a PACKET UPLINK ASSIGNMENT message corresponding to one of the last three sent PACKET CHANNEL REQUEST messages before the timer T3170 expire ( $T+2*S$  TDMA frames). The SS allows the MS to complete the GPRS attach procedure.

#### Maximum duration of the test

15 s.

Expected sequence

| Step | Direction | Message                  | Comments                                                                                                                        |
|------|-----------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                          | The MS is switched on and triggered to perform a GPRS attach.                                                                   |
| 2    | MS -> SS  | PACKET CHANNEL REQUEST   | Received on PRACH.                                                                                                              |
| 3    | MS -> SS  | PACKET CHANNEL REQUEST   | Received on PRACH.                                                                                                              |
| 4    | MS -> SS  | PACKET CHANNEL REQUEST   | Received on PRACH.                                                                                                              |
| 5    | SS -> MS  | PACKET ACCESS REJECT     | Containing WAIT_INDICATION = 15 seconds and packet request reference = pertaining to message received in step 2. Sent on PAGCH. |
| 6    | SS        |                          | The SS checks $0,8 \cdot T3170$ that the MS does not send further PACKET CHANNEL REQUEST messages.                              |
| 7    | SS -> MS  | PACKET ACCESS REJECT     | Without WAIT_INDICATION. Sent $0,8 \cdot T3170$ on PAGCH. The MS shall not consider this message.                               |
| 8    | SS -> MS  | PACKET UPLINK ASSIGNMENT | Random Reference = pertaining to message received in step 2. Sent $0,9 \cdot T3170$ on PAGCH.                                   |
| 9    |           | {GPRS attach procedure}  | Macro. Completion from step 4 in the attach procedure.                                                                          |

Specific message contents

None.

52.1.2.1.3.2 Packet Uplink Assignment / Packet access reject / No respond

52.1.2.1.3.2.1 Conformance requirements

On receipt of a PACKET ACCESS REJECT message containing a Reject structure addressed to the mobile station, where the Packet Request Reference in the Reject structure corresponds to one of its 3 last PACKET CHANNEL REQUEST messages:

- the mobile station is not allowed to make a new attempt for packet access in the same cell until timer T3172 expires, but may attempt packet access in an other cell after successful cell reselection for radio conditions reasons (see 3GPP TS 05.08). A mobile station in class A or B mode of operation may attempt to enter the dedicated mode in the same cell before timer T3172 has expired. During the timer T3172 is running, the mobile station shall ignore all received PACKET PAGING REQUEST messages except paging request to trigger RR connection establishment.

Reference

3GPP TS 04.60 subclause 7.1.2.2.4.

52.1.2.1.3.2.2 Test purpose

To verify that the mobile station ignores PACKET PAGING REQUEST messages requesting TBF establishment when T3172 is running.

52.1.2.1.3.2.3 Method of test

Initial conditions

System Simulator:

1 cell supporting EGPRS. The packet system information ACCESS\_BURST\_TYPE indicates 8 bit access.

Mobile Station:

The MS is GPRS attached and in packet idle mode.

Related PICS/PIXIT statement

- Support EGPRS service.

- Supporting GPRS MS class A and MS class B.

### Test procedure

The SS sends a PACKET PAGING REQUEST message. After response from the MS the SS sends PACKET ACCESS REJECT message with WAIT\_INDICATION set to a value between 1-255 seconds (see specific message contents). The SS sends then a PACKET UPLINK ASSIGNMENT message after timer T3170 has elapse. The SS verifies that the MS not respond to the message. The SS sends a PACKET PAGING REQUEST message request TBF establishment before the wait indication has elapse. The SS verifies that the MS not respond to the message. The SS sends a PACKET PAGING REQUEST message request TBF establishment after the wait indication has elapse. The SS verifies that the MS respond to the message.

The test procedures shall be repeated with different chosen values of WAIT INDICATION.

### Maximum duration of the test

10 minutes.

### Expected sequence

| Step | Direction | Message                  | Comments                                                                                         |
|------|-----------|--------------------------|--------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PACKET PAGING REQUEST    | Sent on PPCH.                                                                                    |
| 2    | MS -> SS  | PACKET CHANNEL REQUEST   | Received on PRACH.                                                                               |
| 3    | SS -> MS  | PACKET ACCESS REJECT     | See specific message contents. Sent on PAGCH.                                                    |
| 4    | SS -> MS  | PACKET UPLINK ASSIGNMENT | Send this message $1,1 * T3170$ on PAGCH.                                                        |
| 5    | SS        |                          | Verify for 5 seconds that the MS does not respond to message in step 4.                          |
| 6    | SS -> MS  | PACKET PAGING REQUEST    | Request TBF establishment. Send this message after $(0,9 * WAIT\_INDICATION)$ (step 3)) on PPCH. |
| 7    | SS        |                          | Verify that the MS does not respond to message in step 6.                                        |
| 8    | SS -> MS  | PACKET PAGING REQUEST    | Request TBF establishment. Send this message after $(1,1 * WAIT\_INDICATION)$ (step 3)) on PPCH. |
| 9    | MS -> SS  | PACKET CHANNEL REQUEST   | Received on PRACH.                                                                               |

The test is repeated with different values of WAIT INDICATION, see specific message contents.

### Specific message contents

As default messages contents, except:

#### PACKET ACCESS REJECT in step 3

| Information element      | Value/remark                         |
|--------------------------|--------------------------------------|
| < WAIT_INDICATION >      | Set values between 1-255, see below. |
| < WAIT_INDICATION_SIZE > | 0 (units of seconds)                 |

Case 1: WAIT\_INDICATION = 60.

Case 2: WAIT\_INDICATION = 240.

### 52.1.2.1.3.3 Packet Uplink Assignment / Packet access reject / Trigger RR connection

#### Applicability

This test is only applicable to GPRS mobiles that can operate in mode B in network mode 1.

#### 52.1.2.1.3.3.1 Conformance requirements

On receipt of a PACKET ACCESS REJECT message containing a Reject structure addressed to the mobile station, where the Packet Request Reference in the Reject structure corresponds to one of its 3 last PACKET CHANNEL REQUEST messages:

- the mobile station is not allowed to make a new attempt for packet access in the same cell until timer T3172 expires, but may attempt packet access in an other cell after successful cell reselection for radio conditions reasons (see 3GPP TS 05.08). A mobile station in class A or B mode of operation may attempt to enter the dedicated mode in the same cell before timer T3172 has expired. During the timer T3172 is running, the mobile station shall ignore all received PACKET PAGING REQUEST messages except paging request to trigger RR connection establishment.

#### Reference

3GPP TS 04.60 subclause 7.1.2.2.4.

#### 52.1.2.1.3.3.2 Test purpose

To verify that when T3172 is running, the mobile station ignores all received PACKET PAGING REQUEST messages except paging request to trigger RR connection establishment.

#### 52.1.2.1.3.3.3 Method of test

##### Initial conditions

System Simulator:

1 cell supporting EGPRS. The packet system information ACCESS\_BURST\_TYPE indicates 8 bit access.

Mobile Station:

The MS is GPRS attached and in packet idle mode. The MS shall have a valid TMSI.

##### Related PICS/PIXIT statement

- Support EGPRS service.
- Supporting GPRS MS class B.

##### Test procedure

The SS sends a PACKET PAGING REQUEST message request TBF connection establishment. After response from the MS the SS sends PACKET ACCESS REJECT message with a WAIT\_INDICATION value. The SS trigger first paging with TBF connection establishment and then RR connection establishment before the wait indication has elapse. The SS verifies that the MS not respond to the TBF connection establishment but respond to the RR connection establishment.

##### Maximum duration of the test

1 minute.

Expected sequence

| Step | Direction | Message                | Comments                                                                                                                |

#### 52.1.2.1.4 Packet Uplink Assignment / Packet Uplink Assignment handling

##### 52.1.2.1.4.1 Conformance requirements

On receipt of a PACKET UPLINK ASSIGNMENT message corresponding to one of its 3 last PACKET CHANNEL REQUEST messages, the mobile station shall stop timers T3186 and T3170 if running, stop sending PACKET CHANNEL REQUEST messages.

Reference

3GPP TS 04.60 subclause 7.1.2.2.1.

##### 52.1.2.1.4.2 Test purpose

To verify that the mobile station stops sending PACKET CHANNEL REQUEST messages on receipt of a PACKET UPLINK ASSIGNMENT message.

##### 52.1.2.1.4.3 Method of test

Initial conditions

System Simulator:

1 cell supporting EGPRS. The packet system information MAX\_RETRANS indicates 7 allowed retransmission.

Mobile Station:

The MS is switched off.

Related PICS/PIXIT statement

- Support EGPRS service.
- Switch off on button Yes/No.
- Method of trigger GPRS attach.

Foreseen final state of the MS

Packet idle mode.

Test procedure

The MS is switched on and triggered to perform a GPRS attach. The SS send a PACKET UPLINK ASSIGNMENT message corresponding to one of the last 3 PACKET CHANNEL REQUEST messages from the MS. The SS verifies that the MS stops sending PACKET CHANNEL REQUEST messages. The SS allows the MS to complete the GPRS attach procedure.

Maximum duration of the test

15 s.

Expected sequence

| Step | Direction | Message                  | Comments                                                                                                                                                                           |
|------|-----------|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                          | The MS is switched on and triggered to perform a PRS attach.                                                                                                                       |
| 2    | MS -> SS  | PACKET CHANNEL REQUEST   | Received on PRACH.                                                                                                                                                                 |
| 3    | MS -> SS  | PACKET CHANNEL REQUEST   | Received on PRACH.                                                                                                                                                                 |
| 4    | SS -> MS  | PACKET UPLINK ASSIGNMENT | Respond to requests message in step 2. Sent on AGCH with dynamic allocation struct. The SS shall verify for 4.5 seconds that the MS stops sending packet channel request messages. |
| 5    |           | {GPRS attach procedure } | Macro. Completion from step 4 in the attach procedure.                                                                                                                             |

Specific message contents

None.

52.1.2.1.5 Packet Uplink Assignment / One or two phase access

52.1.2.1.5.1 Conformance requirements

Unless the mobile station indicated a Single Block Without TBF Establishment in a PACKET CHANNEL REQUEST message, the mobile station shall perform a two phase access, if the PACKET UPLINK ASSIGNMENT message includes a Single Block allocation struct or a Multi Block Allocation struct. If the PACKET UPLINK ASSIGNMENT message includes Dynamic Allocation struct, the mobile station shall perform a one phase access.

Multi block allocationReference

3GPP TS 04.60 subclause 7.1.2.2.1.

52.1.2.1.5.2 Test purpose

To verify that the mobile station proceeds with one phase access or two phase access according to the parameters in the PACKET UPLINK ASSIGNMENT message.

## 52.1.2.1.5.3 Method of test

## Initial conditions

System Simulator:

1 cell supporting EGPRS. The packet system information ACCESS\_BURST\_TYPE indicates 8 bit access.

Mobile Station:

The MS is switched off.

## Related PICS/PIXIT statement

- Support EGPRS service.
- Switch off on button Yes/No.
- Method of trigger GPRS attach.

## Test procedures

The MS is switched on and triggered to perform a GPRS attach. The SS send a PACKET UPLINK ASSIGNMENT message with Dynamic Allocation struct information field, the MS shall proceed with a one-phase access. The SS allows the MS to complete the GPRS attach procedure. Switch off the MS.

The MS is switched on and triggered to perform a GPRS attach. The SS send a PACKET UPLINK ASSIGNMENT message with Multi block allocation struct information field, the MS shall perform a two-phase access i.e. it should transmit a PACKET RESOURCE REQUEST message on the allocated uplink resource. The SS responds with a PACKET UPLINK ASSIGNMENT message with Dynamic Allocation struct information field. The SS allows the MS to complete the GPRS attach procedure. Switch off the MS.

## Maximum duration of the test

2 minutes.

## Expected sequences

| 11   | SS -> MS  | PACKET UPLINK ASSIGNMENT  | Dynamic Allocation struct information. Sent on PACCH.                       |
| 12   |           | { GPRS attach procedure } | Macro. Completion from step 4 in the attach procedure.                      |
| 13   | MS        |                           | The MS is switched off or power is removed (see PICS).                      |
| 14   |           | {GPRS detach procedure }  | Macro. Procedure only applies if MS is switched off.                        |

Specific message contents

PACKET UPLINK ASSIGNMENT dynamic allocation struct specified in subclause 52.1.3.2.8.

PACKET UPLINK ASSIGNMENT multi block allocation struct specified in subclause 52.1.3.2.10.

### 52.1.2.1.6 Packet Uplink Assignment / Decoding of frequency parameters

#### 52.1.2.1.6.1 Conformance requirements

The mobile station may use information received on PBCCH, BCCH or a previous assignment message to decode the frequency parameters contained in the assignment message. If the mobile station detects an invalid Frequency Parameters information element in the assignment message, it shall abort the procedure, if required initiate a partial acquisition of PBCCH or BCCH, and may then re-initiate this procedure.

When the indirect encoding is used, the network may include a CHANGE\_MARK\_1 and a CHANGE\_MARK\_2 in the Frequency Parameters information element. The mobile station shall then verify that it is using a set of PBCCH or BCCH information identified by a PSI or SI *change mark* corresponding to one of the CHANGE\_MARK\_1 or 2 parameters, for the decoding of the frequency information. If that is not the case, an abnormal condition occurs.

#### Reference

3GPP TS 04.60 subclauses 7.1.2.2.1 and 5.5.1.7.

#### 52.1.2.1.6.2 Test purpose

To verify that the mobile station uses information received on PBCCH to decode the frequency parameters contained in the assignment message and when the mobile station receives a PACKET UPLINK ASSIGNMENT message with an invalid frequency parameters information element the mobile station shall abort the procedure.

#### 52.1.2.1.6.3 Method of test

#### Initial conditions

System Simulator:

1 cell supporting EGPRS. Packet system information PSI2 including frequency hopping parameters.

Mobile Station:

The MS is switched off.

#### Related PICS/PIXIT statement

- Support EGPRS service.
- Switch off on button Yes/No.
- Method of trigger GPRS attach.

#### Test procedure

The MS is switched on and triggered to perform a GPRS attach. The SS send a PACKET UPLINK ASSIGNMENT message containing frequency parameter information elements. The SS allows the MS to complete the GPRS attach procedure. The MS is switched off, then switched on again and triggered to perform a GPRS attach. The SS sends PACKET UPLINK ASSIGNMENT message containing an invalid frequency parameter as respond to the PACKET CHANNEL REQUEST message from the MS. The SS verifies that the MS abort the GPRS attach procedure.

#### Maximum duration of the test

30 s.

### 52.1.2.1.7 Packet Uplink Assignment / Most recently received Packet Uplink Assignment

#### 52.1.2.1.7.1 Conformance requirements

A PACKET UPLINK ASSIGNMENT message may indicate an assignment starting time in the TBF Starting Time parameter. The mobile station shall monitor PCCCH until the point in time denoted by the TBF Starting Time. If while monitoring the PCCCH the mobile station receives more than one PACKET UPLINK ASSIGNMENT message, it shall act upon the most recently received message and shall ignore the previous message.

#### Reference

3GPP TS 04.60 subclause 7.1.2.2.1.

#### 52.1.2.1.7.2 Test purpose

To verify that the mobile station monitors PCCCH until the point in time denoted by the TBF Starting Time and that the mobile station acts on the most recently received Packet Uplink Assignment.

#### 52.1.2.1.7.3 Method of test

##### Initial conditions

System Simulator:

1 cell supporting EGPRS. The packet system information ACCESS\_BURST\_TYPE indicates 8 bit access.

Mobile Station:

The MS is switched off.

##### Related PICS/PIXIT statement

- Support EGPRS service.
- Switch off on button Yes/No.
- Method of trigger GPRS attach.

##### Test procedure

The MS is switched on and triggered to perform a GPRS attach. The SS sends PACKET UPLINK ASSIGNMENT message with a TBF starting time. Then send a new PACKET UPLINK ASSIGNMENT message with another TBF starting time and a different timeslot on PCCCH before the first TBF starting time has elapsed. The MS shall start to send the RLC data block on the allocated uplink according to the second TBF starting time. The SS allows the MS to complete the GPRS attach procedure.

##### Maximum duration of the test

15 s.

Expected sequence

## 52.1.2.1.8 Packet Uplink Assignment / One phase access

### 52.1.2.1.8.1 Packet Uplink Assignment / One phase access / Contention Resolution

The contention resolution is successfully completed on the mobile station side when the mobile station receives a PACKET UPLINK ACK/NACK message addressing the mobile station with the TFI value associated with the uplink TBF and including the same TLLI value that the mobile station has included in the RLC header of the first RLC data blocks, or, in EGPRS TBF mode, a PACKET UPLINK ASSIGNMENT message addressing the mobile station with the same TLLI value that the mobile station included in the RLC header of the first RLC data blocks. The mobile shall then stop timer T3166 and counter N3104.

At sending of the first RLC data block, the mobile station shall stop timer T3164, set counter N3104 to 1, and start timer T3166. Counter N3104 shall be stepped each time the mobile station sends an RLC data block.

#### 52.1.2.1.8.1.1 Packet Uplink Assignment / One phase access / Contention resolution / Inclusion of TLLI in RLC data blocks

##### 52.1.2.1.8.1.1.1 Conformance requirements

In order to uniquely identify the mobile station when sending on uplink, the RLC Header is extended to include the TLLI of the mobile station until contention resolution is completed on the mobile station side.

All the RLC data blocks of an uplink TBF initiated by one phase access shall each contain a TLLI field in the RLC data block header until the contention resolution is completed on the mobile station side. After the reaction time specified in 3GPP TS 05.10 no other RLC data blocks shall contain a TLLI field.

The TLLI\_BLOCK\_CHANNEL\_CODING parameter in the PACKET UPLINK ASSIGNMENT message indicates whether a RLC data block containing a TLLI field in the RLC data block header shall be encoded using CS-1 or correspondingly MCS-1 in EGPRS TBF mode, or using the channel coding scheme commanded. In standard GPRS TBF mode, the mobile station shall send all other RLC data blocks using the channel coding scheme commanded.

In EGPRS TBF mode, RLC data blocks that are transmitted for the first time shall be transmitted with the MCS commanded, except if the commanded mode is MCS-5-7, in which case the data block shall be transmitted with MCS-5, or if the commanded mode is MCS-6-9, in which case the data block shall be transmitted with MCS-6.

Upon contention resolution during one phase access, the mobile station shall start transmitting RLC data blocks without the TLLI field no later than the next occurrence of block  $B((x+3) \bmod 12)$  where block  $B(x)$  is the radio block containing the contention resolution message.

## Reference

3GPP TS 04.60 subclauses 7.1.2.3 and 8.1.1.

3GPP TS 05.10 subclause 6.11.3.

