## 40.2.4 Default contents of Layer 3 messages

This clause contains the default values of L3 messages, which unless indicated otherwise in clause 40, shall be transmitted by the system simulator and which are required to be received from the MS under test.

In this clause, decimal values are normally used. However, sometimes a hexadecimal value, indicated by an "Hex", or a binary value, indicated by a "Binary" is used.

## 40.3 Default GPRS Conditions, Message Contents and Macros for the Higher Layer Test Cases

This clause details default conditions and messages that shall be used for the higher layer test cases (GPRS Mobility Management, Session Management and SMDCP).

These alternate conditions and messages are derived from the standard defaults via the changes listed in the following sub-clause. They aim to produce default conditions with permitted channel combinations of:

- FCCH+SCH+BCCH+CCCH+SDCCH/4+SACCH/4 (v. from 3GPP TS 05.02 'Permitted Channel Combinations onto a Basic Physical Channel').
- PBCCH+PCCCH+PDTCH+PACCH+PTCCH (xi. from 3GPP TS 05.02 'Permitted Channel Combinations onto a Basic Physical Channel').
- PDTCH+PACCH+PTCCH (xiii. From 3GPP TS 05.02 'Permitted Channel Combinations onto a Basic Physical Channel').

Where values have not been specified the equivalent overall default values should be used. If values need to be removed from the overall defaults then these should be specified as 'OMITTED'.

### 40.3.1 Default Test Conditions for the Higher Layer Test Cases

| Network dependant parameters |                                                       |
|------------------------------|-------------------------------------------------------|
| CCCH_CONF                    | 1 basic physical channel for CCCH combined with SDCCH |
| BS_AG_BLK_RES                | 0 blocks reserved                                     |
| BS_PA_MFRMS                  | 5 multiframes                                         |
| IMSI Attach-detach           | IMSI attach / detach not allowed                      |

### 40.3.2 Default Message for the Higher Layer Test Cases

#### 40.3.2.1 Default Contents of System Information Messages for the Higher Layer Test Cases

Default Contents of Information Elements in SYSTEM INFORMATION TYPE 1 to 13 Messages Used for the Higher Layer Test Cases.

|                             |                                                               |
|-----------------------------|---------------------------------------------------------------|
| Control Channel Description |                                                               |
| - BS_AG_BLK_RES             | 0 blocks reserved for access grant.                           |
| - CCCH_CONF                 | 1 basic physical channel used for CCCH, combined with SDCCHs. |
| - BS_PA_MFRMS               | 5 multiframe periods for transmission of paging messages.     |
| - Attach-Detach allowed     | IMSI attach / detach not allowed                              |

Normal Case

|                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                                                                                                                                                                              |

|---------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------|

## 40.3.6 Timer tolerance for higher layer test cases

The timers specified in the test cases in section 44, 45 and 46 shall take into account the delay in the establishment of uplink and/or downlink TBF required as per the test sequence. Timer tolerance = Timer Value +/- 10% +/- Delay to establish TBF.

## 40.4 Macros

### 40.4.1 Overview

The present document presents macros for GPRS test cases. It is intended to be a working document forming part of the GPRS Test Specifications.

#### 40.4.1.1 Definition

A macro is a name or sentence, possibly followed by an argument list, that is equated to a text to which it is to be expanded, possibly with the substitution of actual arguments.

Macros may be used to simplify the writing and reading of the test cases or to avoid the repetition of common sentences, message contents or message sequences. The macros defined in this subclause can be used throughout the test cases.

The definition of the macros is done in alphabetical order.

#### 40.4.1.2 Syntax

##### 40.4.1.2.1 Message contents

Any macro referencing message contents shall use the following table:

| Macro reference (arguments) |                     |               |
|-----------------------------|---------------------|---------------|
| (P)SI                       | Information Element | Value/Remarks |
|                             |                     |               |

The table must contain:

**Macro reference:** word or sentence that gives the name to the macro. It may include a list of arguments with actual values for some IE's.

**(P)SI:** the System Information and Packet System Information messages whose content is referenced. Several (P)SIs can be referenced in this column. The defined IE value(s) refers to the (P)SI(s) in the same row.

**Information Element:** IE which value is specified.

**Value/Remarks:** value and any other comment specific to the IE's. In particular, the mapping between an argument value and its coding shall be specified in this column (see note).

NOTE: If possible, only the meaning of the value will be shown and not the value itself; this avoids updating when the core specifications are modified.

### 40.4.1.2.2 Message sequence

Any macro referencing message contents shall use the following table:

| Step | Direction | Message             | Comments          |
|------|-----------|---------------------|-------------------|
|      |           | { Macro reference } | Macro (arguments) |
|      |           |                     |                   |

The table must contain:

**Macro reference:** word or sentence that gives the name to the macro. It may include a list of arguments with actual values for some parameters used within the macro.

**Step:** Number of the message. Letters may be used for general values: the same rules as in 3GPP TS 11.10 apply.

**Direction:** it must be either:

- "MS → SS": for an uplink message or a macro containing only uplink message(s);
- "SS → MS": for a downlink message or a macro containing only downlink message(s);
- "SS ↔ MS": for a macro containing both uplink and downlink message(s);
- "MS": for an action performed on the mobile side; or
- "SS": for an action performed on the system simulator side.

**Message:** Message name or macro reference.

**Comments:** any other comment specific to the message. In particular, value of certain bits/fields of the correspondent message.

The symbol ':' can be used to indicate that the previous and following message or sequence of messages (both previous and following must appear) is sent an unknown number of times, probably referenced with a letter on the 'step' column.

## 40.4.2 Default message contents

### 40.4.2.1 GPRS not supported

| (P)SI                        | Information Element | Value/Remarks      |
|------------------------------|---------------------|--------------------|

| N+1  | SS → MS   | PACKET UPLINK ACK/NACK            |                                                                                                                               |
| N+2  | MS → SS   | PACKET CONTROL<br>ACKNOWLEDGEMENT |                                                                                                                               |

NOTE 1: SI bit set to '0' in all data blocks.

NOTE 2: The SS sends a PACKET UPLINK ACK/NACK message at least every k-1 RLC UPLINK DATA messages, being k the window size with a value of 64 blocks.

NOTE 3: The field CV in the RLC UPLINK DATA messages verifies:

$$CV' = \text{round}\left(\frac{TBC - BSN' - 1}{NTS}\right)$$

$$CV = \begin{cases} CV' & x \leq BS\_CV\_MAX \\ 15 & \text{otherwise} \end{cases}$$

where:

- TBC: total number of RLC data blocks that will be transmitted in the TBF;
- BSN': absolute block sequence number of the RLC data block, from 0 to (TBC - 1);
- NTS: number of timeslots assigned to the uplink TBF, with range 1 to 8;
- the function round() rounds upwards to the nearest integer;
- BS\_CV\_MAX is a parameter broadcast in the system information;
- the division operation is non-integer and results in zero only for (TBC - BSN' - 1) = 0.

NOTE 4: In the case of Dynamic MAC mode, the macro reference in the corresponding test case may contain a certain frequency (in seconds<sup>-1</sup> or frames<sup>-1</sup>) for the SS to indicate the USF allocated to the mobile so that the MS is allowed to transmit. Otherwise, mobile's USF is indicated in every available block.

40.4.3.7 Uplink dynamic allocation one phase access

Sent on PAGCH.                                                                                                                                                                                                                                                   |
| 3    | MS -> SS  | PACKET RESOURCE REQUEST                      | Two phase access procedure. Received on the single block assigned in step 2.<br>Check that the PEAK_THROUGHPUT, RADIO_PRIORITY and RLC_MODE are compliant with the PDP context used.                                                                                                                                                                |
| 4    | SS -> MS  | PACKET UPLINK ASSIGNMENT                     | uplink dynamic allocation, no starting time (as default, otherwise use <b>TBF_STARTING_TIME</b> ), Sent on PACCH of the same PDCH assigned in step 2.                                                                                                                                                                                               |

### 40.4.3.10 Completion of uplink RLC data block transfer

The steps 1A - 3A are applied for the 1 uplink slot with the USF granularity 1 block.

The steps 1B, 2B1-2B4 and 3B are applied for the 1 uplink slot with the USF granularity 4 blocks.

The steps 1C - 5C are applied for the 2 uplink slots with USF granularity 1 block.

The steps 6 - 7 are common the cases A, B and C.

| 1    | SS -> MS  | Packet Cell Change Order                | SS requests the MS to move to a new cell in a Routing Area belonging to a different SGSN.                                                                          |
| 2    | MS -> SS  | Routing Area Update Request             | The updating type shall be "Combined RA/LA Updating" for Class B mobiles in Network Mode I and "RA Updating" for Class C mobiles supporting GPRS.                  |
| 3    | SS->MS    | XID                                     | XID with RESET                                                                                                                                                     |
| 4    | MS->SS    | XID                                     | XID response                                                                                                                                                       |
| 5    | SS -> MS  | Routing Area Update Accept              |                                                                                                                                                                    |
| 6    | MS->SS    | Routing Area Update Complete            | If the Routing Area Update Accept sent in step 5 contains P-TMSI and/or receive N-PDU or new ready timer value, the MS sends Routing Area Update Complete message. |

#### 40.4.3.18 PDP Context Modification

This procedure is always initiated by the network.

| Step | Direction | Message                           | Comments |
|------|-----------|-----------------------------------|----------|
|      |           | <b>{PDP Context Modification}</b> |          |
| 1    | SS -> MS  | Modify PDP Context                |          |
| 2    | MS -> SS  | Modify PDP Context Accept         |          |

#### 40.4.3.19 Location Update Procedure

This procedure is only initiated by mobile stations that are not operating in class mode C "GPRS".

| Step               | Direction | Message                     | Comments                                                              |
|--------------------|-----------|-----------------------------|-----------------------------------------------------------------------|
|                    |           | {Location Update Procedure} | Macro parameters:<br><b>MOBILE_IDENTITY</b>                           |
| 1                  | MS -> SS  | LOCATION UPDATE REQUEST     |                                                                       |
| 2                  | SS -> MS  | AUTHENTICATION REQUEST      |                                                                       |
| 3                  | MS -> SS  | AUTHENTICATION RESPONSE     |                                                                       |
| 4                  | SS -> MS  | LOCATION UPDATE ACCEPT      |                                                                       |
| A5 (optional step) | MS -> SS  | TMSI REALLOCATION COMPLETE  | Step executed only when assigned mobile identity is of the type TMSI. |

## 40.5 Test PDP contexts

The following table defines 7 PDP contexts used in the GPRS dynamic allocation and RLC testcases. Test PDP context3 is the default Test PDP context which is used in the test cases where no particular Test PDP contexts are specified. Compression is always turned off if nothing else is stated explicitly in the test case.

**Table 40.5 Test PDP contexts**

|                                | PDP Context1                                      | PDP Context2                                    | PDP context3       | PDP context4       |
|--------------------------------|---------------------------------------------------|-------------------------------------------------|--------------------|--------------------|
| LLC SAPI                       | SAPI = 3                                          | SAPI = 11                                       | SAPI = 11          | SAPI = 9           |

## 41 GPRS Paging, TBF establishment/release and DCCH related procedures

### 41.1 / RR / Paging

The paging procedure is used by the network to cause the MS to establish either an RR connection for circuit switched services or a downlink GPRS packet transfer. Normally the MS listens to its paging sub-channel when DRX is used, but this can be modified by the use of different page mode. The correct monitoring of its paging sub-channel on PCCCH or CCCH in different control channel configurations and correct implementation of the paging procedure in the MS are essential. They are the test objectives of this subclause.

The subclause is applicable for all MS supporting GPRS service.

#### 41.1.1 RR / Paging / on PCCCH for GPRS service successful

All test cases in this subclause test the MS paging behaviours in a network operating in Mode I or Mode III.

##### 41.1.1.1 RR / Paging / on PCCCH for GPRS service / normal paging with P-TMSI successful

###### 41.1.1.1.1 Conformance requirements

1. In packet idle mode, the mobile station monitors the relevant paging sub-channels on PCCCH, if such is present in the cell. The determination of the paging group for the mobile station is defined in 3GPP TS 05.02.
2. MS in a specific PCCCH GROUP shall monitor the radio blocks on PCCCH corresponding to the PCCCH GROUP the mobile station belongs to and where paging may appear.
3. A PACKET PAGING REQUEST message on PCCCH may include more than one mobile station identification.
4. In response to a PACKET PAGING REQUEST, the mobile station shall initiate the uplink TBF using a PACKET CHANNEL REQUEST with cause value of 'Page Response'.

###### References

3GPP TS 04.60, subclauses 5.5.1, 5.5.1.5, 6.1.2, 6.2, 6.2.2 and 6.2.3.

3GPP TS 05.02, subclauses 6.5.1 and 6.5.6.

###### 41.1.1.1.2 Test purpose

To verify that upon receipt of a PACKET PAGING REQUEST message for GPRS service with paging mode set to normal, the MS in packet idle mode, GPRS attached state, is able to determine its PCCCH group and PAGING group and that the MS responds correctly with PACKET CHANNEL REQUEST with cause value of 'Page Response'.

###### 41.1.1.1.3 Method of test

###### Initial Conditions

System Simulator:

1 cell, CCCH combined with SDCCH, GPRS supported, PCCCH present, Max-Retrans = 2, access burst type = 11 bits, BS\_PACKET\_IDLE\_RES = 2, BS\_PBCCH\_BLK = 3, BS\_PCC\_CHANS = 1, BS\_PRACH\_BLK = 1 in PSII.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated.

## Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900).
- Support GPRS service.

## Test Procedure

The SS sends a PACKET PAGING REQUEST message to the MS. The paging message contains a P-TMSI addressing the MS for TBF establishment. The MS attempts two random accesses for PACKET CHANNEL REQUEST. The SS responds to the 2<sup>nd</sup> one by assigning an uplink channel. The MS sends a correct LLC PDU containing TLLI in the RLC/MAC header implicitly indicating a paging response.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

| Step | Direction | Message                                | Comments                                                                                                                                                |

#### 41.1.1.2 RR / Paging / on PCCCH for GPRS service / normal paging with IMSI successful

##### 41.1.1.2.1 Conformance requirements

If the MS was paged by the network with the IMSI (for GPRS service), the MS shall delete any RAI, P-TMSI, P-TMSI signature and GPRS ciphering key sequence number stored. The MS shall then perform a GPRS attach or combined GPRS attach procedure.

##### References

3GPP TS 04.08 / 3GPP TS 24.008, subclause 4.7.9.1.

##### 41.1.1.2.2 Test purpose

To verify that the MS is able to respond to PACKET PAGING REQUEST for GPRS service when the MS is addressed with its IMSI and that the MS then performs a GPRS attach or combined GPRS attach procedure.

##### 41.1.1.2.3 Method of test

##### Initial Conditions

System Simulator:

1 cell, CCCH combined with SDCCH, GPRS supported, PCCCH present, Max-Retrans = 2, access burst type = 11 bits, BS\_PAG\_BLKES\_RES = 3, BS\_PBCCH\_BLKES = 3, BS\_PCC\_CHANS = 1, BS\_PRACH\_BLKES = 1 in PSI1.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated.

##### Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900).
- Support GPRS service.

Test Procedure

The SS sends a PACKET PAGING REQUEST message containing the IMSI of the MS for TBF establishment. The MS attempts two random accesses for PACKET CHANNEL REQUEST. The SS responds to the 2<sup>nd</sup> one by assigning an uplink channel for an open-end TBF. The MS sends an LLC PDU containing TLLI in the RLC/MAC header and ATTACH REQUEST, implicitly indicating a paging response. The SS allows the completion of the attach procedure to make sure that MS sends a complete ATTACH REQUEST in answer to paging.

Maximum Duration of Test

5 minutes.

Expected Sequence

#### 41.1.1.3 RR / Paging / on PCCCH for GPRS service / extended paging with P-TMSI successful

##### 41.1.1.3.1 Conformance requirements

1. The network may send page mode information in any downlink message on PCCCH. The page mode information controls possible additional requirements on a mobile station receiving the message.
2. In packet idle mode, the paging sub-channels on PCCCH shall be monitored (by the mobile station) according to the current DRX mode and the values of the PAGING\_GROUP parameter defined for the mobile station, and possible page mode information received on PCCCH.
3. The mobile station shall take into account the page mode information received in any message received in a radio block on PCCCH corresponding to one of the paging groups defined by the different PAGING\_GROUP values for the mobile station.
4. In the extended paging mode, the mobile station is required in addition (to normal paging) to receive and analyse the possible message in the third block period on PCCCH where paging may occur (PPCH), following the block corresponding to MS's paging group.

##### References

3GPP TS 04.60, subclauses 5.5.1, 5.5.1.5 and 5.5.1.6.

##### 41.1.1.3.2 Test purpose

1. To verify that the MS operates in the extended page mode when it is ordered by the SS in PACKET PAGING REQUEST which does not address the MS, but on the paging sub-channel corresponding to the MS identity.
2. To verify that the MS operates in the extended page mode when it is ordered by the SS in PACKET UPLINK ASSIGNMENT on the paging sub-channel corresponding to the MS identity.
3. To verify that the MS operates in the extended page mode when it is ordered by the SS in PACKET ACCESS REJECT on the paging sub-channel corresponding to the MS identity.
4. To verify that the MS operates in the extended page mode when it is ordered by the SS in PACKET DOWNLINK ASSIGNMENT on the paging sub-channel corresponding to the MS identity.
5. To verify that the MS operates in the extended page mode when it is ordered by the SS in PACKET QUEUEING NOTIFICATION on the paging sub-channel corresponding to the MS identity.
6. To verify that the MS operates in the extended page mode when it is ordered by the SS in PACKET CELL CHANGE ORDER on the paging sub-channel corresponding to the MS identity.
7. To verify that the MS operates in the extended page mode when it is ordered by the SS in PACKET DOWNLINK DUMMY CONTROL BLOCK on the paging sub-channel corresponding to the MS identity.
8. To verify that the MS operates in the extended page mode when it is ordered by the SS in PACKET PRACH PARAMETERS on the paging sub-channel corresponding to the MS identity.
9. To verify that the MS operates in the extended page mode when it is ordered by the SS in PACKET POLLING REQUEST on the paging sub-channel corresponding to the MS identity.

## 41.1.1.3.3 Method of test

## Initial Conditions

## System Simulator:

1 cell, CCCH combined with SDCCH, GPRS supported, PCCCH present, Max-Retrans = 2  
BS\_PAG\_BLK\_RES = 2, BS\_PBCCH\_BLK = 4 and BS\_PRACH\_BLK = 1 in PSI1.

## Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated.

## Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900).
- Support GPRS service.

## Test Procedure

The test is repeated 9 times. Each time at the start, the SS sends one of the relevant messages listed in the corresponding test purpose to carry the Extended Paging mode. The MS is paged for TBF establishment and the paging mode is reset to Normal. After two attempts of the random access from the MS, the SS rejects the access.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

The test sequence is repeated for  $k = 1 \dots 9$ .

| Step | Direction | Message                             | Comments                                                                                                                                                                                                                                                                                                                                                                                                                                                |

#### 41.1.1.4 RR / Paging / on PCCCH for GPRS service / paging reorganisation successful

##### 41.1.1.4.1 Conformance requirements

1. In the paging reorganisation mode the mobile station shall receive all messages on the PCCCH regardless of the BS\_PAG\_BLK\_RES setting. It is required to receive all PBCCH messages.
2. When the mobile station receives the next message to a (possibly new) PAGING\_GROUP defined for the mobile station, subsequent action is defined by the possible page mode information received in that message.
3. When the mobile station selects a new set of PAGING\_GROUP values, the initial page mode in the mobile station shall be set to paging reorganisation.
4. The CONTROL\_CH\_REL field in PSI1 control channel description indicates, if set = 1, that the last PDCH carrying PCCCH and PBCCH will be released shortly. All mobile stations on PCCCH shall then as soon as this information has been received return to CCCH and there obey the information sent on BCCH as specified in 3GPP TS 04.08 / 3GPP TS 44.018. If the field is set = 0, no channel release is pending.

##### References

3GPP TS 04.60, subclauses 5.5.1.5 and 11.2.18.

##### 41.1.1.4.2 Test purpose

1. To verify that the MS, after reception of a message with page mode set to "paging reorganisation", answers to paging messages (with page mode set to "normal paging") sent on its old PCCCH in paging blocks which do not belong to the MS's paging sub-channel.
2. To test that the MS correctly determines its new paging sub-channel when the number of allocated PBCCH blocks BS\_PBCCH\_BLK and the number of reserved blocks BS\_PAG\_BLK\_RES are changed.
3. To test that the MS correctly determines its new paging sub-channel when the number of PCCCH channels is changed.
4. To test that the MS understands the control channel release bit in control channel description.

##### 41.1.1.4.3 Method of test

##### Initial Conditions

System Simulator:

1 cell, CCCH combined with SDCCH, GPRS supported, PCCCH present, Max-Retrans = 2, access burst type = 8 bits, BS\_PAG\_BLK\_RES = 2, BS\_PBCCH\_BLK = 3, BS\_PRACH\_BLK = 1 and BS\_PCC\_CHAN = 1.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated.

##### Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900).
- Support GPRS service.

### Test Procedure

The SS sends PACKET PAGING REQUEST on PCCCH and sets Paging Mode to paging reorganisation. The MS is paged on a former access grant block. After receipt the 1<sup>st</sup> random access from the MS with the correct access type for the paging response, the SS rejects the packet access and sets the paging mode to paging reorganisation.

The test procedure is similarly repeated twice. Each time the SS changes the PCCCH organisation parameters (see the following test sequence). Then the MS is paged. The random access from the MS is rejected by the SS.

The SS resets the default system setting, but sets CONTROL\_CH\_REL. The MS is then paged on PCH. After the MS starting random access on RACH, the access from the MS is rejected.

### Maximum Duration of Test

5 minutes.

## Expected Sequence

| Step | Direction | Message                             | Comments                                                                                                                                                                                           |

| 18   | SS -> MS  | IMMEDIATE ASSIGNMENT REJECT         | Random Reference = pertaining to the message received in step 17, Sent on AGCH.                                                                                                                    |

## Specific Message Contents

## 41.1.2 RR / Paging / on PCCCH for circuit-switched services / paging successful

### 41.1.2.0 Definition and applicability

These test cases apply to Mobile Station supporting GPRS that can operate in mode A or mode B.

#### 41.1.2.1 Conformance requirements

1. When answering to a paging message the purpose of which is to trigger the establishment of an RR connection, the mobile station, whatever its MS class mode of operation, shall follow the paging response procedures as specified in 3GPP TS 04.08 / 3GPP TS 44.018.
2. The MS shall enter GPRS ATTACHED.SUSPENDED sub-state when entering dedicated mode and when the MS limitations makes it unable to communicate on GPRS channels. In this sub-state, no user data should be sent and no signalling information shall be sent. The MS shall leave this sub-state when leaving dedicated mode.

#### References

3GPP TS 04.60, subclause 6.1.4.

3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.3.2.2,  
3GPP TS 04.08 / 3GPP TS 24.008, subclause 4.1.3.1.3.2.

#### 41.1.2.2 Test purpose

1. To verify that the MS in packet idle mode, GPRS attached state, is able to determine its PCCCH group and PAGING group, and that the MS responds correctly on RACH with CHANNEL REQUEST containing cause value of 'Page Response' upon receipt of a PACKET PAGING REQUEST message for establishment of an RR connection.
2. To verify that the MS is able to respond to PACKET PAGING REQUEST for establishment of an RR connection when the MS is addressed with its TMSI and, but an another field of the paging message contains an IMSI different from that of the MS.
3. To verify that the MS is able to respond to PACKET PAGING REQUEST for establishment of an RR connection when the MS is addressed with its IMSI.

#### 41.1.2.3 Method of test

##### Initial Conditions

###### System Simulator:

1 cell, CCCH combined with SDCCH, GPRS supported, Network mode I, PCCCH present, Max-Retrans = 2, access burst type = 11 bits, BS\_PAG\_BLKES\_RES=2, BS\_PBCCH\_BLKES=3, BS\_PRACH\_BLKES=1, BS\_PCC\_CHANS=1. Early Classmark Sending is disabled.

###### Mobile Station:

The MS is GPRS attached with a P-TMSI and a TMSI allocated and SPLIT PG CYCLE negotiated.

##### Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900).
- Support GPRS service.
- Supporting GPRS MS class A.
- Supporting GPRS MS class B.

##### Test Procedure

The MS is paged with the TMSI on the MS's PCCCH sub-channel for RR establishment. After two random accesses from the MS on RACH the SS assigns a SDCCH. The MS responses with PAGING RESPONSE. The test is repeated with PACKET PAGING REQUEST containing the IMSI of the MS.

Maximum Duration of Test

5 minutes.

Expected Sequence

The test sequence is repeated for k = 1 ... 2

### 41.1.3 RR / Paging / on PCCCH / paging ignored

The MS shall ignore paging not addressing to it. If paging is not implemented correctly unnecessary accesses will be provoked on PCCCH which is shared by all MS in a same cell. This kind of the wrong paging behaviour of the same type of MS in a GSM network can block the use of PCCCH and will, therefore, cause an unacceptable degradation of the GSM services to other users of the mobile stations.

#### 41.1.3.1 Conformance requirements

1. MS in a specific PCCCH GROUP shall monitor the radio blocks on PCCCH corresponding to the PCCCH GROUP the mobile station belongs to and where paging may appear.
2. A PACKET PAGING REQUEST message on PCCCH may include more than one mobile station identification.

#### References

3GPP TS 04.60, subclauses 5.5.1 and 6.1.2.

#### 41.1.3.2 Test purpose

1. To verify that the MS ignores PACKET PAGING REQUEST (for GPRS service) where both P-TMSI and IMSI do not address the MS although the PACKET PAGING REQUEST message is sent on specific PCCCH to which the MS belongs.
2. To verify that the MS ignores PACKET PAGING REQUEST (for circuit-switched service) where both P-TMSI and IMSI do not address the MS although the PACKET PAGING REQUEST message is sent on specific PCCCH to which the MS belongs.

NOTE: The 2<sup>nd</sup> test purpose is valid for GPRS MS class A and B.

#### 41.1.3.3 Method of test

##### Initial Conditions

System Simulator:

1 cell, CCCH combined with SDCCH, GPRS supported, PCCCH present, Max-Retrans = 2, access burst type = 8 bits, BS\_PAG\_BLK\_RES = 2, BS\_PBCCH\_BLK = 3, BS\_PRACH\_BLK = 1 and BS\_PCC\_CHANS = 1.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and SPLIT PG CYCLE negotiated. If the MS has the class A or B of mode of operation the MS is idle, updated with a TMSI allocated.

##### Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900).
- Support GPRS service.
- Supporting GPRS MS class A.
- Supporting GPRS MS class B.
- Supporting GPRS MS class C.

##### Test Procedure

The MS is paged for TBF establishment. The MS attempts a random access which is rejected. The MS is paged again for TBF establishment. PACKET PAGING REQUEST contains two mobility identity which do not address the MS. The MS shall not initiate the random access. The same test is repeated, but the MS is paged for RR connection establishment.

##### Maximum Duration of Test

5 minutes.

## Expected Sequence

The test sequence is repeated for  $k = 1, 2$ . The 2<sup>nd</sup> time ( $k=2$ ) is executed if the MS has the class A or B of mode of operation.

#### 41.1.4 RR / Paging / on PACCH for circuit-switched services

This subclause tests the MS paging behaviours in the packet transfer mode in a network operating in Mode I. The subclause is applicable to mobile stations supporting GPRS MS operation mode A or B.

##### 41.1.4.1 RR / Paging / on PACCH for circuit-switched services/ paging successful

This subclause is applicable for the MS in the class B of mode of operation.

###### 41.1.4.1.1 Conformance requirements

1. Paging initiation using PACCH applies to a mobile station supporting GPRS MS class A or B when such mobile station is in packet transfer mode and when the network operates according to mode I.
2. A mobile station operating in class B mode of operation shall abort the current GPRS data transfer(s) if it was in packet transfer mode, and suspend any GPRS activity until return to idle mode.
3. (For an MS in the mode of operation of class B) when responding to a paging message for other GSM services, the MS shall establish the connection for that incoming service (i.e., enter dedicated mode) and suspend GPRS activity. GPRS activity is resumed upon return to idle mode.

###### References

3GPP TS 04.60, subclauses 6.1.3 and 6.1.4.

3GPP TS 22.060, subclause 6.1.

###### 41.1.4.1.2 Test purpose

1. To verify that upon receipt of a PACKET PAGING REQUEST message on PACCH for RR establishment, the class B mobile in packet transfer mode is able to respond correctly on RACH with CHANNEL REQUEST containing cause value of 'Page Response'.
2. To verify that the MS is able to respond to PACKET PAGING REQUEST when the MS is addressed with its TMSI and even if another field of PACKET PAGING REQUEST contains an IMSI different from that of the MS.
3. To verify that the MS is able to respond to PACKET PAGING REQUEST when the MS is addressed with its IMSI.

## 41.1.4.1.3 Method of test

## Initial Conditions

## System Simulator:

1 cell, CCCH combined with SDCCH, GPRS supported, PCCCH present, Max-Retrans = 2, access burst type = 11 bits, BS\_PAG\_BLK\_RES = 2, BS\_PBCCH\_BLK = 3 and BS\_PCC\_CHAN = 1.

## Mobile Station:

The MS is in packet transfer mode.

## Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900).
- Support GPRS service.
- Supporting GPRS MS class A.
- Supporting GPRS MS class B.
- Supporting GPRS MS class C.

## Test Procedure

The MS is in the packet transfer mode. An USF is assigned to the MS. After receiving the first uplink RLC data block from the MS it is paged on PACCH for an RR connection establishment with the allocated TMSI. The MS sends CHANNEL REQUEST for Answer to Paging. The access attempt is rejected.

The test is repeated once. The difference of the second time lies in the PACKET PAGING REQUEST on PACCH containing IMSI instead of TMSI addressing the MS.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

The test sequence is repeated for  $k = 1, 2$ .

#### 41.1.4.2 RR / Paging / on PACCH for circuit-switched services/ paging ignored

The MS shall ignore paging not addressing to it. If paging is not implemented correctly unnecessary accesses will be provoked on the CCCH which is shared by all MSs in a same cell. This kind of the wrong paging behaviour of the same type of MS in a GSM network can block the use of CCCH and will, therefore, cause an unacceptable degradation of the GSM services to other users of the mobile stations.

##### 41.1.4.2.1 Conformance requirements

The MS shall ignore paging not addressing to it.

##### References

3GPP TS 04.60, clause 6.

##### 41.1.4.2.2 Test purpose

To verify that the MS ignores a PACKET PAGING REQUEST message where both TMSI and IMSI do not address the MS although the PACKET PAGING REQUEST message is sent on PACCH allocated to the MS.

##### 41.1.4.2.3 Method of test

##### Initial Conditions

System Simulator:

1 cell, CCCH combined with SDCCH, GPRS supported, PCCCH present, Max-Retrans = 2, access burst type = 8 bits, BS\_PAG\_BLK\_RES = 2, BS\_PBCCH\_BLK = 3, BS\_PRACH\_BLK = 1 and BS\_PCC\_CHAN = 1.

Mobile Station:

The MS is in packet transfer mode.

## Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900).
- Support GPRS service.
- Supporting GPRS MS class A.
- Supporting GPRS MS class B.
- Supporting GPRS MS class C.

## Test Procedure

The MS is brought to the packet transfer mode. A PACKET PAGING message not addressing the MS is sent on PACCH for RR connection establishment. It is checked that the MS can continue sending the uplink RLC data blocks and does not attempt any random accesses on RACH for 4s.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

## Specific Message Contents

## 41.1.5 RR / Paging / on CCCH for GPRS service

## 41.1.5.1 RR / Paging / on CCCH for GPRS service / normal paging

## 41.1.5.1.1 RR / Paging / on CCCH for GPRS service / normal paging with P-TMSI successful

## 41.1.5.1.1.1 Conformance requirements

1. The network initiates the paging procedure by sending a paging request message on an appropriate paging sub-channel on CCCH. Paging initiation using a paging sub-channel on CCCH is used when sending paging information to a mobile station and PCCCH is not present in the cell.

2. The mobile station in packet idle mode is required to receive and analyse the paging messages and immediate assignment messages sent on the paging sub-channels on CCCH corresponding to the paging groups determined for it in packet idle mode.
3. A PAGING REQUEST message may include more than one mobile station identification.
4. In a PAGING REQUEST message used for the packet paging procedure, the mobile station shall be identified by the P-TMSI (GPRS TMSI) or its IMSI. If the mobile station is identified by the P-TMSI, it shall indicate the receipt of a paging request to the MM sub-layer.

If the mobile station identified by its IMSI, it shall parse the message for a corresponding *Packet Page Indication* field:

- if the *Packet Page Indication* field indicates a paging procedure for RR connection establishment, or the field is not present in the message, the mobile station shall initiate the immediate assignment procedure;
  - if the *Packet Page Indication* field indicates a packet paging procedure, the mobile station shall indicate the receipt of a paging request to the MM sub-layer.
5. The mobile station initiates the packet access procedure by scheduling the sending of CHANNEL REQUEST messages on RACH.

### 41.1.5.1.1.2 Test purpose

1. To verify that the MS in packet idle mode, GPRS attached state, is able to determine its CCCH group and PAGING group and that the MS responds correctly with CHANNEL REQUEST on RACH with cause value of 'packet access' upon receipt of a PAGING REQUEST TYPE 1 message for packet access with paging mode set to normal.
2. To verify that the MS is able to respond to PAGING REQUEST TYPE 1 for packet access when the MS is addressed with its P-TMSI, but another field of the paging message contains an IMSI different from that of the MS.
3. To verify that the MS is able to respond to PAGING REQUEST TYPE 2 for packet access when the MS is addressed with its P-TMSI, but other fields of the paging message contain a TMSI and an IMSI different from that of the MS.
4. To verify that the MS is able to respond to PAGING REQUEST TYPE 3 for packet access when the MS is addressed with its P-TMSI, but other fields of the paging message contain TMSIs different from that of the MS.

### 41.1.5.1.1.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, CCCH combined with SDCCH, GPRS supported, PCCCH absent, Max-Retrans = 2, BS\_AG\_BLK\_RES = 2, BS\_PA\_MFRMS = 6, SPLIT\_PG\_CYCLE is supported on CCCH in the cell.

Mobile Station:

The MS is GPRS attached with a TMSI and a P-TMSI allocated, SPLIT PG CYCLE negotiated.

#### Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900).
- Support GPRS service.

## Test Procedure

The test is repeated three times. Each time the MS is paged for the packet paging procedure through a different paging request type message. After receiving a CHANNEL REQUEST with the establishment cause 'one phase access', an open-end TBF is assigned. A USF is assigned to the MS to enable it to transfer an uplink RLC data block. The received data block is acknowledged by the SS with , Final Ack Indicator = '1' , a valid RRBP. The MS sends PACKET CONTROL ACKNOWLEDGEMENT.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

The test sequence is repeated for k = 1 ... 3.

| Step | Direction | Message                                | Comments                                                                                                                              |

## 41.1.5.1.2 RR / Paging / on CCCH for GPRS service / normal paging with IMSI successful

## 41.1.5.1.2.1 Conformance requirements

1. If the MS was paged by the network with the IMSI (for GPRS service), the MS shall delete any RAI, P-TMSI, P-TMSI signature and GPRS ciphering key sequence number stored. The MS shall then perform a GPRS attach or combined GPRS attach procedure.

## References

3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.3.1.3.

## 41.1.5.1.2.2 Test purpose

To verify that the MS is able to respond to PAGING REQUEST TYPE 1 when the MS is addressed with its IMSI with *Packet Page Indication* set to packet paging procedure, and that the MS then performs a GPRS attach or combined GPRS attach procedure.

## 41.1.5.1.2.3 Method of test

## Initial Conditions

System Simulator:

1 cell, CCCH combined with SDCCH, GPRS supported, PCCCH absent, Max-Retrans = 2, BS\_AG\_BLK\_RES = 2, BS\_PA\_MFRMS = 9.

Mobile Station:

The MS is in GPRS attached with a TMSI and a P-TMSI allocated, SPLIT PG CYCLE negotiated.

## Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900).
- Support GPRS service.

## Test Procedure

The MS is paged on PCH with IMSI for packet paging procedure. After receiving the CHANNEL REQUEST from the MS aTBF is assigned. The MS sends an LLC PDU containing TLLI in the RLC/MAC header and ATTACH REQUEST, implicitly indicating a paging response. The SS verifies the completeness of ATTACH REQUEST and acknowledges the received two RLC data blocks with a valid RRBP and Final Ack indicator = '1'.

## Maximum Duration of Test

5 minutes.

## 41.1.5.1.3 RR / Paging / on CCCH for GPRS service / normal paging with P-TMSI ignored

The MS shall ignore paging not addressing to it. If paging is not implemented correctly unnecessary accesses will be provoked on CCCH which is shared by all MS in a same cell. This kind of the wrong paging behaviour of the same type of MS in a GSM network can block the use of CCCH and will, therefore, cause an unacceptable degradation of the both GSM GPRS and circuit-switched services to other users of the mobile stations.

## 41.1.5.1.3.1 Conformance requirements

In a PAGING REQUEST message used for the packet paging procedure, the mobile station shall be identified by the TMSI (GPRS TMSI) or its IMSI. A PAGING REQUEST message may include more than one mobile station identification.

## References

3GPP TS 04.08 / 3GPP TS 44.018, subclauses 3.3.2.1.1 and 3.5.1.1.

## 41.1.5.1.3.2 Test purpose

To verify that the MS ignores a PAGING REQUEST TYPE 1, 2 messages where both P-TMSI and IMSI do not address the MS although the paging message is sent on the CCCH to which the CCCH\_GROUP belongs.

## 41.1.5.1.3.3 Method of test

## Initial Conditions

System Simulator:

1 cell, CCCH combined with SDCCH, GPRS supported, PCCCH absent, Max-Retrans = 2, BS\_AG\_BLK\_RES = 2, BS\_PA\_MFRMS = 7, .

Mobile Station:

The MS is GPRS attached with a TMSI and a P-TMSI allocated and SPLIT PG CYCLE negotiated.

#### Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900).
- Support GPRS service.

#### Test Procedure

The test is repeated twice. Each time a different paging message not addressing the MS is sent on the PCH belonging to the MS. It is checked that the no access attempt is made by the MS for 5 s.

The MS is then paged for packet paging. The MS attempts a random access for GPRS Attach and is allowed to complete the procedure.

#### Maximum Duration of Test

5 minutes.

#### Expected Sequence

The test steps 1 - 2 is repeated for k = 1 .. 2.

| Step | Direction | Message                                     | Comments                                                                                                                                                                                                                                         |

#### 41.1.5.2 RR / Paging / on CCCH for GPRS service / extended paging

##### 41.1.5.2.1 RR / Paging / on CCCH for GPRS service / extended paging with P-TMSI successful

###### 41.1.5.2.1.1 Conformance requirements

1. A given mobile station shall take into account the page mode information element of any message sent on its own paging sub-channel whatever the nature of this message (paging messages or immediate assignment messages).
2. In the extended paging mode, the mobile station is required in addition (to normal paging) to receive and analyse the next but one message on the PCH.

3GPP TS 04.08 / 3GPP TS 44.018, subclauses 3.3.2.1.1, 9.1.18, 9.1.19 and 9.1.20.

###### 41.1.5.2.1.2 Test purpose

1. To verify that the MS operates in the extended page mode when it is ordered by the SS in PAGING REQUEST TYPE 1 which does not address the MS, but on the paging sub-channel corresponding to the MS identity.
2. To verify that the MS operates in the extended page mode when it is ordered by the SS in PAGING REQUEST TYPE 2 which does not address the MS, but on the paging sub-channel corresponding to the MS identity.
3. To verify that the MS operates in the extended page mode when it is ordered by the SS in PAGING REQUEST TYPE 3 which does not address the MS, but on the paging sub-channel corresponding to the MS identity.
4. To verify that the MS operates in the extended page mode when it is ordered by the SS in IMMEDIATE ASSIGNMENT on the paging sub-channel corresponding to the MS identity.
5. To verify that the MS operates in the extended page mode when it is ordered by the SS in IMMEDIATE ASSIGNMENT EXTENDED on the paging sub-channel corresponding to the MS identity.
6. To verify that the MS operates in the extended page mode when it is ordered by the SS in IMMEDIATE ASSIGNMENT REJECT on the paging sub-channel corresponding to the MS identity.

###### 41.1.5.2.1.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, GPRS supported, PCCCH absent, Max-Retrans = 2, CCCH\_CONF = 1 basic physical channel used for CCCH with non-combined SDCCH, BS\_AG\_BLKES\_RES = 3, BS\_PA\_MFRMS = 8.

Mobile Station:

The MS is GPRS attached with a TMSI and a P-TMSI allocated and SPLIT PG CYCLE negotiated.

## Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900).
- Support GPRS service.

## Test Procedure

The test is repeated 6 times. Each time a different downlink message is sent on PCH or AGCH for setting the page mode to extended paging. The MS is paged on the next but one page block for the packet paging procedure. The MS starts a random accesses which are rejected by the SS.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

The test sequence is repeated for  $k = 1 \dots 6$ .

| Step | Direction | Message                       | Comments                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|      |           |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

### 41.1.5.3 RR / Paging / on CCCH for GPRS service / paging reorganisation

#### 41.1.5.3.1 Conformance requirements

1. In the paging reorganisation mode the mobile station shall receive all messages on the CCCH regardless of the BS-AG-BLKS-RES setting. It is required to receive all BCCH messages.
2. When the mobile station receives the next message to its (possibly new) paging subgroup the subsequent action is defined in the page mode information element in that message.
3. When the mobile station selects a new PCH, the initial page mode in the mobile station shall be set to paging reorganisation. If a message in the paging sub-channel is not received correctly, the message is ignored and the previous page mode is assumed.

#### References

3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.3.2.1.1.

#### 41.1.5.3.2 Test purpose

1. To verify that the MS, after reception of a message with page mode set to "paging reorganisation", answers to paging messages (with page mode set to "normal paging") sent on its old CCCH in paging blocks which do not belong to the MS's paging sub-channel.
2. To test that the MS correctly determines its new paging sub-channel when the number of reserved blocks, BS\_AG\_BLKS\_RES, and the number of 51-multiframes between transmissions of paging messages for mobile stations of the same paging group BS\_PA\_MFRMS are changed.
3. To test that the MS correctly determines its new paging sub-channel when the number of basic physical channels for CCCH is changed.
4. To test that the MS correctly determines its new paging sub-channel on PCCCH when PCCCH is established.

#### 41.1.5.3.3 Method of test

##### Initial Conditions

###### System Simulator:

1 cell, GPRS supported, PCCCH absent, Max-Retrans = 2, CCCH\_CONF = 1 basic physical channel used for CCCH with non-combined SDCCH, BS\_AG\_BLKS\_RES = 3, BS\_PA\_MFRMS = 6.

###### Mobile Station:

The MS is GPRS attached with a TMSI and a P-TMSI allocated and SPLIT PG CYCLE negotiated.

##### Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900).
- Support GPRS service.

##### Test Procedure

The page mode is set to paging reorganisation. The MS is paged for packet paging procedure through PAGING REQUEST TYPE 1 which is sent before the MS's original paging sub-channel re-occurs, but later than the next paging block of that CCCH. The MS starts the random access. The access attempt is rejected.

The SS changes the CCCH configuration with BS\_AG\_BLKS\_RES=2 and BS\_PA\_MFRMS=5 and waits two SI13 repeat periods, and then sets the page mode to Normal Paging. The MS is paged for packet paging procedure through PAGING REQUEST TYPE 2 sent on the new paging sub-channel. The MS starts the random access. The access attempt is rejected via IMMEDIATE ASSIGNMENT REJECT which sets the page mode to 'paging reorganisation'.

Two additional CCCHs are activated by the SS. The same test procedure as above is repeated.

The SS restores all default radio parameters (in subclause 40.1), sets a non-combined CCCH and starts to transmitting PSIs on PBCCH. The SS waits two SI3 repeat periods + two PSI1 repeat periods. The MS is paged on PPCH. The random accesses from the MS are observed and are rejected.

#### Maximum Duration of Test

5 minutes.

#### Expected Sequence

## 41.1.6 RR / Paging / Before T3172 expiry

## 41.1.6.1 Conformance requirements

On receipt of a PACKET ACCESS REJECT message containing a WAIT\_INDICATION field in a Reject structure addressed to the mobile station, where the Packet Request Reference in the Reject structure corresponds to one of its 3 last PACKET CHANNEL REQUEST messages, the mobile station shall stop sending PACKET CHANNEL REQUEST messages, start timer T3172 with the value indicated in the WAIT\_INDICATION field. During the time T3172 is running, the mobile station shall ignore all received PACKET PAGING REQUEST messages except paging request to trigger RR connection establishment.

## References

3GPP TS 04.60, subclause 7.1.2.2.4.

## 41.1.6.2 Test purpose

To verify that during the time T3172 is running, the MS ignores all received PACKET PAGING REQUEST messages except paging request to trigger RR connection establishment.

## 41.1.6.3 Method of test

## Initial Conditions

## System Simulator:

1 cell, CCCH combined with SDCCH, GPRS supported, PCCCH present, Max-Retrans = 2, access burst type = 11 bits, BS\_PAG\_BLK\_RES = 2, BS\_PBCCH\_BLK = 3, BS\_PCC\_CHANS = 1 and BS\_PRACH\_BLK = 1.

## Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated.

## Related PICS/PIXIT Statement(s)

- Type of MS (GSM 450, GSM 480, GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900).
- Support GPRS service.
- Supporting GPRS MS class A.
- Supporting GPRS MS class B.
- Supporting GPRS MS class C.

## Test Procedure

The MS is paged for initiation of a random access. The access attempt is rejected with a WAIT\_INDICATION = 12 s. in PACKET ACCESS REJECT. The MS is then continuously paged for TBF establishment for 5 s. The SS checks that there is no transmission from the MS on PRACH for 8 s. after having sent PACKET ACCESS REJECT. The MS is paged for an RR connection establishment. The MS of class A or B shall start random accesses for channel request with cause 'one phase access'. The access attempt is rejected.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

| Step     | Direction | Message                     | Comments                                                                                                                                                                   |

## 41.2 RR procedures on CCCH related to temporary block flow establishment

This clause presents tests for "RR procedures on CCCH related to temporary block flow establishment" which are specified in 3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.5.

Applicability and default conditions

The clause is applicable for mobiles supporting GPRS.

The SS default conditions simulate one cell with default settings as defined in the GPRS general defaults section, except:

- SI 13 Rest Octets contains no PCCCH description (PCCCH is not supported by the network).

The MS default initial condition is GPRS attached. Unless otherwise stated, no PDP context is required.

Default message contents and signaling macros are also defined in the GPRS general defaults section, except for those messages and macros specified at the end of this clause.

### 41.2.1 Permission to access the network

#### 41.2.1.1 Permission to access the network / priority classes

##### 41.2.1.1.1 Conformance requirements

Access to the network is allowed:

- if packet access is allowed in the cell for the priority class associated with the packet transfer, as indicated by the PRIORITY\_ACCESS\_THR parameter broadcast in SI 13 message.

References

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.2.1.1.

##### 41.2.1.1.2 Test purpose

To verify that the MS accesses the network only if packet access is allowed in the cell for the priority class associated with the packet transfer.

## 41.2.1.1.3 Method of test

## Initial conditions

System Simulator:

Mobile Station:

For PRIORITY\_ACCESS\_THR >2 MS is GPRS attached, a PDP context has been established (with priority level as specified below).

For PRIORITY\_ACCESS\_THR <=2 MS is Idle Updated.

## Related PICS/PIXIT statement

- Support of PDP context.

## Test procedure

Specific test parameters:

PRIORITY\_ACCESS\_THR is chosen from {0, 1, 2, 3, 4, 5, 6, 7}.

priority level is chosen from {1, 2, 3, 4}.

## Expected sequence

For PRIORITY\_ACCESS\_THR >2.

| Step | Direction | Message | Comments                             |
|------|-----------|---------|--------------------------------------|
| 1    |           |         | The MS is triggered to transfer data |
| 2    | SS        |         | See verification                     |

## Verification:

The SS verifies for 10 s that MS access (or not) to the network according to the PRIORITY\_ACCESS\_THR values below.

- 0 1 1 packet access is allowed for priority level 1;
- 1 0 0 packet access is allowed for priority level 1 to 2;
- 1 0 1 packet access is allowed for priority level 1 to 3;
- 1 1 0 packet access is allowed for priority level 1 to 4;
- 1 1 1 spare, shall be interpreted as(packet access allowed).

For PRIORITY\_ACCESS\_THR <=2.

| Step | Direction | Message | Comments                                                                |
|------|-----------|---------|-------------------------------------------------------------------------|
| 1    |           |         | The MS is triggered to do Attach procedure                              |
| 2    | SS        |         | The SS verifies for 10 s that MS does not try to access to the network. |

## 41.2.2 Initiation of the packet access procedure

### 41.2.2.1 Initiation of the packet access procedure / establishment causes

#### 41.2.2.1.1 Conformance requirements

The CHANNEL REQUEST messages are sent on RACH and contain the parameters:

- an establishment cause which indicates packet access, and as applicable, a request for one phase packet access or single block packet access;
- a random reference which is drawn randomly from a uniform probability distribution for every new transmission.

If the requested RLC mode is *unacknowledged mode*, the mobile station shall request a single block packet access and attempt a two phase packet access.

If the purpose of the packet access procedure is to send a Page Response, Cell Update, for a GPRS Mobility Management or a GPRS Session Management procedure the mobile station shall request a one phase packet access.

#### References

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.2.1.2

#### Justification

#### 41.2.2.1.2 Test purpose

To verify that the CHANNEL REQUEST message sent by the MS contains the correct establishment cause when initiating a packet access procedure.

#### 41.2.2.1.3 Method of test

#### Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH.

Mobile Station:

MS is switched off.

#### Related PICS/PIXIT statement

- Support of PDP context.

#### Test procedure

The MS is triggered to initiate a GPRS attach procedure. The SS verifies that the MS attempts a one phase packet access.

If the MS supports PDP context, a PDP context for RLC unacknowledged is established and the MS is triggered to transfer RLC data blocks. The SS verifies that the MS correctly sets the Establishment Cause in the CHANNEL REQUEST message.

#### Maximum duration of the test

-

### 41.2.2.2 Random references for single block packet access

#### 41.2.2.2.1 Conformance requirements

The random reference in the CHANNEL REQUEST messages shall be randomly drawn from a uniform probability distribution for every new transmission.

#### References

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.2.1.2.

#### 41.2.2.2.2 Test purpose

To verify that the MS produces different Random References when accessing the network for single block access.

#### 41.2.2.2.3 Method of test

#### Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH, Parameter MAX\_RETRANS is set to 4 retransmissions.

Mobile Station:

MS is GPRS attached, a PDP context in RLC unacknowledged mode has been established and the MS is in Packet Idle mode.

#### Related PICS/PIXIT statement

-

#### Test procedure

The MS is triggered to transfer data, it shall attempt a single block packet access (3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.2.1.2). The SS does not answer to the access bursts but stores N (= 80) Random References and verifies that the MS uses all possible values (0 ... 7) in its Random Reference.

## Justification

The length of the Random Reference is 3 bits for single block packet access (3GPP TS 04.08 / 3GPP TS 44.018 / table 9.9). This test verifies that the MS uses all values (0 ... 7) in its Random Reference.

The probability that in a sequence of N samples one of the possible value does not appear is  $8 \cdot (7/8)^{N-1}$  for large N.

NOTE: The number of samples N has been computed such that the probability of refusing a correct MS is less than 0,02 %.

## Maximum duration of the test

| 8    | SS        |                 | SS verifies that all Request Reference values (0 to 7) come out in the stored samples. |

## 41.2.2.3 Random references for one phase packet access

### 41.2.2.3.1 Conformance requirements

The random reference in the CHANNEL REQUEST messages shall be randomly drawn from a uniform probability distribution for every new transmission.

### References

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.2.1.2.

### 41.2.2.3.2 Test purpose

To verify that the MS produces different Random References when accessing the network for one phase access.

### 41.2.2.3.3 Method of test

#### Initial conditions

System Simulator: default settings except:

- Parameter MAX\_RETRANS is set to 4 retransmissions.
- T3212 set to 6 minutes.

Mobile Station:

MS is switched off.

Related PICS/PIXIT statement

-

Test procedure

The MS is triggered to initiate the GPRS attach procedure, it shall attempt a one phase packet access (3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.5.2.1.2). The SS does not answer to the access bursts but stores N (= 80) Random References and verifies that the MS uses all possible values (0 ... 3) in its Random Reference and does not use value '111' as a value of the 3 least significant bits for channel request octet (see 3GPP TS 04.08 / 3GPP TS 44.018 / table 9.9).

Justification

Possible values for Random Reference for one phase packet access are 0 to 3 (value '111' is not allowed). This test verifies that the MS uses all values (0 ... 3) in its Random Reference.

Maximum duration of the test

The Channel Request message is coded as follows (reference 3GPP TS 04.08 / 3GPP TS 44.018 table 9.9):

|          |                                                                  |
|----------|------------------------------------------------------------------|
| 011110xx | One phase packet access with request for single timeslot uplink. |
| 01111x0x | transmission; one PDCH is needed.                                |
| 01111xx0 | [TBD]                                                            |

#### 41.2.2.4 Initiation of the packet access procedure / timer T3146

##### 41.2.2.4.1 Conformance requirements

Having sent the maximum number of CHANNEL REQUEST messages, the mobile station starts timer T3146. At expiry of timer T3146, the packet access procedure is aborted and a packet access failure is indicated to upper layers.

Reference

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.2.1.2.

#### 41.2.2.4.2 Test purpose

To verify that the MS waits T3146 seconds before aborting the packet access procedure.

#### 41.2.2.4.3 Method of test

##### Initial conditions

System Simulator: Default settings except:

System Information parameter MAX\_RETRANS is set to 2 retransmissions.

CCCH combined with SDCCH.

System Information parameter TX\_INTEGER in RACH Control Parameters is set to 3.

Mobile Station:

MS is switched off.

##### Related PICS/PIXIT statement

-

##### Test procedure

The MS is triggered to initiate the GPRS attach procedure, the SS waits until the MS sends all M+1 CHANNEL REQUEST messages, where M is the parameter Max Retrans broadcast on BCCH. The SS waits until T3146 seconds elapse and sends an IMMEDIATE ASSIGNMENT which shall be ignored by the MS since the access procedure should be aborted.

The MS shall retry the access procedure (according to 3GPP TS 04.60 subclause 7.1.2.3). Again, the SS waits until the MS sends all M+1 CHANNEL REQUEST messages, and then sends an IMMEDIATE ASSIGNMENT before T3146 seconds elapse. In this case the MS shall correctly send the LLC PDU on the assigned PDCH.

##### Note:

Timer T3146 (3GPP TS 04.08 / 3GPP TS 44.018, clause 11) depends on parameter TX\_INTEGER broadcast on BCCH.

The minimum value of the timer is  $2*S+TX\_INTEGER$  slots, where S is given in 3GPP TS 04.08 / 3GPP TS 44.018, table 3.1.

The maximum value of this timer is 5 s (subclauses 41.2.3.6 and 11.1.1 in 3GPP TS 04.08).

##### Maximum duration of the test

-

| 11   | SS -> MS  | IMMEDIATE ASSIGNMENT                        |                                                                                                                                                                                                                                                                                      |
| 12   | SS <->MS  | Completion of macro {GPRS attach procedure} |                                                                                                                                                                                                                                                                                      |

The complete test is repeated for:

- TX\_INTEGER set to 20; and for
- TX\_INTEGER set to 32.

#### 41.2.2.5 Initiation of the packet access procedure / Request Reference

##### 41.2.2.5.1 Conformance requirements

On receipt of an IMMEDIATE ASSIGNMENT message corresponding to one of its 3 last CHANNEL REQUEST messages, the mobile stops sending CHANNEL REQUEST messages and switches to the assigned PDCH.

##### Reference

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.2.1.3.1.

##### 41.2.2.5.2 Test purpose

1. To verify that the MS continues sending CHANNEL REQUEST messages when receiving an IMMEDIATE ASSIGNMENT containing an incorrect Request Reference.
2. To verify that the MS stops sending CHANNEL REQUEST messages and switches to the assigned PDCH when receiving an IMMEDIATE ASSIGNMENT containing a Request Reference IE corresponding to one of its last 3 CHANNEL REQUEST messages.

##### 41.2.2.5.3 Method of test

##### Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH, Parameter MAX\_RETRANS is set to 7 retransmissions.

Mobile Station:

The MS is switched off.

Related PICS/PIXIT statement

-

Test procedure

The MS is triggered to initiate the GPRS attach procedure. After 3 CHANNEL REQUEST messages, the SS sends an IMMEDIATE ASSIGNMENT including an incorrect Request Reference. The SS verifies that the MS continues sending CHANNEL REQUEST messages.

After the 5<sup>th</sup> CHANNEL REQUEST message the SS sends an IMMEDIATE ASSIGNMENT including a correct Request Reference. The SS verifies that the MS stops sending CHANNEL REQUEST messages, switches to the assigned PDCH and completes the attach procedure.

### 41.2.3 Packet immediate assignment / One phase packet access

#### 41.2.3.1 Two-message assignment / Successful case

##### 41.2.3.1.1 Conformance requirements

If the mobile station receives an IMMEDIATE ASSIGNMENT message and the Dedicated mode or TBF information element indicates that this is the first message in a two-message assignment, the mobile station shall continue to listen to the full CCCH. The network may send a second IMMEDIATE ASSIGNMENT message within two multiframe periods following the first IMMEDIATE ASSIGNMENT, specifying the packet channel description and, if required, a mobile allocation for the assignment.

On receipt of an IMMEDIATE ASSIGNMENT message or, in case of a two-message assignment, a matching pair of IMMEDIATE ASSIGNMENT messages corresponding to one of its 3 last CHANNEL REQUEST messages, the mobile station stops T3146 (if running), stops sending CHANNEL REQUEST messages, and switches to the assigned PDCH.

Reference

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.2.1.3.1.

## 41.2.3.1.2 Test purpose

To verify that the MS correctly decodes a two-message assignment and switches to the assigned PDCH.

## 41.2.3.1.3 Method of test

## Initial conditions

## System Simulator:

1 cell, CCCH combined with SDCCH.

## Mobile Station:

MS is switched off.

## Related PICS/PIXIT statement

-

## Test procedure

The MS is triggered to initiate the GPRS attach procedure. After reception of CHANNEL REQUEST the SS sends a two-message IMMEDIATE ASSIGNMENT which actually describe a default IMMEDIATE ASSIGNMENT message, except that it is split in two parts: basically, the first part contains the IA Rest Octets, and the second part the Packet Channel Description IE.

The SS verifies that the MS correctly switches to the assigned PDCH and completes GPRS attach.

## Maximum duration of the test

| IA Rest Octets:             | Second Part Packet Assignment |

### 41.2.3.2 Two-message assignment / Failure cases

#### 41.2.3.2.1 Conformance requirements

If the indirect encoding is used, the IMMEDIATE ASSIGNMENT message may contain a CHANGE\_MARK\_1 field. If that is present, the mobile station shall verify the validity of the SI13\_CHANGE\_MARK associated with the GPRS mobile allocation to which the message refers, see 3GPP TS 04.60. If the CHANGE\_MARK\_1 field and the SI13\_CHANGE\_MARK do not match, the message does not satisfactorily define a PDCH.

The two IMMEDIATE ASSIGNMENT messages in a two-message assignment shall have the same contents of the Request Reference information elements.

If the mobile station does not receive the second IMMEDIATE ASSIGNMENT messages in a two-message assignment within two multiframe periods following the first message, the mobile station shall discard the first IMMEDIATE ASSIGNMENT message received.

#### Reference

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.2.1.3.1.

#### 41.2.3.2.2 Test purpose

To verify that the MS does not respond to a two-message assignment if:

- CHANGE\_MARK\_1 does not match SI13 CHANGE\_MARK.
- The second IMMEDIATE ASSIGNMENT message is not received within two multiframe periods after the first message.
- Request References in both messages do not have same contents.

## 41.2.3.2.3 Method of test

## Initial conditions

## System Simulator:

1 cell, CCCH combined with SDCCH, CHANGE\_MARK in SI13 is set to 1, TX-INTEGGER = 7.

## Mobile Station:

MS is switched off.

## Related PICS/PIXIT statement

-

## Test procedure

The MS is triggered to initiate the GPRS attach procedure. After reception of CHANNEL REQUEST the SS sends a two-message IMMEDIATE assignment:

- first attempt: CHANGE\_MARK does not match SI13 CHANGE\_MARK. MS shall re-initiate packet access (see 3GPP TS 04.08 / 3GPP TS 24.008, subclause 4.7.3.1.5, GPRS attach procedure / Abnormal cases).
- second attempt: the second IMMEDIATE ASSIGNMENT message is not received within two multiframes after the first message. MS shall discard the first IMMEDIATE ASSIGNMENT message received.
- third attempt: Request References in both messages do not have same contents. MS shall re-initiate packet access.
- fourth attempt: the second IMMEDIATE ASSIGNMENT message is received in the last access grant block before the second multiframes after the first message. In this case the MS shall successfully switch to the assigned PDCH and complete the GPRS attach procedure.

## Maximum duration of the test

## 41.2.3.3 Packet uplink assignment / Polling bit set

## 41.2.3.3.1 Conformance requirement

If the Polling bit is set to 1, MS shall send a PACKET CONTROL ACKNOWLEDGEMENT message (see 04.60) on the assigned PDCH, in the uplink block specified by the TBF Starting Time. In this case the TBF Starting Time is used both to indicate when the assigned PDCH becomes valid and to specify the uplink block.

## Reference

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.2.1.3.2.

## 41.2.3.3.2 Test purpose

To verify that the MS sends a PACKET CONTROL ACKNOWLEDGEMENT message in the correct uplink block if the Polling bit is set in packet uplink assignment construction.

## 41.2.3.3.3 Method of test

## Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH.

Mobile Station:

MS is switched off.

## Related PICS/PIXIT statement

- MS operation mode B Yes/No.
- Automatic GPRS attach procedure at switch on or power on Yes/No.

## Test procedure

The MS is triggered to initiate the GPRS attach procedure. The SS assigns packet uplink resources in an IMMEDIATE ASSIGNMENT message indicating one phase packet access and with the Polling bit set. The MS shall send a PACKET CONTROL ACKNOWLEDGMENT on the assigned uplink block and then complete the GPRS attach procedure.

#### 41.2.3.4 One phase packet access / Contention resolution / Successful case

##### 41.2.3.4.1 Conformance requirements

After receiving an IMMEDIATE ASSIGNMENT message in which one phase packet access for an uplink transfer is granted, the mobile station shall start timer T3164 and proceed with the contention resolution at one phase access defined in 3GPP TS 04.60.

##### Reference

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.2.1.3.2.

3GPP TS 04.60 subclause 7.1.2.3.

##### 41.2.3.4.2 Test purpose

To verify that the MS includes the correct TLLI (Temporary Logical Link Identifier) in the first RLC data blocks until contention resolution is completed.

##### 41.2.3.4.3 Method of test

##### Initial conditions

System Simulator:

1cell, CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached, the PDP context 2 has been established and the MS is in Packet Idle mode.

##### Related PICS/PIXIT statement

- Support of PDP context.

##### Test procedure

The MS is triggered to transfer data. The SS assigns packet uplink resources in an IMMEDIATE ASSIGNMENT message indicating one phase packet access. The MS shall start transferring RLC data blocks including the correct TLLI in the RLC data blocks which are sent preceding the reception of PACKET UPLINK ACK/NACK.

##### Maximum duration of the test

5 minutes.

Expected sequence

| Step | Direction | Message                                    | Comments                                            |
|------|-----------|--------------------------------------------|-----------------------------------------------------|
| 0    | MS        |                                            | The MS is triggered to transfer 200 octets of data. |
| 1    | MS -> SS  | CHANNEL REQUEST                            |                                                     |
| 2    | SS -> MS  | IMMEDIATE ASSIGNMENT                       | For uplink TBF, one phase access                    |
| 3    | MS -> SS  | 3 RLC data blocks                          | SS verifies correct TLLI in RLC headers.            |
| 4    | SS -> MS  | PACKET UPLINK ACK/NACK                     | Including correct TLLI                              |
| 5    | MS<->SS   | Completion of macro {Uplink data transfer} | SS allows MS to complete data transfer.             |

### 41.2.3.5 One phase packet access / Contention resolution / TLLI mismatch

#### 41.2.3.5.1 Conformance requirement

If the TLLI in the PACKET UPLINK ACK/NACK message differs from that sent by the MS in the RLC block headers, the MS shall immediately stop transmitting on this TBF and re-initiate the packet access procedure unless it has already been repeated 4 times.

#### Reference

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.2.1.3.2.

3GPP TS 04.60 subclause 7.1.2.3.

#### 41.2.3.5.2 Test purpose

To verify that the MS immediately stops transmitting if it receives a PACKET UPLINK ACK/NACK with incorrect TLLI.

#### 41.2.3.5.3 Method of test

#### Initial conditions

System Simulator:

1cell, CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached, the PDP context 2 has been established and the MS is in Packet Idle mode.

#### Related PICS/PIXIT statement

- Support of PDP context.

#### Test procedure

The MS is triggered to transfer data. The SS assigns packet uplink resources in an IMMEDIATE ASSIGNMENT message indicating one phase packet access. The MS shall start transferring RLC data blocks including the correct TLLI in the first three blocks. The SS acknowledges the RLC block transfer with a PACKET UPLINK ACK/NACK including an incorrect TLLI. The SS shall verify that the MS 'immediately' stops transmitting (see note below) and retries packet access procedure.

NOTE: The MS is allowed to transmit n RLC blocks after the block containing the PACKET UPLINK ACK/NACK message (the exact value of n is specified in 3GPP TS 05.10 subclause 6.11).

#### Maximum duration of the test

### 41.2.3.6 One phase packet access / Contention resolution / Counter N3104

#### 41.2.3.6.1 Conformance requirement

The contention resolution has failed on the mobile station when the counter N3104 has reached its maximum value.

#### Reference

3GPP TS 04.60 subclause 7.1.2.3

#### 41.2.3.6.2 Test purpose

To verify that the MS correctly sets and considers counter N3104.

NOTE: Counter N3104 is incremented by 1 with each new RLC/MAC block the mobile station sends until the first PACKET UPLINK ACK/NACK message is received.

Its maximum value is  $N3104\_MAX = 3 * (BS\_CV\_MAX + 3) * \text{number of uplink timeslots assigned}$ , where BS\_CV\_MAX is broadcast in SI 13 Rest Octets.

#### 41.2.3.6.3 Method of test

##### Initial conditions

System Simulator: Default settings except:

1 cell, CCCH combined with SDCCH, BS\_CV\_MAX value in System Information Type 13 arbitrarily chosen in the range 3 to 6.