### 52.1.2.1.8.1.1.2 Test purpose

1. To verify that in one phase access the first RLC data blocks of an uplink TBF contain a TLLI field in the RLC data block header and that these blocks are encoded according to the TLLI\_BLOCK\_CHANNEL\_CODING parameter specified in the PACKET UPLINK ASSIGNMENT message.
2. To verify that upon contention resolution during one phase access the RLC data blocks not contain a TLLI field and are encoded using the EGPRS\_Channel Coding Command IE included in the PACKET\_UPLINK\_ASSIGNMENT after the contention resolution reaction time.

### 52.1.2.1.8.1.1.3 Method of test

#### Initial conditions

System Simulator:

1 cell supporting EGPRS.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

#### Related PICS/PIXIT statement

- Support EGPRS service.
- Support PDP context.
- Method of triggering the MS to initiate an uplink packet data transfer.

#### Test procedure

The MS is triggered to transfer an LLC PDU. The SS sends PACKET UPLINK ASSIGNMENT message containing Dynamic Allocation struct. The MS shall start to send RLC data and RLC/MAC control blocks on the allocated uplink. The SS allows the MS to send the uplink data transfer. The SS verifies the coding is the scheme specified by TLLI\_BLOCK\_CHANNEL\_CODING, the TFI is correct and the block contains TLLI in the first RLC data blocks. After contention resolution reaction time shall the remaining RLC data blocks contain coding scheme specified by EGPRS Channel Coding Command, the TFI shall be correct and the blocks do not contain TLLI.

#### Maximum duration of the test

3 minutes.

## Expected sequence

52.1.2.1.8.1.2 Packet Uplink Assignment / One phase access / Contention resolution / Counter N3104

52.1.2.1.8.1.2.1 Conformance requirements

The contention resolution has failed on the mobile station side when the counter N3104 reaches its maximum value, or timer T3166 expires. The contention resolution also fails, if the mobile station receives a PACKET UPLINK ACK/NACK message or in EGPRS TBF mode a PACKET UPLINK ASSIGNMENT message addressing the TFI associated with the TBF and including a TLLI value other than that the mobile station included in the RLC header of the first RLC data blocks; in such a case, the mobile station shall not transmit a PACKET CONTROL ACKNOWLEDGEMENT in the uplink radio block specified if a valid RRBP field is received as part of the PACKET UPLINK ACK/NACK message.

In case of a contention resolution failure on the mobile station side, the mobile station shall reset the counter N3104 and stop timer T3166, if not expired. The mobile station shall stop transmitting on the TBF and reinitiate the packet access procedure, unless it has already been repeated 4 times. In that case, a TBF failure has occurred.

Reference

3GPP TS 04.60 subclause 7.1.2.3.

52.1.2.1.8.1.2.2 Test purpose

To verify that the mobile station correctly sets and considers counter N3104.

NOTE: Counter N3104 is incremented by 1 with each new RLC/MAC block the mobile station sends until the first PACKET UPLINK ACK/NACK message is received.

Its maximum value is  $N3104\_MAX = 3 * BS\_CV\_MAX * \text{no-of-timeslots-assigned}$ , where BS\_CV\_MAX is broadcast in PSI1.

52.1.2.1.8.1.2.3 Method of test

Initial conditions

System Simulator:

1 cell supporting EGPRS. The packet system information BS\_CV\_MAX value = 1.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

## Related PICS/PIXIT statement

- Support EGPRS service.
- Support PDP context.
- Method of triggering the MS to initiate an uplink packet data transfer.

## Test procedure

The MS is triggered to initiate packet uplink transfer of an LLC PDU. The SS assigns packet uplink resources in a PACKET UPLINK ASSIGNMENT message indicating one phase packet access. The MS shall start transferring RLC data blocks.. The SS verifies that the MS stops transmitting and re-initiates the packet access procedure.

At the second attempt, the SS sends PACKET UPLINK ACK/NACK exactly after N3104\_MAX - 1 data blocks. The SS verifies that this time the MS does not abort the access procedure and successfully completes uplink transfer.

## Maximum duration of the test

5 minutes.

## Expected sequence

52.1.2.1.8.1.3 Packet Uplink Assignment / One phase access / Contention resolution / Timer T3166

52.1.2.1.8.1.3.1 Conformance requirements

The contention resolution has failed on the mobile station side when the counter N3104 reaches its maximum value, or timer T3166 expires. The contention resolution also fails, if the mobile station receives a PACKET UPLINK ACK/NACK message or in EGPRS TBF mode a PACKET UPLINK ASSIGNMENT message addressing the TFI associated with the TBF and including a TLLI value other than that the mobile station included in the RLC header of the first RLC data blocks ; in such a case, the mobile station shall not transmit a PACKET CONTROL ACKNOWLEDGEMENT in the uplink radio block specified if a valid RRBP field is received as part of the PACKET UPLINK ACK/NACK message.

In case of a contention resolution failure on the mobile station side, the mobile station shall reset the counter N3104 and stop timer T3166, if not expired. The mobile station shall stop transmitting on the TBF and reinitiate the packet access procedure, unless it has already been repeated 4 times. In that case, a TBF failure has occurred.

## Reference

3GPP TS 04.60 subclause 7.1.2.3.

### 52.1.2.1.8.1.3.2 Test purpose

To verify that the mobile station correctly considers timer T3166.

### 52.1.2.1.8.1.3.3 Method of test

## Initial conditions

### System Simulator:

1 cell supporting EGPRS. BS\_CV\_MAX value = 15.

### Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

## Related PICS/PIXIT statement

- Support EGPRS service.
- Support PDP context.
- Method of triggering the MS to initiate an uplink packet data transfer.

## Foreseen final state of the MS

Packet idle mode.

## Test procedure

The MS is triggered to initiate packet uplink transfer of an LLC PDU. The SS assigns packet uplink resources in a PACKET UPLINK ASSIGNMENT message indicating one phase packet access. The MS shall start transferring RLC data blocks. The SS reduces the block transfer rate by controlling the USF flag. In this way, the SS forces T3166 (with value 5 s.) to expire before counter N3104 reaches N3104\_MAX (with value 45 blocks for current settings). The SS verifies that the MS stops transmitting and re-initiates the packet access procedure.

At the second attempt, the SS sends PACKET UPLINK ACK/NACK before T3166 expire. The SS verifies that this time the MS does not abort the access procedure and successfully completes the data transfer.

## Maximum duration of the test

5 minutes.

## Expected sequence

| 23   |           | {Uplink data transfer, dynamic allocation} | Macro. Completion of the TBF procedure.                                                                                                                                                                                                           |

52.1.2.1.8.1.4 Packet Uplink Assignment / One phase access / Contention resolution / TLLI mismatch

52.1.2.1.8.1.4.1 Conformance requirements

The contention resolution has failed on the mobile station side when the counter N3104 reaches its maximum value, or timer T3166 expires. The contention resolution also fails, if the mobile station receives a PACKET UPLINK ACK/NACK message or in EGPRS TBF mode a PACKET UPLINK ASSIGNMENT message addressing the TFI associated with the TBF and including a TLLI value other than that the mobile station included in the RLC header of the first RLC data blocks ; in such a case, the mobile station shall not transmit a PACKET CONTROL ACKNOWLEDGEMENT in the uplink radio block specified if a valid RRBP field is received as part of the PACKET UPLINK ACK/NACK message.

In case of a contention resolution failure on the mobile station side, the mobile station shall reset the counter N3104 and stop timer T3166, if not expired. The mobile station shall stop transmitting on the TBF and reinitiate the packet access procedure, unless it has already been repeated 4 times. In that case, a TBF failure has occurred.

#### Reference

3GPP TS 04.60 subclause 7.1.2.3.

52.1.2.1.8.1.4.2 Test purpose

To verify that the mobile station reinitiates packet access when it receives a PACKET UPLINK ACK/NACK message with the correct TFI but with a TLLI other than the mobile station has included in the RLC header.

52.1.2.1.8.1.4.3 Method of test

#### Initial conditions

System Simulator:

1 cell supporting EGPRS.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

#### Related PICS/PIXIT statement

- Support EGPRS service.
- Support PDP context.
- Method of triggering the MS to initiate an uplink packet data transfer.

#### Test procedure

The MS is triggered to initiate packet uplink transfer of an LLC PDU. The SS assigns packet uplink resources in a PACKET UPLINK ASSIGNMENT message indicating one phase packet access. The MS shall start transferring RLC data block after SS has assigned USF to the MS. The SS acknowledges the RLC block transfer with a PACKET UPLINK ACK/NACK including correct TFI and incorrect TLLI. The SS continue to assign USF to the MS. The SS shall verify that the MS immediately stops transmitting (see note below) and retries packet access procedure.

At the second attempt, the SS sends PACKET UPLINK ACK/NACK including a correct TLLI. The SS verifies that this time the MS does not abort the access procedure and successfully completes the data transfer.

NOTE: A mobile station, receiving a commanding message in block number N, shall take an "immediate" action as a result of the command, starting in any block from block number N+1 to N+6 (inclusive).

Maximum duration of the test

5 minutes.

52.1.2.1.8.1.5 Packet Uplink Assignment / One phase access / Contention resolution / 4 access repetition attempts

52.1.2.1.8.1.5.1 Conformance requirement

The contention resolution has failed on the mobile station side when the counter N3104 reaches its maximum value, or timer T3166 expires. The contention resolution also fails, if the mobile station receives a PACKET UPLINK ACK/NACK message or in EGPRS TBF mode a PACKET UPLINK ASSIGNMENT message addressing the TFI associated with the TBF and including a TLLI value other than that the mobile station included in the RLC header of the first RLC data blocks ; in such a case, the mobile station shall not transmit a PACKET CONTROL ACKNOWLEDGEMENT in the uplink radio block specified if a valid RRBP field is received as part of the PACKET UPLINK ACK/NACK message.

In case of a contention resolution failure on the mobile station side, the mobile station shall reset the counter N3104 and stop timer T3166, if not expired. The mobile station shall stop transmitting on the TBF and reinitiate the packet access procedure, unless it has already been repeated 4 times. In that case, a TBF failure has occurred.

Reference

3GPP TS 04.60 subclause 7.1.2.3.

52.1.2.1.8.1.5.2 Test purpose

To verify that the mobile station repeats the packet access initiation 4 times.

## 52.1.2.1.8.1.5.3 Method of test

## Initial conditions

System Simulator:

1 cell supporting EGPRS.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

## Related PICS/PIXIT statement

- Support EGPRS service.
- Support PDP context.
- Method of triggering the MS to initiate an uplink packet data transfer.

## Test procedure

The MS is triggered to initiate packet uplink transfer of an LLC PDU. The SS assigns packet uplink resources in a PACKET UPLINK ASSIGNMENT message indicating one phase packet access. The MS shall start transferring RLC data blocks after SS has assigned USF to the MS. The SS acknowledges the RLC block transfer with a PACKET UPLINK ACK/NACK including a TLLI not corresponding to the MS. The SS shall verify that the MS stops transmitting blocks and reinitiates packet access. This test sequence shall be repeated four times.

## Maximum duration of the test

5 minutes.

## Expected sequence

| Step | Direction | Message                             | Comments                                                                                                              |

## Specific message contents

None.

52.1.2.1.8.2 Packet Uplink Assignment / One phase access / Timing Advance

52.1.2.1.8.2.1 Packet Uplink Assignment / One phase access / Timing Advance / TA Index present

52.1.2.1.8.2.1.1 Conformance requirements

If a Timing Advance Index is included in the assignment message, the mobile station shall use the continuous update timing advance mechanism, using its allocation on PTCCH (see 3GPP TS 05.10).

## Reference

3GPP TS 04.60 subclause 7.1.2.5.

3GPP TS 03.64 subclause 6.5.7.2.

## 52.1.2.1.8.2.1.2 Test purpose

To verify that the mobile station uses the continuous update timing advance mechanism and sends access bursts on the PTCCH slots as determined by the Timing Advance Index sent in the PACKET UPLINK ASSIGNMENT message.

## 52.1.2.1.8.2.1.3 Method of test

## Initial conditions

System Simulator:

1 cell supporting EGPRS.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

## Related PICS/PIXIT statement

- Support EGPRS service.
- Support PDP context.
- Method of triggering the MS to initiate an uplink packet data transfer.

## Test procedure

The MS is triggered to initiate uplink data packet transfer. The SS responds with PACKET UPLINK ASSIGNMENT message indicating one phase access and containing a Timing Advance Index. The MS shall start to send data on the allocated uplink. The SS allows the MS to send the uplink data transfer. During the Uplink data transfer, the SS shall verify that the access bursts are sent correctly by the MS in the PTCCH.

## Maximum duration of the test

2 minutes.

## Expected sequence

| Step | Direction | Message                                    | Comments                                                                                            |
|------|-----------|--------------------------------------------|-----------------------------------------------------------------------------------------------------|
| 1    | MS        |                                            | The MS is triggered to initiate packet uplink transfer of an LLC PDU consisting of 500 octets data. |
| 2    | MS -> SS  | EGPRS PACKET CHANNEL REQUEST               | Received on PRACH.                                                                                  |
| 3    | SS -> MS  | PACKET UPLINK ASSIGNMENT                   | Including Timing Advance Index = 0, Dynamic allocation struct. Sent on PAGCH.                       |
| 4    |           | {Uplink data transfer, dynamic allocation} | Macro. Completion from step 4 in the TBF procedure. Verification, see below.                        |

## Verification

During the uplink data transfer (step 4) the SS monitors the access burst on PTCCH which are located on slots with numbers FN, such that  $(FN \bmod (8 \cdot 52)) = 12$  for Timing Advance Index = 0 (3GPP TS 03.64/6.5.7.2 and 3GPP TS 05.02 table 6). The access burst contents shall be MESSAGE\_TYPE = 011111 and CTRL\_ACK = 11.

The test is repeated with an arbitrarily chosen Timing Advance Index in the range 1 to 15. SS shall verify that the access burst are sent in the correct idle slots as specified in 3GPP TS 05.02 table 6.

## Specific message contents

None.

52.1.2.1.8.2.2 Packet Uplink Assignment / One phase access / Timing Advance / TA Index not present

52.1.2.1.8.2.2.1 Conformance requirements

If a Timing Advance Index is included in the assignment message, the mobile station shall use the continuous update timing advance mechanism, using its allocation on PTCCH (see 3GPP TS 05.10). Otherwise, the continuous update timing advance mechanism shall not be used.

## Reference

3GPP TS 04.60 subclause 7.1.2.5.

52.1.2.1.8.2.2.2 Test purpose

To verify that the mobile station does not send any access bursts on the PTCCH if Timing Advance Index is not present in the PACKET UPLINK ASSIGNMENT message.

52.1.2.1.8.2.2.3 Method of test

## Initial conditions

System Simulator:

1 cell supporting EGPRS.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

## Related PICS/PIXIT statement

- Support EGPRS service.
- Support PDP context.
- Method of triggering the MS to initiate an uplink data transfer.

## Test procedure

The MS is triggered to initiate uplink data transfer. The SS responds with PACKET UPLINK ASSIGNMENT message that request one phase access and not including a Timing Advance Index. The MS shall start to send data on the allocated uplink. The SS allows the MS to send the uplink data transfer. During the uplink data transfer, the SS shall verify that the MS not send any access bursts on PTCCH.

## Maximum duration of the test

2 minutes.

Expected sequence

| Step | Direction | Message                                    | Comments                                                                                             |
|------|-----------|--------------------------------------------|------------------------------------------------------------------------------------------------------|
| 1    | MS        |                                            | The MS is triggered to initiate packet uplink transfer of an LLC PDU consisting of 500 octets data.. |
| 2    | MS -> SS  | EGPRS PACKET CHANNEL REQUEST               | Received on PRACH.                                                                                   |
| 3    | SS -> MS  | PACKET UPLINK ASSIGNMENT                   | Not include Timing Advance Index. Indicating Dynamic allocation struct. Sent on PAGCH.               |
| 4    |           | {Uplink data transfer, dynamic allocation} | Macro. Completion from step 4 in the TBF procedure. Verification, see below.                         |

Verification

The SS verifies that the MS does not transmit in idle frames during data block transfer (steps 4). Idle frame numbers are 12, 25, 38 and 51 in the 52-multiframe structure.

Specific message contents

None.

52.1.2.1.8.2.3 Packet Uplink Assignment / One phase access / Timing Advance / TA value field not provided

52.1.2.1.8.2.3.1 Conformance requirements

For the case where a TIMING\_ADVANCE\_VALUE field is not provided in the assignment message, the mobile station is not allowed to send normal bursts on the uplink until it receives a valid timing advance either through the continuous timing advance procedure or in a PACKET TIMING ADVANCE/POWER CONTROL message.

Reference

3GPP TS 04.60 subclause 7.1.2.5.

52.1.2.1.8.2.2.2 Test purpose

To verify that the mobile station does not send normal bursts on the uplink until it receives a valid timing advance in a PACKET POWER CONTROL/TIMING ADVANCE message if Timing Advance Value field is not provided in the PACKET UPLINK ASSIGNMENT message.

52.1.2.1.8.2.2.3 Method of test

Initial conditions

System Simulator:

1 cell supporting EGPRS.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

Related PICS/PIXIT statement

- Support EGPRS service.
- Support PDP context.
- Method of triggering the MS to initiate an uplink data transfer.

## Test procedure

The MS is triggered to initiate uplink data transfer. The SS responds with PACKET UPLINK ASSIGNMENT message that request one phase access and does not include Timing Advance Value field. The SS shall wait 2 seconds and then send a PACKET POWER CONTROL/TIMING ADVANCE message with a valid timing advance information. The MS shall start to send data on the allocated uplink. The SS allows the MS to send the uplink data transfer. The SS verifies that the MS not send any normal burst on the uplink until the SS sends a valid timing advance.

## Maximum duration of the test

2 minutes.

## Expected sequence

| Step | Direction | Message                                    | Comments                                                                                            |

| 1    | MS        |                                            | The MS is triggered to initiate packet uplink transfer of an LLC PDU consisting of 500 octets data. |
| 2    | MS -> SS  | EGPRS PACKET CHANNEL REQUEST               | Received on PRACH.                                                                                  |
| 3    | SS -> MS  | PACKET UPLINK ASSIGNMENT                   | No Timing Advance Value. Indicating Dynamic allocation struct. Sent on PAGCH.                       |
| 4    | SS        |                                            | Wait 2 s and verifies that the MS not send any normal burst on the uplink.                          |
| 5    | SS -> MS  | PACKET POWER CONTROL/TIMING ADVANCE        | Include a valid Timing Advance information. Sent on PACCH.                                          |
| 6    |           | {Uplink data transfer, dynamic allocation} | Macro. Completion of the TBF procedure.                                                             |

## Specific message contents

None.

### 52.1.2.1.9 Packet Uplink Assignment / Two phase access

#### 52.1.2.1.9.1 Packet Uplink Assignment / Two phase access / Packet Resource Request / RLC Octet Count

##### 52.1.2.1.9.1.1 Conformance requirements

The mobile station may request an open-ended or a close-ended TBF. If a close-ended TBF is requested, the number of octets of user data that the MS has to transfer in the TBF shall be indicated in the PACKET RESOURCE REQUEST message.

## Reference

3GPP TS 04.60 subclause 7.1.3.1.