Mobile Station:

MS is GPRS attached, the PDP context 2 has been established and the MS is in Packet Idle mode.

##### Related PICS/PIXIT statement

- Support of PDP context.

##### Test procedure

The MS is triggered to transfer 440 octets of data. The SS assigns packet uplink resources in an IMMEDIATE ASSIGNMENT message indicating one phase packet access. The MS shall start transferring RLC data blocks. The SS acknowledges the RLC block transfer with a correct PACKET UPLINK ACK/NACK sent after N3104\_MAX data blocks. The SS verifies that the MS stops transmitting and restarts packet access procedure.

At the second attempt, the SS sends PACKET UPLINK ACK/NACK exactly after N3104\_MAX - 1 data blocks. The SS verifies that this time the MS does not abort the access procedure and successfully completes uplink transfer.

Maximum duration of the test

-

Expected sequence

|      |           |                                            | SS allows MS to complete uplink data transfer.                                                                                                                        |

### 41.2.3.7 One phase packet access / Contention resolution / Timer T3166

#### 41.2.3.7.1 Conformance requirement

The contention resolution has failed on the mobile station when the counter N3104 has reached its maximum value, or on expiry of timer T3166.

#### Reference

3GPP TS 04.60 subclause 7.1.2.3.

#### 41.2.3.7.2 Test purpose

To verify that the MS correctly considers timer T3166.

#### 41.2.3.7.3 Method of test

#### Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH, BS\_CV\_MAX value in System Information Type 13 is set to 6.

Mobile Station:

MS is GPRS attached, the PDP context 2 has been established and the MS is in Packet Idle mode.

#### Related PICS/PIXIT statement

- Support of PDP context.

#### Test procedure

The MS is triggered to transfer 440 octets of data. The SS assigns packet uplink resources in an IMMEDIATE ASSIGNMENT message indicating one phase packet access and dynamic allocation. The MS shall start transferring RLC data blocks. The SS reduces the block transfer rate by controlling the USF flag. In this way, the SS forces T3166 (with value 5 s) to expire before counter N3104 reaches N3104\_MAX (with value 28 blocks for current settings). The SS verifies that the MS stops transmitting and restarts packet access procedure.

At the second attempt, the SS sends PACKET UPLINK ACK/NACK before T3166 seconds. The SS verifies that this time the MS does not abort the access procedure and successfully completes the data transfer.

#### Maximum duration of the test

5 minutes.

Expected sequence

### 41.2.3.8 One phase packet access / Contention resolution / 4 access repetition attempts

#### 41.2.3.8.1 Conformance requirement

If contention resolution for packet access fails, the mobile station shall reinitiate the packet access procedure unless it has already been repeated 4 times.

## Reference

3GPP TS 04.60 subclause 7.1.2.3.

### 41.2.3.8.2 Test purpose

To verify that the MS attempts the packet access procedure 4 or 5 times.

### 41.2.3.8.3 Method of test

## Initial conditions

### System Simulator:

1cell, CCCH combined with SDCCH.

### Mobile Station:

MS is GPRS attached, the PDP context 2 has been established and the MS is in Packet Idle mode.

## Related PICS/PIXIT statement

- Support of PDP context.

## Test procedure

The MS is triggered to transfer 200 octets of data. The SS assigns packet uplink resources in an IMMEDIATE ASSIGNMENT message indicating one phase packet access. The MS shall start transferring RLC data blocks including the correct TLLI in the first three blocks. The SS acknowledges the RLC block transfer with a PACKET UPLINK ACK/NACK including a TLLI not corresponding to the MS. The SS shall verify that the MS stops transmitting blocks and attempts packet access a total of four or five times.

## Note:

The MS is allowed to transmit n RLC blocks after the block containing the PACKET UPLINK ACK/NACK message (the exact value of n is specified in 3GPP TS 05.10 subclause 6.11).

## Maximum duration of the test

5 minutes.

Expected sequence

| A10<br>(optional step) | MS<->SS                                                                                                                          |                        | repetition 4: MS reinitiates a packet access procedure, steps 2 to 6 are repeated.<br>(MS may only make a total of 4 access attempts) |
| NOTE:                  | After step A10 the MS may reinitiate a packet access procedure, since higher layers may request to restart the access procedure. |                        |                                                                                                                                       |

### 41.2.3.9 One phase packet access / TBF starting time

#### 41.2.3.9.1 Conformance requirement

In case the packet uplink assignment construction contains a TBF starting time and the mobile station receives the IMMEDIATE ASSIGNMENT message before the TBF starting time has expired, it shall wait until the frame number indicated by the TBF starting time before accessing the channel. If the mobile station receives the message after the TBF starting time has expired, it shall ignore the TBF starting time and may immediately access the channel.

#### Reference

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.2.1.3.2.

#### 41.2.3.9.2 Test purpose

To verify that the MS correctly considers the TBF Starting Time included in the IMMEDIATE ASSIGNMENT message.

#### 41.2.3.9.3 Method of test

#### Initial conditions

System Simulator:

1cell, CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached, the PDP context 2 has been established and the MS is in Packet Idle mode.

#### Related PICS/PIXIT statement

- Support of PDP context.

## Test procedure

The MS is triggered to transfer data. The SS assigns packet uplink resources in an IMMEDIATE ASSIGNMENT message indicating one phase packet access and containing a TBF starting time. The MS shall start transferring RLC data blocks after the TBF starting time.

The test is repeated with a TBF starting time in the past. In this case the MS may 'immediately' (see note below) send RLC data blocks .

## Note:

The MS shall start transmitting RLC blocks within n blocks after the block containing the IMMEDIATE ASSIGNMENT message (the exact value of n is specified in 3GPP TS 05.10 subclause 6.11.

## Maximum duration of the test

| 15                     |           |                                            |                                                                                                                                                                                                                                         |

### 41.2.3.10 One phase packet access / Timing Advance Index present

#### 41.2.3.10.1 Conformance requirement

If the timing advance index (TAI) is included in the packet uplink assignment construction, the mobile station shall use the continuous update timing advance mechanism, see 3GPP TS 05.10, using PTCCH in the same timeslot as the assigned PDCH.

#### Reference

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.2.1.3.2.

3GPP TS 03.64 subclause 6.5.7.2.

#### 41.2.3.10.2 Test purpose

To verify that the MS uses the continuous update timing advance mechanism and sends access bursts in the PTCCH slots as determined by the Timing Advance Index (TAI) sent in the IMMEDIATE ASSIGNMENT.

#### 41.2.3.10.3 Method of test

##### Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached, the PDP context 2 has been established and the MS is in Packet Idle mode.

##### Related PICS/PIXIT statement

- Support of PDP context.

##### Test procedure

The MS is triggered for uplink data transfer. The SS assigns packet uplink resources in an IMMEDIATE ASSIGNMENT message indicating one phase packet access and containing a Timing Advance Index. During TBF transfer, the SS shall verify the access bursts sent by the MS in the PTCCH.

##### Maximum duration of the test

-

##### Expected sequence

| Step | Direction | Message                                    | Comments                                                                                  |
|------|-----------|--------------------------------------------|-------------------------------------------------------------------------------------------|
| 0    | MS        |                                            | The MS is triggered to transfer 440 octets of data.                                       |
| 1    | MS -> SS  | CHANNEL REQUEST                            |                                                                                           |
| 2    | SS -> MS  | IMMEDIATE ASSIGNMENT                       | For one phase packet access, dynamic allocation and including Timing Advance Index TAI=0. |
| 3    | MS -> SS  | RLC data blocks                            |                                                                                           |
| 4    | SS -> MS  | PACKET UPLINK ACK/NACK                     | Including correct TLLI.                                                                   |
| 5    | MS<->SS   | Completion of macro {Uplink data transfer} | SS allows MS to complete data transfer.                                                   |

## Verification

During TBF transfer (steps 3 to 5) the SS monitors access bursts on PTCCH which are located on slots with numbers FN, such that  $(FN \bmod (8 \cdot 52)) = 12$  for TAI = 0 (3GPP TS 03.64 subclause 6.5.7.2 and 3GPP TS 05.02 table 6). The access burst contents shall be '11111111 111'.

The test is repeated once more with an arbitrarily chosen TAI in the range 1 to 15. SS shall verify that the access bursts are sent in the correct PTCCH slots as specified in 3GPP TS 05.02 table 6.

### 41.2.3.11 One phase packet access / Timing Advance Index not present

#### 41.2.3.11.1 Conformance requirement

If a timing advance index (TAI) field is not included, the continuous update timing advance mechanism shall not be used.

#### Reference

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.2.1.3.2.

#### 41.2.3.11.2 Test purpose

To verify that the MS does not send any access bursts on PTCCH (i.e. it does not use the continuous update timing advance mechanism) if TAI is not present in the IMMEDIATE ASSIGNMENT message.

#### 41.2.3.11.3 Method of test

#### Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached, the PDP context 2 has been established and the MS is in Packet Idle mode.

#### Related PICS/PIXIT statement

- Support of PDP context.

#### Test procedure

The MS is triggered to transfer data. The SS assigns packet uplink resources in an IMMEDIATE ASSIGNMENT message not including a Timing Advance Index. During TBF transfer, the SS shall verify that the MS does not send any access bursts in idle frames.

#### Maximum duration of the test

-

Expected sequence

| Step | Direction | Message                                    | Comments                                             |
|------|-----------|--------------------------------------------|------------------------------------------------------|
| 0    | MS        |                                            | The MS is triggered to transfer 2000 octets of data. |
| 1    | MS -> SS  | CHANNEL REQUEST                            |                                                      |
| 2    | SS -> MS  | IMMEDIATE ASSIGNMENT                       | not including Timing Advance Index                   |
| 3    | MS -> SS  | 3 RLC data blocks                          |                                                      |
| 4    | SS -> MS  | PACKET UPLINK ACK/NACK                     | Including correct TLLI.                              |
| 5    | MS -> SS  | RLC data blocks                            |                                                      |
| 6    | SS<->MS   | Completion of macro {Uplink data transfer} | SS allows MS to complete data transfer               |

Verification

The SS verifies that the MS does not transmit in idle frames during data block transfer (steps 3 to 6). Idle frame numbers are 12, 25, 38 and 51 in the 52-multiframe structure.

## 41.2.4 Packet immediate assignment / Single block packet access

### 41.2.4.1 Single block packet access / Packet Resource Request

#### 41.2.4.1.1 Conformance requirement

The network shall use the TBF starting time to indicate the first frame number belonging to the single block period granted for packet access. The mobile station may use that block period to send a PACKET RESOURCE REQUEST message to initiate the two phase access defined in 3GPP TS 04.60, or to send a PACKET MEASUREMENT REPORT message, see 3GPP TS 04.60.

Reference

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.2.1.3.3.

#### 41.2.4.1.2 Test purpose

To verify that the MS sends PACKET RESOURCE REQUEST in the assigned block as indicated by the TBF starting time when it is triggered for uplink transfer.

#### 41.2.4.1.3 Method of test

Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached, a PDP context has been established and the MS is in Packet Idle mode.

Related PICS/PIXIT statement

- Support of PDP context.

Test procedure

The MS is triggered to initiate uplink data transfer. The SS assigns packet uplink resources for single block in an IMMEDIATE ASSIGNMENT message including a TBF starting time. The SS verifies that the MS sends a PACKET RESOURCE REQUEST at the first allowed block as indicated by the TBF starting frame.

Maximum duration of the test

#### 41.2.4.2 Single block packet access / Packet Measurement Report

##### 41.2.4.2.1 Conformance requirement

1. The network shall use the TBF starting time to indicate the first frame number belonging to the single block period granted for packet access. The mobile station may use that block period to send a PACKET RESOURCE REQUEST message to initiate the two phase access defined in 3GPP TS 04.60, or to send a PACKET MEASUREMENT REPORT message, see 3GPP TS 04.60.
2. In packet idle mode, the reporting period is NC\_REPORTING\_PERIOD\_I rounded off to the nearest smaller integer multiple of DRX period if NC\_REPORTING\_PERIOD\_I is greater than DRX period, else, the reporting period is DRX period.

##### Reference

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.2.1.3.3.

3GPP TS 45.008 (ex 05.08) subclause 10.1.4.1.

##### 41.2.4.2.2 Test purpose

To verify that the MS sends PACKET MEASUREMENT REPORT in the assigned uplink block when performing a measurement report procedure.

Further on, this tests verifies that the MS correctly considers reporting parameter NC\_REPORTING\_PERIOD\_I.

##### 41.2.4.2.3 Method of test

##### Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached, in Ready state and in Packet Idle mode.

##### Related PICS/PIXIT statement

-

##### Foreseen final state of the MS

-

## Test procedure

The SS requests the MS via a PACKET MEASUREMENT ORDER to periodically send measurement reports. When the MS attempts a measurement report procedure, the SS assigns a single block for uplink TBF with an arbitrarily chosen TBF starting time (not yet elapsed). The SS verifies that the MS sends PACKET MEASUREMENT REPORT in the assigned block.

## Maximum duration of the test

-

## Expected sequence

(3GPP TS 04.08 § 10.1.4.1) |
| 7    | SS -> MS  | IMMEDIATE ASSIGNMENT      | for uplink TBF, single block assignment with an arbitrarily chosen TBF starting time in the future.                                                                                                                                                                                                                                     |
| 8    | MS -> SS  | PACKET MEASUREMENT REPORT | Shall be sent in the assigned block.                                                                                                                                                                                                                                                                                                    |

## 41.2.5 Packet immediate assignment / Packet access rejection

### 41.2.5.1 Packet access rejection / wait indication

#### 41.2.5.1.1 Conformance requirement

On receipt of an IMMEDIATE ASSIGNMENT REJECT message corresponding to one of its 3 last CHANNEL REQUEST messages, the mobile station stops sending CHANNEL REQUEST messages, starts timer T3142 with the indicated value, ("wait indication" information element), starts T3146 if it has not already been started, and listens to the downlink CCCH until T3146 expires. During this time, additional IMMEDIATE ASSIGNMENT REJECT messages are ignored, but any immediate assignment corresponding to any other of its 3 last CHANNEL REQUEST messages make the mobile station follow the assignment procedure. If no such immediate assignment is received, the mobile station returns to packet idle mode.

## Reference

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.2.1.3.4.

## 41.2.5.1.2 Test purpose

To verify that the MS stops sending CHANNEL REQUEST messages when receiving an IMMEDIATE ASSIGNMENT REJECT containing a Request Reference IE corresponding to one of its last 3 CHANNEL REQUEST messages.

Further on, the SS verifies that the MS makes a new attempt for uplink transfer only after T3142 seconds ("wait indication" timer) after last IMMEDIATE ASSIGNMENT REJECT elapse.

## 41.2.5.1.3 Method of test

## Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH, Parameter MAX\_RETRANS is set to 7 retransmissions.

Mobile Station: MS is switched off.

## Related PICS/PIXIT statement

-

## Foreseen final state of the MS

-

## Test procedure

The MS is triggered to initiate the GPRS attach procedure. After reception of 3 CHANNEL REQUEST messages, the SS sends an IMMEDIATE ASSIGNMENT REJECT with correct Request Reference and including a waiting indication (T3142). The SS verifies that the MS stops sending CHANNEL REQUEST messages and does not attempt a new packet access until T3142 seconds elapse.

## Maximum duration of the test

-

## Expected sequence

| Step | Direction | Message                                     | Comments                                                                                                                              |
|------|-----------|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| 0    | MS        |                                             | MS is triggered to initiate GPRS attach procedure                                                                                     |
| 1    | MS -> SS  | CHANNEL REQUEST                             |                                                                                                                                       |
| 2    | MS -> SS  | CHANNEL REQUEST                             |                                                                                                                                       |
| 3    | MS -> SS  | CHANNEL REQUEST                             |                                                                                                                                       |
| 4    | SS -> MS  | IMMEDIATE ASSIGNMENT REJECT                 | including Request Reference corresponding to the CHANNEL REQUEST in step 1, and waiting time indication with value T3142=50s.         |
| 5    | SS        |                                             | SS verifies that MS does not send any further access bursts (see note below).                                                         |
| 6    | MS -> SS  | CHANNEL REQUEST                             | SS verifies that the access burst does not arrive before $T3142 - 0.1 * T3142 (=45s)$ after last IMMEDIATE ASSIGNMENT REJECT message. |
| 7    | SS -> MS  | IMMEDIATE ASSIGNMENT                        | for uplink TBF, one phase access                                                                                                      |
| 8    | MS<->SS   | Completion of macro {GPRS attach procedure} | SS allows MS to complete GPRS attach.                                                                                                 |

The test is repeated with an arbitrarily chosen value of T3142 in the range 2 to 255 s.

NOTE: The number of frames between successive access bursts considering the default Sys Info parameters used in the test is larger than 58 frames (see 3GPP TS 04.08 / 3GPP TS 44.018, table 3.1). This value is large enough to allow the MS to respond to the IMMEDIATE ASSIGNMENT REJECT message by stopping sending the next access bursts.

## 41.2.5.2 Packet access rejection / assignment before T3142 expires

### 41.2.5.2.1 Conformance requirement

On receipt of an IMMEDIATE ASSIGNMENT REJECT message corresponding to one of its 3 last CHANNEL REQUEST messages, the mobile station stops sending CHANNEL REQUEST messages, starts timer T3142 with the indicated value, ("wait indication" information element), starts T3146 if it has not already been started, and listens to the downlink CCCH until T3146 expires. During this time, additional IMMEDIATE ASSIGNMENT REJECT messages are ignored, but any immediate assignment corresponding to any other of its 3 last CHANNEL REQUEST messages make the mobile station follow the assignment procedure. If no such immediate assignment is received, the mobile station returns to packet idle mode.

### Reference

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.2.1.3.4.

### 41.2.5.2.2 Test purpose

To verify that the MS stops sending CHANNEL REQUEST messages when receiving an IMMEDIATE ASSIGNMENT REJECT and, if an IMMEDIATE ASSIGNMENT containing a correct Request Reference arrives before  $T = \min \{T3142, T3146\}$  seconds elapse, then the MS shall accept this assignment (see below for a note on T3146).

### 41.2.5.2.3 Method of test

#### Initial conditions

System Simulator: Default settings except:

Parameter MAX\_RETRANS is set to 7 retransmissions.

Parameter TX\_INTEGER is set to 32.

CCCH combined with SDCCH.

Mobile Station:

MS is switched off.

#### Related PICS/PIXIT statement

-

#### Foreseen final state of the MS

-

#### Test procedure

The MS is triggered to initiate GPRS attach. After reception of 3 CHANNEL REQUEST messages, the SS sends an IMMEDIATE ASSIGNMENT REJECT with correct Request Reference and including a waiting indication (T3142). The SS verifies that the MS stops sending CHANNEL REQUEST messages.

Before  $T = \min \{T3142, T3146\}$  seconds elapse, the SS sends an IMMEDIATE ASSIGNMENT with correct Request Reference. The MS shall switch to the assigned PDCH and transfer the data.

NOTE: T3146 is started when sending the last CHANNEL REQUEST or when receiving the IMMEDIATE ASSIGNMENT REJECT. At its expiry, the packet access is aborted.

The value of T3146 is given by  $T+2*S$  (3GPP TS 04.08 / 3GPP TS 24.008, subclause 11.1.1), where T is TX\_INTEGER and S is given in 3GPP TS 04.08 / 3GPP TS 44.018, table 3.1. The value of T3146 is 2,15 s. for the current settings.

Maximum duration of the test

| 2    | MS -> SS  | CHANNEL REQUEST                             |                                                                                                                                 |
| 3    | MS -> SS  | CHANNEL REQUEST                             |                                                                                                                                 |
| 4    | SS -> MS  | IMMEDIATE ASSIGNMENT REJECT                 | including Request Reference corresponding to the CHANNEL REQUEST in step 2, and waiting time indication with value T3142 = 2 s. |
| 5    |           |                                             | The SS verifies that the MS stops sending CHANNEL REQUEST messages.                                                             |
| 6    | SS -> MS  | IMMEDIATE ASSIGNMENT                        | sent after 1.5s. (of the last IMMEDIATE ASSIGNMENT REJECT) and including Request Reference corresponding to step 1.             |
| 7    | SS<->MS   | Completion of macro {GPRS attach procedure} | SS allows MS to complete GPRS attach.                                                                                           |

## 41.2.6 Packet downlink assignment procedure using CCCH

### 41.2.6.1 Initiation of packet downlink assignment procedure / MS listens to correct CCCH block

#### 41.2.6.1.1 Conformance requirement

The network initiates the packet downlink assignment procedure by sending an IMMEDIATE ASSIGNMENT message in unacknowledged mode on the CCCH timeslot corresponding to CCCH group the mobile station belongs to.

On receipt of an IMMEDIATE ASSIGNMENT message [the MS] stops monitoring downlink CCCH and switches to the assigned PDCH and starts listening for downlink RLC/MAC blocks identified by the assigned TFI; it starts timer T3190.

#### Reference

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.3.1.2.

#### 41.2.6.1.2 Test purpose

To verify that the MS responds to an IMMEDIATE ASSIGNMENT for downlink TBF sent on PCH blocks corresponding to the MS's paging group.

#### 41.2.6.1.3 Method of test

#### Initial conditions

System Simulator: Default settings except:

Parameters CCCH\_CONF, BS\_AG\_BLKs\_RES, and BS\_PA\_MFRMS are arbitrarily chosen.

Mobile Station:

MS is GPRS attached, DRX have been negotiated, MS is in Ready state.

PDP context 2 has been established and the MS is in Packet Idle mode.

Related PICS/PIXIT statement

- Support of PDP context.
- Support of DRX.

Test procedure

The SS sends an IMMEDIATE ASSIGNMENT for downlink transfer on a PCH block corresponding to its paging group (see 3GPP TS 05.02 subclause 6.5.2) which depends on Sys Info parameters and the MS's IMSI. The MS shall switch to the assigned PDCH and exercise downlink transfer.

Maximum duration of the test

-

Expected sequence

| Step | Direction | Message                                      | Comments                                                                                                              |
|------|-----------|----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | IMMEDIATE ASSIGNMENT                         | sent on a PCH block corresponding to the MS's paging group, including a packet downlink assignment with correct TLLI. |
| 2    | MS<->SS   | Completion of macro {Downlink data transfer} | SS completes downlink transfer of 200 octets of data.                                                                 |

## 41.2.6.2 Initiation of packet downlink assignment procedure / timer T3190

### 41.2.6.2.1 Conformance requirement

On receipt of an IMMEDIATE ASSIGNMENT message [the MS] stops monitoring downlink CCCH and switches to the assigned PDCH and starts listening for downlink RLC/MAC blocks identified by the assigned TFI; it then starts timer T3190.

If the mobile station does not receive a RLC/MAC block on the assigned PDCHs before timer T3190 expires, then a TBF establishment failure has occurred.

Reference

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.3.1.2.

### 41.2.6.2.2 Test purpose

To verify that the MS returns to packet idle updated if RLC/MAC blocks are sent after T3190 s, and that the MS correctly receives RLC/MAC blocks if they are sent before T3190 s.

### 41.2.6.2.3 Method of test

Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached, a PDP context has been established and the MS is in Packet Idle mode.

#### Related PICS/PIXIT statement

- Support of PDP context.

#### Test procedure

The SS assigns a PDCH for downlink transfer but does not send any RLC/MAC blocks until T3190 s have elapsed. The MS shall return to packet idle updated and ignore the RLC/MAC blocks.

To verify that the MS returned to packet idle updated, the SS again assigns a PDCH and sends RLC/MAC blocks before T3190 s elapse. The SS shall successfully transfer all RLC data blocks.

#### Maximum duration of the test

-

#### Expected sequence

| Step | Direction | Message                                      | Comments                                                                                                                                                           |
|------|-----------|----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | IMMEDIATE ASSIGNMENT                         | for downlink TBF on a PCH block corresponding to the MS, including a packet downlink assignment. SS waits T3190 + 10% (=5.5s) after the last IMMEDIATE ASSIGNMENT. |
| 2    | SS        |                                              |                                                                                                                                                                    |
| 3    | SS -> MS  | RLC data blocks                              | SS sends data                                                                                                                                                      |
| 4    | SS        |                                              | SS verifies for 10s. that the MS does not respond.                                                                                                                 |
| 5    | SS -> MS  | IMMEDIATE ASSIGNMENT                         | SS assigns again a PDCH. SS waits T3190 – 10% (=4.5s) after the last IMMEDIATE ASSIGNMENT                                                                          |
| 6    | SS        |                                              |                                                                                                                                                                    |
| 7    | SS -> MS  | RLC data blocks                              | SS starts sending 200 octets of data.                                                                                                                              |
| 8    | MS -> SS  | PACKET DOWNLINK ACK/NACK                     | indicating correct reception of data blocks.                                                                                                                       |
| 9    | MS<->SS   | Completion of macro {Downlink data transfer} | SS completes downlink transfer.                                                                                                                                    |

### 41.2.6.3 Initiation of packet downlink assignment procedure / TBF starting time

#### 41.2.6.3.1 Conformance requirement

The IMMEDIATE ASSIGNMENT message may indicate a TBF starting time. If the mobile station receives the message before the TBF starting time has expired, it shall wait until the frame number indicated by the TBF starting time, start timer T3190 and switch to the assigned PDCH. If the mobile station receives the message after the TBF starting time has expired, it shall ignore the indicated TBF starting time, immediately start timer T3190 and switch to the assigned PDCH.

#### Reference

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.3.1.2.

#### 41.2.6.3.2 Test purpose

To verify that the MS correctly considers the TBF starting time during downlink assignment.

#### 41.2.6.3.3 Method of test

#### Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached, a PDP context has been established and the MS is in Packet Idle mode.

Related PICS/PIXIT statement

- Support of PDP context.

Test procedure

The SS assigns a PDCH via an IMMEDIATE ASSIGNMENT including a TBF starting time. The SS does not send RLC data blocks after TBF starting time + T3190 elapses. The MS shall return to packed idle updated and ignore the RLC data blocks.

The SS assigns again a PDCH, and this time the SS sends RLC data blocks before TBF starting time + T3190 expires. The MS shall successfully receive the RLC data blocks.

Finally, the SS assigns the third time a PDCH, but including a TBF starting time which expired. The SS immediately sends RLC data blocks which shall be acknowledged by the MS.

| 13   | MS<->SS   | Completion of macro {Downlink data transfer} |                                                                                                                                                                                                                                                                                                                                                                                 |

NOTE: The requirements to uplink and downlink assignment reaction times are stated in 3GPP TS 05.10 subclause 6.11: An MS shall be ready to transmit and receive using a new assignment no later than the next occurrence of block B((x+3) mod 12) where block B(x) is the last radio block containing the uplink assignment.

#### 41.2.6.4 Initiation of packet downlink assignment procedure / incorrect TFI

##### 41.2.6.4.1 Conformance requirement

On receipt of an IMMEDIATE ASSIGNMENT message [the MS] stops monitoring downlink CCCH and switches to the assigned PDCH and starts listening for downlink RLC/MAC blocks identified by the assigned Temporary Flow Identifier (TFI).

##### Reference

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.3.1.2.

##### 41.2.6.4.2 Test purpose

To verify that the MS correctly considers the TFI in the RLC/MAC blocks.

##### 41.2.6.4.3 Method of test

##### Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached, a PDP context has been established and the MS is in Packet Idle mode.

##### Related PICS/PIXIT statement

- Support of PDP context.

##### Test procedure

The SS assigns a PDCH and starts transmitting RLC/MAC blocks with incorrect TFI. The MS shall ignore these RLC/MAC blocks and, after T3190 expires, return to packet idle mode.

To prove that the MS returns to idle mode, the SS assigns again a PDCH, and this time the SS sends RLC/MAC blocks with correct TFI. The MS shall successfully receive the data packets.

## 41.2.7 Single block packet downlink assignment

### 41.2.7.1 Single block packet downlink assignment / TBF Starting Time

#### 41.2.7.1.1 Conformance requirement

The sending of an RLC/MAC control message to a mobile station in packet idle mode may be initiated by the RR entity on network side using the packet downlink assignment procedure. The procedure is used to assign a single downlink block on a PDCH for the transfer of the RLC/MAC control message.

The packet downlink construction in the IMMEDIATE ASSIGNMENT message shall contain only:

- the TLLI; and
- the TBF starting time.

If the mobile station receives the IMMEDIATE ASSIGNMENT message before the TBF starting time has expired, it shall wait until the frame number indicated by the TBF starting time. The network shall use the TBF starting time to indicate the first frame number belonging to the single block period assigned to the mobile station. The mobile station shall switch to the assigned PDCH and attempt to decode an RLC/MAC control message in the assigned downlink block.

#### Reference

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.3.2.

#### 41.2.7.1.2 Test purpose

To verify that the MS correctly decodes the RLC control block sent by the network on the assigned downlink block given by TBF starting time in the IMMEDIATE ASSIGNMENT message.

#### 41.2.7.1.3 Method of test

##### Initial conditions

System Simulator:

1 cell, CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached, in Ready state and in Packet Idle mode.

##### Related PICS/PIXIT statement

-

##### Test procedure

The SS assigns a single block for downlink via an IMMEDIATE ASSIGNMENT message on CCCH including a TBF starting time . The SS sends a PACKET MEASUREMENT ORDER message addressing the MS with Polling Bit set and a valid RRBP field.

The MS shall respond with a PACKET CONTROL ACKNOWLEDGMENT message on the assigned TBF block. This verifies that the MS correctly received the RLC control block sent in the assigned single block TBF.

## 41.2.7.2 Single block packet downlink assignment / MS returns to packet idle mode

### 41.2.7.2.1 Conformance requirement

1. Unless otherwise indicated by the RLC/MAC control message, the mobile station remains in packet idle mode. If the mobile station remains in packet idle mode, it shall continue to monitor downlink CCCH once the block period indicated by the TBF starting time has passed.
2. In packet idle mode, the reporting period is NC\_REPORTING\_PERIOD\_I rounded off to the nearest smaller integer multiple of DRX period if NC\_REPORTING\_PERIOD\_I is greater than DRX period, else, the reporting period is DRX period.

### Reference

3GPP TS 04.08 / 3GPP TS 44.018 subclause 3.5.3.2.

3GPP TS 45.008 (ex 05.08) subclause 10.1.4.1.

### 41.2.7.2.2 Test purpose

To verify that the MS remains in packet idle mode and monitors downlink CCCH once the block period indicated by the TBF starting time has passed.

### 41.2.7.2.3 Method of test

#### Initial conditions

System Simulator: Default settings except:

NETWORK\_CONTROL\_ORDER in SI 13 Rest Octets set to '00' (no measurement reporting).

CCCH combined with SDCCH.

Mobile Station:

MS is GPRS attached, a PDP context has been established and the MS is in Packet Idle mode.

#### Related PICS/PIXIT statement

- Support of PDP context.

#### Test procedure

The SS assigns a single block for downlink via an IMMEDIATE ASSIGNMENT message on CCCH including a TBF starting time. The SS sends a PACKET MEASUREMENT ORDER message requesting the MS to periodically send measurement reports.

Next, in order to verify that the MS remains in packet idle mode, the SS assigns a downlink TBF which shall be successfully completed.

The SS shall wait until the MS attempts two periodic measurement report procedures, in order to make sure that the MS correctly decoded the PACKET MEASUREMENT ORDER on the assigned single block for downlink.

Maximum duration of the test

-

Expected sequence

## 41.2.8 Macros and default message contents

### 41.2.8.1 Macros

In order to simplify the process of writing and coding test cases, macros are referenced in the expected signaling tables. These macros provide all additional signaling needed to complete the particular test but are not relevant to its purpose.

#### 41.2.8.1.1 GPRS attach procedure

The following table describes a signaling sequence performing the GPRS attach procedure. Note that there are different possible sequences implementing the GPRS attach procedure.

The macros {Completion of GPRS attach} in the test cases refer to the table below starting at the step required for the particular sequence.

{GPRS attach procedure}

#### 41.2.8.1.2 Uplink data transfer

The following table describes a sequence performing uplink data transfer in acknowledged mode.

{Uplink data transfer, acknowledged mode}

| Step | Direction | Message                        | Comments                                                                                         |
|------|-----------|--------------------------------|--------------------------------------------------------------------------------------------------|
| 0    |           |                                | A PDP context (in acknowledged RLC mode) has been established. The MS is triggered to send data. |
| 1    | MS -> SS  | CHANNEL REQUEST                |                                                                                                  |
| 2    | SS -> MS  | IMMEDIATE ASSIGNMENT           | for uplink TBF, single block access.                                                             |
| 3    | MS -> SS  | PACKET RESOURCE REQUEST        |                                                                                                  |
| 4    | SS -> MS  | PACKET UPLINK ASSIGNMENT       | for dynamic allocation                                                                           |
| 5    |           |                                | Steps 6 to 8 are executed 0 to n times as needed.                                                |
| 6    | MS -> SS  | RLC data block                 |                                                                                                  |
| 7    |           |                                | Step 6 is repeated at most 14 times (resulting in at most 15 uplink data blocks)                 |
| 8    | SS -> MS  | PACKET UPLINK ACK/NACK         | indicating correct reception of uplink data blocks                                               |
| 9    |           |                                | Countdown procedure: Step 10 is repeated as needed.                                              |
| 10   | MS -> SS  | RLC data block                 | The MS shall correctly set the CV value in the RLC header, the last one being 0.                 |
| 11   | SS -> MS  | PACKET UPLINK ACK/NACK         | indicating correct reception of uplink blocks, and valid RRBP field and Final Ack Indicator set. |
| 12   | MS -> SS  | PACKET CONTROL ACKNOWLEDGEMENT |                                                                                                  |

#### 41.2.8.1.3 Downlink data transfer

The following table describes a sequence performing downlink data transfer in acknowledged mode.

{Downlink data transfer, acknowledged mode}

| Step | Direction | Message                  | Comments                                                                    |
|------|-----------|--------------------------|-----------------------------------------------------------------------------|
| 0    |           |                          | A PDP context (in acknowledged RLC mode) has been established.              |
| 1    | SS -> MS  | IMMEDIATE ASSIGNMENT     | for downlink TBF, sent on CCCH on the correct CCCH block the MS belongs to. |
| 2    |           |                          | Steps 3 to 6 are executed 0 to n times as needed.                           |
| 3    | SS -> MS  | RLC data block           |                                                                             |
| 4    |           |                          | Step 3 is repeated at most 14 times with polling bit set.                   |
| 5    | SS -> MS  | RLC data block           |                                                                             |
| 6    | MS -> SS  | PACKET DOWNLINK ACK/NACK | indicating correct reception of downlink data blocks.                       |
| 7    | SS -> MS  | RLC data block           |                                                                             |
| 8    |           |                          | Step 7 is repeated as needed.                                               |
| 9    | SS -> MS  | RLC data block           | Last data block with FBI bit set and a valid RRBP field.                    |
| 10   | MS -> SS  | PACKET DOWNLINK ACK/NACK | indicating correct reception of downlink data blocks.                       |

### 41.3 MAC/RLC Release

All test cases in this clause apply to the Mobile Stations which support the GPRS service and are capable of activation of at least one PDP context.

The maximum duration of each test is per default 5 minutes.

## 41.3.1 TBF Release / Uplink / Normal / MS initiated

### 41.3.1.1 TBF Release / Uplink / Normal / MS initiated / Acknowledged mode

#### 41.3.1.1.1 Conformance requirements

1. The mobile station initiates release of the uplink TBF by beginning the countdown process. When the mobile station has sent the RLC data block with CV = 0 and there are no elements in the V(B) array set to the value Nacked, it shall start timer T3182 and stop timer T3180, if running. The mobile station shall continue to send RLC data blocks on each assigned uplink data block, according to the algorithm defined in 3GPP TS 04.60, subclause 9.1.3.2.
2. Upon reception of a PACKET UPLINK ACK/NACK message the mobile station shall stop timer T3182.
3. If the PACKET UPLINK ACK/NACK message has the Final Ack Indicator bit set to '1', the mobile station shall transmit the PACKET CONTROL ACKNOWLEDGEMENT message and release the TBF. If there is no ongoing downlink TBF the mobile station shall enter packet idle mode.
4. If the PACKET UPLINK ACK/NACK message requests retransmission of RLC data blocks, the mobile station shall if necessary wait for allocation of uplink resources and then retransmit the RLC data blocks requested, restarting timer T3180 after each block is transmitted. The mobile station shall then start timer T3182 and wait for a PACKET UPLINK ACK/NACK message as above.
5. Upon transition from the packet transfer mode to the packet idle mode, a mobile station shall enter the Transfer non-DRX mode period.
6. Upon a receipt of a commanding message or indication from the network requiring an action by the mobile station, if the reaction time for such action is not specified elsewhere, the mobile station shall begin to perform the required action no later than the next occurrence of block B((x+6) mod 12), where block B(x) is the radio block containing the commanding message or indication from the network.

#### References

3GPP TS 04.60, subclauses 9.3.2.3 and 5.5.1.5.

3GPP TS 05.10, subclause 6.11.4.

#### 41.3.1.1.2 Test purpose

To verify that in RLC acknowledged mode:

1. the MS initiates release of an uplink TBF by beginning countdown process. After CV = 0 and no elements in the V(B) array set to the value "Nacked" the MS continues to send RLC data blocks on each assigned uplink data block in the way defined in 3GPP TS 04.60, subclause 9.1.3 and waits for PACKET UPLINK ACK/NACK.
2. the MS retransmits the requested RLC data blocks if the PACKET UPLINK ACK/NACK message requests to do so. The MS then waits for another PACKET UPLINK ACK/NACK message.
3. the MS transmits the PACKET CONTROL ACKNOWLEDGEMENT message and release the TBF upon reception of a PACKET UPLINK ACK/NACK with the Final Ack Indicator bit set to '1'. If there is no ongoing downlink TBF the mobile station shall enter packet idle mode.

## 41.3.1.1.3 Method of test

## Initial Conditions

System Simulator:

1 cell, CCCH combined with SDCCH, BS\_PBCCH\_BLKs = 3, BS\_CV\_MAX = 10.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated and PDP test context2 activated.

## Related PICS/PIXIT Statement(s)

- Support GPRS service.
- Support activation of at least one PDP context.
- The way to trigger the MS initiating an uplink packet transfer.
- Support multislot class.

## Test Procedure

The test has three parts.

1. The MS is triggered to transfer user data. A TBF of dynamic allocation in acknowledged mode with USF\_GRANULARITY = 1 block is assigned. The countdown values are checked during the RLC data transferring. The SS acknowledges the all received RLC data blocks with the Final Ack Indicator bit set to '1'. The SS assigns a downlink TBF, transfers a number of downlink data blocks and polls the MS. The MS responds the polling.
2. The MS is assigned a TBF of dynamic allocation in acknowledged mode with USF\_GRANULARITY = 4 blocks. The countdown values are checked during the RLC data transferring. The SS acknowledges the all received RLC data blocks with the Final Ack Indicator bit set to '1'.
3. The MS is triggered to transfer user data. A TBF of dynamic allocation on two timeslots in acknowledged mode with USF\_GRANULARITY = 4 block is assigned. The countdown values are checked during the RLC data transferring. The SS acknowledges the all received RLC data blocks with the Final Ack Indicator bit set to '1'.

| 51   | MS -> SS  | PACKET CONTROL ACKNOWLEDGEMENT               | Received on the block specified by RRB on PACCH of the assigned PDCH.                                                                                                                                                                                                             |

### 41.3.1.2 TBF Release / Uplink / Normal / MS initiated / Unacknowledged mode

#### 41.3.1.2.1 Conformance requirements

The mobile station initiates release of the uplink TBF by beginning the countdown process. It indicates the end of the TBF by setting the CV value to 0 and starts timer T3182.

Upon reception of a PACKET UPLINK ACK/NACK message the mobile station shall stop timer T3182. If the PACKET UPLINK ACK/NACK message has the Final Ack Indicator bit set to '1', the mobile station shall transmit the PACKET CONTROL ACKNOWLEDGEMENT message and release the TBF. If there is no ongoing downlink TBF the mobile station shall enter packet idle mode.

If timer T3182 expires the mobile station shall release the TBF as if a PACKET UPLINK ACK/NACK message was received.

#### References

3GPP TS 04.60, subclause 9.3.3.3.

#### 41.3.1.2.2 Test purpose

To verify that in RLC unacknowledged mode:

1. the MS initiates release of an uplink TBF by beginning the countdown process and indicates the end of the TBF by setting the CV value to 0.
2. the MS transmits the PACKET CONTROL ACKNOWLEDGEMENT message and release the TBF upon reception of a PACKET UPLINK ACK/NACK message with the Final Ack Indicator bit set to '1' after CV=0. If there is no ongoing downlink TBF the mobile station enters packet idle mode.
3. the MS releases the TBF as if a PACKET UPLINK ACK/NACK message was received when timer T3182 expires.

### 41.3.1.2.3 Method of test

#### Initial Conditions

##### System Simulator:

1 cell, CCCH combined with SDCCH, BS\_PBCCH\_BLKs = 3, BS\_CV\_MAX = 12.

##### Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated and PDP test context3 activated.

#### Related PICS/PIXIT Statement(s)

- Support GPRS service.
- Support activation of at least one PDP context.
- The way to trigger the MS initiating an uplink packet transfer.
- Support multislot class.

#### Test Procedure

The test procedure has two parts:

1. The MS is triggered to transfer data. A TBF of dynamic allocation in unacknowledged mode is assigned. The countdown values are checked during the RLC data transferring. The SS acknowledges the all received RLC data blocks with the Final Ack Indicator bit set to '1' and polls the MS. The MS sends PACKET CONTROL ACKNOWLEDGEMENT in response of polling. After 6 blocks the SS assigns a downlink TBF in unacknowledged mode, sends a number downlink data blocks and polls the MS with a valid RRBp. The MS responses the polling.
2. The MS is triggered to transfer data. A TBF of dynamic allocation in unacknowledged mode is assigned. The countdown values are checked during the RLC data transferring. The SS does not acknowledge the received RLC data blocks. After CV = 0 the SS waits for 6 s (T3182 expires). Once CV=0 the SS checks that the MS does not transfer further RLC data blocks on the assigned TBF.
3. The MS is triggered to transfer data. A TBF of dynamic allocation on two timeslots in unacknowledged mode is assigned. The countdown values are checked during the RLC data transferring. The SS does not acknowledge the received RLC data blocks. Once CV=0 the SS checks that the MS does not transfer further RLC data blocks on the assigned TBF.

## Expected Sequence

| 17   | MS -> SS  | UPLINK RLC DATA BLOCKS                       | Received on the assigned PDTCH <sub>7</sub> and PDTCH <sub>0</sub> .<br><br>Check the CV decrement from BS_CV_MAX (=12) to 0 in the received data blocks. After CV=0 no further data blocks are transmitted. The check is done for 6 s. The MS may retransmit the UPLINK RLC DATA BLOCK with countdown value CV=0 at most four times. In this case the 6 seconds wait shall be started after the reception of the last retransmitted block with countdown value CV=0 has been received. |

The MS may send PACKET RESOURCE REQUEST when repeating steps 12 and 17. The SS shall ignore the requests.

### 41.3.1.3 TBF Release / Uplink / Normal / MS initiated / Channel coding change during countdown

#### 41.3.1.3.1 Conformance requirements

If the mobile station receives a change in the Channel Coding Command in a PACKET UPLINK ACK/NACK message during the countdown procedure, the mobile station shall act upon the new Channel Coding Command. The mobile station shall then recalculate the CV values for any untransmitted RLC data blocks using the new RLC data block size.

#### References

3GPP TS 04.60, subclause 9.3.1.

#### 41.3.1.3.2 Test purpose

It is verified that the MS acts upon the new Channel Coding Command and recalculates the CV values for any untransmitted RLC data blocks using the new RLC data block size when the MS receives a change of Channel Coding Command in a PACKET UPLINK ACK/NACK message during the countdown procedure.

#### 41.3.1.3.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, CCCH combined with SDCCH, BS\_PBCCH\_BLKs = 3, BS\_CV\_MAX = 7.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated and PDP context3 activated.

#### Related PICS/PIXIT Statement(s)

- Support GPRS service.
- Support activation of at least one PDP context.
- The way to trigger the MS initiating an uplink packet transfer.

#### Test Procedure

1. The MS is triggered to transfer data. A TBF of dynamic allocation with channel coding CS-4 in unacknowledged mode is assigned. The countdown values are checked during the RLC data transferring.
2. Once CV=7 (BS\_CV\_MAX) the SS acknowledges the all received RLC data blocks and changes the channel coding to CS-1. In the next received RLC data block CV=15. The countdown values are checked during the RLC data transferring.
3. When CV=7 is reached the SS acknowledges the all received RLC data blocks and changes the channel coding to CS-2. The SS checks the next received RLC data block containing CV=5. The countdown values are checked during the RLC data transferring until CV=0. The SS acknowledges the all received RLC data blocks with the Final Ack Indicator bit set to '1'.

## 41.3.2 TBF Release / Uplink / Normal / Network initiated

### 41.3.2.1 TBF Release / Uplink / Normal / Network initiated / Acknowledged mode

#### 41.3.2.1.1 Conformance requirements

The network may initiate release of an uplink TBF by transmitting a PACKET TBF RELEASE message to the mobile station on the PACCH. A cause value indicates the reason for release.

If the cause value is "Normal release" the mobile station shall continue to the next LLC PDU boundary, starting the count down procedure at whatever value of CV is appropriate to count down to zero at the LLC PDU boundary, and then release the TBF according to the procedures in 3GPP TS 04.60, subclause 9.3.2.3.

#### References

3GPP TS 04.60, subclause 8.1.1.4.

#### 41.3.2.1.2 Test purpose

To verify that when the MS, in an uplink TBF of the RLC acknowledged mode, receives a PACKET TBF RELEASE message with cause value "Normal release":

1. the MS continues the TBF to the next LLC PDU boundary;
2. the MS starts the count down procedure at whatever value of CV is appropriate to count down to zero at the LLC PDU boundary;
3. the MS then releases the TBF according to uplink acknowledged mode release procedure.

#### 41.3.2.1.3 Method of test

##### Initial Conditions

System Simulator:

1 cell, CCCH combined with SDCCH, BS\_PBCCH\_BLKs = 3, BS\_CV\_MAX = 7.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated and PDP context2 activated, L2 is reset via the XID parameter Reset command.

##### Related PICS/PIXIT Statement(s)

- Support GPRS service.
- Support activation of at least one PDP context.
- The way to trigger the MS initiating an uplink packet transfer.

##### Test Procedure

1. The MS is triggered to transfer 1 200 octets user data. A TBF of dynamic allocation in acknowledged mode is assigned. After the MS transfers several RLC data blocks the SS sends PACKET TBF RELEASE with cause value "Normal release. The length indicator, M and E bit in data block headers are checked during the RLC data transferring until CV=0 to ensure that the MS has transmitted only the RLC data block of the first LLC PDU.

## 41.3.2.2 TBF Release / Uplink / Normal / Network initiated / Unacknowledged mode

## 41.3.2.2.1 Conformance requirements

The network may initiate release of an uplink TBF by transmitting a PACKET TBF RELEASE message to the mobile station on the PACCH. A cause value indicates the reason for release.

If the cause value is "Normal release" a mobile station shall continue to the next LLC PDU boundary, starting the count down procedure at whatever value of CV is appropriate to count down to zero at the LLC PDU boundary, and then release the TBF according to the procedures in 3GPP TS 04.60, subclause 9.3.3.3.

## References

3GPP TS 04.60, subclauses 8.1.1.4 and 9.3.3.3.

## 41.3.2.2.2 Test purpose

To verify that when the MS receives a PACKET TBF RELEASE message with cause value "Normal release" during an unacknowledged mode uplink TBF:

1. the MS continues the TBF to the next LLC PDU boundary;
2. the MS starts the count down procedure at whatever value of CV is appropriate to count down to zero at the LLC PDU boundary;
3. the MS then releases the TBF according to uplink unacknowledged mode release procedure.

## 41.3.2.2.3 Method of test

## Initial Conditions

System Simulator:

1 cell, CCCH combined with SDCCH, BS\_PBCCH\_BLKs = 3, BS\_CV\_MAX = 15.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated and PDP context3 activated.

## Related PICS/PIXIT Statement(s)

- Support GPRS service.
- Support activation of at least one PDP context.
- The way to trigger the MS initiating an uplink packet transfer.

## Test Procedure

1. The MS is triggered to transfer 1200 octets user data. A TBF of dynamic allocation in unacknowledged mode is assigned. After the MS transfers several RLC data blocks the SS sends PACKET TBF RELEASE with cause value "Normal release. The length indicator, M and E bit in data block headers are checked during the RLC data transferring until CV=0 to ensure that the MS has transmitted only the RLC data block of the first LLC PDU.

## 41.3.3 TBF Release / Uplink / Network initiated / Abnormal release

### 41.3.3.1 Conformance requirements

The network may initiate release of an uplink TBF by transmitting a PACKET TBF RELEASE message to the mobile station on the PACCH. If the cause value is "Abnormal release" the mobile station shall immediately stop transmitting and follow the abnormal release with random access procedure.

3GPP TS 04.60, subclause 8.1.1.4.

### 41.3.3.2 Test purpose

To verify that the MS immediately stops transmitting and follows the abnormal release with random access procedure when it receives a PACKET TBF RELEASE message on the PACCH with cause value "Abnormal release".

### 41.3.3.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, CCCH combined with SDCCH, BS\_PBCCH\_BLKs = 3, BS\_CV\_MAX = 9.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated and PDP context2 activated.

#### Related PICS/PIXIT Statement(s)

- Support GPRS service.
- Support activation of at least one PDP context.
- The way to trigger the MS initiating an uplink packet transfer.

#### Test Procedure

The MS is triggered to transfer user data. A TBF of dynamic allocation in acknowledged mode is assigned. After the MS transfers several RLC data blocks the SS sends PACKET TBF RELEASE with cause value "Abnormal release". The MS reinitiates a random access for one or two phase access request.

### 41.3.4 TBF Release / Downlink / Normal / Network initiated

#### 41.3.4.1 TBF Release / Downlink / Normal / Network initiated / Acknowledged mode

##### 41.3.4.1.1 Conformance requirements

If the mobile station receives an RLC data block with the FBI bit set the value '1' and with a valid RRBP field, the mobile station shall transmit a PACKET DOWNLINK ACK/NACK message in the specified uplink block. The mobile station shall continue to monitor all assigned PDCHs.

Whenever the mobile station receives an RLC data block with a valid RRBP and the mobile station has received all RLC data blocks of the TBF, the mobile station shall send the PACKET DOWNLINK ACK/NACK message with the Final Ack Indicator bit set to '1', stop timer T3190 and start or restart timer T3192.

If the mobile station receives more than one RLC data block with the FBI set to '1', it shall accept the data from only the first one of these blocks.

If the mobile station, after sending the PACKET DOWNLINK ACK/NACK message with the Final Ack Indicator bit set to '1', receives a PACKET DOWNLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message with the Control Ack bit set to '1' while timer T3192 is running, the mobile station shall stop timer T3192, consider the previous downlink TBF released and act upon the new assignment.

When timer T3192 expires the mobile station shall stop monitoring its assigned downlink PDCHs. If the mobile station is operating in half duplex mode and received an uplink assignment during the TBF release procedure, the mobile station shall then immediately act upon the assignment. Otherwise, and if there is no ongoing uplink TBF, enter packet idle mode.

#### References

3GPP TS 04.60, subclause 9.3.2.5.

##### 41.3.4.1.2 Test purpose

To verify that in a downlink TBF of acknowledged mode:

1. The MS sends PACKET DOWNLINK ACK/NACK in the specified uplink block and continues monitoring all assigned PDCHs when it receives an RLC data block with a valid RRBP field and the Final Block Indicator (FBI) = '1'.
2. Whenever the MS receives an RLC data block with a valid RRBP and has received all RLC data blocks of the TBF, it sends PACKET DOWNLINK ACK/NACK with the Final Ack Indicator bit set to '1'.

3. If the MS receives more than one RLC data block with the FBI set to '1', it accepts the data from only the first one of these blocks.
4. While timer T3192 is running, if the MS receives, after sending PACKET DOWNLINK ACK/NACK with the Final Ack Indicator bit set to '1', PACKET DOWNLINK ASSIGNMENT with the Control Ack bit set to '1', the MS acts upon the new downlink assignment.
5. The MS stops monitoring its assigned downlink PDCHs and enters packet idle mode when timer T3192 expires if there is no ongoing uplink TBF.

#### 41.3.4.1.3 Method of test

##### Initial Conditions

###### System Simulator:

1 cell, CCCH combined with SDCCH, BS\_PBCCH\_BLKs = 3, BS\_CV\_MAX = 15, T3192 = 1,5 s.

###### Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated and PDP context2 activated.

##### Related PICS/PIXIT Statement(s)

- Support GPRS service.
- Support activation of at least one PDP context.

##### Test Procedure

1. The MS receives PACKET DOWNLINK ASSIGNMENT on its PPCH. The SS transmits 10 downlink RLC data blocks with consecutive BSN. The SS then transmits a downlink RLC data block with the highest BSN which is ten higher than the BSN of the last RLC data block. The SS sets FBI bit and polls the MS with a valid RRBp in the header of the RLC data block. The MS acknowledges the received data blocks and request a retransmission for the missing 9 data blocks in SSN and RBB fields.
2. The SS sends another 5 RLC data blocks and polls the MS with a valid RRBp. The MS acknowledges the received data blocks and request the retransmission of the missing 4 RLC data blocks. The SS transmits the last 4 RLC data blocks and polls the MS with RRBp=N+26. While the MS is waiting for transmission of the final Acknowledgement the SS transmits a RLC data block which sets FBI bit and has the same BSN value as the highest one in the test procedure 1. The MS ignores the downlink data and acknowledges the entire TBF with FINAL\_ACK\_INDICATION set. The SS transmits another data block with FBI set and polls the MS. The MS acknowledges the entire TBF with FINAL\_ACK\_INDICATION set. The SS waits 3 s.
3. The MS receives PACKET DOWNLINK ASSIGNMENT on its PPCH. The SS transmits a number of downlink RLC data blocks, sets FBI bit and polls the MS with a valid RRBp. The MS acknowledges the entire TBF with FINAL\_ACK\_INDICATION set.
4. The SS sends another PACKET DOWNLINK ASSIGNMENT on the assigned PACCH with Control ACK bit set. The SS transmits a number of downlink RLC data blocks on the new assigned PDTCH, sets FBI bit and polls the MS with a valid RRBp. The MS acknowledges the entire TBF with FINAL\_ACK\_INDICATION set.

#### 41.3.4.2 TBF Release / Downlink / Normal / Network initiated / Unacknowledged mode

##### 41.3.4.2.1 Conformance requirements

The network initiates release of a downlink TBF by sending an RLC data block with the Final Block Indicator (FBI) set to the value '1' and with a valid RRBP field. The RLC data block sent must have the highest BSN' (see 3GPP TS 04.60 subclause 9.3.1) of the downlink TBF. The network shall start timer T3191. The network may retransmit the last block with FBI set to the value '1' and with a valid RRBP field. For each retransmission the timer T3191 is restarted. For each RLC data block with the FBI bit set to '1' and with a valid RRBP field, the mobile station shall transmit the PACKET CONTROL ACKNOWLEDGEMENT message in the uplink block specified by the RRBP field. The mobile station shall continue to read the assigned downlink PDCHs until the block period pointed to by the RRBP. If the mobile station receives more than one RLC data block with the FBI bit set to '1' and with valid RRBP fields that point the same uplink block period, the mobile station shall transmit the PACKET CONTROL ACKNOWLEDGEMENT message only once. The mobile station shall then stop timer T3190, start timer T3192 and continue to monitor all assigned downlink PDCHs. If the mobile station then receives a subsequent RLC data block with a valid RRBP and the FBI bit set to '1', the mobile station shall retransmit the PACKET CONTROL ACKNOWLEDGEMENT message and restart timer T3192.

If the mobile station receives more than one RLC data block with the FBI set to '1', it shall accept the data from only the first one of these blocks.

If the mobile station, after sending the PACKET CONTROL ACKNOWLEDGEMENT message, receives a PACKET DOWNLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message with the Control Ack bit set to '1' while timer T3192 is running, the mobile station shall stop timer T3192, consider the previous downlink TBF released and act upon the new assignment.

When timer T3192 expires the mobile station shall stop monitoring its assigned downlink PDCHs.

#### References

3GPP TS 04.60, subclauses 9.3.3.5 and 9.3.1.

##### 41.3.4.2.2 Test purpose

To verify that in a downlink TBF of unacknowledged mode:

1. The MS transmits PACKET CONTROL ACKNOWLEDGEMENT in the uplink block specified by the RRBP field whenever it receives an RLC data block with a valid RRBP field and the Final Block Indicator (FBI) set to the value '1'.
2. After sending PACKET CONTROL ACKNOWLEDGEMENT the MS continues to monitor all assigned downlink PDCHs.

3. While timer T3192 is running, if the MS receives, after sending PACKET DOWNLINK ACK/NACK with the Final Ack Indicator bit set to '1', PACKET DOWNLINK ASSIGNMENT with the Control Ack bit set to '1', the MS acts upon the new downlink assignment.
4. The MS stops monitoring its assigned downlink PDCHs and enters packet idle mode when timer T3192 expires.

#### 41.3.4.2.3 Method of test

##### Initial Conditions

###### System Simulator:

1 cell, CCCH combined with SDCCH, BS\_PBCCH\_BLKs = 3, BS\_CV\_MAX = 15, T3192 = 1,5 s.

###### Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated and PDP context3 activated.

##### Related PICS/PIXIT Statement(s)

- Support GPRS service.
- Support activation of at least one PDP context.

##### Test Procedure

1. The MS receives PACKET DOWNLINK ASSIGNMENT on its PPCH. The SS transmits 11 downlink RLC data blocks with consecutive BSN. The SS then transmits a downlink RLC data block with the BSN which is ten higher than the BSN of the last RLC data block. The SS polls the MS with a valid RRBp in the header of the RLC data block. The MS acknowledges the received data blocks.
2. The SS sends another RLC data block and polls the MS with a valid RRBp and with the FBI bit set. The MS sends PACKET CONTROL ACKNOWLEDGEMENT.
3. The SS resends the last RLC data block and polls the MS with a valid RRBp and with the FBI bit set. The MS sends PACKET CONTROL ACKNOWLEDGEMENT. The SS waits 1.2s and resends the RLC data block and polls the MS with a valid RRBp and with the FBI bit set. The MS responds with PACKET CONTROL ACKNOWLEDGEMENT. The SS waits till T3192 expires. The SS sends a RLC data block with FBI set and a valid RRBp and checks that the MS does not transmit any data block on RRBp block.
4. The MS receives PACKET DOWNLINK ASSIGNMENT on its PPCH. The SS transmits a number of downlink RLC data blocks, sets FBI bit and polls the MS with a valid RRBp. The MS responds with PACKET CONTROL ACKNOWLEDGEMENT.
5. The SS sends another PACKET DOWNLINK ASSIGNMENT on the assigned PACCH with Control ACK bit set. The SS transmits a number of downlink RLC data blocks on the new assigned PDTCH, sets FBI bit and polls the MS with a valid RRBp. The MS responds with PACKET CONTROL ACKNOWLEDGEMENT.

Expected Sequence

| Step | Direction | Message                        | Comments                                                                                                                                              |
|------|-----------|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PACKET DOWNLINK ASSIGNMENT     | Unacknowledged mode. Sent on its PPCH.                                                                                                                |
| 2    | SS -> MS  | DOWNLINK RLC DATA BLOCK        | Sent on downlink PDTCH assigned.                                                                                                                      |
| 3    |           |                                | Repeat step 2 ten times, each time BSN is incremented by 1                                                                                            |
| 4    | SS -> MS  | DOWNLINK RLC DATA BLOCK        | One data block with valid RRBP, BSN is incremented by 10. The MS has missed 9 consecutive RLC data blocks. BSN of this data block =                   |
| 5    | MS -> SS  | PACKET DOWNLINK ACK/NACK       | (BSN of the last data block in step 3 + 10) mod 128<br>Received on the block specified by RRBP in step 4. Check that the Final Ack indicator = '0'    |
| 6    | SS -> MS  | DOWNLINK RLC DATA BLOCK        | A valid RRBP, BSN is incremented by 1, FBI bit is set.                                                                                                |
| 7    | MS -> SS  | PACKET CONTROL ACKNOWLEDGEMENT | Received on the block specified by RRBP in step 6.                                                                                                    |
| 8    |           |                                | Repeat step 6 and 7 once                                                                                                                              |
| 9    | SS        |                                | Wait 1.2 seconds (T3192 not expired).                                                                                                                 |
| 10   | SS -> MS  | DOWNLINK RLC DATA BLOCK        | One data block with FBI = '1' and valid RRBP. BSN is same as the BSN of the data block sent in step 6.                                                |
| 11   | MS -> SS  | PACKET CONTROL ACKNOWLEDGEMENT | Received on the block specified by RRBP in step 10.                                                                                                   |
| 12   | SS        |                                | Wait for expiry of T3192                                                                                                                              |
| 13   | SS -> MS  | DOWNLINK RLC DATA BLOCK        | One data block with FBI = '1' and valid RRBP. Sent on downlink PDTCH assigned in step 1. BSN is same as the BSN of the data block sent in step 6      |
| 14   | SS        |                                | Check that the MS does not transmit any data block on the RRBP block.<br>Wait 1.2 seconds (T3192 not expired).                                        |

## 41.3.5 PDCH Release

### 41.3.5.1 Void

### 41.3.5.2 PDCH Release / With TIMESLOTS\_AVAILABLE

#### 41.3.5.2.1 Conformance requirements

When a mobile station receives a PACKET PDCH RELEASE message containing a TIMESLOTS\_AVAILABLE field, it shall immediately stop transmitting and receiving on all assigned PDCHs, which are indicated as not present in the TIMESLOTS\_AVAILABLE field, remove those PDCHs from its list of assigned PDCHs.

If all of the mobile station's assigned PDCHs are removed from its list of assigned PDCH, and, if an uplink TBF was in progress, the mobile station shall perform an abnormal release with random access. If no uplink TBF was in progress, the mobile station shall perform an abnormal release with return to CCCH or PCCCH.

#### References

3GPP TS 04.60, subclause 8.2.

#### 41.3.5.2.2 Test purpose

To verify that when the MS receives a PACKET PDCH RELEASE message with a TIMESLOTS\_AVAILABLE field indicating that one or more timeslots is no longer available for packet data service:

1. it immediately stops transmitting and receiving on all assigned PDCHs which are not presented in the TIMESLOTS\_AVAILABLE field.
2. it performs an abnormal release with random access when all of the MS's assigned PDCHs are removed, and an uplink TBF was in progress.
3. it performs an abnormal release with return to CCCH or PCCCH when all of the MS's assigned PDCHs are removed, and no uplink TBF was in progress.

#### 41.3.5.2.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, CCCH combined with SDCCH, BS\_PBCCH\_BLKs = 3, BS\_CV\_MAX = 15.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated and PDP context2 activated.

#### Related PICS/PIXIT Statement(s)

- Support GPRS service.
- Support multislot class.
- Support activation of at least one PDP context.
- The way to trigger the MS initiating an uplink packet transfer.

#### Test Procedure

1. The MS is triggered to transfer user data. A TBF on one slot of dynamic allocation in acknowledged mode is assigned. After the MS transfers several RLC data blocks the SS sends PACKET PDCH RELEASE with TIMESLOTS\_AVAILABLE indicating no timeslot available. It is checked that the MS initiates a random access

for one or two phase access request. A TBF is assigned to the MS to allow it to complete the uplink data transferring.

2. The MS is triggered to transfer user data. A TBF on two consecutive slots of dynamic allocation in acknowledged mode is assigned. After the MS transfers several RLC data blocks the SS sends PACKET PDCH RELEASE with TIMESLOTS\_AVAILABLE indicating that only a timeslot is available and the assigned downlink control timeslot is no more available. The MS uses the available timeslot to complete the uplink data transferring.
3. The MS receives PACKET DOWNLINK ASSIGNMENT on its PPCH. A downlink TBF with a timeslot is assigned. The SS transmits several downlink RLC data blocks. Then SS sends PACKET PDCH RELEASE with TIMESLOTS\_AVAILABLE indicating no timeslot available and polls the MS with a valid RRBP for acknowledgement. It is checked that the MS does not react upon the polling.
4. A downlink TBF with two timeslots is assigned. The SS transmits several downlink RLC data blocks. Then SS sends PACKET PDCH RELEASE with TIMESLOTS\_AVAILABLE indicating only a timeslot available and polls the MS with a valid RRBP for acknowledgement. It is checked that the MS does not react upon the polling and continues receiving the downlink data on the available timeslot. The SS sends another PACKET PDCH RELEASE with TIMESLOTS\_AVAILABLE indicating no timeslot available and polls the MS with a valid RRBP for acknowledgement. It is checked that the MS does not react upon the polling.

## Expected Sequence

| 22   | SS -> MS  | PACKET PDCH RELEASE            | Sent on the PACCH of the PDCH <sub>7</sub> assigned in step 20. With TIMESLOTS_AVAILABLE indicating only the timeslot corresponding to PDCH <sub>0</sub> available. Received on the assigned PDTCH <sub>0</sub> . The MS may send maximum of six data blocks on PDTCH <sub>7</sub> after step 22. Repeat step 23 three times. Acknowledge all data blocks received on PDCH <sub>0</sub> except the RLC data blocks received on PDTCH <sub>7</sub> after step 22. Sent on PACCH <sub>0</sub> until the countdown value CV=0, The MS may send PACKET RESOURCE REQUEST. The SS shall ignore the requests. Acknowledge all data blocks received on PDCH <sub>0</sub> . The SS sets Final Ack Indicator = '1' containing a valid RRB. Received on the block specified by RRB on PDCH <sub>0</sub>                                                                                                                                                                         |

| 44   | SS -> MS  | DOWNLINK RLC DATA BLOCK        | Repeat the step five times on PDTCH <sub>0</sub> . With TIMESLOTS_AVAILABLE indicating no timeslot available sent on the next block from step 44. Sent on the next radio block of step 45 on PDTCH <sub>0</sub> , a valid RRB = N + 21 or 22. Check that no PACKET DOWNLINK ACK/NACK is received on the block specified in step 46.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 45   | SS -> MS  | PACKET PDCH RELEASE            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 46   | SS -> MS  | DOWNLINK RLC DATA BLOCK        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 47   | SS        |                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|      |           |                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

### 41.3.6 Default message contents

The default message contents defined in subclause 42.3.4 are applied for the all tests in subclause 41.3.

## 41.4 VOID

## 41.5 Dual transfer mode

### 41.5.1 PS establishment whilst in dedicated mode

#### 41.5.1.1 Uplink TBF establishment

##### 41.5.1.1.1 Uplink TBF establishment with no reallocation of CS resources

###### 41.5.1.1.1.1 Uplink TBF establishment with no reallocation of CS resources / Successful case / Uplink resources assigned

###### 41.5.1.1.1.1.1 Conformance requirements

While in dedicated mode, the establishment of an uplink packet resource may be initiated by the RR entity of the mobile station using the packet request procedure. The procedure is triggered by a request from upper layers to transfer an LLC PDU; see 3GPP TS 24.007.

On receipt of a DTM REQUEST message the network may allocate an uplink packet resource. The packet uplink resource is assigned to the mobile station in one of the DTM assignment messages:

- DTM ASSIGNMENT COMMAND or
- PACKET ASSIGNMENT.

The PACKET ASSIGNMENT message is only used when the packet resource is a PDCH and no reallocation of the RR connection is needed.

On receipt of:

- DTM ASSIGNMENT COMMAND message or
- PACKET ASSIGNMENT message,

the mobile station shall stop T3148.

- when the network sends a PACKET ASSIGNMENT message, the packet request procedure is completed for the network when assignment message is sent and for the mobile station when it is received.

When the packet request procedure is completed, the mobile station has entered the dual transfer mode.

##### 41.5.1.1.1.1.2 Test purpose

To verify that the MS:

- decodes correctly the Cell's System information, understanding that DTM access is allowed;
- requests an uplink TBF when it has something to send;
- acts upon the PACKET ASSIGNMENT message and then transmitting on the PDCH allocated.

## 41.5.1.1.1.3 Method of test

## Initial Conditions

System Simulator:

1 cell, DTM supported

Mobile Station:

The MS is in the active state (U10) of a call.

The MS is GPRS idle with a P-TMSI allocated and the PDP context 1 activated.

## Related PICS/PIXIT Statement(s)

- DTM Multislot Class 1;
- DTM Multislot Class 5;
- DTM Multislot Class 9.

## Test Procedure

The MS, whilst in dedicated mode, is triggered to initiate packet uplink transfer data in RLC unacknowledged mode and sends a DTM REQUEST message. On receiving the DTM REQUEST message, requesting uplink resources, the SS assigns the MS PS resource. The SS accomplishes the resource assignment by passing a PACKET ASSIGNMENT message to the MS. On receiving the PACKET ASSIGNMENT message, the MS starts to send RLC DATA BLOCKS to the SS on the assigned PDTCH.

The codec to be used in this test is chosen dependent on the capabilities of the MS.

MS of type DTM Multislot class 1 shall follow only complete test for k=1, whereas MSs of types DTM Multislot class 5 or 9 shall complete testing for k=1 and k=2.

## Maximum Duration of Test

5 minutes

## Expected Sequence

The test sequence is repeated for k = 1,2.

41.5.1.1.1.2 Uplink TBF establishment with no reallocation of CS resources / Successful case / Downlink resources assigned

41.5.1.1.1.1 Conformance requirements

While in dedicated mode, the establishment of an uplink packet resource may be initiated by the RR entity of the mobile station using the packet request procedure. The procedure is triggered by a request from upper layers to transfer an LLC PDU; see 3GPP TS 24.007.

On receipt of a DTM REQUEST message the network may allocate an uplink packet resource. The packet uplink resource is assigned to the mobile station in one of the DTM assignment messages:

- DTM ASSIGNMENT COMMAND or
- PACKET ASSIGNMENT.

The PACKET ASSIGNMENT message is only used when the packet resource is a PDCH and no reallocation of the RR connection is needed.

On receipt of:

- DTM ASSIGNMENT COMMAND message or
- PACKET ASSIGNMENT message,

the mobile station shall stop T3148.

If the received DTM ASSIGNMENT COMMAND or PACKET ASSIGNMENT message includes uplink packet resources, the mobile station shall proceed with the packet access. If the received message includes downlink packet resources and no uplink packet resources, the mobile station shall abort the packet access procedure and proceed with the procedure specified in clause 3.4.22.3, and then attempt an establishment of uplink TBF, using the applicable procedure specified in 3GPP TS 04.60.

- when the network sends a PACKET ASSIGNMENT message, the packet request procedure is completed for the network when assignment message is sent and for the mobile station when it is received.

When the packet request procedure is completed, the mobile station has entered the dual transfer mode.

If the received PACKET ASSIGNMENT message includes downlink packet resources and no uplink packet resources, the mobile station shall abort the packet access procedure and proceed with the downlink TBF establishment, and then attempt an establishment of uplink TBF.

#### 41.5.1.1.1.1.2 Test purpose

To verify that the MS:

- decodes correctly the Cell's System information, understanding that DTM access is allowed;
- requests an uplink TBF;
- acts upon the PACKET ASSIGNMENT message containing downlink resources.
- attempts uplink TBF establishment, once the downlink TBF establishment is complete.

#### 41.5.1.1.1.1.3 Method of test

##### Initial Conditions

System Simulator:

1 cell, DTM supported

Mobile Station:

The MS is in the active state (U10) of a call on cell A.

The MS is GPRS idle with a P-TMSI allocated and the PDP context 1 activated.

##### Related PICS/PIXIT Statement(s)

- DTM Multislot Class 1;
- DTM Multislot Class 5;
- DTM Multislot Class 9.

##### Test Procedure

The MS, whilst in dedicated mode, is triggered to initiate packet uplink transfer data in RLC unacknowledged mode and sends a DTM REQUEST message. On receiving the DTM REQUEST message, requesting uplink resources, the SS assigns the MS downlink PS resources using the PACKET ASSIGNMENT message. The MS, upon receiving the assignment message, aborts the packet access procedure and proceeds with the downlink assignment. When possible the MS requests the uplink TBF establishment. The SS upon receiving the resource request allocates the MS uplink resources using the PACKET UPLINK ASSIGNMENT message. The MS then starts to send RLC DATA BLOCKS to the SS on the assigned PDTCH.

The codec to be used in this test is chosen dependent on the capabilities of the MS.

MS of type DTM Multislot class 1 shall follow only complete test for  $k=1$ , whereas MSs of types DTM Multislot class 5 or 9 shall complete testing for  $k=1$  and  $k=2$ .

##### Maximum Duration of Test

5 minutes

##### Expected Sequence

The test sequence is repeated for  $k = 1, 2$ .

41.5.1.1.1.3 Uplink TBF establishment with no reallocation of CS resources / Abnormal cases / DTM reject

41.5.1.1.1.3.1 Conformance requirements

On receipt of the DTM REJECT message within T3148, the upper layers of the MS are notified of a packet resource establishment failure and starts timer T3142 with the value allocated in the DTM REJECT message.

The MS shall not request packet access in the same cell until T3142 expires.

#### References

3GPP TS 04.18/44.018 sub-clause 3.4.22.1.1.3.3

41.5.1.1.1.3.2 Test purpose

To verify that when the MS receives a DTM REJECT message, the MS does not attempt to re-acquire uplink packet resources for a period specified by a wait indication (T3142), contained in the DTM REJECT message.

41.5.1.1.1.3.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, DTM supported

Mobile Station:

The MS is in the active state (U10) of a call on cell A.

The MS is GPRS idle with a P-TMSI allocated and the PDP context 1 activated.

Related PICS/PIXIT Statement(s)

- DTM Multislot Class 1;
- DTM Multislot Class 5;
- DTM Multislot Class 9.

Test Procedure

The MS, whilst in dedicated mode, is triggered to initiate packet uplink transfer data in RLC acknowledged mode and sends a DTM REQUEST message. On receiving the DTM REQUEST message, the SS returns a DTM REJECT message, simulating the inability to allocate the requested packet resource. The DTM REJECT message includes a wait indication (T3142) specifying that the MS is to wait 100 seconds before being allowed to re-request resources. The MS is again prompted to initiate an uplink TBF before the wait indication has expired, it is then tested that the MS does not try to access the network until the Wait Indication has expired.

MS of type DTM Multislot class 1 shall follow only complete test for k=1, whereas MSs of types DTM Multislot class 5 or 9 shall complete testing for k=1 and k=2.

Maximum Duration of Test

5 minutes

Expected Sequence

The test sequence is repeated for k = 1,2.

| 7    | SS        |             | Monitors the MS, checking that the MS does not try and establish an uplink TBF until at least 100 seconds after the DTM REJECT message was passed to the MS. |

41.5.1.1.1.5 Uplink TBF establishment with no reallocation of CS resources / Abnormal cases / Assignment Command

41.5.1.1.1.5.1 Conformance requirements

If the mobile station receives an ASSIGNMENT COMMAND or HANDOVER COMMAND message during the packet access procedure, the mobile station shall abort the packet access procedure, stop timer T3148 and proceed with the channel assignment procedure as specified in clause 3.4.3 or the handover procedure as specified in clause 3.4.4. The mobile station shall then attempt an establishment of uplink TBF, using the procedure specified in clause 3.4.22.

## References

3GPP TS 04.18/44.018 sub-clause 3.4.22.1.1.3.2

### 41.5.1.1.1.5.2 Test purpose

To verify that the MS aborts the packet access procedure when the MS receives an ASSIGNMENT COMMAND message before the expiry of T3148, completing the channel assignment before re-attempting the establishment of the uplink TBF.

### 41.5.1.1.1.5.3 Method of test

## Initial Conditions

System Simulator:

1 cell, DTM supported

Mobile Station:

The MS is in the active state (U10) of a call.

The MS is in the state "idle, updated, GMM-registered" with a TMSI and P-TMSI allocated and the PDP context 1 activated.

## Related PICS/PIXIT Statement(s)

- DTM Multislot Class 1;
- DTM Multislot Class 5;
- DTM Multislot Class 9.

## Test Procedure

The MS, whilst in dedicated mode, is triggered to initiate packet uplink data transfer in RLC unacknowledged mode and sends a DTM REQUEST message. On receiving the DTM REQUEST message, requesting uplink resources, the SS reallocates the MS's CS resources using the ASSIGNMENT COMMAND. Once the MS changes to the newly allocated timeslot the MS re-requests PS resources with a DTM REQUEST message. Once the PS resources are allocated, the MS enters DTM.

The codec to be used in this test is chosen dependent on the capabilities of the MS.

MS of type DTM Multislot class 1 shall follow only complete test for  $k=1$ , whereas MSs of types DTM Multislot class 5 or 9 shall complete testing for  $k=1$  and  $k=2$ .

## Maximum Duration of Test

5 minutes

## Expected Sequence

The test sequence is repeated for  $k = 1, 2$ .

#### 41.5.1.1.1.6 Uplink TBF establishment with no reallocation of CS resources / Abnormal cases / Handover Command

##### 41.5.1.1.1.6.1 Conformance requirements

If the mobile station receives an ASSIGNMENT COMMAND or HANDOVER COMMAND message during the packet access procedure, the mobile station shall abort the packet access procedure, stop timer T3148 and proceed with the channel assignment procedure as specified in clause 3.4.3 or the handover procedure as specified in clause 3.4.4. The mobile station shall then attempt an establishment of uplink TBF, using the procedure specified in clause 3.4.22.

### References

3GPP TS 04.18/44.018 sub-clause 3.4.22.1.1.3.2

##### 41.5.1.1.1.6.2 Test purpose

To verify that the MS aborts the packet access procedure when the MS receives a HANDOVER COMMAND message before the expiry of T3148, completing the handover procedure before re-attempting the establishment of the uplink TBF.

##### 41.5.1.1.1.6.3 Method of test

### Initial Conditions

System Simulator:

2 Cells, A and B, with same LAI and both supporting DTM.

Mobile Station:

The MS is in the active state (U10) of a call.

The MS is GPRS idle with a P-TMSI allocated and the PDP context 1 activated

Related PICS/PIXIT Statement(s)

- DTM Multislot Class 1;
- DTM Multislot Class 5;
- DTM Multislot Class 9.

Test Procedure

The MS, whilst in dedicated mode, is triggered to initiate packet uplink data transfer in RLC acknowledged mode and sends a DTM REQUEST message. On receiving the DTM REQUEST message, requesting uplink resources, the SS returns a HANDOVER COMMAND to the MS. The HANDOVER COMMAND instructs the switching of the MS to the newly assigned channel and the establishment of lower layer connections. Once the CS connection is established, the MS returns an HANDOVER COMPLETE message on the new main signalling link. The MS again sends a DTM REQUEST message to initiate packet uplink data transfer, the SS allocates the MS PS resources and the MS enters DTM.

The codec to be used in this test is chosen dependent on the capabilities of the MS.

MS of type DTM Multislot class 1 shall follow only complete test for k=1, whereas MSs of types DTM Multislot class 5 or 9 shall complete testing for k=1 and k=2.

Maximum Duration of Test

5 minutes

Expected Sequence

The test sequence is repeated for k = 1,2.

41.5.1.1.1.7 Uplink TBF establishment with no reallocation of CS resources / Abnormal cases / Channel Release

41.5.1.1.1.7.1 Conformance requirements

If the MS receives a CHANNEL RELEASE message during the packet access procedure, the MS shall abort the packet access procedure, stop timer T3148 and proceed with the RR connection release procedure. The MS shall then attempt an establishment of the uplink TBF.

#### References

3GPP TS 04.18/44.018 sub-clauses 3.4.13 & 3.4.22.1.1.3.2

41.5.1.1.1.7.2 Test purpose

To verify that the MS aborts the packet access procedure when the MS receives a CHANNEL RELEASE message before the expiry of T3148, completing the release before re-attempting the establishment of the uplink TBF.

41.5.1.1.1.7.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, DTM supported

Mobile Station:

The MS is in the active state (U10) of a call.

The MS is in the state "idle, updated, GMM-registered" with a TMSI and P-TMSI allocated, SPLIT PG CYCLE negotiated and the PDP context 1 activated.

#### Related PICS/PIXIT Statement(s)

- Support of DTM.

#### Test Procedure

The MS, whilst in dedicated mode, is triggered to initiate packet uplink data transfer in RLC acknowledged mode and sends a DTM REQUEST message. On receiving the DTM REQUEST message, requesting uplink resources, the SS orders the MS to release the CS connection. The MS releases lower layer resources and then requests uplink packet transfer using the normal dynamic allocation two phase access.

#### Maximum Duration of Test

5 minutes

#### Expected Sequence

| 6    | MS<->SS   | { Uplink data transfer }                     | Macro - Completion of the 1000 octets of Data.                                                      |

#### 41.5.1.1.2 Uplink TBF establishment with reallocation of CS resources

##### 41.5.1.1.2.1 Uplink TBF establishment with reallocation of CS resources / Successful case

##### 41.5.1.1.2.1.1 Conformance requirements

Upon receipt of the DTM ASSIGNMENT COMMAND message while in dedicated mode, the MS initiates a local end release of link layer connections and disconnects the physical channels. After the release has been successfully completed the MS switches to the assigned channel and initiates the establishment of the lower layer connection (this includes the activation of the channel, their connection and the establishment of the main signalling link).

#### References

3GPP TS 04.18/44.018 sub-clause 3.4.22.1.1.3.1

##### 41.5.1.1.2.1.2 Test purpose

To verify that the MS allows the reallocation of the CS resources during the request of new PS resources. The resources can either be reallocated to a new timeslot within the same frequency or a new frequency.

##### 41.5.1.1.2.1.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, DTM supported.

Mobile Station:

The MS is in the active state (U10) of a call.

The MS is GPRS idle with a P-TMSI allocated and the PDP context 1 activated.

#### Related PICS/PIXIT Statement(s)

- DTM Multislot Class 1;
- DTM Multislot Class 5;
- DTM Multislot Class 9.

#### Test Procedure

The MS, whilst in dedicated mode, is triggered to initiate packet uplink data transfer and sends a DTM REQUEST message. On reception of the DTM REQUEST message, requesting uplink resources, the SS reallocates the MS's CS resources and assigns the MS new PS resources. The SS accomplishes the resource assignment by passing a DTM ASSIGNMENT COMMAND message to the MS. Once the MS has received the assignment message, it moves to the new allocation, reconnect with the CS resources, passes the ASSIGNMENT COMPLETE message to the SS on the main DCCH and starts to send RLC DATA BLOCKS to the SS on the assigned TBF.

The codec to be used in this test is chosen dependent on the capabilities of the MS.

MS of type DTM Multislot class 1 shall follow only complete test for k=1, whereas MSs of types DTM Multislot class 5 or 9 shall complete testing for k=1 and k=2.

#### Maximum Duration of Test

5 minutes

#### Expected Sequence

The test sequence is repeated for k = 1,2.

| Step | Direction | Message                  | Comments                                                                                 |

#### 41.5.1.1.2.2 Uplink TBF establishment with reallocation of CS resources / Abnormal case / Assignment Failure

##### 41.5.1.1.2.2.1 Conformance requirements

If the network commands the MS to reallocate the RR connection and the establishment of the main DCCH fails, the MS shall revert to the old channel and send a DTM ASSIGNMENT FAILURE message on the old main DCCH with cause value "lower layer failure".

#### References

3GPP TS 04.18/44.018 sub-clause 3.4.22.1.1.5

##### 41.5.1.1.2.2.2 Test purpose

To verify that, if the MS cannot complete the reallocation, then the MS shall revert back to the old resources and re-establish a connection.

##### 41.5.1.1.2.2.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, DTM supported.

Mobile Station:

The MS is in the active state (U10) of a call.

The MS is GPRS idle with a P-TMSI allocated and the PDP context 1 activated.

#### Related PICS/PIXIT Statement(s)

- DTM Multislot Class 1;
- DTM Multislot Class 5;
- DTM Multislot Class 9.

#### Test Procedure

The MS, whilst in dedicated mode, is triggered to initiate packet uplink data transfer and sends a DTM REQUEST message. On receipt of the DTM REQUEST message, requesting uplink resources, the SS reallocates the MS's CS resources to a different frequency band and assigns the new PS resources. The SS accomplishes the resource assignment by passing a DTM ASSIGNMENT COMMAND message to the MS. Once the MS has received the assignment message, it moves to the new allocation, attempts to reconnect the CS resources, but the SS is not receptive to the establishment of the main signalling bearer in the new cell. The MS reverts back to the old CS resources and sends a DTM ASSIGNMENT FAILURE message on the old main DCCH, with cause value set to "lower layer failure".

MS of type DTM Multislot class 1 shall follow only complete test for k=1, whereas MSs of type DTM Multislot class 5 or 9 shall complete testing for k=1 and k=2.

## Maximum Duration of Test

5 minutes

## Expected Sequence

The test sequence is repeated for k = 1,2.

The MS is in the active state (U10) of a call, GPRS idle with a P-TMSI allocated and the PDP context 1 activated.

## Related PICS/PIXIT Statement(s)

- DTM Multislot Class 9

## Test Procedure

The MS, whilst in dedicated mode, is triggered to initiate packet uplink data transfer and sends a DTM REQUEST message. On receipt of the DTM REQUEST message, requesting uplink resources, the SS commands the MS to reallocate its CS resources and also assigns the MS new PS resources. The resources provided to the MS by the SS fall outside of the MS multislot classmark. The MS transmits the DTM ASSIGNMENT FAILURE message, with cause value set to "channel mode unacceptable", indicating the discrepancy.

## Maximum Duration of Test

5 minutes

## Expected Sequence

### 41.5.1.1.3 Uplink TBF establishment required whilst DTM is not supported in cell

#### 41.5.1.1.3.1 Conformance requirements

While in dedicated mode, the RR entity of the mobile station rejects the request of establishment of an uplink packet resource triggered by the request from upper layers to transfer an LLC PDU.

## References

3GPP TS 04.18/44.018 sub-clause 3.4.22.1.1

#### 41.5.1.1.3.2 Test purpose

To verify that the MS:

- understands the SI6 Rest Octets information element, containing the DTM support field, which indicates network support of DTM;
- does not attempt to establish an uplink TBF whilst in DM and in a cell that indicates that DTM is unsupported.

## 41.5.1.1.3.3 Method of test

## Initial Conditions

System Simulator:

1 cell, DTM not supported

Mobile Station:

The MS is in the active state (U10) of a call.

The MS is GPRS attached with a P-TMSI allocated and the PDP context 1 activated.

## Related PICS/PIXIT Statement(s)

- Support of DTM.

## Test Procedure

The MS, whilst in dedicated mode, is triggered to initiate uplink packet transfer, whilst the MS has an active call and DTM is not supported in the cell. The MS does not request packet resources from the network until the CS call is complete.

## Maximum Duration of Test

5 minutes

## 41.5.1.2 Downlink TBF establishment

## 41.5.1.2.1 Whilst in Ready State

## 41.5.1.2.1.1 Downlink TBF establishment in Ready State / Successful case

## 41.5.1.2.1.1.1 Conformance requirements

This procedure is only applicable to MS in dedicated mode and with no TBF allocated. When the network sends a PACKET ASSIGNMENT message, the packet downlink assignment procedure is completed for the network when assignment message is sent and for the MS when it is received.

The establishment of a downlink packet resource is initiated by the RR entity on the network side using the packet downlink assignment procedure in dedicated mode. The procedure is triggered by a request from upper layers to transfer an LLC PDU. The request from upper layers specifies a QoS profile, an *RLC mode*, *DRX parameters* and an *MS classmark* associated with the packet transfer.

## References

3GPP TS 04.18/44.018 sub-clause 3.4.22.3

## 41.5.1.2.1.1.2 Test purpose

To test that while in dedicated mode and in ready state, the MS can decode and act upon the allocation of downlink packet resources and enter the dual transfer mode.

## 41.5.1.2.1.1.3 Method of test

## Initial Conditions

System Simulator:

1 cell, DTM supported.

## Mobile Station:

The MS is in the active state (U10) of a call.

The MS is in GMM Ready state with a P-TMSI allocated and the PDP context 1 activated.

## Related PICS/PIXIT Statement(s)

- DTM Multislot Class 1;
- DTM Multislot Class 5;
- DTM Multislot Class 9.

## Test Procedure

Whilst in an active call on timeslot N, the MS receives a PACKET ASSIGNMENT message on the main DCCH, instructing the MS to switch to the designated timeslot (N+1) MOD 8. The SS waits a specified time and then starts to transmit to the newly allocated resources. The test procedure is complete when the MS successfully acknowledges the downlink RLC data blocks.

MS of type DTM Multislot class 1 shall follow only complete test for k=1, whereas MSs of types DTM Multislot class 5 or 9 shall complete testing for k=1 and k=2.

## Maximum Duration of Test

5 minutes

## Expected Sequence

The test sequence is repeated for k = 1,2.

41.5.1.2.1.2 Downlink TBF establishment in Ready State / Abnormal cases / No cell allocation available

41.5.1.2.1.2.1 Conformance requirements

If the MS has no current cell allocation (CA) and if it needs a CA to analyse the DTM ASSIGNMENT COMMAND or PACKET ASSIGNMENT message. The MS shall return a DTM ASSIGNMENT FAILURE message with a cause value set to "no cell allocation available".

#### References

3GPP TS 04.18/44.018 sub-clause 3.4.22.3.3

41.5.1.2.1.2.2 Test purpose

To verify that when the MS is unable analyse a DTM ASSIGNMENT COMMAND message, it returns a DTM ASSIGNMENT FAILURE message with the cause value set to "no cell allocation available".

41.5.1.2.1.2.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, GPRS supported, and DTM supported.

Mobile Station:

The MS is in the active state (U10) of a call and is also in GMM-Ready State.

#### Related PICS/PIXIT Statement(s)

- Support of DTM

#### Test Procedure

The SS attempts to assign a PDCH for downlink transfer, without reallocating the MS's current TCH, but the MS has no current cell allocation (taken from BCCH) and is therefore unable to decode the allocation in the DTM ASSIGNMENT COMMAND message.

#### Maximum Duration of Test

5 minutes

## Expected Sequence

## 41.5.1.2.2 Whilst in Standby State / Downlink TBF establishment

## 41.5.1.2.2.1 Conformance requirements

Upon receipt of the PACKET NOTIFICATION message, the RR sublayer of the MS indicates the receipt of a packet paging request to the GMM sublayer.

The NULL unnumbered command shall be used by an MS LLE to indicate a cell update. The NULL unnumbered command is only allowed if the Cell Notification is indicated by the SGSN (see 3G TS 23.060 and 3G TS 24.008).

No information field is permitted with the NULL command.

## 41.5.1.2.2.2 Test purpose

To test that a MS in an active call and GPRS Stand-by state, can respond to a PACKET NOTIFICATION message sent on the main DCCH, with a NULL command.

## 41.5.1.2.2.3 Method of test

## Initial Conditions

System Simulator:

1 cell, DTM supported.

Mobile Station:

The MS is in the active state (U10) of a call.

The DTM multislot Class 9 MS is in GMM Stand-by state with a P-TMSI allocated and the PDP context 1 activated.

## Related PICS/PIXIT Statement(s)

- DTM Multislot Class 1;
- DTM Multislot Class 5;

- DTM Multislot Class 9.

### Test Procedure

The MS, in an active call using timeslot N, upon receiving a PACKET NOTIFICATION message on the main DCCH returns a bank LLC frame to the SS as Cell Update, drawing the MS into Ready state. Having received the Cell Update from the MS, the SS responds with a PACKET ASSIGNMENT message, assigning resources to the MS. The SS waits a specified time and then starts to transmit to the newly allocated resources. The test procedure is complete when the MS successfully acknowledges the downlink RLC data blocks.

MS of type DTM Multislot class 1 shall follow only complete test for k=1, whereas MSs of types DTM Multislot class 5 or 9 shall complete testing for k=1 and k=2.

### Maximum Duration of Test

5 minutes

### Expected Sequence

The test sequence is repeated for k = 1,2.

## 41.5.2 CS establishment whilst in packet transfer mode

### 41.5.2.1 MT CS establishment whilst in packet transfer mode with a downlink TBF established

#### 41.5.2.1.1 Conformance requirements

Whilst the MS has a downlink TBF established, the MS shall:

- listen to and be able to receive a CS paging message, on the PACCH;
- abort the allocated downlink TBF;
- access the network using the RACH, following the normal MT establishment procedures;
- accept establishment of the downlink TBF after CS resources are successfully established.

## References

3GPP TS 04.60/44.060, sub-clauses 6.1.3, 6.1.4.

### 41.5.2.1.2 Test purpose

To verify that the MS reacts to CS paging on the PACCH, whilst in packet transfer mode, by releasing the downlink TBF and then establishing the RR connection. It is then tested that once the RR connection is established the MS accepts the re-establishment of the downlink TBF.

### 41.5.2.1.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, DTM supported.

Mobile Station:

The MS is in the state "idle, updated, GMM-registered, GPRS attached" with a TMSI, P-TMSI allocated and PDP context 1 has been established.

#### Related PICS/PIXIT Statement(s)

- DTM Multislot Class 1;
- DTM Multislot Class 5;
- DTM Multislot Class 9;
- Way to indicate alerting (only applicable if the MS supports the feature);
- Way to make the MS accept an incoming call after alerting (possibly dependent on teleservice and configuration).

#### Test Procedure

The MS is brought into packet transfer mode before being paged on the PACCH. Upon receiving the PACKET PAGING REQUEST message, the MS shall return to packet idle mode and initiate the establishment of CS connection. Once the MS has established the CS connection, the SS requests the re-establishment of the PS resources with a PACKET ASSIGNMENT message.

MS of type DTM Multislot class 1 shall follow only complete test for k=1, whereas MSs of types DTM Multislot class 5 or 9 shall complete testing for k=1 and k=2.

#### Maximum Duration of Test

5 minutes

#### Expected Sequence

The test sequence is repeated for k = 1,2.

## 41.5.2.2 MT CS establishment whilst in packet transfer mode with a uplink TBF established

### 41.5.2.2.1 Conformance requirements

Whilst the MS has a uplink TBF established, the MS shall:

- listen to and be able to receive a CS paging message, on the PACCH;
- abort the allocated uplink TBF;
- access the network using the RACH, following the normal MT establishment procedures;
- attempt the establishment of an uplink TBF after CS resources are successfully established.

### References

3GPP TS 04.60/44.060, sub-clauses 6.1.3, 6.1.4

### 41.5.2.2.2 Test purpose

To verify that the MS reacts to CS paging on the PACCH, whilst in packet transfer mode, by releasing the uplink TBF and then establishing the RR connection. It is then tested that once the RR connection is established the MS re-establishes the uplink TBF with use of the Packet Request procedure.

### 41.5.2.2.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, DTM supported.

Mobile Station:

The MS is in the state "idle, updated, GMM-registered, GPRS attached" with a TMSI, P-TMSI allocated and PDP context 1 has been established.

#### Related PICS/PIXIT Statement(s)

- DTM Multislot Class 1;
- DTM Multislot Class 5;
- DTM Multislot Class 9;
- Way to indicate alerting (only applicable if the MS supports the feature);
- Way to make the MS accept an incoming call after alerting (possibly dependent on teleservice and configuration).

#### Test Procedure

The MS is brought into packet transfer mode before being paged on the PACCH. Upon receiving the PACKET PAGING REQUEST message, the MS shall return to packet idle mode and initiate the establishment of CS connection.

Once the MS has established the CS connection, the MS then shall request the re-establishment of the PS resources with a DTM REQUEST message.

MS of type DTM Multislot class 1 shall follow only complete test for  $k=1$ , whereas MSs of types DTM Multislot class 5 or 9 shall complete testing for  $k=1$  and  $k=2$ .

#### Maximum Duration of Test

5 minutes

#### Expected Sequence

The test sequence is repeated for  $k = 1,2$ .

### 41.5.2.3 MO CS establishment whilst in packet transfer mode with uplink and downlink TBFs established

#### 41.5.2.3.1 Conformance requirements

Whilst the MS has both a uplink and downlink TBF established and the CC entity in the MS requests the establishment of an RR connection, the MS shall:

- abort the allocated TBFs ;
- access the network using the RACH, following the normal MO establishment procedures;
- attempt the establishment of an uplink TBF after the RR connection are successfully established; and
- accept establishment of the downlink TBF after the RR connection are successfully established.

#### References

3GPP TS 04.60/44.060, sub-clauses 6.1.3, 6.1.4

#### 41.5.2.3.2 Test purpose

To verify that the MS reacts to paging on the PACCH whilst in packet transfer mode by releasing both uplink and downlink TBFs and then establishing an RR connection. It is then tested that once the RR connection is established the MS attempts the re-establishment of the uplink TBF with use of the DTM Request procedure and accepts the assignment of a downlink TBF.

#### 41.5.2.3.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, DTM supported.

Mobile Station:

The MS is in the state "idle, updated, GMM-registered, GPRS attached" with a TMSI, P-TMSI allocated and PDP context 1 has been established.

#### Related PICS/PIXIT Statement(s)

- DTM Multislot Class 1;
- DTM Multislot Class 5;
- DTM Multislot Class 9;
- Way to indicate alerting (only applicable if the MS supports the feature).

#### Test Procedure

The MS is brought into packet transfer mode with the establishment of the uplink TBF and then the SS orders the establishment of a downlink TBF. Once both TBFs are active, the MS . Once the MS has established the CS connection, the MS then shall request the re-establishment of the PS resources with a DTM REQUEST message. The SS then assigns an uplink TBF. When the uplink TBF has been established the SS assigns a downlink TBF.

MS of type DTM Multislot class 1 shall follow only complete test for k=1, whereas MSs of types DTM Multislot class 5 or 9 shall complete testing for k=1 and k=2.

#### Maximum Duration of Test

5 minutes

#### Expected Sequence

The test sequence is repeated for k = 1,2.

#### 41.5.2.4 MO CS establishment whilst in packet transfer mode and DTM is not supported in current cell

##### 41.5.2.4.1 Conformance requirements

The GPRS suspension procedure shall be used to suspend GPRS services when the GPRS attached MS is in a cell that does not support DTM and a circuit switched service is initiated. The GPRS suspension procedure is initiated by the MS by sending a GPRS SUSPENSION REQUEST message with the suspension cause set to "DTM not supported in the cell".

##### References

3GPP TS 04.18/44.018, sub-clause 3.4.25.3

##### 41.5.2.4.2 Test purpose

When an MS supporting DTM is operating in packet transfer mode in a cell that does not support DTM, the MS may be required to establish a CS connection. Upon receipt of the CS establishment request the MS completes the GPRS suspension procedure, establishes an RR connection and does not re-establish PS resources i.e. it does not enter DTM.

##### 41.5.2.4.3 Method of test

##### Initial Conditions

System Simulator:

1 cell, DTM not supported, GPRS supported

Mobile Station:

The MS is in the state "idle, updated, GMM-registered, GPRS attached" with a TMSI, P-TMSI allocated and PDP context 1 has been established.

##### Related PICS/PIXIT Statement(s)

- Support of DTM;
- Way to indicate alerting (only applicable if the MS supports the feature).

##### Test Procedure

The MS is brought into packet transfer mode, before being paged on the PACCH. Upon receiving the PACKET PAGING REQUEST message, the MS returns to idle mode and initiates the establishment of CS connection. Once the MS has acquired the CS connection, the MS shall not request the re-establishment of the PS resources with a DTM REQUEST message until the CS connection has terminated.

##### Maximum Duration of Test

5 minutes

## Expected Sequence

| Step | Direction | Message                                        | Comments                                                                          |
|------|-----------|------------------------------------------------|-----------------------------------------------------------------------------------|
| 1    | MS        |                                                | Trigger the MS to initiate an uplink packet transfer containing 1000 octets.      |
| 2    |           | { Uplink dynamic allocation two phase access } | Macro                                                                             |

## 42 Test of Medium Access Control (MAC) protocol

### 42.1 Test of Medium Access Control (MAC) Procedures on PCCCH in idle mode

This subclause presents tests for "Medium Access Control (MAC) Procedures on PCCCH in idle mode" which are specified in 3GPP TS 04.60 clause 7.

#### Applicability and default conditions

The subclause is applicable for all mobiles supporting GPRS unless otherwise stated in a specific test.

The SS default conditions simulate one cell with default settings as defined in the GPRS general default section.

The MS default initial condition is GPRS attached. Unless otherwise stated, no PDP context is required.

The default message contents and signaling macro not specified in the end of this subclause shall be set as in "GPRS default conditions" clause 40. Specific message contents for a test case is specified in each test case.

Conditions or message contents specified in a test case have the highest precedence. In addition, the default message contents described in the end of this subclause override those specified in "GPRS default conditions".

In case the test case not expected "short access" as access type for Packet Channel Request the amount of RLC data specified in the comments in expected sequence is not necessary to be exactly the specified amount of data. It only has to be more than the limit for short access. If the test case need a specific amount of data this is specified in the test case.

## 42.1.1 Packet Channel Request

### 42.1.1.1 Packet Channel Request / Message format

#### 42.1.1.1.1 Conformance requirements

There are two formats of the PACKET CHANNEL REQUEST message containing either 8 bits or 11 bits of information. The format to be applied on PRACH is controlled by the parameter ACC\_BURST\_TYPE that is broadcast on PBCCH.

#### Reference

3GPP TS 04.60 subclause 7.1.2.1.

#### 42.1.1.1.2 Test purpose

To verify that the mobile station applies the correct PACKET CHANNEL REQUEST message format on PRACH according to the ACC\_BURST\_TYPE parameter broadcast on PBCCH.

#### 42.1.1.1.3 Method of test

#### Initial conditions

##### System Simulator:

1 cell supporting GPRS. The packet system information ACCESS\_BURST\_TYPE indicates 11 bit access.

##### Mobile Station:

The MS is switched off. The SIM is updated to the test cell.

#### Related PICS/PIXIT statement

- Support GPRS service.
- Method of trigger GPRS attach.
- Switch On/off Yes / No.

#### Test procedure

The MS is switched on and triggered to perform a GPRS attach. The MS shall send PACKET CHANNEL REQUEST message. The SS verifies that the MS requests 11 bit access format. Switch off the MS.

Change the ACCESS\_BURST\_TYPE parameter in Packet System Information to 8 bit format and repeat the test procedure. The SS verifies that the MS requests 8 bit access format.

#### Maximum duration of the test

1 minute.

Expected sequence

|------|-----------|----------------------------------|-----------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                                  | The MS is switched on and triggered to perform a GPRS attach.                                                   |
| 2    | MS -> SS  | PACKET CHANNEL REQUEST           | ACCESS TYPE = "Mobility Management procedure".<br>Received on PRACH.                                            |
| 3    | SS        |                                  | SS verifies the requested access bit format.                                                                    |
| 4    | MS        |                                  | If possible the MS is powered down or switched off otherwise it has its power source removed and then restored. |
| 5    | SS        | PACKET SYSTEM INFORMATION Type 1 | Change ACCESS_BURST_TYPE to indicate 8 bit access. Sent on PBCCH.                                               |
| 6    |           |                                  | Repeat step 1 to 3.                                                                                             |

Specific message contents

None.

## 42.1.1.2 Packet Channel Request / Response to Packet Paging

### 42.1.1.2.1 Conformance requirements

A mobile station in class A or class B mode of operation shall respond to a PACKET PAGING REQUEST message indicating an RR connection establishment. A mobile station in class B mode of operation may abort the packet access procedure at the receipt of a PACKET PAGING REQUEST message indicating an establishment of a RR connection. PACKET PAGING REQUEST messages indicating a non-RR connection shall be ignored.

Mobile stations in class C mode of operating shall not respond to any type of PACKET PAGING REQUEST messages during the packet access procedure but decode the PERSISTENCE\_LEVEL parameter if included in the message.

Reference

3GPP TS 04.60 subclause 7.1.2.1.

### 42.1.1.2.2 Test purpose

To verify that the mobile station ignores PACKET PAGING REQUEST messages indicating a non-RR connection after scheduling the sending of PACKET CHANNEL REQUEST messages.

To verify that a mobile station in class A or class B mode of operation shall respond to a PACKET PAGING REQUEST message indicating an RR connection establishment after scheduling the sending of PACKET CHANNEL REQUEST messages.

To verify that a mobile station in class C mode of operating shall not respond to any type of PACKET PAGING REQUEST messages during the packet access procedure.

### 42.1.1.2.3 Method of test

Initial conditions

System Simulator:

1 cell supporting GPRS. The packet system information ACCESS\_BURST\_TYPE indicates 8 bit access and MAX\_RETRANS indicates 7 allowed retransmission.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

## Related PICS/PIXIT statement

- Support GPRS service.
- Supporting GPRS MS class A, B or C Yes/No.
- Support PDP context.
- Method of triggering the MS to initiate an uplink packet transfer.

## Test procedure

All MS classes, non-RR connection paging.

The MS is triggered to initiate an uplink packet transfer. When SS has received the first PACKET CHANNEL REQUEST message a PACKET PAGING REQUEST message indicating a non-RR connection shall be sent to the MS. The MS shall ignore the PACKET PAGING REQUEST message and continue to send PACKET CHANNEL REQUEST messages requesting one or two phase access. The SS sends PACKET ACCESS REJECT to end the test case.

MS class A and class B, RR connection paging.

The MS is triggered to initiate an uplink packet transfer. When SS has received the first PACKET CHANNEL REQUEST message a PACKET PAGING REQUEST message indicating a RR connection shall be sent to the MS. The MS may continue the packet access procedure. The MS shall send CHANNEL REQUEST messages with establishment cause = "Answer to paging". SS verify that the MS request RR connection. The SS sends IMMEDIATE ASSIGNMENT REJECT to end the test case.

MS class C, RR connection paging.

The MS is triggered to initiate an uplink packet transfer. When SS has received the first PACKET CHANNEL REQUEST message a PACKET PAGING REQUEST message indicating a RR connection shall be sent to the MS. The MS shall ignore the PACKET PAGING REQUEST message and continue to send PACKET CHANNEL REQUEST messages requesting one or two phase access. The SS sends PACKET ACCESS REJECT to end the test case.

## Maximum duration of the test

1 minute.

## Expected sequence

All MS classes, non-RR connection paging.

| Step | Direction | Message                | Comments                                                                                                                                         |
|------|-----------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                        | The MS is triggered to send 200 octets data.                                                                                                     |
| 2    | MS -> SS  | PACKET CHANNEL REQUEST | ACCESS TYPE = "One or Two Phase Access Request". Received on PRACH.                                                                              |
| 3    | SS -> MS  | PACKET PAGING REQUEST  | Sent on PPCH for TBF establishment.                                                                                                              |
| 4    | MS -> SS  | PACKET CHANNEL REQUEST | Optional step: The MS may retransmit the PACKET CHANNEL REQUEST up to MAX_RETRANS .                                                              |
| 5    | MS -> SS  | PACKET CHANNEL REQUEST | ACCESS TYPE = "One or Two Phase Access Request". Received on PRACH. The SS verifies that the MS continue request One or Two Phase packet Access. |
| 6    | SS -> MS  | PACKET ACCESS REJECT   | Sent on PAGCH.                                                                                                                                   |

MS class A and class B, RR connection paging.

Only Network mode I.

### 42.1.1.3 Packet Channel Request / Access type

#### 42.1.1.3.1 Conformance requirements

If the mobile station intends to use the TBF to send user data, it shall request two phase access if the requested RLC mode is unacknowledged mode. If the requested RLC mode is acknowledged mode and the amount of data can fit in 8 or less than 8 RLC/MAC blocks, the mobile station shall indicate Short Access as access type. The number of blocks shall be calculated assuming channel coding scheme CS-1. If the requested RLC mode is acknowledged mode and amount of data to send takes more than 8 RLC/MAC blocks, the mobile station shall request either one phase access or two phase access.

#### Reference

3GPP TS 04.60 subclause 7.1.2.1.

#### 42.1.1.3.2 Test purpose

1. To verify that the mobile station indicates Short Access as access type if the amount of data to send can fit in 8 or less than 8 RLC/MAC blocks if the requested RLC mode is acknowledged mode.
2. To verify that the mobile station requests either one phase or two phase access if the amount of data to send takes more than 8 RLC/MAC blocks if the requested RLC mode is acknowledged mode.

3. To verify that the mobile station requests two phase access if the requested RLC mode is unacknowledged mode.

#### 42.1.1.3.3 Method of test

##### Initial conditions

System Simulator:

1 cell supporting GPRS.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP Context 2 (RLC Acknowledged mode) or PDP Context 1 (RLC Unacknowledged mode) has been established.

##### Related PICS/PIXIT statement

- Support GPRS service.
- Support PDP context.
- Method of triggering the MS to initiate an uplink packet data transfer.

##### Test procedure

The MS is triggered to send data that can fit in 8 or less RLC data blocks. The SS verifies that the MS indicates Short Access Request as the access type in the PACKET CHANNEL REQUEST message. The SS sends PACKET ACCESS REJECT to end the test case.

The MS is triggered to send data where the amount of data takes more than 8 RLC blocks. The SS verifies that the MS indicates One or Two Phase Access Request as the access type in the PACKET CHANNEL REQUEST message. The SS sends PACKET ACCESS REJECT to end the test case.

Repeat above tests with RLC unacknowledged mode.

##### Maximum duration of the test

20 s.

##### Expected sequence

The sequence is executed for k=1 (less than 8 RLC data blocks to trigger) and k=2 (more than 8 RLC data blocks to trigger).

| Step | Direction | Message                | Comments                                                                                           |
|------|-----------|------------------------|----------------------------------------------------------------------------------------------------|
| 1A   | MS        |                        | K=1<br>The MS is triggered to send data that can fit in 8 or less RLC data blocks.                 |
| 1B   | MS        |                        | k=2<br>The MS is triggered to send data where the amount of data takes more than 8 RLC/MAC blocks. |
| 2A   | MS -> SS  | PACKET CHANNEL REQUEST | K=1<br>SS verifies that the MS indicates Short Access Request as access type. Received on PRACH.   |
| 2B   | MS->SS    | PACKET CHANNEL REQUEST | k=2<br>SS verifies that the MS indicate One or Two Phase Access Request. Received on PRACH.        |
| 3    | SS -> MS  | PACKET ACCESS REJECT   | Sent on PAGCH.                                                                                     |

Repeat above tests with RLC unacknowledged mode. The SS shall verify that the MS request Two Phase Access in the PACKET CHANNEL REQUEST messages.

Specific message contents

None.

#### 42.1.1.4 Packet Channel Request / Access persistence control on PRACH

##### 42.1.1.4.1 Packet Channel Request / Access persistence control on PRACH / M+1 attempts

###### 42.1.1.4.1.1 Conformance requirements

The mobile station shall make maximally  $M + 1$  attempts to send a PACKET CHANNEL REQUEST message.

Having made  $M + 1$  attempts to send a PACKET CHANNEL REQUEST, the mobile station shall stop timer T3186 and start timer T3170. At expiry of timer T3170, the packet access procedure shall be aborted, a packet access failure shall be indicated to the upper layer and the mobile station shall return to packet idle mode.

#### Reference

3GPP TS 04.60 subclause 7.1.2.1.1.

###### 42.1.1.4.1.2 Test purpose

To verify that the mobile station makes a maximum of  $M + 1$  attempts to send a PACKET CHANNEL REQUEST message,  $M$  is the parameter MAX\_RETRANS broadcast on PBCCH.

To verify that the mobile station aborts the packet access procedure when the network does not respond to the PACKET CHANNEL REQUEST messages.

###### 42.1.3.1.1.3 Method of test

#### Initial conditions

System Simulator:

1 cell supporting GPRS. The packet system information ACCESS\_BURST\_TYPE indicates 8 bit access, MAX\_RETRANS indicate 1 retransmission, PERSISTENCE\_LEVEL  $P(i)=0$  and BS\_PRACH\_BLKs = 12 (all Blocks reserved for PRACH).

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

#### Related PICS/PIXIT statement

- Support GPRS service.
- Support PDP context.

#### Test procedure

The SS send PACKET PAGING REQUEST message. The MS is expected to send  $M+1$  PACKET CHANNEL REQUEST messages,  $M$  is the parameter MAX\_RETRANS broadcast on PBCCH. The SS monitors the MS transmission for a period equal to the maximum length of time it can take to send  $M+1$  PACKET CHANNEL REQUEST messages plus the duration of timer T3170. The SS verifies that the MS makes maximally  $M+1$  attempts to send PACKET CHANNEL REQUEST messages in this period. When the SS not respond the MS shall abort the packet access procedure and perform an abnormal release. The SS sends PACKET UPLINK ASSIGNMENT message corresponding to one of its 3 last PACKET CHANNEL REQUEST messages after a time higher than the duration of timer T3170 and the MS shall not respond to the message.

Repeat the test procedure with the different MAX\_RETRANS parameters {2, 4, 7} sent in Packet System Information.

Maximum duration of the test

4 minutes.

Expected sequence

| Step | Direction | Message                   | Comments                                                                                                                                                                       |

#### 42.1.1.4.2 Packet Channel Request / Access persistence control on PRACH / Persistence level

##### 42.1.1.4.2.1 Conformance requirements

The first attempt to send a PACKET CHANNEL REQUEST message, may be initiated at the first possible TDMA frame containing PRACH on PDCH defined by the PCCCH\_GROUP for the mobile station (see 3GPP TS 05.02). For each attempt, the mobile station shall draw a random value R with uniform probability distribution in the set {0, 1, ..., 15}. The mobile station is allowed to transmit a PACKET CHANNEL REQUEST message if P(i), where i is the radio priority of the TBF being established, is less than or equal to R.

Reference

3GPP TS 04.60 subclause 7.1.2.1.1.

##### 42.1.1.4.2.2 Test purpose

To verify that for each attempt, the mobile station shall draw a random value R with uniform probability distribution in the set {0, 1, ..., 15}. The mobile station is only allowed to transmit a PACKET CHANNEL REQUEST message if P(i), where i is the radio priority of the TBF being established, is less than or equal to R.

##### 42.1.1.4.2.3 Method of test

Initial conditions

System Simulator:

1 cell supporting GPRS. The packet system information indicates BS\_PCC\_CHANS = 1, BS\_PAG\_BLKES\_RES = 2 and BS\_PBCCH\_BLKES = 3, BS\_PRACH\_BLKES = 12 (all Blocks reserved for PRACH).

Mobile Station:

The MS is GPRS attached and in packet idle mode.

#### Related PICS/PIXIT statement

- Support GPRS service.

#### Test procedure

Specific test parameters:

K equals the value of  $120/(MAX\_RETRANS+1)$ .

MAX\_RETRANS is chosen from {1, 2, 4, 7}.

PERSISTENCE\_LEVEL P(i) is chosen from {0, 1, 2, ..., 14, 16}.

Counter J is initialized with 0 (total number of received Packet Channel Requests).

The SS sends PACKET PAGING REQUEST message. The MS shall send between 0 and M+1 PACKET CHANNEL REQUEST message indicating page response. The SS verifies that the MS draw a random value R for each attach. Every received Packet Channel Request in response to Packet Paging Request increment counter J by 1. This test sequence is performed K times.

The test is performed with Persistence level set to at least P(i)=0, P(i)=8 and P(i)=16.

#### Maximum duration of the test

The execution of one sequence (for one value k): 30 s.

Between two consecutive executions (for k and k+1), the SS must wait for amount of time which is enough to guarantee that the MS is in service (listening to its paging subchannel).

#### Expected sequence

The sequence is executed for execution counter k = 1, ..., K.

| Step | Direction | Message                | Comments                                                                                                                                                                             |
|------|-----------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PACKET PAGING REQUEST  | Sent on PPCH.                                                                                                                                                                        |
| 2    | MS -> SS  | PACKET CHANNEL REQUEST | N0 := number of received Packet Channel Requests in response to step1;<br>Count for 10 sec. N0;<br>J = J + N0;<br>0 ≤ N0 ≤ M+1;<br>ACCESS TYPE = "Page Response". Received on PRACH. |
| 3    | MS -> SS  | PACKET CHANNEL REQUEST |                                                                                                                                                                                      |
| :    | :         | :                      |                                                                                                                                                                                      |
| :    | :         | :                      |                                                                                                                                                                                      |
| M+2  | MS -> SS  | PACKET CHANNEL REQUEST |                                                                                                                                                                                      |
| M+3  | SS        |                        | SS waits for expiry of T3170                                                                                                                                                         |
| M+4  | SS        |                        | SS waits to allow Cell Reselection                                                                                                                                                   |

#### Note:

The 10 s in steps 2 to M+2 is derived from the following consideration:

Answer time for the first Packet Channel Request: 0,7 sec + 8\*4,615 ms.

Maximum TDMA frame spread between two successive Packet Channel Requests:

$\max\{S+T-1\} * 4,615\text{ms} = 266 * 4,615\text{ms} \Rightarrow$  maximum time to send M+1 Packet Channel Requests.

$0,7 \text{ sec} + 8 * 4,615\text{ms} + M * 266 * 4,615\text{ms} = 9,33 \text{ s.}$

## Verification

According the test procedure J is  $B(120; 1-P(i)/16)$  distributed. i.e. we will accept MSs, when the following inequality holds  $(1-P(i)/16) - 0,0161*\sqrt{P(i)*(16 - P(i))} \leq J/120 \leq (1-P(i)/16) + 0,0161*\sqrt{P(i)*(16 - P(i))}$

this confidence interval is chosen in such a way that the possibility of non accepting a correct MS is less than 0,5 %.

Remark: If  $P(i) = 0$  the above inequality is simplified to  $1 \leq J/120 \leq 1$ , i.e.  $J = 120$ , i.e. the MS has to answer every PACKET PAGING REQUEST with M+1 PACKET CHANNEL REQUESTS. And if  $P(i) = 16$  the above inequality is simplified to  $0 \leq J/120 \leq 0$ , i.e.  $J = 0$ , i.e. the MS is not allowed to send PACKET CHANNEL REQUESTS.

## Specific message contents

None.

### 42.1.1.4.3 Packet Channel Request / Access persistence control on PRACH / Successive Attempts

#### 42.1.1.4.3.1 Conformance requirements

The first attempt to send a PACKET CHANNEL REQUEST message, may be initiated at the first possible TDMA frame containing PRACH on PDCH defined by the PCCCH\_GROUP for the mobile station (see 3GPP TS 05.02). For each attempt, the mobile station shall draw a random value R with uniform probability distribution in the set  $\{0, 1, \dots, 15\}$ . The mobile station is allowed to transmit a PACKET CHANNEL REQUEST message if  $P(i)$ , where i is the radio priority of the TBF being established, is less than or equal to R.

After each attempt, the S and T parameters are used to determine the next TDMA frame in which it may be allowed to make a successive attempt. The number of TDMA frames belonging to the PRACH on the PDCH defined by the PCCCH group for the mobile station between two successive attempts to send a PACKET CHANNEL REQUEST message excluding the TDMA frames potentially containing the messages themselves is a random value drawn for each transmission with uniform probability distribution in the set  $\{S, S + 1, \dots, S + T - 1\}$ .

## Reference

3GPP TS 04.60 subclause 7.1.2.1.1.

#### 42.1.1.4.3.2 Test purpose

To verify that the number of TDMA frames belonging to the PRACH on the PDCH defined by the PCCCH group for the mobile station between two successive attempts to send a PACKET CHANNEL REQUEST message excluding the TDMA frames potentially containing the messages themselves is a random value drawn for each transmission with uniform probability distribution in the set  $\{S, S + 1, \dots, S + T - 1\}$ .

#### 42.1.1.4.3.3 Method of test

## Initial conditions

System Simulator:

1 cell supporting GPRS. The packet system information:

$BS\_PCC\_CHANS = 1$ ,  $BS\_PAG\_BLKS\_RES = 2$  and  $BS\_PBCCH\_BLKS = 3$ .  $MAX\_RETRANS$  is arbitrarily chosen in the set  $\{1,2,4,7\}$ .

$TX\_INT$  is arbitrarily chosen in the set  $\{6, 7, 8, 9, 10, 12, 14, 16, 20, 25, 32, 50\}$ .

S is arbitrarily chosen in the set  $\{12, 15, 20, 30, 41, 55, 76, 109, 163, 217\}$ .

$PERSISTENCE\_LEVEL P(i) = 0$ .

Mobile Station:

The MS is GPRS attached and in packet idle mode.

## Related PICS/PIXIT statement

- Support GPRS service.

## Test procedure

## Specific test parameters:

- K equals the upper rounded value of  $230/M$ ;

The SS sends PACKET PAGING REQUEST message. The MS shall send PACKET CHANNEL REQUEST messages  $M+1$  times indicating page response. After each attempt, the S and T parameters are used to determine the next TDMA frame in which it may be allowed to make a successive attempt. The SS measure the number of TDMA frames  $f(n,k)$  between each attempt, excluding the slots containing the messages themselves. The SS does not answer the PACKET CHANNEL REQUEST messages MAX\_RETRANS times. The SS sends an PACKET ACCESS REJECT message. The test sequence is executed K times.

- M is the value of the parameter MAX\_RETRANS,;
- T is the value of the parameter TX\_INT;
- S is the value of the parameter S.

## Maximum duration of the test

The execution of one sequence (for one value k): 10 s.

Between two consecutive executions (for k and k+1), the SS must wait for amount of time which is enough to guarantee that the MS is in service (listening to its paging subchannel).

## Expected sequence

The sequence is executed for execution counter  $k = 1, \dots, K$ .

| Step | Direction | Message                | Comments                                                                                                                                 |
|------|-----------|------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PACKET PAGING REQUEST  | Sent on PPCH.                                                                                                                            |
| 2    | MS -> SS  | PACKET CHANNEL REQUEST | ACCESS TYPE = "Page Response". Received on PRACH.                                                                                        |
| 3    | MS -> SS  | PACKET CHANNEL REQUEST | Step 3 and 4 are executed for execution counter $n=1, \dots, \text{MAX\_RETRANS}$ .<br>ACCESS TYPE = "Page Response". Received on PRACH. |
| 4    | SS        |                        | See verification.                                                                                                                        |
| 5    | SS -> MS  | PACKET ACCESS REJECT   | Sent on PAGCH.                                                                                                                           |

## Verification

In step 4 the SS measure the number of TDMA frames belonging to the PRACH on the PDCH defined by the PCCCH group for the MS between two successive attempts to send a PACKET CHANNEL REQUEST message excluding the TDMA frames potentially containing the messages themselves.  $f(n,k)$  shall be in the set  $\{S, S + 1, \dots, S + T - 1\}$ . The SS stores f.

## Test:

The following requirement shall be met:

$$(((\text{sq}(\text{Sum}(S)) + \text{sq}(\text{Sum}(S+1)) + \dots + \text{sq}(\text{Sum}(S+T-1))) * T / (K * M)) - (K * M) \leq$$

$$\frac{1}{2} * \text{sq}(\text{sqrt}(2T-3) + 2,58) + 1,1$$

$\text{Sum}(X) := \text{CARD} \{ k \mid f(n,k) = X \}$  := the number of times that  $f(n,k)$  equals X.

The test and the number of sample are chosen in such a way that the possibility of non-accepting a correct MS is less than [0,5 %].

The SS shall schedule the PRACH blocks so that T3186 does not expire in the MS. The SS shall also ensure that the number of PRACH blocks, which are allocated, match the choosen S, TX\_INT and MAX\_RETRANS values. This ensures that T3186 does not expire in the MS while sending the PACKET CHANNEL REQUEST messages.

Specific message contents

None.

## 42.1.2 Packet Uplink/Downlink Assignment

### 42.1.2.1 Packet uplink assignment procedure

#### 42.1.2.1.1 Packet Uplink Assignment / Packet access queuing notification procedure

##### 42.1.2.1.1.1 Packet Uplink Assignment / Packet queuing notification / Stop sending Packet Channel Requests

###### 42.1.2.1.1.1.1 Conformance requirements

On receipt of a PACKET QUEUING NOTIFICATION message corresponding to one of its 3 last PACKET CHANNEL REQUEST messages, the mobile station shall stop timers T3186 and T3170 if running, start timer T3162, and stop sending PACKET CHANNEL REQUEST messages.

Reference

3GPP TS 04.60 subclause 7.1.2.2.2.

###### 42.1.2.1.1.1.2 Test purpose

To verify that the mobile station stops sending PACKET CHANNEL REQUEST messages on receipt of a PACKET QUEUING NOTIFICATION message.

###### 42.1.2.1.1.1.3 Method of test

Initial conditions

System Simulator:

1 cell supporting GPRS. The packet system information MAX\_RETRANS indicates 7 allowed retransmission.

Mobile Station:

The MS is switched off. The SIM is updated to the test cell.

Related PICS/PIXIT statement

- Support GPRS service.
- Switch off on button Yes/No.
- Method of trigger GPRS attach.

Test procedure

The MS is switched on and triggered to perform a GPRS attach. The SS sends PACKET QUEUING NOTIFICATION message corresponding to one of the last three PACKET CHANNEL REQUEST messages. The SS verifies that the MS stops sending PACKET CHANNEL REQUEST messages.

Maximum duration of the test

15 s.

Expected sequence

| Step | Direction | Message                     | Comments                                                                                                                                     |

| 2    | MS -> SS  | PACKET CHANNEL REQUEST      | Received on PRACH.                                                                                                                           |
| 3    | MS -> SS  | PACKET CHANNEL REQUEST      | Received on PRACH.                                                                                                                           |
| 4    | SS -> MS  | PACKET QUEUING NOTIFICATION | Corresponding to message in step 2.<br>Sent on PAGCH. The SS verifies during 5 seconds that MS stop sending PACKET CHANNEL REQUEST messages. |

Specific message contents

None.

42.1.2.1.1.2 Packet Uplink Assignment / Packet queuing notification / Ignoring Packet Queuing Notification

42.1.2.1.1.2.1 Conformance requirements

If the mobile station receives a PACKET QUEUING NOTIFICATION message while waiting for the TBF Starting Time of a valid PACKET UPLINK ASSIGNMENT message, the mobile station shall ignore the PACKET QUEUEING NOTIFICATION.

Reference

3GPP TS 04.60 subclause 7.1.2.2.2.

42.1.2.1.1.2.2 Test purpose

To verify that the mobile station ignores the PACKET QUEUEING NOTIFICATION if the mobile station receives a PACKET QUEUING NOTIFICATION message while waiting for the TBF Starting Time of a valid PACKET UPLINK ASSIGNMENT message.

42.1.2.1.1.2.3 Method of test

Initial conditions

System Simulator:

1 cell supporting GPRS.

Mobile Station:

The MS is switched off. The SIM is updated to the test cell.

Related PICS/PIXIT statement

- Support GPRS service.
- Switch off on button Yes/No.
- Method of trigger GPRS attach.

## Test procedure

The MS is switched on and triggered to perform a GPRS attach. The SS sends PACKET UPLINK ASSIGNMENT message containing a TBF Starting Time. While the MS is waiting for the TBF Starting Time the SS sends a PACKET QUEUING NOTIFICATION message. The MS shall ignore PACKET QUEUING NOTIFICATION message and at the frame number indicated by the TBF Starting Time, the MS shall start to send the uplink RLC data in the allocated uplink resources. The SS allows the MS to complete the GPRS attach procedure.

## Maximum duration of the test

15 s.

## Expected sequence

| Step | Direction | Message                     | Comments                                                                                                                                                                  |

## 42.1.2.1.1.3 Packet Uplink Assignment / Packet queuing notification / Assigned PDCHs

### 42.1.2.1.1.3.1 Conformance requirements

On receipt of a PACKET UPLINK ASSIGNMENT message following a PACKET QUEUING NOTIFICATION message, the mobile station shall stop timer T3162, and follow the procedures defined in subclause 7.1.2.2.1.

If the PACKET UPLINK ASSIGNMENT message does not specify a TBF starting time, the mobile station shall switch to the assigned PDCHs, start timer T3164 and proceed with contention resolution of the one phase access procedure according to subclause 7.1.2.3.

## Reference

3GPP TS 04.60 subclauses 7.1.2.2.2 and 7.1.2.2.1.

### 42.1.2.1.1.3.2 Test purpose

To verify that the mobile station switches to the assigned PDCHs on receipt of a PACKET UPLINK ASSIGNMENT message after a PACKET QUEUING NOTIFICATION message.

### 42.1.2.1.1.3.3 Method of test

## Initial conditions

System Simulator:

1 cell supporting GPRS. The packet system information ACCESS\_BURST\_TYPE indicates 8 bit access.

Mobile Station:

The MS is switched off. The SIM is updated to the test cell.

Related PICS/PIXIT statement

- Support GPRS service.
- Switch off on button Yes/No.
- Method of trigger GPRS attach.

Test procedure

The MS is switched on and triggered to perform a GPRS attach. The SS send PACKET QUEUING NOTIFICATION message and sends then PACKET UPLINK ASSIGNMENT message. The SS allows the MS to complete the GPRS attach procedure.

Maximum duration of the test

15 s.

Expected sequence

| Step | Direction | Message                     | Comments                                                                |

Specific message contents

None.

42.1.2.1.1.4 Packet Uplink Assignment / Packet queuing notification / Expiry of timer T3162

42.1.2.1.1.4.1 Conformance requirements

On receipt of a PACKET QUEUING NOTIFICATION message corresponding to one of its 3 last PACKET CHANNEL REQUEST messages the mobile station shall stop timer T3170 and T3186 if running and stop sending PACKET CHANNEL REQUEST messages. On receipt of a PACKET UPLINK ASSIGNMENT message following a PACKET QUEUING NOTIFICATION message, the mobile station shall stop timer T3162 and follow the procedures defined in subclause 7.1.2.2.1. At expiry of timer T3162, the packet access procedure shall be aborted and a packet access failure indicated to the upper layer and the mobile station shall return to packet idle mode.

Reference

3GPP TS 04.60 subclauses 7.1.2.2.2 and 13.1.

42.1.2.1.1.4.2 Test purpose

1. To verify that the MS waits T3162 seconds before aborting the packet access procedure on receipt of a PACKET QUEUING NOTIFICATION message.
2. To verify that the mobile station listening to its paging channel after a time greater than timer T3162.

## 42.1.2.1.1.4.3 Method of test

## Initial conditions

System Simulator:

1 cell supporting GPRS.

Mobile Station:

The MS is GPRS attached and in packet idle mode.

## Related PICS/PIXIT statement

- Support GPRS service.

## Test procedure

The SS page the MS with a PACKET PAGING REQUEST message. The SS sends PACKET QUEUING NOTIFICATION message corresponding to one of its 3 last PACKET CHANNEL REQUEST messages. The SS waits until T3162 seconds elapse and sends an PACKET UPLINK ASSIGNMENT message which shall be ignored by the MS since the access procedure should be aborted.

The SS page the MS with a PACKET PAGING REQUEST message. The SS verifies that the MS respond to the paging request and sends PACKET QUEUING NOTIFICATION message corresponding to one of its 3 last PACKET CHANNEL REQUEST messages. The SS sends a PACKET UPLINK ASSIGNMENT message before T3162 seconds elapse and the MS shall complete the uplink data transfer containing the paging response.

## Maximum duration of the test

1 minute.

## Expected sequence

| Step | Direction | Message                        | Comments                                                                                     |

#### 42.1.2.1.2 Packet Uplink Assignment / Response to packet polling request

##### 42.1.2.1.2.1 Conformance requirements

On receipt of a PACKET POLLING REQUEST message, the mobile station shall respond to the network with the PACKET CONTROL ACKNOWLEDGEMENT message in the reserved uplink radio block specified by the RRBP field.

##### Reference

3GPP TS 04.60 subclause 7.1.2.2.3.

##### 42.1.2.1.2.2 Test purpose

To verify that the mobile station responds to the Network with a PACKET CONTROL ACKNOWLEDGEMENT message in the reserved uplink radio block specified by the RRBP field on receipt of a PACKET POLLING REQUEST message.

##### 42.1.2.1.2.3 Method of test

##### Initial conditions

System Simulator:

1 cell supporting GPRS. The packet system information ACCESS\_BURST\_TYPE indicates 8 bit access and CONTROL\_ACK\_TYPE indicates four access bursts.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

##### Related PICS/PIXIT statement

- Support GPRS service.
- Support PDP context.
- Method of triggering the MS to initiate an uplink packet data transfer.

##### Test procedure

The MS is triggered to transfer data. The SS sends a PACKET QUEUING NOTIFICATION message and sends then a PACKET POLLING REQUEST message. On receipt of PACKET POLLING REQUEST message the MS shall respond with PACKET CONTROL ACKNOWLEDGEMENT message as four access bursts. The SS verifies that MS sends the PACKET CONTROL ACKNOWLEDGEMENT and send PACKET UPLINK ASSIGNMENT message. The uplink data transfer is completed.

##### Maximum duration of the test

30 s.

42.1.2.1.3 Packet Uplink Assignment / Packet access reject procedure

42.1.2.1.3.1 Packet Uplink Assignment / Packet access reject / Action during Wait\_Indication

42.1.2.1.3.1.1 Conformance requirements

On receipt of a PACKET ACCESS REJECT message containing a Reject structure addressed to the mobile station, where the Packet Request Reference in the Reject structure corresponds to one of its three last PACKET CHANNEL REQUEST messages, the mobile station shall stop sending PACKET CHANNEL REQUEST messages, start timer T3172 with the value indicated in the WAIT\_INDICATION field if present, start timer T3170 if it has not already been started and listen to the downlink PCCCH until timer T3170 expires. During this time, the mobile station shall ignore additional PACKET ACCESS REJECT message, but on reception of any PACKET UPLINK ASSIGNMENT message corresponding to any other of its 3 last PACKET CHANNEL REQUEST MESSAGE the mobile station shall stop timers T3170 and T3172 if running and follow the procedure defined in subclause 7.1.2.2.1.