##### 52.1.2.1.9.1.2 Test purpose

To verify that the mobile station indicates the number of octets of user data that it has to be transferred in the TBF.

##### 52.1.2.1.9.1.3 Method of test

## Initial conditions

System Simulator:

1 cell supporting EGPRS.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 1 has been established.

## Related PICS/PIXIT statement

- Support EGPRS service.
- Support PDP context.
- Method of triggering the MS to initiate an uplink data transfer.

## Test procedure

The MS is triggered to initiate unacknowledged uplink data transfer. The SS shall send PACKET UPLINK ASSIGNMENT message including Multi Block Allocation struct information to instruct the MS to send PACKET RESOURCE REQUEST. The MS should perform a two-phase access i.e. the MS shall transmit a PACKET RESOURCE REQUEST message on the allocated uplink resource.

The RLC\_OCTET\_COUNT field shall indicate the number of LLC data octets the MS wishes to transfer.

The SS should then respond with PACKET UPLINK ASSIGNMENT message and the MS should begin transmitting RLC data blocks on the allocated uplink resources. The SS allows the MS to complete the sending of the data.

## Maximum duration of the test

2 minutes.

## Expected sequence

| Step | Direction | Message                                    | Comments                                                                                                                 |
|------|-----------|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                                            | The MS is triggered to initiate the transfer of 100 user data octets.                                                    |
| 2    | MS -> SS  | EGPRS PACKET CHANNEL REQUEST               | Two Phase Access Request. Received on PRACH.                                                                             |
| 3    | SS -> MS  | PACKET UPLINK ASSIGNMENT                   | Multi block allocation struct. Sent on PAGCH.                                                                            |
| 4    | MS -> SS  | PACKET RESOURCE REQUEST                    | Received on the single block assigned in step 3.                                                                         |
| 5    | SS -> MS  | PACKET UPLINK ASSIGNMENT                   | Dynamic allocation struct. Sent on the PACCH of the assigned PDCH.                                                       |
| 6    |           | {Uplink data transfer, dynamic allocation} | Macro. Completion from step 4 in the TBF procedure.                                                                      |
| 7    | SS        |                                            | The SS verifies that the MS has transferred the number of user data octets indicated in step 4 as RLC_OCTET_COUNT value. |

## Specific message contents

None.

52.1.2.1.9.2 Packet Uplink Assignment / Two phase access / Contention resolution

52.1.2.1.9.2.1 Packet Uplink Assignment / Two phase access / Contention resolution / Expiry of timer T3168

52.1.2.1.9.2.1.1 Conformance requirements

The contention resolution has failed on the mobile station side when the mobile station does not receive a PACKET UPLINK ASSIGNMENT message with its TLLI before expiry of timer T3168. The mobile station shall then reinitiate the packet access procedure unless it has already been repeated 4 times. In that case, TBF failure has occurred.

## Reference

3GPP TS 04.60 subclause 7.1.3.3.

## 52.1.2.1.9.2.1.2 Test purpose

To verify that the mobile station reinitiates the packet access procedure after a time equal to timer T3168 and the procedure shall be repeated 4 times.

## 52.1.2.1.9.2.1.3 Method of test

## Initial conditions

## System Simulator:

1 cell supporting EGPRS. PSI GPRS Cell Options, T3168 = 7.

## Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 1 has been established.

## Related PICS/PIXIT statement

- Support EGPRS service.
- Support PDP context.
- Method of triggering the MS to initiate an uplink data transfer.

## Test procedure

The MS is triggered to initiate unacknowledged uplink data transfer. The SS sends PACKET UPLINK ASSIGNMENT message including Multi Block Allocation struct information to order the MS to send PACKET RESOURCE REQUEST message. The MS shall perform a two-phase access i.e. the MS shall transmit a PACKET RESOURCE REQUEST message on the allocated uplink resource. The SS wait for a time greater than timer T3168 so the MS shall reinitiate packet access procedure. This procedure shall be repeated 4 times.

## Maximum duration of the test

2 minutes.

## Expected sequence

| Step | Direction | Message                      | Comments                                                                                            |
|------|-----------|------------------------------|-----------------------------------------------------------------------------------------------------|
| 1    | MS        |                              | The MS is triggered to initiate packet uplink transfer of an LLC PDU consisting of 200 octets data. |
| 2    | MS -> SS  | EGPRS PACKET CHANNEL REQUEST | Two Phase Access Request. Received on PRACH.                                                        |
| 3    | SS -> MS  | PACKET UPLINK ASSIGNMENT     | Multi Block Allocation struct. Sent on PAGCH.                                                       |
| 4    | MS -> SS  | PACKET RESOURCE REQUEST      | ACCESS_TYPE = "Two Phase Access Request".<br>Received on the single block assigned in step 3.       |
| 5    | SS        |                              | The SS waits T3168 expiry.                                                                          |
| 6    |           |                              | The SS verifies that the MS reinitiate packet access procedure four times.                          |

## Specific message contents

None.

52.1.2.1.9.2.2 Packet Uplink Assignment / Two phase access / Contention resolution / TLLI in Packet Resource Request message

52.1.2.1.9.2.2.1 Conformance requirements

The mobile station shall provide the network with its radio access capabilities for the frequency bands it supports, in the same priority order as the one specified by the network, by sending a PACKET RESOURCE REQUEST message, and

an ADDITIONAL MS RADIO ACCESS CAPABILITIES if all the requested informations do not fit in the PACKET RESOURCE REQUEST.

The mobile station shall include the TLLI in these two messages until contention resolution. After that, the mobile station shall use the uplink TFI whenever these messages are repeated.

The network may request a retransmission of the PACKET RESOURCE REQUEST and the ADDITIONAL MS RADIO ACCESS CAPABILITIES messages. A request for retransmission of one or both of these messages shall be indicated in the PACKET UPLINK ACK/NACK message. The mobile station has to indicate within the PACKET RESOURCE REQUEST if the message is a retransmitted one.

If the mobile station has been allocated two radio blocks and all the requested information fit in the PACKET RESOURCE REQUEST message, no ADDITIONAL MS RADIO ACCESS CAPABILITIES message shall be sent. Instead, some uplink control block (e.g. packet measurement report, packet uplink dummy control block) may be sent by the mobile station.

The network may indicate in the next PACKET UPLINK ASSIGNMENT message a request for retransmission of the ADDITIONAL MS RADIO ACCESS CAPABILITIES message.

## Reference

3GPP TS 04.60 subclauses 7.1.2.2.1a and 7.1.3.2.

### 52.1.2.1.9.2.2 Test purpose

To verify that the MS includes TLLI in both PACKET RESOURCE REQUEST message, and ADDITIONAL MS RADIO ACCESS CAPABILITIES, if it is present.

To verify that the mobile responds correctly for a request for retransmission of one or both of these messages indicated in the PACKET UPLINK ACK/NACK message.

To verify that the mobile station indicates within the PACKET RESOURCE REQUEST if the message is a retransmitted one and includes TLLI in the message until contention resolution.

To verify that the mobile station does not include TLLI in any of these messages after contention resolution.

### 52.1.2.1.9.2.3 Method of test

#### Initial conditions

System Simulator:

1 cell supporting EGPRS.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 1 has been established.

#### Related PICS/PIXIT statement

- Support EGPRS service.
- Support PDP context.
- Method of triggering the MS to initiate an uplink data transfer.

#### Test procedure

The MS is triggered to initiate unacknowledged uplink data transfer. The SS responds with PACKET UPLINK ASSIGNMENT message that request two phase access and requesting Radio Access Capabilities of frequency bands supported by the mobile. The MS shall then send PACKET RESOURCE REQUEST message and optionally an ADDITIONAL MS RADIO ACCESS CAPABILITIES message with Radio Access Capabilities included.

The SS responds with PACKET UPLINK Ack/Nack message requesting retransmission of PACKET RESOURCE REQUEST and if sent by the mobile, a retransmission of ADDITIONAL MS RADIO ACCESS CAPABILITIES message.

SS verifies that the mobile retransmit the messages, with TLLI included in the messages.

The SS responds with PACKET UPLINK ASSIGNMENT message, with a valid TLLI and requesting retransmission of ADDITIONAL MS RADIO ACCESS CAPABILITIES message, if it was sent by the mobile.

The SS verifies that the mobile retransmit the ADDITIONAL MS RADIO ACCESS CAPABILITIES message, if applicable, without a TLLI field and addressed by TFI.

Maximum duration of the test

5 minutes.

Expected sequence

| Step | Direction | Message                                            | Comments                                                                                                                                                                                                                                                                                                                  |

#### 52.1.2.1.9.2.3 Packet Uplink Assignment / Two phase access / Contention resolution / TLLI mismatch

The contention resolution is completed on the mobile station side when the mobile station receives a PACKET UPLINK ASSIGNMENT message with the same TLLI as the mobile station has included in the PACKET RESOURCE REQUEST message.

##### 52.1.2.1.9.2.3.1 Conformance requirements

If the failure is due to a TLLI mismatch, or to the expiry of timers T3166 or T3168, or to the fact that the counter N3104 reaches its maximum value in the contention resolution procedure, and repetition as described in subclauses 7.1.2.3, 7.1.3.2.1 or 7.1.3.3 has been performed, the mobile station shall remain in packet idle mode, notify higher layer (TBF establishment failure), transactions in progress shall be aborted and cell reselection continued, unless the failure takes place during a RR-cell change order procedure, in which case the mobile behaviour shall be as described in the Abnormal cases of the RR-Network Commanded Cell Change Order Procedure in 3GPP TS 04.08.

#### Reference

3GPP TS 04.60 subclauses 7.1.4 and 7.1.3.3.

##### 52.1.2.1.9.2.3.2 Test purpose

To verify that the MS reinitiates packet access procedure with failure due to a TLLI mismatch in the contention resolution procedure, unless it has already been repeated 4 times. In that case, TBF failure has occurred.

##### 52.1.2.1.9.2.3.3 Method of test

#### Initial conditions

System Simulator:

1 cell supporting EGPRS.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 1 has been established.

#### Related PICS/PIXIT statement

- Support EGPRS service.
- Support PDP context.
- Method of triggering the MS to initiate an uplink data transfer.

## Test procedure

The MS is triggered to initiate unacknowledged uplink data transfer. The SS responds with PACKET UPLINK ASSIGNMENT message that request two phase access. The MS shall then send PACKET RESOURCE REQUEST message. The SS responds with PACKET UPLINK ASSIGNMENT message with a TLLI different to that the MS has sent in PACKET RESOURCE REQUEST message. The MS shall reinitiate the packet access procedure.

This procedure shall be repeated 4 times.

## Maximum duration of the test

2 minutes.

## Expected sequence

| Step | Direction | Message                      | Comments                                                                                                 |
|------|-----------|------------------------------|----------------------------------------------------------------------------------------------------------|
| 1    | MS        |                              | The MS is triggered to initiate packet uplink transfer of an LLC PDU consisting of 200 octets data.      |
| 2    | MS -> SS  | EGPRS PACKET CHANNEL REQUEST | Two Phase Access Request. Received on PRACH.                                                             |
| 3    | SS -> MS  | PACKET UPLINK ASSIGNMENT     | Multi Block Allocation struct. Sent on PAGCH.                                                            |
| 4    | MS -> SS  | PACKET RESOURCE REQUEST      | ACCESS_TYPE = "Two Phase Access Request". Include TLLI. Received on the single block assigned in step 3. |
| 5    | SS -> MS  | PACKET UPLINK ASSIGNMENT     | Include incorrect TLLI according to step 4. Sent on the PACCH of the assigned PDCH.                      |
| 6    |           |                              | The SS verifies that the MS reinitiate packet access procedure four times.                               |

## Specific message contents

None.

### 52.1.2.1.9.3 Packet Uplink Assignment / Two phase access / Radio Access Capabilities

#### 52.1.2.1.9.3.1 Conformance requirements

When assigning an EGPRS TBF, the network may request information about radio access capabilities of the mobile station on one or several frequency bands within the PACKET UPLINK ASSIGNMENT message ; the list of frequency bands is ordered by the network starting with the most important and ending with the least important one . The mobile station shall provide the network with its radio access capabilities for the frequency bands it supports, in the same priority order as the one specified by the network, by sending a PACKET RESOURCE REQUEST message, and an ADDITIONAL MS RADIO ACCESS CAPABILITIES if all the requested informations do not fit in the PACKET RESOURCE REQUEST. . If the mobile station does not support any frequency band requested by the network, it shall report its radio access capabilities for the BCCH frequency band. The mobile station shall indicate in the PACKET RESOURCE REQUEST if it will send more information about its radio access capabilities in the ADDITIONAL MS RADIO ACCESS CAPABILITIES message. The PACKET RESOURCE REQUEST and the ADDITIONAL MS RADIO ACCESS CAPABILITIES shall be sent within the one or two first radio blocks allocated for the mobile station on the assigned PDCH.

## Reference

3GPP TS 04.60 subclauses 7.1.2.2.1a and 7.1.3.2.

### 52.1.2.1.9.3.2 Test purpose

To verify that the mobile station provides the network with the radio access capabilities of the frequency bands it supports.

To verify that the mobile station provides the radio access capabilities in the same priority order as the one specified by network.

To verify that the PACKET RESOURCE REQUEST and the ADDITIONAL MS RADIO ACCESS CAPABILITIES are sent within the one or two first radio blocks allocated for the mobile station on the assigned PDCH.

#### 52.1.2.1.9.3.3 Method of test

##### Initial conditions

System Simulator:

1 cell supporting EGPRS.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 1 has been established.

##### Related PICS/PIXIT statement

- Support EGPRS service.
- Support PDP context.
- Method of triggering the MS to initiate an uplink data transfer.

##### Test procedure

The MS is triggered to initiate unacknowledged uplink data transfer. The SS shall send PACKET UPLINK ASSIGNMENT message with Access Technology request for all the bands. The MS shall respond back with a PACKET RESOURCE REQUEST and an ADDITIONAL MS RADIO ACCESS CAPABILITIES message, if the information do not fir in the PACKET RESOURCE REQUEST message.

SS verifies that the Radio Access Capabilities of all the frequency bands requested are available and are in the same priority as requested by the SS.

##### Maximum duration of the test

10 minutes.

52.1.2.1.9.4 Packet Uplink Assignment / Two phase access / Radio Access Capabilities/  
Frequency band not supported..

52.1.2.1.9.4.1 Conformance requirements

When assigning an EGPRS TBF, the network may request information about radio access capabilities of the mobile station on one or several frequency bands within the PACKET UPLINK ASSIGNMENT message ; the list of frequency bands is ordered by the network starting with the most important and ending with the least important one . The mobile station shall provide the network with its radio access capabilities for the frequency bands it supports, in the same priority order as the one specified by the network, by sending a PACKET RESOURCE REQUEST message, and an ADDITIONAL MS RADIO ACCESS CAPABILITIES if all the requested informations do not fit in the PACKET RESOURCE REQUEST. . If the mobile station does not support any frequency band requested by the network, it shall report its radio access capabilities for the BCCH frequency band. The mobile station shall indicate in the PACKET RESOURCE REQUEST if it will send more information about its radio access capabilities in the ADDITIONAL MS RADIO ACCESS CAPABILITIES message. The PACKET RESOURCE REQUEST and the ADDITIONAL MS RADIO ACCESS CAPABILITIES shall be sent within the one or two first radio blocks allocated for the mobile station on the assigned PDCH.

#### Reference

3GPP TS 04.60 subclauses 7.1.2.2.1a and 7.1.3.2.

52.1.2.1.9.4.2 Test purpose

To verify that if the mobile station does not support any of the frequency band requested by the network, it shall report its radio access capability for the BCCH frequency band.

52.1.2.1.9.4.3 Method of test

#### Initial conditions

System Simulator:

1 cell supporting EGPRS.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 1 has been established.

#### Related PICS/PIXIT statement

- Support EGPRS service.
- Support PDP context.
- Method of triggering the MS to initiate an uplink data transfer.

## Test procedure

The MS is triggered to initiate unacknowledged uplink data transfer. The SS shall send PACKET UPLINK ASSIGNMENT message with Access Technology request for the bands not supported by the MS. SS verifies that MS reports its radio access capability for the BCCH frequency band in the PACKET RESOURCE REQUEST message.

## Maximum duration of the test

10 minutes.

52.1.2.1.9.5 Packet Uplink Assignment / Two phase access / Packet Resource Request / No respond to Packet Downlink Assignment

### 52.1.2.1.9.5.1 Conformance requirements

When the mobile station has received a PACKET UPLINK ASSIGNMENT message it shall respond with a PACKET RESOURCE REQUEST message in the allocated single radio block. At sending of the PACKET RESOURCE REQUEST message, the mobile station shall start timer T3168. Further more, the mobile station shall not respond to PACKET DOWNLINK ASSIGNMENT messages while timer T3168 is running.

## Reference

3GPP TS 04.60 subclause 7.1.3.1.

### 52.1.2.1.9.5.2 Test purpose

To verify that the mobile station does not respond to PACKET DOWNLINK ASSIGNMENT messages while timer T3168 is running after sending of the PACKET RESOURCE REQUEST message.

## 52.1.2.1.9.5.3 Method of test

## Initial conditions

## System Simulator:

1 cell supporting EGPRS.

T3168 indicates value 7 in GPRS Cell Options.

## Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

## Related PICS/PIXIT statement

- Support EGPRS service.
- Support PDP context.
- Method of triggering the MS to initiate an uplink data transfer.

## Test procedure

The MS is triggered to initiate unacknowledged uplink data transfer. The SS shall send PACKET UPLINK ASSIGNMENT message including Multi block allocation struct information to instruct the MS to send PACKET RESOURCE REQUEST. The MS should perform a two-phase access i.e. the MS shall transmit a PACKET RESOURCE REQUEST message on the allocated uplink resource.

While timer T3186 is running the SS send PACKET DOWNLINK ASSIGNMENT message and starts to send data on the allocated downlink before the timer expire. The MS shall not respond to the Downlink data transfer.

The SS should then send PACKET UPLINK ASSIGNMENT message before the timer T3168 expire and the MS should then begin transmitting RLC data blocks on the allocated uplink resources. The SS allows the MS to complete the sending of the data.

## Maximum duration of the test

2 minutes.