Reference

3GPP TS 04.60 subclause 7.1.2.2.4.

42.1.2.1.3.1.2 Test purpose

To verify that the mobile station stops sending PACKET CHANNEL REQUEST messages on receipt of a PACKET ACCESS REJECT message containing a WAIT\_INDICATION field.

To verify that the mobile station ignores additional PACKET ACCESS REJECT messages, but on reception of any PACKET UPLINK ASSIGNMENT message corresponding to any other of its 3 last PACKET CHANNEL REQUEST messages the mobile station shall switch to the assigned PDCHs if the message is received before timer T3170 expire.

42.1.2.1.3.1.3 Method of test

Initial conditions

System Simulator:

1 cell supporting GPRS. The packet system information MAX\_RETRANS indicates 7 retransmissions, TX\_INT indicates 50 slots to spread transmission, parameter S indicates the value 217 and BS\_PRACH\_BLKs = 12 (all Blocks reserved for PRACH).

Mobile Station:

The MS is switched off. The SIM is updated to the test cell.

## Related PICS/PIXIT statement

- Support GPRS service.
- Switch off on button Yes/No.
- Method of trigger GPRS attach.

## Test procedures

The MS is switched on and triggered to perform a GPRS attach. The SS sends PACKET ACCESS REJECT message with WAIT\_INDICATION field corresponding to one of the last three PACKET CHANNEL REQUEST messages. The SS verifies that the MS does not send further PACKET CHANNEL REQUEST messages. The SS sends a new PACKET ACCESS REJECT message without WAIT\_INDICATION field. The SS shall then send a PACKET UPLINK ASSIGNMENT message corresponding to one of the last three sent PACKET CHANNEL REQUEST messages before the timer T3170 expire ( $T+2*S$  TDMA frames). The SS allows the MS to complete the GPRS attach procedure.

## Maximum duration of the test

4 min.

## Expected sequence

| Step | Direction | Message                  | Comments                                                                                                                        |
|------|-----------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------|

| 2    | MS -> SS  | PACKET CHANNEL REQUEST   | Received on PRACH.                                                                                                              |
| 3    | MS -> SS  | PACKET CHANNEL REQUEST   | Received on PRACH.                                                                                                              |
| 4    | MS -> SS  | PACKET CHANNEL REQUEST   | Received on PRACH.                                                                                                              |
| 5    | SS -> MS  | PACKET ACCESS REJECT     | Containing WAIT_INDICATION = 15 seconds and packet request reference = pertaining to message received in step 2. Sent on PAGCH. |
| 6    | SS        |                          | The SS checks $0,8*T3170$ that the MS does not send further PACKET CHANNEL REQUEST messages.                                    |
| 7    | SS -> MS  | PACKET ACCESS REJECT     | Without WAIT_INDICATION. Sent $0,8*T3170$ on PAGCH. The MS shall not consider this message.                                     |
| 8    | SS -> MS  | PACKET UPLINK ASSIGNMENT | Random Reference = pertaining to message received in step 2. Sent $0,9*T3170$ on PAGCH.                                         |
| 9    |           | {GPRS attach procedure}  | Macro. Completion from step 4 in the attach procedure.                                                                          |

## Specific message contents

None.

## 42.1.2.1.3.2 Packet Uplink Assignment / Packet access reject / No respond

## 42.1.2.1.3.2.1 Conformance requirements

On receipt of a PACKET ACCESS REJECT message containing a Reject structure addressed to the mobile station, where the Packet Request Reference in the Reject structure corresponds to one of its 3 last PACKET CHANNEL REQUEST messages:

- the mobile station is not allowed to make a new attempt for packet access in the same cell until timer T3172 expires, but may attempt packet access in an other cell after successful cell reselection for radio conditions reasons (see 3GPP TS 05.08). A mobile station in class A or B mode of operation may attempt to enter the dedicated mode in the same cell before timer T3172 has expired. During the timer T3172 is running, the mobile station shall ignore all received PACKET PAGING REQUEST messages except paging request to trigger RR connection establishment.

## Reference

3GPP TS 04.60 subclause 7.1.2.2.4.

## 42.1.2.1.3.2.2 Test purpose

To verify that the mobile station ignores PACKET PAGING REQUEST messages requesting TBF establishment when T3172 is running.

## 42.1.2.1.3.2.3 Method of test

## Initial conditions

## System Simulator:

1 cell supporting GPRS. The packet system information ACCESS\_BURST\_TYPE indicates 8 bit access.

## Mobile Station:

The MS is GPRS attached and in packet idle mode.

## Related PICS/PIXIT statement

- Support GPRS service.
- Supporting GPRS MS class A and MS class B.

## Test procedure

The SS sends a PACKET PAGING REQUEST message. After response from the MS the SS sends PACKET ACCESS REJECT message with WAIT\_INDICATION set to a value between 1 to 255 s (see specific message contents). The SS sends then a PACKET UPLINK ASSIGNMENT message after timer T3170 has elapse. The SS verifies that the MS not respond to the message. The SS sends a PACKET PAGING REQUEST message request TBF establishment before the wait indication has elapse. The SS verifies that the MS not respond to the message. The SS sends a PACKET PAGING REQUEST message request TBF establishment after the wait indication has elapse. The SS verifies that the MS respond to the message.

The test procedures shall be repeated with different chosen values of WAIT INDICATION.

## Maximum duration of the test

10 minutes.

## Expected sequence

| Step | Direction | Message                  | Comments                                                                                   |
|------|-----------|--------------------------|--------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PACKET PAGING REQUEST    | Sent on PPCH.                                                                              |
| 2    | MS -> SS  | PACKET CHANNEL REQUEST   | Received on PRACH.                                                                         |
| 3    | SS -> MS  | PACKET ACCESS REJECT     | See specific message contents. Sent on PAGCH.                                              |
| 4    | SS -> MS  | PACKET UPLINK ASSIGNMENT | Send this message 1,1*T3170on PAGCH.                                                       |
| 5    | SS        |                          | Verify for 5 seconds that the MS does not respond to message in step 4.                    |
| 6    | SS -> MS  | PACKET PAGING REQUEST    | Request TBF establishment. Send this message after (0,9*WAIT INDICATION (step 3)) on PPCH. |
| 7    | SS        |                          | Verify that the MS does not respond to message in step 6.                                  |
| 8    | SS -> MS  | PACKET PAGING REQUEST    | Request TBF establishment. Send this message after (1,1*WAIT INDICATION (step 3)) on PPCH. |
| 9    | MS -> SS  | PACKET CHANNEL REQUEST   | Received on PRACH.                                                                         |

The test is repeated with different values of WAIT INDICATION, see specific message contents.

## Specific message contents

As default messages contents, except:

## PACKET ACCESS REJECT in step 3

| Information element                             | Value/remark                                                 |
|-------------------------------------------------|--------------------------------------------------------------|
| < WAIT_INDICATION ><br>< WAIT_INDICATION_SIZE > | Set values between 1-255, see below.<br>0 (units of seconds) |

Case 1: WAIT\_INDICATION = 60.

Case 2: WAIT\_INDICATION = 240.

## 42.1.2.1.3.3 Packet Uplink Assignment / Packet access reject / Trigger RR connection

## Applicability

This test is only applicable to GPRS mobiles that can operate in mode B in network mode 1.

## 42.1.2.1.3.3.1 Conformance requirements

On receipt of a PACKET ACCESS REJECT message containing a Reject structure addressed to the mobile station, where the Packet Request Reference in the Reject structure corresponds to one of its 3 last PACKET CHANNEL REQUEST messages:

- the mobile station is not allowed to make a new attempt for packet access in the same cell until timer T3172 expires, but may attempt packet access in an other cell after successful cell reselection for radio conditions reasons (see 3GPP TS 05.08). A mobile station in class A or B mode of operation may attempt to enter the dedicated mode in the same cell before timer T3172 has expired. During the timer T3172 is running, the mobile station shall ignore all received PACKET PAGING REQUEST messages except paging request to trigger RR connection establishment.

## Reference

3GPP TS 04.60 subclause 7.1.2.2.4.

## 42.1.2.1.3.3.2 Test purpose

To verify that when T3172 is running, the mobile station ignores all received PACKET PAGING REQUEST messages except paging request to trigger RR connection establishment.

## 42.1.2.1.3.3.3 Method of test

## Initial conditions

System Simulator:

1 cell supporting GPRS. The packet system information ACCESS\_BURST\_TYPE indicates 8 bit access.

Mobile Station:

The MS is GPRS attached and in packet idle mode. The MS shall have a valid TMSI.

## Related PICS/PIXIT statement

- Support GPRS service.
- Supporting GPRS MS class B.

## Test procedure

The SS sends a PACKET PAGING REQUEST message request TBF connection establishment. After response from the MS the SS sends PACKET ACCESS REJECT message with a WAIT\_INDICATION value. The SS trigger first paging with TBF connection establishment and then RR connection establishment before the wait indication has elapse.

The SS verifies that the MS not respond to the TBF connection establishment but respond to the RR connection establishment.

Maximum duration of the test

1 minute.

Expected sequence

#### 42.1.2.1.4 Packet Uplink Assignment / Packet Uplink Assignment handling

##### 42.1.2.1.4.1 Conformance requirements

On receipt of a PACKET UPLINK ASSIGNMENT message corresponding to one of its 3 last PACKET CHANNEL REQUEST messages, the mobile station shall stop timers T3186 and T3170 if running, stop sending PACKET CHANNEL REQUEST messages.

Reference

3GPP TS 04.60 subclause 7.1.2.2.1.

##### 42.1.2.1.4.2 Test purpose

To verify that the mobile station stops sending PACKET CHANNEL REQUEST messages on receipt of a PACKET UPLINK ASSIGNMENT message.

## 42.1.2.1.4.3 Method of test

## Initial conditions

## System Simulator:

1 cell supporting GPRS. The packet system information MAX\_RETRANS indicates 7 allowed retransmission.

## Mobile Station:

The MS is switched off. The SIM is updated to the test cell.

## Related PICS/PIXIT statement

- Support GPRS service.
- Switch off on button Yes/No.
- Method of trigger GPRS attach.

## Foreseen final state of the MS

Packet idle mode.

## Test procedure

The MS is switched on and triggered to perform a GPRS attach. The SS send a PACKET UPLINK ASSIGNMENT message corresponding to one of the last 3 PACKET CHANNEL REQUEST messages from the MS. The SS verifies that the MS stops sending PACKET CHANNEL REQUEST messages. The SS allows the MS to complete the GPRS attach procedure.

## Maximum duration of the test

15 s.

## Expected sequence

| Step | Direction | Message                  | Comments                                                                                                                                                                            |

| 4    | SS -> MS  | PACKET UPLINK ASSIGNMENT | Respond to requests message in step 2. Sent on PAGCH with dynamic allocation struct. The SS shall verify for 4.5 seconds that the MS stops sending packet channel request messages. |
| 5    |           | {GPRS attach procedure } | Macro. Completion from step 4 in the attach procedure.                                                                                                                              |

## Specific message contents

None.

## 42.1.2.1.5 Packet Uplink Assignment / One or two phase access

## 42.1.2.1.5.1 Conformance requirements

A mobile station that has not indicated Single Block Without TBF Establishment in the PACKET CHANNEL REQUEST message shall perform a two phase access if the Single Block Allocation struct is included in the PACKET UPLINK ASSIGNMENT message, or a one phase access if the Dynamic Allocation is included.

## Reference

3GPP TS 04.60 subclause 7.1.2.2.1.

### 42.1.2.1.5.2 Test purpose

To verify that the mobile station proceeds with one phase access or two phase access according to the parameters in the PACKET UPLINK ASSIGNMENT message.

### 42.1.2.1.5.3 Method of test

#### Initial conditions

System Simulator:

1 cell supporting GPRS. The packet system information ACCESS\_BURST\_TYPE indicates 8 bit access.

Mobile Station:

The MS is switched off. The SIM is updated to the test cell.

#### Related PICS/PIXIT statement

- Support GPRS service.
- Switch off on button Yes/No.
- Method of trigger GPRS attach.

#### Test procedures

The MS is switched on and triggered to perform a GPRS attach. The SS send a PACKET UPLINK ASSIGNMENT message with Dynamic Allocation struct information field, the MS shall proceed with a one-phase access. The SS allows the MS to complete the GPRS attach procedure. Switch off the MS.

The MS is switched on and triggered to perform a GPRS attach. The SS send a PACKET UPLINK ASSIGNMENT message with Single Block Allocation struct information field, the MS shall perform a two-phase access i.e. it should transmit a PACKET RESOURCE REQUEST message on the allocated uplink resource. The SS responds with a PACKET UPLINK ASSIGNMENT message with Dynamic Allocation struct information field. The SS allows the MS to complete the GPRS attach procedure. Switch off the MS.

#### Maximum duration of the test

2 minutes.

## Expected sequences

| Step | Direction | Message                   | Comments                                                                    |

## Specific message contents

PACKET UPLINK ASSIGNMENT dynamic allocation struct specified in subclause 42.1.3.2.8.

PACKET UPLINK ASSIGNMENT single block allocation struct specified in subclause 42.1.3.2.10.

## 42.1.2.1.6 Packet Uplink Assignment / Decoding of frequency parameters

## 42.1.2.1.6.1 Conformance requirements

The mobile station may use information received on PBCCH, BCCH or a previous assignment message to decode the frequency parameters contained in the assignment message. If the mobile station detects an invalid Frequency Parameters information element in the assignment message, it shall abort the procedure, if required initiate a partial acquisition of PBCCH or BCCH, and may then re-initiate this procedure.

When the indirect encoding is used, the network may include a CHANGE\_MARK\_1 and a CHANGE\_MARK\_2 in the Frequency Parameters information element. The mobile station shall then verify that it is using a set of PBCCH or BCCH information identified by a PSI or SI *change mark* corresponding to one of the CHANGE\_MARK\_1 or 2 parameters, for the decoding of the frequency information. If that is not the case, an abnormal condition occurs.

## Reference

3GPP TS 04.60 subclauses 7.1.2.2.1 and 5.5.1.7.

## 42.1.2.1.6.2 Test purpose

To verify that the mobile station uses information received on PBCCH to decode the frequency parameters contained in the assignment message and when the mobile station receives a PACKET UPLINK ASSIGNMENT message with an invalid frequency parameters information element the mobile station shall abort the procedure.

## 42.1.2.1.6.3 Method of test

## Initial conditions

System Simulator:

1 cell supporting GPRS. Packet system information PSI2 including frequency hopping parameters.

Mobile Station:

The MS is switched off. The SIM is updated to the test cell.

Related PICS/PIXIT statement

- Support GPRS service.
- Switch off on button Yes/No.
- Method of trigger GPRS attach.

Test procedure

The MS is switched on and triggered to perform a GPRS attach. The SS send a PACKET UPLINK ASSIGNMENT message containing frequency parameter information elements. The SS allows the MS to complete the GPRS attach procedure. The MS is switched off, then switched on again and triggered to perform a GPRS attach. The SS sends PACKET UPLINK ASSIGNMENT message containing an invalid frequency parameter as responds to the PACKET CHANNEL REQUEST message from the MS. The SS verifies that the MS aborts the procedure.

Maximum duration of the test

30 s.

Expected sequence

#### 42.1.2.1.7 Packet Uplink Assignment / Most recently received Packet Uplink Assignment

##### 42.1.2.1.7.1 Conformance requirements

A PACKET UPLINK ASSIGNMENT message may indicate an assignment starting time in the TBF Starting Time parameter. The mobile station shall monitor PCCCH until the point in time denoted by the TBF Starting Time. If while monitoring the PCCCH the mobile station receives more than one PACKET UPLINK ASSIGNMENT message, it shall act upon the most recently received message and shall ignore the previous message.

##### Reference

3GPP TS 04.60 subclause 7.1.2.2.1.

##### 42.1.2.1.7.2 Test purpose

To verify that the mobile station monitors PCCCH until the point in time denoted by the TBF Starting Time and that the mobile station acts on the most recently received Packet Uplink Assignment.

## 42.1.2.1.7.3 Method of test

## Initial conditions

## System Simulator:

1 cell supporting GPRS. The packet system information ACCESS\_BURST\_TYPE indicates 8 bit access.

## Mobile Station:

The MS is switched off. The SIM is updated to the test cell.

## Related PICS/PIXIT statement

- Support GPRS service.
- Switch off on button Yes/No.
- Method of trigger GPRS attach.

## Test procedure

The MS is switched on and triggered to perform a GPRS attach. The SS sends PACKET UPLINK ASSIGNMENT message with a TBF starting time. Then send a new PACKET UPLINK ASSIGNMENT message with another TBF starting time and a different timeslot on PCCCH before the first TBF starting time has elapsed. The MS shall start to send the RLC data block on the allocated uplink according to the second TBF starting time. The SS allows the MS to complete the GPRS attach procedure.

## Maximum duration of the test

15 s.

## Expected sequence

| Step | Direction | Message                  | Comments                                                                                                                                                                      |

## 42.1.2.1.8 Packet Uplink Assignment / One phase access

## 42.1.2.1.8.1 Packet Uplink Assignment / One phase access / Contention Resolution

The contention resolution is completed on the mobile station when the mobile station receives a PACKET UPLINK ACK/NACK message with the same TLLI as the mobile station has included in the RLC header of the first RLC data blocks. The mobile station shall then stop timer T3166 and counter N3104.

At sending of the first RLC data block, the mobile station shall stop timer T3164, set counter N3104 to 1, and start timer T3166. Counter N3104 shall be stepped each time the mobile station sends an RLC data block.

## 42.1.2.1.8.1.1 Packet Uplink Assignment / One phase access / Contention resolution / Inclusion of TLLI in RLC data blocks

## 42.1.2.1.8.1.1.1 Conformance requirements

In order to uniquely identify the mobile station when sending on uplink, the RLC Header is extended to include the TLLI of the mobile station until contention resolution is completed on the mobile station side.

All the RLC data blocks of an uplink TBF initiated by one phase access shall each contain a TLLI field in the RLC data block header until the contention resolution is completed on the mobile station side. After the reaction time specified in 3GPP TS 05.10 no other RLC data blocks shall contain a TLLI field.

The TLLI\_BLOCK\_CHANNEL\_CODING parameter in the PACKET UPLINK ASSIGNMENT message indicates whether a RLC data block containing a TLLI field in the RLC data block header shall be encoded using CS-1 or using the channel coding scheme commanded.

The mobile station shall send all other RLC data blocks using the channel coding scheme commanded.

Upon contention resolution during one phase access, the mobile station shall start transmitting RLC data blocks without the TLLI field no later than the next occurrence of block  $B((x+3) \bmod 12)$  where block  $B(x)$  is the radio block containing the contention resolution message.

## Reference

3GPP TS 04.60 subclauses 7.1.2.3 and 8.1.1.

3GPP TS 05.10 subclause 6.11.3.

## 42.1.2.1.8.1.1.2 Test purpose

1. To verify that in one phase access the first RLC data blocks of an uplink TBF contain a TLLI field in the RLC data block header and that these blocks are encoded according to the TLLI\_BLOCK\_CHANNEL\_CODING parameter specified in the PACKET UPLINK ASSIGNMENT message.
2. To verify that upon contention resolution during one phase access the RLC data blocks not contain a TLLI field and are encoded using the CHANNEL\_CODING\_COMMAND parameter included in the PACKET\_UPLINK\_ASSIGNMENT after the contention resolution reaction time.

## 42.1.2.1.8.1.1.3 Method of test

## Initial conditions

System Simulator:

1 cell supporting GPRS. The packet system information ACCESS\_BURST\_TYPE indicates 8 bit access.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

Related PICS/PIXIT statement

- Support GPRS service.
- Support PDP context.
- Method of triggering the MS to initiate an uplink packet data transfer.

Test procedure

The MS is triggered to transfer an LLC PDU. The SS sends PACKET UPLINK ASSIGNMENT message containing Dynamic Allocation struct. The MS shall start to send RLC data and RLC/MAC control blocks on the allocated uplink. The SS allows the MS to send the uplink data transfer. The SS verifies the coding is the scheme specified by TLLI\_BLOCK\_CHANNEL\_CODING, the TFI is correct and the block contains TLLI in the first RLC data blocks. After contention resolution reaction time shall the remaining RLC data blocks contain coding scheme specified by CHANNEL\_CODING\_COMMAND, the TFI shall be correct and the blocks do not contain TLLI.

Maximum duration of the test

3 minutes.

#### 42.1.2.1.8.1.2 Packet Uplink Assignment / One phase access / Contention resolution / Counter N3104

##### 42.1.2.1.8.1.2.1 Conformance requirements

The contention resolution has failed on the mobile station side when the counter N3104 has reached its maximum value, or on expiry of timer T3166, or if the mobile station receives a PACKET UPLINK ACK/NACK message with the right TFI but with a another TLLI than the mobile station has included in the RLC header of the first RLC data blocks. The mobile station shall then reset the counter N3104, stop timer T3166 if not expired, immediately stop transmitting on this TBF and reinitiate the packet access procedure unless it has already been repeated 4 times.

##### Reference

3GPP TS 04.60 subclause 7.1.2.3.

##### 42.1.2.1.8.1.2.2 Test purpose

To verify that the mobile station correctly sets and considers counter N3104.

##### Note

Counter N3104 is incremented by 1 with each new RLC/MAC block the mobile station sends until the first PACKET UPLINK ACK/NACK message is received.

Its maximum value is  $N3104\_MAX = 3 * (BS\_CV\_MAX + 3) * \text{no-of-timeslots-assigned}$ , where BS\_CV\_MAX is broadcast in PSII.

##### 42.1.2.1.8.1.2.3 Method of test

##### Initial conditions

System Simulator:

1 cell supporting GPRS. The packet system information BS\_CV\_MAX value = 1.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

##### Related PICS/PIXIT statement

- Support GPRS service.
- Support PDP context.
- Method of triggering the MS to initiate an uplink packet data transfer.

##### Test procedure

The MS is triggered to initiate packet uplink transfer of an LLC PDU. The SS assigns packet uplink resources in a PACKET UPLINK ASSIGNMENT message indicating one phase packet access. The MS shall start transferring RLC data blocks.. The SS verifies that the MS stops transmitting and re-initiates the packet access procedure.

At the second attempt, the SS sends PACKET UPLINK ACK/NACK exactly after N3104\_MAX - 1 data blocks. The SS verifies that this time the MS does not abort the access procedure and successfully completes uplink transfer.

Maximum duration of the test

5 minutes.

Specific message contents

None.

#### 42.1.2.1.8.1.3 Packet Uplink Assignment / One phase access / Contention resolution / Timer T3166

##### 42.1.2.1.8.1.3.1 Conformance requirements

The contention resolution has failed on the mobile station side when the counter N3104 has reached its maximum value, or on expiry of timer T3166, or if the mobile station receives a PACKET UPLINK ACK/NACK message with the right TFI but with a another TLLI than the mobile station has included in the RLC header of the first RLC data blocks. The mobile station shall then reset the counter N3104, stop timer T3166 if not expired, immediately stop transmitting on this TBF and reinitiate the packet access procedure unless it has already been repeated 4 times.

Reference

3GPP TS 04.60 subclause 7.1.2.3.

##### 42.1.2.1.8.1.3.2 Test purpose

To verify that the mobile station correctly considers timer T3166.

##### 42.1.2.1.8.1.3.3 Method of test

Initial conditions

System Simulator:

1 cell supporting GPRS. The packet system information ACCESS\_BURST\_TYPE indicates 8 bit access and BS\_CV\_MAX value = 15.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

#### Related PICS/PIXIT statement

- Support GPRS service.
- Support PDP context.
- Method of triggering the MS to initiate an uplink packet data transfer.

#### Foreseen final state of the MS

Packet idle mode.

#### Test procedure

The MS is triggered to initiate packet uplink transfer of an LLC PDU. The SS assigns packet uplink resources in a PACKET UPLINK ASSIGNMENT message indicating one phase packet access. The MS shall start transferring RLC data blocks. The SS reduces the block transfer rate by controlling the USF flag. In this way, the SS forces T3166 (with value 5 s.) to expire before counter N3104 reaches N3104\_MAX (with value 45 blocks for current settings). The SS verifies that the MS stops transmitting and re-initiates the packet access procedure.

At the second attempt, the SS sends PACKET UPLINK ACK/NACK before T3166 expire. The SS verifies that this time the MS does not abort the access procedure and successfully completes the data transfer.

#### Maximum duration of the test

5 minutes.

#### 42.1.2.1.8.1.4 Packet Uplink Assignment / One phase access / Contention resolution / TLLI mismatch

##### 42.1.2.1.8.1.4.1 Conformance requirements

The contention resolution has failed on the mobile station side when the counter N3104 has reached its maximum value, or on expiry of timer T3166, or if the mobile station receives a PACKET UPLINK ACK/NACK message with the right TFI but with a another TLLI than the mobile station has included in the RLC header of the first RLC data blocks. The mobile station shall then reset the counter N3104, stop timer T3166 if not expired, immediately stop transmitting on this TBF and reinitiate the packet access procedure unless it has already been repeated 4 times.

##### Reference

3GPP TS 04.60 subclause 7.1.2.3.

##### 42.1.2.1.8.1.4.2 Test purpose

To verify that the mobile station reinitiates packet access when it receives a PACKET UPLINK ACK/NACK message with the correct TFI but with a TLLI other than the mobile station has included in the RLC header.

##### 42.1.2.1.8.1.4.3 Method of test

##### Initial conditions

System Simulator:

1 cell supporting GPRS.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

##### Related PICS/PIXIT statement

- Support GPRS service.
- Support PDP context.
- Method of triggering the MS to initiate an uplink packet data transfer.

##### Test procedure

The MS is triggered to initiate packet uplink transfer of an LLC PDU. The SS assigns packet uplink resources in a PACKET UPLINK ASSIGNMENT message indicating one phase packet access. The MS shall start transferring RLC data block after SS has assigned USF to the MS. The SS acknowledges the RLC block transfer with a PACKET UPLINK ACK/NACK including correct TFI and incorrect TLLI. The SS continue to assign USF to the MS. The SS shall verify that the MS immediately stops transmitting (see note below) and retries packet access procedure.

At the second attempt, the SS sends PACKET UPLINK ACK/NACK including a correct TLLI. The SS verifies that this time the MS does not abort the access procedure and successfully completes the data transfer.

NOTE: A mobile station, receiving a commanding message in block number N, shall take an "immediate" action as a result of the command, starting in any block from block number N+1 to N+6 (inclusive).

##### Maximum duration of the test

5 minutes.

Expected sequence

| Step | Direction | Message                                    | Comments                                                                                                                                                                                                                     |

#### 42.1.2.1.8.1.5 Packet Uplink Assignment / One phase access / Contention resolution / 4 access repetition attempts

##### 42.1.2.1.8.1.5.1 Conformance requirement

The contention resolution has failed on the mobile station side when the counter N3104 has reached its maximum value, or on expiry of timer T3166, or if the mobile station receives a PACKET UPLINK ACK/NACK message with the right TFI but with a another TLLI than the mobile station has included in the RLC header of the first RLC data blocks.

The mobile station shall then reset the counter N3104, stop timer T3166 if not expired, immediately stop transmitting on this TBF and reinitiate the packet access procedure unless it has already been repeated 4 times.

##### Reference

3GPP TS 04.60 subclause 7.1.2.3.

##### 42.1.2.1.8.1.5.2 Test purpose

To verify that the mobile station attempts packet access procedure 4 or 5 times.

##### 42.1.2.1.8.1.5.3 Method of test

##### Initial conditions

System Simulator:

1 cell supporting GPRS.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

## Related PICS/PIXIT statement

- Support GPRS service.
- Support PDP context.
- Method of triggering the MS to initiate an uplink packet data transfer.

## Test procedure

The MS is triggered to initiate packet uplink transfer of an LLC PDU. The SS assigns packet uplink resources in a PACKET UPLINK ASSIGNMENT message indicating one phase packet access. The MS shall start transferring RLC data blocks after SS has assigned USF to the MS. The SS acknowledges the RLC block transfer with a PACKET UPLINK ACK/NACK including a TLLI not corresponding to the MS. The SS shall verify that the MS stops transmitting blocks and reinitiates packet access. This test sequence shall be attempted four or five times.

## Maximum duration of the test

5 minutes.

## Expected sequence

| Step | Direction | Message                             | Comments                                                                                                              |
|------|-----------|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------|

| 5    | MS -> SS  | UPLINK RLC DATA BLOCK               | Received on the assigned PDTCH.                                                                                       |
| 6    | SS -> MS  | PACKET UPLINK ACK/NACK              | Assign USF to the MS, include a incorrect TLLI. Sent on PACCH.                                                        |
| 7    | SS        |                                     | The SS verifies that the MS attempts the packet access procedure from step 2 four or five times.                      |

## Specific message contents

None.

42.1.2.1.8.2 Packet Uplink Assignment / One phase access / Timing Advance

42.1.2.1.8.2.1 Packet Uplink Assignment / One phase access / Timing Advance / TA Index present

42.1.2.1.8.2.1.1 Conformance requirements

If a Timing Advance Index is included in the assignment message, the mobile station shall use the continuous update timing advance mechanism, using its allocation on PTCCH (see 3GPP TS 05.10).

## Reference

3GPP TS 04.60 subclause 7.1.2.5.

3GPP TS 03.64 subclause 6.5.7.2.

## 42.1.2.1.8.2.1.2 Test purpose

To verify that the mobile station uses the continuous update timing advance mechanism and sends access bursts on the PTCCH slots as determined by the Timing Advance Index sent in the PACKET UPLINK ASSIGNMENT message.

## 42.1.2.1.8.2.1.3 Method of test

## Initial conditions

## System Simulator:

1 cell supporting GPRS. The packet system information ACCESS\_BURST\_TYPE indicates 8 bit access.

## Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

## Related PICS/PIXIT statement

- Support GPRS service.
- Support PDP context.
- Method of triggering the MS to initiate an uplink packet data transfer.

## Test procedure

The MS is triggered to initiate uplink data packet transfer. The SS responds with PACKET UPLINK ASSIGNMENT message indicating one phase access and containing a Timing Advance Index. The MS shall start to send data on the allocated uplink. The SS allows the MS to send the uplink data transfer. During the Uplink data transfer, the SS shall verify that the access bursts are sent correctly by the MS in the PTCCH.

## Maximum duration of the test

2 minutes.

## Expected sequence

| Step | Direction | Message                                    | Comments                                                                                             |
|------|-----------|--------------------------------------------|------------------------------------------------------------------------------------------------------|
| 1    | MS        |                                            | The MS is triggered to initiate packet uplink transfer of an LLC PDU consisting of 2000 octets data. |
| 2    | MS -> SS  | PACKET CHANNEL REQUEST                     | Received on PRACH.                                                                                   |
| 3    | SS -> MS  | PACKET UPLINK ASSIGNMENT                   | Including Timing Advance Index = 0, Dynamic allocation struct. Sent on PAGCH.                        |
| 4    |           | {Uplink data transfer, dynamic allocation} | Macro. Completion from step 4 in the TBF procedure. Verification, see below.                         |

## Verification

During the uplink data transfer (step 4) the SS monitors the access burst on PTCCH which are located on slots with numbers FN, such that  $(FN \bmod (8 \cdot 52)) = 12$  for Timing Advance Index = 0 (3GPP TS 03.64 subclause 6.5.7.2 and 3GPP TS 05.02 table 6). The access burst contents shall be MESSAGE\_TYPE = 011111 and CTRL\_ACK = 11.

The test is repeated with an arbitrarily chosen Timing Advance Index in the range 1 to 15. SS shall verify that the access burst are sent in the correct idle slots as specified in 3GPP TS 05.02 table 6.

## Specific message contents

None.

#### 42.1.2.1.8.2.2 Packet Uplink Assignment / One phase access / Timing Advance / TA Index not present

##### 42.1.2.1.8.2.2.1 Conformance requirements

If a Timing Advance Index is included in the assignment message, the mobile station shall use the continuous update timing advance mechanism, using its allocation on PTCCH (see 3GPP TS 05.10). Otherwise, the continuous update timing advance mechanism shall not be used.

##### Reference

3GPP TS 04.60 subclause 7.1.2.5.

##### 42.1.2.1.8.2.2.2 Test purpose

To verify that the mobile station does not send any access bursts on the PTCCH if Timing Advance Index is not present in the PACKET UPLINK ASSIGNMENT message.

##### 42.1.2.1.8.2.2.3 Method of test

##### Initial conditions

System Simulator:

1 cell supporting GPRS.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

| 4    |           | Completion of macro {Uplink dynamic allocation one phase access with contention resolution} or; {Uplink dynamic allocation two phase access} | Macro. Completion from step 4 in the TBF procedure. Verification, see below.                         |

Verification

The SS verifies that the MS does not transmit in idle frames during data block transfer (steps 4). Idle frame numbers are 12, 25, 38 and 51 in the 52-multiframe structure.

Specific message contents

None.

42.1.2.1.8.2.3 Packet Uplink Assignment / One phase access / Timing Advance / TA value field not provided

42.1.2.1.8.2.3.1 Conformance requirements

For the case where a TIMING\_ADVANCE\_VALUE field is not provided in the assignment message, the mobile station is not allowed to send normal bursts on the uplink until it receives a valid timing advance either through the continuous timing advance procedure or in a PACKET TIMING ADVANCE/POWER CONTROL message.

Reference

3GPP TS 04.60 subclause 7.1.2.5.

42.1.2.1.8.2.2.2 Test purpose

To verify that the mobile station does not send normal bursts on the uplink until it receives a valid timing advance in a PACKET POWER CONTROL/TIMING ADVANCE message if Timing Advance Value field is not provided in the PACKET UPLINK ASSIGNMENT message.

42.1.2.1.8.2.2.3 Method of test

Initial conditions

System Simulator:

1 cell supporting GPRS.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

Related PICS/PIXIT statement

- Support GPRS service.
- Support PDP context.
- Method of triggering the MS to initiate an uplink data transfer.

## Test procedure

The MS is triggered to initiate uplink data transfer. The SS responds with PACKET UPLINK ASSIGNMENT message that request one phase access and does not include Timing Advance Value field. The SS shall wait 2 seconds and then send a PACKET POWER CONTROL/TIMING ADVANCE message with a valid timing advance information. The MS shall start to send data on the allocated uplink. The SS allows the MS to send the uplink data transfer. The SS verifies that the MS not send any normal burst on the uplink until the SS sends a valid timing advance.

## Maximum duration of the test

2 minutes.

## Expected sequence

| 5    | SS -> MS  | PACKET POWER CONTROL/TIMING ADVANCE        | Include a valid Timing Advance information. Sent on PACCH.                                          |
| 6    |           | {Uplink data transfer, dynamic allocation} | Macro. Completion of the TBF procedure.                                                             |

## Specific message contents

None.

42.1.2.1.9 Packet Uplink Assignment / Two phase access

42.1.2.1.9.1 Packet Uplink Assignment / Two phase access / Packet Resource Request / RLC Octet Count

42.1.2.1.9.1.1 Conformance requirements

The mobile station may request an open-ended or a close-ended TBF. If a close-ended TBF is requested, the number of octets of user data that the MS has to transfer in the TBF shall be indicated in the PACKET RESOURCE REQUEST message.

## Reference

3GPP TS 04.60 subclause 7.1.3.1.

42.1.2.1.9.1.2 Test purpose

To verify that the mobile station indicates the number of octets of user data that it has to be transferred in the TBF.

42.1.2.1.9.1.3 Method of test

## Initial conditions

System Simulator:

1 cell supporting GPRS. The packet system information ACCESS\_BURST\_TYPE indicates 8 bit access.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 1 has been established.

## Related PICS/PIXIT statement

- Support GPRS service.
- Support PDP context.
- Method of triggering the MS to initiate an uplink data transfer.

## Test procedure

The MS is triggered to initiate unacknowledged uplink data transfer. The SS shall send PACKET UPLINK ASSIGNMENT message including Single Block Allocation struct information to instruct the MS to send PACKET RESOURCE REQUEST. The MS should perform a two-phase access i.e. the MS shall transmit a PACKET RESOURCE REQUEST message on the allocated uplink resource.

The RLC\_OCTET\_COUNT field shall indicate the number of LLC data octets the MS wishes to transfer.

The SS should then respond with PACKET UPLINK ASSIGNMENT message and the MS should begin transmitting RLC data blocks on the allocated uplink resources. The SS allows the MS to complete the sending of the data.

## Maximum duration of the test

2 minutes.

## Expected sequence

| 4    | MS -> SS  | PACKET RESOURCE REQUEST                    | Received on the single block assigned in step 3.                                                                                                                                                 |
| 5    | SS -> MS  | PACKET UPLINK ASSIGNMENT                   | Dynamic allocation struct. Sent on the PACCH of the assigned PDCH.                                                                                                                               |
| 6    |           | {Uplink data transfer, dynamic allocation} | Macro. Completion from step 4 in the TBF procedure.                                                                                                                                              |
| 7    | SS        |                                            | The SS verifies that in case of a close-ended TBF is requested ( RLC_OCTET_COUNT≠0) MS has transferred the number of user data octets indicated in step 4 as RLC_OCTET_COUNT value +/- 2 octets. |

## Specific message contents

None.

42.1.2.1.9.2 Packet Uplink Assignment / Two phase access / Contention resolution

42.1.2.1.9.2.1 Packet Uplink Assignment / Two phase access / Contention resolution / Expiry of timer T3168

42.1.2.1.9.2.1.1 Conformance requirements

The contention resolution has failed on the mobile station side when the mobile station does not receive a PACKET UPLINK ASSIGNMENT message with its TLLI before expiry of timer T3168. The mobile station shall then reinitiate the packet access procedure unless it has already been repeated 4 times. In that case, TBF failure has occurred.

## Reference

3GPP TS 04.60 subclause 7.1.3.3.

## 42.1.2.1.9.2.1.2 Test purpose

To verify that the mobile station reinitiates the packet access procedure after a time equal to timer T3168 and the procedure shall be attempted a total of 4 or 5 times.

## 42.1.2.1.9.2.1.3 Method of test

## Initial conditions

## System Simulator:

1 cell supporting GPRS. PSI GPRS Cell Options, T3168 = 7.

## Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 1 has been established.

## Related PICS/PIXIT statement

- Support GPRS service.
- Support PDP context.
- Method of triggering the MS to initiate an uplink data transfer.

## Test procedure

The MS is triggered to initiate unacknowledged uplink data transfer. The SS sends PACKET UPLINK ASSIGNMENT message including Single Block Allocation struct information to order the MS to send PACKET RESOURCE REQUEST message. The MS shall perform a two-phase access i.e. the MS shall transmit a PACKET RESOURCE REQUEST message on the allocated uplink resource. The SS wait for a time greater than timer T3168 so the MS shall reinitiate packet access procedure. This procedure shall be attempted 4 or 5 times.

## Maximum duration of the test

2 minutes.

## Expected sequence

| Step | Direction | Message                  | Comments                                                                                            |
|------|-----------|--------------------------|-----------------------------------------------------------------------------------------------------|
| 1    | MS        |                          | The MS is triggered to initiate packet uplink transfer of an LLC PDU consisting of 200 octets data. |
| 2    | MS -> SS  | PACKET CHANNEL REQUEST   | Two Phase Access Request. Received on PRACH.                                                        |
| 3    | SS -> MS  | PACKET UPLINK ASSIGNMENT | Single Block Allocation struct. Sent on PAGCH.                                                      |
| 4    | MS -> SS  | PACKET RESOURCE REQUEST  | ACCESS_TYPE = "Two Phase Access Request".<br>Received on the single block assigned in step 3.       |
| 5    | SS        |                          | The SS waits T3168 expiry.                                                                          |
| 6    |           |                          | The SS verifies that the MS attempts packet access procedure four or five times.                    |

## Specific message contents

None.

## 42.1.2.1.9.2.2 Packet Uplink Assignment / Two phase access / Contention resolution / TLLI mismatch

The contention resolution is completed on the mobile station side when the mobile station receives a PACKET UPLINK ASSIGNMENT message with the same TLLI as the mobile station has included in the PACKET RESOURCE REQUEST message.

#### 42.1.2.1.9.2.2.1 Conformance requirements

If the failure is due to a TLLI mismatch, or to the expiry of timers T3166 or T3168, or to the fact that the counter N3104 reached its maximum value in the contention resolution procedure, and repetition as described in subclause 7.1.3.3 has been performed, the mobile station shall remain in packet idle mode, notify higher layer (TBF establishment failure), transactions in progress shall be aborted and cell reselection continued.

#### Reference

3GPP TS 04.60 subclauses 7.1.4 and 7.1.3.3.

#### 42.1.2.1.9.2.2.2 Test purpose

To verify that the MS reinitiates packet access procedure with failure due to a TLLI mismatch in the contention resolution procedure, unless it has already been attempted 4 or 5 times. In that case, TBF failure has occurred.

#### 42.1.2.1.9.2.2.3 Method of test

#### Initial conditions

##### System Simulator:

1 cell supporting GPRS. The packet system information ACCESS\_BURST\_TYPE indicates 8 bit access.

##### Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 1 has been established.

#### Related PICS/PIXIT statement

- Support GPRS service.
- Support PDP context.
- Method of triggering the MS to initiate an uplink data transfer.

#### Test procedure

The MS is triggered to initiate unacknowledged uplink data transfer. The SS responds with PACKET UPLINK ASSIGNMENT message that request two phase access. The MS shall then send PACKET RESOURCE REQUEST message. The SS responds with PACKET UPLINK ASSIGNMENT message with a TLLI different to that the MS has sent in PACKET RESOURCE REQUEST message. The MS shall reinitiate the packet access procedure.

This procedure shall be attempted 4 or 5 times.

#### Maximum duration of the test

2 minutes.

Expected sequence

|------|-----------|--------------------------|----------------------------------------------------------------------------------------------------------|
| 1    | MS        |                          | The MS is triggered to initiate packet uplink transfer of an LLC PDU consisting of 200 octets data.      |
| 2    | MS -> SS  | PACKET CHANNEL REQUEST   | Two Phase Access Request. Received on PRACH.                                                             |
| 3    | SS -> MS  | PACKET UPLINK ASSIGNMENT | Single Block Allocation struct. Sent on PAGCH.                                                           |
| 4    | MS -> SS  | PACKET RESOURCE REQUEST  | ACCESS_TYPE = "Two Phase Access Request". Include TLLI. Received on the single block assigned in step 3. |
| 5    | SS -> MS  | PACKET UPLINK ASSIGNMENT | Include incorrect TLLI according to step 4. Sent on the PACCH of the assigned PDCH.                      |
| 6    |           |                          | The SS verifies that the MS attempts packet access procedure four or five times.                         |

Specific message contents

None.

42.1.2.1.9.3 Packet Uplink Assignment / Two phase access / Packet Resource Request / No respond to Packet Downlink Assignment

42.1.2.1.9.3.1 Conformance requirements

When the mobile station has received a PACKET UPLINK ASSIGNMENT message it shall respond with a PACKET RESOURCE REQUEST message in the allocated single radio block. At sending of the PACKET RESOURCE REQUEST message, the mobile station shall start timer T3168. Further more, the mobile station shall not respond to PACKET DOWNLINK ASSIGNMENT messages while timer T3168 is running.

Reference

3GPP TS 04.60 subclause 7.1.3.1.

42.1.2.1.9.3.2 Test purpose

To verify that the mobile station does not respond to PACKET DOWNLINK ASSIGNMENT messages while timer T3168 is running after sending of the PACKET RESOURCE REQUEST message.

42.1.2.1.9.1.3 Method of test

Initial conditions

System Simulator:

1 cell supporting GPRS. The packet system information ACCESS\_BURST\_TYPE indicates 8 bit access, T3168 indicates value 7 in GPRS Cell Options.

Mobile Station:

The MS is GPRS attached and in packet idle mode. PDP context 2 has been established.

Related PICS/PIXIT statement

- Support GPRS service.
- Support PDP context.
- Method of triggering the MS to initiate an uplink data transfer.

## Test procedure

The MS is triggered to initiate uplink data transfer. The SS shall send PACKET UPLINK ASSIGNMENT message including Single Block Allocation struct information to instruct the MS to send PACKET RESOURCE REQUEST. The MS should perform a two-phase access i.e. the MS shall transmit a PACKET RESOURCE REQUEST message on the allocated uplink resource.

While timer T3168 is running the SS send PACKET DOWNLINK ASSIGNMENT message and starts to send data on the allocated downlink before the timer expires. The MS shall not respond to the Downlink data transfer.

The SS should then send PACKET UPLINK ASSIGNMENT message before the timer T3168 expires and the MS should then begin transmitting RLC data blocks on the allocated uplink resources. The SS allows the MS to complete the sending of the data.

## Maximum duration of the test

2 minutes.

## Expected sequence

42.1.2.1.10 Packet Uplink Assignment / Abnormal cases

42.1.2.1.10.1 Packet Uplink Assignment / Abnormal cases / Incorrect PDCH assignment

42.1.2.1.10.1.1 Conformance requirements

If the mobile station has been assigned more PDCHs than it supports according to its MS multislot class, the mobile station shall reinitiate the packet access procedure unless it has already been repeated 4 times. In that case, TBF failure has occurred.

## Reference

3GPP TS 04.60 subclause 7.1.4.

42.1.2.1.10.1.2 Test purpose

To verify that the mobile station reinitiates the packet access procedure when the mobile station has been assigned more PDCHs than it supports and after 4 or 5 attempts of the packet access procedure the mobile station shall initiate TBF failure.

## 42.1.2.1.10.1.3 Method of test

## Initial conditions

System Simulator:

1 cell supporting GPRS.

Mobile Station:

The MS is switched off. The SIM is updated to the test cell.

## Related PICS/PIXIT statement

- Support GPRS service.
- Switch off on button Yes/No.
- Multislot class.
- Method of trigger GPRS attach.

## Test procedure

Convert the MS Multislot Class to number of uplink timeslot supported.

The MS is switched on and triggered to perform a GPRS attach. The SS sends PACKET UPLINK ASSIGNMENT message containing more assigned PDCHs than the MS supports according to its multislot class. The MS shall reinitiate packet access procedure; this procedure shall be attempted 4 or 5 times.

## Maximum duration of the test

2 minutes.

## Expected sequence

## 42.1.2.1.11 Non DRX Mode on PCCCH

## Applicability

This test is only applicable to GPRS mobiles that support non-zero value of the NON\_DRX\_TIMER.

#### 42.1.2.1.11.1 Conformance requirements

The SPLIT\_PG\_CYCLE and NON\_DRX\_TIMER parameters control:

- the occurrence of paging blocks on CCCH or PCCCH belonging to the mobile station (SPLIT\_PG\_CYCLE parameter, see 3GPP TS 05.02) in DRX mode (see 3GPP TS 03.64); and
- the duration of the non-DRX mode period to be applied by the mobile station when it has left the packet transfer mode and enters the packet idle mode.

There are three cases when the mobile station shall enter non-DRX mode.

- 1) Upon transition from the packet transfer mode to the packet idle mode, a mobile station shall enter the Transfer non-DRX mode period. The duration of this period is determined by the minimum value of the NON\_DRX\_TIMER parameter, requested in the *GPRS attach procedure*, and the DRX\_TIMER\_MAX parameter, broadcast in the cell.

#### Reference

3GPP TS 04.60 subclause 5.5.1.5.

#### 42.1.2.1.11.2 Test purpose

To verify that the mobile station correctly enters and remains in the transfer non-DRX mode period for the duration of minimum value of the NON\_DRX\_TIMER parameter, requested in the *GPRS attach procedure*, and the DRX\_TIMER\_MAX parameter, broadcast in the cell.

#### 42.1.2.1.11.3 Method of test

##### Initial conditions

System Simulator:

1 cell supporting GPRS. Packet system information PSI1 DRX\_TIMER\_MAX = 64 s.

Mobile Station:

The MS is switched off. The SIM is updated to the test cell.

##### Related PICS/PIXIT statement

- Support GPRS service.
- Switch off on button Yes/No.
- Method of trigger GPRS attach.
- Support non-zero NON\_DRX\_TIMER.

##### Test procedure

The MS is switched on and triggered to perform a GPRS attach. The SS pages the mobile on the PCCCH group of the mobile by sending PACKET PAGING REQUEST message. The mobile shall respond with PACKET CHANNEL REQUEST.

##### Maximum duration of the test

30 s.

Expected sequence

#### 42.1.2.1.12 Variable PBCCH and PSI Scheduling

##### 42.1.2.1.12.1 Conformance requirements

If PBCCH is present in the serving cell, the mobile station shall receive the PACKET SYSTEM INFORMATION (PSI) messages broadcast on PBCCH. The parameters determining the schedule of PSI messages on PBCCH are provided in the PSI1 message.

When a new cell has been selected where PBCCH is present, the mobile station shall perform a *complete acquisition* of PBCCH messages (see subclause 5.5.1.4). The mobile station shall not perform packet access in the selected cell, or enter the packet transfer mode, until it has:

- acquired the PACKET SYSTEM INFORMATION TYPE 1 (PSI1) message;
- acquired a consistent set of PSI2 messages; and
- made at least one attempt to receive the complete set of PSI messages on PBCCH.

Reference

3GPP TS 04.60 subclause 5.5.1.2.

##### 42.1.2.1.12.2 Test purpose

To verify that the mobile station correctly decodes the parameters determining the schedule of PSI messages from PSI1 message and performs packet access after receiving a complete set of PSI messages on PBCCH.

##### 42.1.2.1.12.3 Method of test

Initial conditions

System Simulator:

1 cell supporting GPRS. PSI1, PSI2, PSI3 and PSI3bis broadcast from the cell. All PSIs except PSI1 broadcast in high repetition rate. Mobile Station:

The MS is switched off. The SIM is updated to the test cell.

#### Related PICS/PIXIT statement

- Support GPRS service.
- Switch off on button Yes/No.
- Method of trigger GPRS attach.

#### Test procedure

The MS is switched on and triggered to perform a GPRS attach. The MS shall perform a packet access by sending PACKET CHANNEL REQUEST. The SS allows the MS to complete the GPRS attach procedure.

#### Maximum duration of the test

30 s.

#### Expected sequence

| Step | Direction | Message                  | Comments                                                      |
|------|-----------|--------------------------|---------------------------------------------------------------|
| 1    | MS        |                          | The MS is switched on and triggered to perform a GPRS attach. |
| 2    | MS -> SS  | PACKET CHANNEL REQUEST   | Received on PRACH                                             |
| 3    | SS -> MS  | PACKET UPLINK ASSIGNMENT | Sent on PAGCH                                                 |
| 4    |           | {GPRS attach procedure}  | Macro. Completion from step 4 in the attach procedure.        |

The test is repeated for BS\_PBCCH\_BLKs = 2 and BS\_PBCCH\_BLKs = 1

#### Specific message contents

As default messages contents, except:

BS\_PBCCH\_BLKs = 4

#### 42.1.2.1.13 Several PCCCHs supported by the cell

##### 42.1.2.1.13.1 Conformance requirements

The mobile station shall be able to store the frequency information for the PCCCH description corresponding to its own PCCCH\_GROUP (see subclause 11.2.19).

The mapping of the PCCCH\_GROUPS (numbered from 0 to KC - 1) starts with the lowest numbered PCCCH\_GROUP, which is mapped on the lowest numbered timeslot carrying PCCCH on the first (non-hopping or hopping) PCCCH carrier appearing in this construction. The next higher numbered PCCCH\_GROUP is mapped on the next (if any) higher numbered timeslot carrying PCCCH on the same carrier, and so on. When all timeslots carrying PCCCH on the first carrier have been used, the next higher numbered PCCCH\_GROUP is mapped on the lowest numbered timeslot carrying PCCCH on the next PCCCH carrier appearing in this construction, and so on. The highest numbered PCCCH\_GROUP is mapped on the highest numbered timeslot carrying PCCCH on the last PCCCH carrier appearing in this construction.

##### Reference

3GPP TS 04.60 subclauses 5.5.1.7 and 11.2.19.

##### 42.1.2.1.13.2 Test purpose

To verify that the mobile station reacts correctly when several timeslots are carrying PCCCH in the cell. As for a given frequency parameter, there are several PCCCH channels, the test validates that the mobile station well understood the number of PCCCH as well as the order from the timeslot allocation structure.

##### 42.1.2.1.13.3 Method of test

##### Initial conditions

System Simulator:

1 cell supporting GPRS. Packet system information PSI2 containing information on multiple PCCCH.

Mobile Station:

The MS is switched off. The SIM is updated to the test cell.

##### Related PICS/PIXIT statement

- Support GPRS service.
- Switch off on button Yes/No.
- Method of trigger GPRS attach.

##### Test procedure

The MS is switched on and triggered to perform a GPRS attach. The SS send a PACKET UPLINK ASSIGNMENT message containing frequency parameter information elements. The SS allows the MS to complete the GPRS attach procedure.

Maximum duration of the test

30 s.

Expected sequence

| Step | Direction | Message                  | Comments                                                                                                      |

## 42.1.2.2 Packet Downlink Assignment

### 42.1.2.2.1 Packet Downlink Assignment / Response to poll bit

#### 42.1.2.2.1.1 Conformance requirements

In case valid timing advance for the mobile station is not available, the network may use one of the following two methods to trigger the mobile station to transmit a PACKET CONTROL ACKNOWLEDGEMENT:

- if the PACKET DOWNLINK ASSIGNMENT message is not segmented and the CONTROL\_ACK\_TYPE parameter in the System Information indicates acknowledgement is access bursts, the network may set the poll bit in the PACKET DOWNLINK ASSIGNMENT message.
- if the PACKET DOWNLINK ASSIGNMENT message is segmented or the CONTROL\_ACK\_TYPE parameter in the System Information does not indicate acknowledgement is access bursts, the network may send PACKET POLLING REQUEST with TYPE\_OF\_ACK parameter set to access bursts (see subclause 11.2.12).

The mobile station shall always transmit the uplink radio block on the same timeslot as the block where the RRBP was received. After receiving an RLC/MAC block containing a valid RRBP field the mobile station need not monitor the USF in the associated downlink RLC/MAC block appearing just before the uplink block it shall transmit.

## Reference

3GPP TS 04.60 subclause 7.2.1.1 and 10.4.5.

## 42.1.2.2.1.2 Test purpose

To verify that the mobile station sends PACKET CONTROL ACKNOWLEDGEMENT as four access bursts if the network sets the poll bit in the PACKET DOWNLINK ASSIGNMENT message when CONTROL\_ACK\_TYPE is set to four access bursts.

## 42.1.2.2.1.3 Method of test

## Initial conditions

System Simulator:

1 cell supporting GPRS. The packet system information CONTROL\_ACK\_TYPE is set to indicate PACKET CONTROL ACKNOWLEDGEMENT format as four access bursts and the ACCESS\_BURST\_TYPE indicates 11 bit access.

Mobile Station:

The MS is GPRS attached and in packet idle mode and Ready state.

## Related PICS/PIXIT statement

Support GPRS service.

## Test procedure

The SS initiate a downlink data transfer. The SS sends PACKET DOWNLINK ASSIGNMENT message. The poll bit in the MAC header of the PACKET DOWNLINK ASSIGNMENT message will be set to indicate RRBP field is valid. The MS may delay the establishment of the downlink channels in order to answer the poll request on the common control channel. The SS verifies that the MS sends PACKET CONTROL ACKNOWLEDGEMENT as four access bursts on the timeslot on which it received the polling command.

## Maximum duration of the test

2 minutes.

## Expected sequence

| Step | Direction | Message                        | Comments                                                                                                                                  |
|------|-----------|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS        |                                | The SS initiate a downlink transfer of 200 octets data.                                                                                   |
| 2    | SS -> MS  | PACKET DOWNLINK ASSIGNMENT     | Poll bit in the MAC header is set to indicate a valid RRBP = 1. Sent on PCCCH.                                                            |
| 3    | MS -> SS  | PACKET CONTROL ACKNOWLEDGEMENT | As four access bursts. Received on PCCCH.                                                                                                 |
| 4    | SS        |                                | The SS verifies that the MS sends the PACKET CONTROL ACKNOWLEDGEMENT as four access bursts, one per TDMA frame of the uplink radio block. |

## Specific message contents

None.

## 42.1.2.2.2 Packet Downlink Assignment / PCCCH monitoring

### 42.1.2.2.2.1 Conformance requirements

A PACKET DOWNLINK ASSIGNMENT message may indicate an assignment starting time in the TBF Starting Time parameter. The mobile station shall monitor PCCCH until the point in time denoted by the TBF Starting Time. Thereafter it shall switch to the assigned PDCHs. If while monitoring the PCCCH the mobile station receives more than one PACKET DOWNLINK ASSIGNMENT message, it shall act upon the most recently received message and shall ignore the previous message.

### Reference

3GPP TS 04.60 subclause 7.2.1.1.

### 42.1.2.2.2.2 Test purpose

To verify that the mobile station monitors PCCCH until the point in time denoted by the TBF Starting Time.

To verify that the mobile station considers the most recently received PACKET DOWNLINK ASSIGNMENT message.

### 42.1.2.2.2.3 Method of test

### Initial conditions

System Simulator:

1 cell supporting GPRS. The packet system information ACCESS\_BURST\_TYPE indicates 8 bit access.

Mobile Station:

The MS is GPRS attached and in packet idle mode and Ready state.

### Related PICS/PIXIT statement

- Support of GPRS Yes/No.

### Test procedure

The SS initiate a downlink data transfer. The SS sends PACKET DOWNLINK ASSIGNMENT message to the MS with a TBF starting time. Then send a new PACKET DOWNLINK ASSIGNMENT message on PCCCH (within the paging group of the MS) with another TBF starting time and a different timeslot before the first starting time has occurred. The SS starts to send RLC/MAC data blocks according to the second PACKET DOWNLINK ASSIGNMENT message. The MS shall send PACKET DOWNLINK ACK/NACK message to indicate correct reception of data blocks.

### Maximum duration of the test

2 minutes.

### Expected sequence

| Step | Direction | Message                    | Comments                                                                                                    |
|------|-----------|----------------------------|-------------------------------------------------------------------------------------------------------------|
| 1    | SS        |                            | The SS initiate a downlink transfer of 200 octets data.                                                     |
| 2    | SS -> MS  | PACKET DOWNLINK ASSIGNMENT | See specific message contents. Sent on PCCCH.                                                               |
| 3    | SS -> MS  | PACKET DOWNLINK ASSIGNMENT | Sent 3 blocks before TBF starting time in step 2 has elapsed. See specific message contents. Sent on PCCCH. |
| 4    | SS -> MS  | DOWNLINK RLC DATA BLOCK    | SS sends data starting at frame as indicated by TBF starting time in step 3 on assigned PDTCH.              |
| 5    | MS -> SS  | PACKET DOWNLINK ACK/NACK   | Indicating correct reception of downlink data block. Received on PACCH.                                     |

Specific message contents

As default messages contents, except:

PACKET DOWNLINK ASSIGNMENT in step 2

#### 42.1.2.2.3 Packet Downlink Assignment / Frequency hopping

##### 42.1.2.2.3.1 Conformance requirements

The mobile station shall use information received on the PBCCH to decode the channel descriptions contained in the assignment. If frequency hopping is applied, the mobile station shall use the last CA received on PBCCH to decode the Mobile Allocation.

##### Reference

3GPP TS 04.60 subclause 7.2.1.1.

##### 42.1.2.2.3.2 Test purpose

To verify that, if frequency hopping is applied, the mobile station uses the last CA received on PBCCH to decode the Mobile Allocation.

To verify that, if frequency hopping is applied, indirect encoding, direct encoding 1 and direct encoding 2 worked as intend together with the information received on PBCCH.

##### 42.1.2.2.3.3 Method of test

##### Initial conditions

System Simulator:

1 cell supporting GPRS. PACKET SYSTEM INFORMATION Type 2 (PSI2) sent on PBCCH indicate frequency hopping parameters, see specific message contents.

Mobile Station:

The MS is GPRS attached and in packet idle mode.

##### Related PICS/PIXIT statement

Support GPRS service.

## Test procedure

The SS initiate a downlink data transfer. The SS send PACKET DOWNLINK ASSIGNMENT message indicating indirect encoding in frequency parameters. The SS shall start to transmit the downlink data to the MS. The MS and SS complete the downlink data transfer. The SS verifies that the MS use the last CA information received on PBCCH to decode the Mobile Allocation. Repeat the test with frequency parameters Direct encoding 1 and Direct encoding 2.

## Maximum duration of the test

5 minutes.

## Expected sequence

| Step | Direction | Message                          | Comments                                                                                      |

## 42.1.2.2.4 Packet Downlink Assignment / Response to Packet Polling

## 42.1.2.2.4.1 Conformance requirements

In case valid timing advance for the mobile station is not available, the network may use one of the following two methods to trigger the mobile station to transmit a PACKET CONTROL ACKNOWLEDGEMENT:

- if the PACKET DOWNLINK ASSIGNMENT message is not segmented and the CONTROL\_ACK\_TYPE parameter in the System Information indicates acknowledgement is access bursts, the network may set the poll bit in the PACKET DOWNLINK ASSIGNMENT message.
- if the PACKET DOWNLINK ASSIGNMENT message is segmented or the CONTROL\_ACK\_TYPE parameter in the System Information does not indicate acknowledgement is access bursts, the network may send PACKET POLLING REQUEST with TYPE\_OF\_ACK parameter set to access bursts (see subclause 11.2.12).

On receipt of a PACKET POLLING REQUEST message, the mobile station shall respond to the network with the PACKET CONTROL ACKNOWLEDGEMENT message in the block period specified by the RRBP field. If the MS has received a PACKET DOWNLINK ASSIGNMENT message with no starting time or with a starting time that has already elapsed, the PACKET POLLING REQUEST message shall be sent on PACCH. Otherwise the PACKET POLLING REQUEST message shall be sent on PAGCH.

## Reference

3GPP TS 04.60 subclauses 7.2.1.3 and 7.2.1.1.

## 42.1.2.2.4.2 Test purpose

To verify that on receipt of a PACKET POLLING REQUEST message, the mobile station responds with PACKET CONTROL ACKNOWLEDGEMENT message in the block period specified by the RRBP field.

## 42.1.2.2.4.3 Method of test

## Initial conditions

## System Simulator:

1 cell supporting GPRS. The packet system information CONTROL\_ACK\_TYPE is set to not indicate acknowledgement as four access bursts and ACCESS\_BURST\_TYPE indicate 8 bit access.

## Mobile Station:

The MS is GPRS attached and in packet idle mode and Ready state.

## Related PICS/PIXIT statement

- Support GPRS service.

## Test procedure

The SS initiate a downlink data transfer. The SS sends PACKET DOWNLINK ASSIGNMENT message to the MS with a TBF starting time. The SS sends a PACKET POLLING REQUEST message containing a valid RRBP field. The SS verifies that the MS sends a PACKET CONTROL ACKNOWLEDGEMENT message in the block period specified by the RRBP field. The SS sends PACKET PDCH RELEASE message to the MS. The SS initiate a downlink data transfer. The SS sends PACKET DOWNLINK ASSIGNMENT message to the MS without TBF starting time. The SS sends a PACKET POLLING REQUEST message containing a valid RRBP field. The SS verifies that the MS sends a PACKET CONTROL ACKNOWLEDGEMENT message in the block period specified by the RRBP field.

## Maximum duration of the test

5 minutes.

## Expected sequence

## 42.1.2.2.5 Packet Downlink Assignment / Abnormal cases

## 42.1.2.2.5.1 Packet Downlink Assignment / Abnormal cases / Incorrect PDCH assignment

## 42.1.2.2.5.1.1 Conformance requirements

If the mobile station has been assigned more PDCHs than it supports according to its MS multislot class, the mobile station shall return to packet idle mode.

## Reference

3GPP TS 04.60 subclause 7.2.2.

## 42.1.2.2.5.1.2 Test purpose

To verify that the mobile station return to packet idle mode if the mobile station is assigned more PDCHs than it supports according to its MS multislot class.

## 42.1.2.2.5.1.3 Method of test

## Initial conditions

System Simulator:

1 cell supporting GPRS.

Mobile Station:

The MS is GPRS attached and in packet idle mode and Ready state.

## Related PICS/PIXIT statement

- Support GPRS service.
- Multislot Class.

## Test procedure

Convert MS Multislot Class to number of downlink timeslot supported.

The SS initiated a downlink data transfer. The SS sends PACKET DOWNLINK ASSIGNMENT message containing one more assigned Rx than the MS supports according to its multislot class. The SS sends RLC data blocks. The SS verify that the MS not respond to the RLC data blocks sent by SS. Verify that the MS return to packet idle mode.

The SS sends PACKET DOWNLINK ASSIGNMENT message again containing correct multislot class. The SS starts to send RLC data blocks and the MS complete the downlink data transfer.

Maximum duration of the test

2 minutes.

Expected sequence

| Step | Direction | Message                    | Comments                                                                                             |
|------|-----------|----------------------------|------------------------------------------------------------------------------------------------------|
| 1    | SS        |                            | The SS initiate a downlink transfer of 200 octets data.                                              |
| 2    | SS -> MS  | PACKET DOWNLINK ASSIGNMENT | Assign one more Rx timeslot than the MS support. Sent on PCCCH.                                      |
| 3    | SS        |                            | Wait one block period.                                                                               |
| 4    | SS -> MS  | DOWNLINK RLC DATA BLOCK    | Sent on assigned PDTCHs.                                                                             |
| 5    | SS        |                            | Verify for 10 s that the MS not respond.                                                             |
| 6    | SS -> MS  | PACKET DOWNLINK ASSIGNMENT | Assign Rx timeslot according to the MS multislot class. Sent on PCCCH.                               |
| 7    | SS -> MS  | DOWNLINK RLC DATA BLOCK    | Sent on assigned PDTCHs with a valid RRBP field.                                                     |
| 8    | MS -> SS  | PACKET DOWNLINK ACK/NACK   | The SS verifies that the MS indicating correct reception of downlink data blocks. Received on PACCH. |

Specific message contents

None.

#### 42.1.2.2.5.2 Packet Downlink Assignment / Abnormal cases / Expiry of timer T3190

##### 42.1.2.2.5.2.1 Conformance requirements

When receiving the PACKET DOWNLINK ASSIGNMENT message and after waiting the TBF Starting Time when applicable, the mobile station starts timer T3190. The timer is reset when receiving the first valid RLC/MAC block.

On expiry of timer T3190, the mobile station shall return to packet idle mode.

Reference

3GPP TS 04.60 subclauses 7.2.1.1 and 7.2.2.

##### 42.1.2.2.5.2.2 Test purpose

To verify that the mobile station aborts the TBF and returns to packet idle mode if a valid RLC block is not received within the duration of timer T3190.

##### 42.1.2.2.5.2.3 Method of test

Initial conditions

System Simulator:

1 cell supporting GPRS. The packet system information ACCESS\_BURST\_TYPE indicates 8 bit access.

Mobile Station:

The MS is GPRS attached and in packet idle mode and Ready state.

## Related PICS/PIXIT statement

- Support GPRS service.