## Expected sequence

| Step | Direction | Message                                    | Comments                                                                                            |
|------|-----------|--------------------------------------------|-----------------------------------------------------------------------------------------------------|
| 1    | MS        |                                            | The MS is triggered to initiate packet uplink transfer of an LLC PDU containing 400 octets of data. |
| 2    | MS -> SS  | EGPRS PACKET CHANNEL REQUEST               | Two Phase Access Request. Received on PRACH.                                                        |
| 3    | SS -> MS  | PACKET UPLINK ASSIGNMENT                   | Multi block allocation struct. Sent on PAGCH.                                                       |
| 4    | MS -> SS  | PACKET RESOURCE REQUEST                    | Received on the single block assigned in step 3.                                                    |
| 5    | SS -> MS  | PACKET DOWNLINK ASSIGNMENT                 | Sent on PACCH.                                                                                      |
| 6    | SS -> MS  | DOWNLINK RLC DATA BLOCK                    | Sent on the assigned PDTCH with poll bit set to 1.                                                  |
|      | SS        |                                            | Verify no response from the MS.                                                                     |
| 7    | SS -> MS  | PACKET UPLINK ASSIGNMENT                   | Dynamic allocation struct. Sent on the PACCH of the assigned PDCH 0,9* T3168.                       |
| 8    |           | {Uplink data transfer, dynamic allocation} | Macro. Completion from step 4 in the TBF procedure.                                                 |

## Specific message contents

### 52.1.2.1.10 Packet Uplink Assignment / Abnormal cases

#### 52.1.2.1.10.1 Packet Uplink Assignment / Abnormal cases / Incorrect PDCH assignment

##### 52.1.2.1.10.1.1 Conformance requirements

If the mobile station has been assigned more PDCHs than it supports according to its MS multislot class, the mobile station shall reinitiate the packet access procedure unless it has already been repeated 4 times. In that case, TBF failure has occurred.

#### Reference

3GPP TS 04.60 subclause 7.1.4.

##### 52.1.2.1.10.1.2 Test purpose

To verify that the mobile station reinitiates the packet access procedure when the mobile station has been assigned more PDCHs than it supports and after 4 repetitions of the packet access procedure the mobile station shall initiate TBF failure.

##### 52.1.2.1.10.1.3 Method of test

#### Initial conditions

System Simulator:

1 cell supporting EGPRS.

Mobile Station:

The MS is switched off.

#### Related PICS/PIXIT statement

- Support EGPRS service.
- Switch off on button Yes/No.
- Multislot class.
- Method of trigger GPRS attach.

#### Test procedure

Convert the MS Multislot Class to number of uplink timeslot supported.

The MS is switched on and triggered to perform a GPRS attach. The SS sends PACKET UPLINK ASSIGNMENT message containing more assigned PDCHs than the MS supports according to its multislot class. The MS shall reinitiate packet access procedure; this procedure shall be repeated 4 times.

#### Maximum duration of the test

2 minutes.

Expected sequence

| Step | Direction | Message                  | Comments                                                                   |
|------|-----------|--------------------------|----------------------------------------------------------------------------|
| 1    | MS        |                          | The MS is switched on and triggered to perform a GPRS attach.              |
| 2    | MS -> SS  | PACKET CHANNEL REQUEST   | Received on PRACH.                                                         |
| 3    | SS -> MS  | PACKET UPLINK ASSIGNMENT | Assign one more Tx than the MS supported . Sent on PAGCH.                  |
| 4    |           |                          | The SS verifies that the MS reinitiate packet access procedure four times. |

Specific message contents

None.

52.1.2.1.10.2 Packet Uplink Assignment / Abnormal cases / Expiry of timer T3164

52.1.2.1.10.2.1 Conformance requirements

On expiry of timer T3164, the mobile station shall reinitiate the packet access procedure unless it has already been reinitiated 3 times, in which case the mobile station shall return to packet idle mode and notify higher layers.

Reference

3GPP TS 04.60 subclause 7.1.4.

52.1.2.1.10.2.2 Test purpose

To verify that the mobile station reinitiate the packet access procedure when the network have sent a PACKET UPLINK ASSIGNMENT message but the MS has not sent the first block within the time equal to the timer T3164. This packet access procedure shall at most be reinitiated 3 times.

52.1.2.1.10.2.3 Method of test

Initial conditions

System Simulator:

1 cell supporting EGPRS.

The packet system information ACCESS\_BURST\_TYPE indicates 8 bit access.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

Related PICS/PIXIT statement

- Support EGPRS service.
- Support PDP context.
- Method of triggering the MS to initiate an uplink data transfer.

Test procedure

The MS is triggered to initiate uplink data transfer. The SS sends PACKET UPLINK ASSIGNMENT message with a USF assigned to the MS. The SS shall send PACKET DOWNLINK DUMMY CONTROL BLOCK messages with USF not assigned to the MS. The SS verifies that the MS reinitiate packet access procedure after a time equal to timer T3164; this shall be repeated 3 times.

Maximum duration of the test

1 minute.

Expected sequence

| Step | Direction | Message                              | Comments                                                                                                       |
|------|-----------|--------------------------------------|----------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                                      | The MS is triggered to initiate packet uplink transfer of an LLC PDU consisting of 200 octets data.            |
| 2    | MS -> SS  | EGPRS PACKET CHANNEL REQUEST         | Received on PRACH.                                                                                             |
| 3    | SS -> MS  | PACKET UPLINK ASSIGNMENT             | Allocate a USF for the MS. Sent on PAGCH.                                                                      |
| 4    | SS -> MS  | PACKET DOWNLINK DUMMY CONTROL BLOCKs | Don't contain the assigned USF in step 3. Repeat step 4 during timer T3164 is running.                         |
| 5    | MS        |                                      | The SS verifies that the packet access procedure is reinitiated after a time equal to timer T3164 three times. |

Specific message contents

None.

## 52.1.2.2 Packet Downlink Assignment

### 52.1.2.2.1 Packet Downlink Assignment / Response to poll bit

#### 52.1.2.2.1.1 Conformance requirements

In case valid timing advance for the mobile station is not available, the network may use one of the following two methods to trigger the mobile station to transmit a PACKET CONTROL ACKNOWLEDGEMENT:

- if the PACKET DOWNLINK ASSIGNMENT message is not segmented and the CONTROL\_ACK\_TYPE parameter in the System Information indicates acknowledgement is access bursts, the network may set the poll bit in the PACKET DOWNLINK ASSIGNMENT message;
- if the PACKET DOWNLINK ASSIGNMENT message is segmented or the CONTROL\_ACK\_TYPE parameter in the System Information does not indicate acknowledgement is access bursts, the network may send PACKET POLLING REQUEST with TYPE\_OF\_ACK parameter set to access bursts (see subclause 11.2.12).

The mobile station shall always transmit the uplink radio block on the same timeslot as the block where the RRBP was received. After receiving an RLC/MAC block containing a valid RRBP field the mobile station need not monitor the USF in the associated downlink RLC/MAC block appearing just before the uplink block it shall transmit.

Reference

3GPP TS 04.60 subclause 7.2.1.1 and 10.4.5.

#### 52.1.2.2.1.2 Test purpose

To verify that the mobile station sends PACKET CONTROL ACKNOWLEDGEMENT as four access bursts if the network sets the poll bit in the PACKET DOWNLINK ASSIGNMENT message when CONTROL\_ACK\_TYPE is set to four access bursts.

#### 52.1.2.2.1.3 Method of test

Initial conditions

System Simulator:

1 cell supporting EGPRS. The packet system information CONTROL\_ACK\_TYPE is set to indicate PACKET CONTROL ACKNOWLEDGEMENT format as four access bursts and the ACCESS\_BURST\_TYPE indicates 11 bit access.

Mobile Station:

The MS is GPRS attached and in packet idle mode and Ready state.

Related PICS/PIXIT statement

- Support EGPRS service.

Test procedure

The SS initiate a downlink data transfer. The SS sends PACKET DOWNLINK ASSIGNMENT message. The poll bit in the MAC header of the PACKET DOWNLINK ASSIGNMENT message will be set to indicate RRBP field is valid. The MS may delay the establishment of the downlink channels in order to answer the poll request on the common control channel. The SS verifies that the MS sends PACKET CONTROL ACKNOWLEDGEMENT as four access bursts on the timeslot on which it received the polling command.

Maximum duration of the test

2 minutes.

Expected sequence

| Step | Direction | Message                        | Comments                                                                                                                                                   |
|------|-----------|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS        |                                | The SS initiate a downlink transfer of 200 octets data.                                                                                                    |
| 2    | SS -> MS  | PACKET DOWNLINK ASSIGNMENT     | Poll bit in the MAC header is set to indicate a valid RRBP = 1. Sent on PCCCH.                                                                             |
| 3    | MS -> SS  | PACKET CONTROL ACKNOWLEDGEMENT | As four access bursts. Received on PCCCH.                                                                                                                  |
| 4    | SS        |                                | The SS verifies that the MS sends the PACKET CONTROL ACKNOWLEDGEMENT as four access bursts, one per TDMA frame of the uplink radio block and the RRBP = 1. |

Specific message contents

None.

#### 52.1.2.2.2 Packet Downlink Assignment / PCCCH monitoring

##### 52.1.2.2.2.1 Conformance requirements

A PACKET DOWNLINK ASSIGNMENT message may indicate an assignment starting time in the TBF Starting Time parameter. The mobile station shall monitor PCCCH until the point in time denoted by the TBF Starting Time. Thereafter it shall switch to the assigned PDCHs. If while monitoring the PCCCH the mobile station receives more than one PACKET DOWNLINK ASSIGNMENT message, it shall act upon the most recently received message and shall ignore the previous message.

Reference

3GPP TS 04.60 subclause 7.2.1.1.

##### 52.1.2.2.2.2 Test purpose

To verify that the mobile station monitors PCCCH until the point in time denoted by the TBF Starting Time..

To verify that the mobile station considers the most recently received PACKET DOWNLINK ASSIGNMENT message.

## 52.1.2.2.2.3 Method of test

## Initial conditions

## System Simulator:

1 cell supporting EGPRS. The packet system information ACCESS\_BURST\_TYPE indicates 8 bit access.

## Mobile Station:

The MS is GPRS attached and in packet idle mode and Ready state.

## Related PICS/PIXIT statement

- Support of GPRS Yes/No.

## Test procedure

The SS initiate a downlink data transfer. The SS sends PACKET DOWNLINK ASSIGNMENT message to the MS with a TBF starting time. Then send a new PACKET DOWNLINK ASSIGNMENT message on PCCCH (within the paging group of the MS) with another TBF starting time and a different timeslot before the first starting time has occurred. The SS starts to send RLC/MAC data blocks according to the second PACKET DOWNLINK ASSIGNMENT message. The MS shall send EGPRS PACKET DOWNLINK ACK/NACK message to indicate correct reception of data blocks.

## Maximum duration of the test

2 minutes.

## Expected sequence

| Step | Direction | Message                        | Comments                                                                                                    |
|------|-----------|--------------------------------|-------------------------------------------------------------------------------------------------------------|
| 1    | SS        |                                | The SS initiate a downlink transfer of 200 octets data.                                                     |
| 2    | SS -> MS  | PACKET DOWNLINK ASSIGNMENT     | See specific message contents. Sent on PCCCH.                                                               |
| 3    | SS -> MS  | PACKET DOWNLINK ASSIGNMENT     | Sent 3 blocks before TBF starting time in step 2 has elapsed. See specific message contents. Sent on PCCCH. |
| 4    | SS -> MS  | DOWNLINK RLC DATA BLOCK        | SS sends data starting at frame as indicated by TBF starting time in step 3 on assigned PDTCH.              |
| 5    | MS -> SS  | EGPRS PACKET DOWNLINK ACK/NACK | Indicating correct reception of downlink data block. Received on PACCH.                                     |

## Specific message contents

As default messages contents, except:

## PACKET DOWNLINK ASSIGNMENT in step 2

| Information element                              | Value/remark                                                                                                                                                            |

52.1.2.2.3 Void

52.1.2.2.4 Packet Downlink Assignment / Response to Packet Polling

52.1.2.2.4.1 Conformance requirements

In case valid timing advance for the mobile station is not available, the network may use one of the following two methods to trigger the mobile station to transmit a PACKET CONTROL ACKNOWLEDGEMENT:

- if the PACKET DOWNLINK ASSIGNMENT message is not segmented and the CONTROL\_ACK\_TYPE parameter in the System Information indicates acknowledgement is access bursts, the network may set the poll bit in the PACKET DOWNLINK ASSIGNMENT message;
- if the PACKET DOWNLINK ASSIGNMENT message is segmented or the CONTROL\_ACK\_TYPE parameter in the System Information does not indicate acknowledgement is access bursts, the network may send PACKET POLLING REQUEST with TYPE\_OF\_ACK parameter set to access bursts (see subclause 11.2.12).

On receipt of a PACKET POLLING REQUEST message, the mobile station shall respond to the network with the PACKET CONTROL ACKNOWLEDGEMENT message in the block period specified by the RRBp field. If the MS has received a PACKET DOWNLINK ASSIGNMENT message with no starting time or with a starting time that has already elapsed, the PACKET POLLING REQUEST message shall be sent on PACCH. Otherwise the PACKET POLLING REQUEST message shall be sent on PAGCH.

## Reference

3GPP TS 04.60 subclauses 7.2.1.3 and 7.2.1.1.

52.1.2.2.4.2 Test purpose

To verify that on receipt of a PACKET POLLING REQUEST message, the mobile station responds with PACKET CONTROL ACKNOWLEDGEMENT message in the block period specified by the RRBp field.

52.1.2.2.4.3 Method of test

## Initial conditions

## System Simulator:

1 cell supporting EGPRS. The packet system information CONTROL\_ACK\_TYPE is set to not indicate acknowledgement as four access bursts and ACCESS\_BURST\_TYPE indicate 8 bit access.

## Mobile Station:

The MS is GPRS attached and in packet idle mode and Ready state.

## Related PICS/PIXIT statement

- Support EGPRS service.

## Test procedure

The SS initiate a downlink data transfer. The SS sends PACKET DOWNLINK ASSIGNMENT message to the MS with a TBF starting time. The SS sends a PACKET POLLING REQUEST message containing a valid RRBp field. The SS verifies that the MS sends a PACKET CONTROL ACKNOWLEDGEMENT message in the block period specified

by the RRBp field. The SS sends PACKET PDCH RELEASE message to the MS. The SS initiate a downlink data transfer. The SS sends PACKET DOWNLINK ASSIGNMENT message to the MS without TBF starting time. The SS sends a PACKET POLLING REQUEST message containing a valid RRBp field. The SS verifies that the MS sends a PACKET CONTROL ACKNOWLEDGEMENT message in the block period specified by the RRBp field.

Maximum duration of the test

5 minutes.

### 52.1.2.2.5 Packet Downlink Assignment / Abnormal cases

#### 52.1.2.2.5.1 Packet Downlink Assignment / Abnormal cases / Incorrect PDCH assignment

##### 52.1.2.2.5.1.1 Conformance requirements

If the mobile station has been assigned more PDCHs than it supports according to its MS multislot class, the mobile station shall return to packet idle mode.

#### Reference

3GPP TS 04.60 subclause 7.2.2.

##### 52.1.2.2.5.1.2 Test purpose

To verify that the mobile station return to packet idle mode if the mobile station is assigned more PDCHs than it supports according to its EGPRS multislot class.

##### 52.1.2.2.5.1.3 Method of test

#### Initial conditions

System Simulator:

1 cell supporting EGPRS.

Mobile Station:

The MS is GPRS attached and in packet idle mode and Ready state.

#### Related PICS/PIXIT statement

- Support EGPRS service.
- Multislot Class.

#### Test procedure

Convert the MS EGPRS Multislot Class to number of downlink timeslot supported.

The SS initiated a downlink data transfer. The SS sends PACKET DOWNLINK ASSIGNMENT message containing one more assigned Rx than the MS supports according to its EGPRS multislot class. The SS sends RLC data blocks. The SS verify that the MS not respond to the RLC data blocks sent by SS. Verify that the MS return to packet idle mode.

The SS sends PACKET DOWNLINK ASSIGNMENT message again containing correct amount of Rx timeslots according to the MS EGPRS multislot class. The SS starts to send RLC data blocks and the MS complete the downlink data transfer.

#### Maximum duration of the test

2 minutes.

Expected sequence

| Step | Direction | Message                        | Comments                                                                                                |
|------|-----------|--------------------------------|---------------------------------------------------------------------------------------------------------|
| 1    | SS        |                                | The SS initiate a downlink transfer of 200 octets data.                                                 |
| 2    | SS -> MS  | PACKET DOWNLINK ASSIGNMENT     | Assign one more Rx timeslot than the MS supports according to its EGPRS multislot class. Sent on PCCCH. |
| 3    | SS        |                                | Wait one block period.                                                                                  |
| 4    | SS -> MS  | DOWNLINK RLC DATA BLOCK        | Sent on assigned PDTCHs.                                                                                |
| 5    | SS        |                                | Verify for 10 seconds that the MS not respond.                                                          |
| 6    | SS -> MS  | PACKET DOWNLINK ASSIGNMENT     | Assign Rx timeslot according to the MS EGPRS multislot class. Sent on PCCCH.                            |
| 7    | SS -> MS  | DOWNLINK RLC DATA BLOCK        | Sent on assigned PDTCHs with a valid RRB field.                                                         |
| 8    | MS -> SS  | EGPRS PACKET DOWNLINK ACK/NACK | The SS verifies that the MS indicating correct reception of downlink data blocks. Received on PACCH.    |

Specific message contents

None.

52.1.2.2.5.2 Packet Downlink Assignment / Abnormal cases / Expiry of timer T3190

52.1.2.2.5.2.1 Conformance requirements

When receiving the PACKET DOWNLINK ASSIGNMENT message and after waiting the TBF Starting Time when applicable, the mobile station starts timer T3190. The timer is reset when receiving the first valid RLC/MAC block.

On expiry of timer T3190, the mobile station shall return to packet idle mode.

Reference

3GPP TS 04.60 subclauses 7.2.1.1 and 7.2.2.

52.1.2.2.5.2.2 Test purpose

To verify that the mobile station aborts the TBF and returns to packet idle mode if a valid RLC block is not received within the duration of timer T3190.

52.1.2.2.5.2.3 Method of test

Initial conditions

System Simulator:

1 cell supporting EGPRS. The packet system information ACCESS\_BURST\_TYPE indicates 8 bit access.

Mobile Station:

The MS is GPRS attached and in packet idle mode and Ready state.

Related PICS/PIXIT statement

- Support EGPRS service.

Test procedure

The SS initiate a downlink data transfer. The SS sends PACKET DOWNLINK ASSIGNMENT message to the MS. The SS wait to send RLC data blocks for a time greater than timer T3190. The SS verifies that the MS not respond to the RLC data blocks sent by SS.

The SS reinitiate the sending of downlink data transfer. The SS sends PACKET DOWNLINK ASSIGNMENT message again and starts to send RLC data blocks after a time less than timer T3190. The MS shall complete the downlink data transfer.

Maximum duration of the test

2 minutes.

Expected sequence

| Step | Direction | Message                           | Comments                                                                                             |
|------|-----------|-----------------------------------|------------------------------------------------------------------------------------------------------|
| 1    | SS        |                                   | The SS initiate a downlink transfer of 200 octets data.                                              |
| 2    | SS -> MS  | PACKET DOWNLINK ASSIGNMENT        | Not indicating any TBF Starting Time. Sent on PCCCH.                                                 |
| 3    | SS        |                                   | The SS waits timer T3190 + 0.1*T3190.                                                                |
| 4    | SS -> MS  | DOWNLINK RLC DATA BLOCK           | Sent on assigned PDTCHs.                                                                             |
| 5    | SS        |                                   | Verify for 10 seconds that the MS not respond.                                                       |
| 6    | SS -> MS  | PACKET DOWNLINK ASSIGNMENT        | Reinitiate the downlink data transfer. Sent on PCCCH.                                                |
| 7    | SS        |                                   | The SS waits timer T3190 – 0.1*T3190.                                                                |
| 8    | SS -> MS  | DOWNLINK RLC DATA BLOCK           | Sent on assigned PDTCHs with a valid RRBP field.                                                     |
| 9    | MS -> SS  | EGPRS PACKET DOWNLINK<br>ACK/NACK | Indicating correct reception of downlink data blocks. SS verifies that ACK/NACK is sent from the MS. |

Specific message contents

## 52.1.3 Macro and default message contents

### 52.1.3.1 Macro

In order to simplify the process of writing and coding test cases, macros are referenced in the expected signaling tables. These macros provide all additional signaling needed to complete the particular test but are not relevant to its purpose. This Macro is only applicable to test case in subclauses 52.1.1 and 52.1.2.

#### 52.1.3.1.1 GPRS attach procedure

The following table describes a signaling sequence performing the GPRS attach procedure when PCCCH is present. Note that there are different possible sequences implementing the GPRS attach procedure. In this case we use dynamic allocation and simultaneous uplink and downlink TBFs.

{GPRS attach procedure}

| Step | Direction | Message                                      | Comments                                                                                                         |
|------|-----------|----------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| 1    |           |                                              | MS is triggered to initiate the GPRS attach procedure.                                                           |
| 2    | MS -> SS  | PACKET CHANNEL REQUEST                       | Mobility Management procedure request.                                                                           |
| 3    | SS -> MS  | PACKET UPLINK ASSIGNMENT                     | Indicate dynamic allocation struct.                                                                              |
| 4    | SS -> MS  | PACKET DOWNLINK DUMMY CONTROL BLOCK          | Containing USF assigned to the MS.                                                                               |
| 5    | MS -> SS  | UPLINK RLC DATA BLOCKs (GMM ATTACH REQUEST)  |                                                                                                                  |
| 6    | SS -> MS  | PACKET UPLINK ACK/NACK                       | Containing Final Ack Indicator bit = 1, and valid RRBp field.                                                    |
| 7    | MS -> SS  | PACKET CONTROL ACKNOWLEDGEMENT               | Sent in the block assigned by the RRBp field in step 6.                                                          |
| 8    | SS -> MS  | PACKET DOWNLINK ASSIGNMENT                   | Assign a downlink TBF, "MAC mode" = dynamic allocation.                                                          |
| 9    | SS -> MS  | DOWNLINK RLC DATA BLOCKs (GMM ATTACH ACCEPT) | Containing USF assigned to the MS. Last block shall contain Final Block Indicator bit = 1, and valid RRBp field. |
| 10   | MS -> SS  | EGPRS PACKET DOWNLINK ACK/NACK               | Sent in the block assigned by the RRBp field in step 9.                                                          |
| 11   | MS -> SS  | PACKET CHANNEL REQUEST                       | Mobility Management procedure request.                                                                           |
| 12   | SS -> MS  | PACKET UPLINK ASSIGNMENT                     | Indicate dynamic allocation struct.                                                                              |
| 13   | SS -> MS  | PACKET DOWNLINK DUMMY CONTROL BLOCK          | Containing USF assigned to the MS.                                                                               |
| 14   | MS -> SS  | UPLINK RLC DATA BLOCKs (GMM ATTACH COMPLETE) |                                                                                                                  |
| 15   | SS -> MS  | PACKET UPLINK ACK/NACK                       | Containing Final Ack Indicator bit = 1, and valid RRBp field.                                                    |
| 16   | MS -> SS  | PACKET CONTROL ACKNOWLEDGEMENT               | Sent in the block assigned by the RRBp field in step 15.                                                         |

## 52.1.3.1.2 Uplink data transfer, dynamic allocation

The following table describes a sequence performing uplink data transfer with one phase access dynamic allocation when PCCCH is present.

{Uplink data transfer, dynamic allocation}

| Step | Direction | Message                             | Comments                                                              |
|------|-----------|-------------------------------------|-----------------------------------------------------------------------|
| 1    |           |                                     | PDP context 2 has been established. The MS is triggered to send data. |
| 2    | MS -> SS  | EGPRS PACKET CHANNEL REQUEST        |                                                                       |
| 3    | SS -> MS  | PACKET UPLINK ASSIGNMENT            | One phase access, dynamic allocation struct.                          |
| 4    | SS -> MS  | PACKET DOWNLINK DUMMY CONTROL BLOCK | Containing USF assigned to the MS.                                    |
| 5    | MS -> SS  | UPLINK RLC DATA BLOCK(S)            | If USF_GRANULARITY = four blocks, 4 RLC data block will be sent.      |
| 6    | SS -> MS  | PACKET UPLINK ACK/NACK              | Containing USF assigned to the MS.                                    |
| 7    | MS -> SS  | UPLINK RLC DATA BLOCK(S)            | If USF_GRANULARITY = four blocks, 4 RLC data block will be sent.      |
| 8    |           |                                     | Repeat step 6 and 7 until the countdown value CV=0 in step 7 .        |
| 9    | SS -> MS  | PACKET UPLINK ACK/NACK              | Final Ack Indicator = 1 containing valid RRBp.                        |
| 10   | MS -> SS  | PACKET CONTROL ACKNOWLEDGEMENT      |                                                                       |

## 52.1.3.1.3 GPRS detach procedure

The following table describes a signalling sequence performing the GPRS detach procedure when PCCCH is present.

{GPRS detach procedure}

| Step | Direction | Message                                     | Comments                                                               |
|------|-----------|---------------------------------------------|------------------------------------------------------------------------|
| 1    | MS -> SS  | EGPRS PACKET CHANNEL REQUEST                |                                                                        |
| 2    | SS -> MS  | PACKET UPLINK ASSIGNMENT                    | Indicate dynamic allocation struct. Containing USF assigned to the MS. |
| 3    | SS -> MS  | PACKET DOWNLINK DUMMY CONTROL BLOCK         |                                                                        |
| 4    | MS -> SS  | UPLINK RLC DATA BLOCKs (GMM DETACH REQUEST) |                                                                        |
| 5    | SS -> MS  | PACKET UPLINK ACK/NACK                      | Containing Final Ack Indicator bit = 1, and valid RRBP field.          |
| 6    | MS -> SS  | PACKET CONTROL ACKNOWLEDGEMENT              |                                                                        |

## 52.1.3.2 Default Messages

These default message contents override those specified in "GPRS default conditions" but messages specified in a test case have always the highest precedence.

## 52.1.3.2.1 EGPRS PACKET CHANNEL REQUEST message:

|                      |                                                          |
|----------------------|----------------------------------------------------------|
| < Access Type >      | "One phase access request" or "Two phase access request" |
| < Multislot class >  | Not checked                                              |

52.2 Void

## 52.3 EGPRS Testcases for Dynamic Allocation in Packet Transfer Mode

All test cases in this clause are applicable to the MS supporting the EGPRS service and the activation of at least one PDP context.

## 52.3.1 Dynamic Allocation / Uplink Transfer

### 52.3.1.1 Dynamic Allocation / Uplink Transfer / Normal

#### 52.3.1.1.1 Dynamic Allocation / Uplink Transfer / Normal / Successful

##### 52.3.1.1.1.1 Conformance requirements

1. The mobile station shall set the TFI field of each uplink RLC data block to the TFI value assigned to the mobile station in the PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message.
2. Whenever the mobile station detects an assigned USF value on an assigned PDCH, the mobile station shall transmit either a single RLC/MAC block or a sequence of four RLC/MAC blocks on the same PDCH in the next block period(s). The time relation between an uplink block, which the mobile station shall use for transmission, and the occurrence of the USF value is defined in 3GPP TS 05.02. The number of RLC/MAC blocks to transmit is controlled by the USF\_GRANULARITY parameter characterising the uplink TBF.
3. At two-phase access the mobile station does not include its TLLI in any RLC data block.

#### References

3GPP TS 04.60, subclauses 8.1.1, 8.1.1.1 and 7.1.3.3.

3GPP TS 05.02, subclause 6.3.2.2.1.

##### 52.3.1.1.1.2 Test purposes

To verify that the MS:

1. depending on the parameter USF\_GRANULARITY, transmits one or a sequence of four RLC/MAC data block(s) in the next block period(s) on the PDCH on which it has detected its corresponding assigned USF.
2. includes the assigned TFI in each uplink RLC data blocks.
3. does not include its TLLI in any RLC data block at two phase access.

##### 52.3.1.1.1.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, default setting, BS\_PBCCH\_BLKs = 3.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context3 activated.

#### Related PICS/PIXIT Statement(s)

Support EGPRS service.

Support activation of at least one PDP context.

The way to trigger the MS initiating an uplink packet transfer.

#### Test Procedure

The MS is triggered to initiate packet uplink transfer data in RLC unacknowledged mode. The SS orders the MS to have two-phase access, in PACKET UPLINK ASSIGNMENT message the USF\_GRANULARITY is set to 4 blocks. The SS sends the assigned USF assigned to the MS and checks that a sequence of four RLC/MAC data blocks in the next radio block period is received, and that each data block contains the correct TFI, but without TLLI. The SS assigns the USF

assigned to the MS again. The check is repeated. The procedure is going on until the MS completes the packet data transfer.

The above test procedure is repeated once for USF\_GRANULARITY set to one block.

Maximum Duration of Test

5 minutes.

## Expected Sequence

### 52.3.1.1.2 Dynamic Allocation / Uplink Transfer / Normal / Request new resources

#### 52.3.1.1.2.1 Conformance requirements

During the TBF, if the countdown procedure has not started, the mobile station shall ask for new or different radio resources, by sending a PACKET RESOURCE REQUEST in the following cases.

1. When the mobile station has more blocks to send than indicated in the EGPRS PACKET CHANNEL REQUEST message with access type short access.
2. When the mobile station has indicated Page Response, Cell update or Mobility Management procedure as access type in the PACKET CHANNEL REQUEST and it has data to send.

#### References

3GPP TS 04.60, subclause 8.1.1.

#### 52.3.1.1.2.2 Test purposes

To verify that the MS requests for new or different radio resources by sending a PACKET RESOURCE REQUEST when the countdown procedure has not started and the MS has more blocks to send than indicated in the EGPRS PACKET CHANNEL REQUEST message with access type short access.

#### 52.3.1.1.2.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, default setting, BS\_PBCCH\_BLKs = 3, BS\_CV\_MAX = 3.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated in cell A and Test PDP context2 activated.

#### Related PICS/PIXIT Statement(s)

Support EGPRS service.

Support activation of at least one PDP context.

The way to trigger the MS initiating an uplink packet transfer.

#### Test Procedure

The MS is triggered to initiate packet uplink transfer 150 octets for a short access in RLC acknowledged mode. After the MS sends the first RLC data block, the MS is triggered to send another 220 octets data. The MS requests new radio resource by sending PACKET RESOURCE REQUEST.

Maximum Duration of Test

5 minutes.

### 52.3.1.1.3 Dynamic Allocation / Uplink Transfer / Normal / Starting frame number encoding

#### 52.3.1.1.3.1 Conformance requirements

1. In case of dynamic allocation, if no uplink TBF is in progress, the MS needs not monitor the USF field until the TDMA frame number occurs. When the indicated TDMA frame number occurs, the mobile station shall immediately begin to monitor the USF field and use the new assigned uplink TBF parameters when its USF occurs.
2. If an uplink TBF is already in progress, the MS shall continue to use the parameters of the existing TBF until the TDMA frame number occurs. When the indicated TDMA frame number occurs, the mobile station shall immediately begin to monitor the USF field and use the new assigned uplink TBF parameters when its USF occurs.
3. In case of single block allocation, the mobile station shall use the assigned timeslot during the RLC/MAC block whose first TDMA burst occurs in the indicated TDMA frame number.
4. If the mobile station is in packet transfer mode during the block immediately before the starting time and the lowest numbered PDCH assigned to the MS is different immediately before and after the starting time then the mobile station shall be ready to receive or transmit no later than one radio block from the starting time.
5. If the Starting FN (in absolute frame number encoding) is not aligned to the start of a block period and the mobile station is in packet transfer mode during the TDMA immediately before the Starting FN, then the mobile station shall align the starting time to the next block boundary and continue to use the currently assigned allocation up to the next block boundary.

#### References

3GPP TS 04.60, subclauses 11.2.29, 12.21 and 12.21.1.

#### 52.3.1.1.3.2 Test purposes

To verify that the MS, in transfer mode:

1. correctly uses the starting frame number description in PACKET UPLINK ASSIGNMENT, and in all subsequent RLC/MAC control messages which are sent on the uplink TBF;
2. is ready to receive or transmit no later than one radio block from the starting time;
3. is able to align the starting time to the next block boundary and continue to use the currently assigned allocation up to the next block boundary.

#### 52.3.1.1.3.3 Method of test

##### Initial Conditions

System Simulator:

1 cell, default setting, BS\_PBCCH\_BLKs = 3.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context3 activated.

##### Related PICS/PIXIT Statement(s)

Support EGPRS service.

Support activation of at least one PDP context.

The way to trigger the MS initiating an uplink packet transfer.

## Test Procedure

The MS is triggered to initiate packet uplink transfer 440 octets in the RLC unacknowledged mode. The PACKET UPLINK ASSIGNMENT message contains a starting time encoded in absolute frame number format for the single block allocation. It is checked that the MS uses the time slot at the assigned frame number. In the two-phase access a starting time is included in PACKET UPLINK ASSIGNMENT. The assigned USF is on a radio block before the starting time. The MS does not react upon that. The assigned USF is on one block after the starting time. The MS sends a RLC data block.

The test procedure is repeated once. The starting time is encoded in relative frame number format.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

The expected sequence is repeated once. In the 2<sup>nd</sup> execution the starting frame numbers in the specific message contents are encoded in the relative format.

### 52.3.1.1.4 Dynamic Allocation / Uplink Transfer / Normal / Starting time

#### 52.3.1.1.4.1 Conformance requirements

- 1 If a TBF starting time information element is present and no uplink TBF is in progress, but a downlink TBF is in progress, the mobile station shall wait until the starting time before beginning to monitor the USFs. While waiting for the starting time, the mobile station shall monitor the assigned PDCHs.
- 2 If an uplink TBF is already in progress, the mobile station shall continue to use the assigned parameters of the uplink TBF until the TDMA frame number indicated by the TBF starting time occurs. At that time the mobile station shall immediately begin to use the newly assigned uplink TBF parameters.
- 3 While waiting for the frame number indicated by the TBF starting time if the mobile station receives another uplink assignment, the mobile station shall act upon the most recently received uplink assignment and shall ignore the previous uplink assignment.

## References

3GPP TS 04.60, subclause 8.1.1.1.

### 52.3.1.1.4.2 Test purposes

To verify that after the MS receives an uplink assignment with starting time:

1. if a downlink TBF is in progress and no uplink TBF is in progress it monitors the assigned PDCHs while waiting for the starting time. If another uplink assignment received while waiting, the mobile station acts upon that and ignores the previous uplink assignment.
2. if an uplink TBF is already in progress, it continues to use the assigned parameters of the uplink TBF until the TDMA frame number indicated by the TBF starting time occurs. While waiting for the frame number indicated by the TBF starting time the mobile station receives another uplink assignment, the mobile station acts upon that and ignores the previous uplink assignment. As soon as the starting time occurs the MS immediately begins to use the newly assigned uplink TBF parameters.

### 52.3.1.1.4.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, default setting, BS\_PBCCH\_BLKs = 3.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context2 activated.

#### Related PICS/PIXIT Statement(s)

Support EGPRS service.

Support activation of at least one PDP context.

The way to trigger the MS initiating an uplink packet transfer.

#### Test Procedure

A downlink TBF is established and in progress. An uplink TBF is established with a starting time which does not yet elapse. The SS sends two downlink data blocks before the starting time to the MS and signals the assigned TBF addressing the MS for uplink transfer. It is checked that no uplink RLC data blocks are sent by the MS. The SS sends PACKET TIMESLOT RECONFIGURE on one radio block before the starting time, assigning a new starting time. Two downlink data blocks are then sent to the MS before the new starting time occurs. Each data block contains one of the assigned USFs addressing the MS. It is checked that no uplink data blocks are sent from the MS. After the new starting time elapses the SS sends a downlink data block containing the USF assigned to the MS. The MS sends an uplink data block. The MS is brought to Idle mode.

An uplink TBF is established and in progress. The SS sends PACKET TIMESLOT RECONFIGURE assigning a reconfigured PDCH with a starting time and a new USF associated. Before the starting time the SS signals the USF of the ongoing TBF addressing the MS. The SS receives an uplink data block from the MS. The SS sends UPLINK ASSIGNMENT on one radio block before the starting time, assigning a new reconfigured PDCH with a starting time and a different USF associated. The later assignment overwrites the earlier one. While waiting for the frame number of the newly assigned starting time the SS signals the USF of the previous assignment on both the ongoing PDCH and on the previous assigned PDCH. The MS ignores it. The SS signals the USF of the ongoing TBF addressing the MS. An uplink data block can be received. On one radio block before the starting time the SS signals the later assigned USF assigned to the MS on the later assigned PDCH. No uplink data block is received. On one radio block after the starting time the SS signals the just expired USF. No uplink data block is received. Then the SS signals the valid USF assigned to the MS. An uplink data block is received.

## Maximum Duration of Test

5 minutes.