## Test procedure

The SS initiate a downlink data transfer. The SS sends PACKET DOWNLINK ASSIGNMENT message to the MS. The SS wait to send RLC data blocks for a time greater than timer T3190. The SS verifies that the MS not respond to the RLC data blocks sent by SS.

The SS reinitiate the sending of downlink data transfer. The SS sends PACKET DOWNLINK ASSIGNMENT message again and starts to send RLC data blocks after a time less than timer T3190. The MS shall complete the downlink data transfer.

## Maximum duration of the test

2 minutes.

## Expected sequence

| Step | Direction | Message                    | Comments                                                                                             |
|------|-----------|----------------------------|------------------------------------------------------------------------------------------------------|
| 1    | SS        |                            | The SS initiate a downlink transfer of 200 octets data.                                              |
| 2    | SS -> MS  | PACKET DOWNLINK ASSIGNMENT | Not indicating any TBF Starting Time. Sent on PCCCH.                                                 |
| 3    | SS        |                            | The SS waits timer T3190 + 0.1*T3190.                                                                |
| 4    | SS -> MS  | DOWNLINK RLC DATA BLOCK    | Sent on assigned PDTCHs.                                                                             |
| 5    | SS        |                            | Verify for 10 s that the MS not respond.                                                             |
| 6    | SS -> MS  | PACKET DOWNLINK ASSIGNMENT | Reinitiate the downlink data transfer. Sent on PCCCH.                                                |
| 7    | SS        |                            | The SS waits timer T3190 – 0.1*T3190.                                                                |
| 8    | SS -> MS  | DOWNLINK RLC DATA BLOCK    | Sent on assigned PDTCHs with a valid RRBP field.                                                     |
| 9    | MS -> SS  | PACKET DOWNLINK ACK/NACK   | Indicating correct reception of downlink data blocks. SS verifies that ACK/NACK is sent from the MS. |

## Specific message contents

### 42.1.3 Macro and default message contents

#### 42.1.3.1 Macro

In order to simplify the process of writing and coding test cases, macros are referenced in the expected signaling tables. These macros provide all additional signaling needed to complete the particular test but are not relevant to its purpose. This Macro is only applicable to test case in subclauses 42.1.1 and 42.1.2.

##### 42.1.3.1.1 GPRS attach procedure

The following table describes a signaling sequence performing the GPRS attach procedure when PCCCH is present. Note that there are different possible sequences implementing the GPRS attach procedure. In this case we use dynamic allocation and simultaneous uplink and downlink TBFs.

{GPRS attach procedure}

| Step | Direction | Message                                      | Comments                                                                                                         |
|------|-----------|----------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| 1    |           |                                              | MS is triggered to initiate the GPRS attach procedure.                                                           |
| 2    | MS -> SS  | PACKET CHANNEL REQUEST                       | Mobility Management procedure request.                                                                           |
| 3    | SS -> MS  | PACKET UPLINK ASSIGNMENT                     | Indicate dynamic allocation struct.                                                                              |
| 4    | SS -> MS  | PACKET DOWNLINK DUMMY CONTROL BLOCK          | Containing USF assigned to the MS.                                                                               |
| 5    | MS -> SS  | UPLINK RLC DATA BLOCK (GMM ATTACH REQUEST)   | Steps 4 & 5 are repeated until the MS has sent the complete GMM ATTACH REQUEST message.                          |
| 6    | SS -> MS  | PACKET UPLINK ACK/NACK                       | Containing Final Ack Indicator bit = 1, and valid RRBp field.                                                    |
| 7    | MS -> SS  | PACKET CONTROL ACKNOWLEDGEMENT               | Sent in the block assigned by the RRBp field in step 6.                                                          |
| 8    | SS -> MS  | PACKET DOWNLINK ASSIGNMENT                   | Assign a downlink TBF, "MAC mode" = dynamic allocation.                                                          |
| 9    | SS -> MS  | DOWNLINK RLC DATA BLOCKs (GMM ATTACH ACCEPT) | Containing USF assigned to the MS. Last block shall contain Final Block Indicator bit = 1, and valid RRBp field. |
| 10   | MS -> SS  | PACKET DOWNLINK ACK/NACK                     | Sent in the block assigned by the RRBp field in step 9.                                                          |
| 11   | MS -> SS  | PACKET CHANNEL REQUEST                       | Mobility Management procedure request.                                                                           |
| 12   | SS -> MS  | PACKET UPLINK ASSIGNMENT                     | Indicate dynamic allocation struct.                                                                              |
| 13   | SS -> MS  | PACKET DOWNLINK DUMMY CONTROL BLOCK          | Containing USF assigned to the MS.                                                                               |
| 14   | MS -> SS  | UPLINK RLC DATA BLOCKs (GMM ATTACH COMPLETE) |                                                                                                                  |
| 15   | SS -> MS  | PACKET UPLINK ACK/NACK                       | Containing Final Ack Indicator bit = 1, and valid RRBp field.                                                    |
| 16   | MS -> SS  | PACKET CONTROL ACKNOWLEDGEMENT               | Sent in the block assigned by the RRBp field in step 15.                                                         |

#### 42.1.3.1.2 Uplink data transfer, dynamic allocation

The following table describes a sequence performing uplink data transfer with one phase access dynamic allocation when PCCCH is present.

{Uplink data transfer, dynamic allocation}

| Step | Direction | Message                             | Comments                                                              |
|------|-----------|-------------------------------------|-----------------------------------------------------------------------|
| 1    |           |                                     | PDP context 2 has been established. The MS is triggered to send data. |
| 2    | MS -> SS  | PACKET CHANNEL REQUEST              |                                                                       |
| 3    | SS -> MS  | PACKET UPLINK ASSIGNMENT            | One phase access, dynamic allocation struct.                          |
| 4    | SS -> MS  | PACKET DOWNLINK DUMMY CONTROL BLOCK | Containing USF assigned to the MS.                                    |
| 5    | MS -> SS  | UPLINK RLC DATA BLOCK(S)            | If USF_GRANULARITY = four blocks, 4 RLC data block will be sent.      |
| 6    | SS -> MS  | PACKET UPLINK ACK/NACK              | Containing USF assigned to the MS.                                    |
| 7    | MS -> SS  | UPLINK RLC DATA BLOCK(S)            | If USF_GRANULARITY = four blocks, 4 RLC data block will be sent.      |
| 8    |           |                                     | Repeat step 6 and 7 until the countdown value CV=0 in step 7 .        |
| 9    | SS -> MS  | PACKET UPLINK ACK/NACK              | Final Ack Indicator = 1 containing valid RRBp.                        |
| 10   | MS -> SS  | PACKET CONTROL ACKNOWLEDGEMENT      |                                                                       |

#### 42.1.3.1.3 GPRS detach procedure

The following table describes a signalling sequence performing the GPRS detach procedure when PCCCH is present.

{GPRS detach procedure}

| Step | Direction | Message                                     | Comments                                                                  |
|------|-----------|---------------------------------------------|---------------------------------------------------------------------------|
| 1    | MS -> SS  | PACKET CHANNEL REQUEST                      | Indicate dynamic allocation struct.<br>Containing USF assigned to the MS. |
| 2    | SS -> MS  | PACKET UPLINK ASSIGNMENT                    |                                                                           |
| 3    | SS -> MS  | PACKET DOWNLINK DUMMY CONTROL BLOCK         |                                                                           |
| 4    | MS -> SS  | UPLINK RLC DATA BLOCKs (GMM DETACH REQUEST) | Containing Final Ack Indicator bit = 1, and valid RRBp field.             |
| 5    | SS -> MS  | PACKET UPLINK ACK/NACK                      |                                                                           |
| 6    | MS -> SS  | PACKET CONTROL ACKNOWLEDGEMENT              |                                                                           |

### 42.1.3.2 Default Messages

These default message contents override those specified in "GPRS default conditions" but messages specified in a test case have always the highest precedence.

#### 42.1.3.2.1 PACKET CHANNEL REQUEST message:

## 42.2 Fixed Allocation in Packet Transfer Mode

This subclause is applicable for all R97 and R98 MS supporting GPRS service.

### 42.2.1 Generic procedures to bring the MS into uplink transfer mode

For most test cases in subclause 42.2.2 the test starts when the MS is in packet uplink transfer mode. This subclause defines several generic test procedures to establish an uplink TBF and to bring the MS into the packet transfer mode. Fixed allocation MAC mode is used for the uplink RLC data block transfer.

Before one of the generic test procedures is used, it is necessary in a test to describe the way to trigger the MS for the relevant uplink access.

#### 42.2.1.1 One phase access

The tables below describe message exchanges which bring the MS into the packet uplink transfer mode with the one phase access procedure. In fixed allocation, the one phase access procedure always indicates an open-ended TBF, because the SS does not know how much data the MS intends to transfer.

**Table 42.2.1.1/1a: Generic procedure for MS entering uplink transfer mode, one phase access, fixed allocation, open-ended TBF (PBCCH present)**

| Step | Direction | Message                  | Comments                                                                                                                                                                                                     |
|------|-----------|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | MS -> SS  | PACKET CHANNEL REQUEST   | Received on PRACH. 11-bit, one phase access requested.                                                                                                                                                       |
| 2    | SS -> MS  | PACKET UPLINK ASSIGNMENT | Uplink fixed allocation. More than one block is allocated, which indicates open-ended TBF. Sent on PAGCH. The fixed allocation parameters are indicated in each test case which uses this generic procedure. |
| 3    | MS -> SS  | UPLINK RLC DATA BLOCK    | Received on the assigned PDTCH. Check that the coding is the scheme specified by TLLI_BLOCK_CHANNEL_CODING, the TFI is correct and the block contains TLLI.                                                  |
| 4    | SS -> MS  | PACKET UPLINK ACK/NACK   | With contention resolution TLLI, Sent on the PACCH of the PDCH assigned in step 2.                                                                                                                           |

**Table 42.2.1.1/1b: Generic procedure for MS entering uplink transfer mode, one phase access, fixed allocation, open-ended TBF (PBCCH not present)**

| Step | Direction | Message                | Comments                                                                                                                                                                                                    |
|------|-----------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | MS -> SS  | CHANNEL REQUEST        | Received on RACH. "One phase packet access with request for single timeslot uplink transmission" requested.                                                                                                 |
| 2    | SS -> MS  | IMMEDIATE ASSIGNMENT   | Uplink fixed allocation. More than one block is allocated, which indicates open-ended TBF. Sent on AGCH. The fixed allocation parameters are indicated in each test case which uses this generic procedure. |
| 3    | MS -> SS  | UPLINK RLC DATA BLOCK  | Received on the assigned PDTCH. Check that the coding is the scheme specified by TLLI_BLOCK_CHANNEL_CODING, the TFI is correct and the block contains TLLI.                                                 |
| 4    | SS -> MS  | PACKET UPLINK ACK/NACK | With contention resolution TLLI, Sent on the PACCH of the PDCH assigned in step 2.                                                                                                                          |

#### 42.2.1.2 Two phase access

The tables below describe message exchanges which bring the MS into the packet uplink transfer mode by two phase access procedure.

Note that the value of RLC\_OCTET\_COUNT in step 3 in each procedure is MS implementation dependent. Therefore, it is MS implementation dependent whether the TBF is open-ended or closed-ended.

Also, the MS may send additional PACKET RESOURCE REQUEST messages at any time after the initial PACKET UPLINK ASSIGNMENT. This is MS implementation dependent.

**Table 42.2.1.2/1a: Generic procedure for MS entering uplink transfer mode, two phase access, fixed allocation, open-ended uplink TBF (PBCCH present)**

| Step | Direction | Message                  | Comments                                                                                                                                                                                               |
|------|-----------|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | MS -> SS  | PACKET CHANNEL REQUEST   | Received on PRACH. 11-bit, two phase access requested.                                                                                                                                                 |
| 2    | SS -> MS  | PACKET UPLINK ASSIGNMENT | Single block assignment, to force the MS into a two phase access procedure. Sent on PAGCH.                                                                                                             |
| 3    | MS -> SS  | PACKET RESOURCE REQUEST  | Two phase access procedure. RLC_OCTET_COUNT = 0. Received on the single block assigned in step 2. Check that the PEAK_THROUGHPUT, RADIO_PRIORITY and RLC_MODE are compliant with the PDP context used. |
| 4    | SS -> MS  | PACKET UPLINK ASSIGNMENT | Open-ended uplink fixed allocation. Sent on PACCH of the same PDCH assigned in step 2. The fixed allocation parameters are indicated in each test case that uses this generic procedure.               |
| 5    | MS -> SS  | UPLINK RLC DATA BLOCK    | Received on the assigned PDTCH. Check that the coding is the scheme specified by CHANNEL_CODING_COMMAND in step 4, and the TFI is correct.                                                             |

**Table 42.2.1.2/1b: Generic procedure for MS entering uplink transfer mode, two phase access, fixed allocation, open-ended uplink TBF (PBCCH not present)**

| Step | Direction | Message                  | Comments                                                                                                                                                                                               |
|------|-----------|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | MS -> SS  | CHANNEL REQUEST          | Received on RACH. "Single block packet access; one block period on a PDCH is needed for two phase packet access" requested.                                                                            |
| 2    | SS -> MS  | IMMEDIATE ASSIGNMENT     | Single block assignment, to force the MS into a two phase access procedure. Sent on AGCH.                                                                                                              |
| 3    | MS -> SS  | PACKET RESOURCE REQUEST  | Two phase access procedure. RLC_OCTET_COUNT = 0. Received on the single block assigned in step 2. Check that the PEAK_THROUGHPUT, RADIO_PRIORITY and RLC_MODE are compliant with the PDP context used. |
| 4    | SS -> MS  | PACKET UPLINK ASSIGNMENT | Open-ended uplink fixed allocation. Sent on PACCH of the same PDCH assigned in step 2. The fixed allocation parameters are indicated in each test case that uses this generic procedure.               |
| 5    | MS -> SS  | UPLINK RLC DATA BLOCK    | Received on the assigned PDTCH. Check that the coding is the scheme specified by CHANNEL_CODING_COMMAND in step 4, and the TFI is correct.                                                             |

| 5    | MS -> SS  | UPLINK RLC DATA BLOCK    | Close-ended uplink fixed allocation, Sent on PACCH of the same PDCH assigned in step 2. The fixed allocation parameters are indicated in each test case that uses this generic procedure. |
|      |           |                          | Received on the assigned PDTCH. Check that the coding is the scheme specified by CHANNEL_CODING_COMMAND in step 4, and the TFI is correct.                                                |

## 42.2.2 Fixed Allocation / Uplink Transfer

### 42.2.2.1 Fixed Allocation / Uplink Transfer / Normal operation

#### 42.2.2.1.1 Fixed Allocation / Uplink Transfer / Normal operation / Blocks

##### 42.2.2.1.1.1 Definition and applicability

This test case applies to all Mobile Station supporting GPRS.

##### 42.2.2.1.1.2 Conformance Requirement

If the BLOCKS\_OR\_BLOCK\_PERIODS field indicates blocks, then the bits in the ALLOCATION\_BITMAP correspond to radio blocks. Bits are included in the bitmap only for radio blocks on assigned PDCHs. Each bit in the bitmap indicates whether the corresponding radio block is assigned to the fixed allocation. The mobile station shall transmit an RLC/MAC block in each radio block assigned by the ALLOCATION\_BITMAP.

## References

3GPP TS 04.60, subclauses 8.1.1.3.1 and 11.2.29.

## 42.2.2.1.1.3 Test purpose

To verify that when BLOCK\_OR\_BLOCK\_PERIODS field is 0 in the PACKET UPLINK ASSIGNMENT, the MS transmits RLC/MAC blocks strictly according to radio blocks allocated in ALLOCATION\_BITMAP array.

## 42.2.2.1.1.4 Method of test

## Initial Conditions

System Simulator:

1 cell, GPRS supported, PCCCH present

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 3 activated.

## Related PICS/PIXIT Statement(s)

- Support GPRS service.
- The way to initiate an uplink transfer.

## Test Procedure

MS is triggered to begin an uplink data transfer. Verify that the MS sends uplink RLC data blocks only in the blocks specified by the ALLOCATION\_BITMAP.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

| Step | Direction | Message                        | Comments                                                                                                                                                                                                                                                                 |
|------|-----------|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                                | Trigger the MS to initiate an uplink packet transfer containing 1000 octets.                                                                                                                                                                                             |
| 2    |           |                                | Bring the MS into packet uplink transfer mode by the generic procedure defined in the table 42.2.1.2/1a or 42.2.1.2/2a.                                                                                                                                                  |
| 3    | MS -> SS  | UPLINK RLC DATA BLOCK          | Received on the assigned PDTCH.                                                                                                                                                                                                                                          |
| 4    | SS        |                                | Repeat step 3 until CV=0. The MS may send a PACKET RESOURCE REQUEST message during the current allocation. The SS shall ignore the request. Verify MS is treating each bit in the ALLOCATION_BITMAP as a block, and only using timeslots allocated in ALLOCATION_BITMAP. |
| 5    | SS -> MS  | PACKET UPLINK ACK/NACK         | Containing valid RRBP. Sent on PACCH.                                                                                                                                                                                                                                    |
| 6    | MS -> SS  | PACKET CONTROL ACKNOWLEDGEMENT | Received on the block specified by RRBP on PACCH of the assigned PDCH.                                                                                                                                                                                                   |

## Specific Message Contents

PACKET UPLINK ASSIGNMENT message as part of macro in step 2:

|                                                                                                                             |                                                                                                         |

|---------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------|

#### 42.2.2.1.2 Fixed Allocation / Uplink Transfer / Normal operation / Block Periods

##### 42.2.2.1.2.1 Definition and applicability

Procedure 1 of this test case applies to all MSs supporting GPRS.

Procedure 2 of this test case applies to all MSs supporting GPRS except those MSs in multi-slot classes 1,2,4 or 8. Multi-slot classes 1, 2, 4, and 8 are untestable for part 2 because they have Tx = 1.

##### 42.2.2.1.2.2 Conformance requirements

If the BLOCKS\_OR\_BLOCK\_PERIODS field (=1) indicates block periods, then the bits in the bitmap indicate which block periods are assigned to the allocation. The mobile station shall transmit an RLC/MAC block on each timeslot assigned in the TIMESLOT\_ALLOCATION field in each block period assigned to the allocation.

#### References

3GPP TS 04.60, subclauses 8.1.1.3.1 and 11.2.29.

##### 42.2.2.1.2.3 Test purpose

Verify that when BLOCK\_OR\_BLOCK\_PERIODS parameter is set to 1, the MS transmits RLC/MAC blocks strictly according to timeslots allocated in TIMESLOT\_ALLOCATION array and block periods allocated in the ALLOCATION\_BITMAP array.

##### 42.2.2.1.2.4 Method of test

#### Initial Conditions

System Simulator:

1 cell, GPRS supported, PCCCH present.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 3 activated.

#### Related PICS/PIXIT Statement(s)

- Support GPRS service.
- The way to initiate an uplink transfer.

## Test Procedure

1. MS is triggered to begin an uplink data transfer. Verify that the MS sends uplink RLC data blocks only in the block periods specified by the ALLOCATION\_BITMAP.
2. MS is triggered to begin an uplink data transfer. Verify that the MS sends uplink RLC data blocks in each timeslot allocated to the MS in the TIMESLOT\_ALLOCATION, if the bit for this block period in the ALLOCATION\_BITMAP is set to 1.

## Maximum Duration of Test

5 minutes.

## Expected Sequence – Procedure 1

| Step | Direction | Message                        | Comments                                                                                                                                                                                                                                                                                                                      |
|------|-----------|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                                | Trigger the MS to initiate an uplink packet transfer containing 1000 octets.                                                                                                                                                                                                                                                  |
| 2    |           |                                | Bring the MS into packet uplink transfer mode by the generic procedure defined in the table 42.2.1.2/1a or 42.2.1.2/2a.                                                                                                                                                                                                       |
| 3    | MS -> SS  | UPLINK RLC DATA BLOCK          | Received on the assigned PDTCH. Check the TFI is correct.                                                                                                                                                                                                                                                                     |
| 4    | SS        |                                | Verify that step 3 is repeated until current allocation is exhausted. The MS may send a PACKET RESOURCE REQUEST message during the current allocation. The SS shall ignore the request. Verify MS is treating each bit in the ALLOCATION_BITMAP as a block period, and only using timeslots allocated in TIMESLOT_ALLOCATION. |
| 5    | SS -> MS  | PACKET UPLINK ACK/NACK         | Sent when current allocation is exhausted. Containing valid RRBP. Sent on PACCH.                                                                                                                                                                                                                                              |
| 6    | MS -> SS  | PACKET CONTROL ACKNOWLEDGEMENT | Received on the block specified by RRBP on PACCH of the assigned PDCH.                                                                                                                                                                                                                                                        |

## Expected Sequence – Procedure 2

| Step | Direction | Message                        | Comments                                                                                                                                                                                                                                                                                                                      |
|------|-----------|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                                | Trigger the MS to initiate an uplink packet transfer containing 1000 octets.                                                                                                                                                                                                                                                  |
| 2    |           |                                | Bring the MS into packet uplink transfer mode by the generic procedure defined in the table 42.2.1.2/1a or 42.2.1.2/2a.                                                                                                                                                                                                       |
| 3    | MS -> SS  | UPLINK RLC DATA BLOCK          | Received on the assigned PDTCH. Check the TFI is correct.                                                                                                                                                                                                                                                                     |
| 4    | SS        |                                | Verify that step 3 is repeated until current allocation is exhausted. The MS may send a PACKET RESOURCE REQUEST message during the current allocation. The SS shall ignore the request. Verify MS is treating each bit in the ALLOCATION_BITMAP as a block period, and only using timeslots allocated in TIMESLOT_ALLOCATION. |
| 5    | SS -> MS  | PACKET UPLINK ACK/NACK         | Sent when current allocation is exhausted. Containing valid RRBP. Sent on PACCH.                                                                                                                                                                                                                                              |
| 6    | MS -> SS  | PACKET CONTROL ACKNOWLEDGEMENT | Received on the block specified by RRBP on PACCH of the assigned PDCH.                                                                                                                                                                                                                                                        |

#### 42.2.2.2 Fixed Allocation / Uplink Transfer / Operation with TS\_OVERRIDE for single-slot TX

##### 42.2.2.2.1 Definition and applicability

This test case applies to all MSs supporting GPRS.

##### 42.2.2.2.2 Conformance requirements

The network may also specify a TS\_OVERRIDE indication in the PACKET UPLINK ACK/NACK. TS\_OVERRIDE applies to the next allocation after the current allocation expires. The TS\_OVERRIDE field is a bitmap with a bit corresponding to each timeslot. For each bit set in the TS\_OVERRIDE, the mobile shall disregard the ALLOCATION\_BITMAP for that timeslot and shall transmit on all uplink radio blocks for that timeslot for the duration of the next allocation. If a bit is not set in the TS\_OVERRIDE field, then the ALLOCATION\_BITMAP shall apply to that timeslot.

#### References

3GPP TS 04.60, subclause 8.1.1.3.2.2.

##### 42.2.2.2.3 Test purpose

To verify that this new allocation begins immediately after the current allocation ends and uses the most recently received ALLOCATION\_BITMAP in consultation with TS\_OVERRIDE as the following:

1. Until the next allocation begins, the mobile disregards the TS\_OVERRIDE field.
2. For each bit set in the TS\_OVERRIDE, the mobile disregards the ALLOCATION\_BITMAP for that timeslot and transmits on all uplink radio blocks for that timeslot for the duration of the next allocation.
3. If a bit is not set in the TS\_OVERRIDE field, then the ALLOCATION\_BITMAP applies to that timeslot.

## 42.2.2.2.4 Method of test

## Initial Conditions

## System Simulator:

1 cell, GPRS supported, PCCCH present.

## Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated and PDP context2 activated.

## Related PICS/PIXIT Statement(s)

- Support GPRS service.
- The way to trigger the MS to initiate an uplink packet transfer.

## Test Procedure

MS is triggered to begin an uplink data transfer. Verify that the MS sends uplink RLC data blocks only in the radio blocks specified by the ALLOCATION\_BITMAP. Network sends a repeat allocation with TS\_OVERRIDE corresponding to the assigned timeslot. Verify the MS finishes the current allocation as specified in the bitmap, then begins the new allocation with the application of TS\_OVERRIDE.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

| Step | Direction | Message                | Comments                                                                                                                                                                                                  |

| Fixed allocation<br>- TS_OVERRIDE | <8 bits, with only the bit corresponding to the assigned timeslot set to '1'> |
|-----------------------------------|-------------------------------------------------------------------------------|

### 42.2.2.3 Fixed Allocation / Uplink Transfer / Operation with TS\_OVERRIDE for multi-slot TX

#### 42.2.2.3.1 Definition and applicability

This test case applies to all MSs supporting GPRS except those MSs in multi-slot classes 1, 2, 4 or 8. Multi-slot classes 1, 2, 4, and 8 are not applicable for this test case because they have  $T_x = 1$ .

#### 42.2.2.3.2 Conformance requirements

The network may also specify a TS\_OVERRIDE indication in the PACKET UPLINK ACK/NACK. TS\_OVERRIDE applies to the next allocation after the current allocation expires. The TS\_OVERRIDE field is a bitmap with a bit corresponding to each timeslot. For each bit set in the TS\_OVERRIDE, the mobile shall disregard the ALLOCATION\_BITMAP for that timeslot and shall transmit on all uplink radio blocks for that timeslot for the duration of the next allocation. If a bit is not set in the TS\_OVERRIDE field, then the ALLOCATION\_BITMAP shall apply to that timeslot.

#### References

3GPP TS 04.60, subclause 8.1.1.3.2.2.

#### 42.2.2.3.3 Test purpose

To verify that this new allocation begins immediately after the old allocation ends and uses the most recently received ALLOCATION\_BITMAP in consultation with TS\_OVERRIDE as the following:

1. Until the next allocation begins, the mobile disregards the TS\_OVERRIDE field.
2. For each bit set in the TS\_OVERRIDE, the mobile disregards the ALLOCATION\_BITMAP for that timeslot and transmits on all uplink radio blocks for that timeslot for the duration of the next allocation.
3. If a bit is not set in the TS\_OVERRIDE field, then the ALLOCATION\_BITMAP applies to that timeslot.

## 42.2.2.3.4 Method of test

## Initial Conditions

## System Simulator:

1 cell, GPRS supported, PCCCH present.

## Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated and PDP context2 activated.

## Related PICS/PIXIT Statement(s)

- Support GPRS service.
- The way to trigger the MS to initiate an uplink packet transfer.

## Test Procedure

MS is triggered to begin an uplink data transfer on 2 timeslots. Verify that the MS sends uplink RLC data blocks only in the radio blocks specified by the ALLOCATION\_BITMAP. Network sends a repeat allocation with TS\_OVERRIDE corresponding to one of the assigned timeslots. Verify the MS finishes the current allocation as specified in the bitmap, then begins the new allocation with the application of TS\_OVERRIDE.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

#### 42.2.2.4 Fixed Allocation / Uplink Transfer / T3184 Expiry

##### 42.2.2.4.1 Definition and applicability

This test case applies to all MSs supporting GPRS.

##### 42.2.2.4.2 Conformance requirements

A mobile station operating with a fixed allocation shall start or restart timer T3184 upon reception of a PACKET UPLINK ACK/NACK message. If timer T3184 expires, the mobile station shall perform an abnormal release with cell re-selection.

[To perform abnormal release with cell re-selection] the mobile station shall abort all TBFs in progress. If access to another cell is allowed, i.e. the RANDOM\_ACCESS\_RETRY bit is set, the mobile station shall perform abnormal cell reselection (see 3GPP TS 05.08) and initiate establishment of an uplink TBF as defined in subclause 7.1 on the new cell. The mobile station shall not reselect back to the original cell for T\_RESEL seconds if another suitable cell is available. The parameters RANDOM\_ACCESS\_RETRY and T\_RESEL (default value 5 s) are broadcast in PSI 3.

If access to another cell is not allowed, i.e. the RANDOM\_ACCESS\_RETRY bit is not set, or if no neighbour cells are available, the mobile station shall go to the CCCH or PCCCH and report an RLC/MAC failure to the higher layer.

#### References

3GPP TS 04.60, subclauses 9.3.2.2 and 9.4.2.

##### 42.2.2.4.3 Test purpose

1. To verify that the mobile starts timer T3184 upon reception of PACKET UPLINK ACK/NACK message during the mobile's transmission if the timer is not running.
2. To verify that the mobile restarts timer T3184 upon reception of PACKET UPLINK ACK/NACK message during the mobile's transmission if the timer is running.
3. To verify that upon expiry of timer T3184, the mobile performs an abnormal release procedure with cell re-selection by initiating establishment of an uplink TBF on a new cell. (This is the case where RANDOM\_ACCESS\_RETRY bit is set.)

##### 42.2.2.4.4 Method of test

#### Initial Conditions

System Simulator:

2 cells, GPRS supported, PCCCH present, PBCCH present.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated and PDP context3 activated.

#### Related PICS/PIXIT Statement(s)

- Support GPRS service.
- The way to trigger the MS to initiate an uplink packet transfer.

#### Test Procedure

MS is triggered to begin an uplink data transfer. Periodic PACKET UPLINK ACK/NACK messages are sent to verify that the T3184 timer is restarted at the correct times, and to verify that when the T3184 timer expires, the MS performs an abnormal release with cell re-selection.

#### Maximum Duration of Test

5 minutes.

#### Expected Sequence

| Step | Direction | Message                | Comments                                                                                                                          |

#### 42.2.2.5 Fixed Allocation / Uplink Transfer / T3188

Applicability of T3188 tests:

All T3168 tests assigns a bit map that is long enough to guarantee that the MS will not return to idle mode before the test is finished.

The MS is supposed to send the PACKET RESOURCE REQUEST at the beginning of the allocation (during the first half of the allocation bitmap) see 3GPP TS 04.60 subclause 8.1.1.3.2.1

##### 42.2.2.5.1 Fixed Allocation / Uplink Transfer / T3188/Expiry

###### 42.2.2.5.1.1 Definition and applicability

This test case applies to all MSs supporting GPRS.

###### 42.2.2.5.1.2 Conformance requirements

If the mobile station exhausts its assigned fixed allocation and has more RLC data blocks to transmit, it shall start timer T3188 and monitor the downlink of all assigned PDCHs

If timer T3188 expires, the mobile station shall perform an abnormal release with random access (see subclause 8.7.2).

#### References

3GPP TS 04.60, subclause 8.1.1.3.2.3.

###### 42.2.2.5.1.3 Test purpose

Verify that when the current fixed allocation is exhausted, the MS starts T3188. Verify that if T3188 expires, the MS performs abnormal release with random access and not perform a cell reselection.

###### 42.2.2.5.1.4 Method of test

#### Initial Conditions

System Simulator:

2 cells, GPRS supported, PCCCH not present.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 3 activated.

## Related PICS/PIXIT Statement(s)

- Support GPRS service.
- The way to initiate an uplink transfer.

## Test Procedure

1. MS is triggered to begin an uplink data transfer.
2. T3188 expires and MS performs abnormal release with random access.

## Maximum Duration of Test

5 minutes.

## 42.2.2.5.2 Fixed Allocation / Uplink Transfer / T3188/Stop with Packet Uplink Assignment

## 42.2.2.5.2.1 Definition and applicability

This test case applies to all MSs supporting GPRS.

## 42.2.2.5.2.2 Conformance requirements

If the mobile station exhausts its assigned fixed allocation and has more RLC data blocks to transmit, it shall start timer T3188 and monitor the downlink of all assigned PDCHs. If the mobile station receives an assignment message containing a fixed allocation, the mobile station shall stop timer T3188 and use the new allocation at the assigned starting time.

42.2.2.5.3 Fixed Allocation / Uplink Transfer / T3188/Stop with Packet Uplink Ack/Nack with REPEAT\_ALLOCATION

42.2.2.5.3.1 Definition and applicability

This test case applies to all MSs supporting GPRS.

42.2.2.5.3.2 Conformance requirements

If the mobile station exhausts its assigned fixed allocation and has more RLC data blocks to transmit, it shall start timer T3188 and monitor the downlink of all assigned PDCHs.

If the mobile station receives a PACKET UPLINK ACK/NACK with a REPEAT ALLOCATION after its current allocation has been exhausted, it shall stop timer T3188, wait until the next repeated allocation boundary and then begin transmitting using the repeated ALLOCATION\_BITMAP.

References

3GPP TS 04.60, subclause 8.1.1.3.2.3.

## 42.2.2.5.3.3 Test purpose

Verify that when the current fixed allocation is exhausted, the MS starts T3188. Verify that T3188 is stopped when a PACKET UPLINK ACK/NACK with REPEAT\_ALLOCATION is received.

## 42.2.2.5.3.4 Method of test

## Initial Conditions

## System Simulator:

2 cells, GPRS supported, PCCCH not present.

## Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 3 activated.

## Related PICS/PIXIT Statement(s)

- Support GPRS service.
- The way to initiate an uplink transfer.

## Test Procedure

1. MS is triggered to begin an uplink data transfer. When the MS exhausts the current allocation, it shall start T3188.
2. When a Packet Uplink Ack/Nack with ALLOCATION\_BITMAP is received, verify that the MS uses the new allocation and stops T3188.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

#### 42.2.2.6 Fixed Allocation / Uplink Transfer / MS requests new resources/ T3168

##### Applicability of T3168 tests:

If the MS requests a closed-ended TBF, and does not send PACKET RESOURCE REQUEST at any time during the test, then the test is considered "passed" for that MS. However, a "pass" for one T3168 test should not be considered as a "pass" for all T3168 tests, as the MS operation is not constrained to one particular implementation method for all executions.

If the MS requests an open-ended TBF at the start of the test, then the test is applicable as written.

This applicability clause is necessary because it is MS implementation dependent whether to start the TBF in open-ended mode (where MS will send periodic PRRs), or in closed-ended mode (where the MS may optionally send a PRR to convert the TBF to open-ended mode). The purpose of T3168 is to test operation when the MS sends PRR and then waits for new uplink resources to be assigned. If the MS does not send a PRR, then T3168 is not applicable.

##### 42.2.2.6.1 Fixed Allocation / Uplink Transfer / MS requests new resources/ T3168/Expiry

###### 42.2.2.6.1.1 Definition and applicability

This test case applies to all MSs supporting GPRS.

###### 42.2.2.6.1.2 Conformance requirements

At sending of the PACKET RESOURCE REQUEST message, the mobile station shall start timer T3168.

On receipt of a PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message the mobile station shall stop timer T3168 and switch to the assigned PDCHs.

On expiry of timer T3168, the mobile station shall retransmit the PACKET RESOURCE REQUEST message unless the PACKET RESOURCE REQUEST message has already been transmitted four times in which case the mobile station shall perform an abnormal release with random access.

If no PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message is received before the mobile station has completed its currently assigned TBFs the mobile station shall stop timer T3168 and return to packet idle mode (listening to its paging channel).

On receipt of a PACKET ACCESS REJECT message, the mobile station shall stop timer T3168 if running and return to packet idle mode. Before initiating a new packet access procedure the mobile station shall decode the PRACH Control Parameters if they are broadcast.

## 42.2.2.6.1.3 Test purpose

Verify that when T3168 expires, the MS retransmits the PACKET RESOURCE REQUEST again (up to four times total). Verify that when T3168 expires after the fourth transmission of the PACKET RESOURCE REQUEST, that the MS performs abnormal release with random access.

## 42.2.2.6.1.4 Method of test

## Initial Conditions

## System Simulator:

1 cell, GPRS supported, PCCCH present.

## Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 2 activated.

## Related PICS/PIXIT Statement(s)

- Support GPRS service.
- The way to initiate an uplink transfer.

## Test Procedure

1. MS is triggered to begin an uplink data transfer and enters a open-ended TBF.
2. Before the current allocation expires, MS sends PACKET RESOURCE REQUEST.
3. When T3168 expires, MS resends PACKET RESOURCE REQUEST (up to 4 times)
4. When T3168 expires the fourth time, MS performs abnormal release with random access.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

| Step | Direction | Message                 | Comments                                                                                                           |
|------|-----------|-------------------------|--------------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                         | Trigger the MS to initiate an uplink packet transfer containing 2500 octets.                                       |
| 2    |           |                         | Bring the MS into packet uplink transfer mode by the generic procedure defined in the table 42.2.1.1/1a.           |
| 3    | MS -> SS  | RLC DATA BLOCKS         | MS transmits RLC blocks only when TBF starting time occurs                                                         |
| 4    | MS -> SS  | PACKET RESOURCE REQUEST | MS requests additional resources<br>- MS starts timer T3168                                                        |
| 5    | MS -> SS  | RLC DATA BLOCKS         | MS continues to transmit RLC data blocks according to allocation from step 2.                                      |
| 6    | MS -> SS  | PACKET RESOURCE REQUEST | MS requests additional resources<br>- This is sent T3168 seconds after previous PRR.<br>- MS re-starts timer T3168 |
| 7    |           |                         | Steps 5 and 6 are repeated 2 more times such that a total of 4 PRRs are sent.                                      |
| 8    | MS -> SS  | PACKET CHANNEL REQUEST  | Verify MS sends Random Access                                                                                      |

NOTE: the MS may not send PACKET CHANNEL REQUEST in step 8 (the first allocation is exhausted and the MS return to idle mode before expiry of T3168 the fourth time).

42.2.2.6.4 Fixed Allocation / Uplink Transfer / MS requests new resources/ T3168/Stop with Packet Access Reject

42.2.2.6.4.1 Definition and applicability

This test case applies to all MSs supporting GPRS.

42.2.2.6.4.2 Conformance requirements

At sending of the PACKET RESOURCE REQUEST message, the mobile station shall start timer T3168.

On receipt of a PACKET ACCESS REJECT message, the mobile station shall stop timer T3168 if running and indicate a packet access failure to upper layer.

Upon receipt of a PACKET ACCESS REJECT message, the mobile station shall stop timer T3188, if running, release the TBF using the procedures in 9.3.2.3 or 9.3.3.3, such that the countdown ends within the current allocation. Then, if the mobile station has additional RLC data blocks to transfer, it shall initiate a new establishment procedure on the RACH or PRACH, or using a PACKET DOWNLINK ACK/NACK if during a downlink TBF.

#### References

3GPP TS 04.60, subclauses 8.1.1.3.2, 8.1.1.3.2.4 and 12.24.

42.2.2.6.4.3 Test purpose

Verify that when PACKET ACCESS REJECT is received, the MS does not complete the current allocation.

42.2.2.6.4.4 Method of test

#### Initial Conditions

System Simulator:

1 cell, GPRS supported, PCCCH present.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 2 activated.

#### Related PICS/PIXIT Statement(s)

- Support GPRS service.
- The way to initiate an uplink transfer.

Test Procedure

1. MS is triggered to begin an uplink data transfer and enters a open-ended TBF.
2. Before the current allocation expires, MS sends PACKET RESOURCE REQUEST.
3. Prior to T3168 expiring, MS receives a PACKET ACCESS REJECT.
4. MS finishes the countdown procedure before the end of the current allocation.

Maximum Duration of Test

5 minutes.

Expected Sequence

| Step | Direction | Message                 | Comments                                                                                                        |

42.2.2.6.5 Fixed Allocation / Uplink Transfer / MS requests new resources/ T3168/Continue with Packet Uplink Ack/Nack without REPEAT\_ALLOCATION and without ALLOCATION\_BITMAP

42.2.2.6.5.1 Definition and applicability

This test case applies to all MSs supporting GPRS.

42.2.2.6.5.2 Conformance requirements

At sending of the PACKET RESOURCE REQUEST message, the mobile station shall start timer T3168.

On expiry of timer T3168, the mobile station shall retransmit the PACKET RESOURCE REQUEST message unless the PACKET RESOURCE REQUEST message has already been transmitted four times in which case the mobile station shall perform an abnormal release with random access.

#### References

3GPP TS 04.60, subclauses 8.1.1.3.2 and 12.24.

#### 42.2.2.6.5.3 Test purpose

Verify that when MS receives a PACKET UPLINK ACK/NACK without an allocation, T3168 continues to run, and then expires, causing the MS to transmit the PACKET RESOURCE REQUEST again.

#### 42.2.2.6.5.4 Method of test

#### Initial Conditions

System Simulator:

1 cell, GPRS supported, PCCCH present.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 2 activated.

#### Related PICS/PIXIT Statement(s)

- Support GPRS service.
- The way to initiate an uplink transfer.

#### Test Procedure

1. MS is triggered to begin an uplink data transfer and enters a open-ended TBF.
2. Before the current allocation expires, MS sends PACKET RESOURCE REQUEST.
3. MS receives a PACKET UPLINK ACK/NACK with no REPEAT\_ALLOCATION and no ALLOCATION\_BITMAP. When T3168 expires, MS resends PACKET RESOURCE REQUEST.

#### Maximum Duration of Test

5 minutes.

#### 42.2.2.7.2 Fixed Allocation / Uplink Transfer / MS requests new resources/ Successful/Multiple Packet Uplink Assignments

##### 42.2.2.7.2.1 Definition and applicability

This test case applies to all MSs supporting GPRS.

##### 42.2.2.7.2.2 Conformance requirements

Upon receipt of a complete uplink assignment containing an ALLOCATION\_BITMAP, the mobile station shall begin transmitting on the new resources at the indicated TBF Starting Time. If there is a conflict between a previous allocation and the new allocation, the new allocation shall take precedence.

#### References

3GPP TS 04.60, subclause 8.1.1.3.2.2.

##### 42.2.2.7.2.3 Test purpose

Verify that when the new PACKET UPLINK ASSIGNMENT is received, MS switches to new resources at the starting time if there is a conflict with the current assignment.

##### 42.2.2.7.2.4 Method of test

#### Initial Conditions

System Simulator:

1 cell, GPRS supported, PCCCH present.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 2 activated.

#### Related PICS/PIXIT Statement(s)

- Support GPRS service.
- The way to initiate an uplink transfer.

#### Test Procedure

1. MS is triggered to begin an uplink data transfer and enters a open-ended TBF.
2. Before the current allocation expires, MS sends PACKET RESOURCE REQUEST.
3. MS receives a PACKET UPLINK ASSIGNMENT with starting time prior to the end of the current allocation.

#### Maximum Duration of Test

5 minutes.

42.2.2.7.3 Fixed Allocation / Uplink Transfer / MS requests new resources/  
Successful/Packet Uplink Ack/Nack with ALLOCATION\_BITMAP

42.2.2.7.3.1 Definition and applicability

This test case applies to all MSs supporting GPRS.

42.2.2.7.3.2 Conformance requirements

Upon receipt of the PACKET RESOURCE REQUEST or PACKET DOWNLINK ACK/NACK with a Channel Request Description IE, the network shall continue the TBF by sending a PACKET UPLINK ASSIGNMENT or PACKET UPLINK ACK/NACK containing a fixed allocation to the mobile station, or shall end the TBF by sending a PACKET ACCESS REJECT message. Alternatively, the network may end the TBF by sending an uplink assignment containing a fixed allocation with the FINAL\_ALLOCATION bit set to 1.

Upon receipt of a uplink assignment containing an ALLOCATION\_BITMAP, the mobile station shall begin transmitting on the new resources at the indicated TBF Starting Time. If there is a conflict between a previous allocation and the new allocation, the new allocation shall take precedence.

## References

3GPP TS 04.60, subclause 8.1.1.3.2.2.

### 42.2.2.7.3.3 Test purpose

Verify that the MS uses the new ALLOCATION\_BITMAP from the PACKET UPLINK ACK/NACK message.

### 42.2.2.7.3.4 Method of test

## Initial Conditions

System Simulator:

1 cell, GPRS supported, PCCCH present.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 2 activated.

## Related PICS/PIXIT Statement(s)

- Support GPRS service.
- The way to initiate an uplink transfer.

## Test Procedure

1. MS is triggered to begin an uplink data transfer and enters a open-ended TBF.
2. Before the current allocation expires, MS sends PACKET RESOURCE REQUEST.
3. After the current allocation expires, MS receives a new allocation in a PACKET UPLINK ACK/NACK.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

| Step | Direction | Message                 | Comments                                                                                                                                                                                              |
|------|-----------|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                         | Trigger the MS to initiate an uplink packet transfer containing 1500 octets.                                                                                                                          |
| 2    |           |                         | Bring the MS into packet uplink transfer mode by the generic procedure defined in the table 42.2.1.1/1a.                                                                                              |
| 3    | MS -> SS  | RLC DATA BLOCKS         | MS transmits RLC blocks only when TBF starting time occurs                                                                                                                                            |
| 4    | MS -> SS  | PACKET RESOURCE REQUEST | MS requests additional resources (can come at any time during the allocation)                                                                                                                         |
| 5    | MS -> SS  | RLC DATA BLOCKS         | MS continues to transmit RLC data blocks according to allocation from step 2, until current allocation is exhausted.                                                                                  |
| 6    | SS -> MS  | PACKET UPLINK ACK/NACK  | Sent 1 second after step 4, with new ALLOCATION_BITMAP.                                                                                                                                               |
| 7    | MS        |                         | MS starts to use the new allocation from step 6 at the indicated TBF Starting Time. The MS may send a PACKET RESOURCE REQUEST message during the current allocation. The SS shall ignore the request. |

#### 42.2.2.7.4 Fixed Allocation / Uplink Transfer / MS requests new resources/ Successful/Multiple Packet Uplink Ack/Nack with ALLOCATION\_BITMAP

##### 42.2.2.7.4.1 Definition and applicability

This test case applies to all MSs supporting GPRS.

##### 42.2.2.7.4.2 Conformance requirements

Upon receipt of a PACKET UPLINK ACK/NACK with a REPEAT\_ALLOCATION, the mobile station shall start a new allocation when the current allocation ends. This new allocation shall begin immediately after the current allocation ends and shall use the most recently received ALLOCATION\_BITMAP. If the mobile station receives multiple PACKET UPLINK ACK/NACK messages with REPEAT\_ALLOCATION during an allocation, the mobile shall repeat the ALLOCATION\_BITMAP only once.

#### References

3GPP TS 04.60, subclause 8.1.1.3.2.2.

##### 42.2.2.7.4.3 Test purpose

Verify that the MS uses the ALLOCATION\_BITMAP currently being used as the allocation bitmap that applies to the REPEAT\_ALLOCATION.

##### 42.2.2.7.4.4 Method of test

#### Initial Conditions

System Simulator:

1 cell, GPRS supported, PCCCH present.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 2 activated.

#### Related PICS/PIXIT Statement(s)

- Support GPRS service.
- The way to initiate an uplink transfer.

## Test Procedure

1. MS is triggered to begin an uplink data transfer and enters a open-ended TBF.
2. Before current allocation expires, MS sends PACKET RESOURCE REQUEST.
3. MS receives a series of PACKET UPLINK ACK/NACK messages before the current allocation expires, containing a new allocation, followed by a repeat allocation, followed by a different new allocation, followed by a repeat allocation.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

## 42.2.2.8 Fixed Allocation / Uplink Transfer / MS requests new resources/ Failure

## 42.2.2.8.1 Fixed Allocation / Uplink Transfer / MS requests new resources/ Failure/Packet Access Reject

## 42.2.2.8.1.1 Definition and applicability

This test case applies to all MSs supporting GPRS.

## 42.2.2.8.1.2 Conformance requirements

On receipt of a PACKET ACCESS REJECT message , the mobile station shall stop timer T3168 if running and indicate a packet access failure to upper layer.

## References

3GPP TS 04.60, subclause 8.1.1.3.2.

## 42.2.2.8.1.3 Test purpose

Verify that the MS returns to packet idle mode when PACKET ACCESS REJECT is received.

## 42.2.2.8.1.4 Method of test

## Initial Conditions

System Simulator:

1 cell, GPRS supported, PCCCH not present.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 2 activated.

## Related PICS/PIXIT Statement(s)

- Support GPRS service.
- The way to initiate an uplink transfer.

## Test Procedure

1. MS is triggered to begin an uplink data transfer and enters a open-ended TBF.
2. Before current allocation expires, MS sends PACKET RESOURCE REQUEST.
3. After the current allocation expires, MS receives a PACKET ACCESS REJECT message.
4. MS returns to packet idle mode.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

| Step | Direction | Message                 | Comments                                                                                                 |
|------|-----------|-------------------------|----------------------------------------------------------------------------------------------------------|
| 1    | MS        |                         | Trigger the MS to initiate an uplink packet transfer containing 1000 octets.                             |
| 2    |           |                         | Bring the MS into packet uplink transfer mode by the generic procedure defined in the table 42.2.1.1/1b. |
| 3    | MS -> SS  | RLC DATA BLOCKS         | MS transmits RLC blocks only when TBF starting time occurs                                               |
| 4    | MS -> SS  | PACKET RESOURCE REQUEST | MS requests additional resources                                                                         |
| 5    | SS -> MS  | PACKET ACCESS REJECT    |                                                                                                          |
| 6    | MS -> SS  | RLC DATA BLOCKS         | MS sends not later than 6 radio blocks after step 5.                                                     |
| 7    | SS        |                         | Verify that MS is not transmitting on the previous PDCH.                                                 |

#### 42.2.2.8.2 Fixed Allocation / Uplink Transfer / MS requests new resources/ Failure/ Packet Access Reject with WAIT\_INDICATION during allocation in progress

##### 42.2.2.8.2.1 Definition and applicability

This test case applies to all MSs supporting GPRS.

##### 42.2.2.8.2.2 Conformance requirements

If the PACKET ACCESS REJECT message contains a WAIT\_INDICATION field in a Reject structure addressed to the mobile station, the mobile station shall

- start timer T3172 and if the mobile station has additional RLC data blocks to transmit, it shall initiate a new TBF establishment procedure on the RACH or PRACH, but the mobile station is not allowed to make a new attempt for packet access in the same cell until timer T3172 expires, it may, however, attempt packet access in an other cell after successful cell reselection. A mobile station in GPRS MS class A or B mode of operation may attempt to enter the dedicated mode in the same cell before timer T3172 has expired. During the time T3172 is running, the mobile station shall ignore all received PACKET PAGING REQUEST messages except paging request to trigger RR connection establishment.

The value of the WAIT\_INDICATION field (i.e. timer T3172) relates to the cell from which it was received.

#### References

3GPP TS 04.60, subclause 8.1.1.3.2.

##### 42.2.2.8.2.3 Test purpose

Verify that the MS waits T3172 before sending additional PACKET RESOURCE REQUEST messages, when PACKET ACCESS REJECT is received with a WAIT\_INDICATION.

##### 42.2.2.8.2.4 Method of test

#### Initial Conditions

System Simulator:

1 cell, GPRS supported, PCCCH present.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 2 activated.

#### Related PICS/PIXIT Statement(s)

- Support GPRS service.
- The way to initiate an uplink transfer.

## Test Procedure

1. MS is triggered to begin an uplink data transfer and enters a open-ended TBF.
2. Before current allocation expires, MS sends PACKET RESOURCE REQUEST.
3. Before the current allocation expires, MS receives a PACKET ACCESS REJECT message.
4. MS waits T3172 before sending additional PACKET RESOURCE REQUEST messages.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

| Step | Direction | Message                 | Comments                                                                                                 |
|------|-----------|-------------------------|----------------------------------------------------------------------------------------------------------|
| 1    | MS        |                         | Trigger the MS to initiate an uplink packet transfer containing 2500 octets.                             |
| 2    |           |                         | Bring the MS into packet uplink transfer mode by the generic procedure defined in the table 42.2.1.1/1a. |

| WAIT_INDICATION_SIZE | 0 – WAIT_INDICATION in units of seconds |

### 42.2.2.9 Fixed Allocation / Uplink Transfer / Network initiates new resources

#### 42.2.2.9.1 Definition and applicability

This test case applies to all MSs supporting GPRS.

#### 42.2.2.9.2 Conformance requirements

The network may at any time during the uplink TBF initiate a change of resources by sending on the downlink PACCH monitored by the MS, an unsolicited PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE, or an uplink resource reassignment in a PACKET UPLINK ACK/NACK message to the mobile station.

## References

3GPP TS 04.60, subclause 8.1.1.3.2.

## 42.2.2.9.3 Test purpose

Verify that the MS obeys unsolicited PACKET UPLINK ASSIGNMENT message during an uplink TBF.

## 42.2.2.9.4 Method of test

## Initial Conditions

System Simulator:

1 cell, GPRS supported, PCCCH not present.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 3 activated.

## Related PICS/PIXIT Statement(s)

- Support GPRS service.
- The way to initiate an uplink transfer.

## Test Procedure

1. MS is triggered to begin an uplink data transfer and enters a open-ended TBF.
2. Before current allocation expires, SS sends unsolicited PACKET UPLINK ASSIGNMENT.
3. After the current allocation expires, MS uses the newly assigned resources.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

| Step | Direction | Message                  | Comments                                                                                                         |
|------|-----------|--------------------------|------------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                          | Trigger the MS to initiate an uplink packet transfer containing 1500 octets.                                     |
| 2    |           |                          | Bring the MS into packet uplink transfer mode by the generic procedure defined in the table 42.2.1.2/1b.         |
| 3    | MS -> SS  | RLC DATA BLOCK           | MS transmits RLC block only when TBF starting time occurs                                                        |
| 4    | MS -> SS  | RLC DATA BLOCKS          | MS continues to transmit RLC data blocks according to allocation from step 2.                                    |
| 4A   | MS -> SS  | PACKET RESOURCE REQUEST  | Optional: MS may request new resources. If this occurs, SS proceeds with step 4B.                                |
| 4B   | SS -> MS  | PACKET UPLINK ASSIGNMENT | Assign uplink resources in response to MS request.                                                               |
| 5    | SS -> MS  | PACKET UPLINK ASSIGNMENT | Unsolicited – sent on PACCH. Different from step 4B.                                                             |
| 6    | MS -> SS  | RLC DATA BLOCK           | MS continues to transmit RLC data blocks according to allocation from step 2, until the allocation is exhausted. |
| 7    | MS -> SS  | RLC DATA BLOCK           | MS starts to use the new allocation from step 5 at the given starting time.                                      |

## Specific Message Contents

#### 42.2.2.10 Fixed Allocation / Uplink Transfer / PACCH operation

##### 42.2.2.10.1 Fixed Allocation / Uplink Transfer / PACCH operation/ Normal Operation

###### 42.2.2.10.1.1 Definition and applicability

This test case applies to all MSs supporting GPRS multi-slot class 3 and higher.

###### 42.2.2.10.1.2 Conformance requirements

A mobile station shall monitor one PDCH in the allocation for downlink PACCH except during the measurement gap. The network shall indicate that PDCH on uplink resource assignment (DOWNLINK\_CONTROL\_TIMESLOT parameter) according to MS multislot class.

#### References

3GPP TS 04.60, subclause 8.1.1.3.4 and annex D.

3GPP TS 05.02, clause B.1.

###### 42.2.2.10.1.3 Test purpose

Verify that the MS monitors the correct PDCH for PACCH during an uplink TBF.

###### 42.2.2.10.1.4 Method of test

#### Initial Conditions

System Simulator:

1 cell, GPRS supported, PCCCH not present.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 3 activated.

#### Related PICS/PIXIT Statement(s)

- Support GPRS service.

- The way to initiate an uplink transfer.

### Test Procedure

1. MS is triggered to begin an uplink data transfer and enters a open-ended TBF on 2 timeslots.
2. MS receives PACKET POLLING REQUEST on the PDCH corresponding to its downlink PACCH.
3. MS responds to the poll by sending PACKET CONTROL ACKNOWLEDGEMENT.

### Maximum Duration of Test

5 minutes.

### Expected Sequence

| Step | Direction | Message                        | Comments                                                                                                         |
|------|-----------|--------------------------------|------------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                                | Trigger the MS to initiate an uplink packet transfer containing 1000 octets.                                     |
| 2    |           |                                | Bring the MS into packet uplink transfer mode by the generic procedure defined in the table 42.2.1.2/1b.         |
| 3    | MS -> SS  | RLC DATA BLOCK                 | MS transmits RLC block only when TBF starting time occurs                                                        |
| 4    | MS -> SS  | RLC DATA BLOCK                 | MS continues to transmit RLC data blocks according to allocation from step 2.                                    |
| 5    | SS -> MS  | PACKET POLLING REQUEST         | Sent on PACCH, PDCH 0.                                                                                           |
| 6    | MS -> SS  | PACKET CONTROL ACKNOWLEDGEMENT | Sent in next but two block (N + 13) after step 5, on PDCH 0.                                                     |
| 7    | MS -> SS  | RLC DATA BLOCKS                | MS continues to transmit RLC data blocks according to allocation from step 2, until the allocation is exhausted. |

### Specific Message Contents

PACKET UPLINK ASSIGNMENT message in step 2:

|                             |                                 |
|-----------------------------|---------------------------------|
| Fixed allocation            |                                 |
| - TIMESLOT ALLOCATION       | Two timeslot assigned (0 and 1) |
| - BLOCKS_OR_BLOCK_PERIODS   | 0 – blocks                      |
| - ALLOCATION_BITMAP_LENGTH  | <any suitable value >           |
| - ALLOCATION_BITMAP         | Exactly 40 bits are set to 1.   |
| - DOWNLINK_CONTROL_TIMESLOT | 000                             |

PACKET POLLING REQUEST message in step 5:

|             |                                        |

### 42.2.2.10.3 Fixed Allocation/ Uplink Transfer / Abnormal cases / PACCH timeslot removed

#### 42.2.2.10.3.1 Definition and applicability

This test case applies to all MSs supporting GPRS multi-slot class 3 and higher.

#### 42.2.2.10.3.2 Conformance requirements

If an uplink TBF in fixed allocation mode was in progress and if one of timeslots that are being released is its downlink PACCH timeslot, the mobile station shall temporarily read all downlink blocks that it is able to decode according to its multislot capability, on all of its remaining assigned PDCHs, and act upon any RLC/MAC control message that is addressed to it, until another downlink PACCH timeslot is assigned. If the mobile station's multislot capability does not allow it to monitor the downlink of any of its assigned PDCHs, it shall perform an abnormal release with random access.

#### References

3GPP TS 04.60, subclause 8.2.

3GPP TS 05.02, clause B.1.

#### 42.2.2.10.3.3 Test purpose

Verify that the MS monitors the correct PDCH for PACCH during an uplink TBF after the previously assigned downlink PACCH timeslot is released.

## 42.2.2.10.3.4 Method of test

## Initial Conditions

## System Simulator:

1 cell, GPRS supported, PCCCH not present.

## Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 3 activated.

## Related PICS/PIXIT Statement(s)

- Support GPRS service.
- The way to initiate an uplink transfer.

## Test Procedure

1. MS is triggered to begin an uplink data transfer (via CCCH) and enters a open-ended TBF on 2 timeslots, with one timeslot assigned for its downlink PACCH.
2. MS receives PACKET PDCH RELEASE message on its assigned PACCH.
3. MS receives PACKET POLLING REQUEST on the PDCH that was just released, corresponding to its downlink PACCH.
4. MS does not respond to the poll.
5. MS receives PACKET POLLING REQUEST on another downlink PDCH to which it is assigned.
6. MS responds to the poll.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

| Step | Direction | Message                        | Comments                                                                                                                                                                                     |

#### 42.2.2.11 Fixed Allocation/ Uplink Transfer / Abnormal cases

##### 42.2.2.11.1 Fixed Allocation/ Uplink Transfer / Abnormal cases / Assignment without fixed allocation

###### 42.2.2.11.1.1 Definition and applicability

This test case applies to all MSs supporting GPRS.

###### 42.2.2.11.1.2 Conformance requirements

If the mobile station receives an assignment message containing an allocation other than a fixed allocation, the mobile station shall perform an abnormal release with random access.

#### References

3GPP TS 04.60, subclause 8.1.1.3.2.5.

###### 42.2.2.11.1.3 Test purpose

Verify that an MS in a fixed allocation uplink transfer performs an abnormal release with random access when an assignment message without a fixed allocation is received.

###### 42.2.2.11.1.4 Method of test

#### Initial Conditions

System Simulator:

2 cells, GPRS supported, PCCCH not present.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 3 activated.

Related PICS/PIXIT Statement(s)

- Support GPRS service.
- The way to initiate an uplink transfer.

Test Procedure

1. MS is triggered to begin an uplink data transfer (via CCCH) and enters a fixed allocation open-ended TBF.
2. Before the current allocation expires, MS sends PACKET RESOURCE REQUEST.
3. Prior to T3168 expiring, MS receives a new allocation containing dynamic allocation.
4. MS performs an abnormal release with random access.

Maximum Duration of Test

5 minutes.

Expected Sequence

42.2.2.11.2 Fixed Allocation/ Uplink Transfer / Abnormal cases / Frequency not supported

42.2.2.11.2.1 Definition and applicability

This test case applies to all MSs supporting GPRS.

#### 42.2.2.11.2.2 Conformance requirements

If the mobile station receives a PACKET UPLINK ASSIGNMENT message containing a Frequency Parameters information element specifying a frequency that is in a frequency band not supported by the mobile station then the mobile station shall perform an abnormal release with random access.

#### References

3GPP TS 04.60, subclause 8.1.1.1.2.1.

#### 42.2.2.11.2.3 Test purpose

Verify that an MS in a fixed allocation uplink transfer performs an abnormal release with random access when an assignment message specifying an unsupported frequency is received.

#### 42.2.2.11.2.4 Method of test

#### Initial Conditions

System Simulator:

2 cells, GPRS supported, PCCCH not present.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 3 activated.

#### Related PICS/PIXIT Statement(s)

- Support GPRS service.
- The way to initiate an uplink transfer.

#### Test Procedure

1. MS is triggered to begin an uplink data transfer (via CCCH) and enters a fixed allocation open-ended TBF.
2. Before the current allocation expires, MS sends PACKET RESOURCE REQUEST.
3. Prior to T3168 expiring, MS receives a new allocation containing Frequency Parameters IE with frequency not supported by the MS.
4. MS performs an abnormal release with random access.

#### Maximum Duration of Test

5 minutes.

## 42.2.2.11.3 Fixed Allocation/ Uplink Transfer / Abnormal cases / Invalid MA\_NUMBER

## 42.2.2.11.3.1 Definition and applicability

This test case applies to all MSs supporting GPRS.

## 42.2.2.11.3.2 Conformance Requirement

If a mobile station receives a PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message and detects an invalid Frequency Parameters information element in the message, it shall perform an abnormal release. If PCCCH is present in the cell the mobile station shall perform an abnormal release with system information (see subclause 8.7.3).

The MA\_NUMBER shall use the following coding:

MA\_NUMBER = 0–13 shall be used to reference a GPRS mobile allocation received in a PSI2 message;

MA\_NUMBER = 14 shall be used to reference a GPRS mobile allocation received in a SI13 or PSI13 message;

MA\_NUMBER = 15 shall be used to reference a GPRS mobile allocation received in a previous assignment message using the direct encoding.

## References

3GPP TS 04.60, subclauses 8.1.1.3.2.5 and 5.5.1.7.

## 42.2.2.11.3.3 Test purpose

Verify that an MS in a fixed allocation uplink transfer performs an abnormal release with random access when an assignment message specifying an invalid MA\_NUMBER as part of the Frequency Parameters IE is received.

## 42.2.2.11.3.4 Method of test

## Initial Conditions

## System Simulator:

2 cells, GPRS supported, PCCCH not present, no PSI2 broadcast in the cell.

## Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, and PDP context 3 activated.

## Related PICS/PIXIT Statement(s)

- Support GPRS service.

## 42.2.3 Fixed Allocation / Uplink Transfer with Downlink TBF Establishment

### 42.2.3.1 Fixed Allocation / Uplink Transfer with Downlink TBF Establishment/T3190

#### 42.2.3.1.1 Fixed Allocation / Uplink Transfer with Downlink TBF Establishment/ T3190/Half-Duplex

##### 42.2.3.1.1.1 Definition and applicability

This test case applies to all MSs supporting GPRS multislots class 19 and 24.

##### 42.2.3.1.1.2 Conformance Requirement

During an uplink fixed allocation TBF, the network may initiate a downlink TBF by sending the PACKET DOWNLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message on the PACCH.

The downlink radio resource is assigned to the mobile station in a PACKET DOWNLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message. The assigned timeslot configuration of the simultaneous uplink and downlink TBF must be compliant with the mobile station's multislots class, and must allow the performing of neighbour cell power measurements as described in subclause 8.1.2.7.

On receipt of an assignment message the mobile station shall follow the procedure below.

If the mobile station is assigned to operate in half duplex mode, the network shall wait for the mobile station to finish its current uplink resource allocation, and for the TBF starting time to elapse, if present, before sending RLC data blocks on the downlink.

Whenever a mobile station operating on an uplink TBF in half duplex mode receives a complete assignment on the PACCH the mobile station shall complete the currently assigned fixed allocation. If the uplink TBF is not completed the mobile station shall, after expiry of the TBF starting time, if present, or if the TBF starting time has already expired, save the RLC state variables associated with the uplink TBF and suspend and save the state of the following timers :

T3182 - Wait for Acknowledgement;

T3184 - No Ack/Nack Received;

T3188 - Allocation Exhausted.

Whenever a mobile station operating on an uplink TBF in half duplex mode receives a complete downlink assignment on the PACCH and has previously saved the state of the downlink TBF and has not since entered idle mode, the mobile station shall restore the saved downlink RLC state variables and timer values.

The mobile station shall then act upon the PACKET DOWNLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message.

When receiving the PACKET DOWNLINK ASSIGNMENT message and after waiting the TBF Starting Time when applicable, the mobile station starts timer T3190. The timer is reset when receiving the first valid RLC/MAC block.

## References

3GPP TS 04.60, subclauses 8.1.1.3.5 and 7.2.1.1.

### 42.2.3.1.1.3 Test purpose

Verify that an MS operating an uplink TBF in half duplex mode can correctly respond to a PACKET DOWNLINK ASSIGNMENT by completing the current fixed allocation and then act upon the PACKET DOWNLINK ASSIGNMENT. Verify that the MS receives downlink RLC data blocks when the first one is received within T3190.

### 42.2.3.1.1.4 Method of test

## Initial Conditions

System Simulator:

2 cells, GPRS supported, PCCCH not present.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 3 activated.

## Related PICS/PIXIT Statement(s)

- Support GPRS service.
- The way to initiate an uplink transfer.

## Test Procedure

1. MS is triggered to begin an uplink data transfer and enters a fixed allocation open-ended TBF in half duplex mode. This is a TBF with 2 timeslots uplink with the assignment forcing the MS into half duplex mode. In this mode, the MS is not required to read the downlink PACCH, except when there are gaps in the uplink allocation.
2. Before the current allocation expires, the MS receives a PACKET DOWNLINK ASSIGNMENT on the PACCH, during a gap in the uplink allocation.
3. After the current allocation expires, the MS acts on the PACKET DOWNLINK ASSIGNMENT and receives the first RLC data block within T3190. During the downlink TBF, the MS does not continue the uplink TBF or request new resources.

## Maximum Duration of Test

5 minutes.

42.2.3.1.2 Fixed Allocation / Uplink Transfer with Downlink TBF Establishment/ T3190/Non Half-Duplex

42.2.3.1.2.1 Definition and applicability

This test case applies to all MSs supporting GPRS multislots class 10 and higher.