EGPRS channel coding command: MCS 1<br>The timeslot TN <sub>3</sub> assigned                                                       |
| 22   | SS -> MS  | PACKET DOWNLINK DUMMY CONTROL BLOCK            | Assigned USF <sub>1</sub> addressing the MS, sent on 3 blocks from the last radio block containing the uplink assignment in step 21.                                                                                                                                                   |
| 23   | MS -> SS  | EGPRS UPLINK RLC DATA BLOCK                    | Check that the coding is MCS 1, the TFI is correct.                                                                                                                                                                                                                                    |
| 24   | SS -> MS  | EGPRS PACKET UPLINK ACK/NACK                   | Assigned USF <sub>1</sub> addressing the MS.                                                                                                                                                                                                                                           |
| 25   | MS -> SS  | EGPRS UPLINK RLC DATA BLOCK                    | Received on the assigned PDTCH.                                                                                                                                                                                                                                                        |
| 26   | SS -> MS  | PACKET TIMESLOT RECONFIGURE                    | Assign an uplink TBF on the timeslot TN <sub>2</sub> , containing new TFI <sub>2</sub> , USF <sub>2</sub> , starting time <sub>3</sub> , current frame + 117 in relative encoding. Sent on PACCH assigned.                                                                             |
| 27   | SS -> MS  | EGPRS PACKET UPLINK ACK/NACK                   | USF <sub>1</sub> addressing the MS, sent on 5 radio blocks before the starting time <sub>3</sub> , on PACCH assigned in step 21.                                                                                                                                                       |
| 28   | MS -> SS  | EGPRS UPLINK RLC DATA BLOCK                    | Check that the coding is MCS 1, the TFI is correct.                                                                                                                                                                                                                                    |
| 29   | SS -> MS  | PACKET UPLINK ASSIGNMENT                       | Assign a TBF on the timeslot TN <sub>1</sub> , containing new TFI <sub>3</sub> , USF <sub>3</sub> , MCS 3 coding, starting time <sub>4</sub> , current frame + 325 in relative encoding. Sent on one radio block before the starting time <sub>3</sub> , on PACCH assigned in step 21. |
| 30   | SS -> MS  | PACKET UPLINK ACK/NACK                         | USF <sub>2</sub> addressing the MS, sent on 4 blocks from the last radio block containing the uplink assignment in step 29 on the both PACCHs assigned in step 21 and 26.                                                                                                              |
| 31   | SS        |                                                | Check that no data block is sent from the MS on the assigned radio block on the two PDTCHs assigned in step 21 and 26.                                                                                                                                                                 |
| 32   | SS -> MS  | PACKET DOWNLINK DUMMY CONTROL BLOCK            | USF <sub>1</sub> addressing the MS, sent on 5 radio blocks before the starting time <sub>4</sub> , on PACCH assigned in step 21.                                                                                                                                                       |
| 33   | MS -> SS  | EGPRS UPLINK RLC DATA BLOCK                    | Check that the coding is MCS1, the TFI is correct.                                                                                                                                                                                                                                     |
| 34   | SS -> MS  | PACKET DOWNLINK DUMMY CONTROL BLOCK            | The USF <sub>3</sub> addressing the MS, sent on one radio block before the starting time <sub>4</sub> , on PACCH assigned in step 26.                                                                                                                                                  |
| 35   | SS -> MS  | PACKET DOWNLINK DUMMY CONTROL BLOCK            | The USF <sub>1</sub> addressing the MS, sent on one radio block after the starting time <sub>4</sub> , on PACCH assigned in step 21.                                                                                                                                                   |
| 36   | SS        |                                                | Check that no data blocks are sent from the MS on the radio blocks assigned in steps 34 and 35, or any intermediate radio blocks, on any of the three PDTCHs assigned                                                                                                                  |
| 37   | SS -> MS  | PACKET UPLINK ACK/NACK                         | Containing USF <sub>3</sub> . Sent on PACCH of assigned in step 29.                                                                                                                                                                                                                    |
| 38   | MS -> SS  | EGPRS UPLINK RLC DATA BLOCK                    | Received on the PDTCH assigned in step 29. Check that the coding MCS 3 and TFI <sub>3</sub> are correct.                                                                                                                                                                               |
| 39   |           | {Completion of uplink RLC data block transfer} |                                                                                                                                                                                                                                                                                        |

### 52.3.1.1.5 Dynamic Allocation / Uplink Transfer / Normal / Close-ended TBF

#### 52.3.1.1.5.1 Conformance requirements

1. During a close-ended TBF the mobile station shall transmit only the number of RLC data blocks indicated in the RLC\_DATA\_BLOCKS\_GRANTED field. RLC/MAC control blocks and retransmissions of RLC data blocks do not count toward the limit.
2. In the case the access type in Channel Request was 'Short Access', only the number of RLC data blocks requested in the Channel Request are allowed to be transmitted within the TBF, unless additional resources have been requested and assigned before the countdown procedure has started.
3. When the mobile station nears the end of the fixed length TBF, it shall begin the count down procedure so that it sends the last RLC data block when CV = 0. The mobile station and network shall then follow the appropriate procedure for release of TBF defined in 3GPP TS 04.60 subclauses 9.3.2.3 or 9.3.3.3.
4. If the number of RLC data blocks granted is not sufficient to empty the mobile station's send buffer, the mobile station shall attempt to establish a new uplink TBF for the transmission of the outstanding LLC frames following the end of the fixed length TBF.

#### References

3GPP TS 04.60, subclause 8.1.1.1.

#### 52.3.1.1.5.2 Test purposes

To verify that during a close-ended TBF:

- 1 The MS transmits only the number of RLC data blocks indicated in the RLC\_DATA\_BLOCKS\_GRANTED field. RLC/MAC control blocks and retransmissions of RLC data blocks do not count toward the limit indicated by RLC\_DATA\_BLOCKS\_GRANTED.
- 2 When the MS nears the end of the close-ended TBF, it begins the count down procedure and sends the last RLC data block when CV = 0.
- 3 If the number of RLC data blocks granted is not sufficient to empty the MS's send buffer, the MS attempts to establish a new uplink TBF for the transmission of the outstanding LLC frames following the end of the close-ended TBF.

It is also verified that:

4. When the access type in Channel Request was "Short Access", the MS transmits only the number of RLC data blocks requested in the Channel Request.

#### 52.3.1.1.5.3 Method of test

##### Initial Conditions

System Simulator:

1 cell, default setting, BS\_PBCCH\_BLKs = 3.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context2 activated.

##### Related PICS/PIXIT Statement(s)

Support EGPRS service.

Support activation of at least one PDP context.

The way to trigger the MS initiating an uplink packet transfer.

## Test Procedure

The MS is triggered to send 570 octets data in acknowledged mode. Only 10 RLC data blocks are granted for a closed TBF in a assignment. After the MS sends the first data block the SS negatively acknowledges the received data. The MS resends the data block. The MS is polled and the USF assigned to the MS. The MS sends another data block and PACKET CONTROL ACKNOWLEDGEMENT. The resent data block and the RLC/MAC control block do not count toward the granted blocks limit. The SS gives the USF assigned to the MS 8 times so that the MS is allowed to send another 8 data blocks. It is checked that the last data block contains the countdown variable CV=0. The MS sends EGPRS PACKET CHANNEL REQUEST for new resource in order to empty the sending buffer. The request is granted and a new PDCH is assigned for empty the MS data buffer.

The MS is triggered to send 89 octets data in acknowledged mode. It is checked that the MS requests five RLC data blocks for short access. Although 10 data blocks are granted in the assignment and it is checked that the MS sends only five RLC data blocks.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

| Step                  | Direction | Message                                      | Comments                                                                                                                                                                                                                                                         |

| 29   | MS -> SS  | PACKET CONTROL ACKNOWLEDGEMENT                 | Received on the block specified by RRBP on PACCH.                                                                                                                                                                                                                          |

### 52.3.1.1.6 Dynamic Allocation / Uplink Transfer / Normal / T3180 expiry

#### 52.3.1.1.6.1 Conformance requirements

When the mobile station transmits an RLC/MAC block to the network, it shall start timer T3180. When the mobile station detects an assigned USF value on an assigned PDCH, the mobile station shall reset timer T3180. If timer T3180 expires, the mobile station shall perform the abnormal release with random access procedure.

#### References

3GPP TS 04.60, subclause 8.1.1.1.

#### 52.3.1.1.6.2 Test purposes

To verify that:

1. Timer T3180 will not expire as long as an USF for the MS under test is detected in the downlink blocks within the defined time period of the timer. (It is implicitly verified).
2. Timer T3180 expires if no USF for the MS under test is detected during a time period longer than T3180.
3. The MS performs an abnormal release with random access procedure after T3180 expires.

## 52.3.1.1.6.3 Method of test

## Initial Conditions

System Simulator:

1 cell, default setting, BS\_PBCCH\_BLKs = 3.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context3 activated.

## Related PICS/PIXIT Statement(s)

Support EGPRS service.

Support activation of at least one PDP context.

The way to trigger the MS initiating an uplink packet transfer.

## Test Procedure

An uplink TBF is established and in progress. After the MS sends an uplink data block the SS repeatedly sends PACKET UPLINK ACK/NACK containing any USF and any TFI which do not address the MS for 4.5s. Before T3180 times out the SS signals the USF assigned to the MS. The MS sends a data block. Then the SS repeatedly sends PACKET UPLINK ACK/NACK containing any USF and any TFI which do not address the MS until receiving EGPRS PACKET CHANNEL REQUEST from the MS for establishment of a new TBF.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

| Step | Direction | Message                                        | Comments                                                                                                                                                                                                                        |

### 52.3.1.1.7 Dynamic Allocation / Uplink Transfer / Normal / PACCH operation

#### 52.3.1.1.7.1 Conformance requirements

1. The mobile station shall attempt to decode every downlink RLC/MAC block on all assigned PDCHs. Whenever the mobile station receives an RLC/MAC block containing an RLC/MAC control block, the mobile station shall attempt to interpret the message contained therein. If the message addresses the mobile station, the mobile station shall act on the message. The mobile station shall not transmit an RLC data block in any uplink radio block allocated via the polling mechanism.
2. PACKET POLLING REQUEST is sent on the PCCCH or PACCH by the network to the mobile station to solicit a PACKET CONTROL ACKNOWLEDGEMENT message from the mobile station.
3. In downlink RLC/MAC control blocks, the TFI identifies the Temporary Block Flow (TBF) to which the RLC/MAC control message contained in the downlink RLC/MAC control block relates. If present, this field indicates the mobile station to which the control message is addressed, and all other mobile stations shall ignore the control message. If this field is present and the contents of the control message also contain a TFI addressing the mobile station, the mobile station shall ignore the TFI in the control message contents.

#### References

3GPP TS 04.60, subclauses 8.1.1.1.1, 11.2.12 and 10.4.10.

#### 52.3.1.1.7.2 Test purposes

To verify that:

1. The MS attempts to decode every downlink RLC/MAC block on all assigned PDCHs whenever the MS receives an RLC/MAC block containing an RLC/MAC control block, the MS attempts to interpret the message contained therein, such as Payload type and TFI in the optional fields. If the message addresses the MS, it acts upon the message.
2. When receiving PACKET POLLING REQUEST on PACCH the MS responds with four PACKET CONTROL ACKNOWLEDGEMENT messages of access burst format and does not transmit an RLC data block in any uplink radio block allocated via the polling mechanism.

## 52.3.1.1.7.3 Method of test

## Initial Conditions

## System Simulator:

1 cell, default setting, BS\_PBCCH\_BLKs = 3.

## Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context3 activated.

## Related PICS/PIXIT Statement(s)

Support EGPRS service.

Support activation of at least one PDP context.

The way to initiate an uplink transfer.

## Test Procedure

A TBF is established. It is polled with PACKET POLLING REQUEST containing a global TFI not addressing the MS. The assigned USF addresses the MS. The MS transmits a data block. The SS polls the MS with PACKET POLLING REQUEST containing any global TFI not addressing the MS. The message has optional octets where TFI does address the MS. The MS responds with PACKET CONTROL ACKNOWLEDGEMENT four times in access burst formats. The SS polls again the MS with PACKET POLLING REQUEST containing the global TFI addressing the MS. The MS responds with PACKET CONTROL ACKNOWLEDGEMENT four times in access burst formats.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

## 52.3.1.1.8 Dynamic Allocation / Uplink Transfer / Normal / Two uplink timeslots

This test case verifies the multislot capabilities and applies to all Mobile Station belonging to the multislot class 3, 5, 6, 7 and 9 - 29.

## 52.3.1.1.8.1 Conformance requirements

Mobile station belonging to multislot class 3, 5, 6, 7 and 9 – 29 shall support at least two transmit timeslots per TDMA frame (refer to 3GPP TS 05.02, clause B.1).

## References

3GPP TS 05.02, clause B.1.

## 52.3.1.1.8.2 Test purposes

To verify that an MS belonging to EGPRS multislot class 3, 5, 6, 7 and 9 – 29 supports an uplink TBF using two timeslots per TDMA frame.

## 52.3.1.1.8.3 Method of test

## Initial Conditions

System Simulator:

1 cell, default setting, BS\_PBCCH\_BLKs = 3.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context2 activated.

#### Related PICS/PIXIT Statement(s)

Support EGPRS service.

Support activation of at least one PDP context.

The way to initiate an uplink packet transfer.

The multislot classes supported.

#### Test Procedure

The MS is triggered to initiate packet uplink transfer data in RLC acknowledged mode. The SS orders the MS to use two-phase access procedure, in PACKET UPLINK ASSIGNMENT two timeslots are assigned. On the same TDMA frame the SS signals to the MS the assigned USFs addressing the MS on the two assigned PDTCHs. It is checked that the two RLC/MAC data blocks in the next radio block period are received on the respective PDTCH channels and that each data block contains the correct TFI without TLLI.

The SS acknowledges the received data and assigns the USFs addressing the MS. The check is repeated. The same procedure is going on until the MS completes the packet data transfer.

#### Maximum Duration of Test

5 minutes.

52.3.1.1.9 Void

52.3.1.2 Dynamic Allocation / Uplink Transfer / Abnormal

52.3.1.2.1 Void

52.3.1.2.2 Dynamic Allocation / Uplink Transfer / Abnormal / with cell reselection in acknowledged mode

52.3.1.2.2.1 Conformance requirements

Upon detecting the stall condition the mobile station shall start timer T3182. If timer T3182 expires, the mobile station shall decrement counter N3102 by PAN\_DEC, and perform an abnormal release with random access.

When  $N3102 \leq 0$  is reached, the mobile station shall perform an abnormal release with cell re-selection.

References

3GPP TS 04.60, subclause 9.3.2.3.

52.3.1.2.2.2 Test purposes

To verify that while in uplink unacknowledged mode operation the MS performs an abnormal release with cell reselection if the  $N3102 \leq 0$  is reached.

## 52.3.1.2.2.3 Method of test

## Initial Conditions

## System Simulator:

2 cells, EGPRS supported, PCCCH present, Max-Retrans = 2, access burst type = 11 bits, BS\_PAG\_BLKES\_RES = 2, BS\_PBCCH\_BLKES = 3, BS\_PCC\_CHANS = 1, BS\_PRACH\_BLKES = 1, PAN\_MAX = 8, PAN\_DEC = 5 and PAN\_INC = 2.

## Cell A:

power level = 63 dB $\mu$ Vemf(), EGPRS\_RXLEV\_ACCESS\_MIN = 33 dB $\mu$ Vemf(), PRIORITY\_CLASS = 3, EGPRS\_PENALTY\_TIME = 0, EGPRS\_RESELECT\_OFFSET = 0 dB $\mu$ Vemf(), RANDOM\_ACCESS\_RETRY = 1.

## Cell B:

power level = 53 dB $\mu$ Vemf(), EGPRS\_RXLEV\_ACCESS\_MIN = 33 dB $\mu$ Vemf(), PRIORITY\_CLASS = 3, EGPRS\_PENALTY\_TIME = 0, EGPRS\_RESELECT\_OFFSET = 16 dB $\mu$ Vemf().

## Mobile Station:

The MS is GPRS attached on cell A, a P-TMSI allocated and test PDP context2 activated.

## Related PICS/PIXIT Statement(s)

Support EGPRS service.

Support activation of at least one PDP context.

The way to initiate an uplink packet transfer.

## Test Procedure

The MS is triggered to initiate packet uplink transfer 1500 octets in the RLC acknowledged mode on cell A. After a successful uplink PDCH assignment the SS sends PACKET DOWNLINK DUMMY indicating the assigned USF assigned to the MS. The MS sends a RLC radio block. The SS allows the MS to transfer so many data blocks without acknowledgement until the stall indication bit is set.

The MS requests the necessary radio resources by EGPRS PACKET CHANNEL REQUEST on cell A. The SS assigns a new PDCH to the MS. The SS sends PACKET DOWNLINK DUMMY indicating the assigned USF assigned to the MS. The MS sends a RLC radio block. The SS allows the MS to transfer so many data blocks without acknowledgement until the stall indication bit is set.

The MS requests the necessary radio resources by EGPRS PACKET CHANNEL REQUEST on cell B. The SS then assigns a new PDCH to the MS for completion of the requested uplink data transfer.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

| Step | Direction | Message                                        | Comments                                                                                                                                                                                                                                                                                                          |

### 52.3.1.2.3 Dynamic Allocation / Uplink Transfer / Abnormal / with cell reselection in unacknowledged mode

#### 52.3.1.2.3.1 Conformance requirements

If the mobile station transmits k RLC data blocks without receiving a Packet Ack/Nack message the mobile station shall start timer T3182. If timer T3182 expires, the mobile station shall decrement counter N3102 by PAN\_DEC, and perform an abnormal release with random access.

When  $N3102 \leq 0$  is reached, the mobile station shall perform an abnormal release with cell re-selection.

#### References

3GPP TS 04.60, subclause 9.3.3.3.

### 52.3.1.2.3.2 Test purposes

To verify that while in uplink unacknowledged mode operation the MS performs an abnormal release with cell reselection if the  $N3102 \leq 0$  is reached.

### 52.3.1.2.3.3 Method of test

#### Initial Conditions

##### System Simulator:

2 cells, EGPRS supported, PCCCH present, Max-Retrans = 2, access burst type = 11 bits, BS\_PAG\_BLKES\_RES = 2, BS\_PBCCH\_BLKES = 3, BS\_PCC\_CHANS = 1, BS\_PRACH\_BLKES = 1, PAN\_MAX = 8, PAN\_DEC = 5 and PAN\_INC = 2.

##### Cell A:

power level = 63 dB $\mu$ Vemf(), GPRS\_RXLEV\_ACCESS\_MIN = 33 dB $\mu$ Vemf(), PRIORITY\_CLASS = 3, GPRS\_PENALTY\_TIME = 0, GPRS\_RESELECT\_OFFSET = 0 dB $\mu$ Vemf(), RANDOM\_ACCESS\_RETRY = 1.

##### Cell B:

power level = 53 dB $\mu$ Vemf(), GPRS\_RXLEV\_ACCESS\_MIN = 33 dB $\mu$ Vemf(), PRIORITY\_CLASS = 3, GPRS\_PENALTY\_TIME = 0, GPRS\_RESELECT\_OFFSET = 16 dB $\mu$ Vemf().

##### Mobile Station:

The MS is GPRS attached with cell A, a P-TMSI allocated and Test PDP context3 activated.

#### Related PICS/PIXIT Statement(s)

Type of MS (P-, E-, R-GSM 900, GSM 400, GSM 700, GSM 850 or DCS 1 800 or PCS 1 900).

Support EGPRS service.

Support activation of at least one PDP context.

The way to initiate an uplink packet transfer.

#### Test Procedure

The MS is triggered to initiate packet uplink transfer 1 500 octets in the RLC unacknowledged mode on cell A. After a successful uplink PDCH assignment the SS sends PACKET DOWNLINK DUMMY indicating the assigned USF assigned to the MS. The MS sends a RLC radio block. The SS allows the MS to transfer 64 data blocks without acknowledgement.

The MS requests the necessary radio resources by EGPRS PACKET CHANNEL REQUEST on cell A. The SS assigns a new PDCH to the MS. The SS sends PACKET DOWNLINK DUMMY indicating the assigned USF assigned to the MS. The MS sends a RLC radio block. The SS allows the MS to transfer 64 data blocks without acknowledgement.

The MS requests the necessary radio resources by EGPRS PACKET CHANNEL REQUEST on cell B. The SS then assigns a new PDCH to the MS for completion of the requested uplink data transfer.

#### Maximum Duration of Test

5 minutes.

## 52.3.2 Dynamic Allocation / Uplink Transfer with Downlink TBF establishment (concurrent)

### 52.3.2.1 Dynamic Allocation / Uplink Transfer with Downlink TBF establishment / Normal

#### 52.3.2.1.1 Dynamic Allocation / Uplink Transfer with Downlink TBF establishment / Normal / Successful

##### 52.3.2.1.1.1 Conformance requirements

During uplink transfer, the network may initiate a downlink TBF by sending a PACKET DOWNLINK ASSIGNMENT message, or a PACKET TIMESLOT RECONFIGURE, to the mobile station on the PACCH. If a PACKET TIMESLOT RECONFIGURE message is sent, then the message shall contain the DOWNLINK\_TFI\_ASSIGNMENT field. On receipt of an assignment message, and after the TBF starting time, if present, the mobile station shall switch to the assigned PDCHs. The operation of the downlink TBF follows the procedures in 3GPP TS 04.60, subclause 8.1.2 with the following additions:

1. If a timer or counter expiry causes the uplink TBF to be aborted in the mobile station, the mobile station shall also abort the downlink TBF and perform an abnormal release with random access.
2. If uplink and downlink TBFs are already established, then the network may send a PACKET TIMESLOT RECONFIGURE message without DOWNLINK\_TFI\_ASSIGNMENT. The mobile station shall interpret this as a reassignment of the timeslot allocations of the concurrent uplink and downlink TBFs and the downlink TFI is not changed.

#### References

3GPP TS 04.60, subclauses 8.1.1.1.3 and 8.1.2.

##### 52.3.2.1.1.2 Test purposes

To verify that during uplink transfer:

1. The MS switches to the assigned PDCHs when the network initiates a downlink TBF by sending PACKET DOWNLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE to the MS on PACCH.
2. When the MS receives PACKET TIMESLOT RECONFIGURE without DOWNLINK\_TFI\_ASSIGNMENT in the case of uplink and downlink TBFs established already, the MS interprets this message as a reassignment of the timeslot allocations of the concurrent uplink and downlink TBFs.
3. The MS also aborts the downlink TBF and performs an abnormal release with random access if a timer or a counter expiry causes the uplink TBF to be aborted in the MS.

##### 52.3.2.1.1.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, default setting, BS\_PBCCH\_BLKs = 3.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context3 activated.

## Related PICS/PIXIT Statement(s)

Support EGPRS service.

Support activation of at least one PDP context.

The way to initiate an uplink packet transfer.

## Test Procedure

An uplink TBF is established and in progress. After the MS sends an uplink data block the SS assigns a downlink TBF on the same timeslot as the uplink TBF. The SS sends a downlink data block with polling for acknowledgement and the assigned USF assigned to the MS for the MS, and indicates FBI=1 for the final data block. The MS sends an uplink data block and acknowledges the received downlink data block on the correct frame. The SS waits 2 s for the MS releasing the downlink PDCH. The SS sends PACKET TIMESLOT RECONFIGURE assigning a new downlink PDCH. A downlink data block is sent, the assigned USF assigned to the MS and the MS is polled for acknowledgement. The MS sends an uplink data block and acknowledges the last received downlink data block on the correct frame.

The SS sends PACKET TIMESLOT RECONFIGURE without DOWNLINK\_TFL\_ASSIGNMENT replacing the existing uplink and downlink PDCH with another pair of concurrent PDCH. A downlink data block is sent on the replaced PDCH and the MS is polled for acknowledgement. The MS shall not react upon it. Another downlink data block is sent on the assigned PDCH, the assigned USF assigned to the MS and the MS is polled for acknowledgement. The MS sends an uplink data block and acknowledges the received downlink data block on the correct frame.

The SS sends downlink data blocks with USF not addressing the MS until receives EGPRS PACKET CHANNEL REQUEST.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

### 52.3.2.1.2 Dynamic Allocation / Uplink Transfer with Downlink TBF establishment / Normal / Multislot capabilities

This test case applies to all Mobile Station belonging to multislot class 2, 3, 4, 5, 6, 8, 9, 10, 19 and 24.

#### 52.3.2.1.2.1 Conformance requirements

1. Mobile station belonging to multislot class 2, 3, 4, 5, 6, 8, 9, 10, 19 and 24 shall support as many uplink and downlink timeslots as indicated in 3GPP TS 05.02 clause B.1.
2. If transmission of the PACKET CONTROL ACKNOWLEDGEMENT would result in more than the maximum Tx timeslots per TDMA frame allowed by the multislot class, transmission of the highest numbered PDCH(s) shall be omitted.

3GPP TS 05.02, clause B.1.

3GPP TS 04.60, subclause 8.6.

### 52.3.2.1.2.2 Test purposes

To verify that the multislot MS supports as many uplink and downlink TBFs per TDMA frame as indicated. Especially, it is verified that the Type 1 MS in a multislot class declared has the capability of supporting:

1.  $T_{tb}$ , the minimum number of slots allowed between the end of the previous transmit or receive TS and the next transmit TS when measurement is to be performed for type 1 MS;
2.  $T_{ra}$ , the minimum number of slots allowed between the previous transmit or receive TS and the next receive TS when measurement is to be performed for type 1 MS;
3. the maximum number of Rx and Tx supported;
4. the sum of slots supported.

It is also verified that the MS of a multislot class transmits PACKET CONTROL ACKNOWLEDGEMENT when polled, and omits the transmission of the highest numbered PDCH(s) if the transmission would result in more than the maximum Tx timeslots per TDMA frame allowed by the multislot class.

### 52.3.2.1.2.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, default setting, BS\_PBCCH\_BLKs = 3.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context3 activated.

#### Related PICS/PIXIT Statement(s)

Support EGPRS service.

Support activation of at least one PDP context.

The way to initiate an uplink packet transfer.

The multislot class with maximum capability supported.

#### Test Procedure

The following multislot configurations are tested in the test case:

- Class 2 and 3 support two downlink timeslots and one uplink timeslot,  $T_{tb}=2$ ,  $T_{ra}=3$ ;
- Class 4 and 6 support three downlink timeslots and one uplink timeslot,  $T_{tb}=1$ ,  $T_{ra}=3$ ;
- Class 5 and 9 supports two downlink timeslots and two uplink timeslots,  $T_{tb}=1$ ,  $T_{ra}=3$ ;
- Class 8 and 10 support four downlink timeslots and one uplink timeslot,  $T_{tb}=1$ ,  $T_{ra}=2$ ;
- Class 19 and 24 support five downlink timeslots and one uplink timeslot,  $T_{tb}=1$ ,  $T_{ra}=2$ .

In the multislot configurations all assigned channels are frequency hopped except for the class 19 and 24 test where non-hopping channels are assigned for PDCHs. The class 3, 6, 9 and 10 are tested in a reduced uplink configuration.

According to the multislot configurations an uplink TBF with one or two timeslots assigned is established and in progress. The SS establishes a concurrent downlink TBF with multiple timeslots assigned. The basic test procedure is executed on four consecutive radio blocks.

On the 1st radio block the SS sends downlink data in the maximum capability allowed under the configuration, signals to the MS the assigned USFs addressing the MS and polls the MS. On the 2<sup>nd</sup> radio block the MS sends RLC data in response of the addressing the MS USFs. On the 3<sup>rd</sup> 1st radio block the SS sends downlink data in the maximum capability allowed under the configuration and signals to the MS the assigned USFs addressing the MS. On the 4<sup>th</sup> radio block the MS responses EGPRS PACKET DOWNLINK ACK/NACK and sends RLC data in response of one of the USFs addressing the MS if the configuration is allowed.

The basic test procedure is repeated until CV=1. The SS sends the last RLC data block with FBI=1 and polls the MS for acknowledgement. The SS sends PACKET UPLINK ACK/NACK setting FINAL\_ACK\_INDICATION=1. The MS sends two separate PACKET CONTROL ACKNOWLEDGEMENT messages to release the uplink and downlink TBFs.

#### Maximum Duration of Test

5 minutes.

#### Expected Sequence for multislot class 2 and class 3 (2 downlink timeslots + 1 uplink timeslot)

| Step | Direction | Message                                      | Comments                                                                                                                                                                                                                                                                                                    |

| 4    | SS -> MS  | PACKET DOWNLINK ASSIGNMENT                   | Sent on PACCH of the uplink PDCH. Assigning a downlink TBF, MAC mode = dynamic allocation, RLC mode = unacknowledged mode, TFI <sub>d</sub> (different from the uplink one), no starting time, assigning TN <sub>1</sub> and TN <sub>2</sub> . Sent on TN <sub>1</sub> of the downlink PDTCH, RRBP invalid. |
| 5    | SS -> MS  | EGPRS DOWNLINK RLC DATA BLOCK                |                                                                                                                                                                                                                                                                                                             |
| 6    | SS -> MS  | EGPRS DOWNLINK RLC DATA BLOCK                | Sent on TN <sub>2</sub> of the downlink PDTCH, a valid RRBP = N + 26, the assigned USF assigned to the MS, and ES/P field set to '01' on the same radio block as step 5.                                                                                                                                    |
| 7    | MS -> SS  | EGPRS UPLINK RLC DATA BLOCK                  | Received on the uplink PDTCH, on the next radio block from step 6.                                                                                                                                                                                                                                          |
| 8    | SS -> MS  | EGPRS DOWNLINK RLC DATA BLOCK                | Sent on TN <sub>1</sub> of the downlink PDTCH, RRBP invalid, on the next radio block from step 7.                                                                                                                                                                                                           |
| 9    | SS -> MS  | EGPRS DOWNLINK RLC DATA BLOCK                | Sent on TN <sub>2</sub> of the downlink PDTCH, the assigned USF assigned to the MS and RRBP invalid, on the same radio block as in step 8.<br>Note: The next uplink radio will not be used for the uplink data. It is reserved for a control block answering the polling in step 6.                         |
| 10   | MS -> SS  | EGPRS PACKET DOWNLINK ACK/NACK               | Received on the RRBP block on TN <sub>2</sub> specified in step 6.                                                                                                                                                                                                                                          |
| 11   |           |                                              | Repeat step 5 to 10, until CV=0 in step 7.                                                                                                                                                                                                                                                                  |
| 12   | SS -> MS  | EGPRS DOWNLINK RLC DATA BLOCK                | Sent on TN <sub>2</sub> with FBI = 1 and a valid RRBP and ES/P field set to '01'.                                                                                                                                                                                                                           |
| 13   | SS -> MS  | PACKET UPLINK ACK/NACK                       | FINAL_ACK_INDICATION = 1. Sent on TN <sub>2</sub> PACCH of the uplink PDCH.                                                                                                                                                                                                                                 |
| 14   | MS -> SS  | PACKET CONTROL ACKNOWLEDGEMENT               | CTRL_ACK = 01. The MS releases the uplink TBF.                                                                                                                                                                                                                                                              |
| 15   | MS -> SS  | PACKET CONTROL ACKNOWLEDGEMENT               | Received on the block specified by RRBP in step 12. CTRL_ACK = 11. The MS releases the downlink TBF.                                                                                                                                                                                                        |

Sent on PACCH of the uplink PDCH.                                                                                                                                                                            |
| 18   | MS -> SS  | PACKET CONTROL ACKNOWLEDGEMENT               | CTRL_ACK = 01. The MS releases the uplink TBF.                                                                                                                                                                                         |
| 19   | MS -> SS  | PACKET CONTROL ACKNOWLEDGEMENT               | Received on the block specified by RRBP in step 16. CTRL_ACK = 11. The MS releases the downlink TBF.                                                                                                                                   |

Specific Message Contents

PACKET UPLINK ASSIGNMENT message in step 1:

Same as in the test for the multiclass 2 and 3 except that instead of timeslot 2, the timeslot 3 is assigned.

PACKET DOWNLINK ASSIGNMET message in step 4:

Same as in the test for the multiclass 2 and 3 except 4 timeslots assigned.

### 52.3.2.2 Dynamic Allocation / Uplink Transfer with Downlink TBF establishment / Abnormal

#### 52.3.2.2.1 Dynamic Allocation / Uplink Transfer with Downlink TBF establishment / Abnormal / with random access

##### 52.3.2.2.1.1 Conformance requirements

1. If a failure occurs on the mobile station side before the new TBF has been successfully established, the newly reserved resources are released.
2. If the information in the PACKET TIMESLOT RECONFIGURE does not properly specify an uplink and downlink PDCH or violates the mobile station's multislot capabilities, the mobile station shall perform an abnormal release with random access.
3. If uplink and downlink TBFs are not already established and the PACKET TIMESLOT RECONFIGURE message does not include a DOWNLINK\_TFI\_ASSIGNMENT field, then the mobile station shall perform an abnormal release with random access.
4. If a failure in the PACKET TIMESLOT RECONFIGURE is due to any other reason, the mobile station shall abort the procedure and perform an abnormal release with random access.
5. If the mobile station receives a PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message specifying frequencies that are not all in one frequency band then the mobile station shall perform an abnormal release with random access.
6. To perform an abnormal release with random access, the mobile station shall abort all TBFs in progress and its associated resources, return to the CCCH or PCCCH and initiate establishment of a new uplink TBF.

#### 52.3.2.2.1.2 Test purposes

To verify that the MS, in downlink TBF establishment during uplink transfer, performs an abnormal release with random access, when the information in the PACKET TIMESLOT RECONFIGURE:

1. does not properly specify an uplink and downlink PDCH;
2. violates the mobile station's multislot capabilities;
3. does not include a DOWNLINK\_TFI\_ASSIGNMENT field;
4. has a failure due to any other reason other than the reasons listed above.

#### 52.3.2.2.1.3 Method of test

##### Initial Conditions

System Simulator:

1 cell, default setting, BS\_PBCCH\_BLKs = 3.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context3 activated.

##### Related PICS/PIXIT Statement(s)

Support EGPRS service.

Support activation of at least one PDP context.

The way to initiate an uplink transfer.

Multislot class of the MS.

##### Test Procedure

An uplink TBF is established and in progress. The SS sends PACKET TIMESLOT RECONFIGURE for establishment a downlink TBF. A failure occurs at the mobile station side before the new downlink TBF has been successfully established. The MS starts a random access for uplink establishment. The SS assigns a new uplink PDCH to the MS. The SS signals the USF of the preceding uplink TBF addressing the MS on the preceding PDCH which shall have been released by the MS. It is checked that no RLC data block is received on the next three radio blocks. The SS signals the assigned USF assigned to the MS on the uplink PDCH assigned. The MS sends a RLC data block.

The test procedure is repeated 4 times. The message contents of PACKET TIMESLOT RECONFIGURE are varied as defined below.

1<sup>st</sup> execution, improper PDCH: hopping frequencies not all in one band.

2<sup>nd</sup> execution, violating the multislot capabilities.

3<sup>rd</sup> execution, no DOWNLINK\_TFI\_ASSIGNMENT.

4<sup>th</sup> execution, CONTROL\_ACK = '1' (shall be set to '0' as the SS has not yet sent the final EGPRS DOWNLINK RLC DATA BLOCK).

##### Maximum Duration of Test

10 minutes.

## Expected Sequence

The sequence is repeated 4 times. The 2<sup>nd</sup> execution is not applicable for the MS multislot class 18, 29.

### 52.3.2.2.2 Dynamic Allocation / Uplink Transfer with Downlink TBF establishment / Abnormal / Continuation of normal operation

#### 52.3.2.2.2.1 Conformance requirements

1. If a failure occurs on the mobile station side before the new TBF has been successfully established, the newly reserved resources are released.
2. If a failure in the PACKET DOWNLINK ASSIGNMENT is due to any reason, the mobile station shall abort the procedure and continue the normal operation of the uplink TBF.
3. If a mobile station receives a PACKET DOWNLINK ASSIGNMENT assigning a different MAC mode than the MAC mode of an already operating uplink TBF, the PACKET DOWNLINK ASSIGNMENT message shall be ignored.

#### References

3GPP TS 04.60, subclauses 8.1.1.1.3.1 and 8.7.

#### 52.3.2.2.2.2 Test purposes

1. To verify that the MS aborts the downlink TBF establishment and continues the normal operation of the uplink TBF when the PACKET DOWNLINK ASSIGNMENT fails due to any reason in downlink TBF establishment during uplink transfer.
2. To verify that the MS ignores the PACKET DOWNLINK ASSIGNMENT message if it assigns a different MAC mode than the MAC mode of an already operating uplink TBF.

#### 52.3.2.2.2.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, default setting, BS\_PBCCH\_BLKs = 3.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context3 activated.

#### Related PICS/PIXIT Statement(s)

Type of MS (P-, E-, R-GSM 900, GSM 400, GSM700, GSM 850 or DCS 1 800 and PCS 1 900).

Support EGPRS service.

Support activation of at least one PDP context.

The way to initiate an uplink packet transfer.

#### Test Procedure

An uplink TBF is established and in progress. The SS sends PACKET DOWNLINK ASSIGNMENT assigning a downlink TBF while a fault occurs in the downlink assignment message.

The SS sends a EGPRS DOWNLINK RLC DATA BLOCK on the downlink PDCH assigned and polls the MS for acknowledgement. It is checked that no EGPRS PACKET DOWNLINK ACK/NACK is received. The SS signals the assigned USF assigned to the MS on the uplink PDCH assigned. The MS sends a RLC data block.

The test procedure is executed twice. The message contents of PACKET DOWNLINK ASSIGNMENT are varied as defined below.

1. Without DOWNLINK\_TFI\_ASSIGNMENT;
2. MAC mode = Fixed Allocation, an inconsistent MAC mode.

#### Maximum Duration of Test

5 minutes.

#### Expected Sequence

The test sequence is executed twice.

| Step | Direction | Message                                        | Comments                                                                                                                                                                                                                                                                                     |

### 52.3.3 Dynamic Allocation / Resource reallocation

The clause is applicable to the MS either supporting two PDP contexts or supporting SMS over GPRS and at least one PDP context.

#### 52.3.3.1 Dynamic Allocation / Resource reallocation / Successful

During an uplink packet transfer, upper layer may request to transfer another LLC PDU with a different Radio Priority, a different peak throughput class or a different RLC mode than the current one, the MS may require the allocation of new uplink resources.

##### 52.3.3.1.1 Dynamic Allocation / Resource reallocation / Successful / Higher throughput class or higher radio priority

###### 52.3.3.1.1.1 Conformance requirements

1. During an uplink packet transfer, upper layer may request to transfer another LLC PDU. If the mobile station has not started the countdown procedure and the new LLC PDU has the same RLC mode as the current uplink TBF and either a higher radio priority or the same radio priority but a higher peak throughput class, the mobile station shall immediately request a resource reallocation for uplink according to the new Radio Priority and peak throughput class of the new LLC PDU by sending a PACKET RESOURCE REQUEST message on the PACCH and starting timer T3168.
2. Then the mobile station shall complete the transmission of the current LLC PDU.
3. After the transmission of the PACKET RESOURCE REQUEST message with the reason for changing the priority or peak throughput class of an assigned uplink TBF the mobile station shall continue to use the currently assigned uplink TBF assuming that the requested priority or peak throughput class is already assigned to that TBF.