42.2.3.1.2.2 Conformance Requirement

During an uplink fixed allocation TBF, the network may initiate a downlink TBF by sending the PACKET DOWNLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message on the PACCH.

The downlink radio resource is assigned to the mobile station in a PACKET DOWNLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message. The assigned timeslot configuration of the simultaneous uplink and downlink TBF must be compliant with the mobile station's multislot class, and must allow the performing of neighbour cell power measurements as described in subclause 8.1.2.7.

On receipt of an assignment message the mobile station shall follow the procedure below.

If the mobile station is not assigned to operate half duplex mode, the mobile station shall, after expiry of the TBF starting time, if present, act upon the complete downlink assignment, and start timer T3190.

The mobile station shall then act upon the PACKET DOWNLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message.

When receiving the PACKET DOWNLINK ASSIGNMENT message and after waiting the TBF Starting Time when applicable, the mobile station starts timer T3190. The timer is reset when receiving the first valid RLC/MAC block.

## References

3GPP TS 04.60, subclauses 8.1.1.3.5 and 7.2.1.1.

### 42.2.3.1.2.3 Test purpose

Verify that an MS operating an uplink TBF in non half duplex mode can correctly respond to a PACKET DOWNLINK ASSIGNMENT by acting upon the PACKET DOWNLINK ASSIGNMENT during the uplink TBF. Verify that the MS receives downlink RLC data blocks when the first one is received within T3190.

### 42.2.3.1.2.4 Method of test

## Initial Conditions

System Simulator:

2 cells, GPRS supported, PCCCH not present.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 3 activated.

## Related PICS/PIXIT Statement(s)

- Support GPRS service.
- The way to initiate an uplink transfer.

## Test Procedure

1. MS is triggered to begin an uplink data transfer and enters a fixed allocation open-ended TBF in non half duplex mode. This is a TBF with 2 timeslots uplink with the assignment forcing the MS into non half duplex mode. In this mode, the MS reads the downlink PACCH on the natural timeslot.
2. Before the current allocation expires, the MS receives a PACKET DOWNLINK ASSIGNMENT on the PACCH, with starting time before the current allocation expires.
3. Before the current allocation expires, the MS acts on the PACKET DOWNLINK ASSIGNMENT and receives the first RLC data block within T3190. During the downlink TBF, the MS continues the uplink TBF.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

| Step | Direction | Message                    | Comments                                                                                                                          |

### 42.2.3.2 Fixed Allocation / Uplink Transfer with Downlink TBF Establishment/ Ending uplink TBF

#### 42.2.3.2.1 Fixed Allocation / Uplink Transfer with Downlink TBF Establishment/ Ending uplink TBF/ Half-Duplex

##### 42.2.3.2.1.1 Definition and applicability

This test case applies to all MSs supporting GPRS multislot class 19 and 24.

#### 42.2.3.2.1.2 Conformance Requirement

The network may initiate release of an uplink TBF by transmitting a PACKET TBF RELEASE message to the mobile station on the PACCH. A cause value indicates the reason for release.

If the cause value is "Normal release" the mobile station shall continue to the next LLC PDU boundary, starting the count down procedure (see subclause 9.3.1) at whatever value of CV is appropriate to count down to zero at the LLC PDU boundary, and then release the TBF according to the procedures in subclauses 9.3.2.3 or 9.3.3.3.

If the PACKET UPLINK ACK/NACK message has the Final Ack Indicator bit set to '1', the mobile station shall transmit the PACKET CONTROL ACKNOWLEDGEMENT message and release the TBF. If the mobile station is operating in half duplex mode and received a downlink assignment during the countdown or while timer T3182 was running, it shall then act on the downlink assignment.

#### References

3GPP TS 04.60, subclauses 8.1.1.4 and 9.3.2.3.

#### 42.2.3.2.1.3 Test purpose

Verify that an MS operating an uplink TBF in half duplex mode can correctly respond to a PACKET TBF RELEASE message to end the uplink TBF before starting the downlink TBF.

#### 42.2.3.2.1.4 Method of test

#### Initial Conditions

System Simulator:

2 cells, GPRS supported, PCCCH not present.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 3 activated.

#### Related PICS/PIXIT Statement(s)

- Support GPRS service.
- The way to initiate an uplink transfer

#### Test Procedure

1. MS is triggered to begin an uplink data transfer and enters a fixed allocation open-ended TBF in half duplex mode.
2. Before the current allocation expires, the MS receives a PACKET TBF RELEASE.
3. During the countdown procedure, the MS receives a PACKET DOWNLINK ASSIGNMENT.
4. After the uplink TBF is ended, the MS acts on the PACKET DOWNLINK ASSIGNMENT and begins the downlink TBF.

#### Maximum Duration of Test

5 minutes.

| TIMESLOT_ALLOCATION     | 3 timeslots assigned – PDCH1, PDCH2 and PDCH3 (multislot class is not violated) |
| Frequency Parameters IE |                                                                                 |
| - TBF_STARTING_TIME     | <some AFN before the current fixed allocation bitmap expires>                   |

### 42.2.3.3 Fixed Allocation/ Uplink Transfer with Downlink TBF Establishment/ Abnormal cases

#### 42.2.3.3.1 Fixed Allocation/ Uplink Transfer with Downlink TBF Establishment/ Abnormal cases / Violation of multi-slot capabilities

##### 42.2.3.3.1.1 Definition and applicability

This test case applies to all MSs supporting GPRS.

##### 42.2.3.3.1.2 Conformance Requirement

During an uplink fixed allocation TBF, the network may initiate a downlink TBF by sending the PACKET DOWNLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message on the PACCH.

- If the information in the PACKET TIMESLOT RECONFIGURE does not properly specify an uplink and downlink PDCH or violates the mobile station's multislot capabilities, the mobile station shall perform an abnormal release with random access (see subclause 8.7.2).

##### Abnormal Release with Random Access:

The mobile station shall abort all TBFs in progress and its associated resources, return to the CCCH or PCCCH and initiate establishment of a new uplink TBF as defined in subclause 7.1.

##### References

3GPP TS 04.60, subclauses 8.1.1.3.5, 8.1.1.3.5.1 and 8.7.2.

##### 42.2.3.3.1.3 Test purpose

Verify that an MS in an uplink TBF performs abnormal release with random access upon receipt of a PACKET TIMESLOT RECONFIGURE message that violates its multislot capabilities.

##### 42.2.3.3.1.4 Method of test

##### Initial Conditions

System Simulator:

2 cells, GPRS supported, PCCCH not present.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 3 activated.

##### Related PICS/PIXIT Statement(s)

- Support GPRS service.
- The way to initiate an uplink transfer.

##### Test Procedure

1. MS is triggered to begin an uplink data transfer and enters a fixed allocation open-ended TBF in non half duplex mode on one PDCH.
2. Before the current allocation expires, the MS receives a PACKET TIMESLOT RECONFIGURE message on the PACCH, with downlink assignment violating its multislot class capabilities.
3. MS performs abnormal release (stops the uplink TBF in progress) with random access.

Maximum Duration of Test

5 minutes.

Expected Sequence

| Step | Direction | Message                     | Comments                                                                                                           |
|------|-----------|-----------------------------|--------------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                             | Trigger the MS to initiate an uplink packet transfer containing 1000 octets.                                       |
| 2    |           |                             | Bring the MS into packet uplink transfer mode on cell A by the generic procedure defined in the table 42.2.1.2/1b. |
| 3    | MS -> SS  | RLC DATA BLOCK              | MS transmits RLC block only when TBF starting time occurs                                                          |
| 4    | MS -> SS  | RLC DATA BLOCKS             | MS continues to transmit RLC data blocks according to allocation from step 2.                                      |
| 5    | SS -> MS  | PACKET TIMESLOT RECONFIGURE | With downlink assignment violating the multislot class capabilities of the MS.                                     |
| 6    | SS        |                             | Verify MS does not transmit on previously assigned PDCH.                                                           |
| 7    | MS -> SS  | CHANNEL REQUEST             | Sent on cell A.                                                                                                    |

Specific Message Contents

Based on the multislot class of the MS, assign uplink and downlink timeslots as follows in order to violate the multislot class of the MS by violating the Ttb parameter.

| Multislot Class | RX slots assigned | TX slots assigned |
|-----------------|-------------------|-------------------|
| 1               | 1                 | 0                 |
| 2               | 2, 3              | 2                 |
| 3               | 0, 1              | 0                 |
| 4               | 1, 2, 3           | 1                 |
| 5               | 1, 2              | 0, 1              |
| 6               | 1, 2, 3           | 1                 |
| 7               | 1, 2, 3           | 1                 |
| 8               | 2, 3, 4, 5        | 3                 |

#### 42.2.3.3.2 Fixed Allocation/ Uplink Transfer with Downlink TBF Establishment/ Abnormal cases / No defined PDCH

##### 42.2.3.3.2.1 Definition and applicability

This test case applies to all MSs supporting GPRS multislot class 2.

##### 42.2.3.3.2.2 Conformance Requirement

During an uplink fixed allocation TBF, the network may initiate a downlink TBF by sending the PACKET DOWNLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message on the PACCH.

- If the information available in the mobile station, after the reception of a PACKET DOWNLINK ASSIGNMENT message does not satisfactorily define a PDCH, the mobile station shall ignore the PACKET DOWNLINK ASSIGNMENT message.

#### References

3GPP TS 04.60, subclause 8.1.1.3.5 and 8.1.1.3.5.1.

##### 42.2.3.3.2.3 Test purpose

Verify that an MS in an uplink TBF ignores a PACKET DOWNLINK ASSIGNMENT message that does not define a PDCH.

##### 42.2.3.3.2.4 Method of test

#### Initial Conditions

System Simulator:

2 cells, GPRS supported, PCCCH not present.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 3 activated.

#### Related PICS/PIXIT Statement(s)

- Support GPRS service.
- The way to initiate an uplink transfer.

#### Test Procedure

1. MS is triggered to begin an uplink data transfer and enters a fixed allocation open-ended TBF in non half duplex mode on one PDCH.
2. Before the current allocation expires, the MS receives a PACKET DOWNLINK ASSIGNMENT message on the PACCH, with no defined PDCH.
3. MS continues uplink TBF and does not begin a downlink TBF.

#### Maximum Duration of Test

5 minutes.

## Expected Sequence

| Step | Direction | Message                    | Comments                                                                                                                          |
|------|-----------|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| 1    | MS        |                            | Trigger the MS to initiate an uplink packet transfer containing 1000 octets.                                                      |

## 42.2.4 Fixed Allocation / Downlink Transfer with Uplink TBF Establishment

### 42.2.4.1 Fixed Allocation/ Downlink Transfer with Uplink TBF Establishment/ T3168

#### 42.2.4.1.1 Fixed Allocation/ Downlink Transfer with Uplink TBF Establishment/ T3168/ Expiry

##### 42.2.4.1.1.1 Definition and applicability

This test case applies to all MSs supporting GPRS.

##### 42.2.4.1.1.2 Conformance Requirement

The mobile station may request establishment of an uplink transfer during a downlink TBF by including a Channel Request Description information element in the PACKET DOWNLINK ACK/NACK message. Initiation is triggered by a request from upper layers to transfer a LLC PDU. The request from upper layers specifies a Radio Priority to be associated with the packet transfer. Upon such a request:

- if access to the network is allowed, according to the latest values for authorized special access classes that the mobile station has received (see subclause 7.1.1), the mobile station shall initiate the packet access procedure;
- otherwise, the RR sublayer in the mobile station shall reject the request.

The mobile station initiates the packet access procedure by sending the Channel Request Description information element in the PACKET DOWNLINK ACK/NACK message on the PACCH and starting timer T3168.

- If timer T3168 expires, the mobile station shall retransmit the Channel Request Description information element in the next PACKET DOWNLINK ACK/NACK message unless it has been transmitted four times in which case the mobile station shall perform an abnormal release with random access. If the downlink TBF is released, including expiry of timer T3192, before expiry of timer T3168 the mobile station shall stop timer T3168 and perform an abnormal release with random access.
- Abnormal Release with Random Access: The mobile station shall abort all TBFs in progress and its associated resources, return to the CCCH or PCCCH and initiate establishment of a new uplink TBF as defined in subclause 7.1.

## References

3GPP TS 04.60, subclauses 8.1.2.5 and 8.7.2.

### 42.2.4.1.1.3 Test purpose

Verify that during a downlink TBF, when the MS requests uplink resources, that the MS makes the request 4 times. Verify that if uplink resources are not assigned within T3168, the MS performs abnormal release with random access.

### 42.2.4.1.1.4 Method of test

## Initial Conditions

System Simulator:

1 cell, GPRS supported, PCCCH present.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 3 activated.

## Related PICS/PIXIT Statement(s)

Support GPRS service

## Test Procedure

1. MS receives a PACKET DOWNLINK ASSIGNMENT message on its assigned PCCCH, containing no starting time.
2. SS transmits downlink RLC data blocks for the downlink allocation, 1 in 10 specifying RRBP field (polling).
3. MS responds by sending PACKET DOWNLINK ACK/NACK messages in response to the polls.
4. MS is triggered to begin an uplink transfer.
5. MS sends next PACKET DOWNLINK ACK/NACK message with a Channel Request Description field, and starts timer T3168.
6. When T3168 expires, MS repeats the Channel Request Description request. (This step is done 3 times, for a total of 4 Channel Request Descriptions.)
7. MS sends PACKET CHANNEL REQUEST again after returning to packet idle mode.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

| Step | Direction | Message                    | Comments                                                                                                                                                                                           |
|------|-----------|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PACKET DOWNLINK ASSIGNMENT | Triggers the MS to switch to assigned PDCH. (no starting time)                                                                                                                                     |
| 2    | SS -> MS  | RLC DATA BLOCKS            | Starting 3 blocks after the previous message, on assigned PDCH, addressed to MS, 1/10 with valid RRBP field (polling).                                                                             |
| 3    | MS -> SS  | PACKET DOWNLINK ACK/NACK   | MS acknowledges the previously received RLC data blocks.                                                                                                                                           |

## 42.2.4.1.2 Fixed Allocation/ Downlink Transfer with Uplink TBF Establishment/ T3168/ Stop with Packet Uplink Assignment

## 42.2.4.1.2.1 Definition and applicability

This test case applies to all MSs supporting GPRS.

## 42.2.4.1.2.2 Conformance Requirement

The mobile station may request establishment of an uplink transfer during a downlink TBF by including a Channel Request Description information element in the PACKET DOWNLINK ACK/NACK message. Initiation is triggered by a request from upper layers to transfer a LLC PDU. The request from upper layers specifies a Radio Priority to be associated with the packet transfer. Upon such a request:

- if access to the network is allowed, according to the latest values for authorized special access classes that the mobile station has received (see subclause 7.1.1), the mobile station shall initiate the packet access procedure.
- otherwise, the RR sublayer in the mobile station shall reject the request.

The mobile station initiates the packet access procedure by sending the Channel Request Description information element in the PACKET DOWNLINK ACK/NACK message on the PACCH and starting timer T3168.

On receipt of a PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message the mobile station shall follow the procedure below. On reception of a complete uplink assignment the mobile station shall stop timer T3168.

3GPP TS 04.60, subclause 8.1.2.5.

#### 42.2.4.1.2.3 Test purpose

Verify that during a downlink TBF, when the MS requests additional resources, that the MS stops timer T3168 when a PACKET UPLINK ASSIGNMENT is received.

#### 42.2.4.1.2.4 Method of test

##### Initial Conditions

###### System Simulator:

1 cell, GPRS supported, PCCCH present.

###### Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 3 activated.

##### Related PICS/PIXIT Statement(s)

- Support GPRS service.

##### Test Procedure

1. MS receives a PACKET DOWNLINK ASSIGNMENT message on its assigned PCCCH, containing no starting time.
2. SS transmits downlink RLC data blocks for the downlink allocation, 1 in 10 specifying RRBP field (polling).
3. MS responds by sending PACKET DOWNLINK ACK/NACK messages in response to the polls.
4. MS is triggered to begin an uplink transfer.
5. MS sends next PACKET DOWNLINK ACK/NACK message with a Channel Request Description field, and starts timer T3168.
6. When T3168 expires, MS repeats the Channel Request Description request.
7. MS receives a PACKET UPLINK ASSIGNMENT message with a starting time such that more Channel Requests could be sent before the starting time.
8. MS does not repeat the Channel Request Description request.

##### Maximum Duration of Test

5 minutes.

## 42.2.4.2 Fixed Allocation/ Downlink Transfer with Uplink TBF Establishment/ Packet Uplink Assignment

## 42.2.4.2.1 Fixed Allocation/ Downlink Transfer with Uplink TBF Establishment/ Packet Uplink Assignment/ Non half-duplex

## 42.2.4.2.1.1 Definition and applicability

This test case applies to all MSs supporting GPRS.

## 42.2.4.2.1.2 Conformance Requirement

The mobile station may request establishment of an uplink transfer during a downlink TBF by including a Channel Request Description information element in the PACKET DOWNLINK ACK/NACK message. Initiation is triggered by a request from upper layers to transfer a LLC PDU. The request from upper layers specifies a Radio Priority to be associated with the packet transfer. Upon such a request:

- if access to the network is allowed, according to the latest values for authorized special access classes that the mobile station has received (see subclause 7.1.1), the mobile station shall initiate the packet access procedure.
- otherwise, the RR sublayer in the mobile station shall reject the request.

The mobile station initiates the packet access procedure by sending the Channel Request Description information element in the PACKET DOWNLINK ACK/NACK message on the PACCH and starting timer T3168.

On receipt of a PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message the mobile station shall follow the procedure below. On reception of a complete uplink assignment the mobile station shall stop timer T3168.

If the mobile station is not assigned to operate half duplex mode, the mobile station shall, after expiry of the TBF starting time, if present, act upon the complete uplink assignment.

The mobile station shall then switch to the assigned uplink PDCHs and begin to send RLC data blocks on the assigned PDCH(s). The TLLI shall not be included in any of the uplink RLC data blocks in that case.

| 16   | MS -> SS  | RLC DATA BLOCK             | Sent in 8 <sup>th</sup> and 9 <sup>th</sup> block of uplink allocation assigned in step 8.                                |
| 17   | MS -> SS  | PACKET DOWNLINK ACK/NACK   | Sent in 10 <sup>th</sup> block of allocation, in response to poll from step 15.                                           |

PACKET DOWNLINK ASSIGNMENT message in step 1:

|                     |                  |
|---------------------|------------------|
| TIMESLOT_ALLOCATION | 10000000         |
| TBF STARTING TIME   | <IE not present> |

PACKET UPLINK ASSIGNMENT message in step 8:

|                            |                                                          |
|----------------------------|----------------------------------------------------------|
| TBF STARTING TIME          | <some suitable value within 100 frames of current frame> |
| Fixed allocation           |                                                          |
| - TIMESLOT_ALLOCATION      | 10000000                                                 |
| - BLOCKS_OR_BLOCK_PERIODS  | 0 – blocks                                               |
| - ALLOCATION_BITMAP_LENGTH | 10                                                       |
| - ALLOCATION_BITMAP        | 0111000011                                               |

DOWNLINK RLC DATA BLOCK in step 10 and 15:

|      |                                                   |
|------|---------------------------------------------------|
| RRBP | 00 – Response shall be sent by MS in N+13 frames. |
| S/P  | 1 – RRBP field is valid                           |

42.2.4.2.2 Fixed Allocation/ Downlink Transfer with Uplink TBF Establishment/ Packet Uplink Assignment/ Half-duplex

42.2.4.2.2.1 Definition and applicability

This test case applies to all MSs supporting GPRS multi-slot classes 19-29.

#### 42.2.4.2.2 Conformance Requirement

The mobile station may request establishment of an uplink transfer during a downlink TBF by including a Channel Request Description information element in the PACKET DOWNLINK ACK/NACK message. Initiation is triggered by a request from upper layers to transfer a LLC PDU. The request from upper layers specifies a Radio Priority to be associated with the packet transfer. Upon such a request:

- if access to the network is allowed, according to the latest values for authorized special access classes that the mobile station has received (see subclause 7.1.1), the mobile station shall initiate the packet access procedure;
- otherwise, the RR sublayer in the mobile station shall reject the request.

The mobile station initiates the packet access procedure by sending the Channel Request Description information element in the PACKET DOWNLINK ACK/NACK message on the PACCH and starting timer T3168.

On receipt of a PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message the mobile station shall follow the procedure below. On reception of a complete uplink assignment the mobile station shall stop timer T3168.

If the mobile station is assigned to operate in half duplex mode, the mobile station shall, after expiry of the TBF starting time, if present, stop the downlink TBF, save the RLC state variables associated with the downlink TBF and save the state of the following timers:

T3190 - Wait for Valid Downlink Data Received from the Network.

T3192 - Wait for Release of the TBF after reception of the final block.

The mobile station shall then switch to the assigned uplink PDCHs and begin to send RLC data blocks on the assigned PDCH(s). The TLLI shall not be included in any of the uplink RLC data blocks in that case.

#### Initial Conditions

System Simulator:

2 cells, GPRS supported, PCCCH present.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 3 activated.

#### Related PICS/PIXIT Statement(s)

- Support GPRS service.

#### Test Procedure

1. MS receives a PACKET DOWNLINK ASSIGNMENT message on its assigned PCCCH, containing no starting time.
2. SS transmits downlink RLC data blocks for the downlink allocation, 1 in 10 specifying RRB field (polling).
3. MS responds by sending PACKET DOWNLINK ACK/NACK messages in response to each poll.

4. MS is triggered to begin an uplink transfer.
5. MS sends next PACKET DOWNLINK ACK/NACK message with a Channel Request Description field.
6. MS receives a PACKET UPLINK ASSIGNMENT message.
7. MS acts on the PACKET UPLINK ASSIGNMENT, by stopping the downlink TBF, and starting the uplink TBF.

Maximum Duration of Test

5 minutes.

Expected Sequence

| Step | Direction | Message                    | Comments                                                                                                                  |
|------|-----------|----------------------------|---------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PACKET DOWNLINK ASSIGNMENT | Triggers the MS to switch to assigned PDCH. (no starting time)                                                            |
| 2    | SS -> MS  | RLC DATA BLOCKS            | Starting 3 blocks after the previous message, on assigned PDCH, addressed to MS, 1 in 10 with valid RRBp field (polling). |
| 3    | MS -> SS  | PACKET DOWNLINK ACK/NACK   | MS acknowledges the previously received RLC data blocks.                                                                  |
| 4    |           |                            | Steps 2 and 3 are repeated throughout until step 8.                                                                       |
| 5    | MS        |                            | MS is triggered to begin an uplink data transfer.                                                                         |
| 6    | MS -> SS  | PACKET DOWNLINK ACK/NACK   | Message contains Channel Request Description IE - MS starts timer T3168                                                   |
| 7    |           |                            | Steps 2 and 3 are repeated as often as necessary until step 8.                                                            |
| 8    | SS -> MS  | PACKET UPLINK ASSIGNMENT   | Sent (.5*T3168) seconds after step 7. Allocates one uplink PDCH.                                                          |
| 9    | MS -> SS  | RLC DATA BLOCK             | Verify MS sends data block on uplink resource assigned in step 8 at the starting time.                                    |
| 10   | SS -> MS  | RLC DATA BLOCK             | In same block as step 9: with valid RRBp field (polling)                                                                  |
| 11   | MS -> SS  | RLC DATA BLOCK             | Verify MS sends data block on uplink resource assigned in step 8 (next block following step 9).                           |
| 12   | SS        |                            | Verify MS does not send DOWNLINK ACK/NACK in response to downlink data block in step 10.                                  |
| 13   | SS        |                            | Verify no uplink data sent by MS in 5 <sup>th</sup> and 6 <sup>th</sup> blocks of allocation assigned in step 8.          |
| 14   | MS -> SS  | RLC DATA BLOCK             | Sent in 7 <sup>th</sup> block of uplink allocation assigned in step 8.                                                    |
| 15   | SS -> MS  | RLC DATA BLOCK             | Sent in 7 <sup>th</sup> block of allocation (same block as step 14) With valid RRBp field (polling).                      |
| 16   | MS -> SS  | RLC DATA BLOCKS            | Sent in 8 <sup>th</sup> and 9 <sup>th</sup> block of uplink allocation assigned in step 8.                                |
| 17   | SS        |                            | Verify MS does not send DOWNLINK ACK/NACK in response to downlink data block in step 15.                                  |

PACKET DOWNLINK ASSIGNMENT message in step 1:

|                     |                  |
|---------------------|------------------|
| TIMESLOT_ALLOCATION | 10000000         |
| TBF STARTING TIME   | <IE not present> |

PACKET UPLINK ASSIGNMENT message in step 8:

|                            |                                                          |
|----------------------------|----------------------------------------------------------|
| TBF STARTING TIME          | <some suitable value within 100 frames of current frame> |
| Fixed allocation           |                                                          |
| - HALF_DUPLEX_MODE         | 1 – MS operates in half-duplex mode                      |
| - TIMESLOT_ALLOCATION      | 10000000                                                 |
| - BLOCKS_OR_BLOCK_PERIODS  | 0 – blocks                                               |
| - ALLOCATION_BITMAP_LENGTH | 10                                                       |
| - ALLOCATION_BITMAP        | 0111000011                                               |

DOWNLINK RLC DATA BLOCK in step 10 and 15:

|             |                                                                              |
|-------------|------------------------------------------------------------------------------|
| RRBP<br>S/P | 00 – Response shall be sent by MS in N+13 frames.<br>1 – RRBP field is valid |
|-------------|------------------------------------------------------------------------------|

#### 42.2.4.3 Fixed Allocation/ Downlink Transfer with Uplink TBF Establishment/Packet Timeslot Reconfigure

##### 42.2.4.3.1 Fixed Allocation/ Downlink Transfer with Uplink TBF Establishment/Packet Timeslot Reconfigure/Starting time with AFN encoding

###### 42.2.4.3.1.1 Definition and applicability

This test case applies to all MSs supporting GPRS.

###### 42.2.4.3.1.2 Conformance Requirement

The mobile station may request establishment of an uplink transfer during a downlink TBF by including a Channel Request Description information element in the PACKET DOWNLINK ACK/NACK message. Initiation is triggered by a request from upper layers to transfer a LLC PDU. The request from upper layers specifies a Radio Priority to be associated with the packet transfer. Upon such a request:

- if access to the network is allowed, according to the latest values for authorized special access classes that the mobile station has received (see subclause 7.1.1), the mobile station shall initiate the packet access procedure;
- otherwise, the RR sublayer in the mobile station shall reject the request.

The mobile station initiates the packet access procedure by sending the Channel Request Description information element in the PACKET DOWNLINK ACK/NACK message on the PACCH and starting timer T3168.

On receipt of a PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message the mobile station shall follow the procedure below. On reception of a complete uplink assignment the mobile station shall stop timer T3168.

If the mobile station is not assigned to operate half duplex mode, the mobile station shall, after expiry of the TBF starting time, if present, act upon the complete uplink assignment.

The mobile station shall then switch to the assigned uplink PDCHs and begin to send RLC data blocks on the assigned PDCH(s). The TLLI shall not be included in any of the uplink RLC data blocks in that case.

#### References

3GPP TS 04.60, subclause 8.1.2.5.

##### 42.2.4.3.1.3 Test purpose

Verify that during a downlink TBF, when the MS requests uplink resources, that the MS obeys the PACKET TIMESLOT RECONFIGURE message at the starting time and enters the uplink TBF.

##### 42.2.4.3.1.4 Method of test

#### Initial Conditions

System Simulator:

2 cells, GPRS supported, PCCCH present.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 3 activated.

## Related PICS/PIXIT Statement(s)

- Support GPRS service.

## Test Procedure

1. MS receives a PACKET DOWNLINK ASSIGNMENT message on its assigned PCCCH, containing no starting time.
2. SS transmits downlink RLC data blocks for the downlink allocation, 1 in 10 specifying RRB field (polling).
3. MS responds by sending PACKET DOWNLINK ACK/NACK messages in response to each poll.
4. MS is triggered to begin an uplink transfer.
5. MS sends next PACKET DOWNLINK ACK/NACK message with a Channel Request Description field.
6. MS receives a PACKET TIMESLOT RECONFIGURE message.
7. MS acts on the PACKET TIMESLOT RECONFIGURE at the appropriate starting time and enters a concurrent TBF.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

| Step | Direction | Message                     | Comments                                                                                                                 |
|------|-----------|-----------------------------|--------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PACKET DOWNLINK ASSIGNMENT  | Triggers the MS to switch to assigned PDCH. (no starting time)                                                           |

| 7    |           |                             | Steps 2 and 3 are repeated as often as necessary until step 8.                                                           |
| 8    | SS -> MS  | PACKET TIMESLOT RECONFIGURE | Sent (0.5*T3168) seconds after step 7.<br>Allocates one uplink PDCH.                                                     |
| 9    | MS -> SS  | RLC DATA BLOCK              | Verify MS sends data block on uplink resource assigned in step 8 at the starting time.                                   |
| 10   | SS -> MS  | RLC DATA BLOCK              | In same block as step 9: with valid RRB field (polling)                                                                  |
| 11   | MS -> SS  | RLC DATA BLOCK              | Verify MS sends data block on uplink resource assigned in step 8 (next block following step 9).                          |
| 12   | MS -> SS  | PACKET DOWNLINK ACK/NACK    | In block specified by step 10. (4 <sup>th</sup> block of allocation assigned in step 8)                                  |
| 13   | SS        |                             | Verify no uplink data sent by MS in 5 <sup>th</sup> and 6 <sup>th</sup> blocks of allocation assigned in step 8.         |
| 14   | MS -> SS  | RLC DATA BLOCK              | Sent in 7 <sup>th</sup> block of uplink allocation assigned in step 8.                                                   |
| 15   | SS -> MS  | RLC DATA BLOCK              | Sent in 7 <sup>th</sup> block of allocation (same block as step 14)<br>With valid RRB field (polling).                   |
| 16   | MS -> SS  | RLC DATA BLOCKS             | Sent in 8 <sup>th</sup> and 9 <sup>th</sup> block of uplink allocation assigned in step 8.                               |
| 17   | MS -> SS  | PACKET DOWNLINK ACK/NACK    | Sent in 10 <sup>th</sup> block of allocation, in response to poll from step 15.                                          |

PACKET DOWNLINK ASSIGNMENT message in step 1:

|                     |                  |
|---------------------|------------------|
| TIMESLOT_ALLOCATION | 10000000         |
| TBF STARTING TIME   | <IE not present> |

PACKET TIMESLOT RECONFIGURE message in step 8:

|                            |                                            |
|----------------------------|--------------------------------------------|
| TBF STARTING TIME          | 0 – AFN encoding                           |
| - AFN                      | <some AFN within 50 frames of current AFN> |
| Fixed allocation           |                                            |
| - TIMESLOT_ALLOCATION      | 10000000                                   |
| - BLOCKS_OR_BLOCK_PERIODS  | 0 – blocks                                 |
| - ALLOCATION_BITMAP_LENGTH | 10                                         |
| - ALLOCATION_BITMAP        | 0111000011                                 |
| Downlink Allocation        | Same as already assigned                   |

DOWNLINK RLC DATA BLOCK in step 10 and 15:

|      |                                                   |
|------|---------------------------------------------------|
| RRBP | 00 – Response shall be sent by MS in N+13 frames. |
| S/P  | 1 – RRBP field is valid                           |

#### 42.2.4.3.2 Fixed Allocation/ Downlink Transfer with Uplink TBF Establishment/ Packet Timeslot Reconfigure/ Starting time with relative encoding

##### 42.2.4.3.2.1 Definition and applicability

This test case applies to all MSs supporting GPRS.

##### 42.2.4.3.2.2 Conformance Requirement

The mobile station may request establishment of an uplink transfer during a downlink TBF by including a Channel Request Description information element in the PACKET DOWNLINK ACK/NACK message. Initiation is triggered by a request from upper layers to transfer a LLC PDU. The request from upper layers specifies a Radio Priority to be associated with the packet transfer. Upon such a request:

- if access to the network is allowed, according to the latest values for authorized special access classes that the mobile station has received (see subclause 7.1.1), the mobile station shall initiate the packet access procedure;
- otherwise, the RR sublayer in the mobile station shall reject the request.

The mobile station initiates the packet access procedure by sending the Channel Request Description information element in the PACKET DOWNLINK ACK/NACK message on the PACCH and starting timer T3168.

On receipt of a PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message the mobile station shall follow the procedure below. On reception of a complete uplink assignment the mobile station shall stop timer T3168.

If the mobile station is not assigned to operate half duplex mode, the mobile station shall, after expiry of the TBF starting time, if present, act upon the complete uplink assignment.

The mobile station shall then switch to the assigned uplink PDCHs and begin to send RLC data blocks on the assigned PDCH(s). The TLLI shall not be included in any of the uplink RLC data blocks in that case.

| S/P  | 1 – RRBP field is valid                           |

#### 42.2.4.4 Fixed Allocation/ Downlink Transfer with Uplink TBF Establishment/ Packet Access Reject

##### 42.2.4.4.1 Fixed Allocation/ Downlink Transfer with Uplink TBF Establishment/ Packet Access Reject/ With WAIT\_INDICATION

###### 42.2.4.4.1.1 Definition and applicability

This test case applies to all MSs supporting GPRS.

###### 42.2.4.4.1.2 Conformance Requirement

The mobile station may request establishment of an uplink transfer during a downlink TBF by including a Channel Request Description information element in the PACKET DOWNLINK ACK/NACK message. Initiation is triggered by a request from upper layers to transfer a LLC PDU. The request from upper layers specifies a Radio Priority to be associated with the packet transfer. Upon such a request:

- if access to the network is allowed, according to the latest values for authorized special access classes that the mobile station has received (see subclause 7.1.1), the mobile station shall initiate the packet access procedure;
- otherwise, the RR sublayer in the mobile station shall reject the request.

The mobile station initiates the packet access procedure by sending the Channel Request Description information element in the PACKET DOWNLINK ACK/NACK message on the PACCH and starting timer T3168.

On receipt of a PACKET ACCESS REJECT message containing a WAIT\_INDICATION field in a Reject structure addressed to the mobile station, the mobile station shall stop timer T3168 and start timer T3172 with the indicated value (Wait Indication). The mobile station is not allowed to make a new attempt for packet access in the same cell until timer T3172 expires, but may attempt packet access in an other cell after successful cell reselection.

#### References

3GPP TS 04.60, subclause 8.1.2.5.

###### 42.2.4.4.1.3 Test purpose

Verify that during a downlink TBF, when the MS requests uplink resources, that the MS obeys a PACKET ACCESS REJECT message with WAIT\_INDICATION by waiting the specified time before any possible subsequent attempt to request uplink resources.

###### 42.2.4.4.1.4 Method of test

#### Initial Conditions

System Simulator:

2 cells, GPRS supported, PCCCH present.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 3 activated.

#### Related PICS/PIXIT Statement(s)

- Support GPRS service.

## Test Procedure

1. MS receives a PACKET DOWNLINK ASSIGNMENT message on its assigned PCCCH, containing no starting time.
2. SS transmits downlink RLC data blocks for the downlink allocation, 1 in 10 specifying RRBP field (polling).
3. MS responds by sending PACKET DOWNLINK ACK/NACK messages in response to each poll.
4. MS is triggered to begin an uplink transfer.
5. MS sends next PACKET DOWNLINK ACK/NACK message with a Channel Request Description field.
6. MS receives a PACKET ACCESS REJECT message with WAIT\_INDICATION.
7. MS acts on the PACKET ACCESS REJECT by waiting the indicated time.
8. MS shall not include the channel request description IE before T3172 expiry

## Maximum Duration of Test

5 minutes.

## Expected Sequence

| Step | Direction | Message                    | Comments                                                                                                                  |

#### 42.2.4.4.2 Fixed Allocation/ Downlink Transfer with Uplink TBF Establishment/ Packet Access Reject/No WAIT\_INDICATION

##### 42.2.4.4.2.1 Definition and applicability

This test case applies to all MSs supporting GPRS.

#### 42.2.4.4.2.2 Conformance Requirement

The mobile station may request establishment of an uplink transfer during a downlink TBF by including a Channel Request Description information element in the PACKET DOWNLINK ACK/NACK message. Initiation is triggered by a request from upper layers to transfer a LLC PDU. The request from upper layers specifies a Radio Priority to be associated with the packet transfer. Upon such a request:

- if access to the network is allowed, according to the latest values for authorized special access classes that the mobile station has received (see subclause 7.1.1), the mobile station shall initiate the packet access procedure;
- otherwise, the RR sublayer in the mobile station shall reject the request.

The mobile station initiates the packet access procedure by sending the Channel Request Description information element in the PACKET DOWNLINK ACK/NACK message on the PACCH and starting timer T3168.

On receipt of a PACKET ACCESS REJECT message that contains a Reject structure addressed to the mobile station, the mobile station shall stop timer T3168 and indicate a packet access failure to upper layer.

## 42.2.5 Default message contents

### 42.2.5.1 Default message contents

The following default values of messages and the default contents of messages defined in clause 40 are used in subclause 42.2. Unless indicated otherwise in subclause 42.2 these shall be transmitted by the system simulator.

In this clause, decimal values are normally used. However, sometimes a hexadecimal value, indicated by an "Hex", or a binary value, indicated by a "Binary" is used.

Get rid of all uplink messages.

PACKET CHANNEL REQUEST message:

|                  |                                                          |

## 42.3 Dynamic Allocation in Packet Transfer Mode

All test cases in this clause are applicable to the MS supporting the GPRS service and the activation of at least one PDP context.

### 42.3.1 Dynamic Allocation / Uplink Transfer

#### 42.3.1.1 Dynamic Allocation / Uplink Transfer / Normal

##### 42.3.1.1.1 Dynamic Allocation / Uplink Transfer / Normal / Successful

###### 42.3.1.1.1.1 Conformance requirements

1. The mobile station shall set the TFI field of each uplink RLC data block to the TFI value assigned to the mobile station in the PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message.
2. Whenever the mobile station detects an assigned USF value on an assigned PDCH, the mobile station shall transmit either a single RLC/MAC block or a sequence of four RLC/MAC blocks on the same PDCH in the next block period(s). The time relation between an uplink block, which the mobile station shall use for transmission, and the occurrence of the USF value is defined in 3GPP TS 05.02. The number of RLC/MAC blocks to transmit is controlled by the USF\_GRANULARITY parameter characterising the uplink TBF.
3. At two-phase access the mobile station does not include its TLLI in any RLC data block.

#### References

3GPP TS 04.60, subclauses 8.1.1, 8.1.1.1 and 7.1.3.3.

3GPP TS 05.02, subclause 6.3.2.2.1.

###### 42.3.1.1.1.2 Test purposes

To verify that the MS:

1. depending on the parameter USF\_GRANULARITY, transmits one or a sequence of four RLC/MAC data block(s) in the next block period(s) on the PDCH on which it has detected its corresponding assigned USF.
2. includes the assigned TFI in each uplink RLC data blocks.
3. does not include its TLLI in any RLC data block at two phase access.

###### 42.3.1.1.1.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, default setting, BS\_PBCCH\_BLKs = 3.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context3 activated.

#### Related PICS/PIXIT Statement(s)

- Support GPRS service.
- Support activation of at least one PDP context.
- The way to trigger the MS initiating an uplink packet transfer.

#### Test Procedure

The MS is triggered to initiate packet uplink transfer data in RLC unacknowledged mode. The SS orders the MS to have two-phase access, in PACKET UPLINK ASSIGNMENT message the USF\_GRANURALITY is set to 4 blocks. The SS sends the assigned USF assigned to the MS and checks that a sequence of four RLC/MAC data blocks in the next radio block period is received, and that each data block contains the correct TFI, but without TLLI. The SS assigns the USF assigned to the MS again. The check is repeated. The procedure is going on until the MS completes the packet data transfer.

The above test procedure is repeated once for USF\_GRANURALITY set to one block.

#### Maximum Duration of Test

5 minutes.

## Expected Sequence

#### 42.3.1.1.2 Dynamic Allocation / Uplink Transfer / Normal / Request new resources

##### 42.3.1.1.2.1 Conformance requirements

During the TBF, if the countdown procedure has not started, the mobile station shall ask for new or different radio resources, by sending a PACKET RESOURCE REQUEST in the following cases:

1. When the mobile station has more blocks to send than indicated in the PACKET CHANNEL REQUEST message with access type short access.
2. When the mobile station has indicated Page Response, Cell update or Mobility Management procedure as access type in the PACKET CHANNEL REQUEST and it has data to send.

##### References

3GPP TS 04.60, subclause 8.1.1.

##### 42.3.1.1.2.2 Test purposes

To verify that the MS requests for new or different radio resources by sending a PACKET RESOURCE REQUEST when the countdown procedure has not started and the MS has more blocks to send than indicated in the PACKET CHANNEL REQUEST message with access type short access.

##### 42.3.1.1.2.3 Method of test

##### Initial Conditions

System Simulator:

1 cell, default setting, BS\_PBCCH\_BLKs = 3, BS\_CV\_MAX = 3.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated in cell A and Test PDP context2 activated.

##### Related PICS/PIXIT Statement(s)

- Support GPRS service.
- Support activation of at least one PDP context.
- The way to trigger the MS initiating an uplink packet transfer.

##### Test Procedure

The MS is triggered to initiate packet uplink transfer 150 octets for a short access in RLC acknowledged mode. After the MS sends the first RLC data block, the MS is triggered to send another 220 octets data. The MS requests new radio resource by sending PACKET RESOURCE REQUEST.

##### Maximum Duration of Test

5 minutes.

### 42.3.1.1.3 Dynamic Allocation / Uplink Transfer / Normal / Starting frame number encoding

#### 42.3.1.1.3.1 Conformance requirements

1. In case of dynamic allocation, if no uplink TBF is in progress, the MS needs not monitor the USF field until the TDMA frame number occurs. When the indicated TDMA frame number occurs, the mobile station shall immediately begin to monitor the USF field and use the new assigned uplink TBF parameters when its USF occurs.
2. If an uplink TBF is already in progress, the MS shall continue to use the parameters of the existing TBF until the TDMA frame number occurs. When the indicated TDMA frame number occurs, the mobile station shall immediately begin to monitor the USF field and use the new assigned uplink TBF parameters when its USF occurs.
3. In case of single block allocation, the mobile station shall use the assigned timeslot during the RLC/MAC block whose first TDMA burst occurs in the indicated TDMA frame number.
4. If the mobile station is in packet transfer mode during the block immediately before the starting time and the lowest numbered PDCH assigned to the MS is different immediately before and after the starting time then the mobile station shall be ready to receive or transmit no later than one radio block from the starting time
5. If the Starting FN (in absolute frame number encoding) is not aligned to the start of a block period and the mobile station is in packet transfer mode during the TDMA immediately before the Starting FN, then the mobile station shall align the starting time to the next block boundary and continue to use the currently assigned allocation up to the next block boundary.

#### References

3GPP TS 04.60, subclauses 11.2.29, 12.21 and 12.21.1.

#### 42.3.1.1.3.2 Test purposes

To verify that the MS, in transfer mode:

1. correctly uses the starting frame number description in PACKET UPLINK ASSIGNMENT, and in all subsequent RLC/MAC control messages which are sent on the uplink TBF;
2. is ready to receive or transmit no later than one radio block from the starting time;
3. is able to align the starting time to the next block boundary and continue to use the currently assigned allocation up to the next block boundary.

#### 42.3.1.1.3.3 Method of test

##### Initial Conditions

System Simulator:

1 cell, default setting, BS\_PBCCH\_BLKs = 3.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context3 activated.

##### Related PICS/PIXIT Statement(s)

- Support GPRS service.
- Support activation of at least one PDP context.
- The way to trigger the MS initiating an uplink packet transfer.

## Test Procedure

The MS is triggered to initiate packet uplink transfer 440 octets in the RLC unacknowledged mode. The PACKET UPLINK ASSIGNMENT message contains a starting time encoded in absolute frame number format for the single block allocation. It is checked that the MS uses the time slot at the assigned frame number. In the two-phase access a starting time is included in PACKET UPLINK ASSIGNMENT. The assigned USF is on a radio block before the starting time. The MS does not react upon that. The assigned USF is on one block after the starting time. The MS sends a RLC data block.

The test procedure is repeated once. The starting time is encoded in relative frame number format.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

The expected sequence is repeated once. In the 2<sup>nd</sup> execution the starting frame numbers in the specific message contents are encoded in the relative format.

| 6    |           | {Completion of uplink RLC data block transfer} |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

#### 42.3.1.1.4 Dynamic Allocation / Uplink Transfer / Normal / Starting time

##### 42.3.1.1.4.1 Conformance requirements

- 1 If a TBF starting time information element is present and no uplink TBF is in progress, but a downlink TBF is in progress, the mobile station shall wait until the starting time before beginning to monitor the USFs. While waiting for the starting time, the mobile station shall monitor the assigned PDCHs.
- 2 If an uplink TBF is already in progress, the mobile station shall continue to use the assigned parameters of the uplink TBF until the TDMA frame number indicated by the TBF starting time occurs. At that time the mobile station shall immediately begin to use the newly assigned uplink TBF parameters.
- 3 While waiting for the frame number indicated by the TBF starting time if the mobile station receives another uplink assignment, the mobile station shall act upon the most recently received uplink assignment and shall ignore the previous uplink assignment.

##### References

3GPP TS 04.60, subclause 8.1.1.1.

##### 42.3.1.1.4.2 Test purposes

To verify that after the MS receives an uplink assignment with starting time:

1. if a downlink TBF is in progress and no uplink TBF is in progress it monitors the assigned PDCHs while waiting for the starting time. If another uplink assignment received while waiting, the mobile station acts upon that and ignores the previous uplink assignment.
2. if an uplink TBF is already in progress, it continues to use the assigned parameters of the uplink TBF until the TDMA frame number indicated by the TBF starting time occurs. While waiting for the frame number indicated by the TBF starting time the mobile station receives another uplink assignment, the mobile station acts upon that and ignores the previous uplink assignment. As soon as the starting time occurs the MS immediately begins to use the newly assigned uplink TBF parameters.

##### 42.3.1.1.4.3 Method of test

##### Initial Conditions

System Simulator:

1 cell, default setting, BS\_PBCCH\_BLKs = 3.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context2 activated.

##### Related PICS/PIXIT Statement(s)

- Support GPRS service.
- Support activation of at least one PDP context.
- The way to trigger the MS initiating an uplink packet transfer.

## Test Procedure

A downlink TBF is established and in progress. An uplink TBF is established with a starting time which does not yet elapse. The SS sends two downlink data blocks before the starting time to the MS and signals the assigned TBF addressing the MS for uplink transfer. It is checked that no uplink RLC data blocks are sent by the MS. The SS sends PACKET TIMESLOT RECONFIGURE on one radio block before the starting time, assigning a new starting time. Two downlink data blocks are then sent to the MS before the new starting time occurs. Each data block contains one of the assigned USFs addressing the MS. It is checked that no uplink data blocks are sent from the MS. After the new starting time elapses the SS sends a downlink data block containing the USF assigned to the MS. The MS sends an uplink data block. The MS is brought to Idle mode.

Subsequently an uplink TBF is established. The SS sends PACKET UPLINK ASSIGNMENT assigning a reconfigured PDCH with a starting time and a new USF associated. Before the starting time the SS signals the USF of the ongoing TBF addressing the MS. The SS receives an uplink data block from the MS. The SS sends UPLINK ASSIGNMENT on one radio block before the starting time, assigning a new reconfigured PDCH with a starting time and a different USF associated. The later assignment overwrites the earlier one.. While waiting for the frame number of the newly assigned starting time the SS signals the USF of the previous assignment on both the ongoing PDCH and on the previous assigned PDCH. The MS ignores it. The SS signals the USF of the ongoing TBF addressing the MS. An uplink data block can be received. On one radio block before the starting time the SS signals the later assigned USF assigned to the MS on the later assigned PDCH. No uplink data block is received. On one radio block after the starting time the SS signals the just expired USF. No uplink data block is received. Then the SS signals the valid USF assigned to the MS. An uplink data block is received.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

#### 42.3.1.1.5 Dynamic Allocation / Uplink Transfer / Normal / Close-ended TBF

##### 42.3.1.1.5.1 Conformance requirements

1. During a close-ended TBF the mobile station shall transmit only the number of RLC data blocks indicated in the RLC\_DATA\_BLOCKS\_GRANTED field. RLC/MAC control blocks and retransmissions of RLC data blocks do not count toward the limit.
2. In the case the access type in Channel Request was 'Short Access', only the number of RLC data blocks requested in the Channel Request are allowed to be transmitted within the TBF, unless additional resources have been requested and assigned before the countdown procedure has started.
3. When the mobile station nears the end of the fixed length TBF, it shall begin the count down procedure so that it sends the last RLC data block when CV = 0. The mobile station and network shall then follow the appropriate procedure for release of TBF defined in 3GPP TS 04.60 subclauses 9.3.2.3 or 9.3.3.3.
4. If the number of RLC data blocks granted is not sufficient to empty the mobile station's send buffer, the mobile station shall attempt to establish a new uplink TBF for the transmission of the outstanding LLC frames following the end of the fixed length TBF.

##### References

3GPP TS 04.60, subclause 8.1.1.1.

##### 42.3.1.1.5.2 Test purposes

To verify that during a close-ended TBF:

- 1 The MS transmits only the number of RLC data blocks indicated in the RLC\_DATA\_BLOCKS\_GRANTED field. RLC/MAC control blocks and retransmissions of RLC data blocks do not count toward the limit indicated by RLC\_DATA\_BLOCKS\_GRANTED.
- 2 When the MS nears the end of the close-ended TBF, it begins the count down procedure and sends the last RLC data block when CV = 0.
- 3 If the number of RLC data blocks granted is not sufficient to empty the MS's send buffer, the MS attempts to establish a new uplink TBF for the transmission of the outstanding LLC frames following the end of the close-ended TBF.

It is also verified that:

4. When the access type in Channel Request was "Short Access", the MS transmits only the number of RLC data blocks requested in the Channel Request.

##### 42.3.1.1.5.3 Method of test

##### Initial Conditions

System Simulator:

1 cell, default setting, BS\_PBCCH\_BLKs = 3.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context2 activated.

##### Related PICS/PIXIT Statement(s)

- Support GPRS service.
- Support activation of at least one PDP context.
- The way to trigger the MS initiating an uplink packet transfer.

## Test Procedure

The MS is triggered to send 570 octets data in acknowledged mode. Only 10 RLC data blocks are granted for a closed TBF in a assignment. After the MS sends the first data block the SS negatively acknowledges the received data. The MS resends the data block. The MS is polled and the USF assigned to the MS. The MS sends another data block and PACKET CONTROL ACKNOWLEDGEMENT. The resent data block and the RLC/MAC control block do not count toward the granted blocks limit. The SS gives the USF assigned to the MS 8 times so that the MS is allowed to send another 8 data blocks. It is checked that the last data block contains the countdown variable CV=0. The MS sends PACKET CHANNEL REQUEST for new resource in order to empty the sending buffer. The request is granted and a new PDCH is assigned for empty the MS data buffer.

The MS is triggered to send 89 octets data in acknowledged mode. It is checked that the MS requests five RLC data blocks for short access. Although 10 data blocks are granted in the assignment and it is checked that the MS sends only five RLC data blocks.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

| Step                  | Direction | Message                                      | Comments                                                                                                                                                                                                                                                         |

#### 42.3.1.1.6 Dynamic Allocation / Uplink Transfer / Normal / T3180 expiry

##### 42.3.1.1.6.1 Conformance requirements

When the mobile station transmits an RLC/MAC block to the network, it shall start timer T3180. When the mobile station detects an assigned USF value on an assigned PDCH, the mobile station shall reset timer T3180. If timer T3180 expires, the mobile station shall perform the abnormal release with random access procedure.

##### References

3GPP TS 04.60, subclause 8.1.1.1.

##### 42.3.1.1.6.2 Test purposes

To verify that

1. Timer T3180 will not expire as long as an USF for the MS under test is detected in the downlink blocks within the defined time period of the timer. (It is implicitly verified).
2. Timer T3180 expires if no USF for the MS under test is detected during a time period longer than T3180.
3. The MS performs an abnormal release with random access procedure after T3180 expires.

## 42.3.1.1.6.3 Method of test

## Initial Conditions

## System Simulator:

1 cell, default setting, BS\_PBCCH\_BLKs = 3.

## Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context3 activated.

## Related PICS/PIXIT Statement(s)

- Support GPRS service.
- Support activation of at least one PDP context.
- The way to trigger the MS initiating an uplink packet transfer.

## Test Procedure

An uplink TBF is established and in progress. After the MS sends an uplink data block the SS repeatedly sends PACKET UPLINK ACK/NACK containing any USF and any TFI which do not address the MS for 4.5s. Before T3180 times out the SS signals the USF assigned to the MS. The MS sends a data block. Then the SS repeatedly sends PACKET UPLINK ACK/NACK containing any USF and any TFI which do not address the MS until receiving PACKET CHANNEL REQUEST from the MS for establishment of a new TBF.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

#### 42.3.1.1.7 Dynamic Allocation / Uplink Transfer / Normal / PACCH operation

##### 42.3.1.1.7.1 Conformance requirements

1. The mobile station shall attempt to decode every downlink RLC/MAC block on all assigned PDCHs. Whenever the mobile station receives an RLC/MAC block containing an RLC/MAC control block, the mobile station shall attempt to interpret the message contained therein. If the message addresses the mobile station, the mobile station shall act on the message. The mobile station shall not transmit an RLC data block in any uplink radio block allocated via the polling mechanism.
2. PACKET POLLING REQUEST is sent on the PCCCH or PACCH by the network to the mobile station to solicit a PACKET CONTROL ACKNOWLEDGEMENT message from the mobile station.
3. In downlink RLC/MAC control blocks, the TFI identifies the Temporary Block Flow (TBF) to which the RLC/MAC control message contained in the downlink RLC/MAC control block relates. If present, this field indicates the mobile station to which the control message is addressed, and all other mobile stations shall ignore the control message. If this field is present and the contents of the control message also contain a TFI addressing the mobile station, the mobile station shall ignore the TFI in the control message contents.

##### References

3GPP TS 04.60, subclauses 8.1.1.1.1, 11.2.12 and 10.4.10.

##### 42.3.1.1.7.2 Test purposes

To verify that:

1. The MS attempts to decode every downlink RLC/MAC block on all assigned PDCHs whenever the MS receives an RLC/MAC block containing an RLC/MAC control block, the MS attempts to interpret the message contained therein, such as Payload type and TFI in the optional fields. If the message addresses the MS, it acts upon the message.
2. When receiving PACKET POLLING REQUEST on PACCH the MS responds with four PACKET CONTROL ACKNOWLEDGEMENT messages of access burst format and does not transmit an RLC data block in any uplink radio block allocated via the polling mechanism.

##### 42.3.1.1.7.3 Method of test

##### Initial Conditions

System Simulator:

1 cell, default setting, BS\_PBCCH\_BLKs = 3.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context3 activated.

#### Related PICS/PIXIT Statement(s)

- Support GPRS service.
- Support activation of at least one PDP context.
- The way to initiate an uplink transfer.

#### Test Procedure

A TBF is established. It is polled with PACKET POLLING REQUEST containing a global TFI not addressing the MS. The assigned USF addresses the MS. The MS transmits a data block. The SS polls the MS with PACKET POLLING REQUEST containing any global TFI not addressing the MS. The message has optional octets where TFI does address the MS. The MS responds with PACKET CONTROL ACKNOWLEDGEMENT four times in access burst formats. The SS polls again the MS with PACKET POLLING REQUEST containing the global TFI addressing the MS. The MS responds with PACKET CONTROL ACKNOWLEDGEMENT four times in access burst formats.

#### Maximum Duration of Test

5 minutes.

#### Expected Sequence

#### 42.3.1.1.8 Dynamic Allocation / Uplink Transfer / Normal / Two uplink timeslots

This test case verifies the multislot capabilities and applies to all Mobile Station belonging to the multislot class 3, 5, 6, 7 and 9 to 29.

##### 42.3.1.1.8.1 Conformance requirements

Mobile station belonging to multislot class 3, 5, 6, 7 and 9 to 29 shall support at least two transmit timeslots per TDMA frame (refer to 3GPP TS 05.02, clause B.1).

#### References

3GPP TS 05.02, clause B.1.

##### 42.3.1.1.8.2 Test purposes

To verify that an MS belonging to multislot class 3, 5, 6, 7 and 9 to 29 supports an uplink TBF using two timeslots per TDMA frame.

##### 42.3.1.1.8.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, default setting, BS\_PBCCH\_BLKs = 3.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context2 activated.

#### Related PICS/PIXIT Statement(s)

- Support GPRS service.
- Support activation of at least one PDP context.
- The way to initiate an uplink packet transfer.
- The multislot classes supported.

#### Test Procedure

The MS is triggered to initiate packet uplink transfer data in RLC acknowledged mode. The SS orders the MS to use two-phase access procedure, in PACKET UPLINK ASSIGNMENT two timeslots are assigned. On the same TDMA frame the SS signals to the MS the assigned USFs addressing the MS on the two assigned PDTCHs. It is checked that the two RLC/MAC data blocks in the next radio block period are received on the respective PDTCH channels and that each data block contains the correct TFI without TLLI.

The SS acknowledges the received data and assigns the USFs addressing the MS. The check is repeated. The same procedure is going on until the MS completes the packet data transfer.

#### Maximum Duration of Test

5 minutes.

#### 42.3.1.1.9 Dynamic Allocation / Uplink Transfer / Normal / Frequency parameters

##### 42.3.1.1.9.1 Conformance requirements

1. Frequency parameters are included in the assignment messages (i.e., PACKET DOWNLINK ASSIGNMENT, PACKET UPLINK ASSIGNMENT, or PACKET TIMESLOT RECONFIGURE) and define the radio frequency channels or set of radio frequency channels the mobile station is to use during the assigned TBF. The first assignment message, sent to the mobile station when it enters packet transfer mode, shall include the frequency parameters. Subsequent assignment messages, sent to the mobile station during packet transfer mode, may omit the frequency parameters. If a mobile station receives a subsequent assignment message, during packet transfer mode, without the frequency parameters, the mobile station shall continue to use the previously assigned frequency parameters.
2. The frequency parameters may use an ARFCN defining a non-hopping radio frequency channel, or use the indirect encoding, direct encoding 1 or direct encoding 2 defining a hopping radio frequency channel.
3. The indirect encoding defines the assigned set of radio frequency channels by referencing information stored within the mobile station. Such information may be received on PBCCH or BCCH or be received in a previous assignment message using one of the direct encoding options. An MA\_NUMBER identifies which of up to eight stored sets of frequency parameters is to be used.
4. When the indirect encoding is used, the network may include a CHANGE\_MARK\_1 and a CHANGE\_MARK\_2 in the Frequency Parameters information element. The mobile station shall then verify that it is using a set of PBCCH or BCCH information identified by a PSI or SI *change mark* corresponding to one of the CHANGE\_MARK\_1 or 2 parameters, for the decoding of the frequency information. If that is not the case, an abnormal condition occurs.
5. The direct encoding defines the assigned set of radio frequency channels by using information contained within the assignment message. The direct encoding 1 references the cell allocation or reference frequency lists received on PBCCH for the decoding of this information. The direct encoding 2 is self contained. When the direct encoding 1 or 2 is used, the mobile station shall store the received GPRS mobile allocation for possible later reference in an assignment message using the indirect encoding.

## References

3GPP TS 04.60, subclauses 5.5.1.7, 11.2.19, 12.8 and 12.10a.

### 42.3.1.1.9.2 Test purposes

To verify that:

1. The MS in the packet transfer mode understands correctly the frequency parameters in the indirect encoding format in PACKET UPLINK ASSIGNMENT and PACKET TIMESLOT RECONFIGURATION, and correctly uses the information received on PBCCH in PSI13, SI13 and a consistent set of PSI2 for the assigned TBF.
2. The MS in the packet transfer mode understands and uses correctly the frequency parameters in the direct encoding 1 and 2 formats in PACKET UPLINK ASSIGNMENT and PACKET TIMESLOT RECONFIGURATION and stores the received GPRS mobile allocation for a possible later reference in an assignment message using the indirect encoding.

### 42.3.1.1.9.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, default setting, BS\_PBCCH\_BLKs = 3, PSI\_COUNT\_HR = 1, REPEAT\_PERIOD = 1, the initial SI13, PSI13 and the 1<sup>st</sup> consistent set of PSI2 including 5 instances(see specific message contents). The PSI2s are transmitted with the high repetition.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context3 activated.

#### Related PICS/PIXIT Statement(s)

- Support GPRS service.
- Support activation of at least one PDP context.
- The way to initiate an uplink packet transfer.

#### Test Procedure

The test sequence is repeated three times. Each time before starting PSI13, SI13 and a consistent set of PSI2 are firstly broadcast. The MS is given 3s for reading partially the modified PSI13 and PSI2s.

The test sequence consists of seven resource assignments to the MS. The MS is triggered to initiate packet uplink transfer 462K octets in the RLC unacknowledged mode. Each assignment (either via PACKET UPLINK ASSIGNMENT, or via PACKET TIMESLOT RECONFIGURATION) contains a specific frequency parameter. The MS is allowed to transfer 3000 radio blocks data on the assigned hopping PDCH. It is checked that coding cs1 and TFI are correct in the received data. The frequency hopping check on the assigned PDCH takes about 3 minutes.

Test parameters:

For GSM 900, CA in PSI13 includes the frequencies:

(10, 17, 20, 26, 34, 42, 45, 46, 52, 59, 66, 73, 74, 76, 108, 114).

For DCS1800, CA in PS13 includes the frequencies:

(739,743, 746, 749, 756, 758, 761,764, 771, 779, 782, 791, 798, 829, 832, 844).

For PCS1900, CA in PS13 includes the frequencies:

(718, 721, 724, 727, 734, 739,743, 746, 749, 756, 758, 761,764, 771, 779, 782).

For GSM700, CA in PSI13 includes the frequencies:

(447, 454, 457, 463, 471, 479, 482, 483, 489, 496, 498, 500, 501, 502, 503, 506, 508).

For GSM850, CA in PSI13 includes the frequencies:

(137, 144, 147, 153, 161, 169, 172, 173, 179, 186, 193, 200, 201, 202, 203, 235, 241).

The algorithm for the calculation of array CA (j, k) and MA (j, k) are following:

**P-GSM 900:**

For k = 1, 2, 3:

$ca_{PGSM}(1, k)$  is set to 64.

An arbitrary subset  $CA_{PGSM}(1, k)$  of the set  $\{1, \dots, 124\}$  containing  $ca_{PGSM}(1, k)$  elements is drawn.

An element B of the set  $CA_{PGSM}(1, k)$  is arbitrarily chosen.

An arbitrary value  $ca_{PGSM}(2, k)$  in the range 20, ..., 63 is chosen.

An arbitrary subset  $CA_{PGSM}(2, k)$  of the set  $\{1, \dots, 124\}$  with  $ca_{PGSM}(2, k)$  elements and containing B is chosen.

An arbitrary value  $ca_{PGSM}(3, k)$  in the range 4, ..., 19 is chosen.

An arbitrary subset  $CA_{PGSM}(3, k)$  of the set  $\{1, \dots, 124\}$  with  $ca_{PGSM}(3, k)$  elements and containing B is chosen.

For j = 1, 2, 3, values  $ma_{PGSM}(j, k)$  in the range j, ...,  $ca_{PGSM}(j, k) - 1$  and values  $MAIO_{PGSM}(j, k)$  in the range 0, ...,  $ma_{PGSM}(j, k) - 1$  are arbitrarily chosen.

Subsets  $MA_{PGSM}(j, k)$  of  $CA_{PGSM}(j, k)$  not containing B and having  $ma(j, k)$  elements are arbitrarily chosen.

**DCS 1 800:**

For k = 1, 2, 3:

$ca_{DCS}(1, k)$  is set to 64.

An arbitrary subset  $CA_{DCS}(1, k)$  of the set  $\{700, \dots, 810\}$  containing  $ca_{DCS}(1, k)$  elements is chosen.

An element B of the set  $CA_{DCS}(1, k)$  is arbitrarily chosen.

An arbitrary value  $ca_{DCS}(2, k)$  in the range 17, ..., 63 is chosen.

An arbitrary subset  $CA_{DCS}(2, k)$  of the set  $\{700, \dots, 810\}$  with  $ca_{DCS}(2, k)$  elements and containing B is chosen.

An arbitrary value  $ca_{DCS}(3, k)$  in the range 4, ..., 16 is chosen.

An arbitrary subset  $CA_{DCS}(3, k)$  of the set  $\{700, \dots, 810\}$  with  $ca_{DCS}(3, k)$  elements and containing B is chosen.

For j = 1, 2, 3, values  $ma_{DCS}(j, k)$  in the range j, ...,  $ca_{DCS}(j, k) - 1$  and values  $MAIO_{DCS}(j, k)$  in the range 0, ...,  $ma_{DCS}(j, k) - 1$  are arbitrarily chosen.

Subsets  $MA_{DCS}(j, k)$  of  $CA_{DCS}(j, k)$  not containing B and having  $ma_{DCS}(j, k)$  elements are arbitrarily chosen.

## PCS 1 900:

For  $k = 1, 2, 3$ :

$ca_{PCS}(1, k)$  is set to 64.

An arbitrary subset  $CA_{PCS}(1, k)$  of the set  $\{700, \dots, 810\}$  containing  $ca_{PCS}(1, k)$  elements is chosen.

An element  $B$  of the set  $CA_{PCS}(1, k)$  is arbitrarily chosen.

An arbitrary value  $ca_{PCS}(2, k)$  in the range  $17, \dots, 63$  is chosen.

An arbitrary subset  $CA_{PCS}(2, k)$  of the set  $\{700, \dots, 810\}$  with  $ca_{PCS}(2, k)$  elements and containing  $B$  is chosen.

An arbitrary value  $ca_{PCS}(3, k)$  in the range  $4, \dots, 16$  is chosen.

An arbitrary subset  $CA_{PCS}(3, k)$  of the set  $\{700, \dots, 810\}$  with  $ca_{PCS}(3, k)$  elements and containing  $B$  is chosen.

For  $j = 1, 2, 3$ , values  $ma_{PCS}(j, k)$  in the range  $j, \dots, ca_{PCS}(j, k) - 1$  and values  $MAIO_{PCS}(j, k)$  in the range  $0, \dots, ma_{PCS}(j, k) - 1$  are arbitrarily chosen.

Subsets  $MA_{PCS}(j, k)$  of  $CA_{PCS}(j, k)$  not containing  $B$  and having  $ma_{PCS}(j, k)$  elements are arbitrarily chosen.

## GSM 700:

For  $k = 1, 2, 3$ :

$ca_{700}(1, k)$  is set to 64.

An arbitrary subset  $CA_{700}(1, k)$  of the set  $\{438, \dots, 511\}$  containing  $ca_{700}(1, k)$  elements is drawn.

An element  $B$  of the set  $CA_{700}(1, k)$  is arbitrarily chosen.

An arbitrary value  $ca_{700}(2, k)$  in the range  $457, \dots, 500$  is chosen.

An arbitrary subset  $CA_{700}(2, k)$  of the set  $\{438, \dots, 511\}$  with  $ca_{700}(2, k)$  elements and containing  $B$  is chosen.

An arbitrary value  $ca_{700}(3, k)$  in the range  $441, \dots, 456$  is chosen.

An arbitrary subset  $CA_{700}(3, k)$  of the set  $\{438, \dots, 511\}$  with  $ca_{700}(3, k)$  elements and containing  $B$  is chosen.

For  $j = 1, 2, 3$ , values  $ma_{700}(j, k)$  in the range  $j, \dots, ca_{700}(j, k) - 1$  and values  $MAIO_{700}(j, k)$  in the range  $0, \dots, ma_{700}(j, k) - 1$  are arbitrarily chosen.

Subsets  $MA_{700}(j, k)$  of  $CA_{700}(j, k)$  not containing  $B$  and having  $ma(j, k)$  elements are arbitrarily chosen.

## GSM 850:

For  $k = 1, 2, 3$ :

$ca_{850}(1, k)$  is set to 64.

An arbitrary subset  $CA_{850}(1, k)$  of the set  $\{128, \dots, 251\}$  containing  $ca_{850}(1, k)$  elements is drawn.

The difference between the maximum and minimum ARFCNs in  $CAGSM850(1, k)$  shall be less than 112.

An element  $B$  of the set  $CA_{850}(1, k)$  is arbitrarily chosen.

An arbitrary value  $ca_{850}(2, k)$  in the range  $147, \dots, 190$  is chosen.

An arbitrary subset  $CA_{850}(2, k)$  of the set  $\{128, \dots, 251\}$  with  $ca_{850}(2, k)$  elements and containing  $B$  is chosen.

An arbitrary value  $ca_{850}(3, k)$  in the range  $131, \dots, 146$  is chosen.

An arbitrary subset  $CA_{850}(3, k)$  of the set  $\{128, \dots, 251\}$  with  $ca_{850}(3, k)$  elements and containing  $B$  is chosen.

For  $j = 1, 2, 3$ , values  $ma_{850}(j, k)$  in the range  $j, \dots, ca_{850}(j, k) - 1$  and values  $MAIO_{850}(j, k)$  in the range  $0, \dots, ma_{850}(j, k) - 1$  are arbitrarily chosen.

Subsets  $MA_{850}(j, k)$  of  $CA_{850}(j, k)$  not containing  $B$  and having  $ma(j, k)$  elements are arbitrarily chosen.

## GSM 700, GSM 850, GSM 900 and DCS 1 800 and PCS 1 900

$T(1) = 91$ .

$T(2) = 42\ 000$ .

$T(3) =$  An arbitrary value chosen in the range  $92, \dots, 29999$ .

## Maximum Duration of Test

70 minutes.

## Expected Sequence

This sequence is performed for  $k = 1, 2, 3$ :

## 42.3.1.2 Dynamic Allocation / Uplink Transfer / Abnormal

### 42.3.1.2.1 Void

### 42.3.1.2.2 Dynamic Allocation / Uplink Transfer / Abnormal / with cell reselection in acknowledged mode

#### 42.3.1.2.2.1 Conformance requirements

Upon detecting the stall condition the mobile station shall start timer T3182. If timer T3182 expires, the mobile station shall decrement counter N3102 by PAN\_DEC, and perform an abnormal release with random access.

When  $N3102 \leq 0$  is reached, the mobile station shall perform an abnormal release with cell re-selection.

#### References

3GPP TS 04.60, subclause 9.3.2.2.

#### 42.3.1.2.2.2 Test purposes

To verify that while in uplink unacknowledged mode operation the MS performs an abnormal release with cell reselection if the  $N3102 \leq 0$  is reached.

#### 42.3.1.2.2.3 Method of test

#### Initial Conditions

System Simulator:

2 cells, GPRS supported, PCCCH present, Max-Retrans = 2, access burst type = 11 bits, BS\_PAG\_BLKES\_RES = 2, BS\_PBCCH\_BLKES = 3, BS\_PCC\_CHANS = 1, BS\_PRACH\_BLKES = 1, PAN\_MAX = 8, PAN\_DEC = 5 and PAN\_INC = 2.

Cell A:

power level = 63 dB $\mu$ Vemf(), GPRS\_RXLEV\_ACCESS\_MIN = 33 dB $\mu$ Vemf(), PRIORITY\_CLASS = 3, GPRS\_PENALTY\_TIME = 0, GPRS\_RESELECT\_OFFSET = 0 dB $\mu$ Vemf(), RANDOM\_ACCESS\_RETRY = 1.

Cell B:

power level = 53 dB $\mu$ Vemf(), GPRS\_RXLEV\_ACCESS\_MIN = 33 dB $\mu$ Vemf(), PRIORITY\_CLASS = 3, GPRS\_PENALTY\_TIME = 0, GPRS\_RESELECT\_OFFSET = 16 dB $\mu$ Vemf().

Mobile Station:

The MS is GPRS attached on cell A, a P-TMSI allocated and test PDP context2 activated.

#### Related PICS/PIXIT Statement(s)

- Support GPRS service.
- Support activation of at least one PDP context.
- The way to initiate an uplink packet transfer.

## Test Procedure

The MS is triggered to initiate packet uplink transfer 1 500 octets in the RLC acknowledged mode on cell A. After a successful uplink PDCH assignment the SS sends PACKET DOWNLINK DUMMY indicating the assigned USF assigned to the MS. The MS sends a RLC radio block. The SS allows the MS to transfer so many data blocks without acknowledgement until the stall indication bit is set.

The MS requests the necessary radio resources by PACKET CHANNEL REQUEST on cell A. The SS assigns a new PDCH to the MS. The SS sends PACKET DOWNLINK DUMMY indicating the assigned USF assigned to the MS. The MS sends a RLC radio block. The SS allows the MS to transfer so many data blocks without acknowledgement until the stall indication bit is set.

The MS requests the necessary radio resources by PACKET CHANNEL REQUEST on cell B. The SS then assigns a new PDCH to the MS for completion of the requested uplink data transfer.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

### 42.3.1.2.3 Dynamic Allocation / Uplink Transfer / Abnormal / with cell reselection in unacknowledged mode

#### 42.3.1.2.3.1 Conformance requirements

If the mobile station transmits k RLC data blocks without receiving a Packet Ack/Nack message the mobile station shall start timer T3182. If timer T3182 expires, the mobile station shall decrement counter N3102 by PAN\_DEC, and perform an abnormal release with random access.

When  $N3102 \leq 0$  is reached, the mobile station shall perform an abnormal release with cell re-selection.

#### References

3GPP TS 04.60, subclause 9.3.3.2.

#### 42.3.1.2.3.2 Test purposes

To verify that while in uplink unacknowledged mode operation the MS performs an abnormal release with cell reselection if the  $N3102 \leq 0$  is reached.

#### 42.3.1.2.3.3 Method of test

#### Initial Conditions

##### System Simulator:

2 cells, GPRS supported, PCCCH present, Max-Retrans = 2, access burst type = 11 bits, BS\_PAG\_BLKES\_RES = 2, BS\_PBCCH\_BLKES = 3, BS\_PCC\_CHANS = 1, BS\_PRACH\_BLKES = 1, PAN\_MAX = 8, PAN\_DEC = 5 and PAN\_INC = 2.

##### Cell A:

power level = 63 dB $\mu$ Vemf(), GPRS\_RXLEV\_ACCESS\_MIN = 33 dB $\mu$ Vemf(), PRIORITY\_CLASS = 3, GPRS\_PENALTY\_TIME = 0, GPRS\_RESELECT\_OFFSET = 0 dB $\mu$ Vemf(), RANDOM\_ACCESS\_RETRY = 1.

##### Cell B:

power level = 53 dB $\mu$ Vemf(), GPRS\_RXLEV\_ACCESS\_MIN = 33 dB $\mu$ Vemf(), PRIORITY\_CLASS = 3, GPRS\_PENALTY\_TIME = 0, GPRS\_RESELECT\_OFFSET = 16 dB $\mu$ Vemf().

##### Mobile Station:

The MS is GPRS attached with cell A, a P-TMSI allocated and Test PDP context3 activated.

#### Related PICS/PIXIT Statement(s)

- Type of MS (GSM 700 or GSM 850 or P-, E-, R-GSM 900 or DCS 1 800 or PCS 1 900).
- Support GPRS service.
- Support activation of at least one PDP context.
- The way to initiate an uplink packet transfer.

#### Test Procedure

The MS is triggered to initiate packet uplink transfer 1500 octets in the RLC unacknowledged mode on cell A. After a successful uplink PDCH assignment the SS sends PACKET DOWNLINK DUMMY indicating the assigned USF assigned to the MS. The MS sends a RLC radio block. The SS allows the MS to transfer 64 data blocks without acknowledgement.

The MS requests the necessary radio resources by PACKET CHANNEL REQUEST on cell A. The SS assigns a new PDCH to the MS. The SS sends PACKET DOWNLINK DUMMY indicating the assigned USF assigned to the MS. The MS sends a RLC radio block. The SS allows the MS to transfer 64 data blocks without acknowledgement.

The MS requests the necessary radio resources by PACKET CHANNEL REQUEST on cell B. The SS then assigns a new PDCH to the MS for completion of the requested uplink data transfer.

#### Maximum Duration of Test

5 minutes.

#### Expected Sequence

## 42.3.2 Dynamic Allocation / Uplink Transfer with Downlink TBF establishment (concurrent)

### 42.3.2.1 Dynamic Allocation / Uplink Transfer with Downlink TBF establishment / Normal

#### 42.3.2.1.1 Dynamic Allocation / Uplink Transfer with Downlink TBF establishment / Normal / Successful

##### 42.3.2.1.1.1 Conformance requirements

During uplink transfer, the network may initiate a downlink TBF by sending a PACKET DOWNLINK ASSIGNMENT message, or a PACKET TIMESLOT RECONFIGURE, to the mobile station on the PACCH. If a PACKET TIMESLOT RECONFIGURE message is sent, then the message shall contain the DOWNLINK\_TFI\_ASSIGNMENT field. On receipt of an assignment message, and after the TBF starting time, if present, the mobile station shall switch to the assigned PDCHs. The operation of the downlink TBF follows the procedures in 3GPP TS 04.60, subclause 8.1.2 with the following additions:

1. If a timer or counter expiry causes the uplink TBF to be aborted in the mobile station, the mobile station shall also abort the downlink TBF and perform an abnormal release with random access.
2. If uplink and downlink TBFs are already established, then the network may send a PACKET TIMESLOT RECONFIGURE message without DOWNLINK\_TFI\_ASSIGNMENT. The mobile station shall interpret this as a reassignment of the timeslot allocations of the concurrent uplink and downlink TBFs and the downlink TFI is not changed.

### References

3GPP TS 04.60, subclauses 8.1.1.1.3 and 8.1.2.

#### 42.3.2.1.1.2 Test purposes

To verify that during uplink transfer:

1. The MS switches to the assigned PDCHs when the network initiates a downlink TBF by sending PACKET DOWNLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE to the MS on PACCH.
2. When the MS receives PACKET TIMESLOT RECONFIGURE without DOWNLINK\_TFI\_ASSIGNMENT in the case of uplink and downlink TBFs established already, the MS interprets this message as a reassignment of the timeslot allocations of the concurrent uplink and downlink TBFs.
3. The MS also aborts the downlink TBF and performs an abnormal release with random access if a timer or a counter expiry causes the uplink TBF to be aborted in the MS.

#### 42.3.2.1.1.3 Method of test

### Initial Conditions

System Simulator:

1 cell, default setting, BS\_PBCCH\_BLKs = 3.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context3 activated.

### Related PICS/PIXIT Statement(s)

- Support GPRS service.
- Support activation of at least one PDP context.

- The way to initiate an uplink packet transfer.

### Test Procedure

An uplink TBF is established and in progress. After the MS sends an uplink data block the SS assigns a downlink TBF on the same timeslot as the uplink TBF. The SS sends a downlink data block with polling for acknowledgement and the assigned USF assigned to the MS for the MS, and indicates FBI=1 for the final data block. The MS sends an uplink data block and acknowledges the received downlink data block on the correct frame. The SS waits 2s for the MS releasing the downlink PDCH. The SS sends PACKET TIMESLOT RECONFIGURE assigning a new downlink PDCH. A downlink data block is sent, the assigned USF assigned to the MS and the MS is polled for acknowledgement. The MS sends an uplink data block and acknowledges the last received downlink data block on the correct frame.

The SS sends PACKET TIMESLOT RECONFIGURE without DOWNLINK\_TFI\_ASSIGNMENT replacing the existing uplink and downlink PDCH with another pair of concurrent PDCH. A downlink data block is sent on the replaced PDCH and the MS is polled for acknowledgement. The MS shall not react upon it. Another downlink data block is sent on the assigned PDCH, the assigned USF assigned to the MS and the MS is polled for acknowledgement. The MS sends an uplink data block and acknowledges the received downlink data block on the correct frame.

The SS sends downlink data blocks with USF not addressing the MS until receives PACKET CHANNEL REQUEST.

### Maximum Duration of Test

5 minutes.

### Expected Sequence

|------|-----------|------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 15   | SS -> MS  | PACKET TIMESLOT RECONFIGURE                    | Without DOWNLINK_TFI_ASSIGNMENT, Assign new uplink and downlink time slots, no starting time, sent on the PACCH of the PDCH assigned in step 11.              |
| 16   | SS -> MS  | DOWNLINK RLC DATA BLOCK                        | Containing USF assigned to the MS. Sent on the downlink PDTCH assigned in step 11 on 3 blocks from the last radio block containing the assignment in step 15. |
| 17   | SS        |                                                | Check that neither data blocks, nor control blocks are sent by the MS within the next seven radio blocks.                                                     |
| 18   | SS -> MS  | DOWNLINK RLC DATA BLOCK                        | Containing a valid RRBP= N+26 and USF assigned to the MS. Sent on the downlink PDTCH assigned in step 15.                                                     |
| 19   | MS -> SS  | UPLINK RLC DATA BLOCK                          | Received on the uplink PDTCH assigned in step 15.                                                                                                             |
| 20   | MS -> SS  | PACKET DOWNLINK ACK/NACK                       | Received on the block of frame number = N+26, N is the frame number of the first burst of the data block in step 18, on the PACCH of the downlink PDCH.       |
| 21   | SS -> MS  | DOWNLINK RLC DATA BLOCK                        | USF not addressing the MS.                                                                                                                                    |
| 22   | SS -> MS  |                                                | Repeat step 21 until receives PACKET CHANNEL REQUEST in step 23.                                                                                              |
| 23   | MS -> SS  | PACKET CHANNEL REQUEST                         | Received on PRACH within 7.5 seconds ( $T_{3180} * 110\% + PS_{11}$ repeat period, 2 s) from step 20.                                                         |
| 24   | SS -> MS  | PACKET UPLINK ASSIGNMENT                       | Single block assignment,                                                                                                                                      |
| 25   | MS -> SS  | PACKET RESOURCE REQUEST                        | Two phase access procedure. Received on the single block assigned in step 24.                                                                                 |
| 26   | SS -> MS  | PACKET UPLINK ASSIGNMENT                       | Open-ended uplink dynamic allocation, no starting time, USF_GRANULARITY = 4 blocks, Sent on PACCH of the same PDCH assigned in step 24.                       |
| 27   | SS -> MS  | PACKET DOWNLINK DUMMY CONTROL BLOCK            | The USF assigned to the MS. Sent on PACCH of PDCH assigned on 3 blocks from the last radio block containing the uplink assignment in step 26.                 |
| 28   | MS -> SS  | UPLINK RLC DATA BLOCK                          | Received 4 consecutive data blocks                                                                                                                            |
| 29   |           | {Completion of uplink RLC data block transfer} |                                                                                                                                                               |

#### 42.3.2.1.2 Dynamic Allocation / Uplink Transfer with Downlink TBF establishment / Normal / Multislot capabilities

This test case applies to all Mobile Station belonging to multislot class 2, 3, 4, 5, 6, 8, 9, 10, 19 and 24.

#### 42.3.2.1.2.1 Conformance requirements

1. Mobile station belonging to multislot class 2, 3, 4, 5, 6, 8, 9, 10, 19 and 24 shall support as many uplink and downlink timeslots as indicated in 3GPP TS 05.02 clause B.1.
2. If transmission of the PACKET CONTROL ACKNOWLEDGEMENT would result in more than the maximum Tx timeslots per TDMA frame allowed by the multislot class, transmission of the highest numbered PDCH(s) shall be omitted.

#### References

3GPP TS 05.02, clause B.1.

3GPP TS 04.60, subclause 8.6.

#### 42.3.2.1.2.2 Test purposes

To verify that the multislot MS supports as many uplink and downlink TBFs per TDMA frame as indicated. Especially, it is verified that the Type 1 MS in a multislot class declared has the capability of supporting:

1.  $T_{tb}$ , the minimum number of slots allowed between the end of the previous transmit or receive TS and the next transmit TS when measurement is to be performed for type 1 MS;
2.  $T_{ra}$ , the minimum number of slots allowed between the previous transmit or receive TS and the next receive TS when measurement is to be performed for type 1 MS;
3. the maximum number of Rx and Tx supported;
4. the sum of slots supported.

It is also verified that the MS of a multislot class transmits PACKET CONTROL ACKNOWLEDGEMENT when polled, and omits the transmission of the highest numbered PDCH(s) if the transmission would result in more than the maximum Tx timeslots per TDMA frame allowed by the multislot class.

#### 42.3.2.1.2.3 Method of test

##### Initial Conditions

System Simulator:

1 cell, default setting, BS\_PBCCH\_BLKs = 3.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context3 activated.

##### Related PICS/PIXIT Statement(s)

- Support GPRS service.
- Support activation of at least one PDP context.
- The way to initiate an uplink packet transfer.
- The multislot class with maximum capability supported.

## Test Procedure

The following multislot configurations are tested in the test case:

- Class 2 and 3 support two downlink timeslots and one uplink timeslot,  $T_{tb}=2$ ,  $T_{ra}=3$ ;
- Class 4 and 6 support three downlink timeslots and one uplink timeslot,  $T_{tb}=1$ ,  $T_{ra}=3$ ;
- Class 5 and 9 supports two downlink timeslots and two uplink timeslots,  $T_{tb}=1$ ,  $T_{ra}=3$ ;
- Class 8 and 10 support four downlink timeslots and one uplink timeslot,  $T_{tb}=1$ ,  $T_{ra}=2$ ;
- Class 19 and 24 support five downlink timeslots and one uplink timeslot,  $T_{tb}=1$ ,  $T_{ra}=2$ .

In the multislot configurations all assigned channels are frequency hopped except for the class 19 and 24 test where non-hopping channels are assigned for PDCHs. The class 3, 6, 9 and 10 are tested in a reduced uplink configuration.

According to the multislot configurations an uplink TBF with one or two timeslots assigned is established and in progress. The SS establishes a concurrent downlink TBF with multiple timeslots assigned. The basic test procedure is executed on four consecutive radio blocks.

On the 1st radio block the SS sends downlink data in the maximum capability allowed under the configuration, signals to the MS the assigned USFs addressing the MS and polls the MS. On the 2<sup>nd</sup> radio block the MS sends RLC data in response of the addressing the MS USFs. On the 3<sup>rd</sup> radio block the SS sends downlink data in the maximum capability allowed under the configuration and signals to the MS the assigned USFs addressing the MS. On the 4<sup>th</sup> radio block the MS responses PACKET DOWNLINK ACK/NACK and sends RLC data in response of one of the USFs addressing the MS if the configuration is allowed.

The basic test procedure is repeated until CV=1. The SS sends the last RLC data block with FBI=1 and polls the MS for acknowledgement. The SS sends PACKET UPLINK ACK/NACK setting FINAL\_ACK\_INDICATION=1. The MS sends two separate PACKET CONTROL ACKNOWLEDGEMENT messages to release the uplink and downlink TBFs.

## Maximum Duration of Test

5 minutes.

Expected Sequence for multislot class 2 and class 3 (2 downlink timeslots + 1 uplink timeslot)

### 42.3.2.2 Dynamic Allocation / Uplink Transfer with Downlink TBF establishment / Abnormal

#### 42.3.2.2.1 Dynamic Allocation / Uplink Transfer with Downlink TBF establishment / Abnormal / with random access

##### 42.3.2.2.1.1 Conformance requirements

1. If a failure occurs on the mobile station side before the new TBF has been successfully established, the newly reserved resources are released.
2. If the information in the PACKET TIMESLOT RECONFIGURE does not properly specify an uplink and downlink PDCH or violates the mobile station's multislot capabilities, the mobile station shall perform an abnormal release with random access.
3. If uplink and downlink TBFs are not already established and the PACKET TIMESLOT RECONFIGURE message does not include a DOWNLINK\_TFI\_ASSIGNMENT field, then the mobile station shall perform an abnormal release with random access.
4. If a failure in the PACKET TIMESLOT RECONFIGURE is due to any other reason, the mobile station shall abort the procedure and perform an abnormal release with random access.
5. If the mobile station receives a PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message specifying frequencies that are not all in one frequency band then the mobile station shall perform an abnormal release with random access.
6. To perform an abnormal release with random access, the mobile station shall abort all TBFs in progress and its associated resources, return to the CCCH or PCCCH and initiate establishment of a new uplink TBF.

#### References

3GPP TS 04.60, subclauses 8.1.1.1.3.1, 8.1.1.1.2.1 and 8.7.2.

#### 42.3.2.2.1.2 Test purposes

To verify that the MS, in downlink TBF establishment during uplink transfer, performs an abnormal release with random access, when the information in the PACKET TIMESLOT RECONFIGURE:

1. does not properly specify an uplink and downlink PDCH;
2. violates the mobile station's multislot capabilities;
3. does not include a DOWNLINK\_TFI\_ASSIGNMENT field;
4. has a failure due to any other reason other than the reasons listed above.

#### 42.3.2.2.1.3 Method of test

##### Initial Conditions

System Simulator:

1 cell, default setting, BS\_PBCCH\_BLKs = 3.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context3 activated.

##### Related PICS/PIXIT Statement(s)

- Support GPRS service.
- Support activation of at least one PDP context.
- The way to initiate an uplink transfer.
- Multislot class of the MS.

##### Test Procedure

An uplink TBF is established and in progress. The SS sends PACKET TIMESLOT RECONFIGURE for establishment a downlink TBF. A failure occurs at the mobile station side before the new downlink TBF has been successfully established. The MS starts a random access for uplink establishment. The SS assigns a new uplink PDCH to the MS. The SS signals the USF of the preceding uplink TBF addressing the MS on the preceding PDCH which shall have been released by the MS. It is checked that no RLC data block is received on the next three radio blocks. The SS signals the assigned USF assigned to the MS on the uplink PDCH assigned. The MS sends a RLC data block.

The test procedure is repeated 4 times. The message contents of PACKET TIMESLOT RECONFIGURE are varied as defined below.

1<sup>st</sup> execution, improper PDCH: hopping frequencies not all in one band.

2<sup>nd</sup> execution, violating the multislot capabilities.

3<sup>rd</sup> execution, no DOWNLINK\_TFI\_ASSIGNMENT.

4<sup>th</sup> execution, CONTROL\_ACK = '1' (shall be set to '0' as the SS has not yet sent the final downlink RLC data block).

##### Maximum Duration of Test

10 minutes.

## Expected Sequence

The sequence is repeated 4 times. The 2<sup>nd</sup> execution is not applicable for the MS multislot class 18 and 29.

## 42.3.2.2.2 Dynamic Allocation / Uplink Transfer with Downlink TBF establishment / Abnormal / Continuation of normal operation

## 42.3.2.2.2.1 Conformance requirements

1. If a failure occurs on the mobile station side before the new TBF has been successfully established, the newly reserved resources are released.
2. If a failure in the PACKET DOWNLINK ASSIGNMENT is due to any reason, the mobile station shall abort the procedure and continue the normal operation of the uplink TBF.
3. If a mobile station receives a PACKET DOWNLINK ASSIGNMENT assigning a different MAC mode than the MAC mode of an already operating uplink TBF, the PACKET DOWNLINK ASSIGNMENT message shall be ignored.

## References

3GPP TS 04.60, subclauses 8.1.1.1.3.1 and 8.7.

## 42.3.2.2.2.2 Test purposes

1. To verify that the MS aborts the downlink TBF establishment and continues the normal operation of the uplink TBF when the PACKET DOWNLINK ASSIGNMENT fails due to any reason in downlink TBF establishment during uplink transfer.
2. To verify that the MS ignores the PACKET DOWNLINK ASSIGNMENT message if it assigns a different MAC mode than the MAC mode of an already operating uplink TBF.

## 42.3.2.2.2.3 Method of test

## Initial Conditions

System Simulator:

1 cell, default setting, BS\_PBCCH\_BLKs = 3.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context3 activated.

## Related PICS/PIXIT Statement(s)

- Type of MS (GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 and PCS 1 900).
- Support GPRS service.
- Support activation of at least one PDP context.
- The way to initiate an uplink packet transfer.

## Test Procedure

An uplink TBF is established and in progress. The SS sends PACKET DOWNLINK ASSIGNMENT assigning a downlink TBF while a fault occurs in the downlink assignment message.

The SS sends a downlink RLC data block on the downlink PDCH assigned and polls the MS for acknowledgement. It is checked that no PACKET DOWNLINK ACK/NACK is received. The SS signals the assigned USF assigned to the MS on the uplink PDCH assigned. The MS sends a RLC data block.

The test procedure is executed twice. The message contents of PACKET DOWNLINK ASSIGNMENT are varied as defined below.

1. Without DOWNLINK\_TFI\_ASSIGNMENT.
2. MAC mode = Fixed Allocation, an inconsistent MAC mode.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

The test sequence is executed twice.

### 42.3.3 Dynamic Allocation / Resource reallocation

The clause is applicable to the MS either supporting two PDP contexts or supporting SMS over GPRS and at least one PDP context.

#### 42.3.3.1 Dynamic Allocation / Resource reallocation / Successful

During an uplink packet transfer, upper layer may request to transfer another LLC PDU with a different Radio Priority, a different peak throughput class or a different RLC mode than the current one, the MS may require the allocation of new uplink resources.

#### 42.3.3.1.1 Dynamic Allocation / Resource reallocation / Successful / Higher throughput class or higher radio priority

##### 42.3.3.1.1.1 Conformance requirements

1. During an uplink packet transfer, upper layer may request to transfer another LLC PDU. If the mobile station has not started the countdown procedure and the new LLC PDU has the same RLC mode as the current uplink TBF and either a higher radio priority or the same radio priority but a higher peak throughput class, the mobile station shall immediately request a resource reallocation for uplink according to the new Radio Priority and peak throughput class of the new LLC PDU by sending a PACKET RESOURCE REQUEST message on the PACCH and starting timer T3168.
2. Then the mobile station shall complete the transmission of the current LLC PDU.
3. After the transmission of the PACKET RESOURCE REQUEST message with the reason for changing the priority or peak throughput class of an assigned uplink TBF the mobile station shall continue to use the currently assigned uplink TBF assuming that the requested priority or peak throughput class is already assigned to that TBF.

#### References

3GPP TS 04.60 subclause 8.1.1.1.2.

##### 42.3.3.1.1.2 Test purposes

It is verified that:

1. Having an uplink TBF in progress without starting the countdown procedure, the MS will immediately send PACKET RESOURCE REQUEST if upper layer requests to transfer another LLC PDU which has the same RLC mode as the current uplink TBF and either a higher radio priority or the same radio priority but a higher peak throughput class.
2. After the request of the resource reallocation for uplink the MS completes the transmission of the current LLC PDU independent of whether or not a new resource is allocated.
3. After the transmission of the PACKET RESOURCE REQUEST the MS continues to use the currently assigned uplink TBF.

##### 42.3.3.1.1.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, default setting, BS\_PBCCH\_BLKs = 3, T3168 timeout value=7 (4s), N201-U=500 for SAPI 3, 5, 9, 11, N201-U=270 for SAPI 7.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated:

- for the MS supporting two PDP contexts: the test PDP context3 and context6 activated;
- for the MS supporting one PDP context and SMS over GPRS: the test PDP context5 activated.

#### Related PICS/PIXIT Statement(s)

- Type of MS (GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 and PCS 1 900).
- Support GPRS service.
- Support activation of at least one PDP context.
- Support two PDP contexts.
- Support Short Message Service.
- Support SMS over GPRS.
- The way to initiate an uplink packet transfer.
- The way to trigger transferring new user data in a different PDP context while an uplink transfer is in progress.
- The way to trigger sending an MO short message over GPRS.

#### Test Procedure

##### 1. Test procedure for the MS supporting two PDP contexts.

An uplink TBF is established and in progress. The MS is triggered to transfer data with a higher throughput in the same RLC mode and the same radio priority.

The MS sends PACKET RESOURCE REQUEST. The current TBF is maintained and SS assigns the USFs allowing the MS transmit more data blocks. It is verified that the MS completes the transmission of the current LLC PDU and then starts transmitting a new LLC PDU with the higher throughput. A new PDCH is assigned to MS to complete the RLC data block transferring.

The test procedure is executed twice. In the 2<sup>nd</sup> execution, after the MS requests a resource reallocation for transferring the data block with a higher throughput a new PDCH is assigned. It is verified that the MS switches on the new PDCH, completes the transmission of the current LLC PDU and then starts transmitting a new LLC PDU with the higher throughput.

##### 2. Test procedure for the MS supporting SMS over GPRS and one PDP context.

Similar to the 1<sup>st</sup> test procedure except that the MS is triggered firstly to send MO SMS over GPRS. After an uplink TBF is established for SMS and is in progress the MS is triggered to transfer data with a higher radio priority in the same RLC mode (SMS has the radio priority level = 3 defined in the attach accept message).

#### Maximum Duration of Test

5 minutes.

#### Expected Sequence

The test sequence is applied to the MS supporting two PDP contexts and executed twice for k = 1 and 2.

When k=1 testing that the MS continues to use the currently assigned uplink TBF, while k=2 testing that the MS to use newly assigned the resource to complete transmission of the current PDU before starting transmission the PDU with a higher radio priority or a higher throughput.

Check that the MS completes firstly the transmission of the 1 <sup>st</sup> LLC PDU for short message and then transmits the 2 <sup>nd</sup> LLC PDU for PDP context 5.              |
| 14   | MS        |                                                | Switch off                                                                                                                                                                                                                                                                                                                                                                        |

### Specific Message Contents

PACKET RESOURCE REQUEST message in step 5:

|                             |                      |
|-----------------------------|----------------------|
| Channel Request Description |                      |
| - PEAK_THROUGHPUT_CLASS     | Any value            |
| - RADIO_PRIORITY            | Any value            |
| - RLC_MODE                  | Acknowledged mode    |
| - LLC_PDU_TYPE              | 1 ( not SACK or ACK) |
| - RLC_OCTET_COUNT           | Any value            |

PACKET UPLINK ASSIGNMET message in step 8:

Same as in step 10 of the test sequence testing the MS supporting two PDP contexts.

#### 42.3.3.1.2 Dynamic Allocation / Resource reallocation / Successful / Lower throughput class

##### 42.3.3.1.2.1 Conformance requirements

1. During an uplink packet transfer, upper layer may request to transfer another LLC PDU. If the new LLC PDU has the same RLC mode as the current uplink TBF and either a lower Radio Priority or the same radio priority but a lower peak throughput class, the mobile station shall first complete the sending of the LLC PDU in transfer.
2. When the sending of LLC PDUs at the higher Radio Priority or the same radio priority but higher peak throughput class stops, without waiting for the acknowledgement from the network if in RLC acknowledged mode, the mobile station shall then perform the request of a resource reallocation for uplink for any remaining LLC PDU(s) by sending a PACKET RESOURCE REQUEST message on the PACCH and start timer T3168.

#### References

3GPP TS 04.60, subclause 8.1.1.1.2.

##### 42.3.3.1.2.2 Test purposes

To verify that during an uplink packet transfer, upper layer requests to transfer another LLC PDU and the new LLC PDU has the same RLC mode as the current uplink TBF and either a lower Radio Priority or the same radio priority but a lower peak throughput class.

1. The MS first complete the sending of the LLC PDU in transfer, including acknowledgement from the network if in RLC acknowledged mode.
2. After the sending of LLC PDUs at the higher Radio Priority or the same radio priority but higher peak throughput class stops, the MS performs the request of a resource reallocation for uplink for any remaining LLC PDU(s).

##### 42.3.3.1.2.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, default setting, BS\_PBCCH\_BLKs = 3, T3168 timeout value=7 (4s), N201-U=500 for SAPI 3, 5, 9, 11, N201-U=270 for SAPI 7.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated:

- for the MS supporting two PDP contexts: test PDP context2 and context4 activated;
- for the MS supporting one PDP context and SMS over GPRS: Test PDP context5 activated.

#### Related PICS/PIXIT Statement(s)

- Type of MS (GSM 700, GSM 850, P-, E-, R-GSM 900 or DCS 1 800 and PCS 1 900).
- Support GPRS service.
- Support activation of at least one PDP context.
- Support two PDP contexts.
- Support SMS.
- Support SMS over GPRS.
- The way to initiate an uplink packet transfer.
- The way to trigger transferring new user data in a different PDP context while an uplink transfer is in progress.
- The way to trigger sending short message over GPRS.

#### Test Procedure

An uplink TBF is established and in progress. The MS is triggered to transfer data with a lower throughput or a lower radio priority in the same RLC mode.

The current TBF is maintained and SS assigns the USFs allowing the MS to transmit more data blocks. It is verified that the MS completes the transmission of the current LLC PDU and then sends PACKET RESOURCE REQUEST.

#### Maximum Duration of Test

5 minutes.

#### Expected Sequence

The branch A is applicable for the MS supporting two PDP contexts. The branch B is applicable for the MS supporting SMS over GPRS (SMS has the radio priority level = 1 defined in the attach accept message) and one PDP context.

PACKET UPLINK ASSIGNMET message in step 9:

Same as in subclause 42.3.3.1.1.3, step 10 of the test sequence testing the MS supporting two PDP contexts.

#### 42.3.3.1.3 Dynamic Allocation / Resource reallocation / Successful / Different RLC mode and higher radio priority

##### 42.3.3.1.3.1 Conformance requirements

During an uplink packet transfer, upper layer may request to transfer another LLC PDU. If the new LLC PDU does not have the same RLC mode as the current uplink TBF but has a higher radio priority, the mobile station shall complete the transmission of the current LLC PDU using the countdown procedure including acknowledgement from the network, if in RLC acknowledged mode. The mobile station shall then release the TBF and establish a new uplink TBF for transmission of the new LLC PDU. When the sending of LLC PDUs with a higher radio priority is completed using the countdown procedure, including acknowledgement from the network if in RLC acknowledged mode, the mobile station shall try to establish an uplink TBF for the transmission of any remaining LLC PDU(s).

#### References

3GPP TS 04.60, subclause 8.1.1.1.2.

##### 42.3.3.1.3.2 Test purposes

To verify that during an uplink packet transfer, upper layer requests to transfer another LLC PDU and the new LLC PDU has a different RLC mode from the current uplink TBF but has a higher radio priority.

1. The mobile station completes the transmission of the current LLC PDU using the countdown procedure including acknowledgement from the network, if in RLC acknowledged mode.
2. Then the MS releases the TBF and establishes a new uplink TBF for transmission of the new LLC PDU.
3. When the sending of the new LLC PDUs with a higher radio priority is completed using the countdown procedure, including acknowledgement from the network if in RLC acknowledged mode, the mobile station tries to establish an uplink TBF for the transmission of any remaining LLC PDU(s).

##### 42.3.3.1.3.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, default setting, BS\_PBCCH\_BLKs = 3, T3168 timeout value=7 (4s), N201-U=500 for SAPI 3, 5, 9, 11, N201-U=270 for SAPI 7.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated:

- for the MS supporting two PDP contexts: Test PDP context1 and context2 activated;
- for the MS supporting SMS over GPRS and one PDP context: Test PDP context1 activated.

Related PICS/PIXIT Statement(s)

- Support GPRS service.
- Support activation of at least one PDP context.
- Support two PDP contexts.
- Support SMS.
- Support SMS over GPRS.
- The way to initiate an uplink packet transfer.
- The way to trigger transferring new user data in a different PDP context while an uplink transfer is in progress.
- The way to trigger sending an MO short message over GPRS.

Test Procedure

An uplink TBF is established and in progress. The MS is triggered to transfer 220 octets user data with a higher throughput or a higher radio priority, but in a different RLC mode.

SS assigns the USFs allowing the MS transmit more data blocks until the MS complete the countdown procedure. It is verified that the MS has transmitted only one LLC PDU.

Random accesses are received from the MS for packet channel request. SS assigns a PDCH to it. SS assigns USFs addressing to the MS allowing more data blocks are transmitted by the MS until the countdown value CV=0. It is checked that the MS sends 11 RLC data blocks in total.

The MS requests more resources through random accesses of channel requests for the remaining LLC PDU in the initial test PDP context. SS starts a two-phase dynamic allocation. It is checked that the values of PEAK\_THROUGHPUT\_CLASS, RADIO\_PRIORITY and RLC\_MODE requested by the MS in the PACKET RESOURCE REQUEST are in consistence with the initial test PDP context2.

Maximum Duration of Test

5 minutes.

Expected Sequence

The branch A is applicable for the MS supporting two PDP contexts. The branch B is applicable for the MS supporting SMS over GPRS (SMS has the radio priority level = 2 assigned in the attach accept message) and one PDP context.

| 25A  | SS        |                                     | Repeat step 23A and 24A until countdown value CV=0. Observe the Length indicator, M bit and E bit of the received data headers.                                                                  |
| 26A  | SS -> MS  | PACKET UPLINK ACK/NACK              | Check that only one LLC PDU is transmitted. Note: the 2nd <sup>t</sup> LLC PDU in PDP context2. FINAL_ACK_INDICATION = '1'. Acknowledge all received data, containing valid RRBp, sent on PACCH. |
| 27A  | MS -> SS  | PACKET CONTROL ACKNOWLEDGEMENT      | Received on the block specified by RRBp on PACCH of the assigned PDCH.                                                                                                                           |

### Specific Message Contents

PACKET UPLINK ASSIGNMET message in step 13:

Same as in subclause 42.3.3.1.1.3, step 10 of the test sequence testing the MS supporting two PDP contexts.

### 42.3.3.2 Dynamic Allocation / Resource reallocation / Abnormal

#### 42.3.3.2.1 Dynamic Allocation / Resource reallocation / Abnormal / T3168 expiry

##### 42.3.3.2.1.1 Conformance requirements

On expiry of timer T3168 the mobile station shall retransmit the PACKET RESOURCE REQUEST message unless the PACKET RESOURCE REQUEST has already been transmitted four times in which case the mobile station shall return to packet idle mode and indicate a packet access failure to upper layer.

### References

3GPP TS 04.60, subclause 8.1.1.1.2.

#### 42.3.3.2.1.2 Test purposes

To verify that during uplink resource reallocation on expiry of timer T3168:

1. The MS retransmits the PACKET RESOURCE REQUEST message unless the PACKET RESOURCE REQUEST has already been transmitted four times;
2. The MS returns to idle mode after PACKET RESOURCE REQUEST has been transmitted four times.

## 42.3.3.2.1.3 Method of test

## Initial Conditions

## System Simulator:

1 cell, default setting, BS\_PBCCH\_BLKs = 3, T3168 timeout value=0 (0.5s), N201-U=500 for SAPI 3, 5, 9, 11, N201-U=270 for SAPI 7.

## Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated:

- for the MS supporting two PDP contexts: test PDP context2 and context5 activated;
- for the MS supporting one PDP context and SMS over GPRS: test PDP context5 activated.

## Related PICS/PIXIT Statement(s)

- Support GPRS service.
- Support activation of at least one PDP context.
- Support two PDP contexts.
- Support SMS.
- Support SMS over GPRS.
- The way to initiate an uplink packet transfer.
- The way to trigger transferring new user data in a different PDP context while an uplink transfer is in progress.
- The way to trigger sending an MO short message.

## Test Procedure

An uplink TBF is established and in progress. The MS is triggered to transfer data with a higher radio priority in the same RLC mode.

The MS sends PACKET RESOURCE REQUEST. The current TBF is maintained and SS assigns the USFs allowing the MS transmit more data blocks, but does not answers to the requested resources. The MS repeatedly sends PACKET RESOURCE REQUEST three times after T3168 expires each time.

SS waits 0,55 s after receiving the 4<sup>th</sup> PACKET RESOURCE REQUEST and then sends PACKET DOWNLINK ASSIGNMENT and polls the MS. The MS answers with PACKET DOWNLINK ACK/NACK.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

The branch A is applicable for the MS supporting two PDP contexts. The branch B is applicable for the MS supporting SMS over GPRS (SMS has the radio priority level = 2 assigned in the attach accept message) and one PDP context.

#### 42.3.3.2.2 Dynamic Allocation / Resource reallocation / Abnormal / Invalid assignment

##### 42.3.3.2.2.1 Conformance requirements

1. If the mobile station receives a PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message and detects an invalid Frequency Parameters information element in the message, it shall perform an abnormal release. If PCCCH is present in the cell the mobile station shall perform an abnormal release with system information. If PCCCH is not present, the mobile station shall perform an abnormal release with random access.
2. If the mobile station receives a PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message specifying frequencies that are not all in one frequency band then the mobile station shall perform an abnormal release with random access.
3. If the mobile station receives a PACKET UPLINK ASSIGNMENT message containing a Frequency Parameters information element specifying a frequency that is in a frequency band not supported by the mobile station then the mobile station shall perform an abnormal release with random access.

##### References

3GPP TS 04.60, subclause 8.1.1.1.2.1.

##### 42.3.3.2.2.2 Test purposes

To verify that during uplink resource reallocation:

1. The MS performs an abnormal release with random access if it receives a PACKET UPLINK ASSIGNMENT message specifying frequencies that are not all in one frequency band.
2. The MS performs an abnormal release with random access if it receives a PACKET UPLINK ASSIGNMENT message containing a Frequency Parameters information element specifying a frequency in the frequency band not supported.
3. The MS performs an abnormal release with system information if it receives a PACKET UPLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message containing an Invalid Frequency Parameters information element, and if PCCCH is present in the cell.

##### 42.3.3.2.2.3 Method of test

##### Initial Conditions

System Simulator:

1 cell, default setting, BS\_PBCCH\_BLKs = 3, N201-U=500 for SAPI 3, 5, 9, 11, N201-U=270 for SAPI 7.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated:

- for the MS supporting two PDP contexts: test PDP context2 and context5 activated;
- for the MS supporting one PDP context and SMS over GPRS: test PDP context5 activated.

##### Related PICS/PIXIT Statement(s)

- Support GPRS service.
- Support activation of at least one PDP context.
- Support two PDP contexts.
- Support SMS.
- Support SMS over GPRS.

- The way to initiate an uplink packet transfer.
- The way to trigger transferring new user data in a different PDP context while an uplink transfer is in progress.

### Test Procedure

An uplink TBF is established and in progress. The MS is triggered to transfer data with a higher radio priority in the same RLC mode. The MS sends PACKET RESOURCE REQUEST. SS sends PACKET UPLINK ASSIGNMENT containing an invalid assignment ( $k=1\dots3$ , see step 6 in expected sequences).

The MS starts random accesses. SS assigns a two-phase dynamic allocation. It is checked that the requested radio priority, throughput and the RLC mode in PACKET RESOURCE REQUEST are in consistence with the test PDP context 5. SS grants the sufficient resources to the MS for transmission of the RLC data blocks until the MS sends PACKET RESOURCE REQUEST. It is checked that the MS has sent only one complete LLC PDU.

The SS assigns new resources to MS for completion the total data transferring.

### Maximum Duration of Test

10 minutes.

### Expected Sequence

The branch A in the sequence is applicable for the MS supporting two PDP contexts. The branch B is applicable for the MS supporting SMS over GPRS (SMS has the radio priority level = 2 assigned in the attach accept message) and one PDP context. The test sequence is executed in total three times,  $k = 1 \dots 3$ . The 3<sup>rd</sup> execution is applicable to the single band MS, but not to the multi-band one.

| 9    | MS -> SS  | PACKET RESOURCE REQUEST                        | Received on the single block assigned in step 8. Check that PEAK_THROUGHPUT_CLASS = 5, RADIO_PRIORITY = 1, RLC_MODE = acknowledged mode                                                                                                                                                               |
| 10   | SS -> MS  | PACKET UPLINK ASSIGNMENT                       | Open-ended uplink dynamic allocation, no starting time, USF_GRANULARITY = single block. Sent on PACCH of the same PDCH assigned in step 8.                                                                                                                                                            |
| 11   | SS -> MS  | PACKET DOWNLINK DUMMY CONTROL BLOCK            | Sent on the PACCH of the PDCH assigned, the USF assigned to the MS.                                                                                                                                                                                                                                   |
| 12-1 | MS -> SS  | UPLINK RLC DATA BLOCK                          | Received on the assigned PDTCH. Check that the coding and the TFI are correct.                                                                                                                                                                                                                        |
| 12-2 | MS -> SS  | PACKET RESOURCE REQUEST                        | Received on the PACCH of the assigned PDCH, acknowledged mode for LLC PDU in a lower radio priority.                                                                                                                                                                                                  |
| 13   | SS        |                                                | Repeat step 11 and 12-1 until PACKET RESOURCE REQUEST in 12-2, instead of a RLC data block in 12-1, is received. Observe the Length indicator, M bit and E bit of the received data headers. Check that a complete LLC PDU is transmitted and the transmission of another LLC PDU is not yet started. |
| 14   | SS -> MS  | PACKET UPLINK ACK/NACK                         | Sent on the PACCH of the PDCH assigned, acknowledge all received data                                                                                                                                                                                                                                 |
| 15   | SS -> MS  | PACKET UPLINK ASSIGNMENT                       | Sent on PACCH of the PDCH assigned in step 10, assigning a new PDCH, USF_GRANULARITY=4.                                                                                                                                                                                                               |
| 16   | SS -> MS  | PACKET DOWNLINK DUMMY CONTROL BLOCK            | Sent on the PACCH of the PDCH assigned in step 15, the USF assigned to the MS.                                                                                                                                                                                                                        |
| 17   | MS -> SS  | UPLINK RLC DATA BLOCK                          | Received on the PDTCH assigned in step 15.                                                                                                                                                                                                                                                            |
| 18   | MS -> SS  | UPLINK RLC DATA BLOCK                          | Received on the PDTCH assigned in step 15.                                                                                                                                                                                                                                                            |
| 19   | MS -> SS  | UPLINK RLC DATA BLOCK                          | Received on the PDTCH assigned in step 15.                                                                                                                                                                                                                                                            |
| 20   | MS -> SS  | UPLINK RLC DATA BLOCK                          | Received on the PDTCH assigned in step 15.                                                                                                                                                                                                                                                            |
| 21   |           | {Completion of uplink RLC data block transfer} |                                                                                                                                                                                                                                                                                                       |
| 22B  | MS        |                                                | Switch off                                                                                                                                                                                                                                                                                            |

NOTE: After the abnormal release for random access in step 7 there are two LLC PDUs waiting for sending. It is assumed in step 9 that the MS requests an uplink PDCH for the LLC PDU in a higher radio priority.

## 42.3.3.3 Dynamic Allocation / Resource reallocation / Reject

## 42.3.3.3.1 Conformance requirements

1. On receipt of a PACKET ACCESS REJECT message, the mobile station shall stop timer T3168 if running and indicate a packet access failure to upper layers. If no downlink TBF exists, the mobile station shall return to packet idle mode.
2. If the PACKET ACCESS REJECT message contains a WAIT\_INDICATION field in a Reject structure addressed to the mobile station, the mobile station shall start timer T3172 and if the mobile station has additional RLC data blocks to transmit, it shall initiate a new TBF establishment procedure on the RACH or PRACH, but the mobile station is not allowed to make a new attempt for packet access in the same cell until timer T3172 expires, it may, however, attempt packet access in an other cell after successful cell reselection. A mobile station in GPRS MS class A or B mode of operation may attempt to enter the dedicated mode in the same cell before timer T3172 has expired. During the time T3172 is running, the mobile station shall ignore all received PACKET PAGING REQUEST messages except paging request to trigger RR connection establishment.

## References

3GPP TS 04.60, subclause 8.1.1.1.2.

## 42.3.3.3.2 Test purposes

To verify that during the uplink resource reallocation:

1. The MS returns to packet idle mode when it receives PACKET ACCESS REJECT without WAIT\_INDICATION.
2. On receipt of a PACKET ACCESS REJECT with a WAIT\_INDICATION the MS waits until T3172 expires. The MS, having another RLC data blocks to transmit, initiates a new TBF establishment procedure on the PRACH.

## 42.3.3.3.3 Method of test

## Initial Conditions

## System Simulator:

1 cell, default setting, BS\_PBCCH\_BLKs = 3, N201-U=500 for SAPI 3, 5, 9, 11, N201-U=270 for SAPI 7.

## Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated:

- for the MS supporting two PDP contexts: test PDP context2 and context5 activated;
- for the MS supporting one PDP context and SMS over GPRS: test PDP context5 activated.

## Related PICS/PIXIT Statement(s)

- Support GPRS service.
- Support activation of at least one PDP context.
- Support two PDP contexts.
- Support SMS.
- Support SMS over GPRS.
- The way to initiate an uplink packet transfer.
- The way to trigger transferring new user data in a different PDP context while an uplink transfer is in progress.
- The way to trigger the MS sending an MO short message over GPRS.

## Test Procedure

An uplink TBF is established and in progress. The MS is triggered to transfer data with a higher radio priority in the same RLC mode.

The MS sends PACKET RESOURCE REQUEST. SS sends PACKET ACCESS REJECT without containing WAIT\_INDICATION. The MS attempts a new random access because of the user data from the upper layer.

SS assigns a two-phase dynamic allocation. It is checked that the requested radio priority, throughput and the RLC mode in PACKET RESOURCE REQUEST are in consistence with the test PDP context 5. SS grants the sufficient resources to the MS for transmission of the RLC data blocks until the MS sends PACKET RESOURCE REQUEST. It is checked that the MS has sent only one complete LLC PDU.

SS acknowledges all received data and assigns new resources to the MS to complete the RLC data block transferring.

The test procedure is repeated once. The difference between the two executions is that in the 2<sup>nd</sup> execution, PACKET ACCESS REJECT contains WAIT\_INDICATION. The MS starts the random access after T3172 expires.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

The test sequence is executed twice for k = 1 ... 2. The branch A in the sequence is applicable for the MS supporting two PDP contexts. The branch B is applicable for the MS supporting SMS over GPRS (SMS has the radio priority level = 2 assigned in the attach accept message) and one PDP context.

| Reject                 |                                     |
| -                      | 0 (TLLI)                            |
| - TLLI                 | The same value as the TLLI received |
| -                      | 1 (WAIT_INDICATION present)         |
| - WAIT_INDICATION      | 30 s                                |
| - WAIT_INDICATION_SIZE | 0 (unites of seconds)               |
| -                      | 0 (end of reject IE)                |

PACKET RESOURCE REQUEST message in step 9:

Same as in subclause 42.3.3.2.2, step 11.

PACKET RESOURCE REQUEST message in step 14-2

Same as in subclause 42.3.3.2.2, step 12-2.

PACKET UPLINK ASSIGNMENT message in step 17

Same as in subclause 42.3.3.2.2, step 15.

## 42.3.4 Default message contents

The following default values of messages and the default contents of messages are defined for subclause 42.3. They, unless indicated otherwise in subclause 42.3, shall be transmitted by the system simulator and are required to be received from the MS under test.

In this clause, decimal values are normally used. However, sometimes a hexadecimal value, indicated by an "Hex", or a binary value, indicated by a "Binary" is used.

All macro definitions are referred to subclause 40.5 and test PDP contexts are referred to subclause 40.6.

The default initial conditions used in subclause 42.3 are that PBCCH is present.

PACKET CHANNEL REQUEST message:

|                  |                                                                                   |
|------------------|-----------------------------------------------------------------------------------|
| Access Type      | "One phase access request" or "Two phase access request"                          |
| Multislot class  | As declared (valid for one phase access request)                                  |
| Radio priority   | Same as in the test PDP context applied to the test, or, Priority level 3 for SMS |
| Random Reference | Any value                                                                         |

PACKET CONTROL ACKNOWLEDGEMENT message:

|               |               |
|---------------|---------------|
| MESSAGE_TYPE  | 000001        |
| TLLI          | Any value     |
| CTRL_ACK      | Any value     |
| Spare padding | Spare Padding |

MESSAGE\_TYPE for 11 bit: 1111 1100 1, MESSAGE\_TYPE for 8 bit: 0111 11, without TLLI.

PACKET DOWNLINK ACK/NACK message:

|                                    |                                |

1. For one-phase uplink assignment, the Packet Request reference is used for addressing the MS.
2. For re-assignment of an uplink TBF, the address information should be changed to UPLINK\_TFI of Global\_TFI. UPLINK\_TFI\_ASSIGNMENT is absent.
3. For assignment of an uplink TBF while a downlink TBF has been established, the address information should be changed to DOWNLINK\_TFI of Global\_TFI. UPLINK\_TFI\_ASSIGNMENT is present.

## 42.4 Measurement reports and Cell change order procedures

This subclause presents tests for "Measurement Reports and Cell Change Order Procedures" which are specified in 3GPP TS 04.60 subclauses 5.6 and 8.4.

Applicability and default conditions

The clause is applicable for mobiles supporting GPRS.

Default message contents and signalling macros are defined in the GPRS general defaults section, except for those messages and macros specified at the end of this subclause.

### 42.4.1 Measurement reports

#### 42.4.1.1 Network Control measurement reporting / Uplink / Normal case

##### 42.4.1.1.1 Conformance requirement

The behaviour of the mobile station is controlled by the NETWORK\_CONTROL\_ORDER parameter in a PACKET MEASUREMENT ORDER message. The reporting periods are indicated in the NC\_REPORTING\_PERIOD\_T field of the PACKET MEASUREMENT ORDER message. The mobile station shall apply to the timer T3158 the NC\_REPORTING\_PERIOD\_T when in packet transfer mode.

The procedure for NC measurement report sending shall be initiated by the mobile station at the expiry of the NC measurement report interval timer T3158. At expiry of the timer T3158 the mobile station shall restart the timer T3158, perform the measurements and send the PACKET MEASUREMENT REPORT message containing the 'NC measurement report struct' on PACCH.

A mobile station in mode NC1 may receive a new indicated reporting period or change packet mode while timer T3158 is active. If the new indicated reporting period is less than the time to expiry of timer T3158, the mobile station shall immediately restart timer T3158 with the new indicated reporting period. Otherwise, the timer T3158 shall continue to run.

#### 42.4.1.1.2 Test Purpose

To verify that the MS sends the measurement report of the NC measurements according to the indicated reporting periods, when the T3158 expires.

To verify that the MS restarts the timer T3158 when it expires.

#### Reference

3GPP TS 04.60, subclauses 5.6.1 and 8.3.

#### 42.4.1.1.3 Method of test

##### Initial conditions

System Simulator:

1 cell, GPRS supported.

Mobile Station:

MS is in Packet Idle mode and GPRS attached.

PDP context 2 established.

##### Related PICS/PIXIT statement

Support of GPRS.

The way to trigger the MS initiating an uplink packet transfer.

##### Foreseen final state of the MS

- MS is in transfer mode.

##### Test procedure

MS is brought into uplink packet transfer mode. SS sends a PACKET MEASUREMENT ORDER message. MS sends continuously data blocks and PACKET MEASUREMENT REPORT messages according to the indicated reporting period. A PACKET MEASUREMENT ORDER message is sent again with new reporting period. MS sends data blocks and PACKET MEASUREMENT REPORT messages according to the new reporting period.

##### Maximum duration of the test

-

Expected sequence

#### 42.4.1.2 Network Control measurement reporting / Idle mode / New cell reselection

##### 42.4.1.2.1 Conformance requirement

The procedure for measurement report sending shall be initiated by the mobile station at expiry of the NC measurement report interval timer T3158. At expiry of the timer T3158 the mobile station shall restart the expired timer T3158, perform the measurements and initiate the packet access. The packet access procedure is initiated by the RR entity in the mobile station with access type 'Single block without TBF establishment' indicated in the PACKET CHANNEL REQUEST message. The radio resource is assigned to the mobile station in a PACKET UPLINK ASSIGNMENT message sent on any PAGCH on the same PCCCH on which the network has received the PACKET CHANNEL REQUEST message.

When receiving a PACKET UPLINK ASSIGNMENT message the mobile station shall send PACKET MEASUREMENT REPORT in the allocated radio block on the assigned PDCH and immediately switch back to the PCCCH in non-DRX mode. No TBF is established and the network shall not acknowledge the reception of the PACKET MEASUREMENT REPORT.

A mobile station may reselect a new cell or may be ordered to reselect a new cell while timer T3158 is active. If time to expiry of timer T3158 is greater than the indicated reporting period for the new cell, the mobile station shall immediately restart timer T3158 with the indicated reporting period for the new cell. Otherwise the timer T3158 shall continue to run.

##### 42.4.1.2.2 Test Purpose

To verify that if the MS reselects a new cell while timer T3158 is active, and the time to expiry of timer T3158 is greater than the indicated reporting period for the new cell, the MS shall immediately restart timer T3158 with the indicated reporting period for the new cell.

To verify that if the MS reselects a new cell while timer T3158 is active, and the time to expiry of timer T3158 is shorter than the indicated reporting period for the new cell, the timer T3158 shall continue to run.

#### Reference

3GPP TS 04.60, subclauses 7.3 and 5.6.1.

##### 42.4.1.2.3 Method of test

#### Initial conditions

##### System Simulator:

3 cells, GPRS supported, PCCCH is present.

##### Mobile Station:

MS is in Packet Idle mode and GPRS attached.

PDP context established.

the Ready Timer is running.

## Related PICS/PIXIT statement

- Support of GPRS.

## Foreseen final state of the MS

- MS is in idle mode.

## Test procedure

SS sends PACKET MEASUREMENT ORDER message to MS. SS sends PACKET CELL CHANGE ORDER message to MS with new reporting period before the old reporting period has expired. MS initiates a packet access and sends the PACKET MEASUREMENT REPORT to SS. Another measurement report is sent before new PACKET CELL CHANGE ORDER message with new reporting period is sent to MS. Two more measurement reports are sent using correct reporting periods.

## Maximum duration of the test

-

## Expected sequence

### 42.4.1.3 Network Control measurement reporting / Downlink transfer / Normal case

#### 42.4.1.3.1 Conformance requirement

The procedure for NC measurement report sending shall be initiated by the mobile station at the expiry of the NC measurement report interval timer T3158. At expiry of the timer T3158 the mobile station shall restart the timer T3158, perform the measurements and send the PACKET MEASUREMENT REPORT message containing the 'NC measurement report struct' on PACCH.

Following a downlink TBF establishment, the PACKET MEASUREMENT REPORT message shall not be sent on the uplink PACCH associated with this TBF until two PACKET DOWNLINK ACK/NACK messages has been sent to the network.

The mobile station shall transmit an RLC/MAC control message other than a PACKET DOWNLINK ACK/NACK message at most every second time it is polled.

#### 42.4.1.3.2 Test Purpose

To verify that the MS sends the measurement report of the NC measurements according to the indicated reporting periods, when the T3158 expires.

To verify that the MS restarts the timer T3158 when it expires.

To verify that the MS sends at least two PACKET DOWNLINK ACK/NACK messages before transmitting a PACKET MEASUREMENT REPORT message upon entering transfer state.

#### Reference

3GPP TS 04.60, subclauses 8.1.2.2, 8.3 and 5.6.1.

## 42.4.1.3.3 Method of test

## Initial conditions

## System Simulator:

1 cell, GPRS supported.

## Mobile Station:

MS is in Packet Idle mode and GPRS attached.

PDP context 2 established.

## Related PICS/PIXIT statement

- Support of GPRS.

## Foreseen final state of the MS

- MS is in transfer mode.

## Test procedure

MS is brought into downlink packet transfer mode. SS sends a PACKET MEASUREMENT ORDER message. SS sends data blocks and MS answers with PACKET DOWNLINK ACK/NACK. When reporting period has expired and at least two PACKET DOWNLINK ACK/NACK messages has been sent, MS sends a PACKET MEASUREMENT REPORT message. SS sends data blocks continuously and MS sends PACKET MEASUREMENT REPORT messages when reporting period has expired and at least one PACKET DOWNLINK ACK/NACK messages have been sent after the last PACKET MEASUREMENT REPORT message.

## Maximum duration of the test

-

## 42.4.2 Cell change order procedures

### 42.4.2.1 Cell change order procedure / Uplink transfer

#### 42.4.2.1.1 Cell change order procedure / Uplink transfer / Normal case

##### 42.4.2.1.1.1 Conformance requirement

The cell change order procedure is started by sending a PACKET CELL CHANGE ORDER message to the mobile station on the PCCCH or PACCH. Upon receipt of the PACKET CELL CHANGE ORDER message the mobile station shall start timer T3174.

When a cell reselection is made controlled by the network, the mobile station shall act upon the IMMEDIATE\_REL value which has been received in the Packet Cell Change Order: if required, the mobile station shall abort any TBF in progress by immediately ceasing to decode the downlink, ceasing to transmit on the uplink, stopping all RLC/MAC timers except for timers related to measurement reporting. The mobile station shall then switch to the identified specified new cell and shall obey the relevant RLC/MAC procedures on this new cell.

##### 42.4.2.1.1.2 Test Purpose

To verify that when the cell change order procedure is started by sending a PACKET CELL CHANGE ORDER message with the IMMEDIATE\_REL value set to 1, the MS shall abort any TBF in progress and stop transmitting.

To verify that the MS shall switch to the new cell.

#### Reference

3GPP TS 04.60, subclauses 8.4 and 5.5.1.1.

##### 42.4.2.1.1.3 Method of test

#### Initial conditions

System Simulator:

2 cells, GPRS supported.

Mobile Station:

MS is in Packet Idle mode and GPRS attached.

PDP context 2 established.

#### Related PICS/PIXIT statement

- Support of GPRS.
- The way to trigger the MS initiating an uplink packet transfer.

#### Foreseen final state of the MS

- MS is in transfer mode.

## Test procedure

MS is brought into uplink packet transfer mode. SS sends a PACKET CELL CHANGE ORDER message. SS checks that there is no traffic on the old cell. MS switches to the new cell and re-establishes the uplink TBF.

## Maximum duration of the test

-

## 42.4.2.1.2 Cell change order procedure / Uplink transfer / Failure cases / T3174 expiry

## 42.4.2.1.2.1 Conformance requirement

If timer T3174 expires before a response to the PACKET CHANNEL REQUEST message has been received from the new cell, the mobile station shall start timer T3176 and return to the old cell. The mobile station shall send a PACKET CELL CHANGE FAILURE message to the network.

If the mobile station was in uplink packet transfer before the cell change, the mobile station shall establish a new uplink TBF and send the PACKET CELL CHANGE FAILURE message on this TBF. The mobile station shall then resume its uplink transfer on this TBF.

## 42.4.2.1.2.2 Test Purpose

To verify that the mobile station sends a PACKET CELL CHANGE FAILURE message to the network, if timer T3174 expires before a response from the new cell, and returns to the old cell.

## Reference

3GPP TS 04.60, subclause 8.4.1.

## 42.4.2.1.2.3 Method of test

## Initial conditions

System Simulator:

2 cells, GPRS supported.

Mobile Station:

MS is in Packet Idle mode and GPRS attached.

PDP context established.

## Related PICS/PIXIT statement

- Support of GPRS.

The way to trigger the MS initiating an uplink packet transfer.

## Foreseen final state of the MS

- MS is in Transfer mode.

## Test procedure

MS is brought into uplink packet transfer mode. SS sends the PACKET CELL CHANGE ORDER message to the MS. MS sends several PACKET CHANNEL REQUESTs on the new cell, but the timer T3174 expires before a response to PACKET CHANNEL REQUEST message has been received from the new cell. MS returns to the old cell, sends a PACKET CELL CHANGE FAILURE message to the SS and continues data transfer on the old cell.

## Maximum duration of the test

42.4.2.1.6 Cell change order procedure / Uplink transfer / Failure cases / Frequency not implemented

42.4.2.1.6.1 Conformance requirement

If the network message instructs the mobile station to use a frequency that it is not capable of using, the mobile station shall send a PACKET CELL CHANGE FAILURE message with cause "frequency not implemented" and remain on the current PDCH(s).

42.4.2.1.6.2 Test Purpose

To verify that the mobile station returns a PACKET CELL CHANGE FAILURE message, if the ordered frequency cannot be used.

Reference

## 42.4.2.2 Cell change order procedure / Downlink transfer

## 42.4.2.2.1 Cell change order procedure / Downlink transfer / Normal case

## 42.4.2.2.1.1 Conformance requirement

The cell change order procedure is started by sending a PACKET CELL CHANGE ORDER message to the mobile station on the PCCCH or PACCH. Upon receipt of the PACKET CELL CHANGE ORDER message the mobile station shall start timer T3174.

When a cell reselection is made controlled by the network, the mobile station shall act upon the IMMEDIATE\_REL value which has been received in the Packet Cell Change Order: if required, the mobile station shall abort any TBF in progress by immediately ceasing to decode the downlink, ceasing to transmit on the uplink, stopping all RLC/MAC timers except for timers related to measurement reporting. The mobile station shall then switch to the identified specified new cell and shall obey the relevant RLC/MAC procedures on this new cell.

## 42.4.2.2.1.2 Test Purpose

To verify that the cell change order procedure is started when the MS receives a PACKET CELL CHANGE ORDER message.

To verify that the MS switches to the new cell.

To verify that the MS uses the established downlink TBF on the new cell.

### 42.4.2.3 Cell change order procedure / Simultaneous uplink and downlink transfer

#### 42.4.2.3.1 Cell change order procedure / Simultaneous uplink and downlink transfer / Normal case

##### 42.4.2.3.1.1 Conformance requirement

The cell change order procedure is started by sending a PACKET CELL CHANGE ORDER message to the mobile station on the PCCCH or PACCH. Upon receipt of the PACKET CELL CHANGE ORDER message the mobile station shall start timer T3174.

When a cell reselection is made controlled by the network, the mobile station shall act upon the IMMEDIATE\_REL value which has been received in the Packet Cell Change Order: if required, the mobile station shall abort any TBF in progress by immediately ceasing to decode the downlink, ceasing to transmit on the uplink, stopping all RLC/MAC timers except for timers related to measurement reporting. The mobile station shall then switch to the identified specified new cell and shall obey the relevant RLC/MAC procedures on this new cell.