#### References

3GPP TS04.60 subclause 8.1.1.1.2.

##### 52.3.3.1.1.2 Test purposes

It is verified that:

1. Having an uplink TBF in progress without starting the countdown procedure, the MS will immediately send PACKET RESOURCE REQUEST if upper layer requests to transfer another LLC PDU which has the same RLC mode as the current uplink TBF and either a higher radio priority or the same radio priority but a higher peak throughput class.
2. After the request of the resource reallocation for uplink the MS completes the transmission of the current LLC PDU independent of whether or not a new resource is allocated.
3. After the transmission of the PACKET RESOURCE REQUEST the MS continues to use the currently assigned uplink TBF.

##### 52.3.3.1.1.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, default setting, BS\_PBCCH\_BLKs = 3, T3168 timeout value=7 (4s), N201-U=500 for SAPI 3, 5, 9, 11, N201-U=270 for SAPI 7.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated:

- for the MS supporting two PDP contexts: the test PDP context3 and context6 activated;
- for the MS supporting one PDP context and SMS over EGPRS: the test PDP context5 activated.

#### Related PICS/PIXIT Statement(s)

Type of MS (P-, E-, R-GSM 900, GSM 400, GSM 700, GSM 850 or DCS 1 800 and PCS 1 900).

Support EGPRS service.

Support activation of at least one PDP context.

Support two PDP contexts.

Support Short Message Service.

Support SMS over EGPRS.

The way to initiate an uplink packet transfer.

The way to trigger transferring new user data in a different PDP context while an uplink transfer is in progress.

The way to trigger sending an MO short message over EGPRS.

#### Test Procedure

##### 1. Test procedure for the MS supporting two PDP contexts.

An uplink TBF is established and in progress. The MS is triggered to transfer data with a higher throughput in the same RLC mode and the same radio priority.

The MS sends PACKET RESOURCE REQUEST. The current TBF is maintained and SS assigns the USFs allowing the MS transmit more data blocks. It is verified that the MS completes the transmission of the current LLC PDU and then starts transmitting a new LLC PDU with the higher throughput. A new PDCH is assigned to MS to complete the RLC data block transferring.

The test procedure is executed twice. In the 2<sup>nd</sup> execution, after the MS requests a resource reallocation for transferring the data block with a higher throughput a new PDCH is assigned. It is verified that the MS switches on the new PDCH, completes the transmission of the current LLC PDU and then starts transmitting a new LLC PDU with the higher throughput.

##### 2. Test procedure for the MS supporting SMS over GPRS and one PDP context.

Similar to the 1<sup>st</sup> test procedure except that the MS is triggered firstly to send MO SMS over GPRS. After an uplink TBF is established for SMS and is in progress the MS is triggered to transfer data with a higher radio priority in the same RLC mode (SMS has the radio priority level = 3 defined in the attach accept message).

#### Maximum Duration of Test

5 minutes.

#### Expected Sequence

The test sequence is applied to the MS supporting two PDP contexts and executed twice for k = 1 and 2.

When k=1 testing that the MS continues to use the currently assigned uplink TBF, while k=2 testing that the MS to use newly assigned the resource to complete transmission of the current PDU before starting transmission the PDU with a higher radio priority or a higher throughput.

Expected Sequence for the MS supporting one PDP context and SMS over GPRS

The test sequence is applicable to the MS supporting SMS over GPRS and one PDP context. The sequence is executed twice for k = 1 and 2.

### Specific Message Contents

PACKET RESOURCE REQUEST message in step 5:

| Information Element         | value/ remark        |
|-----------------------------|----------------------|
| Channel Request Description |                      |
| - PEAK_THROUGHPUT_CLASS     | Any value            |
| - RADIO_PRIORITY            | Any value            |
| - RLC_MODE                  | Acknowledged mode    |
| - LLC_PDU_TYPE              | 1 ( not SACK or ACK) |
| - RLC_OCTET_COUNT           | Any value            |

PACKET UPLINK ASSIGNMET message in step 8:

Same as in step 10 of the test sequence testing the MS supporting two PDP contexts.

### 52.3.3.1.2 Dynamic Allocation / Resource reallocation / Successful / Lower throughput class

#### 52.3.3.1.2.1 Conformance requirements

1. During an uplink packet transfer, upper layer may request to transfer another LLC PDU. If the new LLC PDU has the same RLC mode as the current uplink TBF and either a lower Radio Priority or the same radio priority but a lower peak throughput class, the mobile station shall first complete the sending of the LLC PDU in transfer.
2. When the sending of LLC PDUs at the higher Radio Priority or the same radio priority but higher peak throughput class stops, without waiting for the acknowledgement from the network if in RLC acknowledged mode, the mobile station shall then perform the request of a resource reallocation for uplink for any remaining LLC PDU(s) by sending a PACKET RESOURCE REQUEST message on the PACCH and start timer T3168.

#### References

3GPP TS 04.60, subclause 8.1.1.1.2.

#### 52.3.3.1.2.2 Test purposes

To verify that during an uplink packet transfer, upper layer requests to transfer another LLC PDU and the new LLC PDU has the same RLC mode as the current uplink TBF and either a lower Radio Priority or the same radio priority but a lower peak throughput class.

1. The MS first complete the sending of the LLC PDU in transfer, including acknowledgement from the network if in RLC acknowledged mode.
2. After the sending of LLC PDUs at the higher Radio Priority or the same radio priority but higher peak throughput class stops, the MS performs the request of a resource reallocation for uplink for any remaining LLC PDU(s).

#### 52.3.3.1.2.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, default setting, BS\_PBCCH\_BLKs = 3, T3168 timeout value=7 (4s), N201-U=500 for SAPI 3, 5, 9, 11, N201-U=270 for SAPI 7.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated:

- for the MS supporting two PDP contexts: test PDP context2 and context4 activated;
- for the MS supporting one PDP context and SMS over GPRS: Test PDP context5 activated.

#### Related PICS/PIXIT Statement(s)

Type of MS (P-, E-, R-GSM 900, GSM 400, GSM 700, GSM 850 or DCS 1 800 and PCS 1 900).

Support EGPRS service.

Support activation of at least one PDP context.

Support two PDP contexts.

Support SMS.

Support SMS over GPRS.

The way to initiate an uplink packet transfer.

The way to trigger transferring new user data in a different PDP context while an uplink transfer is in progress.

The way to trigger sending short message over GPRS.

#### Test Procedure

An uplink TBF is established and in progress. The MS is triggered to transfer data with a lower throughput or a lower radio priority in the same RLC mode.

The current TBF is maintained and SS assigns the USFs allowing the MS to transmit more data blocks. It is verified that the MS completes the transmission of the current LLC PDU and then sends PACKET RESOURCE REQUEST.

#### Maximum Duration of Test

5 minutes.

## Expected Sequence

The branch A is applicable for the MS supporting two PDP contexts. The branch B is applicable for the MS supporting SMS over GPRS and one PDP context.

PACKET UPLINK ASSIGNMET message in step 9:

Same as in subclause 52.3.3.1.1.3, step 10 of the test sequence testing the MS supporting two PDP contexts.

### 52.3.3.1.3 Dynamic Allocation / Resource reallocation / Successful / Different RLC mode and higher radio priority

#### 52.3.3.1.3.1 Conformance requirements

During an uplink packet transfer, upper layer may request to transfer another LLC PDU. If the new LLC PDU does not have the same RLC mode as the current uplink TBF but has a higher radio priority, the mobile station shall complete the transmission of the current LLC PDU using the countdown procedure including acknowledgement from the network, if in RLC acknowledged mode. The mobile station shall then release the TBF and establish a new uplink TBF for transmission of the new LLC PDU. When the sending of LLC PDUs with a higher radio priority is completed using the countdown procedure, including acknowledgement from the network if in RLC acknowledged mode, the mobile station shall try to establish an uplink TBF for the transmission of any remaining LLC PDU(s).

#### References

3GPP TS 04.60, subclause 8.1.1.1.2.

#### 52.3.3.1.3.2 Test purposes

To verify that during an uplink packet transfer, upper layer requests to transfer another LLC PDU and the new LLC PDU has a different RLC mode from the current uplink TBF but has a higher radio priority:

1. The mobile station completes the transmission of the current LLC PDU using the countdown procedure including acknowledgement from the network, if in RLC acknowledged mode.
2. Then the MS releases the TBF and establishes a new uplink TBF for transmission of the new LLC PDU.
3. When the sending of the new LLC PDUs with a higher radio priority is completed using the countdown procedure, including acknowledgement from the network if in RLC acknowledged mode, the mobile station tries to establish an uplink TBF for the transmission of any remaining LLC PDU(s).

#### 52.3.3.1.3.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, default setting, BS\_PBCCH\_BLKs = 3, T3168 timeout value=7 (4s), N201-U=500 for SAPI 3, 5, 9, 11, N201-U=270 for SAPI 7.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated:

- for the MS supporting two PDP contexts: Test PDP context1 and context2 activated;
- for the MS supporting SMS over EGPRS and one PDP context: Test PDP context1 activated.

#### Related PICS/PIXIT Statement(s)

Support EGPRS service.

Support activation of at least one PDP context.

Support two PDP contexts.

Support SMS.

Support SMS over GPRS.

The way to initiate an uplink packet transfer.

The way to trigger transferring new user data in a different PDP context while an uplink transfer is in progress.

The way to trigger sending an MO short message over GPRS.

#### Test Procedure

An uplink TBF is established and in progress. The MS is triggered to transfer 220 octets user data with a higher throughput or a higher radio priority, but in a different RLC mode.

SS assigns the USFs allowing the MS transmit more data blocks until the MS complete the countdown procedure. It is verified that the MS has transmitted only one LLC PDU.

Random accesses are received from the MS for EGPRS PACKET CHANNEL REQUEST. SS assigns a PDCH to it. SS assigns USFs addressing to the MS allowing more data blocks are transmitted by the MS until the countdown value CV=0. It is checked that the MS sends 11 RLC data blocks in total.

The MS requests more resources through random accesses of channel requests for the remaining LLC PDU in the initial test PDP context. SS starts a two-phase dynamic allocation. It is checked that the values of PEAK\_THROUGHPUT\_CLASS, RADIO\_PRIORITY and RLC\_MODE requested by the MS in the PACKET RESOURCE REQUEST are in consistence with the initial test PDP context2.

#### Maximum Duration of Test

5 minutes.

#### Expected Sequence

The branch A is applicable for the MS supporting two PDP contexts. The branch B is applicable for the MS supporting SMS over GPRS (SMS has the radio priority level=2 assigned in the attach accept message) and one PDP context.

|------|-----------|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 19A  | MS -> SS  | EGPRS PACKET CHANNEL REQUEST        | Received on PRACH, TBF establishment for transmission of a remaining LLC PDU in PDP context2 for branch A.                                                            |
| 20A  | SS -> MS  | PACKET UPLINK ASSIGNMENT            | Multiblock assignment, to force the MS making two-phase access procedure. Sent on PAGCH.                                                                              |
| 21A  | MS -> SS  | PACKET RESOURCE REQUEST             | Received on the single block assigned in step 20A. Check that PEAK_THROUGHPUT_CLASS = 5, RADIO_PRIORITY = 4, RLC_MODE = acknowledged mode.                            |
| 22A  | SS -> MS  | PACKET UPLINK ASSIGNMENT            | Open-ended uplink dynamic allocation, no starting time, USF_GRANULARITY = single block. Sent on PACCH of the same PDCH assigned in step 20A.                          |
| 23A  | SS -> MS  | PACKET DOWNLINK DUMMY CONTROL BLOCK | The USF assigned to the MS. Sent on PACCH of PDCH assigned in step 20A.                                                                                               |
| 24A  | MS -> SS  | EGPRS UPLINK RLC DATA BLOCK         | Received on the PDTCH assigned in step 20A.                                                                                                                           |
| 25A  | SS        |                                     | Repeat step 23A and 24A until countdown value CV=0. Observe the Length indicators and E bit of the received data headers. Check that only one LLC PDU is transmitted. |
| 26A  | SS -> MS  | PACKET UPLINK ACK/NACK              | Note: the 2nd <sup>t</sup> LLC PDU in PDP context2. FINAL_ACK_INDICATION = '1'. Acknowledge all received data, containing valid RRBP, sent on PACCH.                  |
| 27A  | MS -> SS  | PACKET CONTROL ACKNOWLEDGEMENT      | Received on the block specified by RRBP on PACCH of the assigned PDCH.                                                                                                |

### Specific Message Contents

PACKET UPLINK ASSIGNMET message in step 13:

Same as in subclause 52.3.3.1.1.3, step 10 of the test sequence testing the MS supporting two PDP contexts.

## 52.3.3.2 Dynamic Allocation / Resource reallocation / Abnormal

### 52.3.3.2.1 Dynamic Allocation / Resource reallocation / Abnormal / T3168 expiry

#### 52.3.3.2.1.1 Conformance requirements

On expiry of timer T3168 the mobile station shall retransmit the PACKET RESOURCE REQUEST message unless the PACKET RESOURCE REQUEST has already been transmitted four times in which case the mobile station shall return to packet idle mode and indicate a packet access failure to upper layer.

### References

3GPP TS 04.60, subclause 8.1.1.1.2.

#### 52.3.3.2.1.2 Test purposes

To verify that during uplink resource reallocation on expiry of timer T3168:

1. The MS retransmits the PACKET RESOURCE REQUEST message unless the PACKET RESOURCE REQUEST has already been transmitted four times.
2. The MS returns to idle mode after PACKET RESOURCE REQUEST has been transmitted four times.

## 52.3.3.2.1.3 Method of test

## Initial Conditions

## System Simulator:

1 cell, default setting, BS\_PBCCH\_BLKs = 3, T3168 timeout value=0 (0.5s), N201-U=500 for SAPI 3, 5, 9, 11, N201-U=270 for SAPI 7.

## Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated:

- for the MS supporting two PDP contexts: test PDP context2 and context5 activated;
- for the MS supporting one PDP context and SMS over GPRS: test PDP context5 activated.

## Related PICS/PIXIT Statement(s)

Support EGPRS service.

Support activation of at least one PDP context.

Support two PDP contexts.

Support SMS.

Support SMS over GPRS.

The way to initiate an uplink packet transfer.

The way to trigger transferring new user data in a different PDP context while an uplink transfer is in progress.

The way to trigger sending an MO short message.

## Test Procedure

An uplink TBF is established and in progress. The MS is triggered to transfer data with a higher radio priority in the same RLC mode.

The MS sends PACKET RESOURCE REQUEST. The current TBF is maintained and SS assigns the USFs allowing the MS transmit more data blocks, but does not answers to the requested resources. The MS repeatedly sends PACKET RESOURCE REQUEST three times after T3168 expires each time.

SS waits 0,55 s after receiving the 4<sup>th</sup> PACKET RESOURCE REQUEST and then sends PACKET DOWNLINK ASSIGNMENT and polls the MS. The MS answers with EGPRS PACKET DOWNLINK ACK/NACK.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

The branch A is applicable for the MS supporting two PDP contexts. The branch B is applicable for the MS supporting SMS over GPRS (SMS has the radio priority level = 2 assigned in the attach accept message) and one PDP context.

## Specific Message Contents

PACKET RESOURCE REQUEST message in step 5 and 11:

| Information Element         | value/ remark        |
|-----------------------------|----------------------|
| Channel Request Description |                      |
| - PEAK_THROUGHPUT_CLASS     | 5                    |
| - RADIO_PRIORITY            | 1                    |
| - RLC_MODE                  | Acknowledged mode    |
| - LLC_PDU_TYPE              | 1 ( not SACK or ACK) |
| - RLC_OCTET_COUNT           | Any allowed value    |

### 52.3.3.2.2 Dynamic Allocation / Resource reallocation / Abnormal / Invalid assignment

#### 52.3.3.2.2.1 Conformance requirements

1. If the mobile station receives a PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message and detects an invalid Frequency Parameters information element in the message, it shall perform an abnormal release. If PCCCH is present in the cell the mobile station shall perform an abnormal release with system information. If PCCCH is not present, the mobile station shall perform an abnormal release with random access.
2. If the mobile station receives a PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message specifying frequencies that are not all in one frequency band then the mobile station shall perform an abnormal release with random access.
3. If the mobile station receives a PACKET UPLINK ASSIGNMENT message containing a Frequency Parameters information element specifying a frequency that is in a frequency band not supported by the mobile station then the mobile station shall perform an abnormal release with random access.

#### References

3GPP TS 04.60, subclause 8.1.1.1.2.1.

#### 52.3.3.2.2.2 Test purposes

To verify that during uplink resource reallocation:

1. The MS performs an abnormal release with random access if it receives a PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message specifying frequencies that are not all in one frequency band.
2. The MS performs an abnormal release with random access if it receives a PACKET UPLINK ASSIGNMENT message containing a Frequency Parameters information element specifying a frequency in the frequency band not supported.
3. The MS performs an abnormal release with system information if it receives a PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message containing an Invalid Frequency Parameters information element, and if PCCCH is present in the cell.

#### 52.3.3.2.2.3 Method of test

##### Initial Conditions

System Simulator:

1 cell, default setting, BS\_PBCCH\_BLKs = 3, N201-U=500 for SAPI 3, 5, 9, 11, N201-U=270 for SAPI 7.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated:

- for the MS supporting two PDP contexts: test PDP context2 and context5 activated;
- for the MS supporting one PDP context and SMS over GPRS: test PDP context5 activated.

##### Related PICS/PIXIT Statement(s)

Support EGPRS service.

Support activation of at least one PDP context.

Support two PDP contexts.

Support SMS.

Support SMS over GPRS.

The way to initiate an uplink packet transfer.

The way to trigger transferring new user data in a different PDP context while an uplink transfer is in progress.

### Test Procedure

An uplink TBF is established and in progress. The MS is triggered to transfer data with a higher radio priority in the same RLC mode. The MS sends PACKET RESOURCE REQUEST. SS sends PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE containing an invalid assignment ( $k=1\dots 5$ , see step 6 in expected sequences).

The MS starts random accesses. SS assigns a two-phase dynamic allocation. It is checked that the requested radio priority, throughput and the RLC mode in PACKET RESOURCE REQUEST are in consistence with the test PDP context 5. SS grants the sufficient resources to the MS for transmission of the RLC data blocks until the MS sends PACKET RESOURCE REQUEST. It is checked that the MS has sent only one complete LLC PDU.

The SS assigns new resources to MS for completion the total data transferring.

### Maximum Duration of Test

10 minutes.

### Expected Sequence

The branch A in the sequence is applicable for the MS supporting two PDP contexts. The branch B is applicable for the MS supporting SMS over GPRS (SMS has the radio priority level = 2 assigned in the attach accept message) and one PDP context. The test sequence is executed in total five times,  $k = 1 \dots 5$ . The 5<sup>th</sup> execution is applicable to the single band MS, but not to the multi-band one.