When cell reselection is controlled by the network, the mobile station in packet transfer mode shall act upon the IMMEDIATE\_REL value: it may continue its operation in the old serving cell, as in mobile steered cell reselection, or it shall immediately abort its TBF if it is indicated by the IMMEDIATE\_REL value.

Under no circumstances, operations in the old cell shall be continued more than 5 s after a cell reselection has been determined.

#### 42.4.2.3.1.2 Test Purpose

To verify that when the cell change order procedure is started by sending a PACKET CELL CHANGE ORDER message, the MS shall abort any TBF in progress and stop transmitting.

To verify that the MS shall switch to the new cell.

To verify that the MS shall act upon the IMMEDIATE\_REL value.

#### Reference

3GPP TS 04.60, subclauses 5.5.1.1, 8.4 and 8.4.1.

#### 42.4.2.3.1.3 Method of test

##### Initial conditions

System Simulator:

2 cells, GPRS supported.

Mobile Station:

MS is in Packet Idle mode and GPRS attached.

PDP context established.

##### Related PICS/PIXIT statement

- Support of GPRS.
- The way to trigger the MS initiating an uplink packet transfer.

##### Foreseen final state of the MS

- MS is in simultaneous uplink and downlink packet transfer mode.

##### Test procedure

MS is brought into simultaneous uplink and downlink packet transfer mode. SS sends a PACKET CELL CHANGE ORDER message with IMMEDIATE\_REL value set to 1 to force the mobile to release all ongoing TBFs. MS switches to the new cell and simultaneous uplink and downlink TBF is re-established.

SS sends a PACKET CELL CHANGE ORDER message with IMMEDIATE\_REL value set to 0. The MS continues its operation in the old serving cell.

##### Maximum duration of the test

#### 42.4.2.3.2 Cell change order procedure / Simultaneous uplink and downlink transfer / Failure case / T3174 expiry

##### 42.4.2.3.2.1 Conformance requirement

If timer T3174 expires before a response to the PACKET CHANNEL REQUEST message has been received from the new cell, the mobile station shall start timer T3176 and return to the old cell. The mobile station shall send a PACKET CELL CHANGE FAILURE message to the network.

If the mobile station was in a simultaneous uplink and downlink packet transfer mode before the cell change, the mobile station shall establish a new uplink TBF and send the PACKET CELL CHANGE FAILURE message on this TBF. The mobile station shall then resume its uplink transfer on this TBF. When the mobile station has sent a PACKET CELL CHANGE FAILURE message, timer T3176 shall be stopped. The mobile station shall then resume its uplink transfer on this TBF.

##### 42.4.2.3.2.2 Test Purpose

To verify that the mobile station sends a PACKET CELL CHANGE FAILURE message to the network and returns to the old cell if timer T3174 expires before a response from the new cell.

#### Reference

3GPP TS 04.60, subclause 8.4.1.

##### 42.4.2.3.2.3 Method of test

#### Initial conditions

System Simulator:

2 cells, GPRS supported.

Mobile Station:

MS is in Packet Idle mode and GPRS attached.

PDP context established.

Related PICS/PIXIT statement

- Support of GPRS.
- The way to trigger the MS initiating an uplink packet transfer.

Foreseen final state of the MS

- MS is in Idle mode.

Test procedure

MS is brought into simultaneous uplink and downlink packet transfer mode. SS sends the PACKET CELL CHANGE ORDER message to the MS. MS sends several PACKET CHANNEL REQUESTs to the new cell, but the timer T3174 expires before a response to PACKET CHANNEL REQUEST message has been received from the new cell. MS returns to the old cell and sends a PACKET CELL CHANGE FAILURE message to the SS.

Maximum duration of the test

-

Expected sequence

## 42.4.4 Cell Change Order Procedures without PBCCH

### 42.4.4.1 Network Controlled Cell Reselection – Packet Measurement Order Procedure

#### 42.4.4.1.1 Conformance requirement

A cell re-selection command may be sent from the network to an MS. When the MS receives the command, it shall immediately re-select the cell according to the included cell description and change the network control mode according to the command.

#### Reference:

3GPP TS 04.60 subclause 8.4.0.

3GPP TS 05.08 subclause 10.1.4.2.

#### 42.4.4.1.2 Test purpose

To verify that when the Network initiates the Packet Measurement Order Procedure, the MS correctly interprets the Packet Measurement Order Message and reselects to the cell given in Packet Measurement Order.

#### 42.4.4.1.3 Method of test

#### Initial conditions

| Parameter                 | Carrier1 | Carrier2 | Carrier3 |
|---------------------------|----------|----------|----------|
| RF Signal Level (dBm)     | -70      | -80      | -50      |
| GPRS_RXLEV_ACCE<br>SS_MIN | -100     | -100     | -100     |
| NETWORK_CONTR<br>L_ORDER  | NC2      | NC2      | NC2      |
| C1                        | 30       | 20       | 50       |
| C2                        | 30       | 20       | 50       |

#### System simulator:

3 cells, GPRS supported, PBCCH not present (Carrier 1 & 2 is active. Carrier 3 is off).

#### Mobile Station:

MS is GPRS attached on carrier 1 (with Ready timer value unit set to '111' in the ATTACH ACCEPT message, thus the MS is always in Ready state).

#### Related PICS/PIXIT statement

- Support of GPRS.

#### Test Procedure

The SS establishes single block down link TBF and then initiates the Packet Measurement Order Procedure on carrier 1 with the Packet Measurement Order (PMO) changing NC2 to NC0. The MS shall reselect to carrier 3 and initiate channel request procedure.

## Expected Sequence

| Step | Direction | Message                      | Comments                                                                 |
|------|-----------|------------------------------|--------------------------------------------------------------------------|
| 1    | SS        |                              | Activate carrier 3                                                       |
| 2    | SS->MS    | IMMEDIATE ASSIGNMENT         | SS establishes a single block down link TBF on carrier 1.                |
| 3    | SS->MS    | PACKET MEASUREMENT ORDER     | Sent on PACCH of carrier 1. PMO message contains Network Control Order 0 |
| 4    | MS->SS    | CHANNEL REQUEST              | Verify MS sends channel request on carrier 3 within 30 s of step 3.      |
| 5    | SS->MS    | IMMEDIATE ASSIGNMENT REJECT. | Network sends immediate assignment reject on carrier 3.                  |

#### 42.4.4.2 Network Controlled Cell Reselection/validity of reselection parameters/MS enters standby state

##### 42.4.4.2.1 Conformance requirement

A set of measurement reporting parameters (NETWORK\_CONTROL\_ORDER and NC\_REPORTING\_PERIOD(s)) is broadcast on PBCCH. The parameters may also be sent individually to an MS on PCCCH or PACCH, in which case it overrides the broadcast parameters. The individual parameters are valid until the RESET command is sent to MS., there is a downlink signaling failure or the MS enters Standby State.

##### Reference:

3GPP TS 05.08 subclause 10.1.4.

##### 42.4.4.2.2 Test purpose

To verify that the measurement reporting parameters are valid till the MS enters the standby state.

##### 42.4.4.2.3 Method of test

##### Initial conditions

| Parameter                 | Carrier1 | Carrier2 |
|---------------------------|----------|----------|
| RF Signal Level (dBm)     | -80      | -70      |
| GPRS_RXLEV_ACCE<br>SS_MIN | -100     | -100     |
| NETWORK_CONTRO<br>L_ORDER | NC0      | NC2      |
| C1                        | 20       | 30       |
| C32                       | 20       | 30       |

##### System simulator:

2 cells, GPRS supported, PBCCH not present (Carrier 1 is active. Carrier 2 is off..

##### Mobile Station:

MS is off.

##### Related PICS/PIXIT statement

- Support of GPRS.

## Test Procedure

The SS establishes single block down link TBF and then initiates the Packet Measurement Order Procedure on carrier 1 with the Packet Measurement Order (PMO) changing NC0 to NC2. The SS activates carrier 2 with higher RF signal strength than carrier 1. After the Ready Timer expires in the mobile, the MS shall reselect carrier 2 as NC2 is not applicable in standby mode.

## Expected Sequence

| Step | Direction | Message                  | Comments                                                                      |
|------|-----------|--------------------------|-------------------------------------------------------------------------------|
| 1    | MS        |                          | The MS is powered up or switched on and initiates an attach (see PICS).       |
| 2    | MS -> SS  | ATTACH REQUEST           |                                                                               |
| 3    | SS -> MS  | ATTACH ACCEPT            | Ready timer set to 60 s.<br>Mobile identity = P-TMSI-1<br>P-TMSI-1 signature  |

## 42.5 Downlink Transfer

### 42.5.1 Downlink Transfer / Normal Operation

#### 42.5.1.1 Downlink Transfer/ Normal Operation / Relative Encoding TBF starting time

##### 42.5.1.1.1 Definition and applicability

This test case applies to all MSs supporting GPRS.

##### 42.5.1.1.2 Conformance Requirement

The allocated radio resource is assigned to the mobile station in a PACKET DOWNLINK ASSIGNMENT message to the mobile station. The PACKET DOWNLINK ASSIGNMENT message is transmitted on an appropriate paging subchannel on PCCCH, considering the DRX parameters valid for each targeted mobile (see 3GPP TS 05.02). The multislot capabilities of the mobile station must be considered.

A PACKET DOWNLINK ASSIGNMENT message may indicate an assignment starting time in the TBF Starting Time parameter. The mobile station shall monitor PCCCH until the point in time denoted by the TBF Starting Time. Thereafter it shall switch to the assigned PDCHs. If while monitoring the PCCCH the mobile station receives more than one PACKET DOWNLINK ASSIGNMENT message, it shall act upon the most recently received message and shall ignore the previous message.

The Packet downlink assignment procedure is completed when the mobile station receives a valid RLC/MAC block. The mobile station has entered the packet transfer mode.

## References

3GPP TS 04.60, subclauses 7.2.1.1, 7.2.1.2 and 10.4.5.

## 42.5.1.1.3 Test purpose

Verify that an MS switches to the assigned PDCH at the relative-encoded starting time.

## 42.5.1.1.4 Method of test

## Initial Conditions

## System Simulator:

1 cell, GPRS supported, PCCCH present.

## Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 2 activated.

## Related PICS/PIXIT Statement(s)

- Support GPRS service.

## Test Procedure

1. MS receives a PACKET DOWNLINK ASSIGNMENT message on its assigned PCCCH, containing a starting time with relative encoding.
2. Before the starting time, SS transmits a downlink RLC data block.
3. MS ignores the block.
4. At the starting time block, the MS receives a downlink RLC data block with polling indicated.
5. MS responds by sending a PACKET DOWNLINK ACK/NACK.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

| Step | Direction | Message                                | Comments                                                                                                                                                                                              |
|------|-----------|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## 42.5.1.2 Downlink Transfer/ Normal Operation / Without TBF starting time

### 42.5.1.2.1 Definition and applicability

This test case applies to all MSs supporting GPRS.

### 42.5.1.2.2 Conformance Requirement

The allocated radio resource is assigned to the mobile station in a PACKET DOWNLINK ASSIGNMENT message to the mobile station. The PACKET DOWNLINK ASSIGNMENT message is transmitted on an appropriate paging subchannel on PCCCH, considering the DRX parameters valid for each targeted mobile (see 3GPP TS 05.02). The multislot capabilities of the mobile station must be considered.

1. On receipt of a PACKET DOWNLINK ASSIGNMENT message, the mobile station shall switch to the assigned PDCHs.
2. The Packet downlink assignment procedure is completed when the mobile station receives a valid RLC/MAC block. The mobile station has entered the packet transfer mode.
3. If the MS is required to transmit a PACKET CONTROL ACKNOWLEDGEMENT subsequent to a PACKET DOWNLINK ASSIGNMENT, the MS shall be ready to receive on the new assignment no later than the next occurrence of block B((x+2) mod 12) where block B(x) is radio block containing the PACKET CONTROL ACKNOWLEDGEMENT.

3GPP TS 05.10, subclause 6.11.1.

### 42.5.1.2.3 Test purpose

Verify that an MS switches to the assigned PDCH when assigned to it without a starting time, within 3 blocks.

### 42.5.1.2.4 Method of test

## Initial Conditions

System Simulator:

1 cell, GPRS supported, PCCCH present.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 3 activated.

## Related PICS/PIXIT Statement(s)

- Support GPRS service.

## Test Procedure

1. MS receives a PACKET DOWNLINK ASSIGNMENT message on its assigned PCCCH, containing no starting time.
2. SS transmits a downlink RLC data block.
3. MS responds by sending a PACKET DOWNLINK ACK/NACK.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

| 2    | MS->SS    | PACKET CONTROL ACK                     | Sent on PACCH in block specified by RRBP field in step 1.                                      |
| 3    | SS -> MS  | RLC DATA BLOCK                         | 2 blocks after the previous message, with valid RRBP field, on assigned PDCH, addressed to MS. |
| 4    | MS -> SS  | PACKET DOWNLINK ACK/NACK               | MS acknowledges on PACCH the RLC data block sent at the starting time.                         |
| 5    |           | {Completion of downlink data transfer} | Macro                                                                                          |

## Specific Message Contents

PACKET DOWNLINK ASSIGNMENT message in step 1:

|                       |                                 |
|-----------------------|---------------------------------|
| TIMESLOT_ALLOCATION   | <one timeslot assigned>         |
| PACKET TIMING ADVANCE | Timing Advance Value as default |
| TBF STARTING TIME     | <IE not present>                |

DOWNLINK RLC DATA BLOCKS (various steps):

|      |                                                   |
|------|---------------------------------------------------|
| RRBP | 00 – Response shall be sent by MS in N+13 frames. |
| S/P  | 1 – RRBP field is valid                           |

## 42.5.2 Downlink Transfer / Polling

### 42.5.2.1 Downlink Transfer/ Polling/ Normal operation/RLC data block

#### 42.5.2.1.1 Definition and applicability

This test case applies to all MSs supporting GPRS.

#### 42.5.2.1.2 Conformance Requirement

Whenever the mobile station receives an RLC data block addressed to itself and with a valid RRBP field in the RLC data block header (i.e., is polled), the mobile station shall transmit a PACKET DOWNLINK ACK/NACK message in the uplink radio block specified by the RRBP field whatever the BSN value of the received RLC data block, unless another RLC/MAC control message is waiting to be transmitted, in which case the other RLC/MAC control message shall be sent.

The RRBP value specifies a single uplink block in which the mobile station shall transmit either a PACKET CONTROL ACKNOWLEDGEMENT message or a PACCH block to the network. If the RRBP field is received as part of an RLC/MAC block containing an RLC/MAC control block containing any message except Packet Paging Request, Packet Access Reject, and Packet Queueing Notification, the mobile station shall transmit a PACKET CONTROL ACKNOWLEDGEMENT message in the uplink radio block specified. If the RRBP field is received as part of an RLC/MAC block containing an RLC/MAC control block containing a Packet Paging Request, Packet Access Reject, or Packet Queueing Notification message, the mobile station shall ignore this RRBP field. The mobile station shall only react on RLC/MAC control blocks containing a valid RRBP field if the mobile station is unambiguously addressed either in the downlink RLC/MAC control block header or in the control message itself.

## References

3GPP TS 04.60, subclauses 8.1.2.2 and 10.4.5.

### 42.5.2.1.3 Test purpose

Verify that an MS responds to a poll with a PACKET DOWNLINK ACK/NACK message in the block specified by the RRBP field.

### 42.5.2.1.4 Method of test

## Initial Conditions

System Simulator:

1 cell, GPRS supported, PCCCH present.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 3 activated.

## Related PICS/PIXIT Statement(s)

- Support GPRS service.

## Test Procedure

1. MS receives a PACKET DOWNLINK ASSIGNMENT message on its assigned PCCCH, containing no starting time.
2. SS transmits a downlink RLC data block.
3. MS responds by sending a PACKET DOWNLINK ACK/NACK in the block specified by the RRBP field of the RLC data block.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

| Step | Direction | Message                                | Comments                                                                                       |
|------|-----------|----------------------------------------|------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PACKET DOWNLINK ASSIGNMENT             | Triggers the MS to switch to assigned PDCH.                                                    |
| 2    | SS -> MS  | RLC DATA BLOCK                         | 3 blocks after the previous message, with valid RRBP field, on assigned PDCH, addressed to MS. |
| 3    | MS -> SS  | PACKET DOWNLINK ACK/NACK               | MS acknowledges the RLC DATA BLOCK 26 frames after step 2.                                     |
| 4    |           | {Completion of downlink data transfer} | Macro                                                                                          |

## Specific Message Contents

PACKET DOWNLINK ASSIGNMENT message in step 1:

|                       |                                   |
|-----------------------|-----------------------------------|
| TIMESLOT_ALLOCATION   | <one timeslot assigned>           |
| PACKET TIMING ADVANCE | Timing Advance Value = as default |
| TBF STARTING TIME     | <IE not present>                  |

DOWNLINK RLC DATA BLOCK in step 2:

|      |                                                   |
|------|---------------------------------------------------|
| RRBP | 11 – Response shall be sent by MS in N+26 frames. |
| S/P  | 1 – RRBP field is valid                           |

## 42.5.2.2 Downlink Transfer/ Polling/ Packet Polling Request/ Access Burst format

### 42.5.2.2.1 Definition and applicability

This test case applies to all MSs supporting GPRS.

### 42.5.2.2.2 Conformance Requirement

The network may send to the mobile station a PACKET POLLING REQUEST message. If the MS has received a PACKET DOWNLINK ASSIGNMENT message with no starting time or with a starting time that has already elapsed, the PACKET POLLING REQUEST message shall be sent on PACCH. Otherwise the PACKET POLLING message shall be sent on PAGCH. The mobile station shall be addressed by its TLLI or TFI.

On receipt of a PACKET POLLING REQUEST message, the mobile station shall respond to the network with the PACKET CONTROL ACKNOWLEDGEMENT message in the reserved uplink radio block specified by the RRBP field. The reserved block is considered as a one block PACCH allocation.

### References

3GPP TS 04.60, subclause 7.2.1.3.

### 42.5.2.2.3 Test purpose

Verify that an MS responds to a PACKET POLLING REQUEST message (requesting access burst format) with a PACKET CONTROL ACKNOWLEDGEMENT message in access burst format.

### 42.5.2.2.4 Method of test

### Initial Conditions

System Simulator:

1 cell, GPRS supported, PCCCH present.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 3 activated.

### Related PICS/PIXIT Statement(s)

- Support GPRS service.

## Test Procedure

1. MS receives a PACKET DOWNLINK ASSIGNMENT message on its assigned PCCCH, containing no starting time.
2. SS transmits downlink RLC data blocks.
3. SS transmits a PACKET POLLING REQUEST message, requesting access burst format.
4. MS responds by sending a PACKET CONTROL ACKNOWLEDGE message in access burst format.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

| Step | Direction | Message                                | Comments                                                                         |
|------|-----------|----------------------------------------|----------------------------------------------------------------------------------|
| 1    | SS -> MS  | PACKET DOWNLINK ASSIGNMENT             | Triggers the MS to switch to assigned PDCH.                                      |
| 2    | SS -> MS  | RLC DATA BLOCKS                        | Starting 3 blocks after the previous message, on assigned PDCH, addressed to MS. |
| 3    | SS -> MS  | PACKET POLLING REQUEST                 | Requesting access burst format                                                   |
| 4    | MS -> SS  | PACKET CONTROL ACKNOWLEDGEMENT         | MS acknowledges using 11-bit access burst format.                                |
| 5    |           | {Completion of downlink data transfer} | Macro                                                                            |

## Specific Message Contents

PACKET DOWNLINK ASSIGNMENT message in step 1:

|                     |                         |
|---------------------|-------------------------|
| TIMESLOT_ALLOCATION | <one timeslot assigned> |
| TBF STARTING TIME   | <IE not present>        |

PACKET POLLING REQUEST in step 3:

|                       |                                         |
|-----------------------|-----------------------------------------|
| TYPE_OF_ACK           | 0 – MS response sent as 4 access bursts |
| Global TFI (downlink) | Addressing MS                           |

### 42.5.2.3 Downlink Transfer/ Polling/ Packet Polling Request/ Control block format

#### 42.5.2.3.1 Definition and applicability

This test case applies to all MSs supporting GPRS.

#### 42.5.2.3.2 Conformance Requirement

The network may send to the mobile station a PACKET POLLING REQUEST message. If the MS has received a PACKET DOWNLINK ASSIGNMENT message with no starting time or with a starting time that has already elapsed, the PACKET POLLING REQUEST message shall be sent on PACCH. Otherwise the PACKET POLLING message shall be sent on PAGCH. The mobile station shall be addressed by its TLLI or TFI.

On receipt of a PACKET POLLING REQUEST message, the mobile station shall respond to the network with the PACKET CONTROL ACKNOWLEDGEMENT message in the reserved uplink radio block specified by the RRBP field. The reserved block is considered as a one block PACCH allocation.

## References

3GPP TS 04.60, subclause 7.2.1.3.

### 42.5.2.3.3 Test purpose

Verify that an MS responds to a PACKET POLLING REQUEST message (requesting control block format) with a PACKET CONTROL ACKNOWLEDGEMENT message in control block format, in the uplink block specified by the RRBP field.

### 42.5.2.3.4 Method of test

## Initial Conditions

System Simulator:

1 cell, GPRS supported, PCCCH present.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 3 activated.

## Related PICS/PIXIT Statement(s)

- Support GPRS service.

## Test Procedure

1. MS receives a PACKET DOWNLINK ASSIGNMENT message on its assigned PCCCH, containing no starting time.
2. SS transmits downlink RLC data blocks.
3. SS transmits a PACKET POLLING REQUEST message, requesting control block format.
4. MS responds by sending a PACKET CONTROL ACKNOWLEDGE message in control block format.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

## 42.5.3 Downlink Transfer / T3190 Expiry / Initial allocation

### 42.5.3.1 Downlink Transfer/ T3190 Expiry / Initial allocation / Restart with valid RLC data block

#### 42.5.3.1.1 Definition and applicability

This test case applies to all MSs supporting GPRS.

#### 42.5.3.1.2 Conformance Requirement

When receiving the PACKET DOWNLINK ASSIGNMENT message and after waiting the TBF Starting Time when applicable, the mobile station starts timer T3190. The timer is reset when receiving the first valid RLC/MAC block.

On expiry of timer T3190, the mobile station shall abort the procedure and return to packet idle mode.

If the mobile station receives a valid RLC data block addressed to itself, the mobile station shall reset and restart timer T3190. If timer T3190 expires, the mobile station shall perform an abnormal release with return to CCCH or PCCCH (see subclause 8.7.1).

#### References

3GPP TS 04.60, subclauses 7.2.1.1, 8.1.2.1 and 10.4.5.

#### 42.5.3.1.3 Test purpose

Verify that an MS starts T3190 when receiving the PACKET DOWNLINK ASSIGNMENT, resets and restarts the timer when a valid RLC/MAC block is received, and returns to packet idle mode when T3190 expires.

#### 42.5.3.1.4 Method of test

#### Initial Conditions

System Simulator:

1 cell, GPRS supported, PCCCH present.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 3 activated.

#### Related PICS/PIXIT Statement(s)

- Support GPRS service.

#### Test Procedure

1. MS receives a PACKET DOWNLINK ASSIGNMENT message on its assigned PCCCH, containing relative-encoded starting time.
2. (0.8\*T3190) seconds after the starting time occurs, the SS transmits a downlink RLC data block with polling indicated.
3. MS sends PACKET DOWNLINK ACK/NACK on PACCH in response to the RLC data block.
4. (1.2\*T3190) seconds after the previous downlink RLC data block, the SS transmits another downlink RLC data block with polling indicated.
5. The MS ignores the downlink block (because it has already returned to packet idle mode upon expiry of T3190).

#### Maximum Duration of Test

5 minutes.

#### Expected Sequence

| Step | Direction | Message                                    | Comments                                                                                                                                                                                                                                                                 |
|------|-----------|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PACKET DOWNLINK ASSIGNMENT                 | Triggers the MS to switch to the assigned PDCH and start T3190 at the starting time indicated.<br>Sent on assigned PDCH, (T3190*0.8) seconds after expiry of the TBF Starting Time indicated in Step 1, with valid RRBP field, addressed to MS. T3190 is then restarted. |
| 2    | SS -> MS  | RLC DATA BLOCK                             |                                                                                                                                                                                                                                                                          |
| 3    | MS -> SS  | PACKET DOWNLINK ACK/NACK<br>RLC DATA BLOCK | MS acknowledges the previous RLC data block.                                                                                                                                                                                                                             |
| 4    | SS -> MS  |                                            | Sent on assigned PDCH, (T3190*1.2) seconds after step 2, with valid RRBP field, addressed to MS.                                                                                                                                                                         |
| 5    | SS        |                                            | Verify the MS does not respond to the previous RLC block, and that the MS does not transmit on the PACCH of the assigned PDCH.                                                                                                                                           |
| 6    | SS->MS    | PACKET DOWNLINK ASSIGNMENT                 | Sent on assigned packet paging channel. This is to verify the MS is in packet idle mode with no starting time.                                                                                                                                                           |
| 7    | SS->MS    | RLC DATA BLOCK                             | Sent on assigned PDCH, (T3190*0.8) seconds after step 6, with valid RRBP field, addressed to MS.                                                                                                                                                                         |
| 8    | MS -> SS  | PACKET DOWNLINK ACK/NACK                   | MS acknowledges the previous RLC data block.                                                                                                                                                                                                                             |
| 9    |           | {Completion of downlink data transfer}     | Macro                                                                                                                                                                                                                                                                    |

## 42.5.4 Downlink Transfer / T3190 Expiry / Resource reallocation

### 42.5.4.1 Downlink Transfer/ T3190 Expiry / Resource reallocation / Without TBF starting time

#### 42.5.4.1.1 Definition and applicability

This test case applies to all MSs supporting GPRS.

#### 42.5.4.1.2 Conformance Requirement

On receipt of a PACKET DOWNLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message, and after the TBF starting time, if present, the mobile station shall switch to the assigned PDCHs. Upon switching to the new PDCHs the mobile station shall restart timer T3190.

When the mobile station receives an RLC/MAC block addressed to itself on any of the new assigned resources it shall restart timer T3190. If timer T3190 expires, the mobile station shall perform an abnormal release with return to CCCH or PCCCH (see subclause 8.7.1).

#### References

3GPP TS 04.60, subclause 8.1.2.4.

#### 42.5.4.1.3 Test purpose

Verify that an MS switches to the newly assigned PDCH when no starting time is present, and release the PDCH when T3190 expires.

#### 42.5.4.1.4 Method of test

#### Initial Conditions

System Simulator:

1 cell, GPRS supported, PCCCH present.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 3 activated.

#### Related PICS/PIXIT Statement(s)

- Support GPRS service.

#### Test Procedure

1. MS receives a PACKET DOWNLINK ASSIGNMENT message on its assigned PCCCH, containing no starting time.
2. SS transmits a downlink RLC data block.
3. MS responds by sending a PACKET DOWNLINK ACK/NACK.
4. SS transmits another PACKET DOWNLINK ASSIGNMENT message on PACCH, containing no starting time.

5. (T3190 \* 1.2) seconds later, SS transmits a downlink RLC data block on the newly assigned resources.
6. MS ignores the downlink block (because it has already returned to packet idle mode because T3190 expired).

#### Maximum Duration of Test

5 minutes.

#### Expected Sequence

| Step | Direction | Message                                | Comments                                                                                            |
|------|-----------|----------------------------------------|-----------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PACKET DOWNLINK ASSIGNMENT             | Triggers the MS to switch to PDCH0. (no starting time)                                              |
| 2    | SS -> MS  | RLC DATA BLOCK                         | 3 blocks after the previous message, with valid RRBP field, on assigned PDCH0, addressed to MS.     |
| 3    | MS -> SS  | PACKET DOWNLINK ACK/NACK               | MS acknowledges on PACCH the RLC data block sent on PDCH0.                                          |
| 4    | SS -> MS  | RLC DATA BLOCKS                        | SS continues to transmit RLC data blocks according to allocation from step 1.                       |
| 5    | SS -> MS  | PACKET DOWNLINK ASSIGNMENT             | Triggers the MS to switch to PDCH1. (no starting time)                                              |
| 6    | SS -> MS  | RLC DATA BLOCK                         | (T3190 * 1.2) seconds after the previous message, with valid RRBP field, on PDCH1, addressed to MS. |
| 7    | SS        |                                        | Verify the MS does not transmit on the PACCH of PDCH1.                                              |
| 8    | SS->MS    | PACKET DOWNLINK ASSIGNMENT             | Sent on assigned packet paging channel. This is to verify the MS is in packet idle mode.            |
| 9    | SS->MS    | RLC DATA BLOCK                         | Sent on assigned PDCH, (T3190*0.8) seconds after step 6, with valid RRBP field, addressed to MS.    |
| 10   | MS -> SS  | PACKET DOWNLINK ACK/NACK               | MS acknowledges the previous RLC data block.                                                        |
| 11   |           | {Completion of downlink data transfer} | Macro                                                                                               |

#### Specific Message Contents

PACKET DOWNLINK ASSIGNMENT message in step 1:

|                       |                                 |

| S/P  | 1 – RRBP field is valid                           |

### 42.5.4.2 Downlink Transfer/ T3190 Expiry / Resource reallocation / With TBF starting time

#### 42.5.4.2.1 Definition and applicability

This test case applies to all MSs supporting GPRS.

#### 42.5.4.2.2 Conformance Requirement

On receipt of a PACKET DOWNLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message, and after the TBF starting time, if present, the mobile station shall switch to the assigned PDCHs. Upon switching to the new PDCHs the mobile station shall restart timer T3190.

When the mobile station receives an RLC/MAC block addressed to itself on any of the new assigned resources it shall restart timer T3190. If timer T3190 expires, the mobile station shall perform an abnormal release with return to CCCH or PCCCH (see subclause 8.7.1).

#### References

3GPP TS 04.60, subclause 8.1.2.4.

#### 42.5.4.2.3 Test purpose

Verify that an MS switches to the newly assigned PDCH at the starting time given, and returns to packet idle mode when T3190 expires.

#### 42.5.4.2.4 Method of test

#### Initial Conditions

System Simulator:

1 cell, GPRS supported, PCCCH present.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 3 activated.

#### Related PICS/PIXIT Statement(s)

- Support GPRS service.

#### Test Procedure

1. MS receives a PACKET DOWNLINK ASSIGNMENT message on its assigned PCCCH, containing no starting time.
2. SS transmits a downlink RLC data block.
3. MS responds by sending a PACKET DOWNLINK ACK/NACK.
4. SS transmits another PACKET DOWNLINK ASSIGNMENT message on PACCH, containing a starting time.
5. (T3190 \* 1,2) seconds later, SS transmits a downlink RLC data block on the newly assigned resources.
6. MS ignores the downlink block (because it has already returned to packet idle mode because T3190 expired).

#### Maximum Duration of Test

5 minutes.

## Expected Sequence

| Step | Direction | Message                                | Comments                                                                                                               |
|------|-----------|----------------------------------------|------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PACKET DOWNLINK ASSIGNMENT             | Triggers the MS to switch to PDCH0. (no starting time)                                                                 |
| 2    | SS -> MS  | RLC DATA BLOCK                         | 3 blocks after the previous message, with valid RRB field, on assigned PDCH0, addressed to MS.                         |
| 3    | MS -> SS  | PACKET DOWNLINK ACK/NACK               | MS acknowledges on PACCH the RLC data block sent on PDCH0.                                                             |
| 4    | SS -> MS  | RLC DATA BLOCKS                        | SS continues to transmit RLC data blocks according to allocation from step 1.                                          |
| 5    | SS -> MS  | PACKET DOWNLINK ASSIGNMENT             | Triggers the MS to switch to PDCH1 at the given starting time.                                                         |
| 6    | SS -> MS  | RLC DATA BLOCK                         | (T3190 * 1.2)seconds after the starting time in the previous message, with valid RRB field, on PDCH1, addressed to MS. |
| 7    | SS        |                                        | Verify the MS does not transmit on the PACCH of PDCH1.                                                                 |
| 8    | SS->MS    | PACKET DOWNLINK ASSIGNMENT             | Sent on assigned packet paging channel. This is to verify the MS is in packet idle mode.                               |
| 9    | SS->MS    | RLC DATA BLOCK                         | Sent on assigned PDCH, (T3190*0.8) seconds after step 6, with valid RRB field, addressed to MS.                        |
| 10   | MS -> SS  | PACKET DOWNLINK ACK/NACK               | MS acknowledges the previous RLC data block.                                                                           |
| 11   |           | {Completion of downlink data transfer} | Macro                                                                                                                  |

## Specific Message Contents

PACKET DOWNLINK ASSIGNMENT message in step 1:

|                       |                                 |
|-----------------------|---------------------------------|

3GPP TS 04.60, subclause 8.1.2.4.

### 42.5.4.3.3 Test purpose

Verify that an MS switches to the newly assigned PDCH at the starting time given, and returns to packet idle mode when T3190 expires.

### 42.5.4.3.4 Method of test

## Initial Conditions

System Simulator:

GPRS supported, PCCCH present

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 3 activated.

## Related PICS/PIXIT Statement(s)

- Support GPRS service.

## Test Procedure

1. MS receives a PACKET DOWNLINK ASSIGNMENT message on its assigned PCCCH, containing no starting time.
2. SS transmits a downlink RLC data block.
3. MS responds by sending a PACKET DOWNLINK ACK/NACK.
4. SS transmits another PACKET DOWNLINK ASSIGNMENT message on PACCH, containing a starting time.
5. (T3190 \* 0,8) seconds later, SS transmits a downlink RLC data block on the newly assigned resources.
6. MS responds by sending a PACKET DOWNLINK ACK/NACK.
7. (T3190 \* 1,2) seconds later, SS transmits a downlink RLC data block (using the same resources).
8. MS ignores the downlink block (because it has already returned to packet idle mode because T3190 expired).

## Maximum Duration of Test

5 minutes.

## Expected Sequence

| Step | Direction | Message                    | Comments                                                                                                                     |
|------|-----------|----------------------------|------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PACKET DOWNLINK ASSIGNMENT | Triggers the MS to switch to PDCH0. (no starting time)                                                                       |
| 2    | SS -> MS  | RLC DATA BLOCK             | 3 blocks after the previous message, with valid RRBP field, on assigned PDCH0, addressed to MS.                              |
| 3    | MS -> SS  | PACKET DOWNLINK ACK/NACK   | MS acknowledges on PACCH the RLC data block.                                                                                 |
| 4    | SS -> MS  | RLC DATA BLOCKS            | SS continues to transmit RLC data blocks according to allocation from step 1.                                                |
| 5    | SS -> MS  | PACKET DOWNLINK ASSIGNMENT | Triggers the MS to switch to PDCH1 at the given starting time.                                                               |
| 6    | SS -> MS  | RLC DATA BLOCK             | ( $T3190 * 0.8$ ) seconds after the starting time in the previous message, with valid RRBP field, on PDCH1, addressed to MS. |
| 7    | MS -> SS  | PACKET DOWNLINK ACK/NACK   | MS acknowledges on PACCH the RLC data block.                                                                                 |
| 8    | SS -> MS  | RLC DATA BLOCK             | ( $T3190 * 1.2$ ) seconds after the starting time in the previous message, with valid RRBP field, on PDCH1, addressed to MS. |
| 9    | SS        |                            | Verify the MS does not transmit on the PACCH of PDCH1.                                                                       |

## Specific Message Contents

| - Starting Frame Number Description IE | 000000101101 – k=45: first frame of block is N+199 or N+200 |

DOWNLINK RLC DATA BLOCKS (various steps):

|      |                                                   |
|------|---------------------------------------------------|
| RRBP | 00 – Response shall be sent by MS in N+13 frames. |
| S/P  | 1 – RRBP field is valid                           |

## 42.5.5 Downlink Transfer / Reestablishment

### 42.5.5.1 Downlink Transfer/ Reestablishment/ T3192 Expiry

#### 42.5.5.1.1 Definition and applicability

This test case applies to all MSs supporting GPRS.

#### 42.5.5.1.2 Conformance Requirement

After the network has initiated the release of a downlink TBF and the mobile station has received all the RLC blocks, the mobile station shall send the PACKET DOWNLINK ACK/NACK message with the Final Ack Indicator bit set to '1', start timer T3192 and continue to monitor all assigned PDCHs.

If the network receives a PACKET DOWNLINK ACK/NACK message with the Final Ack Indicator bit set to '1' and has new data to transmit for the mobile station, the network may establish a new downlink TBF for the mobile station by sending the PACKET DOWNLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message with the Control Ack bit set to '1' on PACCH.

If the mobile station, after sending the PACKET DOWNLINK ACK/NACK message with the Final Ack Indicator bit set to '1', receives a PACKET DOWNLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message with the Control Ack bit set to '1' while timer T3192 is running, the mobile station shall stop timer T3192, consider the previous downlink TBF released and act upon the new assignment.

When timer T3192 expires the mobile station shall release the downlink TBF. If the mobile station is operating in half duplex mode and received an uplink assignment during the TBF release procedure, the mobile station shall then immediately act upon the uplink assignment. If there is no ongoing uplink TBF, the mobile station in packet transfer mode shall return to packet idle mode; the mobile station in dual transfer mode shall return to dedicated mode. The DRX mode procedures shall be applied, as specified in subclause 5.5.1.5.

## References

3GPP TS 04.60, subclauses 8.1.2.4 and 9.3.2.6.

### 42.5.5.1.3 Test purpose

Verify that after a downlink TBF is released, MS returns to packet idle mode when T3192 expires.

### 42.5.5.1.4 Method of test

## Initial Conditions

System Simulator:

1 cell, GPRS supported, PCCCH present.

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 2 activated.

## Related PICS/PIXIT Statement(s)

- Support GPRS service.

## Test Procedure

1. MS receives a PACKET DOWNLINK ASSIGNMENT message on its assigned PCCCH, containing no starting time.
2. SS transmits downlink RLC data blocks for the downlink allocation.
3. SS transmits a downlink RLC data block, with valid RRBP field (polling), with Final Block indicator set to 1.
4. MS responds by sending a PACKET DOWNLINK ACK/NACK with Final Ack indicator set to 1 and starting T3192.
5. When T3192 expires, MS returns to packet idle mode.
6. SS transmits a downlink RLC data block (using previous resources).
7. MS ignores this block, because it has returned to packet idle mode.
8. SS transmits a PACKET DOWNLINK ASSIGNMENT, followed by RLC data blocks for the downlink allocation.
9. MS responds with a PACKET DOWNLINK ACK/NACK.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

| Step | Direction | Message                                          | Comments                                                                                             |

## 42.5.5.2 Downlink Transfer/ Reestablishment/ Packet Downlink Assignment

### 42.5.5.2.1 Definition and applicability

This test case applies to all MSs supporting GPRS.

### 42.5.5.2.2 Conformance Requirement

After the network has initiated the release of a downlink TBF and the mobile station has received all the RLC blocks, the mobile station shall send the PACKET DOWNLINK ACK/NACK message with the Final Ack Indicator bit set to '1', start timer T3192 and continue to monitor all assigned PDCHs.

If the network receives a PACKET DOWNLINK ACK/NACK message with the Final Ack Indicator bit set to '1' and has new data to transmit for the mobile station, the network may establish a new downlink TBF for the mobile station by sending the PACKET DOWNLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message with the Control Ack bit set to '1' on PACCH.

If the mobile station, after sending the PACKET DOWNLINK ACK/NACK message with the Final Ack Indicator bit set to '1', receives a PACKET DOWNLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message with the Control Ack bit set to '1' while timer T3192 is running, the mobile station shall stop timer T3192, consider the previous downlink TBF released and act upon the new assignment.

### References

3GPP TS 04.60, subclause 8.1.2.4.

### 42.5.5.2.3 Test purpose

Verify that after a downlink TBF is released, MS acts on a PACKET DOWNLINK ASSIGNMENT message.

### 42.5.5.2.4 Method of test

### Initial Conditions

System Simulator:

GPRS supported, PCCCH present

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 2 activated.

### Related PICS/PIXIT Statement(s)

- Support GPRS service.

### Test Procedure

1. MS receives a PACKET DOWNLINK ASSIGNMENT message on its assigned PCCCH, containing no starting time.
2. SS transmits downlink RLC data blocks for the downlink allocation.
3. SS transmits a downlink RLC data block, with valid RRBp field (polling), with Final Block indicator set to 1.

4. MS responds by sending a PACKET DOWNLINK ACK/NACK with Final Ack indicator set to 1.
5. SS transmits a PACKET DOWNLINK ASSIGNMENT, assigning a new PDCH.
6. SS transmits a downlink RLC data block on newly assigned PDCH, with valid RRBP field.
7. MS responds by sending a PACKET DOWNLINK ACK/NACK.

#### Maximum Duration of Test

5 minutes.

#### Expected Sequence

| Step | Direction | Message                                          | Comments                                                                                   |

### 42.5.5.3 Downlink Transfer/ Reestablishment/ Invalid Frequency Parameters IE

#### 42.5.5.3.1 Definition and applicability

This test case applies to all MSs supporting GPRS.

#### 42.5.5.3.2 Conformance Requirement

After the network has initiated the release of a downlink TBF and the mobile station has received all the RLC blocks, the mobile station shall send the PACKET DOWNLINK ACK/NACK message with the Final Ack Indicator bit set to '1', start timer T3192 and continue to monitor all assigned PDCHs.

If the network receives a PACKET DOWNLINK ACK/NACK message with the Final Ack Indicator bit set to '1' and has new data to transmit for the mobile station, the network may establish a new downlink TBF for the mobile station by sending the PACKET DOWNLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message with the Control Ack bit set to '1' on PACCH.

If the mobile station, after sending the PACKET DOWNLINK ACK/NACK message with the Final Ack Indicator bit set to '1', receives a PACKET DOWNLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message with the Control Ack bit set to '1' while timer T3192 is running, the mobile station shall stop timer T3192, consider the previous downlink TBF released and act upon the new assignment.

- If a mobile station receives a PACKET DOWNLINK ASSIGNMENT or PACKET TIMESLOT RECONFIGURE message and detects an invalid Frequency Parameters information element in the message, it shall perform an abnormal release. If PCCCH is present in the cell the mobile station shall perform an abnormal release with system information (see subclause 8.7.3). If PCCCH is not present, the mobile station shall perform an abnormal release with random access (see subclause 8.7.2).

#### References

3GPP TS 04.60, subclauses 8.1.2.4 and 8.1.2.4.1.

#### 42.5.5.3.3 Test purpose

Verify that after a downlink TBF is released, MS returns to packet idle mode if a PACKET DOWNLINK ASSIGNMENT with invalid frequency parameters IE is received.

#### 42.5.5.3.4 Method of test

##### Initial Conditions

System Simulator:

GPRS supported, PCCCH present

Mobile Station:

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 2 activated.

##### Related PICS/PIXIT Statement(s)

- Support GPRS service.

Test Procedure

1. MS receives a PACKET DOWNLINK ASSIGNMENT message on its assigned PCCCH, containing no starting time.
2. SS transmits downlink RLC data blocks for the downlink allocation.
3. SS transmits a downlink RLC data block, with valid RRBP field (polling), with Final Ack indicator set to 1.
4. MS responds by sending a PACKET DOWNLINK ACK/NACK.
5. SS transmits a PACKET DOWNLINK ASSIGNMENT, assigning a new PDCH, but with invalid frequency parameters.
6. SS transmits a downlink RLC data block on previously assigned PDCH, with valid RRBP field.
7. MS ignores the block because it has returned to packet idle mode.

Maximum Duration of Test

5 minutes.

## 42.6 MAC Modes whilst in DTM

### 42.6.1 Exclusive allocation in single-slot configuration

#### 42.6.1.1 Conformance requirements

The support of exclusive allocation is conditional. A network or a mobile station that supports the dual transfer mode shall support the exclusive allocation. The exclusive allocation shall be used in dual transfer mode during single slot operation (i.e., a half-rate TCH combined with a half-rate PDCH).

When mobile station has received the uplink assignment and granted the right to transmit using exclusive allocation, the mobile station shall start timer T3184 and transmit an RLC/MAC block in every uplink radio block on the PDCHs assigned for the TBF. The timer T3184 shall be restarted every time the mobile station receives a PACKET UPLINK ACK/NACK message.

If the mobile station has an RR connection to the network on a half-rate TCH, the network may assign a downlink TBF using the other sub-channel of the same timeslot for a half-rate PDCH (see 3GPP TS 05.02). In this case, the downlink assignment message shall be encoded with a timeslot allocation including the timeslot number for the half-rate TCH and the half-rate PDCH and only that timeslot number. The mobile station shall interpret this allocation as an allocation of a half-rate PDCH.

If the mobile station has an RR connection to the network on a half-rate TCH, the network may assign an uplink TBF using the other sub-channel of the same timeslot for a half-rate PDCH (see 3GPP TS 05.02)

## 42.6.1.2 Test purpose

To guarantee that the MS transmits an RLC/MAC block in every uplink radio block on the PDCH assigned for the single-slot TBF, ignoring the USF indicator in the downlink radio block corresponding to the uplink PDCH/H channel.

## 42.6.1.3 Method of test

## Initial Conditions

## System Simulator:

1 cell, GPRS supported, DTM supported, PCCCH present.

## Mobile Station:

The MS is in the state " GMM-REGISTERED " with a TMSI and P-TMSI allocated and PDP context 1 activated.

## Related PICS/PIXIT Statement(s)

- Support of DTM

## Test Procedure

The MS is in a active CS call with an assigned TCH/H. The MS is triggered to initiate an uplink TBF and again the MS is allocated the same timeslot for use in a uplink TBF. The MS interprets this as a command to use a combined TCH/H and exclusive mode PDCH/H in a single Timeslot. The SS verifies that the MS sends uplink RLC blocks in each block in the PDCH/H

## Maximum Duration of Test

5 minutes

## Expected Sequence

| Step | Direction | Message                  | Comments                                                                             |

## 42.6.2 Exclusive allocation in multi-slot configuration

### 42.6.2.1 Conformance requirements

The support of exclusive allocation is conditional. A network or a mobile station that supports the dual transfer mode shall support the exclusive allocation. The exclusive allocation shall be used in dual transfer mode during single slot operation (i.e., a half-rate TCH combined with a half-rate PDCH).

When mobile station has received the uplink assignment and granted the right to transmit using exclusive allocation, the mobile station shall start timer T3184 and transmit an RLC/MAC block in every uplink radio block on the PDCHs assigned for the TBF.

### References

3GPP TS 04.60/44.060 sub-clauses 5.2.4 & 8.1.1.3a.1

### 42.6.2.2 Test purpose

To guarantee that the MS transmits an RLC/MAC block in every uplink radio block on the PDCHs assigned for the multi-slot TBF, ignoring the USF indicator in the downlink radio block corresponding to the uplink PDCH channels.

### 42.6.2.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, DTM supported.

Mobile Station:

The MS is in the active state (U10) of a call.

The MS is GPRS idle with a P-TMSI allocated and the PDP context 1 activated.

#### Related PICS/PIXIT Statement(s)

- Support of dynamic allocation in multislot mode = FALSE

#### Test Procedure

The MS, whilst in dedicated mode, is triggered to initiate an uplink TBF and sends a DTM REQUEST message to the SS. On receipt of the DTM REQUEST message, requesting uplink resources, the SS assigns the MS PS resources in a timeslot adjacent to the CS resource. The SS accomplishes the resource assignment by passing a PACKET ASSIGNMENT message to the MS. Once the MS has received the assignment message, the MS starts to send RLC data blocks to the SS in every uplink block on the assigned PDCH.

#### Maximum Duration of Test

5 minutes

## Expected Sequence

| Step | Direction | Message                  | Comments                                                                                    |

## 42.6.3 Dynamic allocation in multi-slot configuration

### 42.6.3.1 Conformance requirements

The exclusive allocation shall be used in dual transfer mode in configurations with full-rate PDCH, if the mobile station indicates in the classmark information sent to the network (see 3G TS 24.008) that exclusive allocation is required in dual transfer mode. If the mobile station does not indicate that, exclusive allocation shall not be used on a full-rate PDCH.

## References

3GPP TS 04.60/44.060 section 8.1.0

### 42.6.3.2 Test purpose

To guarantee that the MS does not use the exclusive allocation in Multislot configuration when requested to do so by the network, when dynamic allocation is allowed on a MS.

### 42.6.3.3 Method of test

## Initial Conditions

System Simulator:

1 cell, DTM supported.

Mobile Station:

The MS is in the active state (U10) of a call.

The MS is GPRS idle with a P-TMSI allocated and the PDP context 1 activated.

## Related PICS/PIXIT Statement(s)

- Support of dynamic allocation in multislot mode.

## Test Procedure

The MS, whilst in dedicated mode, is triggered to initiate uplink TBF and sends a DTM REQUEST message to the SS. On receipt of the DTM REQUEST message, requesting uplink resources, the SS assigns the MS PS resources in a

timeslot adjacent to the CS resource. The SS accomplishes the resource assignment by passing a PACKET ASSIGNMENT message to the MS. Once the MS has received the assignment message, the MS starts to send RLC data blocks to the SS only in the uplink blocks assigned to the MS on the timeslot.

#### Maximum Duration of Test

5 minutes

#### Expected Sequence

## 43 RLC Test Cases

#### Applicability

All test cases in this subclause are applicable for the MS supporting GPRS service with RLC/MAC in acknowledged mode.

#### Default conditions and messages

The default conditions, message contents and macros not specified in this subclause must be set as in clause 40.

#### Initial conditions

Unless otherwise indicated, the initial conditions for all acknowledged mode tests, as a minimum, are as follows. Other initial conditions may apply. In the event of conflict between initial conditions stated here and those stated in a test case, the test case shall take precedence.

- The MS is GPRS attached.
- A PDP context has been established with RLC acknowledged mode operation.

## 43.1 Acknowledged Mode

### 43.1.1 Acknowledged mode / Uplink TBF

#### 43.1.1.1 Acknowledged mode / Uplink TBF / Send state variable V(S)

##### 43.1.1.1.1 Conformance requirements

1. The send state variable, V(S), can take on the values 0 through 127. Each RLC data block contains a block sequence number (BSN) field that is 7 bits in length. At the time that an in-sequence RLC data block is designated for transmission, the value of BSN is set equal to the value of the send state variable.
2. V(S) shall be set to the value 0 at the beginning of each TBF in which the RLC endpoint is the transmitter.
3. The value of V(S) shall be incremented by 1 after transmission of the RLC data block with BSN = V(S).

#### References

3GPP TS 04.60, subclause 9.1.1.

##### 43.1.1.1.2 Test purpose

1. To verify that the mobile station sets the V(S) to 0 at the beginning of each TBF.
2. To verify that the mobile station increases the V(S) by 1 after transmission of the RLC data block with BSN set to V(S).
3. To verify that the mobile station wraps the V(S) to 0 after 127.

##### 43.1.1.1.3 Method of test

#### Initial Conditions

##### System Simulator:

1 cell, default setting, PBCCH not present.

##### Mobile Station:

The MS is GPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP context2 activated.

#### Related PICS/PIXIT Statement(s)

- The way to initiate an acknowledged uplink transfer.

#### Test Procedure

The MS is made to send RLC data blocks. SS checks that the BSN in the RLC data block:

1. is set to the value 0 at the beginning of each TBF in which the mobile station is the transmitter;
2. is incremented by 1 in each subsequent RLC data block in the TBF; and
3. takes on all values in the range 0 to 127 and then back to 0.

#### Maximum Duration of Test

5 minutes.

## 43.1.1.2 Acknowledged mode / Uplink TBF / Transmit window size

## 43.1.1.2.1 Conformance requirements

1.  $V(S)$  shall not exceed  $V(A)$  modulo 128 by more than the maximum allowed number of outstanding RLC data blocks  $k$  (window size  $k$  is defined in 3GPP TS 04.60 subclause 9.1.9).
2. If  $V(S) = V(A) + k$  modulo 128 (i.e., the transmit window is stalled), the mobile station shall set the stall indicator to 1 in each RLC data block transmitted and transmit the oldest RLC data block whose corresponding element in  $V(B)$  has the value PENDING\_ACK, then the next oldest RLC data block whose corresponding element in  $V(B)$  has the value PENDING\_ACK, etc.

## References

3GPP TS 04.60, subclauses 9.1.1, 9.1.3 and 9.1.9.

## 43.1.1.2.2 Test purpose

1. To verify that the mobile station sets the stall indicator to 1 in each RLC data block transmitted once the transmit window is stalled.
2. To verify that the mobile station retransmits data blocks that are pending acknowledgment.
3. To verify that the mobile station retransmits unacknowledged RLC data blocks in correct order while the transmit window is stalled.

## 43.1.1.2.3 Method of test

## Initial Conditions

System Simulator:

1 cell, default setting, PBCCH not present.

Mobile Station:

The MS is GPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP Context2 activated.

## Related PICS/PIXIT Statement(s)

- The way to initiate an acknowledged uplink transfer.

## Test Procedure

The MS transmits k (window size) blocks without acknowledgement from SS. Confirm that the MS:

- a) sets the stall indicator bit once the window is stalled; and
- b) retransmits blocks that are pending acknowledgement, oldest first.

## Maximum Duration of Test

5 minutes.

### 43.1.1.3 Acknowledged mode / Uplink TBF / Acknowledge state variable V(A)

#### 43.1.1.3.1 Conformance requirements

1. The Acknowledge state variable V(A) contains the BSN value of the oldest RLC data block that has not been positively acknowledged by its peer. V(A) can take on the values 0 through 127.
2. V(A) shall be set to the value 0 at the beginning of each TBF in which the RLC endpoint is the transmitter.
3. The value of V(A) shall be updated from the values received from its peer in the received block bitmap (RBB) of the Packet Ack/Nack message (see subclause 9.1.8).

## References

3GPP TS 04.60, subclauses 9.1.2 and 9.1.8.

### 43.1.1.3.2 Test purpose

1. To verify that the mobile station correctly decodes the RBB and updates the values of  $V(A)$ .

### 43.1.1.3.3 Method of test

## Initial Conditions

### System Simulator:

1 cell, default setting, PBCCH not present.

### Mobile Station:

The MS is GPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP Context2 activated.

## Related PICS/PIXIT Statement(s)

- The way to initiate an acknowledged uplink transfer.

## Test Procedure

1. The mobile station transmits  $k$  (window size) blocks without acknowledgement from SS. SS then acknowledges the first  $N$  blocks. The MS retransmits the negatively acknowledged data blocks with BSN from  $N$  to 63 and then it transmits  $N$  more new data blocks (from 64 to  $N+63$ ).
2. The test is performed for the values of  $N = 10, 15$  and 20.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

#### 43.1.1.4 Acknowledged mode / Uplink TBF / Negatively acknowledged RLC data blocks

##### 43.1.1.4.1 Conformance requirements

1. The transmitter shall transmit the oldest RLC data block whose corresponding element in V(B) indexed relative to V(A) has the value NACKED.
2. If  $[V(S) < V(A) + k]$  modulo 128 and no RLC data blocks have a corresponding element in V(B) with the value NACKED, the RLC data block with BSN = V(S) shall be transmitted.
3. As each RLC data block is transmitted the corresponding element in V(B) shall be set to the value PENDING\_ACK.

##### References

3GPP TS 04.60, subclause 9.1.3.

##### 43.1.1.4.2 Test purpose

1. To verify that the mobile station retransmits Nacked data blocks before transmission of new information.
2. To verify that the mobile station retransmits Nacked blocks in order of age, older first.
3. To verify that the mobile station only retransmit Nacked blocks once per negative acknowledgment.

##### 43.1.1.4.3 Method of test

##### Initial Conditions

System Simulator:

1 cell, default setting, , PBCCH not present, BS\_CV\_MAX = 0.

Mobile Station:

The MS is GPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP Context2 activated.

##### Related PICS/PIXIT Statement(s)

- The way to initiate an acknowledged uplink transfer.

##### Test Procedure

The MS is made to transmit RLC data blocks. The SS randomly negatively acknowledges RLC data blocks. The MS retransmits the negatively acknowledged RLC data blocks, oldest first before transmitting new RLC data blocks.

The SS does not send further acknowledgements. The MS does not retransmit the previously negatively acknowledged RLC data blocks.

##### Maximum Duration of Test

5 minutes.

## Expected Sequence

### 43.1.1.5 Acknowledged mode / Uplink TBF / Invalid Negative Acknowledgment

#### 43.1.1.5.1 Conformance requirements

1. If the mobile station is the transmitter, it shall set an instance of timer T3198 for each RLC data block sent (subclause 9.1.3 3GPP TS 04.60).
2. The timer T3198 shall have the expiry value set to BS\_CV\_MAX block periods (subclause 9.1.3 3GPP TS 04.60).
3. The mobile station shall not modify the element in the acknowledge state array, V(B), corresponding to an RLC data block that cannot be validly negatively acknowledged (subclause 9.1.8 3GPP TS 04.60).

#### References

3GPP TS 04.60, subclauses 9.1.3 and 9.1.8.

#### 43.1.1.5.2 Test purpose

1. To verify the operation of the timer T3198.
2. To verify the correct response of the mobile station to an invalid negative acknowledgement.

#### 43.1.1.5.3 Method of test

##### Initial Conditions

System Simulator:

1 cell, default setting, , PBCCH not present, BS\_CV\_MAX = 15.

Mobile Station:

The MS is GPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP Context2 activated.

##### Related PICS/PIXIT Statement(s)

- The way to initiate an acknowledged uplink transfer.

##### Test Procedure

The MS is made to send RLC data blocks. The SS negatively acknowledges some RLC data blocks within BS\_CV\_MAX block periods. The MS shall not retransmit the RLC data blocks that were negatively acknowledged.

##### Maximum Duration of Test

5 minutes.

## 43.1.1.6 Acknowledged mode / Uplink TBF / Decoding of Received Block Bitmap

## 43.1.1.6.1 Conformance requirements

For each bit in the RBB whose corresponding BSN value is within the transmit window, if the bit contains the value '1', the corresponding element in V(B) indexed relative to SSN shall be set to the value ACKED. If the bit contains the value '0', the element in V(B) shall be set to the value NACKED. A bit within the RBB whose corresponding BSN is not within the transmit window, shall be ignored.

## References

3GPP TS 04.60, subclause 9.1.8.

## 43.1.1.6.2 Test purpose

1. To verify the decoding of the received block bitmap of the Packet Uplink Ack/Nack message.

## 43.1.1.6.3 Method of test

## Initial Conditions

## System Simulator:

1 cell, default setting, PBCCH not present.

## Mobile Station:

The MS is GPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP Context2 activated.

## Related PICS/PIXIT Statement(s)

- The way to initiate an acknowledged uplink transfer.

## Test Procedure

The MS is made to send RLC data blocks. The SS negatively acknowledges one or more RLC data blocks after BS\_CV\_MAX block periods. The MS retransmits these blocks.

The SS negatively acknowledges data blocks outside the transmit window. The MS ignores these negative acknowledgments.

## Maximum Duration of Test

5 minutes.

## 43.1.2 Acknowledged mode / Downlink TBF

### 43.1.2.1 Acknowledged mode / Downlink TBF / Receive state variable V(R)

#### 43.1.2.1.1 Conformance requirements

1. In RLC acknowledged mode, each RLC endpoint receiver shall have an associated receive state variable V(R). The receive state variable denotes the BSN of the next in-sequence RLC data block expected to be received.
2. The mobile station shall set V(R) to the value 0 at the beginning of each TBF in which the RLC endpoint is the receiver.

#### References

3GPP TS 04.60, subclause 9.1.5.

#### 43.1.2.1.2 Test purpose

1. To verify correct initialisation of the receive state variable, V(R).
2. To verify the receive state variable, V(R) is set to the next in sequence RLC data block expected to be received.

## 43.1.2.1.3 Method of test

## Initial Conditions

## System Simulator:

1 cell, default setting, PBCCH not present.

## Mobile Station:

The MS is GPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP Context2 activated.

## Related PICS/PIXIT Statement(s)

- Support GPRS service.

## Test Procedure

SS establishes a downlink TBF and sends RLC data blocks with BSN values between 0 to N in sequence. The MS is polled in each RLC data block by setting the S/P bit. SS verifies that the SSN in the Packet Downlink Ack/Nack messages sent by the MS are set to [BSN+1] modulo 128. SS then sends RLC data block with random BSN N1 that holds a value between [N+1] modulo 128 and [N+64] modulo 128. The MS is polled in the last RLC data block by setting the S/P bit. SS verifies that the SSN in the Packet Downlink Ack/Nack message sent by the MS is set to [N1+1] modulo 128.

The test is performed for the values of N = 1, 10, 63, 64, 126, 127.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

## 43.1.2.2 Acknowledged mode / Downlink TBF / Receive window state variable V(Q)

## 43.1.2.2.1 Conformance requirements

In RLC acknowledged mode, each RLC endpoint receiver shall have an associated receive window state variable, V(Q). The mobile station shall set V(Q) to the value 0 at the beginning of each TBF in which the RLC endpoint is the receiver.

The value of V(Q) shall be updated when the RLC receiver receives the RLC data block whose BSN is equal to V(Q).

## References

3GPP TS 04.60, subclause 9.1.6.

## 43.1.2.2.2 Test purpose

1. To verify that V(Q) is not updated when data blocks with BSN not equal to V(Q) are received.

## 43.1.2.2.3 Method of test

## Initial Conditions

## System Simulator:

1 cell, default setting, PBCCH not present.

## Mobile Station:

The MS is GPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP Context2 activated.

## Related PICS/PIXIT Statement(s)

None

## Test Procedure

SS establishes a downlink TBF and sends an RLC data block with BSN value N (N in the range 1..63) and polls the MS. The MS shall accept the block and sends a Packet Downlink Ack/Nack message. SS verifies that SSN is set to [N+1] and RBB bit corresponding to N is set to 1. SS sends another RLC data block to the MS with BSN value 64 and polls the MS. SS verifies that the SSN and RBB fields in the Packet Downlink Ack/Nack message sent by the MS are not updated.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

| Step | Direction | Message                      | Comments                                            |

| 3    | MS -> SS  | Packet Downlink Ack/ Nack    | SSN value should be [N+1] RBB set for block N       |
| 4    | SS -> MS  | DOWNLINK RLC DATA BLOCK      | BSN = 64, polls the MS                              |
| 5    | MS -> SS  | Packet Downlink Ack/ Nack    | SSN value should be [N+1]. No change in RBB         |
| 6    | SS -> MS  | DOWNLINK RLC DATA BLOCK      | BSN = 0, polls the MS                               |
| 7    | MS -> SS  | Packet Downlink Ack/ Nack    | SSN value should be [N+1]. RBB updated              |
| 8    | SS -> MS  | DOWNLINK RLC DATA BLOCK      | BSN = 64, polls the MS                              |
| 9    | MS -> SS  | Packet Downlink Ack/ Nack    | SSN value should be 65.                             |

## 43.1.2.3 Acknowledged mode / Downlink TBF / Re-assembly of RLC data blocks

## 43.1.2.3.1 Conformance requirements

RLC data blocks shall be collected at the receiver until all RLC data blocks comprising an LLC PDU have been received. The RLC headers shall be removed from each RLC data block at this time and the RLC data units re-assembled into an LLC PDU and passed to the next higher layer.

## References

3GPP TS 04.60, subclause 9.1.11.

## 43.1.2.3.2 Test purpose

To verify the correct re-assembly of the RLC data blocks.

## 43.1.2.3.3 Method of test

## Initial Conditions

## System Simulator:

1 cell, default setting, PBCCH not present.

## Mobile Station:

The MS is GPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and PDP Context 12 is activated.

## Related PICS/PIXIT Statement(s)

None.

## Test Procedure

SS establishes a downlink TBF and sends several data blocks in random sequence , but within the range of transmit and receive window.

## Maximum Duration of Test

5 minutes.

## Expected Sequence

#### 43.1.2.4 Acknowledged mode / Downlink TBF / Re-assembly / Length Indicator

##### 43.1.2.4.1 Conformance requirements

1. The Extension (E) bit is used to indicate the presence of an optional extension octet in the RLC data block header. The More (M) bit is used to indicate the presence of an LLC frame following the current LLC frame. The M bit, the E bit, and the Length Indicator, are used to delimit LLC frames within a TBF.
2. The Length Indicator (LI) field is six bits in length and shall be encoded as a binary number. The value 0 shall indicate that no LLC frame boundary does exist, that the M bit shall be ignored and that the E bit shall be interpreted as having the value 1.
3. A singular case occurs when the end of the LLC PDU would fit within the RLC data block but the addition of the Length Indicator octet (to indicate the LLC PDU boundary) causes the LLC PDU to extend into the next RLC data block. In this case, this additional LI field shall take the value 0 whatever is the length of the last but one LLC PDU segment.

##### References

3GPP TS 04.60, subclause 9.1.11 and clause B.2.

##### 43.1.2.4.2 Test purpose

To verify the correct decoding of RLC data block length indication, more(M) and extension(E) bit fields during re-assembly of LLC frames into RLC data blocks.

##### 43.1.2.4.3 Method of test

##### Initial Conditions

System Simulator:

1 cell, default setting, PBCCH not present.

Mobile Station:

The MS is GPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and PDP Context 12 activated.

##### Related PICS/PIXIT Statement(s)

None.

##### Test Procedure

SS establishes a downlink TBF and sends data blocks containing two LLC frames (A bit set) with length indicator encoded. The MS is expected to decode these fields and re-assemble LLC frames correctly.

The size of the first LLC frame is 15 octets and second is 24 octets.

##### Maximum Duration of Test

5 minutes.

## 43.2 Control Blocks

### 43.2.1 Control Blocks Re-assembly

#### 43.2.1.1 Conformance requirements

The network may segment RLC/MAC control messages into one or two RLC/MAC control blocks depending on the length of the RLC/MAC control message.

RLC/MAC control blocks shall be collected at the receiver until all RLC/MAC control blocks comprising a RLC/MAC control message have been received. The receiving side shall determine the length of the RLC/MAC control message contents by interpreting the RLC/MAC control block contents.

#### References

3GPP TS 04.60, subclauses 9.1.11a, 9.1.11b and 9.1.2.

#### 43.2.1.2 Test purpose

To verify that the MS re-assembles a RLC control message If it spans across more than one RLC control block.

#### 43.2.1.3 Method of test

#### Initial Conditions

System Simulator:

1 cell, default setting, PBCCH not present.

Mobile Station:

The MS is switched off.

## Related PICS/PIXIT Statement(s)

- Method of trigger GPRS attach at power on.

## Test Procedure

The MS is switched on and triggered to perform a GPRS attach. The SS sends a PACKET UPLINK ASSIGNMENT message that spans more than one RLC control block. The PACKET UPLINK ASSIGNMENT message contains Dynamic Allocation struct (Timeslot allocation with power control parameters included) and frequency parameters with direct encoding 2 struct information fields. The SS verifies that RLC data blocks containing Attach Request message are received from the MS.. Switch off the MS.

## Maximum Duration of Test

5 minutes.

## Expected sequence

| Step | Direction | Message                             | Comments                                                                                                                                                                                                     |
